Use `delete_line` with branched lines to remove the segment for any connection.

Open the model vdp.

```
open_system('vdp');
```

Delete the line from x1 to the Out1 block. This command deletes only the segment of the line that connects the branch to the specified block.

```
delete_line('vdp','x1/1','Out1/1')
```

Delete the line segment from x2 to the Mux.

```
delete_line('vdp','x2/1','Mux/2')
```

Delete the line segment from x2 to the Product block.

```
delete_line('vdp', 'x2/1', 'Product/2')
```

Input Arguments

sys – Model or subsystem to delete line from
character vector

Model or subsystem to delete the line from, specified as a character vector.

Example: 'vdp', 'f14/Controller'

out – Block output port to delete line from
block/port name or number character vector | port handle

Block output port to delete line from, specified as either:

- The block name, a slash, and the port name or number. Most block ports are numbered from top to bottom or from left to right. For a state port, use the port name State instead of a port number.
- The port handle that you want to delete the line from.

Use 'PortHandles' with get_param to get the handles.

Example: 'Mu/1', 'Subsystem/2'

in — Block input port to delete line from

block/port name or number character vector | port handle

Block input port to delete line from, specified as either:

- The block name, a slash, and the port name or number. The port name on:
 - An enabled subsystem is Enable.
 - A triggered subsystem is Trigger.
 - If Action and Switch Case Action subsystems is Action.
- The port handle that you want to delete the line from.

Use 'PortHandles' with get_param to get handles.

Example: 'Mu/1', 'Subsystem/2'

point — Point on the line you want to delete

1-by-2 matrix

Point that falls on the line you want to delete, specified as a 1-by-2 matrix.

Example: [150 200]

lineHandle — Handle of the line you want to delete

handle

Handle of the line you want to delete. You can get the line handle by using get_param with the 'LineHandles' option or by assigning the line to a handle when you create it programmatically.

Version History

Introduced before R2006a

See Also

add_line | get_param

delete_param

Delete system parameter added with add_param function

Syntax

```
delete_param(sys,param1,...,paramN)
```

Description

delete_param(sys,param1,...,paramN) deletes parameters that were added to the system using the add_param function. If a specified parameter was not added with the add_param function, you receive an error.

Examples

Delete Added Parameter

Add parameters to a system, then delete one of the parameters from the system.

Load the vdp system.

```
load_system('vdp')
```

Add the DemoName and EquationOrder parameters to the vdp system.

```
add_param('vdp','DemoName','VanDerPolEquation','EquationOrder','2')
```

Delete the DemoName parameter from the vdp system.

```
delete_param('vdp','DemoName')
```

Input Arguments

sys — System name

character vector | string scalar

System name, specified as a character vector or string scalar.

Data Types: char | string

param1,...,paramN — One or more parameters to delete from system

character vector | string scalar

One or more parameters to delete from system, each specified as a character vector or string scalar.

Data Types: char | string

Version History

Introduced before R2006a

See Also

add_param

dependencies.fileDependencyAnalysis

Find model file dependencies

Syntax

```
files = dependencies.fileDependencyAnalysis('modelname')
[files,missing] = dependencies.fileDependencyAnalysis('modelname')
[files,missing,depfile] = dependencies.fileDependencyAnalysis('modelname')
[files,missing,depfile,manifestfile] = dependencies.fileDependencyAnalysis('modelname','manifestfile')
```

Description

`files = dependencies.fileDependencyAnalysis('modelname')` returns the full paths of all existing files referenced by the model `modelname`.

`[files,missing] = dependencies.fileDependencyAnalysis('modelname')` also returns `missing`, any referenced files that cannot be found.

`[files,missing,depfile] = dependencies.fileDependencyAnalysis('modelname')` also returns `depfile`, the full path of the user dependencies (.smd) file, if it exists, that stores the names of any files the user manually added or excluded.

`[files,missing,depfile,manifestfile] = dependencies.fileDependencyAnalysis('modelname','manifestfile')` also creates a manifest file specified in `manifestfile`.

Examples

Find Model File Dependencies

Programmatically find all the file dependencies of the model `sldemo_mdref_depgraph`.

```
files = dependencies.fileDependencyAnalysis('sldemo_mdref_depgraph')
```

```
files = 7x1 cell
    {'C:\TEMP\Bdoc22b_2054784_11640\ib975175\9\tpdaee3bcc\simulink-ex05898741\sldemo_mdref_F2C.s...
    {'C:\TEMP\Bdoc22b_2054784_11640\ib975175\9\tpdaee3bcc\simulink-ex05898741\sldemo_mdref_depgraph...
    {'C:\TEMP\Bdoc22b_2054784_11640\ib975175\9\tpdaee3bcc\simulink-ex05898741\sldemo_mdref_heate...
    {'C:\TEMP\Bdoc22b_2054784_11640\ib975175\9\tpdaee3bcc\simulink-ex05898741\sldemo_mdref_heate...
    {'C:\TEMP\Bdoc22b_2054784_11640\ib975175\9\tpdaee3bcc\simulink-ex05898741\sldemo_mdref_hous...
    {'C:\TEMP\Bdoc22b_2054784_11640\ib975175\9\tpdaee3bcc\simulink-ex05898741\sldemo_mdref_outd...
    {'C:\TEMP\Bdoc22b_2054784_11640\ib975175\9\tpdaee3bcc\simulink-ex05898741\sldemo_mdref_therm...
```

Input Arguments

modelname — Model, library, or subsystem name or path

character vector | string

Full name or path of a model, library, or subsystem to analyze, specified as a character vector or string.

Data Types: `char` | `string`

manifestfile — Manifest file name or path

character vector | string

(Optional) Full name or path of the manifest file to create, specified as a character vector or string. The function adds the suffix `.smf` to the user-specified name.

Data Types: `char` | `string`

Output Arguments

files — Full paths of referenced files

character vector | cell array of character vectors

Full paths of all existing files referenced by the model or library `modelName`, returned as a character vector or a cell array of character vectors.

missing — Full paths of missing files

character vector | cell array of character vectors

Full paths of files referenced by the model or library `modelName` that cannot be found, returned as a character vector or a cell array of character vectors.

depfile — Full path of user dependencies file

character vector

Full path of user dependencies (`.smd`) file, if it exists, that stores the names of any files the user manually added or excluded, returned as a character vector.

manifestfile — Full path of created manifest file

character vector

Full path of new manifest (`.smf`) file, returned as a character vector.

Tips

- Interactively generate a dependency graph and a report summarizing the list of required files and products. For more details, see “Analyze Model Dependencies”.
- If your model is in a project, use `listRequiredFiles` instead.
- To programmatically check which add-ons are required, use `dependencies.toolboxDependencyAnalysis` instead.

Version History

Introduced in R2012a

Output arguments `manifestfile` and `depfile` will be removed

Not recommended starting in R2020b

Output arguments `manifestfile` and `depfile` will be removed in a future release.

Starting in R2020b, you can only generate the manifest file programmatically. You can open manifest files created prior to R2020b using the Dependency Analyzer. To interactively generate a dependency graph and report, perform a dependency analysis. For more details, see “Analyze Model Dependencies”.

Starting in R2020b, you can no longer generate a user dependencies file (.smd file). The function only returns a .smd file if it already exists. To manually add or exclude dependencies, create a project from your model. For more details, see “Create a Project from a Model” and “Add Files to the Project”.

`listRequiredFiles` | `listImpactedFiles` | `dependencies.toolboxDependencyAnalysis`

Topics

“What Is Dependency Analysis?”

dependencies.toolboxDependencyAnalysis

Find add-on dependencies

Syntax

```
names = dependencies.toolboxDependencyAnalysis(files)
[names, folders] = dependencies.toolboxDependencyAnalysis(files)
```

Description

`names = dependencies.toolboxDependencyAnalysis(files)` returns `names`, a cell array of the add-on names required by the files in `files`.

`[names, folders] = dependencies.toolboxDependencyAnalysis(files)` also returns `folders`, a cell array of the add-on folders.

Examples

Find Required Add-Ons

Find all the required add-ons for the model `vdp`.

```
files={'vdp'};
names = dependencies.toolboxDependencyAnalysis(files)

names =

    1x1 cell array

    {'Simulink'}
```

Tip You can interactively run a dependency analysis. You can find the required add-ons for the entire project, for selected files, or for a model. You can see which products a new team member requires to use the design, or find which file is introducing a product dependency. See “Find Required Products and Add-Ons”.

To programmatically check which files are required, see `dependencies.fileDependencyAnalysis`.

To view long product names, examine the `names` cell array as follows:

```
names{:}

ans =

    'Simulink'
```

Find Names and Folders of Required Add-Ons

Find the names and folders of the required add-ons for the model `vdp`.

```
files={'vdp'};  
[names, folders] = dependencies.toolboxDependencyAnalysis(files)
```

```
names =  
  
    1×1 cell array  
  
    {'Simulink'}
```

```
folders =  
  
    1×1 cell array  
  
    {'simulink'}
```

Input Arguments

files — Files names or paths

" " (default) | cell array of strings

Names of files on the MATLAB path or full paths to files, specified as a cell array of strings.

Output Arguments

names — Add-on names

cell array of character vectors

Add-on names required by the files in `files`, returned as a cell array of character vectors.

folders — Add-on folders

cell array of character vectors

(Optional) Required add-on folders, returned as a cell array of character vectors.

Version History

Introduced in R2012a

`dependencies.fileDependencyAnalysis`

Topics

"Dependency Analysis"

"What Is Dependency Analysis?"

depview

Analyze and visualize model referencing dependencies with or without library dependencies

Syntax

```
depview(sys)
depview(sys, Name, Value)
```

Description

depview opens the Dependency Analyzer. While `view_mdhrefs` also opens the Dependency Analyzer, `depview` provides programmatic options that allow you to open a specific configuration of the dependency graph.

`depview(sys)` opens the Dependency Analyzer and displays a graph of dependencies for the model or library specified by `sys`.

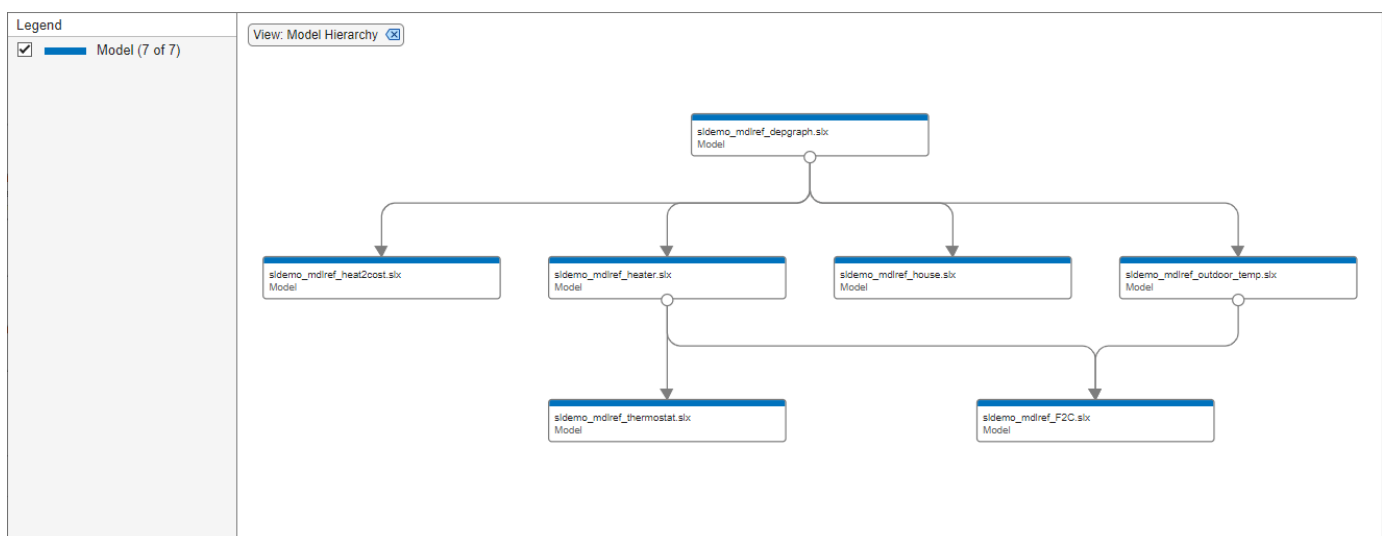

`depview(sys, Name, Value)` opens the Dependency Analyzer and displays a graph of dependencies as specified by one or more `Name, Value` pair arguments.

Examples

Open Dependency Analyzer with Default Settings

Open the Dependency Analyzer for the `sldemo_mdhref_depgraph` model.

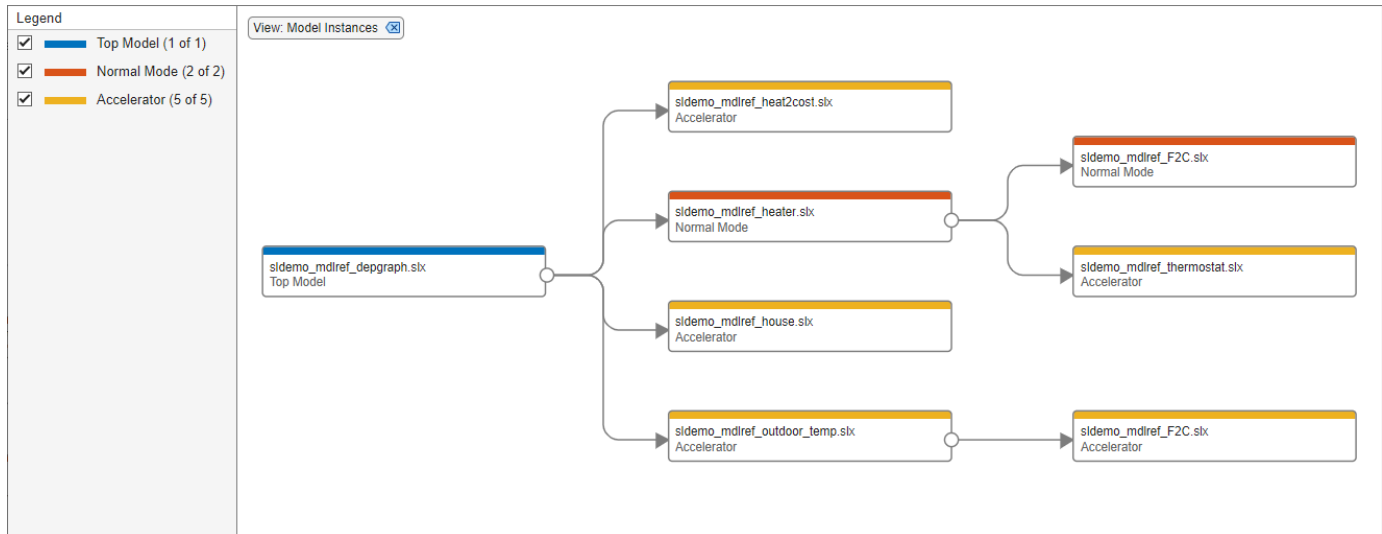

```
depview('sldemo_mdhref_depgraph');
```

Open Dependency Analyzer with Custom Settings

Open the Dependency Analyzer for the `sldemo_mdhref_depgraph` model in **Model Instances** view with a **Horizontal** layout.

```
depview('sldemo_mdhref_depgraph', 'ModelReferenceInstance', true, 'ShowHorizontal', true);
```

In **Model Instances** view, node appearance corresponds to simulation mode.

Input Arguments

`sys` — Name or path of model or library

' ' (default) | character vector

Name or path of model or library, specified as a character vector.

Data Types: `char`

Name-Value Pair Arguments

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify two name and value pair arguments in any order as `Name1`, `Value1`, `Name2`, `Value2`.

Example:

```
depview('sldemo_mdhref_depgraph', 'ModelReferenceInstance', true, 'ShowHorizontal', true)
```

`FileDependenciesExcludingLibraries` — Graph with only models

false (default) | true

To open the dependency graph with only models, set this parameter to `true`. In this view, node appearance corresponds to file type.

Dependencies

You can only set one of 'FileDependenciesExcludingLibraries', 'FileDependenciesIncludingLibraries', and 'ModelReferenceInstance' to true.

FileDependenciesIncludingLibraries — Graph with models and user-defined libraries

true (default) | false

To open the dependency graph with models and user-defined libraries, use the default setting. In this view, node appearance corresponds to file type.

Dependencies

You can only set one of 'FileDependenciesExcludingLibraries', 'FileDependenciesIncludingLibraries', and 'ModelReferenceInstance' to true.

ModelReferenceInstance — Graph with only models that shows each model instance separately

false (default) | true

To open the dependency graph with each instance of a model as a separate node in the graph, set this parameter to true. In this view, node appearance corresponds to simulation mode.

Dependencies

You can only set one of 'FileDependenciesExcludingLibraries', 'FileDependenciesIncludingLibraries', and 'ModelReferenceInstance' to true.

ShowHorizontal — Horizontal dependency display

false (default) | true

To open the dependency graph with referenced models and libraries to the right of their parents, set this parameter to true. By default, the Dependency Analyzer shows referenced models and libraries below their parents.

Version History

Introduced in R2006b

“Analyze Model Dependencies”

detachConfigSet

Dissociate configuration set or configuration reference from model

Syntax

```
configObj = detachConfigSet(model, configObjName)
```

Description

`configObj = detachConfigSet(model, configObjName)` dissociates the configuration set or configuration reference with the name `configObjName` from the model. The function returns the detached configuration as a `Simulink.ConfigSet` object or a `Simulink.ConfigSetRef` object. You cannot detach the active configuration from a model. When you want to detach the active configuration, first activate a different configuration for the model.

Examples

Detach Configuration Set From Model

Create, attach, and activate a configuration set for a model. Then, detach the default configuration set from the model.

Open the “Modeling a Fault-Tolerant Fuel Control System” on page 13-121 example model `sldemo_fuelsys`. Create a configuration set named 'MyConfig' and attach it to the model.

```
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
sldemo_fuelsys
configObj = Simulink.ConfigSet;
set_param(configObj, 'Name', 'MyConfig')
attachConfigSet('sldemo_fuelsys', configObj)
```

The active configuration for `sldemo_fuelsys` is the default configuration set, `Configuration`. To detach `Configuration`, activate another configuration for the model. For this example, set `MyConfig` as the active configuration set for `sldemo_fuelsys`.

```
setActiveConfigSet('sldemo_fuelsys', 'MyConfig')
```

Detach the default configuration set `Configuration` from the model.

```
detachConfigSet('sldemo_fuelsys', 'Configuration');
```

Input Arguments

model — Model from which to detach configuration set

character vector | string scalar

Model from which to disassociate a configuration set, specified as a character vector or string scalar. The model must be open.

Example: 'my_model'

configObjName — Configuration object name

character vector | string scalar

Name of the configuration object to detach from the model, specified as a character vector or string scalar.

Example: 'Configuration'

Version History**Introduced in R2006a****See Also**

setActiveConfigSet | attachConfigSet | attachConfigSetCopy

Topics

"Manage Configuration Sets for a Model"

disableimplicitsignalresolution

Convert model to use only explicit signal resolution

Syntax

```
retVal = disableimplicitsignalresolution('model')  
retVal = disableimplicitsignalresolution('model', displayOnly)
```

Description

`retVal = disableimplicitsignalresolution('model')` inputs a model, reports all signals and states that implicitly resolve to signal objects, and converts the model to resolve only signals and states that explicitly require it. The report and any changes are limited to the model itself; they do not include blocks that are library links.

Before executing this function, ensure that all relevant Simulink data objects are defined in the base workspace or a data dictionary to which the model is linked. The function ignores any data objects that are defined elsewhere.

The function scans *model*, returns a structure of handles to signals and states that resolve implicitly to signal objects, and performs the following operations on *model*:

- Search the model for all output ports and block states that resolve to Simulink signal objects.
- Modify these ports and blocks to enforce signal object resolution in the future.
- Set the model's `SignalResolutionControl` parameter to 'UseLocalSettings' (GUI: **Explicit Only**).

If `SignalResolutionControl` is already set to 'UseLocalSettings' or to 'None', the function takes no action and returns a warning.

- If any Stateflow output data resolves to a Simulink signal object:
 - Turn off hierarchical scoping of signal objects from within the Stateflow chart.
 - Explicitly label the output signal of the Stateflow chart.
 - Enforce signal object resolution for this signal in the future.

Any changes made by `disableimplicitsignalresolution` permanently change the model. Be sure to back up the model before calling the function with `displayOnly` defaulted to or specified as `false`.

`retVal = disableimplicitsignalresolution('model', displayOnly)` is equivalent to `disableimplicitsignalresolution(model)` if `displayOnly` is `false`.

If `displayOnly` is `true`, the function returns a structure of handles to signals and states that resolve implicitly to signal objects, but leaves the model unchanged.

Input Arguments

displayOnly

Boolean specifying whether to change the model.

- `false` — Changes the model.
- `true` — The function returns a structure of handles to signals and states that resolve implicitly to signal objects, but leaves the model unchanged.

Default: `false`

model

Model name or handle

Output Arguments

retVal

A MATLAB structure containing:

Signals

Handles to ports with signal names that resolve to signal objects

States

Handles to blocks with states that resolve to signal objects

Version History

Introduced in R2007a

docblock

Get or set editor invoked by Simulink DocBlock block

Syntax

```
docblock(setEditorType,command)
```

```
editCommand = docblock(getEditorType)
```

Description

`docblock(setEditorType,command)` uses the specified command to set the editor opened by double-clicking a DocBlock block.

By default, a DocBlock block opens Microsoft Word to edit HTML or RTF files. If Word is not available on your system, the block opens these file types using the text editor specified on the **Editor/Debugger Preferences** pane of the MATLAB Preferences dialog box. For text files, the default editor is the text editor specified in the MATLAB preferences.

The editor specifications persist between MATLAB sessions.

`editCommand = docblock(getEditorType)` returns the current command to open the specified editor from a DocBlock block.

Examples

Set DocBlock Text Editor

Specify Notepad as the DocBlock editor for text files.

```
docblock('setEditorTXT','system(''notepad "%<FileName>"'');')
```

Set and Get Current HTML Editor

You can use the `docblock` command to get the current editor.

Set your HTML editor for the DocBlock block to Mozilla Composer. The ampersand executes the command in the background.

```
docblock('setEditorHTML',...  
         'system(''/usr/local/bin/mozilla -edit "%<FileName>" &'');')
```

Get the current HTML editor.

```
htmlEd = docblock('getEditorHTML')
```

```
htmlEd =
    'system('/usr/local/bin/mozilla -edit "%<FileName>" &');'
```

Reset Text Editor to Default

Specify Notepad as the DocBlock editor for text files.

```
docblock('setEditorTXT','system('notepad "%<FileName>"');')
```

Get the current text editor.

```
txtEd = docblock('getEditorTXT')
txtEd =
    'system('notepad "%<FileName>"');
```

Reset the editor to the default editor.

```
docblock('setEditorTXT','')
```

Input Arguments

setEditorType — File type for which to set editor command

```
'setEditorHTML' | 'setEditorDOC' | 'setEditorTXT'
```

File type for which to set editor command, specified as 'setEditorHTML', 'setEditorDOC', or 'setEditorTXT'.

command — Command to open file type in editor

```
character vector | ''
```

Command to open file type in editor from the MATLAB Command Window, specified as a character vector. Use '' to reset to the default editor for that file type.

In the command, use the "%<FileName>" token to represent the full pathname to the document.

getEditorType — File type of editor command to return

```
'getEditorHTML' | 'getEditorDOC' | 'getEditorTXT'
```

File type of editor command to return, specified as 'getEditorHTML', 'getEditorDOC', or 'getEditorTXT'.

Output Arguments

editCommand — Command to open editor

```
character vector
```

Command to open editor, returned as a character vector.

Version History

Introduced in R2007a

Editor specification does not persist between previous releases and R2021b or later

Behavior changed in R2021b

If you used `docblock` to specify the editors that a DocBlock block uses for HTML, RTF, or text documents before R2021b, you must specify the editors again in R2021b or a later release. Otherwise, a DocBlock block uses the default editor for the document type.

DocBlock

Topics

“Use a Simulink DocBlock to Add a Comment” (Embedded Coder)

edittime.getDisplayIssues

Check whether model design warnings and errors is on

Syntax

```
val= edittime.getDisplayIssue
```

Description

Use the `val= edittime.getDisplayIssue` function to check whether model design errors and warnings is on.

Examples

Enable model design errors and warnings via the command-line

By default, model design errors and warnings are visible while you edit a model. You can turn them off by entering this command at the MATLAB command line.

```
edittime.setDisplayIssues('off')
```

You can turn them on by entering this command at the MATLAB command line.

```
edittime.setDisplayIssues('on')
```

You can check whether they are on by entering this command at the MATLAB command line.

```
val=edittime.getDisplayIssues
```

Output Arguments

val — Returns on or off

char

If edit-time checking is on, this function returns on. If edit-time checking is off, this function returns off.

Version History

Introduced in R2019a

See Also

`edittime.setDisplayIssues` | **Simulink Editor**

edittime.setDisplayIssues

Detect model design errors and warnings

Syntax

```
edittime.setDisplayIssues(value)
```

Description

`edittime.setDisplayIssues(value)` function sets whether to display model design errors and warnings while you design your model. This function is equivalent to selecting **Diagnostics > Edit-Time Errors & Warnings**. This setting persists for all models.

Examples

Enable model design errors and warnings through the command-line

By default, model design errors and warnings are visible while you edit a model. You can turn them off. At the MATLAB command line, enter:

```
edittime.setDisplayIssues('off')
```

To turn on errors and warnings, at the MATLAB command line, enter:

```
edittime.setDisplayIssues('on')
```

Input Arguments

value — Enable model design warning and error detection

character vector

To enable warnings and errors while you edit your model, set value to `on`. To disable warnings and errors while you edit, set value to `off`.

Data Types: `char`

Version History

Introduced in R2019a

`edittime.getDisplayIssues` | **Simulink Editor**

Topics

“Detect Modeling Errors During Edit Time” (Stateflow)

find_mdrefs

Find referenced models and Model blocks in model hierarchy

Syntax

```
[models,blocks] = find_mdrefs(system)
[models,blocks] = find_mdrefs(system,Name,Value)
```

Description

`[models,blocks] = find_mdrefs(system)` finds all referenced models and Model blocks in the model hierarchy below the specified system. The `find_mdrefs` function temporarily loads the models.

`[models,blocks] = find_mdrefs(system,Name,Value)` provides additional search options using one or more name-value pairs. For example, to keep the models loaded instead of temporarily loading them, set `KeepModelsLoaded` to `true`.

Examples

Find Referenced Models in Model Hierarchy

Find referenced models and Model blocks for all models referenced by the specified model.

```
load_system('sldemo_mdref_basic');
[myModels,myModelBlks] = find_mdrefs('sldemo_mdref_basic')

myModels = 2x1 cell
    {'sldemo_mdref_counter'}
    {'sldemo_mdref_basic' }

myModelBlks = 3x1 cell
    {'sldemo_mdref_basic/CounterA'}
    {'sldemo_mdref_basic/CounterB'}
    {'sldemo_mdref_basic/CounterC'}
```

Find and Load All Models in Model Hierarchy

By default, the `find_mdrefs` function loads and then closes the models that were not already loaded. To identify what models are loaded, use the `find_system` function.

```
find_mdrefs('sldemo_mdref_depgraph');
find_system('type','block_diagram')

ans =

    0x1 empty cell array
```

To find and load all models in the model hierarchy, set `KeepModelsLoaded` to `true`.

```
find_mdhrefs('sldemo_mdhref_depgraph', 'KeepModelsLoaded', true);
find_system('type', 'block_diagram')

ans = 7x1 cell
    {'sldemo_mdhref_thermostat' }
    {'sldemo_mdhref_heater'     }
    {'sldemo_mdhref_F2C'       }
    {'sldemo_mdhref_outdoor_temp'}
    {'sldemo_mdhref_house'     }
    {'sldemo_mdhref_heat2cost'  }
    {'sldemo_mdhref_depgraph'  }
```

The top model and all referenced models remain loaded. If you open `sldemo_mdhref_depgraph`, you can navigate the model hierarchy without waiting for the referenced models to load as you open them.

Input Arguments

system — System name, block path, or handle

character vector | string scalar | numeric scalar

System name, block path, or handle, specified as a character vector, string scalar, or numeric scalar.

The system must be an SLX file, MDL file, Model block, or Subsystem block.

If you specify a file name, do not include the file extension.

Data Types: `double` | `char` | `string`

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

```
Example: refModels =
find_mdhrefs(topmodel, 'KeepModelsLoaded', true, 'ReturnTopModelAsLastElement', false)
```

KeepModelsLoaded — Option to keep models loaded

`false` or `0` (default) | `true` or `1`

Option to keep models loaded, specified as the comma-separated pair consisting of `'KeepModelsLoaded'` and a numeric or logical `1` (`true`) or `0` (`false`).

By default the function loads and then closes the models that were not already loaded. To keep the models loaded, set this argument to `true`. Keeping the models loaded can be useful if you plan on interacting with the models after finding them.

Data Types: `logical`

AllLevels — Levels to search

true or 1 (default) | false or 0

Levels to search, specified as the comma-separated pair consisting of 'AllLevels' and a numeric or logical 1 (true) or 0 (false).

- true — Search all Model blocks in the model hierarchy of the specified system.
- false — Search only the top-level system.

Data Types: logical

IncludeProtectedModels — Option to include protected models

false or 0 (default) | true or 1

Option to include protected models in the search results, specified as the comma-separated pair consisting of 'IncludeProtectedModels' and a numeric or logical 1 (true) or 0 (false).

This setting only affects the returned list of referenced models; It does not affect the returned list of Model blocks.

Data Types: logical

IncludeCommented — Option to include commented blocks

false or 0 (default) | true or 1

Option to include commented blocks in the search results, specified as the comma-separated pair consisting of 'IncludeCommented' and a numeric or logical 1 (true) or 0 (false).

Data Types: logical

CaseSensitive — Option to match case when searching

true (default) | false

Option to match case when searching, specified as true for case-sensitive search or false for case-insensitive search.

Data Types: logical

FollowLinks — Option for search to follow library links

true (default) | false

Option for the search to follow library links, specified as true or false. If true, search follows links into library blocks.

Data Types: logical

LookUnderMasks — Options to search masked blocks

'all' (default) | 'none' | 'functional' | 'graphical'

Options to search masked blocks, specified as:

- 'all' — Search in all masked blocks.
- 'none' — Prevent searching in masked systems.
- 'functional' — Include masked subsystems that do not have dialogs.
- 'graphical' — Include masked subsystems that do not have workspaces or dialogs.

Data Types: `char` | `string`

MatchFilter — Option to match and filter elements in search

function handle

Option to match and filter elements such as blocks, system, lines, ports, and annotations in a search, specified as function handle. Use `MatchFilter` to determine whether elements should be included or skipped in the search.

The argument:

- Allows you to filter elements with custom filter functions
- Avoids processing elements when filters do not match
- Applies complex filters on blocks, lines, or annotations, to filter the results internally

The named function must be defined within a MATLAB program file. The function takes the handle of the element as input and returns two outputs.

```
function [match, prune] = func(element)
```

- The input `element` is the handle of the block being processed.
- The first output, `match`, is a logical value. If `false`, search skips the element.
- The second output, `prune`, is an optional logical value that only applies when `element` is a subsystem. The default value is `false`. If this value is set to `true`, the entire subsystem is omitted from the search.

For example, use `MatchFilter` to find all `Model` blocks in a model for which the `InitFcn` callback is defined, using the filter function `initFcnMdlBlocks`:

```
function match = initFcnMdlBlocks(handle)
    match = ~isempty(get_param(handle, 'InitFcn'));
end

addpath(fullfile(matlabroot, 'examples', 'simulink_variants', 'main'));
model='slexVariantMdlRefCondProp';
load_system(model);
[models,blocks] = find_mdrefs(model, 'MatchFilter', @initFcnMdlBlocks)
```

Variants: Simulink provides these built-in match filter functions to find variant blocks that are active in simulation or part of the generated code.

- `Simulink.match.activeVariants` — Filter function to find blocks that are active in simulation after model compilation.
- `Simulink.match.codeCompileVariants` — Filter function to find blocks that are part of generated code after model compilation.
- `Simulink.match.allVariants` — Filter function to find all blocks irrespective of whether the block is active or inactive due to variants.

Note To get correct results, you must **compile the model** before using `Simulink.match.activeVariants` and `Simulink.match.codeCompileVariants` filters. If the model is not compiled, these filters return all blocks in the model.

For example, use the `Simulink.match.activeVariants` option to find active variants in a model.

```

addpath(fullfile(matlabroot,'examples','simulink_variants','main'));
model='slexVariantMdlRefCondProp';
load_system(model);
set_param(model,'SimulationCommand','update');
[models,blocks] = find_mdrefs(model,'MatchFilter',@Simulink.match.activeVariants);

```

For example, use the `Simulink.match.codeCompileVariants` option to find variant choices that are part of the generated C code.

```

addpath(fullfile(matlabroot,'examples','simulink_variants','main'));
load_system('slexVariantMdlRefCondProp');
assignin('base','VSS_MODE',2);
slexVariantMdlRefCondProp([],[],[],'compileForCodegen');
[models,blocks] = find_mdrefs('slexVariantMdlRefCondProp',...
    'MatchFilter',@Simulink.match.codeCompileVariants);
slexVariantMdlRefCondProp([],[],[],'term');

```

Example: Use the `Simulink.match.allVariants()` filter to find all blocks in a model.

```

addpath(fullfile(matlabroot,'examples','simulink_variants','main'));
model='slexVariantMdlRefCondProp';
load_system(model);
[models,blocks]=find_mdrefs(model,'MatchFilter',@Simulink.match.allVariants);

```

Variants — Option to include variant models

'ActivePlusCodeVariants' (default) | 'ActiveVariants' | 'AllVariants'

Note The Variants argument will be removed. Use MatchFilter instead. For more information, see “Compatibility Considerations” on page 2-228.

Option to include variant models in the search results, specified as the comma-separated pair consisting of 'Variants' and 'ActivePlusCodeVariants', 'ActiveVariants', or 'AllVariants'.

- 'ActivePlusCodeVariants' — Include all variant models in the Variant Subsystem that are active in simulation and is part of the generated code.
- 'ActiveVariants' — Include the active variant models in the Variant Subsystem block.
- 'AllVariants' — Include all variant models in the Variant Subsystem block.

This search constraint applies only to Variant Subsystem blocks that have the **Variant control mode** set to expression or label. Use the `find_mdrefs` function with the `MatchFilter` option to operate on all types of variant blocks.

Data Types: char | string

ReturnTopModelAsLastElement — Option to include specified system

true or 1 (default) | false or 0

Option to include the specified system in the search results, specified as the comma-separated pair consisting of 'ReturnTopModelAsLastElement' and a numeric or logical 1 (true) or 0 (false).

By default, the last element in the returned list of referenced models is the name of the model, library, or subsystem file that you specified with the `system` argument. If you specify a block, the last element is the name of the file that contains it.

Data Types: logical

Output Arguments

models — Names of models

cell array of character vectors

Names of models, returned as a cell array of character vectors.

By default, the last element is the name of the model, library, or subsystem file that you specified with the `system` argument. If you specify a block, the last element is the model, library, or subsystem file that contains it.

blocks — Names of Model blocks

cell array of character vectors

Names of Model blocks, returned as a cell array of character vectors.

Version History

Introduced before R2006a

Warnings for removal of Variants argument

Warns starting in R2022b

As part of the removal of the `Variants` argument in a future release, these warnings have been introduced:

- When you use the `find_mdhrefs` function without the `Variants` argument, the function generates a warning if it skips the inactive choice of a Variant Subsystem block during the search.

Consider a model with a Variant Model block that has two variant choices, `Mdl_Linear_Controller` and `Mdl_NonLinear_Controller`. The `Mdl_NonLinear_Controller` block is the active choice.

This command skips the inactive `Mdl_Linear_Controller` block and generates a warning.

```
[myModels,myModelBlks] = find_mdhrefs...
('sldemo_variant_subsystems_modelblocks')
```

Warning: Using `find_mdhrefs` without the 'Variants' argument skips inactive Variant Subsystem blocks in the search. This behavior will change in a future release to look at all choices of the Variant Subsystem. To find blocks that are active in simulation or code generation, compile the model and use the built-in variant filters with the 'MatchFilter' option.

myModels =

2x1 cell array

```
{'mdlref_nonlinear_controller' }
{'sldemo_variant_subsystems_modelblocks'}
```

myModelBlks =

1x1 cell array

```
{'sldemo_variant_subsystems_modelblocks/Controller/Mdl_NonLinear_Controller'}
```

- When you use the `Variants` argument with its value set to 'AllVariants', the function generates a warning.

```
[myModels,myModelBlks] = find_mdhrefs...
('sldemo_variant_subsystems_modelblocks','Variants','AllVariants')
```

Warning: 'Variants' will be removed. Instead of using 'Variants' with value set to 'AllVariants', use 'MatchFilter' with value set to @Simulink.match.allVariants.

```
myModels =
    3x1 cell array

    {'Linear_Controller'          }
    {'Nonlinear_Controller'      }
    {'sldemo_variant_subsystems_modelblocks'}
```

```
myModelBlks =
    2x1 cell array

    {'sldemo_variant_subsystems_modelblocks/Controller/Linear Controller' }
    {'sldemo_variant_subsystems_modelblocks/Controller/Nonlinear Controller'}
```

New built-in match filter to find all variant blocks

You can use the built-in match filter, `Simulink.match.allVariants`, to find all the blocks in a variant model regardless of whether the block is active or inactive due to variants. This filter is the recommended replacement for the `AllVariants` option.

To be removed	Recommended Replacement
<code>find_mdhrefs(model, 'Variants', 'AllVariants')</code>	<code>find_mdhrefs(model, 'MatchFilter', ... @Simulink.match.allVariants);</code>

Default behavior has changed for Variants and MatchFilter arguments in model with variant blocks

Behavior changed in R2021a

- **Variants:** When you use the `find_mdhrefs` function without the `Variants` argument, for Variant Subsystem blocks, the function currently includes only those choices that are active during simulation or code generation in the search by default.

For other variant blocks such as Variant Source, Variant Sink, or Variant Subsystem blocks with the **Propagate conditions outside of variant subsystem** parameter set to on, the function includes all choices in the search.

Consider a model with a Variant Model block that has two variant choices, `Mdl_Linear_Controller` and `Mdl_NonLinear_Controller`.

This command returns only the active Model blocks in the model.

```
[myModels,myModelBlks] = find_mdhrefs...
('sldemo_variant_subsystems_modelblocks')
```

```
myModels =
    2x1 cell array

    {'mdlref_nonlinear_controller' }
    {'sldemo_variant_subsystems_modelblocks'}
```

```
myModelBlks =
    1x1 cell array

    {'sldemo_variant_subsystems_modelblocks/Controller/Mdl_NonLinear_Controller'}
```

- **MatchFilter:** When you use the `find_mdhrefs` function with the `MatchFilter` argument, the function applies the filters on the active and inactive variant choices by default.

Consider a model with a Variant Model block that has two variant choices, `Mdl_Linear_Controller` and `Mdl_NonLinear_Controller`. The filter function `initFcnMdlBlocks` finds all the Model blocks for which the `InitFcn` callback is set.

```
function match = initFcnMdlBlocks(handle)
match = ~isempty(get_param(handle, 'InitFcn'));
end
```

This command returns the active and inactive Model blocks in the model.

```
[myModels,myModelBlks] = find_mdhrefs('sldemo_variant_subsystems_modelblocks',...
'MatchFilter', @initFcnMdlBlocks)

myModels =

3x1 cell array

    'mdlref_linear_controller'
    'mdlref_nonlinear_controller'
    'sldemo_variant_subsystems_modelblocks'

myModelBlks =

2x1 cell array

    'sldemo_variant_subsystems_modelblocks/Controller/Mdl_Linear_Controller'
    'sldemo_variant_subsystems_modelblocks/Controller/Mdl_NonLinear_Controller'
```

Variants argument will be removed

Warns starting in R2021a

The `Variants` argument will be removed from `find_mdhrefs` in a future release. Function calls that use the `Variants` argument continue to work with a warning.

Using the `find_mdhrefs` function with the `Variants` argument produces inconsistent search results. The `find_mdhrefs` function is an edit-time operation, but to determine whether a block is active in a model with all types of variant blocks, you need to compile the model.

To find Model blocks that are active during simulation or code generation, compile the model and use the `find_mdhrefs` function with the `MatchFilter` argument.

This table lists the recommended replacement for different values of the `Variants` argument.

To Be Removed	Recommended Replacement
<code>find_mdhrefs(model, 'Variants', ... 'ActiveVariants');</code>	<code>set_param(model, 'SimulationCommand', 'update');</code> <code>find_mdhrefs(model, 'MatchFilter', ... @Simulink.match.activeVariants);</code>
<code>find_mdhrefs(model, 'Variants', ... 'ActivePlusCodeVariants');</code>	<code>model([],[],[], 'compileForCodegen');</code> <code>[models, blocks] = find_mdhrefs(model, 'MatchFilter', ... @Simulink.match.codeCompileVariants);</code> <code>model([],[],[], 'term');</code>

When you use the `find_system` function, you cannot specify both of the `MatchFilter` and `Variants` arguments.

This command produces an error.

```
find_mdrefs(bdroot, 'MatchFilter', @Simulink.match.activeVariants, ...  
            'Variants', 'ActiveVariants');
```

Filter elements during search with MatchFilter

To match and filter model elements during a search, you can define a custom filter function and pass the function handle as value to the `MatchFilter` name-value argument.

To find variant blocks that are active in a simulation or part of the generated code, you can use the built-in match filter functions, `Simulink.match.activeVariants`, `Simulink.match.codeCompileVariants`, and `Simulink.match.allVariants`, after compiling the model.

Specifying a logical value as the second argument of find_mdrefs is discouraged

Not recommended starting in R2020b

The `find_mdrefs` function provides two ways to specify whether to search all levels of the model hierarchy. Both techniques give the same results, but only the name-value pair technique allows you to specify additional options.

Instead of specifying whether to search all levels of the model hierarchy with a logical as the second argument, use the `AllLevels` name-value pair.

find_system

Topics

“Model Reference Basics”

“Inspect Model Hierarchies”

find_system

Find systems, blocks, lines, ports, and annotations

Syntax

```
Objects = find_system
Objects = find_system(System)
Objects = find_system(Name,Value)
Objects = find_system(System,Name,Value)
```

Description

`Objects = find_system` returns loaded systems and their blocks, including subsystems.

`Objects = find_system(System)` returns the specified system and its blocks.

`Objects = find_system(Name,Value)` returns loaded systems and the objects in those systems that meet the criteria specified by one or more `Name, Value` pair arguments. You can use this syntax to specify search constraints and to search for specific parameter values. Specify the search constraints before the parameter and value pairs.

`Objects = find_system(System,Name,Value)` returns the objects in the specified system that meet the specified criteria.

Examples

Find Loaded Systems and Their Blocks

Return the names of all loaded systems and their blocks.

```
load_system('vdp')
find_system

ans = 15x1 cell
    {'vdp' }
    {'vdp/Constant' }
    {'vdp/More Info' }
    {'vdp/More Info/Model Info'}
    {'vdp/Mu' }
    {'vdp/Mux' }
    {'vdp/Product' }
    {'vdp/Scope' }
    {'vdp/Square' }
    {'vdp/Sum' }
    {'vdp/Sum1' }
    {'vdp/x1' }
    {'vdp/x2' }
    {'vdp/Out1' }
    {'vdp/Out2' }
```

Returns loaded systems and libraries, including vdp.

Find Specific System and Its Blocks

Return vdp system and its blocks.

```
load_system({'vdp','ex_sl-demo-clutch'})
find_system('vdp')
```

```
ans = 15x1 cell
    {'vdp' }
    {'vdp/Constant' }
    {'vdp/More Info' }
    {'vdp/More Info/Model Info' }
    {'vdp/Mu' }
    {'vdp/Mux' }
    {'vdp/Product' }
    {'vdp/Scope' }
    {'vdp/Square' }
    {'vdp/Sum' }
    {'vdp/Sum1' }
    {'vdp/x1' }
    {'vdp/x2' }
    {'vdp/Out1' }
    {'vdp/Out2' }
```

Return Names of Loaded Models, Subsystems, and Libraries

Return the names of the loaded models, subsystems, and libraries. A subsystem name is returned only if the subsystem can be loaded independently.

```
load_system('vdp');
find_system('type','block-diagram')
```

```
ans = 1x1 cell array
    {'vdp'}
```

Search Children of Subsystem

Return the names of all Goto blocks that are children of the Unlocked subsystem in the ex_sl-demo-clutch system.

```
load_system('ex_sl-demo-clutch');
find_system('ex_sl-demo-clutch/Unlocked','SearchDepth',1,'BlockType','Goto')
```

```
ans = 2x1 cell
    {'ex_sl-demo-clutch/Unlocked/Goto' }
    {'ex_sl-demo-clutch/Unlocked/Goto1' }
```

Copyright 2020 The MathWorks, Inc.

Search Using Multiple Criteria

Search in the vdp system and return the names of all Gain blocks whose **Gain** value is set to 1.

```
load_system('vdp');  
find_system('vdp', 'BlockType', 'Gain', 'Gain', '1')
```

```
ans = 1x1 cell array  
    {'vdp/Mu'}
```

Return Lines and Annotations as Handles

Get the handles of all lines and annotations in the vdp system. With 'FindAll', the function returns handles regardless of how you specify the system to search.

```
load_system('vdp');  
L = find_system('vdp', 'FindAll', 'on', 'type', 'line')
```

```
L = 19x1  
  
    34.0070  
    33.0066  
    32.0071  
    31.0077  
    30.0074  
    29.0071  
    28.0078  
    27.0070  
    26.0071  
    25.0074  
    :
```

```
A = find_system('vdp', 'FindAll', 'on', 'type', 'annotation')
```

```
A = 2x1  
  
    36.0067  
    35.0068
```

Search for Specific Block Parameter Value

Find any block dialog box parameters with a value of 0 in the vdp and ex_slldemo_clutch systems.

```
load_system({'vdp', 'f14'})  
find_system({'vdp', 'f14'}, 'BlockDialogParams', '0')
```

```
ans =
    32x1 cell array

    {'vdp/More Info' }
    {'vdp/More Info/Model Info' }
    {'vdp/Scope' }
    {'vdp/x2' }
    {'vdp/Out1' }
    {'vdp/Out1' }
    {'vdp/Out2' }
    {'vdp/Out2' }
    {'f14/AircraftDynamicsModel' }
    {'f14/AircraftDynamicsModel/Vertical Velocity-w (ft//sec)'}
    {'f14/AircraftDynamicsModel/Vertical Velocity-w (ft//sec)'}
    {'f14/AircraftDynamicsModel/Pitch Rate-q (rad//sec)'}
    {'f14/AircraftDynamicsModel/Pitch Rate-q (rad//sec)'}
    .
    .
    .
```

Search Using Regular Expressions

Find all blocks in the top level of the currently loaded systems with a block dialog parameter value that starts with 3.

```
load_system({'ex_sl-demo-clutch','vdp'});
find_system('SearchDepth','1','regexp','on','BlockDialogParams','^3')
```

```
ans = 4x1 cell
    {'vdp/Scope' }
    {'vdp/Scope' }
    {'vdp/Square' }
    {'ex_sl-demo-clutch/w'}
```

Regular Expression Search for Partial Match

When you search using regular expressions, you can specify a part of the character vector you want to match to return all objects that contain that character vector. Find all the inport and outport blocks in the ex_sl-demo-clutch model.

```
load_system('ex_sl-demo-clutch');
find_system('ex_sl-demo-clutch','regexp','on','blocktype','port')
```

```
ans = 39x1 cell
    {'ex_sl-demo-clutch/Friction...' }
    {'ex_sl-demo-clutch/Friction...' }
    {'ex_sl-demo-clutch/Friction...' }
    {'ex_sl-demo-clutch/Friction Mode Logic/Tin' }
    {'ex_sl-demo-clutch/Friction Mode Logic/Tfmaxs' }
    {'ex_sl-demo-clutch/Friction Mode Logic/Break Apart...' }
    {'ex_sl-demo-clutch/Friction Mode Logic/Break Apart...' }
```

```

{'ex_sl-demo_clutch/Friction Mode Logic/Break Apart...'} }
{'ex_sl-demo_clutch/Friction Mode Logic/Lockup...'} }
{'ex_sl-demo_clutch/Friction Mode Logic/Lockup...'} }
{'ex_sl-demo_clutch/Friction Mode Logic/Lockup...'} }
{'ex_sl-demo_clutch/Friction Mode Logic/Lockup...'} }
{'ex_sl-demo_clutch/Friction Mode Logic/Lockup...'} }
{'ex_sl-demo_clutch/Friction Mode Logic/Lockup...'} }
{'ex_sl-demo_clutch/Friction Mode Logic/Lockup...'} }
{'ex_sl-demo_clutch/Friction Mode Logic/Lockup...'} }
{'ex_sl-demo_clutch/Friction Mode Logic/Lockup FSM/lock'} }
{'ex_sl-demo_clutch/Friction Mode Logic/Lockup FSM/unlock'} }
{'ex_sl-demo_clutch/Friction Mode Logic/Lockup FSM/locked'} }
{'ex_sl-demo_clutch/Friction Mode Logic/Requisite Friction/Tin'} }
{'ex_sl-demo_clutch/Friction Mode Logic/Requisite Friction/Tf'} }
{'ex_sl-demo_clutch/Friction Mode Logic/locked'} }
{'ex_sl-demo_clutch/Friction Mode Logic/lock'} }
{'ex_sl-demo_clutch/Friction Mode Logic/unlock'} }
{'ex_sl-demo_clutch/Friction Mode Logic/Tf'} }
{'ex_sl-demo_clutch/Locked/Tin'} }
{'ex_sl-demo_clutch/Locked/w'} }
{'ex_sl-demo_clutch/Unlocked/Tfmaxk'} }
{'ex_sl-demo_clutch/Unlocked/Tin'} }
{'ex_sl-demo_clutch/Unlocked/we'} }
:

```

Update Library Links in a Subsystem

In this example, `myModel` contains a single subsystem, which is a library link. After the model was last opened, a Gain block was added to the corresponding subsystem in the library.

Open the model. Use `find_system` with `'FollowLinks'` set to `'off'`. The command does not follow the library links into the subsystem and returns only the subsystem at the top level.

```

open_system('myModel')
find_system(bdroot,'LookUnderMasks','on','FollowLinks','off')

```

ans =

```

' myModel'
' myModel/Subsystem'

```

Use `find_system` with `'FollowLinks'` set to `'on'`. `find_system` updates the library links and returns the block in the subsystem.

```

find_system(bdroot,'LookUnderMasks','on','FollowLinks','on')

```

```

Updating Link: myModel/Subsystem/Gain
Updating Link: myModel/Subsystem/Gain

```

ans =

```

' myModel'

```

```
'myModel/Subsystem'
'myModel/Subsystem/Gain'
```

Return Values as Handles

Provide the system to `find_system` as a handle. Search for block dialog box parameters with a value of 0. If you make multiple calls to `get_param` for the same block, then using the block handle is more efficient than specifying the full block path as a character vector.

```
load_system('vdp');
sys = get_param('vdp','Handle');
find_system(sys,'BlockDialogParams','0')
```

```
ans = 8×1
```

```
3.0083
4.0079
8.0079
13.0076
14.0077
14.0077
15.0074
15.0074
```

Input Arguments

System — System to search

path name | cell array of path names | handle | vector of handles

System to search, specified as the full system path name, a cell array of system path names, a handle, or a vector of handles.

Example: 'MyModel/Subsystem1'

Example: {'vdp','ex_sl-demo_clutch'}

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

When you use the `find_system` function, `Name, Value` pair arguments can include search constraints and parameter name and value pairs. You can specify search constraints in any order, but they must precede the parameter name and value pairs.

See “Block-Specific Parameters” on page 6-24 for the list of block parameters.

Example: 'SearchDepth','0','LookUnderMasks','none','BlockType','Goto' searches in loaded systems, excluding masked subsystems, for Goto blocks.

BlockDialogParams — Option to search block dialog box parameters for the specified value
character vector | string scalar

Option to search block dialog box parameters for the specified value, specified as the comma-separated pair consisting of 'BlockDialogParams' and a character vector or string scalar. This pair must follow the other search constraint pairs.

CaseSensitive — Option to consider case when matching
'on' (default) | 'off'

Option to consider case when matching, specified as the comma-separated pair consisting of 'CaseSensitive' and 'on' for case-sensitive searching or 'off'.

FindAll — Option to include lines, ports, and annotations within systems
'off' (default) | 'on'

Option to include lines, ports, and annotations in systems in the search, specified as the comma-separated pair consisting of 'FindAll' and 'on' or 'off'. When this option is set to 'on', `find_system` returns a vector of handles regardless of how you specify the `System` argument.

FirstResultOnly — Option to return only the first result
'off' (default) | 'on'

Option to return only the first result and then stop the search, specified as the comma-separated pair consisting of 'FirstResultOnly' and 'on' or 'off'.

LookInsideSubsystemReference — Option to look inside a referenced subsystem
'on' (default) | 'off'

Option to look inside a referenced subsystem in a model and list child blocks specified as the comma-separated pair consisting of 'LookInsideSubsystemReference' and 'on' or 'off'.

FollowLinks — Option to follow links into library blocks
'off' (default) | 'on'

Option to follow links into library blocks, specified as the comma-separated pair consisting of 'FollowLinks' and 'on' or 'off'. If you do not specify a system to search, `find_system` includes loaded libraries in the results, whether you set 'FollowLinks' to 'on' or 'off'. You can use 'FollowLinks' with 'LookUnderMasks' to update library links in subsystems. See "Update Library Links in a Subsystem" on page 2-236.

IncludeCommented — Option to include commented blocks
'off' (default) | 'on'

Option to include commented blocks in the search, specified as the comma-separated pair consisting of 'IncludeCommented' and 'on' or 'off'.

LoadFullyIfNeeded — Option to load any partially loaded models
'on' (default) | 'off'

Option to load any partially loaded models, specified as the comma-separated pair of 'LoadFullyIfNeeded' and 'on' to load models or 'off' to disable loading. Use this option, for example, to prevent load warnings.

LookUnderMasks — Options for searching under masks

'graphical' (default) | 'none' | 'functional' | 'all' | 'on' | 'off'

Options for searching under masks, specified as the comma-separated pair consisting of 'LookUnderMasks' and one of these options:

- 'graphical' — Search includes masked subsystems that have no workspaces and no dialogs.
- 'none' — Search skips masked subsystems.
- 'functional' — Search includes masked subsystems that do not have dialogs.
- 'all' — Search includes all masked subsystems.
- 'on' — Search includes all masked subsystems.
- 'off' — Search skips masked subsystem.

RegExp — Option to treat search expressions as regular expressions

'off' (default) | 'on'

Option to treat search expressions as regular expressions specified as the comma-separated pair consisting of 'RegExp' and 'on' to treat search expressions as regular expressions or 'off'. To learn more about MATLAB regular expressions, see “Regular Expressions”.

SearchDepth — Option to restrict the search depth

positive integer character vector or string scalar

Option to restrict the search depth to the specified level, specified as the comma-separated pair consisting of 'SearchDepth' and a positive integer character vector or string scalar. For example, specify '0' to search loaded systems only, '1' for blocks and subsystems of the top-level system, '2' for the top-level system and its children, etc. The default is to search all levels.

Variants — Options for searching variants

'ActiveVariants' (default) | 'AllVariants' | 'ActivePlusCodeVariants'

Note The Variants argument will be removed. Use MatchFilter instead. For more information, see “Compatibility Considerations” on page 2-241.

Options for searching variants, specified as the comma-separated pair consisting of 'Variants' and one of these options:

- 'ActiveVariants' — Search only the active variant choice in the Variant Subsystem.
- 'AllVariants' — Search all variant choices in the Variant Subsystem.
- 'ActivePlusCodeVariants' — Search all variant choices in the Variant Subsystem that are active in simulation and is part of the generated code.

This search constraint applies only to Variant Subsystem blocks that have the **Variant control mode** set to expression or label. Use the find_system function with the MatchFilter option to operate on all types of variant blocks.

MatchFilter — Option to match and filter elements in search

function handle

Option to match and filter elements such as blocks, system, lines, ports, and annotations in a search, specified as function handle. Use `MatchFilter` to determine whether elements should be included or skipped in a search.

The argument:

- Allows you to filter elements with custom filter functions
- Avoids processing elements when filters do not match
- Applies complex filters on blocks, lines, or annotations, to filter the results internally

The named function must be defined within a MATLAB program file. The function takes the handle of the element as input and returns two outputs.

```
function [match, prune] = func(element)
```

- The input `element` is the handle of the block being processed.
- The first output, `match`, is a logical value. If `false`, search skips the element.
- The second output, `prune`, is an optional logical value that only applies when `element` is a subsystem. The default value is `false`. If this value is set to `true`, the entire subsystem is omitted from the search.

Example: Use `MatchFilter` to find all non Inport and Outport blocks in a model using your own defined filter function, `nonInOutBlocks`.

```
function match = nonInOutBlocks(handle)
match = true;
if strcmp(get_param(handle, 'Type'), 'block')
    blockType = get_param(handle, 'BlockType');
    if strcmp(blockType, 'Inport') || ...
        strcmp(blockType, 'Outport')
        match = false;
    end
end
end

load_system('vdp');
blks = find_system('vdp', 'MatchFilter', @nonInOutBlocks)
```

Variants: Simulink provides these built-in match filter functions to find variant blocks that are active in simulation or part of the generated code.

- `Simulink.match.activeVariants` — Filter function to find blocks that are active in simulation after model compilation.
- `Simulink.match.codeCompileVariants` — Filter function to find blocks that are part of generated code after model compilation.
- `Simulink.match.allVariants` — Filter function to find all blocks irrespective of whether the block is active or inactive due to variants.

Note To get correct results, you must **compile the model** before using `Simulink.match.activeVariants` and `Simulink.match.codeCompileVariants` filters. If the model is not compiled, these filters return all blocks in the model.

For an example that compares the pre-compile and post-compile time results for these filters, see “Use find_system with Built-In MatchFilter Options for Variant Blocks”.

Example: Use the `Simulink.match.activeVariants` filter to find active variants in a model.

```
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));
model='sldemo_variant_subsystems';
load_system(model);
assignin('base','VSS_MODE',2);
set_param(model,'SimulationCommand','update');
activeBlks = find_system(model,'MatchFilter',@Simulink.match.activeVariants);
```

Example: Use the `Simulink.match.codeCompileVariants` filter to find variant choices that are part of the generated C code.

```
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));
load_system('sldemo_variant_subsystems');
assignin('base','VSS_MODE',2);
sldemo_variant_subsystems([], [], [], 'compileForCodegen');
activeBlks= find_system('sldemo_variant_subsystems', 'MatchFilter', @Simulink.match.codeCompileVariants);
sldemo_variant_subsystems([], [], [], 'term');
```

Example: Use the `Simulink.match.allVariants()` filter to find all blocks in a model.

```
find_system('sldemo_variant_subsystems', 'MatchFilter', @Simulink.match.allVariants);
```

Output Arguments

Objects — Matching objects

cell array of path names | vector of handles

Matching objects found, returned as:

- A cell array of path names if you specified `System` as a path name or cell array of path names, or if you did not specify a system
- A vector of handles if you specified `System` as a handle or vector of handles

Version History

Introduced before R2006a

Warnings for removal of Variants argument

Warns starting in R2022b

As part of the removal of the `Variants` argument in a future release, these warnings have been introduced:

- When you use the `find_system` function without the `Variants` argument, the function generates a warning if it skips the inactive choice of a Variant Subsystem block during the search.

Consider a model with a Variant Subsystem block that has two variant choices, `Linear Controller` and `Nonlinear Controller`. The `Nonlinear Controller` block is the active choice.

This command skips the inactive `Linear Controller` block and generates a warning.

```
blocks = find_system('sldemo_variant_subsystems/Controller')
```

Warning: Using find_system without the 'Variants' argument skips inactive Variant Subsystem blocks in the search. This behavior will change in a future release to look at all choices of the Variant Subsystem. To find blocks that are active in simulation or code generation, compile the model and use the built-in variant filters with the 'MatchFilter' option.

```
blocks =
```

```
12x1 cell array
```

```
{'sldemo_variant_subsystems/Controller'           }
{'sldemo_variant_subsystems/Controller/sensor1'   }
{'sldemo_variant_subsystems/Controller/sensor2'   }
{'sldemo_variant_subsystems/Controller/sensor3'   }
{'sldemo_variant_subsystems/Controller/Nonlinear Controller' }
{'sldemo_variant_subsystems/Controller/Nonlinear Controller/sensor1' }
{'sldemo_variant_subsystems/Controller/Nonlinear Controller/sensor2' }
{'sldemo_variant_subsystems/Controller/Nonlinear Controller/sensor3' }
{'sldemo_variant_subsystems/Controller/Nonlinear Controller/1-D Lookup Table' }
{'sldemo_variant_subsystems/Controller/Nonlinear Controller/Add' }
{'sldemo_variant_subsystems/Controller/Nonlinear Controller/Out1' }
{'sldemo_variant_subsystems/Controller/Out1'      }
```

- When you use the Variants argument with its value set to 'AllVariants', the function generates a warning.

```
blocks = find_system('sldemo_variant_subsystems/Controller','Variants','AllVariants')
```

Warning: 'Variants' will be removed. Instead of using 'Variants' with value set to 'AllVariants' use 'MatchFilter' with value set to @Simulink.match.allVariants.

```
blocks =
```

```
19x1 cell array
```

```
{'sldemo_variant_subsystems/Controller'           }
{'sldemo_variant_subsystems/Controller/sensor1'   }
{'sldemo_variant_subsystems/Controller/sensor2'   }
{'sldemo_variant_subsystems/Controller/sensor3'   }
{'sldemo_variant_subsystems/Controller/Linear Controller' }
{'sldemo_variant_subsystems/Controller/Linear Controller/sensor1' }
{'sldemo_variant_subsystems/Controller/Linear Controller/sensor2' }
{'sldemo_variant_subsystems/Controller/Linear Controller/sensor3' }
{'sldemo_variant_subsystems/Controller/Linear Controller/Add' }
{'sldemo_variant_subsystems/Controller/Linear Controller/Discrete-Transfer Fcn' }
{'sldemo_variant_subsystems/Controller/Linear Controller/Out1' }
{'sldemo_variant_subsystems/Controller/Nonlinear Controller' }
{'sldemo_variant_subsystems/Controller/Nonlinear Controller/sensor1' }
{'sldemo_variant_subsystems/Controller/Nonlinear Controller/sensor2' }
{'sldemo_variant_subsystems/Controller/Nonlinear Controller/sensor3' }
{'sldemo_variant_subsystems/Controller/Nonlinear Controller/1-D Lookup Table' }
{'sldemo_variant_subsystems/Controller/Nonlinear Controller/Add' }
{'sldemo_variant_subsystems/Controller/Nonlinear Controller/Out1' }
{'sldemo_variant_subsystems/Controller/Out1'      }
```

New built-in match filter to find all variant blocks

You can use the built-in match filter, `Simulink.match.allVariants`, to find all the blocks in a variant model regardless of whether the block is active or inactive due to variants. This filter is the recommended replacement for the `AllVariants` option.

To be removed	Recommended Replacement
<code>find_system(model, 'Variants', ... 'AllVariants');</code>	<code>find_system(model, 'MatchFilter', ... @Simulink.match.allVariants);</code>

Default behavior has changed for Variants and MatchFilter arguments in model with variant blocks

Behavior changed in R2021a

- **Variants:** When you use the `find_system` function without specifying the `Variants` argument, the function currently includes only the active variant choice for Variant Subsystem blocks in the search by default.

For other variant blocks such as Variant Source, Variant Sink, or Variant Subsystem blocks with the **Propagate conditions outside of variant subsystem** parameter set to on, the function includes all choices in the search.

Consider a model with a Variant Subsystem that has two variant choices, Linear Controller and Nonlinear Controller.

This command returns only the active Add blocks in the model.

```
add_blocks = find_system('sldemo_variant_subsystems/Controller', ...  
'BlockType', 'Sum')
```

```
add_blocks =
```

```
1x1 cell array
```

```
{'sldemo_variant_subsystems/Controller/Nonlinear Controller/Add'}
```

- **MatchFilter:** When you use the `find_system` function with the `MatchFilter` argument, the function applies the filters on the active and inactive variant choices by default.

Consider a model with a Variant Subsystem that has two variant choices, Linear Controller and Nonlinear Controller. The filter function `findAddBlocks` finds all the Add blocks in the model.

```
function match = findAddBlocks(handle)  
match = strcmp(get_param(handle, 'Type'), 'block') &&...  
strcmp(get_param(handle, 'BlockType'), 'Sum');  
end
```

This command returns the active and inactive Add blocks in the model.

```
add_blocks = find_system('sldemo_variant_subsystems', 'MatchFilter', ...  
@findAddBlocks)
```

```
add_blocks =
```

```
2x1 cell array
```

```
{'sldemo_variant_subsystems/Controller/Linear Controller/Add' }  
{'sldemo_variant_subsystems/Controller/Nonlinear Controller/Add'}
```

Variants argument will be removed

Warns starting in R2021a

The `Variants` argument will be removed from `find_system` in a future release. Function calls that use the `Variants` argument continue to work with a warning.

Using the `find_system` function with the `Variants` argument produces inconsistent search results. The `find_system` function is an edit-time operation, but to determine whether a block is active in a model with all types of variant blocks, you need to compile the model.

To find variant blocks that are active during simulation or code generation, **compile the model** and use the `find_system` function with the `MatchFilter` argument.

This table lists the recommended replacement for different values of the `Variants` argument.

To Be Removed	Recommended Replacement
<code>find_system(model, 'Variants', ... 'ActiveVariants');</code>	<code>set_param(model, 'SimulationCommand', 'update'); find_system(model, 'MatchFilter', ... @Simulink.match.activeVariants);</code>
<code>find_system(model, 'Variants', ... 'ActivePlusCodeVariants');</code>	<code>model([], [], [], 'compileForCodegen'); activeBlks= find_system(model, 'MatchFilter', ... @Simulink.match.codeCompileVariants); model([], [], [], 'term');</code>

When you use the `find_system` function, you cannot specify both of the `MatchFilter` and `Variants` arguments.

This command produces an error.

```
find_system(bdroot, 'MatchFilter', @Simulink.match.activeVariants, ...
    'Variants', 'ActiveVariants');
```

Filter elements during search with `MatchFilter`

To match and filter model elements during a search, you can define a custom filter function and pass the function handle as value to the `MatchFilter` name-value argument.

To find variant blocks that are active in a simulation or part of the generated code, you can use the built-in match filter functions, `Simulink.match.activeVariants`, `Simulink.match.codeCompileVariants`, and `Simulink.match.allVariants`, after compiling the model.

fixdt

Package: Simulink

Create `Simulink.NumericType` object describing a fixed-point or floating-point data type

Syntax

```
a = fixdt(Signed,WordLength)
a = fixdt(Signed,WordLength,FractionLength)
a = fixdt(Signed,WordLength,TotalSlope,Bias)
a = fixdt(Signed,WordLength,SlopeAdjustmentFactor,FixedExponent,Bias)
a = fixdt(DataTypeNameString)
a = fixdt(___, 'DataTypeOverride', 'Off')
[a,IsScaledDouble] = fixdt(____)
```

Description

`a = fixdt(Signed,WordLength)` returns a `Simulink.NumericType` object that describes a fixed-point data type with the specified signedness and word length, and unspecified scaling.

`a = fixdt(Signed,WordLength,FractionLength)` returns a `Simulink.NumericType` object that describes a fixed-point data type with binary point scaling.

`a = fixdt(Signed,WordLength,TotalSlope,Bias)` returns a `Simulink.NumericType` object that describes a fixed-point data type with slope and bias scaling.

`a = fixdt(Signed,WordLength,SlopeAdjustmentFactor,FixedExponent,Bias)` returns a `Simulink.NumericType` object that describes a fixed-point data type with slope and bias scaling.

`a = fixdt(DataTypeNameString)` returns a `Simulink.NumericType` object that describes an integer, fixed-point, or floating-point data type specified by the name of a data type.

`a = fixdt(____, 'DataTypeOverride', 'Off')` returns a `Simulink.NumericType` object with its `DataTypeOverride` parameter set to `Off`. The default value for this property is `Inherit`. You can specify the `DataTypeOverride` parameter after any combination of other input parameters.

`[a,IsScaledDouble] = fixdt(____)` returns a `Simulink.NumericType` object that describes a fixed-point or floating-point data type and a flag that indicates whether the specified data type is of a scaled double data type.

Examples

Create a `Simulink.NumericType` Object with Unspecified Scaling

Create a signed `Simulink.NumericType` object with a word length of 16 bits and unspecified scaling.

```
a = fixdt(1,16)
```

```
a =  
  NumericType with properties:  
  
    DataTypeMode: 'Fixed-point: unspecified scaling'  
    Signedness: 'Signed'  
    WordLength: 16  
    IsAlias: 0  
    DataScope: 'Auto'  
    HeaderFile: ''  
    Description: ''
```

Create a Simulink.NumericType Object with Binary Point Scaling

Create a `Simulink.NumericType` object that describes a signed fixed-point data types with a word length of 16 bits and fraction length of 2 bits.

```
a = fixdt(1,16,2)  
  
a =  
  NumericType with properties:  
  
    DataTypeMode: 'Fixed-point: binary point scaling'  
    Signedness: 'Signed'  
    WordLength: 16  
    FractionLength: 2  
    IsAlias: 0  
    DataScope: 'Auto'  
    HeaderFile: ''  
    Description: ''
```

Create a Simulink.NumericType Object with Slope and Bias Scaling

The real-world value of a slope bias scaled number is represented by:

$$\text{real world value} = (\text{slope} \times \text{integer}) + \text{bias}$$

Create a `Simulink.NumericType` object that describes a signed fixed-point data type with a word length of 16 bits, slope of 2^{-2} , and bias of 4.

```
a = fixdt(1,16,2^-2,4)  
  
a =  
  NumericType with properties:  
  
    DataTypeMode: 'Fixed-point: slope and bias scaling'  
    Signedness: 'Signed'  
    WordLength: 16  
    Slope: 0.2500  
    Bias: 4  
    IsAlias: 0  
    DataScope: 'Auto'
```

```
HeaderFile: ''
Description: ''
```

Alternatively, the slope can be represented by:

$$\text{slope} = \text{slopeadjustmentfactor} \times 2^{\text{fixedexponent}}$$

```
a = fixdt(1,16,1,-2,4)
```

```
a =
NumericType with properties:

    DataTypeMode: 'Fixed-point: slope and bias scaling'
    Signedness: 'Signed'
    WordLength: 16
        Slope: 0.2500
        Bias: 4
    IsAlias: 0
    DataScope: 'Auto'
    HeaderFile: ''
    Description: ''
```

The `DataTypeMode` property of the `Simulink.NumericType` object, `a`, is slope and bias scaling.

Create a `Simulink.NumericType` Object Using a Data Type Name

Use a data type name to create a `Simulink.NumericType` object that describes an 8-bit, unsigned, fixed-point data type and return a flag that indicates whether the object is of a scaled double data type.

```
[a,IsScaledDouble] = fixdt('ufix8')
```

```
a =
NumericType with properties:

    DataTypeMode: 'Fixed-point: binary point scaling'
    Signedness: 'Unsigned'
    WordLength: 8
    FractionLength: 0
    IsAlias: 0
    DataScope: 'Auto'
    HeaderFile: ''
    Description: ''
```

```
IsScaledDouble = logical
0
```

The `IsScaledDouble` output returns `0`, which indicates that the data type of `a` is not a scaled double data type.

Create a Simulink.NumericType Object with DataTypeOverride Set to Off

Create a Simulink.NumericType object with its DataTypeOverride property set to Off.

```
a = fixdt(0,8,2,'DataTypeOverride','Off')  
  
a =  
  NumericType with properties:  
  
      DataTypeMode: 'Fixed-point: binary point scaling'  
      Signedness: 'Unsigned'  
      WordLength: 8  
      FractionLength: 2  
      DataTypeOverride: 'Off'  
      IsAlias: 0  
      DataScope: 'Auto'  
      HeaderFile: ''  
      Description: ''
```

Input Arguments

Signed — Signedness

true or 1 | false or 0

Signedness of the Simulink.NumericType object, specified as a numeric or logical 1 (true) or 0 (false). A value of 1, or true, indicates a signed data type. A value of 0, or false, indicates an unsigned data type.

Data Types: logical

WordLength — Word length

positive scalar

Word length, in bits, of the Simulink.NumericType object, specified as a positive scalar.

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

FractionLength — Fraction length

0 (default) | scalar

Fraction length, in bits, of the Simulink.NumericType object, specified as a scalar.

FractionLength can be greater than WordLength. For more information, see “Binary Point Interpretation” (Fixed-Point Designer).

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

TotalSlope — Slope of the scaling

1 (default) | scalar

Slope of the scaling, specified as a scalar.

The following equation represents the real-world value of a slope bias scaled number:

$$realworldvalue = (slope \times integer) + bias$$

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

Bias — Bias of the scaling

0 (default) | scalar

Bias of the scaling, specified as a scalar.

The following equation represents the real-world value of a slope bias scaled number:

$$realworldvalue = (slope \times integer) + bias$$

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

SlopeAdjustmentFactor — Slope adjustment factor of slope and bias scaled number

1 (default) | positive scalar

Slope adjustment factor of a slope bias scaled number, specified as a positive scalar.

The slope adjustment factor must be greater than or equal to 1 and less than 2. If you input a `SlopeAdjustmentFactor` outside this range, `fixdt` automatically applies a scaling normalization to the values of `SlopeAdjustmentFactor` and `FixedExponent` so that the revised slope adjustment factor is greater than or equal to 1 and less than 2, and maintains the value of the slope.

The following equation demonstrates the relationship between the slope, fixed exponent, and slope adjustment factor:

$$slope = slopeadjustmentfactor \times 2^{fixedexponent}$$

Data Types: half | single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

FixedExponent — Fixed exponent of slope and bias scaled number

0 (default) | scalar

Fixed exponent of a slope bias scaled number, specified as a scalar.

The following equation demonstrates the relationship between the slope, fixed exponent, and slope adjustment factor:

$$slope = slopeadjustmentfactor \times 2^{fixedexponent}$$

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

DataTypeNameString — Data type name

character vector

Data type name, specified as a character vector.

The data type name can be either the name of a built-in Simulink data type or the name of a fixed-point data type that conforms to the naming convention for fixed-point names established by the

Fixed-Point Designer product. For more information, see “Fixed-Point Data Type and Scaling Notation” (Fixed-Point Designer).

Data Types: char

Output Arguments

a — Data type

Simulink.NumericType object

Data type, returned as a Simulink.NumericType object.

IsScaledDouble — Scaled double flag

logical

Scaled double flag, returned as a logical that indicates whether the specified data type name is the name of a scaled double data type.

fixpt_evenspace_cleanup

Modify breakpoints of lookup table to have even spacing

Syntax

```
xdata_modified = fixpt_evenspace_cleanup(xdata,xdt,xscale)
```

Description

xdata_modified = fixpt_evenspace_cleanup(*xdata*,*xdt*,*xscale*) modifies breakpoints of a lookup table to have even spacing after quantization. By adjusting breakpoints to have even spacing after quantization, Simulink Coder generated code can exclude breakpoints from memory.

xdata is the breakpoint vector of a lookup table to make evenly spaced, such as 0:0.005:1. *xdt* is the data type of the breakpoints, such as sfix(16). *xscale* is the scaling of the breakpoints, such as 2⁻¹². Using these three inputs, fixpt_evenspace_cleanup returns the modified breakpoints in *xdata_modified*.

This function works only with nontunable data and considers data to have even spacing relative to the scaling slope. For example, the breakpoint vector [0 2 5], which has spacing value 2 and 3, appears to have uneven spacing. However, the difference between the maximum spacing 3 and the minimum spacing 2 equals 1. If the scaling slope is 1 or greater, a spacing variation of 1 represents a 1-bit change or less. In this case, the fixpt_evenspace_cleanup function considers a spacing variation of 1 bit or less to be even.

Modifications to breakpoints can change the numerical behavior of a lookup table. To check for changes, test the model using simulation, rapid prototyping, or other appropriate methods.

Examples

Modify breakpoints of a lookup table to have even spacing after quantization:

```
xdata = 0:0.005:1;
xdt = sfix(16);
xscale = 2^-12;
xdata_modified = fixpt_evenspace_cleanup(xdata,xdt,xscale)
```

fixpt_look1_func_approx

Optimize fixed-point approximation of nonlinear function by interpolating lookup table data points

Syntax

```
[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,nptsmax)
[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,[])
[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,[],nptsmax)
[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...
xmin,xmax,xdt,xscale,ydtydt,yscale,rndmeth,errmax,nptsmax,spacing)
```

Description

[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,nptsmax) returns the optimal breakpoints of a lookup table, an ideal function applied to the breakpoints, and the worst-case approximation error. The lookup table satisfies the maximum acceptable error and maximum number of points that you specify.

[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,[]) returns the optimal breakpoints of a lookup table, an ideal function applied to the breakpoints, and the worst-case approximation error. The lookup table satisfies the maximum acceptable error that you specify.

[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,[],nptsmax) returns the optimal breakpoints of a lookup table, an ideal function applied to the breakpoints, and the worst-case approximation error. The lookup table satisfies the maximum number of points that you specify.

[xdata,ydata,errworst] = fixpt_look1_func_approx('func',...
xmin,xmax,xdt,xscale,ydtydt,yscale,rndmeth,errmax,nptsmax,spacing) returns the optimal breakpoints of a lookup table, an ideal function applied to the breakpoints, and the worst-case approximation error. The lookup table satisfies the maximum acceptable error, maximum number of points, and breakpoint spacing that you specify.

In each case, `fixpt_look1_func_approx` interpolates between lookup table data points to optimize the fixed-point approximation. The inputs `xmin` and `xmax` specify the range over which to approximate the breakpoints. The inputs `xdt`, `xscale`, `ydt`, `yscale`, and `rndmeth` follow conventions used by fixed-point Simulink blocks.

The inputs `errmax`, `nptsmax`, and `spacing` are optional. Of these inputs, you must specify at least `errmax` or `nptsmax`. If you omit one of those two inputs, you must use brackets, `[]`, in place of the omitted input. `fixpt_look1_func_approx` ignores that requirement for the lookup table.

If you do not specify spacing, and more than one spacing satisfies `errmax` and `nptsmax`, `fixpt_look1_func_approx` chooses in this order: power-of-2 spacing, even spacing, uneven

spacing. This behavior applies when you specify both *errmax* and *nptsmax*, but not when you specify just one of the two.

Input Arguments

func

Function of x for which to approximate breakpoints. Enclose this expression in single quotes, for example, `'sin(2*pi*x)'`.

xmin

Minimum value of x .

xmax

Maximum value of x .

xdt

Data type of x .

xscale

Scaling for the x values.

ydt

Data type of y .

yscale

Scaling for the y values.

rndmeth

Rounding mode supported by fixed-point Simulink blocks:

'Ceiling'	Round to the nearest representable number in the direction of positive infinity.
'Floor' (default)	Round to the nearest representable number in the direction of negative infinity.
'Nearest'	Round to the nearest representable number.
'Toward Zero'	Round to the nearest representable number in the direction of zero.

errmax

Maximum acceptable error between the ideal function and the approximation given by the lookup table.

nptsmax

Maximum number of points for the lookup table.

spacing

Spacing of breakpoints for the lookup table:

'even'	Even spacing
'pow2'	Even, power-of-2 spacing
'unrestricted' (default)	Uneven spacing

If you specify...	The breakpoints of the lookup table...
<i>errmax</i> and <i>nptsmax</i>	Meet both criteria, if possible. The <i>errmax</i> requirement has higher priority than <i>nptsmax</i> . If the breakpoints cannot meet both criteria with the specified spacing, <i>nptsmax</i> does not apply.
<i>errmax</i> only	Meet the error criteria, and <code>fixpt_look1_func_approx</code> returns the fewest number of points.
<i>nptsmax</i> only	Meet the points criteria, and <code>fixpt_look1_func_approx</code> returns the smallest worst-case error.

Output Arguments**xdata**

Vector of breakpoints for the lookup table.

ydata

Vector of values from applying the ideal function to the breakpoints.

errworst

Worst-case error, which is the maximum absolute error between the ideal function and the approximation given by the lookup table.

Examples

Approximate a fixed-point sine function using a lookup table:

```
func = 'sin(2*pi*x)';
% Define the range over which to optimize breakpoints
xmin = 0;
xmax = 0.25;
% Define the data type and scaling for the inputs
xdt = ufix(16);
xscale = 2^-16;
% Define the data type and scaling for the outputs
ydt = sfix(16);
yscale = 2^-14;
% Specify the rounding method
rndmeth = 'Floor';
```

```
% Define the maximum acceptable error
errmax = 2^-10;
% Choose even, power-of-2 spacing for breakpoints
spacing = 'pow2';
% Create the lookup table
[xdata,ydata,errworst] = fixpt_look1_func_approx(func,...
    xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,[],spacing);
```

fixpt_look1_func_plot

Plot fixed-point approximation function for lookup table

Syntax

```
fixpt_look1_func_plot(xdata,ydata,'func',...  
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth)  
errworst = fixpt_look1_func_plot(xdata,ydata,'func',...  
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth)
```

Description

`fixpt_look1_func_plot(xdata,ydata,'func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth)` plots a lookup table approximation function and the error from the ideal function.

`errworst = fixpt_look1_func_plot(xdata,ydata,'func',...
xmin,xmax,xdt,xscale,ydt,yscale,rndmeth)` plots a lookup table approximation function and the error from the ideal function. The output `errworst` is the maximum absolute error.

You can use `fixpt_look1_func_approx` to generate `xdata` and `ydata`, the breakpoints and table data for the lookup table, respectively. `fixpt_look1_func_approx` applies the ideal function to the breakpoints in `xdata` to produce `ydata`. While this method is the easiest way to generate `ydata`, you can choose other values for `ydata` as input for `fixpt_look1_func_plot`. Choosing different values for `ydata` can, in some cases, produce a lookup table with a smaller maximum absolute error.

Input Arguments

xdata

Vector of breakpoints for the lookup table.

ydata

Vector of values from applying the ideal function to the breakpoints.

func

Function of x for which to approximate breakpoints. Enclose this expression in single quotes, for example, `'sin(2*pi*x)'`.

xmin

Minimum value of x .

xmax

Maximum value of x .

xdt

Data type of x.

xscale

Scaling for the x values.

ydt

Data type of y.

yscale

Scaling for the y values.

rndmeth

Rounding mode supported by fixed-point Simulink blocks:

'Ceiling'	Round to the nearest representable number in the direction of positive infinity.
'Floor' (default)	Round to the nearest representable number in the direction of negative infinity.
'Nearest'	Round to the nearest representable number.
'Toward Zero'	Round to the nearest representable number in the direction of zero.

Examples

Plot a fixed-point approximation of the sine function using data points generated by `fixpt_look1_func_approx`:

```
func = 'sin(2*pi*x)';
% Define the range over which to optimize breakpoints
xmin = 0;
xmax = 0.25;
% Define the data type and scaling for the inputs
xdt = ufix(16);
xscale = 2^-16;
% Define the data type and scaling for the outputs
ydt = sfix(16);
yscale = 2^-14;
% Specify the rounding method
rndmeth = 'Floor';
% Define the maximum acceptable error
errmax = 2^-10;
% Choose even, power-of-2 spacing for breakpoints
spacing = 'pow2';
% Generate data points for the lookup table
[xdata,ydata,errworst]=fixpt_look1_func_approx(func,...
    xmin,xmax,xdt,xscale,ydt,yscale,rndmeth,errmax,[],spacing);
% Plot the sine function (ideal and fixed-point) & errors
fixpt_look1_func_plot(xdata,ydata,func,xmin,xmax,...
    xdt,xscale,ydt,yscale,rndmeth);
```

`fixpt_look1_func_plot` plots the fixed-point sine function, using generated data points, and plots the error between the ideal function and the fixed-point function. The maximum absolute error and the number of points required appear on the plot. The error drops to zero at a breakpoint, but increases between breakpoints due to curvature differences between the ideal function and the line drawn between breakpoints.

The lookup table requires 33 points to achieve a maximum absolute error of $2^{-11.3922}$.

fixpt_set_all

Set property for each fixed-point block in subsystem

Syntax

```
fixpt_set_all(SystemName, fixptPropertyName, fixptPropertyValue)
```

Description

`fixpt_set_all(SystemName, fixptPropertyName, fixptPropertyValue)` sets the property `fixptPropertyName` of every applicable block in the model or subsystem `SystemName` to the value `fixptPropertyValue`

Examples

Set each fixed-point block in a model `Filter_1` to round towards the floor and saturate upon overflow:

```
% Round towards the floor  
fixpt_set_all('Filter_1', 'RndMeth', 'Floor')
```

```
% Saturate upon overflow  
fixpt_set_all('Filter_1', 'DoSatur', 'on')
```

Version History

Introduced before R2006a

fixptbestexp

Exponent that gives best precision for fixed-point representation of value

Syntax

```
out = fixptbestexp(RealWorldValue, TotalBits, IsSigned)
out = fixptbestexp(RealWorldValue, FixPtDataType)
```

Description

`out = fixptbestexp(RealWorldValue, TotalBits, IsSigned)` returns the exponent that gives the best precision for the fixed-point representation of *RealWorldValue*. *TotalBits* specifies the number of bits for the fixed-point number. *IsSigned* specifies whether the fixed-point number is signed: 1 indicates the number is signed and 0 indicates the number is not signed.

`out = fixptbestexp(RealWorldValue, FixPtDataType)` returns the exponent that gives the best precision based on the data type *FixPtDataType*.

Examples

Get the exponent that gives the best precision for the real-world value 4/3 using a signed, 16-bit number:

```
out = fixptbestexp(4/3,16,1)
out =
    -14
```

Alternatively, specify the fixed-point data type:

```
out = fixptbestexp(4/3,sfix(16))
out =
    -14
```

This shows that the maximum precision representation of 4/3 is obtained by placing 14 bits to the right of the binary point:

```
01.01010101010101
```

You can specify the precision of this representation in fixed-point blocks by setting the scaling to 2^{-14} or `2^fixptbestexp(4/3,16,1)`.

Version History

Introduced before R2006a

See Also

`fixptbestprec`

fixptbestprec

Determine maximum precision available for fixed-point representation of value

Syntax

```
out = fixptbestprec(RealWorldValue,TotalBits,IsSigned)
out = fixptbestprec(RealWorldValue,FixPtDataType)
```

Description

`out = fixptbestprec(RealWorldValue,TotalBits,IsSigned)` determines the maximum precision for the fixed-point representation of the real-world value specified by `RealWorldValue`. You specify the number of bits for the fixed-point number with `TotalBits`, and you specify whether the fixed-point number is signed with `IsSigned`. If `IsSigned` is 1, the number is signed. If `IsSigned` is 0, the number is not signed. The maximum precision is returned to `out`.

`out = fixptbestprec(RealWorldValue,FixPtDataType)` determines the maximum precision based on the data type specified by `FixPtDataType`.

Examples

Example 1

The following command returns the maximum precision available for the real-world value 4/3 using a signed, 8-bit number:

```
out = fixptbestprec(4/3,8,1)

out =
    0.015625
```

Alternatively, you can specify the fixed-point data type:

```
out = fixptbestprec(4/3,sfix(8))

out =
    0.015625
```

This value means that the maximum precision available for 4/3 is obtained by placing six bits to the right of the binary point since 2^{-6} equals 0.015625:

```
01.010101
```

Example 2

You can use the maximum precision as the scaling in fixed-point blocks. This enables you to use `fixptbestprec` to perform a type of autoscaling if you would like to designate a known range of your simulation. For example, if your known range is -13 to 22, and you are using a safety margin of 30%:

```
knownMax = 22;
knownMin = -13;
```

```
localSafetyMargin = 30;  
slope = max( fixptbestprec( (1+localSafetyMargin/100)* ...  
    [knownMax,knownMin], sfix(16) ) );
```

The variable `slope` can then be used in the expression that you specify for the **Output data type** parameter in a block mask. Be sure to select the **Lock output data type setting against changes by the fixed-point tools** check box in the same block to prevent the Fixed-Point Tool from overriding the scaling. If you know the range, you can use this technique in place of relying on a model simulation to provide the range to the autoscaling tool, as described in `autofixexp`.

`fixptbestexp`

fmudialog.createBusType

Create all FMU bus objects required for structured input or output ports in workspace

Syntax

```
fmudialog.createBusType(currentBlock)
```

Description

`fmudialog.createBusType(currentBlock)` creates all the FMU bus objects required for structured input or output ports in the workspace.

Examples

Create FMU Bus Object in Current Workspace

Create FMU bus object in current workspace.

```
fmudialog.createBusType(gcf)
```

Input Arguments

currentBlock — Current block

current block

Current block for which to create all required FMU bus objects.

Data Types: char | string

Version History

Introduced in R2020b

frameedit

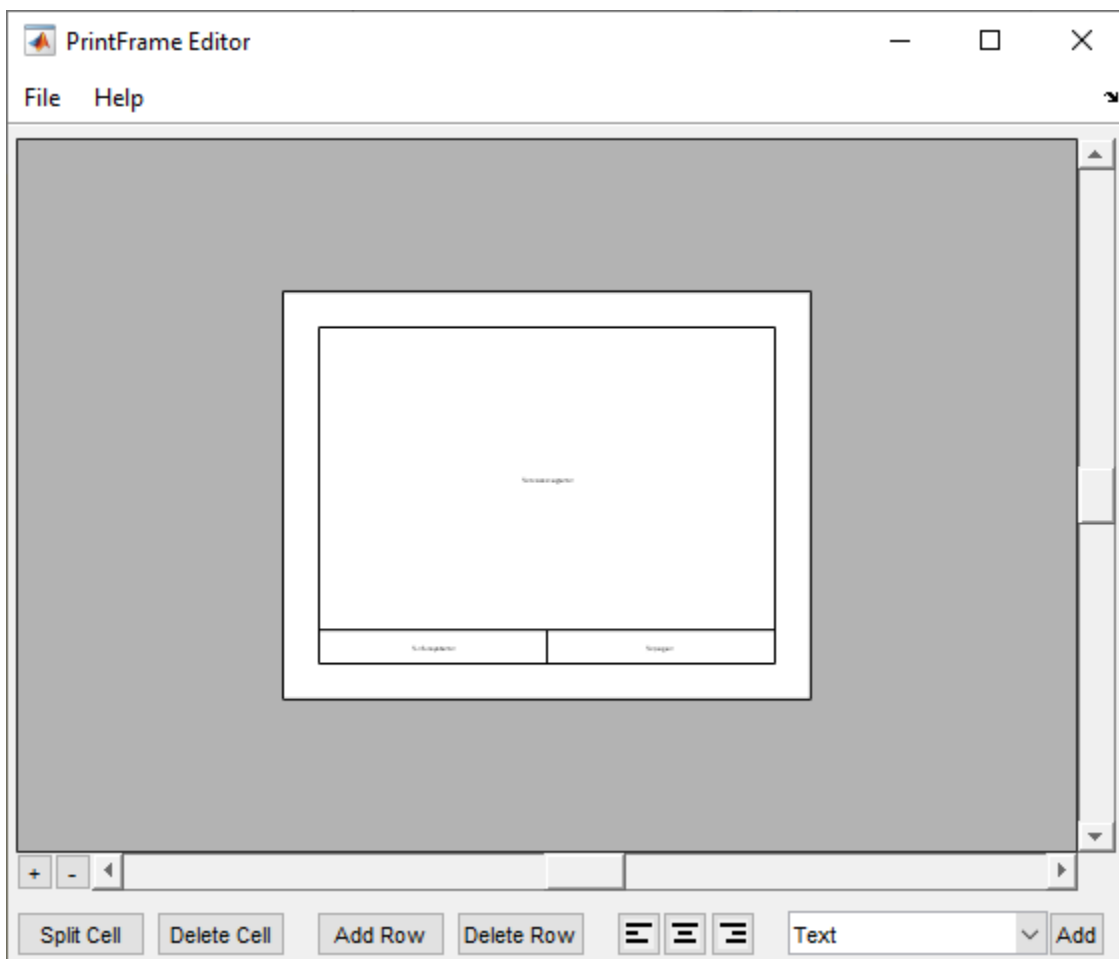

Open PrintFrame Editor to edit print frames for Simulink and Stateflow block diagrams

Syntax

```
frameedit  
frameedit(filename)
```

Description

`frameedit` opens a new file in the **PrintFrame Editor**, which is a graphical interface you use to create borders for Simulink and Stateflow block diagrams.

`frameedit(filename)` opens the specified file in the **PrintFrame Editor**.

Examples

Open Existing Print Frame for Editing

Suppose you have a print frame named `myFrame.fig`. You can open it directly in the **PrintFrame Editor** from the MATLAB Command Window.

```
frameedit('myFrame.fig')
```

The **PrintFrame Editor** opens the print frame named `myFrame.fig`.

Input Arguments

filename — Print frame file name

character vector | string scalar

Print frame file name, specified as a character vector or string scalar.

The specified file must be a figure file (`.fig`) previously created and saved with the **PrintFrame Editor**.

Example: `frameedit('myFrame.fig')`

Data Types: `char` | `string`

gcb

Get path name of current block

Syntax

```
b1 = gcb  
b1 = gcb(sys)
```

Description

`b1 = gcb` returns the full block path name of the current block in the current system. The current block is:

- The most recently clicked block
- The S-Function block currently executing its corresponding MATLAB function
- The block whose callback routine is being executed
- The block whose mask is being evaluated as part of the `MaskInitialization` parameter evaluation
- The last block loaded after opening a model

`b1 = gcb(sys)` returns the full block path name of the current block in the specified system. Load the system first.

Examples

Get Path Name of Most Recently Selected Block

Open a model.

```
vdp
```

In the model, select a block. For example, select the Gain block. Then, enter `gcb` at the command prompt.

```
gcb
```

```
ans =
```

```
vdp/Mu
```

Get Parameters of Current Block

Open a model.

```
vdp
```

Select the Gain block.

Use the value of `gcb` with `get_param` to get the value of the Gain parameter.

```
x = get_param(gcb, 'Gain')
```

```
x =
```

```
1
```

Get Current Block in Specified System

Load the “Modeling a Fault-Tolerant Fuel Control System” on page 13-121 example model `sldemo_fuelsys`.

```
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')  
load_system('sldemo_fuelsys');
```

Get the current block in the `fuel_rate_control` subsystem.

```
bl = gcb('sldemo_fuelsys/fuel_rate_control')
```

```
bl =
```

```
sldemo_fuelsys/fuel_rate_control/validate_sample_time
```

Input Arguments

sys – System that contains the block

character vector

System that contains the block, specified as a character vector.

Example: `'vdp' 'sldemo_fuelsys/fuel_rate_control'`

Version History

Introduced before R2006a

`gcbh` | `gcbp` | `gcs` | `get_param`

Topics

“Mask Callback Code”

gcbh

Get handle of current block

Syntax

```
handle = gcbh
```

Description

`handle = gcbh` returns the handle of the current block in the current system.

Examples

Get Handle of Current Block

Get the handle of the most recently selected block.

```
handle = gcbh
```

```
handle =
```

```
    281.0001
```

Version History

Introduced before R2006a

`gcb` | `gcbp` | `gcs` | `getSimulinkBlockHandle`

gcbp

Get `Simulink.BlockPath` object for current block

Syntax

```
path = gcbp
```

Description

`path = gcbp` returns the `Simulink.BlockPath` object of the current block in the current system. The current block is:

- The most recently clicked block
- The last block loaded after opening a model

The returned `Simulink.BlockPath` object is context sensitive to model hierarchy.

Examples

Create `Simulink.BlockPath` Object for Selected Block

Open `sldemo_mdref_basic`.

```
openExample('sldemo_mdref_basic')
```

Click a block in the model hierarchy. For example, click the block labeled `ScopeA` in the `CounterA` instance of `sldemo_mdref_counter`. Then, use `gcbp` in the Command Window.

```
path = gcbp
```

```
path =
```

```
Simulink.BlockPath  
Package: Simulink
```

```
Block Path:  
  sldemo_mdref_basic/CounterA  
  sldemo_mdref_counter/ScopeA
```

Use the `getBlock` method to access block path strings from this object.

```
Methods
```

Version History

Introduced in R2019a

Objects

Simulink.BlockPath

Functions

gcb | gcbh | gcs | get_param | open (BlockPath)

gcs

Get path name of current system

Syntax

gcs

Description

gcs returns the path name of the current system. The current system is one of these:

- During editing, the system or subsystem most recently clicked or that contains the block most recently clicked
- During simulation of a system that contains an S-Function block, the system or subsystem containing the S-Function block currently being evaluated
- During callbacks, the system containing any block whose callback routine is being executed
- During evaluation of `MaskInitialization`, the system containing the block whose mask is being evaluated
- The system most recently loaded into memory with `load_system`; only the first use of `load_system` makes the model the current system

The current system is the current model or a subsystem of the current model. Use `bdroot` to get the current model.

If you close the model that contains the current system, another open or loaded system becomes the current one. Use `gcs` to find out the new current system.

To explicitly set the current system, you can either:

- Use `set_param` with the 'CurrentSystem' parameter on the root Simulink model, for example:

```
set_param(0, 'CurrentSystem', 'mymodel')
```
- Open the model by using `open_system` or the model name at the MATLAB command prompt.

Examples

Get Current System That Contains a Block

Return the path of the system that contains the most recently selected block.

Open the “Modeling a Fault-Tolerant Fuel Control System” on page 13-121 example model `sldemo_fuelsys`. Open the subsystem `To Controller`.

```
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
sldemo_fuelsys
open_system('sldemo_fuelsys/To Controller')
```

Click the Rate Transition block. Get the current system.

```
gcs
ans =
    'sldemo_fuelsys/To Controller'
```

Get Current System After Loading a Model

Open the model f14 and get the current system.

```
f14
gcs
ans =
    'f14'
```

Load the model vdp using `load_system`. Then get the current system.

```
load_system('vdp');
gcs
ans =
    'vdp'
```

To remove vdp from memory, close it. In this example, the current system becomes the open model, f14.

```
close_system('vdp');
gcs
ans =
    'f14'
```

Version History

Introduced before R2006a

bdroot | gcb | gcbp

get_param

Get parameter names and values

Syntax

```
value = get_param(object,parameter)
```

Description

`value = get_param(object,parameter)` returns the value `value` of the specified parameter `parameter` for the target object specified by `object`. The target object can be a model, subsystem, library, block, line, port, or bus element port element.

Open or load the related Simulink model, subsystem, or library before calling this function.

Examples

Get a Block Parameter Value and a Model Parameter Value

Load the vdp model.

```
load_system('vdp');
```

Get the value for the Expression block parameter.

```
BlockParameterValue = get_param('vdp/Mu','Multiplication')
```

```
BlockParameterValue =
```

```
    'Element-wise(K.*u)'
```

Get the value for the SolverType model parameter.

```
SolverType = get_param('vdp','SolverType')
```

```
SolverType =
```

```
    Variable-step
```

Get Root Parameter Names and Values

Get a list of global parameter names by finding the difference between the Simulink root parameter names and the model parameter names.

```
RootParameterNames = fieldnames(get_param(0,'ObjectParameters'));
load_system('vdp')
```

```
ModelParameterNames = fieldnames(get_param('vdp','ObjectParameters'));
GlobalParameterNames = setdiff(RootParameterNames,ModelParameterNames)
```

```
GlobalParameterNames =
    'AutoSaveOptions'
```

```
'CacheFolder'  
'CallbackTracing'  
'CharacterEncoding'  
.  
.  
'CurrentSystem'
```

Get the value of a global parameter.

```
GlobalParameterValue = get_param(0, 'CurrentSystem')  
  
GlobalParameterValue =  
vdp
```

Get Model Parameter Names and Values

Get a list of model parameters for the vdp model .

```
load_system('vdp')  
ModelParameterNames = get_param('vdp', 'ObjectParameters')  
  
ModelParameterNames =  
    Name: [1x1 struct]  
    Tag: [1x1 struct]  
Description: [1x1 struct]  
    Type: [1x1 struct]  
    Parent: [1x1 struct]  
    Handle: [1x1 struct]  
    .  
    .  
    Version: [1x1 struct]
```

Get the current value of the ModelVersion model parameter for the vdp model.

```
ModelParameterValue = get_param('vdp', 'ModelVersion')  
  
ModelParameterValue =  
1.6
```

Get All Blocks and a Parameter Value

Get a list of block paths and names for the vdp model.

```
load_system('vdp')  
BlockPaths = find_system('vdp', 'Type', 'Block')  
  
BlockPaths =  
  
14x1 cell array  
  
{'vdp/Constant' }  
{'vdp/More Info' }  
{'vdp/More Info/Model Info'}  
{'vdp/Mu' }  
{'vdp/Mux' }  
{'vdp/Product' }  
{'vdp/Scope' }
```

```

    {'vdp/Square'           }
    {'vdp/Sum'             }
    {'vdp/Sum1'           }
    {'vdp/x1'              }
    {'vdp/x2'              }
    {'vdp/Out1'           }
    {'vdp/Out2'           }

```

Get a list of block dialog parameters for the Gain block named Mu.

```
BlockDialogParameters = get_param('vdp/Mu','DialogParameters')
```

```
BlockDialogParameters =
```

```
    struct with fields:
```

```

        Gain: [1x1 struct]
    Multiplication: [1x1 struct]
        ParamMin: [1x1 struct]
        ParamMax: [1x1 struct]
    ParamDataTypeStr: [1x1 struct]
        OutMin: [1x1 struct]
        OutMax: [1x1 struct]
    OutDataTypeStr: [1x1 struct]
        LockScale: [1x1 struct]
        RndMeth: [1x1 struct]
    SaturateOnIntegerOverflow: [1x1 struct]
        SampleTime: [1x1 struct]

```

Get the value for the Multiplication block parameter.

```
BlockParameterValue = get_param('vdp/Mu','Multiplication')
```

```
BlockParameterValue =
    'Element-wise(K.*u)'
```

Get a Block Parameter Value Using a Block Handle

Get the value of a parameter of the Gain block named Mu in the vdp model

To get a handle to the Gain block named Mu, use the `getSimulinkBlockHandle` function. To load the vdp model, specify `true`.

```
mublockhandle = getSimulinkBlockHandle('vdp/Mu',true);
```

If you make multiple calls to `get_param` for the same block, then using the block handle is more efficient than specifying the full block path as a character vector, for example, `'vdp/Mu'`.

You can use the block handle in subsequent calls to `get_param` or `set_param`. The handle contains a double. Do not try to manually enter the number of a handle, for example `5.007`, because you usually need to specify more digits than MATLAB displays. Instead, assign the handle to a variable and use that variable name to specify the block.

Use `getSimulinkBlockHandle` to load the vdp model if necessary by specifying `true`, and get a handle to the Gain block named Mu.

```
mublockhandle = getSimulinkBlockHandle('vdp/Mu',true);
```

Use the block handle with `get_param` and get the value for the `Multiplication` block parameter.

```
BlockParameterValue = get_param(mublockhandle, 'Multiplication')  
  
BlockParameterValue =  
    'Element-wise(K.*u)'
```

Display Block Types for all Blocks in a Model

Get a list of block paths and names for the `vdp` model.

```
load_system('vdp')  
BlockPaths = find_system('vdp', 'Type', 'Block')
```

```
BlockPaths =  
  
    14×1 cell array  
  
    {'vdp/Constant'           }  
    {'vdp/More Info'         }  
    {'vdp/More Info/Model Info'}  
    {'vdp/Mu'                 }  
    {'vdp/Mux'                }  
    {'vdp/Product'           }  
    {'vdp/Scope'             }  
    {'vdp/Square'            }  
    {'vdp/Sum'                }  
    {'vdp/Sum1'               }  
    {'vdp/x1'                 }  
    {'vdp/x2'                 }  
    {'vdp/Out1'               }  
    {'vdp/Out2'               }
```

Get the value for the `BlockType` parameter for each of the blocks in the `vdp` model.

```
BlockTypes = get_param(BlockPaths, 'BlockType')
```

```
BlockTypes =  
  
    14×1 cell array  
  
    {'Constant' }  
    {'SubSystem' }  
    {'SubSystem' }  
    {'Gain'      }  
    {'Mux'       }  
    {'Product'   }  
    {'Scope'     }  
    {'Math'      }  
    {'Sum'       }  
    {'Sum'       }  
    {'Integrator'}  
    {'Integrator'}  
    {'Outport'   }  
    {'Outport'   }
```

Get List of Options for Masked Parameter, Simulink Object, Block Diagram, or Annotation

You can retrieve the list of options for a parameter, Simulink object, block diagram, or annotation using `get_param` with the keyword `options`.

Get the list of options for a masked parameter. For example, suppose you have a Gain block that is masked and has popup and combo box parameters.

```
get_param('vdp/Mu', 'options@Multiplication')
```

```
ans =
```

```
1×4 cell array
```

```
    {'Element-wise(K.*u)'}  
    {'Matrix(K*u)'}      {'Matrix(u*K)'}      {'Matrix(K*u) (u vec...}'
```

Get the list of options for a block parameter, such as the `ShowPortLabels` parameter of a Subsystem block.

```
get_param(gcb, 'options@showportlabels')
```

```
ans =
```

```
1×4 cell array  
    {'none'}      {'FromPortIcon'}      {'FromPortBlockName'}      {'SignalName'}
```

Get Evaluated Value of Mask Parameter

You can access the evaluated value of a masked block parameter using the `get_param` function with the keyword `value`.

For example, get the evaluated value of an `edit` parameter of a masked Gain block.

```
get_param(gcb, 'value@edit')
```

```
ans =
```

```
4
```

The option to retrieve the evaluated value is limited to mask parameters.

Input Arguments

object — Name, path, or handle of object or root

character vector | cell array of character vectors | string array | numeric scalar | 0

Name, path, or handle of object or root, specified as a character vector, cell array of character vectors, string array, numeric scalar, or 0.

How you specify the target object depends on its type.

- Model — Model name or handle.
- Subsystem — Subsystem name or handle.
- Library — Library name or handle.
- Block — Block path or handle.

- Line — Line handle.
- Port — Port handle.
- Bus element port element — Block path of model component with element label. The element can be any element of the port, such as a top-level bus, nested bus, signal, or message.

To specify multiple objects with a common parameter, use a cell array of character vectors, a string array, or an array of handles. All the specified objects must have the specified parameter, otherwise, the function returns an error.

Specify 0 to get root parameter names, including global parameters and model parameters for the current Simulink session.

- Global parameters include Editor preferences and Simulink Coder parameters.
- Model parameters include configuration parameters, Simulink Coder parameters, and Simulink Code Inspector parameters.

Example: 'vdp/Mu'

Example: 'mymodel/Subsystem1/Out1.nonsinusoidal.saw'

Tips

- If you make multiple calls to `get_param` for the same block, specify the block with a numeric handle. This method is more efficient than using the full block path with `get_param`. Use `getSimulinkBlockHandle` to get a block handle.
- Do not try to manually specify the number of a handle, for example, `5.007`, because you usually need to specify more digits than MATLAB displays. Assign the handle to a variable and use that variable name.

Data Types: char | string | double

parameter — Parameter, property, or attribute name

character vector | string scalar

Parameter, property, or attribute name, specified as a character vector or string scalar. Some names are case sensitive.

This table shows special cases.

Specified Parameter	Result
'ObjectParameters'	Parameter names of the specified object as separate fields in a structure array.
'DialogParameters'	Block dialog box parameter names as separate fields in a structure array. If the block has a mask, the function instead returns the mask parameters.

For information about parameters, properties, or attributes, see the programmatic use information on the corresponding reference pages. For example:

- Models — See the configuration parameter reference pages.
- Blocks — See “Common Block Properties” on page 6-12 and block reference pages.

- Ports — See the **Signal Properties** tool reference page.
- Bus element port elements — See the In Bus Element and Out Bus Element block reference pages.

Example: 'ObjectParameters'

Example: 'Solver'

Example: 'SimulationCommand'

Example: 'Position'

Example: 'NameLocation'

Data Types: char | string

Output Arguments

value — Parameter value

format determined by parameter type

Parameter value, returned in the format determined by the parameter type. If you specify multiple objects, the output is a cell array.

This table shows special cases.

Specified Parameter	Result
'ObjectParameters'	Parameter names of the specified object as separate fields in a structure array.
'DialogParameters'	Block dialog box parameter names as separate fields in a structure array. If the block has a mask, the function instead returns the mask parameters.

If you get the root parameters by specifying `get_param(0, 'ObjectParameters')`, then the output value is a structure array with the root parameter names as separate fields in the structure. Each parameter field is a structure containing these fields:

- Type — Parameter type values are 'boolean', 'string', 'int', 'real', 'point', 'rectangle', 'matrix', 'enum', 'ports', or 'list'.
- Enum — Cell array of enumeration character vector values that applies only to 'enum' parameter types.
- Attributes — Cell array of character vectors defining the attributes of the parameter. Values are 'read-write', 'read-only', 'read-only-if-compiled', 'write-only', 'dont-eval', 'always-save', 'never-save', 'nondirty', or 'simulation'.

getActiveConfigSet

Get active configuration set or configuration reference of model

Syntax

```
myConfigObj = getActiveConfigSet(model)
```

Description

`myConfigObj = getActiveConfigSet(model)` returns the active configuration object of the model as a `ConfigSet` object or a `Simulink.ConfigSetRef` object.

Examples

Get Active Configuration Set

Get the active configuration set for a model that is open.

Open the model `vdp` and get the active configuration set.

```
vdp  
vdpConfig = getActiveConfigSet('vdp');
```

Input Arguments

`model` — Name of model

character vector | string scalar

Name of model, specified as a character vector or string scalar. The model must be open.

Example: `'vdp'`

Output Arguments

`myConfigObj` — Configuration object

`ConfigSet` object | `ConfigSetRef` object

The configuration object, returned as a `ConfigSet` object or a `Simulink.ConfigSetRef` object.

Version History

Introduced before R2006a

getCallbackAnnotation

Get annotation executing callback

Syntax

```
ann = getCallbackAnnotation
```

Description

`ann = getCallbackAnnotation` gets the annotation from which a callback was invoked. Invoke a callback from an annotation click function. After you get the annotation, you can, for example, get text or parameters from the annotation to use someplace else in your model.

For information on click functions, see “Make Annotations Interactive”.

Examples

Click Annotation to Change Parameter Value

Invoke a callback by way of an annotation click function. This example shows how to change a parameter value on a block to the value shown on an annotation.

Open `vdp`. Add and position two annotations. Each annotation displays a different value.

```
open_system('vdp');
an1 = Simulink.Annotation('vdp/1');
an1.position = [100,300];
an2 = Simulink.Annotation('vdp/3');
an2.position = [150,300];
```

Assign a click function to each annotation. The click function uses `getAnnotationCallback` to get the annotation instance. Get the text from each annotation and use it to set the parameter on the Gain block (Mu).

```
an1.ClickFcn = 'ann = getCallbackAnnotation; v = ann.Text; set_param(''vdp/Mu'', ''Gain'',v)';
an2.ClickFcn = 'ann = getCallbackAnnotation; v = ann.Text; set_param(''vdp/Mu'', ''Gain'',v)';
```

Click each annotation. When you click, the gain value on the Mu block changes to the number shown on the annotation.

Output Arguments

ann — Annotation

`Simulink.Annotation` instance

Annotation, returned as a `Simulink.Annotation` instance.

Version History

Introduced before R2006a

getConfigSet

Get configuration set or configuration reference from model

Syntax

```
myConfigObj = getConfigSet(model, configObjName)
```

Description

`myConfigObj = getConfigSet(model, configObjName)` returns the configuration set or configuration reference that is attached to `model` and is named `configObjName`.

Examples

Get a Configuration Set

Get a configuration set for a model that is open.

Open the model `vdp` and get the configuration set `Configuration`.

```
vdp  
vdpConfig = getConfigSet('vdp','Configuration');
```

Input Arguments

model — Name of model

character vector | string scalar

Name of model, specified as a character vector or string scalar. The model must be open.

Example: `'vdp'`

configObjName — Configuration object

character vector | string scalar

Name of the configuration object, specified as a character vector or string scalar.

Example: `'Configuration'`

Output Arguments

myConfigObj — Configuration object

ConfigSet object | ConfigSetRef object

The configuration object, returned as a `ConfigSet` object or a `Simulink.ConfigSetRef` object. If no such object exists, the function returns an empty object.

Version History

Introduced before R2006a

getConfigSets

Get names of all of model's configuration sets or configuration references

Syntax

```
myConfigObjNames = getConfigSets(model)
```

Description

`myConfigObjNames = getConfigSets(model)` returns the names of the configuration objects that are attached to the model. You can use the returned name of a configuration set from `myConfigObjNames` to activate it for the model.

Examples

Get Names of Configurations for a Model

Get the names of the configuration sets and configuration references that are attached to a model.

Open the “Using a Data Dictionary to Manage the Data for a Fuel Control System” on page 13-136 example model `sldemo_fuelsys_dd` and the referenced model `sldemo_fuelsys_dd_controller`. Get the configuration object names.

```
openExample('simulink_automotive/UseDDForFuelContSysExample')
sldemo_fuelsys_dd
sldemo_fuelsys_dd_controller
configObjNames = getConfigSets('sldemo_fuelsys_dd_controller')

configObjNames =

    1×1 cell array

    {'ModelReferencing'}
```

The model has one configuration set with the name `ModelReferencing`.

Input Arguments

model — Name of model

character vector | string scalar

Name of model, specified as a character vector or string scalar. The model must be open.

Example: `'vdp'`

Output Arguments

myConfigObjNames — Names of configuration objects

cell array of character vectors

Names of the configuration objects that are attached to the model, returned as a cell array of character vectors. The configuration objects include configuration sets and configuration references.

Version History

Introduced before R2006a

getCurrentAnnotation

Get current annotation object

Syntax

```
getCurrentAnnotation
```

Description

`getCurrentAnnotation` gets the current annotation as a `Simulink.Annotation` object.

Examples

Get Current Annotation Object

Open the model `vdp`.

```
vdp
```

Select the annotation at the top of the diagram. To get the annotation object, use the function `getCurrentAnnotation`.

```
title = getCurrentAnnotation
```

```
title =
```

```
    Annotation with properties:
```

```
        Name: 'van der Pol Equation'
```

getfullname

Get path that identifies block or line

Syntax

```
path = getfullname(handle)
```

Description

`path = getfullname(handle)` returns the full path that identifies the block or line specified by `handle`. If you specify multiple block or line handles, the function returns a cell array of paths.

Examples

Get Path That Identifies Block

Open the vdp model.

```
vdp
```

Interactively, select the block named Mu.

Get the path that identifies the currently selected block.

```
blkpath = getfullname(gcf)
```

```
blkpath =  
    'vdp/Mu'
```

Get Path That Identifies Line

Open the vdp model.

```
vdp
```

Interactively, select the output line from the block named Mu.

Get the handle associated with the currently selected line.

```
line = find_system(gcf, 'SearchDepth', 1, 'FindAll', 'on', ...  
    'Type', 'line', 'Selected', 'on');
```

Get the path that identifies the currently selected line.

```
linepath = getfullname(line)
```

```
linepath =  
    'vdp/Mu/1'
```

The path describes the source port of the line.

Input Arguments

handle — Block or line

handle | cell array of handles

Block or line, specified as a handle or cell array of handles.

Example: `getfullname(gcf)`

Example: `getfullname({handle1,handle2})`

Data Types: double | cell

Version History

Introduced in R2007a

`gcb` | `find_system`

getInputString

Create comma-separated list of variables to map

Syntax

```
externalInputString = getInputString(inputmap, 'base')
externalInputString = getInputString(inputmap, filename)
externalInputString = getInputString(inputmap)
```

Description

`externalInputString = getInputString(inputmap, 'base')` creates an input character vector using the supplied mapping `inputmap` and the variables loaded in the base workspace ('base').

This function generates a comma-separated list of variables (input character vector) to be mapped. You can then use this list:

- As input to the `sim` command. Load the variables in the base workspace first.
- As input for the **Configuration Parameters > Data Import/Export > Input** parameter. Copy the contents of the input character vector into the text field.

This function is most useful if you have created a custom mapping.

`externalInputString = getInputString(inputmap, filename)` creates an input character vector using the supplied mapping `inputmap` and the variables defined in `filename`.

`externalInputString = getInputString(inputmap)` creates an input character vector using the signals from the most recently created mapping.

Examples

Create an input character vector from the base workspace

Create an input character vector from the base workspace and simulate a model.

Open the model.

```
openExample('slexAutotransRootInportsExample');
```

Create signal variables in the base workspace

```
Throttle = timeseries(ones(10,1)*10);
Brake     = timeseries(zeros(10,1));
```

Create a mapping (`inputMap`) for the model.

```
inputMap = getRootInportMap('model', ...
    'slexAutotransRootInportsExample', ...
```

```
'signalName',{ 'Throttle', 'Brake'}, ...
'blockName',{ 'Throttle', 'Brake'});
```

Call `getInputString` with `inputMap` and `'base'` as inputs.

```
externalInputString = getInputString(inputMap, 'base')
externalInputString =
```

```
Throttle, Brake
```

Simulate the model with the input character vector.

```
sim('slexAutotransRootInportsExample', 'ExternalInput', ...
externalInputString);
```

Create an external input character vector from variables in a MAT-file

Create an external input character vector from variables in a MAT-file named `input.mat`.

In a writable folder, create a MAT-file with input variables.

```
Throttle = timeseries(ones(10,1)*10);
Brake = timeseries(zeros(10,1));
save('input.mat', 'Throttle', 'Brake');
```

Open the model.

```
openExample('slexAutotransRootInportsExample');
```

Create map object.

```
inputMap = getRootInportMap('model', ...
'slexAutotransRootInportsExample', ...
'signalName',{ 'Throttle', 'Brake'}, ...
'blockName',{ 'Throttle', 'Brake'});
```

Get the resulting input character vector.

```
externalInputString = getInputString(inputMap, 'input.mat')
externalInputString =
```

```
Throttle, Brake
```

Load variables from the base workspace for the simulation.

```
load('input.mat');
```

Simulate the model.

```
sim('slexAutotransRootInportsExample', 'ExternalInput', ...
externalInputString);
```

Create an external input character vector from only an input map

Create an input character vector from only an input map vector and simulate the model.

Open the model.

```
openExample('slexAutotransRootInportsExample');
```

Create signal variables in the base workspace

```
Throttle = timeseries(ones(10,1)*10);
Brake     = timeseries(zeros(10,1));
```

Create a mapping vector for the model.

```
inputMap = getSIRootInportMap('model', 'slexAutotransRootInportsExample', ...
    'MappingMode', 'BlockName', ...
    'signalName', {'Throttle', 'Brake'}, ...
    'signalValue', {Throttle, Brake});
```

Get the resulting input character vector.

```
externalInputString = getInputString(inputMap)
```

Simulate the model with the input character vector.

```
sim('slexAutotransRootInportsExample', 'ExternalInput', ...
    externalInputString);
```

Alternatively, if you want to input the list of variables through the Configuration Parameters dialog, copy the contents of `externalInputString` (Throttle, Brake) into the **Data Import/Export > Input** parameter. Apply the changes, and then simulate the model.

Input Arguments

inputmap — Map object

character vector

Map object, as returned from the `getRootInportMap` or `getSIRootInportMap` functions.

filename — Input variables

MAT-file name as character vector

Input variables, contained in a MAT-file. The file contains variables to map.

Example: 'data.mat'

Data Types: char

Output Arguments

externalInputString — External input

comma-separated character vector

External input, returned as a comma-separated character vector. The character vector contains root inport information that you can specify to the `sim` command or the **Configuration Parameters > Data Import/Export > Input** parameter.

Version History

Introduced in R2013a

getRootInportMap | getSlRootInportMap

Topics

“Map Root Inport Signal Data”

getRootInportMap

Create custom object to map signals to root-level inports

Syntax

```
map = getRootInportMap('Empty');
map = getRootInportMap(model,mdl,Name,Value);
map = getRootInportMap(inputmap,map,Name,Value);
```

Description

`map = getRootInportMap('Empty');` creates an empty map object, *map*. Use this map object to set up an empty custom mapping object. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards.

`map = getRootInportMap(model,mdl,Name,Value);` creates a map object for *model*, *mdl*, with block names and signal names specified. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

`map = getRootInportMap(inputmap,map,Name,Value);` overrides the mapping object with the specified property. You can override only the properties *model*, *blockName*, and *signalName*. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

Use the `getRootInportMap` function when creating a custom mapping mode to map data to root-level inports. See the example file `BlockNameIgnorePrefixMap.m`, located in `matlabroot/help/toolbox/simulink/examples`, for an example of a custom mapping algorithm.

Input Arguments

Empty

Create an empty map object.

Default: none

Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where *Name* is the argument name and *Value* is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Before R2021a, use commas to separate each name and value, and enclose Name in quotes.

model

Name of model to associate with the root inport map.

Default: None

blockName

Block names of root-level input ports. The tool assigns data to ports according to the name of the root-inport block. If the tool finds a data element whose name matches the name of a root-inport block, it maps the data to the corresponding port.

The value for this argument can be:

Block name of root-level input ports.

Cell array containing multiple block names of root-level input ports.

Default: None

signalName

Signal names to be mapped. The tool assigns data to ports according to the name of the signal on the port. If the tool finds a data element whose name matches the name of a signal at a port, it maps the data to the corresponding port.

The value for this argument can be:

Signal name to be mapped.

Cell array containing multiple signal names of signals to be mapped.

Default: None

inputmap

Name of mapping object to override.

Default: None

Output Arguments**map**

Custom object that you can use to map data to root-level input port. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

Examples**Empty Mapping Object**

Create an empty custom mapping object.

```
map = getRootInportMap('Empty')
```

```
map =
```

```
1x0 InputMap array with properties:
```

```
Type
DataSourceName
Destination
```

Simple Mapping Object

Create a simple mapping object using a MATLAB time series object.

Create a time series object, `signalIn1`.

```
signalIn1 = timeseries((1:10)')
```

Common Properties:

```
Name: 'unnamed'
Time: [10x1 double]
TimeInfo: [1x1 tsdata.timemetadata]
Data: [10x1 double]
DataInfo: [1x1 tsdata.datametadata]
```

Create a mapping object for the time series object for the model, `ex_minportsOnlyModel`.

```
modelFile = fullfile(matlabroot,'help','toolbox','simulink',...
'examples','ex_minportsOnlyModel');
load_system(modelFile);
map = getRootInportMap('model','ex_minportsOnlyModel',...
'blockName','In1','signalname','signalIn1')
```

```
map =
```

InputMap with properties:

```
Type: 'Inport'
DataSourceName: 'signalIn1'
Destination: [1x1 Simulink.iospecification.Destination]
```

Mapping Object with Vectors

Create a mapping object using vectors of block names and signal names for the model `ex_minportsOnlyModel`.

Create a mapping object of vectors.

```
modelFile = fullfile(matlabroot,'help','toolbox','simulink',...
'examples','ex_minportsOnlyModel');
load_system(modelFile);
map = getRootInportMap('model','ex_minportsOnlyModel',...
'blockName',{'In1' 'In2'}, ...
'signalname',{'signalIn1' 'signalIn2'})
```

```
map =
```

1x2 InputMap array with properties:

```
Type
```

```
DataSourceName
Destination
```

Overriding Maps

Create a mapping object that contains the signal *var2*, then override *var2* with *var1*.

Create a mapping object of vectors.

```
% Load the model and define variables
modelFile = fullfile(matlabroot,'help','toolbox','simulink',...
'examples','ex_minportsOnlyModel');
load_system(modelFile);
modelValue = 'ex_minportsOnlyModel';
blockNameValue = 'In1';
signalNameValue = 'var2';
portType = 'Inport';
```

```
% Define var1 and override var2 with var1
signalNameToOverload = 'var1';
mapToOverload = getRootInportMap('model',modelValue,...
'blockName',blockNameValue,...
'signalName',signalNameToOverload)
```

```
mapToOverload =
```

```
InputMap with properties:
```

```
    Type: 'Inport'
DataSourceName: 'var1'
Destination: [1x1 Simulink.iospecification.Destination]
```

Tips

- Load the model before running this function.
- If your custom mapping mode similar to an existing Simulink mapping mode, consider using the `getSlRootInportMap` function instead.

Version History

Introduced in R2012b

`getInputString` | `getSlRootInportMap`

Topics

“Create Custom Mapping File Function”

getSimulinkBlockHandle

Get block handle from block path

Syntax

```
handle = getSimulinkBlockHandle(path)
handle = getSimulinkBlockHandle(path,true)
```

Description

`handle = getSimulinkBlockHandle(path)` returns the numeric handle of the block specified by `path`, if it exists in a loaded model or library. Returns -1 if the block is not found. Library links are resolved where necessary.

Use the numeric handle returned by `getSimulinkBlockHandle` to manipulate the block in subsequent calls to `get_param` or `set_param`. This approach is more efficient than making multiple calls to these functions using the full block path. Do not try to use the number of a handle alone (e.g., 5.007) because you usually need to specify many more digits than MATLAB displays. Assign the handle to a variable and use that variable name to specify a block. The handle applies only to the current MATLAB session.

Use `getSimulinkBlockHandle` to check whether a block path is valid. This approach is more efficient than calling `get_param` inside a `try` statement.

`handle = getSimulinkBlockHandle(path,true)` attempts to load the model or library containing the specified block path, and then checks if the block exists. No error is returned if the model or library is not found. Any models or libraries loaded this way remain in memory even if the function does not find a block with the specified path.

Examples

Get the Handle of a Block

Get the handle of the Pilot block.

```
load_system('f14')
handle = getSimulinkBlockHandle('f14/Pilot')
```

```
handle =
    562.0004
```

You can use the handle in subsequent calls to `get_param` or `set_param`.

Load the Model and Get the Block Handle

Load the model `f14` if necessary (by specifying `true`), and get the handle of the `Pilot` block.

```
handle = getSimulinkBlockHandle('f14/Pilot',true)

handle =

    562.0004
```

You can use the handle in subsequent calls to `get_param` or `set_param`.

Check If a Model Contains a Specific Block

Check whether the model `f14` is loaded and contains a block named `Pilot`. Valid handles are always greater than zero. If the function does not find the block, it returns `-1`.

```
valid_block_path = getSimulinkBlockHandle('f14/Pilot') > 0

valid_block_path =

    0
```

The model contains the block but the model is not loaded, so this command returns `0` because it cannot find the block.

Using `getSimulinkBlockHandle` to check whether a block path is valid is more efficient than calling `get_param` inside a `try` statement.

Input Arguments

path — Block path name

character vector | cell array of character vectors

Block path name, specified as a character vector or a cell array of character vectors.

Example: `'f14/Pilot'`

Data Types: `char`

Output Arguments

handle — Numeric handle of a block

double | array of doubles

Numeric handle of a block, returned as a double or an array of doubles. Valid handles are always greater than zero. If the function does not find the block, it returns `-1`. If the `path` input is a cell array of character vectors, then the output is a numeric array of handles.

Data Types: `double`

Version History

Introduced in R2015a

get_param | set_param

getSlRootInportMap

Create custom object to map signals to root-level inports using Simulink mapping mode

Syntax

```
inputMap = getSlRootInportMap('model',modelname,'MappingMode',
mappingmode,'SignalName',signalname,'SignalValue',signalvalue)
[inputMap, hasASignal] = getSlRootInportMap('model',modelname,'MappingMode',
mappingmode,'SignalName',signalname,'SignalValue',signalvalue)
```

```
inputMap = getSlRootInportMap('model',
modelname,'MappingMode','Custom','CustomFunction',
customfunction,'SignalName',signalname,'SignalValue',signalvalue)
[inputMap,hasASignal] = getSlRootInportMap('model',
modelname,'MappingMode','Custom','CustomFunction',
customfunction,'SignalName',signalname,'SignalValue',signalvalue)
```

Description

`inputMap = getSlRootInportMap('model',modelname,'MappingMode', mappingmode,'SignalName',signalname,'SignalValue',signalvalue)` creates a root inport map using one of the Simulink mapping modes. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

`[inputMap, hasASignal] = getSlRootInportMap('model',modelname,'MappingMode', mappingmode,'SignalName',signalname,'SignalValue',signalvalue)` returns a vector of logical values specifying whether or not the root inport map has a signal associated with it. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

`inputMap = getSlRootInportMap('model', modelname,'MappingMode','Custom','CustomFunction', customfunction,'SignalName',signalname,'SignalValue',signalvalue)` creates a root inport map using a custom mapping mode specified in `customfunction`. Load the model before using this function. If you do not load the model first, the function loads the model to make the mapping and then closes the model afterwards. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

`[inputMap,hasASignal] = getSlRootInportMap('model', modelname,'MappingMode','Custom','CustomFunction', customfunction,'SignalName',signalname,'SignalValue',signalvalue)` returns a vector of logical values specifying whether or not the root inport map has a signal associated with it. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

To map signals to root-level inports using custom mapping modes, you can use `getSlRootInport` with the Root Inport Mapper dialog box custom mapping capability.

Examples

Create inport map using Simulink mapping mode

Create a vector of inport maps using a built-in mapping mode.

```
openExample('slexAutotransRootInportsExample');
Throttle = timeseries(ones(10,1)*10);
Brake = timeseries(zeros(10,1));
inputMap = getSIRootInportMap('model','slexAutotransRootInportsExample',...
    'MappingMode','BlockName', ...
    'SignalName',{'Throttle' 'Brake'},...
    'SignalValue',{Throttle Brake});
```

Create inport map using custom function

Create a vector of inport maps using a custom function

```
openExample('slexAutotransRootInportsExample');
port1 = timeseries(ones(10,1)*10);
port2 = timeseries(zeros(10,1));
inputMap = getSIRootInportMap('model','slexAutotransRootInportsExample',...
    'MappingMode','Custom', ...
    'CustomFunction','slexCustomMappingMyCustomMap',...
    'SignalName',{'port1' 'port2'},...
    'SignalValue',{port1 port2});
```

Input Arguments

modelName — Model name

character vector

Specify the model to associate with the root inport map.

Data Types: char

mappingmode — Simulink mapping mode

character vector

Specify the mapping mode to use with model name and data source. Possible values are:

'Index'	Assign sequential index numbers, starting at 1, to the data in the MAT-file, and map this data to the corresponding inport.
'BlockName'	Assign data to ports according to the name of the root-inport block. If the block name of a data element matches the name of a root-inport block, map the data to the corresponding port.
'SignalName'	Assign data to ports according to the name of the signal on the port. If the signal name of a data element matches the name of a signal at a port, map the data to the corresponding port.
'BlockPath'	Assign data to ports according to the block path of the root-inport block. If the block path of a data element matches the block path of a root-inport block, map the data to the corresponding port.
'Custom'	Apply mappings according to the definitions in a custom file.

Data Types: char

customfunction — Custom function file name

character vector

Specify name of file that implements a custom method to map signals to root-level ports. This function must be on the MATLAB path.

Data Types: char

signalname — signal name

scalar | cell array of character vectors

Specify the signal name(s) of the signal to associate with the root inport map.

Data Types: char | cell

signalvalue — signal value

scalar | cell arrays

Specify the values of the signals to map to the root inport map. For the list of supported data types for the values, see “Choose a Base Workspace and MAT-File Format”.

Output Arguments

inputMap — input map

scalar | vector

Mapping object that defines the mapping of input signals to root-level ports. To create a comma-separated list of variables to map from this object, use the `getInputString` function.

hasASignal — signal presence indicator

scalar | vector

A vector of logical values with the same length as `inputMap`. If the value is true the `inputMap` has a signal associated with it. If the value is false the `inputMap` does not have a signal associated with it and will use a ground value as an input

Data Types: logical

Tips

- Load the model before running this function.
- If your custom mapping mode is not similar to an existing Simulink mapping mode, consider using the `getRootInportMap` function instead.

Version History

Introduced in R2013b

hdlLib

Display blocks that are compatible with HDL code generation

Syntax

```
hdlLib
hdlLib('off')
hdlLib('html')
hdlLib('librarymodel')
```

Description

`hdlLib` displays the blocks that are supported for HDL code generation, and for which you have a license, in the Library Browser. To build models that are compatible with the HDL Coder software, use blocks from this Library Browser view.

If you close and reopen the Library Browser in the same MATLAB session, the Library Browser continues to show only the blocks supported for HDL code generation. To show all blocks, regardless of HDL code generation compatibility, at the command prompt, enter `hdlLib('off')`.

`hdlLib('off')` displays all the blocks for which you have a license in the Library Browser, regardless of HDL code generation compatibility.

`hdlLib('html')` creates a library of blocks that are compatible with HDL code generation. It generates two additional HTML reports: a categorized list of blocks (`hdlblklist.html`) and a table of blocks and their HDL code generation parameters (`hdlsupported.html`).

To run `hdlLib('html')`, you must have an HDL Coder license.

`hdlLib('librarymodel')` displays blocks that are compatible with HDL code generation in the Library Browser. To build models that are compatible with the HDL Coder software, use blocks from this library.

The default library name is `hdlsupported`. After you generate the library, you can save it to a folder of your choice.

To keep the library current, you must regenerate it each time that you install a new software release.

To run `hdlLib('librarymodel')`, you must have an HDL Coder license.

Examples

Display Supported Blocks in the Library Browser

To display blocks that are compatible with HDL code generation in the Library Browser:

```
hdlLib
### Generating view of HDL Coder compatible blocks in Library Browser.
### To restore the Library Browser to the default Simulink view, enter "hdlLib off".
```

Display All Blocks in the Library Browser

To restore the Library Browser to the default view, in the Library Browser, click the  button. Alternatively, at the command line, enter:

```
hdllib('off')
```

Restoring Library Browser to default view; removing the HDL Coder compatibility filter.

Create a Supported Blocks Library and HTML Reports

To create a library and HTML reports showing the blocks that are compatible with HDL code generation:

```
hdlLib('html')
```

```
### HDL supported block list hdlblklist.html
### HDL implementation list hdl-supported.html
```

The `hdl-supported` library opens. To view the reports, click the `hdlblklist.html` and `hdl-supported.html` links.

Create a Supported Blocks Library

To create a library that contains blocks that are compatible with HDL code generation:

```
hdllib('librarymodel')
```

The `hdl_supported` block library opens.

Version History

Introduced in R2006b

hilite_system

Highlight block, signal line, port, or annotation

Syntax

```
hilite_system(obj)  
hilite_system(obj,style)
```

Description

`hilite_system(obj)` highlights a block, line, port, or annotation in an open model using the default highlight style. Use `hilite_system` with a port to highlight the signal line attached to the port. Each use of `hilite_system` adds to the highlighting. Highlighting is not saved with the model.

`hilite_system(obj,style)` uses the specified highlighting style.

Examples

Highlight Block Using Default Highlight Style

Open the model `slexAircraftExample`.

```
openExample('slexAircraftExample')
```

Highlight the Controller block. When you use the default highlight style, the block appears highlighted with a red outline and yellow fill.

```
hilite_system('slexAircraftExample/Controller')
```

Highlight a Block Using a Highlight Style

Open the model `vdp`.

```
vdp
```

Highlight the Mu block using the style 'fade'.

```
hilite_system('vdp/Mu','fade')
```

Use Block Highlighting to Trace Generated Code

If you have a Simulink Coder license, you can trace generated code to the corresponding source block in a model.

Open the model `f14`.

```
f14
```

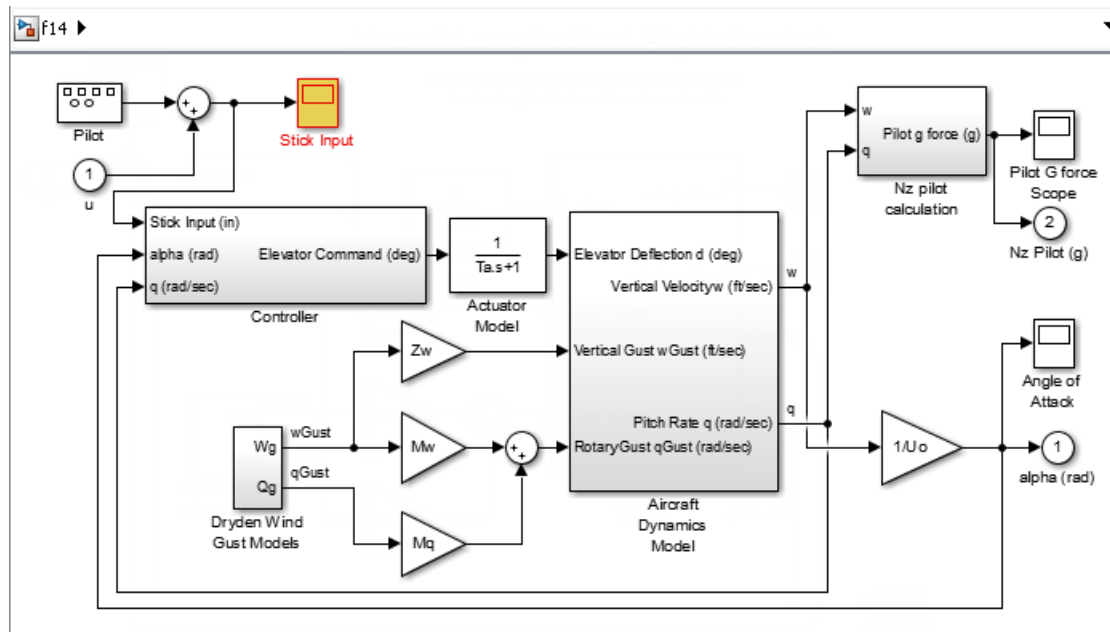

In the model configuration parameters, in the **Solver** pane, set **Type** to Fixed-step.

Generate code for the model. In the **Apps** tab, under **Code Generation**, click **Embedded Coder**. The **C Code** tab appears. Click **Build**.

In an editor or in the code generation report, open a generated source or header file. As you review lines of code, note traceability tags that correspond to code of interest.

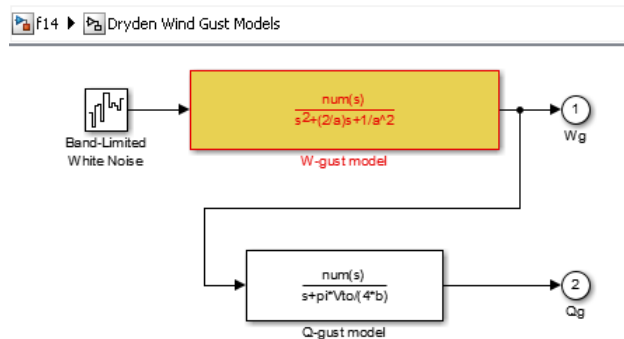

Highlight a block using a traceability tag.

```
hilite_system('<Root>/Stick Input')
```

Highlight a block in a subsystem.

```
hilite_system('<S3>/W-gust model')
```

Customize a Highlighting Style

You can customize a highlighting style by setting the 'HiliteAncestorsData' parameter on the root-level model using `set_param` in this form:

```
set_param(0, 'HiliteAncestorsData', hiliteData)
```

Specify `hiliteData` as a structure array that has these fields:

- 'HiliteType' — Highlighting style to customize, such as 'user1', 'debug', or 'error'.
- 'ForegroundColor' — Color for block fill.
- 'BackgroundColor' — Color for block outline.

The supported values for 'ForegroundColor' and 'BackgroundColor' are:

- 'black'
- 'white'
- 'gray'
- 'red'
- 'orange'
- 'yellow'
- 'green'
- 'darkGreen'
- 'blue'
- 'lightBlue'
- 'cyan'
- 'magenta'

Define a highlight style for 'user1', and customize the style for 'debug'.

```
set_param(0, 'HiliteAncestorsData', ...
          struct('HiliteType', 'user1', ...
                'ForegroundColor', 'darkGreen', ...
                'BackgroundColor', 'lightBlue'));
set_param(0, 'HiliteAncestorsData', ...
          struct('HiliteType', 'debug', ...
                'ForegroundColor', 'red', ...
                'BackgroundColor', 'black'));
```

Use the defined style to highlight a block.

```
f14
hilite_system('f14/Controller/Alpha-sensor Low-pass Filter', 'user1')
```

Input Arguments

obj — Block, port, line, or annotation to highlight

block path name | Simulink.BlockPath object | numeric handle | Simulink identifier | traceability tag

Block, port, line, or annotation to highlight, specified as:

- The full block path name
- A Simulink.BlockPath object

- A numeric handle for lines, ports, or annotations
- Simulink identifier
- A traceability tag from the comments of Simulink Coder generated code.

Using a traceability tag requires a Simulink Coder license.

The format for a traceability tag is `<system>/block`, where `system` is either:

- Root
- A unique system number assigned by Simulink during code generation

Example: `'vdp/Mu'`, `'sldemo_fuelsys/fuel_rate_control/airflow_calc'`, `'vdp:3'`, `'<Root>/Mu'`

style — Highlighting style

'default' (default) | character vector

Highlighting style, specified as one of these values. You can customize the appearance of any of the styles. See “Customize a Highlighting Style” on page 2-313.

- 'default' — Default color scheme: red outline, yellow fill.
- 'none' — Clears the highlight.

To clear all highlighting, in the Simulink Editor, in the **Signal** tab, click **Remove Trace**.

- 'debug' — Uses default color scheme.
- 'different' — Applies red outline, white fill.
- 'error' — Uses default color scheme.
- 'fade' — Applies gray outline, white fill.
- 'find' — Applies dark blue outline, blue fill.
- 'lineTrace' — Applies red outline, blue fill.
- 'unique' — Dark blue outline, white fill.
- 'user1', 'user2', 'user3', 'user4', 'user5' — Applies custom highlight: black outline, white fill by default (i.e., no highlight).

In addition, you can use these color schemes. The first word is the outline and the second is the fill color.

- 'orangeWhite'
- 'blackWhite'
- 'redWhite'
- 'blueWhite'
- 'greenWhite'

isSimulinkStarted

Check whether Simulink is started

Syntax

```
tf = isSimulinkStarted
```

Description

`tf = isSimulinkStarted` returns whether Simulink is started.

Examples

Check Whether Simulink Is Started

```
isSimulinkStarted
```

```
ans =  
  
    logical  
  
     0
```

The returned value 0 indicates that Simulink is not started.

Start Simulink.

```
simulink
```

Confirm that Simulink is started.

```
isSimulinkStarted
```

```
ans =  
  
    logical  
  
     1
```

The returned value 1 indicates that Simulink is started.

Output Arguments

tf — True or false result

1 | 0

True or false result, returned as a 1 or 0 of data type `logical`.

- 1 (`true`) — Simulink is started.
- 0 (`false`) — Simulink is not started.

Version History

Introduced in R2020b

learning.simulink.launchOnramp

Open self-paced, interactive trainings

Syntax

```
learning.simulink.launchOnramp(id)
```

Description

`learning.simulink.launchOnramp(id)` opens the training that corresponds to the specified `id` argument.

Examples

Open Simulink Onramp

To open Simulink Onramp, in the MATLAB Command Window, enter this command.

```
learning.simulink.launchOnramp('simulink')
```

Input Arguments

`id` — Identifier for training

```
"simulink" | "slbe" | "stateflow" | "controls" | "simscape" | "circuits" |  
"powerelectronics"
```

Identifier for training, specified as one of these values:

- "simulink" — **Simulink Onramp**
- "slbe" — **Simulink Fundamentals**
- "stateflow" — **Stateflow Onramp**
- "controls" — **Control Design Onramp with Simulink**
- "simscape" — **Simscape Onramp**
- "circuits" — **Circuit Simulation Onramp**
- "powerelectronics" — **Power Electronics Simulation Onramp**

Version History

Introduced in R2019a

legacy_code

Integrate existing C/C++ code by using the Legacy Code Tool

Syntax

```
legacy_code('help')
specs = legacy_code('initialize')
legacy_code('sfcn_cmex_generate', specs)
legacy_code('compile', specs, compilerOptions)
legacy_code('generate_for_sim', specs, modelname)
legacy_code('slblock_generate', specs, modelname)
legacy_code('sfcn_tlc_generate', specs)
legacy_code('sfcn_makecfg_generate', specs)
legacy_code('rtwmakecfg_generate', specs)
legacy_code('backward_compatibility')
```

Description

`legacy_code('help')` displays instructions for using Legacy Code Tool.

`specs = legacy_code('initialize')` initializes the Legacy Code Tool data structure, `specs`, which registers characteristics of existing C or C++ code and properties of the S-function that the Legacy Code Tool generates.

`legacy_code('sfcn_cmex_generate', specs)` generates an S-function source file as specified by the Legacy Code Tool data structure, `specs`.

`legacy_code('compile', specs, compilerOptions)` compiles and links the S-function generated by the Legacy Code Tool based on the data structure, `specs`, and compiler options that you might specify. The compiler options must be supported by the mex function.

`legacy_code('generate_for_sim', specs, modelname)` generates, compiles, and links the S-function in a single step. If the `Options.useTlcWithAccel` field of the Legacy Code Tool data structure is set to logical 1 (true), the function also generates a TLC file for accelerated simulations.

`legacy_code('slblock_generate', specs, modelname)` generates a masked S-Function block for the S-function generated by the Legacy Code Tool based on the data structure, `specs`. The block appears in the Simulink model specified by `modelname`. If you omit `modelname`, the block appears in an empty model editor window.

`legacy_code('sfcn_tlc_generate', specs)` generates a TLC file for the S-function generated by the Legacy Code Tool based on the data structure, `specs`. This option is relevant if you want to:

- Force Accelerator mode in Simulink software to use the TLC inlining code of the generated S-function. See the description of the `ssSetOptions SimStruct` function and `SS_OPTION_USE_TLC_WITH_ACCELERATOR` S-function option for more information.
- Use Simulink Coder software to generate code from your Simulink model. For more information, see “Import Calls to External Code into Generated Code with Legacy Code Tool” (Simulink Coder).

`legacy_code('sfcn_makecfg_generate', specs)` generates an `sFunction_makecfg.m` file for the S-function generated by the Legacy Code Tool based on the data structure, `specs`. If you use

Simulink Coder to generate code from your Simulink model, you can use this option to specify additional items for the S-function build process such as source folders, preprocessor macros, and link objects. For example, you can specify source files that the S-function depends on that are in folders other than the folder containing the generated S-function executable. For more information, see “Use makecfg to Customize Generated Makefiles for S-Functions” (Simulink Coder) and “Import Calls to External Code into Generated Code with Legacy Code Tool” (Simulink Coder).

`legacy_code('rtwmakecfg_generate', specs)` generates an `rtwmakecfg.m` file for the S-function generated by the Legacy Code Tool based on the data structure, `specs`. If you use Simulink Coder to generate code from your Simulink model, you can use this option to specify additional items for the S-function build process such as source folders, preprocessor macros, and link objects. For example, you can specify source files that the S-function depends on that are in folders other than the folder containing the generated S-function executable. For more information, see “Use `rtwmakecfg.m` API to Customize Generated Makefiles” (Simulink Coder) and “Import Calls to External Code into Generated Code with Legacy Code Tool” (Simulink Coder).

`legacy_code('backward_compatibility')` automatically updates syntax for using Legacy Code Tool to the supported syntax described in this reference page and in “Integrate C Functions Using Legacy Code Tool”.

Examples

Inputs Passed by Value or Address to Legacy Functions

This example shows you how to use the Legacy Code Tool to integrate legacy C functions that pass their input arguments by value versus address.

The Legacy Code Tool allows you to:

- Provide the legacy function specification,
- Generate a C-MEX S-function that is used during simulation to call the legacy code, and
- Compile and build the generated S-function for simulation.

Providing the Legacy Function Specification

Functions provided with the Legacy Code Tool take a specific data structure or array of structures as the argument. The data structure is initialized by calling the function `legacy_code()` using 'initialize' as the first input. After initializing the structure, you have to assign its properties to values corresponding to the legacy code being integrated. The prototypes of the legacy functions being called in this example are:

- `FLT filterV1(const FLT signal, const FLT prevSignal, const FLT gain)`
- `FLT filterV2(const FLT* signal, const FLT prevSignal, const FLT gain)`

where `FLT` is a typedef to float. The legacy source code is found in the files `your_types.h`, `myfilter.h`, `filterV1.c`, and `filterV2.c`.

Note the difference in the `OutputFcnSpec` defined in the two structures; the first case specifies that the first input argument is passed by value, while the second case specifies pass by pointer.

```
defs = [];
```

```

% sldemo_sfun_filterV1
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_filterV1';
def.OutputFcnSpec = 'single y1 = filterV1(single u1, single u2, single p1)';
def.HeaderFiles    = {'myfilter.h'};
def.SourceFiles    = {'filterV1.c'};
def.IncPaths       = {'sldemo_lct_src'};
def.SrcPaths       = {'sldemo_lct_src'};
defs = [defs; def];

% sldemo_sfun_filterV2
def = legacy_code('initialize');
def.SFunctionName = 'sldemo_sfun_filterV2';
def.OutputFcnSpec = 'single y1 = filterV2(single u1[1], single u2, single p1)';
def.HeaderFiles    = {'myfilter.h'};
def.SourceFiles    = {'filterV2.c'};
def.IncPaths       = {'sldemo_lct_src'};
def.SrcPaths       = {'sldemo_lct_src'};
defs = [defs; def];

```

Generating and Compiling an S-Function for Use During Simulation

The function `legacy_code()` is called again with the first input set to `'generate_for_sim'` in order to automatically generate and compile the C-MEX S-function according to the description provided by the input argument `'defs'`. This S-function is used to call the legacy functions in simulation. The source code for the S-function is found in the files `sldemo_sfun_filterV1.c` and `sldemo_sfun_filterV2.c`.

```
legacy_code('generate_for_sim', defs);
```

```

### Start Compiling sldemo_sfun_filterV1
    mex('-IC:\TEMP\Bdoc22b_2054784_11640\ib975175\0\tp2ecad9d5\simulink_features-ex08075368\slder
Building with 'Microsoft Visual C++ 2019 (C)'.
MEX completed successfully.
    mex('sldemo_sfun_filterV1.c', '-IC:\TEMP\Bdoc22b_2054784_11640\ib975175\0\tp2ecad9d5\simulink
Building with 'Microsoft Visual C++ 2019 (C)'.
MEX completed successfully.
### Finish Compiling sldemo_sfun_filterV1
### Exit

### Start Compiling sldemo_sfun_filterV2
    mex('-IC:\TEMP\Bdoc22b_2054784_11640\ib975175\0\tp2ecad9d5\simulink_features-ex08075368\slder
Building with 'Microsoft Visual C++ 2019 (C)'.
MEX completed successfully.
    mex('sldemo_sfun_filterV2.c', '-IC:\TEMP\Bdoc22b_2054784_11640\ib975175\0\tp2ecad9d5\simulink
Building with 'Microsoft Visual C++ 2019 (C)'.
MEX completed successfully.
### Finish Compiling sldemo_sfun_filterV2
### Exit

```

Generating an `rtwmakecfg.m` File for Code Generation

After the TLC block file is created, the function `legacy_code()` can be called again with the first input set to `'rtwmakecfg_generate'` in order to generate an `rtwmakecfg.m` file to support code generation through Simulink® Coder™. Generate the `rtwmakecfg.m` file if the required source and header files for the S-functions are not in the same directory as the S-functions, and you want to add these dependencies in the makefile produced during code generation.

Note: Complete this step only if you are going to simulate the model in accelerated mode.

```
legacy_code('rtwmakecfg_generate', def);
```

Generating Masked S-Function Blocks for Calling the Generated S-Functions

After the C-MEX S-function source is compiled, the function `legacy_code()` can be called again with the first input set to `'slblock_generate'` in order to generate masked S-function blocks which are configured to call those S-functions. The blocks are placed in a new model and can be copied to an existing model.

```
% legacy_code('slblock_generate', defs);
```

Integrate the Legacy Code

The model `sldemo_lct_filter` shows integration with the legacy code. The subsystem `TestFilter` serves as a harness for the calls to the legacy C functions via the generate S-functions, with unit delays serving to store the previous output values.

```
open_system('sldemo_lct_filter')
open_system('sldemo_lct_filter/TestFilter')
sim('sldemo_lct_filter');
```

Input Arguments

specs — Specification for existing C or C++ code and S-function

structure

Specification for existing C or C++ code and the S-function being generated, specified as a `struct` with these fields:

Name the S-function

`SFunctionName` (required) — Name for the S-function to be generated by the Legacy Code Tool, specified as a character vector or string.

Define Legacy Code Tool Function Specifications

- `InitializeConditionsFcnSpec` — Function that the S-function calls to initialize and reset states, specified as a nonempty character vector or string. You must declare this function by using tokens that Simulink software can interpret as explained in “Declaring Legacy Code Tool Function Specifications”.
- `OutputFcnSpec` — Function that the S-function calls at each time step, specified as a nonempty character vector or string. You must declare this function by using tokens that Simulink software can interpret as explained in “Declaring Legacy Code Tool Function Specifications”.
- `StartFcnSpec` — Function that the S-function calls when it begins execution, specified as a character vector or string. This function can access S-function parameter arguments and work data. You must declare this function by using tokens that Simulink software can interpret as explained in “Declaring Legacy Code Tool Function Specifications”.
- `TerminateFcnSpec` — Function that the S-function calls when it terminates execution, specified as a character vector or string. This function can access S-function parameter arguments and work data. You must declare this function by using tokens that Simulink software can interpret as explained in “Declaring Legacy Code Tool Function Specifications”.

Define Compilation Resources

- `HeaderFiles` — File names of header files required for compilation, specified as a cell array of character vectors or string array.
- `SourceFiles` — Source files required for compilation, specified as a cell array of character vectors or string array. You can specify the source files using absolute or relative path names.
- `HostLibFiles` — Library files required for host compilation, specified as a cell array of character vectors or string array. You can specify the library files using absolute or relative path names.
- `TargetLibFiles` — Library files required for target (that is, standalone) compilation, specified as a cell array of character vectors or string array. You can specify the library files using absolute or relative path names.
- `IncPaths` — Directories containing header files, specified as a cell array of character vectors or string array. You can specify the directories using absolute or relative path names.
- `SrcPaths` — Directories containing source files, specified as a cell array of character vectors or string array. You can specify the directories using absolute or relative path names.
- `LibPaths` — Directories containing host and target library files, specified as a cell array of character vectors or string array. You can specify the directories using absolute or relative path names.

Specify a Sample Time

`SampleTime` — One of the following:

- `'inherited'` (default) — Sample time is inherited from the source block.
- `'parameterized'` — Sample time is represented as a tunable parameter. Generated code can access the parameter by calling MEX API functions, such as `mxGetPr` or `mxGetData`.
- `Fixed` — Sample time that you explicitly specify. For information on how to specify sample time, see “Specify Sample Time”.

If you specify this field, you must specify it last.

Define S-Function Options

Options — S-function options, specified as a structure. The structure's fields include:

- `canBeCalledConditionally` — Setting of the S-function `SS_OPTION_CAN_BE_CALLED_CONDITIONALLY` option, specified as a logical. By default, the value is `true` (1).
- `convertNDArrayToRowMajor`— Automatic conversion of a matrix between a column-major format and a row-major format, specified as a logical. The column-major format is used by MATLAB, Simulink, and the generated code. The row-major format is used by C. By default, the value is `false` (0). If you currently specify the previous version of the option, `convert2DMatrixToRowMajor`, the function automatically specifies the new `convertNDArrayToRowMajor` option.

Note This option does not support a 2-D matrix of complex data.

- `isMacro` — Whether the legacy code is a C macro, specified as a logical. By default, the value is `false` (0).
- `isVolatile` — Setting of the S-function `SS_OPTION_NONVOLATILE` option, specified as a logical. By default, the value is `true` (1).
- `language` — Target language of the S-function that Legacy Code Tool will produce, specified as either 'C' or 'C++'. By default, the value is 'C'.

Note The Legacy Code Tool can interface with C++ functions, but not C++ objects. For a work around, see “Legacy Code Tool Limitations” in the Simulink documentation.

- `outputsConditionallyWritten`— Whether the legacy code conditionally writes the output ports, specified as a logical. If `true`, the generated S-function specifies that the memory associated with each output port cannot be overwritten and is global (`SS_NOT_REUSABLE_AND_GLOBAL`). If `false`, the memory associated with each output port is reusable and is local (`SS_REUSABLE_AND_LOCAL`). By default, the value is `false` (0). For more information, see `ssSetOutputPortOptimOpts`.
- `singleCPPMexFile` — Whether generated code:
 - Requires you to generate and manage an inlined S-function as only one file (.cpp) instead of two (.c and .tlc).
 - Maintains model code style (level of parentheses usage and preservation of operand order in expressions and condition expressions in if statements) as specified by model configuration parameters.

Specified as a logical. By default, the value is `false`.

Limitations You cannot set the `singleCPPMexFile` field to `true` if

- `Options.language='C++'`
- You use one of the following Simulink objects with the `IsAlias` property set to `true`:
 - `Simulink.Bus`

- `Simulink.AliasType`
 - `Simulink.NumericType`
 - The Legacy Code Tool function specification includes a `void*` or `void**` to represent scalar work data for a state argument
 - `HeaderFiles` field of the Legacy Code Tool structure specifies multiple header files
-
- `supportsMultipleExecInstances`— Option to include a call to the `ssSupportsMultipleExecInstances` function, specified as a logical. By default, the value is `false` (0).
 - `supportCodeReuseAcrossModels`— Whether the generated S-function can be reused across the model reference hierarchy, specified as a logical. If `true`, the generated S-function includes the `ssSetSupportedForCodeReuseAcrossModels` function call. The code generator produces the code for the S-functions in the `slprj\ert_sharedutils` folder.
 - `supportCoverage`— Whether the generated S-function must be compatible with Model Coverage, specified as a logical. By default, the value is `false` (0).
 - `supportCoverageAndDesignVerifier`— Whether the generated S-function must be compatible with Model Coverage and Simulink Design Verifier, specified as a logical. By default, the value is `false` (0).
 - `useTlcWithAccel` — Setting of the S-function `SS_OPTION_USE_TLC_WITH_ACCELERATOR` option, specified as a logical. By default, the value is `true` (1).

Data Types: `struct`

modelName — Model name

`string` | character vector

The name of a Simulink model, specified as a string or character vector. When you specify `legacy_code` with the action `'slblock_generate'`, Legacy Code Tool inserts the generated masked S-function block into the specified model. If you omit this argument, the block appears in an empty model editor window.

Data Types: `char` | `string`

compilerOptions — Compiler options

`string` | character vector

Compiler options to include when you specify `legacy_code` with the action `'compile'`, specified as a string or character vector. The compiler options must be supported by the `mex` function.

Data Types: `char` | `string`

Syntax

```
libdata = libinfo('system')  
libdata = libinfo('system', constraint1, value1, ...)
```

Description

`libdata = libinfo('system')` returns information about library blocks referenced by `system` and all the systems underneath it.

`libdata = libinfo('system', constraint1, value1, ...)` restricts the search as indicated by the search constraint(s) `c1, v1, ...`

Input Arguments

system

The system to search recursively for library blocks.

constraint1, value1, ...

One or more pairs, each consisting of a search constraint followed by a constraint value. You can specify any of the search constraints that you can use with `find_system`.

Output Arguments

libdata

An array of structures that describes each library block referenced by `system`. Each structure has the following fields:

Block	Path of the link to the library block
Library	Name of the library containing the referenced block
ReferenceBlock	Path of the library block
LinkStatus	Value of the LinkStatus parameter for the link to the library block

Version History

Introduced before R2006a

Topics

“Create Custom Library”

LibraryBrowser.LibraryBrowser2

Get handle of Library Browser object

Syntax

```
libraryhandle = LibraryBrowser.LibraryBrowser2
```

Description

`libraryhandle = LibraryBrowser.LibraryBrowser2` creates the Library Browser object `LibraryBrowser.LBStandalone` and returns the object handle. When you have the object handle, you can use the object properties and functions to display, hide, size, position, and refresh the Library Browser in standalone mode. For more information, see [Library Browser in Standalone Mode](#), `LibraryBrowser.LBStandalone`, `show`, `hide`, `getPosition`, `setPosition`, and `refresh`.

Note You can also use `sLibraryBrowser` to create and get the handle of the Library Browser object.

When you use `sLibraryBrowser` to get the object handle:

- If the Library Browser is open in standalone mode, the Library Browser window moves in front of all other Simulink windows.
- If the Library Browser is not open in standalone mode, the Library Browser opens in standalone mode.

Examples

Keep Library Browser in Front of Other Windows

Create and get the handle of the `LibraryBrowser.LBStandalone` object that lets you programmatically access the Library Browser.

```
lb = LibraryBrowser.LibraryBrowser2;
```

Set the `IsOnTop` property of the Library Browser to 1 (`true`), using dot notation to access the property.

```
lb.IsOnTop = 1;
```

Limitations

The `LibraryBrowser.LibraryBrowser2` function does not act on a docked Library Browser. To use the `LibraryBrowser.LibraryBrowser2` function, open the Library Browser in standalone mode by clicking the Launch standalone library browser button .

Version History

Introduced in R2014b

LibraryBrowser.LBStandalone object replaces LibraryBrowser.LibraryBrowser2 object

Behavior changed in R2016b

In previous releases, these two commands returned a `LibraryBrowser.LibraryBrowser2` object:

```
lb = slLibraryBrowser  
lb = LibraryBrowser.LibraryBrowser2
```

Starting in R2016b, each command returns a `LibraryBrowser.LBStandalone` object. The functions to access Library Browser operations such as `show` and `refresh` support `LibraryBrowser.LBStandalone` objects.

linmod

Extract continuous-time linear state-space model around operating point

Syntax

```
argout = linmod('sys')
argout = linmod('sys',x,u)
argout = linmod('sys',x,u,para)
argout = linmod('sys',x,u,'v5')
argout = linmod('sys',x,u,para,'v5')
argout = linmod('sys',x,u,para,xpert,upert,'v5')
```

Arguments

<i>sys</i>	Name of the Simulink system from which the linear model is extracted.
<i>x</i> and <i>u</i>	State (<i>x</i>) and the input (<i>u</i>) vectors. If specified, they set the operating point at which the linear model is extracted. When a model has model references using the Model block, you must use the Simulink structure format to specify <i>x</i> . To extract the <i>x</i> structure from the model, use the following command: <pre>x = Simulink.BlockDiagram.getInitialState('sys');</pre> You can then change the operating point values within this structure by editing <i>x.signals.values</i> . If the state contains different data types (for example, 'double' and 'uint8'), then you cannot use a vector to specify this state. You must use a structure instead. In addition, you can only specify the state as a vector if the state data type is 'double'.
<i>Ts</i>	Sample time of the discrete-time linearized model
'v5'	An optional argument that invokes the perturbation algorithm created prior to MATLAB 5.3. Invoking this optional argument is equivalent to calling <code>linmodv5</code> .

- para** A three-element vector of optional arguments:
- `para(1)` — Perturbation value of delta, the value used to perform the perturbation of the states and the inputs of the model. This is valid for linearizations using the 'v5' flag. The default value is 1e-05.
 - `para(2)` — Linearization time. For blocks that are functions of time, you can set this parameter with a nonnegative value that gives the time (t) at which Simulink evaluates the blocks when linearizing a model. The default value is 0.
 - `para(3)` — Set `para(3)=1` to remove extra states associated with blocks that have no path from input to output. The default value is 0.
- xpert and upert** The perturbation values used to perform the perturbation of all the states and inputs of the model. The default values are
- $$\text{xpert} = \text{para}(1) + 1\text{e-}3*\text{para}(1)*\text{abs}(x)$$
- $$\text{upert} = \text{para}(1) + 1\text{e-}3*\text{para}(1)*\text{abs}(u)$$
- When a model has model references using the Model block, you must use the Simulink structure format to specify `xpert`. To extract the `xpert` structure, use the following command:
- ```
xpert = Simulink.BlockDiagram.getInitialState('sys');
```
- You can then change the perturbation values within this structure by editing `xpert.signals.values`.
- The perturbation input arguments are only available when invoking the perturbation algorithm created prior to MATLAB 5.3, either by calling `linmodv5` or specifying the 'v5' input argument to `linmod`.
- argout** `linmod`, `dlinmod`, and `linmod2` return state-space representations if you specify the output (left-hand) side of the equation as follows:
- `[A,B,C,D] = linmod('sys', x, u)` obtains the linearized model of `sys` around an operating point with the specified state variables `x` and the input `u`. If you omit `x` and `u`, the default values are zero.
- `linmod` and `dlinmod` both also return a transfer function and MATLAB data structure representations of the linearized system, depending on how you specify the output (left-hand) side of the equation. Using `linmod` as an example:
- `[num, den] = linmod('sys', x, u)` returns the linearized model in transfer function form.
  - `sys_struct = linmod('sys', x, u)` returns a structure that contains the linearized model, including state names, input and output names, and information about the operating point.

## Description

---

**Note** `linmod` provides only basic linearization functionality. For full linearization functionality, use Simulink Control Design software. For more information, see “Choose Linearization Tools” (Simulink Control Design).

---

`linmod` compute a linear state-space model by linearizing each block in a model individually.

`linmod` obtains linear models from systems of ordinary differential equations described as Simulink models. Inputs and outputs are denoted in Simulink block diagrams using Inport and Outport blocks.

The default algorithm uses preprogrammed analytic block Jacobians for most blocks which should result in more accurate linearization than numerical perturbation of block inputs and states. A list of blocks that have preprogrammed analytic Jacobians is available in the Simulink Control Design documentation along with a discussion of the block-by-block analytic algorithm for linearization.

The default algorithm also allows for special treatment of problematic blocks such as the Transport Delay and the Quantizer. See the mask dialog of these blocks for more information and options.

## Notes

By default, the system time is set to zero. For systems that are dependent on time, you can set the variable `para` to a two-element vector, where the second element is used to set the value of `t` at which to obtain the linear model.

The ordering of the states from the nonlinear model to the linear model is maintained. For Simulink systems, a character vector variable that contains the block name associated with each state can be obtained using

```
[sizes,x0,xstring] = sys
```

where `xstring` is a vector of strings whose *i*th row is the block name associated with the *i*th state. Inputs and outputs are numbered sequentially on the diagram.

For single-input multi-output systems, you can convert to transfer function form using the routine `ss2tf` or to zero-pole form using `ss2zp`. You can also convert the linearized models to LTI objects using `ss`. This function produces an LTI object in state-space form that can be further converted to transfer function or zero-pole-gain form using `tf` or `zpk`.

The default algorithms in `linmod` handle Transport Delay blocks by replacing the linearization of the blocks with a Pade approximation. For the 'v5' algorithm, linearization of a model that contains Derivative or Transport Delay blocks can be troublesome. For more information, see “Linearizing Models”.

Linearization is not supported when the model contains model blocks where `Use local solver` when `referencing model` is enabled in the “Solver Pane”.

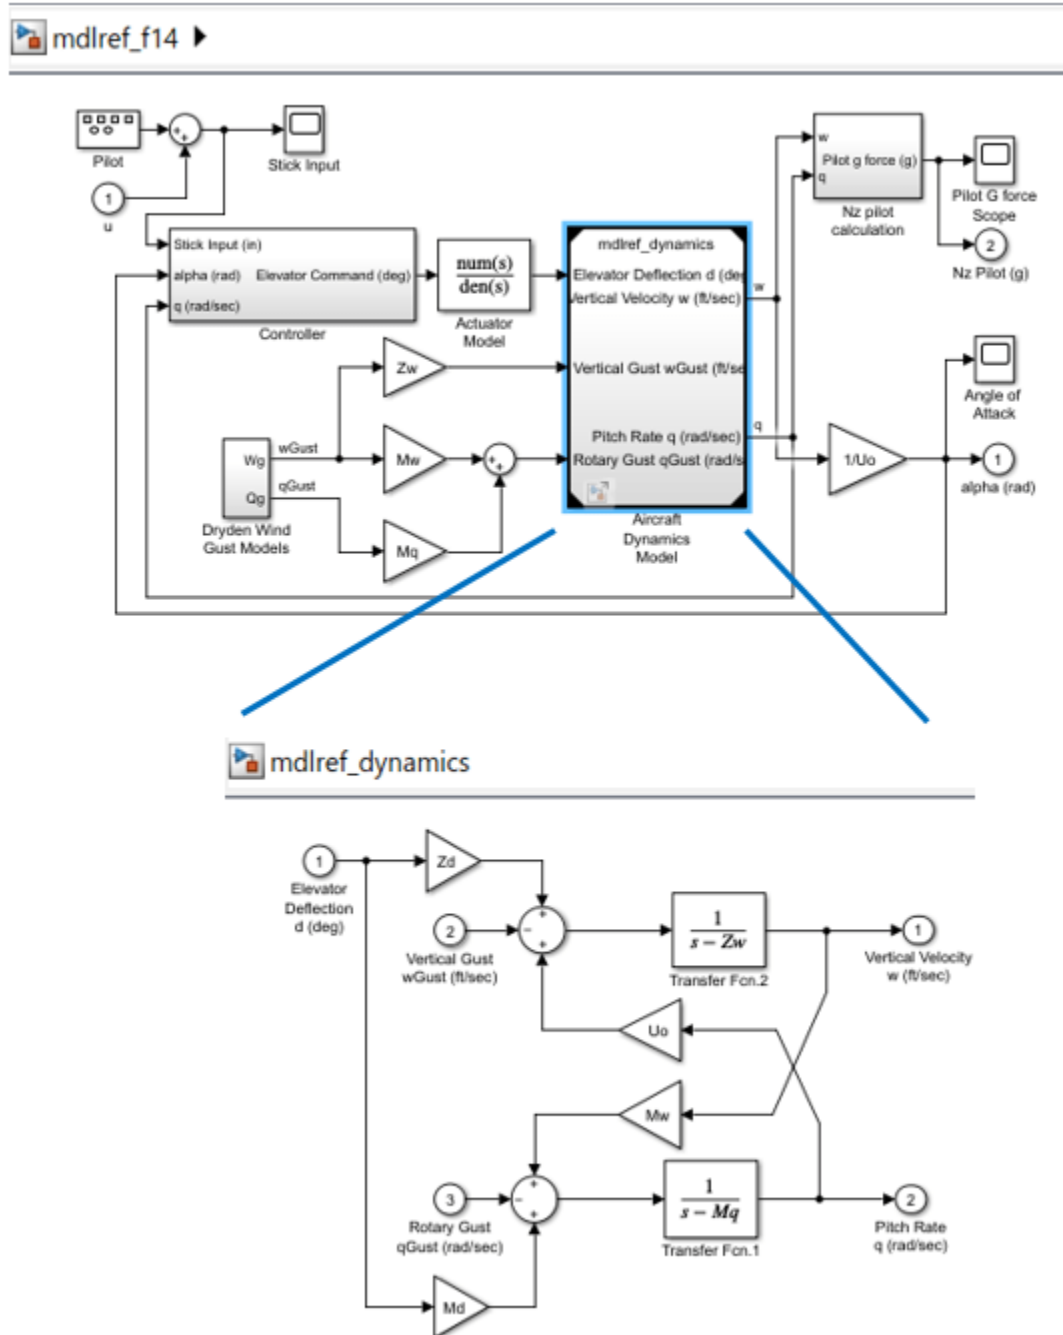

## Examples

### Linearization with Referenced Models

You can use `linmod` to extract a linear model from a Simulink® environment that contains Model blocks. For example, open the referenced model `mdlref_dynamics` and the top model `mdlref_f14`.

```
open_system('mdlref_dynamics');
open_system('mdlref_f14');
```

In the `mdlref_f14` model, the Aircraft Dynamics Model block references the `mdlref_dynamics` model.

To linearize the `mdlref_f14` model, use the `linmod` command.

```
[A,B,C,D] = linmod('mdlref_f14');

Starting serial model reference simulation build.
Successfully updated the model reference simulation target for: mdlref_dynamics

Build Summary

Simulation targets built:

Model Action Rebuild Reason
=====
mdlref_dynamics Code generated and compiled. mdlref_dynamics_msf.mexw64 does not exist.

1 of 1 models built (0 models already up to date)
Build duration: 0h 0m 45.482s
```

The resulting state-space model corresponds to the complete `mdlref_f14` model, including the referenced model.

You can call `linmod` with a state and input operating point for models that contain Model blocks. When using operating points, the state vector `x` refers to the total state vector for the top model and any referenced models. You must enter the state vector using the structure format. To get the complete state vector, use `getInitialState`.

```
x = Simulink.BlockDiagram.getInitialState(topmodelName)
```

### Tip

In Normal mode, the `linmod` command applies the block-by-block linearization algorithm on blocks inside the referenced model. If the Model block is in Accelerator mode, the `linmod` command uses numerical perturbation to linearize the referenced model. Due to limitations on linearizing multirate Model blocks in Accelerator mode, you should use Normal mode simulation for all models referenced by Model blocks when linearizing with referenced models.

### Linearization Using the 'v5' Algorithm

Calling the `linmod` command with the `'v5'` argument invokes the perturbation algorithm created prior to MATLAB software version 5.3. This algorithm also allows you to specify the perturbation values used to perform the perturbation of all the states and inputs of the model.

```
[A,B,C,D]=linmod('sys',x,u,para,xpert,upert,'v5')
```

Using `linmod` with the `'v5'` option to linearize a model that contains Derivative or Transport Delay blocks can be troublesome. Before linearizing, replace these blocks with specially designed blocks that avoid the problems. These blocks are in the Simulink Extras library in the Linearization sublibrary.

You access the Extras library by opening the Blocksets & Toolboxes icon:

- For the Derivative block, use the Switched derivative for linearization.

When using a Derivative block, you can also try to incorporate the derivative term in other blocks. For example, if you have a Derivative block in series with a Transfer Fcn block, it is better implemented (although this is not always possible) with a single Transfer Fcn block of the form

$$\frac{s}{s+a}$$

In this example, the blocks on the left of this figure can be replaced by the block on the right.

## linmod2

Extract continuous-time linear state-space model around operating point

### Syntax

```
argout = linmod2('sys',x,u)
```

```
argout = linmod2('sys',x,u,para)
```

### Arguments

*sys*

Name of the Simulink system from which the linear model is extracted.

*x, u*

State ( $x$ ) and the input ( $u$ ) vectors. If specified, they set the operating point at which the linear model is extracted. When a model has model references using the Model block, you must use the Simulink structure format to specify  $x$ . To extract the  $x$  structure from the model, use the following command:

```
x = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the operating point values within this structure by editing `x.signals.values`.

If the state contains different data types (for example, 'double' and 'uint8'), then you cannot use a vector to specify this state. You must use a structure instead. In addition, you can only specify the state as a vector if the state data type is 'double'.

*para*

A three-element vector of optional arguments:

- `para(1)` — Perturbation value of delta, the value used to perform the perturbation of the states and the inputs of the model. This is valid for linearizations using the 'v5' flag. The default value is 1e-05.
- `para(2)` — Linearization time. For blocks that are functions of time, you can set this parameter with a nonnegative value that gives the time ( $t$ ) at which Simulink evaluates the blocks when linearizing a model. The default value is 0.
- `para(3)` — Set `para(3)=1` to remove extra states associated with blocks that have no path from input to output. The default value is 0.

*argout*

`linmod`, `dlinmod`, and `linmod2` return state-space representations if you specify the output (left-hand) side of the equation as follows:

- `[A,B,C,D] = linmod('sys', x, u)` obtains the linearized model of `sys` around an operating point with the specified state variables `x` and the input `u`. If you omit `x` and `u`, the default values are zero.

`linmod` and `dlinmod` both also return a transfer function and MATLAB data structure representations of the linearized system, depending on how you specify the output (left-hand) side of the equation. Using `linmod` as an example:

- `[num, den] = linmod('sys', x, u)` returns the linearized model in transfer function form.
- `sys_struct = linmod('sys', x, u)` returns a structure that contains the linearized model, including state names, input and output names, and information about the operating point.

## Description

---

**Note** `linmod2` provides only basic linearization functionality. For full linearization functionality, use Simulink Control Design software. For more information, see “Choose Linearization Tools” (Simulink Control Design).

---

`linmod2` computes a linear state-space model by perturbing the model inputs and model states, and uses an advanced algorithm to reduce truncation error.

`linmod2` obtains linear models from systems of ordinary differential equations described as Simulink models. Inputs and outputs are denoted in Simulink block diagrams using Inport and Outport blocks.

## Notes

By default, the system time is set to zero. For systems that are dependent on time, you can set the variable `para` to a two-element vector, where the second element is used to set the value of `t` at which to obtain the linear model.

The ordering of the states from the nonlinear model to the linear model is maintained. For Simulink systems, a character vector variable that contains the block name associated with each state can be obtained using

```
[sizes,x0,xstring] = sys
```

where `xstring` is a vector of strings whose *i*th row is the block name associated with the *i*th state. Inputs and outputs are numbered sequentially on the diagram.

For single-input multi-output systems, you can convert to transfer function form using the routine `ss2tf` or to zero-pole form using `ss2zp`. You can also convert the linearized models to LTI objects using `ss`. This function produces an LTI object in state-space form that can be further converted to transfer function or zero-pole-gain form using `tf` or `zpk`.

The default algorithms in `linmod` and `dlinmod` handle Transport Delay blocks by replacing the linearization of the blocks with a Pade approximation. For more information, see “Linearizing Models”.

# linmodv5

Extract continuous-time linear state-space model around operating point

## Syntax

```
argout = linmodv5('sys')
argout = linmodv5('sys',x,u)
argout = linmodv5('sys',x,u,para)
argout = linmodv5('sys',x,u,para,xpert,upert)
```

## Arguments

*sys*

Name of the Simulink system from which the linear model is extracted.

*x, u*

State ( $x$ ) and the input ( $u$ ) vectors. If specified, they set the operating point at which the linear model is extracted. When a model has model references using the Model block, you must use the Simulink structure format to specify  $x$ . To extract the  $x$  structure from the model, use the following command:

```
x = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the operating point values within this structure by editing `x.signals.values`.

If the state contains different data types (for example, 'double' and 'uint8'), then you cannot use a vector to specify this state. You must use a structure instead. In addition, you can only specify the state as a vector if the state data type is 'double'.

*para*

A three-element vector of optional arguments:

- `para(1)` — Perturbation value of delta, the value used to perform the perturbation of the states and the inputs of the model. This is valid for linearizations using the 'v5' flag. The default value is 1e-05.
- `para(2)` — Linearization time. For blocks that are functions of time, you can set this parameter with a nonnegative value that gives the time ( $t$ ) at which Simulink evaluates the blocks when linearizing a model. The default value is 0.
- `para(3)` — Set `para(3)=1` to remove extra states associated with blocks that have no path from input to output. The default value is 0.

*xpert, upert*

The perturbation values used to perform the perturbation of all the states and inputs of the model. The default values are

```
xpert = para(1) + 1e-3*para(1)*abs(x)
upert = para(1) + 1e-3*para(1)*abs(u)
```

When a model has model references using the Model block, you must use the Simulink structure format to specify *xpert*. To extract the *xpert* structure, use the following command:

```
xpert = Simulink.BlockDiagram.getInitialState('sys');
```

You can then change the perturbation values within this structure by editing `xpert.signals.values`.

The perturbation input arguments are only available when invoking the perturbation algorithm created prior to MATLAB 5.3, either by calling `linmodv5` or specifying the 'v5' input argument to `linmod`.

*argout*

`linmod`, `dlinmod`, and `linmod2` return state-space representations if you specify the output (left-hand) side of the equation as follows:

- `[A,B,C,D] = linmod('sys', x, u)` obtains the linearized model of *sys* around an operating point with the specified state variables *x* and the input *u*. If you omit *x* and *u*, the default values are zero.

`linmod` and `dlinmod` both also return a transfer function and MATLAB data structure representations of the linearized system, depending on how you specify the output (left-hand) side of the equation. Using `linmod` as an example:

- `[num, den] = linmod('sys', x, u)` returns the linearized model in transfer function form.
- `sys_struct = linmod('sys', x, u)` returns a structure that contains the linearized model, including state names, input and output names, and information about the operating point.

## Description

---

**Note** `linmodv5` provides only basic linearization functionality. For full linearization functionality, use Simulink Control Design software. For more information, see “Choose Linearization Tools” (Simulink Control Design).

---

`linmodv5` computes a linear state space model using the full model perturbation algorithm created prior to MATLAB 5.3.

`linmodv5` obtains linear models from systems of ordinary differential equations described as Simulink models. Inputs and outputs are denoted in Simulink block diagrams using Inport and Outport blocks.

## Notes

By default, the system time is set to zero. For systems that are dependent on time, you can set the variable `para` to a two-element vector, where the second element is used to set the value of `t` at which to obtain the linear model.

The ordering of the states from the nonlinear model to the linear model is maintained. For Simulink systems, a character vector variable that contains the block name associated with each state can be obtained using

```

## load\_system

Load Simulink model into memory

### Syntax

```
handle = load_system(sys)
```

### Description

`handle = load_system(sys)` loads the model `sys` into memory without opening the model in the Simulink Editor. After you load a model into memory, you can work with it using Simulink API commands. Save changes to the model using `save_system`.

### Examples

#### Load Model into Memory

Load the model `vdp` into memory and return the model handle.

```
h = load_system("vdp")
```

```
h =
```

```
172.0004
```

### Input Arguments

#### **sys** — System to search

character vector | string scalar

System to search, specified as the full system path name, a cell array of system path names, a handle, or a vector of handles.

Example: "vdp"

Example: 'MyModel/Subsystem1'

Example: {'vdp', 'fuelssystem'}

### Output Arguments

#### **handle** — Handle of loaded model

handle

Handle of loaded model.

### Version History

Introduced before R2006a

**See Also**

close\_system | open\_system | save\_system

# loadIntoMemory

Load logged data into memory

## Syntax

```
logs = loadIntoMemory(logs)
```

## Description

`logs = loadIntoMemory(logs)` loads the data in `logs` into memory. Data is logged to a repository and brought into memory on an as-needed basis. When you want to work with all elements of a large set of logged data, use `loadIntoMemory` to bring all of the elements into memory at once. Loading all the data at once, rather than element by element, is much faster.

## Examples

### Load Logged Data into Memory

This example shows how to load a set of logged data into memory all at once, rather than element by element.

```
% Simulate model to generate logged data
sim('sldemo_fuelsys')
```

The simulation logs all of the instrumented signals in the model to the `Simulink.SimulationData.Dataset` object `sldemo_fuelsys_output`. At the end of simulation, the signal data remains in the repository until used in the MATLAB workspace. When you work with small sets of data or only postprocess a subset, leaving signals in the repository improves performance. But when you have a large set of data and need to postprocess all of the signals, you should bring them all into memory at once.

```
% Load all logged signals into memory
loadIntoMemory(sldemo_fuelsys_output);
```

All of the data in `sldemo_fuelsys_output` is now available for efficient postprocessing.

## Input Arguments

### logs — Data to load into memory

'Simulink.SimulationData.Dataset' | 'Simulink.SimulationOutput'

Data to load into memory. The `loadIntoMemory` function can load `Simulink.SimulationData.Dataset` and `Simulink.SimulationOutput` data.

Example: `logout`

## Output Arguments

### Logs — Data

'Simulink.SimulationData.Dataset' | 'Simulink.SimulationOutput'

Data loaded into memory.

## Version History

**Introduced in R2017b**

# lookupTableEditor

Start Lookup Table Editor

## Syntax

```
lookupTableEditor
lookupTableEditor(path)
```

## Description

`lookupTableEditor` starts a stand-alone version of the Lookup Table Editor.

`lookupTableEditor(path)` starts the Lookup Table Editor for a model, subsystem, or lookup table block.

## Examples

### Start Lookup Table Editor for Model

Start the Lookup Table Editor for the `sldemo_fuelsys` model.

```
lookupTableEditor('sldemo_fuelsys')
```

## Input Arguments

### **path** — Path

character vector

Path to system containing lookup table, specified as a character vector or string.

Data Types: `char` | `string`

## Version History

Introduced in R2022a

## See Also

1-D Lookup Table | 2-D Lookup Table | Direct Lookup Table (n-D) | n-D Lookup Table | Interpolation Using Prelookup | Prelookup

# modeladvisor

Open Model Advisor

## Syntax

```
modeladvisor(model)
modeladvisor(model, 'configuration', configfile)
```

## Description

`modeladvisor(model)` opens the Model Advisor for the model or subsystem specified by `model`. If the specified model or subsystem is not open, this command opens it.

If you have a Simulink Check™ license, you can specify a name-value pair with `modeladvisor(model, 'configuration', configfile)` that opens the Model Advisor with a custom configuration. The configuration defines the organization of folders and checks in the Model Advisor. For more information, see “Create and Deploy a Model Advisor Custom Configuration” (Simulink Check).

## Examples

### Open Model Advisor for model

Open the Model Advisor for vdp example model:

```
modeladvisor('vdp')
```

### Open Model Advisor for subsystem

Open the Model Advisor for the Aircraft Dynamics Model subsystem of the f14 example model:

```
modeladvisor('f14/Aircraft Dynamics Model')
```

### Open Model Advisor for currently selected model

Open the Model Advisor on the currently selected model:

```
modeladvisor(bdroot)
```

### Open Model Advisor for currently selected subsystem

Open the Model Advisor on the currently selected subsystem:

modeladvisor(gcs)

## Input Arguments

### **model** — Model or subsystem name

character vector

Model or subsystem name or handle, specified as a character vector.

Data Types: char

### **configfile** — Custom configuration

character vector

File that contains a Model Advisor custom configuration of folders and checks (available with a Simulink Check license).

Data Types: char

## Version History

**Introduced before R2006a**

### **See Also**

“Run Model Advisor Checks”

## new\_system

Create Simulink model or library in memory

### Syntax

```
h = new_system

h = new_system(name)
h = new_system(name, 'FromTemplate', template)
h = new_system(name, 'FromFile', file)
h = new_system(___, 'ErrorIfShadowed')

h = new_system(name, 'Model')
h = new_system(name, 'Model', subsystem)
h = new_system(name, 'Subsystem')
h = new_system(name, 'Library')
h = new_system(___, 'ErrorIfShadowed')
```

### Description

`h = new_system` creates a model named `untitled` (and then `untitled1`, `untitled2`, and so on) based on your default model template and returns the new model's numeric handle. Select your default model template on the Simulink start page or by using the `Simulink.defaultModelTemplate` function.

The `new_system` function does not open the new model. This function creates the model in memory. To save the model, use `save_system`, or open the model with `open_system` and then save it using the Simulink Editor.

`h = new_system(name)` creates a model based on your default model template and gives the new model the specified name. This function returns the new model's numeric handle. Select your default model template on the Simulink start page or by using the `Simulink.defaultModelTemplate` function.

If `name` is empty, the function creates a model named `untitled`, `untitled1`, `untitled2`, and so on.

The `new_system` function does not open the new model. This function creates the model in memory. To save the model, use `save_system`, or open the model with `open_system` and then save it using the Simulink Editor.

`h = new_system(name, 'FromTemplate', template)` creates the model based on the specified template.

`h = new_system(name, 'FromFile', file)` creates the model based on the specified model or template.

`h = new_system( ___, 'ErrorIfShadowed' )` creates the model or returns an error if another model, MATLAB file, or variable with the same name is on the MATLAB path or in the workspace. It uses any of the input arguments in the previous syntaxes.

`h = new_system(name, 'Model')` creates an empty model based on the Simulink default model and returns the new model's numeric handle. The Simulink default model is also known as the root block diagram and has the numeric handle 0. If `name` is empty, the function creates a model or library named `untitled`, `untitled1`, `untitled2`, and so on.

The `new_system` function does not open the new model. This function creates the model in memory. To save the model, use `save_system`, or open the model with `open_system` and then save it using the Simulink Editor.

`h = new_system(name, 'Model', subsystem)` creates a model based on the subsystem `subsystem` in a currently loaded model.

`h = new_system(name, 'Subsystem')` creates an empty subsystem file that has the specified name.

`h = new_system(name, 'Library')` creates an empty library that has the specified name and returns a numeric handle.

`h = new_system( ___, 'ErrorIfShadowed')` returns an error if another model, MATLAB file, or variable with the same name is on the MATLAB path or in the workspace. This syntax uses any of the input arguments in the previous syntaxes.

## Examples

### Create a Model Based on Default Template

Create a model in memory called `untitled`.

```
h = new_system;
```

You can use `get_param` to get the name.

```
get_param(h, 'Name')
open_system(h)
open_system('untitled')
open_system(get_param(h, 'Name'))
```

```
ans =
```

```
untitled
```

Use the name, the handle, or `get_param` command as input to `open_system`. You can use any of these commands:

### Create a Model Based on Named Template

Before you use this syntax, create a template. In the Simulink Editor, create the model you want to use as the template, then in the **Simulation** tab, select **Save > Template**. For this example, name the template `mytemplate`.

By default, the template is on the MATLAB path, so if you change location, add the folder to the MATLAB path.

Create a model named `templateModel` based on the template `mytemplate`.

```
h = new_system('templateModel','FromTemplate','mytemplate');
```

Invoking template `\\myuserdir\Documents\MATLAB\mytemplate.sltx`

### Create a Model Based on Another Model

Create a model named `mynewmodel` based on `myoldmodel`, which is in the current folder.

```
h = new_system('mynewmodel','FromFile','myoldmodel.slx');
```

### Create Model from Subsystem

Load the model `f14`. Create a model based on the Controller subsystem.

```
load_system('f14');
new_system('mycontroller','Model','f14/Controller');
open_system('mycontroller');
```

### Create a Library

Create a library in memory and then open it.

```
new_system('mylib', 'Library')
open_system('mylib')
```

### Create a Subsystem File

Create a subsystem file in memory and then open it.

```
new_system('mysubsystem', 'Subsystem')
open_system('mysubsystem')
```

### Ensure Model Name Is Unique

Create a variable with the name myvar.

```
myvar = 17;
```

Try to create a model that uses the same name as the variable. When you use the 'ErrorIfShadowed' option, the new\_system function returns an error.

```
new_system('myvar', 'Model', 'ErrorIfShadowed')
```

The model 'myvar' cannot be created because this name is shadowing another name on the MATLAB path or in the workspace. Choose another name, or do not use the option 'ErrorIfShadowed'

## Input Arguments

### **name** — Name of new model or library

character vector

Name of new model or library, specified as a character vector that:

- Has 63 or fewer characters
- Is not a MATLAB keyword
- Is not 'simulink'
- Is unique among model names, variables, and MATLAB files on the MATLAB path and in the workspace

Example: 'mymodel', 'mylibrary'

### **subsys** — Subsystem to base new model on

subsystem block path name

Subsystem to base the new model on, specified as the subsystem block path name in a currently open model.

Example: 'f14/Controller'

### **template** — Name of template to base new model on

character vector

Name of the template to base the new model on, specified as a character vector of the name of a template on the MATLAB path. Create a template in the Simulink Editor. In the **Simulation** tab, select **Save > Template**.

Example: 'mytemplate', 'mytemplate.slx'

**file** — Path name of model or template to base new model on  
character vector

Path name of the model or template to base the new model on, specified as a character vector. You can use an .mdl, .slx, or .sltx file. Include the extension and use a full or relative path.

Example: 'Models/mymodel.slx', 'mytemplate.slx', 'model.mdl'

## Version History

Introduced before R2006a

### See Also

[open\\_system](#) | [save\\_system](#) | [Simulink.defaultModelTemplate](#)

## open\_system

Open model, library, subsystem, or block dialog box

### Syntax

```
open_system(obj)

open_system(sys, 'loadonly')

open_system(sbsys, 'window')
open_system(sbsys, 'tab')

open_system(blk, 'mask')
open_system(blk, 'force')
open_system(blk, 'parameter')
open_system(blk, 'OpenFcn')
```

### Description

`open_system(obj)` opens the specified model, library, subsystem, or block. This is equivalent to double-clicking the model or library in the Current Folder Browser, or the subsystem or block in the Simulink Editor.

A model or library opens in a new window. For a subsystem or block within a model, the behavior depends on the type of block and its properties.

- Any `OpenFcn` callback parameter is evaluated.
- If there is no `OpenFcn` callback, and a mask is defined, the mask parameter dialog box opens.
- Without an `OpenFcn` callback or a mask parameter, Simulink opens the object.
  - A referenced model opens in a new window.
  - A subsystem opens in a new tab in the same window.
  - For blocks, the parameters dialog box for the block opens.

To open a specific subsystem or block, you must load the model or library containing it. Otherwise Simulink returns an error.

You can override the default behavior by supplying a second input argument.

`open_system(sys, 'loadonly')` loads the specified model or library without opening the Simulink Editor. This is equivalent to using `load_system`.

`open_system(sbsys, 'window')` opens the subsystem `sbsys` in a new Simulink Editor window. Before opening a specific subsystem or block, load the model or library containing it. Otherwise Simulink returns an error.

`open_system(sbsys, 'tab')` opens the subsystem in a new Simulink Editor tab in the same window. Before opening a specific subsystem or block, load the model or library containing it. Otherwise Simulink returns an error.

`open_system(blk, 'mask')` opens the mask dialog box of the block or subsystem specified by `blk`. Load the model or library containing `blk` before opening it.

`open_system(blk, 'force')` looks under the mask of a masked block or subsystem. It opens the dialog box of the block under the mask or opens a masked subsystems in a new Simulink Editor tab. This is equivalent to the **Look Under Mask** menu item. Before opening a specific subsystem or block, load the model or library containing it. Otherwise Simulink returns an error.

`open_system(blk, 'parameter')` opens the block parameter dialog box.

`open_system(blk, 'OpenFcn')` runs the block callback `OpenFcn`.

## Examples

### Open a Model

Open the f14 model.

```
open_system('f14')
```

### Load a Model Without Opening it

Load the f14 model.

```
open_system('f14', 'loadonly')
```

### Open a Subsystem

Open the Controller subsystem of the f14 model.

```
load_system('f14')
open_system('f14/Controller')
```

### Open a Subsystem in New Tab in Existing Window

Open the f14 model and open the Controller subsystem in a new tab.

```
f14
open_system('f14/Controller', 'tab')
```

### Open a Subsystem in a Separate Window

Open a subsystem in its own Simulink Editor window.

```
open_system('f14')
open_system('f14/Controller', 'window')
```

### Open a Referenced Model

Open the model `sldemo_mdhref_counter`, which is referenced by the CounterA Model block in `sldemo_mdhref_basic`.

```
openExample('sldemo_mdhref_basic')
open_system('sldemo_mdhref_basic/CounterA')
```

The referenced model opens in its own Simulink Editor window as a top model. To open the referenced model in the context of a model hierarchy, use the `open` function with a `Simulink.BlockPath` object.

### Open Block Dialog Box

Open the block parameters dialog box for the first Gain block in the Controller subsystem.

```
load_system('f14')
open_system('f14/Controller/Gain')
```

### Run Block Open Callback Function

Define an `OpenFcn` callback for a block and execute the block callback.

```
f14
set_param('f14/Pilot','OpenFcn','disp(''Hello World!'')')
open_system('f14/Pilot','OpenFcn')
```

The words `Hello World` appear on the MATLAB Command Prompt.

### Open Masked Subsystem

Open the contents of the masked subsystem Pump in the model `sldemo_hydcyl`.

```
openExample('sldemo_hydcyl')
open_system('sldemo_hydcyl/Pump','force')
```

### Open Multiple Systems with One Command

Create a cell array of two model names, `f14` and `vdp`. Open both models using `open_system` with the cell array name.

```
models = {'f14','vdp'}
open_system(models)
```

## Input Arguments

**obj** — Model, referenced model, library, subsystem, or block path

character vector

Model, referenced model, library, subsystem, or block path, specified as a character vector. If the model is not on the MATLAB path, specify the full path to the model file. Specify the block or subsystem using its full name, e.g., `f14/Controller/Gain`, on an opened or loaded model. On UNIX systems, the fully qualified path name of a model can start with a tilde (~), signifying your home directory.

Data Types: `char`

### **sys — Model or library path**

character vector

The full name or path of a model or library, specified as a character vector.

Data Types: `char`

### **sbsys — Subsystem path**

character vector

The full name or path of a subsystem in an open or loaded model, specified as a character vector.

Data Types: `char`

### **blk — Block or subsystem path**

character vector

The full name or path of a block or subsystem in an open or loaded model, specified as a character vector.

Data Types: `char`

## **Tips**

To open a referenced model in the context of a model hierarchy, use the `open` function with a `Simulink.BlockPath` object.

## **Version History**

**Introduced before R2006a**

## **See Also**

`new_system` | `load_system` | `close_system` | `save_system` | `open` (BlockPath)

## openDialog

Open configuration parameters dialog

### Syntax

```
openDialog(configObj)
```

### Arguments

*configObj*

A configuration set (`Simulink.ConfigSet`) or configuration reference (`Simulink.ConfigSetRef`)

### Description

`openDialog` opens a configuration parameters dialog box. If *configObj* is a configuration set, the dialog box displays the configuration set. If *configObj* is a configuration reference, the dialog box displays the referenced configuration set, or generates an error if the reference does not specify a valid configuration set. If the dialog box is already open, its window becomes selected.

### Examples

The following example opens a configuration parameters dialog box that shows the current parameters for the current model. The parameter values derive from the active configuration set or configuration reference (configuration object). The code is the same in either case; the only difference is which type of configuration object is currently active.

```
myConfigObj = getActiveConfigSet(gcs);
openDialog(myConfigObj);
```

## Version History

**Introduced in R2006b**

# parsim

Simulate dynamic system multiple times in parallel or serial

## Syntax

```
simOut = parsim(in)
simOut = parsim(in, 'ShowSimulationManager', 'on')
simOut = parsim(in, Name, Value)
```

## Description

`simOut = parsim(in)` simulates a model using the inputs specified in the `SimulationInput` object, `in`. The `parsim` command uses an array of `SimulationInput` objects to run multiple simulations.

`simOut = parsim(in, 'ShowSimulationManager', 'on')` simulates a model in parallel using the inputs specified in the `SimulationInput` object and opens the Simulation Manager UI. For more information, see `Simulation Manager`.

`simOut = parsim(in, Name, Value)` simulates a model in parallel using the inputs specified in the `SimulationInput` object and the options specified as the `Name, Value` pair.

The `parsim` command uses the Parallel Computing Toolbox license to run the simulations in parallel. `parsim` runs the simulations in serial if a parallel pool cannot be created or if Parallel Computing Toolbox is not used.

## Examples

### Using `parsim` with Rapid Accelerator

Simulate the model, `vdp`, in rapid accelerator mode.

Load the model.

```
model = 'vdp';
load_system(model)
```

This step builds the Rapid Accelerator target

```
Simulink.BlockDiagram.buildRapidAcceleratorTarget(model);
```

Create a `SimulationInput` object and use `setModelParameter` method to set `RapidAcceleratorUpToDateCheck` to 'off'.

```
in = Simulink.SimulationInput(model);
in = in.setModelParameter('SimulationMode', 'rapid-accelerator');
in = in.setModelParameter('RapidAcceleratorUpToDateCheck', 'off');
```

Simulate the model.

```
out = parsim(in)
```

### **Simulate Model in Parallel with parsim**

Simulate the model, CSTR, in parallel by sweeping over a variable. An array of `SimulationInput` objects is used to perform the sweep.

Specify sweep values.

```
FeedTempSweep = 250:10:300;
```

Create an array of `SimulationInput` objects.

```
for i = length(FeedTempSweep):-1:1
in(i) = Simulink.SimulationInput('CSTR');
in(i) = in(i).setVariable('FeedTemp0',FeedTempSweep(i));
end
```

Simulate the model in parallel.

```
out = parsim(in, 'ShowSimulationManager', 'on')
```

```

[29-Jun-2022 15:08:28] Cleaning up parallel workers...
```

```
out =
```

```
1x6 Simulink.SimulationOutput array
```

## **Input Arguments**

### **in — Simulink.SimulationInput object used to simulate the model**

object, array

A `Simulink.SimulationInput` object or an array of `Simulink.SimulationInput` objects that is used to specify changes to the model for a simulation.

Example: `in = Simulink.SimulationInput('vdp')`

Example: `for i = 10:-1:1 in(i) = Simulink.SimulationInput('vdp'); end`

## Name-Value Pair Arguments

---

**Note** All parameters passed to `parsim` command are unrelated to the parameters that are used with the `sim` command. To pass to the `parsim` command, use the list of following input arguments

---

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` and `Value` must appear inside single quotes ( ' '). You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

Example: `'ShowProgress', 'on'`

### AttachedFiles — Files to attach to parallel pool

cell array

Additional files to attach to the parallel pool, specified as a cell array. `parsim` does not support loading data from From File blocks that make reference to mat files in subdirectories.

### ShowProgress — Show the progress of the simulations

'on'(default) | 'off'

Set to `'on'`, to see the progress of the simulations in the command window. The progress is hidden when set to `'off'`.

---

**Note** When the progress is shown, a message `'Cleaning up parallel workers..'` may be displayed before the completion of the last few simulations. This message does not depend on the completion of the simulations. Simulations complete when the outputs are fetched from the future. For more information, see `Simulink.Simulation.Future`.

---

### RunInBackground — Run simulations in background

'off' (default) | 'on'

Set to `'on'` to run simulations asynchronously, keeping the MATLAB command prompt available for use. To terminate the simulations running in the background, use the `cancel` method on the `Simulink.Simulation.Future` objects.

### SetupFcn — Function handle to run once per worker

function handle

Specify a function handle to `'SetupFcn'` to run once per worker before the start of the simulations.

Example: `'SetupFcn',@( )currentProject('Modelex/Model_example.prj')`

---

**Note** When `buildRapidAcceleratorTarget` is used in the `SetupFcn` and the model has external inputs specified, either set `'LoadExternalInput'` to `'off'` or ensure that the specified external input is available on the workers to prevent compilation error.

---

### CleanupFcn — Function handle to run once per worker after running simulations

function handle

Specify a function handle to 'CleanupFcn' to run once per worker after the simulations are completed.

**ManageDependencies — Manage model dependencies**

'on' (default) | 'off'

When `ManageDependencies` is set to `on`, model dependencies are automatically sent to the parallel workers if required. If `ManageDependencies` is set to `off`, explicitly attach model dependencies to the parallel pool.

**UseFastRestart — Use fast restart**

'off' (default) | 'on'

When `UseFastRestart` is set to `on`, simulations run on the workers using fast restart.

When performing a parameter sweep varying properties of a Simscape component (e.g. mass and inertia of a Solid block in Simscape Multibody), specify the Simscape block parameter as run-time configurable. For more information, see “About Simscape Run-Time Parameters” (Simscape).

---

**Note** When using `parsim`, use the `UseFastRestart` option and not the `FastRestart` option. See “Get Started with Fast Restart” for more information.

`parsim` in fast restart mode does not support models with `ToFile` blocks.

---

**TransferBaseWorkspaceVariables — Transfer variables to the parallel workers**

'off' (default) | 'on'

When `TransferBaseWorkspaceVariables` is set to `on`, variables used in the model and everything defined in the base workspace are transferred to the parallel workers.

**ShowSimulationManager — Starts the Simulation Manager app**

'off' (default) | 'on'

When '`ShowSimulationManager`' is set to '`on`', you can use the Simulation Manager App to monitor simulations.

**StopOnError — Stop simulations on errors**

'off' (default) | 'on'

Setting '`StopOnError`' to '`on`' stops the execution of simulations if an error is encountered.

## Output Arguments

**simOut — Simulation object containing logged simulation results**

object

Array of `Simulink.SimulationOutput` objects that contains all of the logged simulation results. The size of the array is equal to the size of the array of `Simulink.SimulationInput` objects.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You define the model time, states, and output that is logged using the **Data Import/Export** pane of the Model Configuration Parameters dialog box. You can log

signals using blocks such as the To Workspace and Scope blocks. The **Signal & Scope Manager** can directly log signals.

## Version History

Introduced in R2017a

## Extended Capabilities

### Automatic Parallel Support

Accelerate code by automatically running computation in parallel using Parallel Computing Toolbox™.

If you have Parallel Computing Toolbox installed, then when you use `parsim`, MATLAB automatically opens a parallel pool of workers on your local machine. MATLAB runs the simulations across the available workers. Control parallel behavior with the parallel preferences, including scaling up to a cluster.

For details, see “Running Multiple Simulations”.

## polyspacePackNGo

Generate and package options files to run Polyspace analysis on code generated from Simulink model

### Syntax

```
archivePath = polyspacePackNGo mdlName)
archivePath = polyspacePackNGo mdlName, psOpt)
archivePath = polyspacePackNGo mdlName, psOpt, asModelRef)
```

### Description

`archivePath = polyspacePackNGo mdlName)` examines the Simulink model `mdlName`, extracts Polyspace® options files from it, and packages the options files in the zip file located at `archivePath`. Before using `polyspacePackNGo`, generate code from your Simulink model. Then archive the generated code, for instance, by using `packNGo`. Generate the Polyspace options files from the Simulink model and include them in the code archive by using `polyspacePackNGo`. In a different development environment, when running a Polyspace analysis of the generated code, use the options files included in the code archive to preserve model-specific information, such as design range specifications. You must have Embedded Coder to use `slbuild`.

`archivePath = polyspacePackNGo mdlName, psOpt)` generates and packages the Polyspace options files that are generated according to the specification in `psOpt`. The object `psOpt` must be a Polyspace options object that is generated by using `pslinkoptions`. Using `psOpt`, modify the options for the Polyspace analysis.

`archivePath = polyspacePackNGo mdlName, psOpt, asModelRef)` generates and packages the Polyspace options files by using `asModelRef` to specify whether to generate option files for model reference code or standalone code.

### Examples

#### Generate and Package Polyspace Options Files

To generate and package Polyspace options files for a Simulink model, use `polyspacePackNGo`.

Open the Simulink model `rtwdemo_counter` and specify a folder for storing the generated code.

```
% Make temporary folders for code generation
[TEMPDIR, CGDIR] = rtwdemodir();
% Open the model
mdlName = 'rtwdemo_counter';
open_system(mdlName);
% Specify a folder for generated code
codegenFolder = 'rtwdemo_counter_ert_rtw';
```

To enable packing the generated code in an archive, set the option `PackageGeneratedCodeAndArtifacts` to `true`. Specify the name of the generated code archive as `genCodeArchive.zip`.

```
configSet = getActiveConfigSet mdlName);
set_param(configSet, 'PackageGeneratedCodeAndArtifacts', true);
set_param(configSet, 'PackageName', 'genCodeArchive.zip');
```

To make the model compatible with Polyspace, set `SystemTargetFile` to `ert.tlc`.

```
set_param(configSet, 'SystemTargetFile', 'ert.tlc');
```

After configuring the model, generate code.

```
slbuild mdlName)
```

Because `PackageGeneratedCodeAndArtifacts` is set to `true`, the generated code is packed into the archive `genCodeArchive.zip`.

Generate and package Polyspace options files.

```
zipFile = polyspacePackNGo mdlName);
```

In the code archive `genCodeArchive.zip`, the Polyspace options files are packaged in the `polyspace` folder.

### Package Polyspace Options Files That Have Specific Polyspace Analysis Options

To specify the Polyspace analysis options when packaging and generating options files, use `pslinktoptions`.

Open the Simulink model `rtwdemo_counter` and configure the model for generating a code archive that is compatible with Polyspace.

```
% Make temporary folders for code generation
[TEMPDIR, CGDIR] = rtwdemodir();
% Open the model
mdlName = 'rtwdemo_counter';
open_system mdlName);
% Specify a folder for generated code
codegenFolder = 'rtwdemo_counter_ert_rtw';
configSet = getActiveConfigSet mdlName);
% Enable packing the generated code into an archive
set_param(configSet, 'PackageGeneratedCodeAndArtifacts', true);
% Specify a name for the code archive
set_param(configSet, 'PackageName', 'genCodeArchive.zip');
% Configure the model to be Polyspace Compatible
set_param(configSet, 'SystemTargetFile', 'ert.tlc');
```

After configuring the model, generate code.

```
slbuild mdlName)
```

Because `PackageGeneratedCodeAndArtifacts` is set to `true`, the generated code is packed into the archive `genCodeArchive.zip`.

To specify the model configuration for the Polyspace analysis, use a `pslinktoptions` object. Create this object by using the function `pslinktoptions`.

```
psOpt = pslinktoptions mdlName);
```

The object `psOpt` is a structure where the fields are model configurations that you can specify.

Specify the model configuration by using `psOpt` object. For instance, set `InputRangeMode` to full range. For a full options list, see the input argument `psOpt`.

```
psOpt.InputRangeMode = 'FullRange';
```

Generate and package Polyspace options files. Use the `psOpt` object as the second argument in `polyspacePackNGo`.

```
zipFile = polyspacePackNGo mdlName, psOpt);
```

In the code archive `genCodeArchive.zip`, the Polyspace options files are packaged in the `polyspace` folder. The file `optionsFile.txt` contains the specified Polyspace analysis options.

### Package Polyspace Options Files for Code Generated as a Model Reference

To accelerate model simulations, invoke referenced Simulink models as simulation targets. To generate model reference simulation targets from a Simulink model, generate code from the model by using `slbuild` with the build process specified as `ModelReferenceCoderTarget`. Then, package the generated code by using `packNGo`. To generate and package Polyspace options files for analyzing such code, use the function `polyspacePackNGo` with the optional argument `asModelRef` set to `true`.

Open the Simulink model `rtwdemo_counter` and configure the model for generating a code archive that is compatible with Polyspace.

```
% Make temporary folders for code generation
[TEMPDIR, CGDIR] = rtwmoddir();
% Load model
mdlName = 'rtwdemo_counter';
load_system(mdlName);
configSet = getActiveConfigSet(mdlName);
% Enable packing the generated code into an archive
set_param(configSet, 'PackageGeneratedCodeAndArtifacts', true);
set_param(configSet, 'PackageName', '');
% Configure the model to be Polyspace Compatible
set_param(configSet, 'SystemTargetFile', 'ert.tlc');
```

After configuring the model, generate a model reference simulation target from it by using the function `slbuild`. Specify the option `ModelReferenceCoderTarget`. See `slbuild`.

```
slbuild(mdlName, 'ModelReferenceCoderTarget');
```

The code that is generated is stored in the folder `slprj`.

To package the code that is generated as a model reference, use the function `packNGo`. Locate the file `buildinfo.mat` in `<working folder>/slprj/ert/rtwdemo_counter` and use the full path to it as the input to `packNGo`. This command generates an archive containing the generated code and the object `buildinfo.mat`. See `packNGo`.

```
% Locate buildinfo and generate code archive
buildinfo = fullfile(pwd, 'slprj', 'ert', mdlName, 'buildinfo.mat');
packNGo(buildinfo)
```

Generate and package Polyspace options files. Omit the optional second argument. Set the third argument `asModelRef` to `true`.

```
zipFile = polyspacePackNGo mdlName, [], true);
```

In the code archive `rtwdemo_counter.zip`, the Polyspace options files are packaged in the `polyspace` folder.

## Input Arguments

### **mdlName** — Name of Simulink model for which to generate Polyspace options files

model name

A character array containing the name of the model for which you want to generate and package the Polyspace options files.

Example: `polyspacePackNGo('rtwdemo_roll')`

Data Types: `char`

### **psOpt** — Polyspace options object

options associated with `model` (default) | object created by using `pslinkoptions`

Specifies the model configuration for the Polyspace analysis by using a `pslinkoptions` object. You can modify certain analysis options by modifying `psOpt`, which is a structure where individual fields represent analysis options. For a full list of options that you can modify, see the table **Polyspace Analysis Options Supported by polyspacePackNGo**.

**Polyspace Analysis Options Supported by polyspacePacknGo**

| Property                                                                                                                                                                     | Value                          | Description                                                                                                                                                                      |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EnableAdditionalFileList: Enable an additional file list to be analyzed, specified as true or false. Use with the AdditionalFileList option.                                 | true                           | Polyspace verifies additional files specified in the AdditionalFileList option.                                                                                                  |
|                                                                                                                                                                              | false (default)                | Polyspace does not verify additional files.                                                                                                                                      |
| AdditionalFileList: List of additional files to be analyzed specified as a cell array of files. To add these files to the analysis, use the EnableAdditionalFileList option. | cell array                     | Polyspace considers the listed files for verification.                                                                                                                           |
| InputRangeMode: Specifies the range of the input variables.                                                                                                                  | 'DesignMinMax' (default)       | Polyspace uses the input range defined in the workspace or a block.                                                                                                              |
|                                                                                                                                                                              | 'Fullrange'                    | Polyspace uses full range inputs.                                                                                                                                                |
| ParamRangeMode: Specifies the range of the constant parameters.                                                                                                              | 'DesignMinmax'                 | Polyspace uses the constant parameter range defined in the workspace or in a block.                                                                                              |
|                                                                                                                                                                              | 'None' (default)               | Polyspace uses the value of parameters specified in the code.                                                                                                                    |
| OutputRangeMode: Specifies the output assertions.                                                                                                                            | 'DesignMinMax'                 | Polyspace applies assertions to outputs by using a range defined in a block or the workspace.                                                                                    |
|                                                                                                                                                                              | 'None' (default)               | Polyspace does not apply assertions to the output variables.                                                                                                                     |
| ModelRefVerifDepth: Specify the depth for analyzing the models that are referenced by the current model.                                                                     | 'Current model Only' (default) | Polyspace analyzes only the top model without analyzing the referenced models. Use this option when you refer to models that do not need to be analyzed, such as library models. |

| Property                                                                                                               | Value              | Description                                                                                                                                                                                                                                                                                                               |
|------------------------------------------------------------------------------------------------------------------------|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                        | '1'   '2'   '3'    | Polyspace analyzes referenced models up to the specified depth in the reference hierarchy. To analyze the models that are referenced by the top model, specify the property <code>ModelRefVerifDepth</code> as '1'. To analyze models that are referenced by the first level of references, specify this property as '2'. |
|                                                                                                                        | 'All'              | Polyspace verifies all referenced models.                                                                                                                                                                                                                                                                                 |
| ModelRefByModelRefVerif:<br>Specify whether you want to analyze all referenced models together or individually.        | true               | Polyspace analyzes the top model and the referenced models together. Use this option to check for integration or scaling issues.                                                                                                                                                                                          |
|                                                                                                                        | false (default)    | Polyspace analyzes the top model and the referenced models individually.                                                                                                                                                                                                                                                  |
| AutoStubLUT: Specifies how lookup tables are used.                                                                     | true (default)     | Polyspace stubs the lookup tables and verifies the model without analyzing the lookup table code.                                                                                                                                                                                                                         |
|                                                                                                                        | false              | Polyspace includes the lookup table code in the analysis.                                                                                                                                                                                                                                                                 |
| CheckConfigBeforeAnalysis:<br>Specifies the level of configuration checking done before the Polyspace analysis starts. | 'Off'              | Polyspace checks only for errors. The analysis stops if errors are found.                                                                                                                                                                                                                                                 |
|                                                                                                                        | 'OnWarn' (default) | Polyspace stops the analysis when errors are found and displays a message when warnings are found.                                                                                                                                                                                                                        |
|                                                                                                                        | 'OnHalt'           | Polyspace stops the analysis when either errors or warnings are found.                                                                                                                                                                                                                                                    |

Example: `polyspacePackNGo('rtwdemo_roll', psOpt)`, where `ps_opt` is an options object created by calling `pslinkoptions`

### **asModelRef – Indicator for model reference analysis**

false (default) | true

Indicator for model reference analysis, specified as true or false.

- If `asModelRef` is false (default), the function generates options files so that Polyspace analyzes the generated code as standalone code.

- If `asModelRef` is `true`, the function generates options files so that Polyspace analyzes the generated code as model reference code.

---

**Note** If you set `asModelRef` to `true`, use `slbuild` to generate code.

---

Example: `polyspacePackNGo('rtwdemo_roll', psOpt,true)`

Data Types: `logical`

## Output Arguments

**archivePath** — The full path to the archive containing the generated options files

path to archive

A character array containing the path to the generated archive. The options files are located in the `polyspace` folder in the archive. The `polyspace` folder contains these options files:

- `optionsFile.txt`: a text file containing the Polyspace options required to run a Polyspace analysis on the generated code without losing model-specific information, such as design range specification.
- `model_drs.xml`: A file containing the design range specification of the model.
- `linkdata.xml`: A file that links the generated code to the components of the model.

To run a Polyspace analysis on the generated code in an environment that is different than the environment where the code was generated from the Simulink model, use these files.

Data Types: `char`

## Version History

Introduced in R2020b

### See Also

`slbuild` | `pslinkoptions`

### Topics

“Run Polyspace Analysis on Generated Code by Using Packaged Options Files” (Polyspace Bug Finder)

# pslinkoptions

Create an options object to customize configuration of a Simulink model, generated code or a S-Function block. Use the object to specify configuration options for these Simulink objects in a Polyspace run from the MATLAB command line

## Syntax

```
opts = pslinkoptions(codegen)
opts = pslinkoptions(model)
opts = pslinkoptions(sfunc)
```

## Description

`opts = pslinkoptions(codegen)` returns an options object with the configuration options for code generated by codegen.

`opts = pslinkoptions(model)` returns an options object with the configuration options for the Simulink model.

`opts = pslinkoptions(sfunc)` returns an options object with the configuration options for the S-Function.

---

**Note** Before you run Polyspace from MATLAB, you must link your Polyspace and MATLAB installations. See “Integrate Polyspace with MATLAB and Simulink” (Polyspace Bug Finder).

---

## Examples

### Create generic options object for code generated by Embedded Coder

This example shows how you can create a generic Polyspace options object that is suitable for analyzing code generated by using Embedded Coder. This options object is prepopulated with appropriate Embedded Coder parameters. Edit the options object to modify the generic analysis.

Create a new Polyspace configuration object `new_opt` by calling the function `pslinkoptions` and specify `'ec'` as the input argument.

```
new_opt = pslinkoptions('ec')
new_opt =
 ResultDir: 'results_ $ModelName$'
 VerificationSettings: 'PrjConfig'
 OpenProjectManager: 0
 AddSuffixToResultDir: 0
 EnableAdditionalFileList: 0
 AdditionalFileList: {}
 VerificationMode: 'BugFinder'
 EnablePrjConfigFile: 0
```

```

 PrjConfigFile: ''
 AddToSimulinkProject: 0
 InputRangeMode: 'DesignMinMax'
 ParamRangeMode: 'None'
 OutputRangeMode: 'None'
 ModelRefVerifDepth: 'Current model only'
 ModelRefByModelRefVerif: 0
 AutoStubLUT: 1
 CxxVerificationSettings: 'PrjConfig'
 CheckConfigBeforeAnalysis: 'OnWarn'
 VerifAllSFcnInstances: 0

```

By default, this options object uses the same verification settings that you specify in the Polyspace project. To check MISRA C® 2012 coding rule violations in addition to the existing verifications specified in the project, run this code at the MATLAB command line:

```
new_opt.VerificationSettings = 'PrjConfigAndMisraC2012'
```

```
new_opt =
```

```

 ResultDir: 'results_ $ModelName$'
 VerificationSettings: 'PrjConfigAndMisraC2012'
 OpenProjectManager: 0
 AddSuffixToResultDir: 0
 EnableAdditionalFileList: 0
 AdditionalFileList: {}
 VerificationMode: 'BugFinder'
 EnablePrjConfigFile: 0
 PrjConfigFile: ''
 AddToSimulinkProject: 0
 InputRangeMode: 'DesignMinMax'
 ParamRangeMode: 'None'
 OutputRangeMode: 'None'
 ModelRefVerifDepth: 'Current model only'
 ModelRefByModelRefVerif: 0
 AutoStubLUT: 1
 CxxVerificationSettings: 'PrjConfig'
 CheckConfigBeforeAnalysis: 'OnWarn'
 VerifAllSFcnInstances: 0

```

When you start the Polyspace analysis of the generated code, you might want to open the Polyspace User Interface to follow the progress of the and to review the results afterwards. To open the Polyspace interface when you start the analysis, run this code:

```
new_opt.OpenProjectManager = true
```

```
new_opt =
```

```

 ResultDir: 'results_ $ModelName$'
 VerificationSettings: 'PrjConfigAndMisraC2012'
 OpenProjectManager: 1
 AddSuffixToResultDir: 0
 EnableAdditionalFileList: 0
 AdditionalFileList: {}
 VerificationMode: 'BugFinder'
 EnablePrjConfigFile: 0
 PrjConfigFile: ''
 AddToSimulinkProject: 0

```

```

 InputRangeMode: 'DesignMinMax'
 ParamRangeMode: 'None'
 OutputRangeMode: 'None'
 ModelRefVerifDepth: 'Current model only'
 ModelRefByModelRefVerif: 0
 AutoStubLUT: 1
 CxxVerificationSettings: 'PrjConfig'
 CheckConfigBeforeAnalysis: 'OnWarn'
 VerifAllSFcnInstances: 0

```

### Create and edit options object to modify Polyspace configuration

This example shows how you can store the Polyspace configurations of a Simulink model in to an object, and use the object to edit the configuration options.

Load the model `closed_loop_control`.

```
load_system('closed_loop_control');
```

To create an object containing the Polyspace configurations of the model, call `pslinkoptions`.

```
model_opt = pslinkoptions('closed_loop_control')
```

```
model_opt =
```

```

 ResultDir: 'results_ $ModelName$'
 VerificationSettings: 'PrjConfig'
 OpenProjectManager: 0
 AddSuffixToResultDir: 0
 EnableAdditionalFileList: 0
 AdditionalFileList: {}
 VerificationMode: 'BugFinder'
 EnablePrjConfigFile: 0
 PrjConfigFile: ''
 AddToSimulinkProject: 0
 InputRangeMode: 'DesignMinMax'
 ParamRangeMode: 'None'
 OutputRangeMode: 'None'
 ModelRefVerifDepth: 'Current model only'
 ModelRefByModelRefVerif: 0
 AutoStubLUT: 1
 CxxVerificationSettings: 'PrjConfig'
 CheckConfigBeforeAnalysis: 'OnWarn'
 VerifAllSFcnInstances: 0

```

The model is already configured for Embedded Coder®, so only the Embedded Coder configuration options appear as the fields of the object `model_opt`.

To modify a Polyspace configuration option, set the corresponding field of `model_opt`. For instance, change the results directory and set the verification mode to CodeProver by modifying fields : `model_opt.ResultDir` and `model_opt.VerificationMode`, respectively.

```
model_opt.ResultDir = 'results_v1_ $ModelName$';
model_opt.VerificationMode = 'CodeProver'
```

```
model_opt =
 ResultDir: 'results_v1_$ModelName$'
 VerificationSettings: 'PrjConfig'
 OpenProjectManager: 0
 AddSuffixToResultDir: 0
 EnableAdditionalFileList: 0
 AdditionalFileList: {}
 VerificationMode: 'CodeProver'
 EnablePrjConfigFile: 0
 PrjConfigFile: ''
 AddToSimulinkProject: 0
 InputRangeMode: 'DesignMinMax'
 ParamRangeMode: 'None'
 OutputRangeMode: 'None'
 ModelRefVerifDepth: 'Current model only'
 ModelRefByModelRefVerif: 0
 AutoStubLUT: 1
 CxxVerificationSettings: 'PrjConfig'
 CheckConfigBeforeAnalysis: 'OnWarn'
 VerifAllSFcnInstances: 0
```

### Create and edit an options object for TargetLink at the command line

Create a Polyspace® options object called `new_opt` with TargetLink® parameters:

```
new_opt = pslinkoptions('tl')
new_opt =
 ResultDir: 'results_$ModelName$'
 VerificationSettings: 'PrjConfig'
 OpenProjectManager: 0
 AddSuffixToResultDir: 0
 EnableAdditionalFileList: 0
 AdditionalFileList: {}
 VerificationMode: 'CodeProver'
 EnablePrjConfigFile: 0
 PrjConfigFile: ''
 AddToSimulinkProject: 0
 InputRangeMode: 'DesignMinMax'
 ParamRangeMode: 'None'
 OutputRangeMode: 'None'
 AutoStubLUT: 1
```

Set the `OpenProjectManager` option to true to follow the progress in the Polyspace interface. Also change the configuration to check for both run-time errors and MISRA C® coding rule violations:

```
new_opt.OpenProjectManager = true;
new_opt.VerificationSettings = 'PrjConfigAndMisra'
new_opt =
 ResultDir: 'results_$ModelName$'
 VerificationSettings: 'PrjConfigAndMisra'
 OpenProjectManager: 1
```

```

 AddSuffixToResultDir: 0
 EnableAdditionalFileList: 0
 AdditionalFileList: {}
 VerificationMode: 'CodeProver'
 EnablePrjConfigFile: 0
 PrjConfigFile: ''
 AddToSimulinkProject: 0
 InputRangeMode: 'DesignMinMax'
 ParamRangeMode: 'None'
 OutputRangeMode: 'None'
 AutoStubLUT: 1

```

## Input Arguments

### **codegen** — Code generator

'ec' | 'tl'

Code generator, specified as either 'ec' for Embedded Coder or 'tl' for TargetLink®. Each argument creates a Polyspace options object with properties specific to that code generator.

For a description of all configuration options and their values, see `pslinkoptions`.

Example: `ec_opt = pslinkoptions('ec')`

Example: `tl_opt = pslinkoptions('tl')`

Data Types: char

### **model** — Simulink model name

model name

Simulink model, specified by the model name. Creates a Polyspace options object with the configuration options of that model. If you have not set any options, the object has the default configuration options. If you have set a code generator, the object has the default options for that code generator.

For a description of all configuration options and their values, see `pslinkoptions`.

Example: `model_opt = pslinkoptions('my_model')`

Data Types: char

### **sfunc** — path to S-Function

character vector

Path to S-Function, specified as a character vector. Creates a Polyspace options object with the configuration options for the S-function. If you have not set any options, the object has the default configuration options.

For a description of all configuration options and their values, see `pslinkoptions`.

Example: `sfunc_opt = pslinkoptions('path/to/sfunction')`

Data Types: char

## Output Arguments

### **opts** — Polyspace configuration options

options object

Polyspace configuration options, returned as an options object. The object is used with `pslinkrun` to run Polyspace from the MATLAB command line.

For the list of object properties, see `pslinkoptions`.

```
Example: opts= pslinkoptions('ec')
opts.VerificationSettings = 'Misra'
```

## Version History

**Introduced in R2012a**

### **See Also**

`pslinkoptions`

# rehashUnitDBs

Refresh unit database files on MATLAB path

## Syntax

rehashUnitDBs

## Description

rehashUnitDBs refreshes unit database files on the MATLAB path. To load a custom unit database, use this function in conjunction with the createCustomDBFromExcel function.

The rehashUnitDBs function:

- Clears all previously loaded custom units in memory.
- Resets the set of supported units to the built-in set of units.
- Looks for database files with the extension `.slunitdb.mldtax` on the MATLAB path and loads those databases.
- Issues warnings if units with the same names are loaded. If units have several definitions with the same name in different databases, by default the function tries to use the definition in a built-in units databases. If the unit is not defined in a built-in database, the function uses the definition in the database highest on the MATLAB path.

To see the supported spreadsheet format, see “Custom Units Spreadsheet Format”.

## Examples

### Create Custom Units Database File from Excel Spreadsheet

Create a custom units database file from custom Excel spreadsheet file, `unitsDB.xlsx`.

Create a Excel spreadsheet containing these columns and data in any order:

- **name**, containing `ounce_force`
- **symbol**, containing `oz f`
- **asciiSymbol**, containing `oz f`
- **displayName**, containing `{\rm{}}oz_{force}}`
- **definitionExpression**, containing `oz*gn`
- **conversionFactor**, containing `1`
- **conversionOffset**, containing `0`
- **physicalQuantity**, containing `force`

Enter your custom unit specifications.

Save the database file, for example `unitsDB.xlsx`.

Create the database.

```
createCustomDBFromExcel('unitsDB.xlsx')
```

The function creates `unitsDB.slunitdb.mldatx` in the current folder.

Add the current folder to the MATLAB path.

```
addpath C:\work\custom_units
```

Load the new units database into memory.

```
rehashUnitDBs
```

## Version History

Introduced in R2020a

# replace\_block

Replace blocks in Simulink model

## Syntax

```
replBlks = replace_block(sys,current,new)
replBlks = replace_block(sys,Name,Value,new)
replBlks = replace_block(____, 'noprompt')
```

## Description

`replBlks = replace_block(sys,current,new)` replaces the blocks `current` in the model `sys` with blocks of type `new`.

You can use a block from a Simulink library or from another model as the replacement block.

The `replace_block` function prompts you to select the blocks you want to replace from a list of blocks that match the `current` argument.

Before using the `replace_block` function:

- Load the model `sys`. For more information on how to load a model, see `load_system` and `open_system`.
- If the library containing the new block with which you want to replace the current block is not loaded, load the library. For example, to replace the current block with a Message Triggered Subsystem block, load the **Simulink** library by entering this command in the MATLAB Command Window:

```
load_system('simulink.slx');
```

---

**Tip** Save the model before replacing blocks.

---

`replBlks = replace_block(sys,Name,Value,new)` replaces the blocks that match the block parameters specified by the `Name,Value` pair arguments. You can also use `find_system` `Name,Value` pairs to qualify the search for blocks to replace.

Specify optional pairs of arguments as `Name1=Value1, . . . ,NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

With the `replace_block` function, you can use block parameter and value pairs. For a list of all the block parameters, see “Common Block Properties” on page 6-12 and “Block-Specific Parameters” on page 6-24.

To specify additional information about the search for blocks to replace, you use `find_system` `Name,Value` pairs before the block parameters. For example, you can use

'CaseSensitive', 'off' to make the search for blocks case insensitive or 'FollowLinks', 'on' to follow links into library links. See `find_system` for that list of Name, Value pairs.

`replBlks = replace_block( ___, 'noprompt' )` replaces the blocks without prompting you to select them from a dialog box.

## Examples

### Replace Blocks in a Model

Replace blocks in the 'vdp' model.

Load the model 'vdp'.

```
load_system('vdp');
```

Replace Gain blocks with Integrator blocks.

```
RepNames = replace_block('vdp','Gain','Integrator');
```

A dialog box prompts you to select the blocks you want to replace.

With vdp/Mu selected in the dialog box, click **OK**.

Replace Scope blocks with To Workspace blocks.

```
RepNames = replace_block('vdp','Scope','simulink/Sinks/To Workspace');
```

A dialog box prompts you to select the blocks you want to replace.

With vdp/Scope selected in the dialog box, click **OK**.

To replace blocks in the model with blocks from the **Simulink Extras** library, load the **Simulink Extras** library.

```
load_system('simulink_extras.slx');
```

Replace Integrator blocks with Transfer Fcn (with initial states) blocks from the **Simulink Extras** library.

```
RepNames = replace_block('vdp','Integrator','simulink_extras/Additional Linear/Transfer Fcn (w/
```

A dialog box prompts you to select the blocks you want to replace.

With vdp/Mu, vdp/x1, and vdp/x2 selected in the dialog box, click **OK**.

### Replace Blocks in a Subsystem Using Parameter Values

Replace blocks in the Unlocked subsystem of the `sldemo_clutch` model. Replace blocks whose Gain parameter is set to `bv`.

Load the model `sldemo_clutch`.

```
openExample('sldemo_clutch');
```

In the 'Unlocked' subsystem, replace blocks whose Gain value is bv with Integrator blocks.

```
replace_block('sldemo_clutch/Unlocked','Gain','bv','Integrator');
```

A dialog box prompts you to select the blocks to replace.

With sldemo\_clutch/Unlocked/VehicleDamping selected in the dialog box, click **OK**.

### Replace Blocks Without Dialog Box

Load the model f14.

```
load_system('f14')
```

Replace Gain blocks with Integrator blocks. The command returns the blocks it found to replace and replaces the blocks.

```
repl = replace_block('f14','Gain','Integrator','noprompt')
```

```
repl = 13x1 cell
 {'f14/Aircraft...' }
 {'f14/Aircraft...' }
 {'f14/Aircraft...' }
 {'f14/Aircraft...' }
 {'f14/Controller/Gain' }
 {'f14/Controller/Gain2' }
 {'f14/Controller/Gain3' }
 {'f14/Gain' }
 {'f14/Gain1' }
 {'f14/Gain2' }
 {'f14/Gain5' }
 {'f14/Nz pilot...' }
 {'f14/Nz pilot...' }
```

### Use find\_system Pairs with replace\_block

Select a block that is a library link. Follow the library links and replace Gain blocks with Integrator blocks within them.

```
replace_block(gcb, 'FollowLinks', 'on', 'BlockType', 'Gain', 'Integrator', 'noprompt')
```

## Input Arguments

### sys — Model or subsystem whose blocks to replace

character vector

Name of model whose blocks to replace, specified as a character vector. If you specify a model, the command replaces all blocks that match in the model. If you specify a subsystem, the command replaces blocks in that subsystem and below.

Example: 'vdp', 'sldemo\_fuelsys/fuel\_rate\_control'

**current — Type of block to replace**

BlockType value | MaskType value

Type of block to replace, specified as a **BlockType** or **MaskType** value. To find out the block type, select the block and, at the command prompt, enter:

```
get_param(gcb, 'BlockType')
```

For masked blocks, to find out the mask type, select the block and enter:

```
get_param(gcb, 'MaskType')
```

**new — Block to replace current blocks**

BlockType value | MaskType value | library path | block path name from a model

Block to replace the current block, specified in one of these forms:

- **BlockType** value of the replacement block. Specifying this value uses a library block as the replacement block.
- **MaskType** value of the replacement block. Specifying this value uses a library block as the replacement block.
- Library path of the replacement block, for example, 'simulink/Sinks/To Workspace'. Hover over the block in the library to see the library path.
- Block path name of a block from a different model, for example, 'vdp/Mu'. Use this value to reuse an instance of a block from another model in your model.

**Output Arguments****replBlks — Blocks returned by the current argument**

cell array of character vectors

Blocks returned by the **current** argument, returned as a cell array of character vectors. The function returns the values regardless of whether you complete the replacement.

"Block-Specific Parameters" on page 6-24

# save\_system

Save Simulink model

## Syntax

```
filename = save_system
filename = save_system(sys)
filename = save_system(sys,newsys)
filename = save_system(sys,Name,Value)
filename = save_system(sys,newsys,Name,Value)
```

## Description

`filename = save_system` saves the current top-level model. If the model was not previously saved, `save_system` creates a file in the current folder.

To save a subsystem, instead use `Simulink.SubSystem.copyContentsToBlockDiagram` to copy the subsystem contents to a new model. You can then save that model using `save_system`. See `Simulink.SubSystem.copyContentsToBlockDiagram`.

`filename = save_system(sys)` saves the model `sys`. The model must be open or loaded.

`filename = save_system(sys,newsys)` saves the model to a new file `newsys`. If you do not specify an extension, then `save_system` uses the file format specified in your Simulink preferences.

`filename = save_system(sys,Name,Value)` saves the system with additional options specified by one or more `Name,Value` pair arguments.

`filename = save_system(sys,newsys,Name,Value)` saves the system to a new file with additional options specified by one or more `Name,Value` pair arguments. To use `Name,Value` pairs without saving to a new file, use `[]` for `newsys`.

## Examples

### Save Named Model

Create a model.

```
new_system('newmodel')
```

Save the model.

```
save_system('newmodel')
```

### Save Model with Another Name

Open the model `vdp`. Save it to a model named `myvdp` in the current folder. Without a file extension, the function saves the model using the format specified in your Simulink preferences.

```
open_system('vdp')
save_system('vdp','myvdp')
```

After you save the model by another name, the model is no longer open under its original name. Open `vdp` again and save it as an `.mdl` file in the current folder.

```
open_system('vdp')
save_system('vdp','mynewvdp.mdl')
```

### Return Error If Name Exists

Save a model with a new name and return an error if something with this name exists on the MATLAB path. In this case, `save_system` displays an error because `max` is the name of a MATLAB function. The model is not saved.

```
open_system('vdp')
save_system('vdp','max','ErrorIfShadowed',true)
```

```
Error using save_system (line 38)
The model 'vdp' cannot be saved with the new name 'max', because this name is
shadowing another name on the MATLAB path or in the workspace. Choose another
name, or do not use the option 'ErrorIfShadowed'
```

### Save Model with Options

Suppose that you have a model named `mymodel`. Open the model and save it to a model named `newmodel`. Also save the model workspace, break links to user-defined library blocks, and overwrite if the file has changed on disk,

```
open_system('mymodel')
save_system('mymodel','mynewmodel','SaveModelWorkspace',
true,'BreakUserLinks',true,'OverwriteIfChangedOnDisk',true)
```

### Save Model to Same Name and Use Options

Save the model `mymodel`, breaking links to user-defined library blocks in the model.

```
save_system('mymodel','BreakUserLinks',true)
```

## Input Arguments

### **sys** — Name of model to save

character vector | cell array of character vectors | string array | handle | array of handles

Name of model to save, specified as a character, cell array of character vectors, string array, handle, or array of handles. Do not use a file extension.

### **newsys** — File to save to

character vector | cell array of character vectors | string array | [ ]

File to save to, specified as a character vector, cell array of character vectors, string array, or, to use `Name, Value` pairs without changing the file name, [ ]. You can specify a model name in the current folder or the full path name, with or without an extension.

With no an extension, `save_system` saves to the file format specified in your Simulink preferences. Possible model extensions are `.slx` and `.mdl`. With the `'ExportToXML'` option, use the extension `.xml`.

For information on rules for naming models, see “Model Names”.

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, . . . , NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example:

```
save_system('mymodel', 'newmodel', 'SaveModelWorkspace', true, 'BreakUserLinks', true, 'OverwriteIfChangedOnDisk', true)
```

### AllowPrompt — Allow dialog box prompts

false (default) | true | 'on' | 'off'

Option to allow dialog box prompts, specified as `true`, `false`, `'on'`, or `'off'`. By default, warnings and error messages appear at the command line.

### BreakAllLinks — Replace links to library blocks

false (default) | true | 'on' | 'off'

Option to, in the saved file, replace links to library blocks with copies of the library blocks, specified as `true`, `false`, `'on'`, or `'off'`. This option affects user-defined blocks and Simulink library blocks.

---

**Caution** The `'BreakAllLinks'` option can result in compatibility issues when upgrading to newer versions of Simulink. For example:

- Any masks on top of library links to Simulink S-functions do not upgrade to the new version of the S-function.
- Any library links to masked subsystems in a Simulink library do not upgrade to the new subsystem behavior.
- Any broken links prevent the library forwarding mechanism from upgrading the link. See “Maintain Compatibility of Library Blocks Using Forwarding Tables”.

If you saved a model with broken links to built-in libraries, use the Upgrade Advisor to scan the model for out-of-date blocks. Then upgrade the Simulink blocks to their current versions.

---

### BreakUserLinks — Replace links to user-defined blocks

false (default) | true | 'on' | 'off'

Option to, in the saved file, replace links to user-defined library blocks with copies of the library blocks, specified as `true`, `false`, `'on'`, or `'off'`.

### BreakToolboxLinks — Replace links to built-in library block

false (default) | true | 'on' | 'off'

Option to, in the saved file, replace links to built-in library blocks with copies of the library blocks, specified as `true`, `false`, `'on'`, or `'off'`. This option affects Simulink library blocks and blocks from libraries supplied with MathWorks toolboxes or blocksets.

#### **ErrorIfShadowed — Return an error if name exists**

`false` (default) | `true` | `'on'` | `'off'`

Option to return an error if the new name exists on the MATLAB path or workspace, specified as `true`, `false`, `'on'`, or `'off'`.

#### **ExportToXML — Export model to XML format**

`false` (default) | `true` | `'on'` | `'off'`

Option to export the model to a file in a simple XML format, specified as `true`, `false`, `'on'`, or `'off'`. Specify the full name of the file, including the `.xml` extension. The block diagram in memory does not change and no callbacks execute. Use this option without any other `Name, Value` pair arguments. This option warns and will be removed in a future release.

Example: `save_system('mymodel', 'exportfile.xml', 'ExportToXML', true)`

#### **ExportToVersion — MATLAB release name to export to**

character vector | string scalar

MATLAB release name to export to, specified in either of these forms (not case sensitive). You can export to seven years of previous releases.

- Release name, for example, `'R2013B'`, `'R2016B'`
- Release name, followed by an underscore and then the extension, for example, `'R2016A_SLX'`, `'R2014A_MDL'`. If you do not specify an extension, you export to the file format specified in your Simulink preferences.

`save_system` exports the system such that the specified Simulink version can load it. If the system contains functionality not supported by the specified Simulink version, the command removes the functionality in the exported file. It also replaces unsupported blocks with empty masked subsystem blocks colored yellow. As a result, the exported system might generate different results.

Alternatively, use `Simulink.exportToVersion` or, interactively, the Export to Previous Version dialog box.

To export a project to previous releases, see “Export a Project to a Previous Version” on page 2-589.

#### **OverwriteIfChangedOnDisk — Overwrite file**

`false` (default) | `true` | `'on'` | `'off'`

Option to overwrite the file on disk even if it has been modified since the system was loaded, specified as `true`, `false`, `'on'`, or `'off'`. By default, if the file changed on disk since the model was loaded, `save_system` displays an error to prevent the changes on disk from being overwritten.

You can control whether `save_system` displays an error if the file has changed on disk using a Simulink preference. In the **Model File** pane of the Simulink Preferences dialog box, under **Change Notification**, select **Saving the model**. This preference is on by default.

#### **SaveDirtyReferencedModels — Save referenced models with unsaved changes**

`false` (default) | `true` | `'on'` | `'off'`

Option to save referenced models that have unsaved changes while saving changes to their parent model, specified as `true`, `false`, `'on'`, or `'off'`. This option applies to models that are directly referenced by each model that is saved. If the parent model of a dirty referenced model is not saved, the dirty referenced model is not saved.

Suppose you have a model hierarchy in which model A references model B, and model B references model C. If models B and C both have unsaved changes, they are both saved. If model C has unsaved changes but model B does not have unsaved changes, neither model is saved.

By default, attempting to save a model that contains unsaved referenced models return an error.

### **SaveModelWorkspace — Save model workspace**

`false` (default) | `true` | `'on'` | `'off'`

Option to save the contents of the model workspace, specified as `true`, `false`, `'on'`, or `'off'`. The model workspace `DataSource` must be a MAT-file. If the data source is not a MAT-file, `save_system` does not save the workspace. See “Specify Source for Data in Model Workspace”.

## **Output Arguments**

### **filename — Name of saved file**

character vector | cell array of character vectors

Full name of saved file, returned as a character vector or a cell array of character vectors.

## **Version History**

**Introduced before R2006a**

### **See Also**

`close_system` | `new_system` | `open_system` | `Simulink.exportToVersion`

### **Topics**

“Save the Model”

## set\_param

Set Simulink parameter value

### Syntax

```
set_param(object,parameter1,value1,...,parameterN,valueN)
```

### Description

`set_param(object,parameter1,value1,...,parameterN,valueN)` sets the specified Simulink parameter `parameter` to the specified value `value` for the target object specified by `object`. The target object can be a model, subsystem, library, block, line, port, or bus element port element.

To set multiple parameter values for the target object, call the `set_param` function once with multiple name-value arguments instead of separately calling the function for each parameter. Setting multiple parameters with one function call is efficient because one call evaluates the parameters only once. If any parameter names or values are invalid, then the function does not set any parameters.

### Examples

#### Set Configuration Parameters of Model

Open the `vdp` model and set the **Solver** and **StopTime** parameter values.

```
vdp
set_param('vdp','Solver','ode15s','StopTime','3000')
```

#### Set Configuration Parameters of Current Model

Open a model and set the **Solver** and **StopTime** parameters. Use the `bdroot` function to get the current top model.

```
vdp
set_param(bdroot,'Solver','ode15s','StopTime','3000')
```

#### Set Gain Block Parameter Value

Open `vdp` and set the **Gain** parameter value of the Gain block named `Mu`.

```
vdp
set_param('vdp/Mu','Gain','10')
```

## Set Position of Block

Open vdp and set the position of the Gain block named Mu.

```
vdp
set_param('vdp/Mu','Position',[50 100 110 120])
```

## Set Position of Block Using a Handle

Set the position of the Gain block named Mu in the vdp model using the block handle.

To get a handle to the Gain block named Mu, use the `getSimulinkBlockHandle` function. To load the vdp model, specify `true`.

```
mublockhandle = getSimulinkBlockHandle('vdp/Mu',true);
```

If you make multiple calls to `set_param` for the same block, use the block handle, which is more efficient than the full block path.

You can use the block handle in subsequent calls to `get_param` or `set_param`. The handle contains a double. Do not try to manually enter the number of a handle, for example `5.007`, because you usually need to specify more digits than MATLAB displays. Instead, assign the handle to a variable and use that variable name to specify the block.

Use the block handle with `set_param` to set the position.

```
set_param(mublockhandle,'Position',[50 100 110 120])
```

## Put Block Name on Top of Block

Open vdp and, for the Gain block named Mu, set the block name on top of the block.

```
vdp
set_param('vdp/Mu','NameLocation','top')
```

## Input Arguments

### object — Name, path, or handle of object

character vector | string scalar | numeric scalar

Name, path, or handle of object, specified as a character vector, string scalar, or numeric scalar.

How you specify the target object depends on its type.

- Model — Model name or handle.
- Subsystem — Subsystem name or handle.
- Library — Library name or handle.
- Block — Block path or handle.
- Line — Line handle.
- Port — Port handle.

- Bus element port element — Block path of model component with element label. The element can be any element of the port, such as a top-level bus, nested bus, signal, or message.

Example: 'vdp/Mu'

Example: 'myModel/Subsystem1/Out1.nonsinusoidal.saw'

### Tips

- If you make multiple calls to `set_param` for the same block, specify the block with a numeric handle. This method is more efficient than using the full block path with `set_param`. Use `getSimulinkBlockHandle` to get a block handle.
- Do not try to manually specify the number of a handle, for example, `5.007`, because you usually need to specify more digits than MATLAB displays. Assign the handle to a variable and use that variable name.

Data Types: char | string | double

### **parameter** — Parameter, property, or attribute name

character vector | string scalar

Parameter, property, or attribute name, specified as a character vector or string scalar. Some names are case sensitive.

For information about parameters, properties, or attributes, see the programmatic use information on the corresponding reference pages. For example:

- Models — See the configuration parameter reference pages.
- Blocks — See “Common Block Properties” on page 6-12 and block reference pages.
- Ports — See the **Signal Properties** tool reference page.
- Bus element port elements — See the In Bus Element and Out Bus Element block reference pages.

To get all parameters of a target object, use the `get_param` function with the 'ObjectParameters' option. Some of the returned parameters may be for internal use only.

Example: 'Solver'

Example: 'SimulationCommand'

Example: 'Position'

Example: 'NameLocation'

Data Types: char | string

### **value** — Parameter value

format determined by parameter type

Parameter value, specified in the format determined by the parameter type. Some parameter values are case sensitive. Values are often character vectors or string scalars, but they can also be numeric scalars, arrays, and other types.

Many block parameter values are specified as character vectors or string scalars. Two exceptions are `Position`, which is specified as a vector, and `UserData`, which can be any data type.

## Limitations

If you use `matlab -nodisplay` to start a session, you cannot use `set_param` to run a simulation. The `-nodisplay` mode does not support simulation using `set_param`. Use the `sim` function instead.

## Tips

After you set parameters in the MATLAB workspace, to see the changes in a model, update the diagram.

```
set_param(model, 'SimulationCommand', 'Update')
```

## Version History

Introduced before R2006a

## setActiveConfigSet

Specify active configuration set or configuration reference for model

### Syntax

```
setActiveConfigSet(model, configObjName)
```

### Description

`setActiveConfigSet(model, configObjName)` activates the configuration set or configuration reference that is attached to `model` and is named `configObjName`. Before you activate a configuration, attach the configuration to the model by using `attachConfigSet`.

### Examples

#### Activate Configuration Set

Create a configuration set, attach it to a model, and activate it.

Open the “Modeling a Fault-Tolerant Fuel Control System” on page 13-121 example model `sldemo_fuelsys`.

```
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
sldemo_fuelsys
```

Create a configuration set named `Config1` and attach it to the model.

```
configObj = Simulink.ConfigSet;
set_param(configObj, 'Name', 'Config1')
attachConfigSet('sldemo_fuelsys', configObj)
```

Activate the `Config1` configuration set.

```
setActiveConfigSet('sldemo_fuelsys', 'Config1')
```

### Input Arguments

#### **model** — Model for which to activate configuration

character vector | string scalar

Name of model for which you want to activate a configuration set, specified as a character vector or string scalar. The model must be open.

Example: `'my_model'`

#### **configObjName** — Name of configuration object

character vector | string scalar

Name of the configuration object that you want to activate, specified as a character vector or string scalar.

Example: 'Configuration'

## shareMATLABForFMUCoSim

Share current MATLAB session for FMU tool-coupling co-simulation

### Syntax

```
shareMATLABForFMUCoSim
```

### Description

shareMATLABForFMUCoSim dedicates the current MATLAB session available for requests from the external tool to co-simulate an imported FMU. When an FMU is connected to this session, the Simulink editor and Simulink project are loaded, and co-simulation starts automatically. You can use this session to pause, resume co-simulation, tune parameters, and plot signals from the command window while co-simulation is running. If co-simulation is finished, stopped by you, or interrupted by a runtime error, MATLAB closes, unloads the Simulink editor and Simulink project, and discards changes to the model. If an error occurs, it displays in the simulation tool that imports this FMU. Each session can connect to one FMU instance at the same time.

### Examples

#### Dedicate Current MATLAB Session for Co-Simulation

Dedicate the current MATLAB session for requests from external tools to co-simulate an imported FMU.

```
shareMATLABForFMUCoSim
```

```
The current MATLAB session ('MATLAB_27284') is now dedicated
for tool-coupling co-simulation FMU usage. Make sure your work
is saved, and no other application is connecting to this MATLAB session.
```

# showblockdatatypetable

Display HTML page of Simulink block data type support

## Syntax

```
showblockdatatypetable
```

## Description

showblockdatatypetable displays an HTML page of the Simulink block data type support. This table lists the data types that Simulink blocks support.

## Examples

### Display Support of Simulink Block Data Types

Display an HTML page of the Simulink block data type support.

```
showblockdatatypetable
```

## Tips

To open the Block Support Table using a block, double-click the Block Support Table block in the block library or add it to a model and then double-click it.

## Version History

**Introduced before R2006a**

## Topics

“Data Types Supported by Simulink”

## **showunitslist**

Show built-in units, physical quantities, and unit systems supported by Simulink

### **Syntax**

```
showunitslist
```

### **Description**

`showunitslist` opens a web browser that contains the list of built-in units, physical quantities, and unit systems supported by Simulink.

### **Examples**

#### **Show Built-in Units, Physical Quantities, and Unit Systems**

Show built-in units, physical quantities, and unit systems supported by Simulink.

```
showunitslist
```

This function opens a web browser displaying the allowed units.

# signalbuilder

(Not recommended) Create and access Signal Builder blocks

---

**Note** The `signalbuilder` function is not recommended. Use the `signalEditor` function instead.

---

## Syntax

```
[time,data] = signalbuilder(block)
[time,data,signames] = signalbuilder(block)
[time,data,signames,groupnames] = signalbuilder(block)

block = signalbuilder(path,'create',time,data)
block = signalbuilder(path,'create',time,data,signames,groupnames)
block = signalbuilder(path,'create',time,data,signames,groupnames,vis)
block = signalbuilder(path,'create',time,data,signames,groupnames,vis,pos)
block = signalbuilder(path,'create',time,data,signames,groupnames,vis,pos,{
openui openmodel})

block = signalbuilder(block,'appendgroup',time,data,signames,groupnames)
signalbuilder(block,'appendgroup',ds)
signalbuilder(block,'appendgroup',[ds1 ...dsN])
signalbuilder(block,'appendsignal',time,data,signames)

signalbuilder(block,'showsignal',signal,group)
signalbuilder(block,'hidesignal',signal,group)

[time,data] = signalbuilder(block,'get',signal,group)
ds = signalbuilder(block,'get',group)
[ds, ...dsN] = signalbuilder(block,'get',group)
signalbuilder(block,'set',signal,group,time,data)
signalbuilder(block,'set',group,ds)
signalbuilder(block,'set',group,[ds1 ...dsN])

index = signalbuilder(block,'activegroup')
[index, activeGroupLabel] = signalbuilder(block,'activegroup')
signalbuilder(block,'activegroup',index)

signalbuilder(block,'annotategroup')

signalbuilder(block,'print',config,printArgs)
figh = signalbuilder(block,'print',config,'figure')
```

## Description

`[time,data] = signalbuilder(block)` returns the time and data of the Signal Builder block, `block`.

`[time,data,signames] = signalbuilder(block)` returns signal names, `signames`, and time and data.

`[time,data,signames,groupnames] = signalbuilder(block)` returns the signal names, signames, and group names, groupnames, and time and data.

`block = signalbuilder(path,'create',time,data)` creates a new Signal Builder block at path with specified time and data. Signal and group names are default.

`block = signalbuilder(path,'create',time,data,signames,groupnames)` creates a new Signal Builder block at path with specified time and data, signal names, and group names.

`block = signalbuilder(path,'create',time,data,signames,groupnames,vis)` creates a new Signal Builder block and sets the visible signals in each group based on the values of the matrix vis.

`block = signalbuilder(path,'create',time,data,signames,groupnames,vis,pos)` creates a new Signal Builder block and sets the block position to pos.

If you create signals that are smaller than the display range or do not start from 0, the Signal Builder block extrapolates the undefined signal data. It does so by holding the final value.

`block = signalbuilder(path,'create',time,data,signames,groupnames,vis,pos,{openui openmodel})` creates a new Signal Builder block and opens or invisibly loads the model and Signal Builder block window.

`block = signalbuilder(block,'appendgroup',time,data,signames,groupnames)` appends new groups (groupnames) containing signames to the Signal Builder block, block. The time and data arguments must have the same number of signals as the existing block.

`signalbuilder(block,'appendgroup',ds)` appends one dataset.

`signalbuilder(block,'appendgroup',[ds1 ...dsN])` appends *N* datasets.

`signalbuilder(block,'appendsignal',time,data,signames)` appends new signals to all signal groups in the Signal Builder block, block. You can append either the same signals to all groups, or append different signals to different groups. Regardless of which signals you append, append the same number of signals to all the groups. Append signals to all the groups in the block; you cannot append signals to a subset of the groups. Correspondingly, provide time and data arguments for either one group (append the same information to all groups) or different time and data arguments for different groups.

`signalbuilder(block,'showsignal',signal,group)` makes signals that are hidden from the Signal Builder block visible. By default, signals in the current active group are visible when created.

`signalbuilder(block,'hidesignal',signal, group)` makes signals, signal, hidden from the Signal Builder block. By default, all signals are visible when created.

`[time,data] = signalbuilder(block,'get',signal,group)` gets the time and data values for the specified signal(s) and group(s).

`ds = signalbuilder(block,'get',group)` gets one or more datasets for one requested Signal Builder group. *r* gets *N* datasets for *N* requested Signal Builder groups.

`[ds, ...dsN] = signalbuilder(block,'get',group)` gets *N* datasets for *N* requested Signal Builder groups.

`signalbuilder(block, 'set', signal, group, time, data)` sets the time and data values for the specified signal and group. Use empty values of `time` and `data` to remove groups and signals. To remove a signal group, you must also remove all the signals in that group in the same command.

`signalbuilder(block, 'set', group, ds)` sets one dataset for the requested Signal Builder group. Specifying an empty dataset deletes the groups specified in `group`.

`signalbuilder(block, 'set', group, [ds1 ... dsN])` sets  $N$  datasets for  $N$  requested groups.

`index = signalbuilder(block, 'activegroup')` gets the index of the active group.

`[index, activeGroupLabel] = signalbuilder(block, 'activegroup')` gets the label value of the active group.

`signalbuilder(block, 'activegroup', index)` sets the active group to indexed active group.

`signalbuilder(block, 'annotategroup')` controls the display of the current group name on the mask of the Signal Builder block. 'annotategroup' takes one of these values:

- 'on' — Shows the current group name
- 'off' — Hides the current group name

`signalbuilder(block, 'print', config, printArgs)` prints the currently active signal group or the signal group that `config` specifies. Use the `config` to customize the printed appearance of a signal group.

`figh = signalbuilder(block, 'print', config, 'figure')` prints the currently active signal group or the signal group that `config` specifies to a new hidden figure handle, `figh`.

## Examples

### Create Signal Builder Block

Create a Signal Builder block in a new model editor window.

```
block = signalbuilder([], 'create', [0 5], {[2 2];[0 2]});
```

Get Signal Builder data from this block.

```
[time, data, signames, groupnames] = signalbuilder(block)
```

```
time =
```

```
2×1 cell array
```

```
{1×2 double}
{1×2 double}
```

```
data =
```

```
2×1 cell array
```

```
{1×2 double}
{1×2 double}
```

```
signames =
 1x2 cell array
 {'Signal 1'} {'Signal 2'}
groupnames =
 1x1 cell array
 {'Group 1'}
```

The Signal Builder block contains two signals in one group. Alter the second signal in the group.

```
signalbuilder(block, 'set', 2, 1, [0 5], [2 0]);
```

To make this same change using the signal name and group name:

```
signalbuilder(block, 'set', 'Signal 2', 'Group 1', [0 5], [2 0])
```

### **Create Signal Builder Block and Delete Group**

Create a Signal Builder block with two signal groups and delete one of the groups.

```
block = signalbuilder([], 'create', [0 2], {[0 1],[1 0]});
```

The Signal Builder block has two groups, each of which contains a signal.

To delete the second group, also delete its signal.

```
signalbuilder(block, 'set', 1, 2, [], [])
```

### **Create Signal Builder Block with Two Groups**

Create a Signal Builder block with two groups, each of which contains three signals.

```
block = signalbuilder([], 'create', [0 1], ...
 {[0 0],[1 1];[1 0],[0 1];[1 1],[0 0]});
```

### **Create Signal Builder Block and Append Signal Groups**

Create a Signal Builder block in a new model editor window.

```
block = signalbuilder([], 'create', {[0 10],[0 20]},{[6 -6],...
 [2 5]});
```

The Signal Builder block has two groups. Each group contains one signal.

Append a new signal group to the existing block.

```
block = signalbuilder(block, 'appendgroup', [0 30],[10 -10]);
```

Append a new signal, sig3, to all groups.

```
signalbuilder(block, 'appendsignal', [0 30], [0 10], 'sig3');
```

### Create Signal Builder Block and Delete Signal Group

Create a Signal Builder block in a new model editor window.

```
time = [0 1];
data = {[0 0], [1 1]; [1 0], [0 1]; [1 1], [0 0]};
block = signalbuilder([], 'create', time, data);
```

The Signal Builder block has two groups. Each group contains three signals.

Delete the second group. To delete a signal group, also delete all the signals in the group.

```
signalbuilder(block, 'set', [1,2,3], 'Group 2', []);
```

### Create Signal Builder Block and Hide Signal

Create a Signal Builder block in a new model editor window and hide signal.

```
block = signalbuilder([], 'create', [0 5], {[2 2]; [0 2]});
```

The Signal Builder block has one group that contains two signals.

Hide the signal, Signal 1.

```
signalbuilder(block, 'hidesignal', 'Signal 1', 'Group 1')
```

Signal 1 is no longer visible in the Signal Builder block.

Make Signal 1 visible again.

```
signalbuilder(block, 'showsignal', 'Signal 1', 'Group 1')
```

### Create Two Signal Builder Blocks

Create two Signal Builder blocks in new model editor windows.

```
block = signalbuilder([], 'create', [0 5], {[2 2]; [0 2]});
block1 = signalbuilder('untitled/Signal Builder1', 'create', [1 2], {[1 2]; [0 10]});
```

Get a dataset for group 1 of block.

```
ds=signalbuilder(block, 'get', 1);
```

Get a dataset for group 1 of block1.

```
ds1=signalbuilder(block1, 'get', 1);
```

Set the dataset for group 1 of block to ds1.

```
signalbuilder(block, 'set', 1, ds1);
```

Append the original dataset for group 1 of block (ds) to block.

```
signalbuilder(block, 'appendgroup', ds);
```

To create a third group in `block`, append `ds1` to the end of the groups in `block`.

```
signalbuilder(block, 'appendgroup', ds1);
```

## Input Arguments

### **block** — Signal Builder block path or handle

[] (default) | block handle | block name

Signal Builder block handle or name. If you specify [] for this argument, the block has the path 'untitled/Signal Builder'.

Example: 'untitled/Signal Builder'

Example: `block_handle = gcbh`

Data Types: `char` | `string`

### **time** — Time

row vector | column cell vector | row cell vector | cell matrix

Specify `time` format depending on the block configuration.

If `data` is a cell array and `time` is a vector, the `time` values are duplicated for each element of `data`. Each vector within `time` and `data` must be the same length and have at least two elements. If `time` is a cell array, all elements in a column must have the same initial and final value.

| Configuration       | Time Format                                                                                                 |
|---------------------|-------------------------------------------------------------------------------------------------------------|
| 1 signal, 1 group   | Row vector of break points.                                                                                 |
| >1 signal, 1 group  | Column cell vector where each element corresponds to a separate signal and contains a row vector of points. |
| 1 signal, >1 group  | Row cell vector where each element corresponds to a separate group and contains a row vector of points.     |
| >1 signal, >1 group | Cell matrix where each element (i, j) corresponds to signal i and group j.                                  |

### Dependencies

If `signalbuilder` is called for an existing block, the `time` argument must have the same number of signals as the existing block.

Data Types: `double`

### **data** — Data

row vector | column cell vector | row cell vector | cell matrix

Specify `data` format depending on the block configuration.

If `data` is a cell array and `time` is a vector, the `time` values are duplicated for each element of `data`. Each vector within `time` and `data` must be the same length and have at least two elements. If `time` is a cell array, all elements in a column must have the same initial and final value.

| Configuration       | Time/Data Format                                                                                            |
|---------------------|-------------------------------------------------------------------------------------------------------------|
| 1 signal, 1 group   | Row vector of break points.                                                                                 |
| >1 signal, 1 group  | Column cell vector where each element corresponds to a separate signal and contains a row vector of points. |
| 1 signal, >1 group  | Row cell vector where each element corresponds to a separate group and contains a row vector of points.     |
| >1 signal, >1 group | Cell matrix where each element (i, j) corresponds to signal i and group j.                                  |

Data Types: double

### **config** – Configuration structure name

structure name

Configuration structure containing instructions to display signal group information on the block mask. Set up the structure with one or more of these fields before you print.

| Field          | Description                                                                                                                               | Example Value      |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------|--------------------|
| groupIndex     | Scalar specifying index of signal group to print                                                                                          | 2                  |
| timeRange      | Two-element vector specifying the time range to print (must not exceed the block's time range)                                            | [3 6]              |
| visibleSignals | Vector specifying index of signals to print                                                                                               | [1 2]              |
| yLimits        | Cell array specifying limits for each signal's y-axis                                                                                     | {[-1 1],<br>[0 1]} |
| extent         | Two-element vector of the form:<br>[width, height]<br><br>specifying the dimensions (in pixels) of the area in which to print the signals | [500 300]          |
| showTitle      | Logical value specifying whether to print a title:<br>true (1) prints the title                                                           | false              |

For example, to print just group 2 using a configuration structure, `configstruct`, set up the structure as follows. You do not need to specify any other fields.

```
configstruct.groupIndex=1
```

Example: `configstruct`

Data Types: char | string

### 'create' – Create directive

'create'

Create new Signal Builder block.

Data Types: char | string

### signames – Signal names

Signal 1 (default) | ' ' | {} | character vector | cell array of character vectors

Signal names, specified as ' ', {}, a character vector, or cell array of character vectors.

If you specify a value of ' ' or {}, the function uses existing signal names for the new groups.

Data Types: char | string

**groupnames — Signal group names**

Group 1 (default) | character vector | cell array of character vectors

Group names, specified as a character vector or cell array of character vectors.

Data Types: char | string

**path — Block path**

[] (default) | full block path

Block path, specified as full block path. To create a Signal Builder block in a new model, untitled, with the name Signal Builder, specify [].

Data Types: char | string

**vis — Signal visibility**

matrix

Signal visibility, specified as a matrix. The Signal Builder block displays signals in each group based on the values of the matrix vis. This matrix must be the same size as the cell array, data. You cannot create Signal Builder blocks in which all signals are invisible. For example, if you set the vis parameter for all signals to 0, the first signal is still visible.

Data Types: double

**pos — Block position in model**

[0 0] (default) | [x y right bottom]

Block position in model, specified as [x y right bottom].

Data Types: double

**openui — Open Signal Builder block dialog box**

0 (default) | 1

Open Signal Builder block dialog upon creation by signalbuilder function, specified as 0 or 1.

Data Types: double

**openmodel — Open model**

1 (default) | 0

Open model upon creation by signalbuilder function, specified as one of:

- 0 — Load the model but do not open it.
- 1 — Open the model.

Data Types: double

**'appendsignal' — Append signals**

'appendsignal' (default)

Append new signals to all signal groups in the Signal Builder block. You can append either the same signals to all groups, or append different signals to different groups. Regardless of which signals you append, append the same number of signals to all the groups. Append signals to all the groups in the block. You cannot append signals to a subset of the groups.

Data Types: `char` | `string`

### **'appendgroup' — Append new signal group**

`'appendgroup'`

Append new signal groups whose number of time and signal elements are the same as existing signal groups in the Signal Builder block.

For the `showsignal` and `hidesignal` methods, if you do not specify a value for the `group` argument, `signalbuilder` applies the operation to all the signals and groups.

Data Types: `char`

### **'set' — Set values**

`'set'`

Set values based on input arguments.

- `time` and `data` — Return time and data values.
- `ds` — Return `Simulink.SimulationData.Dataset` object(s).

Data Types: `char`

### **'get' — Get values**

`'get'`

Get values based on output arguments.

- `[time, data]` — Return time and data values.
- `[ds, ...dsN]` — Return `Simulink.SimulationData.Dataset` object(s).

Data Types: `char` | `string`

### **'showsignal' — Make signal visible**

`'showsignal'`

Make one or more signals visible in a signal group. If no group is specified, all the signals and groups are visible.

Data Types: `char` | `string`

### **'hidesignal' — Hide signal**

`'hidesignal'`

Hide one or more signals in a signal group. If no group is specified, all the signals and groups are hidden.

Data Types: `char`

### **ds — Dataset**

`timeseries` data elements | 1-D scalar data value at each time | nonempty data and/or time | empty values

Dataset of timeseries elements, specified as a `Simulink.SimulationData.Dataset` object.

Data Types: `double`

### **ds1 ... dsN — Multiple datasets**

vectors of timeseries data elements | vectors of 1-D scalar data value at each time | nonempty data and/or time

One or more datasets of timeseries elements, specified as `Simulink.SimulationData.Dataset` objects.

Example: `[ds1 ds2 ds3]`

Data Types: `double`

### **signal — Signal**

signal name | scalar index | array of signal indices

Signal, specified as a signal name, scalar index, or array of signal indices.

Data Types: `char` | `double` | `string`

### **group — Signal group**

group name | scalar index | array of group indices

Signal group, specified as a group name, scalar index, or array of group indices.

Data Types: `char` | `double` | `string`

### **index — Group index**

active group index

Active signal group index.

Data Types: `double`

### **'activegroup' — Get active group**

`'activegroup'`

Get currently active signal group.

Data Types: `char` | `string`

### **'annotategroup' — Display active signal group name**

`'on'` (default) | `'off'`

Display active signal group name on Signal Builder block mask:

- `'on'` — Display active signal group names on block mask.
- `'off'` — Do not display active signal group names on block mask.

Data Types: `char` | `string`

### **'print' — Print signal group**

`'print'`

Print signal group.

Data Types: `char` | `string`

**printArgs — Configure print options**

[] | print function arguments

Configure print options (see print).

To print the entire contents of the Signal Builder block, specify [].

Data Types: char | string

**'figure' — Figure**

'figure'

Create a figure containing contents of Signal Builder block.

Data Types: char | double | string

**Output Arguments****time — Time**

row vector | column cell vector | row cell vector | cell matrix

Time for the Signal Builder block, returned as row vector, column cell vector, row cell vector, or cell matrix. For the Signal Builder block, time is the x-coordinate.

time returns in different formats depending on the block configuration.

| Configuration       | Time Format                                                                                                 |
|---------------------|-------------------------------------------------------------------------------------------------------------|
| 1 signal, 1 group   | Row vector of break points.                                                                                 |
| >1 signal, 1 group  | Column cell vector where each element corresponds to a separate signal and contains a row vector of points. |
| 1 signal, >1 group  | Row cell vector where each element corresponds to a separate group and contains a row vector of points.     |
| >1 signal, >1 group | Cell matrix where each element (i, j) corresponds to signal i and group j.                                  |

**data — Data**

row vector | column cell vector | row cell vector | cell matrix

Data of the Signal Builder block, returned as a one-dimensional array. For the Signal Builder block, time is the y-coordinate.

data takes different formats depending on the block configuration.

| Configuration       | Data Format                                                                                                 |
|---------------------|-------------------------------------------------------------------------------------------------------------|
| 1 signal, 1 group   | Row vector of break points.                                                                                 |
| >1 signal, 1 group  | Column cell vector where each element corresponds to a separate signal and contains a row vector of points. |
| 1 signal, >1 group  | Row cell vector where each element corresponds to a separate group and contains a row vector of points.     |
| >1 signal, >1 group | Cell matrix where each element (i, j) corresponds to signal i and group j.                                  |

Datasets must have the same number of elements as the signals in a signal group. Dataset format limitations for the `set`, `append`, and `appendgroup` functions include:

- Elements must be MATLAB timeseries data.  
Timeseries data and/or time cannot be empty.
- Timeseries data must be of type double.
- Timeseries data must be 1-D (scalar value at each time).

**signames — Signal names**

character vector | cell array of character vectors

Signal names, returned as a character vector or cell array of character vectors.

**block — Signal Builder block path or handle**

block handle

Signal Builder block path or handle, returned by block creation or append commands.

**ds — Dataset**

timeseries data elements | 1-D scalar data value at each time | nonempty data and/or time

Dataset of timeseries elements, returned as a `Simulink.SimulationData.Dataset` object.

**ds, ...dsN — Multiple datasets**

vectors of timeseries data elements | vectors of 1-D scalar data value at each time | nonempty data and/or time

One or more datasets of timeseries elements, returned as `Simulink.SimulationData.Dataset` objects.

**index — Group index**

active group index

Active signal group index.

**activeGroupLabel — Active group label**

index

Active group label, returned as an index.

**figh — Figure handle**

handle

Figure handle, returned when contents of Signal Builder block are printed to the hidden figure.

## More About

### Interpolating Missing Data Values

When specifying a periodic signal such as a Sine Wave, the `signalbuilder` function uses linear Lagrangian interpolation to compute data values for time steps that occur between time steps for which the `signalbuilder` function supplies data. When specifying periodic signals, specify them as a time vector that is defined as multiples of sample time, for example:

```
t = 0.2*[0:49]';
```

## Version History

**Introduced in R2007a**

**signalbuilder Function is not Recommended**

*Not recommended starting in R2019a*

The signalbuilder function is not recommended. Use the signalEditor function instead.

“Signal Groups”

# signalEditor

Start Signal Editor

## Syntax

```
signalEditor
signalEditor(Name,Value)
```

## Description

`signalEditor` starts Signal Editor without an associated model.

`signalEditor(Name,Value)` starts signal Editor using additional options specified by one or more name-value pair arguments.

Specify optional comma-separated pairs of `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes ( ' '). You can specify the name and value pair arguments in any order as `Name1,Value1, . . . ,NameN,ValueN`.

- `Model` - Model name, specified as a character array, for which Signal Editor is to start. You can specify one model per call to the `signalEditor` function.

---

**Note** Load the model before starting Signal Editor for it.

---

- `DataSource` - Data set name, specified as a character array, to be edited. You can specify one data set file per call to the `signalEditor` function.

---

**Note** You can start multiple sessions of Signal Editor for the same model. However, you can associate a data set file with only one Signal Editor at a time. A data set file cannot have multiple Signal Editor sessions associated with it.

---

To add a scenario to the Signal Editor interface, select **Scenario** from the **Insert** section of the Signal Editor toolstrip.

## Examples

### Start Signal Editor for a Model

Start the Signal Editor for the model, `slexAutotransRootInportsExample`.

Load the `slexAutotransRootInportsExample` model, then start Signal Editor for it.

```
openExample('slexAutotransRootInportsExample')
signalEditor('Model','slexAutotransRootInportsExample');
```

### **Start Signal Editor to Edit a Data Set File**

Start Signal Editor to edit myFile.mat.

```
signalEditor('DataSource', 'myFile.mat');
```

### **Start Signal Editor and Data Set File for a Model**

Load the slxAutotransRootInportsExample model, then start Signal Editor for the model, and edit myFile.mat.

```
openExample('slxAutotransRootInportsExample')
signalEditor('Model', 'slxAutotransRootInportsExample', 'DataSource', 'myFile.mat');
```

## **Version History**

**Introduced in R2017b**

### **See Also**

## sim

Simulate Simulink model

### Syntax

```
simOut = sim(simIn)
simOut = sim(simIn,Name,Value)

simOut = sim(modelName)
simOut = sim(modelName,Name,Value)
simOut = sim(modelName,paramStruct)
simOut = sim(modelName,configSet)
```

### Description

#### Simulink.SimulationInput Object Syntax

`simOut = sim(simIn)` runs one or more simulations of a Simulink model according to the properties defined on one or more `Simulink.SimulationInput` objects.

- If `simIn` is a scalar `Simulink.SimulationInput` object, then `simOut` is a scalar `Simulink.SimulationOutput` object.
- If `simIn` is an array of `Simulink.SimulationInput` objects, then `simOut` is an array of `Simulink.SimulationOutput` objects.

You can use a `SimulationInput` object to configure options and inputs for simulations, including:

- The model to simulate
- Source variables or files for external input data
- Block parameter values to use for the simulation
- Model configuration parameter values to use for the simulation

When a property of the `SimulationInput` object modifies a model or block parameter value, the value is modified during simulation and reverted at the end of the simulation.

When you configure programmatic simulations using `SimulationInput` objects, you can easily transition from using the `sim` function to using other functions, such as `parsim` and `batchsim`.

`simOut = sim(simIn,Name,Value)` simulates a model according to the properties defined on the `Simulink.SimulationInput` object `simIn` with additional options specified using one or more name-value arguments.

For a list of name-value arguments supported for the `Simulink.SimulationInput` syntax, see “`Simulink.SimulationInput` Object Syntax” on page 2-0 .

#### Model Name Syntax

`simOut = sim(modelName)` simulates the model specified by `modelName` using the current configuration parameter and block parameter values for the model.

- If the model has the **Single simulation output** parameter enabled, `simOut` is a `Simulink.SimulationOutput` object.
- If the model does not have the **Single simulation output** parameter enabled, `simOut` is a vector that contains the simulation times. For more information, see “Returning multiple output arguments not recommended” on page 2-422.

`simOut = sim(modelName,Name,Value)` simulates the model specified by `modelName` with options specified using one or more name-value arguments. For example, you can modify a model configuration parameter value for the simulation by specifying the parameter name and value as a name-value argument.

When you modify model configuration parameters by providing inputs to the `sim` function, the changes are applied during simulation and reverted at the end of the simulation.

For a list of name-value arguments supported for the model name syntax, see “Model Name Syntax” on page 2-0 .

`simOut = sim(modelName,paramStruct)` simulates the model specified by `modelName` using the model configuration parameter values specified by the structure `paramStruct`.

`simOut = sim(modelName,configSet)` simulates the model specified by `modelName` using model configuration parameter values in the configuration set `configSet`.

## Examples

### Set Block Parameters for Simulation Using `Simulink.SimulationInput` Object

Modify the parameter values for blocks in a model using a `SimulationInput` object.

Open the model.

```
openExample("simulink_general/sl-demo_househeatExample")
```

Create a `SimulationInput` object for this model.

```
mdl = "sl-demo_househeat";
simIn = Simulink.SimulationInput(mdl);
```

Change the set point for the thermostat to 300 by modifying the **Value** parameter for the Set Point block.

```
simIn = setBlockParameter(simIn,"sl-demo_househeat/Set Point",...
 "Value","300");
```

Simulate the model.

```
out = sim(simIn);
```

### Simulate Model with Current Parameter Settings

Simulate the model `vdp` in its present state, whether the model is not loaded yet or is loaded with unsaved changes.

```
simOut = sim("vdp");
```

### Simulate Model with Options Specified in Structure

Simulate the model vdp using model configuration parameter values specified in a structure.

Create the structure paramStruct. Configure the model to log states using the variable name xoutNew.

```
paramStruct.SaveState = 'on';
paramStruct.StateSaveName = 'xoutNew';
```

Add more fields to the structure to configure the model to log outputs using the variable name youtNew.

```
paramStruct.SaveOutput = 'on';
paramStruct.OutputSaveName = 'youtNew';
```

Simulate the model using the options specified in the structure.

```
simOut = sim('vdp',paramStruct)

simOut =
 Simulink.SimulationOutput:

 xoutNew: [64x2 double]
 youtNew: [64x2 double]

 SimulationMetadata: [1x1 Simulink.SimulationMetadata]
 ErrorMessage: [0x0 char]
```

### Simulate Model Using Simulink.Configset Object

Open the model vdp and get the Simulink.ConfigSet object for the active configuration.

```
mdl = "vdp";
open_system(mdl)
cs = getActiveConfigSet(mdl);
```

Create a copy of the Simulink.ConfigSet object. Then, use the set\_param function to modify parameter values in the configuration set. Configure the parameters in the ConfigSet object to:

- Use an absolute tolerance of 1e-5
- Log states using the variable name xoutNew
- Log outputs using the variable name youtNew

```
csNew = copy(cs);
set_param(csNew, "AbsTol", "1e-5", ...
 "SaveState", "on", "StateSaveName", "xoutNew", ...
 "SaveOutput", "on", "OutputSaveName", "youtNew")
```

Simulate the model using the modified Simulink.ConfigSet object.

```

simOut = sim mdl,csNew)

simOut =
 Simulink.SimulationOutput:

 xoutNew: [65x2 double]
 youtNew: [65x2 double]

 SimulationMetadata: [1x1 Simulink.SimulationMetadata]
 ErrorMessage: [0x0 char]

```

## Input Arguments

### **simIn** — Simulation configuration

Simulink.SimulationInput object

Simulation configuration, specified as a Simulink.SimulationInput object. The properties of the SimulationInput object specify options and parameter values to use in the simulation, including:

- The model to simulate
- Source variables or files for external input data
- Block parameter values to use for the simulation
- Model configuration parameter values to use for the simulation

The values defined in the properties of the SimulationInput object are applied to the model for the simulation and reverted at the end of simulation.

### **modelName** — Model to simulate

string | character vector

Model to simulate, specified as a string or a character vector.

Example: `simOut = sim("vdp")` simulates the model named `vdp` using the parameter values currently configured in the model.

Data Types: char | string

### **paramStruct** — Model configuration to simulate

structure

Model configuration to simulate, specified as a structure. The fields of the structure are the names of model configuration parameters. The value for each field indicates the parameter value to use in simulation. For example, to simulate a model from a start time of 5 to a stop time of 10, create this structure:

```

paramStruct.StartTime = "5";
paramStruct.StopTime = "10";

```

Data Types: struct

### **configSet** — Model configuration to simulate

Simulink.Configset object

Model configuration to simulate, specified as a Simulink.ConfigSet object.

## Name-Value Arguments

Specify optional pairs of arguments as `Name1=Value1, . . . , NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose `Name` in quotes.*

Example: `simOut = sim(simIn,"UseFastRestart","on")` runs a set of simulations configured using an array of `Simulink.SimulationInput` objects with fast restart enabled.

Example: `simOut = sim(modelName,"Solver","ode15s","StopTime","30")` configures a simulation of the model specified by `modelName` to use the `ode15s` solver with a stop time of 30.

The `sim` function supports different name-value arguments depending on whether you specify the first input as a `Simulink.SimulationInput` object or as the name of the model to simulate. In addition to the arguments listed on this page, you can specify values for model configuration parameters using inputs to the `sim` function.

- When the first input argument is a `Simulink.SimulationInput` object, configure model parameter values for the simulation on the input object using the `setModelParameter` function.
- When the first input argument is the model name, specify any model configuration parameter as a name-value argument.

### Simulink.SimulationInput Object Syntax

#### UseFastRestart — Option to enable fast restart

'off' (default) | 'on'

Option to enable fast restart, specified as 'off' or 'on'. Fast restart reduces the time required to run a set of simulations by skipping the compilation and termination phases when appropriate. Consider using fast restart when you run multiple simulations of the same model.

For more information, see “How Fast Restart Improves Iterative Simulations”.

This argument is supported only when you specify the first input argument for the `sim` function as a `Simulink.SimulationInput` object.

Example: `sim(simIn,"UseFastRestart","on")`

Data Types: `char` | `string`

#### StopOnError — Option to stop process that started simulation when error occurs

'off' | 'on'

Option to stop process that started simulation when error occurs, specified as 'off' or 'on'.

- 'off' — When an error occurs in a simulation, that simulation stops and the process that started the simulation continues. For example, when you run a set of simulations using an array of `Simulink.SimulationInput` objects, if the first simulation encounters an error, that simulation stops and subsequent simulations still run.
- 'on' — When an error occurs in a simulation, that simulation and the process that started the simulation both stop. For example, when you run a set of simulations using an array of `Simulink.SimulationInput` objects, if the first simulation encounters an error, that simulation stops and subsequent simulations do not run.

This argument is supported only when you specify the first input argument for the `sim` function as a `Simulink.SimulationInput` object.

Example: `sim(simIn,"StopOnError","on")`

#### Tips

- When you specify the name of the model as the first input argument for the `sim` function, configure this behavior using the `CaptureErrors` name-value argument.
- When an error does not stop the process that started a simulation, error message information is captured in the `Simulink.SimulationOutput` object and the `Simulink.SimulationMetadata` object.
  - To view the message, use the `ErrorMessage` property of the `SimulationOutput` object.
  - For more information about the error, use the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object. The `ErrorDiagnostic` field includes information about the error, including the simulation phase where the error occurred.

Data Types: `char` | `string`

#### ShowProgress — Option to indicate simulation progress

`'off'` | `'on'`

Option to indicate simulation progress, specified as `'off'` or `'on'`.

- `'off'` — Simulations run without displaying progress messages.
- `'on'` — Progress updates are displayed as simulations progress.

This option is useful when you run multiple simulations using an array of `Simulink.SimulationInput` objects.

This argument is supported only when you specify the first input argument for the `sim` function as a `Simulink.SimulationInput` object.

Example: `sim(simIn,"ShowProgress","on")`

#### ShowSimulationManager — Option to open Simulation Manager

`'off'` (default) | `'on'`

Option to open Simulation Manager, specified as `'off'` or `'on'`. Use the **Simulation Manager** to monitor the progress of simulations you run. Consider using the Simulation Manager when you run multiple simulations using an array of `Simulink.SimulationInput` objects.

This argument is supported only when you specify the first input argument for the `sim` function as a `Simulink.SimulationInput` object.

Example: `sim(simIn,"ShowSimulationManager","on")`

#### Model Name Syntax

#### CaptureErrors — Option to continue process that started simulation if error occurs

`'off'` (default) | `'on'`

Option to continue process that started simulation if error occurs, specified as `'off'` or `'on'`. By default, when you run a simulation using the `sim` function and specify the name of the model as the first input:

- Errors are reported in the MATLAB Command Window.
- Both the simulation and the process that invoked the simulation stop when the error occurs.
- The error message is not captured in the `Simulink.SimulationOutput` object or `Simulink.SimulationMetadata` object.

When you specify `CaptureErrors` as 'on', errors are reported only in the simulation outputs. The execution of the simulation with the error stops, but if the simulation was invoked by another process, that process continues. For example, when you run multiple simulations in a loop, if you specify `CaptureErrors` as 'on', subsequent simulations continue to run following a simulation with an error.

This argument is supported only when you specify the first input argument for the `sim` function as the name of the model to simulate.

Example: `sim("myModel", "CaptureErrors", "on")`

### Tips

- This option is not supported for software-in-the-loop (SIL) and processor-in-the-loop (PIL) simulations.
- When you specify one or more `Simulink.SimulationInput` objects as input to the `sim` function, configure this behavior using the `StopOnError` name-value argument.
- When you specify `CaptureErrors` as 'on', error message information is captured in the `Simulink.SimulationOutput` object and the `Simulink.SimulationMetadata` object.
  - To view the message, use the `ErrorMessage` property of the `SimulationOutput` object.
  - For more information about the error, use the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object. The `ErrorDiagnostic` field includes information about the error, including the simulation phase where the error occurred.

Data Types: `char` | `string`

### Debug — Option to start simulation in debug mode

'off' (default) | 'on'

Option to start simulation in debug mode, specified as 'off' or 'on'.

This argument is supported only when you specify the first input argument for the `sim` function as the name of the model to simulate.

Example: `sim("modelName", "Debug", "on")`

Data Types: `char` | `string`

### RapidAcceleratorUpToDateCheck — Option to disable rebuilding rapid accelerator target

'on' (default) | 'off'

Option to disable rebuilding rapid accelerator target, specified as 'on' or 'off'. When you specify this argument as 'on', changes that require rebuilding the rapid accelerator target are ignored. When you use this option, modify only options that do not require rebuilding the rapid accelerator target.

This argument is supported only when you specify the first input argument for the `sim` function as the name of the model to simulate.

Example: `sim("modelName", "RapidAcceleratorUpToDateCheck", "off")`

### Tips

To specify this option for a simulation configured using a `Simulink.SimulationInput` object, use the `setModelParameter` function.

```
simIn = Simulink.SimulationInput("myModel");
simIn = setModelParameter(simIn, "RapidAcceleratorUpToDateCheck", "off");
```

Data Types: `char` | `string`

### Timeout — Maximum simulation run time

positive scalar

Maximum simulation run time, specified as a positive scalar. Specify the time, in seconds, to allow the simulation to run. If the simulation runs for longer than the value you specify, the software issues a warning and stops the simulation. For example, if you specify `Timeout` as 30, the software stops the simulation and issues a warning if computing simulation results takes more than 30 seconds.

The `Timeout` parameter specifies a limit on the amount of clock time for a simulation to run. To specify the maximum time value to simulate, use the **Stop time** parameter.

This argument is supported only when you specify the first input argument for the `sim` function as the name of the model to simulate.

Example: `sim("modelName", "Timeout", 60)` configures a simulation to run for a maximum duration of 60 seconds.

### Tips

To specify this option for a simulation configured using a `Simulink.SimulationInput` object, use the `setModelParameter` function.

```
simIn = Simulink.SimulationInput("modelName");
simIn = setModelParameter(simIn, "Timeout", 60);
```

### Trace — Option to display summary of parameters before simulation

'siminfo'

Option to display summary of parameters before simulation, specified as 'siminfo'.

This argument is supported only when you specify the first input argument for the `sim` function as the name of the model to simulate.

Example: `sim("modelName", "Trace", "siminfo")`

Data Types: `char` | `string`

## Output Arguments

### simOut — Simulation outputs

`Simulink.SimulationOutput` object | array of `Simulink.SimulationOutput` objects | vector

Simulation outputs, returned as a `Simulink.SimulationOutput` object, an array of `Simulink.SimulationOutput` objects, or a vector. The `Simulink.SimulationOutput` object contains all data logged from simulation as well as metadata about the simulation, including timing information and diagnostics.

When you specify only the model name as an input argument and the model you simulate has the **Single simulation output** parameter disabled, the output from the `sim` function is a vector of simulation times. For the `sim` function to return results in a consistent format for any syntax, save the model with the **Single simulation output** parameter enabled.

## Tips

- To ensure the `sim` function returns results in the same format regardless of which input arguments you specify, save your model with the **Single simulation output** parameter enabled. With this option enabled, simulation results are returned as a `Simulink.SimulationOutput` that contains all logged data as well as simulation metadata, including timing information and diagnostics. Analyzing results from multiple simulations is easier when all simulation data and metadata is stored in a single object.
- To get a list of model configuration parameters, use the `getActiveConfigSet` function and the `get_param` function. For example, to see the configuration parameters for the model `vdp`, enter these commands in the MATLAB Command Window.

```
configSet = getActiveConfigSet("vdp");
configSetNames = get_param(configSet,"ObjectParameters")
```

The return from the `get_param` function lists the model configuration parameters such as `StopTime`, `SaveTime`, `SaveState`, `SaveOutput`, and `SignalLogging`.

- When you simulate a model hierarchy, model configuration parameters you specify as input arguments to the `sim` function apply to the top model.
- When you run a simulation using the `sim` function, the simulation runs until an error occurs or the simulation reaches the specified stop time. To programmatically run an interactive simulation that you can pause and continue programmatically, use the `set_param` function with the `SimulationCommand` input argument. For more information, see “Run Simulations Programmatically”.
- When you simulate a model with infinite stop time, stop the simulation from the MATLAB Command Window by pressing **Ctrl+C**. The simulation stops, and simulation results are not saved in the MATLAB workspace.
- Configure logging for time, states, and outputs using the Configuration Parameters dialog box. On the **Modeling** tab, under **Setup**, click **Model Settings**. Then, in the Configuration Parameters dialog box, select **Data Import/Export**.
- To log signals throughout a model, use signal logging or logging blocks such as the To Workspace block or the Record, XY Graph block. For more information about signal logging, see “Export Signal Data Using Signal Logging”.

## Version History

**Introduced before R2006a**

**Returning multiple output arguments not recommended**

*Not recommended starting in R2009b*

Starting in R2009b, the `sim` function provides enhanced compatibility with parallel computing, including an option to return simulation results as a single simulation object, which simplifies data and variable management. The single simulation output syntax is recommended. Syntaxes that return more than one output argument are not recommended.

To configure a model to always return results as a single output object, use the **Single simulation output** parameter.

To simulate a model programmatically in R2009a and earlier, use this syntax.

```
[T,X,Y1,Y2,Yn] = sim('model',Timespan,Options,UT);
```

Only the `model` input argument is required. When you do not specify other input arguments, the simulation uses the current configuration parameter values for the model. When you specify additional arguments, those arguments override the current values for the model. When you specify an argument as `[]`, the simulation uses the current value in the model for that argument.

The tables describe the input and output arguments and provide information about how to update your code to use syntaxes recommended for R2009b and later.

## Input Argument Descriptions and Replacements

| Input Argument | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Replacement                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

### Output Argument Descriptions and Replacements

| Output Argument    | Description                                         | Replacement                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| T                  | Simulation times, returned as a vector.             | Access time, states, and output data through the <code>Simulink.SimulationOutput</code> object. When you log time, states, and outputs, the <code>SimulationOutput</code> object contains the logged data, which you can access as a property using a dot and the variable name for the logged data. For example, if the <code>SimulationOutput</code> object is returned as <code>simOut</code> , and you save time data to the variable <code>tout</code> :<br><br><code>tout = simOut.tout;</code><br><br>Use the model configuration parameters to specify data to log and the variables names for the logged data.<br><br><ul style="list-style-type: none"> <li>• <b>Time</b></li> <li>• <b>States</b></li> <li>• <b>Output</b></li> </ul> |
| X                  | Logged states, returned as an array or a structure. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Y1, Y2, . . . , YN | Logged outputs, returned as one or more vectors.    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### SrcWorkspace argument not recommended

*Not recommended starting in R2009b*

Starting in R2009b, the `SrcWorkspace` name-value argument is not recommended. Specifying this argument can lead to transparency violations for parallel simulations. Instead of using values defined in a workspace, specify values for simulation as input arguments to the `sim` function.

- Before R2017a, specify parameter values for simulation using a structure that contains fields with names that match the parameter names and values that indicate the value to use for the parameter.

- Starting in R2017a, configure model parameter, block parameter, and variable values using a `Simulink.SimulationInput` object.

# simplot

Redirects to the Simulation Data Inspector

---

**Note** `simplot` will be removed in a future release. Use the Simulation Data Inspector instead.

---

## Syntax

```
simplot
```

## Description

`simplot` redirects to the Simulation Data Inspector and returns empty handles. This function is no longer supported and has been replaced by the Simulation Data Inspector. Use the **Simulation Data Inspector** button in the Simulink Editor to capture simulation output in the Simulation Data Inspector. Programmatically, use the function `Simulink.sdi.view` instead.

`Simulink.sdi.view`

# Simulation Manager

Monitor multiple simulations and visualize the simulation data

## Description

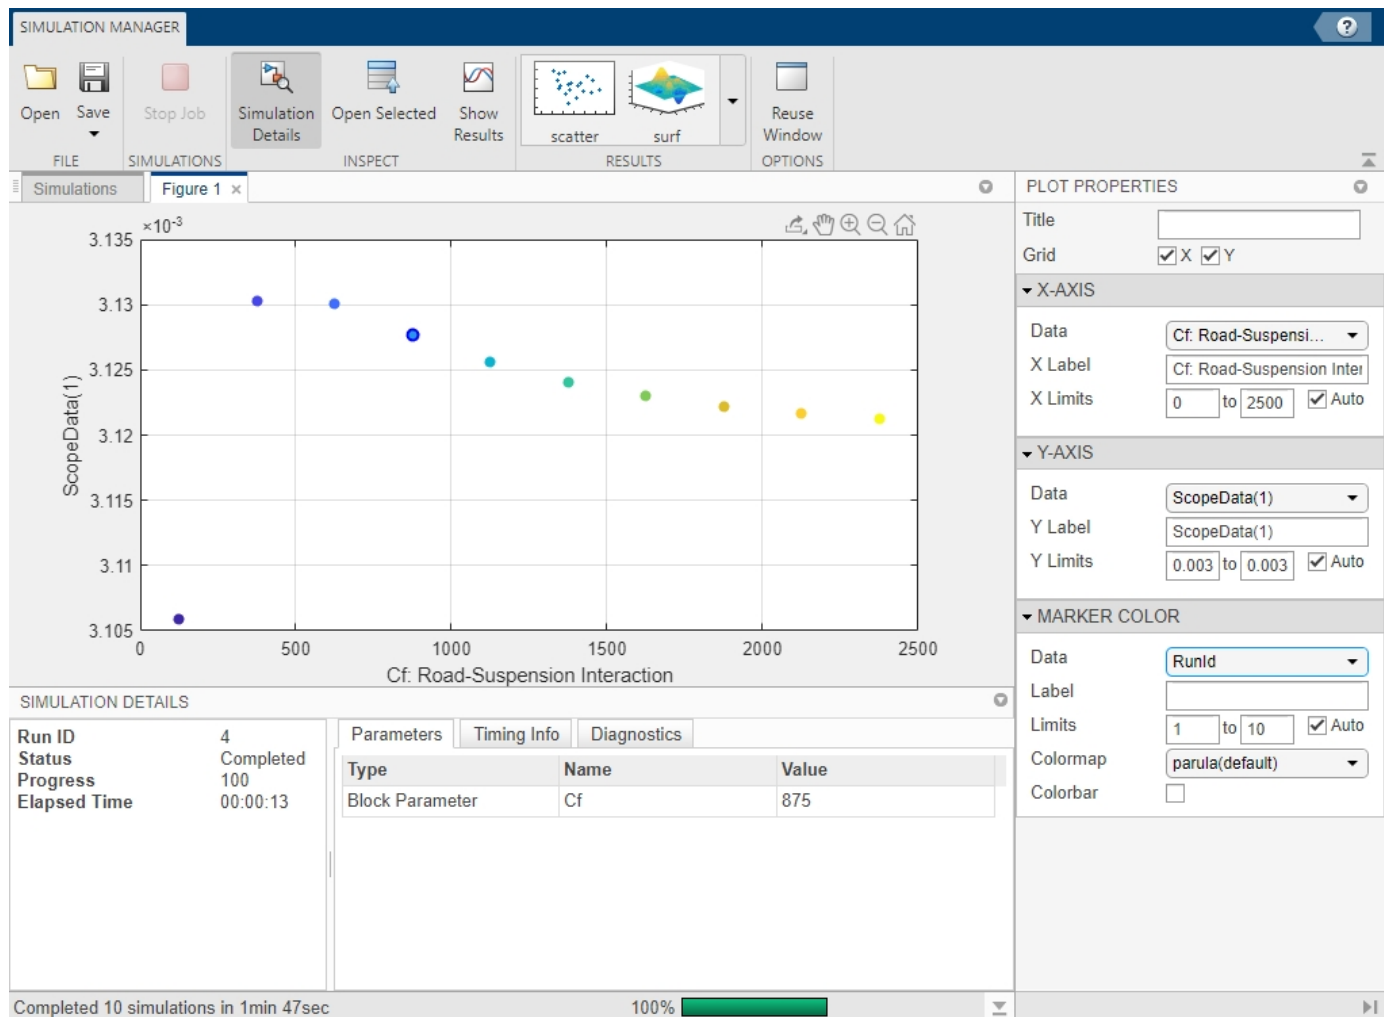

**Simulation Manager** allows you to monitor the status of multiple simulations. Using this tool, you can:

- View the progress of the simulations in a high-level grid view or a detailed list view.
- Find the simulations that error out and view diagnostics for each simulation.
- Visualize simulation data to analyze the trends across the simulations.
- Select a simulation run and open the model in Simulink, with all of the simulation settings applied to the model.
- View simulation results in the Simulation Data Inspector.
- Abort simulations.

The Simulation Manager allows you to monitor multiple simulations, in serial or in parallel, and their progress. You can view the details of every run, such as parameters, elapsed time, and diagnostics. The Simulation Manager provides the option to analyze and compare your logged signal results in the **Simulation Data Inspector**. Through Simulation Manager, you can select a run and apply its values to the model.

With the command line API for running multiple simulations, for the parameter to show up in plots in Simulation Manager use the `setVariable` method on the `Simulink.SimulationInput` object.

## Open the Simulation Manager

- `parsim` and `simfunctions` — Set the argument `ShowSimulationManager` to `on` while using `Simulink.SimulationInput` object to run simulations. For more information, see `Simulink.SimulationInput`.

```
out = parsim(in, 'ShowSimulationManager', 'on')
```

```
out = sim(in, 'ShowSimulationManager', 'on')
```

- To open a saved Simulation Manager session, navigate to the folder where the file is saved and double click the `.mldatx` Simulation Manager file.

```
open filename.mldatx
```

- To open a Simulation Manager with the `Simulink.SimulationInput` object, `in`, and a `Simulink.SimulationOutput` object, `out`, of a completed run, use the `openSimulationManager` command.

```
openSimulationManager(in, out)
```

## Examples

### Open Simulation Manager

Open the model `sldemo_suspn_3dof` and create a set of sweep values.

```
mdl = 'sldemo_suspn_3dof';
openExample(mdl);
Cf_sweep = Cf*(0.05:0.1:0.95);
numSims = length(Cf_sweep);
```

To modify the block parameter **Road-Suspension Interaction** with the sweep values, create an array of `Simulink.SimulationInput` objects.

```
in(1:numSims) = Simulink.SimulationInput(mdl);
for i = 1:numSims
 in(i) = setBlockParameter(in(i), [mdl '/Road-Suspension Interaction'], 'Cf', num2str(Cf_sweep(i)));
end
```

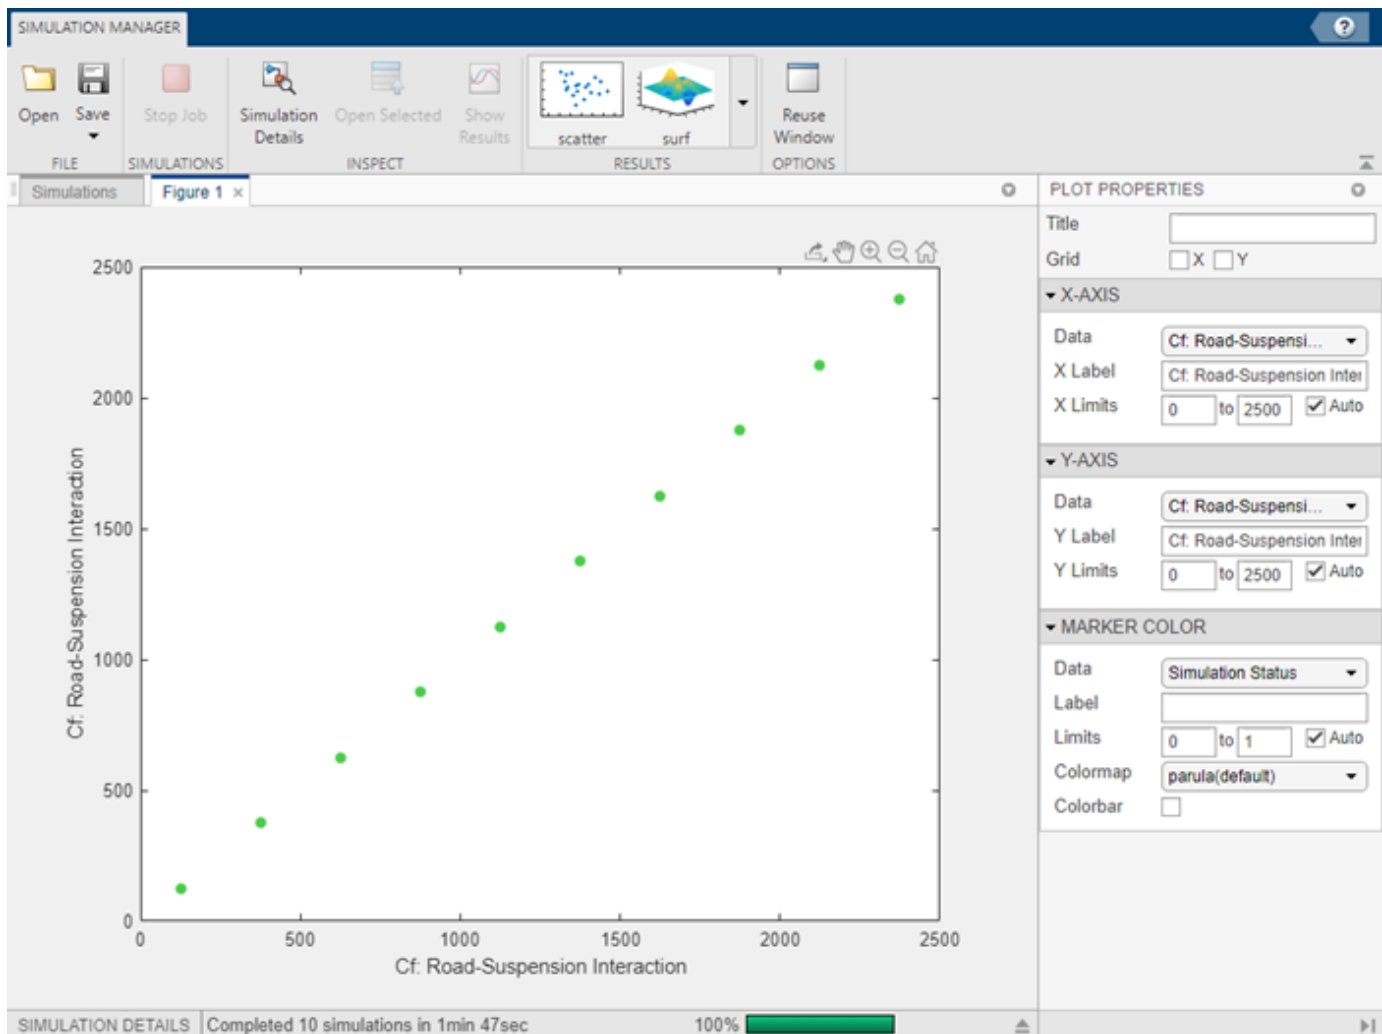

Run multiple simulations and open the Simulation Manager.

```
out = parsim(in, 'ShowSimulationManager', 'on')
```

In the absence of Parallel Computing Toolbox, the simulations run in serial.

### Using Simulation Manager

Once you run the `parsim` command, the Simulation Manager UI opens up as follows:

### Plot results

In the **Figure 1** tab, you can view the default scatter plot where the parameter Cf is plotted against itself. Use the **Plot Properties** to edit the plot. Add grid lines for X and Y by checking the corresponding boxes. You can also change the data that is displayed on X- and Y- axes and the Marker Color. Change the data on y-axis by selecting ScopeData (1) from the **Data** drop-down. Set the Marker Color Data field to RunID.

To add another figure to the Simulation Manager, click **surf** or **scatter** plot and add plots as desired. In this example, click **surf** plot, located in the **Results** section of the toolbar. Drag the **Figure 2** tab to view the two plots together.

Plots in the Simulation Manager support numeric arrays and datasets.

Adding multiple plots to the Simulation Manager enables you to observe the simulation data in different ways. Using the results, you can analyze and study the design space of the parameters and their behavior.

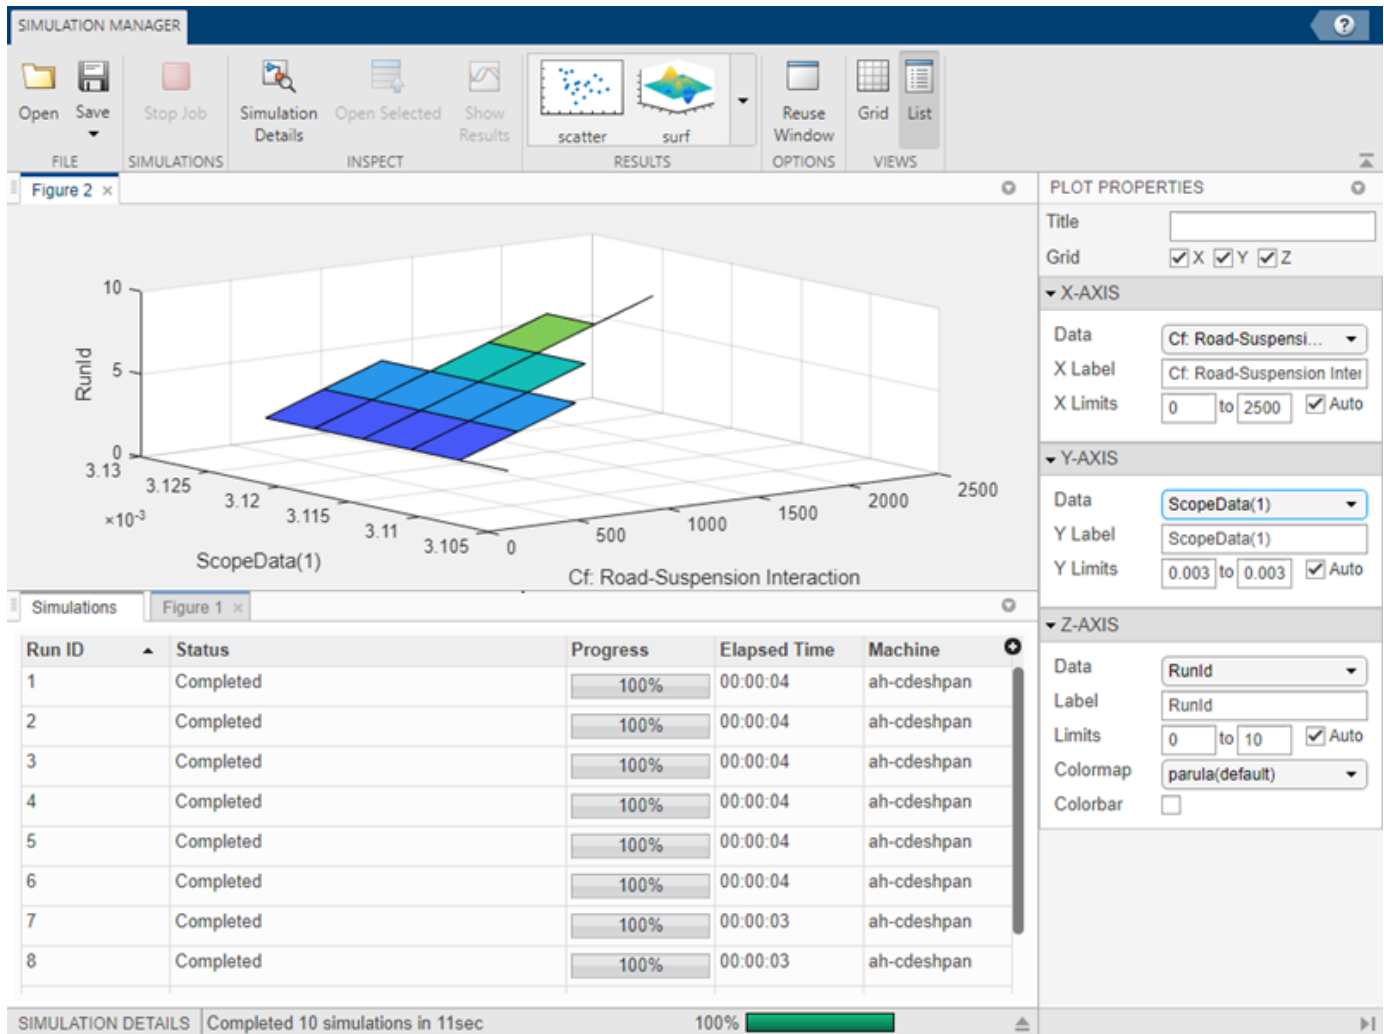

You can modify the configuration of the plot layouts by clicking the down arrow on the right corner of the plot.

- **Tile All** — Choose a layout for multiple plots.
- **Tab Position** — Select where to display the figure tab.

#### **View the Status**

To view the status of the simulations in list and grid views, click the **Simulations** tab next to **Figure 1**. Toggle between the **List** and **Grid** in the **Views** section of the toolbar. The list view shows a tabular view of the simulations with certain details, such as status, parameters and timing information. For large number of simulations, choose grid view for a compact view of the status of the simulations.

The status bar at the bottom of the window shows the progress of the simulations.

You can view all the multiple simulations in a detailed list view. This view gives you an option to add or delete columns. Use the  button to choose which columns to display. You can also sort the columns based on your preference.

Click a specific run to view more details about it.. The simulation details appear at the bottom of the window.

To show or hide the details of the selected simulation, toggle the **Simulation Details** button, .

**Open Selected** button, , allows you to open the model with the specifications of the selected run.

You can view the results of one or more runs in the Simulation Data Inspector by clicking the **Show Results** button, . Clicking **Show Results** creates a Simulation Data Inspector run from the `Simulink.SimulationOutput` object and is displayed in Simulation Data Inspector.

To abort the job while the simulations are running, you can use the **Stop Job** button, .

### Save the Session

To save the Simulation Manager session, click the **Save** button on the toolbar. The saved session contains all the simulation data and the plot configurations and layout. To reopen the saved Simulation Manager session, navigate to the folder where the file is saved and double-click the `.mlatx` Simulation Manager file.

The **Reuse Window**, , button enables you to reuse the plot layout and configurations for new multiple simulations run with a different set of data. If the button is toggled off, a new window opens with each set of simulations. If the button is toggled on, the new simulations reuse the existing window preserving all plot configurations and layouts.

To reopen a saved file, use the **Open** button, navigate to the file location and double click the file.

# simulink

Open Simulink Start Page

## Syntax

```
simulink
```

## Description

`simulink` opens the Simulink Start Page. From the Start Page, choose a model or project template or browse the examples. See “Build and Edit a Model Interactively”.

## Examples

### Open Simulink from MATLAB Command Window

In the MATLAB Command Window, use the `simulink` function.

```
simulink
```

The Simulink Start Page opens.

## Tips

To start Simulink without opening the Library Browser or Start Page, use `start_simulink`, which is faster than `simulink`.

## Version History

**Introduced before R2006a**

### `simulink` function opens Simulink Start Page

*Behavior changed in R2016a*

The behavior of the `simulink` function changed in R2016a. Formerly, it opened the Simulink Library Browser and loaded the Simulink block library.

- To open the Library Browser, use `sLibraryBrowser`.
- To only load the Simulink block library, use this command.

```
load_system simulink
```

## See Also

`start_simulink` | `sLibraryBrowser`

“Modeling”

# simulinkproject

(Not recommended) Open project and get project object

---

**Note** simulinkproject is not recommended. Use currentProject or openProject instead. For more information, see “Compatibility Considerations”.

---

## Syntax

```
simulinkproject
simulinkproject(projectPath)

proj = simulinkproject
proj = simulinkproject(projectPath)
```

## Description

simulinkproject opens the project or brings focus to the tool if it is already open. After you open the tool, you can create projects or access recent projects using the **Project** tab.

simulinkproject(projectPath) opens the project specified by any file or folder under the project root in projectPath and gives focus to the project.

proj = simulinkproject returns a project object proj you can use to manipulate the project at the command line. You need to get a project object before you can use any of the other project functions.

proj = simulinkproject(projectPath) opens the project specified by projectPath and returns a project object.

## Examples

### Open Project Tool

Open the Project Tool.

```
simulinkproject
```

### Open a Project

Specify either the .prj file path or the folder that contains your .SimulinkProject folder and .prj file. The project opens and brings focus to the project.

```
simulinkproject('C:/projects/project1/')
```

## Open a Project and Get a Project Object

Open a specified project and get a project object to manipulate the project at the command line. To avoid your startup script opening windows that take focus away from the MATLAB Desktop, use `start_simulink` instead of the `simulink` function, and use `simulinkproject` with an output argument instead of `uiopen`. If you use `uiopen(myproject.prj)` this calls `simulinkproject` with no output argument and gives focus to the project.

```
start_simulink
proj = simulinkproject('C:/projects/project1/myproject.prj')
```

## Get Airframe Example Project

Open the Airframe project and create a project object to manipulate and explore the project at the command line.

```
sldemo_slproject_airframe
proj = simulinkproject

proj =

 ProjectManager with properties:

 Name: 'Simulink Project Airframe Example'
 Information: [1x1 slproject.Information]
 Dependencies: [1x1 slproject.Dependencies]
 Categories: [1x1 slproject.Category]
 Files: [1x31 slproject.ProjectFile]
 Shortcuts: [1x7 slproject.Shortcut]
 ProjectPath: [1x7 slproject.PathFolder]
 ProjectReferences: [1x0 slproject.ProjectReference]
 StartupFiles: [1x0 slproject.StartupFile]
 ShutdownFiles: [1x0 slproject.ShutdownFile]
 RootFolder: 'C:\slexamples\airframell'
```

## Find Project Commands

Find out what you can do with your project.

```
methods(proj)
```

Methods for class `slproject.ProjectManager`:

```
addFile
addFolderIncludingChildFiles
addPath
addReference
addShortcut
addShutdownFile
addStartupFile
close
createCategory
export
```

```
findCategory
findFile
isLoading
listModifiedFiles
listRequiredFiles
refreshSourceControl
reload
removeCategory
removeFile
removePath
removeReference
removeShortcut
removeShutdownFile
RemoveStartupFile
```

### **Examine Project Properties Programmatically**

After you get a project object using the `simulinkproject` function, you can examine project properties.

Examine the project files.

```
files = proj.Files
```

```
files =
```

```
 1x31 ProjectFile array with properties:
```

```
 Path
 Labels
 Revision
 SourceControlStatus
```

Use indexing to access files in this list. The following command gets file number 14. Each file has properties describing its path, attached labels, and source control information.

```
proj.Files(15)
```

```
ans =
```

```
 ProjectFile with properties:
```

```
 Path: 'C:\slexamples\airframe24\models\DigitalControl.slx'
 Labels: [1x1 slproject.Label]
 Revision: '2'
 SourceControlStatus: Unmodified
```

Examine the labels of the file.

```
proj.Files(15).Labels
```

```
ans =
```

```
 Label with properties:
```

```
File: 'C:\slexamples\airframe24\models\DigitalControl.slx'
DataType: 'none'
```

```
Data: []
Name: 'Design'
CategoryName: 'Classification'
```

Get a particular file by name.

```
myfile = findFile(proj, 'models/AnalogControl.slx')
```

```
myfile =
```

```
ProjectFile with properties:
```

```
Path: 'C:\slexamples\airframe24\models\AnalogControl.slx'
Labels: [1x1 slproject.Label]
Revision: '2'
SourceControlStatus: Unmodified
```

Find out what you can do with the file.

```
methods(myfile)
```

```
Methods for class slproject.ProjectFile:
```

```
addLabel findLabel removeLabel
```

Update the file dependencies.

```
update(proj.Dependencies)
```

The project runs a dependency analysis to update the known dependencies between project files.

For more information on working with project files, including modified files and dependencies, see “Automate Project Tasks Using Scripts”.

## Input Arguments

### **projectPath** — Full path to project file or folder

character vector

Full path to project .prj file, or the path to the project root folder, or any subfolder or file under your project root, specified as a character vector.

Example: 'C:/projects/project1/myProject.prj'

Example: 'C:/projects/project1/'

## Output Arguments

### **proj** — Project

project object

Project, returned as a project object. Use the project object to manipulate the currently open project at the command line.

Properties of proj output argument.

| Project Property  | Description                                                                                                                                   |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| Categories        | Categories of project labels                                                                                                                  |
| Dependencies      | Dependencies between project files in a MATLAB digraph object                                                                                 |
| Files             | Paths and names of project files                                                                                                              |
| Information       | Information about the project such as the description, source control integration, repository location, and whether it is a top-level project |
| Name              | Project name                                                                                                                                  |
| ProjectPath       | Folders that the project puts on the MATLAB path                                                                                              |
| ProjectReferences | Folders that contain referenced projects. Contains read-only project objects for referenced projects.                                         |
| RootFolder        | Full path to project root folder                                                                                                              |
| Shortcuts         | An array of the shortcuts in this project                                                                                                     |
| ShutdownFiles     | An array of the shutdown files in this project                                                                                                |
| StartupFiles      | An array of the startup files in this project                                                                                                 |

## Tips

Alternatively, you can use `slproject.loadProject` to load a project, and `slproject.getCurrentProjects` to get a project object. Use `simulinkproject` to open projects and explore projects interactively. Use `slproject.getCurrentProjects` and `slproject.loadProject` for project automation scripts.

## Version History

### Introduced in R2012a

#### Simulink project API is not recommended

*Not recommended starting in R2019a*

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features will be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

You can continue to use `simulinkproject` and related functions listed in `methods(simulinkproject)`. New functions added after R2019a, such as `runChecks` and `listImpactedFiles`, do not work with `simulinkproject`. Use `currentProject` instead.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

## Simulink.allBlockDiagrams

Find loaded Simulink models and libraries

### Syntax

```
bd = Simulink.allBlockDiagrams()
bd = Simulink.allBlockDiagrams(type)
```

### Description

`bd = Simulink.allBlockDiagrams()` returns all loaded block diagrams, including models and libraries.

`bd = Simulink.allBlockDiagrams(type)` returns either models or libraries.

### Examples

#### Find Loaded Models

Find all loaded models in the current Simulink session, excluding libraries. The example shows a result from a typical session.

```
Simulink.allBlockDiagrams('model')
```

```
ans =

 237.0001
 56.0001
 2.0001
```

#### Get Names of Loaded Block Diagrams

Find all loaded models in the current Simulink session and return results as names. Use `Simulink.allBlockDiagrams` with `get_param` to get the names. The example shows a result from a typical session and includes loaded libraries and models.

```
get_param(Simulink.allBlockDiagrams(), 'Name')
```

```
ans =

 5×1 cell array

 {'simulink_extras'}
 {'simulink' }
 {'sldemo_fuelsys' }
```

```
{'f14' }
{'vdp' }
```

### Get Loaded Block Diagrams Based on Parameter

Find all loaded models in the current Simulink session whose 'Dirty' parameter is 'on'.

```
bds = Simulink.allBlockDiagrams();
dirtyBds = bds(strcmp(get_param(bds,'Dirty'),'on'));
```

## Input Arguments

**type** — Type of block diagram whose blocks to return

'model' | 'library'

Type of block diagram whose blocks to return, specified as 'model' or 'library'.

## Output Arguments

**bd** — Loaded block diagrams

array of handles

Loaded block diagrams, returned as an array of handles.

## Version History

Introduced in R2018a

## Simulink.architecture.add

Add tasks or triggers to selected architecture of model

### Syntax

```
Simulink.architecture.add(Type, Object)
```

### Description

`Simulink.architecture.add(Type, Object)` adds the new task or trigger `Object` of the specified `Type` to a model.

### Examples

#### Add periodic trigger

Add a task, `MyTask1`, to the software node `MulticoreProcessor` of the selected architecture of the `slexMulticoreExample` model.

```
slexMulticoreExample;
Simulink.architecture.add('Task', 'slexMulticoreExample/MulticoreProcessor/Core2/MyTask1');
```

### Input Arguments

#### Type — Object type

'PeriodicTrigger' | 'AperiodicTrigger' | 'Task'

Object type that identifies the kind of trigger or task to add, , specified as a 'PeriodicTrigger', 'AperiodicTrigger', or 'Task'.

- 'PeriodicTrigger'

Adds a periodic trigger to the architecture. Set the properties of the trigger with the `Simulink.architecture.set_param` function.

- 'AperiodicTrigger'

Adds an aperiodic trigger to the architecture. Set the properties of the trigger with the `Simulink.architecture.set_param` function.

- 'Task'

Adds a task to the architecture. Set the properties of the task with the `Simulink.architecture.set_param` function.

#### Object — Trigger or task object identifier

character vector

Trigger or task object identifier to add to architecture, specified as a character vector.

Example: 'slexMulticoreExample/MulticoreProcessor/Core2/MyTask1'

Data Types: char

## **Version History**

**Introduced in R2014a**

### **See Also**

`Simulink.architecture.set_param` | `Simulink.architecture.get_param` |  
`Simulink.architecture.delete` | `Simulink.architecture.find_system` |  
`Simulink.architecture.importAndSelect` | `Simulink.architecture.profile` |  
`Simulink.architecture.register`

## Simulink.architecture.config

Create or convert configuration for concurrent execution

### Syntax

```
Simulink.architecture.config(model, 'Convert')
Simulink.architecture.config(model, 'Add')
Simulink.architecture.config(model, 'OpenDialog')
```

### Description

`Simulink.architecture.config(model, 'Convert')` converts the active configuration set in the specified model to one for concurrent execution.

`Simulink.architecture.config(model, 'Add')` adds and activates a new configuration set for concurrent execution.

`Simulink.architecture.config(model, 'OpenDialog')` opens the Concurrent Execution dialog box for a model configuration.

### Examples

#### Convert existing configuration set

Convert existing configuration set for concurrent execution in the model `vdp`.

```
vdp;
Simulink.architecture.config('vdp', 'Convert');
```

#### Add new configuration set

Add a new configuration set (copied from the existing configuration set) for concurrent execution in the model `vdp`.

```
vdp;
Simulink.architecture.config('vdp', 'Add');
```

#### Open Concurrent Execution dialog box

Open the Concurrent Execution dialog box in the model `slexMulticoreExample`.

```
slexMulticoreExample;
Simulink.architecture.config('slexMulticoreExample','OpenDialog');
```

## Input Arguments

### **model** — Model name

character vector

Model name whose configuration set you want to convert or add to, specified as a character vector.

Example:

Data Types: char

## Version History

Introduced in R2014a

## signalBuilderToSignalEditor

Import signal data and properties from Signal Builder block to Signal Editor block

### Syntax

```
signal_editor = signalBuilderToSignalEditor(signal_builder,Name,Value)
[signal_editor,sorted_group_index,sorted_group_names] =
signalBuilderToSignalEditor(signal_builder,Name,Value)
```

### Description

`signal_editor = signalBuilderToSignalEditor(signal_builder,Name,Value)` imports signal data and properties from Signal Builder block to the Signal Editor block. This function adds a Signal Editor block to the current model using the signal data and properties from the Signal Builder block. To contain the signal data and properties, the function creates a new MAT-file.

During the port, the `signalBuilderToSignalEditor` function:

- Unicode group names are prefixed with `Test_Case_`.
- Group names are converted to valid MATLAB variable names with leading and trailing white spaces removed.
- Group names are converted with trailing underscores removed.
- Remaining numbers maintained in the scenario name.
- Orders signal groups alphabetically.
- Creates unique group names from existing names following MATLAB conventions.

The `signalBuilderToSignalEditor` function does not support

- Models that contain test case parameters. You can successfully port data from the Signal Builder block, but you cannot initialize parameters with the Signal Editor block in test harnesses generated by Simulink Design Verifier.
- Models that contain Signal Builder signal generators created from the **Create and Connect Generator** context menu.

`[signal_editor,sorted_group_index,sorted_group_names] = signalBuilderToSignalEditor(signal_builder,Name,Value)` outputs vectors containing the signal groups and group names.

### Examples

#### Replace Signal Builder Block with Signal Editor Block

This example shows how to replace an existing Signal Builder block with a Signal Editor block. To store signals from Signal Builder, the example uses `RoadProfiles.mat`.

```
model = 'ex_replace_signalbuilder';
open_system(model);
```

```

sbBlockH = [model '/Road Profiles'];
seBlockH = signalBuilderToSignalEditor(sbBlockH,...
'Replace',true,'FileName','RoadProfiles.mat');

```

Copyright 2018 The MathWorks, Inc.

## Input Arguments

### signal\_builder — Signal Builder block to replace

current model (default) | scalar

Signal Builder block to replace, specified as a scalar.

Data Types: char | string

### Name-Value Pair Arguments

Specify optional pairs of arguments as Name1=Value1, ..., NameN=ValueN, where Name is the argument name and Value is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: 'FileName','RoadProfiles.mat'

### FileName — MAT-file that stores signals

'dataset.mat' (default) | scalar

MAT-file that stores signals and properties, specified as a scalar. Do not use a file name from one locale in a different locale. When using the block on multiple platforms, consider specifying just the MAT-file name and having the MAT-file be on the MATLAB path.

Data Types: char | string

### Replace — Replace Signal Builder block with Signal Editor block

false (default) | true

Replace Signal Builder block with Signal Editor block, specified as true or false.

Data Types: logical

## Output Arguments

### signal\_editor — Signal Editor block handle

scalar

Signal Editor block handle, specified as a scalar.

**sorted\_group\_index — List of Signal Builder group indices**

vector

List of Signal Builder group indices, specified as a vector and ordered as they will appear in the Signal Editor.

**sorted\_group\_names — List of Signal Builder group names**

cell array

Signal Editor group names, specified as a cell array of vectors, in alphabetical order.

The names are unique valid MATLAB variable names generated from the Signal Builder group names.

.

**Limitations**

The Signal Editor block can output a bus for each signal, but cannot output all signals in a single bus. If the Signal Builder block from which you are importing signal data has a bus as output, consider:

- Creating or using an existing `Simulink.Bus` bus object to contain the Signal Builder bus signals. The `Simulink.Bus` object contains the `Simulink.BusElement` that define each element in the `Simulink.Bus` object.
- In the Signal Editor user interface, creating a bus element and dragging and dropping the signals imported from the Signal Builder block into that bus element.
- After running the `signalBuilderToSignalEditor` function, select the **Output a bus signal** check box in the Signal Editor block and enter the Signal Builder bus object name in **Select bus object** text box.

**Version History****Introduced in R2018a****See Also**Signal Builder | Signal Editor | `signalbuilder` | `signalEditor`**Topics**

"Replace Signal Builder Block with Signal Editor Block"

"Migrate from Signal Builder Block to Signal Editor Block"

# Simulink.architecture.delete

Delete triggers and tasks from selected architecture of model

## Syntax

```
Simulink.architecture.delete(Object)
```

## Description

`Simulink.architecture.delete(Object)` deletes the specified object trigger or task.

## Examples

### Delete task Plant

Delete the task Task3 from the Core2 periodic trigger of the MulticoreProcessor software node of the selected architecture of the `slexMulticoreExample` model.

```
slexMulticoreExample
Simulink.architecture.delete('slexMulticoreExample/MulticoreProcessor/Core2/Task3')
```

## Input Arguments

**Object** — Object to delete, specified as a character vector

character vector

Object to be deleted. Possible objects are:

- Periodic trigger

---

**Note** You cannot delete the last periodic trigger. The software node must contain at least one periodic trigger.

---

- Aperiodic trigger
- Task

Example: `[bdroot '/MulticoreProcessor/Core2/Task3']`

Data Types: char

## Version History

**Introduced in R2014a**

**See Also**

`Simulink.architecture.get_param` | `Simulink.architecture.add` |  
`Simulink.architecture.find_system` | `Simulink.architecture.importAndSelect` |  
`Simulink.architecture.profile` | `Simulink.architecture.register`

# Simulink.architecture.find\_system

Find objects under architecture object

## Syntax

```
object = Simulink.architecture.find_system(RootObject)
```

```
object = Simulink.architecture.find_system(RootObject, ParamName, ParamValue)
```

## Description

`object = Simulink.architecture.find_system(RootObject)` looks for all objects under `RootObject`.

`object = Simulink.architecture.find_system(RootObject, ParamName, ParamValue)` returns the object in `RootObject` whose parameter `ParamName` has the value `ParamValue`. Parameter name and value character vectors are case-sensitive.

## Examples

### Look for all objects

To find all the objects in `slexMulticoreExample`:

```
slexMulticoreExample
t = Simulink.architecture.find_system('slexMulticoreExample')

t =

 'slexMulticoreExample'
 'slexMulticoreExample/MulticoreProcessor'
 'slexMulticoreExample/MulticoreProcessor/Core1'
 'slexMulticoreExample/MulticoreProcessor/Core1/Task1'
 'slexMulticoreExample/MulticoreProcessor/Core1/Task2'
 'slexMulticoreExample/MulticoreProcessor/Core2'
 'slexMulticoreExample/MulticoreProcessor/Core2/Task3'
 'slexMulticoreExample/MulticoreProcessor/Core2/Task4'
```

### Look for all tasks

To find all the tasks in `slexMulticoreExample`:

```
slexMulticoreExample
t = Simulink.architecture.find_system('slexMulticoreExample', 'Type', 'Task')

t =

 'slexMulticoreExample/MulticoreProcessor/Core1/Task1'
 'slexMulticoreExample/MulticoreProcessor/Core1/Task2'
```

```
'slexMulticoreExample/MulticoreProcessor/Core2/Task3'
'slexMulticoreExample/MulticoreProcessor/Core2/Task4'
```

## Input Arguments

### **RootObject — Object to search**

character vector

Object to search for parameter value, specified as a character vector giving the object full path name. Possible objects are:

- Model
- Software node
- Hardware node
- Periodic trigger
- Aperiodic trigger
- Task

Example: 'slexMulticoreExample'

### **ParamName — Name of parameter to find**

character vector | scalar | vector

Name of the parameter to find. Possible values are:

- 'Name'
- 'Type'
- 'ClockFrequency'
- 'Color'
- 'Period'
- 'EventHandlerType'
- 'SignalNumber'
- 'EventName'

Example: 'EventName'

### **ParamValue — Parameter value to find**

character vector | scalar | vector

Parameter value to find, specified as a character vector, a scalar, or a vector.

Example: 'ERTDefaultEvent'

## Version History

**Introduced in R2014a**

## See Also

`Simulink.architecture.set_param` | `Simulink.architecture.add` |  
`Simulink.architecture.delete` | `Simulink.architecture.importAndSelect` |  
`Simulink.architecture.profile` | `Simulink.architecture.register`

## Simulink.architecture.get\_param

Get configuration parameters of architecture objects

### Syntax

```
ParamValue = Simulink.architecture.get_param(Object,ParamName)
```

### Description

`ParamValue = Simulink.architecture.get_param(Object,ParamName)` returns the value of the specified parameter for the object, `Object`. `ParamName` is case-sensitive.

### Examples

#### Get period

Get the period of task `Task3` of trigger `Core2` of software node `MulticoreProcessor` of the selected architecture for the model `slexMulticoreExample`.

```
slexMulticoreExample;
p = Simulink.architecture.get_param('slexMulticoreExample/MulticoreProcessor/Core2/Task3','Period')

p =

0.2
```

### Input Arguments

#### Object — Object whose parameter value to return

character vector

Object whose parameter value to return, specified as a character vector giving the object full path name. Possible objects are:

- Software node
- Hardware node
- Periodic trigger
- Aperiodic trigger
- Task

#### ParamName — Parameter whose value to return

character vector

Name of a parameter for which `Simulink.architecture.get_param` returns a value.

The following are the possible `ParamName` values:

For a model:

- 'ArchitectureName'
- 'Type'

For a software node:

- 'Name'
- 'Type'

For a hardware node

- 'Name'
- 'ClockFrequency'
- 'Color'
- 'Type'

For a periodic trigger:

- 'Name'
- 'Period'
- 'Color'
- 'Type'

For an aperiodic trigger:

- 'Name'
- 'Color'
- 'EventHandlerType'
- 'SignalNumber'
- 'EventName'
- 'Type'

For a task:

- 'Name'
- 'Period'
- 'Color'
- 'Type'

## Version History

Introduced in R2014a

## Simulink.architecture.importAndSelect

Import and select target architecture for concurrent execution environment for model

### Syntax

```
Simulink.architecture.importAndSelect(model,Architecture)
```

```
Simulink.architecture.importAndSelect(model,
CustomArchitectureDescriptionFile)
```

### Description

`Simulink.architecture.importAndSelect(model,Architecture)` imports and selects the built-in target architecture for the concurrent execution environment for the model.

Importing and selecting target architectures requires that the associated support packages or hardware is installed on your computer.

`Simulink.architecture.importAndSelect(model,CustomArchitectureDescriptionFile)` imports and selects the architecture from an XML-based architecture description file.

Importing and selecting target architectures requires that the associated support packages or hardware is installed on your computer.

### Examples

#### Import and select a different architecture

Import and select the sample architecture to the model `slexMulticoreExample`.

```
slexMulticoreExample
Simulink.architecture.importAndSelect('slexMulticoreExample','Sample Architecture')
```

#### Import and select a custom architecture

Import and select the custom architecture defined in the XML file `custom_arch.xml`. This example requires you to create a `custom_arch.xml` file first.

```
slexMulticoreExample
Simulink.architecture.importAndSelect('slexMulticoreExample','custom_arch.xml')
```

### Input Arguments

#### **model** — Model

character vector

Model to import architecture to, specified as a character vector.

Data Types: char

### Architecture — Target architecture name

character vector

Target architecture name to import into the concurrent execution environment for the model. Possible target names are:

| Property                           | Description                                                                                                                                       |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| 'Multicore'                        | Single CPU with multiple cores                                                                                                                    |
| 'Sample Architecture'              | Example architecture consisting of single CPU with multiple cores and two FPGAs. You can use this architecture to model for concurrent execution. |
| 'Simulink Real-Time'               | Simulink Real-Time™ target                                                                                                                        |
| 'Xilinx Zynq ZC702 evaluation kit' | Xilinx® Zynq® ZC702 evaluation kit target                                                                                                         |
| 'Xilinx Zynq ZC706 evaluation kit' | Xilinx Zynq ZC706 evaluation kit target                                                                                                           |
| 'Xilinx Zynq Zedboard'             | Xilinx Zynq ZedBoard™ target                                                                                                                      |

Data Types: char

### CustomArchitectureDescriptionFile — Custom target architecture file

XML file

Custom target architecture file name, in XML format, that describes a custom target for the concurrent execution environment for the model, specified as a character vector giving the XML file name.

Example: custom\_arch.xml

## Version History

Introduced in R2014a

### Topics

“Define a Custom Architecture File”

## Simulink.architecture.profile

Generate profile report for model configured for concurrent execution

### Syntax

```
Simulink.architecture.profile(model)
Simulink.architecture.profile(model,numSamples)
```

### Description

`Simulink.architecture.profile(model)` generates a profile report for a model configured for concurrent execution. Subsequent calls to the command for the same model name overwrite the existing profile report.

`Simulink.architecture.profile(model,numSamples)` specifies the number of samples to generate a profile report.

### Examples

#### Generate profile report

Generate profile report for the model `slexMulticoreExample`.

```
slexMulticoreExample;
Simulink.architecture.profile('slexMulticoreExample');
```

The command creates the file `slexMulticoreExample_ProfileReport.html` in the current folder and opens it.

#### Generate profile report for 120 time steps

Generate profile report for the model `slexMulticoreExample` with data for 120 time steps.

```
slexMulticoreExample;
Simulink.architecture.profile('slexMulticoreExample',120);
```

The command creates the file `slexMulticoreExample_ProfileReport.html` in the current folder.

### Input Arguments

#### **model** — Model to profile

character vector

Model to profile, specified as a character vector. Specify a model that is configured for concurrent execution.

Data Types: char

**numSamples — Number of time steps**

100 (default) | real, positive integer

Number of time steps, specified as a real, positive integer. This value determines the number of steps to collect data for in the profiled model.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

## Version History

**Introduced in R2014a**

## Simulink.architecture.register

Add custom target architecture to concurrent execution target architecture selector

### Syntax

```
Simulink.architecture.register(CustomArchFile)
```

### Description

`Simulink.architecture.register(CustomArchFile)` adds an XML-format custom target architecture file `CustomArchFile` to the concurrent execution target architecture selector. To access this selector, click the **Select** button on the Concurrent Execution pane of the Concurrent Execution dialog box.

### Examples

#### Add custom target architecture

Add custom target architecture defined in the XML file `custom_arch.xml` to the concurrent execution target architecture selector. This example requires you to create a `custom_arch.xml` first.

```
slexMulticoreExample
Simulink.architecture.register('custom_arch.xml')
```

### Input Arguments

#### CustomArchFile — Custom target architecture file

XML file

Custom target architecture file that describes a custom target for concurrent execution, specified as an XML file.

### Version History

Introduced in R2014a

### See Also

# Simulink.architecture.set\_param

Set architecture object properties

## Syntax

```
Simulink.architecture.set_param(Object, ParamName, ParamValue)
```

## Description

`Simulink.architecture.set_param(Object, ParamName, ParamValue)` sets the specified parameter of `Object` to the specified value. Parameter name and value character vectors are case sensitive.

## Examples

### Set software node name

Set the software node name from `MulticoreProcessor` to `MyCPUNewName`.

```
slexMulticoreExample
Simulink.architecture.set_param([bdroot '/MulticoreProcessor'], 'Name', 'MyCPUNewName');
```

### Change Periodic

Set `Core2` trigger period to `.01`.

```
slexMulticoreExample
Simulink.architecture.set_param([bdroot '/MyCPUNewName/Core2'], 'Period', '.01')
```

## Input Arguments

### Object — Object whose parameter value to set

character vector

Object whose parameter value to set, specified as a character vector giving the object full path name. Possible objects are:

- Software node
- Hardware node
- Periodic trigger
- Aperiodic trigger
- Task

### ParamName — Name of the parameter to set

character vector

Name of parameter whose value to set.

These are the possible parameters whose values you can set for each of the object types:

For software node:

- 'Name' — Name of the software node.

For hardware node:

- 'Name' — Name of the hardware node.
- 'ClockFrequency' — Frequency of the hardware node clock.
- 'Color' — Color of the trigger icon, specified as an RGB triplet (vector).

For a periodic trigger:

- 'Name' — Name of the trigger.
- 'Period' — Period of the trigger.
- 'Color' — Color of the trigger icon, specified as an RGB triplet (vector).

For an aperiodic trigger:

- 'Name' — Name of the trigger.
- 'Color' — Color of the trigger icon, specified as an RGB triplet (vector).
- 'EventHandlerType' — Trigger source for the interrupt-driven task. Possible values:
  - 'Event (Windows)'
  - 'Posix Signal (Linux/VxWorks 6.x)'
- 'SignalNumber' — Signal number for the trigger. You can set this value only if `EventHandlerType` is set to `Event (Windows)`.
- 'EventName' — Event name for the trigger. You can set this value only if `EventHandlerType` is set to `Posix Signal (Linux/VxWorks 6.x)`.

For task:

- 'Name' — Name of the task.
- 'Period' — Period of the task.
- 'Color' — Color of the task icon, specified as an RGB triplet (vector).

Data Types: char

### **ParamValue — Value to set the parameter to**

character vector | vector

Value to set the parameter to, specified as a character vector, scalar, or vector. The possible values depend on the parameter.

Example: 'MyCPUNewName'

## **Version History**

## Simulink.Block.getSampleTimes

Return sample time information for a block

### Syntax

```
ts = Simulink.Block.getSampleTimes(block)
```

### Input Arguments

*block*

Full name or handle of a Simulink block

### Output Arguments

*ts*

The command returns *ts* which is a 1×*n* array of Simulink.SampleTime objects associated with the model passed to Simulink.Block.getSampleTimes. Here *n* is the number of sample times associated with the block. The format of the returns is:

```
1xn Simulink.SampleTime
Package: Simulink
value: [1x2 double]
Description: [char string]
ColorRGBValue: [1x3 double]
Annotation: [char string]
OwnerBlock: [char string]
ComponentSampleTimes: [1x2 struct]
Methods
```

- *value* — A two-element array of doubles that contains the sample time period and offset
- *Description* — A character vector or string that describes the sample time type
- *ColorRGBValue* — A 1x3 array of doubles that contains the red, green and blue (RGB) values of the sample time color
- *Annotation* — A character vector or string that represents the annotation of a specific sample time (e.g., 'D1')
- *OwnerBlock* — For asynchronous and variable sample times, a character vector or string containing the full path to the block that controls the sample time. For all other types of sample times, an empty character vector or string.
- *ComponentSampleTimes* — A structure array of elements of the same type as Simulink.BlockDiagram.getSampleTimes if the sample time is an async union or if the sample time is hybrid and the component sample times are available.

### Description

`ts = Simulink.Block.getSampleTimes(block)` performs an update diagram and then returns the sample times of the block connected to the input argument *mdl/signal*. This method performs an update diagram to ensure that the sample time information returned is up-to-date. If the model is already in the compiled state via a call to the model API, then an update diagram is not necessary.

Using this method allows you to access all information in the Sample Time Legend programmatically.

## **Version History**

**Introduced in R2009a**

## **See Also**

`Simulink.BlockDiagram.getSampleTimes`

## Simulink.BlockDiagram.addBusToVector

Convert virtual bus signals into vector signals by adding Bus to Vector blocks

### Syntax

```
[destBlocks, busToVectorBlocks, ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model)
[destBlocks, busToVectorBlocks, ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model, includeLibs)
[destBlocks, busToVectorBlocks, ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model, includeLibs, reportOnly)
[destBlocks, busToVectorBlocks, ignoredBlocks] =
Simulink.BlockDiagram.addBusToVector(model, includeLibs, reportOnly, strictOnly)
```

### Description

[destBlocks, busToVectorBlocks, ignoredBlocks] = Simulink.BlockDiagram.addBusToVector(model) searches a model, excluding any library blocks, for bus signals used implicitly as vectors, and returns the results of the search.

[destBlocks, busToVectorBlocks, ignoredBlocks] = Simulink.BlockDiagram.addBusToVector(model, includeLibs) searches a model, and if includeLibs is true, includes in the search library blocks for bus signals used implicitly as vectors.

[destBlocks, busToVectorBlocks, ignoredBlocks] = Simulink.BlockDiagram.addBusToVector(model, includeLibs, reportOnly) searches a model, and if reportOnly is set to false, then the function inserts a Bus to Vector block into each bus that is used as a vector in any block that it searches. The insertion replaces the implicit use of a bus as a vector with an explicit conversion of the bus to a vector. The source and destination blocks of the signal do not change.

If Simulink.BlockDiagram.addBusToVector adds Bus to Vector blocks to the model or any library, the function changes the saved copy of the diagram.

If Simulink.BlockDiagram.addBusToVector changes a library block, the change affects every instance of that block in every model that uses the library.

[destBlocks, busToVectorBlocks, ignoredBlocks] = Simulink.BlockDiagram.addBusToVector(model, includeLibs, reportOnly, strictOnly) searches a model, and if strictOnly is true, the function checks for input bus signals used implicitly as vectors that are fed into one of these blocks. These blocks cannot take virtual bus signals, but they can accept nonvirtual bus signals:

- Delay
- Selector
- Assignment
- Vector Concatenate
- Reshape

- Permute Dimensions

## Examples

### Identify Bus-To-Vector Conversions

Model `ex_bus_to_vector` simulates correctly, but the input to the Gain block is a bus, while the output is a vector. The Gain block implicitly converts the bus to a vector.

Open the model.

```
openExample('simulink/ConvertBusSignalToAVectorExample',...
'supportingFile','ex_bus_to_vector.slx')
```

Identify buses treated as vectors.

```
[blocks] = Simulink.BlockDiagram.addBusToVector(...
'ex_bus_to_vector')

Processing block diagram 'ex_bus_to_vector'
Number of blocks left that are connected to a bus being used as a vector: 2
Done processing block diagram 'ex_bus_to_vector'

blocks =

 1x2 struct array with fields:

 BlockPath
 InputPort
 LibPath
```

To understand the relationship between `Simulink.BlockDiagram.addBusToVector` and the **Bus signal treated as vector** configuration parameter, see “Manage Bus-to-Vector Conversions” on page 12-15.

### Add Bus to Vector Blocks

Model `ex_bus_to_vector` simulates correctly, but the input to the Gain block is a bus, while the output is a vector. The Gain block implicitly converts the bus to a vector.

Open the model.

```
openExample('simulink/ConvertBusSignalToAVectorExample',...
'supportingFile','ex_bus_to_vector.slx')
```

Insert Bus to Vector blocks.

When you use function `Simulink.BlockDiagram.addBusToVector` with `reportOnly` set to `false`, the function saves the model. To create a writable copy of model `ex_bus_to_vector`, this example uses the `save_system` function.

```
save_system('ex_bus_to_vector','ex_bus_to_vector_blocks');
[blocks,busToVectors] = Simulink.BlockDiagram.addBusToVector(...
'ex_bus_to_vector_blocks',true,false);
```

The Gain block no longer implicitly converts the bus to a vector. The inserted Bus to Vector block performs the conversion explicitly. The Bus to Vector block is virtual and does not affect simulation results, code generation, or performance.

To understand the relationship between `Simulink.BlockDiagram.addBusToVector` and the **Bus signal treated as vector** configuration parameter, see “Manage Bus-to-Vector Conversions” on page 12-15.

## Input Arguments

### **model** — Model name or handle

character vector | string scalar | numeric scalar

Model name or handle, specified as a character vector, string scalar, or numeric scalar.

Data Types: double | char | string

### **includeLibs** — Search library blocks

false (default) | true

Search library blocks, specified as `false` or `true`.

- `false` — Search only the blocks in the model.
- `true` — Search library blocks for bus signals used implicitly as vectors.

Specify as the second argument.

Data Types: `logical`

### **reportOnly** — Report results without changing model

`true` (default) | `false`

Choice to report results without changing the model, specified as `false` or `true`.

- `false` — Update the model by inserting Bus to Vector blocks for bus signals that are implicitly used as vectors.
- `true` — Report search results, but do not change the model.

Specify as the third argument. Also specify the `model` and `includeLibs` arguments.

Data Types: `logical`

### **strictOnly** — Check input bus signals used implicitly as vectors that feed blocks that can accept nonvirtual, but not virtual, bus signals

`false` (default) | `true`

Check input bus signals used implicitly as vectors that feed blocks that can accept nonvirtual, but not virtual, bus signals, specified as `false` or `true`. If `strictOnly` is `true`, the function checks for input bus signals used implicitly as vectors that are fed into one of these blocks. These blocks cannot take virtual bus signals, but they can accept nonvirtual bus signals.

- Delay
- Selector
- Assignment
- Vector Concatenate
- Reshape
- Permute Dimensions

Specify as the fourth argument. You must also specify the `model`, `includeLibs`, and `reportOnly` arguments.

Data Types: `logical`

## **Output Arguments**

### **destBlocks** — Blocks connected to buses but that treat buses as vectors

array of structures

Blocks connected to buses that treat buses as vectors, returned as an array of structures. Each structure in the array contains these fields:

- `BlockPath` — Character vector specifying the path to the block to which the bus connects.
- `InputPort` — Integer specifying the input port to which the bus connects.
- `LibPath` — If the block is a library block instance, and if `includeLibs` is `true`, the field value is the path to the source library block. Otherwise, `LibPath` is empty (`[]`).

### **busToVectorBlocks** — Bus to Vector blocks added by function

cell array

Bus to Vector blocks added by function, specified as a cell array. If `reportOnly` is set to `false`, the cell array contains the paths to each Bus to Vector block that the function added to replace buses used as vectors. Otherwise, `busToVectorBlocks` is empty (`[]`).

### **ignoredBlocks — Cases where function cannot insert Bus to Vector block**

array of structures

Cases where function cannot insert Bus to Vector block, specified as an array of structures. Each structure in the array contains these fields:

- `BlockPath` — Character vector specifying the path to the block to which the bus connects.
- `InputPort` — Integer specifying the input port to which the bus connects.

These cases occur when a Bus to Vector cannot be inserted because the input virtual bus signal consists of elements with mixed attributes.

### **Tips**

- Before you execute this function:
  - 1** Ensure that the model compiles without error.
  - 2** Save the model.
- Back up the model and any libraries before calling the function with `reportOnly` set to `false`.
- To preview the effects of the change on blocks in all models, call `Simulink.BlockDiagram.addBusToVector` with `includeLibs` set to `true` and `reportOnly` set to `true`. Then, examine the information returned in the `destBlocks` output argument.

## **Version History**

**Introduced in R2007a**

Bus to Vector

# Simulink.BlockDiagram.arrangeSystem

Improve layout of block diagram

## Syntax

```
Simulink.BlockDiagram.arrangeSystem(bd)
Simulink.BlockDiagram.arrangeSystem(bd,FullLayout=tf)
```

## Description

`Simulink.BlockDiagram.arrangeSystem(bd)` improves the layout of the specified block diagram by realigning, resizing, and moving blocks and straightening signal lines.

`Simulink.BlockDiagram.arrangeSystem(bd,FullLayout=tf)` specifies whether to apply the automated layout even when the automated layout might not improve upon the original layout.

## Examples

### Arrange Programmatically Populated Model

You can use `Simulink.BlockDiagram.arrangeSystem` with any open model, and it is particularly useful with models you populate programmatically.

Blocks in the model `ex_arrange_system` are poorly arranged.

```
open_system('ex_arrange_system')
```

Blocks in its subsystem are also poorly arranged.

```
open_system('ex_arrange_system/Subsystem')
```

Programmatically arrange blocks in the top layer of the specified system.

```
Simulink.BlockDiagram.arrangeSystem('ex_arrange_system')
```

```
Simulink.BlockDiagram.arrangeSystem('ex_arrange_system/Subsystem')
```

### Force Automated Layout

By default, `Simulink.BlockDiagram.arrangeSystem` applies an automated layout only when the automated layout is expected to improve upon the original layout. You can force this function to apply the layout even when the automated layout might not improve upon the original layout.

Blocks in the model `ForceArrangeSystem` are arranged well.

```
open_system('ex_arrange_system2')
```

The automated layout might not improve upon the original layout because the blocks are already arranged well.

Suppose you want to apply the automated layout regardless of whether the automated layout is an improvement. To force the automated layout, set `FullLayout` to `true`.

```
Simulink.BlockDiagram.arrangeSystem('ex_arrange_system2',FullLayout='true')
```

## Input Arguments

### **bd** — Block diagram of system

character vector | string scalar | numeric scalar

Block diagram of system, specified as a character vector, string scalar, or numeric scalar.

Specify one of the following options:

- System name (must not include a path or extension)
- System handle
- Subsystem block path

Data Types: double | char | string

### **tf** — Option to force automated layout

'false' (default) | 'true'

Option to force automated layout, specified as 'true' or 'false'.

- 'true' — Applies the automated layout even when the automated layout might not improve upon the original layout
- 'false' — Applies the automated layout only when the automated layout is expected to improve upon the original layout.

## Simulink.BlockDiagram.buildRapidAcceleratorTarget

Build Rapid Accelerator target for model and return run-time parameter set

### Syntax

```
rtp = Simulink.BlockDiagram.buildRapidAcceleratorTarget mdl
```

### Description

`rtp = Simulink.BlockDiagram.buildRapidAcceleratorTarget mdl` builds a Rapid Accelerator target for model, `mdl`, and returns run-time parameter set, `rtp`.

### Input Arguments

`mdl`

Name or handle of a Simulink model

### Output Arguments

`rtp`

Run-time parameter set that contains two elements:

| Element                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |       |             |                           |                                                        |                         |                                                          |                      |                                                                            |                         |                                                          |                     |                                                                                    |                  |                                                                                                                                         |  |                                                                                                                                                                                           |       |             |                         |                         |

| Element | Description |              |                                                                                             |
|---------|-------------|--------------|---------------------------------------------------------------------------------------------|
|         |             | ValueIndices | Start and end indices into the values field, [startIdx, endIdx].                            |
|         |             | Dimensions   | Dimension of this tunable parameter (matrices are generally stored in column-major format). |

## Examples

### Build Rapid Accelerator Target for Model

In the MATLAB Command Window, type:

```
rtp = Simulink.BlockDiagram.buildRapidAcceleratorTarget('f14')
Building the rapid accelerator target for model: f14
Successfully built the rapid accelerator target for model: f14

rtp =
 modelChecksum: [2.6812e+09 2.7198e+09 589261472 4.0180e+09]
 parameters: [1x1 struct]
```

## Version History

Introduced in R2012b

## Simulink.BlockDiagram.copyContentsToSubsystem

Copy graphical contents from system to empty subsystem

### Syntax

```
Simulink.BlockDiagram.copyContentsToSubsystem(sys, subsystem)
```

### Description

`Simulink.BlockDiagram.copyContentsToSubsystem(sys, subsystem)` copies the blocks, lines, and annotations of the specified system to the specified subsystem. It does not affect nongraphical information such as configuration sets.

Use this function to convert a referenced model derived from an atomic subsystem into an atomic subsystem that is equivalent to the original subsystem.

To use this function:

- The specified system must be loaded in memory.
- The specified subsystem must be loaded in memory.
- The specified system must not contain the specified subsystem.
- The specified subsystem must not contain any blocks or lines. Other types of information can exist in the subsystem and are unaffected by the function. To delete the graphical content of the destination subsystem, use `Simulink.SubSystem.deleteContents`.

### Examples

#### Copy Block Diagram of Model to Subsystem

Copy the contents of a referenced model to an empty subsystem.

Open the `sldemo_mdref_basic` model.

```
openExample('sldemo_mdref_basic')
```

Add an empty subsystem to the model.

```
add_block('built-in/Subsystem', 'sldemo_mdref_basic/Subsystem')
```

Load the `sldemo_mdref_counter` referenced model that contains the contents to copy.

```
load_system('sldemo_mdref_counter')
```

Copy the graphical contents from the `sldemo_mdref_counter` referenced model to the empty subsystem.

```
Simulink.BlockDiagram.copyContentsToSubsystem...
('sldemo_mdref_counter', 'sldemo_mdref_basic/Subsystem')
```

## Input Arguments

### **sys** — System name or handle

numeric scalar | character vector | string scalar

System name or handle, specified as a numeric scalar, character vector, or string scalar.

The system name must not include a path or extension.

Example: 'model1'

Data Types: double | char | string

### **subsys** — Subsystem block path or handle

numeric scalar | character vector | string scalar

Subsystem block path or handle, specified as a numeric scalar, character vector, or string scalar.

Example: 'model2/Subsystem'

Data Types: double | char | string

## Version History

**Introduced in R2007a**

“Create Subsystems”

## Simulink.BlockDiagram.createSubsystem

Create subsystem containing specified set of blocks

### Syntax

```
Simulink.BlockDiagram.createSubsystem(blocks)
Simulink.BlockDiagram.createSubsystem()
Simulink.BlockDiagram.createSubsystem(____,Name,Value)
```

### Description

`Simulink.BlockDiagram.createSubsystem(blocks)` creates a subsystem and moves the specified blocks into it. All of the specified blocks must originally reside in the same block diagram.

If any of the blocks have unconnected ports, the function creates and connects Inport and Outport blocks to them inside the subsystem.

If any of the blocks are input or output port blocks, the function creates Inport and Outport blocks in the parent system to connect to the corresponding ports on the new Subsystem block.

`Simulink.BlockDiagram.createSubsystem()` replaces the currently selected blocks with a new subsystem that contains those blocks.

`Simulink.BlockDiagram.createSubsystem( ____,Name,Value)` specifies options using one or more name-value pair arguments in addition to the input arguments in previous syntaxes. For example, 'Name', 'MySubsystem' names the new subsystem 'MySubsystem'.

### Examples

#### Create Subsystem from Model

Open or load the example model.

```
CreateSubsystemModel
```

Get the block handles for all blocks at the top level of the model by using the `Simulink.findBlocks` function.

```
bh = Simulink.findBlocks('CreateSubsystemModel');
```

Replace the contents of the model with a subsystem that contains the model contents.

```
Simulink.BlockDiagram.createSubsystem(bh);
```

#### Create Named Subsystem from Model

Open or load the example model.

## CreateSubsystemModel

Get the block handles for all blocks at the top level of the model by using the `Simulink.findBlocks` function.

```
bh = Simulink.findBlocks('CreateSubsystemModel');
```

Replace the contents of the model with a subsystem named `ss1` that contains the model contents.

```
Simulink.BlockDiagram.createSubsystem(bh, 'Name', 'ss1');
```

## Input Arguments

### blocks — Block handles

numeric array

Block handles, specified as a numeric array. To get block handles, use the `Simulink.findBlocks` or `gcbh` functions.

Data Types: `double`

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `Simulink.BlockDiagram.createSubsystem(blocks, 'Name', 'MySubsystemName')`

### Name — Name of new subsystem

character vector | string scalar

Name of the new subsystem, specified as the comma-separated pair consisting of `'Name'` and a character vector or string scalar.

Data Types: `char` | `string`

### MakeNameUnique — Option to make subsystem name unique

`'on'` (default) | `'off'`

Option to make the subsystem name unique, specified as the comma-separated pair consisting of `'MakeNameUnique'` and `'on'` or `'off'`.

If the value that you specify for `Name` is already used in the diagram:

- `'on'` — Uses the next available increment of the name. For example, if `Name` is set to `'Controller'` and the diagram already contains a block named `'Controller'`, the function names the new subsystem `'Controller1'`.
- `'off'` — Returns an error.

### Dependencies

To use this parameter, specify a value for the `Name` argument.

Data Types: char | string

# Simulink.BlockDiagram.deleteContents

Delete graphical contents of system

## Syntax

```
Simulink.BlockDiagram.deleteContents(sys)
```

## Description

`Simulink.BlockDiagram.deleteContents(sys)` deletes the blocks, lines, and annotations in the specified system, which must be loaded in memory.

## Examples

### Delete Graphical Content from Model

Open the f14 model.

```
open_system('f14')
```

Delete the graphical content of the model, including all subsystems.

```
Simulink.BlockDiagram.deleteContents('f14')
```

## Input Arguments

### **sys** — System name or handle

character vector | string scalar | numeric scalar

System name or handle, specified as a character vector, string scalar, or numeric scalar.

A system name must not include a path or extension.

Example: 'mymodel'

Data Types: double | char | string

## Tips

To delete the contents of a Subsystem block, use the `Simulink.SubSystem.deleteContents` function.

## Version History

Introduced in R2007a

# Simulink.BlockDiagram.getAlgebraicLoops

Show algebraic loops in a model

## Syntax

```
Simulink.BlockDiagram.getAlgebraicLoops(model)
[loops,h] = Simulink.BlockDiagram.getAlgebraicLoops(model)
```

## Description

`Simulink.BlockDiagram.getAlgebraicLoops(model)` returns a list of algebraic loops in a model as a vector of `AlgebraicLoops` objects.

The Algebraic Loops viewer provides a tabular list of all algebraic loops in the model. Use the Algebraic Loops viewer to control the display of algebraic loops in your model.

```
[loops,h] = Simulink.BlockDiagram.getAlgebraicLoops(model)
```

## Examples

### Highlight all algebraic loops in model

Open the `ex_sl_demo_hydcyl` model.

In the **Diagnostics** pane of Model Configuration Parameters, set **Algebraic loop** to none or warning. Setting this parameter to error prevents the model from compiling.

Compile the model without any errors. The model must compile before you can highlight any algebraic loops.

At the MATLAB command prompt, enter:

```
mdl = 'ex_sl_demo_hydcyl';
load_system(mdl);
Simulink.BlockDiagram.getAlgebraicLoops(bdroot)
```

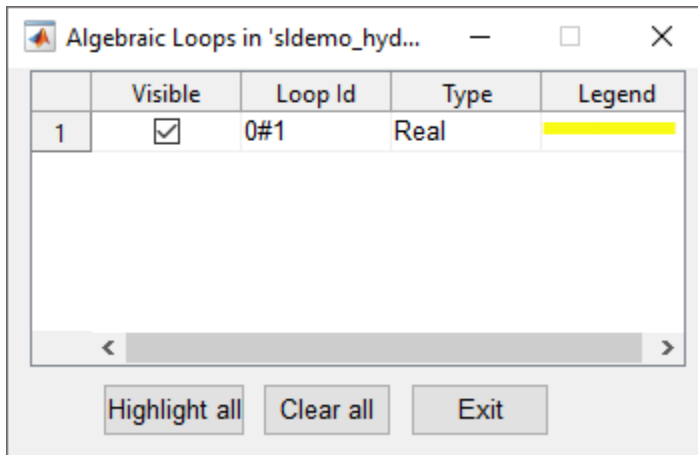

AlgebraicLoop with properties:

```

 Model: [1x1 Simulink.BlockDiagram]
 Id: [0 1]
VariableBlockHandles: [198.0001 145.0001]
 BlockHandles: [9x1 double]
 IsArtificial: 0
```

The resulting output shows that the model has one algebraic loop, which contains three blocks.

Running the `getAlgebraicLoops` function also opens the Algebraic Loop viewer. Use the Algebraic loop viewer to highlight specific algebraic loops in your model or all the loops.

The selected loops are highlighted in the corresponding model, in.

## Input Arguments

### model – Model to highlight

string scalar | character vector

Name of the model being tested, specified as a string scalar or character vector. You can also pass the most recently opened model using `bdroot`.

---

**Note** The model must be loaded into memory using either `open_system` or `load_system`.

---

Data Types: char | string

## Output Arguments

### Loops – Algebraic loops

vector of AlgebraicLoop objects

Every algebraic loop in the model returned as an `AlgebraicLoop` object that contains the following information:

- `Model`— `Simulink.BlockDiagram` object representing the model
- `Id`— Index of the algebraic loop in the model
- `VariableBlockHandles`: Handles to blocks that have been assigned algebraic variables
- `BlockHandles`—Handles to all the blocks contained in the algebraic loop
- `IsArtificial`— Boolean value indicating whether the loop is an artificial algebraic loop.

#### **h — Handle to control UI**

`matlab.ui.Figure` handle

The control UI is a MATLAB figure window. Use the UI handle `h` to control it programmatically. For more information, see [Figure Properties](#).

## **Version History**

## Simulink.BlockDiagram.expandSubsystem

Replace subsystem with subsystem contents

### Syntax

```
Simulink.BlockDiagram.expandSubsystem(subsys)
Simulink.BlockDiagram.expandSubsystem(subsys, 'CreateArea', specifier)
```

### Description

`Simulink.BlockDiagram.expandSubsystem(subsys)` replaces the specified subsystem with its contents in the block diagram that contains it. The file that contains the subsystem must be open or loaded.

You can expand virtual subsystems that are not masked, linked, or commented. For details, see “What Subsystems Can You Expand?”.

`Simulink.BlockDiagram.expandSubsystem(subsys, 'CreateArea', specifier)` provides the option of not creating an area around the expanded subsystem contents.

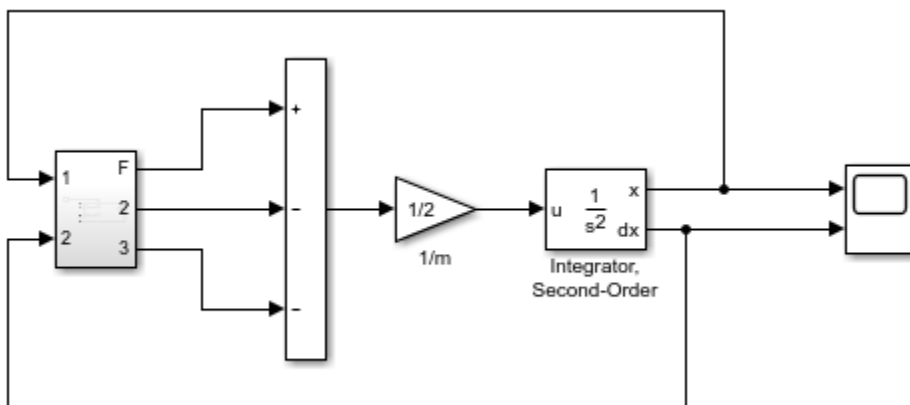

### Examples

#### Expand Subsystem

Replace a subsystem with its contents.

Open the example model, which contains a subsystem that separates functionally related blocks.

```
open_system('SubsystemExpansionModel')
```

Expand the subsystem.

```
Simulink.BlockDiagram.expandSubsystem('SubsystemExpansionModel/Subsystem')
```

An area that contains the subsystem contents replaces the Subsystem block.

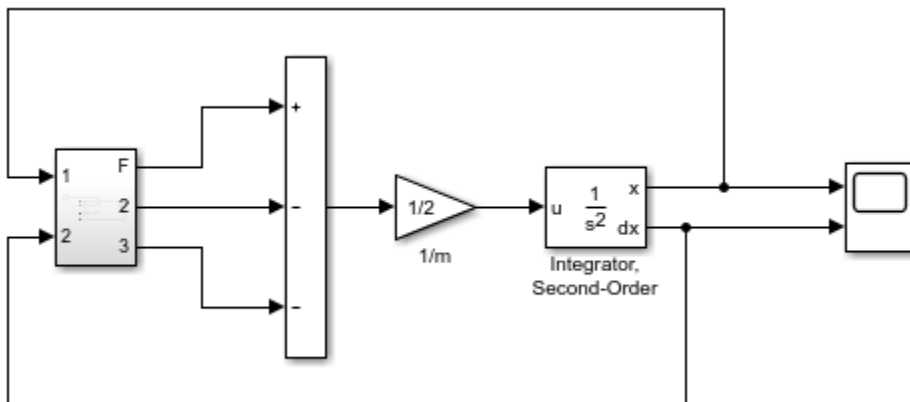

### Expand Subsystem Without Creating Area

Replace a subsystem with its contents without creating an area that surround the contents.

Open the example model, which contains a subsystem that separates functionally related blocks.

```
open_system('SubsystemExpansionModel')
```

Expand the subsystem.

```
Simulink.BlockDiagram.expandSubsystem(...
 'SubsystemExpansionModel/Subsystem', 'CreateArea', 'Off')
```

The subsystem contents replace the Subsystem block.

## Input Arguments

### **subsys** — Subsystem block path or handle

character vector | string scalar | numeric scalar

Subsystem block path or handle, specified as a character vector, string scalar, or numeric scalar.

Data Types: double | char | string

### **specifier** — Option to create area around contents

'on' (default) | 'off'

Option to create area around contents, specified as 'on' to create the area or 'off' to not create the area.

Data Types: char | string

# Simulink.BlockDiagram.getChecksum

Return model checksum

## Syntax

```
[checksum,details] = Simulink.BlockDiagram.getChecksum('model')
```

## Description

[*checksum,details*] = Simulink.BlockDiagram.getChecksum('model') returns the checksum of the specified model. Simulink software computes the checksum based on attributes of the model and the blocks the model contains.

One use of this command is to determine why the Accelerator mode in Simulink software regenerates code. For an example, see “Determine Why Simulink Accelerator Is Regenerating Code” on page 13-577.

---

**Note** Simulink.BlockDiagram.getChecksum compiles the specified model, if the model is not already in a compiled state.

---

This command accepts the argument *model*, which is the full name or handle of the model for which you are returning checksum data.

This command returns the following output:

- *checksum* — Array of four 32-bit integers that represents the model's 128-bit checksum.
- *details* — Structure of the form

```
ContentsChecksum: [1x1 struct]
InterfaceChecksum: [1x1 struct]
ContentsChecksumItems: [nx1 struct]
InterfaceChecksumItems: [mx1 struct]
```

- **ContentsChecksum** — Structure of the following form that represents a checksum that provides information about all blocks in the model.

```
Value: [4x1 uint32]
MarkedUnique: [bool]
```

- **Value** — Array of four 32-bit integers that represents the model's 128-bit checksum.
- **MarkedUnique** — True if any blocks in the model have a property that prevents code reuse.
- **InterfaceChecksum** — Structure of the following form that represents a checksum that provides information about the model.

```
Value: [4x1 uint32]
MarkedUnique: [bool]
```

- **Value** — Array of four 32-bit integers that represents the model's 128-bit checksum.
- **MarkedUnique** — Always true. Present for consistency with ContentsChecksum structure.

- `ContentsChecksumItems` and `InterfaceChecksumItems` — Structure arrays of the following form that contain information that Simulink software uses to compute the checksum for `ContentsChecksum` and `InterfaceChecksum`, respectively:

Handle: [char array]  
Identifier: [char array]  
Value: [type]

- `Handle` — Object for which Simulink software added an item to the checksum. For a block, the handle is a full block path. For a block port, the handle is the full block path and a character vector that identifies the port.
- `Identifier` — Descriptor of the item Simulink software added to the checksum. If the item is a documented parameter, the identifier is the parameter name.
- `Value` — Value of the item Simulink software added to the checksum. If the item is a parameter, `Value` is the value returned by

`get_param(handle, identifier)`

`Simulink.BlockDiagram.getChecksum` returns a checksum that depends on why and how you compiled the model. This function also compiles the model if it is not in a compiled state. The model compiles for:

- Simulation— if the simulation mode is Accelerator or you have not installed Simulink Coder
- Code generation— in all other cases

To compile the model before calling `Simulink.BlockDiagram.getChecksum`, use this command, replacing `modelName` with the name of your model:

```
modelName([], [], [], 'compile')
```

---

**Note** The checksum that `Simulink.BlockDiagram.getChecksum` returns can vary from the checksum returned if you first compile the model programmatically using the model name programmatic interface (see “Use Model Name as Programmatic Interface”) before calling `Simulink.BlockDiagram.getChecksum`.

---

## Tip

The structural checksum reflects changes to the model that can affect the simulation results, including:

- Changing the solver type, for example from `Variable-step` to `Fixed-step`
- Adding or deleting blocks or connections between blocks
- Changing the values of nontunable block parameters, for example, the **Seed** parameter of the Random Number block
- Changing the number of inputs or outputs of blocks, even if the connectivity is vectorized
- Changing the number of states or the initial states in the model
- Selecting a different function in the Trigonometric Function block
- Changing signs used in a Sum block
- Adding a Target Language Compiler (TLC) file to inline an S-function

Examples of model changes that do not affect the structural checksum include:

- Changing the position of a block
- Changing the position of a line
- Resizing a block
- Adding, removing, or changing a model annotation

## **Version History**

**Introduced in R2006b**

`Simulink.SubSystem.getChecksum` | `Simulink.getFileChecksum`

## Simulink.BlockDiagram.getExecutionOrder

Open Execution Order viewer

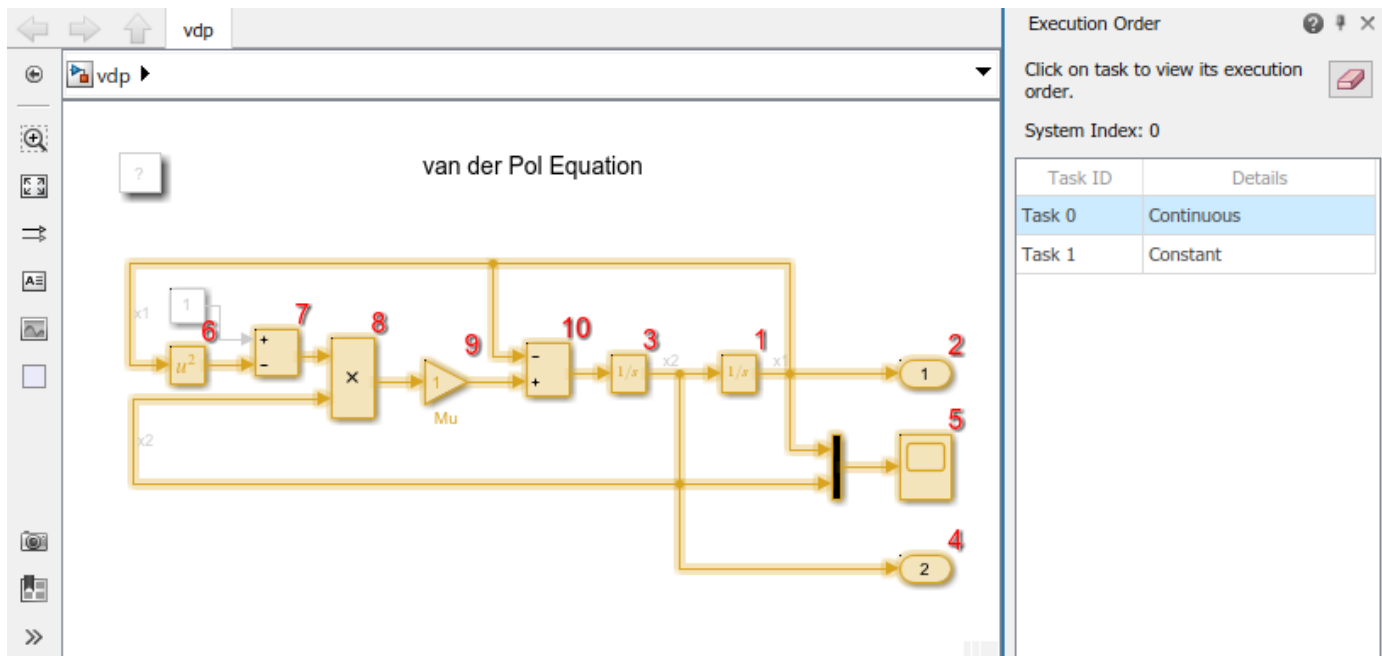

### Syntax

```
Simulink.BlockDiagram.getExecutionOrder(model)
Simulink.BlockDiagram.getExecutionOrder(model,task)
```

### Description

`Simulink.BlockDiagram.getExecutionOrder(model)` opens the Execution Order viewer for the specified model `model`.

The Execution Order viewer opens in a pane on the right side of the Simulink Editor.

`Simulink.BlockDiagram.getExecutionOrder(model,task)` highlights the task that corresponds to the specified task ID number `task`.

### Examples

#### Get Execution Order

Open the Execution Order viewer and highlight the first task, which has a task ID of 0.

```
Simulink.BlockDiagram.getExecutionOrder('vdp')
```

### Highlight Task to View Execution Order

Open the Execution Order viewer and highlight the task with a task ID of 1.

```
Simulink.BlockDiagram.getExecutionOrder('vdp',1)
```

## Input Arguments

### **model** — Model name

character vector | string scalar

Model name, specified as a character vector or string scalar.

Data Types: char | string

### **task** — Task ID number

integer

Task ID number, specified as an integer.

Data Types: double

## Version History

Introduced in R2022b

## See Also

### Topics

“Control and Display Execution Order”

“Specify Block Execution Priority and Tag”

## Simulink.BlockDiagram.getInitialState

Return initial state data of block diagram

### Syntax

```
x0 = Simulink.BlockDiagram.getInitialState('model')
```

### Description

`x0 = Simulink.BlockDiagram.getInitialState('model')` returns the initial state data of the block diagram specified by the input argument *model*. You can use this initial state data as the initial state for simulating a model or to provide an initial state condition to the linearization commands. To specify the initial state for a simulation, use the `LoadInitialState` model argument or the **Data Import/Export > Initial state** configuration parameter.

To specify the format for the initial state data, use the `SaveFormat` model argument. The default format is 'Dataset'. Other formats 'Array', 'Structure', and 'StructureWithTime'. Alternatively, you can set the initial state format using the **Data Import/Export > Format** configuration parameter.

- If format is 'Dataset', then the `Simulink.BlockDiagram.getInitialState` function returns a `Simulink.SimulationData.Dataset` object.
- For other format settings, the function returns a structure of the form:

```
time: 0
signals: [1xn struct]
```

where *n* is the number of states contained in the model, including any models referenced by Model blocks. The `signals` field is a structure of the form:

```
values: [1xm double]
dimensions: [1x1 double]
label: [char array]
blockName: [char array]
inReferencedModel: [bool]
sampleTime: [1x2 double]
```

- `values` — Numeric array of length *m*, where *m* is the number of states in the signal
- `dimensions` — Length of the `values` vector
- `label` — Indication of whether the state is continuous (CSTATE) or discrete. If the state is discrete:

The name of the discrete state is shown for S-function blocks.

The name of the discrete state is shown for those built-in blocks that assign their own names to discrete states.

DSTATE is used in all other cases.

- `blockName` — Full path to block associated with this state

- `inReferencedModel` — Indication of whether the state originates in a model referenced by a Model block (1) or in the top model (0)
- `sampleTime` — Array containing the sample time and offset of the block that owns the state

Using this function to return the initial state data simplifies specifying initial state values for models with multiple states. Each state is associated with the full path to its parent block.

## Simulink.BlockDiagram.getSampleTimes

Return all sample times associated with model

### Syntax

```
ts = Simulink.BlockDiagram.getSampleTimes('model')
```

### Description

`ts = Simulink.BlockDiagram.getSampleTimes('model')` performs an update diagram and then returns the sample times associated with the block diagram `model`. The update diagram ensures that the sample time information returned is up to date. If the model is already in the compiled state via a call to the model API, then an update diagram is not necessary.

Using this method allows you to access all information in the Sample Time Legend programmatically.

### Input Arguments

*model*

Name or handle of a Simulink model

### Output Arguments

*ts*

The command returns a `1xn` array of `Simulink.SampleTime` objects associated with the model passed to `Simulink.BlockDiagram.getSampleTimes`. Here `n` is the number of sample times associated with the block diagram. The format of the returns is as follows:

```
1xn Simulink.SampleTime
Package: Simulink
value: [1x2 double]
Description: [char string]
ColorRGBValue: [1x3 double]
Annotation: [char string]
OwnerBlock: [char string]
ComponentSampleTimes: [1x2 struct]
Methods
```

- `value` — A two-element array of doubles that contains the sample time period and offset.
- `Description` — A character vector or string that describes the sample time type.
- `ColorRGBValue` — A `1x3` array of doubles that contains the red, green, and blue (RGB) values of the sample time color.
- `Annotation` — A character vector or string that represents the annotation of a specific sample time (e.g., 'D1').
- `OwnerBlock` — For asynchronous and variable sample times, a character vector or string containing the full path to the block that controls the sample time. For all other types of sample times, an empty character vector or string.

- `ComponentSampleTimes` — A structure array of elements of the same type as `Simulink.BlockDiagram.getSampleTimes` if the sample time is an async union or if the sample time is hybrid and the component sample times are available.

## **Version History**

**Introduced in R2009a**

## **See Also**

`Simulink.Block.getSampleTimes`

## Simulink.BlockDiagram.propagateConfigSet

Propagate top model configuration reference to referenced models

### Syntax

```
[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model)
[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model, 'include', refModels)
[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model, 'exclude', refModels)
handle = Simulink.BlockDiagram.propagateConfigSet(model, 'gui')
```

### Description

`[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model)` propagates the configuration reference for `model` to all referenced models. Execute the function from a writable folder.

`[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model, 'include', refModels)` propagates the configuration reference for `model` to the models in the `refModels` list. Execute the function from a writable folder.

`[isPropagated, convertedModels] = Simulink.BlockDiagram.propagateConfigSet(model, 'exclude', refModels)` propagates the configuration reference for `model` to all referenced models in the hierarchy except for the models in the `refModels` list. Execute the function from a writable folder.

`handle = Simulink.BlockDiagram.propagateConfigSet(model, 'gui')` opens the **Configuration Reference Propagation to Referenced Models** dialog box.

### Examples

#### Propagate a Configuration Reference to All Referenced Models

```
openExample('simulink/VisualizeModelReferenceHierarchiesExample')
[isPropagated, convertedModels] = ...
Simulink.BlockDiagram.propagateConfigSet('sldemo_mdref_depgraph')
```

#### Propagate a Configuration Reference to Listed Referenced Models

```
openExample('simulink/VisualizeModelReferenceHierarchiesExample')
[isPropagated, convertedModels] = ...
Simulink.BlockDiagram.propagateConfigSet(...
'sldemo_mdref_depgraph', 'include', ...
{'sldemo_mdref_heater', 'sldemo_mdref_house'})
```

## Propagate a Configuration Reference to Referenced Models with Exclusions

```
openExample('simulink/VisualizeModelReferenceHierarchiesExample')
[isPropagated,convertedModels] = ...
Simulink.BlockDiagram.propagateConfigSet(...
'sldemo_mdhref_depgraph','exclude',...
{'sldemo_mdhref_heater','sldemo_mdhref_house'})
```

## Open the Configuration Reference Propagation to Referenced Models Dialog Box for a Model

```
openExample('simulink/VisualizeModelReferenceHierarchiesExample')
Simulink.BlockDiagram.propagateConfigSet(...
'sldemo_mdhref_depgraph','gui')
```

## Input Arguments

### model — Top model

character vector | string scalar

Top model with configuration reference to propagate, specified as a character vector or string scalar.

Example: 'mdl'

### refModels — Referenced models

cell array of character vectors | string array

List of referenced models to be included or excluded in propagation, specified as a cell array of character vectors or string array.

Example: {'mdl1','mdl2','mdl3'}

## Output Arguments

### isPropagated — Success of propagation

false (default) | true

Indication of whether configuration reference propagation is successful, specified as a Boolean.

### convertedModels — Converted models

cell array of character vectors

List of converted model names, specified as a cell array of character vectors.

### handle — Handle to dialog box

handle

Handle to the **Configuration Reference Propagation to Referenced Models** dialog box. Returned when you specify the 'gui' argument to the function.

## Version History

Introduced in R2012b

**See Also**

“Share a Configuration with Multiple Models”

# Simulink.BlockDiagram.restoreConfigSet

Restore model configuration for converted models

## Syntax

```
[isRestored, restoredModels] = Simulink.BlockDiagram.restoreConfigSet(model)
```

## Description

```
[isRestored, restoredModels] = Simulink.BlockDiagram.restoreConfigSet(model)
```

restores the model configuration for all converted models after propagating a configuration reference from a top model to the referenced models. Execute the function from a writable folder.

## Examples

### Restore the Model Configuration for Converted Models

```
openExample('simulink/VisualizeModelReferenceHierarchiesExample')
[isRestored, restoredModels] = ...
Simulink.BlockDiagram.restoreConfigSet('sldemo_mdref_depgraph');
```

## Input Arguments

### model — Top model

character vector | string scalar

Name of top model, specified as a character vector or string scalar.

Example: 'mdl'

## Output Arguments

### isRestored — Success of restoration

false (default) | true

Indication of whether configuration reference propagation is successful, specified as a Boolean.

### restoredModels — Restored models

cell array of character vectors

List of restored model names, specified as a cell array of character vectors.

## Version History

Introduced in R2012b

Simulink.BlockDiagram.propagateConfigSet

**Topics**

“Share a Configuration Across Referenced Models”

“Share a Configuration with Multiple Models”

# Simulink.BlockDiagram.loadActiveConfigSet

**Package:** Simulink.BlockDiagram

Load, associate, and activate configuration set with model

## Syntax

```
Simulink.BlockDiagram.loadActiveConfigSet(model, file)
```

## Description

`Simulink.BlockDiagram.loadActiveConfigSet(model, file)` loads a configuration set, attaches it to a model, and makes it the active configuration set for the model.

## Examples

### Load and Activate a Configuration Set

Load a saved configuration set to a model and activate it.

Open the “Modeling a Fault-Tolerant Fuel Control System” on page 13-121 example model `sldemo_fuelsys`. Save the active configuration set to a file.

```
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
sldemo_fuelsys
Simulink.BlockDiagram.saveActiveConfigSet('sldemo_fuelsys', 'fuelsys_config_set.m')
```

Open the `vdp` model. Load the saved configuration set to `vdp` and activate it.

```
vdp
Simulink.BlockDiagram.loadActiveConfigSet('vdp', 'fuelsys_config_set.m')
```

## Input Arguments

### **model** — Target model

character vector | string scalar

Name or handle of the target model for which you want to use the configuration set, specified as a character vector or string scalar.

Example: `'my_model'`

### **file** — Name of file

character vector | string scalar

Name of the file that contains the configuration set, specified as a character vector or string scalar.

Example: `'configset.m'`

## Tips

- If you load a configuration set with the same name as the active configuration set, Simulink overwrites the active configuration set.
- If you load a configuration set with the same name as an inactive configuration set associated with the model, Simulink detaches the inactive configuration from the model.
- If you load a configuration set object that contains an invalid custom target, Simulink sets the System target file (Simulink Coder) parameter to `ert.tlc`.

## Version History

**Introduced in R2010b**

### Topics

“Load a Saved Configuration Set”

# Simulink.BlockDiagram.saveActiveConfigSet

**Package:** Simulink.BlockDiagram

Save active configuration set of model

## Syntax

```
Simulink.BlockDiagram.saveActiveConfigSet(model, file)
```

## Description

`Simulink.BlockDiagram.saveActiveConfigSet(model, file)` saves the active configuration set of a model to an `.m` file or MAT-file.

## Examples

### Save a Configuration Set

Save the configuration set from the `sldemo_fuelsys` model as a `ConfigSet` object in the file `my_config_set.mat`.

Open the “Modeling a Fault-Tolerant Fuel Control System” on page 13-121 example model `sldemo_fuelsys`.

```
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
sldemo_fuelsys
```

Save the active configuration set.

```
Simulink.BlockDiagram.saveActiveConfigSet('sldemo_fuelsys','my_config_set.mat')
```

## Input Arguments

### **model** — Model using configuration set

character vector | string scalar

Name or handle of the model that uses the configuration set that you want to save, specified as a character vector or string scalar.

Example: `'my_model'`

### **file** — Name of file

character vector | string scalar

Name of the file to save the configuration set, specified as a character vector or string scalar. If you specify an `.m` extension, the file contains a function that creates a configuration set object. If you specify a `.mat` extension, the file contains a configuration set object. If you do not provide a file extension, the active configuration set is saved to a file with a `.m` extension. Do not specify `filename` to be the same as a model name; otherwise, the software cannot determine which file contains the configuration set object when loading the file.

---

**Note** If you specify a `.mat` extension when you save the active configuration set, all of the parameters are preserved. If you specify a `.m` extension, the `.m` file does not include hidden or disabled parameters.

---

Example: `'configset.m'`

## **Version History**

**Introduced in R2010b**

# Simulink.BlockDiagram.routeLine

Route existing lines of model

## Syntax

```
Simulink.BlockDiagram.routeLine(lines)
Simulink.BlockDiagram.routeLine('DeferredLines')
```

## Description

`Simulink.BlockDiagram.routeLine(lines)` takes an array of existing line handles as input and routes the corresponding lines. Routing existing lines improves line route quality and avoids overlaps with other lines and obstacles in the model.

To find the line handles in the model you want to route, use the `find_system` or `get_param` function.

`Simulink.BlockDiagram.routeLine('DeferredLines')` performs all line updates that the `LineUpdate` model parameter defers while a script runs. For this command to route lines, all of these conditions must apply:

- The `LineUpdate` model parameter is set to 'deferred'.
- The script that contains this command affects line routing before using this command.
- If the script saves models, the script affects line routing after using the `save_system` function and before using this command.

## Examples

### Route Existing Lines of Model

Route existing lines of a model that overlap with other lines and blocks in the model.

Open the model `ex_route_lines`.

```
open_system('ex_route_lines');
```

The two lines in the top-level system overlap with each other and with a block. To route these lines, create an array of line handles by using `find_system`. Then, call `Simulink.BlockDiagram.routeLine` with this array as input.

```
lineHandles = find_system(gcs,'FindAll','On','SearchDepth',1,'Type','Line');
Simulink.BlockDiagram.routeLine(lineHandles);
```

The updated model has no overlaps.

### Route Lines Affected by Script

When the `LineUpdate` model parameter is set to `'deferred'`, scripts postpone line routing until they pause, complete, or run the `Simulink.BlockDiagram.routeLine('DeferredLines')` command.

Model `ex_route_deferred_lines` contains virtual subsystems with numerous signal lines connecting them.

To see how the `Simulink.BlockDiagram.routeline('DeferredLines')` command works with the `LineUpdate` model parameter, set this parameter to `'deferred'`.

```
set_param(0,'LineUpdate','deferred');
```

### Capture Image Before Routing Deferred Lines

Run a MATLAB® script that loads the model, moves blocks within the model, and saves an image of the model.

```
load_system('ex_route_deferred_lines');
set_param([gcs '/Subsystem2'],'Position',[765 -370 855 -330]);
set_param([gcs '/Subsystem3'],'Position',[300 215 390 335]);
set_param([gcs '/Subsystem4'],'Position',[270 -135 360 -95]);
print('-s','deferred_lines_unrouted','-dpng');
```

Because the script saves an image of the model before the deferred lines are routed, lines overlap other lines and obstacles in the model.

### Capture Image After Routing Deferred Lines

Run a MATLAB script that loads the original model, moves blocks within the model, updates affected line routing, and saves an image of the model.

```
load_system('ex_route_deferred_lines');
set_param([gcs '/Subsystem2'],'Position',[765 -370 855 -330]);
set_param([gcs '/Subsystem3'],'Position',[300 215 390 335]);
set_param([gcs '/Subsystem4'],'Position',[270 -135 360 -95]);
Simulink.BlockDiagram.routeLine('DeferredLines');
print('-s','deferred_lines_routed','-dpng');
```

Adding command `Simulink.BlockDiagram.routeLine('DeferredLines')` before the print function improves line routing in the saved image.

## Input Arguments

### **Lines** — Handles of lines to route

numeric array

Handles of lines to route, specified as a numeric array. To find the line handles in your model, use the `find_system` or `get_param` function.

Data Types: `double`

## Limitations

- Line routing can require additional empty space on the Simulink canvas. If the canvas does not have the required empty space, using `Simulink.BlockDiagram.routeLine` might not improve line route quality.
- For large models with many lines to route, `Simulink.BlockDiagram.routeLine` can take several minutes to execute.

## Version History

Introduced in R2019a

# Simulink.Bus.addElementToPort

Add element to root input bus element port

## Syntax

```
Simulink.Bus.addElementToPort(model,port,element)
```

## Description

`Simulink.Bus.addElementToPort(model,port,element)` adds the specified element `element` to the specified root input bus element port `port` in the specified model `model`. This function does not add a block to the model.

## Examples

### Add Elements to Bus Element Port

Suppose you want to create a model that receives a bus. The input bus contains a bus named `sinusoidal`, a signal named `constant`, and a bus named `nonsinusoidal`. The `sinusoidal` bus contains signals named `sine` and `chirp`. The `nonsinusoidal` bus contains signals named `pulse` and `saw`.

Open a new model named `myModel`.

```
model = new_system("myModel");
open_system(model);
```

Add an In Bus Element block to the model. Name the port `myBusPort`, and specify `sine` as the element selected by the block. When you specify `sine`, use dots to indicate the levels of bus hierarchy.

```
add_block("simulink/Ports & Subsystems/In Bus Element",...
 "myModel/In Bus Element",...
 PortName="myBusPort",...
 Element="sinusoidal.sine");
```

When you do not specify an element for the block to select, by default, the block selects an element named `signal1`.

Add the remaining elements to the input port that corresponds with the In Bus Element block.

```
Simulink.Bus.addElementToPort("myModel",...
 "myBusPort",...
 "sinusoidal.chirp");
Simulink.Bus.addElementToPort("myModel",...
 "myBusPort",...
 "constant");
Simulink.Bus.addElementToPort("myModel",...
 "myBusPort",...
 "nonsinusoidal.pulse");
```

```
Simulink.Bus.addElementToPort("myModel",...
 "myBusPort",...
 "nonsinusoidal.saw");
```

## Input Arguments

### **model** — Model name

character vector | string scalar

Model name, specified as a character vector or string scalar.

Data Types: char | string

### **port** — Root input bus element port name

character vector | string scalar

Root input bus element port name, specified as a character vector or string scalar.

### Limitations

Input bus element ports of subsystems are not supported.

Data Types: char | string

### **element** — New bus element

character vector | string scalar

New bus element, specified as a character vector or string scalar.

For elements of nested buses, use dots to indicate each level of bus hierarchy. For example, to add a nested bus named `sinusoidal` with an element named `sine`, set `element` to `sinusoidal.sine`.

To add an element to a bus when a `Simulink.Bus` object specifies the bus hierarchy, edit the `Bus` object.

Data Types: char | string

## Alternative Functionality

In the In Bus Element block dialog box, click the **Add element** button arrow. Then, select **Add element without block**.

## Version History

Introduced in R2022b

# Simulink.Bus.cellToObject

Convert cell array containing bus information to Simulink.Bus objects

## Syntax

```
Simulink.Bus.cellToObject(busCell)
Simulink.Bus.cellToObject(busCell,scope)
```

## Description

`Simulink.Bus.cellToObject(busCell)` creates a set of `Simulink.Bus` objects in the MATLAB base workspace from a cell array of bus information.

`Simulink.Bus.cellToObject(busCell,scope)` creates a set of `Simulink.Bus` objects in the data dictionary specified by `scope` from a cell array of bus information.

## Examples

### Create Simulink.Bus Object from Cell Array of Bus Information

This example shows how to create and use a cell array to generate `Simulink.Bus` objects in the base workspace.

To define the elements that the Bus object contains, create an array of `Simulink.BusElement` objects or a cell array of the property values for the `BusElement` objects.

When you define the elements in an array of `BusElement` objects, you must specify the values that differ from the default.

```
elementsArray(1) = Simulink.BusElement;

elementsArray(2) = Simulink.BusElement;
elementsArray(2).Name = 'b';
elementsArray(2).Min = -3;
elementsArray(2).Max = 3;
elementsArray(2).Unit = 'm';
elementsArray(2).Description = 'b is distance from the origin.';
```

When you define the elements in a cell array of property values, you must specify the element name, dimensions, data type, complexity, and sampling mode. You can also specify the dimensions mode, minimum, maximum, units, and description.

```
elementsCellArray = {{ 'a',1,'double',-1,'real','Sample'}; ...
 { 'b',1,'double','real','Sample',...
 'Fixed',-3,3,'m','b is distance from the origin'}};
```

In this example, `elementsArray` and `elementsCellArray` create the same `BusElement` objects in the Bus objects.

Create a cell array with two subordinate cell arrays that define Bus objects. For each Bus object, specify the bus name, header file, description, data scope, alignment, preserve element dimensions,

and elements. For the first Bus object, specify the elements using `elementsArray`. For the second Bus object, specify the elements using `elementsCellArray`.

```
busCells = { ...
 { ...
 'myBusObjArray', ...
 'MyHeader.h', ...
 'My description', ...
 'Exported', ...
 '-1', ...
 '0', ...
 elementsArray,...
 }, ...
 { ...
 'myBusObjCellArray', ...
 'MyHeader.h', ...
 'My description', ...
 'Exported', ...
 '-1', ...
 '0', ...
 elementsCellArray,...
 }, ...
};
```

Generate the Bus objects in the base workspace from the cell array of cell arrays.

```
Simulink.Bus.cellToObject(busCells)
```

Compare the generated Bus objects in the **Type Editor**.

```
typeeditor
```

The Bus objects are identical other than their names.

## Input Arguments

### **busCell** — Simulink.Bus object information

cell array of cell arrays

Bus object information, specified as a cell array of cell arrays. Each subordinate cell array must contain this Bus object information:

- 1 Bus name
- 2 Header file
- 3 Description
- 4 Data scope
- 5 Alignment
- 6 Preserve Element Dimensions
- 7 Elements

The `elements` field is a cell array that contains this information for each of the `Simulink.BusElement` objects that the Bus object references:

The `elements` field must contain arrays or cell arrays with this information for each of the `Simulink.BusElement` objects that the `Bus` object references:

- 1 Element name
- 2 Dimensions
- 3 Data type
- 4 Sample time (optional) — If you specify a sample time, specify an inherited sample time (-1). A noninherited sample time causes an error during model compilation. For more information, see “`Simulink.BusElement` objects no longer support the `SampleTime` property” on page 2-519.
- 5 Complexity
- 6 Sampling mode

The `elements` field arrays or cell arrays can also contain this information:

- 1 Dimensions mode
- 2 Minimum
- 3 Maximum
- 4 Units
- 5 Description

Example: `Simulink.Bus.cellToObject(busCell);`

### **scope — Data dictionary to contain Simulink.Bus objects**

`Simulink.data.Dictionary` object

Data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this argument, represent the dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

If `scope` is empty, the function uses the MATLAB base workspace as the source of the `Bus` objects.

Example: `Simulink.Bus.cellToObject(busCell,dataDictionaryObject);`

## **Tips**

The inverse function is `Simulink.Bus.objectToCell`.

## **Version History**

**Introduced before R2006a**

### **Simulink.BusElement objects no longer support the SampleTime property**

*Errors starting in R2020b*

The `SampleTime` property of `Simulink.BusElement` objects is no longer supported.

`BusElement` objects that specify a sample time cause an error during compile. To remove the sample time specification from a `BusElement` object, set its `SampleTime` to -1.

`Simulink.Bus.cellToObject` continues to accept cell arrays that specify sample time for bus elements. `Simulink.Bus.objectToCell`, `Simulink.Bus.save`, and

`Simulink.Bus.createObject` continue to return cell arrays or arrays that include the sample time when it is noninherited. When the sample time is inherited (-1), they omit it. Similarly, the **Type Editor** and **Model Explorer** omit the sample time when it is inherited.

To specify the sample time for an element of a bus, use the `SampleTime` block parameter of corresponding blocks. For example, you can use `In Bus Element`, `Out Bus Element`, and `Signal Specification` blocks to specify sample time.

### **Simulink.BusElement objects will no longer support the SamplingMode property**

*Not recommended starting in R2016b*

In R2016b, the `SamplingMode` property of `Simulink.BusElement` objects was removed. Scripts that use the `SamplingMode` property of `Simulink.BusElement` objects continue to work. `Simulink.Bus.cellToObject` continues to require the `SamplingMode` field and `Simulink.Bus.objectToCell` continues to include the sampling mode in the output cell arrays.

In a future release, support for the `SamplingMode` property will be removed.

To specify whether a signal is sample-based or frame-based, define the sampling mode of input signals at the block level instead of at the signal level.

# Simulink.Bus.createMATLABStruct

Create MATLAB structures that use the same hierarchy and attributes as buses

## Syntax

```
structs = Simulink.Bus.createMATLABStruct(buses)
structs = Simulink.Bus.createMATLABStruct(buses,values)
structs = Simulink.Bus.createMATLABStruct(buses,values,dims)
structs = Simulink.Bus.createMATLABStruct(buses,values,dims,scope)
```

## Description

`structs = Simulink.Bus.createMATLABStruct(buses)` creates one or more MATLAB structures that have the same hierarchy and attributes as the specified buses. The resulting structures use the ground values of the buses. Use this syntax to create initialization structures for multiple bus ports.

`structs = Simulink.Bus.createMATLABStruct(buses,values)` creates one or more structures that use the specified values.

`structs = Simulink.Bus.createMATLABStruct(buses,values,dims)` creates one or more structures that have the specified dimensions. To create a structure for an array of buses, include the `dims` argument.

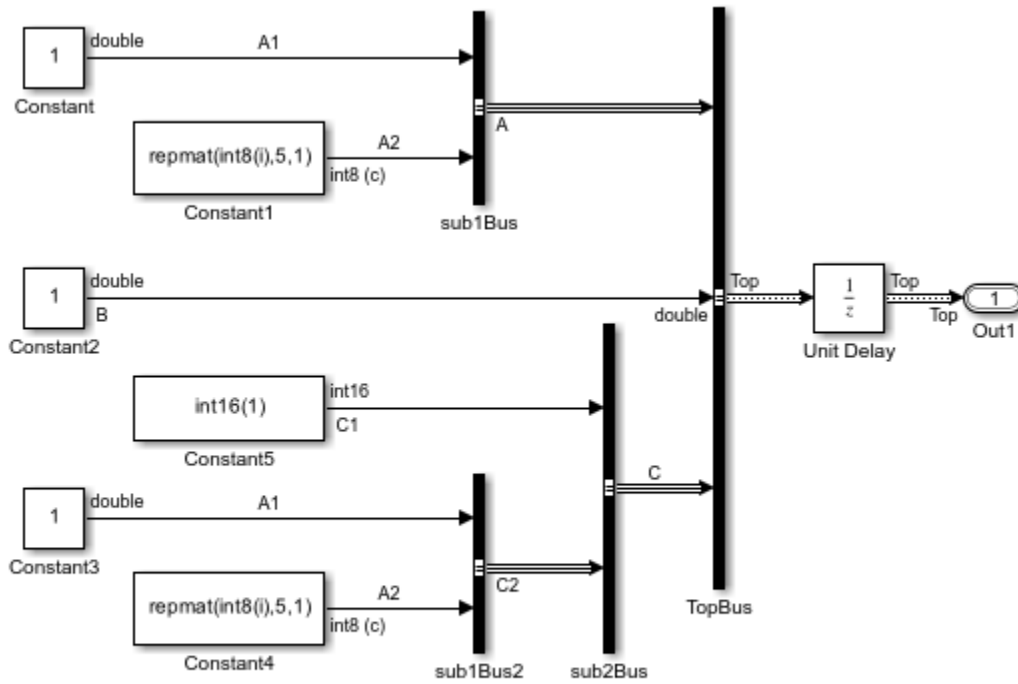

`structs = Simulink.Bus.createMATLABStruct(buses,values,dims,scope)` creates one or more structures in the data dictionary specified by `scope`.

## Examples

### Create MATLAB Structure from Bus Object

Open and simulate model `ex_bus_initial_conditions`.

```
open_system('ex_bus_initial_conditions')
sim('ex_bus_initial_conditions');
```

Copyright 2004-2018 The MathWorks, Inc.

Create a MATLAB structure using bus object Top, which model `ex_bus_initial_conditions` loads.

```
mStruct = Simulink.Bus.createMATLABStruct('Top');
```

Set a value for the field of the `mStruct` structure that corresponds to bus element A1 of bus A.

```
mStruct.A.A1 = 3;
mStruct.A
```

```
ans =
```

```
struct with fields:
```

```
A1: 3
A2: [5x1 int8]
```

Simulink sets the other fields in the structure to the ground values of the corresponding bus elements.

You can use `mStruct` as the initial condition structure for the Unit Delay block.

### Initialize Signal Elements that Use a Data Type Other than Double

Create a MATLAB structure for a bus whose signal elements use a data type other than `double`. Use a partial structure to specify initialization values for a subset of the elements. When you create the

partial structure, match the data types of the fields with the data types of the corresponding elements.

Open and simulate model `ex_bus_initial_conditions`.

```
open_system('ex_bus_initial_conditions')
sim('ex_bus_initial_conditions');
```

Copyright 2004-2018 The MathWorks, Inc.

The C1 signal element that the block labeled Constant5 produces uses the data type `int16`.

Find the port handle for the Bus Creator block port that produces the Top bus signal.

```
ph = get_param('ex_bus_initial_conditions/TopBus', 'PortHandles');
```

Create a partial structure that specifies values for a subset of the elements in the bus signal created by the TopBus block. To set the value of the `C.C1` field, use a typed expression. Match the data type in the expression with the data type of the signal element in the model (`int16`).

```
PartialstructForK = struct('B',3,'C',struct('C1',int16(5)));
```

Create a full structure by using the port handle (`ph`) for the TopBus block. Override the ground values for the `C.C1` and `B` elements.

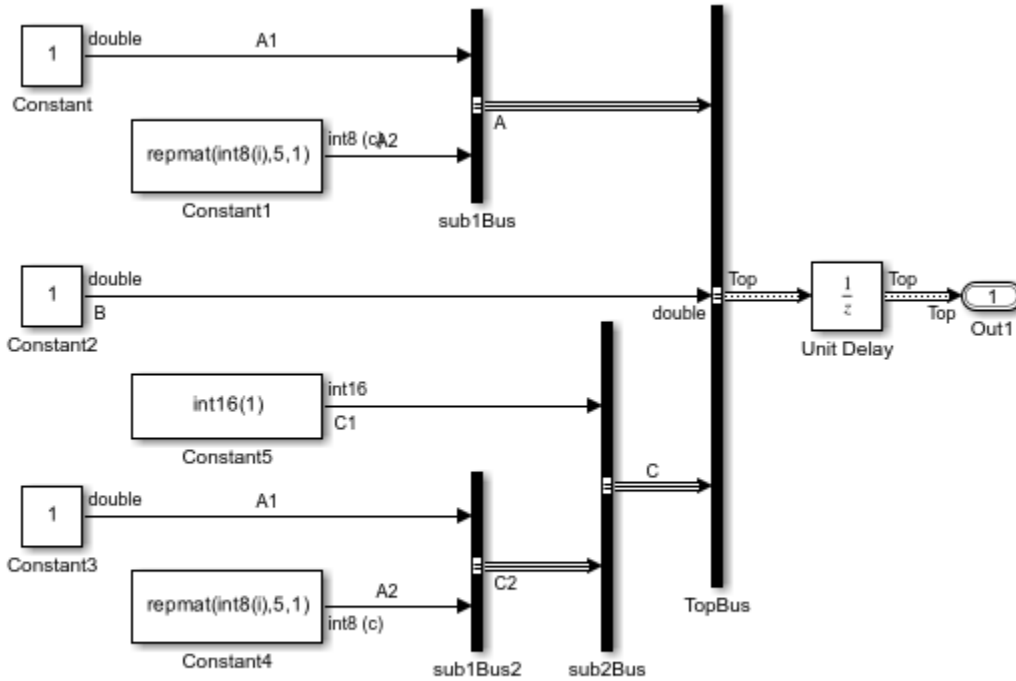

```
outPort = ph.Outport;
mStruct = Simulink.Bus.createMATLABStruct(outPort,PartialstructForK);
```

The field `C.C1` in the output structure continues to use the data type `int16`.

### Create MATLAB Structure with Specified Dimensions

Open and simulate model ex\_bus\_initial\_conditions.

```
open_system('ex_bus_initial_conditions')
sim('ex_bus_initial_conditions');
```

Copyright 2004-2018 The MathWorks, Inc.

Create a partial structure for a subset of bus elements in the bus created by the TopBus block.

```
PartialStructForK = struct('A',struct('A1',4),'B',3)
```

```
PartialStructForK =
 struct with fields:
 A: [1x1 struct]
 B: 3
```

Create a MATLAB structure using bus object Top, a partial structure, and dimensions for the resulting structure.

```
structFromBus = Simulink.Bus.createMATLABStruct...
('Top',PartialStructForK,[2 3])
```

```
structFromBus =
```

2x3 struct array with fields:

A  
B  
C

## Create Cell Array of MATLAB Structures

To create initialization structures for multiple bus ports, specify port handles as arguments for `Simulink.Bus.createMATLABStruct`. The resulting cell array of structures uses ground values.

Open and simulate model `ex_two_outports_create_struct`.

```
open_system('ex_two_outports_create_struct')
sim('ex_two_outports_create_struct');
```

Find the port handles for the Bus Creator blocks Bus1 and Bus2.

```
ph_1 = get_param...
 ('ex_two_outports_create_struct/Bus Creator', 'PortHandles');
ph_2 = get_param...
 ('ex_two_outports_create_struct/Bus Creator1', 'PortHandles');
```

Create a MATLAB® structure using an array of port handles.

```
mStruct = Simulink.Bus.createMATLABStruct([ph_1.Outport ph_2.Outport])
```

```
mStruct =
 2x1 cell array
 {1x1 struct}
```

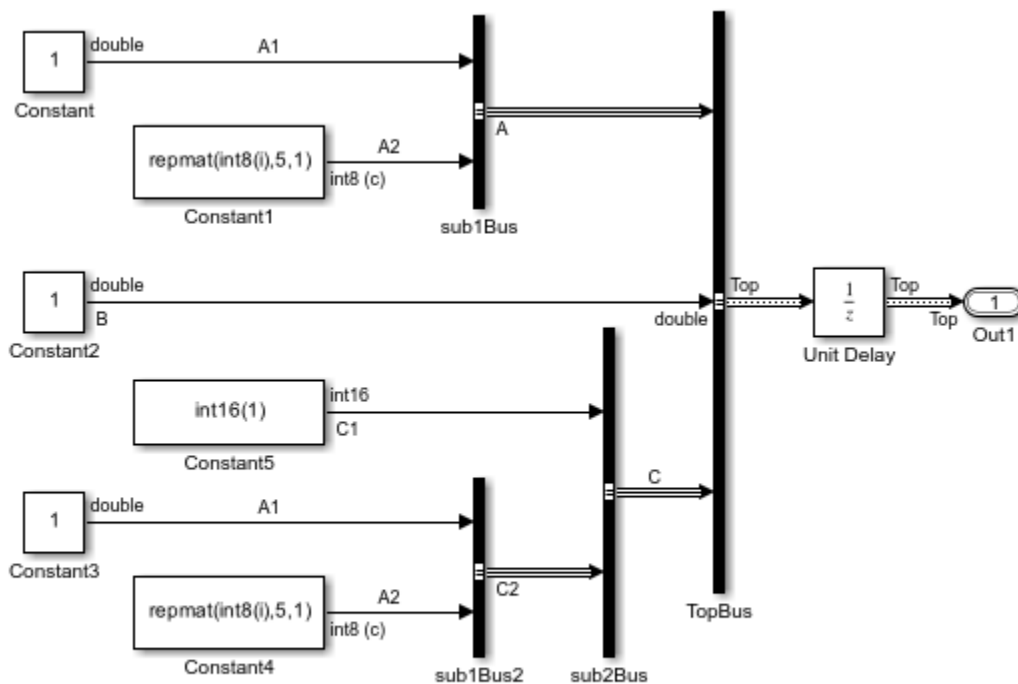

```
{1x1 struct}
```

### Create MATLAB Structure from Bus Port and Partial Structure

Create a MATLAB structure based on a port that connects to a bus signal. Use a partial structure to specify values for a subset of the bus elements in the bus that connects to the port.

Open and simulate model `ex_bus_initial_conditions`.

```
open_system('ex_bus_initial_conditions')
sim('ex_bus_initial_conditions');
```

Copyright 2004-2018 The MathWorks, Inc.

Find the port handle for the Bus Creator block port that produces the Top bus signal. The Output handle is the handle that you need.

```
ph = get_param('ex_bus_initial_conditions/TopBus', 'PortHandles')
```

```
ph =
```

```
struct with fields:
```

```
Inport: [407.0040 409.0057 437.0039]
Output: 442.0037
Enable: []
Trigger: []
```

```

 State: []
 LConn: []
 RConn: []
 Ifaction: []
 Reset: []
 Event: []

```

Create a partial structure for the bus signal created by the TopBus block. You can use a partial structure to specify values for a subset of bus elements.

```
PartialstructForK = struct('A',struct('A1',4), 'B',3)
```

```

PartialstructForK =
 struct with fields:
 A: [1x1 struct]
 B: 3

```

Bus elements represented by structure fields `Top.B` and `Top.A` are at the same level in the bus hierarchy. You can use this partial structure to override the ground values for the B and A bus signal elements.

When you create a structure from a bus object or from a bus port, you can use a partial structure as an optional argument.

Create a MATLAB structure by using the port handle (ph) for the TopBus block. Override the ground values for the A.A1 and B bus elements.

```

outPort = ph.Outport;
mStruct = Simulink.Bus.createMATLABStruct(outPort,PartialstructForK)

```

```

mStruct =
 struct with fields:
 A: [1x1 struct]
 B: 3
 C: [1x1 struct]

```

## Input Arguments

### buses — Source of bus information

Simulink.Bus object name | port handle | cell array of Simulink.Bus object names | array of port handles

Source of the bus information, specified as a Bus object name, port handle, cell array of Bus object names, or array of port handles.

- If you use a Bus object name, then the Bus object must be in the MATLAB base workspace or the data dictionary used by the model. The data type for a Bus object name is `char` or `string`.

- If you use a port handle, then the model must compile successfully before you use this function. The data type for a port handle is `double`.
- For an array of buses, you cannot use a port handle.
- If you use the `dims` argument, then for the `buses` argument, use a `Bus` object or cell array of `Bus` objects.

Specifying a cell array of `Bus` object names or an array of port handles creates multiple structures with one `Simulink.Bus.createMATLABStruct` call and provides better performance than using separate `Simulink.Bus.createMATLABStruct` calls to create the structures.

Example: `struct = Simulink.Bus.createMATLABStruct('BusObject')`

Example: `structs = Simulink.Bus.createMATLABStruct({'BusObject', 'BusObject1'})`

Example: `struct = Simulink.Bus.createMATLABStruct(portHandle)`

Example: `structs = Simulink.Bus.createMATLABStruct([portHandle, portHandle1])`

Data Types: `double` | `char` | `string` | `struct` | `cell`

### **values** — Values for subset of elements in resulting structure

`[]` | partial structure | cell array

Values for a subset of elements in the resulting structure, specified as an empty matrix (`[]`), partial structure, or cell array. The cell array must contain a partial structure or empty matrix for each specified source of bus information.

For information on creating partial structures, see “Create Partial Structures for Initialization”.

To use ground values, use an empty matrix.

Example: `struct = Simulink.Bus.createMATLABStruct('BusObject', PartialStruct)`

Data Types: `struct` | `cell`

### **dims** — Dimensions of resulting structure

scalar | vector | cell array

Dimensions of the resulting structure, specified as a vector.

Each dimension element must be an integer that is greater than or equal to 1. If you specify a partial structure for the `values` argument, each dimension element must be greater than or equal to its corresponding dimension element in the partial structure.

Example: `struct = Simulink.Bus.createMATLABStruct('BusObject', PartialStruct, [2 3])`

Example: `structs = Simulink.Bus.createMATLABStruct({'Bus', 'Bus1', 'Bus2'}, {[[]], [1, []]}, {1, 2, 3})`

Data Types: `double` | `cell`

### **scope** — Data dictionary to contain MATLAB structure

`Simulink.data.Dictionary` object

Data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this argument, represent the dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

If `scope` is empty, the function uses the MATLAB base workspace as the source of the Bus objects.

Example: `structs = Simulink.Bus.createMATLABStruct({'Bus', 'Bus1', 'Bus2'}, {[[], [], []]}, {1,1,1}, dataDictionaryObject)`

## Output Arguments

### **structs** — Structures with same signal hierarchy and attributes as buses

MATLAB structure | cell array of MATLAB structures

Structures with the same signal hierarchy and attributes as buses, returned as a MATLAB structure or a cell array of MATLAB structures.

The structure dimensions depend on the input arguments you specify:

- If you specify only the `buses` argument, then the dimension is 1.
- If you also specify the `values` argument, then the dimensions match the dimensions of `values`.
- If you specify the `dims` argument, then the dimensions match the dimensions of `dims`.

## Tips

- If you use the `Simulink.Bus.createMATLABStruct` function repeatedly for the same model (for example, in a loop in a script), you can improve performance by avoiding multiple model compilations. For improved speed, put the model in compile before using the function multiple times. For example, to put the `vdp` model in compile, use this command:

```
vdp([],[],[], 'compile')
```

After you create the MATLAB structure, terminate the compile by using this command:

```
vdp([],[],[], 'term')
```

- You can use the **Type Editor** to invoke the `Simulink.Bus.createMATLABStruct` function. In the Type Editor, select the Bus object for which you want to create a MATLAB structure. Then, in the toolstrip, click **MATLAB Structure**.

You can edit the MATLAB structure in the MATLAB Editor and evaluate the code to create or update the values in this structure.

- You can use the `Simulink.Bus.createMATLABStruct` function to specify the initial value of the output of a referenced model.

# Simulink.Bus.createObject

Create `Simulink.Bus` objects from blocks or MATLAB structures

## Syntax

```
busInfo = Simulink.Bus.createObject(model,blocks)
busInfo = Simulink.Bus.createObject(struct)
busInfo = Simulink.Bus.createObject(____,file)
busInfo = Simulink.Bus.createObject(____,file,format)
busInfo = Simulink.Bus.createObject(struct,file,format,scope)
```

## Description

`busInfo = Simulink.Bus.createObject(model,blocks)` creates `Simulink.Bus` objects for the specified blocks and returns information about the created Bus objects.

If you specify a block that corresponds to a bus hierarchy, this function creates Bus objects for each bus in the hierarchy.

If the model uses a data dictionary, the Bus objects are created in the data dictionary. Otherwise, they are created in the base workspace.

`busInfo = Simulink.Bus.createObject(struct)` creates Bus objects from a structure that can contain MATLAB timeseries, MATLAB timetable, and `matlab.io.datastore.SimulationDatastore` objects or a numeric structure.

If you specify a structure with hierarchy, this function creates Bus objects for each structure in the hierarchy.

The Bus objects are created in the base workspace.

`busInfo = Simulink.Bus.createObject( ____,file)` saves Bus objects in a function that defines object properties in a cell array of cell arrays, then creates the Bus objects by calling `Simulink.Bus.cellToObject`.

Specify any of the input argument combinations in the previous syntaxes followed by the `file` argument.

`busInfo = Simulink.Bus.createObject( ____,file,format)` saves Bus objects in a function with the specified format. The function can define object properties using cell arrays or arrays.

`busInfo = Simulink.Bus.createObject(struct,file,format,scope)` creates the Bus objects in the data dictionary specified by `scope`.

## Examples

### Create Simulink.Bus Object from Bus Creator Block

Open the example model.

```
open_system('BusObjectCreationModel')
```

Create a Bus object that corresponds with the bus created by the Bus Creator block.

```
busInfo = Simulink.Bus.createObject('BusObjectCreationModel',...
 'BusObjectCreationModel/Bus Creator');
```

### Create and Save Simulink.Bus Objects in a Function

Create Bus objects from two Bus Creator blocks and save the Bus object definition in a function.

Open the example model.

```
open_system('BusObjectCreationModel');
```

Assign the block handle for the Bus Creator block to a variable with the `getSimulinkBlockHandle` function.

```
bc = getSimulinkBlockHandle('BusObjectCreationModel/Bus Creator');
```

Alternatively, you can select a Bus Creator block in the model then use the `gcbh` function to get its block handle.

Assign the block handle for the Bus Creator1 block to a variable.

```
bc1 = getSimulinkBlockHandle('BusObjectCreationModel/Bus Creator1');
```

To create a Bus object, specify the block handle variables in a vector. To save the Bus object definition, also specify a file name.

```
busInfo = Simulink.Bus.createObject('BusObjectCreationModel',...
 [bc bc1], 'BusObjectFunction');
```

Since these Bus Creator blocks create a bus hierarchy, specifying only the Bus Creator1 block creates both Bus objects in the Workspace and in the function.

Compare the BusObjectFunction against the function created by this command.

```
topBusInfo = Simulink.Bus.createObject('BusObjectCreationModel',...
 bc1, 'BusObjectFunctionFromHierarchy');
```

For a function that is formatted to be easier to read, specify the function format as `object`.

```
topBusInfo1 = Simulink.Bus.createObject('BusObjectCreationModel',...
 bc1, 'BusObjectFunctionFormatted', 'object');
```

## Create Simulink.Bus Objects from MATLAB Structures

When you create a nonvirtual bus with a Constant block, you must specify a MATLAB structure for **Constant value** and a Simulink.Bus object as the **Output data type**.

For this example, create a structure that contains other structures.

```
bus_struct.A.A1 = 0;
bus_struct.A.A2 = [0 + 0i;0 + 0i;0 + 0i;0 + 0i;0 + 0i];
bus_struct.B = 5;
bus_struct.C.C1 = 0;
bus_struct.C.C2.A1 = 0;
bus_struct.C.C2.A2 = [0 + 0i;0 + 0i;0 + 0i;0 + 0i;0 + 0i];
```

Create the Bus objects that correspond with the structure.

```
busInfo = Simulink.Bus.createObject(bus_struct);
```

The function creates four Bus objects. The Bus object named `s1Bus1` corresponds to the top-level structure and uses a default Bus object name. The Bus objects named `A`, `C`, and `C2` correspond to the nested structures.

To view the Bus objects, open the **Type Editor**.

```
typeeditor
```

## Input Arguments

**model** — Model name or handle

character vector

Model name or handle, specified as a character vector.

The model you specify must compile successfully.

**blocks — Blocks associated with buses**

character vector | cell array of block path names | vector of block handles

Blocks associated with buses, specified as a character vector, cell array of block path names, or vector of block handles. For one block, specify the full path name of the block. For multiple blocks, specify either a cell array of block path names or a vector of block handles.

This function can create Bus objects from these blocks:

- Bus Creator blocks
- Subsystem Inport blocks
- Subsystem Outport blocks

If you specify a block associated with a bus hierarchy, the function also creates Bus objects for all nested buses in the hierarchy.

**struct — Structure of objects or numeric structure**

structure of MATLAB timeseries, MATLAB timetable, and matlab.io.datastore.SimulationDatastore objects | numeric structure

Structure of objects or numeric structure, specified as a structure that can contain MATLAB timeseries, MATLAB timetable, and matlab.io.datastore.SimulationDatastore objects or a numeric structure.

**file — Name of function being generated**

character vector

Name of function being generated, specified as a character vector. The file name must be unique.

**format — Format of function being generated**

'cell' (default) | 'object'

Format of function being generated, specified as either 'cell' or 'object'. The 'cell' format is more compact, but the 'object' format is easier to read.

The 'cell' format saves the Bus object definitions in a cell array of cell arrays and creates the Bus objects by calling `Simulink.Bus.cellToObject`. Each subordinate cell array represents a Bus object and contains these properties:

- 1 Bus name
- 2 Header file
- 3 Description
- 4 Data scope
- 5 Alignment
- 6 Preserve Element Dimensions
- 7 Elements

The `elements` field is a cell array that contains this information for each of the `Simulink.BusElement` objects that the Bus object references:

- 1 Element name
- 2 Dimensions
- 3 Data type
- 4 Sample time — The cell array contains this field when the sample time is not inherited. A noninherited sample time causes an error during model compilation. For more information, see “Simulink.BusElement objects no longer support the SampleTime property” on page 2-535.
- 5 Complexity
- 6 Dimensions mode
- 7 Minimum
- 8 Maximum
- 9 Units
- 10 Description

The 'object' format saves the Bus object definitions as arrays. The function uses array indexing to access elements of the array and dot notation to assign property values.

### scope — Data dictionary to contain Simulink.Bus objects

`Simulink.data.Dictionary` object

Data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this argument, represent the dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

If `scope` is empty, the function uses the MATLAB base workspace as the source of the Bus objects.

## Output Arguments

### busInfo — Bus object information

structure array

Bus object information, returned as a structure array.

When you specify `blocks`, each element of the `busInfo` structure array corresponds to one block and contains these fields:

- `block` — Handle of the block
- `busName` — Name of the Bus object associated with the block

When you specify a `struct`, the `busInfo` structure contains these fields:

- `block` — Empty matrix (`[]`)
- `busName` — Name of the Bus object that corresponds to the structure

## Version History

Introduced before R2006a

### Simulink.BusElement objects no longer support the SampleTime property

Errors starting in R2020b

The `SampleTime` property of `Simulink.BusElement` objects is no longer supported.

`BusElement` objects that specify a sample time cause an error during compile. To remove the sample time specification from a `BusElement` object, set its `SampleTime` to `-1`.

`Simulink.Bus.cellToObject` continues to accept cell arrays that specify sample time for bus elements. `Simulink.Bus.objectToCell`, `Simulink.Bus.save`, and `Simulink.Bus.createObject` continue to return cell arrays or arrays that include the sample time when it is noninherited. When the sample time is inherited (`-1`), they omit it. Similarly, the **Type Editor** and **Model Explorer** omit the sample time when it is inherited.

To specify the sample time for an element of a bus, use the `SampleTime` block parameter of corresponding blocks. For example, you can use `In Bus Element`, `Out Bus Element`, and `Signal Specification` blocks to specify sample time.

# Simulink.Bus.objectToCell

Use Simulink.Bus objects to create cell array containing bus information

## Syntax

```
cells = Simulink.Bus.objectToCell(busNames)
cells = Simulink.Bus.objectToCell(busNames,scope)
```

## Description

`cells = Simulink.Bus.objectToCell(busNames)` creates a cell array of bus information from a set of Simulink.Bus objects in the MATLAB base workspace. The cell array contains subordinate cell arrays that define each Bus object. The order of elements in the output cell array corresponds to the order of names in the input cell array.

`cells = Simulink.Bus.objectToCell(busNames,scope)` creates a cell array of bus information from a set of Bus objects in the data dictionary specified by `scope`. The cell array contains subordinate cell arrays that define each Bus object. The order of elements in the output cell array corresponds to the order of names in the input cell array.

## Examples

### Create Cell Array Containing Bus Object Information

Use the `Simulink.Bus.objectToCell` function to create a cell array of information about Simulink.Bus objects in the base workspace.

Open a model that has two Bus objects defined, CONTROL and MAIN.

```
open_system('ex_bus_object_tutorial_using_objects')
```

Create a cell array of information about the CONTROL Bus object.

```

cells = Simulink.Bus.objectToCell({'CONTROL'});
cells{1}

ans=1x7 cell array
 Columns 1 through 6

 {'CONTROL'} {0x0 char} {0x0 char} {'Auto'} {'-1'} {'0'}

 Column 7

 {2x1 cell}

```

## Input Arguments

### **busNames** — Names of Simulink.Bus objects

cell array of Bus object names

Bus objects for which to create cell arrays of Bus object information, specified as a cell array. Specify the Bus object names as character vectors. If `busNames` is empty, the function converts all Bus objects in the base workspace or data dictionary.

Example: `cells = Simulink.Bus.objectToCell({'busObject'})`

### **scope** — Data dictionary that contains Simulink.Bus objects

`Simulink.data.Dictionary` object

Data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this argument, represent the dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

If `scope` is empty, the function uses the MATLAB base workspace as the source of the Bus objects.

Example: `cells = Simulink.Bus.objectToCell({'busObject'},dataDictionaryObject)`

## Output Arguments

### **cells** — Bus object information

cell array of cell arrays

Bus object information, specified as a cell array of cell arrays. Each subordinate cell array contains these Bus object properties:

- 1 Bus name
- 2 Header file
- 3 Description
- 4 Data scope
- 5 Alignment
- 6 Preserve Element Dimensions
- 7 Elements

The `elements` field is a cell array that contains this information for each of the `Simulink.BusElement` objects that the Bus object references:

- 1 Bus element name
- 2 Dimensions
- 3 Data type
- 4 Sample time — The cell array contains this field when the sample time is not inherited. A noninherited sample time causes an error during model compilation. For more information, see “Simulink.BusElement objects no longer support the SampleTime property” on page 2-539.
- 5 Complexity
- 6 Sampling mode
- 7 Dimensions mode
- 8 Minimum
- 9 Maximum
- 10 Units
- 11 Description

## Tips

The inverse function is `Simulink.Bus.cellToObject`.

## Version History

### Introduced in R2007a

#### **Simulink.BusElement objects no longer support the SampleTime property**

*Errors starting in R2020b*

The `SampleTime` property of `Simulink.BusElement` objects is no longer supported.

`BusElement` objects that specify a sample time cause an error during compile. To remove the sample time specification from a `BusElement` object, set its `SampleTime` to `-1`.

`Simulink.Bus.cellToObject` continues to accept cell arrays that specify sample time for bus elements. `Simulink.Bus.objectToCell`, `Simulink.Bus.save`, and `Simulink.Bus.createObject` continue to return cell arrays or arrays that include the sample time when it is noninherited. When the sample time is inherited (`-1`), they omit it. Similarly, the **Type Editor** and **Model Explorer** omit the sample time when it is inherited.

To specify the sample time for an element of a bus, use the `SampleTime` block parameter of corresponding blocks. For example, you can use `In Bus Element`, `Out Bus Element`, and `Signal Specification` blocks to specify sample time.

#### **Simulink.BusElement objects will no longer support the SamplingMode property**

*Not recommended starting in R2016b*

In R2016b, the `SamplingMode` property of `Simulink.BusElement` objects was removed. Scripts that use the `SamplingMode` property of `Simulink.BusElement` objects continue to work. `Simulink.Bus.cellToObject` continues to require the `SamplingMode` field and `Simulink.Bus.objectToCell` continues to include the sampling mode in the output cell arrays.

In a future release, support for the `SamplingMode` property will be removed.

To specify whether a signal is sample-based or frame-based, define the sampling mode of input signals at the block level instead of at the signal level.

# Simulink.Bus.save

Save Simulink.Bus objects in function

## Syntax

```
Simulink.Bus.save(fileName)
Simulink.Bus.save(fileName,format)
Simulink.Bus.save(fileName,format,busNames)
Simulink.Bus.save(fileName,format,busNames,scope)
```

## Description

`Simulink.Bus.save(fileName)` saves all `Simulink.Bus` objects from the MATLAB base workspace in a function. The generated function defines object properties in a cell array of cell arrays, then creates the Bus objects by calling `Simulink.Bus.cellToObject`.

`Simulink.Bus.save(fileName,format)` saves the Bus objects in a function with the specified format. The function can define object properties using cell arrays or arrays.

`Simulink.Bus.save(fileName,format,busNames)` saves only the specified Bus objects in a function.

`Simulink.Bus.save(fileName,format,busNames,scope)` saves the Bus objects from the data dictionary specified by `scope` in a function.

## Examples

### Save a Simulink.Bus Object

Use the `Simulink.Bus.save` function to save a Bus object.

Create a cell array of Bus object information.

```
busCell = { ...
 { ...
 'myBusObj', ...
 'MyHeader.h', ...
 'My description', ...
 'Exported', ...
 '-1', ...
 '0', ...
 {'a',1,'double','real','Sample'}; ...
 {'b',1,'double','real','Sample', ...
 'Fixed',-3,3,'m','b is distance from the origin'}}, ...
 } ...
 { ...
 'myBusObj1', ...
 'MyHeader1.h', ...
 'My description', ...
 'Exported', ...
```

```

 '-1', ...
 '0', ...
 {'c',1,'double','real','Sample'}; ...
 {'d',1,'double','real','Sample'}}, ...
 } ...
};

```

Generate Bus objects in the base workspace from the cell array.

```
Simulink.Bus.cellToObject(busCell);
```

Save the Bus objects in a function, using the default format.

```
Simulink.Bus.save('BusObjectFunctionCellFormat');
```

For a function that is formatted to be easier to read, specify the function format as 'object'.

```
Simulink.Bus.save('BusObjectFunctionObjectFormat','object');
```

To save only one of the Bus objects in a function, specify the Bus object name.

```
Simulink.Bus.save('BusObjectFunctionSubset','cell',{'myBusObj'});
```

## Input Arguments

### **fileName** — Name of function to generate

character vector

Name of function to generate, specified as a character vector. The file name must be unique.

Example: `Simulink.Bus.save('BusObjectFunction');`

### **format** — Format of function to generate

'cell' (default) | 'object'

Format of function to generate, specified as either 'cell' or 'object'. The 'cell' format is more compact, but the 'object' format is easier to read.

The 'cell' format saves the Bus object definitions in a cell array of cell arrays and creates the Bus objects by calling `Simulink.Bus.cellToObject`. Each subordinate cell array represents a Bus object and contains these properties:

- 1 Bus name
- 2 Header file
- 3 Description
- 4 Data scope
- 5 Alignment
- 6 Preserve Element Dimensions
- 7 Elements

The elements field is a cell array that contains this information for each of the `Simulink.BusElement` objects that the Bus object references:

- 1 Element name
- 2 Dimensions
- 3 Data type
- 4 Sample time — The cell array contains this field when the sample time is not inherited. A noninherited sample time causes an error during model compilation. For more information, see “Simulink.BusElement objects no longer support the SampleTime property” on page 2-543.
- 5 Complexity
- 6 Dimensions mode
- 7 Minimum
- 8 Maximum
- 9 Units
- 10 Description

The 'object' format saves the Bus object definitions as arrays. The function uses array indexing to access elements of the array and dot notation to assign property values.

Example: `Simulink.Bus.save('BusObjectFunction','object');`

#### **busNames — Bus objects to save**

empty cell array | cell array of bus objects

Bus objects to save, specified as an empty cell array ({} ) or a cell array of Bus object names.

When you specify a cell array of Bus object names, only the specified Bus objects are saved.

When you specify an empty cell array, all Bus objects are saved. Use an empty cell array to save all Bus objects in the data dictionary specified by scope.

Example: `Simulink.Bus.save('BusObjectFunction','cell',{'myBusObj'});`

#### **scope — Data dictionary that contains Bus objects**

Simulink.data.Dictionary object

Data dictionary, specified as a Simulink.data.Dictionary object. Before you use this argument, represent the dictionary with a Simulink.data.Dictionary object by using, for example, the Simulink.data.dictionary.create or Simulink.data.dictionary.open function.

If scope is empty, the function uses the MATLAB base workspace as the source of the Bus objects.

Example: `Simulink.Bus.save('BusObjectFunction','cell',{},dataDictionaryObject);`

## **Version History**

**Introduced before R2006a**

### **Simulink.BusElement objects no longer support the SampleTime property**

*Errors starting in R2020b*

The SampleTime property of Simulink.BusElement objects is no longer supported.

BusElement objects that specify a sample time cause an error during compile. To remove the sample time specification from a BusElement object, set its SampleTime to -1.

`Simulink.Bus.cellToObject` continues to accept cell arrays that specify sample time for bus elements. `Simulink.Bus.objectToCell`, `Simulink.Bus.save`, and `Simulink.Bus.createObject` continue to return cell arrays or arrays that include the sample time when it is noninherited. When the sample time is inherited (-1), they omit it. Similarly, the **Type Editor** and **Model Explorer** omit the sample time when it is inherited.

To specify the sample time for an element of a bus, use the `SampleTime` block parameter of corresponding blocks. For example, you can use `In Bus Element`, `Out Bus Element`, and `Signal Specification` blocks to specify sample time.

# Simulink.clearIntEnumType

Delete enumeration classes defined by `Simulink.defineIntEnumType`

## Syntax

```
Simulink.clearIntEnumType(typeName)
Simulink.clearIntEnumType()
```

## Description

`Simulink.clearIntEnumType(typeName)` deletes a specific enumeration class that is defined by `Simulink.defineIntEnumType`. The function generates a warning if the class name is invalid or if a class cannot be deleted because instances of the class exist.

`Simulink.clearIntEnumType()` deletes all enumeration classes that are defined by `Simulink.defineIntEnumType`. The function generates a warning if a class cannot be deleted because instances of the class exist.

## Examples

### Delete a Specific Dynamic Enumerated Data Type

Define an enumeration type and confirm that it has been created.

```
Simulink.defineIntEnumType('myEnumType', {'e1', 'e2'}, [1 2]);
myResult = Simulink.findIntEnumType('myEnumType')
```

Delete the enumeration type that you created and confirm that it is no longer there.

```
Simulink.clearIntEnumType('myEnumType');
myResult = Simulink.findIntEnumType('myEnumType')
```

### Delete All Dynamic Enumerated Data Types

Define two enumeration types and confirm that they have been created.

```
Simulink.defineIntEnumType('myEnumType1', {'e1', 'e2'}, [1 2]);
Simulink.defineIntEnumType('myEnumType2', {'e3', 'e4'}, [3 4]);
myResult = Simulink.findIntEnumType()
```

Delete all enumeration types and confirm that no enumeration types exist.

```
Simulink.clearIntEnumType();
myResult = Simulink.findIntEnumType()
```

## Input Arguments

### **typeName** — Name of enumeration class

character vector or string

Name of a specific enumeration class that is defined by `Simulink.defineIntEnumType`, specified as a character vector or string.

Example: 'myEnumType'

Data Types: char | string

## Version History

**Introduced in R2018b**

## See Also

enumeration | `Simulink.defineIntEnumType` | `Simulink.findIntEnumType`

# Simulink.createFromTemplate

Create model or project from template

## Syntax

```
Simulink.createFromTemplate(templatename)
h = Simulink.createFromTemplate(templatename)
h = Simulink.createFromTemplate(templatename,Name,Value)
```

## Description

`Simulink.createFromTemplate(templatename)` creates a model or a project from the template file specified by `templatename`. The new project is created in the default project folder.

`h = Simulink.createFromTemplate(templatename)` creates a model or a project from the template file and returns `h`, either a numeric model handle or a `simulinkproject` object.

`h = Simulink.createFromTemplate(templatename,Name,Value)` specifies additional options as one or more `Name, Value` pair arguments.

## Examples

### Create a Model From a Template

```
Simulink.createFromTemplate('simple_simulation.sltx')
```

### Create a Project From a Template and Get the Handle

Create a project from a template, specify the name and root folder, and return the handle to the new project (a `simulinkproject` object) for manipulating it programmatically.

```
proj = Simulink.createFromTemplate('code_generation_example.sltx','Name','myProject','Folder','C
```

## Input Arguments

### templatename — Template file name

character vector

Template file name, specified as a character vector. If the template is not on the MATLAB path, specify the fully-qualified path to the template file and `*.sltx` extension.

Example:

Data Types: char

### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, . . . , NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example:

#### **FoLder — Project root folder**

character vector

Project root folder, if creating a new project, specified as a character vector.

Data Types: char

#### **Name — New model or project name**

character vector

New model or project name, specified as a character vector.

Data Types: char

### **Output Arguments**

#### **h — Handle**

numeric handle | `simulinkproject`

Handle to the new model project, returned either as a numeric model handle or a `simulinkproject` object.

# Simulink.data.adapters.catalog

List registered file adapters

## Syntax

`Simulink.data.adapters.catalog`

## Description

`Simulink.data.adapters.catalog` displays the list of registered file adapters, which are derived from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class. For each registered adapter, the display provides the class name, display name, supported extensions, and full path of the adapter.

## Examples

### List Registered File Adapters

List the registered file adapters available on the MATLAB path.

`Simulink.data.adapters.catalog`

| Class Name   | Adapter Name  | Extensions | Full Path              |
|--------------|---------------|------------|------------------------|
| "XMLAdapter" | "XML Adapter" | "XML"      | "C:\Work\XMLAdapter.m" |

## Topics

"Create External File Adapter for Loading Variables into Simulink.SimulationInput Object"

# Simulink.data.adapters.registerAdapter

Register custom file adapter

## Syntax

```
Simulink.data.adapters.registerAdapter(adapterClassName)
```

## Description

`Simulink.data.adapters.registerAdapter(adapterClassName)` registers the custom external file adapter class `adapterClassName`, which is derived from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class. The adapter registration can be added to a startup script so that the adapter is available for each MATLAB session.

## Examples

### Register XML File Adapter

Register the XML file adapter `XMLAdapter` to make it available during the MATLAB session.

```
Simulink.data.adapters.registerAdapter('XMLAdapter');
```

## Input Arguments

### `adapterClassName` — File adapter class name

string | character array

File adapter class name, specified as a string or character array.

Example: 'adapterName'

Data Types: char | string

## Version History

Introduced in R2022b

## See Also

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

# Simulink.data.adapters.unregisterAdapter

Unregister custom file adapter

## Syntax

```
Simulink.data.adapters.unregisterAdapter(adapterClassName)
```

## Description

`Simulink.data.adapters.unregisterAdapter(adapterClassName)` unregisters the custom external file adapter class `adapterClassName`, which is derived from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class.

## Examples

### Unregister XML File Adapter

Unregister the XML file adapter `XMLAdapter`.

```
Simulink.data.adapters.unregisterAdapter('XMLAdapter');
```

## Input Arguments

### `adapterClassName` — File adapter class name

string | character array

File adapter class name, specified as a string or character array.

Example: 'adapterName'

Data Types: char | string

## Simulink.data.assigninGlobal

Modify variable values in context of Simulink model

### Syntax

```
Simulink.data.assigninGlobal(modelName,varName,varValue)
```

### Description

`Simulink.data.assigninGlobal(modelName,varName,varValue)` assigns the value `varValue` to the variable or data dictionary entry `varName` in the context of the Simulink model `modelName`. `assigninGlobal` creates the variable or data dictionary entry if it does not already exist. The function operates in the Design Data section of the data dictionary that is linked to the target model or in the MATLAB base workspace if the target model is not linked to any data dictionary.

If the target model is linked to a data dictionary that references other dictionaries, `assigninGlobal` searches for `varName` in the entire dictionary hierarchy. If `assigninGlobal` does not find a matching entry, the function creates an entry in the dictionary that is linked to the target model.

### Examples

#### Modify Variable in Model With or Without Data Dictionary

Create a variable `myNewVariable` with value 237 in the context of the Simulink model `vdp.slx`, which is not linked to any data dictionary. `myNewVariable` appears as a variable in the MATLAB base workspace.

```
Simulink.data.assigninGlobal('vdp','myNewVariable',237)
```

Create a variable `myNewEntry` with value `true` in the context of the model `sldemo_fuelsys_dd_controller.slx`, which is linked to the data dictionary `sldemo_fuelsys_dd_controller.sldd`. The entry `myNewEntry` appears in the Design Data section of the dictionary.

```
openExample('simulink_automotive/UseDDForFuelContSysExample')
sldemo_fuelsys_dd_controller
Simulink.data.assigninGlobal('sldemo_fuelsys_dd_controller',...
'myNewEntry',true)
```

Confirm the addition of `myNewEntry` to the data dictionary `sldemo_fuelsys_dd_controller.sldd` by viewing the dictionary in Model Explorer.

```
myDictionaryObj = Simulink.data.dictionary.open(...
'sldemo_fuelsys_dd_controller.sldd');
show(myDictionaryObj)
```

## Input Arguments

### **modelName** — Name of target Simulink model

character vector

Name of target Simulink model, specified as a character vector.

Example: 'myTestModel'

Data Types: char

### **varName** — Name of target variable or data dictionary entry

character vector

Name of target variable or data dictionary entry, specified as a character vector.

Example: 'myTargetVariable'

Data Types: char

### **varValue** — Value to assign to variable or data dictionary entry

MATLAB expression

Value to assign to variable or data dictionary entry, specified as a MATLAB expression that returns any valid data type or data dictionary content.

Example: 27.5

Example: myBaseWorkspaceVariable

Example: Simulink.Parameter

## Tips

- `assigninGlobal` helps you transition Simulink models to using data dictionaries. You can use the function to assign values to model variables before and after linking a model to a data dictionary.

## Version History

Introduced in R2015a

## See Also

`Simulink.data.evalinGlobal` | `Simulink.data.existsInGlobal` | `Simulink.data.dictionary.open`

## Simulink.data.dictionary.cleanupWorkerCache

Restore defaults after parallel simulation with data dictionary

### Syntax

```
Simulink.data.dictionary.cleanupWorkerCache
```

### Description

`Simulink.data.dictionary.cleanupWorkerCache` restores default settings after you have finished parallel simulation of a model that is linked to a data dictionary. Use this function in a `spmd` block, after you finish parallel simulation using `parfor` blocks, to restore default settings that were altered by the `Simulink.data.dictionary.setupWorkerCache` function.

During parallel simulation of a model that is linked to a data dictionary, you can allow each worker to access and modify the data in the dictionary independently of other workers. The function `Simulink.data.dictionary.setupWorkerCache` grants each worker a unique dictionary cache to allow independent access to the data, and the function `Simulink.data.dictionary.cleanupWorkerCache` restores cache settings to their default values.

You must have a Parallel Computing Toolbox license to perform parallel simulation using a `parfor` block.

### Examples

#### Sweep Variant Control Using Parallel Simulation

To use parallel simulation to sweep a variant control (a `Simulink.Parameter` object whose value influences the variant condition of a `Simulink.Variant` object) that you store in a data dictionary, use this code as a template. Change the names and values of the model, data dictionary, and variant control to match your application.

To sweep block parameter values or the values of workspace variables that you use to set block parameters, use `Simulink.SimulationInput` objects instead of the programmatic interface to the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

You must have a Parallel Computing Toolbox license to perform parallel simulation.

```
% For convenience, define names of model and data dictionary
model = 'mySweepMdl';
dd = 'mySweepDD.sldd';

% Define the sweeping values for the variant control
CtrlValues = [1 2 3 4];

% Grant each worker in the parallel pool an independent data dictionary
% so they can use the data without interference
spmd
 Simulink.data.dictionary.setupWorkerCache
```

```

end

% Determine the number of times to simulate
numberOfSims = length(CtrlValues);

% Prepare a nondistributed array to contain simulation output
simOut = cell(1,numberOfSims);

parfor index = 1:numberOfSims
 % Create objects to interact with dictionary data
 % You must create these objects for every iteration of the parfor-loop
 dictObj = Simulink.data.dictionary.open(dd);
 sectObj = getSection(dictObj, 'Design Data');
 entryObj = getEntry(sectObj, 'MODE');
 % Suppose MODE is a Simulink.Parameter object stored in the data dictionary

 % Modify the value of MODE
 temp = getValue(entryObj);
 temp.Value = CtrlValues(index);
 setValue(entryObj,temp);

 % Simulate and store simulation output in the nondistributed array
 simOut{index} = sim(model);

 % Each worker must discard all changes to the data dictionary and
 % close the dictionary when finished with an iteration of the parfor-loop
 discardChanges(dictObj);
 close(dictObj);
end

% Restore default settings that were changed by the function
% Simulink.data.dictionary.setupWorkerCache
% Prior to calling cleanupWorkerCache, close the model

spmd
 bdclose(model)
 Simulink.data.dictionary.cleanupWorkerCache
end

```

---

**Note** If data dictionaries are open, you cannot use the command `Simulink.data.dictionary.cleanupWorkerCache`. To identify open data dictionaries, use `Simulink.data.dictionary.getOpenDictionaryPaths`.

---

## Version History

Introduced in R2015a

# Simulink.data.dictionary.closeAll

Close all connections to all open data dictionaries

## Syntax

```
Simulink.data.dictionary.closeAll
Simulink.data.dictionary.closeAll(dictFileName)
Simulink.data.dictionary.closeAll(____,unsavedAction)
```

## Description

`Simulink.data.dictionary.closeAll` attempts to close all connections to all data dictionaries that are open. For example, if you create objects, such as `Simulink.data.Dictionary`, that refer to a dictionary, that dictionary is open.

Some commands and functions, such as `Simulink.data.dictionary.cleanupWorkerCache`, cannot operate when dictionaries are open. It is a best practice to close each connection individually by using functions and methods such as the `close` method of a `Simulink.data.Dictionary` object. To find dictionaries that are open, use `Simulink.data.dictionary.getOpenDictionaryPaths`. However, you can use this function to close all connections to all dictionaries.

You can also use this function to close dictionaries in a shutdown script that is part of a project.

`Simulink.data.dictionary.closeAll(dictFileName)` closes all connections to the dictionary named `dictFileName`. If you open multiple dictionaries that use this file name (for example, if the dictionaries have different file paths), the function closes all connections to all of the dictionaries.

You cannot specify `dictFileName` as a full file path such as `'C:\temp\myDict.sldd'`.

`Simulink.data.dictionary.closeAll( ____,unsavedAction)` closes all connections to the target dictionaries by discarding or saving unsaved changes. You can choose whether to save or discard all changes to all of the target dictionaries.

## Examples

### Close All Connections to All Open Dictionaries

Discard any unsaved changes. All of the entries in the dictionaries revert to the last saved state.

```
Simulink.data.dictionary.closeAll('-discard')
```

### Close All Connections to Single Data Dictionary

Open multiple connections to a data dictionary, make a change, and close all of the connections by discarding the unsaved change.

At the command prompt, open a data dictionary by creating a `Simulink.data.Dictionary` object that refers to the dictionary.

For example, open the “Using a Data Dictionary to Manage the Data for a Fuel Control System” on page 13-136 example data dictionary.

```
openExample('simulink_automotive/UseDDForFuelContSysExample'
dictObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd.sldd');
```

Display the dictionary in the Model Explorer

```
show(dictObj)
```

You now have two connections to this dictionary: The `Simulink.data.Dictionary` object and the Model Explorer.

Make a change to the dictionary by adding an entry.

```
dDataSectObj = getSection(dictObj, 'Design Data');
addEntry(dDataSectObj, 'myEntry', 5.2);
```

The `Simulink.data.dictionary.Section` object `dDataSectObj` is a third connection to the dictionary.

Close the connections to the dictionary. Discard the unsaved change.

```
Simulink.data.dictionary.closeAll('sldemo_fuelsys_dd.sldd', '-discard')
```

The dictionary no longer appears as a node in the **Model Hierarchy** pane of the Model Explorer. The `Simulink.data.Dictionary` object `dictObj` is disconnected from the dictionary. You cannot interact with the dictionary by using the `Simulink.data.dictionary.Section` object `dDataSectObj`.

Clear the objects that referred to the dictionary.

```
clear dictObj dDataSectObj
```

## Input Arguments

### **dictFileName** — File name of target data dictionary or dictionaries

character vector

File name of target data dictionary or dictionaries, specified as a character vector. Use the file extension `sldd`.

Example: 'myDict.sldd'

Data Types: char

### **unsavedAction** — Action for unsaved changes

'-discard' | '-save'

Action for unsaved changes, specified as '-discard' (to discard changes) or '-save' (to save changes).

## Tips

A data dictionary is open if any of these conditions are true:

- The dictionary appears as a node in the **Model Hierarchy** pane of the Model Explorer. To close this connection to the dictionary, right-click the node in Model Explorer and select **Close**. Alternatively, use the `hide` method of a `Simulink.data.Dictionary` object.
- You created an object of any of these classes that refer to the dictionary:
  - `Simulink.data.Dictionary`
  - `Simulink.data.dictionary.Section`
  - `Simulink.data.dictionary.Entry`

To close these connections to the dictionary, use the `close` method of the `Simulink.data.Dictionary` object or clear the object. Clear the `Simulink.data.dictionary.Section` and `Simulink.data.dictionary.Entry` objects.

- A model that is linked to the dictionary is open. To close this connection to the dictionary, close the model.

## Version History

Introduced in R2016a

## Simulink.data.dictionary.create

Create new data dictionary and create `Simulink.data.Dictionary` object

### Syntax

```
dictionaryObj = Simulink.data.dictionary.create(dictionaryFile)
```

### Description

`dictionaryObj = Simulink.data.dictionary.create(dictionaryFile)` creates a data dictionary file in your current working folder or in a file path you can specify in `dictionaryFile`. The function returns a `Simulink.data.Dictionary` object representing the new data dictionary.

### Examples

#### Create New Data Dictionary and Data Dictionary Object

Create a data dictionary `myNewDictionary.sldd` in your current working folder and a `Simulink.data.Dictionary` object representing the new data dictionary. Assign the object to the variable `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.create('myNewDictionary.sldd')
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```

 DataSourcees: {0x1 cell}
 HasAccessToBaseWorkspace: 0
EnableAccessToBaseWorkspace: 0
 HasUnsavedChanges: 0
 NumberOfEntries: 0

```

### Input Arguments

#### **dictionaryFile** — Name of new data dictionary

character vector

Name of new data dictionary, specified as a character vector containing the file name and, optionally, path of the dictionary to create. If you do not specify a path, `Simulink.data.dictionary.create` creates the new data dictionary file in your working MATLAB folder.

`Simulink.data.dictionary.create` also supports file paths specified relative to your working folder.

Example: `'myDictionary.sldd'`

Example: `'C:\Users\jsmith\myDictionary.sldd'`

Example: `'..\myOtherDictionary.sldd'`

Data Types: char

## Output Arguments

### **dictionaryObj** — Newly created data dictionary

`Simulink.data.Dictionary` object

Newly created data dictionary, returned as a `Simulink.data.Dictionary` object.

## Alternatives

You can use the Simulink Editor to create a data dictionary and link it to a model. See “Migrate Single Model to Use Dictionary” for more information.

## Version History

**Introduced in R2015a**

## See Also

`Simulink.data.Dictionary` | `Simulink.data.dictionary.open`

## Topics

“Store Data in Dictionary Programmatically”

“What Is a Data Dictionary?”

## Simulink.data.dictionary.getOpenDictionaryPaths

Return file names and paths of open data dictionaries

### Syntax

```
openDDs = Simulink.data.dictionary.getOpenDictionaryPaths
openDDs = Simulink.data.dictionary.getOpenDictionaryPaths(dictFileName)
```

### Description

`openDDs = Simulink.data.dictionary.getOpenDictionaryPaths` returns the file names and paths of all data dictionaries that are open. For example, a data dictionary is open if you create objects, such as `Simulink.data.Dictionary`, that refer to the dictionary. If you open two or more dictionaries that have the same file name but different file paths, this function returns multiple file paths.

Before executing commands and functions that cannot operate when dictionaries are open, use this function to identify open dictionaries so that you can close them. For example, when you run parallel simulations as described in “Sweep Variant Control Using Parallel Simulation”, this function helps you identify open dictionaries before executing the command `Simulink.data.dictionary.cleanupWorkerCache`.

`openDDs = Simulink.data.dictionary.getOpenDictionaryPaths(dictFileName)` returns the file paths of data dictionaries that have the file name `dictFileName`. If you open two or more dictionaries that have the same file name but different file paths, you can use this syntax to return all of the file paths.

### Examples

#### Identify and Close All Open Data Dictionaries

Open, identify, and close a data dictionary. After you close the connections to the dictionary, you can use commands and functions, such as `Simulink.data.dictionary.cleanupWorkerCache`, that cannot operate when dictionaries are open.

At the command prompt, open a data dictionary by creating a `Simulink.data.Dictionary` object that refers to the dictionary.

For example, open the “Using a Data Dictionary to Manage the Data for a Fuel Control System” on page 13-136 example data dictionary.

```
openExample('simulink_automotive/UseDDForFuelContSysExample'
dictObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd.sldd');
```

Display the dictionary in the Model Explorer

```
show(dictObj)
```

Identify all of the dictionaries that are open.

```
openDDs = Simulink.data.dictionary.getOpenDictionaryPaths;
```

The file path of the dictionary that you opened, `sldemo_fuelsys_dd.sldd`, appears in the cell array of character vectors `openDDs`.

Close the connection from the Model Explorer to the dictionary.

```
hide(dictObj)
```

The dictionary no longer appears as a node in the **Model Hierarchy** pane of the Model Explorer.

Close the connection from the `Simulink.data.Dictionary` object to the dictionary.

```
close(dictObj)
clear dictObj
```

## Input Arguments

### **dictFileName** — File name of target data dictionary or dictionaries

character vector

File name of target data dictionary or dictionaries, specified as a character vector. Use the file extension `sldd`.

Example: `'myDict.sldd'`

Data Types: `char`

## Output Arguments

### **openDDs** — File names and paths of open data dictionaries

cell array of character vectors

File names and paths of open data dictionaries, returned as a cell array of character vectors.

## Tips

A data dictionary is open if any of these conditions are true:

- The dictionary appears as a node in the **Model Hierarchy** pane of the Model Explorer. To close this connection to the dictionary, right-click the node in Model Explorer and select **Close**. Alternatively, use the `hide` method of a `Simulink.data.Dictionary` object.
- You created an object of any of these classes that refer to the dictionary:
  - `Simulink.data.Dictionary`
  - `Simulink.data.dictionary.Section`
  - `Simulink.data.dictionary.Entry`

To close these connections to the dictionary, use the `close` method of the `Simulink.data.Dictionary` object or clear the object. Clear the `Simulink.data.dictionary.Section` and `Simulink.data.dictionary.Entry` objects.

- A model that is linked to the dictionary is open. To close this connection to the dictionary, close the model.

## **Version History**

# Simulink.data.dictionary.open

Open data dictionary for editing

## Syntax

```
dictionaryObj = Simulink.data.dictionary.open(dictionaryFile)
```

## Description

`dictionaryObj = Simulink.data.dictionary.open(dictionaryFile)` opens the specified data dictionary and returns a `Simulink.data.Dictionary` object representing an existing data dictionary identified by its file name and, optionally, file path with `dictionaryFile`.

Make sure any dictionaries referenced by the target dictionary are on the MATLAB path.

## Examples

### Open Existing Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
```

```
myDictionaryObj =
```

Dictionary with properties:

```
 DataSourcees: {'myRefDictionary_ex_API.sldd'}
 HasUnsavedChanges: 0
 NumberOfEntries: 4
```

## Input Arguments

### **dictionaryFile** — Target data dictionary

character vector

Target data dictionary, specified as a character vector containing the file name and, optionally, path of the dictionary. If you do not specify a path, `Simulink.data.dictionary.open` searches the MATLAB path for the specified file. `Simulink.data.dictionary.open` also supports paths specified relative to the MATLAB working folder.

Example: `'myDictionary_ex_API.sldd'`

Example: `'C:\Users\jsmith\myDictionary_ex_API.sldd'`

Example: `'..\myOtherDictionary.sldd'`

Data Types: char

# Simulink.data.dictionary.setupWorkerCache

Enable parallel simulation with data dictionary

## Syntax

```
Simulink.data.dictionary.setupWorkerCache
```

## Description

`Simulink.data.dictionary.setupWorkerCache` prepares the workers in a parallel pool for simulating a model that is linked to a data dictionary. Use this function in a `spmd` block, prior to starting a `parfor` block, to provide the workers in a parallel pool a way to safely interact with a single data dictionary.

During parallel simulation of a model that is linked to a data dictionary, you can allow each worker to access and modify the data in the dictionary independently of other workers.

`Simulink.data.dictionary.setupWorkerCache` temporarily provides each worker in the pool with its own data dictionary cache, allowing the workers to use the data in the dictionary without permanently changing it.

You must have a Parallel Computing Toolbox license to perform parallel simulation using a `parfor` block.

## Examples

### Sweep Variant Control Using Parallel Simulation

To use parallel simulation to sweep a variant control (a `Simulink.Parameter` object whose value influences the variant condition of a `Simulink.Variant` object) that you store in a data dictionary, use this code as a template. Change the names and values of the model, data dictionary, and variant control to match your application.

To sweep block parameter values or the values of workspace variables that you use to set block parameters, use `Simulink.SimulationInput` objects instead of the programmatic interface to the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

You must have a Parallel Computing Toolbox license to perform parallel simulation.

```
% For convenience, define names of model and data dictionary
model = 'mySweepMdl';
dd = 'mySweepDD.sldd';

% Define the sweeping values for the variant control
CtrlValues = [1 2 3 4];

% Grant each worker in the parallel pool an independent data dictionary
% so they can use the data without interference
spmd
 Simulink.data.dictionary.setupWorkerCache
end
```

```
% Determine the number of times to simulate
numberOfSims = length(CtrlValues);

% Prepare a nondistributed array to contain simulation output
simOut = cell(1,numberOfSims);

parfor index = 1:numberOfSims
 % Create objects to interact with dictionary data
 % You must create these objects for every iteration of the parfor-loop
 dictObj = Simulink.data.dictionary.open(dd);
 sectObj = getSection(dictObj,'Design Data');
 entryObj = getEntry(sectObj,'MODE');
 % Suppose MODE is a Simulink.Parameter object stored in the data dictionary

 % Modify the value of MODE
 temp = getValue(entryObj);
 temp.Value = CtrlValues(index);
 setValue(entryObj,temp);

 % Simulate and store simulation output in the nondistributed array
 simOut{index} = sim(model);

 % Each worker must discard all changes to the data dictionary and
 % close the dictionary when finished with an iteration of the parfor-loop
 discardChanges(dictObj);
 close(dictObj);
end

% Restore default settings that were changed by the function
% Simulink.data.dictionary.setupWorkerCache
% Prior to calling cleanupWorkerCache, close the model

spmd
 bdclose(model)
 Simulink.data.dictionary.cleanupWorkerCache
end
```

---

**Note** If data dictionaries are open, you cannot use the command `Simulink.data.dictionary.cleanupWorkerCache`. To identify open data dictionaries, use `Simulink.data.dictionary.getOpenDictionaryPaths`.

---

## Version History

Introduced in R2015a

# Simulink.data.evalinGlobal

Evaluate MATLAB expression in context of Simulink model

## Syntax

```
returnValue = Simulink.data.evalinGlobal(modelName,expression)
```

## Description

`returnValue = Simulink.data.evalinGlobal(modelName,expression)` evaluates the MATLAB expression `expression` in the context of the Simulink model `modelName` and returns the values returned by `expression`. `evalinGlobal` evaluates `expression` in the Design Data section of the data dictionary that is linked to the target model or in the MATLAB base workspace if the target model is not linked to any data dictionary.

## Examples

### Evaluate MATLAB Expression in Model With or Without Data Dictionary

Evaluate the MATLAB expression `myNewVariable = 237;` in the context of the model `vdp`, which is not linked to any data dictionary. `myNewVariable` appears as a variable in the MATLAB base workspace.

```
Simulink.data.evalinGlobal('vdp','myNewVariable = 237;')
```

Evaluate the MATLAB expression `myNewEntry = true;` in the context of the model `sldemo_fuelsys_dd_controller`, which is linked to the data dictionary `sldemo_fuelsys_dd_controller.sldd`. `myNewEntry` appears as an entry in the Design Data section of the dictionary.

```
openExample('simulink_automotive/UseDDForFuelContSysExample')
sldemo_fuelsys_dd_controller
Simulink.data.evalinGlobal('sldemo_fuelsys_dd_controller',...
'myNewEntry = true;')
```

Confirm the creation of the entry `myNewEntry` in the data dictionary `sldemo_fuelsys_dd_controller.sldd` by viewing the dictionary in Model Explorer.

```
openExample('simulink_automotive/UseDDForFuelContSysExample')
sldemo_fuelsys_dd_controller
myDictionaryObj = Simulink.data.dictionary.open(...
'sldemo_fuelsys_dd_controller.sldd');
show(myDictionaryObj)
```

## Input Arguments

### **modelName** — Name of target Simulink model

character vector

Name of target Simulink model, specified as a character vector.

Example: 'myTestModel'

Data Types: char

**expression — MATLAB expression to evaluate**

character vector

MATLAB expression to evaluate, specified as a character vector.

Example: 'a = 5.3'

Example: 'whos'

Example: 'CurrentSpeed.Value = 290.73'

Data Types: char

**Output Arguments****returnValue — Value returned by specified expression**

valid entry or variable value

Value returned by the specified MATLAB expression.

**Tips**

- `evalinGlobal` helps you transition Simulink models to the use of data dictionaries. You can use the function to manipulate model variables before and after linking a model to a data dictionary.

**Version History**

**Introduced in R2015a**

**See Also**

`evalin` | `Simulink.data.assigninGlobal` | `Simulink.data.existsInGlobal`

**Topics**

“Store Data in Dictionary Programmatically”

“Using a Data Dictionary to Manage the Data for a Fuel Control System” on page 13-136

# Simulink.data.existsInGlobal

Check existence of variable in context of Simulink model

## Syntax

```
varExists = Simulink.data.existsInGlobal(modelName,varName)
```

## Description

`varExists = Simulink.data.existsInGlobal(modelName,varName)` returns an indication of the existence of a variable or data dictionary entry `varName` in the context of the Simulink model `modelName`. `Simulink.data.existsInGlobal` searches the Design Data section of the data dictionary that is linked to the target model or the MATLAB base workspace if the target model is not linked to any data dictionary.

## Examples

### Determine Existence of Variable in Model With or Without Data Dictionary

Determine the existence of a variable `PressVect` in the context of the Simulink model `vdp.slx`, which is not linked to any data dictionary.

```
Simulink.data.existsInGlobal('vdp','PressVect')
```

```
ans =
```

```
0
```

Because `vdp.slx` is not linked to any data dictionary, `existsInGlobal` searches only in the MATLAB base workspace for `PressVect`.

Determine the existence of a variable `PressVect` in the context of the Simulink model `sldemo_fuelsys_dd_controller.slx`, which is linked to the data dictionary `sldemo_fuelsys_dd_controller.sldd`.

Open the “Using a Data Dictionary to Manage the Data for a Fuel Control System” on page 13-136 example model `sldemo_fuelsys_dd_controller`.

```
openExample('simulink_automotive/UseDDForFuelContSysExample')
sldemo_fuelsys_dd_controller
Simulink.data.existsInGlobal('sldemo_fuelsys_dd_controller','PressVect')
```

```
ans =
```

```
1
```

Because `sldemo_fuelsys_dd_controller` is linked to the data dictionary `sldemo_fuelsys_dd_controller.slidd`, `existsInGlobal` searches for `PressVect` only in the Design Data section of the dictionary.

## Input Arguments

### **modelName** — Name of target Simulink model

character vector

Name of target Simulink model, specified as a character vector.

Example: `'myTestModel'`

Data Types: `char`

### **varName** — Name of target variable or data dictionary entry

character vector

Name of target variable or data dictionary entry, specified as a character vector.

Example: `'myTargetVariable'`

Data Types: `char`

## Output Arguments

### **varExists** — Indication of existence of target variable or data dictionary entry

1 | 0

Indication of existence of target variable or data dictionary entry, returned as 1 to indicate existence or 0 to indicate absence.

## Tips

- `existsInGlobal` helps you transition Simulink models to the use of data dictionaries. You can use the function to find model variables before and after linking a model to a data dictionary.

## Alternatives

You can use Model Explorer to search a data dictionary or any workspace for entries or variables.

## Version History

Introduced in R2015a

## See Also

`exist` | `Simulink.data.assignInGlobal` | `Simulink.data.evalInGlobal`

## Topics

“Store Data in Dictionary Programmatically”

# Simulink.data.getEnumTypeInfo

Get information about enumerated data type

## Syntax

```
information = Simulink.data.getEnumTypeInfo(enumTypeName,infoRequest)
```

## Description

`information = Simulink.data.getEnumTypeInfo(enumTypeName,infoRequest)` returns information about an enumerated data type `enumTypeName`.

Use this function only to return information about an enumerated data type. To customize an enumerated data type, for example, by specifying a default enumeration member or by controlling the scope of the type definition in generated code, see “Customize Simulink Enumeration”.

## Examples

### Return Default Value of Enumerated Data Type

Get the default enumeration member of an enumerated data type `LEDcolor`. Suppose `LEDcolor` defines two enumeration members, `GREEN` and `RED`, and uses `GREEN` as the default member.

```
Simulink.data.getEnumTypeInfo('LEDcolor','DefaultValue')
```

```
ans =
 GREEN
```

### Get Scope of Enumerated Data Type Definition in Generated Code

For an enumerated data type `LEDcolor`, find out if generated code exports or imports the definition of the type to or from a header file.

```
Simulink.data.getEnumTypeInfo('LEDcolor','DataScope')
Simulink.data.getEnumTypeInfo('LEDcolor','HeaderFile')
```

```
ans =
Auto

ans =
''
```

Because `DataScope` is 'Auto' and `HeaderFile` is empty, generated code defines the enumerated data type `LEDcolor` in the header file `model_types.h` where `model` is the name of the model used to generate code.

## Input Arguments

### **enumTypeName** — Name of target enumerated data type

character vector

Name of the target enumerated data type, specified as a character vector.

Example: 'myFirstEnumType'

Data Types: char

### **infoRequest** — Information to return

valid character vector

Information to return, specified as one of the character vector options in the table.

| Specified value | Information returned                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Example return value  |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|
| 'DefaultValue'  | The default enumeration member, returned as an instance of the enumerated data type.                                                                                                                                                                                                                                                                                                                                                                                   | enumMember1           |
| 'Description'   | The custom description of this data type, returned as a character vector. Returns an empty character vector if a description was not specified for the type.                                                                                                                                                                                                                                                                                                           | 'My first enum type.' |
| 'HeaderFile'    | The name of the custom header file that defines the data type in generated code, returned as a character vector. Returns an empty character vector if a header file was not specified for the type.                                                                                                                                                                                                                                                                    | 'myEnumType.h'        |
| 'DataScope'     | Indication whether generated code imports or exports the definition of the data type. A return value of 'Auto' indicates generated code defines the type in the header file <code>model_types.h</code> or imports the definition from the header file identified by <code>HeaderFile</code> . A return value of 'Exported' or 'Imported' indicates generated code exports or imports the definition to or from the header file identified by <code>HeaderFile</code> . | 'Exported'            |
| 'StorageType'   | The integer data type used by generated code to store the numeric values of the enumeration members, returned as a character vector. Returns 'int' if you did not specify a storage type for the enumerated type, in which case generated code uses the native integer type of the hardware target.                                                                                                                                                                    | 'int32'               |

| Specified value            | Information returned                                                                                                                   | Example return value |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------|----------------------|
| 'AddClassNameToEnumNames ' | Indication whether generated code prefixes the names of enumeration members with the name of the data type. Returned as true or false. | true                 |

## Version History

Introduced in R2014b

## Simulink.data.isSupportedEnumClass

Determine whether an enumeration class is valid for Simulink

### Syntax

```
valid = Simulink.data.isSupportedEnumClass(enumClass)
```

### Description

`valid = Simulink.data.isSupportedEnumClass(enumClass)` returns true if `enumClass` is a valid enumeration class for Simulink.

### Examples

#### Determine if Enumeration Class is Valid

Define an enumeration class of basic colors, then confirm that it is valid.

```
Simulink.defineIntEnumType('BasicColors', ...
 {'Red', 'Yellow', 'Blue'}, ...
 [0;1;2]);
Simulink.data.isSupportedEnumClass('BasicColors')
```

```
ans =

 logical

 1
```

Perform the same validity check by using the `meta.class` object as the input.

```
Simulink.data.isSupportedEnumClass(?BasicColors)
```

```
ans =

 logical

 1
```

Check if `Simulink.NumericType` is a valid enumeration class by using the `meta.class` object as the input.

```
Simulink.data.isSupportedEnumClass(?Simulink.NumericType)
```

```
ans =

 logical
```

0

## Input Arguments

### **enumClass** — Enumeration class

character vector | `meta.class`

Enumeration class, specified as a character vector or as `meta.class` object.

Example: `'myEnumClass'` or `?myEnumClass`

## Output Arguments

### **valid** — Whether enumeration class is valid

logical

If the input value refers to a valid enumeration class for Simulink, `valid` is `true`, otherwise `valid` is `false`.

## Version History

**Introduced in R2014b**

“Simulink Enumerations”

## Simulink.data.isSupportedEnumObject

Determine whether an enumeration object is valid for Simulink

### Syntax

```
valid = Simulink.data.isSupportedEnumObject(enumObject)
```

### Description

`valid = Simulink.data.isSupportedEnumObject(enumObject)` returns true if `enumObject` is a valid enumeration object for Simulink.

### Examples

#### Determine if Enumeration Object is Valid

Define an enumeration class of basic colors.

```
Simulink.defineIntEnumType('BasicColors', ...
 {'Red', 'Yellow', 'Blue'}, ...
 [0;1;2]);
```

Confirm that an instance of the enumeration class is valid.

```
Simulink.data.isSupportedEnumObject(BasicColors.Yellow)
```

```
ans =

 logical

 1
```

Call the function with input that is not an enumeration object.

```
Simulink.data.isSupportedEnumObject(5)
```

```
ans =

 logical

 0
```

### Input Arguments

#### **enumObject** — Enumeration object

enumeration object

Instance of a defined enumeration, specified as an enumeration object.

Example: `myEnumObject`

## Output Arguments

### **valid** — Whether enumeration class is valid

logical

If the input value refers to a valid enumeration object for Simulink, `valid` is `true`, otherwise `valid` is `false`.

## Version History

**Introduced in R2014b**

“Simulink Enumerations”

## Simulink.defineIntEnumType

Define enumerated data type

### Syntax

```
Simulink.defineIntEnumType(ClassName, CellofEnums,IntValues)
Simulink.defineIntEnumType(__ , 'Description',ClassDesc)
Simulink.defineIntEnumType(__ , 'DefaultValue',DefValue)
Simulink.defineIntEnumType(__ , 'DataScope',ScopeSelection)
Simulink.defineIntEnumType(__ , 'HeaderFile',FileName)
Simulink.defineIntEnumType(__ , 'AddClassNameToEnumNames',Flag)
Simulink.defineIntEnumType(__ , 'StorageType',DataType)
```

### Description

`Simulink.defineIntEnumType(ClassName, CellofEnums,IntValues)` defines an enumeration named `ClassName` with enumeration values specified with `CellofEnums` and underlying numeric values specified by `IntValues`.

`Simulink.defineIntEnumType( __ , 'Description',ClassDesc)` defines the enumeration with a description.

`Simulink.defineIntEnumType( __ , 'DefaultValue',DefValue)` defines a default value for the enumeration, which is one of the character vectors you specify for `CellofEnums`.

`Simulink.defineIntEnumType( __ , 'DataScope',ScopeSelection)` specifies whether the data type definition should be imported from, or exported to, a header file during code generation.

`Simulink.defineIntEnumType( __ , 'HeaderFile',FileName)` specifies the name of a header file containing the enumeration class definition for use in code generated from a model.

`Simulink.defineIntEnumType( __ , 'AddClassNameToEnumNames',Flag)` specifies whether the code generator applies the class name as a prefix to the enumeration values that you specify for `CellofEnums`. For `Flag`, specify `true` or `false`. For example, if you specify `true`, the code generator would use `BasicColors.Red` instead of `Red` to represent an enumerated value.

`Simulink.defineIntEnumType( __ , 'StorageType',DataType)` specifies the data type used to store the enumerations' underlying integer values in code generated from a model.

### Examples

#### Import Enumeration Class Definition Into Workspace

Assume an external data dictionary includes the following enumeration:

```
BasicColors.Red(0), BasicColors.Yellow(1), BasicColors.Blue(2)
```

Import the enumeration class definition into the MATLAB workspace while specifying `int16` as the underlying integer data type for generated code:

```

Simulink.defineIntEnumType('BasicColors', ...
 {'Red', 'Yellow', 'Blue'}, ...
 [0;1;2], ...
 'Description', 'Basic colors', ...
 'DefaultValue', 'Blue', ...
 'HeaderFile', 'mybasiccolors.h', ...
 'DataScope', 'Exported', ...
 'AddClassNameToEnumNames', true, ...
 'StorageType', 'int16');

```

## Input Arguments

### ClassName — Name of enumerated data type

character vector | string

The name of the enumerated data type, specified as a character vector or string.

Example: 'BasicColors'

### CellOfEnums — Enumerations for data type

cell array of character vectors

Enumerations for the data type, specified as a cell array of character vectors.

Example: {'Red', 'Yellow', 'Blue'}

### IntValues — Numeric enumeration values

array of numeric values

Numeric enumeration values, specified as an array.

Example: [0;1;2]

### ClassDesc — Description of enumeration data type

character vector

Description of the enumeration data type, specified as a character vector.

Example: 'Basic colors'

### DefValue — Default enumeration value

character vector

The default enumeration value, specified as a character vector. The value is one of the character vectors specified for CellOfEnums.

Example: 'Blue'

### FileName — Header file

character vector

That header file that is to contain the data type definition, specified as a character vector. By default, the generated `#include` directive uses the preprocessor delimiter `"` instead of `<` and `>`. To generate the directive `#include <mytypes.h>`, specify FileName as `'<myTypes.h>'`.

Example: 'mybasiccolors.h'

**ScopeSelection — Action for data type definition**`'Auto'` (default) | `'Exported'` | `'Imported'`

Action to take for the data type definition during code generation , specified as one of these values:

- `'Auto'` — If no value is specified for `HeaderFile`, export the type definition to `model_types.h` where `model` is the model name. If a value is specified for `HeaderFile`, import the data type definition from the specified header file.
- `'Exported'` — Export the data type definition to a header file. If no value is specified for `HeaderFile`, the header file name defaults to `type.h`, where `type` is the data type name.
- `'Imported'` — Import the data type definition from a header file. If no value is specified for `HeaderFile`, the header file name defaults to `type.h`, where `type` is the data type name.

Set the data scope selection to `Imported` or `Exported` to avoid potential MISRA C:2012 violations.

**Flag — Whether class name is a prefix to enumeration**`false` or `0` (default) | `true` or `1`

Whether the code generator applies the class name as a prefix to the enumerations, specified as a numeric or logical `1` (`true`) or `0` (`false`).

Example: `true`

**DataType — Data type used to store enumeration values**`'int8'` | `'int16'` | `'int32'` | `'uint8'` | `'uint16'`

Data type used to store the enumerations' underlying integer values in generated code, specified as a character vector.

Example: `'int16'`

## Version History

Introduced in R2010b

# Simulink.defaultModelTemplate

Set or get default model template

## Syntax

```
Simulink.defaultModelTemplate(templatename)
templatepath = Simulink.defaultModelTemplate
```

## Description

`Simulink.defaultModelTemplate(templatename)` sets the template file specified by `templatename` as the default model template to use for new models. This setting is persistent between Simulink sessions.

`templatepath = Simulink.defaultModelTemplate` gets the full path to the current default model template.

## Examples

### Set the default model template

```
Simulink.defaultModelTemplate('simple_simulation.sltx')
```

### Get the default model template

```
mydefaulttemplate = Simulink.defaultModelTemplate
```

### Clear and restore the default model template

Use `set_param` to set a root block diagram parameter. This clears the default template so that new models will inherit this property of the root block diagram, and warns.

```
set_param(0, 'StopTime', '99');
```

Restore the default template.

```
Simulink.defaultModelTemplate('$restore');
```

## Input Arguments

### templatename — Template file name

character vector

Template file name, specified as a character vector. If the template is not on the MATLAB path, specify the fully-qualified path to the template file and `*.sltx` extension.

Example: \\Home\username\Documents\MATLAB\template.sltx

Data Types: char

## **Output Arguments**

### **templatepath — Template path**

character vector

Template path, specified as a character vector, showing the full path to the current default model template.

## **Version History**

**Introduced in R2016b**

# Simulink.exportToTemplate

Create template from model or project

## Syntax

```
templatefile = Simulink.exportToTemplate(obj,templatename)
templatefile = Simulink.exportToTemplate(obj,templatename,Name,Value)
```

## Description

`templatefile = Simulink.exportToTemplate(obj,templatename)` creates a template file (*templatename*.sltx) from a model or project specified by `obj`.

If you have project templates created in R2014a or earlier (.zip files), use `Simulink.exportToTemplate` to upgrade them to .sltx files, then you can use them in the start page.

`templatefile = Simulink.exportToTemplate(obj,templatename,Name,Value)` specifies additional template options as one or more Name, Value pair arguments.

## Examples

### Create a Template From a Model

Open the vdp model and create a template from it.

```
vdp
myvdptemplate = Simulink.exportToTemplate(bdroot,'vdptemplate')
```

### Create a Template From a Model and Specify Description

Open the vdp model and create a template from it, specifying a description.

```
vdp
myvdptemplate = Simulink.exportToTemplate(bdroot,'vdptemplate','Description','Use this template')
```

## Input Arguments

### **obj** — Model, library, or project

character vector | numeric handle | `slproject.ProjectManager`

Model, library, or project, specified by name or numeric handle, or a `slproject.ProjectManager` object returned by the `currentProject` function.

Data Types: `double` | `char`

### **templatename** — Template file name

character vector

Template file name, specified as a character vector that can optionally include the fully-qualified path to a template file and \*.sltx extension.

Data Types: char

### **Name-Value Pair Arguments**

Specify optional pairs of arguments as Name1=Value1, . . . , NameN=ValueN, where Name is the argument name and Value is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: Title, 'My Project Template'

### **Group — Group of template**

character vector

Group of template, specified as a character vector. On the Start Page, templates are shown under group headings.

Example: 'My Templates'

Data Types: char

### **Author — Author of template**

character vector

Author of template, specified as a character vector.

Data Types: char

### **Description — Description of template**

character vector

Description of template, specified as a character vector.

Data Types: char

### **ThumbnailFile — Thumbnail image file name**

character vector

Thumbnail image file name, specified as a character vector.

Data Types: char

### **Title — Title of model or project template**

character vector

Title of template, specified as a character vector. On the Start Page, the templates titles are shown on the tiles. The title can be different from the file name, and you can use any characters in the title. The default value is the name of the model or project.

Example: 'My Project Template'

Data Types: char

## Output Arguments

### **templatefile** — Template file

character vector

Template file, returned as *templatename.slx* file.

## Version History

Introduced in R2016a

## Simulink.exportToVersion

Export model, library, or project for use in previous version of Simulink

### Syntax

```
exported_file = Simulink.exportToVersion(modelname, target_filename, version)
exported_file = Simulink.exportToVersion(modelname, target_filename, version,
Name, Value)
exported_project = Simulink.exportToVersion(proj, zipfilename, version)
exported_project = Simulink.exportToVersion(proj, zipfilename, version,
exportReferencedProjects)
```

### Description

`exported_file = Simulink.exportToVersion(modelname, target_filename, version)` exports the model or library `modelname` to a file named `target_filename` in a format that the specified previous Simulink version can load.

If the system contains functionality not supported by the specified Simulink software version, the command removes the functionality and replaces any unsupported blocks with empty masked subsystem blocks colored yellow. As a result, the converted system may generate different results.

The `save_system` `ExportToVersion` option is a legacy option for this functionality that is also supported.

`exported_file = Simulink.exportToVersion(modelname, target_filename, version, Name, Value)` specifies additional options as one or more name-value pair arguments.

`exported_project = Simulink.exportToVersion(proj, zipfilename, version)` exports the project `proj` to a ZIP file `zipfilename` in a format that the specified previous Simulink version can load.

`exported_project = Simulink.exportToVersion(proj, zipfilename, version, exportReferencedProjects)` exports the top-level project `proj` and all referenced projects to a ZIP file `zipfilename` in a format that the specified previous Simulink version can load.

### Examples

#### Export a Model to a Previous Version

Get the current top-level system and export it.

```
Simulink.exportToVersion(bdroot, 'mymodel.slx', 'R2014b');
```

#### Export a Model to a Previous Version and Break Links

Get the current top-level system and export it, replacing links to library blocks with copies of the library blocks in the saved file.

```
Simulink.exportToVersion(bdroot, 'mymodel.slx', 'R2014b', 'BreakUserLinks', true);
```

## Export a Project to a Previous Version

Get the current top-level project and export it.

```
sldemo_slproject_airframe_references;
proj = currentProject;
Simulink.exportToVersion(proj, 'myzipfilename', 'R2019a');
```

Export the current top-level project and all referenced projects.

```
Simulink.exportToVersion(proj, 'myzipfilename', 'R2019a', true);
```

## Input Arguments

### modelName — Model to export

character vector | string scalar

Model to export, specified as a character vector or string scalar, without any file extension. The model must be loaded and unmodified. The target file must not be the same as the model file.

Data Types: char | string

### target\_filename — Exported file name

character vector | string scalar

Exported file name, specified as a character vector or string scalar. The target file must not be the same as the model file.

Example: 'mymodel.slx'

Data Types: char | string

### proj — Project to export

matlab.project.Project object

Project to export, specified as a matlab.project.Project object. Use currentProject to create a project object from the currently loaded project.

### zipfilename — Exported ZIP file name

character vector | string scalar

ZIP file name containing the exported project, specified as a character vector or string scalar.

Example: 'myzipfile.zip'

Data Types: char | string

### version — MATLAB release name

'R2013B' | 'R2014A\_MDL' | 'R2016B\_SLX' | ...

MATLAB release name, specified as a character vector or string scalar, which specifies a previous Simulink version. Simulink.exportToVersion exports the system to a format that the specified previous Simulink version can load. You cannot export to your current version. These version names are not case sensitive.

You can specify model file format as SLX or MDL using the suffix `_MDL` or `_SLX`. If you do not specify a format, you export your default model file format. You cannot specify the model files format when exporting a project.

If you use the Export to Previous Version dialog box instead of `Simulink.exportToVersion`, then the **Save as type** list supports 7 years of previous releases.

Example: 'R2015B'

Data Types: `char` | `string`

### **exportReferencedProjects — Export referenced projects to a previous Simulink version**

`false` (default) | `true` | ...

(Optional) Export referenced projects to a previous release, specified as `true` or `false`.

If `true`, `Simulink.exportToVersion` exports the top-level and all referenced projects to a previous release, and includes the references in the ZIP file. Extracting the ZIP file creates a copy of the referenced projects and links them to the top-level project.

If `false`, `Simulink.exportToVersion` only exports the top-level project to a previous release. `Simulink.exportToVersion` preserves the existing absolute and relative link to the references. For a working project on extraction, the references must be at the same absolute and relative paths.

The argument is ignored if the project does not have references.

### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example:

### **AllowPrompt — Allow prompt or message dialog box**

`false` (default) | `true` | 'on' | 'off'

Allow prompt or message dialog box, specified by a logical value that indicates whether to display any output prompt or message in a dialog box or only messages at the command line. For example, prompts to make files writable, or messages about exported versions. If you want to allow prompts, then set to `true`. or `on`.

### **BreakUserLinks — Break user-defined links**

`false` (default) | `true` | 'on' | 'off'

Break user-defined links, specified by a logical value that indicates whether the function replaces links to user-defined library blocks with copies of the library blocks in the saved file.

### **BreakToolboxLinks — Break all toolbox links**

`false` (default) | `true` | 'on' | 'off'

Break all toolbox links, specified by a logical value that indicates whether the function replaces links to built-in MathWorks library blocks with copies of the library blocks in the saved file. The 'BreakToolboxLinks' option affects Simulink library blocks and blocks from any other libraries supplied with MathWorks toolboxes or blocksets.

---

**Note** The 'BreakToolboxLinks' option can result in compatibility issues when upgrading to newer versions of Simulink software. For example:

- Any masks on top of library links to Simulink S-functions will not upgrade to the new version of the S-function.
- Any library links to masked subsystems in a Simulink library will not upgrade to the new subsystem behavior.
- Any broken links prevent the automatic library forwarding mechanism from upgrading the link. See “Maintain Compatibility of Library Blocks Using Forwarding Tables”.

If you have saved a model with broken links to built-in libraries, use the Upgrade Advisor to scan the model for out-of-date blocks and upgrade the Simulink blocks to their current versions.

---

## Output Arguments

### **exported\_file** — Exported file

character vector

Path of the exported file, returned in the format that the specified previous Simulink version can load.

### **exported\_project** — Exported project in a ZIP file

character vector

Path of the ZIP file containing the exported project, returned in the format that the specified previous Simulink version can load.

## Limitations

Simulink.exportToVersion does not support exporting external test harnesses to previous releases.

- For models with external test harnesses, Simulink.exportToVersion automatically converts them to internal test harnesses.
- For projects containing models with external test harnesses, Simulink.exportToVersion exports the projects and reports the test harnesses as missing files.

## Version History

Introduced in R2016a

### See Also

save\_system

### Topics

“Save the Model”

## **Simulink.history.clear**

Clear the Simulink start page and editor history

### **Syntax**

```
Simulink.history.clear
```

### **Description**

`Simulink.history.clear` clears the list of favorites and the list of recent models and projects in the Simulink start page and editor.

### **Examples**

#### **Clear All Simulink History**

To clear all Simulink history, in the Command Window, type:

```
Simulink.history.clear()
```

# Simulink.fileGenControl

Specify root folders for files generated by diagram updates and model builds

## Syntax

```
cfg = Simulink.fileGenControl('getConfig')
Simulink.fileGenControl(Action,Name,Value)
```

## Description

`cfg = Simulink.fileGenControl('getConfig')` returns a handle to an instance of the `Simulink.FileGenConfig` object, which contains the current values of these file generation control parameters:

- `CacheFolder` - Specifies the root folder for model build artifacts that are used for simulation, including Simulink® cache files.
- `CodeGenFolder` - Specifies the root folder for code generation files.
- `CodeGenFolderStructure` - Controls the folder structure within the code generation folder.

To get or set the parameter values, use the `Simulink.FileGenConfig` object.

These Simulink preferences determine the initial parameter values for the MATLAB session:

- **Simulation cache folder** - `CacheFolder`
- **Code generation folder** - `CodeGenFolder`
- **Code generation folder structure** - `CodeGenFolderStructure`

`Simulink.fileGenControl(Action,Name,Value)` performs an action that uses the file generation control parameters of the current MATLAB session. Specify additional options with one or more `name,value` pair arguments.

## Examples

### Get File Generation Control Parameter Values

To obtain the file generation control parameter values for the current MATLAB session, use `getConfig`.

```
cfg = Simulink.fileGenControl('getConfig');

myCacheFolder = cfg.CacheFolder;
myCodeGenFolder = cfg.CodeGenFolder;
myCodeGenFolderStructure = cfg.CodeGenFolderStructure;
```

### Set File Generation Control Parameters by Using Simulink.FileGenConfig Object

To set the file generation control parameter values for the current MATLAB session, use the `setConfig` action. First, set values in an instance of the `Simulink.FileGenConfig` object. Then,

pass the object instance. This example assumes that your system has `aNonDefaultCacheFolder` and `aNonDefaultCodeGenFolder` folders.

```
% Get the current configuration
cfg = Simulink.fileGenControl('getConfig');

% Change the parameters to non-default locations
% for the cache and code generation folders
cfg.CacheFolder = fullfile('C:', 'aNonDefaultCacheFolder');
cfg.CodeGenFolder = fullfile('C:', 'aNonDefaultCodeGenFolder');
cfg.CodeGenFolderStructure = 'TargetEnvironmentSubfolder';

Simulink.fileGenControl('setConfig', 'config', cfg);
```

### Set File Generation Control Parameters Directly

You can set file generation control parameter values for the current MATLAB session without creating an instance of the `Simulink.FileGenConfig` object. This example assumes that your system has `aNonDefaultCacheFolder` and `aNonDefaultCodeGenFolder` folders.

```
myCacheFolder = fullfile('C:', 'aNonDefaultCacheFolder');
myCodeGenFolder = fullfile('C:', 'aNonDefaultCodeGenFolder');

Simulink.fileGenControl('set', 'CacheFolder', myCacheFolder, ...
 'CodeGenFolder', myCodeGenFolder, ...
 'CodeGenFolderStructure', ...
 Simulink.filegen.CodeGenFolderStructure.TargetEnvironmentSubfolder);
```

If you do not want to generate code for different target environments in separate folders, for `'CodeGenFolderStructure'`, specify the value `Simulink.filegen.CodeGenFolderStructure.ModelSpecific`.

### Reset File Generation Control Parameters

You can reset the file generation control parameters to values from Simulink preferences.

```
Simulink.fileGenControl('reset');
```

### Create Simulation Cache and Code Generation Folders

To create file generation folders, use the `set` action with the `'createDir'` option. You can keep previous file generation folders on the MATLAB path through the `'keepPreviousPath'` option.

```
%
myCacheFolder = fullfile('C:', 'aNonDefaultCacheFolder');
myCodeGenFolder = fullfile('C:', 'aNonDefaultCodeGenFolder');

Simulink.fileGenControl('set', ...
 'CacheFolder', myCacheFolder, ...
 'CodeGenFolder', myCodeGenFolder, ...
 'createDir', true, ...
 'keepPreviousPath', true);
```

```
'keepPreviousPath',true, ...
'createDir',true);
```

## Input Arguments

### Action — Specify action

'reset' | 'set' | 'setConfig'

Specify an action that uses the file generation control parameters of the current MATLAB session:

- 'reset' - Reset file generation control parameters to values from Simulink preferences.
- 'set' - Set file generation control parameters for the current MATLAB session by directly passing values.
- 'setConfig' - Set file generation control parameters for the current MATLAB session by using an instance of a `Simulink.FileGenConfig` object.

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `Simulink.fileGenControl(Action, Name, Value);`

### config — Specify instance of Simulink.FileGenConfig

object handle

Specify the `Simulink.FileGenConfig` object instance containing file generation control parameters that you want to set.

Option for `setConfig`.

Example: `Simulink.fileGenControl('setConfig', 'config', cfg);`

### CacheFolder — Specify simulation cache folder

character vector

Specify a simulation cache folder path value for the `CacheFolder` parameter.

Option for `set`.

Example: `Simulink.fileGenControl('set', 'CacheFolder', myCacheFolder);`

### CodeGenFolder — Specify code generation folder

character vector

Specify a code generation folder path value for the `CodeGenFolder` parameter. You can specify an absolute path or a path relative to build folders. For example:

- 'C:\Work\mymodelsimcache' and '/mywork/mymodelgencode' specify absolute paths.
- 'mymodelsimcache' is a path relative to the current working folder (pwd). The software converts a relative path to a fully qualified path at the time the `CacheFolder` or `CodeGenFolder`

parameter is set. For example, if `pwd` is  `'/mywork'`, the result is  `'/mywork/mymodelsimcache'`.

- `'../test/mymodelgencode'` is a path relative to `pwd`. If `pwd` is  `'/mywork'`, the result is  `'/test/mymodelgencode'`.

Option for `set`.

Example: `Simulink.fileGenControl('set', 'CodeGenFolder', myCodeGenFolder);`

### **CodeGenFolderStructure — Specify generated code folder structure**

`Simulink.filegen.CodeGenFolderStructure.ModelSpecific` (default) |  
`Simulink.filegen.CodeGenFolderStructure.TargetEnvironmentSubfolder`

Specify the layout of subfolders within the generated code folder:

- `Simulink.filegen.CodeGenFolderStructure.ModelSpecific` (default) - Place generated code in subfolders within a model-specific folder.
- `Simulink.filegen.CodeGenFolderStructure.TargetEnvironmentSubfolder` - If models are configured for different target environments, place generated code for each model in a separate subfolder. The name of the subfolder corresponds to the target environment.

Option for `set`.

Example: `Simulink.fileGenControl('set', 'CacheFolder', myCacheFolder, ...  
'CodeGenFolder', myCodeGenFolder, ... 'CodeGenFolderStructure', ...  
Simulink.filegen.CodeGenFolderStructure.TargetEnvironmentSubfolder);`

### **keepPreviousPath — Keep previous folder paths on MATLAB path**

`false` (default) | `true`

Specify whether to keep the previous values of `CacheFolder` and `CodeGenFolder` on the MATLAB path:

- `true` - Keep previous folder path values on MATLAB path.
- `false` (default) - Remove previous folder path values from MATLAB path.

Option for `reset`, `set`, or `setConfig`.

Example: `Simulink.fileGenControl('reset', 'keepPreviousPath', true);`

### **createDir — Create folders for file generation**

`false` (default) | `true`

Specify whether to create folders for file generation if the folders do not exist:

- `true` - Create folders for file generation.
- `false` (default) - Do not create folders for file generation.

Option for `set` or `setConfig`.

Example: `Simulink.fileGenControl('set', 'CacheFolder', myCacheFolder,  
'CodeGenFolder', myCodeGenFolder, 'keepPreviousPath', true,  
'createDir', true);`

## Avoid Naming Conflicts

Using `Simulink.fileGenControl` to set `CacheFolder` and `CodeGenFolder` adds the specified folders to your MATLAB search path. This function has the same potential for introducing a naming conflict as using `addpath` to add folders to the search path. For example, a naming conflict occurs if the folder that you specify for `CacheFolder` or `CodeGenFolder` contains a model file with the same name as an open model. For more information, see “What Is the MATLAB Search Path?” and “Files and Folders that MATLAB Accesses”.

To use a nondefault location for the simulation cache folder or code generation folder:

- 1 Delete any potentially conflicting artifacts that exist in:
  - The current working folder, `pwd`.
  - The nondefault simulation cache and code generation folders that you intend to use.
- 2 Specify the nondefault locations for the simulation cache and code generation folders by using `Simulink.fileGenControl` or Simulink preferences.

## Output Arguments

### **cfg** — Current values of file generation control parameters

object handle

Instance of a `Simulink.FileGenConfig` object, which contains the current values of file generation control parameters.

## Version History

Introduced in R2010b

## Simulink.findBlocks

Find blocks in Simulink models

### Syntax

```
bl = Simulink.findBlocks(sys)
bl = Simulink.findBlocks(sys,options)
bl = Simulink.findBlocks(sys,Param1,Value1,...,ParamN,ValueN)
bl = Simulink.findBlocks(sys,Param1,Value1,...,ParamN,ValueN,options)
```

### Description

`bl = Simulink.findBlocks(sys)` returns handles to all blocks in the model or subsystem `sys`.

`bl = Simulink.findBlocks(sys,options)` finds blocks that match the criteria specified by a `Simulink.FindOptions` object.

`bl = Simulink.findBlocks(sys,Param1,Value1,...,ParamN,ValueN)` finds blocks whose block parameters have the specified values.

`bl = Simulink.findBlocks(sys,Param1,Value1,...,ParamN,ValueN,options)` finds blocks whose parameters have the specified values and that match the criteria specified by a `FindOptions` object.

### Examples

#### Find Blocks in a Model

Return handles for all blocks in the model `vdp`.

```
load_system('vdp');
bl = Simulink.findBlocks('vdp')
```

```
bl =
```

```
1.0e+03 *
```

```
9.4450
9.4460
9.4470
9.4480
9.4490
9.4500
9.4510
9.4520
9.4530
9.4540
9.4550
9.4560
9.4570
9.4580
```

Return block names.

```
bl = getfullname(Simulink.findBlocks('vdp'))
```

```
bl =
```

```
14x1 cell array
```

```
{'vdp/Constant' }
{'vdp/More Info' }
{'vdp/More Info/Model Info'}
{'vdp/Mu' }
{'vdp/Mux' }
{'vdp/Product' }
{'vdp/Scope' }
{'vdp/Square' }
{'vdp/Sum' }
{'vdp/Sum1' }
{'vdp/x1' }
{'vdp/x2' }
{'vdp/Out1' }
{'vdp/Out2' }
```

Return block handles for the block whose name is Mu.

```
Simulink.findBlocks('vdp', 'Name', 'Mu')
```

```
ans =
```

```
9.4480e+03
```

## Input Arguments

**sys** — Model or subsystem to find blocks in

character vector | string array

Model or subsystem to find blocks in, specified as a character vector or string array.

Example: 'vdp' "f14/Aircraft Dynamics Model"

**options** — Search constraints

Simulink.FindOptions object

Search constraints, specified as a Simulink.FindOptions object.

## Output Arguments

**bl** — Search results

array of handles

Search results, returned as an array of handles.

## Version History

Introduced in R2018a

**See Also**

# Simulink.findBlocksOfType

Find specified type of block in Simulink models

## Syntax

```
bl = Simulink.findBlocksOfType(sys,type)
bl = Simulink.findBlocksOfType(sys,type,options)
bl = Simulink.findBlocksOfType(sys,type,Param1,Value1,...,ParamN,ValueN)
bl = Simulink.findBlocksofType(sys,type,Param1,Value1,...,ParamN,ValueN,
options)
```

## Description

`bl = Simulink.findBlocksOfType(sys,type)` returns handles to all blocks of the specified type in the model or subsystem `sys`.

`bl = Simulink.findBlocksOfType(sys,type,options)` matches the criteria specified by a `FindOptions` object.

`bl = Simulink.findBlocksOfType(sys,type,Param1,Value1,...,ParamN,ValueN)` finds blocks whose parameters have the specified values.

`bl = Simulink.findBlocksofType(sys,type,Param1,Value1,...,ParamN,ValueN,options)` finds blocks whose parameters have the specified values and that match the criteria specified by a `FindOptions` object.

## Examples

### Find Blocks of a Type in Model

Find all blocks of type Gain in the model `vdp`.

```
load_system('vdp');
Simulink.findBlocksOfType('vdp','Gain')
```

```
ans =
 7.0001
```

To return block names instead of handles, use `getfullname`.

```
getfullname(Simulink.findBlocksOfType('vdp','Gain'))
```

```
ans =
 'vdp/Mu'
```

## Find Blocks of a Type Using Search Options

Load the model `sldemo_clutch`. Then, create a `FindOptions` object and use it to constrain the search of `GoTo` blocks in the model to the `Unlocked` system.

```
openExample('sldemo_clutch');
f = Simulink.FindOptions('SearchDepth',1);
bl = Simulink.findBlocksOfType('sldemo_clutch/Unlocked','Goto',f)

bl =

 166.0001
 167.0001
```

## Input Arguments

### **sys** — Model or subsystem to find blocks in

character vector | string array

Model or subsystem to find blocks in, specified as a character vector or string array.

Example: `'vdp' "f14/Aircraft Dynamics Model"`

### **type** — Block type

character vector | string scalar

Block type, specified as a character vector or string scalar. Use `get_param` with the `'BlockType'` parameter to get the block type.

### **options** — Search constraints

`simulink.FindOptions` object

Search constraints, specified as a `Simulink.FindOptions` object.

Example: `Simulink.FindOptions('SearchDepth',1)`

## Output Arguments

### **bl** — Search results

array of handles

Search results, returned as an array of handles.

## Version History

Introduced in R2018a

# Simulink.findIntEnumType

Find enumeration classes defined by `Simulink.defineIntEnumType`

## Syntax

```
result = Simulink.findIntEnumType(typeName)
result = Simulink.findIntEnumType()
```

## Description

`result = Simulink.findIntEnumType(typeName)` returns the `meta.class` object for class `type` that is defined by `Simulink.defineIntEnumType`. Use the returned `meta.class` object to query attributes of the enumeration class. If the class does not exist, the function returns an empty `meta.class` object.

`result = Simulink.findIntEnumType()` returns `meta.class` objects for all enumeration classes that are defined by `Simulink.defineIntEnumType`. Use the returned `meta.class` objects to query attributes of the enumeration classes.

## Examples

### Find a Specific Dynamic Enumerated Data Type

Define an enumeration type.

```
Simulink.defineIntEnumType('myEnumType', {'e1', 'e2'}, [1 2]);
```

Check for the enumeration type that you have created.

```
myResult = Simulink.findIntEnumType('myEnumType')
```

```
myResult =
```

```
class with properties:
 Name: 'myEnumType'
 Description: ''
 DetailedDescription: ''
 Hidden: 0
 Sealed: 0
 Abstract: 0
 Enumeration: 1
 ConstructOnLoad: 0
 HandleCompatible: 0
 InferiorClasses: {[1x1 meta.class]}
 ContainingPackage: [0x0 meta.package]
 RestrictsSubclassing: 0
 PropertyList: [0x1 meta.property]
 MethodList: [150x1 meta.method]
 EventList: [0x1 meta.event]
```

```
EnumerationMemberList: [2×1 meta.EnumeratedValue]
SuperclassList: [1×1 meta.class]
```

## Find All Dynamic Enumerated Data Types

Define two enumeration types.

```
Simulink.defineIntEnumType('myEnumType1', {'e1', 'e2'}, [1 2]);
Simulink.defineIntEnumType('myEnumType2', {'e3', 'e4'}, [3 4]);
```

Check for the enumeration types that you have created.

```
myResult = Simulink.findIntEnumType()
```

## Input Arguments

### **typeName** — Name of enumeration class

character vector or string

Name of a specific enumeration class that is defined by `Simulink.defineIntEnumType`, specified as a character vector or string.

Example: 'myEnumType'

Data Types: char | string

## Output Arguments

### **result** — Search results

array of `meta.class` objects

Search result, returned as an array of `meta.class` objects. If there are no enumeration classes, the array is empty.

## Version History

**Introduced in R2018b**

[enumeration](#) | [Simulink.clearIntEnumType](#) | [Simulink.defineIntEnumType](#)

# Simulink.findTemplates

Find model or project templates with specified properties

## Syntax

```
filename = Simulink.findTemplates(templatename)
filename = Simulink.findTemplates(templatename,Name,Value)
[filename,info] = Simulink.findTemplates(templatename)
```

## Description

`filename = Simulink.findTemplates(templatename)` returns the names and `TemplateInfo` objects for all matching templates that include `templatename`.

`filename = Simulink.findTemplates(templatename,Name,Value)` also specifies additional template properties as one or more `Name, Value` pair arguments.

`[filename,info] = Simulink.findTemplates(templatename)` returns the names and `TemplateInfo` objects for all matching templates.

## Examples

### Find a Particular Template

Get the full path to the default model template.

```
filename = Simulink.findTemplates('factory_default_model');
```

### Find All Templates With Specified Folders or Authors

Get all templates inside folders called `work`.

```
filename = Simulink.findTemplates('work/')
```

Get all templates for which the `Author` property includes the character vector `Smith`.

```
filename = Simulink.findTemplates('*', 'Author', 'Smith')
```

### Find All DSP Templates and Get TemplateInfo Objects

Get the paths to all DSP model templates, and `sltemplate.TemplateInfo` objects for each of them.

```
[filename,info] = Simulink.findTemplates('dsp*', 'Type', 'Model');
```

## Input Arguments

### **templatename — Template name**

character vector

Template name, specified as a character vector containing a portion of a file name, which can contain the wildcard asterisk character “\*”.

Example:

Data Types: char

### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

You can specify regular expressions for any of the Value character vectors, e.g., including the wildcard asterisk character “\*”.

Example: 'Author', '\*son'

### **Type — Model, library, or project**

'Model' | 'Library' | 'Project'

Model, library, or project template type, specified as a character vector for model, library, or project.

Example: 'Simscape'

Data Types: char

### **Title — Title of template**

character vector

Title of template, specified as a character vector.

Example: 'Simscape'

Data Types: char

### **Group — Group of template**

character vector

Group of template, specified as a character vector. On the Start Page, templates are shown under group headings.

Example: 'Simscape'

Data Types: char

### **Author — Author of template**

character vector

Author of template, specified as a character vector.

Data Types: char

**Description — Description of template**

character vector

Description of template, specified as a character vector.

Data Types: char

**Output Arguments****filename — Template name**

character vector | cell array of character vectors

Template names of matching templates, returned as character vectors.

**info — Template information**

template info objects | array of template info objects

Template information of matching templates, returned as `sltemplate.TemplateInfo` objects.

**Version History**

**Introduced in R2016a**

**See Also**

## Simulink.findVars

Analyze relationship between variables and blocks in models

### Syntax

```
[variables] = Simulink.findVars(context)
[variables] = Simulink.findVars(context,variablefilter)
[variables] = Simulink.findVars(____,Name,Value)
```

### Description

`[variables] = Simulink.findVars(context)` finds and returns variables that are used in the blocks and models specified by `context`, including subsystems and referenced models. The function returns an empty vector if `context` does not use any variables.

`[variables] = Simulink.findVars(context,variablefilter)` finds only the variables or enumerated types that are specified by `variablefilter`. For example, use this syntax to determine where a variable is used in a model.

`[variables] = Simulink.findVars( ____,Name,Value)` finds variables with additional options specified by one or more `Name,Value` pair arguments. For example, you can search for unused variables. You can also search for enumerated data types that are used in `context`, in addition to variables.

### Examples

#### Variables in Use in a Model

Find variables used by `MyModel`.

```
variables = Simulink.findVars('MyModel');
```

#### Specific Variable in Use in a Model

Find all uses of the base workspace variable `k` by `MyModel`. Use the cached results to avoid compiling `MyModel`.

```
variables = Simulink.findVars('MyModel','Name','k',...
'SearchMethod','cached','SourceType','base workspace');
```

#### Regular Expression Matching

Find all uses of a variable whose name matches the regular expression `^trans`.

```
variables = Simulink.findVars('MyModel', 'Regex', 'on', ...
 'Name', '^trans');
```

### Variables Common to Two Models

Given two models, find the variables used by the first model, the second, and both

```
model1Vars = Simulink.findVars('model1');
model2Vars = Simulink.findVars('model2');
commonVars = intersect(model1Vars,model2Vars);
```

### Variables Not Used in a Model

Find the variables that are defined in the model workspace of MyModel but that are not used by the model.

```
unusedVars = Simulink.findVars('MyModel', 'FindUsedVars', 'off', ...
 'SourceType', 'model workspace');
```

### Specific Variable Not Used in a Model

Determine if the base workspace variable k is not used by MyModel.

```
varObj = Simulink.VariableUsage('k', 'base workspace');
unusedVar = Simulink.findVars('MyModel', varObj, ...
 'FindUsedVars', 'off');
```

### Variables Used by a Block

Find the variables that are used by the block Gain1 in MyModel.

```
variables = Simulink.findVars('MyModel', ...
 'Users', 'MyModel/Gain1');
```

### Variables Used in a Model Reference Hierarchy

Find the variables that are used in a model reference hierarchy. Begin the search with the model MyNestedModel, and search the entire hierarchy below MyNestedModel.

```
variables = Simulink.findVars('MyNestedModel', 'SearchReferencedModels', 'on');
```

### Variables and Enumerated Types Used in a Model

Find variables and enumerated types that are used in MyModel.

```
varsAndEnumTypes = Simulink.findVars('MyModel','IncludeEnumTypes','on');
```

## Input Arguments

### context — Models and blocks to search

character vector | string | cell array of character vectors | string array

Models and blocks to search, specified as a character vector, string, cell array of character vectors, or a string array. You can specify `context` in one of the following ways:

- The name of a model. For example, ('vdp') specifies the model `vdp.slx`.
- The name or path of a block or masked block. For example, ('vdp/Gain1') specifies a block named `Gain1` at the root level of the model `vdp.slx`.
- A cell array of model or block names.

Data Types: `char` | `cell`

### variablefilter — Specific variables to find

array of `Simulink.VariableUsage` objects

Specific variables to find, specified as an array of `Simulink.VariableUsage` objects. Each `Simulink.VariableUsage` object identifies a variable to find.

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose `Name` in quotes.*

Example: 'FindUsedVars','off'

### FindUsedVars — Find variables that are used or not used

'on' (default) | 'off'

Flag to find variables that are explicitly used or not used, specified as the comma-separated pair consisting of 'FindUsedVars' and 'on' or 'off'. If you specify `FindUsedVars` as 'off', the function finds variables that are not used in context but that are defined in the workspace specified by `SourceType`.

Example: 'FindUsedVars','off'

### IncludeEnumTypes — Find enumerated types that are used

'off' (default) | 'on'

Flag to find enumerated data types that are used, specified as the comma-separated pair consisting of 'IncludeEnumTypes' and 'on' or 'off'. The function finds enumerated types that are used explicitly in context as well as types that define variables that are used in context.

The function does not report details about which blocks or objects are using the enumerated types.

If you specify `SourceType` as 'base workspace', 'model workspace', or 'mask workspace', the function does not report enumerated types because those sources cannot define enumerated types.

You cannot find unused enumerated types by specifying `FindUsedVars` as `'off'`.

Example: `'IncludeEnumTypes', 'on'`

### **RegExp — Enable regular expression matching**

`'off'` (default) | `'on'`

Flag to enable regular expression matching for input arguments, specified as the comma-separated pair consisting of `'RegExp'` and `'on'`. You can match only input arguments that have character vector values.

Example: `'RegExp', 'on'`

### **SearchMethod — Compile status**

`'compiled'` (default) | `'cached'`

Compile status, specified as the comma-separated pair consisting of `'SearchMethod'` and one of these values:

- `'compiled'` — Return up-to-date results by compiling every model in the search context before search.
- `'cached'` — Return quicker results by using results cached during the previous compile.

Example: `'SearchMethod', 'compiled'`

### **SearchReferencedModels — Enable search in referenced models**

`'off'` (default) | `'on'`

Flag to enable search in referenced models, specified as the comma-separated pair consisting of `'SearchReferencedModels'` and `'on'`.

If a referenced model uses a global variable, such as a variable stored in a data dictionary, the function returns this global variable when called on the parent model. If `SearchReferencedModels` is set to `'on'`, the `Simulink.VariableUsage` object returned by the function specifies a block in the referenced model as the variable user. Otherwise, the object specifies the Model block as the user.

Example: `'SearchReferencedModels', 'on'`

### **Name — Name of a variable or enumerated type to search for**

character vector | string

Name of a variable or enumerated data type to search for, specified as the comma-separated pair consisting of `'Name'` and a character vector or string.

Example: `'Name', 'trans'`

Data Types: char

### **SourceType — Workspace or source defining the variables or enumerated types**

character vector | string

Workspace or source defining the variables, specified as the comma-separated pair of `'SourceType'` and one of these options:

- `'base workspace'`
- `'model workspace'`

- 'mask workspace'
- 'data dictionary'

The function filters results for variables that are defined in the specified source.

Example: 'SourceType', 'base workspace'

If you search for enumerated data types by specifying 'IncludeEnumTypes' as 'on', 'SourceType' represents the way an enumerated type is defined. You can specify one of these options:

- 'MATLAB file'
- 'dynamic class'
- 'data dictionary'

The function filters results for enumerated types that are defined in the specified source.

Example: 'SourceType', 'MATLAB file'

If you do not specify SourceType, the function does not filter results by source.

### **Users — Name of block to search for variables**

character vector | string

Name of specific block to search for variables, specified as the comma-separated pair consisting of 'Users' and a character vector or string.

To search a set of specific blocks, enable regular expression matching by specifying RegExp as 'on' and use regular expressions in the character vector. For example, you can specify 'Users', 'MyModel/Gain\*' to search all blocks in MyModel whose names begin with Gain.

Example: 'Users', 'MyModel/Gain1'

Example: 'Users', 'MyModel/mySubsystem/Gain2'

Example: 'Users', 'MyModel/Gain\*'

## **Limitations**

Simulink.findVars does not work with these constructs:

- MATLAB code in scripts and initialization and callback functions
- Libraries and blocks in libraries
- Variables in MATLAB Function blocks, except for input arguments

However, Simulink.findVars can find enumerated types anywhere they are used in MATLAB Function blocks.

- Calls directly to MATLAB from the Stateflow action language
- S-functions that use data type variables registered using ssRegisterDataType

To make the variables searchable, use ssRegisterTypeFromNamedObject instead.

- Variables referenced by machine-parented data in Stateflow.
- Variables inside a string.

- Field in a struct.
- Top models configured for parallel model reference builds. In this case, `Simulink.findVars` does not work when called with either of these name-value arguments:
  - 'SearchMethod' specified as 'cached'.
  - 'SearchReferencedModels' specified as 'on'.

`Simulink.findVars` discovers variable usage in inactive subsystem variants only if you set the **Variant activation time** parameter to `code compile` in the Variant Subsystem block dialog box. If you do not select this check box, the function does not discover variable usage in inactive variants.

## Simulink.fmuexport.ExportSimulinkProjectToFMU

Export project as Functional Mockup Unit (FMU)

### Syntax

```
Simulink.fmuexport.ExportSimulinkProjectToFMU(project,model,Name,Value)
```

### Description

`Simulink.fmuexport.ExportSimulinkProjectToFMU(project,model,Name,Value)` exports a project as a Functional Mockup Unit (FMU) and sets the `model` as the main interface model.

### Examples

#### Export Model and Set FMU Icon

If the Simulink model `EngineGasDynamics.slx` exists in the `project root/models/` folder, use the following command to export the FMU from project root:

```
project = slproject.getCurrentProject; ...
Simulink.fmuexport.ExportSimulinkProjectToFMU(project,'models/EngineGasDynamics.slx','-fmuname',fullfile(project.RootFolder,'EngineGasDynamics.slx'))
```

### Input Arguments

#### **project** — Project to export

scalar (default)

Project to export, specified as a string.

Data Types: `string`

#### **model** — Model that defines main interface

scalar (default)

Model that defines the main interface, specified as a string.

Data Types: `string`

#### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose `Name` in quotes.*

Example:

**-fmuname** — The location and name of the generated FMU relative to the current working folder

`string`

If not specified, FMU is saved to current directory folder with the same name as the main model.

Data Types: `string`

**-description — The description of the generated FMU**

`string` (default)

The information is saved in `modelDescription.xml` inside FMU.

Data Types: `string`

**-author — The author of the generated FMU**

`string` (default)

The information is saved in `modelDescription.xml` inside FMU.

Data Types: `string`

**-copyright — The copyright of the generated FMU**

`string` (default)

The information is saved in `modelDescription.xml` inside FMU.

Data Types: `string`

**-license — The license of the generated FMU**

`string` (default)

The information is saved in `modelDescription.xml` inside FMU.

Data Types: `string`

**-fmuiicon — An icon file for the generated FMU**

`string` (default)

The icon file must be in PNG format. If not specified, generated FMU has no icon file.

Data Types: `string`

## Simulink.getFileChecksum

Checksum of file

### Syntax

```
checksum = Simulink.getFileChecksum(filename)
```

### Description

`checksum = Simulink.getFileChecksum(filename)` returns the checksum of the specified file, using the MD5 checksum algorithm. Use the checksum to see if the file has changed compared to a previous checksum. You can use checksums as part of an audit trail.

Use `Simulink.getFileChecksum` to get a checksum for any file. If the file contents do not change from one checksum to the next, the checksum from `Simulink.getFileChecksum` stays the same. Otherwise, the checksum is different with each change to the file contents.

For functional information on a model, use `Simulink.BlockDiagram.getChecksum` instead. `Simulink.BlockDiagram.getChecksum` looks at the functional aspect of the model. If the functional aspect doesn't change, then `Simulink.BlockDiagram.getChecksum` returns the same checksum.

For example, if you moved a block, the file contents are different (measured by `Simulink.getFileChecksum`) but the function of the model is unchanged (measured by `Simulink.BlockDiagram.getChecksum`).

### Examples

#### Get Checksum of a File

Use `fullfile` to specify a full path to a file and get the checksum.

```
filechecksum = Simulink.getFileChecksum(fullfile(matlabroot, 'toolbox', ...
'matlab', 'demos', 'gatlin.mat'));
```

### Input Arguments

**filename** — File name to get checksum for

file of any type

File name to get checksum for, with file extension and optional full path. Use `fullfile` to specify a full path to a file, or use the form `'C:\Work\filename.mat'`.

Example: `'lengthoffline.m'`

Data Types: char

## Output Arguments

**checksum** — Checksum value

character vector

Checksum value in a 32-character vector.

## Version History

**Introduced in R2014b**

### See Also

`Simulink.BlockDiagram.getChecksum` | `Simulink.SubSystem.getChecksum`

## Simulink.getOutputInheritsInitialValue

Determine if conditional subsystem Output block inherits initial output value

### Syntax

```
tf = Simulink.getOutputInheritsInitialValue(outblock)
```

### Description

`tf = Simulink.getOutputInheritsInitialValue(outblock)` evaluates whether `outblock` is a conditional subsystem Output block that inherits its initial output value from an input signal connected to the conditional subsystem. If so, it returns `true`. If not, it returns `false`. The return value is `true` under the same circumstances as the  badge is displayed next to the Output block on the Simulink canvas, as described in “Conditional Subsystem Initial Output Values”.

For the return value to be accurate, update or run the model before calling this function.

The value returned by this function is meaningful only if the model is using simplified initialization mode. See “Simplified Initialization Mode”. If the model is using classic initialization mode, the return value is always `false`.

### Examples

#### Determine If Output Block Inherits Initial Output Value

The model `my_model` contains the enabled subsystem `EnabledSub1`, which contains Output blocks `Out1` and `Out2`.

```
set_param('my_model/EnabledSub1/Out1','InitialOutput','0'); % Explicit initial output value
set_param('my_model','SimulationCommand','Update'); % Update model
inherits = Simulink.getOutputInheritsinitialValue('my_model/EnabledSub1/Out1')
```

```
inherits =
```

```
logical
```

```
0
```

```
set_param('my_model/EnabledSub1/Out2','InitialOutput','[]'); % Inherit initial output value
set_param('my_model','SimulationCommand','Update'); % Update model
inherits = Simulink.getOutputInheritsinitialValue('my_model/EnabledSub1/Out2')
```

```
inherits =
```

```
logical
```

```
1
```

```
inherits = Simulink.getOutputInheritsinitialValue({'my_model/EnabledSub1/Out1','my_model/EnabledSub1/Out2'})
```

```
inherits =

 2×1 logical array

 0
 1
```

## Input Arguments

### **outblock** — Identifier of conditional subsystem Output block

character vector | string scalar | numeric handle

Identifier of conditional subsystem Output block, specified as a character vector, string scalar, or numeric handle. Multiple block identifiers may be specified as a vector or a 1-dimensional cell array.

Example: 'my\_model/EnabledSub1/Out1'

Data Types: character vector | string scalar | handle | vector | cell array

## Output Arguments

### **tf** — Whether block inherits its initial output value

logical

Whether block inherits its initial output value, returned as a logical `true` or `false`. If the input value refers to an Output block connected to a conditional subsystem and the block inherits its initial output value from that subsystem's input signal, `tf` is `true`. Otherwise, `tf` is `false`. If the input value is a vector or a cell array, `tf` is a logical column vector.

For the return value to be accurate, update or run the model before calling this function.

Data Types: logical | logical vector

## Version History

Introduced in R2021a

## Simulink.getSuppressedDiagnostics

Return `Simulink.SuppressedDiagnostic` objects associated with a block, subsystem, or model

### Syntax

```
suppressed_diagnostics = Simulink.getSuppressedDiagnostics(source)
```

### Description

`suppressed_diagnostics = Simulink.getSuppressedDiagnostics(source)` returns an array of `Simulink.SuppressedDiagnostic` objects that are associated with the specified source.

### Examples

#### Get All Simulink.SuppressedDiagnostic Objects on a Specific Block

Using the model from “Suppress Diagnostic Messages Programmatically”, get all suppressed diagnostics associated with a specified block.

Use the `Simulink.suppressDiagnostic` function to suppress the parameter precision loss warning thrown by the Constant block, one.

```
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one',...
 'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

Get the `Simulink.SuppressedDiagnostic` objects associated with the block.

```
suppressed_diagnostic = Simulink.getSuppressedDiagnostics('Suppressor_CLI_Demo/one')
```

```
suppressed_diagnostic =
```

```
 SuppressedDiagnostic with properties:
```

```
 Source: 'Suppressor_CLI_Demo/one'
 Id: 'SimulinkFixedPoint:util:fxpParameterPrecis...'
LastModifiedBy: ''
 Comments: ''
LastModified: '2016-Jul-04 14:12:24'
```

### Input Arguments

#### source — System, block, or model object throwing warning

model | subsystem | block path | block handle

The source of the diagnostic, specified as a model, subsystem, block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the `gcb` function.

To get the block handle, use the `getSimulinkBlockHandle` function.

Data Types: char | cell

## Output Arguments

**suppressed\_diagnostics** — Suppressed diagnostics

array

Suppressed diagnostics, returned as an array of `Simulink.SuppressedDiagnostic` objects.

## Version History

Introduced in R2016b

### See Also

## Simulink.ID.getHandle

(Not recommended) Get handle of object associated with Simulink Identifier

---

**Note** `Simulink.ID.getHandle` is not recommended. Use alternative functions instead.

- For blocks, use `getSimulinkBlockHandle`.
- For annotations, use `find_system` or `getCurrentAnnotation`.
- For Stateflow® objects, use `find`.

For more information, see “Compatibility Considerations”.

---

### Syntax

```
handle = Simulink.ID.getHandle(SID)
```

### Description

`handle = Simulink.ID.getHandle(SID)` returns the handle of the object for the specified Simulink Identifier `SID`.

### Examples

#### Get Handle of Block

Open the model `vdp`.

```
vdp
```

Get the Simulink Identifier (SID) of the Sum block.

```
SID = Simulink.ID.getSID('vdp/Sum');
```

Get the handle of the Sum block using the SID.

```
handle = Simulink.ID.getHandle(SID)
```

### Input Arguments

#### SID — Simulink Identifier

character vector | string scalar

Simulink Identifier (SID), specified as a character vector or string scalar.

To get the SID for an object, use the `Simulink.ID.getSID` function.

Example: `'vdp:4'`

Data Types: `char` | `string`

## Output Arguments

### handle — Object handle

numeric scalar

Object handle, returned as a numeric scalar.

Data Types: double

## Version History

### Introduced in R2009b

#### Not recommended

*Not recommended starting in R2020a*

Simulink.ID.getHandle is not recommended. Use alternative functions instead.

- For blocks, use the `getSimulinkBlockHandle` function.
- For annotations, use the `find_system` or `getCurrentAnnotation` functions.
- For Stateflow objects, use `find`.

This table shows some typical usages of `Simulink.ID.getHandle` and how to update your code.

| Handle Type      | Not Recommended                                                                                                                               | Recommended                                                                                                                                   |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| Block            | <pre>SID = Simulink.ID.getSID('vdp/handle'); handle = Simulink.ID.getHandle(SID)</pre>                                                        | <pre>handle = getSimulinkBlockHandle('vdp/Su')</pre>                                                                                          |
| Annotation       | <pre>object = getCurrentAnnotation; SID = Simulink.ID.getSID(object); handle = Simulink.ID.getHandle(SID)</pre>                               | <pre>object = getCurrentAnnotation; handle = object.Handle</pre>                                                                              |
| Stateflow object | <pre>chart = find(slroot, '-isa', 'Stateflow.Chart', 'Name', 'shift_logi'); SID = Simulink.ID.getSID(chart); Simulink.ID.getHandle(SID)</pre> | <pre>chart = find(slroot, '-isa', 'Stateflow.Chart', 'Name', 'shift_logi'); The Stateflow handle is equivalent to the Stateflow object.</pre> |

## See Also

## Simulink.ID.getSID

(Not recommended) Get Simulink Identifier

---

**Note** Simulink.ID.getSID is not recommended. Use handles, paths, or objects instead of Simulink® Identifiers. For more information, see “Compatibility Considerations”.

---

### Syntax

```
SID = Simulink.ID.getSID(object)
```

### Description

`SID = Simulink.ID.getSID(object)` returns the Simulink Identifier (SID) of the selected object object.

An SID is a unique and unmodifiable designation that Simulink automatically assigns.

The SID format is `model_name:sid_number`, where:

- `model_name` is the name of the model that contains the object.
- `sid_number` is a unique number within the model, assigned by Simulink.

An SID includes additional colons in certain cases, for example, on an instance of a block from a custom library.

### Examples

#### Get SID of Block

Open the model `vdp`.

```
vdp
```

Get the SID of the Mu block.

```
SID = Simulink.ID.getSID('vdp/Mu')
```

### Input Arguments

#### **object** — Name or handle of object

character vector | string scalar | numeric scalar

Name or handle of object, specified as a character vector, string scalar, or numeric scalar.

Example: `'vdp/Mu'`

Data Types: `double` | `char` | `string`

## Output Arguments

### **SID — Simulink Identifier**

string scalar

Simulink Identifier (SID), returned as a string scalar.

Data Types: `string`

## Version History

### **Introduced in R2009b**

#### **Not recommended**

*Not recommended starting in R2020a*

`Simulink.ID.getSID` is not recommended. Use handles, paths, or objects instead of Simulink Identifiers.

- For blocks, use the `find_system` or `getSimulinkBlockHandle` functions.
- For annotations, use the `find_system` or `getCurrentAnnotation` functions.
- For Stateflow objects, use the `find` function.

### **See Also**

`find_system` | `getSimulinkBlockHandle` | `getCurrentAnnotation` | `find`

## Simulink.ID.hilite

(Not recommended) Highlight object associated with Simulink Identifier

---

**Note** Simulink.ID.hilite is not recommended. Use hilite\_system instead. For more information, see “Compatibility Considerations”.

---

### Syntax

```
Simulink.ID.hilite(SID)
Simulink.ID.hilite(SID,style)
```

### Description

Simulink.ID.hilite(SID) highlights the object associated with the Simulink Identifier SID.

Simulink.ID.hilite(SID,style) uses the specified highlighting style.

### Examples

#### Highlight Block

Open the model vdp.

```
vdp
```

Get the Simulink Identifier of the Mu block.

```
muSID = Simulink.ID.getSID('vdp/Mu')
```

Highlight the Mu block.

```
Simulink.ID.hilite(muSID)
```

#### Highlight Block Using a Highlight Style

Open the model vdp.

```
vdp
```

Get the Simulink Identifier of the Mu block.

```
muSID = Simulink.ID.getSID('vdp/Mu')
```

Highlight the Mu block using the style 'fade'.

```
Simulink.ID.hilite(muSID, 'fade')
```

## Input Arguments

### SID — Simulink Identifier

character vector | string scalar

Simulink Identifier, specified as a character vector or string scalar.

To get the SID for an object, use the `Simulink.ID.getSID` function.

Example: `'vdp:4'`

### style — Highlighting style

'find' (default) | character vector | string scalar

Highlighting style, specified as one of these values.

- 'default' — Default color scheme: red outline, yellow fill.
- 'none' — Clears the highlight.

To clear all highlighting, on the **Debug** tab, in the **Trace Signal** button group, click the **Remove trace** button.

- 'debug' — Uses default color scheme.
- 'different' — Applies red outline, white fill.
- 'error' — Uses default color scheme.
- 'fade' — Applies gray outline, white fill.
- 'find' — Applies dark blue outline, blue fill.
- 'lineTrace' — Applies red outline, blue fill.
- 'unique' — Dark blue outline, white fill.
- 'user1', 'user2', 'user3', 'user4', 'user5' — Applies custom highlight: black outline, white fill by default (that is, no highlight).

In addition, you can use these color schemes. The first word is the outline and the second is the fill color.

- 'orangeWhite'
- 'blackWhite'
- 'redWhite'
- 'blueWhite'
- 'greenWhite'

You can customize the appearance of any of the styles. See “Customize a Highlighting Style” on page 2-313.

## Version History

Introduced in R2009b

**Not recommended**

*Not recommended starting in R2020a*

Simulink.ID.hilite is not recommended. Use hilite\_system instead.

This table shows a typical usage of Simulink.ID.hilite and how to update your code.

| <b>Not Recommended</b>                                         | <b>Recommended</b>      |

# Simulink.importExternalCTypes

Generate Simulink representations of custom data types defined by C or C++ code

## Syntax

```
importInfo = Simulink.importExternalCTypes(headerFiles)
importInfo = Simulink.importExternalCTypes(modelName)
importInfo = Simulink.importExternalCTypes(___,Name,Value)
```

## Description

`importInfo = Simulink.importExternalCTypes(headerFiles)` parses the C or C++ header files (.h or .hpp) identified by `headerFiles` for `typedef`, `struct`, and `enum` type definitions, and generates Simulink representations of the types. The output, `importInfo`, identifies the successfully and unsuccessfully imported types.

You can use the Simulink representations to:

- Reuse your existing algorithmic C code and, through simulation, test its interaction with your Simulink control algorithm. For an example that shows how to use the Legacy Code Tool, see “Integrate C Function Whose Arguments Are Pointers to Structures”.
- Generate code (Simulink Coder) that reuses the types and data that your existing code defines. You can then integrate and compile the generated and existing code into a single application. For an example, see “Exchange Structured and Enumerated Data Between Generated and External Code” (Embedded Coder).
- Create and organize data (signals, parameters, and states) in a model by using standard data types that your organization defines in C code.
  - To create structures of signals in Simulink, use nonvirtual buses. See “Group Signals or Messages into Virtual Buses”.
  - To create structures of parameters, use MATLAB structures and `Simulink.Parameter` objects. See “Organize Related Block Parameter Definitions in Structures”.
  - To create enumerated data, see “Use Enumerated Data in Simulink Models”.
  - To match a primitive `typedef` statement, use a `Simulink.AliasType` object to set parameter and signal data types in a model.

By default, the function:

- Imports an enumerated type by generating a script file that derives an enumeration class from `Simulink.IntEnumType`, as described in “Define Simulink Enumerations”. If necessary, you can then edit the class definition to customize it (for example, by implementing the `addClassNameToEnumNames` method).
- Imports a structure type by generating a `Simulink.Bus` object in the base workspace.
- Imports a primitive `typedef` statement by generating a `Simulink.AliasType` object in the base workspace.

- Interprets generic C data types, such as `int` or `short`, according to the word lengths of your host computer. For example, for most modern machines, `int` has a 32-bit word length, so the function represents an `int` structure field as a bus element that uses the Simulink data type `int32`.

To override this default behavior, identify your target hardware board by using the `HardwareImplementation` pair argument.

For additional information about default behavior, see “Tips” on page 2-643.

`importInfo = Simulink.importExternalCTypes(modelName)` generates Simulink representations of custom C data types by analyzing a model that you identify with `modelName`. When you use the **Simulation Target** configuration parameters in a model to identify header files for inclusion during simulation, use this syntax to import types for the purpose of simulating the model on your host computer. The function interprets generic C data types according to the word lengths of your host computer.

When you use this syntax, do not use pair arguments, such as `HardwareImplementation`, that can conflict with the configuration parameters of the target model. When you use such pair arguments with this syntax, the function generates a warning.

`importInfo = Simulink.importExternalCTypes( ____, Name, Value)` specifies additional options using one or more name-value pair arguments. You can use this syntax to:

- Specify the names of types to import by using the `Names` pair argument.
- Control the way that Simulink stores the imported types, for example, by generating the types in a Simulink data dictionary. Use the `MATFile` and `DataDictionary` pair arguments.
- Control the way that the function interprets generic C data types. Use the `HardwareImplementation` pair argument.
- Maintain synchrony between the C-code definitions and the Simulink representations by attempting to import the updated C-code definitions again. You can choose whether to overwrite the existing Simulink representations. Use the `Overwrite` and `Verbose` pair arguments.

## Examples

### Import Simple Structure and Enumerated Types

This example shows how to generate Simulink representations of a C structure type (`struct`) and an enumerated (`enum`) data type from a header file.

- 1 In your current folder, create the file `ex_cc_simpleTypes.h`.

```
typedef enum {
 PWR_LOSS = 0, /* Default value */
 OVERSPD,
 PRESS_LOW,
} fault_T;

typedef struct {
 double coeff;
 double init;
} params_T;
```

- 2 Generate Simulink representations of the types by calling `Simulink.importExternalCTypes`.

```
Simulink.importExternalCTypes('ex_cc_simpleTypes.h');
```

The function creates a `Simulink.Bus` object, `params_T`, in the base workspace.

- 3 To inspect the properties of the object, open the Type Editor.

```
typeeditor
```

Each bus element uses a name and a data type (`double`) that match the corresponding structure field in `ex_cc_simpleTypes.h`.

- 4 In your current folder, inspect the generated file, `fault_T.m`, which defines the enumerated type `fault_T` as an enumeration class.

You can use the bus object and the enumeration class to set signal and parameter data types in Simulink models.

### Import Structure Type Whose Fields Use Custom Data Types

This example shows how to generate a Simulink representation of a structure type whose fields use custom data types (`typedef`).

Create the file `ex_integer_aliases.h` in your current folder.

```
typedef int sint_32;
typedef unsigned short uint_16;
```

Create the file `ex_cc_struct_alias.h` in your current folder.

```
#include "ex_integer_aliases.h"
typedef struct {
 sint_32 accum;
 uint_16 index;
} my_ints_T;
```

Import the structure type into Simulink as a `Simulink.Bus` object in the base workspace. Import the `typedef` statements as `Simulink.AliasType` objects.

```
Simulink.importExternalCTypes('ex_cc_struct_alias.h');
```

Inspect the data types of the bus elements in the bus object. For example, inspect the `DataType` property of the first bus element, which corresponds to the structure field `accum`.

```
my_ints_T.Elements(1)
```

```
ans =
```

```
 BusElement with properties:
```

```
 Name: 'accum'
 Complexity: 'real'
 Dimensions: 1
 DataType: 'sint_32'
```

```
 Min: []
 Max: []
DimensionsMode: 'Fixed'
 SampleTime: -1
 Unit: ''
Description: ''
```

The `Simulink.importExternalCTypes` function uses the generated `Simulink.AliasType` objects to set the data types of the bus elements.

Inspect the `Simulink.AliasType` objects in the base workspace. For example, the object named `sint_32` corresponds to one of the `typedef` statements in `ex_integer_aliases.h`.

```
sint_32
```

```
sint_32 =
```

```
AliasType with properties:
```

```
Description: ''
DataScope: 'Imported'
HeaderFile: 'ex_integer_aliases.h'
BaseType: 'int32'
```

For most host computers (which the function targets by default), the word length of `int` is 32 bits and the word length of `unsigned short` is 16 bits. The function maps `int` and `unsigned short` to the Simulink types `int32` and `uint16`.

If you have Embedded Coder, the code that you generate from the model can use `sint_32` and `uint_16` instead of the standard data type names, `int32_T` and `uint16_T`.

### Store Imported Types in Data Dictionary

This example shows how to store the imported data types in a Simulink data dictionary. A data dictionary stores data specifications (such as for signals and block parameter values), data types, and other design data for one or more Simulink models.

In your current folder, create the file `ex_cc_simpleTypes.h`.

```
typedef enum {
 PWR_LOSS = 0, /* Default value */
 OVERSPD,
 PRESS_LOW,
} fault_T;

typedef struct {
 double coeff;
 double init;
} params_T;
```

Create a subfolder called `myDictionaries`.

```
mkdir('myDictionaries')
```

Generate Simulink representations of the types by calling `Simulink.importExternalCTypes`. Permanently store the type definitions by creating a new data dictionary, `ex_cc_myTypes.sldd`, in the new subfolder.

```
Simulink.importExternalCTypes('ex_cc_simpleTypes.h',...
 'DataDictionary','ex_cc_myTypes.sldd',...
 'OutputDir','myDictionaries');
```

To inspect the contents of the dictionary, set your current folder to `myDictionaries` and double-click the dictionary file.

To use the Simulink representations in the dictionary, you must link a model or models to the dictionary. See “Migrate Models to Use Simulink Data Dictionary”.

### Import Only Specified Types

This example shows how to generate Simulink representations only for enumerated and structure data types that you identify by name.

In your current folder, create the file `ex_cc_manySimpleTypes.h`. The file defines three structure types: `params_T`, `signals_T`, and `states_T`.

```
typedef struct {
 double coeff;
 double init;
} params_T;

typedef struct {
 double flow_rate;
 double steam_press;
} signals_T;

typedef struct {
 double accum;
 double error;
} states_T;
```

Generate Simulink representations only for `params_T` and `signals_T`.

```
Simulink.importExternalCTypes('ex_cc_manySimpleTypes.h',...
 'Names',{'params_T','signals_T'});
```

The `Simulink.Bus` objects, `params_T` and `signals_T`, appear in the base workspace.

### Import Types for 16-Bit Hardware

By default, `Simulink.importExternalCTypes` represents an enumerated data type by creating an enumeration class that derives from the built-in class `Simulink.IntEnumType`. When you simulate or generate code from a model that uses the generated class, configuration parameters that you select for the model (for example, on the **Hardware Implementation** pane) determine the specific integer length that `Simulink.IntEnumType` and the enumeration class employ.

By default, the function interprets generic, primitive C data types, such as `short` and `int`, according to the word lengths of your host computer. For example, to represent an `int` structure field, the function typically applies the 32-bit data type `int32` to the corresponding bus element. When you want to simulate and generate code for hardware other than your host computer, use the `HardwareImplementation` pair argument to identify the target hardware and, by extension, the word lengths of the hardware.

This example shows how to import data types from code that you intend to use on 16-bit hardware. For this board, `int` has a 16-bit length, and each item of enumerated data (`enum`) consumes 16 bits.

In your current folder, create the file `ex_cc_intTypes.h`.

```
typedef enum {
 PWR_LOSS = 0, /* Default value */
 OVERSPD,
 PRESS_LOW,
} fault_T;

typedef struct {
 int coeff;
 int init;
} params_T;
```

The code defines an enumerated data type and a structure type whose fields use the generic C data type `int`.

To generate an accurate Simulink representation of the structure type, first open an existing model or create a new model. For this example, create a new model named `ex_hdwImpl_16bit`.

In the new model, set **Configuration Parameters > Hardware Implementation > Device vendor** to `Atmel`. Set **Device type** to `AVR`.

Alternatively, at the command prompt, use these commands to create and configure the model:

```
new_system('ex_hdwImpl_16bit','Model');
set_param('ex_hdwImpl_16bit','ProdHWDeviceType','Atmel->AVR')
```

Generate Simulink representations of the types. To specify the word lengths of the target 16-bit hardware, extract the model configuration parameters (which include the **Hardware Implementation** settings) as a `Simulink.ConfigSet` object.

```
configSet = getActiveConfigSet('ex_hdwImpl_16bit');
Simulink.importExternalCTypes('ex_cc_intTypes.h','HardwareImplementation',configSet);
```

The `Simulink.Bus` object `params_T` appears in the base workspace. The bus elements, such as `coeff`, use the Simulink data type `int16`.

```
params_T.Elements(1)
```

```
ans =
```

```
 BusElement with properties:
```

```
 Name: 'coeff'
 Complexity: 'real'
```

```

Dimensions: 1
 DataType: 'int16'
 Min: []
 Max: []
DimensionsMode: 'Fixed'
 Unit: ''
Description: ''

```

In your current folder, the file `fault_T.m` defines the enumeration class `fault_T`. The class derives from `Simulink.IntEnumType`, so you must use model configuration parameters to identify the target hardware and, by extension, the correct native integer length.

### Import Structure Type Whose Fields Use 16-Bit Fixed-Point Data Types

Create the file `ex_cc_fixpt_struct.h` in your current folder.

```

typedef struct {
 int coeff; /* Word length 16,
 binary fraction length 7 */

 int init; /* Word length 16,
 binary fraction length 3 */
} params_T;

```

The file defines a structure type whose fields use fixed-point data types. For example, the structure stores the field `coeff` in a signed, 16-bit integer data type. A binary fraction length of 7 relates the stored integer value to the real-world value.

Suppose that this code operates on 16-bit hardware (such that the generic C data type `int` has a 16-bit word length). To generate a Simulink representation of the type, first create a `coder.HardwareImplementation` object that identifies the hardware.

```

hdw = coder.HardwareImplementation;
hdw.ProdHWDeviceType = 'Atmel->AVR';

```

Generate a Simulink representation of the structure type.

```

Simulink.importExternalCTypes('ex_cc_fixpt_struct.h',...
 'HardwareImplementation',hdw);

```

The `Simulink.Bus` object, `params_T`, appears in the base workspace. Each bus element, such as `coeff`, uses the data type `int16`.

```
params_T.Elements(1)
```

```
ans =
```

```

BusElement with properties:
 Name: 'coeff'
Complexity: 'real'

```

```
Dimensions: 1
 DataType: 'int16'
 Min: []
 Max: []
DimensionsMode: 'Fixed'
 Unit: ''
Description: ''
```

`Simulink.importExternalCTypes` cannot infer the fixed-point scaling (binary fraction length) from the C code. You must manually specify the data types of the bus elements. To specify the data types at the command prompt, use the `fixdt` function.

```
params_T.Elements(1).DataType = 'fixdt(1,16,7)';
params_T.Elements(2).DataType = 'fixdt(1,16,3)';
```

To specify the data types interactively (by using the Data Type Assistant), use the Type Editor.

```
typeeditor
```

## Manually Synchronize Simulink Representations with C-Code Definitions

This example shows how to maintain the Simulink representations of C data types whose definitions you modify during the life of a modeling project.

### Import Custom C Types

Create the file `ex_cc_myTypes_rec.h` in your current folder. The file defines a custom structure type.

```
typedef struct {
 double flow;
 double pres;
 double tqe;
} sigStructType;
```

Generate a `Simulink.Bus` object that represents the type.

```
Simulink.importExternalCTypes('ex_cc_myTypes_rec.h');
```

### Modify Type Definition in C Code

In `ex_cc_myTypes_rec.h`, add a field named `spd` to `sigStructType`.

In the same file, create a new structure type, `stateStructType`.

```
typedef struct {
 double flow;
 double pres;
 double tqe;
 double spd;
} sigStructType;

typedef struct {
```

```

 double err;
 double read;
 double write;
} sigStructType;

```

### Attempt to Import Types Again

Attempt to generate bus objects that represent the types.

```
importInfo = Simulink.importExternalCTypes('ex_cc_myTypes_rec.h');
```

The function generates warnings at the command prompt. Instead of relying on the warnings, you can inspect the output, `importInfo`, to determine whether the function failed to import any types.

```
importInfo.failedToImport.Bus
```

```
ans =
```

```

1x1 cell array

{'sigStructType'}

```

The function did not import `sigStructType`. The corresponding bus object in the base workspace still has only three bus elements. To determine the reason that the function did not import `sigStructType`, inspect the `report` field of `importInfo`.

Import `sigStructType` again. This time, overwrite the existing bus object.

```
importInfo = Simulink.importExternalCTypes('ex_cc_myTypes_rec.h', ...
 'Names', importInfo.failedToImport.Bus, 'Overwrite', 'on');
```

When you overwrite existing Simulink representations, any customizations that you made to the Simulink representations (such as the application of fixed-point data types to bus elements) are overwritten.

## Input Arguments

### headerFiles — Names and paths of header files to parse

character vector | cell array of character vectors | string scalar | string array

Names and paths of header files to parse, specified as a character vector, cell array of character vectors, string, or string array. Include the `.h` or `.hpp` file extension.

If you use a hierarchy of included (`#include`) header files to define your types, when you specify `HeaderFiles`, you need to identify only the entry-point files. The function parses the included files as well as the identified entry-point files. If the included files are not in the same folder as the corresponding entry-point file, use the `IncludeDirs` pair argument to identify the additional folders.

Example: `'myHeader.h'`

Example: `{'thisHeader.hpp', 'thatHeader.hpp'}`

Data Types: `char` | `cell` | `string`

### modelName — Name of loaded Simulink model for which to import types

character vector | string scalar

Name of a loaded Simulink model for which to import types, specified as a character vector or string scalar. A model is loaded if, for example, you open the model or use the `load_system` function. When you use this argument, the function:

- Searches the model configuration parameters for custom header files and parses those header files for data types to import. Only the configuration parameters on the **Simulation Target** pane affect this search.

For example, if in the model you set **Configuration Parameters > Simulation Target > Include headers** to `#include "myTypes.h"`, the function parses `myTypes.h` for types to import.

- Interprets generic C data types such as `int` or `short` according to the word lengths of your host computer. Do not use the `HardwareImplementation` pair argument to override this interpretation.

Example: `'myModel'`

Data Types: `char` | `string`

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example:

```
Simulink.importExternalCTypes('myHdr.h','DataDictionary','myDictionary.slidd')
```

### MATFile — Name and path of MAT-file to create for storing generated objects

'' (empty) (default) | character vector | string scalar

Name and, optionally, path of the MAT-file to create for storing generated `Simulink.Bus` and `Simulink.AliasType` objects, specified as a character vector or string. If you do not use `MATFile`, by default, the function generates the objects in the base workspace.

The function does not generate enumeration definitions in MAT-files.

If you import some `struct` types and primitive `typedef` statements by using `MATFile` and later import some of the same types again by using `MATFile`, the function entirely replaces the old MAT-file with a new one. The function discards any changes that you made to the contents of the old MAT-file.

You cannot use the `MATFile` and `DataDictionary` pair arguments simultaneously.

Example: `'myMat.mat'`

Example: `'myMat'`

Example: `fullfile('subfolder','myMat')`

Data Types: `char` | `string`

### DataDictionary — Name and path of Simulink data dictionary to use or create for storing types

'' (default) | character vector | string scalar

Name and, optionally, path of the Simulink data dictionary to use or create for storing generated enumerations and objects, specified as a character vector or string. When you use this pair argument, the function imports enumerated types as `Simulink.data.dictionary.EnumTypeDefinition` objects, and stores those objects (as well as `Simulink.Bus` objects and `Simulink.AliasType` objects) in the target dictionary.

For information about data dictionaries, see “What Is a Data Dictionary?”.

You can optionally specify a `.sldd` extension.

You cannot use the `DataDictionary` and `MATFile` pair arguments simultaneously.

Example: `'myDict.slidd'`

Example: `'myDict'`

Example: `fullfile('subfolder','myDict.slidd')`

Data Types: `char` | `string`

### **Names — Names of types to import**

`''` (default) | character vector | cell array of character vectors | string scalar | string array

Names of types to import, specified as a character vector, cell array of character vectors, string, or string array. By default, if you do not use `Names`, the function attempts to import all of the custom types that the identified header files define.

To match multiple type names with a single character vector, use an asterisk (\*).

Example: `'myEnumType'`

Example: `{'myEnumType','myStructType'}`

Example: `'my*Type'`

Data Types: `char` | `cell` | `string`

### **Defines — Compiler options to define macros that influence type definitions**

`''` (default) | character vector | string scalar

Compiler options to define macros that influence C type definitions, specified as a character vector, or string scalar. For example, a macro influences a type definition if you enclose the definition in an `#ifdef` block that checks whether the macro is defined.

Use `Defines` to specify macro definitions that you otherwise define through compiler options such as `-D`.

Example: `'SIGSTRUCT=1'`

Example: `'SIGSTRUCT=1 ENUM=1'`

Data Types: `char` | `string`

### **UnDefines — Compiler options to delete macros that influence type definitions**

`''` (default) | character vector | string scalar

Compiler options to delete macros that influence C type definitions, specified as a character vector or string scalar. For example, a macro influences a type definition if you enclose the definition in an `#ifdef` block that checks whether the macro is defined.

Use `UnDefines` to specify macro deletions that you otherwise define through compiler options such as `-U`.

Example: `'SIGSTRUCT'`

Example: `'SIGSTRUCT ENUM'`

Data Types: `char` | `string`

### **IncludeDirs — Folders that contain subordinate, included header files**

`''` (default) | character vector | cell array of character vectors | string scalar | string array

Folders that contain subordinate, included (`#include`) header files, specified as a character vector, cell array of character vectors, string, or string array. Use this pair argument to enable the function to locate and parse additional header files on which the primary header files (which you specify with the `headerFiles` argument) depend.

If you use the `modelName` syntax instead of the `headerFiles` syntax, in the target model, you can use the **Simulation Target** configuration parameters to specify include paths. In that case, you do not need to use the `IncludeDirs` pair argument.

Example: `'myHeaders'`

Example: `fullfile('myProject','myHeaders')`

Example:

```
{fullfile('myProject','myHeaders'),fullfile('myProject','myOtherHeaders')}
```

Data Types: `char` | `cell` | `string`

### **OutputDir — Folder for storing generated files**

`''` (default) | character vector | string scalar

Folder for storing generated files, specified as a character vector or string. The function places generated files, such as `classdef` script files and data dictionary files, in this folder.

The folder that you specify must exist before you use the function.

Example: `'myDictionaries'`

Example: `fullfile('myProject','myDictionaries')`

Data Types: `char` | `string`

### **Language — Language to parse header files**

`'Auto'` (default) | `'C'` | `'C++'`

Parse and import compatible data types from C and C++ header files. If specify header files that contain C++ features, specify the `Language` to `'C++'` to import compatible C data types.

When data types are imported from a header file with `hpp` extension, if the `Language` setting is not specified or set to `'Auto'`, `'C++'` is selected to parse your header files. C++ classes and C++ struct types are ignored. Empty structs are not imported.

If you import header files from a loaded model and the `Language` is not specified or set to `'Auto'`, the `Language` setting is inherited from the model's custom settings. If the imported model already has a `Language` setting in **Configuration Parameters > Simulation Target**, this setting is overshadowed by imported model's setting.

**HardwareImplementation — Word lengths for interpreting generic, primitive C data types**

'' (default) | Simulink.ConfigSet object | coder.HardwareImplementation object

Word lengths for interpreting generic, primitive C data types, specified as a `Simulink.ConfigSet` or `coder.HardwareImplementation` object.

- To use a `Simulink.ConfigSet` object, you can extract a configuration set from a model by using functions such as `getConfigSet` and `getActiveConfigSet`. This technique enables you to use the Configuration Parameters dialog box to identify your target hardware (through the **Hardware Implementation** configuration parameters).
- To use a `coder.HardwareImplementation` object (which you create and configure programmatically), specify properties of the object, such as `ProdHWDeviceType`, to identify your target hardware. The object then sets other properties, such as `ProdBitPerInt`, that reflect the native integer size of the hardware.

The function inspects the object to determine which Simulink integer data types to employ when interpreting generic C data types such as `int`. For example, if you create a `coder.HardwareImplementation` object to identify 16-bit hardware and then use the function to import a structure type whose fields use the C data type `int`, the function generates a bus object whose bus elements use the Simulink data type `int16`. The function uses the production hardware settings, not the test hardware settings.

For more information about hardware implementation settings for Simulink models, see “Configure Run-Time Environment Options” (Simulink Coder).

**Overwrite — Specification to overwrite existing Simulink representations**

'off' (default) | 'on'

Specification to overwrite existing Simulink representations, specified as 'on' or 'off'. If an imported type already has a representation in Simulink:

- If you specify 'off' or if you do not specify `Overwrite`, the function does not import the type. In the output argument, `importInfo`, the `failedToImport` field identifies the type.
- If you specify 'on', the function overwrites the existing Simulink representation.

If you use the function to import some types into the base workspace or a data dictionary and later customize the generated Simulink representations, when you use the function again and set `Overwrite` to 'on', the function does not preserve your customizations. These customizations can include:

- In an enumeration class definition, implementing extra methods or modifying the generated methods such as `getDataScope` (see “Customize Simulink Enumeration”).
- Modifying the properties of a generated `Simulink.Bus` or `Simulink.AliasType` object (for example, manually setting the data types of bus elements to a fixed-point data type).

**Verbose — Specification to generate messages for successful import operations**

'off' (default) | 'on'

Specification to generate messages for successful import operations, specified as 'on' or 'off'.

- If you specify 'off' or if you do not specify `Verbose`, the function imports types silently. Messages do not appear in the Command Window unless the function cannot import a type.

- If you specify 'on', the function generates a message in the Command Window for each operation during the import process.

## Output Arguments

### **importInfo** – Information about types that were imported and not imported

structure

Information about types that were imported and not imported, returned as a structure with these fields.

### **report** – Descriptions of types that were imported and not imported

character vector

Descriptions of types that were imported and not imported, returned as a character vector. Inspect the value of this field to determine the reason that the function could not import a type.

### **failedToImport** – Types that were not imported

structure

Types that were not imported, returned as a structure with these fields.

| Field Name | Field Value                     | Purpose                                                                    |
|------------|---------------------------------|----------------------------------------------------------------------------|
| Bus        | Cell array of character vectors | Names of structure ( <code>struct</code> ) types that were not imported.   |
| Enum       | Cell array of character vectors | Names of enumerated types ( <code>enum</code> ) that were not imported.    |
| AliasType  | Cell array of character vectors | Names of primitive <code>typedef</code> statements that were not imported. |

### **importedTypes** – Types that were successfully imported

structure

Types that were successfully imported, returned as a structure with these fields.

| Field Name | Field Value                     | Purpose                                                                                                                                                                                    |
|------------|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bus        | Cell array of character vectors | Names of structure ( <code>struct</code> ) types that were imported. The generated <code>Simulink.Bus</code> objects use these names.                                                      |
| Enum       | Cell array of character vectors | Names of enumerated types ( <code>enum</code> ) that were imported. The generated enumeration classes or <code>Simulink.data.dictionary.EnumTypeDefinition</code> objects use these names. |

| Field Name | Field Value                     | Purpose                                                                                                                          |
|------------|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| AliasType  | Cell array of character vectors | Names of primitive typedef statements that were imported. The generated <code>Simulink.AliasType</code> objects use these names. |

## Limitations

- The function does not support:
  - C data types that do not correspond to a type that Simulink supports. For example, Simulink does not recognize an equivalent for `long double`. For information about data types that Simulink supports, see “Data Types Supported by Simulink”.
  - Pointer types, such as a structure that defines a field whose value is a pointer or a `typedef` statement whose base type is a pointer type.
  - Unions.
- If a structure field represents fixed-point data, or if a `typedef` statement maps to a fixed-point base type, the function sets the data type of the corresponding bus element or `Simulink.AliasType` object to the relevant Simulink integer type (such as `int16`). The importer cannot determine the fixed-point scaling by parsing the C code. After using the function, you must manually specify the data type of the bus element or the base type of the `Simulink.AliasType` object by using the `fixdt` function.

## Tips

- If a MATLAB Function block or Stateflow chart in your model uses an imported enumeration or structure type, configure the model configuration parameters to include (`#include`) the type definition from your external header file. See “Control Imported Bus and Enumeration Type Definitions” (for a MATLAB Function block) and “Access Custom Code Variables and Functions in Stateflow Charts” (Stateflow) and “Integrate Custom Structures in Stateflow Charts” (Stateflow) (for a chart).
- By default:
  - For an imported enumeration, because the Simulink enumeration class derives from `Simulink.IntEnumType`, when you simulate or generate code from a model, the enumeration uses the integer size that is native to your target hardware. You specify the characteristics of your target hardware by using model configuration parameters such as **Production device vendor and type** and **Native word size in production hardware**.
  - For an imported structure type:
    - The function imports a structure field as numerically complex only if the field uses one of the corresponding Simulink Coder structure types as the data type. For example, if a structure field in your external code uses the data type `cint8_T`, the function imports the field as a bus element (`Simulink.BusElement` object) whose data type is `int8` and whose `Complexity` property is set to `'complex'`.
    - For nested structures, the function generates a bus object for each unique structure type.
  - For an imported structure or enumeration type, if your external code uses a `typedef` statement to name the type, the name of the generated bus object or Simulink enumeration

class matches the `typedef` name. If your code does not use a `typedef` statement to name the type, the name of the object or class is the tag name of the type, unless that name conflicts with a type name that is defined in a `typedef` statement elsewhere in your header files, in which case the type is not imported into Simulink. If you do not specify a tag name or apply a `typedef` name, Simulink generates an arbitrary name for the object or class.

---

**Note** To import types that are not named in a `typedef` statement, the model configuration parameter **Import custom code** must be selected.

---

- The function configures the generated Simulink representations as imported for the purposes of simulation and code generation. For example, for bus objects, the function sets the `DataScope` property to 'Imported' and the `HeaderFile` property to the name of your external header file. To simulate or generate code from a model that uses one of these Simulink representations, you must make your header file available to the model.
- When you specify files for `Simulink.importExternalCTypes` to use or generate, for example, by using the `DataDictionary` pair argument:
  - If the existing files to use are in your current folder or on the MATLAB path, you do not need to specify a file path. You can specify the file name by itself.
  - To control the folder location of generated files, you can specify paths as well as file names. You can also use the `OutputDir` pair argument.

# Simulink.io.getFileTypeDiagnostics

Return structure with NamespaceErrors field for Simulink.io.FileType objects

## Syntax

```
diagnosticStruct = Simulink.io.getFileTypeDiagnostics()
```

## Description

`diagnosticStruct = Simulink.io.getFileTypeDiagnostics()` returns a structure with field `NamespaceErrors` `diagnosticStruct` for `Simulink.io.FileType` objects.

## Examples

### Get Diagnostics for Simulink.io.FileType Objects

Get diagnostics for `Simulink.io.FileType` objects and return in `diagnosticStruct`.

```
diagnosticStruct = Simulink.io.getFileTypeDiagnostics()
```

```
diagnosticStruct =
 struct with fields:
 NamespaceErrors: {}
```

In this example, there are no diagnostics.

## Output Arguments

### **diagnosticStruct** — Structure of NamespaceErrors field for Simulink.io.FileType objects

structure with cell array

Structure of diagnostics for `Simulink.io.FileType` objects, returned as a structure with a cell array of `NamespaceErrors` fields. The first column in the cell array is the name of the name space plugin. In this example output, the name of the name space plugin is `not.here`.

```
diagnosticStruct =
 struct with fields:
 NamespaceErrors: { 'not.here' 'Unknown package name ' ' '.' }
```

## Version History

Introduced in R2021a

`Simulink.io.FileType` | `Simulink.io.PluggableNamespace`

# Simulink.MDLInfo.getDescription

Extract SLX, SLXP, or MDL file description without loading file

## Syntax

```
d = Simulink.MDLInfo.getDescription(file)
```

## Description

`d = Simulink.MDLInfo.getDescription(file)` returns the description of the specified SLX, SLXP, or MDL file without loading the file.

## Examples

### Get Model Description

Get the description of the vdp model without loading it or creating a `Simulink.MDLInfo` object for it.

```
d = Simulink.MDLInfo.getDescription('vdp')

d =

 'The van der Pol Equation

 This is a simulation of a nonlinear second order system.'
```

## Input Arguments

### file — Name of SLX, SLXP, or MDL file

character vector | string scalar

Name of the SLX, SLXP, or MDL file, specified as a character vector or string scalar.

The file name can include a partial path, complete path, relative path, or no path. When you do not provide a path, the file extension is optional.

To avoid unexpected results caused by shadowed files that share a name, specify a fully qualified file name.

```
Example: Simulink.MDLInfo('vdp')
```

```
Example: Simulink.MDLInfo('mymodel.slx')
```

```
Example: Simulink.MDLInfo('mydir/mymodel.slx')
```

```
Example: Simulink.MDLInfo('C:/mydir/mymodel.slx')
```

Data Types: char | string

## **Version History**

**Introduced in R2009b**

### **See Also**

`Simulink.MDLInfo` | `Simulink.MDLInfo.getMetadata`

# Simulink.MDLInfo.getMetadata

Extract SLX, SLXP, or MDL file metadata without loading file

## Syntax

```
m = Simulink.MDLInfo.getMetadata(file)
```

## Description

`m = Simulink.MDLInfo.getMetadata(file)` returns the metadata structure associated with the specified SLX, SLXP, or MDL file without loading the file.

The metadata structure contains the names and attributes of arbitrary data associated with the file. The structure fields can be character vectors, numeric matrices of type `double`, or more structures.

## Examples

### Add and Check File Metadata

Create a structure that contains metadata information.

```
m.TestStatus = 'untested';
m.ExpectedCompletionDate = '01/01/2011';
```

Create a model, update the 'Metadata' parameter, and save the metadata in the model.

```
new_system('MDLInfoMetadataModel')
set_param('MDLInfoMetadataModel','Metadata',m)
save_system('MDLInfoMetadataModel')
```

Check the model for metadata without loading the model or creating a `Simulink.MDLInfo` object.

```
Simulink.MDLInfo.getMetadata('MDLInfoMetadataModel')
```

```
ans =
```

```
struct with fields:
```

```
TestStatus: 'untested'
ExpectedCompletionDate: '01/01/2011'
```

## Input Arguments

**file** — Name of SLX, SLXP, or MDL file

character vector | string scalar

Name of the SLX, SLXP, or MDL file, specified as a character vector or string scalar.

The file name can include a partial path, complete path, relative path, or no path. When you do not provide a path, the file extension is optional.

To avoid unexpected results caused by shadowed files that share a name, specify a fully qualified file name.

Example: `Simulink.MDLInfo('vdp')`

Example: `Simulink.MDLInfo('mymodel.slx')`

Example: `Simulink.MDLInfo('mydir/mymodel.slx')`

Example: `Simulink.MDLInfo('C:/mydir/mymodel.slx')`

Data Types: `char` | `string`

## **Tips**

To add metadata to an SLX or MDL file, create a metadata structure that contains the information you require and use the `set_param` function to attach it to the file. To extract the information without loading the file, use `metadata` instead of adding custom data by using the `add_param` function.

## **Version History**

**Introduced in R2009b**

## **See Also**

`Simulink.MDLInfo` | `Simulink.MDLInfo.getDescription`

# Simulink.LibraryDictionary.clear

**Package:** Simulink.LibraryDictionary

Clear library dictionary dependency analysis

## Syntax

```
Simulink.LibraryDictionary.clear
```

## Description

`Simulink.LibraryDictionary.clear` clears any previous library dependency analysis that has been performed on a library hierarchy with attached data dictionaries. When you first attach a dictionary to a library and save that library, Simulink opens and performs this analysis on each library in the current folder as well as in the folder of that library (if different than the current folder). Simulink stores the analysis in the user preference folder. Subsequent changes to a library in the hierarchy results in analysis of only relevant library changes.

Run this function only if you intend to reanalyze the entire library hierarchy.

## Examples

### Clear Library Dependency Analysis for Library Dictionaries

To perform a full reanalysis of dependencies for a library hierarchy with attached data dictionaries, clear any previously stored dependency analysis.

```
Simulink.LibraryDictionary.clear
```

## Version History

Introduced in R2021a

## See Also

`Simulink.LibraryDictionary.refresh` |  
`Simulink.LibraryDictionary.resetLibraryLinks`

## Topics

# Simulink.LibraryDictionary.refresh

**Package:** Simulink.LibraryDictionary

Update library dictionary dependencies

## Syntax

```
Simulink.LibraryDictionary.refresh
Simulink.LibraryDictionary.refresh(libraryDir)
Simulink.LibraryDictionary.refresh(model)
```

## Description

`Simulink.LibraryDictionary.refresh` performs a library dependency analysis on a library hierarchy with attached data dictionaries from the current folder. When you first attach a dictionary to a library and save that library, Simulink opens and performs this analysis on each library in the specified folder as well as in the folder of that library (if different than the current folder). Simulink stores the analysis in the user preference folder. Subsequent changes to a library in the hierarchy result in analysis of only relevant library changes.

Because performing this library dependency analysis can be an expensive operation, call the `Simulink.LibraryDictionary.refresh` function only when you have made changes to your library hierarchy and want to ensure that your library dictionary dependencies are current.

`Simulink.LibraryDictionary.refresh(libraryDir)` performs a library dependency analysis on a library hierarchy with attached data dictionaries from the specified library folder.

`Simulink.LibraryDictionary.refresh(model)` performs a library dependency analysis on a library hierarchy with attached data dictionaries for the specified model.

## Examples

### Refresh Library Dependency Analysis from the Current Folder

Perform a library dependency analysis on a library hierarchy with attached data dictionaries from the current folder.

```
Simulink.LibraryDictionary.refresh
```

### Refresh Library Dependency Analysis from a Specified Folder

Perform a library dependency analysis on a library hierarchy with attached data dictionaries from a specified library folder.

```
Simulink.LibraryDictionary.refresh('C:/Work/myLibraryDir/')
```

## Refresh Library Dependency Analysis for a Specified Model

Perform a library dependency analysis on a library hierarchy with attached data dictionaries for a specified model.

```
Simulink.LibraryDictionary.refresh('myModel.slx')
```

## Input Arguments

### libraryDir — Library folder

character vector

Library folder to use for dependency analysis, specified as a character vector.

Example: 'myLibraryDir'

Data Types: char

### model — Model

character vector

Model to use for dependency analysis, specified as a character vector.

Example: 'myModel'

Data Types: char

## Version History

Introduced in R2021a

# Simulink.LibraryDictionary.resetLibraryLinks

**Package:** Simulink.LibraryDictionary

Clear cached information on library dictionary links

## Syntax

```
Simulink.LibraryDictionary.resetLibraryLinks
```

## Description

`Simulink.LibraryDictionary.resetLibraryLinks` clears previously cached information on library dictionary links. Use this function when you are unable to link your library to a library dictionary due to cache corruption. After calling this function, the ability to link your library to a library dictionary is restored, but information on previously linked library dictionaries is lost.

## Examples

### Clear Cached Link Information for Library Dictionaries

To restore the ability to link your library to a library dictionary, remove corrupt cache information.

```
Simulink.LibraryDictionary.resetLibraryLinks
```

## Version History

**Introduced in R2022a**

# Simulink.ModelAdvisor.getModelAdvisor

Get Model Advisor object for system or subsystem

## Syntax

```
ma = Simulink.ModelAdvisor.getModelAdvisor(system,new)
```

## Description

Use the `ma = Simulink.ModelAdvisor.getModelAdvisor(system,new)` method to return an instance of a `Simulink.ModelAdvisor` class for the model or subsystem that you specify by using the `system` input argument.

## Input Arguments

### **system** — Model or subsystem name

character vector

Name of model or subsystem for which you obtain the corresponding `Simulink.ModelAdvisor` object.

Example: 'sldemo\_fuelsys\_dd\_controller'

Example: 'sldemo\_fuelsys\_dd\_controller/airflow\_calc'

Data Types: char

### **new** — New Model Advisor object

character vector

This argument is optional except when changing the Model Advisor working scope from one system to another without closing the previous session. Alternatively, you can close the previous session before invoking the `getModelAdvisor` method.

Data Types: char

## Output Arguments

### **ma** — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for a model or subsystem that you specify by using a `system` input argument.

## Version History

Introduced in R2006a

**See Also**

Simulink.ModelAdvisor

# Simulink.ModelAdvisor.openConfigUI

Starts Model Advisor Configuration Editor

## Syntax

```
Simulink.ModelAdvisor.openConfigUI(ma)
```

## Description

Use the `Simulink.ModelAdvisor.openConfigUI(ma)` method to open the Model Advisor Configuration Editor. Use the Model Advisor Configuration Editor to create custom Model Advisor configurations.

The Model Advisor Configuration Editor is available with Simulink Check. For more information, see “Use the Model Advisor Configuration Editor to Customize the Model Advisor” (Simulink Check).

Before starting the Model Advisor Configuration Editor, make sure that the current folder is writable. If the folder is not writable, you see an error message when you start the Model Advisor Configuration Editor.

The Model Advisor Configuration Editor uses the `s\prj` folder in the **Code generation folder** to store reports and other information. If the `s\prj` folder does not exist in the code generation folder, the Model Advisor Configuration Editor creates it. For more information, see “Manage Simulation Targets for Referenced Models”.

## Input Arguments

### **ma** — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to open the Model Advisor Configuration Editor.

## Version History

**Introduced in R2006a**

## See Also

`Simulink.ModelAdvisor`

## Simulink.ModelAdvisor.reportExists

Determine whether Model Advisor report exists for model or subsystem

### Syntax

```
exists = Simulink.ModelAdvisor.reportExists(system)
```

### Description

Use the `exists = Simulink.ModelAdvisor.reportExists(system)` method to determine whether a Model Advisor report exists in the `slprj/modeladvisor` subfolder of the MATLAB working folder.

### Input Arguments

**system — Model or subsystem**

character vector

Model or subsystem for which you want to determine whether a Model Advisor report exists.

### Output Arguments

**exists — Boolean value indicating whether Model Advisor report exists**

Boolean

Boolean value that indicates whether Model Advisor report exists. A value of 1 indicates that the report exists. A value of 0 indicates that the report does not exist.

### Version History

Introduced in R2006a

Simulink.ModelAdvisor

# Simulink.ModelReference.refresh

Update Model blocks to reflect changes to referenced models

## Syntax

```
Simulink.ModelReference.refresh(modelBlock)
```

## Description

`Simulink.ModelReference.refresh(modelBlock)` updates the specified Model block to reflect changes to the referenced model.

## Examples

### Refresh Model Blocks Programmatically

Programmatically refresh a Model block in a parent model that has the **Port and parameter mismatch** configuration parameter set to `error`.

Load the example model, which contains two Model blocks that are out of date with the model they reference. The number of input and output ports in the referenced model has increased from one to two.

```
load_system('RefreshModelBlockModel');
```

```
Warning: Ports and parameters of Model block 'RefreshModelBlockModel/Model1' do not reflect changes to the referenced model.
```

```
Warning: Number of input ports must match between Model block 'RefreshModelBlockModel/Model1' (1) and referenced model 'RefreshModelBlockModel/Model1' (2).
Suggested Actions:
```

- Refresh the Model block 'RefreshModelBlockModel/Model1'. - Fix
- Revert the changes to the referenced model.

```
Warning: Ports and parameters of Model block 'RefreshModelBlockModel/Model' do not reflect changes to the referenced model.
```

```
Warning: Number of input ports must match between Model block 'RefreshModelBlockModel/Model' (1) and referenced model 'RefreshModelBlockModel/Model' (2).
Suggested Actions:
```

- Refresh the Model block 'RefreshModelBlockModel/Model'. - Fix
- Revert the changes to the referenced model.

Refresh one of the Model blocks.

```
Simulink.ModelReference.refresh('RefreshModelBlockModel/Model');
```

The number of ports on the refreshed Model block now matches the number of ports for the referenced model.

To see that the refreshed Model block displays all ports in the referenced model, while the other Model block does not, open the parent model.

```
open_system('RefreshModelBlockModel');
```

## Input Arguments

### **modelBlock** – Model block to refresh

character vector | handle

Model block to refresh, specified as a character vector or a handle.

Example: 'RefreshModelBlockModel/Model'

Data Types: char | string | double

## Version History

Introduced in R2020a

## See Also

**Model block version mismatch** | **Port and parameter mismatch**

# Simulink.ProtectedModel.createHarness

Create harness model that provides isolated environment for testing protected model

## Syntax

```
h = Simulink.ProtectedModel.createHarness(pname)
h = Simulink.ProtectedModel.createHarness(pname,hname)
```

## Description

`h = Simulink.ProtectedModel.createHarness(pname)` creates and opens a harness model for the specified protected model. The harness model provides an isolated environment for testing the protected model. The name of the harness model is the name of the protected model followed by `_harness`.

`h = Simulink.ProtectedModel.createHarness(pname,hname)` specifies the name or path of the harness model.

## Examples

### Create Harness Model for Protected Model

To test a protected model in an isolated environment, use the provided harness model or create a harness model for the protected model.

Suppose you receive a protected model named `sldemo_mdhref_counter.slxp` and do not receive a harness model for it. Using the same platform that was used to create the protected model, create a harness model for the protected model.

```
h = Simulink.ProtectedModel.createHarness('sldemo_mdhref_counter.slxp');
```

The harness model is set up for simulation of the protected model.

## Input Arguments

### **pname** — Name of protected model

character vector | string scalar

Name of protected model, specified as a character vector or string scalar.

You can specify the name with or without the `.slxp` extension, however, you cannot specify a full path or partial path. The file must be on the MATLAB path.

Example: `Simulink.ProtectedModel.createHarness('model.slxp')`

Data Types: `char` | `string`

### **hname** — Name of harness model

character vector | string scalar

Name of harness model being created, specified as a character vector or string scalar.

You can specify the name with or without the `.slx` extension.

To save the model in a specific location, specify the full path or a partial path for the harness model, including the name and extension. Otherwise, the harness model is saved in the working directory.

Example: `Simulink.ProtectedModel.createHarness('model.slxp','harness.slx')`

Data Types: `char` | `string`

## Output Arguments

### **h** — Harness model

handle

Harness model, returned as a handle.

Data Types: `double`

## Alternative Functionality

If you have a Simulink Coder or HDL Coder license, create a harness model as part of the model protection process by using one of these options:

- In the Create Protected Model dialog box, set **Contents** to Protected model (`.slxp`) and dependencies in a project, or select **Create harness model for protected model**.
- Using the `Simulink.ModelReference.protect`, set 'Project' or 'Harness' to true.

When you create the harness model as part of the model protection process, you have more information to provide the harness model. Without this information, you might not be able to create a harness model for the protected model.

## Version History

**Introduced in R2020b**

# Simulink.ProtectedModel.getPublisher

Return information about publisher that signed the protected model

## Syntax

```
[publisher,tf] = Simulink.ProtectedModel.getPublisher(protectedModel)
```

## Description

`[publisher,tf] = Simulink.ProtectedModel.getPublisher(protectedModel)` returns the name of the publisher that signed `protectedModel` and whether the certificate is verified by a trusted certificate authority. To verify the certificate, the corresponding certificate file must be in your computer's trusted certificate authority store.

## Examples

### Get Name of Publisher that Signed Protected Model

Get publisher information for the protected model `signed_model_name`.

```
Simulink.ProtectedModel.getPublisher('signed_model_name.slxp')
```

The function returns the name of the publisher that signed the protected model.

### Get Publisher and Verification Status of Protected Model

Verify the publisher and status of the protected model `signed_model_name`.

```
[publisher, verified] = Simulink.ProtectedModel.getPublisher('signed_model_name.slxp');
```

The variable `publisher` represents the name of the publisher that signed the model. `verified` has a value of 1 if the signature is verified by a trusted certificate authority.

## Input Arguments

### **protectedModel** — Name of signed protected model

character vector | string scalar

Name of the signed protected model, specified as a character vector or a string scalar.

Example: `'my_model.slxp'`

## Output Arguments

### **publisher** — Name of publisher

character vector | string scalar

Name of publisher that signed the protected model, returned as a character vector or string scalar. If the signature is not verified by a trusted certificate authority, `publisher` returns empty.

**tf — True or false result**

1 | 0

True or false result, returned as a 1 or 0. `tf` returns 1 if the signature on the protected model is verified by a trusted certificate authority.

## Version History

Introduced in R2020a

# Simulink.ProtectedModel.suppressSignatureVerification

Suppress digital signature verification of protected models

## Syntax

```
Simulink.ProtectedModel.suppressSignatureVerification(protectedModel)
Simulink.ProtectedModel.suppressSignatureVerification(protectedModel,
suppressionSetting)
```

## Description

`Simulink.ProtectedModel.suppressSignatureVerification(protectedModel)` suppresses the error that indicates whether the signature on the model `protectedModel` is unverified. Note that this does not suppress the error if the protected model was changed after it was signed. In this case, you cannot use the protected model.

`Simulink.ProtectedModel.suppressSignatureVerification(protectedModel, suppressionSetting)` disables or enables suppression for the model that you specify. To re-enable signature verification, specify `false` for the `suppressionSetting`. To enable signature verification for all protected models, specify `'All'` for the `model` argument. You cannot suppress verification for all models at once.

## Examples

### Suppress Signature Verification for Model

Suppress the verification of the digital signature for a protected model

Disable signature verification for a protected model named `myProtectedModel`.

```
Simulink.ProtectedModel.suppressSignatureVerification('myProtectedModel.slxp');
```

### Enable Signature Verification for All Protected Models

Enable the verification of digital signatures on all protected models that you open.

```
Simulink.ProtectedModel.suppressSignatureVerification('All', false);
```

If you previously suppressed signature verification for individual protected models, verification is re-enabled for those models.

## Input Arguments

**protectedModel** — Protected model  
character vector | string scalar | `'All'`

Protected model for which you want to suppress digital signature verification, specified as a character vector or string scalar. To re-enable signature verification for all protected models, specify 'All' for this argument and `false` for the second argument. You cannot suppress signature verification for all protected models at once.

Example: `'myProtectedModel.slxp'`

Example: `'All'`

### **suppressionSetting — Whether to suppress signature verification**

`true` or `1` (default) | `false` or `0`

Whether to suppress digital signature verification for the specified model, specified as a numeric or logical `1` (`true`) or `0` (`false`).

## **Version History**

**Introduced in R2020b**

### **See Also**

#### **Topics**

“Reference Protected Models from Third Parties”

# Simulink.ProtectedModel.verifySignature

Verify digital signature on protected model

## Syntax

```
Simulink.ProtectedModel.verifySignature(protectedModel)
```

## Description

`Simulink.ProtectedModel.verifySignature(protectedModel)` verifies the digital signature on the protected model. If the signature is not valid, the function returns an error that indicates why the signature is invalid. A signature is invalid in the following cases:

- The protected model was changed after it was signed.
- The protected model was not signed.
- The protected model was signed with an expired certificate.
- The protected model was self-signed with a certificate issued by the publisher.
- The protected model was signed with a missing or invalid certificate.
- The certificate in your system certificate authority store is missing or invalid.
- The model was signed with an invalid key.

## Examples

### Verify Digital Signature of Protected Model

Verify the digital signature for the protected model `signed_model_name`.

```
Simulink.ProtectedModel.verifySignature('signed_model_name.slxp')
```

The function returns an error if the signature on the protected model cannot be verified.

## Input Arguments

### **protectedModel** — Name of signed protected model

character vector | string scalar

Name of the signed protected model, specified as a character vector or a string scalar.

Example: `'my_model.slxp'`

## Version History

Introduced in R2020a

# Simulink.restoreDiagnostic

Restore diagnostic warnings to a specific block, subsystem, or model

## Syntax

```
Simulink.restoreDiagnostic(source)
Simulink.restoreDiagnostic(source, message_id)
Simulink.restoreDiagnostic(diagnostic)
Simulink.restoreDiagnostic(system, 'FindAll', 'on')
```

## Description

`Simulink.restoreDiagnostic(source)` restores all suppressed diagnostics associated with the blocks specified by `source`.

`Simulink.restoreDiagnostic(source, message_id)` restores all instances of `message_id` on the blocks specified by `source`.

`Simulink.restoreDiagnostic(diagnostic)` restores the suppressed diagnostics associated with MSLDiagnostic object `diagnostic`.

`Simulink.restoreDiagnostic(system, 'FindAll', 'on')` restores all suppressed diagnostics associated with the system specified by `system`.

## Examples

### Restore All Diagnostics for a Specified Block

Using the model from “Suppress Diagnostic Messages Programmatically”, restore all suppressed diagnostics on a specified block.

Create a cell array of message identifiers. Use the `Simulink.suppressDiagnostic` function to suppress these multiple diagnostics from the Constant block, `one`.

```
diags = {'SimulinkFixedPoint:util:fxpParameterPrecisionLoss', ...
 'SimulinkFixedPoint:util:fxpParameterUnderflow'};
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one', diags);
```

Remove all suppressions and restore diagnostics to the block.

```
Simulink.restoreDiagnostic('Suppressor_CLI_Demo/one');
```

### Restore a Diagnostic for a Specified Block

Using the model from “Suppress Diagnostic Messages Programmatically”, restore a suppressed diagnostic on a specified block.

Use the `Simulink.suppressDiagnostic` function to suppress the parameter precision loss warning thrown by the Constant block, one.

```
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one',...
 'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

Remove the suppression and restore diagnostics to the block.

```
Simulink.restoreDiagnostic('Suppressor_CLI_Demo/one',...
 'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

### **Restore All Diagnostics for a Specified System**

Using the model from “Suppress Diagnostic Messages Programmatically”, restore all suppressed diagnostics on the specified subsystem.

To restore all diagnostics from a system, use `'FindAll'`, `'on'` to search within the system hierarchy. Specify the system or system handle within which to search.

```
Simulink.restoreDiagnostic('Suppressor_CLI_Demo/Convert',...
 'FindAll', 'On');
```

### **Restore All Diagnostics for a Specified Model**

Using the model from “Suppress Diagnostic Messages Programmatically”, restore all suppressed diagnostics on the model.

To restore all diagnostics from a model, specify the model name or model handle.

```
Simulink.restoreDiagnostic('Suppressor_CLI_Demo', 'FindAll', 'on');
```

## **Input Arguments**

### **source — Block or model object throwing diagnostic**

block path | block handle

The source of the diagnostic, specified as a block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the `gcb` function.

To get the block handle, use the `getSimulinkBlockHandle` function.

Data Types: `char` | `cell`

### **message\_id — message identifier of diagnostic**

message identifier | cell array of message identifiers

Message identifier of the diagnostic, specified as a character vector or a cell array of character vectors. You can find the message identifier of warnings and errors thrown during simulation by accessing the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object associated with a simulation. You can also use the `lastwarn` function.

Data Types: char | cell

**system — Name of subsystem or model**

character vector

The subsystem name, subsystem handle, model name, or model handle specified as a character vector.

Data Types: char

**diagnostic — Diagnostic object**

MSLDiagnostic object

Diagnostic specified as an MSLDiagnostic object. Access the MSLDiagnostic object through the ExecutionInfo property of the Simulink.SimulationMetadata object.

Data Types: struct

## Version History

Introduced in R2016b

“Suppress Diagnostic Messages Programmatically”

## Simulink.saveVars

(Not recommended) Save workspace variables and their values in MATLAB code format

---

**Note** `Simulink.saveVars` is not recommended. Use `matlab.io.saveVariablesToScript` instead.

---

### Syntax

```
Simulink.saveVars(filename)
Simulink.saveVars(filename, var1,...,varN)
Simulink.saveVars(filename, '-regex',RegExps)
Simulink.saveVars(filename, __, UpdateOption)
Simulink.saveVars(filename, __, Configuration)
Simulink.saveVars(filename, __, MatlabVer)
[r1, r2] = Simulink.saveVars(filename, __)
```

### Description

`Simulink.saveVars(filename)` saves all variables in the current workspace for which MATLAB code can be generated to a MATLAB file named `filename.m`. If MATLAB code cannot be generated for a variable, the variable is saved into a companion MAT-file named `filename.mat`, and a warning is generated. If either file already exists, it is overwritten. The file name cannot match the name of any variable in the current workspace, and can optionally include the suffix `.m`. Using `Simulink.saveVars` has no effect on the contents of any workspace.

Executing the MATLAB file restores the variables saved in the file to the current workspace. If a companion MAT-file exists, code in the MATLAB file loads the MAT-file, restoring its variables also. When both a MATLAB file and a MAT-file exist, do not load the MATLAB file unless the MAT file is available, or an error will occur. Do not load a MAT-file directly, or incomplete data restoration will result. No warning occurs if loading a file overwrites any existing variables.

You can edit a MATLAB file that `Simulink.saveVars` creates. You can insert comments between or within the MATLAB code sections for saved variables. However, if you later use `Simulink.saveVars` to update or append to the file, only comments between MATLAB code sections will be preserved. Internal comments should therefore be used only in files that you do not expect to change any further.

You must not edit the header section in the MATLAB file, which comprises the first five comment lines. `Simulink` does not check that a manually edited MATLAB file is syntactically correct. Do not edit any MATLAB code in the file. You cannot edit a MAT-file and should never attempt to do so.

`Simulink.saveVars(filename, var1,...,varN)` saves only the variables specified by `var1,...,varN`. You can use the wildcard character `*` to save all variables that match a pattern. The `*` matches one or more characters, including non-alphanumeric characters.

`Simulink.saveVars(filename, '-regex',RegExps)` saves only variables whose names match one of the regular expressions in the comma-separated list of expressions `RegExps`. See “Regular Expressions” for more information. A call to the function can specify both `VarNames` and `'-regexps', RegExps`, in that order and comma-separated.

`Simulink.saveVars(filename, ___, UpdateOption)` saves the variables as directed by `UpdateOption`.

`Simulink.saveVars(filename, ___, Configuration)` saves the variables according to the specified configuration options.

`Simulink.saveVars(filename, ___, MatlabVer)` saves any MAT-file that it creates in the format required by the MATLAB version specified by `MatlabVer`.

`[r1, r2] = Simulink.saveVars(filename, ___)` returns the variables saved in `r1` and `r2`.

## Examples

### Explore Options for Saving Workspace Variables

Define some base workspace variables, then save them to a MATLAB file using a variety of input arguments.

Define some base workspace variables then save them to a new MATLAB file `myVars.m`.

```
a = 1;
b = 2.5;
c = 'A string';
d = {a,b,c};
Simulink.saveVars('myVars');
```

Define additional base workspace variables, then append them to the existing file `myVars.m` without changing the values previously saved in the file.

```
K = Simulink.Parameter;
myType = fixdt(1,16,3);
Simulink.saveVars('myVars', '-append', 'K', 'myType');
```

Update the variables `V1` and `V2` with their values in a MATLAB file, or for any whose value cannot be converted to MATLAB code, in a MAT-file. The file must already exist. Any array with more than 10 elements will be saved to a MAT-file that can be loaded on any version of MATLAB. The return argument `r1` lists the names of any variables saved to a MATLAB file; `r2` lists any saved to a MAT-file.

```
[r1, r2] = Simulink.saveVars('MyFile', 'V1', 'V2', '-update',
'-maxnumel', 10, '-v4');
```

Specify a 2-D slice for the output of the `my3Dtable` 3-D array. Specify that the 2-D slice expands along the first and third dimensions. Review the generated MATLAB code.

```
my3Dtable = zeros(3, 4, 2, 'single');
Simulink.saveVars('mfile.m', 'my3Dtable', '-2dslice', 1, 3);
```

```
my3Dtable = zeros(3, 4, 2, 'single');
my3Dtable(:,1,:) = single(...
 [1 13;
 5 17;
 9 21]);
my3Dtable(:,2,:) = single(...
 [2 14;
 6 18];
```

```

 10 22]);
my3DTable(:,3,:) = single(...
 [3 15;
 7 19;
 11 23]);
my3DTable(:,4,:) = single(...
 [4 16;
 8 20;
 12 24]);

```

## Input Arguments

### filename — Name of file to create or update

character vector | string scalar

Name of file that the function creates or updates, specified as a character vector or string scalar. The file name cannot match the name of any variable in the current workspace. The file name can have the suffix `.m`, but the function ignores it.

### var1, ..., varN — Variables to save

character vector | string scalar

A variable or sequence of comma-separated variables, specified as a character vector or string scalar. The function saves only the specified variables to the output file. You can use the wildcard character `*` to save all variables that match a pattern. The `*` matches one or more characters, including non-alphanumeric characters.

Example: `Simulink.saveVars('myFile','A*')` saves all variables in the workspace whose names start with `A` with their values.

### RegExps — Regular expression

character vector | string

A regular expression or sequence of comma-separated regular expressions, specified as a character vector or string. The function saves to the output file only those variables whose names match one of the expressions. See “Regular Expressions” for more information. A call to the function can specify both `VarNames` and `'-regexp', RegExps`, in that order and comma-separated.

Example: `Simulink.saveVars('myFile','-regexp','v*')`

### UpdateOption — Function action

'-create' (default) | 'update' | '-append'

Keyword that controls the action of the function, specified as one of these values:

- `'-create'` — Create a new MATLAB file (and MAT-file if needed).
- `'-update'` — Update the existing MATLAB file (and MAT-file if needed) specified by `filename` by changing only the specified variables that already exist in the file or files. The order of the variables in the file or files is preserved.
- `'-append'` — Update the existing MATLAB file (and MAT-file if needed) specified by `filename` by:
  - Updating the specified variables that already exist in the file or files, preserving the existing order.

- Appending the specified variables that do not exist in the file or files.

### Configuration — Configuration options

'-maxnumel' | '-maxlevels' | '-textwidth' | '-2dslice'

Configuration options for the function, specified as any or all of these values, in any order, separated by commas if more than one appears:

- '-maxnumel' MaxNum — Limits the number of elements saved for an array to MaxNum, which must be an integer between 0 and 10000. If an array is larger than that, the whole array appears in the MAT-file rather than the MATLAB script file, generating a warning. Default: 1000
- '-maxlevels' MaxLevels — Limits the number of levels saved for a structure or cell array to MaxLevels, which must be an integer between 0 and 200. If a structure or cell array is deeper than that, the whole entity appears in the MAT-file rather than the MATLAB script file, generating a warning. Default: 20
- '-textwidth' TextWidth — Sets the text wrap width in the MATLAB script file to TextWidth, which must be an integer between 32 and 256. Default: 76
- '-2dslice' — Sets two dimensions for 2-D slices that represent n-D (where n is greater than 2) arrays of char, logic, or numeric data. Using the '-2dslice' option produces more readable generated code that is consistent with how MATLAB displays n-D array data.

Simulink.saveVars uses the first two dimensions of the n-D array to specify the size of the 2-D slice, unless you supply two positive integer arguments after the -2dslice option. If you specify two integer arguments:

- The two integers must be positive.
- The two integers must be less than or equal to the number of dimensions of the n-D array.
- The second integer must be greater than the first.

---

**Note** You can use the MATLAB Preferences to change the defaults for the -maxnumel, -maxlevels, '-2dslice', and -textwidth configuration options. In the **Workspace** pane, use the options in the **Saving variables as MATLAB script files** group.

---

### MatlabVer — MATLAB version

'-v7.3' | '-v7.0' | '-v6' | '-v4'

MATLAB version whose syntax will be used by any MAT-file saved by the function, specified by values including:

- '-v7.3' — 7.3 or later
- '-v7.0' — 7.0 or later
- '-v6' — Version 6 or later
- '-v4' — Any MATLAB version

## Output Arguments

### r1 — Variables saved to a MATLAB file

cell array of character vectors

Variables that were saved to a MATLAB file, specified as a cell array of character vectors.

**r2 — Variables saved to a MAT- file**

cell array of character vectors

Variables that were saved to a MAT-file, specified as a cell array of character vectors.

**Limitations**

The `Simulink.saveVars` function:

- Does not preserve shared references.
- Ignores dynamic properties of objects.
- Saves the following to the MAT-file although they could appear in the MATLAB file:
  - `Simulink.ConfigSet` objects with custom target components. (Use the `Simulink.ConfigSet` method `saveAs` instead.)
  - `Simulink.Timeseries` and `Simulink.ModelDataLogs` objects.

If you save many variables, the generated MATLAB file can contain many lines of code and take a long time to execute. To avoid the long execution time, consider these alternatives:

- Permanently store variables in a data dictionary instead of using `Simulink.saveVars`. A data dictionary also provides more tools for managing variables. See “Determine Where to Store Variables and Objects for Simulink Models”.
- Save variables in a MAT-file by using the `save` function.

**Tips**

- If you do not need to save variables in an easily-understood form, see the `save` function.
- If you need to save only bus objects, use the `Simulink.Bus.save` function.
- If you need to save only a configuration set, use the `Simulink.ConfigSet.saveAs` method.

# simulink.schedule.createSchedule

Create a new schedule using provided schedule and ordering

## Syntax

```
outputSchedule = createSchedule(inputSchedule, partitionOrder)
outputSchedule = createSchedule(inputSchedule, partitionOrder,
'IgnoreExtra', true)
```

## Description

`outputSchedule = createSchedule(inputSchedule, partitionOrder)` creates a new `simulink.schedule.OrderedSchedule` object, `sch` with all the partitions present in the `simulink.schedule.OrderedSchedule` object, `inputSchedule`, according to order specified by the vector, `partitionOrder`.

`outputSchedule = createSchedule(inputSchedule, partitionOrder, 'IgnoreExtra', true)` creates a new `simulink.schedule.OrderedSchedule` object, `sch` with all the partitions present in the `simulink.schedule.OrderedSchedule`, `Schedule`, according to order specified by the parameter, `partitionOrder` while ignoring any partitions that are not already present in `sch`. `PartitionOrder` must contain all partitions of `inputSchedule`.

## Input Arguments

**inputSchedule** — A `simulink.schedule.Orderedschedule` object  
object

An existing `simulink.schedule.Orderedschedule` object copied to create new schedule.

**partitionOrder** — A vector of partition names  
vector

Partition names in the desired order, specified as a vector of strings.

## Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `'IgnoreExtra', true`

**IgnoreExtra** — Ignore additional partitions  
`false` (default) | `true`

When specified as `true`, the `createSchedule` function ignores any additional partitions in `partitionOrder` that are not present in the object, `inputSchedule`.

## Output Arguments

**outputSchedule** — New `simulink.schedule.Orderedschedule` object  
object

A new or modified `simulink.schedule.Orderedschedule` object.

## Version History

Introduced in R2020a

# Simulink.sdi.addToRun

**Package:** Simulink.sdi

Import data into existing run in Simulation Data Inspector using run ID

## Syntax

```
sigIDs = Simulink.sdi.addToRun(runID, 'vars', var, var2, ..., varn)
sigIDs = Simulink.sdi.addToRun(runID, 'namevalue', sourceNames, sigValues)

sigIDs = Simulink.sdi.addToRun(runID, 'file', filename)
sigIDs = Simulink.sdi.addToRun(runID, 'file', filename, Name=Value)
```

## Description

### Import Data from Workspace

`sigIDs = Simulink.sdi.addToRun(runID, 'vars', var, var2, ..., varn)` imports data from one or more variables into the Simulation Data Inspector by adding one or more signals to the run that corresponds to the specified run ID.

To import data into a new run, use the `Simulink.sdi.Run.create` function or the `Simulink.sdi.createRun` function.

`sigIDs = Simulink.sdi.addToRun(runID, 'namevalue', sourceNames, sigValues)` imports data from one or more variables into the Simulation Data Inspector by adding one or more signals to the run that corresponds to the specified run ID. The `sourceNames` argument specifies values to use for the data source in the metadata for the signals added to the run.

### Import Data from File

`sigIDs = Simulink.sdi.addToRun(runID, 'file', filename)` imports data from a file into the Simulation Data Inspector by adding one or more signals to the run that corresponds to the specified run ID. You can use a built-in file reader to import data from a MAT file, CSV file, Microsoft Excel file, or MDF file.

When you need to import data from a file that the built-in readers do not support, you can write your own reader using the `io.reader` class.

`sigIDs = Simulink.sdi.addToRun(runID, 'file', filename, Name=Value)` imports data from a file into the Simulation Data Inspector by adding one or more signals to the run that corresponds to the specified run ID according to options specified using one or more name-value arguments. For example, `sheets=["sheet1" "sheet2"]` specifies the sheets from which to import data when importing data from an Excel file.

## Examples

## Add Workspace Data to Run

This example shows how to use `Simulink.sdi.addToRun` to add workspace data to a run in the Simulation Data Inspector.

### Generate Workspace Data

Generate workspace data to add to a simulation run in place of measured data, input data, or any other data that you want to associate with the simulation.

```
time = linspace(0, 60, 201);
cos_vals = 2*cos(2*pi/6.8*time);
cos_ts = timeseries(cos_vals, time);
cos_ts.Name = 'cosine';
```

### Simulate Model

Simulate the `slexAircraftExample` model to create a run containing the simulation outputs.

```
load_system('slexAircraftExample');
sim('slexAircraftExample', 'SaveFormat', 'Dataset');
```

### Add Workspace Data to Simulation Run

Add the workspace data to the run. Then, view the results in the Simulation Data Inspector.

```
% Get run ID
count = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(count);

% Add data to run
sigIDs = Simulink.sdi.addToRun(runID, 'vars', cos_ts);

Simulink.sdi.view
```

## Input Arguments

### **runID** — Run ID for run to which you want to add imported data

scalar

Run ID for run to which you want to add imported data, specified as a scalar.

The Simulation Data Inspector assigns a unique ID to each run when the run is created. You can access run IDs for runs in the Simulation Data Inspector using the `Simulink.sdi.getAllRunIDs` and `Simulink.sdi.getRunIDByIndex` functions.

### **var** — Data to import

variable

Data to import, specified as a variable. The Simulation Data Inspector supports time-based data in which sample values are associated with sample times. The Simulation Data Inspector supports all loading and logging data formats, including `timeseries` and `Simulink.SimulationData.Dataset`.

Example: `myData`

**sourceNames — Source names for imported data**

cell array of character vectors

Source names for imported data, specified as a cell array of character vectors. The source name is used to set the `RootSource`, `TimeSource`, and `DataSource` properties of the `Simulink.sdi.Signal` objects created from the data specified by the `sigValues` input.

Provide a `sourceNames` input when you specify 'namevalue' for the second argument.

Example: {'sig1','sig2'}

**sigValues — Data to import**

cell array of variables

Data to import, specified as a cell array of variables.

Provide a `sigValues` input when you specify 'namevalue' for the second argument.

Example: {var1,var2}

**filename — Name of file with data to import**

character vector

Name of file with data to import, specified as a character vector. Provide a `filename` input when you specify 'file' for the second argument.

You can create a run from these types of files using file readers built into the Simulation Data Inspector:

- MAT-file
- CSV file
- Microsoft Excel file that contains data formatted according to “Microsoft Excel Import, Export, and Logging Format”.
- MDF file with one of these extensions:
  - .mdf
  - .mf4
  - .mf3
  - .data
  - .dat

When you need to import data from a file that the built-in readers do not support, you can write your own reader using the `io.reader` class. You can also write a custom reader to use instead of the built-in reader for any file extension. For an example, see “Import Data Using a Custom File Reader”.

Example: 'simulation.mat'

**Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Example: sheets=["sheet1" "sheet2"]

**reader — File reader to use to import data**

string | character vector

File reader to use to import data, specified as a string or character vector.

The Simulation Data Inspector prioritizes using a registered custom reader when one is available for the file. When you do not specify a reader, the Simulation Data Inspector uses the first custom reader registered for the file. If no custom readers are registered, the data is imported using the built-in reader.

Specify the reader input when:

- You want to use the built-in reader to import data for a file that is also supported by a custom reader.
- Multiple registered custom readers support the file.

To determine which readers are available to import your file, use the `io.reader.getSupportedReadersForFile` function.

Example: "MyExcelReader"

Example: "built-in"

**sheets — Sheets in Excel file from which to import data**

string array | cell array of character vectors

Sheets in Excel file from which to import data, specified as a string array or a cell array of character vectors. By default, the Simulation Data Inspector imports data from all sheets. Use the `sheets` name-value argument when you do not want to import data from all sheets in the Excel file.

When the data in the file does not include simulation numbers and source information, the data on each sheet is imported into a separate run. For more information about formatting data to import from an Excel file, see "Microsoft Excel Import, Export, and Logging Format".

Example: ["sheet1" "sheet2"]

**model — Model with definitions of user-defined data types**

string | character vector

Model with definitions of user-defined data types, specified as a string or character vector.

When you load data from an Excel file that defines signal data types using user-defined data types, such as enumerations, buses, or aliases, the Simulation Data Inspector needs access to the type definition to import the data. You can provide access to the type definitions by:

- Loading the associated object into the MATLAB workspace.
- Specifying the `model` name-value argument to use type definitions saved in the model workspace or a data dictionary.

For more information on formatting data to import from an Excel file, see "Microsoft Excel Import, Export, and Logging Format".

Example: "myModel.slx"

## Output Arguments

**sigIDs** — Signal IDs for signals created from imported data

scalar | vector

Signal IDs for signals created from imported data, returned as a scalar or a vector.

## Version History

## Simulink.sdi.addTrigger

Add trigger to signal to control display updates in the Simulation Data Inspector

### Syntax

```
Simulink.sdi.addTrigger(sig)
Simulink.sdi.addTrigger(sig,Name,Value)
```

### Description

`Simulink.sdi.addTrigger(sig)` adds a rising-edge trigger using normal mode and auto-level to the `Simulink.sdi.Signal` object, `sig`. The trigger determines when plots in the Simulation Data Inspector update to display new data for streaming signals.

`Simulink.sdi.addTrigger(sig,Name,Value)` adds trigger to the specified signal with trigger settings specified by one or more name-value pair arguments. For example, `'Mode','Normal'` configures normal mode behavior for the trigger. Triggers in the Simulation Data Inspector behave the same as triggers in the Scope block. For details regarding trigger types and settings, see “Scope Triggers Panel”.

### Examples

#### Programmatically Configure Triggers in the Simulation Data Inspector

Add a trigger to a signal in the Simulation Data Inspector to specify criteria that determine when to update plots to display fresh data. Triggers can allow you to capture transient signal behavior and can help stabilize the display of periodic signals so you can take measurements.

Simulate the `Triggers` model. Data in the model logs to the Simulation Data Inspector.

```
open_system('Triggers');
out = sim('Triggers');
```

Then, add a trigger to the `Pulse` signal. Configure the trigger as a falling-edge trigger with a threshold of 0.5.

```
trigRun = Simulink.sdi.getCurrentSimulationRun('Triggers');
pulseSig = getSignalsByName(trigRun,'Pulse');
Simulink.sdi.addTrigger(pulseSig,'Type','Edge','Level',0.5);
```

You can verify that the trigger was added and configured correctly by opening the Simulation Data Inspector using `Simulink.sdi.view` and clicking the trigger icon next to the `Pulse` signal to check the configuration. You can also use the `Simulink.sdi.getTrigger` function to check which signal is used to generate trigger events and the trigger configuration.

```
[sig,trigOpts] = Simulink.sdi.getTrigger;
```

```
sig.Name
```

```
ans =
'Pulse'
```

```
trigOpts
```

```
trigOpts = struct with fields:
 Mode: 'Auto'
 Type: 'Edge'
 Position: 0.5000
 Delay: 0
 SourceChannelComplexity: 'Scalar'
 Polarity: 'Positive'
 AutoLevel: 1
 Level: 0.5000
 UpperLevel: 0
 LowerLevel: 0
 Hysteresis: 0
 MinTime: 0
 MaxTime: Inf
 Timeout: 0
 Holdoff: 0
```

When you do not want to use a trigger to control when the Simulation Data Inspector updates the plots with fresh data, you can remove the trigger using the `Simulink.sdi.removeTrigger` function.

```
Simulink.sdi.removeTrigger
```

You can verify that the trigger was removed in the Simulation Data Inspector UI or using the `Simulink.sdi.getTrigger` function. The `Simulink.sdi.getTrigger` function returns an empty array of `Simulink.sdi.Signal` objects when no trigger is configured in the Simulation Data Inspector.

```
sig = Simulink.sdi.getTrigger;
size(sig)
```

```
ans = 1×2
 0 0
```

## Input Arguments

### **sig** — Signal used to detect trigger events

`Simulink.sdi.Signal` object

Signal used to detect trigger events, specified as a `Simulink.sdi.Signal` object.

### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `'Type', 'PulseWidth', 'Polarity', 'Falling'` configures a falling-edge, auto-leveled trigger in auto mode.

**Mode — When display updates in response to trigger event**

Auto (default) | Normal | Once

When display updates in response to trigger event, specified as the comma-separated pair consisting of 'Mode' and one of these options:

- Auto — Plots update in response to each trigger event, and the plots update if no trigger event occurs for the duration of time range displayed.
- Normal — Plots update in response to each trigger event.
- Once — Plots update in response to the first trigger event. You can manually rearm the trigger using the Simulation Data Inspector.

Example: 'Mode', 'Normal' configures the trigger to use normal mode.

**Position — Where trigger event appears in plot**

50 (default) | numeric percentage

Where trigger event appears in plot, specified as the comma-separated pair consisting of 'Position' and a numeric percentage. By default, the trigger event appears in the middle of the plot, with a position of 0.5, or at the 50% position within the time span.

Example: 'Position', .3 positions the trigger event at the 30% point within the time span.

**Type — Type of trigger to add to signal**

Edge (default) | PulseWidth | Transition | Runt | Window | Timeout

Type of trigger to add to signal, specified as the comma-separated pair consisting of 'Type' and one of these options:

- Edge — Trigger when the signal crosses a threshold.
- PulseWidth — Trigger when the signal crosses twice between a low threshold and high threshold within a specified time.
- Transition — Trigger when the signal crosses a high threshold and a low threshold within a specified time.
- Runt — Trigger when a signal crosses a low threshold or a high threshold twice within a specified time.
- Window — Trigger when a signal stays within or outside a range defined by a high threshold and a low threshold for a specified time.
- Timeout — Trigger when a signal stays above or below a threshold longer than a specified time.

For details regarding options for each type of trigger, see “Scope Triggers Panel”.

Example: 'Type', 'PulseWidth' configures a pulse width trigger.

**Polarity — Direction of signal value change that causes trigger event**

valid polarity for trigger type

Direction of signal value change that causes trigger event, specified as the comma-separated pair consisting of 'Polarity' and a valid polarity for the trigger type.

| Trigger Type | Polarity Options                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Edge         | <ul style="list-style-type: none"> <li>• <b>Rising</b> — Trigger when the signal crosses the threshold while increasing in value.</li> <li>• <b>Falling</b> — Trigger when the signal crosses the threshold while decreasing in value.</li> <li>• <b>Either</b> — Trigger when the signal crosses the threshold while increasing or decreasing in value.</li> </ul>                                                                                                       |
| PulseWidth   | <ul style="list-style-type: none"> <li>• <b>Positive</b> — Trigger on a rising pulse when the signal crosses the low threshold for a second time.</li> <li>• <b>Negative</b> — Trigger on a falling pulse when the signal crosses the high threshold for a second time.</li> <li>• <b>Either</b> — Trigger on both rising and falling pulses.</li> </ul>                                                                                                                  |
| Transition   | <ul style="list-style-type: none"> <li>• <b>RiseTime</b> — Trigger when the signal increases to cross from the low to the high threshold within the specified time.</li> <li>• <b>FallTime</b> — Trigger when the signal decreases to cross from the high threshold to the low threshold within the specified time.</li> <li>• <b>Either</b> — Trigger when the signal increases or decreases to cross the low and high thresholds within the specified time.</li> </ul>  |
| Runt         | <ul style="list-style-type: none"> <li>• <b>Positive</b> — Trigger on a rising pulse when the signal crosses the low threshold for a second time without crossing the high threshold.</li> <li>• <b>Negative</b> — Trigger on a falling pulse when the signal crosses the high threshold for a second time without crossing the low threshold.</li> <li>• <b>Either</b> — Trigger on rising or falling pulses that stay within the specified value thresholds.</li> </ul> |

| Trigger Type | Polarity Options                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Window       | <ul style="list-style-type: none"> <li>• <b>Inside</b> — Trigger when a signal stays within the specified value range for a duration between the <code>MinTime</code> and <code>MaxTime</code>. The trigger event occurs when the signal exits the specified value range.</li> <li>• <b>Outside</b> — Trigger when a signal is outside the specified value range for a duration between the <code>MinTime</code> and the <code>MaxTime</code>. The trigger event occurs when the signal reenters the specified value range.</li> <li>• <b>Either</b> — Trigger when the signal is inside or outside of the specified value range for a duration between the <code>MinTime</code> and the <code>MaxTime</code>.</li> </ul> |
| Timeout      | <ul style="list-style-type: none"> <li>• <b>Rising</b> — Trigger when the signal remains above the threshold for longer than the specified time.</li> <li>• <b>Falling</b> — Trigger when the signal remains below the threshold for longer than the specified time.</li> <li>• <b>Either</b> — Trigger when the signal remains either above or below the threshold for longer than the specified time.</li> </ul>                                                                                                                                                                                                                                                                                                        |

Example: `'Type', 'Edge', 'Polarity', 'Rising'` configures a rising-edge trigger.

### AutoLevel — Whether to automatically determine trigger levels

`true` or `1` (default) | `false` or `0`

Whether to automatically determine trigger levels, specified as the comma-separated pair consisting of `'AutoLevel'` and `true` or `false`.

When you want to specify thresholds for the trigger, specify `'AutoLevel'` as `false`.

Example: `'AutoLevel', false` configures a trigger to use a user-specified level.

### Level — Threshold for trigger events

numeric scalar

Threshold for trigger events, specified as the comma-separated pair consisting of `'Level'` and a numeric scalar.

You can only specify the `'Level'` name-value pair when you specify the `'Type'` name-value pair as `'Edge'` or `'Timeout'`.

Example: `'Type', 'Timeout', 'Level', '0.5'` configures a timeout trigger with a threshold of `0.5`.

### Hysteresis — Signal value change required around threshold to cause trigger event

numeric scalar

Signal value change required around threshold to cause trigger event, specified as the comma-separated pair consisting of 'Hysteresis' and a numeric scalar. Specifying a hysteresis for the trigger results in noise rejection for trigger events.

You can only specify the 'Hysteresis' name-value pair when you specify the 'Type' name-value pair as 'Edge' or 'Timeout'.

Example: 'Type', 'Timeout', 'Hysteresis', '0.05' configures a timeout trigger that requires the signal value to change by more than 0.05 around the threshold to cause a trigger event.

### **UpperLevel — Upper threshold for trigger event**

numeric scalar

Upper threshold for trigger event, specified as the comma-separated pair consisting of 'UpperLevel' and a numeric scalar.

You can only specify the 'UpperLevel' name-value pair when you specify the 'Type' name-value pair as 'PulseWidth', 'Transition', 'Runt', or 'Window'.

Example: 'Type', 'PulseWidth', 'UpperLevel', '0.9' configures a pulse width trigger with an upper threshold of 0.9.

### **LowerLevel — Lower threshold for trigger event**

numeric scalar

Lower threshold for trigger event, specified as the comma-separated pair consisting of 'LowerLevel' and a numeric scalar.

You can only specify the 'LowerLevel' name-value pair when you specify the 'Type' name-value pair as 'PulseWidth', 'Transition', 'Runt', or 'Window'.

Example: 'Type', 'PulseWidth', 'LowerLevel', '0.1' configures a pulse width trigger with a lower threshold of 0.1.

### **MinTime — Lower time limit for trigger event**

numeric scalar

Lower time limit for trigger event, specified as the comma-separated pair consisting of 'MinTime' and a numeric scalar. You can only specify the 'MinTime' name-value pair when you specify the 'Type' name-value pair as 'PulseWidth', 'Transition', 'Runt', or 'Window'. The significance of the lower time limit depends on the type of trigger.

- 'PulseWidth' — Minimum pulse width for trigger event.
- 'Transition' — Minimum rise or fall time for trigger event.
- 'Runt' — Minimum pulse width for trigger event.
- 'Window' — Minimum time spent within or outside value range for trigger event.

Example: 'Type', 'PulseWidth', 'MinTime', '0.1' configures a pulse width trigger with a minimum pulse width of 100ms.

### **MaxTime — Upper time limit for trigger event**

numeric scalar

Upper time limit for trigger event, specified as the comma-separated pair consisting of 'MaxTime' and a numeric scalar. You can only specify the 'MaxTime' name-value pair when you specify the

'Type' name-value pair as 'PulseWidth', 'Transition', 'Runt', or 'Window'. The significance of the upper time limit depends on the type of trigger.

- 'PulseWidth' — Maximum pulse width for trigger event.
- 'Transition' — Maximum rise or fall time for trigger event.
- 'Runt' — Maximum pulse width for trigger event.
- 'Window' — Maximum time spent within or outside value range for trigger event.

Example: 'Type', 'PulseWidth', 'MaxTime', '0.5' configures a pulse width trigger with a maximum pulse width of 500ms.

### **Timeout — Time threshold for timeout trigger**

numeric scalar

Time threshold for timeout trigger, specified as the comma-separated pair consisting of 'Timeout' and a numeric scalar.

You can only specify the 'Timeout' name-value pair when you specify the 'Type' name-value pair as 'Timeout'.

Example: 'Type', 'Timeout', 'Timeout', '0.5' configures a timeout trigger that causes an event when a signal is above or below the value threshold for longer than 500ms.

### **Delay — Trigger event offset from trigger position**

numeric scalar

Trigger event offset from trigger position, specified as the comma-separated pair consisting of 'Delay' and a numeric scalar.

Example: 'Type', 'Edge', 'Delay', '0.1' configures an edge trigger where the trigger position marker is displayed 100ms after the trigger event.

### **Holdoff — Minimum time between trigger events**

numeric scalar

Minimum time between trigger events, specified as the comma-separated pair consisting of 'Holdoff' and a numeric scalar. After a trigger event, the display does not update again for at least the holdoff time.

Example: 'Type', 'Edge', 'Holdoff', '1' configures an edge trigger with a holdoff of 1s. After a trigger event, the display does not update for at least 1s.

## **Alternative Functionality**

You can add a trigger to a signal and configure the trigger options using the Simulation Data Inspector UI. For details, see “Control Display of Streaming Data Using Triggers”.

## **Version History**

## Simulink.sdi.cleanupWorkerResources

Clean up worker repositories

### Syntax

```
Simulink.sdi.cleanupWorkerResources
```

### Description

`Simulink.sdi.cleanupWorkerResources` removes redundant data from each parallel worker repository file used by the Simulation Data Inspector. Call this function while worker pools are running. The Simulation Data Inspector automatically cleans up repository files when you close the worker pool.

### Examples

#### Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

#### Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

#### Initialize Parallel Workers

Use `gcp` to create a pool of local workers to run parallel simulations if you don't already have one. In an `spm` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spm
```

```
 % Load system and select signals to log
```

```

load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)

```

```
end
```

### Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```

parfor index = 1:7

 % Select value for Ts
 Ts_val = Ts_vals(index);

 % Change the filter time constant and simulate
 modelWorkspace = get_param('slexAircraftExample','modelworkspace');
 modelWorkspace.assignin('Ts',Ts_val)
 sim('slexAircraftExample')

 % Create a worker run for each simulation
 workerRun(index) = Simulink.sdi.WorkerRun.getLatest

```

```
end
```

```
spmd
```

```

% Remove temporary directories
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)

```

```
end
```

### Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```

ds(7) = Simulink.SimulationData.Dataset;

for a = 1:7
 ds(a) = workerRun(a).getDataset;
end
ds(1)

ans =
Simulink.SimulationData.Dataset '' with 2 elements

```

|                | Name       | BlockPath                                |
|----------------|------------|------------------------------------------|
| 1 [1x1 Signal] | alpha, rad | ...rcraftExample/Aircraft Dynamics Model |
| 2 [1x1 Signal] | Stick      | slexAircraftExample/Pilot                |

- Use braces { } to access, modify, or add elements using index.

### Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
 datasetRef(b) = workerRun(b).getDatasetRef;
end
```

```
datasetRef(1)
```

```
ans =
 DatasetRef with properties:

 Name: 'Run 3: slexAircraftExample'
 Run: [1x1 Simulink.sdi.Run]
 numElements: 2
```

### Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local `Run` objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

 Runs(c) = workerRun(c).getLocalRun;
 Ts_val_str = num2str(Ts_vals(c));
 desc = strcat('Ts = ', Ts_val_str);
 Runs(c).Description = desc;
 Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

### Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

## Version History

Introduced in R2017b

“Inspect and Compare Data Programmatically”

# Simulink.sdi.clear

**Package:** Simulink.sdi

Clear all data from the Simulation Data Inspector

## Syntax

```
Simulink.sdi.clear
```

## Description

`Simulink.sdi.clear` clears all plotted signals and deletes all data from the Simulation Data Inspector. The `Simulink.sdi.clear` function does not affect preferences or settings you have configured in the Simulation Data Inspector. Use the `Simulink.sdi.clearPreferences` function to reset the Simulation Data Inspector preferences to their default values. Use the `Simulink.sdi.clearAllSubPlots` function to clear all plotted signals without deleting any data from the Simulation Data Inspector.

## Examples

### Save a Simulation Data Inspector Session

This example creates, saves, and loads a Simulation Data Inspector session. The example logs data in the model `slexAircraftExample` and visualizes the logged data in a Simulation Data Inspector session. Each time you use the Simulation Data Inspector, you create and modify a session. You can save the data and associated visualization settings for a session in an MLDATX file using the `Simulink.sdi.save` function. When you want to review the data later, you can load the session using the `Simulink.sdi.load` function.

### Log Data to the Simulation Data Inspector

This example logs data from a simulation of the model `slexAircraftExample` to the Simulation Data Inspector. The model is not configured to log data. Load the model and mark the `Stick`, the `alpha`, `rad`, and the `q`, `rad/sec` signals for logging.

```
load_system('slexAircraftExample')

Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')
```

For this example, run two simulations of the model. In the first simulation, use the sine wave output from the `Pilot` block, and in the second, use the square wave output.

```
set_param('slexAircraftExample/Pilot','WaveForm','sine')
sim('slexAircraftExample')

set_param('slexAircraftExample/Pilot','WaveForm','square')
sim('slexAircraftExample')
```

## Visualize the Logged Data

You can use the Simulation Data Inspector programmatic interface to access the logged data from the simulations. When you access data using the Simulation Data Inspector programmatic interface, you can use functions to create plots in the Simulation Data Inspector.

To start, access the run IDs for the most recent two runs and then get the corresponding `Simulink.sdi.Run` object. The Run objects allow you to access the logged data for the simulations.

```
runIDs = Simulink.sdi.getAllRunIDs;
sineRunID = runIDs(end-1);
squareRunID = runIDs(end);

sineRun = Simulink.sdi.getRun(sineRunID);
squareRun = Simulink.sdi.getRun(squareRunID);
```

Suppose you want to analyze the relationship between the input and output for the model. Get the `Simulink.sdi.Signal` objects for the input and output signals from the two simulation runs.

```
sineOut = getSignalByIndex(sineRun,1);
sineIn = getSignalByIndex(sineRun,3);

squareOut = getSignalByIndex(squareRun,1);
squareIn = getSignalByIndex(squareRun,3);
```

Change the subplot layout in the Simulation Data Inspector to 2-by-1 and plot the signals from the first simulation run on the top plot and the signals from the second run on the bottom plot.

```
Simulink.sdi.setSubPlotLayout(2,1)

plotOnSubPlot(sineIn,1,1,true)
plotOnSubPlot(sineOut,1,1,true)

plotOnSubPlot(squareIn,2,1,true)
plotOnSubPlot(squareOut,2,1,true)
```

## Save the Simulation Data Inspector Session

To view the plotted data in the Simulation Data Inspector, enter `Simulink.sdi.view` in the command window.

Then, save the Simulation Data Inspector session as an MLDATX file.

```
Simulink.sdi.save('myData.mldatx')
```

## Load the Simulation Data Inspector Session

To mimic a scenario where you want to return to looking at the same data at a later point, clear the data from the Simulation Data Inspector and reset the subplot layout to 1-by-1.

```
Simulink.sdi.clear
Simulink.sdi.setSubPlotLayout(1,1)
```

Load the session file and resume working with the data. You can open the Simulation Data Inspector and view the results using the `Simulink.sdi.view` function.

```
Simulink.sdi.load('myData.mldatx');
```

## Version History

Introduced in R2011b

“Inspect and Compare Data Programmatically”

# Simulink.sdi.clearAllSubPlots

Clear plotted signals from all subplots in the Simulation Data Inspector

## Syntax

```
Simulink.sdi.clearAllSubPlots
```

## Description

`Simulink.sdi.clearAllSubPlots` clears plotted signals from all subplots in the Simulation Data Inspector, including any subplots with plotted data that are not visible in the current layout. Clearing plotted signals using the `Simulink.sdi.clearAllSubPlots` function does not delete data from the Simulation Data Inspector. To clear plotted signals and delete data from the Simulation Data Inspector, use the `Simulink.sdi.clear` function.

## Examples

### Clear Plotted Signals from All Subplots

You can programmatically clear plotted signals from all subplots in the Simulation Data Inspector. For example, clear plotted data at the start of a script that creates plots.

```
Simulink.sdi.clearAllSubPlots
```

### Plot Signals from Simulation Run

This example demonstrates how to access the `Simulink.sdi.Run` object for a Simulation Data Inspector run created by logging signals. From the `Simulink.sdi.Run` object you can get `Simulink.sdi.Signal` objects that contain the logged signal data and metadata. You can use the `Signal` objects and the `plotOnSubPlot` function to plot the data in the Simulation Data Inspector.

### Create a Simulation Run and Access the Run Object

The `ex_vdp` model logs two signals. To create a simulation run containing the logged data, simulate the model.

```
sim('ex_vdp');
```

The Simulation Data Inspector keeps track of runs by assigning a unique numeric run ID to each run created by simulation, importing data, or opening a session. To access the run object for the simulation you just performed, use the `Simulink.sdi.getAllRunIDs` function and take the last run ID in the returned vector.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Once you have the run ID for the run, you can use the `Simulink.sdi.getRun` function to get the `Simulink.sdi.Run` object that corresponds to the run. You can use the Run object to check the metadata associated with the run, including the number of signals in the run.

```
vdpRun = Simulink.sdi.getRun(runID);

vdpRun.SignalCount

ans = int32
 2
```

### **Plot Data Using Signal Objects**

Use the `getSignalByIndex` function to access signals from the Run object, `vdpRun`.

```
signal1 = getSignalByIndex(vdpRun,1);
signal2 = getSignalByIndex(vdpRun,2);
```

Use the `Simulink.sdi.setSubPlotLayout` function to specify a 2-by-1 layout.

```
Simulink.sdi.setSubPlotLayout(2,1)
```

Before plotting the data, use the `Simulink.sdi.clearAllSubPlots` function to clear any data that is already plotted.

```
Simulink.sdi.clearAllSubPlots
```

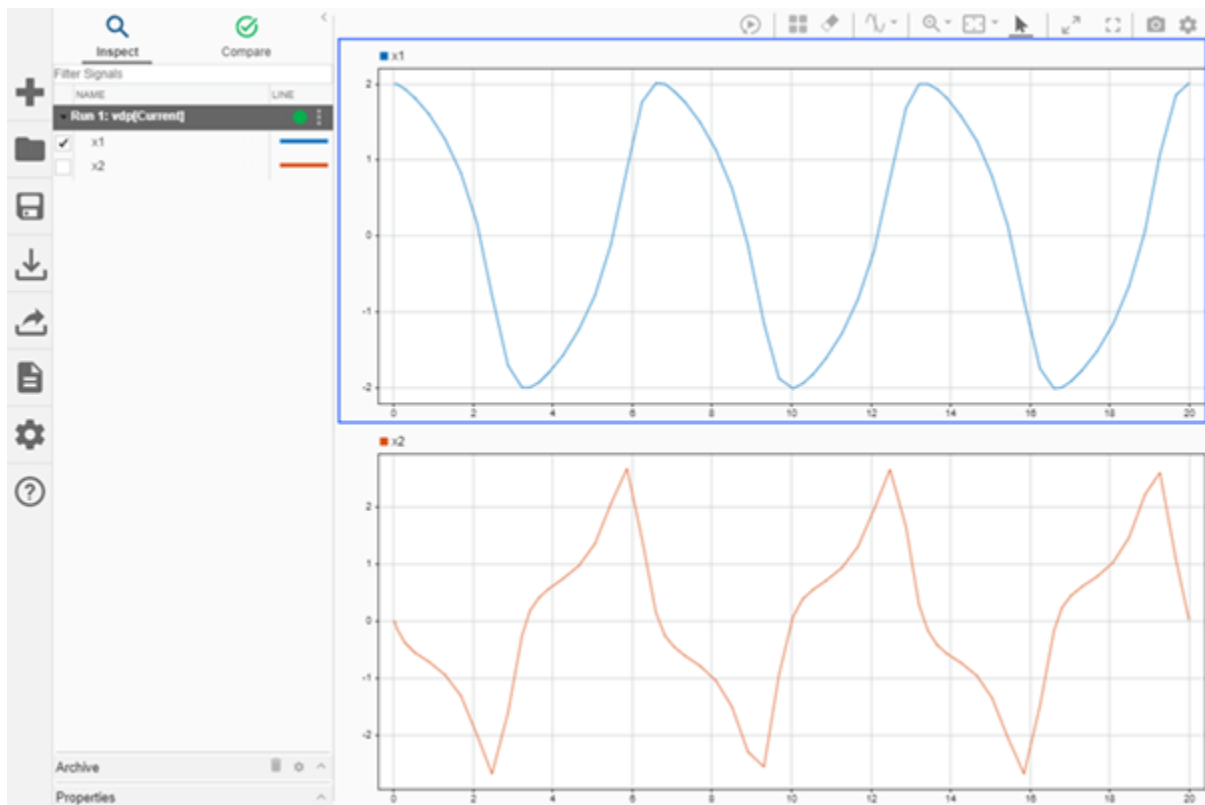

Plot one signal on each subplot. To plot signals on the first subplot, you can set the checked property for the signal. To plot signals on subplots other than the first subplot, use the `plotOnSubPlot` function.

```
signal1.Checked = true;
plotOnSubPlot(signal2,2,1,true);
```

### **View the Plotted Data**

To view the plots you just created, open the Simulation Data Inspector using the `Simulink.sdi.view` function.

## Version History

Introduced in R2019b

## Simulink.sdi.clearPreferences

Restore Simulation Data Inspector preferences to default settings

### Syntax

```
Simulink.sdi.clearPreferences
```

### Description

`Simulink.sdi.clearPreferences` restores all Simulation Data Inspector preferences to their default values.

You can configure these preferences in the Simulation Data Inspector programmatically:

- Preferences:
  - Run naming rule — `Simulink.sdi.setRunNamingRule`
  - Subplot layout — `Simulink.sdi.setSubPlotLayout`
  - Signal grouping within a run — `Simulink.sdi.setTableGrouping`
- Time plot settings:
  - Border display — `Simulink.sdi.setBorderOn`
  - Grid display — `Simulink.sdi.setGridOn`
  - Data markers display — `Simulink.sdi.setMarkersOn`
  - Tick mark labels display — `Simulink.sdi.setTickLabelsDisplay`
  - Tick mark position — `Simulink.sdi.setTicksPosition`
- Archive preferences:
  - Archive behavior — `Simulink.sdi.setAutoArchiveMode`
  - Archive size limit — `Simulink.sdi.setArchiveRunLimit`

### Examples

#### Restore All Simulation Data Inspector Preferences to Default Values

You can restore default values to all Simulation Data Inspector preferences programmatically using the `Simulink.sdi.clearPreferences` function.

```
Simulink.sdi.clearPreferences
```

#### Modify Run Naming Rule Then Restore Default

This example shows how to use the Simulation Data Inspector API to modify the Simulation Data Inspector run naming rule, check a run's name, restore default preferences, and check the run naming rule.

```
% Load model
load_system('sldemo_fuelsys')

% Modify run naming rule
Simulink.sdi.setRunNamingRule('<model_name> Run <run_index>')

% Simulate system
sim('sldemo_fuelsys')

% Check run name
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
fuelRun = Simulink.sdi.getRun(runID);
fuelRun.name

ans =
'sldemo_fuelsys Run 1'

% Clear preferences to reset the run naming rule
Simulink.sdi.clearPreferences

% Check run naming rule
Simulink.sdi.getRunNamingRule

ans =
'Run <run_index>: <model_name>'
```

## Version History

Introduced in R2017a

“Configure the Simulation Data Inspector”

“Inspect and Compare Data Programmatically”

## Simulink.sdi.close

**Package:** Simulink.sdi

Close the Simulation Data Inspector

### Syntax

```
Simulink.sdi.close
Simulink.sdi.close('filename')
```

### Description

`Simulink.sdi.close` closes the **Simulation Data Inspector**.

`Simulink.sdi.close('filename')` closes the Simulation Data Inspector and saves the data in the file, `filename`.

### Examples

#### Close the Simulation Data Inspector from the Command Line

You can close the Simulation Data Inspector from the MATLAB command line when you have finished inspecting and analyzing your data.

```
Simulink.sdi.close
```

#### Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

##### Create Data for the Run

Create `timeseries` objects to contain data for a sine signal and a cosine signal. Give each `timeseries` object a descriptive name.

```
time = linspace(0,20,100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

##### Create a Run and Add Data

Use the `Simulink.sdi.view` function to open the Simulation Data Inspector.

```
Simulink.sdi.view
```

To import data into the Simulation Data Inspector from the workspace, create a `Simulink.sdi.Run` object using the `Simulink.sdi.Run.create` function. Add information about the run to its metadata using the `Name` and `Description` properties of the Run object.

```
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals with different frequencies';
```

Use the `add` function to add the data you created in the workspace to the empty run.

```
add(sinusoidsRun,'vars',sine_ts,cos_ts);
```

### Plot the Data in the Simulation Data Inspector

Use the `getSignalByIndex` function to access `Simulink.sdi.Signal` objects that contain the signal data. You can use the `Simulink.sdi.Signal` object properties to specify the line style and color for the signal and plot it in the Simulation Data Inspector. Specify the `LineColor` and `LineDashed` properties for each signal.

```
sine_sig = getSignalByIndex(sinusoidsRun,1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';

cos_sig = sinusoidsRun.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.LineDashed = '--';
```

Use the `Simulink.sdi.setSubPlotLayout` function to configure a 2-by-1 subplot layout in the Simulation Data Inspector plotting area. Then use the `plotOnSubPlot` function to plot the sine signal on the top subplot and the cosine signal on the lower subplot.

```
Simulink.sdi.setSubPlotLayout(2,1);

plotOnSubPlot(sine_sig,1,1,true);
plotOnSubPlot(cos_sig,2,1,true);
```

### Close the Simulation Data Inspector and Save Your Data

When you have finished inspecting the plotted signal data, you can close the Simulation Data Inspector and save the session to an MLDATX file.

```
Simulink.sdi.close('sinusoids.mldatx')
```

## Version History

Introduced in R2013b

# Simulink.sdi.compareRuns

**Package:** Simulink.sdi

Compare data in two simulation runs

## Syntax

```
diffResult = Simulink.sdi.compareRuns(runID1,runID2)
diffResult = Simulink.sdi.compareRuns(runID1,runID2,Name=Value)
```

## Description

`diffResult = Simulink.sdi.compareRuns(runID1,runID2)` compares the data in the runs that correspond to `runID1` and `runID2` and returns the result in the `Simulink.sdi.DiffRunResult` object `diffResult`. For more information about the comparison algorithm, see “How the Simulation Data Inspector Compares Data”.

`diffResult = Simulink.sdi.compareRuns(runID1,runID2,Name=Value)` compares the simulation runs that correspond to `runID1` and `runID2` using the options specified by one or more name-value arguments. For more information about comparison options, see “How the Simulation Data Inspector Compares Data”.

## Examples

### Compare Runs with Global Tolerance

You can specify global tolerance values to use when comparing two simulation runs. Global tolerance values are applied to all signals within the run. This example shows how to specify global tolerance values for a run comparison and how to analyze and save the comparison results.

First, load the session file that contains the data to compare. The session file contains data for four simulations of an aircraft longitudinal controller. This example compares data from two runs that use different input filter time constants.

```
Simulink.sdi.load('AircraftExample.mldatx');
```

To access the run data to compare, use the `Simulink.sdi.getAllRunIDs` function to get the run IDs that correspond to the last two simulation runs.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end - 1);
runID2 = runIDs(end);
```

Use the `Simulink.sdi.compareRuns` function to compare the runs. Specify a global relative tolerance value of `0.2` and a global time tolerance value of `0.5`.

```
runResult = Simulink.sdi.compareRuns(runID1,runID2,'reltol',0.2,'timetol',0.5);
```

Check the `Summary` property of the returned `Simulink.sdi.DiffRunResult` object to see whether signals were within the tolerance values or out of tolerance.

```
runResult.Summary
ans = struct with fields:
 OutOfTolerance: 0
 WithinTolerance: 3
 Unaligned: 0
 UnitsMismatch: 0
 Empty: 0
 Canceled: 0
 EmptySynced: 0
 DataTypeMismatch: 0
 TimeMismatch: 0
 StartStopMismatch: 0
 Unsupported: 0
```

All three signal comparison results fell within the specified global tolerance.

You can save the comparison results to an MLDATX file using the `saveResult` function.

```
saveResult(runResult, 'InputFilterComparison');
```

### Analyze Simulation Data Using Signal Tolerances

You can programmatically specify signal tolerance values to use in comparisons performed using the Simulation Data Inspector. In this example, you compare data collected by simulating a model of an aircraft longitudinal flight control system. Each simulation uses a different value for the input filter time constant and logs the input and output signals. You analyze the effect of the time constant change by comparing results using the Simulation Data Inspector and signal tolerances.

First, load the session file that contains the simulation data.

```
Simulink.sdi.load('AircraftExample.mldatx');
```

The session file contains four runs. In this example, you compare data from the first two runs in the file. Access the `Simulink.sdi.Run` objects for the first two runs loaded from the file.

```
runIDs = Simulink.sdi.getAllRunIDs;
runIDTs1 = runIDs(end-3);
runIDTs2 = runIDs(end-2);
```

Now, compare the two runs without specifying any tolerances.

```
noTolDiffResult = Simulink.sdi.compareRuns(runIDTs1, runIDTs2);
```

Use the `getResultByIndex` function to access the comparison results for the `q` and `alpha` signals.

```
qResult = getResultByIndex(noTolDiffResult, 1);
alphaResult = getResultByIndex(noTolDiffResult, 2);
```

Check the `Status` of each signal result to see whether the comparison result fell within our out of tolerance.

```
qResult.Status
ans =
 ComparisonSignalStatus enumeration
```

```
 OutOfTolerance
```

```
alphaResult.Status
```

```
ans =
 ComparisonSignalStatus enumeration

 OutOfTolerance
```

The comparison used a value of 0 for all tolerances, so the `OutOfTolerance` result means the signals are not identical.

You can further analyze the effect of the time constant by specifying tolerance values for the signals. Specify the tolerances by setting the properties for the `Simulink.sdi.Signal` objects that correspond to the signals being compared. Comparisons use tolerances specified for the baseline signals. This example specifies a time tolerance and an absolute tolerance.

To specify a tolerance, first access the `Signal` objects from the baseline run.

```
runTs1 = Simulink.sdi.getRun(runIDTs1);
qSig = getSignalsByName(runTs1,'q, rad/sec');
alphaSig = getSignalsByName(runTs1,'alpha, rad');
```

Specify an absolute tolerance of 0.1 and a time tolerance of 0.6 for the `q` signal using the `AbsTol` and `TimeTol` properties.

```
qSig.AbsTol = 0.1;
qSig.TimeTol = 0.6;
```

Specify an absolute tolerance of 0.2 and a time tolerance of 0.8 for the `alpha` signal.

```
alphaSig.AbsTol = 0.2;
alphaSig.TimeTol = 0.8;
```

Compare the results again. Access the results from the comparison and check the `Status` property for each signal.

```
tolDiffResult = Simulink.sdi.compareRuns(runIDTs1,runIDTs2);
qResult2 = getResultByIndex(tolDiffResult,1);
alphaResult2 = getResultByIndex(tolDiffResult,2);
```

```
qResult2.Status
```

```
ans =
 ComparisonSignalStatus enumeration

 WithinTolerance
```

```
alphaResult2.Status
```

```
ans =
 ComparisonSignalStatus enumeration

 WithinTolerance
```

## Configure Comparisons to Check Metadata

You can use the `Simulink.sdi.compareRuns` function to compare signal data and metadata, including data type and start and stop times. A single comparison may check for mismatches in one or more pieces of metadata. When you check for mismatches in signal metadata, the `Summary` property of the `Simulink.sdi.DiffRunResult` object may differ from a basic comparison because the `Status` property for a `Simulink.sdi.DiffSignalResult` object can indicate the metadata mismatch. You can configure comparisons using the `Simulink.sdi.compareRuns` function for imported data and for data logged from a simulation.

This example configures a comparison of runs created from workspace data three ways to show how the `Summary` of the `DiffSignalResult` object can provide specific information about signal mismatches.

### Create Workspace Data

The `Simulink.sdi.compareRuns` function compares time series data. Create data for a sine wave to use as the baseline signal, using the `timeseries` format. Give the `timeseries` the name `Wave Data`.

```
time = 0:0.1:20;
sig1vals = sin(2*pi/5*time);
sig1_ts = timeseries(sig1vals,time);
sig1_ts.Name = 'Wave Data';
```

Create a second sine wave to compare against the baseline signal. Use a slightly different time vector and attenuate the signal so the two signals are not identical. Cast the signal data to the `single` data type. Also name this `timeseries` object `Wave Data`. The Simulation Data Inspector comparison algorithm will align these signals for comparison using the name.

```
time2 = 0:0.1:22;
sig2vals = single(0.98*sin(2*pi/5*time2));
sig2_ts = timeseries(sig2vals,time2);
sig2_ts.Name = 'Wave Data';
```

### Create and Compare Runs in the Simulation Data Inspector

The `Simulink.sdi.compareRuns` function compares data contained in `Simulink.sdi.Run` objects. Use the `Simulink.sdi.createRun` function to create runs in the Simulation Data Inspector for the data. The `Simulink.sdi.createRun` function returns the run ID for each created run.

```
runID1 = Simulink.sdi.createRun('Baseline Run','vars',sig1_ts);
runID2 = Simulink.sdi.createRun('Compare to Run','vars',sig2_ts);
```

You can use the `Simulink.sdi.compareRuns` function to compare the runs. The comparison algorithm converts the signal data to the `double` data type and synchronizes the signal data before computing the difference signal.

```
basic_DRR = Simulink.sdi.compareRuns(runID1,runID2);
```

Check the `Summary` property of the returned `Simulink.sdi.DiffRunResult` object to see the result of the comparison.

**basic\_DRR.Summary**

```
ans = struct with fields:
 OutOfTolerance: 1
 WithinTolerance: 0
 Unaligned: 0
 UnitsMismatch: 0
 Empty: 0
 Canceled: 0
 EmptySynced: 0
 DataTypeMismatch: 0
 TimeMismatch: 0
 StartStopMismatch: 0
 Unsupported: 0
```

The difference between the signals is out of tolerance.

**Compare Runs and Check for Data Type Match**

Depending on your system requirements, you may want the data types for signals you compare to match. You can use the `Simulink.sdi.compareRuns` function to configure the comparison algorithm to check for and report data type mismatches.

```
dataType_DRR = Simulink.sdi.compareRuns(runID1,runID2, 'DataType', 'MustMatch');
dataType_DRR.Summary
```

```
ans = struct with fields:
 OutOfTolerance: 0
 WithinTolerance: 0
 Unaligned: 0
 UnitsMismatch: 0
 Empty: 0
 Canceled: 0
 EmptySynced: 0
 DataTypeMismatch: 1
 TimeMismatch: 0
 StartStopMismatch: 0
 Unsupported: 0
```

The result of the signal comparison is now `DataTypeMismatch` because the data for the baseline signal is double data type, while the data for the signal compared to the baseline is single data type.

**Compare Runs and Check for Start and Stop Time Match**

You can use the `Simulink.sdi.compareRuns` function to configure the comparison algorithm to check whether the aligned signals have the same start and stop times.

```
startStop_DRR = Simulink.sdi.compareRuns(runID1,runID2, 'StartStop', 'MustMatch');
startStop_DRR.Summary
```

```
ans = struct with fields:
 OutOfTolerance: 0
 WithinTolerance: 0
 Unaligned: 0
 UnitsMismatch: 0
```

```

 Empty: 0
 Canceled: 0
 EmptySynced: 0
 DataTypeMismatch: 0
 TimeMismatch: 0
 StartStopMismatch: 1
 Unsupported: 0

```

The signal comparison result is now `StartStopMismatch` because the signals created in the workspace have different stop times.

### Compare Runs with Alignment Criteria

When you compare runs using the Simulation Data Inspector, you can specify alignment criteria that determine how signals are paired with each other for comparison. This example compares data from simulations of a model of an aircraft longitudinal control system. The simulations used a square wave input. The first simulation used an input filter time constant of `0.1s` and the second simulation used an input filter time constant of `0.5s`.

First, load the simulation data from the session file that contains the data for this example.

```
Simulink.sdi.load('AircraftExample.mldatx');
```

The session file contains data for four simulations. This example compares data from the first two runs. Access the run IDs for the first two runs loaded from the session file.

```
runIDs = Simulink.sdi.getAllRunIDs;
runIDTs1 = runIDs(end-3);
runIDTs2 = runIDs(end-2);
```

Before running the comparison, define how you want the Simulation Data Inspector to align the signals between the runs. This example aligns signals by their name, then by their block path, and then by their Simulink identifier.

```
alignMethods = [Simulink.sdi.AlignType.SignalName
 Simulink.sdi.AlignType.BlockPath
 Simulink.sdi.AlignType.SID];
```

Compare the simulation data in your two runs, using the alignment criteria you specified. The comparison uses a small time tolerance to account for the effect of differences in the step size used by the solver on the transition of the square wave input.

```
diffResults = Simulink.sdi.compareRuns(runIDTs1,runIDTs2,'align',alignMethods,...
 'timetol',0.005);
```

You can use the `getResultByIndex` function to access the comparison results for the aligned signals in the runs you compared. You can use the `Count` property of the `Simulink.sdi.DiffRunResult` object to set up a `for` loop to check the `Status` property for each `Simulink.sdi.DiffSignalResult` object.

```
numComparisons = diffResults.count;
for k = 1:numComparisons
 resultAtIdx = getResultByIndex(diffResults,k);
```

```

sigID1 = resultAtIdx.signalID1;
sigID2 = resultAtIdx.signalID2;

sig1 = Simulink.sdi.getSignal(sigID1);
sig2 = Simulink.sdi.getSignal(sigID2);

displayStr = 'Signals %s and %s: %s \n';
fprintf(displayStr,sig1.Name,sig2.Name,resultAtIdx.Status);
end

```

```

Signals q, rad/sec and q, rad/sec: OutOfTolerance
Signals alpha, rad and alpha, rad: OutOfTolerance
Signals Stick and Stick: WithinTolerance

```

## Input Arguments

### runID1 — Baseline run identifier

integer

Numeric identifier for the baseline run in the comparison, specified as a run ID that corresponds to a run in the Simulation Data Inspector. The Simulation Data Inspector assigns run IDs when runs are created. You can get the run ID for a run by using the ID property of the `Simulink.sdi.Run` object, the `Simulink.sdi.getAllRunIDs` function, or the `Simulink.sdi.getRunIDByIndex` function.

### runID2 — Identifier for run to compare

integer

Numeric identifier for the run to compare, specified as a run ID that corresponds to a run in the Simulation Data Inspector. The Simulation Data Inspector assigns run IDs when runs are created. You can get the run ID for a run by using the ID property of the `Simulink.sdi.Run` object, the `Simulink.sdi.getAllRunIDs` function, or the `Simulink.sdi.getRunIDByIndex` function.

## Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `AbsTol=x,Align=alignOpts`

### Align — Signal alignment options

`Simulink.sdi.AlignType` scalar | `Simulink.sdi.AlignType` vector

Signal alignment options, specified as a `Simulink.sdi.AlignType` scalar or vector. The `Simulink.sdi.AlignType` enumeration includes a value for each option available for pairing each signal in the baseline run with a signal in the comparison run. You can specify one or more alignment options for the comparison. To use more than one alignment option, specify an array. When you specify multiple alignment options, the Simulation Data Inspector aligns signals first by the option in the first element of the array, then by the option in the second element array, and so on. For more information, see “Signal Alignment”.

| Value                                          | Aligns By                                    |
|------------------------------------------------|----------------------------------------------|
| <code>Simulink.sdi.AlignType.BlockPath</code>  | Path to the source block for the signal      |
| <code>Simulink.sdi.AlignType.SID</code>        | Automatically assigned Simulink identifier   |
| <code>Simulink.sdi.AlignType.SignalName</code> | Signal name                                  |
| <code>Simulink.sdi.AlignType.DataSource</code> | Path of the variable in the MATLAB workspace |

Example: `[Simulink.sdi.AlignType.SignalName, Simulink.sdi.AlignType.BlockPath]` specifies signal alignment by signal name and then by block path.

### **AbsTol — Global absolute tolerance for comparison**

0 (default) | positive-valued scalar

Global absolute tolerance for comparison, specified as a positive-valued scalar.

Global tolerances apply to all signals in the run comparison. To use a different tolerance value for a signal in the comparison, specify the tolerance you want to use on the `Simulink.sdi.Signal` object in the baseline run and set the `OverrideGlobalTol` property for that signal to `true`.

For more information about how tolerances are used in comparisons, see “Tolerance Specification”.

Example: 0.5

Data Types: `double`

### **RelTol — Global relative tolerance for comparison**

0 (default) | positive-valued scalar

Global relative tolerance for comparison, specified as a positive-valued scalar. The relative tolerance is expressed as a fractional multiplier. For example, 0.1 specifies a 10 percent tolerance.

Global tolerances apply to all signals in the run comparison. To use a different tolerance value for a signal in the comparison, specify the tolerance you want to use on the `Simulink.sdi.Signal` object in the baseline run and set the `OverrideGlobalTol` property for that signal to `true`.

For more information about how tolerances are used in comparisons, see “Tolerance Specification”.

Example: 0.1

Data Types: `double`

### **TimeTol — Global time tolerance for comparison**

0 (default) | positive-valued scalar

Global time tolerance for comparison, specified as a positive-valued scalar, using units of seconds.

Global tolerances apply to all signals in the run comparison. To use a different tolerance value for a signal in the comparison, specify the tolerance you want to use on the `Simulink.sdi.Signal` object in the baseline run and set the `OverrideGlobalTol` property for that signal to `true`.

For more information about tolerances in the Simulation Data Inspector, see “Tolerance Specification”.

Example: 0.2

Data Types: `double`

**DataType — Comparison sensitivity to signal data types**`"MustMatch"`

Comparison sensitivity to signal data types, specified as `"MustMatch"`. Specify `DataType="MustMatch"` when you want the comparison to be sensitive to numeric data type mismatches in compared signals.

When signal data types do not match, the `Status` property of the `Simulink.sdi.DiffSignalResult` object for the result is set to `DataTypeMismatch`.

The `Simulink.sdi.compareRuns` function compares the data types for aligned signals before synchronizing and comparing the signal data. When you do not specify this name-value argument, the comparison checks data types only to detect a comparison between string and numeric data. For a comparison between string and numeric data, results are not computed, and the status for the result is `DataTypeMismatch`. For aligned signals that have different numeric data types, the comparison computes results.

When you configure the comparison to stop on the first mismatch, a data type mismatch stops the comparison. A stopped comparison may not compute results for all signals.

**Time — Comparison sensitivity to signal time vectors**`"MustMatch"`

Comparison sensitivity to signal time vectors, specified as `"MustMatch"`. Specify `Time="MustMatch"` when you want the comparison to be sensitive to mismatches in the time vectors of compared signals. When you specify this name-value argument, the algorithm compares the time vectors of aligned signals before synchronizing and comparing the signal data.

When the time vectors for signals do not match, the `Status` property of the `Simulink.sdi.DiffSignalResult` object for the result is set to `TimeMismatch`.

Comparisons are not sensitive to differences in signal time vectors unless you specify this name-value argument. For comparisons that are not sensitive to differences in the time vectors, the comparison algorithm synchronizes the signals prior to the comparison. For more information about how synchronization works, see ["How the Simulation Data Inspector Compares Data"](#).

When you specify that time vectors must match and configure the comparison to stop on the first mismatch, a time vector mismatch stops the comparison. A stopped comparison may not compute results for all signals.

**StartStop — Comparison sensitivity to signal start and stop times**`"MustMatch"`

Comparison sensitivity to signal start and stop times, specified as `"MustMatch"`. Specify `StartStop="MustMatch"` when you want the comparison to be sensitive to mismatches in signal start and stop times. When you specify this name-value argument, the algorithm compares the start and stop times for aligned signals before synchronizing and comparing the signal data.

When the start times and stop times do not match, the `Status` property of the `Simulink.sdi.DiffSignalResult` object for the result is set to `StartStopMismatch`.

When you specify that start and stop times must match and configure the comparison to stop on the first mismatch, a start or stop time mismatch stops the comparison. A stopped comparison may not compute results for all signals.

**StopOnFirstMismatch — Whether comparison stops on first detected mismatch**`"Metadata" | "Any"`

Whether comparison stops on first detected mismatch without comparing remaining signals, specified as `"Metadata"` or `"Any"`. A stopped comparison may not compute results for all signals, and can return a mismatched result more quickly.

- `Metadata` — A mismatch in metadata for aligned signals causes the comparison to stop. Metadata comparisons happen before comparing signal data.

The Simulation Data Inspector always aligns signals and compares signal units. When you configure the comparison to stop on the first mismatch, an unaligned signal or mismatched units always causes the comparison to stop. You can specify additional name-value arguments to configure the comparison to check and stop on the first mismatch for additional metadata, such as signal data type, start and stop times, and time vectors.

- `Any` — A mismatch in metadata or signal data for aligned signals causes the comparison to stop.

**ExpandChannels — Whether to compute comparison results for each channel in multidimensional signals**`true or 1 (default) | false or 0`

Whether to compute comparison results for each channel in multidimensional signals, specified as logical `true` (1) or `false` (0).

- `true` or `1` — Comparison expands multidimensional signals represented as a single signal with nonscalar sample values to a set of signals with scalar sample values and computes a comparison result for each of these signals.

The representation of the multidimensional signal in the Simulation Data Inspector as a single signal with nonscalar sample values does not change.

- `false` or `0` — Comparison does not compute results for multidimensional signals represented as a single signal with nonscalar sample values.

**Output Arguments****diffResult — Comparison results**`Simulink.sdi.DiffRunResult` object

Comparison results, returned as a `Simulink.sdi.DiffRunResult` object.

**Limitations**

The Simulation Data Inspector does not support comparing:

- Signals of data types `int64` or `uint64`.
- Variable-size signals.

**Version History****Introduced in R2011b**

## Simulink.sdi.compareSignals

**Package:** Simulink.sdi

Compare data in two Simulink.sdi.Signal objects

### Syntax

```
diff = Simulink.sdi.compareSignals(sigID1,sigID2)
```

### Description

`diff = Simulink.sdi.compareSignals(sigID1,sigID2)` compares the signals that correspond to the signal IDs `sigID1` and `sigID2` and returns the results in a `Simulink.sdi.DiffSignalResult` object. For more information on how the comparison results are computed, see “How the Simulation Data Inspector Compares Data”.

### Examples

#### Compare Two Signals in the Same Run

You can use the Simulation Data Inspector programmatic interface to compare signals within a single run. This example compares the input and output signals of an aircraft longitudinal controller.

First, load the session that contains the data.

```
Simulink.sdi.load('AircraftExample.mldatx');
```

Use the `Simulink.sdi.Run.getLatest` function to access the latest run in the data.

```
aircraftRun = Simulink.sdi.Run.getLatest;
```

Then, you can use the `Simulink.sdi.getSignalsByName` function to access the `Stick` signal, which represents the input to the controller, and the `alpha, rad` signal that represents the output.

```
stick = getSignalsByName(aircraftRun,'Stick');
alpha = getSignalsByName(aircraftRun,'alpha, rad');
```

Before you compare the signals, you can specify a tolerance value to use for the comparison. Comparisons use tolerance values specified for the baseline signal in the comparison, so set an absolute tolerance value of `0.1` on the `Stick` signal.

```
stick.AbsTol = 0.1;
```

Now, compare the signals using the `Simulink.sdi.compareSignals` function. The `Stick` signal is the baseline, and the `alpha, rad` signal is the signal to compare against the baseline.

```
comparisonResults = Simulink.sdi.compareSignals(stick.ID,alpha.ID);
match = comparisonResults.Status
```

```
match =
 ComparisonSignalStatus enumeration
```

```
OutOfTolerance
```

The comparison result is out of tolerance. You can use the `Simulink.sdi.view` function to open the Simulation Data Inspector to view and analyze the comparison results.

## Compare Signals from Different Runs

This example shows how to compare signals from different simulation runs using the Simulation Data Inspector's `Simulink.sdi.compareSignals` function. When you only have one signal of interest to compare, using a signal comparison returns the `Simulink.sdi.diffSignalResult` object with the comparison data directly.

### Generate Simulation Data

Use the `slexAircraftExample` model to generate simulation runs. Between the runs, change the time constant of the input filter.

```
% Load example model
load_system('slexAircraftExample')

% Mark the alpha, rad signal for streaming
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')

% Simulate system
out_1 = sim('slexAircraftExample');

% Change input filter time constant
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
assignin(modelWorkspace,'Ts',0.2)

% Simulate again
out_2 = sim('slexAircraftExample');
```

### Get Signal IDs for the Signal Comparison

Create run objects using the run IDs, and then use `getSignalIDByIndex` to get the signal IDs to pass to `Simulink.sdi.compareSignals`.

```
% Get run data
runIDs = Simulink.sdi.getAllRunIDs;

runID1 = runIDs(end-1);
runID2 = runIDs(end);

run1 = Simulink.sdi.getRun(runID1);
run2 = Simulink.sdi.getRun(runID2);

sigID1 = getSignalIDByIndex(run1,1);
sigID2 = getSignalIDByIndex(run2,1);
```

### Compare Signals

Compare the signals, and open the Simulation Data Inspector to view the results.

```
diffResult = Simulink.sdi.compareSignals(sigID1,sigID2);
Simulink.sdi.view
```

## Input Arguments

### **sigID1 — Signal ID of baseline signal**

scalar

Signal ID for the baseline signal, specified as an integer. The Simulation Data Inspector assigns a signal ID to each signal when a run is created. You can get the signal ID for a signal using one of these functions:

- `getAllSignalIDs`
- `getSignalIDByIndex`
- `getSignalIDsByName`
- `Simulink.sdi.createRun`

### **sigID2 — Signal ID of signal to compare**

scalar

Signal ID for the signal to compare, specified as an integer. The Simulation Data Inspector assigns a signal ID to each signal when a run is created. You can get the signal ID for a signal using one of these functions:

- `getAllSignalIDs`
- `getSignalIDByIndex`
- `getSignalIDsByName`
- `Simulink.sdi.createRun`

## Output Arguments

### **diff — Signal comparison results**

`Simulink.sdi.diffSignalResult` | array of `Simulink.sdi.diffSignalResult` objects

Signal comparison results, returned as a `Simulink.sdi.DiffSignalResult` object. Complex signal comparison results are returned as an array of two `DiffSignalResult` objects. One `DiffSignalResult` object contains the real data and the other contains the imaginary data. Check the `Name` property of the `DiffSignalResult` object to determine whether it contains real or imaginary data.

## Limitations

The Simulation Data Inspector does not support comparing:

- Signals of data types `int64` or `uint64`.
- Variable-size signals.

## **Version History**

Introduced in R2011b

## Simulink.sdi.copyRun

Copy a Simulation Data Inspector run

### Syntax

```
newRunID = Simulink.sdi.copyRun(runID)
[newRunID,runIndex] = Simulink.sdi.copyRun(runID)
[newRunID,runIndex,signalIDs] = Simulink.sdi.copyRun(runID)
```

### Description

`newRunID = Simulink.sdi.copyRun(runID)` copies the run corresponding to `runID` and returns the run ID for the new run. The new run includes all the simulation data and metadata from the original run. You can modify the copy of the run by adding or deleting signals and metadata while still retaining the original run.

`[newRunID,runIndex] = Simulink.sdi.copyRun(runID)` copies the run corresponding to `runID` and returns the run ID and index in the Simulation Data Inspector repository for the new run. The new run includes all the simulation data and metadata from the original run.

`[newRunID,runIndex,signalIDs] = Simulink.sdi.copyRun(runID)` copies the run corresponding to `runID` and returns the signal IDs for the signals in the new run along with its run ID and index in the Simulation Data Inspector repository. The new run includes all the simulation data and metadata from the original run.

### Examples

#### Compare a Subset of Signals

This example shows how to use `Simulink.sdi.copyRun` and `Simulink.sdi.deleteSignal` to create a copy of a run that contains a subset of the signals from the original run. You can use the copy to analyze and run comparisons on a subset of signals while still holding onto the original run that has all of the signals. For example, the model `sldemo_fuelsys` is configured to log ten signals. To compare the system's responses to different types of failures, you don't need to run the comparison on all of the logged signals. Deleting signals that do not represent the system's response before running the comparison saves processing time and simplifies the view of the results.

#### Create Runs

Load the model `sldemo_fuelsys` and run simulations to create runs in the Simulation Data Inspector. The first run simulates a failure of the throttle angle sensor, and the second run simulates a failure of the exhaust gas oxygen sensor.

```
load_system('sldemo_fuelsys')
modelWorkspace = get_param('sldemo_fuelsys','modelworkspace');
modelWorkspace.assignin('throttle_sw',0)
modelWorkspace.assignin('ego_sw',1)
sim('sldemo_fuelsys')
```

```
modelWorkspace.assignin('throttle_sw',1)
modelWorkspace.assignin('ego_sw',0)
sim('sldemo_fuelsys')
```

## Copy the Run

Use the Simulation Data Inspector's programmatic interface to get `Simulink.sdi.Run` objects for the simulations, and then create copies of the runs.

```
% Get runs
runIDs = Simulink.sdi.getAllRunIDs;

runID1 = runIDs(end-1);
runID2 = runIDs(end);

run1 = Simulink.sdi.getRun(runID1);
run2 = Simulink.sdi.getRun(runID2);

% Create a copy of each run, truncRun
[truncRun1,runIndex1,signalIDs1] = Simulink.sdi.copyRun(runID1);
[truncRun2,runIndex2,signalIDs2] = Simulink.sdi.copyRun(runID2);
```

## Delete Signals in Run Copy

The `sldemo_fuelsys` model is configured to log the values of the fault switches along with several signals representing the system's response. When you compare the system's response when a throttle angle sensor fails to its response when an exhaust gas oxygen sensor fails, comparing the fault switch states does not provide new information. Therefore, delete the switch signals before running the comparison to eliminate unnecessary computations.

```
Simulink.sdi.deleteSignal(signalIDs1(1))
Simulink.sdi.deleteSignal(signalIDs1(3))
Simulink.sdi.deleteSignal(signalIDs1(5))
Simulink.sdi.deleteSignal(signalIDs1(8))

Simulink.sdi.deleteSignal(signalIDs2(1))
Simulink.sdi.deleteSignal(signalIDs2(3))
Simulink.sdi.deleteSignal(signalIDs2(5))
Simulink.sdi.deleteSignal(signalIDs2(8))
```

## Compare Truncated Runs

You can use the truncated runs you created with `Simulink.sdi.copyRun` and `Simulink.sdi.deleteSignal` to perform a comparison of the system's response to different types of failures. Then, open the Simulation Data Inspector to view the comparison results.

```
truncRunDiff = Simulink.sdi.compareRuns(truncRun1,truncRun2);

Simulink.sdi.view
```

## Input Arguments

**runID** — Numeric run identifier

scalar

Run ID for the run you want to copy. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for your run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

## Output Arguments

### **newRunID** — Run ID for the copy

scalar

Run ID for the copy of the run.

### **runIndex** — Run index for the copy

scalar

Index of the copy in the Simulation Data Inspector repository.

### **signalIDs** — Numeric identifiers for the signals in the copy

matrix

Matrix containing the signal IDs for the copies of signals created in the copy of the run.

## Version History

Introduced in R2011b

“Inspect and Compare Data Programmatically”

# Simulink.sdi.copyRunViewSettings

Copy line style and color for signals from one run to another

## Syntax

```
sigIDs = Simulink.sdi.copyRunViewSettings(run1,run2,plot)
```

## Description

`sigIDs = Simulink.sdi.copyRunViewSettings(run1,run2,plot)` copies the line style and color specifications from `runID1` to `runID2` for matched signals. You can specify `run1` and `run2` with their run ID or as a `Simulink.sdi.Run` object. If `plot` is specified as `true`, `Simulink.sdi.copyRunViewSettings` also changes signal parameters in both runs so that aligned signals that are plotted come from the `run2`. The function returns an array of signal identifiers for the signals that the Simulation Data Inspector aligned between the two runs. To learn more about how the Simulation Data Inspector aligns signals between runs, see “How the Simulation Data Inspector Compares Data”.

## Examples

### Copy View Settings to a Run

This example shows how to copy view settings from one run to another and how to create figures using the `Simulink.sdi.CustomSnapshot` object.

#### Simulate Your Model and Get a Run Object

Configure the `vdp` model to save output data, and run a simulation to create data.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
set_param('vdp/Mu','Gain','1');
sim('vdp');
```

Use the Simulation Data Inspector programmatic interface to access the run data.

```
runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

#### Modify Signal View Settings

Use the `Simulink.sdi.Run` object to access signals in the run. Then, modify the signal view settings. This example specifies the line color and style for each signal. The view settings for the run comprise the view settings for each signal and view settings specified for the plot area.

```
sig1 = vdpRun.getSignalByIndex(1);
sig2 = vdpRun.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
```

```
sig1.LineDashed = '-.-';
sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

### Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;
```

You can use properties of the `Simulink.sdi.CustomSnapshot` object to configure the plot settings, like the subplot layout and axis limits, and to plot signals. When you use a `Simulink.sdi.CustomSnapshot` object to create your figure, these plot settings do not affect the Simulation Data Inspector.

```
snap.Rows = 2;
snap.YRange = {[-2.25 2.25], [-3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)
```

Use `Simulink.sdi.snapshot` to generate the figure you specified in the properties of the `Simulink.sdi.CustomSnapshot` object.

```
fig = Simulink.sdi.snapshot("from", "custom", "to", "figure", "settings", snap);
```

### Copy the View Settings to a New Simulation Run

Simulate the model again, with a different Mu value. Use the Simulation Data Inspector programmatic interface to access the simulation data.

```
set_param('vdp/Mu', 'Gain', '5')
sim('vdp');

runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);
```

To create a plot of the new output data that looks like the one you created in the previous step, you can copy the view settings to the run in a single line of code using `Simulink.sdi.copyRunViewSettings`. The `Simulink.sdi.copyRunViewSettings` function does not automatically update plot settings in `Simulink.sdi.CustomSnapshot` objects, so specify the plot input as `false`.

```
sigIDs = Simulink.sdi.copyRunViewSettings(runID, runID2, false);
```

### Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25], [-8 8]};
snap.plotOnSubPlot(1,1,sigIDs(1),true)
snap.plotOnSubPlot(2,1,sigIDs(2),true)

fig = snap.snapshot("to", "figure");
```

## Input Arguments

### run1 — Simulation Data Inspector run ID for source run

scalar | 'Simulink.sdi.Run' object

Run with the view settings you want to copy specified with its run ID or `Simulink.sdi.Run` object. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for your run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

### run2 — Simulation Data Inspector run ID for destination run

scalar | 'Simulink.sdi.Run' object

Run you want to copy the view settings to, specified with its run ID or `Simulink.sdi.Run` object. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for your run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

### plot — Specify whether to update plotted signals

true | false

Specifies whether the Simulation Data Inspector changes the plot settings in the runs corresponding to `run1` and `run2`.

- When `plot` is `true`, the Simulation Data Inspector modifies the signal parameters so that the aligned signals that are plotted come from `run2`.

- When `plot` is `false`, the Simulation Data Inspector does not change which signals are plotted.

Data Types: `logical`

## Output Arguments

### **sigIDs** — Signal IDs for aligned signals

matrix

Matrix containing the signal IDs for signals in `run2` that aligned with signals in `run1` and had view settings modified.

## Version History

Introduced in R2016a

### See Also

[Simulink.sdi.copyRun](#) | [Simulink.sdi.Signal](#) | [Simulink.sdi.Run](#) | [Simulink.sdi.setMarkersOn](#) | [Simulink.sdi.view](#)

### Topics

“Inspect and Compare Data Programmatically”

“Create Plots Using the Simulation Data Inspector”

## Simulink.sdi.createRun

Import data into new run in Simulation Data Inspector and return run ID

### Syntax

```
runID = Simulink.sdi.createRun
runID = Simulink.sdi.createRun(runName)

runID = Simulink.sdi.createRun(var)
runID = Simulink.sdi.createRun(runName, 'vars', var, var2, ..., varn)
runID = Simulink.sdi.createRun(runName, 'namevalue', sourceNames, sigValues)

runID = Simulink.sdi.createRun(runName, 'file', filename)
runID = Simulink.sdi.createRun(runName, 'file', filename, Name=Value)

[runID, runIndex] = Simulink.sdi.createRun(____)
[runID, runIndex, sigIDs] = Simulink.sdi.createRun(____)
```

### Description

#### Create Empty Run

`runID = Simulink.sdi.createRun` creates an empty, unnamed run in the Simulation Data Inspector and returns the run ID for the created run.

You can use the `Simulink.sdi.getRun` function to access the `Simulink.sdi.Run` object that corresponds to the run. Set the properties on the Run object to add metadata to the run. Use the `Simulink.sdi.addToRun` function or the `add` function to add data to the run.

`runID = Simulink.sdi.createRun(runName)` creates an empty run named `runName`.

#### Import Data from Workspace

`runID = Simulink.sdi.createRun(var)` imports data from the scalar variable `var` into a new run in the Simulation Data Inspector. The run is named according to the input variable. For example, when `var` is a `timeseries` object, the run name comes from the `Name` property on the `timeseries` object.

`runID = Simulink.sdi.createRun(runName, 'vars', var, var2, ..., varn)` imports data from one or more variables into a new run in the Simulation Data Inspector named `runName`.

Use this syntax to import data from multiple variables or from a variable that represents an array of objects, such as an array of `Simulink.SimulationOutput` or `Simulink.SimulationData.Dataset` objects.

`runID = Simulink.sdi.createRun(runName, 'namevalue', sourceNames, sigValues)` imports data from one or more variables into a new run in the Simulation Data Inspector named `runName`. The cell array `sourceNames` specifies the names used to set the `RootSource`, `TimeSource`, and `DataSource` properties for the signals imported from the `sigValues` cell array.

### Import Data from File

`runID = Simulink.sdi.createRun(runName, 'file', filename)` imports data from a file into a new run in the Simulation Data Inspector. You can use a built-in file reader to import data from a MAT file, CSV file, Microsoft Excel file, or an MDF file.

When you need to import data from a file that the built-in readers do not support, you can write your own reader using the `io.reader` class.

`runID = Simulink.sdi.createRun(runName, 'file', filename, Name=Value)` imports data from a file into a new run in the Simulation Data Inspector according to options specified using one or more name-value arguments. For example, `sheets=["sheet1" "sheet2"]` specifies the sheets from which to import data when importing data from an Excel file.

### Return Additional Run Information

`[runID,runIndex] = Simulink.sdi.createRun( ___ )` returns the run ID and the run index in the Simulation Data Inspector for the created run.

`[runID,runIndex,sigIDs] = Simulink.sdi.createRun( ___ )` returns the run ID, run index in the Simulation Data Inspector, and the signal IDs for the signals in the created run.

## Examples

### Create a Run in the Simulation Data Inspector

You can programmatically import data into the Simulation Data Inspector by creating a run from data in the base workspace or a file. This example creates data in the workspace and then illustrates several methods of creating a Simulation Data Inspector run containing the data.

#### Create Data

Create data in the workspace. The Simulation Data Inspector supports time series data in many formats. This example creates data using the `timeseries` and `Simulink.SimulationData.Dataset` formats and saves the data in a MAT-file.

Create a sine signal and a cosine signal. Store the data for each signal in a `timeseries` object with a descriptive name.

```
time = 0:0.2:20;

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

You can use the `Dataset` format to group related signal data together in a single object. The `Dataset` format is the default format for logged data and is supported for loading simulation input data. Create a `Dataset` object that contains the sinusoid `timeseries` data.

```
sinusoids_ds = Simulink.SimulationData.Dataset;
sinusoids_ds = addElement(sinusoids_ds,cos_ts);
sinusoids_ds = addElement(sinusoids_ds,sine_ts);
```

Scale each signal by a factor of 2 and create a Dataset object to contain the signal data for the results.

```
doubSine = 2*sine_ts;
doubCos = 2*cos_ts;

doubSinusoids_ds = Simulink.SimulationData.Dataset;
doubSinusoids_ds = addElement(doubSinusoids_ds,doubSine);
doubSinusoids_ds = addElement(doubSinusoids_ds,doubCos);
```

Finally, save the timeseries data to a MAT-file.

```
save sinusoids.mat sine_ts cos_ts
```

### Open the Simulation Data Inspector

To view the runs you create in each section, open the Simulation Data Inspector by entering `Simulink.sdi.view` in the MATLAB™ Command Window.

### Create a Run Using a Simulink.sdi.Run Object

You can import your data into a run in the Simulation Data Inspector by creating an empty run and then adding data to the run from the workspace or a file. Depending on your task, you can use the `Simulink.sdi.Run.create` function or the `Simulink.sdi.createRun` function to create the empty run. The `Simulink.sdi.Run.create` function returns the `Simulink.sdi.Run` object for the new run, and the `Simulink.sdi.createRun` function returns the run ID for the new run.

This example creates an empty run using the `Simulink.sdi.Run.create` function, gives the run a meaningful name and description, and then adds the sine and cosine timeseries data using the `add` function.

```
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals of different frequencies';

add(sinusoidsRun,'vars',sine_ts,cos_ts)
```

This example uses the `Simulink.sdi.createRun` function to create a new run in the Simulation Data Inspector called `My Waves` and then uses the `Simulink.sdi.addToRun` function to add the sine and cosine timeseries data to the run.

```
runID = Simulink.sdi.createRun('My Waves');
signalID = Simulink.sdi.addToRun(runID,'vars',sine_ts,cos_ts);
```

### Create a Run from a Workspace Variable

You can create a run from a single variable in the workspace. After creating the run, you can add additional data, or you can create another run to contain your other data. The variable you use to create the run can be a `timeseries` object with data that corresponds to only one signal, or it can be a `Dataset` object that contains several signals.

When you use this syntax to create a run from a single workspace variable, the run takes the same name as the object used to create it.

```
runID = Simulink.sdi.createRun(sine_ts);
```

The `Simulink.sdi.createRun` function returns the run ID for the run it creates. You can use the `Simulink.sdi.getRun` function to access the Run object for the run.

```
sineRun = Simulink.sdi.getRun(runID);
sineRun.Name
```

```
ans =
'Sine, T=5'
```

### Create a Run from Multiple Workspace Variables

When your data exists in multiple variables in your workspace, you can use the `Simulink.sdi.createRun` function with the `vars` option to import the data from multiple variables into a single run in the Simulation Data Inspector. You can also use this syntax to create a run for a single variable that uses a name you specify.

This example creates a run called `My Sinusoids` that contains data for the sine and cosine timeseries objects.

```
runID = Simulink.sdi.createRun('My Sinusoids', 'vars', sine_ts, cos_ts);
```

### Create a Run and Specify Source Names

You can use the `namevalue` option of the `Simulink.sdi.createRun` function to create a run and specify names for the signals in the run. This syntax can be particularly helpful when you import individual leaf signals from hierarchical data.

This example creates a run containing the data for both the `Dataset` objects. Each `Dataset` object contains data for more than one signal, so the imported run data has hierarchy. The name-value syntax in this example specifies a name for the hierarchical node that corresponds to each `Dataset` object.

```
runID = Simulink.sdi.createRun('Waves', 'namevalue', {'Sinusoids', ...
 'BigSinusoids'}, {sinusoids_ds, doubSinusoids_ds});
```

### Create a Run from Data in a File

You can also use the `Simulink.sdi.createRun` function to import data into the Simulation Data Inspector from a file. Use the `file` option to import the data in the `simusoids.mat` file.

```
runID = Simulink.sdi.createRun('Wave Data', 'file', 'sinusoids.mat');
```

### Create a Simulation Data Inspector Run and Access Signal Data

This example shows how to access signal data when you create a run in the Simulation Data Inspector.

#### Generate Data for Run

For this example, create timeseries data for sine and cosine signals.

```
% Create timeseries workspace data
time = linspace(0, 20, 101);
```

```
sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';
```

```
cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

### Create a Run and Return Signal IDs

You can use the `Simulink.sdi.createRun` syntax with multiple return arguments to get the signal IDs more directly instead of accessing the signal IDs through a `Simulink.sdi.Run` object.

```
[runID,runIndex,sigIDs] = Simulink.sdi.createRun('Sinusoids','vars',...
 sine_ts,cos_ts);
```

```
cosID = sigIDs(2);
cosSig = Simulink.sdi.getSignal(cosID);
```

### Modify Signal Properties and View in the Simulation Data Inspector

You can use the `Simulink.sdi.Signal` object to view and modify signal properties and to plot signals in the Simulation Data Inspector.

```
cosSig.Checked = true;
cosSig.AbsTol = 0.05;
Simulink.sdi.view
cosSig.Name
```

## Input Arguments

### runName — Name for run

string | character vector

Name for run in Simulation Data Inspector, specified as a string or a character vector.

Example: 'Baseline Simulation'

### var — Data to import

variable

Data to import, specified as a variable. The Simulation Data Inspector supports time-based data in which sample values are associated with sample times. The Simulation Data Inspector supports all loading and logging data formats, including `timeseries` and `Simulink.SimulationData.Dataset`.

Example: `myData`

### sourceNames — Source names for imported data

cell array of character vectors

Source names for imported data, specified as a cell array of character vectors. The source name is used to set the `RootSource`, `TimeSource`, and `DataSource` properties of the `Simulink.sdi.Signal` objects created from the data specified by the `sigValues` input.

Provide a `sourceNames` input when you specify 'namevalue' for the second argument.

Example: {'sig1','sig2'}

### **sigValues – Data to import**

cell array of variables

Data to import, specified as a cell array of variables.

Provide a `sigValues` input when you specify 'namevalue' for the second argument.

Example: {var1,var2}

### **filename – Name of file with data to import**

character vector

Name of file with data to import, specified as a character vector. Provide a `filename` input when you specify 'file' for the second argument.

You can create a run from these types of files using file readers built into the Simulation Data Inspector:

- MAT-file
- CSV file
- Microsoft Excel file that contains data formatted according to “Microsoft Excel Import, Export, and Logging Format”.
- MDF file with one of these extensions:
  - .mdf
  - .mf4
  - .mf3
  - .data
  - .dat

When you need to import data from a file that the built-in readers do not support, you can write your own reader using the `io.reader` class. You can also write a custom reader to use instead of the built-in reader for any file extension. For an example, see “Import Data Using a Custom File Reader”.

Example: 'simulation.mat'

### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, . . . , NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Example: `sheets=["sheet1" "sheet2"]`

### **reader – File reader to use to import data**

string | character vector

File reader to use to import data, specified as a string or character vector.

The Simulation Data Inspector prioritizes using a registered custom reader when one is available for the file. When you do not specify a reader, the Simulation Data Inspector uses the first custom reader

registered for the file. If no custom readers are registered, the data is imported using the built-in reader.

Specify the reader input when:

- You want to use the built-in reader to import data for a file that is also supported by a custom reader.
- Multiple registered custom readers support the file.

To determine which readers are available to import your file, use the `io.reader.getSupportedReadersForFile` function.

Example: "MyExcelReader"

Example: "built-in"

### **sheets** — Sheets in Excel file from which to import data

string array | cell array of character vectors

Sheets in Excel file from which to import data, specified as a string array or a cell array of character vectors. By default, the Simulation Data Inspector imports data from all sheets. Use the `sheets` name-value argument when you do not want to import data from all sheets in the Excel file.

When the data in the file does not include simulation numbers and source information, the data on each sheet is imported into a separate run. For more information about formatting data to import from an Excel file, see "Microsoft Excel Import, Export, and Logging Format".

Example: ["sheet1" "sheet2"]

### **model** — Model with definitions of user-defined data types

string | character vector

Model with definitions of user-defined data types, specified as a string or character vector.

When you load data from an Excel file that defines signal data types using user-defined data types, such as enumerations, buses, or aliases, the Simulation Data Inspector needs access to the type definition to import the data. You can provide access to the type definitions by:

- Loading the associated object into the MATLAB workspace.
- Specifying the `model` name-value argument to use type definitions saved in the model workspace or a data dictionary.

For more information on formatting data to import from an Excel file, see "Microsoft Excel Import, Export, and Logging Format".

Example: "myModel.slx"

## **Output Arguments**

### **runID** — Run ID for run that contains imported data

scalar

Run ID for run that contains imported data, returned as a scalar.

### **runIndex** — Run index in Simulation Data Inspector for run that contains imported data

scalar

Run index in Simulation Data Inspector for run that contains imported data, returned as a scalar.

### **sigIDs — Signal IDs for signals created from imported data**

scalar | vector

Signal IDs for signals created from imported data, returned as a scalar or a vector.

## **Version History**

## Simulink.sdi.createRunOrAddToStreamedRun

**Package:** Simulink.sdi

Create a single run for all simulation outputs

### Syntax

```
runID = Simulink.sdi.createRunOrAddToStreamedRun mdl, runName, varSources, varValues)
```

### Description

`runID = Simulink.sdi.createRunOrAddToStreamedRun mdl, runName, varSources, varValues)` creates a run with the data `varValues` if no run exists in the Simulation Data Inspector repository for the model `mdl`. If one or more runs for the model `mdl` exist in the Simulation Data Inspector repository, the function adds `varValues` to the most recent run associated with `mdl`. The run is named according to `runName`, and the sources for the data in `varValues` are named according to `varSources`.

### Examples

#### Add Signals to a Run

This example shows how to use `Simulink.sdi.createRunOrAddToStreamedRun` to add data to an existing run for a model. In this example, you add data logged using the `Structure with Time` format to a run that contains logged signal data.

#### Simulate the Model

Open the `slexAircraftExample` model and mark the output of the Pilot block for logging. The logged signal data uses the `Dataset` format and streams to the Simulation Data Inspector during simulation. The model is configured to log outputs, states, and time as well as signals. Simulate the model and return a single output in the workspace with all the logged data. Use the `Structure with Time` format for logged states and outputs.

```
load_system('slexAircraftExample')

Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,1)

out = sim('slexAircraftExample','ReturnWorkspaceOutputs','on',...
 'SaveFormat','StructureWithTime');
```

#### Add Logged States Data to Run

The Simulation Data Inspector automatically created a run for the logged signal data. Add the logged states and outputs data to the existing run using `Simulink.sdi.createRunOrAddToStreamedRun`.

```
Simulink.sdi.createRunOrAddToStreamedRun('slexAircraftExample','Run 1',...
 {'out'},{out});
```

## Open the Simulation Data Inspector to View Results

Use the `Simulink.sdi.view` function to open the Simulation Data Inspector and view the results.

Using `Simulink.sdi.createRunOrAddToStreamedRun` avoids redundancy in the data shown in the Simulation Data Inspector. When you use the `Simulink.sdi.createRun` function to import the output and states data, the Simulation Data Inspector creates a second run. When you use the `Simulink.sdi.addToRun` function to add the logged states and output data to the run, the Simulation Data Inspector imports a duplicate of the Pilot block output signal. Using `Simulink.sdi.createRunOrAddToStreamedRun`, you can include all simulation data in a single run without duplicating any signals.

## Input Arguments

### **mdl** — Name of model that created simulation data

character vector

Name of the model the simulation data is from, specified as a character vector.

Example: `'my_model'`

### **runName** — Name for the run

character vector

Name for the new or augmented run. If `Simulink.sdi.createRunOrAddToStreamedRun` adds data to an existing run, the run is renamed according to `runName`.

Example: `'Run 1'`

### **varSources** — Names to use for the sources of data

cell array of character vectors

Names for the sources of the data in `varValues`.

Example: `{'sig1','sig2'}`

### **varValues** — Data to add to run

cell array

Cell array of data to incorporate into the run. `Simulink.sdi.createRunOrAddToStreamedRun` supports data in all logging and loading formats, including `timeseries` and `Simulink.SimulationData.Dataset`.

Example: `{sig1,sig2}`

## Output Arguments

### **runID** — Run identifier

scalar

Run identifier for the new or augmented run.

## Version History

Introduced in R2017a

“View Data in the Simulation Data Inspector”

# Simulink.sdi.deleteRun

**Package:** Simulink.sdi

Delete a run from the Simulation Data Inspector repository

## Syntax

```
Simulink.sdi.deleteRun(runID)
```

## Description

`Simulink.sdi.deleteRun(runID)` deletes the run corresponding to `runID`. When you delete a run, the indices of all runs following the deleted run change to account for the change in the run count. Deleting a run does not change any run IDs.

## Examples

### Delete a Run

You can delete a run from the Simulation Data Inspector repository to free up memory space or to declutter your workspace from data you do not need.

```
% Load and simulate sldemo_fuelsys model
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')

% Get the run ID for the run
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Delete the run
Simulink.sdi.deleteRun(runID)
```

## Input Arguments

### runID — Run identifier

scalar

Run ID for the run you want to delete. You can get the run ID for a run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

## Version History

Introduced in R2011b

## See Also

`Simulink.sdi.clear` | `Simulink.sdi.copyRun` | `Simulink.sdi.deleteSignal` | `Simulink.sdi.getRunIDByIndex` | `Simulink.sdi.getAllRunIDs` | `Simulink.sdi.setArchiveRunLimit` | `Simulink.sdi.getArchiveRunLimit`

**Topics**

“Inspect and Compare Data Programmatically”

# Simulink.sdi.deleteSignal

**Package:** Simulink.sdi

Delete signal in the Simulation Data Inspector

## Syntax

```
Simulink.sdi.deleteSignal(sigID)
```

## Description

`Simulink.sdi.deleteSignal(sigID)` deletes the specified signal or signals from the Simulation Data Inspector.

## Examples

### Compare a Subset of Signals

This example shows how to use `Simulink.sdi.copyRun` and `Simulink.sdi.deleteSignal` to create a copy of a run that contains a subset of the signals from the original run. You can use the copy to analyze and run comparisons on a subset of signals while still holding onto the original run that has all of the signals. For example, the model `sldemo_fuelsys` is configured to log ten signals. To compare the system's responses to different types of failures, you don't need to run the comparison on all of the logged signals. Deleting signals that do not represent the system's response before running the comparison saves processing time and simplifies the view of the results.

### Create Runs

Load the model `sldemo_fuelsys` and run simulations to create runs in the Simulation Data Inspector. The first run simulates a failure of the throttle angle sensor, and the second run simulates a failure of the exhaust gas oxygen sensor.

```
load_system('sldemo_fuelsys')
modelWorkspace = get_param('sldemo_fuelsys','modelworkspace');
modelWorkspace.assignin('throttle_sw',0)
modelWorkspace.assignin('ego_sw',1)
sim('sldemo_fuelsys')

modelWorkspace.assignin('throttle_sw',1)
modelWorkspace.assignin('ego_sw',0)
sim('sldemo_fuelsys')
```

### Copy the Run

Use the Simulation Data Inspector's programmatic interface to get `Simulink.sdi.Run` objects for the simulations, and then create copies of the runs.

```
% Get runs
runIDs = Simulink.sdi.getAllRunIDs;
```

```
runID1 = runIDs(end-1);
runID2 = runIDs(end);

run1 = Simulink.sdi.getRun(runID1);
run2 = Simulink.sdi.getRun(runID2);

% Create a copy of each run, truncRun
[truncRun1,runIndex1,signalIDs1] = Simulink.sdi.copyRun(runID1);
[truncRun2,runIndex2,signalIDs2] = Simulink.sdi.copyRun(runID2);
```

### Delete Signals in Run Copy

The `sldemo_fuelsys` model is configured to log the values of the fault switches along with several signals representing the system's response. When you compare the system's response when a throttle angle sensor fails to its response when an exhaust gas oxygen sensor fails, comparing the fault switch states does not provide new information. Therefore, delete the switch signals before running the comparison to eliminate unnecessary computations.

```
Simulink.sdi.deleteSignal(signalIDs1(1))
Simulink.sdi.deleteSignal(signalIDs1(3))
Simulink.sdi.deleteSignal(signalIDs1(5))
Simulink.sdi.deleteSignal(signalIDs1(8))

Simulink.sdi.deleteSignal(signalIDs2(1))
Simulink.sdi.deleteSignal(signalIDs2(3))
Simulink.sdi.deleteSignal(signalIDs2(5))
Simulink.sdi.deleteSignal(signalIDs2(8))
```

### Compare Truncated Runs

You can use the truncated runs you created with `Simulink.sdi.copyRun` and `Simulink.sdi.deleteSignal` to perform a comparison of the system's response to different types of failures. Then, open the Simulation Data Inspector to view the comparison results.

```
truncRunDiff = Simulink.sdi.compareRuns(truncRun1, truncRun2);

Simulink.sdi.view
```

## Input Arguments

### **sigID** — Signal or signals to delete

scalar | vector

Signal to delete, specified as a scalar signal ID or vector of signal IDs. The Simulation Data Inspector assigns a unique numeric signal ID to each signal when a run is created for logged or imported data.

You can get the signal ID for a signal using one of these functions:

- `getAllSignalIDs`
- `getSignalIDByIndex`
- `getSignalIDsByName`
- `Simulink.sdi.createRun`

## Version History

Introduced in R2016a

### See Also

#### Objects

`Simulink.sdi.Signal` | `Simulink.sdi.Run`

#### Functions

`Simulink.sdi.copyRun` | `Simulink.sdi.createRun`

#### Topics

“Configure the Simulation Data Inspector”

“Inspect and Compare Data Programmatically”

## Simulink.sdi.DiffRunResult.getLatest

Access results from most recent comparison

### Syntax

```
diffRes = Simulink.sdi.DiffRunResult.getLatest
```

### Description

`diffRes = Simulink.sdi.DiffRunResult.getLatest` returns the `Simulink.sdi.DiffRunResult` object `diffRes` for the most recent comparison performed using the Simulation Data Inspector UI or programmatic interface.

---

**Tip** When you compare data using the Simulation Data Inspector UI, results are not returned in the workspace. You can use the `Simulink.sdi.DiffRunResult.getLatest` function to access results for comparisons performed using the Simulation Data Inspector UI. When you compare data using the `Simulink.sdi.compareRuns` or `Simulink.sdi.compareSignals` functions, the function returns the data in a `Simulink.sdi.DiffRunResult` object or a `Simulink.sdi.DiffSignalResult` object.

---

### Examples

#### Access Results for a UI Comparison

Use the `Simulink.sdi.DiffRunResult.getLatest` function to access the results of the most recent comparison to save or process further. For more information about how to compare data using the Simulation Data Inspector UI, see “Compare Simulation Data”.

```
compResults = Simulink.sdi.DiffRunResult.getLatest;
```

#### Retrieve Comparison Results in a Workspace Variable

You can use the `Simulink.sdi.getCurrentComparison` function or the `Simulink.sdi.DiffRunResult.getResult` function to retrieve the results for the most recent comparison if you accidentally delete the returned results from the workspace using the `clear` function.

If you delete the contents of the Simulation Data Inspector using the `Simulink.sdi.clear` function, you cannot recover the results.

#### Compare Simulation Data

This example creates runs to compare by running two simulations of the model `ex_vdp` with different values for `Mu`.

```
load_system('ex_vdp')
```

```
set_param('ex_vdp/Mu', 'Gain', '2');
out1 = sim('ex_vdp');
```

```
set_param('ex_vdp/Mu', 'Gain', '5');
out2 = sim('ex_vdp');
```

Use the `Simulink.sdi.getAllRunIDs` function to access the run IDs for the runs created from the simulations. Then use the `Simulink.sdi.compareRuns` function to compare the data.

```
IDs = Simulink.sdi.getAllRunIDs;
runID1 = IDs(end-1);
runID2 = IDs(end);
```

```
diffRun = Simulink.sdi.compareRuns(runID1, runID2);
```

Suppose you clear the workspace and lose the `diffRun` variable with the comparison results.

```
clear diffRun
```

### Retrieve Comparison Data in the Workspace

Use the `Simulink.sdi.getCurrentComparison` function to recover the comparison results.

```
diffRun = Simulink.sdi.getCurrentComparison
```

```
diffRun =
 DiffRunResult with properties:

 MatlabVersion: '9.13.0.2049777 (R2022b)'
 RunID1: 21076
 RunID2: 21097
 BaselineRunName: 'Run 1: ex_vdp'
 CompareToRunName: 'Run 2: ex_vdp'
 Count: 2
 DateCreated: 01-Sep-2022 11:05:48
 GlobalTolerance: [1x1 struct]
 Summary: [1x1 struct]
 Options: {'Units' 'MustMatch'}
 Status: Completed
 StopReason: []
```

You could also use the `Simulink.sdi.DiffRunResult.getLatest` function to recover the results.

```
clear diffRun
```

```
diffRun = Simulink.sdi.DiffRunResult.getLatest
```

```
diffRun =
 DiffRunResult with properties:

 MatlabVersion: '9.13.0.2049777 (R2022b)'
 RunID1: 21076
 RunID2: 21097
 BaselineRunName: 'Run 1: ex_vdp'
 CompareToRunName: 'Run 2: ex_vdp'
 Count: 2
 DateCreated: 01-Sep-2022 11:05:48
 GlobalTolerance: [1x1 struct]
```

```
Summary: [1x1 struct]
Options: {'Units' 'MustMatch'}
Status: Completed
StopReason: []
```

## Output Arguments

### **diffRes** — Results of most recent comparison

`Simulink.sdi.DiffRunResult` object

Results of the most recent comparison, returned as a `Simulink.sdi.DiffRunResult` object.

## Version History

**Introduced in R2020a**

### See Also

`Simulink.sdi.DiffRunResult` | `Simulink.sdi.DiffSignalResult` |

“Compare Simulation Data”

# Simulink.sdi.enablePCTSupport

Control when to import data from parallel simulations into the Simulation Data Inspector

## Syntax

```
Simulink.sdi.enablePCTSupport(mode)
```

## Description

`Simulink.sdi.enablePCTSupport(mode)` configures data import into the Simulation Data Inspector from parallel workers according to the mode specified by `mode`. You can configure the Simulation Data Inspector to import only data from local workers, or data from local and remote workers. You can also set the mode to manual, which allows you to manually import runs into the Simulation Data Inspector using the `Simulink.sdi.sendWorkerRunToClient` function. By default, the Simulation Data Inspector is configured for the manual import mode.

## Examples

### Enable Automatic Data Import for All Parallel Workers

Configure Simulation Data Inspector parallel worker support to import the output automatically from both local and remote workers.

```
Simulink.sdi.enablePCTSupport('all')
```

### Disable Automatic Data Import from Parallel Workers

To prevent the output from Parallel Computing Toolbox workers from automatically importing into the Simulation Data Inspector, specify the manual support mode.

```
Simulink.sdi.enablePCTSupport('manual')
```

### Manually Send Runs from Parallel Workers to the Simulation Data Inspector

This example shows how to use `Simulink.sdi.sendWorkerRunToClient` to send runs created using parallel workers manually to the Simulation Data Inspector.

#### Setup

This example runs several simulations of the `vdp` model, varying the value of the gain, `Mu`. To set up for the parallel simulation, define a vector of `Mu` values and configure the Simulation Data Inspector for manual Parallel Computing Toolbox support.

```
% Enable manual Parallel Computing Toolbox support
Simulink.sdi.enablePCTSupport('manual');
```

```
% Choose several Mu values
MuVals = [1 2 3 4];
```

### Initialize Parallel Workers

Use `parpool` (Parallel Computing Toolbox) to start a pool of four parallel workers. This example calls `parpool` inside an if statement so you only create a parallel pool if you don't already have one. You can use `spmd` (Parallel Computing Toolbox) to run initialization code common to all workers. For example, load the `vdp` model and select signals to log to runs that we can send to the Simulation Data Inspector on the client MATLAB. To avoid data concurrency issues when simulating with `sim` in `parfor`, create a temporary directory on each worker. After the simulations complete, another `spmd` block deletes the temporary directories.

```
p = gcp('nocreate');
```

```
if isempty(p)
```

```
 parpool(4);
```

```
end
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd
```

```
% Load system and select signals to log
load_system('vdp')
Simulink.sdi.markSignalForStreaming('vdp/x1',1,'on')
Simulink.sdi.markSignalForStreaming('vdp/x2',1,'on')

% Create temporary directory for simulation on worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)
```

```
end
```

### Run Parallel Simulations with parfor

To stream data from parallel workers to the Simulation Data Inspector, you have to run parallel simulations using `parfor` (Parallel Computing Toolbox). Each worker runs a `vdp` simulation with a different value of `Mu`. Simulink cannot access the contents of the `parfor` loop, so the variable `MuVal` is defined in the worker's workspace, where the `vdp` model can see it, using `assignin`.

```
parfor (index = 1:4)
```

```
% Set value of Mu in the worker's base workspace
assignin('base','MuVal',MuVals(index));

% Modify the value of Mu in the model and simulate
set_param('vdp/Mu','Gain','MuVal')
sim('vdp')
```

## Access Data and Send Run to Client MATLAB

You can use the Simulation Data Inspector programmatic interface on the worker the same way you would in the client MATLAB. This example creates a `Simulink.sdi.Run` object and attaches the value of `Mu` used in the simulation with the `Tag` property.

```
% Attach metadata to the run
IDs = Simulink.sdi.getAllRunIDs;
lastIndex = length(IDs);
runID = Simulink.sdi.getRunIDByIndex(lastIndex);
parRun = Simulink.sdi.getRun(runID);
parRun.Tag = strcat('Mu = ', num2str(MuVals(index)));

% Send the run to the Simulation Data Inspector on the client MATLAB
Simulink.sdi.sendWorkerRunToClient
```

```
end
```

## Close Temporary Directories and View Runs in the Simulation Data Inspector

Use another `spm` section to delete the temporary directories created on the workers once the simulations complete. In each simulation, `Simulink.sdi.sendWorkerRunToClient` imported runs from all the workers into the Simulation Data Inspector. You can view the data and check the run properties to see the value of `Mu` used during simulation.

```
spmd
```

```
% Remove temporary directories
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)
```

```
end
```

```
Simulink.sdi.view
```

## Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

### Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')

% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

### Initialize Parallel Workers

Use `gcp` to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd
```

```
% Load system and select signals to log
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)
```

```
end
```

### Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7
```

```
% Select value for Ts
Ts_val = Ts_vals(index);

% Change the filter time constant and simulate
modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
modelWorkspace.assignin('Ts', Ts_val)
sim('slexAircraftExample')

% Create a worker run for each simulation
workerRun(index) = Simulink.sdi.WorkerRun.getLatest
```

```
end
```

```
spmd
```

```
% Remove temporary directories
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)
```

```
end
```

## Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;

for a = 1:7
 ds(a) = workerRun(a).getDataset;
end
ds(1)

ans =
Simulink.SimulationData.Dataset '' with 2 elements
```

|                | Name       | BlockPath                                |
|----------------|------------|------------------------------------------|
| 1 [1x1 Signal] | alpha, rad | ...rcraftExample/Aircraft Dynamics Model |
| 2 [1x1 Signal] | Stick      | slexAircraftExample/Pilot                |

- Use braces { } to access, modify, or add elements using index.

## Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
 datasetRef(b) = workerRun(b).getDatasetRef;
end

datasetRef(1)

ans =
DatasetRef with properties:
 Name: 'Run 3: slexAircraftExample'
 Run: [1x1 Simulink.sdi.Run]
 numElements: 2
```

## Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local `Run` objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

 Runs(c) = workerRun(c).getLocalRun;
 Ts_val_str = num2str(Ts_vals(c));
 desc = strcat('Ts = ', Ts_val_str);
 Runs(c).Description = desc;
 Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

## Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

## Input Arguments

### mode — Parallel worker data import mode

```
'manual' (default) | 'local' | 'all'
```

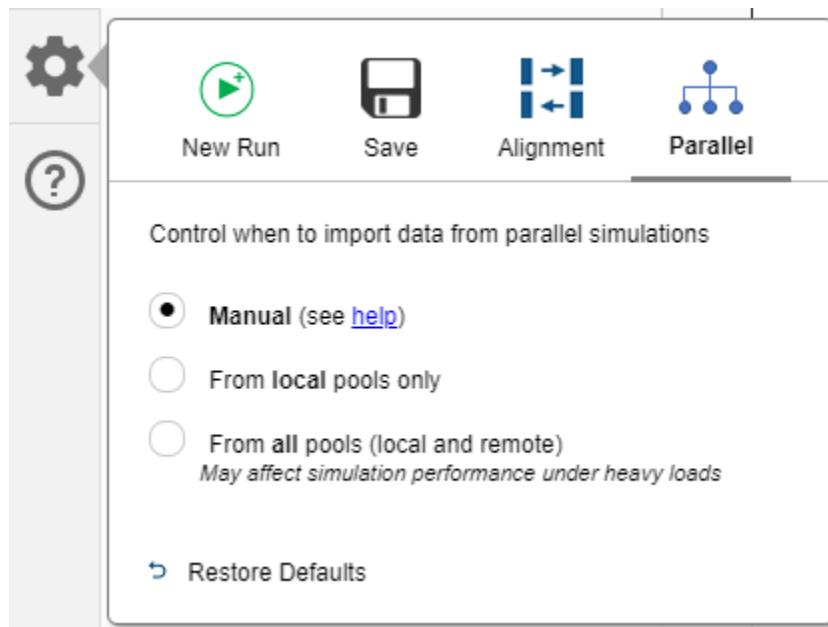

Simulation Data Inspector data import mode for data logged on parallel workers, specified as one of these options:

- 'manual' — Do not automatically import runs created on parallel workers. You can manually import runs created on parallel workers using the `Simulink.sdi.sendWorkerRunToClient` function.
- 'local' — Automatically import runs created on local workers.
- 'all' — Automatically import runs created on local and remote workers.

Data Types: char | string

## Alternative Functionality

You can modify the parallel computing support mode in the Simulation Data Inspector by selecting **Preferences > Parallel**.

## Version History

Introduced in R2017b

**'none' input is no longer supported***Errors starting in R2020a*

Starting in R2020a, the `Simulink.sdi.enablePCTSupport` function no longer supports the 'none' input option. To disable automatic import of data logged on parallel workers into the Simulation Data Inspector, use the 'manual' option.

**Logical inputs are ignored***Behavior changed in R2020a*

Starting in R2020a, the `Simulink.sdi.enablePCTSupport` function ignores logical inputs. In scripts that specify a logical input for the `Simulink.sdi.enablePCTSupport` function, replace a `0` or `false` input with the 'manual' input option and a `1` or `true` input with the 'all' option to achieve equivalent behavior.

**Input values have changed***Behavior changed in R2018a*

Starting in R2018a, the `Simulink.sdi.enablePCTSupport` input values changed to:

- 'local'
- 'none'
- 'all'
- 'manual'

In R2017b, the `Simulink.sdi.enablePCTSupport` function accepted a logical input to enable or disable Simulation Data Inspector support for data logged in parallel simulations.

- `true` or `1` enables support for automatically importing data from all parallel workers into the Simulation Data Inspector.

In R2018a, use the 'all' option for the same behavior. You can also use the new 'local' input when you want to automatically import data only from local workers.

- `false` or `0` disables all support for importing data logged on parallel workers.

In R2018a, use the 'none' option for the same behavior. You can also use the new 'manual' option when you want to analyze data on the worker to determine whether you want to import individual runs into the Simulation Data Inspector from a parallel worker.

## Simulink.sdi.exportRun

Export Simulation Data Inspector run data to the workspace or a file

### Syntax

```
dataset = Simulink.sdi.exportRun(runID)
Simulink.sdi.exportRun(runID,Name,Value)
```

### Description

`dataset = Simulink.sdi.exportRun(runID)` creates a `Simulink.SimulationData.Dataset` object in the base workspace with the data in the Simulation Data Inspector run identified by `runID`.

`Simulink.sdi.exportRun(runID,Name,Value)` exports the data in the run corresponding to `runID` to the base workspace or a file according to the options specified by one or more name-value pair arguments. You can export data for one or more runs to a MAT, MLDATX, or Microsoft Excel file. To export data for multiple runs to a file, you can specify the `runIDs` input as a vector of run IDs.

### Examples

#### Export Run Data

This example shows how to export data from a run in the Simulation Data Inspector to a `Simulink.SimulationData.Dataset` object in the base workspace that you can use to further process your data. The method you choose to export your run depends on the processing you do in your script. If you have a run object for the run, you can use the `export` method to create a `Simulink.SimulationData.Dataset` object with the run data in the base workspace. If you do not have a run object, use the `Simulink.sdi.exportRun` function to export the run to the workspace.

#### Export Run Using Simulink.sdi.exportRun

Use the `Simulink.sdi.export` function to export run data to the workspace or a file when your workflow does not include creating a run object.

To create a run of simulation data, open the `vdp` model, mark signals for logging, and run a simulation.

```
load_system('vdp')

SignalHandles = get_param('vdp', 'Lines');

Simulink.sdi.markSignalForStreaming(SignalHandles(5).Handle, 'on')
Simulink.sdi.markSignalForStreaming(SignalHandles(6).Handle, 'on')

out = sim('vdp');
```

Use the `Simulink.sdi.getAllRunIDs` function to access the most recently created run.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Use the `Simulink.sdi.exportRun` function to export the run data to a `Dataset` object in the workspace.

```
simDataset = Simulink.sdi.exportRun(runID);
```

### Export Run Using the export Function

When your task involves creating a Run object, you can use the `export` function to create a `Simulink.SimulationData.Dataset` object in the base workspace to further process the run data. For example, suppose you need to access Run objects for simulation runs with signal data you want to compare using the `Simulink.sdi.compareSignals` function.

Load a model and mark signals for logging. Then simulate the model to create run data.

```
load_system('vdp')

SignalHandles = get_param('vdp', 'Lines');

Simulink.sdi.markSignalForStreaming(SignalHandles(5).Handle, 'on')
Simulink.sdi.markSignalForStreaming(SignalHandles(6).Handle, 'on')

sim('vdp');
```

Use the `Simulink.sdi.getAllRunIDs` function to access the run ID for the most recently created run. Then, use the `Simulink.sdi.getRun` function to access the Run object corresponding to the run.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
vdpRun = Simulink.sdi.getRun(runID);
```

Use the `export` function to export the run data to a `Dataset` object in the workspace.

```
simDataset = export(vdpRun);
```

## Input Arguments

### runID — Run identifier

scalar | vector

Run identifier for the run you want to export to the workspace or a file. When you export data to a file, you can export more than one run by specifying the `runID` input as a vector of Simulation Data Inspector run IDs.

The Simulation Data Inspector assigns a unique run ID to each run. You can get the run ID for one or more runs using `Simulink.sdi.getAllRunIDs` and `Simulink.sdi.getRunIDByIndex`.

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: 'to', 'file'

### **to — Where to export data**

'variable' (default) | 'file'

Where to export data, specified as the comma-separated pair consisting of 'to' and 'variable' or 'file'.

When you export data to a file, you must also specify a file name using the 'filename' name-value pair argument. You can specify a file name with a .mat, .mlatx, or .xlsx extension.

When you export a run to a MAT-file, the data is saved in a `Simulink.SimulationData.Dataset` object. When you export more than one run to a MAT-file using the `Simulink.sdi.exportRun` function, the data is saved in a `Dataset` object, where each element is a `Dataset` object that contains the data for one exported run.

Data exported to a Microsoft Excel file is saved using the format described in “Microsoft Excel Import, Export, and Logging Format”.

When you export data to a Microsoft Excel file, you can specify additional options using the 'overwrite', 'metadata', and 'sharetimecolumn' name-value pairs.

Example: 'to', 'file'

### **filename — Name of file to contain exported data**

string | character array

Name of the file to contain the exported data, specified as the comma-separated pair consisting of 'filename' and a string or character array. Include a .mat, .mlatx, or .xlsx extension in the file name to specify whether to export the data to a MAT-file, MLATX file, or a Microsoft Excel file. When you do not specify an extension with a file name, the data exports to a MAT-file.

Use the 'filename' name-value pair argument when you specify the 'to' name-value pair argument with the value 'file'.

When you export data to a Microsoft Excel file, you can specify additional options using the 'overwrite', 'metadata', and 'sharetimecolumn' name-value pair arguments.

Example: 'filename', "mySpreadsheet.xlsx"

### **overwrite — Data to overwrite in existing Microsoft Excel file**

'file' (default) | 'sheetonly'

Data to overwrite in existing Microsoft Excel file, specified as the comma-separated pair consisting of 'overwrite' and 'file' or 'sheetonly'.

- 'file' — Overwrite the entire file with the exported data.
- 'sheetonly' — Only overwrite sheets of the Microsoft Excel file with data that corresponds to the exported data.

When you export data to an existing MAT-file or MLATX file, the exported data overwrites the entire file.

Example: 'overwrite', 'sheetonly'

**metadata — Metadata to include in exported Microsoft Excel file**

[] (default) | string array

Metadata to include in the exported Microsoft Excel file, specified as the comma-separated pair consisting of 'metadata' and a string array. By default, the export operation does not include any metadata. You can export this metadata to the Microsoft Excel file:

- `dataType` — Signal data type
- `units` — Signal units
- `blockPath` — Path to the source block for logged signals
- `interp` — Signal interpolation method
- `portIndex` — Index of the port on the source block for logged signals

You can specify the desired metadata in any order you choose in the string array. The order of the metadata in the string array does not affect the format in the exported file, which always matches the description in “Microsoft Excel Import, Export, and Logging Format”.

Example: 'metadata', ["units", "dataType"]

**sharetimecolumn — Whether signals share time columns in exported Microsoft Excel file**

'on' (default) | 'off'

Whether signals that have identical time data share time columns in the exported Microsoft Excel file, specified as the comma-separated pair consisting of 'sharetimecolumn' and 'on' or 'off'. By default, signals with the same time data share a time column in the exported file. When you specify the value as 'off', each signal in the exported file has its own time column.

Example: 'sharetimecolumn', 'off'

**Output Arguments****dataset — Dataset containing run data**

Simulink.SimulationData.Dataset

Simulink.SimulationData.Dataset object containing the data from the run identified by runID.

**Version History**

Introduced in R2017a

## Simulink.sdi.getAllRunIDs

**Package:** Simulink.sdi

Get all Simulation Data Inspector run identifiers

### Syntax

```
runIDs = Simulink.sdi.getAllRunIDs
```

### Description

`runIDs = Simulink.sdi.getAllRunIDs` returns a matrix of the run identifiers for all runs in the Simulation Data Inspector repository.

### Examples

#### Get Simulation Data Inspector Run IDs

Many tasks performed using the Simulation Data Inspector programmatic interface start with obtaining the run ID for a simulation run. This example illustrates several methods to get the run ID for a run. You can use the run ID to access the `Simulink.sdi.Run` object that contains the run data and metadata and perform run comparisons using the `Simulink.sdi.compareRuns` function.

#### Create a Run

The model `sldemo_fuelsys` is already configured for logging. When you simulate the model, the Simulation Data Inspector automatically creates a run and assigns it a run ID.

```
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')
```

#### Get Run ID Using Simulink.sdi.getAllRunIDs

The `Simulink.sdi.getAllRunIDs` function returns an array of all run IDs for the runs in the Simulation Data Inspector repository, in order, with the most recently created run at the end.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

#### Get Run ID Using Simulink.sdi.getRunIDByIndex

You can also use the `Simulink.sdi.getRunCount` and `Simulink.sdi.getRunIDByIndex` functions to get the run ID for a run. This method is useful if you also want to use `count` as a counting variable to index through the runs in the Simulation Data Inspector repository.

```
count = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(count);
```

#### Get Run ID from a Simulink.sdi.Run Object

You can also get the run ID from the `Simulink.sdi.Run` object that corresponds to the run. This example uses the `Simulink.sdi.getCurrentSimulationRun` function to get the Run object that

corresponds to the most recent simulation of the `sldemo_fuelsys` model. You can also use the `Simulink.sdi.Run.getLatest` function to access the most recently created Run object.

```
fuelsysRun = Simulink.sdi.getCurrentSimulationRun('sldemo_fuelsys');
runID = fuelsysRun.ID;
```

## Output Arguments

### **runIDs — Matrix of Simulation Data Inspector run IDs**

matrix

Matrix of run IDs in the Simulation Data Inspector repository.

## Version History

**Introduced in R2017a**

## Simulink.sdi.appendRunToTop

Get order in which Simulation Data Inspector appends run in work area or archive

### Syntax

```
ord = Simulink.sdi.appendRunToTop
```

### Description

`ord = Simulink.sdi.appendRunToTop` returns a logical value that indicates whether the Simulation Data Inspector appends a new run above or below prior runs in the archive or work area.

- 1 — New runs are placed above prior runs in the work area or archive.
- 0 — New runs are placed below prior runs in the work area or archive.

Whether the `Simulink.sdi.appendRunToTop` function gets the order of simulations in the archive or the work area is determined by the **Automatically archive** setting:

- When **Automatically archive** is enabled, the setting applies to runs in the archive.
- When **Automatically archive** is disabled, the setting applies to runs in the work area.

By default, new runs are placed below prior runs in the archive. For more information about configuring the archive behavior, see `Simulink.sdi.setAutoArchiveMode`.

### Examples

#### Change Order and Location of Runs

First, determine the order that runs are currently stored in the archive.

```
ord = Simulink.sdi.appendRunToTop
```

```
ord = logical
 0
```

By default, runs moved into the archive are placed below runs already in the archive. To have runs placed above the runs already in the archive, change the value of the `Simulink.sdi.appendRunToTop` function.

```
Simulink.sdi.appendRunToTop(true)
```

You can restore the original placement of runs as they move to the archive by passing `ord` back to the set function.

```
Simulink.sdi.appendRunToTop(ord)
```

## Output Arguments

**ord** — Whether Simulation Data Inspector appends new runs to top of work area or archive  
true or 1 | false or 0

Whether Simulation Data Inspector appends new runs to top of work area or archive, returned as logical 1 (true) or 0 (false).

## Version History

Introduced in R2022b

### See Also

### Topics

“Configure the Simulation Data Inspector”

## Simulink.sdi.getArchiveRunLimit

Get limit for number of runs to retain in Simulation Data Inspector archive

### Syntax

```
limit = Simulink.sdi.getArchiveRunLimit
```

### Description

`limit = Simulink.sdi.getArchiveRunLimit` returns the limit on the number of runs the Simulation Data Inspector retains in the archive. A return of -1 indicates no limit on the number of runs.

When you run multiple simulations in a single MATLAB session, the Simulation Data Inspector retains results from each simulation so you can analyze the results together. Use the Simulation Data Inspector archive to manage the number of runs the Simulation Data Inspector retains and to visually manage runs in the user interface.

---

**Tip** To automatically limit the number of runs, configure the Simulation Data Inspector to automatically move prior runs into the archive using the `Simulink.sdi.setAutoArchiveMode` function and specify the archive run limit.

For information about how to control the amount of data logged from simulation, see “Limit the Size of Logged Data”.

---

### Examples

#### Stop Retaining Data in Simulation Data Inspector

You can configure the Simulation Data Inspector to retain only the logged data for your current simulation. In iterative design and debugging workflows, this configuration helps prevent the accumulation of unwanted logged data on disk.

First, check the configuration of the Simulation Data Inspector archive. Save the archive preference values to restore your preferences after you finish designing or debugging.

```
limit = Simulink.sdi.getArchiveRunLimit;
mode = Simulink.sdi.getAutoArchiveMode;
```

Configure the Simulation Data Inspector to automatically move runs into the archive. Then, set the archive run limit to 0.

```
Simulink.sdi.setAutoArchiveMode(true)
Simulink.sdi.setArchiveRunLimit(0)
```

When you simulate your model, the Simulation Data Inspector deletes the previous run and updates the view to show signals from the current simulation.

When you finish designing or debugging your model, you can restore the Simulation Data Inspector archive to the previous configuration.

```
Simulink.sdi.setArchiveRunLimit(limit)
Simulink.sdi.setAutoArchiveMode(mode)
```

## Output Arguments

**limit** — Maximum number of runs to store in Simulation Data Inspector archive

numeric scalar

Maximum number of runs to store in Simulation Data Inspector archive, returned as a numeric scalar. A value of -1 indicates no limit on the number of runs to retain in the archive.

## Version History

Introduced in R2018b

### See Also

## Simulink.sdi.getAutoArchiveMode

Get Simulation Data Inspector run management mode

### Syntax

```
archive = Simulink.sdi.getAutoArchiveMode
```

### Description

`archive = Simulink.sdi.getAutoArchiveMode` returns a logical value that indicates whether the Simulation Data Inspector automatically manages runs using the archive.

- 1 — When you start a new simulation, the Simulation Data Inspector automatically moves the prior simulation run into the archive. In the user interface, the run moves into the collapsible **Archive** pane, and plots update to show data from the current simulation.
- 0 — The Simulation Data Inspector does not manage runs automatically with the archive or update plots.

### Examples

#### Stop Retaining Data in Simulation Data Inspector

You can configure the Simulation Data Inspector to retain only the logged data for your current simulation. In iterative design and debugging workflows, this configuration helps prevent the accumulation of unwanted logged data on disk.

First, check the configuration of the Simulation Data Inspector archive. Save the archive preference values to restore your preferences after you finish designing or debugging.

```
limit = Simulink.sdi.getArchiveRunLimit;
mode = Simulink.sdi.getAutoArchiveMode;
```

Configure the Simulation Data Inspector to automatically move runs into the archive. Then, set the archive run limit to 0.

```
Simulink.sdi.setAutoArchiveMode(true)
Simulink.sdi.setArchiveRunLimit(0)
```

When you simulate your model, the Simulation Data Inspector deletes the previous run and updates the view to show signals from the current simulation.

When you finish designing or debugging your model, you can restore the Simulation Data Inspector archive to the previous configuration.

```
Simulink.sdi.setArchiveRunLimit(limit)
Simulink.sdi.setAutoArchiveMode(mode)
```

## Output Arguments

**archive** — Whether Simulation Data Inspector automatically manages runs using archive

true or 1 | false or 0

Whether Simulation Data Inspector automatically manages runs using archive, returned as logical 1 (true) or 0 (false).

## Version History

Introduced in R2018b

## Simulink.sdi.getBorderOn

Get border display setting for time plots

### Syntax

```
border = Simulink.sdi.getBorderOn
```

### Description

`border = Simulink.sdi.getBorderOn` returns the current setting for whether borders are displayed on time plots in the Simulation Data Inspector. The return value corresponds to the value of the **Show border** setting on the **Time Plot** section of the **Visualization Settings** in the Simulation Data Inspector. The setting applies to all time plots in the layout. By default, the Simulation Data Inspector displays the border on time plots.

### Examples

#### Configure Time Plot Border Display

You can use the `Simulink.sdi.setBorderOn` function to show or hide the border on time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector shows the border on time plots.

This example starts by showing how to use the `Simulink.sdi.getBorderOn` function to determine whether the border is currently displayed. Subsequent sections show the code to hide and show the border. To show the result, the example generates an image using the `Simulink.sdi.snapshot` function with settings specified by a `Simulink.sdi.CustomSnapshot` object.

```
snapSettings = Simulink.sdi.CustomSnapshot;
snapSettings.Width = 300;
snapSettings.Height = 300;
```

#### Get Current Border Display Setting

Before modifying the border display setting for time plots, you can save the current setting to a variable in the workspace in case you want to restore the preference later.

```
border = Simulink.sdi.getBorderOn;
```

#### Hide the Border on Time Plots

```
Simulink.sdi.setBorderOn(false)
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

### Show the Border on Time Plots

```
Simulink.sdi.setBorderOn(true)
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

## Output Arguments

### **border** — Border display setting for time plots

true or 1 | false or 0

Border display setting for time plots in the Simulation Data Inspector, returned as true (1) or false (0).

- true or 1 — Border displayed for time plots.
- false or 0 — Border hidden for time plots.

## Version History

Introduced in R2019b

“Create Plots Using the Simulation Data Inspector”

# Simulink.sdi.getCurrentComparison

Access results from most recent comparison

## Syntax

```
diffRes = Simulink.sdi.getCurrentComparison
```

## Description

`diffRes = Simulink.sdi.getCurrentComparison` returns the `Simulink.sdi.DiffRunResult` object `diffRes` for the most recent comparison performed using the Simulation Data Inspector UI or programmatic interface.

---

**Tip** When you compare data using the Simulation Data Inspector UI, results are not returned in the workspace. You can use the `Simulink.sdi.getCurrentComparison` function to access results for comparisons performed using the Simulation Data Inspector UI. When you compare data using the `Simulink.sdi.compareRuns` or `Simulink.sdi.compareSignals` functions, the function returns the data in a `Simulink.sdi.DiffRunResult` object or a `Simulink.sdi.DiffSignalResult` object.

---

## Examples

### Access Results for a UI Comparison

Use the `Simulink.sdi.getCurrentComparison` function to access the results of the most recent comparison to save or process further. For more information about how to compare data using the Simulation Data Inspector UI, see “Compare Simulation Data”.

```
compResults = Simulink.sdi.getCurrentComparison;
```

### Retrieve Comparison Results in a Workspace Variable

You can use the `Simulink.sdi.getCurrentComparison` function or the `Simulink.sdi.DiffRunResult.getResult` function to retrieve the results for the most recent comparison if you accidentally delete the returned results from the workspace using the `clear` function.

If you delete the contents of the Simulation Data Inspector using the `Simulink.sdi.clear` function, you cannot recover the results.

### Compare Simulation Data

This example creates runs to compare by running two simulations of the model `ex_vdp` with different values for `Mu`.

```
load_system('ex_vdp')
```

```
set_param('ex_vdp/Mu', 'Gain', '2');
out1 = sim('ex_vdp');

set_param('ex_vdp/Mu', 'Gain', '5');
out2 = sim('ex_vdp');
```

Use the `Simulink.sdi.getAllRunIDs` function to access the run IDs for the runs created from the simulations. Then use the `Simulink.sdi.compareRuns` function to compare the data.

```
IDs = Simulink.sdi.getAllRunIDs;
runID1 = IDs(end-1);
runID2 = IDs(end);

diffRun = Simulink.sdi.compareRuns(runID1, runID2);
```

Suppose you clear the workspace and lose the `diffRun` variable with the comparison results.

```
clear diffRun
```

### Retrieve Comparison Data in the Workspace

Use the `Simulink.sdi.getCurrentComparison` function to recover the comparison results.

```
diffRun = Simulink.sdi.getCurrentComparison

diffRun =
 DiffRunResult with properties:

 MatlabVersion: '9.13.0.2049777 (R2022b)'
 RunID1: 21076
 RunID2: 21097
 BaselineRunName: 'Run 1: ex_vdp'
 CompareToRunName: 'Run 2: ex_vdp'
 Count: 2
 DateCreated: 01-Sep-2022 11:05:48
 GlobalTolerance: [1x1 struct]
 Summary: [1x1 struct]
 Options: {'Units' 'MustMatch'}
 Status: Completed
 StopReason: []
```

You could also use the `Simulink.sdi.DiffRunResult.getLatest` function to recover the results.

```
clear diffRun

diffRun = Simulink.sdi.DiffRunResult.getLatest

diffRun =
 DiffRunResult with properties:

 MatlabVersion: '9.13.0.2049777 (R2022b)'
 RunID1: 21076
 RunID2: 21097
 BaselineRunName: 'Run 1: ex_vdp'
 CompareToRunName: 'Run 2: ex_vdp'
 Count: 2
 DateCreated: 01-Sep-2022 11:05:48
 GlobalTolerance: [1x1 struct]
```

```
Summary: [1x1 struct]
Options: {'Units' 'MustMatch'}
Status: Completed
StopReason: []
```

## Output Arguments

### **diffRes** — Results of most recent comparison

`Simulink.sdi.DiffRunResult` object

Results of the most recent comparison, returned as a `Simulink.sdi.DiffRunResult` object.

## Version History

**Introduced in R2020a**

### See Also

`Simulink.sdi.DiffRunResult` | `Simulink.sdi.DiffSignalResult` |  
`Simulink.sdi.compareRuns`

### Topics

“Compare Simulation Data”

## Simulink.sdi.getCurrentSimulationRun

Access data for in-progress or most recently completed simulation

### Syntax

```
runObj = Simulink.sdi.getCurrentSimulationRun mdl
```

### Description

`runObj = Simulink.sdi.getCurrentSimulationRun(mdl)` returns the `Simulink.sdi.Run` object that corresponds to the in-progress or most recently completed simulation of the model specified by `mdl`. If you delete the Run object that corresponds to the most recently completed simulation, the `Simulink.sdi.getCurrentSimulationRun` function returns empty.

### Examples

#### Access Simulation Data Inspector Runs

Many tasks performed using the Simulation Data Inspector programmatic interface start by accessing the `Simulink.sdi.Run` object that corresponds to the logged or imported data you want to analyze. For example, you can use the Run object to access the `Simulink.sdi.Signal` objects that correspond to individual signals in the run.

This example shows how to access Run objects by using the `Simulink.sdi.Run.getLatest` function, the `Simulink.sdi.getCurrentSimulationRun` function, or the `Simulink.sdi.getRun` function.

#### Create a Run

The model `sldemo_fuelsys` is already configured for logging. When you simulate the model, the Simulation Data Inspector automatically creates a run and assigns it a run ID.

```
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')
```

#### Get Run Object Using Simulink.sdi.Run.getLatest

In this example, the run created when you simulated the model is the most recently created run in the Simulation Data Inspector. When you want to access the most recently created run, use the `Simulink.sdi.Run.getLatest` function.

```
fuelsysRun = Simulink.sdi.Run.getLatest;
```

#### Get Run Object Using Simulink.sdi.getCurrentSimulationRun

The run you want to access may not be the most recently created run in the Simulation Data Inspector. If the run corresponds to the most recent simulation of a model, you can use the `Simulink.sdi.getCurrentSimulationRun` function to access the Run object. You can also use the `Simulink.sdi.getCurrentSimulationRun` function to access data for an in-progress

simulation when the simulation streams data to the Simulation Data Inspector. This function can be useful when you are working with multiple models.

In this example, the run created when you simulated the model is the current simulation run for the `sldemo_fuelsys` model.

```
fuelsysRun = Simulink.sdi.getCurrentSimulationRun('sldemo_fuelsys');
```

### Get Run Object from a Run ID

When your task also requires the run ID, you can use the `Simulink.sdi.getRun` function to get the corresponding `Simulink.sdi.Run` object that contains the run data and metadata.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
fuelsysRun = Simulink.sdi.getRun(runID);
```

## Input Arguments

### **mdl** — Model name

string | character vector

Name of the model that created the simulation data you want to access, specified as a string or character array.

Example: `'vdp'`

Data Types: `char` | `string`

## Output Arguments

### **runObj** — Simulink.sdi.Run object for the in-progress or most recently completed simulation

`Simulink.sdi.Run` object

`Simulink.sdi.Run` object that corresponds to the in-progress or most recently completed simulation.

## Tips

- You can use the `Simulink.sdi.getCurrentSimulationRun` function to access logged data in a `StopFcn` model callback function. Workspace variable data is not available when the `StopFcn` callback executes, but the `Run` object is available because data streams to the Simulation Data Inspector.
- You can use the `Simulink.sdi.getCurrentSimulationRun` function to analyze run data on parallel workers to determine whether to send the run data to the Simulation Data Inspector.

## Version History

Introduced in R2020a

# Simulink.sdi.getCursorPositions

Get position for active cursors in the Simulation Data Inspector

## Syntax

```
t1 = Simulink.sdi.getCursorPositions
t1 = Simulink.sdi.getCursorPositions(view)
[t1,t2] = Simulink.sdi.getCursorPositions
[t1,t2] = Simulink.sdi.getCursorPositions(view)
```

## Description

`t1 = Simulink.sdi.getCursorPositions` returns the value of the leftmost active cursor in the **Inspect** pane of the Simulation Data Inspector. Assign the return to a single output when one cursor is active.

`t1 = Simulink.sdi.getCursorPositions(view)` returns the value of the leftmost active cursor in the **Inspect** or **Compare** pane of the Simulation Data Inspector according to `view`. Assign the return to a single output when one cursor is active.

`[t1,t2] = Simulink.sdi.getCursorPositions` returns the positions of the active cursors in the **Inspect** pane of the Simulation Data Inspector.

`[t1,t2] = Simulink.sdi.getCursorPositions(view)` returns the positions of the active cursors in the **Inspect** or **Compare** pane of the Simulation Data Inspector according to `view`.

## Examples

### Programmatically Interact with Cursors in the Simulation Data Inspector

You can use the Simulation Data Inspector programmatic interface to specify the position of cursors on time plots or sparklines and to access the time that corresponds to the current cursor position.

Open the session file `vdp_mu.mldatx` to add plot data in the Simulation Data Inspector. The session file contains data for a 20-second simulation of a model of the Van Der Pol equation, with signals `x1` and `x2` plotted on separate subplots in a 2-by-1 subplot layout.

```
open vdp_mu.mldatx;
```

Use the `Simulink.sdi.setNumCursors` function to add one cursor to the plot.

```
Simulink.sdi.setNumCursors(1);
```

Suppose you want to know the signal values 5 seconds into the simulation. Use the `Simulink.sdi.setCursorPositions` function to move the cursor to `t=5s` and read the signal values off from the cursor on each subplot. The asterisk next to the value in the cursor label indicates that the value is interpolated because the simulation did not include a calculation for a simulation time of exactly 5s.

```
Simulink.sdi.setCursorPositions('left',5);
```

Suppose you want to calculate the time between two peaks in the x2 signal. Add a second cursor using the `Simulink.sdi.setNumCursors` function or by using Show/hide data cursors  in the Simulation Data Inspector.

```
numCursors = Simulink.sdi.getNumCursors;
if(numCursors < 2)
 Simulink.sdi.setNumCursors(2);
end
```

Drag the cursors so the left cursor is positioned at the first peak in the x2 signal and the right cursor is positioned at the second peak. Alternatively, you can run this code that positions the cursors for you.

```
Simulink.sdi.setCursorPositions('left',5.921998549931304,...
 'right',12.378442136906246);
```

The Simulation Data Inspector displays the difference between the two cursors in seconds. However, the cursor position and difference values are both rounded. Use the `Simulink.sdi.getCursorPositions` function to programmatically retrieve the exact time values that correspond to the cursor positions. Then, compute the difference between the times.

```
[t1,t2] = Simulink.sdi.getCursorPositions;
T = t2 - t1
```

```
T = 6.4564
```

## Input Arguments

**view** — Plot area on which to return cursor positions

'inspect' (default) | 'compare'

Plot area for which to return cursor positions, specified as 'inspect' or 'compare'.

Example: `[t1,t2] = Simulink.sdi.getCursorPositions('compare')` returns the positions of two cursors on the **Compare** pane of the Simulation Data Inspector.

Data Types: char | string

## Output Arguments

### **t1 — Left cursor position**

scalar

Left cursor position, returned as a scalar. When no cursors are active in the plot area specified by `view`, the value for `t1` is returned as `NaN`.

Cursor identities are relative, not absolute. If the left cursor moves to the right of the right cursor, the left cursor becomes the right cursor and vice versa.

### **t2 — Right cursor position**

scalar

Right cursor position, returned as a scalar. When fewer than two cursors are active in the plot area specified by `view`, the value for `t1` is returned as `NaN`.

Cursor identities are relative, not absolute. If the left cursor moves to the right of the right cursor, the left cursor becomes the right cursor and vice versa.

# Simulink.sdi.getDeleteRunsOnLowSpace

Get configured behavior when size of logged data approaches configured limits

## Syntax

```
deleteRuns = Simulink.sdi.getDeleteRunsOnLowSpace
```

## Description

`deleteRuns = Simulink.sdi.getDeleteRunsOnLowSpace` returns the configured behavior for when the size of logged data approaches a configured size limit or free disk space requirement. When `deleteRuns` is `true`, logged data from prior simulations is deleted first to free space for continued logging in the current simulation. If deleting prior simulation data does not free enough disk space to continue logging through the end of the current simulation, recording data is disabled. When `deleteRuns` is `false`, recording data from the current simulation is disabled and no logged data from prior simulations is deleted.

## Examples

### Get Configured Logging Size Limits

You can limit the size of logged data by specifying a maximum size for the data or a minimum amount of disk space to leave empty. This example uses several functions to get the current configuration of logging size limits.

Use the `Simulink.sdi.getRequiredFreeSpace` function to get the configured minimum free disk space requirement. The returned value uses units of GB.

```
minDiskSpace = Simulink.sdi.getRequiredFreeSpace;
```

Use the `Simulink.sdi.getMaxDiskUsage` function to get the configured maximum size for data logged to disk. The returned value uses units of GB.

```
maxSize = Simulink.sdi.getMaxDiskUsage;
```

Use the `Simulink.sdi.getDeleteRunsOnLowSpace` function to get the configured behavior when approaching the logging limits. When `deleteRuns` is `true`, data from prior simulations is deleted first to free disk space for continued logging in the current simulation. If deleting runs does not free up enough space, recording logged data is disabled for the current simulation. When `deleteRuns` is `false`, recording logged data is disabled for the current simulation and data from prior simulations is retained.

```
deleteRuns = Simulink.sdi.getDeleteRunsOnLowSpace;
```

## Output Arguments

**deleteRuns** — Behavior when logged data size approaches configured limits

1 | 0

Behavior when logged data size approaches configured limits, returned as 1 (`true`) or 0 (`false`).

- `true` — First delete data logged from prior simulations. If deleting prior simulation data does not free enough space, disable recording data.
- `false` — Disable recording data for current simulation. Do not delete prior simulation data.

When recording is disabled due to configured disk space requirements or logged data size limits, you need to enable recording again to log data in subsequent simulations. You can configure the record mode in the Simulation Data Inspector preferences or by using the `Simulink.sdi.setRecordData` function.

# Simulink.sdi.getGridOn

**Package:** Simulink.sdi

Determine grid configuration for time plots

## Syntax

```
grid = Simulink.sdi.getGridOn
```

## Description

`grid = Simulink.sdi.getGridOn` returns the grid configuration for time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector shows horizontal and vertical grid lines.

## Examples

### Configure Grid for Time Plots in the Simulation Data Inspector

You can use `Simulink.sdi.setGridOn` to configure the appearance of the grid for time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector shows horizontal and vertical grid lines.

This example starts by showing how to use `Simulink.sdi.getGridOn` to access the current grid configuration. The subsequent sections show the code for each configuration option for time plot grid in the Simulation Data Inspector. To see the result, the example uses a `Simulink.sdi.CustomSnapshot` object to specify settings for the output of the `Simulink.sdi.snapshot` function.

```
snapSettings = Simulink.sdi.CustomSnapshot;
snapSettings.Width = 300;
snapSettings.Height = 300;
```

### Get Initial Grid Setting

Before modifying the grid display preferences, you can save the current configuration to a variable in the workspace in case you want to restore the preferences later.

```
gridInit = Simulink.sdi.getGridOn;
```

### Configure Horizontal Grid Lines

Show only horizontal grid lines in the Simulation Data Inspector.

```
Simulink.sdi.setGridOn('horizontal')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

### Configure Vertical Grid Lines

Show only vertical grid lines in the Simulation Data Inspector.

```
Simulink.sdi.setGridOn('vertical')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

### Configure No Grid Lines

Show no grid lines in the Simulation Data Inspector.

```
Simulink.sdi.setGridOn('off')
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

### Configure Horizontal and Vertical Grid Lines

Show horizontal and vertical grid lines in the Simulation Data Inspector.

```
Simulink.sdi.setGridOn('on')
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

## Output Arguments

### **grid** — Time plot grid configuration

'on' (default) | 'horizontal' | 'vertical' | 'off'

Grid configuration for time plots in the Simulation Data Inspector.

- 'on' — Horizontal and vertical grid lines are shown on time plots in the Simulation Data Inspector.
- 'horizontal' — Only horizontal grid lines are shown on time plots in the Simulation Data Inspector.
- 'vertical' — Only vertical grid lines are shown on time plots in the Simulation Data Inspector.
- 'off' — No grid lines are shown on time plots in the Simulation Data Inspector.

## Version History

**Introduced in R2019a**

### **Simulink.sdi.getGridOn return values have changed**

*Behavior changed in R2019b*

Starting in R2019b, the `Simulink.sdi.getGridOn` return values changed to:

- 'on'
- 'horizontal'

- 'vertical'
- 'off'

In R2019a, the `Simulink.sdi.getGridOn` returned a logical value:

- `true` or `1` — Horizontal and vertical grid lines are shown on time plots in the Simulation Data Inspector.
- `false` or `0` — Horizontal and vertical grid lines are hidden on time plots in the Simulation Data Inspector.

Starting in R2019b, the 'on' return value is equivalent to the `true` or `1` return, and the 'off' return value is equivalent to the `false` or `0` return.

# Simulink.sdi.getMarkersOn

**Package:** Simulink.sdi

Determine if data markers are shown in the Simulation Data Inspector

## Syntax

```
markersOn = Simulink.sdi.getMarkersOn
```

## Description

`markersOn = Simulink.sdi.getMarkersOn` returns a logical value indicating whether data markers are displayed on plots in the Simulation Data Inspector.

## Examples

### Store Marker State

You can check and store the value of the **Show markers** setting in the Simulation Data Inspector from the command window or in a script.

```
markersOn = Simulink.sdi.getMarkersOn;
```

## Output Arguments

**markersOn** — Logical indication of marker state

false or 0 (default) | true or 1

Logical indication of whether markers are displayed on plots in the Simulation Data Inspector.

- true or 1 indicates that markers are displayed.
- false or 0 indicates that markers are not displayed.

## Version History

Introduced in R2017b

## Simulink.sdi.getMaxDiskUsage

Get configured maximum size for data logged to disk

### Syntax

```
maxSize = Simulink.sdi.getMaxDiskUsage
```

### Description

`maxSize = Simulink.sdi.getMaxDiskUsage` returns the maximum size configured for data logged to disk, in units of GB.

### Examples

#### Get Configured Logging Size Limits

You can limit the size of logged data by specifying a maximum size for the data or a minimum amount of disk space to leave empty. This example uses several functions to get the current configuration of logging size limits.

Use the `Simulink.sdi.getRequiredFreeSpace` function to get the configured minimum free disk space requirement. The returned value uses units of GB.

```
minDiskSpace = Simulink.sdi.getRequiredFreeSpace;
```

Use the `Simulink.sdi.getMaxDiskUsage` function to get the configured maximum size for data logged to disk. The returned value uses units of GB.

```
maxSize = Simulink.sdi.getMaxDiskUsage;
```

Use the `Simulink.sdi.deleteRunsOnLowSpace` function to get the configured behavior when approaching the logging limits. When `deleteRuns` is true, data from prior simulations is deleted first to free disk space for continued logging in the current simulation. If deleting runs does not free up enough space, recording logged data is disabled for the current simulation. When `deleteRuns` is false, recording logged data is disabled for the current simulation and data from prior simulations is retained.

```
deleteRuns = Simulink.sdi.deleteRunsOnLowSpace;
```

### Output Arguments

**maxSize** — Maximum size configured for data logged to disk

scalar

Maximum size configured for data logged to disk, returned as a scalar, in units of GB.

## Version History

Introduced in R2021a

## Simulink.sdi.getNumCursors

Check number of cursors active in the Simulation Data Inspector

### Syntax

```
num = Simulink.sdi.getNumCursors
num = Simulink.sdi.getNumCursors(view)
```

### Description

`num = Simulink.sdi.getNumCursors` returns the number of active cursors in the **Inspect** pane of the Simulation Data Inspector.

`num = Simulink.sdi.getNumCursors(view)` returns the number of active cursors in the **Inspect** or **Compare** pane of the Simulation Data Inspector, as specified by `view`.

### Examples

#### Programmatically Interact with Cursors in the Simulation Data Inspector

You can use the Simulation Data Inspector programmatic interface to specify the position of cursors on time plots or sparklines and to access the time that corresponds to the current cursor position.

Open the session file `vdp_mu.mldatx` to add plot data in the Simulation Data Inspector. The session file contains data for a 20-second simulation of a model of the Van Der Pol equation, with signals `x1` and `x2` plotted on separate subplots in a 2-by-1 subplot layout.

```
open vdp_mu.mldatx;
```

Use the `Simulink.sdi.setNumCursors` function to add one cursor to the plot.

```
Simulink.sdi.setNumCursors(1);
```

Suppose you want to know the signal values 5 seconds into the simulation. Use the `Simulink.sdi.setCursorPositions` function to move the cursor to `t=5s` and read the signal values off from the cursor on each subplot. The asterisk next to the value in the cursor label indicates that the value is interpolated because the simulation did not include a calculation for a simulation time of exactly 5s.

```
Simulink.sdi.setCursorPositions('left',5);
```

Suppose you want to calculate the time between two peaks in the x2 signal. Add a second cursor

using the `Simulink.sdi.setNumCursors` function or by using Show/hide data cursors  in the Simulation Data Inspector.

```
numCursors = Simulink.sdi.getNumCursors;
if(numCursors < 2)
 Simulink.sdi.setNumCursors(2);
end
```

Drag the cursors so the left cursor is positioned at the first peak in the x2 signal and the right cursor is positioned at the second peak. Alternatively, you can run this code that positions the cursors for you.

```
Simulink.sdi.setCursorPositions('left',5.921998549931304,...
 'right',12.378442136906246);
```

The Simulation Data Inspector displays the difference between the two cursors in seconds. However, the cursor position and difference values are both rounded. Use the `Simulink.sdi.getCursorPosition` function to programmatically retrieve the exact time values that correspond to the cursor positions. Then, compute the difference between the times.

```
[t1,t2] = Simulink.sdi.getCursorPosition;
T = t2 - t1
```

```
T = 6.4564
```

## Input Arguments

**view** — Plot area for which to return number of active cursors

'inspect' (default) | 'compare'

Plot area for which to return number of active cursors, specified as 'inspect' or 'compare'.

Data Types: char | string

## Output Arguments

**num** — Number of active cursors

0 | 1 | 2

Number of active cursors, returned as 0, 1, or 2.

## Version History

Introduced in R2021a

## See Also

## Simulink.sdi.getPosition

Get position and size of Simulation Data Inspector

### Syntax

```
pos = Simulink.sdi.getPosition
```

### Description

`pos = Simulink.sdi.getPosition` returns a four-element vector in the form `[left bottom width height]` indicating the position and size of the Simulation Data Inspector window. If the Simulation Data Inspector is not open, `Simulink.sdi.getPosition` returns `[0 0 0 0]`.

### Examples

#### Change Position of Simulation Data Inspector

This example shows you how to change the position and size of the Simulation Data Inspector window. First, open the Simulation Data Inspector.

```
Simulink.sdi.view
```

Set the Simulation Data Inspector window to be:

- 800 pixels wide
- 500 pixels high
- 200 pixels from the left edge of your primary display
- 60 pixels from the bottom of your primary display

```
pos = [200 60 800 500];
Simulink.sdi.setPosition(pos)
```

Alternatively, you can move and resize the Simulation Data Inspector manually. To use this placement in future simulations, retrieve the position vector using the function `Simulink.sdi.getPosition`.

```
newPos = Simulink.sdi.getPosition
```

```
newPos = 1×4
```

```
 200 60 800 500
```

### Output Arguments

**pos** — Position and size of Simulation Data Inspector  
`[left bottom width height]`

Position and size of the Simulation Data Inspector window, specified as a four-element vector in the form `[left bottom width height]`. All measurements have units of pixels.

| Element | Description                                                                                                                                                         |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| left    | Distance from the left edge of the primary display to the inner-left edge of the window. This value can be negative on systems that have more than one monitor.     |
| bottom  | Distance from the bottom edge of the primary display to the inner-bottom edge of the window. This value can be negative on systems that have more than one monitor. |
| width   | Distance between the right and left inner edges of the window.                                                                                                      |
| height  | Distance between the top and bottom inner edges of the window.                                                                                                      |

## Simulink.sdi.getRecordData

Check record mode for logging

### Syntax

```
record = Simulink.sdi.getRecordData
```

### Description

`record = Simulink.sdi.getRecordData` returns the currently configured value for the **Record mode** in the Simulation Data Inspector preferences. When `record` is `true` or `1`, logged data is available to view during simulation and is recorded to the Simulation Data Inspector and workspace for analysis after simulation. When `record` is `false` or `0`, logged data is not recorded and is only available to view during simulation.

### Examples

#### Check Record Mode for Logging

You can use the `Simulink.sdi.getRecordData` function to check the configuration before starting a simulation to ensure you record data you want to save.

```
record = Simulink.sdi.getRecordData
```

```
record =
```

```
 logical
```

```
 1
```

The **Record mode** setting is restored to **View and record data** at the start of each MATLAB session.

### Output Arguments

**record** — Record mode

1 | 0

Record mode, returned as 1 (true) or 0 (false).

- 1 — Logged data is stored on disk and available in the workspace and Simulation Data Inspector after simulation.
- 0 — Logged data is not stored on disk and is only available to view during simulation. After simulation, no logged data is available in the Simulation Data Inspector or workspace. For more information, see “View Data Only During Simulation”.

## Simulink.sdi.getRequiredFreeSpace

Get configured minimum disk space requirement for logging

### Syntax

```
minDiskSpace = Simulink.sdi.getRequiredFreeSpace
```

### Description

`minDiskSpace = Simulink.sdi.getRequiredFreeSpace` returns the minimum free disk space requirement configured for logging, in units of GB.

### Examples

#### Get Configured Logging Size Limits

You can limit the size of logged data by specifying a maximum size for the data or a minimum amount of disk space to leave empty. This example uses several functions to get the current configuration of logging size limits.

Use the `Simulink.sdi.getRequiredFreeSpace` function to get the configured minimum free disk space requirement. The returned value uses units of GB.

```
minDiskSpace = Simulink.sdi.getRequiredFreeSpace;
```

Use the `Simulink.sdi.getMaxDiskUsage` function to get the configured maximum size for data logged to disk. The returned value uses units of GB.

```
maxSize = Simulink.sdi.getMaxDiskUsage;
```

Use the `Simulink.sdi.deleteRunsOnLowSpace` function to get the configured behavior when approaching the logging limits. When `deleteRuns` is true, data from prior simulations is deleted first to free disk space for continued logging in the current simulation. If deleting runs does not free up enough space, recording logged data is disabled for the current simulation. When `deleteRuns` is false, recording logged data is disabled for the current simulation and data from prior simulations is retained.

```
deleteRuns = Simulink.sdi.deleteRunsOnLowSpace;
```

### Output Arguments

**minDiskSpace** — Minimum free disk space requirement for logging

scalar

Minimum free disk space requirement for logging, returned as a scalar, in units of GB.

## Simulink.sdi.getRun

**Package:** Simulink.sdi

Access data for a Simulation Data Inspector run

### Syntax

```
run = Simulink.sdi.getRun(runID)
```

### Description

`run = Simulink.sdi.getRun(runID)` returns a `Simulink.sdi.Run` object that provides access to the data in the run corresponding to the `runID`. The Simulation Data Inspector assigns run IDs when it creates a run. You can get the run ID for your run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

### Examples

#### Access Simulation Data Inspector Runs

Many tasks performed using the Simulation Data Inspector programmatic interface start by accessing the `Simulink.sdi.Run` object that corresponds to the logged or imported data you want to analyze. For example, you can use the Run object to access the `Simulink.sdi.Signal` objects that correspond to individual signals in the run.

This example shows how to access Run objects by using the `Simulink.sdi.Run.getLatest` function, the `Simulink.sdi.getCurrentSimulationRun` function, or the `Simulink.sdi.getRun` function.

#### Create a Run

The model `sldemo_fuelsys` is already configured for logging. When you simulate the model, the Simulation Data Inspector automatically creates a run and assigns it a run ID.

```
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')
```

#### Get Run Object Using Simulink.sdi.Run.getLatest

In this example, the run created when you simulated the model is the most recently created run in the Simulation Data Inspector. When you want to access the most recently created run, use the `Simulink.sdi.Run.getLatest` function.

```
fuelsysRun = Simulink.sdi.Run.getLatest;
```

#### Get Run Object Using Simulink.sdi.getCurrentSimulationRun

The run you want to access may not be the most recently created run in the Simulation Data Inspector. If the run corresponds to the most recent simulation of a model, you can use the `Simulink.sdi.getCurrentSimulationRun` function to access the Run object. You can also use

the `Simulink.sdi.getCurrentSimulationRun` function to access data for an in-progress simulation when the simulation streams data to the Simulation Data Inspector. This function can be useful when you are working with multiple models.

In this example, the run created when you simulated the model is the current simulation run for the `sldemo_fuelsys` model.

```
fuelsysRun = Simulink.sdi.getCurrentSimulationRun('sldemo_fuelsys');
```

### Get Run Object from a Run ID

When your task also requires the run ID, you can use the `Simulink.sdi.getRun` function to get the corresponding `Simulink.sdi.Run` object that contains the run data and metadata.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
fuelsysRun = Simulink.sdi.getRun(runID);
```

### Plot Signals from Simulation Run

This example demonstrates how to access the `Simulink.sdi.Run` object for a Simulation Data Inspector run created by logging signals. From the `Simulink.sdi.Run` object you can get `Simulink.sdi.Signal` objects that contain the logged signal data and metadata. You can use the `Signal` objects and the `plotOnSubPlot` function to plot the data in the Simulation Data Inspector.

### Create a Simulation Run and Access the Run Object

The `ex_vdp` model logs two signals. To create a simulation run containing the logged data, simulate the model.

```
sim('ex_vdp');
```

The Simulation Data Inspector keeps track of runs by assigning a unique numeric run ID to each run created by simulation, importing data, or opening a session. To access the run object for the simulation you just performed, use the `Simulink.sdi.getAllRunIDs` function and take the last run ID in the returned vector.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Once you have the run ID for the run, you can use the `Simulink.sdi.getRun` function to get the `Simulink.sdi.Run` object that corresponds to the run. You can use the `Run` object to check the metadata associated with the run, including the number of signals in the run.

```
vdpRun = Simulink.sdi.getRun(runID);
```

```
vdpRun.SignalCount
```

```
ans = int32
 2
```

### Plot Data Using Signal Objects

Use the `getSignalByIndex` function to access signals from the `Run` object, `vdpRun`.

```
signal1 = getSignalByIndex(vdpRun,1);
signal2 = getSignalByIndex(vdpRun,2);
```

Use the `Simulink.sdi.setSubPlotLayout` function to specify a 2-by-1 layout.

```
Simulink.sdi.setSubPlotLayout(2,1)
```

Before plotting the data, use the `Simulink.sdi.clearAllSubPlots` function to clear any data that is already plotted.

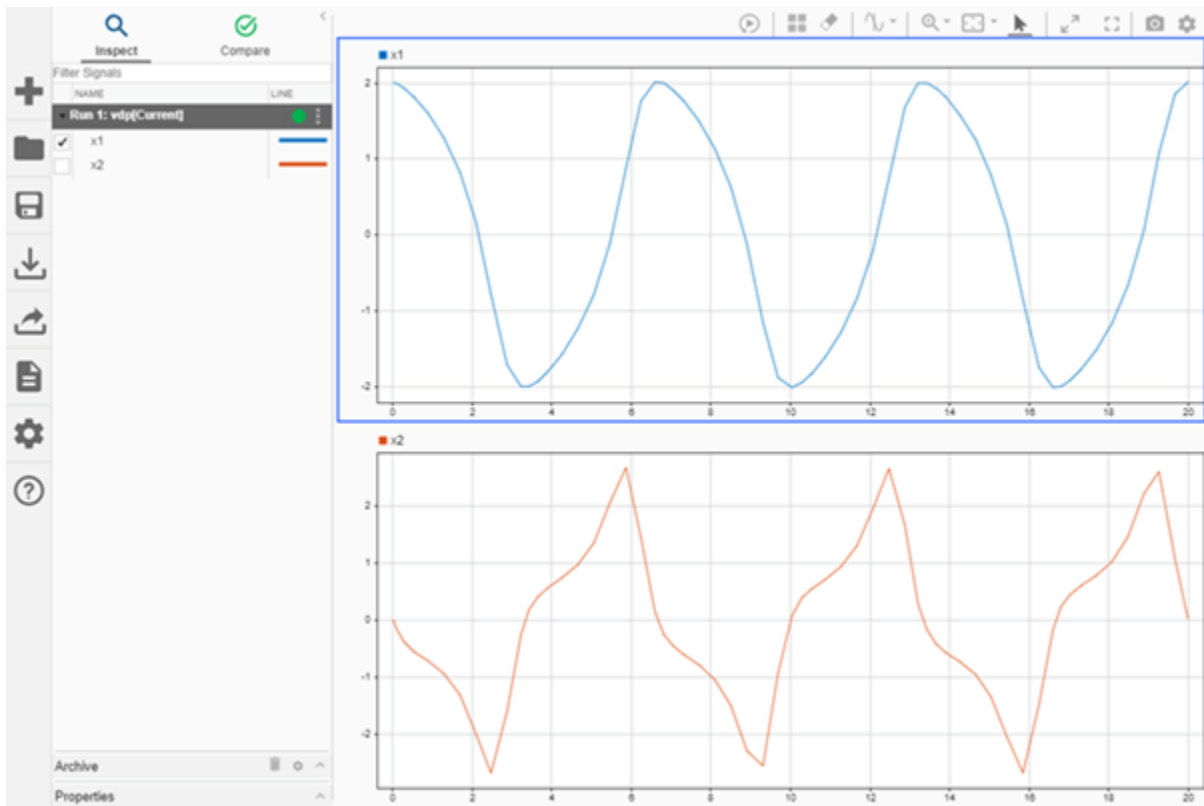

```
Simulink.sdi.clearAllSubPlots
```

Plot one signal on each subplot. To plot signals on the first subplot, you can set the checked property for the signal. To plot signals on subplots other than the first subplot, use the `plotOnSubPlot` function.

```
signal1.Checked = true;
plotOnSubPlot(signal2,2,1,true);
```

### View the Plotted Data

To view the plots you just created, open the Simulation Data Inspector using the `Simulink.sdi.view` function.

### Input Arguments

**runID** — Numeric run identifier

scalar

Run ID for the run you want a `Simulink.sdi.Run` object for. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for a run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

## Output Arguments

**run** — `Simulink.sdi.Run` object

'`Simulink.sdi.Run`'

`Simulink.sdi.Run` object for the run corresponding to the run ID.

## Version History

Introduced in R2011b

“Inspect and Compare Data Programmatically”

## Simulink.sdi.getRunCount

**Package:** Simulink.sdi

Get number of runs in Simulation Data Inspector repository

### Syntax

```
count = Simulink.sdi.getRunCount
```

### Description

`count = Simulink.sdi.getRunCount` returns the number of runs in the Simulation Data Inspector repository. You can use the run count to loop over all runs in the Simulation Data Inspector repository to modify run or signal properties. For example, you could add an absolute tolerance to a signal in every run.

### Examples

#### Apply a Tolerance to a Signal in Multiple Runs

You can use the Simulation Data Inspector programmatic interface to modify a parameter for the same signal in multiple runs. This example adds an absolute tolerance of 0.1 to a signal in all four runs of data.

First, clear the workspace and load the Simulation Data Inspector session with the data. The session includes logged data from four simulations of a Simulink® model of a longitudinal controller for an aircraft.

```
Simulink.sdi.clear
Simulink.sdi.load('AircraftExample.mldatx');
```

Use the `Simulink.sdi.getRunCount` function to get the number of runs in the Simulation Data Inspector. You can use this number as the index for a for loop that operates on each run.

```
count = Simulink.sdi.getRunCount;
```

Then, use a for loop to assign the absolute tolerance of 0.1 to the first signal in each run.

```
for a = 1:count
 runID = Simulink.sdi.getRunIDByIndex(a);
 aircraftRun = Simulink.sdi.getRun(runID);
 sig = getSignalByIndex(aircraftRun,1);
 sig.AbsTol = 0.1;
end
```

### Output Arguments

**count** — Number of runs

scalar

Number of runs in the Simulation Data Inspector repository.

## **Version History**

**Introduced in R2011b**

### **See Also**

[Simulink.sdi.getRunIDByIndex](#) | [Simulink.sdi.getAllRunIDs](#) | [Simulink.sdi.getRun](#) | [Simulink.sdi.Run](#) | [Simulink.sdi.Signal](#)

### **Topics**

“Inspect and Compare Data Programmatically”

## Simulink.sdi.getRunIDByIndex

**Package:** Simulink.sdi

Use Simulation Data Inspector run index to get run ID

### Syntax

```
runID = Simulink.sdi.getRunIDByIndex(index)
```

### Description

`runID = Simulink.sdi.getRunIDByIndex(index)` returns the run ID for the run with the specified index in the Simulation Data Inspector repository.

### Examples

#### Get Simulation Data Inspector Run IDs

Many tasks performed using the Simulation Data Inspector programmatic interface start with obtaining the run ID for a simulation run. This example illustrates several methods to get the run ID for a run. You can use the run ID to access the `Simulink.sdi.Run` object that contains the run data and metadata and perform run comparisons using the `Simulink.sdi.compareRuns` function.

#### Create a Run

The model `sldemo_fuelsys` is already configured for logging. When you simulate the model, the Simulation Data Inspector automatically creates a run and assigns it a run ID.

```
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')
```

#### Get Run ID Using Simulink.sdi.getAllRunIDs

The `Simulink.sdi.getAllRunIDs` function returns an array of all run IDs for the runs in the Simulation Data Inspector repository, in order, with the most recently created run at the end.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

#### Get Run ID Using Simulink.sdi.getRunIDByIndex

You can also use the `Simulink.sdi.getRunCount` and `Simulink.sdi.getRunIDByIndex` functions to get the run ID for a run. This method is useful if you also want to use `count` as a counting variable to index through the runs in the Simulation Data Inspector repository.

```
count = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(count);
```

#### Get Run ID from a Simulink.sdi.Run Object

You can also get the run ID from the `Simulink.sdi.Run` object that corresponds to the run. This example uses the `Simulink.sdi.getCurrentSimulationRun` function to get the Run object that

corresponds to the most recent simulation of the `sldemo_fuelsys` model. You can also use the `Simulink.sdi.Run.getLatest` function to access the most recently created Run object.

```
fuelsysRun = Simulink.sdi.getCurrentSimulationRun('sldemo_fuelsys');
runID = fuelsysRun.ID;
```

## Input Arguments

### **index** — Run index in Simulation Data Inspector

integer

Positive, whole number index of the run in the Simulation Data Inspector repository.

Example: 3

## Output Arguments

### **runID** — Numeric run identifier

scalar

Numeric run identification assigned by the Simulation Data Inspector.

## Version History

Introduced in R2011b

## Simulink.sdi.getRunNamingRule

**Package:** Simulink.sdi

Get the Simulation Data Inspector rule for naming runs

### Syntax

```
namingRule = Simulink.sdi.getRunNamingRule
```

### Description

`namingRule = Simulink.sdi.getRunNamingRule` returns the run naming rule as a character vector. The run naming rule can contain one or more tokens that update for each run, for example, `<run_index>`. The run naming rule applies to runs automatically created through simulating a model in Simulink.

### Examples

#### Modify Run Naming Rule Then Restore Default

This example shows how to use the Simulation Data Inspector API to modify the Simulation Data Inspector run naming rule, check a run's name, restore default preferences, and check the run naming rule.

```
% Load model
load_system('sldemo_fuelsys')

% Modify run naming rule
Simulink.sdi.setRunNamingRule('<model_name> Run <run_index>')

% Simulate system
sim('sldemo_fuelsys')

% Check run name
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
fuelRun = Simulink.sdi.getRun(runID);
fuelRun.name

ans =
'sldemo_fuelsys Run 1'

% Clear preferences to reset the run naming rule
Simulink.sdi.clearPreferences

% Check run naming rule
Simulink.sdi.getRunNamingRule

ans =
'Run <run_index>: <model_name>'
```

## Output Arguments

### **namingRule** — Naming rule for Simulation Data Inspector runs

character vector

Character vector that specifies the naming rule the Simulation Data Inspector uses to name the runs automatically created through simulating a Simulink model. The run naming rule can contain any of the following tokens that represent information pulled for each run:

- `<run_index>` - Run's index in the Simulation Data Inspector repository.
- `<model_name>` - Name of the model simulated to create the run.
- `<time_stamp>` - Start time for the simulation that created the run.
- `<sim_mode>` - Simulation mode used for the simulation that created the run.

## Alternatives

You can view the run naming rule using the Simulation Data Inspector UI. You can find the **New Run** options under the Simulation Data Inspector **Preferences** menu.

## Version History

Introduced in R2015a

## Simulink.sdi.getSignal

**Package:** Simulink.sdi

Get Simulink.sdi.Signal object for a signal

### Syntax

```
signalObj = Simulink.sdi.getSignal(sigID)
```

### Description

`signalObj = Simulink.sdi.getSignal(sigID)` returns a `Simulink.sdi.Signal` object for the signal in the Simulation Data Inspector that corresponds to the signal ID, `sigID`.

### Examples

#### Create a Simulation Data Inspector Run and Access Signal Data

This example shows how to access signal data when you create a run in the Simulation Data Inspector.

##### Generate Data for Run

For this example, create timeseries data for sine and cosine signals.

```
% Create timeseries workspace data
time = linspace(0, 20, 101);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

##### Create a Run and Return Signal IDs

You can use the `Simulink.sdi.createRun` syntax with multiple return arguments to get the signal IDs more directly instead of accessing the signal IDs through a `Simulink.sdi.Run` object.

```
[runID,runIndex,sigIDs] = Simulink.sdi.createRun('Sinusoids','vars',...
 sine_ts,cos_ts);

cosID = sigIDs(2);
cosSig = Simulink.sdi.getSignal(cosID);
```

##### Modify Signal Properties and View in the Simulation Data Inspector

You can use the `Simulink.sdi.Signal` object to view and modify signal properties and to plot signals in the Simulation Data Inspector.

```
cosSig.Checked = true;
cosSig.AbsTol = 0.05;
Simulink.sdi.view
cosSig.Name
```

## Input Arguments

### **sigID** — Signal ID

scalar

Unique, numeric signal identifier, specified as an integer. The Simulation Data Inspector assigns a signal ID to each signal when a run is created. You can get the signal ID for a signal using one of these functions:

- `getAllSignalIDs`
- `getSignalIDByIndex`
- `getSignalIDsByName`
- `Simulink.sdi.createRun`

## Output Arguments

### **signalObj** — `Simulink.sdi.Signal` object

`Simulink.sdi.Signal` object

Signal that corresponds to the signal ID, `sigID`, returned as a `Simulink.sdi.Signal` object.

## Version History

Introduced in R2011b

## See Also

### Objects

`Simulink.sdi.Signal` | `Simulink.sdi.Run`

### Functions

`getSignalIDByIndex` | `Simulink.sdi.createRun`

## Simulink.sdi.getSignalInputProcessingMode

Get value of Input Processing signal property

### Syntax

```
inputMode = Simulink.sdi.getSignalInputProcessingMode(blkPath,port)
inputMode = Simulink.sdi.getSignalInputProcessingMode(h)
```

### Description

`inputMode = Simulink.sdi.getSignalInputProcessingMode(blkPath,port)` returns the value of the **Input Processing** property for the signal produced by the specified block and port. The **Input Processing** property specifies whether to log the signal as sample-based or frame-based.

`inputMode = Simulink.sdi.getSignalInputProcessingMode(h)` returns the value of the **Input Processing** property for the signal that corresponds to the specified line handle, `h`.

### Examples

#### Check Signal Input Processing Setting Using Block Path

Check the value of the **Input Processing** property for the output signal of the Gain block **Mu** in the model `vdp` using the block path and the index of the output port that produces the signal.

```
open_system('vdp')
MuInputProc = Simulink.sdi.getSignalInputProcessingMode('vdp/Mu',1);
```

#### Check Signal Input Processing Setting Using Line Handle

Check the value of the **Input Processing** property for the output signal of the Gain block **Mu** in the model `vdp` using the line handle for the signal.

```
open_system('vdp')
MuLineHandles = get_param('vdp/Mu','LineHandles');
MuOutputHandle = MuLineHandles.Outputport;
MuInputProc = Simulink.sdi.getSignalInputProcessingMode(MuOutputHandle);
```

### Input Arguments

#### **blkPath** — Block path for block that produces signal

string | character vector

Block path for the block that produces the signal, specified as a string or a character vector.

Example: "vdp/Mu"

#### **port** — Index of block output port that produces signal

scalar

Index of block output port that produces signal, specified as a numeric scalar.

Example: 1

### **h** — Signal

line handle

Signal, specified as a line handle. To get the line handle for a signal, use the `get_param` function with the 'LineHandles' option. For example, to access the line handle for the output of the Mu block in the model `vdp`, use:

```
MuLineHandles = get_param('vdp/Mu', 'LineHandles');
MuOutputLineHandle = MuLineHandles.Outputport;
```

## **Output Arguments**

### **inputMode** — Input processing used for signal

'sample' | 'frame'

Input processing used for signal, returned as 'sample' or 'frame'.

Signal **Input Processing** setting.

- 'sample' — Each element in a sample is treated as a channel.
- frame — Each column in a sample is treated as a channel.

## **Version History**

**Introduced in R2020a**

## Simulink.sdi.getStorageLocation

Get path to custom storage location for data logged to disk

### Syntax

```
storagePath = Simulink.sdi.getStorageLocation
```

### Description

`storagePath = Simulink.sdi.getStorageLocation` returns the configured custom location to store data logged to disk. When data logs to the temporary directory on your computer, the `Simulink.sdi.getStorageLocation` function returns an empty character array.

---

**Note** The location returned by the `Simulink.sdi.getStorageLocation` function applies for data logged to the workspace and Simulation Data Inspector and is *not* the location of the file created for data logged to a file.

---

### Examples

#### Check Custom Storage Location

By default, data logged to the workspace and the Simulation Data Inspector is stored in the temporary directory on your computer. You may want to change the location of logged data when you need to log large amounts of data and a secondary drive provides more storage capacity. When you specify a custom storage location for logged data, you can use the `Simulink.sdi.getStorageLocation` function to access the path to the temporary file that contains the logged data.

```
storagePath = Simulink.sdi.getStorageLocation;
```

```
storagePath =
```

```
 'C:\Users\username\LoggedData'
```

### Output Arguments

#### **storagePath** — Location of data logged to disk

character vector

Location of data logged to disk, returned as a character vector. An empty character vector indicates that the data is logged to the temporary directory on your computer.

### Version History

Introduced in R2021a

## Simulink.sdi.getStorageMode

Check if logging is configured to log data to disk or memory

### Syntax

```
storageMode = Simulink.sdi.getStorageMode
```

### Description

`storageMode = Simulink.sdi.getStorageMode` returns the configured logging storage mode as 'disk' or 'memory'. By default, data logged to the workspace and the Simulation Data Inspector is logged to disk.

### Examples

#### Check Whether Data Logs to Disk or Memory

You can configure whether data logged in simulation logs to memory or to disk. By default, data is logged to disk and brought into memory on demand. If your machine has more RAM than disk space, you may want to log data to memory instead.

Use the `Simulink.sdi.getStorageMode` function to check whether logging is configured to store logged data on disk or in memory.

```
storageMode = Simulink.sdi.getStorageMode
```

```
storageMode =
```

```
 'disk'
```

### Output Arguments

**storageMode** — Where logged simulation data is stored on your machine

'disk' | 'memory'

Where logged simulation data is stored on your machine, returned as 'disk' or 'memory'.

## Version History

Introduced in R2021a

## Simulink.sdi.getSubplotLimits

Get  $t$ - and  $y$ -axis limits for time plot in the Simulation Data Inspector

### Syntax

```
[tMin,tMax,yMin,yMax] = Simulink.sdi.getSubplotLimits(r,c)
```

### Description

`[tMin,tMax,yMin,yMax] = Simulink.sdi.getSubplotLimits(r,c)` returns the  $t$ - and  $y$ -axis limits for the subplot at the specified location in the Simulation Data Inspector subplot layout.

### Examples

#### Copy y-Axis Range from One Subplot to Another

You can use the `Simulink.sdi.getSubplotLimits` and `Simulink.sdi.setSubplotLimits` functions to copy the axis limits from one subplot to another. For example, you can specify the same  $y$ -axis limits for two subplots that display the same signal from simulations that used different values of a model parameter. This example copies the  $y$ -axis settings from one subplot to another to analyze the effect of changing the value of  $\mu$  in the model `vdp`.

Create the data in the Simulation Data Inspector by simulating the model `vdp` twice. The first time, specify the value of  $\mu$  as 1. For the second simulation, set the value of  $\mu$  to 2. The model logs data for the signals `x1` and `x2`.

```
open_system('ex_vdp');
set_param('ex_vdp/Mu','Gain','1')
sim('ex_vdp');

set_param('ex_vdp/Mu','Gain','2')
sim('ex_vdp');
```

Open the Simulation Data Inspector.

```
Simulink.sdi.view
```

Create plots in the Simulation Data Inspector to show the results from each simulation. Configure a 2x2 subplot layout so you can plot one signal on each plot, side by side.

```
Simulink.sdi.setSubPlotLayout(2,2)
```

Get the `Simulink.sdi.Signal` objects that correspond to each signal from each run, and plot one signal on each subplot. Plot the signals from the first simulation on the subplots in the first column and the signals from the second simulation on the subplots in the second column.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end-1);
runID2 = runIDs(end);
```

```

runMu1 = Simulink.sdi.getRun(runID1);
runMu2 = Simulink.sdi.getRun(runID2);

sig1 = getSignalByIndex(runMu1,1);
sig2 = getSignalByIndex(runMu1,2);
sig3 = getSignalByIndex(runMu2,1);
sig4 = getSignalByIndex(runMu2,2);

plotOnSubPlot(sig1,1,1,true);
plotOnSubPlot(sig2,2,1,true);
plotOnSubPlot(sig3,1,2,true);
plotOnSubPlot(sig4,2,2,true);

```

The signals in the first column of plots look similar to those in the second column. However, the y-axis limits for the plots of the x2 signal are different.

Use the `Simulink.sdi.getSubplotLimits` function to copy the limits used for the subplot with the `x2` signal from the second simulation.

```
[~,~,ymin,ymax] = Simulink.sdi.getSubplotLimits(2,2);
```

Use the `Simulink.sdi.setSubplotLimits` function to apply the same y-axis limits to the subplot with the `x2` signal from the first run.

```
Simulink.sdi.setSubplotLimits(2,1,'yRange',[ymin,ymax]);
```

With the updated y-axis limits, the difference in the `x2` signal is more apparent.

## Input Arguments

### **r — Subplot row index**

integer

Subplot row index, specified as an integer between 1 and 8, inclusive. Use the *r* and *c* inputs together to specify the location of the subplot for which you want the axis limits.

Example: `[~,~,yMin,yMax] = Simulink.sdi.setSubplotLimits(2,2)` returns y-axis limits for the time plot in the second row of the second column of the subplot layout in the Simulation Data Inspector.

### **c — Subplot column index**

integer

Subplot column index, specified as an integer value between 1 and 8, inclusive. Use the *r* and *c* inputs together to specify the location of the subplot for which you want the axis limits.

Example: `[~,~,yMin,yMax] = Simulink.sdi.setSubplotLimits(2,2)` returns the y-axis limits for the time plot in the second row of the second column of the subplot layout in the Simulation Data Inspector.

## Output Arguments

### **tMin — t-axis minimum**

double

*t*-axis minimum, returned as a double and the first element in a 1-by-4 vector of the form `[tMin, tMax, yMin, yMax]`.

### **tMax — t-axis maximum**

double

*t*-axis maximum, returned as a double and the second element in a 1-by-4 vector of the form `[tMin, tMax, yMin, yMax]`.

### **yMin — y-axis minimum**

double

*y*-axis minimum, returned as a double and the third element in a 1-by-4 vector of the form `[tMin, tMax, yMin, yMax]`.

### **yMax — y-axis maximum**

double

*y*-axis maximum, returned as a double and the last element in a 1-by-4 vector of the form `[tMin, tMax, yMin, yMax]`.

# Simulink.sdi.getTickLabelsDisplay

Get tick mark label setting for time plots

## Syntax

```
tickLabels = Simulink.sdi.getTickLabelsDisplay
```

## Description

`tickLabels = Simulink.sdi.getTickLabelsDisplay` returns the current setting for displayed tick mark labels on time plots in the Simulation Data Inspector. The return value corresponds to the value of the **Tick labels** setting on the **Time Plot** section of the **Visualization Settings** in the Simulation Data Inspector. The setting applies to all time plots in the layout. By default, the Simulation Data Inspector displays tick mark labels for both axes on time plots.

## Examples

### Configure Tick Mark Label Visibility for Time Plots

You can use the `Simulink.sdi.setTickLabelsDisplay` function to configure the visibility of tick mark labels for the *t*- and *y*-axes on time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector displays tick marks for both axes.

This example starts by showing how to use the `Simulink.sdi.getTickLabelsDisplay` function to access the current tick mark label visibility. Subsequent sections show the code to specify each available option for tick mark label visibility on time plots in the Simulation Data Inspector. To see the result of each configuration, the example generates an image using the `Simulink.sdi.snapshot` function with settings specified by a `Simulink.sdi.CustomSnapshot` object.

```
snapSettings = Simulink.sdi.CustomSnapshot;
snapSettings.Width = 300;
snapSettings.Height = 300;
```

### Get Current Tick Mark Label Visibility

Before modifying the visibility of the tick mark labels on time plots, you can save the current configuration to a variable in the workspace in case you want to restore the preference later.

```
initTickLabels = Simulink.sdi.getTickLabelsDisplay;
```

### Show Only *t*-Axis Tick Mark Labels

Show the tick mark labels for the *t*-Axis.

```
Simulink.sdi.setTickLabelsDisplay('t-axis')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

### Show Only y-Axis Tick Mark Labels

Show the tick mark labels for the y-axis.

```
Simulink.sdi.setTickLabelsDisplay('y-axis')
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

### Hide Tick Mark Labels

You can hide the tick mark labels for both axes.

```
Simulink.sdi.setTickLabelsDisplay('none')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

### **Show All Tick Mark Labels**

By default, the Simulation Data Inspector shows tick mark labels for both axes on time plots.

```
Simulink.sdi.setTickLabelsDisplay('all')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

## Output Arguments

### **tickLabels** — Time plot axes that display tick mark labels

'all' | 't-axis' | 'y-axis' | 'none'

Time plot axes that display tick mark labels in the Simulation Data Inspector, returned as one of these options:

- 'all' — Tick mark labels displayed for both time plot axes.
- 't-axis' — Tick mark labels displayed only on the *t*-axis for time plots.
- 'y-axis' — Tick mark labels displayed only on the *y*-axis for time plots.
- 'none' — No tick mark labels displayed on time plots.

## Version History

**Introduced in R2019b**

# Simulink.sdi.getTicksPosition

Get tick mark position setting for time plots

## Syntax

```
ticksPos = Simulink.sdi.getTicksPosition
```

## Description

`ticksPos = Simulink.sdi.getTicksPosition` returns the current setting for the position of tick marks on time plots in the Simulation Data Inspector. The return value corresponds to the value of the **Ticks** setting on the **Time Plot** section of the **Visualization Settings** in the Simulation Data Inspector. The setting applies to all time plots in the layout. By default, the Simulation Data Inspector displays tick marks on the outside of the plot area for time plots.

## Examples

### Configure Position for Tick Marks on Time Plots

You can use `Simulink.sdi.setTicksPosition` function to specify the position for tick marks on time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector displays tick marks outside of the plot area for time plots.

This example starts by showing how to use the `Simulink.sdi.getTicksPosition` function to access the current position of tick marks. Subsequent sections show the code to specify each configuration option for the position of tick marks on time plots in the Simulation Data Inspector. To see the result, the example generates an image using `Simulink.sdi.snapshot` with settings specified by a `Simulink.sdi.CustomSnapshot` object.

```
snapSettings = Simulink.sdi.CustomSnapshot;
snapSettings.Width = 300;
snapSettings.Height = 300;
```

### Get Current Tick Mark Position

Before modifying the position of tick marks on time plots, you can save the current configuration to a variable in the workspace in case you want to restore the preference later.

```
initTickPos = Simulink.sdi.getTicksPosition;
```

### Position Tick Marks Inside Plot Area

Position the tick marks inside the plot area to increase the amount of space used by the plot area.

```
Simulink.sdi.setTicksPosition('inside')
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

### Hide Tick Marks on Time Plots

You can hide the tick marks for time plots in the Simulation Data Inspector. Hiding the tick marks expands the plot area.

```
Simulink.sdi.setTicksPosition('none')
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

### Position Tick Marks Outside Plot Area

By default, the Simulation Data Inspector displays tick marks outside of the plot area for time plots.

```
Simulink.sdi.setTicksPosition('outside')
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

## Output Arguments

**ticksPos** — Current setting for tick mark position on time plots

'outside' | 'inside' | 'none'

Current setting for the position of tick marks on time plots in the Simulation Data Inspector, returned as 'inside' or 'outside'.

## Version History

Introduced in R2019b

“Create Plots Using the Simulation Data Inspector”

# Simulink.sdi.getTrigger

Get signal and trigger options for trigger configured in the Simulation Data Inspector

## Syntax

```
sig = Simulink.sdi.getTrigger
[sig,opts] = Simulink.sdi.getTrigger
```

## Description

`sig = Simulink.sdi.getTrigger` returns the `Simulink.sdi.Signal` object for the signal used to trigger display updates in the Simulation Data Inspector.

`[sig,opts] = Simulink.sdi.getTrigger` returns the trigger options configured for the trigger in the Simulation Data Inspector.

## Examples

### Programmatically Configure Triggers in the Simulation Data Inspector

Add a trigger to a signal in the Simulation Data Inspector to specify criteria that determine when to update plots to display fresh data. Triggers can allow you to capture transient signal behavior and can help stabilize the display of periodic signals so you can take measurements.

Simulate the `Triggers` model. Data in the model logs to the Simulation Data Inspector.

```
open_system('Triggers');
out = sim('Triggers');
```

Then, add a trigger to the `Pulse` signal. Configure the trigger as a falling-edge trigger with a threshold of 0.5.

```
trigRun = Simulink.sdi.getCurrentSimulationRun('Triggers');
pulseSig = getSignalsByName(trigRun,'Pulse');
Simulink.sdi.addTrigger(pulseSig,'Type','Edge','Level',0.5);
```

You can verify that the trigger was added and configured correctly by opening the Simulation Data Inspector using `Simulink.sdi.view` and clicking the trigger icon next to the `Pulse` signal to check the configuration. You can also use the `Simulink.sdi.getTrigger` function to check which signal is used to generate trigger events and the trigger configuration.

```
[sig,trigOpts] = Simulink.sdi.getTrigger;
```

```
sig.Name
```

```
ans =
'Pulse'
```

```
trigOpts
```

```
trigOpts = struct with fields:
 Mode: 'Auto'
```

```
 Type: 'Edge'
 Position: 0.5000
 Delay: 0
SourceChannelComplexity: 'Scalar'
 Polarity: 'Positive'
 AutoLevel: 1
 Level: 0.5000
 UpperLevel: 0
 LowerLevel: 0
 Hysteresis: 0
 MinTime: 0
 MaxTime: Inf
 Timeout: 0
 Holdoff: 0
```

When you do not want to use a trigger to control when the Simulation Data Inspector updates the plots with fresh data, you can remove the trigger using the `Simulink.sdi.removeTrigger` function.

```
Simulink.sdi.removeTrigger
```

You can verify that the trigger was removed in the Simulation Data Inspector UI or using the `Simulink.sdi.getTrigger` function. The `Simulink.sdi.getTrigger` function returns an empty array of `Simulink.sdi.Signal` objects when no trigger is configured in the Simulation Data Inspector.

```
sig = Simulink.sdi.getTrigger;
size(sig)

ans = 1x2

 0 0
```

## Output Arguments

### **sig** — Signal used to trigger display updates in the Simulation Data Inspector

`Simulink.sdi.Signal` object

Signal used to trigger display updates in the Simulation Data Inspector, returned as a `Simulink.sdi.Signal` object.

### **opts** — Configuration of trigger in the Simulation Data Inspector

structure

Configuration of trigger in the Simulation Data Inspector, returned as a structure that contains these fields:

- Mode
- Type
- Position
- Delay

- SourceChannelComplexity
- Polarity
- AutoLevel
- Level
- UpperLevel
- LowerLevel
- Hysteresis
- MinTime
- MaxTime
- Timeout
- Holdoff

For details on trigger configuration, see “Scope Triggers Panel” and `Simulink.sdi.addTrigger`.

## Simulink.sdi.getUnitSystem

Get current unit system configured in Simulation Data Inspector preferences

### Syntax

```
unitSystem = Simulink.sdi.getUnitSystem
[unitSystem,overrideUnits] = Simulink.sdi.getUnitSystem
```

### Description

`unitSystem = Simulink.sdi.getUnitSystem` returns the unit system configured in the Simulation Data Inspector preferences. For more information about unit preferences, see “Signal Display Units”. To specify unit preferences for the Simulation Data Inspector, use the `Simulink.sdi.setUnitSystem` function.

`[unitSystem,overrideUnits] = Simulink.sdi.getUnitSystem` returns the unit system and override units configured in the Simulation Data Inspector preferences.

### Examples

#### Configure Unit Preferences in the Simulation Data Inspector

To specify a system of units to use for plotting signals in the Simulation Data Inspector, use the `Simulink.sdi.setUnitSystem` function. When you choose to display signals using the SI or US Customary unit system, the Simulation Data Inspector automatically changes the **Display Units** property for logged or imported signals that use units that are not part of the specified unit system. The signal data stored on disk does not change. Signals also have a **Stored Units** property, and the Simulation Data Inspector converts the data to plot the signal when the **Stored Units** and **Display Units** differ.

#### Specify a System of Units

By default, the Simulation Data Inspector displays signals using the units assigned to the signal during simulation or in the imported data. To facilitate analyzing multiple signals and data sets together, you can specify a system of units as a preference. The Simulation Data Inspector automatically updates the **Display Units** for logged or imported signals that use units that are invalid in the specified unit system. For example, a signal logged in a model using units of ft could be updated to use units of m when the system of units is specified as SI.

Use the `Simulink.sdi.setUnitSystem` function to configure the Simulation Data Inspector to display signals using units in the US Customary unit system.

```
Simulink.sdi.setUnitSystem('USCustomary');
```

#### Specify Override Units

When you want all signals that represent the same type of measurement to use the same **Display Units**, you can also specify override units. For example, to plot all signals that represent length using units of ft, specify ft as an override unit.

```
Simulink.sdi.setUnitSystem('USCustomary','Overrides','ft');
```

## Check Unit Configuration

Use the `Simulink.sdi.getUnitSystem` function to check the current unit preferences configured in the Simulation Data Inspector.

```
[unitSystem,overrideUnits] = Simulink.sdi.getUnitSystem
```

```
unitSystem =
'USCustomary'
```

```
overrideUnits =
"ft"
```

## Output Arguments

### **unitSystem** — System of units used to define signal display units

character vector

System of units used to define signal display units, returned as a character vector.

### **overrideUnits** — Units to override signal display units

string | string array

Units to override signal display units, returned as a string or string array. The Simulation Data Inspector displays all signals that represent a measurement type using specified override units. For example, if override units of `in` are specified, the Simulation Data Inspector displays all signals that represent length using units of `in`.

## Simulink.sdi.isPCTSupportEnabled

Determine status and mode for Parallel Computing Toolbox support

### Syntax

```
[enabled,mode] = Simulink.sdi.isPCTSupportEnabled
```

### Description

`[enabled,mode] = Simulink.sdi.isPCTSupportEnabled` returns `enabled`, a logical indication of whether support for the Parallel Computing Toolbox is enabled, and `mode`, the mode of support enabled.

### Examples

#### Check Status of Parallel Worker Support

Before running code that depends on whether automatic import of runs created by parallel workers is enabled, you can use the `Simulink.sdi.isPCTSupportEnabled` function to check the support status. The default behavior for the Simulation Data Inspector enables parallel worker support in `local` mode. In `local` mode, only runs created on local workers automatically import into the Simulation Data Inspector.

```
[enabled, mode] = Simulink.sdi.isPCTSupportEnabled
```

```
enabled =
```

```
 logical
```

```
 1
```

```
mode =
```

```
 'local'
```

### Output Arguments

**enabled** — Logical indicator of parallel worker support

logical

Logical indication of parallel worker support.

- 1 indicates that support for parallel workers is enabled.
- 0 indicates that support for parallel workers is not enabled.

**mode** — Parallel worker support mode

local (default)

Mode of Parallel Computing Toolbox support.

- 'local' — Runs generated on local workers automatically import to the Simulation Data Inspector.
- 'none' — Parallel worker support is disabled.
- 'all' — Runs created from local and remote workers automatically import to the Simulation Data Inspector.
- 'manual' — Support for manual import of runs created by parallel workers using the `Simulink.sdi.sendWorkerRunToClient` function.

## Simulink.sdi.isValidRunID

**Package:** Simulink.sdi

Determine whether a run ID is valid

### Syntax

```
valid = Simulink.sdi.isValidRunID(runID)
```

### Description

`valid = Simulink.sdi.isValidRunID(runID)` returns `true` if `runID` corresponds to a run in the Simulation Data Inspector repository.

### Examples

#### Check Run ID Validity

This example shows how to check whether a run ID is valid. You can use `Simulink.sdi.isValidRunID` to ensure you have valid data throughout your script.

#### Create a Simulation Run

Simulate the model `sldemo_fuelsys` to create a run in the Simulation Data Inspector, and use `Simulink.sdi.getAllRunIDs` to get its run ID.

```
% Simulate model
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')

% Get run ID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

#### Check Run ID Validity

Check to verify that the Simulation Data Inspector has a run corresponding to the run ID.

```
Simulink.sdi.isValidRunID(runID)

ans = logical
 1
```

#### Delete the Run and Check Validity

You can delete runs to clear out memory space or clean up the Simulation Data Inspector UI. When you delete a run, the run ID for that run becomes invalid.

```
Simulink.sdi.deleteRun(runID)

Simulink.sdi.isValidRunID(runID)
```

```
ans = logical
 0
```

## Input Arguments

### **runID** — Simulation Data Inspector run identifier

scalar

Unique numeric identification for the run. The Simulation Data Inspector assigns run IDs when it creates runs. You can get the run ID for your run using `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex`.

## Output Arguments

### **valid** — Run validity indicator

logical

Run validity indicator. When `valid` is `true`, the `runID` is valid. When `valid` is `false`, the `runID` is invalid.

## Version History

**Introduced in R2011b**

## See Also

`Simulink.sdi.getAllRunIDs` | `Simulink.sdi.getRunIDByIndex` |  
`Simulink.sdi.createRun` | `Simulink.sdi.deleteRun` | `Simulink.sdi.compareRuns`

## Topics

“Inspect and Compare Data Programmatically”

## Simulink.sdi.load

**Package:** Simulink.sdi

Load a Simulation Data Inspector session or view

### Syntax

```
valid = Simulink.sdi.load(fileName)
```

### Description

`valid = Simulink.sdi.load(fileName)` loads the data and visualization settings in the Simulation Data Inspector session file or MAT file specified by `fileName` and returns 1 when `fileName` is a valid session file or a MAT file that contains data the Simulation Data Inspector supports.

Simulation Data Inspector views are also saved as MLDATX files. To load a view file, use the `Simulink.sdi.loadView` function.

### Examples

#### Save a Simulation Data Inspector Session

This example creates, saves, and loads a Simulation Data Inspector session. The example logs data in the model `slexAircraftExample` and visualizes the logged data in a Simulation Data Inspector session. Each time you use the Simulation Data Inspector, you create and modify a session. You can save the data and associated visualization settings for a session in an MLDATX file using the `Simulink.sdi.save` function. When you want to review the data later, you can load the session using the `Simulink.sdi.load` function.

#### Log Data to the Simulation Data Inspector

This example logs data from a simulation of the model `slexAircraftExample` to the Simulation Data Inspector. The model is not configured to log data. Load the model and mark the `Stick`, the `alpha`, `rad`, and the `q`, `rad/sec` signals for logging.

```
load_system('slexAircraftExample')

Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')
```

For this example, run two simulations of the model. In the first simulation, use the sine wave output from the `Pilot` block, and in the second, use the square wave output.

```
set_param('slexAircraftExample/Pilot','WaveForm','sine')
sim('slexAircraftExample')

set_param('slexAircraftExample/Pilot','WaveForm','square')
sim('slexAircraftExample')
```

## Visualize the Logged Data

You can use the Simulation Data Inspector programmatic interface to access the logged data from the simulations. When you access data using the Simulation Data Inspector programmatic interface, you can use functions to create plots in the Simulation Data Inspector.

To start, access the run IDs for the most recent two runs and then get the corresponding `Simulink.sdi.Run` object. The Run objects allow you to access the logged data for the simulations.

```
runIDs = Simulink.sdi.getAllRunIDs;
sineRunID = runIDs(end-1);
squareRunID = runIDs(end);

sineRun = Simulink.sdi.getRun(sineRunID);
squareRun = Simulink.sdi.getRun(squareRunID);
```

Suppose you want to analyze the relationship between the input and output for the model. Get the `Simulink.sdi.Signal` objects for the input and output signals from the two simulation runs.

```
sineOut = getSignalByIndex(sineRun,1);
sineIn = getSignalByIndex(sineRun,3);

squareOut = getSignalByIndex(squareRun,1);
squareIn = getSignalByIndex(squareRun,3);
```

Change the subplot layout in the Simulation Data Inspector to 2-by-1 and plot the signals from the first simulation run on the top plot and the signals from the second run on the bottom plot.

```
Simulink.sdi.setSubPlotLayout(2,1)

plotOnSubPlot(sineIn,1,1,true)
plotOnSubPlot(sineOut,1,1,true)

plotOnSubPlot(squareIn,2,1,true)
plotOnSubPlot(squareOut,2,1,true)
```

## Save the Simulation Data Inspector Session

To view the plotted data in the Simulation Data Inspector, enter `Simulink.sdi.view` in the command window.

Then, save the Simulation Data Inspector session as an MLDATX file.

```
Simulink.sdi.save('myData.mldatx')
```

## Load the Simulation Data Inspector Session

To mimic a scenario where you want to return to looking at the same data at a later point, clear the data from the Simulation Data Inspector and reset the subplot layout to 1-by-1.

```
Simulink.sdi.clear
Simulink.sdi.setSubPlotLayout(1,1)
```

Load the session file and resume working with the data. You can open the Simulation Data Inspector and view the results using the `Simulink.sdi.view` function.

```
Simulink.sdi.load('myData.mldatx');
```

## Input Arguments

### **fileName** — Name of session file or MAT file

string | character vector

Name of the session file or MAT file to load, specified as a string or character vector. You must specify the file extension to load data from an MLDATX file.

Example: 'myData.mldatx'

Example: 'myData.mat'

## Output Arguments

### **valid** — File validity indicator

logical

File validity indicator, returned as 1 (true) or 0 (false). A return value of 0 indicates that the Simulation Data Inspector did not load the session file or did not import data from the MAT file.

## Version History

**Introduced in R2011b**

## See Also

[Simulink.sdi.save](#) | [Simulink.sdi.close](#) | [Simulink.sdi.saveView](#) | [Simulink.sdi.loadView](#)

“View Data in the Simulation Data Inspector”

# Simulink.sdi.loadView

Load a view file to visualize data in the Simulation Data Inspector

## Syntax

```
Simulink.sdi.loadView(filename)
```

## Description

`Simulink.sdi.loadView(filename)` applies the visualization information in the view file, `filename`, to the data in the Simulation Data Inspector.

A view contains information about the layout and plots in the graphical viewing area as well as properties of plotted signals. When you load a view, the Simulation Data Inspector uses the properties and preferences in the file to display data currently in the Simulation Data Inspector. Signals in the Simulation Data Inspector that align with the signals in the view are plotted in the graphical viewing area. Use a view to apply a consistent set of visualization settings to multiple sets of similar data.

The view file includes the following information:

- Subplot layout and visualization type
- Settings for each visualization type in the layout
- Signal selection mode
- Replay controls visibility
- Metadata displayed in the work area
- Settings for signal grouping in the work area
- Plotted signals and the line style and color for each plotted signal

A view file does not contain data. To load a session file that contains data and visualization information, use the `Simulink.sdi.load` function.

## Examples

### Save and Use a View

This example visualizes the output from the `ex_vdp` model, saves the configuration as a view, and then uses the view to visualize the output from another simulation of the same model.

To generate data to plot in the Simulation Data Inspector, simulate the model.

```
open_system('ex_vdp')
set_param('ex_vdp/Mu', 'Gain', '1')
sim('ex_vdp');
```

### Programmatically Configure and Save a View

The `ex_vdp` model is configured to log two signals, `x1` and `x2`. Plot each signal on a subplot in a 2-by-1 layout.

```
Simulink.sdi.setSubPlotLayout(2,1)
```

To plot one signal on each subplot, first access the `Simulink.sdi.Run` object for the simulation.

```
runIDs = Simulink.sdi.getAllRunIDs;
ex_vdpRunID = runIDs(end);
ex_vdpRun = Simulink.sdi.getRun(ex_vdpRunID);
```

Then, you can access the data for each signal in a `Simulink.sdi.Signal` object and use the `plotOnSubPlot` function to specify where to plot each signal.

```
x1 = getSignalByIndex(ex_vdpRun,1);
x2 = getSignalByIndex(ex_vdpRun,2);
```

```
plotOnSubPlot(x1,1,1,true)
plotOnSubPlot(x2,2,1,true)
```

To view the result in the Simulation Data Inspector, enter `Simulink.sdi.view` in the command window.

Then, save the view.

```
Simulink.sdi.saveView('ex_vdpView.mldatx')
```

## Use the View

To mimic a situation where the Simulation Data Inspector is configured differently and contains data from another simulation, this example clears data from the Simulation Data Inspector, loads a view that represents the default visualization configuration, and runs another simulation of the `ex_vdp` model.

```
Simulink.sdi.clear
Simulink.sdi.loadView('default.mldatx');
set_param('ex_vdp/Mu', 'Gain', '2')
sim('ex_vdp');
```

Use the `Simulink.sdi.loadView` function to apply the saved view from the previous simulation.

```
Simulink.sdi.loadView('ex_vdpView.mldatx')
```

You can open the Simulation Data Inspector to view the results using the `Simulink.sdi.view` function. The saved view includes information regarding the axes limits. When you use a view to apply visualization settings, you may need to adjust axes limits or zoom levels to fit data from a modified simulation.

## Input Arguments

**filename** — Name of the view file  
string | character vector

Name of the view file, specified as a string or character vector. You can specify `filename` as only the file name when the file is on the MATLAB path, or you can specify a full path to the file.

Example: `'myView.mldatx'`

Data Types: `char` | `string`

## **Version History**

# Simulink.sdi.markSignalForStreaming

**Package:** Simulink.sdi

Turn logging on or off for a signal

## Syntax

```
Simulink.sdi.markSignalForStreaming(block,portIndex,log)
Simulink.sdi.markSignalForStreaming(portHandle,log)
Simulink.sdi.markSignalForStreaming(lineHandle,log)
```

## Description

`Simulink.sdi.markSignalForStreaming(block,portIndex,log)` marks the signal on the specified `portIndex` of the specified block for logging when you specify `log` as 'on'. To stop logging a signal, specify `log` as 'off'.

`Simulink.sdi.markSignalForStreaming(portHandle,log)` marks the signal on the port specified by `portHandle` for logging when you specify `log` as 'on'. To stop logging a signal, specify `log` as 'off'.

`Simulink.sdi.markSignalForStreaming(lineHandle,log)` marks the signal with the specified `lineHandle` for logging when you specify `log` as 'on'. To stop logging a signal, specify `log` as 'off'.

## Examples

### Mark Signals for Logging with Port Handles

This example shows how to mark signals for logging using port handles.

### Load Model and Mark Signals for Streaming

User `get_param` to get the port handles for the blocks with your signals of interest. Then, use the handle to mark the desired signals for logging.

```
load_system('vdp')

% Get port handles
x1_handles = get_param('vdp/x1','PortHandles');
x1 = x1_handles.Outputport(1);
x2_handles = get_param('vdp/x2','PortHandles');
x2 = x2_handles.Outputport(1);

% Mark signals for streaming
Simulink.sdi.markSignalForStreaming(x1,'on');
Simulink.sdi.markSignalForStreaming(x2,'on');
```

### Simulate Model and View Signals in the Simulation Data Inspector

Simulate the model and then open the Simulation Data Inspector to view the logged signals.

```
sim('vdp');
Simulink.sdi.view
```

### Mark Signals for Logging Using Line Handles

Load the model `slexAircraftExample`, and use `get_param` to get handles for the signals in the model. Then, use the line handles to mark signals of interest for logging.

```
load_system('slexAircraftExample')
```

Use the `get_param` function to get the line handles for the signals in the model.

```
lines = get_param('slexAircraftExample','Lines');
```

Use the `Simulink.sdi.markSignalForStreaming` function to mark two of the signals for logging using the line handles.

```
sig1handle = lines(1).Handle;
sig2handle = lines(2).Handle;

Simulink.sdi.markSignalForStreaming(sig1handle,'on')
Simulink.sdi.markSignalForStreaming(sig2handle,'on')
```

Simulate the model then open the Simulation Data Inspector to view the logged signal data.

```
out = sim('slexAircraftExample');
Simulink.sdi.view
```

## Input Arguments

### **block** — Source block path or handle

character vector

Block path for the block with the desired signal connected to one of its outputs.

Example: `'slexAircraftExample/Pilot'`

### **portIndex** — Source block output port index

integer

Index of the port connected to the signal you want to mark for streaming.

Example: `1`

### **log** — Logging state

'on' | 'off'

Logging state desired for signal.

- 'on' -- Turn logging on for a signal.
- 'off' -- Turn logging off for a signal.

**portHandle — Source block output port handle**

handle

Port handle for the source block's output port that connects to the signal.

Example: `x1_handles.Outputport(1)`

**lineHandle — Signal line handle**

handle

Line handle for the signal.

Example: `lines(1).Handle`

## Version History

**Introduced in R2015b**

## Simulink.sdi.registerCursorCallback

Register callback for cursor movements in the Simulation Data Inspector

### Syntax

```
callbackID = Simulink.sdi.registerCursorCallback(func)
callbackID = Simulink.sdi.registerCursorCallback(func,view)
```

### Description

`callbackID = Simulink.sdi.registerCursorCallback(func)` registers the callback function associated with the function handle `func` with the Simulation Data Inspector. The Simulation Data Inspector executes the callback when you move a cursor or change the number of cursors displayed on the **Inspect** pane.

`callbackID = Simulink.sdi.registerCursorCallback(func,view)` registers the callback function associated with the function handle `func` with the Simulation Data Inspector. The Simulation Data Inspector executes the callback when you move a cursor or change the number of cursors displayed on the pane specified by `view`.

### Examples

#### Use Simulation Data Inspector Cursor Callback in App Designer App

You can use a Simulation Data Inspector cursor callback function to send cursor position data to an app you build using the App Designer. This example shows how to add a property to the app to store the callback ID and where to register and unregister the cursor callback. For an example of an App Designer app that uses a cursor callback, see “Synchronize Cursors in the Simulation Data Inspector with an App Designer App”.

Add a `callbackID` property to the app object.

```
properties (Access = private)
 callbackID
end
```

Define the behavior of the cursor callback function.

```
methods (Access = public)
 function myCursorCallback(app,~,~)
 if isvalid(app)
 ...
 end
 end
end
```

Register the cursor callback in the app `startupFcn`. This example registers the same callback on the **Inspect** pane and the **Compare** pane.

```
function startupFcn(app)
 app.callbackID = Simulink.sdi.registerCursorCallback(...
```

```

 @(t1,t2)myCursorCallback(app,t1,t2));
 app.callbackID(2) = Simulink.sdi.registerCursorCallback(...
 @(t1,t2)myCursorCallback(app,t1,t2), 'compare');
 ...
end

```

Unregister the cursor callback in the app UIFigureCloseRequest function.

```

function myAppUIFigureCloseRequest(app, event)
 Simulink.sdi.unregisterCursorCallback(app.callbackID(1));
 Simulink.sdi.unregisterCursorCallback(app.callbackID(2));
end

```

## Input Arguments

### func — Cursor callback to register

function handle

Cursor callback to register, specified as a function handle. The function that corresponds to the function handle must accept two input arguments, `t1` and `t2`, that correspond to the left and right cursor positions. When no cursors are displayed, `t1` and `t2` are NaN. When only one cursor is displayed, `t2` is NaN.

Example: `id = Simulink.sdi.registerCursorCallback(@(t1,t2)myFunc(t1,t2))` registers the function `myFunc` as the callback for cursor events on the **Inspect** pane of the Simulation Data Inspector.

Data Types: `function_handle`

### view — Cursor event source

'inspect' (default) | 'compare'

Cursor event source, specified as 'inspect' or 'compare'.

- 'inspect' — Register callback for cursor events on the **Inspect** pane.
- 'compare' — Register callback for cursor events on the **Compare** pane.

The registered cursor callback executes for each cursor event. Cursor events occur when you move cursors or change the number of visible cursors.

Data Types: `char` | `string`

## Output Arguments

### callbackID — Registered callback ID

scalar

Registered callback ID, returned as a scalar. Use the callback ID to unregister the callback.

## Version History

Introduced in R2021a

## **See Also**

### **Functions**

`Simulink.sdi.unregisterCursorCallback` | `Simulink.sdi.setCursorPositions` |  
`Simulink.sdi.getCursorPositions` | `Simulink.sdi.setNumCursors` |  
`Simulink.sdi.getNumCursors`

### **Topics**

“Synchronize Cursors in the Simulation Data Inspector with an App Designer App”

# Simulink.sdi.removeTrigger

Remove trigger from signal in the Simulation Data Inspector

## Syntax

```
Simulink.sdi.removeTrigger
```

## Description

`Simulink.sdi.removeTrigger` removes the trigger from a signal in the Simulation Data Inspector. If a trigger exists in the Simulation Data Inspector, adding a trigger to a different signal also removes the existing trigger.

## Examples

### Programmatically Configure Triggers in the Simulation Data Inspector

Add a trigger to a signal in the Simulation Data Inspector to specify criteria that determine when to update plots to display fresh data. Triggers can allow you to capture transient signal behavior and can help stabilize the display of periodic signals so you can take measurements.

Simulate the Triggers model. Data in the model logs to the Simulation Data Inspector.

```
open_system('Triggers');
out = sim('Triggers');
```

Then, add a trigger to the Pulse signal. Configure the trigger as a falling-edge trigger with a threshold of 0.5.

```
trigRun = Simulink.sdi.getCurrentSimulationRun('Triggers');
pulseSig = getSignalsByName(trigRun,'Pulse');
Simulink.sdi.addTrigger(pulseSig,'Type','Edge','Level',0.5);
```

You can verify that the trigger was added and configured correctly by opening the Simulation Data Inspector using `Simulink.sdi.view` and clicking the trigger icon next to the Pulse signal to check the configuration. You can also use the `Simulink.sdi.getTrigger` function to check which signal is used to generate trigger events and the trigger configuration.

```
[sig,trigOpts] = Simulink.sdi.getTrigger;
```

```
sig.Name
```

```
ans =
'Pulse'
```

```
trigOpts
```

```
trigOpts = struct with fields:
 Mode: 'Auto'
 Type: 'Edge'
 Position: 0.5000
```

```
 Delay: 0
SourceChannelComplexity: 'Scalar'
 Polarity: 'Positive'
 AutoLevel: 1
 Level: 0.5000
 UpperLevel: 0
 LowerLevel: 0
 Hysteresis: 0
 MinTime: 0
 MaxTime: Inf
 Timeout: 0
 Holdoff: 0
```

When you do not want to use a trigger to control when the Simulation Data Inspector updates the plots with fresh data, you can remove the trigger using the `Simulink.sdi.removeTrigger` function.

```
Simulink.sdi.removeTrigger
```

You can verify that the trigger was removed in the Simulation Data Inspector UI or using the `Simulink.sdi.getTrigger` function. The `Simulink.sdi.getTrigger` function returns an empty array of `Simulink.sdi.Signal` objects when no trigger is configured in the Simulation Data Inspector.

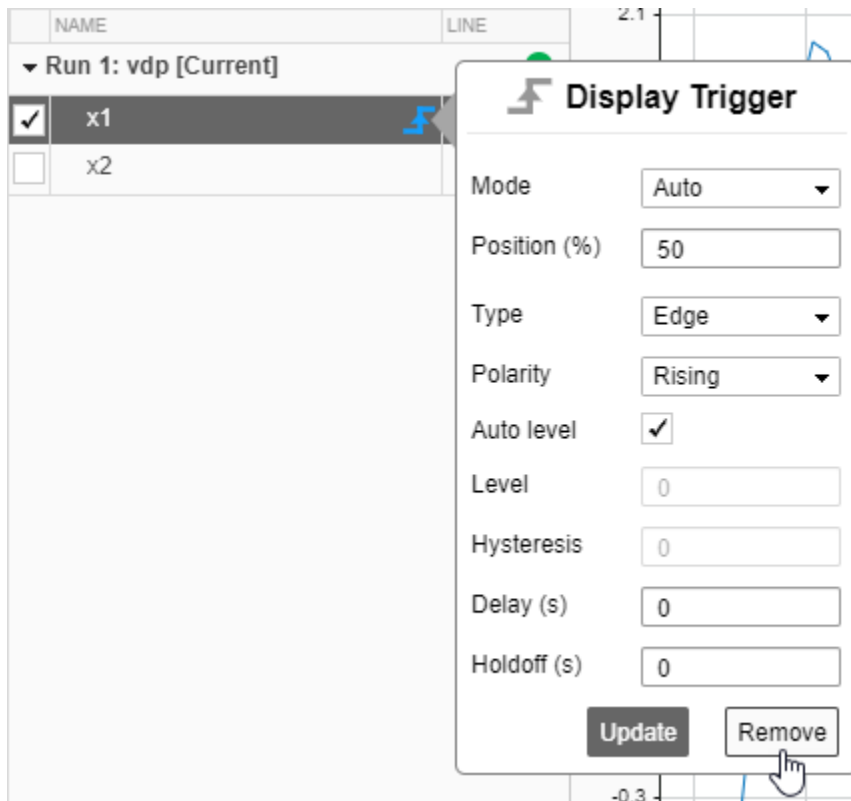

```
sig = Simulink.sdi.getTrigger;
size(sig)
```

```
ans = 1x2
```

```
 0 0
```

## Alternative Functionality

To remove a trigger from a signal using the Simulation Data Inspector UI, click the trigger symbol next to the signal, then click **Remove**.

## Version History

Introduced in R2020b

### Functions

[Simulink.sdi.getTrigger](#) | [Simulink.sdi.addTrigger](#)

### Topics

“Control Display of Streaming Data Using Triggers”

“Inspect and Compare Data Programmatically”

## Simulink.sdi.report

**Package:** Simulink.sdi

Generate a Simulation Data Inspector report

### Syntax

```
Simulink.sdi.report
Simulink.sdi.report(Name,Value)
```

### Description

`Simulink.sdi.report` creates a report that contains plot snapshots and metadata for signals plotted in the **Inspect** pane of the Simulation Data Inspector.

`Simulink.sdi.report(Name,Value)` creates a report as specified by one or more `Name,Value` pair arguments. Using this syntax, you can create a report of data plotted in the **Inspect** pane or a report of comparison results. You can specify details for each report.

### Examples

#### Create a Report for Plotted Signals

Create a report that contains information about and plots of the signals plotted in the **Inspect** pane of the Simulation Data Inspector. By default, the report contains the metadata displayed for signals in the table on the **Inspect** pane. This example shows how to specify which metadata to include in the report.

#### Load the Session File

This example populates the Simulation Data Inspector with data and plotted signals by loading a saved session file. A session file contains the signal data as well as information about plotted signals and plot layout. Load the session file.

```
Simulink.sdi.load('ex_sl-demo_absbrake_slp_Ww.mldatx');
```

## Create a Report for Plotted Signals

The report includes plots and metadata for the plotted signals. By default, the report includes the metadata that corresponds to the columns displayed in the signals table on the **Inspect** pane. You can include more data in the report by displaying more columns in the **Inspect** pane. You can also specify the information you want in the report programmatically using the 'ColumnsToReport' name-value pair and the enumeration class `Simulink.sdi.SignalMetaData`.

```
signalMetadata = [Simulink.sdi.SignalMetaData.Run, ...
 Simulink.sdi.SignalMetaData.Line, ...
 Simulink.sdi.SignalMetaData.BlockName, ...
 Simulink.sdi.SignalMetaData.SignalName];

Simulink.sdi.report('ReportType','Inspect', 'ReportOutputFile', ...
 'absbrake_slp_report.html', 'ColumnsToReport', signalMetadata);
```

The report shows tables of the metadata for plotted signals, organized by run, above a snapshot of the plot.

## Create a Report for Comparison Results

Use the `Simulink.sdi.report` function to create a report of comparison results. The report is web-based and interactive, and you can switch between the interactive view and a printable view.

## Load Comparison Results

This example loads previously computed comparison results that were saved in an MLDATX file using the `saveResult` function. The data came from two simulations of the `slexAircraftExample` model that used different time constant values for the input filter.

```
Simulink.sdi.load('slexAircraftExampleTsComparison.mldatx');
```

## Create Comparison Report

Create a report that contains the comparison results using the `Simulink.sdi.report` function. You can specify a title and author for the report that display in the report header.

```
Simulink.sdi.report('ReportType','Compare','ReportTitle',...
 'Compare: Ts = 0.1 vs Ts = 1','ReportAuthor','Jane Smith');
```

The report opens in the system browser once it is generated. Select signals to see the results displayed in the plot and the metadata for the signals in the **Properties** pane. The report HTML file is in the `sdireports` folder in the working directory.

## Input Arguments

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `'ReportType','Compare','ShortenBlockPath',true`

### ReportType — Type of report to create

`'Inspect'` (default) | `'Compare'`

Type of report to create, specified as the comma-separated pair consisting of `'ReportType'` and `'Inspect'` or `'Compare'`.

- `'Inspect'` -- Create a report that contains plot snapshots and metadata for signals plotted in the **Inspect** pane of the Simulation Data Inspector.
- `'Compare'` -- Create a report that summarizes comparison results. The comparison report is interactive and includes plot snapshots of comparison results as well as metadata for the compared signals.

Example: `'ReportType','Compare'`

### ReportTitle — Report title displayed in header for comparison report

`'Compare: <Baseline Run> vs. <Compare To Run>'` (default) | character vector

Report title displayed in header for comparison report, specified as the comma-separated pair consisting of `'ReportTitle'` and a character vector.

You can only specify a report title for a comparison report.

Example: `'ReportTitle','Trial 1 vs. Trial 2'`

**ReportAuthor — Report author displayed in header for comparison report**

'<username>' (default) | character vector

Report author displayed in header for comparison report, specified as the comma-separated pair consisting of 'ReportAuthor' and a character vector.

You can only specify a report author for a comparison report.

Example: 'ReportAuthor','John Smith'

**ReportOutputFolder — Folder where report is saved**

'<current working folder>/sdireports' (default) | path

Folder where report is saved, specified as the comma-separated pair consisting of 'ReportOutputFolder' and a character vector.

Example: 'ReportOutputFolder','C:\Users\user1\Desktop'

**ReportOutputFile — Report file name**

'SDI\_report.html' (default) | character vector

Report file name, specified as the comma-separated pair consisting of 'ReportOutputFile' and a character vector.

Example: 'ReportOutputFile','MyReport.html'

**PreventOverwritingFile — Whether to prevent overwriting report files**

true (default) | false

Whether to prevent overwriting report files, specified as the comma-separated pair consisting of 'PreventOverwritingFile' and true or false.

- true enables file overwrite protection.
- false disables file overwrite protection.

File overwrite protection prevents the Simulation Data Inspector from overwriting an existing file by appending the file name with a number that increments each time you generate a report. When you disable file overwrite protection, the Simulation Data Inspector overwrites the existing report file unless you specify a unique file name.

Example: 'PreventOverwritingFile',false

**ColumnsToReport — Signal metadata to include in report for plotted signals**

array

Signal metadata to include in the report of signals plotted in the **Inspect** pane of the Simulation Data Inspector, specified as the comma-separated pair consisting of 'ColumnsToReport' and an array. By default, the **Inspect** report includes the block path, name, line style and color, and data source parameters for each plotted signal.

---

**Note** The `ColumnsToReport` input does not affect comparison reports. The comparison report always includes all signal metadata, and the summary at the top of the comparison report always includes the signal name, absolute tolerance, relative tolerance, maximum difference, and result for each signal comparison.

---

Specify metadata to include as an array, using the enumeration class `Simulink.sdi.SignalMetaData`. For example, to include the name of the simulation run and signal name:

```
signal_metadata = [Simulink.sdi.SignalMetaData.Run,...
 Simulink.sdi.SignalMetaData.SignalName];
```

Then, specify `ColumnsToReport` as `signal_metadata` in the name-value pair:

```
Simulink.sdi.report('ColumnsToReport',signal_metadata)
```

The table summarizes the metadata available for Inspect report.

| Column Value         | Description                                                                                    |
|----------------------|------------------------------------------------------------------------------------------------|
| SignalName (default) | Signal name                                                                                    |
| Line (default)       | Signal line style and color                                                                    |
| SID                  | Automatically assigned Simulink identifier                                                     |
| Units                | Signal measurement units                                                                       |
| SigDataType          | Signal data type                                                                               |
| SigSampleTime        | Method used to sample the signal                                                               |
| Model                | Name of the model that generated the signal                                                    |
| BlockName            | Name of the source block for the signal                                                        |
| BlockPath            | Path to the source block for the signal                                                        |
| Port                 | Index of the signal on the output port of its block                                            |
| Dimensions           | Dimensions of the matrix containing the signal                                                 |
| Channel              | Index of signal within matrix                                                                  |
| Run                  | Name of the simulation run containing the signal                                               |
| AbsTol               | Absolute tolerance for the signal                                                              |
| RelTol               | Relative tolerance for the signal                                                              |
| OverrideGlobalTol    | Property that specifies whether signal tolerances take priority over global tolerances         |
| TimeTol              | Time tolerance for the signal                                                                  |
| InterpMethod         | Interpolation method                                                                           |
| SyncMethod           | Synchronization method used to coordinate signals for comparison                               |
| TimeSeriesRoot       | Name of the variable associated with the signal for signals imported from the MATLAB workspace |
| TimeSource           | Name of the array containing the time data for signals imported from the MATLAB workspace      |
| DataSource           | Name of the array containing the signal data for signals imported from the MATLAB workspace    |

Example: `'ColumnsToReport',metadata`

### ShortenBlockPath — Whether to shorten block path in report

`true` (default) | `false`

Whether to shorten block path in report, specified as the comma-separated pair consisting of 'ShortenBlockPath' and true or false.

- `true` -- Use the shortened block path in the report.
- `false` -- Include the full block path in the report.

Example: 'ShortenBlockPath', false

### **LaunchReport — Whether to open report when created**

true (default) | false

Whether to open the report when it is created, specified as the comma-separated pair consisting of 'LaunchReport' and true or false.

- `true` -- Open the report when it is created.
- `false` -- Do not open the report automatically.

Example: 'LaunchReport', false

### **SignalsToReport — Signals to include in comparison report**

'ReportOnlyMismatchedSignals' (default) | 'ReportAllSignals'

Signals to include in a comparison report, specified as the comma-separated pair consisting of 'SignalsToReport' and 'ReportOnlyMismatchedSignals' or 'ReportAllSignals'.

- `ReportOnlyMismatchedSignals` -- Include only signals with out of tolerance comparison results.
- `ReportAllSignals` -- Include all signals.

Example: 'SignalsToReport', 'ReportAllSignals'

## **Version History**

### **Introduced in R2011b**

#### **ReportStyle input ignored**

*Behavior changed in R2020b*

Starting in R2020b, the `ReportStyle` name-value pair input is ignored.

In R2020a, you could use the `Simulink.sdi.report` function to create two separate types of comparison report, and you could use the `ReportStyle` name-value pair to indicate the type of report to create.

From R2020b, the Simulation Data Inspector only produces one comparison report. You can switch between the interactive and printable view within the report.

# Simulink.sdi.resetRunNamingRule

**Package:** Simulink.sdi

Revert the Simulation Data Inspector run naming rule to default

## Syntax

Simulink.sdi.resetRunNamingRule

## Description

Simulink.sdi.resetRunNamingRule resets the run naming rule the Simulation Data Inspector uses to assign a name to runs created through simulating a Simulink model to its default 'Run <run\_index>: <model\_name>'.

## Examples

### Modify then Reset Run Naming Rule

This example shows how to use the Simulation Data Inspector API to modify the Simulation Data Inspector run naming rule, check a run's name, reset the run naming rule to its default, and check the run naming rule.

```
% Load model
load_system('sldemo_fuelsys')

% Modify run naming rule
Simulink.sdi.setRunNamingRule('<model_name> Run <run_index>')

% Simulate system
sim('sldemo_fuelsys')

% Check run name
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
run = Simulink.sdi.getRun(runID);
run.name

ans =
'sldemo_fuelsys Run 1'

% Reset the run naming rule
Simulink.sdi.resetRunNamingRule

% Check run naming rule
Simulink.sdi.getRunNamingRule

ans =
'Run <run_index>: <model_name>'
```

## Alternatives

You can reset the run naming rule to its default using the Simulation Data Inspector UI. Use the **Restore Defaults** button on the **New Run** tab under Simulation Data Inspector **Preferences**.

`Simulink.sdi.clearPreferences` restores the run naming rule, along with all other Simulation Data Inspector preferences.

## Version History

Introduced in R2015a

# Simulink.sdi.Run.create

Import data into new run in Simulation Data Inspector and return `Simulink.sdi.Run` object

## Syntax

```
runObj = Simulink.sdi.Run.create
runObj = Simulink.sdi.Run.create(runName)

runObj = Simulink.sdi.Run.create(var)
runObj = Simulink.sdi.Run.create(runName, 'vars', var, var2, ..., varn)
runObj = Simulink.sdi.Run.create(runName, 'namevalue', sourceNames, sigValues)

runObj = Simulink.sdi.Run.create(runName, 'file', filename)
runObj = Simulink.sdi.Run.create(runName, 'file', filename, Name=Value)
```

## Description

### Create Empty Run

`runObj = Simulink.sdi.Run.create` creates the empty `Simulink.sdi.Run` object, `runObj`. You can add signals to the Run object using the `add` function or the `Simulink.sdi.addToRun` function.

`runObj = Simulink.sdi.Run.create(runName)` creates an empty run named `runName`.

### Import Data from Workspace

`runObj = Simulink.sdi.Run.create(var)` imports data from the scalar variable `var` into a new run in the Simulation Data Inspector. The run is named according to the input variable. For example, when `var` is a `timeseries` object, the run name comes from the `Name` property on the `timeseries` object.

`runObj = Simulink.sdi.Run.create(runName, 'vars', var, var2, ..., varn)` imports data from one or more variables into a new run in the Simulation Data Inspector named `runName`.

Use this syntax to import data from multiple variables or from a variable that represents an array of objects, such as an array of `Simulink.SimulationOutput` or `Simulink.SimulationData.Dataset` objects.

`runObj = Simulink.sdi.Run.create(runName, 'namevalue', sourceNames, sigValues)` imports data from one or more variables into a new run in the Simulation Data Inspector named `runName`. The cell array `sourceNames` specifies the names used to set the `RootSource`, `TimeSource`, and `DataSource` properties for the signals imported from the `sigValues` cell array.

### Import Data from File

`runObj = Simulink.sdi.Run.create(runName, 'file', filename)` imports data from a file into a new run in the Simulation Data Inspector named `runName`. You can use a built-in file reader to import data from a MAT file, CSV file, Microsoft Excel file, or an MDF file.

When you need to import data from a file that the built-in readers do not support, you can write your own reader using the `io.reader` class.

`runObj = Simulink.sdi.Run.create(runName, 'file', filename, Name=Value)` imports data from a file into a new run in the Simulation Data Inspector according to options specified using one or more name-value arguments. For example, `sheets=["sheet1" "sheet2"]` specifies the sheets from which to import data when importing data from an Excel file.

## Examples

### Create a Run in the Simulation Data Inspector

You can programmatically import data into the Simulation Data Inspector by creating a run from data in the base workspace or a file. This example creates data in the workspace and then illustrates several methods of creating a Simulation Data Inspector run containing the data.

#### Create Data

Create data in the workspace. The Simulation Data Inspector supports time series data in many formats. This example creates data using the `timeseries` and `Simulink.SimulationData.Dataset` formats and saves the data in a MAT-file.

Create a sine signal and a cosine signal. Store the data for each signal in a `timeseries` object with a descriptive name.

```
time = 0:0.2:20;

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

You can use the `Dataset` format to group related signal data together in a single object. The `Dataset` format is the default format for logged data and is supported for loading simulation input data. Create a `Dataset` object that contains the sinusoid `timeseries` data.

```
sinusoids_ds = Simulink.SimulationData.Dataset;
sinusoids_ds = addElement(sinusoids_ds,cos_ts);
sinusoids_ds = addElement(sinusoids_ds,sine_ts);
```

Scale each signal by a factor of 2 and create a `Dataset` object to contain the signal data for the results.

```
doubSine = 2*sine_ts;
doubCos = 2*cos_ts;

doubSinusoids_ds = Simulink.SimulationData.Dataset;
doubSinusoids_ds = addElement(doubSinusoids_ds,doubSine);
doubSinusoids_ds = addElement(doubSinusoids_ds,doubCos);
```

Finally, save the `timeseries` data to a MAT-file.

```
save sinusoids.mat sine_ts cos_ts
```

## Open the Simulation Data Inspector

To view the runs you create in each section, open the Simulation Data Inspector by entering `Simulink.sdi.view` in the MATLAB™ Command Window.

## Create a Run Using a Simulink.sdi.Run Object

You can import your data into a run in the Simulation Data Inspector by creating an empty run and then adding data to the run from the workspace or a file. Depending on your task, you can use the `Simulink.sdi.Run.create` function or the `Simulink.sdi.createRun` function to create the empty run. The `Simulink.sdi.Run.create` function returns the `Simulink.sdi.Run` object for the new run, and the `Simulink.sdi.createRun` function returns the run ID for the new run.

This example creates an empty run using the `Simulink.sdi.Run.create` function, gives the run a meaningful name and description, and then adds the sine and cosine timeseries data using the `add` function.

```
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals of different frequencies';

add(sinusoidsRun,'vars',sine_ts,cos_ts)
```

This example uses the `Simulink.sdi.createRun` function to create a new run in the Simulation Data Inspector called `My Waves` and then uses the `Simulink.sdi.addToRun` function to add the sine and cosine timeseries data to the run.

```
runID = Simulink.sdi.createRun('My Waves');
signalID = Simulink.sdi.addToRun(runID,'vars',sine_ts,cos_ts);
```

## Create a Run from a Workspace Variable

You can create a run from a single variable in the workspace. After creating the run, you can add additional data, or you can create another run to contain your other data. The variable you use to create the run can be a timeseries object with data that corresponds to only one signal, or it can be a Dataset object that contains several signals.

When you use this syntax to create a run from a single workspace variable, the run takes the same name as the object used to create it.

```
runID = Simulink.sdi.createRun(sine_ts);
```

The `Simulink.sdi.createRun` function returns the run ID for the run it creates. You can use the `Simulink.sdi.getRun` function to access the Run object for the run.

```
sineRun = Simulink.sdi.getRun(runID);
sineRun.Name
```

```
ans =
'Sine, T=5'
```

## Create a Run from Multiple Workspace Variables

When your data exists in multiple variables in your workspace, you can use the `Simulink.sdi.createRun` function with the `vars` option to import the data from multiple variables into a single run in the Simulation Data Inspector. You can also use this syntax to create a run for a single variable that uses a name you specify.

This example creates a run called `My Sinusoids` that contains data for the sine and cosine `timeseries` objects.

```
runID = Simulink.sdi.createRun('My Sinusoids','vars',sine_ts,cos_ts);
```

### Create a Run and Specify Source Names

You can use the `namevalue` option of the `Simulink.sdi.createRun` function to create a run and specify names for the signals in the run. This syntax can be particularly helpful when you import individual leaf signals from hierarchical data.

This example creates a run containing the data for both the `Dataset` objects. Each `Dataset` object contains data for more than one signal, so the imported run data has hierarchy. The name-value syntax in this example specifies a name for the hierarchical node that corresponds to each `Dataset` object.

```
runID = Simulink.sdi.createRun('Waves','namevalue',{'Sinusoids',...
 'BigSinusoids'},{sinusoids_ds,doubSinusoids_ds});
```

### Create a Run from Data in a File

You can also use the `Simulink.sdi.createRun` function to import data into the Simulation Data Inspector from a file. Use the `file` option to import the data in the `sinusoids.mat` file.

```
runID = Simulink.sdi.createRun('Wave Data','file','sinusoids.mat');
```

### Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

#### Create Data for the Run

Create `timeseries` objects to contain data for a sine signal and a cosine signal. Give each `timeseries` object a descriptive name.

```
time = linspace(0,20,100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

#### Create a Run and Add Data

Use the `Simulink.sdi.view` function to open the Simulation Data Inspector.

```
Simulink.sdi.view
```

To import data into the Simulation Data Inspector from the workspace, create a `Simulink.sdi.Run` object using the `Simulink.sdi.Run.create` function. Add information about the run to its metadata using the `Name` and `Description` properties of the `Run` object.

```
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals with different frequencies';
```

Use the `add` function to add the data you created in the workspace to the empty run.

```
add(sinusoidsRun, 'vars', sine_ts, cos_ts);
```

### Plot the Data in the Simulation Data Inspector

Use the `getSignalByIndex` function to access `Simulink.sdi.Signal` objects that contain the signal data. You can use the `Simulink.sdi.Signal` object properties to specify the line style and color for the signal and plot it in the Simulation Data Inspector. Specify the `LineColor` and `LineDashed` properties for each signal.

```
sine_sig = getSignalByIndex(sinusoidsRun,1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';
```

```
cos_sig = sinusoidsRun.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.LineDashed = '--';
```

Use the `Simulink.sdi.setSubPlotLayout` function to configure a 2-by-1 subplot layout in the Simulation Data Inspector plotting area. Then use the `plotOnSubplot` function to plot the sine signal on the top subplot and the cosine signal on the lower subplot.

```
Simulink.sdi.setSubPlotLayout(2,1);
```

```
plotOnSubPlot(sine_sig,1,1,true);
plotOnSubPlot(cos_sig,2,1,true);
```

### Close the Simulation Data Inspector and Save Your Data

When you have finished inspecting the plotted signal data, you can close the Simulation Data Inspector and save the session to an MLDATX file.

```
Simulink.sdi.close('sinusoids.mldatx')
```

## Input Arguments

### runName — Name for run

string | character vector

Name for run in Simulation Data Inspector, specified as a string or a character vector.

Example: 'Baseline Simulation'

### var — Data to import

variable

Data to import, specified as a variable. The Simulation Data Inspector supports time-based data in which sample values are associated with sample times. The Simulation Data Inspector supports all loading and logging data formats, including `timeseries` and `Simulink.SimulationData.Dataset`.

Example: `myData`

**sourceNames — Source names for imported data**

cell array of character vectors

Source names for imported data, specified as a cell array of character vectors. The source name is used to set the `RootSource`, `TimeSource`, and `DataSource` properties of the `Simulink.sdi.Signal` objects created from the data specified by the `sigValues` input.

Provide a `sourceNames` input when you specify 'namevalue' for the second argument.

Example: {'sig1','sig2'}

**sigValues — Data to import**

cell array of variables

Data to import, specified as a cell array of variables.

Provide a `sigValues` input when you specify 'namevalue' for the second argument.

Example: {var1,var2}

**filename — Name of file with data to import**

character vector

Name of file with data to import, specified as a character vector. Provide a `filename` input when you specify 'file' for the second argument.

You can create a run from these types of files using file readers built into the Simulation Data Inspector:

- MAT-file
- CSV file
- Microsoft Excel file that contains data formatted according to “Microsoft Excel Import, Export, and Logging Format”.
- MDF file with one of these extensions:
  - .mdf
  - .mf4
  - .mf3
  - .data
  - .dat

When you need to import data from a file that the built-in readers do not support, you can write your own reader using the `io.reader` class. You can also write a custom reader to use instead of the built-in reader for any file extension. For an example, see “Import Data Using a Custom File Reader”.

Example: 'simulation.mat'

**Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, . . . ,NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Example: sheets=["sheet1" "sheet2"]

**reader — File reader to use to import data**

string | character vector

File reader to use to import data, specified as a string or character vector.

The Simulation Data Inspector prioritizes using a registered custom reader when one is available for the file. When you do not specify a reader, the Simulation Data Inspector uses the first custom reader registered for the file. If no custom readers are registered, the data is imported using the built-in reader.

Specify the reader input when:

- You want to use the built-in reader to import data for a file that is also supported by a custom reader.
- Multiple registered custom readers support the file.

To determine which readers are available to import your file, use the `io.reader.getSupportedReadersForFile` function.

Example: "MyExcelReader"

Example: "built-in"

**sheets — Sheets in Excel file from which to import data**

string array | cell array of character vectors

Sheets in Excel file from which to import data, specified as a string array or a cell array of character vectors. By default, the Simulation Data Inspector imports data from all sheets. Use the `sheets` name-value argument when you do not want to import data from all sheets in the Excel file.

When the data in the file does not include simulation numbers and source information, the data on each sheet is imported into a separate run. For more information about formatting data to import from an Excel file, see "Microsoft Excel Import, Export, and Logging Format".

Example: ["sheet1" "sheet2"]

**model — Model with definitions of user-defined data types**

string | character vector

Model with definitions of user-defined data types, specified as a string or character vector.

When you load data from an Excel file that defines signal data types using user-defined data types, such as enumerations, buses, or aliases, the Simulation Data Inspector needs access to the type definition to import the data. You can provide access to the type definitions by:

- Loading the associated object into the MATLAB workspace.
- Specifying the `model` name-value argument to use type definitions saved in the model workspace or a data dictionary.

For more information on formatting data to import from an Excel file, see "Microsoft Excel Import, Export, and Logging Format".

Example: "myModel.slx"

## Output Arguments

### **runObj** — Imported data

`Simulink.sdi.Run` object

Imported data, returned as a `Simulink.sdi.Run` object. When you create an empty `Run` object, import data into the run using the `add` function or the `Simulink.sdi.addToRun` function.

# Simulink.sdi.Run.getLatest

Get the most recently created Simulation Data Inspector run

## Syntax

```
runObj = Simulink.sdi.Run.getLatest
```

## Description

`runObj = Simulink.sdi.Run.getLatest` returns the most recently created run in the Simulation Data Inspector repository. A run is created when you simulate a model that logs data or when you import data into the Simulation Data Inspector.

## Examples

### Access Simulation Data Inspector Runs

Many tasks performed using the Simulation Data Inspector programmatic interface start by accessing the `Simulink.sdi.Run` object that corresponds to the logged or imported data you want to analyze. For example, you can use the Run object to access the `Simulink.sdi.Signal` objects that correspond to individual signals in the run.

This example shows how to access Run objects by using the `Simulink.sdi.Run.getLatest` function, the `Simulink.sdi.getCurrentSimulationRun` function, or the `Simulink.sdi.getRun` function.

### Create a Run

The model `sldemo_fuelsys` is already configured for logging. When you simulate the model, the Simulation Data Inspector automatically creates a run and assigns it a run ID.

```
load_system('sldemo_fuelsys')
sim('sldemo_fuelsys')
```

### Get Run Object Using `Simulink.sdi.Run.getLatest`

In this example, the run created when you simulated the model is the most recently created run in the Simulation Data Inspector. When you want to access the most recently created run, use the `Simulink.sdi.Run.getLatest` function.

```
fuelsysRun = Simulink.sdi.Run.getLatest;
```

### Get Run Object Using `Simulink.sdi.getCurrentSimulationRun`

The run you want to access may not be the most recently created run in the Simulation Data Inspector. If the run corresponds to the most recent simulation of a model, you can use the `Simulink.sdi.getCurrentSimulationRun` function to access the Run object. You can also use the `Simulink.sdi.getCurrentSimulationRun` function to access data for an in-progress simulation when the simulation streams data to the Simulation Data Inspector. This function can be useful when you are working with multiple models.

In this example, the run created when you simulated the model is the current simulation run for the `sldemo_fuelsys` model.

```
fuelsysRun = Simulink.sdi.getCurrentSimulationRun('sldemo_fuelsys');
```

### **Get Run Object from a Run ID**

When your task also requires the run ID, you can use the `Simulink.sdi.getRun` function to get the corresponding `Simulink.sdi.Run` object that contains the run data and metadata.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
fuelsysRun = Simulink.sdi.getRun(runID);
```

## **Output Arguments**

### **runObj — Simulink.sdi.Run object**

`Simulink.sdi.Run` object

`Simulink.sdi.Run` object for the most recently created run in the Simulation Data Inspector.

## **Version History**

**Introduced in R2020a**

### **See Also**

`Simulink.sdi.Run` | `Simulink.sdi.getCurrentSimulationRun` | `Simulink.sdi.getRun` |  
`Simulink.sdi.getRunCount` | `Simulink.sdi.getRunIDByIndex` |  
`Simulink.sdi.getAllRunIDs`

# Simulink.sdi.save

**Package:** Simulink.sdi

Save Simulation Data Inspector session

## Syntax

```
Simulink.sdi.save(fileName)
```

## Description

`Simulink.sdi.save(fileName)` saves all runs, signals, and visualization settings as a Simulation Data Inspector session in the file `fileName`.

A session file includes data as well as visualization information. Use the `Simulink.sdi.load` function to open a session file in the Simulation Data Inspector. When the session file opens, you can choose to add the data to existing data in the Simulation Data Inspector or clear the existing data.

You can also save only the visualization information to apply to other sets of data. Save visualization information for reuse in a view file using the `Simulink.sdi.saveView` function.

## Examples

### Save a Simulation Data Inspector Session

This example creates, saves, and loads a Simulation Data Inspector session. The example logs data in the model `slexAircraftExample` and visualizes the logged data in a Simulation Data Inspector session. Each time you use the Simulation Data Inspector, you create and modify a session. You can save the data and associated visualization settings for a session in an MLDATX file using the `Simulink.sdi.save` function. When you want to review the data later, you can load the session using the `Simulink.sdi.load` function.

### Log Data to the Simulation Data Inspector

This example logs data from a simulation of the model `slexAircraftExample` to the Simulation Data Inspector. The model is not configured to log data. Load the model and mark the `Stick`, the `alpha`, `rad`, and the `q`, `rad/sec` signals for logging.

```
load_system('slexAircraftExample')

Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',3,'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')
```

For this example, run two simulations of the model. In the first simulation, use the sine wave output from the `Pilot` block, and in the second, use the square wave output.

```
set_param('slexAircraftExample/Pilot','WaveForm','sine')
sim('slexAircraftExample')
```

```
set_param('slexAircraftExample/Pilot','WaveForm','square')
sim('slexAircraftExample')
```

### Visualize the Logged Data

You can use the Simulation Data Inspector programmatic interface to access the logged data from the simulations. When you access data using the Simulation Data Inspector programmatic interface, you can use functions to create plots in the Simulation Data Inspector.

To start, access the run IDs for the most recent two runs and then get the corresponding `Simulink.sdi.Run` object. The Run objects allow you to access the logged data for the simulations.

```
runIDs = Simulink.sdi.getAllRunIDs;
sineRunID = runIDs(end-1);
squareRunID = runIDs(end);

sineRun = Simulink.sdi.getRun(sineRunID);
squareRun = Simulink.sdi.getRun(squareRunID);
```

Suppose you want to analyze the relationship between the input and output for the model. Get the `Simulink.sdi.Signal` objects for the input and output signals from the two simulation runs.

```
sineOut = getSignalByIndex(sineRun,1);
sineIn = getSignalByIndex(sineRun,3);

squareOut = getSignalByIndex(squareRun,1);
squareIn = getSignalByIndex(squareRun,3);
```

Change the subplot layout in the Simulation Data Inspector to 2-by-1 and plot the signals from the first simulation run on the top plot and the signals from the second run on the bottom plot.

```
Simulink.sdi.setSubPlotLayout(2,1)

plotOnSubPlot(sineIn,1,1,true)
plotOnSubPlot(sineOut,1,1,true)

plotOnSubPlot(squareIn,2,1,true)
plotOnSubPlot(squareOut,2,1,true)
```

### Save the Simulation Data Inspector Session

To view the plotted data in the Simulation Data Inspector, enter `Simulink.sdi.view` in the command window.

Then, save the Simulation Data Inspector session as an MLDATX file.

```
Simulink.sdi.save('myData.mldatx')
```

### Load the Simulation Data Inspector Session

To mimic a scenario where you want to return to looking at the same data at a later point, clear the data from the Simulation Data Inspector and reset the subplot layout to 1-by-1.

```
Simulink.sdi.clear
Simulink.sdi.setSubPlotLayout(1,1)
```

Load the session file and resume working with the data. You can open the Simulation Data Inspector and view the results using the `Simulink.sdi.view` function.

```
Simulink.sdi.load('myData.mldatx');
```

## Input Arguments

### **fileName** — File name

character vector

Name for the session file.

Example: 'myData.mldatx'

## Version History

**Introduced in R2011b**

## See Also

## Topics

“Inspect and Compare Data Programmatically”

“Save and Share Simulation Data Inspector Data and Views”

## Simulink.sdi.saveView

Save visualization settings to apply to other data

### Syntax

```
Simulink.sdi.saveView(filename)
```

### Description

`Simulink.sdi.saveView(filename)` saves the current view in the Simulation Data Inspector to the file, `filename`.

A view contains information about the layout and plots in the graphical viewing area as well as properties of plotted signals. When you load a view, the Simulation Data Inspector uses the properties and preferences in the file to display data currently in the Simulation Data Inspector. Signals in the Simulation Data Inspector that align with the signals in the view are plotted in the graphical viewing area. Use a view to apply a consistent set of visualization settings to multiple sets of similar data.

The view file saves the following information:

- Subplot layout and visualization type
- Settings for each visualization type in the layout
- Signal selection mode
- Replay controls visibility
- Metadata displayed in the work area
- Settings for signal grouping in the work area
- Plotted signals and the line style and color for each plotted signal

A view file does not contain data. To save run data, export the data or save a session using the `Simulink.sdi.save` function.

### Examples

#### Save and Use a View

This example visualizes the output from the `ex_vdp` model, saves the configuration as a view, and then uses the view to visualize the output from another simulation of the same model.

To generate data to plot in the Simulation Data Inspector, simulate the model.

```
open_system('ex_vdp')
set_param('ex_vdp/Mu', 'Gain', '1')
sim('ex_vdp');
```

#### Programmatically Configure and Save a View

The `ex_vdp` model is configured to log two signals, `x1` and `x2`. Plot each signal on a subplot in a 2-by-1 layout.

```
Simulink.sdi.setSubPlotLayout(2,1)
```

To plot one signal on each subplot, first access the `Simulink.sdi.Run` object for the simulation.

```
runIDs = Simulink.sdi.getAllRunIDs;
ex_vdpRunID = runIDs(end);
ex_vdpRun = Simulink.sdi.getRun(ex_vdpRunID);
```

Then, you can access the data for each signal in a `Simulink.sdi.Signal` object and use the `plotOnSubPlot` function to specify where to plot each signal.

```
x1 = getSignalByIndex(ex_vdpRun,1);
x2 = getSignalByIndex(ex_vdpRun,2);
```

```
plotOnSubPlot(x1,1,1,true)
plotOnSubPlot(x2,2,1,true)
```

To view the result in the Simulation Data Inspector, enter `Simulink.sdi.view` in the command window.

Then, save the view.

```
Simulink.sdi.saveView('ex_vdpView.mldatx')
```

## Use the View

To mimic a situation where the Simulation Data Inspector is configured differently and contains data from another simulation, this example clears data from the Simulation Data Inspector, loads a view that represents the default visualization configuration, and runs another simulation of the `ex_vdp` model.

```
Simulink.sdi.clear
Simulink.sdi.loadView('default.mldatx');
set_param('ex_vdp/Mu', 'Gain', '2')
sim('ex_vdp');
```

Use the `Simulink.sdi.loadView` function to apply the saved view from the previous simulation.

```
Simulink.sdi.loadView('ex_vdpView.mldatx')
```

You can open the Simulation Data Inspector to view the results using the `Simulink.sdi.view` function. The saved view includes information regarding the axes limits. When you use a view to apply visualization settings, you may need to adjust axes limits or zoom levels to fit data from a modified simulation.

## Input Arguments

**filename** — Name of view file

string | character array

Name of the view file, specified as a string or character array.

Example: 'myView.mldatx'

Data Types: char | string

## Version History

Introduced in R2020a

## Simulink.sdi.sendWorkerRunToClient

**Package:** Simulink.sdi

Send run created on parallel workers to the Simulation Data Inspector

### Syntax

```
Simulink.sdi.sendWorkerRunToClient
Simulink.sdi.sendWorkerRunToClient(run)
```

### Description

`Simulink.sdi.sendWorkerRunToClient` sends the run most recently generated by the worker to the client MATLAB and imports the run to the Simulation Data Inspector.

`Simulink.sdi.sendWorkerRunToClient(run)` sends the run corresponding to `run` to the client MATLAB and imports the run to the Simulation Data Inspector.

### Examples

#### Manually Send Runs from Parallel Workers to the Simulation Data Inspector

This example shows how to use `Simulink.sdi.sendWorkerRunToClient` to send runs created using parallel workers manually to the Simulation Data Inspector.

#### Setup

This example runs several simulations of the `vdp` model, varying the value of the gain, `Mu`. To set up for the parallel simulation, define a vector of `Mu` values and configure the Simulation Data Inspector for manual Parallel Computing Toolbox support.

```
% Enable manual Parallel Computing Toolbox support
Simulink.sdi.enablePCTSupport('manual');
```

```
% Choose several Mu values
MuVals = [1 2 3 4];
```

#### Initialize Parallel Workers

Use `parpool` (Parallel Computing Toolbox) to start a pool of four parallel workers. This example calls `parpool` inside an `if` statement so you only create a parallel pool if you don't already have one. You can use `spmd` (Parallel Computing Toolbox) to run initialization code common to all workers. For example, load the `vdp` model and select signals to log to runs that we can send to the Simulation Data Inspector on the client MATLAB. To avoid data concurrency issues when simulating with `sim` in `parfor`, create a temporary directory on each worker. After the simulations complete, another `spmd` block deletes the temporary directories.

```
p = gcp('nocreate');

if isempty(p)
```

```

 parpool(4);

end

Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.

spmd

 % Load system and select signals to log
 load_system('vdp')
 Simulink.sdi.markSignalForStreaming('vdp/x1',1,'on')
 Simulink.sdi.markSignalForStreaming('vdp/x2',1,'on')

 % Create temporary directory for simulation on worker
 workDir = pwd;
 addpath(workDir)
 tempDir = tempname;
 mkdir(tempDir)
 cd(tempDir)

end

```

### Run Parallel Simulations with parfor

To stream data from parallel workers to the Simulation Data Inspector, you have to run parallel simulations using `parfor` (Parallel Computing Toolbox). Each worker runs a `vdp` simulation with a different value of `Mu`. Simulink cannot access the contents of the `parfor` loop, so the variable `MuVal` is defined in the worker's workspace, where the `vdp` model can see it, using `assignin`.

```

parfor (index = 1:4)

 % Set value of Mu in the worker's base workspace
 assignin('base','MuVal',MuVals(index));

 % Modify the value of Mu in the model and simulate
 set_param('vdp/Mu','Gain','MuVal')
 sim('vdp')

```

### Access Data and Send Run to Client MATLAB

You can use the Simulation Data Inspector programmatic interface on the worker the same way you would in the client MATLAB. This example creates a `Simulink.sdi.Run` object and attaches the value of `Mu` used in the simulation with the `Tag` property.

```

 % Attach metadata to the run
 IDs = Simulink.sdi.getAllRunIDs;
 lastIndex = length(IDs);
 runID = Simulink.sdi.getRunIDByIndex(lastIndex);
 parRun = Simulink.sdi.getRun(runID);
 parRun.Tag = strcat('Mu = ',num2str(MuVals(index)));

 % Send the run to the Simulation Data Inspector on the client MATLAB
 Simulink.sdi.sendWorkerRunToClient

end

```

## Close Temporary Directories and View Runs in the Simulation Data Inspector

Use another `spmd` section to delete the temporary directories created on the workers once the simulations complete. In each simulation, `Simulink.sdi.sendWorkerRunToClient` imported runs from all the workers into the Simulation Data Inspector. You can view the data and check the run properties to see the value of `Mu` used during simulation.

```
spmd
```

```
 % Remove temporary directories
 cd(workDir)
 rmdir(tempDir, 's')
 rmpath(workDir)
```

```
end
```

```
Simulink.sdi.view
```

## Input Arguments

**run** — Run ID or `Simulink.sdi.Run` object

runID | `Simulink.sdi.Run` object

Run ID or `Simulink.sdi.Run` object corresponding to the run you want to import into the Simulation Data Inspector.

## Version History

Introduced in R2018a

# Simulink.sdi.setAppendRunToTop

Specify order in which Simulation Data Inspector appends new run in work area or archive

## Syntax

```
Simulink.sdi.setAppendRunToTop(ord)
```

## Description

`Simulink.sdi.setAppendRunToTop(ord)` configures the order in which the Simulation Data Inspector appends new runs in the work area or archive.

- 1 — New runs are added to the top of the archive or work area.
- 0 — New runs are added to the bottom of the archive or work area.

Whether the `Simulink.sdi.getAppendRunToTop` function sets the order of simulations in the archive or the work area is determined by the **Automatically archive** setting:

- When **Automatically archive** is enabled, the setting applies to runs in the archive.
- When **Automatically archive** is disabled, the setting applies to runs in the work area.

By default, new runs are placed below prior runs in the archive. For more information about configuring the archive behavior, see `Simulink.sdi.setAutoArchiveMode`.

## Examples

### Change Order and Location of Runs

First, determine the order that runs are currently stored in the archive.

```
ord = Simulink.sdi.getAppendRunToTop
```

```
ord = logical
 0
```

By default, runs moved into the archive are placed below runs already in the archive. To have runs placed above the runs already in the archive, change the value of the `Simulink.sdi.setAppendRunToTop` function.

```
Simulink.sdi.setAppendRunToTop(true)
```

You can restore the original placement of runs as they move to the archive by passing `ord` back to the set function.

```
Simulink.sdi.setAppendRunToTop(ord)
```

## Input Arguments

**ord** — **Whether Simulation Data Inspector appends new run to top of work area or archive**  
false or 0 (default) | true or 1

Whether Simulation Data Inspector appends new run to top of work area or archive, specified by true (1) or false (0).

Data Types: logical

## Version History

**Introduced in R2022b**

### Topics

“Configure the Simulation Data Inspector”

# Simulink.sdi.setArchiveRunLimit

Specify number of runs to retain in Simulation Data Inspector archive

## Syntax

```
Simulink.sdi.setArchiveRunLimit(limit)
```

## Description

`Simulink.sdi.setArchiveRunLimit(limit)` sets the limit `limit` for the number of runs to retain in the Simulation Data Inspector archive. When the number of runs in the archive reaches the specified limit, the Simulation Data Inspector deletes runs from the archive on a first-in, first-out basis.

---

**Tip** To automatically limit the number of runs, configure the Simulation Data Inspector to automatically move prior runs into the archive using the `Simulink.sdi.setAutoArchiveMode` function and specify the archive run limit.

For information about how to control the amount of data logged from simulation, see “Limit the Size of Logged Data”.

---

## Examples

### Limit Number of Runs Retained in Simulation Data Inspector

Configure the Simulation Data Inspector to automatically move prior simulation runs into the archive.

```
Simulink.sdi.setAutoArchiveMode(true)
```

Specify the number of runs to retain in the Simulation Data Inspector by setting the archive run limit. For example, specify the archive run limit as 5 to only retain five prior runs in addition to the current run.

```
Simulink.sdi.setArchiveRunLimit(5)
```

The Simulation Data Inspector automatically moves prior runs into the archive. Once the archive contains five runs, the Simulation Data Inspector deletes run data from the archive on a first-in, first-out basis.

### Stop Retaining Data in Simulation Data Inspector

You can configure the Simulation Data Inspector to retain only the logged data for your current simulation. In iterative design and debugging workflows, this configuration helps prevent the accumulation of unwanted logged data on disk.

First, check the configuration of the Simulation Data Inspector archive. Save the archive preference values to restore your preferences after you finish designing or debugging.

```
limit = Simulink.sdi.getArchiveRunLimit;
mode = Simulink.sdi.getAutoArchiveMode;
```

Configure the Simulation Data Inspector to automatically move runs into the archive. Then, set the archive run limit to 0.

```
Simulink.sdi.setAutoArchiveMode(true)
Simulink.sdi.setArchiveRunLimit(0)
```

When you simulate your model, the Simulation Data Inspector deletes the previous run and updates the view to show signals from the current simulation.

When you finish designing or debugging your model, you can restore the Simulation Data Inspector archive to the previous configuration.

```
Simulink.sdi.setArchiveRunLimit(limit)
Simulink.sdi.setAutoArchiveMode(mode)
```

## Input Arguments

### **limit** — Maximum number of runs to store in Simulation Data Inspector archive

numeric scalar

Maximum number of runs to store in Simulation Data Inspector archive, specified as a whole numeric scalar. To configure no limit, specify -1.

#### **Tips**

To retain simulation results for only the current run, configure the Simulation Data Inspector to automatically archive simulation runs, and specify the archive run limit as 0.

```
Simulink.sdi.setAutoArchiveMode(true)
Simulink.sdi.setArchiveRunLimit(0)
```

## Version History

**Introduced in R2018b**

### **See Also**

#### **Topics**

“Limit the Size of Logged Data”  
“Configure the Simulation Data Inspector”

# Simulink.sdi.setAutoArchiveMode

Specify how Simulation Data Inspector manages simulation runs

## Syntax

```
Simulink.sdi.setAutoArchiveMode(archive)
```

## Description

`Simulink.sdi.setAutoArchiveMode(archive)` configures the Simulation Data Inspector to manage simulation runs according to `archive`.

When you run multiple simulations in a single MATLAB session, the Simulation Data Inspector retains results from each simulation so you can analyze the results together. Use the Simulation Data Inspector archive to manage the number of runs the Simulation Data Inspector retains and to visually manage runs in the user interface.

With automatic archiving enabled, when you start a simulation, the Simulation Data Inspector moves the prior run into the archive. In the user interface, prior runs automatically move into the collapsible **Archive** pane, and plots automatically update to show data from the current simulation.

With automatic archiving disabled, the Simulation Data Inspector does not move runs to the archive or automatically update plots.

---

**Tip** When you enable automatic archiving and specify an archive run limit, the Simulation Data Inspector automatically manages the number of runs it retains. Once the number of runs reaches the specified limit, the Simulation Data Inspector deletes runs from the archive on a first-in, first-out basis.

For more information about how to control the amount of data logged from simulation, see “Limit the Size of Logged Data”.

---

## Examples

### Limit Number of Runs Retained in Simulation Data Inspector

Configure the Simulation Data Inspector to automatically move prior simulation runs into the archive.

```
Simulink.sdi.setAutoArchiveMode(true)
```

Specify the number of runs to retain in the Simulation Data Inspector by setting the archive run limit. For example, specify the archive run limit as 5 to only retain five prior runs in addition to the current run.

```
Simulink.sdi.setArchiveRunLimit(5)
```

The Simulation Data Inspector automatically moves prior runs into the archive. Once the archive contains five runs, the Simulation Data Inspector deletes run data from the archive on a first-in, first-out basis.

## Stop Retaining Data in Simulation Data Inspector

You can configure the Simulation Data Inspector to retain only the logged data for your current simulation. In iterative design and debugging workflows, this configuration helps prevent the accumulation of unwanted logged data on disk.

First, check the configuration of the Simulation Data Inspector archive. Save the archive preference values to restore your preferences after you finish designing or debugging.

```
limit = Simulink.sdi.getArchiveRunLimit;
mode = Simulink.sdi.getAutoArchiveMode;
```

Configure the Simulation Data Inspector to automatically move runs into the archive. Then, set the archive run limit to 0.

```
Simulink.sdi.setAutoArchiveMode(true)
Simulink.sdi.setArchiveRunLimit(0)
```

When you simulate your model, the Simulation Data Inspector deletes the previous run and updates the view to show signals from the current simulation.

When you finish designing or debugging your model, you can restore the Simulation Data Inspector archive to the previous configuration.

```
Simulink.sdi.setArchiveRunLimit(limit)
Simulink.sdi.setAutoArchiveMode(mode)
```

## Input Arguments

### **archive** — Whether Simulation Data Inspector manages runs using archive

true or 1 (default) | false or 0

Whether Simulation Data Inspector manages runs using archive, specified as logical true (1) or false (0).

Data Types: logical

## Version History

Introduced in R2018b

# Simulink.sdi.setBorderOn

Display or hide border on time plots

## Syntax

```
Simulink.sdi.setBorderOn(border)
```

## Description

`Simulink.sdi.setBorderOn(border)` displays or hides the border on time plots in the Simulation Data Inspector according to the logical input, `border`. The function sets the value of the **Show border** setting on the **Time Plot** section of the **Visualization Settings** in the Simulation Data Inspector. The setting applies to all time plots in the layout. By default, the Simulation Data Inspector shows the border on time plots.

## Examples

### Configure Time Plot Border Display

You can use the `Simulink.sdi.setBorderOn` function to show or hide the border on time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector shows the border on time plots.

This example starts by showing how to use the `Simulink.sdi.getBorderOn` function to determine whether the border is currently displayed. Subsequent sections show the code to hide and show the border. To show the result, the example generates an image using the `Simulink.sdi.snapshot` function with settings specified by a `Simulink.sdi.CustomSnapshot` object.

```
snapSettings = Simulink.sdi.CustomSnapshot;
snapSettings.Width = 300;
snapSettings.Height = 300;
```

### Get Current Border Display Setting

Before modifying the border display setting for time plots, you can save the current setting to a variable in the workspace in case you want to restore the preference later.

```
border = Simulink.sdi.getBorderOn;
```

### Hide the Border on Time Plots

```
Simulink.sdi.setBorderOn(false)
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

### Show the Border on Time Plots

```
Simulink.sdi.setBorderOn(true)
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

## Input Arguments

### **border** — Whether border is visible on time plots

`true` or `1` (default) | `false` or `0`

Whether the border is visible on time plots in the Simulation Data Inspector, specified as `true` (`1`) or `false` (`0`).

- `true` or `1` — Display border for time plots.
- `false` or `0` — Hide border for time plots.

## Version History

**Introduced in R2019b**

### Topics

“Create Plots Using the Simulation Data Inspector”

## Simulink.sdi.setCursorOptions

Configure shading options for cursors in the Simulation Data Inspector

### Syntax

```
Simulink.sdi.setCursorOptions(Name,Value)
```

### Description

`Simulink.sdi.setCursorOptions(Name,Value)` configures shading options for cursors in the Simulation Data Inspector according to one or more name-value pair arguments. For example, `'ShadeArea', 'InBetween'` configures the Simulation Data Inspector to apply shading to the area between two cursors. You can specify name-value pair arguments to configure the area to shade, the color and opacity of the shaded region, and whether signal data is emphasized in the shaded region.

### Examples

#### Configure Shading Options for Cursors in the Simulation Data inspector

You can configure shading options for cursors to draw attention to a region of interest in a time plot. You can choose to emphasize or de-emphasize the signal data in the shaded region, and you can specify the shading color and opacity. By default, the Simulation Data Inspector shades areas gray with an opacity of 0.7 to de-emphasize signal data and shades areas light blue with an opacity of 0.7 when signal data is emphasized.

Suppose you want to highlight a signal transition by shading the area where the transition occurs a light yellow. Configure the cursors to highlight the area between the cursors a light yellow color.

```
Simulink.sdi.setCursorOptions('Emphasize',true,...
 'ShadeArea','InBetween','ShadeColor',[1 1 0.6]);
```

### Input Arguments

#### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `'ShadeArea', 'Lead', 'ShadeOpacity', 0.5` configures cursors to shade the area that leads the left-most cursor with an opacity of 0.5.

#### Type — Where to apply cursor options

'Inspect' (default) | 'Compare'

Where to apply cursor options, specified as the name-value pair consisting of 'Type' and 'Inspect' or 'Compare'. You can configure independent cursor options for the **Inspect** and **Compare** panes in the Simulation Data Inspector.

Example: 'Type', 'Compare' configures cursor options for the **Compare** pane.

### **Emphasize — Whether signal data is emphasized in the shaded region**

true or 1 (default) | false or 0

Whether signal data is emphasized in shaded region, specified as the name-value pair consisting of 'Emphasize' and true or false. When emphasized, the signal data is plotted on top of the cursor shading.

Example: 'Emphasize', false configures cursor options to plot signal data under shaded region.

### **ShadeArea — Area to shade relative to cursors**

'lead' (default) | 'lag' | 'leadandlag' | 'inbetween' | 'none'

Area to shade relative to cursors, specified as the name-value pair consisting of 'ShadeArea' and one of these options:

- 'lead' — Shade the plot area that leads the left-most cursor.
- 'lag' — Shade the plot area that lags the right-most cursor.
- 'leadandlag' — Shade the plot area outside of the cursors, when two cursors are displayed.
- 'inbetween' — Shade the plot area between the cursors, when two cursors are displayed.
- 'none' — Do not shade any plot area.

Example: 'ShadeArea', 'none' configures cursor options to not shade any region relative to the cursors.

### **ShadeColor — Color of the shaded area**

[r g b] vector

Color of the shaded area, specified as the name-value pair consisting of 'ShadeColor' and an r g b vector with values between 0 and 1.

Example: 'ShadeColor', [0 0 1] configures the color of the shaded area as blue.

### **ShadeOpacity — Opacity of the shaded area**

percentage value between 0 and 1

Opacity of the shaded area, specified as the name-value pair consisting of 'ShadeOpacity' and a percentage value between 0 and 1.

Example: 'ShadeOpacity', 0.5 configures the opacity of the shaded area as 0.5.

## **Version History**

# Simulink.sdi.setCursorPositions

Specify active cursor positions in the Simulation Data Inspector

## Syntax

```
Simulink.sdi.setCursorPositions(Name,Value)
```

## Description

`Simulink.sdi.setCursorPositions(Name,Value)` configures the position for active cursors in the Simulation Data Inspector as specified by one or more name-value pair arguments.

## Examples

### Programmatically Interact with Cursors in the Simulation Data Inspector

You can use the Simulation Data Inspector programmatic interface to specify the position of cursors on time plots or sparklines and to access the time that corresponds to the current cursor position.

Open the session file `vdp_mu.mldatx` to add plot data in the Simulation Data Inspector. The session file contains data for a 20-second simulation of a model of the Van Der Pol equation, with signals `x1` and `x2` plotted on separate subplots in a 2-by-1 subplot layout.

```
open vdp_mu.mldatx;
```

Use the `Simulink.sdi.setNumCursors` function to add one cursor to the plot.

```
Simulink.sdi.setNumCursors(1);
```

Suppose you want to know the signal values 5 seconds into the simulation. Use the `Simulink.sdi.setCursorPositions` function to move the cursor to `t=5s` and read the signal values off from the cursor on each subplot. The asterisk next to the value in the cursor label indicates that the value is interpolated because the simulation did not include a calculation for a simulation time of exactly 5s.

```
Simulink.sdi.setCursorPositions('left',5);
```

Suppose you want to calculate the time between two peaks in the x2 signal. Add a second cursor using the `Simulink.sdi.setNumCursors` function or by using Show/hide data cursors  in the Simulation Data Inspector.

```
numCursors = Simulink.sdi.getNumCursors;
if(numCursors < 2)
 Simulink.sdi.setNumCursors(2);
end
```

Drag the cursors so the left cursor is positioned at the first peak in the x2 signal and the right cursor is positioned at the second peak. Alternatively, you can run this code that positions the cursors for you.

```
Simulink.sdi.setCursorPositions('left',5.921998549931304,...
 'right',12.378442136906246);
```

The Simulation Data Inspector displays the difference between the two cursors in seconds. However, the cursor position and difference values are both rounded. Use the `Simulink.sdi.getCursorPosition` function to programmatically retrieve the exact time values that correspond to the cursor positions. Then, compute the difference between the times.

```
[t1,t2] = Simulink.sdi.getCursorPositions;
T = t2 - t1
```

```
T = 6.4564
```

## Input Arguments

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `Simulink.sdi.setCursorPositions('right',10,'view','compare')` moves the right cursor on the **Compare** pane to 10s.

**left — Left cursor position**

scalar

Left cursor position, specified as a finite scalar using units of s. Use the 'left' name-value pair argument to specify the position for a single active cursor.

Cursor identities are relative, not absolute. If you specify a value for the left cursor that moves it to the right of the right cursor, the left cursor becomes the right cursor and vice versa.

Example: `Simulink.sdi.setCursorPositions('left',0.5)` moves the left cursor to 500ms.

Data Types: double

**right — Right cursor position**

scalar

Right cursor position, specified as a finite scalar using units of s.

Cursor identities are relative, not absolute. If you specify a value for the left cursor that moves it to the right of the right cursor, the left cursor becomes the right cursor and vice versa.

Example: `Simulink.sdi.setCursorPositions('right',10)` moves the right cursor to 10s.

**Tips**

Use the 'left' name-value pair argument to specify the position for a single active cursor.

Data Types: double

**view — Plot area on which to move cursors**

'inspect' (default) | 'compare'

Plot area on which to move cursors, specified as 'inspect' or 'compare'.

Example: `Simulink.sdi.setCursorPositions('right',10,'view','compare')` moves the right cursor on the **Compare** pane to 10s.

Data Types: char | string

# Simulink.sdi.setDeleteRunsOnLowSpace

Specify behavior when logged data size approaches configured limits

## Syntax

```
Simulink.sdi.setDeleteRunsOnLowSpace(deleteRuns)
```

## Description

`Simulink.sdi.setDeleteRunsOnLowSpace(deleteRuns)` configures the action to take when the size of logged data approaches the configured maximum size or minimum free disk space requirement. When `deleteRuns` is `true`, logged data from prior simulations is deleted first to free space for continued logging in the current simulation. If deleting prior simulation data does not free enough disk space to continue logging through the end of the current simulation, recording data is disabled. When `deleteRuns` is `false`, recording data from the current simulation is disabled and no logged data from prior simulations is deleted.

## Examples

### Configure Logged Data Size Limits

Logging data from simulation can produce large amounts of data that may fill up disk space. To mitigate issues related to filing disk space, you can specify a minimum disk space requirement, a maximum size for logged data, or both. To ensure the logged data does not exceed the specified maximum size or use enough disk space to violate the disk space requirement, prior run data may be deleted and recording logged data may be disabled. You can specify whether to prioritize continuing to log data in the current simulation or retaining prior simulation data.

Use the `Simulink.sdi.setRequiredFreeSpace` function to configure logging to leave at least 1 GB of disk space empty.

```
Simulink.sdi.setRequiredFreeSpace(1);
```

Use the `Simulink.sdi.setMaxDiskUsage` function to specify a maximum logged data size of 100 GB.

```
Simulink.sdi.setMaxDiskUsage(100);
```

When you configure logging size limits, you can also specify what to do when the logging limits are approached. You can choose whether to prioritize retaining data from prior runs or data in the current run.

By default, current simulation data is prioritized. If the size of logged data approaches configured limits, data from prior simulations is deleted. If deleting run data does not free enough space, recording logged data is disabled and no more data from the current simulation is saved. When you choose to prioritize logged data from prior simulations instead, recording is disabled as soon as the size of logged data approaches configured limits. You see a warning when run data is deleted and when recording is disabled.

Use the `Simulink.sdi.setDeleteRunsOnLowSpace` function to configure logging to prioritize retaining prior run data.

```
Simulink.sdi.setDeleteRunsOnLowSpace(false);
```

If recording is disabled due to the size of logged data, you need to enable recording again to save data from future simulations. Use the `Simulink.sdi.setRecordData` function to enable recording.

```
Simulink.sdi.setRecordData(true);
```

## Input Arguments

### **deleteRuns** — Behavior when logged data size approaches configured limits

`true` or `1` (default) | `false` or `0`

Behavior when logged data size approaches configured limits, specified as numeric or logical `1` (`true`) or `0` (`false`).

- `true` — First delete data logged from prior simulations. If deleting prior simulation data does not free enough space, disable recording data.
- `false` — Disable recording data for current simulation. Do not delete prior simulation data.

When recording is disabled due to configured disk space requirements or logged data size limits, you need to enable recording again to log data in subsequent simulations. You can configure the record mode in the Simulation Data Inspector preferences or using the `Simulink.sdi.setRecordData` function.

Data Types: `logical`

# Simulink.sdi.setGridOn

**Package:** Simulink.sdi

Configure grid lines for time plots in the Simulation Data Inspector

## Syntax

```
Simulink.sdi.setGridOn(grid)
```

## Description

`Simulink.sdi.setGridOn(grid)` configures the grid lines for time plots in the Simulation Data Inspector according to the input, `grid`. The function configures the **Horizontal** and **Vertical** options on the **Time Plot** section of the **Visualization Settings** in the Simulation Data Inspector. The settings apply to the session and configure the grids for all time plots. By default, the Simulation Data Inspector shows horizontal and vertical grid lines.

## Examples

### Configure Grid for Time Plots in the Simulation Data Inspector

You can use `Simulink.sdi.setGridOn` to configure the appearance of the grid for time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector shows horizontal and vertical grid lines.

This example starts by showing how to use `Simulink.sdi.getGridOn` to access the current grid configuration. The subsequent sections show the code for each configuration option for time plot grid in the Simulation Data Inspector. To see the result, the example uses a `Simulink.sdi.CustomSnapshot` object to specify settings for the output of the `Simulink.sdi.snapshot` function.

```
snapSettings = Simulink.sdi.CustomSnapshot;
snapSettings.Width = 300;
snapSettings.Height = 300;
```

### Get Initial Grid Setting

Before modifying the grid display preferences, you can save the current configuration to a variable in the workspace in case you want to restore the preferences later.

```
gridInit = Simulink.sdi.getGridOn;
```

### Configure Horizontal Grid Lines

Show only horizontal grid lines in the Simulation Data Inspector.

```
Simulink.sdi.setGridOn('horizontal')
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

### Configure Vertical Grid Lines

Show only vertical grid lines in the Simulation Data Inspector.

```
Simulink.sdi.setGridOn('vertical')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

### Configure No Grid Lines

Show no grid lines in the Simulation Data Inspector.

```
Simulink.sdi.setGridOn('off')
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

### Configure Horizontal and Vertical Grid Lines

Show horizontal and vertical grid lines in the Simulation Data Inspector.

```
Simulink.sdi.setGridOn('on')
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

## Input Arguments

### grid — Visible grid lines

'on' (default) | 'horizontal' | 'vertical' | 'off'

Grid lines to show on time plots in the Simulation Data Inspector, specified as one of these options:

- 'on' — Horizontal and vertical grid lines
- 'horizontal' — Only horizontal grid lines
- 'vertical' — Only vertical grid lines
- 'off' — No grid lines

## Version History

Introduced in R2019a

### Specifying the input as a logical value is not recommended

Starting in R2019b, the `Simulink.sdi.setGridOn` input values changed to:

- 'on'
- 'horizontal'
- 'vertical'

- 'off'

In R2019a, the `Simulink.sdi.setGridOn` accepted a logical input to show or hide the grid on time plots in the Simulation Data Inspector:

- `true` or `1` shows horizontal and vertical grid lines on time plots in the Simulation Data Inspector.
- `false` or `0` hides horizontal and vertical grid lines on time plots in the Simulation Data Inspector.

Starting in R2019b, use the 'on' input value for the same behavior as the `true` or `1` input, and use the 'off' input value for the same behavior as the `false` or `0` input.

# Simulink.sdi.setMarkersOn

**Package:** Simulink.sdi

Show or hide markers for plotted signals

## Syntax

```
Simulink.sdi.setMarkersOn(value)
```

## Description

`Simulink.sdi.setMarkersOn(value)` shows or hides markers on signals plotted in the Simulation Data Inspector according to the logical input, `value`. The function configures the **Show markers** setting in the Simulation Data Inspector. The setting applies to the session and shows or hides markers for all signals plotted in the Simulation Data Inspector. By default, markers are hidden in the Simulation Data Inspector.

## Examples

### Display Markers in the Simulation Data Inspector

```
Simulink.sdi.setMarkersOn(true);
```

## Input Arguments

### `value` — Logical input

false or 0 (default) | true or 1

Logical specification of whether markers are shown on plots in the Simulation Data Inspector.

- true or 1 shows markers on plots in the Simulation Data Inspector.
- false or 0 does not show markers on plots in the Simulation Data Inspector.

Data Types: logical

## Version History

# Simulink.sdi.setMaxDiskUsage

Specify maximum size for data logged to disk

## Syntax

```
Simulink.sdi.setMaxDiskUsage(maxSize)
```

## Description

`Simulink.sdi.setMaxDiskUsage(maxSize)` configures logging to use no more than the maximum amount of disk space specified by `maxSize`, in units of GB.

When you configure a maximum size for logged data, you can also configure the behavior when logged data approaches the maximum size using the `Simulink.sdi.setDeleteRunsOnLowSpace` function. For more information, see “Specify a Minimum Disk Space Requirement or Maximum Size for Logged Data”.

## Examples

### Configure Logged Data Size Limits

Logging data from simulation can produce large amounts of data that may fill up disk space. To mitigate issues related to filing disk space, you can specify a minimum disk space requirement, a maximum size for logged data, or both. To ensure the logged data does not exceed the specified maximum size or use enough disk space to violate the disk space requirement, prior run data may be deleted and recording logged data may be disabled. You can specify whether to prioritize continuing to log data in the current simulation or retaining prior simulation data.

Use the `Simulink.sdi.setRequiredFreeSpace` function to configure logging to leave at least 1 GB of disk space empty.

```
Simulink.sdi.setRequiredFreeSpace(1);
```

Use the `Simulink.sdi.setMaxDiskUsage` function to specify a maximum logged data size of 100 GB.

```
Simulink.sdi.setMaxDiskUsage(100);
```

When you configure logging size limits, you can also specify what to do when the logging limits are approached. You can choose whether to prioritize retaining data from prior runs or data in the current run.

By default, current simulation data is prioritized. If the size of logged data approaches configured limits, data from prior simulations is deleted. If deleting run data does not free enough space, recording logged data is disabled and no more data from the current simulation is saved. When you choose to prioritize logged data from prior simulations instead, recording is disabled as soon as the size of logged data approaches configured limits. You see a warning when run data is deleted and when recording is disabled.

Use the `Simulink.sdi.deleteRunsOnLowSpace` function to configure logging to prioritize retaining prior run data.

```
Simulink.sdi.deleteRunsOnLowSpace(false);
```

If recording is disabled due to the size of logged data, you need to enable recording again to save data from future simulations. Use the `Simulink.sdi.setRecordData` function to enable recording.

```
Simulink.sdi.setRecordData(true);
```

## Input Arguments

### **maxSize** — Maximum size for data logged to disk

0 (default) | scalar

Maximum size for data logged to disk, specified as a scalar, in units of GB. To configure no limit on the size of logged data, specify 0.

Example: `Simulink.sdi.setMaxDiskUsage(500)` configures logging to use no more than 500 GB of disk space.

## Version History

Introduced in R2021a

# Simulink.sdi.setNumCursors

Configure number of cursors active in Simulation Data Inspector

## Syntax

```
Simulink.sdi.setNumCursors(num)
Simulink.sdi.setNumCursors(num,view)
```

## Description

`Simulink.sdi.setNumCursors(num)` configures the Simulation Data Inspector to display the number of cursors specified by `num` in the **Inspect** pane plots.

`Simulink.sdi.setNumCursors(num,view)` configures the Simulation Data Inspector to display the number of cursors specified by `num` in the **Inspect** or **Compare** plot area, as specified by `view`.

## Examples

### Programmatically Interact with Cursors in the Simulation Data Inspector

You can use the Simulation Data Inspector programmatic interface to specify the position of cursors on time plots or sparklines and to access the time that corresponds to the current cursor position.

Open the session file `vdp_mu.mldatx` to add plot data in the Simulation Data Inspector. The session file contains data for a 20-second simulation of a model of the Van Der Pol equation, with signals `x1` and `x2` plotted on separate subplots in a 2-by-1 subplot layout.

```
open vdp_mu.mldatx;
```

Use the `Simulink.sdi.setNumCursors` function to add one cursor to the plot.

```
Simulink.sdi.setNumCursors(1);
```

Suppose you want to know the signal values 5 seconds into the simulation. Use the `Simulink.sdi.setCursorPositions` function to move the cursor to `t=5s` and read the signal values off from the cursor on each subplot. The asterisk next to the value in the cursor label indicates that the value is interpolated because the simulation did not include a calculation for a simulation time of exactly 5s.

```
Simulink.sdi.setCursorPositions('left',5);
```

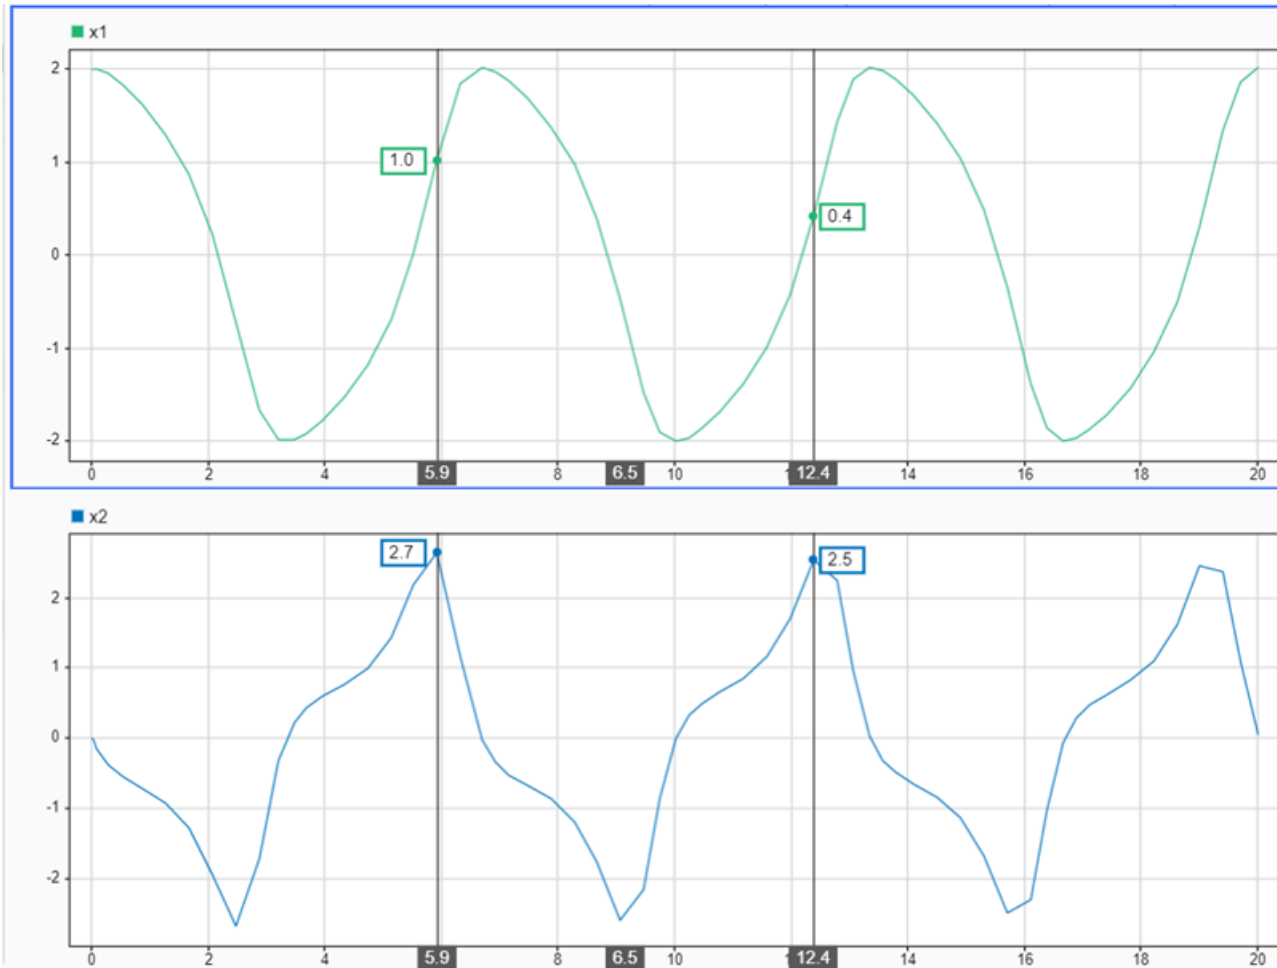

Suppose you want to calculate the time between two peaks in the x2 signal. Add a second cursor using the `Simulink.sdi.setNumCursors` function or by using Show/hide data cursors  in the Simulation Data Inspector.

```
numCursors = Simulink.sdi.getNumCursors;
if(numCursors < 2)
 Simulink.sdi.setNumCursors(2);
end
```

Drag the cursors so the left cursor is positioned at the first peak in the x2 signal and the right cursor is positioned at the second peak. Alternatively, you can run this code that positions the cursors for you.

```
Simulink.sdi.setCursorPositions('left',5.921998549931304,...
 'right',12.378442136906246);
```

The Simulation Data Inspector displays the difference between the two cursors in seconds. However, the cursor position and difference values are both rounded. Use the `Simulink.sdi.getCursorPosition` function to programmatically retrieve the exact time values that correspond to the cursor positions. Then, compute the difference between the times.

```
[t1,t2] = Simulink.sdi.getCursorPosition;
T = t2 - t1
```

```
T = 6.4564
```

## Input Arguments

**num** — Number of cursors to display

0 | 1 | 2

Number of cursors to display, specified as 0, 1, or 2.

**view** — Plot area in which to display cursors

'inspect' (default) | 'compare'

Plot area in which to display cursors, specified as 'inspect' or 'compare'.

Data Types: char | string

# Simulink.sdi.setPosition

Set position and size of Simulation Data Inspector

## Syntax

```
Simulink.sdi.setPosition(pos)
```

## Description

`Simulink.sdi.setPosition(pos)` sets the position and size of the Simulation Data Inspector window based on the values in the vector, `pos`. The Simulation Data Inspector must be open before changing the position or size of the window.

## Examples

### Change Position of Simulation Data Inspector

This example shows you how to change the position and size of the Simulation Data Inspector window. First, open the Simulation Data Inspector.

```
Simulink.sdi.view
```

Set the Simulation Data Inspector window to be:

- 800 pixels wide
- 500 pixels high
- 200 pixels from the left edge of your primary display
- 60 pixels from the bottom of your primary display

```
pos = [200 60 800 500];
Simulink.sdi.setPosition(pos)
```

Alternatively, you can move and resize the Simulation Data Inspector manually. To use this placement in future simulations, retrieve the position vector using the function `Simulink.sdi.getPosition`.

```
newPos = Simulink.sdi.getPosition
```

```
newPos = 1×4
```

```
 200 60 800 500
```

## Input Arguments

**pos** — Position and size of Simulation Data Inspector  
numeric array (default)

Position and size of the Simulation Data Inspector window, specified as a four-element vector in the form `[left bottom width height]`. All measurements have units of pixels.

| <b>Element</b> | <b>Description</b>                                                                                                                                                  |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| left           | Distance from the left edge of the primary display to the inner-left edge of the window. This value can be negative on systems that have more than one monitor.     |
| bottom         | Distance from the bottom edge of the primary display to the inner-bottom edge of the window. This value can be negative on systems that have more than one monitor. |
| width          | Distance between the right and left inner edges of the window.                                                                                                      |
| height         | Distance between the top and bottom inner edges of the window.                                                                                                      |

# Simulink.sdi.setRecordData

Specify record mode for logging

## Syntax

```
Simulink.sdi.setRecordData(record)
```

## Description

`Simulink.sdi.setRecordData(record)` configures the logging **Record mode** according to the value of `record`. When `record` is `true`, logged data is available to view during simulation and for analysis after simulation. When `record` is `false`, data is only available for viewing during simulation and is not available after simulation in the workspace or the Simulation Data Inspector.

## Examples

### Configure Logging to View Data Only During Simulation

In certain scenarios, you may want to only view logged data during simulation and not save any data to disk. For example, when using the Simulation Data Inspector to visualize data streaming from hardware, you may only want to view the data live and not record it. Use the `Simulink.sdi.setRecordData` function to configure the **Record mode** setting in the Simulation Data Inspector programmatically. To view data only during simulation, specify the input as `false`.

```
Simulink.sdi.setRecordData(false)
```

When you want to record logged data on disk so that it is available for analysis after simulation, call the `Simulink.sdi.setRecordData` function with `true` as the input.

```
Simulink.sdi.setRecordData(true)
```

The **Record mode** setting is restored to **View and record data** at the start of each MATLAB session.

## Input Arguments

### record — Record mode

`true` or 1 (default) | `false` or 0

Record mode, specified as numeric or logical 1 (`true`) or 0 (`false`).

- `true` — Logged data is stored on disk and available in the workspace and the Simulation Data Inspector after simulation.
- `false` — Logged data is not stored on disk and is only available to view during simulation. After simulation, no logged data is available in the Simulation Data Inspector or workspace.

Specifying `record` as `false` can affect other applications. For more information, see “View Data Only During Simulation”.

Data Types: `logical`

# Simulink.sdi.setRequiredFreeSpace

Specify minimum disk space to leave free when logging data

## Syntax

```
Simulink.sdi.setRequiredFreeSpace(minDiskSpace)
```

## Description

`Simulink.sdi.setRequiredFreeSpace(minDiskSpace)` configures logging to leave at least the number of GB specified by `minDiskSpace` free when logging data.

When you configure a minimum amount of disk space to leave free, you can also configure the behavior when the free disk space limit is approached using the `Simulink.sdi.setDeleteRunsOnLowSpace` function. For more information, see “Specify a Minimum Disk Space Requirement or Maximum Size for Logged Data”.

## Examples

### Configure Logged Data Size Limits

Logging data from simulation can produce large amounts of data that may fill up disk space. To mitigate issues related to filing disk space, you can specify a minimum disk space requirement, a maximum size for logged data, or both. To ensure the logged data does not exceed the specified maximum size or use enough disk space to violate the disk space requirement, prior run data may be deleted and recording logged data may be disabled. You can specify whether to prioritize continuing to log data in the current simulation or retaining prior simulation data.

Use the `Simulink.sdi.setRequiredFreeSpace` function to configure logging to leave at least 1 GB of disk space empty.

```
Simulink.sdi.setRequiredFreeSpace(1);
```

Use the `Simulink.sdi.setMaxDiskUsage` function to specify a maximum logged data size of 100 GB.

```
Simulink.sdi.setMaxDiskUsage(100);
```

When you configure logging size limits, you can also specify what to do when the logging limits are approached. You can choose whether to prioritize retaining data from prior runs or data in the current run.

By default, current simulation data is prioritized. If the size of logged data approaches configured limits, data from prior simulations is deleted. If deleting run data does not free enough space, recording logged data is disabled and no more data from the current simulation is saved. When you choose to prioritize logged data from prior simulations instead, recording is disabled as soon as the size of logged data approaches configured limits. You see a warning when run data is deleted and when recording is disabled.

Use the `Simulink.sdi.setDeleteRunsOnLowSpace` function to configure logging to prioritize retaining prior run data.

```
Simulink.sdi.setDeleteRunsOnLowSpace(false);
```

If recording is disabled due to the size of logged data, you need to enable recording again to save data from future simulations. Use the `Simulink.sdi.setRecordData` function to enable recording.

```
Simulink.sdi.setRecordData(true);
```

## Input Arguments

### **minDiskSpace** — Minimum amount of free disk space required

0.1 (default) | scalar

Minimum amount of free disk space required, specified as a scalar, in units of GB. The minimum disk space requirement is a way to limit the size of logged data. The **When low on disk space** setting specifies what happens when the minimum disk space requirement is approached. For more information, see “Specify a Minimum Disk Space Requirement or Maximum Size for Logged Data”.

Example: `Simulink.sdi.setRequiredFreeSpace(0.5)` configures logging to leave at least half a gigabyte of free disk space.

## Version History

Introduced in R2021a

# Simulink.sdi.setRunNamingRule

**Package:** Simulink.sdi

Specify the Simulation Data Inspector run naming rule

## Syntax

```
Simulink.sdi.setRunNamingRule('rule')
```

## Description

`Simulink.sdi.setRunNamingRule('rule')` sets the Simulation Data Inspector rule for naming runs created by simulating a Simulink model.

## Examples

### Modify Run Naming Rule Then Restore Default

This example shows how to use the Simulation Data Inspector API to modify the Simulation Data Inspector run naming rule, check a run's name, restore default preferences, and check the run naming rule.

```
% Load model
load_system('sldemo_fuelsys')

% Modify run naming rule
Simulink.sdi.setRunNamingRule('<model_name> Run <run_index>')

% Simulate system
sim('sldemo_fuelsys')

% Check run name
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
fuelRun = Simulink.sdi.getRun(runID);
fuelRun.name

ans =
'sldemo_fuelsys Run 1'

% Clear preferences to reset the run naming rule
Simulink.sdi.clearPreferences

% Check run naming rule
Simulink.sdi.getRunNamingRule

ans =
'Run <run_index>: <model_name>'
```

## Input Arguments

### 'rule' — Simulation Data Inspector run naming rule

'Run <run\_index>: <model\_name> (default) | character vector

Simulation Data Inspector run naming rule for runs created by simulating a Simulink model. The character vector specifying the run naming rule can include plain text and any of the following tokens that represent data pulled from each run:

- <run\_index> - Run's index in the Simulation Data Inspector repository.
- <model\_name> - Name of the model simulated to create the run.
- <time\_stamp> - Start time for the simulation that created the run.
- <sim\_mode> - Simulation mode used for the simulation that created the run.

Example: '<time\_stamp> Simulation <run\_index>: <model\_name>'

Example: '<model\_name> - <run\_index>'

## Alternatives

You can modify the run naming rule using the Simulation Data Inspector UI in the **Preferences** menu. You can rename a run by modifying the Name property of its `Simulink.sdi.Run` object.

## Version History

**Introduced in R2011b**

# Simulink.sdi.setSignalInputProcessingMode

Specify value for Input Processing signal property

## Syntax

```
Simulink.sdi.setSignalInputProcessingMode(blkPath,port,mode)
Simulink.sdi.setSignalInputProcessingMode(h,mode)
```

## Description

`Simulink.sdi.setSignalInputProcessingMode(blkPath,port,mode)` specifies `mode` as the value of the **Input Processing** property for the signal at the specified block path and port. You can only specify the **Input Processing** property for logged signals.

The **Input Processing** setting affects the format of the logged data and how the Simulation Data Inspector and dashboard blocks display the signal. You can configure a signal for frame-based or sample-based input processing.

`Simulink.sdi.setSignalInputProcessingMode(h,mode)` specifies `mode` as the value of the **Input Processing** property for the signal that corresponds to the line handle, `h`.

## Examples

### Programmatically Specify Input Processing Setting to Log a Frame-Based Signal

Many signal processing applications process data using frames, rather than individual signal values. A frame consists of signal values for several sample times. To process signals as frame-based in your model, specify frame-based processing in the blocks. To log and visualize frame-based signals, set the **Input Processing** setting to `Columns as channels (frame based)` in the Instrumentation Properties for the signal.

This example uses a model from the DSP System Toolbox™ to show how to programmatically specify the **Input Processing** setting for signals in a model using the `Simulink.sdi.setSignalInputProcessingMode` function. The model uses frame-based signals and demonstrates single sideband (SSB) modulation.

### Configure Signal Logging

Open or load the model `ssbdemo_frame`. This example illustrates a scripting workflow and only loads the model.

```
load_system('ssbdemo_frame');
```

The model includes visualization blocks and does not use signal logging. Mark the signals that represent the upper sideband and lower sideband for logging.

```
upperSB_block = 'ssbdemo_frame/Up';
lowerSB_block = 'ssbdemo_frame/Down';
```

```
Simulink.sdi.markSignalForStreaming(upperSB_block,1,'on')
Simulink.sdi.markSignalForStreaming(lowerSB_block,1,'on')
```

If you simulate the model as-is, the signals would be logged as though they were sample-based, so each element in a sample would be treated as a separate channel. To log the signals as frame-based, specify the **Input Processing** setting for the signal as frame using the `Simulink.sdi.setSignalInputProcessingMode` function.

```
Simulink.sdi.setSignalInputProcessingMode(upperSB_block,1,'frame');
Simulink.sdi.setSignalInputProcessingMode(lowerSB_block,1,'frame');
```

After configuring the upper and lower sideband signals for logging and as frame-based, the data logs to the workspace and the Simulation Data Inspector in a frame-based format, so each column in a sample is treated as a channel in the signal. You can view and analyze the data in the Simulation Data Inspector or using its programmatic interface.

### Input Arguments

#### **blkPath** — Block path for block that produces signal

string | character array

Block path for the block that produces the signal, specified as a string or character array.

Example: "vdp/Mu"

**port — Number of block output port connected to signal**

scalar

Block output port number for the port that produces the signal, specified as a scalar.

Example: 1

**mode — Signal input processing setting**

"sample" (default) | "frame"

**Input Processing** property value for the signal, returned as "signal" or "frame".

- **sample** — Sample-based input processing, where each element in a sample is treated as a channel.
- **frame** — Frame-based input processing, where each column in a sample is treated as a channel.

**h — Signal line handle**

line handle

Line handle for the signal. You can get the line handle for a signal using the `get_param` function with the 'LineHandles' option. For example, to access the line handle for the output of the Mu block in the model vdp:

```
MuLineHandles = get_param('vdp/Mu','LineHandles');
MuOutputLineHandle = MuLineHandles.Output;
```

Example: MuOutputLineHandle

## Version History

Introduced in R2020a

### See Also

## Simulink.sdi.setStorageLocation

Specify location for logged data on disk

### Syntax

```
Simulink.sdi.setStorageLocation(storagePath)
```

### Description

`Simulink.sdi.setStorageLocation(storagePath)` configures `storagePath` as the location for simulation data logged to disk. By default, data is logged to the temporary directory on your computer.

---

**Note** Logging data to a network location can degrade performance.

---

---

**Note** The `Simulink.sdi.setStorageLocation` function configures the location of data logged to the workspace and Simulation Data Inspector when you log data to disk. The `Simulink.sdi.setStorageLocation` function does *not* configure the location of data logged to a file.

---

### Examples

#### Specify Location of Logged Data

By default, data logged to the workspace and Simulation Data Inspector is stored in the temporary directory on your computer. You may want to change the location of logged data when you need to log large amounts of data and a secondary drive provides more storage capacity.

Use the `Simulink.sdi.setStorageLocation` function to specify the location for the file that holds data logged to disk.

```
Simulink.sdi.setStorageLocation('C:/Users/username/LoggedData');
```

### Input Arguments

#### **storagePath** — Location of data logged to disk

character vector | string

Location of data logged to disk, specified as a character vector or string. By default, data logs to the temporary directory on your computer.

You may want to change the location of logged data when you need to log large amounts and a network location provides more storage capacity than your local machine. However, logging data to a network location can degrade performance.

Example: 'C:/Users/username/LoggedData'

Data Types: char | string

## **Version History**

**Introduced in R2021a**

### **See Also**

## Simulink.sdi.setStorageMode

Specify whether to log data to disk or memory

### Syntax

```
Simulink.sdi.setStorageMode(storageMode)
```

### Description

`Simulink.sdi.setStorageMode(storageMode)` configures logging to log data to disk or to memory according to `storageMode`. By default, data logged to the workspace and the Simulation Data Inspector is logged to disk.

---

**Note** When you change the logging storage mode, data from prior simulations is deleted. You cannot change the logging storage mode while a simulation is running.

---

### Examples

#### Log Simulation Data to Memory

You can configure whether data logged in simulation logs to memory or to disk. By default, data is logged to disk and brought into memory on demand. If your machine has more RAM than disk space, you may want to log data to memory instead.

Use the `Simulink.sdi.setStorageMode` function to configure logging to log data to memory.

```
Simulink.sdi.setStorageMode("memory");
```

### Input Arguments

#### **storageMode** — Where logged simulation data is stored on your machine

'disk' (default) | 'memory'

Where logged simulation data is stored on your machine, specified as 'disk' or 'memory'. By default, data logged to the workspace and the Simulation Data Inspector is logged to disk.

When you change the storage mode to log data to memory:

- Data logged from prior simulations is deleted.
- Configuring limits on the size of logged data is not supported.

You cannot change the storage mode while a simulation is running.

When you configure a parallel worker to log to memory, sending logged data to the client is not supported.

Logging data to memory is not supported for rapid accelerator simulations or models deployed using Simulink Compiler.

Data Types: char | string

## **Version History**

“Configure the Simulation Data Inspector”

# Simulink.sdi.setSubPlotLayout

**Package:** Simulink.sdi

Set subplot layout in the Simulation Data Inspector

## Syntax

```
Simulink.sdi.setSubPlotLayout(r,c)
```

## Description

`Simulink.sdi.setSubPlotLayout(r,c)` sets the grid layout of plots in the **Simulation Data Inspector** using the specified number of rows, `r`, and columns, `c`.

## Examples

### Change Subplot Layout

```
% Change subplot layout to 4 rows and 2 columns
Simulink.sdi.setSubPlotLayout(4,2);
```

### Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

#### Create Data for the Run

Create `timeseries` objects to contain data for a sine signal and a cosine signal. Give each `timeseries` object a descriptive name.

```
time = linspace(0,20,100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

#### Create a Run and Add Data

Use the `Simulink.sdi.view` function to open the Simulation Data Inspector.

```
Simulink.sdi.view
```

To import data into the Simulation Data Inspector from the workspace, create a `Simulink.sdi.Run` object using the `Simulink.sdi.Run.create` function. Add information about the run to its metadata using the `Name` and `Description` properties of the Run object.

```
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals with different frequencies';
```

Use the `add` function to add the data you created in the workspace to the empty run.

```
add(sinusoidsRun, 'vars', sine_ts, cos_ts);
```

### Plot the Data in the Simulation Data Inspector

Use the `getSignalByIndex` function to access `Simulink.sdi.Signal` objects that contain the signal data. You can use the `Simulink.sdi.Signal` object properties to specify the line style and color for the signal and plot it in the Simulation Data Inspector. Specify the `LineColor` and `LineDashed` properties for each signal.

```
sine_sig = getSignalByIndex(sinusoidsRun,1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';

cos_sig = sinusoidsRun.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.LineDashed = '--';
```

Use the `Simulink.sdi.setSubPlotLayout` function to configure a 2-by-1 subplot layout in the Simulation Data Inspector plotting area. Then use the `plotOnSubplot` function to plot the sine signal on the top subplot and the cosine signal on the lower subplot.

```
Simulink.sdi.setSubPlotLayout(2,1);

plotOnSubPlot(sine_sig,1,1,true);
plotOnSubPlot(cos_sig,2,1,true);
```

### Close the Simulation Data Inspector and Save Your Data

When you have finished inspecting the plotted signal data, you can close the Simulation Data Inspector and save the session to an `MLDATX` file.

```
Simulink.sdi.close('sinusoids.mldatx')
```

## Input Arguments

### **r** — Number of rows

integer

Number of rows in the subplot grid layout, specified as a whole number between 1 and 8, inclusive.

Example: 2

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | char

### **c** — Number of columns

integer

Number of columns in the subplot grid layout, specified as a whole number between 1 and 8, inclusive.

Example: 2

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `char`

## **Version History**

“Create Plots Using the Simulation Data Inspector”

# Simulink.sdi.setSubplotLimits

Specify subplot limits for time plots in the Simulation Data Inspector

## Syntax

```
Simulink.sdi.setSubplotLimits(r,c,Name,Value)
```

## Description

`Simulink.sdi.setSubplotLimits(r,c,Name,Value)` configures the time and y-axis limits for the subplot at the location specified by `r` and `c` according to the values specified by one or more name-value pair arguments. You can specify any combination of a *t*-axis minimum, *t*-axis maximum, *y*-axis minimum, and *y*-axis maximum using name-value pair arguments.

---

**Note** Limits for the *t*-axis apply to all linked time plots in the Simulation Data Inspector. For more information, see “Linked Subplots”.

---

## Examples

### Copy y-Axis Range from One Subplot to Another

You can use the `Simulink.sdi.getSubplotLimits` and `Simulink.sdi.setSubplotLimits` functions to copy the axis limits from one subplot to another. For example, you can specify the same *y*-axis limits for two subplots that display the same signal from simulations that used different values of a model parameter. This example copies the *y*-axis settings from one subplot to another to analyze the effect of changing the value of `Mu` in the model `vdp`.

Create the data in the Simulation Data Inspector by simulating the model `vdp` twice. The first time, specify the value of `Mu` as 1. For the second simulation, set the value of `Mu` to 2. The model logs data for the signals `x1` and `x2`.

```
open_system('ex_vdp');
set_param('ex_vdp/Mu','Gain','1')
sim('ex_vdp');

set_param('ex_vdp/Mu','Gain','2')
sim('ex_vdp');
```

Open the Simulation Data Inspector.

```
Simulink.sdi.view
```

Create plots in the Simulation Data Inspector to show the results from each simulation. Configure a 2x2 subplot layout so you can plot one signal on each plot, side by side.

```
Simulink.sdi.setSubPlotLayout(2,2)
```

Get the `Simulink.sdi.Signal` objects that correspond to each signal from each run, and plot one signal on each subplot. Plot the signals from the first simulation on the subplots in the first column and the signals from the second simulation on the subplots in the second column.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end-1);
runID2 = runIDs(end);

runMu1 = Simulink.sdi.getRun(runID1);
runMu2 = Simulink.sdi.getRun(runID2);

sig1 = getSignalByIndex(runMu1,1);
sig2 = getSignalByIndex(runMu1,2);
sig3 = getSignalByIndex(runMu2,1);
sig4 = getSignalByIndex(runMu2,2);

plotOnSubPlot(sig1,1,1,true);
plotOnSubPlot(sig2,2,1,true);
plotOnSubPlot(sig3,1,2,true);
plotOnSubPlot(sig4,2,2,true);
```

The signals in the first column of plots look similar to those in the second column. However, the y-axis limits for the plots of the x2 signal are different.

Use the `Simulink.sdi.getSubplotLimits` function to copy the limits used for the subplot with the x2 signal from the second simulation.

```
[~,~,ymin,ymax] = Simulink.sdi.getSubplotLimits(2,2);
```

Use the `Simulink.sdi.setSubplotLimits` function to apply the same y-axis limits to the subplot with the x2 signal from the first run.

```
Simulink.sdi.setSubplotLimits(2,1, 'yRange', [ymin,ymax]);
```

With the updated y-axis limits, the difference in the x2 signal is more apparent.

## Input Arguments

**r** — Subplot row index  
integer

Subplot row index, specified as an integer between 1 and 8, inclusive. Use the  $r$  and  $c$  inputs together to specify the location of the subplot for which you want to specify axis limits.

Example: `Simulink.sdi.setSubplotLimits(2,2,'yrange',[0,3])` configures y-axis limits for the time plot in the second row of the second column of the subplot layout in the Simulation Data Inspector.

**c — Subplot column index**

integer

Subplot column index, specified as an integer value between 1 and 8, inclusive. Use the `r` and `c` inputs together to specify the location of the subplot for which you want to specify axis limits.

Example: `Simulink.sdi.setSubplotLimits(2,2,'yrange',[0,3])` configures  $y$ -axis limits for the time plot in the second row of the second column of the subplot layout in the Simulation Data Inspector.

**Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `Simulink.sdi.setSubplotLimits(2,2,'ymin',0,'ymax',3)` configures  $y$ -axis limits for the time plot in the second row of the second column of the subplot layout in the Simulation Data Inspector.

**View — Simulation Data Inspector view**

'Inspect' (default) | 'Compare'

Simulation Data Inspector view, specified as 'Inspect' or 'Compare'. Specify the view with the subplot for which you want to specify limits. When you omit the 'View' argument, the limits are applied to the specified subplot in the inspect view.

Example: `Simulink.sdi.setSubplotLimits(2,1,'View','Compare','yRange',[-2,2])` configures  $y$ -axis limits for the difference plot in the compare view of the Simulation Data Inspector.

Data Types: char | string

**tMin — t-axis minimum**

scalar

$t$ -axis minimum, specified as a scalar.

You can specify limits for the  $t$ -axis using the `tMin` and `tMax` name-value arguments, using the `tRange` argument, or using the `AllRange` argument. When you specify the `tMin` name-value pair argument, do not specify the `tRange` or `AllRange` arguments.

Data Types: double

**tMax — t-axis maximum**

scalar

$t$ -axis maximum, specified as a scalar.

You can specify limits for the  $t$ -axis using the `tMin` and `tMax` name-value arguments, the `tRange` argument, or the `AllRange` argument. When you specify the `tMax` name-value argument, do not specify the `tRange` or `AllRange` arguments.

Data Types: double

**yMin — y-axis minimum**

scalar

*y*-axis minimum, specified as a scalar.

You can specify limits for the *y*-axis using the `yMin` and `yMax` name-value arguments, the `yRange` argument, or the `AllRange` argument. When you specify the `yMin` name-value argument, do not specify the `yRange` or `AllRange` arguments.

Data Types: `double`

### **yMax — *y*-axis maximum**

scalar

*y*-axis maximum, specified as a scalar.

You can specify limits for the *y*-axis using the `yMin` and `yMax` name-value arguments, the `yRange` argument, or the `AllRange` argument. When you specify the `yMax` name-value argument, do not specify the `yRange` or `AllRange` arguments.

Data Types: `double`

### **tRange — *t*-axis range**

1-by-2 vector

*t*-axis range, specified as a 1-by-2 vector that contains scalar numeric values.

You can specify limits for the *t*-axis using the `tMin` and `tMax` name-value arguments, the `tRange` argument, or the `AllRange` argument. When you specify the `tRange` name-value argument, do not specify the `tMin`, `tMax`, or `AllRange` arguments.

Example: `Simulink.sdi.setSubplotLimits(1,1,'tRange',[-1,20])` configures the *t*-axis range for the subplot in the first row and first column of the Simulation Data Inspector subplot layout.

Data Types: `double`

### **yRange — *y*-axis range**

1-by-2 vector

*y*-axis range, specified as a 1-by-2 vector that contains scalar numeric values.

You can specify limits for the *y*-axis using the `yMin` and `yMax` name-value arguments, the `yRange` argument, or the `AllRange` argument. When you specify the `yRange` name-value argument, do not specify the `yMin`, `yMax`, or `AllRange` arguments.

Example: `Simulink.sdi.setSubplotLimits(1,1,'yRange',[-5,5])` configures the *y*-axis range for the subplot in the first row and first column of the Simulation Data Inspector subplot layout.

Data Types: `double`

### **AllRange — Ranges for *t*-axis and *y*-axis**

1-by-4 vector

Ranges for *t*-axis and *y*-axis, specified as a 1-by-4 vector that contains scalar numeric values. The values specified in the vector are mapped to the *t*- and *y*-axis limits in this order: `[tMin,tMax,yMin,yMax]`.

When you specify the `AllRange` name-value argument, do not specify the `tMin`, `tMax`, `yMin`, `yMax`, `tRange`, or `yRange` arguments.

Example: `Simulink.sdi.setSubplotLimits(1,1,'AllRange',[-1,20,-5,5])` configures the *t*-axis range and *y*-axis range for the subplot in the first row and first column of the Simulation Data Inspector subplot layout.

Data Types: `double`

# Simulink.sdi.setTableGrouping

Change signal grouping hierarchy in Inspect pane

## Syntax

```
Simulink.sdi.setTableGrouping
Simulink.sdi.setTableGrouping(group,group1,...,groupN)
```

## Description

`Simulink.sdi.setTableGrouping` removes grouping for signals in the Simulation Data Inspector.

`Simulink.sdi.setTableGrouping(group,group1,...,groupN)` groups signals in the Simulation Data Inspector according to one or more specified options. Signal grouping is the same on the **Inspect** and **Compare** panes. You can group signals by any combination of domain, physical system hierarchy, data hierarchy, and model hierarchy.

## Examples

### Group Data by Model Hierarchy Then by Data Hierarchy

To help organize and find signals in the Simulation Data Inspector, you can group the signals. For example, you could group signals according to their location within a model hierarchy and then by data hierarchy.

```
Simulink.sdi.setTableGrouping('Subsystems','DataHierarchy');
```

## Input Arguments

### group — Signal grouping

'Domain' | 'DataHierarchy' | 'Subsystems' | 'PhysmodHierarchy'

Signal grouping, specified as one or more of these values:

- **Domain** — Group signals by domain.
- **DataHierarchy** — Group signals according to data hierarchy, such as the hierarchy for a bus.
- **SubSystems** — Group signals according to their location within the model hierarchy.
- **PhysmodHierarchy** — Group signals according to the Simscape hierarchy. This option is only available when you have a Simscape license.

You can specify up to three grouping options unless you have a Simscape license, in which case you can specify up to four.

By default, the Simulation Data Inspector groups signals by domain, then by physical system hierarchy (if you have a Simscape license), and then by data hierarchy.

## **Version History**

# Simulink.sdi.setTickLabelsDisplay

Configure tick label visibility for time plot axes

## Syntax

```
Simulink.sdi.setTickLabelsDisplay(label)
```

## Description

`Simulink.sdi.setTickLabelsDisplay(label)` displays labels for the tick marks on axes of time plots in the Simulation Data Inspector according to the input, `label`. The function sets the value of the **Tick labels** setting on the **Time Plot** section of the **Visualization Settings** in the Simulation Data Inspector. The setting applies to all time plots in the layout. By default, the Simulation Data Inspector displays tick mark labels for both axes.

## Examples

### Configure Tick Mark Label Visibility for Time Plots

You can use the `Simulink.sdi.setTickLabelsDisplay` function to configure the visibility of tick mark labels for the *t*- and *y*-axes on time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector displays tick marks for both axes.

This example starts by showing how to use the `Simulink.sdi.getTickLabelsDisplay` function to access the current tick mark label visibility. Subsequent sections show the code to specify each available option for tick mark label visibility on time plots in the Simulation Data Inspector. To see the result of each configuration, the example generates an image using the `Simulink.sdi.snapshot` function with settings specified by a `Simulink.sdi.CustomSnapshot` object.

```
snapSettings = Simulink.sdi.CustomSnapshot;
snapSettings.Width = 300;
snapSettings.Height = 300;
```

### Get Current Tick Mark Label Visibility

Before modifying the visibility of the tick mark labels on time plots, you can save the current configuration to a variable in the workspace in case you want to restore the preference later.

```
initTickLabels = Simulink.sdi.getTickLabelsDisplay;
```

### Show Only *t*-Axis Tick Mark Labels

Show the tick mark labels for the *t*-Axis.

```
Simulink.sdi.setTickLabelsDisplay('t-axis')
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

### Show Only y-Axis Tick Mark Labels

Show the tick mark labels for the y-axis.

```
Simulink.sdi.setTickLabelsDisplay('y-axis')
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

### Hide Tick Mark Labels

You can hide the tick mark labels for both axes.

```
Simulink.sdi.setTickLabelsDisplay('none')
Simulink.sdi.snapshot('from','custom','settings',snapSettings);
```

### Show All Tick Mark Labels

By default, the Simulation Data Inspector shows tick mark labels for both axes on time plots.

```
Simulink.sdi.setTickLabelsDisplay('all')
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

## Input Arguments

### Label — Tick mark labels to display

'all' (default) | 't-axis' | 'y-axis' | 'none'

Tick mark labels to display on time plots in the Simulation Data Inspector, specified as one of these options:

- 'all' — Display tick mark labels for both time plot axes.
- 't-axis' — Display tick mark labels only on the *t*-axis for time plots.
- 'y-axis' — Display tick mark labels only on the *y*-axis for time plots.
- 'none' — Do not display tick mark labels.

## Version History

Introduced in R2019b

## Simulink.sdi.setTicksPosition

Configure position for tick marks on time plots in the Simulation Data Inspector

### Syntax

```
Simulink.sdi.setTicksPosition(position)
```

### Description

`Simulink.sdi.setTicksPosition(position)` sets the location of tick marks on time plots in the Simulation Data Inspector according to the input, `position`. The function configures the **Ticks** setting on the **Time Plot** section of the **Visualization Settings** in the Simulation Data Inspector. The setting applies to all time plots in the layout. By default, the Simulation Data Inspector displays tick marks on the outside of the plot area.

### Examples

#### Configure Position for Tick Marks on Time Plots

You can use `Simulink.sdi.setTicksPosition` function to specify the position for tick marks on time plots in the Simulation Data Inspector. By default, the Simulation Data Inspector displays tick marks outside of the plot area for time plots.

This example starts by showing how to use the `Simulink.sdi.getTicksPosition` function to access the current position of tick marks. Subsequent sections show the code to specify each configuration option for the position of tick marks on time plots in the Simulation Data Inspector. To see the result, the example generates an image using `Simulink.sdi.snapshot` with settings specified by a `Simulink.sdi.CustomSnapshot` object.

```
snapSettings = Simulink.sdi.CustomSnapshot;
snapSettings.Width = 300;
snapSettings.Height = 300;
```

#### Get Current Tick Mark Position

Before modifying the position of tick marks on time plots, you can save the current configuration to a variable in the workspace in case you want to restore the preference later.

```
initTickPos = Simulink.sdi.getTicksPosition;
```

#### Position Tick Marks Inside Plot Area

Position the tick marks inside the plot area to increase the amount of space used by the plot area.

```
Simulink.sdi.setTicksPosition('inside')
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

### Hide Tick Marks on Time Plots

You can hide the tick marks for time plots in the Simulation Data Inspector. Hiding the tick marks expands the plot area.

```
Simulink.sdi.setTicksPosition('none')
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

### Position Tick Marks Outside Plot Area

By default, the Simulation Data Inspector displays tick marks outside of the plot area for time plots.

```
Simulink.sdi.setTicksPosition('outside')
Simulink.sdi.snapshot('from', 'custom', 'settings', snapSettings);
```

## Input Arguments

### **position** — Position of tick marks on time plots

'outside' (default) | 'inside' | 'none'

Position of tick marks on time plots in the Simulation Data Inspector, specified as 'inside' or 'outside'.

---

**Tip** Move tick marks to the inside of time plots to increase the space available for the plot area.

---

Example: 'inside'

## Version History

**Introduced in R2019b**

## Simulink.sdi.setUnitSystem

Specify system of units to define signal display units in the Simulation Data Inspector

### Syntax

```
Simulink.sdi.setUnitSystem(unitSystem)
Simulink.sdi.setUnitSystem(unitSystem,"Overrides",overrideUnits)
```

### Description

`Simulink.sdi.setUnitSystem(unitSystem)` configures the Simulation Data Inspector to use the specified unit system to define the display units for logged and imported signals.

The Simulation Data Inspector plots signals using the display units. The display units for a signal may differ from the stored units, which indicate units for the data as stored on disk. When you specify a system of units in the Simulation Data Inspector preferences, the Simulation Data Inspector automatically adjusts the display units for logged or imported signals that use units that are not valid in the specified system.

`Simulink.sdi.setUnitSystem(unitSystem,"Overrides",overrideUnits)` configures the Simulation Data Inspector to use the specified override units. Specify override units when you want a type of measurement, such as length, to use consistent units, such as m or ft, across all signals in the Simulation Data Inspector.

### Examples

#### Configure Unit Preferences in the Simulation Data Inspector

To specify a system of units to use for plotting signals in the Simulation Data Inspector, use the `Simulink.sdi.setUnitSystem` function. When you choose to display signals using the SI or US Customary unit system, the Simulation Data Inspector automatically changes the **Display Units** property for logged or imported signals that use units that are not part of the specified unit system. The signal data stored on disk does not change. Signals also have a **Stored Units** property, and the Simulation Data Inspector converts the data to plot the signal when the **Stored Units** and **Display Units** differ.

#### Specify a System of Units

By default, the Simulation Data Inspector displays signals using the units assigned to the signal during simulation or in the imported data. To facilitate analyzing multiple signals and data sets together, you can specify a system of units as a preference. The Simulation Data Inspector automatically updates the **Display Units** for logged or imported signals that use units that are invalid in the specified unit system. For example, a signal logged in a model using units of ft could be updated to use units of m when the system of units is specified as SI.

Use the `Simulink.sdi.setUnitSystem` function to configure the Simulation Data Inspector to display signals using units in the US Customary unit system.

```
Simulink.sdi.setUnitSystem('USCustomary');
```

## Specify Override Units

When you want all signals that represent the same type of measurement to use the same **Display Units**, you can also specify override units. For example, to plot all signals that represent length using units of ft, specify ft as an override unit.

```
Simulink.sdi.setUnitSystem('USCustomary','Overrides','ft');
```

## Check Unit Configuration

Use the `Simulink.sdi.getUnitSystem` function to check the current unit preferences configured in the Simulation Data Inspector.

```
[unitSystem,overrideUnits] = Simulink.sdi.getUnitSystem

unitSystem =
'USCustomary'

overrideUnits =
"ft"
```

## Input Arguments

### **unitSystem** — System of units used to define signal display units

'Default' (default) | 'SI' | 'USCustomary'

System of units used to define signal display units, specified as 'Default', 'SI', or 'USCustomary'.

- **Default** — Use signal stored units.
- **SI** — Use units from the SI unit system for signal display units.
- **USCustomary** — Use units from the US Customary unit system for signal display units.

### **overrideUnits** — Units to override signal display units

string | string array

Units to override signal display units, specified as a string or string array. Specify override units when you want all signals that represent the same measurement type to use consistent units. For example, specify override units of ft to display all signals that represent length measurements using units of ft.

Example: "Overrides",["in","lb"]

Data Types: string

## Version History

# Simulink.sdi.snapshot

**Package:** Simulink.sdi

Capture contents of Simulation Data Inspector plots

## Syntax

```
fig = Simulink.sdi.snapshot
[fig,image] = Simulink.sdi.snapshot
Simulink.sdi.snapshot(Name,Value)
Simulink.sdi.snapshot(Name,Value)
Simulink.sdi.snapshot(Name,Value)
```

## Description

`fig = Simulink.sdi.snapshot` creates a figure of the plotting area in the open Simulation Data Inspector session with the figure handle `fig`.

`[fig,image] = Simulink.sdi.snapshot` creates a figure of the plotting area in the open Simulation Data Inspector session with the figure handle `fig` and returns the image data in the array, `image`.

`Simulink.sdi.snapshot(Name,Value)` captures an image of the Simulation Data Inspector plots according to the options specified by name-value pairs.

`fig = Simulink.sdi.snapshot(Name,Value)` captures an image of the Simulation Data Inspector plots according to the options specified by name-value pairs. This syntax returns the figure handle, `fig`, if a figure is created.

`[fig, image] = Simulink.sdi.snapshot(Name,Value)` captures an image of the Simulation Data Inspector plots according to the options specified by name-value pairs. This syntax returns the figure handle, `fig`, and an array of image data, `image`, when appropriate for the specified options.

## Examples

### Copy View Settings to a Run

This example shows how to copy view settings from one run to another and how to create figures using the `Simulink.sdi.CustomSnapshot` object.

### Simulate Your Model and Get a Run Object

Configure the `vdp` model to save output data, and run a simulation to create data.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
set_param('vdp/Mu','Gain','1');
sim('vdp');
```

Use the Simulation Data Inspector programmatic interface to access the run data.

```
runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

### **Modify Signal View Settings**

Use the `Simulink.sdi.Run` object to access signals in the run. Then, modify the signal view settings. This example specifies the line color and style for each signal. The view settings for the run comprise the view settings for each signal and view settings specified for the plot area.

```
sig1 = vdpRun.getSignalByIndex(1);
sig2 = vdpRun.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

### **Capture a Snapshot from the Simulation Data Inspector**

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;
```

You can use properties of the `Simulink.sdi.CustomSnapshot` object to configure the plot settings, like the subplot layout and axis limits, and to plot signals. When you use a `Simulink.sdi.CustomSnapshot` object to create your figure, these plot settings do not affect the Simulation Data Inspector.

```
snap.Rows = 2;
snap.YRange = {[-2.25 2.25], [-3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)
```

Use `Simulink.sdi.snapshot` to generate the figure you specified in the properties of the `Simulink.sdi.CustomSnapshot` object.

```
fig = Simulink.sdi.snapshot("from", "custom", "to", "figure", "settings", snap);
```

### Copy the View Settings to a New Simulation Run

Simulate the model again, with a different Mu value. Use the Simulation Data Inspector programmatic interface to access the simulation data.

```
set_param('vdp/Mu','Gain','5')
sim('vdp');
```

```
runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);
```

To create a plot of the new output data that looks like the one you created in the previous step, you can copy the view settings to the run in a single line of code using `Simulink.sdi.copyRunViewSettings`. The `Simulink.sdi.copyRunViewSettings` function does not automatically update plot settings in `Simulink.sdi.CustomSnapshot` objects, so specify the plot input as `false`.

```
sigIDs = Simulink.sdi.copyRunViewSettings(runID,runID2,false);
```

### Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25],[-8 8]};
```

```

snap.plotOnSubPlot(1,1,sigIDs(1),true)
snap.plotOnSubPlot(2,1,sigIDs(2),true)

fig = snap.snapshot("to","figure");

```

## Input Arguments

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `'to','figure','props',{'Name','My Data'}`

### from — Content to include in the snapshot

`'opened'` (default) | `'active'` | `'comparison'` | `'custom'`

Content to include in the snapshot.

- `'opened'` — Include all subplots in the graphical viewing area of the open Simulation Data Inspector session.
- `'active'` — Include only the active (selected) subplot in the open Simulation Data Inspector session.

- `'comparison'` — Include the comparison plots for the selected comparison run or signal in the open Simulation Data Inspector session.
- `'custom'` — Include contents specified by the `settings` name-value pair `Simulink.sdi.CustomSnapshot` object. You can use the `'from', 'custom'` option to create a snapshot without opening the Simulation Data Inspector or affecting your open Simulation Data Inspector session. Include a `settings` name-value pair when you specify `'from', 'custom'`.

Example: `'from', 'comparison'`

Data Types: `char | string`

### **to — Type of snapshot to create**

`'image'` (default) | `'figure'` | `'file'` | `'clipboard'`

Type of snapshot to create.

- `'image'` — Create a figure and return the figure handle and an array of image data. When you specify `'to', 'image'`, the `fig` and `image` outputs both have value.
- `'figure'` — Create a figure and return the figure handle. When you specify `'to', 'figure'` the `fig` output has value, and the `image` output is empty.
- `'file'` — Save to a PNG file with the name specified by the `filename` name-value pair. If you do not specify a `filename` name-value pair, the file is named `plots.png`. When you specify `'to', 'file'`, the `fig` and `image` outputs are both empty.
- `'clipboard'` — Copy the plots to your system clipboard. From the clipboard, you can paste the image into another program such as Microsoft Word. When you specify `'to', 'clipboard'`, the `fig` and `image` outputs are both empty.

Example: `'to', 'file'`

Data Types: `char | string`

### **filename — Name for image file**

`'plots.png'` (default) | character array | string

Name of the image file to store the snapshot when you specify `'to', 'file'`.

Example: `'filename', 'MyImage.png'`

Data Types: `char | string`

### **props — Properties to customize the figure**

cell array

Figure properties, specified as a cell array. You can include settings for the figure properties described in Figure Properties.

Example: `'props', {'Name', 'MyData', 'NumberTitle', 'off'}`

Data Types: `char | string`

### **settings — Custom snapshot settings**

`Simulink.sdi.CustomSnapshot`

`Simulink.sdi.CustomSnapshot` object specifying custom snapshot settings. You can use the `settings` name-value pair to specify the dimensions of the image in pixels, subplot layout, and limits for the `x`- and `y`-axes.

Example: 'settings', customSnap

Data Types: char | string

## Output Arguments

### **fig** — Figure handle

figure handle

Handle for the figure. When a figure is not created with your specified options, the `fig` output is empty.

### **image** — Image data

array

Array of image data. The `image` output has value when you use `Simulink.sdi.snapshot` without any input arguments or without a `to` name-value pair and when you specify `'to', 'image'`.

## Version History

**Introduced in R2018a**

# Simulink.sdi.unregisterCursorCallback

Unregister cursor callback function

## Syntax

```
Simulink.sdi.unregisterCursorCallback(callbackID)
```

## Description

`Simulink.sdi.unregisterCursorCallback(callbackID)` unregisters the cursor callback function that corresponds to `callbackID`.

## Examples

### Use Simulation Data Inspector Cursor Callback in App Designer App

You can use a Simulation Data Inspector cursor callback function to send cursor position data to an app you build using the App Designer. This example shows how to add a property to the app to store the callback ID and where to register and unregister the cursor callback. For an example of an App Designer app that uses a cursor callback, see “Synchronize Cursors in the Simulation Data Inspector with an App Designer App”.

Add a `callbackID` property to the app object.

```
properties (Access = private)
 callbackID
end
```

Define the behavior of the cursor callback function.

```
methods (Access = public)
 function myCursorCallback(app,~,~)
 if isvalid(app)
 ...
 end
 end
end
```

Register the cursor callback in the app `startupFcn`. This example registers the same callback on the **Inspect** pane and the **Compare** pane.

```
function startupFcn(app)
 app.callbackID = Simulink.sdi.registerCursorCallback(...
 @(t1,t2)myCursorCallback(app,t1,t2));
 app.callbackID(2) = Simulink.sdi.registerCursorCallback(...
 @(t1,t2)myCursorCallback(app,t1,t2), 'compare');
 ...
end
```

Unregister the cursor callback in the app `UIFigureCloseRequest` function.

```
function myAppUIFigureCloseRequest(app, event)
 Simulink.sdi.unregisterCursorCallback(app.callbackID(1));
 Simulink.sdi.unregisterCursorCallback(app.callbackID(2));

end
```

## Input Arguments

### **callbackID** — Registered callback ID

scalar

Registered callback ID, specified as a scalar. The callback ID is returned when you register the callback using the `Simulink.sdi.registerCursorCallback` function.

## Version History

**Introduced in R2021a**

## See Also

### **Functions**

`Simulink.sdi.registerCursorCallback` | `Simulink.sdi.setCursorPositions` |  
`Simulink.sdi.getCursorPositions` | `Simulink.sdi.setNumCursors` |  
`Simulink.sdi.getNumCursors`

“Synchronize Cursors in the Simulation Data Inspector with an App Designer App”

# Simulink.sdi.view

**Package:** Simulink.sdi

Open the Simulation Data Inspector

## Syntax

```
Simulink.sdi.view
```

## Description

`Simulink.sdi.view` opens the **Simulation Data Inspector**. You can write a script to plot your data and customize the Simulation Data Inspector properties and then use `Simulink.sdi.view` to see the results.

## Examples

### Open the Simulation Data Inspector from the Command Line

You can open the Simulation Data Inspector from the MATLAB command line to visualize, inspect, and analyze your data.

```
Simulink.sdi.view
```

### Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

#### Create Data for the Run

Create `timeseries` objects to contain data for a sine signal and a cosine signal. Give each `timeseries` object a descriptive name.

```
time = linspace(0,20,100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

#### Create a Run and Add Data

Use the `Simulink.sdi.view` function to open the Simulation Data Inspector.

```
Simulink.sdi.view
```

To import data into the Simulation Data Inspector from the workspace, create a `Simulink.sdi.Run` object using the `Simulink.sdi.Run.create` function. Add information about the run to its metadata using the `Name` and `Description` properties of the Run object.

```
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals with different frequencies';
```

Use the `add` function to add the data you created in the workspace to the empty run.

```
add(sinusoidsRun,'vars',sine_ts,cos_ts);
```

### Plot the Data in the Simulation Data Inspector

Use the `getSignalByIndex` function to access `Simulink.sdi.Signal` objects that contain the signal data. You can use the `Simulink.sdi.Signal` object properties to specify the line style and color for the signal and plot it in the Simulation Data Inspector. Specify the `LineColor` and `LineDashed` properties for each signal.

```
sine_sig = getSignalByIndex(sinusoidsRun,1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';

cos_sig = sinusoidsRun.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.LineDashed = '--';
```

Use the `Simulink.sdi.setSubPlotLayout` function to configure a 2-by-1 subplot layout in the Simulation Data Inspector plotting area. Then use the `plotOnSubplot` function to plot the sine signal on the top subplot and the cosine signal on the lower subplot.

```
Simulink.sdi.setSubPlotLayout(2,1);

plotOnSubPlot(sine_sig,1,1,true);
plotOnSubPlot(cos_sig,2,1,true);
```

### Close the Simulation Data Inspector and Save Your Data

When you have finished inspecting the plotted signal data, you can close the Simulation Data Inspector and save the session to an MLDATX file.

```
Simulink.sdi.close('sinusoids.mldatx')
```

## Alternatives

You can open the Simulation Data Inspector from the Simulink Editor toolbar with the **Simulation**

**Data Inspector** button .

## Version History

## Simulink.SFunctionBuilder.add

Add input, output, parameter, library item, or state to S-Function Builder block

### Syntax

```
Simulink.SFunctionBuilder.add(blk,elem)
Simulink.SFunctionBuilder.add(blk,elem,Name=Value)
```

### Description

`Simulink.SFunctionBuilder.add(blk,elem)` adds the element `elem` with default options to the S-Function Builder block `blk`. Use the `Simulink.SFunctionBuilder.add` function to add:

- Input ports
- Output ports
- Parameters
- Library items
- Discrete states
- Continuous states

`Simulink.SFunctionBuilder.add(blk,elem,Name=Value)` adds the element `elem` with options specified using one or more name-value arguments to the S-Function Builder block `blk`. For example, to specify the data type for a port as `double`, set `DataType` to `double`.

The options you can specify depend on the type of element you add.

### Input Arguments

#### **blk** — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

#### Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

#### **elem** — Type of element to add

'Input' | 'Output' | 'Parameter' | 'LibraryItem' | 'DiscreteState' | 'ContinuousState'

Type of element to add, specified as one of these options:

- 'Input'
- 'Output'

- 'Parameter'
- 'LibraryItem'
- 'DiscreteState'
- 'ContinuousState'

Data Types: char | string

### Name-Value Pair Arguments

Specify optional pairs of arguments as Name1=Value1, . . . , NameN=ValueN, where Name is the argument name and Value is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: Name="in1", DataType="single" specifies options to configure an input port with the name in1 and data type single.

### Name — Port or parameter name

string | character vector

Port or parameter name, specified as a string or a character vector. By default:

- Input ports are named u0, u1, ... un.
- Output ports are named y0, y1, ... ,yn.
- Parameters are named p0, p1, ... , pn.

Specify the Name name-value argument only when you add an input port, an output port, or a parameter.

Example: Name="inputSignal"

Data Types: char | string

### DataType — Port or parameter data type

'double' (default) | 'single' | 'boolean' | 'int8' | 'int16' | 'int32' | 'uint8' | 'uint16' | 'uint32' | 'Fixdt:binary(a,b,c)' | 'Fixdt:slope and bias(a,b,c,d)' | 'Bus: <object name>'

Port or parameter data type, specified as one of these options:

- 'double'
- 'single'
- 'boolean'
- 'int8'
- 'int16'
- 'int32'
- 'uint8'
- 'uint16'
- 'uint32'
- 'Fixdt:binary(a,b,c)'

- 'Fixdt:slope and bias(a,b,c,d)'
- 'Bus: <object name>'

Parameters do not support fixed-point or bus data types.

Specify the **DataType** name-value argument only when you add an input port, an output port, or a parameter.

Example: `DataType="single"`

Data Types: `char` | `string`

### **Complexity — Port or parameter complexity**

'real' (default) | 'complex'

Port or parameter complexity, specified as 'real' or 'complex'.

Specify the **Complexity** name-value argument only when you add an input port, an output port, or a parameter.

Example: `Complexity="complex"`

Data Types: `char` | `string`

### **Dimensions — Input or output port dimensions**

'[1,1]' (default) | string | character vector

Input or output port dimensions, specified as a string or a character vector that defines the port dimensions as a scalar or vector.

Specify the **Dimensions** name-value argument only when you add an input or output port.

Example: `Dimensions="2"`

Example: `Dimensions="[1,2]"`

Data Types: `char` | `string`

### **Value — Parameter value**

1 (default) | string | character vector

Parameter value, specified as a string or a character vector that defines the value of the parameter.

Specify the **Value** name-value argument only when you add a parameter.

Example: `Value="2"` specifies the parameter value as 2.

Example: `Value="[1 2]"` specifies the parameter value as [1 2].

Data Types: `char` | `string`

### **LibraryItemTag — Tag for library item**

'SRC\_PATH' (default) | 'LIB\_PATH' | 'INC\_PATH' | 'ENV\_PATH' | 'ENTRY'

Tag for library item, specified as one of these options:

- 'SRC\_PATH' — Object or library path
- 'LIB\_PATH' — Include search path for header files and source files

- 'INC\_PATH' — Search path for object files and source files
- 'ENV\_PATH' — Environment variable
- 'ENTRY' — Object, source, or library file name or preprocessor directive, such as -DDEBUG

When you add a library item to an S-Function Builder block, use the `LibraryItemTag` and `LibraryItemValue` name-value arguments together to define the library item.

Specify the `LibraryItemTag` name-value argument only when you add a library item.

Example: `LibraryItemTag="LIB_PATH",LibraryItemValue="$MATLABROOT\customobjs"`

Data Types: char | string

### **LibraryItemValue — Library item value**

string | character vector

Library item value, specified as a string or a character vector. The value you specify depends on the tag for the library item you add.

When you add a library item to an S-Function Builder block, use the `LibraryItemTag` and `LibraryItemValue` name-value arguments together to define the library item.

Example: `LibraryItemTag="LIB_PATH",LibraryItemValue="$MATLABROOT\customobjs"`

Data Types: char | string

### **InitialCondition — Initial condition for state**

'0' (default) | string | character vector

Initial condition for state, specified as a string or a character vector that defines the initial value for the state.

Specify the `InitialCondition` name-value argument only when you add a discrete or continuous state.

Example: `InitialCondition="1"` specifies the initial condition for the added state as 1.

Data Types: char | string

## Simulink.SFunctionBuilder.build

Build S-function and generate MEX file for S-Function Builder block

### Syntax

```
Simulink.SFunctionBuilder.build(blk)
```

### Description

`Simulink.SFunctionBuilder.build(blk)` builds the S-function and generates the MEX file for the S-Function Builder block `blk`.

To build the S-function without generating the MEX file, use the `Simulink.SFunctionBuilder.generateCodeOnly` function.

### Input Arguments

#### **blk** — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

#### Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

## Version History

Introduced in R2022a

# Simulink.SFunctionBuilder.delete

Remove input, output, parameter, library item, or state from S-Function Builder block

## Syntax

```
Simulink.SFunctionBuilder.delete(blk,elem,Name=name)
Simulink.SFunctionBuilder.delete(blk,elem,Index=ind)
```

## Description

`Simulink.SFunctionBuilder.delete(blk,elem,Name=name)` deletes the item `item` with the specified name `name` from the S-Function Builder block `blk`. Use this syntax to delete input ports, output ports, and parameters.

`Simulink.SFunctionBuilder.delete(blk,elem,Index=ind)` deletes the item `item` at the specified index `ind` from the S-Function Builder block `blk`. Use this syntax to delete library items, discrete states, and continuous states.

## Input Arguments

### **blk** — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

### Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

### **elem** — Type of element to delete

'Input' | 'Output' | 'Parameter' | 'LibraryItem' | 'DiscreteState' |  
'ContinuousState'

Type of element to delete, specified as one of these options:

- 'Input'
- 'Output'
- 'Parameter'
- 'LibraryItem'
- 'DiscreteState'
- 'ContinuousState'

### Tips

The way to specify which element to delete depends on the type of element you want to delete.

- To specify which input port, output port, or parameter to delete, specify the **Name** name-value argument.
- To specify which library item, discrete state, or continuous state to delete, specify the **Index** name-value argument.

Data Types: `char` | `string`

**name** — Name of input port, output port, or parameter to delete

`string` | character vector

Name of input port, output port, or parameter to delete, specified as a string or a character vector.

Example: `Name="in1"`

Data Types: `char` | `string`

**ind** — Index of library item, discrete state, or continuous state to delete

scalar

Index of library item, discrete state, or continuous state to delete, specified as a scalar.

Example: `Index=1`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

# Simulink.SFunctionBuilder.generateCodeOnly

Build S-function without generating MEX file for S-Function Builder block

## Syntax

```
Simulink.SFunctionBuilder.generateCodeOnly(blk)
```

## Description

`Simulink.SFunctionBuilder.generateCodeOnly(blk)` builds the S-function for the specified S-Function Builder block `blk` without generating the MEX file.

To build the S-function and generate the MEX file, use the `Simulink.SFunctionBuilder.build` function.

## Input Arguments

### **blk** — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

### Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

## Simulink.SFunctionBuilder.getBuildOptions

Get build options for S-Function Builder block

### Syntax

```
buildOpts = Simulink.SFunctionBuilder.getBuildOptions(blk)
```

### Description

`buildOpts = Simulink.SFunctionBuilder.getBuildOptions(blk)` returns a structure with fields that indicate which build options are enabled for the S-Function Builder block `blk`.

### Input Arguments

#### **blk** — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

#### Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

### Output Arguments

#### **buildOpts** — Build options for S-Function Builder block

structure

Build options for S-Function Builder block, returned as a structure that contains these fields:

- `ShowCompileSteps` — Option to log build steps
- `CreateDebuggableMEX` — Option to include debugging information in MEX file
- `GenerateWrapperTLC` — Option to generate TLC file
- `EnableSupportForCoverage` — Option to build S-function that supports model coverage
- `EnableSupportForDesignVerifier` — Option to build S-function that supports Simulink Design Verifier

The value of each field is a logical indication of whether that build option is enabled.

## Simulink.SFunctionBuilder.getSettings

Get settings for S-Function Builder block

### Syntax

```
sFunSettings = Simulink.SFunctionBuilder.getSettings(blk)
```

### Description

`sFunSettings = Simulink.SFunctionBuilder.getSettings(blk)` returns a structure with fields that indicate the value for each setting for the S-Function Builder block `blk`.

### Input Arguments

#### **blk** — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

#### Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

### Output Arguments

#### **sFunSettings** — S-Function Builder block settings

structure

S-Function Builder block settings, returned as a structure that contains these fields:

- `NumberDiscreteStates` — Number of discrete states
- `DiscreteStatesIC` — Initial conditions for discrete states
- `NumberContinuousStates` — Number of continuous states
- `ContinuousStatesIC` — Initial conditions for continuous states
- `ArrayLayout` — Array layout for code
- `SampleMode` — Sample mode for S-function
- `SampleTime` — Sample time for S-function
- `NumberOfPWorks` — Number of PWorks pointers for S-function
- `UseSimStruct` — Whether wrapper has access to SimStruct
- `DirectFeedthrough` — Whether S-function has direct feedthrough

## Simulink.SFunctionBuilder.getSFunctionName

Get name of S-function generated by S-Function Builder block

### Syntax

```
SFunName = Simulink.SFunctionBuilder.getSFunctionName(blk)
```

### Description

`SFunName = Simulink.SFunctionBuilder.getSFunctionName(blk)` returns the name for the S-function generated by the S-Function Builder block `blk`. The S-function name is used as a prefix for all wrapper functions built by the S-Function Builder block.

### Input Arguments

#### **blk** — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

#### Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

### Output Arguments

#### **SFunName** — S-function name

empty (default) | string | character vector

S-function name, returned as a string or a character vector.

Data Types: `char` | `string`

## Simulink.SFunctionBuilder.getTargetLanguage

Get language for S-function generated using S-Function Builder block

### Syntax

```
lang = Simulink.SFunctionBuilder.getTargetLanguage(blk)
```

### Description

`lang = Simulink.SFunctionBuilder.getTargetLanguage(blk)` returns the target language for the S-function built by the S-Function Builder block `blk`.

### Input Arguments

#### **blk** — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

#### Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

### Output Arguments

#### **lang** — S-function language

'inherit' | 'cpp' | 'c'

S-function language, returned as one of these values:

- 'inherit' — Language inherited from the **Language** model configuration parameter .
- 'cpp' — C++
- 'c' — C

## Version History

## Simulink.SFunctionBuilder.getUserCode

Get code for method of S-function generated using S-Function Builder block

### Syntax

```
userCode = Simulink.SFunctionBuilder.getUserCode(blk,methodType)
```

### Description

`userCode = Simulink.SFunctionBuilder.getUserCode(blk,methodType)` returns the user code `userCode` specified for the method indicated by `methodType` of the S-Function Builder block `blk`.

### Input Arguments

#### **blk** — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

#### Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

#### **methodType** — S-function method code to get

'includes' | 'externs' | 'start' | 'output' | 'update' | 'derivatives' | 'terminate'

S-function method code to get, specified as one of these options:

- 'includes' — Return S-function include statements.
- 'externs' — Return global variable declarations for S-function.
- 'start' — Return code defined for start method of S-function.
- 'output' — Return code defined for output method.
- 'update' — Return code defined for update method.
- 'derivatives' — Return code defined for derivatives method.
- 'terminate' — Return code defined for terminate method.

Data Types: char

### Output Arguments

#### **userCode** — Code for specified method of S-function

character vector

Code for specified method of S-function, returned as a character vector.

## Version History

Introduced in R2022a

## Simulink.SFunctionBuilder.list

List inputs, outputs, parameters, library items, and states for S-Function Builder block

### Syntax

```
elemList = Simulink.SFunctionBuilder.list(blk,elem)
elemList = Simulink.SFunctionBuilder.list(blk,elem,Format=listFormat)
```

### Description

`elemList = Simulink.SFunctionBuilder.list(blk,elem)` returns a structure that lists the items of type `elem` configured for the S-Function Builder block `blk`. Use the `Simulink.SFunctionBuilder.list` function to list configurations for:

- Input ports
- Output ports
- Parameters
- Library items
- States

`elemList = Simulink.SFunctionBuilder.list(blk,elem,Format=listFormat)` returns a list of the items of type `elem` configured for the S-Function Builder block `blk` using the format `listFormat`. You can return the list as a structure or a table.

### Input Arguments

#### **blk** — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

#### Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

#### **elem** — Type of element to list

'Input' | 'Output' | 'Parameter' | 'LibraryItem' | 'States'

Type of element to list, specified as one of these options:

- 'Input' — Input ports
- 'Output' — Output ports
- 'Parameter' — Parameters
- 'LibraryItem' — Library items
- 'States' — States

Data Types: char | string

### **ListFormat — Format of list to return**

'Structure' (default) | 'Table'

Format of list to return, specified as 'Structure' or 'Table'. When you do not specify the Format name-value argument, the `Simulink.SFunctionBuilder.list` function returns a structure.

- 'Structure' — Return the list of elements configured for the S-Function Builder block as a structure. The fields in the structure depend on the type of element you specify.
- 'Table' — Return the list of elements configured for the S-Function Builder block as a MATLAB table. The columns in the table depend on the type of element you specify.

Data Types: char | string

## **Output Arguments**

### **elemList — List of elements configured for S-Function Builder block**

structure | MATLAB table

List of elements configured for S-Function Builder block, returned as a structure or a MATLAB table.

## **Version History**

**Introduced in R2022a**

# Simulink.SFunctionBuilder.setBuildOptions

Set build options for S-Function Builder block

## Syntax

```
Simulink.SFunctionBuilder.setBuildOptions(blk,Name=Value)
```

## Description

`Simulink.SFunctionBuilder.setBuildOptions(blk,Name=Value)` sets build options specified using one or more name-value arguments for the S-Function Builder block `blk`. For example, to include debugging information in the generated MEX file, specify `CreateDebuggableMEX` as `true`.

To configure S-function settings such as access to the `SimStruct`, sample mode, and sample time, use the `Simulink.SFunctionBuilder.setSettings` function.

To specify the language for the S-function, use the `Simulink.SFunctionBuilder.setTargetLanguage` function.

## Input Arguments

### **blk** — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

### Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

### Name-Value Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `CreateDebuggableMEX=true`

### **ShowCompileSteps** — Option to log build steps

0 or false (default) | 1 or true

Option to log build steps, specified as logical 1 (true) or 0 (false).

Example: `ShowCompileSteps=true`

Data Types: `logical`

**CreateDebuggableMEX — Option to include debugging information in generated MEX file**

0 or false (default) | 1 or true

Option to include debugging information in generated MEX file, specified as logical 1 (true) or 0 (false).

Example: CreateDebuggableMEX=true

Data Types: logical

**GenerateWrapperTLC — Option to generate TLC file**

1 or true (default) | 0 or false

Option to generate TLC file, specified as logical 1 (true) or 0 (false).

Example: GenerateWrapperTLC=false

Data Types: logical

**EnableSupportForCoverage — Option to build S-function that supports model coverage**

0 or false (default) | 1 or true

Option to build S-function that supports model coverage, specified as logical 1 (true) or 0 (false).

Example: EnableSupportForCoverage=true

Data Types: logical

**EnableSupportForDesignVerifier — Option to build S-function that supports Simulink Design Verifier**

0 or false (default) | 1 or true

Option to build S-function that supports Simulink Design Verifier, specified as logical 1 (true) or 0 (false).

Example: EnableSupportForDesignVerifier=true

Data Types: logical

## Version History

## Simulink.SFunctionBuilder.setSettings

Set settings for S-Function Builder block

### Syntax

```
Simulink.SFunctionBuilder.setSettings(blk,Name=Value)
```

### Description

`Simulink.SFunctionBuilder.setSettings(blk,Name=Value)` sets the settings specified using one or more name-value arguments for the S-Function Builder block `blk`. Use the `Simulink.SFunctionBuilder.setSettings` function to configure:

- The array layout for your code
- The sample mode for the S-function
- The sample time for the S-function
- The number of pointers used in the S-function code
- Whether to make the `SimStruct` available to the S-Function Builder wrapper functions
- Support for direct feedthrough.

To configure the build options for the S-Function Builder block, use the `Simulink.SFunctionBuilder.setBuildOptions` function.

To specify a name for the S-function, use the `Simulink.SFunctionBuilder.setSFunctionName` function.

To specify the language for the S-function, use the `Simulink.SFunctionBuilder.setTargetLanguage` function.

### Input Arguments

#### **blk** — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

#### Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

#### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, . . . , NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example:

### **ArrayLayout — Array layout for code**

'Column' (default) | 'Row'

Array layout for code, specified as 'Column' or 'Row'.

Example: `ArrayLayout="Row"`

Data Types: char | string

### **SampleMode — Sample mode for S-function**

'Inherited' (default) | 'Continuous' | 'Discrete'

Sample mode for S-function, specified as 'Inherited', 'Continuous', or 'Discrete'. The sample mode for the block determines when the block computes a new output value.

- 'Inherited' — The S-Function Builder block inherits sample time from the block connected to the input port.
- 'Continuous' — The S-Function Builder block computes a new output value for every simulation time step.
- 'Discrete' — The S-Function Builder block computes a new output value at a fixed sample time you specify.

Example: `SampleMode="Continuous"`

Data Types: char | string

### **SampleTime — Discrete sample time for S-function**

'Inherited' (default) | scalar | string | character vector

Discrete sample time for S-function, specified as a scalar, a string, or a character vector. By default, the sample time for an S-Function Builder block is 'Inherited' because the default sample mode is 'Inherited'.

Specify the `SampleTime` name-value argument only when the `SampleMode` is set to `Discrete`.

Example: `SampleMode="Discrete",SampleTime=0.2`

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | char | string

### **NumberOfPWorks — Number of pointers used in S-function**

0 (default) | scalar | string | character vector

Number of pointers used in S-function, specified as a scalar, a string, or a character vector.

S-functions that use `PWorks` do not support model operating points.

Example: `NumberOfPWorks=3`

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | char | string

### **UseSimStruct — Option to enable access to SimStruct in wrapper functions**

0 or false (default) | 1 or true

Option to enable access to SimStruct in wrapper functions, specified as logical 0 (`false`) or 1 (`true`). When you enable access to the SimStruct, you can use SimStruct macros and functions in the code you write for the `Outputs_wrapper`, `Derivatives_wrapper`, and `Update_wrapper` functions.

Example: `UseSimStruct=true`

Data Types: `logical`

### **DirectFeedthrough — Whether S-function has direct feedthrough**

1 or `true` (default) | 0 or `false`

Whether S-function has direct feedthrough, specified as logical 1 (`true`) or 0 (`false`).

The direct feedthrough flag for the S-function affects block execution order and is used to detect algebraic loops.

For more information, see “S-Function Concepts”.

Example: `DirectFeedthrough=false`

Data Types: `logical`

# Simulink.SFunctionBuilder.setSFunctionName

Set name of S-function for S-Function Builder block

## Syntax

```
Simulink.SFunctionBuilder.setSFunctionName(blk,SFunName)
```

## Description

`Simulink.SFunctionBuilder.setSFunctionName(blk,SFunName)` sets the name of the S-function built by the S-Function Builder block `blk` to the name specified by `SFunName`. The S-function name is used as a prefix for all wrapper functions built by the S-Function Builder block.

## Input Arguments

### **blk** — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

### Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

### **SFunName** — S-function name

empty (default) | string | character vector

S-function name, specified as a string or a character vector.

Example: "mySFunction"

Data Types: char | string

# Simulink.SFunctionBuilder.setTargetLanguage

Set language for S-function generated using S-Function Builder block

## Syntax

```
Simulink.SFunctionBuilder.setTargetLanguage(blk, lang)
```

## Description

`Simulink.SFunctionBuilder.setTargetLanguage(blk, lang)` sets the target language for the S-function generated by the S-Function Builder block `blk` to the specified language `lang`.

To specify build options such as whether the MEX file includes debugging information, use the `Simulink.SFunctionBuilder.setBuildOptions` function.

## Input Arguments

### **blk** — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

### Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

### **lang** — S-function language

'inherited' (default) | 'cpp' | 'c'

S-function language, specified as one of these options:

- 'inherited' — Language inherited from the **Language** model configuration parameter
- 'cpp' — C++
- 'c' — C

Data Types: char | string

## Version History

Introduced in R2022a

# Simulink.SFunctionBuilder.setUserCode

Set code for methods of S-function generated using S-Function Builder block

## Syntax

```
Simulink.SFunctionBuilder.setUserCode(blk,methodType,userCode)
```

## Description

`Simulink.SFunctionBuilder.setUserCode(blk,methodType,userCode)` specifies the code `userCode` as part of the S-function for the S-Function Builder block `blk`. Use this function to specify include statements, global variables, and code for the S-function methods.

## Input Arguments

### **blk** — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

### Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

### **methodType** — S-function method for which to specify code

'include' | 'externs' | 'start' | 'output' | 'update' | 'derivatives' | 'terminate'

S-function method for which to specify code, specified as one of these options:

- 'include' — Include statement
- 'externs' — Global variable declaration
- 'start' — Start method

Use the start method to allocate memory at the start of the simulation. Reference the allocated memory throughout the S-function code using `PWorks`.

- 'output' — Output method

The output method computes the block output values for each simulation time step.

- 'update' — Update method

The update method computes the value of discrete states for the next simulation time step. Only define the update method when the S-function has discrete states.

- 'derivatives' — Derivatives method

The derivatives method computes the value of state derivatives. Only define the derivatives method when the S-function has continuous states.

- 'terminate' — Terminate method

Use the terminate method to deallocate memory at the end of simulation.

Example: `Simulink.SFunctionBuilder.setUserCode(blk,"output", "*y0 = myCFunction(*u0);")`

**Tips**

- To specify include paths and library paths, add one or more library items using the `Simulink.SFunctionBuilder.add` function.
- To configure the number of PWorks, use the `Simulink.SFunctionBuilder.setSettings` function.
- To add discrete or continuous states, use the `Simulink.SFunctionBuilder.add` function.

Data Types: char | string

**userCode — Code for S-function method**

string | character vector

Code for S-function method, specified as a string or a character vector that defines C or C++ code for part of the S-function.

Example: `Simulink.SFunctionBuilder.setUserCode(blk,"output", "*y0 = myCFunction(*u0);")`

**Tips**

To specify the target language for the S-function, use the `Simulink.SFunctionBuilder.setTargetLanguage` function.

Data Types: char | string

# Simulink.SFunctionBuilder.update

Update attributes for input port, output port, or parameter of S-Function Builder block

## Syntax

```
Simulink.SFunctionBuilder.update(blk,elem,Name=elemName,FieldToUpdate=field,NewValue=newVal)
```

## Description

`Simulink.SFunctionBuilder.update(blk,elem,Name=elemName,FieldToUpdate=field,NewValue=newVal)` updates the value of the specified property for an input port, output port, or parameter of the S-Function Builder block `blk`.

To add a new input port, output port, or parameter to an S-Function Builder block, use the `Simulink.SFunctionBuilder.add` function.

## Input Arguments

### **blk** — S-Function Builder block

block handle | string | character vector

S-Function Builder block, specified as a block handle or as a string or a character vector that defines the block path.

### Tips

- To get the block handle for a block in your model, use the `getSimulinkBlockHandle` function.
- To get the block handle for the most recently selected or added block, use the `gcbh` function.

### **elem** — Type of element to update

'Input' | 'Output' | 'Parameter'

Type of element to update, specified as one of these options:

- 'Input' — Update property for input port on S-Function Builder block.
- 'Output' — Update property for output port on S-Function Builder block.
- 'Parameter' — Update property for parameter of S-Function Builder block.

Data Types: char | string

### **elemName** — Name of input port, output port, or parameter to update

string | character vector

Name of input port, output port, or parameter to update, specified as a string or a character vector.

Data Types: char | string

### **field** — Property of input port, output port, or parameter to update

'Name' | 'DataType' | 'Complexity' | 'Dimensions' | 'Value'

Property of input port, output port, or parameter to update, specified as one of these options:

- 'Name' — Update input port, output port, or parameter name.
- 'DataType' — Update input port, output port, or parameter data type.
- 'Complexity' — Update input port, output port, or parameter complexity.
- 'Dimensions' — Update input port or output port dimensions.

Do not specify `FieldToUpdate='Dimensions'` when you specify the second input argument as 'Parameter'.

- 'Value' — Update parameter value.

Do not specify `FieldToUpdate='Value'` when you specify the second input argument as 'Input' or 'Output'.

Data Types: `char` | `string`

**newValue** — New value for property of input port, output port, or parameter

`string` | character vector

New value for property of input port, output port, or parameter, specified as a string or a character vector that contains the new value. The values you can specify depend on the property you want to update.

| Property to Update | Valid Values                                                                                                                                                                             |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name               | Valid port name                                                                                                                                                                          |

## Simulink.SimulationData.createStructOfTimeseries

Create structure of timeseries data to load as simulation input for bus

### Syntax

```
tsStruct = Simulink.SimulationData.createStructOfTimeseries(busObj,
tsStructIn)
tsStruct = Simulink.SimulationData.createStructOfTimeseries(busObj,
tsCellArray)
tsStructArray = Simulink.SimulationData.createStructOfTimeseries(busObj,
tsCellArray,dims)
tsStruct = Simulink.SimulationData.createStructOfTimeseries(tsArray)
```

### Description

`tsStruct = Simulink.SimulationData.createStructOfTimeseries(busObj, tsStructIn)` creates a structure with attributes that match those specified by the `Simulink.Bus` object, `busObj`, and data specified by the structure of timeseries objects, `tsStructIn`.

When the names in the input structure do not match the names specified by the bus object, the function renames the fields in the output structure to match the bus object specification. When other attributes such as data type and complexity do not match, the function returns an error.

You can use this syntax to create a simulation input that fully or partially specifies the data for a bus. You can also use this syntax to rename the structure elements to match the names in the `Simulink.Bus` object.

`tsStruct = Simulink.SimulationData.createStructOfTimeseries(busObj, tsCellArray)` creates a structure of timeseries objects with attributes that match those specified by the `Simulink.Bus` object, `busObj`, and data specified by the cell array of timeseries objects, `tsCellArray`.

When the names in the input structure do not match the names specified by the bus object, the function renames the fields in the output structure to match the bus object specification. When other attributes such as data type and complexity do not match, the function returns an error.

You can use this syntax to create simulation input that fully or partially specifies the data for a bus using a flat list of timeseries objects. The function maps the timeseries objects to the hierarchy specified by the `Simulink.Bus` object using a depth-first search.

`tsStructArray = Simulink.SimulationData.createStructOfTimeseries(busObj, tsCellArray,dims)` creates an array of timeseries structures where the attributes of each structure match those defined by the `Simulink.Bus` object, `busObj` with the data specified by the cell array of timeseries objects, `tsCellArray`. The input `dims` specifies the dimensions of the array.

`tsStruct = Simulink.SimulationData.createStructOfTimeseries(tsArray)` creates a structure of timeseries objects from the bus data stored in the `Simulink.TsArray` object, `tsArray`. In versions before R2016a, signal logging creates `Simulink.TsArray` objects to store

logged bus data. Use this syntax when you want to use bus data logged in a release before R2016a using ModelDataLogs format as simulation input.

## Examples

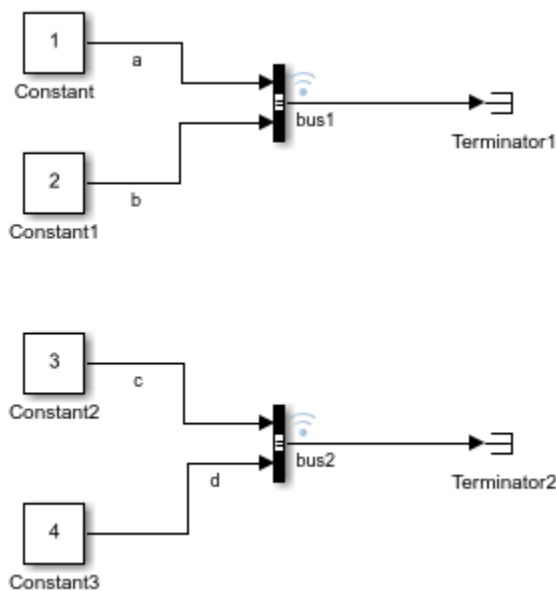

### Use Logged Bus Data as Simulation Input

You can use the `Simulink.SimulationData.createStructOfTimeseries` function to create structures of `timeseries` objects to use as simulation input for bus signals. This example shows you how to create a structure of timeseries to load into a model using timeseries data logged from a different simulation.

#### Create a Structure of Timeseries

Open the `ex_log_structtimeseries` model.

```
open_system('ex_log_structtimeseries')
```

The model uses Constant blocks and Bus Creator blocks to build two buses, `bus1` and `bus2`, with signals `a`, `b`, `c`, and `d`. The model uses signal logging to log the bus data. Create bus data by simulating the model.

```
out = sim('ex_log_structtimeseries');
```

View the data in the logging variable `logstdout`. Signal logging creates a `Simulink.SimulationData.Dataset` object with `Simulink.SimulationData.Signal` objects as elements.

```
logstdout = out.logstdout
```

```
logstdout =
```

```
Simulink.SimulationData.Dataset 'logout' with 2 elements
```

|   |              | Name | BlockPath                            |
|---|--------------|------|--------------------------------------|
| 1 | [1x1 Signal] | bus1 | ex_log_structtimeseries/Bus Creator  |
| 2 | [1x1 Signal] | bus2 | ex_log_structtimeseries/Bus Creator1 |

- Use braces { } to access, modify, or add elements using index.

You can use the `get` function to select the `Simulink.SimulationData.Signal` object for bus2. The bus data is in the `Values` property of the `Simulink.SimulationData.Signal` object. The data representing bus2 is logged in a structure containing `timeseries` objects named `c` and `d`.

```
logout.get(2).Values
```

```
ans =
```

```
struct with fields:
```

```
c: [1x1 timeseries]
d: [1x1 timeseries]
```

### Loading Model Configuration

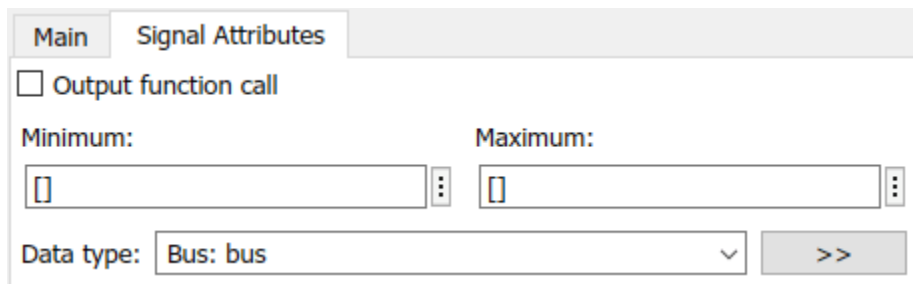

Open the `ex_load_structtimeseries` model, which uses the logged simulation data as input.

```
open_system('ex_load_structtimeseries')
```

The model uses the `InBus` Inport block to load input bus data. A `Bus Selector` block chooses signals from the bus to display on `Display` blocks.

Double-click the `InBus` block and check its **Data type** on the **Signal Attributes** tab of the dialog. The data type is specified by a `Simulink.Bus` object called `bus`.

Close the dialog and open the Model Explorer. On the **Callbacks** tab, you can see the model uses its `PreLoadFcn` to define the `Simulink.Bus` object that defines the data type for the Inport block.

Open the Configuration Parameters and view the specification for the **Input** parameter on the **Data Import/Export** pane. The model uses the variable `inputBus` for its **Input**.

### Create Simulation Input from the Structure of timeseries Data

To load the data logged for `bus1`, you only need to assign the structure data to the Input variable for the model.

```
inputBus = logout.get(1).Values
```

```
inputBus =
 struct with fields:
 a: [1x1 timeseries]
 b: [1x1 timeseries]
```

When you simulate the model, the Display blocks show the values 1 and 2 logged in `bus1` and loaded into the model.

To load the data logged for `bus2`, you need to use the `Simulink.Bus` object that defines the Inport block data type and `Simulink.SimulationData.createStructOfTimeseries` to create a structure of `timeseries` with names specified by the `Simulink.Bus` object.

```
inputBus = Simulink.SimulationData.createStructOfTimeseries('bus', ...
 logout.get(2).Values)
```

```
inputBus =
 struct with fields:
 a: [1x1 timeseries]
 b: [1x1 timeseries]
```

When you simulate the model, the Display blocks show the values 3 and 4 logged in `bus2` and loaded into the model.

### Partially Specify Simulation Input for a Bus

This example shows how to use the `Simulink.SimulationData.createStructOfTimeseries` function to create partially specified simulation input for a bus. This example logs data from `ex_log_structtimeseries` and then loads that data into `ex_load_structtimeseries`.

#### Create timeseries Data

First, open and simulate the `ex_log_structtimeseries` model. The model logs two bus signals, `bus1` and `bus2`, created using Constant blocks and Bus Creator blocks. Access the `logout` Dataset in the `Simulink.SimulationOutput` object, `out`.

```
open_system('ex_log_structtimeseries')
out = sim('ex_log_structtimeseries');
```

```
logout = out.logout;
```

You can use a structure of `timeseries` data or a cell array of `timeseries` data to partially specify simulation input for a bus.

### Partially Specify Bus Data with a Structure of `timeseries` Data

Open the model `ex_load_structtimeseries` that will load some of the data you logged in the previous section.

```
open_system('ex_load_structtimeseries')
```

Use the `get` function to access the structure of `timeseries` data logged for `bus1`.

```
bus1 = logout.get(1).Values;
```

Then, replace the `b` data with `[]`.

```
bus1.b = [];
```

The `ex_load_structtimeseries` model uses the variable `inputBus` as its **Input**. The `Simulink.Bus` object, `bus`, that defines the data type for the `Inport` block is defined in the `PreLoadFcn` callback for the `ex_load_structtimeseries` model. Because the signal names in

bus1 match the `Simulink.Bus` object specification for the Inport block in the `ex_load_structtimeseries` model, you can use the logged structure without modification. To load the data for bus1, assign bus1 to the variable `inputBus`.

```
inputBus = bus1;
```

Simulate the model. The Display blocks show the logged value 1 for a and 0 for b. The simulation uses ground values when you do not specify data for the signal.

```
loadOut = sim('ex_load_structtimeseries');
```

Now, load the data logged for bus2. The signal names in bus2 do not match the `Simulink.Bus` object specification for the Inport block in the `ex_load_structtimeseries` model. Modify the data in the structure to partially specify input data for the bus. Then, use the `Simulink.SimulationData.createStructOfTimeseries` function to change the names in the structure to match the bus specification.

```
bus2 = logout.get(2).Values;
bus2.d = [];
inputBus = bus2;
inputBus = Simulink.SimulationData.createStructOfTimeseries('bus',inputBus);
```

Simulate the model. The Display blocks show the logged value 3 for a and 0 for b.

```
loadOut = sim('ex_load_structtimeseries');
```

### Partially Specify Bus Data with a Cell Array of Timeseries Data

When you have timeseries data, you can use `Simulink.SimulationData.createStructOfTimeseries` to partially specify simulation input for a bus using a cell array of the timeseries data. Load the timeseries data for signal d in bus2 as part of a partial bus specification for the Inport block in the `ex_load_structtimeseries` model. The `PreLoadFcn` callback for the `ex_load_structtimeseries` model defines the `Simulink.Bus` object, bus, that defines the data type for the Inport block.

```
d = logout.get(2).Values.d;
inputBus = Simulink.SimulationData.createStructOfTimeseries('bus',...
 {d, []});
```

Simulate the model. The Display block for signal a in the `ex_load_structtimeseries` model shows the data logged in signal d from the `ex_log_structtimeseries` model. The Display block for signal b shows 0.

```
loadOut = sim('ex_load_structtimeseries');
```

### Load Simulation Input Data for an Array of Buses

This example shows how to use the `Simulink.SimulationData.createStructOfTimeseries` function to generate simulation input for an array of buses. You create timeseries data by simulating one model. Then, you create an input structure using the logged data to load into an array of buses in another model.

### Create timeseries Data

To start, open the `ex_log_structtimeseries` model.

```
open_system('ex_log_structtimeseries')
```

The model creates two buses, `bus1` and `bus2`, using Constant blocks and Bus Creator blocks. The signals are named `a`, `b`, `c`, and `d`. Create logged bus data by simulating the model.

```
out = sim('ex_log_structtimeseries');
```

The output `out` contains a `Simulink.SimulationData.Dataset` object, `logouts`, with the logged data. You can access the `bus1` and `bus2` signals using the `get` function. The data for each signal is in the `Simulink.SimulationData.Signal` object `Values` parameter. You can access the bus elements using a dot followed by the signal name. `bus1` is the first signal in the `Dataset` object and contains signals `a` and `b`. `bus2` contains signals `c` and `d`.

```
logouts = out.logouts;
```

```
a = logouts.get(1).Values.a;
b = logouts.get(1).Values.b;
c = logouts.get(2).Values.c;
d = logouts.get(2).Values.d;
```

### Loading Model Configuration

Open the model `ex_structtimeseries_aob`, which uses an array of buses as input.

```
open_system('ex_load_structtimeseries_aob')
```

The model uses the InAoB Inport block to load simulation input. Selector blocks select a bus from the array of buses, and Bus Selector blocks select signals to show in the Display blocks.

Double-click the InAoB block and look at the **Signal Attributes** pane of the dialog. The **Data type** for the block is set to **Bus** with the type defined by the Simulink.Bus object, bus. The **Port dimensions** parameter is set to [2 1].

You can see the definition for the Simulink.Bus object, bus, in the **Callbacks** tab in the Model Explorer. This model uses the PreLoadFcn to define the bus object.

Open the Model Configuration Parameters and look at the **Input** parameter. The model uses the variable inputAoB as input.

### Create Array of Buses Simulation Input

Use Simulink.SimulationData.createStructOfTimeseries and the data logged in the first section to create a structure to load as simulation input for the array of buses. Specify the dimensions as [2 1] to match the dimensions of the InAoB block.

```
inputAoB = Simulink.SimulationData.createStructOfTimeseries('bus', ...
 {a,b,c,d}, [2 1]);
```

When you simulate the model, the Display blocks show the data for signals a, b, c, and d logged from the ex\_log\_structtimeseries model. The array of buses contains two buses with signals a and b. Simulink.SimulationData.createStructOfTimeseries renamed signals c and d to match the Simulink.Bus specification used by the array of buses.

```
inputAoB(2)
```

```
ans =
```

```
struct with fields:
 a: [1x1 timeseries]
 b: [1x1 timeseries]
```

Simulate the model. The display blocks show the logged values.

```
aob_out = sim('ex_load_structtimeseries_aob');
```

### Create a Structure of timeseries Objects from a Simulink.TsArray Object

In releases before R2016a, when you log simulation data using ModelDataLogs format, bus data is stored as a Simulink.TSArray object. You cannot log data using ModelDataLogs format using a release after R2016a. In this example, the logged data, log sout, was logged in ModelDataLogs format using a release before R2016a. The variable log sout contains data for a single bus, bus1.

```
log sout
```

```
log sout =
```

```
Simulink.ModelDataLogs (log_modeldatalogs):
 Name Elements Simulink Class
 bus1 2 TsArray
```

To load the logged data as simulation input for a bus, create a structure of timeseries objects from the data in bus1.

```
struct_of_ts = ...
Simulink.SimulationData.createStructOfTimeseries(logsout.bus1)

struct_of_ts =

 const1_sig: [1x1 timeseries]
 const2_sig: [1x1 timeseries]
```

## Input Arguments

### busObj — Name of Simulink.Bus object

character vector

Name of the Simulink.Bus object that specifies the attributes for the data in the output structure of timeseries objects. When you want to load the structure of timeseries objects as simulation input for a bus, the busObj is the bus that defines the data type for the root-level Inport block.

Simulink.SimulationData.createStructOfTimeseries validates the input timeseries attributes including data type and complexity against the Simulink.Bus object specification. When element names do not match between the Simulink.Bus specification and the input timeseries data, Simulink.SimulationData.createStructOfTimeseries renames the timeseries data to match the bus specification. When other attributes do not match, the function returns an error.

Example: 'MyInputBus'

### tsStructIn — Structure of timeseries objects

structure of timeseries data

Structure of timeseries data for use in creating the output structure of timeseries objects according to the Simulink.Bus object. The structure must have the same hierarchy as the Simulink.Bus object.

To partially specify data for a bus, use [] in the place of the bus element you want to use ground values.

**tsCellArray — Cell array of timeseries objects**cell array of `timeseries` objects

Cell array of `timeseries` objects specifying the data for the output structure of `timeseries` objects.

To partially specify data for a bus, use `[]` in the place of the bus element you want to use ground values.

The `Simulink.SimulationData.createStructOfTimeseries` function maps the `timeseries` elements of the cell array to the hierarchy specified by the `Simulink.Bus` object using a depth-first search.

Example: `{ts1,ts2,ts3}`

Example: `{ts1,[],ts3}`

**Dependencies**

When you specify the `dims` argument, the number of cells in the cell array must match the number of individual signal elements in the `Simulink.Bus` object multiplied by the product of the specified dimensions.

**dims — Dimensions for output array**

vector

Dimensions for the array of `timeseries` structures, specified as a vector.

When you specify the dimensions as a scalar, `n`, the function creates a 1-by-`n` array.

Example: `[2,1]`

**Dependencies**

When you specify the `dims` argument, the number of cells in the cell array must match the number of individual signal elements in the `Simulink.Bus` object multiplied by the product of the specified dimensions.

Data Types: `double`

**tsArray — Simulink.TsArray object**`Simulink.TsArray`

`Simulink.TsArray` object.

In versions prior to R2016a, signal logging creates `Simulink.TsArray` objects to store logged bus data. Use this syntax when you want to use data logged using `ModelDataLogs` format in a version before R2016a to create simulation input for a bus.

Example: `myTsArrayObj`

**Output Arguments****tsStruct — Structure of timeseries objects**

struct

Structure of `timeseries` objects with attributes specified by the `Simulink.TsArray` or `Simulink.Bus` input. You can load the structure of `timeseries` objects as simulation input for a bus.

**tsStructArray – Array of timeseries structures**

array

Array of structures of `timeseries` objects with dimensions specified by the `dims` input.

## Version History

Introduced in R2013a

“Load Data to Root-Level Input Ports”

“Load Bus Data to Root-Level Input Ports”

# Simulink.SimulationData.DatasetRef.getDatasetVariableNames

List names of variables in MAT file that contain `Simulink.SimulationData.Dataset` objects

## Syntax

```
dsNames = Simulink.SimulationData.DatasetRef.getDatasetVariableNames(
filename)
```

## Description

`dsNames = Simulink.SimulationData.DatasetRef.getDatasetVariableNames(filename)` returns the names of variables in the MAT file `filename` that contain `Simulink.SimulationData.Dataset` objects.

When you want to get the names of variables that contain `Dataset` objects, the `Simulink.SimulationData.DatasetRef.getDatasetVariableNames` function runs faster than the `who` or `whos` functions.

Using the name of the MAT file and the name of a variable that contains a `Dataset` object, you can create a `Simulink.SimulationData.DatasetRef` object that references the data in the MAT file without loading the entire `Dataset` object into memory.

## Examples

### Stream Simulation Input Data Using DatasetRef Object

When your simulation input data is stored as a `Simulink.SimulationData.Dataset` object in a file that is too large to load into memory, you can create a `Simulink.SimulationData.DatasetRef` object to stream input data into your model during simulation. The `DatasetRef` object references the data in the `Dataset` object in the file and incrementally loads the data during simulation.

To create a `DatasetRef` object, you need the name of the file and the name of the variable in the file that contains the `Dataset` object. You can use the `Simulink.SimulationData.DatasetRef.getDatasetVariableNames` function to see the names of all variables in a file that contain `Dataset` objects without loading the file into memory.

Get the names of variables in the file `aircraftData.mat` that contain `Dataset` objects.

```
datasetNames = Simulink.SimulationData.DatasetRef.getDatasetVariableNames('aircraftData.mat')
```

```
datasetNames = 1x3 cell
 {'logout'} {'xout'} {'yout'}
```

Create a reference to the data in the `Dataset` object `logout`.

```
logoutDSR = Simulink.SimulationData.DatasetRef("aircraftData.mat", "logout");
```

To stream the data stored in the `Dataset` object `logout` as input for simulation, specify the value for the **Input** parameter as `logoutDSR`. Loading data from a `DatasetRef` object works the same as loading data from a `Dataset` object except that the data is incrementally loaded into memory.

## Input Arguments

### **filename** — Name of MAT file

string | character vector

Name of MAT file, specified as a string or a character vector.

Example: 'myMATFile.mat'

Data Types: char | string

## Output Arguments

### **dsNames** — Names of variables that contain Dataset objects

cell array of character vectors

Names of variables that contain `Dataset` objects, returned as a cell array of character vectors.

## Version History

**Introduced in R2016a**

“Load Big Data for Simulations”

“Stream Data from a MAT-File as Input for a Parallel Simulation”

# Simulink.SimulationData.forEachTimeseries

Apply function to data contained in set of timeseries objects

## Syntax

```
res = Simulink.SimulationData.forEachTimeseries(func,tsData)
```

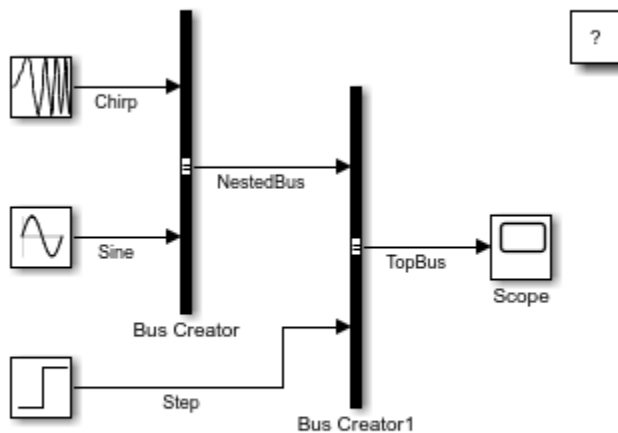

## Description

`res = Simulink.SimulationData.forEachTimeseries(func,tsData)` applies the function `func` to each `timeseries` object in `tsData`. You can use this function to postprocess data logged from a bus or array of buses.

## Examples

### Find Minimum Values for Signals in Bus

Open the model `NonvirtualBusCreationModel`. The model groups the output signals from a Chirp block and a Sine block into a bus that is nested in another bus. The second bus also contains the output signal from a Step block.

Copyright 2019-2020 The MathWorks, Inc.

Mark the bus `TopBus` for logging.

```
Simulink.sdi.markSignalForStreaming("NonvirtualBusCreationModel/Bus Creator1",1,true);
```

Simulate the model.

```
out = sim("NonvirtualBusCreationModel");
```

The `Simulink.SimulationOutput` object contains simulation metadata and all simulation data logged to the workspace.

```
out
```

```
out =
 Simulink.SimulationOutput:

 log sout: [1x1 Simulink.SimulationData.Dataset]
 tout: [53x1 double]

 SimulationMetadata: [1x1 Simulink.SimulationMetadata]
 ErrorMessage: [0x0 char]
```

The variable `log sout` contains the data logged for the bus.

```
log sout = out.log sout
```

```
log sout =
Simulink.SimulationData.Dataset 'log sout' with 1 element

 Name BlockPath

 1 [1x1 Signal] TopBus NonvirtualBusCreationModel/Bus Creator1

- Use braces { } to access, modify, or add elements using index.
```

Access the signal that contains the data logged for the bus `TopBus`. The signal values are stored in the `Values` property for the `Simulink.SimulationData.Signal` object.

```
topBusSig = getElement(log sout,1)

topBusSig =
 Simulink.SimulationData.Signal
 Package: Simulink.SimulationData

 Properties:
 Name: 'TopBus'
 PropagatedName: ''
 BlockPath: [1x1 Simulink.SimulationData.BlockPath]
 PortType: 'output'
 PortIndex: 1
 Values: [1x1 struct]
```

Methods, Superclasses

Access the structure that contains the values for the signals in the bus. The structure hierarchy and field names match the hierarchy and signal names for the bus. The data for each signal in the bus is stored as a `timeseries` object.

```
topBusData = topBusSig.Values

topBusData = struct with fields:
 NestedBus: [1x1 struct]
 Step: [1x1 timeseries]
```

Use the `Simulink.SimulationData.forEachTimeseries` function to find the minimum value for each signal in the bus. The minimum values are returned as a structure with the same fields and hierarchy as the input data.

```
topBusSigMins = Simulink.SimulationData.forEachTimeseries(@min,topBusData)
```

```
topBusSigMins = struct with fields:
 NestedBus: [1x1 struct]
 Step: 0
```

Check the minimum value for the output signal from the Chirp block.

```
chirpMin = topBusSigMins.NestedBus.Chirp
chirpMin = -0.9972
```

## Input Arguments

### **func** — Function to apply to data

function handle

Function to apply to data, specified as a function handle. For more information, see “Create Function Handle”.

The function that you specify must take at least one input argument and return a scalar. You can specify a handle for a built-in function, a function you create, or an anonymous function.

For example, you can use the built-in `min` function to compute the minimum value in each `timeseries` object.

```
res = Simulink.SimulationData.forEachTimeseries(@min,tsData);
```

When the function takes more than one input argument, only the argument for the `timeseries` object can change for each computation. The rest of the arguments must use the same values for each `timeseries` object.

For example, to apply the `resample` function to each `timeseries` object, specify the function as an anonymous function. Here, the variable `tsData` represents the `timeseries` objects. The other arguments for the `resample` function are passed as parameter values. The `Simulink.SimulationData.forEachTimeseries` function passes the `timeseries` data you specify in the second input argument to the anonymous function as the value for `tsData`.

```
res = Simulink.SimulationData.forEachTimeseries(@(tsData) resample(tsData,[2.5 3]),tsData);
```

Data Types: `function_handle`

### **tsData** — Data to process

scalar `timeseries` object | array of `timeseries` | structure of `timeseries` objects | array of structures of `timeseries` objects

Data to process, specified as one of these values:

- Scalar `timeseries` object

- Array of `timeseries` objects
- Structure of `timeseries` objects
- Array of structures of `timeseries` objects

## Output Arguments

### **res** — Results of processing data

scalar `timeseries` object | array of `timeseries` | structure of `timeseries` objects | array of structures of `timeseries` objects

Results of processing data, returned as one of these values:

- Scalar `timeseries` object
- Array of `timeseries` objects
- Structure of `timeseries` objects
- Array of structures of `timeseries` objects

Results are returned in the same form as the input data.

## Version History

Introduced in R2016b

# Simulink.SimulationData.signalLoggingSelector

Open Signal Logging Selector

## Syntax

```
Simulink.SimulationData.signalLoggingSelector(modelName)
```

## Description

`Simulink.SimulationData.signalLoggingSelector(modelName)` opens the Signal Logging Selector dialog box for the model that you specify with `modelName`.

## Input Arguments

### `modelName`

Character vector that specifies the name of the model for which you want to open the Signal Logging Selector dialog box.

## Example

Open the Signal Logging Selector dialog box for `sldemo_mdref_bus`.

```
openExample('sldemo_mdref_bus');
Simulink.SimulationData.signalLoggingSelector('sldemo_mdref_bus')
```

## Version History

Introduced in R2011a

## See Also

`Simulink.SimulationData.Dataset`

## Simulink.SubSystem.convertToModelReference

Convert subsystem to model reference

### Syntax

```
Simulink.SubSystem.convertToModelReference(gcf,'UseConversionAdvisor',true)
```

```
[tf,h] = Simulink.SubSystem.convertToModelReference(subsys,model)
```

```
[tf,h] = Simulink.SubSystem.convertToModelReference(subsys,model,Name,Value)
```

### Description

`Simulink.SubSystem.convertToModelReference(gcf,'UseConversionAdvisor',true)` opens the **Model Reference Conversion Advisor** for the selected Subsystem block.

`[tf,h] = Simulink.SubSystem.convertToModelReference(subsys,model)` converts the specified subsystems to referenced models.

For each subsystem that the function converts, it:

- Creates a model.
- Copies the contents of the subsystem into the new model.
- Updates any root-level input and output blocks and the configuration parameters of the model to match the compiled attributes of the original subsystem.
- Copies the contents of the model workspace of the original model to the new model.

Before you use this function, load the model containing the subsystem.

`[tf,h] = Simulink.SubSystem.convertToModelReference(subsys,model,Name,Value)` specifies options using one or more name-value arguments.

### Examples

#### Open the Model Reference Conversion Advisor

Open the f14 model.

```
open_system('f14');
```

In the f14 model, select the Controller subsystem output signal and click **Log Signals**.

In the Simulink Editor, select the Controller subsystem. Open the **Model Reference Conversion Advisor** from the command window.

```
Simulink.SubSystem.convertToModelReference(gcf,'UseConversionAdvisor',true);
```

Perform the conversion using the advisor.

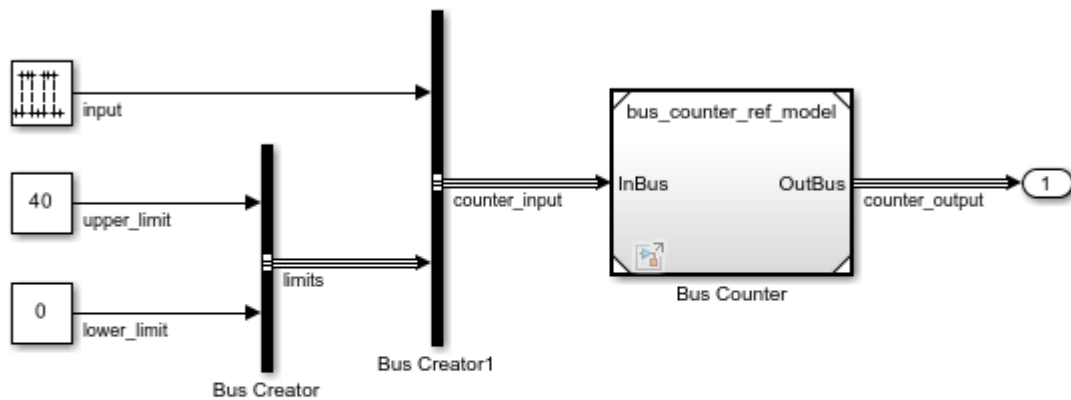

## Programmatically Convert Subsystem to Referenced Model

Convert the Bus Counter subsystem to a referenced model named bus\_counter\_ref\_model.

```
open_system('sldemo_mdref_conversion');
Simulink.SubSystem.convertToModelReference(...
 'sldemo_mdref_conversion/Bus Counter', ...
 'bus_counter_ref_model', ...
 'AutoFix',true,...
 'ReplaceSubsystem',true,...
 'CheckSimulationResults',true);
```

### Successfully converted Subsystem block to Model block.

### Conversion to Model Reference Example

Double-click here to convert the Bus Counter subsystem to a referenced model.

Copyright 1990-2020 The MathWorks, Inc.

## Convert Multiple Subsystems to Referenced Models

Convert the two subsystems with one command.

```
open_system('f14');
set_param(gcs,'SaveOutput','on','SaveFormat','Dataset');
set_param(gcs,'SignalResolutionControl','UseLocalSettings');
Simulink.SubSystem.convertToModelReference(...
 {'f14/Controller','f14/Aircraft Dynamics Model'},...
 {'controller_ref_model','aircraft_dynamics_ref_model'},...
 'ReplaceSubsystem',true,...
```

```
'AutoFix',true,...
'CheckSimulationResults',true)
```

## Input Arguments

### **subsys** — Subsystem names or handles

numeric array | character vector | cell array of character vectors | string array

Subsystem names or handles, specified as a numeric array, character vector, cell array of character vectors, or string array.

For information on which subsystems you can convert, see “Conditionally Execute Referenced Models”.

Data Types: double | char | string

### **model** — Referenced model names

character vector | cell array of character vectors | string array

Referenced model names, specified as a character vector, cell array of character vectors, or string array. Each model name must be 59 characters or less.

If you specify multiple subsystems to convert, specify the same number of referenced model names. Each model name corresponds to the specified subsystem, in the same order.

Data Types: char | string

## Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `Simulink.SubSystem.convertToModelReference...  
(engineSubsys,engineModelRef,'ReplaceSubsystem',true)`

## Conversion

### **AutoFix** — Option to fix all conversion issues that can be fixed automatically

false (default) | true

Option to fix all conversion issues that can be fixed automatically, specified as true or false.

If you set `AutoFix` to true, the function fixes all conversion issues that it can fix. For issues that the function cannot fix, the conversion process generates error messages that you address by modifying the model.

---

**Note** If you set `Force` to true, then the function does not automatically fix conversion issues.

---

Data Types: logical

### **Force** — Option to complete conversion even with errors

false (default) | true

Option to complete conversion even with errors, specified as `true` or `false`.

If `true`, the function returns conversion errors as warnings and continues with the conversion without fixing the errors, even if you set `AutoFix` to `true`. The `Force` option allows you to use the function to do the initial steps of the conversion and then complete the conversion process yourself.

Data Types: `logical`

#### **DataFileName — Name of file for storing conversion data**

character vector

Name of file for storing conversion data, specified as a character vector. You can specify an absolute or relative path.

You can save the conversion data in a MAT file (default) or a MATLAB file. If you use a `.m` file extension, the function serializes all variables to a MATLAB file.

By default, the function uses a file name consisting of the model name plus `_conversion_data.mat`.

Data Types: `char`

#### **Model Interface**

#### **CreateWrapperSubsystem — Option to insert wrapper subsystem to preserve model layout**

`false` (default) | `true`

Option to insert wrapper subsystem to preserve model layout, specified as `true` or `false`.

When you convert a subsystem to a referenced model, you can have the conversion process insert a wrapper subsystem to preserve the layout of the parent model. The subsystem wrapper contains the Model block from the conversion.

The conversion creates a wrapper subsystem automatically if the conversion modifies the Model block interface by adding ports.

Data Types: `logical`

#### **CreateBusObjectsForAllBuses — Option to create bus objects for interface definition**

`false` (default) | `true`

Option to create bus objects for interface definition, specified as `true` or `false`.

Models require a defined interface, unlike subsystems. To define an interface that contains virtual buses, the new model must use either of these options:

- In Bus Element and Out Bus Element blocks
- Inport and Outport blocks that specify `Simulink.Bus` objects

By default, the conversion does not create Bus objects. Instead, the conversion uses In Bus Element and Out Bus Element blocks to support virtual buses at the model interface, and the new model contains the original subsystem.

When you set this parameter to `true`, the conversion creates Bus objects for all virtual buses connected to Inport and Outport blocks that do not specify Bus objects. The conversion keeps the Inport and Outport blocks at the model interface, and they specify the new Bus objects.

Data Types: `logical`

**CopyCodeMappings — Option to copy code mappings from parent model to new model**

`false` (default) | `true`

Option to copy code mappings from parent model to the new model, specified as `true` or `false`.

If `true`, the function copies the existing code mapping configurations from the parent model to the new referenced model.

If `false`, the function does not copy the existing code mapping configurations from the parent model to the new model.

Data Types: `logical`

**Model Implementation****ReplaceSubsystem — Option to replace Subsystem blocks with Model blocks**

`false` (default) | `true`

Option to replace Subsystem blocks with Model blocks, specified as `true` or `false`.

If you set the value to `true`, consider making a backup of the original model before you convert the subsystems. If you want to undo the conversion, having a backup makes it easier to restore the model.

If you set `ReplaceSubsystem` to `true`, the conversion action depends on whether you use the automatic fix options.

- If you use the automatic fixes, then the conversion replaces the Subsystem block with a Model block unless the automatic fixes change the input or output ports. If the ports change, then the conversion includes the contents of the subsystem in a Model block that is inserted in the Subsystem block.
- If you do not use the automatic fixes, then the conversion replaces the Subsystem block with a Model block.

Data Types: `logical`

**SimulationModes — Simulation mode for Model blocks**

`'Normal'` (default) | `'Accelerator'`

Simulation mode for Model blocks, specified as `'Normal'` or `'Accelerator'`. The simulation mode setting applies to the Model blocks that reference the models that the conversion creates.

Data Types: `char` | `string`

**BuildTarget — Model reference targets to generate**

`'Sim'` | `'Coder'`

Model reference targets to generate, specified as `'Sim'` or `'Coder'`.

- `'Sim'` — Model reference simulation target
- `'Coder'` — Code generation target

Data Types: `char`

## Simulation Results Comparison

### CheckSimulationResults — Option to check simulation results before and after conversion

false (default) | true

Option to check simulation results before and after conversion, specified as true or false.

Before performing the conversion:

- Enable signal logging for the subsystem output signals of interest in the model.
- Set CheckSimulationResults to true.
- Set AbsoluteTolerance.
- Set RelativeTolerance.
- Set SimulationModes to the simulation mode used by the original model.

If the difference between simulation results exceeds the tolerance level, the function displays a message.

Data Types: logical

### AbsoluteTolerance — Absolute signal tolerance for comparison

1e-06 (default) | numeric scalar

Absolute signal tolerance for comparison, specified as a numeric scalar.

Use this option only if you set CheckSimulationResults to true.

Data Types: double

### RelativeTolerance — Relative signal tolerance for comparison

1e-06 (default) | numeric scalar

Relative signal tolerance for comparison, specified as a numeric scalar.

Use this option only if you set CheckSimulationResults to true.

Data Types: double

## Output Arguments

### tf — True or false result

1 | 0 | logical array

True or false result, returned as 1 or 0 of data type logical.

A value of 1 indicates a successful conversion.

If you set Force to true, the function returns a value of 1 if the conversion completes. However, the simulation results can differ from the simulation results for the model before conversion.

### h — Handles of created Model blocks

numeric array

Handles of the created Model blocks, returned as a numeric array.

Data Types: double

## Tips

- You cannot convert a parent subsystem and a child of that subsystem at the same time.
- Specifying multiple subsystems to convert with one command can save time compared to converting each subsystem separately. The multiple subsystem conversion process compiles the model once.
- If you specify multiple subsystems to convert, the conversion process attempts to convert each subsystem. Successfully converted subsystems produce referenced models, even if the conversions of other subsystems fail.
- If you specify multiple subsystems, consider:
  - In the input arguments, setting 'Autofix', 'ReplaceSubsystem', and 'CheckSimulationResults' to true.
  - In the model, setting a short simulation time.
- A data dictionary saves bus objects that it creates as part of the conversion process when both of these conditions exist:
  - The top model uses a data dictionary.
  - All changes to the top model are saved.
- To maintain the behavior of a masked subsystem, perform these additional tasks:
  - For masked callbacks, icons, ports, and documentation, create a backup copy of the masked subsystem before converting it to a referenced model. After conversion, copy the content from the Mask Editor of the backup masked subsystem to the Mask Editor of the new Model block.
  - Replace mask parameters with model arguments (see “Parameterize Instances of a Reusable Referenced Model”).

---

**Note** Referenced models do not support the functionality that you can achieve with mask initialization code to create masked parameters.

---

## Version History

### Introduced in R2006a

#### 'BuildTarget' argument value 'RTW' is not recommended

*Not recommended starting in R2019a*

In R2019a, an argument value used with the `Simulink.SubSystem.convertToModelReference` function was updated. The legacy argument value is supported for backward compatibility.

To take advantage of the updated 'BuildTarget' argument value, use 'Coder' instead of 'RTW'.

# Simulink.SubSystem.copyContentsToBlockDiagram

Copy graphical contents from subsystem to empty system

## Syntax

```
Simulink.SubSystem.copyContentsToBlockDiagram(subsys, sys)
```

## Description

`Simulink.SubSystem.copyContentsToBlockDiagram(subsys, sys)` copies the blocks, lines, and annotations of the specified subsystem to the top-level block diagram of the specified system. It does not affect nongraphical information such as configuration sets.

To use this function:

- The specified system must be loaded in memory.
- The specified subsystem must be loaded in memory.
- The specified system must not contain any blocks or lines. Other types of information can exist in the system and are unaffected by the function. To delete the graphical content of the system, use `Simulink.BlockDiagram.deleteContents`.

## Examples

### Copy Subsystem Contents to Model

Copy the graphical contents of a subsystem to a new model.

Open the f14 model.

```
open_system('f14');
```

Create an empty model named f14Controller.

```
model = new_system('f14Controller');
open_system(model)
```

Copy the graphical contents from the f14/Controller subsystem to the empty f14Controller model.

```
Simulink.SubSystem.copyContentsToBlockDiagram('f14/Controller', model)
```

## Input Arguments

### **subsys** — Subsystem block path or handle

character vector | string scalar | numeric scalar

Subsystem block path or handle, specified as a character vector, string scalar, or numeric scalar.

Example: 'model1/Subsystem'

Data Types: `double` | `char` | `string`

**sys** — **System name or handle**

character vector | string scalar | numeric scalar

System name or handle, specified as a character vector, string scalar, or numeric scalar.

A system name must not include a path or extension.

Example: `'model2'`

Data Types: `double` | `char` | `string`

## Tips

To flatten a model hierarchy by replacing a subsystem with its contents, use the `Simulink.BlockDiagram.expandSubsystem` function.

# Simulink.SubSystem.deleteContents

Delete contents of subsystem

## Syntax

```
Simulink.SubSystem.deleteContents(subsys)
```

## Description

`Simulink.SubSystem.deleteContents(subsys)` deletes the blocks, lines, and annotations in the specified subsystem, which must be loaded in memory.

## Examples

### Delete Subsystem Contents

Open the f14 model.

```
open_system('f14')
```

Delete the graphical contents from the f14/Controller subsystem.

```
Simulink.SubSystem.deleteContents('f14/Controller')
```

## Input Arguments

**subsys** — Subsystem block path or handle

character vector | string scalar | numeric scalar

Subsystem block path or handle, specified as a character vector, string scalar, or numeric scalar.

Data Types: double | char | string

## Version History

Introduced in R2007a

## Simulink.SubSystem.getChecksum

Return checksum of nonvirtual subsystem

### Syntax

```
[checksum,details] = Simulink.SubSystem.getChecksum(subsys)
```

### Description

`[checksum,details] = Simulink.SubSystem.getChecksum(subsys)` returns the checksum of the specified nonvirtual subsystem. Simulink computes the checksum based on the subsystem parameter settings and the blocks the subsystem contains. Virtual subsystems do not have checksums.

One use of this command is to determine why code generated for a subsystem is not being reused.

---

**Note** `Simulink.SubSystem.getChecksum` compiles the model that contains the specified subsystem, if the model is not already in a compiled state. If you need to get the checksum for multiple subsystems and want to avoid multiple compiles, use the command `,model([], [], [], 'compile')` to place the model in a compiled state before using `Simulink.SubSystem.getChecksum`.

---

This command accepts the argument `subsys`, which is the full name or handle of the nonvirtual subsystem block for which you are returning checksum data.

### Examples

#### Run getChecksum on Model

Run the function `Simulink.SubSystem.getChecksum` on the model `rtwdemo_ssreuse`. In the MATLAB editor window, both output structures are displayed. In the workspace pane, double-click on either of the structures to view its contents.

Load the model `rtwdemo_ssreuse`.

```
rtwdemo_ssreuse
```

Select subsystem `SS1` and execute the follow line of code in the MATLAB editor to get the full name and path to the subsystem `SS1`:

```
path_ss1 = gcb
```

Run the function `getChecksum` on the subsystem with the following command:

```
[chksum1, chksum1_details] = Simulink.SubSystem.getChecksum(path_ss1)
```

The output structures `chksum1` and `chksum1_details` will store the output of the `getChecksum` function call.

```

checksum1 =
 struct with fields:
 Value: [4x1 uint32]
 MarkedUnique: 0

checksum1_details =
 struct with fields:
 ContentsChecksum: [1x1 struct]
 InterfaceChecksum: [1x1 struct]
 ContentsChecksumItems: [359x1 struct]
 InterfaceChecksumItems: [60x1 struct]

```

## Input Arguments

**subsys** — Name or handle of nonvirtual subsystem

character vector

Input the full name of the nonvirtual subsystem for which you want to calculate the checksum.

Data Types: char

## Output Arguments

**checksum** — A structure that stores the value of the checksum and indicates whether **subsys** contains unique block or subsystem properties which prevent generated code reuse

structure

Checksum information, returned as a structure with the fields:

**Value** - 4x1 uint32 - Array of four 32-bit integers that represents the subsystem's 128-bit checksum

**MarkedUnique** - bool - True if the subsystem or the blocks it contains have properties that would prevent the code generated for the subsystem from being reused; otherwise, false

**details** — A structure that stores checksum data on model contents and the interface

structure

Checksum information, returned as a structure with the fields:

**ContentsChecksum** - structure - A structure of the same form as **checksum**, representing a checksum that provides information about all blocks in the system.

**InterfaceChecksum** - structure - A structure of the same form as **checksum**, representing a checksum that provides information about the subsystem's block parameters and connections

**ContentsChecksumItems** — Structure array that Simulink uses to compute the checksum for **ContentsChecksum**

structure

Structure array returned with the following fields:

**Handle** - char array Object for which Simulink added an item to the checksum. For a block, the handle is a full block path. For a block port, the handle is the full block path and a character vector that identifies the port.

**Identifier** - char array - Descriptor of the item Simulink added to the checksum. If the item is a documented parameter, the identifier is the parameter name

**Value** - type - Value of the item Simulink added to the checksum. If the item is a parameter, Value is the value returned by `get_param(handle, identifier)`.

### **InterfaceChecksumItems — Structure array that Simulink uses to compute the checksum for InterfaceChecksum**

structure

Structure array returned with the following fields:

**Handle** - char array Object for which Simulink added an item to the checksum. For a block, the handle is a full block path. For a block port, the handle is the full block path and a character vector that identifies the port.

**Identifier** - char array - Descriptor of the item Simulink added to the checksum. If the item is a documented parameter, the identifier is the parameter name

**Value** - type - Value of the item Simulink added to the checksum. If the item is a parameter, Value is the value returned by `get_param(handle, identifier)`.

## **Version History**

**Introduced in R2006b**

### **See Also**

`Simulink.BlockDiagram.getChecksum`

# Simulink.suppressDiagnostic

Suppress a diagnostic from a specific block

## Syntax

```
Simulink.suppressDiagnostic(source, message_id)
Simulink.suppressDiagnostic(diagnostic)
```

## Description

`Simulink.suppressDiagnostic(source, message_id)` suppresses all instances of diagnostics represented by `message_id` thrown by the blocks specified by `source`.

`Simulink.suppressDiagnostic(diagnostic)` suppresses the diagnostics associated with MSLDiagnostic object `diagnostic`.

## Examples

### Suppress a Warning Thrown By a Block

Using the model from “Suppress Diagnostic Messages Programmatically”, use the `Simulink.suppressDiagnostic` function to suppress the parameter precision loss warning thrown by the Constant block, `one`.

```
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one', ...
 'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

## Input Arguments

### **source** — Block or model object throwing the diagnostic

block path | block handle

The source of the diagnostic, specified as a block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the `gcb` function.

To get the block handle, use the `getSimulinkBlockHandle` function.

Data Types: char | cell

### **message\_id** — message identifier of diagnostic

message identifier | cell array of message identifiers

Message identifier of the diagnostic, specified as a character vector or a cell array of character vectors. You can find the message identifier of diagnostics thrown during simulation by accessing the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object associated with a simulation. You can also use the `lastwarn` function.

Data Types: char | cell

**diagnostic** – Diagnostic object

MSLDiagnostic object

Diagnostic specified as an MSLDiagnostic object. Access the MSLDiagnostic object through the ExecutionInfo property of the Simulink.SimulationMetadata object.

Data Types: struct

# slblocksearchdb.trainfrommodel

Train suggestion engine to improve quick insert results based on one model

## Syntax

```
slblocksearchdb.trainfrommodel(model)
```

## Description

`slblocksearchdb.trainfrommodel(model)` improves quick insert search results based on a single model.

## Examples

### Use a Single Model for Training

Train the suggestion engine to use a model to improve results. Assume 'MyModels' is in the current folder. This code uses a relative path.

```
slblocksearchdb.trainfrommodel('MyModels/model.slx')
```

## Input Arguments

**model** — Model for training the suggestion engine

model path

Model to train the suggestion engine, specified as a character vector or string scalar of the full model path or relative path. Include the `.slx` or `.mdl` extension

Example: 'H:/MyModels/model.slx' 'mymodel.slx'

## Version History

Introduced in R2018a

## See Also

## Topics

"Improve Quick Block Insert Results"

## slblocksearchdb.trainfrommodelsindir

Train suggestion engine to improve quick insert results based on models in a folder

### Syntax

```
slblocksearchdb.trainfrommodelsindir(folder)
slblocksearchdb.trainfrommodelsindir(folder,'exclude',exclusions)
```

### Description

`slblocksearchdb.trainfrommodelsindir(folder)` improves search results based on the models in `folder`, recursively.

`slblocksearchdb.trainfrommodelsindir(folder,'exclude',exclusions)` excludes the specified models from updating the suggestion engine.

### Examples

#### Train Suggestion Engine and Exclude Folders and Models

Create the cell array `exPath` for a folder you want to exclude and a model you want to exclude. To train the suggestion engine, use the cell array in the `slblocksearchdb.trainfrommodelsindir` command.

```
exPath = {'MyModels/testmodels' 'MyModels/myvdp.slx'}
slblocksearchdb.trainfrommodelsindir('MyModels','exclude',exPath)
```

The command uses the models in the folder 'MyModels' with the exclusions you specified.

### Input Arguments

#### **folder** — Folder whose models to use for training

folder path

Folder whose models to use for training the suggestion engine, specified as an absolute or relative path character vector or string scalar.

Example: 'H:/MyModels/trainingmodels' 'MyModels'

#### **exclusions** — Models to exclude from training models

cell array of character vectors | string array

Models to exclude from training the suggestion engine, specified as a cell array of character vectors or a string array. Specify folders or models to exclude as a full or relative path. Model names must include the file extension `.slx` or `.mdl`.

```
Example: {'H:/MyModels/trainingmodels' 'MyModels/trainingmodels2' 'MyModels/
myvdp.slx'}
```

## **Version History**

**Introduced in R2018a**

### **Topics**

“Improve Quick Block Insert Results”

## **slblocksearchdb.untrainall**

Remove the effects of all added models from the suggestion engine

### **Syntax**

```
slblocksearchdb.untrainall
```

### **Description**

`slblocksearchdb.untrainall` removes the models added to the suggestion engine to improve quick insert results. Use this function when you want to return the database to the default state.

### **Examples**

#### **Add Models and Remove All**

Add some models to the suggestion engine.

```
slblocksearchdb.trainfrommodelsindir('MyModels')
slblocksearchdb.trainfrommodel('C:/users/TrainingModels/mymodel.slx')
```

Remove all added models from the suggestion engine.

```
slblocksearchdb.untrainall
```

### **Version History**

**Introduced in R2018a**

### **See Also**

```
slblocksearchdb.untrainmodelsindir | slblocksearchdb.untrainmodel |
slblocksearchdb.trainfrommodelsindir | slblocksearchdb.trainfrommodel
```

### **Topics**

“Improve Quick Block Insert Results”

# slblocksearchdb.untrainmodel

Remove the effect of a model from the suggestion engine

## Syntax

```
slblocksearchdb.untrainmodel('model')
```

## Description

`slblocksearchdb.untrainmodel('model')` removes the effects of a single model from the suggestion engine.

## Examples

### Remove a Model from the Suggestion Engine

Train the suggestion engine to use a model to improve results.

```
slblocksearchdb.trainfrommodel('MyModels/model.slx')
```

Remove the model from the suggestion engine.

```
slblocksearchdb.untrainmodel('MyModels/model.slx')
```

## Input Arguments

### **model** — Model to remove from the suggestion engine

model path

Model whose effects to remove from the suggestion engine, specified as the full or relative path character vector or string scalar. Include the `.slx` or `.mdl` extension.

Example: `'H:/MyModels/model.slx'`

## Version History

Introduced in R2018a

## See Also

## slblocksearchdb.untrainmodelsindir

Remove the effects of models from the suggestion engine

### Syntax

```
slblocksearchdb.untrainmodelsindir(folder)
slblocksearchdb.untrainmodelsindir(folder,'exclude',exclusions)
```

### Description

`slblocksearchdb.untrainmodelsindir(folder)` removes models in `folder` from the suggestion engine, recursively.

`slblocksearchdb.untrainmodelsindir(folder,'exclude',exclusions)` excludes the specified models from updating the suggestion engine.

### Examples

#### Remove the Effects of Models from Suggestion Engine

Create the cell array `exPath` for a folder and a model whose effects you do not want to remove from the suggestion engine. Then use the cell array in the `slblocksearchdb.untrainmodelsindir` command.

```
exPath = {'MyModels/subfolder' 'MyModels/myvdp.slx'}
slblocksearchdb.untrainmodelsindir('MyModels','exclude',exPath)
```

The command removes the models in the folder 'MyModels' with the exclusions you specified.

### Input Arguments

#### **folder** — Folder whose models to remove from the suggestion engine

folder path

Folder whose models to remove from the suggestion engine, specified as an absolute or relative path character vector or string scalar.

Example: 'H:/MyModels/trainingmodels' 'MyModels'

#### **exclusions** — Folders and models to exclude from removing

cell array of character vectors | string array

Folders or models to exclude from removing from the suggestion engine, specified as a cell array of character vectors or a string array. Specify the folders or models to exclude as a full or relative path. For models, include the `.slx` or `.mdl` extension.

```
Example: {'H:/MyModels/trainingmodels' 'MyModels/trainingmodels2' 'MyModels/
myvdp.slx'}
```

## **Version History**

**Introduced in R2018a**

## slbuild

Build standalone executable file or model reference target for model

### Syntax

```
slbuild(model)
slbuild(model,buildSpec)
slbuild(model,Name,Value)
blockHandle = slbuild(subsystem)
blockHandle = slbuild(subsystem,'Mode','ExportFunctionCalls')
blockHandle = slbuild(subsystem,Name,Value)
```

### Description

`slbuild(model)` builds a standalone Simulink Coder binary executable file from the specified model, using the current configuration parameter settings. If the model is not loaded, `slbuild` loads the model before starting the build process.

`slbuild(model,buildSpec)` builds a standalone Simulink Coder binary executable file from the model according to the specified code generation action.

`slbuild(model,Name,Value)` builds a standalone Simulink Coder binary executable file from the model as specified by one or more name-value arguments.

`blockHandle = slbuild(subsystem)` generates subsystem code and builds a Simulink Coder binary executable file by using the current configuration parameter settings of your model. If the selected system target file creates an S-Function block, the function returns a non-empty block handle to an autogenerated S-Function wrapper. Before you run the command, you must open or load the parent model.

`blockHandle = slbuild(subsystem,'Mode','ExportFunctionCalls')` generates code from the subsystem that includes function calls that you can export to external application code. This command requires Embedded Coder. If the **Create block** configuration parameter is set to SIL, the function returns the handle to a Model block in SIL mode. You can then use the Model block for numerical equivalence testing.

`blockHandle = slbuild(subsystem,Name,Value)` generates subsystem code and builds a Simulink Coder binary executable file as specified by one or more name-value arguments.

### Examples

#### Generate Code and Build Executable File for Model

Generate C code for model `rtwdemo_rtwintr0`.

```
slbuild('rtwdemo_rtwintr0')
% Same operation as ...
% slbuild('rtwdemo_rtwintr0','StandaloneCoderTarget')
```

For the generic real-time (GRT) target, the coder generates these code files and places them in folders `rtwdemo_rtwintrg_grt_rtw` and `slprj/grt/_sharedutils`.

| Model Files                             | Shared Files                        | Interface Files        | Other Files |
|-----------------------------------------|-------------------------------------|------------------------|-------------|
| <code>rtwdemo_rtwintrg.c</code>         | <code>rtwtypes.h</code>             | <code>rtmodel.h</code> | none        |
| <code>rtwdemo_rtwintrg.h</code>         | <code>multiword_types.h</code>      |                        |             |
| <code>rtwdemo_rtwintrg_private.h</code> | <code>builtin_typeid_types.h</code> |                        |             |
| <code>rtwdemo_rtwintrg_types.h</code>   |                                     |                        |             |

If the following model configuration parameters settings apply, the coder generates additional results.

| Parameter Setting                                                                 | Results                                                                                                                                                                                        |
|-----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Code Generation &gt; Generate code only</b> pane is cleared                    | Executable file <code>rtwdemo_rtwintrg.exe</code>                                                                                                                                              |
| <b>Code Generation &gt; Report &gt; Create code generation report</b> is selected | Report appears, providing information and links to generated code files, subsystem and code interface reports, entry-point functions, inports, outports, interface parameters, and data stores |

## Build Multiple Top Models

This example shows how to use `slbuild` to generate executable code for two models, `sldemo_mdhref_depgraph` and `rtwdemo_counter`. `sldemo_mdhref_depgraph` is a top model that references models. The example also shows how to build the referenced models in parallel.

Create a local folder.

```
if exist(fullfile('.', 'myTempFolder'), 'dir')
 rmdir('myTempFolder', 's')
end
mkdir myTempFolder
cd myTempFolder
```

Copy `sldemo_mdhref_depgraph`, which references models, to the local folder.

```
src_dir = fullfile(matlabroot, ...
 'toolbox', ...
 'simulink', ...
 'simdemos', ...
 'simfeatures', ...
 'modelreference');
copyfile(fullfile(src_dir, ...
 'sldemo_mdhref_depgraph.slx'), ...
 '.');
```

Enable parallel building of models referenced by `sldemo_mdhref_depgraph`.

```
load_system('sldemo_mdhref_depgraph')
set_param('sldemo_mdhref_depgraph', ...
'EnableParallelModelReferenceBuilds', 'on');
```

Initialize MATLAB workers for parallel building of referenced models.

```
set_param('sldemo_mdhref_depgraph', ...
'ParallelModelReferenceMATLABWorkerInit', ...
'Copy Base Workspace');
```

Build the models.

```
slbuild({'sldemo_mdhref_depgraph', 'rtwdemo_counter'})
```

In myTempFolder, the build process creates standalone executable files, sldemo\_mdhref\_depgraph.exe and rtwdemo\_counter.exe.

For each model, in the Command Window, the build process displays a build summary.

```
Build Summary|
Code generation targets built:

Model Action Rebuild Reason
=====
sldemo_mdhref_F2C Code generated and compiled sldemo_mdhref_F2C.c does not exist.
sldemo_mdhref_thermostat Code generated and compiled sldemo_mdhref_thermostat.c does not exist.
sldemo_mdhref_heat2cost Code generated and compiled sldemo_mdhref_heat2cost.c does not exist.
sldemo_mdhref_house Code generated and compiled sldemo_mdhref_house.c does not exist.
sldemo_mdhref_heater Code generated and compiled sldemo_mdhref_heater.c does not exist.
sldemo_mdhref_outdoor_temp Code generated and compiled sldemo_mdhref_outdoor_temp.c does not exist.

Top model targets built:

Model Action Rebuild Reason
=====
sldemo_mdhref_depgraph Code generated and compiled Code generation information file does not exist.

7 of 7 models built (0 models already up to date)
Build duration: 0h 3m 56.859s
Starting build procedure for: rtwdemo_counter
Successful completion of build procedure for: rtwdemo_counter

Build Summary

Top model targets built:

Model Action Rebuild Reason
=====
rtwdemo_counter Code generated and compiled Code generation information file does not exist.

1 of 1 models built (0 models already up to date)
Build duration: 0h 1m 12.556s
```

### Force Top Model Build

Generate code and build an executable file for the model TopModelCode, which refers to model ReferenceModelCode, regardless of model checksums and parameter settings.

```
openExample('simulinkcoder/FilePackagingModelsCodeAndDataExample',...
'supportingFile','TopModelCode');
```

```
slbuild('TopModelCode','StandaloneCoderTarget',...
 'ForceTopModelBuild',true)
```

## Generate Code and Build Executable File for Subsystem

Generate C code for subsystem Amplifier in model rtwdemo\_rtwintr.

```
rtwdemo_rtwintr
slbuild('rtwdemo_rtwintr/Amplifier')
```

The code generator produces code files in the Amplifier\_grt\_rtw and slprj/grt/\_sharedutils folders.

In your current working folder, the build process creates an executable file (Amplifier.exe).

## Build Subsystem for Exporting Code to External Application

To export function calls to external application code, build an executable file from a function-call subsystem.

```
rtwdemo_exporting_functions
set_param('rtwdemo_exporting_functions','GenCodeOnly','off');
slbuild('rtwdemo_exporting_functions/rtwdemo_subsystem','Mode','ExportFunctionCalls')
```

The executable file rtwdemo\_subsystem.exe appears in your working folder.

## Create Model Block for SIL Testing

From a function-call subsystem, create a Model block that you can use to test the code generated from a model.

Open subsystem rtwdemo\_subsystem in model rtwdemo\_exporting\_functions.

Set the **Code Generation > Verification > Advanced parameters > Create block** configuration parameter to SIL.

Create the Model block.

```
mysilblockhandle = slbuild('rtwdemo_exporting_functions/rtwdemo_subsystem',...
 'Mode','ExportFunctionCalls')
```

The code generator produces the Model block in a temporary model. The Model block is configured as follows:

- **Model name** is set to the name of a new model that contains the content of the original subsystem.
- **Simulation mode** is set to Software-in-the-loop (SIL).

You can add the block to an environment or test harness model that supplies test vectors or stimulus input. You can then run simulations that perform SIL tests and verify that the Model block produces the same result as the original subsystem.

## Input Arguments

### **model** — Specifies model for the build process

handle | character vector | cell array of handles or character vectors

If you specify the model name as a handle or character vector, the build process creates a standalone executable file or model reference target.

If you specify multiple models through a cell array of handles or character vectors, the build process applies `buildSpec` to each model in the cell array.

Example: `gcs`

### **subsystem** — Subsystem name

handle | character vector | cell array of handles or character vectors

Name of subsystem from which you want to generate code or build an executable file, specified as a handle or character vector representing the subsystem name or the full block path.

You can specify multiple subsystems through a cell array of handles or character vectors

Example: `'rtwdemo_exporting_functions/rtwdemo_subsystem'`

### **buildSpec** — Specifies the code generation action for the build process

'StandaloneCoderTarget' (default) | 'ModelReferenceSimTarget' |  
'ModelReferenceCoderTarget' | 'CleanTopModel'

`buildSpec` directs the code generator to perform the selected build action for the model and the build process:

- Honors the setting of the **Rebuild** parameter on the **Model Referencing** pane of the Configuration Parameters dialog box.
- Requires a Simulink Coder license only if you build a model reference Simulink Coder target, not if you build a model reference simulation target only.

The `buildSpec` argument must be one of the following.

| <b>buildSpec Value</b>      | <b>Build Action</b>                                                                                                                                                                                                                                                                                                        |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 'StandaloneCoderTarget'     | Builds a standalone Simulink Coder binary executable file for the specified model, using the current model configuration settings. It also builds model reference coder targets for the referenced models.<br><br>If the specified model is not loaded, <code>slbuild</code> loads it before initiating the build process. |
| 'ModelReferenceSimTarget'   | Builds a model reference simulation target (does not require a Simulink Coder license).                                                                                                                                                                                                                                    |
| 'ModelReferenceCoderTarget' | Builds a model reference Simulink Coder target.                                                                                                                                                                                                                                                                            |

| <b>buildSpec Value</b> | <b>Build Action</b>                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------|
| 'CleanTopModel'        | Cleans the model build area enough to trigger regeneration of the top model code at the next build. |

Example: 'ModelReferenceSimTarget'

### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, . . . ,NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: 'UpdateThisModelReferenceTarget', 'Force'

### **UpdateThisModelReferenceTarget — Conditional rebuild option for model reference build** 'Force' | 'IfOutOfDateOrStructuralChange' | 'IfOutOfDate'

Conditional rebuild option for the model reference build, specified as the comma-separated pair consisting of 'UpdateThisModelReferenceTarget' and 'Force', 'IfOutOfDateOrStructuralChange', or 'IfOutOfDate'.

This option applies only to the specified model, not to any models referenced by the specified model.

| <b>'UpdateThisModelReferenceTarget' Value</b> | <b>Equivalent Rebuild Option</b>              | <b>Rebuild Action</b>                                                                            |
|-----------------------------------------------|-----------------------------------------------|--------------------------------------------------------------------------------------------------|
| 'Force'                                       | Always                                        | Unconditionally rebuilds the model.                                                              |
| 'IfOutOfDateOrStructuralChange'               | If any changes detected                       | Rebuilds the model if the build process detects any changes.                                     |
| 'IfOutOfDate'                                 | If any changes in known dependencies detected | Rebuilds the model if the build process detects any changes in known dependencies of this model. |

For more information on the different rebuild options, see **Rebuild**.

Example: 'UpdateThisModelReferenceTarget', 'Force'

### **Dependencies**

To use this option, set `buildSpec` to 'ModelReferenceSimTarget' or 'ModelReferenceCoderTarget'.

Data Types: char | string

### **ForceTopModelBuild — Force top model of model hierarchy to build** false (default) | true

Option to force the top model of the model hierarchy to build, specified as the comma-separated pair consisting of 'ForceTopModelBuild' and true or false.

Setting the value to true directs the code generator to generate code and build an executable file for the top model of the model hierarchy, regardless of model checksums and parameter settings.

Example: 'ForceTopModelBuild', true

**Dependencies**

To use this option, set `buildSpec` to `'StandaloneCoderTarget'`.

Data Types: `logical`

**GenerateCodeOnly — Generate code only**

`false` | `true`

If you do not specify a value, the **Generate code only** (`GenCodeOnly`) option on the **Code Generation** pane controls build process behavior.

If you specify a value, the argument overrides the **Generate code only** (`GenCodeOnly`) option on the **Code Generation** pane:

- `true` -- Generate code only.
- `false` -- Generate code and build executable file.

**Mode — Export function calls (for subsystem builds only)**

`'ExportFunctionCalls'` | `'Normal'`

- `'ExportFunctionCalls'` -- If you have Embedded Coder, generates code from `subsystem` that includes function calls that you can export to external application code.
- `'Normal'` -- Does not export function calls.

**ExportFunctionFileName — Function name**

character vector

Name the exported function for the specified subsystem.

Example:

```
slbuild(subsystem, 'Mode', 'ExportFunctionCalls', 'ExportFunctionFileName',
fcname)
```

**OpenBuildStatusAutomatically — Display build information**

`false` (default) | `true`

Option to display the build information, specified as the comma-separated pair consisting of `'OpenBuildStatusAutomatically'` and `true` or `false`.

To display build information in the Build Status window, specify `true`. The default is `false`. For more information about using the status window, see “Monitor Parallel Building of Referenced Models” (Simulink Coder).

The Build Status window supports parallel builds of referenced model hierarchies. Do not use the Build Status window for serial builds.

**Dependencies**

To use this option, set `buildSpec` to `'StandaloneCoderTarget'`.

Data Types: `logical`

**ObfuscateCode — Generate obfuscated C code**

`false` (default) | `true`

Specify whether to generate obfuscated C code:

- `true` -- Generate obfuscated C code that you can share with third parties with reduced likelihood of compromising intellectual property.
- `false` -- Generated C code is not obfuscated.

### **IncludeModelReferenceSimulationTargets — Build model reference simulation targets**

`false` (default) | `true`

Option to build model reference simulation targets, specified as the comma-separated pair consisting of 'IncludeModelReferenceSimulationTargets' and `true` or `false`.

#### **Dependencies**

To use this option, set `buildSpec` to 'StandaloneCoderTarget'.

Data Types: `logical`

## **Output Arguments**

### **blockHandle — Block handle**

handle

Block handle to an autogenerated S-Function wrapper block or Model block.

## **Version History**

**Introduced before R2006a**

### **slbuild does not generate model reference simulation targets by default**

*Behavior changed in R2020b*

Starting in R2020b, the `slbuild` function does not generate model reference simulation targets by default. Excluding the model reference simulation targets allows for faster code generation for model hierarchies.

You can generate both the simulation and code generation targets with the default `buildSpec` value ('StandaloneCoderTarget') by setting `IncludeModelReferenceSimulationTargets` to `true`.

When you specify 'ModelReferenceCoderTarget' for the `buildSpec` argument, `slbuild` no longer builds a model reference simulation target. It builds only a model reference Simulink Coder target.

### **'ModelReferenceCoderTargetOnly' is not recommended**

*Not recommended starting in R2020b*

Starting in R2020b, the `buildSpec` argument values 'ModelReferenceCoderTarget' and 'ModelReferenceCoderTargetOnly' have the same behavior. 'ModelReferenceCoderTargetOnly' is not recommended. Use 'ModelReferenceCoderTarget' instead.

There are no plans to remove 'ModelReferenceCoderTargetOnly'.

### **'StandaloneRTWTarget', 'ModelReferenceRTWTarget', and 'ModelReferenceRTWTargetOnly' are not recommended**

*Not recommended starting in R2019a*

In R2019a, these `buildSpec` argument values received new names for clarity:

- 'StandaloneRTWTarget' — Use 'StandaloneCoderTarget' instead.
- 'ModelReferenceRTWTarget' — Use 'ModelReferenceCoderTarget' instead.
- 'ModelReferenceRTWTargetOnly' — Use 'ModelReferenceCoderTargetOnly' instead.

There are no plans to remove the legacy `buildSpec` argument values.

## Extended Capabilities

### Automatic Parallel Support

Accelerate code by automatically running computation in parallel using Parallel Computing Toolbox™.

To build referenced models in parallel, in the top model, select the configuration parameter check box **Enable parallel model reference builds**. For more information, see “Reduce Build Time for Referenced Models by Using Parallel Builds” (Simulink Coder).

In Parallel Computing Toolbox commands, for example, a `parfor` or `spm` loop, do not invoke `rtwbuild`, `rtwrebuild`, or `slbuild` commands that build models that are configured for parallel builds.

# slCharacterEncoding

Specify encoding to use in code generated from Simulink models

## Syntax

```
slCharacterEncoding(encoding)
encoding = slCharacterEncoding()
```

## Description

`slCharacterEncoding(encoding)` specifies the character set used in the code generated from Simulink models. The character set encoding affects the comments in the generated code.

`encoding = slCharacterEncoding()` returns the current Simulink character set encoding.

## Examples

### Specify Encoding for ASCII Characters

Suppose that you generate code for an embedded target and the compiler you use requires that the source code contain only ASCII characters.

Use this command:

```
slCharacterEncoding('US-ASCII')
```

### Specify Encoding for Non-ASCII Characters

Suppose that you have a model that contains non-ASCII characters (multilingual characters, special symbols) and you want these annotations to be easily readable in your generated code.

If your compiler supports UTF-8, on Windows, use this command:

```
slCharacterEncoding('UTF-8')
```

UTF-8 is the default encoding on Linux and Mac.

### Specify Encoding for Non-English Locale

Suppose that your model contains Japanese text but your machine is configured for an English-language locale. You want to generate code with 'Shift\_JIS' encoded text so that your team members who use 'Shift\_JIS' as their locale-specific encoding can see the Japanese text in the generated code.

Use this command:

```
slCharacterEncoding('Shift_JIS')
```

### Input Arguments

**encoding** – Character encoding to use for the generated code  
'US-ASCII' | 'UTF-8' | other supported encodings

Set the character encoding to a supported encoding value.

### Version History

Introduced before R2006a

# slConvertCustomMenus

Convert custom toolbar menu into toolstrip tab

## Syntax

```
slConvertCustomMenus
slConvertCustomMenus(Name=Value)
```

## Description

`slConvertCustomMenus` converts a custom Simulink toolbar menu into a toolstrip tab that is stored in a toolstrip component called `custom` in the current folder. The new tab has the title **Custom** and contains a single section with the same name as the top level of the toolbar menu. The section is populated with the converted toolbar menu items:

- Action schemas and toggle schemas are converted into push buttons.
- Container schemas are converted into drop-down buttons.

The toolbar menu is not automatically deleted during the conversion. To remove it, delete or comment out the corresponding `addCustomMenuFcn` call in the `sl_customization.m` file, save the file, and rebuild the toolstrip by entering `sl_refresh_customizations` in the MATLAB Command Window.

If a toolstrip component called `custom` already exists in the current folder, a prompt will appear in the Command Window asking you for permission to overwrite the component.

When the conversion is complete, the new tab can be edited like any other custom toolstrip tab. You can adjust the layout of the tab, its labels, and its functionality. See “Create Custom Simulink Toolstrip Tabs” for details.

`slConvertCustomMenus(Name=Value)` converts a custom Simulink toolbar menu into a toolstrip tab that is stored in a toolstrip component whose name and resource location can be specified by name-value arguments.

Permission to overwrite an existing toolstrip component of the same name and at the same location as the one that the conversion creates can be specified via name-value argument as well. If you do not specify this argument and such a component exists, a prompt will appear in the Command Window asking you for permission to overwrite the component.

## Examples

### Convert Toolbar Menu into Toolstrip Tab

Start with the custom Simulink toolbar menu defined by this `sl_customization.m` file.

```
function sl_customization(cm)
 cm.addCustomMenuFcn('Simulink:ToolsMenu', @toolsMenu);
end

%% Tool Menu customization
```

```
function schemas = toolsMenu()
 schemas = {
 @toolsMenu1, ...
 @toolsMenu2, ...
 @toolsMenu3
 };
end

function schema = toolsMenu1(cbinfo)
 schema = sl_action_schema;
 schema.tag = 'toolsMenu1';
 schema.label = 'Tools Menu 1';
 schema.callback = @toolsMenu1CB;
end

function schema = toolsMenu2(cbinfo)
 schema = sl_action_schema;
 schema.tag = 'toolsMenu2';
 schema.label = 'Tools Menu 2';
 schema.callback = @toolsMenu2CB;
end

function schema = toolsMenu3(cbinfo)
 schema = sl_container_schema;
 schema.tag = 'toolsMenu3';
 schema.label = 'Tools Menu 3';
 schema.childrenFcns = {
 @toolsMenu31, ...
 @toolsMenu32
 };
end

function schema = toolsMenu31(cbinfo)
 schema = sl_action_schema;
 schema.tag = 'toolsMenu31';
 schema.label = 'Tools Menu 31';
 schema.callback = @toolsMenu31CB;
end

function schema = toolsMenu32(cbinfo)
 schema = sl_action_schema;
 schema.tag = 'toolsMenu32';
 schema.label = 'Tools Menu 32';
 schema.callback = @toolsMenu32CB;
end

function toolsMenu1CB(cbinfo)
 disp('Executing toolsMenu1');
end

function toolsMenu2CB(cbinfo)
 disp('Executing toolsMenu2');
end

function toolsMenu31CB(cbinfo)
 disp('Executing toolsMenu31');
end
```

```
function toolsMenu32CB(cbinfo)
 disp('Executing toolsMenu32');
end
```

To see the toolbar menu, open Simulink.

If this menu is converted in its current state, the conversion of its callback functions will fail because they are saved in the `sl_customization.m` file. To enable the conversion of the callback functions for Tools Menu 2 and Tools Menu 3, save them in separate function files: `toolsMenu2CB.m`, `toolsMenu31CB.m`, and `toolsMenu32CB.m`.

For comparison, leave the callback function for Tools Menu 1 in the `sl_customization.m` file.

Convert the toolbar menu into a toolstrip tab. In the Command Window, enter this:

```
slConvertCustomMenus;
```

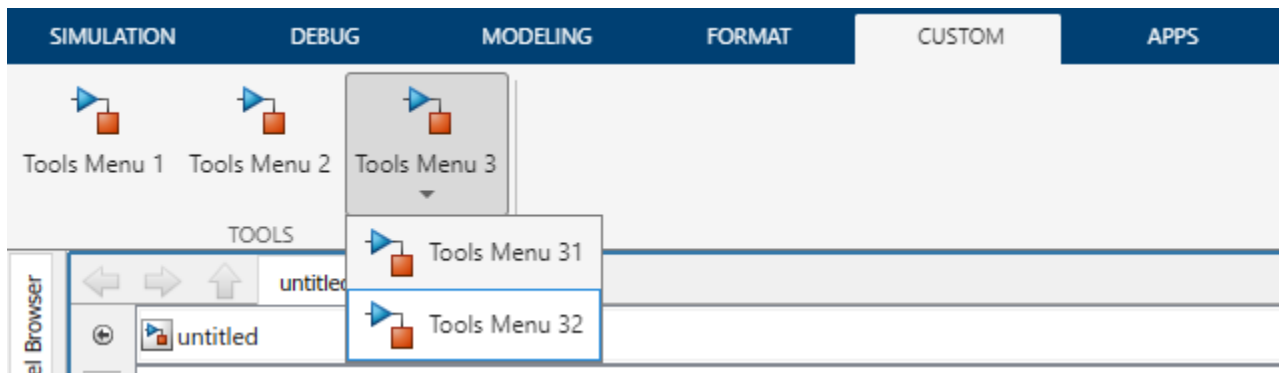

Delete the custom toolbar menu by commenting out the `addCustomMenuFcn` call in the `sl_customization.m` file, and then saving the file.

```
function sl_customization(cm)
 %cm.addCustomMenuFcn('Simulink:ToolsMenu', @toolsMenu);
end
```

To see the results of the menu conversion, open a blank model in Simulink.

Rebuild the toolstrip by entering the `sl_refresh_customizations` command in the Command Window.

Open and view the **Custom** tab.

The tab has a single section titled **Tools** because that is the title of the top level of the toolbar menu from which the tab was created.

The action schemas `Tools Menu 1` and `Tools Menu 2` from the toolbar menu are converted into push buttons of the same names in the tab.

The container schema `Tools Menu 3` in the toolbar menu has a pop-up list, and is converted into a drop-down button.

Click on the `Tools Menu 1` push button. The diagnostic viewer shows an error message, stating that the callback of the `Tools Menu 1` action schema failed to convert. This is because the callback function of that schema is saved in the `sl_customization.m` file.

Click on the `Tools Menu 2`, `Tools Menu 31`, and `Tools Menu 32` buttons. The callbacks execute without error because the callback functions for these buttons are saved in separate function files.

## Input Arguments

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose `Name` in quotes.*

Example: `slConvertCustomMenus(CompName="Name",CompFolder="Folder")`

#### **CompName** — Name of toolstrip component

"custom" (default) | string | character vector

Name of toolstrip component, specified as a string or character vector.

Data Types: char | string

#### **CompFolder** — File path of toolstrip component

pwd (default) | string | character vector

File path of toolstrip component, specified as a string or character vector.

Data Types: char | string

## Replace — Permission to overwrite

true or 1 | false or 0

Permission to overwrite an existing toolbar component of the same name and at the same location as the one that the conversion creates, specified as a numeric or logical 1 (**true**) or 0 (**false**).

Data Types: `logical`

## Limitations

- When converting a custom toolbar menu into a toolbar tab, any functionality that custom tabs do not support is ignored. However, you can edit the generated tab. For more information, see “Create Custom Simulink Toolbar Tabs”.
- If a toolbar component with the name specified by `CompName` already exists in the `CompFolder` location at the time of conversion, a prompt will appear in the Command Window asking you for permission to overwrite the component. If a component of another name already exists in the `CompFolder` location, the menu cannot be converted.
- The conversion of a schema callback fails if its function handle points to a function local to the `sl_customization.m` file. Move all callback functions into separate function files.

## Tips

To delete custom tab elements that are the result of a conversion, you can do one of the following:

- Call `slDestroyToolbarComponent`.
- Delete the resources folder located at `CompFolder` and call `slReloadToolbarConfig`.
- Delete the JSON files of the tab in the resources folder located at `CompFolder` and call `slReloadToolbarConfig`.

## Version History

Introduced in R2022a

# slCreateToolstripComponent

Create custom Simulink Toolstrip component

## Syntax

```
slCreateToolstripComponent(component)
slCreateToolstripComponent(component,Name=Value)
```

## Description

`slCreateToolstripComponent(component)` creates a `resources` folder for a custom Simulink Toolstrip component in the current folder and adds the current folder to the MATLAB path.

`slCreateToolstripComponent(component,Name=Value)` sets properties using name-value arguments. For example, `slCreateToolstripComponent("custom",Location="B:\path\customtab")` creates the `resources` folder for a component named `custom` in the `B:\path\customtab` directory and adds `B:\path\customtab` to the MATLAB path.

## Examples

### Create Simulink Toolstrip Component

A Simulink Toolstrip component contains the definition for one or more custom tabs. Before you create a custom tab, you must create the component that will contain it.

To work with the Simulink Toolstrip, start Simulink. For example, in the MATLAB Command Window, enter:

```
start_simulink
```

Create a custom Simulink Toolstrip component by using the `slCreateToolstripComponent` function. For example, name the component `custom`.

```
slCreateToolstripComponent("custom");
```

This command creates a `resources` folder in your current folder and adds your current folder to the MATLAB path. The `resources` folder contains two folders and one JSON file.

- `icons` folder — Location of icons used by custom tab elements
- `json` folder — Location of JSON files that define custom tabs
- `sl_toolstrip_plugins.json` — JSON file that must not be edited

### Create Temporary Simulink Toolstrip Component

By default, Simulink Toolstrip components persist across sessions. You can create a temporary Simulink Toolstrip component that persists only during the current session.

Create a temporary custom Simulink Toolstrip component by using the `slCreateToolstripComponent` function. For example, name the component `temp`.

```
slCreateToolstripComponent("temp",Persist=false);
```

This command creates a `resources` folder in your current folder and adds your current folder to the MATLAB path. The `resources` folder contains two folders and one JSON file.

- `icons` folder — Location of icons used by custom tab elements
- `json` folder — Location of JSON files that define custom tabs
- `sl_toolstrip_plugins.json` — JSON file that must not be edited

When you open a new MATLAB session, the `temp` component is not loaded.

## Input Arguments

### **component** — Component name

character vector | string scalar

Component name, specified as a character vector or string scalar.

The component name appears in the `sl_toolstrip_plugins.json` file as the value for the `Name` property. Do not edit this file.

Example: `slCreateToolstripComponent("custom")`

Data Types: `char` | `string`

### **Name-Value Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Example: `slCreateToolstripComponent("custom",Location="B:\path\customtab",Persist=false)`

### **Location** — Storage location for component files

current folder (default) | character vector | string scalar

Storage location for component files, specified as a character vector or string scalar. The function adds the storage location to the MATLAB path.

By default, the function generates the component files in a `resources` folder in the current folder.

Example: `slCreateToolstripComponent("custom",Location="B:\path\customtab")`

Data Types: `char` | `string`

### **Persist** — Option to load component for new MATLAB sessions

true or 1 (default) | false or 0

Option to load component for new MATLAB sessions, specified as a numeric or logical 1 (`true`) or 0 (`false`).

Example: `slCreateToolstripComponent("custom",Persist=false)`

Data Types: double | logical

“Create Custom Simulink Toolstrip Tabs”  
“Add Prepopulated Custom Tab to Simulink Toolstrip”

# slCreateToolstripTab

Create custom tab for Simulink Toolstrip

## Syntax

```
slCreateToolstripTab(tab,component)
slCreateToolstripTab(tab,component,Name=Value)
```

## Description

`slCreateToolstripTab(tab,component)` creates a blank custom tab in the specified Simulink Toolstrip component, opens the JSON file that defines the custom tab, and reloads the toolstrip configuration.

`slCreateToolstripTab(tab,component,Name=Value)` sets properties using name-value arguments. For example, `slCreateToolstripTab('toolsTab','custom',Title="Tools")` creates a **Tools** tab.

## Examples

### Create Untitled Custom Tab in Simulink Toolstrip

A Simulink Toolstrip component contains the definition for one or more custom tabs. Before you create a custom tab, you must create the component to contain it.

To work with the Simulink Toolstrip, start Simulink. For example, in the MATLAB Command Window, enter:

```
start_simulink
```

Create a custom Simulink Toolstrip component by using the `slCreateToolstripComponent` function. For example, name the component `custom`.

```
slCreateToolstripComponent("custom");
```

This command creates a `resources` folder in your current folder and adds your current folder to the MATLAB path. The `resources` folder contains two folders and one JSON file.

- `icons` folder — Location of icons used by custom tab elements
- `json` folder — Location of JSON files that define custom tabs
- `sl_toolstrip_plugins.json` — JSON file that must not be edited

Create an untitled custom tab with the `slCreateToolstripTab` function.

For example, create the tab `customTab` in the `custom` component.

```
slCreateToolstripTab("customTab","custom");
```

The function creates a JSON file in the `json` folder that contains information about the tab. For example:

```
{
 "version": "1.0",
 "entries": [
 {
 "type": "Tab",
 "id": "customTab",
 "title": ""
 }
]
}
```

Open a model. For example, open the vdp model.

```
vdp
```

The Simulink Toolstrip displays a blank tab without a title.

### Create Titled Custom Tab in Simulink Toolstrip

A Simulink Toolstrip component contains the definition for one or more custom tabs. Before you create a custom tab, you must create the component to contain it.

To work with the Simulink Toolstrip, start Simulink. For example, in the MATLAB Command Window, enter:

```
start_simulink
```

Create a custom Simulink Toolstrip component by using the `slCreateToolstripComponent` function. For example, name the component `custom`.

```
slCreateToolstripComponent("custom");
```

This command creates a `resources` folder in your current folder and adds your current folder to the MATLAB path. The `resources` folder contains two folders and one JSON file.

- `icons` folder — Location of icons used by custom tab elements
- `json` folder — Location of JSON files that define custom tabs
- `sl_toolstrip_plugins.json` — JSON file that must not be edited

Create a custom tab with the `slCreateToolstripTab` function.

For example, create the tab `customTab` in the `custom` component, and title the tab `CUSTOM TAB`.

```
slCreateToolstripTab("customTab","custom",Title="CUSTOM TAB");
```

The function creates a JSON file named `customTab.json` in the `json` folder that defines the tab.

Open a model. For example, open the vdp model.

vdp

The Simulink Toolstrip displays a blank tab titled CUSTOM TAB.

## Input Arguments

### **tab** — Tab ID

character vector | string scalar

Tab ID, specified as a character vector or string scalar.

The tab ID appears in the JSON file that defines the tab as the value for the `id` property in the JSON object where `"type": "Tab"`.

Data Types: `char` | `string`

### **component** — Component name

character vector | string scalar

Component name, specified as a character vector or string scalar.

The component name appears in the `sl_toolstrip_plugins.json` file as the value for the `Name` property. Do not edit this file.

Data Types: `char` | `string`

## Name-Value Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Example: `slCreateToolstripTab('customTab','custom',Title="Custom Tab")`

### **Title** — Tab title

"" (default) | character vector | string scalar

Tab title, specified as a character vector or string scalar.

Tab titles use all uppercase letters even when you specify a title with lowercase letters.

The tab title appears in the JSON file that defines the tab as the value for the `title` property of the JSON object where `"type": "Tab"`.

Data Types: `char` | `string`

**FileName — Name of file that defines tab**

`<tabname>.json` (default) | character vector | string scalar

Name of file that defines the tab, specified as a character vector or string scalar.

Data Types: `char` | `string`

# sldebug

Start simulation in debug mode

## Syntax

```
sldebug('sys')
```

## Description

`sldebug('sys')` starts a simulation in debug mode. See “Simulink Debugger Programmatic Interface” for information about using the debugger.

## Examples

The following command:

```
sldebug('vdp')
```

loads the Simulink example model `vdp` into memory and starts the simulation in debug mode. Alternatively, you can achieve the same result by using the `sim` command:

```
sim('vdp', 'debug', 'on')
```

## Version History

**Introduced in R2006a**

## See Also

`sim`

# slDestroyToolstripComponent

Destroy Simulink Toolstrip component

## Syntax

```
slDestroyToolstripComponent(component)
slDestroyToolstripComponent(component,RemoveFromPath)
```

## Description

`slDestroyToolstripComponent(component)` destroys the specified Simulink Toolstrip component, removes the component directory from the MATLAB path, and deletes the resource subdirectory that the component directory contains.

`slDestroyToolstripComponent(component,RemoveFromPath)` destroys the specified Simulink Toolstrip component and deletes the resource subdirectory that the component directory contains. When `RemoveFromPath` is set to `true`, the command also removes the component directory from the MATLAB path. When `RemoveFromPath` is set to `false`, the command does not remove the component directory from the MATLAB path.

## Examples

### Delete Custom Simulink Toolstrip Component

Suppose you have a Simulink Toolstrip component that you no longer need named `custom`.

Delete the component named `custom`. In the MATLAB Command Window, enter:

```
slDestroyToolstripComponent("custom")
```

## Input Arguments

### **component** — Component name

character vector | string scalar

Component name, specified as a character vector or string scalar.

The component name appears in the `sl_toolstrip_plugins.json` file as the value for the "Name" property. Do not edit this file.

Example: `slDestroyToolstripComponent("custom")`

Data Types: `char` | `string`

### **RemoveFromPath** — Option to remove component resource directory from path

`true` or `1` (default) | `false` or `0`

Option to remove component resource directory from path, specified as a numeric or logical 1 (`true`) or 0 (`false`).

Example: `slDestroyToolstripComponent("custom",RemoveFromPath=false)`

Data Types: `logical`

## **Version History**

**Introduced in R2021b**

## sldiagnostics

Display diagnostic information about Simulink system

### Syntax

```
sldiagnostics('sys')
[txtRpt, sRpt] = sldiagnostics('sys')
[txtRpt, sRpt] = sldiagnostics('sys', options)
[txtRpt, sRpt] = sldiagnostics('sys', 'CompileStats')
[txtRpt, sRpt] = sldiagnostics('sys', 'RTWBuildStats')
```

### Description

`sldiagnostics('sys')` displays the following diagnostic information associated with the model or subsystem specified by `sys`:

- Number of each type of block
- Number of each type of Stateflow object
- Number of states, outputs, inputs, and sample times of the root model.
- Names of libraries referenced and instances of the referenced blocks
- Time and additional memory used for each compilation phase of the root model

If the model specified by `sys` is not loaded, then `sldiagnostics` loads the model before performing the analysis.

The command `sldiagnostics('sys', options)` displays only the diagnostic information associated with the specific operations listed as `options` character vectors. The table below summarizes the options available and their corresponding valid input and output.

With `sldiagnostics`, you can input the name of a model or the path to a subsystem. For some analysis options, `sldiagnostics` can analyze only a root model. If you provide an incompatible input for one of these analyses, then `sldiagnostics` issues a warning. Finally, if you input a Simulink Library, then `sldiagnostics` cannot perform options that require a model compilation (**Update Diagram**). Instead, `sldiagnostics` issues a warning.

During the analysis, `sldiagnostics` will follow library links but will not follow or analyze Model References. See `find_mdhrefs` for more information on finding all Model blocks and referenced models in a specified model.

| Option      | Valid Inputs                      | Output                                                                                                                                                   |
|-------------|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| CountBlocks | root model, library, or subsystem | Lists all unique blocks in the system and the number of occurrences of each. This includes blocks that are nested in masked subsystems or hidden blocks. |
| CountSF     | root model, library, or subsystem | Lists all unique Stateflow objects in the system and the number of occurrences of each.                                                                  |

| Option        | Valid Inputs                      | Output                                                                                                                                                                                                                                                                                                                                                      |
|---------------|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sizes         | root model                        | Lists the number of states, outputs, inputs, and sample times, as well as a flag indicating direct feedthrough, used in the root model.                                                                                                                                                                                                                     |
| Libs          | root model, library, or subsystem | Lists all unique libraries referenced in the root model, as well as the names and numbers of the library blocks.                                                                                                                                                                                                                                            |
| CompileStats  | root model                        | Lists the time and additional memory used for each compilation phase of the root model. This information helps users troubleshoot model compilation speed and memory issues.                                                                                                                                                                                |
| RTWBuildStats | root model                        | Lists the same information as the <code>CompileStats</code> diagnostic. When issued with the second output argument <code>sRpt</code> , it captures the same statistics included in <code>CompileStats</code> and also the Simulink Coder build statistics.<br><br>You must explicitly specify this option, because it is not part of the default analysis. |
| All           | not applicable                    | Performs all diagnostics.                                                                                                                                                                                                                                                                                                                                   |

**Note** Running the `CompileStats` diagnostic before simulating a model for the first time will show greater memory usage. However, subsequent runs of the `CompileStats` diagnostic on the model will require less memory usage.

`[txtRpt, sRpt] = sldiagnostics('sys')` returns the diagnostic information as a textual report `txtRpt` and a structure array `sRpt`, which contains the following fields that correspond to the diagnostic options:

- `blocks`
- `stateflow`
- `sizes`
- `links`
- `compilestats`

`[txtRpt, sRpt] = sldiagnostics('sys', options)` returns only the specified options. If your chosen options specify just one type of analysis, then `sRpt` contains the results of only that analysis.

`[txtRpt, sRpt] = sldiagnostics('sys', 'CompileStats')` returns information on time and memory usage in `txtRpt` and `sRpt`.

`[txtRpt, sRpt] = sldiagnostics('sys', 'RTWBuildStats')` includes Simulink Coder build statistics in addition to the information reported for `CompileStats` in the `sRpt` output.

- `txtRpt` contains the formatted textual output of time spent in each of the phases in Simulink and Simulink Coder (if you specified `RTWBuildStats`), for example:

```

Compile Statistics For: rtdemo_counter
 Cstat1: 0.00 seconds Model compilation pre-start
 Cstat2: 0.00 seconds Stateflow compile pre-start notification
 Cstat3: 0.10 seconds Post pre-comp-start engine event
 Cstat4: 10.10 seconds Stateflow compile start notification
 Cstat5: 0.00 seconds Model compilation startup completed

```

- `sRpt` is a MATLAB structure containing time and memory usage for each of the phases, for example:

```

sRpt =
Model: 'myModel1'
Statistics: [1x134 struct]

```

The size of the `sRpt.Statistics` array indicates the number of compile and build phases executed during the operation. Examine the Statistics fields:

```

sRpt.Statistics(1) =
Description: 'Phase1'
CPUTime: 7.2490
WallClockTime 4.0092
ProcessMemUsage: 26.2148
ProcessMemUsagePeak: 28.6680
ProcessVMSize: 15.9531

```

`CPUTime` and `WallClockTime` show the elapsed time for the phase in seconds. `ProcessMemUsage`, `ProcessMemUsagePeak` and `ProcessVMSize` show the memory consumption during execution of the phase in MB.

Examine these key metrics to understand the performance:

- `WallClockTime`—The real-time elapsed in each phase in seconds. Sum the `WallClockTime` in each phase to get the total time taken to perform the operation:

```
ElapsedTime = sum([statRpt.Statistics(:).WallClockTime]);
```

- `ProcessMemUsage`—The amount of memory consumed in each phase. Sum the `ProcessMemUsage` across all the phases to get the memory consumption during the entire operation:

```
TotalMemory = sum([statRpt.Statistics(:).ProcessMemUsage]);
```

- `ProcessMemUsagePeak`—The maximum amount of allocated memory in each phase. Get the maximum of this metric across all the phases to find the peak memory allocation during the operation:

```
PeakMemory = max([statRpt.Statistics(:).ProcessMemUsagePeak]);
```

---

**Note** Memory statistics are available only on the Microsoft Windows platform.

---

## Examples

The following command counts and lists each type of block used in the `sldemo_bounce` model that comes with Simulink software.

```

openExample('simulink_general/sldemo_bounceExample')
sldiagnostics('sldemo_bounce', 'CountBlocks')

```

The following command counts and lists both the unique blocks and Stateflow objects used in the `sf_boiler` model that comes with Stateflow software; the textual report returned is captured as `myReport`.

```
openExample('stateflow/BangBangControlUsingTemporalLogicExample')
myReport = sldiagnostics('sf_boiler', 'CountBlocks', 'CountSF')
```

The following commands open the `f14` model that comes with Simulink software, and counts the number of blocks used in the `Controller` subsystem.

```
openExample('simulink_aerospace/AircraftLongitudinalFlightControlExample')
sldiagnostics('f14/Controller', 'CountBlocks')
```

The following command runs the `Sizes` and `CompileStats` diagnostics on the `f14` model, capturing the results as both a textual report and structure array.

```
[txtRpt, sRpt] = sldiagnostics('f14', 'Sizes', 'CompileStats')
```

## Version History

Introduced in R2006a

### See Also

## sldiagviewer.createStage

Create a stage to display diagnostic messages

### Syntax

```
myStage = sldiagviewer.createStage(StageName)
myStage = sldiagviewer.createStage(__, 'modelName', Value)
```

### Description

`myStage = sldiagviewer.createStage(StageName)` creates a stage with the given stage name in the model specified. In the Diagnostic Viewer, errors, warnings, and information messages are displayed in groups based on the operation, such as model load, simulation, and build. These groups are called stages. When you create a stage object, Simulink initializes the stage. When you close the stage object, Simulink ends the stage. If you delete a parent stage object, the corresponding parent and its child stage close in the Diagnostic Viewer.

`myStage = sldiagviewer.createStage(__, 'modelName', Value)` is a required name-value pair that specifies the model in which the diagnostics is run.

### Examples

#### Create Stage and Display Diagnostic Messages

Use the `createStage` function to create a stage to display diagnostic messages in the Diagnostic Viewer.

```
% Create a Stage to display all the messages
```

```
myStage = sldiagviewer.createStage('Analysis', 'modelName', 'vdp');
```

```
myStage =
 Stage with no properties.
```

### Input Arguments

#### StageName — Name of stage

character vector

Name of the stage, specified as a character vector.

Example: 'Analysis'

Data Types: `string`

#### Value — Name of model

character vector

Name of model, specified as a comma-separated pair consisting of 'ModelName' and a character vector or string.

Example: 'vdp'

## Output Arguments

**myStage** — Handle to created stage

stage object

Handle to the created stage, returned as a stage object.

## Version History

Introduced in R2014a

## sldiagviewer.diary

Log simulation warnings and errors and build information to file

### Syntax

```
sldiagviewer.diary
sldiagviewer.diary(filename)
sldiagviewer.diary(toggle)
sldiagviewer.diary(filename, 'UTF-8')
```

### Description

`sldiagviewer.diary` intercepts build information, warnings, and errors transmitted to the Diagnostic Viewer and logs them to a text file `diary.txt` in the current folder.

`sldiagviewer.diary(filename)` toggles the logging state of the text file specified by `filename`.

`sldiagviewer.diary(toggle)` turns logging to the log file on or off. The setting applies to the last file name you specified for logging or to `diary.txt` if you did not specify a file name.

`sldiagviewer.diary(filename, 'UTF-8')` specifies the character encoding for the log file `filename`.

### Examples

#### Log Build Information and Simulation Warnings and Errors

Start logging build information and simulation warnings and errors to `diary.txt`.

```
sldiagviewer.diary
open_system('vdp')
slbuild('vdp')
```

Open `diary.txt` to view logs.

```
Starting build procedure for model: vdp
Build procedure for model: 'vdp' aborted due to an error.
...
```

#### Log to Specific File

Set up logging to a file.

```
sldiagviewer.diary('C:\MyLogs\log1.txt')
```

## Toggle File Logging State

Switch the logging state of a file.

```
sdiagviewer.diary('C:\MyLogs\log1.txt') % Start logging
open_system('vdp')
slbuild('vdp')

sdiagviewer.diary('off') % Switch off logging

openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
open_system('sldemo_fuelsys')
slbuild('sldemo_fuelsys')

sdiagviewer.diary('on') % Resume logging
```

## Specify Log File Name and Character Encoding

Set the file name to log to and the character encoding to use.

```
sdiagviewer.diary('C:\MyLogs\log1.txt','UTF-8')
```

## Input Arguments

### toggle — Logging state

'off' | 'on'

Logging state, specified as 'on' or 'off'.

Example: `sdiagviewer.diary('on')`

### filename — Name of file to log data to

character vector

Name of file to log data to, specified as a character vector.

Example: `sdiagviewer.diary('C:\Simulations\mySimulationDiary.txt')`

## Version History

Introduced in R2014a

“Customize Diagnostic Messages”

## sldiagviewer.reportError

Report error messages in Diagnostic Viewer

### Syntax

```
output = sldiagviewer.reportError(Message)
myStage = sldiagviewer.reportError(__, 'Component', Value)
```

### Description

`output = sldiagviewer.reportError(Message)` reports the message as an error.

`myStage = sldiagviewer.reportError(__, 'Component', Value)` specifies the name of the component. For example, Stateflow or Model Advisor.

### Examples

#### Report an Error Message

Create a stage and use the `reportError` function to report an error message in the Diagnostic Viewer for the specified model.

```
vdp

% Create a stage
my_stage = sldiagviewer.createStage('StageName', 'ModelName', 'vdp');
%% write some code inside try, which will throw an error
try
 i = p;
catch error
end
sldiagviewer.reportError(error);

output =
 logical
 1
```

The diagnostic window opens up for the model vdp. It shows the StageName and the error message

## Input Arguments

### Message — Message to be displayed

MSLException object | MException object | string

This message is displayed as an error in the Diagnostic Viewer.

Example: 'This is a custom error message.'

### Value — Component name

character vector | string

The name of the component specified as the comma-separated pair consisting of 'Component' and a character vector or string.

Example: Stateflow

## Output Arguments

### output — shows the success or failure of the operation

logical

Shows whether the message was displayed successfully.

## Version History

Introduced in R2014a

## sldiagviewer.reportInfo

Report information messages in Diagnostic Viewer

### Syntax

```
output = sldiagviewer.reportInfo(Message)
myStage = sldiagviewer.reportInfo(__, 'Component' Value)
```

### Description

`output = sldiagviewer.reportInfo(Message)` reports the message as information.

`myStage = sldiagviewer.reportInfo(__, 'Component' Value)` specifies the name of the component.

### Examples

#### Report an Information Message

Create a stage and use the `reportInfo` function to report a message as information in the Diagnostic Viewer for the specified model.

```
% Create a Stage to display all the messages
my_stage = sldiagviewer.createStage('Analysis', 'ModelName', 'vdp');

% Report a custom info message to Diagnostic Viewer
sldiagviewer.reportInfo('Information message.', 'Component', 'Stateflow');

output =
 logical
 1
```

### Input Arguments

#### Message — Message to be displayed

MSLException object | MException object | string

This message is displayed in the Diagnostic Viewer as an information.

Example: 'This is a custom information message.'

#### Value — Component name

character vector | string

The name of the component specified as the comma-separated pair consisting of 'Component' and a character vector or string.

Example: Stateflow

## Output Arguments

**output** — shows the success or failure of the operation  
logical

Shows whether the message was displayed successfully.

## Version History

Introduced in R2014a

## See Also

## sldiagviewer.reportWarning

Report warning messages in Diagnostic Viewer

### Syntax

```
output = sldiagviewer.reportWarning(Message)
myStage = sldiagviewer.reportWarning(__, 'Component', Value)
```

### Description

`output = sldiagviewer.reportWarning(Message)` reports a message as warning in the diagnostic Viewer.

`myStage = sldiagviewer.reportWarning(__, 'Component', Value)` specifies the name of the component. For example, Model Advisor or Stateflow.

### Examples

#### Report a Warning in Diagnostic Viewer

Create a stage and use the `reportWarning` function to report a warning message in the Diagnostic Viewer for the specified model.

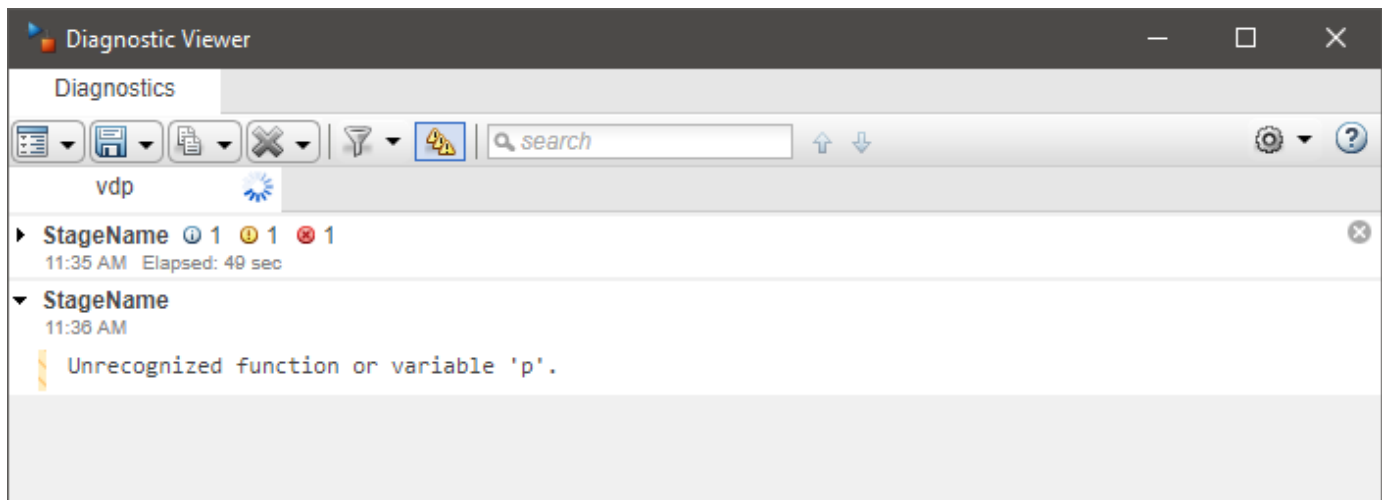

```
vdp

% Create a stage
my_stage = sldiagviewer.createStage('StageName', 'ModelName', 'vdp');
%% write some code inside try, which will throw an error
try
 i = p;
catch error
end
sldiagviewer.reportWarning(error);

output =
 logical
 1
```

The diagnostic window opens up for the model `vdp`. It shows the `StageName` and the warning message in yellow.

## Input Arguments

### Message — Message to display

MSLException object | MException object | string

This message is displayed as a warning in the Diagnostic Viewer.

Example: 'This is a custom warning message.'

### Value — Component name

character vector | string

The name of the component specified as the comma-separated pair consisting of 'Component' and a character vector or string.

Example: Stateflow

## Output Arguments

### output — shows the success or failure of the operation

logical

Shows whether the message was displayed successfully.

# sldiagviewer.reportSimulationMetadataDiagnostic S

Display errors and warnings in `Simulink.SimulationOutput` object using Diagnostic Viewer

## Syntax

```
sldiagviewer.reportSimulationMetadataDiagnostics(simOut)
```

## Description

`sldiagviewer.reportSimulationMetadataDiagnostics(simOut)` displays errors and warnings saved in the `Simulink.SimulationOutput` object `simOut` using the Diagnostic Viewer.

## Examples

### Display Errors in Diagnostic Viewer

You can use the `sldiagviewer.reportSimulationMetadataDiagnostics` function to display error and warning messages captured in a `Simulink.SimulationOutput` object using the Diagnostic Viewer.

Open the model `ex_sldemo_bounce`.

```
model = "ex_sldemo_bounce";
open_system(model)
```

Introduce an error into the model by specifying the **Value** parameter for the block `Initial Velocity` as the undefined variable `z`.

```
set_param("ex_sldemo_bounce/Initial Velocity", "Value", "z");
```

Create a `Simulink.SimulationInput` object to configure the simulation.

```
simIn = Simulink.SimulationInput(model);
```

Simulate the model. When you specify the `StopOnError` option as `off`, errors and warnings that occur during simulation are captured in the `SimulationOutput` object and are not reported in the Command Window or script and do not interrupt the process of the script.

```
simOut = sim(simIn, "StopOnError", "off", "ShowProgress", "off");
```

```
Warning: One or more simulations completed with errors. For more information, inspect the SimulationOutput object.
[1]
```

Use the `sldiagviewer.reportSimulationMetadataDiagnostics` function to display the warning and error messages from the simulation in the Diagnostic Viewer.

```
sldiagviewer.reportSimulationMetadataDiagnostics(simOut)
```

## Input Arguments

**simOut** — Simulation output that contains errors and warnings

Simulink.SimulationOutputobject

Simulation output that contains errors and warnings, specified as a Simulink.SimulationOutput object.

## Version History

Introduced in R2020b

### See Also

Simulink.SimulationOutput

### Topics

## sldiscmdl

Discretize model that contains continuous blocks

### Syntax

```
sldiscmdl('model_name',sample_time)
sldiscmdl('model_name',sample_time,method)
sldiscmdl('model_name',sample_time,options)
sldiscmdl('model_name',sample_time,method,freq)
sldiscmdl('model_name',sample_time,method,options)
sldiscmdl('model_name',sample_time,method,freq,options)
[old_blks,new_blks] = sldiscmdl('model_name',sample_time,method,freq,options)
```

### Description

`sldiscmdl('model_name',sample_time)` discretizes the model named '*model\_name*' using the specified *sample\_time*. The model does not need to be open, and the units for *sample\_time* are simulation seconds.

`sldiscmdl('model_name',sample_time,method)` discretizes the model using *sample\_time* and the transform method specified by *method*.

`sldiscmdl('model_name',sample_time,options)` discretizes the model using *sample\_time* and criteria specified by the *options* cell array. This array consists of four elements: {*target*, *replace\_with*, *put\_into*, *prompt*}.

`sldiscmdl('model_name',sample_time,method,freq)` discretizes the model using *sample\_time*, *method*, and the critical frequency specified by *freq*. The units for *freq* are Hz. When you specify *freq*, *method* must be 'prewarp'.

`sldiscmdl('model_name',sample_time,method,options)` discretizes the model using *sample\_time*, *method*, and *options*.

`sldiscmdl('model_name',sample_time,method,freq,options)` discretizes the model using *sample\_time*, *method*, *freq*, and *options*. When you specify *freq*, *method* must be 'prewarp'.

`[old_blks,new_blks] = sldiscmdl('model_name',sample_time,method,freq,options)` discretizes the model using *sample\_time*, *method*, *freq*, and *options*. When you specify *freq*, *method* must be 'prewarp'. The function also returns two cell arrays that contain full path names of the original, continuous blocks and the new, discretized blocks.

### Input Arguments

#### **model\_name**

Name of the model to discretize.

#### **sample\_time**

Sample-time specification for the model:

|                    |                                                  |
|--------------------|--------------------------------------------------|
| Scalar value       | Sample time with zero offset, such as 1          |
| Two-element vector | Sample time with nonzero offset, such as [1 0.1] |

### method

Method of converting blocks from continuous to discrete mode:

|                 |                                                |
|-----------------|------------------------------------------------|
| 'zoh' (default) | Zero-order hold on the inputs                  |
| 'foh'           | First-order hold on the inputs                 |
| 'tustin'        | Bilinear (Tustin) approximation                |
| 'prewarp'       | Tustin approximation with frequency prewarping |
| 'matched'       | Matched pole-zero method                       |

For single-input, single-output (SISO) systems only

### freq

Critical frequency in Hz. This input applies only when the *method* input is 'prewarp'.

### options

Cell array {*target*, *replace\_with*, *put\_into*, *prompt*}, where each element can take the following values:

|                     |                       |                                                                                              |
|---------------------|-----------------------|----------------------------------------------------------------------------------------------|
| <i>target</i>       | 'all' (default)       | Discretize all continuous blocks                                                             |
|                     | 'selected'            | Discretize only selected blocks in the model                                                 |
|                     | 'full_blk_path'       | Discretize specified block                                                                   |
| <i>replace_with</i> | 'parammask' (default) | Create discrete blocks whose parameters derive from the corresponding continuous blocks      |
|                     | 'hardcoded'           | Create discrete blocks with hard-coded parameters placed directly into each block dialog box |
| <i>put_into</i>     | 'copy' (default)      | Create discretization in a copy of the original model                                        |
|                     | 'variant'             | Create discretization candidate in a variant subsystem                                       |
|                     | 'current'             | Apply discretization to the current model                                                    |
|                     | 'untitled'            | Create discretization in a new untitled window                                               |
| <i>prompt</i>       | 'on' (default)        | Show discretization information at the command prompt                                        |
|                     | 'off'                 | Do not show discretization information at the command prompt                                 |

## Examples

Discretize all continuous blocks in the `slexAircraftExample` model using a 1-second sample time:

```
openExample('slexAircraftExample');
sldiscmdl('slexAircraftExample',1);
```

Discretize the `Aircraft Dynamics Model` subsystem in the `slexAircraftExample` model using a 1-second sample time, a 0.1-second offset, and a first-order hold transform method:

```
sldiscmdl('slexAircraftExample',[1 0.1],'foh',...
{'slexAircraftExample/Aircraft Dynamics Model',...
'parammask','copy','on'});
```

Discretize the `Aircraft Dynamics Model` subsystem in the `slexAircraftExample` model and retrieve the full path name of the second discretized block:

```
[old_blks,new_blks] = sldiscmdl('slexAircraftExample',[1 0.1],...
'foh',{'slexAircraftExample/Aircraft Dynamics Model','parammask',...
'copy','on'});
% Get full path name of the second discretized block
new_blks{2}
```

Discretize all continuous blocks in the `slexAircraftExample` model using a 1-second sample time:

```
openExample('slexAircraftExample');
[old_blk,new_blk] = sldiscmdl('f14',1,'zoh',...
{'f14/Aircraft Dynamics Model',...
'parammask','variant','on'})
```

--discretizing 'f14/Aircraft Dynamics Model' and putting results into a variant subsystem

```
old_blk =
 1x1 cell array
 {'f14/Aircraft Dynamics Model'}
new_blk =
 1x1 cell array
 {'f14/Aircraft↵Dynamics↵Model'}
```

## Version History

# slEditToolstripAction

Open file that defines custom Simulink Toolstrip action

## Syntax

```
slEditToolstripAction(action)
```

## Description

`slEditToolstripAction(action)` opens the file that defines the specified custom toolstrip action.

## Examples

### Edit Custom Toolstrip Action

Suppose you have many JSON files that define actions for a custom tab in a toolstrip component named `custom`.

To open the file that defines a custom action, such as `myAction`, use the `slEditToolstripAction` function.

```
slEditToolstripAction("custom:myAction")
```

## Input Arguments

### action — Fully qualified action name

character vector | string scalar

Fully qualified action name, specified as a character vector or string scalar. The fully qualified name is the name of the toolstrip component followed by a colon and the full path to the action within the toolstrip component.

When an action is defined at the top level of a toolstrip component, the fully qualified action name consists of these parts:

- 1 Name of the toolstrip component followed by a colon
- 2 Action ID

When an action is defined in the JSON object for a control, the action does not use an action ID. The fully qualified action name consists of these parts:

- 1 Name of the toolstrip component followed by a colon
- 2 Tab ID followed by a forward slash
- 3 Section ID or index followed by a forward slash
- 4 Column ID or index followed by a forward slash

**5** Control ID or index

Example: `slEditToolstripAction("custom:myAction")` opens the file that defines `myAction` for the custom toolstrip component.

Example: `slEditToolstripAction("custom:customTab/2/1/3")` opens the file that defines the action for the third control in the first column of the second section on the tab named `customTab` in the custom toolstrip component.

Data Types: `char` | `string`

## Version History

**Introduced in R2021b**

### See Also

# slEditToolstripCommand

Open file that defines custom Simulink Toolstrip command

## Syntax

```
slEditToolstripCommand(action)
```

## Description

`slEditToolstripCommand(action)` opens the file that defines the custom Simulink Toolstrip command.

For scripts, the file that defines the action also defines the command. When you set `commandType` to `Script`, the `command` property directly specifies the script. When you set the `command` property to the name of a script on the MATLAB path, the function opens the JSON file, not the referenced MATLAB script.

## Examples

### Edit Custom Toolstrip Command

Suppose you have many files that define commands for a custom tab in a toolstrip component named `custom`.

To open the file that defines a command for an action, such as `myAction`, use the `slEditToolstripCommand` function.

```
slEditToolstripCommand("custom:myAction");
```

## Input Arguments

### **action** — Fully qualified action name

character vector | string scalar

Fully qualified action name, specified as a character vector or string scalar. The fully qualified name is the name of the toolstrip component followed by a colon and the full path to the action within the toolstrip component.

When an action is defined at the top level of a toolstrip component, the fully qualified action name consists of these parts:

- 1 Name of the toolstrip component followed by a colon
- 2 Action ID

When an action is defined in the JSON object for a control, the action does not use an action ID. The fully qualified action name consists of these parts:

- 1 Name of the toolstrip component followed by a colon

- 2** Tab ID followed by a forward slash
- 3** Section ID or index followed by a forward slash
- 4** Column ID or index followed by a forward slash
- 5** Control ID or index

Example: `slEditToolstripCommand("custom:myAction")` opens the file that defines `myAction` for the custom toolstrip component.

Example: `slEditToolstripCommand("custom:customTab/2/1/3")` opens the file that defines the command for the third control in the first column of the second section on the tab named `customTab` in the custom toolstrip component.

Data Types: `char` | `string`

## **Version History**

# slEditToolstripIcon

Open file that defines custom Simulink Toolstrip icon

## Syntax

```
slEditToolstripIcon(icon)
```

## Description

slEditToolstripIcon(icon) opens the file that defines the specified custom toolstrip icon.

## Examples

### Edit Custom Toolstrip Icon

Suppose you have many JSON files that define icons for a custom tab in a toolstrip component named `custom`.

To open the file that defines a custom icon, such as `myIcon`, use the `slEditToolstripIcon` function.

```
slEditToolstripIcon("custom:myIcon");
```

## Input Arguments

### icon — Fully qualified icon name

character vector | string scalar

Fully qualified icon name, specified as a character vector or string scalar. The fully qualified name is the name of the toolstrip component followed by a colon and the full path to the icon within the toolstrip component.

When an icon is defined at the top level of a toolstrip component, the fully qualified icon name consists of these parts:

- 1 Name of the toolstrip component followed by a colon
- 2 Icon ID

When an icon is defined in the JSON object for a top-level action, the fully qualified icon name consists of these parts:

- 1 Name of the toolstrip component followed by a colon
- 2 Action ID

When an icon is defined in the JSON object for a nested action, the fully qualified icon name consists of these parts:

- 1 Name of the toolstrip component followed by a colon

- 2** Tab ID followed by a forward slash
- 3** Section ID or index followed by a forward slash
- 4** Column ID or index followed by a forward slash
- 5** Control ID or index

Example: `slEditToolstripIcon("custom:myIcon")` opens the file that defines `myIcon` for the `custom` toolstrip component.

Example: `slEditToolstripIcon("custom:customTab/2/1/3")` opens the file that defines the icon for the third control in the first column of the second section on the tab named `customTab` in the `custom` toolstrip component.

Data Types: `char` | `string`

“Add Prepopulated Custom Tab to Simulink Toolstrip”

# sLEditToolstripWidget

Open file that defines custom Simulink Toolstrip tab, section, column, or control

## Syntax

```
sLEditToolstripWidget(widget)
```

## Description

`sLEditToolstripWidget(widget)` opens the file that defines the specified custom toolstrip widget, which can be a custom tab, section, column, or control.

## Examples

### Edit Custom Toolstrip Widget

Suppose you have multiple JSON files that define custom tabs in a toolstrip component named `custom`.

To open the file that defines a custom tab named `customTab`, use the `sLEditToolstripWidget` function.

```
sLEditToolstripWidget("custom:customTab")
```

## Input Arguments

### **widget** — Fully qualified widget name

character vector | string scalar

Fully qualified widget name, specified as a character vector or string scalar. The fully qualified name is the name of the toolstrip component followed by a colon and the full path to the widget within the toolstrip component. When the widget has a parent JSON object, the fully qualified name includes the ID or index of each JSON object above the widget.

Example: `sLEditToolstripWidget("custom:customTab")` opens the file that defines the tab named `customTab` in the `custom` toolstrip component.

Example: `sLEditToolstripWidget("custom:customTab/2")` opens the file that defines the second section on the tab named `customTab` in the `custom` toolstrip component.

Example: `sLEditToolstripWidget("custom:customTab/2/1")` opens the file that defines the first column of the second section on the tab named `customTab` in the `custom` toolstrip component.

Example: `sLEditToolstripWidget("custom:customTab/2/1/3")` opens the file that defines the third control in the first column of the second section on the tab named `customTab` in the `custom` toolstrip component.

Data Types: char | string

## **Version History**

# slExportFavoriteCommands

Export favorite commands from Simulink quick access toolbar

## Syntax

```
slExportFavoriteCommands(file)
```

## Description

`slExportFavoriteCommands(file)` exports the contents of the Simulink **Favorite Commands** gallery to the specified file.

## Examples

### Export Simulink Favorite Commands

Suppose you create a set of favorite commands in the Simulink **Favorite Commands** gallery that you want to share with team members. You can export the contents of your Simulink **Favorite Commands** gallery to a file.

For example, export the gallery contents to a file named `slFavorites.mat` in the `B:\path\` directory.

In the MATLAB Command Window, enter:

```
slExportFavoriteCommands('B:\path\slFavorites.mat');
```

## Input Arguments

### file — File name or path

character vector | string scalar

File name or path, specified as a character vector or string scalar.

Example: `slExportFavoriteCommands('B:\path\slFavorites.mat')`

Data Types: `char` | `string`

## Version History

Introduced in R2021b

## See Also

`slImportFavoriteCommands` | `slResetFavoriteCommands`

## slexpr

Generate expression to use in value of parameter object

### Syntax

```
expressionOut = slexpr(expressionIn)
```

### Description

`expressionOut = slexpr(expressionIn)` converts the MATLAB-syntax expression `expressionIn` to an object, `expressionOut`, that you can use to set the `Value` property of a parameter object (such as `Simulink.Parameter`). When you use multiple parameter objects to set block parameter values, you can use the expression to model mathematical relationships between the objects. For more information, see “Set Variable Value by Using a Mathematical Expression”.

### Examples

#### Model Relationship Between Mass, Length, and Moment of Inertia of Metronome

In the base workspace, create three `Simulink.Parameter` objects that represent the mass, length, and moment of inertia of a pointlike metronome.

```
m = Simulink.Parameter;
r = Simulink.Parameter;
J = Simulink.Parameter;
```

Set the mass to 0.1 kg and the length to 1.0 m.

```
m.Value = 0.1;
r.Value = 1.0;
```

Set the value of the moment of inertia to the mass times the square of the length.

```
J.Value = slexpr('m*r^2');
```

Simulink preserves the expression,  $m*r^2$ . If you change the value of the mass or the length, Simulink recalculates the value of the moment of inertia.

### Input Arguments

#### **expressionIn** — Target expression

string | character vector

Target expression, specified as a string or character vector.

Example: "myParam + myOtherParam"

Data Types: char | string

## Output Arguments

### **expressionOut** — Simulink representation of expression

`Simulink.data.Expression` object

Simulink representation of the target expression, returned as a `Simulink.data.Expression` object. A `Simulink.data.Expression` object has no use outside the `Value` property of a parameter object.

## Version History

**Introduced in R2018a**

### **See Also**

`Simulink.Parameter`

### **Topics**

## slImportFavoriteCommands

Import favorite commands to Simulink quick access toolbar

### Syntax

```
backup = slImportFavoriteCommands(file)
backup = slImportFavoriteCommands(file,'overwrite')
```

### Description

`backup = slImportFavoriteCommands(file)` imports favorite commands and categories from the specified `file` to the Simulink **Favorite Commands** gallery. The specified `file` must be generated by exporting the contents of a Simulink **Favorite Commands** gallery using `slExportFavoriteCommands`.

`backup = slImportFavoriteCommands(file,'overwrite')` overwrites the contents of the Simulink **Favorite Commands** gallery with the contents of the specified `file`. The specified `file` must be generated by exporting the contents of a Simulink **Favorite Commands** gallery using `slExportFavoriteCommands`.

### Examples

#### Import Simulink Favorite Commands

Suppose a team member shares a file that contains favorite commands you want to use in Simulink, and you want to merge the file contents with the contents of your Simulink **Favorite Commands** gallery.

In the MATLAB Command Window, enter this command:

```
slImportFavoriteCommands('B:\path\slFavorites.mat');
```

#### Overwrite Simulink Favorite Commands

Suppose a team member shares a file that contains favorite commands you want to use in Simulink, and you want to overwrite the contents of your Simulink **Favorite Commands** gallery with the file contents.

In the MATLAB Command Window, enter this command:

```
slImportFavoriteCommands('B:\path\slFavorites.mat','overwrite');
```

### Input Arguments

**file** — File name or path  
character vector | string scalar

File name or path, specified as a character vector or string scalar.

Example: `slImportFavoriteCommands('B:\path\slFavorites.mat')`

Data Types: `char` | `string`

## Output Arguments

### **backup** — Backup of previous state

character vector

Path to backup of previous state, returned as a character vector.

To restore the previous state, you can pass the returned value as the input to the function and overwrite the current state.

## Version History

**Introduced in R2021b**

## See Also

`slExportFavoriteCommands` | `slResetFavoriteCommands`

## slIsFileChangedOnDisk

Determine whether model has changed since it was loaded

### Syntax

```
tf = slIsFileChangedOnDisk(sys)
```

### Description

`tf = slIsFileChangedOnDisk(sys)` returns whether the file that contains block diagram `sys` has changed on disk since the block diagram was loaded.

### Examples

#### Return Error When File Has Changed

To ensure that code is not generated for a model whose file has changed on disk since it was loaded, include the following in the 'entry' section of the `STF_make_rtw_hook.m` file.

```
if (slIsFileChangedOnDisk(sys))
 error('File has changed on disk since it was loaded. Aborting code generation.');
```

For more information, see “Customize Build Process with STF\_make\_rtw\_hook File” (Simulink Coder).

### Input Arguments

#### **sys** — System name

character vector | string scalar

System name, specified as a character vector or string scalar.

Data Types: `char` | `string`

### Output Arguments

#### **tf** — True or false result

1 | 0

True or false result, returned as a 1 or 0 of data type `logical`.

- 1 (`true`) — File that contains block diagram `sys` has changed on disk since the block diagram was loaded.
- 0 (`false`) — File that contains block diagram `sys` has not changed on disk since the block diagram was loaded.

## Version History

Introduced in R2007b

## **See Also**

### **Topics**

“Customize Build Process with STF\_make\_rtw\_hook File” (Simulink Coder)

“Model File Change Notification”

## sLibraryBrowser

Open, load, and close Simulink Library Browser, create and get handle of Library Browser object

### Syntax

```
sLibraryBrowser
libraryhandle = sLibraryBrowser
sLibraryBrowser('open')
sLibraryBrowser('noshow')
sLibraryBrowser('close')
```

### Description

`sLibraryBrowser` opens the Simulink Library Browser in standalone mode. For more information on standalone mode, see Library Browser in Standalone Mode.

---

#### Note

- If you want to load the Simulink block library, use `load_system simulink` instead.
  - If you want to start Simulink without opening any windows, use the faster `start_simulink` instead.
- 

`libraryhandle = sLibraryBrowser` creates the Library Browser object `LibraryBrowser.LBStandalone` and returns the object handle. When you have the object handle, you can use the object properties and functions to display, hide, size, position, and refresh the Library Browser in standalone mode. For more information, see Library Browser in Standalone Mode, `LibraryBrowser.LBStandalone`, `show`, `hide`, `getPosition`, `setPosition`, and `refresh`.

When you use `sLibraryBrowser` to get the object handle:

- If the Library Browser is open in standalone mode, the Library Browser window moves in front of all other Simulink windows.
- If the Library Browser is not open in standalone mode, the Library Browser opens in standalone mode.

---

**Note** You can also use `LibraryBrowser.LibraryBrowser2` to create and get the handle of the Library Browser object. `LibraryBrowser.LibraryBrowser2` does not open a Library Browser in standalone mode or move the Library Browser in front of other Simulink windows.

---

`sLibraryBrowser('open')` opens the Library Browser in standalone mode.

`sLibraryBrowser('noshow')` loads the Library Browser in memory without making it visible. Use this to make future calls to `sLibraryBrowser('open')` faster.

`sLibraryBrowser('close')` closes the Library Browser in standalone mode.

## Examples

### Open and Close Library Browser in Standalone Mode

```
sLibraryBrowser
sLibraryBrowser('close')
```

### Load Library Browser and Get Handle

```
libraryhandle = sLibraryBrowser('noshow')
```

## Limitations

The `sLibraryBrowser` function does not act on a docked Library Browser. To use the `sLibraryBrowser` function, open the Library Browser in standalone mode by clicking the Launch standalone library browser button .

## Version History

### Introduced in R2016a

**LibraryBrowser.LBStandalone object replaces LibraryBrowser.LibraryBrowser2 object**  
*Behavior changed in R2016b*

In previous releases, these two commands returned a `LibraryBrowser.LibraryBrowser2` object:

```
lb = sLibraryBrowser
lb = LibraryBrowser.LibraryBrowser2
```

Starting in R2016b, each command returns a `LibraryBrowser.LBStandalone` object. The functions to access Library Browser operations such as `show` and `refresh` support `LibraryBrowser.LBStandalone` objects.

“Build and Edit a Model Interactively”

## slLoadedToolstripComponents

Find loaded custom Simulink Toolstrip components

### Syntax

```
components = slLoadedToolstripComponents
```

### Description

`components = slLoadedToolstripComponents` returns the name, path, and persistence of loaded custom Simulink Toolstrip components.

### Examples

#### Remove Custom Tab by Finding Loaded Custom Simulink Toolstrip Components

Suppose you have a custom tab that you want to remove from the Simulink Toolstrip.

Find the loaded custom Simulink Toolstrip components. In the MATLAB Command Window, enter:

```
components = slLoadedToolstripComponents
```

```
components =
```

```
 1×2 struct array with fields:
```

```
 name
 path
 persisted
```

The function finds two loaded components.

Get information about the first component.

```
components(1)
```

```
ans =
```

```
 struct with fields:
```

```
 name: 'tools'
 path: 'B:\path\components\tools'
 persisted: 0
```

The function returns the name (`tools`), path (`B:\path\components\tools`), and persistence (`0`) of the component. This component does not persist across MATLAB sessions.

Get information about the second component.

```
components(2)
```

```
ans =

 struct with fields:
 name: 'custom'
 path: 'B:\path\customtab'
 persisted: 1
```

The function returns the name (`custom`), path (`B:\path\customtab`), and persistence (`1`) of the component. This component persists across MATLAB sessions.

Inspect the JSON files in the `B:\path\customtab\resources\json` folder of the second component to determine whether the second component defines the custom tab you want to remove. Also check whether the component defines custom tabs that you want to keep.

Remove the custom tab by performing one of these actions:

- Remove the parent folder of the `resources` folder from the MATLAB path.
- Stop the custom Simulink Toolstrip component from persisting across MATLAB sessions by using the `slPersistToolstripComponent` function.
- Rename the `resources` folder to prevent it from being found.
- Edit the JSON file that defines the custom tab.
- Destroy the custom Simulink Toolstrip component using the `slDestroyToolstripComponent` function.

Then, reload the toolstrip configuration.

```
slReloadToolstripConfig;
```

## Output Arguments

**components** — Name, path, and persistence of loaded components

structure array

Name, path, and persistence of loaded components, returned as a structure array.

## Version History

Introduced in R2021b

## See Also

## **slmdliscui**

Open Model Discretizer GUI

### **Syntax**

```
slmdliscui
slmdliscui('model')
```

### **Description**

`slmdliscui` opens the Model Discretizer. A model does not need to be open.

`slmdliscui('model')` opens the Model Discretizer for the model or library called '*name*'.

To use the Model Discretizer, you must have a Control System Toolbox license, version 5.2 or later.

### **Examples**

Open the Model Discretizer for the `slexAircraftExample` model:

```
openExample('slexAircraftExample');
slmdliscui('slexAircraftExample')
```

Open the Model Discretizer for the `discretizing` library:

```
slmdliscui('discretizing')
```

## **Version History**

**Introduced before R2006a**

# slPersistToolstripComponent

Specify whether custom Simulink Toolstrip component persists across MATLAB sessions

## Syntax

```
slPersistToolstripComponent(component,persistence)
```

## Description

`slPersistToolstripComponent(component,persistence)` specifies whether to add the path for the specified custom Simulink Toolstrip component to the list of paths to restore for each MATLAB session.

## Examples

### Remember Custom Simulink Toolstrip Component Across Sessions

Suppose you create a custom tab that you want to remain in the Simulink Toolstrip the next time you open Simulink.

Specify that the component persists in future MATLAB sessions. For example, specify that a component named `custom` persists across sessions. In the MATLAB Command Window, enter:

```
slPersistToolstripComponent("custom",true);
```

## Input Arguments

### **component** — Name of component to persist across sessions

character vector | string scalar

Name of component to persist across sessions, specified as a character vector or string scalar.

Data Types: `char` | `string`

### **persistence** — Option for component to persist across sessions

`true` | `false`

Option for component to persist across sessions, specified as `true` or `false`.

Data Types: `logical`

## Version History

Introduced in R2021b

# slprofreport

(Not recommended) Regenerate profiler report from data, ProfileData, saved from previous run

## Syntax

```
slprofreport(model_nameProfileData)
```

## Description

When you run a model with the profiler enabled, the simulation generates the data and saves it in the variable, `model_nameProfileData`. `slprofreport(model_nameProfileData)` generates a profiler report based on the data in `model_nameProfileData`, saved from the model run.

## Input Arguments

### ProfileData

Variable containing profiler data from a model run. The variable name consists of the model name and ProfileData, for example, `vdpProfileData`.

**Default:** None

## Examples

### Regenerate Simulink Profiler Results

Regenerate the Profiler report for model `vdp`

In the MATLAB Command Window, start the `vdp` model.

In the Simulink editor window, run `vdp` model with Simulink Profiler enabled.

Simulink stores the data to the variable `vdpProfileData`.

To review the report, in the MATLAB Command Window

```
slprofreport(vdpProfileData)
```

The Simulink Profiler Report window is displayed.

## Version History

**Introduced in R2012a**

**slprofreport is not recommended**

*Not recommended starting in R2020a*

Starting in R2020a, the `slprofreport` function is no longer recommended to load saved **Simulink Profiler** reports. The reports are saved to a MAT file and can be directly loaded into the current workspace.

For profiling reports saved before R2019b, you can use the `slprofreport` function to load the report.

# slproject.create

(Not recommended) Create blank project

---

**Note** `slproject.create` is not recommended. Use `matlab.project.createProject` instead. For more information, see “Compatibility Considerations”.

---

## Syntax

```
proj = slproject.create
proj = slproject.create(path)
proj = slproject.create(name)
```

## Description

`proj = slproject.create` creates and opens a project using the blank project template from the Simulink start page, and returns a project object. Use the project object to manipulate the currently open project at the command line. The new project is created in the default project folder. To change the default folder for new projects, on the MATLAB Home tab, click **Preferences**. In the Preferences dialog box, on the MATLAB Project pane, set the **Default folder**.

`proj = slproject.create(path)` creates the project at the location specified by `path`.

`proj = slproject.create(name)` creates the project in the default folder, with the name specified by `name`.

## Examples

### Create a Blank Project in the Default Folder

```
slproject.create
```

You can control the default folder for new projects using the project preferences.

### Create a Blank Project in a Specified Folder

```
proj = slproject.create('C:\work\myprojectname');
```

### Create a Named Blank Project in the Default Folder

```
proj = slproject.create('myprojectname');
```

## Input Arguments

**path** — Path for the new project location

character vector

Path for the new project location, specified as a character vector. If you do not specify the path, `slproject.create` creates the project in the default location. You can change the default location in the project preferences.

Example: `C:\work\projectname`

Data Types: `char`

### **name — Name for the new project**

character vector

Name for the new project, specified as a character vector.

Example: `myproject`

Data Types: `char`

## **Output Arguments**

### **proj — Project**

project object

Project, returned as a project object. Use the project object to manipulate the currently open project at the command line.

Properties of `proj` output argument.

| <b>Project Property</b> | <b>Description</b>                                                                                                                             |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                    | Project name                                                                                                                                   |
| Information             | Information about the project such as the description, source control integration, repository location, and whether it is a top-level project. |
| Dependencies            | Dependencies between project files in a MATLAB digraph object.                                                                                 |
| Shortcuts               | Shortcut files in the project.                                                                                                                 |
| ProjectPath             | Folders that the project puts on the MATLAB path.                                                                                              |
| ProjectReferences       | Folders that contain referenced projects. Contains read-only project objects for referenced projects.                                          |
| Categories              | Categories of project labels.                                                                                                                  |
| Files                   | Paths and names of project files.                                                                                                              |
| RootFolder              | Full path to project root folder.                                                                                                              |

## **Version History**

**Introduced in R2017a**

**Simulink project API is not recommended**

*Not recommended starting in R2019a*

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features will be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

You can continue to use `simulinkproject` and related functions listed in `methods(simulinkproject)`. New functions added after R2019a, such as `runChecks` and `listImpactedFiles`, do not work with `simulinkproject`. Use `currentProject` instead.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

## Topics

“Create and Reference a Project Programmatically” on page 13-495  
“Automate Project Tasks Using Scripts”

## slproject.getCurrentProject

(To be removed) Manipulate current project at command line

---

**Note** `slproject.getCurrentProject` will be removed in a future release. Use `currentProject` instead.

---

### Syntax

```
proj = slproject.getCurrentProject
```

### Description

`proj = slproject.getCurrentProject` gets the current project open in the Project Tool and returns a project object `proj` that you can use to manipulate the project programmatically. If no project is open, then you see an error.

---

**Note** `slproject.getCurrentProject` is replaced by `slproject.getCurrentProjects`.

---

### Examples

#### Get Airframe Example Project

Open the Airframe project and use `slproject.getCurrentProject` to get a project object to manipulate the project at the command line.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProject
```

```
proj =
```

```
 ProjectManager with properties:
```

```
 Name: 'Simulink Project Airframe Example'
 Categories: [1x1 slproject.Category]
 Shortcuts: [1x8 slproject.Shortcut]
 ProjectPath: [1x7 slproject.PathFolder]
 ProjectReferences: [1x0 slproject.ProjectReference]
 Files: [1x30 slproject.ProjectFile]
 RootFolder: 'C:\Work\Simulink\Projects\slexamples\airframe'
```

### Output Arguments

#### **proj** – Project

project object

Project, returned as a project object. Use the project object to manipulate the currently open project at the command line.

## **Version History**

**Introduced in R2013a**

### **See Also**

#### **Functions**

[currentProject](#) | [simulinkproject](#) | [slproject.getCurrentProjects](#) | [slproject.loadProject](#)

## slproject.getCurrentProjects

(Not recommended) List all top-level projects

---

**Note** `slproject.getCurrentProjects` is not recommended. Use `matlab.project.rootProject` instead. For more information, see “Compatibility Considerations”.

---

### Syntax

```
projects = slproject.getCurrentProjects
```

### Description

`projects = slproject.getCurrentProjects` returns a list of all open top-level projects. Currently only one or zero top-level projects can be loaded. Returns an object array of 1 or 0 `ProjectManager` objects `projects` that you can use to manipulate the project programmatically. Use `slproject.getCurrentProjects` for project automation scripts.

If you execute `slproject.getCurrentProjects` inside a project shortcut, it returns only the project that the shortcut belongs to. If the shortcut belongs to a referenced project, it returns the referenced project.

### Examples

#### Get Airframe Example Project

Open the Airframe project and use `slproject.getCurrentProjects` to get a project object to manipulate the project at the command line.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects
```

```
proj =
```

```
ProjectManager with properties:
```

```
 Name: 'Simulink Project Airframe Example'
 Categories: [1x1 slproject.Category]
 Shortcuts: [1x8 slproject.Shortcut]
 ProjectPath: [1x7 slproject.PathFolder]
 ProjectReferences: [1x0 slproject.ProjectReference]
 Files: [1x30 slproject.ProjectFile]
 RootFolder: 'C:\Work\Simulink\Projects\airframe'
```

#### Find Project Commands

Open the airframe project and create a project object.

```

sldemo_slproject_airframe
proj = slproject.getCurrentProject

proj =

## Examine Project Properties

After you get a project object, you can examine project properties.

Open the airframe project and create a project object.

```

sldemo_slproject_airframe
proj = slproject.getCurrentProjects;

```

Examine the project files.

```
files = proj.Files
```

```
files =
```

```
1x30 ProjectFile array with properties:
```

```

 Path
 Labels
 Revision
 SourceControlStatus

```

Examine the labels of the eighth file.

```
proj.Files(8).Labels
```

```
ans =

 Label with properties:

 File: 'C:\Work\airframe\data\system_model.sldd'
 Data: []
 DataType: 'none'
 Name: 'Design'
 CategoryName: 'Classification'
```

Get a particular file.

```
myfile = findFile(proj, 'models/AnalogControl.slx')
```

```
myfile =
```

```
 ProjectFile with properties:

 Path: 'C:\Temp\airframe\models\AnalogControl.slx'
 Labels: [1x1 slproject.Label]
 Revision: '2'
 SourceControlStatus: Unmodified
```

Find out what you can do with the file.

```
methods(myfile)
```

```
Methods for class slproject.ProjectFile:
```

```
addLabel
removeLabel
findLabel
```

## Output Arguments

### projects – Projects

object array of 1 or 0 ProjectManager objects

Projects, returned as an object array of 1 or 0 ProjectManager objects. Use the project object to manipulate the currently open project at the command line.

Properties of ProjectManager objects in output argument.

| Project Property  | Description                                      |
|-------------------|--------------------------------------------------|
| Name              | Project name                                     |
| Categories        | Categories of project labels                     |
| Shortcuts         | Shortcut files in project                        |
| ProjectPath       | Folders that the project puts on the MATLAB path |
| ProjectReferences | Folders that contain referenced projects         |
| Files             | Paths and names of project files                 |
| RootFolder        | Full path to project root folder                 |

## Tips

Alternatively, you can use `simulinkproject` to get a project object, but `simulinkproject` also opens and gives focus to the Project Tool. Use `simulinkproject` to open projects and explore projects interactively. Use `slproject.getCurrentProjects` for project automation scripts.

## Version History

### Introduced in R2016a

#### **Simulink project API is not recommended**

*Not recommended starting in R2019a*

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features will be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

You can continue to use `simulinkproject` and related functions listed in `methods(simulinkproject)`. New functions added after R2019a, such as `runChecks` and `listImpactedFiles`, do not work with `simulinkproject`. Use `currentProject` instead.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

## See Also

### Functions

`matlab.project.rootProject` | `simulinkproject` | `slproject.loadProject` | `slproject.getCurrentProject`

## slproject.loadProject

(Not recommended) Load project

---

**Note** `simulinkproject` is not recommended. Use `currentProject` or `openProject` instead. For more information, see “Compatibility Considerations”.

---

### Syntax

```
slproject.loadProject(projectPath);
proj = slproject.loadProject(projectPath)
```

### Description

`slproject.loadProject(projectPath)`; loads the project specified by the `.prj` file or folder `projectPath` in the Project Tool, and closes any currently open project.

`proj = slproject.loadProject(projectPath)` loads the project and returns a project object `proj` for manipulating the project. Use `slproject.loadProject` for project automation scripts.

### Examples

#### Load Project

Load a project from a folder called 'C:/projects/project1/'. Replace this path with the location of your project.

```
proj = slproject.loadProject('C:/projects/project1/')
```

#### Get Airframe Example Project

Open the Airframe project and use `slproject.getCurrentProjects` to get a project object to manipulate the project at the command line.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects
```

```
proj =
```

```
 ProjectManager with properties:
```

```
 Name: 'Simulink Project Airframe Example'
 Categories: [1x1 slproject.Category]
 Shortcuts: [1x8 slproject.Shortcut]
 ProjectPath: [1x7 slproject.PathFolder]
 ProjectReferences: [1x0 slproject.ProjectReference]
```

```
Files: [1x30 slproject.ProjectFile]
RootFolder: 'C:\Work\Simulink\Projects\airframe'
```

### Find Project Commands

Get the Airframe project.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects;
```

Find project commands.

```
methods(proj)
```

Methods for class slproject.ProjectManager:

```
addFile findCategory
addFolderIncludingChildFiles findFile
close isLoading
createCategory listModifiedFiles
export refreshSourceControl
```

```
reload
removeCategory
removeFile
```

### Examine Project Properties

After you get a project object, you can examine project properties.

Get the airframe project.

```
sldemo_slproject_airframe
proj = slproject.getCurrentProjects;
```

Examine the project files.

```
files = proj.Files
```

```
files =
```

```
1x30 ProjectFile array with properties:
```

```
Path
Labels
Revision
SourceControlStatus
```

Examine the labels of the 13th file.

```
proj.Files(13).Labels
```

```
ans =
```

Label with properties:

```
File: 'C:\Temp\airframe\models\AnalogControl.slx'
 Data: []
 DataType: 'none'
 Name: 'Design'
 CategoryName: 'Classification'
```

Get a particular file by name.

```
myfile = findFile(proj, 'models/AnalogControl.slx')
```

```
myfile =
```

ProjectFile with properties:

```
Path: 'C:\Temp\airframe\models\AnalogControl.slx'
Labels: [1x1 slproject.Label]
Revision: '2'
SourceControlStatus: Unmodified
```

Find out what you can do with the file.

```
methods(myfile)
```

Methods for class slproject.ProjectFile:

```
addLabel
removeLabel
findLabel
```

## Input Arguments

### **projectPath** — Full path to project file or folder

character vector

Full path to project .prj file or the path to the project root folder, specified as a character vector.

Example: 'C:/projects/project1/myProject.prj'

Example: 'C:/projects/project1/'

## Output Arguments

### **proj** — Project

project object

Project, returned as a project object. Use the project object to manipulate and explore the project at the command line.

Properties of proj output argument.

| Project Property | Description                  |
|------------------|------------------------------|
| Name             | Project name                 |
| Categories       | Categories of project labels |

| Project Property  | Description                                      |
|-------------------|--------------------------------------------------|
| Shortcuts         | Shortcut files in project                        |
| ProjectPath       | Folders that the project puts on the MATLAB path |
| ProjectReferences | Folders that contain referenced projects         |
| Files             | Paths and names of project files                 |
| RootFolder        | Full path to project root folder                 |

## Version History

### Introduced in R2013a

#### Simulink project API is not recommended

*Not recommended starting in R2019a*

Starting in R2019a, instead of `simulinkproject` and related functions, use the `currentProject` or `openProject` functions in MATLAB. The Simulink project API will continue to be supported, but, after R2019a, new features will be available only if you use the new MATLAB project API. There are no plans to remove the Simulink project API at this time.

You can continue to use `simulinkproject` and related functions listed in `methods(simulinkproject)`. New functions added after R2019a, such as `runChecks` and `listImpactedFiles`, do not work with `simulinkproject`. Use `currentProject` instead.

The new MATLAB project API is part of the R2019a functionality enabling you to use projects in MATLAB, with or without Simulink. You can now share projects with users who do not have Simulink.

## See Also

### Functions

`simulinkproject` | `slproject.getCurrentProjects`

### Topics

“What Are Projects?”

## sl\_refresh\_customizations

Refresh customizations in the current MATLAB session

### Syntax

```
sl_refresh_customizations
```

### Description

`sl_refresh_customizations`:

- Runs all `sl_customization.m` files on the MATLAB path and in the current folder
- Rebuilds the Simulink Toolstrip
- Rebuilds all Simulink Editor menus
- Rebuilds the Simulink Library Browser menus and toolbars
- Clears the Library Browser cache and refreshes the Library Browser
- Reloads the Viewers and Generators Manager data

### Examples

#### Refresh Library Browser and Toolstrip Tab

Use the `sl_refresh_customizations` command to show the changes that an `sl_customization.m` file makes to the order of the libraries in the Simulink Library Browser and the changes that a modified JSON file makes to the Simulink Toolstrip. Start by changing the order of the libraries in the Library Browser. By default, the libraries are listed in ascending order of priority, and libraries that have the same priority are in alphabetical order. The Simulink library has a sort priority of `-1`. All other libraries have a sort priority of `0`. The Simulink library is the first library listed in the browser because it has the highest priority.

Open a blank model in Simulink.

Open the Simulink Library Browser. The first library listed in the browser is the Simulink library.

Create an `sl_customization.m` file that gives the Simulink Extras library a priority of `-2`. This priority is higher than that of the Simulink library.

```
function sl_customization(cm)
 cm.LibraryBrowserCustomizer.applyOrder({'Simulink Extras', -2});
end
```

Save the `sl_customization.m` file to the MATLAB path.

Check the Simulink Library Browser. The order of the libraries is unchanged.

Now, modify the toolstrip. Create an empty custom toolstrip tab by entering this in the MATLAB Command Window.

```
slCreateToolstripComponent("custom");
slCreateToolstripTab("customTab","custom",Title="CUSTOM TAB");
```

In the `customTab.json` file that is generated, change the title of the tab from `CUSTOM TAB` to `NEW NAME`.

```
{
 "version": "1.0",
 "entries":
 [
 {
 "type": "Tab",
 "id": "customTab",
 "title": "NEW TAB"
 }
]
}
```

Save the `customTab.json` file.

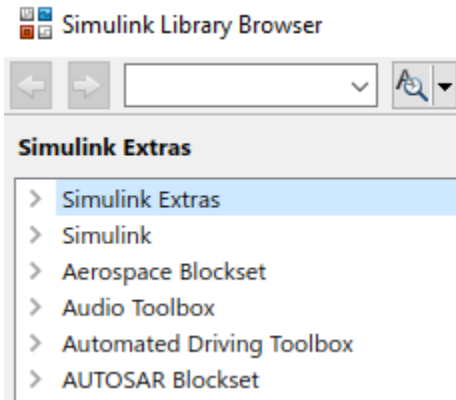

Check the title of the custom tab. Even though the title in the `customTab.json` file is now `NEW NAME`, the title displayed in the toolstrip is still `CUSTOM TAB`.

To see your changes implemented on the Library Browser and toolstrip, rebuild both with this single command.

```
sl_refresh_customizations
```

Check the Library Browser. The order of the libraries has changed: the `Simulink Extras` library is above the `Simulink` library.

Check the toolstrip. The name of the custom tab has changed from CUSTOM TAB to NEW TAB.

## Tips

If you only need to refresh the Library browser displayed in the current MATLAB session, you can also do so using the `refresh` command.

If you only need to refresh the toolstrip displayed in the current MATLAB session, you can also do so using the `slReloadToolstripConfig` command.

## Version History

Introduced in R2022a

### See Also

`refresh` | `slReloadToolstripConfig`

### Topics

# slReloadToolstripConfig

Reload Simulink Toolstrip configuration

## Syntax

```
slReloadToolstripConfig
```

## Description

`slReloadToolstripConfig` reloads the Simulink Toolstrip configuration. Use this function after you make changes to the JSON files that define custom tabs.

## Examples

### Reload Simulink Toolstrip

After you modify a JSON file that defines a custom tab, use the `slReloadToolstripConfig` function to reload the toolstrip configuration with your changes.

In the MATLAB Command Window, enter:

```
slReloadToolstripConfig;
```

The function searches the MATLAB path for `resources` folders that contain a valid `sl_toolstrip_plugins.json` file.

To temporarily modify the toolstrip configuration, perform one of these actions before you call this function:

- Add folders that contain `resources` folders to the MATLAB path.
- Remove folders that contain `resources` folders from the MATLAB path.

If the custom tab does not appear:

- Debug and correct errors in the JSON code.
- Add the folder that contains the corresponding `resources` folder to the MATLAB path.

# slResetFavoriteCommands

Reset Simulink Favorite Commands gallery

## Syntax

```
backup = slResetFavoriteCommands
```

## Description

`backup = slResetFavoriteCommands` resets the Simulink **Favorite Commands** gallery and saves a backup of the previous state of the gallery.

## Examples

### Reset Simulink Favorite Commands Gallery

Suppose you want to delete all the commands and custom categories in the Simulink **Favorite Commands** gallery.

In the MATLAB Command Window, enter:

```
slResetFavoriteCommands;
```

## Output Arguments

### **backup** — Backup of previous state

character vector

Backup of previous state, returned as a character vector.

To restore the previous state, you can pass the returned value as the input to the `slImportFavoriteCommands` function and overwrite the current state.

## Version History

Introduced in R2021b

## See Also

`slImportFavoriteCommands` | `slExportFavoriteCommands`

## slsim.allowedModelChanges

Determine changes you can make to model based on simulation status

### Syntax

```
changeLevel = slsim.allowedModelChanges mdl
```

### Description

`changeLevel = slsim.allowedModelChanges(mdl)` returns a string, `changeLevel`, that indicates the types of changes you can make to the model `mdl` based on the simulation status of the model.

Use this function to control the execution of code that modifies a model and runs during simulation, including model, block, and simulation callback functions. You can also use this function to check which changes are allowed in iterative simulation workflows that use fast restart.

### Examples

#### Check Which Changes Are Allowed for Model

Open and simulate the model `sldemo_autotrans`.

```
mdl = "sldemo_autotrans";
open_system(mdl)
out = sim(mdl, "ReturnWorkspaceOutputs", "on");
```

Use the `slsim.allowedModelChanges` function to check which kinds of changes you can make to the model. Use the `get_param` function to check the simulation status.

```
changeLevel = slsim.allowedModelChanges(mdl)

changeLevel =
'any'

simStatus = get_param(mdl, "SimulationStatus")

simStatus =
'stopped'
```

Because the model does not have fast restart enabled, the model does not stay compiled between simulations, and you can make any change to the model between simulations, including structural changes.

Suppose you want to run a set of simulations for each input scenario in the file the Signal Editor block loads. Enable fast restart so that you only need to compile the model once in that set of simulations.

```
set_param(mdl, "FastRestart", "on")
```

Simulate the model again.

```
out = sim mdl;
```

Check which changes are allowed and the simulation status. Because the model has fast restart enabled, the model remains compiled after the simulation finishes, and you cannot make structural changes to the model. You can change only run-to-run and runtime tunable parameters.

```
changeLevel = slsim.allowedModelChanges mdl)

changeLevel =
'runtorun'

simStatus = get_param mdl, "SimulationStatus")

simStatus =
'compiled'
```

Disable fast restart for the model.

```
set_param mdl, "FastRestart", "off")
```

Check which changes are allowed and the simulation status.

```
changeLevel = slsim.allowedModelChanges mdl)

changeLevel =
'any'

simStatus = get_param mdl, "SimulationStatus")

simStatus =
'stopped'
```

## Input Arguments

### **mdl** — Name of model to be modified

string | character vector

Name of model to be modified, specified as a string or a character vector.

Example: "vdp"

Data Types: char | string

## Output Arguments

### **changeLevel** — Changes allowed for simulation status of model

"any" | "runtorun" | "runtime" | "none"

Changes allowed for simulation status of model, returned as one of these options:

- "any" — All types of changes are allowed, including structural changes and tuning run-to-run and runtime tunable parameters.
- "runtorun" — Only changes to run-to-run and runtime tunable parameters are allowed. Structural changes to the model are not allowed.
- "runtime" — Only changes to runtime tunable parameters are allowed. Structural changes and changes to run-to-run tunable parameters are not allowed.

- "none" — No changes to the model are allowed.

# slToolstripDeveloperMode

Enable developer mode for Simulink Toolstrip

## Syntax

```
tf = slToolstripDeveloperMode(status)
```

## Description

`tf = slToolstripDeveloperMode(status)` enables a developer mode that lets you get action and icon names for controls, such as push buttons, in the Simulink Toolstrip. You can use the action name to add a control that performs the same action to a custom tab. For an example, see “Specify Built-In Simulink Actions”. You can use the icon name to add a control that has the same icon to a custom tab. For an example, see “Define Custom Actions”.

To activate developer mode, set `status` to `'on'`. Then, click anywhere on the Simulink Toolstrip.

If you click away from the Simulink Toolstrip, developer mode is temporarily deactivated. To reactivate developer mode, click anywhere on the Simulink Toolstrip.

When developer mode is active, to display the action and icon names in the MATLAB Command Window, pause on the control in the Simulink Toolstrip and press **Ctrl**. On a Mac, press **command** (⌘) instead of **Ctrl**.

## Examples

### Enable Simulink Toolstrip Developer Mode

In the MATLAB Command Window, enable developer mode for the Simulink Toolstrip.

```
slToolstripDeveloperMode('on')
```

```
ans =
 logical
 0
```

The function enables developer mode for the Simulink Toolstrip. The returned value indicates that developer mode was not enabled before you entered this command.

To activate developer mode, click anywhere on the Simulink Toolstrip.

On the Simulink Toolstrip, pause your pointer on a control. For example, pause on the **Library Browser** button.

Press **Ctrl**. The output in the MATLAB Command Window shows the shows the action and icon names for the button.

Action: `showLibraryBrowserELBAction`  
Icon: `libraryBrowser`  
-----

## Input Arguments

### **status** — Desired status of developer mode

on/off logical value

Desired status of developer mode, specified as specified as 'on' or 'off', or as numeric or logical 1 (true) or 0 (false). A value of 'on' is equivalent to true, and 'off' is equivalent to false. Thus, you can use the value of this property as a logical value. The value is stored as an on/off logical value of type `matlab.lang.OnOffSwitchState`.

By default, developer mode for the Simulink Toolstrip is disabled. Enable developer mode when you want to get the action and icon names of items in the Simulink Toolstrip.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char`

## Output Arguments

### **tf** — Previous status of developer mode

1 | 0

Previous status of developer mode, returned as a 1 or 0 of data type `logical`.

# slxcinfo

Query contents of Simulink cache files

## Syntax

```
info = slxcinfo(filename)
```

## Description

`info = slxcinfo(filename)` creates a MATLAB table that lists the contents of the specified Simulink cache file. The table information includes the corresponding Simulink model name, MATLAB release, platform, and target type.

## Examples

### Query Contents of Simulink Cache File

Suppose you have a Simulink cache file named `model.slxc`. To return a table that lists the artifacts in the Simulink cache file, you would enter:

```
info = slxcinfo('model.slxc')
```

```
info =
```

```
7x4 table
```

| Model   | Release  | Platform | Target                             |
|---------|----------|----------|------------------------------------|
| "model" | "R2020a" | "all"    | "Variable usage information"       |
| "model" | "R2020a" | "win64"  | "Rapid accelerator target"         |
| "model" | "R2020a" | "win64"  | "Accelerator target"               |
| "model" | "R2020b" | "all"    | "Variable usage information"       |
| "model" | "R2020b" | "win64"  | "Rapid accelerator target"         |
| "model" | "R2020b" | "win64"  | "Accelerator target"               |
| "model" | "R2020b" | "win64"  | "grt   Top model   Model specific" |

## Input Arguments

### filename — Name or path of Simulink cache file

character vector | string scalar

Name or path of the Simulink cache file, including the `.slxc` extension, specified as a character vector or string scalar.

Example: `slxcinfo('model.slxc')`

Data Types: `char` | `string`

## Output Arguments

### info — Simulink cache file contents

MATLAB table

Simulink cache file contents, returned as a MATLAB table.

## **Alternative Functionality**

In the Current Folder browser, double-click the Simulink cache file to open the Simulink cache report.

## **Version History**

**Introduced in R2020b**

# slxcunpack

Unpack simulation and code generation targets from Simulink cache file

## Syntax

```
info = slxcunpack(filename)
info = slxcunpack(filename,Name,Value)
```

## Description

`info = slxcunpack(filename)` unpacks the simulation and code generation artifacts from the specified Simulink cache file for the current platform and MATLAB release. Code generation artifacts must apply to the current system target file and folder configuration.

When using this function, consider these limitations:

- Do not use this function during model callbacks, model updates, simulation, or code generation. This function loads the model associated with the Simulink cache file.
- Do not use this function as part of asynchronous functions, such as `parfor` and `parfeval`.
- The contents of the Simulink cache file might be out of date. Simulation and code generation can update the artifacts on disk and in the Simulink cache file.

`info = slxcunpack(filename,Name,Value)` specifies additional options using one or more name-value pair arguments.

## Examples

### Unpack Artifacts from Simulink Cache File

Suppose you have this setup:

- R2020b MATLAB release
- 64-bit Windows operating system
- `grt.tlc` system target file — For more information, see **System target file**.
- `Model specific` code generation folder structure — For more information, see **Code generation folder structure**.

And you have two Simulink cache files:

- `topmodel.slxc` is a Simulink cache file for the top model in a model hierarchy.
- `refmodel.slxc` is a Simulink cache file for the only referenced model in the model hierarchy.

To unpack the simulation and code generation artifacts that correspond to your setup from the Simulink cache file, you would enter:

```
info = slxcunpack('topmodel.slxc')
```

```
info =
```

5×4 table

| Model      | Release  | Platform | Target                                   |
|------------|----------|----------|------------------------------------------|
| "topmodel" | "R2020b" | "win64"  | "Rapid accelerator target"               |
| "topmodel" | "R2020b" | "win64"  | "Accelerator target"                     |
| "topmodel" | "R2020b" | "win64"  | "grt   Top model   Model specific"       |
| "refmodel" | "R2020b" | "win64"  | "Model reference simulation target"      |
| "refmodel" | "R2020b" | "win64"  | "grt   Model reference   Model specific" |

The returned table lists the artifacts that the function unpacks into the **Simulation cache folder** and **Code generation folder**.

### Unpack Only Simulation Artifacts from Simulink Cache File

Suppose you have this setup:

- R2020b MATLAB release
- 64-bit Windows operating system

And you have two Simulink cache files:

- `topmodel.slx` is a Simulink cache file for the top model in a model hierarchy.
- `refmodel.slx` is a Simulink cache file for the only referenced model in the model hierarchy.

To unpack the simulation artifacts that correspond to your setup from the Simulink cache file and display status messages, you would enter:

```
info = slxcunpack('topmodel.slx','Target','Simulation','Verbose',true)
```

```
Rapid accelerator target for 'topmodel': Unpacked.
Accelerator target for 'topmodel': Unpacked.
Model reference simulation target for 'refmodel': Unpacked.
```

```
info =
```

3×4 table

| Model      | Release  | Platform | Target                              |
|------------|----------|----------|-------------------------------------|
| "topmodel" | "R2020b" | "win64"  | "Rapid accelerator target"          |
| "topmodel" | "R2020b" | "win64"  | "Accelerator target"                |
| "refmodel" | "R2020b" | "win64"  | "Model reference simulation target" |

The returned table lists the artifacts that the function unpacks into the **Simulation cache folder**.

## Input Arguments

### filename — Name of Simulink cache file

character vector | string scalar

Name of the Simulink cache file, including the `.slx` extension, specified as a character vector or string scalar.

---

**Note** The Simulink cache file must be in the **Simulation cache folder**, which, by default, is the current working folder (`pwd`).

---

Data Types: `char` | `string`

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose `Name` in quotes.*

Example: `slxcunpack('model.slxc','Target','Simulation')`

### Target — Type of target to unpack

`'All'` (default) | `'Simulation'` | `'CodeGeneration'`

Type of target to unpack, specified as the comma-separated pair consisting of `'Target'` and `'All'`, `'Simulation'`, or `'CodeGeneration'`. If `'All'`, the function unpacks both simulation and code generation targets.

The unpacked simulation targets can be accelerator targets, rapid accelerator targets, and model reference simulation targets.

Data Types: `char` | `string`

### UnpackReferencedModels — Option to unpack referenced model targets

`true` (default) | `false`

Option to unpack referenced model targets, specified as the comma-separated pair consisting of `'UnpackReferencedModels'` and `true` or `false`. If `true`, the function also unpacks the Simulink cache files that correspond to referenced models.

Data Types: `logical`

### Verbose — Option to display status messages

`false` (default) | `true`

Option to display status messages, specified as the comma-separated pair consisting of `'Verbose'` and `true` or `false`.

Data Types: `logical`

## Output Arguments

### info — Unpacked Simulink cache file contents

MATLAB table

Unpacked Simulink cache file contents, returned as a MATLAB table.

## Version History

Introduced in R2020b

# solverprofiler.profileModel

Examine model for performance analysis using the Solver Profiler programmatic interface

## Syntax

```
res = solverprofiler.profileModel(model)
res = solverprofiler.profileModel(model, Name, Value)
```

## Description

`res = solverprofiler.profileModel(model)` runs the Solver Profiler on the specified model and stores the results in `res`.

`res = solverprofiler.profileModel(model, Name, Value)` specifies the Solver Profiler parameters using one or more `Name, Value` arguments.

## Examples

### Examine a Model with Default Settings

Examine the model `f14` using the default settings.

```
model = 'f14';
res = solverprofiler.profileModel(model);
```

Inspect the summary of the results.

```
res.summary

struct with fields:

 solver: 'ode45'
 tStart: 0
 tStop: 60
 absTol: 1.0000e-06
 relTol: 1.0000e-04
 hMax: 0.1000
 hAverage: 0.0444
 steps: 1352
 profileTime: 0.9974
 zcNumber: 0
 resetNumber: 600
 jacobianNumber: 0
 exceptionNumber: 195
```

Open the results in the Solver Profiler to visualize them. This step is equivalent to enabling `OpenSP` when calling the function.

```
solverprofiler.exploreResult(res)
```

## Configure Solver Profiler and Examine a Model

Examine the model `ssc_actuator_custom_pneumatic` with a fully specified configuration.

```
model = 'ssc_actuator_custom_pneumatic';
res = solverprofiler.profileModel(model, ...
 'SaveStates' , 'On' , ...
 'SaveZCSignals' , 'On' , ...
 'SaveSimscapeStates' , 'On' , ...
 'SaveJacobian' , 'On' , ...
 'StartTime' , 5 , ...
 'StopTime' , 50 , ...
 'BufferSize' , 10000 , ...
 'TimeOut' , 5 , ...
 'OpenSP' , 'On' , ...
 'DataFullFile' , fullfile(pwd, 'ssc_profiling_result.mat'));
```

## Input Arguments

### **model** — Name of model to profile

string | character vector

Name of model to profile, specified as a string or a character vector.

Example: `h = solverprofiler.profileModel('vdp')`

### **Name-Value Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `'StartTime',0,'StopTime',10,'SaveStates','On'`

### **SaveStates** — Save model states to file

off (default) | on

By default, the profiler does not save the states of the model. Enabling this parameter configures the profiler to save the states to a MAT-file.

Example: `'SaveStates','On'`

### **SaveSimscapeStates** — Save Simscape states to file

off (default) | on

Enable this parameter to save Simscape states to a MAT-file.

Example: `'SaveSimscapeStates','On'`

### **SaveJacobian** — Save model Jacobian

off (default) | on

Option to log the solver Jacobian matrices to memory. This option is useful for simulations that use implicit solvers. For a comparison of solvers, see “Compare Solvers”.

Example: `'SaveJacobian','On'`

**SaveZCSignals — Save zero-crossing signal to MAT file**

off (default) | on

Option to save the zero-crossing signal to a MAT file, specified as either 'off' or 'on'.

Example: 'SaveZCSignals', 'On'

**StartTime — Profiler start time**

model start time (default) | scalar

Time, in seconds, of the simulation that the profiler starts analyzing the model. This is not the same as the start time of the simulation.

Example: 'StartTime', 5

**StopTime — Profiler stop time**

model stop time (default) | scalar

Time, in seconds, of the simulation to which the profiler should profile the model. By default, the analysis continues until the end of the simulation. Changing this parameter does not change the stop time of the model which you specify in the Model Configuration Parameters.

A value less than the configured stop time of the model stops the profiling and simulation at **StopTime**.

Example: 'StopTime', 30

**BufferSize — Memory impact of logging**

50000 (default) | positive scalar

Maximum number of events that are logged. If the number of logged events reaches this value and memory is available, increase **BufferSize**. If memory is limited, consider lowering the value.

Example: 'BufferSize', 60000

**TimeOut — Maximum time to wait for solver to resume**

positive scalar

Time, in seconds, to wait before the profiler stops running. This option is useful in situations where the simulation is unable to proceed. The profiler waits for the specified time and quits if no progress has been made.

Example: 'TimeOut', 10

**OpenSP — Open the Solver Profiler dialog box**

off (default) | on

Option to open the Solver Profiler dialog box after profiling has completed.

Example: 'OpenSP', 'On'

**DataFullFile — Path and name of saved results**

character vector of full file path

By default, the profiling results are saved in a MAT-file named `model_@_dd_Month_yyyy_hh_mm_ss.mat` in the current working folder. You can specify a different file name by which to save the results in the current working folder. To save the file in a different location, specify the full path of the file, including the file name.

Example: 'DataFullFile', 'C:\Users\myusername\Documents\profiled\vdpr\_results.mat'

## Output Arguments

### **res** — High-level summary of profiling results

structure

Profiling results, returned as a structure with the fields:

### **file** — Full path and name of saved results

character vector

Path and name of the MAT-file where the results of the profiling operation are stored as MAT file. By default, they are stored in the current working folder with a file name having the pattern: `model_@_dd_Month_yyyy_hh_mm_ss.mat`. To store them in a different location or by a different name, specify `DataFullFile` when calling `solverprofiler.profileModel`.

### **summary** — Summary of profiling results

structure

A high-level summary of the results of the profiling operation, returned as a structure. The summary provides an overview of the performance of the simulation and health of the model.

The summary structure contains these fields.

| Field               | Purpose                          | Values                                          | Description                                                                                                                                                                                                                    |
|---------------------|----------------------------------|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>solver</code> | Solver used by simulation        | any of the solvers supported by Solver Profiler | Solver used by the simulation as configured in the Configuration Parameters for the model. For a list of all the solvers, see "Solver". The Solver Profiler does not support models without any continuous states.             |
| <code>tStart</code> | Start time of simulation         | scalar                                          | Start time, in seconds, for the simulation of the model during the profiling operation.                                                                                                                                        |
| <code>tStop</code>  | Stop time of simulation          | scalar                                          | Stop time, in seconds, of the simulation during the profiling operation. If <code>StopTime</code> is set to be earlier than the configured <code>StopTime</code> of the model, the simulation stops at <code>StopTime</code> . |
| <code>absTol</code> | Absolute tolerance of the solver | positive scalar                                 | Absolute tolerance of the solver as specified in the configuration settings for the model. For more information, see "Absolute tolerance"                                                                                      |
| <code>relTol</code> | Relative tolerance of the solver | positive scalar                                 | Relative tolerance of the solver as specified in the configuration settings of the model. For more information, see "Relative tolerance"                                                                                       |
| <code>hMax</code>   | Maximum step size                | positive scalar                                 | Largest time step that the solver can take. See "Max step size".                                                                                                                                                               |

| Field           | Purpose                        | Values             | Description                                                                                                                                                                                                                                                    |
|-----------------|--------------------------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| hAverage        | Average step size              | positive scalar    | Average size of the time step taken by the solver.                                                                                                                                                                                                             |
| steps           | Total steps taken              | positive scalar    | Total number of time steps taken by the solver.                                                                                                                                                                                                                |
| profileTime     | Time to profile                | positive scalar    | Time, in seconds, taken by the Solver Profiler to examine the model.                                                                                                                                                                                           |
| zcNumber        | Total number of zero crossings | nonnegative scalar | Number of times zero crossings occur during the simulation of the model. The detection of these zero crossings incurs computational cost and can slow down the simulation. For information on zero-crossing detection, see “Zero-Crossing Detection”.          |
| resetNumber     | Number of solver resets        | nonnegative scalar | Number of times the solver has to reset its parameters.                                                                                                                                                                                                        |
| jacobiannNumber | Number of Jacobian updates     | nonnegative scalar | Number of times the solver Jacobian matrix is updated during a simulation. For more information, see “Explicit Versus Implicit Continuous Solvers”.                                                                                                            |
| exceptionNumber | Number of solver exceptions    | nonnegative scalar | Total number of solver exceptions encountered during a simulation. These exceptions are events where the solver is unable to solve the model states to the specified accuracy. As a result, the solver runs adjusted trials which increase computational cost. |

Data Types: struct

## Version History

Introduced in R2017b

## start\_simulink

Start Simulink without opening any windows

### Syntax

```
start_simulink
```

### Description

`start_simulink` starts Simulink without opening any models, the Start Page, or the Simulink Library Browser. Use this in startup scripts to start Simulink without any other window taking the focus away from the MATLAB Desktop. For example, use `start_simulink` in the MATLAB `startup.m` file, when starting MATLAB with the `-r` command line option, or in project startup scripts. Opening a model for the first time in a MATLAB session is much quicker after running `start_simulink`.

If you want to open the Simulink Start Page to create or open models, use the `simulink` function instead.

If you want to open the Library Browser, use `sLibraryBrowser`.

### Examples

#### Start Simulink When Starting MATLAB

Use the `-r` command line option to start Simulink when starting MATLAB, without opening any windows.

On Windows, in the operating system prompt, enter:

```
"matlabroot\bin\win64\matlab.exe" -r start_simulink
```

Alternatively, create a desktop shortcut. Right-click the desktop and select **New > Shortcut**.

On Linux® and Mac, enter:

```
matlab -r start_simulink
```

### Version History

Introduced in R2015b

# stringtype

Create string data type

## Syntax

```
string = stringtype(maximum_length)
stringtype(maximum_length)
```

## Description

`string = stringtype(maximum_length)` creates a Simulink string data type with a maximum length. Alternatively, you can also create string data types using the String Constant, String Concatenate, and Compose String blocks.

`stringtype(maximum_length)` creates a Simulink string data type with a maximum length that you can type directly on the MATLAB command line or in the **Output data type** parameter of the String Constant, String Concatenate, or Compose String block.

---

**Tip** Specifying `stringtype(0)` creates a string data type with no maximum length. This syntax is the same as specifying `string` for Simulink block data types.

---

## Examples

### Create a String Data Type of Maximum Length 10

Create a string data type of maximum length 10.

```
h=stringtype(10)
```

h =

StringType with properties:

```
MaximumLength: 10
Description: ''
DataScope: 'Auto'
HeaderFile: ''
```

## Input Arguments

### maximum\_length — Maximum length

scalar

Maximum length of string data type, specified as a scalar, from 1 to 32766. This value can be an integer, MATLAB variable, or MATLAB expression.

Data Types: double

## Output Arguments

**string** — String data type object

scalar

String object, specified as a scalar.

## Version History

**Introduced in R2018a**

## trim

Find trim point of dynamic system

### Syntax

```
[x,u,y,dx] = trim('sys')
[x,u,y,dx] = trim('sys',x0,u0,y0)
[x,u,y,dx] = trim('sys',x0,u0,y0,ix,iu,iy)
[x,u,y,dx] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx)
[x,u,y,dx,options] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx,options)
[x,u,y,dx,options] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx,options,t)
```

### Description

---

**Note** `trim` provides only basic trimming functionality. For full trimming functionality, use Simulink Control Design software. For more information, see “Compute Steady-State Operating Points” (Simulink Control Design).

---

A trim point, also known as an equilibrium point, is a point in the parameter space of a dynamic system at which the system is in a steady state. For example, a trim point of an aircraft is a setting of its controls that causes the aircraft to fly straight and level. Mathematically, a trim point is a point where the system's state derivatives equal zero. `trim` starts from an initial point and searches, using a sequential quadratic programming algorithm, until it finds the nearest trim point. You must supply the initial point implicitly or explicitly. If `trim` cannot find a trim point, it returns the point encountered in its search where the state derivatives are closest to zero in a min-max sense; that is, it returns the point that minimizes the maximum deviation from zero of the derivatives. `trim` can find trim points that meet specific input, output, or state conditions, and it can find points where a system is changing in a specified manner, that is, points where the system's state derivatives equal specific nonzero values.

`[x,u,y,dx] = trim('sys')` finds the equilibrium point of the model 'sys', nearest to the system's initial state, `x0`. Specifically, `trim` finds the equilibrium point that minimizes the maximum absolute value of `[x-x0,u,y]`. If `trim` cannot find an equilibrium point near the system's initial state, it returns the point at which the system is nearest to equilibrium. Specifically, it returns the point that minimizes `abs(dx)` where `dx` represents the derivative of the system. You can obtain `x0` using this command.

```
[sizes,x0,xstr] = sys([],[],[],0)
```

`[x,u,y,dx] = trim('sys',x0,u0,y0)` finds the trim point nearest to `x0`, `u0`, `y0`, that is, the point that minimizes the maximum value of

```
abs([x-x0; u-u0; y-y0])
```

`[x,u,y,dx] = trim('sys',x0,u0,y0,ix,iu,iy)` finds the trim point closest to `x0`, `u0`, `y0` that satisfies a specified set of state, input, and/or output conditions. The integer vectors `ix`, `iu`, and `iy` select the values in `x0`, `u0`, and `y0` that must be satisfied. If `trim` cannot find an equilibrium point that satisfies the specified set of conditions exactly, it returns the nearest point that satisfies the conditions, namely,

```
abs([x(ix)-x0(ix); u(iu)-u0(iu); y(iy)-y0(iy)])
```

`[x,u,y,dx] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx)` finds specific nonequilibrium points, that is, points at which the system's state derivatives have some specified nonzero value. Here, `dx0` specifies the state derivative values at the search's starting point and `idx` selects the values in `dx0` that the search must satisfy exactly.

`[x,u,y,dx,options] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx,options)` specifies an array of optimization parameters that `trim` passes to the optimization function that it uses to find trim points. The optimization function, in turn, uses this array to control the optimization process and to return information about the process. `trim` returns the `options` array at the end of the search process. By exposing the underlying optimization process in this way, `trim` allows you to monitor and fine-tune the search for trim points.

The following table describes how each element affects the search for a trim point. Array elements 1, 2, 3, 4, and 10 are particularly useful for finding trim points.

| No. | Default                   | Description                                                                                                    |
|-----|---------------------------|----------------------------------------------------------------------------------------------------------------|
| 1   | 0                         | Specifies display options. 0 specifies no display; 1 specifies tabular output; -1 suppresses warning messages. |
| 2   | $10^{-4}$                 | Precision the computed trim point must attain to terminate the search.                                         |
| 3   | $10^{-4}$                 | Precision the trim search goal function must attain to terminate the search.                                   |
| 4   | $10^{-6}$                 | Precision the state derivatives must attain to terminate the search.                                           |
| 5   | N/A                       | Not used.                                                                                                      |
| 6   | N/A                       | Not used.                                                                                                      |
| 7   | N/A                       | Used internally.                                                                                               |
| 8   | N/A                       | Returns the value of the trim search goal function ( $\lambda$ in goal attainment).                            |
| 9   | N/A                       | Not used.                                                                                                      |
| 10  | N/A                       | Returns the number of iterations used to find a trim point.                                                    |
| 11  | N/A                       | Returns the number of function gradient evaluations.                                                           |
| 12  | 0                         | Not used.                                                                                                      |
| 13  | 0                         | Number of equality constraints.                                                                                |
| 14  | 100*(Number of variables) | Maximum number of function evaluations to use to find a trim point.                                            |
| 15  | N/A                       | Not used.                                                                                                      |
| 16  | $10^{-8}$                 | Used internally.                                                                                               |
| 17  | 0.1                       | Used internally.                                                                                               |
| 18  | N/A                       | Returns the step length.                                                                                       |

`[x,u,y,dx,options] = trim('sys',x0,u0,y0,ix,iu,iy,dx0,idx,options,t)` sets the time to `t` if the system is dependent on time.

---

**Note** If you fix any of the state, input or output values, `trim` uses the unspecified free variables to derive the solution that satisfies these constraints.

---

## Examples

### Finding Steady-State Points

The Simulink `trim` function uses a model to determine steady-state points of a dynamic system that satisfy input, output, and state conditions that you specify. Consider, for example, this model, called `ex_lmmod`.

You can use the `trim` function to find the values of the input and the states that set both outputs to 1. First, make initial guesses for the state variables ( $x$ ) and input values ( $u$ ), then set the desired value for the output ( $y$ ).

```
x = [0; 0; 0];
u = 0;
y = [1; 1];
```

Use index variables to indicate which variables are fixed and which can vary.

```
ix = []; % Don't fix any of the states
iu = []; % Don't fix the input
iy = [1;2]; % Fix both output 1 and output 2
```

Invoking `trim` returns the solution. Your results might differ because of roundoff error.

```
[x,u,y,dx] = trim('lmmod',x,u,y,ix,iu,iy)
```

```
x =
 0.0000
 1.0000
 1.0000
u =
 2
y =
 1.0000
 1.0000
dx =
 1.0e-015 *
 -0.2220
 -0.0227
 0.3331
```

Note that there might be no solution to equilibrium point problems. If that is the case, `trim` returns a solution that minimizes the maximum deviation from the desired result after first trying to set the derivatives to zero. For a description of the `trim` syntax, see `trim`.

### Finding Equilibrium Points

Consider a linear state-space system modeled using a State-Space block

$$\begin{aligned}\dot{x} &= Ax + Bu \\ y &= Cx + Du\end{aligned}$$

The  $A$ ,  $B$ ,  $C$ , and  $D$  matrices to enter at the command line or in the block parameters dialog are:.

```
A = [-0.09 -0.01; 1 0];
B = [0 -7; 0 -2];
C = [0 2; 1 -5];
D = [-3 0; 1 0];
```

#### Example 1

To find an equilibrium point in this model called `sys`, use:

```
[x,u,y,dx,options] = trim('sys')
x =
 0
 0
u =
 0
 0
y =
 0
 0
dx =
 0
 0
```

The number of iterations taken is:

```
options(10)
ans =
 7
```

#### Example 2

To find an equilibrium point near  $x = [1;1]$ ,  $u = [1;1]$ , enter

```
x0 = [1;1];
u0 = [1;1];
[x,u,y,dx,options] = trim('sys', x0, u0);
x =
 1.0e-13 *
 -0.5160
 -0.5169
u =
 0.3333
 0.0000
y =
 -1.0000
```

```

 0.3333
dx =
 1.0e-12 *
 0.1979
 0.0035

```

The number of iterations taken is

```

options(10)
ans =
 25

```

### Example 3

To find an equilibrium point with the outputs fixed to 1, use:

```

y = [1;1];
iy = [1;2];
[x,u,y,dx] = trim('sys', [], [], y, [], [], iy)
x =
 0.0009
 -0.3075
u =
 -0.5383
 0.0004
y =
 1.0000
 1.0000
dx =
 1.0e-15 *
 -0.0170
 0.1483

```

### Example 4

To find an equilibrium point with the outputs fixed to 1 and the derivatives set to 0 and 1, use

```

y = [1;1];
iy = [1;2];
dx = [0;1];
idx = [1;2];
[x,u,y,dx,options] = trim('sys', [], [], y, [], [], iy, dx, idx)
x =
 0.9752
 -0.0827
u =
 -0.3884
 -0.0124
y =
 1.0000
 1.0000
dx =
 0.0000
 1.0000

```

The number of iterations taken is

```
options(10)
ans =
 13
```

## Limitations

The trim point found by `trim` starting from any given initial point is only a local value. Other, more suitable trim points may exist. Thus, if you want to find the most suitable trim point for a particular application, it is important to try a number of initial guesses for  $x$ ,  $u$ , and  $y$ .

## Algorithms

`trim` uses a sequential quadratic programming algorithm to find trim points. See “Sequential Quadratic Programming (SQP)” (Optimization Toolbox) for a description of this algorithm.

# tunablevars2parameterobjects

Create Simulink parameter objects from tunable parameters

## Syntax

```
tunablevars2parameterobjects ('modelName')
tunablevars2parameterobjects ('modelName', class)
```

## Description

`tunablevars2parameterobjects ('modelName')` creates `Simulink.Parameter` objects in the base workspace for the variables listed in the specified model's Tunable Parameters dialog, then deletes the source information from the dialog. To preserve the information, save the resulting Simulink parameter objects into a MAT-file.

If a tunable variable is already defined as a numeric variable in the base workspace, the variable will be replaced by a parameter object and the original variable will be copied to the object's Value property.

If a tunable variable is already defined as a Simulink parameter object, the object will not be modified but the information for the variable will still be deleted from the Tunable Parameters dialog.

If a tunable variable is defined as any other class of variable, the variable will not be modified and the information for the variable will not be deleted from the Tunable Parameters dialog.

`tunablevars2parameterobjects ('modelName', class)` creates objects of the specified class rather than `Simulink.Parameter` objects.

## Input Arguments

### **modelName**

Model name or handle

### **class**

Parameter class to use for creating objects

**Default:** `Simulink.Parameter`

## Version History

**Introduced in R2007b**

## See Also

`Simulink.Parameter`

# upgradeadvisor

Open Upgrade Advisor

## Syntax

```
upgradeadvisor('modelname')
upgrader = upgradeadvisor('modelname')
```

## Description

`upgradeadvisor('modelname')` opens the Upgrade Advisor for the model specified by `modelname`. This command loads the model if necessary, but does not open it in the Simulink Editor. Use the Upgrade Advisor to help you upgrade and improve models with the current release.

`upgrader = upgradeadvisor('modelname')` returns an object that you can use to analyze and upgrade a hierarchy of models programmatically. If you specify an output, then the Upgrade Advisor does not open. You can use the methods `analyze` and `upgrade` with the `upgrader` object output of the `upgradeadvisor` function.

- To programmatically analyze a model for recommended upgrades, create an `upgrader` object and use the method `analyze`.
- To programmatically analyze and upgrade a model, create an `upgrader` object and use the method `upgrade`.
- To configure options before running `analyze` or `upgrade`, see “Examples” on page 2-1161.

---

**Tip** For an example showing how to programmatically upgrade a whole project, see “Upgrade Simulink Models Using a Project” on page 13-491.

---

## Input Arguments

**modelname**

Name or handle to the model, specified as a character vector.

## Output Arguments

**upgrader**

Object for analyzing and upgrading the hierarchy of models programmatically.

## Examples

### Open Upgrade Advisor on a Model

To open the Upgrade Advisor on the `vdp` example model:

```
upgradeadvisor('vdp')
```

To open the Upgrade Advisor on the currently selected model:

```
upgradeadvisor(bdroot)
```

### Programmatically Analyze and Upgrade a Model

- 1 Get an upgrader object. This example uses a writable copy of the vdp model.

```
load_system('vdp'); save_system('vdp',fullfile(tempdir, 'myvdp'))
upgrader = upgradeadvisor('myvdp')
```

```
upgrader =
```

```
Upgrader with properties:
```

```
ChecksToSkip: {}
SkipLibraries: 0
SkipBlocksets: 1
OneLevelOnly: 0
ShowReport: 1
RootModel: 'myvdp'
ReportFile: ''
```

- 2 To analyze the model for recommended upgrades, following library links and model references, run:

```
analyze(upgrader);
```

You see a report of issues found.

- 3 To analyze the model and automatically fix all issues (where automated fixes are available), run:

```
upgrade(upgrader);
```

This command follows library links and model references, and saves any fixes to the model files.

You see a report of issues found and actions taken.

- 4 To find the location of the report:

```
reportLocation = upgrader.ReportFile
```

- 5 You can configure options before running analyze or upgrade.

- Specify checks to skip before running analyze or upgrade. Find the ID for a check in the Upgrade Advisor by right-clicking the check and selecting **Send Check ID to Workspace**. Then set the `upgrader.ChecksToSkip` property. For example:

```
upgrader.ChecksToSkip = {'mathworks.design.CSStoVSSConvert'};
upgrade(upgrader);
```

- Specify running the Upgrade Advisor on only the current model without following library links or model references, or analyzing test harnesses that are saved as external models:

```
upgrader.OneLevelOnly = true; % default false
```

- Specify running the Upgrade Advisor on the current model, following model references but not library links:

```
upgrader.SkipLibraries = true; % default false
```

- Specify running the Upgrade Advisor on the current model, including upgrading files in blocksets or toolboxes:

```
upgrader.SkipBlocksets = false; % default true
```

By default, the Upgrade Advisor does not upgrade files in blocksets or toolboxes. The Upgrade Advisor detects blocksets from the output of `ver` and the existence of a `Contents.m` file.

- To turn off showing the report after analyze or upgrade, set:

```
upgrader.ShowReport = false; % default true
```

---

**Tip** For an example showing how to programmatically upgrade a whole project, see “Upgrade Simulink Models Using a Project” on page 13-491.

---

## Tips

- The Upgrade Advisor can identify cases where you can benefit by changing your model to use new features and settings in Simulink. The Advisor provides advice for transitioning to new technologies, and upgrading a model hierarchy.

The Upgrade Advisor can also identify cases where a model will not work because changes and improvements in Simulink require changes to a model.

The Upgrade Advisor offers options to perform recommended actions automatically or instructions for manual fixes.

## Alternatives

You can also open the Upgrade Advisor from the Simulink Editor. In the **Modeling** tab, select **Model Advisor > Upgrade Advisor**.

Alternatively, you can open the Upgrade Advisor from the Model Advisor. In the Model Advisor, under **By Task checks**, expand the folder **Upgrading to the Current Simulink Version** and select the check **Open the Upgrade Advisor**.

## Version History

**Introduced in R2012b**

## view\_mdhrefs

Analyze and visualize model referencing dependencies without library dependencies

### Syntax

```
view_mdhrefs(sys)
```

### Description

`view_mdhrefs` opens the Dependency Analyzer with library dependencies omitted. To open a specific configuration of the Dependency Analyzer, use `depview` with programmatic options. The Dependency Analyzer provides the same options regardless of how you open it.

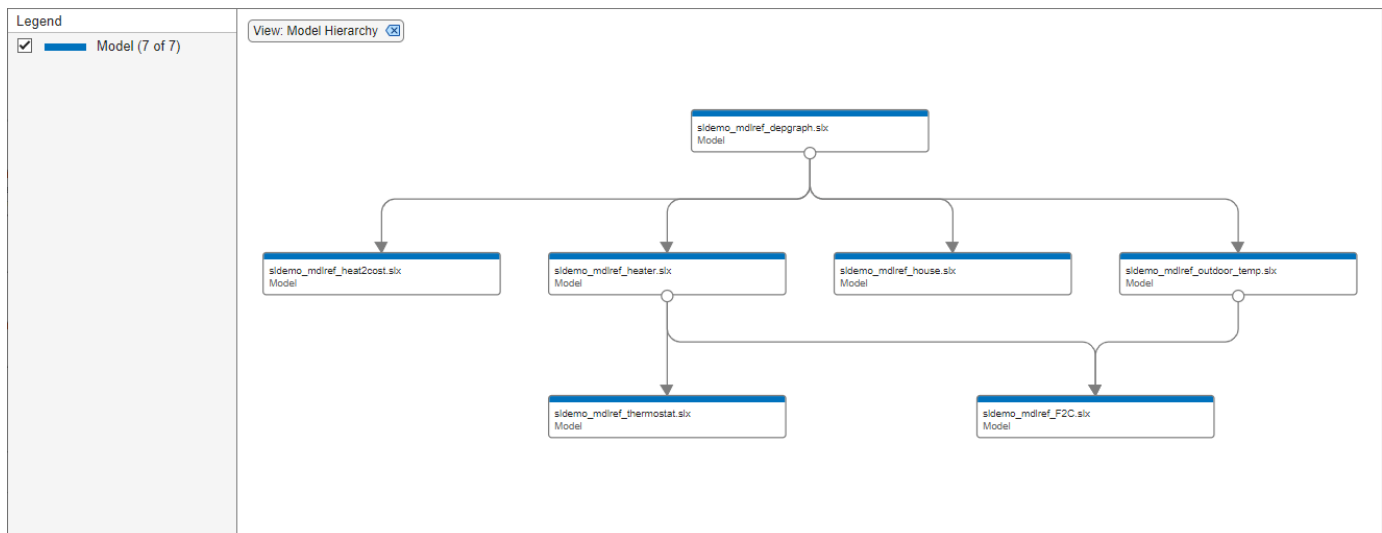

`view_mdhrefs(sys)` opens the Dependency Analyzer. It displays a graph of model referencing dependencies for the specified model. The nodes in the graph represent Simulink models. The directed lines indicate model dependencies.

### Examples

#### Open Dependency Analyzer without Library Dependencies

Open the Dependency Analyzer for the `sldemo_mdhref_depgraph` model.

```
view_mdhrefs('sldemo_mdhref_depgraph');
```

### Input Arguments

**sys** — Model name or path  
character vector

The full name or path of a model, specified as a character vector.

Data Types: char

## **Version History**

**Introduced before R2006a**

# addChoice

**Package:** Simulink

Add choices to variant parameter object

## Syntax

```
P = addChoice(P,Choices{Condition,Value})
```

## Description

`P = addChoice(P,Choices{Condition,Value})` adds a new variant choice to the variant parameter object `P`. A variant choice consists of a variant condition and a value specified as `Condition` and `Value`, respectively. You can add multiple choices to `p` by specifying condition-value pairs in a cell array. No two values of a variant variable can be associated with the same variant condition.

---

**Note** Adding a value to an existing variant condition results in an error.

---

## Examples

### Add Variant Choice

Create a `Simulink.VariantVariable` object.

```
P = Simulink.VariantVariable;
```

Add a variant choice to the object.

```
P = addChoice(P, {'V==1', 3.5});
```

### Add Multiple Variant Choices

Create a `Simulink.VariantVariable` object.

```
P = Simulink.VariantVariable;
```

Add multiple variant choices to the object.

```
P = addChoice(P, {'V==1', 3.5, 'V==2', 8.3});
```

## Input Arguments

**P** — Variant parameter object

`Simulink.VariantVariable` object

Variant parameter object created using `Simulink.VariantVariable`, specified as a `Simulink.VariantVariable` object. The choices that you specify using `addChoice` are added to this object.

### **Condition, Value — Variant condition and associated value**

cell array

Variant condition and associated value, specified as a cell array. A variant condition is a control expression that determines the active value of the variant parameter object. During simulation, when a variant condition evaluates to `true`, the value associated with the condition becomes active. When a variant condition evaluates to `false`, the value associated the condition becomes inactive. You can add multiple values of the object by specifying condition-value pairs in a cell array.

You can specify the variant condition as boolean MATLAB expressions that contain one or more operands and operators. See “Types of Variant Control Variables (Operands) in Variant Parameters” and “Types of Operators in Variant Parameters”.

You can specify values of numeric, enumerated, or `Simulink.Parameter` type. See, “Numeric Variant Control Values for Rapid Prototyping of Variant Parameters”, “Improve Code Readability of Variant Parameters Using Enumerated Types”, and “Reuse Variant Parameter Values from Handwritten Code Using `Simulink.Parameter` Variables”.

Example: `{'V==2',5}`

Data Types: `struct`

## **Version History**

**Introduced in R2021a**

### **See Also**

### **Topics**

“Change Active Values and Activation Time of Variant Parameters”

# getChoice

**Package:** Simulink

Return choices of variant parameter object

## Syntax

```
choices = getChoice(P)
choices = getChoice(P,Condition)
```

## Description

`choices = getChoice(P)` returns all the choices of variant parameter `p` in a cell array.

`choices = getChoice(P,Condition)` returns the value associated with the variant condition `Condition`. You can specify multiple conditions of variant parameter `p` in a cell array.

## Examples

### Get All Variant Choices

Create a `Simulink.VariantVariable` object.

```
p = Simulink.VariantVariable('Choices',{ 'V==1',8, 'V==2',9})
```

Get all variant choices of the object.

```
choices = getChoice(p)
```

### Get Specific Variant Choices

Create a `Simulink.VariantVariable` object.

```
p = Simulink.VariantVariable('Choices',{ 'V==1',8, 'V==2',9})
```

Get the value associated with variant condition `V==1`.

```
choice = getChoice(p, 'V==2')
```

## Input Arguments

### **P** — Variant parameter object

`Simulink.VariantVariable` object

Variant parameter object created using `Simulink.VariantVariable`, specified as a `Simulink.VariantVariable` object.

**Condition – Variant control expression**

string

Variant control expression corresponding to the value to be returned, specified as a string. You can get multiple choices of the object by specifying conditions in a cell array.

Example: 'V==2'

Data Types: char

**Version History****Introduced in R2021a****See Also**

addChoice | setChoice | removeChoice | Simulink.VariantVariable

**Topics**

“Change Active Values and Activation Time of Variant Parameters”

# setChoice

**Package:** Simulink

Modify existing choices of variant parameter object

## Syntax

```
P = setChoice(P,Choices{Condition,Value})
```

## Description

`P = setChoice(P,Choices{Condition,Value})` replaces the value associated with the variant condition `Condition` by the new value `Value`. You can modify multiple values of variant variable `P` by specifying condition-value pairs in a cell array. If the choice corresponding to the specified condition already exists, the associated value is overridden. Otherwise, a new choice is added.

## Examples

### Modify Variant Choice

Create a `Simulink.VariantVariable` object.

```
P = Simulink.VariantVariable('Choices',{ 'V==1',8, 'V==2',9})
```

Modify a variant choice associated with the variant condition `V==1`.

```
P = setChoice(P, {'V==1', 3.5});
```

### Modify Multiple Variant Choices

Create a `Simulink.VariantVariable` object.

```
P = Simulink.VariantVariable('Choices',{ 'V==1',8, 'V==2',9, 'V==3',12})
```

Modify variant choices associated with variant conditions `V==1` and `V==3`.

```
P = setChoice(P, {'V==1', 3.5, 'V==3',20});
```

## Input Arguments

### **P** — Variant parameter object

`Simulink.VariantVariable` object

Variant parameter object created using `Simulink.VariantVariable`, specified as a `Simulink.VariantVariable` object. This object is updated with the new values that you specify using `setChoice`.

**Condition, Value — Variant condition and associated value**

cell array

Variant condition and its associated value, specified as a cell array. Simulink replaces the existing value of the specified variant condition with the new value. You can modify multiple values of the object by specifying condition-value pairs in a cell array.

You can specify the variant condition as boolean MATLAB expressions that contain one or more operands and operators. See “Types of Variant Control Variables (Operands) in Variant Parameters” and “Types of Operators in Variant Parameters”.

Example: { 'V==2' , 5 }

Data Types: struct

## removeChoice

**Package:** Simulink

Remove choices from variant parameter object

### Syntax

```
P = removeChoice(P,Condition)
```

### Description

`P = removeChoice(P,Condition)` removes the condition-value pair from variant variable `P` corresponding to condition `Condition`. You can remove multiple choices from `P` by specifying conditions in a cell array. Specifying variant conditions that do not exist results in an error.

### Examples

#### Remove Variant Choice

Create a `Simulink.VariantVariable` object.

```
P = Simulink.VariantVariable('Choices',{ 'V==1',8, 'V==2',9, 'V==3',20})
```

Remove the variant choice associated with condition `V==2`.

```
P = removeChoice(P, 'V==2');
```

#### Remove Multiple Variant Choices

Create a `Simulink.VariantVariable` object.

```
P = Simulink.VariantVariable('Choices',{ 'V==1',8, 'V==2',9, 'V==3',20})
```

Remove variant choices associated with conditions `V==2` and `V==3`.

```
P = removeChoice(P, {'V==2','V==3'});
```

### Input Arguments

#### **P** — Variant parameter object

`Simulink.VariantVariable` object

Variant parameter object created using `Simulink.VariantVariable`, specified as an `Simulink.VariantVariable` object. The choices that you specify using `removeChoice` are removed from this object.

#### **Condition** — Variant control expression

string

Variant control expression corresponding to the value to be removed, specified as a string. You can remove multiple choices from the object by specifying conditions in a cell array.

Example: 'V==2'

Data Types: char

## **Version History**

## modelfinder

Search and open example models

### Syntax

```
modelfinder(str)
modelfinder(Name,Value)
```

### Description

`modelfinder(str)` finds models that match the specified search string. If there is more than one match, then all matching items are displayed as a list and you are prompted to select one.. Other options in the prompt include `q` to quit and `m` to see more results. If there are more than three words in the search term, then `modelfinder` treats the search as a natural language query and finds models that satisfy the natural language query.

`modelfinder(Name,Value)` specifies search options using one or more name-value arguments. For example, you can filter models based on the combination of specific search strings and blocks.

### Examples

#### Models Matching Search String

Use this command to display models that has the word `autosar`.

```
modelfinder('autosar');
```

1. AUTOSARCounterExample
2. AuthorAUTOSARCompositionsInArchitectureModelExample
3. > autosar\_tpc\_actuator
4. > autosar\_tpc\_composition
5. > autosar\_tpc\_controller
6. > autosar\_tpc\_pedal\_sensor
7. > autosar\_tpc\_system
8. > autosar\_tpc\_throttle\_sensor1
9. > autosar\_tpc\_throttle\_sensor2
10. > autosar\_tpc\_throttle\_sensor\_monitor
11. ConfigureAndSimulateAUTOSARFiMServiceCallsExample

### Models with Additional Filters

You can filter models that contains specific search string and blocks . For example, use this command to filter models that contains the word motor and the block gain.

```
modelfinder('fluid', 'blocks', {'condenser'}, 'verbose', 'off')
```

1. ssc\_rankine\_cycle
2. ssc\_refrigeration
3. sscfluids\_condenser\_evaporator
4. sscfluids\_ev\_thermal\_management
5. sscfluids\_liquid\_air\_energy\_storage
6. sscfluids\_refrigeration
7. sscfluids\_refrigeration\_step2
8. sscfluids\_refrigeration\_step3
9. sscfluids\_refrigeration\_step4
10. sscfluids\_refrigeration\_step5
11. sscfluids\_refrigeration\_step6
12. sscfluids\_refrigerator
13. sscfluids\_residential\_air\_source\_heat\_pump

Enter the example number you want to open (choose number) OR quit (q) :

### Input Arguments

**str** — Search string

(default) | ''

Search string specified as string. You can use wildcard (\*) characters in the search. If there are more than three words in the string `modelfinder` treats it as natural language query.

Example: `modelfinder('autosar')`

Data Types: `char` | `string`

### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Example: `modelfinder('fluid','blocks',{'condenser'})` finds models with the search string `fluid` having block name `condenser`. “Models with Additional Filters” on page 2-1175

### **blocks — Block names in search criteria**

(default) | ''

Block names in search criteria specified as string. This argument limits the models displayed in the search result based on blocks present in the models.

Example: `modelfinder('motor','blocks','gain')`

Data Types: `char` | `string`

### **verbose — Option to display path of matched model and matched character from search term**

(default) | off

If you specify this argument as on, search results are displayed with the path of the matched models and the matching characters from the search term. Additional information about the matched component, such as model name, annotations, and description is displayed. Search results that appear indented and prefixed with > are individual Simulink models that are part of a bigger example or project. You may open an individual model or an entire example, with the corresponding number.

Example: `modelfinder('pmsm models using discrete pulse generator','verbose','on')`

Data Types: `char` | `string`

### **resultsPerPage — Number of results displayed per page**

(default) | 20

Number of results per page specified as positive integer. By default, 20 results are displayed per page.

---

**Note** The number of results displayed may vary to preserve the model hierarchy in output.

---

Example: `modelfinder('pmsm models using discrete pulse generator','resultsPerPage',5)`

Data Types: `char` | `string`

## **Version History**

**Introduced in R2022a**

### **See Also**

`modelfinder.registerFolder` | `modelfinder.unregisterFolder` | “Use modelfinder to Index Simulink Models and Improve its Discoverability within an Organization”

## **modelfinder.registerFolder**

Register folder path to search index of modelfinder

### **Syntax**

```
modelfinder.registerFolder(pathToFolder)
```

### **Description**

`modelfinder.registerFolder(pathToFolder)` registers all models from the path to modelfinder search result. The function searches for models recursively within the specified folder.

### **Input Arguments**

#### **pathToFolder — Path to folder**

(default) | string

Path to folder specified as string. Specify the path of the models to be included for indexing.

Example: `modelfinder.registerFolder("~/Desktop/myFolder")`

Example: `modelfinder.registerFolder(["~/Desktop/myFolder1", "~/Desktop/myFolder2"])`

### **Version History**

**Introduced in R2022a**

### **See Also**

`modelfinder` | `modelfinder.unregisterFolder` | “Use modelfinder to Index Simulink Models and Improve its Discoverability within an Organization”

# modelfinder.unregisterFolder

Unregister folder path from search path of modelfinder

## Syntax

```
modelfinder.unregisterFolder(pathToFolder)
```

## Description

`modelfinder.unregisterFolder(pathToFolder)` unregisters all model from the specified `pathToFolder` from `modelfinder` search index so that the models does not appear in search results. The function unregisters all models recursively within the specified folder.

## Input Arguments

### **pathToFolder** — Path to folder

(default) | string

Path to folder specified as string. Specify path of the models to be excluded from indexing.

Example: `modelfinder.unregisterFolder("~/Desktop/myFolder")`

Example: `modelfinder.unregisterFolder(["~/Desktop/myFolder1", "~/Desktop/myFolder2"])`

## Version History

**Introduced in R2022a**

## **convertAllSubsystemReferenceBlockToSubsystem**

Converts all subsystem reference blocks to regular Subsystem blocks

### **Syntax**

```
Simulink.SubsystemReference.convertAllSubsystemReferenceBlocksToSubsystem(
path)
```

### **Description**

`Simulink.SubsystemReference.convertAllSubsystemReferenceBlocksToSubsystem(path)` converts all subsystem reference blocks inside a given block diagram to regular Subsystem blocks.

### **Input Arguments**

**path** — Path of the block diagram

(default) | string

The path of the block diagram specified as string. You can also specify handle as input argument

### **Examples**

```
>> Simulink.SubsystemReference.convertAllSubsystemReferenceBlocksToSubsystem('mdl1')
```

### **Version History**

Introduced in R2022a

### **See Also**

`Simulink.SubsystemReference`

# convertSubsystemReferenceBlockToSubsystem

Converts a subsystem reference block to a regular Subsystem block

## Syntax

```
Simulink.SubsystemReference.convertSubsystemReferenceBlockToSubsystem(path)
```

## Description

`Simulink.SubsystemReference.convertSubsystemReferenceBlockToSubsystem(path)` converts subsystem reference block to regular Subsystem block for a given block

## Input Arguments

**path** — Path of the subsystem reference block  
(default) |

The path of the subsystem reference block that needs to be converted to Subsystem is specified. You can also specify the handle of the subsystem reference block.

## Examples

```
>> Simulink.SubsystemReference.convertSubsystemReferenceBlockToSubsystem('mdl1/Subsystem Reference')
```

## Version History

Introduced in R2022a

## See Also

`Simulink.SubsystemReference`

## convertSubsystemToSubsystemReference

Converts a Subsystem block to subsystem reference

### Syntax

```
Simulink.SubsystemReference.convertSubsystemToSubsystemReference(path, name)
```

### Description

`Simulink.SubsystemReference.convertSubsystemToSubsystemReference(path, name)` converts a Subsystem block to subsystem reference. The converted subsystem reference block takes the name given in `name`. It returns `true`, if the conversion is successful. `False` otherwise.

### Input Arguments

**path — Path of the subsystem**

(default) | string

The path of the Subsystem that must be converted to subsystem reference is specified as string. You can also specify the handle of the Subsystem.

**name — Name for the converted subsystem**

(default) | string

Name for the converted subsystem is specified as string.

### Examples

```
>> Simulink.SubsystemReference.convertSubsystemToSubsystemReference('mdl1/Subsystem2', 'ssref4')
ans =
 logical
 1
```

### Version History

Introduced in R2022a

### See Also

`Simulink.SubsystemReference`

# getActiveInstances

Returns all the active instances of subsystem references

## Syntax

```
Simulink.SubsystemReference.getActiveInstances(path)
```

## Description

`Simulink.SubsystemReference.getActiveInstances(path)` returns all the active instances of subsystem reference blocks which point to the subsystem file.

## Input Arguments

**path** — Path of the subsystem reference file

(default) | string

The path of the subsystem reference file that is being referred in other Subsystem blocks. You can also specify the handle of the subsystem reference.

## Output Arguments

**path** — Path of the active instances

An array consisting of the path of all the active instances is returned.

## Examples

**Get all active instances of the subsystem**

```
>>Simulink.SubsystemReference.getActiveInstances('mdl2/Subsystem Reference')
```

```
ans =
```

```
4×1 cell array
```

```
{ 'ssref1' }
{ 'mdl1/Subsystem1' }
{ 'mdl2/Subsystem Reference' }
{ 'mdl1/Subsystem/Subsystem Reference' }
```

## Version History

Introduced in R2022a

## See Also

`Simulink.SubsystemReference`

## getAllDirtyInstances

Returns child Subsystem block diagrams that are referred in the given block diagram and are also being edited

### Syntax

```
Simulink.SubsystemReference.getAllDirtyInstances(path)
```

### Description

`Simulink.SubsystemReference.getAllDirtyInstances(path)` returns all the child Subsystem block diagrams that are referred in the given block diagram and are also being edited.

### Input Arguments

**path** — Path of the block diagram  
(default) | string

The path of the block diagram specified as string. You can also specify the handle of the block diagram.

### Output Arguments

**block name** — List of subsystem block diagrams that are being edited and referred in the given block diagram

It returns list of subsystem block diagrams that are being edited and referred in the given block diagram. It is not necessary that the subsystem block diagram is being edited directly. It might be edited through an instance.

### Examples

```
>> Simulink.SubsystemReference.getAllDirtyInstances('mdl1')

ans =

 'ssref1'
```

### Version History

Introduced in R2022a

### See Also

`Simulink.SubsystemReference`

# getAllInstances

Returns all subsystem reference blocks inside a block diagram

## Syntax

```
Simulink.SubsystemReference.getAllInstances(path)
```

## Description

`Simulink.SubsystemReference.getAllInstances(path)` returns all subsystem reference blocks inside a block diagram.

## Input Arguments

**path** — System or model name  
(default) | string

The path of the system or model name specified as string. You can also specify the handle of the system or model name.

## Output Arguments

**path** — Path of all the subsystem reference blocks

It return an array consisting of the path of all the subsystem reference blocks that is inside a block diagram.

## Examples

```
>> Simulink.SubsystemReference.getAllInstances('mdl1')
```

```
ans =
```

```
2×1 cell array
```

```
 {'mdl1/Subsystem1' }
 {'mdl1/Subsystem/Subsystem Reference' }
```

## Version History

Introduced in R2022a

## See Also

`Simulink.SubsystemReference`

## getAllReferencedSubsystemBlockDiagrams

Returns all the child Subsystem block diagrams for a given block diagram

### Syntax

```
Simulink.SubsystemReference.getAllReferencedSubsystemBlockDiagrams(path)
```

### Description

`Simulink.SubsystemReference.getAllReferencedSubsystemBlockDiagrams(path)` returns all the child Subsystem block diagrams for a given block diagram.

### Input Arguments

**path — Path of the system or block diagram**

character vector (default) | string

The path of the system or block diagram is specified as string. You can also specify the handle of the system or block diagram.

### Output Arguments

**block name — Name of the block**

character vector (default)

An array consisting of the name of the child blocks is returned. The output doesn't contain duplicates. So, if a subsystem-block diagram is referred twice, it appears only once in the output. The type of the output(name or handle) is same as the type of the input

### Examples

```
>> Simulink.SubsystemReference.
getAllReferencedSubsystemBlockDiagrams('mdl2')
```

```
ans =
```

```
2x1 cell array
```

```
 {'ssref1'}
 {'ssref2'}
```

### Version History

Introduced in R2022a

**See Also**

Simulink.SubsystemReference

## getNearestParentSubsystemReferenceBlock

Returns the nearest parent subsystem reference for a block

### Syntax

```
Simulink.SubsystemReference.getNearestParentSubsystemReferenceBlock(path)
```

### Description

`Simulink.SubsystemReference.getNearestParentSubsystemReferenceBlock(path)` returns the nearest parent subsystem reference for a block.

### Input Arguments

**path** — Path of the block for which the nearest parent must be returned  
(default) | string

The path of the block for which the nearest parent must be returned. You can also specify the handle of the block.

### Output Arguments

**path** — Path of the nearest parent

The path of the nearest parent subsystem reference for the given block is returned. If the given block is not inside any subsystem reference block, the output will be empty

### Examples

```
>> Simulink.SubsystemReference.getNearestParentSubsystemReferenceBlock(gcf)
```

```
ans =
```

```
 'mdl1/Subsystem/Subsystem Reference'
```

### Version History

Introduced in R2022a

`Simulink.SubsystemReference`

# getSystemOwningTheLock

Returns the system that has acquired the lock for editing

## Syntax

```
Simulink.SubsystemReference.getSystemOwningTheLock(path)
```

## Description

`Simulink.SubsystemReference.getSystemOwningTheLock(path)` For a given system, it returns the system that has acquired the lock for editing.

## Input Arguments

**path** — Path of the subsystem reference

(default) |

The path of the subsystem reference specified as a string. You can also specify the handle of the subsystem reference.

## Output Arguments

**path** — Path of the system owning the lock

The path of the system owning the lock for the given subsystem reference is returned. Output will be empty if no instance is editing.

## Examples

```
>>Simulink.SubsystemReference.getSystemOwningTheLock('mdl2/Subsystem Reference')
```

```
ans =
```

```
 'mdl1/Subsystem1'
```

## Version History

Introduced in R2022a

## See Also

`Simulink.SubsystemReference`

## isSystemLocked

Checks if the system is locked due to an edit or update to the subsystem reference

### Syntax

```
Simulink.SubsystemReference.isSystemLocked(path)
```

### Description

`Simulink.SubsystemReference.isSystemLocked(path)` returns `true`, if the system is locked because of an edit or update to the subsystem reference. It returns `false`, otherwise.

### Input Arguments

**path** — Path of the system

(default) | string

The path of the subsystem reference is specified as string. You can also specify the handle of the system.

### Examples

```
>>Simulink.SubsystemReference.isSystemLocked('mdl2/Subsystem Reference')
```

```
ans =
```

```
 logical
```

```
 1
```

### Version History

`Simulink.SubsystemReference`

# addPortConstraint

Create port constraint on a mask object

## Syntax

```
maskObj.addPortConstraint(pc),
maskObj.addPortConstraint(Name=Value)
```

## Description

`maskObj.addPortConstraint(pc)`, `maskObj.addPortConstraint(Name=Value)`. Creates port constraint on a mask object by adding options specified as name-value pair arguments.

## Input Arguments

### pc — Port constraint object

`Simulink.Mask.PortConstraint` object

Port constraint object, specified as a `Simulink.Mask.PortConstraint` object.

Data Types: `char` | `cell`

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

### Name — Name of the constraint

`string` (default) | character vector

Name of the constraint specified as a string.

### ParameterConditions — Parameters and its values

`cell array` (default)

Example: `ParameterConditions={ 'Name', 'parameter1', 'Values', {'10','20'}}`

sets `Parameter Conditions` as a `Parameter Condition` object with a `Name` of `'parameter1'` and `Values` of `{'10','20'}`.

### Rule — Data type, complexity, and dimension associated with the constraint

vector of `Simulink.Mask.PortConstraintRule` object

Datatype, complexity, and dimension for the constraint, specified as a cell array.

### DiagnosticLevel — Type of diagnostic message

`error` (default) | `warning`

The type of diagnostic message displayed when validation condition fails specified as `error` or `warning`.

**DiagnosticMessage — Diagnostic message**

character vector (default)

The diagnostic message that is displayed when the validation fails, specified as a character vector.

**Examples****Create Port Constraint with Mask Object**

```
% Create an instance of Simulink.Mask.ParameterCondition
p1 = Simulink.Mask.ParameterCondition;
p1.Name = 'param1';
p1.Values = {'on'};
p2=Simulink.Mask.ParameterCondition;
p1.Name = 'param2';
p1.Values ={'0', '1'};
```

Create a `Simulink.Mask.PortConstraint` object, then set its properties using dot notation. Use `p1` and `p2` as its Parameter Conditions.

```
pc = Simulink.Mask.PortConstraint;
pc.Name = 'pc1';
pc.ParameterConditions = ['p1','p2'];
pc.Rule.DataType = {'double','int8'};
pc.Rule.Complexity={'real'};
pc.DiagnosticLevel = 'warning';
pc.DiagnosticMessage = 'Invalid data at port';
```

Get the mask object `maskObj`, then add the port constraint to it.

```
maskObj.addPortConstraint(pc);
```

**Create Port Constraint Directly with Name-Value pair Arguments**

```
%Get mask object
aMaskObj = Simulink.Mask.get('model\subsystem');

%Add a port constraint directly using name-value pair arguments
aMaskObj.addPortConstraint('Name','pc3','ParameterConditions',
 { {'Name','parameter1', 'Values', {'10','20'} },
 {'Name', 'parameter2', 'Values', {'10','20'} } },
 'Rule', {'DataType', {'double','int32'}, 'Complexity', {'real'} } ,
 'DiagnosticLevel', 'error','DiagnosticMessage', 'Invalid Data')
```

```
ans =
```

```
PortConstraint with properties:
```

```

 Name: 'pc3'
ParameterConditions: [1x2 Simulink.Mask.ParameterCondition]
 Rule: [1x1 Simulink.Mask.PortConstraintRule]
DiagnosticLevel: 'error'
DiagnosticMessage: 'Invalid Data'
```

```
%Get the Rule object
pc1.Rule
```

```
ans =
```

```
PortConstraintRule with properties:
```

```
 DataType: {2×1 cell}
 Dimension: {0×1 cell}
 Complexity: {'real'}
 FixedPointConstraint: [1×1 Simulink.Mask.FixedPointConstraint]
```

## Version History

Introduced in R2022a

### Topics

“Validate Input and Output Port Signals Using Port Constraints”

# getPortConstraint

Displays attributes of specified port constraint

## Syntax

```
aMaskObj.getPortConstraint(name)
```

## Description

`aMaskObj.getPortConstraint(name)` displays the attributes of the specified port constraint.

## Input Arguments

### **name** — Name of the port constraint

character vector | string

Name of the port constraint, specified as a string. An error is displayed if the port constraint does not exist.

## Examples

### View Port Constraints

- `%Get mask object and view port constraints`  
`aMaskObj.getPortConstraint('pc3')`

```
ans =
```

```
PortConstraint with properties:
```

```
 Name: 'pc3'
ParameterConditions: [1x2 Simulink.Mask.ParameterCondition]
 Rule: [1x1 Simulink.Mask.PortConstraintRule]
DiagnosticLevel: 'error'
DiagnosticMessage: 'Invalid Data'
```

## Version History

Introduced in R2022a

## See Also

## Topics

“Validate Input and Output Port Signals Using Port Constraints”

# removePortConstraint

Remove specified port constraint

## Syntax

```
aMaskObj.removePortConstraint(name)
```

## Description

`aMaskObj.removePortConstraint(name)` removes the specified port constraint from the mask object.

## Input Arguments

### Name — Name of the port constraint

character vector (default) | string

Name of the port constraints to be removed from the mask object, specified as a character vector. An error is displayed if the port constraint does not exist.

Example: `aMaskObj.removePortConstraint('pc3');`

## Example

```
amaskObj=Simulink.Mask.get(model1/subsystem)
amaskObj.removePortConstraints('pc1')
amaskObj.getPortConstraint('pc1')
```

Constraints 'pc1' is not available in the block 'model1/Subsystem'.

## Version History

Introduced in R2022a

[addPortConstraint](#) | [getPortConstraint](#) | [removeAllPortConstraints](#)

## Topics

“Validate Input and Output Port Signals Using Port Constraints”

## removeAllPortConstraints

Remove all port constraints on masked block

### Syntax

```
aMaskObj.removeAllPortConstraints()
```

### Description

`aMaskObj.removeAllPortConstraints()` removes all the port constraints from the masked block.

### Examples

```
amaskObj=Simulink.Mask.get(model1/subsystem)
amaskObj.removeAllPortConstraints()
amaskObj.getPortConstraint('pc1')
```

Constraints 'pc1' is not available in the block 'model1/Subsystem'.

# addParameterCondition

Creates a mask parameter condition for constraint

## Syntax

```
constraintObj.addParameterCondition(pc)
constraintObj.addParameterCondition(Name=Value)
```

## Description

`constraintObj.addParameterCondition(pc)` and `constraintObj.addParameterCondition(Name=Value)` creates mask parameter conditions on the constraint using the name-value arguments.

## Input Arguments

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

#### **Name** — Name of mask parameter

character vector (default)

Name of the masked parameter specified as a string.

Data Types: `string`

#### **Value** — Possible values for mask parameter

cell array (default)

Values for the masked parameter specified as a cell array.

Data Types: `cell`

## Examples

Create an instance of `Simulink.Mask.PortConstraint`.

```
consObj = Simulink.Mask.PortConstraint
```

Add the parameter condition.

```
consObj.addParameterCondition('Name', 'p1', 'Values', {'10', '20'})
```

```
ans =
```

```
ParameterCondition with properties:
```

Name: 'p1'  
Values: {2×1 cell}

# getParameterCondition

Returns parameter condition associated with constraint

## Syntax

```
consObj.getParameterCondition(parameterName)
```

## Description

`consObj.getParameterCondition(parameterName)` displays the parameter name and its values.

## Input Arguments

### **parameterName** — Name of masked parameter

character vector (default)

Name of the masked parameter specified, as a character vector or string.

Data Types: `char` | `string`

## Examples

```
consObj.addParameterCondition('Name','p1','Values',{'10','20'})
consObj.getParameterCondition('p1')
```

```
ans =
```

```
ParameterCondition with properties:
```

```
 Name: 'p1'
 Values: {2×1 cell}
```

## removeParameterCondition

Removes specified parameter condition on constraint

### Syntax

```
consObj.removeParameterCondition(parameterName)
```

### Description

`consObj.removeParameterCondition(parameterName)` removes the specified parameter condition from the constraint.

### Input Arguments

**parameterName — Name of masked parameter**

character vector (default) | string

Name of the masked parameter to be removed from the constraint, specified as a character vector.

Data Types: `string`

### Example

Add parameter condition.

```
consObj=amaskObj.getPortConstraint('pcl')
consObj.addParameterCondition('Name','p1','Values',{'10','20'})
```

Remove parameter condition

```
consObj.removeParameterCondition('p1')
consObj.getParameterCondition('p1')
```

```
Parameter condition for parameter name 'p1'
not present in port constraint 'pcl'.
```

## Version History

Introduced in R2022a

## setRule

Create rules that are validated against data at port

### Syntax

```
consObj.setRule(rule)
consObj.setRule(Name=Value)
```

### Description

`consObj.setRule(rule)` adds the object of type `Simulink.Mask.PortConstraintRule` rule to the object.

`consObj.setRule(Name=Value)` creates a rule using name-value arguments and adds it to port constraint object.

### Input Arguments

#### rule — Rule object

`Simulink.Mask.PortConstraintRule` object (default)

Rule object, specified as a `Simulink.Mask.PortConstraintRule` object.

#### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

#### Data Type — Permitted data types

cell array (default) | string

Permitted data types, specified as a cell array. The allowed values are `int`, `double`, `fixed point` and so on.

#### Dimension — Permitted dimension for port signals

cell array of character vector (default) | string

The allowed values in the array are `scalar`, `vector`, `2dmatrix`, `ndmatrix`, `rowvector`, and `colvector`.

#### Complexity — Complexity of port signal

character vector (default) | string

The allowed complexity, specified as a cell array. The allowed values in the array are `real` and `complex`.

#### FixedPointConstraint — Fixed point constraints of port signal

character vector (default)

Set the `Signedness`, `bias`, `Wordlength`, and `Scaling` for fixed point data type.

## Examples

### Set Rules Using ConstraintRule Object

```
%Get an instance of Simulink.Mask.PortConstraintRule
consObj=Simulink.Mask.PortConstraint;
rule = Simulink.Mask.PortConstraintRule;
pcl.DataType = {'double','int32'};
pcl.complexity = {'real'};
consObj.setRule(rule);
```

### Set Rules as Name-Value Pair Arguments

```
% Create an instance of Simulink.Mask.PortConstraint to set the rule
constraint.setRule('DataType',{'fixedpoint'},'Dimension',{'scalar'},
'Complexity',{'real'})
```

```
ans =
```

```
PortConstraintRule with properties:
```

```
 DataType: {'fixedpoint'}
 Dimension: {'scalar'}
 Complexity: {'real'}
FixedPointConstraint: [1x1 Simulink.Mask.FixedPointConstraint]
```

```
rule = constraint.getRule
```

```
rule =
```

```
PortConstraintRule with properties:
```

```
 DataType: {'fixedpoint'}
 Dimension: {'scalar'}
 Complexity: {'real'}
FixedPointConstraint: [1x1 Simulink.Mask.FixedPointConstraint]
```

```
%Define the properties of FixedPointConstraint
rule.FixedPointConstraint.Scaling = "binary";
rule.FixedPointConstraint.Signedness = "unsigned";
rule.FixedPointConstraint.WordLength = "[8:12]";
rule.FixedPointConstraint
```

```
ans =
```

```
FixedPointConstraint with properties:
```

```
 Scaling: 'binary'
 Bias: ''
Signedness: 'unsigned'
WordLength: '[8:12]'
```

## Version History

Introduced in R2022a

**See Also**

removeRule

**Topics**

“Validate Input and Output Port Signals Using Port Constraints”

# removeRule

Remove all datatype, complexity, and dimension attributes of port constraint rule

## Syntax

```
consObj.removeRule()
```

## Description

`consObj.removeRule()` clears all the data type, complexity, and dimension attributes of the port constraint rule. The empty rule object is still available in the port constraint object.

## Examples

```
consObj=Simulink.Mask.PortConstraint;
rule = Simulink.Mask.PortConstraintRule;
pcl.DataType = {'double','int32'};
pcl.complexity = {'real'};
consObj.setRule(rule);
consObj.removeRule();
```

“Validate Input and Output Port Signals Using Port Constraints”

# addPortConstraintAssociation

Associate port constraints to port identifiers

## Syntax

```
aMaskObj.addPortConstraintAssociation(name, port identifiers)
```

## Description

`aMaskObj.addPortConstraintAssociation(name, port identifiers)` associates specified port constraint to the specified port identifiers. You can associate multiple port identifiers to the same port constraint.

## Input Arguments

### Name — Name of port constraint

character vector (default) | string

Name of the port constraint, specified as a string.

Data Types: char | string

### portIdentifier — Name of port identifiers

cell array (default)

Name of the port identifiers, specified as a cell array. You can associate same port constraint with multiple port identifiers.

Data Types: cell

## Examples

```
% Get a mask object
aMaskObj = Simulink.Mask.get(gcb);
aMaskObj.PortIdentifiers;
aMaskObj.addPortConstraintAssociation('pc3',{'pi_1'});
```

## Version History

Introduced in R2022a

# getPortConstraintAssociation

Displays port identifiers associated with port constraint

## Syntax

```
aMaskObj.getPortConstraintAssociation(name)
```

## Description

`aMaskObj.getPortConstraintAssociation(name)` returns the port identifiers associated with port constraint.

## Input Arguments

### **name — Name of port constraint**

character vector (default) | string

Name of the port constraint, specified as a string.

Data Types: char | string

## Examples

```
aMaskObj.getPortConstraintAssociation('pc3')
```

## Version History

Introduced in R2022a

## removePortConstraintAssociation

Remove association between port constraint and port identifiers

### Syntax

```
aMaskObj.removePortConstraintAssociation(portConstraint, portIdentifier)
aMaskObj.removePortConstraintAssociation(portConstraint)
```

### Description

`aMaskObj.removePortConstraintAssociation(portConstraint, portIdentifier)` removes the association between the specified port constraint and the port identifier.

`aMaskObj.removePortConstraintAssociation(portConstraint)` removes all the associated port identifiers with the port constraint.

### Input Arguments

#### **portConstraint** — Name of port constraint

character vector (default) | string

Name of the port constraint, specified as a string.

Data Types: char | string

#### **portIdentifier** — Port identifier

character vector (default) | string

Name of the port identifier to be removed from the port constraint association is specified as a string.

Data Types: char | string

### Examples

```
%Specify the port constraint and port identifier
aMaskObj.removePortConstraintAssociation('pc3','pi_1');
%Specify port constraint
aMaskObj.removePortConstraintAssociation('pc3');
```

## Version History

Introduced in R2022a

# removeAllPortConstraintAssociation

Removes the associations of all port constraints from mask

## Syntax

```
aMaskObj.removeAllPortConstraintAssociation()
```

## Description

`aMaskObj.removeAllPortConstraintAssociation()` removes the associations of all the port constraints from the mask object.

## Examples

```
aMaskObj.removeAllPortConstraintAssociations;
```

## Version History

**Introduced in R2022a**

## addPortIdentifier

Creates a port identifier to identify port in mask

### Syntax

```
maskObj.addPortIdentifier(Name=Value)
```

### Description

`maskObj.addPortIdentifier(Name=Value)` creates a port identifier to identify a particular port in the mask object.

### Input Arguments

#### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, . . . , NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

#### Name — Name for the port identifier

empty character vector (default) | string

Name of the port identifier, specified as a character vector. This name uniquely identifies the port identifier in the mask.

Data Types: `char` | `string`

#### Type — Type of port

`input` (default) | `output`

Type of the port, specified as either `Input` or `Output`.

Data Types: `string`

#### IdentifierType — Type of identifier

`index` (default) | `name`

Type of identifier, specified as `name` or `index`. Specify `name` if you want to identify the ports using a name, otherwise specify `index`, if you want to identify the ports using a port index.

Data Types: `string`

#### Identifier — Port identifier appearing in block

character vector (default)

Port identifier appearing in the block, specified as a character vector. If the `IdentifierType` is `index`, you can specify the identifiers in one of these formats:

- **Index:** The index to associate the port with the port identifier. For example, '3' associates port '3' with the port identifier.

- Lower port index:Upper port index: The lower port index and upper port index to associate all the ports between the indices with the port identifier. For example, '2:4' associates ports 2, 3, and 4 with the port identifier.
- List of port indices: The ports separated by comma to associate the ports with the port identifier. For example, 3,5,7. This associates the ports 3, 5, and 7 with the port identifier. Duplicates are not allowed.
- : The name of the port is specified.

Port name: String: If IdentifierType is name, this parameter is the name of the port.

Data Types: string

## Examples

```
amaskObj.addPortIdentifier('Name','pi1','Type','Input','IdentifierType','index','Identifier','2')
```

```
ans =
```

```
PortIdentifier with properties:
```

```
 Name: 'pi1'
 Type: 'Input'
IdentifierType: 'index'
Identifier: '2'
```

```
aMaskObj.addPortIdentifier('Name','pi2','IdentifierType','name','Identifier','common_gain')
```

```
ans =
```

```
PortIdentifier with properties:
```

```
 Name: 'pi2'
 Type: ''
IdentifierType: 'name'
Identifier: 'common_gain'
```

## Version History

Introduced in R2022a

## See Also

## getPortIdentifier

Displays attributes of specified port identifier

### Syntax

```
aMaskObj.getPortIdentifier(portIdentifier)
```

### Description

`aMaskObj.getPortIdentifier(portIdentifier)` displays the attributes of the specified port identifier.

### Input Arguments

#### **portIdentifier** — Name of port identifier

character vector (default) | string

Name of the port identifier, specified as character vector or string.

Data Types: char | string

### Examples

```
aMaskObj.getPortIdentifier('pil')
```

```
ans =
```

```
PortIdentifier with properties:
```

```
 Name: 'pil'
 Type: 'Input'
IdentifierType: 'index'
 Identifier: '2'
```

## Version History

**Introduced in R2022a**

### See Also

# removePortIdentifier

Removes specified port identifier from mask object

## Syntax

```
aMaskObj.removePortIdentifier(portIdentifier)
```

## Description

`aMaskObj.removePortIdentifier(portIdentifier)` removes the specified port identifier on the mask object.

## Input Arguments

### **portIdentifier** — Name of port identifier

(default) | string

Name of the port identifier to be removed from the mask object, specified as a string or character vector.

Data Types: char | string

## Example

Add port identifier

```
amaskObj.addPortIdentifier('Name','pil','Type','Input','IdentifierType','index','Identifier','2')
```

Remove port identifier

```
amaskObj.removeAllPortIdentifier('pil');
amaskObj.getPortIdentifier('pil');
```

Port Identifier 'pil' does not exist in the block 'modell/Subsystem'.

## Version History

Introduced in R2022a

## See Also

## Topics

“Validate Input and Output Port Signals Using Port Constraints”

## removeAllPortIdentifiers

Removes all port identifiers from mask object

### Syntax

```
aMaskObj.removeAllPortIdentifiers()
```

### Description

`aMaskObj.removeAllPortIdentifiers()` removes all the port identifiers from the mask object.

### Examples

Add port identifier

```
amaskObj.addPortIdentifier('Name','pi1','Type','Input','IdentifierType','index','Identifier','2')
```

Remove port identifiers

```
amaskObj.removeAllPortIdentifiers();
amaskObj.getPortIdentifier('pi1');
```

Port Identifier 'pi1' does not exist in the block 'model1/Subsystem'.

# Simulink.Mask.Util.getDialogControlsByType

Mask dialog controls based on specified parameter type

## Syntax

```
Simulink.Mask.Util.getDialogControlsByType(blockPath,Type)
```

## Description

`Simulink.Mask.Util.getDialogControlsByType(blockPath,Type)` returns the mask dialog controls for the specified block based on the specified type.

## Examples

### Display Dialog Controls by Its Type

Open the model `slexMaskLookupTableControlExample`. Then, get the mask dialog controls for the Sharing Breakpoints block that are based on the `lookuptablecontrol` type.

```
openExample('simulink_masking/MaskLookupTableControlExample')
Simulink.Mask.Util.getDialogControlsByType
('slexMaskLookupTableControlExample/Sharing Breakpoints','lookuptablecontrol')
```

```
ans =
```

```
1x2 LookupTableControl array with properties:
```

```
Name
Prompt
WordWrap
Row
Enabled
Visible
HorizontalStretch
Tooltip
Callback
Table
Breakpoints
LookupTableObject
DataSpecification
```

## Input Arguments

### **blockPath** — Handle to block path

character vector (default) | string

Name of the block or the path to the block, specified as a character vector or string.

Data Types: char | string

**Type — Type of dialog control**

character vector (default) | string

The type of dialog control, specified as a character vector or string.

Data Types: char | string

**Version History**

**Introduced in R2022b**

**See Also**

`Simulink.Mask.Util.hasDialogControlOfType`

# Simulink.Mask.Util.hasDialogControlOfType

Determine if dialog control of specified type is present in mask

## Syntax

```
Simulink.Mask.Util.hasDialogControlOfType(blockPath, Type)
```

## Description

`Simulink.Mask.Util.hasDialogControlOfType(blockPath, Type)` determines if any dialog controls of the specified type are present in the mask dialog. This method returns a logical 0 or 1.

## Examples

### Display Existence of Specific Dialog Control Mask Dialog

Open the model `slexMaskLookupTableControlExample`. Then, check if any dialog controls of the `lookupablecontrol` type are present in the `Sharing Breakpoints` block.

```
openExample('simulink_masking/MaskLookupTableControlExample')
Simulink.Mask.Util.hasDialogControlOfType('slexMaskLookupTableControlExample/Sharing Breakpoints')

ans =

 logical

 1
```

## Input Arguments

### **blockPath** — Handle to block path

character vector (default) | string

Name of the block or the path to the block, specified as a character vector or string.

Data Types: char | string

### **Type** — Type of dialog control

character vector (default) | string

The type of dialog control, specified as a character vector or string.

Data Types: char | string

## Version History

# Mask Icon Drawing Commands

---

|            |                                                                 |
|------------|-----------------------------------------------------------------|
| color      | Change drawing color of subsequent mask icon drawing commands   |
| disp       | Display text on masked subsystem icon                           |
| dpoly      | Display transfer function on masked subsystem icon              |
| droots     | Display transfer function on masked subsystem icon              |
| fprintf    | Displays variable text centered on masked subsystem icon        |
| image      | Display RGB image on masked subsystem icon                      |
| patch      | Draw color patch of specified shape on masked subsystem icon    |
| plot       | Draw graph connecting series of points on masked subsystem icon |
| port_label | Draw port label on masked subsystem icon                        |
| text       | Display text at specific location on masked subsystem icon      |
| block_icon | Promote a block icon image to the masked Subsystem              |

## color

Change drawing color of subsequent mask icon drawing commands

### Syntax

```
color(colorstr)
```

### Description

`color(colorstr)` sets the drawing color of all subsequent mask drawing commands to the color specified by the string `colorstr`.

### Examples

#### Set the Drawing Color of all Subsequent Mask Drawing Commands

Set the colors cyan and magenta in the mask icon of the Subsystem.

```
color('cyan');
droots([-1], [-2 -3], 4)
color('magenta')
port_label('input',1,'in')
port_label('output',1,'out')
```

### Input Arguments

**colorstr** — Color for the mask drawing commands is specified as string.

blue | green | red | cyan | magenta | yellow | black

Entering any other string or specifying the color using RGB values results in a warning at the MATLAB command prompt. Simulink ignores the color change. The specified drawing color does not influence the color used by the `patch` or `image` drawing commands.

Data Types: `string`

## Version History

Introduced in R2006b

### See Also

`droots` | `port_label`

## disp

Display text on masked subsystem icon

### Syntax

```
disp(text)
disp(text, 'texmode', 'on')
```

### Description

`disp(text)` displays *text* centered on the block icon. *text* is any MATLAB expression that evaluates to a string.

`disp(text, 'texmode', 'on')` allows you to use TeX formatting commands in *text*. The TeX formatting commands in turn allow you to include symbols and Greek letters in icon text. See “Interpreter” for information on the TeX formatting commands supported by Simulink software.

### Examples

The following command

```
disp('\itEquation: \alpha^2 + \beta^2 \rightarrow \gamma^2, \chi, \phi_3 = cool', 'texmode', 'on')
```

draws the equation that appears on this masked block icon.

Equation

## Version History

Introduced in R2007a

### See Also

`fprintf` | `port_label` | `text`

## dpoly

Display transfer function on masked subsystem icon

### Syntax

```
dpoly(num, den)
```

```
dpoly(num, den, 'character')
```

### Description

`dpoly(num, den)` displays the transfer function whose numerator is *num* and denominator is *den*.

`dpoly(num, den, 'character')` specifies the name of the transfer function independent variable. The default is *s*.

When Simulink draws the block icon, the initialization commands execute and the resulting equation appears on the block icon, as in the following examples:

- To display a continuous transfer function in descending powers of *s*, enter

```
dpoly(num, den)
```

For example, for `num = [0 0 1]`; and `den = [1 2 1]` the icon looks like:

$$\frac{1}{s^2 + 2s + 1}$$

- To display a discrete transfer function in descending powers of *z*, enter

```
dpoly(num, den, 'z')
```

For example, for `num = [0 0 1]`; and `den = [1 2 1]`; the icon looks like:

$$\frac{1}{z^2 + 2z + 1}$$

- To display a discrete transfer function in ascending powers of  $1/z$ , enter

```
dpoly(num, den, 'z-')
```

For example, for *num* and *den* as defined previously, the icon looks like:

$$\frac{z^{-2}}{1 + 2z^{-1} + z^{-2}}$$

If the parameters are not defined or have no values when you create the icon, Simulink software displays three question marks (? ? ?) in the icon. When you define parameter values in the Mask

Settings dialog box, Simulink software evaluates the transfer function and displays the resulting equation in the icon.

**See Also**

`disp` | `port_label` | `text` | `droots`

## droots

Display transfer function on masked subsystem icon

### Syntax

```
droots(zero, pole, gain)
droots(zero, pole, gain, 'z')
droots(zero, pole, gain, 'z-')
```

### Description

`droots(zero, pole, gain)` displays the transfer function whose *zero* is *zero*, *pole* is *pole*, and *gain* is *gain*.

`droots(zero, pole, gain, 'z')` and `droots(zero, pole, gain, 'z-')` expresses the transfer function in terms of *z* or  $1/z$ .

When Simulink draws the block icon, the initialization commands execute and the resulting equation appears on the block icon, as in the following examples:

- To display a zero-pole gain transfer function, enter

```
droots(z, p, k)
```

For example, the preceding command creates this icon for these values:

```
z = []; p = [-1 -1]; k = 1;
```

If the parameters are not defined or have no values when you create the icon, Simulink software displays three question marks (? ? ?) in the icon. When you define parameter values in the Mask Settings dialog box, Simulink software evaluates the transfer function and displays the resulting equation in the icon.

## Version History

Introduced in R2007a

### See Also

`disp` | `port_label` | `text` | `dpoly`

# fprintf

Displays variable text centered on masked subsystem icon

## Syntax

```
fprintf(text)
fprintf(formatspec,var)
```

## Description

`fprintf(text)` command displays formatted text centered on the icon .

`fprintf(formatspec,var)` formats `var` as specified in `formatSpec`.

## Examples

### Display Text on the Block Icon

Display the text Hello on the icon.

```
fprintf('Hello');
```

### Display Formatted Text on the Block Icon

Convert the character a to an integer 97 and display it on the block icon.

```
myvar = 'a'
fprintf('hello = %d',myvar);
```

## Input Arguments

### text — Text that appears on the block

(default) | string

Text that appears on the block is specified as string

Data Types: char | string

### formatspec — Formatting character for the variable

(default) | string

Conversion character for the variable is specified.

Data Types: char | string

### Formatting Operator

A formatting operator starts with a percent sign, %, and ends with a conversion character. It is mandatory to specify the conversion character. Optionally, you can specify identifier, flags, field width, precision, and subtype operators between % and the conversion character. Spaces are invalid between operators and are shown here only for readability.

### Conversion Character

This table shows conversion characters to format numeric and character data as text.

| Value Type            | Conversion | Details                                                                                                                             |
|-----------------------|------------|-------------------------------------------------------------------------------------------------------------------------------------|
| Integer, signed       | %d or %i   | Base 10                                                                                                                             |
| Integer, unsigned     | %u         | Base 10                                                                                                                             |
|                       | %o         | Base 8 (octal)                                                                                                                      |
|                       | %x         | Base 16 (hexadecimal), lowercase letters a-f                                                                                        |
|                       | %X         | Same as %x, uppercase letters A-F                                                                                                   |
| Floating-point number | %f         | Fixed-point notation (Use a precision operator to specify the number of digits after the decimal point.)                            |
|                       | %e         | Exponential notation, such as 3.141593e+00 (Use a precision operator to specify the number of digits after the decimal point.)      |
|                       | %E         | Same as %e, but uppercase, such as 3.141593E+00 (Use a precision operator to specify the number of digits after the decimal point.) |
|                       | %g         | The more compact of %e or %f, with no trailing zeros (Use a precision operator to specify the number of significant digits.)        |
|                       | %G         | The more compact of %E or %f, with no trailing zeros (Use a precision operator to specify the number of significant digits.)        |
| Characters or strings | %c         | Single character                                                                                                                    |
|                       | %s         | Character vector or string array. The type of the output text is the same as the type of formatSpec.                                |

#### var – Variable containing the value is specified

(default) | string

The variable is formatted as per the formatting character specified in formatSpec.

**Note** While this `fprintf` function is identical in name to its corresponding MATLAB function, it provides only the functionality described on this page.

---

## **Version History**

**Introduced before R2006a**

`disp` | `port_label` | `text`

## image

Display RGB image on masked subsystem icon

### Syntax

```
image(a)
image(a, position)
image(a, position, rotation)
```

### Description

`image(a)` displays the image *a*, where *a* is an *m*-by-*n*-by-3 array of RGB values. If necessary, use the MATLAB commands `imread` and `ind2rgb` to read and convert bitmap files (such as GIF) to the necessary matrix format.

`image(a, position)` creates the image at the specified position as follows.

| Position                    | Description                                                                                                                                                                                     |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>[x, y, w, h]</code>   | Position ( <i>x</i> , <i>y</i> ) and size ( <i>w</i> , <i>h</i> ) of the image where the position is relative to the lower-left corner of the mask. The image scales to fit the specified size. |
| <code>'center'</code>       | Center of the mask                                                                                                                                                                              |
| <code>'top-left'</code>     | Top left corner of the mask, unscaled                                                                                                                                                           |
| <code>'bottom-left'</code>  | Bottom left corner of the mask, unscaled                                                                                                                                                        |
| <code>'top-right'</code>    | Top right corner of the mask, unscaled                                                                                                                                                          |
| <code>'bottom-right'</code> | Bottom right corner of the mask, unscaled                                                                                                                                                       |

`image(a, position, rotation)` allows you to specify whether the image rotates (`'on'`) or remains stationary (`'off'`) as the icon rotates. The default is `'off'`.

---

**Note** Images in formats `.cur`, `.hdf4`, `.ico`, `.pcx`, `.ras`, `.xwd`, `.svg` (full version) cannot be used as block mask images.

---

### Examples

You can use different commands depending on your requirement to add an image. These commands can be added in the **Icon & Ports** pane of the Mask Editor dialog box.

| Syntax                                                                              | Description                                                                               |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------|
| <code>image('icon.jpg')</code>                                                      | Reads the icon image from a JPEG file named <code>icon.jpg</code> in the MATLAB path.     |
| <code>[data, map]=image('label.gif');</code><br><code>pic=ind2rgb(data,map);</code> | Reads and converts a GIF file, <code>label.gif</code> , to the appropriate matrix format. |
| <code>image(pic)</code>                                                             | Reads the converted label image.                                                          |

## **Version History**

Introduced before R2006a

### **See Also**

patch | plot

## patch

Draw color patch of specified shape on masked subsystem icon

### Syntax

```
patch(x, y)
patch(x, y, [r g b])
```

### Description

`patch(x, y)` creates a solid patch having the shape specified by the coordinate vectors `x` and `y`. The patch's color is the current foreground color.

`patch(x, y, [r g b])` creates a solid patch of the color specified by the vector `[r g b]`, where `r` is the red component, `g` the green, and `b` the blue. For example,

```
patch([0 .5 1], [0 1 0], [1 0 0])
```

creates a red triangle on the mask's icon.

### Examples

The command

```
patch([0 .5 1], [0 1 0], [1 0 0])
```

creates a red triangle on the mask's icon.

## Version History

Introduced before R2006a

`image` | `plot`

# plot

Draw graph connecting series of points on masked subsystem icon

## Syntax

```
plot(Y)
plot(X1,Y1,X2,Y2,...)
```

## Description

`plot(Y)` plots, for a vector  $Y$ , each element against its index. If  $Y$  is a matrix, it plots each column of the matrix as though it were a vector.

`plot(X1,Y1,X2,Y2,...)` plots the vectors  $Y1$  against  $X1$ ,  $Y2$  against  $X2$ , and so on. Vector pairs must be the same length and the list must consist of an even number of vectors.

Plot commands can include `NaN` and `inf` values. When Simulink software encounters `NaNs` or `infs`, it stops drawing, and then begins redrawing at the next numbers that are not `NaN` or `inf`. The appearance of the plot on the icon depends on the units defined by the **Icon units** option in the Mask Editor.

Simulink software displays three question marks (? ? ?) in the block icon and issues warnings in these situations:

- When you have not defined values for the parameters used in the drawing commands (for example, when you first create the mask, but have not yet entered values in the Mask Settings dialog box)
- When you enter a masked block parameter or drawing command incorrectly

The `plot` command in masking supports a subset of the syntax of the MATLAB `plot` command. The `plot` command in masking supports all numeric data types and accepts only numbers as input.

## Examples

The command

```
plot([0 1 5], [0 0 4])
```

generates the plot that appears on the icon for the Ramp block, in the Sources library.

## port\_label

Draw port label on masked subsystem icon

### Syntax

```
port_label('port_type', port_number, 'label')
port_label('port_type', port_number, 'label', 'texmode', 'on')
```

### Description

`port_label('port_type', port_number, 'label')` draws a label on a port. Valid values for `port_type` include the following.

| Value   | Description                                                                          |
|---------|--------------------------------------------------------------------------------------|
| input   | Simulink input port                                                                  |
| output  | Simulink output port                                                                 |
| lconn   | Physical Modeling connection port on the left side of a masked subsystem             |
| rconn   | Physical Modeling connection port on the right side of a masked subsystem            |
| Enable  | Label for the enable port in a masked Triggered or Enabled and Triggered subsystem.  |
| trigger | Label for the trigger port in a masked Triggered or Enabled and Triggered subsystem. |
| action  | Label for the action port in a masked Switch Case Action Subsystem.                  |

The input argument `port_number` is an integer, and `label` is text specifying the port's label.

---

**Note** Physical Modeling port labels are assigned based on the nominal port location. If the masked subsystem has been rotated or flipped, for example, a port labeled using 'lconn' as the `port_type` may not appear on the left side of the block.

---

`port_label('port_type', port_number, 'label', 'texmode', 'on')` lets you use TeX formatting commands in `label`. The TeX formatting commands allow you to include symbols and Greek letters in the port label. See "Interpreter" for information on the TeX formatting commands that the Simulink software supports.

---

**Note** Simulink does not support LaTeX formatting commands.

---

### Examples

The command

```
port_label('input', 1, 'a')
```

defines a as the label of input port 1.

The command

```
port_label('Enable','En')
```

defines En as the label of Enable port.

The command

```
port_label('trigger','Tr')
```

defines Tr as the label of trigger port.

The command

```
port_label('action','Switch():')
```

defines Switch(): as the label of action port.

The command

```
port_label('trigger','\surd m','interpreter','tex')
```

defines the label of trigger port with TeX interpretation.

The commands

```
disp('Card\nSwapper');
port_label('input',1,'\spadesuit','texmode','on');
port_label('output',1,'\heartsuit','texmode','on');
```

draw playing card symbols as the labels of the ports on a masked subsystem.

## Version History

Introduced before R2006a

disp | fprintf | text

## text

Display text at specific location on masked subsystem icon

### Syntax

```
text(x, y, 'text')
text(x, y, 'text', 'horizontalAlignment', 'halign',
 'verticalAlignment', 'valign')
text(x, y, 'text', 'texmode', 'on')
```

### Description

The `text` command places a character vector at a location specified by the point  $(x, y)$  whose units are defined by the **Icon units** option in the Mask Editor.

`text(x,y, text, 'texmode', 'on')` allows you to use TeX formatting commands in `text`. The TeX formatting commands in turn allow you to include symbols and Greek letters in icon text. See “Interpreter” for information on the TeX formatting commands supported by Simulink software.

You can optionally specify the horizontal and/or vertical alignment of the text relative to the point  $(x, y)$  in the `text` command.

The `text` command offers the following horizontal alignment options.

| Option   | Aligns                                           |
|----------|--------------------------------------------------|
| 'left'   | The left end of the text at the specified point  |
| 'right'  | The right end of the text at the specified point |
| 'center' | The center of the text at the specified point    |

The `text` command offers the following vertical alignment options.

| Option   | Aligns                                               |
|----------|------------------------------------------------------|
| 'base'   | The baseline of the text at the specified point      |
| 'bottom' | The bottom line of the text at the specified point   |
| 'middle' | The midline of the text at the specified point       |
| 'cap'    | The capitals line of the text at the specified point |
| 'top'    | The top of the text at the specified point           |

---

**Note** While this `text` function is identical in name to its corresponding MATLAB function, it provides only the functionality described on this page.

---

### Examples

#### Text Alignment

Center the mask icon text foobar.

```
text(0.5, 0.5, 'foobar', 'horizontalAlignment', 'center')
```

#### Equation in Mask Icon

Draw a left-aligned equation as the mask icon.

In the Icons & Ports dialog of the Mask Editor, set **Icon units** to Normalized.

In the **Icon drawing commands** text box, enter the following command.

```
text(.05,.5,'\itEquation:} \Sigma \alpha^2 +
\beta^2 \rightarrow \infty, \Pi, \phi_3 = {\bfcool}',
'hor','left','texmode','on')
```

Equation

## block\_icon

Promote a block icon image to the masked Subsystem

### Syntax

```
block_icon(BlockName)
```

### Description

`block_icon(BlockName)` displays the underneath block icon image on the masked Subsystem icon. For more information, see `slexMaskDrawingExamples`.

### Input Arguments

#### **BlockName** — Name of the underneath block

string

The name of the underneath block whose icon image you want to display on the Subsystem block that encapsulates the specified block. For more information, see `slexMaskDrawingExamples`

Data Types: `string`

### Version History

**Introduced in R2006b**

| atrace   | Set algebraic loop trace level for                                                    |
| bafter   | Insert breakpoint after specified method                                              |
| break    | Insert breakpoint before specified method                                             |
| bshow    | Show specified block                                                                  |
| clear    | Clear breakpoints from model                                                          |
| continue | Continue simulation                                                                   |
| disp     | Display block's I/O when simulation stops                                             |
| ebreak   | Enable (or disable) breakpoint on solver errors                                       |
| elist    | List simulation methods in order in which they are executed during simulation         |
| emode    | Toggle model execution between accelerated and normal mode                            |
| etrace   | Enable or disable method tracing                                                      |
| help     | Display help for debugger commands                                                    |
| nanbreak | Set or clear nonfinite value break mode                                               |
| next     | Advance simulation to start of next method at current level in model's execution list |
| probe    | I/O and state data for blocks                                                         |
| quit     | Stop simulation debugger                                                              |
| rbreak   | Break simulation before solver reset                                                  |
| run      | Run simulation to completion                                                          |
| slist    | Sorted list of model blocks                                                           |
| states   | Current state values                                                                  |
| status   | Debugging options in effect                                                           |
| step     | Advance simulation by one or more methods                                             |
| stimes   | Model sample times                                                                    |
| stop     | Stop simulation                                                                       |
| strace   | Set solver trace level                                                                |
| systems  | List nonvirtual systems of model                                                      |
| tbreak   | Set or clear time breakpoint                                                          |
| trace    | Display block's I/O each time block executes                                          |
| undisp   | Remove block from debugger's list of display points                                   |
| untrace  | Remove block from debugger's list of trace points                                     |
| where    | Display current location of simulation in simulation loop                             |
| xbreak   | Break when debugger encounters step-size-limiting state                               |
| zcbreak  | Toggle breaking at nonsampled zero-crossing events                                    |
| zclist   | List blocks containing nonsampled zero crossings                                      |

## ashow

Show algebraic loop

### Syntax

```
ashow
ashow gcb
ashow s:b
ashow s#n
ashow clear
```

### Description

ashow returns a list of algebraic loops in the current model.

ashow gcb returns the algebraic loop containing the currently selected block.

ashow s:b returns the algebraic loop containing block b in system s

ashow s#n returns the n<sup>th</sup> algebraic loop in the system s

ashow clear removes algebraic loop highlighting in the current model

### Examples

#### Use ashow to Find Algebraic Loops in the Simulink Debugger

This example shows you how to find algebraic loops and step through a simulation in the Simulink Debugger.

#### Highlight algebraic loops during debugging

Open the `ex_sl_demo_hydcyl` model. Start the Simulink debugger. Select **Debug > Breakpoints List > Debug Model** from the toolstrip. You can also start the debugger from the MATLAB command line using `sldebug`

```
sldebug('ex_sl_demo_hydcyl');
```

Run the debugger. In the MATLAB command prompt, enter:

```
ashow
```

```
Found 1 Algebraic loop(s):
System#Algebraic loop id, number of blocks in loop
- 0#1, 9 blocks in loop
```

The `ashow` command returns the algebraic loops in the model as well as the number of blocks contained within.

### Find algebraic loops containing selected block

Select any nonvirtual block in the model. For example, select the PlotResults block, which is a Scope block.

In the MATLAB command prompt, enter

```
ashow gcb
```

```
Block sldemo_hydcyl/PlotResults isn't in an algebraic loop.
```

The PlotResults block does not belong in any algebraic loop.

In the MATLAB command prompt, enter

```
ashow gcb
```

```
- sldemo_hydcyl/Valve//Cylinder//Piston//Spring Assembly/Control Valve Flow/IC
- sldemo_hydcyl/Valve//Cylinder//Piston//Spring Assembly/Control Valve Flow/signed sqrt
- sldemo_hydcyl/Valve//Cylinder//Piston//Spring Assembly/Control Valve Flow/Product
- sldemo_hydcyl/Valve//Cylinder//Piston//Spring Assembly/laminar flow pressure drop
- sldemo_hydcyl/Valve//Cylinder//Piston//Spring Assembly/Sum7
- sldemo_hydcyl/Pump/IC
- sldemo_hydcyl/Valve//Cylinder//Piston//Spring Assembly/Control Valve Flow/Sum1 (algebraic vari
- sldemo_hydcyl/Pump/Sum1
- sldemo_hydcyl/Pump/leakage (algebraic variable)
```

The laminar flow pressure drop block is contained in an algebraic loop with 8 other blocks.

## Input Arguments

### **gcb** – Currently selected block

gcb

Currently selected block, specified as gcb.

Example: `ashow gcb`

### **s:b** – Block in model

system index:block index

Block index in the model, specified as system index:block index.

Example: `ashow 1:1`

Data Types: double

### **s#n** – Algebraic loop index

system index#loop index

Algebraic loop index, specified as system index#loop index

Example: `ashow 0#1`

Data Types: double

### **clear** – Remove highlighting

clear

Remove algebraic loop highlighting from model.

## **Version History**

Introduced before R2006a

### **See Also**

atrace

### **Topics**

“Identify Algebraic Loops in Your Model”

## atrace

Set algebraic loop trace level for

### Syntax

```
atrace level
```

```
at level
```

### Arguments

level            Trace level (0 = none, 4 = everything).

### Description

The `atrace` command sets the algebraic loop trace level for a simulation.

| Command               | Displays for Each Algebraic Loop                                                                                  |
|-----------------------|-------------------------------------------------------------------------------------------------------------------|
| <code>atrace 0</code> | No information                                                                                                    |
| <code>atrace 1</code> | The loop variable solution, the number of iterations required to solve the loop, and the estimated solution error |
| <code>atrace 2</code> | Same as level 1                                                                                                   |
| <code>atrace 3</code> | Level 2 plus Jacobian matrix used to solve loop                                                                   |
| <code>atrace 4</code> | Level 3 plus intermediate solutions of the loop variable                                                          |

```

```
bafter modelName <(taskId)sysIdx:blkIdx | gcb> [mth] [tid:TID]
```

## Arguments

|                  |                                                                                                   |
|------------------|---------------------------------------------------------------------------------------------------|
| <i>mid</i>       | Method ID                                                                                         |
| <i>taskId</i>    | Task ID                                                                                           |
| <i>blkIdx</i>    | Block ID                                                                                          |
| <b>gcb</b>       | Currently selected block                                                                          |
| <i>sysIdx</i>    | System ID                                                                                         |
| <i>gcs</i>       | Currently selected system                                                                         |
| <b>model</b>     | Currently selected model                                                                          |
| <i>mth</i>       | A method name, e.g., <code>Outputs.Major</code>                                                   |
| <i>TID</i>       | Task ID                                                                                           |
| <i>modelName</i> | The name of the referenced model within the hierarchy of the top model, which is under debugging. |

## Description

`bafter` inserts a breakpoint after the current method.

Instead of `bafter`, you can use the short form of `ba` with any of the syntaxes.

`bafter m:mid` inserts a breakpoint after the method specified by *mid* (see “Method ID”).

`bafter (taskId)sysIdx:blkIdx` inserts a breakpoint after each invocation of the method of the block specified by *sysIdx:blkIdx* (see “Block ID”) in major time steps. `bafter gcb` inserts a breakpoint after each invocation of a method of the currently selected block (see `gcb`) in major time steps.

`bafter s:sysIdx` inserts a breakpoint after each method of the root system or nonvirtual subsystem specified by the system ID: *sysIdx*.

---

**Note** The `systems` command displays the system IDs for all nonvirtual systems in the currently selected model.

---

`bafter gcs` inserts a breakpoint after each method of the currently selected nonvirtual system.

`bafter model` inserts a breakpoint after each method of the currently selected model.

The optional `meth` parameter allow you to set a breakpoint after a particular block, system, or model method and task. For example, `bafter gcb Outputs` sets a breakpoint after the Outputs method of the currently selected block.

The optional TID parameter allows you to set a breakpoint after invocation of a method by a particular task. For example, suppose that the currently selected nonvirtual subsystem operates on task 2 and 3. Then `bafter gcs Outputs tid:2` sets a breakpoint after the invocation of the subsystem's Outputs method that occurs when task 2 is active.

## Version History

Introduced before R2006a

# break

Insert breakpoint before specified method

## Syntax

break

b

break **m:mid**

break mdl

break mdl [mth] [**tid:TID**]

break <(taskId)sysIdx:blkIdx | **gcb**> [mth] [**tid:TID**]

break <(taskId)sysIdx:blkIdx | **gcb**>

break <**s:sysIdx** | **gcs**> [mth] [**tid:TID**]

break **modelName** [mth] [**tid:TID**]

break **modelName** < (taskId)sysIdx:blkIdx> [mth] [**tid:TID**]

## Arguments

|                      |                                    |
|----------------------|------------------------------------|
| <i>mid</i>           | Method ID                          |
| <i>taskId</i>        | Task ID                            |
| <i>sysIdx:blkIdx</i> | Block ID                           |
| <b>gcb</b>           | Currently selected block           |
| <i>sysIdx</i>        | System ID                          |
| <i>gcs</i>           | Currently selected system          |
| <b>modelName</b>     | Currently selected model           |
| <i>mth</i>           | A method name, e.g., Outputs.Major |
| <i>TID</i>           | task ID                            |
| <i>mdl</i>           | Given model                        |

## Description

break inserts a breakpoint before the current method.

Instead of break, you can use the short form of b with any of the syntaxes.

break mdl breaks at each method of model (mdl). mdl refers to the top model.

break mdl [mth] [**tid:TID**] breaks at the method [mth] at tid (TID) of model (mdl).

break **m:mid** inserts a breakpoint before the method specified by *mid* (see “Method ID”).

`break (taskIdx)sysIdx:blkIdx` inserts a breakpoint before each invocation of the method of the block specified by `sysIdx:blkIdx` (see “Block ID”) in major time steps. `break gcb` inserts a breakpoint before each invocation of a method of the currently selected block (see `gcb`) in major times steps.

`break s:sysIdx` inserts a breakpoint at each method of the root system or nonvirtual subsystem specified by the system ID: `sysIdx`.

---

**Note** The `systems` command displays the system IDs for all nonvirtual systems in the currently selected model.

---

`break gcs` inserts a breakpoint at each method of the currently selected nonvirtual system.

`break model` inserts a breakpoint at each method of the currently selected model.

---

**Note** Do not use a model name instead of identifier `model` in the `break model` command.

---

The optional `meth` parameter allow you to set a breakpoint at a particular block, system, or model method. For example, `break gcb Outputs` sets a breakpoint at the `Outputs` method of the currently selected block.

The optional TID parameter allows you to set a breakpoint at the invocation of a method by a particular task. For example, suppose that the currently selected nonvirtual subsystem operates on task 2 and 3. Then `break gcs Outputs tid:2` sets a breakpoint at the invocation of the subsystem's `Outputs` method that occurs when task 2 is active.

`break <(taskIdx)sysIdx:blkIdx | gcb>` breaks at each method of block `((taskIdx)sysIdx:blkIdx)`.

`break modelName < (taskIdx)sysIdx:blkIdx> [meth] [tid:TID]` breaks at the method `[meth]` at `tid` (TID) of block `((taskIdx)sysIdx:blkIdx)` in the model (`modelName`).

## Version History

Introduced before R2006a

# bshow

Show specified block

## Syntax

```
bshow (t)s:b
```

```
bshow [modelName] (taskIdx)sysIdx:blkIdx
```

```
bs s:b
```

## Arguments

|               |                                                                                                                             |
|---------------|-----------------------------------------------------------------------------------------------------------------------------|
| (t)s:b        | The block whose task index is <i>t</i> , system index is <i>s</i> and block index is <i>b</i> .                             |
| modelName s:b | The name of the model that is referenced followed by the block whose system index is <i>s</i> and block index is <i>b</i> . |

## Description

The `bshow` command opens the model window containing the specified block and selects the block.

`bshow [modelName] (taskIdx)sysIdx:blkIdx` shows block in system, `sysIdx`, with sorted list index, `blkIdx`, in the given task, `taskIdx`. The system and block are picked from the top model, unless referenced model is specified through `modelName`.

## Version History

Introduced before R2006a

## See Also

`slist`

## clear

Clear breakpoints from model

### Syntax

```
clear
```

```
cl
```

```
clear m:mid
```

```
clear id
```

```
clear <(taskId)sysIdx:blkIdx | gcb>
```

### Arguments

|                    |                          |
|--------------------|--------------------------|
| <i>mid</i>         | Method ID                |
| <i>id</i>          | Breakpoint ID            |
| <i>taskId</i>      | Task ID                  |
| <i>sysIdx:blkI</i> | Block ID                 |
| <i>dx</i>          |                          |
| <b>gcb</b>         | Currently selected block |

### Description

`clear` clears a breakpoint from the current method.

Instead of `clear`, you can use the short form of `cl` with any of the syntaxes.

`clear m:mid` clears a breakpoint from the method specified by *mid*.

`clear id` clears the breakpoint specified by the breakpoint ID *id*.

`clear sysIdx:blkIdx` clears any breakpoints set on the methods of the block specified by *sysIdx:blkIdx*.

`clear gcb` clears any breakpoints set on the methods of the currently selected block.

### Version History

Introduced before R2006a

### See Also

`break` | `bafter` | `slist`

# continue

Continue simulation

## Syntax

```
continue
```

```
c
```

## Description

The `continue` command continues the simulation from the current breakpoint. If animation mode is not enabled, the simulation continues until it reaches another breakpoint or its final time step. If animation mode is enabled, the simulation continues in animation mode to the first method of the next major time step, ignoring breakpoints.

## Version History

Introduced before R2006a

## See Also

`run` | `stop` | `quit`

## disp

Display block's I/O when simulation stops

### Syntax

```
disp
```

```
d
```

```
disp gcb
```

```
disp (t)s:b
```

```
disp modelName (t)s:b
```

### Arguments

#### Syntax and Description

| Syntax        | Description                                                                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (t)s:b        | The block whose task index is <i>t</i> , system index is <i>s</i> and block index is <i>b</i> .                                                                                                              |
| modelName s:b | The name of the referenced model within the hierarchy of the top model, which is under debugging followed by the block whose task index is <i>t</i> , system index is <i>s</i> and block index is <i>b</i> . |
| gcb           | Current block.                                                                                                                                                                                               |

### Description

The `disp` command registers a block as a display point. The debugger displays the inputs and outputs of all display points in the MATLAB Command Window whenever the simulation halts. Invoking `disp` without arguments shows a list of display points. Use `undisp` to unregister a block.

Instead of `disp`, you can use the short form of `d` with any of the syntaxes.

### Version History

Introduced before R2006a

### See Also

`undisp` | `slist` | `probe` | `trace`

# ebreak

Enable (or disable) breakpoint on solver errors

## Syntax

ebreak

eb

## Description

This command causes the simulation to stop if the solver detects a recoverable error in the model. If you do not set or disable this breakpoint, the solver recovers from the error and proceeds with the simulation without notifying you.

## Version History

Introduced before R2006a

## See Also

break | bafter | tbreak | xbreak | nanbreak | zcbreak | rbreak | clear | where | slist | systems

## elist

List simulation methods in order in which they are executed during simulation

### Syntax

```
elist
```

```
el
```

```
elist m:mid [tid:TID]
```

```
elist <gcs | s:sysIdx> [mth] [tid:TID]
```

```
elist <gcb | (taskId)sysIdx:blkIdx> [mth] [tid:TID]
```

```
elist [modelName] <(taskId)sysIdx:blkIdx >
```

### Description

Instead of `elist`, you can use the short form of `el` with any of the syntaxes.

`elist m:mid` lists the methods invoked by the system or nonvirtual subsystem method corresponding to the method id *mid* (see the `where` command for information on method IDs), e.g.,

```
(sldebug @19): elist m:19

RootSystem.Outputs 'vdp' [tid=0] : ← Calling method
 0:0 Integrator.Outputs 'vdp/x1' [tid=0]
 0:1 Outport.Outputs 'vdp/Out1' [tid=0]
 0:2 Integrator.Outputs 'vdp/x2' [tid=0]
 ...
 ↑ ↑ ↑ ↑
Block id Method Block Task id
```

The method list specifies the calling method followed by the methods that it calls in the order in which they are invoked. The entry for the calling method includes

- The name of the method

The name of the method is prefixed by the type of system that defines the method, e.g., `RootSystem`.

- The name of the model or subsystem instance on which the method is invoked
- The ID of the task that invokes the method

The entry for each called method includes

- The ID (*(taskId)sysIdx:blkIdx*) of the block instance on which the method is invoked

The block ID is prefixed by a number specifying the system that contains the block (the *sysIdx*). This allows Simulink software to assign the same block ID to blocks residing in different subsystems.

- The name of the method

The method name is prefixed with the type of block that defines the method, e.g., Integrator.

- The name of the block instance on which the method is invoked
- The task that invokes the method

The optional task ID parameter (**tid:TID**) allows you to restrict the displayed lists to methods invoked for a specified task. You can specify this option only for system or atomic subsystem methods that invoke Outputs or Update methods.

`elist <gcs | s:sysIdx>` lists the methods executed for the currently selected system (specified by the `gcs` command) or the system or nonvirtual subsystem specified by the system ID *sysIdx*, e.g.,

```
(sdebug @19): elist gcs

RootSystem.Start 'vdp':
 0:0 Integrator.Start 'vdp/x1'
 0:2 Integrator.Start 'vdp/x2'
 0:4 Scope.Start 'vdp/Scope'
 0:5 Fcn.Start 'vdp/Fcn'
 0:6 Product.Start 'vdp/Product'
 0:7 Gain.Start 'vdp/Mu'
 0:8 Sum.Start 'vdp/Sum'

RootSystem.Initialize 'vdp':
 0:0 Integrator.Initialize 'vdp/x1'
 ...
```

The system ID of a model's root system is 0. You can use the debugger's `systems` command to determine the system IDs of a model's subsystems.

---

**Note** The `elist` and `where` commands use block IDs to identify subsystems in their output. The block ID for a subsystem is not the same as the system ID displayed by the `systems` command. Use the `elist (taskIdx)sysIdx:blkIdx` form of the `elist` command to display the methods of a subsystem whose block ID appears in the output of a previous invocation of the `elist` or `where` command.

---

`elist m:mid [tid:TID]` displays the system execution list(s) identified by the system method, `mid` and `tid`.

`elist <gcs | s:sysIdx> mth` lists methods of type *mth* to be executed for the system specified by the `gcs` command or the system ID *sysIdx*, e.g.,

```
(sldebug @19): elist gcs Start

RootSystem.Start 'vdp':
 0:0 Integrator.Start 'vdp/x1'
 0:2 Integrator.Start 'vdp/x2'
 0:4 Scope.Start 'vdp/Scope'
 0:5 Fcn.Start 'vdp/Fcn'
 0:6 Product.Start 'vdp/Product'
 0:7 Gain.Start 'vdp/Mu'
 0:8 Sum.Start 'vdp/Sum'
 ...
```

Use `elist gcb` to list the methods invoked by the nonvirtual subsystem currently selected in the model.

`elist m:mid [tid:TID]` displays the system execution list(s) identified by the system method, `mid` and `tid`.

`elist [modelName] < (taskIdx)sysIdx:blkIdx >` displays the system execution list(s) identified by the subsystem block ((*taskIdx*)*sysIdx:blkIdx*), method, `mth`, and `tid` in the referenced model identified by `modelName`.

`elist <gcb | (taskIdx)sysIdx:blkIdx> [mth] [tid:TID]` displays the system execution list(s) identified by the subsystem block ((*taskIdx*)*sysIdx:blkIdx*), method, `mth`, and `tid`.

## Version History

Introduced before R2006a

### See Also

where | `slist` | `systems`

## **emode**

Toggle model execution between accelerated and normal mode

### **Syntax**

emode

em

### **Description**

Toggles the simulation between accelerated and normal mode when using the Accelerator mode in Simulink software. For more information, see “Run Accelerator Mode with the Simulink Debugger”.

### **Version History**

**Introduced before R2006a**

## **etrace**

Enable or disable method tracing

### **Syntax**

```
etrace level level-number
```

```
et level level-number
```

### **Description**

This command enables or disables method tracing, depending on the value of `level`:

| <b>Level</b> | <b>Description</b>                      |
|--------------|-----------------------------------------|
| 0            | Turn tracing off.                       |
| 1            | Trace model methods.                    |
| 2            | Trace model and system methods.         |
| 3            | Trace model, system, and block methods. |

When method tracing is on, the debugger prints a message at the command line every time a method of the specified level is entered or exited. The message specifies the current simulation time, whether the simulation is entering or exiting the method, the method id and name, and the name of the model, system, or block to which the method belongs.

### **Version History**

**Introduced before R2006a**

# help

Display help for debugger commands

## Syntax

help

?

h

## Description

The help command displays a list of debugger commands in the command window. The list includes the syntax and a brief description of each command.

## Version History

**Introduced before R2006a**

## nanbreak

Set or clear nonfinite value break mode

### Syntax

nanbreak

na

### Description

The `nanbreak` command causes the debugger to break whenever the simulation encounters a nonfinite (NaN or Inf) value. If nonfinite break mode is set, `nanbreak` clears it.

### Version History

Introduced before R2006a

### See Also

`break` | `bafter` | `rbreak` | `tbreak` | `xbreak` | `zcbreak`

### Topics

`ebreak`

## next

Advance simulation to start of next method at current level in model's execution list

### Syntax

next

n

### Description

The `next` command advances the simulation to the start of the next method at the current level in the model's method execution list.

---

**Note** The `next` command has the same effect as the `step over` command. See `step` for more information.

---

### Version History

Introduced before R2006a

### See Also

`step`

## probe

I/O and state data for blocks

### Syntax

```
probe
probe (t)s:b
probe modelName (t)s:b
probe gcb
probe level level-type
p
```

### Description

`probe` sets the Simulink debugger to interactive probe mode. In this mode, the debugger displays the I/O of a selected block. To exit interactive probe mode, enter a debugger command or press the **Enter** key.

`probe (t)s:b` displays the I/O of the block whose task index is *t*, system index is *s* and block index is *b*.

`probe modelName (t)s:b` displays the I/O of the block whose task index is *t* system index is *s* and block index is *b* in the *modelName* model.

`probe gcb` displays the I/O of the currently selected block.

`probe level level-type` sets the verbosity level for `probe`, `trace`, and `dis`. If *level-type* is `io`, the debugger displays block I/O. If *level-type* is `all` (default), the debugger displays all information for the current state of a block, including inputs and outputs, states, and zero crossings.

`p` is the short form of the command.

### Examples

Display I/O for the currently selected block `Out2` in the model `vdp` using the Simulink debugger.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

```
probe gcb
```

The MATLAB Command Window displays:

```
probe: Data of 0:3 Output block 'vdp/Out2':
U1 = [0]
```

## **Version History**

Introduced in R2007a

### **See Also**

disp | trace

## quit

Stop simulation debugger

### Syntax

```
quit
q
```

### Description

`quit` stops the Simulink debugger and returns to the MATLAB command prompt.

`q` is the short form of the command.

### Examples

Start the Simulink debugger for the model `vdp` and then stop it.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

```
quit
```

## Version History

Introduced before R2006a

### See Also

`stop`

# rbreak

Break simulation before solver reset

## Syntax

```
rbreak
rb
```

## Description

`rbreak` enables (or disables) a solver reset breakpoint if the breakpoint is disabled (or enabled). The breakpoint causes the debugger to halt the simulation whenever an event requires a solver reset. The halt occurs before the solver resets.

`rb` is the short form of the command.

## Examples

Start Simulink debugger for the model `vdp` and a set breakpoint before a solver reset.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` is replaced with the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

```
rbreak
```

The MATLAB Command Window displays:

```
Break on solver reset request : enabled
```

## Version History

Introduced before R2006a

`break` | `bafter` | `nanbreak` | `ebreak` | `tbreak` | `xbreak` | `zcbreak`

# run

Run simulation to completion

## Syntax

```
run
r
```

## Description

`run` starts the simulation from the current breakpoint to its final time step. It ignores breakpoints and display points.

`r` is the short form of the command

## Examples

Continue the simulation for the model `vdp` using the Simulink debugger.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

```
run
```

## Version History

Introduced before R2006a

# slist

Sorted list of model blocks

## Syntax

```
slist
sli
```

## Description

`slist` displays a list of blocks for the root system and each nonvirtual subsystem sorted according to data dependencies and other criteria.

For each system (root or nonvirtual), `slist` displays:

- Title line specifying the name of the system, the number of nonvirtual blocks that the system contains, and the number of blocks in the system that have direct feedthrough ports.
- Entry for each block in the order in which the blocks appear in the sorted list.

For each block entry, `slist` displays the block ID and the name and type of the block. The block ID consists of a system index and a block index separated by a colon (`sysIdx:blkIdx`).

- Block index is the position of the block in the sorted list.
- System index is the order in which the Simulink software generated the system sorted list. The system index has no special significance. It simply allows blocks that appear in the same position in different sorted lists to have unique identifiers.

Simulink software uses sorted lists to create block method execution lists (see `elist`) for root system and nonvirtual subsystem methods. In general, root system and nonvirtual subsystem methods invoke the block methods in the same order as the blocks appear in the sorted list.

Exceptions occur in the execution order of block methods. For example, execution lists for multicast models group together all blocks operating at the same rate and in the same task. Slower groups appear later than faster groups. The grouping of methods by task can result in a block method execution order that is different from the block sorted order. However, within groups, methods execute in the same order as the corresponding blocks appear in the sorted list.

`sli` is the short form of the command.

## Examples

Display a sorted list of the root system in the `vdp` model using the Simulink debugger.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

slist

When 'Signal storage reuse' in the Configuration Parameters is enabled, block I/O values displayed in the debugger may not be correct. In order to preserve block output signal values, disable 'Signal storage reuse' in the Configuration Parameters dialog box. The MATLAB Command Window displays:

```
---- Sorted list for 'vdp' [11 nonvirtual block(s), directFeed=0]
 Total number of tasks = 2
- Sorted list of task index [0], 10 nonvirtual block(s)
(0)0:1 'vdp/x1' (Integrator)
 Input ports: [0]
 Output ports: [0]
(0)0:2 'vdp/Out1' (Outport)
 Input ports: [0]
 Output ports: []
(0)0:3 'vdp/x2' (Integrator)
 Input ports: [0]
 Output ports: [0]
(0)0:4 'vdp/Out2' (Outport)
 Input ports: [0]
 Output ports: []
(0)0:5 'vdp/Scope' (Scope)
 Input ports: [0]
 Output ports: []
(0)0:6 'vdp/Square' (Math)
 Input ports: [0]
 Output ports: [0]
(0)0:7 'vdp/Sum1' (Sum)
 Input ports: [0 1]
 Output ports: [0]
(0)0:8 'vdp/Product' (Product)
 Input ports: [0 1]
 Output ports: [0]
(0)0:9 'vdp/Mu' (Gain)
 Input ports: [0]
 Output ports: [0]
(0)0:10 'vdp/Sum' (Sum)
 Input ports: [0 1]
 Output ports: [0]

# states

Current state values

## Syntax

states

## Description

states displays a list of the current states of the model. The list includes the index, current value, system:block:element ID, state vector name, and block name for each state.

## Examples

Display information about the states for the vdp model.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt >> changes to the Simulink debugger prompt (sldebug @0): >>.

- 2 Enter:

```
states
```

The MATLAB Command Window displays:

```
Continuous States:
Idx Value (system:block:element Name 'BlockName')
 0 0 (0:0:0 CSTATE 'vdp/x1')
 1 0 (0:2:0 CSTATE 'vdp/x2')
```

## Version History

Introduced before R2006a

## status

Debugging options in effect

### Syntax

### Description

Display a list of the debugging options in effect.

### Examples

#### View Debugger Status for vdp

Start the debugger with vdp. The command prompt changes to the Simulink debugger prompt (sldebug @0): >>.

```
sldebug 'vdp'
```

Display the debugging status.

```
status

%-----%

## step

Advance simulation by one or more methods

### Syntax

```
step
step in
step over
step out
step top
step blockmth
s
```

### Description

`step` or `step in` advances the simulation to the next method in the current time step.

`step over` advances the simulation over the next method.

`step out` advances the simulation the end of the current simulation point hierarchy.

`step top` advances the simulation to the first method executed in the next time step.

`step blockmth` advances the simulation to the next method that operates on a block.

`s` is the short form of the command.

If `step` advances the simulation to the start of a block method, the debugger points at the block on which the method operates.

.

### Examples

The following diagram illustrates the effect of various forms of the `step` command for the model `vdp`.

# stimes

Model sample times

## Syntax

```
stimes
sti
```

## Description

`stimes` displays information about the model sample times, including the sample time period, offset, and task ID.

`sti` is the short form of the command.

## Examples

Display sample times for the model `vdp` using the Simulink debugger.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

```
stimes
```

The MATLAB Command Window displays:

```
--- Sample times for 'vdp' [Number of sample times = 2]
1. tid=0 (continuous)
2. tid=1 (value = inf in ModelWideParameterChangeEvent)
```

## Version History

Introduced before R2006a

# stop

Stop simulation

## Syntax

```
stop
```

## Description

`stop` stops the simulation of the model you are debugging.

## Examples

Start and stop a simulation for the model `vdp` using the Simulink debugger.

- 1 Start a debugger session. In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Start a simulation of the model. Enter:

```
run
```

- 3 Stop the simulation. Enter:

```
stop
```

## Version History

Introduced before R2006a

## See Also

`continue` | `run` | `quit`

# strace

Set solver trace level

## Syntax

```
strace level
i
```

## Description

`strace level` causes the solver to display diagnostic information in the MATLAB Command Window, depending on the value of `level`. Values are 0 (no information) or 4 (maximum information about time steps, integration steps, zero crossings, and solver resets).

`i` is the short form of the command.

## Examples

Display maximum information about a simulation for the model `vdp` using the Simulink debugger.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'vdp'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Get information about the notation. Enter:

```
help time
```

The MATLAB Command Window displays:

```
Time is displayed as:
TM = <time while in MajorTimeStep>
Tm = <time while in MinorTimeStep>
Tr = <time while in solver reset>
Tz = <time at or just after zero crossing>
TzL = <time while in major step just before (at left post of) zero crossing>
TzR = <time while in major step at or just after (at right post of) zero crossing>
Ts = <time of successful integration step>
Tf = <time of failed integration step>
Tn = <time while in Newton iteration> (when using implicit solvers)
Tj = <time during Jacobian evaluation> (when using implicit solvers)

Step size is displayed as:
Hm = <step size at the start of solver phase>
Hs = <successful integration step size>
Hf = <failed integration step size>
Hn = <step size during Newton iteration> (when using implicit solvers)
Hz = <value of 'TM - TzL' during zero crossing search>
Iz = <value of 'Tz - TzL' during zero crossing search>
```

- 3 Set trace to display all information. Enter:

```
strace 1
```

When diagnostic tracing is on, the debugger displays the start of major and minor time steps.

```
[TM = 13.21072088374186] Start of Major Time Step
[Tm = 13.21072088374186] Start of Minor Time Step
```

The debugger displays integration information. This information includes the time step of the integration method, step size of the integration method, outcome of the integration step, normalized error, and index of the state.

```
[Tm = 13.21072088374186] [H = 0.2751116230148764] Begin Integration Step
[Tf = 13.48583250675674] [Hf = 0.2751116230148764] Fail [Er = 1.0404e+000]
 [Ix = 1]
[Tm = 13.21072088374186] [H = 0.2183536061326544] Retry
[Ts = 13.42907448987452] [Hs = 0.2183536061326539] Pass [Er = 2.8856e-001]
 [Ix = 1]
```

For zero crossings, the debugger displays information about the iterative search algorithm when the zero crossing occurred. This information includes the time step of the zero crossing, step size of the zero crossing detection algorithm, length of the time interval bracketing the zero crossing, and a flag denoting the rising or falling direction of the zero crossing.

```
[Tz = 3.615333333333301] Detected 1 Zero Crossing Event 0[F]
 Begin iterative search to bracket zero crossing event
[Tz = 3.621111157580072] [Hz = 0.005777824246771424] [Iz = 4.2222e-003] 0[F]
[Tz = 3.621116982080098] [Hz = 0.005783648746797265] [Iz = 4.2164e-003] 0[F]
[Tz = 3.621116987943544] [Hz = 0.005783654610242994] [Iz = 4.2163e-003] 0[F]
[Tz = 3.621116987943544] [Hz = 0.005783654610242994] [Iz = 1.1804e-011] 0[F]
[Tz = 3.621116987949452] [Hz = 0.005783654616151157] [Iz = 5.8962e-012] 0[F]
[Tz = 3.621116987949452] [Hz = 0.005783654616151157] [Iz = 5.1514e-014] 0[F]
 End iterative search to bracket zero crossing event
```

When solver resets occur, the debugger displays the time at which the solver was reset.

```
[Tr = 6.246905153573676] Process Solver Reset
[Tr = 6.246905153573676] Reset Zero Crossing Cache
[Tr = 6.246905153573676] Reset Derivative Cache
```

# systems

List nonvirtual systems of model

## Syntax

```
systems
sys
```

## Description

systems displays the nonvirtual subsystems for a model in the MATLAB Command Window.

sys is the short form of the command.

## Examples

Display the nonvirtual systems for the model `sldemo_enginewc` using the Simulink debugger.

- 1 In the MATLAB Command Window, enter:

```
sldebug 'sldemo_enginewc'
```

The MATLAB command prompt `>>` changes to the Simulink debugger prompt (`sldebug @0`): `>>`.

- 2 Enter:

```
systems
```

The MATLAB Command Window displays the nonvirtual subsystems.

```
Nonvirtual subsystems in model 'sldemo_enginewc':
0 'sldemo_enginewc/Compression'
1 'sldemo_enginewc/Controller'
2 'sldemo_enginewc/Throttle & Manifold/Throttle/TmpAtomicSubsysAtSwitchInport1'
3 'sldemo_enginewc/valve timing/positive edge to dual edge conversion'
4 'sldemo_enginewc'
```

## **tbreak**

Set or clear time breakpoint

### **Syntax**

tbreak

tb

tbreak t

### **Description**

The `tbreak` command sets a breakpoint at the specified time step. If a breakpoint already exists at the specified time, `tbreak` clears the breakpoint. If you do not specify a time, `tbreak` toggles a breakpoint at the current time step.

Instead of `tbreak`, you can use the short form of `tb`, with or without `t`.

## **Version History**

**Introduced before R2006a**

# trace

Display block's I/O each time block executes

## Syntax

```
trace gcb
trace (t)s:b
```

```
tr gcb
trace (t)s:b
```

## Arguments

(t)s:b        The block whose task index is t, system index is s and block index is b.  
gcb         Current block.

## Description

The trace command registers a block as a trace point. The debugger displays the I/O of each registered block each time the block executes.

## Version History

**Introduced before R2006a**

## See Also

disp | probe | untrace | slist | strace

## **undisp**

Remove block from debugger's list of display points

### **Syntax**

```
undisp gcb
```

```
und gcb
```

```
undisp (t)s:b
```

```
und (t)s:b
```

### **Arguments**

(t)s:b      The block whose task index is **t**, system index is **s** and block index is **b**.

gcb        Current block.

### **Description**

The `undisp` command removes the specified block from the debugger's list of display points.

### **Version History**

**Introduced before R2006a**

### **See Also**

`disp` | `slist`

## untrace

Remove block from debugger's list of trace points

### Syntax

```
untrace gcb
```

```
unt gcb
```

```
untrace (t)s:b
```

```
unt (t)s:b
```

### Arguments

(t)s:b      The block whose task index is *t*, system index is *s* and block index is *b*.

gcb        Current block.

### Description

The `untrace` command removes the specified block from the debugger's list of trace points.

### Version History

Introduced before R2006a

### See Also

`trace` | `slist`

## where

Display current location of simulation in simulation loop

### Syntax

where [detail]

w [detail]

### Description

The where command displays the current location of the simulation in the simulation loop, for example,

```
sldebug 07): where
0 >> vdp.Simulate
1 >> vdp.Start
2 >> RootSystem.Start 'vdp'
7 >| 0:8 Sum.Start 'Sum'
```

The display consists of a list of simulation nodes with the last entry being the node that is about to be entered or exited. Each entry contains the following information:

- Method ID
  - The method ID identifies a specific invocation of a method.
- A symbol specifying its state:
  - >> (active)
  - >| (about to be entered)
  - <| (about to be exited)
- Name of the method invoked (e.g., RootSystem.Start)
- Name of the block or system on which the method is invoked (e.g., Sum)
- System and block ID (sysIdx:blkIdx) of the block on which the method is invoked

For example, 0:8 indicates that the specified method operates on block 8 of system 0.

where detail, where detail is any nonnegative integer, includes inactive nodes in the display.

```
0 >> vdp.Simulate
 1 >> vdp.Start
 2 >> RootSystem.Start 'vdp'
 3 0:4 Scope.Start 'Scope'
 4 0:5 Fcn.Start 'Fcn'
 5 0:6 Product.Start
'Product '
 6 0:7 Gain.Start 'Mu'
 7 >| 0:8 Sum.Start 'Sum'
```

## Version History

Introduced before R2006a

step

## **xbreak**

Break when debugger encounters step-size-limiting state

### **Syntax**

```
xbreak
```

```
x
```

### **Description**

The `xbreak` command pauses execution of the model when the debugger encounters a state that limits the size of the steps that the solver takes. If `xbreak` mode is already on, `xbreak` turns the mode off.

## **Version History**

**Introduced before R2006a**

### **See Also**

### **Topics**

`ebreak`

# **zcbreak**

Toggle breaking at nonsampled zero-crossing events

## **Syntax**

zcbreak

zcb

## **Description**

The `zcbreak` command causes the debugger to break when a nonsampled zero-crossing event occurs. If zero-crossing break mode is already on, `zcbreak` turns the mode off.

## **Version History**

**Introduced before R2006a**

## **See Also**

`break` | `bafter` | `xbreak` | `tbreak` | `nanbreak` | `zclist`

## **zclist**

List blocks containing nonsampled zero crossings

### **Syntax**

`zclist`

`zcl`

### **Description**

The `zclist` command displays a list of blocks in which nonsampled zero crossings can occur. The command displays the list in the MATLAB Command Window.

### **Version History**

**Introduced before R2006a**

### **See Also**

`zcbreak`

| Simulink.SimState.ModelSimState       | (Not recommended) Access SimState snapshot data                                                                      |
| Simulink.SimulationData.BlockPath     |                                                                                                                      |

# coder.BuildConfig class

**Package:** coder

Build context during code generation

## Description

The code generator creates an object of this class to facilitate access to the build context. The build context encapsulates the settings used by the code generator including:

- Target language
- Code generation target
- Target hardware
- Build toolchain

Use `coder.BuildConfig` methods in the methods that you write for the `coder.ExternalDependency` class.

## Class Attributes

Abstract true

For information on class attributes, see “Class Attributes”.

## Creation

The code generator creates objects of this class.

## Methods

### Public Methods

|                                        |                                                                            |
|----------------------------------------|----------------------------------------------------------------------------|
| <code>getHardwareImplementation</code> | Get handle of copy of hardware implementation object                       |
| <code>getStdLibInfo</code>             | Get standard library information                                           |
| <code>getTargetLang</code>             | Get target code generation language                                        |
| <code>getToolchainInfo</code>          | Returns handle of copy of toolchain information object                     |
| <code>isCodeGenTarget</code>           | Determine if build context represents specified target                     |
| <code>isMatlabHostTarget</code>        | Determine if hardware implementation object target is MATLAB host computer |

## Examples

### Use `coder.BuildConfig` methods to access the build context in `coder.ExternalDependency` methods

This example shows how to use `coder.BuildConfig` methods to access the build context in `coder.ExternalDependency` methods. In this example, you use:

- `coder.BuildConfig.isMatlabHostTarget` to verify that the code generation target is the MATLAB host. If the host is not MATLAB report an error.
- `coder.BuildConfig.getStdLibInfo` to get the link-time and run-time library file extensions. Use this information to update the build information.

Write a class definition file for an external library that contains the function `adder`.

```

=====
% This class abstracts the API to an external Adder library.
% It implements static methods for updating the build information
% at compile time and build time.
=====

classdef AdderAPI < coder.ExternalDependency
 %#codegen

 methods (Static)

 function bName = getDescriptiveName(~)
 bName = 'AdderAPI';
 end

 function tf = isSupportedContext(buildContext)
 if buildContext.isMatlabHostTarget()
 tf = true;
 else
 error('adder library not available for this target');
 end
 end

 function updateBuildInfo(buildInfo, buildContext)
 % Get file extensions for the current platform
 [~, linkLibExt, execLibExt, ~] = buildContext.getStdLibInfo();

 % Add file paths
 hdrFilePath = fullfile(pwd, 'codegen', 'dll', 'adder');
 buildInfo.addIncludePaths(hdrFilePath);

 % Link files
 linkFiles = strcat('adder', linkLibExt);
 linkPath = hdrFilePath;
 linkPriority = '';
 linkPrecompiled = true;
 linkLinkOnly = true;
 group = '';
 buildInfo.addLinkObjects(linkFiles, linkPath, ...
 linkPriority, linkPrecompiled, linkLinkOnly, group);

 % Non-build files for packaging
 nbFiles = 'adder';
 nbFiles = strcat(nbFiles, execLibExt);
 buildInfo.addNonBuildFiles(nbFiles, '', '');
 end

 %API for library function 'adder'
 function c = adder(a, b)
 if coder.target('MATLAB')

```

```
 % running in MATLAB, use built-in addition
 c = a + b;
 else
 % Add the required include statements to the generated function code
 coder.cinclude('adder.h');
 coder.cinclude('adder_initialize.h');
 coder.cinclude('adder_terminate.h');
 c = 0;

 % Because MATLAB Coder generated adder, use the
 % housekeeping functions before and after calling
 % adder with coder.ceval.

 coder.ceval('adder_initialize');
 c = coder.ceval('adder', a, b);
 coder.ceval('adder_terminate');
 end
end
end
end
```

## coder.ExternalDependency class

**Package:** coder

Interface to external code

### Description

`coder.ExternalDependency` is an abstract class for developing an interface between external code and MATLAB code intended for code generation. You can define classes that derive from `coder.ExternalDependency` to encapsulate the interface to external libraries, object files, and C/C++ source code. This encapsulation allows you to separate the details of the interface from your MATLAB code.

To define a class derived from `coder.ExternalDependency`, create a subclass. For example:

```
classdef myClass < coder.ExternalDependency
```

You must define all of the methods listed in “Methods” on page 5-6. These methods are static and are not compiled. The code generator invokes these methods in MATLAB after code generation is complete to configure the build for the generated code. The `RTW.BuildInfo` and `coder.BuildConfig` objects that describe the build information and build context are automatically created during the build process. The `updateBuildInfo` method provides access to these objects. For more information on build information customization, see “Build Process Customization” (MATLAB Coder).

You also define methods that call the external code. These methods are compiled. For each external function that you want to call, write a method to define the programming interface to the function. In the method, use `coder.ceval` to call the external function.

### Class Attributes

Abstract true

For information on class attributes, see “Class Attributes”.

### Methods

#### Public Methods

|                                                          |                                                         |
|----------------------------------------------------------|---------------------------------------------------------|
| <code>coder.ExternalDependency.getDescriptiveName</code> | Return descriptive name for external dependency         |
| <code>coder.ExternalDependency.isSupportedContext</code> | Determine if build context supports external dependency |
| <code>coder.ExternalDependency.updateBuildInfo</code>    | Update build information                                |

### Examples

#### Encapsulate the Interface to an External C Dynamic Library

This example shows how to encapsulate the interface to an external C dynamic linked library using `coder.ExternalDependency`.

Write a function `adder` that returns the sum of its inputs.

```
function c = adder(a,b)
%#codegen
c = a + b;
end
```

Generate a library that contains `adder`.

```
codegen('adder', '-args', {-2,5}, '-config:dll', '-report')
```

Write the class definition file `AdderAPI.m` to encapsulate the library interface.

```
%=====
% This class abstracts the API to an external Adder library.
% It implements static methods for updating the build information
% at compile time and build time.
%=====

classdef AdderAPI < coder.ExternalDependency
 %#codegen

 methods (Static)

 function bName = getDescriptiveName(~)
 bName = 'AdderAPI';
 end

 function tf = isSupportedContext(buildContext)
 if buildContext.isMatlabHostTarget()
 tf = true;
 else
 error('adder library not available for this target');
 end
 end

 function updateBuildInfo(buildInfo, buildContext)
 % Get file extensions for the current platform
 [~, linkLibExt, execLibExt, ~] = buildContext.getStdLibInfo();

 % Add file paths
 hdrFilePath = fullfile(pwd, 'codegen', 'dll', 'adder');
 buildInfo.addIncludePaths(hdrFilePath);

 % Link files
 linkFiles = strcat('adder', linkLibExt);
 linkPath = hdrFilePath;
 linkPriority = '';
 linkPrecompiled = true;
 linkLinkOnly = true;
 group = '';
 buildInfo.addLinkObjects(linkFiles, linkPath, ...
 linkPriority, linkPrecompiled, linkLinkOnly, group);

 % Non-build files for packaging
 nbFiles = 'adder';
 nbFiles = strcat(nbFiles, execLibExt);
 buildInfo.addNonBuildFiles(nbFiles, '', '');
 end
 end
end
```

```

end

%API for library function 'adder'
function c = adder(a, b)
 if coder.target('MATLAB')
 % running in MATLAB, use built-in addition
 c = a + b;
 else
 % Add the required include statements to the generated function code
 coder.cinclude('adder.h');
 coder.cinclude('adder_initialize.h');
 coder.cinclude('adder_terminate.h');
 c = 0;

 % Because MATLAB Coder generated adder, use the
 % housekeeping functions before and after calling
 % adder with coder.ceval.

 coder.ceval('adder_initialize');
 c = coder.ceval('adder', a, b);
 coder.ceval('adder_terminate');
 end
end
end
end
end

```

Write a function `adder_main` that calls the external library function `adder`.

```

function y = adder_main(x1, x2)
 %#codegen
 y = AdderAPI.adder(x1, x2);
end

```

Generate a MEX function for `adder_main`. The MEX Function exercises the `coder.ExternalDependency` methods.

```

codegen('adder_main', '-args', {7,9}, '-report')

```

Copy the library to the current folder using the file extension for your platform. For Windows, use:

```

copyfile(fullfile(pwd, 'codegen', 'dll', 'adder', 'adder.dll'));

```

For Linux, use:

```

copyfile(fullfile(pwd, 'codegen', 'dll', 'adder', 'adder.so'));

```

Run the MEX function and verify the result.

```

adder_main_mex(2,3)

```

## eventData

Provide information about block method execution events

### Description

Simulink software creates an instance of this class when a block method execution event occurs during simulation and passes it to any listeners registered for the event (see `add_exec_event_listener`). The instance specifies the type of event that occurred and the block whose method execution triggered the event. See “Access Block Data During Simulation” for more information.

## io.reader class

**Package:** io

Base class used to define custom variable or file reader for Simulation Data Inspector

### Description

Use the `io.reader` base class to specify how to import custom variable and file formats into the **Simulation Data Inspector**. Write a class definition file that uses the `io.reader` methods to specify how to extract information like time and data values from the variable or file. Use this syntax as the first line in the class definition file to inherit from the `io.reader` class, where `MyReader` is the name of your subclass:

```
classdef MyReader < io.reader
```

For an example that shows how to write and use a custom file reader, see “Import Data Using a Custom File Reader”.

For an example that shows how to write and use a custom workspace data reader, see “Import Workspace Variables Using a Custom Data Reader”.

The `io.reader` class is a `handle` class.

### Class Attributes

|                  |      |
|------------------|------|
| Abstract         | true |
| HandleCompatible | true |

For information on class attributes, see “Class Attributes”.

### Properties

#### FileName — Name of imported file

'' (default) | character array

Name of imported file when using the subclass to import a file, specified as a character array.

Example: 'MyCustomFile'

#### Attributes:

|           |        |
|-----------|--------|
| GetAccess | public |
| SetAccess | public |

#### VariableName — Name of imported variable

'' (default) | character array

Name of imported variable or signal, specified as a character array.

Example: 'MyVar'

**Attributes:**

|           |        |
|-----------|--------|
| GetAccess | public |
| SetAccess | public |

**VariableValue — Imported variable**

variable

Imported variable. The VariableValue property has the same data type as the variable in the workspace or file. Use the VariableValue property to access the variable data inside method definitions.

Example: MyVar

**Attributes:**

|           |        |
|-----------|--------|
| GetAccess | public |
| SetAccess | public |

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical | char | string | struct | enumerated | bus | table | cell | categorical | datetime | duration | calendarDuration | fi

## getChildren

**Class:** `io.reader`

**Package:** `io`

Return custom reader object for each node and signal in data imported using a custom reader

### Syntax

```
childObj = getChildren(obj)
```

### Description

`childObj = getChildren(obj)` returns an array of custom reader objects that correspond to hierarchical nodes and signals in data imported into the Simulation Data Inspector using a custom file or workspace reader. Use the `getChildren` method to preserve the hierarchy for imported data. When you import multiple signals from a file, you can use the `getChildren` method to import the data as a flat list of signals contained under a top-level node that corresponds to the file.

### Input Arguments

**obj — Custom data reader**

`io.reader` subclass object

Custom data reader, specified as an object of a class that inherits from the `io.reader` base class.

Example: `MyCustomFileReader`

### Output Arguments

**childObj — Hierarchical nodes and signals**

cell array of `io.reader` subclass objects

Hierarchical nodes and signals in imported data, returned as a cell array of `io.reader` subclass objects.

### Examples

#### Structure Data Imported from File

This example uses the `getChildren` method to import multiple signals from a file as a flat list of signals contained in a top-level node that represents the file. Specify code for the `getChildren` method in the class definition file.

This example does not show a complete class definition. All custom readers must define behavior for the `getName`, `getTimeValues`, and `getDataValues` methods. For an example that shows the complete class definition and import workflow, see “Import Data Using a Custom File Reader”.

In this example, the `getChildren` method reads the data from the file using the `readtable` function. The custom reader in this example always uses the data in the first column as time, so the

first variable name is cleared and not used. The `getChildren` method creates a custom reader object for the top-level node that corresponds to the file and for each signal in the file and assigns values to the `FileName` and `VariableName` properties.

```
classdef ExcelFirstColumnTimeReader < io.reader
 methods
 % ...

 function childObj = getChildren(obj)
 childObj = {};
 if isempty(obj.VariableName)
 t = readtable(obj.FileName);
 vars = t.Properties.VariableNames;
 vars(1) = [];
 childObj = cell(size(vars));
 for idx = 1:numel(vars)
 childObj{idx} = ExcelFirstColumnTimeReader;
 childObj{idx}.FileName = obj.FileName;
 childObj{idx}.VariableName = vars{idx};
 end
 end
 end
 end
end

% ...
end
end
```

## Structure Data Imported from Workspace

This example uses the `getChildren` method to import an array of structures stored in a variable in the base workspace. Specify code for the `getChildren` method in the class definition file.

This example does not show a complete class definition. All custom readers must define behavior for the `getName`, `getTimeValues`, and `getDataValues` methods, and workspace data readers need to define the `supportsVariable` method. For an example that shows the complete class definition and import workflow for a workspace data reader, see “Import Workspace Variables Using a Custom Data Reader”.

In this example, the `getChildren` method creates a custom reader object for each structure in the input variable when the variable is an array of structures. The workspace reader in this example defines a `ChannelIndex` property that the `getChildren` method uses to identify each object it creates.

```
classdef SimpleStructReader < io.reader

 properties
 ChannelIndex
 end

 methods
 % ...

 function childObj = getChildren(obj)
 childObj = {};
 if ~isscalar(obj.VariableValue) && isempty(obj.ChannelIndex)
```

```
numChannels = numel(obj.VariableValue);
childObj = cell(numChannels,1);
for idx = 1:numChannels
 childObj{idx} = SimpleStructReader;
 childObj{idx}.VariableName = sprintf('%s(%d)',obj.VariableName,idx);
 childObj{idx}.VariableValue = obj.VariableValue;
 childObj{idx}.ChannelIndex = idx;
end
end
end

% ...
end
end
```

# getDataValues

**Class:** `io.reader`

**Package:** `io`

Return data values for data imported using a custom reader

## Syntax

```
dataVals = getDataValues(obj)
```

## Description

`dataVals = getDataValues(obj)` returns data values to use for data imported into the Simulation Data Inspector using a custom file or workspace variable reader. Specify code for the `getDataValues` method to extract signal values from a proprietary file or variable format.

## Input Arguments

**obj** — Custom data reader

`io.reader` subclass object

Custom data reader, specified as an object of a class that inherits from the `io.reader` base class.

Example: `MyCustomFileReader`

## Output Arguments

**dataVals** — Signal values

numeric array | enum array | logical array | string array

Signal values, returned as an array of numeric, enumeration, logical, or string values. For scalar signals and wide signals, the first dimension of the array aligns with time and must match the length of the time vector returned by `getTimeValues`. For multidimensional signals, the last dimension aligns with time and must match the length of the time vector returned by `getTimeValues`.

## Attributes

Abstract true

To learn about attributes of methods, see Method Attributes.

## Examples

### Get Signal Values for Data Imported from File

Write the function definition for the `getDataValues` method to return signal values to use for data imported from a file. The custom reader in this example imports the data from the file with a

hierarchical structure, treating the file as the top node. Specify the code for the `getDataValues` method in the class definition file.

This example does not show a complete class definition. All custom readers must define behavior for the `getName`, `getTimeValues`, and `getDataValues` methods. For an example that shows the complete class definition and import workflow, see “Import Data Using a Custom File Reader”.

In this example, the `getChildren` method reads the data from the file using the `readtable` function and returns an array of custom reader objects for the top-level node that corresponds to the file and for each signal in the file. Then, the `getDataValues` method reads the data using the `readtable` function and selects the signal data to return for each signal in the file using the `VariableName` property of each custom reader object.

```
classdef ExcelFirstColumnTimeReader < io.reader
 methods
 % ...

 function childObj = getChildren(obj)
 childObj = {};
 if isempty(obj.VariableName)
 t = readtable(obj.FileName);
 vars = t.Properties.VariableNames;
 vars(1) = [];
 childObj = cell(size(vars));
 for idx = 1:numel(vars)
 childObj{idx} = ExcelFirstColumnTimeReader;
 childObj{idx}.FileName = obj.FileName;
 childObj{idx}.VariableName = vars{idx};
 end
 end
 end

 function dataVals = getDataValues(obj)
 dataVals = [];
 if ~isempty(obj.VariableName)
 t = readtable(obj.FileName);
 dataVals = t.(obj.VariableName);
 end
 end
 end
end

% ...
end
end
```

### Get Signal Values from Workspace Variable

Write the function definition for the `getDataValues` method to return signal values from a workspace variable. Specify the code executed by the `getDataValues` method in the class definition file.

This example does not show a complete class definition. All custom readers must define behavior for the `getName`, `getTimeValues`, and `getDataValues` methods, and workspace data readers need to define the `supportsVariable` method. For an example that shows the complete class definition and import workflow for a workspace data reader, see “Import Workspace Variables Using a Custom Data Reader”.

The custom reader in this example imports a structure or an array of structures from the workspace. The structures must contain fields for the signal data (d), the time data (t), and the signal name (n). When the variable to import is a scalar structure, the `getDataValues` method returns the data from the `d` field of the structure.

When the variable is an array of structures, the custom reader uses both the `getDataValues` and `getChildren` methods to import the data. The `getChildren` method creates a custom reader object for each structure in the array and sets the `ChannelIndex` property to identify the index of the signal data within the array. Then, the `getDataValues` method uses the `ChannelIndex` property value to select the appropriate structure from the `VariableValue` property value, which is the array of structures.

```
classdef SimpleStructReader < io.reader

 properties
 ChannelIndex
 end

 methods
 % ...

 function childObj = getChildren(obj)
 childObj = {};
 if ~isscalar(obj.VariableValue) && isempty(obj.ChannelIndex)
 numChannels = numel(obj.VariableValue);
 childObj = cell(numChannels,1);
 for idx = 1:numChannels
 childObj{idx} = SimpleStructReader;
 childObj{idx}.VariableName = sprintf('%s(%d)',obj.VariableName,idx);
 childObj{idx}.VariableValue = obj.VariableValue;
 childObj{idx}.ChannelIndex = idx;
 end
 end
 end

 function dataVals = getDataValues(obj)
 if isscalar(obj.VariableValue)
 dataVals = obj.VariableValue.d;
 elseif ~isempty(obj.ChannelIndex)
 varVal = obj.VariableValue(obj.ChannelIndex);
 dataVals = varVal.d;
 else
 dataVals = [];
 end
 end

 % ...
 end
end
```

# getName

**Class:** `io.reader`

**Package:** `io`

Get names for data imported using a custom reader

## Syntax

```
retName = getName(obj)
```

## Description

`retName = getName(obj)` returns the name to use in the **Simulation Data Inspector** for a signal or hierarchical node in data imported from the workspace or a file.

## Input Arguments

**obj** — Custom data reader

`io.reader` subclass object

Custom data reader, specified as an object of a class that inherits from the `io.reader` base class.

Example: `MyCustomFileReader`

## Output Arguments

**retName** — Signal name

character array

Signal name used by the **Simulation Data Inspector**, returned as a character array.

## Attributes

Abstract true

To learn about attributes of methods, see Method Attributes.

## Examples

### Get Names for Data Imported from File

Write the function definition for the `getName` method to return names for signals imported from a file. The custom reader in this example imports the data from the file with a hierarchical structure, treating the file as the top node. Specify code for the `getName` method in the class definition file.

This example does not show a complete class definition. All custom readers must define behavior for the `getName`, `getTimeValues`, and `getDataValues` methods. For an example that shows the complete class definition and import workflow, see “Import Data Using a Custom File Reader”.

In this example, the `getName` and `getChildren` methods work together to assign the appropriate name to each imported signal. The `getChildren` method reads the data from the file using the `readtable` function. The method then constructs a cell array that contains a custom reader object for each signal read from the file.

The `getName` method uses the `FileName` property of the custom reader object to return the file name as the name for the top-level node. The `getName` method uses the `VariableName` property to return the signal name extracted from the file to use as the signal name for each imported signal.

```
classdef ExcelFirstColumnTimeReader < io.reader
 methods
 % ...

 function childObj = getChildren(obj)
 childObj = {};
 if isempty(obj.VariableName)
 t = readtable(obj.FileName);
 vars = t.Properties.VariableNames;
 vars(1) = [];
 childObj = cell(size(vars));
 for idx = 1:numel(vars)
 childObj{idx} = ExcelFirstColumnTimeReader;
 childObj{idx}.FileName = obj.FileName;
 childObj{idx}.VariableName = vars{idx};
 end
 end
 end

 function retName = getName(obj)
 if isempty(obj.VariableName)
 fullName = obj.FileName;
 splitName = split(fullName,["\" "/""]);
 retName = splitName{end};
 else
 retName = obj.VariableName;
 end
 end

 % ...
 end
end
```

### Get Names for Data Imported from Workspace

Write the function definition for the `getName` method to return signal names for data imported from the workspace. Specify code for the `getName` method in the class definition file.

This example does not show a complete class definition. All custom readers must define behavior for the `getName`, `getTimeValues`, and `getDataValues` methods, and workspace data readers need to define the `supportsVariable` method. For an example that shows the complete class definition and import workflow for a workspace data reader, see “Import Workspace Variables Using a Custom Data Reader”.

The custom reader in this example imports a structure or an array of structures from the workspace. The structures must contain fields for the signal data (`d`), the time data (`t`), and the signal name (`n`).

When the variable to import is a scalar structure, the `getName` method returns the value in the `n` field of the imported structure.

When the variable is an array of structures, the custom reader uses both the `getName` and `getChildren` methods to return signal names. The `getChildren` method creates a custom reader object for each structure in the array and sets the `ChannelIndex` property to identify the index of the signal data within the array. Then, the `getName` method uses the `ChannelIndex` property value to select the appropriate structure from the `VariableValue` property value, which is the array of structures.

```
classdef SimpleStructReader < io.reader

 properties
 ChannelIndex
 end

 methods
 % ...

 function childObj = getChildren(obj)
 childObj = {};
 if ~isscalar(obj.VariableValue) && isempty(obj.ChannelIndex)
 numChannels = numel(obj.VariableValue);
 childObj = cell(numChannels,1);
 for idx = 1:numChannels
 childObj{idx} = SimpleStructReader;
 childObj{idx}.VariableName = sprintf('%s(%d)',obj.VariableName,idx);
 childObj{idx}.VariableValue = obj.VariableValue;
 childObj{idx}.ChannelIndex = idx;
 end
 end
 end

 function retName = getName(obj)
 if isscalar(obj.VariableValue)
 retName = char(obj.VariableValue.n);
 elseif ~isempty(obj.ChannelIndex)
 varVal = obj.VariableValue(obj.ChannelIndex);
 retName = char(varVal.n);
 else
 retName = 'Signal Array';
 end
 end

 % ...
 end
end
```

# io.reader.getRegisteredFileReaders

**Class:** io.reader

**Package:** io

Return all custom file readers registered for the Simulation Data Inspector

## Syntax

```
readers = io.reader.getRegisteredFileReaders
```

## Description

`readers = io.reader.getRegisteredFileReaders` returns an array of strings that indicate all custom file readers registered for the Simulation Data Inspector.

## Output Arguments

**readers** — Custom file readers registered for the Simulation Data Inspector

array of strings

Custom file readers registered for the Simulation Data Inspector, returned as an array of strings.

## Attributes

Static true

To learn about attributes of methods, see Method Attributes.

## Examples

### Register Custom File Reader for the Simulation Data Inspector

This example shows how to register a custom file reader with the Simulation Data Inspector, verify registration was successful, and unregister a file reader.

#### Register the Custom File Reader

This example registers the file reader `ExcelFirstColumnTime`. For an example that shows how to author the custom file reader, see “Import Data Using a Custom File Reader”. As the name suggests, the custom file reader for this example supports Microsoft Excel™ files. Register the reader for the `.xlsx` and `.xls` extensions.

```
registerFileReader(ExcelFirstColumnTimeReader, [".xlsx" ".xls"]);
```

#### Verify Custom Reader Registration

To verify registration of a custom reader, you can use the `io.reader.getRegisteredFileReaders` method or the `io.reader.getSupportedReadersForFile` method.

The `io.reader.getRegisteredFileReaders` returns a string array that contains the names of all registered custom file readers.

```
io.reader.getRegisteredFileReaders
```

```
ans =
"ExcelFirstColumnTimeReader"
```

You can also use the `io.reader.getSupportedReadersForFile` method to see all reader options for a specific file. The `built-in` option in the returned string array indicates that the Simulation Data Inspector has a built-in Excel file reader.

```
io.reader.getSupportedReadersForFile('CustomFile.xlsx')
```

```
ans = 1x2 string
"ExcelFirstColumnTimeReader" "built-in"
```

### **Unregister a Custom File Reader**

To unregister a custom file reader, use the `unregisterFileReader` method. All custom readers are unregistered when you close a MATLAB™ session.

```
unregisterFileReader(ExcelFirstColumnTimeReader, [".xlsx" ".xls"])
```

## **Version History**

# io.reader.getSupportedReadersForFile

**Class:** io.reader

**Package:** io

Return all readers available to import file

## Syntax

```
readers = io.reader.getSupportedReadersForFile(filename)
```

## Description

`readers = io.reader.getSupportedReadersForFile(filename)` returns all readers in the Simulation Data Inspector that support importing the file specified by `filename`.

## Input Arguments

**filename** — Name of or path to file to import

character array | string

Name of or path to file to import, specified as a character array or string.

Example: 'MyDataFile.csv'

Data Types: char | string

## Output Arguments

**readers** — File readers available to import file

array of strings

File readers available to import file, returned as an array of strings. When the Simulation Data Inspector has a built-in reader for the file, the array contains "built-in".

## Attributes

Static true

To learn about attributes of methods, see Method Attributes.

## Examples

# getTimeValues

**Class:** `io.reader`

**Package:** `io`

Return time values for data imported using a custom reader

## Syntax

```
timeVals = getTimeValues(obj)
```

## Description

`timeVals = getTimeValues(obj)` returns time values to use for data imported into the **Simulation Data Inspector** using a custom file or workspace variable reader. Specify code for the `getTimeValues` method to extract the data from a proprietary file or variable format.

## Input Arguments

**obj** — Custom data reader

`io.reader` subclass object

Custom data reader, specified as an object of a class that inherits from the `io.reader` base class.

Example: `MyCustomFileReader`

## Output Arguments

**timeVals** — Time values for imported data

column vector

Time values for imported data, returned as a column vector.

## Attributes

Abstract true

To learn about attributes of methods, see [Method Attributes](#).

## Examples

### Get Time Values for Data Imported from File

Write the function definition for the `getTimeValues` method to return time values to use for data imported from a file. The custom reader in this example always uses the data in the first column of the file as time. Specify the code for the `getTimeValues` method in the class definition file.

This example does not show a complete class definition. All custom readers must define behavior for the `getName`, `getTimeValues`, and `getDataValues` methods. For an example that shows the complete class definition and import workflow, see “Import Data Using a Custom File Reader”.

In this example, the `getTimeValues` method reads the data from the file using the `readtable` function and returns the data from the first column to use as the time values for imported signals.

```
classdef ExcelFirstColumnTimeReader < io.reader
 methods
 % ...

 function timeVals = getTimeValues(obj)
 timeVals = [];
 if ~isempty(obj.VariableName)
 t = readtable(obj.FileName);
 timeName = t.Properties.VariableNames{1};
 timeVals = t.(timeName);
 end
 end

 % ...
 end
end
```

### Get Time Values for Data Imported from Workspace

Write the function definition for the `getTimeValues` method to return time values for data imported from the workspace. Specify the code executed by the `getTimeValues` method in the class definition file.

This example does not show a complete class definition. All custom readers must define behavior for the `getName`, `getTimeValues`, and `getDataValues` methods, and workspace data readers need to define the `supportsVariable` method. For an example that shows the complete class definition and import workflow for a workspace data reader, see “Import Workspace Variables Using a Custom Data Reader”.

The custom reader in this example imports a structure or an array of structures from the workspace. The structures must contain fields for the signal data (`d`), the time data (`t`), and the signal name (`n`). When the variable to import is a scalar structure, the `getTimeValues` method returns the value in the `t` field of the imported structure.

When the variable is an array of structures, the custom reader uses both the `getTimeValues` and `getChildren` methods to return time data. The `getChildren` method creates a custom reader object for each structure in the array and sets the `ChannelIndex` property to identify the index of the signal data within the array. Then, the `getTimeData` method uses the `ChannelIndex` property value to select the appropriate structure from the `VariableValue` property value, which is the array of structures.

```
classdef ExcelFirstColumnTimeReader < io.reader

 properties
 ChannelIndex
 end
```

```

methods
% ...

function childObj = getChildren(obj)
 childObj = {};
 if ~isscalar(obj.VariableValue) && isempty(obj.ChannelIndex)
 numChannels = numel(obj.VariableValue);
 childObj = cell(numChannels,1);
 for idx = 1:numChannels
 childObj{idx} = SimpleStructReader;
 childObj{idx}.VariableName = sprintf('%s(%d)',obj.VariableName,idx);
 childObj{idx}.VariableValue = obj.VariableValue;
 childObj{idx}.ChannelIndex = idx;
 end
 end
end

function timeVals = getTimeValues(obj)
 if isscalar(obj.VariableValue)
 timeVals = obj.VariableValue.t;
 elseif ~isempty(obj.ChannelIndex)
 varVal = obj.VariableValue(obj.ChannelIndex);
 timeVals = varVal.t;
 else
 timeVals = [];
 end
end

% ...
end
end

```

# registerFileReader

**Class:** `io.reader`

**Package:** `io`

Register custom file reader for use in the Simulation Data Inspector

## Syntax

```
registerFileReader(obj,ext)
```

## Description

`registerFileReader(obj,ext)` registers the custom file reader `obj` with the Simulation Data Inspector to use for files with extensions specified by `ext`. To use a custom file reader in the Simulation Data Inspector, you must register the reader at the start of each MATLAB session.

---

**Tip** To verify registration, use the `io.reader.getRegisteredFileReaders` method or the `io.reader.getSupportedReadersForFile` method.

---

## Input Arguments

### **obj** — Custom data reader

`io.reader` subclass object

Custom data reader, specified as an object of a class that inherits from the `io.reader` base class.

Example: `MyCustomFileReader`

### **ext** — File extensions supported by custom reader

character vector | string | cell array of character vectors | cell array of strings

File extensions supported by custom reader, specified as a character vector, string, cell array of character vectors, or cell array of strings.

Example: `[".xlsx" ".xls"]`

Data Types: `char` | `string` | `cell`

## Examples

### **Register Custom File Reader for the Simulation Data Inspector**

This example shows how to register a custom file reader with the Simulation Data Inspector, verify registration was successful, and unregister a file reader.

#### **Register the Custom File Reader**

This example registers the file reader `ExcelFirstColumnTime`. For an example that shows how to author the custom file reader, see “Import Data Using a Custom File Reader”. As the name suggests,

the custom file reader for this example supports Microsoft Excel™ files. Register the reader for the .xlsx and .xls extensions.

```
registerFileReader(ExcelFirstColumnTimeReader, [".xlsx" ".xls"]);
```

### Verify Custom Reader Registration

To verify registration of a custom reader, you can use the `io.reader.getRegisteredFileReaders` method or the `io.reader.getSupportedReadersForFile` method.

The `io.reader.getRegisteredFileReaders` returns a string array that contains the names of all registered custom file readers.

```
io.reader.getRegisteredFileReaders
```

```
ans =
"ExcelFirstColumnTimeReader"
```

You can also use the `io.reader.getSupportedReadersForFile` method to see all reader options for a specific file. The `built-in` option in the returned string array indicates that the Simulation Data Inspector has a built-in Excel file reader.

```
io.reader.getSupportedReadersForFile('CustomFile.xlsx')

ans = 1x2 string
 "ExcelFirstColumnTimeReader" "built-in"
```

### Unregister a Custom File Reader

To unregister a custom file reader, use the `unregisterFileReader` method. All custom readers are unregistered when you close a MATLAB™ session.

```
unregisterFileReader(ExcelFirstColumnTimeReader, [".xlsx" ".xls"]);
```

## Version History

Introduced in R2020b

## registerWorkspaceReader

**Class:** `io.reader`

**Package:** `io`

Register custom workspace reader for the Simulation Data Inspector

### Syntax

```
registerWorkspaceReader(obj)
```

### Description

`registerWorkspaceReader(obj)` registers the custom workspace reader specified by `obj` for the Simulation Data Inspector. To use a custom workspace reader, you must register the reader at the start of each MATLAB session.

---

**Tip** To verify registration, use the `io.reader.getRegisteredWorkspaceReaders` method.

---

### Input Arguments

**obj** — Custom data reader

`io.reader` subclass object

Custom data reader, specified as an object of a class that inherits from the `io.reader` base class.

Example: `MyCustomReader`

### Examples

#### Register Custom Workspace Reader for the Simulation Data Inspector

This example shows how to register a custom workspace data reader with the Simulation Data Inspector, verify registration was successful, and unregister the workspace reader.

This example registers a custom workspace data reader called `SimpleStructReader`. For an example that shows how to author the custom workspace reader, see “Import Workspace Variables Using a Custom Data Reader”.

```
registerWorkspaceReader(SimpleStructReader);
```

To verify registration of a custom workspace reader, use the `io.reader.getRegisteredWorkspaceReaders` method, which returns a string array that contains the names of all registered custom workspace readers.

```
io.reader.getRegisteredWorkspaceReaders
```

```
ans =
"SimpleStructReader"
```

To unregister a custom workspace reader, use the `unregisterWorkspaceReader` method. All readers are unregistered when you close the MATLAB™ session.

```
unregisterWorkspaceReader(SimpleStructReader);
```

## supportsFile

**Class:** `io.reader`

**Package:** `io`

Return logical indication of whether custom reader supports file

### Syntax

```
supported = supportsFile(obj, filename)
```

### Description

`supported = supportsFile(obj, filename)` returns the logical value `supported` that indicates whether the custom reader specified by `obj` supports the file specified by `filename`. The Simulation Data Inspector always checks whether a file is supported based on the file extension alone. Use the `supportsFile` method to specify code for additional support validation.

### Input Arguments

**obj — Custom data reader**

`io.reader` subclass object

Custom data reader, specified as an object of a class that inherits from the `io.reader` base class.

Example: `MyCustomFileReader`

**filename — Name of file to import**

character vector | string

Name of file to import, specified as a character vector or string.

Example: `'MyDataFile.xlsx'`

Data Types: `char` | `string`

### Output Arguments

**supported — Whether custom reader supports file**

logical

Whether custom reader supports file, returned as a logical value.

### Examples

#### Determine Whether Custom File Reader Supports File

Write the function definition for the `supportsFile` method to determine whether the custom reader supports the data in the file. This example does not show a complete class definition. All custom readers must define behavior for the `getName`, `getTimeValues`, and `getDataValues` methods. For

an example that shows the complete class definition and import workflow, see “Import Data Using a Custom File Reader”.

In this example, the `supportsFile` method reads the data in the file using the `readtable` function and checks that the file contains data in more than one column.

```
classdef ExcelFirstColumnTimeReader < io.reader
 methods
 % ...

 function childObj = getChildren(obj)
 try
 t = readtable(filename);
 supported = height(t) > 0 && numel(t.Properties.VariableNames) > 1;
 catch
 supported = false;
 end
 end
 end
 % ...
end
end
```

Return logical indication of whether custom reader supports variable

### Syntax

```
supported = supportsVariable(obj,var)
```

### Description

`supported = supportsVariable(obj,var)` returns the logical value `supported` that indicates whether the custom workspace reader specified by `obj` supports the variable specified by `var`. When you write a custom workspace reader, you must implement the `supportsVariable` method in the class definition.

### Input Arguments

**obj — Custom data reader**

`io.reader` subclass object

Custom data reader, specified as an object of a class that inherits from the `io.reader` base class.

Example: `MyCustomReader`

**var — Workspace variable to import**

variable

Workspace variable to import, specified as a variable in the base workspace.

Example: `myVar`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `string` | `struct` | `table` | `cell` | `categorical` | `datetime` | `duration` | `calendarDuration` | `fi`

Complex Number Support: Yes

### Output Arguments

**supported — Whether custom reader supports variable**

logical

Whether the custom reader supports variable, returned as a logical value.

### Examples

## Determine Whether Custom Reader Supports Variable

Write the function definition for the `supportsVariable` method to return true only when the reader can import the input variable. Specify the code for the `supportsVariable` method in the class definition file.

This example does not show a complete class definition. All custom readers must define behavior for the `getName`, `getTimeValues`, and `getDataValues` methods, and workspace data readers need to define the `supportsVariable` method. For an example that shows the complete class definition and import workflow for a workspace data reader, see “Import Workspace Variables Using a Custom Data Reader”.

The custom reader in this example imports a structure or an array of structures from the workspace. The structures must contain fields for the signal data (`d`), the time data (`t`), and the signal name (`n`). The `supportsVariable` method returns true when:

- 1 The input variable is a structure or array of structures that contains the appropriate fields.
- 2 The `n` field of each structure contains a character array or string to represent the signal name.
- 3 The `t` field of each structure is a column vector of double data.
- 4 The `d` field of each structure contains numeric data and is the same size as the `t` field, meaning there is a sample value for each time step.

```
classdef ExcelFirstColumnTimeReader < io.reader

 methods
 % ...

 function supported = supportsVariable(~, val)
 % Support structure with fields t (time), d (data), and n (name)
 supported = ...
 isstruct(val) && ...
 isfield(val,'t') && ...
 isfield(val,'d') && ...
 isfield(val,'n');
 if supported
 for idx = 1:numel(val)
 varName = val(idx).n;
 time = val(idx).t;
 varData = val(idx).d;

 % Name must be string or character array
 if ~ischar(varName) && ~isstring(varName)
 supported = false;
 end

 % Time must be double column vector
 elseif ~isa(time,'double') || ~iscolumn(time)
 supported = false;
 end

 % Data size must match time size
 else
 timeSz = size(time);
 dataSz = size(varData);

 if ~isnumeric(varData) || ~isequal(dataSz, timeSz)
 supported = false;
 end
 end
 end
 end
 end
 end
end
```

```
 end
 end
end
end

% ...
end
end
```

# unregisterFileReader

**Class:** `io.reader`

**Package:** `io`

Unregister custom file reader for the Simulation Data Inspector

## Syntax

```
unregisterFileReader(obj,ext)
```

## Description

`unregisterFileReader(obj,ext)` unregisters the custom file reader specified by `obj` for the extensions specified by `ext`. All custom file and workspace variable readers are unregistered when you close MATLAB.

---

**Tip** To verify the unregister operation, use the `io.reader.getRegisteredFileReaders` method or the `io.reader.getSupportedReadersForFile` method.

---

## Input Arguments

### **obj** — Custom data reader

`io.reader` subclass object

Custom data reader, specified as an object of a class that inherits from the `io.reader` base class.

Example: `MyCustomFileReader`

### **ext** — File extensions supported by custom reader

character vector | string | cell array of character vectors | cell array of strings

File extensions supported by custom reader, specified as a character vector, string, cell array of character vectors, or cell array of strings.

Example: `[".xlsx" ".xls"]`

Data Types: `char` | `string` | `cell`

## Examples

### **Register Custom File Reader for the Simulation Data Inspector**

This example shows how to register a custom file reader with the Simulation Data Inspector, verify registration was successful, and unregister a file reader.

#### **Register the Custom File Reader**

This example registers the file reader `ExcelFirstColumnTime`. For an example that shows how to author the custom file reader, see “Import Data Using a Custom File Reader”. As the name suggests,

the custom file reader for this example supports Microsoft Excel™ files. Register the reader for the .xlsx and .xls extensions.

```
registerFileReader(ExcelFirstColumnTimeReader, [".xlsx" ".xls"]);
```

### Verify Custom Reader Registration

To verify registration of a custom reader, you can use the `io.reader.getRegisteredFileReaders` method or the `io.reader.getSupportedReadersForFile` method.

The `io.reader.getRegisteredFileReaders` returns a string array that contains the names of all registered custom file readers.

```
io.reader.getRegisteredFileReaders
```

```
ans =
"ExcelFirstColumnTimeReader"
```

You can also use the `io.reader.getSupportedReadersForFile` method to see all reader options for a specific file. The `built-in` option in the returned string array indicates that the Simulation Data Inspector has a built-in Excel file reader.

```
io.reader.getSupportedReadersForFile('CustomFile.xlsx')

ans = 1x2 string
 "ExcelFirstColumnTimeReader" "built-in"
```

### Unregister a Custom File Reader

To unregister a custom file reader, use the `unregisterFileReader` method. All custom readers are unregistered when you close a MATLAB™ session.

```
unregisterFileReader(ExcelFirstColumnTimeReader, [".xlsx" ".xls"]);
```

## Version History

Introduced in R2020b

# unregisterWorkspaceReader

**Class:** `io.reader`

**Package:** `io`

Unregister custom workspace reader for the Simulation Data Inspector

## Syntax

```
unregisterWorkspaceReader(obj)
```

## Description

`unregisterWorkspaceReader(obj)` unregisters the custom workspace reader specified by `obj` from the Simulation Data Inspector. All custom file and workspace variable readers are unregistered when you close MATLAB.

## Input Arguments

**obj** — Custom data reader

`io.reader` subclass object

Custom data reader, specified as an object of a class that inherits from the `io.reader` base class.

Example: `MyCustomReader`

## Examples

### Register Custom Workspace Reader for the Simulation Data Inspector

This example shows how to register a custom workspace data reader with the Simulation Data Inspector, verify registration was successful, and unregister the workspace reader.

This example registers a custom workspace data reader called `SimpleStructReader`. For an example that shows how to author the custom workspace reader, see “Import Workspace Variables Using a Custom Data Reader”.

```
registerWorkspaceReader(SimpleStructReader);
```

To verify registration of a custom workspace reader, use the `io.reader.getRegisteredWorkspaceReaders` method, which returns a string array that contains the names of all registered custom workspace readers.

```
io.reader.getRegisteredWorkspaceReaders
```

```
ans =
"SimpleStructReader"
```

To unregister a custom workspace reader, use the `unregisterWorkspaceReader` method. All readers are unregistered when you close the MATLAB™ session.

```
unregisterWorkspaceReader(SimpleStructReader);
```

# matlab.io.datastore.sd datastore class

**Package:** matlab.io.datastore

Datastore for Simulation Data Inspector signals

## Description

A `matlab.io.datastore.sd datastore` object provides access to signals logged to the Simulation Data Inspector that are too large to fit into memory. An `sd datastore` object references the data for a single signal. The `read` method loads the signal data referenced by an `sd datastore` object in a chunk-wise manner such that each chunk always fits into memory. You can use an `sd datastore` object to create a tall timetable for your signal data. For more information about working with tall arrays, see “Tall Arrays”.

---

**Note** `matlab.io.datastore.sd datastore` does not support parallel computations. If you have a Parallel Computing Toolbox license, use `mapreducer(0)` to set the execution environment to the local MATLAB client before creating a tall timetable from the `matlab.io.datastore.sd datastore`.

---

## Construction

`ds = dsrObj.getAsDatastore(arg)` creates the `sd datastore`, `ds`, for the signal in the `Simulink.sdi.DatasetRef` object selected by the search criterion `arg`. You can specify `arg` as an integer representing the index of the desired signal within the `Simulink.sdi.DatasetRef` object, or as a character vector containing the name of the signal.

`ds = matlab.io.datastore.sd datastore(signalID)` creates the `sd datastore`, `ds`, for the signal corresponding to the specified `signalID`.

## Input Arguments

### **arg** — Element selection criterion

character vector | integer

Search criterion used to retrieve the element from the `Simulink.sdi.DatasetRef` object. For name-based searches, specify `arg` as a character vector. For index-based searches, `arg` is an integer, representing the index of the desired element.

Example: 'MySignal'

Example: 3

### **signalID** — Numeric signal identifier

integer

Numeric signal identifier generated for the signal by the Simulation Data Inspector. You can get the signal ID for a signal using methods of the `Simulink.sdi.Run` object containing the signal or as a return from the `Simulink.sdi.createRun` function.

## Properties

### Name — Signal name

character vector

Name of the signal specified as a character vector.

Example: 'My Signal'

### Signal — Simulink.sdi.Signal object

Simulink.sdi.Signal object

Simulink.sdi.Signal object associated with the sddatastore. The Signal property provides access to the signal data and metadata.

## Methods

|         |                                          |
|---------|------------------------------------------|
| hasdata | Determine if data is available to read   |
| preview | Return preview of data in sddatastore    |
| read    | Read a chunk of data from an sddatastore |
| readall | Read all data from an sddatastore        |
| reset   | Reset the read position                  |

## Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects.

## Examples

### Create a Tall Timetable for a Simulation Data Inspector Signal

This example shows how to create a tall timetable for a signal in the Simulation Data Inspector repository. You can create the tall timetable using a Simulink.sdi.Signal object or by first creating a matlab.io.datastore.sddatastore for the signal. You can use a matlab.io.datastore.sddatastore to incrementally read and process signal data for signals that do not fit into memory. A tall timetable handles the data chunking and processing in the background. In general, you can work with tall timetables very similarly to how you work with in-memory data.

### Create Data and Access Signal ID

Whether you create your tall timetable using a Simulink.sdi.Signal object or a matlab.io.datastore.sddatastore, start by creating data and accessing the signal ID for a signal of interest. The sldemo\_fuelsys model is configured to log signals which stream to the Simulation Data Inspector repository when you simulate the model.

```
open_system('sldemo_fuelsys')
sim('sldemo_fuelsys')
```

Then, use the Simulation Data Inspector programmatic interface to access the signal ID for a signal of interest. For example, access the ego signal.

```
runCount = Simulink.sdi.getRunCount;
latestRunID = Simulink.sdi.getRunIDByIndex(runCount);
latestRun = Simulink.sdi.getRun(latestRunID);

egoSigID = latestRun.getSignalIDByIndex(7);
```

### Create a Tall Timetable Using a `matlab.io.datastore.sdidatastore`

In general, tall timetables are backed by datastores. Create a `matlab.io.datastore.sdidatastore` object to reference the signal data in the Simulation Data Inspector repository.

```
egoDs = matlab.io.datastore.sdidatastore(egoSigID);
```

Check the name of the datastore to verify you have the signal you expect.

```
egoDs.Name
```

```
ans =
'fuel'
```

Create a tall timetable from the `matlab.io.datastore.sdidatastore` to use for processing the signal data. When you have a Parallel Computing Toolbox™ license, you need to explicitly set the execution environment to the local MATLAB® session using `mapreducer` before creating the tall timetable. The `matlab.io.datastore.sdidatastore` object does not support parallel computations.

```
mapreducer(0);
```

```
egoTt = tall(egoDs)
```

```
egoTt =
```

```
Mx1 tall timetable
```

| Time           | Data   |
|----------------|--------|
| 0 sec          | 1.209  |
| 0.00056199 sec | 1.209  |
| 0.0033719 sec  | 1.209  |
| 0.01 sec       | 1.1729 |
| 0.02 sec       | 1.1409 |
| 0.03 sec       | 1.1124 |
| 0.04 sec       | 1.0873 |
| 0.05 sec       | 1.0652 |
| ⋮              | ⋮      |
| ⋮              | ⋮      |

### Create a Tall Timetable Using a `Simulink.sdi.Signal` Object

The `Simulink.sdi.Signal` class has a method to create a tall timetable directly, allowing you to skip the step of creating a datastore by creating it behind the scenes. Use the signal ID to access the `Simulink.sdi.Signal` object for the ego signal. Then, use the `getTable` method to create the tall timetable.

```
egoSig = Simulink.sdi.getSignal(egoSigID);
```

```
egoTt = egoSig.getAsTall
```

```
egoTt =
```

```
Mx1 tall timetable
```

| Time           | Data   |
|----------------|--------|
| 0 sec          | 1.209  |
| 0.00056199 sec | 1.209  |
| 0.0033719 sec  | 1.209  |
| 0.01 sec       | 1.1729 |
| 0.02 sec       | 1.1409 |
| 0.03 sec       | 1.1124 |
| 0.04 sec       | 1.0873 |
| 0.05 sec       | 1.0652 |
| :              | :      |
| :              | :      |

### Use the Tall Timetable to Process Your Signal Data

When you use the tall timetable `egoTt`, its underlying datastore reads chunks of data and passes them to the tall timetable to process. Neither the datastore nor the tall timetable retain any of the data in memory after processing. Also, the tall timetable defers processing for many operations. For example, calculate the mean value of the signal.

```
egoMean = mean(egoTt.Data)
```

```
egoMean =
```

```
tall double
```

```
?
```

You can use the `gather` function to evaluate a variable and write its value to the workspace, or you can use the `write` function to write the results to disc. When you use `gather`, be sure the results fit into memory.

```
egoMean = gather(egoMean)
```

```
Evaluating tall expression using the Local MATLAB Session:
```

```
- Pass 1 of 1: Completed in 14 sec
```

```
Evaluation completed in 15 sec
```

```
egoMean = 1.3292
```

When you perform multiple operations on a tall timetable, evaluation of the results for each step is deferred until you explicitly request the results with `write` or `gather`. During evaluation, MATLAB optimizes the number of passes it makes through the tall timetable, which can significantly speed up processing time for analyzing very large signals. For more information about working with tall arrays, see “Tall Arrays for Out-of-Memory Data”.

### Process Signal Data Using a `matlab.io.datastore.sdidatastore`

A `matlab.io.datastore.sdidatastore` references signal data in the Simulation Data Inspector repository. When the signal is too large to fit into memory, you can use the

`matlab.io.datastore.sd datastore` to incrementally process the data manually or to create a tall timetable for the signal that handles the incremental processing for you. This example shows how to process data using a `matlab.io.datastore.sd datastore`.

### Create a `matlab.io.datastore.sd datastore` for a Signal

Simulate the `sldemo_fuelsys` model, which is configured to log several signals, to create data in the Simulation Data Inspector repository.

```
sim('sldemo_fuelsys')
```

Use the Simulation Data Inspector programmatic interface to get the signal ID for the signal.

```
runCount = Simulink.sdi.getRunCount;
latestRunID = Simulink.sdi.getRunIDByIndex(runCount);
latestRun = Simulink.sdi.getRun(latestRunID);
speedSigID = latestRun.getSignalIDByIndex(4);
```

Use the signal ID to create a `matlab.io.datastore.sd datastore` for the speed signal.

```
speedSDIDs = matlab.io.datastore.sd datastore(speedSigID);
```

### Verify the Contents of the Datastore

Check the `Name` property of the `matlab.io.datastore.sd datastore` to verify that it matches your expectations.

```
speedSDIDs.Name
```

```
ans =
'map'
```

You can also use the `preview` method to check that the first ten samples in the signal look correct.

```
speedSDIDs.preview
```

```
ans=10x1 timetable
 Time Data

0 sec 0.589
0.00056199 sec 0.58772
0.0033719 sec 0.58148
0.01 sec 0.56765
0.02 sec 0.54897
0.03 sec 0.53264
0.04 sec 0.51837
0.05 sec 0.50594
0.055328 sec 0.5
0.055328 sec 0.5
```

### Process Signal Data with the `matlab.io.datastore.sd datastore`

When your signal is too large to fit into memory, you can use the `readData` method to read chunks of data from the Simulation Data Inspector repository to incrementally process your data. Use the

`hasdata` method as the condition for a while loop to incrementally process the whole signal. For example, find the maximum signal value.

```
latestMax = [];

while speedSDIds.hasdata
 speedChunk = speedSDIds.read;
 speedChunkData = speedChunk.Data;
 latestMax = max([speedChunkData; latestMax]);

end

latestMax

latestMax = 0.8897
```

On each read operation, the `read` method updates the read position for the start of the next read operation. After reading some or all of the `matlab.io.datastore.sd datastore`, you can reset the read position to start again from the beginning of the signal.

```
speedSDIds.reset
```

### Process Signal Data in Memory

When the signal referenced by your `matlab.io.datastore.sd datastore` fits into memory, you can use the `readall` method to read all the signal data into memory for processing, rather than reading and processing the data incrementally with the `read` method. The `readall` method returns a `timetable` with all the signal data.

```
speedTimetable = speedSDIds.readall;

speedMax = max(speedTimetable.Data)

speedMax = 0.8897
```

## Version History

# hasdata

**Class:** `matlab.io.datastore.sd datastore`

**Package:** `matlab.io.datastore`

Determine if data is available to read

## Syntax

```
tf = sdi_ds.hasdata
```

## Description

`tf = sdi_ds.hasdata` returns logical 1 if the `matlab.io.datastore.sd datastore`, `sdi_ds`, has data available to read. When `sdi_ds` does not have data available to read, `hasdata` returns 0.

## Output Arguments

**tf** — Data availability indication

logical

Logical indication of whether the `matlab.io.datastore.sd datastore` has data available to read. When data is available, `tf` is 1. When data is not available, `tf` is 0.

## Examples

### Process Signal Data Using a `matlab.io.datastore.sd datastore`

A `matlab.io.datastore.sd datastore` references signal data in the Simulation Data Inspector repository. When the signal is too large to fit into memory, you can use the `matlab.io.datastore.sd datastore` to incrementally process the data manually or to create a tall timetable for the signal that handles the incremental processing for you. This example shows how to process data using a `matlab.io.datastore.sd datastore`.

## preview

**Class:** `matlab.io.datastore.sd datastore`

**Package:** `matlab.io.datastore`

Return preview of data in `sd datastore`

### Syntax

```
dataPreview = sdi_ds.preview
```

### Description

`dataPreview = sdi_ds.preview` returns the first 10 samples of signal data in the `matlab.io.datastore.sd datastore`, `sdi_ds`. The `preview` method does not change the read position. Use the `preview` method to verify that the data in your `matlab.io.datastore.sd datastore` appears as you expect.

### Output Arguments

**dataPreview** — Preview of the data

`timetable`

First 10 samples of the signal referenced by the `matlab.io.datastore.sd datastore` in a `timetable`.

### Examples

#### Process Signal Data Using a `matlab.io.datastore.sd datastore`

A `matlab.io.datastore.sd datastore` references signal data in the Simulation Data Inspector repository. When the signal is too large to fit into memory, you can use the `matlab.io.datastore.sd datastore` to incrementally process the data manually or to create a tall `timetable` for the signal that handles the incremental processing for you. This example shows how to process data using a `matlab.io.datastore.sd datastore`.

#### Create a `matlab.io.datastore.sd datastore` for a Signal

Simulate the `sldemo_fuelsys` model, which is configured to log several signals, to create data in the Simulation Data Inspector repository.

```

### **Process Signal Data in Memory**

When the signal referenced by your `matlab.io.datastore.sd datastore` fits into memory, you can use the `readall` method to read all the signal data into memory for processing, rather than reading and processing the data incrementally with the `read` method. The `readall` method returns a `timetable` with all the signal data.

```
speedTimetable = speedSDIds.readall;
```

```
speedMax = max(speedTimetable.Data)
```

```
speedMax = 0.8897
```

## **Version History**

**Introduced in R2017b**

### **See Also**

`matlab.io.datastore.sd datastore`

### **Topics**

“Timetables”

## read

**Class:** `matlab.io.datastore.sd datastore`

**Package:** `matlab.io.datastore`

Read a chunk of data from an `sd datastore`

### Syntax

```
data = sdi_ds.read
```

### Description

`data = sdi_ds.read` reads a chunk of samples from the `matlab.io.datastore.sd datastore`, `sdi_ds`, and updates the read position for `sdi_ds` to the point following the endpoint of the returned data. The samples are returned in the `timetable`, `data`. The number of samples read by the `read` method vary, and the returned `timetable` always fits into memory. Use the `read` method to incrementally process signals that are too large to fit into memory.

### Output Arguments

**data** — Chunk of data read from `sd datastore`

`timetable`

Chunk of samples read from the `matlab.io.datastore.simulationdatastore`, returned as a `timetable`.

### Examples

#### Process Signal Data Using a `matlab.io.datastore.sd datastore`

A `matlab.io.datastore.sd datastore` references signal data in the Simulation Data Inspector repository. When the signal is too large to fit into memory, you can use the `matlab.io.datastore.sd datastore` to incrementally process the data manually or to create a tall `timetable` for the signal that handles the incremental processing for you. This example shows how to process data using a `matlab.io.datastore.sd datastore`.

#### Create a `matlab.io.datastore.sd datastore` for a Signal

Simulate the `sldemo_fuelsys` model, which is configured to log several signals, to create data in the Simulation Data Inspector repository.

```
sim('sldemo_fuelsys')
```

Use the Simulation Data Inspector programmatic interface to get the signal ID for the signal.

```
runCount = Simulink.sdi.getRunCount;
```

```
latestRunID = Simulink.sdi.getRunIDByIndex(runCount);
```

```
latestRun = Simulink.sdi.getRun(latestRunID);
```

```
speedSigID = latestRun.getSignalIDByIndex(4);
```

Use the signal ID to create a `matlab.io.datastore.sd datastore` for the speed signal.

```
speedSDIds = matlab.io.datastore.sd datastore(speedSigID);
```

### Verify the Contents of the Datastore

Check the `Name` property of the `matlab.io.datastore.sd datastore` to verify that it matches your expectations.

```
speedSDIds.Name
```

```
ans =
'map'
```

You can also use the `preview` method to check that the first ten samples in the signal look correct.

```
speedSDIds.preview
```

```
ans=10x1 timetable
 Time Data

0 sec 0.589
0.00056199 sec 0.58772
0.0033719 sec 0.58148
0.01 sec 0.56765
0.02 sec 0.54897
0.03 sec 0.53264
0.04 sec 0.51837
0.05 sec 0.50594
0.055328 sec 0.5
0.055328 sec 0.5
```

### Process Signal Data with the `matlab.io.datastore.sd datastore`

When your signal is too large to fit into memory, you can use the `readData` method to read chunks of data from the Simulation Data Inspector repository to incrementally process your data. Use the `hasdata` method as the condition for a while loop to incrementally process the whole signal. For example, find the maximum signal value.

```
latestMax = [];

while speedSDIds.hasdata

 speedChunk = speedSDIds.read;
 speedChunkData = speedChunk.Data;
 latestMax = max([speedChunkData; latestMax]);

end

latestMax

latestMax = 0.8897
```

On each read operation, the `read` method updates the read position for the start of the next read operation. After reading some or all of the `matlab.io.datastore.sd datastore`, you can reset the read position to start again from the beginning of the signal.

```
speedSDIds.reset
```

### Process Signal Data in Memory

When the signal referenced by your `matlab.io.datastore.sd datastore` fits into memory, you can use the `readall` method to read all the signal data into memory for processing, rather than reading and processing the data incrementally with the `read` method. The `readall` method returns a `timetable` with all the signal data.

```
speedTimetable = speedSDIds.readall;
```

```
speedMax = max(speedTimetable.Data)
```

```
speedMax = 0.8897
```

### Alternatives

You can use your `matlab.io.datastore.sd datastore` to create a tall timetable to process signals too large to fit into memory. The tall timetable handles loading and processing the chunks of signal data for you. The `matlab.io.datastore.sd datastore` reference page includes an example that shows how to process your data using a tall timetable. For more information about working with tall timetables, see “Tall Arrays”.

## Version History

“Datastore”

## matlab.io.datastore.SimulationDatastore class

**Package:** matlab.io.datastore

Datastore for inputs and outputs of Simulink models

### Description

A `matlab.io.datastore.SimulationDatastore` object enables a Simulink model to interact with big data. You can load big data as simulation input and log big output data from a simulation. To simulate models with big data, you store the data in a MAT-file and refer to the data through a `SimulationDatastore` object. See “Work with Big Data for Simulations”.

A `SimulationDatastore` object refers to big simulation data (which a MAT-file stores) for one signal. If the MAT-file stores simulation data for a bus signal, a `SimulationDatastore` object refers to the data for one leaf signal element in the bus. You can use the datastore object to inspect and access the data and, through a parent object such as `Simulink.SimulationData.Signal`, simulate a Simulink model with the data.

To analyze the datastore data, you can use the methods and properties of the `SimulationDatastore` object as well as MATLAB tools such as the `tall` function. For more information about the MATLAB tools, see “Getting Started with Datastore”.

### Construction

After you store big simulation data in a `Simulink.SimulationData.Dataset` object in a MAT-file, a signal element in the `Dataset` object points to the big data. To create a `matlab.io.datastore.SimulationDatastore` object that refers to the big data:

- 1 At the command prompt or in a script, create a `Simulink.SimulationData.DatasetRef` object that refers to the `Dataset` object in the MAT-file.
- 2 Use one of these techniques:
  - Use one-based, curly-brace indexing (for example, `{1}`) to return an object that represents the target signal element, such as `Simulink.SimulationData.Signal` or `Simulink.SimulationData.State`. For example, for a `DatasetRef` object named `logout_ref`, to create a `Signal` object that refers to the second signal element, use this code:

```
myLoggedSig = logout_ref{2}
```
  - Use the `getAsDatastore` method of the `DatasetRef` object to return an object that represents the target signal element. For more information, see `getAsDatastore`.

The `SimulationDatastore` object resides in the `Values` property of the returned object.

### Properties

**FileName** — Name and path of file that contains big data

character vector

Name and path of the file that contains the big data, returned as a character vector. This property is read-only.

Data Types: char

### **NumSamples — Total number of samples (time steps) in the datastore**

integer

Total number of samples (time steps) in the datastore, returned as an integer. The `readall` method extracts this many samples from the big data. This property is read-only.

Data Types: uint64

### **ReadSize — Amount of data to read at a time**

100 (default) | scalar double

Amount of data to read at a time, in number of samples (time steps), specified as a scalar double. The `read` method extracts this many samples from the big data.

Data Types: double

## **Methods**

|                              |                                                               |
|------------------------------|---------------------------------------------------------------|
| <code>hasdata</code>         | Determine if data is available to read                        |
| <code>isPartitionable</code> | Determine whether datastore is partitionable                  |
| <code>isShuffleable</code>   | Determine whether datastore is shuffleable                    |
| <code>preview</code>         | Return subset of data from datastore                          |
| <code>progress</code>        | Return percentage of data that you have read from a datastore |
| <code>read</code>            | Read data in datastore                                        |
| <code>readall</code>         | Read all data in datastore                                    |
| <code>reset</code>           | Reset datastore to initial state                              |

## **Copy Semantics**

Handle. To learn how handle classes affect copy operations, see [Copying Objects](#).

## **Limitations**

- `SimulationDatastore` does not support using a parallel pool with Parallel Computing Toolbox installed. To analyze data using tall arrays or run MapReduce algorithms, set the global execution environment to be the local MATLAB session using `mapreducer`. Enter this code:

```
mapreducer(0)
```

For information about controlling parallel resources, see “Run mapreduce on a Parallel Pool” (Parallel Computing Toolbox).

- You cannot use a MATLAB tall variable as simulation input data.

## **Examples**

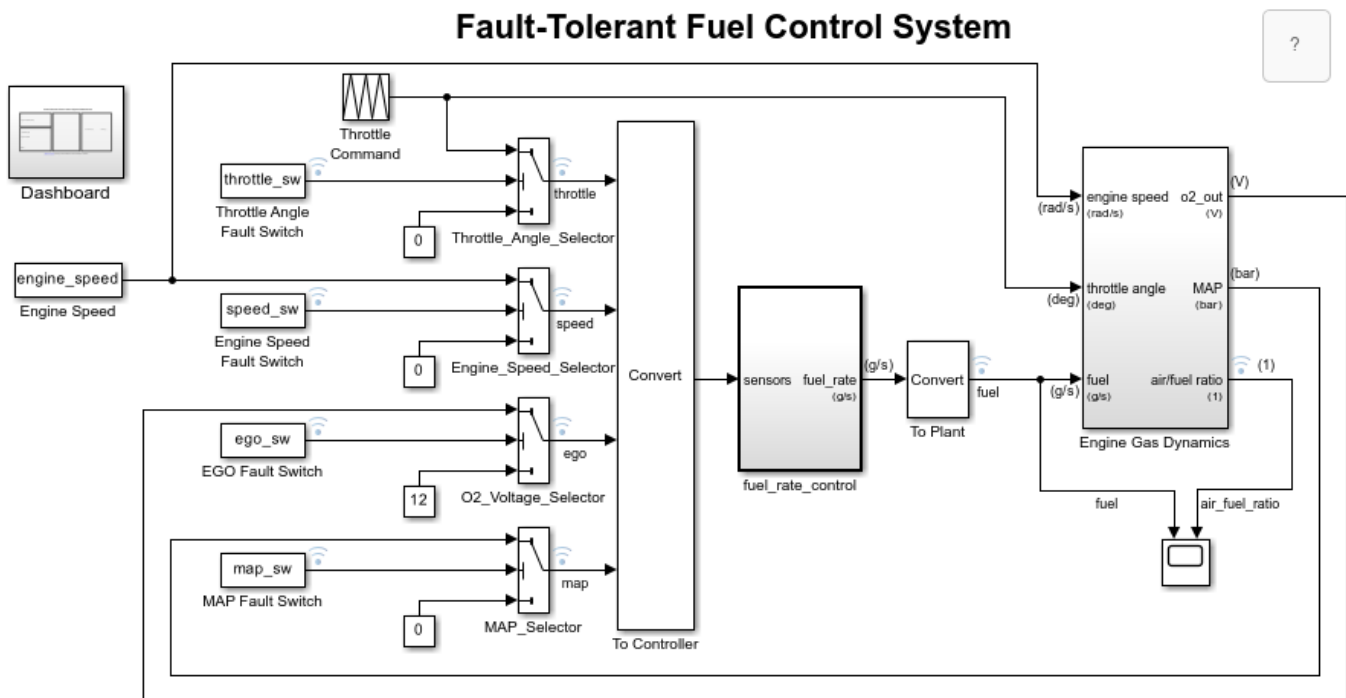

## Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

### Log Big Data from Model

Open the example model `sldemo_fuelsys`.

```
open_system('sldemo_fuelsys')
```

[Open the Dashboard](#) subsystem to simulate any combination of sensor failures.

Copyright 1990-2022 The MathWorks, Inc.

Select **Configuration Parameters > Data Import/Export > Log Dataset data to file.**

```
set_param('sldemo_fuelsys', 'LoggingToFile', 'on')
```

Simulate the model.

```
sim('sldemo_fuelsys')
```

The MAT-file `out.mat` appears in your current folder. The file contains data for logged signals such as `fuel` (which is at the root level of the model).

At the command prompt, create a `DatasetRef` object that refers to the logging variable by name, `sldemo_fuelsys_output`.

```
DSRef = Simulink.SimulationData.DatasetRef('out.mat', 'sldemo_fuelsys_output');
```

## Preview Big Data

Use curly braces (`{` and `}`) to extract the signal element `fuel`, which is the tenth element in `DSRef`, as a `Simulink.SimulationData.Signal` object that contains a `SimulationDatastore` object.

```
SimDataSig = DSRef{10};
```

To more easily interact with the `SimulationDatastore` object that resides in the `Values` property of the `Signal` object, store a handle in a variable named `DStore`.

```
DStore = SimDataSig.Values;
```

Use the `preview` method to inspect the first five samples of logged data for the `fuel` signal.

```
preview(DStore)
```

```
ans =
```

```
10x1 timetable
```

| Time           | Data   |
|----------------|--------|
| 0 sec          | 1.209  |
| 0.00056199 sec | 1.209  |
| 0.0033719 sec  | 1.209  |
| 0.01 sec       | 1.1729 |
| 0.02 sec       | 1.1409 |
| 0.03 sec       | 1.1124 |
| 0.04 sec       | 1.0873 |
| 0.05 sec       | 1.0652 |
| 0.055328 sec   | 1.0652 |
| 0.055328 sec   | 1.0652 |

## Inspect Specific Sample

Inspect the 603rd sample of logged `fuel` data.

Set the `ReadSize` property of `DStore` to a number that, considering memory resources, your computer can tolerate. For example, set `ReadSize` to 200.

```
DStore.ReadSize = 200;
```

Read from the datastore three times. Each read operation advances the reading position by 200 samples.

```
read(DStore);
read(DStore);
read(DStore);
```

Now that you are very close to the 603rd sample, set `ReadSize` to a smaller number. For example, set `ReadSize` to 5.

```
DStore.ReadSize = 5;
```

Read from the datastore again.

```
read(DStore)
```

```
ans =
```

```
5x1 timetable
```

| Time     | Data   |
|----------|--------|
| 5.79 sec | 1.6097 |
| 5.8 sec  | 1.6136 |
| 5.81 sec | 1.6003 |
| 5.82 sec | 1.5904 |
| 5.83 sec | 1.5832 |

The third sample of read data is the 603rd sample in the datastore.

### Inspect Earlier Sample

Inspect the 403rd sample of logged `fuel` data. Due to previous read operations, the datastore now reads starting from the 606th sample, so you must reset the datastore. Then, you can read from the first sample up to the 403rd sample.

Use the `reset` method to reset `DStore`.

```
reset(DStore);
```

Set `ReadSize` to 200 again.

```
DStore.ReadSize = 200;
```

Read from the datastore twice to advance the read position to the 401st sample.

```
read(DStore);
read(DStore);
```

Set `ReadSize` to 5 again.

```
DStore.ReadSize = 5;
```

Read from the datastore.

```
read(DStore)
```

```
ans =
```

```
5x1 timetable
```

| Time     | Data    |
|----------|---------|
| 3.85 sec | 0.999   |
| 3.86 sec | 0.99219 |
| 3.87 sec | 0.98538 |
| 3.88 sec | 0.97858 |

3.89 sec 0.97179

### Extract Multiple Samples

Extract samples 1001 through 1020 (a total of 20 samples).

Reset the datastore.

```
reset(DStore)
```

Advance to sample 1001.

```
DStore.ReadSize = 200;
```

```
for i = 1:5
 read(DStore);
end
```

Prepare to extract 20 samples from the datastore.

```
DStore.ReadSize = 20;
```

Extract samples 1001 through 1020. Store the extracted data in a variable named `targetSamples`.

```
targetSamples = read(DStore)
```

```
targetSamples =
```

```
20x1 timetable
```

| Time     | Data   |
|----------|--------|
| 9.7 sec  | 1.5828 |
| 9.71 sec | 1.5733 |
| 9.72 sec | 1.5664 |
| 9.73 sec | 1.5614 |
| 9.74 sec | 1.5579 |
| 9.75 sec | 1.5553 |
| 9.76 sec | 1.5703 |
| 9.77 sec | 1.582  |
| 9.78 sec | 1.5913 |
| 9.79 sec | 1.5988 |
| 9.8 sec  | 1.605  |
| 9.81 sec | 1.6101 |
| 9.82 sec | 1.6145 |
| 9.83 sec | 1.6184 |
| 9.84 sec | 1.6049 |
| 9.85 sec | 1.595  |
| 9.86 sec | 1.5877 |
| 9.87 sec | 1.5824 |
| 9.88 sec | 1.5785 |
| 9.89 sec | 1.5757 |

### Find Maximum Value of Data in Datastore

Reset the datastore.

```
reset(DStore)
```

Write a while loop, using the `hasdata` method, to incrementally analyze the data in chunks of 200 samples.

```
DStore.ReadSize = 200;
runningMax = [];
while hasdata(DStore)
 tt = read(DStore);
 rawChunk = tt.Data;
 runningMax = max([rawChunk; runningMax]);
end
```

Now, the variable `runningMax` stores the maximum value in the entire datastore.

```
runningMax
```

```
runningMax =
```

```
 1.6423
```

# hasdata

**Class:** `matlab.io.datastore.SimulationDatastore`

**Package:** `matlab.io.datastore`

Determine if data is available to read

## Syntax

```
tf = hasdata(dst)
```

## Description

`tf = hasdata(dst)` returns logical 1 (true) if there is data available to read from the datastore (`matlab.io.datastore.SimulationDatastore` object) specified by `dst`. Otherwise, it returns logical 0 (false).

## Input Arguments

**dst** — Input datastore

`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

## Examples

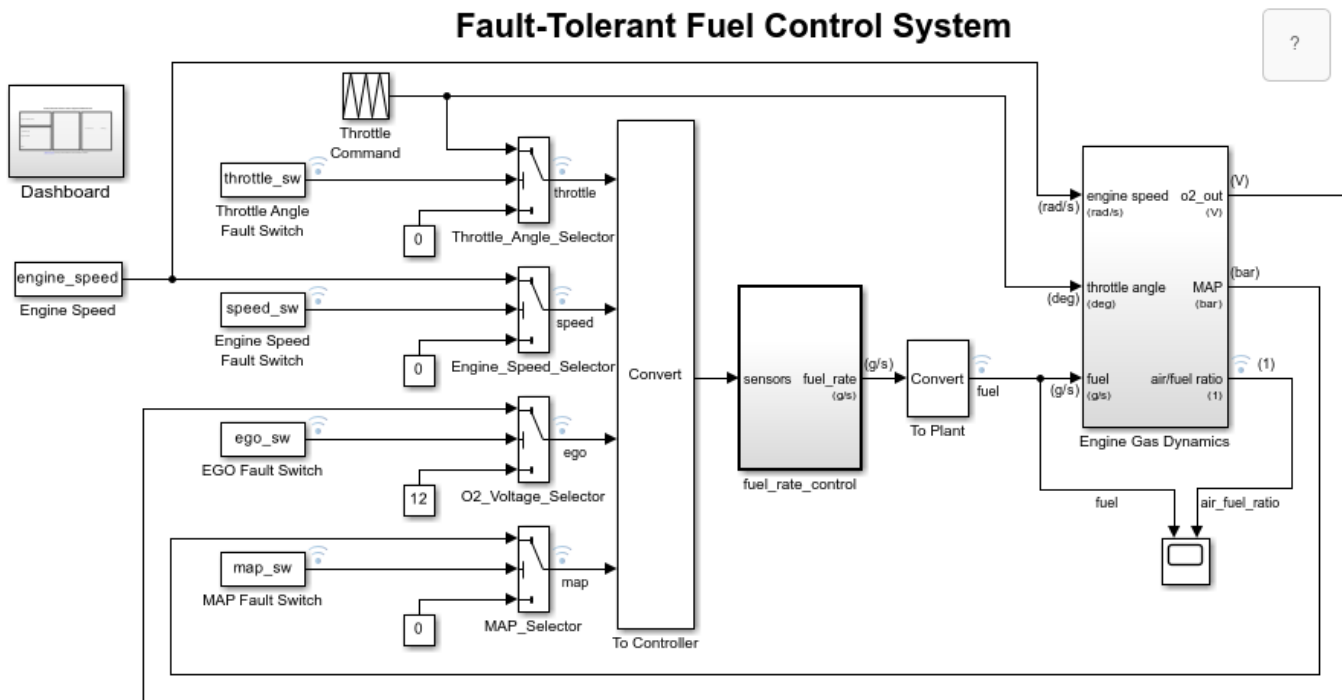

### Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

#### Log Big Data from Model

Open the example model `sldemo_fuelsys`.

```
open_system('sldemo_fuelsys')
```

[Open the Dashboard](#) subsystem to simulate any combination of sensor failures.

Copyright 1990-2022 The MathWorks, Inc.

Select **Configuration Parameters > Data Import/Export > Log Dataset data to file.**

```
set_param('sldemo_fuelsys', 'LoggingToFile', 'on')
```

Simulate the model.

```
sim('sldemo_fuelsys')
```

The MAT-file `out.mat` appears in your current folder. The file contains data for logged signals such as `fuel` (which is at the root level of the model).

At the command prompt, create a `DatasetRef` object that refers to the logging variable by name, `sldemo_fuelsys_output`.

```
DSRef = Simulink.SimulationData.DatasetRef('out.mat', 'sldemo_fuelsys_output');
```

#### Preview Big Data

Use curly braces (`{` and `}`) to extract the signal element `fuel`, which is the tenth element in `DSRef`, as a `Simulink.SimulationData.Signal` object that contains a `SimulationDatastore` object.

```
SimDataSig = DSRef{10};
```

To more easily interact with the `SimulationDatastore` object that resides in the `Values` property of the `Signal` object, store a handle in a variable named `DStore`.

```
DStore = SimDataSig.Values;
```

Use the `preview` method to inspect the first five samples of logged data for the `fuel` signal.

```
preview(DStore)
```

```
ans =
```

```
10x1 timetable
```

| Time           | Data   |
|----------------|--------|
| 0 sec          | 1.209  |
| 0.00056199 sec | 1.209  |
| 0.0033719 sec  | 1.209  |
| 0.01 sec       | 1.1729 |
| 0.02 sec       | 1.1409 |
| 0.03 sec       | 1.1124 |
| 0.04 sec       | 1.0873 |
| 0.05 sec       | 1.0652 |
| 0.055328 sec   | 1.0652 |
| 0.055328 sec   | 1.0652 |

### Inspect Specific Sample

Inspect the 603rd sample of logged `fuel` data.

Set the `ReadSize` property of `DStore` to a number that, considering memory resources, your computer can tolerate. For example, set `ReadSize` to 200.

```
DStore.ReadSize = 200;
```

Read from the datastore three times. Each read operation advances the reading position by 200 samples.

```
read(DStore);
read(DStore);
read(DStore);
```

Now that you are very close to the 603rd sample, set `ReadSize` to a smaller number. For example, set `ReadSize` to 5.

```
DStore.ReadSize = 5;
```

Read from the datastore again.

```
read(DStore)
```

```
ans =
```

```
5x1 timetable
```

| Time     | Data   |
|----------|--------|
| 5.79 sec | 1.6097 |
| 5.8 sec  | 1.6136 |

```
5.81 sec 1.6003
5.82 sec 1.5904
5.83 sec 1.5832
```

The third sample of read data is the 603rd sample in the datastore.

### Inspect Earlier Sample

Inspect the 403rd sample of logged `fuel` data. Due to previous read operations, the datastore now reads starting from the 606th sample, so you must reset the datastore. Then, you can read from the first sample up to the 403rd sample.

Use the `reset` method to reset `DStore`.

```
reset(DStore);
```

Set `ReadSize` to 200 again.

```
DStore.ReadSize = 200;
```

Read from the datastore twice to advance the read position to the 401st sample.

```
read(DStore);
read(DStore);
```

Set `ReadSize` to 5 again.

```
DStore.ReadSize = 5;
```

Read from the datastore.

```
read(DStore)
```

```
ans =
```

```
5x1 timetable
```

| Time     | Data    |
|----------|---------|
| 3.85 sec | 0.999   |
| 3.86 sec | 0.99219 |
| 3.87 sec | 0.98538 |
| 3.88 sec | 0.97858 |
| 3.89 sec | 0.97179 |

### Extract Multiple Samples

Extract samples 1001 through 1020 (a total of 20 samples).

Reset the datastore.

```
reset(DStore)
```

Advance to sample 1001.

```
DStore.ReadSize = 200;
```

```
for i = 1:5
 read(DStore);
end
```

Prepare to extract 20 samples from the datastore.

```
DStore.ReadSize = 20;
```

Extract samples 1001 through 1020. Store the extracted data in a variable named `targetSamples`.

```
targetSamples = read(DStore)
```

```
targetSamples =
```

```
20x1 timetable
```

| Time     | Data   |
|----------|--------|
| 9.7 sec  | 1.5828 |
| 9.71 sec | 1.5733 |
| 9.72 sec | 1.5664 |
| 9.73 sec | 1.5614 |
| 9.74 sec | 1.5579 |
| 9.75 sec | 1.5553 |
| 9.76 sec | 1.5703 |
| 9.77 sec | 1.582  |
| 9.78 sec | 1.5913 |
| 9.79 sec | 1.5988 |
| 9.8 sec  | 1.605  |
| 9.81 sec | 1.6101 |
| 9.82 sec | 1.6145 |
| 9.83 sec | 1.6184 |
| 9.84 sec | 1.6049 |
| 9.85 sec | 1.595  |
| 9.86 sec | 1.5877 |
| 9.87 sec | 1.5824 |
| 9.88 sec | 1.5785 |
| 9.89 sec | 1.5757 |

### Find Maximum Value of Data in Datastore

Reset the datastore.

```
reset(DStore)
```

Write a `while` loop, using the `hasdata` method, to incrementally analyze the data in chunks of 200 samples.

```
DStore.ReadSize = 200;
runningMax = [];
while hasdata(DStore)
 tt = read(DStore);
 rawChunk = tt.Data;
```

```
 runningMax = max([rawChunk; runningMax]);
end
```

Now, the variable `runningMax` stores the maximum value in the entire datastore.

```
runningMax
```

```
runningMax =
```

```
 1.6423
```

“Work with Big Data for Simulations”

# isPartitionable

**Class:** `matlab.io.datastore.SimulationDatastore`

**Package:** `matlab.io.datastore`

Determine whether datastore is partitionable

## Syntax

```
tf = isPartitionable(ds)
```

## Description

`tf = isPartitionable(ds)` returns logical 1 (true) if the datastore `ds` is partitionable. Otherwise, the result is logical 0 (false).

## Input Arguments

### **ds** — Input datastore

datastore

Input datastore. You can use these datastores as input:

- MATLAB datastores — Datastores created using MATLAB datastore functions. For a complete list of datastores, see “Select Datastore for File Format or Application”.
- Combined and transformed datastores — Datastores created using the `combine` and `transform` functions.
- Custom datastores — Datastores created using the custom datastore framework. Any datastore that subclasses from `matlab.io.Datastore` supports the `isPartitionable` function. See “Develop Custom Datastore” for more information.

## Examples

### **Test Partitionability of Simulation Datastore**

This example shows how to determine the partitionability of a `matlab.io.datastore.SimulationDatastore` object that contains big data from a simulation.

### **Log Big Data from Model**

Open the example model `sldemo_fuelsys`.

```
open_system('sldemo_fuelsys')
```

[Open the Dashboard](#) subsystem to simulate any combination of sensor failures.

Copyright 1990-2022 The MathWorks, Inc.

Select **Configuration Parameters > Data Import/Export > Log Dataset data to file.**

```
set_param('sldemo_fuelsys', 'LoggingToFile', 'on')
```

Simulate the model.

```
sim('sldemo_fuelsys')
```

The MAT-file `out.mat` appears in your current folder. The file contains data for logged signals such as `fuel` (which is at the root level of the model).

At the command prompt, create a `DatasetRef` object that refers to the logging variable by name, `sldemo_fuelsys_output`.

```
DSRef = Simulink.SimulationData.DatasetRef('out.mat', 'sldemo_fuelsys_output');
```

#### Preview Big Data

Use curly braces (`{` and `}`) to extract the signal element `fuel`, which is the tenth element in `DSRef`, as a `Simulink.SimulationData.Signal` object that contains a `SimulationDatastore` object.

```
SimDataSig = DSRef{10};
```

To more easily interact with the `SimulationDatastore` object that resides in the `Values` property of the `Signal` object, store a handle in a variable named `DStore`.

```
DStore = SimDataSig.Values;
```

Determine if the datastore is partitionable.

```
if isPartitionable(DStore)
 disp('Datastore is partitionable.')
else
 disp('Datatstore is not partitionable.')
end
```

Datatstore is not partitionable.

## isShuffleable

**Class:** `matlab.io.datastore.SimulationDatastore`

**Package:** `matlab.io.datastore`

Determine whether datastore is shuffleable

### Syntax

```
tf = isShuffleable(ds)
```

### Description

`tf = isShuffleable(ds)` returns logical 1 (true) if the datastore `ds` is shuffleable. Otherwise, the result is logical 0 (false).

You can use the `shuffle` function on shuffleable datastores to randomize the ordering of files, while preserving the row associations of files in different datastores.

### Input Arguments

#### **ds** — Input datastore

datastore

Input datastore. You can use these datastores as input:

- MATLAB datastores — Datastores created using MATLAB `datastore` functions. For a complete list of datastores, see “Select Datastore for File Format or Application”.
- Combined and transformed datastores — Datastores created using the `combine` and `transform` functions.
- Custom datastores — Datastores created using the custom datastore framework. Any datastore that subclasses from `matlab.io.Datastore` supports the `isShuffleable` function. See “Develop Custom Datastore” for more information.

## preview

**Class:** `matlab.io.datastore.SimulationDatastore`

**Package:** `matlab.io.datastore`

Return subset of data from datastore

### Syntax

```
data = preview(dst)
```

### Description

`data = preview(dst)` returns a subset of data from datastore (`matlab.io.datastore.SimulationDatastore` object) `dst` without changing its current read position. `preview` returns only the first ten samples (time steps) of data in the datastore. Use this method to quickly inspect and verify that the data appears as you expect.

### Input Arguments

**dst** — Input datastore

`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

### Output Arguments

**data** — Subset of data

`timetable` object

Subset of data, returned as a `timetable` object. For information about `timetable`, see “Timetables”.

## Examples

### Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

#### Log Big Data from Model

#### **Topics**

“Work with Big Data for Simulations”

# progress

**Class:** `matlab.io.datastore.SimulationDatastore`

**Package:** `matlab.io.datastore`

Return percentage of data that you have read from a datastore

## Syntax

```
p = progress(dst)
```

## Description

`p = progress(dst)` returns the percentage, as a number between 0 and 1, of the data that you have read from a datastore (`matlab.io.datastore.SimulationDatastore` object). For example, a return value of 0.55 means you have read 55% of the data. Use the `progress` method and the `NumSamples` property to determine the current read position.

You read data from a `SimulationDatastore` object by using the `read` method.

## Input Arguments

**dst** — Input datastore

`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

## Output Arguments

**p** — Percentage of data that you have read from the datastore

scalar double

Percentage of data that you have read from the datastore, returned as a scalar double.

Data Types: `double`

## Version History

Introduced in R2017a

### Topics

“Work with Big Data for Simulations”

## read

**Class:** `matlab.io.datastore.SimulationDatastore`

**Package:** `matlab.io.datastore`

Read data in datastore

### Syntax

```
data = read(dst)
[data,info] = read(dst)
```

### Description

`data = read(dst)` returns data from a datastore (`matlab.io.datastore.SimulationDatastore` object). Subsequent calls to the `read` function continue reading from the endpoint of the previous call. Use the `ReadSize` property of the `SimulationDatastore` object to specify the amount of data, in samples (time steps), to read at a time. Use the `progress` method and the `NumSamples` property to determine the current read position.

`[data,info] = read(dst)` also returns information about the extracted data in `info`.

### Input Arguments

**dst** — Input datastore

`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

### Output Arguments

**data** — Output data

`timetable` object

Output data, returned as a `timetable` object. For information about `timetable`, see “Timetables”.

**info** — Information about read data

structure array

Information about read data, returned as a structure. The structure has one field, `FileName`, which is a fully resolved path containing the path string, the name of the file, and the file extension.

### Examples

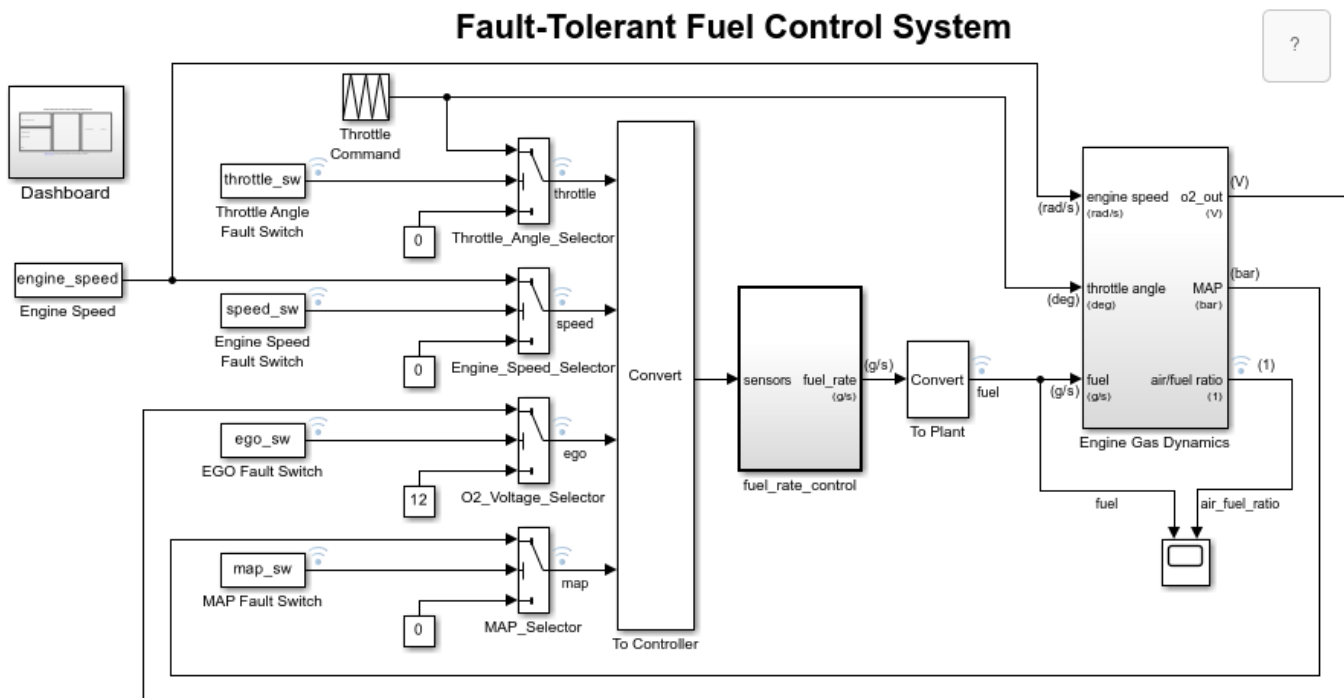

## Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

### Log Big Data from Model

Open the example model `sldemo_fuelsys`.

```
open_system('sldemo_fuelsys')
```

[Open the Dashboard](#) subsystem to simulate any combination of sensor failures.

Copyright 1990-2022 The MathWorks, Inc.

Select **Configuration Parameters > Data Import/Export > Log Dataset data to file.**

```
set_param('sldemo_fuelsys', 'LoggingToFile', 'on')
```

Simulate the model.

```
sim('sldemo_fuelsys')
```

The MAT-file `out.mat` appears in your current folder. The file contains data for logged signals such as `fuel` (which is at the root level of the model).

At the command prompt, create a `DatasetRef` object that refers to the logging variable by name, `sldemo_fuelsys_output`.

```
DSRef = Simulink.SimulationData.DatasetRef('out.mat', 'sldemo_fuelsys_output');
```

**Preview Big Data**

Use curly braces (`{` and `}`) to extract the signal element `fuel`, which is the tenth element in `DSRef`, as a `Simulink.SimulationData.Signal` object that contains a `SimulationDatastore` object.

```
SimDataSig = DSRef{10};
```

To more easily interact with the `SimulationDatastore` object that resides in the `Values` property of the `Signal` object, store a handle in a variable named `DStore`.

```
DStore = SimDataSig.Values;
```

Use the `preview` method to inspect the first five samples of logged data for the `fuel` signal.

```
preview(DStore)
```

```
ans =
```

```
10x1 timetable
```

| Time           | Data   |
|----------------|--------|
| -----          | -----  |
| 0 sec          | 1.209  |
| 0.00056199 sec | 1.209  |
| 0.0033719 sec  | 1.209  |
| 0.01 sec       | 1.1729 |
| 0.02 sec       | 1.1409 |

| 0.04 sec       | 1.0873 |
| 0.05 sec       | 1.0652 |
| 0.055328 sec   | 1.0652 |
| 0.055328 sec   | 1.0652 |

**Inspect Specific Sample**

Inspect the 603rd sample of logged `fuel` data.

Set the `ReadSize` property of `DStore` to a number that, considering memory resources, your computer can tolerate. For example, set `ReadSize` to 200.

```
DStore.ReadSize = 200;
```

Read from the datastore three times. Each read operation advances the reading position by 200 samples.

```
read(DStore);
read(DStore);
read(DStore);
```

Now that you are very close to the 603rd sample, set `ReadSize` to a smaller number. For example, set `ReadSize` to 5.

```
DStore.ReadSize = 5;
```

Read from the datastore again.

```
read(DStore)
```

```
ans =
```

```
5x1 timetable
```

| Time     | Data   |
|----------|--------|
| 5.79 sec | 1.6097 |
| 5.8 sec  | 1.6136 |
| 5.81 sec | 1.6003 |
| 5.82 sec | 1.5904 |
| 5.83 sec | 1.5832 |

The third sample of read data is the 603rd sample in the datastore.

### Inspect Earlier Sample

Inspect the 403rd sample of logged fuel data. Due to previous read operations, the datastore now reads starting from the 606th sample, so you must reset the datastore. Then, you can read from the first sample up to the 403rd sample.

Use the `reset` method to reset `DStore`.

```
reset(DStore);
```

Set `ReadSize` to 200 again.

```
DStore.ReadSize = 200;
```

Read from the datastore twice to advance the read position to the 401st sample.

```
read(DStore);
read(DStore);
```

Set `ReadSize` to 5 again.

```
DStore.ReadSize = 5;
```

Read from the datastore.

```
read(DStore)
```

```
ans =
```

```
5x1 timetable
```

| Time     | Data    |
|----------|---------|
| 3.85 sec | 0.999   |
| 3.86 sec | 0.99219 |
| 3.87 sec | 0.98538 |
| 3.88 sec | 0.97858 |

3.89 sec 0.97179

### Extract Multiple Samples

Extract samples 1001 through 1020 (a total of 20 samples).

Reset the datastore.

```
reset(DStore)
```

Advance to sample 1001.

```
DStore.ReadSize = 200;
```

```
for i = 1:5
 read(DStore);
end
```

Prepare to extract 20 samples from the datastore.

```
DStore.ReadSize = 20;
```

Extract samples 1001 through 1020. Store the extracted data in a variable named `targetSamples`.

```
targetSamples = read(DStore)
```

```
targetSamples =
```

```
20x1 timetable
```

| Time     | Data   |
|----------|--------|
| 9.7 sec  | 1.5828 |
| 9.71 sec | 1.5733 |
| 9.72 sec | 1.5664 |
| 9.73 sec | 1.5614 |
| 9.74 sec | 1.5579 |
| 9.75 sec | 1.5553 |
| 9.76 sec | 1.5703 |
| 9.77 sec | 1.582  |
| 9.78 sec | 1.5913 |
| 9.79 sec | 1.5988 |
| 9.8 sec  | 1.605  |
| 9.81 sec | 1.6101 |
| 9.82 sec | 1.6145 |
| 9.83 sec | 1.6184 |
| 9.84 sec | 1.6049 |
| 9.85 sec | 1.595  |
| 9.86 sec | 1.5877 |
| 9.87 sec | 1.5824 |
| 9.88 sec | 1.5785 |
| 9.89 sec | 1.5757 |

## Find Maximum Value of Data in Datastore

Reset the datastore.

```
reset(DStore)
```

Write a while loop, using the `hasdata` method, to incrementally analyze the data in chunks of 200 samples.

```
DStore.ReadSize = 200;
runningMax = [];
while hasdata(DStore)
 tt = read(DStore);
 rawChunk = tt.Data;
 runningMax = max([rawChunk; runningMax]);
end
```

Now, the variable `runningMax` stores the maximum value in the entire datastore.

```
runningMax
```

```
runningMax =
```

```
 1.6423
```

## Version History

Introduced in R2017a

## See Also

### Topics

“Work with Big Data for Simulations”

## readall

**Class:** `matlab.io.datastore.SimulationDatastore`

**Package:** `matlab.io.datastore`

Read all data in datastore

### Syntax

```
data = readall(dst)
```

### Description

`data = readall(dst)` returns all the data in the datastore (`matlab.io.datastore.SimulationDatastore` object) specified by `dst`.

If all the data in the datastore does not fit in memory, `readall` returns an error. To determine how many samples (time steps) a datastore holds, inspect the `NumSamples` property of the `SimulationDatastore` object.

### Input Arguments

**dst** — Input datastore

`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

### Output Arguments

**data** — All data in the datastore

`timetable` object

All data in the datastore, returned as a `timetable` object. For information about `timetable`, see “Timetables”.

## Version History

Introduced in R2017a

### See Also

#### Topics

“Work with Big Data for Simulations”

# reset

**Class:** `matlab.io.datastore.SimulationDatastore`

**Package:** `matlab.io.datastore`

Reset datastore to initial state

## Syntax

```
reset(dst)
```

## Description

`reset(dst)` sets the read position of the datastore (`matlab.io.datastore.SimulationDatastore` object) specified by `dst` to the first sample in the datastore. Use `reset` to reread data from a datastore. You read from a datastore by using the `read` method.

## Input Arguments

**dst** — Input datastore

`matlab.io.datastore.SimulationDatastore` object

Input datastore, specified as a `matlab.io.datastore.SimulationDatastore` object. To create a `SimulationDatastore` object, see `matlab.io.datastore.SimulationDatastore`.

## Examples

### Inspect and Analyze Data in Simulation Datastore

This example shows how to log big data from a simulation and inspect and analyze portions of that data by interacting with a `matlab.io.datastore.SimulationDatastore` object.

#### Log Big Data from Model

Open the example model `sldemo_fuelsys`.

```
open_system('sldemo_fuelsys')
```

[Open the Dashboard](#) subsystem to simulate any combination of sensor failures.

Copyright 1990-2022 The MathWorks, Inc.

Select **Configuration Parameters > Data Import/Export > Log Dataset data to file.**

```
set_param('sldemo_fuelsys', 'LoggingToFile', 'on')
```

Simulate the model.

```
sim('sldemo_fuelsys')
```

The MAT-file `out.mat` appears in your current folder. The file contains data for logged signals such as `fuel` (which is at the root level of the model).

At the command prompt, create a `DatasetRef` object that refers to the logging variable by name, `sldemo_fuelsys_output`.

```
DSRef = Simulink.SimulationData.DatasetRef('out.mat', 'sldemo_fuelsys_output');
```

#### Preview Big Data

Use curly braces (`{` and `}`) to extract the signal element `fuel`, which is the tenth element in `DSRef`, as a `Simulink.SimulationData.Signal` object that contains a `SimulationDatastore` object.

```
SimDataSig = DSRef{10};
```

To more easily interact with the `SimulationDatastore` object that resides in the `Values` property of the `Signal` object, store a handle in a variable named `DStore`.

```
DStore = SimDataSig.Values;
```

Use the `preview` method to inspect the first five samples of logged data for the `fuel` signal.

```
preview(DStore)
```

```
ans =
```

```
10x1 timetable
```

| Time           | Data   |
|----------------|--------|
| 0 sec          | 1.209  |
| 0.00056199 sec | 1.209  |
| 0.0033719 sec  | 1.209  |
| 0.01 sec       | 1.1729 |
| 0.02 sec       | 1.1409 |
| 0.03 sec       | 1.1124 |
| 0.04 sec       | 1.0873 |
| 0.05 sec       | 1.0652 |
| 0.055328 sec   | 1.0652 |
| 0.055328 sec   | 1.0652 |

### Inspect Specific Sample

Inspect the 603rd sample of logged `fuel` data.

Set the `ReadSize` property of `DStore` to a number that, considering memory resources, your computer can tolerate. For example, set `ReadSize` to 200.

```
DStore.ReadSize = 200;
```

Read from the datastore three times. Each read operation advances the reading position by 200 samples.

```
read(DStore);
read(DStore);
read(DStore);
```

Now that you are very close to the 603rd sample, set `ReadSize` to a smaller number. For example, set `ReadSize` to 5.

```
DStore.ReadSize = 5;
```

Read from the datastore again.

```
read(DStore)
```

```
ans =
```

```
5x1 timetable
```

| Time     | Data   |
|----------|--------|
| 5.79 sec | 1.6097 |
| 5.8 sec  | 1.6136 |

```
5.81 sec 1.6003
5.82 sec 1.5904
5.83 sec 1.5832
```

The third sample of read data is the 603rd sample in the datastore.

### Inspect Earlier Sample

Inspect the 403rd sample of logged `fuel` data. Due to previous read operations, the datastore now reads starting from the 606th sample, so you must reset the datastore. Then, you can read from the first sample up to the 403rd sample.

Use the `reset` method to reset `DStore`.

```
reset(DStore);
```

Set `ReadSize` to 200 again.

```
DStore.ReadSize = 200;
```

Read from the datastore twice to advance the read position to the 401st sample.

```
read(DStore);
read(DStore);
```

Set `ReadSize` to 5 again.

```
DStore.ReadSize = 5;
```

Read from the datastore.

```
read(DStore)
```

```
ans =
```

```
5x1 timetable
```

| Time     | Data    |
|----------|---------|
| 3.85 sec | 0.999   |
| 3.86 sec | 0.99219 |
| 3.87 sec | 0.98538 |
| 3.88 sec | 0.97858 |
| 3.89 sec | 0.97179 |

### Extract Multiple Samples

Extract samples 1001 through 1020 (a total of 20 samples).

Reset the datastore.

```
reset(DStore)
```

Advance to sample 1001.

```
DStore.ReadSize = 200;
```

```
for i = 1:5
 read(DStore);
end
```

Prepare to extract 20 samples from the datastore.

```
DStore.ReadSize = 20;
```

Extract samples 1001 through 1020. Store the extracted data in a variable named `targetSamples`.

```
targetSamples = read(DStore)
```

```
targetSamples =
```

```
20x1 timetable
```

| Time     | Data   |
|----------|--------|
| 9.7 sec  | 1.5828 |
| 9.71 sec | 1.5733 |
| 9.72 sec | 1.5664 |
| 9.73 sec | 1.5614 |
| 9.74 sec | 1.5579 |
| 9.75 sec | 1.5553 |
| 9.76 sec | 1.5703 |
| 9.77 sec | 1.582  |
| 9.78 sec | 1.5913 |
| 9.79 sec | 1.5988 |
| 9.8 sec  | 1.605  |
| 9.81 sec | 1.6101 |
| 9.82 sec | 1.6145 |
| 9.83 sec | 1.6184 |
| 9.84 sec | 1.6049 |
| 9.85 sec | 1.595  |
| 9.86 sec | 1.5877 |
| 9.87 sec | 1.5824 |
| 9.88 sec | 1.5785 |
| 9.89 sec | 1.5757 |

### Find Maximum Value of Data in Datastore

Reset the datastore.

```
reset(DStore)
```

Write a `while` loop, using the `hasdata` method, to incrementally analyze the data in chunks of 200 samples.

```
DStore.ReadSize = 200;
runningMax = [];
while hasdata(DStore)
 tt = read(DStore);
 rawChunk = tt.Data;
```

```
 runningMax = max([rawChunk; runningMax]);
end
```

Now, the variable `runningMax` stores the maximum value in the entire datastore.

```
runningMax
```

```
runningMax =
```

```
 1.6423
```

# allowModelReferenceDiscreteSampleTimeInheritanceImpl

Model reference sample time inheritance status for discrete sample times

## Syntax

```
flag = allowModelReferenceDiscreteSampleTimeInheritanceImpl(obj)
```

## Description

`flag = allowModelReferenceDiscreteSampleTimeInheritanceImpl(obj)` specifies whether a System object in a referenced model is allowed to inherit the sample time of the parent model. Use this method only for System objects that use discrete sample time and are intended for inclusion in Simulink via the MATLAB System block.

## Run-Time Details

During model compilation, Simulink sets the referenced model sample time inheritance before the System object `setupImpl` method is called.

## Method Authoring Tips

You must set `Access = protected` for this method.

## Input Arguments

### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `allowModelReferenceDiscreteSampleTimeInheritanceImpl` method does not use the object, you can replace this input with `~`.

## Output Arguments

### **flag** — discrete sample time inheritance flag

true | false

Flag indicating whether model reference discrete sample time inheritance is allowed for the MATLAB System block containing the System object, returned as a logical value.

The default value for this argument depends on the number of inputs to the System object. If you want to use the default value, you do not need to include this method in your System object class definition file.

| Number of System object Inputs | Default Value and Override Effects                                                                                                                                                                                                                                                                                |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No inputs                      | <p><b>Default:</b> <code>false</code> — Model reference discrete sample time inheritance is not allowed.</p> <p>If your System object uses discrete sample time in its algorithm, override the default by returning <code>true</code> from <code>allowModelReferenceDiscreteSampleTimeInheritanceImpl</code>.</p> |
| One or more inputs             | <p><b>Default:</b> <code>true</code> — If no other Simulink constraint prevents it, model reference sample time inheritance is allowed.</p>                                                                                                                                                                       |

## Examples

### Set Sample Time Inheritance for System Object

For a System object that has one or more inputs, to disallow model reference discrete sample time inheritance for that object, set the sample time inheritance to `false`. Include this code in your class definition file for the object.

```
methods (Access = protected)
 function flag = allowModelReferenceDiscreteSampleTimeInheritanceImpl(~)
 flag = false;
 end
end
```

# getInputNamesImpl

Names of MATLAB System block input ports

## Syntax

```
names = getInputNamesImpl(obj)
```

## Description

`names = getInputNamesImpl(obj)` specifies the names of the input ports from System object, `obj` implemented in a MATLAB System block. The size of `names` matches the number of inputs returned by the `getNumInputs` method. If you change a property value that changes the number of inputs, the names of those inputs also change.

## Class Information

This method is part of the `matlab.System` class.

## Run-Time Details

`getInputNamesImpl` is called by the MATLAB System block.

## Method Authoring Tips

You must set `Access = protected` for this method.

## Input Arguments

### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getInputNamesImpl` method does not use the object, you can replace this input with `~`.

## Output Arguments

### **names** — Names of inputs

empty string array (default) | string array

Names of the inputs for the specified object, returned as a string array whose length equals the number of inputs.

## Examples

“Customize MATLAB System Block Appearance”

## Version History

Introduced in R2013b

# getOutputNamesImpl

Names of MATLAB System block output ports

## Syntax

```
names = getOutputNamesImpl(obj)
```

## Description

`names = getOutputNamesImpl(obj)` specifies the names of the output ports from System object, `obj` implemented in a MATLAB System block. The size of `names` matches the number of outputs returned by the `getNumOutputs` method. If you change a property value that affects the number of outputs, the names of those outputs also change.

## Class Information

This method is part of the `matlab.System` class.

## Run-Time Details

`getOutputNamesImpl` is called by the MATLAB System block.

## Method Authoring Tips

You must set `Access = protected` for this method.

## Input Arguments

### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getOutputNamesImpl` method does not use the object, you can replace this input with `~`.

## Output Arguments

### **names** — Names of outputs

empty string array (default) | string array

Names of the outputs for the specified object, returned as a string array whose length equals the number of outputs.

## Examples

“Customize MATLAB System Block Appearance”

# getPropertyGroupsImpl

Property groups for System object display

## Syntax

```
group = getPropertyGroupsImpl
```

## Description

`group = getPropertyGroupsImpl` specifies how to display properties in the block dialog of a MATLAB System block. You can specify:

- Sections — Arrange properties into sections (panel on the MATLAB System block dialog) with `matlab.system.display.Section`.
- Section Groups — Arrange properties and sections into groups (tabs on the MATLAB System block dialog) with `matlab.system.display.SectionGroup`.
- Order of properties — Specify the order of properties within sections/groups
- Order of sections — Specify the order of sections within groups.

If you create a section, but that section is not in a section group, its properties appear above the block dialog tab panels.

## Run-Time Details

In Simulink, `getPropertyGroupsImpl` modifies the MATLAB System block dialog.

If you choose to modify the MATLAB System block dialog from the Mask Editor, the `getPropertyGroupsImpl` method is removed from the System object. All block dialog customizations are then saved in a supporting XML file: `sysObjectName_mask.xml`.

In MATLAB, `getPropertyGroupsImpl` modifies how properties appear when the System object is displayed at the MATLAB command line. `getPropertyGroupsImpl` defines the order and groupings of properties. If your `getPropertyGroupsImpl` defines multiple section groups, only properties from the first section group are displayed at the command line. To display properties in other sections, a link is provided at the end of a System object property display. Group titles are also displayed at the command line.

## Method Authoring Tips

- You must set `Access = protected` for this method.
- If you include a `getPropertyGroupsImpl` method but do not list all properties, the excluded properties do not appear in the dialog box.
- To omit the Main title for the first group of properties, in `matlab.system.display.SectionGroup`, set `TitleSource` to 'Auto'.
- By default if you do not customize this method in your System object, the MATLAB System block dialog displays all public properties in the order specified in the System object class file.
- To customize property names, add comments above each property. For an example, see “System Object to Block Dialog Box Default Mapping”.

## Output Arguments

### **group** — Property sections and groups

array of `SectionGroup` or `Section` objects

Property groups and sections to pass to the MATLAB System block, specified as an array of `matlab.system.display.Section` and `matlab.system.display.SectionGroup` objects.

## Examples

“Customize System Block Dialog Box Using System object”

## Version History

**Introduced in R2013b**

# getSimulateUsingImpl

Specify value for Simulate using parameter

## Syntax

```
simmode = getSimulateUsingImpl
```

## Description

`simmode = getSimulateUsingImpl` specifies the simulation mode of the System object implemented in a MATLAB System block. The simulation mode restricts your System object to simulation using either code generation or interpreted execution. The associated `showSimulateUsingImpl` method controls whether the **Simulate using** option is displayed on the dialog box.

## Run-Time Details

`getSimulateUsingImpl` is called by the MATLAB System block.

## Method Authoring Tips

You must set `Access = protected` and `Static` for this method.

## Output Arguments

### `simmode` — Simulation mode

"Code generation" | "Interpreted execution"

Simulation mode, returned as the string "Code generation" or "Interpreted execution". If you do not include the `getSimulateUsingImpl` method in your class definition file, the simulation mode is unrestricted. Depending on the value returned by the associated `showSimulateUsingImpl` method, the simulation mode is displayed on the dialog box as either a dropdown list or not at all.

## Examples

### Specify the Simulation Mode

In the class definition file of your System object, define the simulation mode to display in the MATLAB System block. To prevent **Simulate using** from displaying, see `showSimulateUsingImpl`.

```
methods (Static, Access = protected)
 function simMode = getSimulateUsingImpl
 simMode = "Interpreted execution";
 end
end
```

## Version History

Introduced in R2015a

**See Also**

`showSimulateUsingImpl`

**Topics**

“Control Simulation Type in MATLAB System Block”

# getSimulinkFunctionNamesImpl

Register Simulink function names used in your System object

## Syntax

```
names = getSimulinkFunctionNamesImpl(obj)
```

## Description

`names = getSimulinkFunctionNamesImpl(obj)` specifies the Simulink function names used in the System object `obj`.

If you use a Simulink function in your System object, you can only call a Simulink function from the `stepImpl`, `updateImpl`, or `outputImpl` method.

## Run-Time Details

`getSimulinkFunctionNamesImpl` is invoked by the MATLAB System during model compilation to obtain the list of Simulink functions being called from the System object. Simulink uses this information to resolve the function names to a Simulink function declared in a Simulink Function block. If `getSimulinkFunctionNamesImpl` does not return the name of a function being called in the System object methods, Simulink attempts to resolve the function to a function on the MATLAB path.

## Method Authoring Tips

You must set `Access = protected` for this method.

## Input Arguments

### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getSimulinkFunctionNamesImpl` method does not use the object, you can replace this input with `~`.

## Output Arguments

### **names** — Simulink function names

{ ' ' } (default) | cell array of character vectors | string array

The names of the Simulink function you want to call from your System object.

## Examples

“Call Simulink Functions from a MATLAB System Block”

## **Version History**

Introduced in R2019a

# getInterfaceImpl

Set System object as message or data

## Syntax

```
interface = getInterfaceImpl(obj)
```

## Description

MATLAB `interface = getInterfaceImpl(obj)` specifies the inputs and outputs of a System block as either data or a message.

## Run-Time Details

`getInterfaceImpl` is part of the `matlab.System` class and is called before the `setupImpl` method.

## Method Authoring Tips

You must set `Access = protected` for this method.

You cannot modify any properties in this method.

## Input Arguments

### obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getInterfaceImpl` method does not use the object, you can replace this input with `~`.

## Output Arguments

### interface — MATLAB System block interface

scalar of interface objects | vector of interface objects

MATLAB System block interface, returned as a scalar or vector of `matlab.system.interface.*` objects. Use `matlab.system.interface.Input(signalName,signalType)` to define input signal types. Use `matlab.system.interface.Output(signalName,signalType)` to define output signal types.

- `signalName` - Defines the name of the port. Represented by a character array.
- `signalType` - Defines the type of port. The value is either `matlab.system.interface.Data` or `matlab.system.interface.Message`.

## Examples

## Process Message Payload Using MATLAB System Block

This example shows how to send, receive, and process messages using the MATLAB System block. Use System objects to author blocks to model custom behavior to send and receive messages and manipulate the message payload.

### Load and Open the Model

Open the model of the Message Send and Receive system. This model contains a random number generator as a data source. Based on that data, the Message Sender sends a message with a sine wave payload to a queue block. The queue block stores the messages, and the Message Receiver converts the message back to data.

```
open_system('slexMessageArrivalExample');
```

### Use getInterfaceImpl System Object API to Specify Message Ports

`getInterfaceImpl` is used in this example to specify the input and output message ports in the MATLAB System block for both the Message Sender and the Message Receiver. For the Message Sender, `getInterfaceImpl` is used to define the output of the MATLAB System block as a message. This action prompts the System object to create a message output. For the Message Receiver, `getInterfaceImpl` is used to define the input of the System object as a message and the output as data.

```
%Function to send messages
function interface = getInterfaceImpl(~)
 import matlab.system.interface.*;
 interface = Output("Out1", Message);
end

%Function to receive messages and output as data
function interface = getInterfaceImpl(obj)
 import matlab.system.interface.*;
 interface = [Input("In1", Message), ...
 Output("Out1", Data), Output("out2", Data)];
end
```

### Set the Propagators and Sample time

The following four propagators need to be set in the Message Sender: `getOutputSizeImpl`, `getOutputDataTypeImpl`, `isOutputComplexImpl`, `isOutputFixedSizeImpl`.

In this example, the message queue has a maximum capacity of 16 messages. The random number generator has a sample time of 0.1. The receiver has a sample time of 1. The Message Receiver sample time is set in the MATLAB System block using the `getSampleTimeImpl` API.

```

function sts = getSampleTimeImpl(obj)
 sts = createSampleTime(obj, 'Type', 'Discrete', ...
 'SampleTime', obj.SampleTime);
end

```

### Simulate the Model and Review Results

The Scope block displays the results. These results show that as you run more simulations, the random number generator produces a number greater than zero 50% of the time, as expected.

### Syntax

```
flag = showFiSettingsImpl
```

### Description

`flag = showFiSettingsImpl` specifies whether the Data Types tab appears on the MATLAB System block dialog box. The Data Types tab includes parameters to control processing of fixed point data the MATLAB System block. You cannot specify which parameters appear on the tab. If you implement `showFiSettingsImpl`, the simulation mode is set to code generation.

The parameters that appear on the Data Types tab, which cannot be customized, are:

- **Saturate on integer overflow** — a check box to control the action to take on integer overflow for built-in integer types. The default is that the box is checked, which indicates to saturate. This is also the default for when **Same as MATLAB** is selected as the **MATLAB System fimath** option.
- **Treat these inherited Simulink signal types as fi objects** — a pull down that indicates which inherited data types to treat as fi data types. Valid options are:
  - Fixed point (default)
  - Fixed point & integer
- **MATLAB System fimath** has two radio button options:
  - **Same as MATLAB** (default) — uses the current MATLAB fixed-point math settings.
  - **Specify Other** — enables the edit box for specifying the desired fixed-point math settings.

For information on setting fixed-point math, see `fimath`.

### Run-Time Details

`showFiSettingsImpl` is called by the MATLAB System block. For more information, see “Simulink Engine Phases Mapped to System Object Methods”.

### Method Authoring Tips

- If you do not want to display the tab, you do not need to implement this method in your class definition file.
- You must set `Access = protected` for this method.

### Output Arguments

**flag** — Display Data Types tab

false (default) | true

Flag indicating whether to display the Data Types tab on the MATLAB System block mask, returned as a logical scalar value. Returning a `true` value displays the tab. A `false` value does not display the tab.

## Examples

### Show the Data Types Tab

Show the Data Types tab on the MATLAB System block dialog box.

```
methods (Static, Access = protected)
 function isVisible = showFiSettingsImpl
 isVisible = true;
 end
end
```

If you set the flag, `isVisible`, to `true`, the tab appears as follows when you add the object to Simulink with the MATLAB System block.

## Version History

Introduced in R2016a

# showSimulateUsingImpl

Visibility of Simulate using parameter

## Syntax

```
flag = showSimulateUsingImpl
```

## Description

`flag = showSimulateUsingImpl` specifies whether **Simulate using** appears on the MATLAB System block dialog box.

## Run-Time Details

`showSimulateUsingImpl` is called by the MATLAB System block.

## Method Authoring Tips

You must set `Access = protected` and `Static` for this method.

## Output Arguments

### flag — Display parameter on block dialog box

`true` (default) | `false`

Flag indicating whether to display the **Simulate using** parameter and dropdown list on the MATLAB System block mask. `true` displays the parameter and dropdown list. `false` hides the parameter and dropdown list.

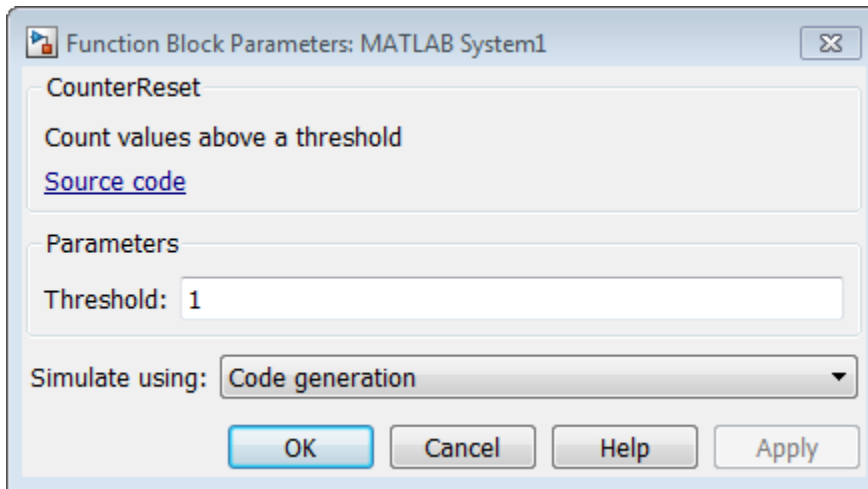

## Examples

### Hide the Simulate using Parameter

Hide the **Simulate using** parameter on the MATLAB System block dialog box.

```
methods (Static, Access = protected)
 function flag = showSimulateUsingImpl
 flag = false;
 end
end
```

If you set the `flag` to `true` or omit the `showSimulateUsingImpl` method, which defaults to `true`, the dialog appears as follows when you add the object to Simulink with the MATLAB System block.

If you also specify a single value for `getSimulateUsingImpl`, the dialog appears as follows when you add the object to Simulink with the MATLAB System block.

## Version History

Introduced in R2015a

“Control Simulation Type in MATLAB System Block”

# getGlobalNamesImpl

Global variable names for MATLAB System block

## Syntax

```
name = getGlobalNamesImpl(obj)
```

## Description

`name = getGlobalNamesImpl(obj)` specifies the names of global variables that are declared in a System object for use in a Simulink P-code file. For P-code files, in addition to declaring your global variables in `stepImpl`, `outputImpl`, or `updateImpl`, you must include the `getGlobalNamesImpl` method. You declare global variables in a cell array in the `getGlobalNamesImpl` method. System objects that contain these global variables are included in Simulink using a MATLAB System block. To enable a global variable in Simulink, your model also must include a Data Store Memory block with a **Data Store Name** that matches the global variable name.

## Run-Time Details

`getGlobalNamesImpl` is called by the MATLAB System block.

## Method Authoring Tips

You must set `Access = protected` for this method.

## Input Arguments

### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getGlobalNamesImpl` method does not use the object, you can replace this input with `~`.

## Output Arguments

### **name** — Global variable names

cell array of character vectors

Cell array containing the global variable names. The elements of the cell array are character vectors.

## Examples

### Specify Global Names

Specify two global names in your class definition file.

```
methods(Access = protected)
 function glnames = getGlobalNamesImpl(obj)
```

```
 glnames = {'FEE','OTHERFEE'};
end

function y = stepImpl(obj,u)
 global FEE
 global OTHERFEE
 y = u - FEE * obj.lastData + OTHERFEE;
 obj.lastData = u;
end
end
```

# getHeaderImpl

Header for System object display

## Syntax

```
header = getHeaderImpl
```

## Description

`header = getHeaderImpl` specifies the dialog header to display on the MATLAB System block dialog box. If you do not specify the `getHeaderImpl` method, no title or text appears for the header in the block dialog box.

## Run-Time Details

`getHeaderImpl` is called by the MATLAB System block.

## Method Authoring Tips

You must set `Access = protected` for this method.

## Output Arguments

### header — Header text

`matlab.system.display.Header` class

Header text specified as a `matlab.system.display.Header` class.

## Examples

### Define Header for System Block Dialog Box

Define a header in your class definition file for the `EnhancedCounter` System object.

```
methods (Static, Access = protected)
 function header = getHeaderImpl
 header = matlab.system.display.Header('EnhancedCounter',...
 'Title','Enhanced Counter');
 end
end
```

## Version History

Introduced in R2013b

## See Also

`getPropertyGroupsImpl`

**Topics**

“Add Header Description”

# getDiscreteStateImpl

Discrete state property values

## Syntax

```
s = getDiscreteStateImpl(obj)
```

## Description

`s = getDiscreteStateImpl(obj)` returns a struct `s` of internal state value properties, which have the `DiscreteState` attribute. The field names of the struct are the object's `DiscreteState` property names. To restrict or change the values returned by `getDiscreteState` method, you can override this `getDiscreteStateImpl` method.

## Run-Time Details

`getDiscreteStateImpl` is called by the `setup` method. For details, see

“Detailed Call Sequence”.

## Method Authoring Tips

- You must set `Access = protected` for this method.
- You cannot modify any properties in this method.

## Input Arguments

### obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getDiscreteStateImpl` method does not use the object, you can replace this input with `~`.

## Output Arguments

### s — State values

struct

State values, returned as a struct.

## Examples

### Get Discrete State Values

Use the `getDiscreteStateImpl` method in your class definition file to get the discrete states of the object.

```
methods (Access = protected)
 function s = getDiscreteStateImpl(obj)
```

end  
end

## **Version History**

“Define Property Attributes”

# supportsMultipleInstanceImpl

Support System object in Simulink For Each subsystem

## Syntax

```
flag = supportsMultipleInstanceImpl(obj)
```

## Description

`flag = supportsMultipleInstanceImpl(obj)` specifies whether the System object can be used in a Simulink For Each subsystem via the MATLAB System block. To enable For Each support, you must include the `supportsMultipleInstanceImpl` in your class definition file and have it return `true`. Do not enable For Each support if your System object allocates exclusive resources that may conflict with other System objects, such as allocating file handles, memory by address, or hardware resources.

## Run-Time Details

During Simulink model compilation and propagation, the MATLAB System block calls the `supportsMultipleInstance` method, which then calls the `supportsMultipleInstanceImpl` method to determine For Each support.

## Method Authoring Tips

- You must set `Access = protected` for this method.
- You cannot modify any properties in this method.

## Input Arguments

### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `supportsMultipleInstanceImpl` method does not use the object, you can replace this input with `~`.

## Output Arguments

### **flag** — Support for For Each subsystem flag

false (default) | true

Boolean value indicating whether the System object can be used in a For Each subsystem. The default value, if you do not include the `supportsMultipleInstanceImpl` method, is `false`.

## Examples

### **Enable For-Each Support for System Object**

Specify in your class definition file that the System object can be used in a Simulink For Each subsystem.

```
methods (Access = protected)
 function flag = supportsMultipleInstanceImpl(obj)
 flag = true;
 end
end
```

## **Version History**

**Introduced in R2014b**

# processTunedPropertiesImpl

Action when tunable properties change

## Syntax

```
processTunedPropertiesImpl(obj)
```

## Description

`processTunedPropertiesImpl(obj)` specifies the algorithm to perform when one or more tunable property values change. This method is called as part of the next call to the System object after a tunable property value changes. A property is tunable only if its `Nontunable` attribute is `false`, which is the default.

## Run-Time Details

`processTunedPropertiesImpl` is called when you run the System object.

In MATLAB when multiple tunable properties are changed before running the System object, `processTunedPropertiesImpl` is called only once for all the changes. `isChangedProperty` returns `true` for all the changed properties.

In Simulink, when a parameter is changed in a MATLAB System block dialog, the next simulation step calls `processTunedPropertiesImpl` before calling `stepImpl`. All tunable parameters are considered changed and `processTunedPropertiesImpl` method is called for each of them. `isChangedProperty` returns `true` for all the dialog properties.

For details, see “Detailed Call Sequence”.

## Method Authoring Tips

- You must set `Access = protected` for this method.
- Use this method when a tunable property affects the value of a different property.
- If the System object will be used in the Simulink MATLAB System block, you cannot modify any tunable properties in this method.
- To check if a property has changed since `stepImpl` was last called, use `isChangedProperty` within `processTunedPropertiesImpl`. See “Specify Action When Tunable Property Changes” on page 5-137 for an example.

## Input Arguments

### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `processTunedPropertiesImpl` method does not use the object, you can replace this input with `~`.

## Examples

### Specify Action When Tunable Property Changes

Use `processTunedPropertiesImpl` to recalculate the lookup table if the value of either the `NumNotes` or `MiddleC` property changes before the next call to the System object. `propChange` indicates if either property has changed.

```
methods (Access = protected)
 function processTunedPropertiesImpl(obj)
 propChange = isChangedProperty(obj, 'NumNotes') || ...
 isChangedProperty(obj, 'MiddleC')
 if propChange
 obj.pLookupTable = obj.MiddleC * (1+log(1:obj.NumNotes)/log(12));
 end
 end
end
```

## Version History

Introduced in R2013b

# matlab.system.mixin.CustomIcon class

**Package:** matlab.system.mixin

Custom icon mixin class

---

**Note** The `matlab.system.mixin.CustomIcon` mixin will be removed in a future release. You no longer need to inherit from this mixin in your `System` object. The associated `getIcon` method has been moved to the `matlab.System` class.

---

## Description

`matlab.system.mixin.CustomIcon` is a class that specifies the `getIcon` method. This method customizes the name of the icon used for the `System` object implemented through a MATLAB System block.

To use this method, you must subclass from this class in addition to the `matlab.System` base class. Type the following syntax as the first line of your class definition file, where `ObjectName` is the name of your object:

```
classdef ObjectName < matlab.system &...
 matlab.system.mixin.CustomIcon
```

The `matlab.system.mixin.CustomIcon` class is a handle class.

## Version History

**Introduced in R2017a**

**matlab.system.mixin.CustomIcon will be removed**

*Not recommended starting in R2020a*

The `matlab.system.mixin.CustomIcon` mixin will be removed in a future release. You no longer need to inherit from this mixin in your `System` object. The associated method has been moved to the `matlab.System` class.

Remove `matlab.system.mixin.CustomIcon` from the `classdef` line of your `System` object.

“Add Text to Block Icon”

## getIconImpl

Name to display as block icon

### Syntax

```
icon = getIconImpl(obj)
```

### Description

`icon = getIconImpl(obj)` specifies the text or image to display on the block icon of the MATLAB System block. If you do not specify the `getIconImpl` method, the block displays the class name of the System object as the block icon. For example, if you specify `pkg.MyObject` in the MATLAB System block, the default icon is labeled `MyObject`.

### Run-Time Details

`getIconImpl` is called by the MATLAB System block during Simulink model compilation.

### Method Authoring Tips

You must set `Access = protected` for this method.

### Input Arguments

#### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getIconImpl` method does not use the object, you can replace this input with `~`.

### Output Arguments

#### **icon** — Block icon

character vector | cell array of character vectors | string | string array |  
`matlab.system.display.Icon` object

The text or image to display as the block icon. Each cell is displayed as a separate line.

### Examples

#### Add System Block Icon Name

Specify in your class definition file the name of the block icon as 'Enhanced Counter' using two lines.

```
methods (Access = protected)
 function icon = getIconImpl(~)
 icon = {'Enhanced', 'Counter'};
```

```
end
end
```

### Add Image to MATLAB System Block

Define an image in your class definition file.

```
methods(Access = protected)
 function icon = getIconImpl(~)
 % Define icon for System block
 icon = matlab.system.display.Icon('my_icon.png');
 end
end
```

The image now appears on the System block icon.

## Version History

Introduced in R2017a

## matlab.system.display.Header class

**Package:** matlab.system.display

Header for System objects properties

### Syntax

```
matlab.system.display.Header(N1,V1,...Nn,Vn)
matlab.system.display.Header(Obj,...)
```

### Description

`matlab.system.display.Header(N1,V1,...Nn,Vn)` specifies a header for the System object, with the header properties defined in Name-Value (N,V) pairs. You use `matlab.system.display.Header` within the `getHeaderImpl` method. The available header properties are

- `Title` — Header title. The default value is an empty character vector.
- `Text` — Header description. The default value is an empty character vector.
- `ShowSourceLink` — Show link to source code for the object.

`matlab.system.display.Header(Obj,...)` creates a header for the specified System object (`Obj`) and sets the following property values:

- `Title` — Set to the `Obj` class name.
- `Text` — Set to help summary for `Obj`.
- `ShowSourceLink` — Set to `true` if `Obj` is MATLAB code. In this case, the **Source Code** link is displayed. If `Obj` is P-coded and the source code is not available, set this property to `false`.

You can use `mfilename('class')` from within this method to get the name of the System object. If you set any Name-Value pairs, those property values override the default settings.

### Examples

#### Define System Block Header

Define a header in your class definition file.

```
methods (Static, Access = protected)
 function header = getHeaderImpl
 header = matlab.system.display.Header(mfilename('class'), ...
 'Title','AlternativeTitle',...
 'Text','An alternative class description');
 end
end
```

The resulting output appears as follows. In this case, **Source code** appears because the `ShowSourceLink` property was set to `true`.

## matlab.system.display.Section class

**Package:** matlab.system.display

Property group section for System objects

### Syntax

```
matlab.system.display.Section(N1,V1,...Nn,Vn)
matlab.system.display.Section(Obj,...)
```

### Description

`matlab.system.display.Section(N1,V1,...Nn,Vn)` creates a property group section for displaying System object properties, which you define using property Name-Value pairs (N,V). You use `matlab.system.display.Section` to define property groups using the `getPropertyGroupsImpl` method. The available Section properties are:

- **Title** — Section title. The default value is an empty character vector.
- **TitleSource** — Source of section title. Valid values are 'Property' and 'Auto'. The default value is 'Property', which uses the character vector from the Title property. If the Obj name is given, the default value is Auto, which uses the Obj name.
- **Description** — Section description. The default value is an empty character vector.
- **PropertyList** — Section property list as a cell array of property names. The default value is an empty array. If the Obj name is given, the default value is all eligible display properties.
- **Type** — Container type. For example, tab, group, panel, and collapsible panel.
- **Row** — Specify the row in which the containers need to be placed (current/new). You can specify the row using the enum class `matlab.system.display.internal.Row`.
- **AlignPrompts** — Specify a boolean value to control align prompts within the containers.

---

**Note** Certain properties are not eligible for display either in a dialog box or in the System object summary on the command-line. Property types that cannot be displayed are: hidden, abstract, private or protected access, discrete state, and continuous state. Dependent properties do not display in a dialog box, but do display in the command-line summary.

---

`matlab.system.display.Section(Obj,...)` creates a property group section for the specified System object (Obj) and sets the following property values:

- **TitleSource** — Set to 'Auto', which uses the Obj name.
- **PropertyList** — Set to all publicly-available properties in the Obj.

You can use `mfilename('class')` from within this method to get the name of the System object. If you set any Name-Value pairs, those property values override the default settings.

### Examples

## Define Property Groups

Define two property groups in your class definition file by specifying their titles and property lists.

```
classdef MultipleGroupsWithSection < matlab.System
 % MultipleGroupsWithTabs Customize block dialog with multiple tabs and parameter groups.

 % Public, tunable properties
 properties
 %StartValue Start Value
 StartValue = 0

 %EndValue End Value
 EndValue = 10

 Threshold = 1
 end
 % Public Nontunable
 properties(Nontunable)
 %UseThreshold Use threshold
 UseThreshold (1,1) logical = true
 end

 methods (Static, Access = protected)
 function groups = getPropertyGroupsImpl
 valueGroup = matlab.system.display.Section(...
 'Title', 'Value parameters', ...
 'PropertyList', {'StartValue', 'EndValue'}, ...
 'SectionType', matlab.system.display.SectionType.tab);

 thresholdGroup = matlab.system.display.Section(...
 'Title', 'Threshold parameters', ...
 'PropertyList', {'Threshold', 'UseThreshold'}, ...
 'SectionType', matlab.system.display.SectionType.tab);
 groups = [valueGroup, thresholdGroup];
 end
 end
end
```

When you specify the System object in the MATLAB System block, the resulting dialog box appears as follows.

## See Also

## Topics

“Customize System Block Dialog Box Using System object”

# matlab.system.display.Action class

**Package:** matlab.system.display

Custom button

## Syntax

```
matlab.system.display.Action(action)
matlab.system.display.Action(action,Name,Value)
```

## Description

`matlab.system.display.Action(action)` specifies a button to display on the MATLAB System block. This button executes a function by launching a System object method or invoking any MATLAB function or code.

A typical button function launches a figure. The launched figure is decoupled from the block dialog box. Changes to the block are not synced to the displayed figure.

You define `matlab.system.display.Action` within the `getPropertyGroupsImpl` method in your class definition file. You can define multiple buttons using separate instances of `matlab.system.display.Action` in your class definition file.

`matlab.system.display.Action(action,Name,Value)` includes `Name,Value` pair arguments, which you can use to specify any properties.

## Input Arguments

### action

Action taken when the user presses the specified button on the MATLAB System block dialog. The action is defined as a function handle or as a MATLAB command. If you define the action as a function handle, the function definition must define two inputs. These inputs are a `matlab.system.display.ActionData` object and a System object instance, which can be used to invoke a method.

A `matlab.system.display.ActionData` object is the callback object for a display action. You use the `UserData` property of `matlab.system.display.ActionData` to store persistent data, such as a figure handle.

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

## Properties

You specify these properties as part of the input using `Name, Value` pair arguments. Optionally, you can define them using `object.property` syntax.

- `ActionCalledFcn` — Action to take when the button is pressed. You cannot specify this property using a `Name-Value` pair argument.
- `Label` — Text to display on the button. The default value is an empty character vector.
- `Description` — Text for the button tooltip. The default value is an empty character vector.
- `Placement` — Character vector indicating where on a separate row in the property group to place the button. Valid values are `'first'`, `'last'`, or a property name. If you specify a property name, the button is placed above that property. The default value is `'last'`.
- `Alignment` — Character vector indicating how to align the button. Valid values are `'left'` and `'right'`. The default value is `'left'`.

## Examples

### Define Button on MATLAB System Block

Define a **Visualize** button and its associated function to open a figure that plots a ramp using the parameter values in the block dialog.

```
methods(Static, Access = protected)
 function group = getPropertyGroupsImpl
 group = matlab.system.display.Section(mfilename('class'));
 group.Actions = matlab.system.display.Action(@(~,obj)...
 visualize(obj), 'Label', 'Visualize');
 end
end

methods
 function obj = PlotRamp(varargin)
 setProperties(obj, nargin, varargin{:});
 end

 function visualize(obj)
 figure;
 d = 1:obj.RampLimit;
 plot(d);
 end
end
```

When you specify the System object in the MATLAB System block, the resulting block dialog box appears as follows.

To open the same figure, rather than multiple figures, when the button is pressed more than once, use this code instead.

```

methods(Static,Access = protected)
 function group = getPropertyGroupsImpl
 group = matlab.system.display.Section(mfilename('class'));
 group.Actions = matlab.system.display.Action(@(actionData,obj)...
 visualize(obj,actionData),'Label','Visualize');
 end
end

methods
 function obj = ActionDemo(varargin)
 setProperties(obj,nargin,varargin{:});
 end

 function visualize(obj,actionData)
 f = actionData.UserData;
 if isempty(f) || ~ishandle(f)
 f = figure;
 actionData.UserData = f;
 else
 figure(f); % Make figure current
 end

 d = 1:obj.RampLimit;
 plot(d);
 end
end

```

# matlab.system.display.SectionGroup class

**Package:** matlab.system.display

Section group for System objects

## Syntax

```
matlab.system.display.SectionGroup(N1,V1,...Nn,Vn)
matlab.system.display.SectionGroup(Obj,...)
```

## Description

`matlab.system.display.SectionGroup(N1,V1,...Nn,Vn)` creates a group for displaying System object properties and display sections created with `matlab.system.display.Section`. You define such sections or properties using property Name-Value pairs (N,V). A section group can contain both properties and sections. You use `matlab.system.display.SectionGroup` to define section groups using the `getPropertyGroupsImpl` method. Section groups display as separate tabs in the MATLAB System block. The available Section properties are:

- **Title** — Group title. The default value is an empty character vector.
- **TitleSource** — Source of group title. Valid values are 'Property' and 'Auto'. The default value is 'Property', which uses the character vector from the Title property. If the Obj name is given, the default value is Auto, which uses the Obj name. In the System object property display at the MATLAB command line, you can omit the default "Main" title for the first group of properties by setting TitleSource to 'Auto'.
- **Description** — Group or tab description that appears above any properties or panels. The default value is an empty character vector.
- **PropertyList** — Group or tab property list as a cell array of property names. The default value is an empty array. If the Obj name is given, the default value is all eligible display properties.
- **Sections** — Group sections as an array of section objects. If the Obj name is given, the default value is the default section for the Obj.
- **Type** — Container type. For example, tab, group, panel, and collapsible panel.
- **Row** — Specify the row in which the containers need to be placed (current/new). You can specify the row using the enum class `matlab.system.display.internal.Row`.
- **AlignPrompts** — Specify a boolean value to control align prompts within the containers.

`matlab.system.display.SectionGroup(Obj,...)` creates a section group for the specified System object (Obj) and sets the following property values:

- **TitleSource** — Set to 'Auto'.
- **Sections** — Set to `matlab.system.display.Section` object for Obj.

You can use `mfilename('class')` from within this method to get the name of the System object. If you set any Name-Value pairs, those property values override the default settings.

## Examples

## Define Block Dialog Containers

Define in your class definition file two tabs, each containing specific properties. For this example, you use the `matlab.system.display.SectionGroup`, `matlab.system.display.Section`, and `getPropertyGroupsImpl` methods.

```
classdef MultipleGroupsWithSectionGroup < matlab.System
 % MultipleGroupsWithTabs Customize block dialog with multiple tabs and parameter groups.

 % Public, tunable properties
 properties
 %StartValue Start Value
 StartValue = 0

 %EndValue End Value
 EndValue = 10

 Threshold = 1

 %BlockLimit Limit
 BlockLimit = 55
 end
 % Public Nontunable
 properties(Nontunable)
 %IC1 First initial condition
 IC1 = 0

 %IC2 Second initial condition
 IC2 = 10

 %IC3 Third initial condition
 IC3 = 100

 %UseThreshold Use threshold
 UseThreshold (1,1) logical = true
 end

 methods (Static, Access = protected)
 function groups = getPropertyGroupsImpl
 % Section to always display above any tabs.
 alwaysSection = matlab.system.display.Section(...
 'Title', '', 'PropertyList', {'BlockLimit'});

 % Group with no sections
 initTab = matlab.system.display.SectionGroup(...
 'Title', 'Initial conditions', ...
 'PropertyList', {'IC1', 'IC2', 'IC3'}, ...
 'GroupType', matlab.system.display.SectionType.group);

 % Section for the value parameters
 valueSection = matlab.system.display.Section(...
 'Title', 'Value parameters', ...
 'PropertyList', {'StartValue', 'EndValue'}, ...
 'SectionType', matlab.system.display.SectionType.collapsiblepanel);

 % Section for the threshold parameters
 thresholdSection = matlab.system.display.Section(...
 'Title', 'Threshold parameters', ...
```

```

 'PropertyList',{ 'Threshold', 'UseThreshold'},...
 'SectionType', matlab.system.display.SectionType.collapsiblepanel);

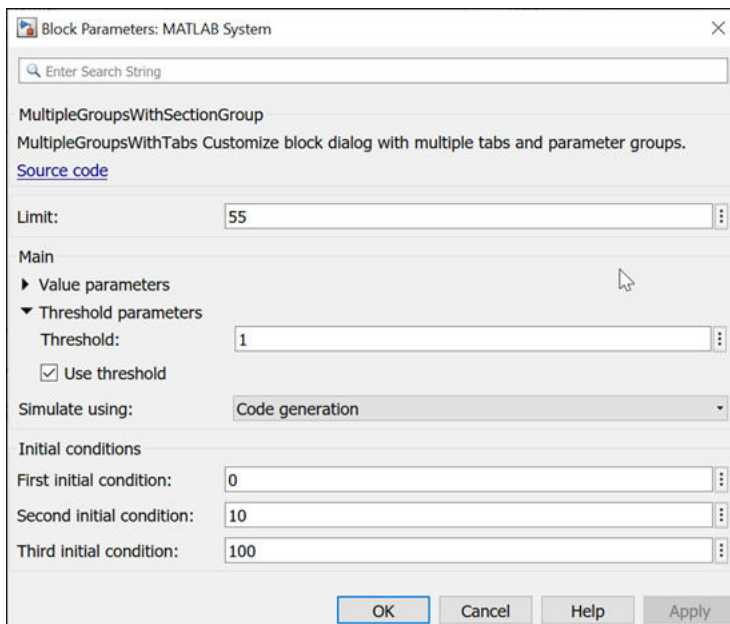

% Group with two sections: the valueSection and thresholdSection sections
mainTab = matlab.system.display.SectionGroup(...
 'Title', 'Main', ...
 'Sections', [valueSection, thresholdSection],...
 'GroupType', matlab.system.display.SectionType.group);

% Return an array with the group-less section, the group with
% two sections, and the group with no sections.
groups = [alwaysSection, mainTab, initTab];
end
end
end

```

The resulting dialog appears as follows when you add the object to Simulink with the MATLAB System block.

# matlab.system.display.Icon class

**Package:** matlab.system.display

Custom icon image

## Syntax

```
icon = matlab.system.display.Icon(imageFile)
```

## Description

`icon = matlab.system.display.Icon(imageFile)` sets the `imageFile` image as the MATLAB System block icon. To set the icon image, use the `icon` output argument from `getIconImpl`.

## Input Arguments

### **imageFile** — Image file

character array

Image file to display on the block icon, specified as a character array. If the image is not on the path, use the full path to your image file.

The image file must be in a file format supported for block masks. See “Draw Static Icon”.

Example: "image.png"

## Examples

### **Add Image to MATLAB System Block**

Define an image in your class definition file.

```
methods(Access = protected)
 function icon = getIconImpl(~)
 % Define icon for MATLAB System block
 icon = matlab.system.display.Icon("my_icon.png");
 end
end
```

The image now appears on the MATLAB System block icon.

# matlab.system.mixin.Propagates class

**Package:** matlab.system.mixin

Signal characteristics propagation mixin class

---

**Note** The `matlab.system.mixin.Propagates` mixin will be removed in a future release. You no longer need to inherit from this mixin in your System object. The associated propagation methods have been moved to the `matlab.System` class.

---

## Description

`matlab.system.mixin.Propagates` specifies the output size, data type, and complexity of a System object. Use this mixin class and its methods when you will include your System object in Simulink via the MATLAB System block. This mixin is called by the MATLAB System block during Simulink model compilation.

---

**Note** If your System object has exactly one input and one output and no discrete property states, or if you do not need bus support, you do not have to implement any of these methods. The `matlab.system.mixin.Propagates` provides default values in these cases.

---

Implement the methods of this class when Simulink cannot infer the output specifications directly from the inputs or when you want bus support. If you do not include this mixin, Simulink cannot propagate the output or bus data type, an error occurs.

To use this mixin, subclass from this `matlab.system.mixin.Propagates` in addition to subclassing from the `matlab.System` base class. Type the following syntax as the first line of your class definition file. `ObjectName` is the name of your System object.

```
classdef ObjectName < matlab.System &...
 matlab.system.mixin.Propagates
```

The `matlab.system.mixin.Propagates` class is a handle class.

## Version History

**Introduced in R2014a**

**matlab.system.mixin.Propagates will be removed**

*Not recommended starting in R2020a*

The `matlab.system.mixin.Propagates` mixin will be removed in a future release. You no longer need to inherit from this mixin in your System object. The associated propagation methods have been moved to the `matlab.System` class.

Remove `matlab.system.mixin.Propagates` from the `classdef` line of your System object.

# getDiscreteStateSpecificationImpl

Discrete state size, data type, and complexity

## Syntax

```
[size,dataType,complexity] = getDiscreteStateSpecificationImpl(obj,
propertyName)
```

## Description

[size,dataType,complexity] = getDiscreteStateSpecificationImpl(obj, propertyName) returns the size, data type, and complexity of the discrete state property. This property must be a discrete state property. You must define this method if your System object has discrete state properties and is used in the MATLAB System block.

## Run-Time Details

getDiscreteStateSpecificationImpl is called by the MATLAB System block during Simulink model compilation.

## Method Authoring Tips

- You must set Access = protected for this method.
- You cannot modify any properties in this method.

## Input Arguments

### obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your getDiscreteStateSpecificationImpl method does not use the object, you can replace this input with ~.

### propertyName — Discrete state property name

property name

Name of discrete state property of the System object

## Output Arguments

### size — Property size

[1 1] (default) | numeric vector

Vector containing the length of each dimension of the property.

### dataType — Property data type

double (default) | character vector

Data type of the property. For built-in data types, `dataType` is a character vector. For fixed-point data types, `dataType` is a numeric type object.

**complexity — Complexity of the property**

`false` (default) | `true`

Complexity of the property as a scalar, logical value:

- `true` — complex
- `false` — real

## Examples

**Specify Discrete State Property Size, Data Type, and Complexity**

Specify in your class definition file the size, data type, and complexity of a discrete state property.

```
methods (Access = protected)
 function [sz,dt,cp] = getDiscreteStateSpecificationImpl(~,name)
 sz = [1 1];
 dt = "double";
 cp = false;
 end
end
```

## Version History

Introduced in R2013b

“Set Discrete State Output Specification”

# getOutputDataTypeImpl

Data types of output ports

## Syntax

```
[dt_1,dt_2,...,dt_n] = getOutputDataTypeImpl(obj)
```

## Description

`[dt_1,dt_2,...,dt_n] = getOutputDataTypeImpl(obj)` returns the data type of each output port as a character vector for built-in data types or as a numeric object for fixed-point data types. The number of outputs must match the value returned from the `getNumOutputsImpl` method or the number of output arguments listed in the `stepImpl` method.

For System objects with one input and one output and where you want the input and output data types to be the same, you do not need to implement this method. In this case, `getOutputDataTypeImpl` assumes the input and output data types are the same and returns the data type of the input.

If your System object has more than one input or output, and you use propagation, you must set the output data types in the `getOutputDataTypeImpl` method. For Simulink, if the input and output data types are different, you might have to cast the output value to the data type of the appropriate `dt_n` output argument. You specify this casting in the `stepImpl` method. For bus output, you must specify the name of the output bus in `getOutputDataTypeImpl`.

If needed to determine the output data type, you can use `propagatedInputDataType` within the `getOutputDataTypeImpl` method to obtain the input type.

## Run-Time Details

`getOutputDataTypeImpl` is called by the MATLAB System block.

## Method Authoring Tips

- You must set `Access = protected` for this method.
- You cannot modify any properties in this method.
- If you are debugging your code and examine the data types before Simulink completes propagation, you might see outputs with empty, `[ ]`, data types. This occurs because Simulink has not completed setting the output data types.

## Input Arguments

### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getOutputDataTypeImpl` method does not use the object, you can replace this input with `~`.

## Output Arguments

### **dt\_1, dt\_2, ... — Property data type**

character vector | numeric type object

Data type of the property. For built-in data types, dt is a character vector. For fixed-point data types, dt is a numeric type object.

## Examples

### Specify Output Data Type

Specify, in your class definition file how to control the output data type from a MATLAB System block. This example shows how to use the `getOutputDataTypeImpl` method to change the output data type from single to double, or propagate the input as a double. It also shows how to cast the data type to change the output data type in the `stepImpl` method.

```
classdef DataTypeChange < matlab.System

 properties(Nontunable)
 Quantize = false
 end

 methods(Access = protected)
 function y = stepImpl(obj,u)
 if obj.Quantize == true
 % Cast for output data type to differ from input.
 y = single(u);
 else
 % Propagate output data type.
 y = u;
 end
 end

 function out = getOutputDataTypeImpl(obj)
 if obj.Quantize == true
 out = "single";
 else
 out = propagatedInputDataType(obj,1);
 end
 end
 end
end
```

### Specify Bus Output

Specify, in your class definition file, that the System object data type is a bus. You must also include a property to specify the bus name.

```
properties(Nontunable)
 OutputBusName = "myBus";
end
```

```
methods (Access = protected)
 function out = getOutputDataTypeImpl(obj)
 out = obj.OutputBusName;
 end
end
```

The data type of the output bus must be defined upfront. The `propagatedInputDataType` method does not support propagation of bus data types to the output data type.

## Version History

### Topics

“Set Output Data Type”

## getOutputSizeImpl

Sizes of output ports

### Syntax

```
[sz_1,sz_2,...,sz_n] = getOutputSizeImpl(obj)
```

### Description

[sz\_1,sz\_2,...,sz\_n] = `getOutputSizeImpl(obj)` returns the size of each output port. The number of outputs must match the value returned from the `getNumOutputs` method or the number of output arguments listed in the `stepImpl` method.

If your System object has only one input and one output and you want the input and output sizes to be the same, you do not need to implement this method. In this case `getOutputSizeImpl` assumes that the input and output sizes are the same and returns the size of the input. For variable-size inputs in MATLAB, the size varies each time you run your object. For variable-size inputs in Simulink, the output size is the maximum input size.

You must implement the `getOutputSizeImpl` method to define the output size, if:

- Your System object has more than one input or output
- You need the output and input sizes to be different.

If the output size differs from the input size, you must also use the `propagatedInputSize` method

By default, in Simulink the MATLAB System block recognizes 1-D input signals and propagates 1-D output signal as 2-D. Use `supports1DVectorsImpl` method to enable the 1-D inputs and outputs to be recognized and propagated as 1-D signals, respectively.

### Run-Time Details

During Simulink model compilation and propagation, the MATLAB System block calls the `getOutputSizeImpl` method to determine the output size.

All inputs default to variable-size inputs For these inputs, the output size is the maximum input size.

### Method Authoring Tips

- You must set `Access = protected` for this method.
- In this method, you cannot modify any properties.

### Input Arguments

#### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getOutputSizeImpl` method does not use the object, you can replace this input with `~`.

## Output Arguments

### **sz\_1, sz\_2, ... — Output size**

numeric vector

Vector containing the size of each output port.

## Examples

### Specify Output Size

Specify in your class definition file the size of a System object output.

```
methods (Access = protected)
 function sz_1 = getOutputSizeImpl(obj)
 sz_1 = [1 1];
 end
end
```

### Specify Multiple Output Ports

Specify in your class definition file the sizes of multiple System object outputs.

```
methods (Access = protected)
 function [sz_1, sz_2] = getOutputSizeImpl(obj)
 sz_1 = propagatedInputSize(obj, 1);
 sz_2 = [1 1];
 end
end
```

### Specify Output When Using Propagated Input Size

Specify in your class definition file the size of System object output when it depends on the propagated input size.

```
methods (Access = protected)
 function varargout = getOutputSizeImpl(obj)
 varargout{1} = propagatedInputSize(obj, 1);
 if obj.HasSecondOutput
 varargout{2} = [1 1];
 end
 end
end
```

"Set Output Size"

# isOutputComplexImpl

Complexity of output ports

## Syntax

```
[cp_1, cp_2, ..., cp_n] = isOutputComplexImpl(obj)
```

## Description

`[cp_1, cp_2, ..., cp_n] = isOutputComplexImpl(obj)` returns whether each output port has complex data. The number of outputs must match the value returned from the `getNumOutputs` method or the number of output arguments listed in the `stepImpl` method.

For System objects with one input and one output and where you want the input and output complexities to be the same, you do not need to implement this method. In this case `isOutputComplexImpl` assumes the input and output complexities are the same and returns the complexity of the input.

If your System object has more than one input or output or you need the output and input complexities to be different, you must implement the `isOutputComplexImpl` method to define the output complexity. You also must use the `propagatedInputComplexity` method if the output complexity differs from the input complexity.

## Run-Time Details

During Simulink model compilation and propagation, the MATLAB System block calls the `isOutputComplex` method, which then calls the `isOutputComplexImpl` method to determine the output complexity.

## Method Authoring Tips

- You must set `Access = protected` for this method.
- You cannot modify any properties in this method.

## Input Arguments

### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `isOutputComplexImpl` method does not use the object, you can replace this input with `~`.

## Output Arguments

### **cp\_1, cp\_2, ...** — Complexity flag

true | false

Logical, scalar value indicating whether the specific output port is complex (`true`) or real (`false`).

## Examples

### Specify Output as Real-Valued

Specify in your class definition file that the output from a System object is a real value.

```
methods (Access = protected)
 function c1 = isOutputComplexImpl(obj)
 c1 = false;
 end
end
```

# isOutputFixedSizeImpl

Fixed- or variable-size output ports

## Syntax

```
[flag_1,flag_2,...flag_n] = isOutputFixedSizeImpl(obj)
```

## Description

`[flag_1,flag_2,...flag_n] = isOutputFixedSizeImpl(obj)` returns whether each output port is fixed size. The number of outputs must match the value returned from the `getNumOutputs` method, which is the number of output arguments listed in the `stepImpl` method.

For System objects with one input and one output and where you want the input and output fixed sizes to be the same, you do not need to implement this method. In this case `isOutputFixedSizeImpl` assumes the input and output fixed sizes are the same and returns the fixed size of the input.

If your System object has more than one input or output or you need the output and input fixed sizes to be different, you must implement the `isOutputFixedSizeImpl` method to define the output fixed size. You also must use the `propagatedInputFixedSize` method if the output fixed size status differs from the input fixed size status.

## Run-Time Details

During Simulink model compilation and propagation, the MATLAB System block calls the `isOutputFixedSize` method, which then calls the `isOutputFixedSizeImpl` method to determine the output fixed size.

All inputs default to variable-size inputs. For these inputs, the output size is the maximum input size.

## Method Authoring Tips

- You must set `Access = protected` for this method.
- You cannot modify any properties in this method.

## Input Arguments

### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `isOutputFixedSizeImpl` method does not use the object, you can replace this input with `~`.

## Output Arguments

### **flag\_1, flag2, ...** — Fixed size flag

true | false

Logical, scalar value indicating whether the specific output port is fixed size (`true`) or variable size (`false`).

## Examples

### Specify Output as Fixed Size

Specify in your class definition file that the output from a System object is of fixed size.

```
methods (Access = protected)
 function c1 = isOutputFixedSizeImpl(obj)
 c1 = true;
 end
end
```

# propagatedInputComplexity

Complexity of input during Simulink propagation

## Syntax

```
flag = propagatedInputComplexity(obj,index)
```

## Description

`flag = propagatedInputComplexity(obj,index)` returns `true` or `false` to indicate whether the input argument for the indicated System object is complex. `index` specifies the input for which to return the complexity flag.

You can use `propagatedInputComplexity` only from within the `isOutputComplexImpl` method in your class definition file. Use `isOutputComplexImpl` when:

- Your System object has more than one input or output.
- The input complexity determines the output complexity.
- The output complexity must differ from the input complexity.

## Input Arguments

### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `propagatedInputComplexity` method does not use the object, you can replace this input with `~`.

### **index** — Input index

positive integer

Index of the specified input. Do not count the `obj` in the `index`. The first input is always `obj`.

## Output Arguments

### **flag** — Complexity flag

`true` | `false`

Complexity of the specified input, returned as `true` or `false`

## Examples

### **Match Input and Output Complexity**

Get the complexity of the second input when you run the object and set the output to match it. Assume that the first input has no impact on the output complexity.

```
methods (Access = protected)
 function outcomplx = isOutputComplexImpl(obj)
 outcomplx = propagatedInputComplexity(obj,2);
 end
end
```

# propagatedInputDataType

Data type of input during Simulink propagation

## Syntax

```
dt = propagatedInputDataType(obj,index)
```

## Description

`dt = propagatedInputDataType(obj,index)` returns the data type of an input argument for a System object. `index` specifies the input for which to return the data type.

You can use `propagatedInputDataType` only from within `getOutputDataTypeImpl`. Use `getOutputDataTypeImpl` when:

- Your System object has more than one input or output.
- The input data type status determines the output data type.
- The output data type must differ from the input data type.

## Input Arguments

### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `propagatedInputDataType` method does not use the object, you can replace this input with `~`.

### **index** — Input index

positive integer

Index of the specified input. Do not count the `obj` in the `index`. The first input is always `obj`.

## Output Arguments

### **dt** — Input data type

character vector | numeric type object

Data type of the specified input, returned as a character vector for floating-point input or as a numeric type for fixed-point input.

## Examples

### Match Input and Output Data Type

Get the data type of the second input. If the second input data type is `double`, then the output data type is `int32`. For all other cases, the output data type matches the second input data type. Assume that the first input has no impact on the output.

```
methods (Access = protected)
 function dt = getOutputDataTypeImpl(obj)
 if strcmpi(propagatedInputDataType(obj,2), 'double')
 dt = 'int32';
 else
 dt = propagatedInputDataType(obj,2);
 end
 end
end
```

# propagatedInputFixedSize

Fixed-size status of input during Simulink propagation

## Syntax

```
flag = propagatedInputFixedSize(obj,index)
```

## Description

`flag = propagatedInputFixedSize(obj,index)` returns `true` or `false` to indicate whether an input argument of a System object is fixed size. `index` specifies the input for which to return the fixed-size flag.

You can use `propagatedInputFixedSize` only from within `isOutputFixedSizeImpl`. Use `isOutputFixedSizeImpl` when:

- Your System object has more than one input or output.
- The input fixed-size status determines the output fixed-size status.
- The output fixed-size status must differ from the input fixed-size status.

## Input Arguments

### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `propagatedInputFixedSize` method does not use the object, you can replace this input with `~`.

### **index** — Input index

positive integer

Index of the specified input. Do not count the `obj` in the `index`. The first input is always `obj`.

## Output Arguments

### **flag** — Fixed size flag

`true` | `false`

Fixed-size status of the specified input, returned as `true` or `false`.

## Examples

### **Match Fixed-Size Status of Input and Output**

Get the fixed-size status of the third input and set the output to match it. Assume that the first and second inputs have no impact on the output.

```
methods (Access = protected)
 function outtype = isOutputFixedSizeImpl(obj)
 outtype = propagatedInputFixedSize(obj,3)
 end
end
```

“Set Fixed- or Variable-Size Output”

# propagatedInputSize

Size of input during Simulink propagation

## Syntax

```
size = propagatedInputSize(obj,index)
```

## Description

`size = propagatedInputSize(obj,index)` returns, as a vector, the input size of the specified System object. The `index` specifies the input for which to return the size information. (Do not count the `obj` in the `index`. The first input is always `obj`.)

You can use `propagatedInputSize` only from within the `getOutputSizeImpl` method in your class definition file. Use `getOutputSizeImpl` when:

- Your System object has more than one input or output.
- The input size determines the output size.
- The output size must differ from the input size.

---

**Note** For variable-size inputs, the propagated input size from `propagatedInputSize` differs depending on the environment.

- MATLAB — `propagatedInputSize` returns the size of the inputs used when you run the object for the first time.
  - Simulink — `propagatedInputSize` returns the upper bound of the input sizes.
- 

By default, in Simulink the MATLAB System block recognizes 1-D input signals and propagates 1-D output signal as 2-D. Use `supports1DVectorsImpl` method to enable the 1-D inputs and outputs to be recognized and propagated as 1-D signals, respectively.

## Input Arguments

### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `propagatedInputSize` method does not use the object, you can replace this input with `~`.

### **index** — Input index

integer

Index of the specified input

## Output Arguments

### size — Input size

numeric vector

Size of the specified input, returned as a vector

## Examples

### Match Size of Input and Output

Get the size of the second input. If the first dimension of the second input has a size greater than 1, then set the output size to a 1 x 2 vector. For all other cases, the output is a 2 x 1 matrix. Assume that the first input has no impact on the output size.

```
methods (Access = protected)
 function outsize = getOutputSizeImpl(obj)
 size = propagatedInputSize(obj,2);
 if size(1) == 1
 outsize = [1,2];
 else
 outsize = [2,1];
 end
 end
end
```

“Set Output Size”

# matlab.system.mixin.Nondirect class

**Package:** matlab.system.mixin

Nondirect feedthrough mixin class

---

**Note** The `matlab.system.mixin.Nondirect` mixin will be removed in a future release. You no longer need to inherit from this mixin in your System object. The associated methods have been moved to the `matlab.System` class.

---

## Description

`matlab.system.mixin.Nondirect` is a class that uses the `output` and `update` methods to process nondirect feedthrough data through a System object.

For System objects that use direct feedthrough, the object's input is needed to generate the output at that time. For these direct feedthrough objects, running the System object calculates the output and updates the state values. For nondirect feedthrough, however, the object's output depends only on the internal states at that time. The inputs are used to update the object states. For these objects, calculating the output with `outputImpl` is separated from updating the state values with `updateImpl`. If you use the `matlab.system.mixin.Nondirect` mixin and include the `stepImpl` method in your class definition file, an error occurs. In this case, you must include the `updateImpl` and `outputImpl` methods instead.

The following cases describe when System objects in Simulink use direct or nondirect feedthrough.

- System object supports code generation and does not inherit from the `Propagates` mixin — Simulink automatically infers the direct feedthrough settings from the System object code.
- System object supports code generation and inherits from the `Propagates` mixin — Simulink does not automatically infer the direct feedthrough settings. Instead, it uses the value returned by the `isInputDirectFeedthroughImpl` method.
- System object does not support code generation — Default `isInputDirectFeedthroughImpl` method returns false, indicating that direct feedthrough is not enabled. To override the default behavior, implement the `isInputDirectFeedthroughImpl` method in your class definition file.

Use the `Nondirect` mixin to allow a System object to be used in a Simulink feedback loop. A delay object is an example of a nondirect feedthrough object.

To use this mixin, you must subclass from this class in addition to subclassing from the `matlab.System` base class. Type the following syntax as the first line of your class definition file, where `ObjectName` is the name of your object:

```
classdef ObjectName < matlab.system & matlab.system.mixin.Nondirect
```

## Version History

**Introduced in R2013b**

**matlab.system.mixin.Nondirect will be removed**

*Not recommended starting in R2020a*

The `matlab.system.mixin.Nondirect` mixin will be removed in a future release. You no longer need to inherit from this mixin in your `System` object. The associated methods have been moved to the `matlab.System` class.

Remove `matlab.system.mixin.Nondirect` from the `classdef` line of your `System` object

**See Also**

`matlab.System`

**Topics**

“Use Update and Output for Nondirect Feedthrough”

# isInputDirectFeedthroughImpl

Direct feedthrough status of input

## Syntax

```
[flag1,...,flagN] = isInputDirectFeedthroughImpl(obj)
[flag1,...,flagN] = isInputDirectFeedthroughImpl(obj,input,input2,...)
```

## Description

[flag1,...,flagN] = isInputDirectFeedthroughImpl(obj) specifies whether each input is a direct feedthrough input. If direct feedthrough is true, the output depends on the input at each time instant.

[flag1,...,flagN] = isInputDirectFeedthroughImpl(obj,input,input2,...) uses one or more of the System object input specifications to determine whether inputs have direct feedthrough.

If you do not include the isInputDirectFeedthroughImpl method in your System object class definition file, all inputs are assumed to be direct feedthrough.

## Code Generation

The following cases describe when System objects in Simulink code generation use direct or nondirect feedthrough.

| System object's code generation support | Uses a propagation Impl method | Simulink Code Generation Result                                                                                                                                                                                                  |
|-----------------------------------------|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Y                                       | N                              | Simulink automatically infers the direct feedthrough settings from the System object code.                                                                                                                                       |
| Y                                       | Y                              | Simulink does not automatically infer the direct feedthrough settings. Instead, it uses the value returned by the isInputDirectFeedthroughImpl method.                                                                           |
| N                                       | —                              | Default isInputDirectFeedthroughImpl method returns false, indicating that direct feedthrough is not enabled. To override the default behavior, implement the isInputDirectFeedthroughImpl method in your class definition file. |

## Run-Time Details

isInputDirectFeedthroughImpl is called by the MATLAB System block.

## Method Authoring Tips

- You must set Access = protected for this method.
- You cannot modify, implement, or access tunable properties in this method.

## Input Arguments

### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `isInputDirectFeedthroughImpl` method does not use the object, you can replace this input with `~`.

### **input1, input2, ...** — Inputs to the System object

inputs to the System object algorithm

Inputs to the algorithm (`stepImpl`) of the System object. The inputs list must match the order of inputs in the `stepImpl` signature.

## Output Arguments

### **flag1, ..., flagN** — Output flag for each input to the System object

logical

Logical value, either `true` or `false` indicating whether the input is direct feedthrough. The number of output flags must match the number of inputs to the System object (inputs to `stepImpl`, `outputImpl`, or `updateImpl`).

## Examples

### Specify Input as Nondirect Feedthrough

Use `isInputDirectFeedthroughImpl` in your class definition file for marking all inputs as nondirect feedthrough.

```
methods (Access = protected)
 function flag = isInputDirectFeedthroughImpl(~)
 flag = false;
 end
end
```

### Complete Class Definition

```
classdef intDelaySysObj < matlab.System
 % intDelaySysObj Delay input by specified number of samples.

 properties
 InitialOutput = 0;
 end
 properties (Nontunable)
 NumDelays = 1;
 end
 properties (DiscreteState)
 PreviousInput;
 end

 methods (Access = protected)
 function validatePropertiesImpl(obj)
```

```

 if ((numel(obj.NumDelays)>1) || (obj.NumDelays <= 0))
 error('Number of delays must be > 0 scalar value.');
```

```

 end
 if (numel(obj.InitialOutput)>1)
 error('Initial Output must be scalar value.');
```

```

 end
end

function setupImpl(obj)
 obj.PreviousInput = ones(1,obj.NumDelays)*obj.InitialOutput;
end

function resetImpl(obj)
 obj.PreviousInput = ones(1,obj.NumDelays)*obj.InitialOutput;
end

function [y] = outputImpl(obj,~)
 y = obj.PreviousInput(end);
end
function updateImpl(obj, u)
 obj.PreviousInput = [u obj.PreviousInput(1:end-1)];
end
function flag = isInputDirectFeedthroughImpl(~)
 flag = false;
end
end
end
end
end
```

## Version History

Introduced in R2013b

### See Also

updateImpl | outputImpl

### Topics

“Use Update and Output for Nondirect Feedthrough”

## outputImpl

Output calculation from input or internal state of System object

### Syntax

```
[y1,y2,...,yN] = outputImpl(obj,u1,u2,...,uN)
```

### Description

`[y1,y2,...,yN] = outputImpl(obj,u1,u2,...,uN)` specifies the algorithm to output the System object states. The output values are calculated from the states and property values. Any inputs that you set to nondirect feedthrough are ignored during output calculation.

### Run-Time Details

`outputImpl` is called by the internal `output` method. It is also called before the `updateImpl` method. For sink objects, calling `updateImpl` before `outputImpl` locks the object. For all other types of objects, calling `updateImpl` before `outputImpl` causes an error.

### Method Authoring Tips

- You must set `Access = protected` for this method.
- If the System object will be used in the Simulink MATLAB System block, you cannot modify any tunable properties in this method.

## Input Arguments

### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `outputImpl` method does not use the object, you can replace this input with `~`.

### **u1,u2,...,uN** — Inputs to the algorithm

inputs

Inputs from the algorithm. The number of inputs must match the number of inputs returned by the `getNumInputs` method. Nondirect feedthrough inputs are ignored during normal execution of the System object. However, for code generation, you must provide these inputs even if they are empty.

## Output Arguments

### **y1,y2,...,yN** — Outputs of the algorithm

outputs

Outputs calculated from the specified algorithm. The number of outputs must match the number of outputs returned by the `getNumOutputs` method.

## Examples

### Set Up Output that Does Not Depend on Input

Specify in your class definition file that the output does not directly depend on the current input with the `outputImpl` method. `PreviousInput` is a property of the `obj`.

```
methods (Access = protected)
 function [y] = outputImpl(obj, ~)
 y = obj.PreviousInput(end);
 end
end
```

## Version History

Introduced in R2013b

### See Also

`updateImpl` | `isInputDirectFeedthroughImpl`

### Topics

“Use Update and Output for Nondirect Feedthrough”

## updateImpl

Update object states based on inputs

### Syntax

```
updateImpl(obj, input1, input2, ...)
```

### Description

`updateImpl(obj, input1, input2, ...)` specifies the algorithm to update the System object states. You implement this method when your algorithm outputs depend only on the object's internal state and internal properties.

### Run-Time Details

`updateImpl` is called by the `update` method and after the `outputImpl` method.

For sink objects, calling `updateImpl` before `outputImpl` locks the object. For all other types of objects, calling `updateImpl` before `outputImpl` causes an error.

### Method Authoring Tips

- Do not use this method to update the outputs from the inputs.
- You must set `Access = protected` for this method.
- If the System object will be used in the Simulink MATLAB System block, you cannot modify any tunable properties in this method.

### Input Arguments

#### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `updateImpl` method does not use the object, you can replace this input with `~`.

#### **input1, input2, ...** — Inputs to the System object

inputs to the System object

List the inputs to the System object. The order of inputs must match the order of inputs defined in the `stepImpl` method.

### Examples

#### **Set Up Output that Does Not Depend on Current Input**

Update the object with previous inputs. Use `updateImpl` in your class definition file. This example saves the `u` input and shifts the previous inputs.

```
methods (Access = protected)
 function updateImpl(obj,u)
 obj.PreviousInput = [u obj.PreviousInput(1:end-1)];
 end
end
```

## matlab.system.mixin.SampleTime class

Control sample time for System objects in Simulink

---

**Note** The `matlab.system.mixin.SampleTime` mixin will be removed in a future release. You no longer need to inherit from this mixin in your System object. The associated sample time methods have been moved to the `matlab.System` class.

---

### Description

`matlab.system.mixin.SampleTime` specifies the sample time specifications for a System object when it is included in a MATLAB System block. Inherit from this mixin class and use its methods to control the sample time of your System object in Simulink, via the MATLAB System block.

With this mixin, you can:

- Specify the sample time type
- Specify the sample time
- Customize the sample time with offsets and tick times
- Get the current simulation time

System objects that inherit from this mixin class must also inherit from `matlab.System`. For example:

```
classdef MySystemObject < matlab.System & matlab.system.mixin.SampleTime
```

The `matlab.system.mixin.SampleTime` class is a handle class.

### Methods

## Version History

**Introduced in R2017b**

**matlab.system.mixin.SampleTime will be removed**

*Not recommended starting in R2020a*

The `matlab.system.mixin.SampleTime` mixin will be removed in a future release. You no longer need to inherit from this mixin in your System object. The associated sample time methods have been moved to the `matlab.System` class.

Remove `matlab.system.mixin.SampleTime` from the `classdef` line of your System object.

MATLAB System

**Topics**

“Specify Sample Time for MATLAB System Block System Objects”

## getSampleTimeImpl

Specify sample time type, offset time, and sample time

### Syntax

```
sts = getSampleTimeImpl(obj)
```

### Description

`sts = getSampleTimeImpl(obj)` returns the sample time specification created within the method body, `sts`, for the System object `obj`. Specify the sample time specification within the body of `getSampleTimeImpl` by calling `createSampleTime`. The sample time specification affects the simulation time when the System object is included in a MATLAB System block.

### Run-Time Details

`getSampleTimeImpl` is called during setup by `setupImpl`.

### Method Authoring Tips

You must set `Access = protected` for this method.

### Default Behavior

If you do not include this method in your System object definition, the sample time is inherited.

### Input Arguments

#### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getSampleTimeImpl` method does not use the object, you can replace this input with `~`.

### Output Arguments

#### **sts** — Sample time specification object

sample time specification object

An object defining the sample time specification values. You create this object with the `createSampleTime` function.

### Examples

#### **Specify Inherited Sample Time**

Specify that the MATLAB System block should inherit the sample from upstream blocks, except if the sample time type is controllable.

```
function sts = getSampleTimeImpl(obj)
 sts = createSampleTime(obj, 'ErrorOnPropagation', 'Controllable');
end
```

### Specify Discrete Sample Time

Specify a discrete sample time for the MATLAB System block.

```
function sts = getSampleTimeImpl(obj)
 sts = createSampleTime(obj, 'Type', 'Discrete', ...
 'SampleTime', 10.2, 'OffsetTime', 0.5);
end
```

## Version History

Introduced in R2017b

### See Also

[createSampleTime](#) | [getCurrentTime](#) | [getSampleTime](#)

### Topics

“Specify Sample Time for MATLAB System Block System Objects”

## getSampleTime

Query sample time

### Syntax

```
sts = getSampleTime(obj)
```

### Description

`sts = getSampleTime(obj)` returns the sample time specification for the System object `obj` when the System object is included in a MATLAB System block. You can call `getSampleTime` in the `stepImpl` method to change the algorithm based on the sample time.

Before sample time has propagated throughout the MATLAB System block model, `getSampleTime` returns the `getSampleTimeImpl` sample time specification. If your system object does not override `getSampleTimeImpl`, the default Inherited sample time specification is returned.

After sample time has propagated, `getSampleTime` returns the sample time specification populated with the actual MATLAB System block sample time type, sample time, and offset time.

### Input Arguments

#### **obj** — System object

System object

System object included in a MATLAB System block that you want to query.

### Output Arguments

#### **sts** — Sample time specification object

sample time specification object

The sample time specification for the System object. For more details about sample time specification objects, see `createSampleTime`.

### Examples

#### **Return Sample Time**

This example of `stepImpl` returns a count value `y`, the current simulation time `ct`, and the sample time `st`. The sample time is obtained by calling `getSampleTime`.

```
function [y,ct,st] = stepImpl(obj,u)
 y = obj.Count + u;
 obj.Count = y;
 ct = getCurrentTime(obj);
 sts = getSampleTime(obj);
 st = sts.SampleTime;
end
```

For a complete class definition, see “Specify Sample Time for MATLAB System Block System Objects”.

## **Topics**

“Specify Sample Time for MATLAB System Block System Objects”

## getCurrentTime

Current simulation time in MATLAB System block

### Syntax

```
time = getCurrentTime(obj)
```

### Description

`time = getCurrentTime(obj)` returns the current simulation time in the MATLAB System block. Call this method in the `stepImpl` method of your System object.

### Dependencies

If the MATLAB System block is operating in continuous sample time, `getCurrentTime` may return non-monotonic times due to solver operation.

### Input Arguments

#### **obj** — System object

system object

System object included in a MATLAB System block that you want to query.

### Output Arguments

#### **time** — Current simulation time

double

The current simulation time of the MATLAB System block that contains the System object.

### Examples

#### **Return Current Simulation Time**

This example of `stepImpl` returns a count value `y` and the current simulation time `ct`. The simulation time is obtained by calling `getCurrentTime`.

```
function [y,ct] = stepImpl(obj,u)
 y = obj.Count + u;
 obj.Count = y;
 ct = getCurrentTime(obj);
end
```

For a complete class definition, see “Specify Sample Time for MATLAB System Block System Objects”.

## **Topics**

“Specify Sample Time for MATLAB System Block System Objects”

## createSampleTime

Create sample time specification object

### Syntax

```
sts = createSampleTime(obj)
sts = createSampleTime(obj, 'Type', Type)
sts = createSampleTime(obj, 'Type', Type, Name, Value)
```

### Description

`sts = createSampleTime(obj)` creates a sample time specification object for inherited sample time for the System object `obj`. Use this sample time specification object in the `getSampleTimeImpl` method of your System object. The sample time specification affects the simulation time when the System object is included in a MATLAB System block. If you do not include this method in your System object definition, the sample time is inherited.

`sts = createSampleTime(obj, 'Type', Type)` creates a sample time specification object with the specified sample time type.

`sts = createSampleTime(obj, 'Type', Type, Name, Value)` creates a sample time specification object with additional options specified by one or more `Name, Value` pair arguments. `Name` is a property name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

### Dependencies

You can only call `createSampleTime` from the `getSampleTimeImpl` method of your System object.

### Input Arguments

#### **obj** – System object

System object

System object that you want to specify the sample time.

#### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `'Type', 'Fixed In Minor Step'`

#### **Type** – Sample time type

`'Inherited'` (default) | `'Controllable'` | `'Discrete'` | `'Fixed In Minor Step'`

Type of sample time you want the System object to use in Simulink. For descriptions of the different types of sample times, see:

- 'Inherited' - "Inherited Sample Time"
- 'Controllable' - "Controllable Sample Time"
- 'Discrete' - "Discrete Sample Time"
- 'Fixed In Minor Step' - "Fixed-in-Minor-Step"

Example: `createSampleTime('Type','Fixed In Minor Step')`

### **AllowPropagation — Allow the propagated sample time**

'Controllable' | 'Constant' | 'Continuous' | cell array of character vectors | string array

For Inherited sample time only.

Specify one or more sample times you want to allow your object to use. When the sample time type is set to `Inherited` and the MATLAB System block receives the specified sample time, the block allows the sample time to propagate. You can specify multiple sample time types as a cell array or string array.

Example: `createSampleTime('Type','Inherited','AllowPropagation',{'Controllable','Continuous'})`

### **AlternatePropagation — Alter the propagated sample time**

'Controllable' | 'Constant' | 'Continuous' | cell array of character vectors | string array

For Inherited sample time only.

Specify one or more sample times you do not want your object to use. When the sample time type is set to `Inherited` and you do not want the MATLAB System block to use the specified inherited sample time type, an alternative sample time is used by the block instead. You can specify multiple sample time types. For each sample time type, Simulink substitutes a different sample time type:

- 'Controllable' — The base rate of the controlled sample is propagated instead. Use this option if your System object depends on having constant time between each sample-time hit.
- 'Constant' — The base rate of the model is propagated instead, either the fastest discrete rate or fixed in minor step.
- 'Continuous' — The fastest discrete rate is propagated instead.

Example:

`createSampleTime('Type','Inherited','AlternatePropagation','Controllable')`

### **ErrorOnPropagation — Error on the propagated sample time**

'Controllable' | 'Constant' | 'Continuous' | cell array of character vectors | string array

For Inherited sample time only.

Specify one or more sample times you do not want your object to use. When the sample time type is set to `Inherited` and the MATLAB System block receives the specified sample time, Simulink throws an error.

Example:

`createSampleTime('Type','Inherited','ErrorOnPropagation','Controllable')`

### **SampleTime — Time between samples**

1 (default) | positive number

For Discrete sample time only.

Specify the time between sample hits in Simulink.

Example: `createSampleTime('Type','Discrete','SampleTime',1)`

Data Types: `single` | `double`

### **OffsetTime — Offset from sample time**

0 (default) | nonnegative number less than `SampleTime`

For `Discrete` sample time only.

Specify the offset time for the sample hit. The offset is a time interval indicating an update delay. The block is updated later in the sample interval than other blocks operating at the same sample rate.

The offset time must be nonnegative and less than `SampleTime`.

Example: `createSampleTime('Type','Discrete','SampleTime',2,'OffsetTime',1)`

Data Types: `single` | `double`

### **TickTime — Time between sample time hits**

-1 (default) | positive scalar

Required for `Controllable` sample time only.

Specify the time between controllable sample time hits. The tick time must be a positive scalar.

Example: `createSampleTime('Type','Controllable','TickTime',obj.TickTime)`

Data Types: `single` | `double`

## **Output Arguments**

### **sts — Sample time specification object**

sample time specification object

The sample time specification object. This object has the following properties:

- `Type` — Type of sample time
- `SampleTime` — Time between samples
- `OffsetTime` — Offset from sample time

Use this object as the return value of `getSampleTimeImpl`.

## **Examples**

### **Create Inherited Sample Time Specification Object**

Specify that the MATLAB System block inherits the sample from upstream blocks. Inherited sample time is the default, so no additional arguments are needed.

```
function sts = getSampleTimeImpl(obj)
 sts = createSampleTime(obj);
end
```

### Create Discrete Sample Time Object

Specify a discrete sample time specification for the MATLAB System block, including offset time and the sample time.

```
function sts = getSampleTimeImpl(obj)
 sts = createSampleTime(obj, 'Type', 'Discrete', ...
 'SampleTime', 10.2, 'OffsetTime', 0.5);
end
```

## Version History

**Introduced in R2017b**

### Topics

“Specify Sample Time for MATLAB System Block System Objects”

## setNumTicksUntilNextHit

Set the number of ticks in Simulink sample time

### Syntax

```
setNumTicksUntilNextHit(obj,ticks)
```

### Description

`setNumTicksUntilNextHit(obj,ticks)` sets the number of ticks in Simulink sample time to wait until the next call to `stepImpl`, or `outputImpl/updateImpl`.

### Dependencies

To use this method, set your System object to controllable sample time with `createSampleTime('Type','Controllable')`. Otherwise, your System object gives a compilation error.

You can only call this method from `stepImpl`, `outputImpl`, `updateImpl`, or `resetImpl`.

### Input Arguments

#### **obj** — System object

System object

System object that you want to specify the sample time.

#### **ticks** — Number of ticks in Simulink sample time

positive integer scalar

Number of ticks in Simulink sample time to wait until the next call to `stepImpl` or `outputImpl/updateImpl`. Specify this number as a positive integer scalar less than `intmax('uint64')`.

The number of sample time ticks to wait until the next hit is persistent. If you don't update this number, Simulink uses the previously set value of number of ticks to wait.

## Version History

Introduced in R2018a

# ModelAdvisor.Preferences class

**Package:** ModelAdvisor

Set Model Advisor window preferences by specifying which folders and tabs to display

## Description

Use instances of this class to set Model Advisor preferences.

## Construction

The constructor `ModelAdvisor.Preferences` creates an instance of this class with default property values.

Create an instance `modelPreferences` of the `ModelAdvisor.Preferences` class.

```
modelPreferences = ModelAdvisor.Preferences;
```

## Properties

### DeselectByProduct — Deselect the By Product folder

(default) | true

Selection of the **By Product** folder in the Model Advisor window. The default value is `true`.

Example: `true`

Data Types: `logical`

### ShowAccordion — Display advisors

(default) | true

Display of the **Code Generation Advisor**, **Upgrade Advisor**, and **Performance Advisor** in the Model Advisor window. You can use these advisors to help configure your model for code generation, upgrade your model for the current release, or improve performance.

Example: `true`

Data Types: `logical`

### ShowByProduct — Display the By Product folder

(default) | true

Display of the **By Product** folder in the Model Advisor window. The default value is `true`.

Example: `true`

Data Types: `logical`

### ShowByTask — Display the By Task folder

(default) | true

Display of the **By Task** folder in the Model Advisor window. The default value is `true`.

Example: `true`

Data Types: `logical`

### **ShowExclusionsInRpt — Include exclusions in report**

(default) | `true`

Include exclusions in the Model Advisor report. The default value is `true`.

Example: `true`

Data Types: `logical`

### **ShowExclusionTab — Display the Exclusions tab**

(default) | `false`

Display of the **Exclusions** tab in the Model Advisor window. The default value is `false`. When you click the **Exclusions** tab, the Model Advisor window displays checks that are excluded from the Model Advisor analysis.

Example: `true`

Data Types: `logical`

### **ShowSourceTab — Display the Source tab**

(default) | `false`

Display of the **Source** tab in the Model Advisor window. The default value is `false`. When you click the **Source** tab, the Model Advisor window displays the check Title, TitleID, and location of the MATLAB source code for the check.

Example: `true`

Data Types: `logical`

## **Examples**

### **Turn Off Display Of By Product Folder**

This example shows how to not display the **By Product** folder in the Model Advisor window:

```
mp = ModelAdvisor.Preferences;
mp.load;
mp.ShowByProduct = false;
mp.save
```

# Simulink.BlockCompDworkData

Provide postcompilation information about block's DWork vector

## Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the “Dwork” on page 5-495 method of a block's run-time object after the model containing the block has been compiled.

## Parent

Simulink.BlockData

## Children

None

## Property Summary

| Name                            | Description                                                                               |
|---------------------------------|-------------------------------------------------------------------------------------------|
| “Usage” on page 5-203           | Usage type of this DWork vector.                                                          |
| “UsedAsDiscState” on page 5-204 | True if this DWork vector is being used to store the values of a block's discrete states. |

## Properties

### Usage

#### Description

Returns a character vector indicating how this DWork vector is used. Permissible values are:

- DWork
- DState
- Scratch
- Mode

#### Data Type

character vector

#### Access

RW for MATLAB S-function blocks, RO for other blocks.

**UsedAsDiscState****Description**

True if this DWork vector is being used to store the values of a block's discrete states.

**Data Type**

Boolean

**Access**

RW for MATLAB S-Function blocks, R0 for other blocks.

**Version History**

Introduced before R2006a

# Simulink.BlockComplInputPortData

Provide postcompilation information about block input port

## Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the “InputPort” on page 5-496 method of a block's run-time object after the model containing the block has been compiled.

## Parent

Simulink.BlockPortData

## Children

None

## Property Summary

| Name                              | Description                               |
|-----------------------------------|-------------------------------------------|
| “DirectFeedthrough” on page 5-205 | True if this port has direct feedthrough. |
| “Overwritable” on page 5-205      | True if this port is overwritable.        |

## Properties

### DirectFeedthrough

#### Description

True if this input port has direct feedthrough.

#### Data Type

Boolean

#### Access

RW for MATLAB S functions, RO for other blocks.

### Overwritable

#### Description

True if this input port is overwritable.

#### Data Type

Boolean

**Access**

RW for MATLAB S functions, R0 for other blocks.

**Version History**

**Introduced before R2006a**

# Simulink.BlockCompOutputPortData

Provide postcompilation information about block output port

## Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the "OutputPort" on page 5-497 method of a block's run-time object after the model containing the block has been compiled.

## Parent

Simulink.BlockPortData

## Children

None

## Property Summary

| Name                     | Description                                            |
|--------------------------|--------------------------------------------------------|
| "Reusable" on page 5-217 | Specifies whether an output port's memory is reusable. |

## Properties

### Reusable

#### Description

Specifies whether an output port's memory is reusable. Options are: `NotReusableAndGlobal` and `ReusableAndLocal`.

#### Data Type

character vector

#### Access

RW for MATLAB S functions, RO for other blocks.

## Version History

Introduced before R2006a

## Simulink.BlockData

Provide run-time information about block-related data, such as block parameters

### Description

This class defines properties that are common to objects that provide run-time information about a block's ports and work vectors.

### Parent

None

### Children

Simulink.BlockPortData, Simulink.BlockCompDworkData

### Property Summary

| Name                                     | Description                                       |
|------------------------------------------|---------------------------------------------------|
| "AliasedThroughDataType" on page 5-208   | Fundamental base data type.                       |
| "AliasedThroughDataTypeID" on page 5-209 | Fundamental base data type ID.                    |
| "Complexity" on page 5-209               | Numeric type (real or complex) of the block data. |
| "Data" on page 5-209                     | The block data.                                   |
| "DataAsDouble" on page 5-210             | The block data in double form.                    |
| "Datatype" on page 5-210                 | Data type of the block data.                      |
| "DatatypeID" on page 5-210               | Index of the data type of the block data.         |
| "Dimensions" on page 5-211               | Dimensions of the block data.                     |
| "Name" on page 5-211                     | Name of the block data.                           |
| "Type" on page 5-211                     | Type of block data (e.g., a parameter).           |

### Properties

#### AliasedThroughDataType

##### Description

Data type aliases allow a data type (B) to be recursively aliased to another alias type or `BaseType` (A). If alias type A is aliased to another alias type that is aliased to another alias type and so forth, this property allows the alias type to be iteratively searched (aliased through) until the type is no longer an alias type and that final result is the value of the property returned. For example, assume that you have created the Simulink Alias types A and B as follows:

```
A=Simulink.AliasType('double')
```

```
A =
```

```

Simulink.AliasType
 Description: ''
 HeaderFile: ''
 BaseType: 'double'
B=Simulink.AliasType('A')

B =
Simulink.AliasType
 Description: ''
 HeaderFile: ''
 BaseType: 'A'

```

If the data type of an item of block data is B, this property returns the base type A instead of B.

#### **Data Type**

character vector

#### **Access**

R0

#### **AliasedThroughDataTypeId**

#### **Description**

Index of the data type alias returned by the `AliasedThroughDataType` property.

#### **Data Type**

integer

#### **Access**

R0

#### **Complexity**

#### **Description**

Numeric type (real or complex) of the block data.

#### **Data Type**

character vector

#### **Access**

RW for MATLAB S functions, R0 for other blocks.

#### **Data**

#### **Description**

The block data.

#### **Data Type**

The data type specified by the “Datatype” on page 5-210 or “DatatypeID” on page 5-210 properties of this object.

**Access**

RW

**DataAsDouble****Description**

The block data's in double form.

**Data Type**

double

**Access**

R0

**Datatype****Description**

Data type of the values of the block-related object.

**Data Type**

character vector

**Access**

R0

**DatatypeID****Description**

Index of the data type of the values of the block-related object. enter the numeric value for the desired data type, as follows:

| <b>Data Type</b>                    | <b>Value</b> |
|-------------------------------------|--------------|
| 'inherited'                         | -1           |
| 'double'                            | 0            |
| 'single'                            | 1            |
| 'int8'                              | 2            |
| 'uint8'                             | 3            |
| 'int16'                             | 4            |
| 'uint16'                            | 5            |
| 'int32'                             | 6            |
| 'uint32'                            | 7            |
| 'boolean' or fixed-point data types | 8            |

**Data Type**

integer

**Access**

RW for MATLAB S functions, R0 for other blocks

**Dimensions****Description**

Dimensions of the block-related object, e.g., parameter or DWork vector.

**Data Type**

array

**Access**

RW for MATLAB S functions, R0 for other blocks

**Name****Description**

Name of block-related object, e.g., a block parameter or DWork vector.

**Data Type**

character vector

**Access**

RW for MATLAB S functions, R0 for other blocks

**Type****Description**

Type of block data. Possible values are:

| Type                          | Description                                                                  |
|-------------------------------|------------------------------------------------------------------------------|
| 'BlockPreCompInputPortData '  | This object contains data for an input port before the model is compiled.    |
| 'BlockPreCompOutputPortData ' | This object contains data for an output port before the model is compiled.   |
| 'BlockCompInputPortData '     | This object contains data for an input port after the model is compiled.     |
| 'BlockCompOutputPortData '    | This object contains data for an output port after the model is compiled.    |
| 'BlockPreCompDworkData '      | This object contains data for a DWork vector before the model is compiled.   |
| 'BlockCompDworkData '         | This object contains data for a DWork vector after the model is compiled.    |
| 'BlockDialogPrmData '         | This object describes a dialog box parameter of a Level-2 MATLAB S-function. |

| <b>Type</b>               | <b>Description</b>                                                                               |
|---------------------------|--------------------------------------------------------------------------------------------------|
| 'BlockRuntimePrmData'     | This object describes a run-time parameter of a Level-2 MATLAB S-function.                       |
| 'BlockCompContStatesData' | This object describes the continuous states of the block at the current time step.               |
| 'BlockDerivativesData'    | This object describes the derivatives of the block's continuous states at the current time step. |

**Data Type**

character vector

**Access**

R0

**Version History**

Introduced before R2006a

# Simulink.BlockPortData

Describe block input or output port

## Description

This class defines properties that are common to objects that provide run-time information about a block's ports.

## Parent

Simulink.BlockData

## Children

Simulink.BlockPreCompInputPortData, Simulink.BlockPreCompOutputPortData, Simulink.BlockCompInputPortData, Simulink.BlockCompOutputPortData

## Property Summary

| Name                            | Description                                                                             |
|---------------------------------|-----------------------------------------------------------------------------------------|
| "IsBus" on page 5-213           | True if this port is connected to a bus.                                                |
| "IsSampleHit" on page 5-213     | True if this port produces output or accepts input at the current simulation time step. |
| "SampleTime" on page 5-214      | Sample time of this port.                                                               |
| "SampleTimeIndex" on page 5-214 | Sample time index of this port.                                                         |

## Properties

### IsBus

#### Description

True if this port is connected to a bus.

#### Data Type

Boolean

#### Access

R0

### IsSampleHit

#### Description

True if this port produces output or accepts input at the current simulation time step.

**Data Type**

Boolean

**Access**

R0

**SampleTime****Description**

Sample time of this port.

**Data Type**

[period offset] where period and offset are values of type double. See “Specify Sample Time” for more information.

**Access**

RW for MATLAB S functions, R0 for other blocks

**SampleTimeIndex****Description**

Sample time index of this port.

**Data Type**

integer

**Access**

R0

**Version History**

Introduced before R2006a

# Simulink.BlockPreComplInputPortData

Provide precompilation information about block input port

## Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the “InputPort” on page 5-496 method of a block's run-time object before the model containing the block has been compiled.

## Parent

Simulink.BlockPortData

## Children

None

## Property Summary

| Name                              | Description                               |
|-----------------------------------|-------------------------------------------|
| “DirectFeedthrough” on page 5-215 | True if this port has direct feedthrough. |
| “Overwritable” on page 5-215      | True if this port is overwritable.        |

## Properties

### DirectFeedthrough

#### Description

True if this input port has direct feedthrough.

#### Data Type

Boolean

#### Access

RW for MATLAB S functions, R0 for other blocks

### Overwritable

#### Description

True if this input port is overwritable.

#### Data Type

Boolean

**Access**

RW for MATLAB S functions, R0 for other blocks

**Version History**

**Introduced before R2006a**

# Simulink.BlockPreCompOutputPortData

Provide precompilation information about block output port

## Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the "OutputPort" on page 5-497 method of a block's run-time object before the model containing the block has been compiled.

## Parent

Simulink.BlockPortData

## Children

none

## Property Summary

| Name                     | Description                                            |
|--------------------------|--------------------------------------------------------|
| "Reusable" on page 5-217 | Specifies whether an output port's memory is reusable. |

## Properties

### Reusable

#### Description

Specifies whether an output port's memory is reusable. Options are: `NotReusableAndGlobal` and `ReusableAndLocal`.

#### Data Type

character vector

#### Access

RW for MATLAB S functions, RO for other blocks

## Version History

Introduced before R2006a

## Simulink.Breakpoint class

**Package:** Simulink

Store and share data for a breakpoint set, configure the data for ASAP2 and AUTOSAR code generation

### Description

An object of the `Simulink.Breakpoint` class stores breakpoint set data for a lookup table. You can use that data in one or more Prelookup blocks. With the object, you can specify a data type and code generation settings for the breakpoint set and share the set between multiple lookup tables. Use `Simulink.Breakpoint` objects and `Simulink.LookupTable` objects to configure COM\_AXIS code generation for calibration.

The code generated for a `Simulink.Breakpoint` object is an array or a structure with two fields. If you configure the object to appear as a structure, one field stores the specified breakpoint set data and one scalar field stores the number of elements in the breakpoint set data. You can configure the structure type name, the field name, and other characteristics by using the properties of the object.

To package lookup table and breakpoint set data into a single structure in the generated code, for example, for STD\_AXIS code generation, use a `Simulink.LookupTable` object to store all of the data. See “Package Shared Breakpoint and Table Data for Lookup Tables”.

To subclass from `Simulink.Breakpoint` and inherit from this base class, type this syntax as the first line of your class definition file, where *myBreakpoint* is the name of your new class:

```
classdef myBreakpoint < Simulink.Breakpoint
```

For an example on subclassing, see “Define Data Classes”.

If you add properties to the subclass, you can see them by displaying the subclass object at the MATLAB command line. In the property dialog box, these properties display in a new tab.

### Construction

`BpSet = Simulink.Breakpoint` returns a `Simulink.Breakpoint` object named `BpSet` with default property values.

To create a `Simulink.Breakpoint` object by using the Model Explorer, use the button  on the toolbar. The default name for the object is `Object`.

## Property Dialog Box

### Breakpoints

The breakpoint set information. You can configure these characteristics:

#### Support tunable size

Specification to enable tuning the effective size of the table in the generated code. If you select this option, in the generated code, the `Simulink.Breakpoint` object appears as a structure variable. The structure has one field to store the breakpoint vector data and one field to store the number of elements in the breakpoint vector. You can change the value of the second field to adjust the effective size of the table.

If you clear this option, the `Simulink.Breakpoint` object appears in the generated code as a separate array variable instead of a structure.

#### Value

Breakpoint set data. Specify a vector with at least two elements.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector. When you click **Apply** or **OK**, the object executes the expression and uses the result to set the value of this property.

When you set **Data type** to `auto`, to set **Value**, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

You can edit this data by using a more intuitive interface in a lookup table block. See “Import Lookup Table Data from MATLAB”.

#### Data type

Data type of the breakpoint set. The default setting is `auto`, which means that the breakpoint set acquires a data type from the value that you specify in **Value**. If you use an untyped expression such as `[1 2 3]` to set **Value**, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object. Enumerated data types are also supported.

You can explicitly specify an integer data type, half data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

### **Dimensions**

Dimension lengths of the breakpoint set.

To use symbolic dimensions, specify a character vector. See “Implement Symbolic Dimensions for Array Sizes in Generated Code” (Embedded Coder).

### **Min**

Minimum value of the elements in the breakpoint set. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

### **Max**

Maximum value of the elements in the breakpoint set. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

### **Stored Int Min**

For `Simulink.Breakpoint` objects with a fixed-point data type, the minimum value of the elements in the breakpoint set, specified as a stored integer value. The value is derived from the real-world value **Min**. This property is available only in the property dialog box.

### **Stored Int Max**

For `Simulink.Breakpoint` objects with a fixed-point data type, the maximum value of the elements in the breakpoint set, specified as a stored integer value. The value is derived from the real-world value **Max**. This property is available only in the property dialog box.

### **Unit**

Physical unit of the elements in the breakpoint set. You can specify text such as `degC`. See “Unit Specification in Simulink Models”.

### **Field name**

Name of a structure field in the generated code. This field stores the breakpoint set data. The default value is `BP`. To change the field name, specify text.

This column appears only if you select **Support tunable size**.

### **Tunable size name**

Name of a structure field in the generated code. This scalar field stores the length of the breakpoint set (the number of elements), which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory. The default name is `N`. To change the field name, specify text.

This column appears only if you select **Support tunable size**.

### Description

Description of the breakpoint set. You can specify text such as `This breakpoint set represents the pressure input`.

### Data definition: Storage class

Storage class of the structure variable (if you select **Support tunable size**) or array variable in the generated code. The variable stores the breakpoint set data. The default setting is `Auto`.

For more information about storage classes, see “C Code Generation Configuration for Model Interface Elements” (Simulink Coder).

If you have Embedded Coder, you can choose a custom storage class. For information about custom storage classes, see “Organize Parameter Data into a Structure by Using Struct Storage Class” (Embedded Coder).

### Data definition: Identifier

Alternative name for the variable in the generated code. The default value is empty, in which case the generated code uses the name of the `Simulink.Breakpoint` object as the name of the variable. To set the identifier, specify text.

To enable this property, set **Data definition: Storage class** to a setting other than `Auto`.

### Data definition: Alignment

Data alignment boundary in the generated code. The starting memory address for the data allocated for the structure or array variable is a multiple of the value that you specify. The default value is `-1`, which allows the code generator to determine an optimal alignment based on usage.

Specify a positive integer that is a power of 2, not exceeding 128. For more information about using data alignment for code replacement, see “Data Alignment for Code Replacement” (Embedded Coder).

### Struct Type definition: Name

Name of the structure type that the structure variable uses in the generated code. The default value is empty. Specify text.

This property appears only if you select **Support tunable size**.

### Struct Type definition: Data scope

Scope of the structure type definition (imported from your handwritten code or exported from the generated code). The default value is `Auto`. When you select `Auto`:

- If you do not specify a value in the **Struct Type definition: Header file** box, the generated code exports the structure type definition to the file `model_types.h`. `model` is the name of the model.
- If you specify a value in the **Struct Type definition: Header file** box, such as `myHdr.h`, the generated code imports the structure type definition from `myHdr.h`.

To explicitly specify the data scope:

- To import the structure type definition into the generated code from your custom code, select `Imported`.
- To export the structure type definition from the generated code, select `Exported`.

Set the data scope of the structure type definition to `Imported` or `Exported` to avoid potential MISRA C:2012 violations.

If you do not specify a value in the **Struct Type definition: Header file** box, the generated code imports or exports the type definition from or to `StructName.h`. `StructName` is the name that you specify with the property **Struct Type definition: Name**.

This property appears only if you select **Support tunable size**.

#### **Struct Type definition: Header file**

Name of the header file that contains the structure type definition. You can import the definition from a header file that you create, or export the definition into a generated header file. To control the scope of the structure type, adjust the setting for the **Struct Type definition: Data scope** property.

This property appears only if you select **Support tunable size**.

## Properties

### **Breakpoints — Breakpoint set data**

`Simulink.lookuptable.Breakpoint` object

Breakpoint set data, specified as a `Simulink.lookuptable.Breakpoint` object. Use this embedded object to configure the structure field names and characteristics of the breakpoint set data such as breakpoint values, data type, and dimensions.

### **CoderInfo — Code generation settings for variable**

`Simulink.CoderInfo` object

Code generation settings for the structure variable (if you set `SupportTunableSize` to `true`) or array variable (`false`) that stores the breakpoint set data, specified as a `Simulink.CoderInfo` object. You can specify a storage class or custom storage class by using this embedded object. For more information, see `Simulink.CoderInfo`.

### **StructTypeInfo — Settings for structure type in the generated code**

`Simulink.lookuptable.StructTypeInfo` object

Settings for the structure type that the structure variable uses in the generated code, specified as a `Simulink.lookuptable.StructTypeInfo` object.

If you set `SupportTunableSize` to `false`, the `Simulink.Breakpoint` object does not appear in the generated code as a structure. The code generator ignores this property.

### **SupportTunableSize — Option to generate code that enables tunability of table size**

`false` (default) | `true`

Option to generate code that enables tunability of the effective size of the table, specified as `true` or `false`. See the **Support Tunable Size** parameter.

Data Types: `logical`

## Copy Semantics

Handle. To learn how handle classes affect copy operations, see `Copying Objects`.

## Examples

### Share Breakpoint Data Between One-Dimensional Lookup Tables

- 1 Create a `Simulink.Breakpoint` object named `myBpSet`.

```
myBpSet = Simulink.Breakpoint
```

- 2 Specify the breakpoint data.

```
myBpSet.Breakpoints.Value = [-2 -1 0 1 2];
```

- 3 Create a `Simulink.LookupTable` object named `FirstLUTObj`.

```
FirstLUTObj = Simulink.LookupTable;
```

- 4 Specify the table data.

```
FirstLUTObj.Table.Value = [1.1 2.2 3.3 4.4 5.5];
```

- 5 Set first `FirstLUTObj` to Reference.

```
FirstLUTObj.BreakpointsSpecification = 'Reference';
```

- 6 Configure the lookup table object to refer to the breakpoint set object.

```
FirstLUTObj.Breakpoints = {'myBpSet'};
```

- 7 Create another `Simulink.LookupTable` object to store a different set of table data. Configure the lookup table object to refer to the same breakpoint set object.

```
SecondLUTObj = Simulink.LookupTable;
SecondLUTObj.Table.Value = [1.2 2.3 3.4 4.5 5.6];
SecondLUTObj.BreakpointsSpecification = 'Reference';
SecondLUTObj.Breakpoints = {'myBpSet'};
```

You can use `FirstLUTObj` and `SecondLUTObj` to specify the table data in two different Interpolation Using Prelookup blocks. Use `myBpSet` to specify the breakpoint set data in one or two Prelookup blocks that provide the inputs for the Interpolation Using Prelookup blocks.

## Limitations

- You cannot generate code according to the `FIX_AXIS` style.
- When blocks in a subsystem use `Simulink.LookupTable` or `Simulink.Breakpoint` objects, you cannot set data type override (see “Control Fixed-Point Instrumentation and Data Type Override”) only on the subsystem. Instead, set data type override on the entire model.

## Version History

Introduced in R2016b

# Simulink.CodeImporter class

**Package:** Simulink

Import custom C/C++ code into Simulink

## Description

Use the `Simulink.CodeImporter` class to import custom C/C++ code into Simulink for modeling, verification, and validation. Instances of this class are used to specify custom code to import into Simulink.

The `Simulink.CodeImporter` class is a handle class.

## Creation

### Description

`obj = Simulink.CodeImporter()` creates an instance of the `CodeImporter` with the `LibraryFileName` property set to "untitled".

`obj = Simulink.CodeImporter(LibName)`, where `LibName` is a file name chosen by the user and specified as a string or character vector, creates an instance of the `CodeImporter` with the `LibraryFileName` property set to `LibName`.

## Properties

### **LibraryFileName** — Name of Simulink library file and generated artifacts

"untitled" (default) | string | character vector

Name of Simulink library file and generated artifacts created for the imported code, specified as a string or a character vector. Name must be a valid MATLAB variable name. The same file name is used with different extensions for the data dictionary and other artifacts generated when code is imported.

Example: "pumpController"

Data Types: string | character vector

### **OutputFolder** — Location of generated library file and generated artifacts

"" (default) | string | character vector

Location of generated library file and generated artifacts, specified as a string or a character vector. If left blank, the current MATLAB folder is used.

File locations that are part of the `CustomCode` property can be specified relative to this folder.

Example: "C:\HeatPump\Controller"

Data Types: string | character vector

**CustomCode — Custom C or C++ code files and associated properties to import**

CustomCode object

C or C++ code files and associated properties to import, specified as an object of class `Simulink.CodeImporter.CustomCode`. Use this property to specify code importing options, such as source and header files, folder paths, libraries, and compiler and linker flags. For information, see `Simulink.CodeImporter.CustomCode`.

Example:

```
%% Create code importer object
obj = Simulink.CodeImporter;

%% Set the custom code to import
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = [".\include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];
obj.CustomCode
```

ans =

CustomCode with properties:

```
 SourceFiles: ["src/pumpController.c" "src/utils.c"]
 InterfaceHeaders: "pumpController.h"
 IncludePaths: ".\include"
 Libraries: [1x0 string]
 Defines: [1x0 string]
 Language: "C"
 CompilerFlags: [1x0 string]
 LinkerFlags: [1x0 string]
GlobalVariableInterface: 0
 FunctionArrayLayout: NotSpecified
```

**ParseInfo — Information regarding parsed custom code**

Simulink.CodeImporter.ParseInfo object

Information regarding the parsed custom code, specified as an object of class `Simulink.CodeImporter.ParseInfo`. This property is read-only. Parsing needs to be successful to obtain information regarding custom code. For information, see `Simulink.CodeImporter.ParseInfo`.

Example:

```
s = obj.parse;
obj.ParseInfo
```

ans =

ParseInfo with properties:

```
 Success: 1
 AvailableFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
 EntryFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
 AvailableTypes: "pump_control_bus"
 Errors: []
```

## Options — Additional options used by Code Importer during import for library creation

Options object

Additional options used by Code Importer during import for library creation, specified as an object of class `Simulink.CodeImporter.Options`. Use this object to change the default values for the size of an argument passed by a pointer to a function, and the Simulink library browser name. For information, see `Simulink.CodeImporter.Options`.

Example:

```
>> obj.Options
ans =

Options with properties:

 PassByPointerDefaultSize: "-1"
 CreateTestHarness: 0
 LibraryBrowserName: ""
 SimulateInSeparateProcess: 0
 UndefinedFunctionHandling: "FilterOut"

>> obj.Options.LibraryBrowserName = "Controller Library";
>> obj.Options
ans =

Options with properties:

 PassByPointerDefaultSize: "-1"
 CreateTestHarness: 0
 LibraryBrowserName: "Controller Library"
 SimulateInSeparateProcess: 0
 UndefinedFunctionHandling: "FilterOut"
```

## Methods

### Public Methods

|                                      |                                                                                    |
|--------------------------------------|------------------------------------------------------------------------------------|
| <code>parse</code>                   | Analyze custom code for functions, types, global variables, and their dependencies |
| <code>import</code>                  | Import custom code, functions, and types into Simulink                             |
| <code>addToProject</code>            | Add custom code and imported artifacts to MATLAB project                           |
| <code>view</code>                    | Launch Simulink Code Importer wizard                                               |
| <code>save</code>                    | Save import settings to JSON format text file                                      |
| <code>load</code>                    | Load import settings from saved import settings file                               |
| <code>computeInterfaceHeaders</code> | Compute interface headers from specified source files                              |

## Examples

### Import Custom Code

Specify location and options for custom code.

```
%% Create code importer object
obj = Simulink.CodeImporter('PumpController');
```

```
%% Set the custom code to import
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = ["/include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];

%% Specify name for Library Browser
obj.Options.LibraryBrowserName = "Controller Library";

Parse custom code and examine results.

%% Parse custom code
s = obj.parse;
obj.ParseInfo

ans =

 ParseInfo with properties:

 Success: 1
 AvailableFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
 EntryFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
 AvailableTypes: "pump_control_bus"
 Errors: []

Import parsed code into Simulink

%% Import code
s = obj.import;
```

## Version History

Introduced in R2021a

### Topics

“Import Custom C/C++ Code Using the Simulink Code Importer”

# addToProject

**Package:** Simulink

Add custom code and imported artifacts to MATLAB project

## Syntax

```
success = obj.addToProject(ProjectFilePath)
```

## Description

`success = obj.addToProject(ProjectFilePath)`, where `obj` is an object of class `Simulink.CodeImporter` or `sltest.CodeImporter`, adds the specified custom C/C++ code and the artifacts generated when importing custom code (using the `import` method) to an existing MATLAB project. Generated artifacts include a Simulink library and a data dictionary, and for objects of class `sltest.CodeImporter`, a sandbox folder. If you choose to generate a test harness and test files for the imported blocks, generated artifacts also include Simulink Test files (Simulink Test license required).

Invoke `addToProject` only after a successful import of custom code.

## Input Arguments

### **ProjectFilePath** — Name of existing MATLAB project

character vector | string scalar

Name of existing MATLAB project, specified as a character vector or string scalar. The path can be a full path or a path relative to the current MATLAB folder. For `addToProject` to be successful, all custom code files and the Simulink library and other generated artifacts must be located in either the same folder as the MATLAB project or in direct or indirect subfolders of that folder.

Data Types: character vector | string scalar

## Output Arguments

### **success** — Success indicator

logical scalar

Success indicator of whether code and artifacts are added to project, returned as a logical scalar. If not successful, Simulink throws an error.

## Version History

Introduced in R2021a

## See Also

`Simulink.CodeImporter`

## build

**Class:** Simulink.CodeImporter

**Package:** Simulink

Detect code errors that prevent imported Simulink library from simulation

### Syntax

```
output_args = method(input_args,Name,Value)
```

### Description

`output_args = method(input_args,Name,Value)` <verb phase> with additional options specified by one or more `Name,Value` pair arguments.

### Input Arguments

**name1** —  
(default) |

Example:

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `string` | `struct` | `table` | `cell` | `function_handle` | `categorical` | `datetime` | `duration` | `calendarDuration` | `fi`  
Complex Number Support: Yes

#### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example:

**name2** —  
(default) |

Example:

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `string` | `struct` | `table` | `cell` | `function_handle` | `categorical` | `datetime` | `duration` | `calendarDuration` | `fi`  
Complex Number Support: Yes

## **Output Arguments**

## computeInterfaceHeaders

**Class:** Simulink.CodeImporter

**Package:** Simulink

Compute interface headers from specified source files

### Syntax

```
listOfHdr = obj.computeInterfaceHeaders()
```

### Description

`listOfHdr = obj.computeInterfaceHeaders()`, where `obj` is an object of class `Simulink.CodeImporter`, computes the interface header information for the custom code specified in the `CustomCode` of `obj`.

### Output Arguments

**listOfHdr** — List of interface header files

string array

List of interface header files computed from specified custom code, returned as a string array. This value can be used to populate the `InterfaceHeader` property of the `CustomCode` property of `obj`.

### Version History

Introduced in R2021b

### See Also

`Simulink.CodeImporter` | `Simulink.CodeImporter.CustomCode`

# import

**Package:** Simulink

Import custom code, functions, and types into Simulink

## Syntax

```
success = obj.import()
success = obj.import(Name1,Value1,...,NameN,ValueN)
```

## Description

`success = obj.import()`, where `obj` is an object of class `Simulink.CodeImporter`, parses the specified custom code and imports it into Simulink with default import options. If the custom code was not previously parsed or if the custom code or the settings of `obj.CustomCode` have changed since the custom code was parsed, then the `ParseInfo` property of `obj` is populated or repopulated with the information resulting from the parse.

`success = obj.import(Name1,Value1,...,NameN,ValueN)` parses the specified custom code and imports it into Simulink with options based on the specified name-value arguments.

## Examples

### Import Custom Code

Specify location and options for custom code, then import the code into Simulink.

```
%% Create code importer object
obj = Simulink.CodeImporter;

%% Set library file name and output folder
obj.LibraryFileName = "pumpController";
obj.OutputFolder = ".";

%% Set the custom code to import
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = ["/include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];

%% Parse custom code and configure function
obj.parse();
fcn = obj.ParseInfo.getFunctions("Controller");
fcn.PortSpecification.ReturnArgument.Label = "control_out";

%% Import function "Controller"
obj.import('Functions', ["Controller"]);
```

## Input Arguments

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose `Name` in quotes.*

Example: `obj.import('Functions', ['Controller'], 'EntryFunctionsOnly', 'On');`

### EntryFunctionsOnly — Option to limit import to entry-point functions

'On' (default) | 'Off'

Option to limit import to entry-point functions, specified as 'On' or 'Off'. If specified as 'On', only entry-point functions from the custom code, that is, functions not called by other functions in the custom code, are imported into the Simulink library. Otherwise, all available custom code functions are imported.

Data Types: char | string

### Functions — Functions to import

"" (default) | cell array of character vectors | string array

Functions to import, specified as a cell array of character vectors or a string array. Specify this argument to limit import to the named custom code functions. Otherwise, all available custom code functions or all available entry-point custom code functions are imported.

Data Types: char | string

### Types — Additional types to import

"" (default) | cell array of character vectors | string array

Additional types to import, specified as a cell array of character vectors or a string array. All types required by the imported functions are imported. Additional types are defined in the interface headers.

Data Types: char | string

### Overwrite — Option to overwrite existing Simulink library

'Off' (default) | 'On'

Option to overwrite existing Simulink library with the same name as the name specified in the `LibraryFileName` property, specified as 'On' or 'Off'. If set to 'Off' and there is an existing Simulink library with the same name, custom code is imported into the existing library without changing block settings applied in the library after previous imports of custom code. If set to 'On', the existing library is overwritten by the library created from the custom code import, and any prior changes to the existing library are lost. If there is no existing Simulink library with the same name, a new library is created.

Data Types: char | string

### AddToProject — Option to add custom code and generated artifacts to existing MATLAB project

project file path

Option to add custom code and generated artifacts to existing MATLAB project, specified as a file path. Artifacts include a library file for imported functions and a data dictionary for imported types. If `obj.Options.CreateTestHarness` is set to `true` and Simulink Test is installed, artifacts also include a Simulink Test file.

Data Types: `char` | `string`

## Output Arguments

### **success** — Whether import is successful

logical scalar

Whether import is successful, specified as a logical scalar. Simulink throws an exception if the import is unsuccessful.

## Version History

**Introduced in R2021a**

### See Also

`Simulink.CodeImporter.ParseInfo` | `Simulink.CodeImporter.Options` | `Simulink.CodeImporter.CustomCode` | `Simulink.CodeImporter`

## load

**Class:** Simulink.CodeImporter

**Package:** Simulink

Load import settings from saved import settings file

### Syntax

```
success = obj.load(filename)
```

### Description

`success = obj.load(filename)`, where `obj` is an object of class `Simulink.CodeImporter`, loads import settings from a saved import settings JSON file, `filename`, created using the `save` method.

### Input Arguments

**filename** — Name or path of file with saved import settings

character vector | string scalar

Name or path of JSON file with saved import settings, specified as a character vector or string scalar.

Example: `'importsettings.json'`

Data Types: `char` | `string`

### Output Arguments

**success** — Indicator of whether loading import settings is successful

logical scalar

Indicator of whether loading import settings is successful, returned as a logical scalar.

## Version History

Introduced in R2020a

### See Also

`Simulink.CodeImporter`

# parse

**Package:** Simulink

Analyze custom code for functions, types, global variables, and their dependencies

## Syntax

```
success = obj.parse()
success = obj.parse('Force', 'On')
success = obj.parse('Force', 'Off')
```

## Description

`success = obj.parse()`, where `obj` is an object of `Simulink.CodeImporter` or `sltest.CodeImporter` class, parses the custom code, but does not re-parse the custom code if the custom code has been parsed previously and neither the custom code nor the settings of `obj.CustomCode` have changed since the previous parse. Results of a successful parse or error information from an unsuccessful parse are stored in the `ParseInfo` property of `obj`.

`success = obj.parse('Force', 'On')` parses the custom code irrespective of whether any changes have been made since a previous parse.

`success = obj.parse('Force', 'Off')` has the same effect as `success = obj.parse()`.

## Examples

### Parse Custom Code

```
%% Create code importer object
obj = Simulink.CodeImporter;

%% Set the custom code to import
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = [".\include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];

%% Parse custom code
s = obj.parse;
obj.ParseInfo

ans =

 ParseInfo with properties:

 Success: 1
 AvailableFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
 EntryFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
 AvailableTypes: "pump_control_bus"
 Errors: []
```

## **Output Arguments**

### **success — Indicator of whether parsing is successful**

logical scalar

Indicator of whether parsing is successful, returned as a logical scalar. Simulink throws an exception if parsing is unsuccessful.

## **Version History**

**Introduced in R2021a**

### **See Also**

`Simulink.CodeImporter`

## save

**Class:** Simulink.CodeImporter

**Package:** Simulink

Save import settings to JSON format text file

### Syntax

```
filepath = obj.save(filename)
filepath = obj.save(filename, 'Overwrite', 'Off')
filepath = obj.save(filename, 'Overwrite', 'On')
```

### Description

`filepath = obj.save(filename)` or `filepath = obj.save(filename, 'Overwrite', 'Off')`, where `obj` is an object of class `Simulink.CodeImporter`, saves import settings in JSON format to the specified file `filename` and returns the full path to the saved file. Import settings include `LibraryFileName`, `OutputFolder`, `CustomCode`, `Options`, selected functions and types, and function configurations. You can subsequently load the settings from this file using the `load` method.

`filepath = obj.save(filename, 'Overwrite', 'On')` overwrites the specified file `filename` if the file already exists.

### Input Arguments

**filename** — Name or path of file to be used to save import settings

character vector | string scalar

Name or path of file to be used to save import settings, specified as a character vector or string scalar.

Example: `'importsettings.json'`

Data Types: `char` | `string`

### Output Arguments

**filepath** — Full path to saved file

character vector

Full path to saved file, returned as a character vector.

## Version History

Introduced in R2020a

Simulink.CodeImporter

## view

**Package:** Simulink

Launch Simulink Code Importer wizard

## Syntax

`obj.view`

## Description

`obj.view`, where `obj` is an object of `Simulink.CodeImporter` class, launches the Simulink Code Importer wizard, a graphical user interface for the Simulink Code Importer. A series of screens leads you through the process of creating a Simulink library from your custom code.

**Note** You can also launch the Simulink Code Importer wizard from within Simulink. On the Simulink toolstrip, go to the **Modeling** tab. From **Design**, select Code Importer.

`Simulink.CodeImporter`

# Simulink.CodeImporter.CustomCode class

**Package:** Simulink.CodeImporter

Specify custom code settings for Simulink.CodeImporter and sltest.CodeImporter classes

## Description

The Simulink.CodeImporter.CustomCode class is a handle class.

## Creation

When you create an object of class Simulink.CodeImporter, an object of class Simulink.CodeImporter.CustomCode is automatically created as the CustomCode property of that object. Do not create an object of class Simulink.CodeImporter.CustomCode directly.

## Properties

---

**Note** The first four properties listed below (SourceFiles, InterfaceHeaders, IncludePaths, and Libraries) let you specify file path information about the location of your custom code. To enable portability, specify this information as a file path relative to the folder specified in the OutputFolder property of the relevant Simulink.CodeImporter object rather than as an absolute path.

---

### SourceFiles — Source files to be imported

cell array of character vectors | string array

Source files to be imported, specified as a cell array of character vector or a string array. Supported files include .c and .cpp files. Each file name can be specified as a path relative to the folder specified in the OutputFolder property of the relevant Simulink.CodeImporter object or as an absolute path.

Providing a value for SourceFiles is optional for Simulink.CodeImporter and optional for sltest.CodeImporter when the TestType is IntegrationTest.

Example: {'foo.c', 'bar.c'}

Example: ['.\\foo.c', '..\\bar.c']

Example: fullfile(pwd, 'Src', 'foo.c')

Data Types: cell array of character vectors | string array

### InterfaceHeaders — Interface headers to be imported

cell array of character vectors | string array

Interface headers to be imported, specified as a cell array of character vectors or a string array. Supported files include .h and .hpp files. Each file name can be specified as a path relative to the folder specified in the OutputFolder property of the relevant Simulink.CodeImporter object or

as an absolute path. Interface headers should contain the function declarations and type definitions that you want to bring into Simulink. These declarations and definitions are usually contained in the export header of your C code library.

Example: {'foo.h', 'bar.h'}

Example: [".\foo.h", "..\bar.h"]

Example: fullfile(pwd, 'Hdr', 'foo.h')

Data Types: cell array of character vectors | string array

### **IncludePaths — Folders containing included header files**

cell array of character vectors | string array

Folders containing included header files for the parser to find, specified as a cell array of character vectors or a string array. Each folder path can be specified as a path relative to the folder specified in the `OutputFolder` property of the relevant `Simulink.CodeImporter` object or as an absolute path.

Example: {'.', '..\..\'}

Example: [".\Include1", "..\Include2"]

Example: fullfile(pwd, 'Include1')

Data Types: cell array of character vectors | string array

### **Libraries — Libraries that contain custom object code to link**

cell array of character vectors | string array

Libraries that contain custom object code to link, specified as a cell array of character vectors or a string array. Supported files include `.obj`, `.dll`, `.lib`, `.so`, `.o`, `.a`, and `.dylib` files. Each file name can be specified as a path relative to the folder specified in the `OutputFolder` property of the relevant `Simulink.CodeImporter` object or as an absolute path.

Providing libraries is optional.

Example: {'foo.lib', 'foo.dll'}

Example: [".\foo.so", "..\bar.so"]

Data Types: cell array of character vectors | string array

### **Defines — Preprocessor macro definitions to be added to the compiler command line**

cell array of character vectors | string array

Preprocessor macro definitions to be added to the compiler command line, specified as a cell array of character vectors or a string array. `'-D'` is optional in defines.

Example: {'-D DEF1', '-D DEF2'}

Example: ["DEF1", "DEF2"]

Data Types: cell array of character vectors | string array

### **Language — Custom code language**

'C' (default) | 'C++'

Custom code language, specified as `'C'` or `'C++'`. C and C++ are the only supported languages.

Data Types: character vector | string scalar

### **CompilerFlags — Additional compiler flags**

cell array of character vectors | string array

Additional compiler flags to be added to the compiler command line, specified as a cell array of character vectors or a string array.

Example: {'/O2' , '/Og'}

Example: "-g"

Data Types: cell array of character vectors | string array

### **LinkerFlags — Additional linker flags**

cell array of character vectors | string array

Additional linker flags to be added to the linker command line, specified as a cell array of character vectors or a string array.

Example: {'/WX'}

Data Types: cell array of character vectors | string array

### **GlobalVariableInterface — Option to enable global variables as function interfaces**

false (default) | true

Option to enable global variables as function interfaces, specified as a logical scalar. If set to true, global variables accessed by the custom code functions will be treated as function interfaces in the generated Simulink library. See “Call C Caller Block and Specify Ports” and “Enable global variables as function interfaces”.

Data Types: logical scalar

### **FunctionArrayLayout — Default array layout for custom code functions**

NotSpecified (default) | RowMajor | ColumnMajor | Any

Default array layout for custom code functions to use to access input argument arrays, specified as **NotSpecified**, **RowMajor**, **ColumnMajor**, or **Any**. You can override the default for an individual function by using the `ArrayLayout` property of the `Simulink.CodeImporter.Function` object corresponding to that function. Matrix data passed to and from your C functions is converted to the function array layout you specify. See “Integrate C Code Using C Caller Blocks” and “Default function array layout”.

Data Types: enum

## **Examples**

### **Specify Custom Code for Import**

Create an object of class `Simulink.CodeImporter`. Set the properties of its `CustomCode` property to specify custom code to import into Simulink.

```
obj = Simulink.CodeImporter("pumpController");
```

```
obj.OutputFolder = ".";
```

```
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = [".include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];
```

## **Version History**

**Introduced in R2021a**

### **See Also**

[Simulink.CodeImporter](#) | [Simulink.CodeImporter.Options](#) |  
[Simulink.CodeImporter.ParseInfo](#) | [Simulink.CodeImporter.Function](#) |  
[Simulink.CodeImporter.SimulinkPortSpecification](#)

# Simulink.CodeImporter.Function class

**Package:** Simulink.CodeImporter

Access and configure detailed information about parsed custom code functions

## Description

Access detailed information about parsed custom code functions obtained from `Simulink.CodeImporter` or `sltest.CodeImporter` class instance. Configure information about custom code functions for importing into Simulink.

The `Simulink.CodeImporter.Function` class is a handle class.

## Creation

One or more objects of this class are automatically created when you invoke the `getFunctions` method of an object of class `Simulink.CodeImporter.ParseInfo`. A `Simulink.CodeImporter.Function` object is created for each function in the parsed custom code for which `getFunctions` is invoked. Do not create an object of class `Simulink.CodeImporter.Function` directly.

## Properties

### Name — Function name

string scalar

Function name, returned as a string scalar.

Example: "Controller"

Data Types: string scalar

### CPrototype — C prototype

string scalar

C prototype for function, returned as a string scalar.

Example: "pump\_control\_bus Controller(real\_T Tset, real\_T Troom\_in);"

Data Types: string scalar

### PortSpecification — Port specification of function

SimulinkPortSpecification object

Port specification of function, specified as an object of class `Simulink.CodeImporter.SimulinkPortSpecification`.

### IsEntry — Whether function is entry-point function

logical scalar

Whether function is an entry-point function, returned as a logical scalar. An entry-point function is not called by other functions in the custom code.

### **IsDefined — Whether function is defined**

logical scalar

Whether function is defined, returned as a logical scalar. This scalar indicates whether custom code contains a function body defining the function in addition to a function prototype defined in a header.

### **IsDeterministic — Whether function is deterministic**

logical scalar

Whether function is deterministic, specified as a logical scalar. A deterministic function always produces the same outputs for the same input values. Specifying a function as deterministic enables the corresponding C Caller block to be used in a For Each subsystem and with continuous sample time, and optimizes the use of the block in conditional input branch execution. See “Deterministic functions”.

### **IsStub — Whether function is stubbed**

logical scalar

Whether function is stubbed, returned as a logical scalar. This scalar indicates whether, for a unit test, a stub for undefined symbols was generated for the function (Simulink Test license required).

### **ArrayLayout — Array layout for function**

NotSpecified (default) | ColumnMajor | RowMajor | Any

Array layout for function, returned as NotSpecified, ColumnMajor, RowMajor, or Any. If NotSpecified, then the default setting for the custom code as specified in the FunctionArrayLayout property of the relevant SimulinkCode.CustomCode object is used. Otherwise, the value specified for the function overrides the default.

Data Types: enum

## **Methods**

### **Public Methods**

## **Examples**

## Parse Custom Code Functions

Specify and parse custom code, then query information regarding custom code functions.

```
obj = Simulink.CodeImporter;

%% Set library file name and output folder
obj.LibraryFileName = "pumpController";
obj.OutputFolder = ".";

%% Set the custom code to import
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = ["/include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];

%% Parse code
obj.parse;
parseobj = obj.ParseInfo

ans =

 ParseInfo with properties:

 Success: 1
 AvailableFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
 EntryFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
 AvailableTypes: "pump_control_bus"
 Errors: []

fcnobj = parseobj.getFunctions(["Controller"])

fcnobj =

 Function with properties:

 Name: "Controller"
 CPrototype: "pump_control_bus Controller(real_T Tset, real_T Troom_in);"
 PortSpecification: [1x1 Simulink.CodeImporter.SimulinkPortSpecification]
 IsEntry: 1
 IsDefined: 1
 IsStub: 0
 ArrayLayout: NotSpecified
 IsDeterministic: 0
```

## Version History

Introduced in R2021a

 Simulink.CodeImporter.SimulinkPortSpecification

## Simulink.CodeImporter.Options class

**Package:** Simulink.CodeImporter

Specify additional import options for Simulink.CodeImporter and sltest.CodeImporter classes

### Description

Use the Simulink.CodeImporter class to specify options for importing custom code beyond what is specified in the CustomCode property of the relevant Simulink.CodeImporter object.

The Simulink.CodeImporter.Options class is a handle class.

### Creation

When you create an object of class Simulink.CodeImporter, an object of class Simulink.CodeImporter.Options is automatically created as the Options property of that object. Do not create an object of class Simulink.CodeImporter.Options directly.

### Properties

#### PassByPointerDefaultSize — Default size of C argument passed by pointer to function

"-1" (default) | character vector | string scalar

Default size of C argument passed by pointer to function in the generated C Caller block port specifications, specified as a character vector or string scalar. By default, the value is set to "-1", meaning that the size is inherited. A value of "1" indicates that arguments passed by address to functions are scalars, unless you override this setting in the Simulink.CodeImporter.SimulinkPortSpecification corresponding to a particular function.

Data Types: char | string

#### CreateTestHarness — Automatic creation of test harness during import

true or 1 (default) | false or 0

Automatic creation of test harness during import, specified as a logical 1 (true) or 0 (false). Specify whether the Simulink Code Importer should automatically create a test harness for each block in the generated Simulink library (Simulink Test license required).

Data Types: logical

#### LibraryBrowserName — Name by which generated Simulink library appears in Simulink Library Browser

"" (default) | character vector | string scalar

Name by which generated Simulink library appears in Simulink Library Browser, specified as a character vector or string scalar. By default, the value is an empty string, meaning that the generated library does not appear in the Simulink Library Browser. If you specify a name, the Simulink Code Importer generates the file slblocks.m as part of the artifacts the Code Importer creates.

Example: "Controller Library"

Data Types: char | string

### SimulateInSeparateProcess — Run custom code in separate process

false or 0 (default) | true or 1

Run custom code in a separate process outside of MATLAB during model simulation, specified as logical 1 (true) or 0 (false). If this property is false, the custom code runs in the same process as the rest of the model during simulation. Simulations usually run faster, but run-time exceptions in the custom code can cause MATLAB to crash. If the property is true, custom code runs in a separate process during model simulation, which can prevent MATLAB from crashing due to run-time exceptions in the custom code or errors in the interface between Simulink and the custom code.

Data Types: logical

### UndefinedFunctionHandling — How to manage undefined functions and variables

"FilterOut" (default) | "ThrowError" | "DoNotDetect" | "UseInterfaceOnly"

How to manage undefined functions and variables, specified as:

| Value              | Purpose                                                                                                                                                                              |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| "FilterOut"        | Filter out undefined functions and variables. Simulink Code Importer does not bring undefined functions and variables into the generated Simulink library.                           |
| "ThrowError"       | Return an error if Simulink Code Importer detects an undefined function or variable.                                                                                                 |
| "DoNotDetect"      | Simulink Code Importer brings undefined functions and variables into the generated Simulink library, but does not automatically generate stub functions and variables equal to zero. |
| "UseInterfaceOnly" | Simulink Code Importer brings undefined functions and variables into the generated Simulink library, and generates stub functions and variables equal to zero.                       |

Data Types: enum

## Examples

### Set Custom Code Options

Create a Simulink.CodeImporter object and set options.

```
obj = Simulink.CodeImporter;
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = ["/include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];
obj.Options.LibraryBrowserName="Controller Library";
```

obj.Options

```
ans =
```

```
Options with properties:
```

```
 PassByPointerDefaultSize: "-1"
 CreateTestHarness: 1
 LibraryBrowserName: "Controller Library"
SimulateInSeparateProcess: 0
UndefinedFunctionHandling: "FilterOut"
```

## **Version History**

**Introduced in R2021a**

# Simulink.CodeImporter.ParseInfo class

**Package:** Simulink.CodeImporter

Information about parsed custom code

## Description

The `Simulink.CodeImporter.ParseInfo` class has read-only properties that store more information about the parsed custom code. Parsing needs to be successful to obtain information regarding custom code.

The `Simulink.CodeImporter.ParseInfo` class is a handle class.

## Creation

When you create an object of class `Simulink.CodeImporter`, an object of class `Simulink.CodeImporter.ParseInfo` is automatically created as the `ParseInfo` property of that object. Do not create an object of class `Simulink.CodeImporter.ParseInfo` directly.

## Properties

### Success — Whether parsing of custom code is successful

`true` | `false`

Whether parsing of custom code is successful, specified as a logical scalar with value `false` before successful parsing of specified custom code, then `true` after successful parsing.

Data Types: `logical` scalar

### AvailableFunctions — Functions compatible with Simulink in custom code

string array

Functions compatible with Simulink in custom code, returned as a string array.

Example: `["myCustomFcn1", "myCustomFcn2", "myCustomFcn3"]`

Data Types: `string` array

### EntryFunctions — Entry-point functions in custom code

string array

Entry-point functions in custom code, returned as a string array. Entry-point functions are not called by other custom code functions. `EntryFunctions` is a subset of `AvailableFunctions`.

Example: `["myCustomFcn1", "myCustomFcn3"]`

Data Types: `string` array

### AvailableTypes — Data types compatible with Simulink in custom code

string array

Data types compatible with Simulink in custom code, returned as a string array. Types are user-defined, such as `struct` and `enum`.

Example: ["myStruct1", "myStruct2"]

Data Types: string array

### Errors — Error messages from failed parse

character vector

Error messages from failed parse of the specified custom code (Success is equal to `false`), returned as a character vector. Multiple error message are concatenated into a single character vector. If the parsing is successful (Success is equal to `true`), Errors is a null vector.

Data Types: character vector

## Methods

### Public Methods

`Simulink.CodeImporter.ParseInfo.getFunctions` Obtain detailed information regarding functions in custom code

## Examples

### Parse Custom Code

```
obj = Simulink.CodeImporter;

%% Set library file name and output folder
obj.LibraryFileName = "pumpController";
obj.OutputFolder = ".";

%% Set the custom code to import
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = ["/include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utls.c"];
obj.parse;
obj.ParseInfo

ans =

 ParseInfo with properties:

 Success: 1
 AvailableFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
 EntryFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
 AvailableTypes: "pump_control_bus"
 Errors: []
```

## Version History

Introduced in R2021a

## Simulink.CodeImporter.ParseInfo.getFunctions

**Package:** Simulink.CodeImporter

Obtain detailed information regarding functions in custom code

### Syntax

```
fcnobjs = obj.ParseInfo.getFunctions()
fcnobjs = obj.ParseInfo.getFunctions(fcnlist)
```

### Description

`fcnobjs = obj.ParseInfo.getFunctions()`, where `obj` is an object of class `Simulink.CodeImporter` or `sltest.CodeImporter`, returns an array of objects of class `Simulink.CodeImporter.Function` with detailed information on all Simulink compatible functions in the custom code.

---

**Note** If your code has a function with a pointer output, specify the size of the output by setting the port specification in the returned function object.

---

`fcnobjs = obj.ParseInfo.getFunctions(fcnlist)` returns an array of objects of class `Simulink.CodeImporter.Function` with detailed information on the custom code functions specified in `fcnlist`.

### Examples

#### Get Custom Code Function Information

Specify and parse custom code, then query information regarding custom code functions.

```
obj = Simulink.CodeImporter;

%% Set library file name and output folder
obj.LibraryFileName = "pumpController";
obj.OutputFolder = ".";

%% Set the custom code to import
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = [".include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];

%% Parse code
obj.parse;
parseobj = obj.ParseInfo

ans =

 ParseInfo with properties:
```

```

 Success: 1
 AvailableFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
 EntryFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
 AvailableTypes: "pump_control_bus"
 Errors: []

fcnobjs = parseobj.getFunctions()
fcnobjs =

 1×3 Function array with properties:

 Name
 CPrototype
 PortSpecification
 IsEntry
 IsDefined
 IsStub
 ArrayLayout
 IsDeterministic

>> fcnobjs(1)
ans =

 Function with properties:

 Name: "Controller"
 CPrototype: "pump_control_bus Controller(real_T Tset, real_T Troom_in);"
 PortSpecification: [1×1 Simulink.CodeImporter.SimulinkPortSpecification]
 IsEntry: 1
 IsDefined: 1
 IsStub: 0
 ArrayLayout: NotSpecified
 IsDeterministic: 0

```

## Input Arguments

### **fcnlist** — Names of functions

cell array of character vectors | string array

Names of functions in custom code about which to obtain information, specified as a cell array of character vectors or a string array. **fcnlist** must be limited to names contained in `obj.ParseInfo.AvailableFunctions`, that is, functions compatible with Simulink in the specified custom code.

Data Types: cell array of character vectors | string array

## Output Arguments

### **fcnobjs** — Information about functions in custom code

array of `Simulink.CodeImporter.Function` objects

Information about functions in custom code, returned as an array of `Simulink.CodeImporter.Function` objects, where each object corresponds to one function. Each

object includes the function name, C prototype, port specification, whether function is an entry-point function, and whether function is defined in the custom code. See `Simulink.CodeImporter.Function`.

## **Version History**

## **See Also**

`Simulink.CodeImporter.ParseInfo` | `Simulink.CodeImporter`

# Simulink.CodeImporter.SimulinkPortSpecification class

**Package:** Simulink.CodeImporter

Configure port specification for imported custom code

## Description

Configure port specification for custom code function arguments imported as C Caller blocks via `Simulink.CodeImporter` or `sltest.CodeImporter` class instances, that is, configure how C/C++ interfaces map to Simulink interfaces for custom code functions.

This class is analogous to the `FunctionPortSpecification` class that is used to configure C Caller block properties outside the context of the Simulink Code Importer. The properties and methods of this class behave similarly to the like-named properties and methods of the `FunctionPortSpecification` class.

The `SimulinkPortSpecification` class is a handle class.

## Creation

One or more objects of this class are automatically created when you invoke the `getFunctions` method of an object of class `Simulink.CodeImporter.ParseInfo`. One `Simulink.CodeImporter.SimulinkPortSpecification` object is created for each function in the parsed custom code for which `getFunctions` is invoked as the `PortSpecification` property of the `Function` object corresponding to that function. Do not create an object of class `Simulink.CodeImporter.SimulinkPortSpecification` directly.

## Properties

### **InputArguments — Port specification for input arguments**

`FunctionArgument` object

Port specification for input arguments, specified as a `FunctionArgument` Object.

### **ReturnArgument — Port specification for function return argument**

`FunctionArgument` object | scalar

Port specification for function return argument, specified as a scalar or an empty `FunctionArgument` Object.

### **GlobalArguments — Port specification for custom code global variables used as function arguments**

`FunctionArgument` object | scalar

Port specification for custom code global variables used as function arguments, specified as a scalar or an empty `FunctionArgument` Object.

## Methods

### Public Methods

`getGlobalArg` Get an object definition of a global variable in a C Caller block

## Examples

### Configure Port Specifications for Custom Code Library Blocks

Specify and parse custom code, then customize port specification before importing into Simulink.

```
%% Create code importer object
obj = Simulink.CodeImporter;

%% Set library file name and output folder
obj.LibraryFileName = "pumpController";
obj.OutputFolder = ".";

%% Set the custom code to import
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = ["/include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];

%% Parse custom code and configure function
obj.parse();
fcn = obj.ParseInfo.getFunctions("Controller");
fcn.PortSpecification.ReturnArgument.Label = "control_out";

fcn.PortSpecification.ReturnArgument

ans =

 FunctionArgument with properties:

 Name: 'out'
 PortNumber: 1
 Size: '1'
 Type: 'Bus: pump_control_bus'
 Label: 'control_out'
 Scope: 'Output'
```

## Version History

Introduced in R2021a

# getGlobalArg

**Class:** Simulink.CodeImporter.SimulinkPortSpecification

**Package:** Simulink.CodeImporter

Get an object definition of a global variable in a C Caller block

## Syntax

```
output_args = getGlobalArg(input_args,Name,Value)
```

## Description

`output_args = getGlobalArg(input_args,Name,Value)` <verb phrase> with additional options specified by one or more `Name,Value` pair arguments.

## Input Arguments

**input\_args** —  
(default) |

Example:

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `string` | `struct` | `table` | `cell` | `function_handle` | `categorical` | `datetime` | `duration` | `calendarDuration` | `fi`  
Complex Number Support: Yes

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, . . . ,NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example:

**Name** —  
(default) |

Example:

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `string` | `struct` | `table` | `cell` | `function_handle` | `categorical` | `datetime` | `duration` | `calendarDuration` | `fi`  
Complex Number Support: Yes

# Simulink.data.adapters.BaseMatlabFileAdapter class

**Package:** Simulink.data.adapters

Base class used to define file adapter for reading custom file formats

## Description

The `Simulink.data.adapters.BaseMatlabFileAdapter` class is the base class for custom file adapters that the `loadVariablesFromExternalSource` function uses to load variables from an external source file into a `Simulink.SimulationInput` object. Subclass the `Simulink.data.adapters.BaseMatlabFileAdapter` class to specify how to load data from your custom external data source.

For an example of how to write, test, and register a custom file adapter, see “Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”.

For an example of how to use a custom file adapter, see `loadVariablesFromExternalSource`.

The `Simulink.data.adapters.BaseMatlabFileAdapter` class is a handle class.

## Class Attributes

|                  |      |
|------------------|------|
| Abstract         | true |
| HandleCompatible | true |

For information on class attributes, see “Class Attributes”.

## Properties

### section — Section of external file

adapter name (default) | character array | string

Section of the external file, specified as a character array.

Example: 'tireManufacturer'

### source — External source file

" (default) | character array

External source file, specified as a character array.

Example: 'Tires.xls'

## Methods

# close

**Class:** Simulink.data.adapters.BaseMatlabFileAdapter

**Package:** Simulink.data.adapters

Code that executes when connection to external file is closed

## Syntax

```
close(adapterObj)
```

## Description

`close(adapterObj)` executes when the connection to an external source file is closed.

Custom file adapters must define behavior for the `getAdapterName`, `getSupportedExtensions`, and `getData` methods. In addition, you can choose to override the `isSourceValid`, `supportsReading`, `getSectionNames`, `getCurrentChecksum`, `open`, and `close` methods.

## Input Arguments

### **adapterObj** — Custom file adapter

Simulink.data.adapters.BaseMatlabFileAdapter subclass object

Custom file adapter, specified as an object of a class that derives from the Simulink.data.adapters.BaseMatlabFileAdapter base class.

Example: myCustomFileAdapter

## Version History

Introduced in R2022b

## See Also

`getAdapterName` | `getCurrentChecksum` | `getData` | `getSectionNames` | `getSupportedExtensions` | `isSourceValid` | `open` | `supportsReading`

## Topics

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

## getAdapterName

**Class:** Simulink.data.adapters.BaseMatlabFileAdapter

**Package:** Simulink.data.adapters

Return display name for file adapter

### Syntax

```
dispName = getAdapterName(adapterObj)
```

### Description

`dispName = getAdapterName(adapterObj)` returns the display name of the file adapter. This name can be used by Simulink to display available adapters or used in an error message.

Custom file adapters must define behavior for the `getAdapterName`, `getSupportedExtensions`, and `getData` methods. In addition, you can choose to override the `isSourceValid`, `supportsReading`, `getSectionNames`, `getCurrentChecksum`, `open`, and `close` methods.

### Input Arguments

#### **adapterObj** — Custom file adapter

Simulink.data.adapters.BaseMatlabFileAdapter subclass object

Custom file adapter, specified as an object of a class that derives from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class.

Example: `myCustomFileAdapter`

### Output Arguments

#### **dispName** — Display name of custom file adapter

character array

Display name of the custom file adapter, returned as a character array.

### Attributes

Abstract true

To learn about attributes of methods, see [Method Attributes](#).

### Examples

#### **Get Display Name for Custom File Adapter**

Write the function definition for the `getAdapterName` method to return the display name for your custom file adapter. Specify code for the `getAdapterName` method in the class definition file.

In this example, the `getAdapterName` method returns the display name for an adapter that can read data from an XML file.

```
function name = getAdapterName(adapterObj)
 name = 'XML Adapter';
end
```

## Version History

Introduced in R2022b

### See Also

### Topics

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

## getCurrentChecksum

**Class:** Simulink.data.adapters.BaseMatlabFileAdapter

**Package:** Simulink.data.adapters

Return marker for identifying last change to external file

### Syntax

```
currentChecksum = getCurrentChecksum(adapterObj)
```

### Description

`currentChecksum = getCurrentChecksum(adapterObj)` returns a marker for identifying the last change to the external source file. The default implementation returns the timestamp for the last modified date of the file. The cache uses this method to determine if the adapter needs to get updates from the external file.

Custom file adapters must define behavior for the `getAdapterName`, `getSupportedExtensions`, and `getData` methods. In addition, you can choose to override the `isSourceValid`, `supportsReading`, `getSectionNames`, `getCurrentChecksum`, `open`, and `close` methods.

### Input Arguments

**adapterObj** — Custom file adapter

Simulink.data.adapters.BaseMatlabFileAdapter subclass object

Custom file adapter, specified as an object of a class that derives from the Simulink.data.adapters.BaseMatlabFileAdapter base class.

Example: myCustomFileAdapter

### Output Arguments

**currentChecksum** — Current checksum for external file

string | character array

Current checksum for the external file, returned as a string or character array.

## Version History

Introduced in R2022b

### See Also

`close` | `getAdapterName` | `getData` | `getSectionNames` | `getSupportedExtensions` | `isSourceValid` | `open` | `supportsReading`

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

# getData

Read external file data into data source workspace

## Syntax

```
diagnostic = getData(adapterObj, sourceWorkspace, prevChecksum, diagnostic)
```

## Description

`diagnostic = getData(adapterObj, sourceWorkspace, prevChecksum, diagnostic)` populates the data from the external source file into a data source workspace.

Custom file adapters must define behavior for the `getAdapterName`, `getSupportedExtensions`, and `getData` methods. In addition, you can choose to override the `isSourceValid`, `supportsReading`, `getSectionNames`, `open`, and `close` methods.

## Input Arguments

### **adapterObj** — Custom file adapter

`Simulink.data.adapters.BaseMatlabFileAdapter` subclass object

Custom file adapter, specified as an object of a class that derives from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class.

Example: `myCustomFileAdapter`

### **sourceWorkspace** — Data source workspace

`Simulink.data.DataSourceWorkspace` object

Workspace that contains the data from an external data source, specified as a `Simulink.data.DataSourceWorkspace` object.

### **prevChecksum** — Previous checksum value

character array | string

Previous checksum value, specified as a character vector or string. By default, the value is the timestamp for the last modified date of the external source file.

### **diagnostic** — Diagnostic information

structure

Diagnostic information from the adapter, specified as a structure. Specify the error information that your `getData` method returns by setting the fields of the empty `diagnostic` structure that Simulink passes in to the method. The structure has these fields.

| Field             | Description                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AdapterDiagnostic | Type of error, specified as an enumeration value from the enumeration class <code>Simulink.data.adapters.AdapterError</code> . These are the possible enumeration values. <ul style="list-style-type: none"> <li>• NoDiagnostic (default)</li> <li>• GenericFailure</li> <li>• HardError</li> <li>• Inaccessible</li> <li>• AmbiguousSource</li> <li>• NoPermission</li> <li>• UnrecognizedFormat</li> <li>• Unsupported</li> </ul> |
| DiagnosticMessage | Message returned as the error text, specified as a string. When <code>AdapterDiagnostic</code> is set to <code>NoDiagnostic</code> , the value is an empty string.                                                                                                                                                                                                                                                                  |

Data Types: struct

## Output Arguments

### **diagnostic** – Diagnostic information

structure

Diagnostic information from the adapter, specified as a structure. For more information, see the `diagnostic` input argument.

## Attributes

Abstract true

To learn about attributes of methods, see [Method Attributes](#).

## Examples

### **Load Data From External Source File into Workspace**

Write the function definition for the `getData` method to populate the data from the external source file into the data source workspace.

In this example, the `getData` method reads data from an XML file with a format similar to the following.

```
<customerData>
<x>10</x>
<y>15</y>
</customerData>
```

```
function diagnostic = getData(adapterObj, sourceWorkspace, previousChecksum, diagnostic)
 % Each time getData is called on the same source, sourceWorkspace is the same as
 % the last time it was called. Clear it to make sure no old variables exist.
 clearAllVariables(sourceWorkspace);
 dom = xmlread(adapterObj.source);
 tree = dom.getFirstChild;
 if tree.hasChildNodes
 item = tree.getFirstChild;
 while ~isempty(item)
 name = item.getNodeName.toCharArray';
 if isvarname(name)
 value = item.getTextContent;
 setVariable(sourceWorkspace, name, str2num(value));
 end
 item = item.getNextSibling;
 end
 end
end
```

### Topics

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

## getSectionNames

**Class:** Simulink.data.adapters.BaseMatlabFileAdapter

**Package:** Simulink.data.adapters

Return logical sections for external file

### Syntax

```
sections = getSectionNames(adapterObj,sourceFile)
```

### Description

`sections = getSectionNames(adapterObj,sourceFile)` returns the sections for the external source file. The default implementation returns the adapter name. You can override this method to define logical sections for the data in the external file.

Custom file adapters must define behavior for the `getAdapterName`, `getSupportedExtensions`, and `getData` methods. In addition, you can choose to override the `isSourceValid`, `supportsReading`, `getSectionNames`, `getCurrentChecksum`, `open`, and `close` methods.

### Input Arguments

**adapterObj — Custom file adapter**

Simulink.data.adapters.BaseMatlabFileAdapter subclass object

Custom file adapter, specified as an object of a class that derives from the Simulink.data.adapters.BaseMatlabFileAdapter base class.

Example: myCustomFileAdapter

**sourceFile — External source file**

character array | string

External source file, specified as a character array or string.

### Output Arguments

**sections — Section names for the external file**

array of strings | cell array of character vectors

Section names for the external file, returned as an array of strings or a cell array of character vectors.

## Version History

**Introduced in R2022b**

**See Also**

close | getAdapterName | getCurrentChecksum | getData | getSupportedExtensions | isSourceValid | open | supportsReading

**Topics**

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

## getSupportedExtensions

**Class:** Simulink.data.adapters.BaseMatlabFileAdapter

**Package:** Simulink.data.adapters

Return supported file extensions for file adapter

### Syntax

```
fileExtensions = getSupportedExtensions(adapterObj)
```

### Description

`fileExtensions = getSupportedExtensions(adapterObj)` returns the file extensions that are supported by the file adapter.

Custom file adapters must define behavior for the `getAdapterName`, `getSupportedExtensions`, and `getData` methods. In addition, you can choose to override the `isSourceValid`, `supportsReading`, `getSectionNames`, `open`, and `close` methods.

### Input Arguments

#### **adapterObj** — Custom file adapter

Simulink.data.adapters.BaseMatlabFileAdapter subclass object

Custom file adapter, specified as an object of a class that derives from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class.

Example: `myCustomFileAdapter`

### Output Arguments

#### **fileExtensions** — Supported file extensions for adapter

array of strings | cell array of character vectors

List of supported file extensions for the custom file adapter, returned as a string array or cell array of character vectors.

### Attributes

Abstract true

To learn about attributes of methods, see [Method Attributes](#).

### Examples

## Get Supported File Extensions for Custom File Adapter

Write the function definition for the `getSupportedExtensions` method to return the list of supported file extensions for your custom adapter. Simulink uses this function to determine if the adapter can be used to load data from a particular external source file.

In this example, the `getSupportedExtensions` method for an XML file adapter returns only XML in its list of supported extensions.

```
function fileExtensions = getSupportedExtensions(adapterObj)
 fileExtensions = {'.XML'};
end
```

## Version History

Introduced in R2022b

### Topics

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

## isSourceValid

**Class:** Simulink.data.adapters.BaseMatlabFileAdapter

**Package:** Simulink.data.adapters

Validates external file

### Syntax

```
tf = isSourceValid(adapterObj,sourceFile)
```

### Description

`tf = isSourceValid(adapterObj,sourceFile)` validates the external source file. The default implementation validates that the source file exists.

Custom file adapters must define behavior for the `getAdapterName`, `getSupportedExtensions`, and `getData` methods. In addition, you can choose to override the `isSourceValid`, `supportsReading`, `getSectionNames`, `getCurrentChecksum`, `open`, and `close` methods.

### Input Arguments

**adapterObj — Custom file adapter**

`Simulink.data.adapters.BaseMatlabFileAdapter` subclass object

Custom file adapter, specified as an object of a class that derives from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class.

Example: `myCustomFileAdapter`

**sourceFile — External source file**

character array | string

External source file, specified as a character array or string.

### Output Arguments

**tf — True or false result**

1 | 0 | logical array

True or false result, returned as a 1 or 0 of data type `logical` or an array of logical values.

## Version History

**Introduced in R2022b**

### See Also

`close` | `getAdapterName` | `getCurrentChecksum` | `getData` | `getSectionNames` | `getSupportedExtensions` | `open` | `supportsReading`

**Topics**

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

## open

**Class:** Simulink.data.adapters.BaseMatlabFileAdapter

**Package:** Simulink.data.adapters

Code that executes when connection to external file is opened

### Syntax

```
open(adapterObj, sourceFile, section)
```

### Description

`open(adapterObj, sourceFile, section)` executes when the connection to an external source file is first opened. By default, the source file and section name are saved as the properties `source` and `section` in the adapter object.

Custom file adapters must define behavior for the `getAdapterName`, `getSupportedExtensions`, and `getData` methods. In addition, you can choose to override the `isSourceValid`, `supportsReading`, `getSectionNames`, `getCurrentChecksum`, `open`, and `close` methods.

### Input Arguments

#### **adapterObj** — Custom file adapter

Simulink.data.adapters.BaseMatlabFileAdapter subclass object

Custom file adapter, specified as an object of a class that derives from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class.

Example: `myCustomFileAdapter`

#### **sourceFile** — External source file

character array | string

External source file, specified as a character array or string.

#### **section** — Section of external source file

character array | string

Section of the external source file, specified as a character array or string. The section name must be one of the sections returned by the `getSectionNames` method. The default implementation of the `getSectionNames` method returns the adapter name.

## Version History

**Introduced in R2022b**

### See Also

`close` | `getAdapterName` | `getCurrentChecksum` | `getData` | `getSectionNames` | `getSupportedExtensions` | `isSourceValid` | `supportsReading`

**Topics**

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

## supportsReading

**Class:** Simulink.data.adapters.BaseMatlabFileAdapter

**Package:** Simulink.data.adapters

Check if external file has read attributes

### Syntax

```
tf = supportsReading(adapterObj,sourceFile)
```

### Description

`tf = supportsReading(adapterObj,sourceFile)` checks if the external source file has read attributes. The default implementation uses the `isSourceValid` method to check that the file exists and is in the correct format, then checks that the file has read attributes. You can override this method so that multiple adapters can read the same file type but with different headers.

Custom file adapters must define behavior for the `getAdapterName`, `getSupportedExtensions`, and `getData` methods. In addition, you can choose to override the `isSourceValid`, `supportsReading`, `getSectionNames`, `getCurrentChecksum`, `open`, and `close` methods.

### Input Arguments

#### **adapterObj** — Custom file adapter

Simulink.data.adapters.BaseMatlabFileAdapter subclass object

Custom file adapter, specified as an object of a class that derives from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class.

Example: `myCustomFileAdapter`

#### **sourceFile** — External source file

character array | string

External source file, specified as a character array or string.

### Output Arguments

#### **tf** — True or false result

1 | 0 | logical array

True or false result, returned as a 1 or 0 of data type `logical` or an array of logical values.

### Examples

#### **Check That External XML File Has Correct Header Information**

Write the function definition for the `supportsReading` method to determine if the external source file supports reading.

In this example, the `supportsReading` method reads data from an XML file with a format similar to the following.

```
<customerData>
<x>10</x>
<y>15</y>
</customerData>
```

The method checks that XML file has read attributes and that it contains the appropriate header information for this adapter.

```
function retVal = supportsReading(adapterObj, source)
 retVal = false;
 % Call base class method to ensure file has read attributes
 if supportsReading@Simulink.data.adapters.BaseMatlabFileAdapter(adapterObj, source)
 dom = xmlread(source);
 tree = dom.getFirstChild;
 if strcmp(tree.getNodeName, "customerData")
 retVal = true;
 end
 end
end
```

## Simulink.dialog.Button class

**Package:** Simulink.dialog

Create a button dialog control

### Description

Use an instance of Simulink.dialog.Button class to add a button dialog control.

### Properties

#### Name

Uniquely identifies the dialog control and is a required field.

**Type:** character vector

#### Prompt

Specifies the text displayed on the button dialog control.

**Type:** character vector

**Default:** empty

#### FilePath

Specifies the path to the image file to be shown on the button dialog control.

**Type:** character vector

**Default:** empty

#### Callback

Specifies the MATLAB command (s) to be executed when the dialog control is invoked.

**Type:** character vector

**Default:** empty

#### Row

Specifies whether dialog control is placed on the current row or on a new row.

**Type:** character vector

**Value:** 'current' | 'new'

**Default:** 'current'

**Enabled**

Indicates whether container is active on the mask dialog box.

**Type:** boolean

**Value:** 'on' | 'off'

**Default:** 'on'

**Visible**

Indicates whether container is displayed on the mask dialog box.

**Type:** boolean

**Value:** 'on' | 'off'

**Default:** 'on'

**See Also**

`Simulink.dialog.Control` | “Create Block Masks”

## Simulink.dialog.Container class

**Package:** Simulink.dialog

Create instances of a container dialog control

### Description

Use an instance of Simulink.dialog.Container class to add container type dialog control.

### Properties

#### Name

Uniquely identifies the container dialog control and is a required field.

**Type:** character vector

#### Enabled

Indicates whether container is active on the mask dialog box.

**Type:** boolean

**Value:** 'on' | 'off'

**Default:** 'on'

#### Visible

Indicates whether container is displayed on the mask dialog box.

**Type:** boolean

**Value:** 'on' | 'off'

**Default:** 'on'

#### AlignPrompts

Allows you to align the parameters vertically on the mask dialog box.

**Type:** boolean

**Value:** 'on' | 'off'

**Default:** 'off'

#### DialogControls

Specifies the child dialog controls contained in the container.

**Type:** Simulink.dialog.Control

**Default:** Empty array

## Methods

<code>addDialogControl</code>	Add dialog control elements to mask dialog box
<code>getDialogControl</code>	Search for a specific dialog control on the mask
<code>removeDialogControl</code>	Remove dialog control element from mask dialog box

# addDialogControl

**Class:** Simulink.dialog.Container

**Package:** Simulink.dialog

Add dialog control elements to mask dialog box

## Syntax

```
successIndicator = maskObj.addDialogControl(controlType,controlIdentifier)
successIndicator = maskObj.addDialogControl(Name,Value)
```

## Description

`successIndicator = maskObj.addDialogControl(controlType,controlIdentifier)` adds dialog control elements like text, hyperlinks, or tabs to mask dialog box. First get the mask object and assign it to the variable `maskObj`

`successIndicator = maskObj.addDialogControl(Name,Value)` specifies the `Name` and `Value` arguments for an element on the mask dialog box. You can specify multiple `Name-Value` pairs.

## Input Arguments

### **controlType** — Value type of dialog control element

character vector

Type of dialog control element, specified

- 'panel'
- 'group'
- 'tabcontainer'
- 'tab'
- 'collapsiblepanel'
- 'text'
- 'image'
- 'hyperlink'
- 'pushbutton'

### **controlIdentifier** — Unique identifier for the element

character vector

Specifies the programmatic identifier for the element of mask dialog box. Use a name that is unique and does not have space between words. For more information, see “Variable Names”.

### **Name-Value Pair Arguments**

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes ( ' ') and is case-sensitive.

You can specify several name and value pair arguments in any order as Name1, Value1, . . . , NameN, ValueN.

**Type**

Type of control that is used to specify the value of this dialog control element. Type is a required argument. The permitted values are 'panel', 'group', 'tabcontainer', 'tab', 'collapsiblepanel', 'text', 'image', 'hyperlink', and 'pushbutton'. If the parent dialog control type is 'tabcontainer', the child dialog control must be 'tab'.

**Name**

The identifier of the dialog control element. Name is a required argument. This field is available for all dialog control types.

**Prompt**

Text that is displayed in the dialog control element on the Mask dialog box. This field is available for all except for panel and image dialog control types.

**Default:** empty

**Enabled**

Option to specify whether you can set value for the dialog control element. This field is available for all dialog control types.

**Default:** 'on'

**Visible**

Option to set whether the dialog control element is hidden or visible to the user. This field is available for all dialog control types.

**Default:** 'on'

**Callback**

Container for MATLAB code that executes when you edit the dialog control element and click **Apply**. This field is available only for the hyperlink and push button dialog control types.

**Default:** empty

**Row**

Option to set whether the dialog control is placed in the new row or the same row. This field is available for all dialog control types.

**Default:** empty

**FilePath**

Contains the path to an image file. This field is available for image, and push button dialog control types.

**Default:** empty

## Container

Option to specifies a container for the child dialog control. The permitted values are the names of 'panel', 'group', and 'tab' dialog controls.

## Examples

### Add Dialog Control Elements to Mask Dialog Box

Get mask object and add dialog control element to it.

```
% Get mask object on model Engine
maskObj = Simulink.Mask.get('Engine/Gain');

% Add hyperlink to mask dialog box

maskLink = maskObj.addDialogControl('hyperlink','link_1');
maskLink.Prompt = 'Mathworks Home Page';
maskLink.Callback = 'web(''www.mathworks.com'')'

% Alternative method to add hyperlink

maskLink = maskObj.addDialogControl('hyperlink','link_2');
maskLink.Prompt = 'www.mathworks.com';

% Add text to mask dialog box

maskText = maskObj.addDialogControl('text','text_tag');
maskText.Prompt = 'Enable range checking';

% Add button to mask dialog box

maskButton = maskObj.addDialogControl('pushbutton','button_tag');
maskButton.Prompt = 'Compute';
```

### Add Dialog Control Elements to Mask Dialog Box Tabs

Create tabs on the mask dialog box and add elements to these tabs.

```
% Get mask object on a block named 'GainBlock'
maskObj = Simulink.Mask.get('GainBlock/Gain');

% Create a tab container

maskObj.addDialogControl('tabcontainer','allTabs');
tabs = maskObj.getDialogControl('allTabs');

% Create tabs and name them

maskTab1 = tabs.addDialogControl('tab','First');
maskTab1.Prompt = 'First tab';
```

```
maskTab2 = tabs.addDialogControl('tab','Second');
maskTab2.Prompt = 'Second tab';

% Add elements to one of the tabs

firstTab = tabs.getDialogControl('First');
firstTab.addDialogControl('text','textOnFirst');
firstTab.getDialogControl('textOnFirst').Prompt = 'Tab one';
```

### Add Dialog Control Element Using Name-Value Pair

Add dialog control element and specify values for it

```
% Get mask object on model Engine

maskObj = Simulink.Mask.get('Engine/Gain');

% Add a dialog box and specify values for it

maskDialog = maskObj.addDialogControl('Type','text',...
'Prompt','hello','Visible','off');
```

## Version History

Introduced in R2014a

### See Also

[Simulink.dialog.Container](#) | “Create Block Masks”

## getDialogControl

**Class:** Simulink.dialog.Container

**Package:** Simulink.dialog

Search for a specific dialog control on the mask

### Syntax

```
[control, phandle] = handle.getDialogControl(controlIdentifier)
```

### Description

[control, phandle] = handle.getDialogControl(controlIdentifier), search for a specific child dialog control recursively on the mask dialog box.

### Input Arguments

**controlIdentifier**

Name of the dialog control being searched on the mask dialog box.

**Default:**

### Output Arguments

**control**

Target dialog control being searched on the mask dialog box.

**phandle**

Parent of the dialog control being searched mask dialog box.

### Examples

#### Find a dialog control

Find a text dialog control on the mask dialog box. `maskObj` is the handle to the mask object. The `getDialogControl` method returns the handle to the dialog control (`hdlgctrl`) and handle to the parent dialog control (`phandle`).

```
[hdlgctrl, phandle] = maskObj.getDialogControl('txt_var')
```

### See Also

Simulink.dialog.Container | “Create Block Masks”

# removeDialogControl

**Class:** Simulink.dialog.Container

**Package:** Simulink.dialog

Remove dialog control element from mask dialog box

## Syntax

```
successIndicator = maskVariable.removeDialogControl(controlIdentifier)
```

## Description

`successIndicator = maskVariable.removeDialogControl(controlIdentifier)` removes dialog control element, specified by `controlIdentifier`, like text, hyperlinks, or tabs from a mask dialog box. First get the mask object and assign it to the variable `maskVariable`.

Successful removal of a dialog control element returns a Boolean value of 1.

## Input Arguments

**controlIdentifier** — Unique identifier for the element

character vector

Programmatic identifier for the dialog control element of mask dialog box, specified as a character vector.

## Examples

### Remove Dialog Control Element from Mask Dialog Box

```
% Get mask object on the Gain block in the model Engine.
```

```
maskObj = Simulink.Mask.get('Engine/Gain');
```

```
% Remove element named AllTab from mask dialog box.
```

```
maskTab = maskObj.removeDialogControl('AllTab');
```

## Version History

**Introduced in R2013b**

# Simulink.dialog.Group class

**Package:** Simulink.dialog

Create an instance of a group dialog control

## Description

Use an instance of Simulink.dialog.Group class to create an instance of group dialog control.

## Properties

### Name

Uniquely identifies the group dialog control and is a required field.

**Type:** character vector

### Prompt

Specifies the text displayed on the group.

**Type:** character vector

**Default:** Empty character vector

### Row

Specifies whether group is placed on the current row or on a new row.

**Type:** character vector

**Values:** 'current' | 'new'

**Default:** 'new'

### Enabled

Specifies whether group is active on the mask dialog box.

**Type:** boolean

**Values:** 'on' | 'off'

**Default:** 'on'

### Visible

Specifies whether group is displayed on the mask dialog box.

**Type:** boolean

**Values:** 'on' | 'off'

**Default:** 'on'

### **DialogControls**

Specifies the child dialog controls contained in the group.

**Type:** Simulink.dialog.Control

**Default:** Empty array

### **Methods**

addDialogControl	Add dialog control elements to mask dialog box
getDialogControl	Search for a specific dialog control on the mask
removeDialogControl	Remove dialog control element from mask dialog box

# Simulink.dialog.Hyperlink class

**Package:** Simulink.dialog

Create a hyperlink dialog control

## Description

Use an instance of `Simulink.dialog.Hyperlink` class to add a hyperlink dialog control.

## Properties

### Name

Uniquely identifies the dialog control and is a required field.

**Type:** character vector

### Prompt

Specifies the text displayed on the hyperlink.

**Type:** character vector

**Default:** empty

### Callback

Specifies the MATLAB command (s) to be executed when the dialog control is invoked.

**Type:** character vector

**Default:** empty

### Row

Specifies whether hyperlink is placed on the current row or on a new row.

**Type:** character vector

**Value:** 'current' | 'new'

**Default:** 'new'

### Enabled

Indicates whether hyperlink is active on the mask dialog box.

**Type:** boolean

**Value:** 'on' | 'off'

**Default:** 'on'

**Visible**

Indicates whether hyperlink is displayed on the mask dialog box.

**Type:** boolean

**Value:** 'on' | 'off'

**Default:** 'on'

# Simulink.dialog.Image class

**Package:** Simulink.dialog

Create an image dialog control

## Description

Use an instance of `Simulink.dialog.Image` class to add an image dialog control.

## Properties

### Name

Uniquely identifies the dialog control and is a required field.

**Type:** character vector

### FilePath

Specifies the path to the image file to be displayed on the dialog box.

**Type:** character vector

**Default:** empty

### Row

Specifies whether dialog control is placed on the current row or on a new row.

**Type:** character vector

**Value:** 'current' | 'new'

**Default:** 'new'

### Enabled

Indicates whether image is active on the mask dialog box.

**Type:** boolean

**Value:** 'on' | 'off'

**Default:** 'on'

### Visible

Indicates whether image is displayed on the mask dialog box.

**Type:** boolean

**Value:** 'on' | 'off'

**Default:** 'on'

# Simulink.dialog.ListBoxControl class

**Package:** Simulink.dialog

Control list box programmatically

## Description

Use an instance of `Simulink.dialog.ListBoxControl` class to perform the following operations:

- Get selected items from the list box
- Set selected items in the list box

## Properties

### Name

Uniquely identifies the dialog control and is a required field.

**Type:** character vector

### Prompt

Specifies the text displayed on the button dialog control.

**Type:** character vector

**Default:** empty

### Type Options

Specifies the options shown in the list box.

**Type:** cell array

**Default:** empty

### Callback

Specifies the MATLAB code to execute when the dialog control is invoked.

**Type:** character vector

**Default:** empty

### Row

Specifies whether dialog control is placed on the current row or on a new row.

**Type:** character vector

**Value:** 'current' | 'new'

**Default:** 'current'

### **Enabled**

Indicates whether container is active on the mask dialog box.

**Type:** boolean

**Value:** 'on' | 'off'

**Default:** 'on'

### **Visible**

Indicates whether container is displayed on the mask dialog box.

**Type:** boolean

**Value:** 'on' | 'off'

**Default:** 'on'

### **Multiselect**

Indicates whether container is enabled for multiple selection.

**Type:** boolean

**Value:** 'on' | 'off'

**Default:** 'on'

# getSelectedItems

**Class:** Simulink.dialog.ListBoxControl

**Package:** Simulink.dialog

Get the values of selected items from a list box

## Syntax

```
getItems = listBoxControl.getSelectedItems
```

## Description

`getItems = listBoxControl.getSelectedItems` gets the information of the selected items from the list box.

## Output Arguments

**getItems** — value of selected items

cell array

Value of the selected items, returned as a cell array.

## Examples

```
% Get block mask handle
maskObj = Simulink.Mask.get(gcb);

% Get listbox handle
listBoxControl = maskObj.getDialogControl('Control2');

% Get selected items
getItems = listBoxControl.getSelectedItems;

getItems =
 1x2 cell array
 {'Hello', 'World'}
```

## Version History

Introduced in R2019a

## See Also

Simulink.Mask | “Create Block Masks”

## setSelectedItems

**Class:** Simulink.dialog.ListBoxControl

**Package:** Simulink.dialog

Set values for a list box

### Syntax

```
setItems = listBoxControl.setSelectedItems({string1,'string2',...})
```

### Description

`setItems = listBoxControl.setSelectedItems({string1,'string2',...})` sets the values for the selected items in the list box.

### Input Arguments

#### **listControl** — List box handle

table object

Handle to the list box, specified as an object. You can use the `getDialogControl` command to get the list box handle. For more information, see `getDialogControl`.

For example, `listboxControl = maskObj.getDialogControl('listboxname')`. Here, `maskObj` is the mask object and `listboxname` is the name of the list box.

Data Types: cell array

#### **string1** — value to be set

string

Value to be set for selected items in the list box

For example, 'Hello'.

### Examples

```
% Get block mask handle
maskObj = Simulink.Mask.get(gcf);

% Get listbox handle
listboxControl = maskObj.getDialogControl('Control2');

% Set selected items
listboxControl.setSelectedItems({'Hello','World'});
```

## Version History

## Simulink.dialog.LookupTableControl class

**Package:** Simulink.dialog

Control mask lookup tables programmatically

### Description

Create an instance of `Simulink.dialog.LookupTableControl` to add values for table and breakpoints data in the lookup table control.

### Properties

#### Public Properties

##### Name — Unique name

(default) | empty

Specifies unique name for the LUT control.

Data Types: `String`

##### Prompt — Display text

(default) | empty

Specifies the text displayed on the lookup table control.

Data Types: `String`

##### Row — Placement of the LUT control

(default) | new

Specifies whether dialog control is placed on the current row or on a new row.

Data Types: `Character vector`

##### Enabled — Is LUT control active

(default) | on

Indicates whether lookup table control is active on the mask dialog box.

Data Types: `Logical`

##### Visible — Visibility of LUT control on mask dialog

(default) | on

Indicates whether lookup table control is displayed on the mask dialog box.

Data Types: `Logical`

##### HorizontalStretch — Resizing of LUT control along the dialog

(default) | on

Indicates if lookup table control gets resized along with the dialog.

Data Types: Logical

### **Tooltip — Tooltip text**

(default) | empty

Tool tip text for the lookup table control.

Data Types: String

### **Table — Table data class**

(default) | empty

A class that holds the properties of table data.

Data Types: String

### **Breakpoints — Breakpoint data set class**

(default) | empty

A class that holds the properties of an array of breakpoint data.

Data Types: String

### **LookupTableObject — Name of the object holding data**

(default) | empty

Specifies the name of the Simulink.LookupTable object in the base workspace or model workspace that holds the table and breakpoint data.

Data Types: String

### **DataSpecification — Value array or table object**

(default) | empty

Indicates if the table and breakpoints data is specified explicitly or through a lookup table object.

Data Types: String

## **Examples**

### **Add Table and Breakpoint Data**

```
new_system('LUTexample');
add_block('built-in/subsystem','LUTexample/subsystem');
save_system;
open_system('LUTexample');
maskObj = Simulink.Mask.create(gcf);
maskObj = Simulink.Mask.get(gcf);
bp1 = maskObj.addParameter('Name', 'torque', 'Prompt', 'Torque:', 'Type', 'edit');
bp2 = maskObj.addParameter('Name', 'speed', 'Prompt', 'Engine speed:', 'Type', 'edit');
table = maskObj.addParameter('Name', 'fuelflowtable', 'Prompt', 'Fuel Flow Map:', 'Type', 'edit');
lutControl = maskObj.addDialogControl('Name', 'fuelflowlut', 'Type', 'lookuptablecontrol');
lutControl.Table.Name = 'fuelflowtable';
lutControl.Table.Unit = 'kg/s';
lutControl.Breakpoints(1).Name = 'torque';
lutControl.Breakpoints(1).Unit = 'Nm';
lutControl.Breakpoints(1).FieldName = 'Torque';
```

```
lutControl.Breakpoints(2).Name = 'speed';
lutControl.Breakpoints(2).FieldName = 'Speed';
save_system;
```

## **Version History**

**Introduced in R2021b**

# Simulink.dialog.LookupTableControlbreakpoints class

**Package:** Simulink.dialog

Control breakpoint data set for mask lookup table

## Description

Create an instance of `Simulink.dialog.LookupTableControl.Breakpoints` to specify the properties of the breakpoint data set in the lookup table control. The value of the `Breakpoints` property is an array of `Simulink.dialog.LookupTableControl.Breakpoints` objects. Each embedded object represents one breakpoint set.

## Properties

### Name — Name of the parameter

(default) | empty

Name of the parameter specifying the breakpoint data.

Data Types: `String`

### Units — Units for the breakpoint data

(default) | empty

Specifies the units for the breakpoint data.

Data Types: `String`

### FieldName — Display name

(default) | empty

Specifies the display name for the breakpoint data.

Data Types: `String`

### Min — Minimum value

(default) | empty

Control the minimum value that can be specified for any cell in the table. This is a read only field and cannot be set through lookup table control.

Data Types: `String`

### Max — Maximum value

(default) | empty

Control the maximum value that can be specified for any cell in the table. This is a read only field and cannot be set through lookup table control.

Data Types: `String`

## Examples

### Add Breakpoint Data Set

```
Set breakpoint properties of Dimension 1.
>>lutControl.Breakpoints(1).Name = 'torque';
>>lutControl.Breakpoints(1).Unit = 'Nm';
>>lutControl.Breakpoints(1).FieldName = 'Torque';
```

```
Set Breakpoint properties of Dimension 2
>>lutControl.Breakpoints(2).Name = 'speed';
>>lutControl.Breakpoints(2).Unit = 'rpm';
>>lutControl.Breakpoints(2).FieldName = 'Speed';
```

## Version History

# Simulink.dialog.LookuptableControlTable class

**Package:** Simulink.dialog

Control table data for mask lookup table

## Description

Create an instance of `Simulink.dialog.LookupTableControlTable` to specify the properties of the table data in the lookup table control.

## Properties

### Public Properties

#### **Name — Name of the parameter**

(default) | empty

Name of the parameter specifying the table data.

Data Types: String

#### **Units — Units for table data**

(default) | empty

Specifies the units for the table data.

Data Types: String

#### **FieldName — Display name**

(default) | empty

Specifies the display name for the table data.

Data Types: String

#### **Min — Minimum value**

(default) | empty

Control the minimum value that can be specified for any cell in the table. This is a read only field and cannot be set through lookup table control.

Data Types: String

#### **Max — Maximum value**

(default) | empty

Control the maximum value that can be specified for any cell in the table. This is a read only field and cannot be set through lookup table control.

Data Types: String

## Examples

### Add Table Data

```
>>lutControl.Table.Name = 'fuelflowtable';
>>lutControl.Table.Unit = 'kg/s' ;
>>lutControl.Table.FieldName = 'Fuel Flow';
```

# Simulink.dialog.Panel class

**Package:** Simulink.dialog

Create an instance of a panel dialog control

## Description

Use an instance of `Simulink.dialog.Panel` class to create an instance of panel dialog control.

## Properties

### Name

Uniquely identifies the panel dialog control and is a required field.

**Type:** character vector

### Row

Specifies whether panel is placed on the current row or on a new row.

**Type:** character vector

**Values:** 'current' | 'new'

**Default:** 'new'

### Enabled

Specifies whether panel is active on the mask dialog box.

**Type:** boolean

**Values:** 'on' | 'off'

**Default:** 'on'

### Visible

Specifies whether panel is displayed on the mask dialog box.

**Type:** boolean

**Values:** 'on' | 'off'

**Default:** 'on'

### DialogControls

Specifies the child dialog controls contained in the panel.

**Type:** Simulink.dialog.Control

**Default:** Empty array

## Methods

<code>addDialogControl</code>	Add dialog control elements to mask dialog box
<code>getDialogControl</code>	Search for a specific dialog control on the mask
<code>removeDialogControl</code>	Remove dialog control element from mask dialog box

# Simulink.dialog.parameter.Control class

**Package:** Simulink.dialog.parameter

Create a parameter dialog control

## Description

Use an instance of `Simulink.dialog.parameter.Control` class to add a parameter dialog control.

## Properties

### Name

Uniquely identifies the dialog control element. This is a required field and has the same value as its underlying parameter name.

**Type:** character vector

### Row

Specifies whether the dialog control is placed on the current row or on a new row.

**Type:** character vector

**Value:** 'current' | 'new'

**Default:** 'new'

## See Also

## Simulink.dialog.parameter.CustomTable class

**Package:** Simulink.dialog.parameter

Create custom tables programmatically

### Description

Use an instance of Simulink.dialog.parameter.CustomTable class to perform the following operations:

- Create and remove custom tables
- Insert, remove, and get values of columns.
- Insert, remove, swap, and add rows.

### Methods

addColumn	Add new column in the custom table
addRow	Add a new row in the custom table
getChangedCells	Get all the changed cells of a custom table
getColumn	Get the column properties
getNumberOfColumns	Get value of a table cell
getNumberOfRows	Get the number of rows available in a custom table
getSelectedRows	Get all the selected rows of a custom table
getTableCell	Get the properties of a custom table cell
getValue	Get value of a table cell
insertColumn	Insert a column at a specific position in the custom table
insertRow	Insert a row at a specific position in a custom table
removeColumn	Remove an existing column from a specific position in a custom table
removeRow	Remove an existing row from a specific position in a custom table
setTableCell	Set the properties of a custom table cell
swapRows	Swap two existing rows in a custom table

# addColumn

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Add new column in the custom table

## Syntax

```
tableControl.addColumn(Name, Value)
```

## Description

`tableControl.addColumn(Name, Value)` adds a column with the specified properties in the custom table.

## Input Arguments

### **tableControl** — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: char vector | cell array

Specify optional comma-separated pairs of `Name, Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

## Examples

```
% Get block mask handle.
```

```
maskObj = Simulink.Mask.get(gcb);
```

```
% Get custom table handle.
```

```
tableControl = maskObj.getDialogControl('myTable');
```

```
% Add column.
```

```
tableControl.addColumn('Name', 'HDL Name', 'Type', 'edit');
```

## Version History

Introduced in R2019a

**See Also**

Simulink.Mask | “Create Block Masks”

# addRow

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Add a new row in the custom table

## Syntax

```
NewRow = tableControl.addRow(RowValue)
```

## Description

`NewRow = tableControl.addRow(RowValue)` adds a row with the specified properties in the custom table.

## Input Arguments

### **tableControl** — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: char vector

### **RowValue** — Row Values for each column

table object

Row values specified for the number of columns available. If five values are provided for `RowValue` in a custom table with five columns, one row is added to the table. If 10 row values are added for such a table, then two rows are added.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: char vector | cell array

## Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Add a row with six column values.
tableControl.addRow('sig5', 'Input', 'Inherit', 'Inherit', 'on', 'Inherit');
```

## **Version History**

**Introduced in R2019a**

### **See Also**

# getChangedCells

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Get all the changed cells of a custom table

## Syntax

```
changedCells = tableControl.getChangedCells()
```

## Description

`changedCells = tableControl.getChangedCells()` gets the properties of a cell in the custom table.

## Output Arguments

**changedCells** — Cells in a custom table whose values have been changed

cell array

Shows the changed cells in a custom table.

## Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Get changed cells.
changedCell = tableControl.getChangedCells();

ans =

 1×4 cell array

 {1×2 double} {1×2 double} {1×2 double} {1×2 double}
Output: Cell Array
Input: None
```

## Version History

Introduced in R2019a

## See Also

Simulink.Mask | “Create Block Masks”

## getColumn

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Get the column properties

### Syntax

```
FetchColumn = tableControl.getColumn(column)
```

### Description

`FetchColumn = tableControl.getColumn(column)` fetches the information from the specified column of the custom table.

### Input Arguments

#### **tableControl** — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: integer

#### **columnIndex** — Column Index

string | character array

Index of the column in the custom table.

For example, '4'.

### Output Arguments

#### **fetchcolumn** — Column properties

column object

Column object

### Examples

```
% Get block mask handle.
```

```
maskObj = Simulink.Mask.get(gcb);
```

```
% Get custom table handle.
```

```
tableControl = maskObj.getDialogControl('myTable');
```

```
% Get properties of column 3.
tableControl.getColumn(3);
```

```
ans =
```

```
TableParamColumnInfo with properties:
```

```
 Name: 'Data Type'
 Type: 'popup'
 Enabled: 'on'
TypeOptions: {4x1 cell}
```

## Version History

Introduced in R2019a

## getNumberOfColumns

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Get value of a table cell

### Syntax

```
numberOfColumns = tableControl()
```

### Description

`numberOfColumns = tableControl()` gets the number of columns in a custom table.

### Output Arguments

**numberOfColumns** — Table cell value

integer

Number of columns in the custom table returned as an integer.

### Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcf);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Get cell value.
numberOfColumns = tableControl.getNumberOfColumns();
```

### Version History

**Introduced in R2019a**

### See Also

`Simulink.Mask` | “Create Block Masks”

# getNumberOfRows

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Get the number of rows available in a custom table

## Syntax

```
numberOfRows = tableControl()
```

## Description

`numberOfRows = tableControl()` gets the number of rows in a custom table.

## Output Arguments

**numberOfRows** — Number of Rows

integer

Number of rows in the custom table returned as an integer.

## Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Get number of rows.
numberOfRows = tableControl.getNumberOfRows();
```

## Version History

**Introduced in R2019a**

## See Also

Simulink.Mask | “Create Block Masks”

## getSelectedRows

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Get all the selected rows of a custom table

### Syntax

```
selectedRows = tableControl.getSelectedRows()
```

### Description

`selectedRows = tableControl.getSelectedRows()` fetches the information from the specified column of a custom table.

### Output Arguments

**selectedRows — Row information**

numeric array

Value of the specified rows, returned as a numeric array.

### Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcf);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Get selected rows.
selectedRows = tableControl.getSelectedRows();
```

```
ans =
```

```
 3 4
```

### Version History

Introduced in R2019a

# getTableCell

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Get the properties of a custom table cell

## Syntax

```
tableCell = tableControl.getTableCell([rowIdx colIdx])
```

## Description

`tableCell = tableControl.getTableCell([rowIdx colIdx])` gets the properties of a cell in a custom table.

## Input Arguments

### **tableControl** — Custom table handle

table object

Handle to a custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: numeric array

### **rowIdx** — Row index

Row index number of the custom table cell for which the value is being fetched.

For example, '3'.

### **colIdx** — Column index

Column index number of the custom table cell for which the value is being fetched.

For example, '5'.

## Output Arguments

### **tableCell** — Table cell object

cell object

Properties of the table cell, returned as a cell array.

## Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);
```

```
% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Get cell properties.
tableCell = tableControl.getTableCell([2 2]);

tableCell =

 CustomTableParamCellObject with properties:

 Value: 'Inherit'
 Type: 'popup'
 Enabled: 'off'
 TypeOptions: {4x1 cell}

tableCell.Value = 'Value'
```

## **Version History**

**Introduced in R2019a**

# getValue

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Get value of a table cell

## Syntax

```
tableCellValue = tableControl.getValue([rowIdx colIdx])
```

## Description

`tableCellValue = tableControl.getValue([rowIdx colIdx])` gets the value of a cell in a custom table.

## Input Arguments

### **tableControl** — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: numeric array

### **rowIdx** — Row index

|

Row index number of the custom table cell for which the value is being fetched.

For example, [2 2].

### **colIdx** — Column index

|

Column index number of the custom table cell for which the value is being fetched.

For example,[2 2].

## Output Arguments

### **tableCellValue** — Table cell value

character vector

Value of the table cell, returned as a character vector.

## Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Get cell value.
tableCellValue = tableControl.getValue([2 2]);

ans =
 'Input'
```

## Version History

Introduced in R2019a

[Simulink.Mask](#) | “Create Block Masks”

# insertColumn

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Insert a column at a specific position in the custom table

## Syntax

```
tableControl.insertColumn(columnIndex[Name,Value])
```

## Description

`tableControl.insertColumn(columnIndex[Name,Value])` inserts a column with the specified properties at a specified index in a custom table.

## Input Arguments

### tableControl — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: char vector | cell array

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

### Type — Type of control

edit | checkbox | popup

Type of control that is used to specify the value of this parameter. The permitted values are: edit (default), checkbox, popup.

### TypeOptions — Options that are displayed within a popup control or in a promoted parameter

''

The options that are displayed within a popup control or in a promoted parameter. This field is a cell array.

### Enabled — Specify whether the user can set the value

'on' | 'off'

Option to specify whether the user can set parameter value.

## Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcf);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Insert a column at the fifth position.
tableControl.insertColumn(5,'Name', 'HDL Name', 'Type', 'edit');
```

## Version History

Introduced in R2019a

### See Also

[Simulink.Mask](#) | “Create Block Masks”

# insertRow

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Insert a row at a specific position in a custom table

## Syntax

```
InsertedRow = tableControl.insertRow(rowIndex,string1,string2)
```

## Description

`InsertedRow = tableControl.insertRow(rowIndex,string1,string2)` inserts a row with specified properties at the specified index in a custom table.

## Input Arguments

### **tableControl** — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: char vector | cell array

### **rowIndex** — Row Index

Index in table at which the new row is to be inserted.

For example, '4'.

## Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Insert Row.
tableControl.insertRow(rowIndex,'insertSig4', 'Input', 'Inherit', 'Inherit', 'on', 'Inherit');
```

## Version History

# removeColumn

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Remove an existing column from a specific position in a custom table

## Syntax

```
tableControl.removeColumn(columnIndex)
```

## Description

`tableControl.removeColumn(columnIndex)` removes a column from the specified index in a custom table.

## Input Arguments

### **tableControl** — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: `string`

### **columnIndex** — Column Index

integer

Column index number of the custom table from which the column is to be removed.

For example, '4'.

## Examples

```
% Get block mask handle.
```

```
maskObj = Simulink.Mask.get(gcb);
```

```
% Get custom table handle.
```

```
tableControl = maskObj.getDialogControl('myTable');
```

```
% Remove the third column.
```

```
tableControl.removeColumn(3);
```

## Version History

**Introduced in R2019a**

**See Also**

Simulink.Mask | “Create Block Masks”

# removeRow

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Remove an existing row from a specific position in a custom table

## Syntax

```
tableControl.removeRow(rowIndex)
```

## Description

`tableControl.removeRow(rowIndex)` removes the row from a specified position in a custom table.

## Input Arguments

### **tableControl** — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: integer

### **rowIndex** — Row Index

Row index number of the custom table from which the row is to be removed.

For example, '4'.

## Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Remove row with index number 6.
tableControl.removeRow(6);
```

## Version History

**Introduced in R2019a**

**See Also**

Simulink.Mask | “Create Block Masks”

# setTableCell

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Set the properties of a custom table cell

## Syntax

```
tableCell = tableControl.setTableCell([rowIdx colIdx], Type, customtable, Evaluate, off)
```

## Description

`tableCell = tableControl.setTableCell([rowIdx colIdx], Type, customtable, Evaluate, off)` sets the specified properties of a cell in a custom table.

## Input Arguments

### **tableControl** — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: Numeric Array Name Value Pair

### **rowIdx** — Row index

Row index number of the custom table cell for which the value is being fetched.

For example, '3'.

### **colIdx** — Column index

Column index number of the custom table cell for which the value is being fetched.

For example, '5'.

### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

### **Type** — Type of control that specifies the value of the parameter

Type of control that is used to specify the value of this parameter. The permitted values are: edit, checkbox, popup, combobox, listbox, radiobutton, slider, dial, spinbox, unit, textarea, breakpoint, customtable, tree, unit, min, max.

### **Value — Value**

The value for the cell is specified. It depends on the Type of the parameter

### **Examples**

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Set cell properties.
tableControl.setTableCell([2 2], 'Type', 'edit', 'Value', '1024');
```

## **Version History**

[Simulink.Mask](#) | “Create Block Masks”

# swapRows

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Swap two existing rows in a custom table

## Syntax

```
tableControl.swapRows(rowIndex1, rowIndex2)
```

## Description

`tableControl.swapRows(rowIndex1, rowIndex2)` swaps specified rows in a custom table.

## Input Arguments

### **tableControl** — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: integer

### **rowIndex1** — Row Index value

integer

Row index number of the first row to be swapped with another row.

For example, '4'.

### **rowIndex2** — Row Index value

integer

Row index number of the second row to be swapped with another row.

For example, '5'.

## Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Swap rows 3 and 6.
```

```
tableControl.swapRows(3,6);
```

## Simulink.dialog.Tab class

**Package:** Simulink.dialog

Create an instance of a tab dialog control

### Description

Use an instance of Simulink.dialog.Tab class to create an instance of tab dialog control.

### Properties

#### Name

Uniquely identifies the tab dialog control and is a required field.

**Type:** character vector

#### Prompt

Specifies the text displayed on the tab.

**Type:** character vector

**Default:** Empty character vector

#### Enabled

Specifies whether tab is active on the mask dialog box.

**Type:** boolean

**Values:** 'on' | 'off'

**Default:** 'on'

#### Visible

Specifies whether tab is displayed on the mask dialog box.

**Type:** boolean

**Values:** 'on' | 'off'

**Default:** 'on'

#### DialogControls

Specifies the child dialog controls contained in the tab dialog control.

**Type:** Simulink.dialog.Control

**Default:** Empty array

## Methods

<code>addDialogControl</code>	Add dialog control elements to mask dialog box
<code>getDialogControl</code>	Search for a specific dialog control on the mask
<code>removeDialogControl</code>	Remove dialog control element from mask dialog box

## See Also

# Simulink.dialog.TabContainer class

**Package:** Simulink.dialog

Create an instance of a tab container dialog control

## Description

Use an instance of `Simulink.dialog.TabContainer` class to create an instance of tab container dialog control. Tab container dialog box be used to group the tab dialog controls.

## Properties

### Name

Uniquely identifies the tab container dialog control and is a required field.

**Type:** character vector

### Row

Specifies whether tab container is placed on the current row or on a new row.

**Type:** enumerated string

**Values:** 'current' | 'new'

**Default:** 'new'

### Enabled

Specifies whether tab container is active on the mask dialog box.

**Type:** boolean

**Values:** 'on' | 'off'

**Default:** 'on'

### Visible

Specifies whether tab container is displayed on the mask dialog box.

**Type:** boolean

**Values:** 'on' | 'off'

**Default:** 'on'

### DialogControls

Specifies the child dialog controls contained in the group. `Simulink.dialog.TabContainer` class can only contain `Simulink.dialog.Tab` dialog control.

**Type:** Simulink.dialog.Tab

**Default:** Empty array

## Methods

addDialogControl	Add dialog control elements to mask dialog box
getDialogControl	Search for a specific dialog control on the mask
removeDialogControl	Remove dialog control element from mask dialog box

## See Also

# Simulink.dialog.Text class

**Package:** Simulink.dialog

Create a text dialog control

## Description

Use an instance of `Simulink.dialog.Text` class to add a text dialog control.

## Properties

### Name

Uniquely identifies the dialog control element and is a required field.

**Type:** character vector

### Prompt

Specifies the text displayed on the mask dialog box.

**Type:** character vector

**Default:** empty

### WordWrap

Specifies whether to wrap long text to the next line on the mask dialog box.

**Type:** boolean

**Value:** 'on' | 'off'

**Default:** 'on'

### Row

Specifies whether dialog control is placed on the current row or on a new row.

**Type:** character vector

**Value:** 'current' | 'new'

**Default:** 'new'

### Enabled

Indicates whether dialog control is active on the mask dialog box.

**Type:** boolean

**Value:** 'on' | 'off'

**Default:** 'on'

**Visible**

Indicates whether dialog control is displayed on the mask dialog box.

**Type:** boolean

**Value:** 'on' | 'off'

**Default:** 'on'

**See Also**

`Simulink.dialog.Control` | “Create Block Masks”

# Simulink.dialog.TreeControl class

**Package:** Simulink.dialog

Control Tree control programmatically

## Description

Use an instance of Simulink.dialog.TreeControl class to perform the following operations:

- Get selected items from the tree
- Set selected items in the tree

## Properties

### Name

Uniquely identifies the dialog control and is a required field.

**Type:** character vector or string

### Prompt

Specifies the text displayed on the tree dialog control.

**Type:** character vector or string

**Default:** empty

### TreeItems

Specifies the items shown in the tree.

**Type:** cell array

**Default:** empty

### Callback

Specifies the MATLAB command (s) to be executed when the dialog control is invoked.

**Type:** character vector or string

**Default:** empty

### Row

Specifies whether dialog control is placed on the current row or on a new row.

**Type:** character vector

**Value:** 'current' | 'new'

**Default:** 'current'

### **Enabled**

Indicates whether tree control is active on the mask dialog box.

**Type:** boolean

**Value:** 'on' | 'off'

**Default:** 'on'

### **Visible**

Indicates whether tree control is displayed on the mask dialog box.

**Type:** boolean

**Value:** 'on' | 'off'

**Default:** 'on'

### **Multiselect**

Indicates whether tree control is enabled for multiple selection.

**Type:** boolean

**Value:** 'on' | 'off'

**Default:** 'on'

### **Tooltip**

Indicates whether tree control has a tooltip configured.

**Type:** character vector or string

**Default:** empty

## **Methods**

setSelectedItems(TreeControl)

Set values for a tree

getSelectedItems(TreeControl)

Get the values of selected items from a tree hierarchy

## **See Also**

# setSelectedItems(TreeControl)

**Class:** Simulink.dialog.TreeControl

**Package:** Simulink.dialog

Set values for a tree

## Syntax

```
treeControl.setSelectedItems({'Node1/ChildNode1','Node1/ChildNode2'})
```

## Description

`treeControl.setSelectedItems({'Node1/ChildNode1','Node1/ChildNode2'})` set the values for the selected items in the tree.

## Input Arguments

### TreeControl — tree handle

table object

Handle to the tree, specified as an object. You can use the `getDialogControl` command to get the tree handle. For more information, see `getDialogControl`.

For example, `treeControl = maskObj.getDialogControl('TreeControl')`. Here, `maskObj` is the mask object and `TreeControl` is the name of the tree.

Data Types: cell array

### value — value to be set

cell-array of string

Value to be set for selected items in the tree.

## Examples

```
maskObj = Simulink.Mask.get(gcb);
treeControl = maskObj.getDialogControl('Control2')
```

```
% Set selected items
treeControl.setSelectedItems({'Node1/ChildNode1', 'Node1/ChildNode2'})
```

## Version History

Introduced in R2019b

# getSelectedItems(TreeControl)

**Class:** Simulink.dialog.TreeControl

**Package:** Simulink.dialog

Get the values of selected items from a tree hierarchy

## Syntax

```
selectedItems = treeControl.getSelectedItems()
```

## Description

`selectedItems = treeControl.getSelectedItems()` fetches the information of the selected items in the tree.

## Output Arguments

**selectedItems** — value of selected items

cell array

Value of the selected items, returned as a cell array.

## Examples

```
% Get block mask handle
maskObj = Simulink.Mask.get(gcf);

% Get tree handle
treeControl = maskObj.getDialogControl('TreeControl');
treeControl.getSelectedItems();
```

```
ans =
```

```
4×1 cell array
```

```
 {'Node1/ChildNode1'}
 {'Node1/ChildNode2'}
 {'Node2/ChildNode1'}
 {'Node2/ChildNode2'}
```

## Version History

**Introduced in R2019b**

## Simulink.GlobalDataTransfer class

**Package:** Simulink

Configure concurrent execution data transfers

### Description

The `Simulink.GlobalDataTransfer` object contains the data transfer information for the concurrent execution of a model. To access the properties of this class, use the `get_param` function to get the handle for this class, and then use dot notation to access the properties. For example:

```
dt=get_param(gcs,'DataTransfer');
dt.DefaultTransitionBetweenContTasks
```

```
ans =
```

```
Ensure deterministic transfer (minimum delay)
```

### Properties

#### DefaultTransitionBetweenSyncTasks

Global setting for data transfer handling option when the source and destination of a signal are in two different and periodic tasks.

Data Type: Enumeration. Can be one of:

- 'Ensure data integrity only'
- 'Ensure deterministic transfer (maximum delay)'
- 'Ensure deterministic transfer (minimum delay)'

Access: Read/write

#### DefaultTransitionBetweenContTasks

Global setting for the data transfer handling option for signals that have a continuous sample time.

Data Type: Enumeration. Can be one of:

- 'Ensure data integrity only'
- 'Ensure deterministic transfer (maximum delay)'
- 'Ensure deterministic transfer (minimum delay)'

Access: Read/write

#### DefaultExtrapolationMethodBetweenContTasks

Global setting for the data transfer extrapolation method for signals that have a continuous sample time.

Data Type: Enumeration. Can be one of:

- 'None'
- 'Zero Order Hold'
- 'Linear'
- 'Quadratic'

Access: Read/write

## Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects.

## Examples

Access the properties of this class.

```
dt=get_param(gcs, 'DataTransfer');
dt.DefaultTransitionBetweenContTasks
```

```
ans =
```

Ensure deterministic transfer (minimum delay)

## Simulink.io.BaseWorkspace class

**Package:** Simulink.io

Read data in format used by base workspace

### Description

Simulink.io.BaseWorkspace inherits from the Simulink.io.FileType base class. It reads data formatted in a format used by the base workspace. Use base workspace file types to move data to and from the base workspace to a function, automated process, or user interface. To import data from the base workspace, use this command.

```
classdef BaseWorkspace < Simulink.io.FileType
```

The Simulink.io.BaseWorkspace class is a handle class.

### Class Attributes

Abstract	false
HandleCompatible	true

For information on class attributes, see “Class Attributes”.

### Properties

#### iofile.BaseWorkspace — Base workspace reader

character array

Base workspace reader, specified as a character array.

#### Attributes:

GetAccess	public
SetAccess	public

Data Types: char | string

### Methods

#### Specialized Operators and Functions

These methods specialize standard MATLAB operators and functions for objects in this class.

isFileSupported	This method always returns true because it operates only on data in the base workspace.
getFileDescription	This method returns the base workspace file reader description.

### Examples

## Read Data in Base Workspace Format

Read data in base workspace format from file, `foo.mat`.

Set up a timeseries variable, `ts`. If `ts` is a variable in the workspace, the object ignores `fileName`.

```
ts = timeseries([0;9]);
```

Set up reader.

```
aReader = Simulink.io.BaseWorkspace();
resultOfWhos = whos(aReader);
```

Load the reader, which has no inputs.

```
varsOnFileStruct = load(aReader);
```

Load one variable.

```
var = loadAVariable(aReader,'ts');
```

Import the file.

```
importedVars = import(aReader);
```

Export to a file.

```
ds = Simulink.SimulationData.Dataset;
ds = ds.addElement(timeseries([1:10]',[1:10]'),'Signal1');
ds = ds.addElement(timeseries([1:10]',[11:20]'),'Signal2');
ds = ds.addElement(timeseries([1:10]',[21:30]'),'Signal3');
%filePath is ignored, must be provided because the API ruleset
filePath = '';
didWrite = aReader.export(filePath,{'ds'},{ds},0);
```

## Version History

Introduced in R2021a

### Topics

“Import Custom File Type”

“Create Custom File Type for Import to Signal Editor”

## Simulink.io.FileType class

**Package:** Simulink.io

Base class for file type readers for Simulink interfaces such as Signal Editor

### Description

Simulink.io.FileType is the base class for Simulink.io.FileType objects. In your class definition file, you must subclass your object from this base class. Simulink requires direct inheritance from FileType. Subclassing allows you to use the implementation methods and service methods provided by this class to build your object. Type this syntax as the first line of your class definition file to directly inherit from the Simulink.io.FileType base class, where ObjectName is the name of your object:

```
classdef ObjectName < Simulink.io.FileType
```

The Simulink.io.FileType class is a handle class.

### Class Attributes

Abstract	true
HandleCompatible	true

For information on class attributes, see “Class Attributes”.

### Properties

#### FileName — File name

character array

File name of file that contains custom signals for import to Signal Editor, specified as a character array.

#### Attributes:

GetAccess	public
SetAccess	public

### Methods

#### Public Methods

exportImpl	Export signals to file
Simulink.io.FileType.getFileTypeDescription	Get custom file reader description
Simulink.io.FileType.isFileSupported	Check if file type is supported in Simulink
Simulink.io.FileType.isInput	Check if input is acceptable Simulink input
Simulink.io.FileType.isSimulinkParameter	Check if input is Simulink parameter
loadImpl	Load signal names from custom FileType object
loadAVariableImpl	Load specified variable from MAT-file
validateFileNameImpl	Validate contents of custom MAT-file

whosImpl

Determine contents of MAT-file associated with Simulink.io.FileType object

### Specialized Operators and Functions

These methods specialize standard MATLAB operators and functions for objects in this class.

export	<p>This method calls the <code>exportImpl</code> method.</p> <p>From Signal Editor, write the structure of signals to a MAT-file. The structure must contain two cell arrays; one for signal names and one for signal values. Specify if the method appends to or overwrites the contents of the MAT-file. The method indicates if it succeeded in writing to the MAT-file and returns any error messages.</p>
import	<p><code>[importedData, warnStr ] = import(reader)</code></p> <p>To import custom signals for a custom file type, identify the custom file type <i>reader</i> as a <code>Simulink.io.FileType</code> object. The method returns the found variable as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”. The method returns a structure with two fields, <code>Data</code> and <code>Name</code>. <code>Data</code> is a cell array of signals and <code>Name</code> is a cell array of character vectors of the corresponding signal names.</p>
importAVariable	<p><code>varOut = importAVariable(reader,variableName)</code></p> <p>To import a specified variable for a custom file type, identify the custom file type reader as a <code>Simulink.io.FileType</code> object. Use <i>VariableName</i>, specified as a character array, to extract the desired signal from the file of custom format signals. The method returns the found variable, returned as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”.</p>
load	<p>This method calls the <code>loadImpl</code> method.</p> <p>Load the signal listed in the custom file type.</p>
loadAVariable	<p>This method calls the <code>loadAVariableImpl</code> method.</p> <p>Validate the format of the signals in the custom MAT-file <code>fileName</code> with the associated <code>Simulink.io.FileType</code> reader.</p>

validateFileName	This method calls the validateFileNameImpl method.  Validate the format of the signals in the custom MAT-file fileName with the associated Simulink.io.FileType reader.
whos	This method calls the whosImpl method.  Return the contents of the custom file type MAT-file.

## Examples

### Subclass FileType

Define a Simulink.io.FileType class.

```
classdef MySignalMatFile < Simulink.io.FileType
end
```

### Interact with FileType Using Specialized Functions

Interact with FileType using specialized functions. This example refers to the open('Simulink.io.CreateSignals') sample file.

Get contents of foo.mat.

```
fileName = 'foo.mat';
aReader = Simulink.io.CreateSignals(fileName);
resultOfWhos = whos(aReader);
```

Import custom signals from foo.mat.

```
aFileType = Simulink.io.CreateSignals('foo.mat');
out = import(aFileType);
```

Load the custom signals in foo.mat.

```
aFileType = Simulink.io.CreateSignals('foo.mat');
out = load(aFileType);
```

Load a variable from foo.mat.

```
aFileType = Simulink.io.CreateSignals('foo.mat');
out = loadAVariable(aFileType, 'bar');
```

Export the signals from Signal Editor.

```
ds = Simulink.SimulationData.Dataset;
ds = ds.addElement(timeseries([1:10]', [1:10]'), 'Siganl1');
ds = ds.addElement(timeseries([1:10]', [11:20]'), 'Siganl2');
ds = ds.addElement(timeseries([1:10]', [21:30]'), 'Siganl3');
```

```
aReader = Simulink.io.CreateSignals('myFileToExport.mat');
didWrite = aReader.export(filePath,{'ds'},{ds},0);
```

## exportImpl

**Class:** Simulink.io.FileType

**Package:** Simulink.io

Export signals to file

### Syntax

```
[didWrite,errMsg] = exportImpl(exportFileName,varNames,varValues,isAppend)
```

### Description

`[didWrite,errMsg] = exportImpl(exportFileName,varNames,varValues,isAppend)` exports signals from Signal Editor using the specified variables and returns `didWrite` and `errMsg` and saves them to `exportFileName`.

### Input Arguments

#### **exportFileName** — File name for exported signals

character array

File name for exported signals, specified as a character array.

Data Types: `char`

#### **varNames** — Signal names

cell array of character vectors

Signal names, specified as a cell array of character vectors.

Data Types: `cell`

#### **varValues** — Signal values

cell array of signal variables

Signal values associated with the signals in `varNames`, specified as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”.

Data Types: `cell`

#### **isAppend** — Append or overwrite signal file

false or 0 (default) | true or 1

Append or overwrite signal file, specified as true (1) or false (0).

Data Types: `logical`

### Output Arguments

#### **didWrite** — Whether signals were successfully written

false or 0 | true or 1

Whether the signals were successfully written to `exportFileName`, returned as true (1) or false (0).

### **errMsg — Error message**

character array

Error message, indicating errors with the reporting process, returned as a character array.

## **Examples**

### **Subclass FileType Class and Implement exportImpl Method**

Subclass `FileType` class and implement `exportImpl` method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement the static method `exportImpl`.

methods

```
function [didWrite,errMsg] = exportImpl(obj,fileName,cellOfVarNames, ...
 cellOfVarValues,isAppend)
 didWrite = false;
 errMsg = '';

 saveStruct = struct;

 for k = 1: length (cellOfVarNames)
 saveStruct.(cellOfVarNames{k}) = cellOfVarValues{k};
 end

 try
 if isAppend
 save(fileName,'-struct','saveStruct','-append');
 else
 save(fileName,'-struct','saveStruct');
 end
 didWrite = true;
 catch ME

 % Optional, return errMsg or throw hard error.
 % Returning an error message allows your automated
 % processes to carry on while allowing you to report the
 % error at a later time.
 errMsg = ME.message;
 end

end

end

end
```

# Simulink.io.FileType.getFileTypeDescription

**Class:** Simulink.io.FileType

**Package:** Simulink.io

Get custom file reader description

## Syntax

```
FileReaderDescription = getFileTypeDescription()
```

## Description

FileReaderDescription = getFileTypeDescription() returns the file reader description.

## Output Arguments

### FileReaderDescription — FileType description

character array

FileType description, returned as a character array. When writing the file type description, consider describing the data layout of the file.

## Examples

### Subclass FileType Class and Implement getFileTypeDescription Method

Subclass FileType class and implement the getFileTypeDescription method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement the static method getFileTypeDescription.

```
methods (Static)
 function aFileReaderDescription = getFileTypeDescription()
 aFileReaderDescription = ['Return a char array describing your reader.'];
 end
end

**Class:** Simulink.io.FileType

**Package:** Simulink.io

Check if file type is supported in Simulink

## Syntax

```
isSupported = isFileSupported(fullFile)
```

## Description

`isSupported = isFileSupported(fullFile)` checks if the file located at `fullFile` is supported in Simulink.

## Input Arguments

**fullFile** — Fully qualified file name

character array

Fully qualified file name, specified as a character array.

Example: `C:\mydir\mySignals.csv`

Data Types: `char`

## Output Arguments

**isSupported** — File supported indicator

true (1) | false (0)

File support indicator, returned as true (1) or false (0).

## Examples

### Subclass FileType Class and Implement isFileSupported Method

Subclass `FileType` class and implement the `isFileSupported` method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement the static method `isFileSupported`.

```
methods (Static)
```

```
 function isSupported = isFileSupported(fileLocation)
 isSupported = false;
 if exist(fileLocation, 'file')
 isSupported = true;

**Class:** Simulink.io.FileType

**Package:** Simulink.io

Check if input is acceptable Simulink input

## Syntax

```
isSimulinkInput = Simulink.io.FileType.isInput(ts)
```

## Description

`isSimulinkInput = Simulink.io.FileType.isInput(ts)` checks if the `ts` argument is a MATLAB variable that can be used as Simulink simulation input.

## Input Arguments

### **ts** — Simulink input

MATLAB variable

Simulink input, specified as a MATLAB variable. This variable must be an acceptable Simulink input, such as the data formats listed at “Data Format or Type”.

Example: `timeseries([0;9])`

Data Types: `char` | `string`

## Output Arguments

### **isSimulinkInput** — File input indicator

't' (true) | 'f' (false)

File input indicator, returned as 't' (true) or 'f' (false).

## Examples

### Check Appropriateness of Input

Check if the `timeseries` `ts` is an input supported by Simulink.

Create `timeseries` variable `ts`.

```
ts = timeseries([sin(0:.01:100)'])
```

```
timeseries
```

Common Properties:

```
 Name: 'unnamed'
```

```
 Time: [10001x1 double]
```

```
TimeInfo: [1x1 tsdata.timemetadata]
 Data: [10001x1 double]
DataInfo: [1x1 tsdata.datametadata]
```

More properties, Methods

Check if *ts* is accepted by Simulink.

```

# Simulink.io.FileType.isSimulinkParameter

**Class:** Simulink.io.FileType

**Package:** Simulink.io

Check if input is Simulink parameter

## Syntax

```
isParameter = Simulink.io.FileType.isSimulinkParameter(aParam)
```

## Description

`isParameter = Simulink.io.FileType.isSimulinkParameter(aParam)` checks if the `aParam` argument is a supported Simulink.Parameter type:

- Simulink.Simulation.ModelParameter
- Simulink.Simulation.BlockParameter
- Simulink.Simulation.Variable
- Simulink.op.ModelOperatingPoint

## Input Arguments

**aParam — Simulink parameter**

vector of Simulink parameters | Simulink parameter as scalar

Simulink parameter, specified as a vector or scalar of one of these types:

- Simulink.Simulation.ModelParameter (can be scalar or vector)
- Simulink.Simulation.BlockParameter (can be scalar or vector)
- Simulink.Simulation.Variable (can be scalar or vector)
- Simulink.op.ModelOperatingPoint (must be scalar)

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical | char | string | struct | table | cell | function\_handle | categorical | datetime | duration | calendarDuration | fi

Complex Number Support: Yes

## Output Arguments

**isParameter — Simulink parameter indicator**

true (1) | false (0)

Simulink parameter indicator, returned as true (1) or false (0).

## Examples

### Check if Input Parameter Is Simulink Parameter

Check if the parameter *aParam* is a Simulink parameter.

Create parameter *aParam*.

```
aParam = Simulink.Simulation.BlockParameter('f/g', 'Gain', '5')
```

```
aParam =
```

```
BlockParameter with properties:
```

```
BlockPath: 'f/g'
Name: 'Gain'
Value: '5'
```

Check if the parameter *aParam* is a Simulink parameter.

```
Simulink.io.FileType.isSimulinkParameter(aParam)
```

```
ans =
```

```
logical
```

```
1
```

# loadAVariableImpl

**Class:** Simulink.io.FileType

**Package:** Simulink.io

Load specified variable from MAT-file

## Syntax

```
varOut = loadAVariableImpl(MATfile,varName)
```

## Description

`varOut = loadAVariableImpl(MATfile,varName)` loads the specified variable from the MAT-file.

## Input Arguments

### **MATfile** — File name of MAT-file

character array

File name of the MAT-file that contains signals to load, specified as a character array.

Data Types: char

### **varName** — Variable name

character array

Variable name to load, specified as a character array.

Data Types: char

## Output Arguments

### **varOut** — Found variable

cell array of signal variables

Found variables to load, returned as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”.

## Examples

### **Subclass FileType Class and Implement loadAVariableImpl Method**

Subclass `FileType` class and implement `loadAVariableImpl` method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement the static method `loadAVariableImpl`.

```
methods
```

```
function structOut = loadAVariableImpl(obj,varName)

 % Assume loading a variable from a MAT-file.
 data = load(obj.FileName,varName);

 if isempty(fieldnames(data))
 error([varName ' was not found on the file.']);
 end

 if isSimulinkSignalFormat(data.(varName))
 structOut.(varName) = ...
 data.(varName);
 else
 error([varName ' is not a Simulink signal format.']);
 end
end
end
```

# loadImpl

**Class:** Simulink.io.FileType

**Package:** Simulink.io

Load signal names from custom FileType object

## Syntax

```
matFileData = loadImpl(reader)
```

## Description

`matFileData = loadImpl(reader)` loads the signal names listed in the custom FileType object.

## Run-Time Details

`loadImpl` is called via `load` when you run the `Simulink.io.FileType` object. You can also run the application, which calls `load`. For details, see “Create Custom File Type for Import to Signal Editor”.

## Input Arguments

**reader — Signals to load**

`Simulink.io.FileType`

Signals to load, specified as a `Simulink.io.FileType` object.

Data Types: `char`

## Output Arguments

**matFileData — Signals**

cell array of signal variables

Variables of signals to load, returned as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”.

## Examples

### Subclass FileType Class and Implement loadImpl Method

Subclass `FileType` class and implement the `loadImpl` method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement the static method `loadImpl`.

methods

```
function structOut = loadImpl(obj)
```

```
structOut = struct;

%assume mat-file
data = load(obj.FileName);
varsOnFile = fieldnames(data);

for k = 1: length(varsOnFile)
 if isSimulinkSignalFormat(data.(varsOnFile{k}))
 structOut.(varsOnFile{k}) = ...
 data.(varsOnFile{k});
 end
end
end
end
```

# validateFileNameImpl

**Class:** Simulink.io.FileType

**Package:** Simulink.io

Validate contents of custom MAT-file

## Syntax

```
validateFileNameImpl(reader, fileName)
```

## Description

`validateFileNameImpl(reader, fileName)` validates the format of the signals in the custom MAT-file `fileName` with the associated `Simulink.io.FileType` reader.

## Input Arguments

### reader — Reader

`Simulink.io.FileType` object

Reader, specified as a `Simulink.io.FileType` object.

### fileName — File name of MAT-file

character array

File name of a MAT-file that contains custom signals, specified as a character array.

Data Types: `char`

## Examples

### Subclass FileType Class and Implement validateFileNameImpl Method

Subclass `FileType` class and implement the `validateFileNameImpl` method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement static method `validateFileNameImpl`.

```
function validateFileNameImpl(aFile, filename) %#ok<INUSL>
%validateFileNameImpl

[-, ~, fileExt] = fileparts(filename);
isSupported = strcmpi(fileExt, '.mat');

if ~isSupported
 error('This file format is not supported by application. ');
end
```

end

# whosImpl

**Class:** Simulink.io.FileType

**Package:** Simulink.io

Determine contents of MAT-file associated with Simulink.io.FileType object

## Syntax

```
signals = whosImpl(reader)
```

## Description

`signals = whosImpl(reader)` returns a structure containing the contents of the MAT-file associated with the `Simulink.io.FileType` object.

## Run-Time Details

`whosImpl` is called via `whos` when you run the application. For details, see “Create Custom File Type for Import to Signal Editor”.

## Input Arguments

### reader — Reader

`Simulink.io.FileType` object

Reader, specified as a `Simulink.io.FileType` object.

## Output Arguments

### signals — Contents of MAT-file

array of structures

Contents of the MAT-file, returned as an array of structures. This structure has a signal name [ 'char array' ] and an optional signal type of a supported type. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”.

## Examples

### Subclass FileType Class and Implement whosImpl Method

Subclass `FileType` class and implement the `whosImpl` method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement the static method `whosImpl`.

methods

```
function outOnFile = whosImpl(obj)
 onFile = whos(obj.FileName);
```

```
numVars = length(onFile);
outOnFile(1).name = [];
outOnFile(1).type = [];

for k = 1: length(numVars)
 outOnFile(k).name = onFile(k).name;

 if strcmpi(onFile(k).class, 'Simulink.SimulationData.Dataset')
 outOnFile(k).type = 'Dataset';
 else
 % Assume Signal(timeseries or timetable)
 % other acceptable types
 % - Bus : for bus signals
 % - Ground: for grounds (empty double)
 % - FunctionCall: for single column double data arrays
 outOnFile(k).type = 'Signal';
 end
end

end

end

# Simulink.io.MatFile class

**Package:** Simulink.io

Read data in MAT-file format

## Description

Simulink.io.MatFile inherits from the Simulink.io.FileType base class. The class reads data formatted in a format used by MAT-files. To import data from a MAT-file, use this class.

```
classdef MatFile < Simulink.io.FileType
```

The Simulink.io.MatFile class is a handle class.

## Class Attributes

Abstract	false
HandleCompatible	true

For information on class attributes, see “Class Attributes”.

## Properties

### iofile.STAMatFile — MAT-file reader

character array

MAT-file reader, specified as a character array.

#### Attributes:

GetAccess	public
SetAccess	public

Data Types: char | string

## Methods

### Specialized Operators and Functions

These methods specialize standard MATLAB operators and functions for objects in this class.

isFileSupported	This method always returns true because it operates only on data in the MAT-file.
getFileTypeIdDescription	This method returns the MAT-file reader description for MAT-files containing data with loading and logging signal formats that Simulink supports.

## Examples

### Read Data in MAT-File Format

Read data in MAT-file format from the file `foo.mat`.

```
fileName = 'foo.mat';
aReader = Simulink.io.MatFile(fileName);
resultOfWhos = whos(aReader);
```

Load the reader, which has no inputs.

```
varsOnFileStruct = load(aReader);
```

Load one variable.

```
var = loadAVariable(aReader, 'ts');
```

Import all the variables from the MAT-file, `foo.mat`.

```
importedVars = import(aReader);
```

Export the dataset to a MAT-file named `bar.mat`.

```
ds = Simulink.SimulationData.Dataset;
ds = ds.addElement(timeseries([1:10]', [1:10]'), 'Signal1');
ds = ds.addElement(timeseries([1:10]', [11:20]'), 'Signal2');
ds = ds.addElement(timeseries([1:10]', [21:30]'), 'Signal3');
```

```
filePath = 'bar.mat';
didWrite = aReader.export(filePath, {'ds'}, {ds}, 0);
```

# Simulink.io.ModelWorkspace class

**Package:** Simulink.io

Read data in format used by model workspace

## Description

Simulink.io.ModelWorkspace inherits from the Simulink.io.FileType base class. It reads data formatted in a format used by the model workspace. Use model workspace file types to move data to and from the model workspace to a function, an automated process, or a user interface. To import data from the model workspace, use this command.

```
classdef ModelWorkspace < Simulink.io.FileType
```

The Simulink.io.ModelWorkspace class is a handle class.

## Class Attributes

Abstract	false
HandleCompatible	true

For information on class attributes, see “Class Attributes”.

## Properties

### DataSource — Source for initializing variables in model workspace

'Model File' (default) | 'MAT-File' | 'MATLAB Code' | 'MATLAB File'

Source for initializing the variables in the model workspace, specified as one of these character vectors:

- 'Model File' — The variables are stored in the model file. When you save the model, you also save the variables.
- 'MATLAB Code' — The variables are created by MATLAB code that you write and store in the model file.
- 'MAT-File' — The variables are stored in a MAT-file, which you can manage and manipulate separately from the model file.
- 'MATLAB File' — The variables are created by MATLAB code in a script file, which you can manage and manipulate separately from the model file.

### Attributes:

GetAccess	public
SetAccess	public

Data Types: char | string

### FileName — Name of external file that stores or creates variables

'' (empty character vector) (default) | character vector

Name of the external file that stores or creates variables, specified as a character vector. To enable this property, set `DataSource` to 'MAT-File' or 'MATLAB File'.

**Attributes:**

GetAccess public  
SetAccess public

Data Types: char | string

**MATLABCode — MATLAB code for initializing variables**

' ' (empty character vector) (default) | character vector

MATLAB code for initializing variables, specified as a character vector. To enable this property, set `DataSource` to 'MATLAB Code'.

**Attributes:**

GetAccess public  
SetAccess public

Data Types: char | string

## Methods

### Specialized Operators and Functions

These methods specialize standard MATLAB operators and functions for objects in this class.

<code>isFileSupported</code>	This method always returns true because it operates only on data in the base workspace.
<code>getFileTypeIdDescription</code>	This method returns the base workspace file reader description.

## Examples

### Read Data in Model Workspace Format

Set up `myExample` to use with the model workspace and perform basic operations.

Set up the model workspace for the `myExample`. Assign `timeseries([1;3])` as the value of `aSignal`.

```
myExample;
```

```
mWS = get_param('myExample','ModelWorkspace');
assignin(mWS, 'aSignal', timeseries([1;3]));
```

Determine the contents of the MAT-file `aFileType` associated with the `Simulink.io.ModelWorkspace` object.

```
aFileType = Simulink.io.ModelWorkspace('myExample.slx');
```

```
%whos on file
out = whos(aFileType)
```

```
out =

 struct with fields:

 name: 'aSignal'
 type: 'Signal'
```

Load signal names from the aFileType of the myExample model workspace.

```
aFileType = Simulink.io.ModelWorkspace('myExample.slx');
%load
out = load(aFileType)
```

```
out =

 struct with fields:

 aSignal: [1x1 timeseries]
```

```
aFileType = Simulink.io.ModelWorkspace('myExample.slx');
%import all
out = import(aFileType)
```

```
out =

 struct with fields:

 Data: {[1x1 timeseries]}
 Names: {'aSignal'}
```

```
out =

 struct with fields:

 Data: {[1x1 timeseries]}
 Names: {'aSignal'}
```

Import the specified variable *aSignal* from the model workspace.

```
aFileType = Simulink.io.ModelWorkspace('myExample.slx');
var = importAVariable(aFileType, 'aSignal'
```

```
timeseries

 Common Properties:
 Name: 'unnamed'
 Time: [2x1 double]
 TimeInfo: [1x1 tsdata.timemetadata]
 Data: [2x1 double]
 DataInfo: [1x1 tsdata.datametadata]
```

More properties, Methods

Write a structure of signals to a MAT-file.

```
ts = timeseries([11112;36532415]);
aFileType = Simulink.io.ModelWorkspace('minportsOnly_withOutputs.slx');
```

```
[didWrite, errMsg] = export(aFileType, 'minportsOnly_withOutputs.slx', ...
 {'ts'}, {ts}, ...
 false)
```

```
didWrite =
```

```
 logical
```

```
 1
```

```
errMsg =
```

```
 0x0 empty char array
```

# Simulink.io.PluggableNamespace class

**Package:** Simulink.io

Register Simulink.io.FileType objects from different name space

## Description

Use the Simulink.io.PluggableNamespace class interface to implement a name space to register Simulink.io.FileType objects from custom name spaces.

In your class definition file, you must subclass your object from this base class. Simulink requires direct inheritance from PluggableNamespace.

The process to contain the new class is similar to the one to create a custom file type. To contain your class, create a folder and add that folder path to the MATLAB path. In that folder, create a +Simulink folder, and inside that folder, create a +io folder.

To examine issues with the registration of these objects, use the Simulink.io.getFileTypeDiagnostics function.

The Simulink.io.PluggableNamespace class is a handle class.

## Class Attributes

Abstract	false
HandleCompatible	true

For information on class attributes, see “Class Attributes”.

## Creation

### Description

`classdef SimulinkIOPlugin < Simulink.io.PluggableNamespace` creates a name space.

## Properties

### NameSpace — Name space to register

character array

Name space to register, specified as a character array.

Example: `Namespace = 'Simulink.io'`

### Attributes:

GetAccess	public
-----------	--------

Data Types:

## Examples

### Create Pluggable Name Space

Create a pluggable name space, MyNamespace.

Inherit from the `Simulink.io.PluggableNamespace` base class.

```
classdef MyNamespace < Simulink.io.PluggableNamespace
```

Implement the property, `Namespace`, as `MyNamespace`.

```
 properties (Access = public, Constant)
 Namespace = 'MyNamespace';
 end
 end
```

You can now create a folder on the MATLAB path, create a folder such as `+MyNamespace` and place your file types in that folder.

## Version History

**Introduced in R2021a**

### Specialized Operators and Functions

These methods specialize standard MATLAB operators and functions for objects in this class.

export	<p>This method calls the <code>exportImpl</code> method.</p> <p>From Signal Editor, write the structure of signals to a MAT-file. The structure must contains two cell arrays; one for signal names and one for signal values. Specify if the method appends to or overwrites the contents of the MAT-file. The method indicates if it succeeded in writing to the MAT-file and returns any error messages.</p>
import	<p><code>[importedData, warnStr ] = import(reader)</code></p> <p>To import custom signals for a custom file type, identify the custom file type <i>reader</i> as a <code>Simulink.io.FileType</code> object. The method returns the found variable as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”. The method returns a structure with two fields, <code>Data</code> and <code>Name</code>. <code>Data</code> is a cell array of signals and <code>Name</code> is a cell array of character vectors of the corresponding signal names.</p>
importAVariable	<p><code>varOut = importAVariable(reader,variableName)</code></p> <p>To import a specified variable for a custom file type, identify the custom file type reader as a <code>Simulink.io.FileType</code> object. Use <i>VariableName</i>, specified as a character array, to extract the desired signal from the file of custom format signals. The method returns the found variable, returned as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”.</p>
load	<p>This method calls the <code>loadImpl</code> method.</p> <p>Load the signal listed in the custom file type.</p>
loadAVariable	<p>This method calls the <code>loadAVariableImpl</code> method.</p> <p>Validate the format of the signals in the custom MAT-file <code>fileName</code> with the associated <code>Simulink.io.FileType</code> reader.</p>
validateFileName	<p>This method calls the <code>validateFileNameImpl</code> method.</p> <p>Validate the format of the signals in the custom MAT-file <code>fileName</code> with the associated <code>Simulink.io.FileType</code> reader.</p>

whos	This method calls the whosImpl method.  Return the contents of the custom file type MAT-file.
------	-----------------------------------------------------------------------------------------------------

## Examples

### Interact with SignalBuilderSpreadsheet Using Specialized Functions

Interact with FileType using specialized functions. This example refers to the open('Simulink.io.CreateSignals') sample file.

Get contents of Signal Builder format foo.xlsx spreadsheet.

```
fileName = 'foo.xlsx';
aReader = Simulink.io.SignalBuilderSpreadsheet(fileName);
resultOfWhos = whos(aReader);
```

Load the custom signals in foo.xlsx.

```
fileName = 'foo.xlsx';

aReader = Simulink.io.SignalBuilderSpreadsheet(fileName);
varsOnFileStruct = load(aReader, 'myGroup1');
```

Load a variable from foo.xlsx.

```
fileName = 'foo.xlsx';

aReader = Simulink.io.SignalBuilderSpreadsheet(fileName);
var = loadAVariable(aReader, 'myGroup1');
```

Import custom signals from foo.xlsx.

```
fileName = 'foo.xlsx';

aReader = Simulink.io.SignalBuilderSpreadsheet(fileName);
importedVars = import(aReader, 'myGroup1');
```

Export the signals from Signal Editor.

```
ds = Simulink.SimulationData.Dataset;
ds = ds.addElement(timeseries([1:10]', [1:10]'), 'Signal1'); %#ok<*NBRAK>
ds = ds.addElement(timeseries([1:10]', [11:20]'), 'Signal2');
ds = ds.addElement(timeseries([1:10]', [21:30]'), 'Signal3');

aReader = Simulink.io.SignalBuilderSpreadsheet('myFileToExport.xls');
didWrite = aReader.export(filePath, {'ds'}, {ds}, 0);
```

validateFileName	<p>This method calls the <code>validateFileNameImpl</code> method.</p> <p>Validate the format of the signals in the custom MAT-file <code>fileName</code> with the associated <code>Simulink.io.FileType</code> reader.</p>
whos	<p>This method calls the <code>whosImpl</code> method.</p> <p>Return the list of <code>sldvData</code> structure datasets.</p>

## Examples

## Read Data in Simulink Design Verifier MAT-File Format

List the test cases in a Simulink Design Verifier MAT-file. The `whos()` method returns a structure with the fields `name` and `type`. The structure contains the names of all the test cases in the `sldvData` structure file along with the type `Dataset`.

```
fileName = 'foo.mat';
aReader = Simulink.io.SLDVMatFile(fileName);
resultOfWhos = whos(aReader);
```

Load the data. The `load()` method converts the test case data in the `sldvData` structure into `Simulink.SimulationData.Dataset` objects. The result is a structure where each field is the name of the test case and the value is the corresponding dataset object.

```
loadedVars = load(aReader);
```

Import the data. Similarly to `load()`, the `import()` method converts the test case data in the `sldvData` structure into `Simulink.SimulationData.Dataset` objects. The result is a structure with fields `Data` and `Names`. The `Names` field contains the name of the test cases. The `Data` field contains the corresponding dataset objects.

```
importedVars = import(aReader);
```

## Simulink.LookupTable class

**Package:** Simulink

Store and share lookup table and breakpoint data, configure data for ASAP2 and AUTOSAR code generation

### Description

An object of the `Simulink.LookupTable` class stores lookup table and breakpoint data. You can use that data in a lookup table block such as the n-D Lookup Table block. With the object, you can specify data types and code generation settings for the table and the breakpoint sets.

When you store all of the table and breakpoint set data in a single `Simulink.LookupTable` object, all of the data appears in a single structure in the generated code. To configure `STD_AXIS` code generation for calibration, use this technique.

To share a breakpoint set between multiple lookup tables, for example for `COM_AXIS` code generation, use a `Simulink.Breakpoint` object in one or more Prelookup blocks. Use `Simulink.LookupTable` objects in Interpolation Using Prelookup blocks. Then, configure the lookup table objects to refer to the breakpoint object. For more information, see “Package Shared Breakpoint and Table Data for Lookup Tables”.

To subclass from `Simulink.LookupTable` and inherit from this base class, type this syntax as the first line of your class definition file, where *myLookuptable* is the name of your new class:

```
classdef myLookuptable < Simulink.LookupTable
```

For an example on subclassing, see “Define Data Classes”.

If you add properties to the subclass, you can see them by displaying the subclass object at the MATLAB command line. In the property dialog box, these properties display in a new tab.

### Construction

`LUTObj = Simulink.LookupTable` returns a `Simulink.LookupTable` object `LUTObj` with default property values.

To create a `Simulink.LookupTable` object by using the Model Explorer, use the button  on the toolbar. The default name for the object is `Object`.

### Property Dialog Box

Setting **Breakpoints specification** to `Explicit` values (default) displays this view of the property dialog box.

The bottom of the dialog box contains the table and breakpoint data values. For more information on this tabular area, see “Edit Lookup Table Data with Lookup Table Spreadsheet”. The contents of this table are equivalent to the **Value** property, visible when the **Breakpoints specification** property is set to Even spacing or Reference.

### Table and Breakpoints

#### Number of table dimensions

Number of dimensions of the lookup table. Specify an integer value up to 30 (inclusive). For example, to represent a three-dimensional lookup table, specify the integer 3.

#### Breakpoints specification

Source for the information of the breakpoint sets, specified as **Explicit values** (default), **Reference**, or **Even spacing**.

- To store all of the table and breakpoint set data in the `Simulink.LookupTable` object, set **Breakpoints specification** to **Explicit values**.

The `Simulink.LookupTable` object appears in the generated code as a single structure variable.

- To store the table data in the `Simulink.LookupTable` object and store the breakpoint set data in `Simulink.Breakpoint` objects, set **Breakpoints specification** to **Reference**.

The `Simulink.LookupTable` object appears in the generated code as a separate array variable that contains the table data. Each `Simulink.Breakpoint` object appears as a separate array or structure variable that contains the breakpoint set data.

- To store the table data and evenly spaced breakpoints in the `Simulink.LookupTable` object, set **Breakpoints specification** to `Even spacing`. Use the **First point** and **Spacing** parameters to generate a set of evenly spaced breakpoints.

**Note** When **Breakpoints specification** is set to `Explicit values` or `Even spacing`, you can change the order of the tunable size, breakpoint, and table entries in a lookup table object-generated structure.

## Table

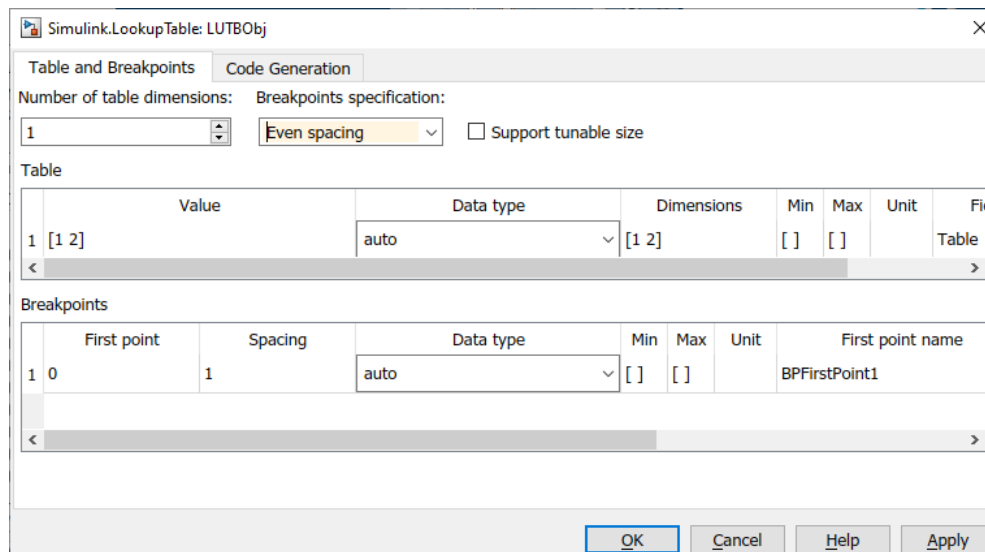

Information for the table data. You can configure these characteristics:

### Value

Table data. Specify a numeric vector or multidimensional array with at least two elements.

The **Value** table data is the same as the contents of the tabular interface visible at the bottom of the dialog box when the **Breakpoints specification** property is set to `Explicit values`. For more information on this tabular area, see “Edit Lookup Table Data with Lookup Table Spreadsheet”.

**Note** This property appears only if **Breakpoints specification** is set to `Even spacing` or `Reference`.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector or multidimensional array. When you click **Apply** or **OK**, the object executes the expression and uses the result to set the value of this property.

When you set **Data type** to `auto`, to set **Value**, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

When you specify table data with three or more dimensions, **Value** displays the data as an expression that contains a call to the `reshape` function. To edit the values in the data, modify

the first argument of the `reshape` call, which contains all of the values in a serialized vector. When you add or remove elements along a dimension, you must also correct the argument that represents the length of the modified dimension.

You can edit this data by using a more intuitive interface in a lookup table block. See “Import Lookup Table Data from MATLAB”.

#### Data type

Data type of the table data. The default setting is `auto`, which means that the table data acquire a data type from the value that you specify in **Value**. If you use an untyped expression such as `[1 2 3]` to set **Value**, the table data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the table data use the data type specified by the expression or object. Enumerated data types are also supported.

You can explicitly specify an integer data type, half data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

#### Dimensions

Dimension lengths of the lookup table data.

To use symbolic dimensions, specify a character vector. See “Implement Symbolic Dimensions for Array Sizes in Generated Code” (Embedded Coder).

#### Min

Minimum value of the elements in the table data. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

#### Max

Maximum value of the elements in the table data. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

#### Stored Int Min

For `Simulink.LookupTable` objects with a fixed-point data type, the minimum value of the elements in the table data, specified as a stored integer value. The value is derived from the real-world value **Min**. This property is available only in the property dialog box.

#### Stored Int Max

For `Simulink.LookupTable` objects with a fixed-point data type, the maximum value of the elements in the table data, specified as a stored integer value. The value is derived from the real-world value **Max**. This property is available only in the property dialog box.

#### Unit

Physical units of the elements in the lookup table. You can specify text such as `degC`. See “Unit Specification in Simulink Models”.

**Field name**

Name of a structure field in the generated code. This field stores the table data if you configure the `Simulink.LookupTable` object to appear in the generated code as a structure. The default value is `Table`. To change the field name, specify text.

**Description**

Description of the lookup table. You can specify text such as `This lookup table describes the action of a pump.`

**Breakpoints**

Breakpoint set information. Each row is one breakpoint set. To configure additional breakpoint sets, specify an integer value in the **Number of table dimensions** box.

For the breakpoint sets, you can configure these characteristics:

**Value**

Data for the breakpoint set. Specify a numeric vector with at least two elements.

---

**Note** This property appears only if **Breakpoints specification** is set to `Even spacing` or `Reference`. The **Value** breakpoint set data is the same as the contents of the tabular interface visible at the bottom of the dialog box when the **Breakpoints specification** property is set to `Explicit values`. For more information on this tabular area, see “Edit Lookup Table Data with Lookup Table Spreadsheet”.

---

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector. When you click **Apply** or **OK**, the object executes the expression and uses the result to set the value of this property.

When you set **Data type** to `auto`, to set **Value**, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

You can edit this data by using a more intuitive interface in a lookup table block. See “Import Lookup Table Data from MATLAB”.

**Data type**

Data type of the breakpoint set. The default setting is `auto`, which means that the breakpoint set acquires a data type from the value that you specify in **Value**. If you use an untyped expression such as `[1 2 3]` to set **Value**, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object.

You can explicitly specify an integer data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

**Dimensions**

Dimension lengths of the breakpoint set.

To use symbolic dimensions, specify a character vector. See “Implement Symbolic Dimensions for Array Sizes in Generated Code” (Embedded Coder).

**Min**

Minimum value of the elements in the breakpoint set. The default value is empty, []. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

**Max**

Maximum value of the elements in the breakpoint set. The default value is empty, []. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

**Unit**

Physical unit of the elements in the breakpoint set. You can specify text such as degF. See “Unit Specification in Simulink Models”.

**Field name**

Name of a structure field in the generated code. This field stores the breakpoint set data. The default value is BP1 for the first breakpoint set and BP2 for the second set. To change the field name, specify text.

**Tunable size name**

Name of a structure field in the generated code. This field stores the length (number of elements) of the breakpoint set, which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory. The default name is N1 for the first breakpoint set and N2 for the second set. To change the field name, specify text.

This column appears only if you select **Support tunable size**.

**Description**

Description of the breakpoint set. You can specify text such as This breakpoint set represents the pressure input.

**First point**

First point in evenly spaced breakpoint data. This parameter is available when **Breakpoints specification** is set to Even spacing.

**Spacing**

Spacing between points in evenly spaced breakpoint data. This parameter is available when **Breakpoints specification** is set to Even spacing.

**Name**

Name of the Simulink.Breakpoint object that stores the information for this breakpoint set.

This column appears only if you set **Breakpoints specification** to Reference.

**First point name**

Name of the Simulink.Breakpoint object that stores the information for the first point. This parameter is available when **Breakpoints specification** is set to Even spacing.

### Spacing name

Name of the `Simulink.Breakpoint` object that stores the information for the spacing. This parameter is available when **Breakpoints specification** is set to `Even spacing`.

### Table and breakpoint value edit area

Information for table and breakpoint data. You can enter a MATLAB expression in the associated text box or add data directly in the accompanying table. Select the desired data type:

- Select table elements
- Use standard keyboard shortcuts such as:
  - Copy — **Ctrl+C**
  - Paste — **Ctrl+V**
  - Undo — **Ctrl+Z**
  - Delete
  - Redo — **Shift+Ctrl+Z**

Entering or manipulating data in the table is simple and intuitive. Like Microsoft Excel spreadsheets, you can work with the table with operations such as:

- **Table** — Table data. Specify a numeric vector or multidimensional array with at least two elements.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector or multidimensional array. When you press **Enter**, the object executes the expression and uses the result to set the value of this property.

When you specify table data with three or more dimensions, the table displays the data as an expression that contains a call to the `reshape` function. To edit the values in the data, modify the first argument of the `reshape` call, which contains all of the values in a serialized vector. When you add or remove elements along a dimension, you must also correct the argument that represents the length of the modified dimension.

You can edit this data using a more intuitive interface in a lookup table block. See “Import Lookup Table Data from MATLAB”.

- **BPN** — Data for the breakpoint set.

Specify a numeric vector with at least two elements.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector. When you press **Enter**, the object executes the expression and uses the result to set the value of this property.

You can edit this data by using a more intuitive interface in a lookup table block. See “Import Lookup Table Data from MATLAB”.

## Code Generation

### Data definition: Storage class

Storage class of the structure variable (if you set **Breakpoints specification** to `Explicit values` or `Even spacing`) or array variable (`Reference`) in the generated code. The variable stores the table data and, if the variable is a structure, the breakpoint set data. The default setting is `Auto`.

For more information about storage classes, see “C Code Generation Configuration for Model Interface Elements” (Simulink Coder).

If you have Embedded Coder, you can choose a custom storage class. For information about custom storage classes, see “Organize Parameter Data into a Structure by Using Struct Storage Class” (Embedded Coder).

#### Data definition: Identifier

Alternative name for the structure variable (if you set **Breakpoints specification** to `Explicit values` or `Even spacing`) or array variable (`Reference`) in the generated code. The default value is empty, in which case the generated code uses the name of the `Simulink.LookupTable` object as the name of the structure or array variable. To set the identifier, specify text.

To enable this property, set **Data definition: Storage class** to a setting other than `Auto`.

#### Data definition: Alignment

Data alignment boundary in the generated code. The starting memory address for the data allocated for the structure or array variable is a multiple of the value that you specify. The default value is `-1`, which allows the code generator to determine an optimal alignment based on usage.

Specify a positive integer that is a power of 2, not exceeding 128. For more information about using data alignment for code replacement, see “Data Alignment for Code Replacement” (Embedded Coder).

#### Struct Type definition: Name

Name of the structure type that the structure variable uses in the generated code. The default value is empty. Specify text.

This property appears only if you set **Breakpoints specification** to `Explicit values` or `Even spacing`.

#### Struct Type definition: Data scope

Scope of the structure type definition (imported from your custom code or exported from the generated code). The default value is `Auto`. When you select `Auto`:

- If you do not specify a value in the **Struct Type definition: Header file** box, the generated code exports the structure type definition to the file `modelName_types.h`. `modelName` is the name of the model.
- If you specify a value in the **Struct Type definition: Header file** box, such as `myHdr.h`, the generated code imports the structure type definition from `myHdr.h`.

To explicitly specify the data scope:

- To import the structure type definition into the generated code from your custom code, select `Imported`.
- To export the structure type definition from the generated code, select `Exported`.

Set the data scope of the structure type definition to `Imported` or `Exported` to avoid potential MISRA C:2012 violations.

If you do not specify a value in the **Struct Type definition: Header file** box, the generated code imports or exports the type definition from or to `StructName.h`. `StructName` is the name that you specify by using the property **Struct Type definition: Name**.

This property appears only if you set **Breakpoints specification** to `Explicit` values or `Even spacing`.

Struct Type definition: Header file

Name of the header file that contains the structure type definition. You can import the definition from a header file that you create, or export the definition into a generated header file. To control the scope of the structure type, adjust the setting for the **Struct Type definition: Data scope** property.

This property appears only if you set **Breakpoints specification** to `Explicit` values or `Even spacing`.

## Advanced

Support tunable size

Specification to enable tuning the effective size of the table in the generated code. In the code, the structure that corresponds to the object has an extra field for each breakpoint vector. Each extra field stores the length of the corresponding breakpoint vector. You can change the value of each field to adjust the effective size of the table. For more information on breakpoint and table sizes, see “Breakpoint and Table Size Features in Lookup Tables”.

This property appears only if you set **Breakpoints specification** to `Explicit` values or `Even spacing`. Selecting **Allow multiple instances of this type to have different table and breakpoint sizes** automatically selects this property.

---

**Note** If you store breakpoint data in `Simulink.Breakpoint` objects by setting **Breakpoints specification** to `Reference`, to enable tuning of the table size in the generated code, use the **Support tunable size** property of each `Simulink.Breakpoint` object.

---

Allow multiple instances of this type to have different table and breakpoint sizes

Specification to configure a Lookup Table object to support differently sized tables and breakpoints that have the same structure type. For example, assume two 1-D lookup table objects are configured as shown and have the same struct type name.

- Lookup table with tables and breakpoints of size [1x4]
- Lookup table with tables and breakpoints of size [1x6]

To enable a model with two blocks containing these objects to simulate, select the **Allow multiple instances of this type to have different table and breakpoint sizes** check box. For code generation with Simulink Coder, the software generates a common struct type with pointer typed member fields for the two objects to represent the table and breakpoint data.

This property appears only if you set **Breakpoints specification** to `Explicit` values or `Even spacing`.

For more information on breakpoint and table sizes, see “Breakpoint and Table Size Features in Lookup Tables”.

## Properties

### Breakpoints — Breakpoint set information

vector of `Simulink.lookupable.Breakpoint` objects | cell array of character vectors

Breakpoint set information, specified as a vector of `Simulink.lookupable.Breakpoint` objects, a cell array of character vectors, or a vector of `Simulink.lookupable.Evenspacing` objects.

If you use a vector of `Simulink.lookupable.Breakpoint` objects, each object represents a breakpoint set. To use a vector of `Simulink.lookupable.Breakpoint` objects, set the property `BreakpointsSpecification` to 'Explicit values'.

If you use a cell array of character vectors, each character vector represents the name of a `Simulink.Breakpoint` object. To use a cell array of character vectors, set the property `BreakpointsSpecification` to 'Reference'.

If you use a vector of `Simulink.lookupable.Evenspacing` objects, each object represents a breakpoint set. To use a vector of `Simulink.lookupable.Evenspacing` objects, set the property `BreakpointsSpecification` to 'Even Spacing'.

### **BreakpointsSpecification — Source of breakpoint set information**

'Explicit values' (default) | 'Reference' | 'Even spacing'

Source of the breakpoint set information, specified as 'Explicit values' (default), 'Even spacing', or 'Reference'. See the **Breakpoints > Specification** parameter.

Data Types: char

### **CoderInfo — Code generation settings for structure or array variable**

`Simulink.CoderInfo` object

Code generation settings for the structure variable (if you set `BreakpointsSpecification` to 'Explicit values' or 'Even spacing') or array variable ('Reference') that stores the lookup table and breakpoint sets, specified as a `Simulink.CoderInfo` object. You can specify a storage class or custom storage class by using this embedded object. See `Simulink.CoderInfo`.

### **StructTypeInfo — Settings for structure type in the generated code**

`Simulink.lookupable.StructTypeInfo` object

Settings for the structure type that the structure variable uses in the generated code, specified as a `Simulink.lookupable.StructTypeInfo` object.

If you set `BreakpointsSpecification` to 'Reference', the `Simulink.LookupTable` object does not appear in the generated code as a structure. The code generator ignores this property.

### **SupportTunableSize — Option to generate code that enables tunability of table size**

false (default) | true

Option to generate code that enables tunability of the effective size of the table, specified as true or false. See the **Support Tunable Size** parameter.

Data Types: logical

### **Table — Information for table data**

`Simulink.lookupable.Table` object

Information for the table data, specified as a `Simulink.lookupable.Table` object.

## **Copy Semantics**

Handle. To learn how handle classes affect copy operations, see Copying Objects.

## Examples

### Represent a One-Dimensional Lookup Table

- 1 Create a `Simulink.LookupTable` object named `LUTObj`.

```
LUTObj = Simulink.LookupTable;
```

- 2 Specify the table data.

```
LUTObj.Table.Value = [1.1 2.2 3.3 4.4 5.5];
```

- 3 Specify the breakpoint set data.

```
LUTObj.Breakpoints(1).Value = [-2 -1 0 1 2];
```

- 4 Specify a name for the structure type in the generated code.

```
LUTObj.StructTypeInfo.Name = 'myLUTStruct';
```

You can use `LUTObj` in a 1-D Lookup Table block dialog box. In the block, set **Data specification** to `Lookup table object` and **Name** to `LUTObj`.

To view the data, use the property dialog as described in “Edit Lookup Table Data with Lookup Table Spreadsheet”.

### Represent a Two-Dimensional Lookup Table

- 1 Create a `Simulink.LookupTable` object named `LUTObj`.

```
LUTObj = Simulink.LookupTable;
```

- 2 Specify the table data.

```
LUTObj.Table.Value = [1.1 2.2 3.3 4.4 5.5; ...
 6.6 7.7 8.8 9.9 10.1];
```

- 3 Specify the breakpoint set data. In the `Breakpoints` property, use the vector index 2 to set the values in the second breakpoint set.

```
LUTObj.Breakpoints(1).Value = [-1 1];
```

```
LUTObj.Breakpoints(2).Value = [-2 -1 0 1 2];
```

`LUTObj` creates a `Simulink.lookuptable.Breakpoint` object as the second vector element in the value of the `Breakpoints` property. Except for the `Value` property, the new object has default property values.

- 4 Specify a name for the structure type in the generated code.

```
LUTObj.StructTypeInfo.Name = 'myLUTStruct';
```

You can use `LUTObj` in a 2-D Lookup Table block dialog box.

To view the data, use the property dialog as described in “Edit Lookup Table Data with Lookup Table Spreadsheet”.

### Evenly Space Every Second Value Starting from 1

To evenly space every second value starting from 1, use the `Breakpoint` object.

- 1 Create a `Simulink.LookupTable` object named `LUTObj`.

```
LUTObj=Simulink.LookupTable
```

```
LUTObj =
```

```
LookupTable with properties:
```

```

 Table: [1x1 Simulink.lookuptable.Table]
 BreakpointsSpecification: 'Explicit values'
 Breakpoints: [1x1 Simulink.lookuptable.Breakpoint]
 SupportTunableSize: 0
 CoderInfo: [1x1 Simulink.CoderInfo]
 StructTypeInfo: [1x1 Simulink.lookuptable.StructTypeInfo]
```

- 2 Set up the breakpoint property to even spacing.

```
LUTObj.BreakpointsSpecification='Even spacing'
```

```
LUTObj =
```

```
LookupTable with properties:
```

```

 Table: [1x1 Simulink.lookuptable.Table]
 BreakpointsSpecification: 'Even spacing'
 Breakpoints: [1x1 Simulink.lookuptable.Evenspacing]
 SupportTunableSize: 0
 CoderInfo: [1x1 Simulink.CoderInfo]
 StructTypeInfo: [1x1 Simulink.lookuptable.StructTypeInfo]
```

- 3 Get the properties of the breakpoint.

```
LUTObj.Breakpoints(1)
```

```
ans =
```

```
Evenspacing with properties:
```

```

 FirstPoint: 0
 Spacing: 1
 DataType: 'auto'
 Min: []
 Max: []
 Unit: ''
 FirstPointName: 'BPFirstPoint1'
 SpacingName: 'BPSpacing1'
 TunableSizeName: 'N1'
 Description: ''
```

- 4 To set the first point property, use the Breakpoint object `FirstPoint` property.

```
LUTObj.Breakpoints(1).FirstPoint=1
```

- 5 To set the spacing property, use the Breakpoint object.

```
LUTObj.Breakpoints(1).Spacing=2
```

- 6 Get the properties of the breakpoint.

```

LUTObj.Breakpoints(1)

ans =

 Evenspacing with properties:

 FirstPoint: 1
 Spacing: 2
 DataType: 'auto'
 Min: []
 Max: []
 Unit: ''
FirstPointName: 'BPFirstPoint1'
 SpacingName: 'BPSpacing1'
TunableSizeName: 'N1'
 Description: ''

```

### Control Code Generation for Lookup Table and Breakpoint Sets

Create a `Simulink.LookupTable` object named `LUTObj`.

```
LUTObj = Simulink.LookupTable;
```

Specify the table data.

```
LUTObj.Table.Value = [1.00 2.25 3.50 4.75 6.00; ...
 7.25 8.50 9.75 11.00 12.25];
```

Specify the breakpoint set data. In the `Breakpoints` property, use the array index 2 to create an additional `Simulink.lookuptable.BreakpointInfo` object, which represents the second breakpoint set.

```
LUTObj.Breakpoints(1).Value = [-1 1];
```

```
LUTObj.Breakpoints(2).Value = [-2 -1 0 1 2];
```

Specify data types for the lookup table and each breakpoint set.

```
LUTObj.Table.DataType = 'fixdt(1,16,2)';
```

```
LUTObj.Breakpoints(1).DataType = 'int16';
```

```
LUTObj.Breakpoints(2).DataType = 'int16';
```

Specify unique names for the structure fields that store the table data and breakpoint sets in the generated code.

```
LUTObj.Table.FieldName = 'myTable';
```

```
LUTObj.Breakpoints(1).FieldName = 'myBPSet1';
```

```
LUTObj.Breakpoints(2).FieldName = 'myBPSet2';
```

Export the structure variable definition from the generated code by using the storage class `ExportedGlobal`.

```
LUTObj.CoderInfo.StorageClass = 'ExportedGlobal';
```

Name the structure type in the generated code `LUTStructType`. Export the structure type definition to a generated header file named `myLUTHdr.h`.

```
LUTObj.StructTypeInfo.Name = 'LUTStructType';
LUTObj.StructTypeInfo.DataScope = 'Exported';
LUTObj.StructTypeInfo.HeaderFileName = 'myLUTHdr.h';
```

In an n-D Lookup Table block in a model, set **Data specification** to Lookup table object and **Name** to `LUTObj`.

```
load_system('myModel_LUTObj')
set_param('myModel_LUTObj/Lookup Table', 'DataSpecification', 'Lookup table object', ...
 'LookupTableObject', 'LUTObj')
```

Generate code from the model.

```
slbuild('myModel_LUTObj')

Starting build procedure for: myModel_LUTObj
Generated code for 'myModel_LUTObj' is up to date because no structural, parameter or code re
Successful completion of code generation for: myModel_LUTObj
```

Build Summary

```
0 of 1 models built (1 models already up to date)
Build duration: 0h 0m 2.141s
```

The generated code defines the structure type `LUTStructType` in the generated header file `myLUTHdr.h`.

```
file = fullfile('myModel_LUTObj_ert_rtw', 'myLUTHdr.h');
rtwdemodbtype(file, 'typedef struct {', '} LUTStructType;', 1, 1)

typedef struct {
 int16_T myBPSet1[2];
 int16_T myBPSet2[5];
 int16_T myTable[10];
} LUTStructType;
```

The code uses the global structure variable `LUTObj` to store the table and breakpoint set data. The table data is scaled based on the specified fixed-point data type.

```
file = fullfile('myModel_LUTObj_ert_rtw', 'myModel_LUTObj.c');
rtwdemodbtype(file, 'LUTStructType LUTObj = {', '/* Variable: LUTObj', 1, 1)

LUTStructType LUTObj = {
 { -1, 1 },

 { -2, -1, 0, 1, 2 },

 { 4, 29, 9, 34, 14, 39, 19, 44, 24, 49 }
}; /* Variable: LUTObj
```

## Limitations

When blocks in a subsystem use `Simulink.LookupTable` or `Simulink.Breakpoint` objects, you cannot set data type override only on the subsystem. Instead, set data type override on the entire model.

## Version History

### Introduced in R2016b

### New Advanced Tab

*Behavior changed in R2022b*

- The **Support tunable size** property has been moved to the new **Advanced** tab.
- To configure a Lookup Table object to support differently sized tables and breakpoints, select the new **Allow multiple instances of this type to have different table and breakpoint sizes** check box.

# Simulink.lookupable.Breakpoint class

**Package:** Simulink.lookupable

Configure breakpoint set data for lookup table object

## Description

An object of the `Simulink.lookupable.Breakpoint` class stores breakpoint set information for a lookup table. The object resides in the `Breakpoints` property of a `Simulink.LookupTable` object or `Simulink.Breakpoint` object.

You can use `Simulink.LookupTable` and `Simulink.Breakpoint` objects to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

To represent multiple breakpoint sets for a multidimensional lookup table, store a vector of `Simulink.lookupable.Breakpoint` objects in the `Breakpoints` property of a `Simulink.LookupTable` object.

To share a breakpoint set between multiple lookup tables, use a `Simulink.Breakpoint` object to store and configure the breakpoint set information. Use the object in a `Prelookup` block and create `Simulink.LookupTable` objects to use in `Interpolation Using Prelookup` blocks.

## Construction

When you create a `Simulink.LookupTable` object or `Simulink.Breakpoint` object, a `Simulink.lookupable.Breakpoint` object appears as the value of the `Breakpoints` property.

To create more `Simulink.lookupable.Breakpoint` objects for a `Simulink.LookupTable` object, use this technique:

Access the `Breakpoints` property by specifying a vector index.

To create a `Simulink.lookupable.Breakpoint` object, you can set the value of any of the object properties. The `Simulink.LookupTable` object creates the `Simulink.lookupable.Breakpoint` object with default property values, and sets the property that you specified.

The value of the `Breakpoints` property is an array of `Simulink.lookupable.Breakpoint` objects. Each embedded object represents one breakpoint set.
