For example, suppose that you create a `Simulink.LookupTable` object named `LUTObj`. To create more breakpoint sets, access the `Breakpoints` property by specifying vector indices:

```
LUTObj.Breakpoints(1).Value = [-1 1];
LUTObj.Breakpoints(2).Value = [-2 -1 0 1 2];
LUTObj.Breakpoints(3).Value = [-5 -3 0 3 5];
```

The object `LUTObj` creates additional `Simulink.lookupable.Breakpoint` objects and sets the `Value` property of each object. `LUTObj` now stores information for three breakpoint sets.

## Properties

### Data Type — Data type of breakpoint set elements

'auto' (default) | character vector

Data type of breakpoint set elements, specified as a character vector. You can explicitly specify an integer, half data type, a floating-point, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

The default value, 'auto', means that the breakpoint set acquires a data type from the value that you specify in the `Value` property. If you use an untyped expression such as `[1 2 3]` to set `Value`, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Example: 'int16'

Example: 'myTypeAlias'

Data Types: char

### Description — Description of breakpoint set

' ' (default) | character vector

Description of the breakpoint set, specified as a character vector.

Example: 'This breakpoint set represents the pressure input.'

Data Types: char

### Dimensions — Dimension lengths of breakpoint set

[0 0] (default) | numeric vector

Dimension lengths of the breakpoint set, returned as a numeric vector or specified as a character vector.

To use symbolic dimensions, specify a character vector.

### FieldName — Name of structure field that stores breakpoint set data

'BP' (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the breakpoint set data.

The code generator uses this property only under these circumstances, which cause the breakpoint data to appear in the generated code as a structure field:

- The `Simulink.lookuptable.Breakpoint` object exists in a `Simulink.LookupTable` object and in the `Simulink.LookupTable` object you set `BreakpointsSpecification` to 'Explicit values'.
- The `Simulink.lookuptable.Breakpoint` object exists in a `Simulink.Breakpoint` object and in the `Simulink.Breakpoint` object you set `SupportTunableSize` to true.

Example: 'MyBkptSet1'

Data Types: char

### **Max — Maximum value of breakpoint set elements**

[] (default) | numeric double value

Maximum value of the elements of the breakpoint set, specified as a numeric, real value of the data type double.

Example: 17.23

Data Types: double

### **Min — Minimum value of breakpoint set elements**

[] (default) | numeric double value

Minimum value of the elements of the breakpoint set, specified as a numeric, real value of the data type double.

Example: -52.6

Data Types: double

### **TunableSizeName — Name of structure field that stores length of breakpoint set**

'N' (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the length of the breakpoint set, which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory.

The code generator uses this property only under these circumstances, which enable a tunable table size in the generated code:

- The `Simulink.lookupable.Breakpoint` object exists in a `Simulink.LookupTable` object and in the `Simulink.LookupTable` object you set:
  - `BreakpointsSpecification` to 'Explicit values'.
  - `SupportTunableSize` to true.
- The `Simulink.lookupable.Breakpoint` object exists in a `Simulink.Breakpoint` object and in the `Simulink.Breakpoint` object you set `SupportTunableSize` to true.

Example: 'LengthForDim1'

Data Types: char

### **Unit — Physical unit of breakpoint set**

' ' (default) | character vector

Physical unit of the elements of the breakpoint set, specified as a character vector.

Example: 'inches'

Data Types: char

### **Value — Breakpoint set data**

[] (default) | numeric vector

The breakpoint set data, specified as a numeric vector with at least two elements. To control the data type of the breakpoint set, use the `DataType` property of the `Simulink.LookupTable.Breakpoint` object.

When you set `DataType` to 'auto', to set the `Value` property, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

Example: `[10 20 30]`

Data Types: `single` | `double` | `half` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fi`

`Simulink.LookupTable` | `Simulink.Breakpoint`

# Simulink.lookupable.Evenspacing class

**Package:** Simulink.lookupable

Configure even spacing set data for lookup table object

## Description

An object of the Simulink.lookupable.Evenspacing class stores event spacing set information for a lookup table. The object resides in the Evenspacing property of a Simulink.LookupTable object.

You can use Simulink.LookupTable objects to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

To represent multiple breakpoint sets for a multidimensional lookup table, store a vector of Simulink.lookupable.Evenspacing objects in the Evenspacing property of a Simulink.LookupTable object.

## Construction

When you create a Simulink.LookupTable object and set BreakpointSpecification to 'Even spacing', a Simulink.lookupable.Evenspacing object appears as the value of the Breakpoints property.

To create more Simulink.lookupable.Evenspacing objects for a Simulink.LookupTable object, use this technique:

Access the Breakpoints property by specifying a vector index.

To create a Simulink.lookupable.Evenspacing object, you can set the value of any of the object properties. The Simulink.LookupTable object creates the Simulink.lookupable.Evenspacing object with default property values, and sets the property that you specified.

The value of the Breakpoints property is an array of Simulink.lookupable.Evenspacing objects. Each embedded object represents one breakpoint set.

For example, suppose that you create a Simulink.LookupTable object named myLUTObj. To create more breakpoint sets, access the Breakpoints property by specifying scalar indices for FirstPoint and Spacing properties. To create more even spacing breakpoint sets, update the object with this pair of properties:

```
LUTObj.Breakpoints(1).FirstPoint=-1;
LUTObj.Breakpoints(1).Spacing=2;
LUTObj.Breakpoints(1).FirstPoint=-2;
LUTObj.Breakpoints(1).Spacing=1;
LUTObj.Breakpoints(1).FirstPoint=-5;
LUTObj.Breakpoints(1).Spacing=2;
```

The object `myLUTObj` creates additional `Simulink.lookuptable.Evenspacing` objects and sets the `FirstPoint` and `Spacing` properties of each object. `LUTObj` now stores information for three breakpoint sets.

## Properties

### FirstPoint — First point in evenly spaced breakpoint data

[] (default) | numeric scalar

First point in evenly spaced breakpoint data, specified as a numeric scalar. To control the data type of the breakpoint set, use the `DataType` property of the `Simulink.lookuptable.Evenspacing` object.

When you set `DataType` to 'auto', to set the `FirstPoint` property, use a typed expression such as `single(1)` or use the `fi` constructor to embed a `fi` object.

Example: -1

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fi`

### Spacing — Spacing between points in evenly spaced breakpoint data

[] (default) | numeric, positive, monotonically increasing scalar

Spacing between points in evenly spaced breakpoint data, specified as a numeric scalar. To control the data type of the breakpoint set, use the `DataType` property of the `Simulink.lookuptable.Evenspacing` object.

When you set `DataType` to 'auto', to set the `Spacing` property, use a typed expression such as `single(1)` or use the `fi` constructor to embed an `fi` object.

Example: -1

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fi`

### DataType — Data type of breakpoint set elements

'auto' (default) | character vector

Data type of breakpoint set elements, specified as a character vector. You can explicitly specify an integer, a floating-point, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

The default value, 'auto', means that the breakpoint set acquires a data type from the value that you specify in the `Value` property. If you use an untyped expression such as `[1 2 3]` to set `Value`, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Example: 'int16'

Example: 'myTypeAlias'

Data Types: `char`

**Min — Minimum value of breakpoint set elements**

[] (default) | numeric double value

Minimum value of the elements of the breakpoint set, specified as a numeric, real value of the data type `double`.

Example: `-52.6`

Data Types: `double`

**Max — Maximum value of breakpoint set elements**

[] (default) | numeric double value

Maximum value of the elements of the breakpoint set, specified as a numeric, real value of the data type `double`.

Example: `17.23`

Data Types: `double`

**Unit — Physical unit of breakpoint set**

' ' (default) | character vector

Physical unit of the elements of the breakpoint set, specified as a character vector.

Example: `'inches'`

Data Types: `char`

**FirstPointName — Name of the Simulink.lookuptable.Evenspacing object that stores the information for the first point**

'BPFIRSTPOINT1' (default) | character vector

Name of the `Simulink.Breakpoint` object that stores the information for the first point, specified as a character vector. Generated code uses this name to display the first point.

Example: `'myFirstPointName'`

Data Types: `char`

**SpacingName — Name of the Simulink.lookuptable.Evenspacing object that stores the information for the spacing**

'auto' (default) | character vector

Name of the `Simulink.Breakpoint` object that stores the information for the spacing, specified as a character vector. Generated code uses this name to display the spacing.

Example: `'mySpacing'`

Data Types: `char`

**TunableSizeName — Name of structure field that stores length of breakpoint set**

'N' (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the length of the breakpoint set, which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory.

The code generator uses the property only under these circumstances, which enable a tunable table size in the generated code:

- The `Simulink.lookuptable.Evenspacing` object exists in a `Simulink.LookupTable` object, in which you set `BreakpointsSpecification` to 'Even spacing' and `SupportTunableSize` to `true`.

Example: 'LengthForDim1'

Data Types: char

### **Description — Description of breakpoint set**

' ' (default) | character vector

Description of the breakpoint set, specified as a character vector.

Example: 'This breakpoint set represents the pressure input.'

Data Types: char

`Simulink.LookupTable` | `Simulink.lookuptable.Breakpoint`

# Simulink.lookupable.StructTypeInfo class

**Package:** Simulink.lookupable

Configure settings for structure type that lookup table object uses in the generated code

## Description

An object of the Simulink.lookupable.StructTypeInfo class controls the structure type that the generated code creates to store data for lookup table objects. The Simulink.lookupable.StructTypeInfo object resides in the StructTypeInfo property of a Simulink.LookupTable object or Simulink.Breakpoint object. Use these parent objects to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

A Simulink.LookupTable object appears as a structure in the generated code when you set the Specification property to 'Explicit values'. A Simulink.Breakpoint object appears as a structure in the generated code when you set the SupportTunableSize property to true.

## Construction

When you create a Simulink.LookupTable or Simulink.Breakpoint object, a Simulink.lookupable.StructTypeInfo object appears as the value of the StructTypeInfo property.

## Properties

### DataScope — Scope of structure type definition

'Auto' (default) | 'Exported' | 'Imported'

Scope of structure type definition, specified as a character vector.

Set the data scope to Imported or Exported to avoid potential MISRA C:2012 violations.

Data Types: char

### HeaderFileName — Name of header file that contains structure type definition

'' (default) | character vector

Name of the header file that contains the structure type definition, specified as a character vector.

Example: 'myHdr.h'

Data Types: char

### Name — Name of structure type

'' (default) | character vector

Name of the structure type, specified as a character vector.

Data Types: char

`Simulink.LookupTable` | `Simulink.Breakpoint`

# Simulink.lookupable.Table class

**Package:** Simulink.lookupable

Configure table data for lookup table object

## Description

An object of the Simulink.lookupable.Table class stores table information for a lookup table. The object resides in the Table property of a Simulink.LookupTable object. You can use the Simulink.LookupTable object to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

## Construction

When you create a Simulink.LookupTable object, a Simulink.lookupable.Table object appears as the value of the Table property.

## Properties

### Data Type — Data type of table data elements

'auto' (default) | character vector

Data type of the table data elements, specified as a character vector. You can explicitly specify an integer data type, half data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a Simulink.AliasType object.

The default value, 'auto', means that the table data acquire a data type from the value that you specify in the Value property. If you use an untyped expression such as [1 2 3] to set Value, the table data use the data type double. If you specify a typed expression such as single([1 2 3]) or an fi object, the table data use the data type specified by the expression or object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in Simulink.LookupTable and Simulink.Breakpoint objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Example: 'int16'

Example: 'myTypeAlias'

Data Types: char

### Description — Description of table data

' ' (default) | character vector

Description of the table data, specified as a character vector.

Example: 'This lookup table describes the action of a pump.'

Data Types: char

### Dimensions — Dimension lengths of table data

[0 0] (default) | numeric vector

Dimension lengths of the table data, returned as a numeric vector or specified as a character vector.

To use symbolic dimensions, specify a character vector.

**FieldName — Name of a structure field in the generated code**

'Table' (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the table data if you configure the `Simulink.LookupTable` object to appear in the generated code as a structure.

Example: 'MyPumpTable'

Data Types: char

**Max — Maximum value of table data elements**

[] (default) | numeric double value

Maximum value of the elements of the table data, specified as a numeric, real value of the data type `double`.

Example: 17.23

Data Types: double

**Min — Minimum value of table data elements**

[] (default) | numeric double value

Minimum value of the elements of the table data, specified as a numeric, real value of the data type `double`.

Example: -52.6

Data Types: double

**Unit — Physical unit of table elements**

' ' (default) | character vector

Physical unit of the elements of the table data, specified as a character vector.

Example: 'degC'

Data Types: char

**Value — Table data**

[] (default) | numeric vector or multidimensional array

The table data, specified as a numeric vector or multidimensional array with at least two elements. To control the data type of the table data, use the `DataType` property of the `Simulink.lookuptable.Table` object.

When you set `DataType` to 'auto', to set the `Value` property, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

Example: [10 20 30; 40 50 60]

Data Types: single | double | half | int8 | int16 | int32 | uint8 | uint16 | uint32 | fi

## Simulink.Mask class

**Package:** Simulink

Control masks programmatically

### Description

Use an instance of `Simulink.Mask` class to perform the following operations:

- Create, copy, and delete masks.
- Create, edit, and delete mask parameters.
- Determine the block that owns the mask.
- Obtain workspace variables defined for a mask.

### Properties

#### Type

Specifies the mask type of the associated block.

**Type:** character vector | string scalar

**Default:** Empty character vector

#### Description

Specifies the block description of the associated block.

**Type:** character vector | string scalar

**Default:** Empty character vector

#### Help

Specifies the help text that is displayed for the mask.

**Type:** character vector | string scalar

**Default:** Empty character vector

#### Initialization

Specifies the initialization commands for the associated block.

**Type:** character vector | string scalar

**Default:** Empty character vector

#### SelfModifiable

Indicates that the block can modify itself and its content.

**Type:** boolean

**Values:** 'on' | 'off'

**Default:** 'off'

### **Display**

Specifies MATLAB code for drawing the block icon.

**Type:** character vector | string scalar

**Default:** Empty character vector

### **IconFrame**

Sets the visibility of the block frame. (Visible is on, Invisible is off).

**Type:** boolean

**Values:** 'on' | 'off'

**Default:** 'on'

### **IconOpaque**

Sets the transparency of the icon (Opaque is on, Transparent is off).

**Type:** boolean

**Values:** 'on' | 'off'

**Default:** 'on'

### **RunInitForIconRedraw**

Specifies whether Simulink must run mask initialization before executing the mask icon commands.

**Type:** enum

**Values:** 'auto' | 'on' | 'off'

**Default:** 'auto'

### **IconRotate**

Sets icon to rotate with the block.

**Type:** enum

**Values:** 'none' | 'port'

**Default:** 'none'

### **PortRotate**

Specifies the port rotation policy for the masked block.

**Type:** enum

**Values:** 'default' | 'physical'

**Default:** 'default'

**IconUnits**

Specifies the units for the drawing commands.

**Type:** enum

**Values:** 'pixels' | 'autoscale' | 'normalized'

**Default:** 'autoscale'

## Methods

<code>addCrossParameterConstraint</code>	Add cross-parameter constraint
<code>addDialogControl</code>	Add dialog control elements to mask dialog box
<code>addParameter</code>	Add a parameter to a mask
<code>addParameterConstraint</code>	Add parameter constraint to a mask
<code>copy</code>	Copy a mask from one block to another
<code>create</code>	Create a mask on a Simulink block
<code>delete</code>	Unmask a block and delete the mask from memory
<code>get</code>	Get a block mask as a mask object
<code>getAssociatedParametersOfConstraint</code>	Get mask parameters associated with a constraint
<code>getCrossParameterConstraint</code>	Get cross-parameter constraint
<code>getDialogControl</code>	Search for a specific dialog control on the mask
<code>getOwner</code>	Determine the block that owns a mask
<code>getParameter</code>	Get a mask parameter using its name
<code>getParameterConstraint</code>	Get mask parameter constraint properties
<code>getWorkspaceVariables</code>	Get all the variables defined in the mask workspace for a masked block
<code>numParameters</code>	Determine the number of parameters in a mask
<code>removeAllCrossParameterConstraints</code>	Delete all cross-parameter constraints from a mask
<code>removeAllParameterConstraints</code>	Delete all mask parameter constraints
<code>removeAllParameters</code>	Remove all existing parameters from a mask
<code>removeCrossParameterConstraint</code>	Delete a cross-parameter constraint
<code>removeDialogControl</code>	Remove dialog control element from mask dialog box
<code>removeParameter</code>	Remove parameter from mask dialog box
<code>removeParameterConstraint</code>	Delete a mask parameter constraint
<code>set</code>	Set the properties of an existing mask

## addCrossParameterConstraint

**Class:** Simulink.Mask

**Package:** Simulink

Add cross-parameter constraint

### Syntax

```
CrossConstraint = maskObj.addCrossParameterConstraint(Name,Value)
```

### Description

`CrossConstraint = maskObj.addCrossParameterConstraint(Name,Value)` adds a constraint among parameters of a mask.

### Input Arguments

**maskObj** — Block mask handle

mask object

Block mask handle, specified as a mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: char | cell

**Name-Value Pair Arguments**

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

**Name** — Cross-parameter constraint name

character vector | string

Cross-parameter constraint name, specified as a character vector. Must be a valid MATLAB value.

**Rule** — Cross-parameter constraint rule

MATLAB expression | string

Cross-parameter constraint rule, specified as a valid MATLAB expression that returns logical true or false. You can specify multiple rules by separating them with a logical operators like `&&`. For example, `parameter1 > parameter2 && parameter2 > parameter3`. Here, `parameter1`, `parameter2` and `parameter3` are parameters of a mask.

**ErrorMessage** — Error message

character vector | string

Optional field. Specifies the error message to be displayed when the cross parameter constraint rule is not satisfied. You can specify the error message as character vector or as a message catalog ID. If you use the message catalog ID to specify an error, the error message must not have any holes in it. Simulink displays a default error message if no user-defined error message is found.

## Output Arguments

### CrossConstraint — Cross parameter constraint

cell array

Handle to the cross-parameter constraint, returned as a cell array.

## Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Add cross parameter constraint.
CrossConstraint = maskObj.addCrossParameterConstraint('Name','crossconstraint1',...
'MATLABexpression','upperbound > lowerbound','ErrorMessage','Incorrect value specified.')

ans =

 CrossParameterConstraints with properties:

 Name: 'crossconstraint1'
MATLABexpression: 'upperbound > lowerbound'
 ErrorMessage: 'Incorrect value specified.'
```

## Version History

Introduced in R2018a

Simulink.Mask | “Create Block Masks”

# addDialogControl

**Class:** Simulink.Mask

**Package:** Simulink

Add dialog control elements to mask dialog box

## Syntax

```
successIndicator = maskObj.addDialogControl(controlType,controlIdentifier)
successIndicator = maskObj.addDialogControl(Name,Value)
```

## Description

`successIndicator = maskObj.addDialogControl(controlType,controlIdentifier)` adds dialog control elements like text, hyperlinks, or tabs to mask dialog box. First get the mask object and assign it to the variable `maskObj`

`successIndicator = maskObj.addDialogControl(Name,Value)` specifies the `Name` and `Value` arguments for an element on the mask dialog box. You can specify multiple `Name-Value` pairs.

## Input Arguments

### **controlType** — Value type of dialog control element

character vector | string scalar

Type of dialog control element, specified

- 'panel'
- 'group'
- 'tabcontainer'
- 'tab'
- 'collapsiblepanel'
- 'text'
- 'image'
- 'hyperlink'
- 'pushbutton'

### **controlIdentifier** — Unique identifier for the element

character vector | string scalar

Specifies the programmatic identifier for the element of mask dialog box. Use a name that is unique and does not have space between words. For more information, see “Variable Names”.

### **Name-Value Pair Arguments**

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes ( ' ') and is case-sensitive.

You can specify several name and value pair arguments in any order as Name1,Value1, . . . ,NameN,ValueN.

**Type**

Type of control that is used to specify the value of this dialog control element. Type is a required argument. The permitted values are 'panel', 'group', 'tabcontainer', 'tab', 'collapsiblepanel', 'text', 'image', 'hyperlink', and 'pushbutton'.

**Default:** empty

**Name**

The identifier of the dialog control element. Name is a required argument. This field is available for all dialog control types.

**Default:** empty

**Prompt**

Text that is displayed in the dialog control element on the Mask dialog box. This field is available for all except for panel and image dialog control types.

**Default:** empty

**Tooltip**

Tooltip for the dialog control element.

**Default:** empty

**Enabled**

Option to specify whether you can set value for the dialog control element. This field is available for all dialog control types.

**Default:** 'on'

**Visible**

Option to set whether the dialog control element is hidden or visible to the user. This field is available for all dialog control types.

**Default:** 'on'

**Callback**

Container for MATLAB code that executes when you edit the dialog control element and click **Apply**. This field is available only for the hyperlink and pushbutton dialog control types.

**Default:** empty

**Row**

Option to set whether the dialog control is placed in the new row or the same row. This field is available for all dialog control types.

**Default:** empty

### Filepath

Contains the path to an image file. This field is available for image, and pushbutton dialog control types.

**Default:** empty

### Container

Option to specify a container for the child dialog control. The permitted values are the names of 'panel', 'group', and 'tab' dialog controls.

## Examples Add Dialog Control Elements to Mask Dialog Box

Get mask object and add dialog control element to it.

```
% Get mask object on model Engine
new_system('Engine');
add_block('built-in/gain','Engine/gain');
save_system;
open_system('Engine');
maskObj = Simulink.Mask.create(gcf);
maskObj = Simulink.Mask.get(gcf);
save_system;
% Add hyperlink to mask dialog box

maskLink = maskObj.addDialogControl('hyperlink','link');
maskLink.Prompt = 'Mathworks Home Page';
maskLink.Callback = 'web(''www.mathworks.com'')'

maskLink =
 Hyperlink with properties:

 Name: 'link'
 Prompt: 'Mathworks Home Page'
 Callback: 'web(''www.mathworks.com'')'
 Row: 'new'
 Enabled: 'on'
 Visible: 'on'
 HorizontalStretch: 'on'
 Tooltip: ''

% Add text to mask dialog box
maskText = maskObj.addDialogControl('text','text_tag');
maskText.Prompt = 'Enable range checking';

% Add button to mask dialog box
maskButton = maskObj.addDialogControl('pushbutton','button_tag');
maskButton.Prompt = 'Compute';
save_system;
```

### Add Dialog Control Elements to Mask Dialog Box Tabs

Create tabs on the mask dialog box and add elements to these tabs.

```

% Get mask object on a block named 'GainBlock'
add_block('built-in/gain','Engine/gain1');
maskObj = Simulink.Mask.create(gcf);
maskObj = Simulink.Mask.get(gcf);

% Create a tab container

maskObj.addDialogControl('tabcontainer','allTabs');
tabs = maskObj.getDialogControl('allTabs');

% Create tabs and name them

maskTab1 = tabs.addDialogControl('tab','First');
maskTab1.Prompt = 'First tab';

maskTab2 = tabs.addDialogControl('tab','Second');
maskTab2.Prompt = 'Second tab';

% Add elements to one of the tabs

firstTab = tabs.getDialogControl('First');
firstTab.addDialogControl('text','textOnFirst');
firstTab.getDialogControl('textOnFirst').Prompt = 'Tab one';
save_system;

```

### Add Dialog Control Element Using Name-Value Pair

Add dialog control element and specify values for it.

```

% Get mask object on model Engine

add_block('built-in/gain','Engine/gain2');
maskObj = Simulink.Mask.create(gcf);
maskObj = Simulink.Mask.get(gcf);

% Add a dialog box and specify values for it

maskDialog = maskObj.addDialogControl('Name','abc','Type','text','Prompt','hello','Visible','off');
save_system;

```

## Version History

Introduced in R2014a

Simulink.Mask | “Create Block Masks” | Control Masks Programmatically

# addParameter

**Class:** Simulink.Mask

**Package:** Simulink

Add a parameter to a mask

## Syntax

```
p = Simulink.Mask.get(blockName)
p.addParameter(Name, Value)
```

## Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.addParameter(Name, Value)` appends a parameter to the mask. If you do not specify name-value pairs as arguments with this command, Simulink generates name for the mask parameter with control type set to edit.

## Input Arguments

### **blockName**

The handle to the block or the path to the block inside the model.

### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, . . . , NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

### **Type — Type of control that specifies the value of the parameter**

Type of control that is used to specify the value of this parameter. The permitted values are: edit, checkbox, popup, combobox, listbox, radiobutton, slider, dial, spinbox, unit, textarea, breakpoint, customtable, tree, unit, min, max.

### **TypeOptions — Options that are displayed within a popup control or in a promoted parameter**

The options that are displayed within a popup control or in a promoted parameter. This field is a cell array.

### **Name — Name of the mask parameter**

The name of the mask parameter. This name is assigned to the mask workspace variable created for this parameter.

**Prompt — Text that identifies the parameter on the mask parameter dialog box**

Text that identifies the parameter on the Mask Parameters dialog box.

**Value — Default value of the Mask Parameter on the mask parameter dialog box**

The default value of the mask parameter in the Mask Parameters dialog box. Type specific; depends on the Type of the parameter

**Evaluate — Option to specify whether to evaluate the parameter**

(default) | on

Option to specify whether parameter must be evaluated.

**Tunable — Option to specify whether parameter is tunable**

(default) | on

Option to specify whether parameter is tunable.

**Enabled — Option to specify whether user can set parameter value**

(default) | on

Option to specify whether user can set parameter value.

**Visible — Set the visibility of the mask parameter**

(default) | on

Option to set whether mask parameter is hidden or visible to the user.

**Callback — Set the MATLAB code that need to be executed when there is a change in the mask parameter dialog box**

(default) | empty

Container for MATLAB code that executes when user makes a change in the Mask Parameters dialog box.

**Container — Set this option to specify a container for the child parameters**

(default) | empty

Option to specify a container for the child parameters. The permitted values are the names of 'panel', 'group', and 'tab'.

**ExamplesAdd Popup Parameter**

Step 1: Get mask as an object using a masked block's path.

```
new_system('paramexample');
add_block('built-in/subsystem', 'paramexample/subsystem');
save_system;
open_system('paramexample');
p= Simulink.Mask.create(gcf);
p= Simulink.Mask.get(gcf);
```

Step 2: Add a parameter to the mask without specifying name-value pairs for parameter attributes.

```
p.addParameter;
```

Step 3: Add a mask parameter of type popup that cannot be evaluated.

```
p.addParameter('Type','popup','TypeOptions',{ 'Red' 'Blue' 'Green'}, 'Evaluate','off');
save_system;
```

### **See Also**

# addParameterConstraint

**Class:** Simulink.Mask

**Package:** Simulink

Add parameter constraint to a mask

## Syntax

```
paramConstraint = maskObj.addParameterConstraint(Name,Value)
```

## Description

`paramConstraint = maskObj.addParameterConstraint(Name,Value)` adds a constraint to the specified mask. Constraints can only be associated to the **Edit** type mask parameters.

## Input Arguments

### **maskObj** — Block mask handle

mask object

Block mask handle, specified as a mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`

Data Types: `char` | `cell`

### **Name-Value Pair Arguments**

Specify optional comma-separated pairs of `Name, Value` arguments. `Name` is the argument name and `Value` is the corresponding value. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

### **Name** — Mask constraint name

character vector | string

Required field. Must be a valid MATLAB name. Specifies a name for the mask parameter constraint.

### **Parameters** — Mask parameter name

cell array of character vector | string

Optional field. Specifies the **Edit** mask parameter name to which you want to associate the constraint.

### **Rules** — Rule for mask parameter constraint

`Data Type` | `Dimension` | `Complexity` | `Sign` | `Finiteness` | `Minimum` | `Maximum` | `CustomConstraint`

Required field. Rules are defined within curly braces. A constraint can have single or multiple rules.

**Name-Value Pairs for Rules**

Name	Value
DataType	double, single, numeric, integer, int8, uint8, int16, uint16, int32, uint32, boolean, enum, fixdt
Dimension	scalar, row vector, column vector, 2-D matrix, n-D matrix
Complexity	real, complex
Sign	positive, negative, zero
Finiteness	finite, inf, -inf, NaN
Minimum	character vector
Maximum	character vector
CustomConstraint	Valid MATLAB expression returning logical true or false.
CustomErrorMessage	character vector or a message catalog ID. If you use the message catalog ID to specify an error, the error message must not have any holes in it. This error message is specifically for custom constraint validation failure.

**Output Arguments****paramConstraint — Mask parameter constraint**

character vector | string

Handle to the mask parameter constraint, returned as a character vector. You can associate a constraint to the mask parameter either during or after creating the constraint.

**Examples****Create Mask Constraint with Single Rule**

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Create mask constraint with single rule.
paramConstraint = maskObj.addParameterConstraint('Name','const2',...
'Parameters',{'Parameter2'}, 'Rules', {'DataType', 'uint8'})
```

ans =

Constraints with properties:

```
 Name: 'const2'
ConstraintRules: [1x1 Simulink.Mask.ParameterConstraintRules]
```

**Create Mask Constraint with Multiple Rules**

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);
```

```
% Create mask constraint with multiple rules.
paramConstraint = maskObj.addParameterConstraint('Name','const3',...
'Parameters',{'Parameter3'}, 'Rules', {{'DataType', 'uint8'},{'DataType', {'fixdt(1,8,4)'}}})

ans =

 Constraints with properties:

 Name: 'const3'
 ConstraintRules: [1x2 Simulink.Mask.ParameterConstraintRules]
```

## Version History

Introduced in R2018a

### See Also

Simulink.Mask | “Create Block Masks”

## Simulink.Mask.copy

**Class:** Simulink.Mask

**Package:** Simulink

Copy a mask from one block to another

### Syntax

```
pSource = Simulink.Mask.get(srcBlockName)
pDest = Simulink.Mask.create(destBlockName)
pDest.copy(pSource)
```

### Description

`pSource = Simulink.Mask.get(srcBlockName)` gets the mask on the source block specified by `blockName` as a mask object.

`pDest = Simulink.Mask.create(destBlockName)` creates an empty mask on the destination block specified by `destBlockName`.

`pDest.copy(pSource)` overwrites the destination mask with the source mask.

### Input Arguments

#### `srcBlockName`

The handle to the source block or the path to the source block inside the model.

---

**Note** The source block should be masked.

---

#### `destBlockName`

The handle to the destination block or the path to the destination block inside the model.

---

**Note** The destination block should have an empty mask. Otherwise, the copied mask will overwrite the non-empty mask.

---

### Examples

- 1 Create an empty mask on the destination block using the block's path.  
`pDest = Simulink.Mask.create('myModel/Subsystem');`
- 2 Get source mask as an object using the source block's path.  
`pSource = Simulink.Mask.get('myModel/Abs');`
- 3 Make the destination mask a copy of the source mask.

```
pDest.copy(pSource);
```

### **See Also**

Simulink.Mask | “Create Block Masks”

## Simulink.Mask.create

**Class:** Simulink.Mask

**Package:** Simulink

Create a mask on a Simulink block

### Syntax

```
p = Simulink.Mask.create(blockName)
```

### Description

`p = Simulink.Mask.create(blockName)` creates an empty mask on the block specified by `blockName`. If the specified block is already masked, an error message appears.

### Input Arguments

#### **blockName**

The handle to the block or the path to the block inside the model.

### Examples

- 1 Create a mask using a block's handle.

---

**Note** In the model, select the block to be masked.

---

```
p = Simulink.Mask.create(gcbh);
```

- 2 Create a mask using the block's path.

```
p = Simulink.Mask.create('myModel/Subsystem');
```

### See Also

`Simulink.Mask` | "Create Block Masks"

# delete

**Class:** Simulink.Mask

**Package:** Simulink

Unmask a block and delete the mask from memory

## Syntax

```
p = Simulink.Mask.get(blockName)
p.delete
```

## Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.delete` unmask the block and deletes the mask from memory.

## Input Arguments

### `blockName`

The handle to the block or the path to the block inside the model.

## Examples

- 1 Get mask as an object using a masked block's path.  

```
p = Simulink.Mask.get('myModel/Subsystem');
```
- 2 Unmask the block using the mask object and delete the mask from memory.  

```
p.delete;
```

## See Also

`Simulink.Mask` | "Create Block Masks"

## Simulink.Mask.get

**Class:** Simulink.Mask

**Package:** Simulink

Get a block mask as a mask object

### Syntax

```
p = Simulink.Mask.get(blockName)
```

### Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object. If the specified block is not masked, a null value returns.

### Input Arguments

#### **blockName**

The handle to the block or the path to the block inside the model.

### Examples

- 1 Get mask as an object using a masked block's handle.

---

**Note** In the model, select the masked block.

---

```
p = Simulink.Mask.get(gcbh);
```

- 2 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

# getAssociatedParametersOfConstraint

**Class:** Simulink.Mask

**Package:** Simulink

Get mask parameters associated with a constraint

## Syntax

```
maskParam = maskObj.getAssociatedParametersOfConstraint(paramConstraintName)
```

## Description

`maskParam = maskObj.getAssociatedParametersOfConstraint(paramConstraintName)` gets the parameters that are associated with a mask constraint.

## Input Arguments

**maskObj — Block mask handle**

mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: char | cell

**paramConstraintName — Mask constraint name**

character vector | string

Name of the constraint for which you want to find the associated mask parameters, specified as character vector.

## Output Arguments

**maskParam — Mask parameter name**

cell array of character vector

Mask parameter, specified as a cell array.

## Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Find parameters associated with the constraint.
maskParam = maskObj.getAssociatedParametersOfConstraint('const3')
```

ans =

1×1 cell array

```
{'Parameter1'}
```

## **Version History**

**Introduced in R2018a**

### **See Also**

[Simulink.Mask](#) | “Create Block Masks”

# getCrossParameterConstraint

**Class:** Simulink.Mask

**Package:** Simulink

Get cross-parameter constraint

## Syntax

```
CrossConstraint = maskObj.getCrossParameterConstraint(CrossConstraintName)
```

## Description

`CrossConstraint = maskObj.getCrossParameterConstraint(CrossConstraintName)` gets the properties of a cross parameter constraint on a mask. Apply a cross-parameter constraint to specify rules between mask parameter values.

## Input Arguments

**maskObj — Block mask handle**

mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: char | cell

**CrossConstraintName — Cross-constraint name**

character vector | string

Name of the cross-parameter constraint for which you get the constraint properties, specified as the mask object.

## Output Arguments

**CrossConstraint — Cross-constraint property**

cell array

Cross-parameter constraint properties, returned as a cell array.

## Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get cross constraint.
CrossConstraint = maskObj.getCrossParameterConstraint('crossparam1')
```

ans =

```
CrossParameterConstraints with properties:
 Name: 'crossparam1'
 Rule: 'Parameter2 > Parameter3'
 ErrorMessage: ''
```

## **Version History**

**Introduced in R2018a**

`Simulink.Mask` | “Create Block Masks”

# getDialogControl

**Class:** Simulink.Mask

**Package:** Simulink

Search for a specific dialog control on the mask

## Syntax

```
[control, phandle] = handle.getDialogControl(cname)
```

## Description

`[control, phandle] = handle.getDialogControl(cname)` , search for a specific child dialog control recursively on the mask dialog.

## Input Arguments

**cname**

Name of the dialog control being searched on the mask dialog.

**Default:**

## Output Arguments

**control**

Target dialog control being searched on the mask dialog.

**phandle**

Parent of the dialog control being searched mask dialog.

## Examples

### Find a dialog control

Find a text dialog control on the mask dialog box. `maskObj` is the handle to the mask object. The `getDialogControl` method returns the handle to the dialog control (`hdlgctrl` ) and handle to the parent dialog control (`phandle` ).

```
[hdlgctrl, phandle] = maskObj.getDialogControl('txt_var')
```

## See Also

`Simulink.Mask` | “Create Block Masks”

## getOwner

**Class:** Simulink.Mask

**Package:** Simulink

Determine the block that owns a mask

### Syntax

```
p = Simulink.Mask.get(blockName)
p.getOwner
```

### Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.getOwner` returns the interface to the block that owns the mask.

### Input Arguments

#### **blockName**

The handle to the block or the path to the block inside the model.

### Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Get the interface to the block that owns the mask.

```
p.getOwner;
```

### See Also

`Simulink.Mask` | "Create Block Masks"

# getParameter

**Class:** Simulink.Mask

**Package:** Simulink

Get a mask parameter using its name

## Syntax

```
p = Simulink.Mask.get(blockName)
param = p.getParameter(paramName)
```

## Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`param = p.getParameter(paramName)` returns an array of mask parameters.

## Input Arguments

### **blockName**

The handle to the block or the path to the block inside the model.

### **paramName**

The name of the parameter you want to get.

## Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Get a mask parameter by using its name.

```
param = p.getParameter('intercept');
```

## See Also

`Simulink.Mask` | "Create Block Masks"

## getParameterConstraint

**Class:** Simulink.Mask

**Package:** Simulink

Get mask parameter constraint properties

### Syntax

```
paramConstraint = maskObj.getParameterConstraint(paramConstraintName)
```

### Description

`paramConstraint = maskObj.getParameterConstraint(paramConstraintName)` gets the properties of a mask parameter constraint.

### Input Arguments

**maskObj** — Block mask handle

mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: char | cell

**paramConstraintName** — Mask constraint name

character vector | string

Name of the constraint of which you want get the properties, specified as character vector.

### Output Arguments

**paramConstraint** — Mask constraint property

cell array of character vector

Constraint properties, returned as a cell array.

### Examples

```
% Get block mask handle.
```

```
maskObj = Simulink.Mask.get(gcb);
```

```
% Find parameters associated with the constraint.
```

```
paramConstraint = maskObj.getParameterConstraint('const3')
```

```
ans =
```

```
Constraints with properties:
```

Name: 'const3'  
ConstraintRules: [1x2 Simulink.Mask.ParameterConstraintRules]

## **Version History**

**Introduced in R2018a**

### **See Also**

## getWorkspaceVariables

**Class:** Simulink.Mask

**Package:** Simulink

Get all the variables defined in the mask workspace for a masked block

### Syntax

```
p = Simulink.Mask.get(blockName)
vars = p.getWorkspaceVariables
```

### Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`vars = p.getWorkspaceVariables` returns as a structure all the variables defined in the mask workspace for the masked block.

### Input Arguments

#### `blockName`

The handle to the block or the path to the block inside the model.

### Examples

- 1 Get mask as an object using a masked block's path.  

```
p = Simulink.Mask.get('myModel/Subsystem');
```
- 2 Get all the variables defined in the mask workspace for the masked block.  

```
vars = p.getWorkspaceVariables;
```

### See Also

`Simulink.Mask` | "Create Block Masks"

# numParameters

**Class:** Simulink.Mask

**Package:** Simulink

Determine the number of parameters in a mask

## Syntax

```
p = Simulink.Mask.get(blockName)
p.numParameters
```

## Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.numParameters` returns the number of parameters in the mask.

## Input Arguments

### blockName

The handle to the block or the path to the block inside the model.

## Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Get the number of parameters in the mask.

```
p.numParameters;
```

## See Also

`Simulink.Mask` | "Create Block Masks"

## removeAllCrossParameterConstraints

**Class:** Simulink.Mask

**Package:** Simulink

Delete all cross-parameter constraints from a mask

### Syntax

```
maskObj.removeAllCrossParameterConstraints()
```

### Description

`maskObj.removeAllCrossParameterConstraints()` deletes all cross-constraints from a mask.

### Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Remove all cross constraints from the mask.
maskObj.removeAllCrossParameterConstraints()
```

### Version History

Introduced in R2018a

### See Also

Simulink.Mask | “Create Block Masks”

# removeAllParameterConstraints

**Class:** Simulink.Mask

**Package:** Simulink

Delete all mask parameter constraints

## Syntax

```
maskObj.removeAllParameterConstraints()
```

## Description

`maskObj.removeAllParameterConstraints()` deletes all the parameter constraints from a mask.

## Input Arguments

**maskObj** — Block mask handle

mask object

Handle to the block mask. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information see, `Simulink.Mask.get`

## Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Remove all constraints from the mask.
maskObj.removeAllParameterConstraints()
```

## Version History

Introduced in R2018a

## See Also

`Simulink.Mask` | “Create Block Masks”

## removeAllParameters

**Class:** Simulink.Mask

**Package:** Simulink

Remove all existing parameters from a mask

### Syntax

```
p = Simulink.Mask.get(blockName)
p.removeAllParameters
```

### Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.removeAllParameters` deletes all existing parameters from the mask.

### Input Arguments

#### `blockName`

The handle to the block or the path to the block inside the model.

### Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Delete all existing parameters from the mask.

```
p.removeAllParameters;
```

### See Also

`Simulink.Mask` | "Create Block Masks"

# removeCrossParameterConstraint

**Class:** Simulink.Mask

**Package:** Simulink

Delete a cross-parameter constraint

## Syntax

```
maskObj.removeCrossParameterConstraint(CrossConstraint)
```

## Description

`maskObj.removeCrossParameterConstraint(CrossConstraint)` deletes the specified cross-constraint.

## Input Arguments

**maskObj** — Block mask handle

mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: char | cell

**CrossConstraint** — Cross constraint name

character vector | string

Name of the cross-constraint to be removed, specified as character vector.

## Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Remove cross-constraint of name 'const1'.
maskObj.removeCrossParameterConstraint('const1')
```

## Version History

Introduced in R2018a

## See Also

`Simulink.Mask` | “Create Block Masks”

# removeDialogControl

**Class:** Simulink.Mask

**Package:** Simulink

Remove dialog control element from mask dialog box

## Syntax

```
successIndicator = maskVariable.removeDialogControl(controlIdentifier)
```

## Description

`successIndicator = maskVariable.removeDialogControl(controlIdentifier)` removes dialog control element, specified by `controlIdentifier`, like text, hyperlinks, or tabs from a mask dialog box. First get the mask object and assign it to the variable `maskVariable`.

Successful removal of a dialog control element returns a Boolean value of 1.

## Input Arguments

**controlIdentifier** — Unique identifier for the element

character vector | string scalar

Programmatic identifier for the dialog control element of mask dialog box.

## Examples

### Remove Dialog Control Element from Mask Dialog Box

```
% Get mask object on the Gain block in the model Engine.
```

```
maskObj = Simulink.Mask.get('Engine/Gain');
```

```
% Remove element named AllTab from mask dialog box.
```

```
p = maskObj.removeDialogControl('AllTab');
```

## Version History

Introduced in R2013b

## See Also

Simulink.Mask | “Create Block Masks”

# removeParameter

**Class:** Simulink.Mask

**Package:** Simulink

Remove parameter from mask dialog box

## Syntax

```
successIndicator = maskVariable.removeParameter(controlIdentifier)
```

## Description

`successIndicator = maskVariable.removeParameter(controlIdentifier)` removes parameter, specified by `controlIdentifier`, like edit, check box, popup from an existing mask dialog box. First get the mask object and assign it to the variable `maskVariable`.

Successful removal of a parameter returns a Boolean value of 1.

## Input Arguments

**controlIdentifier** — Unique identifier for the parameter

character vector | string scalar

Programmatic identifier for the parameter of mask dialog box, specified as a character vector.

## Examples

### Remove Parameter from Mask Dialog Box

```
% Get mask object on the Gain block in the model Engine.
maskObj = Simulink.Mask.get('Engine/Gain');

% Remove parameter named checkbox1 from mask dialog box.
p = maskObj.removeParameter('checkbox1');
```

---

**Note** You can also use the index number as the `controlIdentifier`.

---

## Version History

Introduced in R2012b

## See Also

Simulink.Mask | “Create Block Masks”

## removeParameterConstraint

**Class:** Simulink.Mask

**Package:** Simulink

Delete a mask parameter constraint

### Syntax

```
maskObj.removeParameterConstraint(paramConstraint)
```

### Description

`maskObj.removeParameterConstraint(paramConstraint)` deletes the specified mask parameter constraint.

### Input Arguments

**maskObj** — Block mask handle

mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `Simulink.Mask.get`.

Data Types: char | cell

**paramConstraint** — Mask constraint name

character vector | string

Name of the mask parameter constraint to be deleted, specified as character vector.

### Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Remove mask constraint with name 'const1'.
maskObj.removeParameterConstraint('const1')
```

### Version History

Introduced in R2018a

### See Also

`Simulink.Mask` | “Create Block Masks”

# set

**Class:** Simulink.Mask

**Package:** Simulink

Set the properties of an existing mask

## Syntax

```
p = Simulink.Mask.get(blockName)
p.set(Name,Value)
```

## Description

`p = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`p.set(Name,Value)` sets mask properties that you specify using name-value pairs as arguments.

## Input Arguments

### blockName

The handle to the block or the path to the block inside the model.

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

### Type

Text used as title for mask documentation that user sees on clicking **Help** in the Mask Parameters dialog box.

**Default:** empty

### Description

Text used as summary for mask documentation that user sees on clicking **Help** in the Mask Parameters dialog box.

**Default:** empty

### Help

Text used as body text for mask documentation that user sees on clicking **Help** in the Mask Parameters dialog box.

**Default:** empty

### **Initialization**

MATLAB code that initializes the mask.

**Default:** empty

### **SelfModifiable**

Option to set whether the mask can modify itself during simulation.

**Default:** 'off'

### **Display**

MATLAB code that draws the mask icon.

**Default:** empty

### **IconFrame**

Option to specify whether the mask icon appears inside a visible block frame.

**Default:** 'on'

### **MaskIconOpaque**

Option to set the mask icon as opaque or transparent.

**Default:** 'opaque'

### **RunInitForIconRedraw**

Option to specify whether Simulink should run mask initialization before executing the mask icon commands.

**Default:** 'off'

### **IconRotate**

Option to specify icon rotation.

**Default:** 'none'

### **PortRotate**

Option to specify port rotation.

**Default:** 'default'

### **IconUnits**

Option to specify whether mask icon is autoscaled, normalized, or scaled in pixels.

**Default:** 'autoscale'

## Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Modify the mask so that its mask icon is transparent and its documentation summarizes what it does.

```
p.set('IconOpaque','off','Type','Random number generator','Description',...
'This block generates random numbers.');
```

## Simulink.Mask.Constraints class

**Package:** Simulink.Mask

Create Mask Constraint

### Description

Use an instance of the Simulink.Mask.Constraint to add or remove a parameter constraint rule.

### Properties

#### DataType

Specifies the data type associated with the constraint rule.

**Type:** double, single, numeric, integer, int8, uint8, int16, uint16, int32, uint32, boolean, enum, fixdt, string

**Default:** Empty

#### Dimension

Specifies the dimension associated with the constraint rule.

**Type:** scalar, row vector, column vector, 2-D matrix, n-D matrix

**Default:** Empty

#### Complexity

Specifies the complexity associated with the constraint rule.

**Type:** real, complex

**Default:** Empty

#### Sign

Specifies the sign associated with the constraint rule.

**Type:** positive, negative, zero

**Default:** Empty

#### Finiteness

Specifies the finiteness associated with the constraint rule.

**Type:** finite, inf, -inf, NaN

**Default:** Empty

**Range**

Specifies the range associated with the constraint rule.

**Type:** Minimum, Maximum

**Default:** Empty

**CustomConstraint**

Specifies the custom constraint associated with the constraint rule.

**Type:** Valid MATLAB expression

**Default:** Empty

**CustomErrorMessage**

Specifies the custom error message associated with the custom constraint rule.

**Type:** Character vector

**Default:** Empty

**Methods**

addParameterConstraintRule

Add rules to a parameter constraint

removeParameterConstraintRule

Delete a mask parameter constraint rule

## addParameterConstraintRule

**Class:** Simulink.Mask.Constraints

**Package:** Simulink.Mask

Add rules to a parameter constraint

### Syntax

```
paramConstRule = paramConstraint.addParameterConstraintRule(Name,Value)
```

### Description

`paramConstRule = paramConstraint.addParameterConstraintRule(Name,Value)` adds rule to a parameter constraint.

### Input Arguments

#### **paramConstraint** — Handle to mask constraint

constraint object

Handle to the mask parameter constraint for which you want to add constraint rules, specified as constraint object.

Data Types: char | cell

#### **Name-Value Pair Arguments**

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

#### **Name-Value Pair for Rules**

Name	Value
DataType	double, single, numeric, integer, int8, uint8, int16, uint16, int32, uint32, boolean, enum, fixdt
Dimension	scalar, row vector, column vector, 2-d matrix, n-d matrix
Complexity	real, complex
Sign	positive, negative, zero
Finiteness	finite, inf, -inf, NaN
Minimum	string
Maximum	string
CustomConstraint	Valid MATLAB expression

## Output Arguments

### **paramConstRule** — Mask constraint rule

cell array

Mask constraint rule, specified as a cell array.

## Examples

```
% Get mask constraint handle
paramConstraint = maskObj.getParameterConstraint('const3');

% Add rules to the constraint.
paramConstRule = paramConstraint.addParameterConstraintRule('DataType','int8')
```

ans =

ParameterConstraintRules with properties:

```
 DataType: 'int8'
 Dimension: {0x1 cell}
 Complexity: {0x1 cell}
 Sign: {0x1 cell}
 Finiteness: {0x1 cell}
 Minimum: ''
 Maximum: ''
 CustomConstraint: ''
```

## Version History

## removeParameterConstraintRule

**Class:** Simulink.Mask.Constraints

**Package:** Simulink.Mask

Delete a mask parameter constraint rule

### Syntax

```
paramConstraint.removeParameterConstraintRule(RuleIndex)
```

### Description

`paramConstraint.removeParameterConstraintRule(RuleIndex)` deletes the specified constraint rule from a mask parameter constraint.

### Input Arguments

**paramConstraint** — Handle to constraint

constraint object

Handle to mask parameter constraint of which you want to remove constraint rule, specified as an object.

Data Types: char | cell

**RuleIndex** — Constraint rule index

integer

Index number of the mask constraint rule, specified as an integer.

### Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get mask constraint handle.
paramConstraint = maskObj.getParameterConstraint('const3');

% Remove mask constraint rule.
paramConstraint.removeParameterConstraintRule(1)
```

# Simulink.Mask.EnumerationBase class

Derive an enumeration class to hold numeric values of any datatype

## Description

The members of the enumeration class derived from `Simulink.Mask.EnumerationBase` can hold values of any numeric datatype. The datatype of the enumeration members should be consistent.

## Methods

### Public Methods

<code>getValueArrayName</code>	Simulink creates an internal array which holds the value corresponding to each enumeration members. You can customize the name of the array as the return value of the function.
<code>addClassNameToEnumNames</code>	This method belongs to <code>Simulink.IntEnumType</code> . Override this function to return true to prefix the member name with the class name, false otherwise.

## Examples

### Derive an enumeration class from `Simulink.Mask.EnumerationBase`

```
classdef XFactor < Simulink.Mask.EnumerationBase
 enumeration
 alpha(.001, 'alpha (.001)')
 beta(.0001, 'beta (.0001)')
 gamma(.00001, 'gamma (.00001)')
 end
end
```

## Version History

Introduced in R2021a

## See Also

## Simulink.Mask.EnumerationTypeOptions class

Parse information from enumeration file derived from `Simulink.IntEnumType` and `Simulink.Mask.EnumerationBase`

### Description

Create an instance of `Simulink.Mask.EnumerationTypeOptions` to parse the information from the enumeration file into the object.

### Creation

```
enumObj = Simulink.Mask.EnumerationTypeOptions('ExternalEnumerationClass',
'XFactor')
```

### Properties

#### Public Properties

##### **ExternalEnumerationClass** — Reference external enumeration class

empty (default) | Name of the enumeration file

This property holds the name of the enumeration class file.

Data Types: char

##### **EnumerationMembers** — Contains the information parsed from the enumeration file

empty (default) | MemberName | DescriptiveName | Value

This property holds the member name, display name, and numeric value specified in the enumeration file.

Data Types: `Simulink.Mask.EnumerationMember`

### Examples

#### Display the properties of the enumeration members

```
>> obj = Simulink.Mask.EnumerationTypeOptions
('ExternalEnumerationClass', 'XFactor')
```

```
obj =
 EnumerationTypeOptions with properties:
```

```
 ExternalEnumerationClass: 'XFactor'
 EnumerationMembers: [1x3 Simulink.Mask.EnumerationMember]
```

```
>> obj.EnumerationMembers(1)
```

```
ans =
 EnumerationMember with properties:
```

```
MemberName: 'alpha'
DescriptiveName: 'alpha (.001)'
Value: 1.0000e-03
```

---

**Note** The properties are read only. You can modify the enumeration file to change the properties of the enumeration members .

## Simulink.MaskParameter class

**Package:** Simulink

Control mask parameters programmatically

### Description

Use an instance of `Simulink.MaskParameter` to set the properties of mask parameters.

### Properties

#### Type

Specifies the mask parameter type.

**Type:** character vector

#### Values:

'edit' | 'checkbox' | 'popup' | 'combobox' | 'listbox' | 'radiobutton' | 'slider' | 'dial' |  
'spinbox' | 'unit' | 'textarea' | 'customtable' | 'unidt' | 'min' | 'max' | 'promote'

**Default:** 'edit'

#### TypeOptions

Specifies the option for the parameter if it exists, otherwise, it is empty. Applicable for parameters of type popup, radio, textarea, combobox, Datatypestr, and promote .

**Type:** cell array of character vectors

**Default:** {''}

#### Name

Specifies the name of the mask parameter. This name is assigned to the mask workspace variable created for the mask parameter. The mask parameter name must not match the built-in parameter name.

**Type:** character vector

**Default:** Auto generated

#### Prompt

Specifies a character vector that appears as the label associated with the parameter on the mask dialog.

**Type:** character vector

**Default:** Empty character vector

**Value**

Specifies the value of the mask parameter. Masking supports all value types.

**Default:** Default value depends on the type of mask parameter. For example, the default value for `Checkbox` is 'on' while the default value for `Listbox` is { ' ' } and accepts a cell array of character vectors.

**Evaluate**

Indicates if the parameter value is to be evaluated in MATLAB or treated as a character vector when the block is evaluated.

**Type:** boolean

**Values:** 'on' | 'off'

**Default:** 'on'

**Tunable**

Indicates if the parameter value can be changed during simulation.

**Type:** boolean

**Values:** 'on' | 'off'

**Default:** 'on'

**NeverSave**

Indicates if the parameter value gets saved in the model file.

**Type:** boolean

**Values:** 'on' | 'off'

**Default:** 'off'

**Hidden**

Indicates if the parameter should never show on the mask dialog box.

**Type:** boolean

**Values:** 'on' | 'off'

**Default:** 'off'

**ReadOnly**

Indicates if the parameter on the mask dialog box is editable or is read-only.

**Type:** boolean

**Values:** 'on' | 'off'

**Default:** 'off'

### **Enabled**

Indicates if the parameter is enabled in the mask dialog box.

**Type:** boolean

**Values:** 'on' | 'off'

**Default:** 'on'

### **Visible**

Indicates if the parameter is visible in the mask dialog box.

**Type:** boolean

**Values:** 'on' | 'off'

**Default:** 'on'

### **ShowTooltip**

Indicates if tool tip is enabled for the mask parameter.

**Type:** boolean

**Values:** 'on' | 'off'

**Default:** 'on'

### **Callback**

Specifies the MATLAB code that executes when a user changes the parameter value from the mask dialog box.

**Type:** character vector

**Default:** Empty character vector

### **TabName**

Specifies the tab name of the mask dialog box where the parameter is displayed.

**Type:** character vector

**Default:** Empty character vector

### **Alias**

Specifies the alternate name for mask parameter.

**Type:** character vector

**Default:** Empty character vector

## DialogControl

Specifies the layout options of mask dialog.

**Type:** Class of type Simulink.dialog.parameter.<Typeofparameter>

**Values:**

'Edit' | 'Checkbox' | 'Popup' | 'Combobox' | 'Listbox' | 'RadioButton' | 'Slider' | 'Dial' | 'Spinbox' | 'Unit' | 'TextArea' | 'CustomTable' | 'Min' | 'Max'

**Default:** Edit

## ConstraintName

Indicates the constraint associated with a parameter. To associate a constraint programmatically the constraint must be already available. To associate a constraint from a mat file use the format <matfilename>:<constraintname>.

**Type:** character vector

**Default:** Empty character vector

## Methods

set      Set properties of mask parameters

## See Also

### Topics

“Control Masks Programmatically”

“Create Block Masks”

## set

**Class:** Simulink.MaskParameter

**Package:** Simulink

Set properties of mask parameters

### Syntax

```
Simulink.MaskParameter.set(Name, Value)
```

### Description

`Simulink.MaskParameter.set(Name, Value)` sets the properties of a mask parameter.

### Input Arguments

#### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, . . . , NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

#### Type

Type of control that is used to specify the value of this parameter.

**Default:** edit

#### TypeOptions

The options that are displayed within a popup control or in a promoted parameter. This field is a cell array.

**Default:** empty

#### Name

The name of the mask parameter. This name is assigned to the mask workspace variable created for this parameter.

**Default:** empty

#### Prompt

Text that identifies the parameter on the Mask Parameters dialog.

**Default:** empty

**Value**

The default value of the mask parameter in the Mask Parameters dialog.

**Default:** Type specific; depends on the Type of the parameter

**Evaluate**

Option to specify whether parameter must be evaluated.

**Default:** 'on'

**Tunable**

Option to specify whether parameter is tunable.

**Default:** 'on'

**Enabled**

Option to specify whether user can set parameter value.

**Default:** 'on'

**Visible**

Option to set whether mask parameter is hidden or visible to the user.

**Default:** 'on'

**Callback**

Container for MATLAB code that executes when user makes a change in the Mask Parameters dialog and clicks **Apply**.

**Default:** empty

**Examples**

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Get a mask parameter.

```
a = p.Parameters(1);
```

- 3 Edit mask parameter so it is of type popup, cannot be evaluated.

```
a.set('Type','popup','TypeOptions',{'Red' 'Blue' 'Green'},...
'Evaluate','off');
```

## Simulink.MSFcnRunTimeBlock

Get run-time information about Level-2 MATLAB S-function block

### Description

This class allows a Level-2 MATLAB S-function or other MATLAB program to obtain information from Simulink software and provide information to Simulink software about a Level-2 MATLAB S-Function block. Simulink software creates an instance of this class for each Level-2 MATLAB S-Function block in a model. Simulink software passes the object to the callback methods of Level-2 MATLAB S-functions when it updates or simulates a model, allowing the callback methods to get and provide block-related information to Simulink software. See “Write Level-2 MATLAB S-Functions” for more information.

You can also use instances of this class in MATLAB programs to obtain information about Level-2 MATLAB S-Function blocks during a simulation. See “Access Block Data During Simulation” for more information.

The Level-2 MATLAB S-function template `matlabroot/toolbox/simulink/blocks/msfuntmpl.m` shows how to use a number of the following methods.

### Parent Class

Simulink.RunTimeBlock

### Derived Classes

None

### Property Summary

Name	Description
“AllowSignalsWithMoreThan2D” on page 5-480	enable Level-2 MATLAB S-function to use multidimensional signals.
“DialogPrmsTunable” on page 5-480	Specifies which of the S-function's dialog parameters are tunable.
“NextTimeHit” on page 5-480	Time of the next sample hit for variable sample time S-functions.

### Method Summary

Name	Description
“AutoRegRuntimePrms” on page 5-480	Register this block's dialog parameters as run-time parameters.

Name	Description
"AutoUpdateRuntimePrms" on page 5-481	Update this block's run-time parameters.
"IsDoingConstantOutput" on page 5-481	Determine whether the current simulation stage is the constant sample time stage.
"IsMajorTimeStep" on page 5-482	Determine whether the current simulation time step is a major time step.
"IsSampleHit" on page 5-482	Determine whether the current simulation time is one at which a task handled by this block is active.
"IsSpecialSampleHit" on page 5-482	Determine whether the current simulation time is one at which multiple tasks handled by this block are active.
"RegBlockMethod" on page 5-483	Register a callback method for this block.
"RegisterDataTypeFxpBinaryPoint" on page 5-483	Register fixed-point data type with binary point-only scaling.
"RegisterDataTypeFxpFSlopeFixexpBias" on page 5-484	Register fixed-point data type with [Slope Bias] scaling specified in terms of fractional slope, fixed exponent, and bias.
"RegisterDataTypeFxpSlopeBias" on page 5-485	Register data type with [Slope Bias] scaling.
"SetAccelRunOnTLC" on page 5-486	Specify whether to use this block's TLC file to generate the simulation target for the model that uses it.
"SetPreCompInpPortInfoToDynamic" on page 5-487	Set precompiled attributes of this block's input ports to be inherited.
"SetPreCompOutPortInfoToDynamic" on page 5-487	Set precompiled attributes of this block's output ports to be inherited.
"SetPreCompPortInfoToDefaults" on page 5-487	Set precompiled attributes of this block's ports to the default values.
"SetSimViewingDevice" on page 5-487	Specify whether block is a viewer.
"SupportsMultipleExecInstances" on page 5-488	
"WriteRTWParam" on page 5-488	Write custom parameter information to Simulink Coder file.

## Properties

### AllowSignalsWithMoreThan2D

#### Description

Allow Level-2 MATLAB S-functions to use multidimensional signals. You must set the AllowSignalsWithMoreThan2D property in the setup method.

#### Data Type

Boolean

#### Access

RW

### DialogPrmsTunable

#### Description

Specifies whether a dialog parameter of the S-function is tunable. Tunable parameters are registered as run-time parameters when you call the “AutoRegRuntimePrms” on page 5-480 method. Note that SimOnlyTunable parameters are not registered as run-time parameters. For example, the following lines initializes three dialog parameters where the first is tunable, the second in not tunable, and the third is tunable only during simulation.

```
block.NumDialogPrms = 3;
block.DialogPrmsTunable = {'Tunable','Nontunable','SimOnlyTunable'};
```

#### Data Type

array

#### Access

RW

### NextTimeHit

#### Description

Time of the next sample hit for variable sample-time S-functions.

#### Data Type

double

#### Access

RW

## Methods

### AutoRegRuntimePrms

#### Purpose

Register a block's tunable dialog parameters as run-time parameters.

**Syntax**

```
AutoRegRuntimePrms;
```

**Description**

The default names for the MATLAB S-Function tunable parameters are `MSFcnParameter`, `MSFcnParameter1`, ... `MSFcnParameterN`. You can assign other names by passing a cell array to `AutoRegRuntimePrms`. Use `AutoRegRuntimePrms` in the `PostPropagationSetup` method to register this block's tunable dialog parameters as run-time parameters.

**AutoUpdateRuntimePrms****Purpose**

Update a block's run-time parameters.

**Syntax**

```
AutoUpdateRuntimePrms;
```

**Description**

Automatically update the values of the run-time parameters during a call to `ProcessParameters`.

See the S-function `matlabroot/toolbox/simulink/simdemos/simfeatures/adapt_lms.m` in the Simulink model `sldemo_msfcn_lms` for an example.

**IsDoingConstantOutput****Purpose**

Determine whether this is in the constant sample time stage of a simulation.

**Syntax**

```
bVal = IsDoingConstantOutput;
```

**Description**

Returns true if this is the constant sample time stage of a simulation, i.e., the stage at the beginning of a simulation where Simulink software computes the values of block outputs that cannot change during the simulation (see “Constant Sample Time”). Use this method in the `Outputs` method of an S-function with port-based sample times to avoid unnecessarily computing the outputs of ports that have constant sample time, i.e., `[inf, 0]`.

```
function Outputs(block)
.
.
 if block.IsDoingConstantOutput
 ts = block.OutputPort(1).SampleTime;
 if ts(1) == Inf
 %% Compute port's output.
 end
 end
 end
.
.
%% end of Outputs
```

See “Specifying Port-Based Sample Times” for more information.

### **IsMajorTimeStep**

#### **Purpose.**

Determine whether current time step is a major or a minor time step.

#### **Syntax**

```
bVal = IsMajorTimeStep;
```

#### **Description**

Returns true if the current time step is a major time step; false, if it is a minor time step. This method can be called only from the `Outputs` or `Update` methods.

### **IsSampleHit**

#### **Purpose**

Determine whether the current simulation time is one at which a task handled by this block is active.

#### **Syntax**

```
bVal = IsSampleHit(stIdx);
```

#### **Arguments**

`stIdx`

Global index of the sample time to be queried.

#### **Description**

Use in `Outputs` or `Update` block methods when the MATLAB S-function has multiple sample times to determine whether a sample hit has occurred at `stIdx`. The sample time index `stIdx` is a global index for the Simulink model. For example, consider a model that contains three sample rates of 0.1, 0.2, and 0.5, and a MATLAB S-function block that contains two rates of 0.2 and 0.5. In the MATLAB S-function, `block.IsSampleHit(0)` returns true for the rate 0.1, not the rate 0.2.

This block method is similar to `ssIsSampleHit` for C-MeX S-functions, however `ssIsSampleHit` returns values based on only the sample times contained in the S-function. For example, if the model described above contained a C-MeX S-function with sample rates of 0.2 and 0.5, `ssIsSampleHit(S,0,tid)` returns true for the rate of 0.2.

Use port-based sample times to avoid using the global sample time index for multi-rate systems (see `Simulink.BlockPortData`).

### **IsSpecialSampleHit**

#### **Purpose**

Determine whether the current simulation time is one at which multiple tasks implemented by this block are active.

#### **Syntax**

```
bVal = IsSpecialSampleHit(stIdx1,stIdx1);
```

**Arguments**`stIdx1`

Index of sample time of first task to be queried.

`stIdx2`

Index of sample time of second task to be queried.

**Description**

Use in `Outputs` or `Update` block methods to ensure the validity of data shared by multiple tasks running at different rates. Returns true if a sample hit has occurred at `stIdx1` and a sample hit has also occurred at `stIdx2` in the same time step (similar to `ssIsSpecialSampleHit` for C-Mex S-functions).

When using the `IsSpecialSampleHit` macro, the slower sample time must be an integer multiple of the faster sample time.

**RegBlockMethod****Purpose**

Register a block callback method.

**Syntax**

```
RegBlockMethod(methName, methHandle);
```

**Arguments**`methName`

Name of method to be registered.

`methHandle`

MATLAB function handle of the callback method to be registered.

**Description**

Registers the block callback method specified by `methName` and `methHandle`. Use this method in the `setup` function of a Level-2 MATLAB S-function to specify the block callback methods that the S-function implements.

**RegisterDataTypeFxpBinaryPoint****Purpose**

Register fixed-point data type with binary point-only scaling.

**Syntax**

```
dtID = RegisterDataTypeFxpBinaryPoint(isSigned, wordLength, fractionalLength, obeyDataTypeOverride);
```

**Arguments**`isSigned`

true if the data type is signed.

false if the data type is unsigned.

`wordLength`

Total number of bits in the data type, including any sign bit.

`fractionalLength`

Number of bits in the data type to the right of the binary point.

`obeyDataTypeOverride`

`true` indicates that the **Data Type Override** setting for the subsystem is to be obeyed. Depending on the value of **Data Type Override**, the resulting data type could be `Double`, `Single`, `ScaledDouble`, or the fixed-point data type specified by the other arguments of the function.

`false` indicates that the **Data Type Override** setting is to be ignored.

### Description

This method registers a fixed-point data type with Simulink software and returns a data type ID. The data type ID can be used to specify the data types of input and output ports, run-time parameters, and DWork states. It can also be used with all the standard data type access methods defined for instances of this class, such as “DatatypeSize” on page 5-494.

Use this function if you want to register a fixed-point data type with binary point-only scaling. Alternatively, you can use one of the other fixed-point registration functions:

- Use “RegisterDataTypeFxpFSlopeFixexpBias” on page 5-484 to register a data type with [Slope Bias] scaling by specifying the word length, fractional slope, fixed exponent, and bias.
- Use “RegisterDataTypeFxpSlopeBias” on page 5-485 to register a data type with [Slope Bias] scaling.

If the registered data type is not one of the Simulink built-in data types, a Fixed-Point Designer license is checked out.

### RegisterDataTypeFxpFSlopeFixexpBias

#### Purpose

Register fixed-point data type with [Slope Bias] scaling specified in terms of fractional slope, fixed exponent, and bias

#### Syntax

```
dtID = RegisterDataTypeFxpFSlopeFixexpBias(isSigned, wordLength,
fractionalSlope, fixedexponent, bias, obeyDataTypeOverride);
```

#### Arguments

`isSigned`

`true` if the data type is signed.

`false` if the data type is unsigned.

`wordLength`

Total number of bits in the data type, including any sign bit.

`fractionalSlope`

Fractional slope of the data type.

**fixedexponent**

exponent of the slope of the data type.

**bias**

Bias of the scaling of the data type.

**obeyDataTypeOverride**

true indicates that the **Data Type Override** setting for the subsystem is to be obeyed. Depending on the value of **Data Type Override**, the resulting data type could be True Doubles, True Singles, ScaledDouble, or the fixed-point data type specified by the other arguments of the function.

false indicates that the **Data Type Override** setting is to be ignored.

**Description**

This method registers a fixed-point data type with Simulink software and returns a data type ID. The data type ID can be used to specify the data types of input and output ports, run-time parameters, and DWork states. It can also be used with all the standard data type access methods defined for instances of this class, such as "DatatypeSize" on page 5-494.

Use this function if you want to register a fixed-point data type by specifying the word length, fractional slope, fixed exponent, and bias. Alternatively, you can use one of the other fixed-point registration functions:

- Use "RegisterDataTypeFxpBinaryPoint" on page 5-483 to register a data type with binary point-only scaling.
- Use "RegisterDataTypeFxpSlopeBias" on page 5-485 to register a data type with [Slope Bias] scaling.

If the registered data type is not one of the Simulink built-in data types, a Fixed-Point Designer license is checked out.

**RegisterDataTypeFxpSlopeBias****Purpose**

Register data type with [Slope Bias] scaling.

**Syntax**

```
dtID = RegisterDataTypeFxpSlopeBias(isSigned, wordLength, totalSlope, bias, obeyDataTypeOverride);
```

**Arguments****isSigned**

true if the data type is signed.

false if the data type is unsigned.

**wordLength**

Total number of bits in the data type, including any sign bit.

**totalSlope**

Total slope of the scaling of the data type.

`bias`

Bias of the scaling of the data type.

`obeyDataTypeOverride`

`true` indicates that the **Data Type Override** setting for the subsystem is to be obeyed. Depending on the value of **Data Type Override**, the resulting data type could be `True Doubles`, `True Singles`, `ScaledDouble`, or the fixed-point data type specified by the other arguments of the function.

`false` indicates that the **Data Type Override** setting is to be ignored.

### Description

This method registers a fixed-point data type with Simulink software and returns a data type ID. The data type ID can be used to specify the data types of input and output ports, run-time parameters, and DWork states. It can also be used with all the standard data type access methods defined for instances of this class, such as “DatatypeSize” on page 5-494.

Use this function if you want to register a fixed-point data type with [Slope Bias] scaling. Alternatively, you can use one of the other fixed-point registration functions:

- Use “RegisterDataTypeFxpBinaryPoint” on page 5-483 to register a data type with binary point-only scaling.
- Use “RegisterDataTypeFxpFSlopeFixexpBias” on page 5-484 to register a data type by specifying the word length, fractional slope, fixed exponent, and bias

If the registered data type is not one of the Simulink built-in data types, a Fixed-Point Designer license is checked out.

### SetAccelRunOnTLC

#### Purpose

Specify whether to use block's TLC file to generate code for the Accelerator mode of Simulink software.

#### Syntax

```
SetAccelRunOnTLC(bVal);
```

#### Arguments

`bVal`

May be `'true'` (use TLC file) or `'false'` (run block in interpreted mode).

#### Description

Specify if the block should use its TLC file to generate code that runs with the accelerator. If this option is `'false'`, the block runs in interpreted mode. See the S-function `msfcn_times_two.m` in the Simulink model `msfcndemo_timestwo` for an example.

---

**Note** The default JIT Accelerator mode does not support inlining of user-written TLC S-Functions. Please see “How Acceleration Modes Work” and “Control S-Function Execution” for more information.

---

### **SetPreCompInPortInfoToDynamic**

#### **Purpose**

Set precompiled attributes of this block's input ports to be inherited.

#### **Syntax**

```
SetPreCompInPortInfoToDynamic;
```

#### **Description**

Initialize the compiled information (dimensions, data type, complexity, and sampling mode) of this block's input ports to be inherited. See the S-function *matlabroot/toolbox/simulink/simdemos/simfeatures/adapt\_lms.m* in the Simulink model *sldemo\_msfcn\_lms* for an example.

### **SetPreCompOutPortInfoToDynamic**

#### **Purpose**

Set precompiled attributes of this block's output ports to be inherited.

#### **Syntax**

```
SetPreCompOutPortInfoToDynamic;
```

#### **Description**

Initialize the compiled information (dimensions, data type, complexity, and sampling mode) of the block's output ports to be inherited. See the S-function *matlabroot/toolbox/simulink/simdemos/simfeatures/adapt\_lms.m* in the Simulink model *sldemo\_msfcn\_lms* for an example.

### **SetPreCompPortInfoToDefaults**

#### **Purpose**

Set precompiled attributes of this block's ports to the default values.

#### **Syntax**

```
SetPreCompPortInfoToDefaults;
```

#### **Description**

Initialize the compiled information (dimensions, data type, complexity, and sampling mode) of the block's ports to the default values. By default, a port accepts a real scalar sampled signal with a data type of double.

### **SetSimViewingDevice**

#### **Purpose**

Specify whether this block is a viewer.

#### **Syntax**

```
SetSimViewingDevice(bVal);
```

**Arguments**

bVal

May be 'true' (is a viewer) or 'false' (is not a viewer).

**Description**

Specify if the block is a viewer/scope. If this flag is specified, the block will be used only during simulation and automatically stubbed out in generated code.

**SupportsMultipleExecInstances****Purpose**

Specify whether or not a For Each Subsystem supports an S-function inside of it.

**Syntax**

```
SupportsMultipleExecInstances(bVal);
```

**Arguments**

bVal

May be 'true' (S-function is supported) or 'false' (S-function is not supported).

**Description**

Specify if an S-function can operate within a For Each Subsystem.

**WriteRTWParam****Purpose**

Write a custom parameter to the Simulink Coder information file used for code generation.

**Syntax**

```
WriteRTWParam(pType, pName, pVal)
```

**Arguments**

pType

Type of the parameter to be written. Valid values are 'string' and 'matrix'.

pName

Name of the parameter to be written.

pVal

Value of the parameter to be written.

**Description**

Use in the `WriteRTW` method of the MATLAB S-function to write out custom parameters. These parameters are generally settings used to determine how code should be generated in the TLC file for the S-function. See the S-function `matlabroot/toolbox/simulink/simdemos/simfeatures/adapt_lms.m` in the Simulink model `sldemo_msfcn_lms` for an example.

## Simulink.RunTimeBlock

Allow Level-2 MATLAB S-function and other MATLAB programs to get information about block while simulation is running

### Description

This class allows a Level-2 MATLAB S-function or other MATLAB program to obtain information about a block. Simulink software creates an instance of this class or a derived class for each block in a model. Simulink software passes the object to the callback methods of Level-2 MATLAB S-functions when it updates or simulates a model, allowing the callback methods to get block-related information from and provide such information to Simulink software. See “Write Level-2 MATLAB S-Functions” in Writing S-Functions for more information. You can also use instances of this class in MATLAB programs to obtain information about blocks during a simulation. See “Access Block Data During Simulation” for more information.

**Note** Simulink.RunTimeBlock objects do not support MATLAB sparse matrices. For example, the following line of code attempts to assign a sparse identity matrix to the run-time object's output port data. This line of code in a Level-2 MATLAB S-function produces an error:

```
block.Outputport(1).Data = speye(10);
```

### Parent Class

None

### Derived Classes

Simulink.MSFcnRunTimeBlock

### Property Summary

Name	Description
“BlockHandle” on page 5-491	Block's handle.
“CurrentTime” on page 5-491	Current simulation time.
“NumDworks” on page 5-491	Number of discrete work vectors used by the block.
“NumOutputPorts” on page 5-492	Number of block output ports.
“NumContStates” on page 5-492	Number of block's continuous states.
“NumDworkDiscStates” on page 5-492	Number of block's discrete states
“NumDialogPrms” on page 5-492	Number of parameters that can be entered on S-function block's dialog box.
“NumInputPorts” on page 5-493	Number of block's input ports.

Name	Description
"NumRuntimePrms" on page 5-493	Number of run-time parameters used by block.
"SampleTimes" on page 5-493	Sample times at which block produces outputs.

## Method Summary

Name	Description
"ContStates" on page 5-493	Get a block's continuous states.
"DataTypeIsFixedPoint" on page 5-494	Determine whether a data type is fixed point.
"DatatypeName" on page 5-494	Get name of a data type supported by this block.
"DatatypeSize" on page 5-494	Get size of a data type supported by this block.
"Derivatives" on page 5-495	Get a block's continuous state derivatives.
"DialogPrm" on page 5-495	Get a parameter entered on an S-function block's dialog box.
"Dwork" on page 5-495	Get one of a block's DWork vectors.
"FixedPointNumericType" on page 5-496	Determine the properties of a fixed-point data type.
"InputPort" on page 5-496	Get one of a block's input ports.
"OutputPort" on page 5-497	Get one of a block's output ports.
"RuntimePrm" on page 5-497	Get one of the run-time parameters used by a block.

## Properties

### BlockHandle

#### Description

Block's handle.

#### Access

R0

### CurrentTime

#### Description

Current simulation time.

#### Access

R0

### NumDworks

#### Description

Number of data work vectors.

**Access**

RW

**See Also**

ssGetNumDWork

**NumOutputPorts****Description**

Number of output ports.

**Access**

RW

**See Also**

ssGetNumOutputPorts

**NumContStates****Description**

Number of continuous states.

**Access**

RW

**See Also**

ssGetNumContStates

**NumDworkDiscStates****Description**

Number of discrete states. In a MATLAB S-function, you need to use DWorks to set up discrete states.

**Access**

RW

**See Also**

ssGetNumDiscStates

**NumDialogPrms****Description**Number of parameters declared on the block's dialog. In the case of the S-function, it returns the number of parameters listed as a comma-separated list in the **S-function parameters** dialog field.**Access**

RW

**See Also**

ssGetNumSFcnParams

**NumInputPorts****Description**

Number of input ports.

**Access**

RW

**See Also**

ssGetNumInputPorts

**NumRuntimePrms****Description**

Number of run-time parameters used by this block. See “Create and Update S-Function Run-Time Parameters” for more information.

**Access**

RW

**See Also**

ssGetNumSFcnParams

**SampleTimes****Description**

Block's sample times.

**Access**

RW for MATLAB S-functions, RO for all other blocks.

**Methods****ContStates****Purpose**

Get a block's continuous states.

**Syntax**

```
states = ContStates();
```

**Description**

Get vector of continuous states.

**See Also**

ssGetContStates

**DataTypesFixedPoint****Purpose**

Determine whether a data type is fixed point.

**Syntax**

```
bVal = DataTypeIsFixedPoint(dtID);
```

**Arguments**

dtID

Integer value specifying the ID of a data type.

**Description**

Returns `true` if the specified data type is a fixed-point data type.

**DatatypeName****Purpose**

Get the name of a data type.

**Syntax**

```
name = DatatypeName(dtID);
```

**Arguments**

dtID

Integer value specifying ID of a data type.

**Description**

Returns the name of the data type specified by `dtID`.

**See Also**

“DatatypeSize” on page 5-494

**DatatypeSize****Purpose**

Get the size of a data type.

**Syntax**

```
size = DatatypeSize(dtID);
```

**Arguments**

dtID

Integer value specifying the ID of a data type.

**Description**

Returns the size of the data type specified by dtID.

**See Also**

“DatatypeName” on page 5-494

**Derivatives****Purpose**

Get derivatives of a block's continuous states.

**Syntax**

```
derivs = Derivatives();
```

**Description**

Get vector of state derivatives.

**See Also**

ssGetdX

**DialogPrm****Purpose**

Get an S-function's dialog parameters.

**Syntax**

```
param = DialogPrm(pIdx);
```

**Arguments**

pIdx

Integer value specifying the index of the parameter to be returned.

**Description**

Get the specified dialog parameter. In the case of the S-function, each DialogPrm corresponds to one of the elements in the comma-separated list of parameters in the **S-function parameters** dialog field.

**See Also**

ssGetSFcnParam, “RuntimePrm” on page 5-497

**Dwork****Purpose**

Get one of a block's DWork vectors.

**Syntax**

```
dworkObj = Dwork(dwIdx);
```

**Arguments**

dwIdx

Integer value specifying the index of a work vector.

**Description**

Get information about the DWork vector specified by dwIdx where dwIdx is the index number of the work vector. This method returns an object of type `Simulink.BlockCompDworkData`.

**See Also**

ssGetDWork

**FixedPointNumericType****Purpose**

Get the properties of a fixed-point data type.

**Syntax**

```
eno = FixedPointNumericType(dtID);
```

**Arguments**

dtID

Integer value specifying the ID of a fixed-point data type.

**Description**

Returns an object of `embedded.Numeric` class that contains the attributes of the specified fixed-point data type.

---

**Note** `embedded.Numeric` is also the class of the `numerictype` objects created by Fixed-Point Designer software. For information on the properties defined by `embedded.Numeric` class, see “`numerictype` Object Properties” (Fixed-Point Designer).

---

**InputPort****Purpose**

Get an input port of a block.

**Syntax**

```
port = InputPort(pIdx);
```

**Arguments**

pIdx

Integer value specifying the index of an input port.

**Description**

Get the input port specified by pIdx, where pIdx is the index number of the input port. For example,

```
port = rto.InputPort(1)
```

returns the first input port of the block represented by the run-time object `rto`.

This method returns an object of type `Simulink.BlockPreCompInputPortData` or `Simulink.BlockCompInputPortData`, depending on whether the model that contains the port is uncompiled or compiled. You can use this object to get and set the input port's uncompiled or compiled properties, respectively.

#### See Also

## OutputPort

### Purpose

Get an output port of a block.

### Syntax

```
port = OutputPort(pIdx);
```

### Arguments

`pIdx`

Integer value specifying the index of an output port.

### Description

Get the output port specified by `pIdx`, where `pIdx` is the index number of the output port. For example,

```
port = rto.OutputPort(1)
```

returns the first output port of the block represented by the run-time object `rto`.

This method returns an object of type `Simulink.BlockPreCompOutputPortData` or `Simulink.BlockCompOutputPortData`, depending on whether the model that contains the port is uncompiled or compiled, respectively. You can use this object to get and set the output port's uncompiled or compiled properties, respectively.

## RuntimePrm

### Purpose

Get an S-function's run-time parameters.

### Syntax

```
param = RuntimePrm(pIdx);
```

**Arguments**

`pIdx`

Integer value specifying the index of a run-time parameter.

**Description**

Get the run-time parameter whose index is `pIdx`. This run-time parameter is a `Simulink.BlockData` on page 5-208 object of type `Simulink.BlockRunTimePrmData`.

**See Also**

`ssGetRunTimeParamInfo`

# Simulink.SampleTime class

**Package:** Simulink

Object containing sample time information

## Description

The `SampleTime` class represents the sample time information associated with an individual sample time.

Use the methods `Simulink.Block.getSampleTimes` and `Simulink.BlockDiagram.getSampleTimes` to retrieve the values of the `SampleTime` properties for a block and for a block diagram, respectively.

## Properties

### Value

A two-element array of doubles that contains the period and offset of the sample time

### Description

A  $1 \times n$  character array that describes the sample time type

### ColorRGBValue

A  $1 \times 3$  array of doubles that contains the red, green and blue (RGB) values of the sample time color

### Annotation

A  $1 \times n$  character array that represents the annotation of a specific sample time (for example, 'D1')

### OwnerBlock

For asynchronous and variable sample times, `OwnerBlock` is a character vector containing the full path to the block that controls the sample time. For all other types of sample times, it is an empty character vector.

### ComponentSampleTimes

If the sample time is an async union or if the sample time is hybrid and the component sample times are available, then the array `ComponentSampleTimes` contains `Simulink.SampleTime` objects.

## Copy Semantics

Value. To learn how value classes affect copy operations, see [Copying Objects in the MATLAB Programming Fundamentals documentation](#).

## Examples

Retrieve the sample time information for the 'vdp' model.

```
ts = Simulink.BlockDiagram.getSampleTimes('vdp')
```

Simulink returns:

```
ts =
```

```
1x2 Simulink.SampleTime
Package: Simulink
```

```
Properties:
```

```
Value
Description
ColorRGBValue
Annotation
OwnerBlock
ComponentSampleTimes
```

```
Methods
```

To examine the values of the properties:

```
ts(1), ts(2)
```

```
ans =
```

```
Simulink.SampleTime
Package: Simulink
```

```
Properties:
```

```
Value: [0 0]
Description: 'Continuous'
ColorRGBValue: [0 0 0]
Annotation: 'Cont'
OwnerBlock: []
ComponentSampleTimes: {}
```

```
Methods
```

```
ans =
```

```
Simulink.SampleTime
Package: Simulink
```

```
Properties:
```

```
Value: [Inf 0]
Description: 'Constant'
ColorRGBValue: [1 0.2600 0.8200]
Annotation: 'Inf'
OwnerBlock: []
ComponentSampleTimes: {}
```

```
Methods
```

## See Also

[Simulink.Block.getSampleTimes](#) | [Simulink.BlockDiagram.getSampleTimes](#)

# simulink.schedule.OrderedSchedule class

**Package:** simulink.schedule

Creates an OrderedSchedule object containing priority order of the partitions of a model

## Description

The `simulink.schedule.OrderedSchedule` object is a representation of the execution order of the partitions of the specified model. Access this object as a model parameter with `get_param`. You can use the `OrderedSchedule` object to modify the schedule of the partitions of the model through the command line.

You can use `set_param` to apply the schedule to the model.

## Creation

`get_param mdl, 'Schedule')` creates an `OrderedSchedule` object for the specified model, `mdl`.

## Properties

### Order — Priority order of the partitions

table

Priority order of the partitions, specified as a table where:

- The row names are names of the partitions.
- The first column is the index of the partition. Modify the index to change the order of the partitions.
- The second column shows the type of the partitions.
- The third column shows the trigger of the partition. This column lists either the sample time of the partitions, or the hit times at which the partitions execute.

### RateSections — Sections of the order table

array

`RateSections` is an array of objects containing a portion of the order table with a single rate. Use `RateSections` to easily modify the order of the execution of partitions within valid groups.

### Description — Description of the OrderedSchedule object

string

Purpose of an individual schedule object, specified as a string.

### Events — Schedule Editor events

array

Schedule Editor events that may be triggers for aperiodic partitions. Schedule Editor events are sent by Stateflow chart and by Input Events in Simulink, specified as an array of `simulink.schedule.Event` objects

## Examples

### Create and Analyze Random Schedules for a Model Using the Schedule Editor API

This example uses the Schedule Editor API to perform operations on the schedule. Then it uses a function to generate random schedules and analyze them in Simulation Data Inspector

#### Open the Model and get the Schedule Object

Open a model of a Throttle Position Control system and use `get_param` to obtain the `simulink.schedule.OrderedSchedule` object. This object contains the current schedule.

```
model = 'ScheduleEditorAPIWithSubsystemPartitions';
open_system(model);
schedule = get_param(model, 'Schedule')
```

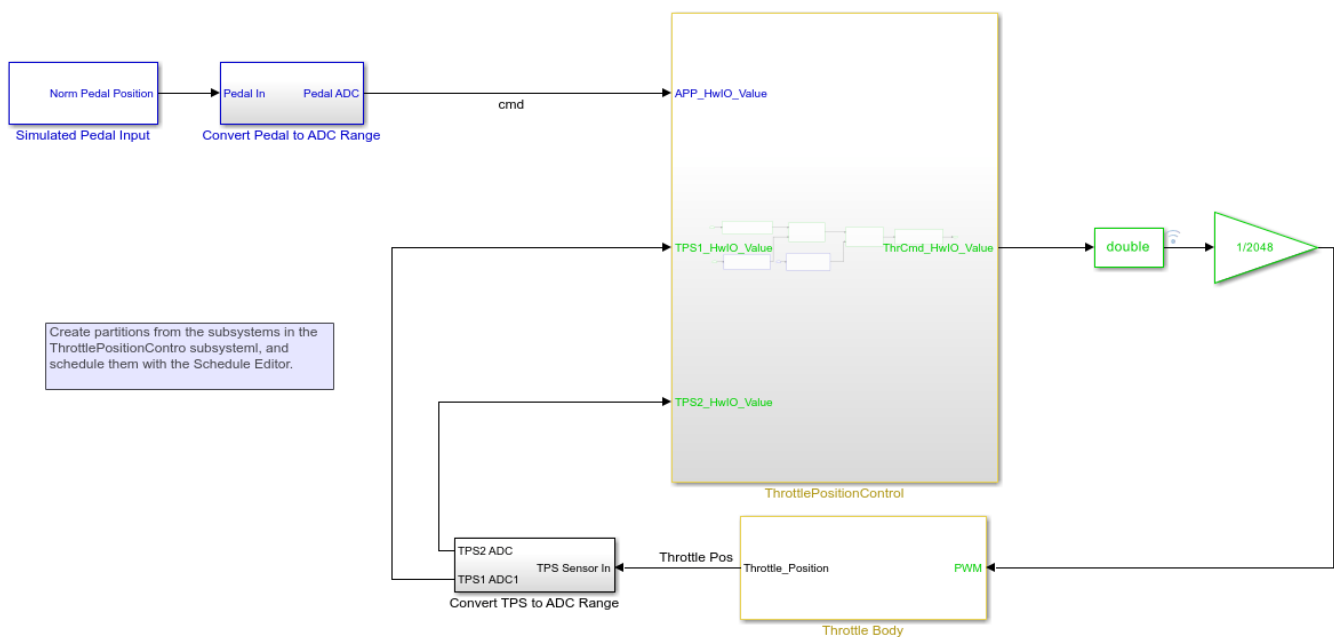

schedule =

OrderedSchedule with properties:

```
Order: [9x3 table]
RateSections: [3x1 simulink.schedule.RateSection]
Events: [0x1 simulink.schedule.Event]
Description: ''
```

### Schedule Subsystem Partitions with the Schedule Editor

Copyright 2018 The MathWorks, Inc.

## Examine the Schedule Object

The schedule object has an `Order` property that contains the execution order of the partitions in the model. The `Order` property displays a table that contains partition names, their index, type, and their trigger.

```
schedule.Order
```

```
ans =
```

```
9x3 table
```

	Index	Type	Trigger
Cont	1	Periodic	"0"
TPSSecondaryRun5ms	2	Periodic	"0.005"
MonitorRun5ms	3	Periodic	"0.005"
ControllerRun5ms	4	Periodic	"0.005"
ActuatorRun5ms	5	Periodic	"0.005"
D2	6	Periodic	"0.005"
D3	7	Periodic	"0.01"
APPSnsrRun	8	Periodic	"0.01"
TPSPPrimaryRun10ms	9	Periodic	"0.01"

Use the index variable in the `Order` table to change the execution order of the model

```
schedule.Order.Index('ActuatorRun5ms') = 2;
schedule.Order
```

```
ans =
```

```
9x3 table
```

	Index	Type	Trigger
Cont	1	Periodic	"0"
ActuatorRun5ms	2	Periodic	"0.005"
TPSSecondaryRun5ms	3	Periodic	"0.005"
MonitorRun5ms	4	Periodic	"0.005"
ControllerRun5ms	5	Periodic	"0.005"
D2	6	Periodic	"0.005"
D3	7	Periodic	"0.01"
APPSnsrRun	8	Periodic	"0.01"
TPSPPrimaryRun10ms	9	Periodic	"0.01"

Any moves within the `Order` property that are made to modify the schedule should result in valid schedule. To perform the schedule modifications and valid moves easier, each partition is grouped with partitions of the same rate in the `RateSections` property. Each element of the `RateSection` property contains an order table with partitions of the same rate.

```
schedule.RateSections(2)
schedule.RateSections(2).Order
```

```
ans =
```

```
RateSection with properties:
```

```
Rate: "0.005"
Order: [5x3 table]
```

```
ans =
```

```
5x3 table
```

	Index	Type	Trigger
ActuatorRun5ms	2	Periodic	"0.005"
TPSSecondaryRun5ms	3	Periodic	"0.005"
MonitorRun5ms	4	Periodic	"0.005"
ControllerRun5ms	5	Periodic	"0.005"
D2	6	Periodic	"0.005"

Use the index variable to move the partitions within RateSections.

```
schedule.RateSections(2).Order.Index('ActuatorRun5ms') = 5;
schedule.Order
```

```
ans =
```

```
9x3 table
```

	Index	Type	Trigger
Cont	1	Periodic	"0"
TPSSecondaryRun5ms	2	Periodic	"0.005"
MonitorRun5ms	3	Periodic	"0.005"
ControllerRun5ms	4	Periodic	"0.005"
ActuatorRun5ms	5	Periodic	"0.005"
D2	6	Periodic	"0.005"
D3	7	Periodic	"0.01"
APPSnsrRun	8	Periodic	"0.01"
TPSPPrimaryRun10ms	9	Periodic	"0.01"

### Create a Function to Generate Random Schedules

In this section, we create three different functions: `randomSchedule`, `generateSimulationInputs` and `simulateRandomSchedules`

`randomSchedule` function is used to create random schedules by using random permutations of index modifications in the `schedule` object. Using the `Order` and the `RateSections` properties of the `schedule` object, partitions in the schedules are moved around in different, random combinations. With these randomly created schedules, models are simulated and compared to study the effect of different schedules on simulation. In the function `randomSchedule`, the input is the model name. Then use `get_param` to obtain the `simulink.schedule.OrderedSchedule` object of

the model. The schedule object and its properties are used to modify and randomize the schedules. Create a variable `firstExecutionOrder` for the first rate section of the model. The `rateSections(1).ExecutionOrder = [firstExecutionOrder(1,:); reSchedule(firstExecutionOrder(2:end,:))]` line of code calls the function `reSchedule` which creates random permutations of the indexes.

type `randomSchedule`

```
function schedule = randomSchedule(model)
 % schedule = randomSchedule(model) Produces a
 % simulink.schedule.OrderedSchedule that has a randomized permutation
 % of the model's original execution order schedule

 arguments
 model char = bdroot
 end

 schedule = get_param(model, 'Schedule');

 rateSections = schedule.RateSections;
 firstOrder = rateSections(1).Order;

 % This assumes that the slowest discrete rate is at index 1. This may
 % not be the case for all models (ex. JMAAB-B).
 rateSections(1).Order = [firstOrder(1,:); reSchedule(firstOrder(2:end,:))];

 for i=2:length(rateSections)
 rateSections(i).Order = reSchedule(rateSections(i).Order);
 end

 schedule.RateSections = rateSections;
end

function out = reSchedule(in)
 numPartitions = height(in);
 in.Index = in.Index(randperm(numPartitions));
 out = in;
end
```

To analyze the effects of different schedules on the model, simulate the model with the different schedules. In this function, create an array of `Simulink.SimulationInput` objects. Through this array of `Simulink.SimulationInput` objects, you can apply the schedules to the model with the `setModelParameters` method of the `Simulink.SimulationInput` object.

type `generateSimulationInputs`

```
function in = generateSimulationInputs(model, numSimulations)
 % in = generateSimulationInputs(model, numSimulations) Generates
 % numSimulations Simulink.SimulationInput objects each containing a
 % different, randomized execution order schedule
 arguments
 model char = bdroot
 numSimulations double = 10
 end

 in(numSimulations) = Simulink.SimulationInput();
```

```

 in = in.setModelName(model);
 for idx = 1:numSimulations
 in(idx) = in(idx).setModelParameter('Schedule', randomSchedule(model));
 end
end

```

In the last function, use the array of `Simulink.SimulationInput` objects to run multiple simulations. Once the simulations are complete, you can plot the output of all the simulations in Simulation Data Inspector.

type `simulateRandomSchedules`

```

function out = simulateRandomSchedules(model, numSimulations)
 % out = simulateRandomSchedules(model, numSimulations) Simulates a
 % model numSimulations number of times. Each simulation has a
 % randomized execution order schedule.
 arguments
 model char = bdroot
 numSimulations double = 10
 end

 in = generateSimulationInputs(model, numSimulations);
 out = sim(in);
 plot(out);
end

```

### Execute the Functions

Now run the above functions for the `ScheduleEditorAPIWithSubsystemPartitions` model. First, use the `randomSchedule` function to create randomly generated schedules, then, use the `generateSimulationInputs` function to generate an array of `Simulink.SimulationInput` objects, and use the `simulateRandomSchedule` function to simulate the model with different schedules and plot their results for comparison. Let's run simulations with 15 randomly generated schedules.

```
simulateRandomSchedules(model, 15)
```

```

[01-Sep-2022 12:07:16] Running simulations...

## Simulink.sdi.constraints.MatchesSignal class

**Package:** Simulink.sdi.constraints

**Superclasses:** matlab.unittest.constraints.Constraint

Constraint that compares time series data with tolerances using the Simulation Data Inspector

### Description

Use the `Simulink.sdi.constraints.MatchesSignal` constraint to compare time series data against an expected value as part of a test. You can configure the constraint to use a combination of absolute, relative, and time tolerance values for the comparison. You can also specify additional options to configure the comparison behavior using a `Simulink.sdi.constraints.MatchesSignalOptions` object or using one or more name-value pair arguments on page 5-508. For more information about how tolerances and alignment options affect comparisons, see “How the Simulation Data Inspector Compares Data”.

---

**Note** The `MatchesSignal` constraint uses the Simulation Data Inspector to perform comparisons and requires a license for one of these products:

- Simulink
  - Signal Processing Toolbox™
  - MATLAB Coder
  - Fixed-Point Designer
- 

## Creation

### Description

`MatchesSignal(expVal)` creates a constraint that determines whether time series data representing an actual value matches the data specified by the expected value, `expVal` on page 5-0 .

`MatchesSignal(expVal, Name, Value)` creates a constraint with additional properties on page 5-510 specified by one or more `Name, Value` pair arguments.

### Input Arguments

#### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, . . . , NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose `Name` in quotes.*

Example: `'IgnoringDataTypes', true`

**IgnoringDataTypes — Constraint behavior when data types do not match**`false (default) | true`

Configure constraint sensitivity to the actual value having a different data type from the expected value.

- `false` — The constraint checks whether the expected value and actual value data types match.
- `true` — The constraint is insensitive to data type mismatches between the expected value and actual value.

Example: `'IgnoringDataTypes', true`

**IgnoringSignalsNotAligned — Constraint behavior when signals do not align**`false (default) | true`

Configure constraint sensitivity to one or more signals not aligning between the expected value and actual value.

- `false` — The constraint checks for signals that do not align between the expected value and actual value.
- `true` — The constraint is insensitive to one or more signals not aligning between the expected value and actual value.

Example: `'IgnoringSignalsNotAligned', true`

**IgnoringExtraData — Constraint behavior when the actual value covers a different time interval from the expected value**`false (default) | true`

Configure the constraint sensitivity to the actual value containing data outside of the time interval defined by the expected value.

- `false` — The constraint checks whether the actual value contains data outside the time interval defined by the expected value.
- `true` — The constraint is insensitive to the actual value containing data outside the time interval defined by the expected value.

Example: `'IgnoringExtraData', true`

**AligningBy — Signal alignment criteria**`string array`

Alignment criteria for the comparison. When the expected value contains more than one signal, the Simulation Data Inspector comparison algorithm aligns signals for comparison between the expected and actual values. By default, the Simulation Data Inspector aligns by data source, then by block path, then by SID, and then by signal name. For details about the Simulation Data Inspector alignment algorithm, see “How the Simulation Data Inspector Compares Data”.

Specify alignment criteria as a string array with one or more of these options listed in the order in which you want them considered:

- `BlockPath` — The path to the source block for the signal.
- `SID` — Automatically assigned Simulink identifier.

- `SignalName` — The name of the signal.
- `DataSource` — Path of the variable.

Example: `'AligningBy', ["SignalName", "BlockPath"]` specifies signal alignment by signal name and then by block path.

## Properties

### Expected — Expected value to use as the baseline for the comparison

time series data | string scalar | character array

Expected value to use as the baseline for the comparison. The data for the expected value must pair data values with time. The data can be in any format supported by the Simulation Data Inspector. The Simulation Data Inspector requires data in a format that associates sample values with time. Supported formats include `timeseries`, `Structure with time`, and `Dataset`.

You can specify the expected value for the constraint using a variable in the workspace that contains the data or by specifying the full path or file name of a file that contains the data, as a string scalar or a character array.

#### Attributes:

<code>GetAccess</code>	<code>public</code>
<code>SetAccess</code>	<code>immutable</code>

### MatchesSignalOptions — Constraint comparison configuration options

`Simulink.sdi.constraints.MatchesSignalOptions`

`Simulink.sdi.constraints.MatchesSignalOptions` object that specifies options to configure the comparison for the constraint. By default, the comparison uses the default alignment settings for the Simulation Data Inspector and has strict acceptance criteria, meaning that the comparison does not ignore any checks. You can use the `MatchesSignalOptions` property to configure how the constraint aligns signals in the expected and actual runs and whether tests using the constraint are sensitive to:

- The actual value having a different data type from the expected value.
- One or more signals not aligning between the expected and actual runs.
- The actual value containing data outside the time interval defined by the expected value.

You can specify the `MatchesSignalOptions` property for the constraint using individual name-value pair arguments on page 5-508 or using the name-value pair `'WithOptions'` with a `Simulink.sdi.constraints.MatchesSignalOptions` object as the value. When you specify the `MatchesSignalOptions` property using a `MatchesSignalOptions` object, you can use a single name-value pair to configure all the options for comparisons that use the constraint.

#### Attributes:

<code>GetAccess</code>	<code>public</code>
<code>SetAccess</code>	<code>immutable</code>

Data Types: `Simulink.sdi.constraints.MatchesSignalOptions`

### AbsTol — Absolute tolerance for comparison

0 (default) | scalar

Absolute tolerance for comparisons using the constraint. For details about how the Simulation Data Inspector uses tolerance values in comparisons, see “How the Simulation Data Inspector Compares Data”.

Example: 0.1

Example: 2

**Attributes:**

GetAccess	public
SetAccess	immutable

Data Types: double

**RelTol — Relative tolerance for comparison**

0 (default) | scalar

Relative tolerance for comparisons using the constraint. For example, specify 0.1 to use a 10% tolerance for the comparison. For details about how the Simulation Data Inspector uses tolerance values in comparisons, see “How the Simulation Data Inspector Compares Data”.

Example: 0.05

**Attributes:**

GetAccess	public
SetAccess	immutable

Data Types: double

**TimeTol — Time tolerance for comparison**

0 (default) | scalar

Time tolerance for comparisons using the constraint, in seconds. For details about how the Simulation Data Inspector uses tolerance values in comparisons, see “How the Simulation Data Inspector Compares Data”.

Example: 0.001

**Attributes:**

GetAccess	public
SetAccess	immutable

Data Types: double

## Examples

### Create Tests for Time Series Comparisons

This example shows how to use the `Simulink.sdi.constraints.MatchesSignal` constraint to compare time series data using data generated in the workspace. You can use the `MatchesSignal` constraint to compare data from many sources, including measured test data in a file and logged simulation outputs.

When you use the `MatchesSignal` constraint, you can specify absolute, relative, and time tolerances to use in the comparison. The `MatchesSignal` constraint uses the Simulation Data Inspector comparison algorithm, which includes steps for alignment and synchronization. For more information about the algorithm, see “How the Simulation Data Inspector Compares Data”.

The `MatchesSignal` constraint uses the Simulation Data Inspector for the time series comparison and requires one of these products:

- Simulink®
- Signal Processing Toolbox™
- MATLAB Coder™
- Fixed-Point Designer™

### Create Time Series Data

This example generates workspace data in `timeseries` format for illustrative purposes only. You can use the `MatchesSignal` constraint to compare data from other sources, such as simulation outputs or a file containing test data, and the constraint can compare time series data in any format supported by the Simulation Data Inspector.

In this example, the first signal is a `timeseries` object containing data for a sine wave with the name `Wave Data`.

```
time = 0:0.1:20;
sig1vals = sin(2*pi/5*time);
sig1_ts = timeseries(sig1vals,time);
sig1_ts.Name = 'Wave Data';
```

The second signal is also a sine wave at the same frequency, with a slight attenuation and sampled at a different rate. Because the comparison algorithm for the `MatchesSignal` constraint includes a synchronization step, comparing these two signals with different time vectors does not always result in a test failure. The second signal is also named `Wave Data` so the alignment algorithm can pair the signals for comparison.

```
time2 = 0:0.05:20;
sig2vals = 0.98*sin(2*pi/5*time2);
sig2_ts = timeseries(sig2vals,time2);
sig2_ts.Name = 'Wave Data';
```

### Create a Test Case and Compare the Signals

This example uses an interactive test for illustrative purposes. You can use the `MatchesSignal` constraint with other types of unit tests in the MATLAB testing framework. For example, to write class-based unit tests, see “Write Simple Test Case Using Classes”.

Create a `TestCase` instance for interactive use.

```
import matlab.unittest.TestCase
testCase = TestCase.forInteractiveUse;
```

Compare `sig1_ts` and `sig2_ts` using the `MatchesSignal` constraint. Use `sig1_ts` for the expected value in the instance of the `MatchesSignal` constraint.

```

import Simulink.sdi.constraints.MatchesSignal

testCase.verifyThat(sig2_ts,MatchesSignal(sig1_ts));
Verification failed.

Framework Diagnostic:

MatchesSignal(<Value>) failed.
--> The following aligned signals did not match:

 Name ActualSignals ExpectedSignals
 ----- ----- -----
 Wave Data <Actual>.Data <Expected>.Data

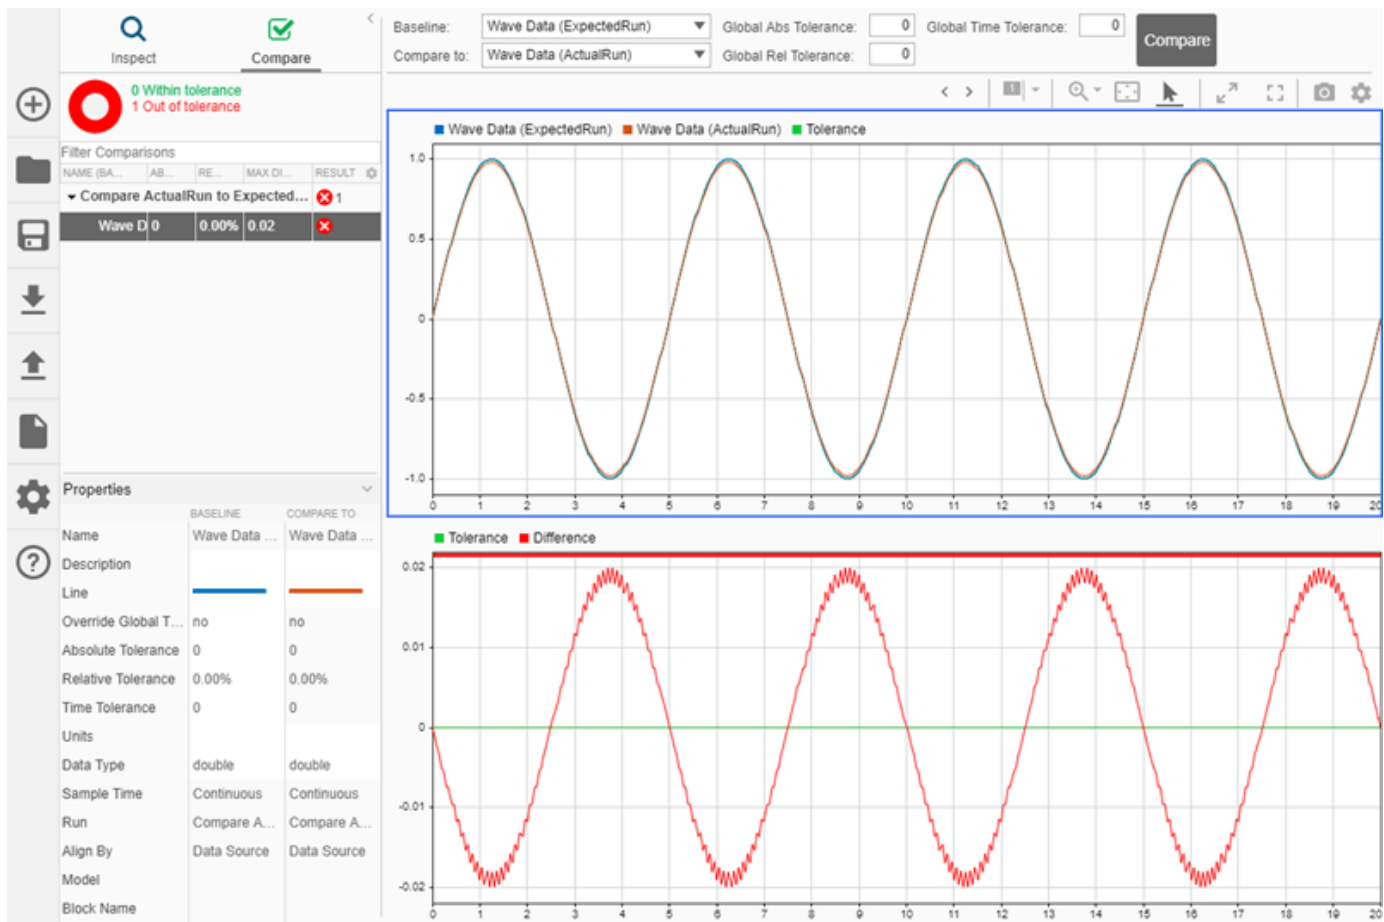

Comparison results have been saved to:
--> C:\TEMP\Bdoc22b_2054784_11640\ib975175\5\comparisonResults_adf47515-ed66-47a8-be4b-81faf

Stack Information:

In C:\TEMP\Bdoc22b_2054784_11640\ib975175\5\tpe586203a\simulink-ex22803619\TestTimeSeriesData

In B:\matlab\tools\examples\exampletools\+mwtools\liveCodeToDocbook.m (doRunConvert) at 343
In B:\matlab\tools\examples\exampletools\+mwtools\liveCodeToDocbook.m (liveCodeToDocbook) at
In B:\matlab\tools\build_using_matlab\BML.m (BML) at 13

```

The diagnostic information shows that the verification failed. When a test fails, the comparison results and original run data are saved in a Simulation Data Inspector session file. Click the link for the MLDATX file to open the session in the Simulation Data Inspector, where you can investigate the data compared by the test and the comparison results. When you inspect the results, you can see the attenuation creates the difference and causes the comparison to fail.

Specify an absolute tolerance of `0.02` for the instance of the `MatchesSignal` constraint to use in the comparison.

```
testCase.verifyThat(sig2_ts,MatchesSignal(sig1_ts,'AbsToL',0.02));
```

Verification passed.

### Configure MatchesSignal Constraint Behavior

This example shows how to configure the comparison behavior of a `Simulink.sdi.constraints.MatchesSignal` constraint using a `Simulink.sdi.constraints.MatchesSignalOptions` object. You can use a `MatchesSignalOptions` object to configure multiple comparison properties with a single name-value pair input in the construction of the `MatchesSignal` instance.

### Create Time Series Data

This example creates workspace data to use for illustrative purposes only. You can use the `MatchesSignal` constraint to compare data from other sources, such as simulation outputs or a file containing test data, and the constraint can compare time series data in any format supported by the Simulation Data Inspector.

In this example, the first signal is a `timeseries` object with the name `Wave Data` that contains data for a sine wave.

```
time = 0:0.1:20;
sig1vals = sin(2*pi/5*time);
sig1_ts = timeseries(sig1vals,time);
sig1_ts.Name = 'Wave Data';
```

The second signal is also a sine wave at the same frequency, with a slight attenuation and sampled at a different rate. Because the comparison algorithm for the `MatchesSignal` constraint includes a synchronization step, comparing these two signals with different time vectors does not necessarily result in a test failure. The second signal is cast to `single` data type and also named `Wave Data` so the alignment algorithm can pair the signals for comparison.

```
time2 = 0:0.1:22;
sig2vals = single(0.98*sin(2*pi/5*time2));
sig2_ts = timeseries(sig2vals,time2);
sig2_ts.Name = 'Wave Data';
```

### Configure a MatchesSignal Instance and Compare the Data

You can use a `MatchesSignalOptions` object to specify how an instance of the `MatchesSignal` constraint handles conditions such as mismatched data types and how signals are aligned between the actual and expected data sets. You can specify the properties of the `MatchesSignalOptions` object to suit the test you want to write. For example, if you want your test to compare data of varying types and a data type match is not functionally relevant, you could set the `IgnoreDataTypes` property to `true`.

Create a `MatchesSignalOptions` object to create a `MatchesSignal` instance that ignores data type mismatches and data samples outside the time interval the actual and expected signals share.

```
import Simulink.sdi.constraints.MatchesSignalOptions
opts = MatchesSignalOptions('IgnoringDataTypes',true,'IgnoringExtraData',true);
```

Create a `TestCase` instance for interactive use and compare `sig1_ts` and `sig2_ts` using the `MatchesSignal` constraint, the `MatchesSignalOptions` object, and an absolute tolerance of `0.02`.

```
import matlab.unittest.TestCase
testCase = TestCase.forInteractiveUse;

import Simulink.sdi.constraints.MatchesSignal
testCase.verifyThat(sig2_ts,MatchesSignal(sig1_ts,'AbsTol',0.02,'WithOptions',opts))
```

Verification passed.

The test passes. When you run the same test again without the options defined by the `MatchesSignalOptions` object, the test fails due to the mismatched data types.

```
testCase.verifyThat(sig2_ts,MatchesSignal(sig1_ts,'AbsTol',0.02))
```

Verification failed.

```

Framework Diagnostic:

```

```
MatchesSignal(<Value>,'AbsTol',0.02) failed.
```

```
--> Data types do not match for the following aligned signals:
```

Name	ActualSignals	ActualDataType	ExpectedSignals	ExpectedData
"Wave Data"	"<Actual>.Data"	{'single'}	"<Expected>.Data"	{'double'}

```

## Version History

### Introduced in R2019a

#### Enhanced diagnostic information

*Behavior changed in R2020a*

Starting in R2020a, when a test that uses the `Simulink.sdi.constraints.MatchesSignal` constraint fails, the diagnostic information provides a path and link to a Simulation Data Inspector session file that includes the comparison results and the original data compared by the test. Open the session file to inspect the data and comparison results in the Simulation Data Inspector.

In previous releases, the diagnostic information included a path and link to a static image of the comparison results. The diagnostic information no longer includes the image.

# Simulink.sdi.constraints.MatchesSignalOptions class

**Package:** Simulink.sdi.constraints

Specify comparison options for Simulink.sdi.MatchesSignal constraint

## Description

Use a Simulink.sdi.constraints.MatchesSignalOptions object to configure the comparison behavior and acceptance criteria for an instance of the Simulink.sdi.constraints.MatchesSignal constraint.

---

**Note** The MatchesSignal constraint uses the Simulation Data Inspector to perform comparisons and requires a license for one of these products:

- Simulink
  - Signal Processing Toolbox
  - MATLAB Coder
  - Fixed-Point Designer
- 

## Creation

### Description

MatchesSignalOptions creates an instance of the Simulink.sdi.constraints.MatchesSignalOptions class with properties that correspond to a constraint that does not ignore any checks and uses the default alignment settings for the Simulation Data Inspector.

MatchesSignalOptions(Name, Value) creates an instance of the Simulink.sdi.constraints.MatchesSignalOptions class with comparison behavior using properties on page 5-517 specified by one or more Name, Value pair arguments.

## Properties

### IgnoreDataTypes — Constraint behavior when data types do not match

false (default) | true

Constraint sensitivity to the actual value having a different data type from the expected value.

- false — The constraint checks whether the expected value and actual value data types match.
- true — The constraint is insensitive to data type mismatches between the expected value and actual value.

You can specify the IgnoreDataTypes property in the constructor using the 'IgnoringDataTypes' name-value pair argument.

**Attributes:**

GetAccess	public
SetAccess	public

**IgnoreSignalsNotAligned — Constraint behavior when signals do not align**

false (default) | true

Constraint sensitivity to one or more signals not aligning between the expected value and actual value.

- `false` — The constraint checks for signals that do not align between the expected value and actual value.
- `true` — The constraint is insensitive to one or more signals not aligning between the expected value and actual value.

You can specify the `IgnoreSignalsNotAligned` property in the constructor using the `'IgnoringSignalsNotAligned'` name-value pair argument.

**Attributes:**

GetAccess	public
SetAccess	public

**IgnoreExtraData — Constraint behavior when the actual value covers a different time interval from the expected value**

false (default) | true

Constraint sensitivity to the actual value containing data outside of the time interval defined by the expected value.

- `false` — The constraint checks whether the actual value contains data outside the time interval defined by the expected value.
- `true` — The constraint is insensitive to the actual value containing data outside the time interval defined by the expected value.

You can specify the `IgnoreExtraData` property in the constructor using the `'IgnoringExtraData'` name-value pair argument.

**Attributes:**

GetAccess	public
SetAccess	public

**Alignment — Signal alignment criteria**

string array

Alignment criteria for the comparison. When the expected value contains more than one signal, the Simulation Data Inspector comparison algorithm aligns signals for comparison between the expected and actual values. By default, the Simulation Data Inspector aligns by data source, then by block path, then by SID, and then by signal name. For details about the Simulation Data Inspector alignment algorithm, see “How the Simulation Data Inspector Compares Data”.

Specify alignment criteria as a string array with one or more of these options listed in the order in which you want them considered:

- `BlockPath` — The path to the source block for the signal.
- `SID` — Automatically assigned Simulink identifier.
- `SignalName` — The name of the signal.
- `DataSource` — Path of the variable.

You can specify the `Alignment` property in the constructor using the `'AligningBy'` name-value pair argument.

## Examples

### Configure MatchesSignal Constraint Behavior

This example shows how to configure the comparison behavior of a `Simulink.sdi.constraints.MatchesSignal` constraint using a `Simulink.sdi.constraints.MatchesSignalOptions` object. You can use a `MatchesSignalOptions` object to configure multiple comparison properties with a single name-value pair input in the construction of the `MatchesSignal` instance.

#### Create Time Series Data

This example creates workspace data to use for illustrative purposes only. You can use the `MatchesSignal` constraint to compare data from other sources, such as simulation outputs or a file containing test data, and the constraint can compare time series data in any format supported by the Simulation Data Inspector.

In this example, the first signal is a `timeseries` object with the name `Wave Data` that contains data for a sine wave.

```
time = 0:0.1:20;
sig1vals = sin(2*pi/5*time);
sig1_ts = timeseries(sig1vals,time);
sig1_ts.Name = 'Wave Data';
```

The second signal is also a sine wave at the same frequency, with a slight attenuation and sampled at a different rate. Because the comparison algorithm for the `MatchesSignal` constraint includes a synchronization step, comparing these two signals with different time vectors does not necessarily result in a test failure. The second signal is cast to `single` data type and also named `Wave Data` so the alignment algorithm can pair the signals for comparison.

```
time2 = 0:0.1:22;
sig2vals = single(0.98*sin(2*pi/5*time2));
sig2_ts = timeseries(sig2vals,time2);
sig2_ts.Name = 'Wave Data';
```

#### Configure a MatchesSignal Instance and Compare the Data

You can use a `MatchesSignalOptions` object to specify how an instance of the `MatchesSignal` constraint handles conditions such as mismatched data types and how signals are aligned between the actual and expected data sets. You can specify the properties of the `MatchesSignalOptions` object to suit the test you want to write. For example, if you want your test to compare data of varying types and a data type match is not functionally relevant, you could set the `IgnoreDataTypes` property to `true`.

Create a `MatchesSignalOptions` object to create a `MatchesSignal` instance that ignores data type mismatches and data samples outside the time interval the actual and expected signals share.

```
import Simulink.sdi.constraints.MatchesSignalOptions
opts = MatchesSignalOptions('IgnoringDataTypes',true,'IgnoringExtraData',true);
```

Create a `TestCase` instance for interactive use and compare `sig1_ts` and `sig2_ts` using the `MatchesSignal` constraint, the `MatchesSignalOptions` object, and an absolute tolerance of 0.02.

```
import matlab.unittest.TestCase
testCase = TestCase.forInteractiveUse;

import Simulink.sdi.constraints.MatchesSignal
testCase.verifyThat(sig2_ts,MatchesSignal(sig1_ts,'AbsTol',0.02,'WithOptions',opts))
```

Verification passed.

The test passes. When you run the same test again without the options defined by the `MatchesSignalOptions` object, the test fails due to the mismatched data types.

```
testCase.verifyThat(sig2_ts,MatchesSignal(sig1_ts,'AbsTol',0.02))
```

Verification failed.

```

Framework Diagnostic:

```

```
MatchesSignal(<Value>,'AbsTol',0.02) failed.
```

```
--> Data types do not match for the following aligned signals:
```

Name	ActualSignals	ActualDataType	ExpectedSignals	ExpectedDataType
"Wave Data"	"<Actual>.Data"	{'single'}	"<Expected>.Data"	{'double'}

```

Stack Information:

## Simulink.sdi.CustomSnapshot class

**Package:** Simulink.sdi

Specify settings for a snapshot without opening or affecting the Simulation Data Inspector

### Description

Use a `Simulink.sdi.CustomSnapshot` object to specify settings for a snapshot you want to create without opening the Simulation Data Inspector or affecting the open session. Creating a snapshot using a `Simulink.sdi.CustomSnapshot` object is the best option for fully scripted workflows. You can specify the snapshot dimensions in pixels, the subplot layout, and limits for the *x*- and *y*- axes. You can use the `clearSignals` and `plotOnSubplot` methods to plot signals you want to include in the snapshot. To capture the snapshot, you can pass the `Simulink.sdi.CustomSnapshot` object as the value for the `settings` name-value pair for the `Simulink.sdi.snapshot` function or use the `snapshot` method.

### Construction

`snap = Simulink.sdi.CustomSnapshot` creates a `Simulink.sdi.CustomSnapshot` object.

### Properties

#### Width — Image width

600 (default) | scalar

Image width, in pixels.

Example: 750

#### Height — Image height

400 (default) | scalar

Image height, in pixels.

Example: 500

#### Rows — Number of subplot rows

1 (default) | scalar

Number of subplot rows, specified as a scalar between 1 and 8, inclusive. Use `Rows` and `Columns` to set your desired subplot layout.

Example: 2

#### Columns — Number of subplot columns

1 (default) | scalar

Number of subplot columns, specified as a scalar between 1 and 8, inclusive. Use `Rows` and `Columns` to set your desired subplot layout.

Example: 3

**TimeSpan — X-axis limits**

2x1 matrix

Limits for the time axis in the snapshot. The time axis limits are the same for all subplots. By default, the time axis adjusts to accommodate the largest time range of the plotted signals.

Example: [0 20]

**YRange — Y-axis limits**

cell array

Cell array of 1-by-2 matrices specifying the y-axis limits for all subplots in the custom snapshot. By default, YRange is [-3 3] for all subplots.

Example: {[-10 10],[0 100]}

**Methods**

`clearSignals` Clear signals plotted on subplots of a `Simulink.sdi.CustomSnapshot` object  
`plotOnSubPlot` Plot signals on `Simulink.sdi.CustomSnapshot` object subplots  
`snapshot` Create a custom snapshot

**Copy Semantics**

Handle. To learn how handle classes affect copy operations, see [Copying Objects](#).

**Examples****Copy View Settings to a Run**

This example shows how to copy view settings from one run to another and how to create figures using the `Simulink.sdi.CustomSnapshot` object.

**Simulate Your Model and Get a Run Object**

Configure the `vdp` model to save output data, and run a simulation to create data.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
set_param('vdp/Mu','Gain','1');
sim('vdp');
```

Use the Simulation Data Inspector programmatic interface to access the run data.

```
runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

**Modify Signal View Settings**

Use the `Simulink.sdi.Run` object to access signals in the run. Then, modify the signal view settings. This example specifies the line color and style for each signal. The view settings for the run comprise the view settings for each signal and view settings specified for the plot area.

```
sig1 = vdpRun.getSignalByIndex(1);
sig2 = vdpRun.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

### Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;
```

You can use properties of the `Simulink.sdi.CustomSnapshot` object to configure the plot settings, like the subplot layout and axis limits, and to plot signals. When you use a `Simulink.sdi.CustomSnapshot` object to create your figure, these plot settings do not affect the Simulation Data Inspector.

```
snap.Rows = 2;
snap.YRange = {[-2.25 2.25], [-3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)
```

Use `Simulink.sdi.snapshot` to generate the figure you specified in the properties of the `Simulink.sdi.CustomSnapshot` object.

```
fig = Simulink.sdi.snapshot("from", "custom", "to", "figure", "settings", snap);
```

### Copy the View Settings to a New Simulation Run

Simulate the model again, with a different Mu value. Use the Simulation Data Inspector programmatic interface to access the simulation data.

```
set_param('vdp/Mu','Gain','5')
sim('vdp');
```

```
runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);
```

To create a plot of the new output data that looks like the one you created in the previous step, you can copy the view settings to the run in a single line of code using `Simulink.sdi.copyRunViewSettings`. The `Simulink.sdi.copyRunViewSettings` function does not automatically update plot settings in `Simulink.sdi.CustomSnapshot` objects, so specify the plot input as `false`.

```
sigIDs = Simulink.sdi.copyRunViewSettings(runID,runID2,false);
```

### Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25],[-8 8]};
```

```
snap.plotOnSubPlot(1,1,sigIDs(1),true)
snap.plotOnSubPlot(2,1,sigIDs(2),true)

fig = snap.snapshot("to","figure");
```

## Version History

Introduced in R2018a

“Create Plots Using the Simulation Data Inspector”

# clearSignals

**Class:** Simulink.sdi.CustomSnapshot

**Package:** Simulink.sdi

Clear signals plotted on subplots of a Simulink.sdi.CustomSnapshot object

## Syntax

```
snap.clearSignals
```

## Description

`snap.clearSignals` clears plotted signals from all subplots in the Simulink.sdi.CustomSnapshot object, `snap`. Using the `clearSignals` method does not affect any subplots or signals in your open Simulation Data Inspector session.

## Examples

### Copy View Settings to a Run

This example shows how to copy view settings from one run to another and how to create figures using the Simulink.sdi.CustomSnapshot object.

### Simulate Your Model and Get a Run Object

Configure the vdp model to save output data, and run a simulation to create data.

```
load_system('vdp')
set_param('vdp', 'SaveFormat', 'Dataset', 'SaveOutput', 'on')
set_param('vdp/Mu', 'Gain', '1');
sim('vdp');
```

Use the Simulation Data Inspector programmatic interface to access the run data.

```
runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

### Modify Signal View Settings

Use the Simulink.sdi.Run object to access signals in the run. Then, modify the signal view settings. This example specifies the line color and style for each signal. The view settings for the run comprise the view settings for each signal and view settings specified for the plot area.

```
sig1 = vdpRun.getSignalByIndex(1);
sig2 = vdpRun.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

### Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;
```

You can use properties of the `Simulink.sdi.CustomSnapshot` object to configure the plot settings, like the subplot layout and axis limits, and to plot signals. When you use a `Simulink.sdi.CustomSnapshot` object to create your figure, these plot settings do not affect the Simulation Data Inspector.

```
snap.Rows = 2;
snap.YRange = {[-2.25 2.25], [-3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)
```

Use `Simulink.sdi.snapshot` to generate the figure you specified in the properties of the `Simulink.sdi.CustomSnapshot` object.

```
fig = Simulink.sdi.snapshot("from","custom","to","figure","settings",snap);
```

### Copy the View Settings to a New Simulation Run

Simulate the model again, with a different `Mu` value. Use the Simulation Data Inspector programmatic interface to access the simulation data.

```
set_param('vdp/Mu', 'Gain', '5')
sim('vdp');
```

```
runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);
```

To create a plot of the new output data that looks like the one you created in the previous step, you can copy the view settings to the run in a single line of code using `Simulink.sdi.copyRunViewSettings`. The `Simulink.sdi.copyRunViewSettings` function does not automatically update plot settings in `Simulink.sdi.CustomSnapshot` objects, so specify the plot input as `false`.

```
sigIDs = Simulink.sdi.copyRunViewSettings(runID, runID2, false);
```

### Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25], [-8 8]};
snap.plotOnSubPlot(1,1,sigIDs(1),true)
snap.plotOnSubPlot(2,1,sigIDs(2),true)
```

```
fig = snap.snapshot("to", "figure");
```

## Version History

Introduced in R2018a

# plotOnSubPlot

**Class:** Simulink.sdi.CustomSnapshot

**Package:** Simulink.sdi

Plot signals on Simulink.sdi.CustomSnapshot object subplots

## Syntax

```
snap.plotOnSubPlot(row, column, signal, plot)
```

## Description

`snap.plotOnSubPlot(row, column, signal, plot)` plots the signal on the subplot in the Simulink.sdi.CustomSnapshot object, `snap`, specified by `row` and `column` when `plot` is true. When `plot` is false, `plotOnSubPlot` clears the signal from the subplot.

## Input Arguments

### **row** — Subplot row

scalar

Row for subplot on which you want to plot a signal. Specify `row` as a value from 1 through 8, inclusive.

Example: 2

### **column** — Subplot column

scalar

Column for subplot on which you want to plot a signal. Specify `column` as a value from 1 through 8, inclusive.

Example: 3

### **signal** — Signal to plot

Simulink.sdi.Signal | signal ID

Signal ID or Simulink.sdi.Signal object corresponding to the signal you want to plot.

Example: sigID

### **plot** — Plot indicator

logical

Logical indicator of whether to plot or clear the signal from the subplot.

- `true` - Plot the signal.
- `false` - Clear the signal.

Example: true

Data Types: logical

## Examples

### Copy View Settings to a Run

This example shows how to copy view settings from one run to another and how to create figures using the `Simulink.sdi.CustomSnapshot` object.

### Simulate Your Model and Get a Run Object

Configure the `vdp` model to save output data, and run a simulation to create data.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
set_param('vdp/Mu','Gain','1');
sim('vdp');
```

Use the Simulation Data Inspector programmatic interface to access the run data.

```
runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

### Modify Signal View Settings

Use the `Simulink.sdi.Run` object to access signals in the run. Then, modify the signal view settings. This example specifies the line color and style for each signal. The view settings for the run comprise the view settings for each signal and view settings specified for the plot area.

```
sig1 = vdpRun.getSignalByIndex(1);
sig2 = vdpRun.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

### Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;
```

You can use properties of the `Simulink.sdi.CustomSnapshot` object to configure the plot settings, like the subplot layout and axis limits, and to plot signals. When you use a `Simulink.sdi.CustomSnapshot` object to create your figure, these plot settings do not affect the Simulation Data Inspector.

```
snap.Rows = 2;
snap.YRange = {[-2.25 2.25], [-3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)
```

Use `Simulink.sdi.snapshot` to generate the figure you specified in the properties of the `Simulink.sdi.CustomSnapshot` object.

```
fig = Simulink.sdi.snapshot("from","custom","to","figure","settings",snap);
```

### Copy the View Settings to a New Simulation Run

Simulate the model again, with a different Mu value. Use the Simulation Data Inspector programmatic interface to access the simulation data.

```
set_param('vdp/Mu','Gain','5')
sim('vdp');
```

```
runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);
```

To create a plot of the new output data that looks like the one you created in the previous step, you can copy the view settings to the run in a single line of code using `Simulink.sdi.copyRunViewSettings`. The `Simulink.sdi.copyRunViewSettings` function does not automatically update plot settings in `Simulink.sdi.CustomSnapshot` objects, so specify the plot input as `false`.

```
sigIDs = Simulink.sdi.copyRunViewSettings(runID,runID2,false);
```

### Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25],[-8 8]};
```

```
snap.plotOnSubPlot(1,1,sigIDs(1),true)
snap.plotOnSubPlot(2,1,sigIDs(2),true)

fig = snap.snapshot("to","figure");
```

## Version History

Introduced in R2018a

# snapshot

**Class:** Simulink.sdi.CustomSnapshot

**Package:** Simulink.sdi

Create a custom snapshot

## Syntax

```
fig = snap.snapshot
[fig,image] = snap.snapshot
fig = snap.snapshot(Name,Value)
[fig,image] = snap.snapshot
```

## Description

`fig = snap.snapshot` creates a figure according to the properties of the Simulink.sdi.CustomSnapshot object, `snap`, and returns the handle for the figure, `fig`.

`[fig,image] = snap.snapshot` creates a figure according to the properties of the Simulink.sdi.CustomSnapshot object, `snap`, and returns the handle for the figure, `fig`, and an array of image data, `image`.

`fig = snap.snapshot(Name,Value)` creates a figure according to the properties of the Simulink.sdi.CustomSnapshot object, `snap`, with additional options specified by one or more Name,Value pair arguments. This syntax returns the figure handle, `fig`.

`[fig,image] = snap.snapshot` creates a figure according to the properties of the Simulink.sdi.CustomSnapshot object, `snap`, with additional options specified by one or more Name,Value pair arguments. This syntax returns the figure handle, `fig`, and an array of image data, `image`.

## Input Arguments

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `'to','figure','props',{'Name','My Data'}`

### to — Type of snapshot to create

`'image'` (default) | `'figure'` | `'file'` | `'clipboard'`

Type of snapshot to create.

- `'image'` — Create a figure and return the figure handle and an array of image data. When you specify `'to','image'`, the `fig` and `image` outputs both have value.

- `'figure'` — Create a figure and return the figure handle. When you specify `'to'`, `'figure'` the `fig` output has value, and the `image` output is empty.
- `'file'` — Save to a PNG file with the name specified by the `filename` name-value pair. If you do not specify a `filename` name-value pair, the file is named `plots.png`. When you specify `'to'`, `'file'`, the `fig` and `image` outputs are both empty.
- `'clipboard'` — Copy the plots to your system clipboard. From the clipboard, you can paste the image into another program such as Microsoft Word. When you specify `'to'`, `'clipboard'`, the `fig` and `image` outputs are both empty.

Example: `'to','file'`

Data Types: `char` | `string`

### **filename** — Name for image file

`'plots.png'` (default) | character array | string

Name of the image file to store the snapshot when you specify `'to','file'`.

Example: `'filename','MyImage.png'`

Data Types: `char` | `string`

### **props** — Properties to customize the figure

cell array

Figure properties, specified as a cell array. You can include settings for the figure properties described in Figure Properties.

Example: `'props',{'Name','MyData','NumberTitle','off'}`

Data Types: `char` | `string`

## **Output Arguments**

### **fig** — Figure handle

figure handle

Handle for the figure. When a figure is not created with your specified options, the `fig` output is empty.

### **image** — Image data

array

Array of image data. The `image` output has value when you use `Simulink.sdi.snapshot` without any input arguments or without a `to` name-value pair and when you specify `'to','image'`.

## **Examples**

### **Copy View Settings to a Run**

This example shows how to copy view settings from one run to another and how to create figures using the `Simulink.sdi.CustomSnapshot` object.

### **Simulate Your Model and Get a Run Object**

Configure the `vdp` model to save output data, and run a simulation to create data.

```
load_system('vdp')
set_param('vdp','SaveFormat','Dataset','SaveOutput','on')
set_param('vdp/Mu','Gain','1');
sim('vdp');
```

Use the Simulation Data Inspector programmatic interface to access the run data.

```
runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

### Modify Signal View Settings

Use the `Simulink.sdi.Run` object to access signals in the run. Then, modify the signal view settings. This example specifies the line color and style for each signal. The view settings for the run comprise the view settings for each signal and view settings specified for the plot area.

```
sig1 = vdpRun.getSignalByIndex(1);
sig2 = vdpRun.getSignalByIndex(2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = '-.';

sig2.LineColor = [1 0 0];
sig2.LineDashed = ':';
```

### Capture a Snapshot from the Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;
```

You can use properties of the `Simulink.sdi.CustomSnapshot` object to configure the plot settings, like the subplot layout and axis limits, and to plot signals. When you use a `Simulink.sdi.CustomSnapshot` object to create your figure, these plot settings do not affect the Simulation Data Inspector.

```
snap.Rows = 2;
snap.YRange = {[-2.25 2.25], [-3 3]};
snap.plotOnSubPlot(1,1,sig1,true)
snap.plotOnSubPlot(2,1,sig2,true)
```

Use `Simulink.sdi.snapshot` to generate the figure you specified in the properties of the `Simulink.sdi.CustomSnapshot` object.

```
fig = Simulink.sdi.snapshot("from","custom","to","figure","settings",snap);
```

### Copy the View Settings to a New Simulation Run

Simulate the model again, with a different Mu value. Use the Simulation Data Inspector programmatic interface to access the simulation data.

```
set_param('vdp/Mu', 'Gain', '5')
sim('vdp');
```

```
runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);
```

To create a plot of the new output data that looks like the one you created in the previous step, you can copy the view settings to the run in a single line of code using `Simulink.sdi.copyRunViewSettings`. The `Simulink.sdi.copyRunViewSettings` function does not automatically update plot settings in `Simulink.sdi.CustomSnapshot` objects, so specify the plot input as `false`.

```
sigIDs = Simulink.sdi.copyRunViewSettings(runID, runID2, false);
```

### Capture a Snapshot of the New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
snap.clearSignals
snap.YRange = {[-2.25 2.25], [-8 8]};
```

```
snap.plotOnSubPlot(1,1,sigIDs(1),true)
snap.plotOnSubPlot(2,1,sigIDs(2),true)

fig = snap.snapshot("to","figure");
```

## Simulink.sdi.DatasetRef class

**Package:** Simulink.sdi

Access data in Simulation Data Inspector repository

### Description

The `Simulink.sdi.DatasetRef` object provides access to data in the Simulation Data Inspector without loading the entire set of data into memory. The object is compatible with the `Simulink.SimulationData.DatasetRef` class.

### Construction

`dsr_array = Simulink.sdi.DatasetRef` constructs an array that contains a `Simulink.sdi.DatasetRef` object that corresponds to each run in the Simulation Data Inspector.

`dsr_array = Simulink.sdi.DatasetRef(domain)` creates an array of `DatasetRef` objects that contains a `Simulink.sdi.DatasetRef` object for each run, with the contents of each run limited to the specified domain.

`dsr = Simulink.sdi.DatasetRef(runID)` creates a `Simulink.sdi.DatasetRef` object that references the run specified by the run identifier, `runID`.

`dsr = Simulink.sdi.DatasetRef(runID, domain)` creates a `Simulink.sdi.DatasetRef` object that references the run specified by `runID` with contents specified by `domain`.

`dsr = Simulink.sdi.DatasetRef(runID, domain, repositoryPath)` creates a `Simulink.sdi.DatasetRef` object that references the run specified by the run identifier, `runID`. The `DatasetRef` object contains the contents specified by `domain` from the repository specified by `repositoryPath`.

### Input Arguments

#### **domain — Data to reference in DatasetRef object**

'signals' | 'outports' | 'dsm' | 'state' | 'param' | ...

Data to reference in `DatasetRef` object, specified as one of the following:

- 'signals' — Signals produced by signal logging.
- 'outports' — Model output signals, represented by top-level Output blocks.
- 'dsm' — Data Store Memory blocks.
- 'state' — Simulink states.
- 'param' — Parameter data for block parameters and variables tuned using dashboard blocks.
- 'sf\_data' — Stateflow local data.
- 'sf\_state' — Stateflow states.
- 'sf\_state\_child' — Stateflow child activity.
- 'sf\_state\_leaf' — Stateflow leaf activity.

- 'slt\_verify' — Assertion blocks and verify assessments in Simulink Test.

### **runID — Run identifier**

integer

Specifies the run containing the data for the `Simulink.sdi.DatasetRef` object.

### **repositoryPath — Path containing the run**

string | character vector

Specifies the location of the run containing the data for the `Simulink.sdi.DatasetRef` object.

## **Properties**

### **Name — Run name**

character vector

The name of the run that corresponds with the `Simulink.sdi.DatasetRef` object.

Example: 'Run 1'

### **Run — Simulink.sdi.Run object**

`Simulink.sdi.Run` object

`Simulink.sdi.Run` object associated with the `Simulink.sdi.DatasetRef` object.

### **numElements — Number of top-level elements in run**

`Simulink.sdi.Run` object

Number of top-level elements in the `Simulink.sdi.Run` object associated with the `Simulink.sdi.DatasetRef` object.

## **Methods**

<code>compare</code>	Compare runs with <code>DatasetRef</code> objects
<code>getAsDatastore</code>	Retrieve element as <code>sdidatastore</code> object
<code>getElement</code>	Retrieve <code>DatasetRef</code> element by index
<code>getElementNames</code>	Get character vectors of element names
<code>getSignal</code>	Return <code>Signal</code> object
<code>plot</code>	Open the Simulation Data Inspector to view and compare data

## **Copy Semantics**

Handle. To learn how handle classes affect copy operations, see [Copying Objects](#).

## **Examples**

### **Compare Runs with the Simulink.sdi.DatasetRef Object**

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl_demo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sldemo_absbrake to create a run of logged signals
load_system('ex_sldemo_absbrake')
sim('ex_sldemo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell
 {'yout'}
 {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
 Ww: [1x1 timeseries]
 Vs: [1x1 timeseries]
 Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

## Version History

Introduced in R2017b

**See Also**

## compare

**Class:** Simulink.sdi.DatasetRef

**Package:** Simulink.sdi

Compare runs with DatasetRef objects

### Syntax

```
[matches, mismatches, results] = dsrObj.compare(other)
```

### Description

`[matches, mismatches, results] = dsrObj.compare(other)` returns the number of matches, number of mismatches, and comparison results for a comparison of data in a `Simulink.sdi.DatasetRef` object. The comparison results are returned as a `Simulink.sdi.DiffRunResult` object.

### Input Arguments

**other — Comparison data**

MAT-file | variable

Comparison data, which can come from another `Simulink.sdi.DatasetRef` object, a Dataset in the workspace, or a MAT-file.

Example: 'data.mat'

Example: var

### Output Arguments

**matches — Number of matching signals**

integer

Number of signals that matched within tolerance in the comparison.

**mismatches — Number of mismatched signals**

integer

Number of signals that did not match within tolerance in the comparison.

**results — Simulink.sdi.DiffRunResult object with comparison results**

`Simulink.sdi.DiffRunResult` object

Results of the comparison, returned in a `Simulink.sdi.DiffRunResult` object.

## Examples

### Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl-demo-absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl-demo-absbrake to create a run of logged signals
load_system('ex_sl-demo-absbrake')
sim('ex_sl-demo-absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell
 {'yout'}
 {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
 Ww: [1x1 timeseries]
 Vs: [1x1 timeseries]
 Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sl-demo-absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sl-demo-absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

## Alternatives

Using the Simulation Data Inspector API, you could create runs for the data you want to compare and use `Simulink.sdi.compareRuns` for the comparison. You can also view runs created from simulation, import data to runs, and compare runs with the Simulation Data Inspector UI.

## Version History

Introduced in R2017b

## Topics

“Inspect and Compare Data Programmatically”

“How the Simulation Data Inspector Compares Data”

# getAsDatastore

**Class:** Simulink.sdi.DatasetRef

**Package:** Simulink.sdi

Retrieve element as sdatastore object

## Syntax

```
[elementDatastore, name, index] = SDIDatasetRef.getAsDatastore(arg)
```

## Description

[elementDatastore, name, index] = SDIDatasetRef.getAsDatastore(arg) returns the requested element as a `matlab.io.datastore.sdatastoreobject`, along with the element name and index.

## Input Arguments

**arg — Element selection criterion**

integer | character vector

Search criterion used to retrieve the element from the `Simulink.sdi.DatasetRef` object. For name-based searches, specify `arg` as a character vector. For index-based searches, `arg` is an integer, representing the index of the desired element.

Example: 'MySignal'

Example: 3

## Output Arguments

**elementDatastore — Element as sdatastore**

sdatastore object

Element as `matlab.io.datastore.sdatastore` object.

**name — Element name**

character vector

The name of the element.

**index — Element index in DatasetRef object**

integer

The index of the element in the `Simulink.sdi.DatasetRef` object.

## Examples

### Create an `sdidastore` Object for a Signal

This example shows how to create a `sdidastore` object for a signal in a `Simulink.sdi.DatasetRef` object.

```
% Simulate model sldemo_fuelsys to create a run of logged signals
sim('sldemo_fuelsys')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
fuelRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = fuelRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 16x1 cell
 {'CheckRange' }
 {'air_fuel_ratio' }
 {'speed' }
 {'map' }
 {'ego' }
 {'throttle' }
 {'fuel' }
 {'EGO Fault Switch:1' }
 {'Engine Speed Fault Switch:1' }
 {'MAP Fault Switch:1' }
 {'Throttle Angle Fault Switch:1'}
 {'ego_sw' }
 {'engine_speed' }
 {'speed_sw' }
 {'map_sw' }
 {'throttle_sw' }
```

```
% Get sdidastore object for fuel signal
fuel_ds = run_DSRef.getAsDatastore(10);
```

## Alternatives

You can construct a `sdidastore` object for a specified signal using `matlab.io.datastore.sdidastore`.

## Version History

**Introduced in R2017b**

## getElement

**Class:** Simulink.sdi.DatasetRef

**Package:** Simulink.sdi

Retrieve DatasetRef element by index

### Syntax

```
[element, name, index] = SDIdatasetRef.getElement(index)
```

### Description

`[element, name, index] = SDIdatasetRef.getElement(index)` returns the element within the Run in the `Simulink.sdi.DatasetRef` object at the specified index.

### Input Arguments

**index** — Index of element

integer

Location of the element in the `Simulink.sdi.DatasetRef` object.

### Output Arguments

**element** — Run element in the DatasetRef object

signal

Element from the run in the `Simulink.sdi.DatasetRef` object.

**name** — Element name

character vector

Name of the element retrieved from the `Simulink.sdi.DatasetRef` object.

**index** — Location of element

integer

Location of the element within the `Simulink.sdi.DatasetRef` object.

### Examples

#### Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl-demo-absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl-demo-absbrake to create a run of logged signals
load_system('ex_sl-demo-absbrake')
sim('ex_sl-demo-absbrake')
```

```

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell
 {'yout'}
 {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
 Ww: [1x1 timeseries]
 Vs: [1x1 timeseries]
 Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot

```

# getElementNames

**Class:** Simulink.sdi.DatasetRef

**Package:** Simulink.sdi

Get character vectors of element names

## Syntax

```
names = dsrObj.getElementNames
```

## Description

`names = dsrObj.getElementNames` returns a cell array of character vectors containing the names of the elements in `dsrObj`.

## Output Arguments

**names — Element names**

cell array

Names of the top level elements in the `Simulink.sdi.DatasetRef` object in a cell array.

## Examples

### Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl_demo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl_demo_absbrake to create a run of logged signals
load_system('ex_sl_demo_absbrake')
sim('ex_sl_demo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell
 {'yout'}
 {'slp' }
```

```
% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
 Ww: [1x1 timeseries]
 Vs: [1x1 timeseries]
 Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sl-demo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sl-demo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

## Version History

# getSignal

**Class:** Simulink.sdi.DatasetRef

**Package:** Simulink.sdi

Return Signal object

## Syntax

```
sigObj = SDIDatasetRef.getSignal(searchArg)
```

## Description

`sigObj = SDIDatasetRef.getSignal(searchArg)` returns the `Simulink.sdi.Signal` object corresponding to the search argument, `searchArg`.

## Input Arguments

### **searchArg** — Search parameter

character vector | integer

The search parameters to select the `Simulink.sdi.Signal` object. The `searchArg` can be a character vector or string targeting a signal name or an integer for an index-based search.

Example: 'throttle'

Example: 2

## Output Arguments

### **sigObj** — Simulink.sdi.Signal object

`Simulink.sdi.Signal` object

The `Simulink.sdi.Signal` object corresponding to the search query.

## Examples

### **Compare Runs with the Simulink.sdi.DatasetRef Object**

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl-demo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl-demo_absbrake to create a run of logged signals
load_system('ex_sl-demo_absbrake')
sim('ex_sl-demo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
```

```
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell
 {'yout'}
 {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
 Ww: [1x1 timeseries]
 Vs: [1x1 timeseries]
 Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_slldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_slldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

## Alternatives

If the signal is a top-level element in the `Simulink.sdi.DatasetRef` object, you can use the `getElement` method to get the `Simulink.sdi.Signal` object by index.

## Version History

## Simulink.sdi.WorkerRun class

**Package:** Simulink.sdi

Access simulation data from parallel workers

### Description

The `Simulink.sdi.WorkerRun` class provides access to run data generated on Parallel Computing Toolbox parallel workers. Create a `Simulink.sdi.WorkerRun` object on the worker, and then use the object to access data in your local MATLAB session.

### Construction

`workerRun = Simulink.sdi.WorkerRun(runID)` creates a `Simulink.sdi.WorkerRun` object with the run identifier specified by `runID`.

`workerRun = Simulink.sdi.WorkerRun.getLatest` creates a `Simulink.sdi.WorkerRun` object of the most recent run.

### Input Arguments

**runID — Run identifier**

integer

Run identifier

### Methods

<code>getDataset</code>	Create Dataset of worker run data
<code>getDatasetRef</code>	Create DatasetRef for worker run
<code>getLatest</code>	Create worker run for latest run
<code>getLocalRun</code>	Create local run from worker run

### Copy Semantics

Handle. To learn how handle classes affect copy operations, see [Copying Objects](#).

### Examples

#### Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

## Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')
```

```
% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

## Initialize Parallel Workers

Use `gcp` to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd
```

```
% Load system and select signals to log
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)
```

```
end
```

## Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7
```

```
% Select value for Ts
Ts_val = Ts_vals(index);

% Change the filter time constant and simulate
modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
modelWorkspace.assignin('Ts', Ts_val)
sim('slexAircraftExample')
```

```

% Create a worker run for each simulation
workerRun(index) = Simulink.sdi.WorkerRun.getLatest

end

spmd

% Remove temporary directories
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)

```

```
end
```

### Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;
```

```
for a = 1:7
 ds(a) = workerRun(a).getDataset;
```

```
end
```

```
ds(1)
```

```
ans =
Simulink.SimulationData.Dataset '' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	alpha, rad	...rcraftExample/Aircraft Dynamics Model
2	[1x1 Signal]	Stick	slexAircraftExample/Pilot

- Use braces { } to access, modify, or add elements using index.

### Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
 datasetRef(b) = workerRun(b).getDatasetRef;
```

```
end
```

```
datasetRef(1)
```

```
ans =
DatasetRef with properties:

 Name: 'Run 3: slexAircraftExample'
 Run: [1x1 Simulink.sdi.Run]
numElements: 2
```

## Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local Run objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

 Runs(c) = workerRun(c).getLocalRun;
 Ts_val_str = num2str(Ts_vals(c));
 desc = strcat('Ts = ', Ts_val_str);
 Runs(c).Description = desc;
 Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

## Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

## Alternatives

You can also access, view, and analyze simulation data from Parallel Computing Toolbox workers using the Simulation Data Inspector UI.

## getDataset

**Class:** Simulink.sdi.WorkerRun

**Package:** Simulink.sdi

Create Dataset of worker run data

### Syntax

```
dataset = workerRun.getDataset
dataset = workerRun.getDataset(domain)
```

### Description

`dataset = workerRun.getDataset` returns a `Simulink.SimulationData.Dataset` object of the data corresponding to the `Simulink.sdi.WorkerRun` object.

`dataset = workerRun.getDataset(domain)` returns a `Simulink.SimulationData.Dataset` object of the data corresponding to the `Simulink.sdi.WorkerRun` object limited to the scope specified by `domain`.

### Input Arguments

**domain — Scope specifier**

'signals' | 'outports'

Scope limiting argument that selects the data to return in the `Simulink.SimulationData.Dataset` object.

- 'signals' limits the data returned in the Dataset to signals in the WorkerRun.
- 'outports' limits the data returned in the Dataset to output data in the WorkerRun.

### Output Arguments

**dataset — Simulink.SimulationData.Dataset object**

`Simulink.SimulationData.Dataset` object

`Simulink.SimulationData.Dataset` object containing the data from the `Simulink.sdi.WorkerRun` object.

### Examples

#### Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

## Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

## getDatasetRef

**Class:** Simulink.sdi.WorkerRun

**Package:** Simulink.sdi

Create DatasetRef for worker run

### Syntax

```
datasetRef = workerRun.getDatasetRef
datasetRef = workerRun.getDatasetRef(domain)
```

### Description

`datasetRef = workerRun.getDatasetRef` returns a `Simulink.SimulationData.DatasetRef` object referencing the data in the `Simulink.sdi.WorkerRun` object, `workerRun`.

`datasetRef = workerRun.getDatasetRef(domain)` returns a `Simulink.SimulationData.DatasetRef` object referencing the data in the `Simulink.sdi.WorkerRun` object, `workerRun`, limited to the scope specified by `domain`.

### Input Arguments

**domain — Scope limiting input**

'signals' | 'outports'

Scope limiting argument that selects the data to reference in the `Simulink.SimulationData.DatasetRef` object.

- 'signals' limits the data referenced in the `DatasetRef` to signals in the `WorkerRun`.
- 'outports' limits the data referenced in the `DatasetRef` to output data in the `WorkerRun`.

### Output Arguments

**datasetRef — Simulink.SimulationData.DatasetRef object**

`Simulink.sdi.DatasetRef` object

`Simulink.sdi.DatasetRef` object referencing the data in the Parallel Computing Toolbox worker run.

### Examples

#### Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

## Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')
```

```
% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

## Initialize Parallel Workers

Use `gcp` to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd
```

```
% Load system and select signals to log
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)
```

```
end
```

## Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7
```

```
% Select value for Ts
Ts_val = Ts_vals(index);

% Change the filter time constant and simulate
modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
modelWorkspace.assignin('Ts', Ts_val)
sim('slexAircraftExample')
```

```

 % Create a worker run for each simulation
 workerRun(index) = Simulink.sdi.WorkerRun.getLatest

end

spmd

 % Remove temporary directories
 cd(workDir)
 rmdir(tempDir, 's')
 rmpath(workDir)

```

```
end
```

### Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;
```

```
for a = 1:7
 ds(a) = workerRun(a).getDataset;
```

```
end
ds(1)
```

```
ans =
Simulink.SimulationData.Dataset '' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	alpha, rad	...rcraftExample/Aircraft Dynamics Model
2	[1x1 Signal]	Stick	slexAircraftExample/Pilot

- Use braces { } to access, modify, or add elements using index.

### Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
 datasetRef(b) = workerRun(b).getDatasetRef;
```

```
end
```

```
datasetRef(1)
```

```
ans =
DatasetRef with properties:

 Name: 'Run 3: slexAircraftExample'
 Run: [1x1 Simulink.sdi.Run]
numElements: 2
```

## Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local Run objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

 Runs(c) = workerRun(c).getLocalRun;
 Ts_val_str = num2str(Ts_vals(c));
 desc = strcat('Ts = ', Ts_val_str);
 Runs(c).Description = desc;
 Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

## Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

## Simulink.sdi.WorkerRun.getLatest

**Class:** Simulink.sdi.WorkerRun

**Package:** Simulink.sdi

Create worker run for latest run

### Syntax

```
runObj = Simulink.sdi.WorkerRun.getLatest
```

### Description

`runObj = Simulink.sdi.WorkerRun.getLatest` creates a `Simulink.sdi.WorkerRun` object for the latest run on a Parallel Computing Toolbox worker.

### Output Arguments

**runObj** — Local Simulink.sdi.Run object

Simulink.sdi.WorkerRun object

Simulink.sdi.WorkerRun object to access the data from the latest Parallel Computing Toolbox worker run.

### Examples

#### Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

#### Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')
```

```
% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

#### Initialize Parallel Workers

Use `gcp` to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd
```

```
% Load system and select signals to log
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)
```

```
end
```

### Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7
```

```
% Select value for Ts
Ts_val = Ts_vals(index);

% Change the filter time constant and simulate
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
modelWorkspace.assignin('Ts',Ts_val)
sim('slexAircraftExample')

% Create a worker run for each simulation
workerRun(index) = Simulink.sdi.WorkerRun.getLatest
```

```
end
```

```
spmd
```

```
% Remove temporary directories
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)
```

```
end
```

### Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;
```

```

for a = 1:7
 ds(a) = workerRun(a).getDataset;
end
ds(1)

ans =
Simulink.SimulationData.Dataset '' with 2 elements

 Name BlockPath

1 [1x1 Signal] alpha, rad ...rcraftExample/Aircraft Dynamics Model
2 [1x1 Signal] Stick slexAircraftExample/Pilot

- Use braces { } to access, modify, or add elements using index.

```

### Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```

for b = 1:7
 datasetRef(b) = workerRun(b).getDatasetRef;
end

datasetRef(1)

ans =
DatasetRef with properties:

 Name: 'Run 3: slexAircraftExample'
 Run: [1x1 Simulink.sdi.Run]
 numElements: 2

```

### Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local `Run` objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```

for c = 1:7

 Runs(c) = workerRun(c).getLocalRun;
 Ts_val_str = num2str(Ts_vals(c));
 desc = strcat('Ts = ', Ts_val_str);
 Runs(c).Description = desc;
 Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end

```

### Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

Simulink.sdi.cleanupWorkerResources

## **Version History**

**Introduced in R2017b**

### **See Also**

Simulink.sdi.WorkerRun | getDataset | getDatasetRef | getLocalRun

### **Topics**

“Inspect and Compare Data Programmatically”

## getLocalRun

**Class:** Simulink.sdi.WorkerRun

**Package:** Simulink.sdi

Create local run from worker run

### Syntax

```
runObj = workerRun.getLocalRun
```

### Description

`runObj = workerRun.getLocalRun` creates the local `Simulink.sdi.Run` object `runObj` for the `Simulink.sdi.WorkerRun` object `workerRun`. Use `getLocalRun` in the client MATLAB to access the `Simulink.sdi.WorkerRun` data.

### Output Arguments

**runObj** — Local `Simulink.sdi.Run` object

`Simulink.sdi.Run` object

Local `Simulink.sdi.Run` object.

### Examples

#### Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

#### Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')
```

```
% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

#### Initialize Parallel Workers

Use `gcp` to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd
```

```
% Load system and select signals to log
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)
```

```
end
```

### Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7
```

```
% Select value for Ts
Ts_val = Ts_vals(index);

% Change the filter time constant and simulate
modelWorkspace = get_param('slexAircraftExample','modelworkspace');
modelWorkspace.assignin('Ts',Ts_val)
sim('slexAircraftExample')

% Create a worker run for each simulation
workerRun(index) = Simulink.sdi.WorkerRun.getLatest
```

```
end
```

```
spmd
```

```
% Remove temporary directories
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)
```

```
end
```

### Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;
```

```

for a = 1:7
 ds(a) = workerRun(a).getDataset;
end
ds(1)

ans =
Simulink.SimulationData.Dataset '' with 2 elements

 Name BlockPath

1 [1x1 Signal] alpha, rad ...rcraftExample/Aircraft Dynamics Model
2 [1x1 Signal] Stick slexAircraftExample/Pilot

- Use braces { } to access, modify, or add elements using index.

```

### Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```

for b = 1:7
 datasetRef(b) = workerRun(b).getDatasetRef;
end

datasetRef(1)

ans =
DatasetRef with properties:

 Name: 'Run 3: slexAircraftExample'
 Run: [1x1 Simulink.sdi.Run]
 numElements: 2

```

### Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local `Run` objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```

for c = 1:7

 Runs(c) = workerRun(c).getLocalRun;
 Ts_val_str = num2str(Ts_vals(c));
 desc = strcat('Ts = ', Ts_val_str);
 Runs(c).Description = desc;
 Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end

```

### Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

## Simulink.sfunction.Analyzer class

**Package:** Simulink.sfunction

Create a Simulink S-function analyzer object

### Description

This class enables you to perform checks on S-functions within a model or a library. These checks include MEX compiler setup check, source code check, MEX-file check, parameter robustness check for S-functions. The check result can be accessed either from a MATLAB structure or an HTML report.

The S-function analyzer checks the source code of the S-functions based on the S-function names. The S-function source code can be automatically included in the analysis if the source file is a single .c or .cpp file in the MATLAB path that has the same name as the S-function. Otherwise, the build information can be specified through the S-function Analyzer APIs. If no source code is available on the specified path, the analysis is skipped.

### Construction

`sfunAnalyzer = Simulink.sfunction.Analyzer(model)` creates a `Simulink.sfunction.Analyzer` object with the model you specify. In this case, the source code for the S-function can be automatically included in the analysis if the source code file is a single .c or .cpp file in the MATLAB path that has the same name as the S-function. For example, if the specified model contains an S-function called `mysfun`, and the source file for `mysfun` is a single file `mysfun.c` in the MATLAB path, a `Simulink.sfunction.analyzer.BuildInfo` object is automatically created and included in the analysis.

`sfunAnalyzer = Simulink.sfunction.Analyzer(model, 'BuildInfo', {bdInfo})` creates a `Simulink.sfunction.Analyzer` object with the model and a `Simulink.sfunction.analyzer.BuildInfo` object named `bdInfo`.

`sfunAnalyzer = Simulink.sfunction.Analyzer(model, 'Options', {opts})` creates a `Simulink.sfunction.Analyzer` object with the model and a `Simulink.sfunction.analyzer.Options` object named `opts`.

### Input Arguments

#### **model** — Specify a model in the path

character vector | string

Names of the model in the path, specified as a string or character vector.

#### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: 'BuildInfo', {buildInfo}

### **BuildInfo — Specify the buildinfo object**

cell array

A cell array of buildinfo objects. See `Simulink.sfunction.analyzer.BuildInfo` for more information.

### **Options — Specify the S-function analyzer running options**

object

An object to specify S-function analyzer running options. These checks include Polyspace Code Prover™ and parameter robustness checks. See `Simulink.sfunction.analyzer.Options` for more information.

## **Methods**

<code>generateReport</code>	Generate an HTML report of S-function checks
<code>run</code>	Perform checks on S-functions

## **Version History**

**Introduced in R2017b**

### **See Also**

`run` | `generateReport` | `Simulink.sfunction.analyzer.BuildInfo` | `Simulink.sfunction.analyzer.Options` | `findSfunctions`

## findSfunctions

Find and return all eligible S-functions in a model

### Syntax

```
sfuncs = Simulink.sfunction.analyzer.findSfunctions(model)
```

### Description

`sfuncs = Simulink.sfunction.analyzer.findSfunctions(model)` returns all eligible S-functions in a model for the S-function checks. Rules are applied to filter out all ineligible S-functions.

### Input Arguments

**model** — A Simulink model or library in path

character vector | string vector

A Simulink model or library in path specified as a string or a character vector.

### Output Arguments

**sfuncs** — A list of all eligible S-functions

cell array of character vectors

Eligible S-functions in the model, specified as a cell array of character vectors.

## Version History

Introduced in R2017b

## run

**Class:** Simulink.sfunction.Analyzer

**Package:** Simulink.sfunction

Perform checks on S-functions

### Syntax

```
result = run()
```

### Description

`result = run()` returns a struct containing the result from the analyzer checks. An example result struct has the following fields:

```
TimeGenerated: '19-Jul-2017 19:25:32'
Platform: 'win64'
Release: '(R2017b)'
SimulinkVersion: '9.0'
ExemptedBlocks: {}
MexConfiguration: [1x1 mex.CompilerConfiguration]
Data: [4x4 struct]
```

### Output Arguments

**result** — Sfunction.Analyzer structure

MATLAB structure

MATLAB structure containing the result of S-function analyzer.

# Simulink.sfunction.analyzer.BuildInfo class

**Package:** Simulink.sfunction.analyzer

Create an object to represent build information

## Description

Simulink.sfunction.analyzer.BuildInfo object captures the build information for S-functions, such as source files, header files, and linking libraries, for use with the Simulink.sfunction.Analyzer class.

## Construction

`bdInfo= Simulink.sfunction.analyzer.BuildInfo(SfcnFile)` creates a Simulink.sfunction.analyzer.BuildInfo object.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'SrcPath', {srcpaths}, 'ExtraSrcFileList', {srcfilelist})` creates a Simulink.sfunction.analyzer.BuildInfo object for a C-MEX S-function source file, a list of extra source files located in the specified path.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'ObjFileList', {objfilelist})` creates a Simulink.sfunction.analyzer.BuildInfo object for C-MEX S-function source file and list of extra objective code files.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'IncPaths', {incpathslist})` creates a Simulink.sfunction.analyzer.BuildInfo object for C-MEX S-function source file and paths to the folders including header files.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'LibFileList', {libfilelist}, 'LibPaths', {libpaths})` creates a Simulink.sfunction.analyzer.BuildInfo object for C-MEX S-function source file and library files and library file paths used for building.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'PreProcDefList', {preprocdir})` creates a Simulink.sfunction.analyzer.BuildInfo object for C-MEX S-function source file and pre-processor directives list.

## Input Arguments

### SfcnFile — S-function source file

character vector | string

S-function source file having the same name as the S-function.

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: 'SrcPath', {srcpath}

### **SrcPath — Source file path**

cell array of character vectors | string

Search paths to extra S-function source files that are referenced by SfcnFile, specified as a cell array or a string.

### **ExtraSrcFileList — Extra source file list**

cell array of character vectors | string

List of extra S-function source files, specified as a cell array or string.

### **ObjFileList — Extra objective code**

cell array

List of objective files used for building, specified as a cell array.

### **IncPaths — Search paths for header files**

cell array of character vectors | string

Specify paths to include folders for header files, specified as a cell array or a string.

### **LibFileList — External libraries list**

cell array of character vectors | string

List of external library files used for building, specified as a cell array or string.

### **LibPaths — Search paths for external libraries**

cell array of character vectors | string

Search paths for external library files used for building, specified as a cell array or a string.

### **PreProcDefList — Preprocessor directives**

cell array of character vectors | string

List of the preprocessor directives, specified as a cell array or a string.

## **Output Arguments**

### **bdInfo — BuildInfo object**

object

Build information for the S-functions supplied to the S-function analyzer. Returns a `simulink.sfunction.analyzer.BuildInfo` object.

## **Examples**

Create a `bdInfo` object for an S-function `mysfun` that includes a source file `mysfun.c`:

### **Basic Use**

```
bdInfo = Simulink.sfunction.analyzer.BuildInfo('mysfun.c');
```

The output `bdInfo` has the following fields:

```
bdInfo =
```

```
BuildInfo with properties:
```

```

 SfcnFile: 'mysfun.c'
 SfcnName: 'mysfun'
 SrcType: 'C'
 SrcPaths: {}
 ExtraSrcFileList: {}
 ObjFileList: {}
 IncPaths: {}
 LibFileList: {}
 LibPaths: {}
 PreProcDefList: {}

```

### Advanced Use

Create a `bdInfo` object for an S-function `mysfun` that includes a source file `mysfun.c` and also includes:

- List of extra source files, `extra1.c` and `extra2.c`
- Paths to source file folders, `/path1` and `/path2`.
- List of objective files, `o1.obj` and `o2.obj`.
- List of library files, `l1.lib` and `l2.lib`.
- Library paths, `/libpath1`.
- Pre-processor running directives, `-DDEBUG`.

```

Simulink.sfunction.analyzer.BuildInfo('mysfun.c',...
 'ExtraSrcFileList',{extra1.c,extra2.c},... %specify extra s
 'SrcPaths',{/path1,/path2},... %specify paths t
 'ObjFileList',{o1.obj,o2.obj},... %specify object
 'LibFileList',{l1.lib,l2.lib},... %specify library
 'LibPaths',{/libpath1},... %specify library
 'PreProcDefList',{DEBUG}); %specify preproc

```

## Version History

Introduced in R2017b

## Simulink.sfunction.analyzer.Options class

**Package:** Simulink.sfunction.analyzer

Create an object to specify options for running S-function checks

### Description

Simulink.sfunction.analyzer.Options object is created through the constructor Simulink.sfunction.analyzer.Options(). Simulink.sfunction.analyzer.Options object captures the options for running S-function checks. These checks include whether to enable Polyspace and Parameter Robustness checks, maximum model simulation time and output path for result report.

### Construction

opts= Simulink.sfunction.analyzer.Options() returns a options object with these property values:

```
EnablePolyspace: 0
EnableRobustness: 0
EnableUsePublishedOnly: 0
ReportPath: pwd
ModelSimTimeOut: 10
```

### Properties

#### EnablePolyspace — Polyspace Code Prover check

False (default) | True

Boolean type check to determine whether to include Polyspace Code Prover check.

---

**Note** These checks usually take some time to run.

---

#### EnableRobustness — Parameter robustness check

False (default) | True

Boolean type check to indicate whether to include Robustness checks.

---

**Note** These checks usually take some time to run.

---

#### ReportPath — Generated report directory

current working directory (default) | character array

Path to the generated report directory.

#### ModelSimTimeOut — Maximum model simulation time

10 (default) | scalar

Maximum model simulation time in seconds.

**EnableUsePublishedOnly — Check for use of only documented APIs**

False (default) | True

Check to indicate if any undocumented S-function APIs are used in the code.

## Version History

Introduced in R2017b

## Simulink.SimState.ModelSimState class

**Package:** Simulink.SimState

(Not recommended) Access SimState snapshot data

---

**Note** Simulink.SimState.ModelSimState is not recommended. Use Simulink.op.ModelOperatingPoint instead.

---

### Description

The Simulink.SimState.ModelSimState class contains all of the information associated with a “snapshot” of a simulation, including the logged states, the time of the snapshot, and the start time of the simulation. To access these data for a block, use the `getBlockSimState` method or the `loggedStates` property.

### Properties

#### description

Specify a description. By default, Simulink generates a character vector based on your model name.

#### loggedStates

The logged states are the continuous and discrete states of the blocks in a model. These states represent a subset of the complete simulation state (SimState) of the model.

If `loggedStates` is in Dataset format, you cannot assign a structure or a Simulink.SimulationData.Dataset object with a different number of elements than that of the Dataset object used for `loggedStates`.

If the `loggedStates` is in Structure format, you cannot assign a Dataset object.

#### Attributes:

dependent

`loggedStates` is obtained from the saved states of the block. `loggedStates` depends on the full state being saved in the SimState object, unlike, properties like `description`, which are independent of the save states.

#### snapshotTime

Time at which Simulink takes a “snapshot” of the complete simulation states. This data is read only.

#### startTime

Time at which the simulation starts. This data is read only.

## Methods

`getBlockSimState` (Not recommended) Access `SimState` of individual Stateflow Chart, MATLAB Function, or S-function block

`setBlockSimState` (Not recommended) Set `SimState` of individual Stateflow Chart, MATLAB Function, or S-function block

## Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects in the MATLAB Programming Fundamentals documentation.

## getBlockSimState

**Class:** Simulink.SimState.ModelSimState

**Package:** Simulink.SimState

(Not recommended) Access SimState of individual Stateflow Chart, MATLAB Function, or S-function block

---

**Note** Simulink.SimState.ModelSimState.getBlockSimState is not recommended. Use `get` instead.

---

### Syntax

```
blockSimState = getBlockSimState(x, 'blockpath')
```

### Description

`blockSimState = getBlockSimState(x, 'blockpath')` returns the SimState of the block specified as `blockpath`. `blockpath` must be either a Stateflow Chart, MATLAB Function, or S-function block. For other types of blocks, see the `loggedStates` property of the Simulink.SimState.ModelSimState class.

### Input Arguments

**x**

The `x` argument is a Simulink.SimState.ModelSimState object.

**blockpath**

The path to the block for which you are requesting the SimState values.

### Output Arguments

**blockSimState**

The SimState of the block specified.

### Examples

```
chartState = getBlockSimState(x, 'mymodel/chart')
```

To get the SimState of a block that is in a referenced model, specify the full path of the block relative to the root model.

```
openExample('sldemo_fuelsys_dd');
rootModel = 'sldemo_fuelsys_dd';
opt = struct('SaveFinalState', 'on', 'SaveCompleteFinalSimState', 'on', 'StopTime', '1');
```

```
simOut = sim(rootModel,opt);
x = simOut.xFinal;
blockPath = 'sldemo_fuelsys_dd/Fuel Rate Controller|sldemo_fuelsys_dd_controller/control_logic';
chartState = getBlockSimState(x,blockPath)
```

**See Also**

setBlockSimState

## setBlockSimState

**Class:** Simulink.SimState.ModelSimState

**Package:** Simulink.SimState

(Not recommended) Set SimState of individual Stateflow Chart, MATLAB Function, or S-function block

---

**Note** Simulink.SimState.ModelSimState.setBlockSimState is not recommended. Use set instead.

---

### Syntax

```
setBlockSimState(x, 'blockpath', blockSimState)
```

### Description

setBlockSimState(x, 'blockpath', blockSimState) sets the SimState of the block specified as *blockpath*. *blockpath* must be either a Stateflow Chart, MATLAB Function, or S-function block. For other types of blocks, see the `loggedStates` property of the Simulink.SimState.ModelSimState class.

### Input Arguments

**x**

The argument *x* is a Simulink.SimState.ModelSimState object.

**blockpath**

The path to the block for which you are setting the SimState values

**blockSimState**

The SimState of the block specified.

### Examples

```
newObj = setBlockSimState(obj, 'mymodel/chart', newChartState);
```

### See Also

getBlockSimState

# Simulink.Simulation.BlockParameter class

**Package:** Simulink.Simulation

Block parameters in Simulink.SimulationInput objects

## Description

The `Simulink.Simulation.BlockParameter` object specifies the block parameter, path of the block, and the value of the block parameter used by the `Simulink.SimulationInput` object during simulation.

In most cases, there is no need to create an object of this class directly. It is recommended that you use the `setBlockParameter` method on the `Simulink.SimulationInput` object to add a block parameter to the `Simulink.SimulationInput` object.

## Creation

`bp = Simulink.Simulation.BlockParameter('BlockPath', 'Name', 'Value')` creates a `Simulink.Simulation.BlockParameter` object, `bp`, that specifies the block parameter, `Name`, with a `Value` on its path, `BlockPath`.

## Properties

### **BlockPath — Path of the block**

character vector

Path of the block, specified as a character vector.

### **Name — Name of the block parameter**

character vector

Name of the block parameter, specified as a character vector.

### **Value — Value of the block parameter**

character vector

Value of the block parameter, specified as a character vector.

## Version History

Introduced in R2020a

**Topics**

“Running Multiple Simulations”

“Run Parallel Simulations for a Thermal Model of a House Using parsim”

# Simulink.Simulation.Future class

**Package:** Simulink.Simulation

Create Future object for simulation

## Description

Create a `Simulink.Simulation.Future` object when you execute `parsim` with the `'RunInBackground'` argument set to `'on'`. The `parsim` command runs multiple simulations in parallel using the inputs specified with an array of `Simulink.SimulationInput` objects. You can use this object to monitor the status of ongoing simulations, fetch outputs of completed simulations, or cancel ongoing simulations.

The `parsim` command uses the Parallel Computing Toolbox license to run the simulations in parallel. `parsim` runs the simulations in serial if a parallel pool cannot be created or if Parallel Computing Toolbox is not used.

## Construction

`future = parsim(in, 'RunInBackground', 'on')` creates a `Simulink.Simulation.Future` object, `future`, while running multiple simulations in parallel using the inputs specified in the `Simulink.SimulationInput` object, `in`.

## Input Arguments

**in** — `Simulink.SimulationInput` object array

object (default) | array

A `Simulink.SimulationInput` object or an array of `Simulink.SimulationInput` objects is used to run multiple simulations. Specify parameters and values of a model to run multiple simulations without making it dirty.

Example: `in = Simulink.SimulationInput('vdp'), in(1:10) = Simulink.SimulationInput('vdp')`

**'RunInBackground'** — `parsim` argument to enable `RunInBackground`

'off' (default) | 'on'

Set to `'on'`, to run simulations asynchronously, keeping the MATLAB command prompt available.

## Properties

**Diary** — Log of outputs from the simulation

text file

Text log of outputs from the simulation.

This property is read-only.

**ID** — Numeric identifier of the future object

scalar integer

ID of the `future` object, specified as a scalar integer.

This property is read-only.

### Read — Whether the outputs have been read

1 | 0

Whether a call to `fetchNext` or `fetchOutputs` has read the outputs in the `Simulink.Simulation.Future` object array, specified as 1 if true and 0 if false.

This property is read-only.

### State — Current state of future object array

'pending' | 'queued' | 'running' | 'finished' | 'failed' | 'unavailable'

Current state of future object array, specified as 'pending', 'queued', 'running', 'finished', 'failed', or 'unavailable'.

This property is read-only.

## Methods

Method	Purpose
<code>cancel</code>	Cancel a pending, queued, or running <code>Simulink.Simulation.Future</code> object
<code>fetchNext</code>	Fetch next available unread output from <code>Simulink.Simulation.Future</code> object array
<code>fetchOutputs</code>	Retrieve <code>Simulink.SimulationOutput</code> from <code>Simulink.Simulation.Future</code>
<code>wait</code>	Wait for <code>Simulink.Simulation.Future</code> objects to complete simulation

## Examples

### Create a `Simulink.Simulation.Future` Object

This example shows how to create a `Simulink.Simulation.Future` object array and use it to retrieve outputs and see the status of simulations.

This example runs several simulations of the `vdp` model, varying the value of the gain `Mu`.

Open the model and define a vector of `Mu` values.

```
open_system('vdp');
Mu_Values = [0.5:0.25:5];
MuVal_length = length(Mu_Values);
```

Using `Mu_Values`, initialize an array of `Simulink.SimulationInput` objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1
 in(i) = Simulink.SimulationInput('vdp');
```

```
 in(i) = in(i).setBlockParameter('vdp/Mu',...
 'Gain',num2str(Mu_Values(i)));
end
```

Simulate the model using `parsim`. Set it to 'RunInBackground', to be able to use the command prompt, while simulations are running.

```
Future = parsim(in, 'RunInBackground', 'on');
```

Use the `fetchNext` method on Future simulations.

```
for i = 1:MuVal_length
 [completedIdx, simOut] = fetchNext(Future)
end
```

## Version History

Introduced in R2018a

### See Also

#### Functions

`parsim` | `batchsim` | `batch` | `cancel` | `fetchNext` | `fetchOutputs` | `wait`

#### Classes

`Simulink.SimulationInput`

## cancel

Cancel a pending, queued, or running `Simulink.Simulation.Future` object

### Syntax

```
cancel(Future)
```

### Description

`cancel(Future)` stops the objects of the `Simulink.Simulation.Future` array, `Future`, that are currently in 'pending', 'queued', or 'running' state. For elements of the Futures in the 'finished' state, no action is taken.

### Examples

#### Cancel Simulations of Future Objects

This example shows how to use the `cancel` method on an array of future objects to stop the simulations.

This example runs several simulations of the `vdp` model, varying the value of the gain `Mu`.

Open the model and define a vector of `Mu` values.

```
open_system('vdp');
Mu_Values = [0.5:0.25:1000];
MuVal_length = length(Mu_Values)
```

Using `Mu_Values`, initialize an array of `Simulink.SimulationInput` objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1
 in(i) = Simulink.SimulationInput('vdp');
 in(i) = in(i).setBlockParameter('vdp/Mu', ...
 'Gain', num2str(Mu_Values(i)));
end
```

Simulate the model using `parsim`. Set to 'RunInBackground' to enable the use the command prompt, while simulations are running.

```
Future = parsim(in, 'RunInBackground', 'on');
```

Now, assume that you want to run simulations with different values of `Mu` and cancel the ongoing simulations.

---

`cancel(Future)`

## Input Arguments

**Future** — `Simulation.Simulink.Future` object

array

Array of `Simulation.Simulink.Future` objects. To create `Future`, run `parsim` with `'RunInBackground'` option set to `'on'`.

Example: `Future = parsim(in, 'RunInBackground', 'on')`

## Version History

Introduced in R2018a

## See Also

### Functions

`parsim` | `batchsim` | `batch` | `fetchOutputs` | `fetchNext` | `wait`

### Classes

`Simulink.Simulation.Future` | `Simulink.SimulationInput`

## fetchNext

Fetch next available unread output from `Simulink.Simulation.Future` object array

### Syntax

```
[idx,simOut] = fetchNext(Future)
[idx,simOut] = fetchNext(Future, Timeout)
```

### Description

`[idx,simOut] = fetchNext(Future)` waits for the unread element of `Simulink.Simulation.Future` array, `Future`, to reach a 'finished' state. It returns the index of the simulation that finished, and the corresponding `Simulink.SimulationOutput` object.

`[idx,simOut] = fetchNext(Future, Timeout)` waits for a maximum of `Timeout` seconds for a result to become available. If the timeout expires before any result is available, `simOut` is returned as an empty array.

An error is reported if there are no elements in `Future` with property `Read` as false. You can check for any unread futures using `anyUnread = ~all([F.Read])`.

`fetchNext` displays an error if any element of `Future` with a 'finished' state encounters an error during execution. The `Read` property of that element becomes `true` allowing any subsequent call to `fetchNext` to proceed.

### Examples

#### Create a `Simulink.Simulation.Future` Object

This example shows how to create a `Simulink.Simulation.Future` object array and use it to retrieve outputs and see the status of simulations.

This example runs several simulations of the `vdp` model, varying the value of the gain `Mu`.

Open the model and define a vector of `Mu` values.

```
open_system('vdp');
Mu_Values = [0.5:0.25:5];
MuVal_length = length(Mu_Values);
```

Using `Mu_Values`, initialize an array of `Simulink.SimulationInput` objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1
 in(i) = Simulink.SimulationInput('vdp');
 in(i) = in(i).setBlockParameter('vdp/Mu',...
 'Gain',num2str(Mu_Values(i)));
end
```

Simulate the model using `parsim`. Set it to 'RunInBackground' to be able to use the command prompt, while simulations are running.

```
Future = parsim(in, 'RunInBackground', 'on');
```

Use the `fetchNext` method on `Future`.

```
for i = 1:MuVal_length
 [completedIdx, simOut] = fetchNext(Future)
end
```

## Input Arguments

### **Future** — Simulation.Simulink.Future object

array

Array of `Simulation.Simulink.Future` objects. To create `Future`, run `parsim` with 'RunInBackground' option set to 'on'.

Example: `Future = parsim(in, 'RunInBackground', 'on')`

### **Timeout** — Number of seconds specified for `fetchNext` to time out

scalar

Specify a `Timeout` for `fetchNext` to retrieve the results from the `Simulation.Simulink.Future` array, `Future`.

Example: `[idx, simOut] = fetchNext(Future, 45)`

## Output Arguments

### **idx** — Index of the simulation

integer

When `fetchNext` method is used on an array of `Simulation.Simulink.Future` objects, it returns the index of the simulation whose output is being retrieved.

### **simOut** — Simulation object containing logged simulation results

object | array

Array of `Simulink.SimulationOutput` objects that contain all of the logged simulation results. The size of the array is equal to the size of the array of `Simulink.SimulationInput` objects.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You define the model time, states, and output that are logged using the **Data Import/Export** pane of the Model Configuration Parameters dialog box. You can log signals using blocks such as the To Workspace and Scope blocks. The **Viewers & Generators Manager** tool can directly log signals.

# fetchOutputs

Retrieve `Simulink.SimulationOutput` from `Simulink.Simulation.Future` objects

## Syntax

```
simOut = fetchOutputs(Future)
```

## Description

`simOut = fetchOutputs(Future)` fetches the output from an array of `Simulink.Simulation.Future` objects, `Future`, after each element of `Future` is in a 'finished' state. `fetchOutputs` returns an array of `Simulink.SimulationOutput` objects.

## Examples

### Create a Future and Retrieve Outputs Using fetchOutputs

This example shows how to use the `fetchOutputs` method on an array of future objects to retrieve a `Simulink.SimulationOutput` array.

This example runs several simulations of the `vdp` model, varying the value of the gain `Mu`.

Open the model and define a vector of `Mu` values.

```
open_system('vdp');
Mu_Values = [0.5,0.75,1,1.25];
MuVal_length = length(Mu_Values);
```

Using `Mu_Values`, initialize an array of `Simulink.SimulationInput` objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1
 in(i) = Simulink.SimulationInput('vdp');
 in(i) = in(i).setBlockParameter('vdp/Mu',...
 'Gain',num2str(Mu_Values(i)));
end
```

Simulate the model using `parsim`. Set to 'RunInBackground' to enable the use of command prompt, while simulations are running.

```
Future = parsim(in,'RunInBackground','on');
```

Use the `fetchOutputs` method on `Future`

```
simOut = fetchOutputs(Future)
```

```
simOut =
1x4 Simulink.SimulationOutput array
```

## Input Arguments

### **Future** — `Simulation.Simulink.Future` object

array

Array of `Simulation.Simulink.Future` objects. To create, `Future`, run `parsim` with 'RunInBackground' option set to 'on'.

Example: `Future = parsim(in, 'RunInBackground', 'on')`

## Output Arguments

### **simOut** — Simulation object containing logged simulation results

object

Array of `Simulink.SimulationOutput` objects that contain all of the logged simulation results. The size of the array is equal to the size of the array of `Simulink.SimulationInput` objects.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You define the model time, states, and output that are logged using the **Data Import/Export** pane of the Model Configuration Parameters dialog box. You can log signals using blocks such as the To Workspace and Scope blocks. The **Viewers & Generators Manager** tool can directly log signals.

### Classes

`Simulink.Simulation.Future` | `Simulink.SimulationInput`

## wait

Wait for `Simulink.Simulation.Future` objects to complete simulation

### Syntax

```
Ok = wait(Future)
```

### Description

`Ok = wait(Future)` blocks the command prompt until each element of the `Simulink.Simulation.Future` array, `Future` is in a 'finished' state.

### Examples

#### Wait for the Future Array to Complete Simulations

This example shows how to use the `wait` method on an array of future objects.

This example runs several simulations of the `vdp` model, varying the value of the gain `Mu`.

Open the model and define a vector of `Mu` values.

```
open_system('vdp');
Mu_Values = [0.5:0.25:5];
MuVal_length = length(Mu_Values);
```

Using `Mu_Values`, initialize an array of `Simulink.SimulationInput` objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1
 in(i) = Simulink.SimulationInput('vdp');
 in(i) = in(i).setBlockParameter('vdp/Mu', ...
 'Gain', num2str(Mu_Values(i)));
end
```

Simulate the model using `parsim`. Set to 'RunInBackground' to enable the use of command prompt while the simulations are running and to create an array of `Simulink.Simulation.Future` objects.

```
Future = parsim(in, 'RunInBackground', 'on');
```

Use the `wait` method on `Future` to block the execution.

```
Ok = wait(Future)
```

### Input Arguments

**Future** — `Simulation.Simulink.Future` object

array

Array of `Simulation.Simulink.Future` objects. To create `Future`, run `parsim` with `'RunInBackground'` option set to `'on'`.

Example: `Future = parsim(in, 'RunInBackground', 'on')`

## Output Arguments

### **Ok — Whether the wait is completed successfully**

1 | 0

`Ok` is `true` if the wait completes successfully, `false` if any of the `Future` objects failed execution or were canceled. Specified as 1 if true, 0 if false.

# Simulink.Simulation.Job class

**Package:** Simulink

Execute `batchsim` to create a `Simulink.Simulation.Job` object, `simJob`

## Description

Execute `batchsim` command with a parallel pool to create a `Simulink.Simulation.Job` object. The `batchsim` command offloads multiple simulations to run in batch using the inputs specified with an array of `Simulink.SimulationInput` objects. You can use this object to monitor the status of a batch job, fetch outputs of a completed batch job, or cancel one or more jobs.

The `batchsim` command uses the Parallel Computing Toolbox™ license to run the simulations on compute cluster. If a parallel pool cannot be created `batchsim` runs the simulations in serial. In the absence of Parallel Computing Toolbox license, `batchsim` errors out.

## Construction

`simJob = batchsim(in)` creates a `Simulink.Simulation.Job` object, `simJob`, while running multiple simulations in batches on a compute cluster using the inputs specified in the `Simulink.SimulationInput` object, `in`.

`createSimulationJob(batchJob)` creates a `Simulink.Simulation.Job` object from a `parallel.job` object, `batchJob`. Use the `createSimulationJob` command to retrieve the job object returned by the `batchsim` command.

## Input Arguments

### **in** — `Simulink.SimulationInput` object array

object (default) | array

A `Simulink.SimulationInput` object or an array of `Simulink.SimulationInput` objects used to run multiple simulations. Specify parameters and values of a model to run multiple simulations without making it dirty.

Example: `in = Simulink.SimulationInput('vdp'), in(1:10) = Simulink.SimulationInput('vdp')`

## Properties

### **AdditionalPaths** — Folders to add to MATLAB search path of workers

character vector | string | string array | array of character vectors

Specified folders to add to MATLAB search path of parallel workers.

This property is read-only.

### **AttachedFiles** — Files and folders sent to the workers

character vector | string | string array | array of character vectors

Files and folders to send to the parallel workers.

This property is read-only.

**AutoAddClientPath — Whether user-added entries on client path are added to each worker path**

true (default) | false

Whether user-added entries on the client path are added to each parallel worker path at the start of the batch job, specified as true or false.

**CreateDateTime — Date and time of simJob creation**

datetime object

Date and time at which the batch job was created, specified as a datetime object.

This property is read-only.

**EnvironmentVariables — Environment variables sent to the workers**

character vector | string | string array | array of character vectors

Defines the names of environment variables that are copied from a client session to the parallel workers.

This property is read-only after job submission.

**FinishDateTime — Date and time of simJob completion**

datetime object

Date and time at when the batch job completes execution, specified as a datetime object.

This property is read-only.

**ID — Numeric identifier of the simJob object**

scalar integer

ID of the future object, specified as a scalar integer.

This property is read-only.

**Name — simJob name**

string | character vector

Name of the job object, specified as a string.

**Parent — Cluster object containing simJob**

parallel.cluster object

Cluster object that contains the Simulink.Simulation.Job object, simJob.

**SimulationInputs — Array of Simulink.Simulation.Input objects**

Simulink.Simulation.Input object | Array

Array of Simulink.Simulation.Input objects used for simulations for simJob.

**StartDateTime — Date and time when simJob starts running**

datetime object

Date and time when the `Simulink.Simulation.Job` starts running, specified as a `datetime` object.

This property is read-only.

#### State — Current state of future object array

'pending' | 'queued' | 'running' | 'finished' | 'failed'

Current state of future object array, specified as 'pending', 'queued', 'running', 'finished', or 'failed'.

This property is read-only.

#### SubmitDateTime — Date and time of simJob submission

`datetime` object

Date and time when the `Simulink.Simulation.Job` is submitted, specified as a `datetime` object.

This property is read-only.

#### Tag — Label associated with simJob

string

Label associated with `Simulink.Simulation.Job` object.

#### Type — Job Type

independent | pool

Type of the `Simulink.Simulation.Job` object, specified as `independent` or `pool`.

#### UserData — Data associated with simJob

string

Stores any data associated with a job object. The data is stored in a client MATLAB session, and is not available on the workers.

#### UserName — Name of the user who creates the simJob object

string | character vector

Name of the user who creates the `Simulink.Simulation.Job` object.

## Methods

Method	Purpose
<code>cancel</code>	Cancel a pending, queued, or running <code>Simulink.Simulation.Job</code> object
<code>diary</code>	Display or save Command Window text of batch job
<code>fetchOutputs</code>	Retrieve an array of <code>Simulink.SimulationOutput</code> objects from all simulations in <code>Simulink.Simulation.Job</code>
<code>listAutoAttachedFiles</code>	List of files automatically attached to job, task, or parallel pool
<code>wait</code>	Wait for <code>Simulink.Simulation.Job</code> object to change state

## Examples

### Run Parallel Simulations With `batchsim` to Create `Simulink.Simulation.Job`

This example shows how to run parallel simulations in batch using the `sldemo_househeat` model. `batchsim` offloads simulations to the compute cluster, enabling you to carry out other tasks while the batch job is processing, or close the client MATLAB and access the batch job later.

Observe the model behavior for different temperature set points.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using the `setPointValues`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
 in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point',...
 'Value',num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job ID to access the job object later from any machine. `NumWorkers` displays how many workers are running the simulations - the number of workers specified in the 'Pool' argument plus an additional head worker.

```
simJob = batchsim(in, 'Pool',3)

 ID: 1
 Type: pool
 NumWorkers: 4
 Username: #####
 State: running
 SubmitDateTime: ##-###-#### #:##:##
 StartDateTime:
 Running Duration: 0 days 0h 0m 0s
```

## Version History

Introduced in R2018b

## cancel

**Package:** Simulink

Cancel a pending, queued, or running `Simulink.Simulation.Job` object

### Syntax

```
cancel(simJob)
cancel(simJob, 'Message')
```

### Description

`cancel(simJob)` stops the `Simulink.Simulation.Job` object, `simJob`, that is currently in 'pending', 'queued', or 'running' state.

`cancel(simJob, 'Message')` stops the `Simulink.Simulation.Job` object, `simJob`, that is in 'pending', 'queued', or 'running' state and displays a user-specified message.

The `State` property of `Simulink.Simulation.Job` object is set to finished, and other pending simulations are canceled. Canceling a job object disables you to fetch results from it. A canceled job object cannot be started again.

---

**Note** On canceling the job, the results of the completed simulations in the job are also lost.

---

## Examples

### Cancel a Batch Job

This example shows how to use the `cancel` method on a `simJob` object to stop simulations. The example runs several simulations of the `vdp` model, varying the value of the gain `Mu`.

1. Open the model and define a vector of `Mu` values.

```
open_system('vdp');
mu_Values = [0.5:0.25:1000];
muVal_Length = length(mu_Values);
```

2. Using `mu_Values`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:muVal_Length) = Simulink.SimulationInput('vdp');
for i = 1:1:muVal_Length
 in(i).setBlockParameter('vdp/Mu', ...
 'Gain', num2str(mu_Values(i)));
end
```

3. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The simulations are offloaded onto the default cluster profile.

```
simJob = batchsim(in, 'Pool',3);
```

4. Now, assume that you want to run simulations with different values of Mu and cancel the ongoing simulations.

```
cancel(simJob)
```

## Input Arguments

**simJob** — **Simulink.Simulation.Job** object  
object

A `Simulink.Simulation.Job` object. To create a `simJob`, run `batchsim`.

Example: `simJob = batchsim(in, 'Pool',6)`

# diary

**Package:** Simulink

Display or save Command Window text of `Simulink.Simulation.Job` object

## Syntax

```
diary(simJob)
diary(simJob, 'filename')
```

## Description

`diary(simJob)` displays the Command Window output from the `Simulink.Simulation.Job` object, `simJob`, in the MATLAB Command Window. The Command Window output is captured only if the `batchsim` command includes the `'CaptureDiary'` argument with a value of `true`.

`diary(simJob, 'filename')` causes the Command Window output from the batch job to be appended to the specified file. Open the file, `filename`, with any text editor.

## Examples

### Display the Diary of `simJob`

This example uses `sldemo_househeat` model to show how to display the diary of the `Simulink.Simulation.Job` object, `simJob`. To create a `simJob`, you run parallel simulations using the `batchsim` command.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using `setPointValues`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
 in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point',...
 'Value', num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job ID to access the job object later from any machine. `NumWorkers` displays how many workers are running the simulations - the number of workers specified in the `'Pool'` argument plus an additional head worker.

```
simJob = batchsim(in, 'Pool',3)

 ID: 1
 Type: pool
 NumWorkers: 4
 Username: #####
 State: running
 SubmitDateTime: ##-##-#### #:##:##
 StartDateTime:
 Running Duration: 0 days 0h 0m 0s
```

5. Use the `diary` method of the `Simulink.Simulation.Job` object to display the output of the batch job in the MATLAB command window.

Note that the diary is not displayed here because this is an example model.

```
diary(simJob)
```

## Input Arguments

**simJob** — `Simulink.Simulation.Job` object  
object

A `Simulink.Simulation.Job` object. To create a `simJob`, run `batchsim`.

Example: `simJob = batchsim(in, 'Pool',4)`

**'filename'** — File to append with Command Window output text  
string

Specify a file to append with Command Window output text from the `Simulink.Simulation.Job` object.

Example: `diary(simJob, 'abc.txt')`

## fetchOutputs

**Package:** Simulink

Retrieve an array of `Simulink.SimulationOutput` objects from all simulations in `Simulink.Simulation.Job`

### Syntax

```
out = fetchOutputs(simJob)
```

### Description

`out = fetchOutputs(simJob)` returns an array of `Simulink.SimulationOutput` objects containing the results of the simulations in a batch job, `simJob`.

`fetchOutputs` reports an error if the job is not in the 'finished' state, or if one of its simulations encounters an error during execution. Use the `wait` method to wait for the job to complete before fetching outputs.

### Examples

#### Fetch Outputs of the Batch Simulations

This example shows how to run parallel simulations in batch and fetch the resulting `Simulink.SimulationOutput` objects from the `Simulink.Simulation.Job` object. `batchsim` command offloads simulations to the compute cluster, enabling you to carry out other tasks while the batch job is processing, or close the client MATLAB and access the batch job later.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using `setPointValues`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
 in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point',...
 'Value',num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job ID to access the job object later from any machine. `NumWorkers` displays

how many workers are running the simulations - the number of workers specified in the 'Pool' argument plus an additional head worker.

```
simJob = batchsim(in, 'Pool', 3)
```

```

 ID: 1
 Type: pool
NumWorkers: 4
 Username: #####
 State: running
SubmitDateTime: ##-##-#### #:##:##
 StartDateTime:
Running Duration: 0 days 0h 0m 0s

```

5. Access the results of the batch job using the `fetchOutputs` method. `fetchOutputs` returns an array of `Simulink.SimulationOutput` objects. You can fetch outputs only once `simJob` is in finished state.

```
out = fetchOutputs(simJob)
```

```
1x11 Simulink.SimulationOutput array
```

## Input Arguments

**simJob** — `Simulink.Simulation.Job` object  
object

A `Simulink.Simulation.Job` object. To create `simJob`, run `batchsim`.

Example: `simJob = batchsim(in, 'Pool', 4)`

## Output Arguments

**out** — Simulation object containing logged simulation results  
object

Array of `Simulink.SimulationOutput` objects that contain all of the logged simulation results. The size of the array is equal to the size of the array of `Simulink.SimulationInput` objects passed to `batchsim`.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You define the model time, states, and output that are logged using the **Data Import/Export** pane of the Model Configuration Parameters dialog box. You can log signals using blocks such as the To Workspace and Scope blocks. The **Signal & Scope Manager** tool can directly log signals.

# getSimulationJobs

Get all `Simulink.Simulation.Job` objects from cluster

## Syntax

```
jobs = getSimulationJobs(myCluster)
```

## Description

`jobs = getSimulationJobs(myCluster)` returns an array of `Simulink.Simulation.Job` objects that correspond to the jobs created by executing of `batchsim` on cluster, `myCluster`.

## Examples

### Get a Simulink.Simulation.Job Object from the Cluster

This example shows how to access a `batchsim` job that was submitted to a cluster. Assume that `myCluster` is a `parallel.Cluster` object on which the `Simulink.Simulation.Job` object is running.

```
jobs = getSimulationJobs(myCluster)
```

1×2 Job array:

	ID	Type	State	FinishDateTime	Username
1	3	pool	queued		#####
2	4	pool	queued		#####

The output displays all the `Simulink.Simulation.Job` objects on cluster, `myCluster`.

## Input Arguments

**myCluster** — `parallel.Cluster` object

object

Cluster object representing parallel cluster compute resources.

## Output Arguments

**jobs** — Array of `Simulink.Simulation.Job` objects

array

Array of `Simulink.Simulation.Job` objects submitted by executing `batchsim` command.

## **Version History**

**Introduced in R2018b**

# listAutoAttachedFiles

**Package:** Simulink

List of files automatically attached to the `Simulink.Simulation.Job` object or parallel pool

## Syntax

```
listAutoAttachedFiles(simJob)
```

## Description

`listAutoAttachedFiles(simJob)` performs a dependency analysis on the `Simulink.Simulation.Job` job object, `simJob`. Then it displays a list of the code files that are already attached or are going to be automatically attached to the job object, `simJob`.

## Examples

### Run Parallel Simulations with `batchsim` and List Attached Files

This example shows how to run parallel simulations in batch and list any attached files. `batchsim` offloads simulations to the compute cluster, enabling you to carry out other tasks while the batch job is processing, or close the client MATLAB and access the batch job later.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using the `setPointValues`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
 in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point',...
 'Value',num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job ID to access the job object later from any machine. `NumWorkers` displays how many workers are running the simulations - the number of workers specified in the `'Pool'` argument plus an additional head worker.

```
simJob = batchsim(in,'Pool',3)
```

```
 ID: 1
 Type: pool
```

```
 NumWorkers: 4
 Username: #####
 State: running
 SubmitDateTime: ##-##-#### #:##:##
 StartDateTime:
Running Duration: 0 days 0h 0m 0s
```

If `AutoAttachFiles` property of `Simulink.Simulation.Job` is set to true in the cluster profile, then the job running on the cluster has the necessary code files automatically attached to it. Use the `listAutoAttachedFiles` method to view the attached files.

Note that the list of attached files is not displayed here because this is an example model.

```
listAutoAttachedFiles(simJob)
```

## Input Arguments

**simJob** — `Simulink.Simulation.Job` object  
object

A `Simulink.Simulation.Job` object. To create a `simJob`, run `batchsim`.

Example: `simJob = batchsim(in,'Pool',4)`

# wait

**Package:** Simulink

Wait for Simulink.Simulation.Job object to change state

## Syntax

```
wait(simJob)
wait(simJob, 'stateOfJob')
wait(simJob, 'stateOfJob', timeout)
```

## Description

`wait(simJob)` blocks execution in a client session until the job identified by the object `simJob` reaches the 'finished' state or fails. This occurs when all the simulations finish execution on the workers.

`wait(simJob, 'stateOfJob')` blocks execution in the client session until the specified job object changes state to the value of 'state'. The valid states to wait for are 'queued', 'running', and 'finished'. If the object is currently or has already been in the specified state, `wait` is not performed and execution returns immediately. For example, if you execute `wait(simJob, 'queued')` for a job already in the 'finished' state, the call returns immediately.

`wait(simJob, 'stateOfJob', timeout)` blocks execution until either the job reaches the specified 'state', or timeout seconds elapse, whichever happens first.

## Examples

### Wait for Simulations in simJob to Finish

This example shows uses the `sldemo_househeat` model to show how to wait for the batch simulations to finish.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using the `setPointValues`, initialize an array of Simulink.SimulationInput objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
 in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point', ...
 'Value', num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job ID to access the job object later from any machine. `NumWorkers` displays how many workers are running the simulations - the number of workers specified in the 'Pool' argument plus an additional head worker.

```
simJob = batchsim(in, 'Pool', 3)

 ID: 1
 Type: pool
 NumWorkers: 4
 Username: #####
 State: running
 SubmitDateTime: ##-##-#### #:##:##
 StartDateTime:
 Running Duration: 0 days 0h 0m 0s
```

5. Now, wait for the job to finish before retrieving the outputs.

```
wait(simJob)
```

## Input Arguments

**simJob** — `Simulink.Simulation.Job` object  
object

A `Simulink.Simulation.Job` object. To create a `simJob`, run `batchsim`.

Example: `simJob = batchsim(in, 'Pool', '5')`

**'stateOfJob'** — Value of the simulation job object State property to wait for  
'pending' | 'queued' | 'running' | 'finished' | 'failed' | 'unavailable'

Value of the State property of `Simulink.Simulation.Job` object to wait for.

Example: `wait(simJob, 'queued')`

**timeout** — Maximum time to wait, in seconds  
object

Specify a timeout for `wait` to block execution in seconds.

Example: `wait(simJob, 5)`

## Simulink.Simulation.Variable class

**Package:** Simulink.Simulation

Variables in Simulink.SimulationInput objects

### Description

The Simulink.Simulation.Variables object specifies the variable and its value used by the Simulink.SimulationInput object during simulation. By default, this object overrides variables that already exist in the base workspace or the data dictionary.

In most cases, there is no need to create an object of this class directly. To add a variable to the Simulink.SimulationInput object use the setVariable method on the Simulink.SimulationInput object.

### Creation

`var = Simulink.Simulation.Variable(variableName,Value)` creates a Simulink.Simulation.Variables object, var, that specifies the variable and its value.

`var = Simulink.Simulation.Variable(variableName,Value,'Workspace',WorkspaceName)` creates a Simulink.Simulation.Variables object, var, that specifies the variable defined in the specified workspace, WorksapceName and its value. Workspace can either be a model's name to indicate that the variable is in a model workspace or 'global-workspace' to indicate that it is either in the base workspace or in a data dictionary.

### Properties

**variableName — Name of the variable**

character vector

Name of the variable, specified as a character vector.

**Value — Value of the variable**

character vector

Value of the variable, specified as a character vector.

**WorkspaceName — Name of the variable**

character vector

Name of the workspace that the variable is defined in, specified as a character vector.

### Version History

## Simulink.SimulationData.BlockPath class

**Package:** Simulink.SimulationData

Fully specified Simulink block path

### Description

Simulink creates block path objects when creating dataset objects for signal logging and data store logging. `Simulink.SimulationData.Signal` and `Simulink.SimulationData.DataStoreMemory` objects include block path objects.

You can create a block path that you can use with the `getElement` method to access a specific dataset element. If you want to create a dataset in MATLAB to use as a baseline to compare against a signal logging or data store logging dataset, then you need to create the block paths as part of that dataset.

The `Simulink.SimulationData.BlockPath` class is very similar to the `Simulink.BlockPath` class.

You do not have to have Simulink installed to use the `Simulink.SimulationData.BlockPath` class. However, you must have Simulink installed to use the `Simulink.BlockPath` class. If you have Simulink installed, consider using `Simulink.BlockPath` instead of `Simulink.SimulationData.BlockPath`, because the `Simulink.BlockPath` class includes a method for checking the validity of block path objects without you having to update the model diagram.

### Property Summary

Name	Description
SubPath	Individual component within the block specified by the block path

### Method Summary

Name	Description
BlockPath	Create a block path.
convertToCell	Convert a block path to a cell array of character vectors.
getBlock	Get a single block path in the model reference hierarchy.
getLength	Get the length of the block path.

### Properties

#### SubPath

##### Description

Represents an individual component within the block specified by the block path.

For example, if the block path refers to a Stateflow chart, you can use SubPath to indicate the chart signals. For example:

```
Block Path:
 'sf_car/shift_logic'

 SubPath:
 'gear_state.first'
```

### Data Type

character vector

### Access

RW

## Methods

### BlockPath

#### Purpose

Create block path

#### Syntax

```
blockpath_object = Simulink.SimulationData.BlockPath()
blockpath_object = Simulink.SimulationData.BlockPath(blockpath)
blockpath_object = Simulink.SimulationData.BlockPath(paths)
blockpath_object = Simulink.SimulationData.BlockPath(paths, subpath)
```

#### Input Arguments

**blockpath**

The block path object that you want to copy.

**paths**

A character vector or cell array of character vectors that Simulink uses to build the block path.

Specify each character vector in order, from the top model to the specific block for which you are creating a block path.

Each character vector must be a path to a block within the Simulink model. The block must be:

- A block in a single model
- A Model block (except for the last character vector, which may be a block other than a Model block)
- A block that is in a model that is referenced by a Model block that is specified in the previous character vector

**subpath**

A character vector that represents an individual component within a block.

**Output Arguments**

`blockpath_object`

The block path that you create.

**Description**

`blockpath_object = Simulink.SimulationData.BlockPath()` creates an empty block path.

`blockpath_object = Simulink.SimulationData.BlockPath(blockpath)` creates a copy of the block path of the block path object that you specify with the `source_blockpath` argument.

`blockpath = Simulink.SimulationData.BlockPath(paths)` creates a block path from the character vector or cell array of character vectors that you specify with the `paths` argument. Each character vector represents a path at a level of model hierarchy.

`blockpath = Simulink.SimulationData.BlockPath(paths, subpath)` creates a block path from the character vector or cell array of character vectors that you specify with the `paths` argument and creates a path for the individual component (for example, a signal) of the block.

**Example**

Create a block path object called `bp1`, using a cell array of character vectors representing elements of the block path.

```
bp1 = Simulink.SimulationData.BlockPath(...
{'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/Fahrenheit to Celsius', ...
'sldemo_mdref_F2C/Gain1'})
```

The resulting block path reflects the model reference hierarchy for the block path.

```
bp1 =
```

```
Simulink.BlockPath
Package: Simulink
```

```
Block Path:
'sldemo_mdref_depgraph/thermostat'
'sldemo_mdref_heater/Fahrenheit to Celsius'
'sldemo_mdref_F2C/Gain1'
```

**convertToCell****Purpose**

Convert block path to cell array of character vectors

**Syntax**

```
cellarray = blockPathObject.convertToCell()
```

**Output Arguments**

`cellarray`

The cell array of character vectors representing the elements of the block path.

**Description**

`cellarray = blockPathObject.convertToCell()` converts a block path to a cell array of character vectors.

**Examples**

```
bp1 = Simulink.SimulationData.BlockPath(...
{'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/Fahrenheit to Celsius', ...
'sldemo_mdref_F2C/Gain1'})
cellarray_for_bp1 = bp1.convertToCell()
```

The result is a cell array representing the elements of the block path.

```
cellarray_for_bp1 =
 'sldemo_mdref_depgraph/thermostat'
 'sldemo_mdref_heater/Fahrenheit to Celsius'
 'sldemo_mdref_F2C/Gain1'
```

**getBlock****Purpose**

Get single block path in model reference hierarchy

**Syntax**

```
block = blockPathObject.getBlock(index)
```

**Input Arguments**

`index`

The index of the block for which you want to get the block path. The index reflects the level in the model reference hierarchy. An index of 1 represents a block in the top-level model, an index of 2 represents a block in a model referenced by the block of index 1, and an index of *n* represents a block that the block with index *n*-1 references.

**Output Arguments**

`block`

The block representing the level in the model reference hierarchy specified by the `index` argument.

**Description**

`blockpath = Simulink.SimulationData.BlockPath.getBlock(index)` returns the block path of the block specified by the `index` argument.

**Example**

Get the block for the second level in the model reference hierarchy.

```
bp1 = Simulink.SimulationData.BlockPath(...
{'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/Fahrenheit to Celsius', ...
```

```
'sldemo_mdref_F2C/Gain1'})
blockpath = bp1.getBlock(2)
```

The result is the thermostat block, which is at the second level in the block path hierarchy.

```
blockpath =
sldemo_mdref_heater/Fahrenheit to Celsius
```

## **getLength**

### **Purpose**

Get length of block path

### **Syntax**

```
length = blockPathObject.getLength()
```

### **Output Arguments**

length

The length of the block path. The length is the number of levels in the model reference hierarchy.

### **Description**

`length = Simulink.SimulationData.BlockPath.getLength()` returns a numeric value that corresponds to the number of levels in the model reference hierarchy for the block path.

### **Example**

Get the length of block path bp1.

```
bp1 = Simulink.SimulationData.BlockPath(...
{'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/Fahrenheit to Celsius', ...
'sldemo_mdref_F2C/Gain1'})
length_bp1 = bp1.getLength()
```

The result reflects that the block path has three elements.

```
length_bp1 =
3
```

## **Version History**

**Introduced in R2012b**

### **See Also**

[Simulink.BlockPath](#) | [Simulink.SimulationData.Dataset](#)

# Simulink.SimulationData.DatasetRef class

**Package:** Simulink.SimulationData

Create Simulink.SimulationData.DatasetRef object

## Description

To use a reference for accessing a Simulink.SimulationData.Dataset object stored in a MAT-file, create a Simulink.SimulationData.DatasetRef object. You can use this reference to avoid running out of memory, by retrieving data signal by signal, for data that you log to persistent storage. You can stream a DatasetRef object into a root-level input port or you can use it to create a SimulationDatastore object to use for streaming. For details, see “Load Big Data for Simulations”.

For parallel simulations, for which you specify an array of Simulink.SimulationInput objects, if you are logging to file, Simulink:

- Creates Simulink.SimulationData.DatasetRef objects to access output data in the MAT-file and includes those objects in the SimulationOutput object data
- Enables the CaptureErrors argument for simulation

## Construction

`DSRefObj = Simulink.SimulationData.DatasetRef(location, identifier)` creates a reference to the contents of a Simulink.SimulationData.Dataset variable stored in a MAT-file.

### Input Arguments

**location — MAT-file containing Simulink.SimulationData.Dataset object to reference**

character vector

MAT-file containing Simulink.SimulationData.Dataset object to reference, specified as a character vector. The character vector is a path to the MAT-file. Do not use a file name from one locale in a different locale.

**identifier — Name of variable in MAT-file**

character vector

Name of a Simulink.SimulationData.Dataset variable in MAT-file, specified as a character vector. When you log to persistent storage, Simulink uses the variable names specified for each kind of logging.

Suppose that you use the default variable name for signal logging (`logout`) and default MAT-file name for persistent storage logging (`mat.out`). After you simulate the model, then to create a reference to the Dataset object for signal logging, at the MATLAB command line, enter:

```
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat', 'logout');
```

## Output Arguments

### DSRefObj — Reference to Dataset object

`Simulink.SimulationData.DatasetRef` object

Reference to logging dataset, returned as a `Simulink.SimulationData.DatasetRef` object.

## Properties

### Location — MAT-file containing `Simulink.SimulationData.Dataset` object to reference

character vector

MAT-file containing `Simulink.SimulationData.Dataset` object to reference, specified as a character vector. The character vector is a path to the MAT-file. Include the `.mat` extension in the file name. Do not use a file name from one locale in a different locale.

### Identifier — Name of variable in MAT-file

character vector

Name of a `Simulink.SimulationData.Dataset` variable in MAT-file, specified as a character vector. When you log to persistent storage, Simulink uses the variable names specified for each kind of logging (for example, 'logout' for signal logging data).

## Methods

Use the `numElements`, `getElement`, and `getElementNames` methods for a `Simulink.SimulationData.DatasetRef` object the same way that you use those methods for a `Simulink.SimulationData.Dataset` object.

Method	Purpose
<code>numElements</code>	Get number of elements from dataset
<code>getElementNames</code>	Return names of all elements in dataset
<code>get</code> The <code>get</code> method is an alias for the <code>getElement</code> method.	Get element from dataset
<b>Note</b> You can use curly braces to streamline indexing syntax to access elements in a dataset reference, instead of using <code>get</code> or <code>getElement</code> methods. To get an element using curly braces, the index must be a scalar that is not greater than the number of elements in the variable. The <code>get</code> and <code>getElement</code> methods support specifying an element by name or block path, as well as by index.	
<code>getAsDatastore</code>	Get <code>matlab.io.datastore.SimulationDatastore</code> representation of element from a <code>DatasetRef</code> object

Method	Purpose
getDatasetVariableNames on page 2-1017	List names of Dataset variables in MAT-file
plot	Plot data in the Simulation Data Inspector

**Tip** To get the names of Dataset variables in the MAT-file, using the `Simulink.SimulationData.DatasetRef.getDatasetVariableNames` function processes faster than using the `who` or `whos` functions.

## Copy Semantics

You can copy `DatasetRef` object properties by value. However, copying the `DatasetRef` object produces a handle object. Copying the `DatasetRef` object does not copy the data in the MAT-file that the object references. For details about copy operations, see [Copying Objects in the MATLAB documentation](#).

## Examples

### Create References to Persistent Storage Dataset Objects

This example shows how to construct and use `Simulink.SimulationData.DatasetRef` objects to access data for a model that logs to persistent storage. This simple example shows the basic steps for logging to persistent storage. This example does not represent a realistic situation for logging to persistent storage, because it shows a short simulation with small memory requirements.

Open the `vdp` model.

In the **Configuration Parameters** > **Data Import/Export** pane, select these parameters:

- **States**
- **Log Dataset data to file**

Set the **Format** parameter to **Dataset**.

Leave the other parameter settings as they are and click **Apply**.

In the model, click a signal and from the action bar, select **Enable Data Logging**.

Simulate the model.

Get a list of Dataset variable names in the `out.mat` file.

```
varNames = Simulink.SimulationData.DatasetRef.getDatasetVariableNames('out.mat')
varNames =
 1x2 cell array
 'logout' 'xout'
```

Create a reference to the logged states data that is stored in `out.mat`. The variable for the logged states data is `xout`.

```
statesLogRef = Simulink.SimulationData.DatasetRef('out.mat','xout')
```

```
statesLogRef =
```

```
Simulink.SimulationData.DatasetRef
Characteristics:
 Location: out.mat (/my_files/out.mat)
 Identifier: xout
```

```
Resolved Dataset: 'xout' with 2 elements
```

	Name	BlockPath
1	' '	vdp/x1
2	' '	vdp/x2

Create a reference to the signal logging data that is stored in `out.mat`. The variable for the signal logging data is `logout`.

```
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat','logout')
```

```
sigLogRef =
```

```
Simulink.SimulationData.DatasetRef
Characteristics:
 Location: out.mat (/my_files/out.mat)
 Identifier: logout
```

```
Resolved Dataset: 'logout' with 1 element
```

	Name	BlockPath
1	x1	vdp/x1

Use the `numElements` to access the number of elements in the logged states dataset.

```
statesLogRef.numElements
```

```
ans =
```

```
2
```

Use the `DatasetRef` to access the first element of the signal logging dataset.

```
sigLogRef{1}
```

```
ans =
```

```
Simulink.SimulationData.Signal
Package: Simulink.SimulationData
```

```
Properties:
```

```
 Name: 'x1'
 PropagatedName: ''
 BlockPath: [1x1 Simulink.SimulationData.BlockPath]
 PortType: 'outport'
```

```
PortIndex: 1
Values: [1x1 timeseries]
```

Methods, Superclasses

Delete the persistent storage MAT-file and try to use one of the DatasetRef objects.

```
delete('out.mat');
statesLogRef.get(1)
```

```
File does not exist.
```

The statesLogRef still exists, but it is a reference to a Dataset object that is in a file that no longer exists.

## Version History

## getAsDatastore

**Class:** Simulink.SimulationData.DatasetRef

**Package:** Simulink.SimulationData

Get matlab.io.datastore.SimulationDatastore representation of element from referenced Dataset object

### Syntax

```
element =
Simulink.SimulationData.DatasetRef.getAsDatastore(datasetref_elements)
```

### Description

element =  
Simulink.SimulationData.DatasetRef.getAsDatastore(datasetref\_elements) returns a matlab.io.datastore.SimulationDatastore representation of an element or collection of elements from the referenced dataset, based on index, name, or block path of the element.

You can represent a Dataset element as a matlab.io.datastore.SimulationDatastore object if the element was placed into the MAT-file using either of these approaches:

- Log Dataset format data to persistent storage (MAT-file).
- Place the element into a Simulink.SimulationData.Dataset object and saved the Dataset object to a v7.3 MAT-file.

The SimulationDatastore representation for a Dataset element creates a SimulationDatastore object for the Values field of that element. The SimulationDatastore representation supports streaming of the data for the Values property of the element into other simulations or into MATLAB.

---

**Note** You cannot use create a SimulationDatastore for Dataset elements that contain these types of data:

- Array
- 

You can use SimulationDatastore objects to:

- Refer to logged simulation data that is stored on disk in a MAT-file.
- Specify signals to stream incrementally from disk to a simulation.
- Provide a basis for big data analysis using MATLAB functions.

### Input Arguments

**datasetref\_element** — Element of referenced dataset in MAT-file  
index of the element

Element of a referenced dataset in a MAT-file, specified as an index, name (as a character vector), or block path (as a character vector).

## Output Arguments

### element — Element accessed using SimulationDatastore object

matlab.io.datastore.SimulationDatastore object | Simulink.SimulationData.Signal, Simulink.SimulationData.State or similar object, whose Values data uses a matlab.io.datastore.SimulationDatastore object

Element accessed using SimulationDatastore object, returned as either a matlab.io.datastore.SimulationDatastore object or a Simulink.Signal, Simulink.State, or similar object, whose Values data uses a matlab.io.datastore.SimulationDatastore object.

## Examples

### Use a SimulationDatastore to Reference a Signal's Data in a DatasetRef

Log signal data to persistent storage (select the **Log Dataset data to file** configuration parameter) and simulate a model.

Create a DatasetRef for the signal logging Dataset data (logout) in the out.mat MAT-file.

```
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat', 'logout');
firstSig = sigLogRef.getAsDatastore(1)
```

```
firstSig =
```

```
Simulink.SimulationData.Signal
Package: Simulink.SimulationData

Properties:
 Name: 'x1'
 PropagatedName: ''
 BlockPath: [1x1 Simulink.SimulationData.BlockPath]
 PortType: 'output'
 PortIndex: 1
 Values: [1x1 matlab.io.datastore.SimulationDatastore]
```

Load the data into another model. This approach streams the values of the signal x1 for another simulation.

```
ds = Simulink.SimulationData.Dataset;
ds{1} = sigLogRef{1};
sim('other_model', 'ExternalInput', 'ds');
```

## Alternative

To streamline the use of indexing, you can use curly braces ({} ) syntax to obtain a SimulationDatastore object for DatasetRef object signal values. The requirements and results are the same as using getAsDatastore. For example, if you log signal data to persistent storage (select the **Log Dataset data to file** configuration parameter) and simulate a model.

```
sigLogRef = Simulink.SimulationData.DatasetRef('out.mat','logout');
firstSig = sigLogRef{1}
```

```
ans =
```

```
Simulink.SimulationData.Signal
Package: Simulink.SimulationData
```

```
Properties:
```

```
 Name: 'x1'
PropagatedName: ''
 BlockPath: [1x1 Simulink.SimulationData.BlockPath]
 PortType: 'outport'
 PortIndex: 1
 Values: [1x1 matlab.io.datastore.SimulationDatastore]
```

## Version History

“Load Big Data for Simulations”

# Simulink.SimulationData.DataStoreMemory

Container for data store logging information

## Description

Simulink uses `Simulink.SimulationData.DataStoreMemory` objects to store logging information from Data Store Memory blocks during simulation. The objects contain information about the blocks that write to the data store.

## Property Summary

Name	Description
BlockPath on page 5-643	Location of Data Store Memory block for the logged data store
DSMWriterBlockPaths on page 5-643	Location of Data Store Write blocks that write to the data store
DSMWriters on page 5-644	Data Store Write blocks for each signal value
Name on page 5-644	Name of the data store dataset
Scope on page 5-644	Scope of the data store: 'local' or 'global'
Values on page 5-644	Time and data that were logged

## Properties

### BlockPath

#### Description

Location of Data Store Memory block for the logged data store.

#### Data Type

character vector

#### Access

RW

### DSMWriterBlockPaths

#### Description

Location of blocks that write to the data store. Each element of the array contains the full block path of one writer block.

#### Data Type

Vector of `Simulink.SimulationData.BlockPath` objects

**Access**

R0

**DSM Writers****Description**

The number of writes in the data store.

The *n*th element of `DSM Writers` contains the index of the element in `DSM WriterBlockPaths` that contains the block path of the writer that performed the *n*th write to `Values`.

**Data Type**

Integer vector

**Access**

R0

**Name****Description**

Name of the data store dataset

**Data Type**

character vector

**Access**

R0

**Scope****Description**

Scope of the data store: 'local' or 'global'

**Data Type**

character vector

**Access**

RW

**Values****Description**

Time and data that were logged

**Data Type**

MATLAB timeseries

**Access**

RW

## Simulink.SimulationData.LoggingInfo

Signal logging override settings

### Description

This object specifies a set of signal logging override settings.

Use a `Simulink.SimulationData.LoggingInfo` object to specify the signal logging override settings for a signal. You can use this object for the `LoggingInfo` property of a `Simulink.SimulationData.SignalLoggingInfo` object.

### Property Summary

Name	Description
DataLogging on page 5-646	Signal logging mode.
NameMode on page 5-647	Source of signal logging name.
LoggingName on page 5-647	Custom signal logging name.
DecimateData on page 5-647	Use subset of sample points.
Decimation on page 5-647	Decimation value (n): Simulink logs every nth data point.
LimitDataPoints on page 5-648	Limit number of data points to log.
MaxPoints on page 5-648	Maximum number of data points to log (N). The set of logged data points is the last N data points generated by the simulation.

### Method Summary

Name	Description
LoggingInfo on page 5-648	Create a set of signal logging override settings for a signal.

### Properties

#### DataLogging

##### Description

Signal logging mode.

Indicates whether logging is enabled for this signal.

##### Data Type

logical value — {true} | false

##### Access

RW

**NameMode****Description**

Source of signal logging name.

Indicates whether the signal logging name is a custom name ('true') or whether the signal logging name is the same as the signal name ('false').

**Data Type**

logical value — true | {false}

**Access**

RW

**LoggingName****Description**

Custom signal logging name

The custom signal logging name to use for this signal, if the NameMode property is true.

**Data Type**

character vector

**Access**

RW

**DecimateData****Description**

Log a subset of sample points, selecting data points at a specified interval. The first sample point is always logged.

**Data Type**

logical value — true | {false}

**Access**

RW

**Decimation****Description**

Decimation value (n). If the DecimateData property is true, then Simulink logs every nth data point.

**Data Type**

positive integer

**Access**

RW

**LimitDataPoints****Description**

Limit the number of data points to log.

**Data Type**

logical value — true | {false}

**Access**

RW

**MaxPoints****Description**

Maximum number of data points to log (N). If the `LimitDataPoints` property is `true`, then the set of logged data points includes the last N data points generated by the simulation.

**Data Type**

positive integer

**Access**

RW

**Methods****LoggingInfo****Purpose**

Create a `Simulink.SimulationData.LoggingInfo` object.

**Syntax**

```
logging_info_object = Simulink.SimulationData.LoggingInfo()
logging_info_object = Simulink.SimulationData.LoggingInfo(object)
```

**Input Arguments**

`object`

A signal logging override settings object whose property values the constructor uses for the new `Simulink.SimulationData.LoggingInfo` object. The signal logging override object that you specify must be one of the following types of objects:

- `Simulink.SimulationData.LoggingInfo` object
- `Simulink.LoggingInfo` object

**Output Arguments**

`logging_info_object`

A `Simulink.SimulationData.LoggingInfo` object.

**Description**

`logging_info_object = Simulink.SimulationData.LoggingInfo()` creates a `Simulink.SimulationData.LoggingInfo` object that has default property values.

`logging_info_object = Simulink.SimulationData.LoggingInfo(object)` creates a `Simulink.SimulationData.LoggingInfo` object that copies the property values from the signal logging override object that you specify with the `object` argument.

**Examples**

The following example creates a `Simulink.SimulationData.LoggingInfo` object with default settings, changes the `DecimateData` and `Decimation` properties, and uses the object for the `LoggingInfo` property of a `Simulink.SimulationData.SignalLoggingInfo` object `mi`.

```
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', 'examples', 'ex_mdref_counter_bus', 'ex_bus_logging')));
log_info = Simulink.SimulationData.LoggingInfo();
log_info.DecimateData = true;
log_info.Decimation = 2;
mi = Simulink.SimulationData.SignalLoggingInfo('ex_bus_logging');
mi.LoggingInfo = log_info
```

```
Simulink.SimulationData.SignalLoggingInfo
 Package: Simulink.SimulationData
```

```
 BlockPath:
 'ex_bus_logging'
```

```
 OutputPortIndex: 1
```

```
 LoggingInfo:
 DataLogging: 1
 NameMode: 0
 LoggingName: ''
 DecimateData: 1
 Decimation: 2
 LimitDataPoints: 0
 MaxPoints: 5000
```

**Version History**

## Simulink.SimulationData.ModelLoggingInfo

Signal logging override settings for a model

### Description

This class is a collection of `Simulink.SimulationData.SignalLoggingInfo` objects that specify all signal logging override settings for a model.

Use methods and properties of this class to:

- Turn off logging for a signal or a Model block.
- Change logging settings for any signals that are marked for logging within a model.

You can control whether a top model and referenced models override signal logging settings or use the signal logging settings specified by the model. Use the `LoggingMode` and `LogAsSpecifiedByModels` properties to control which logging settings to apply.

Logging Mode for Models	Property Settings
For top model and all referenced models, use logging settings specified in the model.	Set <code>LoggingMode</code> to <code>LogAllAsSpecifiedInModel</code> .
For top model and all referenced models, use override signal logging settings.	Set <code>LoggingMode</code> to <code>OverrideSignals</code> .
For top model and referenced models, use a mix of override signal logging settings and the signal logging settings specified in the model.	Set <code>LoggingMode</code> to <code>OverrideSignals</code> . Include models you want to ignore override signal logging settings in the <code>LogAsSpecifiedByModels</code> cell array.

For more information and examples, see “Override Signal Logging Settings from MATLAB”.

### Property Summary

Name	Description
<code>LoggingMode</code> on page 5-651	Signal logging override status
<code>LogAsSpecifiedByModels</code> on page 5-651	Source of signal logging settings for the top model or a top-level Model block
<code>Signals</code> on page 5-652	All signals that have signal override settings

### Method Summary

Name	Description
<code>findSignal</code> on page 5-656	Find signals within the <code>Signals</code> vector, using block path and output port index.

Name	Description
<code>verifySignalAndModelPaths</code> on page 5-659	Verify signal and model paths for the model signal logging override object.
<code>getLogAsSpecifiedInModel</code> on page 5-657	Determine whether the model logs signals as specified in the model or uses override settings.
<code>setLogAsSpecifiedInModel</code> on page 5-658	Set the logging mode for the top model or a top-level Model block.
<code>createFromModel</code> on page 5-652	Create and populate a model signal logging override object with all logged signals in the model hierarchy.
<code>ModelLoggingInfo</code> on page 5-655	Set signals to log or override logging settings.

## Properties

### LoggingMode

#### Description

Signal logging override status. Values are:

- `OverrideSignals` — (Default) Uses the logging settings for signals, as specified in the `Signals` property. For models where `getLogAsSpecifiedInModel` is:
  - `true` — Logs all signals, as specified in the model.
  - `false` — Logs only the signals specified in the `Signals` property.
- `LogAllAsSpecifiedInModel` — Logs signals in the top model and all referenced models, as specified in the model. Simulink honors the signal logging indicators (blue antennae) and ignores the `Signals` property.

To change the logging mode for the top model or for a given referenced model, use the `setLogAsSpecifiedInModel` method.

#### Data Type

character array

#### Access

RW

### LogAsSpecifiedByModels

#### Description

When `LoggingMode` is set to `'OverrideSignals'`, the `LogAsSpecifiedByModels` cell array specifies the top models and top-level Model blocks that ignore the `'OverrideSignals'` setting and log signals as specified in the models or Model blocks.

- For the top model and top-level Model blocks that the cell array includes, Simulink ignores the `Signals` property overrides.
- For a model or Model block that the cell array does *not* include, Simulink uses the `Signals` property to determine which signals to log.

When `LoggingMode` is set to `'LogAllAsSpecifiedInModel'`, Simulink ignores the `LogAsSpecifiedByModels` property.

Use the `getLogAsSpecifiedInModel` method to determine whether the top model or top-level Model block logs signals as specified in the model (default logging), and use `setLogAsSpecifiedInModel` to turn default logging on and off.

#### Data Type

cell array — For the top model, specify the model name. For Model blocks, specify the block path.

#### Access

RW

#### Signals

#### Description

Vector of `Simulink.SimulationData.SignalLoggingInfo` objects for all signals with signal logging override settings.

#### Data Type

vector of `Simulink.SimulationData.SignalLoggingInfo` objects

#### Access

RW

## Methods

### `createFromModel`

#### Purpose

Create a `Simulink.SimulationData.ModelLoggingInfo` object for a top model, with override settings for each logged signal in the model.

#### Syntax

```
model_logging_info_object = ...
Simulink.SimulationData.ModelLoggingInfo.createFromModel(...
model,options)
```

#### Input Arguments

`model`

Name of the top model for which to create a `Simulink.SimulationData.ModelLoggingInfo` object.

`options`

You can use any combination of the following option name and value pairs to control the kinds of systems from which to include logged signals.

- `FollowLinks`
  - `on` — (Default) Include logged signals from inside of libraries.

- `off` — Skip all libraries.
- `LookUnderMasks`
  - `all` — (Default) Include logged signals from all masked subsystems.
  - `none` — Skip all masked subsystems.
  - `graphical` — Include logged signals from masked subsystems that do not have a workspace or dialog box.
  - `functional` — Include logged signals from masked subsystems that do not have a dialog box.
- `Variants`
  - `ActiveVariants` — (Default) Include logged signals from only active subsystem and model variants.
  - `AllVariants` — Include logged signals from all subsystem and model variants.
- `RefModels`
  - `on` — (Default) Include logged signals from referenced models.
  - `off` — Skip all referenced models.

If you select more than one option, then the created `Simulink.SimulationData.ModelLoggingInfo` object includes signals that fit the combinations (the “AND”) of the specified options. For example, if you set `FollowLinks` to `on` and set `RefModels` to `off`, then the model signal logging override object does not include signals from library links that exist inside of referenced models.

### Output Arguments

`model_logging_override_object`

`Simulink.SimulationData.ModelLoggingInfo` object for the top model.

### Description

`model_logging_info_object = Simulink.SimulationData.ModelLoggingInfo.createFromModel(model)` creates a `Simulink.SimulationData.ModelLoggingInfo` object for the model that includes logged signals for the following kinds of systems:

- Libraries
- Masked subsystems
- Referenced models
- Active variants

`model_logging_override_object = Simulink.SimulationData.ModelLoggingInfo.createFromModel(model, options)` creates a `Simulink.SimulationData.ModelLoggingInfo` object for the model. The included logged signals reflect the options settings for the following kinds of systems:

- Libraries
- Masked subsystems

- Referenced models
- Variants

### Examples

The following example creates a model logging override object for the `sldemo_mdhref_bus` model and automatically adds each logged signal in the model to that object:

```
openExample('sldemo_mdhref_bus')
mi = Simulink.SimulationData.ModelLoggingInfo.createFromModel(...
'sldemo_mdhref_bus')

mi =

ModelLoggingInfo with properties:

 Model: 'sldemo_mdhref_bus'
 LoggingMode: 'OverrideSignals'
LogAsSpecifiedByModels: {}
 Signals: [1x4 Simulink.SimulationData.SignalLoggingInfo]
```

To apply the model override object settings, use:

```
set_param(sldemo_mdhref_bus, 'DataLoggingOverride', mi);
```

You can use the options for the `createFromModel` method to specify how the method should handle model components like variants and model references. For example, use the `Variants` option to create a `model_logging_override` object that includes logged signals in all variants of the `sldemo_variant_subsystems` model.

By default, the `sldemo_variant_subsystems` model does not log any signals. Start by configuring the output signals from the `Linear Controller` and `Nonlinear Controller` subsystems for logging.

```
% Open the sldemo_variant_subsystems model
sldemo_variant_subsystems;

% Mark the output of the Linear Controller subsystem for logging
ph = get_param('sldemo_variant_subsystems/Controller/Linear Controller',...
'PortHandles');
set_param(ph.Outputport(1), 'DataLogging', 'on');

% Mark the output of the Nonlinear Controller subsystem for logging
ph1 = get_param('sldemo_variant_subsystems/Controller/Nonlinear Controller',...
'PortHandles');
set_param(ph1.Outputport(1), 'DataLogging', 'on');
```

Then, use the `createFromModel` method to create a `model_logging_override` object that includes signals logged in all variant subsystems of the `sldemo_variant_subsystems` model.

```
% Create a model_logging_override object for the model including all variants
mi = Simulink.SimulationData.ModelLoggingInfo.createFromModel(...
'sldemo_variant_subsystems', 'Variants', 'AllVariants')

mi =

ModelLoggingInfo with properties:

 Model: 'sldemo_variant_subsystems'
 LoggingMode: 'OverrideSignals'
LogAsSpecifiedByModels: {}
 Signals: [1x2 Simulink.SimulationData.SignalLoggingInfo]
```

## ModelLoggingInfo

### Purpose

Specify signals to log or override logging settings.

### Syntax

```
model_logging_override_object = ...
Simulink.SimulationData.ModelLoggingInfo(model)
```

### Input Arguments

`model`

Name of the top model for which to create a `Simulink.SimulationData.ModelLoggingInfo` object

### Output Arguments

`model_logging_override_object`

`Simulink.SimulationData.ModelLoggingInfo` object created for the specified top model.

### Description

`model_logging_override_object = Simulink.SimulationData.ModelLoggingInfo(model)` creates a `Simulink.SimulationData.ModelLoggingInfo` object for the specified top model.

If you use the `Simulink.SimulationData.ModelLoggingInfo` constructor, specify a `Simulink.SimulationData.SignalLoggingInfo` object for each logged signal for which you want to override logging settings.

To check that you have specified valid signal logging override settings for a model, use the `verifySignalAndModelPaths` method with the `Simulink.SimulationData.ModelLoggingInfo` object for the model.

### Examples

The following example shows how to log all signals as specified in the top model and all referenced models.

```
mi = Simulink.SimulationData.ModelLoggingInfo('sldemo_mdref_bus');
mi.LoggingMode = 'LogAllAsSpecifiedInModel'

mi =

 ModelLoggingInfo with properties:

 Model: 'sldemo_mdref_bus'
 LoggingMode: 'LogAllAsSpecifiedInModel'
LogAsSpecifiedByModels: {}
 Signals: []
```

To apply the model override object settings, use:

```
set_param(sldemo_mdref_bus, 'DataLoggingOverride', mi);
```

The following example shows how to log only signals in the top model:

```
mi = ...
Simulink.SimulationData.ModelLoggingInfo('sldemo_mdref_bus');
```

```
mi.LoggingMode = 'OverrideSignals';
mi = mi.setLogAsSpecifiedInModel('sldemo_mdref_bus', true);
set_param('sldemo_mdref_bus', 'DataLoggingOverride', mi);
```

## findSignal

### Purpose

Find signals within the Signals vector, using a block path and optionally an output port index.

### Syntax

```
signal_indices = ...
 model_logging_override_object.findSignal(block_path)
signal_indices = ...
 model_logging_override_object.findSignal(...
 block_path, port_index)
```

### Input Arguments

**block\_path**

Source block to search. The `block_path` must be one of the following:

- Character vector
- Cell array of character vectors
- `Simulink.BlockPath` object

**port\_index**

Index of the output port to search. Specify a scalar greater than, or equal to, 1.

### Output Arguments

**signal\_indices**

Vector of numeric indices into the signals vector of the `Simulink.SimulationData.ModelLoggingInfo` object.

### Description

`signal_indices = model_logging_override_object.findSignal(block_path)` finds the indices of the signals for the block path that you specify.

To find a *single* instance of a signal within a referenced model, use a `Simulink.BlockPath` object or a cell array with a *full path*.

To find *all* instances of a signal within a referenced model, use a character vector with the *relative* path of the signal within the referenced model.

To find a logged chart signal within a Stateflow chart, use a `Simulink.BlockPath` object and set the `SubPath` property to the name of the Stateflow chart signal.

`signal_indices = model_logging_override_object.findSignal(block_path, port_index)` finds the indices of the output signal for the port that you specify, for the block path that you specify.

Do not use the `port_index` argument for Stateflow chart signals.

## Examples

To find a signal that is *not* in a Stateflow chart and that does *not* appear in multiple instances of a referenced model:

```
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', 'examples', 'ex_bus_logging')))
% Open the referenced model
ex_mdhref_counter_bus
mi = Simulink.SimulationData.ModelLoggingInfo.createFromModel(...
 'ex_bus_logging');
% Click the COUNTERBUSCreator block that is the source of
% the logged COUNTERBUS signal
signal_index = mi.findSignal(gcb)
```

```
signal_index =
 1
```

To find a signal in a specific instance of a referenced model that is not in a Stateflow chart, use the following approach:

```
signal_index = mi.findSignal({'ex_bus_logging/CounterA', ...
 'ex_mdhref_counter_bus/Bus Creator'})
```

```
signal_index =
 4
```

For an example that uses the `findSignal` method with a Stateflow chart, see “Override Logging Properties with the Command-Line API” (Stateflow).

## getLogAsSpecifiedInModel

### Purpose

Determine whether the model logs as specified in the model or uses override settings.

### Syntax

```
logging_mode = ...
getLogAsSpecifiedInModel(model_logging_override_object, path)
```

### Input Arguments

`model_logging_override_object`

A `Simulink.SimulationData.ModelLoggingInfo` object.

`path`

The path is a character vector that specifies one of the following:

- Name of the top model
- Block path of a Model block in the top model

### Output Arguments

`logging_mode`

The `logging_mode` is:

- `true`, if the model specified by `path` is logged as specified in the model.

- `false`, if the model specified by `path` is logged using the override settings specified in the `Signals` property.

**Description**

`logging_mode = model_logging_override_object.getLogAsSpecifiedInModel(path)`  
returns:

- `true`, if the model specified by `path` is logged as specified in the model.
- `false`, if the model specified by `path` is logged using the override settings specified in the `Signals` property.

**Examples**

In the following example, the `Simulink.SimulationData.ModelLoggingInfo` object `mi` uses the override settings specified in its `Signals` property.

```
mi = Simulink.SimulationData.ModelLoggingInfo('sldemo_mdref_bus');
logging_mode = getLogAsSpecifiedInModel(mi, 'sldemo_mdref_bus')
```

```
logging_mode =
```

```
0
```

**setLogAsSpecifiedInModel****Purpose**

Set logging mode for top model or top-level Model block

**Syntax**

```
setLogAsSpecifiedInModel(override_object, path)
```

**Input Arguments**

`override_object`

`Simulink.SimulationData.ModelLoggingInfo` object.

`path`

Character vector that specifies one of the following:

- Name of the top model
- Block path of a Model block in the top model

`value`

Logging mode:

- `true`, if the model specified by `path` is logged as specified in the model
- `false`, if the model specified by `path` is logged using the override settings specified in the `Signals` property.

**Description**

`setLogAsSpecifiedInModel(override_object, path, value)` sets the `LoggingMode` property for a top model or a Model block in the top model.

**Example**

The following example shows how to log only signals in the top model, using the logging settings specified in that model:

```
sldemo_mdref_bus;
mi = Simulink.SimulationData.ModelLoggingInfo('sldemo_mdref_bus');
mi.LoggingMode = 'OverrideSignals';
mi = setLogAsSpecifiedInModel(mi, 'sldemo_mdref_bus', true);
set_param('sldemo_mdref_bus', 'DataLoggingOverride', mi);
```

**verifySignalAndModelPaths****Purpose**

Verify paths in `Simulink.SimulationData.ModelLoggingInfo` object.

**Syntax**

```
verified_object = verifySignalAndModelPaths...
(model_logging_override_object, action)
```

**Input Arguments**

`model_logging_override_object`

The `Simulink.SimulationData.ModelLoggingInfo` object to verify. This argument is required.

`action`

The action that the function performs if verification fails. This argument is optional. Specify one of the following values:

- `error` — (default) Throw an error when verification fails
- `warnAndRemove` — Issue a warning when verification fails and update the `Simulink.SimulationData.ModelLoggingInfo` object.
- `remove` — Silently update the `Simulink.SimulationData.ModelLoggingInfo` object.

**Output Arguments**

`verified_object`

If the method detects no invalid paths, it returns the validated object. For example:

```
verified_object =
 Simulink.SimulationData.ModelLoggingInfo
 Package: Simulink.SimulationData

 Properties:
 Model: 'logging_top'
 LoggingMode: 'OverrideSignals'
 LogAsSpecifiedByModels: {}
 Signals: [1x11 Simulink.SimulationData.SignalLoggingInfo]
```

If the method detects an invalid path, it performs the action specified by the `action` argument. By default, it issues an error message.

**Description**

```
verified_object = verifySignalAndModelPaths(model_logging_override_object,
action)
```

For a `Simulink.SimulationData.ModelLoggingInfo` object, verify that:

- All character vectors in the `LogAsSpecifiedByModels` property are either the name of the top model or the block path of a `Model` block in the top model.
- The block paths for signals in the `Signals` property refer to valid blocks within the hierarchy of the top model.
- The `OutputPortIndex` property for all signals in the `Signals` property are valid for the given block.
- All signals in the `Signals` property refer to *logged* signals.

The `action` argument specifies what action the method performs. By default, the method returns an error if it detects an invalid path.

If you use the `Simulink.SimulationData.ModelLoggingInfo` constructor and specify a `Simulink.SimulationData.SignalLoggingInfo` object for each signal, then consider using the `verifySignalAndModelPaths` method to verify that your object definitions are valid.

### Example

The following example shows how to validate the signal and block paths in a `Simulink.SimulationData.ModelLoggingInfo` object. Because the `action` argument is `warnAndRemove`, if the validation fails, the `verifySignalAndModelPaths` method issues a warning and updates the `Simulink.SimulationData.ModelLoggingInfo` object.

```
mi = Simulink.SimulationData.ModelLoggingInfo('sldemo_mdlref_bus');
verified_object = verifySignalAndModelPaths...
 (mi, 'warnAndRemove')
```

 “Export Signal Data Using Signal Logging”  
 “Log Data Stores”

# Simulink.SimulationData.Parameter class

**Package:** Simulink.SimulationData

Stores logged parameter data and metadata

## Description

The `Simulink.SimulationData.Parameter` object stores data and metadata for logged block parameters. Tunable parameters connected to Dashboard blocks are logged to the Simulation Data Inspector during simulation. To access logged parameter data, you can export the simulation run from the Simulation Data Inspector using the UI or the `Simulink.sdi.exportRun` function. For more information about exporting simulation runs with the Simulation Data Inspector UI, see “Export Data to the Workspace or a File”.

## Construction

`dataset = Simulink.sdi.exportRun(runID)` returns a `Simulink.SimulationData.Parameter` object as an element in `dataset` when the run corresponding to `runID` contains logged parameter data.

## Input Arguments

**runID — Run ID for a run with logged parameter data**

integer

Run ID for the run containing logged parameter data. Run IDs are assigned by the Simulation Data Inspector. You can get the run ID for a simulation run using the `Simulink.sdi.getAllRunIDs` or `Simulink.sdi.getRunIDByIndex` function.

## Output Arguments

**dataset — Dataset containing the run data**

`Simulink.SimulationData.Dataset`

`Simulink.SimulationData.Dataset` object containing the run data and metadata. When the run contains logged parameter data, the dataset contains a `Simulink.SimulationData.Parameter` object as an element for each logged parameter. The `Simulink.SimulationData.Parameter` element takes the name of the logged parameter. You can access a `Simulink.SimulationData.Parameter` object using `get`.

## Properties

**Name — Parameter name in Dashboard label**

character vector

Parameter name as it appears in the label for the Dashboard block.

Example: 'Mu:Gain'

**BlockPath — Path of the block associated with the parameter**

`Simulink.SimulationData.BlockPath`

Path to the block the parameter or variable corresponds to, returned as a `Simulink.SimulationData.BlockPath` object.

Example: `vdp/Mu`

### **ParameterName — Parameter name**

character vector

Name of the logged parameter as it appears in the block dialog box. For variables, the `ParameterName` property is empty.

Example: `'Gain'`

### **VariableName — Variable name**

character vector

Name of the logged variable. For parameters, the `VariableName` property is empty.

Example: `'Zw'`

### **Values — Timeseries of parameter values**

timeseries

timeseries of parameter values. For logged variables, the `timeseries` name is the variable name. For logged parameters, the `timeseries` name is empty.

## **Methods**

`plot` Plot simulation results in Simulation Data Inspector

## **Copy Semantics**

Value. To learn how value classes affect copy operations, see [Copying Objects](#).

## **Examples**

### **Access Logged Parameter Data**

This example shows how to access logged parameter data. Parameter data automatically logs to the Simulation Data Inspector when you connect a Dashboard block to a block parameter. Parameter data does not export to the workspace with other simulation data at the end of simulation. You can access the logged parameter data by exporting the run containing it from the Simulation Data Inspector.

### **Log Parameter Data**

Run a simulation of the model `ex_vdp_param`, a modified version of the `vdp` model with an Edit block connected to the gain parameter of the Mu block. The parameter data logs with the signal data for signals marked for logging.

```
sim('ex_vdp_param');
```

### **Export Run**

Use the Simulation Data Inspector programmatic interface to get the run ID for the `ex_vdp_param` simulation, and export the run.

```
index = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(index);

dataset = Simulink.sdi.exportRun(runID);
```

### Access Parameter Data

Use the `get` method to access the `Simulink.SimulationData.Parameter` object for the logged parameter data. The `Values` property contains the timeseries data for the parameter.

```
muGain = dataset.get('Mu:Gain')

muGain =
 Simulink.SimulationData.Parameter
 Package: Simulink.SimulationData

 Properties:

## Simulink.SimulationData.Signal

Container for signal logging information

### Description

Simulink uses `Simulink.SimulationData.Signal` objects to store signal logging information during simulation. The objects contain information about the source block for the signal, including the port type and index.

### Property Summary

Name	Description
BlockPath on page 5-664	Block path for the source block for the signal
Name on page 5-664	Name of signal element to use for name-based access
PropagatedName on page 5-664	Propagated signal name, if any
PortIndex on page 5-665	Numeric index of port that was logged
PortType on page 5-665	Type of port that was logged: for signal logging, the port type is 'outport'
Values on page 5-665	Time and data that were logged

### Properties

#### BlockPath

##### Description

Block path for the source block for the signal

##### Data Type

`Simulink.SimulationData.BlockPath`

##### Access

RW

#### Name

##### Description

Name of signal element to use for name-based access

##### Data Type

character vector

##### Access

RW

## PropagatedName

### Description

Propagated name of signal element

Signal logging and root Output block logging data for a signal captures the propagated signal name if the logging format is `Dataset` and:

- For signal logging, you:
  - Mark the signal for signal logging and in the Signal Properties dialog box select **Show Propagated Signals**.
  - Enable **Configuration Parameters > Data Import/Export > Signal logging**.
- For root Output block logging, you select **Configuration Parameters > Data Import/Export > Output**.

The propagated signal name does not include angle brackets (<>).

### Data Type

character vector

### Access

R0

### PortIndex

### Description

Numeric index of port that was logged

### Data Type

scalar real integer

### Access

RW

### PortType

### Description

Type of port that was logged: for signal logging, the port type is 'outport'

### Data Type

character vector

### Access

RW

### Values

### Description

Time and data that were logged.

For an example of how to use the `Values` property and plot logged signal data, see “Logging Intervals” on page 13-364.

**Data Type**

- MATLAB `timeseries` object
- Structure of MATLAB `timeseries` objects (for bus signals)
- Array of structures of MATLAB `timeseries` objects (for array of buses signals)
- Array of MATLAB `timeseries` objects (for nonbus signals in a For Each subsystem)
- MATLAB `timetable` object
- Structure of MATLAB `timetable` objects (for bus signals)
- Array of structures of MATLAB `timetable` objects (for array of buses signals)
- Cell array of MATLAB `timetable` objects (for nonbus signals in a For Each subsystem)

# plot

**Package:** Simulink.SimulationData

Plot simulation results in Simulation Data Inspector

## Syntax

```
plot(simRes)
runObj = plot(simRes)
```

## Description

`plot(simRes)` plots the simulation results in the object `simRes` in the **Simulation Data Inspector** and opens the Simulation Data Inspector. You can use the `plot` function to plot simulation results stored in these objects:

- `Simulink.SimulationOutput`
- `Simulink.SimulationData.DataStoreMemory`
- `Simulink.SimulationData.Parameter`
- `Simulink.SimulationData.Signal`
- `Simulink.SimulationData.State`
- `Stateflow.SimulationData.Data`
- `Stateflow.SimulationData.State`
- `sltest.Assessment`

When the input object contains fewer than eight signals, the Simulation Data Inspector layout changes to 1-by- $n$ , where  $n$  is the number of signals, and each subplot displays one signal. When the simulation results contain more than eight signals to plot, the Simulation Data Inspector layout changes to 1-by-1, and the plot displays the first signal.

When some or all of the data in a `Simulink.SimulationOutput` object is in a Simulation Data Inspector run, the `plot` function opens the Simulation Data Inspector and plots all the signals in the run. When the `SimulationOutput` object does not correspond to a run in the Simulation Data Inspector, the `plot` function imports the data into a new run.

When you use the `plot` function to plot a single signal, the `plot` function always imports the data for the signal into a new run.

These objects also have plot functions that plot data in the Simulation Data Inspector:

- `Simulink.SimulationData.Dataset`
- `Simulink.SimulationData.DatasetRef`

`runObj = plot(simRes)` returns the `Simulink.sdi.Run` object that corresponds to the plotted data.

## Examples

### Plot Simulation Output Data

The model `ex_vdp_simout_plot` is configured to log signals, outputs, and states and return all logged data as a single simulation output. You can use the `plot` function to plot the simulation results in the Simulation Data Inspector.

Simulate the model. The model logs data using the `Dataset` format, so all the logged data streams to the Simulation Data Inspector during simulation.

```
open_system('ex_vdp_simout_plot')
out = sim('ex_vdp_simout_plot');
```

Use the `plot` function to plot all the simulation results in the Simulation Data Inspector. The Simulation Data Inspector updates to a 1-by-8 layout and plots one signal on each subplot.

```
plot(out)
```

You can also use the `plot` function to plot data for a single signal or a subset of the simulation results. When you plot the data for a single signal, the Simulation Data Inspector always imports the data for the signal into a new run.

The `Simulink.SimulationOutput` object contains a property for each logging variable. Access the signal logging data in the property `logouts`.

```
logouts = out.logouts;
```

Then, use the `get` function for the `Dataset` object to access the data for the first element, which contains the data for a single logged signal.

```
sig1 = get(logouts,1);
```

When you plot the data for the signal, the Simulation Data Inspector imports the signal into a new run, updates the layout to 1-by-1, and plots the signal.

```
plot(sig1)
```

## Input Arguments

### **simRes** — Object that contains simulation data to plot

`Simulink.SimulationOutput` | `Simulink.SimulationData.DataStoreMemory` |  
`Simulink.SimulationData.Parameter` | `Simulink.SimulationData.Signal` |  
`Simulink.SimulationData.State` | `sltest.Assessment` |  
`Stateflow.SimulationData.Data` | `Stateflow.SimulationData.State`

Object that contains simulation data plot, specified in one of these forms:

- `Simulink.SimulationOutput` object
- `Simulink.SimulationData.DataStoreMemory` object
- `Simulink.SimulationData.Parameter` object
- `Simulink.SimulationData.Signal` object

- `Simulink.SimulationData.State` object
- `Stateflow.SimulationData.Data` object
- `Stateflow.SimulationData.State` object
- `sltest.Assessment` object

Example: `plot(out)` plots the contents of the `Simulink.SimulationOutput` object `out` in the Simulation Data Inspector and opens the Simulation Data Inspector.

## Output Arguments

### **runObj** — Run that corresponds to plotted data

`Simulink.sdi.Run` object

Run that corresponds to plotted data, returned as a `Simulink.sdi.Run` object.

## Version History

Introduced in R2019b

## Simulink.SimulationData.SignalLoggingInfo

Signal logging override settings for signal

### Description

This object contains the signal override signal logging settings for a single logged signal.

### Property Summary

Name	Description
BlockPath on page 5-670	Simulink.BlockPath of source block of a signal to log.
OutputPortIndex on page 5-670	Index of an output port to log.
LoggingInfo on page 5-671	Simulink.SimulationData.LoggingInfo object containing all logging override settings for a signal.

### Method Summary

Name	Description
SignalLoggingInfo on page 5-671	Create a signal logging override object for a signal.

### Properties

#### BlockPath

##### Description

Simulink.BlockPath of source block of signal to log. The block path represents the full model reference hierarchy.

To specify a specific instance of a signal, use an absolute path, reflecting the model reference hierarchy, starting at the top model. For example:

```
openExample('sldemo_mdref_bus')
sig_log_info = Simulink.SimulationData.SignalLoggingInfo(...
{'sldemo_mdref_bus/CounterA', ...
'sldemo_mdref_counter_bus/Bus Creator'})
```

##### Data Type

Simulink.BlockPath

##### Access

RW

#### OutputPortIndex

##### Description

Index of the output port to log. The index is a 1-based numeric value.

**Data Type**

nonzero integer

**Access**

RW

**LoggingInfo****Description**

`Simulink.SimulationData.LoggingInfo` object containing logging override settings for a signal. The logging settings specify whether signal logging is overridden for this signal. The logging settings also can specify a logging name, a decimation factor, and a maximum number of data points.

**Data Type**

`Simulink.SimulationData.LoggingInfo` object

**Access**

RW

**Methods****SignalLoggingInfo****Purpose**

Construct a `Simulink.SimulationData.SignalLoggingInfo` object.

**Syntax**

```
signal_logging_info_object = ...
 Simulink.SimulationData.SignalLoggingInfo()
signal_loggingInfo_object = ...
 Simulink.SimulationData.SignalLoggingInfo(path)
signalLoggingInfo_object = ...
 Simulink.SimulationData.SignalLoggingInfo(path,index)
```

**Input Arguments**

`path`

The block path of the source block for which the signal logging override settings apply. If you use this argument without also using the `port` argument, then Simulink sets the output port index to 1.

`index`

Output port index to which the signal logging override settings apply.

**Output Arguments**

`signal_logging_object`

`Simulink.SimulationData.SignalLoggingInfo` object that represents the override settings of a signal.

**Description**

`signal_logging_override_object = Simulink.SimulationData.SignalLoggingInfo()` creates a `Simulink.SimulationData.LoggingInfo` object that contains default logging settings for a signal.

`signal_logging_override_object = Simulink.SimulationData.SignalLoggingInfo(path)` creates a `Simulink.SimulationData.LoggingInfo` object, using the specified block path, and sets the output port index to 1.

`signal_logging_override_object = Simulink.SimulationData.SignalLoggingInfo(path, port)` creates a `Simulink.SimulationData.LoggingInfo` object that contains default logging settings for the specified block path and output port index.

**Examples**

The following example creates a `Simulink.SimulationData.SignalLoggingInfo` object for the first output port of the `Bus Creator` block in the `sldemo_mdref_bus` model.

```
openExample('sldemo_mdref_bus')
mi = Simulink.SimulationData.ModelLoggingInfo(...
'sldemo_mdref_bus');
mi.LoggingMode = 'OverrideSignals';
mi.Signals = ...
 Simulink.SimulationData.SignalLoggingInfo(...
 {'sldemo_mdref_bus/CounterA', ...
'sldemo_mdref_counter_bus/Bus Creator'}, 1)
```

The output is:

```
mi =
 Data.ModelLoggingInfo with properties:
 Model: 'sldemo_mdref_bus'
 LoggingMode: 'OverrideSignals'
 LogAsSpecifiedByModels: {}
 Signals: [1x1 Simulink.SimulationData.SignalLoggingInfo]

Methods
```

# Simulink.SimulationData.State class

**Package:** Simulink.SimulationData

State logging element

## Description

Simulink uses `Simulink.SimulationData.State` objects to store state logging information during simulation. The objects contain state information about which block the state data is coming from and the type of state.

## Properties

### Name — Name of state element to use for name-based access

character vector

Name of state element to use for name-based access, specified as a character vector. If you do not specify a name, 'CSTATE' or 'DSTATE' is used, depending on whether it is a continuous or discrete state.

### BlockPath — Block path for state source block

a `Simulink.SimulationData.BlockPath` object

Block path for state source block, specified as a `Simulink.SimulationData.BlockPath` object

### Label — Type of state

'CSTATE' | 'DSTATE'

Type of state, returned as 'CSTATE' or 'DSTATE'. Read-only property.

- 'CSTATE' - Continuous state
- 'DSTATE' - Discrete state

### Values — State element information

single MATLAB timeseries object | a structure of MATLAB timeseries objects

State element information, specified as a single MATLAB timeseries object or as a structure of MATLAB timeseries objects.

## Methods

`plot` Plot simulation results in Simulation Data Inspector

## Examples

## Access Final State Information Saved Using the Dataset Format

This example shows how to save final state information using the Dataset format and then access the state data after simulation.

Load the model `vdp` and configure the model to log final states using the Dataset format. This example uses the default final states variable name, `xFinal`.

```
load_system('vdp');
set_param('vdp', 'SaveFinalState', 'on', 'SaveFormat', 'Dataset');
```

Simulate the model.

```
out = sim('vdp');
```

By default, models create a single simulation output that contains all logged data in a `Simulink.SimulationOutput` object. Get the `xFinal` Dataset object from the `SimulationOutput` object. The `xFinal` Dataset object contains data for two states.

```
xFinal = get(out, 'xFinal')
```

```
xFinal =
Simulink.SimulationData.Dataset 'xFinal' with 2 elements
```

	Name	BlockPath
1	[1x1 State]	' ' vdp/x1
2	[1x1 State]	' ' vdp/x2

- Use braces `{ }` to access, modify, or add elements using index.

Examine the data for the state that corresponds to the `x1` block.

```
state_x1 = get(xFinal, 1)
```

```
state_x1 =
Simulink.SimulationData.State
Package: Simulink.SimulationData

Properties:
 Name: ''
 BlockPath: [1x1 Simulink.SimulationData.BlockPath]
 Label: CSTATE
 Values: [1x1 timeseries]
```

## Simulink.SimulationData.Unit class

**Package:** Simulink.SimulationData

Store units for simulation data

### Description

Simulink creates `Simulink.SimulationData.Unit` objects to store unit information for signals when:

- Performing signal logging, which uses the `Dataset` format
- Logging root Output blocks, if in **Configurations Parameters** you select the **Output** parameter and set **Format** to `Dataset`
- Logging to a To Workspace block or To File block, if you set the **Save format** block parameter to the default of `Timeseries`

### Construction

`unitsObj = Simulink.SimulationData.Unit(unitName)` creates a `Simulink.SimulationData.Unit` object with the unit that you specify.

### Input Arguments

**unitName** — Name of logging data units

character vector

Name of logging data units, specified as a character vector.

### Output Arguments

**unitObj** — Logging data units

`Simulink.SimulationData.Unit` object

Logging data units, returned as a `Simulink.SimulationData.Unit` object.

### Properties

**Name** — Name of the units

character vector

Name of the units, specified as a character vector.

### Methods

Method	Purpose
<code>setName</code>	Specify name of logging data unit

## Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects.

## Examples

### Create and Use Inches Logging Units

Create a `Simulink.SimulationData.Unit` object representing inches.

```
inchesUnit = Simulink.SimulationData.Unit('inches');
```

Create a MATLAB `timeseries` object and set its `Units` field to the `Simulink.SimulationData.Unit` object.

```
ts = timeseries(1:10);
ts.DataInfo.Units = inchesUnit;
ts.DataInfo.Units
```

```
ans =
```

```
Units with properties:
```

```
Name: 'inches'
```

## setName

**Class:** Simulink.SimulationData.Unit

**Package:** Simulink.SimulationData

Specify name of logging data units

### Syntax

```
unitObject = setName(unitObj,unitName)
```

### Description

`unitObject = setName(unitObj,unitName)` sets the name for the `Simulink.SimulationData.Unit` object to the name specified in `unitName`.

### Input Arguments

**unitObj — Logging data unit object to name**

`Simulink.SimulationData.Unit` object

Logging data unit object to name, specified as a `Simulink.SimulationData.Unit` object.

**unitName — Name of logging data unit**

character vector

Name of logging data unit, specified as a character vector.

### Output Arguments

**name — Name of logging data units**

character vector

Name of logging data units, returned as a character vector.

### Examples

**Name a Logging Data Unit Object**

```
inchesUnit = Simulink.SimulationData.Unit('in');
inchesUnit = setName(inchesUnit,'inches')
```

```
inchesUnit =
```

```
 Units with properties:
```

Name: 'inches'

## Simulink.SimulationMetadata class

**Package:** Simulink

Access metadata of simulation runs

### Description

The `SimulationMetadata` class contains information about a simulation run including:

- Model information
- Timing information
- Execution and diagnostic information
- Custom character vector to tag the simulation
- Custom data to describe the simulation

`SimulationMetadata` packages this information with the `SimulationOutput` object. To use `SimulationMetadata`, use one of these approaches:

- In **Configuration Parameters > Data Import/Export**, under **Save options**, select **Single simulation output**.
- Use `set_param` to set `ReturnWorkspaceOutputs` to on.

```
set_param(model_name, 'ReturnWorkspaceOutputs', 'on');
```

To retrieve the `SimulationMetadata` object, use the `getSimulationMetadata` method on a `SimulationOutput` object.

### Properties

#### **ModelInfo — Information about the model and simulation operating environment**

structure

The `ModelInfo` structure has these fields.

Field Name	Type	Description
<code>ModelName</code>	char	Name of the model
<code>ModelVersion</code>	char	Version of the model
<code>ModelFilePath</code>	char	Absolute location of the <code>.mdl/.slx</code> file
<code>UserID</code>	char	System user ID of the machine used for the simulation
<code>MachineName</code>	char	Hostname of the machine used for the simulation
<code>Platform</code>	char	Operating system of the machine used for the simulation

Field Name	Type	Description
ModelStructuralChecksum	4-by-1 uint32	Structural checksum of the model calculated after an update diagram
SimulationMode	char	Simulation mode
StartTime	double	Simulation start time
StopTime	double	Time at which the simulation was terminated
SolverInfo	structure	Solver information: <ul style="list-style-type: none"> <li>Fixed-step solvers - Solver type, name, and fixed step size</li> <li>Variable solvers - Solver type, name, and max step size (initial setting)</li> </ul>
SimulinkVersion	structure	Version of Simulink
LoggingInfo	structure	Metadata about logging to persistent storage: <ul style="list-style-type: none"> <li>LoggingToFile field — Indicates whether logging to persistent storage is enabled ('on' or 'off')</li> <li>LoggingFileName field — Specifies the resolved file name for the persistent storage MAT-file (if LoggingToFile is 'on').</li> </ul>

### ExecutionInfo — Structure to store information about a simulation run

structure

Structure to store information about a simulation run, including the reason a simulation stopped and any diagnostics reported during the simulation. The structure has these fields.

Field Name	Type	Description
StopEvent	Nontranslated character vector	Reason the simulation stopped, represented by one of the following: <ul style="list-style-type: none"> <li>ReachedStopTime - Simulation stopped upon reaching stop time and no errors were reported during execution. StopEvent has value ReachedStopTime, even if errors are reported in the stop callbacks, which are executed after the simulation ends.</li> <li>ModelStop - Simulation stopped by a block or by solver before reaching stop time.</li> <li>StopCommand - Simulation stopped manually by clicking the <b>Stop</b> button or using the set_param command.</li> <li>DiagnosticError - Simulation stopped because an error was reported during simulation.</li> <li>KeyboardControlC - Simulation stopped using keystroke Ctrl+C.</li> <li>PauseCommand - Simulation paused manually by clicking the <b>Pause</b> button or using the set_param command.</li> <li>ConditionalPause - Simulation paused using a conditional breakpoint.</li> <li>PauseTime - Simulation paused at or after specified pause time.</li> <li>StepForward - Simulation paused after clicking step forward.</li> <li>StepBackward - Simulation paused after clicking step backward.</li> <li>TimeOut - Simulation stopped because execution time exceeded timeout specified by TimeOut.</li> </ul>
StopEventSource	Simulink.SimulationData.BlockPath	Source of stop event, if it is a valid Simulink object.
StopEventDescription	Translated character vector	Superset of information stored in StopEvent and StopEventSource.

Field Name	Type	Description
ErrorDiagnostic	struct	<p>Error reported during simulation, represented by the following fields:</p> <ul style="list-style-type: none"> <li>• <b>Diagnostic</b> - MSLDiagnostic object that includes object paths, ID, message, cause, and stack.</li> <li>• <b>SimulationPhase</b> - Represented by one of these: Initialization, Execution, or Termination.</li> <li>• <b>SimulationTime</b> - Simulation time represented as a double, if reported during Execution; else, represented as [].</li> </ul> <p>By passing the name-value pair 'CaptureErrors', 'on' to the sim command, errors generated during simulation are reported in ExecutionInfo.ErrorDiagnostic. The sim command does not capture generated errors.</p>
WarningDiagnostics	Array of struct	<p>Array of all warnings reported during the simulation. Each array item is represented by the following fields:</p> <ul style="list-style-type: none"> <li>• <b>Diagnostic</b> - MSLDiagnostic object that includes object paths, ID, message, cause, and stack.</li> <li>• <b>SimulationPhase</b> - Represented as: Initialization, Execution, or Termination.</li> <li>• <b>SimulationTime</b> - Simulation time represented as a double, if reported during Execution; else, represented as [].</li> </ul>

### TimingInfo — Structure to store profiling information about the simulation

structure

Structure to store profiling information about the simulation, including the time stamps for the start and end of the simulation. The structure has these fields.

Field Name	Type	Description
WallClockTimestampStart	character vector	Wall clock time when the simulation started, in YYYY-MM-DD HH:MI:SS format with microsecond resolution
WallClockTimestampStop	character vector	Wall clock time when the simulation stopped, in YYYY-MM-DD HH:MI:SS format with microsecond resolution

Field Name	Type	Description
InitializationElapsedWallTime	double	Time spent before execution, in seconds
ExecutionElapsedWallTime	double	Time spent during execution, in seconds
TerminationElapsedWallTime	double	Time spent after execution, in seconds
TotalElapsedWallTime	double	Total time spent in initialization, execution, and termination, in seconds
ProfilerData	Simulink.profiler.Data	Profiling results of the model, returned as a Simulink.profiler.Data object  <b>Note</b> The ProfilerData field is shown only when the Profile and ReturnWorkspaceOutputs model parameters are enabled

The ExecutionElapsedWallTime includes the time that Simulink spent to roll back or step back in a simulation. The ExecutionElapsedWallTime does not include the time spent between steps. For example, if you use Stepper to step through a simulation, the ExecutionElapsedWallTime time does not include the time when the simulation is in a paused state. For more information about using Stepper, see “How Simulation Stepper Helps With Model Analysis”.

### UserString — Custom character vector to describe the simulation

character vector

Use Simulink.SimulationOutput.setUserString to directly store a character vector in the SimulationMetadata object that is contained in the SimulationOutput object.

### UserData — Custom data to store in SimulationMetadata object that is contained in the SimulationOutput object

character vector

Use Simulink.SimulationOutput.setUserData to store custom data in the SimulationMetadata object that is contained in the SimulationOutput object.

## Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects.

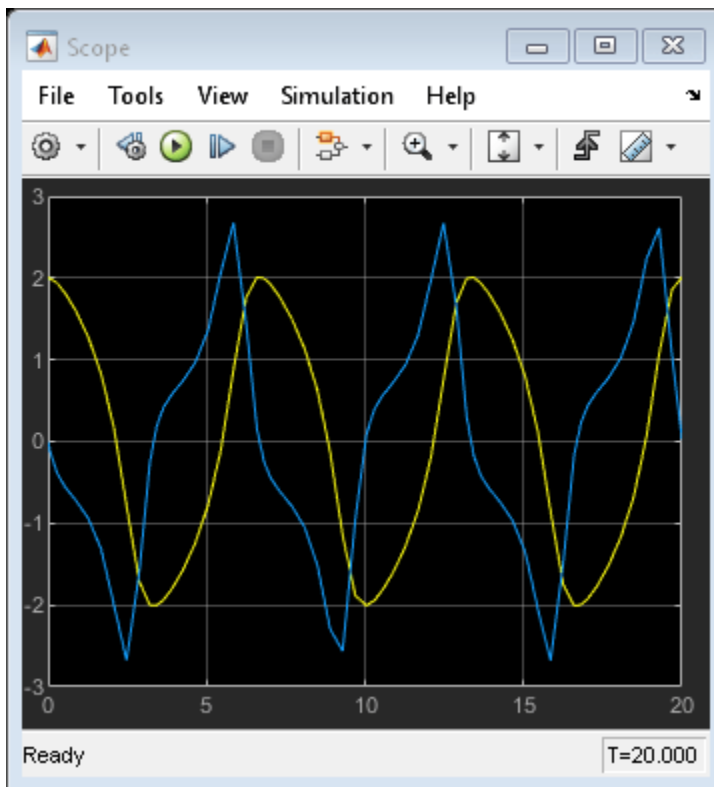

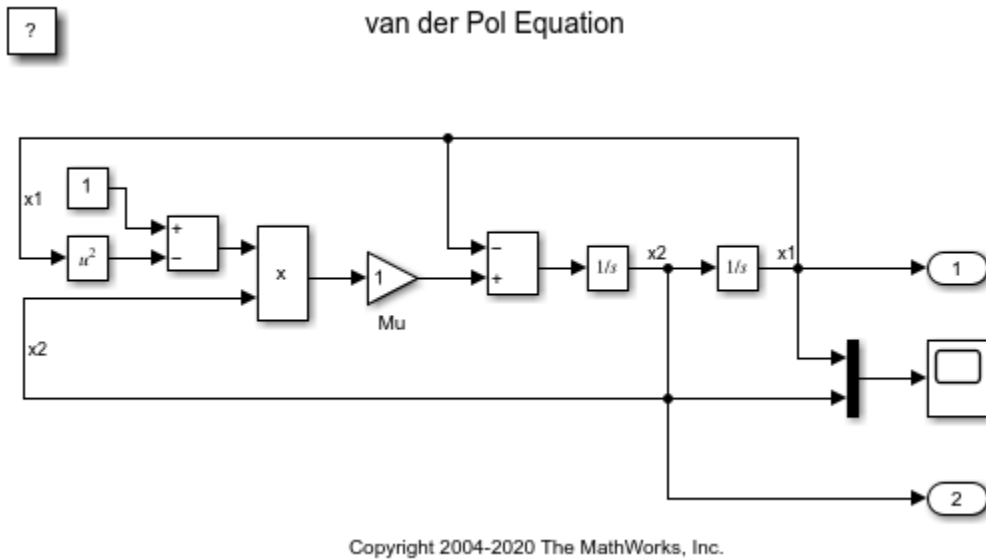

## Examples

### Get a SimulationMetadata Object for vdp Simulation

Simulate the vdp model. Retrieve metadata from a SimulationMetadata object of the simulation.

Simulate the vdp model. Save the results of the Simulink.SimulationOutput object in simout.

```
open_system('vdp');
simout = sim(bdroot, 'ReturnWorkspaceOutputs', 'on');
```

Retrieve metadata information about this simulation using `mData`. This is the `SimulationMetadata` object that `simout` contains.

```
mData=simout.getSimulationMetadata()
```

```
mData =
```

SimulationMetadata with properties:

```
 ModelInfo: [1x1 struct]
 TimingInfo: [1x1 struct]
 ExecutionInfo: [1x1 struct]
 UserString: ''
 UserData: []
```

Store custom data or string in simout.

```
simout=simout.setUserData(struct('param1','value1','param2','value2','param3','value3'));
simout=simout.setUserString('Store first simulation results');
```

Retrieve the custom data you stored from mData.

```
mData=simout.getSimulationMetadata()
disp(mData.UserData)
```

mData =

SimulationMetadata with properties:

```
 ModelInfo: [1x1 struct]
 TimingInfo: [1x1 struct]
 ExecutionInfo: [1x1 struct]
 UserString: 'Store first simulation results'
 UserData: [1x1 struct]
```

```
param1: 'value1'
param2: 'value2'
param3: 'value3'
```

Retrieve the custom string you stored from mData.

```
mData=simout.getSimulationMetadata()
disp(mData.UserString)
```

mData =

SimulationMetadata with properties:

```
 ModelInfo: [1x1 struct]
 TimingInfo: [1x1 struct]
 ExecutionInfo: [1x1 struct]
 UserString: 'Store first simulation results'
 UserData: [1x1 struct]
```

Store first simulation results

# Simulink.SuppressedDiagnostic class

**Package:** Simulink

Suppress diagnostic messages from a specified block

## Description

A `Simulink.SuppressedDiagnostic` object contains information related to diagnostic warnings or errors that are suppressed from being thrown during simulation.

## Construction

The Diagnostic Viewer in Simulink includes an option to suppress certain diagnostics. This feature enables you to suppress warnings or errors for specific objects in your model. Click the **Suppress** button next to the warning in the Diagnostic Viewer to suppress the warning from the specified source. This action creates a `Simulink.SuppressedDiagnostic` object. You can access this object at the MATLAB command line using the `Simulink.getSuppressedDiagnostics` function. You can add a comment for the suppressed diagnostic. You can restore the diagnostic by clicking **Restore**.

`DiagnosticObject = Simulink.SuppressedDiagnostic(source, message_id)` creates a suppressed diagnostic object. The object suppresses all instances of diagnostics represented by `message_id` thrown by the blocks specified by `source`.

## Input Arguments

**source** — System, block, or model object throwing diagnostic

model | subsystem | block path | block handle

The source of the diagnostic, specified as a model, subsystem, block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the `gcb` function.

To get the block handle, use the `getSimulinkBlockHandle` function.

Data Types: char | cell | string

**message\_id** — message identifier of diagnostic

message identifier

The message identifier of the diagnostic, specified as a character vector or string. You can find the message identifier of diagnostics thrown during simulation by accessing the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object associated with a simulation. You can also use the `lastwarn` function.

Data Types: char | string

## Properties

### **Comments — Comments associated with the suppression object**

character vector

Comments associated with the suppression object, specified as a character vector. This property is optional.

Data Types: char

### **ID — Message identifier of the diagnostic that was suppressed**

character vector

The message identifier of the diagnostic that was suppressed, specified as a character vector.

Data Types: char

### **LastModified — Date and time the suppression object was last modified**

character vector

Date and time the suppression object was last modified, specified as a character vector. This property is read-only.

Data Types: char

### **LastModifiedBy — Name of the user who was last to add or edit the suppression object**

character vector

Name of the user who last added or edited the suppression object, specified as a character vector. This property is optional.

Data Types: char

### **Source — block path of the source of the diagnostic**

character vector

The block path of the model object that has a suppressed diagnostic, specified as a character vector.

Data Types: char

## Methods

restore Remove specified diagnostic suppressions

suppress Suppress diagnostic specified by Simulink.SuppressedDiagnostic object

## Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects.

## Examples

## Create a Simulink.SuppressedDiagnostic Object

Using the model from “Suppress Diagnostic Messages Programmatically”, create and then restore a diagnostic suppression.

Create a `Simulink.SuppressedDiagnostic` object, suppression to suppress the parameter precision loss warning thrown by the Constant block, one.

```
suppression = Simulink.SuppressedDiagnostic('Suppressor_CLI_Demo/one',...
'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

The parameter precision loss warning is no longer thrown in future simulations of this model.

Add accountability information to the object by editing the `LastModifiedBy` and `Comments` properties of the object.

```
suppression.LastModifiedBy = 'John Doe';
suppression.Comments = 'Reviewed: Joe Schmoe'
```

```
suppression =
```

```
SuppressedDiagnostic with properties:
```

```
 Source: 'Suppressor_CLI_Demo/one'
 Id: 'SimulinkFixedPoint:util:fxpParameterPrecisionLoss'
LastModifiedBy: 'John Doe'
 Comments: 'Reviewed: Joe Schmoe'
 LastModified: '2016-Jun-01 17:25:21'
```

You can restore the diagnostic using the `restore` method.

```
restore(suppression);
```

## Version History

**Introduced in R2016b**

### See Also

Class Attributes

Property Attributes

## restore

**Class:** Simulink.SuppressedDiagnostic

**Package:** Simulink

Remove specified diagnostic suppressions

### Syntax

```
restore(SuppressedDiagnostic)
```

### Description

`restore(SuppressedDiagnostic)` removes the specified suppressed diagnostic object.

### Input Arguments

**SuppressedDiagnostic** — Suppressed diagnostic object to restore

Simulink.SuppressedDiagnostic object

Simulink.SuppressedDiagnostic object

### Examples

#### Restore a Suppressed Diagnostic

Using the model from “Suppress Diagnostic Messages Programmatically”, create and then restore a diagnostic suppression.

Create a `Simulink.SuppressedDiagnostic` object, `suppression` to suppress the parameter precision loss warning from the Constant block, `one`.

```
suppression = Simulink.SuppressedDiagnostic('Suppressor_CLI_Demo/one', ...
'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

You can restore the diagnostic using the `restore` method.

```
restore(suppression);
```

#### Restore All Suppressed Diagnostics

Using the model from “Suppress Diagnostic Messages Programmatically”, restore all diagnostic suppressions associated with a model.

Use the `Simulink.suppressDiagnostic` function to suppress the parameter precision loss and parameter underflow warnings from the Constant block, `one`.

```
diags = {'SimulinkFixedPoint:util:fxpParameterPrecisionLoss', 'SimulinkFixedPoint:util:fxpParameterUnderflowWarning'};
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one', diags);
```

Use the `Simulink.getSuppressedDiagnostics` function to get all suppressions associated with the model, returned as an array of `Simulink.SuppressedDiagnostic` objects.

```
suppressed_diagnostics = Simulink.getSuppressedDiagnostics('Suppressor_CLI_Demo')
```

```
suppressed_diagnostics =
```

```
1x2 SuppressedDiagnostic array with properties:
```

```
Source
Id
LastModifiedBy
Comments
LastModified
```

Restore all diagnostics using the `restore` method and iterating through the `suppressed_diagnostics` array.

```
for iter = 1:numel(suppressed_diagnostics)
 restore(suppressed_diagnostics(iter));
end
```

## Version History

**Introduced in R2016b**

# Simulink.Variant class

**Package:** Simulink

Specify conditions that control variant selection

## Description

An object of the `Simulink.Variant` class represents a conditional expression called a variant control. The object allows you to specify a Boolean expression that activates a specific variant choice when it evaluates to `true`.

A variant control comprises one or more variant control variables, specified using MATLAB variables or `Simulink.Parameter` objects.

You specify variant controls for each variant choice represented in a Variant Subsystem or Model Variant block. For a given Variant Subsystem or Model Variant block, only one variant control can evaluate to `true` at a time. When a variant control evaluates to `true`, Simulink activates the variant choice that corresponds to that variant control.

## Construction

`variantControl = Simulink.Variant(conditionExpression)` creates a variant control.

## Properties

### **conditionExpression** — Variant condition expression

'(default)' | character vector

Variant condition expression, specified as a character vector containing one or more of these operands and operators.

### Operands

- Variable names that resolve to MATLAB variables or `Simulink.Parameter` objects with integer or enumerated data type and scalar literal values
- Variable names that resolve to `Simulink.Variant` objects
- Scalar literal values that represent integer or enumerated values

### Operators

- Parentheses for grouping
- Arithmetic, relational, logical, or bit-wise operators

The variant condition expression evaluates to a Boolean value. This property has read and write access.

Example: `'(Fuel==2 || Emission==1) && Ratio==2'`

## Examples

### Create Variant Controls Using MATLAB Variables

Use MATLAB variables when you want to simulate the model but are not considering code generation.

Create MATLAB variables with scalar literal values.

```
Fuel = 3;
Emission = 1;
Ratio = 3;
```

Develop conditional expressions using the variables.

```
Variant1 = Simulink.Variant('Fuel==1 && Emission==2');
Variant2 = Simulink.Variant('(Fuel==2 || Emission==1) && Ratio==2');
Variant3 = Simulink.Variant('Fuel==3 || Ratio==4');
```

### Create Variant Controls Using Simulink.Parameter Objects

If you want to generate preprocessor conditionals for code generation, use `Simulink.Parameter` objects.

Create variant `Simulink.Parameter` objects with scalar literal values.

```
Fuel = Simulink.Parameter(3);
Emission = Simulink.Parameter(1);
Ratio = Simulink.Parameter(3);
```

Specify the custom storage class for these objects as `ImportedDefine` so that the values are specified by an external header file.

Other valid values for the custom storage class are `Define` and `CompilerFlag`

---

**Note** If you generate code with startup activation time, specify the supported custom storage class for the objects. For more information on built-in and custom storage classes supported with startup activation time see “Storage Classes for Different Variant Activation Times”.

---

```
Fuel.CoderInfo.StorageClass = 'Custom';
Fuel.CoderInfo.CustomStorageClass = 'ImportedDefine';

Emission.CoderInfo.StorageClass = 'Custom';
Emission.CoderInfo.CustomStorageClass = 'ImportedDefine';

Ratio.CoderInfo.StorageClass = 'Custom';
Ratio.CoderInfo.CustomStorageClass = 'ImportedDefine';
```

Develop conditional expressions using the variables and create variant controls.

```
Variant1 = Simulink.Variant('Fuel==1 && Emission==2');
Variant2 = Simulink.Variant('(Fuel==2 || Emission==1) && Ratio==2');
Variant3 = Simulink.Variant('Fuel==3 || Ratio==4');
```

# Simulink.VariantConfigurationAnalysis class

**Package:** Simulink

Analyze variant configurations programmatically

## Description

---

**Note** This class requires Variant Manager for Simulink.

---

Use the `Simulink.VariantConfigurationAnalysis` class to analyze variant configurations for a model by specifying either named variant configurations or variable groups. The class returns a variant configuration analysis object and has methods that can be used to:

- Get the list of active blocks in a variant configuration.
- Find blocks that are active across all variant configurations.
- Find blocks that are inactive in all variant configurations.
- Get the list of blocks that differ in active choice between variant configurations.
- Get the list of dependent models for a variant configuration.
- Get the list of dependent libraries that are used in a variant configuration.
- View the variant configuration analysis report.
- Hide the variant configuration analysis report.
- View variant conditions on a block in a given variant configuration.

## Creation

`varConfigObj = Simulink.VariantConfigurationAnalysis(model,Name,Value)` returns a variant configuration analysis object for the model specified by `model` and sets the `ModelName` and `Configurations` properties.

### Input Arguments

#### Name-Value Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `'NamedConfigurations', {'config1', 'config2'}`

#### **NamedConfigurations — Names of variant configurations**

string | cell array of strings

Names of variant configurations, specified as a string or a cell array of strings. Use this argument to perform the analysis by specifying named variant configurations defined for the model.

You can use Variant Manager to create named variant configurations for a model, save them in a variant configuration object of type `Simulink.VariantConfigurationData`, and associate this object with the model. You can specify one or more configuration names defined in this variant configuration object for the analysis.

---

**Note** If the model is associated with a variant configuration object, then the `VariantConfigurationObject` model parameter contains the name of the corresponding variant configuration object.

---

Example: `NamedConfigurations={'config1', 'config2'}`

### VariableGroups — Variant control variable names and values

struct array

Variant control variable names and values, specified as a struct array. Use this argument to perform the analysis by specifying values for the variant control variables used by the model.

You can specify multiple variable groups that represent the different variant configurations to be analyzed. In each variable group, you must specify the variant control variables and their values that must be used for the analysis.

To define the variable groups, provide a struct array with these fields:

- **Name** — Name of variable group
- **VariantControls** — Cell array with variant control variable names and their values

Example: `'VariableGroups',[struct('Name', 'V1W1',... 'VariantControls', {'V',1,'W',1})),struct('Name', 'V1W2',... 'VariantControls', {'V',1,'W',2})]`

---

**Note** Specifying both `NamedConfigurations` and `VariableGroups` is not supported.

---

## Properties

### ModelName — Name of the model

character vector

Name of model to be analyzed, specified as a character vector.

Example: `'slxVariantReducer'`

#### Attributes:

GetAccess	public
SetAccess	private

Data Types: character vector

**Configurations — Names of variant configurations or variable groups**

cell array of strings

Names of variant configurations or variable groups to be analyzed, specified as a cell array of strings.

Example: {'config1', 'config2'}

**Attributes:**

GetAccess	public
SetAccess	private

Data Types: character vector

**Methods****Public Methods**

getActiveBlocks	List of active blocks in a named variant configuration
getAlwaysActiveBlocks	List of blocks that are always active across named variant configurations
getBlockDifferences	List of blocks that differ in their active choice between multiple named variant configurations
getDependentLibraries	List of libraries that are used in a named variant configuration
getDependentModels	List of dependent models that are used in a named variant configuration
getNeverActiveBlocks	List of blocks that are inactive in named variant configurations
getVariantCondition	Variant condition on a block in a named variant configuration
hideUI	Hide variant configuration analysis report for a model
showUI	Show variant configuration analysis report for a model

**Examples****Create Variant Configuration Analysis Object for Model**

Create a variant configuration analysis object by specifying either named variant configurations or variable groups.

Open the model `slexVariantReducer`.

```
open_system('slexVariantReducer');
```

The model has two named variant configurations, `config1` and `config2`. The named configurations are saved in a variant configuration object, `slexVariantReducer_config`, associated with the model.

Analyze the model using the named configurations.

```
VarConfigObjnc = Simulink.VariantConfigurationAnalysis('slexVariantReducer', ...
 'NamedConfigurations',{'config1', 'config2'})
```

```
VarConfigObjnc =
 VariantConfigurationAnalysis with properties:
```

```
 ModelName: 'slexVariantReducer'
 Configurations: {'config1' 'config2'}
```

Next, specify variable groups for analysis.

The `slexVariantReducer` model contains two variant control variables V and W.

Analyze the model using two variable groups, V1W1 and V2W2:

```
VarConfigObjvg = Simulink.VariantConfigurationAnalysis(...
 'slexVariantReducer',...
 'VariableGroups',[struct('Name','V1W1','VariantControls',{ 'V',1,'W',2})
 struct('Name','V1W2','VariantControls',{ 'V',1,'W',2})])
```

```
VarConfigObjvg =
 VariantConfigurationAnalysis with properties:
```

```
 ModelName: 'slexVariantReducer'
 Configurations: {'V1W1' 'V1W2'}
```

## getActiveBlocks

**Class:** Simulink.VariantConfigurationAnalysis

**Package:** Simulink

List of active blocks in a named variant configuration

### Syntax

```
activeBlocks = varConfigObj.getActiveBlocks(configName)
```

### Description

Use this method to find the active blocks in a named variant configuration after analyzing it using the `Simulink.VariantConfigurationAnalysis` class. You must create a variant configuration analysis object of type `Simulink.VariantConfigurationAnalysis` for a model and use it to analyze the required named variant configurations for that model before calling the `getActiveBlocks` method.

---

**Note** This method requires Variant Manager for Simulink.

---

`activeBlocks = varConfigObj.getActiveBlocks(configName)` returns the list of active blocks in the variant configuration named `configName`. `varConfigObj` is the `VariantConfigurationAnalysis` object for a model.

### Input Arguments

**configName — Name of variant configuration**

character vector | string

Name of the variant configuration for which you want to find the active blocks, specified as a character vector. You must analyze this configuration using the `Simulink.VariantConfigurationAnalysis` class first.

### Output Arguments

**activeBlocks — List of active blocks**

cell array

List of active blocks in the input variant configuration, returned as a cell array.

### Examples

```
% Add model to path
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));

% Open model
open_system('slexVariantManagement');

% Get variant configuration analysis object
```

```
varConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantManagement', 'NamedConfigurations', {'LinInterStd', ...
'NonLinExterLowFid', 'NonLinExterHighFid'})

% Get active blocks
ActiveBlocks = varConfigObj.getActiveBlocks('LinInterStd')
```

## Version History

Introduced in R2019a

## getAlwaysActiveBlocks

**Class:** Simulink.VariantConfigurationAnalysis

**Package:** Simulink

List of blocks that are always active across named variant configurations

### Syntax

```
alwaysActiveBlocks = varConfigObj.getAlwaysActiveBlocks()
```

### Description

Use this method to find the blocks that are always active across all named variant configurations after analyzing them using the `Simulink.VariantConfigurationAnalysis` class. You must create a variant configuration analysis object of type `Simulink.VariantConfigurationAnalysis` for a model and use it to analyze the required named variant configurations for that model before calling the `getAlwaysActiveBlocks` method.

---

**Note** This method requires Variant Manager for Simulink.

---

`alwaysActiveBlocks = varConfigObj.getAlwaysActiveBlocks()` returns the list of blocks that are always active across all the named variant configurations that have been analyzed using a `VariantConfigurationAnalysis` object. `varConfigObj` is the `VariantConfigurationAnalysis` object for a model.

### Output Arguments

**alwaysActiveBlocks** — List of blocks that are always active

cell array

List of blocks that are active across all the named variant configurations that are analyzed, returned as a cell array.

### Examples

```
% Add model to path
addpath(fullfile(matlabroot, 'examples', 'simulink_variants', 'main'));

% Open model
open_system('slexVariantManagement');

% Get variant configuration analysis object
varConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantManagement', 'NamedConfigurations', {'LinInterStd', ...
'NonLinExterLowFid', 'NonLinExterHighFid'})

% Get always active blocks
alwaysActiveBlocks = varConfigObj.getAlwaysActiveBlocks()
```

## getBlockDifferences

**Class:** Simulink.VariantConfigurationAnalysis

**Package:** Simulink

List of blocks that differ in their active choice between multiple named variant configurations

### Syntax

```
getBlockDifferences = varConfigObj.getBlockDifferences()
```

### Description

Use this method to find the blocks that differ in their active choice between all named variant configurations after analyzing them using the `Simulink.VariantConfigurationAnalysis` class. You must create a variant configuration analysis object of type `Simulink.VariantConfigurationAnalysis` for a model and use it to analyze the required named variant configurations for that model before calling the `getBlockDifferences` method.

---

**Note** This method requires Variant Manager for Simulink.

---

`getBlockDifferences = varConfigObj.getBlockDifferences()` returns a list of blocks that are active in some of the analyzed variant configurations and inactive in other configurations. `varConfigObj` is the `VariantConfigurationAnalysis` object for a model.

### Output Arguments

**getBlockDifferences** — List of blocks that differ in active choice

cell array

List of blocks that differ in active choice between variant configurations, returned as a cell array.

### Examples

```
% Add model to path
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));

% Open model
open_system('slexVariantManagement');

% Get variant configuration analysis object
varConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantManagement', 'NamedConfigurations', {'LinInterStd', ...
'NonLinExterLowFid', 'NonLinExterHighFid'})

% Get block differences
getBlockDifferences = varConfigObj.getBlockDifferences()
```

## getDependentLibraries

**Class:** Simulink.VariantConfigurationAnalysis

**Package:** Simulink

List of libraries that are used in a named variant configuration

### Syntax

```
dependentLibraries = varConfigObj.getDependentLibraries(configName)
```

### Description

Use this method to find the libraries used in a named variant configuration after analyzing it using the `Simulink.VariantConfigurationAnalysis` class. You must create a variant configuration analysis object of type `Simulink.VariantConfigurationAnalysis` for a model and use it to analyze the required named variant configurations for that model before calling the `getDependentLibraries` method.

---

**Note** This method requires Variant Manager for Simulink.

---

`dependentLibraries = varConfigObj.getDependentLibraries(configName)` returns a list of libraries that are used in the variant configuration named `configName`. `varConfigObj` is the `VariantConfigurationAnalysis` object for a model.

### Input Arguments

**configName — Name of variant configuration**

character vector | string

Name of the variant configuration for which you want to find the dependent libraries, specified as a character vector. You must analyze this configuration using the `Simulink.VariantConfigurationAnalysis` class first.

### Output Arguments

**dependentLibraries — List of libraries**

cell array

List of dependent libraries, returned as a cell array.

### Examples

```
% Add model to path
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));

% Open model
open_system('slexVariantConfigurationAnalysis');

% Get variant configuration analysis object
```

```
varConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantConfigurationAnalysis', 'NamedConfigurations', {'VendorACtrlNonLinear', 'VendorACtrlFuzzy'})

% Get dependent libraries
dependentLibraries = varConfigObj.getDependentLibraries('VendorACtrlLinear')
```

**Class:** Simulink.VariantConfigurationAnalysis

**Package:** Simulink

List of dependent models that are used in a named variant configuration

### Syntax

```
dependentModels = varConfigObj.getDependentModels(configName)
```

### Description

Use this method to find the dependent models used in a named variant configuration after analyzing it using the `Simulink.VariantConfigurationAnalysis` class. You must create a variant configuration analysis object of type `Simulink.VariantConfigurationAnalysis` for a model and use it to analyze the required named variant configurations for that model before calling the `getDependentModels` method.

---

**Note** This method requires Variant Manager for Simulink.

---

`dependentModels = varConfigObj.getDependentModels(configName)` returns a list of dependent models that are used in the variant configuration named `configName`. `varConfigObj` is the `VariantConfigurationAnalysis` object for a model.

### Input Arguments

**configName — Variant configuration name**

character vector | string

Name of the variant configuration for which you want to find the dependent models, specified as a character vector. You must analyze this configuration using the `Simulink.VariantConfigurationAnalysis` class first.

### Output Arguments

**dependentModels — List of models**

cell array

List of dependent models, returned as a cell array.

### Examples

```
% Add model to path
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));

% Open model
open_system('slexVariantManagement');

% Get variant configuration analysis object
```

```
varConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantManagement', 'NamedConfigurations', {'LinInterStd', ...

## getNeverActiveBlocks

**Class:** Simulink.VariantConfigurationAnalysis

**Package:** Simulink

List of blocks that are inactive in named variant configurations

### Syntax

```
getNeverActiveBlocks = varConfigObj.getNeverActiveBlocks()
```

### Description

Use this method to find the blocks that are always inactive across all named variant configurations after analyzing them using the Simulink.VariantConfigurationAnalysis class. You must create a variant configuration analysis object of type Simulink.VariantConfigurationAnalysis for a model and use it to analyze the required named variant configurations for that model before calling the getNeverActiveBlocks method.

---

**Note** This method requires Variant Manager for Simulink.

---

getNeverActiveBlocks = varConfigObj.getNeverActiveBlocks() returns a list of blocks that are inactive in all the named variant configurations that have been analyzed using a VariantConfigurationAnalysis object. varConfigObj is the VariantConfigurationAnalysis object for a model.

### Output Arguments

#### neverActiveBlocks — List of never active blocks

cell array

List of blocks that are never active in all the named variant configurations that are analyzed, returned as a cell array.

### Examples

```
% Add model to path
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));

% Open model
open_system('slexVariantManagement');

% Get variant configuration analysis object
varConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantManagement', 'NamedConfigurations', {'LinInterStd', ...
'NonLinExterLowFid', 'NonLinExterHighFid'})

% Get never active blocks
neverActiveBlocks = varConfigObj.getNeverActiveBlocks()
```

## getVariantCondition

**Class:** Simulink.VariantConfigurationAnalysis

**Package:** Simulink

Variant condition on a block in a named variant configuration

### Syntax

```
variantCondition = varConfigObj.getVariantCondition(configName,blockName)
```

### Description

Use this method to find the variant condition on a block in a named variant configuration after analyzing it using the `Simulink.VariantConfigurationAnalysis` class. You must create a variant configuration analysis object of type `Simulink.VariantConfigurationAnalysis` for a model and use it to analyze the required named variant configurations for that model before calling the `getVariantCondition` method.

---

**Note** This method requires Variant Manager for Simulink.

---

`variantCondition = varConfigObj.getVariantCondition(configName,blockName)`, returns the variant condition on the block `blockName` in the named variant configuration `configName`. `varConfigObj` is the `VariantConfigurationAnalysis` object for a model.

### Input Arguments

**configName — Name of variant configuration**

character vector | string

Name of the variant configuration, specified as a character vector. You must analyze this configuration using the `Simulink.VariantConfigurationAnalysis` class first.

**blockName — Name of block**

character vector | string

Name of the block for which you want to find the variant condition, specified as character vector of block path.

### Output Arguments

**variantCondition — Variant condition on a block**

cell array

Variant condition on the block in the given variant configuration, returned as cell array.

## Examples

```
% Add model to path
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));

% Open model
open_system('slexVariantManagement');

% Get variant configuration analysis object
varConfigObj = Simulink.VariantConfigurationAnalysis('slexVariantManagement',...
'NamedConfigurations', {'LinInterStd','NonLinExterLowFid', 'NonLinExterHighFid'})

% Get variant condition
VariantCondition = varConfigObj.getVariantCondition('NonLinExterLowFid',...

**Note** This class requires Variant Manager for Simulink.

---

Use the `Simulink.VariantConfigurationData` class to create a variant configuration data object that stores a collection of variant configurations, constraints, and the name of a preferred variant configuration for a model. The class has methods that enable you to:

- Define new variant configurations.
- Add variant control variables to variant configurations.
- Create a copy of a variant configuration.
- Define constraints to check for invalid variant configurations.
- Delete existing variant configurations, constraints, and control variables.
- Set a specific configuration as the preferred variant configuration.

### Creation

#### Description

`varconfigdataObj = Simulink.VariantConfigurationData` creates an empty variant configuration data object.

`varconfigdataObj = Simulink.VariantConfigurationData(Name=Value)` creates a variant configuration data object and sets “Properties” on page 5-718 using one or more name-value arguments.

### Properties

#### Configurations — Set of variant configurations

structure | array of structures

Set of variant configurations in the variant configuration data object, specified as an array of structures with the following fields:

Field	Type	Description
Name	character vector	Name of the configuration. The value must be a unique and valid MATLAB variable name.
Description	character vector	Description of the configuration

Data Types: struct

### **PreferredConfiguration — Name of preferred variant configuration**

character vector

Name of the preferred variant configuration, specified as a character vector. Use this property to indicate the configuration that is suited for the model for common workflows. The value must be the name of a variant configuration present in the variant configuration data object.

#### **Attributes:**

GetAccess	public
SetAccess	private

Data Types: char

## **Methods**

### **Public Methods**

addConfiguration	Add new variant configuration to VariantConfigurationData object
addComponentConfiguration	Associate top-model variant configuration with variant configuration of referenced model
addConstraint	Add constraint to VariantConfigurationData object
addControlVariables	Add variant control variables to named variant configuration in VariantConfigurationData object
addCopyOfConfiguration	Add copy of existing variant configuration to VariantConfigurationData object
convertDefaultToPreferred	Convert default variant configuration to preferred variant configuration
getConfiguration	Get specific variant configuration from VariantConfigurationData object
getPreferredConfiguration	Get name of preferred variant configuration for variant configuration data object
removeConfiguration	Remove variant configuration from variant configuration data object
removeComponentConfiguration	Remove association between variant configurations of top-level model and referenced model
removeConstraint	Remove constraint from variant configuration data object
removeControlVariable	Remove variant control variable from variant configuration

### **Specialized Operators and Functions**

These methods specialize standard MATLAB operators and functions for objects in this class.

intersect	<p><code>vcdC = intersect(vcdA,vcdB)</code></p> <p>Find the intersection of variant configuration data objects <code>vcdA</code> and <code>vcdB</code>. This method returns a variant configuration data object, <code>vcdC</code>, with the common variant configurations present in <code>vcdA</code> and <code>vcdB</code>. The intersection is found by matching the variant control variables and their values.</p> <p>Constraints in <code>vcdC</code> are formed as follows. Consider the case where <code>vcdA</code> and <code>vcdB</code> have two constraints each.</p> <ul style="list-style-type: none"><li>• <code>vcdA</code>: <code>constraintA1</code>, <code>constraintA2</code></li><li>• <code>vcdB</code>: <code>constraintB1</code>, <code>constraintB2</code></li></ul> <p>Then, <code>vcdC</code> has these constraints:</p> <ul style="list-style-type: none"><li>• <code>constraintC1</code>: <code>constraintA1 &amp;&amp; (constraintB1 &amp;&amp; constraintB2)</code></li><li>• <code>constraintC2</code>: <code>constraintA2 &amp;&amp; (constraintB1 &amp;&amp; constraintB2)</code></li></ul> <p>The constraint conditions formed by logical AND, OR, and NOT operations are simplified by default using boolean algebra arithmetic, and symbols can be reordered.</p> <p><code>vcdC = intersect(vcdA, vcdB, SimplifyConditions=false)</code> returns a variant configuration data object <code>vcdC</code> in which constraint conditions are not simplified to simpler expressions.</p> <p>The remaining properties of <code>vcdC</code> are the same as <code>vcdA</code>, and items in <code>vcdC</code> appear in the same order as they appear in <code>vcdA</code>.</p>
-----------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

setdiff	<p><code>vcdC = setdiff(vcdA,vcdB)</code></p> <p>Find the difference of variant configuration data objects <code>vcdA</code> and <code>vcdB</code>. This method returns a variant configuration data object <code>vcdC</code> that contains configurations that are in <code>vcdA</code> but not in <code>vcdB</code>. The result is found based on the differences in the values of variant control variables.</p> <p>Constraints in <code>vcdC</code> are formed as follows. Consider the case where <code>vcdA</code> and <code>vcdB</code> have two constraints each.</p> <ul style="list-style-type: none"><li>• <code>vcdA</code> : <code>constraintA1, constraintA2</code></li><li>• <code>vcdB</code> : <code>constraintB1, constraintB2</code></li></ul> <p>Then, <code>vcdC</code> has these constraints:</p> <ul style="list-style-type: none"><li>• <code>constraintC1: constraintA1 &amp;&amp; ~(constraintB1 &amp;&amp; constraintB2)</code></li><li>• <code>constraintC2: constraintA2 &amp;&amp; ~(constraintB1 &amp;&amp; constraintB2)</code></li></ul> <p>The constraint conditions formed by logical AND, OR, and NOT operations are simplified by default using boolean algebra arithmetic, and symbols can be reordered.</p> <p><code>vcdC = setdiff(vcdA, vcdB, SimplifyConditions=false)</code> returns a variant configuration data object <code>vcdC</code> in which constraint conditions are not simplified.</p> <p>The remaining properties of <code>vcdC</code> are the same as <code>vcdA</code>, and items in <code>vcdC</code> appear in the same order as they appear in <code>vcdA</code>.</p>
---------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

union	<p><code>vcdC = union(vcdA,vcdB)</code></p> <p>Find the union of variant configuration data objects <code>vcdA</code> and <code>vcdB</code>. This method returns a variant configuration data object <code>vcdC</code> that contains configurations from both <code>vcdA</code> and <code>vcdB</code>, with no duplicates. The union is found by matching the variant control variables and their values.</p> <p>Constraints in <code>vcdC</code> are formed as follows. Consider the case where <code>vcdA</code> and <code>vcdB</code> have two constraints each.</p> <ul style="list-style-type: none"> <li>• <code>vcdA : constraintA1, constraintA2</code></li> <li>• <code>vcdB : constraintB1, constraintB2</code></li> </ul> <p>Then, <code>vcdC</code> has these constraints:</p> <ul style="list-style-type: none"> <li>• <code>constraintC1: constraintA1    (constraintB1 &amp;&amp; constraintB2)</code></li> <li>• <code>constraintC2: constraintA2    (constraintB1 &amp;&amp; constraintB2)</code></li> </ul> <p>The constraint conditions formed by logical AND, OR, and NOT operations are simplified by default using boolean algebra arithmetic, and symbols can be reordered.</p> <p><code>vcdC = union(vcdA, vcdB, SimplifyConditions=false)</code> returns a variant configuration data object <code>vcdC</code> in which constraint conditions are not simplified to simpler expressions.</p> <p>The remaining properties of <code>vcdC</code> are the same as <code>vcdA</code>, and items in <code>vcdC</code> appear in the same order as they appear in <code>vcdA</code>, then <code>vcdB</code>.</p>
unique	<p><code>uniquedVCD = unique(vcd)</code></p> <p>Find unique configurations in the variant configuration data object <code>vcd</code>.</p> <p>Duplicate configurations in <code>vcd</code> are removed based on values of variant control variables. Duplicate constraints in <code>vcd</code> are removed based on the constraint conditions.</p>

## Examples

### Create Variant Configuration Data Object

This example shows how to create an instance of the `Simulink.VariantConfigurationData` class and set these class properties:

- `Configurations (struct)`
- `Constraints (struct)`
- `PreferredConfiguration (char)`

## Define New Variant Configuration

Define a new variant configuration to add to the variant configuration data object.

The `VariantConfigurations` property in the `Simulink.VariantConfigurationData` class has these fields:

- Name (char)
- ControlVariables (struct)
- Description (char)
- Create a struct for the `ControlVariables` field that contains the variant control variables and values for the new configuration.

```
ctrlVarStruct = struct(Name='ControllerType.Linear',Value='NoiseType.NoNoise',Source='plant.sldd')
```

- Create a struct for the new variant configuration.

```
configStruct = struct(Name='LinInterExpNoNoise',ControlVariables=ctrlVarStruct, ...
 Description='Linear Internal Experimental Plant Controller');
```

## Define Constraints

Define any constraints applicable for all the variant configurations in the variant configuration data object.

```
constrStruct = struct(Name='PlantLocation',Condition= ...
 '(PlantLoc==PlantLocation.Internal) || (PlantLoc==PlantLocation.External)', ...
 Description='Plant location constraint');
```

## Create Variant Configuration Data Object

Create the object by adding variant configurations, global constraints, and the name of the preferred configuration.

```
vcdo = Simulink.VariantConfigurationData(Configurations=configStruct,Constraints=constrStruct,
 PreferredConfiguration='LinInterExpNoNoise')
```

```
vcdo =
 VariantConfigurationData with properties:

 Configurations: [1x1 struct]
 Constraints: [1x1 struct]
 PreferredConfiguration: 'LinInterExpNoNoise'
```

## Associate Variant Configuration Data Object With Model

You can associate `vcdo` with a Simulink® model using the `VariantConfigurationObject` model parameter, for example:

```
set_param("<model_name>",VariantConfigurationObject="vcdo");
```

## Tips

You can edit a variant configuration object from the global workspace (base workspace or data dictionary) without launching Variant Manager. Double-click the object that is present in the base

workspace or in the **Configurations** section of the data dictionary in the Model Explorer. This action launches the `Simulink.VariantConfigurationData` property dialog box. This dialog box functions as a standalone variant manager and allows you to modify variant configurations, control variables, and constraints in the variant configuration object.

## Version History

### Introduced in R2013b

#### New add-on required

*Behavior changed in R2022b*

You must install the Variant Manager for Simulink software support package to use this class and its methods.

#### New capabilities

- Support for set operations:

You can use the `intersect`, `setdiff`, `union`, and `unique` methods in `Simulink.VariantConfigurationData` class to perform set operations on variant configuration data objects. See “Specialized Operators and Functions” on page 5-720.

- New `PreferredConfiguration` property:

You can set any of the named configurations defined for a model as the `PreferredConfiguration` to indicate the configuration that is suited for the model for common workflows. This configuration is not applied automatically when compiling or simulating a model. You must apply the preferred configuration explicitly on the model, if required.

If the variant configuration data object (`vcd`) for your model has an existing `DefaultConfiguration`, you can convert it to `PreferredConfiguration` using this command:

```
vcd.convertDefaultToPreferred(model);
```

To apply the `PreferredConfiguration` on your model before compiling or simulating the model, use this command:

```
Simulink.VariantManager.applyConfiguration(model,...
vcd.getPreferredConfigurationName());
```

#### **DefaultConfigurationName and SubModelConfiguration properties will be removed**

*Warns starting in R2022b*

- The `DefaultConfigurationName` property will be removed. Use the `PreferredConfiguration` property instead. Setting a default variant configuration for a variant configuration data object is not recommended. Previously, if you had set a default configuration, compiling or simulating the model automatically activated the default configuration irrespective of the variant control variable values in the global workspace. Now, this behavior is not applicable and setting the `DefaultConfigurationName` property has no effect.

If the variant configuration data object (`vcd`) for your model has an existing `DefaultConfiguration`, you can convert it to `PreferredConfiguration` using the `convertDefaultToPreferred` method.

- The `SubModelConfiguration` property will be removed. The variant configurations for a top-level model must also define the variant control variables used by any referenced components in the model hierarchy, such as referenced models. This approach helps to maintain a single consistent definition for a variant control across the hierarchy.

If the referenced component has named variant configurations of its own, you can use them to set up the corresponding variant control variables in the top-level model configuration. For more information, see “Compose Variant Configurations for Top Model Using Referenced Model Configurations”.

For existing models with an associated variant configuration object, variant control variables in the referenced model configuration will be automatically migrated to the configuration of the top-level model. You must save the variant configuration object using Variant Manager to fix related warnings.

Scripts that use these properties run with a warning.

### Methods to be removed

*Not recommended starting in R2022b*

These methods will be removed in a future release. Scripts that use these methods run with a warning.

To be Removed	Recommended Replacement
<code>validateModel</code>	<code>Simulink.VariantManager.activateModel</code>
<code>getFor</code>	<code>Simulink.VariantManager.getConfigurationData</code>
<code>addSubModelConfigurations</code>	<code>Simulink.VariantConfigurationData.addComponentConfigurations</code>
<code>removeSubModelConfiguration</code>	<code>Simulink.VariantConfigurationData.removeComponentConfiguration</code>
<code>getDefaultConfiguration</code>	<code>Simulink.VariantConfigurationData.getPreferredConfiguration</code>
<code>setDefaultConfigurationName</code>	<code>Simulink.VariantConfigurationData.setPreferredConfiguration</code>

### Change in the format of errors output argument of `validateModel` method

*Behavior changed in R2022b*

The fields `Type`, `Source`, `PathInModel`, and `PathInHierarchy` have been removed from the structure named `Errors` within the second output argument, `errors`. For an example, see “Compatibility Considerations When Using Variant Manager for Simulink Support Package”.

# addComponentConfiguration

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

Associate top-model variant configuration with variant configuration of referenced model

## Syntax

```
addComponentConfiguration(vcdTop, ConfigurationName=topConfig, ComponentName=
refmdl, ComponentConfigurationName=refConfig)
addComponentConfiguration(vcdTop, ConfigurationName=topConfig, ComponentName=
refmdl, ComponentConfigurationName=refConfig, PopulateControlVariables=false)
```

## Description

Consider a variant model that has predefined variant configurations and also has a referenced model in its model hierarchy. In Variant Manager, a variant configuration for a top-level model must also define the variant control variables used by any referenced components in the model hierarchy, such as referenced models. If the referenced component defines its own variant configurations, you can use them to set up the control variables in the top-level configuration.

Use the `addComponentConfiguration` method to associate a variant configuration of the referenced model with a variant configuration of the top-level model. This operation adds the control variables present in the specified component configuration to the top-level model configuration. This method thus allows you to author a top-model configuration using referenced component configurations. For more information on this workflow, see “Compose Variant Configurations for Top Model Using Referenced Model Configurations”.

---

**Note** This method requires Variant Manager for Simulink.

---

`addComponentConfiguration(vcdTop, ConfigurationName=topConfig, ComponentName=refmdl, ComponentConfigurationName=refConfig)` associates the variant configuration `refConfig` of the referenced model `refmdl` with the top-level variant configuration `topConfig` that is present in the variant configuration data object `vcdTop`.

This operation populates variant control variables from `refConfig` to `topConfig`; that is `topConfig` contains all variant control variables that are in `refConfig`, these variables are set to the same values as in `refConfig`, and they are also marked as read-only in the top-level configuration in the Variant Manager user interface. To populate variant control variables, `refmdl` is loaded. The operation also checks that there are no conflicts in existing variant control variable definitions of `topConfig` if it is associated with other referenced model configurations.

`addComponentConfiguration(vcdTop, ConfigurationName=topConfig, ComponentName=refmdl, ComponentConfigurationName=refConfig, PopulateControlVariables=false)` associates `refConfig` with `topConfig` but does not populate variant control variables from `refConfig` to `topConfig`. Use this syntax if you do not want to update existing control variable values in `topConfig` but only indicate that they come from `refConfig`. By default, `PopulateControlVariables` is set to `true`.

## Input Arguments

### **vcdTop** — Name of variant configuration object of top-level model

character vector | string

Name of the variant configuration data object of the top-level model, specified as a character vector or string.

Example: "vcdo"

Data Types: char | string

### **topConfig** — Name of top-level variant configuration

character vector | string

Name of the top-level variant configuration present in `vcdTop` to which the referenced component configuration `refConfig` is associated, specified as a character vector or string.

Example: "LinInterExpNoNoise"

Data Types: char | string

### **refmdl** — Name of referenced component

character vector | string

Name of the referenced component, such as a referenced model, specified as a character vector or string.

Example: "slexVariantManagementExternalPlantMdlRef"

Data Types: char | string

### **refConfig** — Name of referenced component configuration

character vector | string

Name of the referenced component configuration to associate with the top-level configuration `topConfig`, specified as a character vector or string.

Example: "HighFid"

Data Types: char | string

## Examples

### **Add Component Variant Configuration to Top-Model Variant Configuration**

Consider the `slexVariantManagement` model, which is associated with the variant configuration object `vcd`. The model has a referenced model named `slexVariantManagementExternalPlantMdlRef` in its hierarchy that has a predefined variant configuration named `LowFid`.

This command associates `LowFid` with the variant configuration named `NonLinExterLowFid` present in `vcd` and populates the variant control variables from `LowFid` to `NonLinExterLowFid`.

```
addComponentConfiguration(vcd, ConfigurationName="NonLinExterLowFid", ...
 ComponentName="slexVariantManagementExternalPlantMdlRef", ComponentConfigurationName="LowFid");
```

This command associates LowFid with NonLinExterLowFid but does not update existing control variable values in NonLinExterLowFid.

```
addComponentConfiguration(vcd, ConfigurationName="NonLinExterLowFid",...
 ComponentName="slexVariantManagementExternalPlantMdlRef", ComponentConfigurationName="LowFid", PopulateControlVariables=false);
```

## Version History

**Introduced in R2022b**

### Recommended over addSubModelConfigurations

The addSubModelConfigurations method will be removed in a future release. Use the Simulink.VariantConfigurationData.addComponentConfiguration method instead.

# addConfiguration

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

Add new variant configuration to VariantConfigurationData object

## Syntax

```
vcdataObj.addConfiguration(name)
vcdataObj.addConfiguration(name,description)
vcdataObj.addConfiguration(name,description,controlVars)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`vcdataObj.addConfiguration(name)` adds a new variant configuration with the given name to the variant configuration data object `vcdataObj`, which is an object of the `Simulink.VariantConfigurationData` class.

`vcdataObj.addConfiguration(name,description)` adds a new variant configuration with a given name and optional description to the variant configuration data object.

`vcdataObj.addConfiguration(name,description,controlVars)` adds a new variant configuration with a given name, optional description, and control variables to the variant configuration data object.

## Input Arguments

### **name — Name of variant configuration**

character vector | string

Name of the new variant configuration that you want to add to the variant configuration data object, specified as a character vector or string.

Example: 'LinInterExpNoNoise'

Data Types: char | string

### **description — Description of variant configuration**

character vector | string

Description of the variant configuration, specified as a character vector or string.

Example: 'Linear configuration with internal plant'

Data Types: char | string

### **controlVars — Control variables in variant configuration**

structure | array of structure

Variant control variable names and their values, specified as a structure or array of structures with fields:

- **Name** — Name of the control variable, specified as a character vector
- **Value** — Value of the control variable, specified as any of these data types:
  - Normal MATLAB variable
  - `Simulink.Parameter`
  - `Simulink.VariantControl` with value as normal MATLAB variable
  - `Simulink.VariantControl` with value as `Simulink.Parameter`
- **Source** — Source of the control variable, specified as a character vector. Source must be 'base workspace' or the name of a data dictionary.

Example:

```
ctrlVarStruct=struct(Name='Noise',Value='NoiseType.NoNoise',Source='plant.sld
d');
```

For an example that shows the use of different types of variant control variables, see “Use Variant Control Variables in Variant Blocks”.

Data Types: struct

## Examples

### Add Variant Configuration

This example shows how to add a new variant configuration to a variant configuration data object.

Create an empty `Simulink.VariantConfigurationData` object.

```
vardataObj = Simulink.VariantConfigurationData
vardataObj =
 VariantConfigurationData with properties:
 Configurations: [1x0 struct]
 Constraints: [1x0 struct]
 PreferredConfiguration: ''
```

Create a struct with the control variable names and values for the new configuration.

```
% Define a variant control variable
PlantLoc = Simulink.VariantControl('Value',1,'ActivationTime','code compile');
% Create a variant control variable structure
ctrlVarStruct = struct(Name='PlantLoc',Value=PlantLoc,Source='topdata.sldd')

ctrlVarStruct = struct with fields:
 Name: 'PlantLoc'
 Value: [1x1 Simulink.VariantControl]
 Source: 'topdata.sldd'
```

Add the new configuration to `vardataObj`.

```
vardataObj.addConfiguration('LinInterExpNoNoise','Linear Internal Experimental Plant Controller')
```

## Version History

Introduced in R2013b

# addConstraint

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

Add constraint to VariantConfigurationData object

## Syntax

```
vcdataObj.addConstraint(nameOfConstraint)
vcdataObj.addConstraint(nameOfConstraint,condition)
vcdataObj.addConstraint(nameOfConstraint,condition,description)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`vcdataObj.addConstraint(nameOfConstraint)` adds a constraint with the given name to `vcdataObj`, which is an object of the `Simulink.VariantConfigurationData` class.

You can use constraints to check if all the variant configurations present in `vcdataObj` satisfy certain conditions. The constraint must be specified as a valid Boolean condition expression. Simulink evaluates these constraints during variant configuration activation, model compilation, simulation, and code generation workflows.

`vcdataObj.addConstraint(nameOfConstraint,condition)` adds a new constraint with the given name and condition expression to `vcdataObj`.

`vcdataObj.addConstraint(nameOfConstraint,condition,description)` adds a new constraint with the given name, condition expression, and description to `vcdataObj`.

## Input Arguments

### **nameOfConstraint** — Name of constraint

character vector | string

Name of the constraint, specified as a character vector or string.

Example: "LinInternal"

Data Types: char | string

### **condition** — Boolean condition expression

character vector | string

Boolean condition expression that is defined in terms of variant control variables, specified as a character vector or string. The expression must evaluate to true to satisfy the constraint.

Example: "~((Ctrl==ControllerType.Linear) && (PlantLoc==PlantLocation.External))"

Data Types: char | string

**description — Description of constraint**

character vector | string

Description of the constraint, specified as a character vector or string.

Example: "Linear controller must not have an external plant"

Data Types: char | string

## Examples

### Add Constraint

Add a new constraint to a variant configuration data object.

Create an empty `Simulink.VariantConfigurationData` object.

```
vcd = Simulink.VariantConfigurationData;
```

Add a constraint named `LinInternal` to the variant configuration data object `vcdataObj`.

```
vcd.addConstraint(Name="LinInternal", ...
Condition= "~((Ctrl==ControllerType.Linear) && (PlantLoc==PlantLocation.External))", ...
Description="Linear controller must not have an external plant");
```

# addControlVariables

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

Add variant control variables to named variant configuration in VariantConfigurationData object

## Syntax

```
vcdataObj.addControlVariables(nameOfConfiguration,variantControlVars)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`vcdataObj.addControlVariables(nameOfConfiguration,variantControlVars)` adds variant control variables to the specified variant configuration in `vcdataObj`, which is an object of the `Simulink.VariantConfigurationData` class.

## Input Arguments

### **nameOfConfiguration** — Name of variant configuration

character vector | string

Name of the variant configuration to which the variant control variables must be added, specified as a character vector or string. This configuration must be present in the variant configuration data object, `vcdataObj`.

Example: "LinInterExpNoNoise"

Data Types: char | string

### **variantControlVars** — Variant control variable names and values

structure | array of structures

Variant control variable names and their values, specified as a structure or array of structures with fields:

- **Name** — Name of the control variable, specified as a character vector
- **Value** — Value of the control variable, specified as any of these data types:
  - Normal MATLAB variable
  - `Simulink.Parameter`
  - `Simulink.VariantControl` with value as normal MATLAB variable
  - `Simulink.VariantControl` with value as `Simulink.Parameter`
- **Source** — Source of the control variable, specified as a character vector. Source must be 'base workspace' or the name of a data dictionary.

Example:

```
ctrlVarStruct=struct(Name='Noise',Value='NoiseType.NoNoise',Source='plant.sldd');
```

For an example that shows the use of different types of variant control variables, see “Use Variant Control Variables in Variant Blocks”.

Data Types: struct

## Examples

### Add Control Variables

This example shows how to add new variant control variables to an existing variant configuration in a variant configuration data object.

Create an empty Simulink.VariantConfigurationData object.

```
vardataObj = Simulink.VariantConfigurationData
```

```
vardataObj =
 VariantConfigurationData with properties:
 Configurations: [1x0 struct]
 Constraints: [1x0 struct]
 PreferredConfiguration: ''
```

Create a variant configuration and add it to the variant configuration data object.

```
% Define a variant control variable
PlantLoc = Simulink.VariantControl('Value',1,'ActivationTime','code compile');
% Create a variant control variable structure
ctrlVarStruct=struct(Name='PlantLoc',Value=PlantLoc,Source='topdata.sldd')
```

```
ctrlVarStruct = struct with fields:
 Name: 'PlantLoc'
 Value: [1x1 Simulink.VariantControl]
 Source: 'topdata.sldd'
```

```
% Add a variant configuration to vardataObj
vardataObj.addConfiguration('LinInterExpNoNoise','Linear Internal Experimental Plant Controller')
```

Create a new variant control variable of type Simulink.VariantControl.

```
% Create a new variant control variable
SmartSensorMod=Simulink.VariantControl('Value',2,'ActivationTime','code compile');
newControlVarStruct=struct(Name='SmartSensorMod',Value=SmartSensorMod,Source='topdata.sldd')
```

```
newControlVarStruct = struct with fields:
 Name: 'SmartSensorMod'
 Value: [1x1 Simulink.VariantControl]
 Source: 'topdata.sldd'
```

Add the control variable to the existing variant configuration, LinInterExpNoNoise.

```
vardataObj.addControlVariables('LinInterExpNoNoise',newControlVarStruct);
```

# addCopyOfConfiguration

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

Add copy of existing variant configuration to VariantConfigurationData object

## Syntax

```
vcdataObj.addCopyOfConfiguration(nameofExistingConfig)
```

```
vcdataObj.addCopyOfConfiguration(nameofExistingConfig,nameofNewConfig)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`vcdataObj.addCopyOfConfiguration(nameofExistingConfig)` adds a copy of an existing variant configuration to `vcdataObj`, which is an object of the `Simulink.VariantConfigurationData` class. This syntax gives the new configuration a default name based on the name of the configuration that is copied.

`vcdataObj.addCopyOfConfiguration(nameofExistingConfig,nameofNewConfig)` adds a copy of an existing variant configuration to the variant configuration data object and gives the specified name to the new configuration.

## Input Arguments

**nameofExistingConfig** — Name of an existing configuration

character vector | string

Name of the existing variant configuration that must be copied, specified as a character vector or string. This configuration must exist in the variant configuration data object `vcdataObj`.

Example: "LinInterExpNoNoise"

Data Types: char | string

**nameofNewConfig** — Name to be used for copied configuration

character vector | string

Name to be used for the copied configuration, specified as a character vector or string.

Example: "LinInterExpNoise"

Data Types: char | string

## Examples

## Copy Variant Configuration

Add a copy of the existing variant configuration `LinInterExpNoNoise` to `vdataObj` and name the copy as `LinInterExpNoise`.

```
vdataObj.addCopyOfConfiguration("LinInterExpNoNoise","LinInterExpNoise");
```

## Version History

Introduced in R2013b

## Topics

"Variant Manager for Simulink"

## addSubModelConfigurations

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

(To be removed) Add to a variant configuration the names of the configurations to be used for submodels

### Syntax

```
vcdataObj.addSubModelConfigurations(nameOfConfiguration,
subModelConfigurations)
```

### Description

`vcdataObj.addSubModelConfigurations(nameOfConfiguration, subModelConfigurations)`, specifies names of the configurations to be used for submodels.

### Input Arguments

#### **nameOfConfiguration**

Name for the configuration of submodels that are model references.

#### **subModelConfigurations**

Vector of structures containing fields: `ModelName`, `ConfigurationName`. The names of submodels must be unique and valid MATLAB variable names and configuration names must be valid MATLAB variables.

### Examples

- 1 Add the path to the model file.

```
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));
```

- 2 Load the model.

```
load_system('slexVariantManagement');
```

- 3 Obtain variant configuration data object for the model.

```
vcdataObj = Simulink.VariantConfigurationData.getFor('slexVariantManagement');
```

- 4 Add a new submodel configuration to `LinInterExpNoNoise`.

```
vcdataObj.addSubModelConfigurations('LinInterExpNoNoise',...
[struct('ModelName', 'slexVariantManagementExternalPlantMdlRef',...
'ConfigurationName', 'LowFid')])
```

## Version History

### **addSubModelConfigurations will be removed**

*Warns starting in R2022b*

The `addSubModelConfigurations` will be removed in a future release. Scripts which use this method continue to work with a warning.

Use the `Simulink.VariantConfigurationData.addComponentConfiguration` or add the variant control variables used by referenced components in the model hierarchy to the variant configurations of the top-level model instead.

For existing models with an associated variant configuration object, variant control variables in the referenced model configuration will be automatically migrated to the configuration of the top-level model. You must save the variant configuration object using Variant Manager to fix related warnings.

For more information on setting up variant control variables for referenced components, see “Compose Variant Configurations for Top Model Using Referenced Model Configurations”.

### **See Also**

`Simulink.VariantConfigurationData.removeSubModelConfiguration` | `addControlVariables` | `removeControlVariable`

## convertDefaultToPreferred

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

Convert default variant configuration to preferred variant configuration

### Syntax

```
vcdataObj.convertDefaultToPreferred()
vcdataObj.convertDefaultToPreferred (model,Name=Value)
```

### Description

Setting a default variant configuration for a variant configuration data object is not recommended. If the variant configuration data object associated with your model has an existing default configuration, you can convert it to the preferred variant configuration using this method.

---

**Note** This method requires Variant Manager for Simulink.

---

`vcdataObj.convertDefaultToPreferred()` sets the existing `DefaultConfiguration` property of `vcdataObj` to its `PreferredConfiguration` property and then clears the `DefaultConfiguration` property. `vcdataObj` is an object of the `Simulink.VariantConfigurationData` class.

`vcdataObj.convertDefaultToPreferred (model,Name=Value)` sets the existing `DefaultConfiguration` property of `vcdataObj` to its `PreferredConfiguration` property and clears the `DefaultConfiguration`. It additionally updates the model callback functions specified using `Name=Value` arguments to activate the preferred variant configuration on the model.

The preferred variant configuration is not applied automatically when compiling or simulating a model. You must apply the preferred configuration explicitly on the model, if required. To additionally activate the preferred configuration on the model, you can set the `Name=Value` arguments in this method to add commands to the `PostLoadFcn` or `InitFcn` callbacks or both.

### Input Arguments

**model** — Name of model

character vector | string

Name of the model, specified as a character vector or string.

Example: "slexVariantManagement"

Data Types: char | string

## Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Example: `AddActivateToPostLoadFcn=true`

### AddActivateToPostLoadFcn — Option to activate preferred configuration using PostLoadFcn callback of the model

`false` or `0` (default) | `true` or `1`

Option to add commands to the `PostLoadFcn` callback to activate the preferred configuration on the model, specified as a numeric or logical `1` (`true`) or `0` (`false`).

Example: `true`

Data Types: `logical`

### AddActivateToInitFcn — Option to activate preferred configuration using InitFcn callback of the model

`false` or `0` (default) | `true` or `1`

Option to add commands to the `InitFcn` callback to activate the preferred configuration on the model, specified as a numeric or logical `1` (`true`) or `0` (`false`).

Example: `true`

Data Types: `logical`

## Examples

### Convert Default to Preferred Configuration

Convert an existing default configuration of a variant configuration data object to its preferred configuration.

Convert the `DefaultConfiguration` of a variant configuration data object `vcdataObj` to its `PreferredConfiguration` and clear the `DefaultConfiguration`.

```
vcdataObj.convertDefaultToPreferred();
```

Convert the configuration and update the `PostLoadFcn` callback of the model to activate the preferred configuration:

```
vcdataObj.convertDefaultToPreferred(model, ...
AddActivateToPostLoadFcn=true);
```

Convert the configuration and update the `InitFcn` callback of the model to activate the preferred configuration:

```
vcdataObj.convertDefaultToPreferred(model, ...
AddActivateToInitFcn=true);
```

Convert the configuration and update both the `PostLoadFcn` and `InitFcn` callbacks of the model to activate the preferred configuration:

```
vcdataObj.convertDefaultToPreferred(model, ...
 AddActivateToPostLoadFcn=true,AddActivateToInitFcn=true);
```

# getConfiguration

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

Get specific variant configuration from VariantConfigurationData object

## Syntax

```
config_struct = vcdatabj.getConfiguration(nameOfConfiguration)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`config_struct = vcdatabj.getConfiguration(nameOfConfiguration)` returns the specified variant configuration from `vcdatabj`, which is an object of the `Simulink.VariantConfigurationData` class.

## Input Arguments

**nameOfConfiguration** — Name of variant configuration to be returned

character vector | string

Name of the variant configuration to be returned, specified as a character vector or string.

Example: "LinInterExpNoNoise"

Data Types: char | string

## Output Arguments

**config\_struct** — Variant configuration

structure

Variant configuration, returned as a structure with the following fields:

Field	Type	Description
Name	char	Name of the configuration.
Description	char	Description of the configuration
ControlVariables	structure	The variant control variable names and their values, returned as a <code>struct</code> .

## Examples

**Get Variant Configuration**

Get the variant configuration named `LinInterExpNoNoise` from the variant configuration data object `vardataObj`.

```
vardataObj.getVariantConfiguration("LinInterExpNoNoise");
```

**Version History**

**Introduced in R2013b**

# getDefaultConfiguration

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

(To be removed) Returns default variant configuration, if any, for a variant configuration data object

## Syntax

```
vcdataObj.getDefaultConfiguration
```

## Description

`vcdataObj.getDefaultConfiguration` returns the default variant configuration. If no default variant configuration is defined, then `[]` is returned.

---

**Note** Setting a default variant configuration for a variant configuration data object is not recommended. Activate and validate the model using a specific variant configuration instead. If you set a default configuration, compiling or simulating the model will apply the default configuration irrespective of the variant control variable values in the global workspace.

---

## Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the variant configuration named LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
 'Linear Internal Experimental Plant Controller');

% Add the variant configuration LinInterStd
vcdataObj.addConfiguration('LinInterStd',...
 'Linear Internal Standard Plant Controller');

% Set LinExtExp as the default variant configuration
vcdataObj.setDefaultConfigurationName('LinInterExp');

% Obtain the default variant configuration
defvc = vcdataObj.getDefaultConfiguration
```

## Version History

### **getDefaultConfiguration will be removed**

*Warns starting in R2022b*

The `getDefaultConfiguration` method will be removed in a future release. Scripts which use this method continue to work with a warning.

Setting a default variant configuration for a variant configuration data object is not recommended. If the variant configuration data object associated with your model has an existing default

configuration, you can convert it to the preferred variant configuration using the `convertDefaultToPreferred` method.

`Simulink.VariantConfigurationData` | `getConfiguration` | `setDefaultConfigurationName`

# getFor

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

(To be removed) Get the variant configuration data object associated with a model

---

**Note** getFor will be removed in a future release. Use Simulink.VariantManager.getConfigurationData instead.

---

## Syntax

```
vardatObj = Simulink.VariantConfigurationData.getFor(modelName)
```

## Description

vardatObj = Simulink.VariantConfigurationData.getFor(modelName) returns the variant configuration data object for a model. If no object is associated with the model, then [] is returned.

## Input Arguments

### modelName — Model name

character vector

Model name specified as character vector.

Example: "slexVariantManagement"

Data Types: char

## Output Arguments

### vardatObj — Variant configuration data object

VariantConfigurationData

Variant configuration data object associated with the model, returned as object of Simulink.VariantConfigurationData class.

## Version History

Introduced in R2013b

### getFor will be removed

Warns starting in R2022b

The getFor will be removed in a future release. To find the variant configuration data object associated with a model, use the Simulink.VariantManager.getConfigurationData method. Scripts which use this method continue to work with a warning.

# getPreferredConfiguration

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

Get name of preferred variant configuration for variant configuration data object

## Syntax

```
configname = vcdataObj.getPreferredConfiguration()
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`configname = vcdataObj.getPreferredConfiguration()` gets the name of the preferred variant configuration for the `Simulink.VariantConfigurationData` object `vcdataObj`.

## Output Arguments

**configname** — Name of preferred variant configuration

character vector | string

Name of the preferred variant configuration, returned as a character vector or string.

Data Types: `char` | `string`

## Examples

### Get Name of Preferred Variant Configuration for VariantConfigurationData Object

Open the model `slexVariantManagement`.

```
model='slexVariantManagement';
open_system(model);
```

Get the variant configuration data object associated with the model.

```
vcdataobj = Simulink.VariantManager.getConfigurationData(model);
```

Get the name of the preferred variant configuration for the variant configuration data object.

```
configname = vcdataobj.getPreferredConfiguration();
```

# removeComponentConfiguration

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

Remove association between variant configurations of top-level model and referenced model

## Syntax

```
removeComponentConfiguration(vcdTop, ConfigurationName=
topConfig, ComponentName=refmdl)
```

## Description

Consider a model that has predefined variant configurations and also has a referenced model in its model hierarchy. The referenced model defines its own variant configurations. While authoring the variant configurations for the top-level model, you might associate a referenced model configuration with a top-level variant configuration to populate the corresponding control variables in the top-level configuration. Use the `removeComponentConfiguration` method to remove this association. For more information on the workflow, see “Compose Variant Configurations for Top Model Using Referenced Model Configurations”.

---

**Note** This method requires Variant Manager for Simulink.

---

`removeComponentConfiguration(vcdTop, ConfigurationName=topConfig, ComponentName=refmdl)` removes an existing association between a variant configuration of the referenced model `refmdl` and the top-level variant configuration `topConfig` that is present in the variant configuration data object `vcdTop`. This operation also makes variant control variables in `topConfig` populated using the referenced model configuration writeable in the Variant Manager user interface. You can modify these variables in `topConfig` independently of their values in the referenced model configuration.

## Input Arguments

**vcdTop** — Name of variant configuration object of top-level model

character vector | string

Name of the variant configuration data object of the top-level model, specified as a character vector or string.

Example: "vcdo"

Data Types: char | string

**topConfig** — Name of top-level variant configuration

character vector | string

Name of the top-level variant configuration present in `vcdTop` from which the referenced component configuration is disassociated, specified as a character vector or string.

Example: "LinInterExpNoNoise"

Data Types: char | string

### **refmdl — Name of referenced component**

character vector | string

Name of the referenced component, such as a referenced model, specified as a character vector or string.

Example: "slexVariantManagementExternalPlantMdlRef"

Data Types: char | string

## **Examples**

### **Remove Association Between Variant Configurations of Top-Level Model and Referenced Model**

Consider the `slexVariantManagement` model, which is associated with the variant configuration object `vcd`. The model has a referenced model named `slexVariantManagementExternalPlantMdlRef` in its hierarchy that uses a predefined variant configuration named `LowFid`. This command disassociates `LowFid` from the variant configuration named `NonLinExterLowFid` present in `vcd`.

```
removeComponentConfiguration(vcd, ConfigurationName="NonLinExterLowFid",
 ComponentName="slexVariantManagementExternalPlantMdlRef");
```

## **Version History**

**Introduced in R2022b**

### **Recommended over `removeSubModelConfiguration`**

The `removeSubModelConfiguration` method will be removed in a future release. Use the `Simulink.VariantConfigurationData.removeComponentConfiguration` method instead.

# removeConfiguration

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

Remove variant configuration from variant configuration data object

## Syntax

```
vcdataObj.removeConfiguration(nameOfConfiguration)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`vcdataObj.removeConfiguration(nameOfConfiguration)` removes the configuration from the variant configuration data object `vcdataObj`, which is an object of the `Simulink.VariantConfigurationData` class.

## Input Arguments

**nameOfConfiguration** — Name of the configuration to be removed

character vector | string

Name of the configuration to be removed, specified as a character vector or string.

Example: "LinInterExpNoNoise"

Data Types: char | string

## Examples

### Remove Variant Configuration

Remove a variant configuration named `LinInterExpNoNoise` from the variant configuration data object `vcdataObj`.

```
vcdataObj.removeConfiguration("LinInterExpNoNoise");
```

# removeConstraint

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

Remove constraint from variant configuration data object

## Syntax

```
vcdataObj.removeConstraint(constrName)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`vcdataObj.removeConstraint(constrName)` removes the specified model-wide constraint from the variant configuration data object `vcdataObj`, which is an object of the `Simulink.VariantConfigurationData` class.

## Input Arguments

**constrName** — Name of constraint

character vector | string

Name of the constraint that must be removed, specified as a character vector or string. This constraint must be present in the variant configuration data object `vcdataObj`.

Example: "PlantLocConstraint"

Data Types: char | string

## Examples

### Remove Constraint

Remove a constraint named `PlantLocConstraint` from the variant configuration data object `vcdataObj`:

```
constr_struct=vcdataObj.removeGlobalConstraint("PlantLocConstraint");
```

## Version History

Introduced in R2013b

# removeControlVariable

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

Remove variant control variable from variant configuration

## Syntax

```
vcdataObj.removeControlVariable(nameOfConfiguration,nameOfControlVariable)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`vcdataObj.removeControlVariable(nameOfConfiguration,nameOfControlVariable)` removes the specified variant control variable from the specified variant configuration in `vcdataObj`, which is an object of the `Simulink.VariantConfigurationData` class.

## Input Arguments

### **nameOfConfiguration** — Name of variant configuration

character vector | string

Name of the variant configuration from which the control variable must be removed, specified as a character vector or string. The configuration name must be present in the variant configuration data object.

Example: "LinInterExpNoNoise"

Data Types: char | string

### **nameOfControlVariable** — Name of control variable

character vector | string

Name of the control variable to be removed from the variant configuration, specified as a character vector or string.

Example: "PlantLoc"

Data Types: char | string

## Examples

### **Remove Control Variable**

Remove a control variable named `PlantLoc` from the variant configuration `LinInterExpNoNoise`.

```
vcdataObj.removeControlVariable("LinInterExpNoNoise","PlantLoc");
```

## **Version History**

"Variant Manager for Simulink"

# removeSubModelConfiguration

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

(To be removed) Remove from a variant configuration, the configuration to be used for a sub model.

## Syntax

```
vcdataObj.removeSubModelConfiguration(nameOfConfiguration,nameOfSubModel)
```

## Description

`vcdataObj.removeSubModelConfiguration(nameOfConfiguration,nameOfSubModel)`, removes the configuration specified for a submodel.

## Input Arguments

### nameOfConfiguration

Name of the submodel configuration to be removed.

### nameOfSubModel

Name of the submodel from which the configuration must be removed.

## Examples

- 1 Add the path to the model file.

```
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));
```

- 2 Load the model.

```
load_system('slexVariantManagement');
```

- 3 Obtain variant configuration data object for the model.

```
vcdataObj = Simulink.VariantConfigurationData.getFor('slexVariantManagement');
```

- 4 Add a new submodel configuration to LinInterExpNoNoise.

```
vcdataObj.addSubModelConfigurations('LinInterExpNoNoise',...
 [struct('ModelName','slexVariantManagementExternalPlantMdlRef',...
 'ConfigurationName','LowFid')]);
```

- 5 Remove the submodel configuration LinInterExpNoNoise from the submodel `slexVariantManagementExternalPlantMdlRef`.

```
vcdataObj.removeSubModelConfiguration('LinInterExpNoNoise',...
 'slexVariantManagementExternalPlantMdlRef')
```

## Version History

### **removeSubModelConfiguration will be removed**

*Warns starting in R2022b*

The `removeSubModelConfiguration` will be removed in a future release. Use the `Simulink.VariantConfiguratonData.removeComponentConfigurationmethod` instead.

For more information on setting up variant control variables for referenced components, see “Referenced Component Configurations”.

### **See Also**

`Simulink.VariantConfigurationData | addSubModelConfigurations`

# setDefaultConfigurationName

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

(To be removed) Set name of the default variant configuration for a variant configuration data object

## Syntax

```
vcdataObj.setDefaultConfigurationName(nameOfConfiguration)
```

## Description

`vcdataObj.setDefaultConfigurationName(nameOfConfiguration)` sets the default configuration name. A variant configuration must exist with the same name. If an empty value is passed, then the default configuration name is cleared.

## Input Arguments

### nameOfConfiguration

Name of the configuration to be set as the default.

---

**Note** Setting a default variant configuration for a variant configuration data object is not recommended. Activate and validate the model using a specific variant configuration instead. If you set a default configuration, compiling or simulating the model will apply the default configuration irrespective of the variant control variable values in the global workspace.

---

## Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the LinInterExp variant configuration
vcdataObj.addConfiguration('LinInterExp',...
 'Linear Internal Experimental Plant Controller');

% Set the configuration LinInterExp as default
vcdataObj.setDefaultConfigurationName('LinInterExp');

% Obtain the default variant configuration
dconfig = vcdataObj.getDefaultConfiguration
```

## Version History

**setDefaultConfigurationName will be removed**

*Warns starting in R2022b*

The `setDefaultConfigurationName` method will be removed in a future release. Scripts which use this method continue to work with a warning.

Setting a default variant configuration for a variant configuration data object is not recommended. If the variant configuration data object associated with your model has an existing default configuration, you can convert it to the preferred variant configuration using the `convertDefaultToPreferred` method.

**See Also**

`Simulink.VariantConfigurationData | getDefaultConfiguration`

# validateModel

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

(To be removed) Validate and activate variant blocks in a model hierarchy

---

**Note** `validateModel` will be removed in a future release. Use `Simulink.VariantManager.activateModel` instead.

---

## Syntax

```
[valid,errors] = vcdObj.validateModel(modelName)
[valid,errors] = vcdObj.validateModel(modelName,configName)
```

## Description

The `validateModel` method allows you to validate and activate a variant configuration on a model hierarchy. You can activate a named variant configuration defined for the model or the global workspace configuration.

The process validates if the variant elements in the model such as variant blocks, variant controls, constraints, and the variant configuration are set up correctly. Activating a configuration:

- Checks if applicable constraints are satisfied
- Applies the variant control variable values defined in the configuration on the model
- Pushes the variant control variable values to the global workspace of the model, for use in simulation and code generation workflows

`[valid,errors] = vcdObj.validateModel(modelName)`, where `vcdObj` is an object of the `Simulink.VariantConfigurationData` class, returns the result of validating and activating the global workspace configuration on the model hierarchy. The variant control variables must be defined in the global workspace (base workspace or data dictionary) used by the model.

`[valid,errors] = vcdObj.validateModel(modelName,configName)` returns the result of validating and activating the specified named variant configuration on the model hierarchy.

---

**Note** Activation of a variant configuration performed by this method differs from the Simulink update diagram process. See “Differences Between Variant Manager Activation and Update Diagram Process”.

For more information on the types of variant configurations, see .

---

## Input Arguments

**modelName — Name of the model**

character vector

Name of the model, specified as character vector.

Example: "slexVariantManagement"

Data Types: char

### **configName — Name of the variant configuration**

character vector

Name of the variant configuration to be validated and activated, specified as character vector.

Example: "LinInterExpNoNoise"

Data Types: char

## **Output Arguments**

### **valid — True or false result**

1 | 0

True or false result, returned as a 1 or 0 of data type logical.

### **errors — List of errors**

structure

List of errors, returned as an  $M \times 1$  structure where  $M$  is the number of models with errors. The structure has these fields:

Field	Type	Description
Model	char	Name of the model
Errors	structure	An $M \times 1$ structure where $M$ is the number of errors in the model. The structure has these fields: <ul style="list-style-type: none"> <li>• Message</li> <li>• MessageID</li> </ul>

## **Version History**

**Introduced in R2013b**

### **validateModel will be removed**

*Warns starting in R2022b*

The `validateModel` will be removed in a future release. To validate and activate a variant configuration on a model, use the `Simulink.VariantManager.activateModel` method. Scripts which use this method continue to work with a warning.

### **Change in the format of errors output argument**

The fields `Type`, `Source`, `PathInModel`, and `PathInHierarchy` have been removed from the structure named `Errors` within the second output argument, `errors`.

**Topics**

“Variant Manager for Simulink”

## Simulink.VariantControl class

**Package:** Simulink

Create a variant control variable object

### Description

The `Simulink.VariantControl` class creates a variant control variable object to associate the value of a variant control variable with a variant activation time. Use the `Simulink.VariantControl` object to determine the active choices of variant blocks and variant parameters during simulation.

### Creation

`variantControlVariable = Simulink.VariantControl` creates a variant control variable object with no value and `'ActivationTime'` set to `'update diagram'`.

`variantControlVariable = Simulink.VariantControl(Name, Value)` creates a variant control variable object as specified by `Name, Value` pair arguments. Using this syntax, you create an object and associate its value with a variant activation time.

### Input Arguments

#### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose `Name` in quotes.*

Example: `'Value', 1, 'ActivationTime', 'update diagram'`

#### Value — Value of variant control variable object

scalar variable | enumerated type | `Simulink.Parameter`

Value of variant control variable object, specified as scalar variables, enumerated types, or `Simulink.Parameter` object.

Example: `'Value', 1`

#### ActivationTime — Activation time of active value

`'update diagram'` (default) | `'update diagram analyze all choices'` | `'code compile'` | `'startup'`

Simulink can set active choice of the variant blocks or variant parameters at different stages of the simulation and code generation workflow. Based on the stage you specify using this property, Simulink determines if the generated code must contain only the active choice or both active and inactive choices. The property also determines whether to analyze all the choices for incompatibilities in signal attributes. For more information on variant activation time, see “Activate Variant During Different Stages of Simulation and Code Generation Workflow”.

When you specify the variant activation time as:

- `'update diagram'` -- Simulink does not analyze the choices for incompatibilities in signal attributes. It generates code only for the active choice.
- `'update diagram analyze all choices'` -- Simulink analyzes both active and inactive choices for incompatibilities in signal attributes, however it generates code only for the active choice.
- `'code compile'` -- Simulink analyzes both active and inactive choices of variant blocks or variant parameters for incompatibilities in signal attributes and it also generates code for both active and inactive choices. The choices are enclosed in C preprocessor conditional statements `#if` and `#endif` that are conditionally compiled when you compile the generated code.
- `'startup'` -- Simulink analyzes both active and inactive choices of variant blocks and variant parameters for incompatibilities in signal attributes and it also generates code for both active and inactive choices. The choices are enclosed in regular `if` conditions inside the `model_initialize` function of the generated code that are conditionally evaluated when you run the executable that is built from the code.

Example: `'ActivationTime', 'code compile'`

## Methods

### Specialized Operators and Functions

These methods specialize standard MATLAB operators and functions for objects in this class.

<code>ne</code>	Compare if the inputs are not equal.
<code>eq</code>	Compares if the inputs are equal.
<code>not</code>	Returns logical NOT of input.

## Examples

### Simulink.VariantControl Variables for Coherent Switching of Choices in Variant Blocks

You can associate a variant control variable of type `Simulink.VariantControl` with a variant activation time. `Simulink.VariantControl` variant control variables help you switch variant elements such as blocks and parameters coherently.

Consider a group of blocks that represents a design choice, with each block having the same variant control variable of type `Simulink.VariantControl`. If you set the variant activation time of these blocks to `inherit` from `Simulink.VariantControl`, the blocks inherit the activation time from the variant control variable. As a result, all the blocks have the same activation time and are activated simultaneously to generate rational simulation results and valid code.

You can define `Simulink.VariantControl` type of control variables in storage locations as listed in “Storage Locations for Variant Control Variables (Operands) in Variant Blocks”.

Open the `slexVariantSubsystems` model.

```
open_system('slexVariantSubsystems');
```

```
VSS_MODE = 2
```

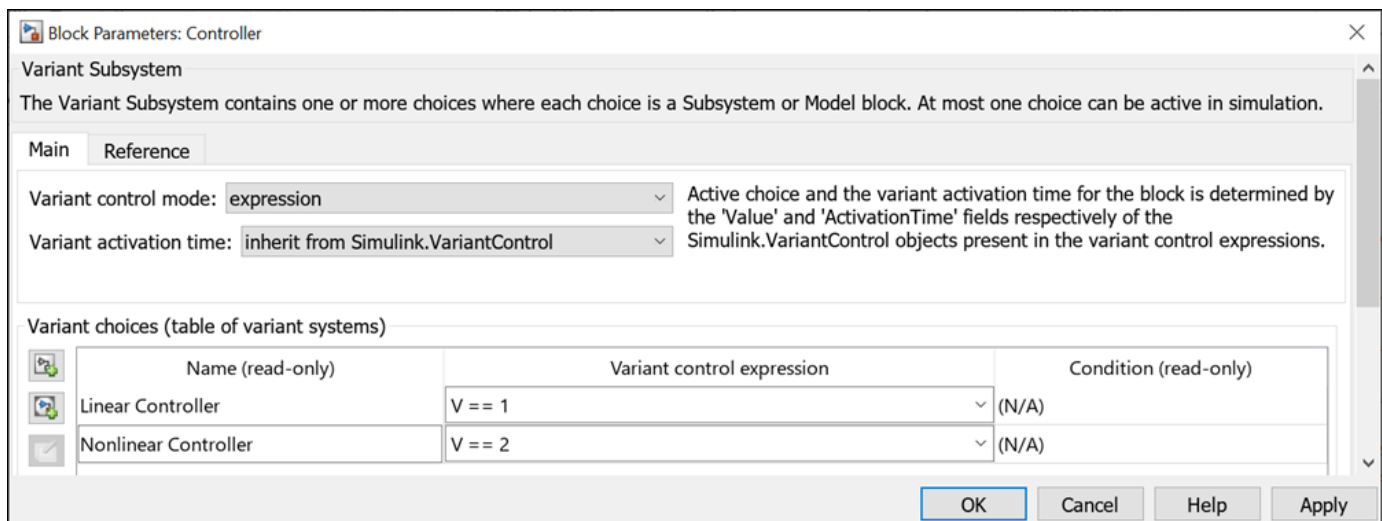

In the block parameters dialog box of the Controller block:

1. Specify the variant controls, `V == 1` and `V == 2`.

```
set_param('slexVariantSubsystems/Controller/Linear Controller', 'VariantControl', 'V==1')
set_param('slexVariantSubsystems/Controller/Nonlinear Controller', 'VariantControl', 'V==2')
```

2. Set **Variant activation time** to inherit from `Simulink.VariantControl` to inherit the activation time from V.

```
set_param('slexVariantSubsystems/Controller', 'VariantActivationTime', 'inherit from Simulink.Va
```

In the base workspace, define a `Simulink.VariantControl` object, V. Set its value to 1, variant activation time to `update diagram`, and then simulate the model.

```
V = Simulink.VariantControl('Value', 1, 'ActivationTime', 'update diagram')
```

```
V =
 VariantControl with properties:
 Value: 1
 ActivationTime: 'update diagram'
```

During simulation, the Controller block inherits the `update diagram` activation time from V and the Linear Controller block becomes active.

Double-click the Controller block to see the active choice.

```
sim('slexVariantSubsystems');
```

If you change the value of V to 2, the Nonlinear Controller block becomes active during simulation. You can change the value of V using this command or from `Simulink.VariantControl` dialog box.

```
V.Value = 2;
sim('slexVariantSubsystems');
```

If you change the variant activation time of V to update diagram analyze all choices, the Controller block inherits the update diagram analyze all choices activation time from V. You can observe the inherited activation time using CompiledVariantActivationTime.

```
V.ActivationTime = 'update diagram analyze all choices';
sim ('slexVariantSubsystems');
get_param('slexVariantSubsystems/Controller', 'CompiledVariantActivationTime')

ans =
'update diagram analyze all choices'
```

### Numeric Variant Control Values for Rapid Prototyping of Variant Parameters

Numeric values allow you to rapidly prototype variant values when you are still building your model. Numeric values help you focus more on building your variant values than on developing the expressions that activate those choices.

You can define numeric control values in locations listed in “Storage Locations for Variant Control Variables (Operands) in Variant Blocks”.

Open the slexVariantParameters model.

```
open_system('slexVariantParameters')
```

In the MATLAB Editor, specify variant choices in their simplest form as numeric values in Simulink.VariantVariable objects K1 and K2.

```
K1 = Simulink.VariantVariable('Choices',{ 'V==1', 3.5, 'V==2', 8.5})
```

```
K1 =
VariantVariable with 2 choices:
```

Condition	Value
V == 1	3.5000
V == 2	8.5000

```
Specification: ''
```

Use getChoice, setChoice, addChoice, removeChoice to access, modify, add or remove choices

```
K2 = Simulink.VariantVariable('Choices',{ 'V==1', 4.5, 'V==2', 9.5})
```

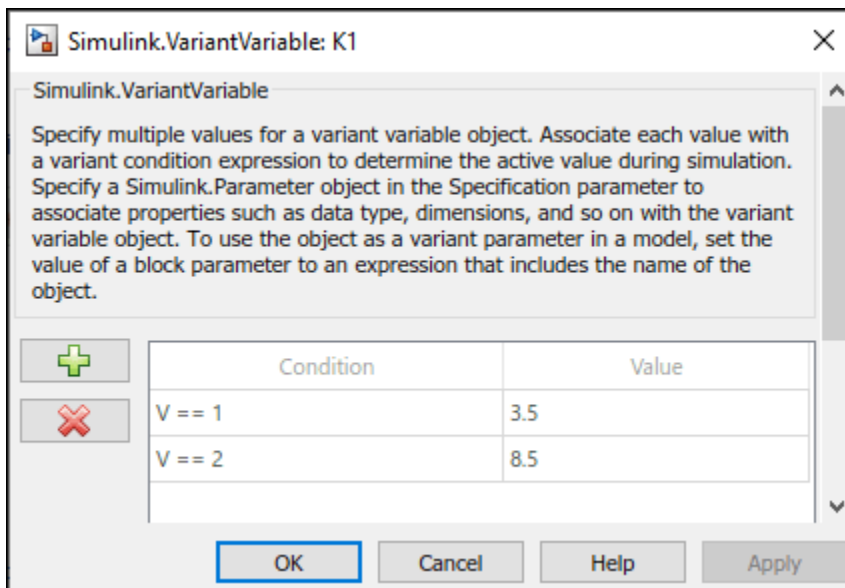

```
K2 =
VariantVariable with 2 choices:
```

Condition	Value
V == 1	4.5000
V == 2	9.5000

```
Specification: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

Once you successfully create the `Simulink.VariantVariable` objects, you can modify them by using the methods described in “Public Methods” on page 5-813 or from the `VariantVariable` dialog box.

Activate one of the variant values by defining a control variable, `V`, and setting its value to 1 in a `Simulink.VariantControl` object.

```
V = Simulink.VariantControl('Value', 1, 'ActivationTime', 'update diagram')
```

```
V =
VariantControl with properties:
 Value: 1
 ActivationTime: 'update diagram'
```

When you simulate the model, the condition `V == 1` evaluates to `true`. `K1` is assigned a value of 3.5 and `K2` is assigned a value of 8.5.

```
sim('slexVariantParameters')
```

If you change the value of `V` to 2, Simulink® sets the value of `K1` and `K2` to 4.5 and 9.5 during simulation. You can change the value of `V` using this command or from `Simulink.VariantControl` dialog box.

```
V.Value = 2;
sim('slexVariantParameters')
```

## Enumerated Types to Improve Code Readability of Variant Control Variables of Variant Parameters

Use enumerated types to give meaningful names to integers used as variant control values. For more information on enumerated type data, see “Use Enumerated Data in Simulink Models”.

In the MATLAB® Editor, define the classes that map enumerated values to meaningful names.

Open the `slexVariantParameters` model.

```
open_system('slexVariantParameters')
```

Specify the variant condition expressions `V == EngType.Small` and `V == EngType.Big` in `Simulink.VariantVariable` objects K1 and K2.

```
K1 = Simulink.VariantVariable('Choices', {'V == EngType.Small',3.5,'V == EngType.Big',8.5})
```

```
K1 =
VariantVariable with 2 choices:
```

Condition	Value
V == EngType.Big	8.5000
V == EngType.Small	3.5000

```
Specification: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

```
K2 = Simulink.VariantVariable('Choices', {'V == EngType.Small',4.5,'V == EngType.Big',9.5})
```

```
K2 =
VariantVariable with 2 choices:
```

Condition	Value
V == EngType.Big	9.5000
V == EngType.Small	4.5000

```
Specification: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

Here, `EngType` is an integer-based enumeration class that is derived from the built-in data type, `int32`. The class has two enumeration values, `Small` and `Big`. These enumerated values have underlying integer values 1 and 2. In this example, the enumeration class is defined in the base workspace. You can choose to define the class in other storage locations as listed in “Storage Locations for Variant Control Variables (Operands) in Variant Blocks”.

```
type EngType.m
```

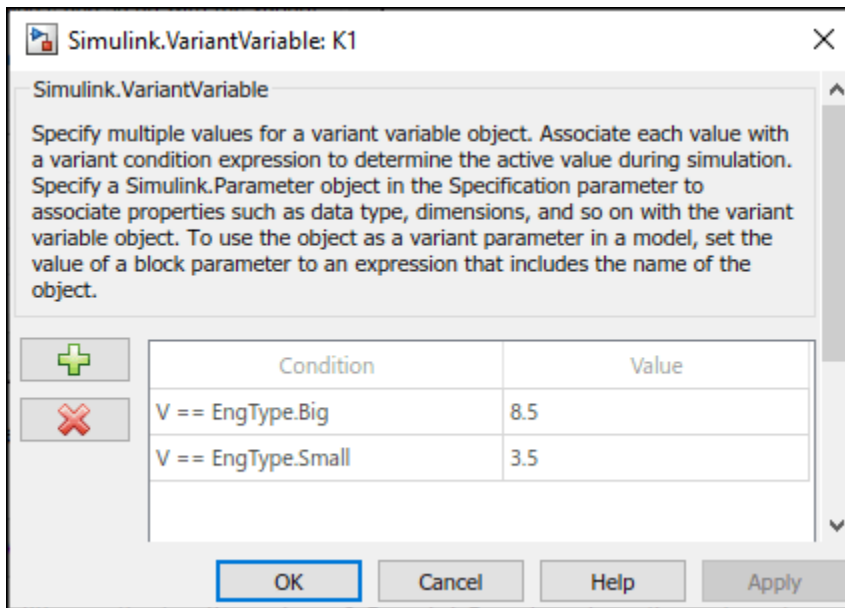

```
classdef EngType < Simulink.IntEnumType
 enumeration
 Small (1)
```

```

 Big (2)
 end
end

```

Once you successfully create the `Simulink.VariantVariable` objects, you can modify them by using the methods described in “Public Methods” on page 5-813 or from the `VariantVariable` dialog box.

Activate one of the variant values by defining the control variable `V` and setting its value to `EngType.Small` in `Simulink.VariantControl` object `V`.

```
V = Simulink.VariantControl('Value',EngType.Small,'ActivationTime','code compile')
```

```

V =
 VariantControl with properties:
 Value: Small
 ActivationTime: 'code compile'

```

When you simulate the model, the condition `V == 1` evaluates to `true`. `K1` is assigned a value of 3.5, and `K2` is assigned a value of 8.5.

```
sim('slexVariantParameters')
```

If you change the value of `V` to 2, Simulink® sets the value of `K1` and `K2` to 4.5 and 9.5 during simulation. You can change the value of `V` using this command or from `Simulink.VariantControl` dialog box.

```
V.Value = 2
```

```

V =
 VariantControl with properties:
 Value: 2

```

```
ActivationTime: 'code compile'
```

```
sim ('slexVariantParameters')
```

The code that you generate using enumerated types contains the names of the values rather than integers.

```
% slexVariantParameters_private.h
% #if V == EngType_Big || V == EngType_Small
% /* Variable: K1 Referenced by: '<Root>/Gain' */
% #if V == EngType_Big
% #define rtCP_Gain_K1 (8.5)
% #elif V == EngType_Small
% #define rtCP_Gain_K1 (3.5)
% #endif
% #endif
%
% #if V == EngType_Big || V == EngType_Small
% /* Variable: K2 Referenced by: '<Root>/Gain1' */
% #if V == EngType_Big
% #define rtCP_Gain1_K2 (9.5)
% #elif V == EngType_Small
% #define rtCP_Gain1_K2 (4.5)
% #endif
% #endif
% #endif
/* RTW_HEADER_slexVariantParameters_private_h_ */
```

Note that for variant parameters with “startup” activation time, only enumerations that are defined using these techniques are supported:

- Using the function `Simulink.defineIntEnumType`
- By subclassing built-in integer data types `int8`, `int16`, `int32`, `uint8`, or `uint16`, or by subclassing `Simulink.IntEnumType`

These enumerations are also supported when permanently stored in a Simulink® data dictionary. See “Enumerations in Data Dictionary”.

### Simulink.Parameter Type of Variant Control Variables for Code Generation of Variant Parameters

If you intend to generate code for a model containing variant parameters, specify variant control variables as `Simulink.Parameter` objects. `Simulink.Parameter` objects allow you to specify other attributes, such as data type and storage class, and control the appearance and placement of variant control variables in generated code.

- You can define a variant control variable of type `Simulink.Parameter` only in the base workspace or in a data dictionary. Defining `Simulink.Parameter` type of variant control variables in the mask or model workspace is not supported. For more information on storage locations for variant control variables, see “Storage Locations for Variant Control Variables (Operands) in Variant Blocks”.
- `Simulink.Parameter` objects within structures and that have data types other than `Simulink.Bus` objects are not supported.

Open the `slexVariantParameters` model.

```
open_system('slexVariantParameters')
```

In the MATLAB Editor, define a `Simulink.Parameter` object.

```
VSS_MODE = Simulink.Parameter;
VSS_MODE.Value = 1;
VSS_MODE.DataType = 'int32';
VSS_MODE.CoderInfo.StorageClass = 'Custom';
VSS_MODE.CoderInfo.CustomStorageClass = 'Define';
VSS_MODE.CoderInfo.CustomAttributes.HeaderFile = 'demo_macros.h';
```

Variant control variables defined as `Simulink.Parameter` objects can have any of the storage classes listed in “Storage Classes for Different Variant Activation Times” (Embedded Coder).

You can also convert a scalar variant control variable into a `Simulink.Parameter` object. For more information, see “Convert Variant Control Variables into `Simulink.Parameter` Objects”.

Specify the object as a variant control in `Simulink.VariantVariable` objects K1 and K2.

```
K1 = Simulink.VariantVariable('Choices',{'V == 1', 3.5, 'V == 2', 8.5})
```

```
K1 =
VariantVariable with 2 choices:
```

Condition	Value
V == 1	3.5000
V == 2	8.5000

```
Specification: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

```
K2 = Simulink.VariantVariable('Choices',{'V == 1', 4.5, 'V == 2', 9.5})
```

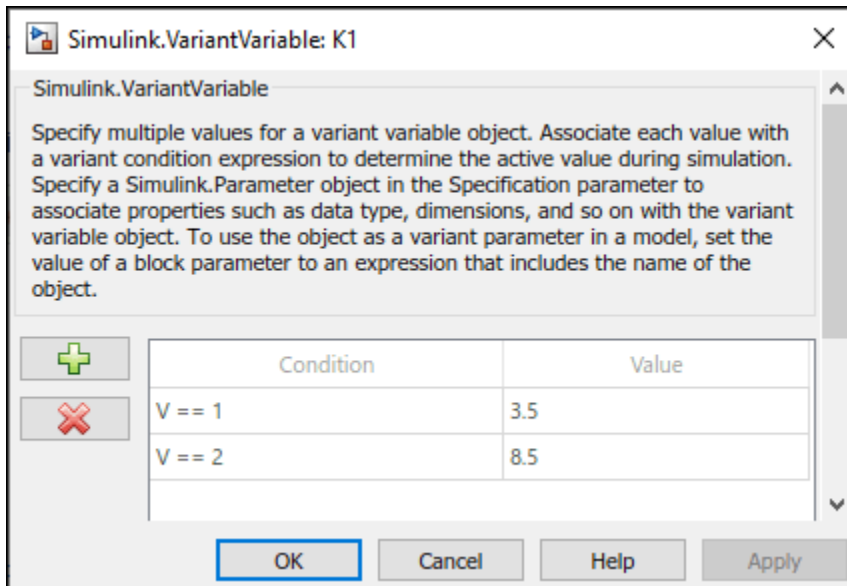

```
K2 =
VariantVariable with 2 choices:
```

Condition	Value
V == 1	4.5000
V == 2	9.5000

```
Specification: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

Once you successfully create the `Simulink.VariantVariable` objects, you can modify them by using the methods described in “Public Methods” on page 5-813 or from the `VariantVariable` dialog box.

Activate one of the variant values by defining a control variable `V` and setting its value to `VSS_MODE` in a `Simulink.VariantControl` object.

```
V = Simulink.VariantControl('Value',VSS_MODE,'ActivationTime','code compile')
```

```
V =
 VariantControl with properties:
 Value: [1x1 Simulink.Parameter]
 ActivationTime: 'code compile'
```

When you simulate the model, the condition `V == 1` evaluates to `true`. `K1` is assigned a value of 3.5, and `K2` is assigned a value of 8.5.

```
sim('slexVariantParameters')
```

If you change the value of `VSS_MODE` to 2, Simulink® sets the value of `K1` and `K2` to 4.5 and 9.5 during simulation. You can change the value of `V` using this command or from `Simulink.VariantControl` dialog box.

```
VSS_MODE.Value = 2;
V.Value = VSS_MODE;
sim('slexVariantParameters')
```

Generate code from the model. For information on how to generate code, see “Generate Code Using Embedded Coder” (Embedded Coder)

The generated code contains both `Linear` and `Nonlinear` choices in preprocessor conditionals `#if` and `#elif` because of the `code compile` activation time. The variant control variable `V` is defined using a macro — `#define` directive — in the header file `demo_macros.h`. You can control the appearance and placement of `V` in the generated code and prevent optimizations from eliminating storage for `V` using the storage class property. For more information, see “Storage Classes for Different Variant Activation Times” (Embedded Coder).

```
% demo_macros.h
% /* Exported data define */
```

```
%
% /* Definition for custom storage class: Define */
% #define V 2 /* Referenced by:
% * '<Root>/Gain'
% * '<Root>/Gain1'
% */
% #endif /* RTW_HEADER_demo_macros_h_ */
%
% /*
```

## Version History

Introduced in R2021a

### Extended Capabilities

#### C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

# Simulink.VariantManager class

**Package:** Simulink

Access Variant Manager functionality programmatically

## Description

---

**Note** This class requires Variant Manager for Simulink.

---

The variant manager class provides a set of methods to access Variant Manager functionality from the MATLAB command line. Use an instance of `Simulink.VariantManager` class to:

- Apply a variant configuration to a model.
- Validate and activate a variant configuration in a model.
- Automatically generate all possible variant configurations for a model.
- Generate a reduced model for specified variant configurations.
- Get the `VariantConfigurationData` object associated with a model.
- Get the name of the preferred variant configuration for a model.
- Find variant control variables used in variant control expressions in a model.
- Convert a Variant Subsystem block to a Variant Assembly Subsystem block.
- Convert Subsystem or Model block to a Variant Subsystem block.
- Display or control the behavior of the variant condition legend.

## Methods

### Public Methods

<code>Simulink.VariantManager.activateModel</code>	Validate and activate variant blocks in model hierarchy
<code>Simulink.VariantManager.applyConfiguration</code>	Apply specified variant configuration to model
<code>Simulink.VariantManager.convertToVariant</code>	Convert Subsystem, Model, or Variant Model block to Variant Subsystem block
<code>Simulink.VariantManager.convertToVariantAssemblySubsystem</code>	Convert Variant Subsystem block to Variant Assembly Subsystem block
<code>Simulink.VariantManager.findVariantControlVars</code>	Find variables used in variant control expressions
<code>Simulink.VariantManager.generateConfigurations</code>	Generate variant configurations automatically
<code>Simulink.VariantManager.getConfigurationData</code>	Get variant configuration data object associated with model
<code>Simulink.VariantManager.getPreferredConfigurationName</code>	Get name of preferred variant configuration for model

Simulink.VariantManager.reduceModel  
Simulink.VariantManager.variantLegend

Generate reduced model for  
specified variant configurations  
Display or control behavior of  
variant condition legend

## Examples

### Find Variant Control Variables for Model

Open the model `slexVariantManagement`.

```
model = 'slexVariantManagement';
open_system(model);
```

Find the variant control variables.

```
vars = Simulink.VariantManager.findVariantControlVars(model)
```

```
vars=6x1 struct array with fields:
 Name
 Value
 Exists
 Source
 SourceType
```

## Version History

**Introduced in R2016a**

**New add-on required**

*Behavior changed in R2022b*

You must install the Variant Manager for Simulink software support package to use this class and its methods.

### New methods

The class has these new methods:

- `Simulink.VariantManager.activateModel`
- `Simulink.VariantManager.applyConfiguration`
- `Simulink.VariantManager.generateConfigurations`
- `Simulink.VariantManager.getPreferredConfigurationName`
- `Simulink.VariantManager.getConfigurationData`

# Simulink.VariantManager.activateModel

**Class:** Simulink.VariantManager

**Package:** Simulink

Validate and activate variant blocks in model hierarchy

## Syntax

```
Simulink.VariantManager.activateModel(modelName)
```

```
Simulink.VariantManager.activateModel(modelName, Configuration=configName)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

The `Simulink.VariantManager.activateModel` method allows you to validate and activate a variant configuration on the given model and any referenced components in the model hierarchy. You can activate a named variant configuration defined for the model or the global workspace configuration.

The process validates if the variant elements in the model, such as variant blocks, variant controls, constraints, and the variant configuration, are set up correctly. When you activate a configuration using this method, it:

- Checks if applicable constraints are satisfied
- Pushes the variant control variable values to the global workspace of the model, for use in simulation and code generation workflows
- Reports an error if the activation fails

`Simulink.VariantManager.activateModel(modelName)` validates and activates the global workspace configuration on the model hierarchy. The variant control variables must be defined in the global workspace (base workspace or data dictionary) used by the model.

`Simulink.VariantManager.activateModel(modelName, Configuration=configName)` validates and activates the specified named variant configuration on the model hierarchy.

---

**Note** Activation of a variant configuration performed by this method differs from the Simulink update diagram process. See “Differences Between Variant Manager Activation and Update Diagram Process”.

---

## Input Arguments

**modelName — Name of model**

character vector | string

Name of the model, specified as a character vector or string.

Example: "slexVariantManagement"

Data Types: char | string

### **configName — Name of variant configuration**

character vector | string

Name of the variant configuration to be validated and activated, specified as a character vector or string.

Example: "LinInterExpNoNoise"

Data Types: char | string

## **Examples**

### **Validate and Activate Variant Configuration**

This example shows how to validate and activate a variant configuration programmatically, using either the global workspace configuration or a named variant configuration.

Open the model `slexVariantManagement`.

```
open_system('slexVariantManagement');
```

Activate and validate the model using the global workspace configuration.

```
Simulink.VariantManager.activateModel('slexVariantManagement')
```

Activate and validate the model using the variant configuration, `LinInterExpNoNoise`.

```
Simulink.VariantManager.activateModel ...
('slexVariantManagement', Configuration="LinInterExpNoNoise")
```

## **Version History**

**Introduced in R2022b**

### **Recommended over `validateModel`**

The `validateModel` method will be removed in a future release. Use the `Simulink.VariantManager.activateModel` method instead.

“Variant Manager for Simulink”

“Variant Configurations”

# Simulink.VariantManager.applyConfiguration

**Class:** Simulink.VariantManager

**Package:** Simulink

Apply specified variant configuration to model

## Syntax

```
Simulink.VariantManager.applyConfiguration(model, Configuration=configname)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`Simulink.VariantManager.applyConfiguration(model, Configuration=configname)` applies the variant configuration specified by `configname` to the model `model` and any referenced components in the model hierarchy.

The variant configuration named `configname` must be present in the `VariantConfigurationData` object associated with `model`. The operation exports the variant control variables defined in the specified configuration to the global workspace (base workspace or data dictionary) used by the model.

This method allows you to quickly switch the variant configuration for a model. The method does not validate the configuration. To validate and activate a model using a specific configuration or using the currently applied configuration, use the `Simulink.VariantManager.activateModel` method.

## Input Arguments

### **model** — Name of model

character vector | string

Name of the model to which the specified variant configuration must be applied, specified as a character vector or string.

Example: "slexVariantManagement"

Data Types: char | string

### **configname** — Name of variant configuration

character vector | string

Name of the variant configuration that must be applied to the model, specified as a character vector or string.

Example: "Config1"

Data Types: char | string

## Examples

### Apply Variant Configuration on Model

Open the model `slexVariantManagement`.

```
model='slexVariantManagement';
open_system(model);
```

The model has multiple named variant configurations, stored in the variant configuration data object `vcd` associated with the model.

To apply the configuration `LinInterExpNoNoise` on the model:

```
Simulink.VariantManager.applyConfiguration(model, Configuration="LinInterExpNoNoise");
```

# Simulink.VariantManager.convertToVariantAssemblySubsystem

**Class:** Simulink.VariantManager

**Package:** Simulink

Convert Variant Subsystem block to Variant Assembly Subsystem block

## Syntax

```
Simulink.VariantManager.convertToVariantAssemblySubsystem(blockPathOrHandle)
Simulink.VariantManager.convertToVariantAssemblySubsystem(blockPathOrHandle,
folderPathToKeepNewSubsystemFiles)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`Simulink.VariantManager.convertToVariantAssemblySubsystem(blockPathOrHandle)` converts the Variant Subsystem block `blockPathOrHandle` to a Variant Assembly Subsystem block. Use this syntax if the Variant Subsystem block has only Model blocks and Subsystem Reference blocks as its variant choices.

`Simulink.VariantManager.convertToVariantAssemblySubsystem(blockPathOrHandle, folderPathToKeepNewSubsystemFiles)` converts the Variant Subsystem block `blockPathOrHandle` to a Variant Assembly Subsystem block. Use this syntax if the Variant Subsystem block has at least one Subsystem block as its variant choice. During the conversion, the Model and Subsystem Reference blocks, if any, continue to remain in the same location. The Subsystem blocks are converted to Subsystem Reference blocks and are saved in corresponding subsystem files inside the folder specified as `folderPathToKeepNewSubsystemFiles`.

## Input Arguments

### **blockPathOrHandle — Variant Subsystem block to convert**

character vector | double scalar

The path or the block handle of the Variant Subsystem block to convert to a Variant Assembly Subsystem block, specified as a character vector (for a block path) or double scalar (for a handle).

Example: 'slexVariantSubsystem/Controller'

Data Types: char | double

### **folderPathToKeepNewSubsystemFiles — Relative or absolute path to folder**

character vector

The relative or absolute path to the folder where all the new subsystem files must be created, specified as a character vector. The folder that you specify must be on the search path of your current MATLAB session. For information on how to add files and folders to the MATLAB path, see `addpath`.

Example: 'ControllersList'

Data Types: char

## Examples

### Convert Variant Subsystem Block to Variant Assembly Subsystem Programmatically

This example explains how to convert the Variant Subsystem block in a Simulink® model to a Variant Assembly Subsystem using the `Simulink.VariantManager.convertToVariantAssemblySubsystem` method.

1. Consider the Controller block in the `slexVariantSubsystems` model. The Controller block is a Variant Subsystem block that is to be converted to a Variant Assembly Subsystem block.

```
modelName = 'slexVariantSubsystems';
open_system(modelName);
```

```
VSS_MODE = 2
```

```
vssBlockPath = [modelName, '/Controller'];
```

2. Set the variant control mode of the Controller block to `label`.

```
set_param(vssBlockPath, 'VariantControlMode', 'label');
```

3. To convert the Controller block to a Variant Assembly Subsystem block, use the `convertToVariantAssemblySubsystem` method. After the conversion, the Subsystem choices `Linear_Controller` and `Nonlinear_Controller` are converted to Subsystem Reference blocks with the same name as the Subsystem blocks. The Subsystem Reference blocks are saved in the newly created subsystem files `Linear_Controller.slx` and `Nonlinear_Controller.slx` in your current working folder.

```
Simulink.VariantManager.convertToVariantAssemblySubsystem(vssBlockPath, pwd);
```

## Limitations

Only Variant Subsystem blocks with the **Variant control mode** set to `label` can be converted to a Variant Assembly Subsystem block.

## Alternatives

You can convert a Variant Subsystem block to a Variant Assembly Subsystem block through the block dialog. For more information, see “Convert Variant Subsystem to Variant Assembly Subsystem”.

## Version History

Introduced in R2022b

## See Also

Variant Subsystem

**Topics**

“Add or Remove Variant Choices of Variant Assembly Subsystem Blocks Using External Files”

# Simulink.VariantManager.convertToVariant

**Class:** Simulink.VariantManager

**Package:** Simulink

Convert Subsystem, Model, or Variant Model block to Variant Subsystem block

## Syntax

```
variant_subsystem = Simulink.VariantManager.convertToVariant(
blockPathOrHandle)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`variant_subsystem = Simulink.VariantManager.convertToVariant(blockPathOrHandle)` converts a Subsystem block, Model block, or Variant Model block to a Variant Subsystem block. A Variant Subsystem can contain Subsystem blocks, Model blocks, or both as choices.

---

**Note** Future releases will no longer support using a Model block to contain model variants. You can use the `convertToVariant` method to convert model variants so that Model blocks are contained in a Variant Subsystem. Use of a Variant Subsystem block provides these advantages:

- Allows you to mix Model and Subsystem blocks as variant choices
- Supports flexible I/O, so that all variants do not need to have the same number of input and output ports

For an example of a model that uses a Variant Subsystem block as a container for variant models, see “Model Reference Variants” on page 13-433.

---

## Input Arguments

**blockPathOrHandle** — Subsystem or Model block to convert

block path | block handle

The Subsystem or Model block to convert to a Variant Subsystem block, specified as a block path or handle. Specify a block path as a character vector and a block handle as a scalar.

Example: 'mdlVar1/VariantModelBlock1'

## Output Arguments

**variant\_subsystem** — Handle of Variant Subsystem block

scalar

The block handle of the Variant Subsystem block created by the conversion, returned as a scalar.

## Examples

### Convert Subsystem block or Model block to Variant Subsystem

Consider this model with a Subsystem block.

You can convert this Subsystem block to a Variant Subsystem block using the `convertToVariant` method.

Similarly you can convert a Variant Model block to a Variant Subsystem block.

If there are inconsistencies in the port name or port number in models referenced by Variant Model block, Simulink corrects these inconsistencies while converting the Variant Model block to a Variant Subsystem block.

Consider this model with a Variant Model block having different port names.

When you convert this Variant Model block to a Variant Subsystem block, the inconsistencies are corrected automatically.

## Limitations

The `convertToVariant` method does not support these scenarios:

- The Subsystem block is in a Simscape model that has Editing Mode set to **Restricted**.
- The Variant Model block has a mix of control ports or there is a name mismatch in control port types.
- The Variant Model block has control ports with different port numbers and name mapping.

## Alternatives

### Simulink Editor

In the Simulink Editor, right-click the Model block and select **Subsystems & Model Reference > Convert to > Variant Subsystem**.

### Upgrade Advisor Check

To convert a Variant Model block to a Variant Subsystem block, you can use the Upgrade Advisor check **Identify Variant Model blocks and convert those to Variant Subsystem containing Model block choices**. This check provides a **Fix** button to convert Variant Model blocks to Variant Subsystem blocks. For more information on using Upgrade Advisor check to convert a Variant Model block to a Variant Subsystem block, see “Upgrade Advisor Checks”.

## Version History

Introduced in R2017b

### Topics

“Create a Simple Variant Model”

“What Are Variants and When to Use Them”

# Simulink.VariantManager.findVariantControlVars

**Class:** Simulink.VariantManager

**Package:** Simulink

Find variables used in variant control expressions

## Syntax

```
vars = Simulink.VariantManager.findVariantControlVars(model)
vars = Simulink.VariantManager.findVariantControlVars(model,
'SearchReferencedModels','off')
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`vars = Simulink.VariantManager.findVariantControlVars(model)` returns the variant control variables used by variant blocks and variant parameters in the model, `Model`. If the variant control is a `Simulink.Variant` object, then the variables are retrieved from the variant condition within the object.

`vars = Simulink.VariantManager.findVariantControlVars(model, 'SearchReferencedModels','off')` disables the search in referenced models. By default, this search is enabled across the model hierarchy.

## Input Arguments

**model** — Model name

character vector | string

Model name for which variant control variables must be found, specified as a character vector or string.

Data Types: char | string

**'SearchReferencedModels'** — Option to search in referenced models

'on' (default) | 'off'

Option to search in referenced models within the given model, specified as 'on' or 'off'. By default, search is enabled for referenced models.

## Output Arguments

**vars** — Variant control variables for model

structure

Variant control variables for model, returned as an  $N$ -by-1 structure with the following fields:

- **Name** — Name of the variable used in the variant control expression.
- **Value** — Value of the variable. This field is `0` if the variable is not defined in the global workspace of the model.
- **Exists** — Logical value that indicates if the variable is defined in the global workspace of the model. If the variable is defined in the global workspace, this value is `true`; otherwise `false`.
- **Source** — Value is either `base workspace` or the *name* of the data dictionary where the variable is stored.
- **SourceType** — Value is either `base workspace` or `data dictionary` depending on where the variable is stored.

## Examples

### Find Variant Control Variables for Model

Open the model `slexVariantManagement`.

```
model = 'slexVariantManagement';
open_system(model);
```

Find the variant control variables.

```
vars = Simulink.VariantManager.findVariantControlVars(model)
```

```

# Simulink.VariantManager.getConfigurationData

**Class:** Simulink.VariantManager

**Package:** Simulink

Get variant configuration data object associated with model

## Syntax

```
vcdo = Simulink.VariantManager.getConfigurationData(model)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`vcdo = Simulink.VariantManager.getConfigurationData(model)` returns the variant configuration data object associated with the model `model`.

## Input Arguments

**model** — Name of model

character vector | string

Name of the model, specified as a character vector or string.

Example: "slexVariantManagement"

Data Types: char | string

## Output Arguments

**vcdo** — Variant configuration data object

Simulink.VariantConfigurationData object

Variant configuration data object associated with the model, returned as an object of the Simulink.VariantConfigurationData class.

## Examples

### Get Variant Configuration Object for Model

Open the model `slexVariantManagement`.

```
model='slexVariantManagement';
open_system(model);
```

Get the existing variant configuration object for the model.

```
Simulink.VariantManager.getConfigurationData(model)
```

```
ans =
 VariantConfigurationData with properties:
 Configurations: [1x6 struct]
 Constraints: [1x1 struct]
 PreferredConfiguration: ''
```

Get the name of variant configuration object associated with the model.

```
get_param(model, 'VariantConfigurationObject')
```

```
ans =
'vcd'
```

## Version History

Introduced in R2022b

### Recommended over `getFor`

The `getFor` method will be removed in a future release. Use the `Simulink.VariantManager.getConfigurationData` method instead.

# Simulink.VariantManager.generateConfigurations

**Class:** Simulink.VariantManager

**Package:** Simulink

Generate variant configurations automatically

## Syntax

```
vcdataobj = Simulink.VariantManager.generateConfigurations(modelName)
[vcdataobj,configsInfo] = Simulink.VariantManager.generateConfigurations(
modelName,Name=Value)
```

## Description

`vcdataobj = Simulink.VariantManager.generateConfigurations(modelName)` generates variant configurations for the given model. The method returns a variant configuration data object `vcdataobj` that contains the generated configurations.

`[vcdataobj,configsInfo] = Simulink.VariantManager.generateConfigurations(modelName,Name=Value)` generates variant configurations for the given model `modelName` as specified by optional `Name=Value` arguments.

If `Precondition` is specified and the `AddPreconditionAsConstraint` argument is set to `true`, the corresponding condition is defined as a global constraint in the output object `vcdataobj`. The optional `configsInfo` output contains information on the validity of the generated configurations.

## Input Arguments

### **modelName** — Name of the model

string | character vector

Name of the model, specified as a character vector or string.

Example: "slexVariantManagement"

Data Types: char | string

### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Example:

```
vcdataobj=Simulink.VariantManager.generateConfigurations("slexVariantManagemen
t", Precondition={'Ctrl == ControllerType.Linear', 'PlantLoc ==
PlantLocation.Internal'}, AddPreconditionAsConstraint=true, Validity="valid")
```

### **Precondition** — Conditions that must be satisfied by generated configurations

character vector | cell array of character vectors

Conditions that must be satisfied by the generated configurations, specified as a character vector or cell array of character vectors containing valid Boolean expressions. You can use preconditions to limit the combinations of control variables to consider at a time or to apply constraints based on requirements.

Example: {'Ctrl == ControllerType.Linear', 'PlantLoc == PlantLocation.Internal'}

Data Types: char | cell

### AddPreconditionAsConstraint — Option to export preconditions as constraints

false or 0 (default) | true or 1

Option to export preconditions as constraints in the output variant configuration data object `vcdataobj` specified as a numeric or logical 1 (true) or 0 (false). If false, the predicate conditions are not added to `vcdataobj`. If true, the conditions are added as constraints that must be satisfied by all configurations in `vcdataobj`.

### Validity — Type of configurations to include in the output

"valid-unique" (default) | "valid" | "all"

Type of configurations to include in the output, specified as `valid-unique`, `valid`, or `all`.

The configurations generated by this method can include invalid configurations that might result in compilation errors or duplicate configurations that are functionally equivalent and hence produce similar results. Use this argument to specify which of these configurations to retain in the output.

- `valid-unique` — Include only valid configurations without any duplicates that are functionally equivalent. Two variant configurations are functionally equivalent if they result in same set of active blocks in the model. This option generates a minimal set of configurations with maximum coverage.

If a configuration has functional equivalents, this option lists one of those equivalent configurations also in the result with the **Validity Status** value as `EquivalentK`. *K* is an annotation to identify a group of equivalent configurations, for example, `Equivalent1`.

- `valid` — Include only valid configurations.

These configurations might include duplicate configurations that are functionally equivalent. Functional duplicates might occur due to the structure of a model resulting in the same variant paths being active for different variant control values. This option generates the full set of configurations with repetitive coverage.

- `all` — Include valid, invalid, and duplicate configurations.

An invalid configuration violates variant semantics and causes an error during the update diagram process. For example, you have a configuration that deactivates all choices in an inline variant block. However, this block has the **Allow zero variant control** set to `off`, which contradicts the deactivation and causes an error.

For any validity option, the method generates only those configurations that satisfy the specified preconditions.

Example: "valid"

### ExcludeVariantConfigurationData — Configurations and constraints that do not need to be generated

character vector

Name of a variant configuration data object of type `Simulink.VariantConfigurationData` that contains the configurations that do not need to be generated, specified as a character vector. This also excludes any constraints present in the variant configuration data object. Use this option to augment existing configurations for a model or to generate configurations incrementally.

Example: `'vcataObjIgnore'`

## Output Arguments

### **vcdataobj** — Variant configuration data object

`Simulink.VariantConfigurationData`

Variant configuration data object that contains the generated variant configurations for the given model, returned as an object of type `Simulink.VariantConfigurationData`. If `Precondition` is provided and `AddPreconditionAsConstraint` is set to `true`, the corresponding conditions are defined as model-wide constraints in this object.

### **configsInfo** — Name and validity of configurations

structure array

Name and validity of generated configurations, returned as a structure array with the fields:

- **Name** — Name of the generated configuration
- **ValidityStatus** — Validity of the generated configuration that indicates whether a configuration is unique, a functional equivalent, or an invalid one, specified as one of these values:
  - **Unique** — Configuration is valid and unique without any functional duplicates.
  - **Equivalent $K$**  — Configuration is valid and is a functional equivalent of another configuration.  $K$  is an annotation to identify a group of equivalent configurations, for example, **Equivalent1**.
  - **Invalid** — Configuration is not valid.

For example, consider a variant configuration object `vcdataobj` with six generated configurations. The generated configurations have validity as follows:

- `VConfig1` is valid and has no functional duplicates.
- `VConfig3` is invalid.
- `VConfig2` and `VConfig5` are valid and equivalent.
- `VConfig4` and `VConfig6` are valid and equivalent.

Then, `configsInfo` is a 1-by-6 structure array:

```
'VConfig1' 'Unique'
'VConfig2' 'Equivalent1'
'VConfig3' 'Invalid'
'VConfig4' 'Equivalent2'
'VConfig5' 'Equivalent1'
'VConfig6' 'Equivalent2'
```

Data Types: struct

## Limitations

- The auto-generation process supports only `==`, `~=`, `&&`, `||`, and `~` operators in the variant control expressions of variant blocks and in the preconditions. If the variant control expressions use other operators such as arithmetic or relational operators, the configurations that can activate those variant choices might not get generated.
- The process does not support generating variant configurations for these modeling elements:
  - Variant blocks with a **Variant control expression** that contains noninteger double values, structure fields, or `Simulink.Parameter` objects with value set to an expression of type `slexpr`
  - Variant parameter objects of type `Simulink.VariantVariable`
  - Model that represents a library or subsystem
- For variant blocks with the **Variant control mode** parameter set to `label`, the variant control labels are strings, not variables. Hence they are not present in the generated configurations.
- For Variant Subsystem blocks, these conditions also apply:
  - If the **Variant control mode** parameter is set to `label`, only the variations present in the active label path are considered when you generate configurations.

Consider this model hierarchy for a model with a Variant Subsystem block in `label` mode. The active choice for the variant subsystem is the Subsystem block, which has its variant control set to a label, `SUB1`. The variant control variable `A` is used by the active choice and is considered when you generate configurations. The process does not consider the control variable `B` because it is in the inactive choice of the variant subsystem.

Name	Variant Control	Condition
✓ mLabelMode		
✓ Variant Subsystem		
✓ <input type="checkbox"/> Subsystem	SUB1	(N/A)
Variant Source		
✕ Input 1	PORT_1	(N/A)
✕ Input 2	PORT_2	(N/A)
Variant Source1		
✕ Input 1	A==1	(N/A)
✕ Input 2	A==2	(N/A)
✓ <input type="checkbox"/> Subsystem1	SUB2	(N/A)
Variant Sink		
Output 1	B==1	(N/A)
Output 2	B==2	(N/A)

Here is the list of all generated configurations.

Name	Data Type	Values
A	double	[1, 2]

	Name	A
<input checked="" type="checkbox"/>	VarConf_1_E1	1
<input checked="" type="checkbox"/>	VarConf_2_E1	2

- If the **Variant control mode** parameter is set to `sim codegen switching`, only the variations present in the `sim` choice are considered when you generate configurations. For the variant controls present in the codegen hierarchy, only the default values are included in the generated configurations.

Consider this model hierarchy for a model with a Variant Subsystem block in `sim codegen switching` mode. The `sim` choice for the variant subsystem is the Subsystem block. The variant control variable `B` present in this choice is considered when you generate configurations. The process only considers the default value for the control variable `C` because it is in the `codegen` choice of the variant subsystem.

Name	Variant Control	Condition
<ul style="list-style-type: none"> <li>mSimCodegenWithUDAAC                             <ul style="list-style-type: none"> <li>Variant Subsystem                                     <ul style="list-style-type: none"> <li>Subsystem (sim) (N/A)                                             <ul style="list-style-type: none"> <li>Variant Sink                                                     <ul style="list-style-type: none"> <li>Output 1 (B==1) <span style="border: 1px solid black; padding: 2px;">B is in sim choice</span></li> <li>Output 2 (B==2) (N/A)</li> </ul> </li> <li>Subsystem1 (codegen) (N/A)                                                     <ul style="list-style-type: none"> <li>Variant Source                                                             <ul style="list-style-type: none"> <li>Input 1 (C==1) <span style="border: 1px solid black; padding: 2px;">C is in codegen choice</span></li> <li>Input 2 (C==2) (N/A)</li> </ul> </li> </ul> </li> </ul> </li> </ul> </li> </ul> </li> </ul>		

Here is the list of all generated configurations.

Name	Data Type	Values
B	double	[1, 2]
C	double	[1]

	Name	B	C
<input checked="" type="checkbox"/>	VarConf_1_E1	1	1
<input checked="" type="checkbox"/>	VarConf_2_E2	2	1

- If the **Variant activation time** is set to `update diagram`, only the variations in the active choice are considered for generating configurations.

## Examples

### Generate Variant Configurations

This command returns valid variant configurations for the model `slexVariantManagement` that satisfy the conditions specified on the variant control variables `Ctrl` and `PlantLoc`.

```
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));
model = "slexVariantManagement";
open_system(model);
[vcdatabj,configsInfo] = Simulink.VariantManager.generateConfigurations ...
(model, Precondition = {'Ctrl == ControllerType.Linear', 'PlantLoc == PlantLocation.Internal'}, ...
AddPreconditionAsConstraint = true, Validity = "valid");
```

The variant configuration data object `vcdatabj` stores all the valid configurations. The structure array `configsInfo` provides information on the validity status of generated configurations.

To return only valid and functionally unique configurations, set `Validity` to `valid-unique`.

```
[vcdatabj,configsInfo] = Simulink.VariantManager.generateConfigurations(model,...
Precondition = {'Ctrl == ControllerType.Linear', 'PlantLoc == PlantLocation.Internal'}, ...
AddPreconditionAsConstraint = true, Validity = "valid-unique")
```

To return all generated configurations, including invalid configurations, set `Validity` to `all`.

```
[vcdatabj,configsInfo] = Simulink.VariantManager.generateConfigurations(model,...
Precondition = {'Ctrl == ControllerType.Linear', 'PlantLoc == PlantLocation.Internal'}, ...
AddPreconditionAsConstraint = true, Validity = "all")
```

### Tips

You can use the `intersect`, `setdiff`, `union`, and `unique` methods in the `Simulink.VariantConfigurationData` class to perform set operations on variant configuration data objects. See “Specialized Operators and Functions” on page 5-720.

# Simulink.VariantManager.getPreferredConfigurationName

**Class:** Simulink.VariantManager

**Package:** Simulink

Get name of preferred variant configuration for model

## Syntax

```
configname = Simulink.VariantManager.getPreferredConfigurationName(model)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`configname = Simulink.VariantManager.getPreferredConfigurationName(model)` returns the name of the preferred variant configuration for the model `model`.

## Input Arguments

**model** — Name of model

character vector | string

Name of the model, specified as a character vector or string.

Example: "slexVariantManagement"

Data Types: char

## Output Arguments

**configname** — Name of preferred variant configuration

character vector

Name of the preferred variant configuration, returned as a character vector.

## Examples

### Get Name of Preferred Variant Configuration for Model

Open the model `slexVariantManagement`.

```
model='slexVariantManagement';
open_system(model);
```

Get the name of the preferred variant configuration for the variant configuration data object associated with this model.

```
configname = Simulink.VariantManager.getPreferredConfigurationName(model);
```

## **Version History**

# Simulink.VariantManager.reduceModel

**Class:** Simulink.VariantManager

**Package:** Simulink

Generate reduced model for specified variant configurations

## Syntax

```
Simulink.VariantManager.reduceModel(model)
Simulink.VariantManager.reduceModel(model,Name,Value)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`Simulink.VariantManager.reduceModel(model)` generates a reduced model from the input model `model`.

By default, the current values of variant control variables in the global workspace (base workspace or data dictionary) of the input model are used for reduction. The reduction process retains the variant configurations corresponding to these values and removes the inactive model components. The reduced artifacts are generated in a folder named `./reducedModel` within the input model folder. The name of the reduced model and any reduced referenced model is the original model name suffixed with `_r`, by default.

`Simulink.VariantManager.reduceModel(model,Name,Value)` allows you to specify additional reduction options using one or more `Name,Value` arguments.

## Input Arguments

**model** — Name of model to be reduced

string | character vector

Name of the model to be reduced, specified as a string or character vector.

### Name-Value Pair Arguments

Specify optional `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. You can specify several name and value arguments in any order as `Name1,Value1,...,NameN,ValueN`.

**NamedConfigurations** — Names of variant configurations to be retained

string | character vector | cell array of strings | cell array of character vectors

Names of variant configurations to be retained in the reduced model, specified as a string, a character vector, a cell array of strings, or a cell array of character vectors. These named variant configurations must be present in the variant configuration data object (of type `Simulink.VariantConfigurationData`) associated with the model.

Example: 'NamedConfigurations', 'C1'

Example: 'NamedConfigurations', {'C2'}

Data Types: char | string | cell

### VariableGroups — Groups of variant control variables and their values

cell array

Variant control variables and their values that must be used for reduction, specified as a cell array containing the variable names and values.

---

**Note** Specifying both VariableGroups and NamedConfigurations is not supported.

---

You can create multiple named variable groups for a model. To specify names for the variable groups, specify a struct array with the fields Name and VariantControls. Name denotes the name of the variable group, and VariantControls must be a cell array with variant control variable names and their corresponding values. For example:

```
Simulink.VariantManager.reduceModel('slexVariantReducer',...
'VariableGroups', struct('Name', 'Group1', 'VariantControls', {'V',1,'W',[1 2]}));
```

Example: 'VariableGroups', {'V',1,'W',1},{'V',2,'W',2}}

Data Types: cell

### FullRangeVariables — Variables for which full range must be considered for reduction

cell array

Variables for which their full range must be considered for reduction, specified as a cell array of variant control variable names and their corresponding values. This option allows you to reduce a model for all valid values of the specified variant control variables. You must also provide a reference value for this variant control variable for which the model compiles successfully.

For example, consider a variant control variable, W, that is specified as a full-range variant control variable. W uses a reference value of 1. The reduction process considers V=1 and all valid values of W. To perform full-range analysis, Variant Reducer compiles the model once using the values {'V',1,'W',1}.

```
Simulink.VariantManager.reduceModel('slexVariantReducer',...
'VariableGroups',{'V',1},...
'FullRangeVariables',{'W',1});
```

Data Types: cell

### CompileMode — Compilation mode

'sim' (default) | 'codegen'

Compilation mode, specified as 'sim' or 'codegen'. These options indicate whether the model should be compiled for simulation or code generation mode, respectively, as part of reduction. If the model contains variant blocks with the **Variant control mode** parameter set to sim codegen switching, you can specify the value as codegen to retain the code generation branches of the blocks in the reduced model. For the default value sim, Variant Reducer compiles and retains the simulation branches in the top-level model.

### ExcludeFiles — List of files to exclude during reduction

cell array of character vectors

List of any dependent Simulink data dictionary files (\*.sldd) and MAT-files (\*.mat) outside the MATLAB root folder to exclude during reduction, specified as a cell array of character vectors.

You can also provide wildcard characters, for example {'\*.sldd'}.

Example: {'topData.sldd'}

Data Types: cell

### **OutputFolder — Folder to place reduced model and related artifacts**

string | character vector

Folder to place the reduced models and related artifacts, specified as a character vector or string. By default, the reduced models are generated in a folder named ./reducedModel within the original model folder.

### **PreserveSignalAttributes — Option to preserve signal attributes in reduced model**

true or 1 (default) | false or 0

Option to preserve signal attributes in the reduced model, specified as a numeric or logical 1 (true) or 0 (false). When the value is true, Variant Reducer preserves the compiled signal attributes from the original model by adding signal specification blocks at appropriate block ports in the reduced model. Compiled signal attributes include signal data types, signal dimensions, and compiled sample times.

### **Verbose — Option to display detailed reduction steps**

false or 0 (default) | true or 1

Option to display detailed reduction steps, specified as a numeric or logical 1 (true) or 0 (false). When the value is true, Variant Reducer displays details of the steps performed during model reduction.

### **ModelSuffix — Suffix to append to name of reduced model**

'\_r' (default) | character vector

Suffix to append to the name of the reduced model and the related artifacts, specified as a character vector.

### **GenerateSummary — Option to generate summary HTML file**

false or 0 (default) | true or 1

Option to generate a summary HTML file, specified as a numeric or logical 1 (true) or 0 (false). When the value is true, Variant Reducer generates an HTML file with details about the reduced model and any modifications that may be required for masks and callbacks.

---

**Note** To generate a summary, you must have a Simulink Report Generator™ license.

---

## **Limitations**

For information on modifications made to model components during reduction and limitations of the reduction process, see “Considerations and Limitations for Variant Reduction”.

## Examples

### Reduce Variant Model Using Different Reduction Options

Open the example models.

```
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));
open_system('slexVariantReducer');
open_system('sldemo_variant_subsystems');
```

Reduce the `sldemo_variant_subsystems` model based on the variant control variable values in the base workspace.

```
Simulink.VariantManager.reduceModel('sldemo_variant_subsystems');
```

Reduce the model based on the variant control variable values in the base workspace, and place the reduced model in the specified output directory.

```
Simulink.VariantManager.reduceModel('sldemo_variant_subsystems', ...
'OutputFolder', 'outdir');
```

Reduce the model by specifying named variant configurations present in the variant configuration data object associated with the model.

```
Simulink.VariantManager.reduceModel('slexVariantReducer', ...
'NamedConfigurations', {'config1', 'config2'});
```

Reduce the model by specifying variant control variables and their values.

This syntax specifies two configurations for reduction corresponding to  $\{V==1, W==1\}$  and  $\{V==2, W==2\}$ .

```
Simulink.VariantManager.reduceModel('slexVariantReducer', ...
'VariableGroups', {{'V',1,'W',1},{'V',2,'W',2}});
```

Reduce the model by specifying configurations in the form of a structure of variant control variables.

This syntax specifies four configurations for reduction corresponding to  $\{V==1, W==1\}$ ,  $\{V==1, W==2\}$ ,  $\{V==2, W==1\}$ , and  $\{V==2, W==2\}$ .

```
Simulink.VariantManager.reduceModel('slexVariantReducer', ...
'VariableGroups', {'V',[1 2],'W',[1 2]});
```

Reduce the model by specifying names for variable groups.

This syntax specifies two named variable groups, `Group1` and `Group2`.

The reduced model has named configurations with the same name as the named variable groups, along with a suffix. In this case, the reduced model has three configurations named `Group1_1`, `Group1_2`, and `Group2_1` corresponding to  $\{V==1, W==1\}$ ,  $\{V==1, W==2\}$ , and  $\{V==2, W==1\}$ , respectively.

```
Simulink.VariantManager.reduceModel('slexVariantReducer', ...
'VariableGroups', [struct('Name', 'Group1', 'VariantControls', {{'V',1,'W',[1 2]}}), ...
struct('Name', 'Group2', 'VariantControls', {{'V',2,'W',2}})]);
```

Reduce the model by specifying a variant control variable as a full-range variable.

This syntax specifies *W* as a full-range variant control variable with a reference value of 1. The reduction process considers four configurations corresponding to  $\{V==1, W==1\}$ ,  $\{V==1, W==2\}$ ,  $\{V==1, W==3\}$ , and  $\{V==1, W==0\}$ .

```
Simulink.VariantManager.reduceModel('slexVariantReducer',...
'VariableGroups',{ 'V',1},...
'FullRangeVariables',{ 'W',1});
```

Reduce the model by specifying the compilation mode as code generation.

```
Simulink.VariantManager.reduceModel...
('slexVariantReducer','NamedConfigurations',{'config1'},...
'CompileMode','codegen','OutputFolder','L:\Models');
```

Reduce the model and generate a variant reducer summary report after reduction.

This command generates the summary and saves it to the path `L:\Models\variantReducerRpt`.

```
Simulink.VariantManager.reduceModel...
('slexVariantReducer','NamedConfigurations',{'config1'},...
'GenerateSummary',true,'OutputFolder','L:\Models');
```

## Version History

### Introduced in R2016a

#### Exclude dependent files during reduction

The `ExcludeFiles` argument allows you to exclude Simulink data dictionary files (\*.sldd) and MAT-files (\*.mat) outside the MATLAB root folder during reduction.

#### Simulink Design Verifier license requirement removed

*Behavior changed in R2022b*

The `reduceModel` method no longer requires a Simulink Design Verifier license. The functionality is available as part of the Variant Manager for Simulink support package.

# Simulink.VariantManager.variantLegend

**Class:** Simulink.VariantManager

**Package:** Simulink

Display or control behavior of variant condition legend

## Syntax

```
Simulink.VariantManager.variantLegend(modelName,action)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`Simulink.VariantManager.variantLegend(modelName,action)` displays or performs a specified action on the variant condition legend.

## Input Arguments

**modelName** — Model for which the variant legend is displayed

character vector | string

Model for which the variant legend is displayed, specified as a character vector or a string.

**action** — Task to be performed on the variant legend

'open' | 'print' | 'showCodeConditions' | 'close'

Task to be performed on the variant condition legend for the model, specified as:

- 'open' — Displays the variant condition legend for a model. The model must be open. If the legend is opened for the first time, the model is updated.
- 'print' — Prints the data in the variant condition legend. The legend must be open. There is no preview before printing the legend.
- 'showCodeConditions' — Displays code generation conditions column in the variant condition legend. The legend must be open. `showCodeConditions` is used as a name-value pair and accepts 'on' or 'off' as its values.
- 'close' — Closes the variant condition legend belonging to the specified model.

## Examples

### Open Variant Legend

Open the `sldemo_variant_subsystems` model.

```
addpath(fullfile(matlabroot, 'examples', 'simulink_variants', 'main'));
model = 'sldemo_variant_subsystems';
open_system(model);
```

Display the variant condition legend for the model.

```
Simulink.VariantManager.variantLegend(model, 'open');
```

Display the code generation conditions column in the variant condition legend.

```
Simulink.VariantManager.variantLegend(model, 'showCodeConditions', 'on');
```

## Simulink.VariantVariable class

**Package:** Simulink

Create a variant parameter object

### Description

The `Simulink.VariantVariable` class creates a variant parameter object. You can specify multiple values for each object. You can also specify properties such as dimension, data type, and so on. Each value of the object is associated with a variant condition expression. Set the parameter values and properties in the object, then reference the object from the block.

Before you create a new `Simulink.VariantVariable` object, create a `Simulink.VariantControl` object representing the variant control variable to be used in the `Simulink.VariantVariable` object.

---

**Note** You can create the variant parameter object only in the base workspace or in a data dictionary.

---

### Creation

`P = Simulink.VariantVariable` creates an empty variant parameter object.

`P = Simulink.VariantVariable(Name, Value)` creates a variant parameter object as specified by one or more `Name, Value` pair arguments. Using this syntax, you can specify multiple values for the object and associate each value with a variant condition expression. You can also specify other properties of the object such as data types, storage class, dimensions, and so on.

### Input Arguments

#### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `'Specification', 'Pspec', 'Choices', {'V==1', 4.5, 'V==2', 9.5}`

#### Specification — Properties of variant parameter object

`Simulink.Parameter` object name

Properties of variant parameter object such as data type, dimensions, storage class, and so on, specified as the `Simulink.Parameter` object. The default storage class of a `Simulink.Parameter` object is `Auto`. If you specify the storage class as `Auto`, the value of the object is inline to the literal value in the generated code. If you specify the storage class of the object anything other than `Auto`, the object is represented as tunable parameters using symbolic names in the generated code. For more information, see “Options to Represent Variant Parameters in Generated Code” (Embedded Coder).

Example: 'Specification', 'Pspec'

### Choices — Variant conditions and values

cell array

Variant conditions and values, specified as a struct. During simulation, when a variant condition evaluates to `true`, its associated value becomes active. When a variant condition evaluates to `false`, its associated value becomes inactive. No two values of the same variant parameter must be associated with the same variant condition.

You can specify the variant condition as boolean MATLAB expressions that contain one or more operands and operators. See “Types of Variant Control Variables (Operands) in Variant Parameters” and “Types of Operators in Variant Parameters”.

You can specify values of numeric, enumerated, or `Simulink.Parameter` type. See, “Numeric Variant Control Values for Rapid Prototyping of Variant Parameters”, “Improve Code Readability of Variant Parameters Using Enumerated Types”, and “Reuse Variant Parameter Values from Handwritten Code Using `Simulink.Parameter` Variables”.

Example: 'Choices', {'V==1', 4.5, 'V==2', 9.5}

## Methods

### Public Methods

`addChoice`      Add choices to variant parameter object  
`getChoice`      Return choices of variant parameter object  
`setChoice`      Modify existing choices of variant parameter object  
`removeChoice`   Remove choices from variant parameter object

### Specialized Operators and Functions

These methods specialize standard MATLAB operators and functions for objects in this class.

<code>bitcmp</code>	Performs bit-wise complement on input.
<code>eq</code>	Compares if the inputs are equal.
<code>gt</code>	Compares if the first input is greater than the second input.
<code>mrdivide</code>	Divides the first input by the second input.
<code>or</code>	Performs a logical OR on inputs.
<code>uminus</code>	Negates the input.
<code>bitor</code>	Performs bit-wise OR on inputs.
<code>ge</code>	Compares if the first input is greater than or equal to the second input.
<code>le</code>	Compares if the first input is less than or equal to the second input.
<code>mtimes</code>	Multiplies the inputs.
<code>plus</code>	Adds the inputs.
<code>uplus</code>	Returns the value of the input.

and	Performs logical AND on inputs.
bitshift	Shift bits by specified number of places.
lt	Compares if the first input is less than the second input.
ne	Compares if the inputs are not equal.
bitand	Performs bit-wise AND on inputs.
bitxor	Performs bit-wise XOR on inputs.
minus	Subtracts the second input from the first input.
not	Returns logical NOT of input.

## Examples

### Numeric Variant Control Values for Rapid Prototyping of Variant Parameters

Numeric values allow you to rapidly prototype variant values when you are still building your model. Numeric values help you focus more on building your variant values than on developing the expressions that activate those choices.

You can define numeric control values in locations listed in “Storage Locations for Variant Control Variables (Operands) in Variant Blocks”.

Open the `slexVariantParameters` model.

```
open_system('slexVariantParameters')
```

In the MATLAB Editor, specify variant choices in their simplest form as numeric values in `Simulink.VariantVariable` objects K1 and K2.

```
K1 = Simulink.VariantVariable('Choices',{ 'V==1', 3.5, 'V==2', 8.5})
```

```
K1 =
VariantVariable with 2 choices:
```

Condition	Value
V == 1	3.5000
V == 2	8.5000

```
Specification: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

```
K2 = Simulink.VariantVariable('Choices',{ 'V==1', 4.5, 'V==2', 9.5})
```

```
K2 =
VariantVariable with 2 choices:
```

Condition	Value
V == 1	4.5000

```
V == 2 9.5000
```

```
Specification: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

Once you successfully create the `Simulink.VariantVariable` objects, you can modify them by using the methods described in “Public Methods” on page 5-813 or from the `VariantVariable` dialog box.

Activate one of the variant values by defining a control variable, `V`, and setting its value to 1 in a `Simulink.VariantControl` object.

```
V = Simulink.VariantControl('Value', 1, 'ActivationTime', 'update diagram')
```

```
V =
 VariantControl with properties:
 Value: 1
 ActivationTime: 'update diagram'
```

When you simulate the model, the condition `V == 1` evaluates to `true`. `K1` is assigned a value of 3.5 and `K2` is assigned a value of 8.5.

```
sim('slexVariantParameters')
```

If you change the value of `V` to 2, Simulink® sets the value of `K1` and `K2` to 4.5 and 9.5 during simulation. You can change the value of `V` using this command or from `Simulink.VariantControl` dialog box.

```
V.Value = 2;
sim('slexVariantParameters')
```

## Simulink.Parameter Type of Variant Control Variables for Code Generation of Variant Parameters

If you intend to generate code for a model containing variant parameters, specify variant control variables as `Simulink.Parameter` objects. `Simulink.Parameter` objects allow you to specify other attributes, such as data type and storage class, and control the appearance and placement of variant control variables in generated code.

- You can define a variant control variable of type `Simulink.Parameter` only in the base workspace or in a data dictionary. Defining `Simulink.Parameter` type of variant control variables in the mask or model workspace is not supported. For more information on storage locations for variant control variables, see “Storage Locations for Variant Control Variables (Operands) in Variant Blocks”.
- `Simulink.Parameter` objects within structures and that have data types other than `Simulink.Bus` objects are not supported.

Open the `slexVariantParameters` model.

```
open_system('slexVariantParameters')
```

In the MATLAB Editor, define a `Simulink.Parameter` object.

```
VSS_MODE = Simulink.Parameter;
VSS_MODE.Value = 1;
VSS_MODE.DataType = 'int32';
VSS_MODE.CoderInfo.StorageClass = 'Custom';
VSS_MODE.CoderInfo.CustomStorageClass = 'Define';
VSS_MODE.CoderInfo.CustomAttributes.HeaderFile = 'demo_macros.h';
```

Variant control variables defined as `Simulink.Parameter` objects can have any of the storage classes listed in “Storage Classes for Different Variant Activation Times” (Embedded Coder).

You can also convert a scalar variant control variable into a `Simulink.Parameter` object. For more information, see “Convert Variant Control Variables into `Simulink.Parameter` Objects”.

Specify the object as a variant control in `Simulink.VariantVariable` objects K1 and K2.

```
K1 = Simulink.VariantVariable('Choices',{'V == 1', 3.5, 'V == 2', 8.5})
```

```
K1 =
VariantVariable with 2 choices:
```

Condition	Value
V == 1	3.5000
V == 2	8.5000

```
Specification: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

```
K2 = Simulink.VariantVariable('Choices',{'V == 1', 4.5, 'V == 2', 9.5})
```

```
K2 =
VariantVariable with 2 choices:
```

Condition	Value
V == 1	4.5000
V == 2	9.5000

```
Specification: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

Once you successfully create the `Simulink.VariantVariable` objects, you can modify them by using the methods described in “Public Methods” on page 5-813 or from the `VariantVariable` dialog box.

Activate one of the variant values by defining a control variable `V` and setting its value to `VSS_MODE` in a `Simulink.VariantControl` object.

```
V = Simulink.VariantControl('Value',VSS_MODE,'ActivationTime','code compile')
```

```
V =
VariantControl with properties:
```

```
Value: [1x1 Simulink.Parameter]
ActivationTime: 'code compile'
```

When you simulate the model, the condition `V == 1` evaluates to `true`. `K1` is assigned a value of 3.5, and `K2` is assigned a value of 8.5.

```
sim('slexVariantParameters')
```

If you change the value of `VSS_MODE` to 2, Simulink® sets the value of `K1` and `K2` to 4.5 and 9.5 during simulation. You can change the value of `V` using this command or from Simulink.VariantControl dialog box.

```
VSS_MODE.Value = 2;
V.Value = VSS_MODE;
sim('slexVariantParameters')
```

Generate code from the model. For information on how to generate code, see “Generate Code Using Embedded Coder” (Embedded Coder)

The generated code contains both `Linear` and `NonLinear` choices in preprocessor conditionals `#if` and `#elif` because of the code compile activation time. The variant control variable `V` is defined using a macro — `#define` directive — in the header file `demo_macros.h`. You can control the appearance and placement of `V` in the generated code and prevent optimizations from eliminating storage for `V` using the storage class property. For more information, see “Storage Classes for Different Variant Activation Times” (Embedded Coder).

```
% demo_macros.h
% /* Exported data define */
%
% /* Definition for custom storage class: Define */
% #define V 2 /* Referenced by:
% * '<Root>/Gain'
% * '<Root>/Gain1'
% */
% #endif /* RTW_HEADER_demo_macros_h_ */
%
% /*
```

### Simulink.Variant Objects for Variant Condition Reuse of Variant Parameters

After identifying the variant values that your model requires, you can construct complex variant conditions to control the activation of your variant parameter values by defining variant conditions as `Simulink.Variant` objects. `Simulink.Variant` objects enable you to reuse common variant conditions across models and help you encapsulate complex variant condition expressions.

- You can define a variant control variable of type `Simulink.Variant` only in the base workspace or in a data dictionary. Defining `Simulink.Variant` type of variant control variables in the mask or model workspace is not supported. For more information on storage locations for variant control variables, see “Storage Locations for Variant Control Variables (Operands) in Variant Blocks”.
- `Simulink.Variant` within structures are not supported.

Open the `slexVariantParameters` model.

```
open_system('slexVariantParameters')
```

In the MATLAB® Editor, encapsulate variant control expressions as `Simulink.Variant` objects.

```
LinearController=Simulink.Variant('V==1');
NonLinearController=Simulink.Variant('V==2');
```

Specify the `Simulink.Variant` objects as the variant controls in a `Simulink.VariantVariable` objects K1 and K2.

```
K1 = Simulink.VariantVariable('Choices',{'LinearController',3.5,'NonLinearController',8.5})
```

```
K1 =
VariantVariable with 2 choices:
```

Condition	Value
LinearController	3.5000
NonLinearController	8.5000

```
Specification: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

```
K2 = Simulink.VariantVariable('Choices',{'LinearController',4.5,'NonLinearController',9.5})
```

```
K2 =
VariantVariable with 2 choices:
```

Condition	Value
LinearController	4.5000
NonLinearController	9.5000

```
Specification: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

Once you successfully create the `Simulink.VariantVariable` objects, you can modify them by using the methods described in “Public Methods” on page 5-813 or from the `VariantVariable` dialog box.

Activate one of the variant values by defining a `Simulink.VariantControl` object `V` and setting its value to 1.

```
V = Simulink.VariantControl('Value',1,'ActivationTime','update diagram')
```

```
V =
VariantControl with properties:

Value: 1
ActivationTime: 'update diagram'
```

When you simulate the model, the condition `V == 1` evaluates to `true`. `K1` is assigned a value of 3.5, and `K2` is assigned a value of 8.5.

```
sim('slexVariantParameters')
```

If you change the value of `V` to 2, Simulink® sets the value of `K1` and `K2` to 4.5 and 9.5 during simulation. You can change the value of `V` using this command or from `Simulink.VariantControl` dialog box.

```
V.Value = 2;
sim('slexVariantParameters')
```

Using this approach, you can develop complex variant condition expressions that are reusable.

## Version History

Introduced in R2021a

## Extended Capabilities

### C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

- For variant parameters associated with the `startup` activation time, you can generate code for both active and inactive choices by installing Simulink Coder or Embedded Coder.
- For variant parameters associated with the `code compile` activation time:
  - You must install Simulink Coder to generate code for only active values of variant parameters. Generating code using Simulink Coder is supported only if values of a variant parameter have same dimension.
  - You must install Embedded Coder to generate code for both active and inactive values of variant parameters. Generating code using Embedded Coder is supported for variant parameters values having same and different dimensions.

For more information on code generation with variant parameters, see “Options to Represent Variant Parameters in Generated Code” (Embedded Coder).

## SubsystemReference class

Control subsystem reference programmatically

### Description

Use the methods of `Simulink.SubsystemReference` to query and control the subsystem reference blocks.

### Methods

#### Public Methods

<code>convertAllSubsystemReferenceBlockToSubsystem</code>	Converts all subsystem reference blocks to regular Subsystem blocks
<code>convertSubsystemReferenceBlockToSubsystem</code>	Converts a subsystem reference block to a regular Subsystem block
<code>convertSubsystemToSubsystemReference</code>	Converts a Subsystem block to subsystem reference
<code>getActiveInstances</code>	Returns all the active instances of subsystem references
<code>getAllDirtyInstances</code>	Returns child Subsystem block diagrams that are referred in the given block diagram and are also being edited
<code>getAllInstances</code>	Returns all subsystem reference blocks inside a block diagram
<code>getAllReferencedSubsystemBlockDiagrams</code>	Returns all the child Subsystem block diagrams for a given block diagram
<code>getNearestParentSubsystemReferenceBlock</code>	Returns the nearest parent subsystem reference for a block
<code>getSystemOwningTheLock</code>	Returns the system that has acquired the lock for editing
<code>isSystemLocked</code>	Checks if the system is locked due to an edit or update to the subsystem reference

### Version History

Introduced in R2022a

# Simulink.Mask.PortConstraint class

Create mask port constraints programmatically

## Description

Use an instance of the `Simulink.Mask.PortConstraint` class to add or remove port constraints on a masked block.

## Properties

### Public Properties

#### Name — Name of the constraint

(default) | character vector

Name of the port constraint specified as a string.

Data Types: `char`

#### ParameterConditions — Mask parameter conditions

(default) | `Simulink.Mask.ParameterCondition` object

Mask parameter conditions are specified as an array of `Simulink.Mask.ParameterCondition` object. The port constraints are active on the associated port only when the port satisfies all the parameter conditions.

#### Rule — Datatype, complexity, and dimension associated with the constraint

(default) | `Simulink.Mask.PortConstraintRule` object

The allowed datatype, complexity, and dimension associated with the constraint, specified as a `PortConstraintRule` object.

Data Types: `string`

#### DiagnosticLevel — Type of diagnostic message

`error` (default) | `warning`

The type of diagnostic message displayed when validation condition fails specified as `error` or `warning`.

Data Types: `char`

#### DiagnosticMessage — Diagnostic message

(default) | character vector

The diagnostic message that is displayed when the validation fails, specified as a character vector.

Data Types: `character vector`

## Methods

### Public Methods

<code>addPortConstraint</code>	Create port constraint on a mask object
<code>getPortConstraint</code>	Displays attributes of specified port constraint
<code>removePortConstraint</code>	Remove specified port constraint
<code>removeAllPortConstraint</code>	Remove all port constraints on masked block

## Version History

Introduced in R2022a

# Simulink.Mask.ParameterCondition class

Create mask parameter conditions

## Description

Create an instance of the `Simulink.Mask.ParameterCondition` class to create mask parameter conditions for constraints.

## Properties

### Public Properties

#### Name — Name of mask parameter

character vector (default)

Name of the mask parameter present in the mask object, specified as a string.

Data Types: `string`

#### Value — Possible values for mask parameter

character vector (default)

List of possible values for the mask parameter, specified as a cell array.

Data Types: `cell`

## Methods

### Public Methods

<code>addParameterCondition</code>	Creates a mask parameter condition for constraint
<code>getParameterCondition</code>	Returns parameter condition associated with constraint
<code>removeParameterCondition</code>	Removes specified parameter condition on constraint
<code>removeAllParameterCondition</code>	Removes all parameter conditions from constraint

## Version History

Introduced in R2022a

## Topics

“Validate Input and Output Port Signals Using Port Constraints”

## Simulink.Mask.PortConstraintRule class

Create instance of `Simulink.Mask.PortConstraintRule` to define rules of port constraint

### Description

Define the `DataType`, `Dimension`, and `Complexity` rules for a port constraint. Port signal values are validated against these rules.

### Properties

#### Public Properties

##### **DataType — Permitted data types**

cell array (default) | string

Permitted data types, specified as a cell array. The allowed values are `int`, `double`, `fixed point` and so on.

Data Types: string

##### **Dimension — Permitted dimension for port signals**

cell array of character vector (default) | string

The allowed values in the array are `scalar`, `vector`, `2dmatrix`, `ndmatrix`, `rowvector`, and `colvector`.

Data Types: cell

##### **Complexity — Complexity of port signal**

character vector (default) | string

The allowed complexity, specified as a cell array. The allowed values in the array are `real` and `complex`.

##### **FixedPointConstraint — Fixed point constraints of port signal**

character vector (default)

Set the `Signedness`, `bias`, `Wordlength`, and `Scaling` for `fixed point` data type.

### Methods

#### Public Methods

`setRule` Create rules that are validated against data at port

`removeRule` Remove all datatype, complexity, and dimension attributes of port constraint rule

### Version History

## Simulink.Mask.PortIdentifier class

Create port identifiers to identify ports of block in mask object

### Description

Create an instance of `Simulink.Mask.PortIdentifier` to create and set the properties for the port identifier on a masked block.

### Properties

#### Public Properties

##### Name — Name for the port identifier

empty character vector (default)

Name of the port identifier, specified as a character vector. This name uniquely identifies the port identifier in the mask.

Data Types: `char`

##### Type — Type of port

`input` (default) | `output`

Type of the port, specified as either `Input` or `Output`.

Data Types: `string`

##### IdentifierType — Type of identifier

`index` (default) | `name`

Type of identifier, specified as `name` or `index`. Specify `name` if you want to identify the ports using a name, otherwise specify `index`, if you want to identify the ports using a port index.

Data Types: `string`

##### Identifier — Port identifier appearing in block

character vector (default)

Port identifier appearing in the block, specified as a character vector. If the `IdentifierType` is `index`, you can specify the identifiers in one of these formats:

- **Index:** The index to associate the port with the port identifier. For example, '3' associates port '3' with the port identifier.
- **Lower port index:Upper port index:** The lower port index and upper port index to associate all the ports between the indices with the port identifier. For example, '2:4' associates ports 2, 3, and 4 with the port identifier.
- **List of port indices:** The ports separated by comma to associate the ports with the port identifier. For example, '3,5,7'. This associates the ports 3, 5, and 7 with the port identifier. Duplicates are not allowed.

- : The name of the port is specified.

Port name: String: If IdentifierType is name, this parameter is the name of the port.

Data Types: string | char

## Methods

### Public Methods

addPortIdentifier	Creates a port identifier to identify port in mask
getPortIdentifier	Displays attributes of specified port identifier
remove PortIdentifier	Removes specified port identifier from mask object
removeAllPortIdentifiers	Removes all port identifiers from mask object

## Version History

Introduced in R2022a

## **Programmatic Model Editor Appearance Parameters**

Use the following parameters to control how your model appears in the Simulink editor. To query and/or modify the value of a parameter, use `get_param` or `set_param`.

**Model Appearance Parameters**

Parameter	Description	Values
BlockNameDataTip	Specifies whether to display the block name as a data tip. In the Simulink Editor, in the <b>Debug</b> tab, select <b>Information Overlays &gt; Name in Tooltip</b> .	'on'   {'off'}
BlockParametersDataTip	Specifies whether to display a block parameter in a data tip.  In the Simulink Editor, in the <b>Debug</b> tab, select <b>Information Overlays &gt; Parameters in Tooltip</b> .	'on'   {'off'}
BlockDescription-StringDataTip	Specifies whether to display the user description for a block as a data tip.  In the Simulink Editor, in the <b>Debug</b> tab, select <b>Information Overlays &gt; Description in Tooltip</b> .	'on'   {'off'}
BrowserLookUnderMasks	Show masked subsystems in the Model Browser.  On the <b>Modeling</b> tab, select <b>Environment &gt; Model Browser</b> . In the <b>Model Browser</b> pane, click  and select <b>Systems with Mask Parameters</b> .	'on'   {'off'}
BrowserShowLibraryLinks	Show library links in the Model Browser.  On the <b>Modeling</b> tab, select <b>Environment &gt; Model Browser</b> . In the <b>Model Browser</b> pane, click  and select <b>Library Links</b> .	'on'   {'off'}
CompiledModelBlockNormalModeVisibility	For a top model that is being simulated or that is in a compiled state, return information about which Model blocks have normal mode visibility enabled.	Return values indicate which Model blocks have normal mode visibility enabled.

Parameter	Description	Values
DefaultAnnotationFontName DefaultBlockFontName DefaultLineFontName	Name of font to use for new annotation text, block text, or signal line labels and on existing annotations, block names, or signal lines whose FontName property is set to 'auto'.  To set, on the <b>Format</b> tab, click the <b>Font Properties</b> button arrow, then click <b>Fonts for Model</b> .	character vector
DefaultAnnotationFontSize DefaultBlockFontSize DefaultLineFontSize	Size of font to use for new annotation text, block text, or signal line labels and on existing annotations, blocks, or signal lines whose FontSize property is set to -1.  To set, on the <b>Format</b> tab, click the <b>Font Properties</b> button arrow, then click <b>Fonts for Model</b> .	positive integer
DefaultAnnotationFontAngle DefaultBlockFontAngle DefaultLineFontAngle	Angle of font for new annotation text, block text, or signal line labels and on existing annotations, blocks, or signal lines whose FontAngle property is set to 'auto'.  To set, on the <b>Format</b> tab, click the <b>Font Properties</b> button arrow, then click <b>Fonts for Model</b> .	{'normal'}   'italic'
DefaultAnnotationFontWeight DefaultBlockFontWeight DefaultLineFontWeight	Weight of font for new annotation text, block text, or signal line labels and on existing annotations, blocks, or signal lines whose FontWeight property is set to 'auto'.  To set, on the <b>Format</b> tab, click the <b>Font Properties</b> button arrow, then click <b>Fonts for Model</b> .	{'normal'}   'bold'
HideAutomaticNames	Hides block names given automatically by the Simulink Editor. See "Hide or Display Block Names".	{'on'}   'off'

Parameter	Description	Values
LineUpdate	<p>Specifies when to update line routing to avoid overlapping lines and obstacles in the model.</p> <p>When set to the default 'deferred', scripts postpone line routing until they pause or complete. To perform deferred line routing within a script, you can use function <code>Simulink.BlockDiagram.routeLine</code>.</p>	{'deferred'}   'none'   'immediate'
ModelBrowserVisibility	<p>Show the Model Browser.</p> <p>In the Simulink Editor, in the <b>Modeling</b> tab, select <b>Environment &gt; Model Browser</b>.</p>	'on'   {'off'}
ModelBrowserWidth	<p>Width of the Model Browser pane in the model window. To display the Model Browser pane, see the <code>ModelBrowserVisibility</code> parameter.</p>	integer — {200}
ModelBlockNormalModeVisibility	<p>Use with <code>set_param</code> to set normal mode visibility on for the specified Model blocks.</p> <p>You can set this parameter with the Model Block Normal Mode Visibility dialog box. For details, see “Specify the Instance Having Normal Mode Visibility”.</p>	<p>With <code>set_param</code>, use an array of <code>Simulink.BlockPath</code> objects or cell array of cell arrays of character vectors of paths to blocks or models.</p> <p>With <code>set_param</code>, an empty array specifies to use the Simulink default selection for the instance to have normal mode visibility enabled.</p>
ModelBlockNormalModeVisibilityBlockPath	<p>Return information about which Model blocks have normal mode visibility enabled. Use with a model that you are editing.</p>	<p>Return values indicate which Model blocks have normal mode visibility enabled. See “Simulate Multiple Referenced Model Instances in Normal Mode”.</p>
PortDataTypeDisplayFormat	<p>When you display port data types in a model, choose whether to display data type aliases, base data types, or both.</p> <p>In the Simulink Editor, in the <b>Debug</b> tab, set by <b>Information Overlays &gt; Base Data Types</b> and <b>Information Overlays &gt; Alias Data Types</b>.</p>	{'AliasTypeOnly'}   'BaseTypeOnly'   'BaseAndAliasTypes'

Parameter	Description	Values
ReqHilite	Highlights all the blocks in the Simulink diagram that have requirements associated with them.  In the Simulink Editor, in the <b>Apps</b> tab, under <b>Verification, Validation, and Test</b> , click <b>Requirements Viewer</b> . The <b>Requirements Viewer</b> tab appears. Click <b>Highlight Links</b> .	'on'   {'off'}
SampleTimeAnnotations	In the Simulink Editor, in the <b>Debug</b> tab, select <b>Information Overlays &gt; Text</b> .	'on'   {'off'}
SampleTimeColors	In the Simulink Editor, in the <b>Debug</b> tab, select <b>Information Overlays &gt; Colors</b> .	'on'   {'off'}
ScreenColor	Background color of the model window.  In the Simulink Editor, on the <b>Format</b> tab, set <b>Background</b> .	'black'   {'white'}   'red'   'green'   'blue'   'cyan'   'magenta'   'yellow'   'gray'   'lightBlue'   'orange'   'darkGreen'   [r,g,b,a] where r, g, b, and a are the red, green, blue, and alpha values of the color normalized to the range 0.0 to 1.0. The alpha value is ignored.
ShowLinearization-Annotations	Toggles linearization icons in the model.	{'on'}   'off'
ShowLineDimensions	Show signal dimensions on this model's block diagram.  In the Simulink Editor, on the <b>Debug</b> tab, select <b>Information Overlays &gt; Signal Dimensions</b> .	'on'   {'off'}
ShowLoopsOnError	Highlight invalid loops graphically.	{'on'}   'off'
ShowModelReferenceBlockIO	Toggles display of I/O mismatch on block.  In the Simulink Editor, in the <b>Debug</b> tab, select <b>Information Overlays &gt; Ref. Model I/O Mismatch</b> .	'on'   {'off'}
ShowModelReference-BlockVersion	Toggles display of version on block.  In the Simulink Editor, in the <b>Debug</b> tab, select <b>Information Overlays &gt; Ref. Model Version</b> .	'on'   {'off'}

Parameter	Description	Values
ShowPageBoundaries	<p>Toggles display of page boundaries on the Simulink Editor canvas.</p> <p>In the Simulink Editor, in the <b>Simulation</b> tab, select <b>Print &gt; Show Page Boundaries</b>.</p>	'on'   {'off'}
ShowPortDataTypes	<p>Show data types of ports on this model's block diagram.</p> <p>In the Simulink Editor, in the <b>Debug</b> tab, select <b>Information Overlays &gt; Base Data Types</b>.</p>	'on'   {'off'}
ShowPortUnits	<p>Show units of ports, subsystem, and model block icons on the model block diagram.</p> <p>In the Simulink Editor, in the <b>Debug</b> tab, select <b>Information Overlays &gt; Port Units</b>.</p>	'on'   {'off'}
ShowStorageClass	<p>Show storage classes of signals on this model's block diagram.</p> <p>In the Simulink Editor, in the <b>Debug</b> tab, select <b>Information Overlays &gt; Storage Class</b>.</p>	'on'   {'off'}
ShowTestPointIcons	<p>Show test point icons on this model's block diagram.</p> <p>In the Simulink Editor, in the <b>Debug</b> tab, select <b>Information Overlays &gt; Log &amp; Testpoint</b>.</p>	{'on'}   'off'
ShowViewerIcons	<p>Show viewer icons on this model's block diagram.</p> <p>In the Simulink Editor, in the <b>Debug</b> tab, select <b>Information Overlays &gt; Viewers</b>.</p>	{'on'}   'off'
ZoomFactor	<p>Zoom factor of the Simulink Editor window expressed as a percentage of normal (100%) or by the keywords FitSystem or FitSelection.</p> <p>In the Simulink Editor, on the <b>Modeling</b> tab, select one of the options under <b>Environment &gt; Zoom</b>.</p>	{'100'}   'FitSystem'   'FitSelection'

<b>Parameter</b>	<b>Description</b>	<b>Values</b>
WideLines	<p>Draws lines that carry vector or matrix signals wider than lines that carry scalar signals.</p> <p>In the Simulink Editor, on the <b>Debug</b> tab, select <b>Information Overlays &gt; Nonscalar Signals</b>.</p>	'on'   {'off'}

## **Common Block Properties**

This table lists the properties common to all Simulink blocks, including block callback properties (see “Customize Model Behavior with Callbacks”). Examples of commands that change these properties follow this table (see “Examples of Setting Block Properties” on page 6-23).

## Common Block Properties

Property	Description	Values
AncestorBlock	Name of the library block that the block is linked to (for blocks with a disabled link).	character vector
AttributesFormatString	Block annotation text (corresponds to block properties).	character vector
BackgroundColor	Block background color.	color value   '[r,g,b]'   '[r,g,b,a]'  r, g, and b, are the red, green, blue values of the color in the range 0.0 to 1.0. If specified, the alpha value (a) is ignored.  Possible color values are 'black', 'white', 'red', 'green', 'blue', 'cyan', 'magenta', 'yellow', 'gray', 'lightBlue', 'orange', 'darkGreen'.
BlockDescription	Block description shown at the top of the block parameters dialog box or property inspector.	character array
BlockType	Block type (read-only).	character array
BlockKeywords	Associates one or more keywords with a custom library block.	character vector   string scalar   string array
ClipboardFcn	Function called when block is copied to the clipboard ( <b>Ctrl+C</b> ) or when the menu item <b>Copy</b> is selected.	function   character vector
CloseFcn	Function called when <code>close_system</code> is run on block.	function   character vector
Commented	Exclude block from simulation.	{'off'}   'on'   'through'
CompiledBusType	Returns whether the signal connected to a port is not a bus, is a virtual, or is a nonvirtual bus (read-only).  Specify a port or line handle when using <code>get_param</code> . For example:  <code>ports = get_param(gcb, 'PortHandles');</code> <code>feval(gcs, [], [], [], 'compile');</code> <code>bt = get_param(ports.Outputport, 'CompiledBusType')</code>  See "Display Bus Information".	'NOT_BUS'   'VIRTUAL_BUS'   'NON_VIRTUAL_BUS'

Property	Description	Values
CompiledIsActive	<p>Specifies whether the block status is active at compile time.</p> <p>CompiledIsActive returns off if any one of these conditions is true at compile time:</p> <ul style="list-style-type: none"> <li>Block is an inactive path of an inline variant.</li> <li>Block is an inactive choice of a variant subsystem.</li> <li>Block is in a subsystem that is commented out.</li> <li>Block is inactive due to a condition propagated from a variant subsystem.</li> </ul> <p>CompiledisActive returns off for inactive choices and returns on for active choices of a variant subsystem.</p>	'off'   'on'
CompiledPortComplexSignals	<p>Complexity of port signals after updating diagram. You must compile the model before querying this property. For example:</p> <pre>vdp([], [], [], 'compile'); d = get_param(gcb, 'CompiledPortComplexSignals'); vdp([], [], [], 'term');</pre>	structure array
CompiledPortDataTypes	<p>Data types of port signals after updating diagram. You must compile the model before querying this property. See CompiledPortComplexSignals .</p>	structure array
CompiledPortDesignMin	<p>Design minimum of port signals after updating diagram. You must compile the model before querying this property. For example:</p> <pre>feval(gcs, [], [], [], 'compile'); ports = get_param(gcb, 'PortHandles'); min = get_param(ports.Outputport, 'CompiledPortDesignMin'); feval(model, [], [], [], 'term');</pre>	structure array
CompiledPortDesignMax	<p>Design maximum of port signals at compile time. You must compile the model before querying this property. For example:</p> <pre>feval(gcs, [], [], [], 'compile'); ports = get_param(gcb, 'PortHandles'); max = get_param(ports.Outputport, 'CompiledPortDesignMax'); feval(model, [], [], [], 'term');</pre>	structure array
CompiledPortDimensions	<p>Dimensions of port signals after updating diagram. You must compile the model before querying this property. For details, see “Get Compiled Port Dimensions”.</p>	numeric array

Property	Description	Values
CompiledPortDimensionsMode	Indication whether the port signal has a variable size (after updating diagram). You must compile the model before querying this property. See “Determine Whether Signal Line Has Variable Size”.	double number. 0 indicates the signal does not have a variable size. 1 indicates the signal has a variable size.
CompiledPortFrameData	Frame mode of port signals after updating diagram. You must compile the model before querying this property.	structure array
CompiledPortUnits	Structure array of block port units (after updating diagram). You must compile the model before querying this property.	structure array
CompiledPortWidths	Structure of port widths after updating diagram. You must compile the model before querying this property.	structure array
CompiledSampleTime	Block sample time after updating diagram. You must compile the model before querying this property.	vector [sample time, offset time] or cell {[sample time 1, offset time 1]; [sample time 2, offset time 2];..... [sample time n, offset time n]}
ContinueFcn	Function called at the restart of a simulation (after a pause).	function   character vector
CopyFcn	Function called when block is copied. See “Block Callbacks” for details.	function   character vector
DataTypeOverrideCompiled	For internal use.	
DeleteFcn	Function called when block is deleted. See “Block Callbacks” for details.	MATLAB expression
DestroyFcn	Function called when block is destroyed. See “Block Callbacks” for details.	MATLAB expression
Description	Description of block. Set by the <b>Description</b> field in the <b>General</b> pane of the Block Properties dialog box.	text and tokens
Diagnostics	For internal use.	
DialogParameters	List of names/attributes of block-specific parameters for an unmasked block, or mask parameters for a masked block.	structure
DropShadow	Display drop shadow.	{'off'}   'on'
ExtModeLogging-Supported	Enable a block to support uploading of signal data in external mode, for example, with a scope block.	{'off'}   'on'
ExtModeLogging-Trig	Enable a block to act as the trigger block for external mode signal uploading.	{'off'}   'on'

Property	Description	Values
ExtModeUploadOption	Enable a block to upload signal data in external mode when the <b>Select all</b> check box on the External Signal & Triggering dialog box is not selected. A value of <code>log</code> indicates the block uploads signals. A value of <code>none</code> indicates the block does not upload signals. The value <code>monitor</code> is currently not in use. If the <b>Select all</b> check box on the External Signal & Triggering dialog box is selected, it overrides this parameter setting.	{'none'}   'log'   'monitor'
FontAngle	Font angle.	'normal'   'italic'   'oblique'   {'auto'}
FontName	Font name.	character array
FontSize	Font size. A value of -1 specifies that this block inherits the font size specified by the <code>DefaultBlockFontSize</code> model parameter.	real {'-1'}
FontWeight	Font weight.	'light'   'normal'   'demi'   'bold'   {'auto'}
ForegroundColor	Foreground color of block icon.	color value   '[r,g,b]'   '[r,g,b,a]'  r, g, and b, are the red, green, blue values of the color in the range 0.0 to 1.0. The value changes if it is too similar to the canvas color ( <code>ScreenColor</code> parameter). Use <code>get_param</code> to return the actual value. If specified, the alpha value (a) is ignored.  Possible color values are 'black', 'white', 'red', 'green', 'blue', 'cyan', 'magenta', 'yellow', 'gray', 'lightBlue', 'orange', 'darkGreen'.
Handle	Block handle.	real
HideAutomaticName	Specify whether the block name given automatically by the Simulink Editor displays in the model. To hide automatic names, use the default setting of 'on'. (The <code>HideAutomaticNames</code> parameter for the model must also be set to 'on'.) Set to 'off' to display the name, and also set the block <code>ShowName</code> parameter to 'on'. Blocks whose <code>ShowName</code> parameter is 'off' are hidden regardless of this setting. For more information on how the parameters interact, see "Hide or Display Block Names".	{'on'}   'off'

Property	Description	Values
HiliteAncestors	For internal use.	
InitFcn	Initialization function for a block. Created on the <b>Callbacks</b> pane of the Model Properties dialog box. For more information, see “Create Model Callbacks”.  On non-masked blocks, updating the diagram or running the simulation call this function.	MATLAB expression
InputSignalNames	Names of input signals.	cell array
IntrinsicDialogParameters	List of names/attributes of block-specific parameters (regardless of whether the block is masked or unmasked). Use instead of <code>DialogParameters</code> if you want block-specific parameters for masked or unmasked blocks.	structure
IOSignalStrings	Block paths to objects that are connected to the Viewers & Generators Manager. Simulink software saves these paths when the model is saved.	list
IOType	Viewers & Generators Manager type. For internal use.	
IsStateOwnerBlock	Indicates whether the block is a supported state owner block that can be used with the State Reader and State Writer blocks (read-only). See State Reader and State Writer.	'off'   'on'
LibraryVersion	For a linked block, the initial value of this property is the <code>ModelVersion</code> of the library at the time the link was created. The value updates with increments in the model version of the library.	character vector — {'1.1'}
LineHandles	Handles of lines connected to block.	structure
LinkData	Array of details about changes to the blocks inside the link that differ between a parameterized link and its library, listing the block names and parameter values. Use [] to reset to deparameterized, for example, <code>set_param(gcb, 'linkData', [])</code> .	cell array
LinkStatus	Link status of block. Updates out-of-date linked blocks when queried using <code>get_param</code> .  See “Control Linked Block Programmatically”.	'none'   'resolved'   'unresolved'   'implicit'   'inactive'   'restore'   'propagate'   'propagateHierarchy'   'restoreHierarchy'
LoadFcn	Function called when block is loaded.	MATLAB expression

Property	Description	Values
MinMaxOverflow-Logging_Compiled	For internal use.	
ModelCloseFcn	Function called when model is closed. The <code>ModelCloseFcn</code> is called prior to the block <code>DeleteFcn</code> and <code>DestroyFcn</code> callbacks, if either are set.	MATLAB expression
ModelParamTable-Info	For internal use.	
MoveFcn	Function called when block is moved.	MATLAB expression
Name	Block or signal name.  To specify a signal name, use the corresponding port or line handle.  <code>ports = get_param(gcf, 'PortHandles');</code> <code>set_param(ports.Outport(1), 'Name', 'NewName');</code>  To propagate the signal name, compile the model. In the Simulink Toolstrip, on the <b>Modeling</b> tab, click <b>Update Model</b> .  Alternatively, to name an output signal of a block, you can use <code>SignalNameFromLabel</code> .	character vector
NameChangeFcn	Function called when block name is changed.	MATLAB expression
NamePlacement	Position of block name.	{'normal'}   'alternate'
ObjectParameters	Names/attributes of block parameters.	structure
OpenFcn	Function called when this Block Parameters dialog box opens.	MATLAB expression
Orientation	Where block faces.	{'right'}   'left'   'up'   'down'
OutputSignalNames	Names of output signals.	cell array
Parent	Name of the system that owns the block.	character vector {'untitled'}
ParentCloseFcn	Function called when parent subsystem is closed. The <code>ParentCloseFcn</code> of blocks at the root model level is not called when the model is closed.	MATLAB expression
PauseFcn	Function called at the pause of a simulation.	function   character vector

Property	Description	Values
PortConnectivity	<p>The value of this property is an array of structures, each of which describes one of the block input or output ports. Each port structure has the following fields:</p> <ul style="list-style-type: none"> <li>• <b>Type</b> Specifies the port type and/or number. The value of this field can be: <ul style="list-style-type: none"> <li>• <math>n</math>, where <math>n</math> is the number of the port for data ports</li> <li>• 'enable' if the port is an enable port</li> <li>• 'trigger' if the port is a trigger port</li> <li>• 'state' for state ports</li> <li>• 'ifaction' for action ports</li> <li>• 'LConn#' for a left connection port where # is the port number</li> <li>• 'RConn#' for a right connection port where # is the port number</li> <li>• 'event' for reinitialize event ports of subsystems</li> </ul> </li> <li>• <b>Position</b> The value of this field is a two-element vector, <math>[x\ y]</math>, that specifies the port position.</li> <li>• <b>SrcBlock</b> Handle of the block connected to this port. This field is null for output ports and -1 for unconnected input ports. SrcBlock property is a valid source handle for Variant Subsystem blocks.</li> <li>• <b>SrcPort</b> Number of the port connected to this port, starting at zero. This field is null for both output ports and unconnected input ports.</li> <li>• <b>DstBlock</b> Handle of the block to which this port is connected. This field is null for input ports and contains a 1-by-0 empty matrix for unconnected output ports.</li> </ul>	structure array

Property	Description	Values
	<ul style="list-style-type: none"> <li>• <b>DstPort</b></li> </ul> <p>Number of the port to which this port is connected, starting at zero. This field is null for input ports and contains a 1-by-0 empty matrix for unconnected output ports. For Simscape blocks, the field contains port handles.</p>	
PortHandles	<p>The value of this property is a structure that specifies the handles of the block ports. The structure has the following fields:</p> <ul style="list-style-type: none"> <li>• <b>Inport</b> Handles of the input ports.</li> <li>• <b>Outport</b> Handles of the output ports.</li> <li>• <b>Enable</b> Handle of the enable port.</li> <li>• <b>Trigger</b> Handle of the trigger port.</li> <li>• <b>State</b> Handle of the state port.</li> <li>• <b>LConn</b> Handles of the left connection ports (for blocks that support Physical Modeling tools).</li> <li>• <b>RConn</b> Handles of the right connection ports (for blocks that support Physical Modeling tools).</li> <li>• <b>Ifaction</b> Handle of the action port.</li> <li>• <b>Reset</b> Handle of the reset port.</li> <li>• <b>Event</b> Handles of the subsystem reinitialize event ports.</li> </ul>	structure array

Property	Description	Values
PortRotationType	Type of port rotation used by this block (read-only).	'default'   'physical'
Ports	<p>A vector that specifies the number of each kind of port this block has. The order of the vector elements corresponds to the following port types:</p> <ul style="list-style-type: none"> <li>• Inport</li> <li>• Outport</li> <li>• Enable</li> <li>• Trigger</li> <li>• State</li> <li>• LConn</li> <li>• RConn</li> <li>• Ifaction</li> <li>• Reset</li> <li>• Event</li> </ul>	vector
Position	<p>Position of block in model window.</p> <p>To help with block alignment, the position you set can differ from the actual block position by a few pixels. Use <code>get_param</code> to return the actual position.</p>	<p>vector of coordinates, in pixels: [left top right bottom]</p> <p>The origin is the upper-left corner of the Simulink Editor canvas before any canvas resizing. Supported coordinates are between -1073740824 and 1073740823, inclusive. Positive values are to the right of and down from the origin. Negative values are to the left of and up from the origin.</p>
PostSaveFcn	Function called after the block is saved.	MATLAB expression
PreCopyFcn	Function called before the block is copied. See "Block Callbacks" for details.	MATLAB expression
PreDeleteFcn	Function called before the block is deleted. See "Block Callbacks" for details.	MATLAB expression
PreSaveFcn	Function called before the block is saved. See "Block Callbacks" for details.	MATLAB expression
Priority	Specifies the block order of execution relative to other blocks in the same model. Set by the <b>Priority</b> field on the <b>General</b> pane of the Block Properties dialog box.	character vector { ' ' }
ReferenceBlock	Name of the library block to which this block links.	character vector { ' ' }
RequirementInfo	For internal use.	

Property	Description	Values
RTWData	User specified data, used by Simulink Coder software. Intended only for use with user written S-functions. See the section “S-Function RTWdata” (Simulink Coder) for details.	
SampleTime	Value of the sample time parameter. See “Specify Sample Time” for more details.	character vector
Selected	Status of whether or not block is selected.	{'on'}   'off'
ShowName	Display or hide block name.  To display a block name given by the Simulink Editor (automatic names), set the block 'HideAutomaticName' parameter to 'off' and ShowName to 'on'. To hide an automatic block name given by the Editor, set ShowName to 'on', HideAutomaticName to 'on', and HideAutomaticNames on the model to 'on'. For more information on how the parameters interact, see “Hide or Display Block Names”.	{'on'}   'off'
SignalHierarchy	If the signal is a bus, returns the name and hierarchy of the signals in the bus (read-only).  Specify a port or line handle when using <code>get_param</code> . For example:  <pre>ports = get_param(gcb, 'PortHandles'); feval(gcs, [], [], [], 'compile'); sh = get_param(ports.Outputport, 'SignalHierarchy')</pre> See “Display Bus Information”.	values reflect the structure of the signal that you specify
StartFcn	Function called at the start of a simulation.	MATLAB expression
StatePerturbationForJacobian	State perturbation size to use during linearization. See “Change Perturbation Level of Blocks Perturbed During Linearization” (Simulink Control Design) for details.	character vector
StaticLinkStatus	Link status of block. Does not update out-of-date linked blocks when queried using <code>get_param</code> . See also <code>LinkStatus</code> .	'none'   'resolved'   'unresolved'   'implicit'   'inactive'   'restore'   'propagate'   'propagateHierarchy'   'restoreHierarchy'
StopFcn	Function called at the termination of a simulation.	MATLAB expression

Property	Description	Values
Tag	Text that appears in the block label that Simulink software generates. Set by the <b>Tag</b> field on the <b>General</b> pane of the Block Properties dialog box.	character vector {''}
Type	Simulink object type (read-only).	'block'
UndoDeleteFcn	Function called when block deletion is undone.	MATLAB expression
UserData	User-specified data that can have any MATLAB data type.	{''}
UserDataPersistent	Status of whether or not UserData will be saved in the model file.	'on'   {'off'}
VariantConfigurationObject	Specifies the variant configuration object that is associated with the model. See “Save and Reuse Variant Configurations Using Variant Configuration Data Object”.	{''} The value is an empty character vector if no configuration object is associated; otherwise, it is the name of a Simulink.VariantConfigurationData object.

## Examples of Setting Block Properties

These examples illustrate how to change common block properties.

This command changes the orientation of the Gain block in the mymodel system so it faces the opposite direction (right to left).

```
set_param('mymodel/Gain','Orientation','left')
```

This command associates an OpenFcn callback with the Gain block in the mymodel system.

```
set_param('mymodel/Gain','OpenFcn','my_open_cb')
```

This command sets the Position property of the Gain block in the mymodel system. The block is 75 pixels wide by 25 pixels high.

```
set_param('mymodel/Gain','Position',[50 250 125 275])
```

## Block-Specific Parameters

To write scripts that create and modify models, you can use the `get_param` and `set_param` functions to query and modify the properties and parameters of a block or diagram. Use the tables to determine the programmatic name of a parameter or property in a block dialog box.

## Programmatic Parameters of Blocks and Models

Programmatic parameters that describe a model are model parameters. Parameters that describe a block are block parameters. Parameters that are common to all Simulink blocks are common block parameters (see “Common Block Properties” on page 6-12). Many blocks also have unique block-specific parameters. A masked block can have mask parameters (see “Mask Parameters” on page 6-128).

The model and block properties also include callbacks, which are commands that execute when a certain model or block event occurs. These events include opening a model, simulating a model, copying a block, opening a block, etc. See “Model, Block, and Port Callbacks”.

---

**Tip** For block parameters that accept array values, the number of elements in the array cannot exceed what `int_T` can represent. This limitation applies to both simulation and Simulink Coder code generation.

---

The maximum number of characters that a parameter edit field can contain is 49,000.

---

## Block-Specific Parameters and Programmatic Equivalents

The tables list block-specific parameters for Simulink blocks. The type of the block appears in parentheses after the block name. Some Simulink blocks work as masked subsystems. The tables indicate masked blocks by adding the designation “masked subsystem” after the block type.

The type listed for nonmasked blocks is the value of the `BlockType` parameter (see “Common Block Properties” on page 6-12). The type listed for masked blocks is the value of the `MaskType` parameter (see “Mask Parameters” on page 6-128).

The **Dialog Box Prompt** column indicates the text of the prompt for the parameter in the block dialog box. The **Values** column shows the type of value required (scalar, vector, variable), the possible values (separated with a vertical line), and the default value (enclosed in braces).

**Continuous Library Block Parameters**

Block (Type)/Parameter	Dialog Box Prompt	Values
Derivative (Derivative)		
CoefficientInTFApproximation	Coefficient $c$ in the transfer function approximation $s/(c*s+1)$ used for linearization	{'inf'}
Integrator (Integrator)		
ExternalReset	External reset	{'none'}   'rising'   'falling'   'either'   'level'   'level hold'
InitialConditionSource	Initial condition source	{'internal'}   'external'
InitialCondition	Initial condition	scalar or vector — {'0'}
LimitOutput	Limit output	{'off'}   'on'
UpperSaturationLimit	Upper saturation limit	scalar or vector — {'inf'}
LowerSaturationLimit	Lower saturation limit	scalar or vector — {'-inf'}
ShowSaturationPort	Show saturation port	{'off'}   'on'
ShowStatePort	Show state port	{'off'}   'on'
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'}   {'-1'}   any real scalar or vector
IgnoreLimit	Ignore limit and reset when linearizing	{'off'}   'on'
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
ContinuousStateAttributes	State Name	{' '}   user-defined
WrapState	Wrap state	{'off'}   'on'
WrappedStateUpperValue	Upper value of wrapped state	scalar or vector — {'pi'}
WrappedStateLowerValue	Lower value of wrapped state	scalar or vector — {'-pi'}
Second-Order Integrator (SecondOrderIntegrator)		
ICSourceX	Initial condition source $x$	{'internal'}   'external'
ICX	Initial condition $x$	scalar or vector — {'0'}
LimitX	Limit $x$	{'off'}   'on'
UpperLimitX	Upper limit $x$	scalar or vector — {'inf'}
LowerLimitX	Lower limit $x$	scalar or vector — {'-inf'}
WrapStateX	Enable wrapping of $x$	{'off'}   'on'
WrappedUpperValueX	Upper value for wrapping $x$	scalar or vector — {'pi'}
WrappedLowerValueX	Lower value for wrapping $x$	scalar or vector — {'-pi'}
AbsoluteToleranceX	Absolute tolerance $x$	character vector, scalar, or vector — {'auto'}   {'-1'}   any real scalar or vector
StateNameX	State name $x$	{ }   user-defined

Block (Type)/Parameter	Dialog Box Prompt	Values
ICSourceDXDT	Initial condition source dx/dt	{'internal'}   'external'
ICDXDT	Initial condition dx/dt	scalar or vector — {'0'}
LimitDXDT	Limit dx/dt	{'off'}   'on'
UpperLimitDXDT	Upper limit dx/dt	scalar or vector — {'inf'}
LowerLimitDXDT	Lower limit dx/dt	scalar or vector — {'-inf'}
AbsoluteToleranceDXDT	Absolute tolerance dx/dt	character vector, scalar, or vector — {'auto'}   {'-1'}   any real scalar or vector
StateNameDXDT	State name dx/dt	{ }   user-defined
ExternalReset	External reset	{'none'}   'rising'   'falling'   'either'
ZeroCross	Enable zero-crossing detection	{'on'}   'off'
ReinitDXDTwhenXreachesSaturation	Reinitialize dx/dt when x reaches saturation	{'off'}   'on'
IgnoreStateLimitsAndResetForLinearization	Ignore state limits and the reset for linearization	{'off'}   'on'
ShowOutput	Show output	{'both'}   'x'   'dxdt'
<b>State-Space (StateSpace)</b>		
A	A	matrix — {'1'}
B	B	matrix — {'1'}
C	C	matrix — {'1'}
D	D	matrix — {'1'}
InitialCondition	Initial conditions	vector — {'0'}
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'}   {'-1'}   any real scalar or vector
ContinuousStateAttributes	State Name	{' '}   user-defined
<b>Transfer Fcn (TransferFcn)</b>		
Numerator	Numerator coefficients	vector or matrix — {'[1]'}
Denominator	Denominator coefficients	vector — {'[1 1]'}
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'}   {'-1'}   any real scalar or vector
ContinuousStateAttributes	State Name	{' '}   user-defined
<b>Transport Delay (TransportDelay)</b>		
DelayTime	Time delay	scalar or vector — {'1'}
InitialOutput	Initial output	scalar or vector — {'0'}
BufferSize	Initial buffer size	scalar — {'1024'}
FixedBuffer	Use fixed buffer size	{'off'}   'on'

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
TransDelayFeedthrough	Direct feedthrough of input during linearization	{'off'}   'on'
PadeOrder	Pade order (for linearization)	{'0'}
Variable Time Delay (VariableTimeDelay)		
VariableDelayType	Select delay type	'Variable transport delay'   {'Variable time delay'}
MaximumDelay	Maximum delay	scalar or vector — {'10'}
InitialOutput	Initial output	scalar or vector — {'0'}
MaximumPoints	Initial buffer size	scalar — {'1024'}
FixedBuffer	Use fixed buffer size	{'off'}   'on'
ZeroDelay	Handle zero delay	{'off'}   'on'
TransDelayFeedthrough	Direct feedthrough of input during linearization	{'off'}   'on'
PadeOrder	Pade order (for linearization)	{'0'}
ContinuousStateAttributes	State Name	{' '}   user-defined
Variable Transport Delay (VariableTransportDelay)		
VariableDelayType	Select delay type	{'Variable transport delay'}   'Variable time delay'
MaximumDelay	Maximum delay	scalar or vector — {'10'}
InitialOutput	Initial output	scalar or vector — {'0'}
MaximumPoints	Initial buffer size	scalar — {'1024'}
FixedBuffer	Use fixed buffer size	{'off'}   'on'
TransDelayFeedthrough	Direct feedthrough of input during linearization	{'off'}   'on'
PadeOrder	Pade order (for linearization)	{'0'}
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'}   {'-1'}   any positive real scalar or vector
ContinuousStateAttributes	State Name	{' '}   user-defined
Zero-Pole (ZeroPole)		
Zeros	Zeros	vector — {'[1]'} vector — {'[0 -1]'} vector — {'[1]'} character vector, scalar, or vector — {'auto'}   {'-1'}   any positive real scalar or vector
Poles	Poles	
Gain	Gain	
AbsoluteTolerance	Absolute tolerance	
ContinuousStateAttributes	State Name	{' '}   user-defined

**Discontinuities Library Block Parameters**

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
<b>Backlash (Backlash)</b>		
BacklashWidth	Deadband width	scalar or vector — {'1'}
InitialOutput	Initial output	scalar or vector — {'0'}
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
<b>Coulomb &amp; Viscous Friction (Coulombic and Viscous Friction) (masked subsystem)</b>		
offset	Coulomb friction value (Offset)	{'[1 3 2 0]'}
gain	Coefficient of viscous friction (Gain)	{'1'}
<b>Dead Zone (DeadZone)</b>		
LowerValue	Start of dead zone	scalar or vector — {'-0.5'}
UpperValue	End of dead zone	scalar or vector — {'0.5'}
SaturateOnIntegerOverflow	Saturate on integer overflow	'off'   {'on'}
LinearizeAsGain	Treat as gain when linearizing	'off'   {'on'}
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
<b>Dead Zone Dynamic (Dead Zone Dynamic) (masked subsystem)</b>		
<b>Hit Crossing (HitCross)</b>		
HitCrossingOffset	Hit crossing offset	scalar or vector — {'0'}
HitCrossingDirection	Hit crossing direction	'rising'   'falling'   {'either'}
ShowOutputPort	Show output port	'off'   {'on'}
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
<b>Quantizer (Quantizer)</b>		
QuantizationInterval	Quantization interval	scalar or vector — {'0.5'}
LinearizeAsGain	Treat as gain when linearizing	'off'   {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
<b>Rate Limiter (RateLimiter)</b>		
RisingSlewLimit	Rising slew rate	{'1'}
FallingSlewLimit	Falling slew rate	{'-1'}
SampleTimeMode	Sample time mode	'continuous'   {'inherited'}
InitialCondition	Initial condition	{'0'}
LinearizeAsGain	Treat as gain when linearizing	'off'   {'on'}
<b>Rate Limiter Dynamic (Rate Limiter Dynamic) (masked subsystem)</b>		
<b>Relay (Relay)</b>		

Block (Type)/Parameter	Dialog Box Prompt	Values
OnSwitchValue	Switch on point	{'eps'}
OffSwitchValue	Switch off point	{'eps'}
OnOutputValue	Output when on	{'1'}
OffOutputValue	Output when off	{'0'}
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via back propagation'   {'Inherit: All ports same datatype'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16)'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
Saturation (Saturate)		
UpperLimit	Upper limit	scalar or vector — {'0.5'}
LowerLimit	Lower limit	scalar or vector — {'-0.5'}
LinearizeAsGain	Treat as gain when linearizing	'off'   {'on'}
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via back propagation'   {'Inherit: Same as input'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
Saturation Dynamic (Saturation Dynamic) (masked subsystem)		
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Same as second input'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
OutputDataTypeScalingMode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
DoSatur	Saturate on integer overflow	{'off'}   'on'
Wrap To Zero (Wrap To Zero) (masked subsystem)		
Threshold	Threshold	{'255'}

**Discrete Library Block Parameters**

Block (Type)/Parameter	Dialog Box Prompt	Values
Delay (Delay)		
DelayLengthSource	Delay length > Source	{'Dialog'}   'Input port'
DelayLength	Delay length > Value	{'2'}
DelayLengthUpperLimit	Delay length > Upper limit	{'100'}
InitialConditionSource	Initial condition > Source	{'Dialog'}   'Input port'
InitialCondition	Initial condition > Value	{'0.0'}
ExternalReset	External reset	{'None'}   'Rising'   'Falling'   'Either'   'Level'   'Level hold'
InputProcessing	Input processing	'Columns as channels (frame based)'   {'Elements as channels (sample based)'}   'Inherited'
UseCircularBuffer	Use circular buffer for state	{'off'}   'on'
PreventDirectFeedthrough	Prevent direct feedthrough	{'off'}   'on'
RemoveDelayLengthCheckInGeneratedCode	Remove delay length check in generated code	{'off'}   'on'
DiagnosticForDelayLength	Diagnostic for delay length	{'None'}   'Warning'   'Error'
SampleTime	Sample time (-1 for inherited)	{'-1'}
StateName	State name	{''}
StateMustResolveToSignalObject	State name must resolve to Simulink signal object	{'off'}   'on'
StateSignalObject	Signal object class	Simulink.Signal object
	Code generation storage class	Object of a class that is derived from Simulink.Signal
StateStorageClass	Code generation storage class	{'Auto'}   'Model default'   'ExportedGlobal'   'ImportedExtern'   'ImportedExternPointer'   'Custom'
CodeGenStateStorageTypeQualifier	Code generation storage type qualifier	{''}
Difference (Difference) (masked subsystem)		
ICPrevInput	Initial condition for previous input	{'0.0'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'}   'Inherit: Inherit via back propagation'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
OutputDataTypeScalingMode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'}   'on'
Discrete Derivative (Discrete Derivative) (masked subsystem)		
gainval	Gain value	{'1.0'}
ICPrevScaledInput	Initial condition for previous weighted input $K*u/Ts$	{'0.0'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'}   'Inherit: Inherit via back propagation'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
OutputDataTypeScalingMode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'}   'on'
Discrete FIR Filter (Discrete FIR Filter)		
CoefSource	Coefficient source	{'Dialog parameters'}   'Input port'
FilterStructure	Filter structure	{'Direct form'}   'Direct form symmetric'   'Direct form antisymmetric'   'Direct form transposed'   'Lattice MA'  <b>Note</b> You must have a DSP System Toolbox license to use a filter structure other than Direct form.
Coefficients	Coefficients	vector — {'[0.5 0.5]'}  <b>Note</b> You must have a DSP System Toolbox license to use a filter structure other than Direct form.
InputProcessing	Input processing	'Columns as channels (frame based)'   {'Elements as channels (sample based)'}  <b>Note</b> You must have a DSP System Toolbox license to use a filter structure other than Direct form.
InitialStates	Initial states	scalar or vector — {'0'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
CoefMin	Coefficients minimum	{'[]'}
CoefMax	Coefficients maximum	{'[]'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
TapSumDataTypeStr	Tap sum data type	{'Inherit: Same as input'}   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16,0)'
CoefDataTypeStr	Coefficients data type	{'Inherit: Same word length as input'}   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16)'   'fixdt(1,16,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
ProductDataTypeStr	Product output data type	{'Inherit: Inherit via internal rule'}   'Inherit: Same as input'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16,0)'
AccumDataTypeStr	Accumulator data type	{'Inherit: Inherit via internal rule'}   'Inherit: Same as input'   'Inherit: Same as product output'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16,0)'
StateDataTypeStr	State data type	'Inherit: Same as input'   {'Inherit: Same as accumulator'}   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16,0)'
OutDataTypeStr	Output data type	'Inherit: Same as input'   {'Inherit: Same as accumulator'}   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16)'   'fixdt(1,16,0)'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'}   'on'
Discrete Filter (DiscreteFilter)		
Numerator	Numerator coefficients	vector — {'[1]'}'
Denominator	Denominator coefficients	vector — {'[1 0.5]'}'
IC	Initial states	{'0'}
SampleTime	Sample time (-1 for inherited)	{'1'}
a0EqualsOne	Optimize by skipping divide by leading denominator coefficient (a0)	{'off'}   'on'
NumCoefMin	Numerator coefficient minimum	{'[]'}
NumCoefMax	Numerator coefficient maximum	{'[]'}
DenCoefMin	Denominator coefficient minimum	{'[]'}

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
DenCoefMax	Denominator coefficient maximum	{'[]'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
StateDataTypeStr	State data type	{'Inherit: Same as input'   'int8'   'int16'   'int32'   'fixdt(1,16,0)'}

## Logic and Bit Operations Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Bit Clear (Bit Clear) (masked subsystem)		
iBit	Index of bit (0 is least significant)	{'0'}
Bit Set (Bit Set) (masked subsystem)		
iBit	Index of bit (0 is least significant)	{'0'}
Bitwise Operator (S-Function) (Bitwise Operator) (masked subsystem)		
logicop	Operator	{'AND'   'OR'   'NAND'   'NOR'   'XOR'   'NOT'}
UseBitMask	Use bit mask ...	'off'   {'on'}
NumInputPorts	Number of input ports	{'1'}
BitMask	Bit Mask	{'bin2dec('11011001')'}
BitMaskRealWorld	Treat mask as	'Real World Value'   {'Stored Integer'}
Combinatorial Logic (CombinatorialLogic)		
TruthTable	Truth table	{'[0 0;0 1;0 1;1 0;0 1;1 0;1 0;1 1]'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Compare To Constant (Compare To Constant) (masked subsystem)		
relop	Operator	'=='   '~='   '<'   {'<='}   '>='   '>'
const	Constant value	{'3.0'}
OutDataTypeStr	Output data type	{'boolean'}   'uint8'
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
Compare To Zero (Compare To Zero) (masked subsystem)		
relop	Operator	'=='   '~='   '<'   {'<='}   '>='   '>'
OutDataTypeStr	Output data type	{'boolean'}   'uint8'
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
Detect Change (Detect Change) (masked subsystem)		
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'}   'uint8'
Detect Decrease (Detect Decrease) (masked subsystem)		
vinit	Initial condition	{'0.0'}
OutDataTypeStr	Output data type	{'boolean'}   'uint8'
Detect Fall Negative (Detect Fall Negative) (masked subsystem)		
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'}   'uint8'
Detect Fall Nonpositive (Detect Fall Nonpositive) (masked subsystem)		

Block (Type)/Parameter	Dialog Box Prompt	Values
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'}   'uint8'
Detect Increase (Detect Increase) (masked subsystem)		
vinit	Initial condition	{'0.0'}
OutDataTypeStr	Output data type	{'boolean'}   'uint8'
Detect Rise Nonnegative (Detect Rise Nonnegative) (masked subsystem)		
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'}   'uint8'
Detect Rise Positive (Detect Rise Positive) (masked subsystem)		
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'}   'uint8'
Extract Bits (Extract Bits) (masked subsystem)		
bitsToExtract	Bits to extract	{'Upper half'}   'Lower half'   'Range starting with most significant bit'   'Range ending with least significant bit'   'Range of bits'
numBits	Number of bits	{'8'}
bitIdxRange	Bit indices ([start end], 0-based relative to LSB)	{'[0 7]'}
outScalingMode	Output scaling mode	{'Preserve fixed-point scaling'}   'Treat bit field as an integer'
Interval Test (Interval Test) (masked subsystem)		
IntervalClosedRight	Interval closed on right	'off'   {'on'}
uplimit	Upper limit	{'0.5'}
IntervalClosedLeft	Interval closed on left	'off'   {'on'}
lowlimit	Lower limit	{'-0.5'}
OutDataTypeStr	Output data type	{'boolean'}   'uint8'
Interval Test Dynamic (Interval Test Dynamic) (masked subsystem)		
IntervalClosedRight	Interval closed on right	'off'   {'on'}
IntervalClosedLeft	Interval closed on left	'off'   {'on'}
OutDataTypeStr	Output data type	{'boolean'}   'uint8'
Logical Operator (Logic)		
Operator	Operator	{'AND'}   'OR'   'NAND'   'NOR'   'XOR'   'NXOR'   'NOT'
Inputs	Number of input ports	{'2'}

Block (Type)/Parameter	Dialog Box Prompt	Values
IconShape	Icon shape	{'rectangular'}   'distinctive'
SampleTime	Sample time (-1 for inherited)	{'-1'}
AllPortsSameDT	Require all inputs and output to have the same data type	{'off'}   'on'
OutDataTypeStr	Output data type	'Inherit: Logical (see Configuration Parameters: Optimization)'   {'boolean'}   'fixdt(1,16)'
<b>Relational Operator (RelationalOperator)</b>		
Operator	Relational operator	'=='   '~='   '<'   {'<='}   '>='   '>'   'isInf'   'isNaN'   'isFinite'
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have the same data type	{'off'}   'on'
OutDataTypeStr	Output data type	'Inherit: Logical (see Configuration Parameters: Optimization)'   {'boolean'}   'fixdt(1,16)'
<b>Shift Arithmetic (ArithShift)</b>		
BitShiftNumberSource	Bits to shift > Source	{'Dialog'}   'Input port'
BitShiftDirection	Bits to shift > Direction	'Left'   'Right'   {'Bidirectional'}
BitShiftNumber	Bits to shift > Number	{'8'}
BinPtShiftNumber	Binary points to shift > Number	{'0'}
DiagnosticFor00RShift	Diagnostic for out-of-range shift value	{'None'}   'Warning'   'Error'
Check00RBitShift	Check for out-of-range 'Bits to shift' in generated code	{'off'}   'on'
nBitShiftRight	Deprecated in R2011a	
nBinPtShiftRight	Deprecated in R2011a	

## Lookup Table Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Cosine (Cosine) (masked subsystem)		
Formula	Output formula	'sin(2*pi*u)'   {'cos(2*pi*u)'}   'exp(j*2*pi*u)'   'sin(2*pi*u) and cos(2*pi*u)'
NumDataPoints	Number of data points for lookup table	{'(2^5)+1'}
OutputWordLength	Output word length	{'16'}
InternalRulePriority	Internal rule priority for lookup table	{'Speed'}   'Precision'
Direct Lookup Table (n-D) (LookupNDDirect)		
NumberOfTableDimensions	Number of table dimensions	'1'   {'2'}   '3'   '4'
InputsSelectThisObjectFromTable	Inputs select this object from table	{'Element'}   'Vector'   '2-D Matrix'
TableIsInput	Make table an input	{'off'}   'on'
Table	Table data	{'[4 5 6;16 19 20;10 18 23]}'
DiagnosticForOutOfRangeInput	Diagnostic for out-of-range input	'None'   {'Warning'}   'Error'
SampleTime	Sample time (-1 for inherited)	{'-1'}
TableMin	Table minimum	{'[]}'
TableMax	Table maximum	{'[]}'
TableDataTypeStr	Table data type	{'Inherit: Inherit from 'Table data''}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'boolean'   'fixdt(1,16)'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'}   'on'
maskTabDims	Deprecated in R2009b	
explicitNumDims	Deprecated in R2009b	
outDims	Deprecated in R2009b	
tabIsInput	Deprecated in R2009b	
mxTable	Deprecated in R2009b	
clipFlag	Deprecated in R2009b	
samptime	Deprecated in R2009b	
Interpolation Using Prelookup (Interpolation_n-D)		
NumberOfTableDimensions	Number of table dimensions	'1'   {'2'}   '3'   '4'

Block (Type)/Parameter	Dialog Box Prompt	Values
Table	Table data > Value	{'sqrt([1:11]' * [1:11])'}
TableSource	Table data > Source	{'Dialog'}   'Input port'
TableSpecification	Specification	{'Explicit values'}     'Lookup table object'  To set this parameter from 'Explicit values' to 'Lookup table object', use the same call to set_param to set the parameter LookupTableObject. For example:  <pre>set_param('myModel/myInterpBlock',... 'TableSpecification',... 'Lookup table object',... 'LookupTableObject','myLUTObject')</pre>
LookupTableObject	Name of lookup table object	{''}
InterpMethod	Interpolation method	'Flat'   {'Linear point-slope'}   'Nearest'   'Linear Lagrange'
ExtrapMethod	Extrapolation method	'Clip'   {'Linear'}
ValidIndexMayReachLast	Valid index input may reach last index	{'off'}   'on'
DiagnosticForOutOfRangeInput	Diagnostic for out-of-range input	{'None'}   'Warning'   'Error'
RemoveProtectionIndex	Remove protection against out-of-range index in generated code	{'off'}   'on'
NumSelectionDims	Number of sub-table selection dimensions	{'0'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
TableDataTypeStr	Table data > Data Type	'Inherit: Inherit from 'Table data''   {'Inherit: Same as output'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16)'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
TableMin	Table data > Minimum	{'[]'}
TableMax	Table data > Maximum	{'[]'}
IntermediateResultsDataTy peStr	Intermediate results > Data Type	{'Inherit: Inherit via internal rule'}   'Inherit: Same as output'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output > Data Type	'Inherit: Inherit via back propagation'   {'Inherit: Inherit from table data'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
OutMin	Output > Minimum	{'[]'}
OutMax	Output > Maximum	{'[]'}
InternalRulePriority	Internal rule priority	{'Speed'}   'Precision'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'}   'on'
CheckIndexInCode	Deprecated in R2011a	
n-D Lookup Table, 1-D Lookup Table, 2-D Lookup Table (Lookup_n-D)		
NumberOfTableDimensions	Number of table dimensions	'1'   '2'   '3'   '4'. Default is '1' for 1-D Lookup Table, '2' for 2-D Lookup Table, '3' for n-D Lookup Table.
DataSpecification	(n-D Lookup Table) Data specification	{'Table and breakpoints'}   'Lookup table object'  To set this parameter from 'Table and breakpoints' to 'Lookup table object', use the same call to set_param to set the parameter LookupTableObject. For example:  set_param('myModel/myLookupBlock',... 'DataSpecification','Lookup table... object',... 'LookupTableObject','myLUTObject')
LookupTableObject	Name of lookup table object.	{''}
Table	Table data	{'reshape(repmat([4 5 6;16 19 20;10 18 23],1,2),[3,3,2])'}
BreakpointsSpecification	Breakpoints specification	{'Explicit values'}   'Even spacing'
BreakpointsFor-Dimension1FirstPoint	First point	{'1'}
BreakpointsFor-Dimension2FirstPoint	First point	{'1'}

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
BreakpointsFor-Dimension3FirstPoint	First point	{'1'}
...	...	...
BreakpointsFor-Dimension30FirstPoint	First point	{'1'}
BreakpointsFor-Dimension1Spacing	Spacing	{'1'}
BreakpointsFor-Dimension2Spacing	Spacing	{'1'}
BreakpointsFor-Dimension3Spacing	Spacing	{'1'}
...	...	...
BreakpointsFor-Dimension30Spacing	Spacing	{'1'}
BreakpointsForDimension1	Breakpoints 1	{'[10,22,31]}'}
BreakpointsForDimension2	Breakpoints 2	{'[10,22,31]}'}
BreakpointsForDimension3	Breakpoints 3	{'[5, 7]}'}
...	...	...
BreakpointsForDimension30	Breakpoints 30	{'[1:3]}'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InterpMethod	Interpolation method	'Flat'   'Nearest'   {'Linear point-slope'}   'Linear Lagrange'   'Cubic spline'
ExtrapMethod	Extrapolation method	'Clip'   {'Linear'}   'Cubic spline'
UseLastTableValue	Use last table value for inputs at or above last breakpoint	{'off'}   'on'
DiagnosticForOutOfRangeInput	Diagnostic for out-of-range input	{'None'}   'Warning'   'Error'
RemoveProtectionInput	Remove protection against out-of-range input in generated code	{'off'}   'on'
IndexSearchMethod	Index search method	'Evenly spaced points'   'Linear search'   {'Binary search'}
BeginIndexSearchUsingPreviousIndexResult	Begin index search using previous index result	{'off'}   'on'
UseOneInputPortForAllInputData	Use one input port for all input data	{'off'}   'on'
SupportTunableTableSize	Support tunable table size in code generation	{'off'}   'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
MaximumIndicesForEachDimension	Maximum indices for each dimension	{'[]'}
TableDataTypeStr	Table data > Data Type	'Inherit: Inherit from 'Table data''   {'Inherit: Same as output'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16)'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
TableMin	Table data > Minimum	{'[]'}
TableMax	Table data > Maximum	{'[]'}
BreakpointsForDimension1DataTypeStr	Breakpoints 1 > Data Type	{'Inherit: Same as corresponding input'}   'Inherit: Inherit from 'Breakpoint data''   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16)'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
BreakpointsForDimension1Min	Breakpoints 1 > Minimum	{'[]'}
BreakpointsForDimension1Max	Breakpoints 1 > Maximum	{'[]'}
BreakpointsForDimension2DataTypeStr	Breakpoints 2 > Data Type	{'Inherit: Same as corresponding input'}   'Inherit: Inherit from 'Breakpoint data''   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16)'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
BreakpointsForDimension2Min	Breakpoints 2 > Minimum	{'[]'}
BreakpointsForDimension2Max	Breakpoints 2 > Maximum	{'[]'}
...	...	...
BreakpointsForDimension30DataTypeStr	Breakpoints 30 > Data Type	{'Inherit: Same as corresponding input'}   'Inherit: Inherit from 'Breakpoint data''   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16)'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
BreakpointsForDimension30 Min	Breakpoints 30 > Minimum	{'[]'}
BreakpointsForDimension30 Max	Breakpoints 30 > Maximum	{'[]'}
FractionDataTypeStr	Fraction > Data Type	{'Inherit: Inherit via internal rule'}   'double'   'single'   'fixdt(1,16,0)'
IntermediateResults DataTypeStr	Intermediate results > Data Type	'Inherit: Inherit via internal rule'   {'Inherit: Same as output'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
OutDataTypeStr	Output > Data Type	'Inherit: Inherit via back propagation'   'Inherit: Inherit from table data'   {'Inherit: Same as first input'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
OutMin	Output > Minimum	{'[]'}
OutMax	Output > Maximum	{'[]'}
InternalRulePriority	Internal rule priority	{'Speed'}   'Precision'
InputSameDT	Require all inputs to have the same data type	'off'   {'on'}
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   'Floor'   'Nearest'   'Round'   {'Simplest'}   'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'}   'on'
ProcessOutOfRangeInput	Deprecated in R2009b	
Lookup Table Dynamic (Lookup Table Dynamic) (masked subsystem)		
LookUpMeth	Lookup Method	'Interpolation-Extrapolation'   {'Interpolation-Use End Values'}   'Use Input Nearest'   'Use Input Below'   'Use Input Above'

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	{'fixdt('double')}   'Inherit: Inherit via back propagation'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'boolean'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
OutputDataTypeScaling Mode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'}   'on'
Prelookup (PreLookup)		
BreakpointsSpecification	Specification	{'Explicit values'}   'Even spacing'   'Breakpoint object'  To set this parameter from 'Explicit values' or 'Even spacing' to 'Breakpoint object', use the same call to <code>set_param</code> to set the parameter <code>BreakpointObject</code> . For example:  <code>set_param('myModel/myPrelookupBlock', ... 'BreakpointsSpecification', ... 'Breakpoint object', ... 'BreakpointObject', 'myBPObject')</code>
BreakpointObject	Name of breakpoint object	{''}
BreakpointsFirstPoint	First point	{'10'}
BreakpointsSpacing	Spacing	{'10'}
BreakpointsNumPoints	Number of points	{'11'}
BreakpointsData	Value	{'[10:10:110]'}
BreakpointsDataSource	Source	{'Dialog'}   'Input port'
IndexSearchMethod	Index search method	'Evenly spaced points'   'Linear search'   {'Binary search'}
BeginIndexSearchUsing PreviousIndexResult	Begin index search using previous index result	{'off'}   'on'

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
OutputOnlyTheIndex	Output only the index	{'off'}   'on'
ExtrapMethod	Extrapolation method	'Clip'   {'Linear'}
UseLastBreakpoint	Use last breakpoint for input at or above upper limit	{'off'}   'on'
DiagnosticForOutOfRange Input	Diagnostic for out-of-range input	{'None'}   'Warning'   'Error'
RemoveProtectionInput	Remove protection against out-of-range input in generated code	{'off'}   'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
BreakpointDataTypeStr	Breakpoint > Data Type	{'Inherit: Same as input'}   'Inherit: Inherit from Breakpoint data'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16)'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
BreakpointMin	Breakpoint > Minimum	{'[]'}
BreakpointMax	Breakpoint > Maximum	{'[]'}
IndexDataTypeStr	Index > Data Type	'int8'   'uint8'   'int16'   'uint16'   'int32'   {'uint32'}   'fixdt(1,16)'
FractionDataTypeStr	Fraction > Data Type	{'Inherit: Inherit via internal rule'}   'double'   'single'   'fixdt(1,16,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
ProcessOutOfRangeInput	Deprecated in R2011a	
Sine (Sine) (masked subsystem)		
Formula	Output formula	{'sin(2*pi*u)'}   'cos(2*pi*u)'   'exp(j*2*pi*u)'   'sin(2*pi*u) and cos(2*pi*u)'
NumDataPoints	Number of data points for lookup table	{'(2^5)+1'}
OutputWordLength	Output word length	{'16'}
InternalRulePriority	Internal rule priority for lookup table	{'Speed'}   'Precision'

## Math Operations Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Abs (Abs)		
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via internal rule'   'Inherit: Inherit via back propagation'   {'Inherit: Same as input'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'}   'on'
Add (Sum)		
IconShape	Icon shape	{'rectangular'}   'round'
Inputs	List of signs	{'++'}
CollapseMode	Sum over	{'All dimensions'}   'Specified dimension'
CollapseDim	Dimension	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have the same data type	{'off'}   'on'
AccumDataTypeStr	Accumulator data type	{'Inherit: Inherit via internal rule'}   'Inherit: Same as first input'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'}   'Inherit: Inherit via back propagation'   'Inherit: Same as first input'   'Inherit: Same as accumulator'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'}   'on'
<b>Algebraic Constraint (Algebraic Constraint)</b>		
Constraint	Constraint on input signal	{'f(z) = 0'}   'f(z) = z'
Solver	Algebraic Loop Solver	{'auto'}   'Trust Region'   'Line Search'
Tolerance	Solver Tolerance	{'auto'}
InitialGuess	Initial guess	{'0'}
<b>Assignment (Assignment)</b>		
NumberOfDimensions	Number of output dimensions	{'1'}
IndexMode	Index mode	'Zero-based'   {'One-based'}
OutputInitialize	Initialize output (Y)	{'Initialize using input port <Y0>'}   'Specify size for each dimension in table'
IndexOptionArray	Index Option	'Assign all'   {'Index vector (dialog)'}   'Index vector (port)'   'Starting index (dialog)'   'Starting index (port)'
IndexParamArray	Index	cell array
OutputSizeArray	Output Size	cell array

Block (Type)/Parameter	Dialog Box Prompt	Values
DiagnosticForDimensions	Action if any output element is not assigned	'Error'   'Warning'   {'None'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
IndexOptions	See the <b>IndexOptionArray</b> parameter for more information.	
Indices	See the <b>IndexParamArray</b> parameter for more information.	
OutputSizes	See the <b>OutputSizeArray</b> parameter for more information.	
Bias (Bias)		
Bias	Bias	{'0.0'}
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'}   'on'
Complex to Magnitude-Angle (ComplexToMagnitudeAngle)		
Output	Output	'Magnitude'   'Angle'   {'Magnitude and angle'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Complex to Real-Imag (ComplexToRealImag)		
Output	Output	'Real'   'Imag'   {'Real and imag'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Divide (Product)		
Inputs	Number of inputs	{'*/'}
Multiplication	Multiplication	{'Element-wise(*)'}   'Matrix(*)'
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have same data type	{'off'}   'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'}   'Inherit: Inherit via back propagation'   'Inherit: Same as first input'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'}   'on'
Dot Product (DotProduct)		
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have same data type	'off'   {'on'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'}   'Inherit: Inherit via back propagation'   'Inherit: Same as first input'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
OutputDataTypeScaling Mode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'}   'on'
Find (Find)

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
CMTag20	CMTag20	{''}
Timed-Based Linearization (Timed Linearization) (masked subsystem)		
LinearizationTime	Linearization time	{'1'}
SampleTime	Sample time (of linearized model)	{'0'}
Trigger-Based Linearization (Triggered Linearization) (masked subsystem)		
TriggerType	Trigger type	{'rising'}   'falling'   'either'   'function-call'
SampleTime	Sample time (of linearized model)	{'0'}

## Ports &amp; Subsystems Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Action Port (ActionPort)		
InitializeStates	States when execution is resumed	{'held'}   'reset'
PropagateVarSize	Propagate sizes of variable-size signals	{'Only when execution is resumed'}   'During execution'
Atomic Subsystem (SubSystem)		
ShowPortLabels	Show port labels  <b>Note</b> The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none'   {'FromPortIcon'}   'FromPortBlockName'   'SignalName'   'off'   'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'}   'ReadOnly'   'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'}   'ExplicitOnly'   'None'
TreatAsAtomicUnit	Treat as atomic unit	'off'   {'on'}
TreatAsGroupedWhenPropagatingVariantConditions	Treat as grouped when propagating variant conditions	'off'   {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'}   'on'
CheckFcnCallInpInsideContextMsg	Warn if function-call inputs are context-specific	{'off'}   'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Function packaging	{'Auto'}   'Inline'   'Nonreusable function'   'Reusable function'
RTWFcnNameOpts	Function name options	{'Auto'}   'Use subsystem name'   'User specified'
RTWFcnName	Function name	{''}
RTWFileNameOpts	File name options	{'Auto'}   'Use subsystem name'   'Use function name'   'User specified'
RTWFileName	File name (no extension)	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
FunctionInterfaceSpec	Function interface  This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'void_void'}   'Allow arguments (Optimized)'   'Allow arguments (Match graphical interface)'
FunctionWithSeparateData	"Function with separate data" on page 1-0  This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'off'}   'on'
RTWMemSecFuncInitTerm	"Memory section for initialize/terminate functions" on page 1-0  This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'}   'Default'   list of memory sections from model's package
RTWMemSecFuncExecute	"Memory section for execution functions" on page 1-0  This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'}   'Default'   list of memory sections from model's package
RTWMemSecDataConstants	"Memory section for constants" on page 1-0  This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'}   'Default'   list of memory sections from model's package
RTWMemSecDataInternal	"Memory section for internal data" on page 1-0  This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'}   'Default'   list of memory sections from model's package
RTWMemSecDataParameters	"Memory section for parameters" on page 1-0  This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'}   'Default'   list of memory sections from model's package
DataTypeOverride	No dialog box prompt  Specifies data type used to override fixed-point data types. Set by <b>Data type override</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'ScaledDouble'   'Double'   'Single'   'Off'

Block (Type)/Parameter	Dialog Box Prompt	Values
MinMaxOverflowLogging	No dialog box prompt  Setting for fixed-point instrumentation. Set by <b>Fixed-point instrumentation mode</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'MinMaxAndOverflow'   'OverflowOnly'   'ForceOff'
SimViewingDevice	No dialog box prompt  If set to 'on', designates the block as a Signal Viewing Subsystem — an atomic subsystem that encapsulates processing and viewing of signals received from the target system in External mode. For more information, see “Signal Viewing Subsystems” (Simulink Coder).	{'off'}   'on'
IsSubsystemVirtual		boolean — {'off'}   'on'  Read-only
Code Reuse Subsystem (SubSystem)		
ShowPortLabels	Show port labels  <b>Note</b> The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none'   {'FromPortIcon'}   'FromPortBlockName'   'SignalName'   'off'   'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'}   'ReadOnly'   'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'}   'ExplicitOnly'   'None'
TreatAsAtomicUnit	Treat as atomic unit	'off'   {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'}   'on'
CheckFcnCallInpInsideContextMsg	Warn if function-call inputs are context-specific	{'off'}   'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWSystemCode	Function packaging	'Auto'   'Inline'   'Nonreusable function'   {'Reusable function'}
RTWFcnNameOpts	Function name options	'Auto'   {'Use subsystem name'}   'User specified'
RTWFcnName	Function name	{''}
RTWFileNameOpts	File name options	'Auto'   {'Use subsystem name'}   'Use function name'   'User specified'

Block (Type)/Parameter	Dialog Box Prompt	Values
MinMaxOverflowLogging	No dialog box prompt  Setting for fixed-point instrumentation. Set by <b>Fixed-point instrumentation mode</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'MinMaxAndOverflow'   'OverflowOnly'   'ForceOff'
IsSubsystemVirtual		boolean — {'off'}   'on'  Read-only
For Each(ForEach)		
InputPartition	Partition	cell array of character vectors
InputPartitionDimension	Partition dimension for input signal	cell array of character vectors
InputPartitionWidth	Width of partition for input signal	cell array of character vectors
OutputConcatenationDimension	Concatenation dimension of output signal	cell array of character vectors
For Iterator (ForIterator)		
ResetStates	States when starting	{'held'}   'reset'
IterationSource	Iteration limit source	{'internal'}   'external'
IterationLimit	Iteration limit	{'5'}
ExternalIncrement	Set next i (iteration variable) externally	{'off'}   'on'
ShowIterationPort	Show iteration variable	'off'   {'on'}
IndexMode	Index mode	'Zero-based'   {'One-based'}
IterationVariableDataType	Iteration variable data type	{'int32'}   'int16'   'int8'   'double'
For Iterator Subsystem (SubSystem)		
ShowPortLabels	Show port labels  <b>Note</b> The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none'   {'FromPortIcon'}   'FromPortBlockName'   'SignalName'   'off'   'on'

MinMaxOverflowLogging	No dialog box prompt  Setting for fixed-point instrumentation. Set by <b>Fixed-point instrumentation mode</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'MinMaxAndOverflow'   'OverflowOnly'   'ForceOff'

Block (Type)/Parameter	Dialog Box Prompt	Values
IsSubsystemVirtual		boolean — {'off'}   'on' Read-only
If (If)		
NumInputs	Number of inputs	{'1'}
IfExpression	If expression (e.g., $u1 \sim= 0$ )	{'u1 > 0'}
ElseIfExpressions	Elseif expressions (comma-separated list, e.g., $u2 \sim= 0, u3(2) < u2$ )	{' '}
ShowElse	Show else condition	'off'   {'on'}
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
If Action Subsystem (SubSystem)		
ShowPortLabels	Show port labels  <b>Note</b> The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none'   {'FromPortIcon'}   'FromPortBlockName'   'SignalName'   'off'   'on'
BlockChoice	Block choice	{' '}
TemplateBlock	Template block	{' '}
MemberBlocks	Member blocks	{' '}
Permissions	Read/Write permissions	{'ReadWrite'}   'ReadOnly'   'NoReadOrWrite'
ErrorFcn	Name of error callback function	{' '}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'}   'ExplicitOnly'   'None'
TreatAsAtomicUnit	Treat as atomic unit	'off'   {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'}   'on'
CheckFcnCallInpInsideContextMsg	Warn if function-call inputs are context-specific	{'off'}   'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Function packaging	{'Auto'}   'Inline'   'Nonreusable function'   'Reusable function'
RTWFcnNameOpts	Function name options	{'Auto'}   'Use subsystem name'   'User specified'
RTWFcnName	Function name	{' '}

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWFileNameOpts	File name options	{'Auto'}   'Use subsystem name'   'Use function name'   'User specified'
RTWFileName	File name (no extension)	{''}
DataTypeOverride	No dialog box prompt  Specifies data type used to override fixed-point data types. Set by <b>Data type override</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'ScaledDouble'   'Double'   'Single'   'Off'
MinMaxOverflowLogging	No dialog box prompt  Setting for fixed-point instrumentation. Set by <b>Fixed-point instrumentation mode</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'MinMaxAndOverflow'   'OverflowOnly'   'Off'
IsSubsystemVirtual		boolean — {'off'}   'on'  Read-only
<b>In1 (Inport)</b>		
Port	Port number	{'1'}
IconDisplay	Icon display	'Signal name'   {'Port number'}   'Port number and signal name'
LatchByDelayingOutsideSignal	Latch input by delaying outside signal	{'off'}   'on'
LatchInputForFeedbackSignals	Latch input for feedback signals of function-call subsystem outputs	{'off'}   'on'
Interpolate	Interpolate data	'off'   {'on'}
UseBusObject	Specify properties via bus object	{'off'}   'on'
BusObject	Bus object for specifying bus properties	{'BusObject'}
BusOutputAsStruct	Output as nonvirtual bus	{'off'}   'on'
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Data type	{'Inherit: auto'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'boolean'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
Unit	Specify physical unit of the input signal to the block.	{'inherit'}   '<Enter unit>'
UnitNoProp	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	'<Enter unit>'
SignalType	Signal type	{'auto'}   'real'   'complex'
<b>Model (ModelReference)</b>		
ModelNameDialog	The name of the referenced model exactly as you typed it in, with any surrounding white space removed. When you set ModelNameDialog programmatically or interactively, Simulink automatically sets the values of ModelName and ModelFile based on the value of ModelNameDialog.	{'<Enter Model Name>'}
ModelName	The value of ModelNameDialog stripped of any file name extension that you provided. For backward compatibility, setting ModelName programmatically actually sets ModelNameDialog, which then sets ModelName as described. You cannot use get_param to obtain the ModelName of a protected model, because the name without a suffix would be ambiguous. Use get_param on ModelFile instead. You can test ProtectedModel to determine programmatically whether a referenced model is protected.	character vector — Set automatically when ModelNameDialog is set.

Block (Type)/Parameter	Dialog Box Prompt	Values
ModelFile	The value of ModelNameDialog with a file name extension. The suffix of the first match Simulink finds becomes the suffix of ModelFile. Setting ModelFile programmatically actually sets ModelNameDialog, which then sets ModelFile as described.	character vector — Set automatically when ModelNameDialog is set.
ProtectedModel	Read-only boolean indicating whether the model referenced by the block is protected (on) or unprotected (off).	boolean — 'off'   'on' — Set automatically when ModelNameDialog is set.
InstanceParameters	Structure array of instance-specific parameters on the Model block.	structure with fields: Name, Value, Path, and Argument.
ParameterArgumentNames	Names of instance-specific parameters that the referenced model defines. Corresponds to the <b>Name</b> column in the table on the <b>Instance parameters</b> tab.	{ '' }
ParameterArgumentValues	Values for model arguments. Corresponds to the <b>Value</b> column in the table on the <b>Instance parameters</b> tab.	structure with no fields
SimulationMode	Specifies whether to simulate the model by generating and executing code or by interpreting the model in Simulink software.	{ 'Normal' }   'Accelerator'   'Software-in-the-loop (SIL)'   'Processor-in-the-loop (PIL)'
DefaultDataLogging		{ 'off' }   'on'
Out1 (Output)		
Port	Port number	{ '1' }
IconDisplay	Icon display	'Signal name'   { 'Port number' }   'Port number and signal name'
UseBusObject	Specify properties via bus object	{ 'off' }   'on'
BusObject	Bus object for validating input bus	{ 'BusObject' }
BusOutputAsStruct	Output as nonvirtual bus in parent model	{ 'off' }   'on'
PortDimensions	Port dimensions (-1 for inherited)	{ '-1' }
VarSizeSig	Variable-size signal	{ 'Inherit' }   'No'   'Yes'
SampleTime	Sample time (-1 for inherited)	{ '-1' }
OutMin	Minimum	{ [] }
OutMax	Maximum	{ [] }

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Data type	{'Inherit: auto'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'boolean'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'   'Bus: <object name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
Unit	Specify physical unit of the input signal to the block. For a list of acceptable units, see Allowed Units.	{'inherit'}   '<Enter unit>'
UnitNoProp	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	'<Enter unit>'
SignalObject	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “Design Data Interface by Configuring Inport and Outport Blocks” (Simulink Coder).	Simulink.Signal object  Object of a class that is derived from Simulink.Signal
StorageClass	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “Design Data Interface by Configuring Inport and Outport Blocks” (Simulink Coder).	{'Auto'}   'Model default'   'ExportedGlobal'   'ImportedExtern'   'ImportedExternPointer'   'Custom'
SignalName	Signal name	character vector
SignalType	Signal type	{'auto'}   'real'   'complex'
OutputWhenDisabled	Output when disabled	{'held'}   'reset'
InitialOutput	Initial output	{'[]'}
MustResolveToSignalObject	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “For Signals”.	{'off'}   'on'
Subsystem (SubSystem)		

Block (Type)/Parameter	Dialog Box Prompt	Values
ShowPortLabels	Show port labels  <b>Note</b> The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none'   {'FromPortIcon'}   'FromPortBlockName'   'SignalName'   'off'   'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'}   'ReadOnly'   'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'}   'ExplicitOnly'   'None'
TreatAsAtomicUnit	Treat as atomic unit	{'off'}   'on'
TreatAsGroupedWhenPropagatingVariantConditions	Treat as grouped when propagating variant conditions	'off'   {'on'}
VariantControl	Variant control	{'Variant'}   '(default)'
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'}   'on'
CheckFcnCallInpInsideContextMsg	Warn if function-call inputs are context-specific	{'off'}   'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Code generation function packaging	{'Auto'}   'Inline'   'Nonreusable function'   'Reusable function'
RTWFcnNameOpts	Code generation function name options	{'Auto'}   'Use subsystem name'   'User specified'
RTWFcnName	Code generation function name	{''}
RTWFileNameOpts	Code generation file name options	{'Auto'}   'Use subsystem name'   'Use function name'   'User specified'
RTWFileName	Code generation file name (no extension)	{''}
DataTypeOverride	Specifies data type used to override fixed-point data types. Set by <b>Data type override</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'ScaledDouble'   'Double'   'Single'   'Off'

Block (Type)/Parameter	Dialog Box Prompt	Values
MinMaxOverflowLogging	No dialog box prompt  Setting for fixed-point instrumentation. Set by <b>Fixed-point instrumentation mode</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'MinMaxAndOverflow'   'OverflowOnly'   'ForceOff'
IsSubsystemVirtual		boolean — {'on'}   'off'  Read-only
Virtual	For internal use	
Switch Case (SwitchCase)		
CaseConditions	Case conditions (e.g., {1,[2,3]})	{' {1}'}
ShowDefaultCase	Show default case	'off'   {'on'}
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
SampleTime	Sample time (-1 for inherited)	{' -1'}
CaseShowDefault	Deprecated in R2009b	
Switch Case Action Subsystem (SubSystem)		
ShowPortLabels	Show port labels  <b>Note</b> The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none'   {'FromPortIcon'}   'FromPortBlockName'   'SignalName'   'off'   'on'
BlockChoice	Block choice	{' '}
TemplateBlock	Template block	{' '}
MemberBlocks	Member blocks	{' '}
Permissions	Read/Write permissions	{'ReadWrite'}   'ReadOnly'   'NoReadOrWrite'
ErrorFcn	Name of error callback function	{' '}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'}   'ExplicitOnly'   'None'
TreatAsAtomicUnit	Treat as atomic unit	'off'   {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'}   'on'
CheckFcnCallInpInsideContextMsg	Warn if function-call inputs are context-specific	{'off'}   'on'
SystemSampleTime	Sample time (-1 for inherited)	{' -1'}
RTWSystemCode	Code generation function packaging	{'Auto'}   'Inline'   'Nonreusable function'   'Reusable function'

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWFcnNameOpts	Code generation function name options	{'Auto'}   'Use subsystem name'   'User specified'
RTWFcnName	Code generation function name	{''}
RTWFileNameOpts	Code generation file name options	{'Auto'}   'Use subsystem name'   'Use function name'   'User specified'
RTWFileName	Code generation file name (no extension)	{''}
DataTypeOverride	No dialog box prompt Specifies data type used to override fixed-point data types. Set by <b>Data type override</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'ScaledDouble'   'Double'   'Single'   'Off'
MinMaxOverflowLogging	No dialog box prompt Setting for fixed-point instrumentation. Set by <b>Fixed-point instrumentation mode</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'MinMaxAndOverflow'   'OverflowOnly'   'ForceOff'
IsSubsystemVirtual		boolean — {'off'}   'on' Read-only
Trigger (TriggerPort)		
TriggerType	Trigger type	{'rising'}   'falling'   'either'   'function-call'
IsSimulinkFunction	Configure the Function-call subsystem to be a Simulink Function	{'off'}   'on'
StatesWhenEnabling	States when enabling	{'held'}   'reset'   'inherit'
PropagateVarSize	Propagate sizes of variable-size signals	{'During execution'}   'Only when enabling'
ShowOutputPort	Show output port	{'off'}   'on'
OutputDataType	Output data type	{'auto'}   'double'   'int8'
SampleTimeType	Sample time type	{'triggered'}   'periodic'
SampleTime	Sample time	{'1'}
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
TriggerSignalSampleTime	Trigger signal sample time	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Data type	{'Inherit: auto'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'boolean'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'
Interpolate	Interpolate data	'off'   {'on'}
Triggered Subsystem (SubSystem)		
ShowPortLabels	Show port labels  <b>Note</b> The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none'   {'FromPortIcon'}   'FromPortBlockName'   'SignalName'   'off'   'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'}   'ReadOnly'   'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'}   'ExplicitOnly'   'None'
TreatAsAtomicUnit	Treat as atomic unit	'off'   {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'}   'on'
CheckFcnCallInpInsideContextMsg	Warn if function-call inputs are context-specific	{'off'}   'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Code generation function packaging	{'Auto'}   'Inline'   'Nonreusable function'   'Reusable function'
RTWFcnNameOpts	Code generation function name options	{'Auto'}   'Use subsystem name'   'User specified'
RTWFcnName	Code generation function name	{''}
RTWFileNameOpts	Code generation file name options	{'Auto'}   'Use subsystem name'   'Use function name'   'User specified'

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWFileName	Code generation file name (no extension)	{''}
DataTypeOverride	No dialog box prompt  Specifies data type used to override fixed-point data types. Set by <b>Data type override</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'ScaledDouble'   'Double'   'Single'   'Off'
MinMaxOverflowLogging	No dialog box prompt  Setting for fixed-point instrumentation. Set by <b>Fixed-point instrumentation mode</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'MinMaxAndOverflow'   'OverflowOnly'   'ForceOff'
IsSubsystemVirtual		boolean — {'off'}   'on'  Read-only
Unit Conversion		
OutDataTypeStr	Output data type	{'Inherit via internal rule'}   'Inherit via back propagation'
Unit System Configuration		
AllowAllUnitSystems	Allow or restrict unit systems.	boolean — {'on'}   'off'
UnitSystems	Displays allowed unit system.	cell array of character vectors — {'SI', 'English', 'SI (extended)', 'CGS'}
While Iterator (WhileIterator)		
MaxIters	Maximum number of iterations (-1 for unlimited)	{'5'}
WhileBlockType	While loop type	{'while'}   'do-while'
ResetStates	States when starting	{'held'}   'reset'
ShowIterationPort	Show iteration number port	{'off'}   'on'
OutputDataType	Output data type	{'int32'}   'int16'   'int8'   'double'
While Iterator Subsystem (SubSystem)		
ShowPortLabels	Show port labels  <b>Note</b> The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none'   {'FromPortIcon'}   'FromPortBlockName'   'SignalName'   'off'   'on'
BlockChoice	Block choice	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'}   'ReadOnly'   'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'}   'ExplicitOnly'   'None'
TreatAsAtomicUnit	Treat as atomic unit	'off'   {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'}   'on'
CheckFcnCallInpInsideContextMsg	Warn if function-call inputs are context-specific	{'off'}   'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Code generation function packaging	{'Auto'}   'Inline'   'Nonreusable function'   'Reusable function'
RTWFcnNameOpts	Code generation function name options	{'Auto'}   'Use subsystem name'   'User specified'
RTWFcnName	Code generation function name	{''}
RTWFileNameOpts	Code generation file name options	{'Auto'}   'Use subsystem name'   'Use function name'   'User specified'
RTWFileName	Code generation file name (no extension)	{''}
DataTypeOverride	No dialog box prompt  Specifies data type used to override fixed-point data types. Set by <b>Data type override</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'ScaledDouble'   'Double'   'Single'   'Off'
MinMaxOverflowLogging	No dialog box prompt  Setting for fixed-point instrumentation. Set by <b>Fixed-point instrumentation mode</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'MinMaxAndOverflow'   'OverflowOnly'   'ForceOff'
IsSubsystemVirtual		boolean — {'off'}   'on'  Read-only
Variant Subsystem (Subsystem)		
Variant	No dialog box prompt  Check if the subsystem is a Variant Subsystem block.	boolean — {'off'}   'on'  Read-only

Block (Type)/Parameter	Dialog Box Prompt	Values
VariantChoices	No dialog box prompt  List of variant choices in a Variant Subsystem block.	{ ' ' }  The value is an empty structure array if the block is not a Variant Subsystem block. Otherwise, the value is a structure array with fields: Name and BlockName.  Read-only
VariantControl	Variant control for the choice block of a Variant Subsystem block.	{ ' ' }  The value is an empty character vector if the block is not a variant choice. Otherwise, the value is the variant control for the choice block.
VariantControlMode	Specifies the mode used to determine the active variant choice.	{'expression'}   'label'   'sim codegen switching'
LabelModeActiveChoice	Specifies the variant control label of the active choice for the Variant Subsystem block when VariantControlMode is specified as label.	{ ' ' }  The value is an empty character vector if the VariantControlMode for the Variant Subsystem block is not label. Otherwise, the value is the variant control label for the active choice.
TreatAsGroupedWhenPropagatingVariantConditions	No dialog box prompt  Specifies if the subsystem is treated as a group when propagating variant conditions.	boolean — {'on'}   'off'
GeneratePreprocessorConditionals	No dialog box prompt  Specifies if all the choices are to be analyzed and if preprocessor conditionals should be generated.	boolean — {'off'}   'on'
PropagateVariantConditions	Specifies if variant conditions on the ports inside the Variant Subsystem block should be propagated outside the block.  <b>Note</b> Use the “Propagate conditions outside of variant subsystem” on page 1-0 parameter instead.	boolean — {'off'}   'on'
AllowZeroVariantControls	Specifies if the Variant Subsystem block is allowed to have no active choices.	boolean — {'off'}   'on'

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
Variant Activation Time	Specifies when the active choice of a Variant Subsystem block is set.  The <b>Variant activation time</b> parameter is available only when you set the <b>Variant control mode</b> parameter to expression or sim codegen switching.	{'update diagram'}   'update diagram analyze all choices'   'code compile'

## Signal Attributes Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Bus to Vector (BusToVector)		
Data Type Conversion (DataTypeConversion)		
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via back propagation'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'boolean'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
ConvertRealWorld	Input and output to have equal	{'Real World Value (RWV)'   'Stored Integer (SI)'}   'Stored Integer (SI)'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'}   'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
Data Type Conversion Inherited (Conversion Inherited) (masked subsystem)		
ConvertRealWorld	Input and Output to have equal	{'Real World Value'}   'Stored Integer'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'}   'on'
Data Type Duplicate (DataTypeDuplicate)		
NumInputPorts	Number of input ports	{'2'}
Data Type Propagation (Data Type Propagation) (masked subsystem)		
PropDataTypeMode	1. Propagated data type	'Specify via dialog'   {'Inherit via propagation rule'}
PropDataType	1.1. Propagated data type (e.g., fixdt(1,16), fixdt('single'))	{'fixdt(1,16)'}   'fixdt('single')'

Block (Type)/Parameter	Dialog Box Prompt	Values
IfRefDouble	1.1. If any reference input is double, output is	{'double'}   'single'
IfRefSingle	1.2. If any reference input is single, output is	'double'   {'single'}
IsSigned	1.3. Is-Signed	'IsSigned1'   'IsSigned2'   {'IsSigned1 or IsSigned2'}   'TRUE'   'FALSE'
NumBitsBase	1.4.1. Number-of-Bits: Base	'NumBits1'   'NumBits2'   {'max([NumBits1 NumBits2])'}   'min([NumBits1 NumBits2])'   'NumBits1+NumBits2'
NumBitsMult	1.4.2. Number-of-Bits: Multiplicative adjustment	{'1'}
NumBitsAdd	1.4.3. Number-of-Bits: Additive adjustment	{'0'}
NumBitsAllowFinal	1.4.4. Number-of-Bits: Allowable final values	{'1:128'}
PropScalingMode	2. Propagated scaling	'Specify via dialog'   {'Inherit via propagation rule'}   'Obtain via best precision'
PropScaling	2.1. Propagated scaling: Slope or [Slope Bias] ex. 2 <sup>-9</sup>	{'2 <sup>-10</sup> '}
ValuesUsedBestPrec	2.1. Values used to determine best precision scaling	{'[5 -7]'}
SlopeBase	2.1.1. Slope: Base	'Slope1'   'Slope2'   'max([Slope1 Slope2])'   {'min([Slope1 Slope2])'}   'Slope1*Slope2'   'Slope1/Slope2'   'PosRange1'   'PosRange2'   'max([PosRange1 PosRange2])'   'min([PosRange1 PosRange2])'   'PosRange1*PosRange2'   'PosRange1/PosRange2'
SlopeMult	2.1.2. Slope: Multiplicative adjustment	{'1'}
SlopeAdd	2.1.3. Slope: Additive adjustment	{'0'}

Block (Type)/Parameter	Dialog Box Prompt	Values
BiasBase	2.2.1. Bias: Base	{'Bias1'}   'Bias2'   'max([Bias1 Bias2])'   'min([Bias1 Bias2])'   'Bias1*Bias2'   'Bias1/Bias2'   'Bias1+Bias2'   'Bias1-Bias2'
BiasMult	2.2.2. Bias: Multiplicative adjustment	{'1'}
BiasAdd	2.2.3. Bias: Additive adjustment	{'0'}
Data Type Scaling Strip (Scaling Strip) (masked subsystem)		
IC (InitialCondition)		
Value	Initial value	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Probe (Probe)		
ProbeWidth	Probe width	'off'   {'on'}
ProbeSampleTime	Probe sample time	'off'   {'on'}
ProbeComplexSignal	Detect complex signal	'off'   {'on'}
ProbeSignalDimensions	Probe signal dimensions	'off'   {'on'}
ProbeFramedSignal	Detect framed signal	'off'   {'on'}
ProbeWidthDataType	Data type for width	{'double'}   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'Same as input'
ProbeSampleTimeDataType	Data type for sample time	{'double'}   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'Same as input'
ProbeComplexityDataType	Data type for signal complexity	{'double'}   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'boolean'   'Same as input'
ProbeDimensionsDataType	Data type for signal dimensions	{'double'}   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'Same as input'
ProbeFrameDataType	Data type for signal frames	{'double'}   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'boolean'   'Same as input'
Rate Transition (RateTransition)		

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
Integrity	Ensure data integrity during data transfer	'off'   {'on'}
Deterministic	Ensure deterministic data transfer (maximum delay)	'off'   {'on'}
InitialCondition	Initial conditions	{'0'}
OutPortSampleTimeOpt	Output port sample time options	{'Specify'}   'Inherit'   'Multiple of input port sample time'
OutPortSampleTimeMultiple	Sample time multiple (>0)	{'1'}
OutPortSampleTime	Output port sample time	{'-1'}
<b>Signal Conversion (SignalConversion)</b>		
ConversionOutput	Output	{'Signal copy'}   'Virtual bus'   'Nonvirtual bus'
OutDataTypeStr	Data type	{'Inherit: auto'}   'Bus: <object name>'
OverrideOpt	Exclude this block from 'Block reduction' optimization	{'off'}   'on'
<b>Signal Specification (SignalSpecification)</b>		
Dimensions	Dimensions (-1 for inherited)	{'-1'}
VarSizeSig	Variable-size signal	{'Inherit'}   'No'   'Yes'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'boolean'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'   'Bus: <object name>'
BusOutputAsStruct	Require nonvirtual bus	{'off'}   'on'
Unit	Specify physical unit of the input signal to the block. For a list of acceptable units, see Allowed Units.	{'inherit'}   '<Enter unit>'
UnitNoProp	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	'<Enter unit>'

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
SignalType	Signal type	{'auto'}   'real'   'complex'
Weighted Sample Time (SampleTimeMath)		
TsampMathOp	Operation	'+'   '-'   '*'   '/'   {'Ts Only'}   '1/Ts Only'
weightValue	Weight value	{'1.0'}
TsampMathImp	Implement using	{'Online Calculations'}   'Offline Scaling Adjustment'
OutDataTypeStr	Output data type	{'Inherit via internal rule'}   'Inherit via back propagation'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'}   'on'
OutputDataTypeScaling Mode	Deprecated in R2009b	
DoSatur	Deprecated in R2009b	
Width (Width)		
OutputDataTypeScaling Mode	Output data type mode	{'Choose intrinsic data type'}   'Inherit via back propagation'   'All ports same datatype'
DataType	Output data type	{'double'}   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'

## Signal Routing Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Bus Assignment (BusAssignment)		
AssignedSignals	Elements that are being assigned	{ '' }
InputSignals	Elements in the bus	matrix — { '{' }'
Bus Creator (BusCreator)		
InheritFromInputs	Use names from inputs instead of from bus object	{ 'on' }   'off'  If set to 'on', overrides bus signal names from inputs. Otherwise, inherits bus signal names from a bus object.
Inputs	Number of inputs	{ '2' }
DisplayOption		'none'   'signals'   { 'bar' }
NonVirtualBus	Output as nonvirtual bus	{ 'off' }   'on'
OutDataTypeStr	Data type	{ 'Inherit: auto' }   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'boolean'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'   'Bus: <object name>'
Bus Selector (BusSelector)		
OutputSignals	Selected elements	character vector — in the form 'signal1,signal2'
OutputAsBus	Output as bus	{ 'off' }   'on'
InputSignals	Signals in bus	matrix — { '{' }'
Data Store Memory (DataStoreMemory)		
DataStoreName	Data store name	{ 'A' }
ReadBeforeWriteMsg	Detect read before write	'none'   { 'warning' }   'error'
WriteAfterWriteMsg	Detect write after write	'none'   { 'warning' }   'error'
WriteAfterReadMsg	Detect write after read	'none'   { 'warning' }   'error'
InitialValue	Initial value	{ '0' }
StateMustResolveToSignalObject	Data store name must resolve to Simulink signal object	{ 'off' }   'on'
DataLogging	Log Signal Data	'off'   { 'on' }
DataLoggingNameMode	Logging Name	{ 'SignalName' }   'Custom'
DataLoggingName	Logging Name	{ '' }
DataLoggingLimitDataPoints	Limit data points to last	'off'   { 'on' }
DataLoggingMaxPoints	Limit data points to last	non-zero integer {5000}

Block (Type)/Parameter	Dialog Box Prompt	Values
DataLoggingDecimateData	Decimation	'off'   {'on'}
DataLoggingLimitDataPoints	Decimation	non-zero integer {2}
StateStorageClass	Storage class	{'Auto'}   'Model default'   'ExportedGlobal'   'ImportedExtern'   'ImportedExternPointer'   'Custom'
StateSignalObject	Signal object class Storage class	Simulink.Signal object Object of a class that is derived from Simulink.Signal
RTWStateStorageTypeQualifier	Code generation type qualifier	{''}
VectorParams1D	Interpret vector parameters as 1-D	'off'   {'on'}
ShowAdditionalParam	Show additional parameters	{'off'}   'on'
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'boolean'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
SignalType	Signal type	{'auto'}   'real'   'complex'
Data Store Read (DataStoreRead)		
DataStoreElements	Corresponds to the parameters on the <b>Element Selection</b> tab of the block dialog box. See "Specification using the command line".	
DataStoreName	Data store name	{'A'}
SampleTime	Sample time	{'0'}
Data Store Write (DataStoreWrite)		
DataStoreElements	Corresponds to the parameters on the <b>Element Assignment</b> tab of the block dialog box. See "Specification using the command line".	

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
DataStoreName	Data store name	{'A'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Demux (Demux)		
Outputs	Number of outputs	{'2'}
DisplayOption	Display option	'none'   {'bar'}
Environment Controller (Environment Controller) (masked subsystem)		
From (From)		
GotoTag	Goto tag	{'A'}
IconDisplay	Icon display	'Signal name'   {'Tag'}   'Tag and signal name'
Goto (Goto)		
GotoTag	Goto tag	{'A'}
IconDisplay	Icon display	'Signal name'   {'Tag'}   'Tag and signal name'
TagVisibility	Tag visibility	{'local'}   'scoped'   'global'
Goto Tag Visibility (GotoTagVisibility)		
GotoTag	Goto tag	{'A'}
Index Vector (MultiPortSwitch)		
DataPortOrder	Data port order	{'Zero-based contiguous'}   'One-based contiguous'   'Specify indices'
Inputs	Number of data ports	{'1'}
zeroidx	Deprecated in R2010a	
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all data port inputs to have the same data type	{'off'}   'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'}   'Inherit: Inherit via back propagation'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'}   'on'
AllowDiffInputSizes	Allow different data input sizes (Results in variable-size output signal)	{'off'}   'on'
Manual Switch (Manual Switch) (masked subsystem)		
varsize	Allow different input sizes (Results in variable-size output signal)	{'off'}   'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
Merge (Merge)		
Inputs	Number of inputs	{'2'}
InitialOutput	Initial output	{'[]'}
AllowUnequalInputPortWidths	Allow unequal port widths	{'off'}   'on'
InputPortOffsets	Input port offsets	{'[]'}
Multiport Switch (MultiPortSwitch)		
DataPortOrder	Data port order	'Zero-based contiguous'   {'One-based contiguous'}   'Specify indices'
Inputs	Number of data ports	{'3'}
zeroidx	Deprecated in R2010a	
DataPortIndices	Data port indices	{'1,2,3'}
DataPortForDefault	Data port for default case	{'Last data port'}   'Additional data port'
DiagnosticForDefault	Diagnostic for default case	'None'   'Warning'   {'Error'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all data port inputs to have the same data type	{'off'}   'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'}   'on'
AllowDiffInputSizes	Allow different data input sizes (Results in variable-size output signal)	{'off'}   'on'
Mux (Mux)		
Inputs	Number of inputs	{'2'}
DisplayOption	Display option	'none'   'signals'   {'bar'}
UseBusObject	For internal use	
BusObject	For internal use	
NonVirtualBus	For internal use	
Selector (Selector)		
NumberOfDimensions	Number of input dimensions	{'1'}
IndexMode	Index mode	'Zero-based'   {'One-based'}
IndexOptionArray	Index Option	'Select all'   {'Index vector (dialog)'}   'Index vector (port)'   'Starting index (dialog)'   'Starting index (port)'
IndexParamArray	Index	cell array
OutputSizeArray	Output Size	cell array
InputPortWidth	Input port size	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
IndexOptions	See the <b>IndexOptionArray</b> parameter for more information.	
Indices	See the <b>IndexParamArray</b> parameter for more information.	
OutputSizes	See the <b>IndexParamArray</b> parameter for more information.	
Switch (Switch)		
Criteria	Criteria for passing first input	{'u2 >= Threshold'}   'u2 > Threshold'   'u2 ~= 0'
Threshold	Threshold	{'0'}
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
InputSameDT	Require all data port inputs to have the same data type	{'off'}   'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'}   'Inherit: Inherit via back propagation'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'

SaturateOnInteger Overflow	Saturate on integer overflow	{'off'}   'on'
AllowDiffInputSizes	Allow different input sizes (Results in variable-size output signal)	{'off'}   'on'
Variant Source (VariantSource)		
VariantControls	Variant control	{'Variant'}   '(default)'
LabelModeActiveChoice	Label mode active choice	{''}
AllowZeroVariantControls	Allow zero active variant controls	{'off'}   'on'
ShowConditionOnBlock	Show variant condition on block	{'off'}   'on'
VariantActivationTime	Variant activation time	'update diagram'   'update diagram analyze all choices'   'code compile'
CompiledActiveVariantControl		string – {''}  The value is a empty string if no variant is active; or the name of the active variant. Compile the model before querying this property.
CompiledActiveVariantPort		string – {'-1'}  The value is -1 if no variant is active; or the index of the active variant. Compile the model before querying this property.
Variant Sink (VariantSink)		

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
VariantControls	Variant control	{'Variant'}   '(default)'
LabelModeActiveChoice	Label mode active choice	{''}
AllowZeroVariantControls	Allow zero active variant controls	{'off'}   'on'
ShowConditionOnBlock	Show variant condition on block	{'off'}   'on'
VariantActivationTime	Variant activation time	'update diagram'   'update diagram analyze all choices'   'code compile'
CompiledActiveVariantControl		string – {''}  The value is a empty string if no variant is active; or the name of the active variant. Compile the model before querying this property.
CompiledActiveVariantPort		string – {'-1'}  The value is -1 if no variant is active; or the index of the active variant. Compile the model before querying this property.
Vector Concatenate (Concatenate)		
NumInputs	Number of inputs	{'2'}
Mode	Mode	{'Vector'}   'Multidimensional array'

## Sinks Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Display (Display)		
Numeric display format	Format	{'short'}   'long'   'short_e'   'long_e'   'bank'   'hex (Stored Integer)'   'binary (Stored Integer)'   'decimal (Stored Integer)'   'octal (Stored Integer)'
Decimation	Decimation	{'1'}
Floating	Floating display	{'off'}   'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
Floating Scope (Scope)		
Floating		'off'   {'on'}
Location		vector — {'[376 294 700 533]'} 
Open		{'off'}   'on'
NumInputPorts		Do not change this parameter with the command-line. To add inputs, use the signal selector button  .
TickLabels		'on'   'off'   {'OneTimeTick'}
ZoomMode		{'on'}   'xonly'   'yonly'
AxesTitles		character vector
Grid		'off'   {'on'}   'xonly'   'yonly'
TimeRange		{'auto'}
YMin		{'-5'}
YMax		{'5'}
SaveToWorkspace		{'off'}   'on'
SaveName		{'ScopeData'}
DataFormat		{'StructureWithTime'}   'Structure'   'Array'
LimitDataPoints		'off'   {'on'}
MaxDataPoints		{'5000'}
Decimation		{'1'}
SampleInput		{'off'}   'on'
SampleTime		{'0'}
Out1 (Output)		

Block (Type)/Parameter	Dialog Box Prompt	Values
Port	Port number	{'1'}
IconDisplay	Icon display	'Signal name'   {'Port number'}   'Port number and signal name'
BusOutputAsStruct	Output as nonvirtual bus in parent model	{'off'}   'on'
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
VarSizeSig	Variable-size signal	{'Inherit'}   'No'   'Yes'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'boolean'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'   'Bus: <object name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
SignalObject	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “Design Data Interface by Configuring Inport and Outport Blocks” (Simulink Coder).	Simulink.Signal object Object of a class that is derived from Simulink.Signal
StorageClass	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “Design Data Interface by Configuring Inport and Outport Blocks” (Simulink Coder).	{'Auto'}   'Model default'   'ExportedGlobal'   'ImportedExtern'   'ImportedExternPointer'   'Custom'
SignalName	Signal name	character vector
SignalType	Signal type	{'auto'}   'real'   'complex'
OutputWhenDisabled	Output when disabled	{'held'}   'reset'
InitialOutput	Initial output	{'[]'}

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
SampleTime	Sample time (-1 for inherited)	{'-1'}
To Workspace (ToWorkspace)		
VariableName	Variable name	{'simout'}
MaxDataPoints	Limit data points to last	{'inf'}
Decimation	Decimation	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
SaveFormat	Save format	{'Timeseries'}   'Structure With Time'   'Structure'   'Array'
FixptAsFi	Log fixed-point data as a fi object	{'off'}   'on'

## Sources Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Band-Limited White Noise (Band-Limited White Noise) (masked subsystem)		
Cov	Noise power	{' [0.1] '}
Ts	Sample time	{'0.1'}
seed	Seed	{' [23341] '}
VectorParams1D	Interpret vector parameters as 1-D	'off'   {'on'}
Chirp Signal (chirp) (masked subsystem)		
f1	Initial frequency	{'0.1'}
T	Target time	{'100'}
f2	Frequency at target time	{'1'}
VectorParams1D	Interpret vectors parameters as 1-D	'off'   {'on'}
Clock (Clock)		
DisplayTime	Display time	{'off'}   'on'
Decimation	Decimation	{'10'}
Constant (Constant)		
Value	Constant value	{'1'}
VectorParams1D	Interpret vector parameters as 1-D	'off'   {'on'}
SampleTime	Sampling time	{'Sample based'}   'Frame based'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit from 'Constant value''}   'Inherit: Inherit via back propagation'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'boolean'   'fixdt(1,16)'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'}
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
SampleTime	Sample time	{'inf'}
FramePeriod	Frame period	{'inf'}
Counter Free-Running (Counter Free-Running) (masked subsystem)		
NumBits	Number of Bits	{'16'}

Block (Type)/Parameter	Dialog Box Prompt	Values
tsamp	Sample time	{'-1'}
Counter Limited (Counter Limited) (masked subsystem)		
uplimit	Upper limit	{'7'}
tsamp	Sample time	{'-1'}
Digital Clock (DigitalClock)		
SampleTime	Sample time	{'1'}
Enumerated Constant (Enumerated Constant) (masked subsystem)		
OutDataTypeStr	Output data type	{'Enum: SLDemoSign'}
Value	Value	{'SLDemoSign.Positive'}   'SLDemoSign.Zero'   'SLDemoSign.Negative'
SampleTime	Sample time	{'inf'}
From File (FromFile)		
FileName	File name	{'untitled.mat'}
ExtrapolationBeforeFirstDataPoint	Data extrapolation before first data point	{'Linear extrapolation'}   'Hold first value'   'Ground value'
InterpolationWithinTimeRange	Data interpolation within time range	{'Linear interpolation'}   'Zero order hold'
ExtrapolationAfterLastDataPoint	Data extrapolation after last data point	{'Linear extrapolation'}   'Hold last value'   'Ground value'
SampleTime	Sample time	{'0'}
From Workspace (FromWorkspace)		
VariableName	Data	{'simin'}
OutDataTypeStr	Output Data type	{'Inherit: auto'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'boolean'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'   'Bus: <object name>'
SampleTime	Sample time	{'0'}
Interpolate	Interpolate data	'off'   {'on'}
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
OutputAfterFinalValue	Form output after final data value by	{'Extrapolation'}   'Setting to zero'   'Holding final value'   'Cyclic repetition'

Block (Type)/Parameter	Dialog Box Prompt	Values
Ground		
In1 (Inport)		
Port	Port number	{'1'}
IconDisplay	Icon display	'Signal name'   {'Port number'}   'Port number and signal name'
BusOutputAsStruct	Output as nonvirtual bus	{'off'}   'on'
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
VarSizeSig	Variable-size signal	{'Inherit'}   'No'   'Yes'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'boolean'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'   'Bus: <object name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
Unit	Specify physical unit of the input signal to the block. For a list of acceptable units, see Allowed Units.	{'inherit'}   '<Enter unit>'
UnitNoProp	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	'<Enter unit>'
SignalType	Signal type	{'auto'}   'real'   'complex'
LatchByDelayingOutsideSignal	Latch input by delaying outside signal	{'off'}   'on'
LatchInputForFeedbackSignals	Latch input for feedback signals of function-call subsystem outputs	{'off'}   'on'
OutputFunctionCall	Output a function-call trigger signal	{'off'}   'on'
Interpolate	Interpolate data	'off'   {'on'}
Pulse Generator (DiscretePulseGenerator)		

Block (Type)/Parameter	Dialog Box Prompt	Values
PulseType	Pulse type	{'Time based'}   'Sample based'
TimeSource	Time (t)	{'Use simulation time'}   'Use external signal'
Amplitude	Amplitude	{'1'}
Period	Period	{'10'}
PulseWidth	Pulse width	{'5'}
PhaseDelay	Phase delay	{'0'}
SampleTime	Sample time	{'1'}
VectorParams1D	Interpret vector parameters as 1-D	'off'   {'on'}
Ramp (Ramp) (masked subsystem)		
slope	Slope	{'1'}
start	Start time	{'0'}
InitialOutput	Initial output	{'0'}
VectorParams1D	Interpret vector parameters as 1-D	'off'   {'on'}
Random Number (RandomNumber)		
Mean	Mean	{'0'}
Variance	Variance	{'1'}
Seed	Seed	{'0'}
SampleTime	Sample time	{'0.1'}
VectorParams1D	Interpret vector parameters as 1-D	'off'   {'on'}
Repeating Sequence (Repeating table) (masked subsystem)		
rep_seq_t	Time values	{'[0 2]'}
rep_seq_y	Output values	{'[0 2]'}
Repeating Sequence Interpolated (Repeating Sequence Interpolated) (masked subsystem)		
OutValues	Vector of output values	{'[3 1 4 2 1].''}
TimeValues	Vector of time values	{'[0 0.1 0.5 0.6 1].''}
LookUpMeth	Lookup Method	{'Interpolation-Use End Values'}   'Use Input Nearest'   'Use Input Below'   'Use Input Above'
tsamp	Sample time	{'0.01'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	'Inherit: Inherit via back propagation'   {'double'}   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
OutputDataTypeScaling Mode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
Repeating Sequence Stair (Repeating Sequence Stair) (masked subsystem)		
OutValues	Vector of output values	{'[3 1 4 2 1].''}
tsamp	Sample time	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via back propagation'   {'double'}   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'boolean'   'fixdt(1,16)'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'
OutputDataTypeScaling Mode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
ConRadixGroup	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
Signal Builder (Sigbuilder block) (masked subsystem)		
Signal Editor (SignalEditor)		
Filename	File name	{'untitled.mat'}
ActiveScenario	Active scenario	{'Scenario'}

Block (Type)/Parameter	Dialog Box Prompt	Values
ActiveSignal	Signals	{'Signal 1'}
IsBus	Output a bus signal	'on'   {'off'}
OutputBusObjectStr	Select bus object	{'Bus: BusObject'}
SampleTime	Sample time	{'0'}
Interpolate	Interpolate data	{'off'}   'on'
ZeroCross	Enable zero-crossing detection	{'off'}   'on'
OutputAfterFinalValue	Form output after final data value by	{'Setting to zero'}   'Extrapolation'   'Holding final value'
Unit	Unit	{'inherit'}
PreserveSignalName	—	boolean — {'off'}   'on'
NumberOfScenarios	—	Read-only. Use get_param to get this value.
NumberOfSignals	—	Read-only. Use get_param to get this value.
Signal Generator (SignalGenerator)		
WaveForm	Wave form	{'sine'}   'square'   'sawtooth'   'random'
TimeSource	Time (t)	{'Use simulation time'}   'Use external signal'
Amplitude	Amplitude	{'1'}
Frequency	Frequency	{'1'}
Units	Units	'rad/sec'   {'Hertz'}
VectorParams1D	Interpret vector parameters as 1-D	'off'   {'on'}
Sine Wave (Sin)		
SineType	Sine type	{'Time based'}   'Sample based'
TimeSource	Time	{'Use simulation time'}   'Use external signal'
Amplitude	Amplitude	{'1'}
Bias	Bias	{'0'}
Frequency	Frequency	{'1'}
Phase	Phase	{'0'}
Samples	Samples per period	{'10'}
Offset	Number of offset samples	{'0'}
SampleTime	Sample time	{'0'}
VectorParams1D	Interpret vector parameters as 1-D	'off'   {'on'}
Step (Step)		
Time	Step time	{'1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
Before	Initial value	{'0'}
After	Final value	{'1'}
SampleTime	Sample time	{'0'}
VectorParams1D	Interpret vector parameters as 1-D	'off'   {'on'}
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
Uniform Random Number (UniformRandomNumber)		
Minimum	Minimum	{'-1'}
Maximum	Maximum	{'1'}
Seed	Seed	{'0'}
SampleTime	Sample time	{'0.1'}
VectorParams1D	Interpret vector parameters as 1-D	'off'   {'on'}
Waveform Generator (WaveformGenerator)		
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via back propagation'   {'Inherit: Inherit from table data'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'boolean'   'fixdt(1,16)'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   'Floor'   {'Nearest'}   'Round'   'Simplest'   'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'}   'on'
SelectedSignal	Output signal	{'1'}
SampleTime	Sample time	{'0'}

**User-Defined Functions Library Block Parameters**

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
MATLAB Function (Stateflow) (masked subsystem)		
MATLAB System (MATLABSystem)		
System	System object class name	{''}
Level-2 MATLAB S-Function (M-S-Function)		
FunctionName	S-function name	{'mlfile'}
Parameters	Arguments	{''}
Interpreted MATLAB Function (MATLABFcn)		
MATLABFcn	MATLAB function	{'sin'}
OutputDimensions	Output dimensions	{'-1'}
OutputSignalType	Output signal type	{'auto'}   'real'   'complex'
Output1D	Collapse 2-D results to 1-D	'off'   {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
S-Function (S-Function)		
FunctionName	S-function name	{'system'}
Parameters	S-function parameters	{''}
SFunctionModules	S-function modules	{''}
S-Function Builder (S-Function Builder) (masked subsystem)

Parameters	S-function parameters	{''}
SFunctionModules	S-function modules	{''}

**Additional Discrete Library Block Parameters**

Block (Type)/Parameter	Dialog Box Prompt	Values
Fixed-Point State-Space (Fixed-Point State-Space) (masked subsystem)		
A	State Matrix A	{'[2.6020 -2.2793 0.6708; 1 0 0; 0 1 0]}'
B	Input Matrix B	{'[ 1; 0; 0]}'
C	Output Matrix C	{'[0.0184 0.0024 0.0055]}'
D	Direct Feedthrough Matrix D	{'[0.0033]}'
InitialCondition	Initial condition for state	{'0.0'}
InternalDataType	Data type for internal calculations	{'fixdt('double')}'
StateEqScaling	Scaling for State Equation AX+BU	{'2^0'}
OutputEqScaling	Scaling for Output Equation CX+DU	{'2^0'}
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'}   'on'
Transfer Fcn Direct Form II (Transfer Fcn Direct Form II) (masked subsystem)		
NumCoefVec	Numerator coefficients	{'[0.2 0.3 0.2]}'
DenCoefVec	Denominator coefficients excluding lead (which must be 1.0)	{'[-0.9 0.6]}'
vinit	Initial condition	{'0.0'}
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'}   'on'
Transfer Fcn Direct Form II Time Varying (Transfer Fcn Direct Form II Time Varying) (masked subsystem)		
vinit	Initial condition	{'0.0'}
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'}   'on'
Unit Delay Enabled (Unit Delay Enabled) (masked subsystem)		

Block (Type)/Parameter	Dialog Box Prompt	Values
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay Enabled External IC (Unit Delay Enabled External Initial Condition) (masked subsystem)		
tsamp	Sample time	{'-1'}
Unit Delay Enabled Resettable (Unit Delay Enabled Resettable) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay Enabled Resettable External IC (Unit Delay Enabled Resettable External Initial Condition) (masked subsystem)		
tsamp	Sample time	{'-1'}
Unit Delay External IC (Unit Delay External Initial Condition) (masked subsystem)		
tsamp	Sample time	{'-1'}
Unit Delay Resettable (Unit Delay Resettable) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay Resettable External IC (Unit Delay Resettable External Initial Condition) (masked subsystem)		
tsamp	Sample time	{'-1'}
Unit Delay With Preview Enabled (Unit Delay With Preview Enabled) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay With Preview Enabled Resettable (Unit Delay With Preview Enabled Resettable) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay With Preview Enabled Resettable External RV (Unit Delay With Preview Enabled Resettable External RV) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay With Preview Resettable (Unit Delay With Preview Resettable) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay With Preview Resettable External RV (Unit Delay With Preview Resettable External RV) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}

**Additional Math: Increment - Decrement Library Block Parameters**

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
Decrement Real World (Real World Value Decrement) (masked subsystem)		
Decrement Stored Integer (Stored Integer Value Decrement) (masked subsystem)		
Decrement Time To Zero (Decrement Time To Zero) (masked subsystem)		
Decrement To Zero (Decrement To Zero) (masked subsystem)		
Increment Real World (Real World Value Increment) (masked subsystem)		
Increment Stored Integer (Stored Integer Value Increment) (masked subsystem)		

## Mask Parameters

### About Mask Parameters

This section lists parameters that describe masked blocks. You can use these descriptive parameters with `get_param` and `set_param` to obtain and specify the properties of a block mask.

The descriptive mask parameters listed in this section apply to all masks, and provide access to all mask properties. Be careful not to confuse these descriptive mask parameters with the mask-specific parameters defined for an individual mask in the Mask Editor **Parameters** pane.

See “Masking Fundamentals” and “Mask Editor Overview” for information about block masks and the Mask Editor.

## Mask Parameters

Parameter	Description/Prompt	Values
Mask	Turns mask on or off.	{ 'on' }   'off'
MaskCallbackString	Mask parameter callbacks that are executed when the respective parameter is changed on the dialog. Set by the <b>Dialog callback</b> field on the <b>Parameters</b> pane of the Mask Editor dialog box.  For more information, see “Mask Callback Code”.	pipe-delimited character vector { ' ' }
MaskCallbacks	Cell array version of MaskCallbackString.	cell array { ' [ ] ' }
MaskDescription	Block description. Set by the <b>Mask description</b> field on the <b>Documentation</b> pane of the Mask Editor dialog box.	character vector { ' ' }
MaskDisplay	Drawing commands for the block icon. Set by the <b>Icon Drawing commands</b> field on the <b>Icon &amp; Ports</b> pane of the Mask Editor dialog box.	character vector { ' ' }
MaskEditorHandle	For internal use only.	
MaskEnableString	Option that determines whether a parameter is greyed out in the dialog. Set by the <b>Enable parameter</b> check box on the <b>Parameters</b> pane of the Mask Editor dialog box.	pipe-delimited character vector { ' ' }
MaskEnables	Cell array version of MaskEnableString.	cell array of character vectors, each either 'on' or 'off' { ' [ ] ' }
MaskHelp	Block help. Set by the <b>Mask help</b> field on the <b>Documentation</b> pane of the Mask Editor dialog box.	character vector { ' ' }
MaskIconFrame	Set the visibility of the icon frame (Visible is on, Invisible is off). Set by the <b>Block Frame</b> option on the <b>Icon &amp; Ports</b> pane of the Mask Editor dialog box.	{ 'on' }   'off'
MaskIconOpaque	Set the transparency of the icon. Set by the <b>Icon Transparency</b> option on the <b>Icon &amp; Ports</b> pane of the Mask Editor dialog box.	{ 'opaque' }   'transparent'   'opaque-with-ports'

Parameter	Description/Prompt	Values
MaskIconRotate	Set the rotation of the icon (Rotates is on, Fixed is off). Set by the <b>Icon Rotation</b> option on the <b>Icon &amp; Ports</b> pane of the Mask Editor dialog box.	'on'   {'off'}
MaskIconUnits	Set the units for the drawing commands. Set by the <b>Icon Units</b> option on the <b>Icon &amp; Ports</b> pane of the Mask Editor dialog box.	'pixel'   {'autoscale'}   'normalized'
MaskInitialization	Initialization commands. Set by the <b>Initialization commands</b> field on the <b>Initialization</b> pane of the Mask Editor dialog box.	MATLAB command {' '}
MaskNames	Cell array of mask dialog parameter names. Set inside the <b>Variable</b> column in the <b>Parameters</b> pane of the Mask Editor dialog box.	matrix {' []'}
MaskPortRotate	Specify the port rotation policy for the masked block. Set in the <b>Port Rotation</b> area on the <b>Icon &amp; Ports</b> pane of the Mask Editor dialog box.  For more information, see “Format a Model”.	{'default'}   'physical'
MaskPrompts	List of dialog parameter prompts (see below). Set inside the <b>Dialog parameters</b> area on the <b>Parameters</b> pane of the Mask Editor dialog box.	cell array of character vectors {' []'}
MaskPromptString	List of dialog parameter prompts (see below). Set inside the <b>Dialog parameters</b> area on the <b>Parameters</b> pane of the Mask Editor dialog box.	character vector {' '}
MaskPropertyName	Pipe-delimited version of MaskNames.	character vector {' '}
MaskRunInitForIconRedraw	Specifies whether Simulink must run mask initialization before executing the mask icon commands.	{'auto'}   'on'   'off'
MaskSelfModifiable	Indicates that the block can modify itself. Set by the <b>Allow library block to modify its contents</b> check box on the <b>Initialization</b> pane of the Mask Editor dialog box.	'on'   {'off'}

Parameter	Description/Prompt	Values
MaskStyles	Determines whether the dialog parameter is a check box, edit field, or pop-up list. Set by the <b>Type</b> column in the <b>Parameters</b> pane of the Mask Editor dialog box.	cell array {' [] '} edit, checkbox, popup, combobox, radiobutton, slider, dial, spinbox, unit, textarea, customtable, unidt, min, max.
MaskStyleString	Comma-separated version of MaskStyles.	character vector { ' ' }
MaskTabNameString	For internal use only.	
MaskTabNames	For internal use only.	
MaskToolTipsDisplay	Determines which mask dialog parameters to display in the tooltip for this masked block. Specify as a cell array of 'on' or 'off' values, each of which indicates whether to display the parameter named at the corresponding position in the cell array returned by MaskNames.	cell array of 'on' and 'off' {''}
MaskToolTipString	Comma-delimited version of MaskToolTipsDisplay.	character vector { ' ' }
MaskTunableValues	Allows the changing of mask dialog values during simulation. Set by the <b>Tunable</b> column in the <b>Parameters</b> pane of the Mask Editor dialog box.	cell array of character vectors { ' [] ' }
MaskTunableValueString	Comma-delimited character vector version of MaskTunableValues.	delimited character vector { ' ' }
MaskType	Mask type. Set by the <b>Mask type</b> field on the <b>Documentation</b> pane of the Mask Editor dialog box.	character vector { 'Stateflow' }
MaskValues	Dialog parameter values.	cell array { ' [] ' }
MaskValueString	Delimited character vector version of MaskValues.	delimited character vector { ' ' }
MaskVarAliases	Specify aliases for a block's mask parameters. The aliases must appear in the same order as the parameters appear in the block's MaskValues parameter.	cell array { ' [] ' }
MaskVarAliasString	For internal use only.	
MaskVariables	List of the dialog parameters' variables (see below). Set inside the <b>Dialog parameters</b> area on the <b>Parameters</b> pane of the Mask Editor dialog box.	character vector { ' ' }

Parameter	Description/Prompt	Values
MaskVisibilities	Specifies visibility of parameters. Set with the <b>Show parameter</b> check box in the <b>Options for selected parameter</b> area on the <b>Parameters</b> pane of the Mask Editor dialog box.	matrix {' []'}
MaskVisibilityString	Delimited character vector version of MaskVisibilities.	character vector {' '}
MaskWSVariables	List of the variables defined in the mask workspace (read only).	matrix {' []'}

See Control Masks Programmatically, for more information on setting the mask parameters from the MATLAB command line.

# Tools and Apps

---

## Create Signal

Create signal in Live Editor

### Description

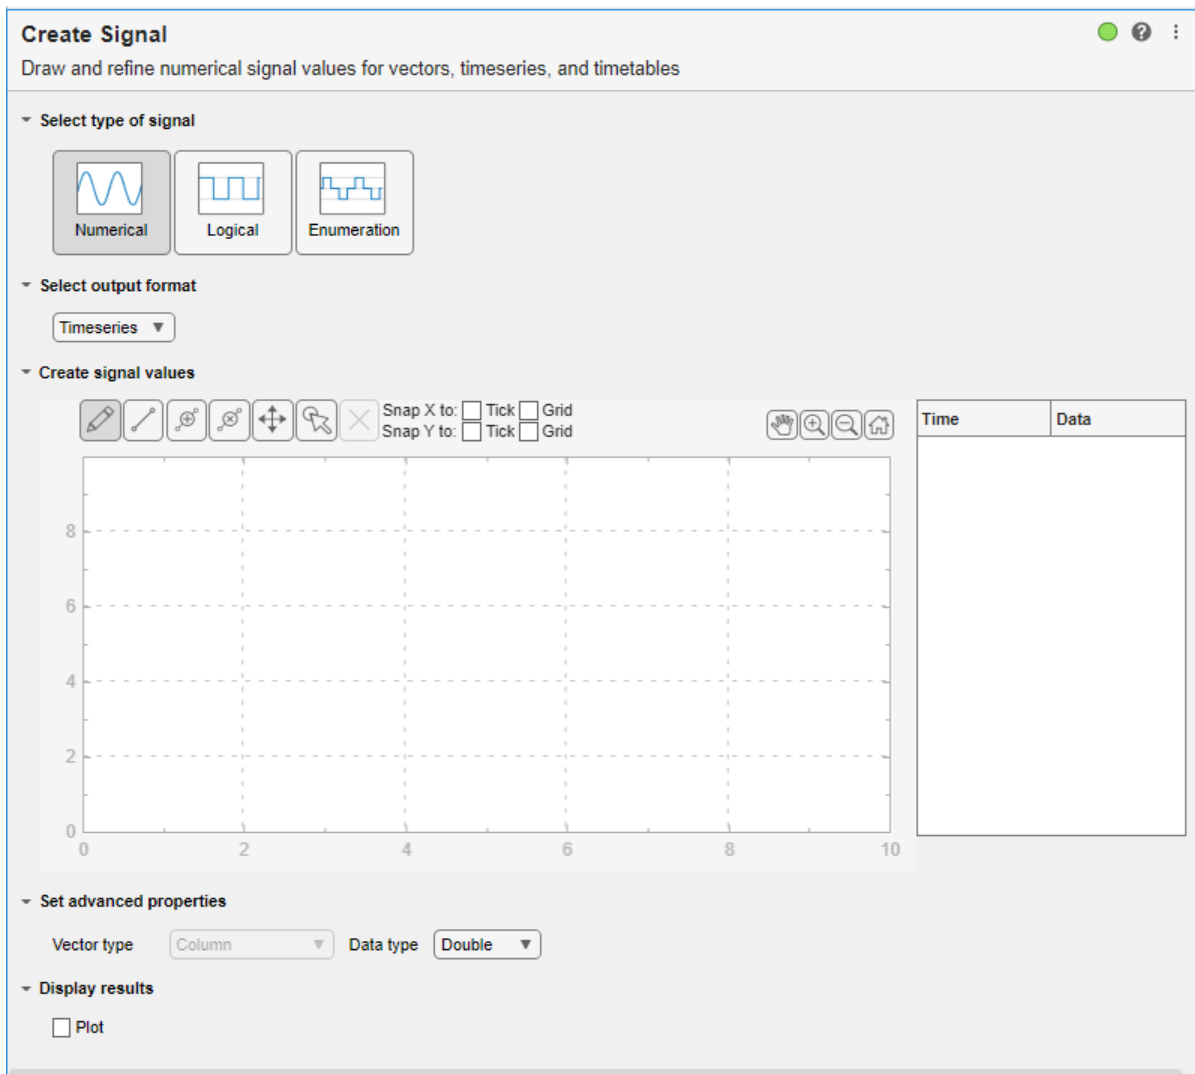

The **Create Signal** task lets you create numerical, logical, and enumeration data. The task automatically generates MATLAB code for your live script.

Using this task, you can interactively draw and refine numerical data values for vectors, timeseries, timetables, and data arrays using:

- Pointer
- Keyboard
- Touchscreen

By default, the live task creates a workspace variable, `createdSignal`.

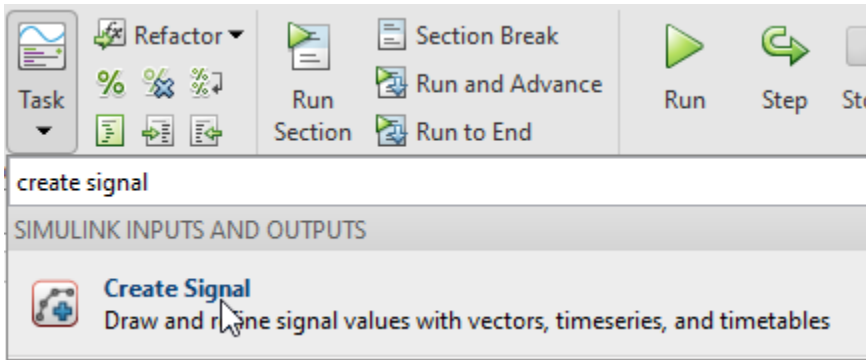

For general information about Live Editor tasks, see “Add Interactive Tasks to a Live Script”.

## Open the Task

To add the **Create Signal** task to a live script in the MATLAB Editor:

- On the Live Editor tab, select **Task > Create Signal**.
- In a code block in the script, type a relevant keyword, such as `create signal`, `vector`, `timeseries`, `timetable`, `input`, `signal`, or `source`. From the selected completions, select **Create Signal**.

## Parameters

### Select type of signal – Type of data to create

Numerical | Logical | Enumeration

Type of data to create, specified as Numerical, Logical, or Enumeration.

### Select output format – Type of created data

Timeseries (default) | Data array | Timeseries | Timetable | Vector

Data type of the created data, specified as Timeseries, Data array, Timeseries, and Timetable.

### Create signal values – Options to interactively create signals

palette of mouse and touchscreen actions

Interactively create signals using the palette of mouse and touchscreen actions. The interactively created data is plotted in the plot area. You can refine this data or create new data by:

- Editing the data in the **Time Data** table using the keyboard
- Manipulating the points in the plot using the pointer or touchscreen

Action	Keyboard	Pointer	Multi-Touch
Insert point	<b>Ctrl+P</b>	Click	Tap
Insert line	<b>Ctrl+L</b>	Click	Pan and pinch
Select a point	<b>Ctrl+T</b>	Click  , then click and select point or area  To select all areas, double-click	Pan and pinch  To select all areas, double-tap
Move a point	<b>Ctrl+M</b>	Click  and drag	Tap and move
Continuously delete points on a line		Click	

Action	Keyboard	Pointer	Multi-Touch
Draw		Click 	Pan
Zoom in, zoom out		Click  or 	
Home		Click 	
Pan in x-axis, y, and x- and y-axes		Click 	
Expand along x-axis	<b>Ctrl</b> +pointer pan		Pry x-axis
Expand along y-axis	<b>Shift</b> +pointer pan		Pry y-axis
Snap X or Y to tick			
Snap X or Y to grid			

### Advanced properties — Advanced properties for data

Row | Column | variable name | time unit | enumeration

Set up the properties for your data. The data properties depend on the **Select type of signal** and **Select output format** settings. Depending on these settings, you can set properties such as:

- Vector type
- Data type
- Variable names
- Time units

### Plot — Option to plot data

off | on

To plot the data, select the **Plot** check box. The plot displays to the right.

## Examples

### Create Signals Using Live Editor Task

This example shows how to use the **Create Signal** Live Editor task to create numerical data by drawing an arc. By default, **Create Signal** creates a variable named `createdSignal` in the workspace with a numerical signal type and outputs data in the `timeseries` format.

In the **Create signal values** section, click , then left-click and drag to create a line of data points.

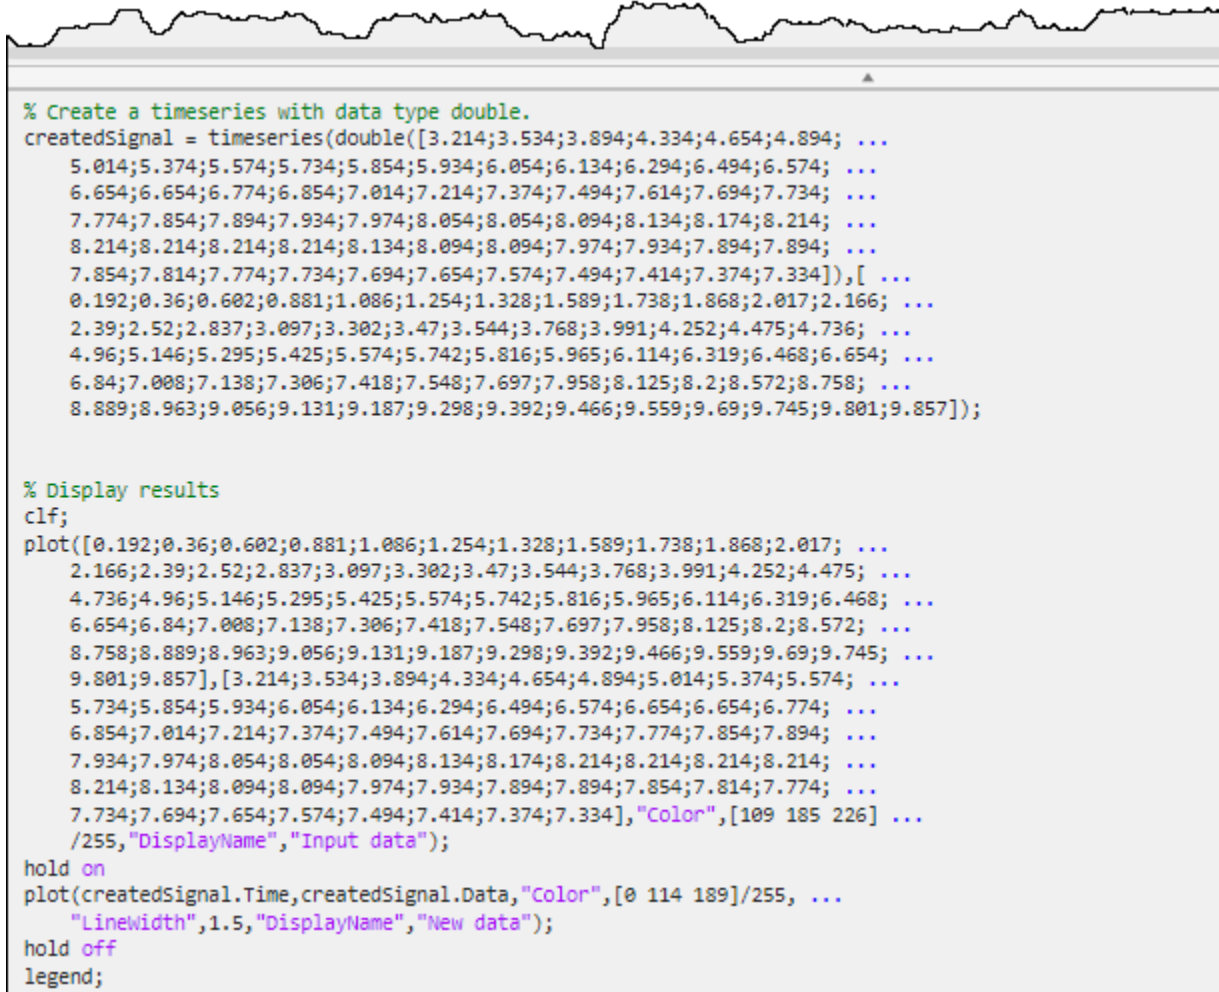

To the right of the window, observe the time and data points that result from the drawing.

To view a plot of the line, in the **Display results** section, click **Plot**. The plot displays to the right.

To see the code that this task generates, expand the task display by clicking  at the bottom of the task parameter area.

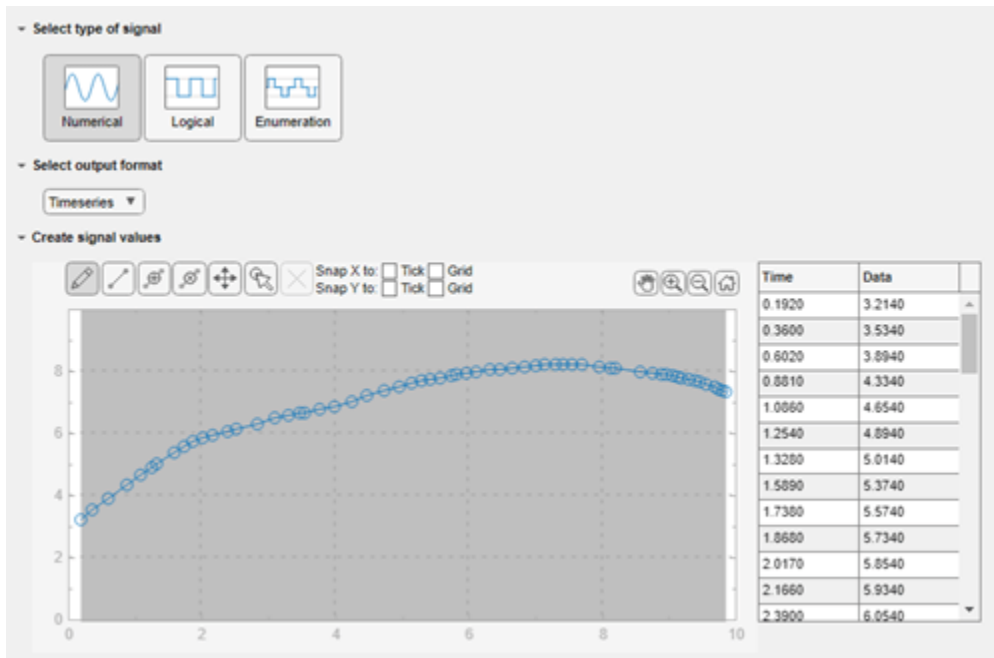

You can use the `createdSignal` timeseries object data in many of the cases where you want to input data, for example, to import to Root Inport Mapper or to work with source blocks. To save this task, save the live script.

### Create Signals Using Live Editor Task for Input Port

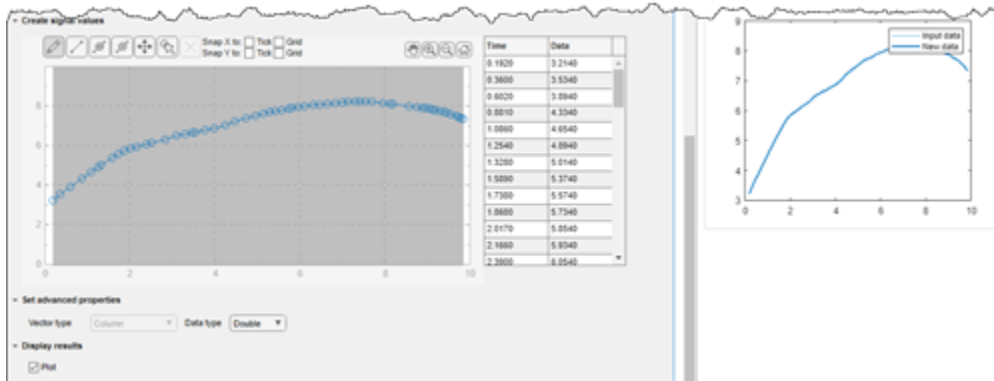

This example shows how to use the **Create Signal** Live Editor task to create numerical data for an inport port in a model. by drawing an arc. By default, **Create Signal** creates a variable named `createdSignal` in the workspace with a numerical signal type and outputs data in the `timeseries` format.

In the **Create signal values** section, click , then left-click and drag to create a line of data points.

To the right of the window, observe the time and data points that result from the drawing.

To view a plot of the line, in the **Display results** section, click **Plot**. The plot displays to the right.

At the bottom of the live task, add the code to open the CreateSignalInport model, set the createdSignal variable to the input, load the input from the workspace, and simulate the model.

```

 Plot

model = "CreateSignalInport";
open_system(model);

set_param('CreateSignalInport','ExternalInput','createdSignal');
set_param('CreateSignalInport','LoadExternalInput','on');
sim("CreateSignalInport.slx");

```

In the live task, click **Run**.

In the model, open the Scope block.

## MATLAB Function Block Editor

Create, edit, and debug MATLAB code in MATLAB Function blocks

### Description

The **MATLAB Function Block Editor** allows you to view, edit, and create the MATLAB functions for a MATLAB Function block. When you update the MATLAB code, Simulink updates the MATLAB Function block with input and output ports that match the input and output arguments in the MATLAB function. The **MATLAB Function Block Editor** opens in the **Simulink Editor**.

### Open the MATLAB Function Block Editor

- Double-click a MATLAB Function block.
- Select a MATLAB Function block and, in the **Function** tab, click **Open in Simulink**.

## Examples

### Open and Use the MATLAB Function Block Editor

Add a MATLAB Function to your model to open the **MATLAB Function Block Editor**.

- 1 In the **Simulation** tab, click **Library Browser**. Select **Simulink > User-Defined Functions**. Drag a MATLAB Function block to the Simulink canvas.
- 2 Double-click the block to open the **MATLAB Function Block Editor**. Replace the function body code with the following:

```
y = 2*u;
```

- 3 Return to the model by clicking the Up to Parent button . Add a Sine Wave block as the input signal and add a Scope block to capture the input and output of the MATLAB Function block.

- 4 Run the simulation and open the Scope block to see the effects of the code.

### Redefine the Function Header

Rename the default function and adjust function arguments to automatically update the block inports, outports, and block icon.

- 1 Create a new MATLAB Function block and open the **MATLAB Function Block Editor**.
- 2 In the function header, change the text to:
 

```
function [x y] = test_function(u1, u2)
```
- 3 Return to the model window. The name on the block icon is now `test_function`, and the block has two input ports for **u1** and **u2**, and two output ports **x** and **y**.

### Add Variables with the Symbols Pane

Add function arguments and content to the MATLAB Function block by using the **Symbols** pane.

- 1 Create a new MATLAB Function block and double-click the block to open the **MATLAB Function Block Editor**.
- 2 Open the **Symbols** pane and Property Inspector. In the **Function** tab, click **Edit Data**.
- 3 In the **Symbols** pane, click the Create Data button .
- 4 Select the new data and adjust the properties in the Property Inspector.

For more information, see “Create and Define MATLAB Function Block Variables”.

### Add Breakpoints to Debug a Function

You can add breakpoints to debug MATLAB Function blocks.

- 1 Create a new MATLAB Function block and open the **MATLAB Function Block Editor**.
- 2 Enter the following code:

```
function [mult,add,subtract] = number_operations(u1,u2)

add = u1 + u2;
subtract = u1 - u2;
mult = u1 * u2;
```

- 3 Click line numbers 3 and 4 to add two breakpoints. The line numbers highlight in red.
- 4 Run the simulation. The simulation stops at the first breakpoint. Click the **Continue** button to simulate until the next breakpoint. If the last breakpoint has been reached, click **Continue** to advance to the next time step.

### Investigate Code by Running a Report

Run a report on your MATLAB function code to find information on variables and help detect warnings and errors.

- 1 Create a new MATLAB Function block and open the **MATLAB Function Block Editor**.
- 2 Enter the following code:

```
function [mult,add,subtract] = number_operations(u1,u2)

add = u1 + u2;
subtract = u1 - u2;
mult = u1 * u2;
```

- 3 Click the Function Report button .
- 4 The report lists variables in the **Variables** tab at the bottom. Click any of the variable names to highlight instances where the variable appears in the code.
- 5 In the function code, point to or click any variable or expression to see a dialog box with more information.
  - “Debug MATLAB Function Blocks”
  - “Implement MATLAB Functions in Simulink with MATLAB Function Blocks”
  - “Call MATLAB Function Files in MATLAB Function Blocks”

## Parameters

### Prepare

#### Edit Data — Opens the Symbols pane and Property Inspector

button

Opens the **Symbols** pane and the Property Inspector. Click the button to define function variables and edit properties.

### Navigate

#### Go To — Goes to specified code

button

Goes to specified code, including functions and line numbers.

#### Find — Finds and replaces code in function

button

Finds specified text written in the **MATLAB Function Block Editor**. You can also use the **Ctrl+F** keyboard shortcut. If you want to find and replace code, use the **Ctrl+H** keyboard shortcut. This parameter has the same functionality as the MATLAB Editor. For more information, see “Find and Replace Text in Files and Go to Location”.

### Code

#### Refactor — Converts selected code to a function

button

Converts selected code to a function. Use this feature on code that is not already contained in a function. You can create a separate file for the function code or you can convert code into a local function.

- 1 To convert code and save it in a separate m-file, select the code and click **Refactor > Convert to Function**. The code saves as a m-file and the **MATLAB Function Block Editor** calls the code by the name you specify. To run the model without error, the m-file must be on the path.
- 2 To convert code into a local function, select the code and click **Refactor > Convert to Local Function**. The **MATLAB Function Block Editor** creates a local function at the bottom of the code and replaces the selected code with a function call to the local function.

#### Comment — Comments out code

button

Comments out code. Select the lines you want to comment and click the Comment button . The button adds one % to the selected lines each time you press it. You can also select the code and use the **Ctrl+R** keyboard shortcut.

#### Uncomment — Removes comments from code

button

Removes comments from code. Select the lines you want to uncomment and click the Uncomment button . The button removes one % from the selected lines each time you press it. You can also select the code and use the **Ctrl+T** keyboard shortcut.

**Wrap Comments — Wraps comments**

button

Wraps comments. Select the lines you want to comment and click the Wrap comments button .

The **MATLAB Function Block Editor** does not wrap comments with:

- 1 Code section titles (comments that begin with %%).
- 2 Long contiguous text, such as URLs.
- 3 Bulleted list items (text that begins with \* or #) onto the preceding line.

**Smart Indent — Formats code with smart indenting**

button

Formats code with smart Indenting. Smart indenting automatically formats code to improve code readability, such as when you use functions or logical statements. To manually deploy smart

indenting, select the lines of code and click the Smart Indent button . By default, the **MATLAB Function Block Editor** automatically uses smart indenting. For more information, see “Edit and Format Code”.

**Increase Indent — Increases the code indent**

button

Increases the code indent by one tab indent. To increase the indent, select the lines of code and click the Increase Indent button .

**Decrease Indent — Decreases the code indent**

button

Decreases the code indent by one tab indent if the code is indented. To decrease the indent, select the lines code and click the Decrease Indent button .

**Specify fixed-point data — Builds fi object constructors**

button

Builds fi object constructors with a user interface. To open the interface, click the Specify fixed-point data button . Click the arrow next to the icon to select additional fi constructors. For more information, see “Building fimath Object Constructors in a GUI” (Fixed-Point Designer). This features requires a Fixed-Point Designer license.

**Compile****Update Model — Updates the model and checks for errors**

button

Updates the model and checks for errors. Expand the menu under **Update Model** to select from two options.

- **Update Model:** Compiles the model and checks for static errors.
- **Refresh blocks:** Updates the model blocks to reflect changes made.

You can also use the **Ctrl+Shift+D** keyboard shortcut to update the model. For more information, see “Update Diagram and Run Simulation” and “Simulation Phases in Dynamic Systems”.

## Simulate

### Stop Time — Specifies the simulation stop time

10 (default) | scalar

Specifies the simulation stop time.

### Simulation Mode — Changes the simulation mode

menu item

Changes the simulation mode. You can select from **Normal**, **Accelerator** or **Rapid Accelerator**. For more information, see “Choosing a Simulation Mode”.

### Fast Restart — Enables fast restart

"off" (default) | "on"

Enables fast restart for model simulation. Fast restart can improve performance by preventing compiling. For more information, see “Get Started with Fast Restart”.

### Step Back — Steps back in simulation

button

Steps back in simulation. You must configure this option first with the Simulation Stepping Options. If you have not configured these options, the button opens the Simulation Stepping Options window. For more information, see “Simulation Stepping Options”.

### Run — Runs the simulation

button

Runs the simulation. You can run a single simulation, or run multiple simulations by creating design studies with **Multiple Simulations** and selecting **Run All** from the drop down. Adjust the time pacing by selecting **Simulation Pacing** from the drop down.

### Step Forward — Steps through the simulation at each time step

button

Steps through the simulation at each time step. For more information, see “Step Through a Simulation”.

### Stop — Stops the simulation

button

Stops the simulation.

## Debug Code

### Step over — Steps over the breakpoint during debugging

button

Steps over the breakpoint during debugging in the MATLAB Function block. When you press the button, the debugger steps past function calls and does not enter called functions for line-by-line execution. You can use this button only after simulation stops at a breakpoint.

**Step In – Goes to next line of code during debugging**

button

Goes to next line of code during debugging in the MATLAB Function block. If the line calls a local function, step into the first line of the local function. You can use this button only after simulation stops at a breakpoint.

**Step out – Exits line-by-line function execution during debugging**

button

Exits line-by-line function execution during debugging of the current function or local function. If in a local function, the debugger continues to the line following the call to this local function. You can use this button only after simulation stops at a breakpoint.

**Report****Function Report – Opens a report**

button

Opens a report that contains information about the MATLAB Function. You can use this report to find information about variables and expressions in the code. For more information, see “MATLAB Function Reports”.

## Version History

**Introduced in R2011a****MATLAB Function Block Editor in Simulink window**

The **MATLAB Function Block Editor** opens in the same Simulink window as the parent model of the MATLAB Function block. Previously, when you opened a function in the **MATLAB Function Block Editor**, the editor opened in the MATLAB window.

**See Also****Simulink Editor** | **Model Explorer** | `function`**Topics**

“Debug MATLAB Function Blocks”

“Implement MATLAB Functions in Simulink with MATLAB Function Blocks”

“Call MATLAB Function Files in MATLAB Function Blocks”

# Finder

Find and optionally replace values in Simulink models, libraries, and subsystems

## Description

Use the **Finder** to search Simulink models, libraries, and subsystems for elements that contain the search string that you enter.

The search can match the string anywhere in the element, such as in the name or in the parameter values. You can customize the search to look only in certain types of elements or for elements with specific parameter settings.

From the search results, you can select and navigate to elements. You can also replace found instances of the search string with another string.

By default, the **Finder** searches all model elements in the current system, its referenced models, its linked blocks, and its masked systems for case-insensitive partial or full matches.

Finder: Search from top model

Find

x
Find
Result 1 of 67

Name	Type	Propert...	Label S...	Script	Description
▼  sldemo_fuelsys	Model				
▼  Dashboard	Subsystem				
 Engine <b>Speed</b> (rpm)	Annotation				
 Engine <b>Speed</b>	Annotation				
▼  fuel_rate_control	Subsystem				
▼  control_logic	Subsystem				
▼  Speed.speed_estimate	Subsystem				
 <b>Speed</b> Estimation	Annotation				
▼  <b>Speed</b> Estimation	Lookup_n-D				
 Table data:	Property	<b>Speed</b> Est			
 <b>speed</b>	Output				
▼  Saturation	Saturate				

## Open the Finder

- In the Simulink Toolstrip, on the **Modeling** tab, click **Find**.
- In the Simulink quick access toolbar, click the **Find** button .

If the **Find** button  is not in the quick access toolbar, click the **Common Controls** button  and select the **Find** check box.

- With the Simulink Editor selected, press **Ctrl+F**.

## Examples

### Search One Level of Model

In this example, you search the top level of the `sldemo_fuelsys` model for any model element that contains the number 2.

- 1 Open the “Modeling a Fault-Tolerant Fuel Control System” on page 13-121 example model `sldemo_fuelsys`.

```
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
sldemo_fuelsys
```

- 2 Open the **Finder**. On the **Modeling** tab, click **Find**.

- 3 Click the **Change the search scope**  button arrow and select **Search this level only**.

- 4 In the search box, enter 2.

Model elements that contain the search string appear in a table. The first element in the table is selected.

- 5 To move to the next element, click the down arrow .
- 6 Use the up and down arrows to move through the rest of the found elements. Alternatively, scroll through the table and click an element to select it.

### Perform Advanced Search

When a search returns too many results, use the advanced search settings to narrow your search.

The advanced search settings allow you to:

- Include only the elements you are interested in, such as blocks, annotations, or signals.
- Omit block parameter values from the search.
- Search for case-sensitive matches.
- Search for exact matches.
- Search using regular expressions.
- Omit masked systems, linked blocks, and referenced models from the search.
- Search based on property values such as `BlockDescription` or `BlockType`.

In this example, you search the `sldemo_fuelsys` model for all elements that contain the string `speed`. You then use the **Advanced settings** pane to refine your results.

- 1 Open the “Modeling a Fault-Tolerant Fuel Control System” on page 13-121 example model `sldemo_fuelsys`.

```
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
sldemo_fuelsys
```

- 2 Open the **Finder**. On the **Modeling** tab, click **Find**.
- 3 Enter the search string. For example, enter **speed**.

Model elements that contain the search string appear in a table. The first element in the table is selected.

Alternatively, you can enter the search string after you specify the search settings

- 4 Click the **Advanced settings** button .

The **Advanced Settings** pane opens.

- 5 Specify the advanced settings you want. For example, in the **Property:Value** section, change **BlockDescription** to **BlockType**. In the corresponding text box, type **Constant** and click the **Add property and value** button .

---

**Note** In the **Property:Value** section, if you want to search based on a property that is not in the list, select **Other**, then enter the full programmatic name of the property. To find the programmatic name, in the Property Inspector, pause on the property. You cannot use regular expressions or partial matches for the property name.

---

6 Click **Find** to find results that match the updated search criteria.

To restore the default advanced settings, click **Reset**.

## Find and Replace Text

You can find and replace text using the **Finder**.

For search results to support replacement:

- You must have write access for the field.
- The field value must be the same as when you performed the search.
- The text formatting must be plain.

In this example, you search the `sldemo_fuelsys` model for the string `rad` and replace `rad` with `deg`.

1 Open the “Modeling a Fault-Tolerant Fuel Control System” on page 13-121 example model `sldemo_fuelsys`.

```
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
sldemo_fuelsys
```

2 Open the **Finder**. On the **Modeling** tab, click **Find**.

3 In the search box, enter the search string. For example, enter `rad`.

Model elements that contain the search string appear in a table.

4 To the left of the search box, click the **Find** button arrow, and select **Replace**.

Replace options appear in the Finder.

5 In the text box next to the **Replace** button, enter the replacement string. For example, enter `deg`.

6 Select the instance you want to replace, then click **Replace**.

Finder: Search from top model

Replace [x] rad Find Result 2 of 4 [up/down] [deg] Replace [dropdown] Replaced 1 Revert [dropdown]

Name	Type	Property Value	Description	Source	Destination
▼ sldemo_fuelsys	Model				
▼ Engine Gas Dynamics	Subsystem				
▼ Throttle & Manifold	Subsystem				
▼ Intake Manifold	Subsystem				
▼ N (deg/sec)	Inport				
Unit (e.g., m, m/s^2, N*m):	Property	rad/s			
▼ Engine Speed, N	Inport				
Unit (e.g., m, m/s^2, N*m):	Property	rad/s			
▼ engine speed	Inport				
Unit (e.g., m, m/s^2, N*m):	Property	rad/s			

Alternatively, replace all instances of the found string by clicking **Replace > Replace All**.

**Note** If you stop the replacement operation before it completes, the completed replacements do not revert.

- 7 To view a replacement in the model, double-click the row that corresponds to the replaced element.

If you want to revert replacements, you must revert them before you perform another search or close the **Finder**. To revert replacements, select the instance to revert, then click **Revert**. Alternatively, click the **Revert** button arrow and select **Revert All**. The **Finder** applies the inverse replacements to restore the original values.

- “Build and Edit a Model Interactively”

## Tips

- To select the starting point for your search, use the Model Browser.
- To go to and select the element in the model, double-click an item in the list.
- To search for any model elements that match the search criteria, enter an asterisk (\*) in the search box.
- To search for a string that contains a colon, escape the colon using a backslash (for example, `Earth\ : a planet`), or use single or double quotes around the expression (for example, `'Earth: a planet'` or `"Earth: a planet"`).
- You can interact with search results while the search runs. However, you can sort the results only after the search is complete.
- To stop a search and view partial search results, in the Finder, click the **Stop** button.
- For table display options, pause on the **Name** heading and click the arrow that appears. The menu provides options to expand, collapse, and sort results. To sort the table based on another column, pause on the corresponding table heading and click the arrow that appears.

## Version History

### Topics

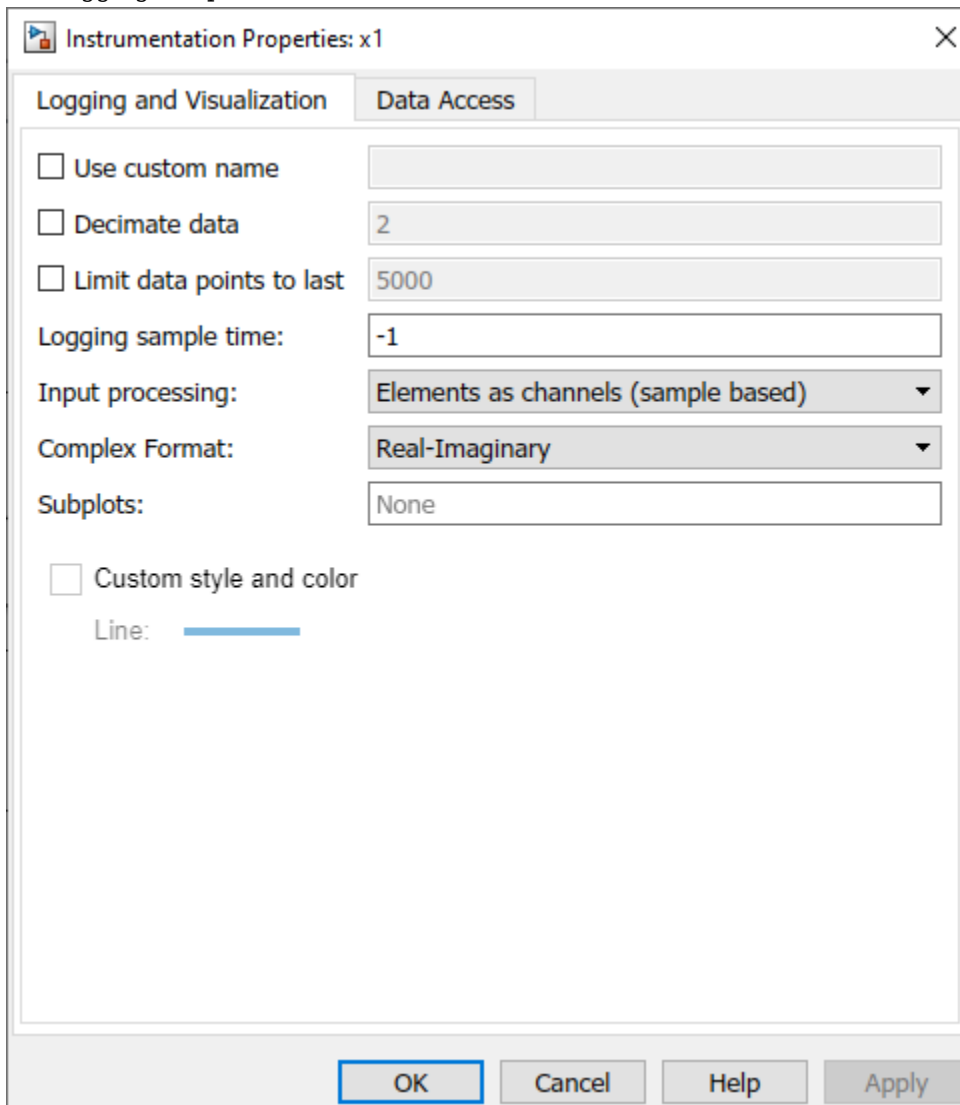

“Build and Edit a Model Interactively”

## Instrumentation Properties

View and edit logging and visualization properties for logged signal

### Description

Use the Instrumentation Properties dialog box to configure logging and visualization settings for logged signals, including a data access callback function to process logged data during simulation and logging sample time.

### Open the Instrumentation Properties

- Right-click the logging badge on a signal that is marked for logging and select **Properties**.

## Parameters

### Logging and Visualization

#### Use custom name — Signal logging name

string | character vector

Select this option to specify a name for logged signal data that is different from the name of the signal in the model. By default, logged signal data uses the name of the signal specified in the model.

The **Use custom name** property is the same as the **Logging name** property that you configure using the **Signal Properties** dialog box.

#### Programmatic Use

To specify the logging name programmatically, use the `set_param` function to configure the `DataLoggingNameMode` and `DataLoggingName` parameters for the port handle that corresponds to the block output port that produces the signal. For an example, see “Signal-Specific Logging Name Specified Programmatically”.

**Parameter:** `DataLoggingNameMode`

**Value:** 'SignalName' | 'Custom'

**Default:** 'SignalName'

**Parameter:** `DataLoggingName`

**Type:** string | character vector

#### Decimate data — Option to log every *n*th sample value

'off' (default) | 'on'

When you want to reduce the effective sample rate for logged data, select **Decimate data** and specify the desired decimation factor in the text box. For example, if you specify a decimation factor of 2, every other signal value is logged.

Consider data requirements for each signal before reducing the number of data points logged in simulation. Decimation can cause aliasing if the effective sample rate is too low.

For more information, see “Specify Signal Values to Log” and “Limit the Size of Logged Data”.

#### Programmatic Use

To configure this option programmatically, use the `set_param` function to configure the `DataLoggingDecimateData` and `DataLoggingDecimation` parameters for the port handle that corresponds to the block output port that produces the signal.

**Parameter:** `DataLoggingDecimateData`

**Value:** 'on' | 'off'

**Default:** 'off'

**Parameter:** `DataLoggingDecimation`

**Value:** numeric scalar

**Type:** string | character vector

**Default:** '2'

#### Limit data points to last — Option to log only last *n* data points

'off' (default) | 'on'

When you only want to save or analyze the data from the end of a simulation, you can configure logging to capture only the last  $n$  signal values. Select **Limit data points to last** and specify the number of data points you want to log.

When you only log the last simulation values, dashboard blocks and the Simulation Data Inspector do not display data during simulation. Consider data requirements for each signal before you reduce the number of data points logged in simulation.

For more information, see “Specify Signal Values to Log” and “Limit the Size of Logged Data”.

### Programmatic Use

To configure this option programmatically, use the `set_param` function to specify the `DataLoggingLimitDataPoints` and `DataLoggingMaxPoints` parameters for the port handle that corresponds to the block output port that produces the signal.

**Parameter:** `DataLoggingLimitDataPoints`

**Value:** 'on' | 'off'

**Default:** 'off'

**Parameter:** `DataLoggingMaxPoints`

**Value:** numeric scalar

**Type:** string | character vector

**Default:** '5000'

### Logging sample time — Sample time for logged signal data

-1 (default) | scalar

Specify the sample time to use for logging the data for the selected signal. By default, the logging sample time is inherited (-1) from the block that produces the signal. For continuous logging sample time, specify the value as 0. To use a discrete sample time for logging data, specify the sampling interval as a scalar.

Specifying a logging sample time may add a new sample time to the model. When you specify a logging sample time, the model calculates a value for the exact time hits. When you use a fixed-step solver, the logging sample time you specify must be a multiple of the base rate for the model.

Logging sample time is not supported for signals inside conditional subsystems or conditional referenced models.

The **Logging sample time** property is the same as the **Sample time** property you configure using the **Signal Properties** dialog box.

### Programmatic Use

To configure this option programmatically, use the `set_param` function to configure the `DataLoggingSampleTime` parameter for the port handle that corresponds to the block output port that produces the signal.

**Parameter:** `DataLoggingSampleTime`

**Value:** numeric scalar

**Type:** string | character vector

**Default:** '-1'

### Input processing — Option to log data as samples or as frames

Elements as channels (sample based) (default) | Columns as channels (frame based)

Specify how multidimensional data is logged and interpreted by the Simulation Data Inspector. By default, signals are logged as sample-based, with each element in a multidimensional sample treated as a channel.

When logging a frame-based signal, set **Input processing** to `Columns as channels (frame based)`. A frame-based signal buffers a batch of samples to create a frame of data. When you log the data as frame-based, each column in a sample is treated as a channel, and the row dimension is treated as evenly-spaced samples within the channel.

You can also remove the buffering from a frame-based signal after simulation using the Simulation Data Inspector. For more information, see “Convert Representation of Frame-Based Data”.

### Programmatic Use

To programmatically configure or access the **Input processing** property for a logged signal, use the `Simulink.sdi.setSignalInputProcessingMode` function and the `Simulink.sdi.getSignalInputProcessingMode` function.

### Complex format — Option to specify how complex signal is displayed in Simulation Data Inspector

`Real-Imaginary (default) | Magnitude-Phase | Magnitude | Phase`

Complex signal data is logged as a single signal. Use the **Complex format** property to specify how to display a complex signal in the Simulation Data Inspector. By specifying the complex format in the Instrumentation Properties, you save the preference in the model so logged data is displayed consistently for each simulation. You can also modify the complex format for a signal in the Simulation Data Inspector, after data is logged from simulation or imported.

For all complex formats, you plot the complex signal as one signal. Some formats display components of the plotted signal as separate traces.

- **Real-Imaginary** — Plot real and imaginary components as separate traces.

The signal line color specifies the color of the real component. The imaginary component uses a different shade of the specified line color.

- **Magnitude-Phase** — Plot magnitude and phase components as separate traces.

The signal line color specifies the color of the magnitude component. The phase component uses a different shade of the specified line color.

- **Magnitude** — Plot only the magnitude component.
- **Phase** — Plot only the phase component.

### Subplots — Option to plot signals in Simulation Data Inspector from model

`scalar between 1 and 64`

When you specify a value for the **Subplots** property, the signal is plotted on the corresponding subplot or subplots in the Simulation Data Inspector. You can use this property to save a plotting configuration in the model. However, the property does not affect the subplot layout in the Simulation Data Inspector or clear signals that are already plotted.

### Custom style and color — Option to configure signal line style and color in model

`'off' (default) | 'on'`

When enabled, you can configure the line style and color used to display the signal in the Simulation Data Inspector and on Dashboard Scope blocks and save the preference in the model so the signal is displayed consistently across MATLAB sessions.

Specifying the line style and color in the model does not prevent you from changing the line style and color in the Simulation Data Inspector. The Dashboard Scope block and the Simulation Data Inspector always display a signal using the line style and color specified in the logged signal properties, as displayed in the **Properties** pane in the Simulation Data Inspector.

### **Line — Line style, color, and width for Simulation Data Inspector and Dashboard Scope blocks**

line style, width, and color

Set the line style, width, and color used to display the signal on Dashboard Scope blocks and in the Simulation Data Inspector.

Specifying the line style and color in the model does not prevent you from changing the line style and color in the Simulation Data Inspector. The Dashboard Scope block and the Simulation Data Inspector always display a signal using the line style and color specified in the logged signal properties, as displayed in the **Properties** pane in the Simulation Data Inspector.

#### **Dependencies**

To enable the **Line** property, select **Custom style and color**.

#### **Data Access**

### **Enable run-time data access — Option to stream signal data to MATLAB function during simulation**

'on' (default) | 'off'

When enabled, you can specify a data access callback function that processes or visualizes the logged signal data during simulation. The function receives data in packets asynchronously throughout the simulation, and the function executes each time it receives new data. For more information, see “Access Data in a MATLAB Function During Simulation”.

### **Function name — MATLAB function that receives signal data during simulation**

name of MATLAB function

Name of the data access callback function that processes or visualizes signal data during simulation. The data access callback function always receives signal data as the first argument and may also receive simulation time and a function parameter as additional arguments. When the function receives all three arguments, simulation time is the second argument. For more information, see “Access Data in a MATLAB Function During Simulation”.

For more information about writing MATLAB functions, see “Create Functions in Files”.

#### **Dependencies**

To enable the **Function name** property, select **Enable run-time data access**.

### **Include simulation time — Option to send simulation time to MATLAB function**

'on' (default) | 'off'

Option to send simulation time along with signal data to the data access callback function during simulation. The data access callback function always receives signal data as the first argument and

may also receive simulation time and a function parameter as additional arguments. When a function receives all three arguments, simulation time is the second argument. For more information, see “Access Data in a MATLAB Function During Simulation”.

#### Dependencies

To enable the **Include simulation time** property, select **Enable run-time data access**.

#### Function parameter — Option to use parameter to identify data source

numeric | text

When you specify a value for the **Function parameter**, the data access callback receives the specified value as a second or third argument depending on whether time is included with data sent to the callback function. When you use the same data access callback function to process data for more than one signal, specify a function parameter to identify which signal data the function receives in a given call. For more information, see “Access Data in a MATLAB Function During Simulation”.

#### Dependencies

To enable the **Function parameter** property, select **Enable run-time data access**.

# Library Browser

Find and add blocks to model

## Description

The Library Browser displays a tree view of the Simulink libraries on your system. Use the Library Browser to add blocks and annotations to your model. To browse the items that you can add to your model, expand the libraries in the tree. To search for a library item with key words or phrases, use the search box at the top of the Library Browser. To add an item to your model, drag it into your model, or right-click it and select the option to add it to your model.

By default, the Library Browser is docked as a panel in the Simulink window so that the Library Browser window stays to one side of the model and does not cover areas in the model canvas where you want to add items. When you have multiple Simulink windows open, you can open a Library Browser in each one.

You can use the Library Browser in docked mode or in standalone mode.

A Library Browser that is not docked is in standalone mode.

Use standalone mode to:

- Add the same items to many Simulink windows.
- View the Library Browser in full-screen mode.

- Open, close, hide, or position the Library Browser programmatically.
- Browse the libraries without opening a Simulink model.

To open a Library Browser in standalone mode, on the Library Browser in docked mode, click the Launch standalone library browser button .

For information on standalone mode, see Library Browser in Standalone Mode.

## Open the Library Browser

In the Simulink Toolstrip, on the **Simulation** tab, click **Library Browser**. The Library Browser opens in docked mode.

---

### Note

- If you have multiple Simulink windows open, you can open a Library Browser in each one by clicking **Library Browser** in the toolstrip of the respective window.
  - To open or close the Library Browser programmatically, open the Library Browser in standalone mode. The `sLibraryBrowser` function does not act on the Library Browser in docked mode.
- 

## Examples

### Library Browser Keyboard Shortcuts

You can use these keyboard shortcuts to interact with the **Library Browser** in docked mode.

Task	Shortcut
Open Library Browser in docked mode	Select the Simulink window, then press <b>Ctrl+Shift+L</b> .
Refresh libraries	<b>F5</b>
Insert selected block in model that Library Browser is docked to	<b>Ctrl+I</b>
Find a block	<b>Ctrl+F</b> or <b>F3</b>

**Note** When you use the keyboard shortcuts on a Mac, press **command** (⌘) instead of **Ctrl**.

### Navigate Levels of Library Browser Tree

To navigate the Library Browser in docked mode, expand the hierarchy of libraries in the tree on the libraries pane.

You can have multiple libraries expanded at once.

When you expand a library, the library contents appear in the tree underneath the library name.

Library contents can be any combination of blocks, annotations, and sublibraries.

### Search for Library Items by Keyword

To search for a library item using key words or phrases, use the search box at the top of the Library Browser.

- 1 In the search box, type the search term or select it from the list of recent search terms.

To search for an annotation, type any of the text from the annotation or its description.

- 2 To use regular expressions, case-sensitive search, or whole-word search, click the **Search for subsystems, blocks, and annotations** button and select the search options you want to use.

- 3 Press **Enter** to start the search. The **Search Results** tab displays the search results, grouped by library.

If there are more than 100 search results, the results take up multiple pages in the blocks pane. To navigate to the previous or next page of results, use the arrows in the upper left corner of the Library Browser window.

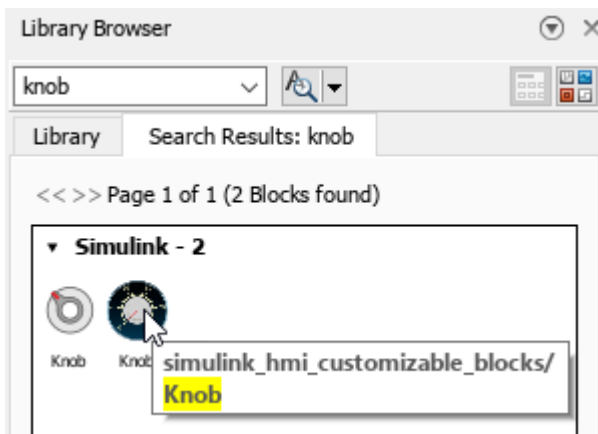

To see where the search string matches, pause on a block.

To return to browsing the library tree, click the **Library** tab.

As an example, search for the customizable Knob block.

- 1 In the search box at the top of the Library Browser, enter the keyword knob.
- 2 Press **Enter**. The **Search Results** tab opens and shows two Knob blocks.
- 3 Pause over the two blocks to find out which is the customizable Knob block. When you pause over the customizable Knob block, this text appears: `simulink_hmi_customizable_blocks/`Knob.

### View Library Item Documentation or Block Parameters

To see a description of the functionality of a library item, pause on the item.

To open the help documentation for an item, right-click the item icon and select **Help** for the item.

To preview the parameters of a library block before you add it to your model, right-click the block icon and select **Block Parameters**. The Block Parameters dialog box opens.

---

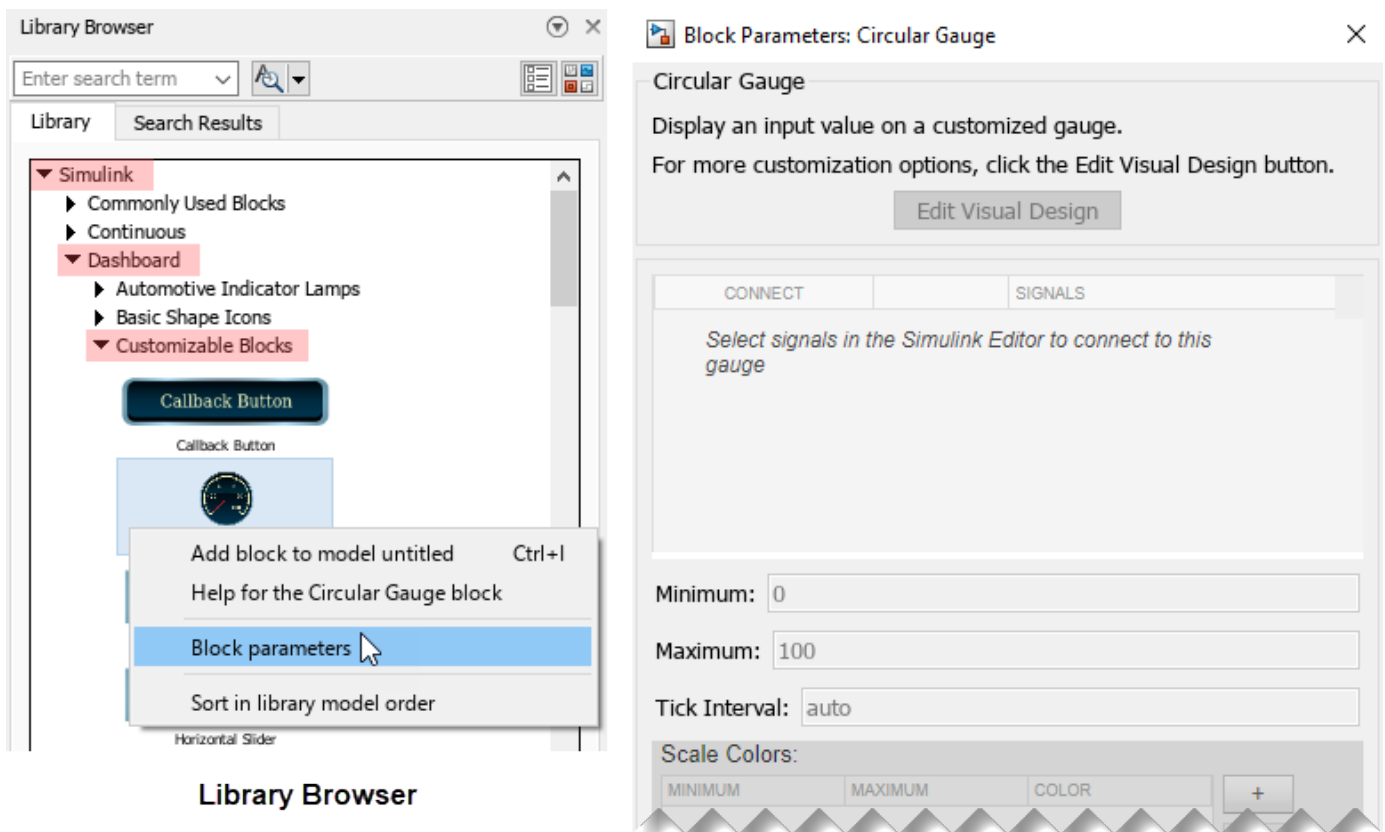

**Note** You cannot set values for any of the parameters when you open the Block Parameters dialog box from the Library Browser. To set values, add the block to your model and then double-click the block in the canvas.

---

As an example, open the Block Parameters dialog box of the Circular Gauge block.

- 1 In the Library Browser tree, expand the **Simulink** library.

- 2 In the **Simulink** library, expand the **Dashboard** sublibrary.
- 3 In the **Dashboard** sublibrary, expand the **Customizable Blocks** sublibrary.
- 4 In the **Customizable Blocks** sublibrary, right-click the Circular Gauge block icon and select **Block Parameters**. In the Block Parameters dialog box, you can see which parameters you can set. For example, you can customize the maximum, minimum, and tick interval on the scale of the Circular Gauge block.

Library Browser

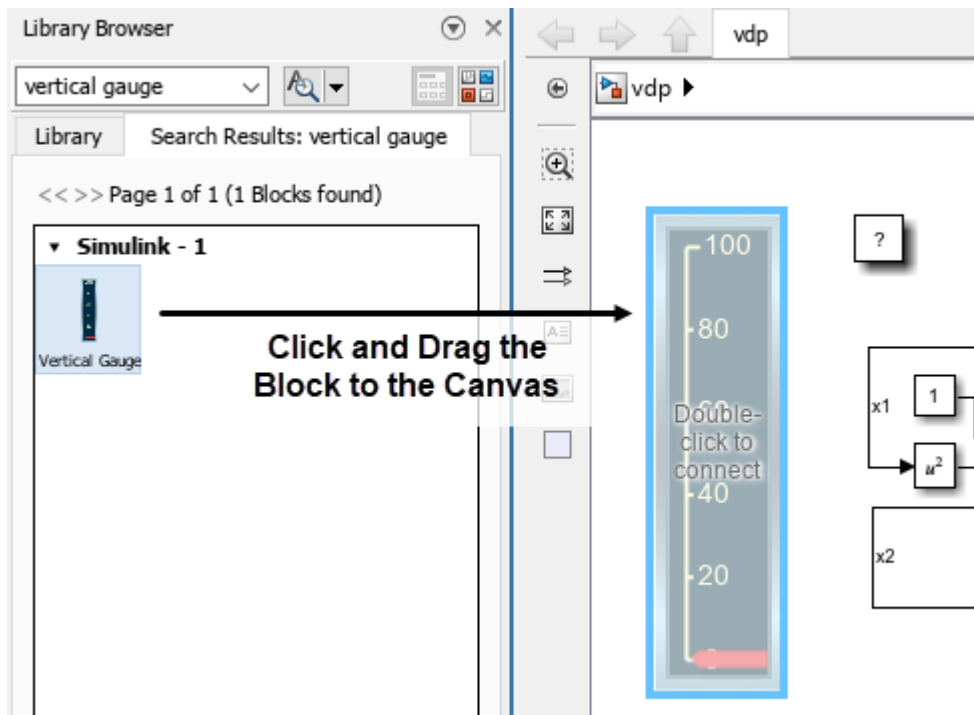

Block Parameters Dialog Box  
for the Circular Gauge Block

### Add Blocks and Annotations to Model from Library Browser

To add blocks and annotations from the **Library Browser** to an open model, drag the block or annotation from the Library Browser to the Simulink canvas.

As an example, add a customizable Vertical Gauge block to an open model.

- 1 In the search box at the top of the Library Browser, enter `vertical gauge`.
- 2 Press **Enter**. The **Search Results** tab opens and shows the Vertical Gauge block.
- 3 Click and drag the Vertical Gauge block to the canvas.

### Customize Library Browser Appearance

When you resize the Library Browser, the library contents flow to match the width of the window.

Use the layout button to switch between viewing the blocks in a single column  or in a responsive layout that adapts the number of columns to the browser width .

You can also programmatically customize the appearance of the Library Browser.

- Set the sort priority to change the order of the libraries in the tree.
- Hide libraries.
- Deactivate libraries.
- Expand or collapse libraries in the tree.
- For more information, see “Customize Library Browser Appearance”.

### Sort Libraries and Library Contents

The libraries and library contents are first sorted by sort priority and then by sorting order.

Libraries appear in ascending order of sort priority. By default, the **Simulink** library has a sort priority of -1, and all other libraries have a sort priority of 0. For more information about sort priority, see “Customize Library Browser Appearance”.

By default, the sorting order is alphabetical. Sublibraries appear first, then subsystems, then blocks, and then annotations.

You can change the sorting order of library items to model order, which is the order set by the library developer. Typically, model order sorts the contents according to functionality and groups related blocks together.

---

**Note** In docked mode, you can only change the sorting order of the library items. For libraries and sublibraries, the sorting order is always alphabetical.

---

To switch from alphabetical order to model order in docked mode, right-click the item icon in the tree and select **Sort in library model order**. This setting is preserved from session to session.

To return to the alphabetical order, right-click the item icon in the tree and select **Sort in alphabetical order**.

Some libraries do not follow the sorting order. For example, in the Simulink library, the **Quick Insert** library appears as the last item regardless of the sorting option you choose.

As an example, sort the contents of the **Commonly Used Blocks** sublibrary in model order.

- 1 In the Library Browser tree, expand the **Simulink** library.
- 2 In the **Simulink** library, expand the **Commonly Used Blocks** sublibrary.
- 3 In the **Commonly Used Blocks** sublibrary, right-click the icon of any item, for example the Bus Creator block icon, and select **Sort in library model order**. The order of the library changes to model order. In model order, related blocks are grouped together. For example, the In1 and Out1 blocks are far apart when the **Commonly Used Blocks** sublibrary is in alphabetical order but follow each other when the sublibrary is in model order.

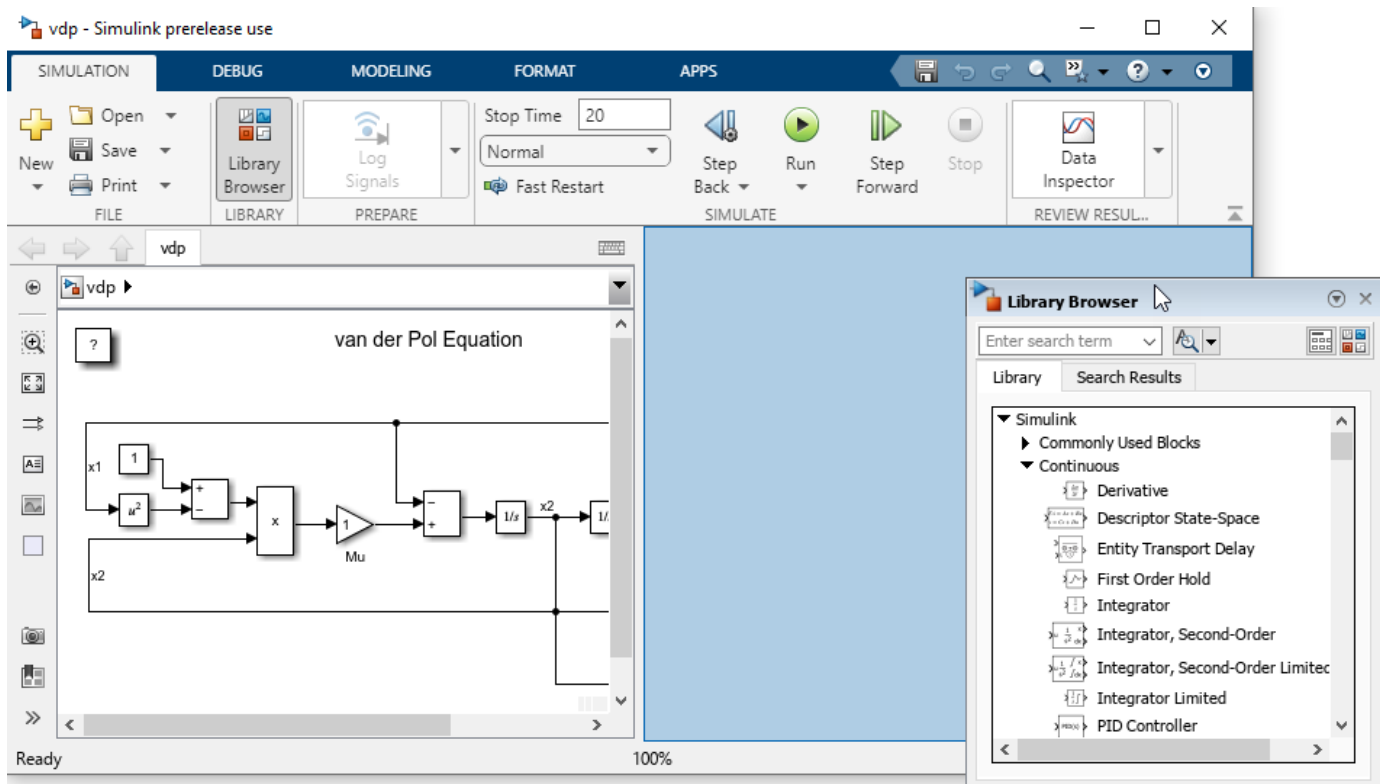

## Position the Library Browser

In docked mode, the default position of the **Library Browser** is on the left side of the Simulink window.

You can position the Library Browser on the left side, the right side, or the bottom of a Simulink window.

To move the Library Browser to a different position, click and drag the top of the Library Browser window to the left, right, or bottom of the Simulink window. Release the Library Browser over the blue area that appears.

## Minimize Library Browser

To minimize the Library Browser in docked mode, click the **Minimize** button arrow  at the top right of the Library Browser window and select **Minimize**.

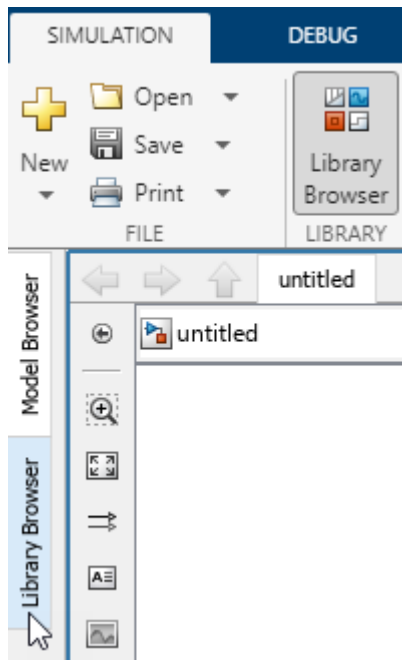

To temporarily expand the Library Browser when it is minimized, at the left edge of the Simulink window, click the **Library Browser** tab. The Library Browser expands. If you click the canvas, the Library Browser minimizes again.

To restore the expanded view, click the **Restore** button arrow  at the top right of the Library Browser window and select **Restore**. The Library Browser no longer minimizes when you click the canvas.

As an example, minimize the Library Browser, temporarily expand the Library Browser to add a Constant block to the model, and then minimize the Library Browser again.

- 1 To minimize the **Library Browser**, click the **Minimize** button arrow  at the top right of the Library Browser window and select **Minimize**. The Library Browser window disappears.
- 2 To temporarily expand the Library Browser, at the left edge of the Simulink window, click the **Library Browser** tab. The **Library Browser** window reappears.

- 3 In the tree, expand the **Simulink** library and the **Commonly Used Blocks** sublibrary.
- 4 From the **Commonly Used Blocks** sublibrary, click and drag the Constant block to the canvas.
- 5 To minimize the **Library Browser**, click anywhere in the canvas.

### Create Custom Libraries

You can create your own libraries and, optionally, have them appear in the Library Browser.

For more information, see “Create Custom Library”.

For an example of how to create a custom block library and a custom block sublibrary, see “Add Libraries to Library Browser”.

### Refresh Library Browser

Refresh your Library Browser if you:

- Modify existing libraries or resave them in .slx file format.
- Move or delete your library files.

- Add a library.
- Change your Library Browser customizations. See “Customize Library Browser Appearance”.

To refresh the libraries displayed in the Library Browser after you have added, deleted, resaved, or modified the contents of libraries, right-click in the libraries pane and select **Refresh Library Browser**. The Library Browser updates to display any libraries or blocks added to or deleted from the MATLAB path since the Library Browser was last opened or refreshed.

To refresh the libraries displayed in the Library Browser after you have changed your Library Browser customizations, enter this command in the MATLAB Command Window:

```
sl_refresh_customizations
```

For an example of how to refresh the Library Browser after adding a new library, see “Customize Library Browser Appearance”.

## Limitations

These functions do not act on a docked Library Browser:

- `getPosition`
- `hide`
- `LibraryBrowser.LibraryBrowser2`
- `setPosition`
- `show`
- `slLibraryBrowser`

You cannot use the `LibraryBrowser.LBStandalone` object to act on a docked Library Browser.

To use these functions and the `LibraryBrowser.LBStandalone` object, open the Library Browser in Standalone Mode.

## Version History

**Introduced before R2006a**

### Docked Simulink Library Browser

Starting in R2022b, the **Library Browser** button in the Simulink Toolstrip opens a Library Browser that is docked as a panel in the Simulink window. The Library Browser is docked so that the Library Browser window stays to one side of the model and does not cover areas in the model canvas where you want to add items.

When you have multiple Simulink windows open, you can open a docked Library Browser in each one by clicking the **Library Browser** button of the respective window.

## See Also

### Topics

Library Browser in Standalone Mode

## Library Browser in Standalone Mode

Use standalone Library Browser to find and add blocks to model

### Description

You can use the Library Browser in docked mode or in standalone mode. By default, the Library Browser is in docked mode, so the Library Browser window stays to one side of the model and does not cover areas in the model canvas where you want to add items. A Library Browser that is not docked is in standalone mode.

Use standalone mode to:

- Add the same items to many Simulink windows.
- View the Library Browser in full-screen mode.
- Open, close, hide, or position the Library Browser programmatically.
- Browse the libraries without opening a Simulink model.

For an introduction to the Library Browser and more information about docked mode, see Library Browser.

## Open the Library Browser in Standalone Mode

- Open from Library Browser in docked mode: Click the Launch standalone library browser button .
- Open from MATLAB Command Window: Enter `slLibraryBrowser('open')`.

---

**Note** You can only open one Library Browser in standalone mode.

---

## Examples

### Library Browser Keyboard Shortcuts

You can use these keyboard shortcuts to interact with the **Library Browser** in standalone mode.

Task	Shortcut
Move selection down	Down arrow
Move selection up	Up arrow
Expand a library	Right arrow
Collapse a library	Left arrow
Refresh libraries	<b>F5</b>
Navigate to parent library	<b>Esc</b>
Navigate from search result to library containing block	<b>Ctrl+R</b>

Task	Shortcut
Insert selected block in active model	<b>Ctrl+I</b>
<b>Note</b> If no model is open, <b>Add block to a new model</b> creates new model and adds selected block to it	
Increase zoom	<b>Ctrl+Plus (+)</b>
Decrease zoom	<b>Ctrl+Minus (-)</b>
Reset zoom to default	<b>Alt+1</b>
Find a block	<b>Ctrl+F</b> or <b>F3</b>
Close Library Browser	<b>Ctrl+W</b>

**Note** When you use the keyboard shortcuts on a Mac, press **command** (⌘) instead of **Ctrl**.

### Navigate Levels of Library Browser Tree

To navigate the Library Browser in standalone mode, expand the hierarchy of libraries in the tree on the libraries pane.

You can have multiple libraries expanded at once.

To view the contents of a library, click the library name in the tree. The library contents appear in the blocks pane of the Library Browser window.

Library contents can be any combination of blocks, annotations, and libraries that are at a lower level in the hierarchy.

To select the parent library of the open library, right-click on any item in the open library and click **Go to parent**.

### Search for Library Items by Keyword

To search for a library item using key words or phrases, use the search box at the top of the Library Browser.

- 1 In the search box, type the search term or select it from the list of recent search terms.

To search for an annotation, type any of the text from the annotation or its description.

- 2 To use regular expressions, case-sensitive search, or whole-word search, click the **Search for subsystems, blocks, and annotations** button and select the search options you want to use.

- 3 Press **Enter** to start the search. The blocks pane displays the search results, grouped by library.

If there are more than 100 search results, the results take up multiple pages in the blocks pane. To navigate to the previous or next page of results, use the arrows in the upper left corner of the Library Browser window.

To see where the search string matches, pause on a block.

To navigate to the library that contains an item in the search results, right-click the item and select **Select in library view**.

As an example, search for the customizable Knob block.

- 1 In the search box at the top of the Library Browser, enter the keyword knob.
- 2 Press **Enter**. The blocks pane shows the search results, which are two Knob blocks.
- 3 Pause over the two blocks to find out which is the customizable Knob block. When you pause over the customizable Knob block, this text appears: `simulink_hmi_customizable_blocks/Knob`.

### Add Blocks and Annotations to Model from Library Browser

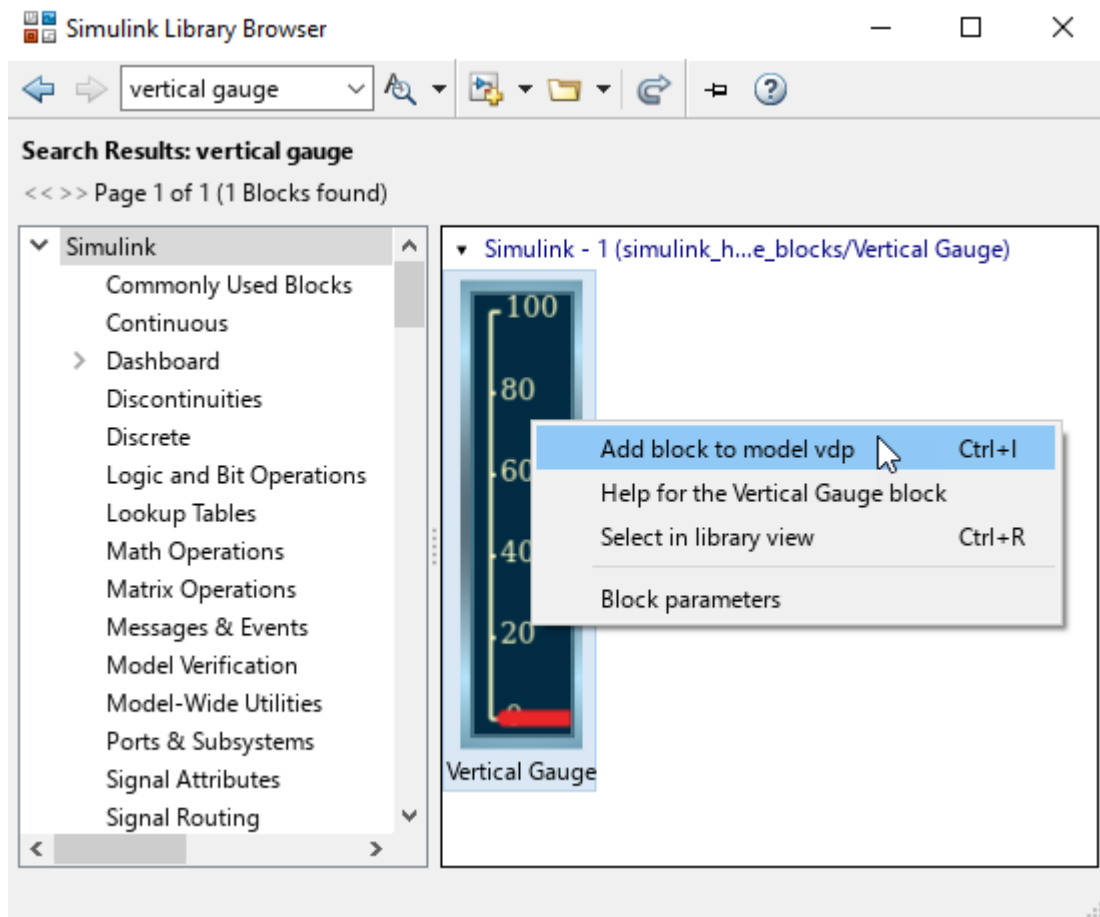

To add blocks and annotations from the **Library Browser** to an open model, right-click the block or annotation and select **Add block to model** or **Add block to a new model**. If no model is open, the **Add block to a new model** creates a model and adds the block to it.

Blocks that you have recently added to your model from the Library Browser appear in the **Recently Used** library at the bottom of the tree.

As an example, add a customizable Vertical Gauge block to an open model.

- 1 In the search box at the top of the Library Browser, enter `vertical gauge`.
- 2 Press **Enter**. The block pane shows the Vertical Gauge block.
- 3 Right-click the Vertical Gauge block and select **Add block to model**.

### Customize Library Browser Appearance

When you resize the libraries panel, the library contents flow to match the width of the window.

You can also programmatically customize the appearance of the Library Browser.

- Set the sort priority to change the order of the libraries in the tree.
- Hide libraries.
- Deactivate libraries.
- Expand or collapse libraries in the tree.

For more information and examples, see “Customize Library Browser Appearance”.

### Sort Libraries and Library Contents

The libraries and library contents are first sorted by sort priority and then by sorting order.

Libraries appear in ascending order of sort priority. By default, the Simulink library has a sort priority of -1, and all other libraries have a sort priority of 0. For more information about sort priority, see “Customize Library Browser Appearance”.

By default, the sorting order is alphabetical. Sublibraries appear first, then subsystems, then blocks, and then annotations.

You can change the sorting order to model order, the order set by the library developer. Typically, model order sorts the contents according to functionality and group related blocks together.

---

**Note** In standalone mode, you can only change the sorting order in the blocks pane. The sorting order of the tree is always alphabetical.

---

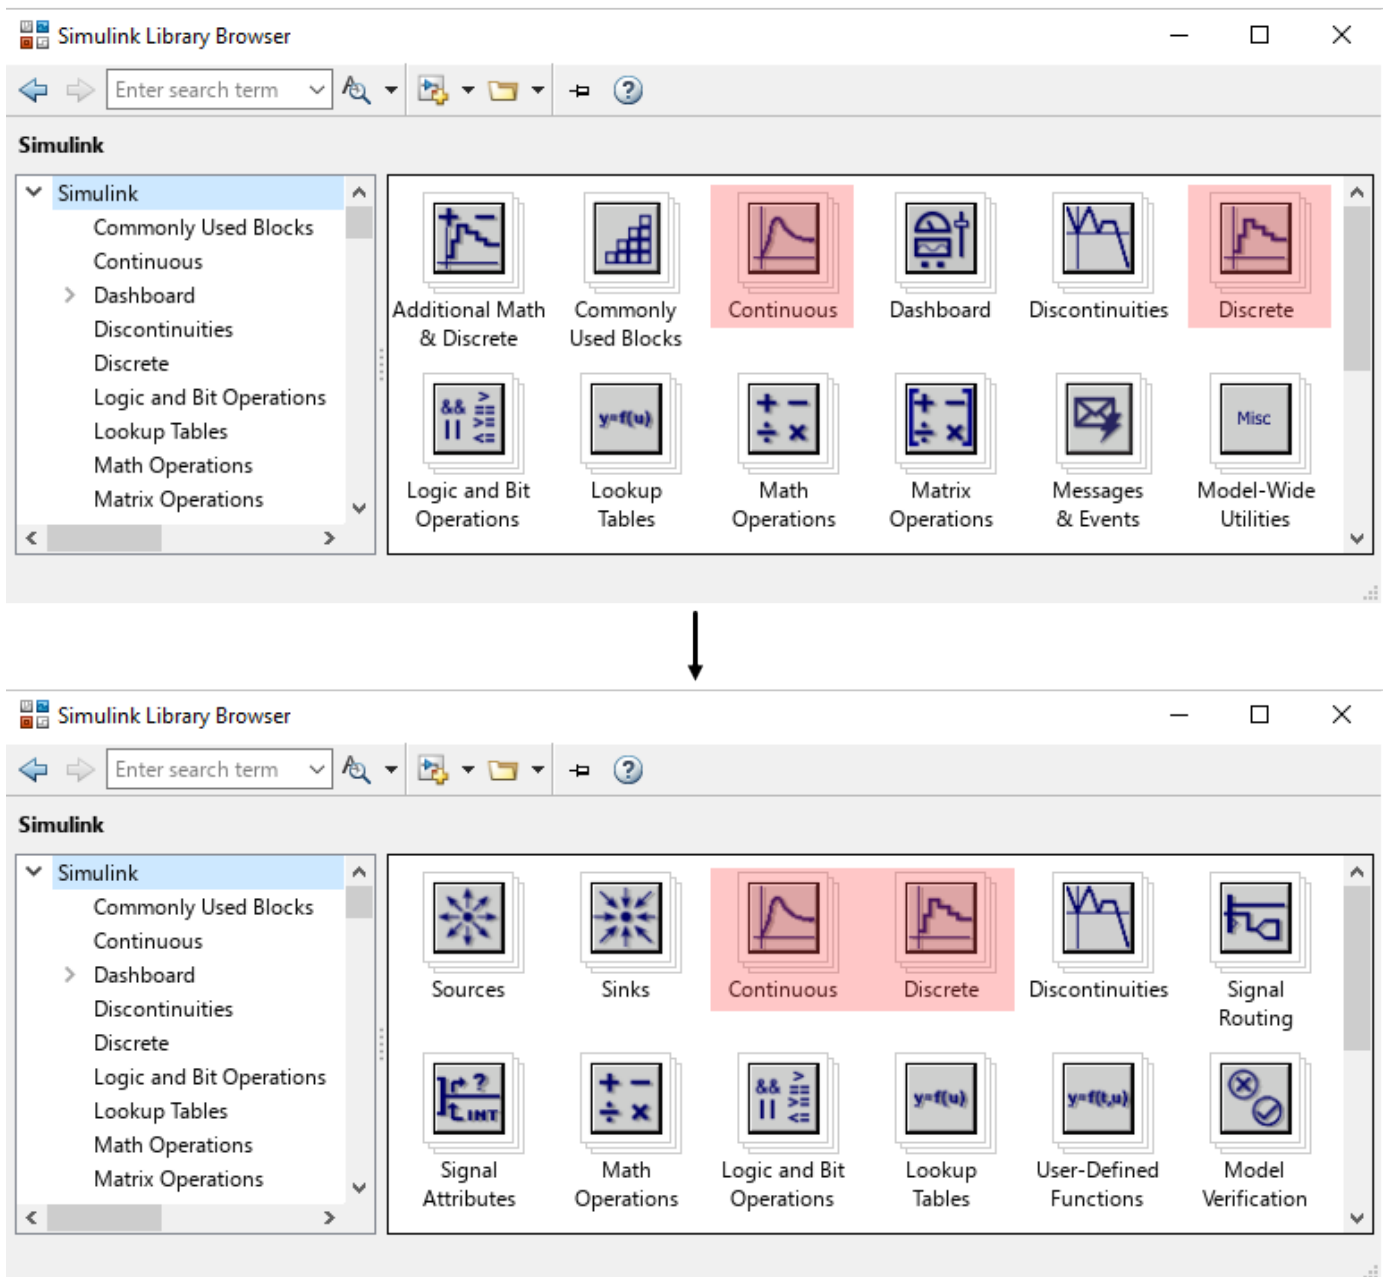

To switch from alphabetical order to model order in standalone mode, right-click the blocks pane or a library item in the blocks pane and select **Sort in library model order**. This setting is preserved from session to session.

To return to the alphabetical order, right-click the blocks pane or a library item in the blocks pane and select **Sort in alphabetical order**.

Some libraries do not follow the sorting order. For example, in the Simulink library, the **Quick Insert** library appears as the last item regardless of the sorting option you choose.

As an example, sort the contents of the **Simulink** library in model order.

- 1 In the Library Browser tree, select the **Simulink** library.
- 2 In the **Simulink** library, right-click any sublibrary, for example the **Dashboard** library, and select **Sort in library model order**. The order of the library changes to model order. In model order, related libraries are grouped together. For example, the **Continuous** and **Discrete** sublibraries have two other sublibraries between them when the **Simulink** library is in alphabetical order but follow each other when the sublibrary is in model order.

### Keep Library Browser in Front of Other Windows

To keep the Library Browser in front of other Simulink windows, in the Library Browser toolbar, click

**Stay on Top** .

To turn off this setting, click **Stay on Top** again.

For information on how to turn on this setting programmatically, see “Keep Library Browser in Front of Other Windows” on page 2-330.

## Programmatic Use

`libraryhandle = sllibrarybrowser` creates the Library Browser object `LibraryBrowser.LBStandalone` and returns the object handle.

When you use `sllibrarybrowser` to get the object handle:

- If the Library Browser is open in standalone mode, the Library Browser window moves in front of all other Simulink windows.
- If the Library Browser is not open in standalone mode, the Library Browser opens in standalone mode.

`sllibrarybrowser('close')` closes the Library Browser in standalone mode.

`sllibrarybrowser('open')` opens the Library Browser in standalone mode.

`sllibrarybrowser('noshow')` loads the Library Browser in memory without making it visible. Use this command to quickly open the Library Browser programmatically in standalone mode.

## Version History

**Introduced before R2006a**

### Docked Simulink Library Browser

Starting in R2022b, the **Library Browser** button in the Simulink Toolstrip opens a Library Browser that is docked as a panel in the Simulink window. The Library Browser is docked so that the Library Browser window stays to one side of the model and does not cover areas in the model canvas where you want to add items.

When you have multiple Simulink windows open, you can open a docked Library Browser in each one by clicking the **Library Browser** button of the respective window.

# Model Data Editor

Inspect and edit data items (signals, parameters, and states) in a table that you can sort, group, and filter

## Description

The **Model Data Editor** enables you to inspect and edit data items such as signals, block parameters (for example, the **Gain** parameter of a Gain block), and data stores in a list that you can sort, group, and filter. You can then configure properties and parameters, such as data types and dimensions, without having to locate the items in the block diagram.

Use the Model Data Editor to configure multiple signals, states, and algorithmic parameters. The Model Data Editor can set only certain parameters and properties such as data types, initial values, and physical units. To work with one model element at a time, open the **Property Inspector**. To perform batch operations, open the Model Data Editor.

For information about setting block properties and parameters, see “Signal Properties”.

When creating and debugging a model, you can configure multiple data items at once by selecting the corresponding signals and blocks in the block diagram. Work with the selected items in the Model Data Editor instead of opening individual dialog boxes. Use this technique to more quickly view and compare properties of multiple signals that are close to each other in the diagram, for example, in a subsystem.

Use the Model Data Editor to configure:

- Instrumentation for signals and data stores, which allows you to view and collect the simulation values. For example, you can log signals to compare data in the Simulation Data Inspector.
- Design attributes such as data type, minimum and maximum value, and physical units. You can use these attributes to:
  - Specify the values of numeric block parameters.
  - Control the interaction (interface) between components through Inport and Outport blocks and data stores (see “Configure Data Interfaces”).
  - Specify the dimensions of nonscalar signals in a model.

---

**Note** The Model Data Editor does not show information about data items in referenced models (which you reference with Model blocks). To work with data items in a referenced model, open the Model Data Editor in that model.

---

## Columns in the Data Table

Use this table to find more information about the purpose of the columns in the Model Data Editor.

Column Name	Purpose and More Information
<b>Source</b>	Shows the name of the block that defines the data item. For signals, also shows the number of the block port that generates the signal.  For workspace variables, shows the name of the workspace or data dictionary that contains the variable.
<b>Signal Name</b> or <b>Name</b>	Sets the name of the signal, state, or data store. For information about naming signals, see “Signal Names and Labels”.  For parameters, displays the programmatic name of each parameter.  For workspace variables, sets the name of the variable.
<b>Data Type</b>	“Control Data Types of Signals” and “Control Block Parameter Data Types”
<b>Min and Max</b>	“Specify Signal Ranges” and “Specify Minimum and Maximum Values for Block Parameters”
<b>Dimensions</b>	“Determine Signal Dimensions”
<b>Complexity</b>	Sets the numeric complexity of the data item.
<b>Sample Time</b>	“What Is Sample Time?”
<b>Unit</b>	“Unit Specification in Simulink Models”
<b>Test Point</b>	“Configure Signals as Test Points”
<b>Log Data</b>	“Iterate Model Design Using the Simulation Data Inspector”
<b>Resolve</b>	Corresponds to the <b>Signal name must resolve to Simulink signal object</b> check box in the Signal Properties dialog box and similar check boxes in block dialog boxes for states and data stores. See “Use Signal Objects”.
<b>Shared</b>	Corresponds to the <b>Share across model instances</b> parameter of the Data Store Memory block. See Data Store Memory.
<b>Initial Value</b>	Sets the initial value of the state or data store. See “Initialize Signal Values”.
<b>Value</b>	“Set Block Parameter Values”
<b>Argument</b>	Configures a variable in a model workspace as a model argument. See “Parameterize Instances of a Reusable Referenced Model”.
<b>Path</b>	Shows the location of the block in the model and provides a link to the block in the Simulink Editor. Visible when you click the <b>Change Scope</b> button.

## Two Entries Per Cell in the Data Table

When a cell contains two entries (for instance, in the **Data Type** column), the entry on the right side of the cell indicates compiled information. The compiled information shows you the value that the data item uses for simulation.

For example, the default data type setting for most signals in a model is `Inherit: Inherit via internal rule`. With this setting, after you update the block diagram, Simulink chooses a specific data type, such as `single`, for the signal to use for simulation. In the Model Data Editor, the cell in the **Data Type** column shows `Inherit: Inherit via internal rule` on the left side and `single` on the right side.

## Open the Model Data Editor

- In the Simulink Toolstrip, on the **Modeling** tab, click **Model Data Editor**.
- While in the Simulink Editor, press **Ctrl+Shift+E**.

## Examples

### Configure Distant Data Items

In this example, use the Model Data Editor to log signals in different subsystems and referenced models so you can inspect their data using the **Simulation Data Inspector**.

The “Using a Data Dictionary to Manage the Data for a Fuel Control System” on page 13-136 example model `sldemo_fuelsys_dd` represents the fueling system of a vehicle engine. The referenced model `sldemo_fuelsys_dd_controller` controls the rate of fuel flow to the engine.

First, explore the example models.

- 1 Open the example model `sldemo_fuelsys_dd` and the referenced model `sldemo_fuelsys_dd_controller`.

```
openExample('simulink_automotive/UseDDForFuelContSysExample')
sldemo_fuelsys_dd
sldemo_fuelsys_dd_controller
```

- 2 Navigate to the `airflow_calc` subsystem.

The Pumping Constant block contains a lookup table that describes the performance of a fuel pump. You can stream the output of this block to the Simulation Data Inspector.

- 3 Navigate to the root of the model and into the `fuel_calc` subsystem.
- 4 Navigate into the `feedforward_fuel_rate` subsystem.

The Output block named `ff_fuel_rate` passes feedforward information to the fuel rate control algorithm.

- 5 Navigate back to the `fuel_calc` subsystem and into the `switchable_compensation` subsystem.

The Inport block named `ff_fuel_rate` carries the feedforward information. You can stream the output of this Inport block.

Then, log signals for data inspection.

- 1 Navigate to the root of the `sldemo_fuelsys_dd_controller` model.
- 2 In the Model Data Editor, inspect the **Signals** tab.
- 3 Set the **Change view** drop-down to Instrumentation.

- 4 Activate the **Change scope** button  to display the contents of the subsystems.

The Model Data Editor identifies all the signals in the model. The **Path** column appears.

- 5 In the **Filter Contents** box, type `ff_fuel_rate`.

The Model Data Editor updates the list of signals to include only those named `ff_fuel_rate`. You can click the link in the **Path** column to view where the signal resides within the model.

- 6 Select the **Log Data** check box for the signal whose path is `sldemo_fuelsys_dd_controller/fuel_calc/switchable_compensation`.

This instructs Simulink to send the data for the logged signals to the Simulation Data Inspector.

- 7 Filter the signals again using the text `Pumping Constant`.

The table contains one row that corresponds to the output of the Pumping Constant block.

- 8 Select the **Log Data** check box for the `Pumping Constant` signal.
- 9 Simulate the system model, `sldemo_fuelsys_dd`. During the simulation, double-click a Manual Switch block, such as `Engine Speed Selector`, to disturb the fuel control system.

- 10 When the simulation finishes, the **Simulation Data Inspector** button  is highlighted. This indicates that there is data to inspect and compare. Click the **Simulation Data Inspector** button.

- 11 In the left pane, expand the **Run** node that corresponds to the simulation run and select the check boxes for the signals whose data you want to inspect and compare.

The Simulation Data Inspector presents the values for the selected signals on the same graph.

## Find and Organize Data by Filtering, Sorting, and Grouping

In the example model `sldemo_fuelsys_dd_controller`, variables and parameter objects set the values of block parameters. The variables and objects reside in a data dictionary. Use the Model Data Editor to display these dictionary entries together in a group.

- 1 Open the `sldemo_fuelsys_dd_controller` model.
- 2 In the example model, open the Model Data Editor and select the **Parameters** tab.
- 3 Activate the **Change scope** button to display the contents of the subsystems.
- 4 Click the **Show/refresh additional information** button to display rows that correspond to the dictionary entries.
- 5 Right-click the **Source** column header and select **Group by This Column**.

The Model Data Editor groups the list by block or workspace (including a group for the dictionary entries).

- 6 Find the group labeled **Source: Dictionary**. Now, you can use the Model Data Editor to inspect and modify the attributes of the variables and objects in the dictionary.

The Model Data Editor allows you to filter a list of data items by using one or a combination of these methods:

- To filter the data table through a text search, use the **Filter contents** box.
- To filter based on the blocks or signals that you select in the model, next to the **Filter contents** box, click the **Filter using selection** button. Then, as you click blocks and signals in the model, the Model Data Editor shows you only the rows that are relevant to that block or signal. If you lasso multiple blocks or signals, the Model Data Editor shows only the rows that are relevant to those model elements.
- To filter based on column-specific criteria, point to a column header and click the filter icon . As you type in the text box, the editor applies a substring filter to the column contents. After the filter is applied, the column displays a smaller filter icon  next to the column header. To edit a filter, remove a filter, or remove all column filters, click this icon.

## Select Multiple Data Items from Block Diagram

In the example model `sldemo_househeat`, use the Model Data Editor to log the signals in the Heater subsystem for inspection using the **Simulation Data Inspector**.

- 1 Open the `sldemo_househeat` model.
- 2 In the `sldemo_househeat` model, open the Heater subsystem.
- 3 Open the Model Data Editor and select the **Signals** tab.

The Model Data Editor identifies all the signals in the subsystem.

- 4 In the Model Data Editor, set the **Change view** drop-down list to **Instrumentation**.
- 5 Using the Simulink Editor, select all the signals in the subsystem. Optionally, do not select the output of the Constant block because the signal value does not change during the simulation.

In response, the Model Data Editor highlights the rows that correspond to the signals you selected.

- 6 In the Model Data Editor, for any of the signals, click the check box in the **Log Data** column.

The Model Data Editor selects the check box for all of the selected signals.

- 7 Simulate the model.
- 8 Open the Simulation Data Inspector and, in the leftmost pane, expand the **Run** node that corresponds to the simulation run. Select the check boxes for the signals whose values you want to inspect and compare.

### Interact with a Model That Uses Workspace Variables

When you use workspace variables (such as numeric MATLAB variables and `Simulink.AliasType` objects) to share settings between data items, you can interact with those variables through the Model Data Editor. You do not need to work outside the Editor to configure the data items. In the Editor, click the **Show/refresh additional information** button, which finds variables that the model uses by updating the block diagram.

This example shows how to work with objects that a model uses to set block parameter values. You modify the value of a variable that the model `sldemo_fuelsys` uses.

- 1 Open the “Modeling a Fault-Tolerant Fuel Control System” on page 13-121 example model `sldemo_fuelsys`.

```
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
sldemo_fuelsys
```

- 2 Open the Model Data Editor **Parameters** tab.
- 3 In the Model Data Editor, click the **Show/refresh additional information** button.

The data table now contains rows that correspond to variables and objects that the model uses.

- 4 In the model, navigate into the `fuel_rate_control` subsystem and then the `airflow_calc` subsystem.
- 5 In the Model Data Editor, next to the **Filter contents** box, select the **Filter using selection** button.

With this button selected, when you select a block or signal in the block diagram, the data table shows only the data items and workspace variables that are relevant to that block or signal.

- 6 In the model, click the lookup table block labeled **Pumping Constant**.

The Model Data Editor shows that the block uses three workspace variables. The block acquires some breakpoint values from the variable `SpeedVect`.

Now, you can use the columns in the Model Data Editor to configure the properties of SpeedVect.

You can further interact with a variable to:

- Configure other properties that the columns do not represent:
  - 1** In the model, open the Property Inspector. On the **Modeling** tab, under **Design**, click **Property Inspector**.
  - 2** In the Model Data Editor, select the row that corresponds to the target variable or object. If the Property Inspector does not respond, select a different row and then select the target row again.
  - 3** Use the Property Inspector to configure the target properties.
- Move the variable between workspaces and data dictionaries and configure the variable alongside other variables. Use the Model Explorer. To open the Model Explorer, in the Model Data Editor data table, double-click the icon in the leftmost column. For more information about using the Model Explorer, see “Edit and Manage Workspace Variables by Using Model Explorer”.
- Rename a variable everywhere it is used by blocks in Simulink models. In the Model Data Editor, right-click the variable and select **Rename All**. You can rename only variables that the function `Simulink.findVars` supports.
- Find blocks that use a specific variable. In the Model Data Editor, right-click the variable and select **Find Where Used**.

### Inspect Individual Data Item

To focus on an individual data item, use one of these techniques:

- In the Model Data Editor, next to the **Filter contents** box, select the **Filter using selection** button. Then, in the model, click the block or signal that corresponds to the data item.

Use this technique to configure the item by using the columns in the data table.

- In the model, open the Property Inspector. On the **Modeling** tab, under **Design**, click **Property Inspector**. Then, in the data table, click the target row. The Property Inspector shows the properties of the data item. If the Property Inspector does not respond when you click the target row, click a different row and then click the target row again.

Use this technique to inspect all of the properties that the Model Data Editor can access at once (in other words, the union of the columns available in the **Design** and **Instrumentation** views).

- In the model, open the Property Inspector. Then, in the data table, for the target row, double-click the cell in the leftmost column (the icon). In the model, select the highlighted block or signal.

Use this technique to inspect all properties, including those that the Model Data Editor cannot access.

### Navigate from Model Data Editor to Block Diagram

To navigate from a data item in the Model Data Editor to the block in the diagram that owns the data item, double-click the icon in the left-most column. The Simulink Editor then focuses on the relevant

block. Use this technique to navigate to blocks when you select **Change scope** to view the contents of subsystems below the current system.

- “Use the Model Data Editor for Batch Editing”
- “Using a Data Dictionary to Manage the Data for a Fuel Control System” on page 13-136

## Limitations

- You cannot access these attributes by using the Model Data Editor:
    - Any settings related to code generation. Instead, use the Code Mappings editor or code mappings API.
    - For mask parameters:
      - Any settings for tunable mask parameters other than the parameter value.
      - Any settings for nontunable mask parameters.
- Note that some built-in blocks are masked and can have tunable or nontunable mask parameters.
- Any settings for parameters of Simscape blocks.
  - Any settings for data items in referenced models. Instead, open the Model Data Editor in the referenced models.
  - Any settings for variables that are not defined in the base workspace, a model workspace, or a data dictionary. For example, you cannot access the attributes of variables created by mask initialization code.
  - On the **Parameters** tab, the data type, minimum value, and maximum value of a Constant block. Use the **Signals** tab instead.

For some settings that you cannot access with the Model Data Editor, you can use the **Property Inspector** instead. Open the Property Inspector and select the target data item in the model, not in the Model Data Editor. For mask parameters, use the mask dialog box or the Mask Editor as described in “Masking Fundamentals”.

- The Model Data Editor does not show Stateflow data. However, the Model Data Editor shows the data for Simulink functions that you define inside Stateflow charts.

To manage Stateflow data, events, and messages in a chart, see “Manage Symbols in the Stateflow Editor” (Stateflow).

- On the **Parameters** tab, these variables are not available:
  - Variables used by non-tunable block parameters. For example, the minimum and maximum parameters on a Gain block or the `Sample time` on a Constant block.
  - Variant control variables
  - Variables used for symbolic dimensions

# Model Explorer

View, modify, and add elements of Simulink models, Stateflow charts, and workspace variables

## Description

Use the Model Explorer to view, modify, and add elements of Simulink models, Stateflow charts, and workspace variables.

The Model Explorer lets you focus on specific elements (for example, blocks, signals, and properties) without navigating through the model or chart.

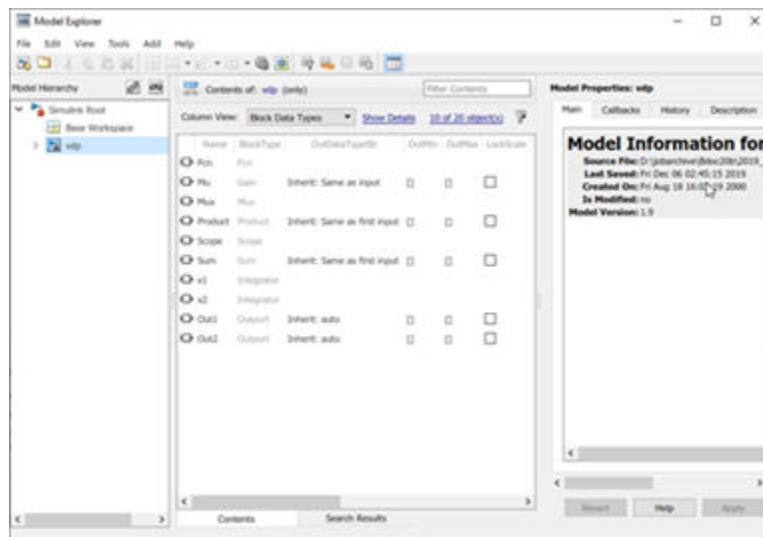

Use the Model Explorer to search for:

- Variables in workspaces and data dictionaries
- Variable usage in a model
- Instances of a type of block
- Block parameters and parameter values

You can combine search criteria and iteratively refine the results. Search in the Model Explorer for model elements, starting with the node you select in the model hierarchy. You can search the entire model, in a particular system, or in a system and all the systems below it in the hierarchy. Using your search results, you can apply changes to multiple elements at once.

To manipulate model data (block parameters, signals, and states) in a searchable, sortable table, consider using the **Model Data Editor**. You can specify data attributes such as parameter values, signal names, and initial values for states.

To create, modify, and view the entries in a data dictionary, use the Model Explorer. See “Edit and Manage Workspace Variables by Using Model Explorer” and “View and Revert Changes to Dictionary Data”.

## Open the Model Explorer

- In the Simulink Toolstrip, on the **Modeling** tab, click **Model Explorer**.
- In an open model in the Simulink Editor, right-click a block and select **Explore**.
- In an open Stateflow chart, right-click the drawing area and select **Explore**.

## Examples

### Add Objects to a Model, Chart, or Workspace

You can use the Model Explorer to add many kinds of objects to a model, chart, or workspace. The types of objects that you can add depend on the node that you select in the **Model Hierarchy** pane.

Use toolbar buttons or the **Add** menu to add objects. The **Add** menu lists the types of objects you can add.

### Cut, Copy, and Paste Objects Between Workspaces

You can cut, copy, and paste objects from one workspace into another workspace.

- 1 In the **Contents** pane, perform one of these actions:
  - Right-click the workspace object you want to cut or copy. Select **Cut** or **Copy**.
  - Click the workspace object you want to cut or copy. In the **Edit** menu, select **Cut** or **Copy**.
  - Click the workspace object you want to cut or copy. In the toolbar, click the **Cut** button  or **Copy** button .
- 2 To paste the workspace object that you cut or copied, in the **Model Hierarchy** pane:
  - Right-click the workspace into which you want to paste the object, and select **Paste**.
  - Click the workspace into which you want to paste the object. In the **Edit** menu, select **Paste**.
  - Click the workspace into which you want to paste the object. In the toolbar, click the **Paste** button .

When you copy and paste (or drag and drop), you can manage the resolution of name conflicts. In the dialog box, choose an action for each item whose name conflicts with an existing item.

- **Skip** — Default action when the conflicting items have the same value.
- **Replace** — Default action when the conflicting items have different values.
- **Keep both** — Preserve both copies. The name given to the copied item follows the naming rules that are used in the MATLAB workspace.

If the source and destination are the same, the software resolves the name conflict by following the naming rules that are used in the MATLAB workspace.

You can also cut, copy, and paste by selecting an object and performing drag and drop operations.

## Edit Object Properties

You can edit object properties in the Model Explorer.

In the **Contents** pane, first select the row that contains the value, and then click the value. Change the value of the selected property by typing or selecting a new value.

To assign the same property value to multiple objects in the **Contents** pane, select the objects and then change one of the values of the selected objects. The Model Explorer assigns the new property value to all of the selected objects.

Alternatively, you can edit values for model elements in the **Dialog** pane. To display the **Dialog** pane, click **View > Show Dialog Pane**.

To edit workspace variables, such as arrays or structures, you can use the Variable Editor.

To open a properties dialog box for an object, in the **Model Hierarchy** pane, right-click the object and select **Properties**. Alternatively, click an object and from the **Edit** menu, select **Properties**.

## Search and Refine Search Results

To find objects that might not be currently displayed, search.

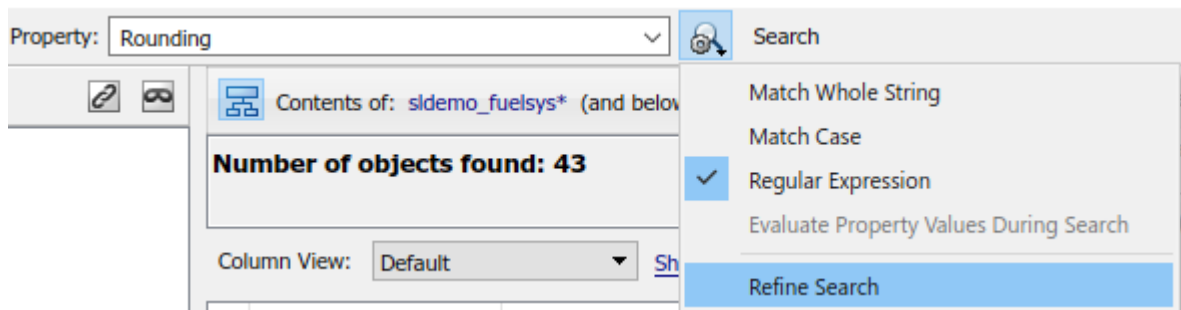

In this example, you search for elements that have an **Integer rounding mode** parameter. You then refine the results to include only n-D Lookup table blocks. You can use the search results to find out more about how these values are set or make batch changes to the elements found by the search.

- 1 Open the “Modeling a Fault-Tolerant Fuel Control System” on page 13-121 example model `sldemo_fuelsys`.
 

```
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
sldemo_fuelsys
```
- 2 On the **Modeling** tab, click **Model Explorer**.
- 3 To specify the scope of the search, use the **Model Hierarchy** pane in combination with the **View > Show Current System and Below** setting. For example, to search the current system and loaded systems below it, select the `sldemo_fuelsys` node and enable **View > Show Current System and Below**.
- 4 Display the search bar by enabling **View > Toolbars > Search Bar**.
- 5 In the search bar, set:
  - **Search** to by Property Name
  - **Property** to Rounding

Rounding is the programmatic name for the **Integer rounding mode** parameter. Block reference pages list the programmatic name for a parameter in the parameter description.
- 6 Click **Search**. In the **Search Results** box, results appear. You can go to an item by clicking the link to the path.
- 7 Refine the search. In the search bar, click the **Search Options** button  and select **Refine Search**.

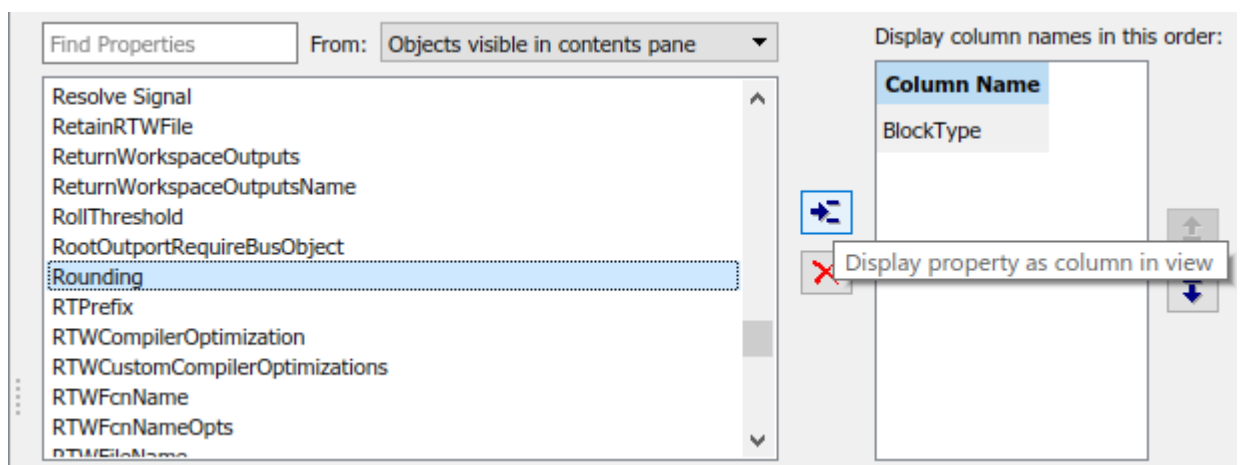

The search button label changes to **Refine**. Additional search criteria act on the previous set of results.

- 8 Set **Search** to by **Block Type** and set **Type** to **Lookup\_n-D**. Click **Refine**.
- 9 To work further with the values, click **Show Details**.

Suppose the property you are interested in learning more about or acting on is **Rounding**. First, add a column for it. Select **Rounding** from the list (you can enter it in the **Find Properties** box to locate it quickly), and click the **Display property as column in view** button .

A column for **Rounding** appears in the search results. For any column, you can view, sort, and change values for multiple items. For example, to change the **Rounding** values on all of the n-D Lookup Table blocks in this search, select all the items in the list. In the **Rounding** column, click any cell and select a new value from the list (for example, **Floor**).

**Tip** To view a summary of the search options that you used, expand the **Number of objects found** box by clicking the **Show Search Details** button .

You can use the Model Explorer to create, modify, and view the entries in a data dictionary. See “Edit and Manage Workspace Variables by Using Model Explorer” and “View and Revert Changes to Dictionary Data”.

## Display Partial or Whole Model Hierarchy Contents

By default, the Model Explorer displays objects for the system that you select in the **Model Hierarchy** pane. It does not display data for child systems. You can override that setting, so that the Model Explorer displays objects for the whole hierarchy of the currently selected system.

To toggle between displaying only the current system and displaying the whole system hierarchy of the current system, use one of these techniques:

- Select **View > Show Current System and Below**.
- Click the **Show contents of current system and below** button  at the top of the **Contents** pane.

When you select the **Show Current System and Below** option:

- The **Model Hierarchy** pane highlights the current system and its child systems.
- After the path in the **Contents** pane, the text (and below) appears.

Loading very large models for the current system and below can be slow. To stop the loading process at any time, either click the **Show contents of current system only** button or click another node in the tree hierarchy.

If you show the current system and below, you might want to change the view to better reflect the displayed system contents.

The setting for the **Show Current System and Below** option is persistent across Simulink sessions.

---

**Note** To open a graphical object (for example, a model, subsystem, or chart) in a Simulink Editor window from the Model Explorer, right-click the object in the **Model Hierarchy** pane, then select **Open**.

---

## Display Linked Library Subsystems and Masked Subsystems

By default, the Model Explorer does not display the contents of linked library subsystems or masked subsystems in the **Model Hierarchy** pane.

To display the contents of linked library subsystems or masked subsystems, use one of these approaches:

- At the top of the **Model Hierarchy** pane, click the **Show/Hide Library Links** button  or the **Show/Hide Masked Subsystems** button .
- From the **View** menu, select **Show Library Links** or **Show Masked Subsystems**.

Linked subsystems and masked subsystems are visible in the **Contents** pane, regardless of how you configure the **Model Hierarchy** pane.

---

**Note** Search does not find elements in linked library or masked subsystems that are not displayed in the **Model Hierarchy** pane.

---

For subsystems that are both linked and masked, how you set the linked subsystems and masked subsystems options affects which subsystems appear in the **Model Hierarchy** pane, as described in the following table.

Settings	Subsystems Displayed in the Model Hierarchy Pane
<b>Show Library Links</b> <b>Hide Masked Subsystems</b>	Only library-linked, unmasked subsystems
<b>Hide Library Links</b> <b>Show Masked Subsystems</b>	Only masked subsystems that are not library-linked subsystems
<b>Show Library Links</b> <b>Show Masked Subsystems</b>	All library-linked or masked subsystems

### Expand and Edit Referenced Models

To browse a model that includes Model blocks, you can expand the **Model Hierarchy** pane nodes of the Model blocks.

To browse a model referenced by a Model block:

- 1 Right-click the referenced model node in the **Model Hierarchy** pane.
- 2 Select **Open Model**.

The referenced model opens as a top model and appears as a separate node in the **Model Hierarchy** pane. While you can expand the Model block node and display the corresponding contents, you must use the node that corresponds to the referenced model to edit them.

For example, the `sldemo_mdref_depgraph` model includes Model blocks that reference other models. If you open the `sldemo_mdref_depgraph` model and expand that model node in the **Model Hierarchy** pane, you see that the model contains several Model blocks, including `heat2cost`.

If you right-click the `heat2cost` Model block node and select **Open Model**, the **Contents** pane displays the objects in the `heat2cost` Model block. You can expand the `heat2cost` node.

You can browse the contents of the referenced model, but you cannot edit the objects in the Model block.

To edit the referenced model, expand the referenced model node in the **Model Hierarchy** pane, and then access the properties of objects in the referenced model. For example, expand the `sldemo_mdref_heat2cost` node.

Model Hierarchy

- Simulink Root
  - Base Workspace
  - f14
    - sldemo\_mdref\_depgraph
      - Configurations
      - Model Workspace
      - External Data
      - DependencyGraphLauncher
      - More Info
      - heat2cost (sldemo\_mdref\_heat2cc)
        - house (sldemo\_mdref\_house)
        - outdoor temp (sldemo\_mdref\_outd)
          - thermostat (sldemo\_mdref\_heater)
      - sldemo\_mdref\_heat2cost (selected)
        - Configurations
        - Model Workspace
        - External Data
        - More Info

Contents of: **sldemo\_mdref\_heat2cost** (only) Filter Contents

Column View: **Block Data Types** Show Details 4 of 9 object

Name	BlockType	OutDataTypeStr	OutMin	OutMax	LockScale
Heat	Inport	double	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Dollar Gain	Gain	Inherit: Same as input	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Integrator	Integrator				
Cost	Output	Inherit: auto	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

For information about referenced models, see “Model Reference Basics”.

## Change Font Size

You can change the font size in the Model Explorer panes.

To increase the font size, press **Ctrl+Plus (+)**. Alternatively, from the Model Explorer **View** menu, select **Increase Font Size**.

To decrease the font size, press **Ctrl+Minus (-)**. Alternatively, from the Model Explorer **View** menu, select **Decrease Font Size**.

The changes remain in effect for the Model Explorer and in Simulink dialog boxes across Simulink sessions.

## Create Views

If a default view that ships with the Model Explorer does not meet your needs, you can modify or create a view.

To open the View Manager dialog box, select **View > Column View > Manage Views**.

To copy and rename an existing view:

- 1 In the View Manager dialog box, select the view that you want to use as the starting point for your new view.
- 2 Click the **Copy** button.

A new row appears at the bottom of the View Manager table. The new row contains the name of the view you copied, followed by a number in parentheses. For example, if you copy the Stateflow view, the initial name of the copied view is Stateflow (1).

To create a new view, in the View Manager dialog box, click the **New** button. A new view row appears at the bottom of the View Manager table.

After you create a view, you can name and describe the view:

- 1 Double-click the name of the view in the **View** column and enter a name for the view.
- 2 Double-click the text in the **Description** column and enter a description for the view.
- 3 Click **OK**.

### **Customize Views and Filter Contents**

You can control the information the **Contents** pane displays and directly manipulate column headings.

To control which property columns to display, use the **View > Column View** option.

To control which types of objects to display, use the **View > Row Filter** option.

To focus on specific objects in the **Contents** pane, based on a search string, filter contents.

As you customize the table represented by the current view, you change the current view definition. The Model Explorer saves the following changes to the table as part of the column view definition:

- Grouping by property
- Sorting in a column
- Changing the order of property columns
- Adding a property column
- Hiding and removing property columns

When you change from one view to another view, the Model Explorer saves any customizations that you have made to the previous view.

For example, suppose you set **Column View** to **Block Data Types** view and you hide the **LockScale** property column. If you then switch to use the **Data Objects** view, and later use the **Block Data Types** view again, the **Block Data Types** view no longer includes the **LockScale** column that you hid.

At the end of a Simulink session, the Model Explorer saves the view customizations that you made during that session. When you reopen the Model Explorer, Simulink uses the customized view, and maintains any changes that you made to the view in the previous session.

If you modify a default view that ships with the Model Explorer, you can reset it to factory settings. With the default view as the current view, in the **Contents** pane, click **Show Details**, then click **Options > Reset This View to Factory Settings**.

To reset the factory settings for *all* default views in one step, in the View Manager dialog box, click the **Options > Reset All Views to Factory Settings**.

---

**Note** When you reset all views, the Model Explorer removes all the custom views you have created. Before you reset views to factory settings, export any views that you will want to use in the future. For more information, see “Manage Views” on page 7-67.

---

## Manage Views

In the View Manager, you can delete, reposition, export, and import views for use by the Model Explorer.

To open the View Manager, select **View > Column View > Manage Views**.

To delete a view from the **Column View** list of views:

- 1 In the View Manager dialog box, select one or more views that you want to remove from the list.
- 2 Click the **Delete** button or press the **Delete** key.
- 3 Click **OK**.

Deleting a view using the View Manager dialog box permanently deletes that view from the Model Explorer interface. If you think you or someone else might want to use a view again, consider exporting the view before you delete it.

To change the position of a view in the **Column View** list:

- 1 In the View Manager dialog box, select one or more views that you wish to move up or down in the table of views.
- 2 Click the up or down arrow buttons to the right of the table. Repeat this step until the view appears where you want it to be in the table.
- 3 Click **OK**.

To export views that you or others can then import:

- 1 In the View Manager dialog box, select one or more views that you want to export.
- 2 Click the **Export** button. The Export Views dialog box opens with check marks next to the views that you selected.
- 3 Click **OK**. An Export to File Name dialog box opens.

Navigate to the folder where you want to export the view. By default, the Model Explorer exports views to the current folder in MATLAB.

- 4 Specify the file name for the exported view. The file is saved as a **.mat** file.
- 5 Click **OK**.

To import view files for use by the Model Explorer:

- 1 In the View Manager dialog box, click **Import**. The Select .mat File to Import dialog box opens.
- 2 Navigate to the folder that contains the view you want to import.
- 3 Select the MAT-file containing the view that you want to import and click **Open**. A confirmation dialog box opens. Click **OK** to import the view.

The imported views are added at the bottom of the View Manager table. The Model Explorer automatically renames the view if a name conflict occurs.

- “Build and Edit a Model Interactively”

## Parameters

### Search Bar

#### Search — Specify the type of objects or properties to include in the search

by Name | by Property Name | by Property Value | by Block Type | ...

Open the search bar by selecting **View > Toolbars > Search Bar**.

Use the **Search** setting to specify the type of objects or properties to include in the search.

Search Type Option	Description
by Name	Searches a model or chart for all objects that have the specified string in the name of the object.
by Property Name	Searches for objects that have a specified property. Specify the target property name from a list of properties that objects in the search domain can have.
by Property Value	Searches for objects with a property value that matches the value you specify. Specify the name of the property, the value to be matched, and the type of match (for example, equals, less than, or greater than).
by Block Type	Searches for blocks of a specified block type. Select the target block type from the list of types contained in the currently selected model.
by Stateflow Type	Searches for Stateflow objects of a specified type.
for Variable Usage	Searches for blocks that use variables defined in a workspace. Select the base workspace or a model workspace (model name) and, optionally, the name of a variable.
for Referenced Variables	Searches for variables that a model or block uses. Specify the name of the model or block in the <b>by System</b> field. The model or block must be in the <b>Model Hierarchy</b> pane.
for Unused Variables	Searches for variables that are defined in a workspace but not used by any model or block. Select the name of the workspace from the drop-down list for the <b>in Workspace</b> field.
for Library Links	Searches for library links in the current model.
by Class	Searches for Simulink objects of a specified class.

Search Type Option	Description
for Fixed Point Capable	Searches a model for all blocks that support fixed-point computations.
for Model References	Searches a model for references to other models.
by Dialog Prompt	Searches a model for all objects whose dialogs contain the prompt you specify.
by String	Searches a model for all objects in which the string you specify occurs.

### Search Options — Specify search strings

name | property | type | variables | ...

Use search option settings to specify the scope of the search.

Search Option	Description
<b>Match Whole String</b>	Do not allow partial string matches (for example, do not allow sub to match substring).
<b>Match Case</b>	Considers case when matching strings (for example, Gain does not match gain).
<b>Regular Expression</b>	Considers a string to be matched as a regular expression.
<b>Evaluate Property Values During Search</b>	This option applies only for searches by property value. If enabled, Model Explorer evaluates the value of each property as a MATLAB expression and compares the result to the search value. If this option is disabled, the Model Explorer compares the unevaluated property value to the search value.
<b>Refine Search</b>	Enables you to search the initial search results. The second search operation searches for objects that meet both the original and the new search criteria.

By default, search strings are case-insensitive and are treated as regular expressions. The search allows partial string matches. You cannot use wildcard characters in search strings. For example, if you enter \*1 as a name search string, you get no search results unless there is an item whose name starts with the characters \*1. If there is an out1 item, the search results do not include that item.

### Model Hierarchy Pane

#### Simulink Root — Display display nodes representing the MATLAB workspace, Simulink models, and Stateflow charts

node structure

Expand **Simulink Root** to display nodes representing the MATLAB workspace, Simulink models, and Stateflow charts that are in the current session.

#### Base Workspace — MATLAB workspace

node structure

**Base Workspace** represents the MATLAB workspace. The MATLAB workspace is the base workspace for Simulink models and Stateflow charts. Variables defined in this workspace are visible to all open models and charts.

Expanding a model or chart node in the **Model Hierarchy** pane displays nodes representing the following elements, as applicable, for the models and charts you have open.

Node	Description
Configurations	Select the <b>Configurations</b> node to show the model's configuration sets and configuration references in the <b>Contents</b> pane. For information about adding, deleting, saving, and moving configuration sets, see "Manage Configuration Sets for a Model".
Model Workspace	For information about how to use the Model Explorer to work with model workspace variables, see these topics: <ul style="list-style-type: none"> <li>• "Edit and Manage Workspace Variables by Using Model Explorer"</li> <li>• "Model Workspaces"</li> </ul>
External data	Expand the <b>External Data</b> node to display external data sources for the model, including the base workspace (if access is enabled), and data dictionaries.
Top-level subsystems	Expand a node representing a subsystem to display underlying subsystems.
Model blocks	Expand model blocks to show contents of referenced models.
Stateflow charts	<ul style="list-style-type: none"> <li>• Expand a node representing a Stateflow chart to display the top-level states of the chart.</li> <li>• Expand a node representing a state to display its substates.</li> </ul>

### Contents Pane

#### Contents Pane — Describe contents of node

table

The **Contents** pane displays one of two tables containing information about models and charts, depending on the tab that you select:

- The **Contents** tab displays an object property table for the node that you select in the **Model Hierarchy** pane.
- The **Search Results** tab displays the search results table.

You can also click **Show Details** to add and modify the columns that appear in the tables.

The **Contents** pane displays a table of model and chart object data.

In the **Contents** tab and in the **Search Results** tab:

- Table columns correspond to object properties (for example, **Name** and **BlockType**).

The table displays the first two columns (the object icon and the **Name** property) persistently, so that these columns remain visible regardless of how far you scroll to the right.

- Table rows correspond to objects (for example, blocks, and states).

The objects and properties displayed in the **Contents** pane depend on:

- The column view that you select in the **Column View** menu
- The node that you select in the **Model Hierarchy** pane
- The kind of object (for example, subsystem or chart) that you select in the **Model Hierarchy** pane
- The **View > Row Filter** options that you select

The link next to **Contents of** at the top of the **Contents** pane links to the currently selected node in the **Model Hierarchy** pane. The model data displayed in the **Contents** pane reflects the setting of the **Current System and Below** option.

### Column View — Named set of properties

properties

The Model Explorer uses views to specify sets of property columns to display in the **Contents** pane.

Each kind of node in the **Model Hierarchy** pane displays specific properties in the **Contents** pane. For example, a Simulink model or subsystem node displays properties such as:

- `BlockType` (block type)
- `OutDataTypeStr` (output data type)
- `OutMin` (minimum value for the block output)

Generally, a column view does not contain the total set of properties for all the objects in a node. Specifying a subset of properties to display can streamline the task of exploring and editing model and chart object properties and increase the density of the data displayed in the **Contents** pane.

You can use a view to capture the following characteristics of the model information to show in the Model Explorer:

- Properties that you want to display in the **Contents** pane
- The layout of the **Contents** pane (for example, grouping by property, the order of property columns, and sorting)

You can use views in the following ways:

- Use the standard views that ship with the Model Explorer
- Customize the standard views
- Create your own views

The first time you open the Model Explorer, Simulink automatically applies one of the standard views to the node you select in the **Model Hierarchy** pane. The Model Explorer applies a view based on the kind of node you select.

The Model Explorer assigns one of four categories of nodes in the **Model Hierarchy** pane. The Model Explorer initially associates a default view with each node category. The four node categories are:

Node Category	Kinds of Hierarchy Nodes Included	Initial Associated View
Simulink	Models, subsystems, and root level models	Block Data Types
Workspace	Base and model workspace objects	Data Objects
Stateflow	Stateflow charts and states	Stateflow
Configurations	Configurations section node	Configurations
Other	Objects that do not fit into one of the first three categories; for example, configuration sets	Default

The **Column View** field at the top of the **Contents** pane displays the view that the Model Explorer is currently using.

In the **Contents** pane, from the **Column View** list, you can select a different view. If you select a different view, then the Model Explorer associates that view with the category of the current node. For example, suppose the selected node in the **Model Hierarchy** pane is a Simulink model, and the current view is **Data Objects**. If you change the view to **Signals**, then when you select another Simulink model node, the Model Explorer uses the **Signals** view.

By default, the Model Explorer automatically applies a view based on the category of node that you select and the last view used for that node. You can manually select a view from the **Column View** list that better meets your current task.

You can shift from the default mode of having the Model Explorer automatically apply views to a mode in which you must manually select a view to change views.

To enable the manual view selection mode:

- 1 Select **View > Column View > Manage Views**.

The View Manager dialog box opens.

- 2 In the View Manager dialog box, click the **Options** button and clear **Change View Automatically**.

In the manual view selection mode, if you switch to a different kind of node in the **Model Hierarchy** pane that has a different view associated with it, the **Contents** pane displays a yellow informational bar suggesting a view to use.

You can manage views (for example, create a new view or export a view) using the View Manager dialog box. To open the View Manager dialog box, select the **Manage Views** option from either:

- The **View > Column View** menu
- The options listed when you click the **Options** button in the column view details section

The View Manager dialog box displays a list of defined views and provides tools for you to manage views.

You can manage views in several ways, including creating, deleting, reordering, exporting, importing, and resetting views.

## Tip Interface — Display or hide tips

tip field

The tip interface appears immediately above the table in the **Contents** pane. It does not appear if, in the View Manager dialog box, you clear **Options > Change View Automatically**. The tip interface displays a link for changing the current view to a suggested view. To choose the suggested view displayed in the tip bar, click the link. To hide the currently displayed tip, from the menu button on the right side of the tip bar, select **Hide This Tip**.

Initially, the suggested view is the default view associated with a node. If you associate a different view with a node category, then the tip suggests the most recently selected view when you select similar nodes.

To change from manual specification of views to automatic specification, from the tip interface, select the down arrow and **Change View Automatically**.

To enable the tip interface, in the **View** menu, select **Column View > Manage Views**. In the View Manager, enable **Options > Change View Automatically**.

## Dialog Pane

### Dialog Pane — Display properties of objects

dialog pane

Use the **Dialog** pane to view and change properties of objects that you select in the **Model Hierarchy** pane or in the **Contents** pane.

By default, the **Dialog** pane appears to the right of the **Contents** pane. To show or hide the **Dialog** pane, use one of these approaches:

- From the **View** menu, select **Show Dialog Pane**.
- From the main toolbar, click the **Dialog View** button .

To edit property values using the **Dialog** pane:

- 1 In the **Contents** pane, select an object (such as a block or signal). The **Dialog** pane displays the properties of the object you selected.
- 2 Change a property (for example, the port number of an Outport block).
- 3 Click **Apply** to accept the change, or click **Revert** to return to the original value.

By default, clicking outside the **Dialog** pane when a field has unapplied changes causes the Apply Changes dialog box to appear. Click **Apply** to accept the changes or **Ignore** to revert to the original settings.

To prevent the Apply Changes dialog box from displaying:

- 1 In the dialog box, click the **In the future Apply or Ignore (whichever I select) without asking** check box.
- 2 If you want Simulink to apply changes without warning you, press **Apply**. If you want Simulink to ignore changes without warning you, press **Ignore**.

To restore the **Apply Changes** dialog box, from the **Tools** menu, select **Prompt if dialog has unapplied changes**.

When you select a numeric MATLAB variable or a `Simulink.Parameter` object in a model workspace, the **Argument** check box appears in the **Dialog** pane. This check box configures the variable or object as a model argument. See “Parameterize Instances of a Reusable Referenced Model”.

## **Programmatic Use**

# Model Reference Conversion Advisor

Convert subsystems to referenced models

## Description

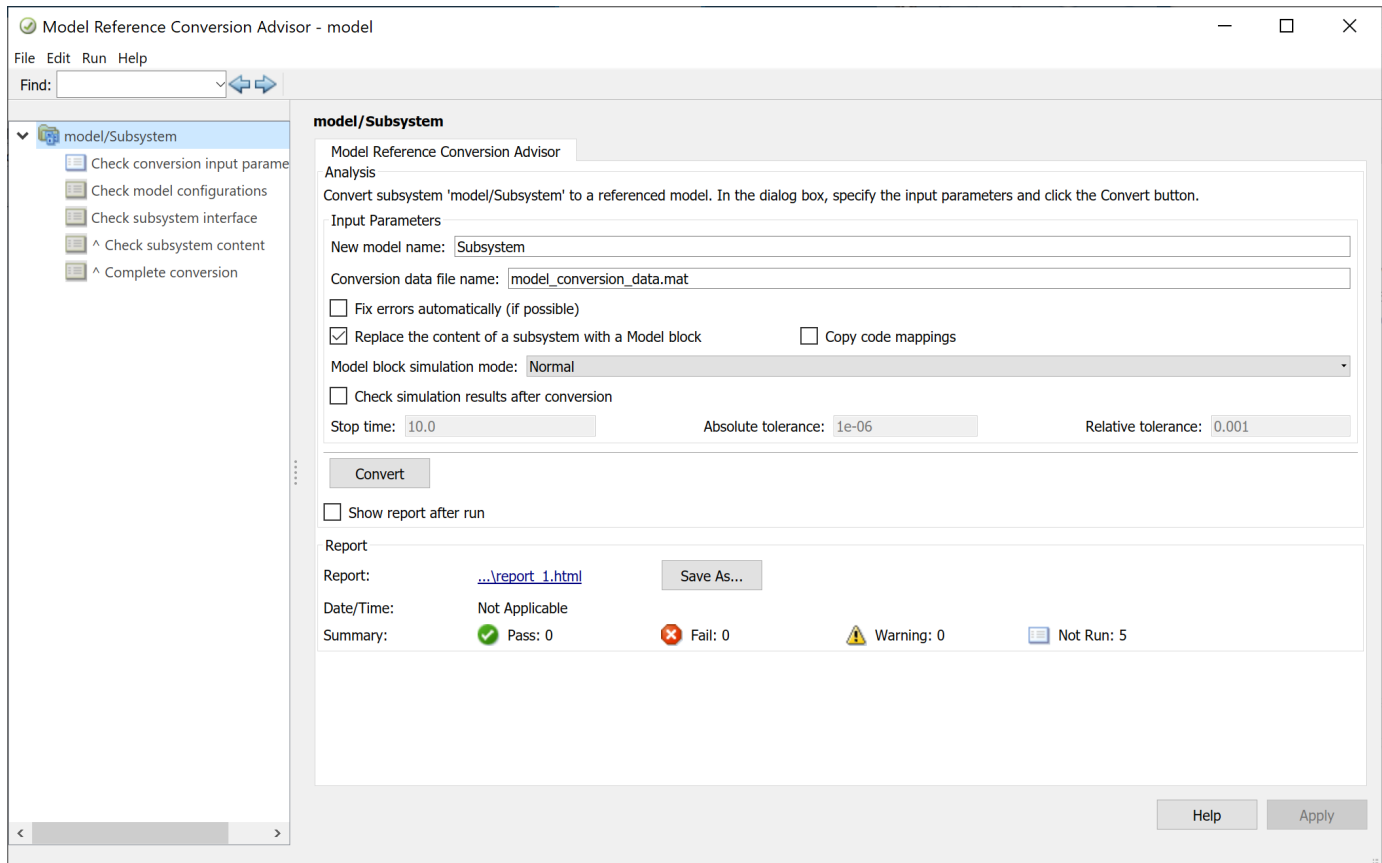

The Model Reference Conversion Advisor converts subsystems, including conditional and referenced subsystems, to referenced models.

Converting subsystems to referenced models is beneficial for modeling large, complex systems and for team-based development. Many large models use a combination of subsystems and referenced models. To decide whether to convert a subsystem to a referenced model, see “Choose Among Types of Model Components”.

When the conversion encounters an issue, the advisor helps you review and fix the issue. Preparing the contents of a Subsystem block can eliminate or reduce the number of issues that the advisor identifies. Addressing these issues in the model editing environment can be more efficient than switching repeatedly between the advisor and the Simulink Editor.

The Model Reference Conversion Advisor does not support conversion for some types of subsystems. For example:

- Subsystem blocks with Simscape Multibody components that cross the subsystem boundary
- Asynchronous subsystems — To convert asynchronous subsystems to referenced models that accept asynchronous function calls, see “Asynchronous Support Limitations” (Simulink Coder).

## Open the Model Reference Conversion Advisor

- In the Simulink Editor, select a Subsystem block. In the Simulink Toolstrip, perform one of these actions.
  - On the **Subsystem Block** tab, select **Convert > Model Block**.
  - On the **Modeling** tab, in the **Component** gallery, select **Convert to Model Block**.
- In the MATLAB Command Window, use the `Simulink.SubSystem.convertToModelReference` function with the 'UseConversionAdvisor' argument set to true.

## Examples

### Set Subsystem Conversion Options

Specify input parameters that determine the output of the conversion and control whether the advisor automatically attempts to fix conversion errors.

When you open the advisor, in the left pane, the top node is selected. This node identifies the Subsystem block that the advisor will convert to a referenced model and provides conversion input parameters. You can use the default parameter values or change the values to customize the conversion.

Input Parameter	Description
<b>New model name</b>	<p>The advisor provides a model name based on the Subsystem block name that is unique in the MATLAB path.</p> <p>The model name cannot exceed 59 characters. For more information, see “Model Names”.</p> <hr/> <p><b>Tip</b> If the advisor generates an error indicating that the target referenced model already exists, then use the <b>New model name</b> parameter to specify a new file name.</p>
<b>Conversion data file name</b>	<p>The advisor creates a file for storing data created during the conversion. By default, the advisor uses the model name at the beginning of the file name and appends the file name with <code>_conversion_data.mat</code>. For example, for a subsystem in a model named <code>myModel</code>, the conversion file name is <code>myModel_conversion_data.mat</code>.</p> <p>You can save the conversion data in a MAT-file (default) or a MATLAB file. If you use a <code>.m</code> file extension, the advisor serializes all variables to a MATLAB file.</p> <hr/> <p><b>Note</b> If the top model uses a data dictionary, you cannot select this option.</p>
<b>Fix errors automatically (if possible)</b>	<p>By default, if an advisor check finds an error that the advisor can fix, the advisor provides a <b>Fix</b> button. Click it to have the advisor fix the issue.</p> <p>If you enable this parameter, the advisor fixes all the conversion errors it can without displaying the <b>Fix</b> button.</p>
<b>Replace the content of a subsystem with a Model block</b>	<p>By default, the advisor updates the original model by inserting a Model block. The advisor action depends on whether you use the automatic fix options.</p> <ul style="list-style-type: none"> <li>• If you use the automatic fixes, then the advisor replaces the Subsystem block with a Model block unless the automatic fixes change the input or output ports. If the ports change, the advisor includes the contents of the subsystem in a Model block and inserts it into the Subsystem block.</li> <li>• If you do not use the automatic fixes, then the advisor replaces the Subsystem block with a Model block.</li> </ul> <p>Clear this parameter to have the advisor open a new Simulink Editor window that contains only a Model block that references the newly created referenced model. The advisor does not update the original model in the other Simulink Editor window.</p>

Input Parameter	Description
<b>Copy code mappings</b>	<p>Copy the code mapping information from the parent model to the new, converted referenced model. By default, this parameter is cleared.</p> <p>Code mapping information includes configurations of model data elements for code generation. This parameter does not affect simulation.</p> <p>For more information, see “Convert Subsystem to Referenced Model and Generate Code” (Simulink Coder).</p>
<b>Model block simulation mode</b>	<p>Simulation mode for the new Model block that references the referenced model.</p> <ul style="list-style-type: none"> <li>• Normal (default)</li> <li>• Accelerator</li> </ul>
<b>Check simulation results after conversion</b>	<p>Compare top-model simulation results before and after conversion.</p> <p>To use this option, before performing the conversion:</p> <ul style="list-style-type: none"> <li>• Enable signal logging for the subsystem output signals of interest.</li> <li>• Select <b>Replace the content of a subsystem with a Model block</b>.</li> <li>• Set the <b>Model block simulation mode</b> option in the advisor to the same simulation mode as the original model.</li> <li>• Specify the <b>Stop time</b>, <b>Absolute tolerance</b>, and <b>Relative tolerance</b>.</li> </ul> <p>To see the results after the conversion is complete, click <b>View comparison results</b>. The advisor displays the results of the comparison in the Simulation Data Inspector. For more information, see “Compare Simulation Results Before and After Conversion”.</p>
<b>Stop time</b>	<p>By default, the advisor uses the stop time of the top model, unless the stop time of the top model is <code>inf</code>. If the stop time of the top model is <code>inf</code>, the advisor uses a default stop time of 10.</p> <p>To use this option, select <b>Check simulation results after conversion</b>.</p>
<b>Absolute tolerance</b>	<p>The absolute signal tolerance for the simulation run comparison. The default is <math>1e-06</math>.</p> <p>To use this option, select <b>Check simulation results after conversion</b>.</p>
<b>Relative tolerance</b>	<p>The relative signal tolerance for the simulation run comparison. The default is <math>1e-03</math>.</p> <p>To use this option, select <b>Check simulation results after conversion</b>.</p>
<b>Show report after run</b>	<p>After the conversion completes, open a report that summarizes the conversion setup and results.</p>

### Automatically Convert Subsystem to Referenced Model

The Model Reference Conversion Advisor can step through each check automatically.

- 1 After you configure the subsystem conversion options, click **Convert**.

The Model Reference Conversion Advisor steps through each check automatically.

- 2 Address any issues that the advisor reports. The advisor provides a **Fix** button for any issues it can fix automatically.
- 3 After you address the reported issues, click **Continue**.

After the Model Reference Conversion Advisor successfully runs all checks, it completes the conversion.

### Check Conversion Input Parameters

Verify that all conversion input parameters are valid.

For information on conversion input parameters, see “Set Subsystem Conversion Options” on page 7-76.

- 1 In the left pane, select the **Check conversion input parameters** node.
- 2 Click the **Run This Task** button.
- 3 Address any issues that the advisor reports. The advisor provides a **Fix** button for any issues it can fix automatically.
- 4 After you address the reported issues, click **Continue**.

### Check Model Configurations

Verify that the model configurations meet model referencing requirements. This check identifies model configuration parameter settings that are not valid for model references.

- 1 In the left pane, select the **Check model configurations** node.
- 2 Click the **Run This Task** button.
- 3 Address any issues that the advisor reports. The advisor provides a **Fix** button for any issues it can fix automatically.
- 4 After you address the reported issues, click **Continue**.

### Check Subsystem Interface

Verify whether the subsystem interface meets model reference requirements.

- 1 In the left pane, select the **Check subsystem interface** node.
- 2 Click the **Run This Task** button.

The advisor verifies that the type of subsystem is one that the advisor can convert. Then, it verifies that the interfaces to specific types of subsystems, such as masked subsystems, meet conversion requirements.

- 3 Address any issues that the advisor reports. The advisor provides a **Fix** button for any issues it can fix automatically.

- 4 After you address the reported issues, click **Continue**.

### Check Subsystem Content

Verify whether the subsystem content meets model reference requirements.

- 1 In the left pane, select the **Check subsystem content** node.
- 2 Click the **Run This Task** button.

The advisor checks whether the model compiles successfully. Upon successful compilation, the advisor checks whether the blocks in the subsystem meet the requirements for conversion.

- 3 Address any issues that the advisor reports. The advisor provides a **Fix** button for any issues it can fix automatically.
- 4 After you address the reported issues, click **Continue**.

### Complete Conversion

After all checks run successfully, complete the conversion.

- 1 In the left pane, select the **Complete conversion** node.
- 2 Click the **Run This Task** button.

The Model Reference Conversion Advisor:

- Creates a referenced model from the subsystem.
- Creates the `Simulink.Bus` objects, `Simulink.Signal` objects, and tunable parameters that the referenced model requires.
- By default, replaces the Subsystem block with a Model block that references the new model.
- Inserts the Model block in a Subsystem block if the automatic fixes added ports to the Model block interface.
- Creates an HTML conversion summary report in the `s\prj` folder. This report summarizes the results of the conversion process, including the results of the fixes that the advisor performed. This report also describes the elements that the advisor copies.
- Optionally checks the consistency of simulation results before and after conversion.
- Copies the following elements from the original model to the new referenced model.
  - **Configuration set** — If the parent model uses:
    - A configuration set that is not a referenced configuration set, the advisor copies the entire configuration set to the referenced model
    - A referenced configuration set, then both the parent and referenced models use the same referenced configuration set
  - **Variables** — The advisor copies only the model workspace variables that the subsystem used in the original model to the model workspace of the referenced model. If the model that contained the subsystem uses a data dictionary, then the referenced model uses the same data dictionary.

- **Requirements links** — The advisor copies requirements links created with Requirements Toolbox™ software to the Model block from the original Subsystem block.

If you are not satisfied with the conversion results, you can restore the model to its initial state. After you successfully run the **Complete conversion** check, use the **Click here to restore the original model** link.

If you selected **Check simulation results after conversion**, you can view the results by using the **Click here to view the comparison results** link.

### Compare Simulation Results Before and After Conversion

If you selected **Check simulation results after conversion**, the Model Reference Conversion Advisor provides a comparison of top-model simulation results before and after conversion.

After you successfully run the **Complete conversion** check, click **Click here to view the comparison results**. The results display in the **Simulation Data Inspector**. A green check mark indicates that simulation results are within tolerance between the baseline model and the model with the new referenced model.

For more information, see “Compare Simulation Data”.

# Multiple Simulations

Run multiple simulations from the Simulink Editor

## Description

**Multiple Simulations** panel allows you to setup multiple simulations for a block parameter that you want to vary, for example, for a parameter sweep, or Monte-Carlo simulations. You can pick the block parameter of interest from the model canvas and specify values that you want to use for the simulations. You can also specify variables for the simulations. With the **Multiple Simulations** panel, you can provide configurations such as **Use Parallel** to run your simulations in parallel. To run the simulations that you have set up, first, select the design study, then click the **Run All** button in the **Simulation** section on the Simulink toolstrip. Once the simulations are complete, you can view and manage the results in **Simulation Manager**.

## Open the Multiple Simulations

- To open the **Multiple Simulations** panel, navigate to the **Prepare** section on the Simulink

toolstrip. In the **Inputs & Parameter Tuning** section, click **Multiple Simulations**

## Examples

- "Multiple Simulations Panel: Simulate for Different Values of Stiffness for a Vehicle Dynamics System"

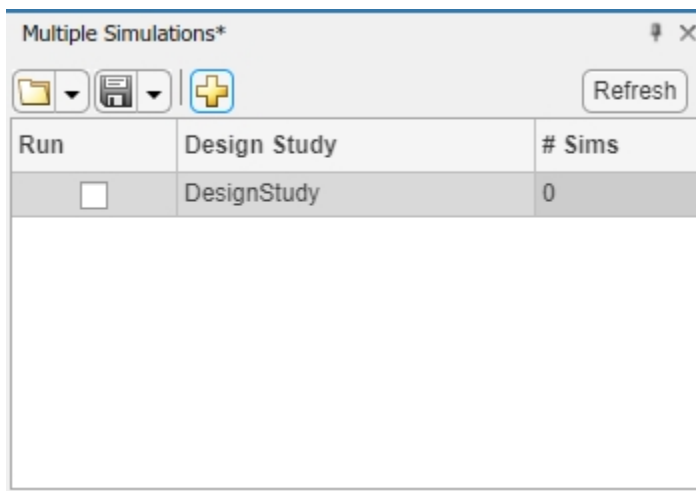

## Programmatic Use

`parsim(in)` is the command line equivalent syntax for the command line.

## More About

### Design Study

In the panel, you can click the right most button to create a new design study. A new design study object is added to the panel. The name of this design study is automatically populated. To change the name, double click on the name and enter your preferred name. A design study is an object that allows you to set up simulations. Once you configure and set up the values for the simulations, you can select this design study and click **Run All** on the Simulink toolstrip to run the simulations.

## Version History

Introduced in R2021b

# Performance Advisor

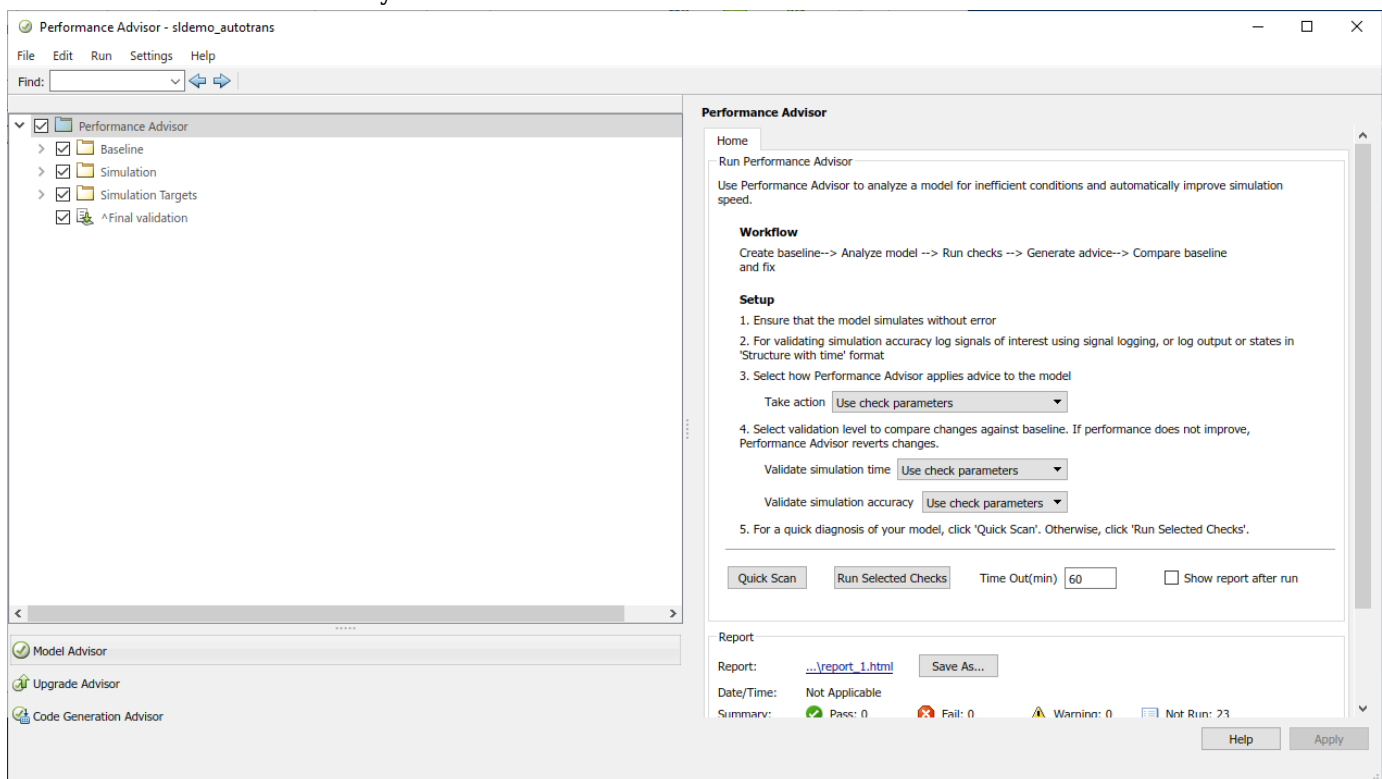

Run checks on model to improve simulation performance

## Description

The Performance Advisor checks for configuration settings that slow down simulation and produces a report of suggested changes. You can configure the Performance Advisor to apply changes suggested in the report automatically, or you can make changes to your model manually. When you configure the Performance Advisor to apply changes automatically, the Performance Advisor verifies that the change improves performance without affecting results before applying the change.

When you use the Performance Advisor to modify your model, the Performance Advisor does not save the changes automatically. You must save the model.

The Performance Advisor analyzes only the top model and does not traverse model reference boundaries or library links.

## Open the Performance Advisor

- Simulink Toolstrip: On the **Debug** tab, click **Performance Advisor**.
- MATLAB Command Window: Enter `performanceadvisor(modelName)`, where `modelName` specifies the name or handle for the model you want to analyze. If the model is not already open, the function opens the model as well as the Performance Advisor.

## Examples

- “Improve Simulation Performance Using Performance Advisor”
- “Perform a Quick Scan Diagnosis”
- “Improve vdp Model Performance”

# Property Inspector

Edit parameters and properties for any Simulink model element

## Description

The Simulink **Property Inspector** enables you to use a single interface to edit parameters and properties for any model element.

You can leave the Property Inspector open as you build your model, and it updates with your selection. You can use the Property Inspector to edit:

- Block parameters and properties
- Stateflow elements
- Annotations, areas, and images
- Signals
- Model properties

When you open the Property Inspector, it opens as a pane in the current Simulink Editor window. You can drag the Property Inspector from the default location and dock it in another location in the editor. The down arrow to the right of the pane title provides options to undock, minimize, and open help for the pane.

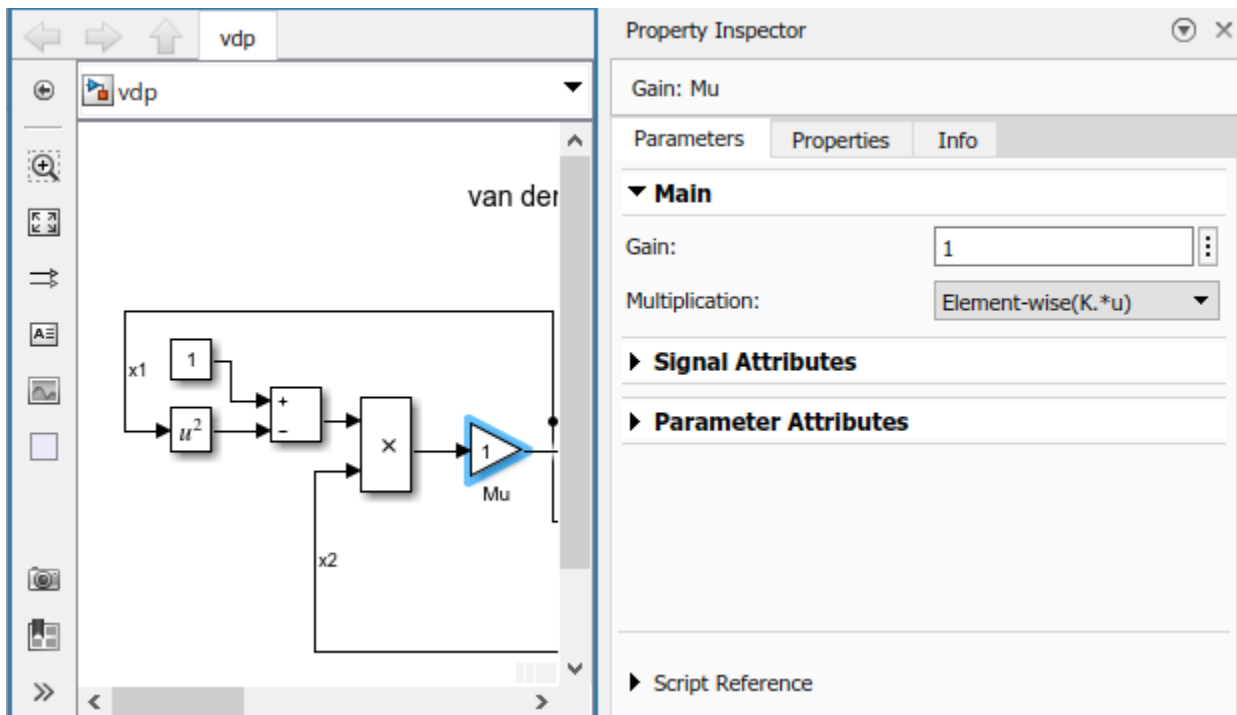

The Property Inspector lets you quickly set parameters and properties as you work. Values take effect when you set them. For more information on setting block parameters and properties, see “Add Blocks and Set Parameters”.

---

**Note** You can alternatively open a dialog box for a selected model element by right-clicking and selecting an item such as **Properties**, or for blocks, **Block Parameters**. Double-clicking a block generally opens a block dialog box. (Use one of the menu commands on Subsystem and Model blocks.)

The Property Inspector and dialog boxes operate on a single selected element. The main difference is that the Property Inspector updates with each selection, and the dialog box shows settings for only the element you opened it from. For this reason, the dialog box is useful if:

- You are moving through the model hierarchy and want to see or set element parameters or properties as you navigate the model.
  - You want to compare the parameters or properties of similar elements.
  - The settings are advanced and appear only in the dialog box.
-

## Open the Property Inspector

- In the Simulink Toolstrip, on the **Modeling** tab, in the **Design** gallery, select **Property Inspector**.
- While in the Simulink Editor, press **Ctrl+Shift+I**.

## Examples

### Set Block Parameter Value

You can set parameters on most blocks. Parameters allow you to specify how a block operates in the model.

- 1 Open the vdp model.  
vdp
- 2 Open the Property Inspector. On the **Modeling** tab, in the **Design** gallery, click **Property Inspector**.
- 3 In the model, select the Gain block named Mu.
- 4 In the Property Inspector, set the **Gain** parameter to 2, then press **Enter**.

## Referenced Files Pane

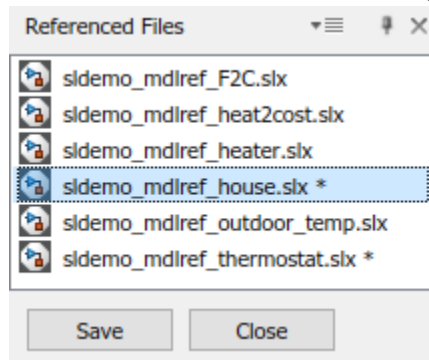

View, save, and close referenced subsystems and models

### Description

The **Referenced Files** pane allows you to view, save, and close referenced subsystems and models in the corresponding model hierarchy.

The **Referenced Files** pane shows a flat list of model and subsystem files that are loaded and referenced by the model hierarchy. Opening the top model in the model hierarchy does not load the referenced models in the model hierarchy. Load referenced models by opening them in the Simulink Editor or by using a function such as `load_system`. Referenced subsystems load when you load the models that reference them.

When you save a model using the **Referenced Files** pane, you also save the models it references. When you close a model using the **Referenced Files** pane, you also close the models it references that are not open in another model hierarchy. Before you can close a modified model, you must choose whether to save the corresponding changes, which include changes to the model workspace.

### Open the Referenced Files Pane

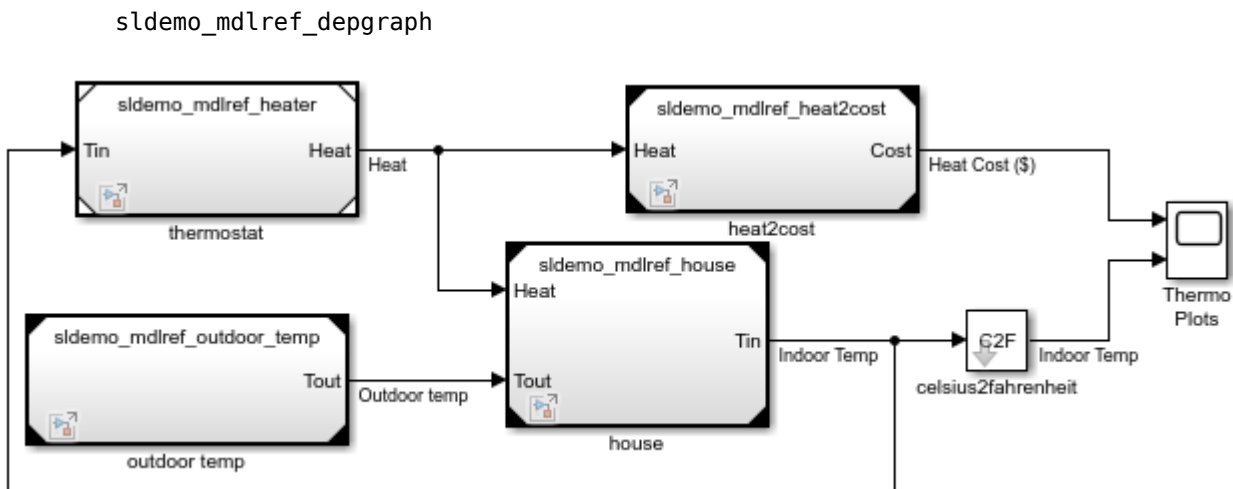

- On the **Modeling** tab, in the **Design** gallery, click **Referenced Files**.
- If a referenced file in the model hierarchy has been modified, on the **Simulation** tab, click the **Save All** button arrow, then click **Save Referenced Files > Manage Referenced Files**.
- Navigate into a referenced model in the model hierarchy. The **Referenced Files** pane opens as a tab on the left side of the Simulink Editor unless you have previously hidden the pane.

### Examples

#### Individually Save and Close Referenced Models

Save and discard changes to individual referenced models in a model hierarchy.

Open the top model in a model hierarchy that contains multiple referenced models.

On the Simulink Toolstrip **Modeling** tab, in the **Design** gallery, click **Referenced Files**.

The **Referenced Files** pane opens. It does not show any referenced subsystems or models. The `sldemo_mdref_depgraph` model does not reference any subsystems, but it references multiple models. The referenced models must be loaded to appear in the **Referenced Files** pane.

Double-click the block named `thermostat`.

The `sldemo_mdref_heater` model loads and opens. When **Show Only Modified Files** in the **Filter contents** list (☰) is cleared, this model appears in the **Referenced Files** pane. Otherwise, you must modify the file before it appears.

Modify `sldemo_mdref_heater` by moving a block.

Next to the model name, the dirty flag (\*) indicates that the model has unsaved changes.

Double-click the block named `Fahrenheit` to `Celsius`.

The `sldemo_mdref_F2C` model loads and opens.

Modify `sldemo_mdref_F2C` by moving a block.

Next to the model name, the dirty flag (\*) indicates that the model has unsaved changes.

Suppose you want to keep your changes to `sldemo_mdref_F2C`, and you want to discard your changes to `sldemo_mdref_heater`.

If you select `sldemo_mdref_heater` and click **Close**, you receive a message asking whether to save the changes to `sldemo_mdref_heater` and `sldemo_mdref_F2C` before closing both models. Unless a referenced model is open in another model hierarchy, closing its parent model closes the referenced model.

To keep your changes to `sldemo_mdref_F2C`, select it in the **Referenced Files** pane and click **Save**. Then, select `sldemo_mdref_heater` and click **Close**.

## Schedule Editor

View and edit the schedule of model components (partitions)

### Description

The Schedule Editor is a scheduling tool that represents the components in the model known as partitions, the data connections between them, and the order of those partitions.

Partitions are the components of the model that execute independently as tasks. The data connections between the partitions show the flow of the data between those partitions. The scheduling of these partitions is based on the rates and the events in the model. This schedule is shown in the **Order** table in the Schedule Editor.

Using the Schedule Editor, you can:

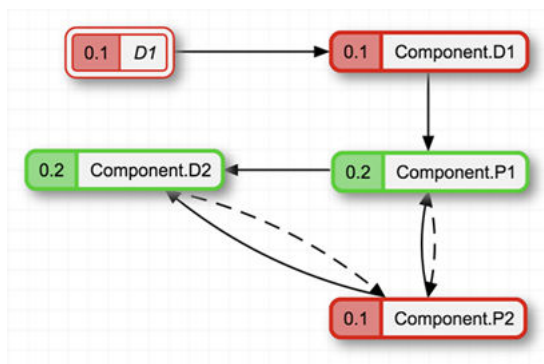

- Create partitions and specify their order.
- Edit and analyze the schedule of the executable partitions without disturbing the structure of the model.
- Visualize how Simulink executes partitions.

Changes made in the Schedule Editor affect both, simulation and code generation.

### Using the Schedule Editor

The Schedule Editor consists of two parts representing two different views of partitions in the model:

- A graph that shows the partitions and the data connections between them.

- A table that shows the order in which the partitions execute.

ORDER		
Order	Name	Trigger
1	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: black; margin-right: 5px;"></div> <span>Cont <i>implicit</i></span> </div> <div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: red; margin-right: 5px;"></div> <span>D1 <i>implicit</i></span> </div>	0 0.001
2	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> <span>D2 <i>implicit</i></span> </div>	0.005
3	▶ ThrottleControl.APPSnsrRun	
4	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> <span>ThrottleControl.ActuatorRun5ms</span> </div>	0.005
5	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> <span>ThrottleControl.TPSSecondaryRun5ms</span> </div>	0.005
6	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> <span>ThrottleControl.MonitorRun5ms</span> </div>	0.005
7	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> <span>ThrottleControl.ControllerRun5ms</span> </div>	0.005
8	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: blue; margin-right: 5px;"></div> <span>D3 <i>implicit</i></span> </div>	0.01
9	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: blue; margin-right: 5px;"></div> <span>ThrottleControl.TPSPrimaryRun10ms</span> </div>	0.01

Changing one of the views impacts the other.

To use the Schedule Editor, select **Schedule Editor** in the **Design** section of the **Modeling** tab. If the model is already partitioned, you can open the Schedule Editor by clicking the  badge, which appears above the blocks. To see the default partitions present in the model in the Schedule Editor, update the diagram by clicking the  icon on the toolbar or by selecting **Ctrl+D**. As you create partitions in the model and update the diagram, partitions appear in the Schedule Editor.

To check how the partitions map to the model, right-click the partitions and select **Show Source**. The Simulink model window appears with every block corresponding to the partition highlighted.

## Order

The **Order** shows the order in which the partitions execute. To change the order, you can drag and drop the partitions. You can also use the **Up** and **Down** arrows on the toolbar. Partitions are sorted based on their rates. You can only reorder the partitions with the same rate. Clicking a partition in the **Order**, highlights the corresponding partition in the graph. On changing the order, the connections that are affected by this specified change get highlighted.

3	▶ ThrottleControl.APPSnsrRun	
4	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> <span>ThrottleControl.ActuatorRun5ms</span> </div>	0.005
5	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> <span>ThrottleControl.TPSSecondaryRun5ms</span> </div>	0.005
6	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> <span>ThrottleControl.MonitorRun5ms</span> </div>	0.005
7	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> <span>ThrottleControl.ControllerRun5ms</span> </div>	0.005
8	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: blue; margin-right: 5px;"></div> <span>D3 <i>implicit</i></span> </div>	0.01
9	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: blue; margin-right: 5px;"></div> <span>ThrottleControl.TPSPrimaryRun10ms</span> </div>	0.01

## Connections

Connections between the partitions show data dependencies. You can right-click the connections between the partitions to change the constraints on data connections. The different types of connections illustrate how the partitions behave with each other.

The types of connections are:

- **Dependency** — Indicates that the source always runs before the destination. The dependency connection is a solid line.

- **Delay** — Indicates that the destination runs before the source. When the destination runs before the source, a scheduling delay is introduced. The delay connection is a dashed line.

You can put these types of constraints on connections:

- **Allow Delay** — Inserts a delay when required. When you specify this constraint for a connection, Simulink inserts a delay for that connection only when necessary. The unlock icon on the connections signifies an allowed delay. When you select this constraint on a connection, Simulink prefers these connections to be turned into a delay if necessary over other connections.

This constraint is displayed as one of these options.

- **Prevent Delay** — Prevents delay from being inserted in the connection. When you specify this constraint for a connection, Simulink ensures that the connection is a dependency. The lock icon on the connection indicates that the connection is locked as a dependency and is not changed to a delay.

## Events

The **Events** panel allows you to manage events in the Schedule Editor. The events in the Schedule Editor can bind with aperiodic partitions to schedule their execution. You can create events in the Schedule Editor and use these events to send from Stateflow to schedule execution of an aperiodic partition. To send the events from the Stateflow chart, use the `send(eventName)` command.

In the **Events** panel, you can see the listeners and the broadcasters of the event. The icon 

denotes the listeners, and the icon  denotes the broadcasters. When you bind the aperiodic partition with an event, the aperiodic partition executes when that event is sent. The broadcaster of the event shows you the path of the Stateflow chart that sends the event.

Click the icon  to create an event in the Schedule Editor, and select a listener partition from the drop down. You can also bind an event by dragging and dropping the event over a valid aperiodic partition. When an event is bound to a partition, the event name appears on the left side of the partition and in, the **Trigger** column of the **Order** table.

Order	Name	Trigger
1	Cont implicit	0
2	D1 implicit	0.001
3	D2 implicit	0.005
4	ThrottleControl.APPSnsrRun	0.005
5	ThrottleControl.ActuatorRun5ms	0.005
6	ThrottleControl.TPSSecondaryRun5ms	0.005
7	ThrottleControl.MonitorRun5ms	0.005
8	ThrottleControl.ControllerRun5ms	0.005
9	D3 implicit	0.01
10	ThrottleControl.TPSPrimaryRun10ms	0.01

Block Name	Partition Name	Sample time
Convert Pedal to ADC Range		
Convert TPS to ADC Range		
ThrottleControl	ThrottleControl.<...>	

## Open the Schedule Editor

- Simulink: In the **Modeling** tab, expand the **Design** section and select **Schedule Editor** from **System Design**.
- Simulink model: Click the badge on the partitioned blocks.

## Examples

- “Schedule an Export-Function Model Using the Schedule Editor”
- “Schedule a Rate-Based Model Using the Schedule Editor”
- “Events in Schedule Editor”

## Parameters

### Manage Partitions

**Partition Name** — Name of the partitions  
character vector

Name of the partitions created. Double-click the name to edit and use the enter key to save the partition name.

### **Sample Time — Sample time for partitions to execute**

discrete value | variable

Sample time at which the partitions execute. The sample time is a discrete value or a defined variable that contains a discrete value.

### **Property Inspector**

### **Hit times — Times for aperiodic partitions to execute**

vector

Times at which the aperiodic partitions execute, specified as a vector of discrete values.

### **Connections — Data connections between partitions**

Auto (default) | Delay | Dependency | Prevent Delays | Allow Delays

Dependency between the partitions is shown as a solid line. A delay between the partitions is shown as a dashed line. The arrow tail and head denote the source and destination, respectively.

Specify constraints on the connections by right-clicking the lines and selecting the constraint type.

## **More About**

### **Order**

By default, the **Order** table is expanded. **Order** shows the order of partition execution. Edit the order by dragging the partitions or using the **Up** and **Down** arrows on the toolbar.

### **Manage Partitions**

By default, the **Manage Partitions** panel is collapsed. Expand the panel to create partitions, edit names and/or sample times of the existing partitions, and remove existing partitions. Changes made in the **Manage Partitions** panel take effect after updating the diagram.

### **Property Inspector**

The **Property Inspector** shows information about the selected partition. It shows the rate at which the partition executes and the connections on that partition. Enter the **Hit times** when you select an aperiodic partition in the **Property Inspector**.

### **Arrange**

The **Arrange** button organizes the partition graph.

### **Layout**

By default, the **Order** panel and the **Property Inspector** panel are expanded. From the **Layout** dropdown, select the preferred panels to be expanded as per preference. Clearing the panels collapses them.

## Events

From the **Events** panel, you can manage events in the Schedule Editor. In the **Events** panel, you can see the listeners and the broadcasters of the event. The icon  denotes the listeners, and the icon  denotes the broadcasters.

## Version History

**Introduced in R2019a**

## Sequence Viewer

Visualize messages, events, states, transitions, and functions

### Description

The Sequence Viewer visualizes message flow, function calls, and state transitions.

Use the Sequence Viewer to see the interchange of messages, events, function calls in Simulink models, Simulink behavior models in System Composer and between Stateflow charts in Simulink models.

In the Sequence Viewer window, you can view event data related to Stateflow chart execution and the exchange of messages between Stateflow charts. The Sequence Viewer window shows messages as they are created, sent, forwarded, received, and destroyed at different times during model execution. The Sequence Viewer window also displays state activity, transitions, and function calls to Stateflow graphical functions, Simulink functions, and MATLAB functions. For more information, see “Use the Sequence Viewer to Visualize Messages, Events, and Entities”.

---

**Note** The Sequence Viewer does not display function calls generated by MATLAB Function blocks and S-functions.

---

### Open the Sequence Viewer

- Simulink Toolstrip: On the **Simulation** tab, in the **Review Results** section, click **Sequence Viewer**.

## Examples

### Using the Sequence Viewer Tool

- 1 To activate logging events, in the Simulink Toolstrip, under the **Simulation** tab, in the **Prepare** section, click **Log Events**.
  - 2 Simulate your model.
  - 3 To open the tool, in the Simulink Toolstrip, under the **Simulation** tab, in the **Review Results** section, click **Sequence Viewer**.
- “Use the Sequence Viewer to Visualize Messages, Events, and Entities”
  - “Simulink Messages Overview”

## Parameters

### Time Precision for Variable Step — Digits for time increment precision

3 (default) | scalar

Number of digits for time increment precision. When using a variable step solver, change this parameter to adjust the time precision for the sequence viewer. By default the block supports 3 digits of precision. Minimum and maximum precision are 1 and 16, respectively.

Suppose the block displays two events that occur at times 0.1215 and 0.1219. Displaying these two events precisely requires 4 digits of precision. If the precision is 3, then the block displays two events at time 0.121.

#### Programmatic Use

**Block Parameter:** SequenceViewerTimePrecision

**Type:** character vector

**Values:** '3' | scalar

**Default:** '3'

### History — Maximum number of previous events to display

1000 (default) | scalar

Total number of events before the last event to display. Minimum and maximum number of events are 0 and 25000, respectively.

For example, if **History** is 5 and there are 10 events in your simulation, then the block displays 6 events, including the last event and the five events prior the last event. Earlier events are not displayed. The time ruler is greyed to indicate the time between the beginning of the simulation and the time of the first displayed event.

Each send, receive, drop, or function call event is counted as one event, even if they occur at the same simulation time.

#### Programmatic Use

**Block Parameter:** SequenceViewerHistory

**Type:** character vector

**Values:** '1000' | scalar  
**Default:** '1000'

## **Version History**

# Signal Properties

View and edit signal properties

## Description

Use the Signal Properties dialog box to view and edit properties for signals in your model. Using the Signal Properties dialog box, you can mark a signal for logging, specify a signal name, and configure logging options, including which data points to log and the logging sample time.

When your model is configured for concurrent execution, the Signal Properties dialog box also includes a **Data Transfer** tab. For more information, see “Configure Data Transfer Settings Between Concurrent Tasks” and “Configure Your Model for Concurrent Execution”.

## Open the Signal Properties

- Right-click a signal line in the model and select **Properties**.
- When you select a signal line in your model, the Signal Properties are available in the Property Inspector.

## Parameters

### Signal Name Properties

#### Signal name — Signal name

string | character vector

Specify a name for the signal as a character vector or string.

When you select **Signal name must resolve to Simulink signal object**, the name must match the name of a `Simulink.Signal` object in the base workspace, the model workspace, or a data dictionary. The signal name can implicitly resolve to a `Simulink.Signal` object when you do not select **Signal name must resolve to Simulink signal object**. For more information, see “Explicit and Implicit Symbol Resolution”.

By default, the name for logged signal data matches the signal name specified in the model. To use a different name for the logged signal data, specify the name for the logged data using the **Logging Name** property.

#### Programmatic Use

To specify a signal name programmatically, use the `set_param` function to set the `Name` property for the line handle that corresponds to the signal or the port handle that corresponds to the block output port that produces the signal. For an example, see “Name a Signal Programmatically”.

**Parameter:** Name

**Type:** string | character vector

#### Signal name must resolve to Simulink signal object — Explicit signal name resolution

'off' (default) | 'on'

When enabled, the signal name specified in the Signal Properties dialog box must match the name of a `Simulink.Signal` object in the base workspace, the model workspace, or a data dictionary. When disabled, the signal name can implicitly resolve to a `Simulink.Signal` object. For more information, see “Explicit and Implicit Symbol Resolution”.

By default, signals that require resolution to a `Simulink.Signal` object are marked with the signal resolution icon to the left of the signal label. For more information, see “Signal to Object Resolution Indicator”.

#### Programmatic Use

To configure this option for a signal programmatically, use the `set_param` function to set the `MustResolveToSignalObject` property for the port handle that corresponds to the block output port that produces the signal. For an example, see “Use Signal Objects”.

**Parameter:** `MustResolveToSignalObject`

**Value:** 'on' | 'off'

**Default:** 'off'

#### Show propagated signals — Option to display propagated signal name

'off' (default) | 'on'

When a downstream signal originates from a block that supports signal label propagation, you can enable this option on the downstream signal line to display the propagated signal name as a label on the signal line.

For example, the output signal from the Subsystem block is configured for signal label propagation. The propagated signal label <const> comes from the name of the upstream Constant block output signal const.

For more information see, “Signal Label Propagation”.

### Tips

To display propagated signal labels for all signals, in the Simulink Editor, on the **Debug** tab, select **Information Overlays**, then select **Propagated Signal Labels**.

### Dependencies

The **Show propagated signals** property is only available for signals produced by blocks that support signal label propagation.

### Programmatic Use

To configure a signal to display its propagated name programmatically, use the `set_param` function to specify the value of the `ShowPropagatedSignals` property for the port handle that corresponds to the block output port that produces the signal. For an example, see “Display Propagated Signal Labels”.

**Parameter:** `ShowPropagatedSignals`

**Value:** 'on' | 'off'

**Default:** 'off'

### Logging and Accessibility

#### Log signal data — Signal logging

'off' (default) | 'on'

Select this option to mark a signal for logging. When the **Signal logging** option in the model configuration parameters is enabled, data for signals marked for logging is sent to the workspace and the Simulation Data Inspector during simulation. For more information, see “Export Signal Data Using Signal Logging”.

### Programmatic Use

You can control whether to log a signal programmatically using the `Simulink.sdi.markSignalForStreaming` function or by using the `set_param` function to configure the `DataLogging` property of the port handle that corresponds to the block output port that produces the signal.

**Parameter:** `DataLogging`

**Value:** 'on' | 'off'

**Default:** 'off'

#### Test point — Test point designation

'off' (default) | 'on'

When enabled, the signal is designated as a test point. For more information, see “Configure Signals as Test Points”.

#### **Programmatic Use**

To designate a signal as a test point programmatically, use the `set_param` function to specify the value of the `TestPoint` property for the port handle that corresponds to port that produces the signal.

**Parameter:** `TestPoint`

**Value:** `'on' | 'off'`

**Default:** `'off'`

#### **Logging Name — Name for logged signal data**

`'SignalName' (default) | 'Custom'`

Specify a name for the logged signal data. By default, logged signal data uses the name of the signal specified in the model.

To specify a logging name for a signal that is different from the name of the signal in the model, select `Custom` and specify the logging name in the text box.

#### **Dependencies**

To enable the **Logging Name** property, select **Log signal data**.

#### **Programmatic Use**

To specify the logging name programmatically, use the `set_param` function to configure the `DataLoggingNameMode` and `DataLoggingName` parameters for the port handle that corresponds to the block output port that produces the signal. For an example, see “Signal-Specific Logging Name Specified Programmatically”.

**Parameter:** `DataLoggingNameMode`

**Value:** `'SignalName' | 'Custom'`

**Default:** `'SignalName'`

**Parameter:** `DataLoggingName`

**Type:** `string | character vector`

#### **Limit data points to last — Option to log only last $n$ data points**

`'off' (default) | 'on'`

When you only want to save or analyze the data from the end of a simulation, you can configure logging to capture only the last  $n$  signal values. Select **Limit data points to last** and specify the number of data points you want to log.

When you only log the last simulation values, dashboard blocks and the Simulation Data Inspector do not display data during simulation. Consider data requirements for each signal before you reduce the number of data points logged in simulation.

For more information, see “Specify Signal Values to Log” and “Limit the Size of Logged Data”.

#### **Dependencies**

To enable the **Limit data points to last** property, select **Log signal data**.

**Programmatic Use**

To configure this option programmatically, use the `set_param` function to configure the `DataLoggingLimitDataPoints` and `DataLoggingMaxPoints` parameters for the port handle that corresponds to the block output port that produces the signal.

**Parameter:** `DataLoggingLimitDataPoints`

**Value:** 'on' | 'off'

**Default:** 'off'

**Parameter:** `DataLoggingMaxPoints`

**Value:** numeric scalar

**Type:** string | character vector

**Default:** '5000'

**Decimation — Option to log every *n*th data point**

'off' (default) | 'on'

When you want to reduce the effective sample rate for logged data, select **Decimation** and specify the desired decimation factor in the text box. For example, if you specify a decimation factor of 2, every other signal value is logged.

Consider data requirements for each signal before reducing the number of data points logged in simulation. Decimation can cause aliasing if the effective sample rate is too low.

For more information, see “Specify Signal Values to Log” and “Limit the Size of Logged Data”.

**Dependencies**

To enable the **Decimation** property, select **Log signal data**.

**Programmatic Use**

To configure this option programmatically, use the `set_param` function to configure the `DataLoggingDecimateData` and `DataLoggingDecimation` parameters for the port handle that corresponds to the block output port that produces the signal.

**Parameter:** `DataLoggingDecimateData`

**Value:** 'on' | 'off'

**Default:** 'off'

**Parameter:** `DataLoggingDecimation`

**Value:** numeric scalar

**Type:** string | character vector

**Default:** '2'

**Sample time — Logging sample time**

-1 (default) | scalar

Specify the sample time to use for logging the data for the selected signal. By default, the logging sample time is inherited (-1) from the block that produces the signal. For continuous logging sample time, specify the value as 0. To use a discrete sample time for logging data, specify the sampling interval as a scalar.

Specifying a logging sample time may add a new sample time to the model. When you specify a logging sample time, the model calculates a value for the exact time hits. When you use a fixed-step solver, the logging sample time you specify must be a multiple of the base rate for the model.

Logging sample time is not supported for signals inside conditional subsystems or conditional referenced models.

## Dependencies

To enable the **Sample time** property, select **Log signal data**.

## Programmatic Use

To configure this option programmatically, use the `set_param` function to configure the `DataLoggingSampleTime` parameter for the port handle that corresponds to the block output port that produces the signal.

**Parameter:** `DataLoggingSampleTime`

**Value:** numeric scalar

**Type:** string | character vector

**Default:** '-1'

## Documentation

### Description — Signal description

string | character vector

You can provide a description of the signal that shows in the **Info** tab of the Property Inspector when the signal is selected.

The description specified in the Signal Properties dialog box does not appear in generated code. To provide a signal description that becomes a comment in generated code, use a `Simulink.Signal` object.

## Programmatic Use

To configure this option programmatically, use the `set_param` function to configure the `Description` parameter for the port handle that corresponds to the block output port that produces the signal.

**Parameter:** `Description`

**Type:** string | character vector

### Document link — Link to documentation about signal

MATLAB expression

Specify a MATLAB expression that opens documentation for the signal. For example, you can call the `web` function to open an HTML file. When you specify a value for the **Document link** property, you can click the **Document link** field label to open the document.

## Programmatic Use

To programmatically specify a document link, use the `set_param` property to specify the `DocumentLink` property of the port handle that corresponds to the block output port that produces the signal.

**Parameter:** `DocumentLink`

**Type:** string | character vector

## Version History

Introduced before R2006a

# Simulation Data Inspector

Inspect and compare data and simulation results to validate and iterate model designs

## Description

The Simulation Data Inspector visualizes and compares multiple kinds of data.

Using the Simulation Data Inspector, you can inspect and compare time series data at multiple stages of your workflow. This example workflow shows how the Simulation Data Inspector supports all stages of the design cycle:

**1** “View Data in the Simulation Data Inspector”

Run a simulation in a model configured to log data to the Simulation Data Inspector, or import data from the workspace or a MAT-file. You can view and verify model input data or inspect logged simulation data while iteratively modifying your model diagram, parameter values, or model configuration.

**2** “Inspect Simulation Data”

Plot signals on multiple subplots, zoom in and out on specified plot axes, and use data cursors to understand and evaluate the data. “Create Plots Using the Simulation Data Inspector” to tell your story.

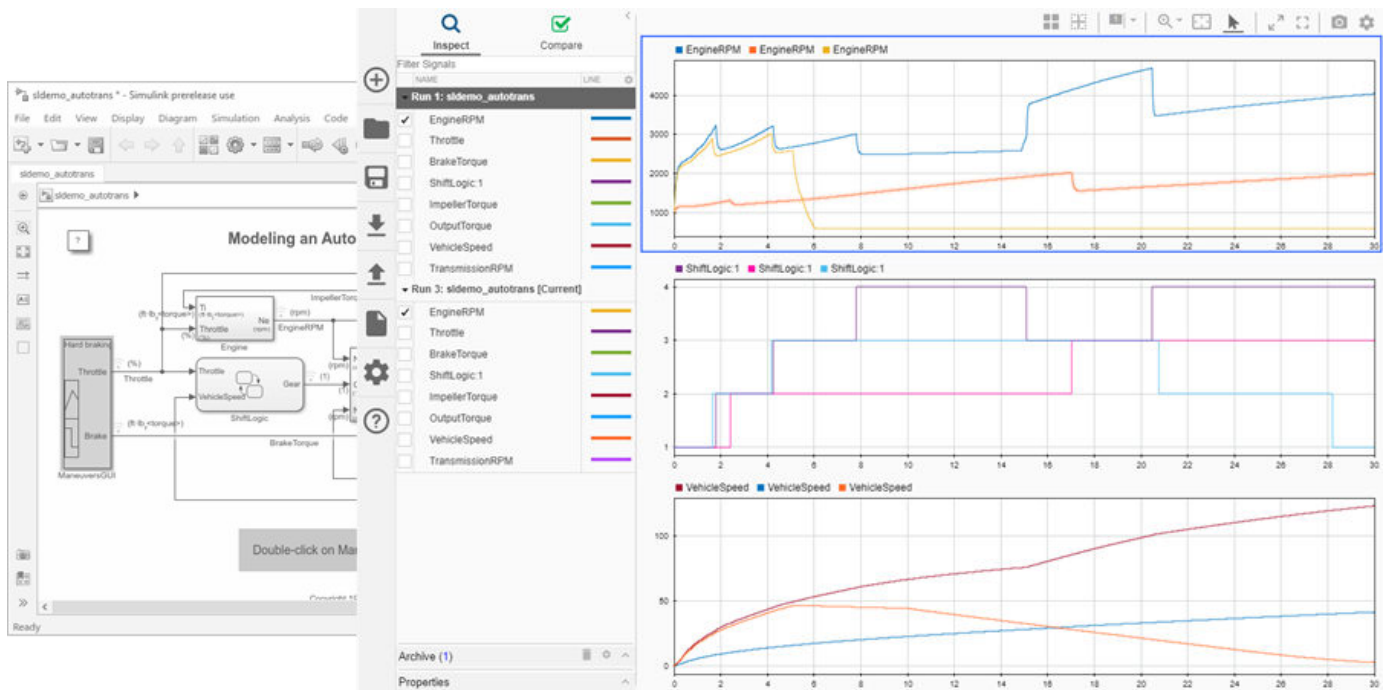

**3** “Compare Simulation Data”

Compare individual signals or simulation runs and analyze your comparison results with relative, absolute, and time tolerances. The compare tools in the Simulation Data Inspector facilitate iterative design and allow you to highlight signals that do not meet your tolerance requirements. For more information about the comparison operation, see “How the Simulation Data Inspector Compares Data”.

**4** “Save and Share Simulation Data Inspector Data and Views”

Share your findings with others by saving Simulation Data Inspector data and views.

You can also harness the capabilities of the Simulation Data Inspector from the command line. For more information, see “Inspect and Compare Data Programmatically”.

## Open the Simulation Data Inspector

- Simulink Toolstrip: On the **Simulation** tab, under **Review Results**, click **Data Inspector**.
- Click the streaming badge on a signal to open the Simulation Data Inspector and plot the signal.
- MATLAB command prompt: Enter `Simulink.sdi.view`.

## Examples

### Apply a Tolerance to a Signal in Multiple Runs

You can use the Simulation Data Inspector programmatic interface to modify a parameter for the same signal in multiple runs. This example adds an absolute tolerance of `0.1` to a signal in all four runs of data.

First, clear the workspace and load the Simulation Data Inspector session with the data. The session includes logged data from four simulations of a Simulink® model of a longitudinal controller for an aircraft.

```
Simulink.sdi.clear
Simulink.sdi.load('AircraftExample.mldatx');
```

Use the `Simulink.sdi.getRunCount` function to get the number of runs in the Simulation Data Inspector. You can use this number as the index for a for loop that operates on each run.

```
count = Simulink.sdi.getRunCount;
```

Then, use a for loop to assign the absolute tolerance of `0.1` to the first signal in each run.

```
for a = 1:count
 runID = Simulink.sdi.getRunIDByIndex(a);
 aircraftRun = Simulink.sdi.getRun(runID);
 sig = getSignalByIndex(aircraftRun,1);
 sig.AbsTol = 0.1;
end
```

- “View Data in the Simulation Data Inspector”
- “Inspect Simulation Data”
- “Compare Simulation Data”
- “Iterate Model Design Using the Simulation Data Inspector”

## Programmatic Use

`Simulink.sdi.view` opens the Simulation Data Inspector from the MATLAB command line.

## Version History

Introduced in R2010b

# Simulink Editor

Create models and set model properties

## Description

The Simulink Editor allows you to create and configure system models.

The Simulink Editor is a tool for building models. In addition to providing standard methods for working with diagrams in a vector graphics editor, the editor provides shortcuts that help you to add and connect blocks. The Simulink Editor also gives you access to the tools you need for technical operations such as importing data, simulating your model, and analyzing model performance.

## Open the Simulink Editor

- Create a model. On the MATLAB **Home** tab, click **Simulink** and choose a model template.

Alternatively, if you already have the Library Browser open, click the **New Model** button .

- Open an existing model. To open recent models, on the MATLAB **Home** tab, click **Simulink**.

Alternatively, if you know the name of the model you want to open, enter the name in the MATLAB Command Window, such as `vdp`.

---

**Tip** The first model that you open in a MATLAB session takes longer to open than subsequent models. By default, MATLAB does not start Simulink until you open the first model to reduce MATLAB startup time and avoid unnecessary system memory use.

To speed up opening the first model, you can configure MATLAB startup to also start Simulink. For more information on how to start Simulink without opening models or the Library Browser, see the `start_simulink` reference page.

---

## Examples

### Interactively Build Models

When you build a model in the Simulink Editor, you use common techniques for working with graphics objects.

Actions you can perform in the Simulink Editor include:

- Selecting using click, shift-click, and dragging
- Resizing objects using handles and moving objects by dragging
- Cutting, copying, and pasting
- Undoing and redoing up to 101 operations

---

**Note** After you undo or redo block parameter changes, a visual cue appears that shows the current values of the affected parameters. Some parameter changes are not affected by the undo or redo commands. After you undo or redo changes to block parameters, use the cue to see the parameters affected.

A small subset of parameters cannot be undone. Changing these parameters clears the undo history when you make the change in the Property Inspector or in the block dialog box.

---

You can also zoom and scroll the editing area. On the **Modeling** tab, select **Environment > Zoom**, and select the zoom or view you want to use. If you are using a supported touch display platform, you can pinch to zoom and swipe to scroll. The supported touch display devices include Microsoft Windows platforms with a Windows 7 certified or Windows 8 certified touch display and Macintosh platforms with an Apple Magic Trackpad.

The editor supports additional shortcuts for scrolling that are unique to Simulink. Shortcuts and other interactive model building techniques are summarized in “Keyboard Shortcuts and Mouse Actions for Simulink Modeling”. For a tutorial, see “Build and Edit a Model Interactively”.

### Detect Model Design Errors

The Simulink Editor can provide you with visual cues for some model design issues. Highlighted blocks alert you to issues. To see a description of the issue, pause on a highlighted block and click the error or warning symbol.

Similar to the Diagnostic Viewer, if an error or warning has a predefined fix, the notification dialog box lists actions and may include a **Fix** button to apply these changes.

Simulink can detect block errors and warnings, such as:

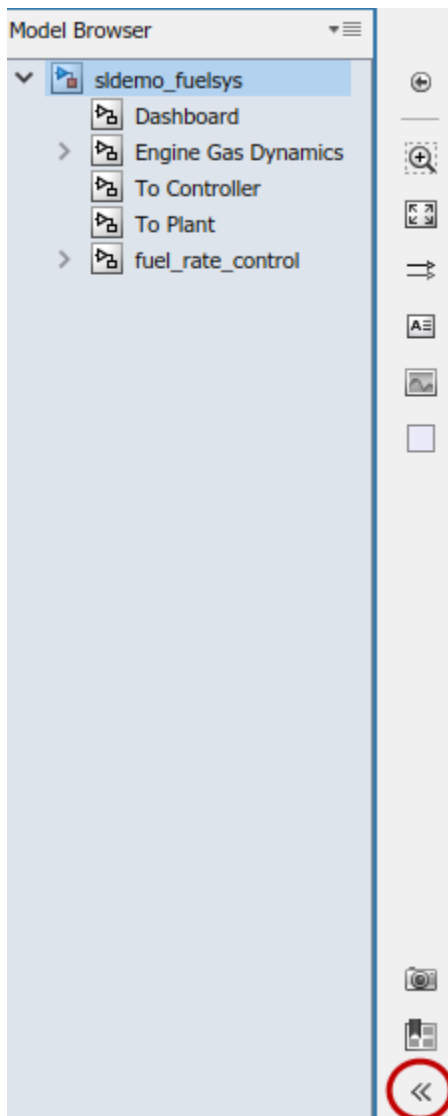

- Goto and From block mismatches.
- Duplicate data store blocks. The value of the Duplicate data store names parameter determines whether to display a warning or an error symbol.

The **Errors and Warnings** option is enabled by default. To turn off this option, in the **Debug** tab, select **Diagnostics > Edit-Time Errors & Warnings**.

### Explore Model Hierarchy

Use the Model Browser to navigate a model hierarchy using a tree structure. The browser helps you to understand the organization of your model and explore systems within systems.

To display the Model Browser, in the Simulink Editor, in the **Modeling** tab, select **Environment > Model Browser**. You can toggle the Model Browser display by clicking the **Hide/Show Model Browser** control .

In the Model Browser, you can specify whether to display blocks that are linked to a library or to masked subsystems. Click  and select **Library Links** or **Systems with Mask Parameters**. For information on these types of blocks, see “Linked Blocks” and “Masking Fundamentals”.

### Set Properties and Parameters

As you build a model, you can set parameters and properties on model elements. For example, you can set parameters and properties for blocks that affect how the block functions. You can also set properties on Stateflow charts, signal lines, visual elements such as annotations, and on the model.

Based on your workflow and goals, set parameters and properties using:

- The **Property Inspector**, which stays open in the editor as you work and updates based on the current selection

- A dialog box that is associated with an element, such as a specific block
- The **Model Data Editor**, which stays open and displays information about signals, states, and algorithmic block parameters (for instances, gains and filter coefficients) in a table

For blocks whose parameter value appears on the block icon, you can select the block, pause on the value, and edit the value directly. For more information, see “Set Block Parameters”.

- “Build and Edit a Model Interactively”

## Parameters

### Toolstrip — Access and discover Simulink capabilities

**Simulation** | **Debug** | **Modeling** | **Format** | **Apps**

To support common user workflow tasks, tabs called **Simulation**, **Debug**, **Modeling**, **Format**, and **Apps** provide functionality corresponding to each task.

The **Apps** tab provides a gallery of applications from the Simulink family of products. Apps may open a new contextual tab, a separate window, or they may be a shortcut to the configuration parameters.

After you open a gallery, you can mark buttons as favorites. Buttons that are favorites appear at the top of the gallery for quicker access. You can drag these buttons to reorder them.

When you select a model component, a contextual tab displays tools to assist you. For example, when you select a Subsystem block, the **Subsystem Block** tab appears. If you select a Stateflow chart, the **State Chart** tab appears. When the block or chart is no longer selected, the contextual tabs disappear.

The preferences folder saves the product-specific tabs that you have open for a model. Open tabs that require a license checkout do not persist after you close the model.

To add custom tabs to the Simulink Toolstrip, see “Create Custom Simulink Toolstrip Tabs”.

The quick access toolbar contains frequently used options such as save, undo, and redo. To customize the quick access toolbar, see “Access Frequently Used Features and Commands in Simulink”.

Commands also appear on context menus. Context menus appear when you right-click a model element or a blank area of the editor. For example, if you right-click a block, the menus display the commands relevant for working on blocks, such as clipboard and alignment operations. Some commands appear only on a context menu.

### Palette — Access additional shortcuts along the left side of the editor

icons

The palette along the left side of the editor provides shortcuts to commands you can use to modify the model appearance and navigate the model. For example, the palette includes a shortcut for adding annotations and other visuals, like boxed-in areas for labeling the model. It also provides a zoom button for zooming on a particular part of the model.

### Hide/Show Explorer Bar — Hide or display a bar that shows where you are in the model hierarchy

off (default) | on

The **Hide/Show Explorer Bar** button in the upper left corner of the editor window displays a bar that shows where you are in the model hierarchy.

### **Hide/Show Model Browser — Hide or display a hierarchical view of the model**

off (default) | on

The **Hide/Show Model Browser** button displays the **Model Browser** pane. You can use this pane to view and navigate a hierarchical view of the model.

### **Show Perspectives Views — Enable code, requirements, and interface perspectives**

off (default) | on

The icon in the lower-right corner opens additional views of the model. One such view is the interface view, which helps you to trace model interfaces. Click the control to see these views.

### **Model Data Access — Retrieve model data**

off (default) | on

A badge in the lower-left corner indicates that a model has external data sources, such as a data dictionary, or that there is data in the model workspace. Click the badge, then use the menu to navigate to these data sources.

- To open the Model Explorer with the **Model Workspace** node selected, click the **Model Workspace** link.
- To open the Model Explorer with the **External Data** node for the model selected, click the **External Data** link.
- To add or change a linked data dictionary, click the gear icon to open the **External Data** tab of the Model Properties dialog box.

## **Programmatic Use**

`simulink` opens the Simulink Start Page. Select a model or template to open the Simulink Editor.

# Simulink Fundamentals

Self-paced, interactive course available as part of Online Training Suite subscription or for individual purchase

## Description

Simulink Fundamentals is a self-paced, interactive course that is included with the Online Training Suite. If you do not have access to the Online Training Suite, you can purchase access to the course.

Simulink Fundamentals builds upon concepts covered in **Simulink Onramp**. To get the most out of Simulink Fundamentals, take Simulink Onramp first. Simulink Onramp is a free, self-paced, interactive course that offers a quick and high-level introduction to Simulink.

Simulink Fundamentals is a comprehensive course that teaches you to:

- Use the Simulink environment.
- Model continuous and discrete dynamic systems.
- Organize growing models in subsystems that create visual and functional hierarchy.
- Componentize models by referencing other models and creating libraries.
- Optimize simulation performance.

Simulink Fundamentals uses tasks to teach concepts incrementally, such as through a real-life example with a 3D printer. You receive automated assessments and feedback after submitting tasks. Your progress is saved when you exit the course, so you can complete the course in multiple sessions.

The screenshot displays the Simulink Fundamentals training interface. On the left, the 'Training - Tasks' panel shows 'Task 1' with instructions: 'As you work through this module, you will build different representations of the nozzle logic system. The blocks at right represent most of an algorithm that compares both the current (simulated) X and Y position of the nozzle with the desired position. In this task, you will add the last piece of the logic: a check that an external control signal is true at the specified time steps.' Below this, it says 'In this training environment, clicking Submit will simulate and submit your model for grading. If you wish to simulate your model before grading, you can use the Run button in the Simulink toolstrip.' A 'TASK' box instructs: 'Complete the algorithm by adding a Logical Operator block from the Simulink library to your model. Leave the default Operator, AND, selected. Connect the block to the unconnected'.

The central workspace shows a Simulink model titled 'SimulinkFundamentals'. It features a 'Nozzle Algorithm' subsystem. Inputs include 'Reference signals' (desired\_x, desired\_y) and 'Simulated sensor data' (meas\_x, meas\_y). The algorithm contains a summing junction for 'des\_pos', a gain block '1/4', a logical operator block 'pos\_or', and a comparison block '<= tol'. The output is 'meas\_pos', which is also connected to a 'Select X Position' block. A 'nozzle\_cmd' signal is also present.

On the right, the 'Training - Assessment' panel lists requirements:
 

- Does the model contain the following block? Logical Operator
- Are the following blocks connected correctly? Logical Operator, Scope
- Are the following blocks connected correctly? From Workspace, Logical Operator
- Are the following blocks connected correctly? Compare To Constant, Logical Operator

## Open the Simulink Fundamentals

- Simulink Start Page: On the **Learn** tab, click the button that appears when you pause on any of the items in the **Simulink Fundamentals** group.

- MATLAB Command Window: Enter `learning.simulink.launchOnramp("slbe")`.

---

**Note** If you do not have access to the Simulink Fundamentals course, explore access options at Self-Paced Online Courses.

---

# Simulink Onramp

Free, self-paced, interactive Simulink course

## Description

Simulink Onramp is a free, self-paced, interactive course that helps you get started with Simulink.

After completing Simulink Onramp, you will be able to create, modify, and troubleshoot Simulink models that simulate dynamic systems and perform basic signal analysis.

Simulink Onramp teaches you to:

- Use Simulink blocks and signals.
- Visualize signal values during simulation.
- Apply math and logic operators for algorithms.
- Access help from documentation.
- Use MATLAB variables and functions in Simulink.
- Model dynamic, discrete-time, and continuous-time systems in Simulink.
- Set simulation duration.

Simulink Onramp uses tasks to teach concepts incrementally, such as through real-life examples with automotive performance modes, a thermostat, and a peregrine falcon dive. You receive automated assessments and feedback after submitting tasks. Your progress is saved when you exit the course, so you can complete the course in multiple sessions.

The screenshot displays the Simulink Onramp interface with three main panels:

- Task 1 (Left Panel):** Titled "1.2 Running Simulations", it contains instructions for connecting a signal line labeled 'velocity' to a Signal Assessment block. It includes a "TASK" section with detailed instructions and buttons for "Submit" and "Next task".
- Simulink Model (Center Panel):** A block diagram representing a falling object with air drag. It includes a gravitational force input of 9.81, a drag force coefficient of 0.05, a mass block (1/mass), an integrator block (1/s), and a velocity output signal. The governing equations are shown as  $\Sigma F = ma$  and  $-mg + \alpha v^2 = ma$ .
- Task 1 Signal (Right Panel):** An assessment window showing a plot of "Value" versus "Time". The plot shows a blue curve representing "My signal" that starts at 0 and decays towards a value of approximately -15 over a time period of 10. A legend indicates "Signal requirement" (orange line) and "My signal" (blue line). Below the plot, a "Requirements" section shows a green checkmark and the text "Does the connected signal meet the requirement?".

## Open the Simulink Onramp

- Simulink Start Page: On the **Learn** tab, click the **Launch** button that appears when you pause on **Simulink Onramp**.
- Simulink block diagram: On the quick access toolbar, click **Help** > **Learn Simulink**.

- MATLAB Command Window: Enter `learning.simulink.launchOnramp("simulink")`.

---

**Note** If you do not have a Simulink license, you can take the course at Self-Paced Online Courses.

---

# Simulink Preferences

Settings for Simulink Editor and model files

## Description

Use Simulink Preferences to specify Simulink editing environment options and default behaviors. Your settings affect the behavior of all Simulink models, including those currently open and all subsequent models. Your preference settings are preserved for the next time you use the software.

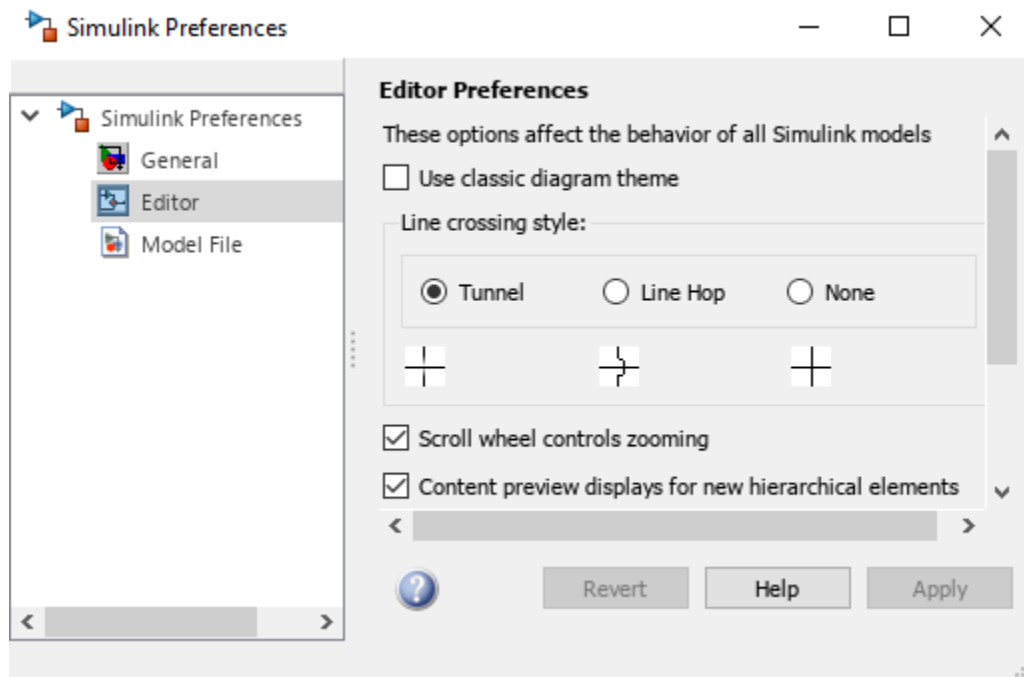

Use the Simulink Preferences window to:

- Set preferences for generated file folders
- Set background colors for print or export
- Set model block, callback, and sample time legend display
- Configure Simulink Editor
- Set preferences for file change, autosave, version notifications, and other behaviors relating to model files

---

**Note** To remove items that appear in the Simulink Toolstrip and context menus, see “Disable Simulink Toolstrip and Context Menu Actions”.

---

## Open the Simulink Preferences

- Simulink Toolstrip: On the **Modeling** tab, in the **Evaluate and Manage** section, select **Environment > Simulink Preferences**.
- MATLAB Command Window: Enter `lprivate('showprefs')`.

## Examples

### Show Callback Tracing for Double Mass-Spring System

Callbacks are commands you can define that execute in response to a specific modeling action, for example, opening a model or stopping a simulation. When you enable **Show Callback Tracing** in Simulink Preferences, the MATLAB Command Window displays callbacks as they are invoked. For more information on callbacks, see “Customize Model Behavior with Callbacks”.

Display the callback that runs when you open the “Double Spring Mass System” on page 13-64 model. The example model represents a double spring-mass-damper system with a periodically varying forcing function.

- 1 Open Simulink Preferences. In the Simulink Toolstrip of any open model window, on the **Modeling** tab, in the **Evaluate and Manage** section, select **Environment > Simulink Preferences**.
- 2 In Simulink Preferences, on the **General** Pane, select **Show Callback Tracing**.
- 3 Click **Apply**.
- 4 If the Double Spring Mass System model is open, close it.
- 5 Open the Double Spring Mass System model.

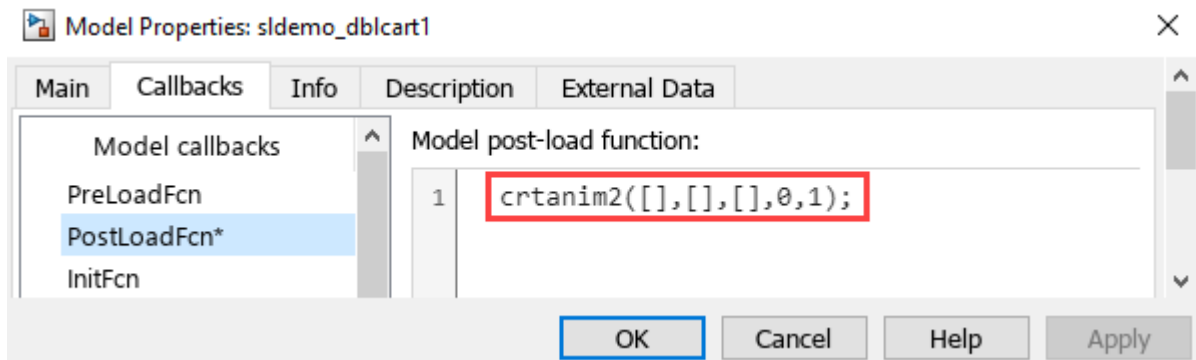

```
openExample('simulink_general/sl_demo_dblcart1Example')
```

```
Evaluating callback 'PostLoadFcn' for sl_demo_dblcart1
Callback: crtanim2([],[],[],0,1);
```

The invoked callback is a **PostLoadFcn** callback that runs the `crtanim2` function.

- 6 You can use the information about the type of callback to find where the commands that it executes are specified. To do so for this example, right-click the canvas and select **Model Properties**.
- 7 On the **Callbacks** tab, select **PostLoadFcn\***. The right pane of the Model Properties dialog box shows the callback that ran when the model opened.

### Turn Off Display of Variable Values in Block Parameters Dialog Box

By default, when you specify a block parameter as a variable, the text box in the Block Parameters dialog box where you specify the parameter displays the value of the variable. You can use the display to obtain the value that a variable has at a certain point during simulation, and to debug your model.

You can use Simulink Preferences to turn the display off, for example when you are demonstrating a model and the value of the variable is confidential, or when the display gives away the answer to a problem that your students or trainees are supposed to solve.

In this example, view and then turn off the display of the heater air temperature in the “Thermal Model of a House” on page 13-21 model. The heater air temperature is specified as the variable THeater in the Heater subsystem.

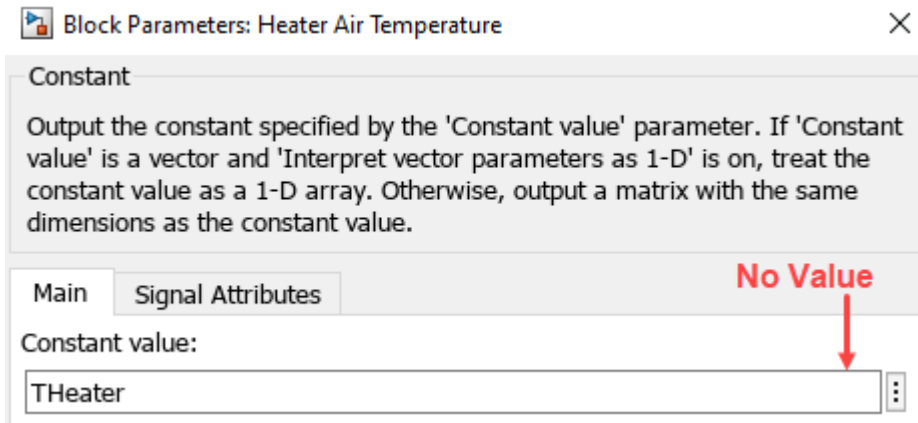

- 1 To open the model, use this command.  

```
openExample('simulink_general/sldemo_househeatExample')
```
- 2 To open the Heater subsystem, double-click the Subsystem block.
- 3 To see the value of the THeater variable, double-click the Heater Air Temperature block. The Block Parameters dialog box opens.
- 4 The **Constant value** text box displays the name of the variable on the left and the value of the variable on the right.

- 5 Close the Block Parameters dialog box.

- 6 Open Simulink Preferences. In the Simulink Toolstrip, on the **Modeling** tab, in the **Evaluate and Manage** section, select **Environment > Simulink Preferences**.
- 7 In Simulink Preferences, on the **Editor** Pane, turn off **Display value of parameter when specified using variables**.
- 8 Click **Apply**.
- 9 In the model, double-click the Heater Air Temperature block. The Block Parameters dialog box opens. The **Constant value** text box no longer displays a value.

## Parameters

### General Pane

#### Simulation cache folder — Path to simulation cache folder

pwd (default)

Simulink cache files contain build artifacts that can speed up simulation and code generation. For more information, see “Share Simulink Cache Files for Faster Simulation” and “Manage Build Process Folders” (Simulink Coder).

The cache files are stored in the simulation cache folder. The simulation cache folder is a root folder.

Specify the path to the simulation cache folder as a character vector.

You can specify an absolute or relative path to the folder. For example:

- 'C:\Work\mymodelsimcache' and '/mywork/mymodelsimcache' specify absolute paths.
- 'mymodelsimcache' is a path relative to the current working folder (pwd). The software converts a relative path to an absolute path when you set the preference. For example, if pwd is '/mywork', the result is '/mywork/mymodelsimcache'.
- '../test/mymodelsimcache' is a path relative to 'pwd'. If 'pwd' is '/mywork', the result is '/test/mymodelsimcache'.

Example: 'C:\Work\mymodelsimcache'

#### Programmatic Use

**Parameter:** CacheFolder

**Type:** character vector

**Default:** 'pwd'

### Code generation folder — Path to code generation folder

pwd (default)

The Simulink Coder build process uses system target files to generate production code from a Simulink model. For more information, see “Manage Build Process Folders” (Simulink Coder).

The production code is stored in the code generation folder. The code generation folder is a root folder.

Specify the path to the code generation folder as a character vector.

You can specify an absolute or relative path to the folder. For example:

- 'C:\Work\mycode\mycode' and '/mywork/mycode' specify absolute paths.
- 'mycode' is a path relative to the current working folder (pwd). The software converts a relative path to an absolute path when you set the preference. For example, if pwd is '/mywork', the result is '/mywork/mycode'.
- '../test/mycode' is a path relative to 'pwd'. If 'pwd' is '/mywork', the result is '/test/mycode'.

Example: 'C:\Work\mycode'

### Programmatic Use

**Parameter:** CodeGenFolder

**Type:** character vector

**Default:** 'pwd'

### Code generation folder structure — Structure of code generation folder

Model specific (default) | Target environment subfolder

The Simulink Coder build process uses system target files to generate production code from a Simulink model. For more information, see “Manage Build Process Folders” (Simulink Coder).

The production code is stored in the code generation folder. The code generation folder is a root folder.

Select the structure of the code generation folder.

- **Model specific**— Store the code in folders named after the model.
- **Target environment subfolder**— Store the code in folders named after the target environment for which the model was configured.

### Programmatic Use

**Parameter:** CodeGenFolderStructure

**Values:** 'ModelSpecific' | 'TargetEnvironmentSubfolder'

**Default:** 'ModelSpecific'

### Print — Canvas (background) color of printed models

White (default) | Match Canvas Color

Specify whether the color of the model canvas is white when printed or matches the color of the digital model. For more information on printing models, see “Print Model Diagrams”.

**Programmatic Use****Parameter:** PrintBackgroundColorMode**Values:** 'White' | 'MatchCanvas'**Default:** 'White'**Export — Canvas (background) color of models exported to different file format**

Match Canvas Color (default) | White | Transparent

Specify whether the color of the model canvas when exported to a different file format matches the color of the digital model, is white, or is transparent. For example, you can export models to the .png format with a transparent background. For more information on exporting a model to a different file format, see “Print Models to Image File Formats”.

- Match Canvas Color— Match the canvas color of the model.
- White— Use a white canvas.
- Transparent— Use a transparent canvas so that whatever is behind the canvas is visible.

**Programmatic Use****Parameter:** ExportBackgroundColorMode**Values:** 'MatchCanvas' | 'White' | 'Transparent'**Default:** 'MatchCanvas'**Clipboard — Canvas (background) color of models exported to different application**

Match Canvas Color (default) | White | Transparent

Specify whether the color of the model canvas when exported to a different application matches the color of the digital model, is white, or is transparent. For more information on exporting a model to a different application, see “Copy Diagrams as Images”.

- Match Canvas Color— Match the canvas color of the model.
- White— Use a white canvas.
- Transparent— Use a transparent canvas, so that whatever is behind the canvas image shows through.

**Programmatic Use****Parameter:** ClipboardBackgroundColorMode**Values:** 'MatchCanvas' | 'White' | 'Transparent'**Default:** 'MatchCanvas'**Show callback tracing — Option to display model callbacks**

Off (default) | On

Specify whether to display the model callbacks that Simulink invokes when simulating a model. Enabling **Show callback tracing** displays the callbacks in the MATLAB Command Window as they are invoked. For an example, see “Show Callback Tracing for Double Mass-Spring System” on page 7-124.

**Programmatic Use****Parameter:** CallbackTracing**Values:** 'off' | 'on'**Default:** 'off'

**Open the sample time legend when the sample time display changes — Option to display sample time legend when sample time display changes**

On (default) | Off

Specify whether to display the sample time legend whenever you change the sample time display. To change the display, in the Simulink Toolstrip, on the **Debug** tab, in the **Diagnostics** section, click **Information Overlays**. In the **Sample Time** section, select **Colors**, **Text**, or both. For more information on the sample time legend, see “View Sample Time Information”.

**Programmatic Use****Parameter:** OpenLegendWhenChangingSampleTimeDisplay**Values:** 'on' | 'off'**Default:** 'on'**Editor Pane****Use classic diagram theme — Option to use pre-R2012b visual theme in editor**

Off (default) | On

Option to view diagrams in the Simulink Editor with the visual theme from before R2012b. To use the visual theme from before R2012b, set **Use classic diagram theme** to On. To use the visual theme introduced in R2012b, set **Use classic diagram theme** to Off.

---

**Note** Content preview does not display when Use classic diagram theme is enabled.

---

**Programmatic Use**

To programmatically specify whether to use the visual theme introduced in R2012b in the editor, set the `EditorModernTheme` parameter. To use the visual theme from before R2012b, set `EditorModernTheme` to 'off'. To use the visual theme introduced in R2012b, set `EditorModernTheme` to 'on'.

**Parameter:** EditorModernTheme**Values:** 'on' | 'off'**Default:** 'on'**Line crossing style — Change default display for signal lines that cross**

Tunnel (default) | Line Hop | None

Change the default display for signal lines that cross.

- **Tunnel**— Causes straight signal lines that cross each other but are not connected to display a slight gap before and after the vertical line where it intersects the horizontal line.
- **Line Hop**— Shows a bend where the vertical line intersects the horizontal line. Simulink adjusts the side the bend appears on to avoid overlapping with a block icon. If having the bend on either side overlaps with a block, Simulink uses a solid line.

**None**— Uses solid lines. This format can improve performance slightly for updating very large models. With the **Use classic diagram theme** preference enabled, Simulink uses a solid line.

**Programmatic Use****Parameter:** EditorPathXStyle**Values:** 'grad\_pin' | 'hop' | 'none'**Default:** 'grad\_pin'

**Scroll wheel controls zooming — Option to use scroll wheel to zoom**

On (default) | Off

Option to use the scroll wheel to zoom without pressing the **Ctrl** key modifier. If you enable **Scroll wheel controls zooming** on macOS platforms with an Apple Magic Trackpad, a panning gesture causes zooming. For more information on zooming, see “Zoom and Pan”.

**Programmatic Use****Parameter:** EditorScrollWheelZooms**Values:** 'on' | 'off'**Default:** 'on'**Content preview displays for new hierarchical elements — Option to display preview of contents on cover of hierarchical elements**

On (default) | Off

Specify whether the cover of hierarchical model elements should display a preview of the contents of the elements. For example, a Subsystem block can display a preview of the model that it contains. The setting only applies to elements that are added to the model after the setting is enabled.

**Programmatic Use****Parameter:** EditorContentPreviewDefaultOn**Values:** 'on' | 'off'**Default:** 'on'**Enable smart editing features — Option to display model callbacks**

On (default) | Off

Specify whether to enable the use of these smart editing cues to perform common model editing tasks quickly:

- Quick insert — Add a block to a model by typing a block name.
- Tear-off block addition — Add a complementary block from a block tear-off cue. For example, when you add a GoTo block, you can use a tear-off to add a corresponding From block.
- Multiselection actions — Perform actions from the prompt that appears when you select multiple blocks.
- Single-selection actions — Perform actions from the prompt that appears when you select a block or a signal.

**Programmatic Use****Parameter:** EditorSmartEditing**Values:** 'on' | 'off'**Default:** 'on'**Edit key parameter when adding new blocks — Option to edit key block parameter when adding block to model**

On (default) | Off

Specify whether to be prompted to enter a key parameter when you add a block to a model.

**Programmatic Use****Parameter:** EditorSmartEditingHotParam**Values:** 'on' | 'off'**Default:** 'on'

### Use docked Diagnostic Viewer – Option to open Diagnostic Viewer docked in model window

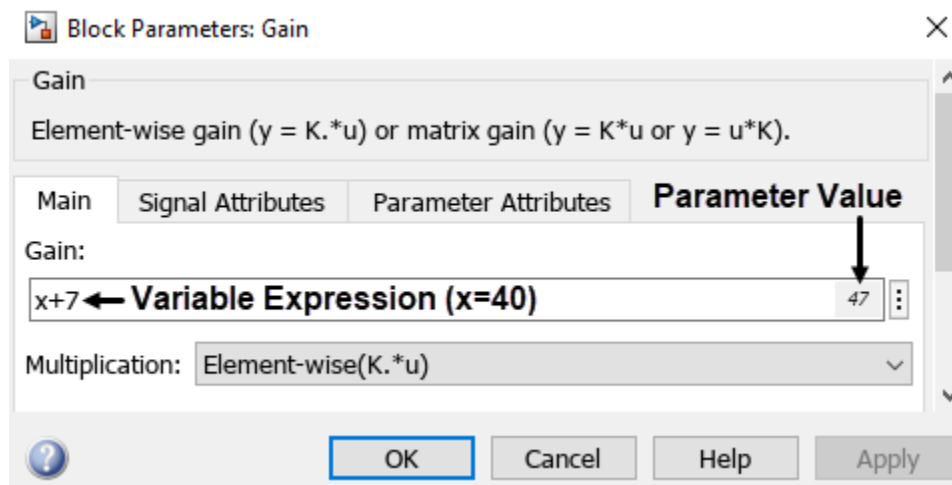

On (default) | Off

Specify whether the Diagnostic Viewer should open docked in the Simulink model window. To open the Diagnostic Viewer, in the Simulink Toolstrip, on the **Debug** tab, in the **Diagnostics** section, click **Diagnostics** and select Diagnostic Viewer.

### Display value of parameter when specified using variables – Option to evaluate parameter specified as variable or variable expression

On (default) | Off

When you specify the value of a Simulink parameter as a variable or as an expression that contains variables, the Block Parameters dialog box and the Property Inspector can display the value of the variable or expression. The text box where you enter the parameter value displays the variable or expression on the left and the value on the right. For more information, see “View Values of Parameters Set as Variables”. For an example, see “Turn Off Display of Variable Values in Block Parameters Dialog Box” on page 7-125.

Specify whether to enable the display of parameter values.

### Model File Pane

#### File format for new models and libraries – Save new models and libraries in the SLX or MDL format

SLX (default) | MDL

Specify the default file format for new models and libraries.

- SLX— Save new models and libraries in SLX format
- MDL— Save new models and libraries in MDL format

#### Programmatic Use

**Parameter:** ModelFileFormat

**Values:** 'mdl' | 'slx'

**Default:** slx

**Save a thumbnail image inside SLX files — Save model screenshot to display in Current Folder browser preview pane**

On (default) | Off

Specify whether to save a small screenshot of the model with the SLX file to display in the Current Folder browser preview pane.

---

**Tip** If your model is large and you want to reduce the time the model takes to save, clear this parameter to avoid saving thumbnail model images.

---

**Programmatic Use****Parameter:** SaveSLXThumbnail**Default:** on**Values:** 'on' | 'off'**Updating or simulating the model — Option to receive notification if model has changed on disk when updating or simulating the model**

On (default) | Off

Specify whether to notify if a different MATLAB session changes the model on disk while you are updating or simulating the model. When **Updating or simulating the model** is enabled, use **Action** in **Model File Preferences** to specify the action to take if the model has changed. For more information, see “Model File Change Notification”.

---

**Tip** To programmatically check whether the model has changed on disk since it was loaded, use the function `slIsFileChangedOnDisk`.

---

**Programmatic Use****Parameter:** MDLFileChangedOnDiskChecks**Type:** struct, field name: CheckWhenUpdating**Values:** true | false | 1 | 0**Default:** true**Action — Action to take if file has changed on disk**

Warning (default) | Error | Reload model (if unmodified) | Show prompt dialog

Select the action to take if the file has changed on disk since it was loaded. This parameter is enabled by the **Updating or simulating the model** parameter.

- **Warning**— Displays a warning in the MATLAB Command Window.
- **Error**— Displays an error. If simulating programmatically, the error appears in the MATLAB Command Window. If simulating interactively, the error appears in a Simulation Diagnostics window.
- **Reload model (if unmodified)**— Reloads if the model is unmodified. If the model is modified, the prompt dialog box appears.
- **Show prompt dialog**— Shows prompt dialog box in which you can choose to close and reload or ignore the changes.

For more information, see “Model File Change Notification”.

---

**Tip** To programmatically check whether the model has changed on disk since it was loaded, use the function `slIsFileChangedOnDisk`.

---

**Programmatic Use**

**Parameter:** `MdlFileChangedOnDiskHandling`

**Values:** 'Warning' | 'Error' | 'Reload model (if unmodified)' | 'Show prompt dialog'

**Default:** 'Warning'

**First editing the model – Option to receive notification if model has changed on disk when editing the model**

On (default) | Off

Specify whether to notify if a different MATLAB session changes the model on disk while, for example, you are editing the model. For more information, see “Model File Change Notification”.

Any interactive operation that modifies the block diagram, for example, adding a block, causes a warning dialog box to appear.

Any programmatic operation that causes the block diagram to be modified, for example, a call to `set_param`, causes a warning in the MATLAB Command Window.

---

**Tip** To programmatically check whether the model has changed on disk since it was loaded, use the function `slIsFileChangedOnDisk`.

---

**Programmatic Use**

**Parameter:** `MDLFileChangedOnDiskChecks`

**Type:** struct, field name: `CheckWhenEditing`

**Values:** true | false | 1 | 0

**Default:** true

**Saving the model – Option to receive notification if model has changed on disk when saving the model**

On (default) | Off

Specify whether to notify if a different MATLAB session changes the model on disk while you are saving the model.

When the notification is enabled, saving the model in the Simulink Editor causes a dialog box to appear. In the dialog box, you can choose to overwrite or save with a new name.

The `save_system` function displays an error, unless you use the `OverwriteIfChangedOnDisk` option.

For more information, see “Model File Change Notification”.

---

**Tip** To programmatically check whether the model has changed on disk since it was loaded, use the function `slIsFileChangedOnDisk`.

---

**Programmatic Use**

**Parameter:** `MDLFileChangedOnDiskChecks`

**Type:** struct, field name: CheckWhenSaving

**Values:** true | false | 1 | 0

**Default:** true

### Save before updating or simulating the model – Option to autosave before updating or simulating model

On (default) | Off

Specify whether to automatically save a backup copy of the model before updating or simulating.

The copy is saved in the same directory as the model, with the name *MyModel*.slx.autosave or *MyModel*.mdl.autosave.

#### Note

- If you open or load a model that has a more recent autosave copy available, then after the model loads, a dialog box prompts to restore, ignore, or discard the autosave copy. If multiple models are involved, then the Model Recovery dialog box appears.
- For each model listed, you can select a check box to specify any of these options. Alternatively, click the **Restore All**, **Delete All** or **Ignore All** button to select that option for all listed models.

Option	Result
<b>Restore</b>	Overwrite the original model file with the autosave copy and delete the autosave copy. Simulink will close the model and reload from the restored file. If you select the check box to <b>Keep a copy of original model file</b> , you can save copies of the original model files named <i>MyModel</i> .slx.original or <i>MyModel</i> .mdl.original.
<b>Delete Autosave</b>	Delete the autosave copy.
<b>Ignore</b>	Leave the model and the autosave copy untouched. This setting is the default. The next time you open the model, the Model Recovery dialog will reappear and you can choose to restore or delete autosave files.

- Closing a modified model deletes any autosave copy.
- Autosave does not occur for models that are part of the MATLAB installation, so you will not create autosave copies of those models.
- Autosave does not occur if the autosave file or location is read-only.
- Autosave does not occur in the Parallel Computing Toolbox.
- If a segmentation violation occurred, then the last autosave file for the model reflects the state of the autosave data prior to the segmentation violation. Because Simulink models might be corrupted by a segmentation violation, Simulink does not autosave a model after a segmentation violation occurs.

#### Programmatic Use

**Parameter:** AutoSaveOptions

**Type:** struct, field name: SaveOnModelUpdate

**Values:** true | false | 1 | 0

**Default:** true

**Save backup when overwriting a file created in an older version of Simulink — Option to save copy of file created in older version of Simulink before overwriting**

On (default) | Off

Specify whether to automatically save a backup copy of the model when overwriting with a newer version of Simulink.

The backup copy is saved in the same directory as the model, with the name *MyModel.slx.Version* or *MyModel.mdl.Version*, where *Version* is the last version that saved the model, e.g., R2010a.

---

**Tip** To recover the original model, rename the backup copy to *MyModel.mdl* or *MyModel.slx* by deleting the *Version* suffix.

---

**Programmatic Use**

**Parameter:** AutoSaveOptions

**Type:** struct, field name: SaveBackupOnVersionUpgrade

**Values:** true | false | 1 | 0

**Default:** true

**Notify when loading an old model — Option to notify when model being loaded was last saved in older MATLAB version**

Off (default) | On

Specify whether to be notified when loading a model last saved in a older version of Simulink software. The notification appears in the MATLAB Command Window.

---

**Tip**

- Run the Upgrade Advisor to convert the block diagram to the format of the current version of Simulink software.
  - For advice on upgrading a model to the current version of Simulink, see “Model Upgrades”.
- 

**Programmatic Use**

**Parameter:** NotifyIfLoadOldModel

**Values:** 'on' | 'off'

**Default:** off

**Do not load models created with a newer version of Simulink — Option to prevent models created in newer version of Simulink from loading**

On (default) | Off

Specify whether to load a model last saved in a newer version of Simulink software.

- When this option is selected and you try to load a model last saved in a newer version of Simulink, the model does not load, and an error message appears in the MATLAB Command Window.
- When this option is cleared and you try to load a model last saved in a newer version of Simulink, the model loads, and a warning message appears in the MATLAB Command Window.

**Tip** If possible, use the **Save As** command to convert the block diagram to the format of the desired version of the Simulink software. The **Save As** command allows you to save a model created with the latest version of the Simulink software in formats used by earlier versions. See “Export Model to Previous Simulink Version”.

---

**Programmatic Use****Parameter:** `ErrorIfLoadNewModel`**Values:** 'on' | 'off'**Default:** on**Do not load models that are shadowed on the MATLAB path — Option to prevent models with same name as other models higher on MATLAB path from loading**

Off (default) | On

Specify whether to load a model that is shadowed by another file of the same name higher on the MATLAB path.

- When the option is enabled and you try to load a shadowed model, the model does not load, and an error message appears in the MATLAB Command Window.

The option applies when you try to open or load a model or library by either:

- Selecting a file in the current folder browser
- Calling `open_system` or `load_system` with a path to a file in a different folder to the current folder
- When the option is not enabled and you try to load a shadowed model, the model loads, and a warning message appears in the MATLAB Command Window.

**Programmatic Use****Parameter:** `ErrorIfLoadShadowedModel`**Values:** 'on' | 'off'**Default:** off**Verify digital signature of protected model before opening — Option to verify signature before opening protected model**

Off (default) | On

Specify whether to verify the signature on a protected model before opening the model.

When enabled, you cannot load a protected model that does not have a verified digital signature.

An error message appears if the signature verification process finds any of the these conditions:

- The protected model was changed after it was signed.
- The protected model was not signed.
- The protected model was signed with an expired certificate.
- The protected model was self-signed with a certificate issued by the author.
- The protected model was signed with a missing or invalid certificate.
- The certificate in your system certificate authority store is missing or invalid.
- The model was signed with an invalid key.

Verification does not check if the certificate expired or was revoked after the protected model was signed.

Verification runs when you try to open or load a protected model by:

- Simulating or generating code for a model that references the protected model
- Performing an action that updates the diagram for a model that references the protected model
- Opening the web view of the protected model
- Opening the protected model report

You can suppress the diagnostic for an unverified protected model when the error message appears in the **Diagnostic Viewer**. The error cannot be suppressed if the signature is not valid because model was changed after it was signed.

#### Programmatic Use

**Parameter:** ProtectedModelValidateCertificate

**Values:** 'on' | 'off'

**Default:** off

#### Notify when opening a model in an unopened project — Option to open project when opening associated model

On (default) | Off

Specify whether opening a model prompts you to open the project that contains a model.

For more information on projects, see “Create a Project from a Model”.

## Programmatic Use

To get the value that a preference is set to programmatically, use `get_param(Object, ParameterName, ...ParameterNameN)`. For example:

```
get_param(0, 'EditorModernTheme')
```

To set preferences programmatically, set the root parameter using `set_param(Object, ParameterName, Value, ...ParameterNameN, ValueN)`. For example:

```
set_param(0, 'EditorModernTheme', 'off')
```

---

**Note** Parameters set programmatically do not persist between Simulink sessions.

---

## Version History

Introduced before R2006a

### Simulink Block Parameters dialog box and Property Inspector display values of variables

Starting in R2022b, when you specify the value of a Simulink parameter as a variable or as an expression that contains variables, the Block Parameters dialog box and the Property Inspector display the value of the variable or the expression.

The text box where you enter the parameter value displays the variable or expression on the left and the value on the right.

To turn the value display off, in the Simulink Toolstrip, on the **Modeling** tab, in the **Evaluate and Manage** section, open the **Environment** menu and select Simulink Preferences. On the **Editor** tab, clear Display value of parameter when specified using variables.

# Simulink Profiler

Identify sources of simulation slowdowns

## Description

Use the **Simulink Profiler** to examine model and block execution and identify issues that can contribute to poor simulation performance.

The screenshot displays the Simulink Profiler interface. The main window shows a Simulink model titled "Anti-Windup PID Control Example". The model consists of a reference input  $r(t)$  entering a summing junction, followed by a PID controller block, a saturation block labeled "Plant Actuator" with input  $u(t)$  and output  $SAT(u)$ , a first-order process block with transfer function  $\frac{1}{10s + 1}$ , a dead time block, and a scope block labeled "yout".

The Profiler Report pane at the bottom shows the following data:

Path	Time Plot (Dark Band = Self Time)	Total Time (s)	Self Time (s)	Number of Calls
sldemo_antiwindup	[Bar chart]	4.247	1.198	18013
Scope	[Bar chart]	2.398	2.398	6004
Scope1	[Bar chart]	0.642	0.642	6004
PID Controller	[Bar chart]	0.004	0.000	0
> Filter	[Bar chart]	0.001	0.000	0
> Integrator	[Bar chart]	0.001	0.000	0
> D Gain	[Bar chart]	0.000	0.000	0
> I Gain	[Bar chart]	0.000	0.000	0
> N Gain	[Bar chart]	0.000	0.000	0

A tooltip for the Integrator block shows: Self Time (dark band): 0.000, Total Time: 0.001.

The Property Inspector pane on the right shows the Simulink Profiler details for the model, including a total time breakdown and a self time breakdown table.

Exec Node	Time (s)	Calls
simulationPhase	0.767	1
initializationPhase	0.338	1
terminationPhase	0.034	1
sldemo_antiwindup...	0.019	1
sldemo_antiwindup...	0.014	1
solverPhase	0.007	2000
sldemo_antiwindup...	0.006	2001
simulate(sldemo_a...	0.004	1
sldemo_antiwindup...	0.003	4000
ode3.Integrate	0.002	2000
sldemo_antiwindup...	0.002	1
sldemo_antiwindup...	0.001	5999
sldemo_antiwindup...	0.001	2001
sldemo_antiwindup...	0.001	1
sldemo_antiwindup...	0.000	1
reset	0.000	1
sldemo_antiwindup...	0.000	1
sldemo_antiwindup...	0.000	1

## Open the Simulink Profiler

- 1 Open a model.
- 2 On the **Debug** tab, select **Performance Advisor > Simulink Profiler**.
- 3 On the **Profile** tab, click **Profile**.

When simulation is complete, the **Profiler Report** pane opens and displays the simulation profile for the model. You can share the results of the Profiling Run by exporting the report to HTML, as well as by saving the profiling data to a MAT file.

The screenshot displays the Simulink Profiler interface for a model named 'sldemo\_antiwindup'. The main workspace shows a block diagram titled 'Anti-Windup PID Control Example' with components including a reference input  $r(t)$ , a summing junction, a PID controller, a saturation block 'SAT(u)', a 'Plant Actuator', a 'First Order Process' with transfer function  $\frac{1}{10s + 1}$ , a 'Dead Time' block, and an output 'yout'.

The Profiler Report (sldemo\_antiwindup @ 21-Dec-2020 12:39:31) is shown below the model. It includes a table with the following data:

Path	Time Plot (Dark Band = Self Time)	Total Time (s)	Self Time (s)	Number of Calls
sldemo_antiwindup	[Bar]	4.247	1.198	18013
Scope	[Bar]	2.398	2.398	6004
Scope1	[Bar]	0.642	0.642	6004
PID Controller	[Bar]	0.004	0.000	0
Filter	[Bar]	0.001	0.000	0
Integrator	[Bar]	0.001	0.000	0
D Gain	[Bar]	0.000	0.000	0
I Gain	[Bar]	0.000	0.000	0
N Gain	[Bar]	0.000	0.000	0

A tooltip for the PID Controller path shows: Self Time (dark band): 0.000, Total Time: 0.001.

The Property Inspector on the right shows the Simulink Profiler details for 'sldemo\_antiwindup':

- Total Time Breakdown for sldemo\_antiwindup: 4.247 s (Total Time) = 1.198 s (Self Time) + 3.049 s (Total Time of children)
- Note: Model hierarchy view does not include compile time
- Self Time Breakdown for sldemo\_antiwindup:

Exec Node	Time (s)	Calls
simulationPhase	0.767	1
initializationPhase	0.338	1
terminationPhase	0.034	1
sldemo_antiwindup...	0.019	1
sldemo_antiwindup...	0.014	1
solverPhase	0.007	2000
sldemo_antiwindup...	0.006	2001
simulate(sldemo_a...	0.004	1
sldemo_antiwindup...	0.003	4000
ode3.Integrate	0.002	2000
sldemo_antiwindup...	0.002	1
sldemo_antiwindup...	0.001	5999
sldemo_antiwindup...	0.001	2001
sldemo_antiwindup...	0.001	1
sldemo_antiwindup...	0.000	1
reset	0.000	1
sldemo_antiwindup...	0.000	1
sldemo_antiwindup...	0.000	1

## Examples

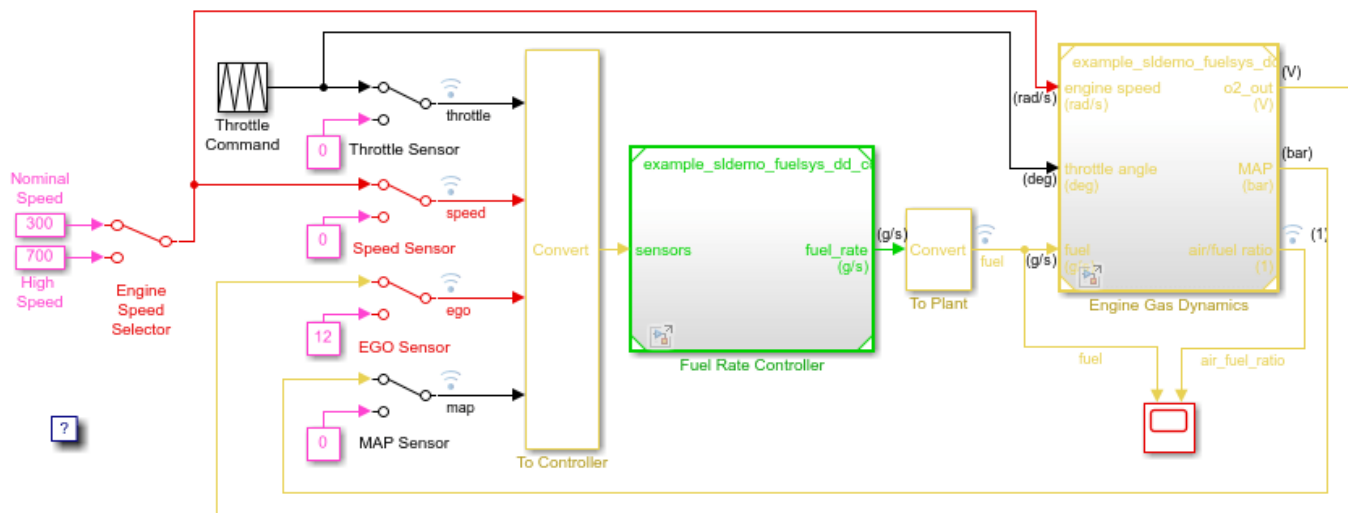

### Identify Performance Slowdowns Using the Simulink Profiler

This example shows how to use the Simulink Profiler to track down the source of a simulation slowdown in your model.

This example uses a modified version of the sldemo\_fuelssystem\_dd model, (the Modeling a Fault-Tolerant Fuel Control System example) model with a slowdown artificially inserted.

## Fault-Tolerant Fuel Control System

The sensor switches simulate any combination of sensor failures.  
The Engine Speed Selector switch simulates different engine speeds (rad/s).

Copyright 1990-2017 The MathWorks, Inc.

Open the profiler for your model from the **Debug** tab by selecting **Performance Advisor > Simulink Profiler**.

The screenshot displays the MATLAB/Simulink Profiler interface. The main workspace shows a Simulink model titled "Fault-Tolerant Fuel Control System". The model includes blocks for "Throttle Command", "Throttle Sensor", "Speed Sensor", "EGO Sensor", "MAP Sensor", "Fuel Rate Controller", and "Engine Gas Dynamics". The Profiler Report pane is open at the bottom, showing a table with the following columns: Path, Time Plot (Dark Band = Self Time), Total Time (s), Self Time (s), and Number of Calls. The status bar at the bottom indicates "Ready", "81%", and "FixedStepAuto".

Copyright 1990-2017 The MathWorks, Inc.

Path	Time Plot (Dark Band = Self Time)	Total Time (s)	Self Time (s)	Number of Calls
Click profile to generate data				

Click **Profile** to profile the model. When simulation completes, the Profiler Report pane opens.

Observe that the Engine Gas Dynamics block takes a large portion of the total profiling time (177.759s out of 231.443s) of the top model. This is a useful place to start looking for the problematic block in the model.

**Fault-Tolerant Fuel Control System**

The diagram shows a control system with inputs: Throttle Command (deg), Speed Sensor (rad/s), EGO Sensor (V), and MAP Sensor (bar). These feed into a 'Fuel Rate Controller' block. The controller outputs 'fuel\_rate (g/s)', which is converted to 'fuel (g/s)' and sent to the 'Engine' block. The engine outputs 'throttle and speed (deg)' and 'engine speed (rad/s)'. There are also 'To Controller' and 'To Plant' conversion blocks.

**Profiler Report (profiling\_example\_fuelcontrol\_model @ 21-Dec-2020 13:13:27)**

Path	Time Plot (Dark Band = Self Time)	Total Time (s)	Self Time (s)	Number of Calls
profiling_example_fuelcontrol_model	[Bar]	198.379	16.524	9000015
Engine Gas Dynamics	[Bar]	160.690	7.286	8000014
Throttle Command	[Bar]	12.096	0.000	0
To Controller	[Bar]	2.553	0.000	0
Scope	[Bar]	2.194	2.194	1000004
EGO Sensor	[Bar]	1.058	1.058	2000009
MAP Sensor	[Bar]	0.930	0.930	4000009

**Property Inspector: Simulink Profiler**

Detail: Engine Gas Dynamics

**Total Time Breakdown for Engine Gas Dynamics:**  
 160.690 s (Total Time) = 7.286 s (Self Time) + 153.404 s (Total Time of children)

Note: Model hierarchy view does not include compile time

**Self Time Breakdown for Engine Gas Dynamics:**

Exec Node	Time (s)	Calls
ModelReferen...	2.825	2000000
ModelReferen...	1.801	1000001
ModelReferen...	1.368	1000001
ModelReferen...	1.065	2999999
ToAsyncQueu...	0.223	1000001
ModelReferen...	0.002	1
ModelReferen...	0.001	1
ModelReferen...	0.001	1
ModelReferen...	0.001	1
ToAsyncQueu...	0.000	1
ModelReferen...	0.000	1
ModelReferen...	0.000	1
ModelReferen...	0.000	1
ToAsyncQueu...	0.000	1
ModelReferen...	0.000	1
ToAsyncQueu...	0.000	1
ToAsyncQueu...	0.000	1

Recursively expand the block hierarchy view. By default, the profiler sorts the blocks at the same level of the model in descending order of **Total Time(s)**.

The screenshot displays the Simulink Profiler interface for a model named 'profiling\_example\_fuelcontrol\_model'. The main workspace shows a block diagram of a 'Fault-Tolerant Fuel Control System'. The diagram includes a 'Throttle Command' block, an 'Engine Speed Selector' block, a 'Throttle Sensor' block, a 'Speed Sensor' block, an 'EGO Sensor' block, a 'MAP Sensor' block, a 'Fuel Rate Controller' block, and an 'Engine Gas Dynamics' block. The sensors are connected to the controller, which outputs fuel and air/fuel ratio to the engine dynamics block. A text box in the diagram states: 'The sensor switches simulate any combination of sensor failures. The Engine Speed Selector switch simulates different engine speeds (rad/s). Copyright 1990-2017 The MathWorks, Inc.'

The Profiler Report window at the bottom shows the following data:

Path	Time Plot (Dark Band = Self Time)	Total Time (s)	Self Time (s)	Number of Calls
profiling_example_fuelcontrol_model	[Bar chart]	198.379	16.524	9000015
Engine Gas Dynamics	[Bar chart]	160.690	7.286	8000014
Mixing & Combustion	[Bar chart]	127.246	0.000	0
EGO Sensor	[Bar chart]	124.698	0.371	1000006
For Iterator Subsystem	[Bar chart]	122.215	55.689	1000004
In1	[Bar chart]	66.526	66.526	500000501
For Iterator	[Bar chart]	0.000	0.000	1

The Property Inspector window on the right shows the 'Simulink Profiler' details for 'Engine Gas Dynamics':

**Total Time Breakdown for Engine Gas Dynamics:**  
 160.690 s (Total Time) = 7.286 s (Self Time) + 153.404 s (Total Time of children)

**Self Time Breakdown for Engine Gas Dynamics:**

Exec Node	Time (s)	Calls
ModelReferen...	2.825	2000000
ModelReferen...	1.801	1000001
ModelReferen...	1.368	1000001
ModelReferen...	1.065	2999999
ToAsyncQueu...	0.223	1000001
ModelReferen...	0.002	1
ModelReferen...	0.001	1
ModelReferen...	0.001	1
ModelReferen...	0.001	1
ToAsyncQueu...	0.000	1
ModelReferen...	0.000	1
ModelReferen...	0.000	1
ModelReferen...	0.000	1
ToAsyncQueu...	0.000	1
ModelReferen...	0.000	1
ToAsyncQueu...	0.000	1
ModelReferen...	0.000	1
ToAsyncQueu...	0.000	1

Observe that the For Iterator subsystem accounts for approximately 98% of the execution time of the EGO Sensor subsystem. It is highly probable that this is the source of the slow performance of the model.

The screenshot shows the Simulink Profiler interface. The main workspace displays a block diagram with a 'For Iterator' block and a 'double (V)' block. The Profiler Report (profiling\_example\_fuelcontrol\_model @ 21-Dec-2020 13:13:27) is visible at the bottom, showing a table of performance metrics. The Property Inspector on the right shows details for the 'In1' block, including a total time breakdown and a self-time breakdown table.

Path	Time Plot (Dark Band = Self Time)	Total Time (s)	Self Time (s)	Number of Calls
EGO Sensor	[Bar]	124.698	0.371	1000006
For Iterator Subsystem	[Bar]	122.215	55.689	1000004
In1	[Bar]	66.526	66.526	50000501
For Iterator	[Bar]	0.000	0.000	1
EGO Sensor	[Bar]	2.111	2.111	2000013
System Lag	[Bar]	1.747	0.000	0
Product	[Bar]	0.544	0.544	3000005

Exec Node	Time (s)	Calls
Inport.Output...	66.526	500000...
Inport.Cleanu...	0.000	1

Delete the block, reconnect the broken signal, and profile the model again. You should see significantly faster simulation times.

To compare the results between the two runs, click **Add Report Panel** and select the previous run from the **Run** list.

You can share the results of a selected run as an HTML report or as a MAT file. To share the profiler report, from the **Share** menu, select **Generate Report** for an HTML report or **Export** to save the results in a MAT file. The profiling results are exported to the current working folder in MATLAB™.

To view the generated report, you can open it in a supported web browser or use the built-in browser by passing the file path to the web command. If you have MATLAB Report Generator™ installed, you can also use rptview to view the report.

The screenshot shows the Simulink Profiler interface. On the left, a table lists the execution stack with a 'Time Plot' visualization. The main window displays a report titled 'Simulink Profiler Report for profiling\_example\_fuelcontrol\_model'. The report includes a summary and an execution stack table.

Path	Total Time (s)	Self Time (s)	Number of Calls

# Solver Profiler

Identify solver performance bottlenecks

## Description

Use the **Solver Profiler** to examine solver and model behavior to identify issues that can contribute to poor simulation performance.

Use the **Solver Profiler** to analyze a model for patterns that affect its simulation. The **Solver Profiler** presents graphical and statistical information about the simulation, solver settings, events, and errors. You can use this data to identify locations in the model that caused simulation bottlenecks.

In addition, there are multiple factors that can limit the simulation speed. The Solver Profiler logs and reports all the major events that occur when simulating a model:

- Zero-crossing events
- Solver exception events
- Solver reset events
- Jacobian computation events

These events are common and necessary for an accurate simulation. However, they do incur computational cost and frequent occurrences can slow down or even stall the simulation.

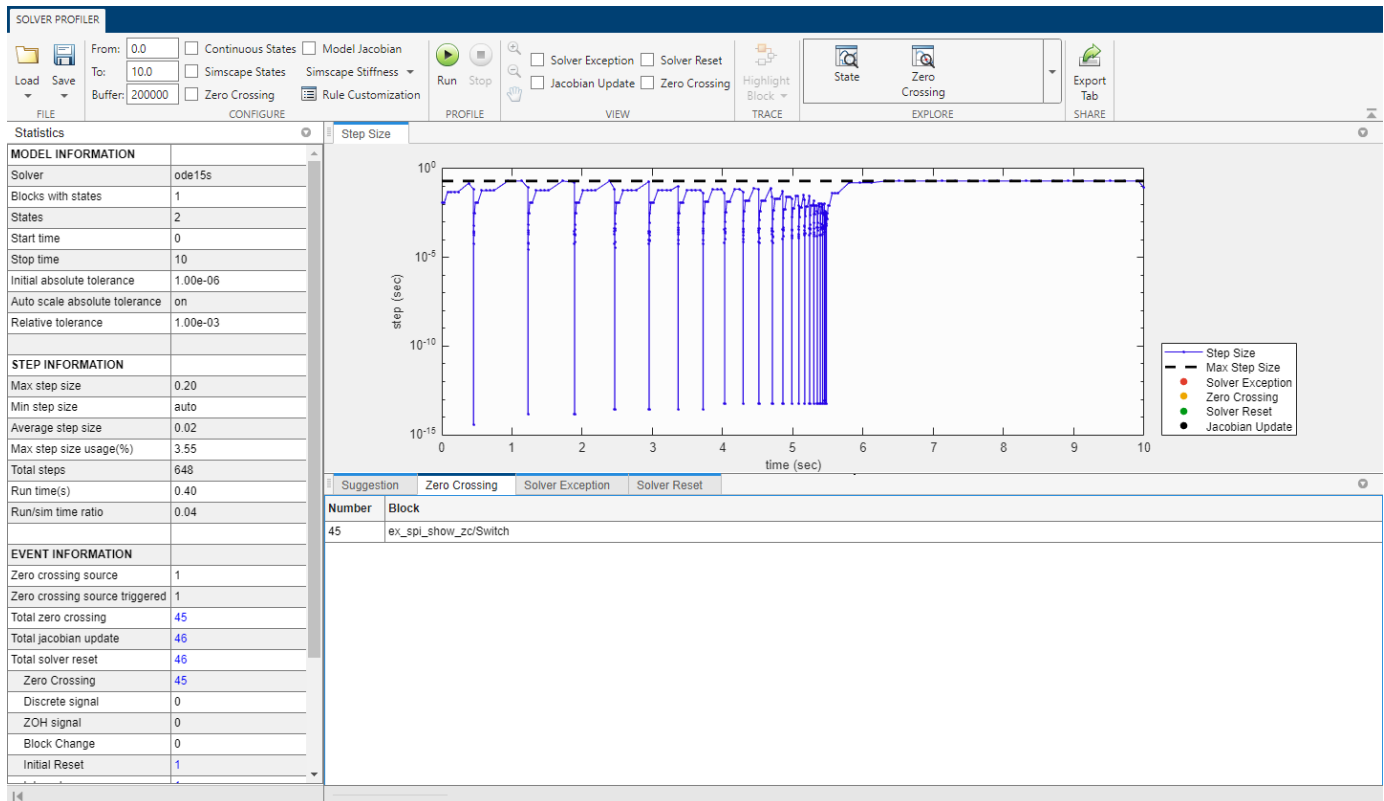

### Available actions

- **Trace**
- **Configure**
- **Explore**

### Information Panes

- **Statistics**
- **Step Size**
- **Suggestions**

## Open the Solver Profiler

Open the Solver Profiler by clicking the hyperlink in the lower-right corner of the Simulink Editor.

## Examples

### Locate source blocks for solver events

This example shows how to find the source of particular solver events or zero-crossings using a model that simulates a ball bouncing off the ground. As the ball comes to rest, the density of zero-crossings increase, leading to a solver slowdown.

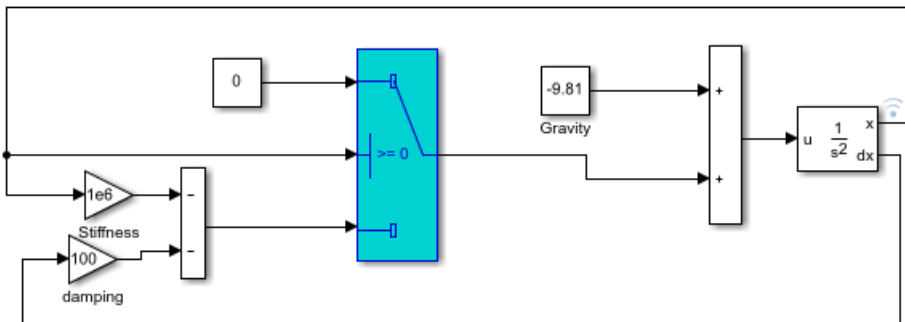

To begin, open the `ex_spi_show_zc` model, click **Debug**, open the drop down menu of **Performance Advisor**, select Solver Profiler.

Click **Run** to profile the model.

Notice that the model has 45 Zero Crossing events. To obtain more details, click **Total zero crossing** from Statistic pane or **Zero Crossing** tab from the suggestion pane to bring the zero-crossing table to the front. From the **Zero Crossing** tab, you will notice that the `ex_spi_show_zc/Switch` block caused all 45 zero crossing events. Click `ex_spi_show_zc/Switch` from the table, all zero crossing events are shown on the Step Size plot as yellow dots.

If you click on the **Highlight Block** from the **Trace** tab, you will notice that the `ex_spi_show_zc/Switch` block causes the zero crossing events to be highlighted in the model. All zero crossing events caused by the Switch block are highlighted in the **Step Size** plot.

- “Examine Model Dynamics Using Solver Profiler”
- “Solver Resets”
- “Zero-Crossing Events”
- “Solver Exception Events”
- “Jacobian Logging and Analysis”

## Parameters

### Configure

#### From — Profiler start time

model start time (default) | scalar

Time, in seconds, of the simulation that the profiler starts analyzing the model. This is not the same as the start time of the simulation.

#### To — Profiler stop time

model stop time (default) | scalar

Time, in seconds, of the simulation to which the profiler should profile the model. By default, the analysis continues until the end of the simulation. Changing this parameter does not change the stop time of the model which you specify in the Model Configuration Parameters.

A value less than the configured stop time of the model stops the profiling and simulation at `StopTime`.

#### Buffer — Memory impact of logging

50000 (default) | positive scalar

Maximum number of events that are logged. If the number of logged events reaches this value and memory is available, increase `BufferSize`. If memory is limited, consider lowering the value.

#### Continuous States — Save model states to file

off (default) | on

By default, the profiler does not save the states of the model. Enabling this parameter configures the profiler to save the states to the profiler data MAT file.

If you select this parameter, it will enable the States explorer.

#### Simscape States — Save Simscape states to file

off (default) | on

Enable this parameter to save Simscape states to the profiler data MAT file.

If you select this parameter, it will enable the Simscape explorer.

#### Zero Crossing — Save zero crossing data to file

off (default) | on

Enable this parameter to save zero crossing information to the profiler data MAT file

If you select this parameter, it will enable the Zero-Crossing explorer.

#### Model Jacobian — Save model Jacobian

off (default) | on

Option to log the solver Jacobian matrices to memory. This option is useful for simulations that use implicit solvers. For a comparison of solvers, see “Compare Solvers”.

For a more detailed explanation of the solver Jacobian, see “Choose a Jacobian Method for an Implicit Solver”.

## Simscape Stiffness — Log stiffness analysis of Simscape states

array

Log stiffness analysis Simscape states, specified as an array. This parameter provides an array of time points that you want to log the Simscape Stiffness states to the profiler data MAT file. Enable this parameter to show Simscape Stiffness tab in the Suggestion Pane.

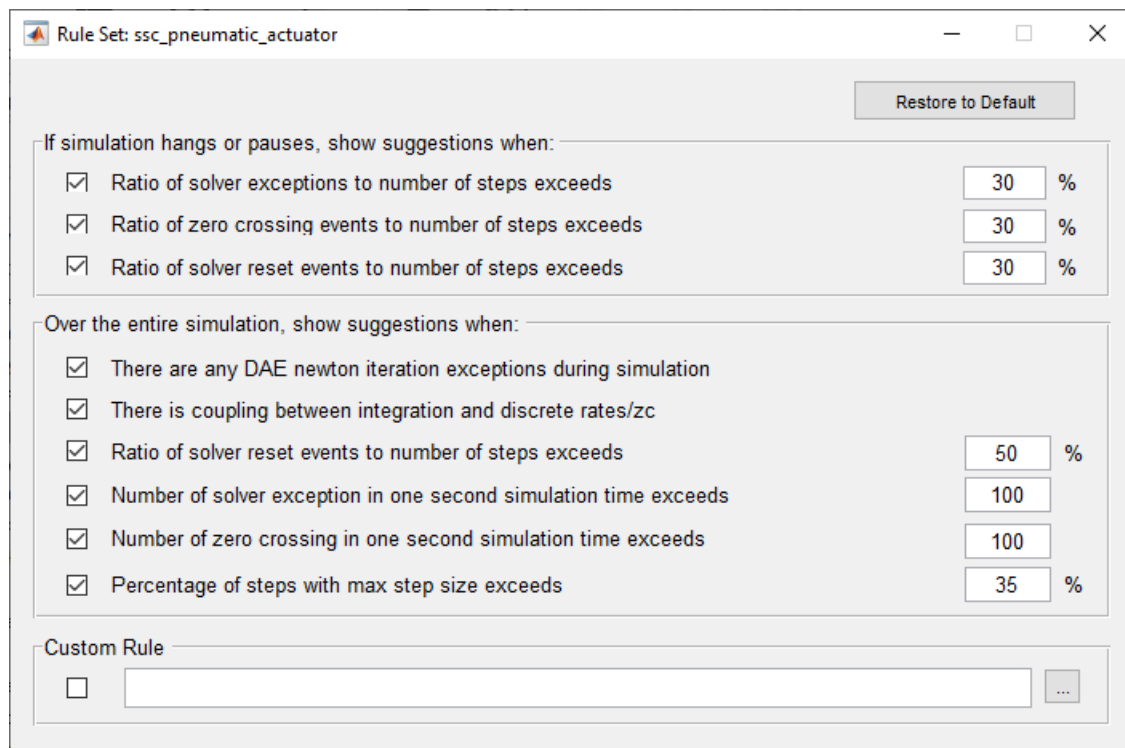

Enable this parameter to log the stiffness analysis of Simscape states to the profiler data MAT file. For more information on Simscape representation of stiffness and other physical system concepts, see “How Simscape Models Represent Physical Systems” (Simscape)

## Rule Customization — Change thresholds for profiler rules

off (default) | on

Click **Rule Customization** in the Solver Profiler to access the rule set. You can change the thresholds for most of these rules and also select which rules you want to apply selectively during a simulation run.

To modify a rule, enable its customization and then enter a desired threshold value.

### Custom Rule Set

You can override the settings on the **Rule Set** dialog box by specifying a custom rule set.

Create a rule set as a MATLAB script and specify the path to the script in the **Custom Rule Set** section of the **Rule Set** dialog box.

A simple rule set example looks as follows:

```
function diagnosticsString = customRule(profilerData)
 if isempty(profilerData.zcEvents)
 diagnosticsString{1} = 'No zero crossing event detected.';
 else
 diagnosticsString{1} = 'Zero-crossing events detected.';
 end
end
```

The input to the function is an array of structures called `profilerData`. This array of structures organizes all the information that the Solver Profiler collects during a profiling run. It contains the following substructures.

Substructure	Fields
<code>stateInfo</code> : Stores information on block states	<ul style="list-style-type: none"> <li>• <code>name</code>: Block name</li> <li>• <code>value</code>: State values</li> <li>• <code>blockIdx</code>: Block ID</li> </ul>
<code>blockInfo</code> : Cross-reference of blocks and state IDs	<ul style="list-style-type: none"> <li>• <code>name</code>: Block name</li> <li>• <code>stateIdx</code>: State ID</li> </ul>
<code>zcSrcInfo</code> : Stores information on blocks causing zero crossing events	<ul style="list-style-type: none"> <li>• <code>name</code>: Block name</li> <li>• <code>blockIdx</code>: Block ID</li> </ul>
<code>zcEvents</code> : Cross-reference of the time stamps of zero crossing events and the corresponding state IDs	<ul style="list-style-type: none"> <li>• <code>t</code>: Event timestamp</li> <li>• <code>srcIdx</code>: Block ID</li> </ul>
<code>exceptionEvents</code> : Cross-reference of exception event timestamps, the ID of the corresponding state that caused the event, and the cause.	<ul style="list-style-type: none"> <li>• <code>t</code>: Event timestamp</li> <li>• <code>stateIdx</code>: State ID</li> <li>• <code>cause</code>: Cause of exception</li> </ul>
<code>resetTime</code> : Stores timestamps of solver resets.	None
<code>tout</code> : Stores simulation times.	None

#### View

##### **Solver Exception – Show solver exception events**

off (default) | on

Enable this parameter to highlight solver exception events in the Step Size plot of the Solver Profiler.

##### **Solver Reset – Show solver reset events**

off (default) | on

Enable this parameter to highlight solver reset events in the Step Size plot of the Solver Profiler.

##### **Jacobian Update – Show Jacobian update events**

off (default) | on

Enable this parameter to highlight Jacobian update events in the Step Size plot of the Solver Profiler.

##### **Zero Crossing – Show zero crossing events**

off (default) | on

Enable this parameter to highlight zero crossing events in the Step Size plot of the Solver Profiler.

## Version History

Introduced in R2016a

# States Explorer

Visualize states in model

## Description

Use the **State Explorer** to view individual state dynamics of your model

## Open the States Explorer

- Profile the model using the **Solver Profiler**. Ensure that the **Continuous States** parameter is enabled.
- Select **States** in the **Explore** section of the **Solver Profiler** toolstrip.

## Examples

### Interactively explore states

This example shows how to use States Explorer to explore Newton Exceptions.

To begin, open the `ex_spi_show_zc` model, click **Debug**, open the drop down menu of **Performance Advisor**, select Solver Profiler.

Enable the “Continuous States” on page 7-0 parameter in the **Configure** section of the toolbar and run Solver Profiler.

When profiling has completed, launch State Explorer. Select **Newton/DAE Exception** in the **Filter** section of the State Explorer toolbar.

There is an increase in the density of Newton exceptions through the simulation. Zoom in on the State plot between the 5 and 6 second mark.

A closer examination reveals that each bounce causes two Newton iterations to switch from positive to negative corresponding to two zero crossing events. For more details, see “Interactively Explore Zero Crossings” on page 7-166. Around 5.48 seconds, the bouncing ball being simulated in the model comes to ‘rest’, hence the isolated single Newton iteration exception.

# Type Editor

Create, modify, and manage types, such as bus objects

## Description

The Type Editor lets you interactively create, modify, and manage types.

The supported types are:

- `Simulink.Bus` objects with `Simulink.BusElement` objects
- `Simulink.ConnectionBus` objects with `Simulink.ConnectionElement` objects
- `Simulink.ValueType` objects
- `Simulink.AliasType` objects
- `Simulink.NumericType` objects
- `Simulink.data.dictionary.EnumTypeDefinition` objects in data dictionaries

The **Sources** pane provides available sources, which are the MATLAB base workspace and open data dictionaries. The objects that you create are stored in the selected source. In the toolstrip, you can create or open a data dictionary. You can also import objects defined by a MAT file, function, or script into the base workspace.

The **Contents** pane provides an interactive table with information about the objects, such as hierarchy and properties. You can select which columns appear in the table by using the **Columns** list in the toolstrip. Use the table to:

- Filter objects — Enter a universal filter or a column-specific filter.
- Edit objects — Double-click a value in the table and enter a new value. When you enter a value that is not supported, a diagnostic message appears in this pane.
- Batch edit objects — Select objects of the same type that you want to edit. Double-click a value of one of the selected objects and enter a new value. The new value applies to all selected objects.
- Navigate among types — Right-click an object that references another object and select **Go to**. Alternatively, click an object to highlight its referenced object. Use this navigation to bring you to the editable instance of a bus object and its elements.
- Reorder bus element objects — Drag the bus element objects to a new position or use the **Move Up** and **Move Down** buttons in the toolstrip.
- Cut, copy, and paste objects — Use keyboard shortcuts or the corresponding buttons in the toolstrip.
- Delete objects — Press the **Delete** key or click the **Delete** button in the toolstrip. When you delete a bus object, you also delete the bus element objects it contains. Update any blocks that specify the deleted object. To find where a bus object is used in a model, see “Finding Blocks That Use a Specific Variable”.

---

**Note** Changes that create, reorder, or delete objects take effect immediately in the base workspace. The **Contents** pane of the Type Editor does not support undo or redo actions.

---

The **Property Inspector** pane lets you focus on one object at a time and edit the object properties. When you enter a value that is not supported, a diagnostic message appears in this pane. To undo or redo a change, right-click the corresponding box. Then, select **Undo** or **Redo**.

The Type Editor can export object definitions to a MAT file (.mat) or function (.m). It can also create a MATLAB structure or Simulink.Parameter object from a Simulink.Bus object. You can find these actions in the **Share** section of the toolstrip.

## Open the Type Editor

- Simulink Toolstrip: On the **Modeling** tab, in the **Design** gallery, click **Type Editor**.
- MATLAB Command Window: Enter `typeeditor`.
- Model Explorer: In a bus object dialog box, click **Launch Type Editor**.
- MATLAB Workspace: Double-click a bus object, alias type, or value type.

## Examples

### Create Bus Objects Using Type Editor

Suppose you want to define an interface for a model with a `Simulink.Bus` object. For this example, the interface receives signals named `sine`, `chirp`, `constant`, `pulse`, and `saw`. You want the

interface to group all the signals. Within that group, you want the interface to group the sinusoidal and nonsinusoidal signals.

You can create the objects in the base workspace or a data dictionary. In the **Sources** pane, select the location to contain the new objects.

- To create a data dictionary, in the Type Editor toolbar, click **New**. In the dialog box, specify a name for the data dictionary. Then, click **Save**.
- To open a data dictionary, in the Type Editor toolbar, click **Open**. In the dialog box, specify the data dictionary that you want to open. Then, click **Open**.

Create three `Simulink.Bus` objects.

- 1 In the toolbar, in the **Add** gallery, click **Bus** three times to create three `Bus` objects.
- 2 Name the objects `interface`, `sinusoidal`, and `nonsinusoidal`. Double-click each object name in the table and enter the new name, or use the **Property Inspector** pane.

Add `Simulink.BusElement` objects to the `Bus` objects.

- 1 Select the object named `interface`, and add three `BusElement` objects to it. In the toolbar, click **Bus Element** three times.
- 2 Name the elements `constant`, `sinusoidal_bus`, and `nonsinusoidal_bus`. Double-click each object name in the table and enter the new name or use the **Property Inspector** pane.
- 3 Similarly, select the `sinusoidal` bus object and add two elements to it named `sine` and `chirp`.
- 4 Select the `nonsinusoidal` bus object and add two elements to it named `pulse` and `saw`.

Any element in a bus can be another bus, which can in turn contain subordinate buses, to any depth. To mimic this bus hierarchy, a bus-element object can specify a bus object data type.

Nest the `Bus` objects named `sinusoidal` and `nonsinusoidal` in the `Bus` object named `interface`.

- 1 For the object named `sinusoidal_bus`, set **Data Type** to `Bus: sinusoidal`.
- 2 For the object named `nonsinusoidal_bus`, set **Data Type** to `Bus: nonsinusoidal`.

The object named `interface` now matches the desired hierarchy for the component interface. To specify the object at a component interface, you can specify it as the data type of In Bus Element, Inport, Out Bus Element, and Outport blocks.

## Create Alias, Numeric, Value, and Enumerated Types Using Type Editor

In the **Sources** pane, select the location to contain the new objects.

You can create `Simulink.AliasType`, `Simulink.NumericType`, and `Simulink.ValueType` objects in the base workspace or a data dictionary. You can create `Simulink.data.dictionary.EnumTypeDefinition` objects only in a data dictionary.

- To create a data dictionary, in the Type Editor toolbar, click **New**. In the dialog box, specify a name for the data dictionary. Then, click **Save**.
- To open a data dictionary, in the Type Editor toolbar, click **Open**. In the dialog box, specify the data dictionary that you want to open. Then, click **Open**.

In the Type Editor toolbar, in the **Add** gallery, select one of these options:

- **Alias Type** — Create a `Simulink.AliasType` object.
- **Numeric Type** — Create a `Simulink.NumericType` object.
- **Value Type** — Create a `Simulink.ValueType` object.
- **Enum Type** — Create a `Simulink.data.dictionary.EnumTypeDefinition` object.

The new object appears in the **Contents** pane.

### Modify Objects Using Type Editor

You can use the Type Editor to modify objects in the base workspace and data dictionaries.

To edit one or more objects of the same type in the Type Editor:

- 1 Select the objects that you want to update.
  - To select multiple noncontiguous objects, hold **Ctrl** and select each element.
  - To select multiple contiguous objects, hold **Shift** and select the first and last element.
  - To select all objects, first select one object. Then, press **Ctrl+A**.
- 2 In the **Contents** pane, double-click the property value that you want to change for all the selected objects of the same type. Then, enter the new value.

When you commit the new value, the change applies to all the selected objects that are the same type of object.

You can also edit one object at a time in the **Property Inspector** pane. Some object properties are available only in the **Property Inspector** pane.

For a bus object, edit the properties of the bus object and its elements at the top level, not where the bus object is specified as a data type. Right-click the dimmed object and select **Go to** to bring you to the editable instance of the object.

To reorder bus object elements, select and drag the elements to a new position or use the **Move Up** and **Move Down** buttons in the toolbar.

You can edit contents in the filtered view just like the unfiltered view. Elements that no longer match the filter disappear from the table. Conversely, if some activity outside the Type Editor changes a filtered object so that it passes the current filter, the object immediately becomes visible.

Operations affect only the available objects. An object that a filter hides is unaffected by the operation. To act on all available objects, clear the filter.

### Save Objects Using Type Editor

When you create or modify objects in the base workspace or a data dictionary, save the objects for future use. If blocks specify these objects, the objects are required for simulation.

The Type Editor can save objects in a MAT file (`.mat`), MATLAB function (`.m`), or data dictionary (`.sldd`).

To save the objects that are in the base workspace:

- 1 In the **Sources** pane, select the base workspace.
- 2 In the toolbar, click the **Export** button arrow. Then, select an option, which creates a MAT file or MATLAB function.

For MATLAB functions, you have the option to save the objects in a compressed cell format or a more readable object format.

- 3 In the Export dialog box, specify the file name, then click **Save**.

Alternatively, cut or copy the objects from the base workspace. Then, paste them in a data dictionary.

To save the objects that are in a data dictionary:

- 1 In the **Sources** pane, select the modified data dictionary.
- 2 In the toolbar, click **Save**. Alternatively, right-click the data dictionary and select **Save changes**.

## Manage Objects Using Type Editor

You can use the Type Editor to manage objects from multiple sources.

You can import objects from a function, script, or MAT file.

- 1 In the toolbar, click the **Import** button arrow, then select one of the options.
- 2 In the Import into Base Workspace dialog box, select the file that defines the objects and click **Open**.

The import loads the complete contents of the file, not just the objects. The table displays the available objects in alphabetical order.

You can also open a data dictionary to manage its objects.

- 1 In the toolbar, click **Open**.
- 2 In the Open dialog box, select the data dictionary that defines the objects and click **Open**.

Use filters to quickly find objects by name or property value. The filter can be a search term or regular expression. For information about regular expressions, see “Regular Expressions”.

To quickly find objects with a `double` data type, type `double` in either the **Filter contents** box or the **Filter by DataType** box that appears when you pause on the **DataType** column heading and click the button that appears. As you type, the table updates dynamically to show only the objects whose names or property values match the filter and their parents. The comparison is not case-sensitive.

## Initialize Buses and Arrays of Buses Using Type Editor

You can use the Type Editor to create MATLAB structures for initialization.

Suppose you have a `Simulink.Bus` object named `MyData` that contains two elements named `temperature` and `pressure`.

- `temperature` — Signal with a data type of `int16`
- `pressure` — Nested array of buses with a data type of `Bus: PressureBus` and dimensions specified as `[1 3]`

The nested Bus object named `PressureBus` has two elements named `s1` and `s2`.

Name	DataType	Dimensions
MyData		
— temperature	int16	1
— pressure	Bus: PressureBus	[1 3]
— s1	double	1
— s2	double	1
PressureBus		
— s1	double	1
— s2	double	1

Select the Bus object named `MyData`. Then, in the toolstrip, click **MATLAB Structure**.

Specify a name and location for the new MATLAB structure.

The MATLAB structure specifies an initial condition of 0 for each element.

```
MyData_MATLABStruct = struct;
MyData_MATLABStruct.temperature = int16(0);
MyData_MATLABStruct.pressure = struct;
MyData_MATLABStruct.pressure(1).s1 = 0;
MyData_MATLABStruct.pressure(1).s2 = 0;
MyData_MATLABStruct.pressure(2).s1 = 0;
MyData_MATLABStruct.pressure(2).s2 = 0;
MyData_MATLABStruct.pressure(3).s1 = 0;
MyData_MATLABStruct.pressure(3).s2 = 0;
```

Optionally, change the initial conditions of the structure elements.

Use the MATLAB structure to specify the **Initial condition** parameter of a block such as a Unit Delay block.

To create a MATLAB structure for a top-level Bus object that defines an array of buses, use the `Simulink.Bus.createMATLABStruct` function.

## Tips

- In the **Contents** pane, display only the columns that are relevant to you. For example, if your focus is simulation, in the Type Editor toolstrip, in the **View** section, change the column display from **All** to **Value**. If your focus is code generation, change the column display to **Code**. Alternatively, individually select which table columns appear with the **Columns** list.
- A bus object cannot directly or indirectly reference itself. If you define a circular structure, the Type Editor keeps the original data type of the element that would have completed the circle.

- When you have a model that creates a bus with a Bus Creator block, you can use the `Simulink.Bus.createObject` function to create the corresponding objects instead of creating each `Simulink.Bus` and `Simulink.BusElement` object individually.

## Version History

Introduced before R2006a

### **buseditor function is not recommended**

*Not recommended starting in R2022b*

In R2022b, the **Bus Editor** was renamed the Type Editor to reflect that it now supports value types, alias types, numeric types, and enumerations in addition to bus objects. While there are no plans to remove the `buseditor` function, the `typeditor` function is now the recommended function to open the tool.

### **Custom import and export functions are not supported**

Starting in R2022a, the **Bus Editor** loads faster and has an updated interface for creating, modifying, and managing bus objects. However, the **Bus Editor** no longer supports custom import and export functions.

Remove the `cm.BusEditorCustomizer.importCallbackFcn` and `cm.BusEditorCustomizer.exportCallbackFcn` registration functions from the `sl_customization` function. To eliminate both customizations in one operation for a customization manager object named `cm`, use this command.

```
cm.BusEditorCustomizer.clear
```

For more information about customizations, see “Register Customizations with Simulink”.

# Zero Crossing Explorer

Visualize and interactively explore zero-crossing events

## Description

Use the **Zero Crossing Explorer** to visualize and analyze zero crossing events that occur for each state in your model.

## Open the Zero Crossing Explorer

- Profile the model using the **Solver Profiler**. Ensure that the **Zero Crossing** parameter is enabled.
- Select **Zero Crossing** in the **Explore** section of the **Solver Profiler** toolstrip.

## Examples

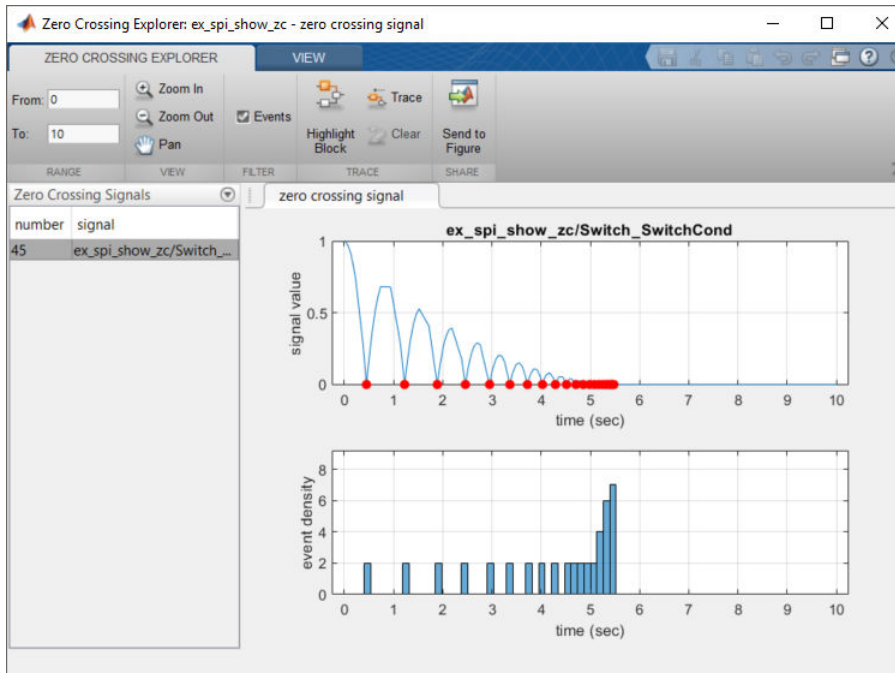

### Interactively Explore Zero Crossings

Use the **Zero Crossing Explorer** to examine clusters of zero crossing events

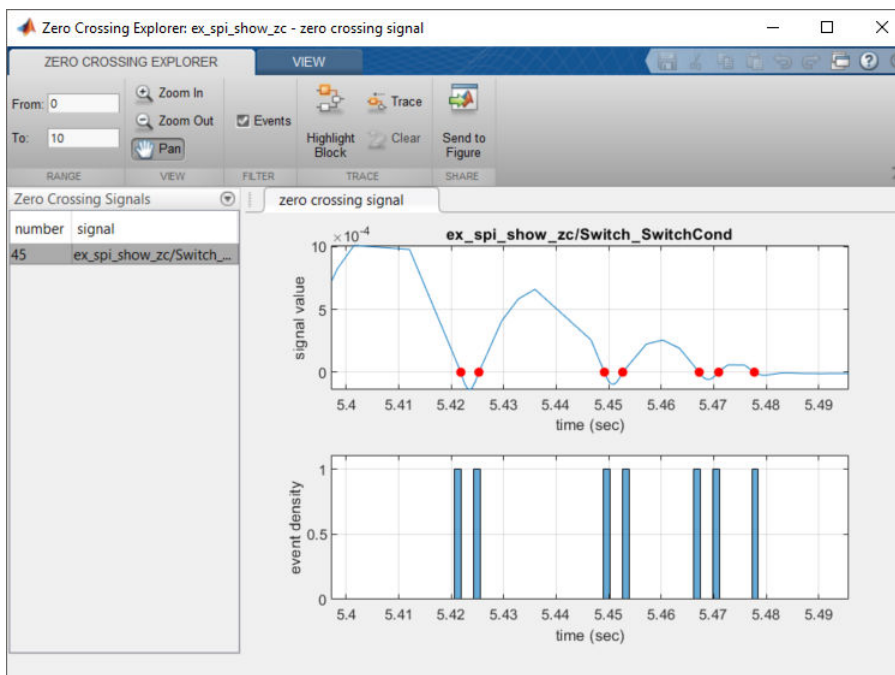

Open the `ex_spi_show_zc` model and launch the **Solver Profiler**.

Enable the **Zero Crossing** parameter in the **Configure** section of the toolstrip and run the **Solver Profiler**.

When profiling has completed, launch the **Zero Crossing Explorer**

There is an increase in the density of zero crossing events halfway through the simulation. Zoom in on the **event density** plot between the 5 and 6 second mark.

A closer examination reveals that each bounce corresponds to two zero crossings — from positive to negative and vice-versa. This is an artefact of numerically solving state dynamics that approach 0 value. Around 5.48 seconds, the ball being simulated in the model comes to 'rest', hence the isolated single zero crossing event.

- “Zero-Crossing Events”

# Objects

---

## LibraryBrowser.LBStandalone

Display, hide, size, and position Simulink Library Browser

### Description

Use `LibraryBrowser.LBStandalone` objects to programmatically display, hide, size, position, and refresh the Simulink Library Browser in standalone mode. For more information, see `Library Browser in Standalone Mode`, `show`, `hide`, `getPosition`, `setPosition`, and `refresh`. To interact with a `LibraryBrowser.LBStandalone` object, create and get the handle of the object, then set the object properties or run the object functions.

### Creation

To create and get the handle of the Library Browser object, use either `sLibraryBrowser` or `LibraryBrowser.LibraryBrowser2`.

---

**Note** When you use the `sLibraryBrowser` to get the handle:

- If the Library Browser is open in standalone mode, the Library Browser window moves in front of all other Simulink windows.
  - If the Library Browser is not open in standalone mode, the Library Browser opens in standalone mode.
- 

### Properties

#### **IsOnTop — Always put Library Browser window on top**

`false` or `0` (default) | `true` or `1`

Always put the Library Browser window on top of other Simulink Editor windows, specified as a numeric or logical `1` (`true`) or `0` (`false`).

### Object Functions

<code>refresh</code>	Refresh Simulink Library Browser
<code>show</code>	Display Simulink Library Browser
<code>hide</code>	Hide Simulink Library Browser
<code>getPosition</code>	Get position of Simulink Library Browser
<code>setPosition</code>	Set position of Simulink Library Browser

### Examples

## Keep Library Browser in Front of Other Windows

Create and get the handle of the `LibraryBrowser.LBStandalone` object that lets you programmatically access the Library Browser.

```
lb = LibraryBrowser.LibraryBrowser2;
```

Set the `IsOnTop` property of the Library Browser to 1 (true), using dot notation to access the property.

```
lb.IsOnTop = 1;
```

## Limitations

The `LibraryBrowser.LBStandalone` object does not allow you to programmatically act on a docked Library Browser. To use the `LibraryBrowser.LBStandalone` object, open the Library Browser in standalone mode by clicking the Launch standalone library browser button .

## Version History

### Introduced in R2014b

**LibraryBrowser.LBStandalone object replaces LibraryBrowser.LibraryBrowser2 object**  
*Behavior changed in R2016b*

In previous releases, these two commands returned a `LibraryBrowser.LibraryBrowser2` object:

```
lb = sLibraryBrowser
lb = LibraryBrowser.LibraryBrowser2
```

Starting in R2016b, each command returns a `LibraryBrowser.LBStandalone` object. The functions to access Library Browser operations such as show and refresh support `LibraryBrowser.LBStandalone` objects.

## getPosition

**Package:** LibraryBrowser

Get position of Simulink Library Browser

### Syntax

```
position = getPosition(lb)
```

### Description

`position = getPosition(lb)` returns the position of the Simulink Library Browser in standalone mode. For more information on standalone mode, see [Library Browser in Standalone Mode](#).

### Examples

#### Get Position of Library Browser

```
lb = LibraryBrowser.LibraryBrowser2;
getPosition(lb)
```

```
ans =
```

```
 50 279 600 600
```

### Input Arguments

#### **lb** — Simulink Library Browser

`LibraryBrowser.LBStandalone` object

Simulink Library Browser, specified as a `LibraryBrowser.LBStandalone` object.

### Output Arguments

#### **position** — Position of Library Browser

numeric array

Position of Library Browser, returned as a numeric array of integers, in pixels: upper-left x-coordinate, upper-left y-coordinate, width, and height.

### Limitations

The `getPosition` function does not act on a docked Library Browser. To use the `getPosition` function, open the Library Browser in standalone mode by clicking the Launch standalone library browser button .

## **Version History**

Introduced in R2016b

# hide

**Package:** LibraryBrowser

Hide Simulink Library Browser

## Syntax

```
hide(lb)
```

## Description

`hide(lb)` hides the Simulink Library Browser in standalone mode. For more information on standalone mode, see Library Browser in Standalone Mode.

## Examples

### Hide Library Browser

```
lb = LibraryBrowser.LibraryBrowser2;
hide(lb)
```

## Input Arguments

### lb — Simulink Library Browser

LibraryBrowser.LBStandalone object

Simulink Library Browser, specified as a `LibraryBrowser.LBStandalone` object.

## Limitations

The `hide` function does not act on a docked Library Browser. To use the `hide` function, open the Library Browser in standalone mode by clicking the Launch standalone library browser button .

# refresh

**Package:** LibraryBrowser

Refresh Simulink Library Browser

## Syntax

```
refresh(lb)
```

## Description

`refresh(lb)` updates the Simulink Library Browser with changes that affect it. Examples include adding a library to the Library Browser, removing a library from the Library Browser, and making changes to your custom libraries, `slblocks` function, or `sl_customization.m` file.

## Examples

### Refresh Library Browser

Refresh the Library Browser when you have made any changes that affect libraries on your MATLAB path that are registered in the Library Browser.

```
lb = LibraryBrowser.LibraryBrowser2;
refresh(lb)
```

## Input Arguments

### lb — Simulink Library Browser

LibraryBrowser.LBStandalone object

Simulink Library Browser, specified as a `LibraryBrowser.LBStandalone` object.

## setPosition

**Package:** LibraryBrowser

Set position of Simulink Library Browser

### Syntax

```
setPosition(lb,position)
```

### Description

`setPosition(lb,position)` sets the position of the Simulink Library Browser in standalone mode. For more information on standalone mode, see [Library Browser in Standalone Mode](#).

### Examples

#### Set Position of Library Browser

```
lb = LibraryBrowser.LibraryBrowser2;
setPosition(lb,[70 250 500 500])
```

### Input Arguments

#### **lb** — Simulink Library Browser

`LibraryBrowser.LBStandalone` object

Simulink Library Browser, specified as a `LibraryBrowser.LBStandalone` object.

#### **position** — New position of Library Browser

numeric array

New position of Library Browser, specified as a numeric array of integers, in pixels: upper-left x-coordinate, upper-left y-coordinate, width, and height.

Data Types: double

### Limitations

The `setPosition` function does not act on a docked Library Browser. To use the `setPosition` function, open the Library Browser in standalone mode by clicking the Launch standalone library browser button .

## Version History

**Introduced in R2016b**

## show

**Package:** LibraryBrowser

Display Simulink Library Browser

### Syntax

```
show(lb)
```

### Description

`show(lb)` displays the Simulink Library Browser in standalone mode. For more information on standalone mode, see [Library Browser in Standalone Mode](#).

### Examples

#### Display Library Browser

```
lb = LibraryBrowser.LibraryBrowser2;
show(lb)
```

### Input Arguments

#### lb — Simulink Library Browser

LibraryBrowser.LBStandalone object

Simulink Library Browser, specified as a `LibraryBrowser.LBStandalone` object.

### Limitations

The `show` function does not act on a docked Library Browser. To use the `show` function, open the Library Browser in standalone mode by clicking the Launch standalone library browser button .

## Stateflow.EMChart

Stateflow interface to MATLAB Function block

### Description

Use `Stateflow.EMChart` objects to configure MATLAB Function blocks through the Stateflow programmatic interface. For more information, see “Overview of the Stateflow API” (Stateflow).

---

**Tip** You can also configure the properties of a MATLAB Function block programmatically by using a `MATLABFunctionConfiguration` object. This object provides a direct interface to the properties of a MATLAB Function block. For more information, see “Configure MATLAB Function Blocks Programmatically”.

---

### Creation

Each MATLAB Function block has its own `Stateflow.EMChart` object. When you add a MATLAB Function block to a Simulink model, a `Stateflow.EMChart` object is automatically created for it. For example, you can use the function `add_block` to add a MATLAB Function with the name `MATLAB Function` to a model called `myModel`:

```
add_block("simulink/User-Defined Functions/MATLAB Function", ...
 "myModel/MATLAB Function")
```

Then, to access the `Stateflow.EMChart` object, call the `find` function for the loaded system:

```
block = find(get_param("myModel", "Object"), ...
 "-isa", "Stateflow.EMChart", "Name", "MATLAB Function");
```

### Properties

Stateflow API objects have properties that correspond to the values you set in the Stateflow Editor. To access or modify a property, use dot notation. To access or modify multiple properties for multiple API objects, use the `get` and `set` functions, respectively. For more information, see “Modify Properties and Call Functions of Stateflow Objects” (Stateflow).

#### Content

##### Name — Name of MATLAB Function block

"MATLAB Function" (default) | string scalar | character vector

Name of the MATLAB Function block, specified as a string scalar or character vector.

##### Script — Code for MATLAB Function block

string scalar | character vector

Code for the MATLAB Function block, specified as a string scalar or character vector. To enter multiple lines of code, you can:

- Call the MATLAB function `sprintf` and use `\n` to insert newline characters:

```
str = sprintf("function y=f(x)\ny=x+1;\nend");
block.Script = str;
```

- Enter a concatenated text expression that uses the function `newline` to create newline characters:

```
str = "function y=f(x)" + newline + ...
 "y=x+1;" + newline + ...
 "end";
block.Script = str;
```

### **SupportVariableSizing — Whether MATLAB Function block supports variable-size data**

true or 1 (default) | false or 0

Whether the MATLAB Function block supports variable-size data, specified as a numeric or logical 1 (true) or 0 (false). For more information, see “Declare Variable-Size MATLAB Function Block Variables”.

### **AllowDirectFeedthrough — Whether MATLAB Function block supports direct feedthrough semantics**

true or 1 (default) | false or 0

Whether the MATLAB Function block supports direct feedthrough semantics, specified as a numeric or logical 1 (true) or 0 (false). For more information, see “Allow direct feedthrough”.

### **VectorOutputs1D — Whether MATLAB Function block outputs column vectors as one-dimensional data**

false or 0 (default) | true or 1

Whether the MATLAB Function block outputs column vectors as one-dimensional data, specified as a numeric or logical 0 (false) or 1 (true). For more information, see “Interpret output column vectors as one-dimensional data”.

## **Interface**

### **Inputs — Input arguments**

array of `Stateflow.Data` objects

This property is read-only.

Input arguments of the MATLAB Function block, specified as an array of `Stateflow.Data` objects. The value of this property depends on the inputs defined in the `Script` property for the block.

### **Outputs — Output arguments**

array of `Stateflow.Data` objects

This property is read-only.

Output arguments of the MATLAB Function block, specified as an array of `Stateflow.Data` objects. The value of this property depends on the outputs defined in the `Script` property for the block.

## **Discrete and Continuous-Time Semantics**

### **ChartUpdate — Activation method for MATLAB Function block**

"INHERITED" (default) | "CONTINUOUS" | "DISCRETE"

Activation method for the MATLAB Function block, specified as "CONTINUOUS", "DISCRETE", or "INHERITED". For more information, see "Update method".

**SampleTime — Sample time for activating MATLAB Function block**

"-1" (default) | string scalar | character vector

Sample time for activating the MATLAB Function block, specified as a string scalar or character vector. This property applies only when the `ChartUpdate` property for the MATLAB function is "DISCRETE".

**Integer and Fixed-Point Data****SaturateOnIntegerOverflow — Whether data saturates on integer overflow**

true or 1 (default) | false or 0

Whether the data in the MATLAB Function block saturates on integer overflow, specified as a numeric or logical 1 (true) or 0 (false). When this property is disabled, the data in the function wraps on integer overflow. For more information, see "Saturate on integer overflow".

**TreatAsFi — Inherited Simulink signals to treat as fi objects**

"Fixed-point" (default) | "Fixed-point & Integer"

Inherited Simulink signals to treat as Fixed-Point Designer `fi` objects, specified as one of these values:

- "Fixed-point" — The MATLAB Function block treats all fixed-point inputs as `fi` objects.
- "Fixed-point & Integer" — The MATLAB Function block treats all fixed-point and integer inputs as `fi` objects.

**Em1DefaultFimath — Default fimath properties**

"Same as MATLAB Default" (default) | "Other:UserSpecified"

Default `fimath` properties for the MATLAB Function block, specified as one of these values:

- "Same as MATLAB Default" — Use the same `fimath` properties as the current default `fimath` object.
- "Other:UserSpecified" — Use the `InputFimath` property to specify the default `fimath` object.

**InputFimath — Default fimath object**

string scalar | character vector

Default `fimath` object, specified as a string scalar or character vector. When the `Em1DefaultFimath` property for the MATLAB Function block is "Other:UserSpecified", you can use this property to:

- Enter an expression that constructs a `fimath` object.
- Enter the variable name for a `fimath` object in the MATLAB or model workspace.

**Hierarchy****Machine — Machine that contains MATLAB Function block**

`Stateflow.Machine` object

This property is read-only.

Machine that contains the MATLAB Function block, specified as a `Stateflow.Machine` object.

**Path — Location of MATLAB Function block in model hierarchy**

string scalar | character vector

This property is read-only.

Location of the MATLAB Function block in the model hierarchy, specified as a character vector.

**Dirty — Whether MATLAB Function block has changed**

true or 1 | false or 0

Whether the MATLAB Function block has changed after being opened or saved, specified as a numeric or logical 1 (true) or 0 (false).

**Locked — Whether MATLAB Function block is locked**

false or 0 (default) | true or 1

Whether the MATLAB Function block is locked, specified as a numeric or logical 1 (true) or 0 (false). Enable this property to prevent changes in the MATLAB Function block.

**Iced — Whether MATLAB Function block is locked**

false or 0 (default) | true or 1

This property is read-only.

Whether the MATLAB Function block is locked, specified as a numeric or logical 1 (true) or 0 (false). This property is equivalent to the property `Locked`, but is used internally to prevent changes in the MATLAB Function block during simulation.

**Identification**

**Description — Description**

"" (default) | string scalar | character vector

Description for the MATLAB Function block, specified as a string scalar or character vector.

**Document — Document link**

"" (default) | string scalar | character vector

Document link for the MATLAB Function block, specified as a string scalar or character vector.

**Tag — User-defined tag**

[] (default) | any data type

User-defined tag for the MATLAB Function block, specified as data of any type.

**Id — Unique identifier**

scalar

This property is read-only.

Unique identifier, specified as an integer scalar. Use this property to distinguish the MATLAB Function block from other objects in the model. The value of this property is reassigned every time you start a new MATLAB session and may be recycled after an object is deleted.

## Object Functions

find	Identify specified objects in hierarchy
getChildren	Identify children of object
dialog	Open properties dialog box
view	Display object in editing environment

## Examples

### Program MATLAB Function Block

Access the Stateflow.EMChart object for a MATLAB Function block named My Function in a model called myModel.

```
block = find(get_param(gcs,"Object"), ...
 "-isa","Stateflow.EMChart","Path","myModel/My Function");
```

Store the MATLAB code to calculate the mean and standard deviation for a vector of values as a string scalar.

```
str = "function [mean,stdev] = stats(vals)" + newline + ...
 "% Calculates a statistical mean and a standard" + newline + ...
 "% deviation for the values in vals." + newline + newline + ...
 "len = length(vals);" + newline + ...
 "mean = avg(vals,len);" + newline + ...
 "stdev = sqrt(sum(((vals-avg(vals,len)).^2))/len);" + newline + ...
 "plot(vals,"-"+");" + newline + newline + ...
 "function mean = avg(array,size)" + newline + ...
 "mean = sum(array)/size;";
```

Populate the block with code by modifying the Script property of the corresponding Stateflow.EMChart object.

```
block.Script = str;
```

Open the function in the **MATLAB Function Block Editor**.

```
view(block)
```

The editor shows this code.

```
function [mean,stdev] = stats(vals)
% Calculates a statistical mean and a standard
% deviation for the values in vals.

len = length(vals);
mean = avg(vals,len);
stdev = sqrt(sum(((vals-avg(vals,len)).^2))/len);
plot(vals,"-"+");

function mean = avg(array,size)
mean = sum(array)/size;
```

## Import Code from MATLAB Function

Open a Simulink model called myModel.

```
open_system("myModel")
```

Add a MATLAB Function block to myModel named My Function.

```
blockPath = "myModel/My Function";
add_block("simulink/User-Defined Functions/MATLAB Function",blockPath)
```

Populate the block with code from the MATLAB function myFunction.m.

```
block = find(get_param("myModel","Object"),"-isa", ...
 "Stateflow.EMChart","Path",blockPath);
block.Script = fileread("myFunction.m");
```

## Find Number of MATLAB Function Blocks in Model

Open a Simulink model called myModel.

```
open_system("myModel")
```

Find the MATLAB Function blocks in the model.

```
blocks = find(get_param("myModel","Object"),"-isa","Stateflow.EMChart");
```

Count the number of blocks.

```
numel(blocks)
```

## Version History

Introduced in R2011a

## Simulink.AliasType

Create alias for signal and parameter data type

### Description

Use a `Simulink.AliasType` to create an alias of a built-in data type such as `int8`.

The name of the object is the alias. The data type to which an alias refers, such as `int8`, is the base type. Alias names cannot be:

- Floating-point types: `half`, `single`, `double`
- Integer types: `int8`, `uint8`, `int16`, `uint16`, `int32`, `uint32`, `int64`, or `uint64`.
- Fixed-Point Designer types beginning with `sfix`, `ufix`, or `flt`.

You create the object in the base workspace or a data dictionary. To use the alias, you use the name of the object to set data types for signals, states, and parameters in a model.

Using aliases to specify signal and parameter data types can greatly simplify global changes to the data types that a model specifies. In particular, changing the data type of all signals, states, and parameters whose data type is specified by an alias requires changing only the base type of the alias. By contrast, changing the data types of signals, states, and parameters whose data types are specified by an actual type name requires respecifying the data type of each signal and parameter individually.

You can use objects of this class to create an alias for Simulink built-in data types, fixed-point data types, enumerated data types, `Simulink.NumericType` objects, and other `Simulink.AliasType` objects. The code that you generate from a model (Simulink Coder) uses the alias only if you use an ERT-based system target file (Embedded Coder).

Alternatively, to define and name a numeric data type, you can use an object of the class `Simulink.NumericType`.

### Creation

You can create a `Simulink.AliasType` object several ways.

- Interactively create a data type alias using the **Type Editor** or **Model Explorer**.
- Generate data type aliases that correspond to `typedef` statements in your external C code using the `Simulink.importExternalCTypes` function.
- Programmatically create a data type alias using the `Simulink.AliasType` function described here.

---

**Note** You must create data type aliases in the MATLAB workspace or in a data dictionary. You cannot create an alias in a model workspace.

---

## Syntax

```
aliasObj = Simulink.AliasType
aliasObj = Simulink.AliasType(baseType)
```

## Description

`aliasObj = Simulink.AliasType` returns a `Simulink.AliasType` object with default property values.

`aliasObj = Simulink.AliasType(baseType)` returns a `Simulink.AliasType` object and initializes the value of the `BaseType` property by using `baseType`.

## Properties

To interactively edit the properties of a `Simulink.AliasType` object, use the **Type Editor**.

### BaseType — Name of base data type

'double' (default) | character vector | string scalar

Name of the base data type that this alias renames, specified as a character vector or string scalar. You can specify the name of a standard data type, such as `int8` or `half`, or the name of a custom data type, such as the name of another `Simulink.AliasType` object or the name of an enumeration.

To specify a fixed-point data type, you can use a call to the `fixdt` function, such as `'fixdt(0,16,7)'`. To specify the characteristics of the type interactively, expand the Data Type Assistant and set **Mode** to `Fixed point`. For information about using the Data Type Assistant, see “Specify Data Types Using Data Type Assistant”.

You can, with one exception, specify a nonstandard data type, e.g., a data type defined by a `Simulink.NumericType` object, by specifying the data type name. The exception is a `Simulink.NumericType` object whose `DataTypeMode` is `Fixed-point: unspecified scaling`.

---

**Note** `Fixed-point: unspecified scaling` is a partially specified type whose definition is completed by the block that uses the `Simulink.NumericType` object. Forbidding its use in alias types avoids creating aliases that have different base types depending on where they are used.

---

Example: `'int8'`

Example: `'myOtherAlias'`

Data Types: `char` | `string`

### DataScope — Specification to generate or import type definition in the generated code

'Auto' (default) | 'Exported' | 'Imported'

Specification to generate or import the type definition (`typedef`) in the generated code (Simulink Coder), specified as `'Auto'`, `'Exported'`, or `'Imported'`.

The table shows the effect of each option.

Value	Action
'Auto' (default)	<p>If no value is specified for <code>HeaderFile</code>, export the type definition to <code>model_types.h</code>, where <code>model</code> is the model name. If you have an Embedded Coder license, and you have specified a data type replacement, then export the type definition to <code>rtwtypes.h</code>.</p> <p>If a value is specified for <code>HeaderFile</code>, import the data type definition from the specified header file.</p>
'Exported'	Export the data type definition to a header file, which can be specified in the <code>HeaderFile</code> property. If no value is specified for <code>HeaderFile</code> , the header file name defaults to <code>type.h</code> . <code>type</code> is the data type name.
'Imported'	Import the data type definition from a header file, which can be specified in the <code>HeaderFile</code> property. If no value is specified for <code>HeaderFile</code> , the header file name defaults to <code>type.h</code> . <code>type</code> is the data type name.

Set the data scope to `Imported` or `Exported` to avoid potential MISRA C:2012 violations.

For more information, see “Control File Placement of Custom Data Types” (Embedded Coder).

#### Description — Custom description of data type alias

' ' (empty character vector) (default) | character vector

Custom description of the data type alias, specified as a character vector.

Example: 'This type alias corresponds to a floating-point implementation.'

Data Types: char

#### HeaderFile — Name of header file that contains type definition in the generated code

' ' (empty character vector) (default) | character vector

Name of the header file that contains the type definition (`typedef`) in the generated code, specified as a character vector.

If this property is specified, the specified name is used during code generation for importing or exporting. If this property is empty, the value defaults to `type.h` if `DataScope` is 'Imported' or 'Exported', or defaults to `model_types.h` if `DataScope` is 'Auto'.

By default, the generated `#include` directive uses the preprocessor delimiter `"` instead of `<` and `>`. To generate the directive `#include <myTypes.h>`, specify `HeaderFile` as `'<myTypes.h>'`.

For more information, see “Control File Placement of Custom Data Types” (Embedded Coder).

Corresponds to **Header file** in the property dialog box.

Example: 'myHdr.h'

Example: 'myHdr'

Example: 'myHdr.hpp'

Data Types: char

## Examples

### Create Alias for Enumerated Data Type

To create an alias for an enumerated type called `SLDemoSign`:

```
myEnumAlias = Simulink.AliasType('Enum: SLDemoSign');
```

### Create Alias for Fixed-Point Data Type

To create an alias for a fixed-point data type by using a `Simulink.AliasType` object, set the `BaseType` property of the object by using a call to the `fixdt` function. The value of `BaseType` must be specified as a character vector.

For example, this code creates an alias for an unsigned fixed-point data type with word length 16 and fraction length 7.

```
myFixptAlias = Simulink.AliasType;
myFixptAlias.BaseType = 'fixdt(0,16,7)';
```

## Version History

Introduced before R2006a

## Extended Capabilities

### C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

A `Simulink.AliasType` object appears in the generated code as a `typedef` statement. The generated code uses the named type to define and declare data (variables).

The `Simulink.AliasType` class does not support multiword base data types for code generation.

### Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

## Simulink.Annotation

Create and specify properties of text, image, and area annotations

### Description

Annotations are visual elements that you can use to add descriptive notes and callouts to your model. You can programmatically access and modify them as `Simulink.Annotation` objects.

To get an existing `Simulink.Annotation` object, select the annotation. Then, use the `getCurrentAnnotation` function.

### Creation

You can create a `Simulink.Annotation` object in multiple ways.

- To programmatically create an `Annotation` object, use the `Simulink.Annotation` function described on this page.
- To interactively create an `Annotation` object, see “Describe Models Using Notes and Annotations”.

### Syntax

```
a = Simulink.Annotation(sys,name)
a = Simulink.Annotation(path,Name,Value)
```

#### Description

`a = Simulink.Annotation(sys,name)` creates an annotation with the specified name and default properties in the specified system or subsystem.

`a = Simulink.Annotation(path,Name,Value)` creates an annotation with properties on page 8-25 specified using name-value pairs. For example, `Simulink.Annotation('model/annotation','BackgroundColor','yellow')` creates an annotation with a yellow background. You can specify multiple name-value pairs. Enclose each property name in quotes.

#### Input Arguments

##### **sys** — System or subsystem to contain annotation

character vector | string scalar

System or subsystem to contain annotation, specified as a character vector or string scalar.

Data Types: `char` | `string`

##### **name** — Name of new annotation

character vector

Name of new annotation, specified as a character vector.

Data Types: char

### **path — Path to new annotation**

character vector | string scalar

Path to new annotation, specified as a character vector or string scalar composed of the system name and the annotation name.

Example: `Simulink.Annotation('model/annotation')`

Data Types: char | string

## **Properties**

### **Interaction**

#### **Selected — Option to select annotation**

'off' (default) | on/off logical value

Option to select or deselect the annotation, specified as 'on' or 'off', or numeric or logical 1 (true) or 0 (false). A value of 'on' is equivalent to true, and 'off' is equivalent to false. Thus, you can use the value of this property as a logical value. The value is stored as an on/off logical value of type `OnOffSwitchState`.

- 'on' — Select annotation.
- 'off' — Remove selection from annotation.

Data Types: logical | char | string

### **Text**

#### **Name — Text of annotation**

character vector | string scalar

Text of annotation, specified as a character vector or string scalar.

Same as Text.

Data Types: char | string

#### **Text — Text of annotation**

character vector | string scalar

Text of annotation, specified as a character vector or string scalar.

Same as Name.

Data Types: char | string

#### **Interpreter — Option to format text style**

'off' (default) | 'rich' | 'tex'

Option to format text style, specified as 'off' for plain text, 'rich' for rich text, or 'tex' for text that contains LaTeX commands. When you format a plain text annotation using the formatting toolbar, the annotation becomes a rich text annotation.

**TeXMode — Option to render TeX markup**`'off'` (default) | on/off logical value

Option to render TeX markup, specified as `'on'` or `'off'`, or numeric or logical 1 (true) or 0 (false). A value of `'on'` is equivalent to `true`, and `'off'` is equivalent to `false`. Thus, you can use the value of this property as a logical value. The value is stored as an on/off logical value of type `OnOffSwitchState`.

- `'on'` — Render TeX markup.
- `'off'` — Do not render TeX markup.

**MarkupType — Option to make markup annotation**`'model'` (default) | `'markup'`

Option to make markup annotation, specified as `'model'` or `'markup'`.

---

**Note** Set the `'ShowMarkup'` model parameter to `'on'` to show markup annotations or `'off'` to hide markup annotations.

---

**Font****FontName — Font name**`'auto'` (default) | character vector | string scalar

This property affects only plain text annotations.

Font name, specified as a character vector or string scalar. The default value, `'auto'`, uses the default font specified for annotations in the Font Styles dialog box. To open the Font Styles dialog box, on the **Format** tab, click the **Font Properties** button arrow, then click **Fonts for Model**.

Data Types: `char` | `string`

**FontSize — Font size, in points**`-1` (default) | numeric scalar

This property affects only plain text annotations.

Font size, in points, specified as a numeric scalar. The default value, `-1`, uses the default font size for annotations specified in the Font Styles dialog box. To open the Font Styles dialog box, on the **Format** tab, click the **Font Properties** button arrow, then click **Fonts for Model**.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

**FontWeight — Character thickness**`'auto'` (default) | `'normal'` | `'bold'` | `'light'` | `'demi'`

This property affects only plain text annotations.

Character thickness, specified as one of the values listed in the table.

Value	Description
'auto'	The default weight for annotations specified in the Font Styles dialog box. To open the Font Styles dialog box, on the <b>Format</b> tab, click the <b>Font Properties</b> button arrow, then click <b>Fonts for Model</b> .
'normal'	Normal font weight.
'bold'	Bold font weight.
'light'	Not recommended.
'demi'	Not recommended.

### FontAngle — Angle of annotation font

'auto' (default) | 'normal' | 'italic' | 'oblique'

This property affects only plain text annotations.

Angle of annotation font, specified as one of the values listed in the table.

Value	Description
'auto'	The default font angle specified for annotations in the Font Styles dialog box. To open the Font Styles dialog box, on the <b>Format</b> tab, click the <b>Font Properties</b> button arrow, then click <b>Fonts for Model</b> .
'normal'	Normal font.
'italic'	Italic font.
'oblique'	Oblique font (usually the same as italic font).

### Colors and Effects

#### BackgroundColor — Background color of annotation

'white' (default) | RGB value array | 'automatic' (transparent) | 'black' | 'red' | 'green' | 'blue' | ...

Background color of annotation, specified as one of the values listed in this table.

Value	Description
'automatic'	Transparent
'black'	Black
'white'	White
'red'	Red
'green'	Green
'blue'	Blue
'cyan'	Cyan
'magenta'	Magenta

Value	Description
'yellow'	Yellow
'gray'	Gray
'lightBlue'	Light blue
'orange'	Orange
'darkGreen'	Dark green
RGB value array, specified as '[r,g,b]' where r, g, and b are the red, green, and blue values of the color normalized to the range 0.0 to 1.0.	Fully opaque custom color

Data Types: char | string

### ForegroundColor — Foreground color of annotation

'black' (default) | RGB value array | 'white' | 'red' | 'green' | 'blue' | ...

Foreground color of annotation, specified as one of the values listed in this table.

Value	Description
'black'	Black
'white'	White
'red'	Red
'green'	Green
'blue'	Blue
'cyan'	Cyan
'magenta'	Magenta
'yellow'	Yellow
'gray'	Gray
'lightBlue'	Light blue
'orange'	Orange
'darkGreen'	Dark green
RGB value array, specified as '[r,g,b]' where r, g, and b are the red, green, and blue values of the color normalized to the range 0.0 to 1.0.	Fully opaque custom color

Data Types: char | string

### DropShadow — Option to display drop shadow

'off' (default) | on/off logical value

Option to display drop shadow, specified as 'on' or 'off', or numeric or logical 1 (true) or 0 (false). A value of 'on' is equivalent to true, and 'off' is equivalent to false. Thus, you can use the value of this property as a logical value. The value is stored as an on/off logical value of type OnOffSwitchState.

- 'on' — Display drop shadow.

- 'off' — Do not display drop shadow.

### Size and Position

#### FixedHeight — Option to control annotation height

'off' (default) | on/off logical value

Option to control annotation height, specified as 'on' or 'off', or numeric or logical 1 (true) or 0 (false). A value of 'on' is equivalent to true, and 'off' is equivalent to false. Thus, you can use the value of this property as a logical value. The value is stored as an on/off logical value of type OnOffSwitchState.

- 'on' — The annotation does not resize to accommodate text changes. The visible text may be truncated.
- 'off' — The annotation automatically resizes to accommodate text changes.

Interactively resizing the annotation sets this parameter to 'on'.

#### VerticalAlignment — Vertical anchor point of annotation

'top' (default) | 'middle' | 'bottom' | 'cap' | 'baseline'

Vertical anchor point of annotation, specified as one of the values listed in this table.

Value	Description
'top'	The top of the annotation remains fixed as the annotation grows or shrinks.
'middle'	The middle of the annotation remains fixed as the annotation grows or shrinks.
'bottom'	The bottom of the annotation remains fixed as the annotation grows or shrinks.
'cap'	Not recommended.
'baseline'	Not recommended.

#### Dependencies

To enable VerticalAlignment, set FixedHeight to 'off'.

#### FixedWidth — Option to control annotation width

'off' (default) | on/off logical value

Option to control annotation width, specified as 'on' or 'off', or numeric or logical 1 (true) or 0 (false). A value of 'on' is equivalent to true, and 'off' is equivalent to false. Thus, you can use the value of this property as a logical value. The value is stored as an on/off logical value of type OnOffSwitchState.

- 'on' — The annotation does not resize to accommodate text changes. When text cannot fit inside the annotation bounds, it wraps onto the next line.
- 'off' — The annotation automatically resizes to accommodate text changes.

Interactively resizing the annotation sets this parameter to 'on'.

#### HorizontalAlignment — Horizontal alignment of text within annotation

'left' (default) | 'center' | 'right'

Horizontal alignment of text within annotation, specified as one of the values listed in the table.

Value	Result
'left'	Text in the annotation is left justified.
'center'	Text in the annotation is centered.
'right'	Text in the annotation is right justified.

### InternalMargins — Space between bounding box and borders

[0 0 0 0] (default) | 1x4 array

Space between bounding box of text and borders of annotation, specified as a 1x4 array. The array provides the space between the text and each side of the annotation. The elements of the array specify the space at the left, top, right, and bottom sides in order ([left top right bottom]).

Supported coordinates are between -1073740824 and 1073740823, inclusive.

Data Types: double

### Position — Location of annotation

[0 0 28 14] (default) | 1x4 array

Location of annotation, specified as a 1x4 array. The array provides the locations of the annotation sides, in pixels. The elements of the array specify the locations of the left, top, right, and bottom sides in order ([left top right bottom]).

The origin is the upper-left corner of the Simulink Editor canvas before any canvas resizing. Positive values are to the right of and down from the origin. Negative values are to the left of and up from the origin. Supported coordinates are between -1073740824 and 1073740823, inclusive.

### Dependencies

- To programmatically move the location of the right side without moving the left side the same amount, `FixedWidth` must be set to 'on'.
- To programmatically move the location of the bottom side without moving the top side the same amount, `FixedHeight` must be set to 'on'.

Data Types: double

### Metadata

#### Description — Description of annotation

character vector | string scalar

Description of annotation, specified as a character vector or string scalar.

Data Types: char | string

#### Tag — Text tag for annotation

character vector | string scalar

Text tag for annotation, specified as a character vector or string scalar.

Data Types: char | string

#### UserData — Data to associate with annotation

user data

Data to associate with annotation.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `string` | `struct` | `table` | `cell` | `function_handle` | `categorical` | `datetime` | `duration` | `calendarDuration` | `fi`

### Callback Functions

#### **ClickFcn — MATLAB code that executes when you click annotation**

character vector | string scalar

MATLAB code that executes when you click annotation, specified as a character vector or string scalar.

For more information, see “Make Annotations Interactive”.

### Dependencies

When `UseDisplayTextAsClickCallback` is set to `'on'`, the `ClickFcn` value matches the `Name` and `Text` value.

Data Types: `char` | `string`

#### **UseDisplayTextAsClickCallback — Option to use text as click function**

`'off'` (default) | on/off logical value

Option to use text as click function, specified as `'on'` or `'off'`, or numeric or logical `1` (`true`) or `0` (`false`). A value of `'on'` is equivalent to `true`, and `'off'` is equivalent to `false`. Thus, you can use the value of this property as a logical value. The value is stored as an on/off logical value of type `OnOffSwitchState`.

- `'on'` — Clicking the annotation runs the annotation text specified by `Text`, which is interpreted as a valid MATLAB expression.
- `'off'` — Clicking the annotation runs the function specified by `ClickFcn`, if available. If a click function is not specified, clicking the annotation does not run a function.

For more information, see “Make Annotations Interactive”.

#### **LoadFcn — MATLAB code to execute when model containing annotation loads**

character vector | string scalar

MATLAB code to execute when model containing annotation is loaded, specified as a character vector or string scalar. For more information, see “Make Annotations Interactive”.

Data Types: `char` | `string`

#### **DeleteFcn — MATLAB code to execute before programmatically deleting annotation**

character vector | string scalar

MATLAB code to execute before programmatically deleting annotation, specified as a character vector or string scalar.

For more information, see “Make Annotations Interactive”.

Data Types: `char` | `string`

**Information (Read-Only)****Type — Annotation type**

'annotation' (default)

This property is read-only.

Annotation type, returned as 'annotation'.

**AnnotationType — Type of annotation**

'note\_annotation' | 'area\_annotation' | 'image\_annotation'

This property is read-only.

Type of annotation, specified as 'note\_annotation' for a text-based note, 'area\_annotation' for an area, or 'image\_annotation' for an image.

To programmatically create an area, see “Create Area Programmatically”.

To programmatically create an image-only annotation, see setImage.

**IsImage — Check whether annotation is image-only annotation**

'off' (default) | 'on'

This property is read-only.

Check whether annotation is an image-only annotation, returned as 'on' or 'off'.

**PlainText — Text in annotation**

vector

This property is read-only.

Text in annotation, without formatting, returned as a vector.

**Handle — Annotation handle**

double

This property is read-only.

Annotation handle, returned as a double.

**Parent — System that contains annotation**

character vector

This property is read-only.

System that contains annotation, returned as a character vector.

**Path — Path to annotation**

character vector

This property is read-only.

Path to annotation, returned as a character vector.

## Object Functions

view	Find annotation
setImage	Specify image to display as annotation
delete	Delete annotation

## Examples

### Create Annotation Programmatically

Programmatically create, modify, and view an annotation.

Open a new model.

```
open_system(new_system)
```

Create an annotation with default properties using the `Simulink.Annotation` function.

```
a = Simulink.Annotation(gcs, 'This is an annotation.');
```

After creating the annotation, use dot notation to set property values. For example, apply an 18-point font and light blue background to the annotation.

```
a.FontSize = 18;
a.BackgroundColor = 'lightBlue';
```

To view and briefly highlight the new annotation, use the `view` function.

```
view(a)
```

### Create Annotation with Custom Properties

Programmatically create an annotation with custom properties.

Open a model.

```
new_system('CreateAnnotationModel')
open_system('CreateAnnotationModel')
```

Create an annotation with custom properties specified as comma-separated pairs consisting of the property and value by using the `Simulink.Annotation` function. For example, apply an 18-point font and light blue background to the annotation.

```
a = Simulink.Annotation('CreateAnnotationModel/This is an annotation.', ...
 'FontSize', 18, 'BackgroundColor', 'lightblue');
```

## Tips

- To programmatically modify an existing annotation, use the `find_system` function to get the annotation handle, then use the `get_param` function to get the object. For example:

```
h = find_system(gcs, 'FindAll', 'on', 'Type', 'annotation');
a1 = get_param(h(1), 'Object');
```

- If an annotation invoked a currently executing callback function, use the `getCallbackAnnotation` to determine which annotation invoked it. The function returns the corresponding `Annotation` object. This function is also useful if you write a callback function in a separate MATLAB file that contains multiple callback calls.

## Alternative Functionality

You also can create annotations using the `add_block` function. For example:

- `add_block('built-in/Note','model/This is a note.', 'BackgroundColor', 'yellow')` creates a note annotation with a yellow background.
- `add_block('built-in/Area','model/This is an Area.', 'Position', [120, 100, 230, 200])` creates an area annotation at the specified position.

To interactively create an annotation and edit its properties, see “Describe Models Using Notes and Annotations”.

## Version History

**Introduced before R2006a**

# delete

**Package:** Simulink

Delete annotation

## Syntax

```
delete(a)
```

## Description

`delete(a)` deletes the specified annotation.

## Examples

### Delete Annotation

Programmatically delete an annotation.

Open the vdp model.

```
vdp
```

To get the handles for the annotations in the model, use the `find_system` function.

```
h = find_system(gcs, 'FindAll', 'on', 'Type', 'annotation');
```

To identify the annotations, query the text inside the annotations.

```
get_param(h, 'PlainText')

ans = 2x1 cell
 {'Copyright 2004-2020 The MathWorks, Inc.'}
 {'van der Pol Equation'}
```

To delete the title of the model ('van der Pol Equation'), get the `Simulink.Annotation` object that corresponds to the second handle.

```
a = get_param(h(2), 'Object');
```

Delete the annotation from the model.

```
delete(a)
```

## Input Arguments

### **a** — Annotation

`Simulink.Annotation` object

Annotation, specified as a `Simulink.Annotation` object.

## **Version History**

# setImage

**Package:** Simulink

Specify image to display as annotation

## Syntax

```
setImage(a,img)
```

## Description

`setImage(a,img)` changes the annotation to display only the specified image.

## Examples

### Add Image to Model

Add an image to your model, such as a logo, by creating an image-only annotation.

Open a new model and create an annotation in it.

```
open_system(new_system)
a = Simulink.Annotation(gcs,'This is an annotation.');
```

Change the annotation to display only the specified image.

```
img = fullfile(matlabroot,'toolbox','matlab','imagesci','peppers.png');
setImage(a,img)
```

## Input Arguments

### **a** — Annotation

Simulink.Annotation object

Annotation, specified as a Simulink.Annotation object.

### **img** — Image filename

character vector | string scalar

Image filename, specified as a character vector or string scalar. The filename must contain the file extension and can include a partial path, complete path, relative path, or no path.

Data Types: char | string

# Simulink.BlockPath

Fully specified Simulink block path

## Description

A `Simulink.BlockPath` object represents a fully specified block path that uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times.

## Creation

Use either the `Simulink.BlockPath` or `gcbp` function to create a `Simulink.BlockPath` object. To get a `Simulink.BlockPath` object for the most recently clicked or loaded block, use the `gcbp` function.

## Syntax

```
bp = Simulink.BlockPath
bp = Simulink.BlockPath(blockpath)
bp = Simulink.BlockPath(paths)
bp = Simulink.BlockPath(paths, subpath)
```

### Description

`bp = Simulink.BlockPath` creates an empty `BlockPath` object.

`bp = Simulink.BlockPath(blockpath)` creates a copy of the specified `BlockPath` object.

`bp = Simulink.BlockPath(paths)` creates a `BlockPath` object from the specified character vector or cell array of character vectors. Each character vector represents a path at a level of the model hierarchy. Simulink builds the full block path based on the character vectors.

`bp = Simulink.BlockPath(paths, subpath)` additionally specifies an individual component of the block, such as a signal, that you specify with the `subpath` argument.

### Input Arguments

#### **blockpath** — Existing `BlockPath` object

`BlockPath` object

Existing `BlockPath` object that you want to copy, specified as a `BlockPath` object.

#### **paths** — Paths used to build block path

character vector | cell array of character vectors

Paths used to build the block path, specified as a character vector or cell array of character vectors.

Specify each character vector in order, from the top model to the specific block for which you are creating a `BlockPath` object.

Each character vector must be a path to a block within the Simulink model. The block must be:

- A block in a single model
- A Model block (except for the last character vector, which may be a block other than a Model block)
- A block in the model referenced by the Model block that the previous character vector specifies

### subpath — Individual component of block

character vector

Individual component of a block, such as a signal, specified as a character vector.

## Properties

### SubPath — Component of block

' ' (default) | character vector

Component of the block, specified as a character vector that provides the block path. For example, if the block path refers to a Stateflow chart, you can use `SubPath` to indicate the chart signals.

Example: `'gear_state.first'`

Data Types: `char`

## Object Functions

<code>convertToCell</code>	Convert block path to cell array of character vectors
<code>getBlock</code>	Get single block path in model reference hierarchy
<code>getLength</code>	Get number of hierarchy levels in block path
<code>open</code>	Open specified model, library, subsystem, or block
<code>validate</code>	Determine whether block path represents valid block hierarchy

## Examples

### Create Simulink.BlockPath Object Using Cell Array

Create a block path object called `bp2`, using a cell array of character vectors representing elements of the block path.

```
sldemo_mdref_depgraph
bp2 = Simulink.BlockPath({'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/Fahrenheit to Celsius', ...
'sldemo_mdref_F2C/Gain1'})
```

```
bp2 =
```

```
Simulink.BlockPath
Package: Simulink
```

```
Block Path:
sldemo_mdref_depgraph/thermostat
sldemo_mdref_heater/Fahrenheit to Celsius
sldemo_mdref_F2C/Gain1
```

The resulting block path reflects the model reference hierarchy for the block path.

## **Version History**

**Introduced in R2010b**

### **See Also**

#### **Classes**

`Simulink.SimulationData.BlockPath` | `Simulink.SimulationData.Dataset`

#### **Functions**

`gcbp`

## convertToCell

**Package:** Simulink

Convert block path to cell array of character vectors

### Syntax

```
cellarray = convertToCell(bp)
```

### Description

`cellarray = convertToCell(bp)` converts a block path to a cell array of character vectors.

### Examples

#### Create Cell Array that Represents Block Path

Open the example model, which references multiple models.

```
sldemo_mdhref_depgraph
```

Create a `Simulink.BlockPath` object.

```
bp = Simulink.BlockPath({'sldemo_mdhref_depgraph/thermostat', ...
'sldemo_mdhref_heater/Fahrenheit to Celsius', ...
'sldemo_mdhref_F2C/Gain1'});
```

Create a cell array that represents the elements of the block path.

```
cellarray = convertToCell(bp)
```

```
cellarray =
```

```
3x1 cell array
```

```
 {'sldemo_mdhref_depgraph/thermostat' }
 {'sldemo_mdhref_heater/Fahrenheit to Celsius'}
 {'sldemo_mdhref_F2C/Gain1' }
```

### Input Arguments

#### bp — Fully specified block path

`Simulink.BlockPath` object

Fully specified block path, specified as a `Simulink.BlockPath` object. This block path uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times.

## Output Arguments

### **cellarray — Block path elements**

cell array of character vectors

Block path elements, returned as a cell array of character vectors.

## Version History

Introduced in R2010b

## See Also

### **Objects**

Simulink.BlockPath

### **Functions**

getBlock | getLength | open | validate

## getBlock

**Package:** Simulink

Get single block path in model reference hierarchy

### Syntax

```
block = getBlock(bp,index)
```

### Description

`block = getBlock(bp,index)` returns the block path of the block at the level of the model reference hierarchy specified by the `index` argument.

### Examples

#### Get Block Path for Specified Model Hierarchy Level

Open the example model, which references multiple models.

```
sldemo_mdhref_depgraph
```

Create a `Simulink.BlockPath` object.

```
bp = Simulink.BlockPath({'sldemo_mdhref_depgraph/thermostat', ...
'sldemo_mdhref_heater/Fahrenheit to Celsius', ...
'sldemo_mdhref_F2C/Gain1'});
```

Get the block for the second level in the model reference hierarchy.

```
blockpath = getBlock(bp,2)
```

```
blockpath =
```

```
 'sldemo_mdhref_heater/Fahrenheit to Celsius'
```

Get the block for the third level in the model reference hierarchy.

```
blockpath = getBlock(bp,3)
```

```
blockpath =
```

```
 'sldemo_mdhref_F2C/Gain1'
```

### Input Arguments

**bp** — Fully specified block path

`Simulink.BlockPath` object

Fully specified block path, specified as a `Simulink.BlockPath` object. This block path uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times.

### **index — Index of block**

integer

Index of the block for which you want to get the block path, specified as an integer. The index reflects the level in the model reference hierarchy. For example:

- An index of 1 represents a block in the top model.
- An index of 2 represents a block in the model that is referenced by the Model block of index 1.
- An index of  $n$  represents a block in the model that is referenced by the Model block of index  $n - 1$ .

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

## **Output Arguments**

### **block — Block path of block**

character vector

Block path of the block at the level of the model reference hierarchy specified by the `index` argument, returned as a character vector.

## **Version History**

**Introduced in R2010b**

## **See Also**

### **Objects**

`Simulink.BlockPath`

### **Functions**

`convertToCell` | `getLength` | `open` | `validate`

## getLength

**Package:** Simulink

Get number of hierarchy levels in block path

### Syntax

```
length = getLength(bp)
```

### Description

`length = getLength(bp)` returns a numeric value that corresponds to the number of levels in the model reference hierarchy for the block path.

### Examples

#### Get Number of Hierarchy Levels in Block Path

Create a `Simulink.BlockPath` object that represents a referenced model within a model hierarchy.

```
load_system('sldemo_mdhref_depgraph')
bp = Simulink.BlockPath({'sldemo_mdhref_depgraph/thermostat', ...
 'sldemo_mdhref_heater/Fahrenheit to Celsius'});
```

Get the number of hierarchy levels in the block path for the `Simulink.BlockPath` object.

```
length = getLength(bp)
```

```
length =
```

```
 2
```

### Input Arguments

#### **bp** — Fully specified block path

`Simulink.BlockPath` object

Fully specified block path, specified as a `Simulink.BlockPath` object. This block path uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times.

### Output Arguments

#### **length** — Length of block path

integer

Length of the block path, returned as an integer. The length is the number of levels in the model reference hierarchy.

## **Version History**

Introduced in R2010b

### **See Also**

#### **Objects**

Simulink.BlockPath

#### **Functions**

convertToCell | getBlock | open | validate

## open

**Package:** Simulink

Open specified model, library, subsystem, or block

### Syntax

```
open(bp)
open(bp, Name, Value)
```

### Description

`open(bp)` opens the specified model, library, subsystem, or block. This is equivalent to double-clicking the model or library in the Current Folder browser or the subsystem or block in the Simulink Editor.

`open(bp, Name, Value)` opens the specified model, library, subsystem, or block with additional options.

### Examples

#### Open Referenced Model in Context of Model Hierarchy

Create a `Simulink.BlockPath` object that represents a referenced model within a model hierarchy.

```
load_system('sldemo_mdref_depgraph')
bp = Simulink.BlockPath({'sldemo_mdref_depgraph/thermostat', ...
 'sldemo_mdref_heater/Fahrenheit to Celsius'});
```

Open the referenced model specified by `bp` in the context of the model hierarchy.

```
open(bp)
```

#### Open Referenced Model in New Window

Open the `sldemo_mdref_depgraph` model.

```
sldemo_mdref_depgraph
```

Create a `Simulink.BlockPath` object that represents a referenced model within a model hierarchy.

```
bp = Simulink.BlockPath({'sldemo_mdref_depgraph/thermostat', ...
 'sldemo_mdref_heater/Fahrenheit to Celsius'})
```

Open the referenced model specified by `bp` in a new window.

```
open(bp, 'OpenType', 'new-window')
```

## Input Arguments

### bp — Fully specified block path

Simulink.BlockPath object

Fully specified block path, specified as a Simulink.BlockPath object. This block path uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times.

### Name-Value Pair Arguments

Specify optional pairs of arguments as Name1=Value1, ..., NameN=ValueN, where Name is the argument name and Value is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `open(bp, 'OpenType', 'new-window')`

### OpenType — Option to open object in new tab or window

'current-tab' (default) | 'new-tab' | 'new-window'

Option to open object in a new tab or window, specified as the comma-separated pair consisting of 'OpenType' and 'current-tab', 'new-tab', or 'new-window'. This option determines whether the subsystem or model specified by a Simulink.BlockPath object opens in the current window and tab, a new tab, or a new window, respectively.

Data Types: char | string

### Force — Option to open object under block mask

'off' (default) | 'on'

Option to open the object under the block mask, specified as the comma-separated pair consisting of 'Force' and 'off' or 'on'. When this argument is set to 'off', the function opens the block mask. When this argument is set to 'on', the function opens the dialog box of the block under the mask or opens the masked system in a new tab, which is equivalent to the **Look Under Mask** menu item. It forces the Simulink.BlockPath object to open, regardless of the block mask.

Data Types: char | string

## Version History

Introduced in R2019a

## See Also

### Objects

Simulink.BlockPath

### Functions

open\_system | validate

# validate

**Package:** Simulink

Determine whether block path represents valid block hierarchy

## Syntax

```
validate(bp)
```

## Description

`validate(bp)` determines whether the block path represents a valid block hierarchy. If the block path is invalid, the function returns an error. The function checks that:

- All elements in the block path represent valid blocks
- Each element except the last is a valid Model block and references the model of the following element

## Examples

### Validate Block Path

Create a `Simulink.BlockPath` object that incorrectly represents a referenced model within a model hierarchy.

```
load_system('sldemo_mdref_depgraph')
bp = Simulink.BlockPath({'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/F2C'});
```

Check whether the block path is valid.

```
validate(bp);
```

The function returns an error because the block path is invalid. It does not specify the name of a block in the `sldemo_mdref_heater` model.

Create a `Simulink.BlockPath` object that correctly represents the referenced model within a model hierarchy.

```
bp = Simulink.BlockPath({'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/Fahrenheit to Celsius'});
```

Check whether the block path is valid.

```
validate(bp);
```

The block path is valid, so the function does not return an error.

## Input Arguments

### **bp — Fully specified block path**

`Simulink.BlockPath` object

Fully specified block path, specified as a `Simulink.BlockPath` object. This block path uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times.

## Version History

**Introduced in R2010b**

## See Also

## Simulink.Bus

Specify properties of buses

### Description

A `Simulink.Bus` object is a data type that, when used with `Simulink.BusElement` objects, specifies and validates the properties of a bus. When you simulate or update a model, Simulink checks whether buses connected to blocks match the `Simulink.Bus` object data types that the blocks specify.

A `Bus` object specifies only the architectural properties of a bus. For example, a bus object can specify element names, hierarchy, order, and data types. A `Bus` object cannot specify the values of the signals in a bus.

A `Bus` object is analogous to a structure definition in C: it defines the members of the bus but does not create the bus. A `Bus` object is also similar to a cable connector. The connector defines all the pins and their configuration and controls what types of wires can be connected to it. Similarly, a `Bus` object defines the configuration and properties of the signals that the associated bus must have.

`Bus` objects contain `Simulink.BusElement` objects. Each `BusElement` object specifies the properties of a signal in a bus, such as its name, data type, and dimension. The order of the `BusElement` objects in the `Bus` object defines the order of the signals in the bus.

A `Bus` object can specify properties that were not defined by constituent signals, but were left to be inherited.

To create and modify `Bus` objects in the base workspace or a data dictionary, you can use the **Type Editor**, **Model Explorer**, or MATLAB commands. You cannot store `Bus` objects in model workspaces.

To use `Bus` objects in a model, see “Specify Bus Properties with `Simulink.Bus` Object Data Types”.

### Creation

You can create a `Bus` object in multiple ways.

- To programmatically create a `Bus` object, use the `Simulink.Bus` function described below.
- To interactively create a `Bus` object, use the **Type Editor** or **Model Explorer**.
- To create `Bus` objects from blocks in a model, MATLAB data, and external C code, see “Programmatically Create Simulink Bus Objects”.

### Syntax

```
name = Simulink.Bus
```

#### Description

`name = Simulink.Bus` returns a `Bus` object with default property values. The name of the `Bus` object is the name of the MATLAB variable to which you assign the `Bus` object.

## Properties

### Description — Bus description

' ' (default) | character vector

Bus description, specified as a character vector. Use the description to document information about the `Bus` object, such as the kind of signal it applies to or where the `Bus` object is used. This information does not affect Simulink processing.

Data Types: `char` | `string`

### Elements — Elements of bus

empty array (default) | array of `Simulink.BusElement` objects

Elements of bus, specified as an array of `Simulink.BusElement` objects. Each `BusElement` object defines the name, data type, dimensions, and other properties of a signal within the bus. For more information, see `Simulink.BusElement`.

### DataScope — Data type definition mode in generated code

'Auto' (default) | 'Exported' | 'Imported'

Data type definition mode in generated code, specified as 'Auto', 'Exported', or 'Imported'. This property specifies whether during code generation the data type definition is imported from, or exported to, the header file specified with the `HeaderFile` property.

Value	Action
'Auto' (default)	Import the data type definition from the specified header file. If you do not specify the header file, export the data type definition to the default header file.
'Exported'	Export the data type definition to the specified header file or default header file.
'Imported'	Import the data type definition from the specified header file or default header file.

Set the data scope to `Imported` or `Exported` to avoid potential MISRA C:2012 violations.

Data Types: `char` | `string`

### HeaderFile — C header file used with data type definition

' ' (default) | character vector

C header file used with data type definition, specified as a character vector. Based on the value of the `DataScope` property, import the data type definition from or export the data type definition to the header file. The Simulink Coder software uses this property for code generation. Simulink software ignores this property.

By default, the generated `#include` directive uses the preprocessor delimiter `"` instead of `<` and `>`. To generate the directive `#include <myTypes.h>`, specify `HeaderFile` as `<myTypes.h>`.

Data Types: `char` | `string`

### Alignment — Data alignment boundary

-1 (default) | integer

Data alignment boundary, specified as an integer, in number of bytes. The Simulink Coder software uses this property for code generation. Simulink software ignores this property.

The starting memory address for the data allocated for the bus is a multiple of the `Alignment` setting. If the object occurs in a context that requires alignment, you must specify an `Alignment` value with a positive integer that is a power of 2, not exceeding 128.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

### **PreserveElementDimensions — Specification to preserve dimensions of multidimensional bus elements**

`'false'` (default) | `'true'`

Specification for the code generator to preserve dimensions of multidimensional bus elements in the generated code. For more information, see “Preserve Dimensions of Bus Elements in Generated Code” (Embedded Coder).

Data Types: `logical`

## **Examples**

### **Create Bus Objects from Bus Element Objects**

Create a hierarchy of `Simulink.Bus` objects using arrays of `Simulink.BusElement` objects.

Create an array that contains two `BusElement` objects, named `Chirp` and `Sine`, in the base workspace.

```
elems(1) = Simulink.BusElement;
elems(1).Name = 'Chirp';
```

```
elems(2) = Simulink.BusElement;
elems(2).Name = 'Sine';
```

Array indexing lets you create and access the elements of the array. Dot notation lets you access property values of the elements.

Create a `Bus` object, named `Sinusoidal`, that contains the elements defined in the `elems` array.

```
Sinusoidal = Simulink.Bus;
Sinusoidal.Elements = elems;
```

To create a hierarchy of `Bus` objects, create another `Bus` object to reference the `Bus` object named `Sinusoidal`.

Create an array that contains two `BusElement` objects, named `NestedBus` and `Step`. Specify the `Bus` object named `Sinusoidal` as the data type of the `NestedBus` element.

```
clear elems
```

```
elems(1) = Simulink.BusElement;
elems(1).Name = 'NestedBus';
elems(1).DataType = 'Bus: Sinusoidal';
```

```
elems(2) = Simulink.BusElement;
elems(2).Name = 'Step';
```

Create a Bus object, named TopBus, that contains the elements defined in the elems array.

```
TopBus = Simulink.Bus;
TopBus.Elements = elems;
```

You can view the hierarchy of the created objects in the **Type Editor**.

typeeditor

# Simulink.BusElement

Specify properties of elements of buses

## Description

A `Simulink.BusElement` object is an element of a `Simulink.Bus` object that validates the properties of an element in a bus. When you simulate or update a model, Simulink checks whether the properties specified by the `BusElement` object match the properties specified by the corresponding bus elements.

`BusElement` objects exist only within the `Bus` object. You can specify a `Bus` object, but not a `BusElement` object, as a data type.

To create and modify `Bus` and `BusElement` objects in the base workspace or a data dictionary, you can use the **Type Editor**, **Model Explorer**, or MATLAB commands. You cannot store `Bus` objects in model workspaces.

## Creation

You can create a `BusElement` object in multiple ways.

- To programmatically create a `BusElement` object, use the `Simulink.BusElement` function (described here).
- To interactively create a `BusElement` object, use the **Type Editor** or **Model Explorer**.
- To create `BusElement` objects from blocks in a model, MATLAB data, and external C code, see “Programmatically Create Simulink Bus Objects”.

## Syntax

```
be = Simulink.BusElement
```

### Description

`be = Simulink.BusElement` returns a `BusElement` object with default property values.

## Properties

### Name — Name of element

'a' (default) | character vector

Name of element, specified as a character vector.

---

**Note** To validate the properties of a signal against a `BusElement` object, the signal name must be a valid identifier that starts with an alphabetic character or underscore (`_`), followed by alphanumeric characters or underscores.

---

Data Types: char | string

### Complexity — Numeric type of element

'real' (default) | 'complex'

Numeric type of the element, specified as 'real' or 'complex'.

Data Types: char | string

### Dimensions — Dimensions of element

1 (default) | scalar | vector

Dimensions of element, specified as a scalar or vector.

To use symbolic dimensions in generated code, see “Implement Symbolic Dimensions for Array Sizes in Generated Code” (Embedded Coder).

Data Types: double

### Data Type — Data type of element

'double' (default) | character vector | string scalar

Data type of element, specified as a character vector or string scalar.

Click the **Show data type assistant** button  to display the **Data Type Assistant**, which helps you set the data type attributes. For more information, see “Specify Data Types Using Data Type Assistant”.

You can specify any of these options:

- Built-in Simulink data type — For example, specify 'single' or 'uint8'. See “Data Types Supported by Simulink”.
- Fixed-point data type — Use the `fixdt` function. For example, specify 'fixdt(1,16,0)'.
- Enumerated data type — Use the name of the type preceded by `Enum:`. For example, specify 'Enum: myEnumType'.
- Bus data type — Use the name of the `Simulink.Bus` object preceded by `Bus:`. For example, specify 'Bus: myBusObject'.
- Value type — Use the name of the `Simulink.ValueType` object preceded by `ValueType:`. For example, specify 'ValueType: windVelocity'.
- Custom data type — Use a MATLAB expression that specifies the type. For example, you can specify a `Simulink.NumericType` object whose `DataTypeMode` property is set to a value other than 'Fixed-point: unspecified scaling'.

Specifying a `Simulink.Bus` object allows you to create Bus objects that specify hierarchical buses (that is, buses that contain other buses).

When you specify a `Simulink.ValueType` or `Simulink.Bus` object, the object defines more than the data type. The object also defines properties such as **Min**, **Max**, and **Unit**. The property values specified by the `ValueType` object override the corresponding property values specified by a block. For example, suppose a block sets **Unit** to ft/s. When the **Data type** of the block specifies a `ValueType` object that has m/s as its unit, the block uses m/s instead of ft/s.

Data Types: char | string

**Min — Minimum value of element**

[] (default) | scalar

Minimum value of the element, specified as a scalar. This value must be a finite real double scalar or, if the element is a bus, the value must be empty, [].

Data Types: double

**Max — Maximum value of element**

[] (default) | scalar

Maximum value of the element, specified as a scalar. This value must be a finite real double scalar or, if the element is a bus, the value must be empty, [].

Data Types: double

**DimensionsMode — Specify how to handle size of element**

'Fixed' (default) | 'Variable'

Specify how to handle size of element, specified as 'Fixed' or 'Variable'.

Data Types: char | string

**Unit — Physical unit for expressing element**

' ' (default) | character vector

Physical unit for expressing element, specified as a character vector.

For more information, see “Unit Specification in Simulink Models”.

Example: 'inches'

Data Types: char | string

**Description — Bus element description**

' ' (default) | character vector

Bus element description, specified as a character vector. Use the description to document information about the BusElement object, such as the kind of signal it applies to. This information does not affect Simulink processing.

Data Types: char | string

## Examples

**Create Bus Objects from Bus Element Objects**

Create a hierarchy of Simulink.Bus objects using arrays of Simulink.BusElement objects.

Create an array that contains two BusElement objects, named Chirp and Sine, in the base workspace.

```
elems(1) = Simulink.BusElement;
elems(1).Name = 'Chirp';
```

```
elems(2) = Simulink.BusElement;
elems(2).Name = 'Sine';
```

Array indexing lets you create and access the elements of the array. Dot notation lets you access property values of the elements.

Create a `Bus` object, named `Sinusoidal`, that contains the elements defined in the `elems` array.

```
Sinusoidal = Simulink.Bus;
Sinusoidal.Elements = elems;
```

To create a hierarchy of `Bus` objects, create another `Bus` object to reference the `Bus` object named `Sinusoidal`.

Create an array that contains two `BusElement` objects, named `NestedBus` and `Step`. Specify the `Bus` object named `Sinusoidal` as the data type of the `NestedBus` element.

```
clear elems

elems(1) = Simulink.BusElement;
elems(1).Name = 'NestedBus';
elems(1).DataType = 'Bus: Sinusoidal';

elems(2) = Simulink.BusElement;
elems(2).Name = 'Step';
```

Create a `Bus` object, named `TopBus`, that contains the elements defined in the `elems` array.

```
TopBus = Simulink.Bus;
TopBus.Elements = elems;
```

You can view the hierarchy of the created objects in the **Type Editor**.

```
typeeditor
```

## Version History

Introduced before R2006a

### **Simulink.BusElement** objects no longer support the **SampleTime** property

*Errors starting in R2020b*

The `SampleTime` property of `Simulink.BusElement` objects is no longer supported.

`BusElement` objects that specify a sample time cause an error during compile. To remove the sample time specification from a `BusElement` object, set its `SampleTime` to `-1`.

`Simulink.Bus.cellToObject` continues to accept cell arrays that specify sample time for bus elements. `Simulink.Bus.objectToCell`, `Simulink.Bus.save`, and `Simulink.Bus.createObject` continue to return cell arrays or arrays that include the sample time when it is noninherited. When the sample time is inherited (`-1`), they omit it. Similarly, the **Type Editor** and **Model Explorer** omit the sample time when it is inherited.

To specify the sample time for an element of a bus, use the `SampleTime` block parameter of corresponding blocks. For example, you can use `In Bus Element`, `Out Bus Element`, and `Signal Specification` blocks to specify sample time.

### **Simulink.BusElement** objects will no longer support the **SamplingMode** property

*Not recommended starting in R2016b*

In R2016b, the `SamplingMode` property of `Simulink.BusElement` objects was removed. Scripts that use the `SamplingMode` property of `Simulink.BusElement` objects continue to work. `Simulink.Bus.cellToObject` continues to require the `SamplingMode` field and `Simulink.Bus.objectToCell` continues to include the sampling mode in the output cell arrays.

In a future release, support for the `SamplingMode` property will be removed.

To specify whether a signal is sample-based or frame-based, define the sampling mode of input signals at the block level instead of at the signal level.

# Simulink.CoderInfo

Specify information needed to generate code for signal, state, or parameter data

## Description

Use a `Simulink.CoderInfo` object to specify code generation settings for signal, state, and parameter data in a model.

Simulink creates a `Simulink.CoderInfo` object for each data object that you create. Data objects represent signal, state, or parameter data. The `Simulink.CoderInfo` object exists in the `CoderInfo` property of each data object.

Data objects include objects of these classes:

- `Simulink.Parameter`
- `Simulink.Signal`
- `Simulink.LookupTable`
- `Simulink.Breakpoint`
- `Simulink.DualScaledParameter`

Use the properties of the `Simulink.CoderInfo` object to configure the representation of the parent data object in the generated code.

You can set the properties of a `Simulink.CoderInfo` object through the `CoderInfo` property or the property dialog box of the parent data object. For example, the following MATLAB expression sets the `StorageClass` property of a `Simulink.CoderInfo` object used by a signal object named `mysignal`.

```
mysignal.CoderInfo.StorageClass = 'ExportedGlobal';
```

## Creation

When you create a data object, Simulink sets the value of the `CoderInfo` property by creating a `Simulink.CoderInfo` object. You do not need to create a `Simulink.CoderInfo` object explicitly.

## Properties

### Identifier — Alternative name for code generation

' ' (empty character vector) (default) | character vector

Alternative name for the data in the generated code, specified as a character vector.

Example: `'myOtherName'`

Data Types: `char`

### Alignment — Data alignment boundary

-1 (default) | positive integer

Data alignment boundary for this data, specified as a positive integer that is a power of 2, not exceeding 128. Specify an integer number of double data type. See “Data Alignment for Code Replacement” (Embedded Coder) for more information.

Example: 8

Data Types: double

Complex Number Support: Yes

### **CustomAttributes — Custom storage class attributes of this data**

`SimulinkCSC.AttribClass_Simulink_Default` object (default) | custom attributes object

Custom storage class attributes of this data, returned as a custom attributes object. You must set the property `StorageClass` to 'Custom' to enable this property.

Depending on the custom storage class that you apply by using the `CustomStorageClass` property of the `Simulink.CoderInfo` object, Simulink sets the value of this property by creating a custom attributes object. Then, you can set the values of the properties of the custom attributes object. See “Organize Parameter Data into a Structure by Using Struct Storage Class” (Embedded Coder) for more information.

### **CustomStorageClass — Custom storage class of this data**

'Default' (default) | character vector

Custom storage class of this data, specified as a character vector. You must set the property `StorageClass` to 'Custom' to enable this property.

For a list of valid custom storage classes (Embedded Coder) when you create the data object from the `Simulink` package, see “Choose Storage Class for Controlling Data Representation in Generated Code” (Embedded Coder).

Example: 'ExportToFile'

Data Types: char

### **StorageClass — Storage class of this data**

'Auto' (default) | character vector

Storage class of this data, specified as a character vector. For more information, see “C Code Generation Configuration for Model Interface Elements” (Simulink Coder).

Example: 'ExportedGlobal'

Data Types: char

## **Examples**

### **Configure Code Generation Settings Programmatically**

For examples that show how to configure code generation settings for a data item programmatically, see “C Code Generation Configuration for Model Interface Elements” (Simulink Coder) and “Organize Parameter Data into a Structure by Using Struct Storage Class” (Embedded Coder).

# Simulink.ConfigSet

Model configuration set

## Description

Use the `Simulink.ConfigSet` object to access a model configuration set. Get information about your configuration set and manage configuration parameters.

The `Simulink.ConfigSet` object is a `handle` object.

## Creation

Use the `getActiveConfigSet` function to get the active configuration set for a model. Use the `getConfigSet` function to get a model configuration set by name.

## Properties

### Description — Description of the configuration set

character vector

Description of the configuration set, specified as a character vector. Use the description to provide additional information about a configuration set, such as its purpose.

### Name — Name of the configuration set

character vector

Name of the configuration set, specified by a character vector. This name represents the configuration set in the Model Explorer.

## Object Functions

<code>copy</code>	Copy configuration set or reference
<code>getFullName</code>	
<code>getModel</code>	
<code>get_param</code>	Get parameter names and values
<code>isActive</code>	
<code>isValidParam</code>	
<code>saveAs</code>	
<code>setPropEnabled</code>	
<code>set_param</code>	Set Simulink parameter value

## Examples

### Get the Active Configuration Set for a Model

Open the model `vdp` and get the active configuration set.

```
vdp
configSetObj = getActiveConfigSet('vdp');
```

## **Version History**

**Introduced in R2006a**

## Simulink.ConfigSetRef

Link model to freestanding configuration set

### Description

Use the ConfigSetRef object to allow a model to reference configuration sets that are not saved in a model.

The Simulink.ConfigSetRef object is a handle object.

### Creation

Create a ConfigSetRef object by using the getConfigSet function to call a model configuration reference by name.

### Properties

#### Description — Description of configuration reference

character vector

Description of the configuration reference, specified as a character vector. Use this property to provide additional information about a configuration reference, such as its purpose. This field can remain blank.

#### Name — Name of configuration reference

character vector

Name of the configuration reference, specified as a character vector. This name represents the configuration reference in the Model Explorer.

#### SourceName — Variable that contains referenced configuration set

character vector

Name of the variable in the workspace or the data dictionary that contains the referenced configuration set, specified as a character vector.

### Object Functions

copy	Copy configuration set or reference
getFullName	
getModel	
get_param	Get parameter names and values
getRefConfigSet	
isActive	
refresh	

### Examples

## Create and Reference a Freestanding Configuration Set

Use a `ConfigSetRef` object to allow a model to use a freestanding configuration set, which is not associated with a model.

Open the model `vdp`. Create a freestanding configuration set by copying the configuration set of the model.

```
model = 'vdp';
open_system(model)

freeConfigSet = copy(getActiveConfigSet(model));
```

Create a configuration reference. To point the reference to your freestanding configuration, set the `SourceName` property to `freeConfigSet`, the base workspace variable that represents your configuration. Name the reference `vdpConfigRef`.

```
configRef = Simulink.ConfigSetRef;
set_param(configRef, 'SourceName', 'freeConfigSet');
set_param(configRef, 'Name', 'vdpConfigRef');
```

Attach the configuration reference to the `vdp` model and activate it.

```
attachConfigSet('vdp', configRef);
setActiveConfigSet('vdp', 'vdpConfigRef');
```

## Version History

Introduced in R2007a

### See Also

## copy

Copy configuration set or reference

### Syntax

```
copyCs = copy(cs)
```

### Description

`copyCs = copy(cs)` returns a copy of a configuration set or configuration reference.

### Examples

#### Attach New Configuration Set to a Model

Create a copy of a configuration set and attach it to a model.

Get the active configuration set for your model.

```
activeConfig = getActiveConfigSet ('vdp');
```

Copy the active configuration set.

```
develConfig = copy(activeConfig);
```

Give the copied configuration set a name.

```
develConfig.Name = 'develConfig';
```

Attach the new configuration set to the model.

```
attachConfigSet('vdp',develConfig);
```

### Input Arguments

#### **cs** — Configuration set

`ConfigSet` object | `ConfigSetRef` object

Configuration set object to copy, specified as a `ConfigSet` object or a `Simulink.ConfigSetRef` object.

### Output Arguments

#### **copyCs** — Copy of configuration set

`ConfigSet` object

A copy of the configuration set, returned as a `ConfigSet` object or a `ConfigSetRef` object.

## **Version History**

**Introduced before R2006a**

# Symbol

C Function block data symbol

## Description

Define C Function block symbols and their properties.

## Creation

Access a `Symbol` object through one of the following methods.

- `addSymbol` function
- `getSymbol` function
- Access the `Symbols` property of a `SymbolSpec` object.

## Properties

### **Name — Symbol name in source code**

character vector

Symbol name in source code, specified as a character vector.

Data Types: character

### **PortNumber — Port number**

scalar integer

Port number, specified as a scalar integer. For input and output symbols, `PortNumber` indicates the port index on the block. For parameter symbols, `PortNumber` indicates the order that the symbol appears in the block parameter mask.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

### **Size — Size dimensions of the symbol**

'1' (default) | character vector

Size of the symbol data specified as a character vector containing a scalar integer. The C Function block supports only scalars and vectors. Matrices and higher-dimension arrays are not supported. You can use a size expression to define the size of an output. Use -1 to inherit size.

Data Types: character

### **Type — Data type of symbol**

'double' (default) | character vector

Data type of the symbol, specified as a character vector that evaluates to a numeric data type, or as a `Simulink.AliasType` object.

Example: `mySymbol.DataType = 'int32'`

Data Types: char

### Scope — Scope of the symbol

'Input' (default) | 'Output' | 'Persistent' | 'Parameter' | 'Constant'

Scope of the symbol, specified as one of the following values.

- **Input** — Input symbol to the C Function block.
- **Output** — Output symbol to the C Function block.
- **Parameter** — Define a symbol as parameter. The parameter name is defined by the `Label` property of the symbol.
- **Persistent** — Define a symbol as persistent data.
- You can define a void pointer using the `Persistent` scope in the C Function block. A *void pointer* is a pointer that can store any type of data that you create or allocate.
- **Constant** — Define a symbol as constant using value-size or numeric expressions.

Data Types: character

### Label — Symbol label

character vector

Symbol label, specified as a character vector. For symbols with their scope set to `Input` or `Output`, this label appears as the port name on the block. For symbols with their scope set to `Parameter`, this label is the label that appears on the block parameter mask. If the scope is `Constant`, the label is the constant expression. You cannot define a label for `Persistent` symbols.

Data Types: character

# SymbolSpec

Query and configure C Function block data symbols

## Description

Use the SymbolSpec object to query and configure C Function block symbol definitions and their properties.

## Creation

### Syntax

```
myCFunctionObj = get_param(CFcnBlk, 'SymbolSpec')
```

### Description

`myCFunctionObj = get_param(CFcnBlk, 'SymbolSpec')` creates a C Function block symbol configuration object for the specified C Function block.

### Input Arguments

#### **CFcnBlk — C Function block**

character vector

C Function block path specified as a character vector, or a handle to the C Function block.

## Properties

### **Symbols — Symbols defined in the C Function block**

Symbol object | array of Symbol objects

The symbols defined in the C Function block, specified as a Symbol object, or an array of Symbol objects.

Symbol objects define the properties of each symbol in the C Function block.

## Object Functions

<code>addSymbol</code>	Add a symbol object definition to a C Function block
<code>getSymbol</code>	Get a symbol object definition of a C Function block
<code>deleteSymbol</code>	Delete a symbol object definition from a C Function block

## Version History

# addSymbol

**Package:** Simulink.CFunctionBlock

Add a symbol object definition to a C Function block

## Syntax

```
mySymbol = addSymbol(mySymbolSpec)
mySymbol = addSymbol(mySymbolSpec, name)
```

## Description

`mySymbol = addSymbol(mySymbolSpec)` creates a `Symbol` object, `mySymbol`, and adds the symbol to the `SymbolSpec` object, `mySymbolSpec`.

`mySymbol = addSymbol(mySymbolSpec, name)` creates a `Symbol` object, `mySymbol`, with the `Name` property specified by `name` and adds the symbol to the `SymbolSpec` object `mySymbolSpec`.

## Examples

### Specify and Edit Symbol Attributes Used in a C Function Block

Access and edit the properties of a symbol used in a C Function block.

Obtain the `SymbolSpec` object of the C Function block in your model using `get_param`. For example, select the C Function block in the model canvas and enter the following at the command line.

```
mySymbolSpec = get_param(gcb, 'SymbolSpec');
```

Use the `addSymbol` function to specify a new parameter symbol, `myParam`, in your C Function block code.

```
myParam = addSymbol(mySymbolSpec, 'myParam')
```

The `Symbol` object, `myParam`, uses default properties. Specify the scope of the symbol using the `Scope` property.

```
myParam.Scope = 'Parameter';
```

You can use the `getSymbol` function to access symbols specified for the block. For example, access the parameter symbol you added.

```
myParam = getSymbol(mySymbolSpec, 'myParam');
```

Edit the label of the parameter in the Block Parameters dialog using the `Label` property.

```
myParam.Label = 'Amplitude';
```

To delete a symbol from the `SymbolSpec` object, use the `deleteSymbol` function.

```
deleteSymbol(mySymbolSpec, 'myParam');
```

## Input Arguments

### **mySymbolSpec** — Symbol specifications of C Function block

SymbolSpec object

Symbol specifications of C Function block, specified as a SymbolSpec object.

### **name** — Name of symbol

character vector

Name of the symbol, specified as a character vector.

Data Types: character

## Output Arguments

### **mySymbol** — Symbol

Symbol object

Symbol added to the C Function block, returned as a Symbol object. The Symbol object has default properties, except when you specify a name for the symbol in the input arguments. You can edit the properties of the Symbol object after creation.

## Version History

Introduced in R2020a

# getSymbol

**Package:** Simulink.CFunctionBlock

Get a symbol object definition of a C Function block

## Syntax

```
mySymbol = getSymbol(mySymbolSpec, name)
```

## Description

`mySymbol = getSymbol(mySymbolSpec, name)` returns the `Symbol` object with the `Name` property specified by `name` associated with the `SymbolSpec` object.

## Examples

### Specify and Edit Symbol Attributes Used in a C Function Block

Access and edit the properties of a symbol used in a C Function block.

Obtain the `SymbolSpec` object of the C Function block in your model using `get_param`. For example, select the C Function block in the model canvas and enter the following at the command line.

```
mySymbolSpec = get_param(gcf, 'SymbolSpec');
```

Use the `addSymbol` function to specify a new parameter symbol, `myParam`, in your C Function block code.

```
myParam = addSymbol(mySymbolSpec, 'myParam')
```

The `Symbol` object, `myParam`, uses default properties. Specify the scope of the symbol using the `Scope` property.

```
myParam.Scope = 'Parameter';
```

You can use the `getSymbol` function to access symbols specified for the block. For example, access the parameter symbol you added.

```
myParam = getSymbol(mySymbolSpec, 'myParam');
```

Edit the label of the parameter in the Block Parameters dialog using the `Label` property.

```
myParam.Label = 'Amplitude';
```

To delete a symbol from the `SymbolSpec` object, use the `deleteSymbol` function.

```
deleteSymbol(mySymbolSpec, 'myParam');
```

## Input Arguments

### **mySymbolSpec** — Symbol specifications of C Function block

SymbolSpec object

Symbol specifications of C Function block, specified as a SymbolSpec object.

### **name** — Name of symbol

character vector

Name of the symbol, specified as a character vector.

Data Types: character

## Output Arguments

### **mySymbol** — Symbol

Symbol object

Symbol associated with the C Function block, returned as a Symbol object.

## Version History

Introduced in R2020a

Delete a symbol object definition from a C Function block

## Syntax

```
deleteSymbol(mySymbolSpec, name)
```

## Description

`deleteSymbol(mySymbolSpec, name)` deletes the `Symbol` object with the `Name` property specified by `name` from the `SymbolSpec` object.

## Examples

### Specify and Edit Symbol Attributes Used in a C Function Block

Access and edit the properties of a symbol used in a C Function block.

Obtain the `SymbolSpec` object of the C Function block in your model using `get_param`. For example, select the C Function block in the model canvas and enter the following at the command line.

```
mySymbolSpec = get_param(gcf, 'SymbolSpec');
```

Use the `addSymbol` function to specify a new parameter symbol, `myParam`, in your C Function block code.

```
myParam = addSymbol(mySymbolSpec, 'myParam')
```

The `Symbol` object, `myParam`, uses default properties. Specify the scope of the symbol using the `Scope` property.

```
myParam.Scope = 'Parameter';
```

You can use the `getSymbol` function to access symbols specified for the block. For example, access the parameter symbol you added.

```
myParam = getSymbol(mySymbolSpec, 'myParam');
```

Edit the label of the parameter in the Block Parameters dialog using the `Label` property.

```
myParam.Label = 'Amplitude';
```

To delete a symbol from the `SymbolSpec` object, use the `deleteSymbol` function.

```
deleteSymbol(mySymbolSpec, 'myParam');
```

## Input Arguments

### **mySymbolSpec** — Symbol specifications of C Function block

SymbolSpec object

Symbol specifications of C Function block, specified as a SymbolSpec object.

### **name** — Name of symbol

character vector

Name of the symbol to delete, specified as a character vector.

Data Types: character

## Simulink.ConnectionBus

Specify properties of physical connection buses

### Description

A `Simulink.ConnectionBus` object is a data type that, when used with `Simulink.ConnectionElement` objects, lets you design rigid interface specifications for Simscape conserving connections. When you apply such rigid specification to a Simscape Bus or Connection Port block, the block ports become typed by the interface and do not accept connections to a different domain type.

A `ConnectionBus` object specifies the architectural properties of an interface, such as element names, hierarchy, and domain types. A `ConnectionBus` object is similar to a cable connector. The connector defines all the pins and their configuration and controls what types of wires can be connected to it. Similarly, a `ConnectionBus` object defines the configuration and domain types of the ports of the associated Simscape Bus or Connection Port blocks.

`ConnectionBus` objects contain `Simulink.ConnectionElement` objects. Each `ConnectionElement` object specifies the properties of a port in a connection bus, such as its name and domain type. To create nested connection buses, specify a `ConnectionElement` on the parent bus and set its type as the child `ConnectionBus` object.

To create and modify `ConnectionBus` objects in the base workspace or a data dictionary, you can use the **Type Editor**, the **Model Explorer**, or MATLAB commands. You cannot store `ConnectionBus` objects in model workspaces.

To simulate a model containing blocks that use a `ConnectionBus` object, that `ConnectionBus` object must be in the base workspace or in a data dictionary. You save and load `ConnectionBus` objects similar to `Simulink.Bus` objects. For more information, see “Determine How to Manage `Simulink.Bus` Objects”.

To apply an existing connection bus specification to a Simscape Bus or Connection Port block, use the **Connection type** parameter and select the bus name from the drop-down list.

### Creation

#### Syntax

```
name = Simulink.ConnectionBus
```

#### Description

`name = Simulink.ConnectionBus` returns a `ConnectionBus` object with default property values. The name of the `ConnectionBus` object is the name of the MATLAB variable to which you assign the `ConnectionBus` object.

## Properties

### Description — Connection bus description

' ' (default) | character vector

Connection bus description, specified as a character vector. Use the description to document information about the `ConnectionBus` object, such as the application it is used for or domain types of its ports. This information does not affect Simulink processing.

Data Types: `char` | `string`

### Elements — Elements of connection bus

empty array (default) | array of `Simulink.ConnectionElement` objects

Elements of connection bus, specified as an array of `Simulink.ConnectionElement` objects. Each `ConnectionElement` object defines the properties of a conserving connection within the bus, such as its name and domain type. For more information, see `Simulink.ConnectionElement`.

## Examples

### Create Connection Bus and Connection Element Objects Using MATLAB Commands

Define a rigid interface with one mechanical translational and one electrical port by creating a `ConnectionBus` object containing a two-element array of `ConnectionElement` objects. Array indexing lets you create and access multiple elements in an array. Dot notation lets you access property values.

Create a `ConnectionBus` object called `MechElec`:

```
MechElec = Simulink.ConnectionBus
```

```
MechElec =
```

```
ConnectionBus with properties:
```

```
 Description: ''
 Elements: [0x0 Simulink.ConnectionElement]
```

By default, the connection bus has no description and an empty array of connection elements.

Use the dot notation to fill in the description:

```
MechElec.Description = 'Rigid interface with one mechanical and one electrical port'
```

```
MechElec =
```

```
ConnectionBus with properties:
```

```
 Description: 'Rigid interface with one mechanical and one electrical port'
 Elements: [0x0 Simulink.ConnectionElement]
```

Create a `ConnectionElement` object to define the mechanical translational port:

```
mech = Simulink.ConnectionElement
```

```
mech =

 ConnectionElement with properties:
 Name: 'a'
 Type: 'Connection: <domain name>'
 Description: ''
```

This command creates a `ConnectionElement` object with default properties.

Change the `ConnectionElement` name to `mech`:

```
mech.Name = 'mech'
```

```
mech =

 ConnectionElement with properties:
 Name: 'mech'
 Type: 'Connection: <domain name>'
 Description: ''
```

Specify the domain type for the connection:

```
mech.Type = 'Connection: foundation.mechanical.translational.translational'
```

```
mech =

 ConnectionElement with properties:
 Name: 'mech'
 Type: 'Connection: foundation.mechanical.translational.translational'
 Description: ''
```

For a list of Foundation domain types, see “Domain-Specific Line Styles” (Simscape).

Optionally, fill in the port description:

```
mech.Description = 'Mechanical translational port'
```

```
mech =

 ConnectionElement with properties:
 Name: 'mech'
 Type: 'Connection: foundation.mechanical.translational.translational'
 Description: 'Mechanical translational port'
```

Similarly, create another `ConnectionElement` object to define the electrical port:

```
elec = Simulink.ConnectionElement;
elec.Name = 'elec';
elec.Type = 'Connection: foundation.electrical.electrical';
elec.Description = 'Electrical port'
```

```
elec =

 ConnectionElement with properties:
 Name: 'elec'
```

```
Type: 'Connection: foundation.electrical.electrical'
Description: 'Electrical port'
```

Add the two elements to the ConnectionBus object:

```
MechElec.Elements = [mech elec]
```

```
MechElec =
```

```
ConnectionBus with properties:
```

```
Description: 'Rigid interface containing one mechanical and one electrical port'
Elements: [2x1 Simulink.ConnectionElement]
```

You can view the created objects in the **Type Editor**:

```
typeeditor
```

## Alternatives

To interactively create a ConnectionBus object, use the **Type Editor** or the **Model Explorer**.

“Design Rigid Interface Specifications for Conserving Connections” (Simscape)

# Simulink.ConnectionElement

Specify properties of elements of physical connection buses

## Description

A `Simulink.ConnectionElement` object is an element of a `Simulink.ConnectionBus` object. It validates the properties of a physical connection port.

`ConnectionElement` objects exist only within the `ConnectionBus` object. You can specify a `ConnectionBus` object, but not a `ConnectionElement` object, as a data type.

When you simulate or update a model, Simulink checks whether the ports connected to Simscape Bus or Connection Port blocks with rigid interface specifications match the properties of the corresponding `ConnectionElement` objects.

To create and modify `ConnectionBus` and `ConnectionElement` objects in the base workspace or a data dictionary, you can use the **Type Editor**, the **Model Explorer**, or MATLAB commands. You cannot store `ConnectionBus` and `ConnectionElement` objects in model workspaces.

## Creation

### Syntax

```
ce = Simulink.ConnectionElement
```

### Description

`ce = Simulink.ConnectionElement` returns a `ConnectionElement` object with default property values.

## Properties

### Name — Name of element

'a' (default) | character vector

Name of element, specified as a character vector. The element name must be a valid MATLAB identifier that starts with an alphabetic character or underscore (`_`), followed by alphanumeric characters or underscores.

Data Types: `char` | `string`

### Type — Connection type of element

'Connection: <domain name>' (default) | registered Simscape domain | Simscape Multibody conserving connection type | `ConnectionBus` object present in the base workspace or a data dictionary

Connection type of element, specified as a Simscape Foundation domain name, a custom domain name registered in your MATLAB session, or a Simscape Multibody conserving connection type.

For a list of Foundation domains, see “Domain-Specific Line Styles” (Simscape).

Selecting a `ConnectionBus` object present in the base workspace or a data dictionary lets you create nested connection buses.

If you create `ConnectionElement` objects interactively, by using the **Type Editor** or the **Model Explorer**, the drop-down list automatically contains all the valid domain and connection types.

Data Types: char | string

### Description — Connection element description

' ' (default) | character vector

Connection element description, specified as a character vector. Use the description to document information about the `ConnectionElement` object, such as the domain type. This information does not affect Simulink processing.

Data Types: char | string

## Examples

### Create Connection Bus and Connection Element Objects Using MATLAB Commands

Define a rigid interface with one mechanical translational and one electrical port by creating a `ConnectionBus` object containing a two-element array of `ConnectionElement` objects. Array indexing lets you create and access multiple elements in an array. Dot notation lets you access property values.

Create a `ConnectionBus` object called `MechElec`:

```
MechElec = Simulink.ConnectionBus
```

```
MechElec =
```

```
ConnectionBus with properties:
```

```
Description: ''
Elements: [0x0 Simulink.ConnectionElement]
```

By default, the connection bus has no description and an empty array of connection elements.

Use the dot notation to fill in the description:

```
MechElec.Description = 'Rigid interface with one mechanical and one electrical port'
```

```
MechElec =
```

```
ConnectionBus with properties:
```

```
Description: 'Rigid interface with one mechanical and one electrical port'
Elements: [0x0 Simulink.ConnectionElement]
```

Create a `ConnectionElement` object to define the mechanical translational port:

```
mech = Simulink.ConnectionElement
```

```
mech =

 ConnectionElement with properties:

 Name: 'a'
 Type: 'Connection: <domain name>'
 Description: ''
```

This command creates a `ConnectionElement` object with default properties.

Change the `ConnectionElement` name to `mech`:

```
mech.Name = 'mech'
```

```
mech =

 ConnectionElement with properties:

 Name: 'mech'
 Type: 'Connection: <domain name>'
 Description: ''
```

Specify the domain type for the connection:

```
mech.Type = 'Connection: foundation.mechanical.translational.translational'
```

```
mech =

 ConnectionElement with properties:

 Name: 'mech'
 Type: 'Connection: foundation.mechanical.translational.translational'
 Description: ''
```

For a list of Foundation domain types, see “Domain-Specific Line Styles” (Simscape).

Optionally, fill in the port description:

```
mech.Description = 'Mechanical translational port'
```

```
mech =

 ConnectionElement with properties:

 Name: 'mech'
 Type: 'Connection: foundation.mechanical.translational.translational'
 Description: 'Mechanical translational port'
```

Similarly, create another `ConnectionElement` object to define the electrical port:

```
elec = Simulink.ConnectionElement;
elec.Name = 'elec';
elec.Type = 'Connection: foundation.electrical.electrical';
elec.Description = 'Electrical port'
```

```
elec =

 ConnectionElement with properties:

 Name: 'elec'
```

```
Type: 'Connection: foundation.electrical.electrical'
Description: 'Electrical port'
```

Add the two elements to the `ConnectionBus` object:

```
MechElec.Elements = [mech elec]
```

```
MechElec =
```

```
ConnectionBus with properties:
```

```
Description: 'Rigid interface containing one mechanical and one electrical port'
Elements: [2x1 Simulink.ConnectionElement]
```

You can view the created objects in the **Type Editor**:

```
typeeditor
```

## Alternatives

To interactively create a `ConnectionElement` object, use the **Type Editor** or the **Model Explorer**.

# FunctionPortSpecification

Query and configure C Caller block properties

## Description

Query and configure the C Caller block function definition and return argument. Configure the C Caller block input arguments programmatically.

## Creation

`myCCallerObj = get_param(gcb, 'FunctionPortSpecification')` creates a C Caller block configuration object for the selected C Caller block.

## Properties

### CPrototype — C function mapping to the C Caller block

character vector

Displays the mapping of the C function input to the C Caller block in the model. You cannot edit this property using the command line. To edit the C function mapping, edit the source code of the C Caller block.

Example: `real_T add(real_T u1, real_T u2);`

Data Types: char

### InputArguments — List of function input arguments

FunctionArgument object

Returns the list of function input arguments in a “FunctionArgument Object” on page 8-90.

### ReturnArgument — List of function output arguments

FunctionArgument scalar

Returns a scalar or an empty “FunctionArgument Object” on page 8-90.

Data Types: char

### GlobalArguments — List of global arguments

FunctionArgument scalar

Returns a scalar or an empty “FunctionArgument Object” on page 8-90.

Data Types: char

### FunctionArgument Object

The `FunctionArgument` is a class that carries port specification information of a C Caller block programmatically. The `FunctionArgument` object has these properties:

- 1 **Name** — Name of the variable in the source code, specified as a character vector. This property is read-only.
- 2 **PortNumber** — Port number of the InputArgument that has been edited, specified as uint32. This property is read-only.
- 3 **Size** — Size of the Simulink port dimensions specified as a character vector. You can edit this property if it is allowed in the function definition.
- 4 **Type** — Simulink data type for the specified port specified as a character vector. You can edit this property if it is allowed in the function definition.
- 5 **Label** — Port label on the Simulink block specified as a character vector. You can change the port label programmatically, for example:

```
myCCallerObj.my_CCaller.InputArguments(1).Label = 'inputport1'
```

```
my_CCallerObj =
```

```
FunctionPortSpecification with properties:
```

```
 CPrototype: 'real_T add(real_T u1, real_T u2);'
 InputArguments: [1x2 Simulink.CustomCode.FunctionArgument]
 ReturnArgument: [1x1 Simulink.CustomCode.FunctionArgument]
 GlobalArguments: [1x0 Simulink.CustomCode.FunctionArgument]
```

- 6 **Scope** — Mapping of the Simulink scope to the input argument specified as a character vector. If the variable is defined as a constant qualifier, the argument can be an input or a parameter. If no constant qualifier exists, you can change an output argument to an input, inputoutput, or to a parameter. If your scope fits any of the scenarios above, you can change it programmatically:

```
my_CCallerObj.InputArguments(1).Scope = 'parameter'
```

```
my_CCallerObj =
```

```
FunctionPortSpecification with properties:
```

```
 CPrototype: 'extern real_T add(real_T u1, real_T u2);'
 InputArguments: [1x2 Simulink.CustomCode.FunctionArgument]
 ReturnArgument: [1x1 Simulink.CustomCode.FunctionArgument]
 GlobalArguments: [1x0 Simulink.CustomCode.FunctionArgument]
```

## Object Functions

`getGlobalArg` Get an object definition of a global variable in a C Caller block

## Examples

### Create a C Caller Configuration Object

This example creates a C Caller configuration object using the 'slexCCallerExample' demo model.

```
my_CCallerObj = get_param('slexCCallerExample/C Caller','FunctionPortSpecification')
```

```
my_CCallerObj =
```

```
FunctionPortSpecification with properties:
```

```
 CPrototype: 'real_T add(real_T u1, real_T u2);'
```

```
InputArguments: [1x2 Simulink.CustomCode.FunctionArgument]
ReturnArgument: [1x1 Simulink.CustomCode.FunctionArgument]
GlobalArguments: [1x0 Simulink.CustomCode.FunctionArgument]
```

Create a `FunctionArgument` object for the 1st input port:

```
inargone = my_CCallerObj.InputArguments(1)
inargone =
```

FunctionArgument with properties:

```
 Name: 'u1'
PortNumber: 1
 Size: '1'
 Type: 'double'
 Label: 'u1'
 Scope: 'Parameter'
```

Change the label for the first input port:

```
inargone.Label = 'inputport1'
inargone =
```

FunctionArgument with properties:

```
 Name: 'u1'
PortNumber: 1
 Size: '1'
 Type: 'double'
 Label: 'inputport1'
 Scope: 'Parameter'
```

## Version History

# getGlobalArg

**Package:** Simulink.CustomCode

Get an object definition of a global variable in a C Caller block

## Syntax

```
GlobalArg = PortSpecObj.getGlobalArg(globalVariableName)
```

## Description

GlobalArg = PortSpecObj.getGlobalArg(globalVariableName), where PortSpecObj is an object of class FunctionPortSpecification or Simulink.CodeImporter.SimulinkPortSpecification, creates a FunctionArgument on page 8-90 object. To use global variables in a model that uses C Caller blocks, turn on the **Enable custom code globals as function interface** setting from **Configuration Parameters > Simulation Target**.

## Examples

### Create Handle to Global Variable in C Caller Block

Access the properties of a global variable used in a C Caller block.

Create a FunctionPortSpecification object.

```
myFunctionPortSpecObject = get_param(gcb, 'FunctionPortSpecification')
```

Query and create a FunctionArgument object for the global argument.

```
myGlobalVariable = myFunctionPortSpecObject.getGlobalArg('myGlobalVariableName')
```

```
myGlobalVariable =
```

```
FunctionArgument with properties:
```

```
 Name: 'myGlobalVarPort'
PortNumber: 1
 Size: '1'
 Type: 'double'
 Label: 'myGlobalVarPort'
 Scope: 'Input'
```

## Input Arguments

**globalVariableName** — Name of global variable

character vector | string scalar

Name of global variable, specified as a character vector.

Data Types: char

## Output Arguments

### **GlobalArg** — Global argument object

FunctionArgument object

Global argument object associated with the C Caller block, returned as a FunctionArgument object.

## Version History

**Introduced in R2020b**

# Simulink.data.adapters.AdapterDataTester

Test custom external file adapter

## Description

A `Simulink.data.adapters.AdapterDataTester` object provides functions for testing a custom external file adapter derived from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class.

## Creation

### Syntax

```
adapterTester = Simulink.data.adapters.AdapterDataTester(adapterObj, source, section)
```

### Description

`adapterTester = Simulink.data.adapters.AdapterDataTester(adapterObj, source, section)` creates a `Simulink.data.adapters` object that can test an instance of an adapter derived from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class. With this adapter tester you can test the `getData` method for your custom file adapter.

### Input Arguments

#### **adapterObj** — Custom file adapter

`BaseMatlabFileAdapter` subclass object

Custom file adapter, specified as an object of a class that derives from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class.

Example: `myCustomFileAdapter`

#### **source** — External source file

character array

External source file, specified as a character array.

Example: `'Tires.xls'`

#### **section** — Section of external file

adapter name (default) | character array | string

Section of the external file source, specified as a character array or string.

Example: `'tireManufacturer'`

## Properties

### WorkspaceVariables — Workspace variables

`containers.Map` object

This property is read-only.

Workspace variables, specified as a `containers.Map` object. Simulink populates the map object when you call the object function `readFromSource`. The keys to the map object are the workspace variable names..

## Object Functions

`clear` Clear variables from file adapter tester object  
`readFromSource` Test custom file adapter by reading from source

## Examples

### Create External File Adapter Tester

Create a `Simulink.data.adapters.AdapterDataTester` object to test the `getData` method of an XML file adapter derived from a `Simulink.data.adapters.BaseMatlabFileAdapter` base class. For an example of an XML file adapter, see .

The `getData` method reads data from an XML file `test.xml` in the following format.

```
<customerData>
<x>10</x>
<y>15</y>
</customerData>
```

Create an instance of your file adapter.

```
adapterInstance = myXMLAdapter;
```

Create an instance of the file adapter tester object using the test file specified above.

```
adapterTester = Simulink.data.adapters.AdapterDataTester(adapterInstance, 'test.xml', 'XML Adapter');
```

Use `adapterTester` to read the data from your XML file. Then, check the data in the `WorkspaceVariables` property.

```
readFromSource(adapterTester);
variables = adapterTester.WorkspaceVariables
```

```
variables =
 Map with properties:
 Count: 2
 KeyType: char
 ValueType: double
```

Check the data in the `WorkspaceVariables` map object.

```
variables.keys
```

```
ans =
 1x2 cell array
 {"x"} {"y"}
```

Finally, clear the workspace variables.

```
clear(adapterTester);
```

After clearing the variables, you can make changes to your XML file and use the same adapter to read the file again.

```
readFromSource(adapterTester);
```

## Version History

Introduced in R2022b

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

## clear

**Package:** Simulink.data.adapters

Clear variables from file adapter tester object

### Syntax

```
clear(testerObj)
```

### Description

`clear(testerObj)` clears the workspace variables from the `Simulink.data.adapters.AdapterDataTester` object `testerObj`. The tester object provides functions for testing a custom external file adapter derived from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class.

### Examples

#### Clear Variables from XML File Adapter Tester

Clear the workspace variables from a `Simulink.data.adapters.AdapterDataTester` object after using the object to test an XML file adapter derived from a `Simulink.data.adapters.BaseMatlabFileAdapter` base class. For an example of an XML file adapter, see .

The example uses an XML file `test.xml` with the following format.

```
<customerData>
<x>10</x>
<y>15</y>
</customerData>
```

Create an instance of your file adapter.

```
adapterInstance = myXMLAdapter;
```

Create an instance of the file adapter tester object using the test file specified above.

```
adapterTester = Simulink.data.adapters.AdapterDataTester(adapterInstance, 'test.xml', 'XML Adapter');
```

Use `adapterTester` to read the data from your XML file. Then, check the data in the `WorkspaceVariables` property.

```
readFromSource(adapterTester);
variables = adapterTester.WorkspaceVariables
```

```
variables =
 Map with properties:
 Count: 2
 KeyType: char
 ValueType: double
```

Check the data in the WorkspaceVariables map object.

```
variables.keys
```

```
ans =
 1x2 cell array
 {"x"} {"y"}
```

Finally, clear the workspace variables.

```
clear(adapterTester);
```

## Input Arguments

### **testerObj** – File adapter tester

`Simulink.data.adapters.AdapterDataTester` object

File adapter tester, specified as a `Simulink.data.adapters.AdapterDataTester` object.

### Topics

“Create External File Adapter for Loading Variables into `Simulink.SimulationInput` Object”

## readFromSource

**Package:** Simulink.data.adapters

Test custom file adapter by reading from source

### Syntax

```
readFromSource(testerObj)
```

### Description

`readFromSource(testerObj)` tests the `getData` method of a custom external file adapter derived from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class. When you create the `Simulink.data.adapters.AdapterDataTester` object, `testerObj`, you open a connection to a test file by using an instance of a custom file adapter. The object function reads data from that test file.

### Examples

#### Test Custom XML File Adapter

Use a `Simulink.data.adapters.AdapterDataTester` object to test the `getData` method of an XML file adapter derived from a `Simulink.data.adapters.BaseMatlabFileAdapter` base class. For an example of an XML file adapter, see .

The `getData` method reads data from an XML file `test.xml` with the following format.

```
<customerData>
<x>10</x>
<y>15</y>
</customerData>
```

Create an instance of your file adapter.

```
adapterInstance = myXMLAdapter;
```

Create an instance of the file adapter tester object using the test file specified above.

```
adapterTester = Simulink.data.adapters.AdapterDataTester(adapterInstance, 'test.xml', 'XML Adapter');
```

Use `adapterTester` to read the data from your XML file. Then, check the data in the `WorkspaceVariables` property.

```
readFromSource(adapterTester);
variables = adapterTester.WorkspaceVariables
```

```
variables =
 Map with properties:
 Count: 2
 KeyType: char
 ValueType: double
```

Check the data in the WorkspaceVariables map object.

```
variables.keys
```

```
ans =
 1x2 cell array
 {"x"} {"y"}
```

Finally, clear the workspace variables.

```
clear(adapterTester);
```

## Input Arguments

### Topics

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

## Simulink.data.DataSourceWorkspace

Contains data for external data source

### Description

A `Simulink.data.DataSourceWorkspace` object is a handle object that can contain data from an external data source.

When you load data from an external source, for example by using the `loadVariablesFromExternalSource` function, Simulink passes a reference to a `Simulink.data.DataSourceWorkspace` object to the custom file adapter that can read that external file format. The file adapter, derived from the `Simulink.data.adapters.BaseMatlabFileAdapter` class, loads the data into the workspace in the form of MATLAB variables and data objects. The workspace object acts as a cache for Simulink and can run a MATLAB script, similar to a base workspace. Symbol resolution includes symbols in the workspace. See `run`.

### Creation

Only Simulink can create and manage a `Simulink.data.DataSourceworkspace` object, but you can create another handle for the workspace object by assignment.

```
copyWks = dsWks
```

```
copyWks =
DataSourceWorkspace with no properties
```

To test a custom file adapter without creating a data source workspace, use the `Simulink.data.adapters.AdapterDataTester` object.

### Object Functions

<code>clearVariables</code>	Clear specified variables from data source workspace
<code>clearAllVariables</code>	Clear variables from data source workspace
<code>getVariable</code>	Return value of variable in data source workspace
<code>getVariables</code>	Return values of variables in data source workspace
<code>hasVariables</code>	Check if variables exist in data source workspace
<code>listVariables</code>	List variables in data source workspace
<code>run</code>	Execute the specified MATLAB script in data source workspace
<code>setVariable</code>	Set variable in data source workspace
<code>setVariables</code>	Set variables in data source workspace

### Examples

#### Load Data From External Source File into Workspace

Define a `getData` method for an XML file adapter to populate the data from an XML file into the data source workspace that Simulink passes to the method.

This `getData` method reads an XML file in the following format:

```
<customerData>
<x>10</x>
<y>15</y>
</customerData>
```

```
function diagnostic = getData(adapterObj, sourceWorkspace, previousChecksum, diagnostic)
 % Each time getData is called on the same source, sourceWorkspace is the same as
 % the last time it was called. Clear it to make sure no old variables exist.
 clearAllVariables(sourceWorkspace);
 dom = xmlread(adapterObj.source);
 tree = dom.getFirstChild;
 if tree.hasChildNodes
 item = tree.getFirstChild;
 while ~isempty(item)
 name = item.getNodeName.toCharArray';
 if isvarname(name)
 value = item.getTextContent;
 setVariable(sourceWorkspace, name, str2num(value));
 end
 item = item.getNextSibling;
 end
 end
end
```

## Version History

Introduced in R2022b

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

## clearAllVariables

**Package:** Simulink.data

Clear variables from data source workspace

### Syntax

```
clearAllVariables(dsWks)
```

### Description

`clearAllVariables(dsWks)` clears the variables from the data source workspace represented by the `Simulink.data.DataSourceWorkspace` object `dsWks`.

### Examples

#### Clear All Variables From Data Source Workspace

Add some variables to a data source workspace.

```
setVariable(sourceWorkspace, 'b', 2);
setVariables(sourceWorkspace, ["c" "d"], {3,4});
setVariables(sourceWorkspace, {'e', 'f'}, {5,6});
```

Now return the list of variables that are contained in the workspace.

```
vars = listVariables(sourceWorkspace);
vars
```

```
vars
 5x1 string array

 "b"
 ... "c"
 ... "d"
 "e"
 "f"
```

Clear the variables from the workspace.

```
clearAllVariables(sourceWorkspace);
```

Now return the list of variables again and confirm that the workspace is empty.

```
vars = listVariables(sourceWorkspace);
vars
```

vars  
0x1 empty string array

## Input Arguments

### **dsWks — Data source workspace**

Simulink.data.DataSourceWorkspace object

Data source workspace, specified as a Simulink.data.DataSourceWorkspace object.

## Version History

Introduced in R2022b

### See Also

clearVariables | getVariable | getVariables | hasVariables | listVariables | run | setVariable | setVariables | Simulink.data.adapters.BaseMatlabFileAdapter

### Topics

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

## clearVariables

**Package:** Simulink.data

Clear specified variables from data source workspace

### Syntax

```
clearVariables(dsWks,varNames)
```

### Description

`clearVariables(dsWks,varNames)` clears the specified variables from the data source workspace represented by the `Simulink.data.DataSourceWorkspace` object `dsWks`.

### Examples

#### Clear Specified Variables From a Data Source Workspace

Add some variables to a data source workspace.

```
setVariable(sourceWorkspace,'b',2);
setVariables(sourceWorkspace,['c' 'd'],{3,4});
setVariables(sourceWorkspace',{'e','f'},{5,6});
```

Remove variables `c` and `d` from the workspace.

```
clearVariables(sourceWorkspace,['c' 'd']);
```

Now return the list of variables in the workspace and check that variables `c` and `d` are no longer there.

```
vars = listVariables(sourceWorkspace);
vars
```

```
vars
 3x1 string array

 "b"
 "e"
 "f"
```

### Input Arguments

**dsWks** — Data source workspace

`Simulink.data.DataSourceWorkspace` object

Data source workspace, specified as a `Simulink.data.DataSourceWorkspace` object.

**varNames** — Variable names

string array | cell array of character arrays

Variable names, specified as a string array or cell array of character vectors.

Example: ["c" "d"]

Example: {'e', 'f'}

## **Version History**

**Introduced in R2022b**

### **See Also**

## getVariable

**Package:** Simulink.data

Return value of variable in data source workspace

### Syntax

```
varValue = getVariable(dsWks,varName)
```

### Description

`varValue = getVariable(dsWks,varName)` returns the value of the variable `varName` that exists in the data source workspace represented by the `Simulink.data.DataSourceWorkspace` object `dsWks`.

### Examples

#### Get Value of Variable in Data Source Workspace

Set the value of variable `b` in a data source workspace.

```
setVariable(sourceWorkspace,'b',2);
```

Now return that variable and store the value in another variable `c`.

```
c = getVariable(sourceWorkspace,'b');
c
```

```
ans =
```

```
2
```

### Input Arguments

#### **dsWks** — Data source workspace

`Simulink.data.DataSourceWorkspace` object

Data source workspace, specified as a `Simulink.data.DataSourceWorkspace` object.

#### **varName** — Variable name

string | character array

Variable name, specified as a string or character array.

Example: "x"

Data Types: char | string

## Output Arguments

### **varValue** — Variable value

number, structure, or other MATLAB value

Variable value, returned as a number, structure, or other MATLAB value.

## Version History

**Introduced in R2022b**

### See Also

[clearVariables](#) | [clearAllVariables](#) | [getVariables](#) | [hasVariables](#) | [listVariables](#) | [run](#) | [setVariable](#) | [setVariables](#) | [Simulink.data.adapters.BaseMatlabFileAdapter](#)

### Topics

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

## getVariables

**Package:** Simulink.data

Return values of variables in data source workspace

### Syntax

```
varValues = getVariables(dsWks,varNames)
```

### Description

`varValues = getVariables(dsWks,varNames)` returns the values of the variables `varNames` that exist in the data source workspace represented by the `Simulink.data.DataSourceWorkspace` object `dsWks`.

### Examples

#### Get Values of Variables in Data Source Workspace

Set the value of variables `c` and `d` in a data source workspace.

```
setVariables(sourceWorkspace,["c" "d"], {3,4});
```

Now return the variables.

```
getVariables(sourceWorkspace,["c" "d"])
```

```
ans =
```

```
1x2 cell array
```

```
 {[3]} {[4]}
```

### Input Arguments

#### **dsWks** — Data source workspace

`Simulink.data.DataSourceWorkspace` object

Data source workspace, specified as a `Simulink.data.DataSourceWorkspace` object.

#### **varNames** — Variable names

string array | cell array of character vectors

Variable names, specified as a string array or cell array of character vectors.

Example: `["c" "d"]`

Example: `{'e', 'f'}`

## Output Arguments

### **varValues** — Variable values

cell array of numbers, structures, or other MATLAB values

Variable values, returned as a cell array of numbers, structures, or other MATLAB values. The dimensions of the cell array match the dimensions of `varNames`.

## Version History

Introduced in R2022b

### See Also

## hasVariables

**Package:** Simulink.data

Check if variables exist in data source workspace

### Syntax

```
varExists = hasVariables(dsWks,varNames)
```

### Description

`varExists = hasVariables(dsWks,varNames)` checks if the specified variables exist in the data source workspace represented by the `Simulink.data.DataSourceWorkspace` object `dsWks`.

### Examples

#### Check if Specified Variables Exist in Data Source Workspace

Add some variables to a data source workspace.

```
setVariable(sourceWorkspace,'b',2);
setVariables(sourceWorkspace,['c' 'd'],{3,4});
setVariables(sourceWorkspace',{'e','f'},{5,6});
```

Check if variable `b` is in the data source workspace.

```
retVal = hasVariables(sourceWorkspace,'b');
retVal
```

```
retVal =
 true
```

Now check if the variables `a` and `e` are in the data source workspace.

```
retVal = hasVariables(sourceWorkspace,['a' 'e']);
retVal
```

```
retVal =
 1x2 logical array

 0 1
```

### Input Arguments

**dsWks** — Data source workspace

`Simulink.data.DataSourceWorkspace` object

Data source workspace, specified as a `Simulink.data.DataSourceWorkspace` object.

**varNames** — Variable names

string array | cell array of character vectors

Variable names, specified as a string array or cell array of character vectors.

Example: ["c" "d"]

Example: {'e', 'f'}

## Output Arguments

### **varExists** — True or false result

logical array

True or false result, returned as a logical array. Dimensions of the logical array match the dimensions of varNames.

## Version History

**Introduced in R2022b**

### **See Also**

[clearVariables](#) | [clearAllVariables](#) | [getVariable](#) | [getVariables](#) | [listVariables](#) | [run](#) | [setVariable](#) | [setVariables](#) | [Simulink.data.adapters.BaseMatlabFileAdapter](#)

### **Topics**

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

## listVariables

**Package:** Simulink.data

List variables in data source workspace

### Syntax

```
varNames = listVariables(dsWks)
```

### Description

`varNames = listVariables(dsWks)` lists the variables contained in the data source workspace represented by the `Simulink.data.DataSourceWorkspace` object `dsWks`.

### Examples

#### List Variables in Data Source Workspace

Add some variables to a data source workspace.

```
setVariable(sourceWorkspace, 'b', 2);
setVariables(sourceWorkspace, ['c' 'd'], {3,4});
setVariables(sourceWorkspace, {'e', 'f'}, {5,6});
```

Now return that list of variables and store the list in another variable `vars`.

```
vars = listVariables(sourceWorkspace);
vars
```

```
vars
 5x1 string array

 "b"
 "c"
 "d"
 "e"
 "f"
```

### Input Arguments

#### **dsWks** — Data source workspace

`Simulink.data.DataSourceWorkspace` object

Data source workspace, specified as a `Simulink.data.DataSourceWorkspace` object.

### Output Arguments

#### **varNames** — Variable names

array of strings | cell array of character vectors

Variable names, returned as an array of strings or cell array of character vectors.

## **Version History**

**Introduced in R2022b**

### **See Also**

[clearVariables](#) | [clearAllVariables](#) | [getVariable](#) | [getVariables](#) | [hasVariables](#) | [run](#) | [setVariable](#) | [setVariables](#) | [Simulink.data.adapters.BaseMatlabFileAdapter](#)

### **Topics**

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

## run

**Package:** Simulink.data

Execute the specified MATLAB script in data source workspace

### Syntax

```
run(dsWks,mscript)
```

### Description

`run(dsWks,mscript)` executes the specified MATLAB script in the data source workspace represented by the `Simulink.data.DataSourceWorkspace` object `dsWks`.

While executing a script on the data source workspace, MATLAB temporarily changes the current folder to the folder that contains the script.

### Examples

#### Execute Script in Data Source Workspace

Write a short script that sets some variables in a data source workspace.

```
% myscript.m
x = 10;
p = p+1;
```

Before running the script, check the current value of variable `p` in the data source workspace object `sourceWorkspace`.

```
getVariable(sourceWorkspace,'p')
```

```
2
```

Also check the value of variable `x`.

```
getVariable(sourceWorkspace,'x')
```

```
Error: undefined variable 'x'
```

The output shows that `x` is not yet defined in the workspace.

Now run the script `myscript.m` and check the values of `p` and `x` again.

```
run(sourceWorkspace,'myscript.m');
getVariables(sourceWorkspace,['p' 'x'])
```

```
ans =
```

```
1x2 cell array
```

```
{[3]} {[10]}
```

## Input Arguments

### **dsWks — Data source workspace**

Simulink.data.DataSourceWorkspace object

Data source workspace, specified as a Simulink.data.DataSourceWorkspace object.

### **mscript — MATLAB script**

character vector | string scalar

MATLAB script, specified as a character vector or string scalar. The script must be a .m or .mlx file on the MATLAB path.

Example: 'mfun.m'

## Version History

**Introduced in R2022b**

### **See Also**

[clearVariables](#) | [clearAllVariables](#) | [getVariable](#) | [getVariables](#) | [hasVariables](#) | [listVariables](#) | [setVariable](#) | [setVariables](#) | [Simulink.data.adapters.BaseMatlabFileAdapter](#)

### **Topics**

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

## setVariable

**Package:** Simulink.data

Set variable in data source workspace

### Syntax

```
setVariable(dsWks, varName, varValue)
```

### Description

`setVariable(dsWks, varName, varValue)` assigns `varValue` to the variable `varName` in the data source workspace represented by the `Simulink.data.DataSourceWorkspace` object `dsWks`.

### Examples

#### Modify Variable in Data Source Workspace

Define a `getData` method for an XML file adapter to read the data from an XML file and then use the `setVariable` function to populate the data into the data source workspace that Simulink passes to the method.

This `getData` method reads an XML file in the following format.

```
<customerData>
<x>10</x>
<y>15</y>
</customerData>
```

```
function diagnostic = getData(adapterObj, sourceWorkspace, previousChecksum, diagnostic)
 % Each time getData is called on the same source, sourceWorkspace is the same as
 % the last time it was called. Clear it to make sure no old variables exist.
 clearAllVariables(sourceWorkspace);
 dom = xmlread(adapterObj.source);
 tree = dom.getFirstChild;
 if tree.hasChildNodes
 item = tree.getFirstChild;
 while ~isempty(item)
 name = item.getNodeName.toCharArray';
 if isvarname(name)
 value = item.getTextContent;
 setVariable(sourceWorkspace, name, str2num(value));
 end
 item = item.getNextSibling;
 end
 end
```

```
end
end
```

## Input Arguments

### **dsWks — Data source workspace**

Simulink.data.DataSourceWorkspace object

Data source workspace, specified as a Simulink.data.DataSourceWorkspace object.

### **varName — Variable name**

string | character array

Variable name specified as a string or character array.

Example: "x"

Data Types: char | string

### **varValue — Variable value**

scalar

Variable value, specified as a scalar.

Example: 2

## Version History

**Introduced in R2022b**

### **See Also**

## setVariables

**Package:** Simulink.data

Set variables in data source workspace

### Syntax

```
setVariables(dsWks, varNames, varValues)
```

### Description

`setVariables(dsWks, varNames, varValues)` assigns the values `varValues` to the variables `varNames` in the data source workspace represented by the `Simulink.data.DataSourceWorkspace` object `dsWks`.

### Examples

#### Set Variables in Data Source Workspace

Specify values for multiple variables in a `DataSourceWorkspace` object.

```
setVariables(sourceWorkspace, ["c" "d"], {3,4})
```

### Input Arguments

#### **dsWks** — Data source workspace

`Simulink.data.DataSourceWorkspace` object

Data source workspace, specified as a `Simulink.data.DataSourceWorkspace` object.

#### **varNames** — Variable names

string array | cell array of character vectors

Variable names, specified as a string array or cell array of character vectors.

Example: ["c" "d"]

Example: {'e', 'f'}

#### **varValues** — Variable values

cell array of scalars

Variable values, specified as a cell array of scalars. The dimensions of the cell array must match the dimensions of `varNames`.

Example: {3,4}

# Simulink.data.Dictionary

Configure data dictionary

## Description

A `Simulink.data.Dictionary` object represents a data dictionary. The object allows you to perform operations on the data dictionary such as save or discard changes, import data from the base workspace, and add other data dictionaries as references.

## Creation

The functions `Simulink.data.dictionary.create` and `Simulink.data.dictionary.open` create a `Simulink.data.Dictionary` object.

## Properties

### **DataSources — Referenced data dictionaries**

cell array of character vectors

This property is read-only.

Referenced data dictionaries by file name, returned as a cell array of character vectors. This property only lists directly referenced dictionaries whose parent is the `Simulink.data.Dictionary` object.

### **EnableAccessToBaseWorkspace — Specify whether models can use design data in the base workspace**

false (default) | true

Whether linked models can use design data in the base workspace, specified as `true` or `false`.

To determine whether a dictionary provides access to the base workspace (including through referenced dictionaries), query the `HasAccessToBaseWorkspace` property.

For more information about this property, including restrictions that limit your ability to interact with base workspace data through the dictionary, see “Continue to Use Shared Data in the Base Workspace”.

Data Types: `logical`

### **HasAccessToBaseWorkspace — Query whether models can use design data in the base workspace**

0 (default) | 1

This property is read-only.

Query whether models can use design data in the base workspace, returned as 1 (true) or 0 (false). If the dictionary or a referenced dictionary has the `EnableAccessToBaseWorkspace` property set to `true`, this property returns 1.

Use this property to determine whether models that link to the dictionary can use design data in the base workspace. You do not need to query each referenced dictionary to determine whether it has the `EnableAccessToBaseWorkspace` property set to `true`.

Data Types: `logical`

### **HasUnsavedChanges** — Indicator of unsaved changes

0 | 1

This property is read-only.

Indicator of unsaved changes to the data dictionary, returned as 0 or 1. The value is 1 if changes have been made since last data dictionary save and 0 if not.

### **NumberOfEntries** — Total number of entries in data dictionary

integer

This property is read-only.

Total number of entries in data dictionary, including those in referenced dictionaries, returned as an integer.

## **Object Functions**

<code>addDataSource</code>	Add reference data dictionary to parent data dictionary
<code>close</code>	Close connection between data dictionary and <code>Simulink.data.Dictionary</code> object
<code>discardChanges</code>	Discard changes to data dictionary
<code>exportToVersion</code>	Export a <code>Simulink.data.Dictionary</code> object to a previous version
<code>filepath</code>	Full path and file name of data dictionary
<code>getSection</code>	Return <code>Simulink.data.dictionary.Section</code> object to represent data dictionary section
<code>hide</code>	Remove data dictionary from Model Explorer
<code>importEnumTypes</code>	Import enumerated type definitions to data dictionary
<code>importFromBaseWorkspace</code>	Import base workspace variables to data dictionary
<code>listEntry</code>	List data dictionary entries
<code>removeDataSource</code>	Remove reference data dictionary from parent data dictionary
<code>saveChanges</code>	Save changes to data dictionary
<code>show</code>	Show data dictionary in Model Explorer

## **Examples**

### **Create New Data Dictionary and Data Dictionary Object**

Create a data dictionary file `myNewDictionary.sldd` and a `Simulink.data.Dictionary` object representing the new data dictionary. Assign the object to variable `ddl`.

```
ddl = Simulink.data.dictionary.create('myNewDictionary.sldd')
```

```
ddl =
```

```
data dictionary with properties:
```

```
 DataSources: {0x1 cell}
```

```
HasUnsavedChanges: 0
 NumberOfEntries: 0
```

### **Open Existing Data Dictionary**

Create a `Simulink.data.Dictionary` object representing the existing data dictionary `myDictionary_ex_API.sldd`. Assign the object to variable `dd2`.

```
dd2 = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
```

```
dd2 =
```

```
Dictionary with properties:
```

```
 DataSources: {'myRefDictionary_ex_API.sldd'}
HasUnsavedChanges: 0
 NumberOfEntries: 4
```

## **Version History**

**Introduced in R2015a**

### **See Also**

`Simulink.data.dictionary.open` | `Simulink.data.dictionary.create` |  
`Simulink.data.dictionary.Section` | `Simulink.data.dictionary.Entry`

### **Topics**

“Store Data in Dictionary Programmatically”

“What Is a Data Dictionary?”

# addDataSource

**Package:** Simulink.data

Add reference data dictionary to parent data dictionary

## Syntax

```
addDataSource(dictionaryObj, refDictionaryFile)
```

## Description

`addDataSource(dictionaryObj, refDictionaryFile)` adds a data dictionary, `refDictionaryFile`, as a reference dictionary to a parent dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object.

The parent dictionary contains all the entries that are defined in the referenced dictionary until the referenced dictionary is removed from the parent dictionary. The `DataSource` property of an entry indicates the dictionary that defines the entry.

## Examples

### Add a Reference Data Dictionary to a Parent Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Add the data dictionary `mySubDictionary_ex_API.sldd` as a reference dictionary to `myDictionary_ex_API.sldd`.

```
addDataSource(myDictionaryObj, 'mySubDictionary_ex_API.sldd');
```

Confirm the addition by viewing the `DataSources` property of variable `myDictionaryObj`. The property returns the name of the newly referenced dictionary.

```
myDictionaryObj.DataSources
```

```
ans =
```

```
 'myRefDictionary_ex_API.sldd'
 'mySubDictionary_ex_API.sldd'
```

## Input Arguments

### **dictionaryObj** — Parent data dictionary

`Simulink.data.Dictionary` object

Parent data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for

example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

**refDictionaryFile** — File name of data dictionary to reference

character vector

File name of data dictionary to reference, specified as a character vector that includes the `.sldd` extension. The data dictionary file must be on your MATLAB path.

Example: `'mySubDictionary_ex_API.sldd'`

Data Types: `char`

**Alternatives**

You can use the Model Explorer window to manage reference dictionaries. See “Partition Dictionary Data Using Referenced Dictionaries” for more information.

**Version History**

Introduced in R2015a

**See Also**

`Simulink.data.Dictionary` | `removeDataSource`

**Topics**

“Store Data in Dictionary Programmatically”

# close

**Package:** Simulink.data

Close connection between data dictionary and Simulink.data.Dictionary object

## Syntax

```
close(dictionaryObj)
```

## Description

`close(dictionaryObj)` closes the connection between the Simulink.data.Dictionary object `dictionaryObj` and the data dictionary it represents. `dictionaryObj` remains as a Simulink.data.Dictionary object but no longer represents any data dictionary.

## Examples

### Close Connection Between Data Dictionary Object and Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a Simulink.data.Dictionary object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Remove connection between `myDictionaryObj` and `myDictionary_ex_API.sldd`.

```
close(myDictionaryObj);
```

## Input Arguments

### **dictionaryObj** — Target Simulink.data.Dictionary object

handle to Simulink.data.Dictionary object

Target Simulink.data.Dictionary object, specified as a handle to the object.

## Tips

- Use the `close` function in a custom MATLAB function to disassociate a Simulink.data.Dictionary object from a data dictionary. Custom MATLAB functions can create and store variables and objects in function workspaces but cannot delete those variables and objects.
- The `close` function does not affect the content or the state of the represented data dictionary. The function does not discard unsaved changes to the represented dictionary or entries. You can save or discard them later.

## Version History

**Introduced in R2015a**

**See Also**

Simulink.data.Dictionary

**Topics**

“Store Data in Dictionary Programmatically”

# discardChanges

**Package:** Simulink.data

Discard changes to data dictionary

## Syntax

```
discardChanges(dictionaryObj)
```

## Description

`discardChanges(dictionaryObj)` discards all changes made to the specified data dictionary since the last time changes to the dictionary were saved using the `saveChanges` function. `discardChanges` also discards changes made to referenced data dictionaries. The changes to the target dictionary and its referenced dictionaries are permanently lost.

## Examples

### Discard Changes to Data Dictionary

Create a `Simulink.data.Dictionary` object representing the data dictionary `myDictionary_ex_API.sldd` and assign the object to variable `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
 DataSourcees: {'myRefDictionary_ex_API.sldd'}
 HasUnsavedChanges: 0
 NumberOfEntries: 4
```

Make a change to `myDictionary_ex_API.sldd` by adding an entry named `myNewEntry` with value 237. View the `HasUnsavedChanges` property of `myDictionaryObj` to confirm a change was made.

```
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
addEntry(dDataSectObj, 'myNewEntry', 237);
myDictionaryObj
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
 DataSourcees: {'myRefDictionary_ex_API.sldd'}
 HasUnsavedChanges: 1
 NumberOfEntries: 5
```

Discard all changes to `myDictionary_ex_API.sldd`. The `HasUnsavedChanges` property of `myDictionaryObj` indicates changes were discarded.

```
discardChanges(myDictionaryObj)
myDictionaryObj

myDictionaryObj =

 Dictionary with properties:

 DataSourcees: {'myRefDictionary_ex_API.slidd'}
 HasUnsavedChanges: 0
 NumberOfEntries: 4
```

## Input Arguments

### **dictionaryObj** — Target data dictionary

Simulink.data.Dictionary object

Target data dictionary, specified as a Simulink.data.Dictionary object. Before you use this function, represent the target dictionary with a Simulink.data.Dictionary object by using, for example, the Simulink.data.dictionary.create or Simulink.data.dictionary.open function.

## Alternatives

You can use the Model Explorer window to discard changes to data dictionaries. See “View and Revert Changes to Dictionary Entries” for more information.

## Version History

Introduced in R2015a

## See Also

saveChanges | Simulink.data.Dictionary

## Topics

“Store Data in Dictionary Programmatically”

“What Is a Data Dictionary?”

# exportToVersion

**Package:** Simulink.data

Export a Simulink.data.Dictionary object to a previous version

## Syntax

```
Simulink.data.Dictionary.exportToVersion(dictionaryObj, target_folder, version)
```

## Description

`Simulink.data.Dictionary.exportToVersion(dictionaryObj, target_folder, version)` exports the data dictionary `dictionaryObj` to the folder `target_folder` in a format that the specified previous Simulink `version` can load. The function also exports references to the specified folder. The file names of the dictionary and its references are preserved.

## Examples

### Export a Data Dictionary to a Previous Version

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
openExample('sldemo_fuelsys_dd_controller');
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

Export the data dictionary to a previous version of Simulink.

```
exportToVersion(myDictionaryObj, 'myR2018aFolder', 'R2018a');
```

## Input Arguments

### **dictionaryObj** — Data dictionary

`Simulink.data.Dictionary` object

Data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

### **target\_folder** — Folder for dictionary

string scalar | character vector

Target folder for the new version of the dictionary, specified as a character vector or string scalar.

Example: 'myR2018aFolder'

Data Types: char | string

### **version** — MATLAB release name

string scalar | character vector

MATLAB release name, specified as a character vector or string scalar, which specifies a previous Simulink version. The release name is not case sensitive.

`Simulink.data.Dictionary.exportToVersion` exports the data dictionary to a format that the specified previous Simulink version can load. The value must be R2014a or later. You cannot export to your current version.

Example: 'R2018a'

Data Types: char | string

## **Version History**

“Using a Data Dictionary to Manage the Data for a Fuel Control System” on page 13-136

“What Is a Data Dictionary?”

# filepath

**Package:** Simulink.data

Full path and file name of data dictionary

## Syntax

```
dictionaryFilePath = filepath(dictionaryObj)
```

## Description

`dictionaryFilePath = filepath(dictionaryObj)` returns the full path and file name of the data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object.

## Examples

### Return Path of Data Dictionary File

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Return the full path of `myDictionary_ex_API.sldd` and assign it to variable `myDictionaryFilePath`.

```
myDictionaryFilePath = filepath(myDictionaryObj)
```

```
myDictionaryFilePath =
```

```
C:\Users\jsmith\myDictionary_ex_API.sldd
```

## Input Arguments

### **dictionaryObj** — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

## Version History

**Introduced in R2015a**

## See Also

`Simulink.data.Dictionary`

# getSection

**Package:** Simulink.data

Return Simulink.data.dictionary.Section object to represent data dictionary section

## Syntax

```
sectionObj = getSection(dictionaryObj,sectionName)
```

## Description

sectionObj = getSection(dictionaryObj,sectionName) returns a Simulink.data.dictionary.Section object representing one section, sectionName, of a data dictionary dictionaryObj, a Simulink.data.Dictionary object.

When you access the **Embedded Coder** section of a data dictionary, getSection returns a coder.Dictionary object representing the Embedded Coder Dictionary in the data dictionary.

## Examples

### Create New Data Dictionary Section Object

Open the data dictionary myDictionary\_ex\_API.sldd and represent it with a Simulink.data.Dictionary object named myDictionaryObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Represent the Design Data section of the data dictionary myDictionary\_ex\_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
dDataSectObj = getSection(myDictionaryObj, 'Design Data')
```

```
dDataSectObj =
```

```
 Section with properties:
```

```
 Name: 'Design Data'
```

## Input Arguments

### dictionaryObj — Data dictionary containing target section

Simulink.data.Dictionary object

Data dictionary containing target section, specified as a Simulink.data.Dictionary object. Before you use this function, represent the dictionary with a Simulink.data.Dictionary object by using, for example, the Simulink.data.dictionary.create or Simulink.data.dictionary.open function.

### sectionName — Name of target data dictionary section

character vector

Name of target data dictionary section, specified as a character vector.

Example: 'Design Data'

Example: 'Configurations'

Example: 'EmbeddedCoder'

Data Types: char

## **Version History**

“Store Data in Dictionary Programmatically”

# hide

**Package:** Simulink.data

Remove data dictionary from Model Explorer

## Syntax

```
hide(dictionaryObj)
```

## Description

`hide(dictionaryObj)` removes the data dictionary `dictionaryObj` from the **Model Hierarchy** pane of Model Explorer. The target dictionary no longer appears as a node in the model hierarchy tree. Use this function when you are finished working with a data dictionary and want to reduce clutter in the Model Explorer.

## Examples

### Hide Data Dictionary from Model Explorer

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Open Model Explorer and display the new data dictionary as the selected tree node in the **Model Hierarchy** pane.

```
show(myDictionaryObj)
```

With Model Explorer open, at the MATLAB command prompt, call the `hide` function to observe the removal of `myDictionary_ex_API.sldd` from the model hierarchy tree.

```
hide(myDictionaryObj)
```

## Input Arguments

### **dictionaryObj** — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

## Tips

- To add a data dictionary as a node in the model hierarchy tree in Model Explorer, use the `show` function or use the interface to open and view the dictionary in Model Explorer.

- The hide function does not affect the content of the target dictionary.

## Alternatives

You can remove a data dictionary from the **Model Hierarchy** pane of Model Explorer by right-clicking the dictionary tree node and selecting **Close**.

## Version History

Introduced in R2015a

## See Also

`Simulink.data.Dictionary` | `show`

## Topics

“Store Data in Dictionary Programmatically”

# importEnumTypes

**Package:** Simulink.data

Import enumerated type definitions to data dictionary

## Syntax

```
importedTypes = importEnumTypes(dictionaryObj,targetTypes)
[importedTypes,importFailures] = importEnumTypes(dictionaryObj,targetTypes)
```

## Description

`importedTypes = importEnumTypes(dictionaryObj,targetTypes)` imports to the data dictionary `dictionaryObj` the definitions of one or more enumerated types `targetTypes`. `importEnumTypes` does not import MATLAB variables created using enumerated types but instead, in support of those variables, imports the definitions of the types. The target data dictionary stores the definition of a successfully imported type as an entry. This syntax returns a list of the names of successfully imported types. `importEnumTypes` saves changes made to the target dictionary, so before you use `importEnumTypes`, confirm that unsaved changes are acceptable.

`[importedTypes,importFailures] = importEnumTypes(dictionaryObj,targetTypes)` additionally returns a list of any target types that were not successfully imported. You can inspect the list to determine the reason for each failure.

## Examples

### Import Enumerated Data to Data Dictionary

Create a data dictionary `myNewDictionary.sldd` in your current working folder and a `Simulink.data.Dictionary` object representing the new data dictionary. Assign the object to the variable `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.create('myNewDictionary.sldd');
```

Run the script in the MATLAB file `myDataEnum_ex_API.m`. The file defines an enumerated type named `InstrumentTypes` using the `Simulink.defineIntEnumType` function and creates three variables based on the new type. Then, import the new variables from the base workspace to `myDictionary_ex_API.sldd`.

```
myDataEnum_ex_API
importFromBaseWorkspace(myDictionaryObj,'varList',...
{'firstEnumVariable','secondEnumVariable','thirdEnumVariable'});
```

Clear the imported variables from the base workspace. Before you can import an enumerated data type definition to the target data dictionary, you must clear the base workspace of any variables created using the target type.

```
clear firstEnumVariable
clear secondEnumVariable
clear thirdEnumVariable
```

Import the data type definition to `myDictionary_ex_API.slidd`.

```
importEnumTypes(myDictionaryObj, {'InstrumentTypes'})

ans =

 className: 'InstrumentTypes'
 renamedFiles: {}
```

## Input Arguments

### **dictionaryObj** — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

### **targetTypes** — Enumerated type definitions to import

cell array of character vectors | string array

Enumerated type definitions to import, specified as a cell array of character vectors or a string array. If any target types are defined using `classdef` blocks in MATLAB files or P-files, the files must be available on your MATLAB path so that `importEnumTypes` can disable them.

Example: {'myEnumType'}

Example: {'myFirstEnumType', 'mySecondEnumType', 'myThirdEnumType'}

Data Types: `cell`

## Output Arguments

### **importedTypes** — Target types successfully imported

array of structures

Target enumerated type definitions successfully imported, returned as an array of structures. Each structure in the array represents one imported type. The `className` field of each structure identifies a type by name and the `renamedFiles` field identifies any renamed MATLAB files or P-files.

### **importFailures** — Target types not imported

array of structures

Enumerated type definitions targeted but not imported, returned as an array of structures. Each structure in the array represents one type not imported. The `className` field of each structure identifies a type by name and the `reason` field explains the failure.

## Tips

- Before you can import an enumerated data type definition to a data dictionary, you must clear the base workspace of any variables created using the target type.
- You can define an enumerated type using a `classdef` block in a MATLAB file or a P-file. `importEnumTypes` imports type definitions directly from these files if you specify the names of

the types to import using the input argument `targetTypes` and if the files defining the types are on your MATLAB path.

- To avoid conflicting definitions for imported types, `importEnumTypes` renders MATLAB files or P-files ineffective by appending `.save` to their names. The `.save` extensions cause variables to rely on the definitions in the target data dictionary and not on the definitions in the files. You can remove the `.save` extensions to restore the files to their original state.
- You can use `importEnumTypes` to import enumerated types defined using the `Simulink.defineIntEnumType` function. Because such types are not defined using MATLAB files or P-files, `importEnumTypes` does not rename any files.
- Use the function `Simulink.findVars` to generate a list of the enumerated types that are used by a model. Then, use the list with `importEnumTypes` to import the definitions of the types to a data dictionary. See “Enumerations in Data Dictionary” for more information.

## Version History

Introduced in R2015a

# importFromBaseWorkspace

**Package:** Simulink.data

Import base workspace variables to data dictionary

## Syntax

```
importedVars = importFromBaseWorkspace(dictionaryObj)
importedVars = importFromBaseWorkspace(dictionaryObj,Name,Value)
[importedVars,existingVars] = importFromBaseWorkspace(____)
[importedVars,existingVars,unsupportedVars] = importFromBaseWorkspace(____)
```

## Description

`importedVars = importFromBaseWorkspace(dictionaryObj)` imports all variables from the MATLAB base workspace to the data dictionary `dictionaryObj` without overwriting existing entries in the dictionary. If any base workspace variables are already in the dictionary, the function present a warning and a list.

This syntax returns a list of names of the successfully imported variables. A variable is considered successfully imported only if `importFromBaseWorkspace` assigns the value of the variable to the corresponding entry in the target data dictionary.

`importedVars = importFromBaseWorkspace(dictionaryObj,Name,Value)` imports base workspace variables to a data dictionary, with additional options specified by one or more `Name,Value` pair arguments.

`[importedVars,existingVars] = importFromBaseWorkspace(____)` additionally returns a list of variables that were not overwritten. Use this syntax if `existingVarsAction` is set to 'none', the default value, which prevents existing dictionary entries from being overwritten.

`[importedVars,existingVars,unsupportedVars] = importFromBaseWorkspace(____)` additionally returns a list of unsupported variables that were not imported. When there are unsupported variables in the base workspace, if you call this function without the `unsupportedVars` output argument, Simulink reports a warning.

## Examples

### Import All Base Workspace Variables to Data Dictionary

In the MATLAB base workspace, create variables to import.

```
a = 'Char Variable';
myVariable = true;
fuelFlow = 324;
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import all base workspace variables to the data dictionary and return a list of successfully imported variables. If any base workspace variables are already in `myDictionary_ex_API.sldd`, `importFromBaseWorkspace` presents a warning and a list of the affected variables.

```
importFromBaseWorkspace(myDictionaryObj);
```

```
Warning: The following variables were not imported because
they already exist in the dictionary:
 fuelFlow
```

### Specify Variables to Import to Data Dictionary from Base Workspace

In the MATLAB base workspace, create variables to import.

```
b = 'Char Variable';
mySecondVariable = true;
airFlow = 324;
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import only the new base workspace variables to the data dictionary.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', ...
{'b', 'mySecondVariable', 'airFlow'});
```

### Import Variables from Base Workspace and Overwrite Conflicts

In the MATLAB base workspace, create a variable to import.

```
fuelFlow = 324;
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`. `myDictionary_ex_API.sldd` already contains an entry called `fuelFlow`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the variable `fuelFlow` and overwrite the corresponding entry in `myDictionary_ex_API.sldd`.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', {'fuelFlow'}, ...
'existingVarsAction', 'overwrite');
```

`importFromBaseWorkspace` assigns the value of the base workspace variable `fuelFlow` to the value of the corresponding entry in `myDictionary_ex_API.sldd`.

### Return Variables Not Imported to Data Dictionary from Base Workspace

Return a list of variables that are not imported from the MATLAB base workspace because they are already in the target data dictionary.

In the MATLAB base workspace, create variables to import.

```
fuelFlow = 324;
myNewVariable = 'This is a character vector.'
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`. `myDictionary_ex_API.sldd` already contains an entry called `fuelFlow`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the variables `fuelFlow` and `myNewVariable` to the data dictionary. Specify names for the output arguments of `importFromBaseWorkspace` to return the names of successfully and unsuccessfully imported variables.

```
[importedVars,existingVars] = importFromBaseWorkspace(myDictionaryObj,...
'varList',{'fuelFlow','myNewVariable'})
```

```
importedVars =
 'myNewVariable'
```

```
existingVars =
 'fuelFlow'
```

`importFromBaseWorkspace` does not import the variable `fuelFlow` because it is already in the target data dictionary.

## Input Arguments

### **dictionaryObj** — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `'varList',{'fuelFlow'}, 'existingVarsAction','overwrite'` imports the variable `fuelFlow` and overwrites the corresponding entry in the data dictionary.

### **clearWorkspaceVars** — Flag to clear base workspace of imported variables

false (default) | true

Flag to clear the base workspace of any successfully imported variables, specified as the comma-separated pair consisting of `'clearWorkspaceVars'` and `true` or `false`.

Example: `'clearWorkspaceVars',true`

Data Types: logical

### **existingVarsAction — Action to take for existing dictionary variables**

'none' (default) | 'error' | 'overwrite'

Action to take for existing dictionary variables, specified as the comma-separated pair consisting of 'existingVarsAction' and 'none', 'error', or 'overwrite'.

If you specify 'none', `importFromBaseWorkspace` attempts to import target variables but does not import or make any changes to variables that are already in the data dictionary.

If you specify 'error', `importFromBaseWorkspace` returns an error, without importing any variables, if any target variables are already in the data dictionary.

If you specify 'overwrite', `importFromBaseWorkspace` imports all target variables and overwrites any variables that are already in the data dictionary.

Example: 'existingVarsAction','error'

Data Types: char

### **varList — Variables to import**

cell array of character vectors | string array

Names of specific base workspace variables to import, specified as the comma-separated pair consisting of 'varList' and a cell array of character vectors or a string array. If you want to import only one variable, specify the name inside a cell array. If you do not specify 'varList', `importFromBaseWorkspace` imports all variables from the MATLAB base workspace.

Example: 'varList',{'a','myVariable','fuelFlow'}

Example: 'varList',{'fuelFlow'}

Data Types: cell

## **Output Arguments**

### **importedVars — Successfully imported variables**

cell array of character vectors

Names of successfully imported variables, returned as a cell array of character vectors. A variable is considered successfully imported only if `importFromBaseWorkspace` assigns the value of the variable to the corresponding entry in the target data dictionary.

### **existingVars — Existing variables that were not imported**

cell array of character vectors

Names of target variables that were not imported due to their existence in the target data dictionary, returned as a cell array of character vectors. `existingVars` has content only if 'existingVarsAction' is set to 'none' which is also the default. In that case `importFromBaseWorkspace` imports only variables that are not already in the target data dictionary.

### **unsupportedVars — Unsupported variables that were not imported**

cell array of character vectors

Names of unsupported target variables that were not imported, returned as a cell array of character vectors. If this output argument is not included in the function call when there are unsupported variables, Simulink reports a warning. For the types of variables that can be imported into a data dictionary, see “Valid Design Data Classes”.

## Tips

- `importFromBaseWorkspace` can import MATLAB variables created from enumerated data types but cannot import the definitions of the enumerated types. Use the `importEnumTypes` function to import enumerated data type definitions to a data dictionary. If you import variables of enumerated data types to a data dictionary but do not import the enumerated type definitions, the dictionary is less portable and might not function properly if used by someone else.
- If the value of a variable is a `timeseries` object (which a data dictionary cannot store) or a structure with fields identical to a `timeseries` object, `importFromBaseWorkspace` cannot import the variable.

## Alternatives

- When you use the Simulink Editor to link a model to a data dictionary, you can choose to import model variables from the base workspace. See “Migrate Single Model to Use Dictionary” for more information.
- You can also use the Model Explorer window to drag-and-drop variables from the base workspace into a data dictionary.

## Version History

Introduced in R2015a

`Simulink.data.Dictionary` | `importEnumTypes`

## Topics

“Store Data in Dictionary Programmatically”

# listEntry

**Package:** Simulink.data

List data dictionary entries

## Syntax

```
listEntry(dictionaryObj)
listEntry(dictionaryObj,Name,Value)
```

## Description

`listEntry(dictionaryObj)` displays in the MATLAB Command Window a table of information about all the entries in the data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object. The displayed information includes the name of each entry, the name of the section containing each entry, the status of each entry, the date and time each entry was last modified, the last user name to modify each entry, and the class of the value each entry contains. By default, the function sorts the list of entries alphabetically by entry name.

`listEntry(dictionaryObj,Name,Value)` displays the entries in a data dictionary with additional options specified by one or more `Name,Value` pair arguments.

To return the value of a data dictionary entry at the command prompt, use the `getValue` method of a `Simulink.data.dictionary.Entry` object. See “Store Data in Dictionary Programmatically”.

To get a list of entries in a dictionary section, returned as an array of `Simulink.data.dictionary.Entry` objects, use the `find` method of a `Simulink.data.dictionary.Section` object with no arguments.

## Examples

### List All Entries in Data Dictionary

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
openExample('sldemo_fuelsys_dd_controller');
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List all the entries in the data dictionary.

```
listEntry(myDictionaryObj)
```

### Sort List of Data Dictionary Entries in Descending Order

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
openExample('sldemo_fuelsys_dd_controller');
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List all the entries in the data dictionary and sort the list in descending order by entry name.

```
listEntry(myDictionaryObj, 'Ascending', false)
```

### Filter List of Data Dictionary Entries by Name

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
openExample('sldemo_fuelsys_dd_controller');
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List only the entries in the data dictionary whose names begin with `max`.

```
listEntry(myDictionaryObj, 'Name', 'max*')
```

### Sort List of Data Dictionary Entries by Time of Modification

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
openExample('sldemo_fuelsys_dd_controller');
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List all the entries in the dictionary and sort the list by the date and time each entry was last modified.

```
listEntry(myDictionaryObj, 'SortBy', 'LastModified')
```

## Input Arguments

### **dictionaryObj** — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose `Name` in quotes.*

Example: `'SortBy', 'LastModified'` sorts the entries in the data dictionary by the date and time each entry was last modified.

### **Ascending** — Sort order of list

`true` (default) | `false`

Sort order of the list of data dictionary entries, specified as the comma-separated pair consisting of 'Ascending' and true or false. If you specify false, listEntry sorts the list in descending order.

Example: 'Ascending',false

Data Types: logical

### **Class — Criteria to filter list by class**

character vector

Criteria to filter the list of data dictionary entries by class, specified as the comma-separated pair consisting of 'Class' and a character vector identifying a valid class. The function lists only entries whose values are of the specified class.

Example: 'Class', 'Simulink.Parameter'

Data Types: char

### **LastModifiedBy — Criteria to filter list by user name of last modifier**

character vector

Criteria to filter the list of data dictionary entries by the user name of the last user to modify each entry, specified as the comma-separated pair consisting of 'LastModifiedBy' and a character vector identifying the specified user name. The function lists only entries that were last modified by the specified user name.

Example: 'LastModifiedBy', 'jsmith'

Data Types: char

### **Limit — Maximum number of entries to list**

integer

Maximum number of entries to list, specified as the comma-separated pair consisting of 'Limit' and an integer. The function lists up to the specified number of entries starting from the top of the sorted and filtered list.

Example: 'Limit',9

Data Types: double

### **Name — Criteria to filter list by entry name**

character vector

Criteria to filter the list of data dictionary entries by entry name, specified as the comma-separated pair consisting of 'Name' and a character vector defining the filter criteria. You can use an asterisk character, \*, as a wildcard to represent any number of characters. The function lists only entries whose names match the filter criteria.

Example: 'Name', 'fuelFlow'

Example: 'Name', 'fuel\*'

Data Types: char

### **Section — Criteria to filter list by data dictionary section**

character vector

Criteria to filter the list of data dictionary entries by section, specified as the comma-separated pair consisting of 'Section' and a character vector identifying the target section. The function lists only entries that are contained in the target section.

Example: 'Section','Design Data'

### **SortBy — Flag to sort list by specific property**

'Name' (default) | 'Section' | 'LastModified' | 'LastModifiedBy'

Flag to sort the list of data dictionary entries by a specific property, specified as the comma-separated pair consisting of 'SortBy' and a character vector identifying a property in the list of entries. Valid properties include 'Name', 'Section', 'LastModified', and 'LastModifiedBy'.

Example: 'SortBy','LastModifiedBy'

## **Version History**

“What Is a Data Dictionary?”

# removeDataSource

**Package:** Simulink.data

Remove reference data dictionary from parent data dictionary

## Syntax

```
removeDataSource(dictionaryObj, refDictionaryFile)
```

## Description

`removeDataSource(dictionaryObj, refDictionaryFile)` removes a referenced data dictionary, `refDictionaryFile`, from a parent dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object.

The parent dictionary no longer contains the entries that are defined in the referenced dictionary.

## Examples

### Remove Referenced Data Dictionary from Parent Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`. The `DataSources` property of `myDictionaryObj` indicates `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
 DataSources: {'myRefDictionary_ex_API.sldd'}
 HasUnsavedChanges: 0
 NumberOfEntries: 4
```

Remove `myRefDictionary_ex_API.sldd` from `myDictionary_ex_API.sldd`.

```
removeDataSource(myDictionaryObj, 'myRefDictionary_ex_API.sldd');
```

View the properties of the `Simulink.data.Dictionary` object `myDictionaryObj`, which represents the parent data dictionary. The `DataSources` property confirms the removal of `myRefDictionary_ex_API.sldd`.

```
myDictionaryObj
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
 DataSources: {0x1 cell}
```

```
HasUnsavedChanges: 1
NumberOfEntries: 3
```

## Input Arguments

### **dictionaryObj** — Parent data dictionary

`Simulink.data.Dictionary` object

Parent data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

### **refDictionaryFile** — File name of referenced data dictionary

character vector

File name of referenced data dictionary, specified as a character vector that includes the `.sldd` extension. The data dictionary file must be on your MATLAB path.

Example: `'myRefDictionary_ex_API.sldd'`

Data Types: `char`

## Alternatives

You can use Model Explorer to manage reference dictionaries. See “Partition Dictionary Data Using Referenced Dictionaries” for more information.

“Store Data in Dictionary Programmatically”

# saveChanges

**Package:** Simulink.data

Save changes to data dictionary

## Syntax

```
saveChanges(dictionaryObj)
```

## Description

`saveChanges(dictionaryObj)` saves all changes made to a data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object. `saveChanges` also saves changes made to referenced data dictionaries. The previous states of the target dictionary and its referenced dictionaries are permanently lost.

## Examples

### Save Changes to Data Dictionary

Create a new data dictionary `myNewDictionary.sldd` and represent the Design Data section with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.create('myNewDictionary.sldd')
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

```
myDictionaryObj =
```

```
data dictionary with properties:
```

```
 DataSources: {0x1 cell}
 HasUnsavedChanges: 0
 NumberOfEntries: 0
```

Change `myNewDictionary.sldd` by adding an entry named `myNewEntry` with value 237. View the `HasUnsavedChanges` property of `myDictionaryObj` to confirm a change was made.

```
addEntry(dDataSectObj, 'myNewEntry', 237);
myDictionaryObj
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
 DataSources: {0x1 cell}
 HasUnsavedChanges: 1
 NumberOfEntries: 1
```

Save all changes to `myNewDictionary.sldd`. The `HasUnsavedChanges` property of `myDictionaryObj` indicates changes were saved.

```
saveChanges(myDictionaryObj)
myDictionaryObj

myDictionaryObj =

 Dictionary with properties:
 DataSources: {0x1 cell}
 HasUnsavedChanges: 0
 NumberOfEntries: 1
```

## Input Arguments

### **dictionaryObj** — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

## Alternatives

You can use Model Explorer to save changes to a data dictionary by right-clicking on the dictionary tree node in the **Model Hierarchy** pane and selecting **Save Changes**.

## Version History

Introduced in R2015a

## See Also

`Simulink.data.Dictionary` | `discardChanges`

## Topics

“Store Data in Dictionary Programmatically”

# show

**Package:** Simulink.data

Show data dictionary in Model Explorer

## Syntax

```
show(dictionaryObj)
show(dictionaryObj, openModelExplorer)
```

## Description

`show(dictionaryObj)` opens Model Explorer and displays the data dictionary `dictionaryObj` as the selected tree node in the **Model Hierarchy** pane.

`show(dictionaryObj, openModelExplorer)` enables you to add the target dictionary to the **Model Hierarchy** pane without opening Model Explorer.

## Examples

### Show Data Dictionary in Model Explorer

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Open Model Explorer and display `myDictionary_ex_API` as the selected node of the model hierarchy tree in the **Model Hierarchy** pane.

```
show(myDictionaryObj)
```

### Add Data Dictionary to Model Hierarchy Tree

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Add `myDictionary_ex_API.sldd` to the model hierarchy tree without opening Model Explorer.

```
show(myDictionaryObj, false)
```

You can confirm the addition of `myDictionary_ex_API` to the model hierarchy tree by manually opening Model Explorer.

## Input Arguments

### **dictionaryObj** — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

### **openModelExplorer** — Flag to open Model Explorer

`true` (default) | `false`

Flag to open Model Explorer, specified as `true` or `false`.

Data Types: `logical`

## Tips

- Use the `hide` function to remove a data dictionary from the tree in the **Model Hierarchy** pane of Model Explorer. The dictionary does not appear in the hierarchy again until you use the `show` function or you open and view the dictionary in the Model Explorer using the interface.

## Version History

**Introduced in R2015a**

## See Also

`Simulink.data.Dictionary` | `hide`

## Topics

“Store Data in Dictionary Programmatically”

# Simulink.data.dictionary.Entry

Configure data dictionary entry

## Description

An object of the `Simulink.data.dictionary.Entry` class represents one entry of a data dictionary. The object allows you to perform operations such as assign the entry a value or change the name of the entry.

Before you can create a new `Simulink.data.dictionary.Entry` object, you must create a `Simulink.data.dictionary.Section` object representing the data dictionary section that contains the target entry. However, once created, the `Simulink.data.dictionary.Entry` object exists independently of the `Simulink.data.dictionary.Section` object. Use the function `getSection` to create a `Simulink.data.dictionary.Section` object.

## Creation

### Syntax

#### Description

The functions `addEntry`, `getEntry`, and `find` create `Simulink.data.dictionary.Entry` objects.

## Properties

### DataSource — File name of containing data dictionary

character vector

File name of containing data dictionary, specified as a character vector. Changes you make to this property affect the represented data dictionary entry.

Example: `'myDictionary.sldd'`

Data Types: `char`

### LastModified — Date and time of last modification

character vector

Date and time of last modification to entry, returned in Coordinated Universal Time (UTC) as a character vector. This property is read only.

### LastModifiedBy — Name of last user to modify entry

character vector

Name of last user to modify entry, returned as a character vector. This property is read only.

### Name — Name of entry

character vector

Name of entry, specified as a character vector. Changes you make to this property affect the represented data dictionary entry.

Data Types: char

### Status — State of entry

'New' | 'Modified' | 'Unchanged' | 'Deleted'

State of entry, returned as 'New', 'Modified', 'Unchanged', or 'Deleted'. The state is valid since the last data dictionary save. If the state is 'Deleted', the represented entry was deleted from its data dictionary. This property is read only.

## Object Functions

deleteEntry	Delete data dictionary entry
discardChanges	Discard changes to data dictionary entry
find	Search in array of data dictionary entries
getValue	Return value of data dictionary entry
setValue	Set value of data dictionary entry
showChanges	Display changes made to data dictionary entry

## Examples

### Add Entry to Data Dictionary and Modify its Value

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Add an entry `myEntry` with value 27 to the Design Data section of `myDictionary_ex_API.sldd`. Assign the returned `Simulink.data.dictionary.Entry` object to variable `e`.

```
e = addEntry(dDataSectObj, 'myEntry', 27)
```

```
e =
```

```
Entry with properties:
```

```
 Name: 'myEntry'
 Value: 27
 DataSource: 'myDictionary_ex_API.sldd'
LastModified: '2014-Aug-26 18:42:08.439709'
LastModifiedBy: 'jsmith'
 Status: 'New'
```

Change the value of `myEntry` from 27 to the character vector 'My New Value'.

```
setValue(e, 'My New Value')
```

```
e
```

```
e =
```

```
Entry with properties:
```

```

 Name: 'myEntry'
 Value: 'My New Value'
 DataSource: 'myDictionary_ex_API.sldd'
 LastModified: '2014-Aug-26 18:45:58.336598'
 LastModifiedBy: 'jsmith'
 Status: 'New'

```

## Return Value of Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```

myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');

```

Return the value of the entry `fuelFlow` and assign the value to the variable `fuelFlowValue`.

```
fuelFlowValue = getValue(fuelFlowObj)
```

```
fuelFlowValue =
```

```
237
```

## Move Entry Within Data Dictionary Hierarchy

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`. `myDictionary_ex_API.sldd` references the data dictionary `myRefDictionary_ex_API.sldd`.

```

myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');

```

Create a `Simulink.data.dictionary.Entry` object representing the entry `fuelFlow`, which resides in `myDictionary_ex_API.sldd`. Assign the object to variable `e`.

```
e = getEntry(dDataSectObj, 'fuelFlow')
```

```
e =
```

```
Entry with properties:
```

```

 Name: 'fuelFlow'
 Value: 237
 DataSource: 'myDictionary_ex_API.sldd'
 LastModified: '2014-Sep-05 13:12:06.099278'
 LastModifiedBy: 'jsmith'
 Status: 'Unchanged'

```

Migrate the entry `fuelFlow` to the reference data dictionary `myRefDictionary_ex_API.sldd` by modifying the `DataSource` property of `e`.

```
e.DataSource = 'myRefDictionary_ex_API.sldd'
```

```
e =
```

```
Entry with properties:
```

```
Name: 'fuelFlow'
Value: 237
DataSource: 'myRefDictionary_ex_API.sldd'
LastModified: '2014-Sep-05 13:12:06.099278'
LastModifiedBy: 'jsmith'
Status: 'Modified'
```

Because `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`, both dictionaries belong to the same dictionary hierarchy, allowing you to migrate the entry `fuelFlow` between them.

## Version History

Introduced in R2015a

### See Also

`Simulink.data.dictionary.Section` | `getEntry` | `Simulink.data.Dictionary`

### Topics

“Store Data in Dictionary Programmatically”

“What Is a Data Dictionary?”

# deleteEntry

**Package:** Simulink.data.dictionary

Delete data dictionary entry

## Syntax

```
deleteEntry(entryObj)
```

## Description

`deleteEntry(entryObj)` deletes the data dictionary entry represented by `entryObj`, a `Simulink.data.dictionary.Entry` object. The represented entry no longer exists in the data dictionary that defined it.

The function sets the `Status` properties of any `Simulink.data.dictionary.Entry` objects representing the deleted entry to 'Deleted'. You can access only the `Status` properties of the objects.

## Examples

### Delete Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Delete the entry `fuelFlow` from the data dictionary `myDictionary_ex_API.sldd`. `myDictionary_ex_API.sldd` no longer contains the `fuelFlow` entry.

```
deleteEntry(fuelFlowObj)
```

## Input Arguments

### **entryObj** — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

## Alternatives

You can use the Model Explorer window to view the contents of a data dictionary and delete entries.

## **Version History**

**Introduced in R2015a**

### **See Also**

`Simulink.data.dictionary.Entry | addEntry`

### **Topics**

“Store Data in Dictionary Programmatically”

# discardChanges

**Package:** Simulink.data.dictionary

Discard changes to data dictionary entry

## Syntax

```
discardChanges(entryObj)
```

## Description

`discardChanges(entryObj)` discards all changes made to the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object, since the last time the containing data dictionary was saved using the `saveChanges` function. The changes to the entry are permanently lost.

## Examples

### Discard Changes to Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Change the entry `fuelFlow` by assigning it the new value 493. Confirm a change was made by viewing the `Status` property of `fuelFlowObj`.

```
setValue(fuelFlowObj, 493);
fuelFlowObj
```

```
fuelFlowObj =
```

```
Entry with properties:
```

```
 Name: 'fuelFlow'
 Value: 493
 DataSource: 'myDictionary_ex_API.sldd'
 LastModified: '2014-Sep-05 13:14:30.661978'
 LastModifiedBy: 'jsmith'
 Status: 'Modified'
```

Discard all changes to the entry `fuelFlow`. The `Status` property of `fuelFlowObj` shows that changes were discarded.

```
discardChanges(fuelFlowObj)
fuelFlowObj
```

```
fuelFlowObj =
```

```
Entry with properties:
```

```
Name: 'fuelFlow'
Value: 237
DataSource: 'myDictionary_ex_API.slidd'
LastModified: '2014-Sep-05 13:12:06.099278'
LastModifiedBy: 'jsmith'
Status: 'Unchanged'
```

## Input Arguments

### **entryObj** — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

## Tips

- You can use the `discardChanges` function or the `saveChanges` function with an entire data dictionary, discarding or saving changes to all entries in the dictionary at once. However, only the `discardChanges` function can additionally operate on individual entries. You cannot use the `saveChanges` function to save changes to individual entries.

## Alternatives

You can use Model Explorer and the Comparison Tool to discard changes to data dictionary entries. See “View and Revert Changes to Dictionary Entries” for more information.

## Version History

**Introduced in R2015a**

## See Also

`Simulink.data.dictionary.Entry` | `saveChanges`

## Topics

“Store Data in Dictionary Programmatically”

# find

**Package:** Simulink.data.dictionary

Search in array of data dictionary entries

## Syntax

```
foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN)
foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN,options)
```

## Description

`foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN)` searches the array of data dictionary entries `targetEntries` using search criteria `PName1,PValue1,...,PNameN,PValueN`, and returns an array of entries matching the criteria. This syntax matches the search criteria with the properties of the target entries, which are `Simulink.data.dictionary.Entry` objects, but not with the properties of their values. See `Simulink.data.dictionary.Entry` for a list of data dictionary entry properties.

`foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN,options)` searches for data dictionary entries using additional search options. For example, you can match the search criteria with the values of the target entries.

## Examples

### Search Data Dictionary Entry Values for Specific Class

Search in an array of data dictionary entries `myEntryObjs` for entries whose values are objects of the class `Simulink.Parameter`.

```
foundEntries = find(myEntryObjs,'-value','-class','Simulink.Parameter')
```

### Search Data Dictionary Entries for Modifying User

Search in an array of data dictionary entries `myEntryObjs` for entries that were last modified by the user `jsmith`.

```
foundEntries = find(myEntryObjs,'LastModifiedBy','jsmith')
```

### Search Data Dictionary Entries Using Multiple Criteria

Search in an array of data dictionary entries `myEntryObjs` for entries that were last modified by the user `jsmith` or whose names begin with `fuel`.

```
foundEntries = find(myEntryObjs, 'LastModifiedBy', 'jsmith', '-or', ...
'-regexp', 'Name', 'fuel*')
```

### Search Data Dictionary Entries Using Regular Expressions

Search in an array of data dictionary entries `myEntryObjs` for entries whose names begin with `Press`.

```
foundEntries = find(myEntryObjs, '-regexp', 'Name', 'Press*')
```

### Search Data Dictionary Entries for Specific Value

Search in an array of data dictionary entries `myEntryObjs` for entries whose values are 273. If you find more than one entry, store the entries in an array called `foundEntries`.

```
foundEntries = [];
for i = 1:length(myEntryObjs)
 if getValue(myEntryObjs(i)) == 237
 foundEntries = [foundEntries myEntryObjs(i)];
 end
end
```

### Search Data Dictionary Entry Values for Specific Property

Search in an array of data dictionary entries `myEntryObjs` for entries whose values have a property `DataType`.

```
foundEntries = find(myEntryObjs, '-value', '-property', 'DataType')
```

## Input Arguments

### **targetEntries** — Data dictionary entries to search

array of `Simulink.data.dictionary.Entry` objects

Data dictionary entries to search, specified as an array `Simulink.data.dictionary.Entry` objects. Before you use this function, represent the target entries with `Simulink.data.dictionary.Entry` objects by using, for example, the `getEntry` function.

Example: `[myEntryObj1, myEntryObj2, myEntryObj3]`

### **PName1, PValue1, ..., PNameN, PValueN** — Search criteria

name-value pairs representing properties

Search criteria, specified as one or more name-value pairs representing names and values of properties of the target data dictionary entries. For a list of the properties of a data dictionary entry, see `Simulink.data.dictionary.Entry`. If you specify more than one name-value pair, the returned entries meet all of the criteria.

If you include the `'-value'` option to search in the values of the target entries, the search criteria apply to the values of the entries rather than to the entries themselves.

Example: 'LastModifiedBy','jsmith'

Example: 'DataSource','myRefDictionary\_ex\_API.sldd'

### options – Additional search options

supported option codes

Additional search options, specified as one or more of the following supported option codes.

'-value'	This option causes <code>find</code> to search only in the values of the target data dictionary entries. Specify this option before any other search criteria or <code>options</code> arguments.
'-and', '-or', '-xor', or '-not' logical operators	These options modify or combine multiple search criteria or other option codes.
'-property',propertyName	This name-value pair causes <code>find</code> to search for entries or values that have the property <code>propertyName</code> regardless of the value of the property. Specify <code>propertyName</code> as a character vector.
'-class',className	This name-value pair causes <code>find</code> to search for entries or values that are objects of the class <code>className</code> . Specify <code>className</code> as a character vector.
'-isa',className	This name-value pair causes <code>find</code> to search for entries or values that are objects of the class or of any subclass derived from the class <code>className</code> . Specify <code>className</code> as a character vector.
'-regexp'	This option allows you to use regular expressions in your search criteria. This option affects only search criteria that follow '-regexp'.

Example: '-value'

Example: '-value','-property','CoderInfo'

Example: '-value','-class','Simulink.Parameter'

## Output Arguments

### foundEntries – Data dictionary entries matching search criteria

array of `Simulink.data.dictionary.Entry` objects

Data dictionary entries matching the specified search criteria, returned as an array of `Simulink.data.dictionary.Entry` objects.

## Version History

Introduced in R2015a

### See Also

`Simulink.data.dictionary.Entry` | `find`

**Topics**

“Store Data in Dictionary Programmatically”

# getValue

**Package:** Simulink.data.dictionary

Return value of data dictionary entry

## Syntax

```
entryValue = getValue(entryObj)
```

## Description

`entryValue = getValue(entryObj)` returns the value of the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

## Examples

### Return Value of Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Return the value of the entry `fuelFlow` and assign the value to variable `fuelFlowValue`.

```
fuelFlowValue = getValue(fuelFlowObj)
```

```
fuelFlowValue =
```

```
 237
```

## Input Arguments

### **entryObj** — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

## Version History

**Introduced in R2015a**

**See Also**

`Simulink.data.dictionary.Entry` | `setValue`

**Topics**

“Store Data in Dictionary Programmatically”

# setValue

**Package:** Simulink.data.dictionary

Set value of data dictionary entry

## Syntax

```
setValue(entryObj, newValue)
```

## Description

`setValue(entryObj, newValue)` assigns the value `newValue` to the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

## Examples

### Set Value of Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Set the value of the entry `fuelFlow` to 493. Then, view the `Value` property of `fuelFlowObj` to observe the change.

```
setValue(fuelFlowObj, 493)
fuelFlowObj
```

```
fuelFlowObj =
```

```
Entry with properties:
```

```
 Name: 'fuelFlow'
 Value: 493
 DataSource: 'myDictionary_ex_API.sldd'
 LastModified: '2014-Sep-05 13:37:22.161124'
 LastModifiedBy: 'jsmith'
 Status: 'Modified'
```

## Input Arguments

**entryObj** — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

**newValue — Value to assign to data dictionary entry**

MATLAB expression

Value to assign to data dictionary entry, specified as a MATLAB expression. The expression must return a value that is supported by the data dictionary section that contains the entry.

Example: `27.5`

Example: `myBaseWorkspaceVariable`

Example: `Simulink.Parameter`

**Alternatives**

You can use the Model Explorer window to view and change the values of data dictionary entries.

**Version History**

Introduced in R2015a

**See Also**

`Simulink.data.dictionary.Entry` | `getValue`

**Topics**

“Store Data in Dictionary Programmatically”

# showChanges

**Package:** Simulink.data.dictionary

Display changes made to data dictionary entry

## Syntax

```
showChanges(entryObj)
```

## Description

showChanges(entryObj) opens the Comparison Tool to show changes made to the data dictionary entry entryObj, a Simulink.data.dictionary.Entry object. The Comparison Tool displays the properties of entryObj as they were when the data dictionary was last saved and as they were when the showChanges function was called.

## Examples

### View Unsaved Changes to Data Dictionary Entry

Represent the data dictionary entry fuelFlow with a Simulink.data.dictionary.Entry object named fuelFlowObj. fuelFlow is defined in the data dictionary myDictionary\_ex\_API.sldd.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Make a change to the entry fuelFlow by assigning it the new value 494.

```
setValue(fuelFlowObj, 494);
```

Observe the unsaved change to the entry fuelFlow. The Comparison Tool opens and compares side by side the current state of the entry with its most recently saved state.

```
showChanges(fuelFlowObj)
```

## Input Arguments

### entryObj — Target data dictionary entry

Simulink.data.dictionary.Entry object

Target data dictionary entry, specified as a Simulink.data.dictionary.Entry object. Before you use this function, represent the target entry with a Simulink.data.dictionary.Entry object by using, for example, the getEntry function.

## Alternatives

You can use Model Explorer and the Comparison Tool to view changes to data dictionary entries. See “View and Revert Changes to Dictionary Entries” for more information.

## **Version History**

**Introduced in R2015a**

### **See Also**

`Simulink.data.dictionary.Entry` | `discardChanges`

### **Topics**

*"Store Data in Dictionary Programmatically"*

# Simulink.data.dictionary.EnumTypeDefinition

Store enumerated type definition in data dictionary

## Description

A `Simulink.data.dictionary.EnumTypeDefinition` object defines an enumerated data type in a data dictionary. You store the object in a data dictionary entry so models linked to the dictionary can use the enumerated type definition.

In the MATLAB base workspace, `Simulink.data.dictionary.EnumTypeDefinition` objects retain information about an enumerated type but do not define the type for use by other variables or by models.

## Creation

You can create a `Simulink.data.dictionary.EnumTypeDefinition` object several ways.

- Interactively create a `Simulink.data.dictionary.EnumTypeDefinition` object using the **Type Editor** or **Model Explorer**.
- Import the definitions of enumerated types to a data dictionary using the `importEnumTypes` function. Simulink creates a `Simulink.data.dictionary.EnumTypeDefinition` object in the dictionary for each imported definition. The dictionary stores each object in an individual entry.
- Programmatically create a `Simulink.data.dictionary.EnumTypeDefinition` object using the `Simulink.data.dictionary.EnumTypeDefinition` function described here.

## Syntax

`Simulink.data.dictionary.EnumTypeDefinition`

### Description

The `Simulink.data.dictionary.EnumTypeDefinition` function creates a `Simulink.data.dictionary.EnumTypeDefinition` object with default property values and a single enumeration member that has underlying integer value 0.

## Properties

### **AddClassNameToEnumNames** — Flag to control enumeration identifiers in generated code

`false` (default) | `true`

Flag to prefix enumerations with the class name in generated code, specified as `true` or `false`.

If you specify `true`, when you generate code the identifier of each enumeration member begins with the name of the enumeration class. For example, an enumeration class `LEDcolor` with enumeration members `GREEN` and `RED` defines the enumeration members in generated code as `LEDcolor_GREEN` and `LEDcolor_RED`.

Data Types: logical

### DataScope — Flag to control data type definition in generated code

'Auto' (default) | 'Imported' | 'Exported'

Flag to control data type definition in generated code, specified as 'Auto', 'Imported', or 'Exported'. The table describes the behavior of generated code for each value.

Value	Action
Auto (default)	<p>If you do not specify the property <code>Headerfile</code>, export the data type definition to <code>model_types.h</code>, where <code>model</code> is the model name.</p> <p>If you specify <code>Headerfile</code>, import the data type definition from the specified header file.</p>
Exported	<p>Export the data type definition to a separate header file.</p> <p>If you do not specify the property <code>Headerfile</code>, the header file name defaults to <code>type.h</code>, where <code>type</code> is the data type name.</p>
Imported	<p>Import the data type definition from a separate header file.</p> <p>If you do not specify the property <code>Headerfile</code>, the header file name defaults to <code>type.h</code>, where <code>type</code> is the data type name.</p>

### DefaultValue — Default enumeration member

'' (default) | character vector

Default enumeration member, specified as a character vector. Specify `DefaultValue` as the name of an enumeration member you have already defined.

When you create a `Simulink.data.dictionary.EnumTypeDefinition` object, `DefaultValue` is an empty character vector, '', and Simulink uses the first enumeration member as the default member.

Example: 'enumMember1'

### Description — Description of enumerated data type in generated code

'' (default) | character vector

Description of the enumerated data type, specified as a character vector. Use this property to explain the purpose of the type in generated code.

Example: 'Two possible colors of LED indicator: GREEN and RED.'

Data Types: char

### HeaderFile — Name of header file defining enumerated data type in generated code

'' (default) | character vector

Name of the header file that defines the enumerated data type in generated code, specified as a character vector. Use a .h extension to specify the file name.

If you do not specify `HeaderFile`, generated code uses a default header file name that depends on the value of the `DataScope` property .

Example: `'myTypeIncludeFile.h'`

Data Types: char

### StorageType — Data type of underlying integer values

' ' (default) | character vector

Data type of the integer values underlying the enumeration members, specified as a character vector. Generated code stores the underlying integer values using the data type you specify.

You can specify one of these supported integer types:

- `'int8'`
- `'int16'`
- `'int32'`
- `'uint8'`
- `'uint16'`

To store the underlying integer values in generated code using the native integer type of the target hardware, specify `StorageType` as an empty character vector, `' '`, which is the default value.

Example: `'int16'`

''

## Object Functions

<code>appendEnumeral</code>	Add enumeration member to enumerated data type definition in data dictionary
<code>removeEnumeral</code>	Remove enumeration member from enumerated data type definition in data dictionary

## Examples

### Programmatically Create Enumerated Type Definition in Data Dictionary

Create an object that can store the definition of an enumerated type. By default, the new type defines a single enumeration member `enum1` with underlying integer value 0.

```
myColors = Simulink.data.dictionary.EnumTypeDefinition
```

```
myColors =
```

```
 Simulink.data.dictionary.EnumTypeDefinition
 enum1
```

Add some enumeration members to the definition of the type.

```
appendEnumeral(myColors, 'Orange', 1, '')
appendEnumeral(myColors, 'Black', 2, '')
```

```
appendEnumeral(myColors, 'Cyan', 3, '')
myColors
```

```
myColors =
 Simulink.data.dictionary.EnumTypeDefinition
 enum1
 Orange
 Black
 Cyan
```

Remove the default enumeration member `enum1`. Since `enum1` is the first enumeration member in the list, identify it with index 1.

```
removeEnumeral(myColors, 1)
myColors
```

```
myColors =
 Simulink.data.dictionary.EnumTypeDefinition
 Orange
 Black
 Cyan
```

Customize the enumerated type by configuring the properties of the object representing it.

```
myColors.Description = 'These are my favorite colors.';
myColors.DefaultValue = 'Cyan';
myColors.HeaderFile = 'colorsType.h';
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the object that defines the enumerated type `myColors` to the dictionary.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', {'myColors'});
```

## Alternatives

You can use Model Explorer to add and modify enumerated data types stored in a data dictionary.

## Version History

Introduced in R2015a

## See Also

`Simulink.data.Dictionary` | enumeration

## Topics

“Store Data in Dictionary Programmatically”

“Use Enumerated Data in Simulink Models”

# appendEnumeral

**Package:** Simulink.data.dictionary

Add enumeration member to enumerated data type definition in data dictionary

## Syntax

```
appendEnumeral(typeObj,memberName,memberValue,memberDesc)
```

## Description

`appendEnumeral(typeObj,memberName,memberValue,memberDesc)` adds an enumeration member to the enumerated type definition stored by `typeObj`, a `Simulink.data.dictionary.EnumTypeDefinition` object.

## Examples

### Programmatically Create Enumerated Type Definition in Data Dictionary

Create an object that can store the definition of an enumerated type. By default, the new type defines a single enumeration member `enum1` with underlying integer value 0.

```
myColors = Simulink.data.dictionary.EnumTypeDefinition
```

```
myColors =
```

```
 Simulink.data.dictionary.EnumTypeDefinition
 enum1
```

Add some enumeration members to the definition of the type.

```
appendEnumeral(myColors,'Orange',1,'')
```

```
appendEnumeral(myColors,'Black',2,'')
```

```
appendEnumeral(myColors,'Cyan',3,'')
```

```
myColors
```

```
myColors =
```

```
 Simulink.data.dictionary.EnumTypeDefinition
 enum1
 Orange
 Black
 Cyan
```

Remove the default enumeration member `enum1`. Since `enum1` is the first enumeration member in the list, identify it with index 1.

```
removeEnumeral(myColors,1)
```

```
myColors
```

```
myColors =
```

```

Simulink.data.dictionary.EnumTypeDefinition
 Orange
 Black
 Cyan

```

Customize the enumerated type by configuring the properties of the object representing it.

```

myColors.Description = 'These are my favorite colors.';
myColors.DefaultValue = 'Cyan';
myColors.HeaderFile = 'colorsType.h';

```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the object that defines the enumerated type `myColors` to the dictionary.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', {'myColors'});
```

## Input Arguments

### **typeObj** — Target enumerated type definition

`Simulink.data.dictionary.EnumTypeDefinition` object

Target enumerated type definition, specified as a `Simulink.data.dictionary.EnumTypeDefinition` object.

### **memberName** — Name of new enumeration member

character vector

Name of the new enumeration member, specified as a character vector.

Example: 'myNewEnumMember'

Data Types: char

### **memberValue** — Integer value underlying new enumeration member

integer

Integer value underlying the new enumeration member, specified as an integer.

The definition of the enumeration class determines the integer data type used in generated code to store the underlying values of enumeration members.

Example: 3

Data Types: single | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | double

### **memberDesc** — Description of new enumeration member

character vector

Description of the new enumeration member, specified as a character vector.

If you do not want to supply a description for the enumeration member, use an empty character vector.

Example: 'Enumeration member number 1.'

Example: ''

Data Types: char

## Alternatives

You can use Model Explorer to add enumeration members to the enumerated data type represented by a `Simulink.data.dictionary.EnumTypeDefinition` object.

## Version History

Introduced in R2015a

## See Also

`Simulink.data.dictionary.EnumTypeDefinition` | `removeEnumeral`

## Topics

“Store Data in Dictionary Programmatically”

“Use Enumerated Data in Simulink Models”

## removeEnumeral

**Package:** Simulink.data.dictionary

Remove enumeration member from enumerated data type definition in data dictionary

### Syntax

```
removeEnumeral(typeObj,memberNum)
```

### Description

`removeEnumeral(typeObj,memberNum)` removes an enumeration member from the enumerated type definition stored by `typeObj`, a `Simulink.data.dictionary.EnumTypeDefinition` object.

### Examples

#### Programmatically Create Enumerated Type Definition in Data Dictionary

Create an object that can store the definition of an enumerated type. By default, the new type defines a single enumeration member `enum1` with underlying integer value 0.

```
myColors = Simulink.data.dictionary.EnumTypeDefinition
myColors =
 Simulink.data.dictionary.EnumTypeDefinition
 enum1
```

Add some enumeration members to the definition of the type.

```
appendEnumeral(myColors,'Orange',1,'')
appendEnumeral(myColors,'Black',2,'')
appendEnumeral(myColors,'Cyan',3,'')
myColors
myColors =
 Simulink.data.dictionary.EnumTypeDefinition
 enum1
 Orange
 Black
 Cyan
```

Remove the default enumeration member `enum1`. Since `enum1` is the first enumeration member in the list, identify it with index 1.

```
removeEnumeral(myColors,1)
myColors
myColors =
```

```

Simulink.data.dictionary.EnumTypeDefinition
 Orange
 Black
 Cyan

```

Customize the enumerated type by configuring the properties of the object representing it.

```

myColors.Description = 'These are my favorite colors.';
myColors.DefaultValue = 'Cyan';
myColors.HeaderFile = 'colorsType.h';

```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the object that defines the enumerated type `myColors` to the dictionary.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', {'myColors'});
```

## Input Arguments

### **typeObj** — Target enumerated type definition

`Simulink.data.dictionary.EnumTypeDefinition` object

Target enumerated type definition, specified as a `Simulink.data.dictionary.EnumTypeDefinition` object.

### **memberNum** — Index of target enumeration member

integer

Index of target enumeration member, specified as an integer.

The first enumeration member in an enumerated type definition has index 1. For example, suppose an enumerated type `BasicColors` has this definition:

```

myColors =
 Simulink.data.dictionary.EnumTypeDefinition
 Orange
 Black
 Cyan

```

To remove the enumeration member `Black`, specify `memberNum` as 2. To remove the enumeration member `Cyan`, specify 3.

Do not specify `memberNum` using the integer value underlying an enumeration member. The integer value underlying the member is not equivalent to the index of the member.

Example: 3

```
Data Types: single | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | double
```

## Alternatives

You can use Model Explorer to remove enumeration members from the enumerated data type represented by a `Simulink.data.dictionary.EnumTypeDefinition` object.

## **Version History**

**Introduced in R2015a**

“Use Enumerated Data in Simulink Models”

# Simulink.data.dictionary.Section

Configure data dictionary section

## Description

An object of the `Simulink.data.dictionary.Section` class represents one section of a data dictionary, such as Design Data or Configurations. The object allows you to perform operations on the section such as add or delete entries and import data from files.

Before you can create a `Simulink.data.dictionary.Section` object, you must create a `Simulink.data.Dictionary` object representing the target data dictionary. Once created, the `Simulink.data.dictionary.Section` object exists independently of the `Simulink.data.Dictionary` object.

You cannot use the data dictionary programmatic interface (see “Store Data in Dictionary Programmatically”) to access the **Embedded Coder** section of a data dictionary. Instead, see Embedded Coder Dictionary (Embedded Coder).

## Creation

### Syntax

#### Description

The function `getSection` creates a `Simulink.data.dictionary.Section` object.

### Properties

#### Name — Name of data dictionary section

character vector

Name of data dictionary section, returned as a character vector. This property is read only.

### Object Functions

<code>addEntry</code>	Add new entry to data dictionary section
<code>assignin</code>	Assign value to data dictionary entry
<code>deleteEntry</code>	Delete data dictionary entry
<code>evalin</code>	Evaluate MATLAB expression in data dictionary section
<code>exist</code>	Check existence of data dictionary entry
<code>exportToFile</code>	Export data dictionary entries from section to MAT-file or MATLAB file
<code>find</code>	Search in data dictionary section
<code>getEntry</code>	Create <code>Simulink.data.dictionary.Entry</code> object to represent data dictionary entry
<code>importFromFile</code>	Import variables from MAT-file or MATLAB file to data dictionary section

### Examples

### **Create New Data Dictionary Section Object**

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
dDataSectObj = getSection(myDictionaryObj, 'Design Data')
```

```
dDataSectObj =
```

```
 Section with properties:
```

```
 Name: 'Design Data'
```

## **Version History**

**Introduced in R2015a**

### **See Also**

`getSection` | `Simulink.data.Dictionary`

### **Topics**

“Store Data in Dictionary Programmatically”

“What Is a Data Dictionary?”

# addEntry

**Package:** Simulink.data.dictionary

Add new entry to data dictionary section

## Syntax

```
addEntry(sectionObj,entryName,entryValue)
entryObj = addEntry(sectionObj,entryName,entryValue)
```

## Description

addEntry(sectionObj,entryName,entryValue) adds an entry, with name entryName and value entryValue, to the data dictionary section sectionObj, a Simulink.data.dictionary.Section object.

entryObj = addEntry(sectionObj,entryName,entryValue) returns a Simulink.data.dictionary.Entry object representing the newly added data dictionary entry.

## Examples

### Add Entry to Design Data Section of Data Dictionary

Represent the Design Data section of the data dictionary myDictionary\_ex\_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Add an entry to the Design Data section of myDictionary\_ex\_API.sldd an entry myNewEntry with value 237.

```
addEntry(dDataSectObj,'myNewEntry',237)
```

### Add New Simulink.Parameter Object to Data Dictionary

Represent the Design Data section of the data dictionary myDictionary\_ex\_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Add an entry to the Design Data section of myDictionary\_ex\_API.sldd. Name the new entry myNewParam and assign a Simulink.Parameter object to the value.

```
addEntry(dDataSectObj,'myNewParam',Simulink.Parameter)
```

The expression `Simulink.Parameter` constructs a new `Simulink.Parameter` object, and the `addEntry` function assigns the object to the value of the new data dictionary entry `myNewParam`.

## Input Arguments

### **sectionObj** — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

### **entryName** — Name of new data dictionary entry

character vector

Name of new data dictionary entry, specified as a character vector.

Example: `'myNewEntry'`

Data Types: `char`

### **entryValue** — Value of new data dictionary entry

MATLAB expression

Value of new data dictionary entry, specified as a MATLAB expression that returns any valid data dictionary content.

Example: `27.5`

Example: `myBaseWorkspaceVariable`

Example: `Simulink.Parameter`

## Tips

- `addEntry` returns an error if the entry name you specify with `entryName` is already the name of an entry in the target data dictionary section or in the same section of any referenced dictionaries.

## Alternatives

You can use Model Explorer to add entries to a data dictionary in the same way you can use it to add variables to a model workspace or the base workspace.

## Version History

Introduced in R2015a

## See Also

`Simulink.data.dictionary.Section` | `Simulink.data.dictionary.Entry` | `assignin`

## Topics

“Store Data in Dictionary Programmatically”

# assignin

**Package:** Simulink.data.dictionary

Assign value to data dictionary entry

## Syntax

```
assignin(sectionObj,entryName,entryValue)
```

## Description

`assignin(sectionObj,entryName,entryValue)` assigns the value `entryValue` to the data dictionary entry `entryName` in the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object. If an entry with the specified name is not in the target section, `assignin` creates the entry with the specified name and value.

If an entry with the name specified by input argument `entryName` is not defined in the target data dictionary section but is defined in a referenced dictionary, `assignin` does not create a new entry in the target section but operates on the entry in the referenced dictionary.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

## Examples

### Assign Value to Data Dictionary Entry

Assign a value to a data dictionary entry by operating on a `Simulink.data.dictionary.Section` object.

Represent the Design Data section of the data dictionary `myDictionary_ex_API.slidd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.slidd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Assign the value 237 to an entry `myAssignedEntry` in the data dictionary `myDictionary_ex_API.slidd`. If an entry named `myAssignedEntry` is not in `myDictionary_ex_API.slidd`, create it.

```
assignin(dDataSectObj,'myAssignedEntry',237)
```

## Input Arguments

**sectionObj** — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

**entryName — Name of target data dictionary entry**

character vector

Name of target data dictionary entry, specified as a character vector. If a matching entry does not already exist, the function creates a new entry using the specified name.

Example: 'myEntry'

Data Types: char

**entryValue — Value to assign to data dictionary entry**

MATLAB expression

Value to assign to data dictionary entry, specified as a MATLAB expression that returns any valid data dictionary content.

Example: 27.5

Example: myBaseWorkspaceVariable

Example: Simulink.Parameter

**Alternatives**

You can use the Model Explorer window to view and change the values of data dictionary entries.

**Version History**

Introduced in R2015a

**See Also**

`Simulink.data.dictionary.Section` | `setValue`

**Topics**

“Store Data in Dictionary Programmatically”

# deleteEntry

**Package:** Simulink.data.dictionary

Delete data dictionary entry

## Syntax

```
deleteEntry(sectionObj,entryName)
deleteEntry(sectionObj,entryName,'DataSource',dictionaryName)
```

## Description

`deleteEntry(sectionObj,entryName)` deletes a data dictionary entry `entryName` from the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object. If there are multiple entries with the specified name in a hierarchy of reference dictionaries, the function deletes all the entries. If you represent a data dictionary entry with one or more `Simulink.data.dictionary.Entry` objects and later delete the entry using the `deleteEntry` function, the objects remain with their `Status` property set to 'Deleted'.

`deleteEntry(sectionObj,entryName,'DataSource',dictionaryName)` deletes an entry that is defined in the data dictionary `DictionaryName`. Use this syntax to uniquely identify an entry that is defined more than once in a hierarchy of referenced data dictionaries.

## Examples

### Delete Entry from Data Dictionary Section

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`. The Design Data section of `myDictionary_ex_API.sldd` already contains an entry named `fuelFlow`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Delete the entry `fuelFlow` from the data dictionary `myDictionary_ex_API.sldd`. `myDictionary_ex_API.sldd` no longer contains the `fuelFlow` entry.

```
deleteEntry(dDataSectObj,'fuelFlow')
```

### Delete Entry from Reference Data Dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Delete the entry `myRefEntry` from the data dictionary `myRefDictionary_ex_API.sldd`. `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`, and `myRefDictionary_ex_API.sldd` defines an entry `myRefEntry`.

```
deleteEntry(dDataSectObj, 'myRefEntry', 'DataSource', ...
'myRefDictionary_ex_API.sldd')
```

## Input Arguments

### **sectionObj** — Target data dictionary section

Simulink.data.dictionary.Section object

Target data dictionary section, specified as a Simulink.data.dictionary.Section object. Before you use this function, represent the target section with a Simulink.data.dictionary.Section object by using, for example, the getSection function.

### **entryName** — Name of target data dictionary entry

character vector

Name of target data dictionary entry, specified as a character vector.

Example: 'myEntry'

Data Types: char

### **dictionaryName** — Name of data dictionary that defines target entry

character vector

File name of data dictionary that defines the target entry, specified as a character vector including the .sldd extension.

Example: 'mySubDictionary\_ex\_API.sldd'

Data Types: char

## Alternatives

You can use the Model Explorer window to delete entries from a data dictionary in the same way you can delete variables from a model workspace or the base workspace.

## Version History

**Introduced in R2015a**

## See Also

Simulink.data.dictionary.Section | addEntry | Simulink.data.dictionary.Entry

## Topics

“Store Data in Dictionary Programmatically”

# evalin

**Package:** Simulink.data.dictionary

Evaluate MATLAB expression in data dictionary section

## Syntax

```
returnValue = evalin(sectionObj,expression)
```

## Description

`returnValue = evalin(sectionObj,expression)` evaluates a MATLAB expression in the data dictionary section `sectionObj` and returns the values returned by `expression`.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

## Examples

### List All Entries in Data Dictionary Section

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Execute the `whos` command in the Design Data section of `myDictionary_ex_API.sldd`.

```
evalin(dDataSectObj,'whos')
```

Name	Size	Bytes	Class	Attributes
fuelFlow	1x1	8	double	
myRefEntry	1x1	1	logical	
parameterGain37	1x1	112	Simulink.Parameter	

## Input Arguments

### **sectionObj** — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

### **expression** — MATLAB expression to evaluate

character vector

MATLAB expression to evaluate, specified as a character vector.

Example: 'a = 5.3'

Example: 'whos'

Example: 'CurrentSpeed.Value = 290.73'

Data Types: char

## **Tips**

- `evalin` allows you to treat a data dictionary section as a MATLAB workspace. You can think of entries contained in the section as workspace variables you can manipulate with MATLAB expressions.

## **Version History**

**Introduced in R2015a**

## **See Also**

`Simulink.data.dictionary.Section` | `Simulink.data.evalinGlobal`

## **Topics**

“Store Data in Dictionary Programmatically”

# exist

**Package:** Simulink.data.dictionary

Check existence of data dictionary entry

## Syntax

```
doesExist = exist(sectionObj,entryName)
```

## Description

`doesExist = exist(sectionObj,entryName)` determines if the data dictionary section `sectionObj` contains an entry by the name of `entryName` and returns an indication.

## Examples

### Determine if Data Dictionary Entry Exists

Determine if an entry exists in a data dictionary by searching for the name of the entry

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Determine if an entry `fuelFlow` exists in the Design Data section of `myDictionary_ex_API.sldd`.

```
exist(dDataSectObj,'fuelFlow')
```

```
ans =
```

```
1
```

Determine if an entry `myEntry` exists in the Design Data section of `myDictionary_ex_API.sldd`.

```
exist(dDataSectObj,'myEntry')
```

```
ans =
```

```
0
```

## Input Arguments

### **sectionObj** — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

**entryName — Name of target entry**

character vector

Name of target entry, specified as a character vector.

Example: 'myEntry'

Data Types: char

**Output Arguments****doesExist — Indication of entry existence**

0 | 1

Indication of entry existence, returned as 0 if false and 1 if true.

**Tips**

- `exist` also determines if a matching entry exists in the same section of any referenced data dictionaries. For example, if `sectionObj` represents the Design Data section of a data dictionary `myDictionary_ex_API.sldd`, `exist` searches the Design Data section of `myDictionary_ex_API.sldd` and the Design Data sections of any dictionaries referenced by `myDictionary_ex_API.sldd`.

**Alternatives**

You can use Model Explorer to search a data dictionary for an entry.

**Version History**

Introduced in R2015a

**See Also**`Simulink.data.dictionary.Section | find | Simulink.data.existsInGlobal`**Topics**

"Store Data in Dictionary Programmatically"

# exportToFile

**Package:** Simulink.data.dictionary

Export data dictionary entries from section to MAT-file or MATLAB file

## Syntax

```
exportToFile(sectionObj, fileName)
```

## Description

`exportToFile(sectionObj, fileName)` exports to a MAT or MATLAB file all the values of the entries contained in the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object. `exportToFile` exports the values of all entries, including those defined in referenced dictionaries.

## Examples

### Export Data Dictionary Entries to MAT or MATLAB Files

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`. Represent the Configurations section of `myDictionary_ex_API.sldd` with an object named `configSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
configSectObj = getSection(myDictionaryObj, 'Configurations');
```

Export the entries from the Design Data section of `myDictionary_ex_API.sldd` to a MATLAB file in your current working folder.

```
exportToFile(dDataSectObj, 'myDictionaryDesignData.m')
```

Export the entries from the Configurations section of `myDictionary_ex_API.sldd` to a MAT-file in your current working folder.

```
exportToFile(configSectObj, 'myDictionaryConfigurations.mat')
```

```
Exported 1 entries from scope 'Configurations'
to MAT-file myDictionaryConfigurations.mat.
```

## Input Arguments

### **sectionObj** — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

**fileName — Name of MAT or MATLAB file**

character vector

Name of target MAT or MATLAB file, specified as a character vector. `exportToFile` supplies a file extension `.mat` if you do not specify an extension.

Example: `'myNewFile.mat'`

Example: `'myNewFile.m'`

Data Types: `char`

**Limitation**

The `exportToFile` method does not export enumerated data types (which are stored as `Simulink.data.dictionary.EnumTypeDefinition` objects). To transfer or copy an enumerated type from one dictionary to another, use the `getEntry` and `addEntry` methods of `Simulink.data.dictionary.Section` objects.

**Alternatives**

You can use Model Explorer to export data dictionary entries to a file. See “Export Design Data from Dictionary” for more information.

**Version History**

Introduced in R2015a

**See Also**

`Simulink.data.dictionary.Section` | `importFromFile`

“Store Data in Dictionary Programmatically”

# find

**Package:** Simulink.data.dictionary

Search in data dictionary section

## Syntax

```
foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN)
foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN,options)
```

## Description

`foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN)` searches the data dictionary section `sectionObj` using search criteria `PName1,PValue1,...,PNameN,PValueN`, and returns an array of matching entries that were found in the target section. This syntax matches the search criteria with the properties of the entries in the target section but not with the properties of their values. See `Simulink.data.dictionary.Entry` for a list of data dictionary entry properties.

`foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN,options)` searches for data dictionary entries using additional search options. For example, you can match the search criteria with the values of the entries in the target section.

## Examples

### Return Array of All Entries in Data Dictionary Section

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Return all of the entries stored in the Design Data section of the data dictionary `myDictionary_ex_API.sldd`.

```
allEntries = find(dDataSectObj)
```

### Search Data Dictionary Section for Specific Class

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries whose values are objects of the `Simulink.Parameter` class.

```
foundEntries = find(dDataSectObj, '-value', '-class', 'Simulink.Parameter')
```

### Search Data Dictionary Section for Modifying User

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries that were last modified by the user `jsmith`.

```
foundEntries = find(dDataSectObj, 'LastModifiedBy', 'jsmith')
```

### Search Data Dictionary Section Using Multiple Criteria

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries that were last modified by the user `jsmith` or whose names begin with `fuel`.

```
foundEntries = find(dDataSectObj, 'LastModifiedBy', 'jsmith', '-or', ...
'-regexp', 'Name', 'fuel*')
```

### Search Data Dictionary Section Using Regular Expressions

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries whose names begin with `fuel`.

```
foundEntries = find(dDataSectObj, '-regexp', 'Name', 'fuel*')
```

### Search Data Dictionary Section for Specific Value

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Return all of the entries stored in the Design Data section of the data dictionary `myDictionary_ex_API.sldd`.

```
allEntries = find(dDataSectObj);
```

Find the entries with value 237. If you find more than one entry, store the entries in an array called `foundEntries`.

```
foundEntries = [];
for i = 1:length(allEntries)
 if getValue(allEntries(i)) == 237
 foundEntries = [foundEntries allEntries(i)];
 end
end
```

### Search Data Dictionary Section for Specific Property

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries whose values have a property `DataType`.

```
foundEntries = find(dDataSectObj, '-value', '-property', 'DataType')
```

## Input Arguments

### `sectionObj` — Data dictionary section to search

`Simulink.data.dictionary.Section` object

Data dictionary section to search, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

### `PName1, PValue1, . . . , PNameN, PValueN` — Search criteria

name-value pairs representing properties

Search criteria, specified as one or more name-value pairs representing names and values of properties of the entries in the target data dictionary section. For a list of the properties of a data dictionary entry, see `Simulink.data.dictionary.Entry`. If you specify more than one name-value pair, the returned entries meet all of the criteria.

If you include the `'-value'` option to search in the values of the entries, the search criteria apply to the values of the entries rather than to the entries themselves.

Example: `'LastModifiedBy', 'jsmith'`

Example: `'DataSource', 'myRefDictionary_ex_API.sldd'`

### `options` — Additional search options

supported option codes

Additional search options, specified as one or more of the following supported option codes.

'-value'	This option causes <code>find</code> to search only in the values of the entries in the target data dictionary section. Specify this option before any other search criteria or options arguments.
'-and', '-or', '-xor', '-not' logical operators	These options modify or combine multiple search criteria or other option codes.
'-property', <code>propertyName</code>	This name-value pair causes <code>find</code> to search for entries or values that have the property <code>propertyName</code> regardless of the value of the property. Specify <code>propertyName</code> as a character vector.
'-class', <code>className</code>	This name-value pair causes <code>find</code> to search for entries or values that are objects of the class <code>className</code> . Specify <code>className</code> as a character vector.
'-isa', <code>className</code>	This name-value pair causes <code>find</code> to search for entries or values that are objects of the class or of any subclass derived from the class <code>className</code> . Specify <code>className</code> as a character vector.
'-regexp'	This option allows you to use regular expressions in your search criteria. This option affects only search criteria that follow '-regexp'.

Example: '-value'

Example: '-value', '-property', 'CoderInfo'

Example: '-value', '-class', 'Simulink.Parameter'

## Output Arguments

### **foundEntries** — Data dictionary entries matching search criteria

array of `Simulink.data.dictionary.Entry` objects

Data dictionary entries matching the specified search criteria, returned as an array of `Simulink.data.dictionary.Entry` objects.

## Alternatives

You can use Model Explorer to search a data dictionary for entries using arbitrary criteria.

## Version History

Introduced in R2015a

## See Also

`Simulink.data.dictionary.Section` | `exist` | `Simulink.data.dictionary.Entry` | `find`

## Topics

“Store Data in Dictionary Programmatically”

# getEntry

**Package:** Simulink.data.dictionary

Create Simulink.data.dictionary.Entry object to represent data dictionary entry

## Syntax

```
entryObj = getEntry(sectionObj,entryName)
entryObj = getEntry(sectionObj,entryName,'DataSource',dictionaryName)
```

## Description

entryObj = getEntry(sectionObj,entryName) returns an array of Simulink.data.dictionary.Entry objects representing data dictionary entries entryName found in the data dictionary section sectionObj, a Simulinkdata.dictionary.Section object. getEntry returns multiple objects if multiple entries have the specified name in a reference hierarchy of data dictionaries.

entryObj = getEntry(sectionObj,entryName,'DataSource',dictionaryName) returns an object representing a data dictionary entry that is defined in the data dictionary dictionaryName. Use this syntax to uniquely identify an entry that is defined more than once in a hierarchy of referenced data dictionaries.

## Examples

### Set Value of Data Dictionary Entry

Represent the Design Data section of the data dictionary myDictionary\_ex\_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Represent the data dictionary entry fuelFlow with a Simulink.data.dictionary.Entry object named fuelFlowObj. fuelFlow is defined in the data dictionary myDictionary\_ex\_API.sldd.

```
fuelFlowObj = getEntry(dDataSectObj,'fuelFlow');
```

Set the value of the entry fuelFlow to 493.

```
setValue(fuelFlowObj,493)
```

### Set Value of Entry in Reference Dictionary

Represent the Design Data section of the data dictionary myDictionary\_ex\_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Represent the data dictionary entry `myRefEntry` with a `Simulink.data.dictionary.Entry` object named `refEntryObj`. `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`, and `myRefDictionary_ex_API.sldd` defines an entry `myRefEntry`.

```
refEntryObj = getEntry(dDataSectObj, 'myRefEntry', 'DataSource', ...
'myRefDictionary_ex_API.sldd');
```

Set the value of the entry `myRefEntry` to 493.

```
setValue(refEntryObj, 493)
```

## Input Arguments

### **sectionObj** — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

### **entryName** — Name of target data dictionary entry

character vector

Name of target data dictionary entry, specified as a character vector.

Example: `'myEntry'`

Data Types: `char`

### **dictionaryName** — Name of data dictionary containing target entry

character vector

File name of data dictionary containing the target entry, specified as a character vector including the `.sldd` extension.

Example: `'mySubDictionary_ex_API.sldd'`

Data Types: `char`

## Output Arguments

### **entryObj** — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, returned as one or more `Simulink.data.dictionary.Entry` objects.

## Version History

Introduced in R2015a

## See Also

`Simulink.data.dictionary.Section` | `addEntry` | `Simulink.data.dictionary.Entry` | `getValue`

**Topics**

“Store Data in Dictionary Programmatically”

## importFromFile

**Package:** Simulink.data.dictionary

Import variables from MAT-file or MATLAB file to data dictionary section

### Syntax

```
importedVars = importFromFile(sectionObj,fileName)
importedVars = importFromFile(sectionObj,fileName,'existingVarsAction',
existAction)
[importedVars,existingVars] = importFromFile(__)
```

### Description

`importedVars = importFromFile(sectionObj,fileName)` imports variables defined in the MAT-file or MATLAB file `fileName` to the data dictionary section `sectionObj` without overwriting any variables that are already in the target section. If any variables are already in the target section, the function displays a warning and a list in the MATLAB Command Window. This syntax returns a list of variables that were successfully imported. A variable is considered successfully imported only if `importFromFile` assigns the value of the variable to the corresponding entry in the target data dictionary.

`importedVars = importFromFile(sectionObj,fileName,'existingVarsAction',existAction)` imports variables that are already in the target section by taking a specified action `existAction`. For example, you can choose to use the variable values in the target file to overwrite the corresponding values in the target section.

`[importedVars,existingVars] = importFromFile( __ )` returns a list of variables in the target section that were not overwritten. Use this syntax if `existingVarsAction` is set to 'none', the default value, which prevents existing dictionary entries from being overwritten.

### Examples

#### Import to Data Dictionary from File

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Import all variables contained in the file `myData_ex_API.m` to the data dictionary and return a list of successfully imported variables. If any variables are already in `myDictionary_ex_API.sldd`, `importFromFile` returns a warning and a list of the affected variables.

```
importFromFile(dDataSectObj,'myData_ex_API.m')
```

```
Warning: The following variables were not imported because
they already exist in the dictionary:
 fuelFlow
```

```
ans =
 'myFirstEntry'
 'mySecondEntry'
 'myThirdEntry'
```

### Import Variables from File and Overwrite Conflicts

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Import all variables contained in the file `myData_ex_API.m` to the data dictionary, overwrite any variables that are already in the dictionary, and return a list of successfully imported variables.

```
importFromFile(dDataSectObj,'myData_ex_API.m','existingVarsAction','overwrite')
```

```
ans =
 'fuelFlow'
 'myFirstEntry'
 'mySecondEntry'
 'myThirdEntry'
```

### Return Variables Not Imported to Data Dictionary from File

Return a list of variables that are not imported from a file because they are already in the target data dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Import all variables contained in the file `myData_ex_API.m` to the data dictionary. Specify names for the output arguments of `importFromFile` to return the names of successfully and unsuccessfully imported variables.

```
[importedVars,existingVars] = importFromFile(dDataSectObj,'myData_ex_API.m')
```

```
importedVars =
 'myFirstEntry'
 'mySecondEntry'
 'myThirdEntry'
```

```
existingVars =
 'fuelFlow'
```

`importFromFile` does not import the variable `fuelFlow` because it is already in the target data dictionary.

## Input Arguments

### **sectionObj** — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

### **fileName** — Name of MAT or MATLAB file

character vector

Name of target MAT or MATLAB file, specified as a character vector. `importFromFile` automatically supplies a file extension `.mat` if you do not specify an extension.

Example: `'myFile.mat'`

Example: `'myFile.m'`

Data Types: `char`

### **existAction** — Action to take for existing dictionary variables

`'none'` (default) | `'overwrite'` | `'error'`

Action to take for existing dictionary variables, specified as `'none'`, `'overwrite'`, or `'error'`.

If you specify `'none'`, `importFromFile` attempts to import target variables but does not import or make any changes to variables that are already in the data dictionary section.

If you specify `'overwrite'`, `importFromFile` imports all target variables and overwrites any variables that are already in the data dictionary section.

If you specify `'error'`, `importFromFile` returns an error, without importing any variables, if any target variables are already in the data dictionary section.

Example: `'overwrite'`

Data Types: `char`

## Output Arguments

### **importedVars** — Successfully imported variables

cell array of character vectors

Names of successfully imported variables, returned as a cell array of character vectors. A variable is considered successfully imported only if `importFromFile` assigns its value to the corresponding entry in the target data dictionary.

### **existingVars** — Variables that were not imported

cell array of character vectors

Names of target variables that were not imported due to their existence in the target data dictionary, returned as a cell array of character vectors. `existingVars` has content only if `existAction` is set

to 'none', which is also the default. In that case `importFromFile` imports only variables that are not already in the target data dictionary.

## Tips

- `importFromFile` can import MATLAB variables created from enumerated data types but cannot import the definitions of the enumerated types. Use the `importEnumTypes` function to import enumerated data type definitions to a data dictionary. If you import variables of enumerated data types to a data dictionary but do not import the enumerated type definitions, the dictionary is less portable and might not function properly if used by someone else.

## Alternatives

You can use the Model Explorer to import variables to a data dictionary from a file. See “Import Data to Dictionary from File” for more information.

## Version History

**Introduced in R2015a**

## See Also

`Simulink.data.dictionary.Section` | `exportToFile` | `importEnumTypes`

## Topics

## Simulink.DualScaledParameter

Specify name, value, units, and other properties of Simulink dual-scaled parameter

### Description

Use `Simulink.DualScaledParameter` so that you can define an object that stores two scaled values of the same physical value.

For example, for temperature measurement, you can store a Fahrenheit scale and a Celsius scale with conversion defined by a computation method that you provide. Given one scaled value, the `Simulink.DualScaledParameter` computes the other scaled value using the computation method.

A dual-scaled parameter inherits some properties from the `Simulink.Parameter` class. A dual-scaled parameter has:

- A calibration value. The value that you prefer to use.
- A main value. The real-world value that Simulink uses.
- An internal stored integer value. The value that is used in the embedded code.

You can use `Simulink.DualScaledParameter` objects in your model for both simulation and code generation. The parameter computes the internal value before code generation via the computation method. This offline computation results in leaner generated code.

If you provide the calibration value, the parameter computes the main value using the computation method. This method can be a first-order rational function.

$$y = \frac{ax + b}{cx + d}$$

- $x$  is the calibration value.
- $y$  is the main value.
- $a$  and  $b$  are the coefficients of the CalToMain compute numerator.
- $c$  and  $d$  are the coefficients of the CalToMain compute denominator.

If you provide the calibration minimum and maximum values, the parameter computes minimum and maximum values of the main value. Simulink performs range checking of parameter values. The software alerts you when the parameter object value lies outside a range that corresponds to its specified minimum and maximum values and data type.

### Creation

Create a `Simulink.DualScaledParameter` object:

- By using the **Model Data Editor**. Instead of creating a `Simulink.Parameter` object, create a `Simulink.DualScaledParameter` object.
- By using the **Model Explorer**:

- 1 In the **Model Hierarchy** pane, select a workspace or data dictionary.
  - 2 On the toolbar, select **Add > Add Custom**.
  - 3 In the Model Explorer — Select Object dialog box, set **Object class** to `Simulink.DualScaledParameter`.
- By using the `Simulink.DualScaledParameter` function, described below.

## Syntax

`DSParam = Simulink.DualScaledParameter`

## Description

`DSParam = Simulink.DualScaledParameter` returns a `Simulink.DualScaledParameter` object with default property values.

## Properties

For information about properties in the property dialog box of a `Simulink.DualScaledParameter` object, see “`Simulink.DualScaledParameter` Property Dialog Box”.

### CalibrationValue — Calibration value of this parameter

[ ] (default) | finite, real, double number

Calibration value of this parameter, specified as a finite, real, double number. This value represents the value that you prefer to use.

Before specifying `CalibrationValue`, you must specify `CalToMainCompuNumerator` and `CalToMainCompuDenominator` to define the computation method. The parameter uses the computation method and the calibration value to calculate the main value that Simulink uses.

Corresponds to **Calibration value** in the property dialog box.

Example: 5.34

Data Types: double

### CalibrationMin — Calibration minimum value of this parameter

[ ] (default) | finite, real, double, scalar number

Calibration minimum value of this parameter, specified as a finite, real, double, scalar number. The default value, [ ], means the minimum is unspecified.

Before specifying `CalibrationMin`, you must specify `CalToMainCompuNumerator` and `CalToMainCompuDenominator` to define the computation method. The parameter uses the computation method and the calibration minimum value to calculate the minimum or maximum value that Simulink uses. A first order rational function is strictly monotonic, either increasing or decreasing. If it is increasing, setting the calibration minimum sets the main minimum value. If it is decreasing, setting the calibration minimum sets the main maximum.

If the parameter value is less than the minimum value or if the minimum value is outside the range of the parameter data type, Simulink generates a warning. In these cases, when updating the diagram or starting a simulation, Simulink generates an error.

Corresponds to **Calibration minimum** in the property dialog box.

Example: 10.51

Data Types: double

### **CalibrationMax** — Calibration maximum value of this parameter

[ ] (default) | finite, real, double, scalar number

Calibration maximum value of this parameter, specified as a finite, real, double, scalar number. The default value, [ ], means the maximum is unspecified.

Before specifying `CalibrationMax`, you must specify `CalToMainCompuNumerator` and `CalToMainCompuDenominator` to define the computation method. The parameter uses the computation method and the calibration maximum value to calculate the corresponding maximum or minimum value that Simulink uses. A first order rational function is strictly monotonic, either increasing or decreasing. If it is increasing, setting the calibration maximum sets the main maximum value. If it is decreasing, setting the calibration maximum sets the main minimum.

If the parameter value is less than the minimum value or if the minimum value is outside the range of the parameter data type, Simulink generates a warning. In these cases, when updating the diagram or starting a simulation, Simulink generates an error.

Corresponds to **Calibration maximum** in the property dialog box.

Example: -10.51

Data Types: double

### **CalToMainCompuNumerator** — Numerator coefficients of the computation method

[ ] (default) | finite, real, double scalar | finite, real, double vector

Numerator coefficients of the computation method, specified as a scalar number or vector of values for the numerator coefficients *a* and *b* of the first-order linear equation:

$$y = \frac{ax + b}{cx + d}$$

The default value is [ ] (unspecified). Specify finite, real, double scalar values for *a* and *b*. For example, [1 1] or, for reciprocal scaling, 1.

Once you have applied `CalToMainCompuNumerator`, you cannot change it.

Corresponds to **CalToMain compute numerator** in the property dialog box.

Example: [1 1]

Example: 1

Data Types: double

### **CalToMainCompuDenominator** — Denominator coefficients of the computation method

[ ] (default) | finite, real, double scalar | finite, real, double vector

Denominator coefficients of the computation method, specified as a scalar number or vector of values for the denominator coefficients *c* and *d* of the first-order linear equation:

$$y = \frac{ax + b}{cx + d}$$

The default value is `[]` (unspecified). Specify finite, real, double scalar values for `c` and `d`. For example, `[1 1]`.

Once you have applied `CalToMainCompuDenominator`, you cannot change it.

Corresponds to **CalToMain compute denominator** in the property dialog box.

Example: `[1 1]`

Data Types: `double`

### **CalibrationName — Name of the calibration parameter**

`''` (empty character vector) (default) | character vector

Name of the calibration parameter, specified as a character vector.

Corresponds to **Calibration name** in the property dialog box.

Example: `'This is a calibration parameter.'`

Data Types: `char`

### **CalibrationDocUnits — Measurement units for this calibration parameter's value**

`''` (empty character vector) (default) | character vector

Measurement units for this calibration parameter's value, specified as a character vector.

Corresponds to **Calibration units** in the property dialog box.

Example: `'Fahrenheit'`

Data Types: `char`

### **IsConfigurationValid — Information about validity of configuration**

`true` (default) | `false`

This property is read-only.

Information about the validity of the object configuration, returned as `true` (valid) or `false` (invalid). If Simulink detects an issue with the configuration, it sets this field to `false` and provides information in the `DiagnosticMessage` property.

Corresponds to **Is configuration valid** in the property dialog box.

Data Types: `logical`

### **DiagnosticMessage — Diagnostic information about invalid configuration**

`''` (empty character vector) (default) | character vector

This property is read-only.

Diagnostic information about an invalid object configuration, returned as a character vector. If you specify invalid property settings, Simulink displays a message in this field. Use the diagnostic information to help you fix an invalid configuration issue.

Corresponds to **Diagnostic message** in the property dialog box.

Data Types: `char`

## Examples

### Create and Update a Dual-Scaled Parameter

Create a `Simulink.DualScaledParameter` object that stores a temperature as both Fahrenheit and Celsius.

Create a `Simulink.DualScaledParameter` object.

```
Temp = Simulink.DualScaledParameter;
```

Set the computation method that converts between Fahrenheit and Celsius.

```
Temp.CalToMainCompuNumerator = [1 -32];
Temp.CalToMainCompuDenominator = [1.8];
```

Set the value of the temperature that you want to see in Fahrenheit.

```
Temp.CalibrationValue = 212
```

```
Temp =
```

```
DualScaledParameter with properties:
```

```

 CalibrationValue: 212
 CalibrationMin: []
 CalibrationMax: []
 CalToMainCompuNumerator: [1 -32]
 CalToMainCompuDenominator: 1.8000
 CalibrationName: ''
 CalibrationDocUnits: ''
 IsConfigurationValid: 1
 DiagnosticMessage: ''
 Value: 100
 CoderInfo: [1x1 Simulink.CoderInfo]
 Description: ''
 DataType: 'auto'
 Min: []
 Max: []
 Unit: ''
 Complexity: 'real'
 Dimensions: [1 1]
```

The `Simulink.DualScaledParameter` calculates `Temp.Value` which is the value that Simulink uses. `Temp.CalibrationValue` is 212 (degrees Fahrenheit), so `Temp.Value` is 100 (degrees Celsius).

Name the value and specify the units.

```
Temp.CalibrationName = 'TempF';
Temp.CalibrationDocUnits = 'Fahrenheit';
```

Set calibration minimum and maximum values.

```
Temp.CalibrationMin = 0;
Temp.CalibrationMax = 300;
```

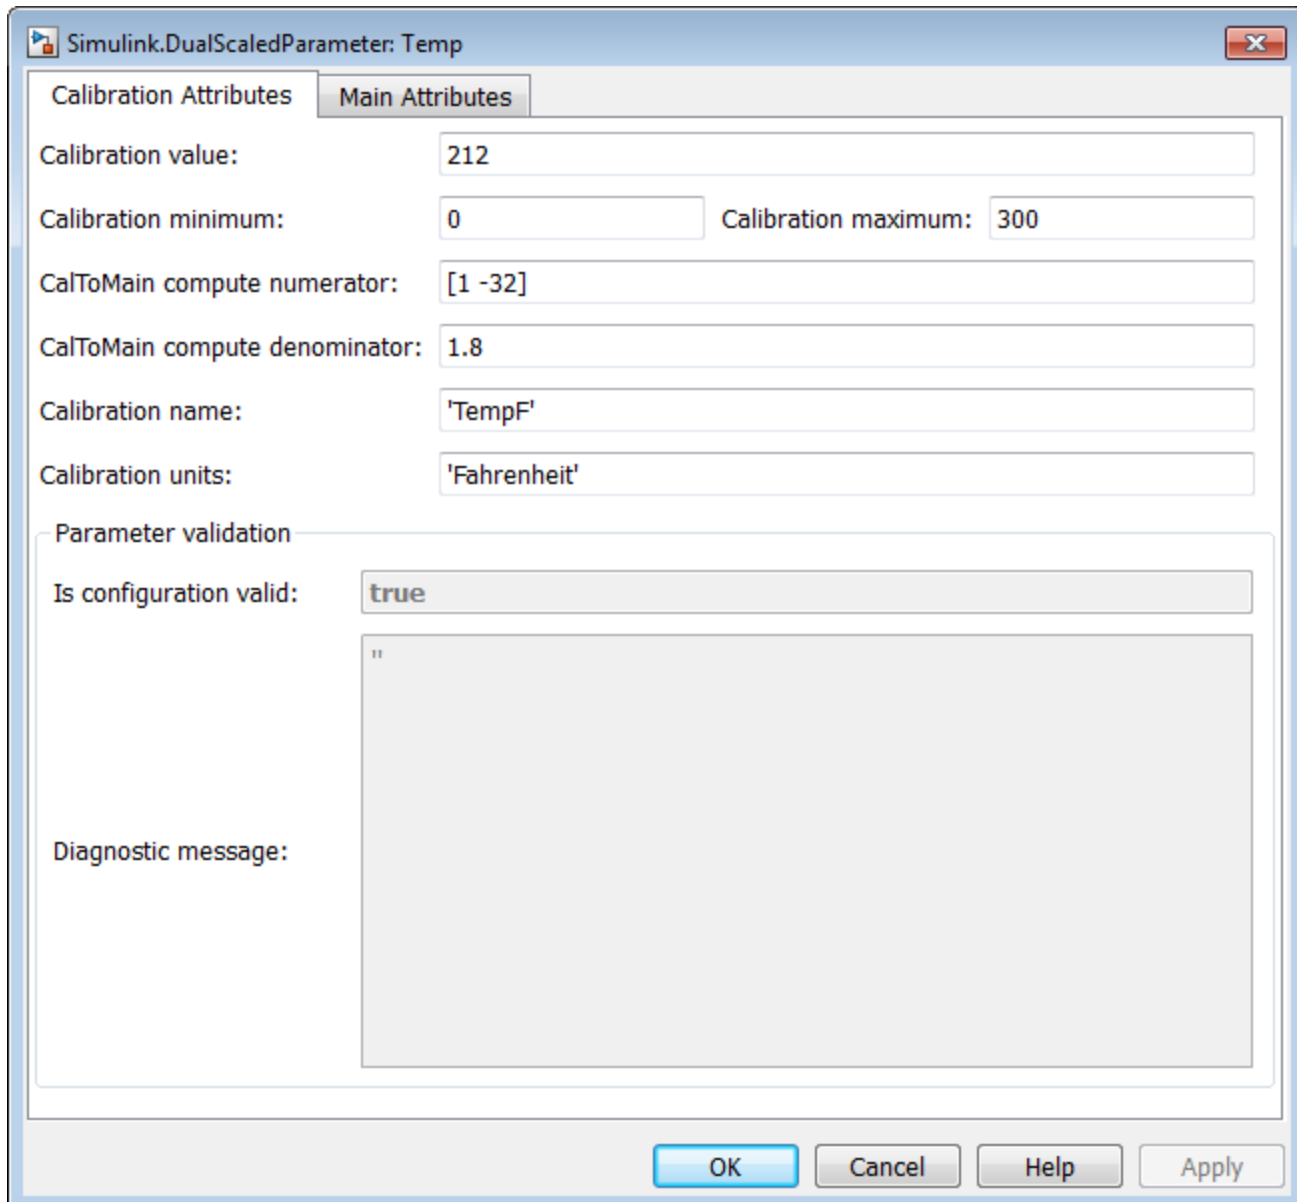

If you specify a calibration value outside this allowable range, Simulink generates a warning.

Specify the units that Simulink uses.

```
Temp.Unit = 'degC';
```

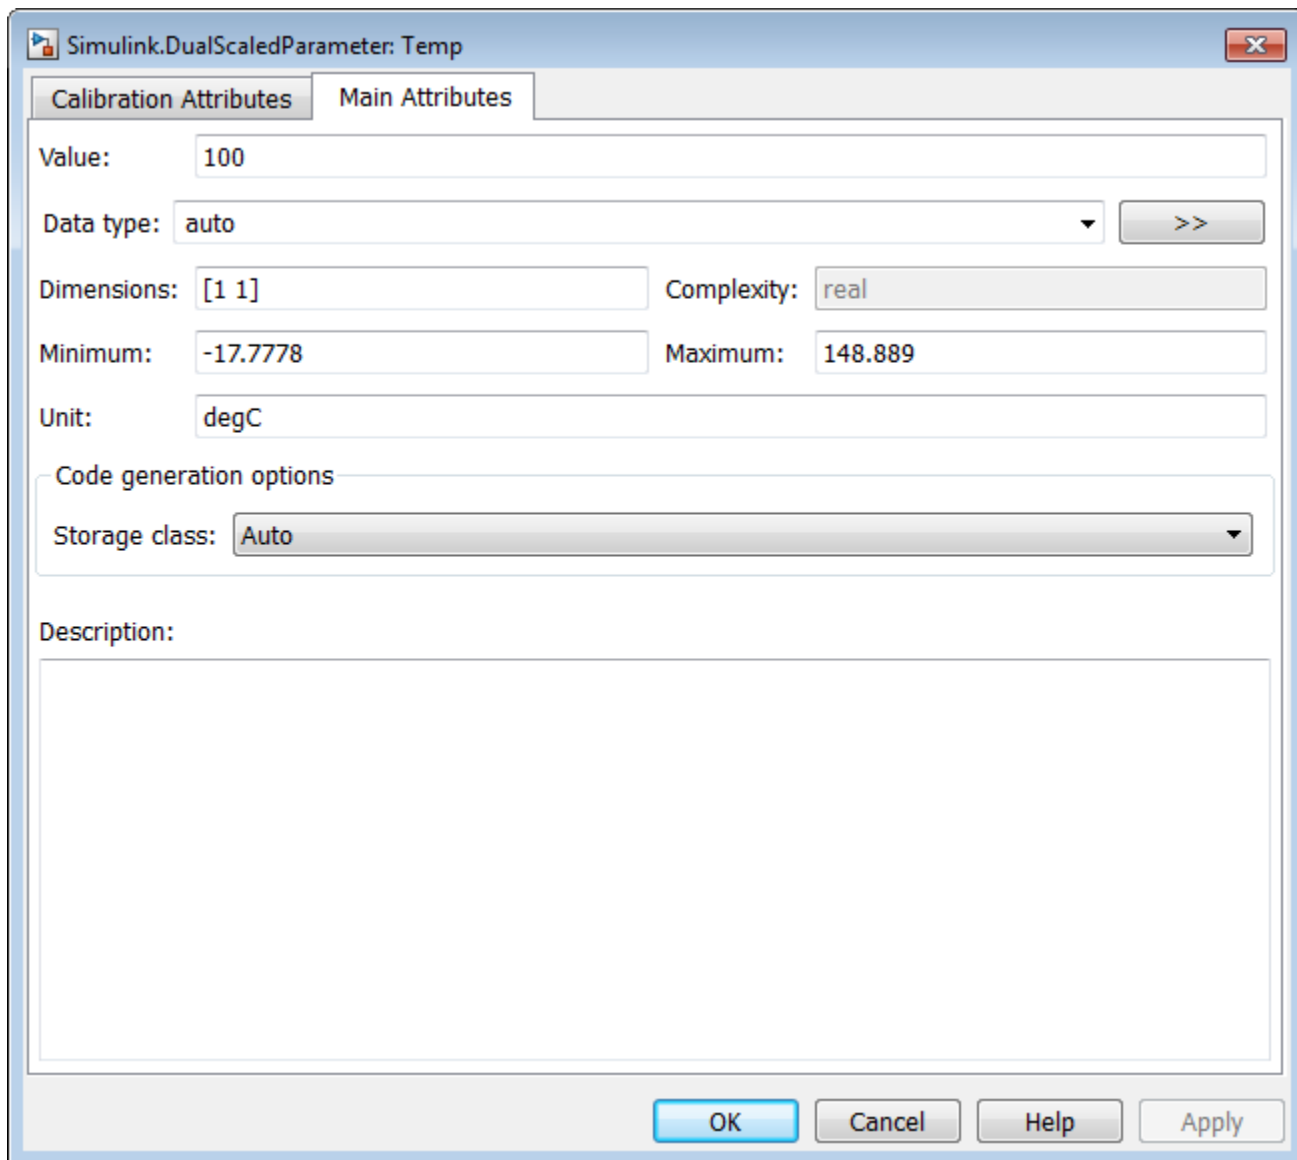

Open the Simulink.DualScaledParameter dialog box.

open `Temp`

The **Calibration Attributes** tab displays the calibration value and the computation method that you specified.

In the dialog box, click the **Main Attributes** tab.

This tab displays information about the value used by Simulink.

## Version History

Introduced in R2013b

## Extended Capabilities

### C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

To control the appearance of a `Simulink.DualScaledParameter` object in the generated code, use the **Storage class** property, which the object inherits from `Simulink.Parameter`.

**Fixed-Point Conversion**

Design and simulate fixed-point systems using Fixed-Point Designer™.

## simulink.event.InputWrite

Trigger event when input port value updates

### Description

Use a `simulink.event.InputWrite` object to configure a root input port to trigger a schedule event each time the port value updates. By configuring event triggers on input ports, you can model and simulate quality of service effects.

You can trigger one or more model partitions in a rate-based system based on the flow of data into an input port in the top model or on a model reference interface. The `EventTriggers` parameter of an Inport or In Bus Element block stores the event trigger objects associated with the port. Each event trigger maps an input event to the name of the schedule event it triggers. The schedule for the model specifies the partition to execute in response to the schedule event. The table summarizes the event triggers you can configure on input ports. For each input port, you can configure one event trigger for each input event.

Input Event	Input Event Description	Event Trigger Object
Input write	Value for input port updates.	<code>simulink.event.InputWrite</code>
Input write timeout	Input port value does not update within a specified amount of time.	<code>simulink.event.InputWriteTimeout</code>
Input write lost	Input port value update overwrites unprocessed data.	<code>simulink.event.InputWriteLost</code>

To configure the schedule for your model, use the **Schedule Editor**.

### Creation

You can configure the event triggers for an input port programmatically or interactively.

- When you configure the input port programmatically, create and configure the event trigger object yourself using the `simulink.event.InputWrite` function.
- When you configure the input port interactively using the Block Parameters dialog box or the Property Inspector, the software creates and configures the event trigger object.

### Syntax

```
inputWrite = simulink.event.InputWrite
```

### Description

`inputWrite = simulink.event.InputWrite` creates the event trigger object `inputWrite` that you can use to configure an input port to trigger a specified schedule event each time the port value updates.

## Properties

### EventName — Event to trigger when input port value updates

'Auto' (default) | string | character vector

Event to trigger when input port value updates, specified as a string or a character vector. The event name must be 'Auto' or the name of an event defined in the Schedule Editor.

By default, the event name is 'Auto'. When you update or compile a model that has an input port configured with an InputWrite event trigger with the event name 'Auto', the software:

- 1 Creates a schedule event that is scoped to the block. For example, for a block named Inport, the software creates the event Inport.InputWrite.

This event appears in the **Events** panel in the Schedule Editor with other events defined for the model.

- 2 Configures the listener for the event as the aperiodic partition connected to the input port, if the input port is connected to an aperiodic partition.

To configure a different listener for the event, use the **Schedule Editor**.

Example: `inWrite.EventName = "myEvent"` configures the event trigger object `inWrite` to trigger the event `myEvent` that is defined in the Schedule Editor.

Data Types: `char` | `string`

## Examples

### Trigger Partition Each Time Input Port Value Updates

Open the model `TimesTwo`. The model loads external input data into a subsystem. The subsystem contains a Gain block that multiplies the subsystem input by two.

```
mdl = "TimesTwo";
open_system(mdl)
```

Create a `timeseries` object with input data for the model. The input data represents a line with a slope of one sampled every second for ten seconds.

```
sampleTime = 1;
numSteps = 11;
time = sampleTime*(0:numSteps-1);
time = time';
```

```
data = time;
```

```
lineTS = timeseries(data,time);
```

Configure the model to load the `timeseries` object.

```
set_param("TimesTwo","LoadExternalInput","on")
set_param("TimesTwo","ExternalInput","lineTS")
```

Simulate the model. By default, the maximum step size for the simulation is calculated such that the simulation takes 50 steps, resulting in a time step every 0.2 seconds.

```
out = sim mdl;
```

Configure the model to execute the partition only when the value of the input port updates.

Configure the subsystem to execute as an aperiodic partition. In the Block Parameters dialog box or the Property Inspector, select **Treat as atomic unit**, then from the **Schedule as** list, select **Aperiodic partition**. Alternatively, use the `set_param` function to configure the `TreatAsAtomicUnit` and `ScheduleAs` parameters.

```
set_param("TimesTwo/Subsystem","TreatAsAtomicUnit","on")
set_param("TimesTwo/Subsystem","ScheduleAs","Aperiodic partition")
```

Add an input write event trigger to the Inport block. In the Block Parameters dialog box, on the

**Execution** tab, click Add event trigger , then select **Input Write** from the list. Alternatively, create a `simulink.event.InputWrite` object and use the `set_param` function to configure the `EventTriggers` parameter.

```
inputWrite = simulink.event.InputWrite;
set_param("TimesTwo/Inport","EventTriggers",{inputWrite})
```

Update the block diagram by pressing **Ctrl+D** or by using the `set_param` function. By default, the input write event trigger is configured to trigger the `Auto` event. When you update the block diagram or compile the model, the software creates the event `Inport.InputWrite` that is scoped to the Inport block and configures the partition connected to the Inport block as the listener for the event.

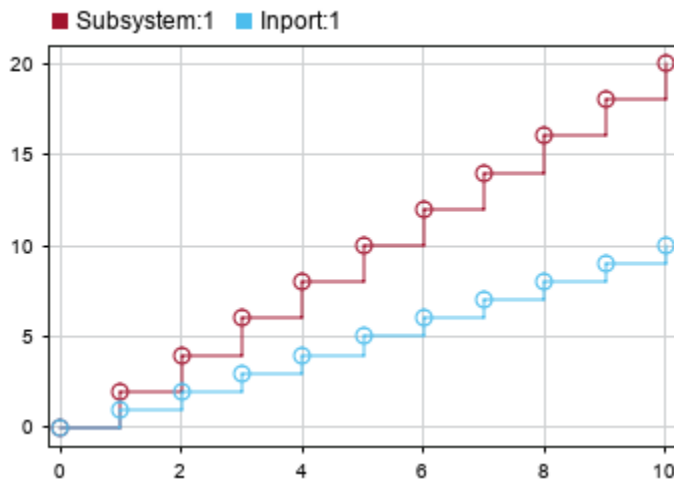

```
set_param("TimesTwo","SimulationCommand","update")
```

Simulate the model again. Because input port data drives the partition execution, the simulation takes a step only when the input value updates.

```
out = sim mdl;
```

## simulink.event.InputWriteLost

Trigger event when input port value update overwrites unprocessed data

### Description

Use a `simulink.event.InputWriteLost` object to configure a root input port to trigger a schedule event each time a value update on the input port overwrites unprocessed data. By configuring event triggers on input ports, you can model and simulate quality of service effects.

You can trigger one or more model partitions in a rate-based system based on the flow of data into an input port in the top model or on a model reference interface. The `EventTriggers` parameter of an Inport or In Bus Element block stores the event trigger objects associated with the port. Each event trigger maps an input event to the name of the schedule event it triggers. The schedule for the model specifies the partition to execute in response to the schedule event. The table summarizes the event triggers you can configure on input ports. For each input port, you can configure one event trigger for each input event.

Input Event	Input Event Description	Event Trigger Object
Input write	Value for input port updates.	<code>simulink.event.InputWrite</code> <code>e</code>
Input write timeout	Input port value does not update within a specified amount of time.	<code>simulink.event.InputWrite</code> <code>Timeout</code>
Input write lost	Input port value update overwrites unprocessed data.	<code>simulink.event.InputWrite</code> <code>Lost</code>

To configure the schedule for your model, use the **Schedule Editor**.

### Creation

You can configure the event triggers for an input port programmatically or interactively.

- When you configure an event trigger programmatically, create and configure the event trigger object yourself using the `simulink.event.InputWriteLost` function.
- When you configure an event trigger interactively by using the Block Parameters dialog box or the Property Inspector, the software creates and configures the event trigger object.

### Syntax

```
writeLost = simulink.event.InputWriteLost
```

### Description

`writeLost = simulink.event.InputWriteLost` creates the event trigger `writeLost` that you can use to configure an input port to trigger a specified schedule event each time an update of the input port value overwrites unprocessed data.

## Properties

### EventName — Event to trigger when input port value update overwrites unprocessed data

'Auto' (default) | string | character vector

Event to trigger when input port value update overwrites unprocessed data, specified as a string or a character vector. The event name must be 'Auto' or the name of an event defined in the Schedule Editor.

By default, the event name is 'Auto'. When you update or compile a model that has an input port configured with an `InputWriteTimeout` event trigger with the event name 'Auto', the software creates a schedule event that is scoped to the block. For example, for a block named `Inport`, the software creates the event `Inport.InputWriteLost`. Use the **Schedule Editor** to configure the listener for the event.

Example: `inLost.EventName = "myEvent"` configures the event trigger object `inLost` to trigger the event `myEvent` that is defined in the Schedule Editor.

Data Types: `char` | `string`

## Examples

### Trigger Partition Each Time Sample Overwritten in Queue

Configure a model to execute a partition each time an incoming value overwrites unprocessed data in a queue.

Open the model `SampleLost`. The model contains the subsystem `Sensors` that models transmitting data from a single sensor every 0.1 seconds. A `Queue` block stores the sensor messages, and the model reference `SinkSystem` reads the sensor data from the queue. The model is configured to log events so you can visualize how messages propagate through the system using the Sequence Viewer.

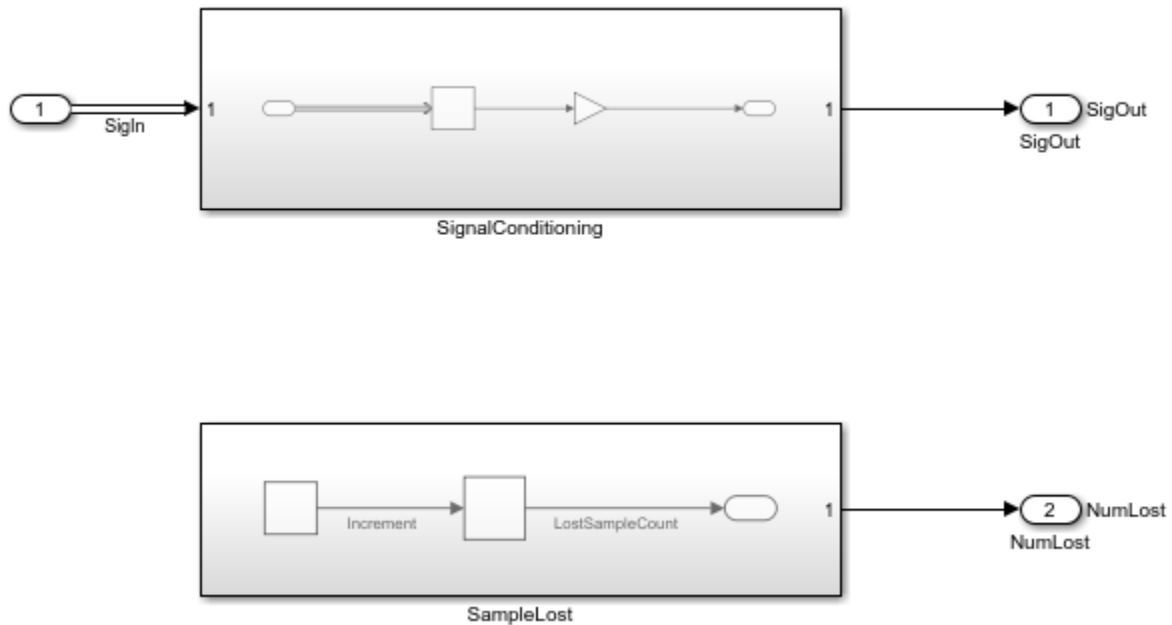

```
mdl = "SampleLost";
open_system(mdl)
```

The referenced model `SinkSystem` contains two subsystems:

- The `SignalConditioning` subsystem receives messages of sensor data from the queue and scales the data using a `Gain` block.

- The SampleLost subsystem contains a Constant block with a value of 1 connected to an Accumulator block.

Configure the subsystem `SignalConditioning` as a periodic partition that receives a message from the queue every 0.5 seconds.

- In the Block Parameters dialog box or the Property Inspector, select **Treat as atomic unit**.
- From the **Schedule as** list, select `Periodic` partition.
- Specify the partition name as `SignalConditioning`.
- Specify the sample time as 0.5.

Alternatively, use the `set_param` function to configure the `TreatAsAtomicUnit`, `ScheduleAs`, `PartitionName`, and `SystemSampleTime` parameters.

```
load_system("SinkSystem");
set_param("SinkSystem/SignalConditioning", "TreatAsAtomicUnit", "on", ...
 "ScheduleAs", "Periodic partition", ...
 "PartitionName", "SignalConditioning", ...
 "SystemSampleTime", "0.5");
```

Configure the subsystem `SampleLost` as an aperiodic partition.

- In the Block Parameters dialog box or the Property Inspector, select **Treat as atomic unit**.
- From the **Schedule as** list, select `Aperiodic` partition.
- Specify the partition name as `SampleLost`.

Alternatively, use the `set_param` function to configure the `TreatAsAtomicUnit`, `ScheduleAs`, and `PartitionName` parameters.

```
set_param("SinkSystem/SampleLost", "TreatAsAtomicUnit", "on", ...
 "ScheduleAs", "Aperiodic partition", ...
 "PartitionName", "SampleLost")
```

Configure the input port for the model reference SinkSystem with an input write lost event trigger.

- 1 In the Block Parameters dialog box, on the **Execution** tab, click Add event trigger.
- 2 From the list, select Input Write Lost.

Alternatively, create and configure a `simulink.event.InputWriteLost` object. Then, configure the `EventTriggers` parameter of the input port using the `set_param` function.

```
inLost = simulink.event.InputWriteLost;
set_param("SinkSystem/Inport", "EventTriggers", {inLost})
```

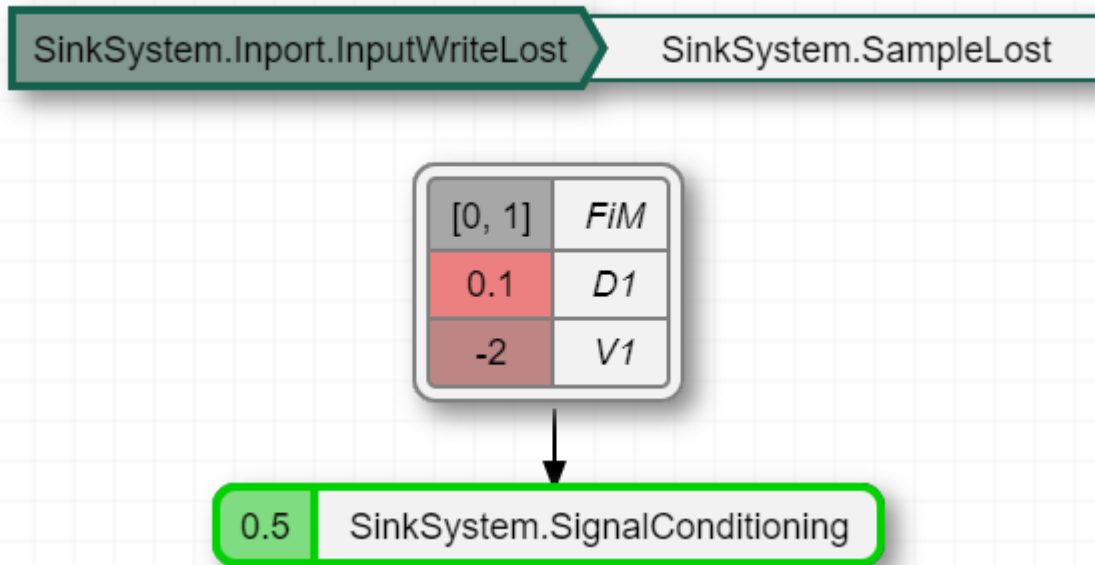

Update the block diagram by pressing **Ctrl+D** or by using the `set_param` function. By default, the event trigger is configured to trigger the Auto event. When you update the block diagram or compile the model, the software creates the event `SampleLost.Inport.InputWriteLost` that is scoped to the Inport block in the model reference.

```
set_param mdl, "SimulationCommand", "update")
```

Configure the model so the `SampleLost.Inport.InputWriteLost` event triggers the `SampleLost` partition.

- 1 Open the Schedule Editor. In the model, click the badge  on one of the partitioned subsystems. Alternatively, from the Block Parameters dialog box for the Inport block, on the **Execution** tab, click **Open Schedule Editor**.
- 2 To expand the **Events** pane, click Expand Side .
- 3 Select the `SampleLost.Inport.InputWriteLost` event. Then, drag it into the Schedule Editor canvas and release it on the `SampleLost` partition.

Alternatively, use the `get_param` function to get the schedule for the model. Then, using the `Order` property of the schedule, specify the trigger for the `SampleLost` partition and use the `set_param` function to specify the modified schedule as the schedule for the model.

```

sched = get_param mdl, "Schedule";
sched.Order.Trigger("SinkSystem.SampleLost") = "SinkSystem.Inport.InputWriteLost";
set_param(mdl, "Schedule", sched)

```

Simulate the model.

```
out = sim mdl;
```

Use the Simulation Data Inspector and the Sequence Viewer to analyze how the sensor data moves through the system. On the **Simulation** tab, under **Review Results**, click **Data Inspector** and **Sequence Viewer**.

To plot the data, display markers, and add cursors in the Simulation Data Inspector, load the view `SampleLostView` using the `Simulink.sdi.loadView` function.

```
Simulink.sdi.loadView("SampleLostView.mldatx")
```

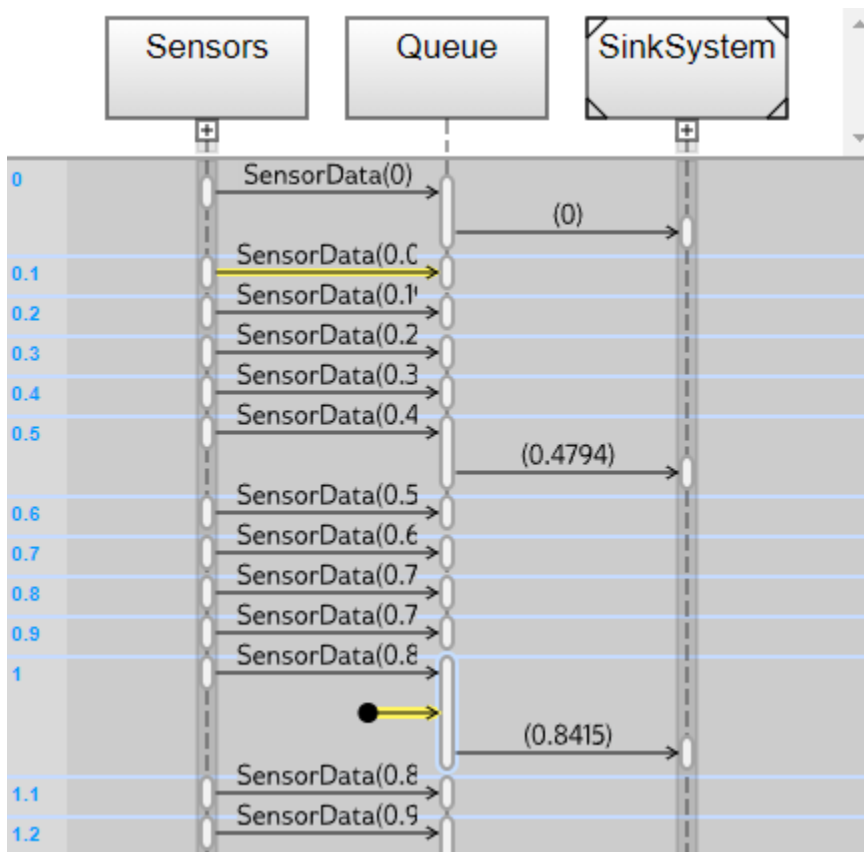

Use the cursors to analyze the data.

A sensor sample overwrites data in the queue for the first time when the sensor system writes the eleventh sample into the queue. The sensor writes into the queue before the sink system reads a value from the queue for the third time, so the queue size of 8 is no longer sufficient.

The sink system reading the third value frees up space in the queue so no input write lost event occurs on the next time step, 1.1. Then, starting with time 1.2, four input write lost events occur in sequence as the sensor system continues writing values into the queue. The sink system pulls another value at time 1.5, freeing space in the queue. This pattern continues for the rest of the simulation.

The sequence viewer denotes overwritten queue values with a closed black circle.

# simulink.event.InputWriteTimeout

Trigger event when input port value does not update within specified time

## Description

Use a `simulink.event.InputWrite` object to configure a root input port to trigger a schedule event when the input port value does not update within a specified amount of time. By configuring event triggers on input ports, you can model and simulate quality of service effects.

You can trigger one or more model partitions in a rate-based system based on the flow of data into an input port in the top model or on a model reference interface. The `EventTriggers` parameter of an Inport or In Bus Element block stores the event trigger objects associated with the port. Each event trigger maps an input event to the name of the schedule event it triggers. The schedule for the model specifies the partition to execute in response to the schedule event. The table summarizes the event triggers you can configure on input ports. For each input port, you can configure one event trigger for each input event.

Input Event	Input Event Description	Event Trigger Object
Input write	Value for input port updates.	<code>simulink.event.InputWrite</code>
Input write timeout	Input port value does not update within a specified amount of time.	<code>simulink.event.InputWriteTimeout</code>
Input write lost	Input port value update overwrites unprocessed data.	<code>simulink.event.InputWriteLost</code>

To configure the schedule for your model, use the **Schedule Editor**.

## Creation

You can configure the event triggers for an input port programmatically or interactively.

- When you configure an event trigger programmatically, create and configure the event trigger object yourself using the `simulink.event.InputWriteTimeout` function.
- When you configure an event trigger interactively by using the Block Parameters dialog box or the Property Inspector, the software creates and configures the event trigger object.

## Syntax

```
writeTimeout = simulink.event.InputWriteTimeout
```

### Description

`writeTimeout = simulink.event.InputWriteTimeout` creates the event trigger `writeTimeout` that you can use to configure an input port to trigger a specified schedule event each time the input port value does not update within the specified amount of time.

## Properties

### **EventName — Event to trigger when input port value does not update within specified time**

'Auto' (default) | string | character vector

Event to trigger when input port value does not update within specified time, specified as a string or a character vector. The event name must be 'Auto' or the name of an event defined in the Schedule Editor.

By default, the event name is 'Auto'. When you update or compile a model that has an input port configured with an `InputWriteTimeout` event trigger with the event name 'Auto', the software creates a schedule event that is scoped to the block. For example, for a block named `Inport`, the software creates the event `Inport.InputWriteTimeout`. Use the **Schedule Editor** to configure the listener for the event.

Example: `inTimeout.EventName = "myEvent"` configures the event trigger object `inTimeout` to trigger the event `myEvent` that is defined in the Schedule Editor.

Data Types: char | string

### **Timeout — Time limit for update of input port value**

' ' (default) | string | character vector

Time limit for update of input port value, specified as a string or a character vector that defines a positive numeric value.

Example: `inTimeout.Timeout = "1"` configures the event trigger object `inTimeout` with a timeout of one second.

Data Types: char | string

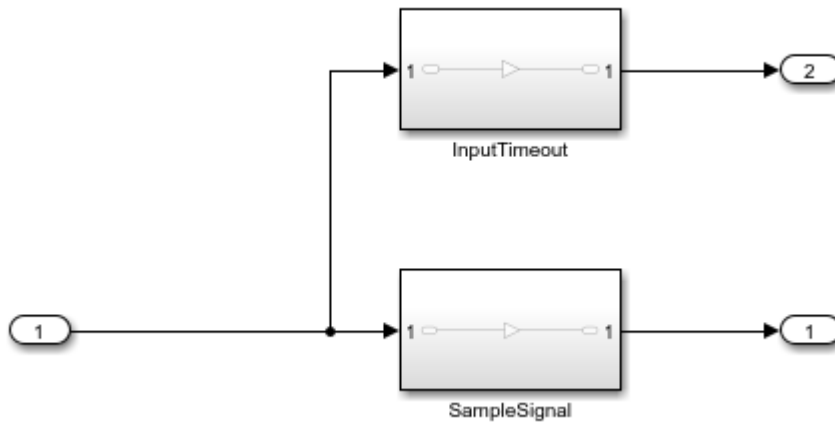

## Examples

### **Trigger Partition When Input Value Becomes Stale**

Configure a model to execute a partition when the input value does not update within ten seconds.

Open the model `InputTimeout`. The model contains an input port that loads external data into two subsystems.

```
mdl = "InputTimeout";
open_system(mdl);
```

Configure the model to allow multiple partitions to access the model inputs and outputs. Both subsystems need to use the input port value, and each subsystem will execute at its own rate.

- 1 On the **Modeling** tab, under **Setup**, click **Model Settings**.
- 2 In the Configuration Parameters dialog box, on the **Solver** pane, expand **Solver details**.
- 3 Under **Tasking and sample time options**, select **Allow multiple tasks to access inputs and outputs**.

Alternatively, use the `set_param` function to configure the `AllowMultiTaskInputOutput` parameter.

```
set_param mdl, "AllowMultiTaskInputOutput", "on")
```

Configure the subsystem `SampleSignal` as a periodic partition that samples the input signal every second.

- 1 In the Block Parameters dialog box or the Property Inspector, select **Treat as atomic unit**.
- 2 From the **Schedule as** list, select `Periodic` partition.
- 3 Specify the partition name as `SampleSignal`.
- 4 Specify the sample time as 1.

Alternatively, use the `set_param` function to configure the `TreatAsAtomicUnit`, `ScheduleAs`, `PartitionName`, and `SystemSampleTime` parameters.

```
set_param("InputTimeout/SampleSignal", "TreatAsAtomicUnit", "on", ...
 "ScheduleAs", "Periodic partition", ...
 "PartitionName", "SampleSignal", ...
 "SystemSampleTime", "1")
```

Configure the subsystem `InputTimeout` as an aperiodic partition.

- 1 In the Block Parameters dialog box or the Property Inspector, select **Treat as atomic unit**.
- 2 From the **Schedule as** list, select `Aperiodic` partition.
- 3 Specify the partition name as `InputTimeout`.

Alternatively, use the `set_param` function to configure the `TreatAsAtomicUnit`, `ScheduleAs`, and `PartitionName` parameters.

```
set_param("InputTimeout/InputTimeout", "TreatAsAtomicUnit", "on", ...
 "ScheduleAs", "Aperiodic partition", ...
 "PartitionName", "InputTimeout")
```

Configure the input port with an input write timeout event trigger.

- 1 In the Block Parameters dialog box, on the **Execution** tab, click Add event trigger.
- 2 From the list, select **Input Write Timeout**.
- 3 In the **Timeout** column of the table, specify the timeout as 10.

Alternatively, create and configure a `simulink.event.InputWriteTimeout` object. Then, configure the `EventTriggers` parameter of the input port using the `set_param` function.

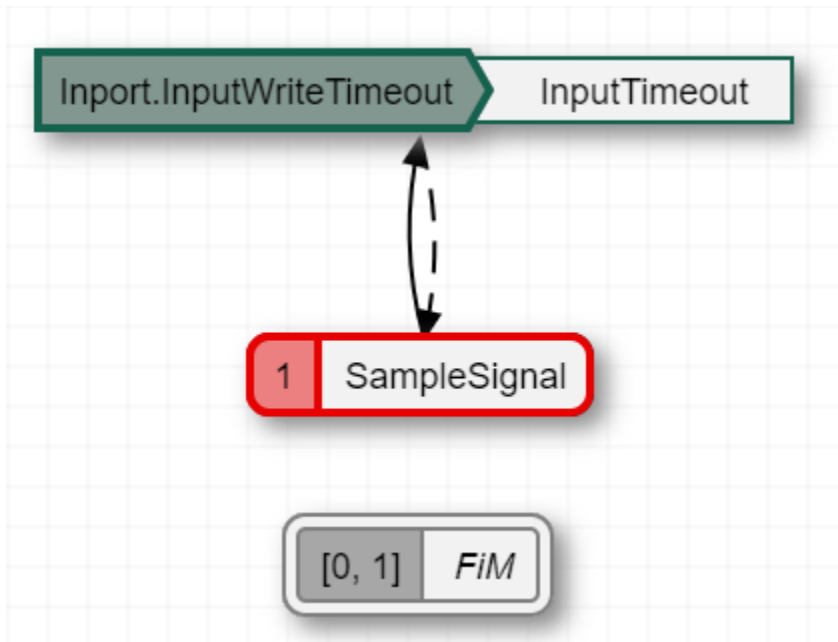

```
inTimeout = simulink.event.InputWriteTimeout;
inTimeout.Timeout = "10";
set_param("InputTimeout/Inport", "EventTriggers", {inTimeout})
```

Update the block diagram by pressing **Ctrl+D** or by using the `set_param` function. By default, the event trigger is configured to trigger the **Auto** event. When you update the block diagram or compile the model, the software creates the event `Inport.InputWriteTimeout` that is scoped to the `Inport` block.

```
set_param mdl, "SimulationCommand", "update")
```

Configure the model schedule such that the `Inport.InputWriteTimeout` event triggers the `InputTimeout` partition.

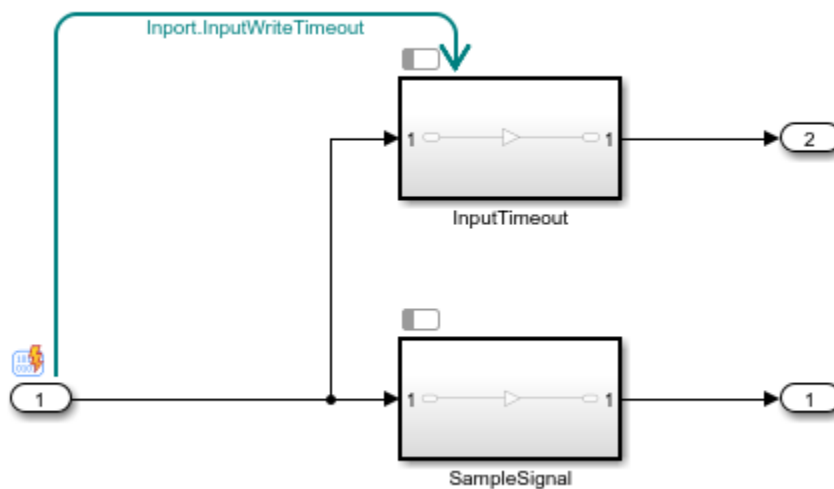

- 1 Open the Schedule Editor. In the model, click the badge on one of the partitioned subsystems . Alternatively, from the Block Parameters dialog box for the `Inport` block, on the **Execution** tab, click **Open Schedule Editor** .
- 2 To expand the **Events** pane, click **Expand Side** .
- 3 Select the `Inport.InputWriteTimeout` event. Then, drag it into the Schedule Editor canvas and release it on the `InputTimeout` partition.

In the Schedule Editor, click **Update Diagram**. The block diagram updates to reflect the binding of the `Inport.InputWriteTimeout` event to the `InputTimeout` partition.

Alternatively, use the `get_param` function to get the schedule for the model. Then, using the `Order` property of the schedule, specify the trigger for the `InputTimeout` partition and use the `set_param` function to specify the modified schedule as the schedule for the model.

```
sched = get_param mdl, "Schedule";
sched.Order.Trigger("InputTimeout") = "Inport.InputWriteTimeout";
set_param(mdl, "Schedule", sched)
```

Create a `timeseries` object that contains input data with sample values separated by an increasing time interval.

```
time = [0 1 3 5 8 13 21 34 55 89 144];
data = (0:10)';
inp = timeseries(data,time);
```

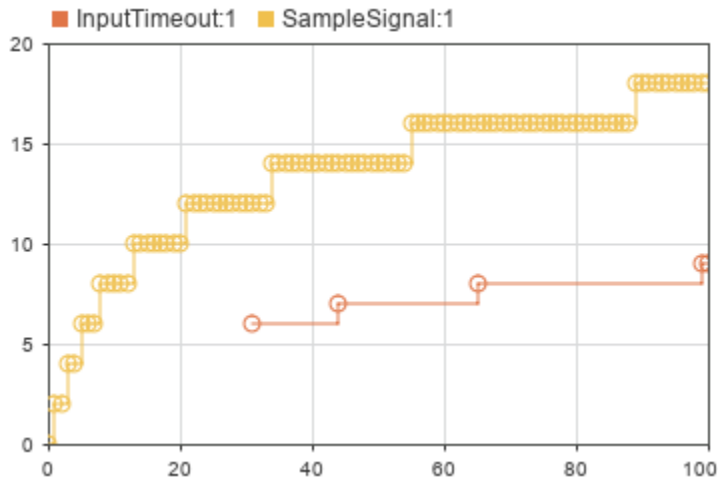

Configure the model to load the input data.

```
set_param mdl, "LoadExternalInput", "on", ...
 "ExternalInput", "inp")
```

Simulate the model.

```
out = sim mdl;
```

The InputTimeout partition executes only when the input value does not update for at least ten seconds.

### Objects

simulink.event.InputWrite | simulink.event.InputWriteLost

# Simulink.FindOptions

Specify options for finding blocks in models and subsystems

## Description

Simulink.FindOptions objects allow you to constrain a search with the Simulink.findBlocks and Simulink.findBlocksOfType functions.

## Creation

### Syntax

```
f = Simulink.FindOptions
f = Simulink.FindOptions(Name,Value)
```

### Description

f = Simulink.FindOptions creates a FindOptions object that uses the default search options.

f = Simulink.FindOptions(Name,Value) sets properties on page 8-235 using name-value pairs. For example, Simulink.FindOptions('SearchDepth',1) creates a FindOptions object with a search depth of 1. You can specify multiple name-value pairs. Enclose each property name in single quotes.

## Properties

### CaseSensitive — Option to match case when searching

true (default) | false

Option to match case when searching, specified as true for case-sensitive search or false for case-insensitive search.

Data Types: logical

### FollowLinks — Option for search to follow library links

false (default) | true

Option for search to follow library links, specified as true or false. If true, search follows links into library blocks.

Data Types: logical

### IncludeCommented — Option for search to include commented blocks

true (default) | false

Option for search to include commented blocks, specified as true or false.

Data Types: logical

**LookUnderMasks — Options to search masked blocks**`'all' (default) | 'none' | 'functional' | 'graphical'`

Options to search masked blocks, specified as:

- `'all'` — Search in all masked blocks.
- `'none'` — Prevent searching in masked systems.
- `'functional'` — Include masked subsystems that do not have dialogs.
- `'graphical'` — Include masked subsystems that do not have workspaces or dialogs.

Data Types: `char` | `string`**Variants — Options to search variant subsystems**`'AllVariants' (default) | 'ActiveVariants' | 'ActivePlusCodeVariants'`

---

**Note** The `Variants` argument will be removed. Use `MatchFilter` instead. For more information, see [Compatibility Considerations](#) on page 8-239.

---

Options to search variant subsystems, specified as:

- `'AllVariants'` — Search all variant choices.
- `'ActiveVariants'` — Search only active variant choices.
- `'ActivePlusCodeVariants'` — Search all variant choices in the Variant Subsystem that are active in simulation and is part of the generated code.

This search constraint applies only to Variant Subsystem blocks that have the **Variant control mode** set to `expression` or `label`. Use the `Simulink.FindOptions` object with the `MatchFilter` option to operate on all types of variant blocks.

Data Types: `char` | `string`**MatchFilter — Option to match and filter elements in search**`function handle`

Option to match and filter elements such as blocks, system, lines, ports, and annotations in a search, specified as function handle. Use `MatchFilter` to determine whether elements should be included or skipped in a search.

The option:

- Allows you to filter elements with custom filter functions
- Avoids processing elements when filters do not match
- Applies complex filters on blocks, lines, or annotations, to filter the results internally

The named function must be defined within a MATLAB program file. The function takes the handle of the element as input and returns two outputs.

```
function [match, prune] = func(element)
```

- The input `element` is the handle of the block being processed.

- The first output, `match`, is a logical value. If `false`, search skips the element.
- The second output, `prune`, is an optional logical value that only applies when `element` is a subsystem. The default value is `false`. If this value is set to `true`, the entire subsystem is omitted from the search.

Example: Use `MatchFilter` to find all Gain blocks in the model `vdp` with a gain value between 1 and 10.

```
function match = gainOneToTen(blk)
match = false;
if strcmp(get_param(blk, 'Type'), 'block') ...
 && strcmp(get_param(blk, 'BlockType'), 'Gain')
 gainValue = str2double(get_param(blk, 'Gain'));
 match = gainValue >= 1 && gainValue <= 10;
end
end

load_system('vdp');
findOptObj = Simulink.FindOptions('MatchFilter', @gainOneToTen);
blks=getfullname((Simulink.findBlocks('vdp', findOptObj)));
```

**Variants:** Simulink provides these built-in match filter functions to find variant blocks that are active in simulation or part of the generated code.

- `Simulink.match.activeVariants` — Filter function to find blocks that are active in simulation after model compilation
- `Simulink.match.codeCompileVariants` — Filter function to find blocks that are part of generated code after model compilation
- `Simulink.match.allVariants` — Filter function to find all blocks irrespective of whether the block is active or inactive due to variants.

---

**Note** To get correct results, you must **compile the model** before using `Simulink.match.activeVariants` and `Simulink.match.codeCompileVariants` filters. If the model is not compiled, these filters return all blocks in the model.

---

Example: Use the `Simulink.match.activeVariants` option to find active variants in a model:

```
addpath(fullfile(matlabroot, 'examples', 'simulink_variants', 'main'));
model='sldemo_variant_subsystems';
load_system(model);
assignin('base', 'VSS_MODE', 2);
set_param(model, 'SimulationCommand', 'update');
findOptObj= Simulink.FindOptions('MatchFilter', @Simulink.match.activeVariants);
blks=getfullname((Simulink.findBlocks(model, findOptObj)))
```

Example: Use the `Simulink.match.codeCompileVariants` option to find variant choices that are part of the generated C code:

```
addpath(fullfile(matlabroot, 'examples', 'simulink_variants', 'main'));
load_system('sldemo_variant_subsystems');
assignin('base', 'VSS_MODE', 2);
sldemo_variant_subsystems([], [], [], 'compileForCodegen');
findOptObj = Simulink.FindOptions('MatchFilter', @Simulink.match.codeCompileVariants);
```

```
blks=getfullname((Simulink.findBlocks('sldemo_variant_subsystems',findOptObj)));
sldemo_variant_subsystems([], [], [], 'term');
```

Example: Use the `Simulink.match.allVariants()` option to find all blocks in a model.

```
addpath(fullfile(matlabroot,'examples','simulink_variants','main'));
model='sldemo_variant_subsystems';
load_system(model);
findOptObj= Simulink.FindOptions('MatchFilter', @Simulink.match.allVariants);
blks=getfullname((Simulink.findBlocks(model,findOptObj)))
```

### RegExp — Option to treat search text as regular expression

false (default) | true

Option to treat search text as a regular expression, specified as `true` or `false`. To learn more about MATLAB regular expressions, see “Regular Expressions”.

Data Types: `logical`

### SearchDepth — Levels in model to search

-1 (default) | positive integer

Levels in model to search, specified as a positive integer. The default (-1) is to search all levels. Specify:

- 1 — Search in the top-level system.
- 2 — Search the top-level system and its children, 3 to search an additional level, and so on.

Data Types: `int32`

## Examples

### Specify Search Options

Create a `Simulink.FindOptions` object that specifies a search depth of 1.

```
f = Simulink.FindOptions('SearchDepth',1);
```

Using the `FindOptions` object, search for all blocks in the subsystem named `Unlocked`, but not in any of its children.

```
openExample('sldemo_clutch');
bh = Simulink.findBlocks('sldemo_clutch/Unlocked',f);
```

The `Simulink.findBlocks` function returns the block handles.

To get the block path, use the `getfullname` function.

```
bp = getfullname(bh)
```

```
bp =
```

```
20x1 cell array
```

```
{'sldemo_clutch/Unlocked/Tfmaxk' }
{'sldemo_clutch/Unlocked/Tin' }
{'sldemo_clutch/Unlocked/Enable' }
{'sldemo_clutch/Unlocked/E_Sum' }
```

```

{'sldemo_clutch/Unlocked/Engine↔Damping' }
{'sldemo_clutch/Unlocked/Engine↔Inertia' }
{'sldemo_clutch/Unlocked/Engine↔Integrator' }
{'sldemo_clutch/Unlocked/Goto' }
{'sldemo_clutch/Unlocked/Goto1' }
{'sldemo_clutch/Unlocked/Max↔Dynamic↔Friction↔Torque'}
{'sldemo_clutch/Unlocked/V_Sum' }
{'sldemo_clutch/Unlocked/Vehicle↔Damping' }
{'sldemo_clutch/Unlocked/Vehicle↔Inertia' }
{'sldemo_clutch/Unlocked/Vehicle↔Integrator' }
{'sldemo_clutch/Unlocked/W_Slip' }
{'sldemo_clutch/Unlocked/slip direction' }
{'sldemo_clutch/Unlocked/w0' }
{'sldemo_clutch/Unlocked/w0 ' }

## Version History

### Introduced in R2018a

#### New built-in match filter to find all variant blocks

You can use the built-in match filter, `Simulink.match.allVariants`, to find all the blocks in a variant model regardless of whether the block is active or inactive due to variants. This filter is the recommended replacement for the `AllVariants` option.

To be removed	Recommended Replacement
<code>findOptObj= Simulink.FindOptions('Variants', 'AllVariants');</code>	<code>findOptObj= Simulink.FindOptions('MatchFilter', ... @Simulink.match.allVariants);</code>

#### Variants option will be removed

*Warns starting in R2021a*

The `Variants` option will be removed from `Simulink.FindOptions` in a future release. Scripts that use the `Variants` option continue to work with a warning.

Using the `Simulink.FindOptions` object with the `Variants` argument produces inconsistent search results. `Simulink.FindOptions` is used at edit-time, but to determine whether a block is active in a model with all types of variant blocks, you need to compile the model.

To find variant blocks that are active during simulation or code generation, compile the model and use the `Simulink.FindOptions` object with the `MatchFilter` option.

This table lists the recommended replacement for different values of the `Variants` option.

To Be Removed	Recommended Replacement
<code>findOptObj= Simulink.FindOptions('Variants', 'ActiveVariants');</code>	<code>set_param(model, 'SimulationCommand', 'update');</code> <code>findOptObj= Simulink.FindOptions('MatchFilter', ... @Simulink.match.activeVariants);</code>

To Be Removed	Recommended Replacement
<pre>findOptObj= Simulink.FindOptions('Variants' 'ActivePlusCodeVariants');</pre>	<pre>model([], [], [], 'compileForCodegen'); findOptObj = Simulink.FindOptions('MatchFilter', ... @Simulink.match.codeCompileVariants); blks=getfullname((Simulink.findBlocks(model, findOptObj))); model([], [], [], 'term');</pre>

When you use the `Simulink.FindOptions` object, you cannot specify both of the `MatchFilter` and `Variants` arguments.

This command produces an error.

```
f = Simulink.FindOptions('MatchFilter',...
@Simulink.match.activeVariants, 'Variants', 'ActiveVariants');
blocks=Simulink.findBlocks('sldemo_variant_subsystems',f)
```

### Filter elements during search with MatchFilter

To match and filter model elements during a search, you can define a custom filter function and pass the function handle as value to the `MatchFilter` option.

To find variant blocks that are active in a simulation or part of the generated code, you can use the built-in match filter functions, `Simulink.match.activeVariants`, `Simulink.match.codeCompileVariants`, and `Simulink.match.allVariants`, after compiling the model.

# Simulink.HMI.InstrumentedSignals

Save and restore signal logging specification

## Description

A `Simulink.HMI.InstrumentedSignals` object acts as a specification for logged signals in a model, including signals in subsystems, library instances, and Stateflow charts. You can get a `Simulink.HMI.InstrumentedSignals` object for the logging configuration in your model using the `get_param` function with the `InstrumentedSignals` model parameter. You can save several logging configurations as `Simulink.HMI.InstrumentedSignals` objects and easily swap the logging configuration for your model using `set_param`.

---

**Note** An `InstrumentedSignals` object for a model does not include signals logged inside referenced models. To get a list of logged signals in a referenced model, create an `InstrumentedSignals` object for the referenced model.

---

## Creation

The `get_param` function returns a `Simulink.HMI.InstrumentedSignals` object for the `InstrumentedSignals` model parameter.

## Properties

### Model — Model name

character vector

Name of the model that corresponds to the list of logged signals.

Example: 'sldemo\_fuelsys'

### Count — Number of logged signals

integer

Number of logged signals in the model.

Example: 10

Data Types: `uint32`

## Examples

### Save and Restore a Set of Logged Signals

This example shows how to use the `Simulink.HMI.InstrumentedSignals` object to save a set of logged signals to restore after running a simulation with a different signal logging configuration.

### Save the Initial Signal Logging Configuration

This example uses the `sldemo_fuelsys` model, which is configured to log 10 signals. Open the model and use the `get_param` function to get a `Simulink.HMI.InstrumentedSignals` object representing the signal logging configuration.

```
load_system sldemo_fuelsys

initSigs = get_param('sldemo_fuelsys','InstrumentedSignals');
```

You can save the initial signal logging configuration in a MAT-file for later use.

```
save initial_instSigs.mat initSigs
```

### Remove All Logging Badges

To return to a baseline of no logged signals, you can use the `set_param` function to remove all logging badges from signals in your model. Then, you can easily select a different configuration of signals to log in the Simulink™ Editor or using the `Simulink.sdi.markSignalForStreaming` function.

```
set_param('sldemo_fuelsys','InstrumentedSignals',[])
```

### Restore Saved Logging Configuration

After working with a different set of logged signals, you can restore a saved configuration using the `Simulink.HMI.InstrumentedSignals` object. For example, if you saved the logging configuration to a MAT-file, you can load the MAT-file contents into the workspace and use the `set_param` function to restore the previously saved logging configuration.

```
load initial_instSigs.mat

set_param('sldemo_fuelsys','InstrumentedSignals',initSigs)
```

## Version History

Introduced in R2015b

# Simulink.HMI.ParamSourceInfo

Information about Dashboard block variable and parameter connections

## Description

Use a `Simulink.HMI.ParamSourceInfo` object to connect a Dashboard block to a variable or parameter programmatically using the `set_param` function. The `get_param` function returns a `Simulink.HMI.ParamSourceInfo` object when you use the function to query the connection information for a Dashboard block connected to a variable or parameter.

The `Simulink.HMI.ParamSourceInfo` object contains four properties. Some of the properties apply to connecting Dashboard blocks to parameters, and some apply for connecting Dashboard blocks to variables. Not all fields have a value for a connection because a given Dashboard block connects to either a parameter or a variable.

## Creation

### Syntax

```
paramSourceInfo = Simulink.HMI.ParamSourceInfo
```

### Description

`paramSourceInfo = Simulink.HMI.ParamSourceInfo` creates the empty `Simulink.HMI.ParamSourceInfo` object, `paramSourceInfo`.

## Properties

### BlockPath — Path to the block associated with the parameter or variable

`Simulink.BlockPath`

`Simulink.BlockPath` object for the block associated with the parameter or variable. You can create a `Simulink.BlockPath` object for a block by passing a character array describing the path to `Simulink.BlockPath`. You can get a character array describing the block path for a selected block using the `gcb` function.

Example: `Simulink.BlockPath('vdp/Mu')`

### ParamName — Name of the connected tunable block parameter

character array

Name of the connected tunable block parameter, specified as a character array. A `Simulink.HMI.ParamSourceInfo` object connected to a variable does not have a value for the `ParamName` property.

Example: `Gain`

### VarName — Name of the connected variable

character array

Name of the connected variable, specified as a character array. A

`Simulink.HMI.ParamSourceInfo` object connected to a tunable parameter does not have a value for the `VarName` property.

Example: `Mu`

### **Element — Element of nonscalar variable or parameter value to connect**

character array

Element of nonscalar variable or parameter value to connect, specified as a character array.

When the value of the variable or parameter you want to tune using a dashboard block is nonscalar, use the `Element` property to specify the scalar element of the nonscalar value that you want to tune. To connect to a scalar element in a vector or matrix, specify the element index. To connect to an element of a bus or structure, specify the element in the context of the bus or structure hierarchy by using dots to indicate different levels in the hierarchy, and omit the top level. The value of the `VarName` property or the `ParamName` property specifies the top level.

Example: `3` connects the block to the third element of the variable specified by the `VarName` property or the parameter specified by the `ParamName` property.

Example: `(3,2)` connects the block to the element in the third row and second column of the variable specified by the `VarName` property or the parameter specified by the `ParamName` property.

Example: `a.b` connects the block to element `b` of the nested structure or bus `a` within the value of the variable specified by the `VarName` property or the parameter specified by the `ParamName` property.

### **WksType — Source workspace for the connected variable**

'base' | 'model' | data dictionary file path

Source workspace for the connected variable, specified as a character array. The source workspace can be the base workspace, model workspace, or a data dictionary. When the source workspace is a data dictionary, the `WksType` property value is the file path for the data dictionary, specified as a character array. A `Simulink.HMI.ParamSourceInfo` object connected to a tunable parameter does not have a value for the `WksType` property.

Example: `'modelData.sldd'`

## **Examples**

### **Programmatically Add and Connect a Dashboard Block**

This example shows how to programmatically add Dashboard blocks to a model and connect them to elements in the model. The example adds a Dashboard Scope block and a Slider block to the `vdp` model and connects and configures the blocks.

#### **Add Blocks**

Use the `add_block` function to add a Dashboard Scope block and a Slider block to the `vdp` model. This example also specifies the position of the blocks.

```
open_system('vdp')

scopePos = [550 140 800 305];
sliderPos = [550 30 800 120];
```

```
add_block('simulink_hmi_blocks/Dashboard Scope','vdp/Dashboard Scope',...
 'Position',scopePos)
add_block('simulink_hmi_blocks/Slider','vdp/Slider','Position',sliderPos)
```

### Connect the Dashboard Scope Block

Use a cell array of `Simulink.HMI.SignalSpecification` objects to connect the Dashboard block to the x1 and x2 signals. The `Simulink.HMI.SignalSpecification` object specifies a connected signal using the block path and port index for the source of the signal. The default value for the `OutputPortIndex` is 1, so this example does not specify the output port for the x1 and x2 signals.

```
x1_sigSpec = Simulink.HMI.SignalSpecification;
x1_sigSpec.BlockPath = Simulink.BlockPath('vdp/x1');

x2_sigSpec = Simulink.HMI.SignalSpecification;
x2_sigSpec.BlockPath = Simulink.BlockPath('vdp/x2');

connection_dashboardScope = {x1_sigSpec x2_sigSpec};
```

Use the `set_param` function to configure the connected signals for the Dashboard Scope block.

```
set_param('vdp/Dashboard Scope',"Binding",connection_dashboardScope)
```

### Connect and Configure the Slider Block

Use a `Simulink.HMI.ParamSourceInfo` object and the `set_param` function to connect the Slider block to the Gain parameter of the Mu block. To connect a parameter, the `Simulink.HMI.ParamSourceInfo` needs to specify the block path for the block that corresponds to the parameter and the name of the parameter.

```
slider_param = Simulink.HMI.ParamSourceInfo;
slider_param.BlockPath = Simulink.BlockPath('vdp/Mu');
slider_param.ParamName = 'Gain';

set_param('vdp/Slider',"Binding",slider_param)
```

Configure the scale for the slider for a range of 1 to 10 with a tick mark spacing of 1.

```
slider_limits = [1 1 10];

set_param('vdp/Slider',"Limits",slider_limits)
```

## Version History

Introduced in R2019a

# Simulink.HMI.SignalSpecification

Programmatically connect a Dashboard block to a signal

## Description

Use a `Simulink.HMI.SignalSpecification` object to programmatically connect a Dashboard block to a signal.

The `SignalSpecification` object contains the block path, port index, and frame processing mode for a signal. To connect a Dashboard block to a signal, specify the corresponding `SignalSpecification` object as the value for the `Binding` parameter for the block using the `set_param` function.

## Creation

### Syntax

```
sigSpec = Simulink.HMI.SignalSpecification
```

### Description

`sigSpec = Simulink.HMI.SignalSpecification` creates an empty `Simulink.HMI.SignalSpecification` object. Specify the block path and port index that correspond to the origin of the signal you want to connect.

## Properties

### BlockPath — Path of the block with the signal as an output

`Simulink.BlockPath` (default) | character vector

Block path for the block that has the signal you want to connect as an output, specified as a character vector or a `Simulink.BlockPath` object.

```
Example: sigSpec.BlockPath = 'vdp/Mu';
```

```
Example: sigSpec.BlockPath = myBlockPath;
```

### OutputPortIndex — Block output port corresponding to the signal

1 (default) | scalar

Output port index corresponding to the signal, specified as a scalar, real integer.

```
Example: sigSpec.OutputPortIndex = 2;
```

### FrameProcessingMode — Processing mode for the signal data

"sample" (default) | "frame"

Processing mode for the signal data, specified as `sample` or `frame`.

- `sample` — Each element in a sample of the signal is processed as a channel.
- `frame` — Each column in a sample of the signal is processed as a channel.

Example: `sigSpec.FrameProcessingMode = "frame";`

---

**Note** Only the Dashboard Scope block supports frame-based data.

---

## Examples

### Programmatically Add and Connect a Dashboard Block

This example shows how to programmatically add Dashboard blocks to a model and connect them to elements in the model. The example adds a Dashboard Scope block and a Slider block to the `vdp` model and connects and configures the blocks.

#### Add Blocks

Use the `add_block` function to add a Dashboard Scope block and a Slider block to the `vdp` model. This example also specifies the position of the blocks.

```
open_system('vdp')

scopePos = [550 140 800 305];
sliderPos = [550 30 800 120];

add_block('simulink_hmi_blocks/Dashboard Scope','vdp/Dashboard Scope',...
 'Position',scopePos)
add_block('simulink_hmi_blocks/Slider','vdp/Slider','Position',sliderPos)
```

#### Connect the Dashboard Scope Block

Use a cell array of `Simulink.HMI.SignalSpecification` objects to connect the Dashboard block to the `x1` and `x2` signals. The `Simulink.HMI.SignalSpecification` object specifies a connected signal using the block path and port index for the source of the signal. The default value for the `OutputPortIndex` is 1, so this example does not specify the output port for the `x1` and `x2` signals.

```
x1_sigSpec = Simulink.HMI.SignalSpecification;
x1_sigSpec.BlockPath = Simulink.BlockPath('vdp/x1');

x2_sigSpec = Simulink.HMI.SignalSpecification;
x2_sigSpec.BlockPath = Simulink.BlockPath('vdp/x2');

connection_dashboardScope = {x1_sigSpec x2_sigSpec};
```

Use the `set_param` function to configure the connected signals for the Dashboard Scope block.

```
set_param('vdp/Dashboard Scope',"Binding",connection_dashboardScope)
```

#### Connect and Configure the Slider Block

Use a `Simulink.HMI.ParamSourceInfo` object and the `set_param` function to connect the Slider block to the `Gain` parameter of the `Mu` block. To connect a parameter, the `Simulink.HMI.ParamSourceInfo` needs to specify the block path for the block that corresponds to the parameter and the name of the parameter.

```
slider_param = Simulink.HMI.ParamSourceInfo;
slider_param.BlockPath = Simulink.BlockPath('vdp/Mu');
slider_param.ParamName = 'Gain';
```

```
set_param('vdp/Slider','Binding',slider_param)
```

Configure the scale for the slider for a range of 1 to 10 with a tick mark spacing of 1.

```
slider_limits = [1 1 10];
```

```
set_param('vdp/Slider','Limits',slider_limits)
```

# MATLABFunctionConfiguration

MATLAB Function block property configuration

## Description

The MATLABFunctionConfiguration object controls the MATLAB Function block properties such as the description, sample time, and function script.

---

**Tip** You can also configure a MATLAB Function block programmatically by using a Stateflow.EMChart object. This object provides access to the inputs, outputs, and properties of a MATLAB Function block. For more information, see “Configure MATLAB Function Blocks Programmatically”.

---

## Creation

Each MATLAB Function block has its own MATLABFunctionConfiguration object. To access this object, use the `get_param` function. For example, if the model `myModel` contains a MATLAB Function block called `MATLAB Function`, enter:

```
config = get_param("myModel/MATLAB Function", ...
 "MATLABFunctionConfiguration");
```

## Properties

### Path — Path of block relative to model

string scalar | character vector

Path of the MATLAB Function block relative to the model, specified as a string scalar or character vector.

Data Types: string | char

### FunctionScript — Code for MATLAB Function block

string scalar | character vector

Code for the MATLAB Function block, specified as a string scalar or character vector.

Data Types: string | char

### UpdateMethod — Update method for MATLAB Function block

"Inherited" (default) | "Discrete" | "Continuous"

Update method for the MATLAB Function block, specified as one of these values:

- "Inherited" — The input signal at the trigger port determines when the block is updated during a simulation. A signal from a connected Simulink block triggers the port. If `UpdateMethod` is changed to "Inherited", `Sample Time` is automatically set to -1.

- "Discrete" — The Simulink model generates an implicit event at regular time intervals to awaken the block at the rate you specify in the `SampleTime` property. Other blocks in the model can have different sample times.
- "Continuous" — The MATLAB Function block updates at major time steps only, although it computes outputs and local continuous variables during minor and major time steps. If the `UpdateMethod` is changed to "Continuous", `Sample Time` is automatically set to 0.

When you set `UpdateMethod` to "Inherited" or "Continuous" and attempt to change `SampleTime`, Simulink displays a warning and ignores the input sample time.

#### UI Use

In the Property Inspector or Model Explorer, set **Update method** to Inherited, Discrete, or Continuous.

Data Types: enumerated

#### SampleTime — Sample time

"-1" (default) | "0" | string scalar | character vector

Sample time of the MATLAB Function block, specified as a string scalar or character vector. Sample time is only valid when `UpdateMethod` is set to "Discrete". If `UpdateMethod` is set to "Continuous" or "Inherited", any changes made to the sample time are ignored.

#### UI Use

In the Property Inspector or Model Explorer, enter a value for the **Sample Time** parameter.

Data Types: string | char

#### Description — Description

string scalar | character vector

Description of the MATLAB Function block, specified as a string scalar or character vector.

#### UI Use

In the Property Inspector or Model Explorer, enter a description in the **Description** box.

Data Types: string | char

#### DocumentLink — Documentation link

string scalar | character vector

Documentation link for the MATLAB Function block, specified as a string scalar or character vector.

#### UI Use

In the Property Inspector or Model Explorer, enter a link in the **Document link** box.

Data Types: string | char

#### SupportVariableSizing — Whether MATLAB Function block supports variable-size data

true or 1 (default) | false or 0

Whether the MATLAB Function block supports variable-size data, specified as a numeric or logical 1 (true) or 0 (false).

**UI Use**

In the Property Inspector or Model Explorer, select **Support variable-size arrays** to enable this setting.

Data Types: `logical`

**AllowDirectFeedthrough — Whether MATLAB Function block supports direct feedthrough semantics**

`true` or `1` (default) | `false` or `0`

Whether the MATLAB Function block supports direct feedthrough semantics, specified as a numeric or logical `1` (`true`) or `0` (`false`). The block has direct feedthrough if the output of the block directly depends on the input of the block. The block does not have direct feedthrough if the outputs of the block depend on the internal states and properties rather than the input of the block.

**UI Use**

In the Property Inspector or Model Explorer, select **Allow direct feedthrough** to enable this setting.

Data Types: `logical`

**VectorOutputs1D — Whether MATLAB Function block outputs column vectors as one-dimensional data**

`false` or `0` (default) | `true` or `1`

Whether the MATLAB Function block outputs column vectors as one-dimensional data, specified as a numeric or logical `0` (`false`) or `1` (`true`). When enabled, the block converts vectors of size  $N$ -by-1 to one-dimensional signals with a signal size equal to  $N$ .

**UI Use**

In the Property Inspector or Model Explorer, select or clear **Interpret output column vectors as one-dimensional data**.

Data Types: `logical`

**SaturateonIntegerOverflow — Whether data saturates on integer overflow**

`true` or `1` (default) | `false` or `0`

Whether the data in the MATLAB Function block saturates on integer overflow, specified as a numeric or logical `1` (`true`) or `0` (`false`). If this setting is set to `true`, the overflows saturate to either the minimum or maximum value that the data type can represent. If the setting is `false`, the overflow wraps to the appropriate value that the data type can represent. If your model has a possible overflow and you want to apply saturation protection in your generated code, it is recommended to enable this setting. If you have performance restrictions or are not concerned with integer overflow, you can disable this setting.

**UI Use**

In the Property Inspector or Model Explorer, select **Saturate on integer overflow** to enable this setting.

Data Types: `logical`

**TreatAsFi — Inherited signals to treat as fi objects**

"FixedPoint" (default) | "FixedPointAndInteger"

Inherited Simulink signals to treat as Fixed-Point Designer `fi` objects, specified as one of these values:

- `"FixedPoint"` — The MATLAB Function block treats all fixed-point inputs as `fi` objects.
- `"FixedPointAndInteger"` — The MATLAB Function block treats all fixed-point and integer inputs as `fi` objects.

To learn more about `fi` objects, see “`fi` Object Properties” (Fixed-Point Designer).

#### UI Use

In the Property Inspector or Model Explorer, set **Treat these inherit Simulink signal types as `fi` objects** to `Fixed-point` or `Fixed-point and & Integer`.

Data Types: `enumerated`

#### FimathMode — Default `fimath` properties

`"SameAsMATLAB"` (default) | `"UserSpecified"`

Default `fimath` properties for the MATLAB Function block, specified as one of these values:

- `"SameAsMATLAB"` — Use the same `fimath` properties as the current default `fimath` object.
- `"UserSpecified"` — Use the `Fimath` property to specify the default `fimath` object.

To learn more about fixed-point math, see `fimath`.

#### UI Use

In the Property Inspector or Model Explorer, set **MATLAB Function `fimath`** to `Same as MATLAB` or `Specify Other`.

Data Types: `enumerated`

#### Fimath — Default `fimath` object

`string scalar` | `character vector`

Default `fimath` object, specified as a `string scalar` or `character vector`. When the `FimathMode` property for the MATLAB Function block is `"UserSpecified"`, you can use this property to:

- Enter an expression that constructs a `fimath` object.
- Enter the variable name for a `fimath` object in the MATLAB or model workspace.

To learn more about `fimath` object properties, see “`fimath` Object Properties” (Fixed-Point Designer).

#### UI Use

In the Property Inspector or Model Explorer, set **MATLAB Function `fimath`** to `Specify Other` and enter a `fimath` expression.

Data Types: `string` | `char`

## Object Functions

<code>openReport</code>	Open MATLAB function report
<code>closeReport</code>	Close MATLAB function report
<code>getReport</code>	Generate MATLAB function report

## Examples

### Configure MATLAB Function Block Properties

Access the MATLABFunctionConfiguration object for the MATLAB Function block in the model `call_stats_block1` described in “Implement MATLAB Functions in Simulink with MATLAB Function Blocks”.

```
config = get_param("call_stats_block1/MATLAB Function", ...
 "MATLABFunctionConfiguration");
```

Set the value of the Description property.

```
config.Description = "Calculate the mean and standard deviation for a vector of values.";
```

### Create Custom Report for MATLAB Function Block

Access the MATLABFunctionConfiguration object for the MATLAB Function block in the model `call_stats_block2` described in “Implement MATLAB Functions in Simulink with MATLAB Function Blocks”.

```
config = get_param("call_stats_block2/MATLAB Function", ...
 "MATLABFunctionConfiguration");
```

Create the MATLABFunctionReport object for the MATLAB Function block.

```
report = getReport(config);
```

Access the `coder.Function` objects in the report.

```
functions = report.Functions;
```

Create a custom report that lists the functions and variables in the MATLAB Function block.

```
for i = 1:numel(functions)
 fprintf("Function %s uses these variables:\n", functions(i).Name)
 variables = functions(i).Variables;
 for j = 1:numel(variables)
 fprintf("%d. %s -- %s\n", j, variables(j).Name, variables(j).Scope)
 end
 fprintf("\n")
end
```

```
Function stats uses these variables:
```

```
1. mean -- Output
2. stdev -- Output
3. vals -- Input
4. len -- Local
```

```
Function avg uses these variables:
```

```
1. mean -- Output
```

2. `array` -- Input
3. `size` -- Input

## Version History

Introduced in R2019b

### Programmatically access MATLAB function reports

You can access MATLAB function reports for MATLAB Function blocks by calling these functions on `MATLABFunctionConfiguration` objects:

- `openReport` opens the MATLAB function report for the block.
- `closeReport` closes the MATLAB function report for the block.
- `getReport` returns a `MATLABFunctionReport` object for the block. You can query report information from this object by accessing its `'Functions'` property, which is an array of `coder.Function` objects.

# closeReport

**Package:** Simulink

Close MATLAB function report

## Syntax

```
closeReport(config)
```

## Description

`closeReport(config)` closes the MATLAB function report for a MATLAB Function block.

## Examples

### Open and Close MATLAB Function Report

Access the `MATLABFunctionConfiguration` object for the MATLAB Function block in the model `call_stats_block2` described in “Implement MATLAB Functions in Simulink with MATLAB Function Blocks”.

```
config = get_param("call_stats_block2/MATLAB Function", ...
 "MATLABFunctionConfiguration");
```

Open the MATLAB function report.

```
openReport(config)
```

Close the MATLAB function report.

```
closeReport(config)
```

## Input Arguments

### **config** — MATLAB Function block property configuration

`MATLABFunctionConfiguration` object

MATLAB Function block property configuration, specified as a `MATLABFunctionConfiguration` object.

Data Types: `MATLABFunctionConfiguration`

## Version History

Introduced in R2021a

# getReport

**Package:** Simulink

Generate MATLAB function report

## Syntax

```
report = getReport(config)
```

## Description

`report = getReport(config)` returns the `MATLABFunctionReport` object for a MATLAB Function block. Use the `MATLABFunctionReport` object to access information about the functions and variables used by the MATLAB Function block.

## Examples

### Create Custom Report for MATLAB Function Block

Access the `MATLABFunctionConfiguration` object for the MATLAB Function block in the model `call_stats_block2` described in “Implement MATLAB Functions in Simulink with MATLAB Function Blocks”.

```
config = get_param("call_stats_block2/MATLAB Function", ...
 "MATLABFunctionConfiguration");
```

Create the `MATLABFunctionReport` object for the MATLAB Function block.

```
report = getReport(config);
```

Access the `coder.Function` objects in the report.

```
functions = report.Functions;
```

Create a custom report that lists the functions and variables in the MATLAB Function block.

```
for i = 1:numel(functions)
 fprintf("Function %s uses these variables:\n", functions(i).Name)
 variables = functions(i).Variables;
 for j = 1:numel(variables)
 fprintf("%d. %s -- %s\n", j, variables(j).Name, variables(j).Scope)
 end
 fprintf("\n")
end
```

Function stats uses these variables:

1. mean -- Output
2. stdev -- Output
3. vals -- Input
4. len -- Local

Function avg uses these variables:

1. mean -- Output
2. array -- Input
3. size -- Input

## Input Arguments

### **config** — MATLAB Function block property configuration

MATLABFunctionConfiguration object

MATLAB Function block property configuration, specified as a MATLABFunctionConfiguration object.

## Tips

The first time that you create a MATLABFunctionReport object or open the MATLAB function report, Simulink automatically updates your model. If you make subsequent changes to the MATLAB code in the block, you must update your model before you generate a new MATLABFunctionReport object. Otherwise, the object does not reflect your changes. From the **Modeling** tab, select **Update Model**, or use the **Ctrl+D** keyboard shortcut. If you are in the **MATLAB Function Block Editor**, update the model by using the **Ctrl+Shift+D** keyboard shortcut instead. For more information, see “Update Diagram and Run Simulation”.

## Version History

**Introduced in R2021a**

# openReport

**Package:** Simulink

Open MATLAB function report

## Syntax

```
openReport(config)
```

## Description

`openReport(config)` opens the MATLAB function report for a MATLAB Function block.

## Examples

### Open and Close MATLAB Function Report

Access the `MATLABFunctionConfiguration` object for the MATLAB Function block in the model `call_stats_block2` described in “Implement MATLAB Functions in Simulink with MATLAB Function Blocks”.

```
config = get_param("call_stats_block2/MATLAB Function", ...
 "MATLABFunctionConfiguration");
```

Open the MATLAB function report.

```
openReport(config)
```

Close the MATLAB function report.

```
closeReport(config)
```

## Input Arguments

### **config** — MATLAB Function block property configuration

`MATLABFunctionConfiguration` object

MATLAB Function block property configuration, specified as a `MATLABFunctionConfiguration` object.

Data Types: `MATLABFunctionConfiguration`

## Tips

The first time that you open the MATLAB function report, Simulink automatically updates your model. If you make subsequent changes to the MATLAB code in the block, you must update your model before you reopen the report. Otherwise, the report does not reflect your changes. From the **Modeling** tab, select **Update Model**, or use the **Ctrl+D** keyboard shortcut. If you are in the

**MATLAB Function Block Editor**, update the model by using the **Ctrl+Shift+D** keyboard shortcut instead. For more information, see “Update Diagram and Run Simulation”.

# MATLABFunctionReport

MATLAB function report

## Description

Use MATLABFunctionReport objects to access information about the functions and variables used by MATLAB Function blocks.

## Creation

To create a MATLABFunctionReport object for a MATLAB Function block, call the `getReport` function on the MATLABFunctionConfiguration object for the block. For example, if the model `myModel` contains a MATLAB Function block called `MATLAB Function`, enter:

```
config = get_param("myModel/MATLAB Function", ...
 "MATLABFunctionConfiguration");
report = getReport(config);
```

## Properties

### Functions — Functions in block

array of `coder.Function` objects

This property is read-only.

Functions in the MATLAB Function block, specified as an array of `coder.Function` objects. The array contains one `coder.Function` object for each function in the block. Use these objects to access information such as the name, scope, and type of the variables used by each function. For more information, see `coder.Function` Properties.

Data Types: `coder.Function`

## Examples

### Create Custom Report for MATLAB Function Block

Access the MATLABFunctionConfiguration object for the MATLAB Function block in the model `call_stats_block2` described in “Implement MATLAB Functions in Simulink with MATLAB Function Blocks”.

```
config = get_param("call_stats_block2/MATLAB Function", ...
 "MATLABFunctionConfiguration");
```

Create the MATLABFunctionReport object for the MATLAB Function block.

```
report = getReport(config);
```

Access the `coder.Function` objects in the report.

```
functions = report.Functions;
```

Create a custom report that lists the functions and variables in the MATLAB Function block.

```
for i = 1:numel(functions)
 fprintf("Function %s uses these variables:\n", functions(i).Name)
 variables = functions(i).Variables;
 for j = 1:numel(variables)
 fprintf("%d. %s -- %s\n", j, variables(j).Name, variables(j).Scope)
 end
 fprintf("\n")
end
```

Function stats uses these variables:

1. mean -- Output
2. stdev -- Output
3. vals -- Input
4. len -- Local

Function avg uses these variables:

1. mean -- Output
2. array -- Input
3. size -- Input

## Tips

The first time that you create a `MATLABFunctionReport` object or open the MATLAB function report, Simulink automatically updates your model. If you make subsequent changes to the MATLAB code in the block, you must update your model before you generate a new `MATLABFunctionReport` object. Otherwise, the object does not reflect your changes. From the **Modeling** tab, select **Update Model**, or use the **Ctrl+D** keyboard shortcut. If you are in the **MATLAB Function Block Editor**, update the model by using the **Ctrl+Shift+D** keyboard shortcut instead. For more information, see “Update Diagram and Run Simulation”.

# Simulink.MDLInfo

Extract SLX, SLXP, or MDL file information without loading file

## Description

`Simulink.MDLInfo` objects extract information from an SLX, SLXP or MDL file without loading it into memory.

To extract the description and metadata from a file without creating an `MDLInfo` object, use the `Simulink.MDLInfo.getDescription` and `Simulink.MDLInfo.getMetadata` functions, respectively.

## Creation

### Syntax

```
info = Simulink.MDLInfo(file)
```

### Description

`info = Simulink.MDLInfo(file)` creates an `MDLInfo` object called `info` and populates the properties with the information from the specified model file.

### Input Arguments

#### **file** — Name of SLX, SLXP, or MDL file

character vector | string scalar

Name of the SLX, SLXP, or MDL file, specified as a character vector or string scalar.

The file name can include a partial path, complete path, relative path, or no path. When you do not provide a path, the file extension is optional.

To avoid unexpected results caused by shadowed files that share a name, specify a fully qualified file name.

Example: `Simulink.MDLInfo('vdp')`

Example: `Simulink.MDLInfo('mymodel.slx')`

Example: `Simulink.MDLInfo('mydir/mymodel.slx')`

Example: `Simulink.MDLInfo('C:/mydir/mymodel.slx')`

Data Types: `char` | `string`

## Properties

### File Name and Contents

#### **BlockDiagramName** — Name of block diagram

character vector

This property is read-only.

Name of the block diagram, returned as a character vector.

The name of the block diagram matches the file name, but without an extension.

Data Types: `char`

#### **BlockDiagramType** — Type of file

character vector

This property is read-only.

Type of file, returned as a character vector.

Data Types: `char`

#### **FileName** — Fully qualified file name

character vector

This property is read-only.

Fully qualified file name, returned as a character vector.

Data Types: `char`

#### **Interface** — Description of inputs, outputs, and references

structure

This property is read-only.

Description of inputs, outputs, and references, returned as a structure.

The structure includes the names and attributes of the top-level ports, model references, and subsystem references.

Data Types: `struct`

#### **IsLibrary** — True or false result

1 | 0

This property is read-only.

True or false result, returned as a 1 or 0 of data type `logical`.

- 1 (`true`) — File is a library.
- 0 (`false`) — File is not a library.

Data Types: `logical`

## User-Specified Information

### Description — User-specified description

character vector

This property is read-only.

User-specified description for the file, returned as a character vector.

#### Tips

- To extract the description without loading the model or creating an MDLInfo object, use the `Simulink.MDLInfo.getDescription` function.
- To view the description without loading the model or creating an MDLInfo object, in the MATLAB Command Window, enter:

```
help 'mymodelName'
```

- To view the description for an open model, open the **Description** tab in the Model Properties dialog box.

Data Types: char

### Metadata — Names and values of arbitrary data

structure

This property is read-only.

Names and values of arbitrary data associated with the file, returned as a structure.

The structure fields can be character vectors, numeric matrices of type `double`, or more structures.

#### Tips

To extract the metadata structure without loading the model or creating an MDLInfo object, use the `Simulink.MDLInfo.getMetadata` function.

Data Types: struct

## Save Information

### ReleaseUpdateLevel — Release update used to save file

positive integer

This property is read-only.

Release update used to save the file, returned as a positive integer.

- 0 — The file was saved in a general release, for example, 'R2020a', or was saved in a release before R2020a.
- Positive integer — The file was saved in an update release, for example, 2, if the model was saved in 'R2020a Update 2'.

Data Types: int32

### LastModifiedBy — Name of user who last saved file

character vector

This property is read-only.

Name of the user who last saved the file, returned as a character vector.

Data Types: char

**LastSavedArchitecture — Platform used to save file**

character vector

This property is read-only.

Platform used to save the file, returned as a character vector.

Example: 'glnxa64'

Data Types: char

**ModelVersion — Version number**

character vector

This property is read-only.

Version number of the file, returned as a character vector.

Data Types: char

**ReleaseName — MATLAB release used to save file**

character vector

This property is read-only.

MATLAB release used to save the file, returned as a character vector.

Example: 'R2020a'

Data Types: char

**SavedCharacterEncoding — Character encoding**

character vector

This property is read-only.

Character encoding when the file was saved, returned as a character vector.

Example: 'UTF-8'

Data Types: char

**SimulinkVersion — Simulink version number used to save file**

character vector

This property is read-only.

Simulink version number used to save the file, returned as a character vector.

Example: '10.1'

Data Types: char

## Examples

### Get Model Information

Create a Simulink.MDLInfo object that corresponds to the vdp.slx file.

```
info = Simulink.MDLInfo('vdp.slx');
```

Get information about the file, such as the type of file, by using dot notation to access the property values.

```
type = info.BlockDiagramType
```

```
type =
```

```
 'Model'
```

vdp is a model file.

### Find Referenced Models Without Loading Top Model

Get information about the sldemo\_mdhref\_depgraph model.

```
info = Simulink.MDLInfo('sldemo_mdhref_depgraph');
```

Get the interface information.

```
info.Interface
```

```
ans =
```

```
 struct with fields:
```

```

 Inports: [0x1 struct]
 Outports: [0x1 struct]
 Trigports: [0x1 struct]
 Enableports: [0x1 struct]
 ModelVersion: '1.84'
 SubsystemReferences: {0x1 cell}
 ModelReferences: {4x1 cell}
 ParameterArgumentNames: ''
 TestPointedSignals: [0x1 struct]
 ProvidedFunctions: [0x1 struct]
 IsExportFunctionModel: 0
 IsArchitectureModel: 0
 IsAUTOSARArchitectureModel: 0
 ResetEvents: [0x1 struct]
 HasInitializeEvent: 0
 HasTerminateEvent: 0
 PreCompExecutionDomainType: 'Unset'
 ParameterArguments: [0x1 struct]
 ExternalFileReference: [4x1 struct]
```

Get the referenced models.

```
info.Interface.ModelReferences
```

```
ans =

4x1 cell array

{'sldemo_mdhref_depgraph/heat2cost|sldemo_mdhref_heat2cost' }
{'sldemo_mdhref_depgraph/house|sldemo_mdhref_house' }
{'sldemo_mdhref_depgraph/outdoor temp|sldemo_mdhref_outdoor_temp'}
{'sldemo_mdhref_depgraph/thermostat|sldemo_mdhref_heater' }
```

## Add and Check File Metadata

Create a structure that contains metadata information.

```
m.TestStatus = 'untested';
m.ExpectedCompletionDate = '01/01/2011';
```

Create a model, update the 'Metadata' parameter, and save the metadata in the model.

```
new_system('MDLInfoMetadataModel')
set_param('MDLInfoMetadataModel','Metadata',m)
save_system('MDLInfoMetadataModel')
```

Check the model for metadata by using an MDLInfo object.

```
info = Simulink.MDLInfo('MDLInfoMetadataModel');
info.Metadata
```

```
ans =

struct with fields:

 TestStatus: 'untested'
ExpectedCompletionDate: '01/01/2011'
```

## Version History

# Simulink.ModelAdvisor

Run Model Advisor from MATLAB file

## Description

To run the Model Advisor, use instances of this class in MATLAB programs. For example, you can perform a standard set of checks.

Many `Simulink.ModelAdvisor` object methods require or return IDs. An *ID* is a unique identifier for a Model Advisor check, task, or group. IDs must remain constant. A `Simulink.ModelAdvisor` object includes methods that enable you to retrieve the ID or IDs for:

- All checks, tasks, and groups
- Checks belonging to groups and tasks
- The active check
- Selected checks, tasks, and groups

To find check IDs in the Model Advisor, use the check context menu.

Find	Action
Check ID	<ol style="list-style-type: none"> <li>1 In the left pane of the Model Advisor, select the check.</li> <li>2 Right-click the check name and select <b>Send Check ID to Workspace</b>. The ID is displayed in the Command Window and sent to the base workspace.</li> </ol>
Check IDs for selected checks in a folder	<ol style="list-style-type: none"> <li>1 In the left pane of the Model Advisor, select the checks for which you want IDs. Clear the other checks in the folder.</li> <li>2 Right-click the folder and select <b>Send Check ID to Workspace</b>. An array of the selected check IDs are sent to the base workspace.</li> </ol>

If you have a Simulink Check license, consider using the `ModelAdvisor.run` function or the `Advisor.Application` run method instead of the `Simulink.ModelAdvisor.runCheck` or `runTask` functions.

Consider using `Advisor.Application` class if you have a large model with subsystems and model references. `Advisor.Application` does not run checks on library models. If you want to run checks on multiple independent models that are not in a model reference hierarchy or you want to leverage parallel processing, use `ModelAdvisor.run` to run Model Advisor checks on your model.

## Creation

### Syntax

```
ma = Simulink.ModelAdvisor.getModelAdvisor(system)
```

## Description

MATLAB creates an instance of this object for each model that you open in the current MATLAB session. To get a handle to a model's Model Advisor object, execute this command: `ma = Simulink.ModelAdvisor.getModelAdvisor(system)` where `system` is the name of the model or subsystem that you want to check. Your program can then use the Model Advisor object methods to initialize and run the Model Advisor checks.

## Input Arguments

### **system** — Model or subsystem name

character vector

Model or subsystem that the Model Advisor checks.

Data Types: `char`

## Properties

### **EmitInputParametersToReport** — Display check input parameters in Model Advisor report

`true` (default) | `false`

A value of `true` displays input parameters in the Model Advisor report. A value of `false` does not display input parameters in the Model Advisor report.

Data Types: `char`

## Object Functions

<code>closeReport</code>	Close Model Advisor report
<code>deselectCheck</code>	Clear Model Advisor check
<code>deselectCheckAll</code>	Clear Model Advisor checks
<code>deselectCheckForGroup</code>	Clear Model Advisor checks for groups
<code>deselectCheckForTask</code>	Clear Model Advisor checks that belong to a specified task or set of tasks
<code>deselectTask</code>	Clear Model Advisor checks that belong to a specified task or set of tasks
<code>deselectTaskAll</code>	Clear all Model Advisor tasks
<code>displayReport</code>	Display report in Model Advisor window
<code>exportReport</code>	Create copy of Model Advisor report
<code>filterResultWithExclusion</code>	Filter excluded objects
<code>getBaselineMode</code>	Determine whether Model Advisor is in baseline data generation mode
<code>getCheckAll</code>	Get check IDs of all Model Advisor checks
<code>getCheckForGroup</code>	Get checks belonging to Model Advisor check group
<code>getCheckForTask</code>	Get checks belonging to a task
<code>getCheckResult</code>	Get Model Advisor check results
<code>getCheckResultData</code>	Obtain Model Advisor check result data
<code>getCheckResultStatus</code>	Obtain Model Advisor check result status
<code>getGroupAll</code>	Get all groups of checks that Model Advisor runs
<code>getInputParameters</code>	Get Model Advisor check input parameters
<code>getSelectedCheck</code>	Get currently selected Model Advisor checks
<code>getSelectedSystem</code>	Get system that Model Advisor targets
<code>getSelectedTask</code>	Get selected Model Advisor tasks
<code>getTaskAll</code>	Get tasks run by Model Advisor
<code>runCheck</code>	Run currently selected checks
<code>runTask</code>	Run currently selected tasks

<code>selectCheck</code>	Select checks
<code>selectCheckAll</code>	Select all checks
<code>selectCheckForGroup</code>	Select check group
<code>selectCheckForTask</code>	Select checks for a specific task or tasks
<code>selectTask</code>	Select Model Advisor task
<code>selectTaskAll</code>	Select all Model Advisor tasks
<code>setActionEnable</code>	Set status for check action
<code>setBaselineMode</code>	Set Model Advisor baseline mode
<code>setCheckErrorSeverity</code>	Set severity of check failure
<code>setCheckResult</code>	Set result for currently running check
<code>setCheckResultData</code>	Set result data for currently running check
<code>setCheckResultStatus</code>	Set status for currently running check
<code>setInputParameters</code>	Specify input parameters
<code>verifyCheckRan</code>	Verify that Model Advisor ran a set of checks
<code>verifyCheckResult</code>	Generate baseline Model Advisor check results file or compare current check results to baseline check results
<code>verifyCheckResultStatus</code>	Verify that a model passed or failed a set of checks
<code>verifyHTML</code>	Generate baseline Model Advisor report or compare current report to baseline report

“Run Model Advisor Checks”

## closeReport

**Package:** Simulink

Close Model Advisor report

### Syntax

```
closeReport(ma)
```

### Description

For a Model Advisor object, use the `closeReport(ma)` method to close a Model Advisor Report.

### Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to close the corresponding Model Advisor report.

### Version History

Introduced in R2006a

### See Also

`Simulink.ModelAdvisor`

# deselectCheck

**Package:** Simulink

Clear Model Advisor check

## Syntax

```
output = deselectCheck(ma,checkID)
```

## Description

For a Model Advisor object, use the `output = deselectCheck(ma,checkID)` method to clear a Model Advisor check. This method cannot clear disabled checks.

## Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object that you want to clear Model Advisor check(s).

**checkID — Check IDs associated with Model Advisor check(s)**

character vector | cell array of character vectors

Model Advisor Check IDs for which you want to clear from the Model Advisor.

Example: 'mathworks.design.UnconnectedLinesPorts'

## Output Arguments

**output — Logical value**

boolean

A logical value indicating whether Simulink cleared the specified check. A value of 1 indicates success. A value of 0 indicates that Simulink was not able to clear the specified check.

## Version History

**Introduced in R2006a**

## See Also

`Simulink.ModelAdvisor`

## deselectCheckAll

**Package:** Simulink

Clear Model Advisor checks

### Syntax

```
output = deselectCheckAll(ma)
```

### Description

For a Model Advisor object, use the `output = deselectCheckAll(ma)` method to clear all selected Model Advisor checks. This method cannot clear disabled checks.

### Input Arguments

**ma** — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to clear all selected Model Advisor checks.

### Output Arguments

**output** — Logical value

`boolean`

A logical value indicating whether Simulink cleared all selected checks. A value of 1 indicates success. A value of 0 indicates that Simulink did not clear all checks.

## Version History

**Introduced in R2006a**

### See Also

`Simulink.ModelAdvisor`

# deselectCheckForGroup

**Package:** Simulink

Clear Model Advisor checks for groups

## Syntax

```
output = deselectCheckForGroup(ma,groupName)
```

## Description

For a Model Advisor object, use the `output = deselectCheckForGroup(ma,groupName)` method to clear all selected Model Advisor checks for one or more groups. To locate the group name, use the `getGroupAll` method.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to clear all selected Model Advisor checks for one or more groups.

**groupName — Check group names**

character vector | cell array of character vectors

Name of group or groups that contain the selected Model Advisor checks that you want to clear.

## Output Arguments

**output — Logical value**

boolean

A logical value indicating whether Simulink cleared the checks for the specified group. A value of 1 indicates success. A value of 0 indicates that Simulink did not clear the specified checks.

## Version History

**Introduced in R2006a**

## See Also

Simulink.ModelAdvisor

# deselectCheckForTask

**Package:** Simulink

Clear Model Advisor checks that belong to a specified task or set of tasks

## Syntax

```
output = deselectCheckForTask(ma,task)
```

## Description

For a Model Advisor object, use the `output = deselectCheckForTask(ma,task)` method to clear all selected Model Advisor checks for one or more tasks. To locate the task name, use the `getTaskAll` method.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to clear all selected Model Advisor checks for a task or tasks

**task — Task name**

character vector | cell array of character vectors

Name of task or tasks that contain selected Model Advisor checks that you want to clear.

## Output Arguments

**output — Logical value**

boolean

A logical value indicating whether Simulink cleared the checks for the specified group. A value of 1 indicates success. A value of 0 indicates that Simulink did not clear the specified checks.

## Version History

Introduced in R2006a

## See Also

Simulink.ModelAdvisor

# deselectTask

**Package:** Simulink

Clear Model Advisor checks that belong to a specified task or set of tasks

## Syntax

```
output = deselectTask(ma,task)
```

## Description

For a Model Advisor object, use the `output = deselectTask(ma,task)` method to clear all selected Model Advisor checks for one or more tasks. To locate the task name, use the `getTaskAll` method.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to clear all selected Model Advisor checks for a task or tasks

**task — Task name**

character vector | cell array of character vectors

Name of task or tasks that contain selected Model Advisor checks that you want to clear.

## Output Arguments

**output — Logical value**

boolean

A logical value indicating whether Simulink removed the checks for the specified task. A value of 1 indicates success. A value of 0 indicates that Simulink was not able to clear the checks for the specified task.

## Version History

**Introduced in R2006a**

## See Also

Simulink.ModelAdvisor

## deselectTaskAll

**Package:** Simulink

Clear all Model Advisor tasks

### Syntax

```
output = deselectTaskAll(ma)
```

### Description

For a Model Advisor object, use the `output = deselectTaskAll(ma)` method to clear all selected Model Advisor checks for all tasks.

### Input Arguments

**ma** — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to clear all selected Model Advisor checks for all tasks

### Output Arguments

**output** — Logical value

`boolean`

A logical value indicating whether Simulink cleared the checks for all tasks. A value of 1 indicates success. A value of 0 indicates that Simulink did not clear the checks.

## Version History

**Introduced in R2006a**

### See Also

`Simulink.ModelAdvisor`

# displayReport

**Package:** Simulink

Display report in Model Advisor window

## Syntax

```
displayReport(ma)
```

## Description

For a Model Advisor object, use the `displayReport(ma)` method to display a Model Advisor report in the Model Advisor window. The report includes the most recent results of running checks on the system corresponding to the Model Advisor object and the current selection status of checks, groups, and tasks for the system.

## Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to open the corresponding Model Advisor report.

## Version History

Introduced in R2006a

## See Also

`Simulink.ModelAdvisor`

# exportReport

**Package:** Simulink

Create copy of Model Advisor report

## Syntax

```
[output, message] = exportReport(ma, destination)
```

## Description

For a Model Advisor object, use the `[output, message] = exportReport(ma, destination)` method to create a copy of a Model Advisor report. The report includes the most recent results of running checks on the system corresponding to the Model Advisor object and the current selection status of checks, groups, and tasks for the system.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to export the corresponding Model Advisor report.

**destination — Path name**

character vector

Path name to report file location.

## Output Arguments

**output — Logical value**

boolean

A logical value indicating whether Simulink created a report in location that you specify by `destination` input argument. A value of 1 indicates success. A value of 0 indicates that Simulink did not create a copy of the report in the specified location.

**message — Reason why report was not created**

character vector

This output argument is empty if a report is created. If a report was not created, this argument contains the reason why.

## Version History

Introduced in R2006a

**See Also**

Simulink.ModelAdvisor

## filterResultWithExclusion

**Package:** Simulink

Filter excluded objects

### Syntax

```
filteredResultHandles = filterResultWithExclusion(ma,ResultHandles)
```

### Description

Use the `filteredResultHandles = filterResultWithExclusion(ma,ResultHandles)` method to filter objects that have exclusions enabled and cause a check warning or failure.

This method is intended for excluding objects from custom checks that you create by using the Model Advisor customization API, available with Simulink Check.

### Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to filter objects causing exclusion enabled checks to warn or fail.

**ResultHandles — Array of model objects causing a check warning or failure**

array of model objects

Array of objects causing a check warning or failure.

### Output Arguments

**filteredResultHandles — Array of objects causing a check warning or failure**

array of objects

An array of objects causing exclusion enabled checks to warn or fail.

## Version History

Introduced in R2006a

### See Also

Simulink.ModelAdvisor

“Exclude Blocks From Custom Checks” (Simulink Check)

# getBaselineMode

**Package:** Simulink

Determine whether Model Advisor is in baseline data generation mode

## Syntax

```
mode = getBaselineMode(ma)
```

## Description

`mode = getBaselineMode(ma)` returns true if the Model Advisor is in baseline data mode. Baseline data mode causes the verification methods of the Model Advisor, for example, `verifyHTML`, to generate baseline data.

## Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to determine if it is in baseline data mode.

## Output Arguments

**mode — Boolean value indicating baseline mode**

0 (default)

A value of 1 indicates that the Model Advisor is in baseline data generation mode.

## Version History

**Introduced in R2006a**

## See Also

`Simulink.ModelAdvisor`

## getCheckAll

**Package:** Simulink

Get check IDs of all Model Advisor checks

### Syntax

```
CheckIDs = getCheckAll(ma)
```

### Description

The `CheckIDs = getCheckAll(ma)` method returns a cell array of character vectors specifying the Check IDs of all checks that the Model Advisor performs.

### Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to get the Check IDs of all checks that the Model Advisor performs.

### Output Arguments

**CheckIDs — Model Advisor Check IDs**

cell array of character vectors

Cell array of character vectors specifying the Check IDs of all Model Advisor checks.

### Version History

**Introduced in R2006a**

### See Also

`Simulink.ModelAdvisor`

# getCheckForGroup

**Package:** Simulink

Get checks belonging to Model Advisor check group

## Syntax

```
groupChecks = getCheckForGroup(ma, groupName)
```

## Description

For a Model Advisor object, use the `groupChecks = getCheckForGroup(ma, groupName)` method to get all of the Model Advisor checks in a group. To locate the group name, use the `getGroupAll` method.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to get all of the Model Advisor checks corresponding to a check group.

**groupName — Check group name**

character vector

Name of group that contains the Model Advisor checks.

Example: 'Simulink Coder'

## Output Arguments

**groupChecks — Model Advisor checks**

cell array of character vectors

Checks that belong to a Model Advisor group.

## Version History

Introduced in R2006a

## See Also

Simulink.ModelAdvisor

# getCheckForTask

**Package:** Simulink

Get checks belonging to a task

## Syntax

```
taskChecks = getCheckForTask(ma,taskID)
```

## Description

For a Model Advisor object, use the `taskChecks = getCheckForTask(ma,taskID)` method to get all of the Model Advisor checks that are part of a task. To locate the task name, use the `getTaskAll` method.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to get all of the Model Advisor checks that are part of a task.

**taskID — Task name**

character vector

Name of task that contains the Model Advisor checks.

Example: `'_SYSTEM_By Task_Modeling_Physical_Systems'`

## Output Arguments

**taskChecks — Model Advisor checks**

cell array of character vectors

Checks that are part of a Model Advisor task

## Version History

Introduced in R2006a

## See Also

Simulink.ModelAdvisor

# getCheckResult

**Package:** Simulink

Get Model Advisor check results

## Syntax

```
results = getCheckResult(ma,checkID)
```

## Description

For a Model Advisor object, use the `results = getCheckResult(ma,checkID)` method to get the results of running a check or set of checks.

This method enables you to access results generated by custom checks that you create using the Model Advisor customization API, an optional feature available with Simulink Check software. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to obtain check results.

**checkID — Check IDs associated with Model Advisor check**

character vector|cell array of character vectors

Model Advisor Check IDs for which you want to obtain results.

Example: 'mathworks.design.UnconnectedLinesPorts'

## Output Arguments

**results — Check results**

cell array

Cell array of check results. The result format depends on the check data.

## Version History

Introduced in R2006a

## See Also

Simulink.ModelAdvisor

# getCheckResultData

**Package:** Simulink

Obtain Model Advisor check result data

## Syntax

```
results = getCheckResultData(ma,checkID)
```

## Description

For a Model Advisor object, use the `results = getCheckResultData(ma,checkID)` method to get the check result data for a specified set of checks. You set the check result data for a check by using `setCheckResultData` in the check callback function.

This method enables you to access results generated by custom checks that you create using the Model Advisor customization API, an optional feature available with Simulink Check software. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to obtain check result data.

**checkID — Check IDs associated with Model Advisor checks**

character vector|cell array of character vectors

Model Advisor Check IDs that you want to obtain results

Example: 'mathworks.design.UnconnectedLinesPorts'

## Output Arguments

**results — Check results**

cell array

Data from a check result or cell array of data from check results. The data format depends on the checks that generate the data.

## Version History

Introduced in R2006a

## See Also

Simulink.ModelAdvisor

# getCheckResultStatus

**Package:** Simulink

Obtain Model Advisor check result status

## Syntax

```
status = getCheckResultStatus(ma,checkID)
```

## Description

After running a set of checks, use the `status = getCheckResultStatus(ma,checkID)` method to determine whether these checks passed or failed.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to determine whether a check or set of checks passed or failed.

**checkID — Model Advisor Check IDs**

character vector | cell array of character vectors

Model Advisor Check IDs for which you want to obtain results.

Example: 'mathworks.design.UnconnectedLinesPorts'

## Output Arguments

**status — Pass or fail**

Boolean | cell array of Boolean values

Boolean value or cell array of Boolean values indicating the pass or fail status of a check or set of checks.

## Version History

Introduced in R2006a

## See Also

Simulink.ModelAdvisor

## getGroupAll

**Package:** Simulink

Get all groups of checks that Model Advisor runs

### Syntax

```
groupChecks = getGroupAll(ma)
```

### Description

For a Model Advisor object, use the `groupChecks = getGroupAll(ma)` method to get all groups of checks that the Model Advisor runs.

### Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to determine all Model Advisor check groups.

### Output Arguments

**groupChecks — Model Advisor check groups**

cell array of character vectors

IDs of check groups that the Model Advisor runs.

## Version History

**Introduced in R2006a**

### See Also

Simulink.ModelAdvisor

# getInputParameters

**Package:** Simulink

Get Model Advisor check input parameters

## Syntax

```
params = getInputParameters(ma,CheckID)
```

## Description

Use the `params = getInputParameters(ma,CheckID)` method to get the input parameters for a Model Advisor check.

This method enables you to access custom checks that you create using Simulink Check. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you determine the input parameters for specific Model Advisor check.

**CheckID — Model Advisor check**

character vector

Model Advisor check ID for which to obtain its input parameters. If you use the method inside a check callback function, you can omit this argument.

Example: 'mathworks.design.UnconnectedLinesPorts'

## Output Arguments

**params — Input parameters**

cell array of ModelAdvisor.InputParameter objects

Cell array that contains the ModelAdvisor.InputParameter objects for a Model Advisor check.

## Version History

Introduced in R2006a

## See Also

Simulink.ModelAdvisor

**Topics**

“Run Model Advisor Checks”

# getListViewParameters

**Package:** Simulink

Get Model Advisor checklist parameters displayed in checklist view

## Syntax

```
params = getListViewParameters(ma,CheckID)
```

## Description

Use the `params = getListViewParameters(ma,CheckID)` method to get the list view of parameters for a Model Advisor check.

This method enables you to access custom checks that you create by using Simulink Check. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you determine the list view of parameters for a specific Model Advisor check.

**CheckID — Model Advisor check**

character vector

Name of Model Advisor check for which to obtain its parameters in list view. You can omit this argument if you use the method inside a check callback function.

Example: 'mathworks.design.UnconnectedLinesPorts'

## Output Arguments

**params — Input parameters**

cell array of ModelAdvisor.ListViewParameter objects

Cell array that contains the ModelAdvisor.ListViewParameter objects for a Model Advisor check.

## Version History

Introduced in R2006a

## See Also

Simulink.ModelAdvisor | ModelAdvisor.ListViewParameter

## getSelectedCheck

**Package:** Simulink

Get currently selected Model Advisor checks

### Syntax

```
CheckIDs = getSelectedCheck(ma)
```

### Description

Use the `CheckIDs = getSelectedCheck(ma)` method to obtain the selected Model Advisor checks for a corresponding `Simulink.ModelAdvisor` object.

### Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to obtain the selected Model Advisor checks.

### Output Arguments

**CheckIDs — Model Advisor checks**

cell array of character vectors

Check IDs of currently selected Model Advisor checks.

## Version History

**Introduced in R2006a**

### See Also

`Simulink.ModelAdvisor`

# getSelectedSystem

**Package:** Simulink

Get system that Model Advisor targets

## Syntax

```
system = getSelectedSystem(ma)
```

## Description

Use the `system = getSelectedSystem(ma)` method to obtain the model or subsystem that is the target of the `Simulink.ModelAdvisor` object.

## Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to obtain the model or subsystem that the object targets.

## Output Arguments

**system — Model or subsystem**

character vector

Name of the model or subsystem that the `ModelAdvisor` object `ma` targets.

## Version History

**Introduced in R2006a**

## See Also

`Simulink.ModelAdvisor`

## getSelectedTask

**Package:** Simulink

Get selected Model Advisor tasks

### Syntax

```
TaskIDs = getSelectedTask(ma)
```

### Description

Use the `TaskIDs = getSelectedTask(ma)` method to obtain the tasks that are selected for the `Simulink.ModelAdvisor` object `ma`.

### Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to obtain the currently selected tasks.

### Output Arguments

**TaskIDs — Model Advisor Task IDs**

cell array of character vectors

Cell array of selected Task IDs for the `Simulink.ModelAdvisor` object that you specify as an input.

## Version History

**Introduced in R2006a**

### See Also

`Simulink.ModelAdvisor`

# getTaskAll

**Package:** Simulink

Get tasks run by Model Advisor

## Syntax

```
TaskIDs = getTaskAll(ma)
```

## Description

Use the `TaskIDs = getTaskAll(ma)` method to obtain the tasks that are run for the `Simulink.ModelAdvisor` object `ma`.

## Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to obtain the tasks that the Model Advisor ran.

## Output Arguments

**TaskIDs — Model Advisor Task IDs**

cell array of character vectors

Cell array of Task IDs that are run for the `Simulink.ModelAdvisor` object that you specify as an input.

## Version History

**Introduced in R2006a**

## See Also

`Simulink.ModelAdvisor`

# runCheck

**Package:** Simulink

Run currently selected checks

## Syntax

```
success = runCheck(ma,checkID)
```

## Description

The `success = runCheck(ma,checkID)` method runs selected Model Advisor checks. Invoking this method is equivalent to selecting the **Run Checks** button on the Model Advisor.

If you have a Simulink Check license, consider using the `ModelAdvisor.run` function or the `Advisor.Application.run` method instead of the `Simulink.ModelAdvisor.runCheck` or `runTask` functions.

Consider using `Advisor.Application` class if you have a large model with subsystems and model references. `Advisor.Application` does not run checks on library models. If you want to run checks on multiple independent models that are not in a model reference hierarchy or you want to leverage parallel processing, use `ModelAdvisor.run` to run Model Advisor checks on your model.

## Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to run Model Advisor.

**checkID — Model Advisor check IDs**

character vector | cell array of character vectors

If you want to run the Model Advisor on a subset of the currently selected Model Advisor checks, specify this optional input parameter.

Example: `'mathworks.design.UnconnectedLinesPorts'`

## Output Arguments

**success — Boolean value indicating whether the Model Advisor ran on selected checks**

`Boolean`

`Boolean` value that indicates whether the Model Advisor ran on the selected checks. A value of 1 indicates that the Model Advisor successfully ran on the selected checks. A value of 0 indicates that the Model Advisor did not run on the selected checks.

## Version History

**Introduced in R2006a**

**See Also**

Simulink.ModelAdvisor

## runTask

**Package:** Simulink

Run currently selected tasks

### Syntax

```
success = runTask(ma)
```

### Description

The `success = runTask(ma)` method runs selected Model Advisor tasks. Invoking this method is equivalent to the **Run Checks** button on the Model Advisor.

If you have a Simulink Check license, consider using the `ModelAdvisor.run` function or the `Advisor.Application.run` method instead of the `Simulink.ModelAdvisor.runCheck` or `runTask` functions.

Consider using `Advisor.Application` class if you have a large model with subsystems and model references. `Advisor.Application` does not run checks on library models. If you want to run checks on multiple independent models that are not in a model reference hierarchy or you want to leverage parallel processing, use `ModelAdvisor.run` to run Model Advisor checks on your model.

### Input Arguments

**ma** — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to run the Model Advisor.

### Output Arguments

**success** — Boolean value indicating whether the Model Advisor ran selected tasks

Boolean

Boolean value that indicates whether the Model Advisor ran on the selected tasks. A value of 1 indicates that the Model Advisor successfully ran on the selected tasks. A value of 0 indicates that the Model Advisor did not run on the selected tasks.

## Version History

Introduced in R2006a

### See Also

# selectCheck

**Package:** Simulink

Select checks

## Syntax

```
success = selectCheck(ma,checkID)
```

## Description

The `success = selectCheck(ma,checkID)` method selects Model Advisor checks.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to select Model Advisor checks.

**checkID — Model Advisor Check IDs**

character vector | cell array of character vectors

Model Advisor checks for you to select.

Example: 'mathworks.design.UnconnectedLinesPorts'

## Output Arguments

**success — Boolean value indicating whether the Model Advisor selected the checks**

Boolean

Boolean value that indicates whether the Model Advisor selected the checks. A value of 1 indicates that the Model Advisor successfully selected the specified checks. A value of 0 indicates that the Model Advisor did not select the specified checks.

## Version History

Introduced in R2006a

## See Also

Simulink.ModelAdvisor

## selectCheckAll

**Package:** Simulink

Select all checks

### Syntax

```
success = selectCheckAll(ma)
```

### Description

The `success = selectCheckAll(ma)` method selects all Model Advisor checks.

### Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to select all Model Advisor checks.

### Output Arguments

**success — Boolean value indicating whether all Model Advisor checks are selected**

Boolean

Boolean value that indicates whether all Model Advisor checks are selected. A value of 1 indicates that the Model Advisor successfully selected all checks. A value of 0 indicates that the Model Advisor did not select all checks.

## Version History

**Introduced in R2006a**

`Simulink.ModelAdvisor`

# selectCheckForGroup

**Package:** Simulink

Select check group

## Syntax

```
success = selectCheckForGroup(ma,groupName)
```

## Description

The `success = selectCheckForGroup(ma,groupName)` method selects all Model Advisor checks in the group that you specify.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to select the Model Advisor checks.

**groupName — Check group name**

character vector | cell array of character vectors

Name of groups that contain the Model Advisor checks that you want to select.

## Output Arguments

**success — Boolean value indicating whether the Model Advisor selected the checks**

Boolean

Boolean value that indicates whether the Model Advisor selected the checks. A value of 1 indicates that the Model Advisor successfully selected the specified checks. A value of 0 indicates that the Model Advisor did not select the specified checks.

## Version History

Introduced in R2006a

## See Also

Simulink.ModelAdvisor

## selectCheckForTask

**Package:** Simulink

Select checks for a specific task or tasks

### Syntax

```
success = selectCheckforTask(ma,taskIDs)
```

### Description

Use the `success = selectCheckforTask(ma,taskIDs)` method to select the checks for a task or tasks.

### Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to select checks for a specific task or tasks.

**taskIDs — Model Advisor Task IDs**

cell array of character vectors | character vector

Cell array of Task IDs for the Simulink.ModelAdvisor object that you specify as an input.

### Output Arguments

**success — Boolean value indicating whether the checks are selected**

Boolean

Boolean value that indicates whether the Model Advisor successfully selected the checks for the specified task or tasks. A value of 1 indicates that the Model Advisor successfully selected the checks. A value of 0 indicates that the Model Advisor did not select the checks.

## Version History

Introduced in R2006a

Simulink.ModelAdvisor

# selectTask

**Package:** Simulink

Select Model Advisor task

## Syntax

```
success = selectTask(ma, TaskIDs)
```

## Description

The `success = selectTask(ma, TaskIDs)` method selects the Model Advisor tasks.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to select Model Advisor tasks.

**TaskIDs — Model Advisor Task IDs**

cell array of character vectors

Cell array of Task IDs that you want to select for the Simulink.ModelAdvisor object, which you specify as an input.

## Output Arguments

**success — Boolean value indicating whether Model Advisor selected tasks**

Boolean

Boolean value that indicates whether the Model Advisor selected tasks. A value of 1 indicates that the Model Advisor successfully selected the tasks. A value of 0 indicates that the Model Advisor did not select the tasks.

## Version History

Introduced in R2006a

## See Also

Simulink.ModelAdvisor

## selectTaskAll

**Package:** Simulink

Select all Model Advisor tasks

### Syntax

```
success = selectTaskAll(ma)
```

### Description

The `success = selectTaskAll(ma)` method selects all Model Advisor tasks.

### Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to select the Model Advisor tasks.

### Output Arguments

**success — Boolean value indicating whether Model Advisor selected tasks**

Boolean

Boolean value that indicates whether the Model Advisor selected tasks. A value of 1 indicates that the Model Advisor successfully selected the tasks. A value of 0 indicates that the Model Advisor did not select the tasks.

## Version History

**Introduced in R2006a**

Simulink.ModelAdvisor

# setActionEnable

**Package:** Simulink

Set status for check action

## Syntax

```
setActionEnable(ma, value)
```

## Description

The `setActionEnable(ma, value)` method enables or disables the Action box. Only a check callback function can invoke this method.

This method enables you to access custom checks that you create by using the Model Advisor customization API, an optional feature that is available with Simulink Check software. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to set check action status.

**value — Boolean value indicating whether to enable or disable the Model Advisor Action box**

Boolean

Boolean value that indicates whether to enable or disable Model Advisor **Action** box. To enable the box, specify a value of `true`. To disable the box, specify a value of `false`.

## Version History

Introduced in R2006a

## See Also

Simulink.ModelAdvisor

## setBaselineMode

**Package:** Simulink

Set Model Advisor baseline mode

### Syntax

```
setBaselineMode(ma,mode)
```

### Description

Use the `setBaselineMode(ma,mode)` method to set the Model Advisor baseline mode. Baseline mode causes the Model Advisor verify methods to generate baseline comparison data for verifying the results of a Model Advisor run.

### Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to set the baseline mode.

**mode — Boolean value indicating the Model Advisor baseline mode**

`Boolean`

Boolean value that indicates the Model Advisor baseline mode. A value of `true` indicates that baseline mode is on. A value of `false` indicates that baseline mode is off.

### Version History

**Introduced in R2006a**

### See Also

`Simulink.ModelAdvisor`

# setCheckErrorSeverity

**Package:** Simulink

Set severity of check failure

## Syntax

```
setCheckErrorSeverity(ma, value)
```

## Description

Use the `setCheckErrorSeverity(ma, value)` method to set the check error severity for the currently running check. Only the callback function of a check can invoke this method.

This method enables you to access custom checks that you create by using the Model Advisor customization API, an optional feature that is available with Simulink Check software. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

## Input Arguments

***ma* — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to set the check error severity for the currently running check.

***value* — Integer indicating severity of failure**

0 (default) | integer

A value of 0 indicates a warning check result. A value of 1 indicates a failed check result.

## Version History

**Introduced in R2006a**

## See Also

`Simulink.ModelAdvisor`

## setCheckResult

**Package:** Simulink

Set result for currently running check

### Syntax

```
success = setCheckResult(ma,result)
```

### Description

Use the `success = setCheckResult(ma,result)` method to set the check result for the currently running check. Only the callback function of a check can invoke this method.

This method enables you to access custom checks that you create using the Model Advisor customization API, an optional feature that is available with Simulink Check software. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

### Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to set the result for the currently running check.

**result — Result to be set**

character vector | cell array of character vectors

Character vector or cell array that specifies the result of the currently running check.

### Output Arguments

**success — Boolean value indicating whether the result is set**

Boolean

Boolean value that indicates whether the Model Advisor successfully set the result for the currently running check. A value of 1 indicates that the Model Advisor successfully set the result. A value of 0 indicates that the Model Advisor did not set the result.

## Version History

Introduced in R2006a

### See Also

Simulink.ModelAdvisor

# setCheckResultData

**Package:** Simulink

Set result data for currently running check

## Syntax

```
success = setCheckResultData(ma,data)
```

## Description

Use the `success = setCheckResultData(ma,data)` method to set the check result data for the currently running check. Only the callback function of a check can invoke this method.

This method enables you to access custom checks that you create with the Model Advisor customization API, an optional feature that is available with Simulink Check software. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to set result data for the currently running check.

**data — Result data**

cell array of character vectors

Result data that you specify for a custom check.

## Output Arguments

**success — Boolean value indicating whether result data is set**

Boolean

Boolean value that indicates whether the Model Advisor successfully set result data for the currently running check. A value of 1 indicates that the Model Advisor successfully set the data. A value of 0 indicates that the Model Advisor did not set the data.

## Version History

Introduced in R2006a

## See Also

Simulink.ModelAdvisor

## setCheckResultStatus

**Package:** Simulink

Set status for currently running check

### Syntax

```
success = setCheckResultStatus(ma,status)
```

### Description

The `success = setCheckResultStatus(ma,status)` method sets the status for the currently running check. Only the callback function of a check can invoke this method.

This method enables you to access custom checks that you create with the Model Advisor customization API, an optional feature that is available with Simulink Check software. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

### Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to set the status for the currently running check.

**status — Status of currently running check**

`Char` | `Boolean`

For `char` type inputs, `pass` | `fail` | `warn` values indicate the status of the check that just ran. If you use `char` as input parameter, you do not need to update the severity of the error using the `setCheckErrorSeverity` function.

`Boolean` value that indicates the status of the check that just ran. A value of `true` indicates that the check passed. A value of `false` indicates that the check failed.

### Output Arguments

**success — Boolean value indicating whether the Model Advisor successfully set the status**

`Boolean`

`Boolean` value that indicates whether the Model Advisor successfully set the status of the currently running check. A value of 1 indicates that the Model Advisor successfully set the status. A value of 0 indicates that the Model Advisor did not set the status.

## Version History

**Introduced in R2006a**

**See Also**

Simulink.ModelAdvisor

## setInputParameters

**Package:** Simulink

Specify input parameters

### Syntax

```
success = setInputParameters(ma, checkID, InputParameters)
```

### Description

Use the `success = setInputParameters(ma, checkID, InputParameters)` method to specify input parameters for a Model Advisor check.

This method enables you to access custom checks that you create using Simulink Check. For more information, see “Define Custom Model Advisor Checks” (Simulink Check) .

### Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which to specify the input parameters for the specific Model Advisor check.

**checkID — Model Advisor check**

character vector

Model Advisor check ID to which the input parameters apply. If you use this method inside a current active check function, you can omit this argument.

Example: 'mathworks.design.UnconnectedLinesPorts'

**InputParameters — Input parameters**

cell array of ModelAdvisor.InputParameter objects

Cell array that contains the ModelAdvisor.InputParameter objects for a Model Advisor check.

### Output Arguments

**success — Boolean value indicating whether the input parameters were specified for check**

Boolean

Boolean value that indicates whether the Model Advisor specified the input parameters. A value of 1 indicates that the Model Advisor successfully specified the input parameters for the check. A value of 0 indicates that the Model Advisor did not specify the input parameters.

## Version History

Introduced in R2006a

# setListViewParameters

**Package:** Simulink

Specify list-view parameters for check

## Syntax

```
setListViewParameters(ma,checkID, params)
```

## Description

The `setListViewParameters(ma,checkID, params)` method sets the list-view parameters for a check. Only the callback function of a check can invoke this method.

This method enables you to access custom checks that you create with the Model Advisor customization API, an optional feature that is available with Simulink Check software. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

## Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to set list-view parameters.

**checkID — Model Advisor Check ID**

character vector

Character vector specifying the identifier for a Model Advisor check.

**params — Cell array of `ModelAdvisor.ListViewParameter` objects**

`ModelAdvisor.ListViewParameter` objects

Set the list-view parameters for the check.

## Version History

**Introduced in R2006a**

# verifyCheckRan

**Package:** Simulink

Verify that Model Advisor ran a set of checks

## Syntax

```
[success, missingChecks, additionalChecks]= verifyCheckRan(ma,CheckIDs)
```

## Description

Use the `[success, missingChecks, additionalChecks]= verifyCheckRan(ma,CheckIDs)` method to verify that the Model Advisor ran a set of checks.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to verify that a set of checks ran

**CheckIDs — Model Advisor Check IDs**

cell array of character vectors

Cell array of character vectors specifying the identifiers of Model Advisor checks that you want to verify have run.

## Output Arguments

**success — Boolean value indicating whether the Model Advisor ran checks**

Boolean

Boolean value that indicates whether the Model Advisor successfully ran a set of checks. A value of 1 indicates that the Model Advisor successfully ran the checks. A value of 0 indicates that the Model Advisor did not run the checks.

**missingChecks — Cell array of Check IDs**

cell array of character vectors

Cell array of character vectors specifying the identifiers of specified Model Advisor checks that did not run.

**additionalChecks — Model Advisor Check IDs**

cell array of character vectors

Cell array of character vectors specifying the identifiers of unspecified Model Advisor checks that ran.

## **Version History**

**Introduced in R2006a**

`Simulink.ModelAdvisor`

# verifyCheckResult

**Package:** Simulink

Generate baseline Model Advisor check results file or compare current check results to baseline check results

## Syntax

```
[success, message]= verifyCheckResult(ma,baseline,CheckIDs)
```

## Description

Use the `[success, message]= verifyCheckResult(ma,baseline,CheckIDs)` method to generate a baseline Model Advisor check results file or compare to current check results to baseline check results. If the Model Advisor is in baseline mode, this method stores the most recent results of running the checks that you specify by the `CheckIDs` argument in a MAT-file. For the MAT-file, use the location that you specify by using the `baseline` input argument.

To generate a baseline report, put the Model Advisor in baseline mode. Then invoke this method with the `baseline` argument set to the location where you want to store the baseline results. To perform a current-to-baseline report comparison, first check that the Model Advisor is not in baseline mode. Then, invoke this method with the path of the baseline report as the value of the `baseline` input argument.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to verify that a set of checks ran.

**baseline — Path of the baseline check results MAT-file**

character vector

To perform a current-to-baseline report comparison, make sure that the Model Advisor is not in baseline mode and specify a path to the baseline report.

**CheckIDs — Model Advisor Check IDs**

cell array of character vectors

Cell array of character vectors specifying the identifiers of Model Advisor checks that you want to verify by using check results.

## Output Arguments

**success — Boolean value indicating whether the method succeeded**

Boolean

Boolean value that indicates whether the method ran successfully. A value of 1 indicates that the method verified that the current check results match the baseline results. A value of 0 indicates that

the Model Advisor did not verify check results. If the method is unable to store the check results at the specified location, it returns false in the output variable success. The reason for the failure is in the message argument.

**message — Error message**

character vector

Error message indicating why Simulink did not verify check result.

## **Version History**

**Introduced in R2006a**

### **See Also**

Simulink.ModelAdvisor

# verifyCheckResultStatus

**Package:** Simulink

Verify that a model passed or failed a set of checks

## Syntax

```
[success message]= verifyCheckResultStatus(ma, baseline, checkIDs)
```

## Description

Use the `[success message]= verifyCheckResultStatus(ma, baseline, checkIDs)` method to verify that a model has passed or failed a set of checks.

Before invoking the `verifyCheckResultStatus` method, run the checks that you specify with `checkIDs`. Then use the `getCheckResultStatus` method to obtain the boolean values for the baseline argument.

## Input Arguments

### **ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to verify that a set of checks passed.

### **baseline — Statuses from running most recent round of checks**

Cell array of Boolean variables

Statuses from the most recent checks run that you specify by Check IDs.

### **checkIDs — Model Advisor Check IDs**

cell array of character vectors

Cell array of character vectors specifying the identifiers of Model Advisor checks that you want to verify have run.

## Output Arguments

### **success — Boolean value indicating whether the check statuses match the baseline**

Boolean

Boolean value that indicates whether the statuses match the baseline. A value of 1 indicates that the statuses match. A value of 0 indicates that the statuses do not match the baseline.

### **message — Message indicating status**

character vector

Message indicating whether the method successfully verified the check result statuses.

## **Version History**

**Introduced in R2006a**

`Simulink.ModelAdvisor`

# verifyHTML

**Package:** Simulink

Generate baseline Model Advisor report or compare current report to baseline report

## Syntax

```
[success message]= verifyHTML(ma,baseline)
```

## Description

Use the `[success message]= verifyHTML(ma,baseline)` method to generate a Model Advisor report or to compare a current report to a baseline report.

This method enables you to compare a Model Advisor report with a baseline report to determine if they differ. You can use the method to generate the baseline report and perform current-to-baseline report comparisons. To generate a baseline report, use the `setBaselineMode` method to put the Model Advisor in baseline mode. Invoke this method with the baseline argument set to the location where you want to store the baseline report. To perform a current-to-baseline report comparison, first make sure that the Model Advisor is not in baseline mode. Then, invoke this method with the path of the baseline report as the value of the `baseline` input argument.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to generate a baseline report or compare current report to baseline report

**baseline — Path of Model Advisor report**

character vector

Path to baseline Model Advisor report

## Output Arguments

**success — Boolean value indicating whether the method is successful**

Boolean

Boolean value that indicates whether the method is successful. If the Model Advisor is in baseline mode, this method stores the most recently generated Model Advisor report at the location specified by the `baseline` input argument. If the method is unable to store a copy of the report at the specified location, it returns `false` in the output variable `success`. The reason for the failure is in the output variable `message`. If the Model Advisor is not in baseline mode, this method compares the report most recently generated by the Model Advisor with the report specified by `baseline`. If the current report has the same content as the baseline report, this method returns `true` as the value of the `success` output variable.

**message — Message indicating status**

character vector

Message indicating whether the Model Advisor is able to successfully store a report.

# Simulink.ModelDataLogs

(Not recommended) Access signal data logs for data logged using ModelDataLogs format

---

**Note** The ability to log and load data using the ModelDataLogs format has been removed. Use another supported format, such as Dataset format, instead. For more information, see “Compatibility Considerations”.

---

## Description

The Simulink.ModelDataLogs object contains all data logged from simulation in a model that logs data using the ModelDataLogs format.

## Creation

Prior to R2016a, you could configure a model to log data using the ModelDataLogs format. Simulating a model with the **Signal logging format** parameter set to ModelDataLogs created a Simulink.ModelDataLogs object that contained the data for all logged signals. You could specify the name for the ModelDataLogs object using the **Signal logging name** parameter.

## Properties

### Logged Data Properties

The Simulink.ModelDataLogs object contains properties with the signal data logged from simulation. The number, type, and names of the properties that contain logged data depend on the structure of the model and the logging configuration.

Property Name Source	Logged Data Source	Value
Model name	Top model or model reference	Simulink.ModelDataLogs
Subsystem name	Subsystem	Simulink.SubsysDataLogs
Signal name	Signal	Simulink.Timeseries
Mux or virtual bus name	Mux or virtual bus	Simulink.TSArray
Bus object	Nonvirtual bus	Simulink.TSArray

The hierarchy of ModelDataLogs and SubsysDataLogs objects in a ModelDataLogs object matches the hierarchy of the model. The hierarchy of a Simulink.TSArray object for a bus matches the bus hierarchy.

### Model Properties

**Name — Model or Model block name**

character vector

Model or Model block name, returned as a character vector. For the top model, the Name property value is the name of the model. For a referenced model, the Name property value is the name of the Model block that references the model.

## Object Functions

convertToDataset	(Not recommended) Convert data logged using ModelDataLogs format to Dataset format
unpack	(Not recommended) Extract signal data from ModelDataLogs, SubsysDataLogs, or TSError object into workspace variables
who	(Not recommended) List names of objects inside ModelDataLogs, SubsysDataLogs, or TSError object
whos	(Not recommended) List name and type of objects inside ModelDataLogs, SubsysDataLogs, or TSError object

## Examples

### Access Data Using Names with Spaces or New Lines

Property names in a ModelDataLogs object can have spaces or new line characters when a logged signal:

- Has a name that includes a space or new line character
- Is unnamed and originates in a block with a name that includes a space or new line character
- Exists in a subsystem or referenced model, and the name of the subsystem, Model block, or of any upstream block in the model hierarchy includes a space or new line character

This model logs signals with names that include spaces or new line characters.

```
logout
```

```
logout =
```

```
Simulink.ModelDataLogs (model_name):
 Name Elements Simulink Class
```

```

('x y') 1 Timeseries
('a
b') 1 Timeseries
('SL_Sine
Wave1') 1 Timeseries

```

You cannot access elements of the `ModelDataLogs` object by using tab completion or by typing the name after a dot. The MATLAB parser interprets the space or new line character as a separator between identifiers. For example, this code results in an error.

```

logout.x y
??? logout.x y
 |
Error: Unexpected MATLAB expression.

```

To access an element with a name that includes a space, enclose the name in single quotes.

```

logout.('x y')

 Name: 'x y'
 BlockPath: 'model_name/Sine'
 PortIndex: 1
 SignalName: 'x y'
 ParentName: 'x y'
 TimeInfo: [1x1 Simulink.TimeInfo]
 Time: [51x1 double]
 Data: [51x1 double]

```

To access an element with a name that includes a new line character, construct the element name by concatenating a new line character in the appropriate location.

```

cr=sprintf('\n')
logout.(['a' cr 'b'])

```

## Version History

### Introduced before R2006a

#### Loading data saved in the ModelDataLogs format no longer supported

*Errors starting in R2022b*

Starting in R2022b, you can no longer load data stored in the `ModelDataLogs` format, including data stored in `Simulink.Timeseries`, `Simulink.TSArray`, and `Simulink.SubsysDataLogs` objects.

You can convert data stored in the `ModelDataLogs` format to the `Dataset` format. For more information, see “Dataset Conversion for Logged Data”.

#### Loading data saved in the ModelDataLogs format will not be supported

*Warns starting in R2021a*

When you load data that uses the `ModelDataLogs` format as input for simulation, the software issues a warning that support for loading data in the `ModelDataLogs` format will be removed in a future release.

#### Loading data saved in the ModelDataLogs format will not be supported

*Not recommended starting in R2020b*

In a future release, the ability to load data that uses the `ModelDataLogs` format as input for simulation will be removed.

### **Logging data using `ModelDataLogs` format no longer supported**

Starting in R2016a, you can no longer log data using the `ModelDataLogs` format, and signal logging always uses the `Dataset` format. When you open a model from a previous release that had logged data using the `ModelDataLogs` format, the model configuration parameters are updated to log data using the `Dataset` format instead.

You can still use and access data logged using the `ModelDataLogs` format in previous releases, including data in `Simulink.SubsysDataLogs`, `Simulink.TSArray`, and `Simulink.Timeseries` objects. You can also convert data saved in the `ModelDataLogs` format to the `Dataset` format, which can simplify data processing. For more information, see “Dataset Conversion for Logged Data”.

For information about updating scripts that processed `ModelDataLogs` data, see “Migrate Scripts That Use Legacy `ModelDataLogs` API”.

# convertToDataset

**Package:** Simulink

(Not recommended) Convert data logged using ModelDataLogs format to Dataset format

---

**Note** The ability to log and load data using the ModelDataLogs format has been removed. Use another supported format, such as Dataset, instead. For more information, see “Compatibility Considerations”.

---

## Syntax

```
ds = convertToDataset mdlObj, dsName)
```

## Description

`ds = convertToDataset(mdlObj, dsName)` converts the data in the `Simulink.ModelDataLogs` object `mdlObj` to a `Simulink.SimulationData.Dataset` with the name specified by `dsName`. The output `ds` is a `Dataset` object that contains a flat list with an element for each `Simulink.Timeseries`, `Simulink.ModelDataLogs`, `Simulink.TSArray`, and `Simulink.SubsysDataLogs` object inside `mdlObj`.

You can also use the `Simulink.SimulationData.Dataset` function to convert data from the `ModelDataLogs` format to the `Dataset` format.

## Input Arguments

### **mdlObj — Data to convert**

`Simulink.ModelDataLogs` object

Data to convert, specified as a `Simulink.ModelDataLogs` object.

### **dsName — Name of Dataset object to contain converted data**

character vector

Name of `Dataset` object to contain converted data, specified as a character vector.

## Output Arguments

### **ds — Converted data**

`Simulink.Simulationdata.Dataset` object

Converted data, returned as a `Simulink.Simulationdata.Dataset` object.

## Limitations

Source of Simulink.ModelDataLogs Data	Conversion Limitation
Model reference	Conversion fails if any ancestor of the model reference is not on the MATLAB path.  Conversion might fail if the model reference or any ancestors of the model reference have changed since the Simulink.ModelDataLogs object was created. For example, adding, deleting, or renaming a block after the object was created can cause conversion to fail.
Variant model or subsystem	Conversion fails if the current active variant is not the same as the active variant when the Simulink.ModelDataLogs object was created.
Frame signal	Not supported.
Mux block	Conversion produces a different Dataset object than logging the output using the Dataset format would produce.
Stateflow chart	Not supported.

## Version History

### Introduced in R2011a

#### Loading data saved in the ModelDataLogs format no longer supported

*Errors starting in R2022b*

Starting in R2022b, you can no longer load data stored in the ModelDataLogs format, including data stored in Simulink.Timeseries, Simulink.TSArray, and Simulink.SubsysDataLogs objects.

You can convert data stored in the ModelDataLogs format to the Dataset format. For more information, see “Dataset Conversion for Logged Data”.

#### Loading data saved in the ModelDataLogs format will not be supported

*Warns starting in R2021a*

When you load data that uses the ModelDataLogs format as input for simulation, the software issues a warning that support for loading data in the ModelDataLogs format will be removed in a future release.

#### Loading data saved in the ModelDataLogs format will not be supported

*Not recommended starting in R2020b*

In a future release, the ability to load data that uses the ModelDataLogs format as input for simulation will be removed.

#### Logging data using ModelDataLogs format no longer supported

Starting in R2016a, you can no longer log data using the ModelDataLogs format, and signal logging always uses the Dataset format. When you open a model from a previous release that had logged

data using `ModelDataLogs` format, the model configuration parameters are updated to log data using the `Dataset` format instead.

You can still use and access data logged using the `ModelDataLogs` format in previous releases, including data in `Simulink.SubsysDataLogs`, `Simulink.TSArray`, and `Simulink.Timeseries` objects. # unpack

**Package:** Simulink

(Not recommended) Extract signal data from `ModelDataLogs`, `SubsysDataLogs`, or `TSArray` object into workspace variables

---

**Note** The ability to log and load data using the `ModelDataLogs` format has been removed. Use another supported format, such as `Dataset` format, instead. For more information, see “Compatibility Considerations”.

---

## Syntax

```
unpack(logs)
unpack(logs, opt)
```

## Description

`unpack(logs)` extracts the top-level contents of the data logging object `logs` into one or more workspace variables.

`unpack(logs, opt)` extracts the contents specified by `opt` from the data logging object `logs` into one or more workspace variables.

## Input Arguments

### logs — Object from which to extract logged data

`Simulink.ModelDataLogs` object | `Simulink.TSArray` object | `Simulink.SubsysDataLogs` object

Object from which to extract logged data, specified as a `Simulink.ModelDataLogs` object, a `Simulink.SubsysDataLogs` object, or a `Simulink.TSArray` object.

### opt — Logged data to extract into workspace variables

'systems' | 'all'

Logged data to unpack into workspace, specified as 'systems' or 'all'.

- 'systems' — Extract `Simulink.Timeseries` and `Simulink.TSArray` objects from `Simulink.ModelDataLogs` or `Simulink.SubsysDataLogs` object. `Simulink.Timeseries` objects are not extracted from `Simulink.TSArray` objects, and intermediate `Simulink.ModelDataLogs` and `Simulink.SubsysDataLogs` objects are not extracted to the workspace.
- 'all' — Extract `Simulink.Timeseries` objects from all `Simulink.ModelDataLogs`, `Simulink.SubsysDataLogs`, and `Simulink.TSArray` objects.

## Simulink.ModelWorkspace

Interact with the model workspace of a model programmatically

### Description

Use a `Simulink.ModelWorkspace` object to interact with a model workspace. For example, you can add and remove variables, set the data source of the workspace, and save changes to the workspace.

For more information, see “Model Workspaces”.

### Creation

To create a `Simulink.ModelWorkspace`, use the `get_param` function to query the value of the model parameter `ModelWorkspace`. For example, to create an object named `mdlWks` that represents the model workspace of a model named `myModel.slx`:

```
mdlWks = get_param('myModel', 'ModelWorkspace')
```

### Properties

#### **DataSource** — Source for initializing variables in model workspace

'Model File' (default) | 'MAT-File' | 'MATLAB Code' | 'MATLAB File'

Source for initializing the variables in the model workspace, specified as one of these character vectors:

- 'Model File' — The variables are stored in the model file. When you save the model, you also save the variables.
- 'MATLAB Code' — The variables are created by MATLAB code that you write and store in the model file.
- 'MAT-File' — The variables are stored in a MAT-file, which you can manage and manipulate separately from the model file.
- 'MATLAB File' — The variables are created by MATLAB code in a script file, which you can manage and manipulate separately from the model file.

Data Types: char

#### **FileName** — Name of external file that stores or creates variables

' ' (empty character vector) (default) | character vector

Name of the external file that stores or creates variables, specified as a character vector. To enable this property, set `DataSource` to 'MAT-File' or 'MATLAB File'.

Example: 'myFile.mat'

Example: 'myFile.m'

Data Types: char

**MATLABCode — MATLAB code for initializing variables**

' ' (empty character vector) (default) | character vector

MATLAB code for initializing variables, specified as a character vector. To enable this property, set `DataSource` to 'MATLAB Code'.

Example: `sprintf('%% Create variables that this model uses.\n\nK = 0.00983;\n\nP = Simulink.Parameter(5);')`

Data Types: char

**Object Functions**

<code>getVariable</code>	Return value of variable in the model workspace of a model
<code>getVariablePart</code>	Get value of variable property in model workspace
<code>setVariablePart</code>	Set property of variable in model workspace
<code>hasVariable</code>	Determine whether variable exists in the model workspace of a model
<code>whos</code>	Return list of variables in the model workspace of a model
<code>saveToSource</code>	Save model workspace changes to the external data source of the model workspace
<code>save</code>	Save contents of model workspace to a MAT-file
<code>reload</code>	Reinitialize variables from the data source of a model workspace
<code>evalin</code>	Evaluate expression in the model workspace of a model
<code>clear</code>	Clear variables from the model workspace of a model
<code>assignin</code>	Assign value to variable in the model workspace of a model

**Examples****Interact With Model Workspace Programmatically**

Create a variable in the model workspace of a model. Then, modify the variable and query the variable value to confirm the modification.

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object `mdlWks` that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a variable named `myVar` with value 5.12 in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
```

Apply a new value, 7.22. To do so, first create a temporary copy of the variable by using the `getVariable` function. Then, modify the copy and use it to overwrite the original variable in the model workspace.

```
temp = getVariable(mdlWks, 'myVar');
temp = 7.22;
assignin(mdlWks, 'myVar', temp)
```

Confirm the new value by querying the value of the variable.

```
getVariable(mdlWks, 'myVar')
```

ans =

7.2200

## **Version History**

# assignin

**Package:** Simulink

Assign value to variable in the model workspace of a model

## Syntax

```
assignin mdlWks, varName, varValue)
```

## Description

`assignin(mdlWks, varName, varValue)` assigns the value `varValue` to the MATLAB variable `varName` in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`. If the variable does not exist, `assignin` creates it.

## Examples

### Assign Value to Variable in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a variable named `myVar` with value `5.12` in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
```

## Input Arguments

### **mdlWks** — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

### **varName** — Name of target variable

character vector

Name of the target variable, specified as a character vector.

Example: `'myVar'`

Data Types: `char`

### **varValue** — Value to assign to target variable

valid value

Value to assign to the target variable, specified as a valid value. For example, you can specify a literal number, a structure, or an expression that evaluates to a valid value.

If you specify the name of a handle object, such as a `Simulink.Parameter` object, use the `copy` function to create a separate copy of the object.

Example: `5.12`

Example: `struct('a',5.12,'b',7.22)`

Example: `Simulink.Parameter(5.12)`

Example: `copy(myExistingParameterObject)`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `string` | `struct` | `table` | `cell` | `categorical` | `datetime` | `duration` | `calendarDuration` | `fi`

Complex Number Support: Yes

## **Version History**

**Introduced before R2006a**

### **See Also**

`Simulink.ModelWorkspace`

# clear

**Package:** Simulink

Clear variables from the model workspace of a model

## Syntax

```
clear mdlWks
```

## Description

`clear(mdlWks)` removes all variables from the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

## Examples

### Clear Variables From Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a variable named `myVar` with value `5.12` in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
```

Clear all variables from the model workspace, including `myVar`.

```
clear(mdlWks)
```

## Input Arguments

**mdlWks** — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

## Version History

Introduced before R2006a

## See Also

`Simulink.ModelWorkspace`

## evalin

**Package:** Simulink

Evaluate expression in the model workspace of a model

### Syntax

```
result = evalin mdlWks, expression)
```

### Description

`result = evalin(mdlWks, expression)` evaluates the expression `expression` in the model workspace represented by the `Simulink.ModelWorkspace` object represented by `mdlWks`. The function returns the result of the expression in `result`.

---

**Note** For setting and getting variable properties in the model workspace, consider using `setVariablePart` and `getVariablePart` instead of `evalin` because:

- The functions do not create new variables or cause unintended results.
- `getVariablePart` does not dirty the model.

For information on these alternatives, see `Simulink.ModelWorkspace`.

---

## Examples

### Evaluate Expression in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create some variables in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
assignin(mdlWks, 'myOtherVar', 7.22)
```

Evaluate the expression `myLastVar = myVar + myOtherVar` in the model workspace. The expression creates another variable, `myLastVar`, whose value is the sum of the first two variables.

```
evalin(mdlWks, 'myLastVar = myVar + myOtherVar');
```

### Input Arguments

**mdlWks** — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

**expression — Expression to evaluate**

character vector

Expression to evaluate, specified as a character vector.

Example: `'myLastVar = myVar + myOtherVar'`

Data Types: `char`

## Output Arguments

**result — Result of expression**

number, structure, or other MATLAB value

Result of the evaluated expression, returned as a number, structure, or other MATLAB value.

## Version History

Introduced before R2006a

## See Also

`Simulink.ModelWorkspace`

## getVariable

**Package:** Simulink

Return value of variable in the model workspace of a model

### Syntax

```
varValue = getVariable mdlWks, varName)
```

### Description

`varValue = getVariable(mdlWks, varName)` returns the value of the variable whose name is `varName` that exists in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

If the value of the target variable is a handle to a handle object (such as `Simulink.Parameter`), `getVariable` returns a copy of the handle. Changes you make to the variable in the model workspace or to the returned variable (`variableValue`) affect both variables.

To return a deep copy of the handle object, use the `copy` method of the object. To modify a handle object that you store in a model workspace, it is a best practice to use both the `getVariable` and `assignin` methods (see “Modify Property Value of Handle Object” on page 8-346).

### Examples

#### Return Value of Variable in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a variable named `myVar` in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
```

Return the value of the new variable. Store the value in another variable named `varValue`.

```
varValue = getVariable(mdlWks, 'myVar');
```

#### Modify Property Value of Handle Object

Modify a property of the `Simulink.Parameter` object `K`, which is defined in model `mdl.slx`. When you call `getVariable`, use the `copy` method because `Simulink.Parameter` is a handle class.

```
wksp = get_param mdl, 'ModelWorkspace';
value = copy(getVariable(wksp, 'K'));
```

```
value.DataType = 'single';
assignin(wksp, 'K', value);
```

## Input Arguments

### **mdlWks** — Target model workspace

Simulink.ModelWorkspace object

Target model workspace, specified as a Simulink.ModelWorkspace object.

### **varName** — Name of target variable

character vector

Name of the target variable, specified as a character vector.

Example: 'myVariable'

Data Types: char

## Output Arguments

### **varValue** — Value of target variable

number, structure, or other MATLAB value

Value of the target variable, returned as a number, structure, or other MATLAB value.

## Version History

Introduced in R2012a

## See Also

get\_param | Simulink.ModelWorkspace

## getVariablePart

**Package:** Simulink

Get value of variable property in model workspace

### Syntax

```
varValue = getVariablePart mdlWks, varName.Property)
```

### Description

`varValue = getVariablePart(mdlWks, varName.Property)` returns the value of the variable property named `varName.Property` that exists in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

If the value of the variable property is a handle to a handle object (such as `Simulink.Parameter`), `getVariablePart` returns a copy of the handle.

Using `getVariablePart` is preferable to using `evalin` for getting variable properties in the model workspace because:

- The function does not dirty the model.
- Use of the function does not result in the creation of a new variable or other unintended results.

### Examples

#### Return Value of Variable Properties in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a structure named `myStruct` with fields `a`, `b`, and `c`.

```
aStruct.a = 10;
aStruct.b = {1,2,3,4,5};
aStruct.c = Simulink.Parameter(7);
mdlWks.assignin('myStruct', aStruct);
```

Return the values of the structure fields. Store the values in `varValuea`, `varValueb`, and `varValuec`.

```
varValuea = getVariablePart mdlWks, 'myStruct.a');
varValueb = getVariablePart mdlWks, 'myStruct.b{1}';
varValuec = getVariablePart mdlWks, 'myStruct.c.Value');
```

## Input Arguments

### **mdlWks** — Target model workspace

Simulink.ModelWorkspace object

Target model workspace, specified as a Simulink.ModelWorkspace object.

### **varName.Property** — Name of target variable property

character vector

Name of the target variable property, specified as a character vector.

Example: 'myVariable.Property'

Data Types: char

## Output Arguments

### **varValue** — Value of variable property

number, structure, or other MATLAB value

Value of the variable property, returned as a number, structure, or other MATLAB value.

If the value of the variable property is a handle to a handle object (such as Simulink.Parameter), getVariablePart returns a copy of the handle.

## Version History

**Introduced in R2018b**

### **See Also**

Simulink.ModelWorkspace

## hasVariable

**Package:** Simulink

Determine whether variable exists in the model workspace of a model

### Syntax

```
varExists = hasVariable mdlWks, varName)
```

### Description

`varExists = hasVariable(mdlWks, varName)` returns 1 if a variable whose name is `varName` exists in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

### Examples

#### Determine Existence of Variable in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a variable named `myVar` in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
```

Determine whether a variable named `myVar` exists in the model workspace.

```
exists = hasVariable(mdlWks, 'myVar')
```

```
exists =
 1
```

### Input Arguments

#### **mdlWks** — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

#### **varName** — Name of target variable

character vector

Name of the target variable, specified as a character vector.

Example: `'myVariable'`

Data Types: char

## Output Arguments

**varExists** — Indication of existence

1 | 0

Indication of variable existence, returned as 1 (true) or 0.

## Version History

Introduced in R2012a

## See Also

`get_param` | `Simulink.ModelWorkspace`

## reload

**Package:** Simulink

Reinitialize variables from the data source of a model workspace

### Syntax

```
reload mdlWks
```

### Description

`reload mdlWks` reinitializes the variables in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`. When you set the `DataSource` property of the model workspace to `'MAT-File'`, `'MATLAB File'`, or `'MATLAB Code'`, `reload` overwrites variables that exist in the model workspace by loading the associated MAT-file or by running the associated MATLAB code.

### Examples

#### Reinitialize Variables in a Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Configure the model workspace to use some MATLAB code as a data source.

```
mdlWks.DataSource = 'MATLAB Code';
mdlWks.MATLABCode = sprintf('myVar = 5.12;\nmyOtherVar = 7.22;');
```

Create variables in the model workspace by executing the MATLAB code.

```
reload mdlWks
```

Assign new values to the variables in the model workspace.

```
assignin mdlWks, 'myVar', 5.22
assignin mdlWks, 'myOtherVar', 7.33
```

Overwrite the new values with the values specified by the MATLAB code.

```
reload mdlWks
```

Confirm that the variables have the values specified by the MATLAB code.

```
myVarValue = getVariable mdlWks, 'myVar'
myOtherVarValue = getVariable mdlWks, 'myOtherVar'
```

```
myVarValue =
```

```
 5.1200
```

```
myOtherVarValue =
```

```
 7.2200
```

## Input Arguments

**mdlWks** — Target model workspace

Simulink.ModelWorkspace object

Target model workspace, specified as a Simulink.ModelWorkspace object.

## Version History

Introduced before R2006a

## See Also

Simulink.ModelWorkspace

## save

**Package:** Simulink

Save contents of model workspace to a MAT-file

### Syntax

```
save mdlWks, fileName)
```

### Description

`save mdlWks, fileName)` saves the variables in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks` to the MAT-file specified by `fileName`.

When you set the `DataSource` property of the model workspace to 'MAT-File' or 'MATLAB File', to save to the file that acts as the external data source of the model, use `saveToSource` instead of `save`.

### Examples

#### Save Contents of Model Workspace to MAT-File

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create some variables in the model workspace.

```
assignin mdlWks, 'myVar', 5.12
assignin mdlWks, 'myOtherVar', 7.22)
```

Save the variables to a new MAT-file named `myVars.mat`.

```
save(mdlWks, 'myVars.mat')
```

The MAT-file appears in your current folder.

### Input Arguments

**mdlWks** — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

**fileName** — Name of target MAT-file

character vector

Name of the target MAT-file, specified as a character vector.

Example: 'myFile.mat'

Data Types: char

## **Version History**

**Introduced before R2006a**

## **See Also**

Simulink.ModelWorkspace

## saveToSource

**Package:** Simulink

Save model workspace changes to the external data source of the model workspace

### Syntax

```
saveToSource mdlWks
```

### Description

`saveToSource mdlWks` saves the variables in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks` to the MAT-file or script file specified by the `FileName` property of the model workspace.

When you set the `DataSource` property of the model workspace to 'MAT-File' or 'MATLAB File', the `FileName` property specifies the name of the file that acts as the external data source of the workspace. As you make changes to the variables in the model workspace, use `saveToSource` to permanently save the changes in the external data source.

### Examples

#### Save Variables to External Data Source of Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create some variables in the model workspace.

```
assignin mdlWks, 'myVar', 5.12
assignin mdlWks, 'myOtherVar', 7.22
```

Configure the model workspace to use a MAT-file named `myVars.mat` as the data source.

```
mdlWks.DataSource = 'MAT-File';
mdlWks.FileName = 'myVars.mat';
```

Save the variables to the external data source (the MAT-file).

```
saveToSource mdlWks
```

The file appears in your current folder.

## Input Arguments

### **mdlWks — Target model workspace**

Simulink.ModelWorkspace object

Target model workspace, specified as a Simulink.ModelWorkspace object.

## Version History

**Introduced before R2006a**

## See Also

Simulink.ModelWorkspace

## setVariablePart

**Package:** Simulink

Set property of variable in model workspace

### Syntax

```
varValue = setVariablePart mdlWks, varName.Property, varValue)
```

### Description

`varValue = setVariablePart(mdlWks, varName.Property, varValue)` assigns `varValue` to the MATLAB variable property `varName.Property` in the model workspace represented by the Simulink.ModelWorkspace object `mdlWks`.

Using `setVariablePart` is preferable to using `evalin` for assigning variable properties in the model workspace because the `setVariablePart` function does not create a new variable or cause unintended results.

### Examples

#### Assign Value to Variable Properties in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a Simulink.ModelWorkspace object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a structure named `myStruct` with fields `a`, `b`, and `c`.

```
aStruct.a = 10;
aStruct.b = {1,2,3,4,5};
aStruct.c = Simulink.Parameter(7);
mdlWks.assignin('myStruct', aStruct);
```

Assign new values to the structure fields.

```
setVariablePart(mdlWks, 'myStruct.a', 2);
setVariablePart(mdlWks, 'myStruct.b{1}', 2);
setVariablePart(mdlWks, 'myStruct.c', Simulink.Parameter(2));
```

Return the new values of the structure fields. Store the values in `varValuea`, `varValueb`, and `varValuec`.

```

varValuea = getVariablePart mdlWks, 'myStruct.a')
varValueb = getVariablePart mdlWks, 'myStruct.b{1}')
varValuec = getVariablePart mdlWks, 'myStruct.c.Value')

```

## Input Arguments

### **mdlWks** — Target model workspace

Simulink.ModelWorkspace object

Target model workspace, specified as a Simulink.ModelWorkspace object.

### **varName.Property** — Name of target variable property

character vector

Name of the target variable property, specified as a character vector.

Example: 'myVariable.Property'

Data Types: char | string

### **varValue** — Value to assign to variable property

valid value

Value to assign to the value property, specified as a valid value. For example, you can specify a literal number, a structure, or an expression that evaluates to a valid value.

If you specify the name of a handle object, such as a Simulink.Parameter object, use the copy function to create a separate copy of the object.

Example: 5.12

Example: struct('a',5.12,'b',7.22)

Example: Simulink.Parameter(5.12)

Example: copy(myExistingParameterObject)

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical | char | string | struct | table | cell | categorical | datetime | duration | calendarDuration | fi

Complex Number Support: Yes

Simulink.ModelWorkspace

# whos

**Package:** Simulink

Return list of variables in the model workspace of a model

## Syntax

```
varList = whos mdlWks)
```

## Description

`varList = whos(mdlWks)` returns a list of the variables in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

## Examples

### Return List of Variables in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create some variables in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
assignin(mdlWks, 'myOtherVar', 7.22)
```

Display a list of the variables in the model workspace.

```
whos(mdlWks)
```

Name	Size	Bytes	Class	Attributes
myOtherVar	1x1	8	double	
myVar	1x1	8	double	

## Input Arguments

**mdlWks** — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

## Output Arguments

### **varList** — List of variables

nested structure array

List of variables, returned as a nested structure array. For details about the information in the list, see whos.

## Version History

Introduced before R2006a

### See Also

Simulink.ModelWorkspace

# Simulink.NumericType

Specify floating-point, integer, or fixed-point data type

## Description

Use a `Simulink.NumericType` object to set and share numeric data types for signal, state, and parameter data in a model.

- 1 Create an instance of this class in the MATLAB base workspace, a model workspace, or a data dictionary. To create a numeric type in a model workspace, you must clear the **Is alias** property.
- 2 Set the properties of the object to create a custom floating point, integer, or fixed point data type.
- 3 Assign the data type to all signals and parameters of your model that you want to conform to the data type.

Assigning a data type in this way allows you to change the data types of the signals and parameters in your model by changing the properties of the object that describe them. You do not have to change the model itself.

To rename a data type in a model and in the code that you generate from a model (by generating a `typedef` statement), you can use a `Simulink.AliasType` object.

## Creation

You can create a `Simulink.NumericType` object several ways.

- Interactively create a `Simulink.NumericType` object using the **Type Editor** or **Model Explorer**.
- Programmatically create a `Simulink.NumericType` object using the `Simulink.NumericType` function described here.

## Syntax

```
typeObj = Simulink.NumericType
```

### Description

`typeObj = Simulink.NumericType` returns a `Simulink.NumericType` object with default property values.

## Properties

### Bias — Bias for slope and bias scaling

0 (default) | real number

Bias for slope and bias scaling of a fixed-point data type (Fixed-Point Designer), specified as a real number.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

Example: 3

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

### DataScope — Specification to generate or import type definition in the generated code

'Auto' (default) | 'Exported' | 'Imported'

Specification to generate or import the type definition (`typedef`) in the generated code (Simulink Coder), specified as 'Auto', 'Exported', or 'Imported'.

The table shows the effect of each option.

Value	Action
'Auto' (default)	If no value is specified for <code>HeaderFile</code> , export the type definition to <code>model_types.h</code> . <code>model</code> is the model name. If a value is specified for <code>HeaderFile</code> , import the data type definition from the specified header file.
'Exported'	Export the data type definition to a header file, which can be specified in the <code>HeaderFile</code> property. If no value is specified for <code>HeaderFile</code> , the header file name defaults to <code>type.h</code> . <code>type</code> is the data type name.
'Imported'	Import the data type definition from a header file, which can be specified in the <code>HeaderFile</code> property. If no value is specified for <code>HeaderFile</code> , the header file name defaults to <code>type.h</code> . <code>type</code> is the data type name.

Set the data scope to `Imported` or `Exported` to avoid potential MISRA C:2012 violations.

For more information, see “Control File Placement of Custom Data Types” (Embedded Coder).

### DataTypeMode — Mode of numeric data type

'Double' (default) | 'Single' | 'Half' | 'Boolean' | 'Fixed-point: unspecified scaling' | 'Fixed-point: binary point scaling' | 'Fixed-point: slope and bias scaling'

Mode of the numeric data type, specified as one of these character vectors:

- 'Double' — Same as the MATLAB `double` type.
- 'Single' — Same as the MATLAB `single` type.
- 'Half' — Half-precision floating-point type.
- 'Boolean' — Same as the MATLAB `boolean` type.
- 'Fixed-point: unspecified scaling' — A fixed-point data type with unspecified scaling.
- 'Fixed-point: binary point scaling' — A fixed-point data type with binary-point scaling.
- 'Fixed-point: slope and bias scaling' — A fixed-point data type with slope and bias scaling.

Selecting a half-precision or fixed-point data type mode can, depending on the other dialog box options that you select, cause the model to run only on systems that have a Fixed-Point Designer license.

Data Types: char

### **DataTypeOverride — Data type override mode**

'Inherit' (default) | 'Off'

Data type override mode, specified as 'Inherit' or 'Off'.

- If you specify 'Inherit', the data type override setting for the context in which this numeric type is used (block, signal, Stateflow chart in Simulink) applies to this numeric type.
- If you specify 'Off', data type override does not apply to this numeric type.

For more information about data type override, see “Control Data Type Override”.

Data Types: char

### **Description — Custom description of data type**

' ' (empty character vector) (default) | character vector

Custom description of the data type, specified as a character vector.

Example: 'This is a floating-point data type.'

Data Types: char

### **FixedExponent — Exponent for binary point scaling**

0 (default) | real number

Exponent for binary point scaling, specified as a real number. Setting this property causes Simulink software to set the `FractionLength` and `Slope` properties accordingly, and vice versa. This property applies only if the `DataTypeMode` is `Fixed-point: binary point scaling` or `Fixed-point: slope and bias scaling`.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

This property must be set programmatically.

Example: -8

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical

### **FractionLength — Bit length of the fractional portion of a fixed-point number**

0 (default) | real integer

Bit length of the fractional portion of a fixed-point number (Fixed-Point Designer), specified as a real integer. This property equals `-FixedExponent`. Setting this property causes Simulink software to set the `FixedExponent` property accordingly, and vice versa.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

Example: 8

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical

**HeaderFile — Name of header file that contains type definition in the generated code**

'' (empty character vector) (default) | character vector

Name of the header file that contains the type definition (typedef) in the generated code, specified as a character vector.

If this property is specified, the specified name is used during code generation for importing or exporting. If this property is empty, the value defaults to `type.h` if `DataScope` equals 'Imported' or 'Exported', or defaults to `model_types.h` if `DataScope` equals 'Auto'.

By default, the generated `#include` directive uses the preprocessor delimiter `"` instead of `<` and `>`. To generate the directive `#include <myTypes.h>`, specify `HeaderFile` as `'<myTypes.h>'`.

For more information, see “Control File Placement of Custom Data Types” (Embedded Coder).

Example: 'myHdr.h'

Example: 'myHdr'

Example: 'myHdr.hpp'

Data Types: char

**IsAlias — Specification to create data type alias using object name**

false (default) | true

Specification to create a data type alias by using the name of the object, specified as `true` (yes) or `false` (no).

If you specify `true`, the object acts as a data type alias in a similar manner to a `Simulink.AliasType` object. For more information, see “Control Data Type Names in Generated Code” (Embedded Coder).

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical

**Signedness — Signedness of fixed-point data type**

'Signed (default) | 'Unsigned' | 'Auto'

Signedness of a fixed-point data type (Fixed-Point Designer), specified as 'Signed' (signed), 'Unsigned' (unsigned), or 'Auto' (inherit signedness).

Data Types: char

**SignednessBool — Signedness of fixed-point data type**

false | true

Signedness of a fixed-point data type (Fixed-Point Designer), specified as a Boolean.

Data Types: logical

**Slope — Slope for slope and bias scaling of fixed-point data type**

2^0 (default) | real number

Slope for slope and bias scaling of a fixed-point data type (Fixed-Point Designer), specified as a real number.

This property equals `SlopeAdjustmentFactor * 2^FixedExponent`. If `SlopeAdjustmentFactor` is 1.0, Simulink software displays the value of this field as

$2^{\text{SlopeAdjustmentFactor}}$ . Otherwise, it displays it as a numeric value. Setting this property causes Simulink software to set the `FixedExponent` and `SlopeAdjustmentFactor` properties accordingly, and vice versa.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

This property appears only if `DataTypeMode` is `Fixed-point: slope and bias scaling`.

Example: 5.2

Example:  $2^9$

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

### **SlopeAdjustmentFactor — Slope for slope and bias scaling of fixed-point data type**

1 (default) | real number

Slope for slope and bias scaling of a fixed-point data type (Fixed-Point Designer), specified as a real number in the range [1, 2).

Setting this property causes Simulink software to adjust the `Slope` property accordingly, and vice versa. This property applies only if `DataTypeMode` is `Fixed-point: slope and bias scaling`.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

This property must be set programmatically.

Example: 1.7

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

### **WordLength — Word size of fixed-point or integer data type**

16 (default) | integer

Word size of a fixed-point (Fixed-Point Designer) or integer data type, specified as an integer number of bits.

This property appears only if `DataTypeMode` is `Fixed-point`.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

Example: 8

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

## **Object Functions**

<code>isboolean</code>	Determine whether numeric type represents the Boolean data type <code>boolean</code>
<code>isdouble</code>	Determine whether numeric type represents the double-precision, floating-point data type <code>double</code>
<code>isfixed</code>	Determine whether numeric type represents a fixed-point data type

<code>isfloat</code>	Determine whether numeric type represents a floating-point data type
<code>isscalingbinarypoint</code>	Determine whether fixed-point numeric type has binary-point scaling
<code>isscalingslopebias</code>	Determine whether numeric type represents a fixed-point data type with slope-and-bias scaling
<code>isscalingunspecified</code>	Determine whether numeric type represents a data type with unspecified scaling
<code>issingle</code>	Determine whether numeric type represents the single-precision, floating-point data type <code>single</code>
<code>ishalf</code>	Determine whether numeric type represents the half-precision, floating-point data type <code>half</code>

## Examples

### Share a Data Type Between Separate Algorithms, Data Paths, Models, and Bus Elements

See “Share a Data Type Between Separate Algorithms, Data Paths, Models, and Bus Elements”.

## Version History

Introduced before R2006a

## Extended Capabilities

### C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

When you select the **Is alias** property, a `Simulink.NumericType` object appears in the generated code as a `typedef` statement. The generated code uses the named type to define and declare data (variables).

### Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

# isboolean

**Package:** Simulink

Determine whether numeric type represents the Boolean data type `boolean`

## Syntax

```
indication = isboolean(numericType)
```

## Description

`indication = isboolean(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents the Boolean data type `boolean` and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

## Input Arguments

**numericType — Target numeric type**

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

## Output Arguments

**indication — Indication of whether target object represents boolean**

1 | 0

Indication of whether the target object represents `boolean`, returned as 1 (true) or 0 (false).

## Version History

**Introduced in R2010b**

## See Also

`Simulink.NumericType`

# isdouble

**Package:** Simulink

Determine whether numeric type represents the double-precision, floating-point data type `double`

## Syntax

```
indication = isdouble(numericType)
```

## Description

`indication = isdouble(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents the double-precision, floating-point data type `double` and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

## Input Arguments

**numericType — Target numeric type**

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

## Output Arguments

**indication — Indication of whether target object represents double**

1 | 0

Indication of whether the target object represents double, returned as 1 (true) or 0 (false).

## Version History

**Introduced in R2010b**

## isfixed

**Package:** Simulink

Determine whether numeric type represents a fixed-point data type

### Syntax

```
indication = isfixed(numericType)
```

### Description

`indication = isfixed(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents a fixed-point data type and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

### Input Arguments

**numericType — Target numeric type**

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

### Output Arguments

**indication — Indication of whether target object represents a fixed-point type**

1 | 0

Indication of whether the target object represents a fixed-point type, returned as 1 (true) or 0 (false).

## Version History

**Introduced in R2010b**

# isfloat

**Package:** Simulink

Determine whether numeric type represents a floating-point data type

## Syntax

```
indication = isfloat(numericType)
```

## Description

`indication = isfloat(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents a floating-point data type such as `double`, `single`, or `half`, and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

## Input Arguments

**numericType** — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

## Output Arguments

**indication** — Indication of whether target object represents a floating-point type

1 | 0

Indication of whether the target object represents a floating-point type, returned as 1 (true) or 0 (false).

## Version History

**Introduced in R2010b**

## See Also

# ishalf

**Package:** Simulink

Determine whether numeric type represents the half-precision, floating-point data type `half`

## Syntax

```
indication = ishalf(numericType)
```

## Description

`indication = ishalf(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents the half-precision, floating-point data type `half` and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

## Input Arguments

**numericType — Target numeric type**

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

## Output Arguments

**indication — Indication of whether target object represents half**

1 | 0

Indication of whether the target object represents `half`, returned as 1 (true) or 0 (false).

## Version History

**Introduced in R2020b**

# isscalingbinarypoint

**Package:** Simulink

Determine whether fixed-point numeric type has binary-point scaling

## Syntax

```
indication = isscalingbinarypoint(numericType)
```

## Description

`indication = isscalingbinarypoint(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents a fixed-point data type with binary-point scaling and 0 (false) otherwise. A numeric type object can use binary-point scaling if you explicitly specify it or if you specify trivial slope-and-bias scaling (the slope is an integer power of two and the bias is zero).

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

## Input Arguments

**numericType** — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

## Output Arguments

**indication** — Indication of whether target object represents fixed-point type with binary-point scaling

1 | 0

Indication of whether the target object represents a fixed-point type with binary-point scaling, returned as 1 (true) or 0 (false).

## Version History

**Introduced in R2010b**

## See Also

# isscalingslopebias

**Package:** Simulink

Determine whether numeric type represents a fixed-point data type with slope-and-bias scaling

## Syntax

```
indication = isscalingslopebias(numericType)
```

## Description

`indication = isscalingslopebias(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents a fixed-point data type with nontrivial slope-and-bias scaling and 0 (false) otherwise. A slope-and-bias fixed-point type has trivial scaling if the slope is an integer power of two and the bias is zero.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

## Input Arguments

**numericType** — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

## Output Arguments

**indication** — Indication of whether target object represents fixed-point type with slope-and-bias scaling

1 | 0

Indication of whether the target object represents a fixed-point type with nontrivial slope-and-bias scaling, returned as 1 (true) or 0 (false).

## Version History

Introduced in R2010b

## See Also

# isscalingunspecified

**Package:** Simulink

Determine whether numeric type represents a data type with unspecified scaling

## Syntax

```
indication = isscalingunspecified(numericType)
```

## Description

`indication = isscalingunspecified(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents a fixed-point or scaled double data type with unspecified scaling and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

## Input Arguments

**numericType** — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

## Output Arguments

**indication** — Indication of whether target object represents a type with unspecified scaling

1 | 0

Indication of whether the target object represents a type with unspecified scaling, returned as 1 (true) or 0 (false).

## Version History

**Introduced in R2010b**

# issingle

**Package:** Simulink

Determine whether numeric type represents the single-precision, floating-point data type `single`

## Syntax

```
indication = issingle(numericType)
```

## Description

`indication = issingle(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents the single-precision, floating-point data type `single` and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

## Input Arguments

**numericType — Target numeric type**

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

## Output Arguments

**indication — Indication of whether target object represents single**

1 | 0

Indication of whether the target object represents `single`, returned as 1 (true) or 0 (false).

# Simulink.op.ModelOperatingPoint

Complete information that represents model operating point in simulation

## Description

A `Simulink.op.ModelOperatingPoint` object contains a complete representation of a model operating point that you can use to specify the initial state for a simulation. For example, when you run a set of simulations for a model of a system that has a startup phase or initialization behavior, you can simulate the model through the end of the startup or initialization phase once, save the model operating point, then run a set of simulations that use the operating point as the initial state. If you do not modify the model, simulating a model using a `Simulink.op.ModelOperatingPoint` object as the initial state produces the same results as a simulation with no initial state specified.

The operating point for a model represents the model state in simulation, including logged block states, hidden block states, the state of the solver and execution engine, and output values for some blocks. For more information, see “Use Model Operating Point for Faster Simulation Workflow”.

## Creation

A model configured to save the final operating point creates a `Simulink.op.ModelOperatingPoint` object when the simulation completes or when you pause or stop the simulation. To configure a model to save the final operating point:

- 1 On the **Modeling** tab, click **Model Settings**.
- 2 In the Configuration Parameters dialog box, select **Data Import/Export**.
- 3 Select **Final states** and **Save final operating point**.

By default, the `Simulink.op.ModelOperatingPoint` object is saved using a variable called `xFinal`. To save the operating point using a different variable name, specify the variable name you want to use in the **Final states** text box.

When you return simulation results using a single simulation output, the `Simulink.op.ModelOperatingPoint` object is returned as part of the `Simulink.SimulationOutput` object that contains all the simulation data.

## Properties

### **description** — Description of saved operating point

string | character vector

Description of saved operating point, specified as a string or a character vector. The `ModelOperatingPoint` object has a default description that includes the name of the model and the simulation time at which the operating point was saved.

Example: Operating point of the model 'vdp' at simulation time  
3.2137655751098118

**Tips**

The simulation time at which the model operating point was saved is also stored in the `snapshotTime` property.

**LoggedStates — Operating point information for built-in blocks**

`Simulink.SimulationData.Dataset` object | structure

Operating point information for built-in blocks, specified as a `Simulink.SimulationData.Dataset` object or a structure.

The format of the data in the `loggedStates` property for a `ModelOperatingPoint` object created from simulation depends on the format used for logging states and output data. To configure the format for logging states and outputs, use the Configuration Parameters dialog box. On the **Modeling** tab, click **Model Settings**. Then, on the **Data Import/Export** pane, select a value for the **Format** parameter.

Format parameter value	Format of loggedStates property value
Dataset	<code>Simulink.SimulationData.Dataset</code> object
<ul style="list-style-type: none"> <li>• Structure with time</li> <li>• Structure</li> <li>• Array</li> </ul>	Structure that contains block states data

**Tips**

- The `loggedStates` property contains the operating point information for built-in blocks and S-functions that do not implement custom operating point behavior. To access or modify the operating point information for a Stateflow chart, a MATLAB System block, or an S-function with a custom operating point implementation, use the `get` and `set` functions.
- Not all operating point information for built-in blocks is exposed in the `loggedStates` property for viewing or editing. For example, the `loggedStates` property does not include operating point information for:
  - Blocks inside For Each subsystems
  - Simscape blocks
  - Blocks inside referenced models that execute in accelerator mode
- You cannot change the format for the data in the `loggedStates` property after a `ModelOperatingPoint` object is created.

**snapshotTime — Simulation time at which operating point was saved**

double

This property is read-only.

Simulation time at which operating point was saved, returned as a double.

**startTime — Start time of simulation that created operating point**

double

This property is read-only.

Start time of simulation that created operating point, returned as a double.

## Object Functions

`get` Get operating point information for Stateflow chart, MATLAB System block, or S-function  
`set` Set operating point information for Stateflow chart, MATLAB System block, or S-function

## Examples

### Save and Restore Model Operating Point

Open the model `sldemo_tonegen`.

```
model = "sldemo_tonegen";
open_system(model);
```

Create a `Simulink.SimulationInput` object to specify parameter values to use in simulation.

```
simIn = Simulink.SimulationInput(model);
```

Configure the simulation to stop after ten seconds and save the final operating point in a variable named `finalOP`.

```
simIn = setModelParameter(simIn,"StopTime","10",...
 "SaveFinalState","on","SaveOperatingPoint","on",...
 "FinalStateName","finalOP");
```

Simulate the model using the settings configured on the `SimulationInput` object.

```
out = sim(simIn);
```

Access the saved operating point, returned as part of the single `Simulink.SimulationOutput` object.

```
finalOP = out.finalOP
```

```
finalOP =
 Simulink.op.ModelOperatingPoint

 Operating point of the model 'sldemo_tonegen' at simulation time 10.
```

#### Properties

```
loggedStates
description
startTime (Read-only)
snapshotTime (Read-only)
```

#### Methods

```
get
set
```

Create a `SimulationInput` object to configure another simulation that uses the operating point saved from the first simulation.

```
simIn2 = Simulink.SimulationInput(model);
```

Configure the model to simulate to a stop time of twenty seconds.

```
simIn2 = setModelParameter(simIn2, "StopTime", "20");
```

Use the `setInitialState` function to specify the initial state for the simulation using the `Simulink.op.ModelOperatingPoint` object saved from the first simulation.

```
simIn2 = setInitialState(simIn2, finalOP);
```

Simulate the model from the initial operating point.

```
out2 = sim(simIn2);
```

## Tips

When you want to save an operating point from a simulation, disable **Block reduction** before simulating the model.

## Version History

**Introduced in R2019a**

# get

**Package:** Simulink.op

Get operating point information for Stateflow chart, MATLAB System block, or S-function

## Syntax

```
op = get(modelOP,blockPath)
```

## Description

`op = get(modelOP,blockPath)` returns the operating point information `op` for the model element at the specified path `blockPath`. Use the `get` function to access operating point information for:

- Stateflow charts
- MATLAB System blocks
- S-functions with custom operating point implementation

To access the state for a built-in block, use the `loggedStates` property of the `Simulink.op.ModelOperatingPoint` object.

## Examples

### Get Operating Point for Stateflow Chart

To get the operating point for a Stateflow chart that is inside a referenced model, specify the full path to the chart relative to the top model.

```
model = 'sldemo_fuelsys_dd';
opt = struct('SaveFinalState','on','SaveOperatingPoint','on','StopTime','1');
simOut = sim(model,opt);
modelOp = simOut.xFinal;
blockPath = 'sldemo_fuelsys_dd/Fuel Rate Controller|sldemo_fuelsys_dd_controller/control_logic';
chartOp = get(modelOp,blockPath)
```

## Input Arguments

### modelOP — Model operating point

`Simulink.op.ModelOperatingPoint` object

Model operating point, specified as a `Simulink.op.ModelOperatingPoint` object.

### blockPath — Path to model element whose operating point you want to access

string | character vector

Path to model element whose operating point you want to access, specified as a string or a character vector.

You cannot access or modify operating point information for Stateflow charts, MATLAB System blocks, or S-functions inside referenced models simulated using accelerator mode.

## Output Arguments

### **op** — Element operating point

Stateflow.op.BlockOperatingPoint object | S-function operating point | MATLAB System block operating point

Element operating point, returned as a `Stateflow.op.BlockOperatingPoint` object, an S-function operating point, or a MATLAB System block operating point.

### Tips

- For more information about working with operating points for Stateflow charts, see “Save and Restore Operating Points for Stateflow Charts” (Stateflow).
- Use the `ssSetOperatingPointVisibility` function to specify whether operating point information for an S-function is accessible from the `ModelOperatingPoint` object.

## Version History

Introduced in R2019a

# set

**Package:** Simulink.op

Set operating point information for Stateflow chart, MATLAB System block, or S-function

## Syntax

```
set(modelOP,blockPath,op)
```

## Description

`set(modelOP,blockPath,op)` sets the operating point `op` for the model element at the specified path `blockPath`. Use the `set` function to specify operating point information for:

- Stateflow charts
- MATLAB System blocks
- S-functions with custom operating point implementation

To modify the operating point information for a built-in block, use the `loggedStates` property for the `Simulink.op.ModelOperatingPoint` object.

## Examples

### Set Operating Point for Stateflow Chart

Specify the operating point for the Stateflow chart 'mymodel/chart' as the contents of the variable `newChartOpPoint`.

```
newOpPoint = set(myOpPoint,'mymodel/chart',newChartOpPoint)
```

## Input Arguments

### modelOP — Model operating point

`Simulink.op.ModelOperatingPoint` object

Model operating point, specified as a `Simulink.op.ModelOperatingPoint` object.

### blockPath — Path to element whose operating point you want to modify

string | character vector

Path to element whose operating point you want to modify, specified as a string or a character vector.

You cannot access or modify operating point information for Stateflow charts, MATLAB System blocks, or S-functions inside model references that execute in accelerator mode.

### op — Operating point information to set

`Stateflow.op.BlockOperatingPoint` object | S-function operating point | MATLAB System block operating point

Operating point information to set, specified as a `Stateflow.op.BlockOperatingPoint` object, an S-function operating point, or a MATLAB System block operating point.

**Tips**

- For more information about working with operating points for Stateflow charts, see “Save and Restore Operating Points for Stateflow Charts” (Stateflow).
- Use the `ssSetOperatingPointVisibility` function to specify whether operating point information for an S-function is accessible from the `ModelOperatingPoint` object.

# Simulink.Parameter

Store, share, and configure parameter values

## Description

Create a `Simulink.Parameter` object to set the value of one or more block parameters in a model, such as the **Gain** parameter of a Gain block. You create the object in a workspace or in a data dictionary. Set the parameter value in the object, then reference the object from the block.

Use a `Simulink.Parameter` object to:

- Share a value among multiple block parameters.
- Represent an engineering constant or a tunable calibration parameter.
- Separate a parameter value from its data type and other properties.
- Configure parameter data for code generation.

The `Value` property of the object stores the parameter value. To use the object in a model, set the value of a block parameter to an expression that includes the name of the object. Omit the `Value` property from the expression. For more information, see “Use Parameter Objects”.

For more information about block parameters, see “Set Block Parameter Values” and “How Generated Code Stores Internal Signal, State, and Parameter Data” (Simulink Coder).

## Creation

Create a `Simulink.Parameter` object:

- Directly from a block dialog box or the Property Inspector. See “Create, Edit, and Manage Workspace Variables”.
- By using the Model Data Editor. Inspect the **Parameters** tab. Right-click the row that contains a variable and from the context menu, select **Convert to parameter object**.
- By using the Model Explorer. See “Create Data Objects from Built-In Data Class Package Simulink”.
- By using the `Simulink.Parameter` function described below.

## Syntax

```
paramObj = Simulink.Parameter
paramObj = Simulink.Parameter(paramValue)
```

## Description

`paramObj = Simulink.Parameter` returns a `Simulink.Parameter` object with default property values.

`paramObj = Simulink.Parameter(paramValue)` returns a `Simulink.Parameter` object and initializes the `Value` property to `paramValue`.

## Properties

For information about the properties in the property dialog box of a `Simulink.Parameter` object, see “`Simulink.Parameter` Property Dialog Box”.

### CoderInfo — Specifications for generating code for parameter object

`Simulink.CoderInfo` object

Specifications for generating code for the parameter object, returned as a `Simulink.CoderInfo` object.

This property is read only. Instead, modify the properties of the `Simulink.CoderInfo` object that this property contains.

For example, the `StorageClass` property of the `Simulink.CoderInfo` object determines how Simulink code generation toolboxes allocate memory for the parameter object in the generated code. For more information, see “C Code Generation Configuration for Model Interface Elements” (Simulink Coder) and “Choose Storage Class for Controlling Data Representation in Generated Code” (Embedded Coder).

### Complexity — Numeric complexity of parameter value

'real' (default) | 'complex'

Numeric complexity of the parameter value, specified as either 'real' or 'complex'. For `Simulink.Parameter` objects in the model workspace, use this property to configure the complexity of a model argument. See “Parameterize Instances of a Reusable Referenced Model”.

For numeric values, Simulink derives the complexity from the parameter value that you specify in the `Value` property. In this case, changing the complexity results in error.

When the value is a structure or a mathematical expression, Simulink ignores the specified complexity.

Data Types: char

### DataType — Data type of parameter value

'auto' (default) | character vector

Data type of the parameter value in the `Value` property, specified as 'auto' or a character vector. When you simulate the model or generate code, Simulink casts the value to the specified data type.

If you specify 'auto', the default setting, the parameter object uses the same data type as the block parameters that use the object. See “Reduce Maintenance Effort with Data Type Inheritance”.

When you set the `Value` property to something other than a double number, the object typically sets the `DataType` property based on the value of the `Value` property. For example, when you set the `Value` property to `int8(5)`, the object sets the value of the `DataType` property to 'int8'.

To explicitly specify a built-in data type (see “Data Types Supported by Simulink”), specify one of these options:

- 'double'
- 'single'
- 'half'
- 'int8'
- 'uint8'
- 'int16'
- 'uint16'
- 'int32'
- 'uint32'
- 'int64'
- 'uint64'
- 'boolean'

To specify a fixed-point data type, use the `fixdt` function. For example, specify `'fixdt(1,16,5)'`.

If you use a `Simulink.AliasType` or `Simulink.NumericType` object to create and share custom data types in your model, specify the name of the object.

To specify an enumerated data type, use the name of the type preceded by `Enum:`. For example, specify `'Enum: myEnumType'`.

When you store a structure or array of structures in the `Value` property of the object, the object sets the `DataType` property to `'struct'`. To specify a `Simulink.Bus` object as the data type, use the name of the bus object preceded by `Bus:`. For example, specify `'Bus: myBusObject'`.

Example: `'auto'`

Example: `'int8'`

Example: `'fixdt(1,16,5)'`

Example: `'myAliasTypeObject'`

Example: `'Enum: myEnumType'`

Example: `'Bus: myBusObject'`

Data Types: char

### **Description — Custom description of parameter object**

`''` (default) | character vector

Custom description of the parameter object, specified as a character vector. Use this property to document the significance that the parameter object has in your algorithm.

If you have an Embedded Coder license, you can configure this description to appear in the generated code as a comment. See Simulink data object descriptions (Embedded Coder).

Example: `'This parameter represents the maximum rotation speed of the engine.'`

Data Types: char

### **Dimensions — Dimensions of parameter value**

`[0 0]` (default) | row vector | character vector

Dimensions of the value stored in the `Value` property, returned as a row vector or specified as a character vector. When the `Value` property is empty (set to `[]`), you can configure the `Dimensions`. Otherwise, the property is derived from `Value`.

When you set the `Value` property of the object, the object sets the value of the `Dimensions` property to a `double` row vector. The vector is the same vector that the `size` function returns.

If you are configuring the object as a model argument, and you intend to provide a value for the object elsewhere in the parent model reference hierarchy, you can leave the `Value` property empty (set to `[]`) and set the `Dimensions` and `Data Type` properties explicitly. See “Parameterize Instances of a Reusable Referenced Model”.

To use symbolic dimensions, specify a character vector. See “Implement Symbolic Dimensions for Array Sizes in Generated Code” (Embedded Coder).

Example: `[1 3]`

Example: `'[1 myDimParam]'`

Data Types: `double` | `char`

### **Max — Maximum value of parameter**

`[]` (default) | real `double` scalar

Maximum value that the `Value` property of the object can store, specified as a real `double` scalar.

The default value is empty, which means the parameter value does not have a maximum.

If you store a complex number in the `Value` property, the `Max` property applies separately to the real and imaginary parts.

If you store a structure in the `Value` property, the object ignores the `Max` property. Instead, use a `Simulink.Bus` object as the data type of the parameter object and specify a maximum value for each field by using the elements of the bus object. See “Control Field Data Types and Characteristics by Creating Parameter Object”.

If `Value` is greater than the maximum value or if the maximum value is outside the range of the object data type, Simulink generates a warning. When updating the diagram or starting a simulation, Simulink generates an error.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Example: `5.32`

Data Types: `double`

### **Min — Minimum value of parameter**

`[]` (default) | real `double` scalar

Minimum value that the `Value` property of the object can store, specified as a real `double` scalar.

The default value is empty, which means the parameter value does not have a minimum.

If you store a complex number in the `Value` property, the `Min` property applies separately to the real and imaginary parts.

If you store a structure in the `Value` property, the object ignores the `Min` property. Instead, use a `Simulink.Bus` object as the data type of the parameter object and specify a minimum value for each field by using the elements of the bus object. See “Control Field Data Types and Characteristics by Creating Parameter Object”.

If `Value` is less than the minimum value or if the minimum value is outside the range of the object data type, Simulink generates a warning. When updating the diagram or starting a simulation, Simulink generates an error.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”

Example: `-0.92`

Data Types: `double`

### Unit — Physical unit of parameter value

`''` (default) | character vector

Physical unit of parameter value, specified as a character vector that describes a valid unit. For more information, see “Unit Specification in Simulink Models”.

Example: `'degC'`

Data Types: `char`

### Value — Value to use in block parameters

`[]` (default) | numeric | boolean | enum | structure | scalar | array | <mathematical expression>

Value to use in block parameters, specified as any of these valid values:

- Numeric value
- Boolean value
- Instance of enumerated type
- Structure
- Scalar or array
- Mathematical expression (see “Set Variable Value by Using a Mathematical Expression”)

If you use a `Simulink.Parameter` object to set the block parameter value in a reusable referenced model, you can compile and simulate the model as a referenced model with the value for the object left empty (`Value` set to `''`) as long as you provide an explicit value somewhere in the parent model reference hierarchy. In this case, you cannot simulate the model directly. When the value is empty, you must provide the `Data Type` and `Dimensions` for the object. Although you have specified an empty value, Simulink still synthesizes a `Value` by using one of these:

- `Max`.
- `Min`, if you have not specified `Max`.
- `1`, if you have not specified either `Min` or `Max`.

See “Parameterize Instances of a Reusable Referenced Model”.

You can also use MATLAB syntax to specify the value.

Example Expression	Description
15.23	Specifies a scalar value
[3 4; 9 8]	Specifies a matrix
3+2i	Specifies a complex value
struct('A',20,'B',5)	Specifies a structure with two fields, A and B, with double-precision values 20 and 5.  Organize block parameters into structures (see “Organize Related Block Parameter Definitions in Structures”) or initialize the signal elements in a bus (see “Specify Initial Conditions for Bus Elements”).
slexpr('myVar + myOtherVar')	Specifies the expression myVar + myOtherVar where myVar and myOtherVar are other MATLAB variables or parameter objects. Simulink preserves this mathematical relationship between the object and the variables.

To use a `Simulink.Parameter` object to store a value of a particular numeric data type, specify the ideal value with the `Value` property and control the type with the `DataType` property.

If you set the `Value` property by using a typed expression such as `single(32.5)`, the `DataType` property changes to reflect the new type. A best practice is to use an expression that is not typed to avoid accumulating numerical error through repeated quantizations or data type saturation, especially for fixed-point data types.

Example: 3.15

Example: 1.2 + 3.2i

Example: true

Example: myEnumType.myEnumValue

Example: struct('field1',15,'field2',7.32)

Example: slexpr('myVar + myOtherVar')

Data Types: double | single | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical | struct | fi | enum

Complex Number Support: Yes

## Examples

### Use Parameter Object to Set Value of Gain Parameter

- 1 At the command prompt, create a `Simulink.Parameter` object.

```
myParam = Simulink.Parameter;
```

- 2 Assign a numeric value to the `Value` property.

```
myParam.Value = 15.23;
```

- 3 Specify the minimum and maximum values the parameter can take with the `Min` and `Max` properties.

```
myParam.Min = 10.11;
myParam.Max = 25.27;
```

- 4 Open a new Simulink model. Add a Gain block and set its **Gain** parameter to myParam. During simulation, the **Gain** parameter uses the value 15.23.

### Change Value Stored by Parameter Object

- 1 At the command prompt, create a Simulink.Parameter object that stores the value 2.52.

```
myParam = Simulink.Parameter(2.52);
```

- 2 Change the value by accessing the Value property of the object. This technique preserves the values of the other properties of the object.

```
myParam.Value = 1.13;
```

### Create Parameter Object with Specific Numeric Data Type

To reduce model maintenance, you can leave the `DataType` property at its default value, `auto`. The parameter object acquires a data type from the block parameter that uses the object.

To reduce the risk of the data type changing when you make changes to signal data types and other data types in your model, you can explicitly specify a data type for the parameter object. For example, when you generate code that exports parameter data to your custom code, explicitly specify a data type for the object.

- 1 At the MATLAB command prompt, create a Simulink.Parameter object that stores the value 18.25.

```
myParam = Simulink.Parameter(18.25);
```

The expression `18.25` returns the number 18.25 with the double-precision, floating-point data type `double`. The `Value` property stores the number 18.25 with double precision.

- 2 Use the `DataType` property to specify the single-precision data type `single`.

```
myParam.DataType = 'single';
```

When you simulate or generate code, the object casts the value of the `Value` property, 18.25, to the data type specified by the `DataType` property, `single`.

### Set Parameter Value to a Mathematical Expression

This example shows how to set the value of a parameter object, `myParam`, to the sum of two other variables, `myVar` and `myOtherVar`. With this technique, when you change the values of the independent variables, Simulink immediately calculates the new value of the parameter object.

- 1 Create the two independent variables.

```
myVar = 5.2;
myOtherVar = 9.8;
```

- 2 Create the parameter object.

```
myParam = Simulink.Parameter;
```

- 3 Set the value of the parameter object to the expression `myVar + myOtherVar`.

```
myParam.Value = slexpr('myVar + myOtherVar')
```

When you simulate or generate code, the expression evaluates to 15.

# Simulink.profiler.Data

Programmatically access Simulink Profiler information

## Description

The `Simulink.profiler.Data` object provides access to simulation profiling metadata.

## Creation

Access the `Simulink.profiler.Data` object from the `SimulationMetadata.TimingInfo` field of the `Simulink.SimulationOutput` object.

## Properties

### **run** — Profiling session identifier

character vector | string scalar

This is a read only property.

Identifier of the profiling session, returned as a character vector or string scalar.

Example: `'vdp @ 21-Nov-2019 13:48:00'`

Data Types: `char` | `string`

### **UserString** — User documentation of profiling session

"" (default) | character vector | string scalar

Use the `UserString` field to document relevant information about the current profiling session

Example: `profilingData.UserString = "Updated gain to reduce chatter.";`

Data Types: `char` | `string`

### **rootUINode** — Block hierarchy of the model

`Simulink.profiler.UINode` object

Block hierarchy of the model, returned as a `Simulink.profiler.UINode` object with the following fields:

Field	Value	Description
<code>totalTime</code>	double	Execution time of the block, as well as its children.
<code>selfTime</code>	double	Execution time of the block, excluding its children
<code>numberOfCalls</code>	double	Number of times the block was executed during the simulation.

Field	Value	Description
children	Simulink.profiler.UINode array	Contents of the current block
path	string scalar	Path of the block relative to the top level of the model.  <b>Note</b> The path of the rootUINode field is the name of the model

A `Simulink.profiler.UINode` object corresponds to a row in the block hierarchy view of the Simulink Profiler.

### rootExecNode — Execution stack of the model

`Simulink.profiler.ExecNode`

Execution phases of the model, returned as a `Simulink.profiler.ExecNode` object with the following fields:

Field	Value	Description
totalTime	double	Execution time of the stack element, as well as its children.
selfTime	double	Execution time of the stack element, excluding its children
numberOfCalls	double	Number of times the stack element was executed during the simulation.
location		Specific phase of the model's execution
children	Simulink.profiler.ExecNode array	Similar tasks corresponding to the execution phase of the parent.
objectPath	string scalar	Path of the model element corresponding to the current element of the execution stack.  <b>Note</b> The <code>objectPath</code> field of the <code>rootExecNode</code> is the name of the model

A `Simulink.profiler.ExecNode` object corresponds to a row in the execution stack view of the Simulink Profiler.

# Simulink.sdi.DiffRunResult

Access run comparison results

## Description

The `Simulink.sdi.DiffRunResult` object provides access to run comparison metadata and comparison results. Use the `getSignalByIndex` function to access the metadata and comparison results for each signal in the run comparison.

## Creation

A `Simulink.sdi.DiffRunResult` object is created when you perform a comparison using the Simulation Data Inspector.

When you compare data using the UI, use the `Simulink.sdi.getCurrentComparison` function to access the results in a `Simulink.sdi.DiffRunResult` object.

Programmatic comparisons using the `Simulink.sdi.compareRuns` function or the `compare` function return a `DiffRunResult` object.

## Properties

### MatlabVersion — Software version used to create object

character vector

This property is read-only.

Version of MATLAB used to create the `DiffRunResult` object, returned as a character vector.

### RunID1 — Baseline run ID

integer

This property is read-only.

Run identifier for the comparison baseline run, returned as an integer.

### RunID2 — ID for run to compare

integer

This property is read-only.

Run identifier of the run to compare, returned as an integer.

### Count — Number of signals compared

integer

This property is read-only.

Number of signals that aligned between the two runs in the comparison, returned as an integer. For more information on how signals are aligned for comparisons, see “Signal Alignment”.

### **DateCreated — Object creation date**

`datetime`

This property is read-only.

Date and time the `Simulink.sdi.DiffRunResult` object was created, returned as a `datetime` object.

Data Types: `datetime`

### **GlobalTolerance — Global tolerance values used for comparison**

`structure`

This property is read-only.

Global tolerance values used for the run comparison, returned as a structure with fields:

- `AbsTol` — Global absolute tolerance used for the run comparison.
- `RelTol` — Global relative tolerance used for the run comparison.
- `TimeTol` — Global time tolerance used for the run comparison.

For more information about how tolerances are used and calculated for comparisons, see “Tolerance Specification”.

### **Summary — Comparison results summary**

`structure`

This property is read-only.

Comparison results summary, returned as a structure with a field for each `Status` a signal comparison result could have. The value of each field indicates the number of signals in the run comparison with the corresponding `Status`.

- `WithinTolerance` — Signal comparison completed, and all data points compared fell within the specified tolerance.
- `OutOfTolerance` — Signal comparison completed, and some data points compared fell outside of the specified tolerance.
- `Unaligned` — Signal from the baseline run did not align with a signal in the run to compare.
- `Empty` — Aligned signal in the baseline run or run to compare contains no data.
- `EmptySynced` — Synchronized signal in the baseline run or run to compare contains no data. An empty synchronized signal can mean that the signals do not overlap or, if you specified the intersection synchronization method, that they included none of the same time points.
- `Canceled` — Signal result not computed because the user canceled the comparison.
- `Pending` — Comparison is in progress and the signal result computation has not started.
- `Processing` — Signal result computation in progress.
- `UnitsMismatch` — The signal units in the baseline run and run to compare do not match.
- `DataTypeMismatch` — The signal data types in the baseline run and run to compare do not match. Only results of comparisons configured to check signal data types can have this status.

- **TimeMismatch** — The signal time vectors in the baseline run and run to compare do not match. Only results of comparisons configured to check signal time vectors can have this status.
- **StartStopMismatch** — The signal start and stop times in the baseline run and run to compare do not match. Only results of comparisons configured to check signal start and stop times can have this status.
- **Unsupported** — The Simulation Data Inspector comparison algorithm does not support this type of signal. For example, signals with data types that lose precision when converted to `double` are not supported.

For more information about alignment, tolerances, and synchronization, see “How the Simulation Data Inspector Compares Data”. For more information about how to configure a comparison to check additional metadata, see `Simulink.sdi.compareRuns`.

### Options — Comparison configuration

`n-by-2` cell array

This property is read-only.

Configuration options used for the comparison, returned as an `n-by-2` cell array. Each row in the cell array corresponds to an option used by the comparison. Every comparison requires that aligned signal units match, so the `Options` property always includes a row to indicate that units must match. Other possible configuration options correspond to these name-value pairs for the `Simulink.sdi.compareRuns` function:

- `DataType`
- `Time`
- `StartStop`
- `StopOnFirstMismatch`

### Status — Status of run comparison

`Completed` | `Canceled` | `Stopped`

This property is read-only.

Status of the run comparison, indicating how the comparison ended, returned as one of the following:

- `Completed` — Comparison finished computing all results
- `Canceled` — Comparison ended because the user canceled the comparison operation in the UI
- `Stopped` — Comparison ended because the comparison detected a mismatch and was configured to stop on the first mismatch

### StopReason — Signal result that stopped the run comparison

`Simulink.sdi.DiffSignalResult`

This property is read-only.

Signal result for signal comparison that caused the run comparison to stop without comparing remaining signals, returned as a `Simulink.sdi.DiffSignalResult` object. The `StopReason` property is empty when the comparison completes without detecting a mismatch and when the comparison is not configured to stop on the first mismatch. You can configure a simulation to stop on the first mismatch using the `Simulink.sdi.compareRuns` function and the `'StopOnFirstMismatch'` name-value pair.

## Object Functions

<code>getResultByIndex</code>	Return signal comparison result
<code>getResultsByName</code>	Return signal comparison results based on signal name
<code>saveResult</code>	Save comparison results to an MLDATX file

## Examples

### Analyze Simulation Data Using Signal Tolerances

You can programmatically specify signal tolerance values to use in comparisons performed using the Simulation Data Inspector. In this example, you compare data collected by simulating a model of an aircraft longitudinal flight control system. Each simulation uses a different value for the input filter time constant and logs the input and output signals. You analyze the effect of the time constant change by comparing results using the Simulation Data Inspector and signal tolerances.

First, load the session file that contains the simulation data.

```
Simulink.sdi.load('AircraftExample.mldatx');
```

The session file contains four runs. In this example, you compare data from the first two runs in the file. Access the `Simulink.sdi.Run` objects for the first two runs loaded from the file.

```
runIDs = Simulink.sdi.getAllRunIDs;
runIDs1 = runIDs(end-3);
runIDs2 = runIDs(end-2);
```

Now, compare the two runs without specifying any tolerances.

```
noTolDiffResult = Simulink.sdi.compareRuns(runIDs1,runIDs2);
```

Use the `getResultByIndex` function to access the comparison results for the `q` and `alpha` signals.

```
qResult = getResultByIndex(noTolDiffResult,1);
alphaResult = getResultByIndex(noTolDiffResult,2);
```

Check the `Status` of each signal result to see whether the comparison result fell within our out of tolerance.

```
qResult.Status
```

```
ans =
 ComparisonSignalStatus enumeration
 OutOfTolerance
```

```
alphaResult.Status
```

```
ans =
 ComparisonSignalStatus enumeration
 OutOfTolerance
```

The comparison used a value of 0 for all tolerances, so the `OutOfTolerance` result means the signals are not identical.

You can further analyze the effect of the time constant by specifying tolerance values for the signals. Specify the tolerances by setting the properties for the `Simulink.sdi.Signal` objects that correspond to the signals being compared. Comparisons use tolerances specified for the baseline signals. This example specifies a time tolerance and an absolute tolerance.

To specify a tolerance, first access the `Signal` objects from the baseline run.

```
runTs1 = Simulink.sdi.getRun(runIDTs1);
qSig = getSignalsByName(runTs1,'q, rad/sec');
alphaSig = getSignalsByName(runTs1,'alpha, rad');
```

Specify an absolute tolerance of 0.1 and a time tolerance of 0.6 for the `q` signal using the `AbsTol` and `TimeTol` properties.

```
qSig.AbsTol = 0.1;
qSig.TimeTol = 0.6;
```

Specify an absolute tolerance of 0.2 and a time tolerance of 0.8 for the `alpha` signal.

```
alphaSig.AbsTol = 0.2;
alphaSig.TimeTol = 0.8;
```

Compare the results again. Access the results from the comparison and check the `Status` property for each signal.

```
tolDiffResult = Simulink.sdi.compareRuns(runIDTs1,runIDTs2);
qResult2 = getResultByIndex(tolDiffResult,1);
alphaResult2 = getResultByIndex(tolDiffResult,2);
```

```
qResult2.Status
```

```
ans =
 ComparisonSignalStatus enumeration
```

```
 WithinTolerance
```

```
alphaResult2.Status
```

```
ans =
 ComparisonSignalStatus enumeration
```

```
 WithinTolerance
```

### Configure Comparisons to Check Metadata

You can use the `Simulink.sdi.compareRuns` function to compare signal data and metadata, including data type and start and stop times. A single comparison may check for mismatches in one or more pieces of metadata. When you check for mismatches in signal metadata, the `Summary` property of the `Simulink.sdi.DiffRunResult` object may differ from a basic comparison because the `Status` property for a `Simulink.sdi.DiffSignalResult` object can indicate the metadata mismatch. You can configure comparisons using the `Simulink.sdi.compareRuns` function for imported data and for data logged from a simulation.

This example configures a comparison of runs created from workspace data three ways to show how the Summary of the DiffSignalResult object can provide specific information about signal mismatches.

### Create Workspace Data

The `Simulink.sdi.compareRuns` function compares time series data. Create data for a sine wave to use as the baseline signal, using the `timeseries` format. Give the `timeseries` the name `Wave Data`.

```
time = 0:0.1:20;
sig1vals = sin(2*pi/5*time);
sig1_ts = timeseries(sig1vals,time);
sig1_ts.Name = 'Wave Data';
```

Create a second sine wave to compare against the baseline signal. Use a slightly different time vector and attenuate the signal so the two signals are not identical. Cast the signal data to the `single` data type. Also name this `timeseries` object `Wave Data`. The Simulation Data Inspector comparison algorithm will align these signals for comparison using the name.

```
time2 = 0:0.1:22;
sig2vals = single(0.98*sin(2*pi/5*time2));
sig2_ts = timeseries(sig2vals,time2);
sig2_ts.Name = 'Wave Data';
```

### Create and Compare Runs in the Simulation Data Inspector

The `Simulink.sdi.compareRuns` function compares data contained in `Simulink.sdi.Run` objects. Use the `Simulink.sdi.createRun` function to create runs in the Simulation Data Inspector for the data. The `Simulink.sdi.createRun` function returns the run ID for each created run.

```
runID1 = Simulink.sdi.createRun('Baseline Run','vars',sig1_ts);
runID2 = Simulink.sdi.createRun('Compare to Run','vars',sig2_ts);
```

You can use the `Simulink.sdi.compareRuns` function to compare the runs. The comparison algorithm converts the signal data to the `double` data type and synchronizes the signal data before computing the difference signal.

```
basic_DRR = Simulink.sdi.compareRuns(runID1,runID2);
```

Check the `Summary` property of the returned `Simulink.sdi.DiffRunResult` object to see the result of the comparison.

```
basic_DRR.Summary
ans = struct with fields:
 OutOfTolerance: 1
 WithinTolerance: 0
 Unaligned: 0
 UnitsMismatch: 0
 Empty: 0
 Canceled: 0
 EmptySynced: 0
 DataTypeMismatch: 0
 TimeMismatch: 0
 StartStopMismatch: 0
```

```
Unsupported: 0
```

The difference between the signals is out of tolerance.

### Compare Runs and Check for Data Type Match

Depending on your system requirements, you may want the data types for signals you compare to match. You can use the `Simulink.sdi.compareRuns` function to configure the comparison algorithm to check for and report data type mismatches.

```
dataType_DRR = Simulink.sdi.compareRuns(runID1,runID2,'DataType','MustMatch');
dataType_DRR.Summary
```

```
ans = struct with fields:
 OutOfTolerance: 0
 WithinTolerance: 0
 Unaligned: 0
 UnitsMismatch: 0
 Empty: 0
 Canceled: 0
 EmptySynced: 0
 DataTypeMismatch: 1
 TimeMismatch: 0
 StartStopMismatch: 0
 Unsupported: 0
```

The result of the signal comparison is now `DataTypeMismatch` because the data for the baseline signal is double data type, while the data for the signal compared to the baseline is single data type.

### Compare Runs and Check for Start and Stop Time Match

You can use the `Simulink.sdi.compareRuns` function to configure the comparison algorithm to check whether the aligned signals have the same start and stop times.

```
startStop_DRR = Simulink.sdi.compareRuns(runID1,runID2,'StartStop','MustMatch');
startStop_DRR.Summary
```

```
ans = struct with fields:
 OutOfTolerance: 0
 WithinTolerance: 0
 Unaligned: 0
 UnitsMismatch: 0
 Empty: 0
 Canceled: 0
 EmptySynced: 0
 DataTypeMismatch: 0
 TimeMismatch: 0
 StartStopMismatch: 1
 Unsupported: 0
```

The signal comparison result is now `StartStopMismatch` because the signals created in the workspace have different stop times.

## Alternatives

You can view and inspect comparison results using the Simulation Data Inspector UI. For more information, see “Compare Simulation Data”.

For software tests, see the `Simulink.sdi.constraints.MatchesSignal` constraint.

## Version History

## Topics

“Inspect and Compare Data Programmatically”

“How the Simulation Data Inspector Compares Data”

“Compare Simulation Data”

## getResultByIndex

**Package:** Simulink.sdi

Return signal comparison result

### Syntax

```
diffSig = getResultByIndex(diffRes,index)
```

### Description

`diffSig = getResultByIndex(diffRes,index)` returns the `Simulink.sdi.DiffSignalResult` object `diffSig` at the specified index in the `Simulink.sdi.DiffRunResult` object, `diffRes`.

### Examples

#### Analyze Simulation Data Using Signal Tolerances

You can programmatically specify signal tolerance values to use in comparisons performed using the Simulation Data Inspector. In this example, you compare data collected by simulating a model of an aircraft longitudinal flight control system. Each simulation uses a different value for the input filter time constant and logs the input and output signals. You analyze the effect of the time constant change by comparing results using the Simulation Data Inspector and signal tolerances.

First, load the session file that contains the simulation data.

```
Simulink.sdi.load('AircraftExample.mldatx');
```

The session file contains four runs. In this example, you compare data from the first two runs in the file. Access the `Simulink.sdi.Run` objects for the first two runs loaded from the file.

```
runIDs = Simulink.sdi.getAllRunIDs;
runIDs1 = runIDs(end-3);
runIDs2 = runIDs(end-2);
```

Now, compare the two runs without specifying any tolerances.

```
noTolDiffResult = Simulink.sdi.compareRuns(runIDs1,runIDs2);
```

Use the `getResultByIndex` function to access the comparison results for the `q` and `alpha` signals.

```
qResult = getResultByIndex(noTolDiffResult,1);
alphaResult = getResultByIndex(noTolDiffResult,2);
```

Check the `Status` of each signal result to see whether the comparison result fell within our out of tolerance.

```
qResult.Status
```

```
ans =
 ComparisonSignalStatus enumeration
```

```
 OutOfTolerance
```

```
alphaResult.Status
```

```
ans =
 ComparisonSignalStatus enumeration

 OutOfTolerance
```

The comparison used a value of 0 for all tolerances, so the `OutOfTolerance` result means the signals are not identical.

You can further analyze the effect of the time constant by specifying tolerance values for the signals. Specify the tolerances by setting the properties for the `Simulink.sdi.Signal` objects that correspond to the signals being compared. Comparisons use tolerances specified for the baseline signals. This example specifies a time tolerance and an absolute tolerance.

To specify a tolerance, first access the `Signal` objects from the baseline run.

```
runTs1 = Simulink.sdi.getRun(runIDTs1);
qSig = getSignalsByName(runTs1,'q, rad/sec');
alphaSig = getSignalsByName(runTs1,'alpha, rad');
```

Specify an absolute tolerance of 0.1 and a time tolerance of 0.6 for the `q` signal using the `AbsTol` and `TimeTol` properties.

```
qSig.AbsTol = 0.1;
qSig.TimeTol = 0.6;
```

Specify an absolute tolerance of 0.2 and a time tolerance of 0.8 for the `alpha` signal.

```
alphaSig.AbsTol = 0.2;
alphaSig.TimeTol = 0.8;
```

Compare the results again. Access the results from the comparison and check the `Status` property for each signal.

```
tolDiffResult = Simulink.sdi.compareRuns(runIDTs1,runIDTs2);
qResult2 = getResultByIndex(tolDiffResult,1);
alphaResult2 = getResultByIndex(tolDiffResult,2);
```

```
qResult2.Status
```

```
ans =
 ComparisonSignalStatus enumeration

 WithinTolerance
```

```
alphaResult2.Status
```

```
ans =
 ComparisonSignalStatus enumeration

 WithinTolerance
```

## Input Arguments

### **diffRes** — Run comparison results

`Simulink.sdi.DiffRunResult` object

Run comparison results that contain the signal result you want to access, specified as a `Simulink.sdi.DiffRunResult` object.

### **index** — Index of signal in run comparison results

integer

Index of signal in run comparison results, specified as an integer.

Example: 2

## Output Arguments

### **diffSig** — Comparison results for signal at specified index

`Simulink.sdi.DiffSignalResult` object

Comparison results for the signal at the specified index, returned as a `Simulink.sdi.DiffSignalResult` object.

## Version History

Introduced in R2012b

### See Also

`Simulink.sdi.DiffRunResult` | `Simulink.sdi.DiffSignalResult` | `getResultsByName`

### Topics

“Inspect and Compare Data Programmatically”

# getResultsByName

**Package:** Simulink.sdi

Return signal comparison results based on signal name

## Syntax

```
diffSig = getResultsByName(diffRes, sigName)
```

## Description

`diffSig = getResultsByName(diffRes, sigName)` returns the signal comparison result with name `sigName` in the run comparison results `diffRes`.

The output of the function `getResultsByName` depends on the signal that is being compared.

- If the result that corresponds to `sigName` is a real, scalar signal, then `diffSig` is a `Simulink.sdi.DiffSignalResult` object.
- If the result that corresponds to `sigName` is a complex signal, a multidimensional signal, or a bus, then `diffSig` is an array of `Simulink.sdi.DiffSignalResult` objects. The size of the array corresponds to characteristics of the comparison result.

## Examples

### Get Comparison Results By Name

Load the Simulation Data Inspector session file `getResultsByNameData`. The file contains data logged from two simulations of the model `getResultsByNameModel`, which logs data for five signals.

```
Simulink.sdi.load("getResultsByNameData.mldatx");
```

Access the run IDs for the two runs loaded from the file.

```
runIDs = Simulink.sdi.getAllRunIDs;
baselineID = runIDs(end-1);
comparedToID = runIDs(end);
```

Compare the two runs.

```
diffResult = Simulink.sdi.compareRuns(baselineID, comparedToID);
```

Use the function `getResultsByName` to access comparison results for the signal `ScalarOut`.

```
compareSig = getResultsByName(diffResult, "ScalarOut")
```

```
compareSig =
 DiffSignalResult with properties:
```

```
 Name: 'ScalarOut'
```

```

 Status: WithinTolerance
 AlignBy: 'Path'
 SignalID1: 5217
 SignalID2: 5137
 MaxDifference: 0
 Sync1: [1x1 timeseries]
 Sync2: [1x1 timeseries]
 Diff: [1x1 timeseries]

```

### Get Comparison Results for Complex Signal

Load the Simulation Data Inspector session file `getResultsByNameData`. The file contains data logged from two simulations of the model `getResultsByNameModel`, which logs data for five signals, including the complex signal `ComplexOut`.

```
Simulink.sdi.load("getResultsByNameData.mldatx");
```

Access the run IDs for the two runs loaded from the file.

```
runIDs = Simulink.sdi.getAllRunIDs;
baselineID = runIDs(end-1);
comparedToID = runIDs(end);
```

Compare the two runs.

```
diffResult = Simulink.sdi.compareRuns(baselineID,comparedToID);
```

Use the function `getResultsByName` to access comparison results for the complex signal `ComplexOut`.

```
compareComplex = getResultsByName(diffResult,"ComplexOut")
```

```
compareComplex=1x2 object
 1x2 DiffSignalResult array with properties:
```

```

 Name
 Status
 AlignBy
 SignalID1
 SignalID2
 MaxDifference
 Sync1
 Sync2
 Diff

```

You can also use the function `getResultsByName` to access comparison results for the real or imaginary parts of the signal by specifying `(real)` or `(imag)` as part of the signal name.

```
compareComplexReal = getResultsByName(diffResult,"ComplexOut (real)")
```

```
compareComplexReal =
 DiffSignalResult with properties:
 Name: 'ComplexOut (real)'
```

```

 Status: WithinTolerance
 AlignBy: 'Path'
 SignalID1: 1932
 SignalID2: 1852
 MaxDifference: 0
 Sync1: [1x1 timeseries]
 Sync2: [1x1 timeseries]
 Diff: [1x1 timeseries]

```

### Get Comparison Results for Nonscalar Signal

Load the Simulation Data Inspector session file `getResultsByNameData`. The file contains data logged from two simulations of the model `getResultsByNameModel`, which logs data for five signals, including two multidimensional signals: `SmallMux` and `LargeMux`.

```
Simulink.sdi.load("getResultsByNameData.mldatx");
```

Access run IDs for the two runs loaded from the file.

```
runIDs = Simulink.sdi.getAllRunIDs;
baselineID = runIDs(end-1);
comparedToID = runIDs(end);
```

Compare the two runs.

```
diffResult = Simulink.sdi.compareRuns(baselineID,comparedToID);
```

Use the function `getResultsByName` to access comparison results for `LargeMux` and `SmallMux`. By default, when you compare runs that contain signals with multidimensional sample values, the Simulation Data Inspector expands the signal to channels and compares the channels. For more information, see “Analyze Multidimensional Signal Data”.

```
compareLargeMux = getResultsByName(diffResult,"LargeMux")
```

```
compareLargeMux=1x5 object
 1x5 DiffSignalResult array with properties:
```

```

 Name
 Status
 AlignBy
 SignalID1
 SignalID2
 MaxDifference
 Sync1
 Sync2
 Diff

```

```
compareSmallMux = getResultsByName(diffResult,"SmallMux")
```

```
compareSmallMux=1x2 object
 1x2 DiffSignalResult array with properties:
```

```

 Name
 Status

```

```

AlignBy
SignalID1
SignalID2
MaxDifference
Sync1
Sync2
Diff

```

You can access comparison results for an element within a multidimensional signal using the index of the element within the logged signal. For example, get comparison results for the fourth element of the `LargeMux` signal.

```
compareElement = compareLargeMux(4)
```

```

compareElement =
 DiffSignalResult with properties:
 Name: 'LargeMux(2)'
 Status: WithinTolerance
 AlignBy: 'Path'
 SignalID1: 4242
 SignalID2: 4246
 MaxDifference: 0
 Sync1: [1x1 timeseries]
 Sync2: [1x1 timeseries]
 Diff: [1x1 timeseries]

```

### Get Comparison Results for Bus

Load the Simulation Data Inspector session file `getResultsByNameData`. The file contains data logged from two simulations of the model `getResultsByNameModel`, which logs data for five signals, including a bus.

```
Simulink.sdi.load("getResultsByNameData.mldatx");
```

Access the run IDs for the two runs loaded from the file.

```

runIDs = Simulink.sdi.getAllRunIDs;
baselineID = runIDs(end-1);
comparedToID = runIDs(end);

```

Compare the two runs.

```
diffResult = Simulink.sdi.compareRuns(baselineID,comparedToID);
```

Use the function `getResultsByName` to access the comparison results for `BusOut`.

```
compareBus = getResultsByName(diffResult,"BusOut")
```

```

compareBus=1x4 object
 1x4 DiffSignalResult array with properties:
 Name
 Status

```

```

AlignBy
SignalID1
SignalID2
MaxDifference
Sync1
Sync2
Diff

```

You can also get comparison results for bus elements. Use the function `getResultsByName` to access the comparison results for the signal `Constant_4` inside the bus `BusOut`.

```
compareConst4 = getResultsByName(diffResult, "BusOut.Constant_4")
```

```

compareConst4 =
 DiffSignalResult with properties:
 Name: 'BusOut.Constant_4'
 Status: WithinTolerance
 AlignBy: 'Path'
 SignalID1: 277
 SignalID2: 197
 MaxDifference: 0
 Sync1: [1x1 timeseries]
 Sync2: [1x1 timeseries]
 Diff: [1x1 timeseries]

```

## Input Arguments

### **diffRes** — Run comparison results

`Simulink.sdi.DiffRunResult` object

Run comparison results that contain the signal result you want to access, specified as a `Simulink.sdi.DiffRunResult` object.

### **sigName** — Name of signal result in run comparison results

string | character vector

Name of the signal in the run comparison results, specified as a character vector or string.

To access a bus element, specify the path to the element through the hierarchy of the bus. For example, to access comparison results for the signal `Sine` inside the bus `BusOut`, specify `sigName` as `"BusOut.Sine"`.

```
sineRes = getResultsByName(diffRes, "BusOut.Sine");
```

To access only the real or imaginary result for a complex signal, append the signal name with either `(real)` or `(imag)`. For example, to access the comparison results for the imaginary part of the complex signal `ComplexOut`, specify `sigName` as `"ComplexOut (imag)"`.

```
imagRes = getResultsByName(diffRes, "ComplexOut (imag)");
```

Data Types: char | string

## Output Arguments

### diffSig — Comparison results for specified name

Simulink.sdi.DiffSignalResult object | array of Simulink.sdi.DiffSignalResult objects

Comparison results for specified name, returned as a Simulink.sdi.DiffSignalResult object or an array of Simulink.sdi.DiffSignalResult objects.

The type of output returned by `getResultsByName` depends on the `sigName` input.

sigName Input	diffSig Result
Uniquely named scalar signal	Simulink.sdi.DiffSignalResult object
One of N scalar signals with the same name	1×N array of Simulink.sdi.DiffSignalResult objects
Complex signal	1×2 array of Simulink.sdi.DiffSignalResult objects that contain the real and imaginary results
Vector or matrix signal with N elements	1×N array of Simulink.sdi.DiffSignalResult objects
Bus	1×N array of Simulink.sdi.DiffSignalResult objects, where N is the number of elements in the bus

---

**Note** If you specify a name for `sigName` that is not in the run comparison results, then the function returns an empty array.

---

## Version History

Introduced in R2022b

# saveResult

**Package:** Simulink.sdi

Save comparison results to an MLDATX file

## Syntax

```
saveResult(DiffRes, fileName)
saveResult(DiffRes, fileName, saveRuns)
```

## Description

`saveResult(DiffRes, fileName)` saves the comparison results in the `Simulink.sdi.DiffRunResult` object, `DiffRes`, and original run data to the MLDATX file, `fileName`. You can load the MLDATX file containing the runs and comparison results into the Simulation Data Inspector using the `Simulink.sdi.load` or `open` functions.

`saveResult(DiffRes, fileName, saveRuns)` saves the comparison results with or without the original run data, depending on the specified value for `saveRuns`.

## Examples

### Compare Runs with Global Tolerance

You can specify global tolerance values to use when comparing two simulation runs. Global tolerance values are applied to all signals within the run. This example shows how to specify global tolerance values for a run comparison and how to analyze and save the comparison results.

First, load the session file that contains the data to compare. The session file contains data for four simulations of an aircraft longitudinal controller. This example compares data from two runs that use different input filter time constants.

```
Simulink.sdi.load('AircraftExample.mldatx');
```

To access the run data to compare, use the `Simulink.sdi.getAllRunIDs` function to get the run IDs that correspond to the last two simulation runs.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID1 = runIDs(end - 1);
runID2 = runIDs(end);
```

Use the `Simulink.sdi.compareRuns` function to compare the runs. Specify a global relative tolerance value of 0.2 and a global time tolerance value of 0.5.

```
runResult = Simulink.sdi.compareRuns(runID1, runID2, 'reltol', 0.2, 'timetol', 0.5);
```

Check the `Summary` property of the returned `Simulink.sdi.DiffRunResult` object to see whether signals were within the tolerance values or out of tolerance.

```
runResult.Summary
```

```
ans = struct with fields:
 OutOfTolerance: 0
 WithinTolerance: 3
 Unaligned: 0
 UnitsMismatch: 0
 Empty: 0
 Canceled: 0
 EmptySynced: 0
 DataTypeMismatch: 0
 TimeMismatch: 0
 StartStopMismatch: 0
 Unsupported: 0
```

All three signal comparison results fell within the specified global tolerance.

You can save the comparison results to an MLDATX file using the `saveResult` function.

```
saveResult(runResult, 'InputFilterComparison');
```

## Input Arguments

### **DiffRes** — Run comparison results

`Simulink.sdi.DiffRunResult` object

Run comparison results that contain the data you want to save, specified as a `Simulink.sdi.DiffRunResult` object.

### **fileName** — MLDATX file name

string | character vector

Name of the MLDATX file where you want to save the results, specified as a string or character array.

Example: `'ComparisonResults'`

### **saveRuns** — Whether to save original run data

1 or true (default) | 0 or false

Whether to save the original run data for the compared runs, specified as a logical 1 (true) or 0 (false). By default, the `saveResult` function saves the original run data along with the comparison results.

# Simulink.sdi.DiffSignalResult

Access signal comparison results

## Description

When you compare runs or signals using the **Simulation Data Inspector**, the results are returned as either a `Simulink.sdi.DiffSignalResult` object or a `Simulink.sdi.DiffRunResult` object that contains one or more `Simulink.sdi.DiffSignalResult` objects. The `DiffSignalResult` object contains the data and metadata for signal comparison results, such as the difference signal, tolerance data, and the synchronized signal data.

## Creation

When you use the Simulation Data Inspector to compare runs or signals, you can access signal comparison results in a `Simulink.sdi.DiffSignalResult` object two ways:

- By using the `Simulink.sdi.compareSignals` function to compare signals.
- By using the `getResultByIndex` function to access `DiffSignalResult` objects in `Simulink.sdi.DiffRunResult` objects.

## Properties

### Name — Baseline signal name

character vector

This property is read-only.

Baseline signal name, returned as a character vector. When comparison results are complex, the name of the `DiffSignalResult` object that contains the real data is appended with `(real)`, and the name of the `DiffSignalResult` object that contains the imaginary data is appended with `(imag)`.

### Status — Comparison result signal status

`WithinTolerance` | `OutOfTolerance` | `Unaligned` | `Pending` | `Processing` | ...

This property is read-only.

Status of the signal comparison corresponding to the `DiffSignalResult` object, returned as one of the following options. The status can indicate where a given signal comparison is in the comparison process during a long comparison, or it can indicate information about the result of the signal comparison.

- `WithinTolerance` — Signal comparison completed, and all data points compared fell within the specified tolerance.
- `OutOfTolerance` — Signal comparison completed, and some data points compared fell outside of the specified tolerance.

- **Unaligned** — Signal from the baseline run did not align with a signal in the run to compare.
- **Empty** — Aligned signal in the baseline run or run to compare contains no data.
- **EmptySynced** — Synchronized signal in the baseline run or run to compare contains no data. An empty synchronized signal can mean that the signals do not overlap or, if you specified the intersection synchronization method, that they included none of the same time points.
- **Canceled** — Signal result not computed because the user canceled the comparison or the algorithm ended the comparison before computing this signal result.
- **Pending** — Comparison is in progress and the signal result computation has not started.
- **Processing** — Signal result computation in progress.
- **UnitsMismatch** — The signal units in the baseline run and run to compare do not match.
- **DataTypeMismatch** — The signal data types in the baseline run and run to compare do not match. Only results of comparisons configured to check signal data types can have this status.
- **TimeMismatch** — The signal time vectors in the baseline run and run to compare do not match. Only results of comparisons configured to check signal time vectors can have this status.
- **StartStopMismatch** — The signal start and stop times in the baseline run and run to compare do not match. Only results of comparisons configured to check signal start and stop times can have this status.
- **Unsupported** — The Simulation Data Inspector comparison algorithm does not support this type of signal. For example, signals with data types that lose precision when converted to `double` are not supported.

For more information about alignment, tolerances, and synchronization, see “How the Simulation Data Inspector Compares Data”. For more information about configuring comparisons to check for additional metadata, see `Simulink.sdi.compareRuns`.

### **AlignBy** — Property by which signals aligned for comparison

character vector

This property is read-only.

Property by which signals aligned in a run comparison, returned as a character vector. When the `DiffSignalResult` object was created from a signal comparison, the `AlignBy` property is empty. For more information about how run comparisons align signals, see “How the Simulation Data Inspector Compares Data”.

### **SignalID1** — Baseline signal ID

integer

This property is read-only.

Unique signal identifier for the baseline signal in the comparison, returned as an integer.

### **SignalID2** — Signal ID of the signal to compare

integer

This property is read-only.

Unique signal identifier for the signal to compare against the baseline signal, returned as an integer.

### **MaxDifference** — Maximum difference

double

This property is read-only.

Maximum difference between the two comparison signals, returned as a double.

### **Sync1 — Synchronized Baseline signal**

`timeseries`

This property is read-only.

Synchronized baseline signal, returned as a `timeseries` object. For more information about synchronization, see “How the Simulation Data Inspector Compares Data”.

### **Sync2 — Synchronized Compare to signal**

`timeseries`

This property is read-only.

Synchronized signal to compare, returned as a `timeseries` object. For more information about synchronization, see “How the Simulation Data Inspector Compares Data”.

### **Diff — Difference signal**

`timeseries`

This property is read-only.

Difference signal resulting from the comparison, returned as a `timeseries` object.

## **Examples**

### **Compare Two Signals in the Same Run**

You can use the Simulation Data Inspector programmatic interface to compare signals within a single run. This example compares the input and output signals of an aircraft longitudinal controller.

First, load the session that contains the data.

```
Simulink.sdi.load('AircraftExample.mldatx');
```

Use the `Simulink.sdi.Run.getLatest` function to access the latest run in the data.

```
aircraftRun = Simulink.sdi.Run.getLatest;
```

Then, you can use the `Simulink.sdi.getSignalsByName` function to access the `Stick` signal, which represents the input to the controller, and the `alpha, rad` signal that represents the output.

```
stick = getSignalsByName(aircraftRun, 'Stick');
alpha = getSignalsByName(aircraftRun, 'alpha, rad');
```

Before you compare the signals, you can specify a tolerance value to use for the comparison. Comparisons use tolerance values specified for the baseline signal in the comparison, so set an absolute tolerance value of `0.1` on the `Stick` signal.

```
stick.AbsTol = 0.1;
```

Now, compare the signals using the `Simulink.sdi.compareSignals` function. The `Stick` signal is the baseline, and the `alpha, rad` signal is the signal to compare against the baseline.

```
comparisonResults = Simulink.sdi.compareSignals(stick.ID,alpha.ID);
match = comparisonResults.Status

match =
 ComparisonSignalStatus enumeration

 OutOfTolerance
```

The comparison result is out of tolerance. You can use the `Simulink.sdi.view` function to open the Simulation Data Inspector to view and analyze the comparison results.

## Alternatives

You can view and inspect comparison results using the Simulation Data Inspector UI. For more information, see “Compare Simulation Data”.

# Simulink.sdi.Run

Access run signals and metadata

## Description

The `Simulink.sdi.Run` object contains run metadata and allows you to access the `Simulink.sdi.Signal` objects that contain data and metadata for the signals in the run. You can also use a `Simulink.sdi.Run` object to import data into the Simulation Data Inspector from the workspace or a file.

## Creation

The Simulation Data Inspector creates `Simulink.sdi.Run` objects when you import data or simulate a model that logs data. You can access a Run object in the Simulation Data Inspector three ways:

- When you want to access a run that corresponds to a specific run ID, use the `Simulink.sdi.getRun` function.

---

**Tip** Use the `Simulink.sdi.getAllRunIDs` function to get the run IDs for all the runs in the Simulation Data Inspector.

---

- When you want to access the most recently created run in the Simulation Data Inspector, use the `Simulink.sdi.Run.getLatest` function.
- When you want to access the run that corresponds to the in-progress or most recently completed simulation of a model, use the `Simulink.sdi.getCurrentSimulationRun` function.

You can also programmatically create a `Simulink.sdi.Run` object to import data into the Simulation Data Inspector.

- Create an empty run in the Simulation Data Inspector using the `Simulink.sdi.Run.create` function.
- Create an empty run in the Simulation Data Inspector or import data into the Simulation Data Inspector using the `Simulink.sdi.createRun`.

---

**Tip** Use the `add` function or the `Simulink.sdi.addToRun` function to import data into an empty Run object.

---

## Properties

### ID — Run ID

integer

This property is read-only.

Unique numerical identification for the run, returned as an integer.

**Name — Run name**

character vector | string

Run name, specified as a character vector or string.

By default, the `Name` property is empty when you use the `Simulink.sdi.Run.create` function to create a run.

You can specify the run name when you use the `Simulink.sdi.createRun` function to create a run.

When you create a run by simulating a model that logs data, the run name is generated according to the run-naming rule in the Simulation Data Inspector. You can modify the run-naming rule in the Simulation Data Inspector in the UI or by using the `Simulink.sdi.setRunNamingRule` function.

Example: 'Run 1: vdp'

**Description — Run description**

[] (default) | character vector | string

Description of the run, specified as a character vector or string. By default, `Description` is empty. Use the `Description` property to add notes about the significance of the data within the run, like the test or simulation conditions used to create the data.

Example: 'Initial simulation'

**Tag — Information tag**

[] (default) | character vector | string

Tag for additional run information, specified as a character vector or string. By default, `Tag` is empty. You can use the `Tag` property to attach additional information to the `Run` object. For example, you could use the `Tag` property to include parameter values used for the simulation that created the run in the `Run` object metadata.

Example: 'Gain = 2'

**DateCreated — Run creation timestamp**

datetime object

Date and time the run was created, returned as a `datetime` object.

Example: 07-Dec-2019 13:55:25

Data Types: `datetime`

**RunIndex — Index of run in Simulation Data Inspector**

integer

This property is read-only.

Index of the run in the Simulation Data Inspector when the run was created, returned as an integer. The `RunIndex` matches the run number in the run name when you use the run index as part of the run-naming rule.

If you delete runs from the Simulation Data Inspector, the value of the `RunIndex` property may not match the index of the run ID in the vector returned by the `Simulink.sdi.getAllRunIDs` function.

**SignalCount — Number of signals in run**

integer

This property is read-only.

Number of signals in the run, returned as an integer.

**Model — Model simulated to create run**

character vector

Name of the model simulated to create the run, returned as a character vector. The `Model` property is empty for runs created by importing data into the Simulation Data Inspector.

**SimMode — Simulation mode**

character vector

Simulation mode used in the simulation that created the run, returned as a character vector. The `SimMode` property is empty for runs created by importing data into the Simulation Data Inspector.

**StartTime — Run start time**

scalar

First time point shared by all signals in the run, returned as a scalar.

**StopTime — Run stop time**

scalar

Last time point shared by all signals in the run, returned as a scalar.

**SLVersion — Software version used for model simulation that created run**

character vector

Version of Simulink used for the simulation that created the run, returned as a character vector. The `SLVersion` property is empty for runs created by importing data into the Simulation Data Inspector.

**ModelVersion — Version of model simulated to create run**

character vector

Version of the model that was simulated to create the run, returned as a character vector. The version of a model is stored in its model properties. The `ModelVersion` property is empty for runs created by importing data into the Simulation Data Inspector.

**UserID — System account**

character vector

System account used to perform the simulation that created the run, returned as a character vector. The `UserID` property is empty for runs created by importing data into the Simulation Data Inspector.

**MachineName — Name of machine used for simulation**

character vector

Name of the machine used to perform the simulation that created the run, returned as a character vector. The `MachineName` property is empty for runs created by importing data into the Simulation Data Inspector.

**Platform — Operating system on machine used for simulation**

character vector

Operating system on the machine used to perform the simulation, returned as a character vector. The `Platform` property is empty for runs that do not correspond to a simulation.

Example: 'PCWIN64'

### **TaskName — Task name**

[] (default) | character vector

Name of the simulation task that corresponds to the run, returned as a character vector. The `TaskName` property is empty unless the run was created using Parallel Computing Toolbox workers.

### **SolverType — Type of solver used in simulation that created run**

'Variable-Step' | 'Fixed-Step'

Type of solver used in the simulation that created the run, returned as 'Variable-Step' or 'Fixed-Step'. The `SolverType` property is empty for runs created by importing data into the Simulation Data Inspector.

### **SolverName — Name of solver used in simulation that created run**

character vector

Name of the solver used in the simulation that created the run, returned as a character vector. The `SolverName` property is empty for runs created by importing data into the Simulation Data Inspector.

Example: ode45

### **SolverStepSize — Solver step size used in simulation**

character vector

Step size used by the solver during the simulation, returned as a character vector. If the simulation used a fixed-step solver, the `SolverStepSize` property indicates the fixed step size used in the simulation. If the simulation used a variable-step solver, the `SolverStepSize` property indicates the maximum step size used in the simulation.

Example: '0.4'

### **Status — Simulation status**

character vector

Simulation status, returned as a character vector. When the simulation is running, the `Status` property is 'Running'. When a simulation is paused or completes, the `Status` property takes the value from the `StopEvent` field of the `Simulink.SimulationMetadata` object `StopEvent` property. The `StopEvent` property has one of these values:

- `ReachedStopTime` — The simulation completed with no reported errors, not including errors reported in the `StopFcn` callback, which executes after the simulation stops.
- `ModelStop` — A block or solver stopped the simulation before the simulation stop time.
- `StopCommand` — A **Stop** button press or `set_param` function call ended the simulation.
- `DiagnosticError` — A reported error ended the simulation.
- `KeyboardControlC` — A Ctrl+C keyboard entry ended the simulation.
- `PauseCommand` — A **Pause** button press or `set_param` function call paused the simulation.
- `ConditionalPause` — A conditional breakpoint paused the simulation.

- **PauseTime** — A specified pause time paused the simulation.
- **StepForward** — The simulation paused after stepping forward while stepping through a simulation.
- **StepBackward** — The simulation paused after stepping backward while stepping through a simulation.
- **TimeOut** — The simulation stopped after the simulation execution time exceeded the timeout time specified using the 'TimeOut' name-value pair for the `sim` function.

#### **StopEventSource — Block that issued stop event**

`Simulink.SimulationData.BlockPath`

Block that issued the stop event that stopped the simulation, returned as a `Simulink.SimulationData.BlockPath` object.

#### **StopEventDescription — Translated description of simulation stop**

character vector

Translated description of the simulation stop, returned as a character vector. The `StopEventDescription` includes a description of the stop event and the associated simulation time, if applicable. The `StopEventDescription` property takes its value from the `StopEventDescription` field of the `Simulink.SimulationMetadata` object `ExecutionInfo` property.

Example: 'Pause command issued at time 100'

#### **ExecutionErrors — Errors that occurred during simulation**

character vector

Errors that occurred during simulation, returned as a character vector.

#### **ExecutionWarnings — Warnings that occurred during simulation**

character vector

Warnings that occurred during simulation, returned as a character vector.

#### **ModelInitializationTime — Time to initialize model for simulation that created run**

double

Time required to initialize the model for the simulation that created the run, returned as a double. The `ModelInitializationTime` property is empty for runs created by importing data into the Simulation Data Inspector.

#### **ModelExecutionTime — Execution time for simulation that created run**

double

Execution time for the simulation that created the run, returned as a double. The `ModelExecutionTime` property is empty for runs created by importing data into the Simulation Data Inspector.

#### **ModelTerminationTime — Time to terminate simulation that created run**

double

Time to terminate the simulation that created the run, returned as a double. The `ModelTerminationTime` property is empty for runs created by importing data into the Simulation Data Inspector.

**ModelTotalElapsedTime — Total simulation time for simulation that created run**

double

Total simulation time for the simulation that created the run, returned as a double. The `ModelTotalElapsedTime` property is empty for runs created by importing data into the Simulation Data Inspector.

**UserString — User-specified string**

character vector

User-specified string that corresponds to the simulation, returned as a character vector. Often, the `UserString` provides a brief description of the simulation. You specify the `UserString` for a simulation in the `Simulink.SimulationInput` object for the simulation.

**Object Functions**

<code>add</code>	Import data into existing run in Simulation Data Inspector using <code>Simulink.sdi.Run</code> object
<code>export</code>	Export run to base workspace or file
<code>getAllSignalIDs</code>	Get all signal IDs for signals in <code>Simulink.sdi.Run</code> object
<code>getAllSignals</code>	Get all signals in <code>Simulink.sdi.Run</code> object
<code>getDatasetRef</code>	Create a <code>Simulink.sdi.DatasetRef</code> object for a run
<code>getSignalByIndex</code>	Get signal in <code>Simulink.sdi.Run</code> object by index
<code>getSignalIDByIndex</code>	Get signal ID for signal at specified index in <code>Simulink.sdi.Run</code> object
<code>getSignalIDsByName</code>	Get signal IDs for signals inside <code>Simulink.sdi.Run</code> object using signal name
<code>getSignalsByName</code>	Access signals in a <code>Simulink.sdi.Run</code> object using signal name
<code>isValidSignalID</code>	Check whether signal ID corresponds to signal in <code>Simulink.sdi.Run</code> object

**Examples****Plot Signals from Simulation Run**

This example demonstrates how to access the `Simulink.sdi.Run` object for a Simulation Data Inspector run created by logging signals. From the `Simulink.sdi.Run` object you can get `Simulink.sdi.Signal` objects that contain the logged signal data and metadata. You can use the `Signal` objects and the `plotOnSubPlot` function to plot the data in the Simulation Data Inspector.

**Create a Simulation Run and Access the Run Object**

The `ex_vdp` model logs two signals. To create a simulation run containing the logged data, simulate the model.

```
sim('ex_vdp');
```

The Simulation Data Inspector keeps track of runs by assigning a unique numeric run ID to each run created by simulation, importing data, or opening a session. To access the run object for the simulation you just performed, use the `Simulink.sdi.getAllRunIDs` function and take the last run ID in the returned vector.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Once you have the run ID for the run, you can use the `Simulink.sdi.getRun` function to get the `Simulink.sdi.Run` object that corresponds to the run. You can use the `Run` object to check the metadata associated with the run, including the number of signals in the run.

```
vdpRun = Simulink.sdi.getRun(runID);
vdpRun.SignalCount
ans = int32
 2
```

### Plot Data Using Signal Objects

Use the `getSignalByIndex` function to access signals from the Run object, `vdpRun`.

```
signal1 = getSignalByIndex(vdpRun,1);
signal2 = getSignalByIndex(vdpRun,2);
```

Use the `Simulink.sdi.setSubPlotLayout` function to specify a 2-by-1 layout.

```
Simulink.sdi.setSubPlotLayout(2,1)
```

Before plotting the data, use the `Simulink.sdi.clearAllSubPlots` function to clear any data that is already plotted.

```
Simulink.sdi.clearAllSubPlots
```

Plot one signal on each subplot. To plot signals on the first subplot, you can set the checked property for the signal. To plot signals on subplots other than the first subplot, use the `plotOnSubPlot` function.

```
signal1.Checked = true;
plotOnSubPlot(signal2,2,1,true);
```

### View the Plotted Data

To view the plots you just created, open the Simulation Data Inspector using the `Simulink.sdi.view` function.

### Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

#### Create Data for the Run

Create `timeseries` objects to contain data for a sine signal and a cosine signal. Give each `timeseries` object a descriptive name.

```
time = linspace(0,20,100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

#### Create a Run and Add Data

Use the `Simulink.sdi.view` function to open the Simulation Data Inspector.

```
Simulink.sdi.view
```

To import data into the Simulation Data Inspector from the workspace, create a `Simulink.sdi.Run` object using the `Simulink.sdi.Run.create` function. Add information about the run to its metadata using the `Name` and `Description` properties of the `Run` object.

```
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals with different frequencies';
```

Use the `add` function to add the data you created in the workspace to the empty run.

```
add(sinusoidsRun, 'vars', sine_ts, cos_ts);
```

### Plot the Data in the Simulation Data Inspector

Use the `getSignalByIndex` function to access `Simulink.sdi.Signal` objects that contain the signal data. You can use the `Simulink.sdi.Signal` object properties to specify the line style and color for the signal and plot it in the Simulation Data Inspector. Specify the `LineColor` and `LineDashed` properties for each signal.

```
sine_sig = getSignalByIndex(sinusoidsRun,1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';
```

```
cos_sig = sinusoidsRun.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.LineDashed = '--';
```

Use the `Simulink.sdi.setSubPlotLayout` function to configure a 2-by-1 subplot layout in the Simulation Data Inspector plotting area. Then use the `plotOnSubplot` function to plot the sine signal on the top subplot and the cosine signal on the lower subplot.

```
Simulink.sdi.setSubPlotLayout(2,1);
```

```
plotOnSubPlot(sine_sig,1,1,true);
plotOnSubPlot(cos_sig,2,1,true);
```

### Close the Simulation Data Inspector and Save Your Data

When you have finished inspecting the plotted signal data, you can close the Simulation Data Inspector and save the session to an `MLDATX` file.

```
Simulink.sdi.close('sinusoids.mldatx')
```

### Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

#### Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')
```

```
% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

### Initialize Parallel Workers

Use `gcp` to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd
```

```
% Load system and select signals to log
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)
```

```
end
```

### Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7
```

```
% Select value for Ts
Ts_val = Ts_vals(index);

% Change the filter time constant and simulate
modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
modelWorkspace.assignin('Ts', Ts_val)
sim('slexAircraftExample')

% Create a worker run for each simulation
workerRun(index) = Simulink.sdi.WorkerRun.getLatest
```

```
end
```

```
spmd
```

```
% Remove temporary directories
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)
```

```
end
```

## Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;

for a = 1:7
 ds(a) = workerRun(a).getDataset;
end
ds(1)

ans =
Simulink.SimulationData.Dataset '' with 2 elements
```

	Name	BlockPath
1 [1x1 Signal]	alpha, rad	...rcraftExample/Aircraft Dynamics Model
2 [1x1 Signal]	Stick	slexAircraftExample/Pilot

- Use braces { } to access, modify, or add elements using index.

## Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
 datasetRef(b) = workerRun(b).getDatasetRef;
end

datasetRef(1)

ans =
DatasetRef with properties:
 Name: 'Run 3: slexAircraftExample'
 Run: [1x1 Simulink.sdi.Run]
 numElements: 2
```

## Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local `Run` objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

 Runs(c) = workerRun(c).getLocalRun;
 Ts_val_str = num2str(Ts_vals(c));
 desc = strcat('Ts = ', Ts_val_str);
 Runs(c).Description = desc;
 Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

### **Clean Up Worker Repositories**

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

`Simulink.sdi.cleanupWorkerResources`

### **Alternatives**

You can view run metadata and import data using the Simulation Data Inspector UI. For more information, see “View Data in the Simulation Data Inspector”.

## **Version History**

# add

**Package:** Simulink.sdi

Import data into existing run in Simulation Data Inspector using `Simulink.sdi.Run` object

## Syntax

```
add(runObj,var)
add(runObj,'vars',var,var2,...,varn)
add(runObj,'namevalue',sourceNames,sigValues)

add(runObj,'file',filename)
add(runObj,'file',filename,Name=Value)
```

## Description

### Import Data from Workspace

`add(runObj,var)` imports the data in the variable `var` into the Simulation Data Inspector by adding a signal to the run that corresponds to the specified `Simulink.sdi.Run` object.

To import data into a new run, use the `Simulink.sdi.Run.create` function or the `Simulink.sdi.createRun` function.

`add(runObj,'vars',var,var2,...,varn)` imports data from one or more variables into the Simulation Data Inspector by adding one or more signals to the run that corresponds to the specified Run object.

`add(runObj,'namevalue',sourceNames,sigValues)` imports data from one or more variables into the Simulation Data Inspector by adding one or more signals to the run that corresponds to the specified Run object. The `sourceNames` argument specifies values to use for the data source in the metadata for the signals added to the run.

### Import Data from File

`add(runObj,'file',filename)` imports data from a file into the Simulation Data Inspector by adding one or more signals to the run that corresponds to the specified Run object. You can use a built-in file reader to import data from a MAT file, CSV file, Microsoft Excel file, or MDF file.

When you need to import data from a file that the built-in readers do not support, you can write your own reader using the `io.reader` class.

`add(runObj,'file',filename,Name=Value)` imports data from a file into the Simulation Data Inspector by adding one or more signals to the run that corresponds to the specified Run object. For example, `sheets=["sheet1" "sheet2"]` specifies the sheets from which to import data when importing data from an Excel file.

## Examples

## Create a Run and View the Data

This example shows how to create a run, add data to it, and then view the data in the Simulation Data Inspector.

### Create Data for the Run

Create `timeseries` objects to contain data for a sine signal and a cosine signal. Give each `timeseries` object a descriptive name.

```
time = linspace(0,20,100);

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

### Create a Run and Add Data

Use the `Simulink.sdi.view` function to open the Simulation Data Inspector.

```
Simulink.sdi.view
```

To import data into the Simulation Data Inspector from the workspace, create a `Simulink.sdi.Run` object using the `Simulink.sdi.Run.create` function. Add information about the run to its metadata using the `Name` and `Description` properties of the `Run` object.

```
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals with different frequencies';
```

Use the `add` function to add the data you created in the workspace to the empty run.

```
add(sinusoidsRun,'vars',sine_ts,cos_ts);
```

### Plot the Data in the Simulation Data Inspector

Use the `getSignalByIndex` function to access `Simulink.sdi.Signal` objects that contain the signal data. You can use the `Simulink.sdi.Signal` object properties to specify the line style and color for the signal and plot it in the Simulation Data Inspector. Specify the `LineColor` and `LineDashed` properties for each signal.

```
sine_sig = getSignalByIndex(sinusoidsRun,1);
sine_sig.LineColor = [0 0 1];
sine_sig.LineDashed = '-.';

cos_sig = sinusoidsRun.getSignalByIndex(2);
cos_sig.LineColor = [0 1 0];
cos_sig.LineDashed = '--';
```

Use the `Simulink.sdi.setSubPlotLayout` function to configure a 2-by-1 subplot layout in the Simulation Data Inspector plotting area. Then use the `plotOnSubplot` function to plot the sine signal on the top subplot and the cosine signal on the lower subplot.

```
Simulink.sdi.setSubPlotLayout(2,1);
```

```
plotOnSubPlot(sine_sig,1,1,true);
plotOnSubPlot(cos_sig,2,1,true);
```

### Close the Simulation Data Inspector and Save Your Data

When you have finished inspecting the plotted signal data, you can close the Simulation Data Inspector and save the session to an MLDATX file.

```
Simulink.sdi.close('sinusoids.mldatx')
```

## Input Arguments

### **runObj** — Run to which you want to add imported data

Simulink.sdi.Run object

Run to which you want to add imported data, specified as a Simulink.sdi.Run object.

### **var** — Data to import

variable

Data to import, specified as a variable. The Simulation Data Inspector supports time-based data in which sample values are associated with sample times. The Simulation Data Inspector supports all loading and logging data formats, including timeseries and Simulink.SimulationData.Dataset.

Example: myData

### **sourceNames** — Source names for imported data

cell array of character vectors

Source names for imported data, specified as a cell array of character vectors. The source name is used to set the RootSource, TimeSource, and DataSource properties of the Simulink.sdi.Signal objects created from the data specified by the sigValues input.

Provide a sourceNames input when you specify 'namevalue' for the second argument.

Example: {'sig1','sig2'}

### **sigValues** — Data to import

cell array of variables

Data to import, specified as a cell array of variables.

Provide a sigValues input when you specify 'namevalue' for the second argument.

Example: {var1,var2}

### **filename** — Name of file with data to import

character vector

Name of file with data to import, specified as a character vector. Provide a filename input when you specify 'file' for the second argument.

You can create a run from these types of files using file readers built into the Simulation Data Inspector:

- MAT-file
- CSV file
- Microsoft Excel file that contains data formatted according to “Microsoft Excel Import, Export, and Logging Format”.
- MDF file with one of these extensions:
  - .mdf
  - .mf4
  - .mf3
  - .data
  - .dat

When you need to import data from a file that the built-in readers do not support, you can write your own reader using the `io.reader` class. You can also write a custom reader to use instead of the built-in reader for any file extension. For an example, see “Import Data Using a Custom File Reader”.

Example: `'simulation.mat'`

### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, . . . , NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Example: `sheets=["sheet1" "sheet2"]`

### **reader — File reader to use to import data**

string | character vector

File reader to use to import data, specified as a string or character vector.

The Simulation Data Inspector prioritizes using a registered custom reader when one is available for the file. When you do not specify a reader, the Simulation Data Inspector uses the first custom reader registered for the file. If no custom readers are registered, the data is imported using the built-in reader.

Specify the reader input when:

- You want to use the built-in reader to import data for a file that is also supported by a custom reader.
- Multiple registered custom readers support the file.

To determine which readers are available to import your file, use the `io.reader.getSupportedReadersForFile` function.

Example: `"MyExcelReader"`

Example: `"built-in"`

### **sheets — Sheets in Excel file from which to import data**

string array | cell array of character vectors

Sheets in Excel file from which to import data, specified as a string array or a cell array of character vectors. By default, the Simulation Data Inspector imports data from all sheets. Use the `sheets` name-value argument when you do not want to import data from all sheets in the Excel file.

When the data in the file does not include simulation numbers and source information, the data on each sheet is imported into a separate run. For more information about formatting data to import from an Excel file, see “Microsoft Excel Import, Export, and Logging Format”.

Example: `["sheet1" "sheet2"]`

### **model** — Model with definitions of user-defined data types

string | character vector

Model with definitions of user-defined data types, specified as a string or character vector.

When you load data from an Excel file that defines signal data types using user-defined data types, such as enumerations, buses, or aliases, the Simulation Data Inspector needs access to the type definition to import the data. You can provide access to the type definitions by:

- Loading the associated object into the MATLAB workspace.
- Specifying the `model` name-value argument to use type definitions saved in the model workspace or a data dictionary.

For more information on formatting data to import from an Excel file, see “Microsoft Excel Import, Export, and Logging Format”.

Example: `"myModel.slx"`

## **Version History**

## export

**Package:** Simulink.sdi

Export run to base workspace or file

### Syntax

```
ds = export(runObj)
export(runObj,Name,Value)
```

### Description

`ds = export(runObj)` exports the `Simulink.sdi.Run` object `runObj` to the base workspace as the `Simulink.SimulationData.Dataset` object `ds`.

`export(runObj,Name,Value)` exports the `Simulink.sdi.Run` object `runObj` to the base workspace or a file according to the options specified by one or more name-value pair arguments.

### Examples

#### Export Run Data

This example shows how to export data from a run in the Simulation Data Inspector to a `Simulink.SimulationData.Dataset` object in the base workspace that you can use to further process your data. The method you choose to export your run depends on the processing you do in your script. If you have a run object for the run, you can use the `export` method to create a `Simulink.SimulationData.Dataset` object with the run data in the base workspace. If you do not have a run object, use the `Simulink.sdi.exportRun` function to export the run to the workspace.

#### Export Run Using Simulink.sdi.exportRun

Use the `Simulink.sdi.export` function to export run data to the workspace or a file when your workflow does not include creating a run object.

To create a run of simulation data, open the vdp model, mark signals for logging, and run a simulation.

```
load_system('vdp')

SignalHandles = get_param('vdp', 'Lines');

Simulink.sdi.markSignalForStreaming(SignalHandles(5).Handle, 'on')
Simulink.sdi.markSignalForStreaming(SignalHandles(6).Handle, 'on')

out = sim('vdp');
```

Use the `Simulink.sdi.getAllRunIDs` function to access the most recently created run.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Use the `Simulink.sdi.exportRun` function to export the run data to a `Dataset` object in the workspace.

```
simDataset = Simulink.sdi.exportRun(runID);
```

### Export Run Using the export Function

When your task involves creating a Run object, you can use the `export` function to create a `Simulink.SimulationData.Dataset` object in the base workspace to further process the run data. For example, suppose you need to access Run objects for simulation runs with signal data you want to compare using the `Simulink.sdi.compareSignals` function.

Load a model and mark signals for logging. Then simulate the model to create run data.

```
load_system('vdp')

SignalHandles = get_param('vdp', 'Lines');

Simulink.sdi.markSignalForStreaming(SignalHandles(5).Handle, 'on')
Simulink.sdi.markSignalForStreaming(SignalHandles(6).Handle, 'on')

sim('vdp');
```

Use the `Simulink.sdi.getAllRunIDs` function to access the run ID for the most recently created run. Then, use the `Simulink.sdi.getRun` function to access the Run object corresponding to the run.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
vdpRun = Simulink.sdi.getRun(runID);
```

Use the `export` function to export the run data to a `Dataset` object in the workspace.

```
simDataset = export(vdpRun);
```

## Input Arguments

### runObj — Run with data to export

`Simulink.sdi.Run` object

Run with data to export, specified as a `Simulink.sdi.Run` object.

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `'to', 'file'`

### to — Where to export data

`'variable'` (default) | `'file'`

Where to export data, specified as the comma-separated pair consisting of `'to'` and `'variable'` or `'file'`.

When you export data to a file, you must also specify a file name using the `'filename'` name-value pair argument. You can specify a file name with a `.mat`, `.mldatax`, or `.xlsx` extension.

When you export a run to a MAT-file, the data is saved in a `Simulink.SimulationData.Dataset` object. When you export more than one run to a MAT-file using the `Simulink.sdi.exportRun` function, the data is saved in a `Dataset` object, where each element is a `Dataset` object that contains the data for one exported run.

Data exported to a Microsoft Excel file is saved using the format described in “Microsoft Excel Import, Export, and Logging Format”.

When you export data to a Microsoft Excel file, you can specify additional options using the `'overwrite'`, `'metadata'`, and `'sharetimecolumn'` name-value pairs.

Example: `'to', 'file'`

### **filename** — Name of file to contain exported data

string | character array

Name of the file to contain the exported data, specified as the comma-separated pair consisting of `'filename'` and a string or character array. Include a `.mat`, `.mldatax`, or `.xlsx` extension in the file name to specify whether to export the data to a MAT-file, MLDATX file, or a Microsoft Excel file. When you do not specify an extension with a file name, the data exports to a MAT-file.

Use the `'filename'` name-value pair argument when you specify the `'to'` name-value pair argument with the value `'file'`.

When you export data to a Microsoft Excel file, you can specify additional options using the `'overwrite'`, `'metadata'`, and `'sharetimecolumn'` name-value pair arguments.

Example: `'filename', 'mySpreadsheet.xlsx'`

### **overwrite** — Data to overwrite in existing Microsoft Excel file

`'file'` (default) | `'sheetonly'`

Data to overwrite in existing Microsoft Excel file, specified as the comma-separated pair consisting of `'overwrite'` and `'file'` or `'sheetonly'`.

- `'file'` — Overwrite the entire file with the exported data.
- `'sheetonly'` — Only overwrite sheets of the Microsoft Excel file with data that corresponds to the exported data.

When you export data to an existing MAT-file or MLDATX file, the exported data overwrites the entire file.

Example: `'overwrite', 'sheetonly'`

### **metadata** — Metadata to include in exported Microsoft Excel file

`[]` (default) | string array

Metadata to include in the exported Microsoft Excel file, specified as the comma-separated pair consisting of `'metadata'` and a string array. By default, the export operation does not include any metadata. You can export this metadata to the Microsoft Excel file:

- `dataType` — Signal data type

- `units` — Signal units
- `blockPath` — Path to the source block for logged signals
- `interp` — Signal interpolation method
- `portIndex` — Index of the port on the source block for logged signals

You can specify the desired metadata in any order you choose in the string array. The order of the metadata in the string array does not affect the format in the exported file, which always matches the description in “Microsoft Excel Import, Export, and Logging Format”.

Example: `'metadata', ["units", "dataType"]`

**sharetimecolumn** — Whether signals share time columns in exported Microsoft Excel file  
'on' (default) | 'off'

Whether signals that have identical time data share time columns in the exported Microsoft Excel file, specified as the comma-separated pair consisting of 'sharetimecolumn' and 'on' or 'off'. By default, signals with the same time data share a time column in the exported file. When you specify the value as 'off', each signal in the exported file has its own time column.

Example: `'sharetimecolumn', 'off'`

## Output Arguments

**ds** — Exported run data

`Simulink.SimulationData.Dataset` object

Exported run data, returned as a `Simulink.SimulationData.Dataset` object.

## Alternatives

You can export data programmatically for one or more runs using the `Simulink.sdi.exportRun` function, or you can use the Simulation Data Inspector UI. For more information, see “Save and Share Simulation Data Inspector Data and Views”.

## Version History

Introduced in R2017b

## See Also

`Simulink.sdi.Run` | `Simulink.sdi.getRun` | `Simulink.sdi.exportRun` | `Simulink.sdi.report`

## getAllSignalIDs

**Package:** Simulink.sdi

Get all signal IDs for signals in Simulink.sdi.Run object

### Syntax

```
sigIDs = getAllSignalIDs(runObj)
```

### Description

`sigIDs = getAllSignalIDs(runObj)` returns an array, `sigIDs`, that contains the signal IDs for all signals in the Simulink.sdi.Run object `runObj`. Use the `getAllSignalIDs` function when you need to work with many or all of the signals in the run. When you only need to analyze a specific signal, you can access the single `Signal` object using the `getSignalIDsByName` function or the `getSignalIDByIndex` function.

### Examples

#### Get Signal IDs for All Signals in a Run

You can use the `getAllSignalIDs` function to access an array containing the signal IDs for all the signals in a run. This example simulates the `slexAircraftExample` model to create run data and then shows how to get the signal IDs for the signals in the run and use the IDs to compare the signals.

#### Create a Run

This example creates a run in the Simulation Data Inspector by simulating a model that logs data. Load the `slexAircraftExample` model and mark the `Stick` and `alpha, rad` signals for logging.

```
load_system('slexAircraftExample')
```

```
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot',1,'on')
```

```
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model',4,'on')
```

Simulate the model.

```
out = sim('slexAircraftExample');
```

#### Access Run Data and Signal IDs

Use the `Simulink.sdi.getCurrentSimulationRun` function to access the run created when you simulated the `slexAircraftExample` model.

```
airRun = Simulink.sdi.getCurrentSimulationRun('slexAircraftExample');
```

Get an array of the signal IDs for the logged signals using the `getAllSignalIDs` function.

```
sigIDs = getAllSignalIDs(airRun);
```

## Compare Logged Signals

You can use the signal IDs to compare the logged signals. Use the `Simulink.sdi.getSignal` function to get the `Simulink.sdi.Signal` object with the first ID in the array `sigIDs`. Check the `Name` property for the returned `Signal` object.

```
sigID1 = sigIDs(1);
sig1 = Simulink.sdi.getSignal(sigID1);
sig1.Name
```

```
ans =
'alpha, rad'
```

Use the input signal, `Stick`, as the baseline signal in the signal comparison.

```
sigID2 = sigIDs(2);
DSR = Simulink.sdi.compareSignals(sigID2, sigID1);
DSR.Status
```

```
ans =
 ComparisonSignalStatus enumeration
 OutOfTolerance
```

The signals do not match. You can use the tolerance properties of the `Signal` objects to programmatically analyze the data, or you can open the Simulation Data Inspector using the `Simulink.sdi.view` function to view and analyze the comparison results using the UI.

## Input Arguments

### **runObj** — Run containing signals you want to access

`Simulink.sdi.Run` object

Run containing the signals you want to access, specified as a `Simulink.sdi.Run` object.

## Output Arguments

### **sigIDs** — Signal IDs for signals in run

array

Signal IDs for the signals in the run, returned as an array.

## Version History

Introduced in R2020a

## See Also

`Simulink.sdi.Signal` | `Simulink.sdi.Run` | `getAllSignals` | `getSignalsByName` | `getSignalIDsByName` | `getSignalByIndex` | `getSignalIDByIndex` | `Simulink.sdi.getSignal` | `getSignal`

**Topics**

# getAllSignals

**Package:** Simulink.sdi

Get all signals in Simulink.sdi.Run object

## Syntax

```
sigs = getAllSignals(runObj)
```

## Description

`sigs = getAllSignals(runObj)` returns an array of `Simulink.sdi.Signal` objects, `sigs`, that correspond to the signals contained in the `Simulink.sdi.Run` object `runObj`. Use the `getAllSignals` function when you need to work with many or all of the signals in the run. When you need to analyze a specific signal, you can access the single `Signal` object using the `getSignalsByName` function or the `getSignalByIndex` function.

## Examples

### Get All Signals in a Run

You can use the `getAllSignals` function to access `Simulink.sdi.Signal` objects for each signal in a `Simulink.sdi.Run` object when you want to analyze all the data in the run. This example shows how to access and inspect signal data logged in the `sldemo_autotrans` model.

#### Create a Run

This example creates a run in the Simulation Data Inspector by simulating a model that logs data.

```
out = sim('sldemo_autotrans');
```

#### Access Run and Signal Data

Access the run and signal data using the Simulation Data Inspector programmatic interface. Use the `Simulink.sdi.getCurrentSimulationRun` function to get the `Run` object created when you simulated the `sldemo_autotrans` model.

```
autoRun = Simulink.sdi.getCurrentSimulationRun('sldemo_autotrans');
```

Use the `getAllSignals` function to get an array of `Signal` objects containing the logged signal data.

```
autoSigs = getAllSignals(autoRun);
```

You can use a `for` loop to inspect or analyze the data in each `Signal` object in the array. For example, you could check the name of each signal.

```
count = length(autoSigs);
for idx = 1:count
 sig = autoSigs(idx);
```

```
name = sig.Name;
formatSpec = "The signal at index %d is named %s\n";
fprintf(formatSpec,idx,name)
end
```

```
The signal at index 1 is named EngineRPM
The signal at index 2 is named Throttle
The signal at index 3 is named Brake
The signal at index 4 is named ShiftLogic:1
The signal at index 5 is named ImpellerTorque
The signal at index 6 is named OutputTorque
The signal at index 7 is named VehicleSpeed
The signal at index 8 is named TransmissionRPM
```

## Input Arguments

### **runObj** — Run containing signals you want to access

`Simulink.sdi.Run` object

Run containing the signals you want to access, specified as a `Simulink.sdi.Run` object.

## Output Arguments

### **sigs** — Signals contained in run

array of `Simulink.sdi.Signal` objects

Signals contained in the run, returned as an array of `Simulink.sdi.Signal` objects.

## Version History

Introduced in R2020a

## See Also

`Simulink.sdi.Signal` | `Simulink.sdi.Run` | `getAllSignalIDs` | `getSignalsByName` | `getSignalIDsByName` | `getSignalByIndex` | `getSignalIDByIndex` | `Simulink.sdi.getSignal` | `getSignal`

# getDatasetRef

**Package:** Simulink.sdi

Create a Simulink.sdi.DatasetRef object for a run

## Syntax

```
sdiDSRef = getDatasetRef(runObj)
```

## Description

`sdiDSRef = getDatasetRef(runObj)` creates a `Simulink.sdi.DatasetRef` object, `sdiDSRef`, that references the data in the `Simulink.sdi.Run` object `runObj`. Use a `DatasetRef` object to process your data when the data is too large to fit into memory.

## Examples

### Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl-demo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl-demo_absbrake to create a run of logged signals
load_system('ex_sl-demo_absbrake')
sim('ex_sl-demo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell
 {'yout'}
 {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
 Ww: [1x1 timeseries]
```

```
Vs: [1x1 timeseries]
Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sl-demo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sl-demo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

## Input Arguments

### **runObj** — Run with data that does not fit in memory

`Simulink.sdi.Run` object

Run with data you want to process that does not fit into memory, specified as a `Simulink.sdi.Run` object.

## Output Arguments

### **sdiDSRef** — Reference to run data

`Simulink.sdi.DatasetRef` object

Reference to run data that you can use to process data that does not fit into memory, returned as a `Simulink.sdi.DatasetRef` object.

## Version History

**Introduced in R2017b**

## See Also

`Simulink.sdi.Run` | `Simulink.sdi.DatasetRef`

## Topics

“Inspect and Compare Data Programmatically”

# getSignalByIndex

**Package:** Simulink.sdi

Get signal in Simulink.sdi.Run object by index

## Syntax

```
sig = getSignalByIndex(runObj,idx)
```

## Description

`sig = getSignalByIndex(runObj,idx)` returns the `Simulink.sdi.Signal` object, `sig`, at the index specified by `idx` within the `Simulink.sdi.Run` object `runObj`.

## Examples

### Plot Signals from Simulation Run

This example demonstrates how to access the `Simulink.sdi.Run` object for a Simulation Data Inspector run created by logging signals. From the `Simulink.sdi.Run` object you can get `Simulink.sdi.Signal` objects that contain the logged signal data and metadata. You can use the `Signal` objects and the `plotOnSubPlot` function to plot the data in the Simulation Data Inspector.

#### Create a Simulation Run and Access the Run Object

The `ex_vdp` model logs two signals. To create a simulation run containing the logged data, simulate the model.

```
sim('ex_vdp');
```

The Simulation Data Inspector keeps track of runs by assigning a unique numeric run ID to each run created by simulation, importing data, or opening a session. To access the run object for the simulation you just performed, use the `Simulink.sdi.getAllRunIDs` function and take the last run ID in the returned vector.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Once you have the run ID for the run, you can use the `Simulink.sdi.getRun` function to get the `Simulink.sdi.Run` object that corresponds to the run. You can use the `Run` object to check the metadata associated with the run, including the number of signals in the run.

```
vdpRun = Simulink.sdi.getRun(runID);
```

```
vdpRun.SignalCount
```

```
ans = int32
 2
```

### **Plot Data Using Signal Objects**

Use the `getSignalByIndex` function to access signals from the Run object, `vdpRun`.

```
signal1 = getSignalByIndex(vdpRun,1);
signal2 = getSignalByIndex(vdpRun,2);
```

Use the `Simulink.sdi.setSubPlotLayout` function to specify a 2-by-1 layout.

```
Simulink.sdi.setSubPlotLayout(2,1)
```

Before plotting the data, use the `Simulink.sdi.clearAllSubPlots` function to clear any data that is already plotted.

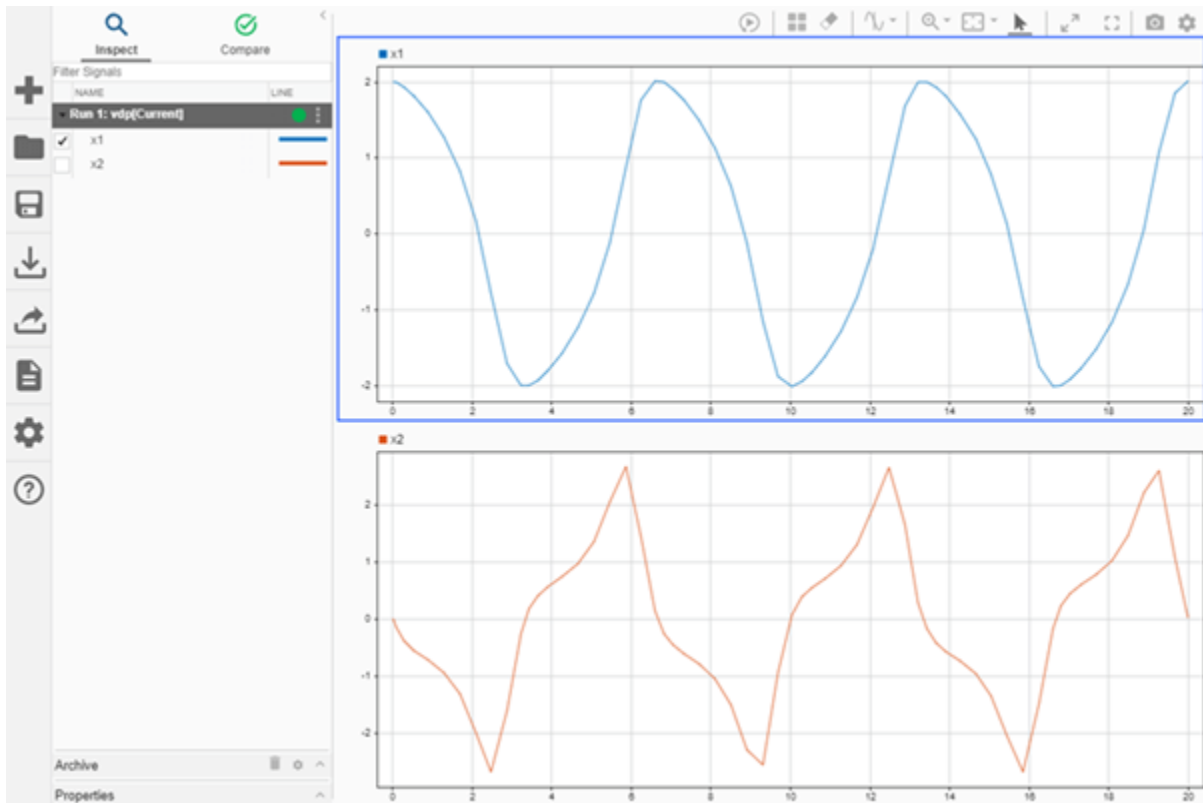

```
Simulink.sdi.clearAllSubPlots
```

Plot one signal on each subplot. To plot signals on the first subplot, you can set the `checked` property for the signal. To plot signals on subplots other than the first subplot, use the `plotOnSubPlot` function.

```
signal1.Checked = true;
plotOnSubPlot(signal2,2,1,true);
```

### **View the Plotted Data**

To view the plots you just created, open the Simulation Data Inspector using the `Simulink.sdi.view` function.

## Input Arguments

### **runObj** — Run that contains desired signal

Simulink.sdi.Run object

Run that contains the signal you want to access, specified as a Simulink.sdi.Run object.

### **idx** — Index of signal in run

integer

Index of the signal within the run, specified as an integer.

## Output Arguments

### **sig** — Signal at specified index

Simulink.sdi.Signal object

Signal at the specified index in the Run object, returned as a Simulink.sdi.Signal object.

## Version History

Introduced in R2012b

**See Also**

[Simulink.sdi.Signal](#) | [Simulink.sdi.Run](#) | [getSignalIDByIndex](#) | [getSignalsByName](#) | [getSignalIDsByName](#) | [getAllSignals](#) | [getAllSignalIDs](#)

**Topics**

[“Inspect and Compare Data Programmatically”](#)

# getSignalIDByIndex

**Package:** Simulink.sdi

Get signal ID for signal at specified index in Simulink.sdi.Run object

## Syntax

```
sigID = getSignalIDByIndex(runObj,idx)
```

## Description

`sigID = getSignalIDByIndex(runObj,idx)` returns the signal ID `sigID` for the signal at the specified index `idx` in the Simulink.sdi.Run object `runObj`.

---

**Tip** You can use the signal ID to get the Simulink.sdi.Signal object that contains the signal data and metadata or perform a signal comparison using the Simulink.sdi.compareSignals function.

---

## Examples

### Compare Two Signals in the Same Run

You can use the Simulation Data Inspector programmatic interface to compare signals within a single run. This example compares the input and output signals of an aircraft longitudinal controller.

First, load the session that contains the data.

```
Simulink.sdi.load('AircraftExample.mldatx');
```

Use the Simulink.sdi.Run.getLatest function to access the latest run in the data.

```
aircraftRun = Simulink.sdi.Run.getLatest;
```

Then, you can use the Simulink.sdi.getSignalsByName function to access the `Stick` signal, which represents the input to the controller, and the `alpha, rad` signal that represents the output.

```
stick = getSignalsByName(aircraftRun,'Stick');
alpha = getSignalsByName(aircraftRun,'alpha, rad');
```

Before you compare the signals, you can specify a tolerance value to use for the comparison. Comparisons use tolerance values specified for the baseline signal in the comparison, so set an absolute tolerance value of 0.1 on the `Stick` signal.

```
stick.AbsTol = 0.1;
```

Now, compare the signals using the Simulink.sdi.compareSignals function. The `Stick` signal is the baseline, and the `alpha, rad` signal is the signal to compare against the baseline.

```
comparisonResults = Simulink.sdi.compareSignals(stick.ID,alpha.ID);
match = comparisonResults.Status
```

```
match =
 ComparisonSignalStatus enumeration

 OutOfTolerance
```

The comparison result is out of tolerance. You can use the `Simulink.sdi.view` function to open the Simulation Data Inspector to view and analyze the comparison results.

## Input Arguments

### **runObj** — Run that contains desired signal

`Simulink.sdi.Run` object

Run that contains the desired signal, specified as a `Simulink.sdi.Run` object.

### **idx** — Index of signal in run

integer

Index of the signal within the run, specified as an integer.

## Output Arguments

### **sigID** — Signal ID

integer

Unique numeric signal identifier, returned as an integer.

## Version History

**Introduced in R2012b**

### Topics

“Inspect and Compare Data Programmatically”

# getSignalIDsByName

**Package:** Simulink.sdi

Get signal IDs for signals inside Simulink.sdi.Run object using signal name

## Syntax

```
sigIDs = getSignalIDsByName(runObj,name)
```

## Description

`sigIDs = getSignalIDsByName(runObj,name)` returns one or more signal IDs for signals in the Simulink.sdi.Run object with the specified name, name.

## Examples

### Get Signal IDs by Signal Name

You can access signal IDs for signals inside a Simulink.sdi.Run object by specifying the name of the signal for which you want the signal ID. You can use the signal ID to compare signals using the Simulink.sdi.compareSignals function, access the Simulink.sdi.Signal object for the signal using the Simulink.sdi.getSignal function, or delete the signal from the Simulation Data Inspector using the Simulink.sdi.deleteSignal function.

This example shows how to use the getSignalIDsByName function to access a signal using its name or its block path and how to access the signal ID for a signal contained inside a bus.

### Create Data in the Simulation Data Inspector

This example uses a model of a pulse counter to create simulation data in the Simulation Data Inspector. The model has two input signals that define the upper and lower limits for the counter, and one input pulse signal with pulses to count. The model uses buses to send data into the Bus Counter subsystem and out of it to an Outport block. The model is configured to log the pulse signal, input, and the output signal, OUT, which is connected to the Outport block.

Simulate the model to create a run that contains the logged data in the Simulation Data Inspector.

```
out = sim('ex_pulse_counter');
```

#### Access Signal IDs

Use the Simulation Data Inspector programmatic interface to access the logged data. The `Simulink.sdi.Run.getLatest` function returns the `Simulink.sdi.Run` object that corresponds to the most recently created run. You can access the signal IDs for logged signals from the `Simulink.sdi.Run` object.

```
countRun = Simulink.sdi.Run.getLatest;
```

Use the `getSignalIDsByName` function to access the signal ID for the input signal.

```
inSigID = getSignalIDsByName(countRun, 'input');
```

In a more complicated model, multiple signals might have the same name. In that case, using only the signal name with the `getSignalIDsByName` function results in an array of signal IDs for all logged signals in the model that use that name. To avoid duplicate results, you can specify the block path and signal name together. Use dots to separate elements of the block path instead of slashes. For example, to access the signal ID for the input signal, you could also specify the name as `'ex_pulse_counter.Pulse Generator.input'`.

```
inSigID = getSignalIDsByName(countRun, 'ex_pulse_counter.Pulse Generator.input');
```

#### Access Signal IDs for Signals Inside Composite Signals

The output logged in the `ex_pulse_counter` model is a bus signal. You can access the signal ID that corresponds to the top bus signal, `OUT`, the nested bus, `LIMITBUS`, and the individual signals in the bus: `output`, `upper_limit`, and `lower_limit`.

To access the signal ID for the top bus, specify the signal name, `OUT`.

```
OUTSigID = getSignalIDsByName(countRun, 'OUT');
```

To access the signal ID for the nested bus, specify the path to the signal in the bus hierarchy.

```
LIMITBUSsigID = getSignalIDsByName(countRun, 'OUT.LIMITBUS');
```

To access the signal ID for one of the individual signals, specify the path to the signal in the bus hierarchy. You cannot access the signal using only the signal name. The `Name` property of the `Signal` object includes the bus hierarchy.

```
upper_limitSigID = getSignalIDsByName(countRun, 'OUT.LIMITBUS.upper_limit');
upper_limitSig = Simulink.sdi.getSignal(upper_limitSigID);
upper_limitSig.Name
```

```
ans =
'OUT.LIMITBUS.upper_limit'
```

## Input Arguments

### **runObj** — Run containing signals with IDs you want to access

`Simulink.sdi.Run` object

Run containing the signals with the signal IDs you want to access, specified as a `Simulink.sdi.Run` object.

### **name** — Name of signal with ID you want to access

character vector | string

Name of the signal with the signal ID you want to access, specified as a character vector or string.

A model can use the same signal name for more than one signal. In that case, when you want to access the signal ID for a specific signal, you can include the block path for the block that produces the signal in the name argument. For example, specify name as `'slexAircraftExample.Pilot.Stick'` to access the signal ID for the signal named `Stick` that is the output of the `Pilot` block in the `slexAircraftExample` model.

To access signals inside composite signals, specify the path to the signal through the hierarchy of the composite signal. For example, specify name as `'COUNTERBUS.LIMITBUS.lower_limit'` to access the signal ID for the `lower_limit` signal inside the bus `LIMITBUS` that is nested in the bus `COUNTERBUS`.

Data Types: `char` | `string`

## Output Arguments

### **sigIDs** — Signal IDs for signals with specified name

scalar | array

One or more signal IDs for signals with the specified name, returned as a scalar or array.

## Version History

Introduced in R2020a

**See Also**

`Simulink.sdi.compareSignals` | `Simulink.sdi.deleteSignal` | `Simulink.sdi.getSignal`  
| `getSignalsByName`

**Topics**

“Inspect and Compare Data Programmatically”

# getSignalsByName

**Package:** Simulink.sdi

Access signals in a Simulink.sdi.Run object using signal name

## Syntax

```
sigs = getSignalsByName(runObj,name)
```

## Description

`sigs = getSignalsByName(runObj,name)` returns one or more Simulink.sdi.Signal objects with the name specified by name.

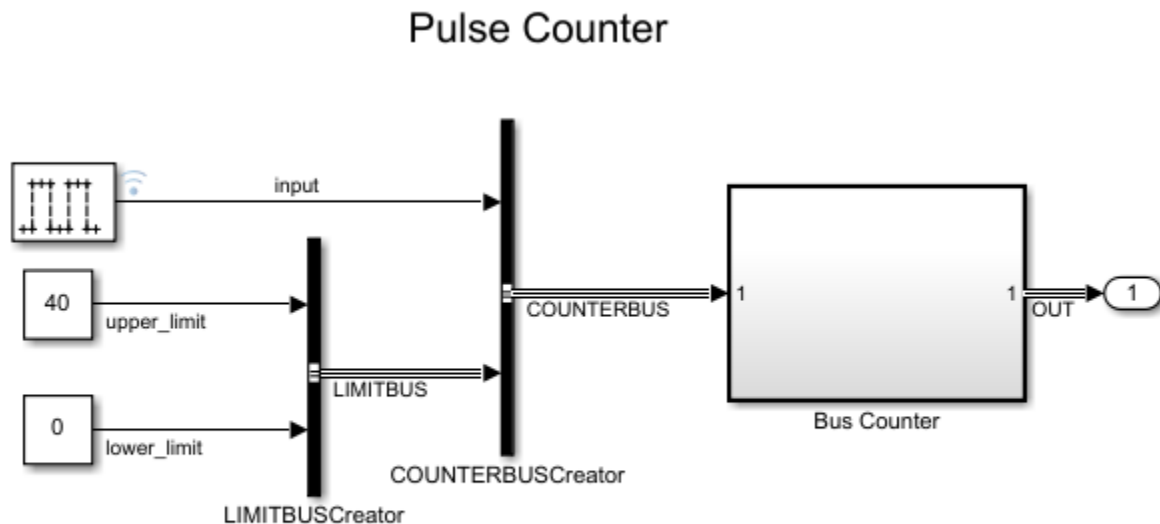

## Examples

### Access Simulink.sdi.Signal Objects by Name

You can use the Simulation Data Inspector programmatic interface to access Simulink.sdi.Signal objects that correspond to logged or imported data. Using the getSignalsByName function, you can specify the name of the signal you want to get from a Simulink.sdi.Run object. You can access data for individual signals and composite signals.

### Create Data in the Simulation Data Inspector

This example uses a model of a pulse counter to create simulation data in the Simulation Data Inspector. The model has two input signals that define the upper and lower limit for the counter, and one input pulse signal with pulses to count. The model uses buses to send data into the Bus Counter subsystem and out of it to an Outport block. The model is configured to log the pulse signal, input, and the output connected to the Outport block.

Copyright 1990-2014 The MathWorks, Inc.

Simulate the model to create a run that contains the logged data in the Simulation Data Inspector.

```
out = sim('ex_pulse_counter');
```

#### Access Signals in the Simulation Data Inspector

Use the Simulation Data Inspector programmatic interface to access the logged data. The `Simulink.sdi.Run.getLatest` function returns the `Simulink.sdi.Run` object that corresponds to the most recently created run.

```
countRun = Simulink.sdi.Run.getLatest;
```

Use the `getSignalsByName` function to access the input signal. Check the `Name` property of the returned `Simulink.sdi.Signal` object.

```
inSig = getSignalsByName(countRun, 'input');
inSig.Name
```

```
ans =
'input'
```

The input signal is not a composite signal, so the `Children` property of the `Signal` object is empty.

```
inChildren = inSig.Children;
size(inChildren)
```

```
ans = 1x2
```

```
0 0
```

Now, use the `getSignalsByName` function to access the output signal, `OUT`. `OUT` is a bus signal that contains the output signal from the counter, `output`, and the counter limit signals, `upper_limit` and `lower_limit`, in a nested bus named `LIMITBUS`.

```
outSig = getSignalsByName(countRun, 'OUT');
```

Check the Name and Children properties for the returned Signal object. The Children property value contains two Signal objects that correspond to the signals at the next level of hierarchy in the OUT bus.

```
outSig.Name
```

```
ans =
'OUT'
```

```
outChildren = outSig.Children;
size(outChildren)
```

```
ans = 1×2
 1 2
```

Because the Signal object `outSig` corresponds to a composite signal, you cannot plot the signal data in the Simulation Data Inspector using the Checked property or the `plotOnSubPlot` function. To plot data in the composite signal, access the individual Signal objects.

### Access Signals Inside a Composite Signal

You can access the signals inside the OUT bus and LIMITBUS by indexing into the Children property of the corresponding Signal object. For example, you can access the output signal from the OUT bus Signal object.

```
outChildren = outSig.Children;
outputSig = outChildren(1);
outputSig.Name
```

```
ans =
'OUT.output'
```

You can also get the Signal object for the output signal by specifying the path to the signal through the bus hierarchy.

```
outputSig = getSignalsByName(countRun, 'OUT.output');
outputSig.Name
```

```
ans =
'OUT.output'
```

To access the `upper_limit` signal, specify the full path to the signal within the bus.

```
upper_limitSig = getSignalsByName(countRun, 'OUT.LIMITBUS.upper_limit');
upper_limitSig.Name
```

```
ans =
'OUT.LIMITBUS.upper_limit'
```

## Input Arguments

**runObj** — Run containing signals you want to access

Simulink.sdi.Run object

Run containing the signals you want to access, specified as a `Simulink.sdi.Run` object.

**name — Name of signal you want to access**

character vector | string

Name of the signal you want to access, specified as a character vector or string.

A model can use the same signal name for more than one signal. In that case, when you want to access a specific signal, you can include the block path for the block that produces the signal in the name argument. For example, specify name as `'slexAircraftExample.Pilot.Stick'` to access the signal named `Stick` that is the output of the `Pilot` block in the `slexAircraftExample` model.

To access signals inside composite signals, specify the path to the signal through the hierarchy of the composite signal. For example, specify name as `'COUNTERBUS.LIMITBUS.lower_limit'` to access the `lower_limit` signal inside the bus `LIMITBUS` that is nested in the bus `COUNTERBUS`.

Data Types: `char` | `string`

## Output Arguments

**sigs — Signals matching specified name**

`Simulink.sdi.Signal` object | array of `Simulink.sdi.Signal` objects

One or more signals matching the specified name, returned as a `Simulink.sdi.Signal` object or an array of `Simulink.sdi.Signal` objects.

## Version History

# isValidSignalID

**Package:** Simulink.sdi

Check whether signal ID corresponds to signal in Simulink.sdi.Run object

## Syntax

```
isValid = isValidSignalID(runObj,sigID)
```

## Description

`isValid = isValidSignalID(runObj,sigID)` returns the logical indication `isValid` of whether the signal ID `sigID` corresponds to a signal in the Simulink.sdi.Run object `runObj`.

## Input Arguments

### **runObj** — Run in Simulation Data Inspector

Simulink.sdi.Run object

Run in the Simulation Data Inspector, specified as a Simulink.sdi.Run object.

### **sigID** — Signal ID

integer

Unique numeric signal identifier, specified as an integer. The Simulation Data Inspector assigns a signal ID to each signal when a run is created. You can get the signal ID for a signal using one of these functions:

- `getAllSignalIDs`
- `getSignalIDByIndex`
- `getSignalIDsByName`
- `Simulink.sdi.createRun`

## Output Arguments

### **isValid** — Signal validity

logical

Signal validity, returned as a logical 1 or 0.

- 1 — The specified signal ID corresponds to a signal in the specified run.
- 0 — The specified signal ID does not correspond to a signal in the specified run.

## Version History

**Introduced in R2012b**

# Simulink.sdi.Signal

Access signal data and metadata

## Description

A `Simulink.sdi.Signal` object contains data and metadata for a signal in the **Simulation Data Inspector**. You can use the `Signal` object properties to inspect signal metadata, visualize signals on time plots, and compare signals using the `Simulink.sdi.compareSignals` function.

## Creation

A `Simulink.sdi.Signal` object is created for each signal you log in a model simulation or import into the Simulation Data Inspector. You can access `Signal` objects in the Simulation Data Inspector several ways. Generally, to access a `Signal` object, you first need to get the `Simulink.sdi.Run` object that contains the signal.

- The `Simulink.sdi.getSignal` function returns a `Signal` object that corresponds to the signal ID you provide.
- The `getSignal` function returns the `Signal` object with the specified signal ID inside the specified `Run` object.
- The `getSignalByIndex` function returns the `Signal` object at the specified index within the specified `Run` object.

## Properties

### Signal Properties

#### ID — Signal identifier

integer

This property is read-only.

Unique number identifying the signal, returned as an integer. The Simulation Data Inspector assigns a unique numeric ID to each run and signal.

#### RunID — Run identifier

integer

This property is read-only.

Run identifier for the run that contains the signal, returned as an integer. The Simulation Data Inspector assigns a unique numeric ID to each run and signal.

#### Name — Signal name

character vector | string

Name of the signal, specified as a character vector or a string. When the `Signal` object contains data logged from a simulation, the name matches the name specified for the signal in the model. If the

model does not specify the name, the signal name is the block path to the block that produces the signal.

Example: 'fuel'

### Domain — Signal type

'Signals' | 'Outports' | 'States' | 'Data Store Memory' | 'Parameters' | ...

Signal type, specified as one of these options:

- 'Signals' — Signal logging data.
- 'Outports' — Output logging data.
- 'States' — States logging data.
- 'Data Store Memory' — Data store memory logging data.
- 'Parameters' — Logged parameter data.
- 'Stateflow' — Stateflow data.
- 'Simscape' — Simscape data.
- 'Assessments' — Simulink Test assessment data.
- 'Profiling' — Execution profiling data.

The Domain property is empty for data not created by logging simulation data.

### Description — Signal description

' ' (default) | character vector | string

Description of the signal, specified as a character vector or a string. You can use the Description property to annotate the signal or identify the signal content beyond the Name. When you log Simscape data to the Simulation Data Inspector, the Description property is populated automatically for each node.

### Stored Units — Units of signal data stored on disk

character vector | string

This property is read-only.

Units of signal data stored on disk, specified as a character vector or a string. For signals generated from simulating a model, the stored units of the Signal objects use the units specified in the model. When you specify display units for a signal without units, the same units are used to set the stored units. To analyze a signal alongside another that uses different units, modify the display units for the signal. The Simulation Data Inspector performs the conversion to plot the data using the display units.

You can convert the stored units for a signal using the convertUnits function. Stored unit conversion does not support undo and may result in precision loss.

Example: 'g/s'

### Display Units — Units used to display signal data in Simulation Data Inspector

character vector | string

Units used to display signal data in the Simulation Data Inspector, specified as a character vector or a string. The display units for a signal may differ from the stored units that reflect the data stored on disk. Modify signal display units to analyze data in the Simulation Data Inspector. Unit preferences in

the Simulation Data Inspector may change the display units for logged and imported signal data. For more information, see “Signal Display Units”.

Example: 'm/s'

### **Data Type — Data type for signal data**

character vector | string

This property is read-only.

Data type of signal data, returned as a character vector or string.

Example: 'double'

### **Complexity — Complexity of signal data**

"real" | "complex"

This property is read-only.

Complexity of signal data, returned as "real" or "complex".

Example: "real"

### **SampleTime — Signal sample time**

character vector

This property is read-only.

Signal sample time, returned as a character vector or scalar. A value of 'Continuous' indicates a variable-step simulation.

Example: 'Continuous'

Example: '0.1'

### **Model — Name of model that produced signal**

character vector

This property is read-only.

Name of the model that produced the signal, returned as a character vector. The `Model` property is empty for `Signal` objects that contain data that was not produced by simulating a model.

Example: 'sldemo\_fuelsys'

### **BlockPath — Block path for block that produced signal**

character vector

This property is read-only.

Block path for the block that produced the signal, returned as a character array. The `BlockPath` property is a relative path that does not include model hierarchy. The `BlockPath` property is empty for `Signal` objects that contain data that was not produced by simulating a model.

Example: 'sldemo\_fuelsys/Engine Gas Dynamics'

### **FullBlockPath — Complete block path for block that produced signal**

character vector | cell array

This property is read-only.

Complete block path for the block that produced the signal, including the full model hierarchy, returned as a character vector. For signals within referenced models, `FullBlockPath` is a cell array that contains the full path. For other signals, `FullBlockPath` is identical to `BlockPath`. The `FullBlockPath` property is empty for `Signal` objects that contain data that was not produced by simulating a model.

### **BlockName — Name of block that produced signal**

character vector

This property is read-only.

Name of the block that produced the signal, returned as a character vector. The `BlockName` property is empty for `Signal` objects that contain data that was not produced by simulating a model.

Example: 'Engine Gas Dynamics'

### **PortIndex — Block port index**

integer

This property is read-only.

Index of the output port connected to the signal on the block that produces the signal. The `PortIndex` property is empty for `Signal` objects that contain data that was not produced by simulating a model.

Example: 1

### **Dimensions — Signal dimensions**

integer | integer array

This property is read-only.

Signal dimensions, returned as an integer or integer array.

Example: [1 2]

### **Channel — Index of signal within matrix**

integer array

This property is read-only.

Index of the signal within a matrix, returned as an integer array.

### **NumPoints — Number of samples in signal**

integer

This property is read-only.

Number of samples in the signal, returned as an integer.

### **Values — Signal values**

timeseries | structure

Time and data values for the signal, returned as a `timeseries` object for non-bus signals or structure matching the bus hierarchy for bus signals.

**RootSource — High-level structure that contains imported signal**

character vector

This property is read-only.

Name of the high-level structure containing the signal, returned as a character vector. The **RootSource** property only has value for imported signals.

Example: When you import the `Simulink.SimulationOutput` object `simOut` containing structure `xout`, the **RootSource** is `'simOut.get('xout')`

**TimeSource — Source of imported signal time data**

character vector

This property is read-only.

Path to the signal time data, returned as a character vector. The **TimeSource** property only has value for imported signals.

Example: When you import the `Simulink.SimulationOutput` object `simOut` containing structure `xout`, the **TimeSource** is `'simOut.get('xout').time'`

**DataSource — Source of imported signal data**

character vector

This property is read-only.

Path to the signal sample values, returned as a character array. The **DataSource** property only has value for imported signals.

Example: When you import the `Simulink.SimulationOutput` object `simOut` containing structure `xout`, the **DataSource** is `'simOut.get('xout').signals(1).values'`

**Children — Signals contained by composite signal**`Simulink.sdi.Signal` vector

This property is read-only.

Signals contained by the composite signal, returned as `Simulink.sdi.Signal` objects. The **Children** property is empty for scalar signals.

**Display Scaling — Scaling used to display signal data in Simulation Data Inspector**

1 (default) | scalar

Scaling used to display signal data in the Simulation Data Inspector, specified as a real non-zero scalar. **Display Scaling** acts as a multiplier, allowing you to scale the appearance of an individual signal in the Simulation Data Inspector. Scaling the display does not change the data values of the signal. Signals scale differently depending on the visualization type.

Visualization	Scaling
<b>Time Plot</b>	Scale an individual signal display in the y direction.
<b>Sparklines</b>	Scale an individual signal display in the y direction.

Visualization	Scaling
<b>XY</b>	Scale signal display in the y direction and x direction independently.
<b>Array</b>	Scale each element of the multidimensional signal display in the same manner in the y direction.
<b>Map</b>	Scale signal display in the longitudinal and latitudinal directions independently. Note that this allows you to convert other units to longitude and latitude.

### Display Offset – Offset used to display signal data in Simulation Data Inspector

1 (default) | scalar

Offset used to display signal data in the Simulation Data Inspector, specified as a real scalar. **Display Offset** allows you to shift the appearance of an individual signal in the Simulation Data Inspector. Offsetting the display does not change the data values of the signal. Signals shift differently depending on the visualization type.

Visualization	Scaling
<b>Time Plot</b>	Shift an individual signal display in the y direction.
<b>Sparklines</b>	Shift an individual signal display in the y direction.
<b>XY</b>	Shift signal display in the y direction and x direction independently.
<b>Array</b>	Shift each element of the multidimensional signal display in the same manner in the y direction.
<b>Map</b>	Shift signal display in the longitudinal and latitudinal directions independently.

### Visualization Properties

#### ComplexFormat – Display format for complex signals

"real-imaginary" | "magnitude" | "magnitude-phase" | "phase"

Complex format used to display complex signal data in the Simulation Data Inspector, specified as one of the following values. You can modify the ComplexFormat property for a Signal object to change how the Simulation Data Inspector displays the signal data when the object contains data for a complex signal.

- "real-imaginary" — The real and imaginary components of the signal display together when you plot the signal. The imaginary component of the signal is plotted with a different shade of the **Line Color**.
- "magnitude" — The magnitude of the signal displays when you plot the signal.
- "magnitude-phase" — The magnitude and phase of the signal display together when you plot the signal.
- "phase" — The phase of the signal displays when you plot the signal. The phase is plotted with a different shade of the **Line Color**.

Data Types: `char` | `string`

### Checked — Whether signal is plotted

`0` or `false` (default) | `1` or `true`

Whether the signal is plotted, specified as a logical value. Setting `Checked` to `false` clears the signal from all subplots. Setting `Checked` to `true` plots the signal on the active subplot.

Data Types: `logical`

### LineColor — Signal line color

1-by-3 vector

Color of signal in plots, specified as a 1-by-3 RGB vector with values between `0` and `1`.

Example: `[0 0.5 0.5]`

Data Types: `double`

### LineDashed — Signal line style

`'-'` | `'--'` | `':'` | `'-.'`

Signal line style used when the signal is plotted in the Simulation Data Inspector, specified as one of these options:

- `'-'` — Solid
- `'--'` — Dashed
- `':'` — Dotted
- `'-.'` — Dash-dotted

### LineWidth — Signal line width

`1` (default) | integer between `1` and `20`

Signal line width used when the signal is plotted in the Simulation Data Inspector, specified as an integer between `1` and `20`, inclusive.

### InterpMethod — Interpolation method

`'linear'` (default) | `'zoh'` | `'none'`

Interpolation method used in data visualization and the synchronization step of comparisons, specified as one of the following values:

- `'zoh'` — Zero-order hold interpolation
- `'linear'` — Linear interpolation
- `'none'` — No interpolation

For more information about the interpolation options, see “How the Simulation Data Inspector Compares Data”.

## Comparison Properties

### AbsTol — Absolute tolerance

`0` (default) | scalar

Absolute tolerance to use in signal comparisons, specified as a positive-valued scalar.

The Simulation Data Inspector uses tolerances specified in the signal properties of the baseline signal when the `OverrideGlobalTol` property is set to `1` or `true`. For more information about tolerances in the Simulation Data Inspector, see “How the Simulation Data Inspector Compares Data”.

Example: `0.1`

Data Types: `double`

### **RelTol – Relative tolerance**

`0` (default) | `scalar`

Relative tolerance to use in signal comparisons, specified as a positive-valued scalar. The relative tolerance is expressed as a fractional multiplier. For example, `0.1` specifies a 10 percent tolerance.

The Simulation Data Inspector uses tolerances specified in the signal properties of the baseline signal when the `OverrideGlobalTol` property is set to `1` or `true`. For more information about tolerances in the Simulation Data Inspector, see “How the Simulation Data Inspector Compares Data”.

Example: `0.05`

Data Types: `double`

### **TimeTol – Time tolerance**

`0` (default) | `scalar`

Time tolerance for the signal used in signal comparisons, specified as a positive-valued scalar. Specify the time tolerance in seconds.

The Simulation Data Inspector uses tolerances specified in the signal properties of the baseline signal when the `OverrideGlobalTol` property is set to `1` or `true`. For more information about tolerances in the Simulation Data Inspector, see “How the Simulation Data Inspector Compares Data”.

Example: `0.1`

Data Types: `double`

### **OverrideGlobalTol – Whether comparisons use signal tolerance**

`0` or `false` (default) | `1` or `true`

Whether comparisons use signal tolerance values instead of global tolerance values, specified as a logical value. Set the `OverrideGlobalTol` property to `1` or `true` to use the tolerance values defined in the `Signal` object properties. Set the property to `0` or `false` to use global tolerance values.

For more information about tolerances in the Simulation Data Inspector, see “How the Simulation Data Inspector Compares Data”.

Data Types: `logical`

### **SyncMethod – Synchronization method**

`'union'` (default) | `'intersection'`

Method used to synchronize signals in comparisons, specified as `'union'` or `'intersection'`. For more information about the synchronization options, see “How the Simulation Data Inspector Compares Data”.

## Object Functions

<code>convertUnits</code>	Convert units of <code>Simulink.sdi.Signal</code> object
<code>export</code>	Export data for signal in Simulation Data Inspector to workspace or file
<code>getAsTall</code>	Create tall timetable from <code>Simulink.sdi.Signal</code> object
<code>plotOnSubPlot</code>	Plot <code>Simulink.sdi.Signal</code> object on Simulation Data Inspector subplot

## Examples

### Analyze Simulation Data Using Signal Tolerances

You can programmatically specify signal tolerance values to use in comparisons performed using the Simulation Data Inspector. In this example, you compare data collected by simulating a model of an aircraft longitudinal flight control system. Each simulation uses a different value for the input filter time constant and logs the input and output signals. You analyze the effect of the time constant change by comparing results using the Simulation Data Inspector and signal tolerances.

First, load the session file that contains the simulation data.

```
Simulink.sdi.load('AircraftExample.mldatx');
```

The session file contains four runs. In this example, you compare data from the first two runs in the file. Access the `Simulink.sdi.Run` objects for the first two runs loaded from the file.

```
runIDs = Simulink.sdi.getAllRunIDs;
runIDs1 = runIDs(end-3);
runIDs2 = runIDs(end-2);
```

Now, compare the two runs without specifying any tolerances.

```
noTolDiffResult = Simulink.sdi.compareRuns(runIDs1,runIDs2);
```

Use the `getResultByIndex` function to access the comparison results for the `q` and `alpha` signals.

```
qResult = getResultByIndex(noTolDiffResult,1);
alphaResult = getResultByIndex(noTolDiffResult,2);
```

Check the `Status` of each signal result to see whether the comparison result fell within our out of tolerance.

```
qResult.Status
```

```
ans =
 ComparisonSignalStatus enumeration
 OutOfTolerance
```

```
alphaResult.Status
```

```
ans =
 ComparisonSignalStatus enumeration
 OutOfTolerance
```

The comparison used a value of 0 for all tolerances, so the `OutOfTolerance` result means the signals are not identical.

You can further analyze the effect of the time constant by specifying tolerance values for the signals. Specify the tolerances by setting the properties for the `Simulink.sdi.Signal` objects that correspond to the signals being compared. Comparisons use tolerances specified for the baseline signals. This example specifies a time tolerance and an absolute tolerance.

To specify a tolerance, first access the `Signal` objects from the baseline run.

```
runTs1 = Simulink.sdi.getRun(runIDTs1);
qSig = getSignalsByName(runTs1, 'q, rad/sec');
alphaSig = getSignalsByName(runTs1, 'alpha, rad');
```

Specify an absolute tolerance of 0.1 and a time tolerance of 0.6 for the `q` signal using the `AbsTol` and `TimeTol` properties.

```
qSig.AbsTol = 0.1;
qSig.TimeTol = 0.6;
```

Specify an absolute tolerance of 0.2 and a time tolerance of 0.8 for the `alpha` signal.

```
alphaSig.AbsTol = 0.2;
alphaSig.TimeTol = 0.8;
```

Compare the results again. Access the results from the comparison and check the `Status` property for each signal.

```
tolDiffResult = Simulink.sdi.compareRuns(runIDTs1, runIDTs2);
qResult2 = getResultByIndex(tolDiffResult, 1);
alphaResult2 = getResultByIndex(tolDiffResult, 2);
```

```
qResult2.Status
```

```
ans =
 ComparisonSignalStatus enumeration
 WithinTolerance
```

```
alphaResult2.Status
```

```
ans =
 ComparisonSignalStatus enumeration
 WithinTolerance
```

### Define Comparison and Visualization Properties for a Signal

This example shows how to obtain a `Simulink.sdi.Signal` object and modify its properties using the Simulation Data Inspector programmatic interface.

#### Create Data in the Simulation Data Inspector

When you simulate a model that logs data, a run is created in the Simulation Data Inspector to contain the logged data. You can also create a run in the Simulation Data Inspector by importing data. This example simulates the `slexAircraftExample` model and logs the data in `Dataset` format.

```
simOut = sim('slexAircraftExample', 'SaveFormat', 'Dataset');
```

## Get a Simulink.sdi.Signal Object

The programmatic simulation returns the logged data in the workspace variable `simOut`. You can access the logged data in that variable. However, to use the Simulation Data Inspector programmatic interface, you need to access the logged data in `Simulink.sdi.Run` and `Simulink.sdi.Signal` objects.

First, use the `Simulink.sdi.getCurrentSimulationRun` to get the `Run` object that was created when you simulated the `slexAircraftExample` model.

```
aircraftRun = Simulink.sdi.getCurrentSimulationRun('slexAircraftExample');
```

You can use the `getAllSignals` function to access the `Signal` objects for all the signals in the run. From the returned array of `Signal` objects, select the first signal.

```
signals = getAllSignals(aircraftRun);
sig = signals(1);
```

## Modify the Signal Properties

The `Simulink.sdi.Signal` object has properties that specify options for comparing and visualizing the signal. Specify a line style and color for the signal. Then, use the `Simulink.sdi.setSubPlotLayout` to configure the Simulation Data Inspector to show a single subplot, and use the `plotOnSubPlot` function to plot the signal.

```
sig.LineColor = [1 0.4 0.6];
sig.LineDashed = '-';
```

```
Simulink.sdi.setSubPlotLayout(1,1)
plotOnSubPlot(sig,1,1,true)
```

Use the `Simulink.sdi.view` function to open the Simulation Data Inspector and view the plotted signal.

## Compare Two Signals in the Same Run

You can use the Simulation Data Inspector programmatic interface to compare signals within a single run. This example compares the input and output signals of an aircraft longitudinal controller.

First, load the session that contains the data.

```
Simulink.sdi.load('AircraftExample.mldatx');
```

Use the `Simulink.sdi.Run.getLatest` function to access the latest run in the data.

```
aircraftRun = Simulink.sdi.Run.getLatest;
```

Then, you can use the `Simulink.sdi.getSignalsByName` function to access the `Stick` signal, which represents the input to the controller, and the `alpha, rad` signal that represents the output.

```
stick = getSignalsByName(aircraftRun,'Stick');
alpha = getSignalsByName(aircraftRun,'alpha, rad');
```

Before you compare the signals, you can specify a tolerance value to use for the comparison. Comparisons use tolerance values specified for the baseline signal in the comparison, so set an absolute tolerance value of `0.1` on the `Stick` signal.

```
stick.AbsTol = 0.1;
```

Now, compare the signals using the `Simulink.sdi.compareSignals` function. The `Stick` signal is the baseline, and the `alpha`, `rad` signal is the signal to compare against the baseline.

```
comparisonResults = Simulink.sdi.compareSignals(stick.ID,alpha.ID);
match = comparisonResults.Status

match =
 ComparisonSignalStatus enumeration

 OutOfTolerance
```

The comparison result is out of tolerance. You can use the `Simulink.sdi.view` function to open the Simulation Data Inspector to view and analyze the comparison results.

### Plot Signals from Simulation Run

This example demonstrates how to access the `Simulink.sdi.Run` object for a Simulation Data Inspector run created by logging signals. From the `Simulink.sdi.Run` object you can get `Simulink.sdi.Signal` objects that contain the logged signal data and metadata. You can use the `Signal` objects and the `plotOnSubPlot` function to plot the data in the Simulation Data Inspector.

#### Create a Simulation Run and Access the Run Object

The `ex_vdp` model logs two signals. To create a simulation run containing the logged data, simulate the model.

```
sim('ex_vdp');
```

The Simulation Data Inspector keeps track of runs by assigning a unique numeric run ID to each run created by simulation, importing data, or opening a session. To access the run object for the simulation you just performed, use the `Simulink.sdi.getAllRunIDs` function and take the last run ID in the returned vector.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Once you have the run ID for the run, you can use the `Simulink.sdi.getRun` function to get the `Simulink.sdi.Run` object that corresponds to the run. You can use the `Run` object to check the metadata associated with the run, including the number of signals in the run.

```
vdpRun = Simulink.sdi.getRun(runID);

vdpRun.SignalCount

ans = int32
 2
```

#### Plot Data Using Signal Objects

Use the `getSignalByIndex` function to access signals from the `Run` object, `vdpRun`.

```
signal1 = getSignalByIndex(vdpRun,1);
signal2 = getSignalByIndex(vdpRun,2);
```

Use the `Simulink.sdi.setSubPlotLayout` function to specify a 2-by-1 layout.

```
Simulink.sdi.setSubPlotLayout(2,1)
```

Before plotting the data, use the `Simulink.sdi.clearAllSubPlots` function to clear any data that is already plotted.

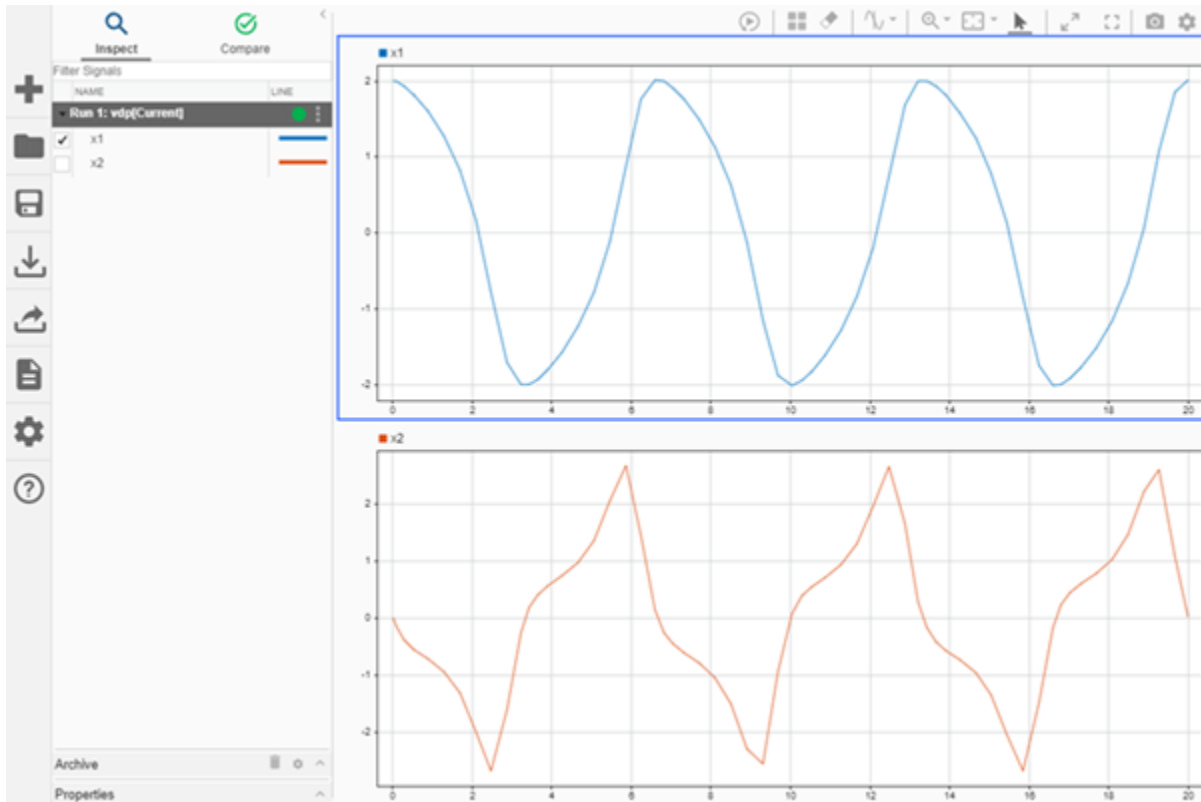

```
Simulink.sdi.clearAllSubPlots
```

Plot one signal on each subplot. To plot signals on the first subplot, you can set the checked property for the signal. To plot signals on subplots other than the first subplot, use the `plotOnSubPlot` function.

```
signal1.Checked = true;
plotOnSubPlot(signal2,2,1,true);
```

### View the Plotted Data

To view the plots you just created, open the Simulation Data Inspector using the `Simulink.sdi.view` function.

# collapse

**Package:** Simulink.sdi

Represent multidimensional signal as a single signal with nonscalar sample values

## Syntax

```
collapse(sigObj)
```

## Description

`collapse(sigObj)` converts the representation of the signal that corresponds to the `Simulink.sdi.Signal` object `sigObj` from a set of signals with scalar sample values to a single signal with nonscalar sample values.

When you convert the representation of a multidimensional signal from a set of scalar signals, called channels, to a single signal with nonscalar sample values:

- The `Signal` object that previously contained the data for the first channel contains the data for the multidimensional signal.
- The `Signal` objects for all other channels no longer contain data.
- The signal IDs for all other channels become invalid.

## Examples

### Convert Representation of Multidimensional Signal Data

When you analyze multidimensional signal data using the Simulation Data Inspector, you can choose whether to represent the data as a single signal with multidimensional sample values or as a set of signals, called *channels*, with scalar sample values. Use the Simulation Data Inspector programmatic interface to convert the representation of a signal created by logging the output of the Mux block in the model `vdp`.

### Open and Simulate the Model

Open the model `vdp`, mark the output of the Mux block for logging, and name the Mux block output signal. Then, simulate the model.

```
open_system('vdp');

MuxPort = get_param('vdp/Mux','PortHandles');
set_param(MuxPort.Outputport,'DataLogging','on');

MuxSig = get_param(MuxPort.Outputport,'Line');
set_param(MuxSig,'Name','Mux');

sim('vdp');
```

### Access the Run and Signal Data

By default, the output of the Mux block is represented as channels in the Simulation Data Inspector because it contains fewer than four channels, so the run contains two signals: one for each channel in the Mux block output.

Use the `Simulink.sdi.getCurrentSimulationRun` function to access the `Simulink.sdi.Run` object that contains the simulation data. Then, check how many `Simulink.sdi.Signal` objects the Run object contains using the `SignalCount` property on the Run object.

```
runObj = Simulink.sdi.getCurrentSimulationRun('vdp');
runObj.SignalCount
```

```
ans = int32
 2
```

Signals with multidimensional data have a top-level `Signal` object that does not contain data. The `Children` property of the top-level signal object contains one or more `Signal` objects associated with the top-level composite signal that contain the data. Because the top-level signals do not contain data, they are not counted to determine the value of the `SignalCount` property for the Run object.

Use the `getSignalsByName` function to access the top-level `Signal` object for the Mux block output.

```
topSig = getSignalsByName(runObj, 'Mux');
```

Use the `Children` property to access the `Signal` object for each channel.

```
sig1 = topSig.Children(1);
sig1.Name
```

```
ans =
'Mux(1)'
```

```
sig2 = topSig.Children(2);
sig2.Name
```

```
ans =
'Mux(2)'
```

### Convert Channels to a Multidimensional Signal

Use the `collapse` function to convert the representation of the Mux block output so you access the data as a single signal with multidimensional sample values.

```
collapse(sig1)
```

The Run object now contains only one signal with multidimensional sample values.

```
runObj.SignalCount
```

```
ans = int32
 1
```

The `Children` property of the top-level `Signal` object now contains only one signal.

```
size(topSig.Children)
```

```
ans = 1x2
```

```
1 1
```

After you convert a signal from channels to multidimensional representation, the `Signal` object that previously contained the data for the first channel contains the data for the multidimensional signal.

```
sig1.Values.Data
```

```
ans = 64x2
```

```
2.0000 0
2.0000 -0.0002
2.0000 -0.0012
2.0000 -0.0062
1.9998 -0.0306
1.9943 -0.1398
1.9379 -0.3840
1.8155 -0.5570
1.5990 -0.7204
1.2687 -0.9452
⋮
```

After conversion, the signal IDs for the `Signal` objects that contained data for other channels become invalid.

```
isValidSignalID(runObj,sig2.ID)
```

```
ans = logical
0
```

### Convert a Multidimensional Signal to Channels

Use the `expand` function to convert the Mux output back to channels.

```
expand(sig1)
```

After converting a multidimensional signal to channels, the `Signal` object that previously contained the data for the multidimensional signal contains the data for the first channel. New `Signal` objects are created for other channels.

```
sig1.Name
```

```
ans =
'Mux(1)'
```

The `Run` object and the `Children` property of the top-level `Signal` object both contain two signals.

```
runObj.SignalCount
```

```
ans = int32
2
```

```
size(topSig.Children)
```

```
ans = 1x2
1 2
```

Access the new `Signal` object that contains the data for the second channel.

```
newSig = topSig.Children(2);
newSig.Name
```

```
ans =
'Mux(2)'
```

## Input Arguments

**sigObj** — Channel of multidimensional signal to convert to single signal

`Simulink.sdi.Signal` object

Channel of multidimensional signal to convert to a single signal, specified as a `Simulink.sdi.Signal` object.

# convertDataType

**Package:** Simulink.sdi

Convert data type for signal in Simulation Data Inspector

## Syntax

```
convertDataType(sigObj, dataType)
```

## Description

`convertDataType(sigObj, dataType)` converts the data in the `Simulink.sdi.Signal` object `sigObj` to the specified data type `dataType`.

The `convertDataType` function supports converting to all built-in data types. For more information, see “Data Types Supported by Simulink”. When you have a license for Fixed-Point Designer, you can also convert to fixed-point data types defined using the `fixdt` function.

You cannot convert the data type for a signal produced by logging simulation data while the simulation that produces the signal is in progress.

---

**Warning** You cannot undo a data type conversion in the Simulation Data Inspector. Some data types allow more precision in the stored data values than others. Conversion to a data type with less precision can result in permanent loss of precision in data values.

---

## Examples

### Convert Data Type for Logged Signal

Simulate the model `vdp` while logging outputs using the `Dataset` format.

```
mdl = "vdp";
open_system(mdl)
out = sim(mdl, SaveOutput="on", SaveFormat="Dataset");
```

Access the `Simulink.sdi.Run` object that contains the logged data and metadata in the Simulation Data Inspector:

```
run1 = Simulink.sdi.getCurrentSimulationRun(mdl);
```

Access the `Simulink.sdi.Signal` object that contains the data for the signal `x1`.

```
x1Sig = getSignalsByName(run1, "x1");
```

Check the `DataType` property for the signal. The model uses the `double` data type for the signal.

```
x1Sig.DataType
```

```
ans =
'double'
```

Convert the data type for the signal from `double` to `single`. You cannot undo a data type conversion in the Simulation Data Inspector. When you convert to a data type with less precision in the stored data values, precision lost due to conversion is permanent. A warning occurs when the data type conversion causes a loss in precision.

```
convertDataType(x1Sig, "single");
```

Warning: Changing the data type of signal 'x1' from 'double' to 'single' causes precision loss t

Check the `DataType` property for the signal again.

```
x1Sig.DataType
```

```
ans =
'single'
```

### Convert Data Type for Imported Signal

Create time and signal data that represents a sine wave.

```
time = 0.01*(0:1000);
time = time';
data = 50*sin(2*pi/3*time);
```

By default, MATLAB® creates `double` data. To represent a scenario where another process creates `int32` data you want to analyze in the Simulation Data Inspector, convert the data type for the signal values to `int32`.

```
data = cast(data, "int32");
```

Create a `timeseries` object using the time and data values for the signal. Then, name the `timeseries` object `Sine Wave`.

```
sigTS = timeseries(data,time);
sigTS.Name = "Sine Wave";
```

Import the signal into the Simulation Data Inspector.

```
runObj = Simulink.sdi.Run.create("Imported Data", "vars", sigTS);
```

Access the `Simulink.sdi.Signal` object with the data values. Then, check the signal data type.

```
sigObj = getSignalsByName(runObj, "Sine Wave");
sigObj.DataType
```

```
ans =
'int32'
```

Use the `convertDataType` function to convert the data type to `double`. Then, check the signal data type again.

```
convertDataType(sigObj, "double");
sigObj.DataType
```

```
ans =
'double'
```

## Input Arguments

### **sigObj** — Signal with data to convert

`Simulink.sdi.Signal` object

Signal with data to convert, specified as a `Simulink.sdi.Signal` object.

### **dataType** — Desired data type for signal

string | character vector

Desired data type for signal, specified as a string or a character vector.

You can convert to any built-in data type by specifying the name for the data type as a string or character vector. For example, to convert to an 8-bit unsigned integer data type, specify the data type as `"uint8"`. For more information about built-in data types and their names, see “Data Types Supported by Simulink”.

When you have a license for Fixed-Point Designer, you can also convert to fixed-point data types defined using the `fixdt` function. To convert to a fixed-point data type, specify the `fixdt` command as a string or a character vector.

Example: `"int16"` specifies conversion to the built-in signed 16-bit integer data type

Example: `"fixdt(1,12,4)"` specifies conversion to a fixed-point data type defined using the `fixdt` function

### Topics

“Modify Signal Properties in the Simulation Data Inspector”

## convertToFrames

**Package:** Simulink.sdi

Remove buffering from frames of frame-based signal

### Syntax

```
convertToFrames(sigObj)
```

### Description

`convertToFrames(sigObj)` removes the buffering from each frame of the frame-based signal that corresponds to the `Simulink.sdi.Signal` object `sigObj`. For example, suppose `sigObj` is a frame-based signal with 64-by-2 sample values. The `convertToFrames` function interprets each 64-by-2 sample as 64 evenly spaced 1-by-2 samples.

To convert the representation of a signal using the `convertToFrames` function, the signal must have a discrete sample rate, and the sample values must be nonscalar with fixed dimensions. The `convertToFrames` function does not support variable-size signals. The Simulation Data Inspector does not support converting frames for imported data.

### Examples

#### Interpret Data in Simulation Data Inspector as Frame-Based

Some applications buffer several samples of a signal into a *frame* to process with a single computation. When you log a frame-based signal to the Simulation Data Inspector, you can view and analyze the data for each frame using an array plot, or you can convert the representation of the signal data to undo the buffering. This example converts the representation of a frame-based signal from the model `sfcndemo_frame`.

Simulating the model for this example requires a license for DSP System Toolbox™. Converting frame-based data in the Simulation Data Inspector does not require a license for DSP System Toolbox.

Open the model `sfcndemo_frame`. Then, mark the output from the A/D Converter block for logging and specify a name for the signal line.

```
open_system('sfcndemo_frame');
ADPort = get_param(find_system(gcs, 'FindAll', 'on', 'name', 'A/D Converter'), 'PortHandles');
set_param(ADPort.Outputport, 'DataLogging', 'on');
```

```
ADLine = get_param(ADPort.Outputport, 'Line');
set_param(ADLine, 'Name', 'Noisy Signal');
```

Simulate the model.

```
out = sim('sfcndemo_frame', 'StopTime', '99.84');
```

Use the `Simulink.sdi.getCurrentSimulationRun` function to access the simulation data.

```
runObj = Simulink.sdi.getCurrentSimulationRun('sfcndemo_frame');
```

Use the `getSignalsByName` function to access the `Simulink.sdi.Signal` object for the A/D Converter block output signal named `Noisy Signal`.

```
NoisySig = getSignalsByName(runObj, 'Noisy Signal');
```

Check the dimensions for a sample of the signal. The signal has two channels with a frame size of 64, resulting in sample values with dimensions 64-by-2. Because each sample is two-dimensional, the samples are concatenated along the third dimension, such that the time values align with the third dimension of the array of sample values.

```
size(NoisySig.Values.Data(:,:,1))
```

```
ans = 1×2
 64 2
```

To analyze the the data for the signal over the duration of the simulation, use the `convertToFrames` function to interpret the signal as frame-based.

```
convertToFrames(NoisySig);
```

Check the dimensions for a sample of the signal. After interpreting the signal as frame-based, each sample is a vector, and time aligns with the first dimension of the array of sample values.

```
size(NoisySig.Values.Data(1,:))
```

```
ans = 1×2
 1 2
```

Because the resulting signal has fewer than four elements in each sample, the Simulation Data Inspector also automatically converts the signal to channels. You can access the `Signal` objects for each channel using the `Children` property of the original `Signal` object.

```
NoisyChannel1 = NoisySig.Children(1);
NoisyChannel1.Name
```

```
ans =
'Noisy Signal(1)'
```

```
NoisyChannel2 = NoisySig.Children(2);
NoisyChannel2.Name
```

```
ans =
'Noisy Signal(2)'
```

Each channel has scalar sample values.

```
size(NoisyChannel1.Values.Data(1,:))
```

```
ans = 1×2
 1 1
```

## Input Arguments

### **sigObj** — Signal with data to convert

`Simulink.sdi.Signal` object

Signal with data to convert, specified as a `Simulink.sdi.Signal` object. The `convertToFrames` function does not support variable-size signals.

## Version History

Introduced in R2021b

## See Also

### Objects

### Functions

`collapse` | `expand`

# convertUnits

**Package:** Simulink.sdi

Convert units of Simulink.sdi.Signal object

## Syntax

```
convertUnits(sig,units)
```

## Description

`convertUnits(sig,units)` converts the stored units of the `Simulink.sdi.Signal` object `sig` to the units specified by `units`. When you convert the stored units, the display units are updated. For a list of supported units, see [Allowed Units](#). You can use the `convertUnits` function to convert the units of `Simulink.sdi.Signal` objects that contain data of all built-in and fixed-point types.

---

**Note** Unit conversion does not support undo and may lead to precision loss.

---

## Examples

### Programmatically Convert Signal Units

Use the `convertUnits` function to convert the stored units of a `Simulink.sdi.Signal` object. This example uses data generated by simulating the model `sldemo_autotrans`. When you convert the stored units of the `Signal` object, the Simulation Data Inspector performs a conversion on the data and updates the signal display units any plots that display the signal. Changing the stored units of a `Signal` object does not affect the model that created the signal.

### Generate Simulation Data

Simulate the `sldemo_autotrans` model to create a run in the Simulation Data Inspector. Then, use the `Simulink.sdi.Run.getLatest` function to access the `Run` object that corresponds to the simulation.

```
out = sim('sldemo_autotrans');
autoRun = Simulink.sdi.Run.getLatest;
```

### Inspect the Signal Properties

Get the `Simulink.sdi.Signal` object for the `EngineRPM` signal and check the `StoredUnits` and `DisplayUnits` properties.

```
engine_sig = getSignalsByName(autoRun, 'EngineRPM');
engine_sig.StoredUnits
ans =
'rpm'
```

```
engine_sig.DisplayUnits
```

```
ans =
'rpm'
```

### Convert Stored Units

Use the `convertUnits` function to convert the `EngineRPM` signal units to `rad/s`. When you convert the stored units, the display units are updated. Then, change the signal name to reflect the new units.

```
convertUnits(engine_sig,'rad/s')
engine_sig.Name = 'EngineFreq,rad/s';
```

Check the modified signal properties.

```
engine_sig.StoredUnits
```

```
ans =
'rad/s'
```

```
engine_sig.DisplayUnits
```

```
ans =
'rad/s'
```

```
engine_sig.Name
```

```
ans =
'EngineFreq,rad/s'
```

## Input Arguments

### **sig** — Signal with units to convert

`Simulink.sdi.Signal` object

Signal with units to convert, specified as a `Simulink.sdi.Signal` object.

### **units** — Desired signal units

string | character vector

Desired signal units, specified as a string or character vector. For a list of accepted units, see [Allowed Units](#).

Example: 'm'

Example: "ft/s"

Data Types: char | string

## expand

**Package:** Simulink.sdi

Represent multidimensional signal as group of signals with scalar sample values

### Syntax

```
expand(sigObj)
```

### Description

`expand(sigObj)` converts the representation of the signal that corresponds to the `Simulink.sdi.Signal` object `sigObj` from a single signal with nonscalar sample values to a set of signals with scalar sample values: one signal, called a channel, for each element in the multidimensional sample values.

Expanding a signal creates a new `Signal` object for each channel except the channel that corresponds to the first element in the multidimensional signal value. The data for the first channel in the multidimensional signal is stored in the `Signal` object that previously contained the multidimensional signal data.

The `expand` function does not support variable-size signals.

### Examples

#### Convert Representation of Multidimensional Signal Data

When you analyze multidimensional signal data using the Simulation Data Inspector, you can choose whether to represent the data as a single signal with multidimensional sample values or as a set of signals, called *channels*, with scalar sample values. Use the Simulation Data Inspector programmatic interface to convert the representation of a signal created by logging the output of the Mux block in the model `vdp`.

#### Open and Simulate the Model

Open the model `vdp`, mark the output of the Mux block for logging, and name the Mux block output signal. Then, simulate the model.

```
open_system('vdp');

MuxPort = get_param('vdp/Mux','PortHandles');
set_param(MuxPort.Outputport,'DataLogging','on');

MuxSig = get_param(MuxPort.Outputport,'Line');
set_param(MuxSig,'Name','Mux');

sim('vdp');
```

## Access the Run and Signal Data

By default, the output of the Mux block is represented as channels in the Simulation Data Inspector because it contains fewer than four channels, so the run contains two signals: one for each channel in the Mux block output.

Use the `Simulink.sdi.getCurrentSimulationRun` function to access the `Simulink.sdi.Run` object that contains the simulation data. Then, check how many `Simulink.sdi.Signal` objects the Run object contains using the `SignalCount` property on the Run object.

```
runObj = Simulink.sdi.getCurrentSimulationRun('vdp');
runObj.SignalCount
```

```
ans = int32
 2
```

Signals with multidimensional data have a top-level `Signal` object that does not contain data. The `Children` property of the top-level signal object contains one or more `Signal` objects associated with the top-level composite signal that contain the data. Because the top-level signals do not contain data, they are not counted to determine the value of the `SignalCount` property for the Run object.

Use the `getSignalsByName` function to access the top-level `Signal` object for the Mux block output.

```
topSig = getSignalsByName(runObj, 'Mux');
```

Use the `Children` property to access the `Signal` object for each channel.

```
sig1 = topSig.Children(1);
sig1.Name
```

```
ans =
'Mux(1)'
```

```
sig2 = topSig.Children(2);
sig2.Name
```

```
ans =
'Mux(2)'
```

## Convert Channels to a Multidimensional Signal

Use the `collapse` function to convert the representation of the Mux block output so you access the data as a single signal with multidimensional sample values.

```
collapse(sig1)
```

The Run object now contains only one signal with multidimensional sample values.

```
runObj.SignalCount
```

```
ans = int32
 1
```

The `Children` property of the top-level `Signal` object now contains only one signal.

```
size(topSig.Children)
```

```
ans = 1x2
```

```
1 1
```

After you convert a signal from channels to multidimensional representation, the `Signal` object that previously contained the data for the first channel contains the data for the multidimensional signal.

```
sig1.Values.Data
```

```
ans = 64x2
```

```
2.0000 0
2.0000 -0.0002
2.0000 -0.0012
2.0000 -0.0062
1.9998 -0.0306
1.9943 -0.1398
1.9379 -0.3840
1.8155 -0.5570
1.5990 -0.7204
1.2687 -0.9452
⋮
```

After conversion, the signal IDs for the `Signal` objects that contained data for other channels become invalid.

```
isValidSignalID(runObj,sig2.ID)
```

```
ans = logical
0
```

### Convert a Multidimensional Signal to Channels

Use the `expand` function to convert the Mux output back to channels.

```
expand(sig1)
```

After converting a multidimensional signal to channels, the `Signal` object that previously contained the data for the multidimensional signal contains the data for the first channel. New `Signal` objects are created for other channels.

```
sig1.Name
```

```
ans =
'Mux(1)'
```

The `Run` object and the `Children` property of the top-level `Signal` object both contain two signals.

```
runObj.SignalCount
```

```
ans = int32
2
```

```
size(topSig.Children)
```

```
ans = 1x2
1 2
```

Access the new `Signal` object that contains the data for the second channel.

```
newSig = topSig.Children(2);
newSig.Name
```

```
ans =
'Mux(2)'
```

## Input Arguments

### **sigObj** – Multidimensional signal to convert to channels

`Simulink.sdi.Signal` object

Multidimensional signal to convert to channels, specified as a `Simulink.sdi.Signal` object. The `expand` function does not support variable-size signals.

## Version History

**Introduced in R2021b**

## See Also

### **Objects**

`Simulink.sdi.Signal` | `Simulink.sdi.Run`

### **Functions**

`collapse` | `convertToFrames`

## export

**Package:** Simulink.sdi

Export data for signal in Simulation Data Inspector to workspace or file

### Syntax

```
sigData = export(sig)
sigData = export(sig,startTime,endTime)
export(___,Name=Value)
```

### Description

`sigData = export(sig)` exports the data for one or more signals in the Simulation Data Inspector to the workspace.

- If `sig` is a scalar `Simulink.sdi.Signal` object, then `sigData` is a `timeseries` object.
- If `sig` is an array of `Simulink.sdi.Signal` objects, then `sigData` is a `Simulink.SimulationData.Dataset` object that contains a `Simulink.SimulationData.Signal` object for each signal in the input array.

`sigData = export(sig,startTime,endTime)` exports to the workspace the portion of one or more signals within the interval defined by the start time `startTime` and the end time `endTime`.

`export( ___,Name=Value)` exports one or more signals in the Simulation Data Inspector to the workspace or a file according to the options specified by one or more name-value arguments.

For most signals, you can choose to export the data to the workspace, a MAT file, or a Microsoft Excel file.

When the signal contains video data, you can export the signal to an MP4 file. Exporting a video signal to an MP4 file is not supported for Linux operating systems.

### Examples

#### Export Signal Data to Workspace

This example shows how to create a run in the Simulation Data Inspector, access the data, and export the signal data to a `timeseries` object in the workspace.

Simulate the model `sldemo_fuelsys` to create a run in the Simulation Data Inspector that contains the logged data.

```
sim('sldemo_fuelsys');
```

Use the `Simulink.sdi.getCurrentSimulationRun` function to access the run.

```
fuelRun = Simulink.sdi.getCurrentSimulationRun('sldemo_fuelsys');
```

Use the `getSignalByIndex` function to get the second signal in the `Simulink.sdi.Run` object.

```
sig = getSignalByIndex(fuelRun,2);
```

Export the signal data to the workspace using the `export` function.

```
ts = export(sig);
```

## Input Arguments

### **sig** — Signal to export

`Simulink.sdi.Signal` object | array of `Simulink.sdi.Signal` objects

Signal to export, specified as a `Simulink.sdi.Signal` object or an array of `Simulink.sdi.Signal` objects.

### **startTime** — Start of signal portion to export

numeric scalar

Start of signal portion to export, specified as a numeric scalar.

Example: `sigData = export(sig,0,10)` exports to the workspace the portion of the signal `sig` between the times 0 and 10.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

### **endTime** — End of signal portion to export

numeric scalar

End of signal portion to export, specified as a numeric scalar.

Example: `sigData = export(sig,0,10)` exports to the workspace the portion of the signal `sig` between the times 0 and 10.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

## Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `to="file",filename="mySpreadshee.xlsx"`

### **to** — Where to export data

'variable' (default) | 'file'

Where to export data, specified as:

- 'variable' — Export one or more signals to the workspace.
- 'file' — Export one or more signals to a MAT file, a Microsoft Excel file, or an MP4 file.

When you export data to a file, specify a file name using the `filename` name-value argument.

Example: `to="file",filename="mySpreadsheet.xlsx"`

**filename — Name and type of file to which to export data**

string | character vector

Name and type of file to which to export data, specified as a string or character vector. Include a file extension to specify the type of file:

- `.mat` — Export data to MAT file.
- `.xlsx` — Export data to Microsoft Excel file.
- `.mp4` — Export data to MP4 file.

When you do not specify an extension with the file name, the data exports to a MAT file.

To specify the `filename` name-value argument, you must specify the `to` name-value argument as `'file'`.

To export a video signal to an MP4 file:

- The signal must be 2D or 3D and contain RGB or monochrome video data.
- The data type for the signal values must be `double`, `single`, or `uint8`.
- The signal must be represented as a single signal with multidimensional sample values.

You may need to convert the representation of the signal using the `collapse` function before exporting the signal data. For more information, see “Analyze Multidimensional Signal Data”.

Example: `to="file",filename="mySpreadsheet.xlsx"`

**Tips**

- When you export one signal to a MAT file, the data is saved in the MAT file as a `timeseries` object.
- When you export multiple signals to a MAT file, the data is saved as a `Simulink.SimulationData.Dataset` object that contains a `Simulink.SimulationData.Signal` object for each exported signal.
- Data exported to a Microsoft Excel file is saved using the format described in “Microsoft Excel Import, Export, and Logging Format”.
- When you export data to a Microsoft Excel file, you can specify additional options using the `overwrite`, `metadata`, and `sharetimecolumn` name-value arguments.

**overwrite — Data to overwrite in existing Microsoft Excel file**`'file'` (default) | `'sheetonly'`

Data to overwrite in existing Microsoft Excel file, specified as `'file'` or `'sheetonly'`.

- `'file'` — Overwrite the entire file with the exported data.
- `'sheetonly'` — Overwrite only sheets of the Microsoft Excel file that contain data that corresponds to the exported data.

Specify the `overwrite` name-value argument only when you export data to a Microsoft Excel file.

When you export data to an existing MAT file, the exported data overwrites the entire file.

Example: `overwrite="sheetonly"`

**metadata — Metadata to include in exported Microsoft Excel file**

[] (default) | string array

Metadata to include in the exported Microsoft Excel file, specified as a string array. By default, the exported file does not include any metadata. You can export this metadata to a Microsoft Excel file:

- `dataType` — Signal data type
- `units` — Signal units
- `blockPath` — Path to the source block for logged signals
- `interp` — Signal interpolation method
- `portIndex` — Index of the port on the source block for logged signals

The order of metadata options in the string array does not determine the order of the metadata in the exported file, which always matches the description in “Microsoft Excel Import, Export, and Logging Format”.

Example: `metadata=["units" "dataType"]`

**sharetimecolumn — Option for signals to share time columns in exported Microsoft Excel file**

'on' (default) | 'off'

Option for signals that have identical time data to share time columns in the exported Microsoft Excel file, specified as 'on' or 'off'. By default, signals that have identical time data share a time column in the exported file. When you specify the value as 'off', each signal in the exported file has its own time column.

Example: `sharetimecolumn='off'`

**Output Arguments****sigData — Exported signal data**

timeseries object | Simulink.SimulationData.Dataset object

Exported signal data, returned as a timeseries object or a Simulink.SimulationData.Dataset object.

**Alternatives**

You can export data to the workspace or a file using the Simulation Data Inspector. For more information, see “Save and Share Simulation Data Inspector Data and Views”.

**Version History**

Introduced in R2017b

# getAsTall

**Package:** Simulink.sdi

Create tall timetable from Simulink.sdi.Signal object

## Syntax

```
tt = getAsTall(sig)
```

## Description

`tt = getAsTall(sig)` returns a tall timetable containing the time and data values in the Simulink.sdi.Signal object `sig`. For more information on working with tall arrays, see “Tall Arrays for Out-of-Memory Data”.

## Examples

### Get Tall Timetable of Signal Data

This example shows how to generate a tall timetable from the signal data in a Simulink.sdi.Signal object.

Create a run containing logged data in the Simulation Data Inspector by simulating the model `sldemo_fuelsys`.

```
sim('sldemo_fuelsys');
```

Use the `Simulink.sdi.getAllRunIDs` function to get the run ID for the run that corresponds to the simulation. Then use the `Simulink.sdi.getRun` function to get the `Simulink.sdi.Run` object that corresponds to the run ID.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

```
fuelRun = Simulink.sdi.getRun(runID);
```

Use the `getSignalByIndex` function to get the `Simulink.sdi.Signal` object that corresponds to the second signal in the run.

```
sig = getSignalByIndex(fuelRun,2);
```

Get a tall timetable containing the signal data by using the `getAsTall` function.

```
tt = getAsTall(sig)
```

```
tt =
```

```
 Mx1 tall timetable
```

```
 Time
```

```
 Data
```

```

## Input Arguments

### **sig** — Signal to return as a tall timetable

`Simulink.sdi.Signal` object

Signal to return as a tall timetable, specified as a `Simulink.sdi.Signal` object.

## Output Arguments

### **tt** — Tall timetable

tall timetable

Data from the `Simulink.sdi.Signal`, returned as a tall timetable.

## Version History

Introduced in R2017b

# plotOnSubPlot

**Package:** Simulink.sdi

Plot Simulink.sdi.Signal object on Simulation Data Inspector subplot

## Syntax

```
plotOnSubplot(sig,r,c,checked)
```

## Description

plotOnSubplot(sig,r,c,checked) plots or clears the signal that corresponds to the Simulink.sdi.Signal object sig on the subplot specified by r and c.

## Examples

### Plot Signals from Simulation Run

This example demonstrates how to access the Simulink.sdi.Run object for a Simulation Data Inspector run created by logging signals. From the Simulink.sdi.Run object you can get Simulink.sdi.Signal objects that contain the logged signal data and metadata. You can use the Signal objects and the plotOnSubPlot function to plot the data in the Simulation Data Inspector.

#### Create a Simulation Run and Access the Run Object

The ex\_vdp model logs two signals. To create a simulation run containing the logged data, simulate the model.

```
sim('ex_vdp');
```

The Simulation Data Inspector keeps track of runs by assigning a unique numeric run ID to each run created by simulation, importing data, or opening a session. To access the run object for the simulation you just performed, use the Simulink.sdi.getAllRunIDs function and take the last run ID in the returned vector.

```
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);
```

Once you have the run ID for the run, you can use the Simulink.sdi.getRun function to get the Simulink.sdi.Run object that corresponds to the run. You can use the Run object to check the metadata associated with the run, including the number of signals in the run.

```
vdpRun = Simulink.sdi.getRun(runID);
```

```
vdpRun.SignalCount
```

```
ans = int32
 2
```

### **Plot Data Using Signal Objects**

Use the `getSignalByIndex` function to access signals from the Run object, `vdpRun`.

```
signal1 = getSignalByIndex(vdpRun,1);
signal2 = getSignalByIndex(vdpRun,2);
```

Use the `Simulink.sdi.setSubPlotLayout` function to specify a 2-by-1 layout.

```
Simulink.sdi.setSubPlotLayout(2,1)
```

Before plotting the data, use the `Simulink.sdi.clearAllSubPlots` function to clear any data that is already plotted.

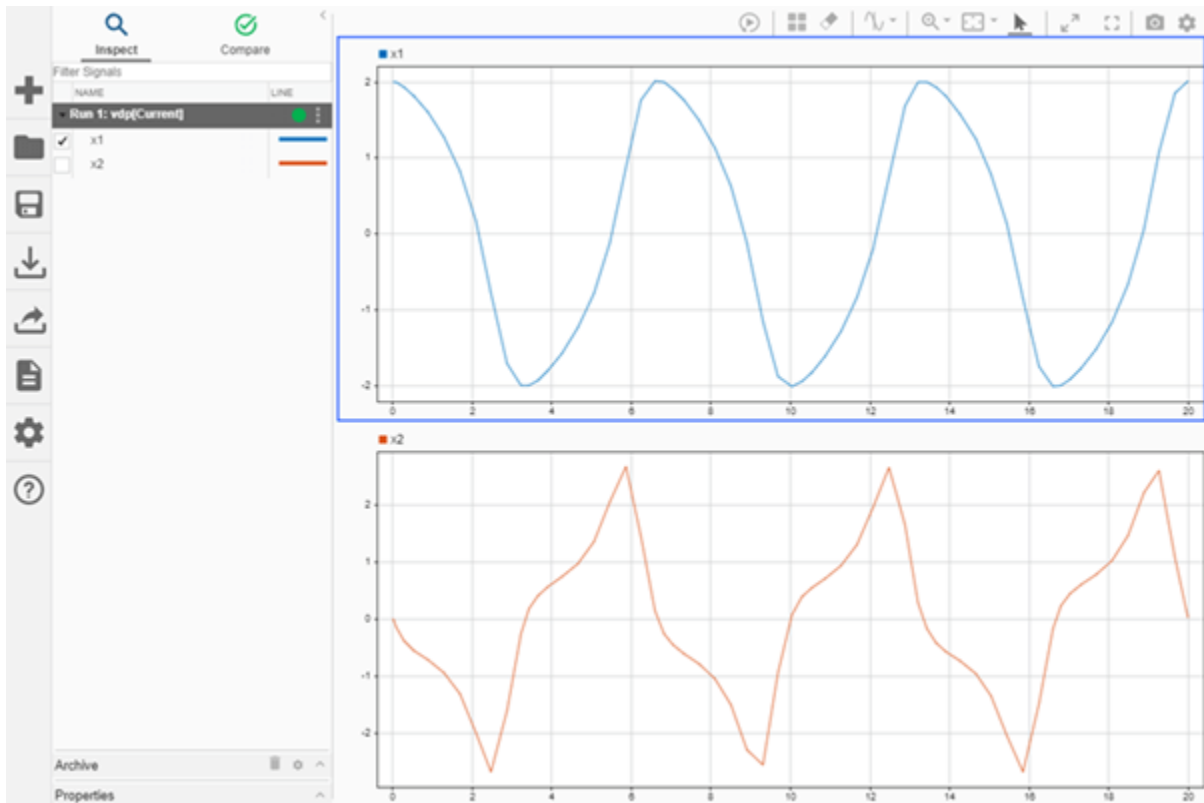

```
Simulink.sdi.clearAllSubPlots
```

Plot one signal on each subplot. To plot signals on the first subplot, you can set the `checked` property for the signal. To plot signals on subplots other than the first subplot, use the `plotOnSubPlot` function.

```
signal1.Checked = true;
plotOnSubPlot(signal2,2,1,true);
```

### **View the Plotted Data**

To view the plots you just created, open the Simulation Data Inspector using the `Simulink.sdi.view` function.

## Input Arguments

### **sig** – Signal to plot

Simulink.sdi.Signal object

Signal to plot, specified as a Simulink.sdi.Signal object.

### **r** – Row index

integer

Row index for the subplot, specified as an integer between 1 and 8, inclusive.

Example: 1

### **c** – Column index

integer

Column index for the subplot, specified as an integer between 1 and 8, inclusive.

Example: 2

### **checked** – Plot or clear signal

true | false

Plot or clear the signal on the subplot, specified as one of these values:

- `true` plots the signal on the subplot.

- `false` clears the signal from the subplot.

Data Types: `logical`

## Alternatives

You can use the Simulation Data Inspector UI to modify the plot layout and plotted signals. For more information, see “Inspect Simulation Data”.

## Version History

Introduced in R2017b

# Simulink.Signal

Specify instance-specific properties of signal or discrete state

## Description

This object enables you to create workspace objects that you can use to assign or validate the attributes of a signal or discrete state, such as its data type, numeric type, dimensions, and so on.

You can use a signal object to:

- Assign values to signal attributes that are left unassigned (have a value of `-1` or `auto`) by the signal source.
- Validate signal attributes whose values are explicitly assigned by the signal source. Such attributes have values other than `-1` or `auto`. Successful validation guarantees that the signal has the attributes that you intended it to have.

You can create a `Simulink.Signal` object in the MATLAB workspace or in a model workspace.

Use signal objects to assign or validate signal or discrete state attributes by giving the signal or discrete state the same name as the workspace variable that references the `Simulink.Signal` object.

For more information about using signal objects, see “Use Simulink.Signal Objects to Specify and Control Signal Attributes” and “Data Objects”.

To assign or validate the properties of signals based on an application-specific type, such as wind velocity, use a `Simulink.ValueType` object.

## Creation

Create a `Simulink.Signal` object:

- By using the Model Data Editor. See “For Signals”.
- By using the Model Explorer. See “Create Data Objects from Built-In Data Class Package Simulink”.
- Directly from a signal properties dialog box or the Property Inspector in a model. See “Create Signal Object from Signal Properties Dialog Box”.
- By using the `Simulink.Signal` function, described below.

## Syntax

```
signalObj = Simulink.Signal
```

## Description

`signalObj = Simulink.Signal` returns a `Simulink.Signal` object with default property values.

## Properties

For information about properties in the property dialog box of a `Simulink.Signal` object, see “Property Dialog Box”.

### **CoderInfo — Specifications for generating code for signal**

`Simulink.CoderInfo` object

Information used by Simulink Coder for generating code for this signal. The value of this property is an object of `Simulink.CoderInfo` class.

For more information, see “C Code Generation Configuration for Model Interface Elements” (Simulink Coder) and “Choose Storage Class for Controlling Data Representation in Generated Code” (Embedded Coder).

### **Complexity — Numeric complexity of signal**

'auto' (default) | 'real' | 'complex'

Character vector specifying the numeric type of this signal. Valid values are 'auto' (determined by Simulink), 'real', or 'complex'.

Data Types: char

### **DataType — Data type of signal**

'auto' (default) | character vector

Character vector specifying the data type of this signal.

The default value, 'auto', specifies that Simulink should determine the data type. You can specify a built-in data type (for example, 'uint8' or 'single'), a data type such as 'half', or a custom data type. To specify a custom data type, use a MATLAB expression that specifies the type, (for example, the name of a `Simulink.NumericType` object that you create in the base workspace).

To specify a bus object as the data type for the signal object, use the 'Bus: <object\_name>' syntax. See “Bus Support” for details about what you need to do if you specify a bus object as the data type.

Example: 'auto'

Example: 'int8'

Example: 'fixdt(1,16,5)'

Example: 'myAliasTypeObject'

Example: 'Enum: myEnumType'

Example: 'Bus: myBusObject'

Data Types: char

### **Description — Custom description of signal**

' ' (empty character vector) (default) | character vector

Description of this signal. This field is intended for use in documenting this signal.

This property is used by the Simulink Report Generator and for code generation.

If you have an Embedded Coder license, you can add the signal description as a comment for the variable declaration in generated code:

- Specify a storage class for the signal object other than `Auto`.
- On the **Code Generation > Comments** pane of the model Configuration Parameters dialog box, select the model configuration parameter **Simulink data object descriptions**. For more information, see Simulink data object descriptions (Embedded Coder).

Example: `'This signal represents the rotation speed of the engine.'`

Data Types: `char`

### **Dimensions — Dimensions of signal**

`-1` (default) | row vector | character vector

Scalar or vector specifying the dimensions of this signal.

Valid values are `-1` (the default) specifying any dimensions, `N` specifying a vector signal of size `N`, or `[M N]` specifying an `MxN` matrix signal.

To use symbolic dimensions, specify a character vector.

Example: `[1 3]`

Example: `'[1 myDimParam]'`

Data Types: `double` | `char`

### **DimensionsMode — Dimension mode of signal**

`'auto'` (default) | `'Fixed'` | `'Variable'`

Dimensions mode of the signal. Valid values are:

- `'auto'` — Allows variable-size and fixed-size signals.
- `'Fixed'` — Allows only fixed-size signals. Does not allow variable-size signals.
- `'Variable'` — Allows only variable-size signals.

For information about variable-size signals, see “Variable-Size Signal Basics”.

### **Max — Maximum value of signal**

`[]` (empty) (default) | real double scalar

Maximum value that this signal can have.

The default value is `[]` (unspecified). Specify a finite, real, double, scalar value.

---

**Note** If you specify a bus object as the data type for a signal, do not set the maximum value for bus data on the signal property dialog box. Simulink ignores this setting. Instead, set the maximum values for bus elements of the bus object specified as the data type. For information on the Maximum property of a bus element, see `Simulink.BusElement`.

---

Simulink uses this value in the following ways:

- When updating the diagram or starting a simulation, Simulink generates an error if the initial value of the signal is greater than the maximum value or if the maximum value is outside the range of the data type of the signal.
- When you enable the **Simulation range checking** diagnostic, Simulink alerts you during simulation if the signal value is greater than the maximum value (see “Simulation range checking”).

Example: 5.32

Data Types: double

### Min — Minimum value of signal

[ ] (empty) (default) | real double scalar

Minimum value that this signal can have.

The default value is [ ] (unspecified). Specify a finite, real, double, scalar value.

---

**Note** If you specify a bus object as the data type for a signal, do not set the minimum value for bus data on the signal property dialog box. Simulink ignores this setting. Instead, set the minimum values for bus elements of the bus object specified as the data type. For information on the Minimum property of a bus element, see `Simulink.BusElement`.

---

Simulink uses this value in the following ways:

- When updating the diagram or starting a simulation, Simulink generates an error if the signal's initial value is less than the minimum value or if the minimum value is outside the range for the data type of the signal.
- When you enable the **Simulation range checking** diagnostic, Simulink alerts you during simulation if the signal value is less than the minimum value (see “Simulation range checking”).

Example: -0.92

Data Types: double

### InitialValue — Initial value of signal or state

' ' (empty character vector) (default) | character vector

Signal or state value before a simulation takes its first time step.

You can specify any MATLAB expression, including the name of a workspace variable, that evaluates to a numeric scalar value or array.

At the command prompt or in a script, even if you use a number, specify the initial value as a character vector.

```
mySigObject.InitialValue='5.3';
```

```
mySigObject.InitialValue = 'myNumericVariable';
```

To specify an initial value for a signal that uses a numeric data type other than `double`, cast the initial value to the signal data type. For example, you can specify `'single(73.3)'` to use 73.3 as the initial value for a signal of data type `single`.

If you use a bus object as the data type for the signal object, set `InitialValue` to a character vector containing either `0` or a MATLAB structure that matches the bus object. See “Bus Support” for details.

If the initial value evaluates to a MATLAB structure, then in the **Configuration Parameters** dialog box, set “Underspecified initialization detection” to **Simplified**.

If necessary, Simulink converts the initial value to ensure type, complexity, and dimension consistency with the corresponding block parameter value. If you specify an invalid value or expression, an error message appears when you update the model. Also, Simulink performs range checking of the initial value. The software alerts you when the initial value of the signal lies outside a range that corresponds to its specified minimum and maximum values and data type.

**Classic initialization mode:** In this mode, initial value settings for signal objects that represent the following signals and states override the corresponding block parameter initial values if undefined (specified as `[]`):

- Output signals of conditionally executed subsystems and Merge blocks
- Block states

**Simplified initialization mode:** In this mode, if a signal object is attached to the signal line connected to the Outport block of a conditionally executed subsystem, Simulink uses the initial value from the `Simulink.Signal` object.

Example: `'15.23'`

Example: `'myInitParam'`

Data Types: `char`

### **SampleTime — Sample time of signal**

`-1` (default) | `double` scalar or array

Rate at which this signal should be updated.

See “Specify Sample Time” for details.

Example: `0.001`

Example: `2`

Data Types: `double`

### **Unit — Physical unit of signal value**

`''` (default) | valid unit

Physical unit used for expressing this signal value (for example, inches).

For more information, see “Unit Specification in Simulink Models”.

Example: `'degC'`

Data Types: `char`

## Examples

### Simulink.Signal Examples

For examples that show how to use `Simulink.Signal` objects, see “Use Simulink.Signal Objects to Specify and Control Signal Attributes” and “Data Objects”.

## Version History

Introduced before R2006a

## Extended Capabilities

### C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

To control the appearance of a `Simulink.Signal` object in the generated code, use the **Storage class** property.

### Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

# Simulink.SimulationData.Dataset

Access logged simulation data or group simulation input data

## Description

A `Simulink.SimulationData.Dataset` object groups related data. Logged simulation results are often grouped in `Dataset` objects. You can also use a `Dataset` object to group simulation input data when you load initial states and when you load external input data using `Inport` blocks or the `Signal Editor` block.

A `Dataset` object created by logging simulation data contains one or more elements. Each element contains data for one logged signal, output, data store, or state. Each element is an object, and the type of the object depends on the data it contains.

- Signals and outputs — `Simulink.SimulationData.Signal` object
- States and final states — `Simulink.SimulationData.State` object
- Data stores — `Simulink.SimulationData.DataStoreMemory` object

When you create a `Dataset` object that groups simulation input data, each element contains data for a signal, bus, or array of buses. You can add data in any format supported by the loading method you use.

Type of Input	Data Formats
Scalar, vector, or multidimensional signal	<ul style="list-style-type: none"> <li>• <code>timeseries</code></li> <li>• <code>timetable</code></li> <li>• <code>Simulink.SimulationData.Signal</code></li> <li>• <code>matlab.io.datastore.SimulationDataStore</code></li> <li>• <code>matlab.io.datastore.sd datastore</code></li> <li>• Structure with one field called <code>signals.values</code> that contains data for a single signal and a field called <code>time</code> that optionally includes time data</li> <li>• Array where the first column contains time data and subsequent columns contain data for a signal</li> </ul>
Bus	<ul style="list-style-type: none"> <li>• Structure of <code>timeseries</code>, <code>timetable</code>, or <code>matlab.io.datastore.SimulationDataStore</code> objects that matches the hierarchy of the bus</li> <li>• <code>Simulink.SimulationData.Signal</code></li> </ul>
Array of buses	<ul style="list-style-type: none"> <li>• Array of structures</li> <li>• <code>Simulink.SimulationData.Signal</code></li> </ul>

Type of Input	Data Formats
Function-call signal	<ul style="list-style-type: none"> <li>• <i>N</i>-by-1 vector</li> <li>• <code>Simulink.SimulationData.Signal</code></li> </ul>

## Creation

Logging simulation data often creates a `Simulink.SimulationData.Dataset` object, including when you:

- Log data using signal logging.
- Log outputs, states, or final states using the `Dataset` format.
- Log data stores.
- Log data to the workspace or a MAT file using the Record block.
- Log data in `Dataset` format using a Scope block.
- Log data using a Floating Scope or Scope Viewer.

To group external input data for a model in a `Dataset` object, you can:

- Create an empty `Dataset` object and add the input data using the `addElement` function.
- Use the `createInputDataset` to create a `Dataset` object that contains an element for each root-level Inport block or In Bus Element block in a model. Then, specify the data for each element.
- Use the Signal Editor to interactively create and edit `Dataset` objects that contain simulation input data. For details, see “Create and Edit Signal Data”.

You can also create a `Dataset` object by converting data that uses another format to use the `Dataset` format. Having all data in a common format can facilitate postprocessing. For details, see “Convert Logged Data to Dataset Format”.

## Syntax

```
ds = Simulink.SimulationData.Dataset
ds = Simulink.SimulationData.Dataset(dataToConvert)
ds = Simulink.SimulationData.Dataset(dataToConvert, "DatasetName", dsName)
```

### Description

`ds = Simulink.SimulationData.Dataset` creates an empty, unnamed `Dataset` object to which you can add elements. Use this syntax to manually create a `Dataset` object that contains external input data to load using Inport or In Bus Element blocks.

`ds = Simulink.SimulationData.Dataset(dataToConvert)` creates an unnamed `Dataset` object that contains one or more elements that contain the data `dataToConvert`. Use this syntax to convert data that uses another format to use the `Dataset` format. For details, see “Convert Logged Data to Dataset Format”.

The conversion process only converts data for one input at a time. To convert data for multiple variables, convert each variable one at a time, then use the `concat` function to combine the resulting `Dataset` objects.

`ds = Simulink.SimulationData.Dataset(dataToConvert, "DatasetName", dsName)` creates a Dataset object with the name specified by `dsName` that contains one or more elements that contain the data `dataToConvert`. Use this syntax to convert data that uses another format to use the Dataset format. For details, see “Convert Logged Data to Dataset Format”.

### Input Arguments

#### **dataToConvert — Data to convert to Dataset format**

timeseries object | structure | array | Simulink.ModelDataLogs object

Data to convert to Dataset format, specified as a timeseries object, a structure, an array, or a Simulink.ModelDataLogs object. The results of conversion depend on the format of the input data.

Input Data	Conversion Results
timeseries object	Dataset object that contains one Simulink.SimulationData.Signal object with timeseries data in its Values property.
ModelDataLogs object	Dataset object that contains one or more Simulink.SimulationData.Signal objects that contain the data for each signal in the input object.
Structure that matches the Structure with time logging format.	Dataset object that contains one or more Simulink.SimulationData.Signal objects that contain the data for each signal in the input structure.
Structure that matches the Structure logging format	Dataset object that contains one or more Simulink.SimulationData.Signal objects that contain the data for each signal in the input structure.  Because the input does not contain time data, the conversion creates a time vector for each signal that starts at 0 and uses a sampling interval of 1.
Array	Dataset object that contains one Simulink.SimulationData.Signal object. The Values property of the Signal object contains a timeseries object, and the Data property of the timeseries object contains the entire array.  Because the input does not contain time data, the conversion creates a time vector for the signal that starts at 0 uses a sampling interval of 1.

For more information, see “Convert Logged Data to Dataset Format” and “Dataset Conversion for Logged Data”.

#### **dsName — Dataset object name**

string | character vector

Dataset object name, specified as a string or character vector.

## Output Arguments

### ds — Dataset object

`Simulink.SimulationData.Dataset` object

Dataset object, returned as a `Simulink.SimulationData.Dataset` object. The Dataset object is empty when you do not specify input arguments. Create an empty Dataset object when you want to group simulation input data in a single variable.

When you specify input arguments, the Dataset object contains one or more elements that contain the input data. The results of conversion depend on the format of the input data.

Input Data	Conversion Results
timeseries object	Dataset object that contains one <code>Simulink.SimulationData.Signal</code> object with the timeseries data in its <code>Values</code> property.
ModelDataLogs object	Dataset object that contains one or more <code>Simulink.SimulationData.Signal</code> objects that contain the data for each signal in the input object.
Structure that matches the Structure with time logging format	Dataset object that contains one or more <code>Simulink.SimulationData.Signal</code> objects that contain the data for each signal in the input structure.
Structure that matches the Structure logging format	<p>Dataset object that contains one or more <code>Simulink.SimulationData.Signal</code> objects that contain the data for each signal in the input structure.</p> <p>Because the input does not contain time data, the conversion creates a time vector for each signal that starts at 0 and uses a sampling interval of 1.</p>
Array	<p>Dataset object that contains one <code>Simulink.SimulationData.Signal</code> object. The <code>Values</code> property of the Signal object contains a timeseries object, and the <code>Data</code> property of the timeseries object contains the entire array.</p> <p>Because the input does not contain time data, the conversion creates a time vector for the signal that starts at 0 uses a sampling interval of 1.</p>

For more information, see “Convert Logged Data to Dataset Format” and “Dataset Conversion for Logged Data”.

## Properties

### Name — Dataset object name

string | character vector

**Dataset** object name, specified as a string or character vector. When you create a **Dataset** object to group simulation input data, you specify the name for the **Dataset** object. The name you specify does not need to match the name of the variable that contains the **Dataset** object.

The **Name** property of **Dataset** objects created by logging simulation data is set to match the logging variable name specified in the model configuration parameters.

- **Output** — Default: `yout`
- **Signal logging** — Default: `logout`
- **States** — Default: `xout`
- **Data stores** — Default: `dsmout`
- **Final states** — Default: `xFinal`

## Object Functions

<code>addElement</code>	Add element to end of a <b>Dataset</b> object
<code>concat</code>	Concatenate dataset to another dataset
<code>exportToPreviousRelease</code>	Save a <b>Dataset</b> object to a MAT-file you can open in any release
<code>extractTimetable</code>	Extract data from <b>Simulink.SimulationData.Dataset</b> or <b>Simulink.SimulationData.Signal</b> objects into timetables
<code>find</code>	Get element or collection of elements from dataset
<code>get</code>	Get element or collection of elements from dataset
<code>getElementNames</code>	Return names of all elements in dataset
<code>numElements</code>	Get number of elements in data set
<code>plot</code>	Plot data in the Simulation Data Inspector
<code>removeElement</code>	Remove element from <b>Simulink.SimulationData.Dataset</b> object
<code>setElement</code>	Change element stored at specified index

## Examples

### Access Data Logged Using Dataset Format

Log the outputs of the `vdp` model and access the logged data.

Open the model. Configure output logging using the **Dataset** format and simulate the model using the `sim` function.

```
open_system('vdp');
out = sim('vdp', 'SaveOutput', 'on', 'SaveFormat', 'Dataset');
```

All logged data is returned in a single variable, `out`, as a **Simulink.SimulationOutput** object. The **SimulationOutput** object contains a **Simulink.SimulationData.Dataset** object that groups each kind of logged data. This example only logs outputs, so there is one **Dataset** object, `yout`.

```
out
```

```
out =
 Simulink.SimulationOutput:
 yout: [1x1 Simulink.SimulationData.Dataset]
 SimulationMetadata: [1x1 Simulink.SimulationMetadata]
```

```
ErrorMessage: [0x0 char]
```

Access the `Dataset` object that includes the logged output data using a dot and the name of the `Dataset` object. The `Dataset` object contains a `Simulink.SimulationData.Signal` object for each output.

```
outputs = out.yout
```

```
outputs =
Simulink.SimulationData.Dataset 'yout' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	x1	vdp/Out1
2	[1x1 Signal]	x2	vdp/Out2

- Use braces { } to access, modify, or add elements using index.

The `Signal` object has metadata about the signal, including the path to the block and index of the port that produces the signal. Use the `getElement` function to access the `Signal` object that contains the data for signal `x1` by name. You can also use curly braces({}) to access elements in a `Dataset` object by index.

```
outputX1 = getElement(outputs, 'x1')
```

```
outputX1 =
Simulink.SimulationData.Signal
Package: Simulink.SimulationData

Properties:
 Name: 'x1'
 PropagatedName: ''
 BlockPath: [1x1 Simulink.SimulationData.BlockPath]
 PortType: 'inport'
 PortIndex: 1
 Values: [1x1 timeseries]
```

Methods, Superclasses

The signal data is stored in the `Values` property of the `Signal` object as a `timeseries` object. The time values are in the `Time` property of the `timeseries` object. The signal values are in the `Data` property.

```
outputValsX1 = outputX1.Values
```

```
timeseries

Common Properties:
 Name: 'x1'
 Time: [64x1 double]
 TimeInfo: tsdata.timemetadadata
 Data: [64x1 double]
 DataInfo: tsdata.datametadadata
```

```
outputTimesX1 = outputValsX1.Time
```

```
outputTimesX1 = 64x1
```

## Group Simulation Inputs Using Dataset Object

Create data for three simulation input signals and group them in a `Dataset` object. A simple model loads the contents of the `Dataset` object using three root-level Inport blocks. Dashboard Scope blocks in the model display each signal created using the loaded input data.

First, create the signal data to load into the model. Use the expression in this example to create the evenly-spaced time vector for an input signal, especially when modeling discrete input signals. MATLAB® supports several other methods for creating an evenly-spaced vector, but other methods can introduce double-precision rounding errors in the time data, which can lead to unexpected simulation results.

```
sampleTime = 0.01;
numSteps = 1001;
time = sampleTime*(0:numSteps-1);
time = time';
```

Create signal data for a sine signal, a cosine signal, and a linear signal.

```
sineVals = sin(2*pi/3*time);
cosVals = cos(2*pi/3*time);
lineVals = time;
```

Create a `timeseries` object to contain the data for each signal. Give each `timeseries` object a descriptive name so signals are easy to identify once they are grouped in the `Dataset` object.

```
sineTS = timeseries(sineVals,time,'Name','Sine Wave');
cosTS = timeseries(cosVals,time,'Name','Cosine Wave');
lineTS = timeseries(lineVals,time,'Name','Line');
```

Create a `Dataset` object and use the `addElement` function to add each `timeseries` object to the `Dataset` object.

```
inputData = Simulink.SimulationData.Dataset;
inputData.Name = 'inputData';
inputData = addElement(inputData,sineTS);
inputData = addElement(inputData,cosTS);
inputData = addElement(inputData,lineTS)

inputData =
Simulink.SimulationData.Dataset 'inputData' with 3 elements
```

		Name	BlockPath
1	[1x1 timeseries]	Sine Wave	''
2	[1x1 timeseries]	Cosine Wave	''
3	[1x1 timeseries]	Line	''

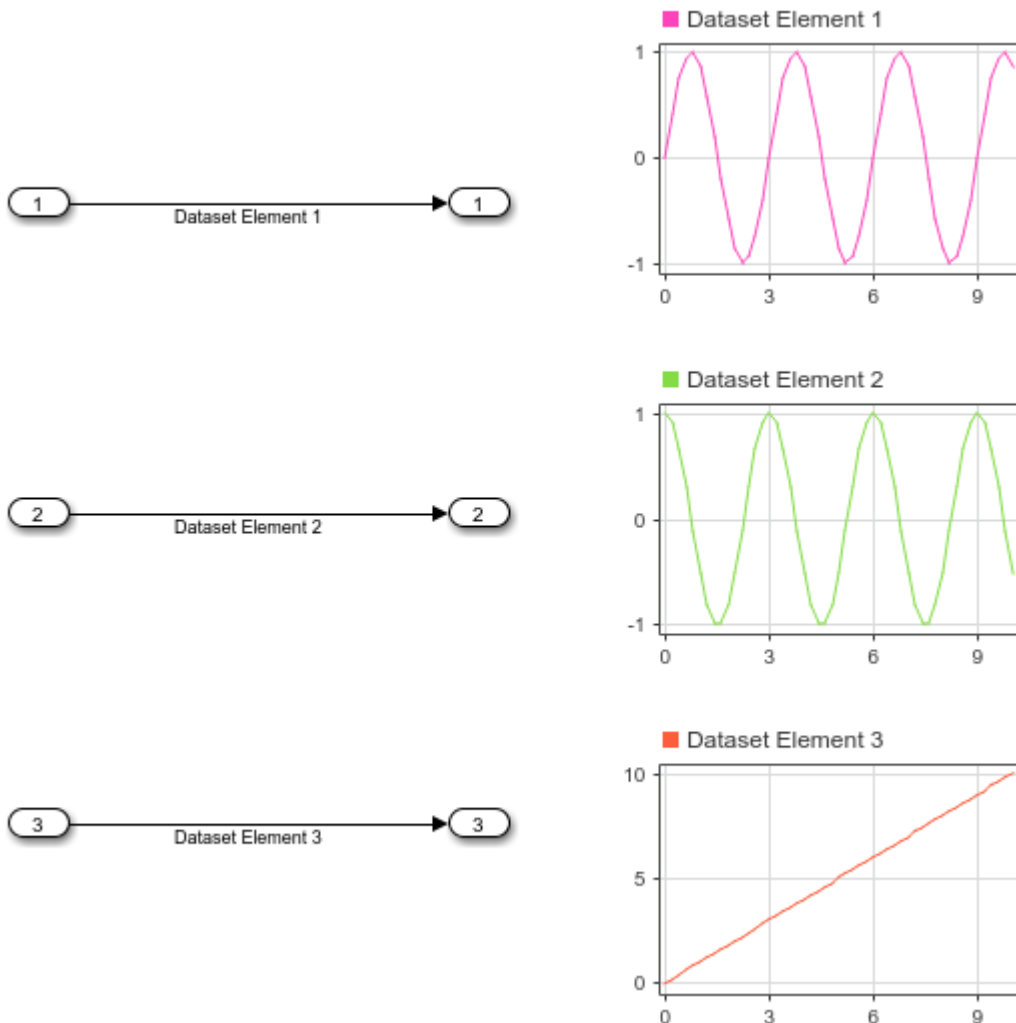

- Use braces { } to access, modify, or add elements using index.

When you load external input data using root-level Inport blocks, you specify the data to load using the **Input** parameter in the Model Configuration Parameters on the Data Import/Export pane. Open the model `LoadInputDataset` and see that the **Input** parameter is specified as `inputData`.

```
open_system('LoadInputDataset.slx');
```

Simulate the model. The Dashboard Scope block connected to the first Inport block shows the sine signal, the Dashboard Scope block connected to the second Inport block shows the cosine signal, and the Dashboard Scope block connected to the third Inport block shows the linear signal.

```
out = sim('LoadInputDataset.slx');
```

You can swap the order of elements in the Dataset object and see the change reflected in how the elements are mapped to the Inport blocks.

```
inputData{1} = lineTS;
inputData{3} = sineTS
```

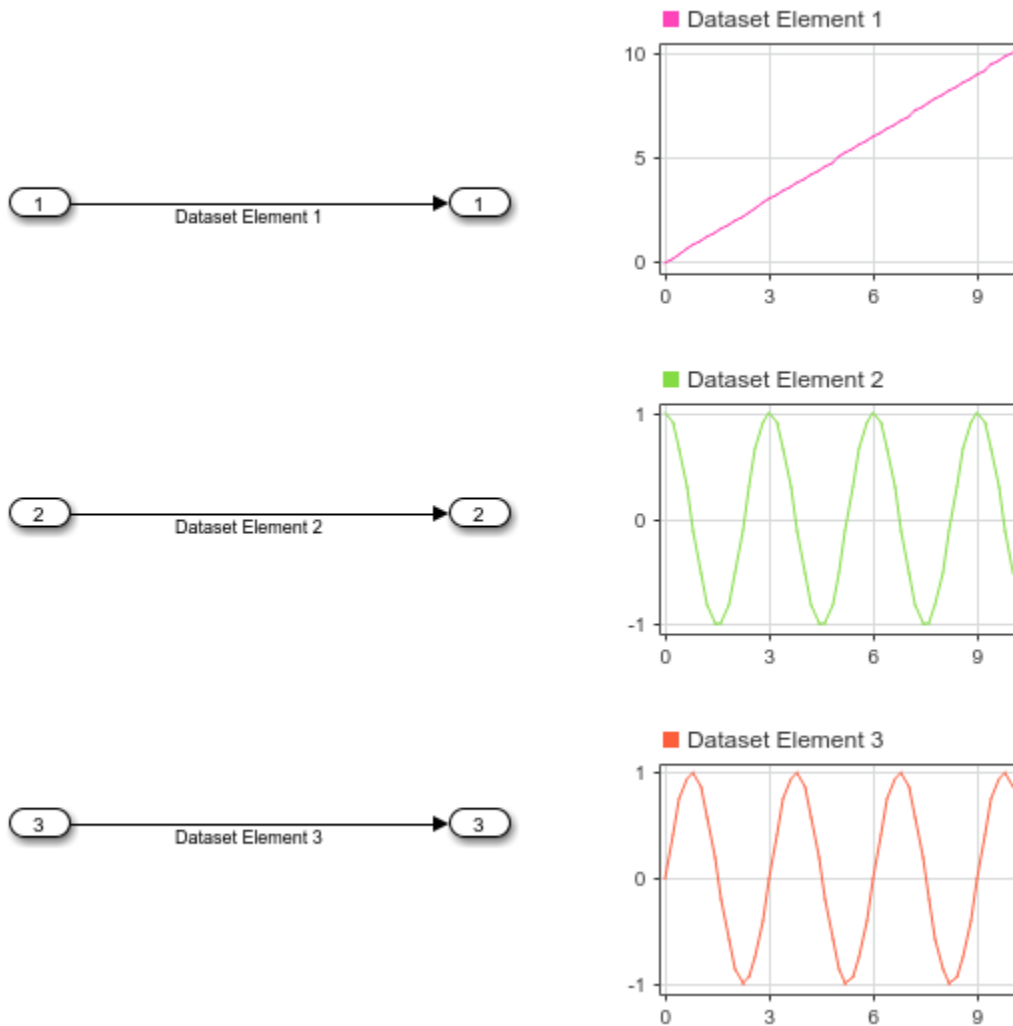

```
inputData =
Simulink.SimulationData.Dataset 'inputData' with 3 elements
```

	Name	BlockPath
1 [1x1 timeseries]	Line	''
2 [1x1 timeseries]	Cosine Wave	''
3 [1x1 timeseries]	Sine Wave	''

- Use braces { } to access, modify, or add elements using index.

Simulate the model again. The Dashboard Scope block that displays the first element now shows the line, and the Dashboard Scope block that displays the third element shows the sine wave, reflecting the new order of elements in the Dataset object.

```
out = sim('LoadInputDataset.slx');
```

## Tips

- You can use curly braces ({} ) to access, add, or modify an element in a Dataset object by index.
- To access, add, or modify an element of a Dataset object by name, use the getElement, addElement, and setElement functions.
- When you group simulation inputs using Dataset objects, you can use the Signal Editor or the Signal Editor block to easily change which Dataset object provides input for the simulation.

- When you load external input data from a `Dataset` object using root-level Inport blocks, you can use the Root Inport Mapper to map each element in the `Dataset` object to an Inport block by block name, block path, signal name, or port order. You can also write your own function to map the data. For more information, see “Map Root Inport Signal Data”.
- When you save data in a `Dataset` object to a MAT file, consider saving to a Version 7.3 MAT file if the contents of the `Dataset` object are too large to fit in memory. You can create a `Simulink.SimulationData.DatasetRef` that references a `Dataset` object in a MAT file without loading the data into memory for data processing or for loading big data. For more information, see “Load Big Data for Simulations”.
- To save a `Dataset` object to a MAT file that you can open in an earlier release, use the `exportToPreviousRelease` function instead of the `save` function.
- You can write your own reader to import data from a file into a `Dataset` object in the base workspace, the model workspace, or the Signal Editor using the `Simulink.io.FileType` class. For more information, see “Create Custom File Type for Import to Signal Editor”.

## addElement

Add element to end of a Dataset object

### Syntax

```
dataset = addElement(dataset,element)
dataset = addElement(dataset,element,name)
```

### Description

`dataset = addElement(dataset,element)` adds an element to the `Simulink.SimulationData.Dataset` dataset.

`dataset = addElement(dataset,element,name)` adds an element to the `Simulink.SimulationData.Dataset` data set and gives the element the name that you specify with the name argument. If the object already has a name, the element instead uses the name you specify by using the name argument.

### Input Arguments

#### **dataset** — Data set

`SimulationData.Dataset` object

The data set to which to add the element.

#### **element** — Element to add

`Simulink.SimulationData.Signal` object | `Simulink.SimulationData.State` object | `Simulink.SimulationData.DataStoreMemory` object | timeseries object | `matlab.io.datastore.SimulationDatastore` object

Element to add to the data set, specified as a `Simulink.SimulationData.Signal`, `Simulink.SimulationData.DataStoreMemory`, or `matlab.io.datastore.SimulationDatastore` object.

#### **name** — Name for element

character vector

Name for element, specified as a character vector.

### Output Arguments

#### **dataset** — Data set

character vector

The data set to which you add the element, returned as a character vector. The new element is added to the end of the data set.

### Examples

## Create a Data Set

Create a data set and add three elements to it.

```
time = 0.1*(0:100)';
ds = Simulink.SimulationData.Dataset;
element1 = Simulink.SimulationData.Signal;
element1.Name = 'A';
element1.Values = timeseries(sin(time),time);
ds = addElement(ds,element1);
element2 = Simulink.SimulationData.Signal;
element2.Name = 'B';
element2.Values = timeseries(2*sin(time),time);
ds = addElement(ds,element2);
element3 = Simulink.SimulationData.Signal;
element3.Name = 'C';
element3.Values = timeseries(3*sin(time),time);
ds = addElement(ds,element3);
ds
```

ds =

Simulink.SimulationData.Dataset '' with 3 elements

		Name	BlockPath
1	[1x1 Signal]	A	''
2	[1x1 Signal]	B	''
3	[1x1 Signal]	C	''

- Use braces { } to access, modify, or add elements using index.

## Create a Run in the Simulation Data Inspector

You can programmatically import data into the Simulation Data Inspector by creating a run from data in the base workspace or a file. This example creates data in the workspace and then illustrates several methods of creating a Simulation Data Inspector run containing the data.

### Create Data

Create data in the workspace. The Simulation Data Inspector supports time series data in many formats. This example creates data using the `timeseries` and `Simulink.SimulationData.Dataset` formats and saves the data in a MAT-file.

Create a sine signal and a cosine signal. Store the data for each signal in a `timeseries` object with a descriptive name.

```
time = 0:0.2:20;

sine_vals = sin(2*pi/5*time);
sine_ts = timeseries(sine_vals,time);
sine_ts.Name = 'Sine, T=5';

cos_vals = cos(2*pi/8*time);
cos_ts = timeseries(cos_vals,time);
cos_ts.Name = 'Cosine, T=8';
```

You can use the `Dataset` format to group related signal data together in a single object. The `Dataset` format is the default format for logged data and is supported for loading simulation input data. Create a `Dataset` object that contains the sinusoid timeseries data.

```
sinusoids_ds = Simulink.SimulationData.Dataset;
sinusoids_ds = addElement(sinusoids_ds,cos_ts);
sinusoids_ds = addElement(sinusoids_ds,sine_ts);
```

Scale each signal by a factor of 2 and create a `Dataset` object to contain the signal data for the results.

```
doubSine = 2*sine_ts;
doubCos = 2*cos_ts;

doubSinusoids_ds = Simulink.SimulationData.Dataset;
doubSinusoids_ds = addElement(doubSinusoids_ds,doubSine);
doubSinusoids_ds = addElement(doubSinusoids_ds,doubCos);
```

Finally, save the timeseries data to a MAT-file.

```
save sinusoids.mat sine_ts cos_ts
```

### Open the Simulation Data Inspector

To view the runs you create in each section, open the Simulation Data Inspector by entering `Simulink.sdi.view` in the MATLAB™ Command Window.

### Create a Run Using a `Simulink.sdi.Run` Object

You can import your data into a run in the Simulation Data Inspector by creating an empty run and then adding data to the run from the workspace or a file. Depending on your task, you can use the `Simulink.sdi.Run.create` function or the `Simulink.sdi.createRun` function to create the empty run. The `Simulink.sdi.Run.create` function returns the `Simulink.sdi.Run` object for the new run, and the `Simulink.sdi.createRun` function returns the run ID for the new run.

This example creates an empty run using the `Simulink.sdi.Run.create` function, gives the run a meaningful name and description, and then adds the sine and cosine timeseries data using the `add` function.

```
sinusoidsRun = Simulink.sdi.Run.create;
sinusoidsRun.Name = 'Sinusoids';
sinusoidsRun.Description = 'Sine and cosine signals of different frequencies';

add(sinusoidsRun,'vars',sine_ts,cos_ts)
```

This example uses the `Simulink.sdi.createRun` function to create a new run in the Simulation Data Inspector called `My Waves` and then uses the `Simulink.sdi.addToRun` function to add the sine and cosine timeseries data to the run.

```
runID = Simulink.sdi.createRun('My Waves');
signalID = Simulink.sdi.addToRun(runID,'vars',sine_ts,cos_ts);
```

### Create a Run from a Workspace Variable

You can create a run from a single variable in the workspace. After creating the run, you can add additional data, or you can create another run to contain your other data. The variable you use to create the run can be a `timeseries` object with data that corresponds to only one signal, or it can be a `Dataset` object that contains several signals.

When you use this syntax to create a run from a single workspace variable, the run takes the same name as the object used to create it.

```
runID = Simulink.sdi.createRun(sine_ts);
```

The `Simulink.sdi.createRun` function returns the run ID for the run it creates. You can use the `Simulink.sdi.getRun` function to access the Run object for the run.

```
sineRun = Simulink.sdi.getRun(runID);
sineRun.Name
```

```
ans =
'Sine, T=5'
```

### Create a Run from Multiple Workspace Variables

When your data exists in multiple variables in your workspace, you can use the `Simulink.sdi.createRun` function with the `vars` option to import the data from multiple variables into a single run in the Simulation Data Inspector. You can also use this syntax to create a run for a single variable that uses a name you specify.

This example creates a run called `My Sinusoids` that contains data for the sine and cosine `timeseries` objects.

```
runID = Simulink.sdi.createRun('My Sinusoids','vars',sine_ts,cos_ts);
```

### Create a Run and Specify Source Names

You can use the `namevalue` option of the `Simulink.sdi.createRun` function to create a run and specify names for the signals in the run. This syntax can be particularly helpful when you import individual leaf signals from hierarchical data.

This example creates a run containing the data for both the `Dataset` objects. Each `Dataset` object contains data for more than one signal, so the imported run data has hierarchy. The name-value syntax in this example specifies a name for the hierarchical node that corresponds to each `Dataset` object.

```
runID = Simulink.sdi.createRun('Waves','namevalue',{'Sinusoids',...
 'BigSinusoids'},{sinusoids_ds,doubSinusoids_ds});
```

### Create a Run from Data in a File

You can also use the `Simulink.sdi.createRun` function to import data into the Simulation Data Inspector from a file. Use the `file` option to import the data in the `simusoids.mat` file.

```
runID = Simulink.sdi.createRun('Wave Data','file','sinusoids.mat');
```

## Alternative

To streamline indexing syntax, you can use curly braces (`{}`) to add an element to a dataset, instead of using `addElement`. For the index, use a scalar that is greater than the number of elements by one. The new element becomes the last element of the dataset.

```
time = 0.1*(0:100)';
ds = Simulink.SimulationData.Dataset;
element1 = Simulink.SimulationData.Signal;
element1.Name = 'A';
```

```
element1.Values = timeseries(sin(time),time);
ds{1} = element1;
element2 = Simulink.SimulationData.Signal;
element2.Name = 'B';
element2.Values = timeseries(2*sin(time),time);
ds{2} = element2;
element3 = Simulink.SimulationData.Signal;
element3.Name = 'C';
element3.Values = timeseries(3*sin(time),time);
ds{3} = element3;
```

# concat

Concatenate dataset to another dataset

## Syntax

```
dataset1 = concat(dataset1,dataset2)
```

## Description

`dataset1 = concat(dataset1,dataset2)` concatenates the elements of `dataset2` to `dataset1`.

## Input Arguments

### **dataset1** — Dataset to concatenate to

data set

Dataset to concatenate to with `dataset2`, returned as a cell array.

### **dataset2** — Dataset to concatenate

data set

Data set to concatenate to `dataset1`, specified as a cell array.

## Output Arguments

### **dataset1** — Concatenated dataset

data set

Concatenated dataset from `dataset1` and `dataset2`.

## Examples

### **Concatenate ds1 to ds**

Convert output from two To Workspace blocks to Dataset format and concatenate them.

```
mdl = 'myvdp';
open_system(mdl);
sim(mdl)
ds = Simulink.SimulationData.Dataset(simout);
ds1 = Simulink.SimulationData.Dataset(simout1);
dsfinal = concat(ds,ds1);
```

# exportToPreviousRelease

**Package:** Simulink.SimulationData

Save a Dataset object to a MAT-file you can open in any release

## Syntax

```
exportToPreviousRelease(ds, filename, dsname)
exportToPreviousRelease(____, version)
exportToPreviousRelease(____, '-append')
exportToPreviousRelease(____, '-nocompression')
```

## Description

`exportToPreviousRelease(ds, filename, dsname)` saves the `Simulink.SimulationData.Dataset` object, `ds`, to the MAT-file specified by the `filename` input, using the name specified by the `dsname` input. You can load the Dataset saved in the file in any release that supports the Dataset format. When you do not use this function to save a Dataset object to a file, you may not be able to load the data in releases prior to R2017a. When you do not need to open and use the Dataset data in a release prior to R2017a, you can use the `save` function.

`exportToPreviousRelease( ____, version)` saves data stored in a Dataset object to a MAT-file you can load in a previous release, using the MAT-file version specified by `version`.

`exportToPreviousRelease( ____, '-append' )` adds data stored in a Dataset object to a MAT-file you can load in a previous release without overwriting the contents of the MAT-file.

`exportToPreviousRelease( ____, '-nocompression' )` saves the Dataset object to a MAT-file without compression. The `'-nocompression'` option only supports Version 7 and Version 7.3 MAT-files.

## Examples

### Save a Dataset to a MAT-File to Load in a Prior Release

You can use the `exportToPreviousRelease` function to save data stored in a `Simulink.SimulationData.Dataset` object in a MAT-file that you can load in a previous release. This example saves data logged from a simulation in a MAT-file using the `exportToPreviousRelease` function, and then appends another Dataset object containing data logged from another simulation to the same MAT-file.

### Save Dataset Data to a MAT-File

To create a Dataset object containing logged data, run a simulation of the `ex_vdp` model that logs data for signals `x1` and `x2`. The model is configured to generate a single simulation output containing all simulation data, including the signal logging data stored in the Dataset object, `logout`.

```
open_system('ex_vdp.slx')
out = sim('ex_vdp');
logouts = out.logouts;
```

Use the `exportToPreviousRelease` function to save the signal logging data to a MAT-file you can share with colleagues and collaborators who may use different Simulink™ versions.

```
exportToPreviousRelease(logouts, 'vdpLoggedData.mat', 'ex_vdpSim1')
```

### Append Additional Data to the MAT-File

You can use the `exportToPreviousRelease` function to add data to a MAT-file. For example, if you run another simulation that logs data and get new results you want to share. You can load the `Dataset` object saved using the `exportToPreviousRelease` function in any release that supports the `Dataset` format.

```
set_param('ex_vdp/Mu', 'Gain', '0.5')
out = sim('ex_vdp');
logouts = out.logouts;

exportToPreviousRelease(logouts, 'vdpLoggedData.mat', 'ex_vdpSim2', '-append')
```

## Input Arguments

### **ds** — Dataset object containing data you want to load in an earlier release

`Simulink.SimulationData.Dataset` object

`Simulink.SimulationData.Dataset` object you want to save in a MAT-file and load in a previous release.

Example: `logouts`

### **filename** — Name of file to export data to

string | character array

Name of the file to export data to. If the file does not exist, the `exportToPreviousRelease` function creates the file. When the file exists, you can overwrite the data in the file, or you can use the `'-append'` input to append the `Dataset` data to the file.

Example: `'myfile.mat'`

Data Types: `char` | `string`

### **dsname** — Name to use for the saved Dataset object in the MAT-file

string | character array

Name to use for the `Dataset` object saved in the MAT-file. The name does not have to match the name of the `Dataset` object containing the data you want to save in the MAT-file.

Example: `'myLoggedData'`

Data Types: `char` | `string`

### **version** — MAT-file version

`'-v7'` (default) | `'-v7.3'` | `'-v6'`

MAT-file version. By default, the `exportToPreviousRelease` function creates Version 7 MAT-files, unless you have changed the preference for the default MAT-file version created by save operations. For more information, see “MAT-File Versions”. You cannot save `Dataset` data to Version 4 MAT-files.

Data Types: `char` | `string`

## **Version History**

**Introduced in R2019b**

### **See Also**

`Simulink.SimulationData.Dataset` | `save`

“MAT-File Versions”

## extractTimetable

**Package:** Simulink.SimulationData

Extract data from `Simulink.SimulationData.Dataset` or `Simulink.SimulationData.Signal` objects into timetables

### Syntax

```
TT = extractTimetable(ds)
TT = extractTimetable(ds,Name=Value)
```

### Description

`TT = extractTimetable(ds)` extracts data from multiple elements of `ds` into a timetable. The input argument `ds` is a `Simulink.SimulationData.Dataset` or `Simulink.SimulationData.Signal` object.

`TT = extractTimetable(ds,Name=Value)` extracts data into one or more timetables according to options that are specified by one or more name-value arguments. For example, the `SignalNames` argument specifies the names of the signals to extract from `ds`.

You can return the data as:

- A single timetable that includes all elements that contain time series data, synchronized to the union of the time stamps of all signals.
- A cell array of timetables that each contain data for signals that share the same sample time.
- A cell array of timetables that each contain time series data for a single signal.

### Examples

#### Extract Signals into Timetable

Extract signals from a `Simulink.SimulationData.Dataset` object into a timetable.

First, create a `Dataset` object and add two signals to it. To calculate data for the signals, use the `sin` and `cos` functions. Each signal is in its own `timeseries` object. These signals both have a 0.1-second time step.

```
Time = 0.1*(0:99)';
ds = Simulink.SimulationData.Dataset;

element1 = Simulink.SimulationData.Signal;
element1.Name = "Sine";
element1.Values = timeseries(sin(Time),Time);
ds = addElement(ds,element1);

element2 = Simulink.SimulationData.Signal;
element2.Name = "Cosine";
element2.Values = timeseries(cos(Time),Time);
ds = addElement(ds,element2)
```

```
ds =
Simulink.SimulationData.Dataset '' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	Sine	''
2	[1x1 Signal]	Cosine	''

- Use braces { } to access, modify, or add elements using index.

Next, extract data from `ds` and put the data into a timetable. The timetable `TT` has two variables, `Sine` and `Cosine`, that contain data from both elements of `ds`.

```
TT = extractTimetable(ds)
```

```
TT=100x2 timetable
 Time Sine Cosine

0 sec 0 1
0.1 sec 0.099833 0.995
0.2 sec 0.19867 0.98007

1.2 sec 0.93204 0.36236
1.3 sec 0.96356 0.2675
1.4 sec 0.98545 0.16997
1.5 sec 0.99749 0.070737
 :
```

Add a third signal to `ds` with a time vector that has a 0.05-second time step.

```
Time2 = 0.05*(0:149)';
element3 = Simulink.SimulationData.Signal;
element3.Name = "Tangent";
element3.Values = timeseries(tan(Time2),Time2);
ds = addElement(ds,element3)
```

```
ds =
Simulink.SimulationData.Dataset '' with 3 elements
```

		Name	BlockPath
1	[1x1 Signal]	Sine	''
2	[1x1 Signal]	Cosine	''
3	[1x1 Signal]	Tangent	''

- Use braces { } to access, modify, or add elements using index.

Extract the data from the three elements of `ds`. The elements have `timeseries` objects whose time vectors do not match. Thus, the vector of row times of `TT` is the union of the time vectors of the three `timeseries` objects. Then, the `extractTimetable` function synchronizes data from the three signals to its row times. the function fills in missing values for the row times where `Sine` and `Cosine` do not provide data.

```
TT2 = extractTimetable(ds)
```

```

### Return Timetables for Each Sample Time and Synchronize Them

Extract data from signals that have time vectors with different sample times. To avoid returning a timetable that contains NaNs, return the data in a cell array of timetables. Then, synchronize the output timetables by using linear interpolation to fill gaps in the data.

Create a `Dataset` object that has three elements. The first two elements have the same time vector and sample time. The third element has a time vector with a different sample time.

```
Time1 = 0.1*(0:99)';
ds = Simulink.SimulationData.Dataset;

element1 = Simulink.SimulationData.Signal;
element1.Name = "Sine";
element1.Values = timeseries(sin(Time1),Time1);
ds = addElement(ds,element1);

element2 = Simulink.SimulationData.Signal;
element2.Name = "Cosine";
element2.Values = timeseries(cos(Time1),Time1);
ds = addElement(ds,element2);

Time2 = 0.05*(0:149)';
```

```

element3 = Simulink.SimulationData.Signal;
element3.Name = "Tangent";
element3.Values = timeseries(tan(Time2),Time2);
ds = addElement(ds,element3)

```

```

ds =
Simulink.SimulationData.Dataset '' with 3 elements

```

		Name	BlockPath
1	[1x1 Signal]	Sine	''
2	[1x1 Signal]	Cosine	''
3	[1x1 Signal]	Tangent	''

- Use braces { } to access, modify, or add elements using index.

Extract data from the signals into timetables. To avoid NaNs in the output, extract signals by sample time.

```

TT = extractTimetable(ds,OutputFormat="cell-by-sampletime")

```

```

TT=1x2 cell array
 {150x1 timetable} {100x2 timetable}

```

Display the first timetable. The timetable contains the data from ds{3} and has a sample time of 0.05 seconds.

```

TT{1}

```

```

### Dataset with Timetable and timeseries Objects

A Dataset object can have some elements that contain timetables and other elements that contain timeseries objects. The extractTimetable function extracts data from both sets of elements and returns all data in one timetable.

Create a Dataset object with one element that has a timetable.

```
ds = Simulink.SimulationData.Dataset;
element1 = Simulink.SimulationData.Signal;
element1.Name = "TrigFuncs";
element1.Values = timetable(seconds(0:99)',sin(0:99)',cos(0:99)',...
 VariableNames=["Sine","Cosine"])
```

```
element1 =
 Simulink.SimulationData.Signal
 Package: Simulink.SimulationData

 Properties:
 Name: 'TrigFuncs'
 PropagatedName: ''
 BlockPath: [1x1 Simulink.SimulationData.BlockPath]
 PortType: 'inport'
 PortIndex: 1
 Values: [100x2 timetable]
```

Methods, Superclasses

```
ds = addElement(ds,element1);
```

Add another element that has a timeseries object.

```
element2 = Simulink.SimulationData.Signal;
element2.Name = "Tangent";
element2.Values = timeseries(tan(0:99),0:99)
```

```
element2 =
 Simulink.SimulationData.Signal
 Package: Simulink.SimulationData

 Properties:
 Name: 'Tangent'
 PropagatedName: ''
 BlockPath: [1x1 Simulink.SimulationData.BlockPath]
 PortType: 'inport'
 PortIndex: 1
 Values: [1x1 timeseries]
```

Methods, Superclasses

```
ds = addElement(ds,element2);
```

Extract all the data and return one timetable.

```
TT = extractTimetable(ds)
```

```
TT=100x3 timetable
 Time TrigFuncs.Sine TrigFuncs.Cosine Tangent

Add another element that has a `timeseries` object with a different sample time. When you extract the timetable, it has many NaN values filled in.

```
element3 = Simulink.SimulationData.Signal;
element3.Name = "Mini-Tangent";
element3.Values = timeseries(tan(0.5*(0:99)),0.5*(0:99));
ds = addElement(ds,element3);
TT = extractTimetable(ds)
```

To extract all data from elements with a one-second sample time, you must use different name-value arguments because one element has a timetable and the others have `timeseries` objects.

- To extract data from timetables with a one-second sample time, use the `TimeStep` argument. Specify the sample time as a duration value.
- To extract data from `timeseries` objects with a one-second sample time, use the `SampleTime` argument. Specify the sample time as a numeric value.

```
TT = extractTimetable(ds,TimeStep=seconds(1),SampleTime=1)
```

```

TT=100×3 timetable

### Match Template to Data

Create a `Dataset` object that has elements with different time vectors.

```

Time1 = 0.1*(0:99)';
ds = Simulink.SimulationData.Dataset;

element1 = Simulink.SimulationData.Signal;
element1.Name = "Sine";
element1.Values = timeseries(sin(Time1),Time1);
ds = addElement(ds,element1);

Time2 = 0.05*(0:99)';
element2 = Simulink.SimulationData.Signal;
element2.Name = "Cosine";
element2.Values = timeseries(cos(Time2),Time2);
ds = addElement(ds,element2);

Time3 = (0:99)';
element3 = Simulink.SimulationData.Signal;
element3.Name = "Tangent";
element3.Values = timeseries(tan(Time3),Time3);
ds = addElement(ds,element3)

ds =
Simulink.SimulationData.Dataset '' with 3 elements

```

		Name	BlockPath
1	[1x1 Signal]	Sine	''
2	[1x1 Signal]	Cosine	''
3	[1x1 Signal]	Tangent	''

- Use braces { } to access, modify, or add elements using index.

If you have data stored in another `Dataset` object, then you can use one of its elements as a template. You can extract data from elements of `ds` whose time properties match the time properties of the template.

Create a second `Dataset` object with one element.

```

ds2 = Simulink.SimulationData.Dataset;
templ = Simulink.SimulationData.Signal;
templ.Name = "Template";
templ.Values = timeseries(randi(100,1),(0:99)');
ds2 = addElement(ds2,templ)

ds2 =
Simulink.SimulationData.Dataset '' with 1 element

```

		Name	BlockPath
1	[1x1 Signal]	Template	''

- Use braces { } to access, modify, or add elements using index.

Return data from the elements of `ds` that match the time properties of `ds2{1}`. The template matches the time properties of the third element of `ds`, named "Tangent".

```

TT = extractTimetable(ds,Template=ds2{1})

```

```

TT=100x1 timetable

```

## Input Arguments

### ds — Object that contains time series data

Simulink.SimulationData.Dataset object | Simulink.SimulationData.Signal object

Object that contains time series data, specified as a Simulink.SimulationData.Dataset or Simulink.SimulationData.Signal object.

### Name-Value Arguments

Specify optional pairs of arguments as Name1=Value1, . . . , NameN=ValueN, where Name is the argument name and Value is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Example: TT = extractTimetable(ds,OutputFormat="cell-by-sampletime")

### Arguments for All Inputs

#### OutputFormat — Output format and grouping

"timetable" (default) | "cell-by-signal" | "cell-by-sampletime" | "cell-by-timestep"

Output format and grouping of time series data, specified as one of the values described in the table.

Value	Output Format
"timetable"	Timetable that contains the synchronized union of all signal data, padded with missing values.
"cell-by-signal"	Cell array that contains a timetable for each signal found in the input.

Value	Output Format
"cell-by-sampletime"	Cell array that contains a timetable for each sample time found in the input.
"cell-by-timestep"	

Example: `TT = extractTimetable(ds,OutputFormat="cell-by-signal")` returns a cell array where each element is a timetable that contains data from a corresponding element of `ds`.

### SignalNames — Names of signals

string array | pattern object

Names of signals to extract the timetable, specified as a string array or a `pattern` object.

Example: `TT = extractTimetable(ds,SignalNames=["Sensor1","Sensor2"])` extracts data from signals named "Sensor1" or "Sensor2".

Example: `TT = extractTimetable(ds,SignalNames="Sensor" + wildcardPattern)` extracts data from signals whose names start with "Sensor".

### Template — Template to match to time properties of input

timeseries object | timetable | `Simulink.SimulationData.Signal` object | name of signal in `ds`

Template to match to time properties of input signals, specified as a `timeseries` object, timetable, `Simulink.SimulationData.Signal` object, or the name of a signal in `ds`.

- If the template is or contains a `timeseries` object, then `extractTimetable` matches it only to elements of `ds` that contain `timeseries` objects.
- If the template is or contains a timetable, then `extractTimetable` matches it only to elements of `ds` that contain timetables.

Example: `TT = extractTimetable(ds,Template=ds{1})` extracts data from all elements of `ds` whose time properties match the time properties of the first element of `ds`.

### Arguments for Inputs with Signals That Contain timeseries Objects

#### SampleTime — Sample time

one or more positive numeric values

Sample time, specified as one or more positive numeric values. When you specify the value of `SampleTime`, this function extracts data from all signals in `ds` that have `timeseries` objects whose time vectors have the specified sample time. The sample time is interpreted as a time interval in seconds.

If you provide multiple sample times in a numeric array, then the output is a timetable synchronized to the union of all signals that have `timeseries` objects with any of the specified sample times, unless you also specify the value of `OutputFormat`.

Example: `TT = extractTimetable(ds,SampleTime=0.5)` extracts data from any signals that have `timeseries` objects where the sample time is 0.5 seconds and returns the data in one timetable.

Example: `TT = extractTimetable(ds,SampleTime=[0.5,1.0],OutputFormat="cell-by-sampletime")` extracts data from signals that have `timeseries` objects where the sample time is either 0.5 or 1.0 seconds and returns a cell array that contains two timetables.

**TimeVector – Time vector**

datetime vector | duration vector

Time vector, specified as a `datetime` vector or `duration` vector.

The output timetable contains data from all signals in `ds` that have `timeseries` objects whose time vector matches the value of `TimeVector`.

Example: `TT = extractTimetable(ds,TimeVector=seconds(0:99))` extracts data from signals that have `timeseries` objects whose time vector is an array spanning 0–99 seconds with a sample time of one second.

**Arguments for Inputs with Signals That Contain Timetables****SampleRate – Sample rate**

one or more positive numeric values

Sample rate, specified as one or more positive numeric values. When you specify the value of `SampleRate`, this function extracts data from all signals in `ds` that have timetables with the specified sample rate. The sample rate is interpreted as a rate in Hertz (Hz).

If you provide multiple sample rates in a numeric array, then the output is a timetable synchronized to the union of all signals that have timetables with any of the specified sample rates, unless you also specify the value of `OutputFormat`.

You can use this argument in combination with the `StartTime` name-value argument.

Example: `TT = extractTimetable(ds,SampleRate=100)` extracts data from any signals that have timetables where the sample rate is 100 Hz and returns the data in one timetable.

Example: `TT = extractTimetable(ds,SampleRate=[100,200],OutputFormat="cell-by-sampletime")` extracts data from signals that have timetables where the sample rate is either 100 or 200 Hz and returns a cell array that contains two timetables.

Example: `TT = extractTimetable(ds,SampleRate=100,StartTime=seconds(25))` extracts data from any signals that have timetables where the sample rate is 100 Hz and the signal starts at 25 seconds.

**TimeStep – Time step**

duration array

Time step, specified as a `duration` array. When you specify the value of `TimeStep`, this function extracts the timetable that contains data from all signals in `ds` that have timetables with the specified time step.

If you provide multiple time steps in an array, then the output is a timetable synchronized to the union of all signals that have timetables with any of the specified time steps, unless you also specify the value of `OutputFormat`.

You can use this argument in combination with the `StartTime` name-value argument.

Example: `TT = extractTimetable(ds,TimeStep=seconds(0.5))` extracts data from any signals that have timetables where the time step is 0.5 seconds and returns the data in one timetable.

Example: `TT = extractTimetable(ds,TimeStep=seconds([0.5,1.0]),OutputFormat="cell-by-sampletime")` extracts data from signals that have timetables where the time step is either 0.5 or 1.0 seconds and returns a cell array that contains two timetables.

Example: `TT = extractTimetable(ds,TimeStep=seconds(0.5),StartTime=seconds(10))` extracts data from any signals that have timetables where the time step is 0.5 seconds and the signal starts at 10 seconds.

### **RowTimes – Time vector**

`datetime vector` | `duration vector`

Time vector, specified as a `datetime` vector or `duration` vector.

The output timetable contains data from all the signals in `ds` that have timetables whose row times are in a time vector that matches the vector specified by `RowTimes`.

Example: `TT = extractTimetable(ds,RowTimes=seconds(0:99))` extracts data from any signals that have timetables whose time vector is an array spanning 0-99 seconds with a time step of one second.

### **StartTime – Start time**

`datetime scalar` | `duration scalar`

Start time, specified as a `datetime` scalar or `duration` scalar.

The output timetable contains data from all the signals in `ds` that have timetables whose row times start with a value matches the value specified by `StartTime`.

You can use `StartTime` in combination with either the `SampleRate` or `TimeStep` name-value arguments.

Example: `TT = extractTimetable(ds,StartTime=seconds(50))` extracts data from any signals that have timetables where the signal starts at 50 seconds.

Example: `TT = extractTimetable(ds,SampleRate=100,StartTime=seconds(25))` extracts data from any signals that have timetables where the sample rate is 100 Hz and the signal starts at 25 seconds.

Example: `TT = extractTimetable(ds,TimeStep=seconds(0.5),StartTime=seconds(10))` extracts data from any signals that have timetables where the time step is 0.5 seconds and the signal starts at 10 seconds.

## **Version History**

**Introduced in R2021b**

## find

Get element or collection of elements from dataset

### Syntax

```
[datasetOut,retIndex]=find(datasetIn,Name,Value,...)
```

```
[datasetOut,retIndex]=find(datasetIn,Name,Value,'-logicaloperator',...Name,Value,...)
```

```
[datasetOut,retIndex]=find(datasetIn,'-regexp',Name,Value,...)
```

### Description

`[datasetOut,retIndex]=find(datasetIn,Name,Value,...)` returns a `Simulink.SimulationData.Dataset` object and indices of the elements whose property values match the specified property names and values. Specify optional comma-separated pairs of `Name,Value` properties. `Name` is the property name and `Value` is the corresponding value. `Name` must appear inside single quotes ( ' '). You can specify several name-value pair properties in any order as `Name1,Value1,...,NameN,ValueN`.

`[datasetOut,retIndex]=find(datasetIn,Name,Value,'-logicaloperator',...Name,Value,...)` applies the logical operator to the matching property value. You can combine multiple logical operators. Logical operator can be one of:

- -or
- -and

If you do not specify an operation, the method assumes -and.

`[datasetOut,retIndex]=find(datasetIn,'-regexp',Name,Value,...)` matches elements using regular expressions as if the value of the property is passed to the `regexp` function as:

```
regexp(element.Name,Value)
```

The method applies regular expression matching to the name-value pairs that appear after -regexp. If there is no -regexp, the method matches elements as if the value of the property is passed as:

```
isequal(element.Name,Value)
```

For more information on -regexp, see “-regexp With Multiple Block Paths” on page 8-545.

#### -regexp With Multiple Block Paths

-regexp works with properties of type char. To specify multiple block paths, you can use `Simulink.SimulationData.BlockPath` and `Simulink.BlockPath`. For example, when a signal is logged in a referenced model, you can use `Simulink.SimulationData.BlockPath` to specify multiple block paths.

The method returns elements that contain a **BlockPath** property where one or more of the individual block paths match the specified `Value` path when you use:

- - regexp with the **BlockPath** Name property.
- Value as a character vector or scalar object of type `Simulink.SimulationData.BlockPath` with one block path

## Input Arguments

### **datasetIn** — `SimulationData.Dataset`

`SimulationData.Dataset` object

`SimulationData.Dataset` object in which to search for matching elements.

### **Name** — Name of property

character vector

Name of property to find in the element.

### **Value** — Value of property

character vector | double | `Simulink.SimulationData.BlockPath`

Value of property to find in the element.

## Output Arguments

### **datasetOut** — `SimulationData.Dataset` data set

`SimulationData.Dataset`

`SimulationData.Dataset` object that contains the elements that match the specified criteria. If there is no matching `SimulationData.Dataset` object, the returned `SimulationData.Dataset` object contains no elements.

### **retIndex** — Indices

vector

Indices of the elements `datasetIn` that match the specified criteria.

## Examples

### **Find Block Path**

Find a specific block path (specified by character vector) and port index.

```
dsOut = find(dsIn, 'BlockPath', 'vdp/x1', 'PortIndex', 1)
```

### **Find Elements**

Find elements that have either name or propagated name as `InValve`.

```
dsOut = find(dsIn, 'Name', 'InValve', '-or', 'PropagatedName', 'InValve')
dsOut = find(dsIn, '-regex', 'Name', 'In*', '-or', ...
 '-regex', 'PropagatedName', 'In*')
```

### Find and Change Element

Find and replace all elements containing `specified_name` with a `new_name`.

```
[dsOut,idxInDs] = find(ds, 'specified_name');
for idx=1: length(idxInDs)
 % process each element
 elm = get(dsOut, idx);
 elm.Name= 'New_Name'
 dsIn = setElement(dsIn, idxInDs(idx), elm);
end
```

### Find Signals in subSys Using -regexp

Find all signals logged in a `subSys` using `-regexp`.

```
dsOut = find(dsIn, '-regexp', 'BlockPath', 'mdl/subSys/.*')
```

### Find Signals in Referenced Model

Find all signals logged in the Model block.

```
dsOut = find(dsIn, '-regexp', 'BlockPath', 'refmdl/ModelBlk')
```

### Alternative

You can use curly braces to streamline indexing syntax to get an element in a dataset, instead of using `find`. The index must be a scalar that is not greater than the number of elements in the variable. For example, get the second element of the `logout` dataset.

```
logout{2}
```

Also, you can use the `get` method to get an element or collection of elements from a dataset.

# get

Get element or collection of elements from dataset

## Syntax

```
element = get(dataset,index)
element = get(dataset,name)
element = get(dataset,{name})
```

## Description

`element = get(dataset,index)` returns the element corresponding to the `index`. The `getElement` method uses the same syntax and behavior as the `get` method.

`element = get(dataset,name)` returns the element whose name matches `name`. When `name` is in a cell array, return the index of the element whose name matches `name`.

`element = get(dataset,{name})` returns a single element if only one element name matches, a `SimulationData.Dataset` if multiple elements with this name exist.

If you use **Log Dataset data to file** to create the MAT-file, use `getAsDatastore` for fast access to the data.

## Input Arguments

### **dataset** — Dataset

`SimulationData.Dataset` object

The data set from which to get the element.

### **index** — Index value of element to get

scalar numeric

Index value of element to get. The index reflects the index value of a data set element.

### **name** — Name for data set element

character array | cell array

Name for a data set element, specified as:

- A character array reflecting the name of the data set element
- A cell array containing one character vector. To return a `SimulationData.Dataset` object that can contain one element, use this format. Consider this form when writing scripts.

## Output Arguments

### **element** — Element

element | `SimulationData.Dataset` object | empty object

The element that the `get` method finds.

- If `index` is the first argument after the data set, the method returns the element at the `index`.
- If `name` is the first argument after the data set:
  - If the method finds one element, it returns the element.
  - If the method finds more than one element, return a Dataset that contains the elements.
  - If the method does not find an element, it returns an empty object.

## Examples

### Access Dataset Elements

Access `Simulink.SimulationData.Dataset` elements in the top model of the `ex_bus_logging` model. The signal logging dataset is `topOut`.

```
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', ...
'examples', 'ex_bus_logging')));
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', ...
'examples', 'ex_mdref_counter_bus')));
sim('ex_bus_logging')
topOut
```

```
topOut =
```

```
Simulink.SimulationData.Dataset
Package: Simulink.SimulationData
```

```
Characteristics:
 Name: 'topOut'
 Total Elements: 4
```

```
Elements:
 1: 'COUNTERBUS'
 2: 'OUTPUTBUS'
 3: 'INCREMENTBUS'
 4: 'inner_bus'
```

```
-Use get or getElement to access elements by index, name or
 block path.
-Use addElement or setElement to add or modify elements.
```

```
Methods, Superclasses
```

### Access Dataset Elements with Index

Access the element at `index` if the first argument is a numeric value.

```
e1 = logout.get(1);
```

### Access Dataset Elements with Characters

Access the element whose name matches `name`.

```
el = logouts.get('name');
```

### Access Dataset Elements with Cell Array

Return a dataset if the first argument is a cell array with a character vector as the first element.

```
ds = logouts.get({'my_name'});
```

### Alternatives

You can use curly braces to streamline indexing syntax to get an element in a dataset, instead of using `get` or `getElement`. The index must be a scalar that is not greater than the number of elements in the variable. For example, get the second element of the `logouts` dataset.

```
logouts{2}
```

Also, you can use the `find` method to get an element or collection of elements from a dataset.

## Version History

## getElementNames

Return names of all elements in dataset

### Syntax

```
element_list = getElementNames(dataset)
```

### Description

`element_list = getElementNames(dataset)` returns the names of all of the elements in the `Simulink.SimulationData.Dataset` object.

### Input Arguments

#### **dataset** — Data set

`SimulationData.Dataset` object

The data set from which to the element name.

### Output Arguments

#### **element\_list** — Data set

cell array

Data set, returned as a cell array of the character vectors containing names of all of the elements of the dataset.

### Examples

#### **Return Names of Elements**

Return the names of the elements for the `topOut` data set (the signal logging data).

```
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', ...
'examples', 'ex_bus_logging')));
open_system(docpath(fullfile(docroot, 'toolbox', 'simulink', ...
'examples', 'ex mdlref_counter_bus')));
sim('ex_bus_logging')
el_names = topOut.getElementNames
```

```
el_names =
 'COUNTERBUS'
 'OUTPUTBUS'
```

```
'INCREMENTBUS'
'inner_bus'
```

## numElements

Get number of elements in data set

### Syntax

```
length = numElements(dataset)
```

### Description

`length = numElements(dataset)` gets the number of elements in the top-level dataset. To get the number of elements of a nested data set, use `numElements` with the nested data set.

### Input Arguments

**dataset — Data set**

`SimulationData.Dataset` object

The data set from which to get the number of elements.

### Output Arguments

**length — Number of elements**

double

Number of elements, returned as a double.

### Examples

**Get Number of Elements**

Get the number of elements in the signal logging data set for the `ex_bus_logging`.

```
length = topOut.numElements()
```

## Version History

Introduced in R2011a

## plot

Plot data in the Simulation Data Inspector

### Syntax

```
plot(ds)
plot(ds,viewer)
runObj = plot(ds)
```

### Description

`plot(ds)` plots the data in the `Simulink.SimulationData.Dataset` or `Simulink.SimulationData.DatasetRef` in the **Simulation Data Inspector**. When there are eight signals or fewer in the `Dataset` or `DatasetRef` object, the Simulation Data Inspector plot layout changes to 1-by-n, where n is equal to the number of signals, and plots one signal on each subplot. When the `Dataset` or `DatasetRef` object contains more than eight signals, the Simulation Data Inspector plot layout changes to 1-by-1 and plots the first signal.

`plot(ds,viewer)` displays the plot in the Simulation Data Inspector or Signal Preview window, according to the value specified for `viewer`.

`runObj = plot(ds)` plots the data in the `Dataset` object and returns the corresponding `Simulink.sdi.Run` object.

### Input Arguments

#### **ds** — Dataset or DatasetRef object with data to plot

`Simulink.SimulationData.Dataset` object | `Simulink.SimulationData.DatasetRef` object

`Dataset` or `DatasetRef` object that contains the data to plot.

#### **viewer** — Viewer to use to plot data

'datainspector' (default) | 'preview'

Viewer used to plot the data, specified as 'datainspector' or 'preview'. When you do not specify the viewer input, the plot function plots data in the Simulation Data Inspector.

- 'datainspector' — Plot data in the **Simulation Data Inspector**.
- 'viewer' — Plot data in the Signal Preview window. For more information, see “Preview Signal Data”.

### Output Arguments

#### **runObj** — `Simulink.sdi.Run` object corresponding to the plotted data

`Simulink.sdi.Run` object

`Simulink.sdi.Run` object corresponding to the plotted data. When you view data in a Signal Preview window, the plot function returns empty (`[]`).

## Examples

### Plot a Data Set

Create a `timeseries` object `ts` and add elements to plot in the Simulation Data Inspector.

```
% Create a timeseries object
ts = timeseries([0;20],[0;10]);
% Create a SimulationData.Dataset
ds = Simulink.SimulationData.Dataset();
% Place timeseries object in dataset
ds = ds.addElement(ts,'ts');
% Plot the element
plot(ds);
```

## Version History

### Introduced in R2016b

#### 'sdi' input is not recommended

*Not recommended starting in R2019b*

Starting in R2019b, specify the viewer argument for the `plot` function as `'datainspector'` to view plotted data in the Simulation Data Inspector.

### See Also

`Simulink.SimulationData.Dataset | addElement`

## setElement

Change element stored at specified index

### Syntax

```
dataset = setElement(dataset,index,... element)
dataset = setElement(index,element, name)
```

### Description

`dataset = setElement(dataset,index,... element)` changes the element stored at the specified index, for an existing index. If `index` is one greater than the number of elements in the data set, the function adds the element at the end of the data set.

`dataset = setElement(index,element, name)` changes the element stored at the specified index and gives it the name that you specify. You can use `name` to identify an element that does not have a name. If the signal already has a name, the element instead uses the name you specify by using the `name` argument.

### Input Arguments

#### **dataset** — Data set

`SimulationData.Dataset` object

The data set for which to set the element.

#### **index** — Index

scalar

Index for the added element, specified as a scalar numeric value. The value must be between 1 and the number of elements plus 1.

#### **element** — Element to replace existing element

`Simulink.SimulationData.Signal` object | `Simulink.SimulationData.DataStoreMemory` object

Element to replace existing element or to add to the data set, specified as a `Simulink.SimulationData.Signal` object or `Simulink.SimulationData.DataStoreMemory` object.

#### **name** — Element name

character vector

Element name, returned as a character vector.

### Output Arguments

#### **dataset** — Data set

character vector

Data set in which you change or add an element, specified as a character vector.

## Examples

### Set Element Name

Set element name.

```
ds = Simulink.SimulationData.Dataset
element1 = Simulink.SimulationData.Signal
element1.Name = 'A'
ds = ds.addElement(element1)
element2 = Simulink.SimulationData.Signal
element2.Name = 'B'
elementNew = Simulink.SimulationData.Signal
ds = ds.setElement(2,elementNew,'B1')
ds
```

ds =

```
Simulink.SimulationData.Dataset
Package: Simulink.SimulationData
```

```
Characteristics:
 Name: 'topOut'
 Total Elements: 2
```

```
Elements:
 1: 'A'
 2: 'B1'
```

Use `getElement` to access elements by index, name or block path.

Methods, Superclasses

### Alternative

You can use curly braces to streamline indexing syntax to change an element in a dataset, instead of using `setElement`. The index must be a scalar that is not greater than the number of elements in the variable. For example, change the name of second element of the `logsout` dataset.

```
logsout{2}.Name = 'secondSignal'
```

# removeElement

**Package:** Simulink.SimulationData

Remove element from Simulink.SimulationData.Dataset object

## Syntax

```
ds = removeElement(ds,ind)
```

## Description

`ds = removeElement(ds,ind)` removes the elements at the indices specified by `ind` from the Simulink.SimulationData.Dataset object `ds`.

## Examples

### Remove Signal from Dataset Object

Open the model `LogDataDatasetFormat`. The model logs the data generated by three source blocks using the Dataset format.

```
open_system("LogDataDatasetFormat.slx");
```

Simulate the model.

```
out = sim("LogDataDatasetFormat.slx");
```

By default, all logged data is returned in a single variable in the workspace as a Simulink.SimulationOutput object.

out

```
out =
 Simulink.SimulationOutput:

 tout: [101x1 double]
 yout: [1x1 Simulink.SimulationData.Dataset]

 SimulationMetadata: [1x1 Simulink.SimulationMetadata]
 ErrorMessage: [0x0 char]
```

Check the contents of the Simulink.SimulationData.Dataset object, `yout`, that contains the logged output data.

```
yout = out.yout
```

```
yout =
 Simulink.SimulationData.Dataset 'yout' with 3 elements
```

Name	BlockPath
------	-----------

1	[1x1 Signal]	Sine Wave	LogDataDatasetFormat/Out1
2	[1x1 Signal]	Pulse	LogDataDatasetFormat/Out2
3	[1x1 Signal]	White Noise	LogDataDatasetFormat/Out3

- Use braces { } to access, modify, or add elements using index.

Suppose you want to use the logged outputs as input for another simulation that does not use the `White Noise` signal. To create a `Dataset` object that you can load as external input data for that simulation, remove the `White Noise` signal from the `Dataset` object `yout`. The `White Noise` signal is the third signal in the `Dataset` object, so specify the index as 3. Then, rename the `Dataset` object with the input data.

```
inputData = removeElement(yout,3);
inputData.Name = "Input Data";
inputData
```

```
inputData =
Simulink.SimulationData.Dataset 'Input Data' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	Sine Wave	LogDataDatasetFormat/Out1
2	[1x1 Signal]	Pulse	LogDataDatasetFormat/Out2

- Use braces { } to access, modify, or add elements using index.

The value of the variable `yout` remains unchanged. To modify the value of the variable `yout`, assign the return from the `removeElement` function back to `yout`.

```
yout = removeElement(yout,3)
```

```
yout =
Simulink.SimulationData.Dataset 'yout' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	Sine Wave	LogDataDatasetFormat/Out1
2	[1x1 Signal]	Pulse	LogDataDatasetFormat/Out2

- Use braces { } to access, modify, or add elements using index.

The original `Dataset` object in the `SimulationOutput` object remains unchanged. To modify the data in the `SimulationOutput` object, access the `Dataset` object through the `SimulationOutput` object instead of assigning it to a separate variable.

```
out.yout = removeElement(out.yout,3);
out.yout
```

```
ans =
Simulink.SimulationData.Dataset 'yout' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	Sine Wave	LogDataDatasetFormat/Out1

```
2 [1x1 Signal] Pulse LogDataDatasetFormat/Out2
```

- Use braces { } to access, modify, or add elements using index.

## Input Arguments

### **ds** — Data set from which to remove element

`Simulink.SimulationData.Dataset` object

Data set from which to remove element, specified as a `Simulink.SimulationData.Dataset` object.

### **ind** — Index of element to remove from data set

scalar | vector

Index of element to remove from data set, specified as a scalar or a vector. To remove more than one element from the data set, specify a vector that contains the index for each element you want to remove.

Example: 1

Example: [1 3]

## Output Arguments

### **ds** — Data set with element removed

`Simulink.SimulationData.Dataset` object

Data set with element removed, returned as a `Simulink.SimulationData.Dataset` object.

## Version History

Introduced in R2011a

## Simulink.SimulationInput class

**Package:** Simulink

Creates SimulationInput objects to make changes to model for multiple or individual simulations

### Description

The Simulink.SimulationInput object allows you to make changes to a model and run simulations with those changes. These changes are temporarily applied to the model. Using a Simulink.SimulationInput object, you can change:

- Initial state
- Model parameters
- Block parameters
- External inputs
- Variables

Through the Simulink.SimulationInput object, you can also specify MATLAB functions to run at the start and the end of each simulation by using the setPreSimFcn function and the setPostSimFcn.

### Construction

`simIn = Simulink.SimulationInput(modelName)` creates a SimulationInput object for a model.

#### Input Arguments

**modelName — Name of model**

string | character vector

Name of model, specified as a string or a character vector.

Example: `simIn = Simulink.SimulationInput('cstr')`

### Properties

**modelName — Name of model**

character vector

Name of the model for which the SimulationInput object is created.

**InitialState — Initial state**

Simulink.op.ModelOperatingPoint object

Initial state of the model for a simulation, specified as a Simulink.op.ModelOperatingPoint object.

**ExternalInput — External input**

Simulink.SimulationData.Dataset object | timeseries object | numerical array

External inputs added to the model for a simulation.

**BlockParameters — Block parameters**

array of Simulink.Simulation.BlockParameter objects

Block parameters of the model that are modified.

**Variables — Variables**

array of Simulink.Simulation.Variable objects

Variables of the model that are modified.

**ModelParameters — Model parameters**

array of Simulink.Simulation.ModelParameter objects

Model parameters of the model that are modified.

**PreSimFcn — Presimulation function**

MATLAB function

MATLAB function to run before the start of the simulation.

**PostSimFcn — Post simulation function**

MATLAB function

MATLAB function to run after each simulation.

**UserString — User string**

character array | string

Brief description of the simulation specified as a character array or a string.

**Methods**

Method	Purpose
setModelParameter	Set model parameters to be used for a specific simulation through SimulationInput object.
setBlockParameter	Set block parameters to be used for a specific simulation through SimulationInput object.
setInitialState	Set initial state to be used for a specific simulation through SimulationInput object.
setExternalInput	Set external inputs for a simulation through SimulationInput object.
setVariable	Set variables for a simulation through SimulationInput object.
setPreSimFcn	Specify a MATLAB function to run before start of each simulation through SimulationInput object.

Method	Purpose
setPostSimFcn	Specify a MATLAB function to run after each simulation is complete through SimulationInput object.
applyToModel	Apply changes to the model specified through a SimulationInput object.
validate	Validate the contents of the SimulationInput object.
loadVariablesFromMATFile	Load variables from MAT file into a Simulink.SimulationInput object.

## Examples

### Create a Simulink.SimulationInput Object

Create a SimulationInput object.

Open the model.

```
openExample('simulink/OpenTheModelExample');
open_system('ex_sldemo_househeat');
load_system('ex_sldemo_househeat')
```

Create a single SimulationInput object for a model.

```
model = 'ex_sldemo_househeat';
simIn = Simulink.SimulationInput(model);
```

### Create Array of Simulink.SimulationInput Objects

This example shows you how to create an array of SimulationInput objects.

Create an array of SimulationInput objects by using a for loop.

```
model = 'vdp';
for k = 10:-1:1
 simIn(k) = Simulink.SimulationInput(model);
end
```

### Set Block Parameters Using Array of Simulink.SimulationInput Objects

This example modifies the block parameters of a model through the SimulationInput object.

Open the model.

```
openExample('simulink/OpenTheModelExample');
open_system('ex_sldemo_househeat');
load_system('ex_sldemo_househeat')
```

Create a SimulationInput object for this model.

```
mdl = 'sldemo_househeat';
simIn = Simulink.SimulationInput(mdl);
```

Modify block parameter.

```
simIn = setBlockParameter(simIn, 'ex_sl-demo_househeat/Set Point', ...,
 'Value', '300');
```

Simulate the model.

```
out = sim(simIn);
```

## Use Dataset as External Input with Simulink.SimulationInput Objects

This example shows how use Dataset objects to set external inputs with Simulink.SimulationInput objects.

Open the model

```
mdl = 'sl-demo_md-ref_counter';
open_system(mdl);
```

Create a Dataset object for this model.

```
t = (0:0.01:10)';
ds = Simulink.SimulationData.Dataset;
ds = setElement(ds,1,timeseries(5*ones(size(t)),t));
ds = setElement(ds,2,timeseries(10*sin(t),t));
ds = setElement(ds,3,timeseries(-5*ones(size(t)),t));
```

Create a Simulink.SimulationInput object and set the external inputs.

```
simIn = Simulink.SimulationInput('sl-demo_md-ref_counter');
simIn = setExternalInput(simIn,ds);
```

Simulate the model.

```
out = parsim(simIn);
```

## Version History

Introduced in R2017a

# applyToModel

**Package:** Simulink

Apply configuration specified on Simulink.SimulationOutput object to model

## Syntax

```
applyToModel(simIn)
applyToModel(simIn, 'EnableConfigSetRefUpdate', configUpdate)
```

## Description

`applyToModel(simIn)` applies the configuration specified on the Simulink.SimulationInput object `simIn` to the model specified in the object. Use this function to debug or interactively analyze a simulation.

`applyToModel(simIn, 'EnableConfigSetRefUpdate', configUpdate)` applies the configuration specified in the Simulink.SimulationInput object `simIn` to the model specified in the object.

## Examples

### Apply Simulink.SimulationInput Object Configuration to Model

This example shows how to modify a model to use the options specified in a Simulink.SimulationInput object and save those modifications.

Open the model and create a SimulationInput object.

```
openExample('simulink_general/sldemo_househeat');
in = Simulink.SimulationInput('sldemo_househeatExample');
```

Specify block parameter, model parameter, and variable values on a Simulink.SimulationInput object.

```
simIn = setBlockParameter(simIn, 'sldemo_househeat/Set Point', ...,
 'Value', '75');
simIn = setVariable(simIn, 'cost', 50, 'Workspace', 'sldemo_househeat');
simIn = setModelParameter(simIn, 'StartTime', '1', 'StopTime', '5');
```

Apply the values specified on the Simulink.SimulationInput object to the model.

```
applyToModel(simIn)
```

## Input Arguments

### **simIn** — Simulation inputs and configuration

Simulink.SimulationInput object

Simulation inputs and configuration, specified as a Simulink.SimulationInput object.

---

**configUpdate** — Option to enable ConfigSetRef parameter to be updated in Simulink.SimulationInput object

'off' (default) | 'on'

Specify EnableConfigSetRefUpdate flag to 'on' to apply the ConfigSetRefs settings to the Simulink.SimulationInput object, for the model that uses reference configuration sets.

## Version History

Introduced in R2017a

## loadVariablesFromMATFile

**Package:** Simulink

Load variables from MAT file into Simulink.SimulationInput object

### Syntax

```
simIn = loadVariablesFromMATFile(simIn,filename)
simIn = loadVariablesFromMATFile(simIn,filename,'Append', 'on')
```

### Description

`simIn = loadVariablesFromMATFile(simIn,filename)` loads variables from the MAT file `filename` into the `Variables` property of the `Simulink.SimulationInput` `simIn`.

`simIn = loadVariablesFromMATFile(simIn,filename,'Append', 'on')` loads variables from the MAT file `filename` into the `Variables` property of the `Simulink.SimulationInput` `simIn`, while adding to the existing variables in the `Variables` property instead of replacing them.

### Examples

#### Load Variables from MAT File into Simulink.SimulationInput Object

Load variables from a MAT file into a `Simulink.SimulationInput` object using the `loadVariablesFromMATFile` function.

Create a `Simulink.SimulationInput` object for the model.

```
mdl = "ex_loadVar_sldemo_househeat";
simIn = Simulink.SimulationInput(mdl);
```

Use the `loadVariablesFromMATFile` function to load variables from a MAT file into the `Variables` property of the `Simulink.SimulationInput` object.

```
simIn = loadVariablesFromMATFile(simIn,"sldemo_househeat_data.mat")
```

```
simIn =
 SimulationInput with properties:

 ModelName: "ex_loadVar_sldemo_househeat"
 InitialState: [0x0 Simulink.op.ModelOperatingPoint]
 ExternalInput: []
 ModelParameters: [0x0 Simulink.Simulation.ModelParameter]
 BlockParameters: [0x0 Simulink.Simulation.BlockParameter]
 Variables: [1x25 Simulink.Simulation.Variable]
 PreSimFcn: []
 PostSimFcn: []
 UserString: ''
```

The simulation uses the variables loaded into the `Simulink.SimulationInput` object.

```
out = sim(simIn);
```

## Input Arguments

### **simIn** — Simulation inputs and configuration

Simulink.SimulationInput object

Simulation inputs and configuration, specified as a Simulink.SimulationInput object.

### **filename** — Name of MAT file

character vector | string

Name of MAT file, specified as a character vector or a string.

Example: 'myFile'

### **Append** — Append to existing variables in Simulink.SimulationInput object

'off' (default) | 'on'

Option to append new loaded variables to existing variables in Simulink.SimulationInput object, specified as 'off' or 'on'

## Output Arguments

### **simIn** — Simulation configuration with variables from MAT file added

Simulink.SimulationInput object

Simulation configuration with variables from MAT file added, returned as a Simulink.SimulationInput object.

## Version History

Introduced in R2017a

## loadVariablesFromExternalSource

**Package:** Simulink

Load variables from a custom file into `Simulink.SimulationInput` object

### Syntax

```
simIn = loadVariablesFromExternalSource(simIn,'filename')
simIn = loadVariablesFromExternalSource(simIn,'filename',Name,Value)
```

### Description

`simIn = loadVariablesFromExternalSource(simIn,'filename')` loads variables from the custom file `filename` into the `Variables` property of the `Simulink.SimulationInput` object `simIn` using the custom adapter registered for the file format.

`simIn = loadVariablesFromExternalSource(simIn,'filename',Name,Value)` loads variables from a custom file into the `Variables` property of a `Simulink.SimulationInput` object `simIn` with options specified using one or more name-value arguments.

For information on writing a custom file adapter, see “Create External File Adapter for Loading Variables into `Simulink.SimulationInput` Object”.

### Examples

#### Load Variables from Custom File Format for Multiple Simulations

This example shows how you can load variables into a `Simulink.SimulationInput` object from a custom file source, and run parallel simulations with those variables. To enable this, write and register an adapter. In this example, we use a model of a road suspension system. that we want to simulate with different sets of variables. The set of variables and their values for simulations is stored in the Excel files `CompactAndMidsizeCar.xls` and `LargeCars.xls`

For the simulations, we have stored different sets of variable values in the Excel files `CompactAndMidsizeCar.xls` and `LargeCars.xls`. Normally, you write a script to load variables into the base workspace, and then run your simulation. In this example, you load the variables directly into a `Simulink.SimulationInput` object and run simulations without changing the base workspace.

#### Register Adapter

To load the variables from a custom file format, you first must to write and register an adapter. `Simulink.data.adapters.excel_example_adapter` enables loading data from your custom file format. For more information on creating and registering adapters, see..

```
Simulink.data.adapters.registerAdapter('Simulink.data.adapters.excel_example_adapter')
```

```
ans = logical
 1
```

## Create Simulink.SimulationInput Object

First, create the Simulink.SimulationInput object for the ex\_loadvar\_sldemo\_suspn\_3dof model.

```
mdl = 'ex_loadvar_sldemo_suspn_3dof';
in = Simulink.SimulationInput(mdl)

in =
 SimulationInput with properties:

 ModelName: 'ex_loadvar_sldemo_suspn_3dof'
 InitialState: [0x0 Simulink.op.ModelOperatingPoint]
 ExternalInput: []
 ModelParameters: [0x0 Simulink.Simulation.ModelParameter]
 BlockParameters: [0x0 Simulink.Simulation.BlockParameter]
 Variables: [0x0 Simulink.Simulation.Variable]
 PreSimFcn: []
 PostSimFcn: []
 UserString: ''
```

## Load Variables from External File Source

You can now use the adapter to load variables from Excel files into a SimulationInput object by using the loadVariablesFromExternalSource function.

Multiple variable sets are saved in different files and in different sheets. To load the variables, first create a cell array named fileAndSectionNames of file-section paris. Each row in this cell array represents the data for a single simulation. Section represents the sheet or sheets present in the excel files.

```
fileAndSectionNames = {
 {'CompactAndMidsizeCar.xls', 'CompactCar'};
 {'CompactAndMidsizeCar.xls', 'Midsize'};
 {'LargeCars.xls', 'LargeCar'};
 {'LargeCars.xls', 'LargeSUV'};
}
```

```
fileAndSectionNames=4x1 cell array
 {1x2 cell}
 {1x2 cell}
 {1x2 cell}
 {1x2 cell}
```

Next, create an array of Simulink.SimulationInput objects and use the loadVariablesFromExternalSource method to load the variable sets into the array. To load variables from specific sheets from the excel files, use the 'Section' argument of the loadVariablesFromExternalSource method.

```
simIn = Simulink.SimulationInput.empty(length(fileAndSectionNames), 0);
for i = 1 : length(fileAndSectionNames)
 simIn(i) = Simulink.SimulationInput(mdl);
 simIn(i) = simIn(i).loadVariablesFromExternalSource(fileAndSectionNames{i}{1}, ...

## Run Multiple Simulations

To run multiple simulations, use the `parsim` function with the `Simulink.SimulationInput` object. Data in each file is isolated and has no impact on simulations that use data from the other files, regardless of the order in which the files are specified.

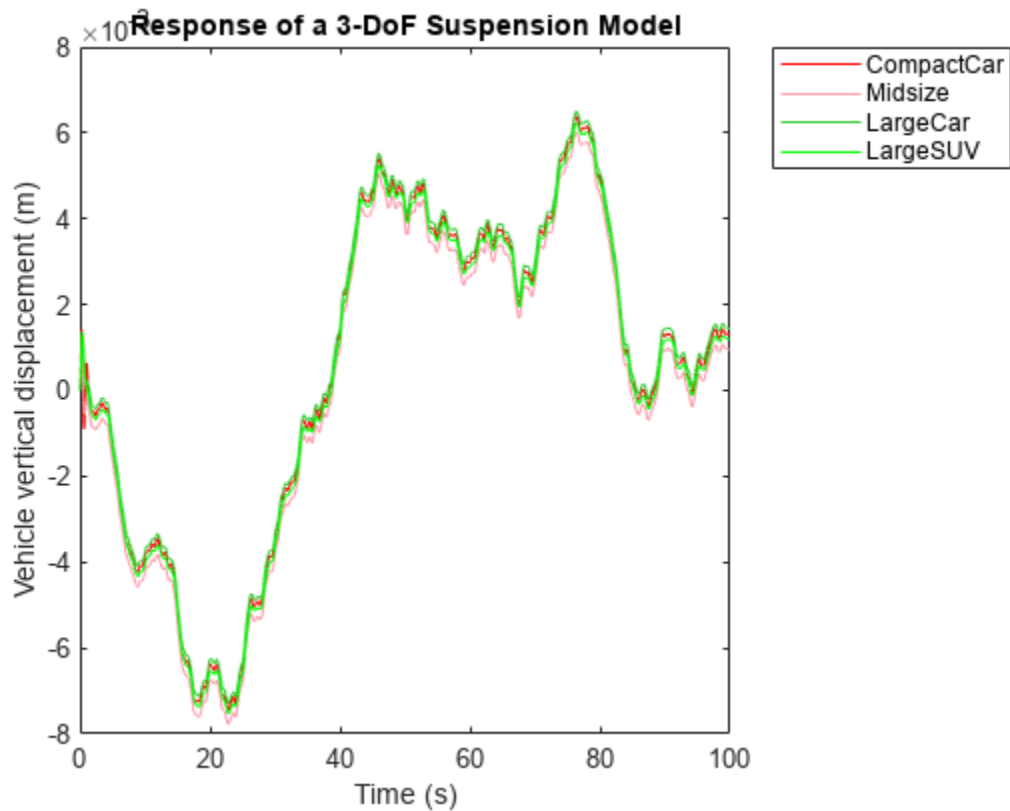

```
simOut = parsim(simIn)

[01-Sep-2022 10:49:50] Checking for availability of parallel pool...
Starting parallel pool (parpool) using the 'Processes' profile ...
Connected to the parallel pool (number of workers: 12).
[01-Sep-2022 10:54:27] Starting Simulink on parallel workers...
[01-Sep-2022 10:55:13] Configuring simulation cache folder on parallel workers...
[01-Sep-2022 10:55:14] Loading model on parallel workers...
[01-Sep-2022 10:55:36] Running simulations...
[01-Sep-2022 10:56:10] Completed 1 of 4 simulation runs
[01-Sep-2022 10:56:10] Completed 2 of 4 simulation runs
[01-Sep-2022 10:56:10] Completed 3 of 4 simulation runs
[01-Sep-2022 10:56:10] Completed 4 of 4 simulation runs
[01-Sep-2022 10:56:10] Cleaning up parallel workers...

simOut =
1x4 Simulink.SimulationOutput array
```

To plot the results, `plotResult` uses a MATLAB® timeseries object. The timeseries object `ts` stores the time and data values for the logged signal. The `plot` function plots the data against the simulation time. The plot shows the results for the simulations that uses the variable values loaded from the Excel files.

```
plotResult(fileAndSectionNames, simOut)
```

As the last step, unregister the adapter.

```
Simulink.data.adapters.unregisterAdapter('Simulink.data.adapters.excel_example_adapter')
```

```
ans = logical
 1
```

## Input Arguments

### **simIn** — Simulation inputs and configuration

Simulink.SimulationInput object

Simulation inputs and configuration, specified as a Simulink.SimulationInput object.

### **filename** — Name of custom external file

character vector | string

Name of custom external file, specified as a character vector or a string.

To use a custom file format, register an adapter that the method `loadVariablesFromExternalSource` uses to load variables from `filename` into the Simulink.SimulationInput object. `filename` must be specified with its extension.

Example: 'myFile'

## Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose `Name` in quotes.*

```
Example: simIn =
loadVariablesFromExternalSource(simIn,'filename','Append','on')
```

### Section — Section names in custom file

character vector

Section names in custom file from which variables are loaded, specified as a character vector or a string.

### Append — Option to append new loaded variables

'off' (default) | 'on'

Option to append new loaded variables to existing variables in a `Simulink.SimulationInput` object, specified as 'off' or 'on'.

By default, the loaded variables and their values override the variables and values already present in the `Variable` property of the `Simulink.SimulationInput` object.

### Workspace — Workspace for loaded variables

'global-workspace' (default) | 'modelName'

Workspace for loaded variables, specified as 'global-workspace' or 'modelName'.

### Context — Context for loaded variables within global workspace

'modelName'

Context for loaded variables within global workspace, specified as a string.

When the parameter 'EnforceDataConsistency' is set to `off`, the current model and the models below it in the model hierarchy can use variables with the same name but different values as long as each model in the hierarchy can see only one definition of the variable. These variables that have the same name are only attached to their respective models. In such a case, the `Context` option allows you to set the scope of the variable.

## Output Arguments

### simIn — Simulation configuration with variables from custom file format added

`Simulink.SimulationInput` object

Simulation configuration with variables from custom file format added, returned as a `Simulink.SimulationInput` object.

# removeVariable

**Package:** Simulink

Remove variable from Simulink.SimulationInput object

## Syntax

```
simIn = removeVariable(simIn,varName)
simIn = removeVariable(simIn,varName,'Workspace',workspace)
```

## Description

`simIn = removeVariable(simIn,varName)` removes the variable with the name `varName` from the Simulink.SimulationInput object `simIn`.

`simIn = removeVariable(simIn,varName,'Workspace',workspace)` removes the variable with the name `varName` specified in the workspace `workspace` from the Simulink.SimulationInput object `simIn`.

## Examples

### Modify and Remove Variable in Simulink.SimulationOutput Object

Open the model.

```
openExample('simulink/OpenTheModelExample');
open_system('ex_sl_demo_househeat');
```

Create a SimulationInput object for this model.

```
in = Simulink.SimulationInput mdl;
```

Set the cost variable value to 50.

```
in = setVariable(simIn,'cost',50);
```

By default, this variable is placed in the global workspace scope.

Suppose you want to simulate using the variable value saved in the model. Remove the variable from the Simulink.SimulationInput object.

```
in = removeVariable(simIn,'cost');
```

## Input Arguments

### **simIn** — Simulation inputs and configuration

Simulink.SimulationInput object

Simulation inputs and configuration, specified as a Simulink.SimulationInput object.

**varName — Name of variable to remove**

string | character vector

Name of variable to remove, specified as a string or a character vector.

Example: 'Gain'

**wkspc — Workspace from which to remove variable**

string | character vector

Workspace from which to remove variable, specified as a string or a character vector.

Example: 'Workspace', 'sldemo\_househeat'

**Output Arguments****simIn — Simulation configuration with variable removed**

Simulink.SimulationInput object

Simulation configuration with variable removed, returned as a Simulink.SimulationInput object.

**Version History**

Introduced in R2019a

# setBlockParameter

**Package:** Simulink

Set block parameter values on Simulink.SimulationInput object

## Syntax

```
simIn = setBlockParameter(simIn,blkPath,blkParam,
paramVal,...,blkPathN,blkParamN,paramValN)
```

## Description

`simIn = setBlockParameter(simIn,blkPath,blkParam,paramVal,...,blkPathN,blkParamN,paramValN)` sets one or more block parameter values on the Simulink.SimulationInput object `simIn`.

You can use the `setBlockParameter` function to specify block parameters for blocks throughout a model reference hierarchy. You can set multiple block parameters on a Simulink.SimulationInput object.

You can use `getBlockParameter(blkPath,blkParam)` to get the value of a block parameter and `removeBlockParameter(blkPath,blkParam)` to remove a block parameter from the Simulink.SimulationInput object.

## Examples

### Modify Block Parameter Value for Simulation

Modify a block parameter for a simulation using a Simulink.SimulationInput object.

Open the model

```
openExample("simulink_general/sldemo_househeatExample");
```

Create a SimulationInput object for this model.

```
mdl = "sldemo_househeat";
simIn = Simulink.SimulationInput(mdl);
```

Modify block parameter value.

```
simIn = setBlockParameter(simIn,'sldemo_househeat/Set Point',...,
'Value','300');
```

Simulate the model.

```
out = sim(simIn);
```

## Modify Multiple Block Parameter Values for Simulation

Modify multiple block parameter values for a simulation using a `Simulink.SimulationInput` object.

Open the model

```
mdl = 'vdp';
open_system(mdl);
```

Create a `SimulationInput` object for this model.

```
simIn = Simulink.SimulationInput(mdl);
```

Modify the `Gain` parameter value for the `Mu` block and the position of the `Product` block.

```
simIn = setBlockParameter(simIn,'vdp/Mu','Gain','40',...,
 'vdp/Product','Position',[50 100 110 120]);
```

Simulate the model.

```
out = sim(simIn);
```

## Input Arguments

### **simIn** — Simulation inputs and configuration

`Simulink.SimulationInput` object

Simulation inputs and configuration, specified as a `Simulink.SimulationInput` object.

### **blkPath** — Path of the block

string | character vector

Path of the block, specified as a string or a character vector.

Example: 'sldemo\_househeat/Set Point'

### **blkParam** — Block parameter name

string | character vector

Block parameter name, specified as a string or a character vector.

Example: 'Value', '350'

### **paramVal** — Block parameter value

character vector

Block parameter value, typically specified as a character vector.

Example: 'Value', '350'

## Output Arguments

### **simIn** — Simulation configuration with block parameter values added

`Simulink.SimulationInput` object

Simulation configuration with block parameter values added, returned as a `Simulink.SimulationInput` object.

## Version History

Introduced in R2017a

## setExternalInput

**Package:** Simulink

Set external inputs for simulation on `SimulationInput` object

### Syntax

```
simIn = setExternalInput(simIn,inVals)
```

### Description

`simIn = setExternalInput(simIn,inVals)` sets external input data `inVals` on the `Simulink.SimulationInput` object `simIn`. The external input data defines the values loaded by root-level input ports in the model specified on the `Simulink.SimulationInput` object.

### Examples

#### Specify Arrays as External Input Using `Simulink.SimulationInput` Object

Specify an array of external input data on a `Simulink.SimulationInput` object.

Open the model

```
open_system('sldemo_mdlref_counter');
```

Create a `SimulationInput` object for this model.

```
simIn = Simulink.SimulationInput('sldemo_mdlref_counter');
```

Create array of external input data.

```
t = (0:0.01:10)';
u1 = 5*ones(size(t));
u2 = 10*sin(t);
u3 = -5*ones(size(t));
```

Set external inputs on the `Simulink.SimulationInput` object.

```
simIn = setExternalInput(simIn,[t u1 u2 u3]);
```

Simulate the model.

```
out = sim(simIn);
```

### Input Arguments

#### **simIn** — Simulation inputs and configuration

`Simulink.SimulationInput` object

Simulation inputs and configuration, specified as a `Simulink.SimulationInput` object.

**inVals — External input data**

Simulink.SimulationData.Dataset object | array | timeseries object

External input data, specified as a `Simulink.SimulationData.Dataset` object, an array, or a `timeseries` object. The external input data specifies the values loaded by root-level input ports in the model. Use a `timeseries` object only when the model contains one input port.

**Output Arguments****simIn — Simulation configuration with external inputs added**

Simulink.SimulationInput object

Simulation configuration with external inputs added, returned as a `Simulink.SimulationInput` object.

**Version History**

Introduced in R2017a

## setInitialState

**Package:** Simulink

Configure Simulink.SimulationInput object to set initial state for simulation

### Syntax

```
simIn = setInitialState(simIn,xInitial)
```

### Description

`simIn = setInitialState(simIn,xInitial)` sets the value of the `InitialState` property for the `Simulink.SimulationInput` object `simIn` using the contents of the variable `xInitial`. Simulations run using the `SimulationInput` object `simIn` start from the initial state or operating point stored in the `InitialState` property of the object.

### Examples

#### Save and Restore Model Operating Point

Open the model `sldemo_tonegen`.

```
model = "sldemo_tonegen";
open_system(model);
```

Create a `Simulink.SimulationInput` object to specify parameter values to use in simulation.

```
simIn = Simulink.SimulationInput(model);
```

Configure the simulation to stop after ten seconds and save the final operating point in a variable named `finalOP`.

```
simIn = setModelParameter(simIn,"StopTime","10",...
 "SaveFinalState","on","SaveOperatingPoint","on",...
 "FinalStateName","finalOP");
```

Simulate the model using the settings configured on the `SimulationInput` object.

```
out = sim(simIn);
```

Access the saved operating point, returned as part of the single `Simulink.SimulationOutput` object.

```
finalOP = out.finalOP
```

```
finalOP =
 Simulink.op.ModelOperatingPoint
```

```
 Operating point of the model 'sldemo_tonegen' at simulation time 10.
```

```
 Properties
```

```

 loggedStates
 description
 startTime (Read-only)
 snapshotTime (Read-only)

```

#### Methods

```

 get
 set

```

Create a `SimulationInput` object to configure another simulation that uses the operating point saved from the first simulation.

```
simIn2 = Simulink.SimulationInput(model);
```

Configure the model to simulate to a stop time of twenty seconds.

```
simIn2 = setModelParameter(simIn2, "StopTime", "20");
```

Use the `setInitialState` function to specify the initial state for the simulation using the `Simulink.op.ModelOperatingPoint` object saved from the first simulation.

```
simIn2 = setInitialState(simIn2, finalOP);
```

Simulate the model from the initial operating point.

```
out2 = sim(simIn2);
```

## Input Arguments

### **simIn** — Simulation input to specify initial state

`Simulink.SimulationInput` object

Simulation input to specify initial state, specified as a `Simulink.SimulationInput` object.

### **xInitial** — Initial state or operating point

`Simulink.op.ModelOperatingPoint` object | `Simulink.SimulationData.Dataset` object | structure

Initial state or operating point, specified as a `Simulink.op.ModelOperatingPoint` object, a `Simulink.SimulationData.Dataset` object, or a structure that matches the `Structure` or `Structure with Time logging format`.

## Output Arguments

### **simIn** — Simulation configuration with initial states added

`Simulink.SimulationInput` object

Simulation configuration with initial states added, returned as a `Simulink.SimulationInput` object.

## Version History

Introduced in R2017a

# setModelParameter

**Package:** Simulink

Specify parameter values for simulation configured using `Simulink.SimulationInput` object

## Syntax

```
simIn = setModelParameter(simIn,Name,Value)
```

## Description

`simIn = setModelParameter(simIn,Name,Value)` sets configuration parameter values on the `Simulink.SimulationInput` object `simIn` according to one or more name-value arguments.

You can use the `setModelParameter` function to configure the value for any model configuration parameter on a `Simulink.SimulationInput` object by passing the parameter name and value as a name-value argument.

Use `getModelParameter('ParameterName')` to get the value of a configuration parameter. Use `removeModelParameter('ParameterName')` to remove a configuration parameter from the `Simulink.SimulationInput` object.

## Examples

### Configure Model Parameter Value for Simulation

Configure model parameter values for a simulation using a `Simulink.SimulationInput` object.

Open the model.

```
openExample('simulink_general/sldemo_househeatExample')
```

Create a `SimulationInput` object for the model.

```
mdl = "sldemo_househeat";
simIn = Simulink.SimulationInput(mdl);
```

Specify a simulation timeout of 5 seconds then specify the start and stop time for the simulation.

```
simIn = setModelParameter(simIn,"Timeout",5);
simIn = setModelParameter(simIn,"StartTime","1","StopTime","4");
```

Simulate the model.

```
out = sim(simIn);
```

## Input Arguments

**simIn** — Simulation inputs and configuration

`Simulink.SimulationInput` object

Simulation inputs and configuration, specified as a `Simulink.SimulationInput` object.

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `simIn = setModelParameter(simIn,"StopTime","100")` configures a `Simulink.SimulationInput` object with a simulation stop time of 100.

In addition to the name-value arguments listed in this page, you can specify the value for any model configuration parameter as a name-value argument.

### RapidAcceleratorUpToDateCheck — Option to disable rebuilding rapid accelerator target 'on' (default) | 'off'

Option to disable rebuilding rapid accelerator target, specified as 'on' or 'off'. When you specify this argument as 'on', changes that require rebuilding the rapid accelerator target are ignored. When you use this option, modify only options that do not require rebuilding the rapid accelerator target.

Example: `simIn = setModelParameter(simIn,"RapidAcceleratorUpToDateCheck","off")` configures a `Simulink.SimulationInput` object to disable rebuilding the rapid accelerator target.

Data Types: char | string

### TimeOut — Maximum simulation run time

positive scalar

Maximum simulation run time, specified as a positive scalar. Specify the time, in seconds, to allow the simulation to run. If the simulation runs for longer than the value you specify, the software issues a warning and stops the simulation. For example, if you specify `TimeOut` as 30, the software stops the simulation and issues a warning if computing simulation results takes more than 30 seconds.

The `TimeOut` parameter specifies a limit on the amount of clock time for a simulation to run. To specify the maximum time value to simulate, use the **Stop time** parameter.

Example: `simIn = setModelParameter(simIn,"TimeOut",60)` configures a `Simulink.SimulationInput` object with a maximum simulation run time of 60 seconds.

Data Types: char | string

## Output Arguments

### simIn — Simulation configuration with model parameters added

`Simulink.SimulationInput` object

Simulation configuration with model parameters added, returned as a `Simulink.SimulationInput` object.

## Version History

Introduced in R2017a

## See Also

Simulink.SimulationInput

### Functions

sim | parsim | batchsim | setBlockParameter | applyToModel | validate

### Topics

“Running Multiple Simulations”

“Run Parallel Simulations for a Thermal Model of a House Using parsim”

## setPostSimFcn

**Package:** Simulink

Set MATLAB function to run after each simulation

### Syntax

```
simIn = setPostSimFcn(simIn,func)
```

### Description

`simIn = setPostSimFcn(simIn,func)` configures the post simulation function associated with the function handle `func` on the `Simulink.SimulationInput` object `simIn`. The `Simulink.SimulationInput` object is passed as an argument to this function. `func` is any MATLAB function and can be used to do the post processing on the output. To return post processed data, you must return it as values in a structure. These values are then packed into the `Simulink.SimulationOutput` output to replace the usual logged data or add new data to the `Simulink.SimulationOutput` object.

### Examples

#### Specify MATLAB Function to Process Simulation results

This example specifies a post simulation function for a simulation using a `Simulink.SimulationInput` object.

Create a `PostSimFcn` that calculates the mean for logged outputs.

```
function newout = postsim(out);
newout.mean = mean(out.yout);
end
```

Create a `SimulationInput` object for the model `vdp`.

```
simIn = Simulink.SimulationInput('vdp');
simIn = setPostSimFcn(simIn,@(x) postsim(x));
simIn = setModelParameter(simIn,'SaveOutput','on');
```

Simulate the model.

```
out = sim(simIn);
```

View the result from the post simulation function.

```
out.mean
```

As a best practice, avoid using `ErrorMessage` and `SimulationMetadata` as field names in the function.

## Input Arguments

### **simIn** — Simulation inputs and configuration

`Simulink.SimulationInput` object

Simulation inputs and configuration, specified as a `Simulink.SimulationInput` object.

### **func** — Function to run after each simulation completes

function handle | function name

Function to run after each simulation completes, specified as a function handle or a function name. The software passes the `Simulink.SimulationInput` object in the shape of `y` argument. For example:

```
in = in.setPreSimFcn(@myfunc, y)
```

where `myfunc` is a MATLAB function.

```
function f = myfunc(x)
f ...%Compute function value with x as an input argument
```

You can also specify the function as a function handle for an anonymous function.

```
in = in.setPostSimFcn(@(y) myfunction(arg1, arg2 ...))
```

## Output Arguments

### **simIn** — Simulation configuration with post simulation function added

`Simulink.SimulationInput` object

Simulation configuration with post simulation function added, returned as a `Simulink.SimulationInput` object.

## Version History

Introduced in R2017a

## See Also

`sim` | `parsim` | `batchsim` | `setPreSimFcn`

### Topics

“Running Multiple Simulations”

“Run Parallel Simulations for a Thermal Model of a House Using `parsim`”

## setPreSimFcn

**Package:** Simulink

Specify MATLAB function to run before start of each simulation on `Simulink.SimulationInput` object

### Syntax

```
simIn = setPreSimFcn(simIn,func)
```

### Description

`simIn = setPreSimFcn(simIn,func)` registers the callback function associated with the function handle `func` before each simulation starts. The `Simulink.SimulationInput` object is passed as an argument to this function. `func` is any MATLAB function and can be used to modify the `Simulink.SimulationInput` object. If you use `func` to modify the `Simulink.SimulationInput` object, you must return the `Simulink.SimulationInput` object as the only output argument.

### Input Arguments

#### **simIn** — Simulation inputs and configuration

`Simulink.SimulationInput` object

Simulation inputs and configuration, specified as a `Simulink.SimulationInput` object.

#### **func** — Function to run before each simulation

function handle | function name

Function to run before each simulation, specified as a function handle or a function name. `setPreSimFcn` passes the `Simulink.SimulationInput` object in the shape of `x` argument. The output of `func` has to be a `Simulink.SimulationInput` object to be used in a simulation. For example:

```
simIn = setPreSimFcn(simIn,@myfunc,x)
```

where `myfunc` is a MATLAB function such as

```
function f = myfunc(x)
f ...%Compute function value with x as an input argument
```

You can also specify the presimulation function as a function handle for an anonymous function

```
simIn = setPreSimFcn(simIn,@(x) myfunction(arg1, arg2 ...))
```

### Output Arguments

#### **simIn** — Simulation configuration with presimulation function added

`Simulink.SimulationInput` object

Simulation configuration with presimulation function added, returned as a `Simulink.SimulationInput` object.

## Version History

Introduced in R2017a

## setVariable

**Package:** Simulink

Set variable value on SimulationInput object

### Syntax

```
simIn = setVariable(simIn,varName,varValue)
simIn = setVariable(simIn,varName,varValue,'Workspace',wkspc)
```

### Description

`simIn = setVariable(simIn,varName,varValue)` sets the variable `varName` with the value `varValue` on the `Simulink.SimulationInput` object `simIn`. You can configure a `Simulink.SimulationInput` object with multiple variables. When you use the `setVariable` function, specify only one variable at a time.

`simIn = setVariable(simIn,varName,varValue,'Workspace',wkspc)` assigns the value `varValue` to variable `varName`. Variables that are defined through the `SimulationInput` object are placed in the global workspace scope by default. The term global workspace is specific to the `Simulink.SimulationInput` object and its functions. Variables in the global workspace scope take precedence if a variable with the same name exists in the base workspace or the data dictionary. The variables in the model workspace take precedence over the global workspace scope. To change the value of a model workspace variable, set the scope by specifying the model name when you add the variable to the `SimulationInput` object.

You can use `getVariable(simIn,varName)` to get a variable value and `removeVariable(simIn,varName)` to remove a variable from the `Simulink.SimulationInput` object

For information on using nonscalar variables, structure variables, and parameter objects, see “Sweep Nonscalars, Structures, and Parameter Objects”.

### Examples

#### Modify Variable for Simulation

Specify the value for a variable using a `Simulink.SimulationInput` object.

Open the model.

```
openExample('simulink/OpenTheModelExample');
```

Create a `SimulationInput` object for this model.

```
simIn = Simulink.SimulationInput('ex_sl_demo_househeat');
```

Set the cost variable value to 50.

```
simIn = setVariable(simIn,'cost',50);
```

By default, this variable has global workspace scope.

Simulate the model.

```
out = sim(simIn);
```

### Modify Variable in Model Workspace

Modify the value of a variable in the model workspace using a `Simulink.SimulationInput` object.

Open the model

```
openExample('simulink/OpenTheModelExample');
```

Create a `SimulationInput` object for this model.

```
simIn = Simulink.SimulationInput('ex_sldemo_househeat');
```

Set the `cost` variable value to 50 and set the scope to the model workspace.

```
simIn = setVariable(simIn, 'cost', 50, 'Workspace', 'ex_sldemo_househeat');
```

Simulate the model.

```
out = sim(simIn);
```

## Input Arguments

### **simIn** — Simulation inputs and configuration

`Simulink.SimulationInput` object

Simulation inputs and configuration, specified as a `Simulink.SimulationInput` object.

### **varName** — Variable name

string | character vector

Variable name, specified as a string or a character vector.

### **varValue** — Variable value

MATLAB expression

Variable value, specified as a MATLAB expression.

### **wkspc** — Variable scope

model name

Variable scope, specified as the model name.

Example: `'Workspace', 'sldemo_househeat'`

## Output Arguments

### **simIn** — Simulation configuration with variable added

`Simulink.SimulationInput` object

Simulation configuration with variable added, returned as a `Simulink.SimulationInput` object.

## **Version History**

#### **Topics**

“Running Multiple Simulations”

“Run Parallel Simulations for a Thermal Model of a House Using `parsim`”

# showContents

**Package:** Simulink

View contents of Simulink.SimulationInput object

## Syntax

```
showContents(simIn)
```

## Description

showContents(simIn) displays the contents of the Simulink.SimulationInput object simIn as a table. The function lets you view all the information such as block parameters, variables, model parameters, external Inputs and the initial states that are set in the Simulink.SimulationInput object. You can view the contents of a single Simulink.SimulationInput object at a given time.

## Examples

### View Contents of Simulink.SimulationInput Object

Use the showContents function to view the simulation configuration stored in a Simulink.SimulationInput object.

Open the model .

```
open_system('ex_sldemo_househeat')
```

Create a Simulink.SimulationInput object for the model ex\_sldemo\_househeat.

```
simIn = Simulink.SimulationInput('ex_sldemo_househeat');
```

Configure a variable value and model parameter values on the Simulink.SimulationInput object.

```
simIn = setVariable(simIn, 'cost', 50);
simIn = setModelParameter(simIn, 'Start', '0', 'Stop', '50');
```

View the configuration stored on the Simulink.SimulationInput object.

```
showContents(simIn)
```

```
ModelName: 'ex_sldemo_househeat'
```

```
ModelParameters:
```

Index	Name	Value
1	Start	'0'
2	Stop	'50'

```
Variables:
```

Index	Name	Value	Workspace	Context
1	cost	50	global-workspace	<undefined>

RuntimeFcns: 1x1 RuntimeFcns

## Input Arguments

### **simIn** — Simulation inputs and configuration

Simulink.SimulationInput object

Simulation inputs and configuration, specified as a Simulink.SimulationInput object.

## Version History

Introduced in R2020a

“Run Parallel Simulations for a Thermal Model of a House Using parsim”

# validate

**Package:** Simulink

Validate contents of `SimulationInput` object

## Syntax

```
validate(simIn)
```

## Description

`validate(simIn)` validates the changes made to the model through the `SimulationInput` object `simIn`.

## Examples

### Validate Changes Made Using `SimulationInput` Object

Configure a `Simulink.SimulationInput` object with modifications to make in a model for a simulation then validate the object.

Open the model.

```
openExample('simulink/OpenTheModelExample');
mdl = 'ex_sl-demo_househeat';
open_system(mdl);
```

Create a `SimulationInput` object for this model

```
simIn = Simulink.SimulationInput(mdl);
```

Specify the value for an invalid model parameter using the `setModelParameter` function.

```
simIn = setModelParameter(simIn,'InvalidParamName','5');
```

Validate the `Simulink.SimulationInput` object.

```
validate(simIn)
```

## Input Arguments

# Simulink.SimulationOutput

Access simulation outputs and metadata

## Description

The `Simulink.SimulationOutput` object provides a single point of access for all data associated with a simulation. Properties on the object contain all data logged from simulation and complete simulation metadata, including information about the model configuration, simulation timing, and errors or warnings that occur during simulation. Accessing simulation results in a single object helps distinguish the simulation results from other workspace data and makes it easier to manage data from multiple simulations.

## Creation

Simulating a model creates one or more `Simulink.SimulationOutput` objects in any of these situations:

- You enable the **Single simulation output** parameter.

By default, the **Single simulation output** parameter is enabled when you create a new model. You can enable the parameter using the Configuration Parameters dialog box. On the **Modeling** tab, under **Settings**, click **Model Settings**. Then, in the Configuration Parameters dialog box, select **Data Import/Export** and select **Single simulation output**.

- You run a set of simulations using the **Multiple Simulations** pane.
- You simulate the model programmatically using one or more `Simulink.SimulationInput` objects.

You can configure simulations using `SimulationInput` objects when you run simulations using the `sim`, `parsim`, and `batchsim` functions.

- You simulate the model using a `sim` function syntax that returns results as a single simulation output.

For more information, see `sim`.

## Properties

### Logged Data Properties

When you log data to the workspace and return a single simulation output, the `Simulink.SimulationOutput` object contains a property for each logging variable. The name of the property matches the name you specify for the logging variable. For example, when you log data using signal logging and use the default variable name `logsout`, the `Simulink.SimulationOutput` object has the property `logsout` that contains the logged signal data.

Configure data to log and variable names using the **Data Import/Export** pane of the Configuration Parameters dialog box or by adding logging blocks, such as the To Workspace block, to your model. The table summarizes the default property name for several common logging techniques.

Default Property Name	Logging Source	Value
tout	<b>Time</b> logging	Format specified by <b>Format</b> parameter.
yout	<b>Output</b> logging	Format specified by <b>Format</b> parameter.
xout	<b>States</b> logging	Format specified by <b>Format</b> parameter.
xFinal	<b>Final states</b> logging	When <b>Save final operating point</b> is selected, final states are saved as a <code>Simulink.op.ModelOperatingPoint</code> object.  When <b>Save final operating point</b> is not selected, final states are saved according to the value of the <b>Format</b> parameter.  For more information, see “Save Block States and Simulation Operating Points”.
logout	<b>Signal logging</b>	<code>Simulink.SimulationData.Dataset</code> object.
dsmout	<b>Data stores</b> logging	<code>Simulink.SimulationData.Dataset</code> object.
simout	To Workspace block	Format specified by <b>Save format</b> block parameter.
recordout	Record, XY Graph block	<code>Simulink.SimulationData.Dataset</code> object.
ScopeData	Scope block	Format specified by <b>Save format</b> block parameter.

Data you log to a file using To File blocks, Record blocks, or the **Log Dataset data to file** parameter is not captured as a property of the `Simulink.SimulationOutput` object.

### Custom Properties

You can add properties to a `Simulink.SimulationOutput` object to store additional data or metadata. For example, when you run parallel simulations using `parsim` or `batchsim`, you can define properties on the `Simulink.SimulationOutput` object to send data from parallel workers to the client.

Adding a property to a `Simulink.SimulationOutput` object is similar to defining a field in a structure. For example, this code adds the property `NewProperty` with a value of 1 to the `Simulink.SimulationOutput` object `simOut`.

```
simOut.NewProperty = 1;
```

## Simulation Metadata Properties

### SimulationMetadata — Information about simulation

Simulink.SimulationMetadata object

This property is read-only.

Information about simulation, returned as a Simulink.SimulationMetadata object. The SimulationMetadata object contains:

- Detailed information about the model, including the model version and the version of software used to create the model
- Warnings and errors that occur during simulation
- Timing information, such as the amount of time spent in the initialization and execution phases of the simulation

### ErrorMessage — Message for errors from simulation

character vector

This property is read-only.

Message for errors from simulation, returned as a character vector. When a simulation runs without error, the ErrorMessage property is empty.

#### Tips

When you run a simulation using the `sim` function, specify the `CaptureErrors` name-value argument as `'on'` to capture error messages in the `ErrorMessage` property. By default, errors are reported in the MATLAB Command Window and not captured in the `Simulink.SimulationOutput` object.

## Object Functions

<code>find</code>	Query simulation results in Simulink.SimulationOutput object
<code>get</code>	Access simulation results in Simulink.SimulationOutput object
<code>getSimulationMetadata</code>	Access simulation metadata in Simulink.SimulationOutput object
<code>plot</code>	Plot simulation results in Simulation Data Inspector
<code>removeProperty</code>	Remove property from Simulink.SimulationOutput object
<code>setUserData</code>	Add data to metadata in Simulink.SimulationOutput object
<code>setUserString</code>	Add string to metadata in Simulink.SimulationOutput object
<code>who</code>	Get names of editable properties on Simulink.SimulationOutput object

## Examples

### Access Data Logged as Single Simulation Output

When simulation results are returned as a single output object, you can access all logged data and simulation metadata using the `Simulink.SimulationOutput` object.

The model in this example has the **Single simulation output** parameter enabled and logs data using several different logging methods.

- The output of the Sine Wave block is logged using signal logging.
- The output of the Gain block is logged using a To Workspace block.
- The outputs of the Gain, Chirp Signal, and Square Wave Generator blocks are logged using a Record block.
- The output of the Square Wave Generator block is logged using output logging.

The model is also configured to log time data.

Open the model.

```
mdl = "LoggingBlocks";
open_system(mdl)
```

Create a `Simulink.SimulationInput` object to configure the simulation for the model. Use the `setModelParameter` function to set the `StopTime` parameter to 20.

```
simIn = Simulink.SimulationInput(mdl);
simIn = setModelParameter(simIn, 'StopTime', '20');
```

Simulate the model. The `sim` function output `out` is a `Simulink.SimulationOutput` object that contains all data logged from the simulation. The data for each block and each type of logging is stored as a property that matches the name of the logging variable specified in the block or model.

```
out = sim(simIn);
```

You can access logged data using a dot, the `get` function, or the `find` function. Each method operates on the logging variable name, and you can use any method to access any kind of logged data.

Use a dot to access the `Big Sine` signal logged using the To Workspace block.

```
simout = out.simout

timeseries

Common Properties:
 Name: 'Big Sine'
 Time: [51x1 double]
 TimeInfo: tsdata.timemetadata
```

```
Data: [51x1 double]
DataInfo: tsdata.datametadate
```

Use the `get` function to access the **Sine** signal logged using signal logging.

```
logsout = get(out, "logsout")
```

```
logsout =
Simulink.SimulationData.Dataset 'logsout' with 1 element
```

	Name	BlockPath
1 [1x1 Signal]	<u>Sine</u>	<u>LoggingBlocks/Sine Wave</u>

- Use braces { } to access, modify, or add elements using index.

Use the `find` function to access the **Square Wave** signal logged using output logging.

```
yout = find(out, "yout")
```

```
yout =
Simulink.SimulationData.Dataset 'yout' with 1 element
```

	Name	BlockPath
1 [1x1 Signal]	<u>Square Wave</u>	<u>LoggingBlocks/Outputport</u>

- Use braces { } to access, modify, or add elements using index.

You can access the simulation metadata using a dot or using the `getSimulationMetadata` function.

```
simMetadata = getSimulationMetadata(out)
```

```
simMetadata =
SimulationMetadata with properties:
```

```
ModelInfo: [1x1 struct]
TimingInfo: [1x1 struct]
ExecutionInfo: [1x1 struct]
UserString: ''
UserData: []
```

The simulation metadata is returned as a `Simulink.SimulationMetadata` object. The `SimulationMetadata` object groups information about the simulation in properties with structure values and has properties that allow you to specify a string and additional data related to the simulation.

Access the `ExecutionInfo` property on the `SimulationMetadata` object. The execution information shows that the simulation ran through its stop time of 20 without warnings or errors.

```
simMetadata.ExecutionInfo
```

```
ans = struct with fields:
 StopEvent: 'ReachedStopTime'
 StopEventSource: []
 StopEventDescription: 'Reached stop time of 20'
```

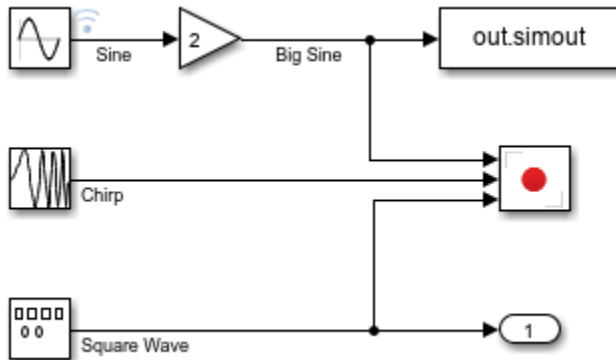

```
ErrorDiagnostic: []
WarningDiagnostics: [0x1 struct]
```

### Modify Contents of Simulink.SimulationOutput Object

A `Simulink.SimulationOutput` object represents the result of a simulation. The `SimulationOutput` object contains all data logged from simulation and simulation metadata. You can modify the contents of a `Simulink.SimulationOutput` object by adding or removing information about the simulation.

Open the model `LoggingBlocks`, which logs several input signals using multiple logging techniques.

```
open_system("LoggingBlocks");
```

Use the `get_param` function to save the values for the **Amplitude** and **Frequency** parameters of the Sine Wave block. Store the values in the structure `sinConfig`.

```
sinConfig.sinAmp = get_param("LoggingBlocks/Sine Wave", "Amplitude");
sinConfig.sinFreq = get_param("LoggingBlocks/Sine Wave", "Frequency");
```

Simulate the model.

```
simOut = sim("LoggingBlocks");
```

The simulation results contain all logging variables created in simulation. Use the `who` function to get a list of properties you can modify.

```
props = who(simOut)
```

```
props = 5x1 cell
 {'logout' }
 {'recordout'}
 {'simout' }
 {'tout' }
 {'yout' }
```

For this simulation, suppose you wanted to save only the data for the signal path related to the Sine Wave block. Use the `removeProperty` function to remove the `recordout` and `yout` properties.

```
simOut = removeProperty(simOut,["recordout" "yout"]);
who(simOut)
```

Contents of the `Simulink.SimulationOutput` object are:

```
logout simout tout
```

You can also add data to a `Simulink.SimulationOutput` object by adding your own properties to the object or by using the `setUserData` function to specify the value for the `UserData` property on the `Simulink.SimulationMetadata` object. Suppose you wanted to save the parameter values for the Sine Wave block as a property on the `Simulink.SimulationOutput` object. Add the property `SineWaveParameters` by using a dot the same way you add a field to a structure.

```
simOut.SineWaveParameters = sinConfig;
who(simOut)
```

Contents of the `Simulink.SimulationOutput` object are:

```
SineWaveParameters logout simout tout
```

## Display Errors in Diagnostic Viewer

You can use the `sldiagviewer.reportSimulationMetadataDiagnostics` function to display error and warning messages captured in a `Simulink.SimulationOutput` object using the Diagnostic Viewer.

Open the model `ex_sldemo_bounce`.

```
model = "ex_sldemo_bounce";
open_system(model)
```

Introduce an error into the model by specifying the **Value** parameter for the block `Initial Velocity` as the undefined variable `z`.

```
set_param("ex_sldemo_bounce/Initial Velocity","Value","z");
```

Create a `Simulink.SimulationInput` object to configure the simulation.

```
simIn = Simulink.SimulationInput(model);
```

Simulate the model. When you specify the `StopOnError` option as `off`, errors and warnings that occur during simulation are captured in the `SimulationOutput` object and are not reported in the Command Window or script and do not interrupt the process of the script.

```
simOut = sim(simIn,"StopOnError","off","ShowProgress","off");
```

```
Warning: One or more simulations completed with errors. For more information, inspect the SimulationOutput object.
[1]
```

Use the `sldiagviewer.reportSimulationMetadataDiagnostics` function to display the warning and error messages from the simulation in the Diagnostic Viewer.

```
sldiagviewer.reportSimulationMetadataDiagnostics(simOut)
```

## Version History

# find

**Package:** Simulink

Query simulation results in `Simulink.SimulationOutput` object

## Syntax

```
res = find(simOut,varName)
```

## Description

`res = find(simOut,varName)` returns the simulation data specified by `varName` from the `Simulink.SimulationOutput` object `simOut`. If no property exists in the object with the name `varName`, the return value is empty.

You can also access data inside a `Simulink.SimulationOutput` object using the `get` function or by using a dot to access the data as a property.

## Examples

### Access Data Logged as Single Simulation Output

When simulation results are returned as a single output object, you can access all logged data and simulation metadata using the `Simulink.SimulationOutput` object.

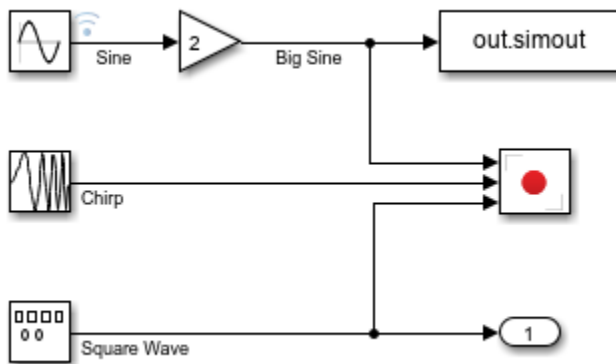

The model in this example has the **Single simulation output** parameter enabled and logs data using several different logging methods.

- The output of the Sine Wave block is logged using signal logging.
- The output of the Gain block is logged using a To Workspace block.
- The outputs of the Gain, Chirp Signal, and Square Wave Generator blocks are logged using a Record block.
- The output of the Square Wave Generator block is logged using output logging.

The model is also configured to log time data.

Open the model.

```
mdl = "LoggingBlocks";
open_system(mdl)
```

Create a `Simulink.SimulationInput` object to configure the simulation for the model. Use the `setModelParameter` function to set the `StopTime` parameter to 20.

```
simIn = Simulink.SimulationInput mdl;
simIn = setModelParameter(simIn, 'StopTime', '20');
```

Simulate the model. The `sim` function output `out` is a `Simulink.SimulationOutput` object that contains all data logged from the simulation. The data for each block and each type of logging is stored as a property that matches the name of the logging variable specified in the block or model.

```
out = sim(simIn);
```

You can access logged data using a dot, the `get` function, or the `find` function. Each method operates on the logging variable name, and you can use any method to access any kind of logged data.

Use a dot to access the `Big Sine` signal logged using the `To Workspace` block.

```
simout = out.simout

timeseries

Common Properties:
 Name: 'Big Sine'
 Time: [51x1 double]
 TimeInfo: tsdata.timemetadata
 Data: [51x1 double]
 DataInfo: tsdata.datametadata
```

Use the `get` function to access the `Sine` signal logged using signal logging.

```
logcout = get(out, "logcout")

logcout =
Simulink.SimulationData.Dataset 'logcout' with 1 element
```

	Name	BlockPath
1	[1x1 Signal]	Sine LoggingBlocks/Sine Wave

- Use braces `{ }` to access, modify, or add elements using index.

Use the `find` function to access the Square Wave signal logged using output logging.

```
yout = find(out, "yout")

yout =
Simulink.SimulationData.Dataset 'yout' with 1 element

 Name BlockPath

1 [1x1 Signal] Square Wave LoggingBlocks/Outputport
```

- Use braces { } to access, modify, or add elements using index.

You can access the simulation metadata using a dot or using the `getSimulationMetadata` function.

```
simMetadata = getSimulationMetadata(out)

simMetadata =
SimulationMetadata with properties:

 ModelInfo: [1x1 struct]
 TimingInfo: [1x1 struct]
 ExecutionInfo: [1x1 struct]
 UserString: ''
 UserData: []
```

The simulation metadata is returned as a `Simulink.SimulationMetadata` object. The `SimulationMetadata` object groups information about the simulation in properties with structure values and has properties that allow you to specify a string and additional data related to the simulation.

Access the `ExecutionInfo` property on the `SimulationMetadata` object. The execution information shows that the simulation ran through its stop time of 20 without warnings or errors.

```
simMetadata.ExecutionInfo

ans = struct with fields:
 StopEvent: 'ReachedStopTime'
 StopEventSource: []
 StopEventDescription: 'Reached stop time of 20'
 ErrorDiagnostic: []
 WarningDiagnostics: [0x1 struct]
```

## Input Arguments

### **simOut** — Simulation results

`Simulink.SimulationOutput` object

Simulation results, specified as a `Simulink.SimulationOutput` object.

### **varName** — Simulation data to return

string | character vector

Simulation data to return, specified as a string or a character vector.

Use the `find` function to access data logged from simulation, such as signal logging data, logged outputs, and states, by specifying the name of the logging variable. For example, when you use the default signal logging variable name `logsout`, specify `"logsout"` to access the signal logging data.

Example: `"logsout"`

Data Types: `char` | `string`

## Output Arguments

### **res** — Simulation results

`Simulink.SimulationData.Dataset` object | `timeseries` object | `timetable` | `array` | `structure`

Simulation results, returned in one of these forms:

- `Simulink.SimulationData.Dataset` object
- `timeseries` object
- `timetable`
- `Simulink.op.ModelOperatingPoint` object
- `array`
- `structure`

The form of the return argument depends on the type of data you access and the configuration of the model for the simulation.

## Version History

Introduced in R2009b

# get

**Package:** Simulink

Access simulation results in `Simulink.SimulationOutput` object

## Syntax

```
res = get(simOut,varName)
```

## Description

`res = get(simOut,varName)` returns the simulation data specified by `varName` from the `Simulink.SimulationOutput` object `simOut`.

You can also access data inside a `Simulink.SimulationOutput` object using the `find` function or by using a dot to access the data as a property.

## Examples

### Access Data Logged as Single Simulation Output

When simulation results are returned as a single output object, you can access all logged data and simulation metadata using the `Simulink.SimulationOutput` object.

The model in this example has the **Single simulation output** parameter enabled and logs data using several different logging methods.

- The output of the Sine Wave block is logged using signal logging.
- The output of the Gain block is logged using a To Workspace block.
- The outputs of the Gain, Chirp Signal, and Square Wave Generator blocks are logged using a Record block.
- The output of the Square Wave Generator block is logged using output logging.

The model is also configured to log time data.

Open the model.

```
mdl = "LoggingBlocks";
open_system(mdl)
```

Create a `Simulink.SimulationInput` object to configure the simulation for the model. Use the `setModelParameter` function to set the `StopTime` parameter to 20.

```
simIn = Simulink.SimulationInput mdl;
simIn = setModelParameter(simIn, 'StopTime', '20');
```

Simulate the model. The `sim` function output `out` is a `Simulink.SimulationOutput` object that contains all data logged from the simulation. The data for each block and each type of logging is stored as a property that matches the name of the logging variable specified in the block or model.

```
out = sim(simIn);
```

You can access logged data using a dot, the `get` function, or the `find` function. Each method operates on the logging variable name, and you can use any method to access any kind of logged data.

Use a dot to access the `Big Sine` signal logged using the `To Workspace` block.

```
simout = out.simout

timeseries

Common Properties:
 Name: 'Big Sine'
 Time: [51x1 double]
 TimeInfo: tsdata.timemetadata
 Data: [51x1 double]
 DataInfo: tsdata.datametadata
```

Use the `get` function to access the `Sine` signal logged using signal logging.

```
logcout = get(out, "logcout")

logcout =
Simulink.SimulationData.Dataset 'logcout' with 1 element
```

	Name	BlockPath
1	[1x1 Signal]	Sine LoggingBlocks/Sine Wave

- Use braces `{ }` to access, modify, or add elements using index.

Use the `find` function to access the Square Wave signal logged using output logging.

```
yout = find(out, "yout")

yout =
Simulink.SimulationData.Dataset 'yout' with 1 element

 Name BlockPath

1 [1x1 Signal] Square Wave LoggingBlocks/Outputport
```

- Use braces { } to access, modify, or add elements using index.

You can access the simulation metadata using a dot or using the `getSimulationMetadata` function.

```
simMetadata = getSimulationMetadata(out)

simMetadata =
SimulationMetadata with properties:

 ModelInfo: [1x1 struct]
 TimingInfo: [1x1 struct]
 ExecutionInfo: [1x1 struct]
 UserString: ''
 UserData: []
```

The simulation metadata is returned as a `Simulink.SimulationMetadata` object. The `SimulationMetadata` object groups information about the simulation in properties with structure values and has properties that allow you to specify a string and additional data related to the simulation.

Access the `ExecutionInfo` property on the `SimulationMetadata` object. The execution information shows that the simulation ran through its stop time of 20 without warnings or errors.

```
simMetadata.ExecutionInfo

ans = struct with fields:
 StopEvent: 'ReachedStopTime'
 StopEventSource: []
 StopEventDescription: 'Reached stop time of 20'
 ErrorDiagnostic: []
 WarningDiagnostics: [0x1 struct]
```

## Input Arguments

### **simOut** — Simulation results

`Simulink.SimulationOutput` object

Simulation results, specified as a `Simulink.SimulationOutput` object.

### **varName** — Simulation data to return

string | character vector

Simulation data to return, specified as a string or a character vector.

Use the `get` function to access data logged from simulation, such as signal logging data, logged outputs, and states, by specifying the name of the logging variable. For example, when you use the default signal logging variable name `logouts`, specify `"logouts"` to access the signal logging data.

Example: `"logouts"`

Data Types: `char` | `string`

## Output Arguments

### **res** — Simulation results

`Simulink.SimulationData.Dataset` object | `timeseries` object | `timetable` | `array` | `structure`

Simulation results, returned in one of these forms:

- `Simulink.SimulationData.Dataset` object
- `timeseries` object
- `timetable`
- `Simulink.op.ModelOperatingPoint` object
- `array`
- `structure`

The form of the return argument depends on the type of data you access and the configuration of the model for the simulation.

# getSimulationMetadata

**Package:** Simulink

Access simulation metadata in `Simulink.SimulationOutput` object

## Syntax

```
simMeta = getSimulationMetadata(simOut)
```

## Description

`simMeta = getSimulationMetadata(simOut)` returns the simulation metadata stored in the `Simulink.SimulationOutput` object `simOut`. The simulation metadata includes information about the model, simulation execution and timing, and details about errors and warnings that occurred during the simulation.

You can also get the simulation metadata using a dot to access the value of the `SimulationMetadata` property.

```
simMeta = simOut.SimulationMetadata;
```

## Examples

### Access Data Logged as Single Simulation Output

When simulation results are returned as a single output object, you can access all logged data and simulation metadata using the `Simulink.SimulationOutput` object.

The model in this example has the **Single simulation output** parameter enabled and logs data using several different logging methods.

- The output of the Sine Wave block is logged using signal logging.
- The output of the Gain block is logged using a To Workspace block.
- The outputs of the Gain, Chirp Signal, and Square Wave Generator blocks are logged using a Record block.
- The output of the Square Wave Generator block is logged using output logging.

The model is also configured to log time data.

Open the model.

```
mdl = "LoggingBlocks";
open_system(mdl)
```

Create a `Simulink.SimulationInput` object to configure the simulation for the model. Use the `setModelParameter` function to set the `StopTime` parameter to 20.

```
simIn = Simulink.SimulationInput mdl;
simIn = setModelParameter(simIn, 'StopTime', '20');
```

Simulate the model. The `sim` function output `out` is a `Simulink.SimulationOutput` object that contains all data logged from the simulation. The data for each block and each type of logging is stored as a property that matches the name of the logging variable specified in the block or model.

```
out = sim(simIn);
```

You can access logged data using a dot, the `get` function, or the `find` function. Each method operates on the logging variable name, and you can use any method to access any kind of logged data.

Use a dot to access the `Big Sine` signal logged using the `To Workspace` block.

```
simout = out.simout

timeseries

Common Properties:
 Name: 'Big Sine'
 Time: [51x1 double]
 TimeInfo: tsdata.timemetadata
 Data: [51x1 double]
 DataInfo: tsdata.datametadata
```

Use the `get` function to access the `Sine` signal logged using signal logging.

```
logout = get(out, "logout")

logout =
Simulink.SimulationData.Dataset 'logout' with 1 element
```

	Name	BlockPath
1	[1x1 Signal]	Sine LoggingBlocks/Sine Wave

- Use braces `{ }` to access, modify, or add elements using index.

Use the `find` function to access the Square Wave signal logged using output logging.

```
yout = find(out, "yout")
```

```
yout =
Simulink.SimulationData.Dataset 'yout' with 1 element
```

	Name	BlockPath
1 [1x1 Signal]	Square Wave	LoggingBlocks/Outputport

- Use braces { } to access, modify, or add elements using index.

You can access the simulation metadata using a dot or using the `getSimulationMetadata` function.

```
simMetadata = getSimulationMetadata(out)
```

```
simMetadata =
SimulationMetadata with properties:
```

```
 ModelInfo: [1x1 struct]
 TimingInfo: [1x1 struct]
 ExecutionInfo: [1x1 struct]
 UserString: ''
 UserData: []
```

The simulation metadata is returned as a `Simulink.SimulationMetadata` object. The `SimulationMetadata` object groups information about the simulation in properties with structure values and has properties that allow you to specify a string and additional data related to the simulation.

Access the `ExecutionInfo` property on the `SimulationMetadata` object. The execution information shows that the simulation ran through its stop time of 20 without warnings or errors.

```
simMetadata.ExecutionInfo
```

```
ans = struct with fields:
 StopEvent: 'ReachedStopTime'
 StopEventSource: []
 StopEventDescription: 'Reached stop time of 20'
 ErrorDiagnostic: []
 WarningDiagnostics: [0x1 struct]
```

## Input Arguments

### **simOut** — Simulation results

Simulink.SimulationOutput object

Simulation results, specified as a `Simulink.SimulationOutput` object.

## Output Arguments

### **simMeta** — Simulation metadata

Simulink.SimulationMetadata object

Simulation metadata, returned as a Simulink.SimulationMetadata object.

## Tips

You can view the contents of the Simulink.SimulationMetadata object using the Variables editor in MATLAB. In the **Workspace** pane, double-click the variable that contains the Simulink.SimulationOutput object with metadata you want to view. Then, in the Variables editor, select **Explore SimulationMetadata** to open a pane that displays the information in the SimulationMetadata object using a tree structure.

## Version History

Introduced in R2015a

# removeProperty

**Package:** Simulink

Remove property from Simulink.SimulationOutput object

## Syntax

```
simOut = removeProperty(simOut,prop)
```

## Description

`simOut = removeProperty(simOut,prop)` removes one or more properties `prop` from the Simulink.SimulationOutput object `simOut`.

You can use the `removeProperty` function to remove data logging properties and user-defined properties from a Simulink.SimulationOutput object. You cannot use the `removeProperty` function to remove read-only properties.

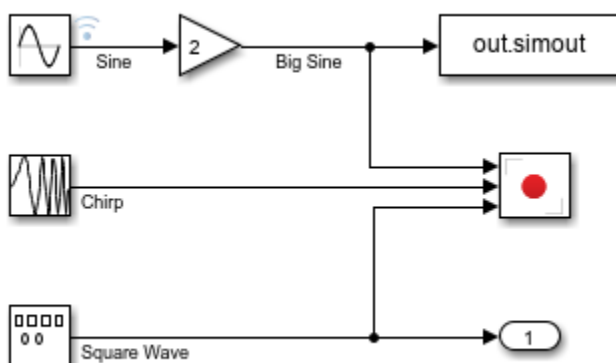

## Examples

### Modify Contents of Simulink.SimulationOutput Object

A Simulink.SimulationOutput object represents the result of a simulation. The SimulationOutput object contains all data logged from simulation and simulation metadata. You can modify the contents of a Simulink.SimulationOutput object by adding or removing information about the simulation.

Open the model LoggingBlocks, which logs several input signals using multiple logging techniques.

```
open_system("LoggingBlocks");
```

Use the `get_param` function to save the values for the **Amplitude** and **Frequency** parameters of the Sine Wave block. Store the values in the structure `sinConfig`.

```
sinConfig.sinAmp = get_param("LoggingBlocks/Sine Wave", "Amplitude");
sinConfig.sinFreq = get_param("LoggingBlocks/Sine Wave", "Frequency");
```

Simulate the model.

```
simOut = sim("LoggingBlocks");
```

The simulation results contain all logging variables created in simulation. Use the `who` function to get a list of properties you can modify.

```
props = who(simOut)
```

```
props = 5x1 cell
 {'logout' }
 {'recordout'}
 {'simout' }
 {'tout' }
 {'yout' }
```

For this simulation, suppose you wanted to save only the data for the signal path related to the Sine Wave block. Use the `removeProperty` function to remove the `recordout` and `yout` properties.

```
simOut = removeProperty(simOut, ["recordout" "yout"]);
who(simOut)
```

Contents of the `Simulink.SimulationOutput` object are:

```
logout simout tout
```

You can also add data to a `Simulink.SimulationOutput` object by adding your own properties to the object or by using the `setUserData` function to specify the value for the `UserData` property on the `Simulink.SimulationMetadata` object. Suppose you wanted to save the parameter values for the Sine Wave block as a property on the `Simulink.SimulationOutput` object. Add the property `SineWaveParameters` by using a dot the same way you add a field to a structure.

```
simOut.SineWaveParameters = sinConfig;
who(simOut)
```

Contents of the `Simulink.SimulationOutput` object are:

```
SineWaveParameters logout simout tout
```

## Input Arguments

### **simOut** — Simulation results

`Simulink.SimulationOutput` object

Simulation results, specified as a `Simulink.SimulationOutput` object.

### **prop** — Property to remove

string | string array | character vector | cell array of character vectors

Property to remove, specified as a string, a string array, a character vector, or a cell array of character vectors. To delete a single property, specify the name of the property as a string or a character vector. To delete multiple properties, specify the names of the properties as a string array or a cell array of character vectors.

You cannot remove read-only properties, such as the `SimulationMetadata` and `ErrorMessage` properties, from a `Simulink.SimulationOutput` object. To get a list of properties that you can remove, use the `who` function.

```
Example: simOut = removeProperty(simOut, "MyProperty")
```

Data Types: char | string

## Output Arguments

### **simOut** — Simulation results with property removed

`Simulink.SimulationOutput` object

Simulation results with property removed, returned as a `Simulink.SimulationOutput` object.

## Tips

- Modifying the contents of simulation results in a `Simulink.SimulationOutput` object using the post-simulation function can be useful in parallel computing workflows. For example, you can remove data logging properties and send only a subset of logged data from the worker back to the client.
- You can use the `removeElement` function to remove logged data from a `Simulink.SimulationData.Dataset` object.

## Version History

Introduced in R2019a

## See Also

### Objects

`Simulink.SimulationOutput` | `Simulink.SimulationData.Dataset`

### Functions

`who` | `removeElement`

## setUserData

**Package:** Simulink

Add data to metadata in `Simulink.SimulationOutput` object

### Syntax

```
simOut = setUserData(simOut,userData)
```

### Description

`simOut = setUserData(simOut,userData)` adds the data `userData` to the simulation metadata stored in the `Simulink.SimulationOutput` object `simOut`.

Use this function to add additional information about the simulation that created the `Simulink.SimulationOutput` object. For example, you could add some of the model configuration parameter values used in the simulation.

### Examples

#### Add Data to Simulation Metadata

The `Simulink.SimulationOutput` object contains a `Simulink.SimulationMetadata` object that captures information about the simulation. You can specify additional information about the simulation in the `UserData` and `UserString` properties. For example, you can save the `Simulink.SimulationInput` object used to configure the simulation in the `UserData` property and specify the `UserString` as a description of the simulation.

Open the model `ex_sl-demo_bounce`. This model simulates the motion of a bouncing ball based on an initial velocity.

```
mdl = "ex_sl-demo_bounce";
open_system(mdl);
```

Create a `Simulink.SimulationInput` object to configure a simulation of the model. Use the `setBlockParameter` function to specify the initial velocity as 20.

```
simIn = Simulink.SimulationInput(mdl);
simIn = setBlockParameter(simIn,"ex_sl-demo_bounce/Initial Velocity",...
 "Value","20");
```

Simulate the model.

```
simOut = sim(simIn);
```

Use the `setUserData` function to add the `Simulink.SimulationInput` object to the simulation metadata.

```
simOut = setUserData(simOut,simIn);
```

Use the `setUserString` function to add a description for the simulation.

```
simOut = setUserString(simOut, "Initial Velocity = 20");
```

Inspect the simulation metadata.

```
simMetadata = getSimulationMetadata(simOut)
```

```
simMetadata =
 SimulationMetadata with properties:

 ModelInfo: [1x1 struct]
 TimingInfo: [1x1 struct]
 ExecutionInfo: [1x1 struct]
 UserString: "Initial Velocity = 20"
 UserData: [1x1 Simulink.SimulationInput]
```

## Input Arguments

### **simOut** — Simulation results to which to add data

Simulink.SimulationOutput object

Simulation results to which to add data, specified as a Simulink.SimulationOutput object.

### **userData** — Data to add to simulation metadata

MATLAB variable | MATLAB expression

Data to add to simulation metadata, specified as a MATLAB variable or a MATLAB expression.

## Output Arguments

### **simOut** — Simulation results with user data

Simulink.SimulationOutput object

Simulation results with user data, returned as a Simulink.SimulationOutput object. The SimulationOutput object stores simulation metadata as a Simulink.SimulationMetadata object. The data you specify is added to the UserData property of the Simulink.SimulationMetadata object.

```
simMetadata = simOut.SimulationMetadata;
userData = simMetadata.UserData;
```

## Version History

Introduced in R2015a

### Objects

Simulink.SimulationOutput | Simulink.SimulationMetadata

### Functions

setUserString | getSimulationMetadata | sim | parsim | batchsim

## setUserString

**Package:** Simulink

Add string to metadata in Simulink.SimulationOutput object

### Syntax

```
simOut = setUserString(simOut,str)
```

### Description

`simOut = setUserString(simOut,str)` adds the text `str` to the metadata stored in the Simulink.SimulationOutput object `simOut`.

You can use this function to add a description about the simulation that produced the Simulink.SimulationOutput object or a description of the results.

### Examples

#### Add Data to Simulation Metadata

The Simulink.SimulationOutput object contains a Simulink.SimulationMetadata object that captures information about the simulation. You can specify additional information about the simulation in the UserData and UserString properties. For example, you can save the Simulink.SimulationInput object used to configure the simulation in the UserData property and specify the UserString as a description of the simulation.

Open the model `ex_sl-demo_bounce`. This model simulates the motion of a bouncing ball based on an initial velocity.

```
mdl = "ex_sl-demo_bounce";
open_system(mdl);
```

Create a Simulink.SimulationInput object to configure a simulation of the model. Use the `setBlockParameter` function to specify the initial velocity as 20.

```
simIn = Simulink.SimulationInput(mdl);
simIn = setBlockParameter(simIn,"ex_sl-demo_bounce/Initial Velocity",...
 "Value","20");
```

Simulate the model.

```
simOut = sim(simIn);
```

Use the `setUserData` function to add the Simulink.SimulationInput object to the simulation metadata.

```
simOut = setUserData(simOut,simIn);
```

Use the `setUserString` function to add a description for the simulation.

```
simOut = setUserString(simOut,"Initial Velocity = 20");
```

Inspect the simulation metadata.

```
simMetadata = getSimulationMetadata(simOut)
```

```
simMetadata =
 SimulationMetadata with properties:
 ModelInfo: [1x1 struct]
 TimingInfo: [1x1 struct]
 ExecutionInfo: [1x1 struct]
 UserString: "Initial Velocity = 20"
 UserData: [1x1 Simulink.SimulationInput]
```

## Input Arguments

### **simOut** — Simulation results to which to add text

Simulink.SimulationOutput object

Simulation results to which to add text, specified as a Simulink.SimulationOutput object.

### **str** — Text to add to metadata

string | character vector

Text to add to metadata, specified as a string or a character vector.

Data Types: char | string

## Output Arguments

### **simOut** — Simulation results with text added

Simulink.SimulationOutput object

Simulation results with text added, returned as a Simulink.SimulationOutput object. The SimulationOutput object stores simulation metadata as a Simulink.SimulationMetadata object. The data you specify is added to the UserString property of the Simulink.SimulationMetadata object.

```
simMetadata = simOut.SimulationMetadata;
userData = simMetadata.UserString;
```

## Version History

Introduced in R2015a

# who

**Package:** Simulink

Get names of editable properties on `Simulink.SimulationOutput` object

## Syntax

```
who(simOut)
props = who(simOut)
```

## Description

`who(simOut)` lists the names of user-added properties and properties that contain logged data on the `Simulink.SimulationOutput` object `simOut`.

`props = who(simOut)` returns a cell array of character vectors that contains the names of user-added properties and properties that contain logged data on the `Simulink.SimulationOutput` object `simOut`.

## Examples

### Inspect Contents of `Simulink.SimulationOutput` Object

A `Simulink.SimulationOutput` object contains all data logged from simulation as well as simulation metadata and error messages that occur during simulation. You can use the `who` function to list properties on a `Simulink.SimulationOutput` object created by logging data from simulation or by a user.

Open the model `LoggingBlocks`, which uses multiple blocks and signal logging to log simulation data.

```
mdl = "LoggingBlocks";
open_system(mdl);
```

Create a `Simulink.SimulationInput` object to configure a simulation that runs to a stop time of 20.

```
simIn = Simulink.SimulationInput(mdl);
simIn = setModelParameter(simIn,"StopTime","20");
```

Simulate the model.

```
simOut = sim(simIn);
```

Use the `who` function to inspect the contents of the simulation results.

```
dataLogs = who(simOut)
```

```
dataLogs = 5x1 cell
 {'logstdout' }
 {'recordout' }
```

```
{'simout' }
{'tout' }
{'yout' }
```

Use the `get` function to access the data for the variable `simout`.

```
simout = get(simOut,dataLogs{3})

timeseries

Common Properties:
 Name: 'Big Sine'
 Time: [51x1 double]
 TimeInfo: tsdata.timemetadata
 Data: [51x1 double]
 DataInfo: tsdata.datametadata
```

## Input Arguments

### **simOut** — Simulation results

Simulink.SimulationOutput object

Simulation results, specified as a Simulink.SimulationOutput object.

## Output Arguments

### **props** — Names of user-added properties and properties that contain logged data

cell array of character vectors

Names of user-added properties and properties that contain logged data, returned as a cell array of character vectors.

# sltrace.Graph

Provide tracing information as graph for structure analysis

## Description

An `sltrace.Graph` object stores tracing information generated by the `sltrace` function.

## Creation

You can create `sltrace.Graph` object using the `sltrace` function.

## Properties

### TraceGraph — Tracing graph with edges and nodes

`digraph`

Tracing graph with edges and nodes, returned as a `digraph` object. A node in the graph is decided by a block port on the tracing path and shown as `'NodeIndex'`. For each node, `TraceGraph.Nodes` provides a table with more details, including `Block`, `PortNumber` and `PortType`. If `'BlockPath'` is set to `'on'` in `sltrace`, then the `Block` column of the `TraceGraph.Nodes` table will be shown as `Simulink.BlockPath`.

`TraceGraph.Edges` shows a table that contains the `EndNodes` of the `digraph` object, and the `Segments` between them. `Segments` is an array of segment handles that are connected together to form a line between two blocks. If the `EndNodes` belong to the same block, their `Segments` is marked as `'Internal'`. If the end nodes are from connectionless block pairs, such as the pair formed by `'From'` and `'Goto'`, then their `Segments` is marked as `'Hidden'`.

### SrcBlocks, DstBlocks — Blocks on the tracing path

array of block handles | `Simulink.BlockPath` array

Blocks on tracing path, specified as an array of block handles or `Simulink.BlockPath` objects. If tracing in the direction of source, source blocks are returned in `g.SrcBlocks`. If tracing in the direction of the destination, destination blocks are returned in `g.DstBlocks`.

## Object Functions

`highlight`            Highlight tracing results  
`removeHighlight`    Remove highlighted tracing results

## Examples

### Trace All Sources in Model

This example shows how to trace from the first inport of the block `vdp/x1` to all sources.

```
open_system('vdp')
G = sltrace('vdp/x1', 'Source', 'Port', 1, 'TraceAll', 'on');
```

Highlight the tracing results and plot the trace graph.

```
highlight(G)
```

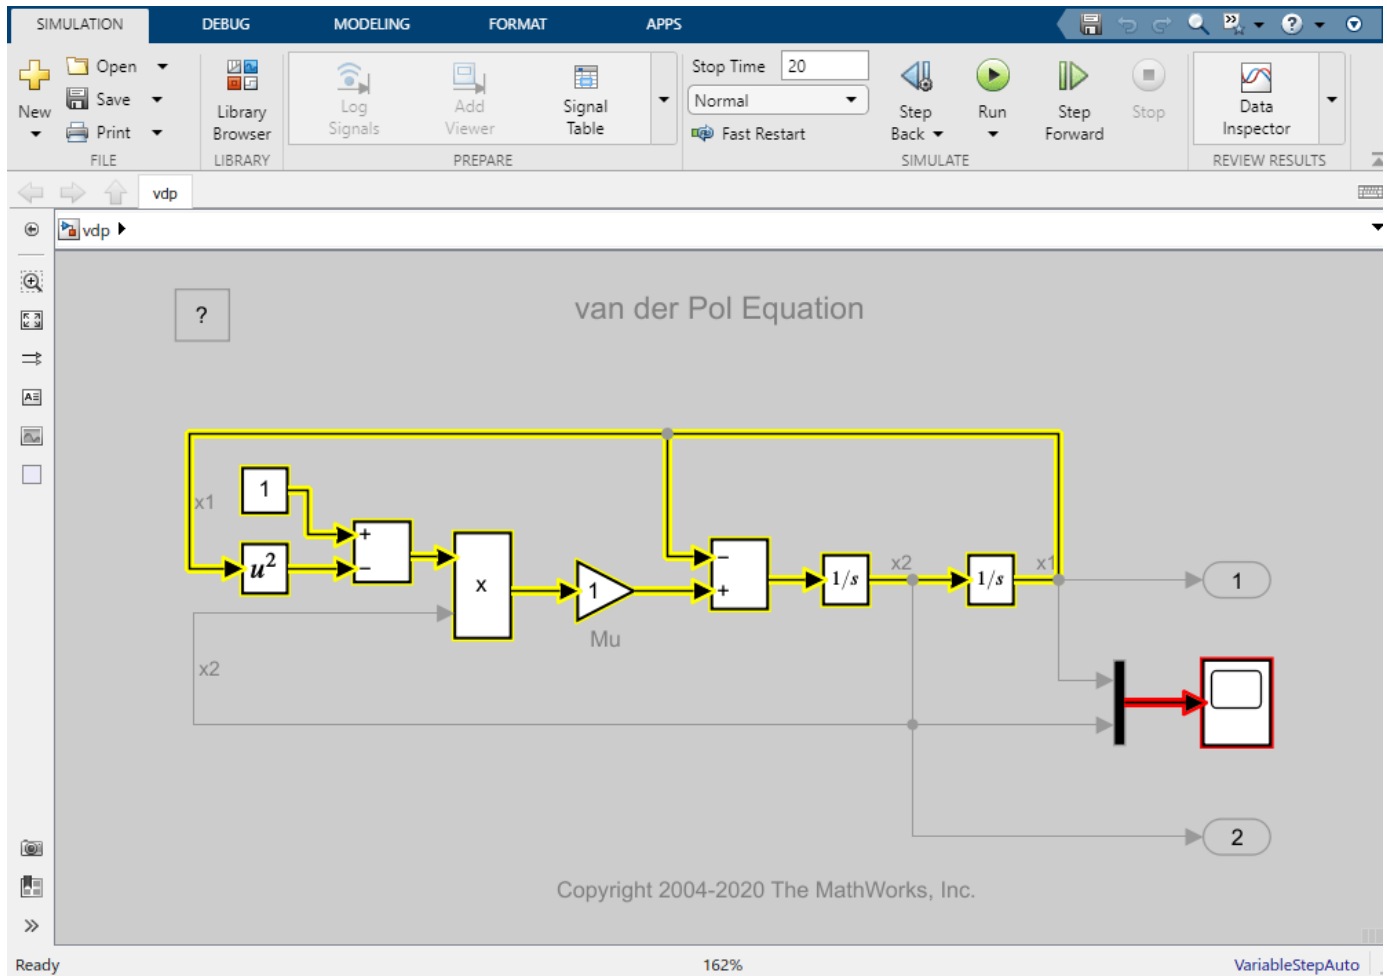

```
plot(G.TraceGraph)
```

Highlight the block vdp/Scope and the line connecting to the inport of vdp/Scope.

```
bh = get_param('vdp/Scope', 'Handle');
inportH = get_param('vdp/Scope', 'PortHandles').Inport;
lh = get_param(inportH, 'line');
highlight(G, [bh, lh])
```

Remove the highlighting.

`removeHighlight(G)`

## Version History

Introduced in R2021b

# highlight

**Package:** sltrace

Highlight tracing results

## Syntax

```
highlight(g)
highlight(g, target)
```

## Description

`highlight(g)` highlights all tracing results, blocks and lines in the `sltrace.Graph` object `g`.

`highlight(g, target)` highlights the blocks and lines specified in `target`.

## Examples

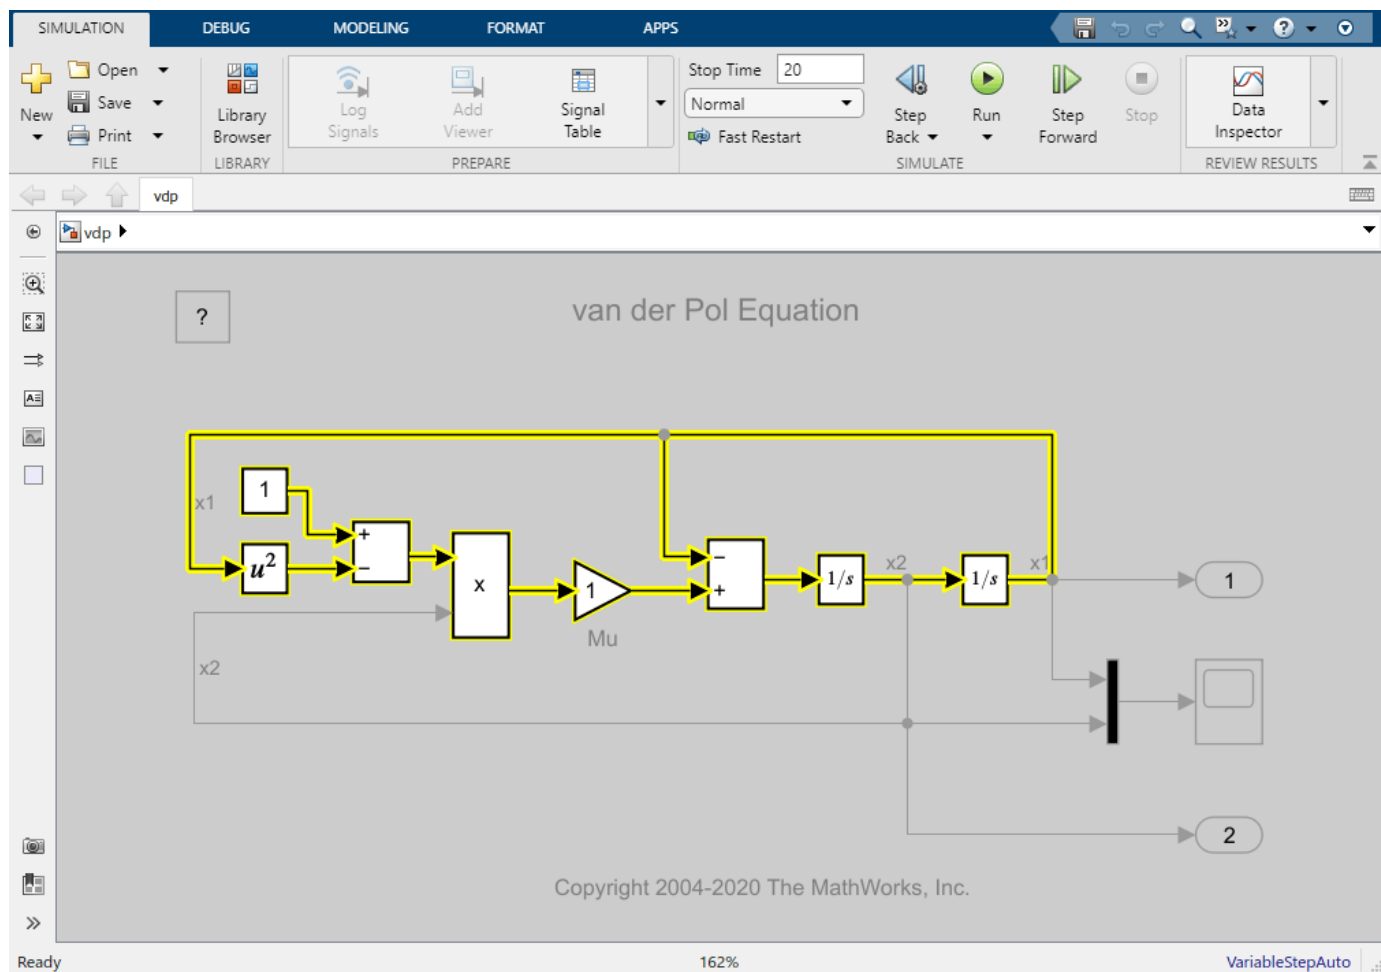

### Trace All Sources in Model

This example shows how to trace from the first inport of the block `vdp/x1` to all sources.

```
open_system('vdp')
G = sltrace('vdp/x1', 'Source', 'Port', 1, 'TraceAll', 'on');
```

Highlight the tracing results and plot the trace graph.

```
highlight(G)
```

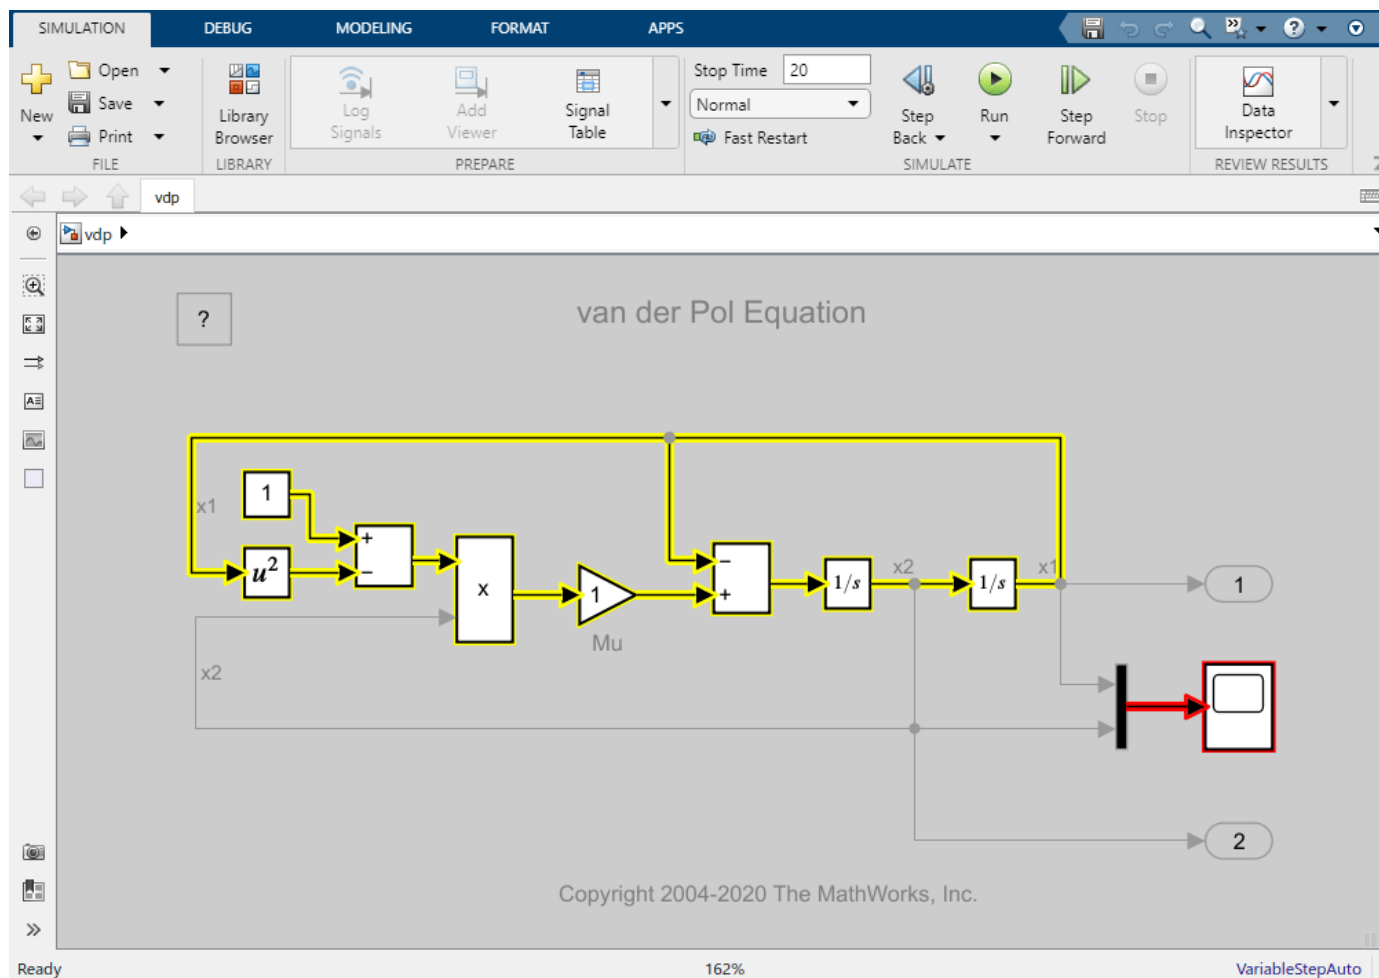

```
plot(G.TraceGraph)
```

Highlight the block vdp/Scope and the line connecting to the inport of vdp/Scope.

```
bh = get_param('vdp/Scope', 'Handle');
inportH = get_param('vdp/Scope', 'PortHandles').Inport;
lh = get_param(inportH, 'line');
highlight(G, [bh, lh])
```

Remove the highlighting.

`removeHighlight(G)`

## Input Arguments

### **g** — Graph object

`sltrace.Graph` object

Graph created by `sltrace` function, specified as a `sltrace.Graph` object.

### **target** — Items to highlight

block handle | line handle | array of block or line handles

Specific items to highlight, specified as a block handle, a line handle, or an array of block and line handles.

Example: `g.highlight([bh, seg]);`

## Version History

Introduced in R2021b

## removeHighlight

**Package:** sltrace

Remove highlighted tracing results

### Syntax

```
removeHighlight(g)
```

### Description

`removeHighlight(g)` removes all highlighting in a model created by the `highlight` function of `sltrace.Graph` object `g`.

### Examples

#### Trace All Sources in Model

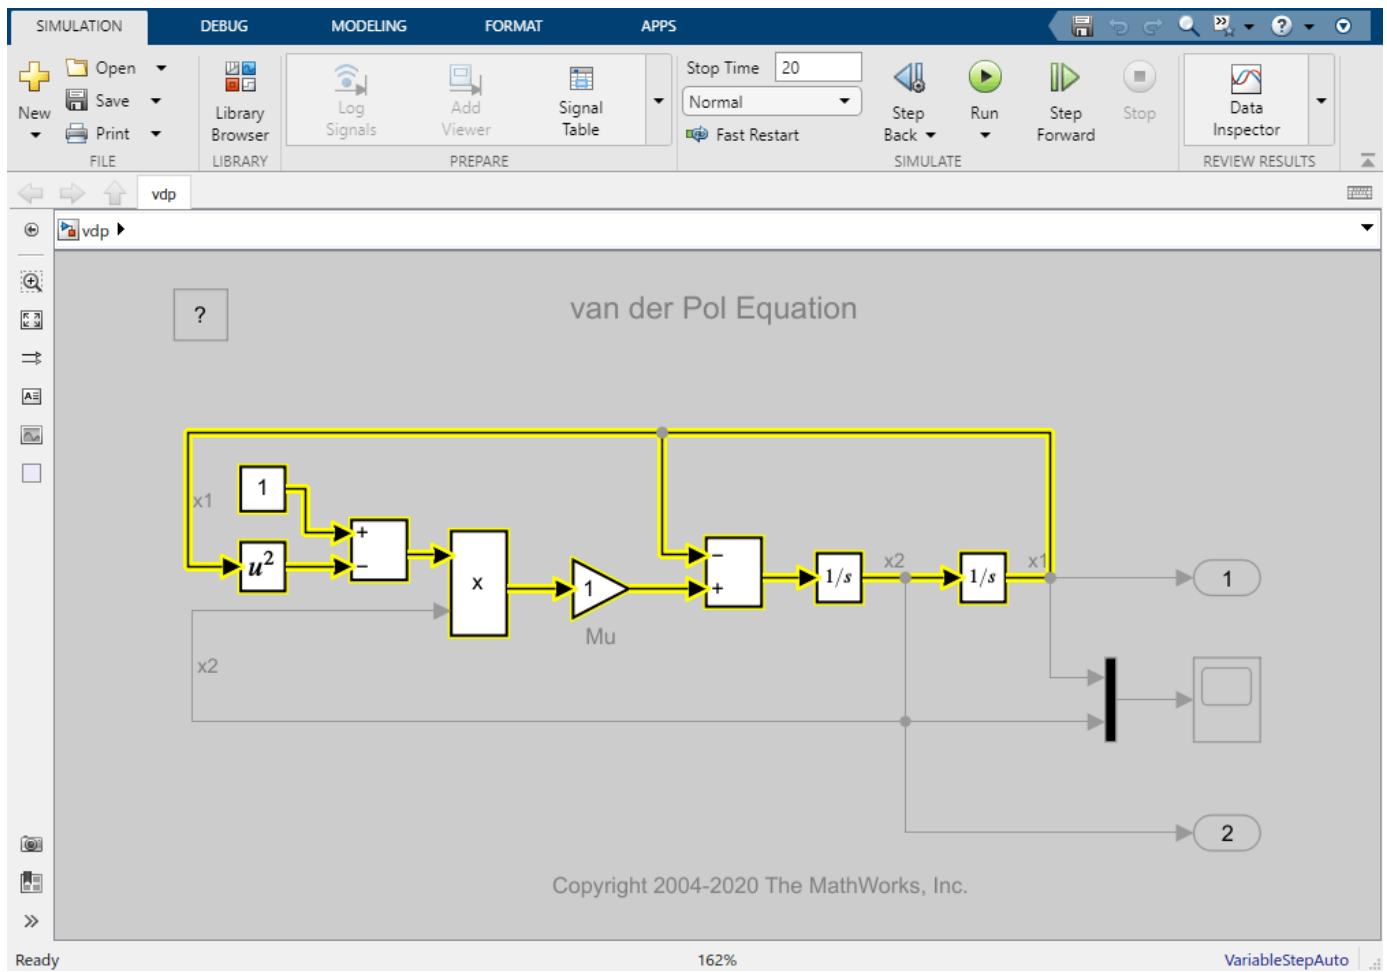

This example shows how to trace from the first inport of the block `vdp/x1` to all sources.

```
open_system('vdp')
G = sltrace('vdp/x1', 'Source', 'Port', 1, 'TraceAll', 'on');
```

Highlight the tracing results and plot the trace graph.

```
highlight(G)
```

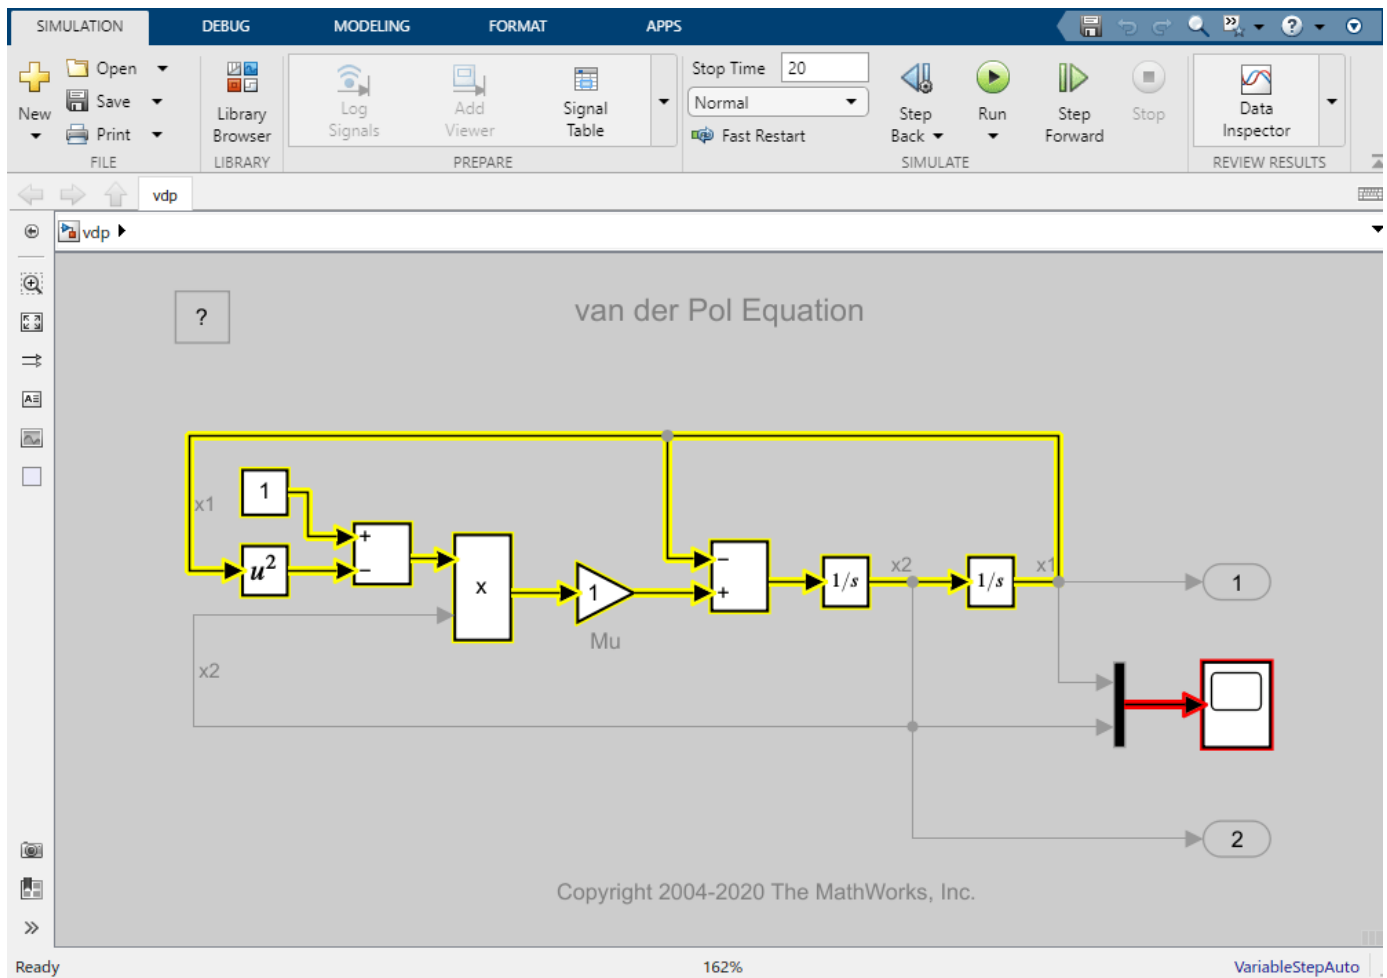

```
plot(G.TraceGraph)
```

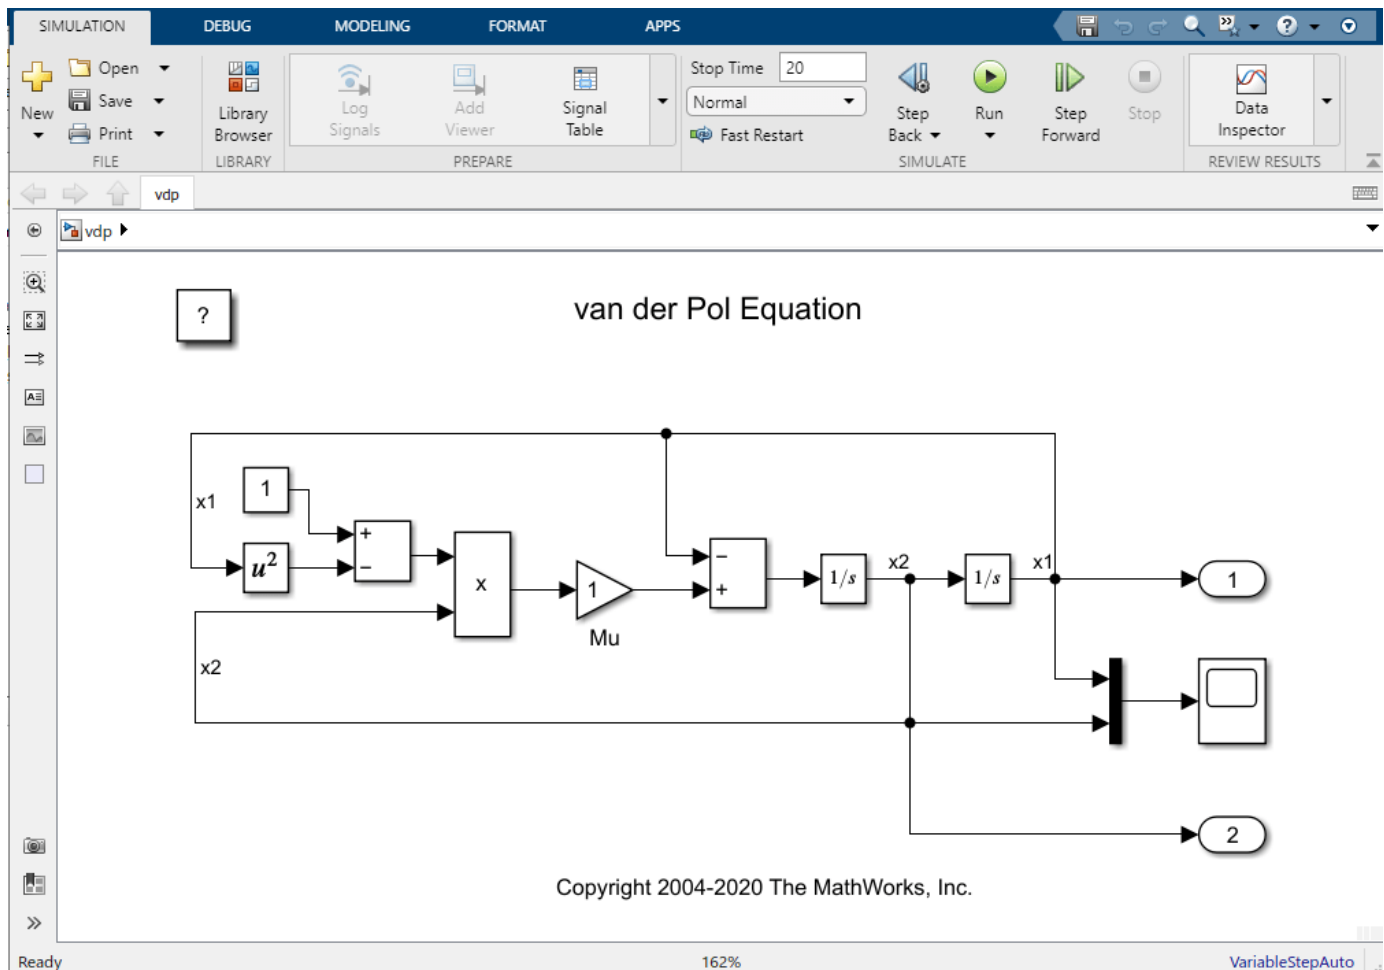

Highlight the block vdp/Scope and the line connecting to the inport of vdp/Scope.

```
bh = get_param('vdp/Scope','Handle');
inportH = get_param('vdp/Scope','PortHandles').Inport;
lh = get_param(inportH,'line');
highlight(G,[bh, lh])
```

Remove the highlighting.

removeHighlight(G)

## Input Arguments

**g** — Graph object

`sltrace.Graph` object

Graph created by `sltrace` function, specified as a `sltrace.Graph` object.

# Simulink.SubsysDataLogs

(Not recommended) Access data for signals logged inside subsystems

---

**Note** The ability to log and load data using the `ModelDataLogs` format has been removed. Use another supported format, such as `Dataset`, instead. For more information, see “Compatibility Considerations”.

---

## Description

The `Simulink.SubsysDataLogs` object contains the data for each signal, mux, and bus logged inside a subsystem.

## Creation

Prior to R2016a, you could configure a model to log data using the `ModelDataLogs` format. Simulating a model with the **Signal logging format** parameter set to `ModelDataLogs` created a `Simulink.ModelDataLogs` object that contained the data for all logged signals. You could specify the name for the `ModelDataLogs` object using the **Signal logging name** parameter.

A `ModelDataLogs` object contains a `Simulink.SubsysDataLogs` object for each subsystem in the model that contains logged data.

## Properties

### Logged Data Properties

The `Simulink.SubsysDataLogs` object contains properties with the signal data logged inside the subsystem the object represents. The number, type, and names of the properties that contain logged data depend on subsystem contents and the logging configuration.

Property Name Source	Logged Data Source	Value
Model name	Top model or model reference	<code>Simulink.ModelDataLogs</code>
Subsystem name	Subsystem	<code>Simulink.SubsysDataLogs</code>
Signal name	Signal	<code>Simulink.Timeseries</code>
Mux or virtual bus name	Mux or virtual bus	<code>Simulink.TSArray</code>
Bus object	Nonvirtual bus	<code>Simulink.TSArray</code>

### Subsystem Properties

#### Name — Name of subsystem represented by object

character vector

Name of subsystem represented by object, specified as a character vector.

## Object Functions

- `unpack` (Not recommended) Extract signal data from `ModelDataLogs`, `SubsysDataLogs`, or `TSArray` object into workspace variables
- `who` (Not recommended) List names of objects inside `ModelDataLogs`, `SubsysDataLogs`, or `TSArray` object
- `whos` (Not recommended) List name and type of objects inside `ModelDataLogs`, `SubsysDataLogs`, or `TSArray` object

## Examples

### Access Data Logged Inside Subsystem Using `ModelDataLogs` Format

Suppose you have data logged in a release prior to R2016a for a model that marked signals for logging inside the subsystem `Subsystem`. The `Simulink.ModelDataLogs` object `logouts` has the property `Subsystem` that contains the logged data for signals marked for logging inside the subsystem. You can view the contents of the `Simulink.SubsysDataLogs` object by using a dot to access the `Subsystem` property. In this example, the signal `a` and the bus `m` were marked for logging inside the subsystem.

```
logouts.Subsystem
```

```
Simulink.SubsysDataLogs (Subsystem):
 Name elements Simulink Class
 a 1 Timeseries
 m 2 TsArray
```

You can access the data for the signal or bus by using the `unpack` function to assign the value of each property to a variable in the base workspace with the same name.

```
unpack(logouts, 'all');
data = a.Data;
```

## Version History

### Introduced before R2006a

#### Loading data saved in the `ModelDataLogs` format no longer supported

*Errors starting in R2022b*

Starting in R2022b, you can no longer load data stored in the `ModelDataLogs` format, including data stored in `Simulink.Timeseries`, `Simulink.TSArray`, and `Simulink.SubsysDataLogs` objects.

You can convert data stored in the `ModelDataLogs` format to the `Dataset` format. For more information, see “Dataset Conversion for Logged Data”.

#### Loading data saved in the `ModelDataLogs` format will not be supported

*Warns starting in R2021a*

When you load data that uses the `ModelDataLogs` format as input for simulation, the software issues a warning that support for loading data in the `ModelDataLogs` format will be removed in a future release.

**Loading data saved in the ModelDataLogs format will not be supported**

*Not recommended starting in R2020b*

In a future release, the ability to load data that uses the ModelDataLogs format as input for simulation will be removed.

**Logging data using ModelDataLogs format no longer supported**

Starting in R2016a, you can no longer log data using the ModelDataLogs format, and signal logging always uses the Dataset format. When you open a model from a previous release that had logged data using ModelDataLogs format, the model configuration parameters are updated to log data using the Dataset format instead.

You can still use and access data logged using the ModelDataLogs format in previous releases, including data in `Simulink.SubsysDataLogs`, `Simulink.TSArray`, and `Simulink.Timeseries` objects. You can also convert data saved in the ModelDataLogs format to the Dataset format, which can simplify data processing. For more information, see “Dataset Conversion for Logged Data”.

For information about updating scripts that processed ModelDataLogs data, see “Migrate Scripts That Use Legacy ModelDataLogs API”.

## Simulink.TimeInfo

(Not recommended) Metadata for time data in Simulink.Timeseries object

---

**Note** The ability to log and load data using the ModelDataLogs format has been removed. Use another supported format, such as Dataset format, instead. For more information, see “Compatibility Considerations”.

---

### Description

The Simulink.TimeInfo object contains metadata for the time data in a Simulink.Timeseries object, including the units and the start and stop times.

### Creation

Prior to R2016a, you could configure a model to log data using the ModelDataLogs format. Simulating a model with the **Signal logging format** parameter set to ModelDataLogs created a Simulink.ModelDataLogs object that contained the data for all logged signals. You could specify the name for the ModelDataLogs object using the **Signal logging name** parameter.

A ModelDataLogs object contains a Simulink.Timeseries object for each logged signal, mux element, and bus element in a model. Each Simulink.Timeseries object contains a Simulink.TimeInfo object.

### Properties

#### Units — Time data units

character vector

Time data units, specified as a character vector.

Example: 'seconds'

#### Start — Start time for time data

scalar | array

Start time for time data, specified as a scalar or an array.

- For a signal that is not in a conditionally executed subsystem, the value is a scalar that matches the start time for the simulation that produced the Simulink.Timeseries object.
- For a signal inside a conditionally executed subsystem, the value is an array that contains the times at which the subsystem became active.

#### End — End time for time data

scalar | array

End time for time data, specified as a scalar or an array.

- For a signal that is not in a conditionally executed subsystem, the value is a scalar that matches the end time for the simulation that produced the `Simulink.Timeseries` object.
- For a signal inside a conditionally executed subsystem, the value is an array that contains the times at which the subsystem became inactive.

### Increment — Sample rate

NaN | scalar

Sample rate, returned as NaN or a scalar.

- The value is NaN for signals with continuous sample time logged in simulations that use a variable-step solver.
- The value is a scalar for a signal with a discrete sample time and signals logged in simulations that use a fixed-step solver.

### Length — Length of time data vector

integer

This property is read-only.

Length of time data vector, specified as an integer. The length of the vector indicates the number of samples logged from simulation.

## Version History

### Introduced before R2006a

#### Loading data saved in the ModelDataLogs format no longer supported

*Errors starting in R2022b*

Starting in R2022b, you can no longer load data stored in the `ModelDataLogs` format, including data stored in `Simulink.Timeseries`, `Simulink.TSArray`, and `Simulink.SubsysDataLogs` objects.

You can convert data stored in the `ModelDataLogs` format to the `Dataset` format. For more information, see “Dataset Conversion for Logged Data”.

#### Loading data saved in the ModelDataLogs format will not be supported

*Warns starting in R2021a*

When you load data that uses the `ModelDataLogs` format as input for simulation, the software issues a warning that support for loading data in the `ModelDataLogs` format will be removed in a future release.

#### Loading data saved in the ModelDataLogs format will not be supported

*Not recommended starting in R2020b*

In a future release, the ability to load data that uses the `ModelDataLogs` format as input for simulation will be removed.

#### Logging data using ModelDataLogs format no longer supported

Starting in R2016a, you can no longer log data using the `ModelDataLogs` format, and signal logging always uses the `Dataset` format. When you open a model from a previous release that had logged

data using `ModelDataLogs` format, the model configuration parameters are updated to log data using the `Dataset` format instead.

You can still use and access data logged using the `ModelDataLogs` format in previous releases, including data in `Simulink.SubsysDataLogs`, `Simulink.TSArray`, and `Simulink.Timeseries` objects. You can also convert data saved in the `ModelDataLogs` format to the `Dataset` format, which can simplify data processing. For more information, see “Dataset Conversion for Logged Data”.

For information about updating scripts that processed `ModelDataLogs` data, see “Migrate Scripts That Use Legacy `ModelDataLogs` API”.

---

## Description

The `Simulink.Timeseries` object contains the data logged from simulation for a signal along with metadata. Logged data for a mux or bus is stored as a `Simulink.TSArray` object that contains a `Simulink.Timeseries` object for each element.

## Creation

Prior to R2016a, you could configure a model to log data using the `ModelDataLogs` format. Simulating a model with the **Signal logging format** parameter set to `ModelDataLogs` created a `Simulink.ModelDataLogs` object that contained the data for all logged signals. You could specify the name for the `ModelDataLogs` object using the **Signal logging name** parameter.

The structure of the `Simulink.ModelDataLogs` object reflects the structure of the model.

- One or more `Simulink.Timeseries` objects contain data for one or more signals logged in the model the `ModelDataLogs` object represents.
- One or more `Simulink.TSArray` objects contain the `Simulink.Timeseries` and `Simulink.TSArray` objects for one or more muxes or buses logged in the model the `ModelDataLogs` object represents.
- One or more `Simulink.SubsysDataLogs` objects contain the `Simulink.Timeseries`, `Simulink.TSArray`, `Simulink.SubsysDataLogs`, and `Simulink.ModelDataLogs` objects for data logged inside subsystems in the model the `ModelDataLogs` object represents.
- One or more `Simulink.ModelDataLogs` objects contain the `Simulink.Timeseries`, `Simulink.TSArray`, `Simulink.SubsysDataLogs`, and `Simulink.ModelDataLogs` objects for data logged inside model references in the model the `ModelDataLogs` object represents.

## Properties

### Name — Name for logged signal data

character vector

Name for logged signal data, specified as a character vector.

### BlockPath — Path to block that produces signal in model

character vector

Path to block that produces signal in model, specified as a character vector.

**PortIndex — Index of port on block that produces signal in model**

integer

Index of port on block that produces signal in model, specified as an integer.

**SignalName — Name of signal in model**

character vector

Name of signal in model, specified as a character vector

**ParentName — Name of parent for mux or bus element**

character vector

Name of parent for mux or bus element, specified as a character vector. For a signal that is not part of a mux or bus, the ParentName property is the same as the SignalName property.

**TimeInfo — Time metadata**

Simulink.TimeInfo object

Time metadata, specified as a Simulink.TimeInfo object.

**Time — Logged time values**

array

Logged time values, specified as an array.

**Data — Logged signal values**

array

Logged signal values, specified as an array.

## Version History

**Introduced before R2006a****Loading data saved in the ModelDataLogs format no longer supported***Errors starting in R2022b*

Starting in R2022b, you can no longer load data stored in the ModelDataLogs format, including data stored in Simulink.Timeseries, Simulink.TSArray, and Simulink.SubsysDataLogs objects.

You can convert data stored in the ModelDataLogs format to the Dataset format. For more information, see “Dataset Conversion for Logged Data”.

**Loading data saved in the ModelDataLogs format will not be supported***Warns starting in R2021a*

When you load data that uses the ModelDataLogs format as input for simulation, the software issues a warning that support for loading data in the ModelDataLogs format will be removed in a future release.

**Loading data saved in the ModelDataLogs format will not be supported***Not recommended starting in R2020b*

In a future release, the ability to load data that uses the `ModelDataLogs` format as input for simulation will be removed.

### **Logging data using `ModelDataLogs` format no longer supported**

Starting in R2016a, you can no longer log data using the `ModelDataLogs` format, and signal logging always uses the `Dataset` format. When you open a model from a previous release that had logged data using `ModelDataLogs` format, the model configuration parameters are updated to log data using the `Dataset` format instead.

You can still use and access data logged using the `ModelDataLogs` format in previous releases, including data in `Simulink.SubsysDataLogs`, `Simulink.TSArray`, and `Simulink.Timeseries` objects. You can also convert data saved in the `ModelDataLogs` format to the `Dataset` format, which can simplify data processing. For more information, see “Dataset Conversion for Logged Data”.

For information about updating scripts that processed `ModelDataLogs` data, see “Migrate Scripts That Use Legacy `ModelDataLogs` API”.

## Simulink.TSArray

(Not recommended) Access logged data for mux or bus

---

**Note** The ability to log and load data using the `ModelDataLogs` format has been removed. Use another supported format, such as `Dataset`, instead. For more information, see “Compatibility Considerations”.

---

### Description

The `Simulink.TSArray` object contains the data for a logged mux or bus.

### Creation

Prior to R2016a, you could configure a model to log data using the `ModelDataLogs` format. Simulating a model with the **Signal logging format** parameter set to `ModelDataLogs` created a `Simulink.ModelDataLogs` object that contained the data for all logged signals. You could specify the name for the `ModelDataLogs` object using the **Signal logging name** parameter.

A `ModelDataLogs` object contains a `Simulink.TSArray` object for each mux or bus logged in the model the object represents. A `SubsysDataLogs` object contains a `Simulink.TSArray` object for each mux or bus logged in the subsystem the object represents.

### Properties

#### Logged Data Properties

The `Simulink.TSArray` object contains properties with the data logged for each element of the bus or mux the object represents. The number, type, and names of the properties that contain logged data depend on the structure of the mux or bus the object represents.

Property Name Source	Logged Data Source	Value
Signal name	Mux or bus element	<code>Simulink.Timeseries</code> object
Nested mux or virtual bus name	Nested mux or virtual bus	<code>Simulink.TSArray</code> object
Bus object	Nested nonvirtual bus	<code>Simulink.TSArray</code> object

#### Metadata Properties

##### Name — Signal logging name

character vector

Signal logging name, specified as a character vector.

## Object Functions

- `unpack` (Not recommended) Extract signal data from `ModelDataLogs`, `SubsysDataLogs`, or `TSArray` object into workspace variables
- `who` (Not recommended) List names of objects inside `ModelDataLogs`, `SubsysDataLogs`, or `TSArray` object
- `whos` (Not recommended) List name and type of objects inside `ModelDataLogs`, `SubsysDataLogs`, or `TSArray` object

## Examples

### Access Data for Bus Logged Using ModelDataLogs Format

Suppose you have data logged in a release prior to R2016a using `ModelDataLogs` format. The `Simulink.ModelDataLogs` object `logout` contains a `Simulink.TSArray` object for the bus `b2`. You can view the contents of the `Simulink.TSArray` object by using a dot to access the `b2` property of the `Simulink.ModelDataLogs` object. The bus `b2` contains the signal `x1` and the nested bus `b1`.

```
logout.b2
```

```
Simulink.TsArray (untitled/Bus Creator1):
 Name elements Simulink Class
 x1 1 Timeseries
 b1 2 TSArray
```

To access the logged signal data for the signal `x1`, you can use the `unpack` function to assign the contents of the `ModelDataLogs` property to a variable in the workspace with the same name. Then, you can use a dot to inspect the property values for the `Simulink.Timeseries` object that contains the signal data.

```
unpack(logout, 'all');
data = x1.Data;
```

## Version History

### Introduced before R2006a

#### Loading data saved in the ModelDataLogs format no longer supported

*Errors starting in R2022b*

Starting in R2022b, you can no longer load data stored in the `ModelDataLogs` format, including data stored in `Simulink.Timeseries`, `Simulink.TSArray`, and `Simulink.SubsysDataLogs` objects.

You can convert data stored in the `ModelDataLogs` format to the `Dataset` format. For more information, see “Dataset Conversion for Logged Data”.

#### Loading data saved in the ModelDataLogs format will not be supported

*Warns starting in R2021a*

When you load data that uses the `ModelDataLogs` format as input for simulation, the software issues a warning that support for loading data in the `ModelDataLogs` format will be removed in a future release.

**Loading data saved in the ModelDataLogs format will not be supported**

*Not recommended starting in R2020b*

In a future release, the ability to load data that uses the ModelDataLogs format as input for simulation will be removed.

**Logging data using ModelDataLogs format no longer supported**

Starting in R2016a, you can no longer log data using the ModelDataLogs format, and signal logging always uses the Dataset format. # Simulink.ValueType

Specify properties of signals based on application-specific value types

## Description

A `Simulink.ValueType` object is an application-specific set of properties that you define once and reuse for each signal that represents the same value type. For example, you can specify the unit, minimum value, maximum value, and dimensions of wind velocity, tire pressure, or water temperature.

To create and modify `ValueType` objects in the base workspace or a data dictionary, you can use the **Model Explorer** or MATLAB commands. You cannot store `ValueType` objects in model workspaces.

Specify a `ValueType` object:

- At an interface with Inport, Outport, In Bus Element, or Out Bus Element blocks
- In a model with Signal Specification blocks
- In a `Simulink.BusElement` object

Use `ValueType` objects to validate the properties of a signal and enforce consistency between connected blocks at an interface.

## Creation

You can create a `Simulink.ValueType` object several ways.

- Interactively create a value type using the **Type Editor** or **Model Explorer**.
- Programmatically create a value type using the `Simulink.ValueType` function described here.

## Syntax

```
vt = Simulink.ValueType
```

### Description

`vt = Simulink.ValueType` returns a `ValueType` object with default property values.

## Properties

### Data Type — Data type

'double' (default) | character vector | string scalar

Data type, specified as a character vector or string scalar.

You can specify any of these options:

- Built-in Simulink data type — For example, specify 'single' or 'uint8'. See “Data Types Supported by Simulink”.

- Fixed-point data type — Use the `fixdt` function. For example, specify `'fixdt(1,16,0)'`.
- Enumerated data type — Use the name of the type preceded by `Enum:`. For example, specify `'Enum: myEnumType'`.
- Custom data type — Use a MATLAB expression that specifies the type. For example, you can specify a `Simulink.NumericType` object whose `DataTypeMode` property is set to a value other than `'Fixed-point: unspecified scaling'`.

Data Types: `char` | `string`

**Min — Minimum value**

`[]` (default) | scalar

Minimum value, specified as a finite real double scalar.

Data Types: `double`

**Max — Maximum value**

`[]` (default) | scalar

Maximum value, specified as a finite real double scalar.

Data Types: `double`

**Unit — Physical unit**

`''` (default) | character vector | string scalar

Physical unit, specified as a character vector or string scalar.

For more information, see “Unit Specification in Simulink Models”.

Example: `'inches'`

Data Types: `char` | `string`

**Complexity — Numeric type**

`'real'` (default) | `'complex'`

Numeric type, specified as `'real'` or `'complex'`.

Data Types: `char` | `string`

**Dimensions — Dimensions**

`1` (default) | scalar | vector

Dimensions, specified as a scalar or vector.

Data Types: `double`

**DimensionsMode — Option to allow only fixed-size or variable-size signals**

`'Fixed'` (default) | `'Variable'`

Option to allow only fixed-size or variable-size signals, specified as `'Fixed'` or `'Variable'`, respectively.

Data Types: `char` | `string`

**Description — Description**

`''` (default) | character vector | string scalar

Description, specified as a character vector or string scalar. Use the description to document information about the `ValueType` object, such as the kind of signal it applies to. This information does not affect Simulink processing.

Data Types: `char` | `string`

## Examples

### Specify Signal Properties for Value Type

In the MATLAB Command Window, define a reusable set of properties that correspond to wind velocity by using the `Simulink.ValueType` function.

Create a `ValueType` object with default properties.

```
windVelocity = Simulink.ValueType
```

```
windVelocity =
 ValueType with properties:
```

```
 DataType: 'double'
 Min: []
 Max: []
 Unit: ''
 Complexity: 'real'
 Dimensions: 1
 DimensionsMode: 'Fixed'
 Description: ''
```

Specify the desired property values for wind velocity.

```
windVelocity.DataType = 'single';
windVelocity.Min = 11;
windVelocity.Max = 17;
windVelocity.Unit = 'm/s';
windVelocity.Dimensions = [2 4 3];
windVelocity.Description = 'Wind velocity value type'
```

```
windVelocity =
 ValueType with properties:
```

```
 DataType: 'single'
 Min: 11
 Max: 17
 Unit: 'm/s'
 Complexity: 'real'
 Dimensions: [2 4 3]
 DimensionsMode: 'Fixed'
 Description: 'Wind velocity value type'
```

# Simulink.VariableUsage

Store information about the relationship between variables and blocks in models

## Description

A `Simulink.VariableUsage` object describes where a variable is used in models.

Use this information to:

- Prepare to permanently store the variables in files and workspaces. For more information about storing variables for a model, see “Determine Where to Store Variables and Objects for Simulink Models”.
- Reduce the number of variables that you need to store by eliminating unused variables.
- Prepare to partition variables and establish variable ownership when you work in a team.

To analyze variable usage in models, use `Simulink.VariableUsage` objects together with the `Simulink.findVars` function. The function returns and accepts `Simulink.VariableUsage` objects as arguments. For more information, see `Simulink.findVars`.

A `Simulink.VariableUsage` object can also describe the usage of an enumerated data type.

Only a `Simulink.VariableUsage` constructor or the `Simulink.findVars` function can set property values in a `Simulink.VariableUsage` object. The properties are otherwise read only.

## Creation

The `Simulink.findVars` function returns `Simulink.VariableUsage` objects.

To create variable usage objects for use as a filter when using `Simulink.findVars`, use the `Simulink.VariableUsage` function described below.

## Syntax

```
variableUsageObj = Simulink.VariableUsage(varNames,sourceName)
```

### Description

`variableUsageObj = Simulink.VariableUsage(varNames,sourceName)` creates an array of `Simulink.VariableUsage` objects to describe the variables `varNames`. The constructor sets the `Name` property of each object to one of the variable names specified by `varNames`, and sets the `Source` property of all the objects to the source specified by `sourceName`. You can specify `varNames` with variables that are not used in any loaded models.

### Input Arguments

#### **varNames — Names of target variables**

character vector | cell array of character vectors

Names of target variables, specified as a character vector or a cell array of character vectors. The constructor creates a `Simulink.VariableUsage` object for each variable name.

Example: `'k'`

Example: `{'k','asdf','fuelFlow'}`

Data Types: `char` | `cell`

#### **sourceName — Name of variable source**

character vector

Name of the source that defines the target variables, specified as a character vector. For example, you can specify the MATLAB base workspace or a data dictionary as a source. The constructor also determines and sets the `SourceType` property of each of the returned `Simulink.VariableUsage` objects.

Example: `'base workspace'`

Example: `'myModel'`

Example: `'myDictionary.sldd'`

Data Types: `char`

## Properties

#### **Name — Name of variable or enumerated type**

`''` (empty character vector) (default) | character vector

This property is read-only.

The name of the variable or enumerated data type the object describes, returned as a character vector.

#### **Source — Name of defining workspace**

`''` (empty character vector) (default) | character vector

This property is read-only.

The name of the workspace or data dictionary that defines the described variable, returned as a character vector. The table shows some examples.

Source Value	Meaning
<code>'base workspace'</code>	MATLAB base workspace
<code>'MyModel'</code>	Model workspace for the model <code>MyModel</code>
<code>'MyModel/Mask1'</code>	Mask workspace for the masked block <code>Mask1</code> in the model <code>MyModel</code>
<code>'sldemo_fuelsys_dd_controller.sldd'</code>	The data dictionary named <code>'sldemo_fuelsys_dd_controller.sldd'</code>

The table shows some examples if you created the `Simulink.VariableUsage` object by using the `Simulink.findVars` function to find enumerated data types.

Source Value	Meaning
'BasicColors.m'	The enumerated type is defined in the MATLAB file 'BasicColors.m'.
' '	The enumerated type is defined dynamically and has no source.
'sldemo_fuelsys_dd_controller.sldd'	The enumerated type is defined in the data dictionary named 'sldemo_fuelsys_dd_controller.sldd'.

### SourceType — Type of defining workspace

'unknown source' (default) | 'base workspace' | 'model workspace' | 'mask workspace' | 'data dictionary'

This property is read-only.

The type of the workspace that defines the variable, returned as a character vector. The possible values are:

- 'base workspace'
- 'model workspace'
- 'mask workspace'
- 'data dictionary'

If you created the Simulink.VariableUsage object by using the Simulink.findVars function to find enumerated data types, the possible values are:

- 'MATLAB file'
- 'dynamic class'
- 'data dictionary'

### Users — Blocks that use the variable or models that use the enumerated type

{ } (empty cell array) (default) | cell array of character vectors

This property is read-only.

Blocks that use the variable or models that use the enumerated type, returned as a cell array of character vectors. Each character vector names a block or model that uses the variable or enumerated type. The Simulink.findVars function populates this property.

### Object Functions

`intersect` Return intersection of two arrays of Simulink.VariableUsage objects  
`setdiff` Return difference between two arrays of Simulink.VariableUsage objects  
`union` Return union of two arrays of Simulink.VariableUsage objects

### Examples

#### Create Object That Represents Variable in Base Workspace

Return a Simulink.VariableUsage object for a variable `k` in the base workspace.

```
var = Simulink.VariableUsage('k', 'base workspace');
```

You can use `var` as a filter for the `Simulink.findVars` function.

### **Represent All Variables in the Base Workspace**

Return an array of `Simulink.VariableUsage` objects containing one object for each variable returned by the `whos` command in the base workspace.

```
vars = Simulink.VariableUsage(whos,'base workspace')
```

### **Represent All Variables in a Model Workspace**

Return an array of `Simulink.VariableUsage` objects that describes all the variables in a model workspace.

```
hws = get_param('mymodel','ModelWorkspace');
vars = Simulink.VariableUsage(hws.whos,'MyModel')
```

### **Represent All Variables in a Mask Workspace**

Return an array of `Simulink.VariableUsage` objects that describes all the variables in a mask workspace.

```
maskVars = get_param('mymodel/maskblock','MaskWSVariables');
vars = Simulink.VariableUsage(maskVars,'mymodel/maskblock');
```

# intersect

**Package:** Simulink

Return intersection of two arrays of `Simulink.VariableUsage` objects

## Syntax

```
VarsOut = intersect(VarsIn1,VarsIn2)
```

## Description

`VarsOut = intersect(VarsIn1,VarsIn2)` returns an array that identifies the variables described in `VarsIn1` and in `VarsIn2`, which are arrays of `Simulink.VariableUsage` objects. If a variable is described by a `Simulink.VariableUsage` object in `VarsIn1` and in `VarsIn2`, the function returns a `Simulink.VariableUsage` object that stores the variable usage information from both objects in the `Users` property.

`intersect` compares the `Name`, `Source`, and `SourceType` properties of the `Simulink.VariableUsage` objects in `VarsIn1` with the same properties of the objects in `VarsIn2`. If `VarsIn1` and `VarsIn2` each contain `Simulink.VariableUsage` objects that have the same values for these three properties, they both describe the same variable.

To create `Simulink.VariableUsage` objects that describe the usage of variables in a model, use the `Simulink.findVars` function.

## Examples

### Compare Variables Used by Models

Given two models, discover the variables needed by both models.

```
model1Vars = Simulink.findVars('model1');
model2Vars = Simulink.findVars('model2');
commonVars = intersect(model1Vars,model2Vars);
```

## Input Arguments

### VarsIn1 — First array of variables for comparison

array of `Simulink.VariableUsage` objects

First array of variables for comparison, specified as an array of `Simulink.VariableUsage` objects.

### VarsIn2 — Second array of variables for comparison

array of `Simulink.VariableUsage` objects

Second array of variables for comparison, specified as an array of `Simulink.VariableUsage` objects.

## Output Arguments

### **VarsOut** — Variables described in both input arrays

array of `Simulink.VariableUsage` objects

Variables that are described in both input arrays, returned as an array of `Simulink.VariableUsage` objects. The function returns an object for each variable that is described in `VarsIn1` and in `VarsIn2`.

## Version History

**Introduced in R2012b**

### See Also

`Simulink.findVars` | `Simulink.VariableUsage` | `setdiff` | `union`

### Topics

“Manage Design Data”

# setdiff

**Package:** Simulink

Return difference between two arrays of `Simulink.VariableUsage` objects

## Syntax

```
VarsOut = setdiff(VarsIn1,VarsIn2)
```

## Description

`VarsOut = setdiff(VarsIn1,VarsIn2)` returns an array that identifies the variables described in `VarsIn1` but not in `VarsIn2`, which are arrays of `Simulink.VariableUsage` objects. If a variable is described by a `Simulink.VariableUsage` object in `VarsIn1` but not in `VarsIn2`, the function returns a copy of the object.

`setdiff` compares the `Name`, `Source`, `SourceType`, and `Users` properties of the `Simulink.VariableUsage` objects in `VarsIn1` with the same properties of the objects in `VarsIn2`. If `VarsIn1` and `VarsIn2` each contain a `Simulink.VariableUsage` object with the same values for these three properties, the objects describe the same variable, and `setdiff` does not return an object to describe it.

To create `Simulink.VariableUsage` objects that describe the usage of variables in a model, use the `Simulink.findVars` function.

## Examples

### Determine Variable Usage Difference Between Models

Given two models, discover the variables that are needed by the first model but not the second model.

```
model1Vars = Simulink.findVars('model1');
model2Vars = Simulink.findVars('model2');
differentVars = setdiff(model1Vars,model2Vars);
```

### Find Variables Not Used by Model

Locate all variables in the base workspace that are not used by a loaded model that has been recently compiled.

```
models = find_system('type','block_diagram','LibraryType','None');
base_vars = Simulink.VariableUsage(who,'base workspace');
```

```
used_vars = Simulink.findVars(models, 'WorkspaceType', 'base');
unusedVars = setdiff(base_vars, used_vars);
```

## Input Arguments

### **VarsIn1 — First array of variables for comparison**

array of `Simulink.VariableUsage` objects

First array of variables for comparison, specified as an array of `Simulink.VariableUsage` objects.

### **VarsIn2 — Second array of variables for comparison**

array of `Simulink.VariableUsage` objects

Second array of variables for comparison, specified as an array of `Simulink.VariableUsage` objects.

## Output Arguments

### **VarsOut — Variables described in first array but not second array**

array of `Simulink.VariableUsage` objects

Variables that are described in the first input array but not in the second input array, returned as an array of `Simulink.VariableUsage` objects. The function returns an object for each variable that is described in `VarsIn1` but not in `VarsIn2`.

## Version History

**Introduced in R2012b**

### **See Also**

`Simulink.findVars` | `Simulink.VariableUsage` | `intersect` | `union`

### **Topics**

“Manage Design Data”

# union

**Package:** Simulink

Return union of two arrays of Simulink.VariableUsage objects

## Syntax

```
VarsOut = union(VarsIn1,VarsIn2)
```

## Description

`VarsOut = union(VarsIn1,VarsIn2)` returns an array that is a combined set of the variables from `VarsIn1` and `VarsIn2`, which are arrays of Simulink.VariableUsage objects. The output array does not contain duplicates. If a variable is described by a Simulink.VariableUsage object in `VarsIn1` and in `VarsIn2`, the function returns a Simulink.VariableUsage object that stores the variable usage information from both objects in the `Users` property.

To create Simulink.VariableUsage objects that describe the usage of variables in a model, use the Simulink.findVars function.

## Examples

### Find the Union of Variables Used by Models

Given two models, discover the combined set of variables from both models.

```
model1Vars = Simulink.findVars('model1');
model2Vars = Simulink.findVars('model2');
unionVars = union(model1Vars,model2Vars);
```

## Input Arguments

### VarsIn1 — First array of variables for union

array of Simulink.VariableUsage objects

First array of variables for union, specified as an array of Simulink.VariableUsage objects.

### VarsIn2 — Second array of variables for union

array of Simulink.VariableUsage objects

Second array of variables for union, specified as an array of Simulink.VariableUsage objects.

## Output Arguments

### VarsOut — Combined set of variables described in input arrays

array of Simulink.VariableUsage objects

Combined set of variables that are described in input arrays, returned as an array of `Simulink.VariableUsage` objects. The function returns an object for each variable that is described in `VarsIn1` or in `VarsIn2`.

# Simulink.WorkspaceVar

Store information about workspace variables and blocks that use them

---

**Note** Simulink.WorkspaceVar is not recommended. Use Simulink.VariableUsage instead.

---

## Description

A Simulink.WorkspaceVar object describes attributes of a workspace variable and lists the blocks that use the variable.

## Creation

The Simulink.findVars function returns one or more Simulink.WorkspaceVar objects that embody the results of searching for variables.

Only the Simulink.WorkspaceVar function can set any field value in a Simulink.WorkspaceVar object. The fields are otherwise read-only.

## Syntax

```
varObj = Simulink.WorkspaceVar(varNames, wkspName)
```

### Description

varObj = Simulink.WorkspaceVar(varNames, wkspName) creates an array of Simulink.WorkspaceVar objects to describe the variables varNames. The constructor sets the Name property of each object to one of the variable names specified by varNames, and sets the Workspace property of all the objects to the workspace specified by wkspName. You can specify varNames with variables that are not used in any loaded models.

### Input Arguments

#### varNames — Names of target variables

character vector | cell array of character vectors

Names of target variables, specified as a character vector or a cell array of character vectors. The constructor creates a Simulink.WorkspaceVar object for each variable name. You can specify varNames with variables that are not used in any loaded models.

Example: 'k'

Example: {'k', 'asdf', 'fuelFlow'}

Data Types: char | cell

#### wkspName — Name of containing workspace

character vector

Name of the workspace that defines the target variables, specified as a character vector. For example, you can specify the MATLAB base workspace. The constructor also determines and sets the `WorkspaceType` property of each of the returned `Simulink.WorkspaceVar` objects.

Example: `'base workspace'`

Example: `'myModel'`

Example: `'myDictionary.slidd'`

Data Types: `char`

## Properties

### Name — Name of variable

`''` (empty character vector) (default) | character vector

This property is read-only.

Name of the variable described by the object, returned as a character vector.

### Workspace — Name of workspace that contains variable

`''` (empty character vector) (default) | character vector

This property is read-only.

Name of the workspace that contains the variable, returned as a character vector. For example:

Workspace value	Meaning
<code>'base workspace'</code>	The MATLAB base workspace
<code>'MyModel'</code>	The model workspace for the model <code>MyModel</code> .
<code>'MyModel/Mask1'</code>	The mask workspace for the masked block <code>Mask1</code> in the model <code>MyModel</code> .

### WorkspaceType — Type of workspace containing variable

`'unknown'` (default) | `'base'` | `'model'` | `'mask'`

This property is read-only.

Type of workspace that contains the variable, returned as a character vector. The possible values are:

- `'base'` — The base workspace
- `'model'` — A model workspace
- `'mask'` — A mask workspace

### UsedByBlocks — Users of variable

`{}` (empty cell array) (default) | cell array of character vectors

This property is read-only.

Users of the variable, returned as a cell array of character vectors. Each character vector identifies a block that uses the variable. The `Simulink.findVars` function populates this property.

## Object Functions

`intersect` Return intersection of two arrays of `Simulink.VariableUsage` objects  
`setdiff` Return difference between two arrays of `Simulink.VariableUsage` objects

## Examples

### Create Object That Represents Variable in Base Workspace

Return a `Simulink.WorkspaceVar` object for a variable `k` in the base workspace.

```
var = Simulink.WorkspaceVar('k', 'base workspace');
```

### Represent All Variables in the Base Workspace

Return an array of `Simulink.WorkspaceVar` objects containing one object for each variable returned by the `whos` command in the base workspace.

```
vars = Simulink.WorkspaceVar(who,WkspName)
```

### Represent All Variables in a Model Workspace

Return an array of `Simulink.WorkspaceVar` objects that describes all the variables in a model workspace.

```
hws = get_param('mymodel', 'ModelWorkspace');
vars=Simulink.WorkspaceVar(hws.whos, 'MyModel')
```

### Represent All Variables in a Mask Workspace

Return an array of `Simulink.WorkspaceVar` objects that describes all the variables in a mask workspace.

```
maskVars = get_param('mymodel/maskblock', 'MaskWSVariables');
vars = Simulink.WorkspaceVar(maskVars, 'mymodel/maskblock');
```

## Version History

Introduced in R2010a

### See Also

`Simulink.findVars` | `setdiff` | `intersect`

# TimeScopeConfiguration

Control Scope block appearance and behavior

## Description

Scope configuration properties control the appearance and behavior of a scope block. Create a scope configuration object with `get_param`, and then change property values using the object with dot notation.

## Creation

`myScopeConfiguration = get_param(gcbh, 'ScopeConfiguration')` creates a scope configuration object for the selected scope block.

## Properties

### Name — Title on a scope window

`block name (default)` | character vector | string scalar

Title on a scope window, specified as a character vector or string scalar.

### Position — Size and location of the scope

`[left bottom width height]`

Size and location of scope window, specified as a four-element vector consisting of the left, bottom, width, and height positions, in pixels.

By default, a scope window appears in the center of your screen with a width of 560 pixels and height of 420 pixels.

### Visible — Visibility of scope window

`true (default)` | `false`

Set this property to `true` to make the scope window visible.

### OpenAtSimulationStart — Open scope when starting simulation

`true (default for Time Scope)` | `false (default for Scope)`

Set this property to `true` to open the scope when the simulation starts.

### DisplayFullPath — Display full path

`false (default)` | `true`

Set this property to `true` to display the full path of the scope relative to the model on top of the scope window. If you set this property to `false`, only the name of the scope block appears on top of the scope window.

### PreserveColorsForCopyToClipboard — Preserve colors for copy to clipboard

`false (default)` | `true`

Set this property to `true` to maintain the background color of the scope and the signal colors while copying the scope to clipboard. When you paste this scope to a document or print this scope, the colors are retained. If you set this property to `false` and copy the scope to clipboard, colors change to a toner friendly version when you paste or print the scope.

### **NumInputPorts — Number of input ports**

'1' (default) | character vector

Number of input ports on a scope block, specified as a character vector or string scalar. The maximum number of input ports is 96.

### **LayoutDimensions — Number of display rows and columns**

[1 1] (default) | [numberOfRows numberOfColumns]

Number of display rows and columns, specified with as a two-element vector. The maximum layout dimension is 16-by-16.

- If the number of displays is equal to the number of ports, signals from each port appear on separate displays.
- If the number of displays is less than the number of ports, signals from additional ports appear on the last *y*-axis.

### **SampleTime — Time interval**

'-1' (default) | character vector | string scalar

Time interval between Scope block updates during a simulation, specified as a character vector or string scalar. This property does not apply to floating scopes and scope viewers.

### **FrameBasedProcessing — Frame-based processing of signals**

`false` (default for Time Scope block) | `true` (default for Scope block)

Set this property to `true` to process signals as frame-based.

- `false` — Process signal values in a channel at each time interval (sample based).
- `true` — Process signal values in a channel as a group of values from multiple time intervals (frame based). Frame-based processing is available only with discrete input signals.

### **MaximizeAxes — Maximize size of signal plots**

'Auto' (default) | 'On' | 'Off'

Specify whether or not to maximize the size of signal plots:

- 'Auto' — If `Title` and `YLabel` are not specified, maximize all plots.
- 'On' — Maximize all plots. Values in `Title` and `YLabel` are hidden.
- 'Off' — Do not maximize plots.

Each of the plots expands to fit the full display. Maximizing the size of signal plots removes the background area around the plots.

### **MinimizeControls — Hide menu and toolbar**

`false` (default) | `true`

Set this property to `true` to hide the menu and toolbar.

If you dock the scope, this property is inactive.

### **AxesScaling — How to scale y-axes**

'Manual' (default) | 'Auto' | 'Updates'

How to scale y-axes, specified as one of these values:

- 'Manual' — Manually scale y-axes with the **Scale Y-axis Limits** button.
- 'Auto' — Scale y-axes during and after simulation.
- 'Updates' — Scale y-axes after specified number of block updates (time intervals).

### **Dependency**

If this property is set to 'Updates', also specify the property `AxesScalingNumUpdates`

### **AxesScalingNumUpdates — Number of updates before scaling y-axes**

'10' (default) | character vector | string scalar

Number of updates before scaling y-axes, specified as a character vector or string scalar.

### **Dependency**

Activate this property by setting `AxesScaling` to 'Updates'.

### **TimeSpan — Length of x-axis range to display**

'0' (default) | character vector | string scalar | 'Auto'

Length of x-axis range to display, specified as one of these values:

- Positive real number — Any value less than the total simulation time specified as a character vector or string scalar.
- 'Auto' — Difference between the simulation start and stop times.

The block calculates the beginning and end times of the x-axis range using the `TimeDisplayOffset` and `TimeSpan` properties. For example, if you set `TimeDisplay` to 10 and the `TimeSpan` to 20, the scope sets the x-axis range from 10 to 30.

### **TimeSpanOverrunAction — How to display data**

'Wrap' (default) | 'Scroll'

How to display data beyond the visible x-axis range, specified as one of these values:

- 'Wrap' — Draw a full screen of data from left to right, clear the screen, and then restart drawing of data.
- 'Scroll' — Move data to the left as new data is drawn on the right. This mode is graphically intensive and can affect run-time performance.

You can see the effects of this option only when plotting is slow with large models or small step sizes.

### **TimeUnits — Units to display on the x-axis**

'Metric' (default for Time Scope block) | 'None' (default for Scope block) | 'Seconds'

Units to display on the x-axis, specified as one of these values:

- 'Metric' — Display time units based on the length of the `TimeSpan` property.

- 'None' — Display Time on the x-axis.
- 'Seconds' — Display Time (seconds) on the x-axis.

### **TimeDisplayOffset — x-axis range offset**

'0' (default) | character vector | string scalar

x-axis range offset number, specified as a character vector or string scalar. For input signals with multiple channels, enter a scalar or vector of offsets.

- Scalar — Offset all channels of an input signal by the same value.
- Vector — Independently offset the channels.

### **TimeAxisLabels — How x-axis labels display**

'All' (default for Time Scope block) | 'Bottom' (default for Scope block) | 'None'

How x-axis labels display, specified as one of these values:

- 'All' — Display x-axis labels on all displays.
- 'Bottom' — Display x-axis labels only on the bottom display.
- 'None' — Do not display labels and deactivate ShowTimeAxisLabel property.

#### **Dependency**

Set the ActiveDisplay property before specifying this property.

Set ShowTimeAxisLabel to true and set Maximize axes to 'Off'.

### **ShowTimeAxisLabel — Display or hide x-axis labels**

true (default for Time Scope block) | false (default for Scope block)

Set this property to true to display the x-axis labels.

#### **Dependency**

Set the ActiveDisplay property before setting this property.

If this property is set to true, also set TimeAxisLabels. If TimeAxisLabels is set to 'None', this property is inactive.

### **ActiveDisplay — Display for setting display-specific properties**

'1' (default) | character vector

Display for setting display-specific properties, specified as a character vector or string. The number of a display corresponds to its column-wise placement index. For multi-column layouts, the displays are numbered down and then across.

#### **Dependency**

Setting this property selects the display for setting the properties ShowGrid, ShowLegend, Title, PlotAsMagnitudePhase, YLabel, and YLimits.

### **Title — Title for display**

'%<SignalLabel>' (default) | character vector | string scalar

Title for a display, specified as a character vector or string scalar. The default value %<SignalLabel> uses the input signal name for the title.

**Dependency**

Set the `ActiveDisplay` property before setting this property.

**ShowLegend — Signal legend**

`false` (default) | `true`

Set this property to `true` to display the legend.

Names listed in the legend are the signal names from the model. For signals with multiple channels, a channel index is appended after the signal name. See the Scope block reference for an example.

**Dependency**

Set the `ActiveDisplay` property before setting this property.

**ShowGrid — Vertical and horizontal grid lines**

`true` (default) | `false`

Set this property to `true` to display vertical and horizontal grid lines.

**Dependency**

Set the `ActiveDisplay` property before setting this property.

**PlotAsMagnitudePhase — Magnitude and phase plots**

`false` (default) | `true`

Specify whether or not to display the magnitude and phase plots:

- `false` — Display signal plot.

If the signal is complex, plot the real and imaginary parts on the same *y*-axis (display).

- `true` — Display magnitude and phase plots.

If the signal is real, plot the absolute value of the signal for the magnitude. The phase is 0 degrees for positive values and 180 degrees for negative values.

**Dependency**

Set the `ActiveDisplay` property before setting this property.

**YLimits — Minimum and maximum values of y-axis**

`[-10 10]` (default) | [*ymin ymax*]

Minimum and maximum values of *y*-axis, specified as a two-element numeric vector.

**Dependency**

Set the `ActiveDisplay` property before setting this property.

When `PlotAsMagnitudePhase` is `true`, this property specifies the *y*-axis limits for the magnitude plot. The *y*-axis limits of the phase plot are always `[-180 180]`.

**YLabel — Y-axis label**

`''` (default) | character vector | string scalar

*y*-axis label for active display, specified as a character vector or string scalar.

**Dependency**

Set the `ActiveDisplay` property before setting this property.

If `PlotAsMagnitudePhase` is `true`, the value of `YLabel` is hidden and plots are labeled `Magnitude` and `Phase`.

**DataLogging — Save scope data**

`false` (default) | `true`

Set this property to `true` to save scope data to a variable in the MATLAB workspace.

This property does not apply to floating scopes and scope viewers.

**Dependency**

If this property is set to `true`, you must also specify the properties `DataLoggingVariableName` and `DataLoggingSaveFormat`.

**DataLoggingVariableName — Variable name for saving scope data**

`'ScopeData'` (default) | character vector | string scalar

Variable name for saving scope data in the MATLAB workspace, specified as a character vector or string scalar. This property does not apply to floating scopes and scope viewers.

**Dependency**

Activate this property by setting `DataLogging` to `true`.

**DataLoggingLimitDataPoints — Limit buffered data**

`false` (default) | `true`

Set to `true` to limit buffered data before plotting and saving data.

For simulations with **Stop time** set to `inf`, always set this parameter to `true`.

**Dependency**

If this property is set to `true`, also specify the number of data values to plot and save with the property `DataLoggingMaxPoints`.

**DataLoggingMaxPoints — Maximum number of data values**

`'5000'` (default) | character vector | string scalar

Maximum number of data values to plot and save, specified as a character vector or string scalar. The data values that are plotted and saved are from the end of a simulation. For example, setting this property to 100 saves the last 100 data points.

**Dependency**

Activate this property by setting `DataLoggingLimitDataPoints` to `true`. Specifying this property limits the data values a scope plots and the data values saved in the MATLAB variable specified in `DataLoggingVariableName`.

**DataLoggingDecimateData — Reduce scope data**

`false` (default) | `true`

Set this property to `true` to reduce scope data before plotting and saving.

**Dependency**

If this property is set to `true`, you must also specify the `DataLoggingDecimation` property.

**DataLoggingDecimation — Decimation factor**

'1' (default) | character vector | string scalar

Decimation factor applied to the signal data before plotting and saving, specified as a character vector or string scalar. The scope buffers every  $N^{\text{th}}$  data point, where  $N$  is the decimation factor you specify. A value of 1 buffers all data values.

**Dependency**

Activate this property by setting `DataLoggingDecimateData` to `true`.

**DataLoggingSaveFormat — Variable format for saving scope data**

'Dataset' (default) | 'Structure With Time' | 'Structure' | 'Array'

Variable format for saving scope data to the MATLAB workspace, specified as one of these values:

- 'Dataset' — Save data as a dataset object. This format does not support variable-size data, MAT-file logging, or external mode archiving. See `Simulink.SimulationData.Dataset`.
- 'StructureWithTime' — Save data as a structure with associated time information. This format does not support single- or multiport frame-based data, or multirate data.
- 'Structure' — Save data as a structure. This format does not support multirate data.
- 'Array' — Save data as an array with associated time information. This format does not support multiport sample-based data, single- or multiport frame-based data, variable-size data, or multirate data.

This property does not apply to floating scopes and scope viewers.

**Dependency**

Activate this property by setting `DataLogging` to `true`.

**Examples****Create Scope Configuration Object**

This example creates a scope configuration object using the 'vdp' model which models the van der Pol equation.

```
open_system('vdp')
myScopeConfiguration = get_param('vdp/Scope', 'ScopeConfiguration');
myScopeConfiguration.NumInputPorts = '2';
```

## Migrating to Simplified Initialization Mode Overview

Simplified initialization mode was introduced in R2008b to improve the consistency of simulation results. This mode is especially important for models that do not specify initial conditions for conditionally executed subsystem output ports. For more information, see “Simplified Initialization Mode” and “Classic Initialization Mode”.

Use the Model Advisor checks in **Migrating to Simplified Initialization Mode** to help migrate your model to simplified initialization mode.

### See Also

- “Check model settings for migration to simplified initialization mode” on page 9-35

## Identify unconnected lines, input ports, and output ports

**Check ID:** `mathworks.design.UnconnectedLinesPorts`

Check for unconnected lines or ports.

### Description

This check lists unconnected lines or ports. These can have difficulty propagating signal attributes such as data type, sample time, and dimensions.

---

**Note** Ports connected to ground/terminator blocks will pass this test.

---

### Results and Recommended Actions

Condition	Recommended Action
Lines, input ports, or output ports are unconnected.	Connect the signals. Double-click the list of unconnected items to locate failure.

### Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

### Tips

Use the `PortConnectivity` command to obtain an array of structures describing block input or output ports.

### See Also

“Common Block Properties” on page 6-12 for information on the `PortConnectivity` command.

“Model Advisor Exclusion Overview” (Simulink Check)

## Check root model Inport block specifications

**Check ID:** `mathworks.design.RootInportSpec`

Check that root model Inport blocks fully define dimensions, sample time, and data type.

**Description**

Using root model Inport blocks that do not fully define dimensions, sample time, or data type can lead to undesired simulation results. Simulink software back-propagates dimensions, sample times and data types from downstream blocks unless you explicitly assign them values.

**Results and Recommended Actions**

Condition	Recommended Action
Root-level Inport blocks have undefined attributes.	Fully define the attributes of the root-level Inport blocks.

**Capabilities and Limitations**

If you have a Simulink Check license, you can exclude blocks and charts from this check.

**Tips**

The following configurations pass this check:

- **Configuration Parameters > Solver > Periodic sample time constraint** is set to Ensure sample time independent
- For export-function models, *inherited sample time* is not flagged.

**See Also**

- “About Data Types in Simulink”.
- “Determine Signal Dimensions”.
- “Specify Sample Time”.
- “Model Advisor Exclusion Overview” (Simulink Check)

**Check optimization settings**

**Check ID:** `mathworks.design.OptimizationSettings`

Check for optimizations that can lead to non-optimal code generation and simulation.

**Description**

This check reviews the status of optimizations that can improve code efficiency and simulation time.

## Results and Recommended Actions

Condition	Recommended Action
<p>The specified optimizations are off.</p>	<p>Select the following optimization check boxes on the <b>Optimization</b> pane in the Configuration Parameters dialog box:</p> <ul style="list-style-type: none"> <li>• Remove root level I/O zero initialization (Embedded Coder)</li> <li>• Remove internal data zero initialization (Embedded Coder)</li> </ul> <p>Select the following optimization check boxes on the <b>Optimization</b> pane in the Configuration Parameters dialog box:</p> <ul style="list-style-type: none"> <li>• Inline invariant signals (Simulink Coder) (only if you have a Simulink Coder license)</li> </ul> <p>Select the following optimization check boxes in the Configuration Parameters dialog box:</p> <ul style="list-style-type: none"> <li>• “Block reduction”</li> <li>• “Conditional input branch execution”</li> <li>• “Implement logic signals as Boolean data (vs. double)”</li> <li>• Use memset to initialize floats and doubles to 0.0 (Simulink Coder)</li> <li>• Remove code from floating-point to integer conversions that wraps out-of-range values (Simulink Coder) (only if you have a Simulink Coder license)</li> <li>• Signal storage reuse (Simulink Coder) (only if you have a Simulink Coder license)</li> <li>• Enable local block outputs (Simulink Coder)</li> <li>• Reuse local block outputs (Simulink Coder)</li> <li>• Eliminate superfluous local variables (Expression folding) (Simulink Coder)</li> </ul> <p>Select the following optimization check boxes on the <b>Optimization</b> pane in the Configuration Parameters dialog box:</p> <hr/> <p><b>Note</b> Model Advisor checks these parameters only if there is a Stateflow chart in the model.</p> <hr/> <ul style="list-style-type: none"> <li>• Use bitsets for storing state configuration (Simulink Coder)</li> <li>• Use bitsets for storing Boolean data (Simulink Coder)</li> </ul>
<p>“Application lifespan (days)” is set as infinite. This could lead to expensive 64-bit counter usage.</p>	<p>Choose a stop time if this is not intended.</p>

Condition	Recommended Action
The specified diagnostics, which can increase the time it takes to simulate your model, are set to warning or error.	Select none for: <ul style="list-style-type: none"> <li>• <b>Solver data inconsistency</b></li> <li>• <b>Array bounds exceeded</b></li> <li>• <b>Diagnostics &gt; Data Validity &gt; Simulation range checking</b></li> </ul>
The specified Embedded Coder parameters are off.	If you have an Embedded Coder license and you are using an ERT-based system target file: <ul style="list-style-type: none"> <li>• Select <b>Single output/update function</b>. For details, see “Single output/update function” (Simulink Coder).</li> <li>• Select <b>Ignore test point signals</b>. For details, see “Ignore test point signals” (Embedded Coder).</li> <li>• Set <b>Pass reusable subsystem outputs as</b> to <code>Individual</code> arguments. For details, see <code>Pass reusable subsystem outputs as</code> (Embedded Coder).</li> </ul>

### Tips

If the system contains Model blocks and the referenced model is in Accelerator mode, simulating the model requires generating and compiling code.

check

### See Also

- “Model Configuration Parameters: Code Generation Optimization” (Simulink Coder)

## Check diagnostic settings ignored during accelerated model reference simulation

**Check ID:** `mathworks.design.ModelRefSIMConfigCompliance`

Checks for referenced models for which Simulink changes configuration parameter settings during accelerated simulation.

### Description

For models referenced in accelerator mode, Simulink ignores the settings of the following configuration parameters that you set to a value other than None.

- **Array bounds exceeded**
- **Diagnostics > Data Validity > Inf or NaN block output**
- **Diagnostics > Data Validity > Division by singular matrix**
- **Diagnostics > Data Validity > Wrap on overflow**

Also, for models referenced in accelerator mode, Simulink ignores the following **Configuration Parameters > Diagnostics > Data Validity > Data Store Memory block** parameters if you set them to a value other than `Disable all`. For details, see “Data Store Diagnostics”.

- **Detect read before write**
- **Detect write after read**
- **Detect write after write**

### Results and Recommended Actions

Condition	Recommended Action
You want to see the results of running the identified diagnostics with settings to produce warnings or errors.	Simulate the model in Normal mode and resolve diagnostic warnings or errors.

## Check for parameter tunability information ignored for referenced models

**Check ID:** `mathworks.design.ParamTunabilityIgnored`

Checks if parameter tunability information is included in the Model Parameter Configuration dialog box.

### Description

Simulink software ignores tunability information specified in the Model Parameter Configuration dialog box. This check identifies those models containing parameter tunability information that Simulink software will ignore if the model is referenced by other models.

### Results and Recommended Actions

Condition	Recommended Action
Model contains ignored parameter tunability information.	Click the links to convert to equivalent Simulink parameter objects in the MATLAB workspace.

### See Also

- “Create Tunable Calibration Parameter in the Generated Code” (Simulink Coder)

## Check for implicit signal resolution

**Check ID:** `mathworks.design.ImplicitSignalResolution`

Identify models that attempt to resolve named signals and states to `Simulink.Signal` objects.

### Description

Requiring Simulink software to resolve all named signals and states is inefficient and slows incremental code generation and model reference. This check identifies those signals and states for which you may turn off implicit signal resolution and enforce resolution.

**Results and Recommended Actions**

Condition	Recommended Action
Not all signals and states are resolved.	Turn off implicit signal resolution and enforce resolution for each signal and state that does resolve.

**See Also**

“Resolve Signal Objects for Output Variables”.

**Check for optimal bus virtuality**

**Check ID:** `mathworks.design.OptBusVirtuality`

Identify virtual buses that could be made nonvirtual. Making these buses nonvirtual improves generated code efficiency.

**Description**

This check identifies blocks incorporating virtual buses that cross a subsystem boundary. Changing these to nonvirtual improves generated code efficiency.

**Results and Recommended Actions**

Condition	Recommended Action
Blocks that specify a virtual bus crossing a subsystem boundary.	Change the highlighted bus to nonvirtual.

**Capabilities and Limitations**

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

**See Also**

- “Signal Basics”
- “Composite Interface Guidelines”
- “Model Advisor Exclusion Overview” (Simulink Check)

**Check for Discrete-Time Integrator blocks with initial condition uncertainty**

**Check ID:** `mathworks.design.DiscreteTimeIntegratorInitCondition`

Identify Discrete-Time Integrator blocks with state ports and initial condition ports that are fed by neither an Initial Condition nor a Constant block.

**Description**

Discrete-Time Integrator blocks with state port and initial condition ports might not be suitably initialized unless they are fed from an Initial Condition or Constant block. This is more likely to happen when Discrete-Time Integrator blocks are used to model second-order or higher-order dynamic systems.

**Results and Recommended Actions**

Condition	Recommended Action
Discrete-Time Integrator blocks are not initialized during the model initialization phase.	Add a Constant or Initial Condition block to feed the external Initial Condition port.

**Capabilities and Limitations**

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

**See Also**

- IC block
- Discrete-Time Integrator block
- Constant block
- “Model Advisor Exclusion Overview” (Simulink Check)

**Identify disabled library links**

**Check ID:** mathworks.design.DisabledLibLinks

Search model for disabled library links.

**Description**

Disabled library links can cause unexpected simulation results. Resolve disabled links before saving a model.

---

**Note** This check may overlap with “Check model for block upgrade issues” on page 9-41.

---

**Results and Recommended Actions**

Condition	Recommended Action
Library links are disabled.	Click the <b>Library Link &gt; Resolve link</b> option in the context menu.

**Capabilities and Limitations**

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

### Tips

- Use the Model Browser to find library links.
- To enable a broken link, right-click a block in your model to display the context menu. Select **Library Link > Resolve link**.

### See Also

“Restore Disabled Links”

“Model Advisor Exclusion Overview” (Simulink Check)

## Check for large number of function arguments from virtual bus across model reference boundary

**Check ID:** `mathworks.design.CheckVirtualBusAcrossModelReferenceArgs`

Checks virtual bus signals that cross model reference boundaries and flags cases where using virtual buses across a model reference boundary increases the number of function arguments significantly.

### Description

To improve the speed of the code generation process, you can use this check to reduce the number of generated function arguments. If the check finds a model that where many arguments will be generated for a function, you can click **Update Model** to modify the model so that it generates fewer arguments.

### Results and Recommended Action

Methods that generate many function arguments as the result of a virtual bus signal crossing model reference boundary slow down the code generation process.

Condition	Recommended Action
Methods are listed that generate a large number of arguments for the current the model configuration that this check can reduce by modifying the model.	Click <b>Update Model</b> .

Clicking **Update Model** resets Inport and Outport block parameters and inserts Signal Conversion blocks, as necessary, to reduce the number of generated function arguments for the model.

### See Also

“Use Buses at Model Interfaces”

## Identify parameterized library links

**Check ID:** `mathworks.design.ParameterizedLibLinks`

Search model for parameterized library links.

### Description

Parameterized library links that are unintentional can result in unexpected parameter settings in your model. This can result in improper model operation.

### Results and Recommended Actions

Condition	Recommended Action
Parameterized links are listed.	Verify that the links are intended to be parameterized.

### Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

### Tips

- Right-click a block in your model to display the context menu. Choose **Link Options** and click **Go To Library Block** to see the original block from the library.
- To parameterize a library link, choose **Look Under Mask**, from the context menu and select the parameter.

### See Also

“Restore Disabled Links”

“Model Advisor Exclusion Overview” (Simulink Check)

## Identify unresolved library links

**Check ID:** mathworks.design.UnresolvedLibLinks

Search the model for unresolved library links, where the specified library block cannot be found.

### Description

Check for unresolved library links. Models do not simulate while there are unresolved library links.

### Results and Recommended Actions

Condition	Recommended Action
Library links are unresolved.	Locate missing library block or an alternative.

### Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

### See Also

“Fix Unresolved Library Links”

“Model Advisor Exclusion Overview” (Simulink Check)

## Identify configurable subsystem blocks for converting to variant subsystem blocks

**Check ID:** `mathworks.design.CSStoVSSConvert`

Search the model to identify configurable subsystem blocks at the model or subsystem level.

### Results and Recommended Actions

Condition	Recommended Action
Configurable subsystem blocks are identified.	Convert these blocks to variant subsystem blocks to avoid compatibility issues. See Configurable Subsystem.

### Capabilities and Limitations

You can run this check on your library models.

### See Also

“Convert to Variant Subsystem” on page 1-221

## Identify Variant Model blocks and convert those to Variant Subsystem containing Model block choices

**Check ID:** `mathworks.design.ConvertMdlrefVarToVSS`

Search the model to identify Variant Model blocks.

### Results and Recommended Actions

Condition	Recommended Action
Variant Model blocks available in the model are listed.	Convert these blocks to Variant Subsystem blocks.

### See Also

“Convert to Variant Subsystem Block”

## Identify Variant blocks using Variant objects with empty conditions

**Check ID:** `mathworks.design.emptyVariantObjects`

Search the model to identify the Variant blocks or library having empty Variant objects.

### Results and Recommended Actions

Condition	Recommended Action
The Variant blocks in the model or library having empty Variant objects are listed.	Use valid conditions in the variant objects.

### See Also

“Introduction to Variant Controls”

## Check usage of function-call connections

**Check ID:** `mathworks.design.CheckForProperFcnCallUsage`

Check model diagnostic settings that apply to function-call connectivity and that might impact model execution.

### Description

Check for connectivity diagnostic settings that might lead to non-deterministic model execution.

### Results and Recommended Actions

Condition	Recommended Action
Configuration parameter “Context-dependent inputs” is set to Warning. This might lead to non-deterministic model execution.	Set Configuration parameter “Context-dependent inputs” to Error.

### See Also

Function-Call Subsystem

## Check Data Store Memory blocks for multitasking, strong typing, and shadowing issues

**Check ID:** `mathworks.design.DataStoreMemoryBlkIssue`

Look for modeling issues related to Data Store Memory blocks.

### Description

Checks for multitasking data integrity, strong typing, and shadowing of data stores of higher scope.

## Results and Recommended Actions

Condition	Recommended Action
The <b>Duplicate data store names</b> check is set to none or warning.	Consider setting the “Duplicate data store names” check to error in the Configuration Parameters dialog box, on the <b>Diagnostics &gt; Data Validity</b> pane.
The data store variable names are not strongly typed in one of the following: <ul style="list-style-type: none"> <li>• <b>Signal Attributes</b> pane of the <b>Block Parameters</b> dialog for the Data Store Memory block</li> <li>• Global data store name</li> </ul>	Specify a data type other than auto by taking one of the following actions: <ul style="list-style-type: none"> <li>• Choose a data type other than Inherit: auto on the <b>Signal Attributes</b> pane of the <b>Block Parameters</b> dialog for the Data Store Memory block.</li> <li>• If you are using a global data store name, then specify its data type in the Simulink.Signal object.</li> </ul>
The <b>Multitask data store</b> check is set to none or warning.	Consider setting the “Multitask data store” check to error in the Configuration Parameters dialog box, on the <b>Diagnostics &gt; Data Validity</b> pane.

## Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

### See Also

- “Local and Global Data Stores”

- Data Store Write
- “Duplicate data store names”
- “Multitask data store”
- “Model Advisor Exclusion Overview” (Simulink Check)

## Check if read/write diagnostics are enabled for data store blocks

**Check ID:** `mathworks.design.DiagnosticDataStoreBlk`

For data store blocks in the model, enable the read-and-write diagnostics order checking to detect run-time issues.

### Description

Check for the read-and-write diagnostics order checking. By enabling the read-and-write diagnostics, you detect potential run-time issues.

## Results and Recommended Actions

Condition	Recommended Action
The <b>Detect read before write</b> check is disabled.	Consider enabling “Detect read before write” in the Configuration Parameter dialog box <b>Diagnostics&gt; Data Validity</b> pane.
The <b>Detect write after read</b> check is disabled.	Consider enabling “Detect write after read” in the Configuration Parameter dialog box <b>Diagnostics&gt; Data Validity</b> pane.
The <b>Detect write after write</b> check is disabled.	Consider enabling “Detect write after write” in the Configuration Parameter dialog box <b>Diagnostics&gt; Data Validity</b> pane.

## Capabilities and Limitations

Exclude blocks and charts from this check if you have a Simulink Check license.

## Tips

- The run-time diagnostics can slow simulations down considerably. Once you have verified that Simulink does not generate warnings or errors during simulation, set them to **Disable all**.

## See Also

- “Local and Global Data Stores”
- Data Store Memory
- Data Store Read
- Data Store Write
- “Detect read before write”
- “Detect write after read”
- “Detect write after write”
- “Check for potential ordering issues involving data store access” on page 9-18
- “Model Advisor Exclusion Overview” (Simulink Check)

## Check data store block sample times for modeling errors

**Check ID:** `mathworks.design.DataStoreBlkSampleTime`

Identify modeling errors due to the sample times of data store blocks.

### Description

Check data store blocks for continuous or fixed-in-minor-step sample times.

### Results and Recommended Actions

Condition	Recommended Action
Data store blocks in your model have continuous or fixed-in-minor-step sample times.	Consider making the listed blocks discrete or replacing them with either Memory or Goto and From blocks.

### Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

### See Also

- “Local and Global Data Stores”
- Data Store Memory
- Data Store Read
- Data Store Write
- “Fixed-in-Minor-Step”
- “Model Advisor Exclusion Overview” (Simulink Check)

## Check for potential ordering issues involving data store access

**Check ID:** `mathworks.design.OrderingDataStoreAccess`

Look for read/write issues which may cause inaccuracies in the results.

### Description

During an **Update Diagram**, identify potential issues relating to read-before-write, write-after-read, and write-after-write conditions for data store blocks.

### Results and Recommended Actions

Condition	Recommended Action
Reading and writing (read-before-write or write-after-read condition) occur out of order.	Consider restructuring your model so that the Data Store Read block executes before the Data Store Write block.
Multiple writes occur within a single time step.	Change the model to write data only once per time step or refer to the following Tips section.

### Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

### Tips

This check performs a static analysis which might not identify every instance of improper usage. Specifically, Function-Call Subsystems, Stateflow Charts, MATLAB for code generation, For Iterator Subsystems, and For Each Subsystems can cause both missed detections and false positives. For a more comprehensive check, consider enabling the following diagnostics on the **Diagnostics > Data**

**Validity** pane in the Configuration Parameters dialog box: “Detect read before write”, “Detect write after read”, and “Detect write after write”.

### See Also

- “Local and Global Data Stores”

## Check structure parameter usage with bus signals

**Check ID:** `mathworks.design.MismatchedBusParams`

Identify blocks and `Simulink.Signal` objects that initialize bus signals by using mismatched structures.

### Description

In a model, you can use a MATLAB structure to initialize a bus signal. For example, if you pass a bus signal through a Unit Delay block, you can set the **Initial condition** parameter to a structure. For basic information about initializing buses by using structures, see “Specify Initial Conditions for Bus Elements”.

Run this check to generate efficient and readable code by matching the shape and numeric data types of initial condition structures with those of bus signals. Matching these characteristics avoids unnecessary explicit typecasts and replaces field-by-field structure assignments with, for example, calls to `memcpy`.

### Partial Structures

This check lists blocks and `Simulink.Signal` objects that initialize bus signals by using partial structures. During the iterative process of creating a model, you can use partial structures to focus on a subset of signal elements in a bus. For a mature model, use full structures to:

- Generate readable and efficient code.
- Support a modeling style that explicitly initializes unspecified signals. When you use partial structures, Simulink implicitly initializes unspecified signals.

For more information about full and partial structures, see “Create Full Structures for Initialization” and “Create Partial Structures for Initialization”.

### Data Type Mismatches

This check lists blocks and `Simulink.Signal` objects whose initial condition structures introduce data type mismatches. The fields of these structures have numeric data types that do not match the data types of the corresponding bus signal elements.

This check does not detect a mismatch for blocks, such as the Unit Delay block, that implicitly convert the data type of initial condition to the input signal.

When you configure an initial condition structure to appear as a tunable global structure in the generated code, avoid unnecessary explicit typecasts by matching the data types. See “Generate Tunable Initial Condition Structure for Bus Signal” (Simulink Coder).

### Results and Recommended Actions

Condition	Recommended Action
Block or signal object uses partial structure	Consider using the function <code>Simulink.Bus.createMATLABStructure</code> to create a full initial condition structure.
Data types of structure fields do not match data types of corresponding signal elements	Consider defining the structure as a <code>Simulink.Parameter</code> object, and creating a <code>Simulink.Bus</code> object to use as the data type of the bus signal and of the parameter object. To control numeric data types, use the <code>Simulink.BusElement</code> objects in the bus object.

## Check Delay, Unit Delay and Zero-Order Hold blocks for rate transition

**Check ID:** `mathworks.design.ReplaceZOHDelayByRTB`

Identify Delay, Unit Delay, or Zero-Order Hold blocks that are used for rate transition. Replace these blocks with actual Rate Transition blocks.

### Description

If a model uses Delay, Unit Delay, or Zero-Order Hold blocks to provide rate transition between input and output signals, Simulink makes a hidden replacement of these blocks with built-in Rate Transition blocks. In the compiled block diagram, a yellow symbol and the letters “RT” appear in the upper-left corner of a replacement block. This replacement can affect the behavior of the model, as follows:

- These blocks lose their algorithmic design properties to delay a signal or implement zero-order hold. Instead, they acquire rate transition behavior.
- This modeling technique works only in specific transition configurations (slow-to-fast for Delay and Unit Delay blocks, and fast-to-slow for Zero-Order Hold block). Set the block sample time to be equal to the slower rate (source for the Delay and Unit Delay blocks and destination for the Zero-Order Hold block).
- When the block sample time of a downstream or upstream block changes, these Delay, Unit Delay and Zero-Order Hold blocks might not perform rate transition. For example, setting the source

and destination sample times equal stops rate transition. The blocks then assume their original algorithmic design properties.

- The block sample time shows incomplete information about sample time rates. The block code runs at two different rates to handle data transfer. However, the block sample time and sample time color show it as a single-rate block. Tools and MATLAB scripts that use sample time information base their behavior on this information.

An alternative is to replace Delay, Unit Delay, or Zero-Order Hold blocks with actual Rate Transition blocks.

- The technique ensures unambiguous results in block behavior. Delay, Unit Delay, or Zero-Order Hold blocks act according to their algorithmic design to delay and hold signals respectively. Only Rate Transition blocks perform actual rate transition.
- Using an actual Rate Transition block for rate transition offers a configurable solution to handle data transfer if you want to specify deterministic behavior or the type of memory buffers to implement.

Use this check to identify instances in your model where Delay, Unit Delay or Zero-Order Hold blocks undergo hidden replacement to provide rate transition between signals. Click **Upgrade Model** to replace these blocks with actual Rate Transition blocks.

### Results and Recommended Actions

Condition	Recommended Action
Model has no instances of Delay, Unit Delay, or Zero-Order Hold blocks used for rate transition.	No action required.
Model has instances of Delay, Unit Delay, or Zero-Order Hold blocks used for rate transition.	<p>The check identifies these instances and allows you to upgrade the model.</p> <ol style="list-style-type: none"> <li>1 Click <b>Upgrade Model</b> to replace with actual Rate Transition blocks.</li> <li>2 Save changes to your model.</li> </ol>

If you do not choose to replace the Delay, Unit Delay, and/or Zero-Order Hold blocks with actual Rate Transition blocks, Simulink continues to perform a hidden replacement of these blocks with built-in rate transition blocks.

### Capabilities and Limitations

You can:

- Run this check on your library models.
- Exclude blocks and charts from this check if you have a Simulink Check license.

### See Also

- “Run Model Advisor Checks”
- “Model Upgrades”
- Rate Transition
- “Model Advisor Exclusion Overview” (Simulink Check)

## Check for calls to `slDataTypeAndScale`

**Check ID:** `mathworks.design.CallsSlDataTypeAndScale`

Identify calls to the internal function `slDataTypeAndScale`.

### Description

In some previous versions of Simulink, opening a model that had been saved in an earlier version triggers an automatic upgrade to code for data type handling. The automatic upgrade inserts calls to the internal function `slDataTypeAndScale`. Although Simulink continues to support some uses of the function, if you eliminate calls to it, you get cleaner and faster code.

Simulink does not support calls to `slDataTypeAndScale` when:

- The first argument is a `Simulink.AliasType` object.
- The first argument is a `Simulink.NumericType` object with property `IsAlias` set to true.

Running **Check for calls to `slDataTypeAndScale`** identifies calls to `slDataTypeAndScale` that are required or recommended for replacement. In most cases, running the check and following the recommended action removes the calls. You can ignore calls that remain. Run the check unless you are sure there are not calls to `slDataTypeAndScale`.

### Results and Recommended Actions

Condition	Recommended Action
Required Replacement Cases	Manually or automatically replace calls to <code>slDataTypeAndScale</code> . Cases listed require you to replace calls to <code>slDataTypeAndScale</code> .
Recommended Replacement Cases	For the listed cases, it is recommended that you manually or automatically replace calls to <code>slDataTypeAndScale</code> .
Manual Inspection Cases	Inspect each listed case to determine whether it should be manually upgraded.

### Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

### Tips

- Do not manually insert a call to `slDataTypeAndScale` into a model. The function was for internal use only.
- Running **Check for calls to `slDataTypeAndScale`** calls the Simulink function `slRemoveDataTypeAndScale`. Calling this function directly provides a wider range of conversion options. However, you very rarely need more conversion options.

### See Also

- For more information about upgrading data types and scales, in the MATLAB Command Window, execute the following:

- `help slDataTypeAndScale`
- `help slRemoveDataTypeAndScale`
- “Model Advisor Exclusion Overview” (Simulink Check)

## Check bus signals treated as vectors

**Check ID:** `mathworks.design.BusTreatedAsVector`

Identify bus signals that Simulink treats as vectors.

### Description

You cannot use bus signals that the Simulink software implicitly converts to vectors. Instead, either insert a Bus to Vector conversion block between the bus signal and the block input port that it feeds, or use the `Simulink.BlockDiagram.addBusToVector` command.

### Results and Recommended Actions

Condition	Recommended Action
Bus signals are implicitly converted to vectors.	Use <code>Simulink.BlockDiagram.addBusToVector</code> or insert a Bus to Vector block.
Model is not configured to identify bus signals that Simulink treats as vectors.	In the Configuration Parameters dialog box, on the <b>Diagnostics &gt; Connectivity</b> pane, set <b>Bus signal treated as vector</b> to error.

### Action Results

Clicking **Modify** inserts a Bus to Vector block at the input ports of blocks that implicitly convert bus signals to vectors.

### Tips

- Run this check before running **Check consistency of initialization parameters for Output and Merge blocks**.
- For more information, see “Identify Automatic Bus Conversions”.

### See Also

- “Identify Automatic Bus Conversions”
- Bus to Vector block
- “Bus signal treated as vector”
- “Migrating to Simplified Initialization Mode Overview” on page 9-4
- `Simulink.BlockDiagram.addBusToVector`

## Check for potentially delayed function-call subsystem return values

**Check ID:** `mathworks.design.DelayedFcnCallSubsys`

Identify function-call return values that might be delayed because Simulink software inserted an implicit Signal Conversion block.

### Description

So that signals reside in contiguous memory, Simulink software can automatically insert an implicit Signal Conversion block in front of function-call initiator block input ports. This can result in a one-step delay in returning signal values from calling function-call subsystems. The delay can be avoided by ensuring the signal originates from a signal block within the function-call system. Or, if the delay is acceptable, insert a Unit Delay block in front of the affected input ports.

### Results and Recommended Actions

Condition	Recommended Action
The listed block input ports could have an implicit Signal Conversion block.	Decide if a one-step delay in returning signal values is acceptable for the listed signals. <ul style="list-style-type: none"> <li>• If the delay is not acceptable, rework your model so that the input signal originates from within the calling subsystem.</li> <li>• If the delay is acceptable, insert a Unit Delay block in front of each listed input port.</li> </ul>

### Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

### See Also

Signal Conversion block

Unit Delay block

“Model Advisor Exclusion Overview” (Simulink Check)

## Identify block output signals with continuous sample time and non-floating point data type

**Check ID:** `mathworks.design.OutputSignalSampleTime`

Find continuous sample time, non-floating-point output signals.

### Description

Non-floating-point signals might not represent continuous variables without loss of information.

## Results and Recommended Actions

Condition	Recommended Action
Signals with continuous sample times have a non-floating-point data type.	On the identified signals, either change the sample time to be discrete or fixed-in-minor-step ([0 1]).

## Capabilities and Limitations

If you have a Simulink Check license, you can exclude blocks and charts from this check.

## See Also

“What Is Sample Time?”.

“Model Advisor Exclusion Overview” (Simulink Check)

## Check usage of Merge blocks

**Check ID:** `mathworks.design.MergeBlkUsage`

Identify Merge blocks with parameter settings that can lead to unexpected behavior, and help migrate your model to simplified initialization mode.

---

**Note** Run this check along with the other checks in the “Migrating to Simplified Initialization Mode Overview” on page 9-4.

---

## Description

Simplified initialization mode was introduced in R2008b to improve the consistency of simulation results. For more information, see “Simplified Initialization Mode” and “Classic Initialization Mode”.

This Model Advisor check identifies settings in the Merge blocks in your model that can cause problems if you use classic initialization mode. It also recommends settings for consistent behavior of Merge blocks. The results of the subchecks contain two types of statements: Failed and Warning. Failed statements identify issues that you must address manually before you can migrate the model to the simplified initialization mode. Warning statements identify issues or changes in behavior that can occur after migration.

## Results and Recommended Actions

Condition	Recommended Action
Check the run-time diagnostic setting of the Merge block.	<ol style="list-style-type: none"> <li>1 In the Configuration Parameters dialog box, set “Detect multiple driving blocks executing at the same time step” to <code>error</code>.</li> <li>2 Verify that the model simulates without errors before running this check again.</li> </ol>

Condition	Recommended Action
Check for Model blocks that are using the PIL simulation mode.	The simplified initialization mode does not support the Processor-in-the-loop (PIL) simulation for model references.
Check for library blocks with instances that cannot be migrated.	Examine the failed subcheck results for each block to determine the corrective actions.
Check for single-input Merge blocks.	<p>Replace both the Mux block used to produce the input signal and the Merge block with one multi-input Merge block.</p> <p>Single-input Merge blocks are not supported in the simplified initialization mode.</p>
Check for root Merge blocks that have an unspecified <b>Initial output</b> value.	<p>If you do not specify an explicit value for the <b>Initial output</b> parameter of root Merge blocks, then Simulink uses the default initial value of the output data type.</p> <p>A root Merge block is a Merge block with an output port that does not connect to another Merge block. For information on the default initial value, see “Initialize Signal Values”.</p>
Check for Merge blocks with nonzero input port offsets.	<p>Clear the <b>Allow unequal port widths</b> parameter of the Merge block.</p> <hr/> <p><b>Note</b> Consider using Merge blocks only for signal elements that require true merging. You can combine other elements with merged elements using the Concatenate block.</p>
Check for Merge blocks that have unconnected inputs or that have inputs from non-conditionally executed subsystems.	<p>Set the <b>Number of inputs</b> parameter of the Merge block to the number of Merge block inputs. You must connect each input to a signal.</p> <p>Verify that each Merge block input is driven by a conditionally executed subsystem. Merge blocks cannot be driven directly by an Iterator Subsystem or a block that is not a conditionally executed subsystem.</p>
Check for Merge blocks with inputs that are combined or reordered outside of conditionally executed subsystems.	Verify that combinations or reordering of Merge block input signals takes place within a conditionally executed subsystem. Such designs may use Mux, Bus Creator, or Selector blocks.
Check for Merge blocks with multiple input ports that are driven by a single source.	Verify that the Merge block does not have multiple input signals that are driven by the same conditionally executed subsystem or conditionally executed Model block.

Condition	Recommended Action
Check for Merge blocks that use signal objects to specify the <b>Initial output</b> value.	<p>Verify that the following behavior is acceptable.</p> <p>In the simplified initialization mode, signal objects cannot specify the <b>Initial output</b> parameter of the Merge block. While you can still initialize the output signal for a Merge block using a signal object, the initialization result may be overwritten by that of the Merge block.</p> <hr/> <p><b>Note</b> Simulink generates a warning that the initial value of the signal object has been ignored.</p>

### See Also

- “Migrating to Simplified Initialization Mode Overview” on page 9-4
- “Model Advisor Exclusion Overview” (Simulink Check)

## Check usage of Outport blocks

**Check ID:** `mathworks.design.InitParamOutportMergeBlk`

Identify Outport blocks and conditional subsystems with parameter settings that can lead to unexpected behavior, and help migrate your model to simplified initialization mode.

---

**Note** Run this check along with the other checks in the “Migrating to Simplified Initialization Mode Overview” on page 9-4.

---

### Description

Simplified initialization mode was introduced in R2008b to improve the consistency of simulation results. This mode is especially important for models that do not specify initial conditions for conditionally executed subsystem output ports. For more information, see “Simplified Initialization Mode” and “Classic Initialization Mode”.

This Model Advisor check identifies Outport blocks and conditional subsystems in your model that can cause problems if you use the simplified initialization mode. It also recommends settings for consistent behavior of Outport blocks. The results of the subchecks contain two types of statements: Failed and Warning. Failed statements identify issues that you must address manually before you can migrate the model to the simplified initialization mode. Warning statements identify issues or changes in behavior that can occur after migration.

## Results and Recommended Actions

Condition	Recommended Action
<p>Check for blocks inside of the Iterator Subsystem that require elapsed time.</p>	<p>Within an Iterator Subsystem hierarchy, do not use blocks that require a service that maintains the time that has elapsed between two consecutive executions.</p> <p>Since an Iterator Subsystem can execute multiple times at a given time step, the concept of elapsed time is not well-defined between two such executions. Using these blocks inside of an Iterator Subsystem can cause unexpected behavior.</p>
<p>Check for Outport blocks that have conflicting signal buffer requirements.</p>	<p>The Outport block has a function-call trigger or function-call data dependency signal passing through it, along with standard data signals. Some of the standard data signals require an explicit signal buffer for the initialization of the output signal of the corresponding subsystem. However, buffering function-call related signals lead to a function-call data dependency violation.</p> <p>Consider modifying the model to pass function-call related signals through a separate Outport block. For examples of function-call data dependency violations, see “Simulink Subsystem Semantics” on page 13-371.</p> <p>A standard data signal may require an additional signal copy for one of the following reasons:</p> <ul style="list-style-type: none"> <li>• The Outport block is driven by a block with output that cannot be overwritten. The Ground block and the Constant block are examples of such blocks.</li> <li>• The Outport block shares the same signal source with another Outport block in the same subsystem or in one nested within the current subsystem but having a different initial output value.</li> <li>• The Outport block connects to the input of a Merge block</li> <li>• One of the input signals of the Outport block is specifying a <code>Simulink.Signal</code> object with an explicit initial value.</li> </ul>

Condition	Recommended Action
Check for Outport blocks that are driven by a bus signal and whose <b>Initial output</b> value is not scalar.	For Outport blocks driven by bus signals, classic initialization mode does not support Initial Condition (IC) structures, while simplified initialization mode does. Hence, when migrating a model from classic to simplified mode, specify a scalar for the <b>Initial Output</b> parameter. After migration completes, to specify different initial values for different elements of the bus signal, use IC structures. For more information, see "Create Initial Condition Structures".
Check for Outport blocks that require an explicit signal copy.	<p>An explicit copy of the bus signal driving the Outport block is required for the initialization of the output signal of the corresponding subsystem. Insert a Signal Conversion block before the Outport block, then set the <b>Output</b> parameter of the Signal Conversion block to <b>Bus copy</b>.</p> <p>A standard data signal may require an additional signal copy for one or more of the following reasons:</p> <ul style="list-style-type: none"> <li>• A block with output that cannot be overwritten is driving the Outport block. The Ground block and the Constant block are examples of such blocks.</li> <li>• The Outport block shares the same signal source with another Outport block in the same subsystem or in one nested within the current subsystem but having a different initial output value.</li> <li>• The Outport block connects to the input of a Merge block</li> <li>• One of the input signals of the Outport block is specifying a <code>Simulink.Signal</code> object with an explicit initial value.</li> </ul>
Check for merged Outport blocks that inherit the <b>Initial Output</b> value from Outport blocks that have been configured to reset when the blocks become disabled.	When Outport blocks are driving a Merge block, do not set their <b>Output when disabled</b> parameters to <b>reset</b> .
Check for merged Outport blocks that are driven by nested conditionally executed subsystems.	Determine if the new behavior of the Outport blocks is acceptable. If it is not acceptable, modify the model to account for the new behavior before migrating to the simplified initialization mode.

Condition	Recommended Action
Check for merged Outport blocks that reset when the blocks are disabled.	<p>Set the <b>Output when disabled</b> parameter of the Outport block to <code>held</code>. This setting is required because the Outport block connects to a Merge block.</p> <p>For more information, see <a href="#">Outport</a>.</p>
Check for Outport blocks that have an undefined <b>Initial output</b> value with invalid initial condition sources.	<p>Verify that the following behavior is acceptable.</p> <p>When the <b>Initial output</b> parameter is unspecified (<code>[]</code>), it inherits the initial output from the source blocks. If at least one of the sources of the Outport block is not a valid source to inherit the initial value, the block uses the default initial value for that data type.</p> <p>For simplified initialization mode, valid sources an Outport blocks can inherit the <b>Initial output</b> value from are: Constant, Initial Condition, Merge (with initial output), Stateflow chart, function-call model reference, or conditionally executed subsystem blocks.</p>
Check Outport blocks that have automatic rate transitions.	<p>Simulink has inserted a Rate Transition block at the input of the Outport block. Specify the <b>Initial output</b> parameter for each Outport block.</p> <p>Otherwise, perform the following procedure:</p> <ol style="list-style-type: none"> <li><b>1</b> In the Configuration Parameters dialog box, on the <b>Solver</b> pane, clear the option “Automatically handle rate transition for data transfer”.</li> <li><b>2</b> Run this Model Advisor check again.</li> </ol>
Check Outport blocks that have a special signal storage requirement and have an undefined <b>Initial output</b> value.	<p>Verify that the following behavior is acceptable.</p> <p>Specify the <b>Initial output</b> parameter for the Outport block. Set this value to <code>[]</code> (empty matrix) to use the default initial value of the output data type.</p>
Check the <b>Initial output</b> setting of Outport blocks that reset when they are disabled.	<p>Specify the <b>Initial output</b> parameter of the Outport block.</p> <p>You must specify the <b>Initial output</b> value for blocks that are configured to reset when they become disabled.</p>

Condition	Recommended Action
Check the <b>Initial output</b> setting for Outport blocks that pass through a function-call data dependency signal.	<p>You cannot specify an <b>Initial output</b> value for the Outport block because function-call data dependency signals are passing through it. To set the <b>Initial output</b> value:</p> <ol style="list-style-type: none"> <li><b>1</b> Set the <b>Initial output</b> parameter of the Outport block to [ ].</li> <li><b>2</b> Provide the initial value at the source of the data dependency signal rather than at the Outport block.</li> </ol>
Check for Outport blocks that use signal objects to specify the <b>Initial output</b> value.	<p>Verify that the following behavior is acceptable.</p> <p>In the simplified initialization mode, signal objects cannot specify the <b>Initial output</b> parameter of an Outport block. You can still initialize the input or output signals for an Outport block using signal objects, but the initialization results may be overwritten by those of the Outport block.</p> <p><b>Note</b> If you are working with a conditionally executed subsystem Outport block, Simulink generates a warning that the initial value of the signal object has been ignored.</p>
Check for library blocks with instances that have warnings.	Examine the warning subcheck results for each block before migrating to the simplified initialization mode.
Check for merged Outport blocks that are either unconnected or connected to a Ground block.	<p>Verify that the following behavior is acceptable.</p> <p>The Outport block is driving a Merge block, but its inputs are either unconnected or connected to Ground blocks. In the classic initialization mode, unconnected or grounded outputs do not update the merge signal even when their parent conditionally executed subsystems are executing. In the simplified initialization mode, however, these outputs will update the merge signal with a value of zero when their parent conditionally executed subsystems are executing.</p>

Condition	Recommended Action
<p>Check for Outport blocks that obtain the <b>Initial output</b> value from an input signal when they are migrated.</p>	<p>Verify that the following behavior is acceptable.</p> <p>The <b>Initial output</b> parameter of the Outport block is not specified. As a result, the simplified initialization mode will assume that the <b>Initial output</b> value for the Outport block is derived from the input signal. This assumption may result in different initialization behavior.</p> <p>If this behavior is not acceptable, modify your model before you migrate to the simplified initialization mode.</p>
<p>Check for outer Outport blocks that have an explicit <b>Initial output</b>.</p>	<p>Verify that the following behavior is acceptable.</p> <p>In classic initialization mode, the <b>Initial output</b> and <b>Output when disabled</b> parameters of the Outport block must match those of their source Outport blocks.</p> <p>In simplified initialization mode, Simulink sets the <b>Initial output</b> parameter of outer Outport blocks to [ ] (empty matrix) and <b>Output when disabled</b> parameter to held.</p>
<p>Check for blocks that read input from conditionally executed subsystems during initialization.</p>	<p>Verify that the following behavior is acceptable.</p> <p>Some blocks, such as the Discrete-Time Integrator block, read their inputs from conditionally executed subsystems during initialization in the classic initialization mode. Simulink performs this step as an optimization technique.</p> <p>This optimization is not allowed in the simplified initialization mode because the output of a conditionally executed subsystem at the first time step after initialization may be different than the initial value declared in the corresponding Outport block. In particular, this discrepancy occurs if the subsystem is active at the first time step.</p>

Condition	Recommended Action
<p>Check for a migration conflict for Outport blocks that use a Dialog as the <b>Source of initial output value</b>.</p>	<p>Other instances of Outport blocks with the same library link either cannot be migrated or are being migrated in a different manner. Review the results from the <b>Check for library blocks with instances that cannot be migrated</b> to learn about the different migration paths for other instances of each Outport block.</p> <p>The Outport block will maintain its current settings and use its specified <b>Initial output value</b>.</p>
<p>Check for a migration conflict for Outport blocks that use Input signal as the <b>Source of initial output value</b>.</p>	<p>Other instances of Outport blocks with the same library link either cannot be migrated or are being migrated in a different manner. Review the results from the <b>Check for library blocks with instances that cannot be migrated</b> to learn about the different migration paths for other instances of each Outport block.</p> <p>The Outport block currently specifies an <b>Initial output</b> of [ ] (empty matrix), and the <b>Output when disabled</b> as held. This means that each output does not perform initialization, but implicitly relies on source blocks to initialize its input signal.</p> <p>After migration, the parameter <b>Source of initial output value</b> will be set to Input signal to reflect this behavior.</p>
<p>Check for a migration conflict for Outport blocks that have SimEvents semantics.</p>	<p>Other instances of Outport blocks with the same library link either cannot be migrated or are being migrated in a different manner. Review the results from the <b>Check for library blocks with instances that cannot be migrated</b> to learn about the different migration paths for other instances of each Outport block.</p> <p>The Outport blocks will continue to use an <b>Initial output</b> value of [ ] (empty matrix) and an <b>Output when disabled</b> setting of held. Simulink will maintain these settings because their parent conditionally executed subsystems are connected to SimEvents blocks.</p>

Condition	Recommended Action
Check for a migration conflict for innermost Outport blocks with variable-size input and unspecified <b>Initial output</b> .	<p>For these Outport blocks, the signal size varies only when the parent subsystem of the block is re-enabled. Therefore, Simulink implicitly assumes that the <b>Initial output</b> parameter is equal to 0, even though the parameter is unspecified, []. Consequently, unless you specify the parameter, the Model Advisor will explicitly set the parameter to 0 when the model is migrated to the simplified initialization mode.</p> <p>Other instances of Outport blocks with the same library link either cannot be migrated or are being migrated in a different manner. Review the results from the <b>Check for library blocks with instances that cannot be migrated</b> to learn about the different migration paths for other instances of each Outport block.</p>
Check for a migration conflict for Outport blocks that use a default ground value as the Initial output.	The parameter <b>Initial output</b> is set to [] (empty matrix) and the source of the Outport is an invalid initial condition source. Thus, the block uses the default initial value as the initial output in the simplified initialization mode. Other instances of Outport blocks with the same library link either have errors or are being migrated differently.
Check for a migration conflict for merged Outport blocks without explicit specification of <b>Initial output</b> .	Review the results from the subcheck <b>Check for library blocks with instances that cannot be migrated</b> to learn about different migration paths for other instances of each Outport block. For the remaining Outport blocks, <b>Initial output</b> is set to [] (empty matrix) and <b>Output when disabled</b> is set to held respectively, in simplified initialization mode.
