Risk Management Toolbox™ Release Notes

© COPYRIGHT 2016–2023 by The MathWorks, Inc.

The software described in this document is furnished under a license agreement. The software may be used or copied only under the terms of the license agreement. No part of this manual may be photocopied or reproduced in any form without prior written consent from The MathWorks, Inc.

FEDERAL ACQUISITION: This provision applies to all acquisitions of the Program and Documentation by, for, or through the federal government of the United States. By accepting delivery of the Program or Documentation, the government hereby agrees that this software or documentation qualifies as commercial computer software or commercial computer software documentation as such terms are used or defined in FAR 12.212, DFARS Part 227.72, and DFARS 252.227-7014. Accordingly, the terms and conditions of this Agreement and only those rights specified in this Agreement, shall pertain to and govern the use, modification, reproduction, release, performance, display, and disclosure of the Program and Documentation by the federal government (or other entity acquiring for or through the federal government) and shall supersede any conflicting contractual terms or conditions. If this License fails to meet the government's needs or is inconsistent in any respect with federal procurement law, the government agrees to return the Program and Documentation, unused, to The MathWorks, Inc.

Trademarks

MATLAB and Simulink are registered trademarks of The MathWorks, Inc. See www.mathworks.com/trademarks for a list of additional trademarks. Other product or brand names may be trademarks or registered trademarks of their respective holders.

Patents

MathWorks products are protected by one or more U.S. patents. Please see www.mathworks.com/patents for more information.

R2023a

Lifetime Probability of Default: Cox model support for discard residuals and tie break method	1-2
Example: Transition scenarios for analyzing climate-related financial risks	1-2
Credit Scorecard Example: Explainability for credit scorecard models ..	1-2
Modelscape: Manage financial models throughout a lifecycle	1-2
Credit Models: Name change for PD, LGD, and EAD functions for modelAccuracy and modelAccuracyPlot	1-3
PD Credit Models: Name change for Logistic, Probit, and Cox property from Model to UnderlyingModel	1-3

R2022b

Credit Models: Custom PD models	2-2
Examples: Climate change and credit risk	2-2
Credit Scorecard Examples: Fairness mitigation	2-2
Lifetime Credit Risk Analysis: Beta regression for LGD and EAD models	2-2

R2022a

Lifetime Credit Risk Analysis: Calculate lifetime expected credit loss ...	3-2
ECL Example: Calculate lifetime ECL using Econometrics Toolbox	3-2
Credit Scorecard Example: Explore fairness metrics for bias	3-2

Lifetime Credit Risk Analysis: Updates to credit models	3-2
--	------------

R2021b

Lifetime Credit Risk Analysis: Exposure at default (EAD) models	4-2
Deep Learning Examples: Credit risk analysis using Deep Learning Toolbox	4-2
Insurance Example: Mean square error of prediction (MSEP) for estimated ultimate claims	4-2
Insurance Example: Bootstrap using chain ladder method to estimate ultimate claims	4-2
Live Editor Task: Predictor screening	4-2
Lifetime Credit Risk Analysis: Cox lifetime probability of default (PD) model	4-2

R2021a

Lifetime Credit Risk Analysis: Create Loss Given Default (LGD) models	5-2
Binning Explorer app: New user interface design for improved usability and performance	5-2
Lifetime Credit Risk Analysis: Plot discrimination and accuracy of lifetime probability of default (PD) models	5-2
Insurance Analysis: Plot link ratios and claims for development triangles	5-2
Insurance Analysis: Estimate unpaid claims using Cape Cod technique	5-2

R2020b

Market Risk: Backtest expected shortfall (ES) models using minimally biased Acerbi-Szekely tests	6-2
---	------------

Market Risk: Expected shortfall (ES) model VaR level extended to 99.9%	6-2
Lifetime Credit Analysis: Probability of default models and examples ...	6-2
Insurance Analysis: Chain ladder, expected claims, and Bornhuetter-Ferguson techniques for analyzing insurance claims reserves	6-2

R2020a

Consumer Credit Risk: Screen credit scorecard predictors on data that is too big to fit in memory using tall Arrays	7-2
Random number generation for credit copula classes has changed	7-2

R2019b

Market Risk: Backtest expected shortfall (ES) models using Du and Escanciano tests	8-2
Consumer Credit Risk: Validation of compact credit scorecards using validateModel	8-2
Credit Scorecard: Example comparing credit score using logistic regression and decision trees	8-2
Credit Scorecard: Example using reject inference to incorporate credit rejection data into creditscorecard workflow	8-2
Consumer Credit Risk: Example comparing probability of default using through-the-cycle and point-in-time models	8-2
Consumer Credit Risk: Example fitting different types of models to loss given default (LGD) data	8-3
Calculation of p-value for bin has changed	8-3

R2019a

Consumer Credit Risk: Predictor screening for credit scorecards	9-2
--	-----

Consumer Credit Risk: Support for compact credit scorecards for easier deployment and reduced memory usage	9-2
---	------------

R2018b

Binning Explorer: Bin data automatically using merge and split algorithms	10-2
Binning Explorer: Bin missing data in a separate bin	10-2
Binning Explorer: Load data from the command line	10-2
Corporate Credit Risk: Perform parallel simulations using creditDefaultCopula and creditMigrationCopula	10-2
creditCopula object removed	10-2

R2018a

Corporate Credit Risk: Calculate standard deviation and value-at-risk contributions for each counterparty in a credit portfolio	11-2
--	-------------

R2017b

Corporate Credit Risk: Compute regulatory capital and value-at-risk using an asymptotic single risk factor (ASRF) model	12-2
Corporate Credit Risk: Perform credit portfolio simulation with random loss given default (LGD)	12-2
Market Risk: Backtest expected shortfall models	12-2
Consumer Credit Risk: Specify weights in credit scorecards using Binning Explorer	12-2
creditCopula object renamed	12-3

R2017a

Corporate Credit Risk: Estimate the probability of credit rating migration based on multifactor copula model	13-2
Corporate Credit Risk: Quantify credit concentration risk by Herfindahl index and other concentration measures	13-2
Corporate Credit Risk: Model corporate default risk using Merton model	13-2
creditCopula object renamed	13-2

R2016b

Consumer Credit Risk: Binning Explorer for Credit Scorecards	14-2
Corporate Credit Risk: Copula-based simulation framework	14-2
Market Risk: Value-at-Risk Backtesting Tools	14-2

R2023a

Version: 2.2

New Features

Bug Fixes

Compatibility Considerations

Lifetime Probability of Default: Cox model support for discard residuals and tie break method

The Cox model for lifetime probability of default (PD) has a function (`discardResiduals`) to discard residuals. Also, the Cox model has a new name-value argument `TieBreakMethod` to specify a method to handle tied default times.

Example: Transition scenarios for analyzing climate-related financial risks

The “Analyze Transition Scenarios for Climate-Related Financial Risks” example demonstrates how climate changes impact financial systems, with a focus on Canada and the United States.

Credit Scorecard Example: Explainability for credit scorecard models

The “Interpretability and Explainability for Credit Scoring” example shows different interpretability techniques applied to a credit scoring model.

Modelscope: Manage financial models throughout a lifecycle

You can now implement workflows for creating, documenting, validating, deploying, and managing financially regulated models and associated data using Modelscope™. Modelscope supports models that you built in MATLAB®, Python®, R, SAS®, and other programming languages.

To host Modelscope for your organization, contact MathWorks Consulting Services.

After you set up Modelscope, follow these steps to use it with MATLAB R2023a:

- 1 Download the Support Software Downloader from Download Hardware Support Packages and Optional Features.
- 2 Run the Support Software Downloader.
- 3 Install Modelscope for MATLAB.

To learn about Modelscope, see “Get Started with Modelscope”.

For information about the workflow tools that Modelscope supports, see these pages:

- “Modelscope Governance”
- “Modelscope Develop”
- “Modelscope Validate”
- “Modelscope Test”
- “Modelscope Deploy”
- “Extensibility”

Use these live editor tasks to work with risk factors using the Modelscope for MATLAB support package:

- Remove Risk Factors
- Screen Risk Factors

Credit Models: Name change for PD, LGD, and EAD functions for modelAccuracy and modelAccuracyPlot

The modelAccuracy and modelAccuracyPlot functions for PD, LGD, and EAD models are renamed to modelCalibration and modelCalibrationPlot. The use of modelAccuracy and modelAccuracyPlot functions is discouraged.

Compatibility Considerations

Function	Compatibility Considerations
For PD: modelAccuracy	modelAccuracy is renamed to modelCalibration. modelAccuracy is not recommended. Use modelCalibration instead.
For PD: modelAccuracyPlot	modelAccuracyPlot is renamed to modelCalibrationPlot. modelAccuracyPlot is not recommended. Use modelCalibrationPlot instead.
For LGD: modelAccuracy	modelAccuracy is renamed to modelCalibration. modelAccuracy is not recommended. Use modelCalibration instead.
For LGD: modelAccuracyPlot	modelAccuracyPlot is renamed to modelCalibrationPlot. modelAccuracyPlot is not recommended. Use modelCalibrationPlot instead.
For EAD: modelAccuracy	modelAccuracy is renamed to modelCalibration. modelAccuracy is not recommended. Use modelCalibration instead.
For EAD: modelAccuracyPlot	modelAccuracyPlot is renamed to modelCalibrationPlot. modelAccuracyPlot is not recommended. Use modelCalibrationPlot instead.

PD Credit Models: Name change for Logistic, Probit, and Cox property from Model to UnderlyingModel

The Model property for Logistic, Probit, and Cox PD models is renamed to UnderlyingModel.

Compatibility Considerations

PD Model	Compatibility Considerations
Logistic	Model property is renamed to UnderlyingModel. The use of Model is discouraged.
Probit	Model property is renamed to UnderlyingModel. The use of Model is discouraged.
Cox	Model property is renamed to UnderlyingModel. The use of Model is discouraged.

R2022b

Version: 2.1

New Features

Bug Fixes

Credit Models: Custom PD models

Support for custom probability of default (PD) models using `customLifetimePDModel`. After creating a `customLifetimePDModel` object, you can use the following PD functions:

- `predict`
- `predictLifetime`
- `modelDiscrimination`
- `modelDiscriminationPlot`
- `modelAccuracy`
- `modelAccuracyPlot`

For examples using `customLifetimePDModel`, see [Create Custom Lifetime PD Model for Credit Scorecard Model with Function Handle](#) and [Create Custom Lifetime PD Model for Decision Tree Model with Function Handle](#).

Examples: Climate change and credit risk

The [Measure Transition Risk for Loan Portfolios with Respect to Climate Scenarios](#) example demonstrates how different climate scenarios change the market shares of different energy sectors in different geographies.

The [Assess Physical and Transition Risk for Mortgages](#) example shows an approach to assess physical and transition risks for mortgages. Physical and transition risks are the two main categories of climate change risks.

Credit Scorecard Examples: Fairness mitigation

The [Bias Mitigation in Credit Scoring by Reweighting](#) example shows how to remove bias from a credit scorecard model to make it fair by using the bias mitigation process.

The [Bias Mitigation in Credit Scoring by Disparate Impact Removal](#) example shows how to reduce bias in a credit scorecard model by using disparate impact removal as a preprocessing technique.

Lifetime Credit Risk Analysis: Beta regression for LGD and EAD models

You can use `fitLGDModel` to create a Beta model. After creating a Beta model object, you can use the following loss given default (LGD) functions:

- `predict`
- `modelDiscrimination`
- `modelDiscriminationPlot`
- `modelAccuracy`
- `modelAccuracyPlot`

You can use `fitEADModel` to create a Beta model. After creating a Beta model object, you can use the following exposure at default (EAD) functions:

- `predict`

-
- modelDiscrimination
 - modelDiscriminationPlot
 - modelAccuracy
 - modelAccuracyPlot

R2022a

Version: 2.0

New Features

Bug Fixes

Lifetime Credit Risk Analysis: Calculate lifetime expected credit loss

The lifetime expected credit loss (ECL) calculator supports `portfolioECL` to compute the ECL value at the individual or portfolio level.

ECL Example: Calculate lifetime ECL using Econometrics Toolbox

The Economic Scenarios and Expected Credit Loss Calculations example shows how to generate macroeconomic scenarios and perform expected credit loss (ECL) calculations for a portfolio of loans.

Credit Scorecard Example: Explore fairness metrics for bias

The Explore Fairness Metrics for Credit Scoring Model example demonstrates how to calculate fairness metrics for the data and model levels. The example also explores the metrics for the presence of bias.

Lifetime Credit Risk Analysis: Updates to credit models

The following updates:

- Regression and Tobit loss given default (LGD) models support a `modelDiscriminationPlot` reference LGD outside of `[0,1]` range.
- `modelDiscrimination` for probability of default (PD) models, `modelDiscrimination` for LGD models, and `modelDiscrimination` for exposure at default (EAD) models have an additional name-value pair for `ShowDetails` to indicate if the `DiscMeasure` output includes columns for `Segment` value and the `SegmentCount`.
- `modelAccuracy` for PD models has an additional column for `AccData` for `GroupCount`.

R2021b

Version: 1.10

New Features

Bug Fixes

Lifetime Credit Risk Analysis: Exposure at default (EAD) models

You can use `fitEADModel` to create a Regression or Tobit model for exposure at default. After creating a Regression or Tobit model object, you can use the following functions:

- `predict`
- `modelDiscrimination`
- `modelDiscriminationPlot`
- `modelAccuracy`
- `modelAccuracyPlot`

Deep Learning Examples: Credit risk analysis using Deep Learning Toolbox

Two examples demonstrate using Deep Learning Toolbox™ for credit risk analysis:

- The Compare Deep Learning Networks for Credit Default Prediction (Deep Learning Toolbox) example shows how to create, train, and compare three deep learning networks for predicting credit default probability.
- The Interpret and Stress-Test Deep Learning Networks for Probability of Default example shows how to train a model for credit risk for probability of default (PD) prediction using a deep neural network. The example also shows how to use locally interpretable model-agnostic explanations (LIME) and Shapley values interpretability techniques to understand the predictions of the model.

Insurance Example: Mean square error of prediction (MSEP) for estimated ultimate claims

The Mean Square Error of Prediction for Estimated Ultimate Claims example demonstrates a workflow to measure the quality of the estimated ultimate claims by calculating the MSEP.

Insurance Example: Bootstrap using chain ladder method to estimate ultimate claims

The Bootstrap Using Chain Ladder Method example demonstrates a workflow using the chain ladder bootstrap method to generate several `developmentTriangle` objects and estimate the ultimate claims.

Live Editor Task: Predictor screening

Use the Live Editor task **Threshold Predictors** to interactively set credit scorecard predictor thresholds for one or more risk metrics computed for a set of predictors, or features.

Lifetime Credit Risk Analysis: Cox lifetime probability of default (PD) model

You can perform lifetime credit analysis using `fitLifetimePDMoel` to create a Cox model for survival analysis of a lifetime probability of default model. You can then use the following functions:

-
- predict
 - predictLifetime
 - modelDiscrimination
 - modelDiscriminationPlot
 - modelAccuracy
 - modelAccuracyPlot

R2021a

Version: 1.9

New Features

Bug Fixes

Lifetime Credit Risk Analysis: Create Loss Given Default (LGD) models

You can use `fitLGDModel` to create a Regression or Tobit model for loss given default. After creating a Regression or Tobit model object, you can use the following functions:

- `predict`
- `modelDiscrimination`
- `modelDiscriminationPlot`
- `modelAccuracy`
- `modelAccuracyPlot`

Binning Explorer app: New user interface design for improved usability and performance

The **Binning Explorer** app is updated with a new user interface. The new design includes an **Overview** pane that makes the app easier to use and speeds up your workflow.

Lifetime Credit Risk Analysis: Plot discrimination and accuracy of lifetime probability of default (PD) models

You can create validation plots for lifetime PD models using `modelDiscriminationPlot` and `modelAccuracyPlot`.

Insurance Analysis: Plot link ratios and claims for development triangles

Using a `developmentTriangle` object, you can generate plots using `linkRatiosPlot` and `claimsPlot`.

Insurance Analysis: Estimate unpaid claims using Cape Cod technique

You can use `developmentTriangle` objects for reported and paid claims to create a `capeCod` object. You can then use the following functions:

- `ibnr`
- `unpaidClaims`
- `ultimateClaims`
- `summary`

R2020b

Version: 1.8

New Features

Bug Fixes

Market Risk: Backtest expected shortfall (ES) models using minimally biased Acerbi-Szekely tests

You can perform minimally biased Acerbi-Szekely tests with the `minBiasRelative` and `minBiasAbsolute` functions when using an `esbacktestbysim` object.

Market Risk: Expected shortfall (ES) model VaR level extended to 99.9%

The VaR level is extended to 99.9% for ES backtesting with an `esbacktest` object that uses precomputed tables of critical values.

Lifetime Credit Analysis: Probability of default models and examples

You can perform lifetime credit analysis using `fitLifetimePDMoDel` to create a `Logistic` or `Probit` lifetime probability of default model. You can then use the `predict`, `predictLifetime`, `modelDiscrimination`, and `modelAccuracy` functions to analyze the probability of default model. For more information, see examples:

- Compare Logistic Model for Lifetime PD to Champion Model
- Compare Lifetime PD Models Using Cross-Validation
- Expected Credit Loss (ECL) Computation

Insurance Analysis: Chain ladder, expected claims, and Bornhuetter-Ferguson techniques for analyzing insurance claims reserves

You can use a development triangle with the chain ladder technique, expected claims technique, or Bornhuetter-Ferguson technique to calculate important measures of insurance risk.

- The `developmentTriangle` object supports the following functions:
 - `view`
 - `linkRatios`
 - `linkRatioAverages`
 - `cdfSummary`
 - `ultimateClaims`
 - `fullTriangle`
- The `chainLadder` object supports the following functions:
 - `ibnr`
 - `unpaidClaims`
 - `summary`
- The `expectedClaims` object supports the following functions:
 - `ultimateClaims`
 - `ibnr`

-
- unpaidClaims
 - summary
 - The bornhuetterFerguson object supports the following functions:
 - ultimateClaims
 - ibnr
 - unpaidClaims
 - summary

R2020a

Version: 1.7

New Features

Bug Fixes

Compatibility Considerations

Consumer Credit Risk: Screen credit scorecard predictors on data that is too big to fit in memory using tall Arrays

Tall variable support for screenpredictors.

Random number generation for credit copula classes has changed

In R2019b and previous releases, when using the `creditDefaultCopula` and `creditMigrationCopula` classes to perform nonparallel simulations, the MATLAB global random number generator was used to generate scenarios.

Compatibility Considerations

In R2020a, the random number generator for the `creditDefaultCopula` and `creditMigrationCopula` classes is set to `Threefry` for both parallel and nonparallel code paths.

R2019b

Version: 1.6

New Features

Bug Fixes

Compatibility Considerations

Market Risk: Backtest expected shortfall (ES) models using Du and Escanciano tests

The following new functions provide support for performing expected shortfall (ES) backtests by Du and Escanciano:

- `esbacktestbyte`
- `summary`
- `runtests`
- `unconditionalDE`
- `conditionalDE`
- `simulate`

New examples demonstrating workflows using expected shortfall (ES) backtests by Du and Escanciano:

- Workflow for Expected Shortfall (ES) Backtesting by Du and Escanciano
- Rolling Windows and Multiple Models for Expected Shortfall (ES) Backtesting by Du and Escanciano

Consumer Credit Risk: Validation of compact credit scorecards using `validateModel`

Work with compact credit scorecards using the `compactCreditScorecard` class and then use `validateModel` to validate a compact credit scorecard.

Credit Scorecard: Example comparing credit score using logistic regression and decision trees

A new example compares credit score values using logistic regression and decision trees (Comparison of Credit Scoring Using Logistic Regression and Decision Trees).

Credit Scorecard: Example using reject inference to incorporate credit rejection data into `creditscorecard` workflow

A new example demonstrates two approaches for using reject inference techniques to incorporate credit rejection data as part of the `creditscorecard` modeling workflow (Use Reject Inference Techniques with Credit Scorecards).

Consumer Credit Risk: Example comparing probability of default using through-the-cycle and point-in-time models

A new example compares the probability of default using through-the-cycle (TTC) and point-in-time (PIT) models (Comparison of Probability of Default Using Through-the-Cycle and Point-in-Time Models).

Consumer Credit Risk: Example fitting different types of models to loss given default (LGD) data

A new example demonstrates fitting different types of models to loss given default (LGD) data (Model Loss Given Default).

Calculation of p-value for bin has changed

In R2019a and previous releases, the binomial VaR backtest reports the tail probability as the p -value and compares the reported p -value to half of the α (1- TestLevel) of the bin test.

In R2019b, the binomial VaR backtest `bin` calculates the p -value contained in the `TestResults` output using the 2*tail probability convention and the p -value can be compared to α . For more information, see Algorithms.

R2019a

Version: 1.5

New Features

Bug Fixes

Consumer Credit Risk: Predictor screening for credit scorecards

Perform predictor screening for credit scorecards using the `screenpredictors` function. For more information, see [Feature Screening with `screenpredictors`](#).

Consumer Credit Risk: Support for compact credit scorecards for easier deployment and reduced memory usage

Work with compact credit scorecards using the `compactCreditScorecard` class along with associated functions for `displaypoints`, `score`, and `probdefault`. In addition, you can create a compact credit scorecard by using the `compact` function from [Financial Toolbox™](#) with a `creditscorecard` object. For more information, see [compactCreditScorecard Object Workflow and Validate the Quality of a Compact Credit Scorecard Model](#).

R2018b

Version: 1.4

New Features

Bug Fixes

Compatibility Considerations

Binning Explorer: Bin data automatically using merge and split algorithms

The Binning Explorer app supports the merge and split algorithms. For more information, see **Binning Explorer**.

Binning Explorer: Bin missing data in a separate bin

The **Binning Explorer** app supports binning missing data for a predictor in a separate <missing> bin. For more information, see **Binning Explorer**.

Binning Explorer: Load data from the command line

The Binning Explorer app supports loading data or a `creditscorecard` object from the command line. For more information, see **Binning Explorer**.

Corporate Credit Risk: Perform parallel simulations using `creditDefaultCopula` and `creditMigrationCopula`

The `creditDefaultCopula` and `creditMigrationCopula` classes support the 'UseParallel' property for parallel simulations when using the `simulate` and `riskContributions` functions. You can set the 'UseParallel' property when creating `creditDefaultCopula` or `creditMigrationCopula` objects only if you have Parallel Computing Toolbox™.

`creditCopula` object removed

The `creditCopula` object is removed.

Compatibility Considerations

Object Name	What Happens When You Use It	Use This Instead	Compatibility Considerations
<code>creditCopula</code>	Removed	<code>creditDefaultCopula</code>	Replace all instances of <code>creditCopula</code> object with a <code>creditDefaultCopula</code> object using <code>creditDefaultCopula</code> .

R2018a

Version: 1.3

New Features

Bug Fixes

Corporate Credit Risk: Calculate standard deviation and value-at-risk contributions for each counterparty in a credit portfolio

The `riskContribution` function for `creditDefaultCopula` and the `riskContribution` function for `creditMigrationCopula` support returned information for counterparty contributions for standard deviation of the losses (Std) and value at risk (VaR) at the threshold `VaRLevel`.

R2017b

Version: 1.2

New Features

Bug Fixes

Compatibility Considerations

Corporate Credit Risk: Compute regulatory capital and value-at-risk using an asymptotic single risk factor (ASRF) model

The `asrf` function provides an ASRF model for credit risk analysis. `asrf` accepts the risk characteristics of a portfolio of credit-sensitive instruments as input and computes the necessary capital using an ASRF model.

Corporate Credit Risk: Perform credit portfolio simulation with random loss given default (LGD)

Support is provided for specifying random LGD (loss given default) for `creditDefaultCopula` and `creditMigrationCopula` objects. You can now specify the LGD input argument as a `NumCounterparties-by-2` matrix, where the first column contains the LGD mean values and the second column contains the LGD standard deviations. In this case, LGD values are drawn randomly from a beta distribution with the parameters provided for the defaulting counterparty.

Market Risk: Backtest expected shortfall models

The following tools support expected shortfall (ES) backtesting for table-based tests for the unconditional Acerbi-Szekely test.

- `esbacktest`
- `summary`
- `runtests`
- `unconditionalNormal`
- `unconditionalT`

The following tools support expected shortfall (ES) backtesting for distribution tests for normal and `t` distributions.

- `esbacktestbysim`
- `summary`
- `runtests`
- `conditional`
- `unconditional`
- `quantile`
- `simulate`

Consumer Credit Risk: Specify weights in credit scorecards using Binning Explorer

Specify weights in a credit scorecard when using the Binning Explorer app. For more information on defining weights for a `creditscorecard` object, see the optional name-value pair argument `WeightsVar` for `creditscorecard`.

creditCopula object renamed

The `creditCopula` object is renamed to the `creditDefaultCopula` object.

Compatibility Considerations

Object Name	What Happens When You Use This Object	Use This Object Instead	Compatibility Considerations
<code>creditCopula</code>	Errors	<code>creditDefaultCopula</code>	<p>Replace all instances of <code>creditCopula</code> object with <code>creditDefaultCopula</code> object using <code>creditDefaultCopula</code>.</p> <hr/> <p>Note The <code>CounterpartyLosses</code> property of the <code>creditCopula</code> object is removed in the <code>creditDefaultCopula</code> object. To obtain counterparty losses, use the <code>getScenarios</code> function.</p>

R2017a

Version: 2.5

New Features

Bug Fixes

Compatibility Considerations

Corporate Credit Risk: Estimate the probability of credit rating migration based on multifactor copula model

The following tools support corporate credit portfolio analysis for credit migration simulation using a `creditMigrationCopula` object for copula-based simulations:

- `creditMigrationCopula`
- `simulate`
- `portfolioRisk`
- `riskContribution`
- `confidenceBands`
- `getScenarios`

Corporate Credit Risk: Quantify credit concentration risk by Herfindahl index and other concentration measures

The `concentrationIndices` function supports the following concentration indices:

- CR — Concentration ratio
- Deciles — Deciles of the portfolio weights distribution
- Gini — Gini coefficient
- HH — Herfindahl-Hirschman index
- HK — Hannah-Kay index
- HT — Hall-Tideman index
- TE — Theil entropy index

Corporate Credit Risk: Model corporate default risk using Merton model

The `mertonmodel` and `mertonByTimeSeries` functions estimate the default probability using Merton's model.

creditCopula object renamed

The `creditCopula` object is renamed to the `creditDefaultCopula` object.

Compatibility Considerations

Object Name	What Happens When You Use This Object	Use This Object Instead	Compatibility Considerations
creditCopula	Warns	creditDefaultCopula	<p>Replace all instances of <code>creditCopula</code> object with <code>creditDefaultCopula</code> object using the <code>creditDefaultCopula</code> constructor.</p> <hr/> <p>Note The <code>CounterpartyLosses</code> property of <code>creditCopula</code> object is removed in the <code>creditDefaultCopula</code> object. To obtain counterparty losses, use the <code>getScenarios</code> function.</p>

R2016b

Version: 2.4

New Features

Consumer Credit Risk: Binning Explorer for Credit Scorecards

Binning Explorer is an app for developing and modifying binning assignments for a `creditscorecard` object. For more information, see [Binning Explorer](#).

Corporate Credit Risk: Copula-based simulation framework

The following tools support corporate credit portfolio analysis using a `creditCopula` object for copula-based simulations:

- `creditCopula` — Creates a `creditCopula` object.
- `simulate` — Simulates credit defaults using a `creditCopula` object.
- `portfolioRisk` — Generates portfolio-level risk measurements for a `creditCopula` object.
- `confidenceBands` — Generates confidence interval bands for a `creditCopula` object.
- `riskContribution` — Generates risk contributions for each counterparty in the `creditCopula` object.

Market Risk: Value-at-Risk Backtesting Tools

Value-at-risk (VaR) is an important measure of financial risk. VaR is an estimate of how much value a portfolio can lose in a given time period with a given confidence level. VaR backtesting tools assess the accuracy of VaR models. The following VaR backtesting tools are supported:

- `varbacktest` — Creates a `varbacktest` object using portfolio outcomes data and corresponding value-at-risk (VaR) data.
- `bin` — Binomial test.
- `cc` — Christoffersen's conditional coverage mixed test.
- `cci` — Christoffersen's conditional coverage independence test.
- `pof` — Kupiec's proportion of failures test.
- `tbf` — Haas's time between exceptions independence test.
- `tbf_i` — Haas's mixed time between exceptions (independence and frequency) test.
- `tl` — Traffic light test.
- `tuff` — Kupiec's time until the first failure test.
- `summary` — Summary report on the given `varbacktest` data.
- `runtests` — Runs all tests and reports the final test results.
