```

## Description

`flag = showFiSettingsImpl` specifies whether the Data Types tab appears on the MATLAB System block dialog box. The Data Types tab includes parameters to control processing of fixed point data the MATLAB System block. You cannot specify which parameters appear on the tab. If you implement `showFiSettingsImpl`, the simulation mode is set to code generation.

The parameters that appear on the Data Types tab, which cannot be customized, are:

- **Saturate on integer overflow** — a check box to control the action to take on integer overflow for built-in integer types. The default is that the box is checked, which indicates to saturate. This is also the default for when **Same as MATLAB** is selected as the **MATLAB System fimath** option.
- **Treat these inherited Simulink signal types as fi objects** — a pull down that indicates which inherited data types to treat as fi data types. Valid options are:
  - Fixed point (default)
  - Fixed point & integer
- **MATLAB System fimath** has two radio button options:
  - **Same as MATLAB** (default) — uses the current MATLAB fixed-point math settings.
  - **Specify Other** — enables the edit box for specifying the desired fixed-point math settings.

For information on setting fixed-point math, see `fimath`.

## Run-Time Details

`showFiSettingsImpl` is called by the MATLAB System block. For more information, see “Simulink Engine Phases Mapped to System Object Methods”.

## Method Authoring Tips

- If you do not want to display the tab, you do not need to implement this method in your class definition file.
- You must set `Access = protected` for this method.

## Output Arguments

**flag** — Display Data Types tab

false (default) | true

Flag indicating whether to display the Data Types tab on the MATLAB System block mask, returned as a logical scalar value. Returning a `true` value displays the tab. A `false` value does not display the tab.

## Examples

### Show the Data Types Tab

Show the Data Types tab on the MATLAB System block dialog box.

```
methods (Static, Access = protected)
 function isVisible = showFiSettingsImpl
 isVisible = true;
 end
end
```

If you set the flag, `isVisible`, to `true`, the tab appears as follows when you add the object to Simulink with the MATLAB System block.

## Version History

Introduced in R2016a

“Customize System Block Dialog Box Using System object”

## showSimulateUsingImpl

Visibility of Simulate using parameter

### Syntax

```
flag = showSimulateUsingImpl
```

### Description

`flag = showSimulateUsingImpl` specifies whether **Simulate using** appears on the MATLAB System block dialog box.

### Run-Time Details

`showSimulateUsingImpl` is called by the MATLAB System block.

### Method Authoring Tips

You must set `Access = protected` and `Static` for this method.

### Output Arguments

#### flag — Display parameter on block dialog box

`true` (default) | `false`

Flag indicating whether to display the **Simulate using** parameter and dropdown list on the MATLAB System block mask. `true` displays the parameter and dropdown list. `false` hides the parameter and dropdown list.

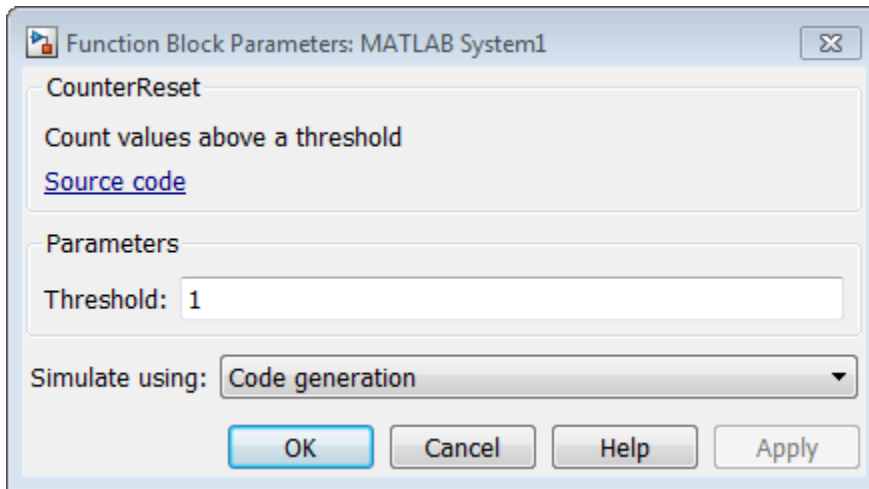

### Examples

#### Hide the Simulate using Parameter

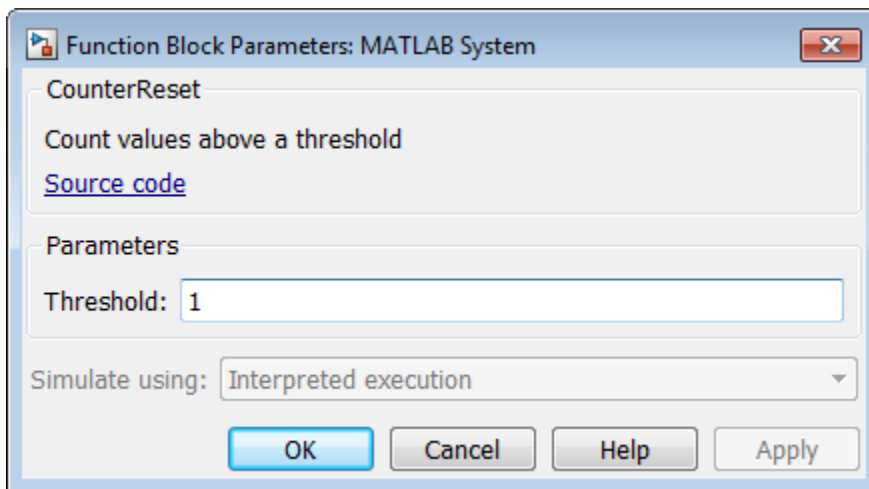

Hide the **Simulate using** parameter on the MATLAB System block dialog box.

```
methods (Static, Access = protected)
 function flag = showSimulateUsingImpl
 flag = false;
 end
end
```

If you set the `flag` to `true` or omit the `showSimulateUsingImpl` method, which defaults to `true`, the dialog appears as follows when you add the object to Simulink with the MATLAB System block.

If you also specify a single value for `getSimulateUsingImpl`, the dialog appears as follows when you add the object to Simulink with the MATLAB System block.

## Version History

Introduced in R2015a

## getGlobalNamesImpl

Global variable names for MATLAB System block

### Syntax

```
name = getGlobalNamesImpl(obj)
```

### Description

`name = getGlobalNamesImpl(obj)` specifies the names of global variables that are declared in a System object for use in a Simulink P-code file. For P-code files, in addition to declaring your global variables in `stepImpl`, `outputImpl`, or `updateImpl`, you must include the `getGlobalNamesImpl` method. You declare global variables in a cell array in the `getGlobalNamesImpl` method. System objects that contain these global variables are included in Simulink using a MATLAB System block. To enable a global variable in Simulink, your model also must include a Data Store Memory block with a **Data Store Name** that matches the global variable name.

### Run-Time Details

`getGlobalNamesImpl` is called by the MATLAB System block.

### Method Authoring Tips

You must set `Access = protected` for this method.

### Input Arguments

#### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getGlobalNamesImpl` method does not use the object, you can replace this input with `~`.

### Output Arguments

#### **name** — Global variable names

cell array of character vectors

Cell array containing the global variable names. The elements of the cell array are character vectors.

### Examples

#### **Specify Global Names**

Specify two global names in your class definition file.

```
methods(Access = protected)
 function glnames = getGlobalNamesImpl(obj)
```

```
 glnames = {'FEE','OTHERFEE'};
end

function y = stepImpl(obj,u)
 global FEE
 global OTHERFEE
 y = u - FEE * obj.lastData + OTHERFEE;
 obj.lastData = u;
end
end
```

## Version History

Introduced in R2016b

## getHeaderImpl

Header for System object display

### Syntax

```
header = getHeaderImpl
```

### Description

`header = getHeaderImpl` specifies the dialog header to display on the MATLAB System block dialog box. If you do not specify the `getHeaderImpl` method, no title or text appears for the header in the block dialog box.

### Run-Time Details

`getHeaderImpl` is called by the MATLAB System block.

### Method Authoring Tips

You must set `Access = protected` for this method.

### Output Arguments

#### **header** — Header text

`matlab.system.display.Header` class

Header text specified as a `matlab.system.display.Header` class.

### Examples

#### **Define Header for System Block Dialog Box**

Define a header in your class definition file for the `EnhancedCounter` System object.

```
methods (Static, Access = protected)
 function header = getHeaderImpl
 header = matlab.system.display.Header('EnhancedCounter',...
 'Title','Enhanced Counter');
 end
end
```

### Version History

Introduced in R2013b

### See Also

`getPropertyGroupsImpl`

**Topics**

“Add Header Description”

## getDiscreteStateImpl

Discrete state property values

### Syntax

```
s = getDiscreteStateImpl(obj)
```

### Description

`s = getDiscreteStateImpl(obj)` returns a struct `s` of internal state value properties, which have the `DiscreteState` attribute. The field names of the struct are the object's `DiscreteState` property names. To restrict or change the values returned by `getDiscreteState` method, you can override this `getDiscreteStateImpl` method.

### Run-Time Details

`getDiscreteStateImpl` is called by the `setup` method. For details, see

“Detailed Call Sequence”.

### Method Authoring Tips

- You must set `Access = protected` for this method.
- You cannot modify any properties in this method.

### Input Arguments

#### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getDiscreteStateImpl` method does not use the object, you can replace this input with `~`.

### Output Arguments

#### **s** — State values

struct

State values, returned as a struct.

### Examples

#### Get Discrete State Values

Use the `getDiscreteStateImpl` method in your class definition file to customize the behavior of `getDiscreteState` method. The System object contains discrete states `value` and `power`. A nontunable parameter `keepTrack` determines the states displayed by `getDiscreteState` method.

```
methods (Access = protected)
 function s = getDiscreteStateImpl(obj)
 if obj.keepTrack
 s.value = obj.value;
 s.power = obj.power;
 else
 s.value = obj.value;
 end
 end
end
```

## Version History

Introduced in R2012b

### See Also

setupImpl

“Define Property Attributes”

## supportsMultipleInstanceImpl

Support System object in Simulink For Each subsystem

### Syntax

```
flag = supportsMultipleInstanceImpl(obj)
```

### Description

`flag = supportsMultipleInstanceImpl(obj)` specifies whether the System object can be used in a Simulink For Each subsystem via the MATLAB System block. To enable For Each support, you must include the `supportsMultipleInstanceImpl` in your class definition file and have it return `true`. Do not enable For Each support if your System object allocates exclusive resources that may conflict with other System objects, such as allocating file handles, memory by address, or hardware resources.

### Run-Time Details

During Simulink model compilation and propagation, the MATLAB System block calls the `supportsMultipleInstance` method, which then calls the `supportsMultipleInstanceImpl` method to determine For Each support.

### Method Authoring Tips

- You must set `Access = protected` for this method.
- You cannot modify any properties in this method.

### Input Arguments

#### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `supportsMultipleInstanceImpl` method does not use the object, you can replace this input with `~`.

### Output Arguments

#### **flag** — Support for For Each subsystem flag

false (default) | true

Boolean value indicating whether the System object can be used in a For Each subsystem. The default value, if you do not include the `supportsMultipleInstanceImpl` method, is `false`.

### Examples

### Enable For-Each Support for System Object

Specify in your class definition file that the System object can be used in a Simulink For Each subsystem.

```
methods (Access = protected)
 function flag = supportsMultipleInstanceImpl(obj)
 flag = true;
 end
end
```

## Version History

Introduced in R2014b

### See Also

## processTunedPropertiesImpl

Action when tunable properties change

### Syntax

```
processTunedPropertiesImpl(obj)
```

### Description

`processTunedPropertiesImpl(obj)` specifies the algorithm to perform when one or more tunable property values change. This method is called as part of the next call to the System object after a tunable property value changes. A property is tunable only if its `Nontunable` attribute is `false`, which is the default.

### Run-Time Details

`processTunedPropertiesImpl` is called when you run the System object.

In MATLAB when multiple tunable properties are changed before running the System object, `processTunedPropertiesImpl` is called only once for all the changes. `isChangedProperty` returns `true` for all the changed properties.

In Simulink, when a parameter is changed in a MATLAB System block dialog, the next simulation step calls `processTunedPropertiesImpl` before calling `stepImpl`. All tunable parameters are considered changed and `processTunedPropertiesImpl` method is called for each of them. `isChangedProperty` returns `true` for all the dialog properties.

For details, see “Detailed Call Sequence”.

### Method Authoring Tips

- You must set `Access = protected` for this method.
- Use this method when a tunable property affects the value of a different property.
- If the System object will be used in the Simulink MATLAB System block, you cannot modify any tunable properties in this method.
- To check if a property has changed since `stepImpl` was last called, use `isChangedProperty` within `processTunedPropertiesImpl`. See “Specify Action When Tunable Property Changes” on page 5-136 for an example.

### Input Arguments

#### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `processTunedPropertiesImpl` method does not use the object, you can replace this input with `~`.

### Examples

## Specify Action When Tunable Property Changes

Use `processTunedPropertiesImpl` to recalculate the lookup table if the value of either the `NumNotes` or `MiddleC` property changes before the next call to the System object. `propChange` indicates if either property has changed.

```
methods (Access = protected)
function processTunedPropertiesImpl(obj)
 propChange = isChangedProperty(obj, 'NumNotes') || ...
 isChangedProperty(obj, 'MiddleC')
 if propChange
 obj.pLookupTable = obj.MiddleC * (1+log(1:obj.NumNotes)/log(12));
 end
end
end
```

## matlab.system.mixin.CustomIcon class

**Package:** matlab.system.mixin

Custom icon mixin class

---

**Note** The `matlab.system.mixin.CustomIcon` mixin will be removed in a future release. You no longer need to inherit from this mixin in your `System` object. The associated `getIcon` method has been moved to the `matlab.System` class.

---

### Description

`matlab.system.mixin.CustomIcon` is a class that specifies the `getIcon` method. This method customizes the name of the icon used for the `System` object implemented through a MATLAB System block.

To use this method, you must subclass from this class in addition to the `matlab.System` base class. Type the following syntax as the first line of your class definition file, where `ObjectName` is the name of your object:

```
classdef ObjectName < matlab.system &...
 matlab.system.mixin.CustomIcon
```

The `matlab.system.mixin.CustomIcon` class is a handle class.

### Version History

**Introduced in R2017a**

**R2020a: matlab.system.mixin.CustomIcon will be removed**

*Not recommended starting in R2020a*

The `matlab.system.mixin.CustomIcon` mixin will be removed in a future release. You no longer need to inherit from this mixin in your `System` object. The associated method has been moved to the `matlab.System` class.

Remove `matlab.system.mixin.CustomIcon` from the `classdef` line of your `System` object.

“Add Text to Block Icon”

# getIconImpl

Name to display as block icon

## Syntax

```
icon = getIconImpl(obj)
```

## Description

`icon = getIconImpl(obj)` specifies the text or image to display on the block icon of the MATLAB System block. If you do not specify the `getIconImpl` method, the block displays the class name of the System object as the block icon. For example, if you specify `pkg.MyObject` in the MATLAB System block, the default icon is labeled `MyObject`.

## Run-Time Details

`getIconImpl` is called by the MATLAB System block during Simulink model compilation.

## Method Authoring Tips

You must set `Access = protected` for this method.

## Input Arguments

### obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getIconImpl` method does not use the object, you can replace this input with `~`.

## Output Arguments

### icon — Block icon

character vector | cell array of character vectors | string | string array |  
`matlab.system.display.Icon` object

The text or image to display as the block icon. Each cell is displayed as a separate line.

## Examples

### Add System Block Icon Name

Specify in your class definition file the name of the block icon as 'Enhanced Counter' using two lines.

```
methods (Access = protected)
 function icon = getIconImpl(~)
 icon = {'Enhanced', 'Counter'};
```

```
end
end
```

### Add Image to MATLAB System Block

Define an image in your class definition file.

```
methods(Access = protected)
 function icon = getIconImpl(~)
 % Define icon for System block
 icon = matlab.system.display.Icon('my_icon.png');
 end
end
```

The image now appears on the System block icon.

# matlab.system.display.Header class

**Package:** matlab.system.display

Header for System objects properties

## Syntax

```
matlab.system.display.Header(N1,V1,...Nn,Vn)
matlab.system.display.Header(Obj,...)
```

## Description

`matlab.system.display.Header(N1,V1,...Nn,Vn)` specifies a header for the System object, with the header properties defined in Name-Value (N,V) pairs. You use `matlab.system.display.Header` within the `getHeaderImpl` method. The available header properties are

- `Title` — Header title. The default value is an empty character vector.
- `Text` — Header description. The default value is an empty character vector.
- `ShowSourceLink` — Show link to source code for the object.

`matlab.system.display.Header(Obj,...)` creates a header for the specified System object (`Obj`) and sets the following property values:

- `Title` — Set to the `Obj` class name.
- `Text` — Set to help summary for `Obj`.
- `ShowSourceLink` — Set to `true` if `Obj` is MATLAB code. In this case, the **Source Code** link is displayed. If `Obj` is P-coded and the source code is not available, set this property to `false`.

You can use `mfilename('class')` from within this method to get the name of the System object. If you set any Name-Value pairs, those property values override the default settings.

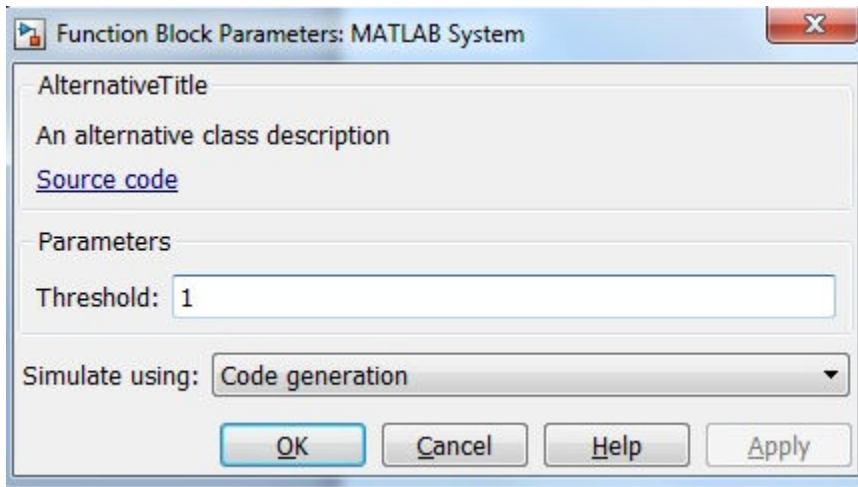

## Examples

### Define System Block Header

Define a header in your class definition file.

```
methods (Static, Access = protected)
 function header = getHeaderImpl
 header = matlab.system.display.Header(mfilename('class'), ...
 'Title','AlternativeTitle',...
 'Text','An alternative class description');
 end
end
```

The resulting output appears as follows. In this case, **Source code** appears because the `ShowSourceLink` property was set to `true`.

# matlab.system.display.Section class

**Package:** matlab.system.display

Property group section for System objects

## Syntax

```
matlab.system.display.Section(N1,V1,...Nn,Vn)
matlab.system.display.Section(Obj,...)
```

## Description

`matlab.system.display.Section(N1,V1,...Nn,Vn)` creates a property group section for displaying System object properties, which you define using property Name-Value pairs (N,V). You use `matlab.system.display.Section` to define property groups using the `getPropertyGroupsImpl` method. The available Section properties are:

- **Title** — Section title. The default value is an empty character vector.
- **TitleSource** — Source of section title. Valid values are 'Property' and 'Auto'. The default value is 'Property', which uses the character vector from the Title property. If the Obj name is given, the default value is Auto, which uses the Obj name.
- **Description** — Section description. The default value is an empty character vector.
- **PropertyList** — Section property list as a cell array of property names. The default value is an empty array. If the Obj name is given, the default value is all eligible display properties.
- **Type** — Container type. For example, tab, group, panel, and collapsible panel.
- **Row** — Specify the row in which the containers need to be placed (current/new). You can specify the row using the enum class `matlab.system.display.internal.Row`.
- **AlignPrompts** — Specify a boolean value to control align prompts within the containers.

---

**Note** Certain properties are not eligible for display either in a dialog box or in the System object summary on the command-line. Property types that cannot be displayed are: hidden, abstract, private or protected access, discrete state, and continuous state. Dependent properties do not display in a dialog box, but do display in the command-line summary.

---

`matlab.system.display.Section(Obj,...)` creates a property group section for the specified System object (Obj) and sets the following property values:

- **TitleSource** — Set to 'Auto', which uses the Obj name.
- **PropertyList** — Set to all publicly-available properties in the Obj.

You can use `mfilename('class')` from within this method to get the name of the System object. If you set any Name-Value pairs, those property values override the default settings.

## Examples

## Define Property Groups

Define two property groups in your class definition file by specifying their titles and property lists.

```
classdef MultipleGroupsWithSection < matlab.System
 % MultipleGroupsWithTabs Customize block dialog with multiple tabs and parameter groups.

 % Public, tunable properties
 properties
 %StartValue Start Value
 StartValue = 0

 %EndValue End Value
 EndValue = 10

 Threshold = 1
 end
 % Public Nontunable
 properties(Nontunable)
 %UseThreshold Use threshold
 UseThreshold (1,1) logical = true
 end

 methods (Static, Access = protected)
 function groups = getPropertyGroupsImpl
 valueGroup = matlab.system.display.Section(...
 'Title', 'Value parameters', ...
 'PropertyList', {'StartValue', 'EndValue'}, ...
 'SectionType', matlab.system.display.SectionType.tab);

 thresholdGroup = matlab.system.display.Section(...
 'Title', 'Threshold parameters', ...
 'PropertyList', {'Threshold', 'UseThreshold'}, ...
 'SectionType', matlab.system.display.SectionType.tab);
 groups = [valueGroup, thresholdGroup];
 end
 end
end
```

When you specify the System object in the MATLAB System block, the resulting dialog box appears as follows.

## See Also

“Customize System Block Dialog Box Using System object”

## matlab.system.display.Action class

**Package:** matlab.system.display

Custom button

### Syntax

```
matlab.system.display.Action(action)
matlab.system.display.Action(action,Name,Value)
```

### Description

`matlab.system.display.Action(action)` specifies a button to display on the MATLAB System block. This button executes a function by launching a System object method or invoking any MATLAB function or code.

A typical button function launches a figure. The launched figure is decoupled from the block dialog box. Changes to the block are not synced to the displayed figure.

You define `matlab.system.display.Action` within the `getPropertyGroupsImpl` method in your class definition file. You can define multiple buttons using separate instances of `matlab.system.display.Action` in your class definition file.

`matlab.system.display.Action(action,Name,Value)` includes `Name,Value` pair arguments, which you can use to specify any properties.

### Input Arguments

#### **action**

Action taken when the user presses the specified button on the MATLAB System block dialog. The action is defined as a function handle or as a MATLAB command. If you define the action as a function handle, the function definition must define two inputs. These inputs are a `matlab.system.display.ActionData` object and a System object instance, which can be used to invoke a method.

A `matlab.system.display.ActionData` object is the callback object for a display action. You use the `UserData` property of `matlab.system.display.ActionData` to store persistent data, such as a figure handle.

#### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

## Properties

You specify these properties as part of the input using `Name, Value` pair arguments. Optionally, you can define them using `object.property` syntax.

- `ActionCalledFcn` — Action to take when the button is pressed. You cannot specify this property using a `Name-Value` pair argument.
- `Label` — Text to display on the button. The default value is an empty character vector.
- `Description` — Text for the button tooltip. The default value is an empty character vector.
- `Placement` — Character vector indicating where on a separate row in the property group to place the button. Valid values are `'first'`, `'last'`, or a property name. If you specify a property name, the button is placed above that property. The default value is `'last'`.
- `Alignment` — Character vector indicating how to align the button. Valid values are `'left'` and `'right'`. The default value is `'left'`.

## Examples

### Define Button on MATLAB System Block

Define a **Visualize** button and its associated function to open a figure that plots a ramp using the parameter values in the block dialog.

```
methods(Static, Access = protected)
 function group = getPropertyGroupsImpl
 group = matlab.system.display.Section(mfilename('class'));
 group.Actions = matlab.system.display.Action(@(~,obj)...
 visualize(obj), 'Label', 'Visualize');
 end
end

methods
 function obj = PlotRamp(varargin)
 setProperties(obj, nargin, varargin{:});
 end

 function visualize(obj)
 figure;
 d = 1:obj.RampLimit;
 plot(d);
 end
end
```

When you specify the System object in the MATLAB System block, the resulting block dialog box appears as follows.

To open the same figure, rather than multiple figures, when the button is pressed more than once, use this code instead.

```

methods(Static,Access = protected)
 function group = getPropertyGroupsImpl
 group = matlab.system.display.Section(mfilename('class'));
 group.Actions = matlab.system.display.Action(@(actionData,obj)...
 visualize(obj,actionData),'Label','Visualize');
 end
end

methods
 function obj = ActionDemo(varargin)
 setProperties(obj,nargin,varargin{:});
 end

 function visualize(obj,actionData)
 f = actionData.UserData;
 if isempty(f) || ~ishandle(f)
 f = figure;
 actionData.UserData = f;
 else
 figure(f); % Make figure current
 end

 d = 1:obj.RampLimit;
 plot(d);
 end
end

```

## matlab.system.display.SectionGroup class

**Package:** matlab.system.display

Section group for System objects

### Syntax

```
matlab.system.display.SectionGroup(N1,V1,...Nn,Vn)
matlab.system.display.SectionGroup(Obj,...)
```

### Description

`matlab.system.display.SectionGroup(N1,V1,...Nn,Vn)` creates a group for displaying System object properties and display sections created with `matlab.system.display.Section`. You define such sections or properties using property Name-Value pairs (N,V). A section group can contain both properties and sections. You use `matlab.system.display.SectionGroup` to define section groups using the `getPropertyGroupsImpl` method. Section groups display as separate tabs in the MATLAB System block. The available Section properties are:

- **Title** — Group title. The default value is an empty character vector.
- **TitleSource** — Source of group title. Valid values are 'Property' and 'Auto'. The default value is 'Property', which uses the character vector from the Title property. If the Obj name is given, the default value is Auto, which uses the Obj name. In the System object property display at the MATLAB command line, you can omit the default "Main" title for the first group of properties by setting TitleSource to 'Auto'.
- **Description** — Group or tab description that appears above any properties or panels. The default value is an empty character vector.
- **PropertyList** — Group or tab property list as a cell array of property names. The default value is an empty array. If the Obj name is given, the default value is all eligible display properties.
- **Sections** — Group sections as an array of section objects. If the Obj name is given, the default value is the default section for the Obj.
- **Type** — Container type. For example, tab, group, panel, and collapsible panel.
- **Row** — Specify the row in which the containers need to be placed (current/new). You can specify the row using the enum class `matlab.system.display.internal.Row`.
- **AlignPrompts** — Specify a boolean value to control align prompts within the containers.

`matlab.system.display.SectionGroup(Obj,...)` creates a section group for the specified System object (Obj) and sets the following property values:

- **TitleSource** — Set to 'Auto'.
- **Sections** — Set to `matlab.system.display.Section` object for Obj.

You can use `mfilename('class')` from within this method to get the name of the System object. If you set any Name-Value pairs, those property values override the default settings.

### Examples

## Define Block Dialog Containers

Define in your class definition file two tabs, each containing specific properties. For this example, you use the `matlab.system.display.SectionGroup`, `matlab.system.display.Section`, and `getPropertyGroupsImpl` methods.

```
classdef MultipleGroupsWithSectionGroup < matlab.System
 % MultipleGroupsWithTabs Customize block dialog with multiple tabs and parameter groups.

 % Public, tunable properties
 properties
 %StartValue Start Value
 StartValue = 0

 %EndValue End Value
 EndValue = 10

 Threshold = 1

 %BlockLimit Limit
 BlockLimit = 55
 end
 % Public Nontunable
 properties(Nontunable)
 %IC1 First initial condition
 IC1 = 0

 %IC2 Second initial condition
 IC2 = 10

 %IC3 Third initial condition
 IC3 = 100

 %UseThreshold Use threshold
 UseThreshold (1,1) logical = true
 end

 methods (Static, Access = protected)
 function groups = getPropertyGroupsImpl
 % Section to always display above any tabs.
 alwaysSection = matlab.system.display.Section(...
 'Title', '', 'PropertyList', {'BlockLimit'});

 % Group with no sections
 initTab = matlab.system.display.SectionGroup(...
 'Title', 'Initial conditions', ...
 'PropertyList', {'IC1', 'IC2', 'IC3'}, ...
 'GroupType', matlab.system.display.SectionType.group);

 % Section for the value parameters
 valueSection = matlab.system.display.Section(...
 'Title', 'Value parameters', ...
 'PropertyList', {'StartValue', 'EndValue'}, ...
 'SectionType', matlab.system.display.SectionType.collapsiblepanel);

 % Section for the threshold parameters
 thresholdSection = matlab.system.display.Section(...
 'Title', 'Threshold parameters', ...
```

```

 'PropertyList',{ 'Threshold', 'UseThreshold'},...
 'SectionType', matlab.system.display.SectionType.collapsiblepanel);

% Group with two sections: the valueSection and thresholdSection sections
mainTab = matlab.system.display.SectionGroup(...
 'Title','Main', ...
 'Sections',[valueSection,thresholdSection],...
 'GroupType', matlab.system.display.SectionType.group);

% Return an array with the group-less section, the group with
% two sections, and the group with no sections.
groups = [alwaysSection,mainTab,initTab];
end
end
end

```

The resulting dialog appears as follows when you add the object to Simulink with the MATLAB System block.

## matlab.system.display.Icon class

**Package:** matlab.system.display

Custom icon image

### Syntax

```
icon = matlab.system.display.Icon(imageFile)
```

### Description

`icon = matlab.system.display.Icon(imageFile)` sets the `imageFile` image as the MATLAB System block icon. To set the icon image, use the `icon` output argument from `getIconImpl`.

### Input Arguments

#### **imageFile** — Image file

character array

Image file to display on the block icon, specified as a character array. If the image is not on the path, use the full path to your image file.

The image file must be in a file format supported for block masks. See “Draw Static Icon”.

Example: "image.png"

### Examples

#### **Add Image to MATLAB System Block**

Define an image in your class definition file.

```
methods(Access = protected)
 function icon = getIconImpl(~)
 % Define icon for MATLAB System block
 icon = matlab.system.display.Icon("my_icon.png");
 end
end
```

The image now appears on the MATLAB System block icon.

## Version History

## matlab.system.mixin.Propagates class

**Package:** matlab.system.mixin

Signal characteristics propagation mixin class

---

**Note** The `matlab.system.mixin.Propagates` mixin will be removed in a future release. You no longer need to inherit from this mixin in your System object. The associated propagation methods have been moved to the `matlab.System` class.

---

### Description

`matlab.system.mixin.Propagates` specifies the output size, data type, and complexity of a System object. Use this mixin class and its methods when you will include your System object in Simulink via the MATLAB System block. This mixin is called by the MATLAB System block during Simulink model compilation.

---

**Note** If your System object has exactly one input and one output and no discrete property states, or if you do not need bus support, you do not have to implement any of these methods. The `matlab.system.mixin.Propagates` provides default values in these cases.

---

Implement the methods of this class when Simulink cannot infer the output specifications directly from the inputs or when you want bus support. If you do not include this mixin, Simulink cannot propagate the output or bus data type, an error occurs.

To use this mixin, subclass from this `matlab.system.mixin.Propagates` in addition to subclassing from the `matlab.System` base class. Type the following syntax as the first line of your class definition file. `ObjectName` is the name of your System object.

```
classdef ObjectName < matlab.System &...
 matlab.system.mixin.Propagates
```

The `matlab.system.mixin.Propagates` class is a handle class.

### Version History

**Introduced in R2014a**

**R2020a: matlab.system.mixin.Propagates will be removed**

*Not recommended starting in R2020a*

The `matlab.system.mixin.Propagates` mixin will be removed in a future release. You no longer need to inherit from this mixin in your System object. The associated propagation methods have been moved to the `matlab.System` class.

Remove `matlab.system.mixin.Propagates` from the `classdef` line of your System object.

“Set Discrete State Output Specification”

## getDiscreteStateSpecificationImpl

Discrete state size, data type, and complexity

### Syntax

```
[size,dataType,complexity] = getDiscreteStateSpecificationImpl(obj,
propertyName)
```

### Description

[size,dataType,complexity] = getDiscreteStateSpecificationImpl(obj, propertyName) returns the size, data type, and complexity of the discrete state property. This property must be a discrete state property. You must define this method if your System object has discrete state properties and is used in the MATLAB System block.

### Run-Time Details

getDiscreteStateSpecificationImpl is called by the MATLAB System block during Simulink model compilation.

### Method Authoring Tips

- You must set Access = protected for this method.
- You cannot modify any properties in this method.

### Input Arguments

#### obj — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your getDiscreteStateSpecificationImpl method does not use the object, you can replace this input with ~.

#### propertyName — Discrete state property name

property name

Name of discrete state property of the System object

### Output Arguments

#### size — Property size

[1 1] (default) | numeric vector

Vector containing the length of each dimension of the property.

#### dataType — Property data type

double (default) | character vector

Data type of the property. For built-in data types, `dataType` is a character vector. For fixed-point data types, `dataType` is a numeric type object.

### **complexity — Complexity of the property**

`false` (default) | `true`

Complexity of the property as a scalar, logical value:

- `true` — complex
- `false` — real

## **Examples**

### **Specify Discrete State Property Size, Data Type, and Complexity**

Specify in your class definition file the size, data type, and complexity of a discrete state property.

```
methods (Access = protected)
 function [sz,dt,cp] = getDiscreteStateSpecificationImpl(~,name)
 sz = [1 1];
 dt = "double";
 cp = false;
 end
end
```

## **Version History**

“Set Discrete State Output Specification”

# getOutputDataTypeImpl

Data types of output ports

## Syntax

```
[dt_1,dt_2,...,dt_n] = getOutputDataTypeImpl(obj)
```

## Description

`[dt_1,dt_2,...,dt_n] = getOutputDataTypeImpl(obj)` returns the data type of each output port as a character vector for built-in data types or as a numeric object for fixed-point data types. The number of outputs must match the value returned from the `getNumOutputsImpl` method or the number of output arguments listed in the `stepImpl` method.

For System objects with one input and one output and where you want the input and output data types to be the same, you do not need to implement this method. In this case, `getOutputDataTypeImpl` assumes the input and output data types are the same and returns the data type of the input.

If your System object has more than one input or output, and you use propagation, you must set the output data types in the `getOutputDataTypeImpl` method. For Simulink, if the input and output data types are different, you might have to cast the output value to the data type of the appropriate `dt_n` output argument. You specify this casting in the `stepImpl` method. For bus output, you must specify the name of the output bus in `getOutputDataTypeImpl`.

If needed to determine the output data type, you can use `propagatedInputDataType` within the `getOutputDataTypeImpl` method to obtain the input type.

## Run-Time Details

`getOutputDataTypeImpl` is called by the MATLAB System block.

## Method Authoring Tips

- You must set `Access = protected` for this method.
- You cannot modify any properties in this method.
- If you are debugging your code and examine the data types before Simulink completes propagation, you might see outputs with empty, `[]`, data types. This occurs because Simulink has not completed setting the output data types.

## Input Arguments

### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getOutputDataTypeImpl` method does not use the object, you can replace this input with `~`.

## Output Arguments

### **dt\_1, dt\_2, ... — Property data type**

character vector | numeric type object

Data type of the property. For built-in data types, `dt` is a character vector. For fixed-point data types, `dt` is a numeric type object.

For outputs with enumeration data type defined in the base workspace, `dt` is a character vector specifying the name of the enumeration class. For outputs with enumeration data type defined as `Simulink.data.dictionary.EnumTypeDefinition` object in the design data section of a data dictionary, `dt` is a character vector specifying the name of the object.

## Examples

### Specify Output Data Type

Specify, in your class definition file how to control the output data type from a MATLAB System block. This example shows how to use the `getOutputDataTypeImpl` method to change the output data type from single to double, or propagate the input as a double. It also shows how to cast the data type to change the output data type in the `stepImpl` method.

```
classdef DataTypeChange < matlab.System

 properties(Nontunable)
 Quantize = false
 end

 methods(Access = protected)
 function y = stepImpl(obj,u)
 if obj.Quantize == true
 % Cast for output data type to differ from input.
 y = single(u);
 else
 % Propagate output data type.
 y = u;
 end
 end
 end

 function out = getOutputDataTypeImpl(obj)
 if obj.Quantize == true
 out = "single";
 else
 out = propagatedInputDataType(obj,1);
 end
 end
end
end
```

### Specify Bus Output

Specify, in your class definition file, that the System object data type is a bus. You must also include a property to specify the bus name.

```
properties(Nontunable)
 OutputBusName = "myBus";
end

methods (Access = protected)
 function out = getOutputDataTypeImpl(obj)
 out = obj.OutputBusName;
 end
end
```

The data type of the output bus must be defined upfront. The `propagatedInputDataType` method does not support propagation of bus data types to the output data type.

“Set Output Data Type”

# getOutputSizeImpl

Sizes of output ports

## Syntax

```
[sz_1,sz_2,...,sz_n] = getOutputSizeImpl(obj)
```

## Description

`[sz_1,sz_2,...,sz_n] = getOutputSizeImpl(obj)` returns the size of each output port. The number of outputs must match the value returned from the `getNumOutputs` method or the number of output arguments listed in the `stepImpl` method.

If your System object has only one input and one output and you want the input and output sizes to be the same, you do not need to implement this method. In this case `getOutputSizeImpl` assumes that the input and output sizes are the same and returns the size of the input. For variable-size inputs in MATLAB, the size varies each time you run your object. For variable-size inputs in Simulink, the output size is the maximum input size.

You must implement the `getOutputSizeImpl` method to define the output size, if:

- Your System object has more than one input or output
- You need the output and input sizes to be different.

If the output size differs from the input size, you must also use the `propagatedInputSize` method

By default, in Simulink the MATLAB System block recognizes 1-D input signals and propagates 1-D output signal as 2-D. Use `supports1DVectorsImpl` method to enable the 1-D inputs and outputs to be recognized and propagated as 1-D signals, respectively.

## Run-Time Details

During Simulink model compilation and propagation, the MATLAB System block calls the `getOutputSizeImpl` method to determine the output size.

All inputs default to variable-size inputs For these inputs, the output size is the maximum input size.

## Method Authoring Tips

- You must set `Access = protected` for this method.
- In this method, you cannot modify any properties.

## Input Arguments

### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getOutputSizeImpl` method does not use the object, you can replace this input with `~`.

## Output Arguments

### **sz\_1, sz\_2, ... — Output size**

numeric vector

Vector containing the size of each output port.

## Examples

### Specify Output Size

Specify in your class definition file the size of a System object output.

```
methods (Access = protected)
 function sz_1 = getOutputSizeImpl(obj)
 sz_1 = [1 1];
 end
end
```

### Specify Multiple Output Ports

Specify in your class definition file the sizes of multiple System object outputs.

```
methods (Access = protected)
 function [sz_1, sz_2] = getOutputSizeImpl(obj)
 sz_1 = propagatedInputSize(obj, 1);
 sz_2 = [1 1];
 end
end
```

### Specify Output When Using Propagated Input Size

Specify in your class definition file the size of System object output when it depends on the propagated input size.

```
methods (Access = protected)
 function varargout = getOutputSizeImpl(obj)
 varargout{1} = propagatedInputSize(obj, 1);
 if obj.HasSecondOutput
 varargout{2} = [1 1];
 end
 end
end
```

## Version History

Introduced in R2013b

“Set Output Size”

## isOutputComplexImpl

Complexity of output ports

### Syntax

```
[cp_1,cp_2,...,cp_n] = isOutputComplexImpl(obj)
```

### Description

[cp\_1,cp\_2,...,cp\_n] = isOutputComplexImpl(obj) returns whether each output port has complex data. The number of outputs must match the value returned from the `getNumOutputs` method or the number of output arguments listed in the `stepImpl` method.

For System objects with one input and one output and where you want the input and output complexities to be the same, you do not need to implement this method. In this case `isOutputComplexImpl` assumes the input and output complexities are the same and returns the complexity of the input.

If your System object has more than one input or output or you need the output and input complexities to be different, you must implement the `isOutputComplexImpl` method to define the output complexity. You also must use the `propagatedInputComplexity` method if the output complexity differs from the input complexity.

### Run-Time Details

During Simulink model compilation and propagation, the MATLAB System block calls the `isOutputComplex` method, which then calls the `isOutputComplexImpl` method to determine the output complexity.

### Method Authoring Tips

- You must set `Access = protected` for this method.
- You cannot modify any properties in this method.

### Input Arguments

#### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `isOutputComplexImpl` method does not use the object, you can replace this input with `~`.

### Output Arguments

#### **cp\_1, cp\_2, ...** — Complexity flag

true | false

Logical, scalar value indicating whether the specific output port is complex (`true`) or real (`false`).

## Examples

### Specify Output as Real-Valued

Specify in your class definition file that the output from a System object is a real value.

```
methods (Access = protected)
 function c1 = isOutputComplexImpl(obj)
 c1 = false;
 end
end
```

## Version History

## isOutputFixedSizeImpl

Fixed- or variable-size output ports

### Syntax

```
[flag_1,flag_2,...flag_n] = isOutputFixedSizeImpl(obj)
```

### Description

[flag\_1,flag\_2,...flag\_n] = isOutputFixedSizeImpl(obj) returns whether each output port is fixed size. The number of outputs must match the value returned from the `getNumOutputs` method, which is the number of output arguments listed in the `stepImpl` method.

For System objects with one input and one output and where you want the input and output fixed sizes to be the same, you do not need to implement this method. In this case `isOutputFixedSizeImpl` assumes the input and output fixed sizes are the same and returns the fixed size of the input.

If your System object has more than one input or output or you need the output and input fixed sizes to be different, you must implement the `isOutputFixedSizeImpl` method to define the output fixed size. You also must use the `propagatedInputFixedSize` method if the output fixed size status differs from the input fixed size status.

### Run-Time Details

During Simulink model compilation and propagation, the MATLAB System block calls the `isOutputFixedSize` method, which then calls the `isOutputFixedSizeImpl` method to determine the output fixed size.

All inputs default to variable-size inputs For these inputs, the output size is the maximum input size.

### Method Authoring Tips

- You must set `Access = protected` for this method.
- You cannot modify any properties in this method.

### Input Arguments

#### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `isOutputFixedSizeImpl` method does not use the object, you can replace this input with `~`.

### Output Arguments

#### **flag\_1, flag2, ...** — Fixed size flag

true | false

Logical, scalar value indicating whether the specific output port is fixed size (`true`) or variable size (`false`).

## Examples

### Specify Output as Fixed Size

Specify in your class definition file that the output from a System object is of fixed size.

```
methods (Access = protected)
 function c1 = isOutputFixedSizeImpl(obj)
 c1 = true;
 end
end
```

## Version History

## propagatedInputComplexity

Complexity of input during Simulink propagation

### Syntax

```
flag = propagatedInputComplexity(obj, index)
```

### Description

`flag = propagatedInputComplexity(obj, index)` returns `true` or `false` to indicate whether the input argument for the indicated System object is complex. `index` specifies the input for which to return the complexity flag.

You can use `propagatedInputComplexity` only from within the `isOutputComplexImpl` method in your class definition file. Use `isOutputComplexImpl` when:

- Your System object has more than one input or output.
- The input complexity determines the output complexity.
- The output complexity must differ from the input complexity.

### Input Arguments

#### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `propagatedInputComplexity` method does not use the object, you can replace this input with `~`.

#### **index** — Input index

positive integer

Index of the specified input. Do not count the `obj` in the `index`. The first input is always `obj`.

### Output Arguments

#### **flag** — Complexity flag

`true` | `false`

Complexity of the specified input, returned as `true` or `false`

### Examples

#### **Match Input and Output Complexity**

Get the complexity of the second input when you run the object and set the output to match it. Assume that the first input has no impact on the output complexity.

```
methods (Access = protected)
 function outcomplx = isOutputComplexImpl(obj)
 outcomplx = propagatedInputComplexity(obj,2);
 end
end
```

## Version History

## propagatedInputDataType

Data type of input during Simulink propagation

### Syntax

```
dt = propagatedInputDataType(obj,index)
```

### Description

`dt = propagatedInputDataType(obj,index)` returns the data type of an input argument for a System object. `index` specifies the input for which to return the data type.

You can use `propagatedInputDataType` only from within `getOutputDataTypeImpl`. Use `getOutputDataTypeImpl` when:

- Your System object has more than one input or output.
- The input data type status determines the output data type.
- The output data type must differ from the input data type.

### Input Arguments

#### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `propagatedInputDataType` method does not use the object, you can replace this input with `~`.

#### **index** — Input index

positive integer

Index of the specified input. Do not count the `obj` in the `index`. The first input is always `obj`.

### Output Arguments

#### **dt** — Input data type

character vector | numeric type object

Data type of the specified input, returned as a character vector for floating-point input or as a numeric type for fixed-point input.

### Examples

#### **Match Input and Output Data Type**

Get the data type of the second input. If the second input data type is `double`, then the output data type is `int32`. For all other cases, the output data type matches the second input data type. Assume that the first input has no impact on the output.

```
methods (Access = protected)
 function dt = getOutputDataTypeImpl(obj)
 if strcmpi(propagatedInputDataType(obj,2), 'double')
 dt = 'int32';
 else
 dt = propagatedInputDataType(obj,2);
 end
 end
end
```

## Version History

## propagatedInputFixedSize

Fixed-size status of input during Simulink propagation

### Syntax

```
flag = propagatedInputFixedSize(obj,index)
```

### Description

`flag = propagatedInputFixedSize(obj,index)` returns `true` or `false` to indicate whether an input argument of a System object is fixed size. `index` specifies the input for which to return the fixed-size flag.

You can use `propagatedInputFixedSize` only from within `isOutputFixedSizeImpl`. Use `isOutputFixedSizeImpl` when:

- Your System object has more than one input or output.
- The input fixed-size status determines the output fixed-size status.
- The output fixed-size status must differ from the input fixed-size status.

### Input Arguments

#### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `propagatedInputFixedSize` method does not use the object, you can replace this input with `~`.

#### **index** — Input index

positive integer

Index of the specified input. Do not count the `obj` in the `index`. The first input is always `obj`.

### Output Arguments

#### **flag** — Fixed size flag

`true` | `false`

Fixed-size status of the specified input, returned as `true` or `false`.

### Examples

#### **Match Fixed-Size Status of Input and Output**

Get the fixed-size status of the third input and set the output to match it. Assume that the first and second inputs have no impact on the output.

```
methods (Access = protected)
 function outtype = isOutputFixedSizeImpl(obj)
 outtype = propagatedInputFixedSize(obj,3)
 end
end
```

## Version History

Introduced in R2014a

### See Also

isOutputFixedSizeImpl

### Topics

“Set Fixed- or Variable-Size Output”

## propagatedInputSize

Size of input during Simulink propagation

### Syntax

```
size = propagatedInputSize(obj,index)
```

### Description

`size = propagatedInputSize(obj,index)` returns, as a vector, the input size of the specified System object. The `index` specifies the input for which to return the size information. (Do not count the `obj` in the `index`. The first input is always `obj`.)

You can use `propagatedInputSize` only from within the `getOutputSizeImpl` method in your class definition file. Use `getOutputSizeImpl` when:

- Your System object has more than one input or output.
- The input size determines the output size.
- The output size must differ from the input size.

---

**Note** For variable-size inputs, the propagated input size from `propagatedInputSize` differs depending on the environment.

- MATLAB — `propagatedInputSize` returns the size of the inputs used when you run the object for the first time.
  - Simulink — `propagatedInputSize` returns the upper bound of the input sizes.
- 

By default, in Simulink the MATLAB System block recognizes 1-D input signals and propagates 1-D output signal as 2-D. Use `supports1DVectorsImpl` method to enable the 1-D inputs and outputs to be recognized and propagated as 1-D signals, respectively.

### Input Arguments

#### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `propagatedInputSize` method does not use the object, you can replace this input with `~`.

#### **index** — Input index

integer

Index of the specified input

## Output Arguments

### size — Input size

numeric vector

Size of the specified input, returned as a vector

## Examples

### Match Size of Input and Output

Get the size of the second input. If the first dimension of the second input has a size greater than 1, then set the output size to a 1 x 2 vector. For all other cases, the output is a 2 x 1 matrix. Assume that the first input has no impact on the output size.

```
methods (Access = protected)
 function outsize = getOutputSizeImpl(obj)
 size = propagatedInputSize(obj,2);
 if size(1) == 1
 outsize = [1,2];
 else
 outsize = [2,1];
 end
 end
end
```

## matlab.system.mixin.Nondirect class

**Package:** `matlab.system.mixin`

Nondirect feedthrough mixin class

---

**Note** The `matlab.system.mixin.Nondirect` mixin will be removed in a future release. You no longer need to inherit from this mixin in your System object. The associated methods have been moved to the `matlab.System` class.

---

### Description

`matlab.system.mixin.Nondirect` is a class that uses the `output` and `update` methods to process nondirect feedthrough data through a System object.

For System objects that use direct feedthrough, the object's input is needed to generate the output at that time. For these direct feedthrough objects, running the System object calculates the output and updates the state values. For nondirect feedthrough, however, the object's output depends only on the internal states at that time. The inputs are used to update the object states. For these objects, calculating the output with `outputImpl` is separated from updating the state values with `updateImpl`. If you use the `matlab.system.mixin.Nondirect` mixin and include the `stepImpl` method in your class definition file, an error occurs. In this case, you must include the `updateImpl` and `outputImpl` methods instead.

The following cases describe when System objects in Simulink use direct or nondirect feedthrough.

- System object supports code generation and does not inherit from the `Propagates` mixin — Simulink automatically infers the direct feedthrough settings from the System object code.
- System object supports code generation and inherits from the `Propagates` mixin — Simulink does not automatically infer the direct feedthrough settings. Instead, it uses the value returned by the `isInputDirectFeedthroughImpl` method.
- System object does not support code generation — Default `isInputDirectFeedthroughImpl` method returns `false`, indicating that direct feedthrough is not enabled. To override the default behavior, implement the `isInputDirectFeedthroughImpl` method in your class definition file.

Use the `Nondirect` mixin to allow a System object to be used in a Simulink feedback loop. A delay object is an example of a nondirect feedthrough object.

To use this mixin, you must subclass from this class in addition to subclassing from the `matlab.System` base class. Type the following syntax as the first line of your class definition file, where `ObjectName` is the name of your object:

```
classdef ObjectName < matlab.system & matlab.system.mixin.Nondirect
```

### Version History

**Introduced in R2013b**

**R2020a: `matlab.system.mixin.Nondirect` will be removed**

*Not recommended starting in R2020a*

The `matlab.system.mixin.Nondirect` mixin will be removed in a future release. You no longer need to inherit from this mixin in your `System` object. The associated methods have been moved to the `matlab.System` class.

Remove `matlab.system.mixin.Nondirect` from the `classdef` line of your `System` object

## **See Also**

`matlab.System`

## **Topics**

“Use Update and Output for Nondirect Feedthrough”

## isInputDirectFeedthroughImpl

Direct feedthrough status of input

### Syntax

```
[flag1,...,flagN] = isInputDirectFeedthroughImpl(obj)
[flag1,...,flagN] = isInputDirectFeedthroughImpl(obj,input,input2,...)
```

### Description

[flag1,...,flagN] = isInputDirectFeedthroughImpl(obj) specifies whether each input is a direct feedthrough input. If direct feedthrough is true, the output depends on the input at each time instant.

[flag1,...,flagN] = isInputDirectFeedthroughImpl(obj,input,input2,...) uses one or more of the System object input specifications to determine whether inputs have direct feedthrough.

If you do not include the isInputDirectFeedthroughImpl method in your System object class definition file, all inputs are assumed to be direct feedthrough.

### Code Generation

The following cases describe when System objects in Simulink code generation use direct or nondirect feedthrough.

| System object's code generation support | Uses a propagation Impl method | Simulink Code Generation Result                                                                                                                                                                                                  |
|-----------------------------------------|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Y                                       | N                              | Simulink automatically infers the direct feedthrough settings from the System object code.                                                                                                                                       |
| Y                                       | Y                              | Simulink does not automatically infer the direct feedthrough settings. Instead, it uses the value returned by the isInputDirectFeedthroughImpl method.                                                                           |
| N                                       | —                              | Default isInputDirectFeedthroughImpl method returns false, indicating that direct feedthrough is not enabled. To override the default behavior, implement the isInputDirectFeedthroughImpl method in your class definition file. |

### Run-Time Details

isInputDirectFeedthroughImpl is called by the MATLAB System block.

### Method Authoring Tips

- You must set Access = protected for this method.
- You cannot modify, implement, or access tunable properties in this method.

- Do not use the input values of the System object in this method if you intend to use the System object in Simulink using the MATLAB System block. You can only query the inputs for their specifications namely data type, complexity and size.

## Input Arguments

### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `isInputDirectFeedthroughImpl` method does not use the object, you can replace this input with `~`.

### **input1, input2, ...** — Inputs to the System object

inputs to the System object algorithm

Inputs to the algorithm (`stepImpl`) of the System object. The inputs list must match the order of inputs in the `stepImpl` signature.

## Output Arguments

### **flag1, ..., flagN** — Output flag for each input to the System object

logical

Logical value, either `true` or `false` indicating whether the input is direct feedthrough. The number of output flags must match the number of inputs to the System object (inputs to `stepImpl`, `outputImpl`, or `updateImpl`).

## Examples

### Specify Input as Nondirect Feedthrough

Use `isInputDirectFeedthroughImpl` in your class definition file for marking all inputs as nondirect feedthrough.

```
methods (Access = protected)
 function flag = isInputDirectFeedthroughImpl(~)
 flag = false;
 end
end
```

### Complete Class Definition

```
classdef intDelaySysObj < matlab.System
 % intDelaySysObj Delay input by specified number of samples.

 properties
 InitialOutput = 0;
 end
 properties (Nontunable)
 NumDelays = 1;
 end
 properties (DiscreteState)
```

```
 PreviousInput;
 end

 methods (Access = protected)
 function validatePropertiesImpl(obj)
 if ((numel(obj.NumDelays)>1) || (obj.NumDelays <= 0))
 error('Number of delays must be > 0 scalar value.');
 end
 if (numel(obj.InitialOutput)>1)
 error('Initial Output must be scalar value.');
 end
 end
 end

 function setupImpl(obj)
 obj.PreviousInput = ones(1,obj.NumDelays)*obj.InitialOutput;
 end

 function resetImpl(obj)
 obj.PreviousInput = ones(1,obj.NumDelays)*obj.InitialOutput;
 end

 function [y] = outputImpl(obj,~)
 y = obj.PreviousInput(end);
 end
 function updateImpl(obj, u)
 obj.PreviousInput = [u obj.PreviousInput(1:end-1)];
 end
 function flag = isInputDirectFeedthroughImpl(~)
 flag = false;
 end
end
end
```

## Version History

Introduced in R2013b

### See Also

[updateImpl](#) | [outputImpl](#)

### Topics

“Use Update and Output for Nondirect Feedthrough”

# outputImpl

Output calculation from input or internal state of System object

## Syntax

```
[y1,y2,...,yN] = outputImpl(obj,u1,u2,...,uN)
```

## Description

`[y1,y2,...,yN] = outputImpl(obj,u1,u2,...,uN)` specifies the algorithm to output the System object states. The output values are calculated from the states and property values. Any inputs that you set to nondirect feedthrough are ignored during output calculation.

## Run-Time Details

`outputImpl` is called by the internal `output` method. It is also called before the `updateImpl` method. For sink objects, calling `updateImpl` before `outputImpl` locks the object. For all other types of objects, calling `updateImpl` before `outputImpl` causes an error.

## Method Authoring Tips

- You must set `Access = protected` for this method.
- If the System object will be used in the Simulink MATLAB System block, you cannot modify any tunable properties in this method.

## Input Arguments

### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `outputImpl` method does not use the object, you can replace this input with `~`.

### **u1,u2,...,uN** — Inputs to the algorithm

inputs

Inputs from the algorithm. The number of inputs must match the number of inputs returned by the `getNumInputs` method. Nondirect feedthrough inputs are ignored during normal execution of the System object. However, for code generation, you must provide these inputs even if they are empty.

## Output Arguments

### **y1,y2,...,yN** — Outputs of the algorithm

outputs

Outputs calculated from the specified algorithm. The number of outputs must match the number of outputs returned by the `getNumOutputs` method.

## Examples

### Set Up Output that Does Not Depend on Input

Specify in your class definition file that the output does not directly depend on the current input with the `outputImpl` method. `PreviousInput` is a property of the `obj`.

```
methods (Access = protected)
 function [y] = outputImpl(obj, ~)
 y = obj.PreviousInput(end);
 end
end
```

## Version History

Introduced in R2013b

### Topics

“Use Update and Output for Nondirect Feedthrough”

# updateImpl

Update object states based on inputs

## Syntax

```
updateImpl(obj, input1, input2, ...)
```

## Description

`updateImpl(obj, input1, input2, ...)` specifies the algorithm to update the System object states. You implement this method when your algorithm outputs depend only on the object's internal state and internal properties.

## Run-Time Details

`updateImpl` is called by the `update` method and after the `outputImpl` method.

For sink objects, calling `updateImpl` before `outputImpl` locks the object. For all other types of objects, calling `updateImpl` before `outputImpl` causes an error.

## Method Authoring Tips

- Do not use this method to update the outputs from the inputs.
- You must set `Access = protected` for this method.
- If the System object will be used in the Simulink MATLAB System block, you cannot modify any tunable properties in this method.

## Input Arguments

### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `updateImpl` method does not use the object, you can replace this input with `~`.

### **input1, input2, ...** — Inputs to the System object

inputs to the System object

List the inputs to the System object. The order of inputs must match the order of inputs defined in the `stepImpl` method.

## Examples

### **Set Up Output that Does Not Depend on Current Input**

Update the object with previous inputs. Use `updateImpl` in your class definition file. This example saves the `u` input and shifts the previous inputs.

```
methods (Access = protected)
 function updateImpl(obj,u)
 obj.PreviousInput = [u obj.PreviousInput(1:end-1)];
 end
end
```

# matlab.system.mixin.SampleTime class

Control sample time for System objects in Simulink

---

**Note** The `matlab.system.mixin.SampleTime` mixin will be removed in a future release. You no longer need to inherit from this mixin in your System object. The associated sample time methods have been moved to the `matlab.System` class.

---

## Description

`matlab.system.mixin.SampleTime` specifies the sample time specifications for a System object when it is included in a MATLAB System block. Inherit from this mixin class and use its methods to control the sample time of your System object in Simulink, via the MATLAB System block.

With this mixin, you can:

- Specify the sample time type
- Specify the sample time
- Customize the sample time with offsets and tick times
- Get the current simulation time

System objects that inherit from this mixin class must also inherit from `matlab.System`. For example:

```
classdef MySystemObject < matlab.System & matlab.system.mixin.SampleTime
```

The `matlab.system.mixin.SampleTime` class is a handle class.

## Methods

## Version History

**Introduced in R2017b**

**R2020a: `matlab.system.mixin.SampleTime` will be removed**

*Not recommended starting in R2020a*

The `matlab.system.mixin.SampleTime` mixin will be removed in a future release. You no longer need to inherit from this mixin in your System object. The associated sample time methods have been moved to the `matlab.System` class.

Remove `matlab.system.mixin.SampleTime` from the `classdef` line of your System object.

MATLAB System

**Topics**

“Specify Sample Time for MATLAB System Block System Objects”

# getSampleTimeImpl

Specify sample time type, offset time, and sample time

## Syntax

```
sts = getSampleTimeImpl(obj)
```

## Description

`sts = getSampleTimeImpl(obj)` returns the sample time specification created within the method body, `sts`, for the System object `obj`. Specify the sample time specification within the body of `getSampleTimeImpl` by calling `createSampleTime`. The sample time specification affects the simulation time when the System object is included in a MATLAB System block.

## Run-Time Details

`getSampleTimeImpl` is called during setup by `setupImpl`.

## Method Authoring Tips

You must set `Access = protected` for this method.

## Default Behavior

If you do not include this method in your System object definition, the sample time is inherited.

## Input Arguments

### **obj** — System object

System object

System object handle used to access properties, states, and methods specific to the object. If your `getSampleTimeImpl` method does not use the object, you can replace this input with `~`.

## Output Arguments

### **sts** — Sample time specification object

sample time specification object

An object defining the sample time specification values. You create this object with the `createSampleTime` function.

## Examples

### Specify Inherited Sample Time

Specify that the MATLAB System block should inherit the sample from upstream blocks, except if the sample time type is controllable.

```
function sts = getSampleTimeImpl(obj)
 sts = createSampleTime(obj, 'ErrorOnPropagation', 'Controllable');
end
```

### **Specify Discrete Sample Time**

Specify a discrete sample time for the MATLAB System block.

```
function sts = getSampleTimeImpl(obj)
 sts = createSampleTime(obj, 'Type', 'Discrete', ...
 'SampleTime', 10.2, 'OffsetTime', 0.5);
end
```

## **Version History**

**Introduced in R2017b**

### **See Also**

### **Topics**

“Specify Sample Time for MATLAB System Block System Objects”

# getSampleTime

Query sample time

## Syntax

```
sts = getSampleTime(obj)
```

## Description

`sts = getSampleTime(obj)` returns the sample time specification for the System object `obj` when the System object is included in a MATLAB System block. You can call `getSampleTime` in the `stepImpl` method to change the algorithm based on the sample time.

Before sample time has propagated throughout the MATLAB System block model, `getSampleTime` returns the `getSampleTimeImpl` sample time specification. If your system object does not override `getSampleTimeImpl`, the default Inherited sample time specification is returned.

After sample time has propagated, `getSampleTime` returns the sample time specification populated with the actual MATLAB System block sample time type, sample time, and offset time.

## Input Arguments

### **obj** — System object

System object

System object included in a MATLAB System block that you want to query.

## Output Arguments

### **sts** — Sample time specification object

sample time specification object

The sample time specification for the System object. For more details about sample time specification objects, see `createSampleTime`.

## Examples

### Return Sample Time

This example of `stepImpl` returns a count value `y`, the current simulation time `ct`, and the sample time `st`. The sample time is obtained by calling `getSampleTime`.

```
function [y,ct,st] = stepImpl(obj,u)
 y = obj.Count + u;
 obj.Count = y;
 ct = getCurrentTime(obj);
 sts = getSampleTime(obj);
 st = sts.SampleTime;
end
```

For a complete class definition, see “Specify Sample Time for MATLAB System Block System Objects”.

### **Topics**

“Specify Sample Time for MATLAB System Block System Objects”

# getCurrentTime

Current simulation time in MATLAB System block

## Syntax

```
time = getCurrentTime(obj)
```

## Description

`time = getCurrentTime(obj)` returns the current simulation time in the MATLAB System block. Call this method in the `stepImpl` method of your System object.

## Dependencies

If the MATLAB System block is operating in continuous sample time, `getCurrentTime` may return non-monotonic times due to solver operation.

## Input Arguments

### **obj** — System object

system object

System object included in a MATLAB System block that you want to query.

## Output Arguments

### **time** — Current simulation time

double

The current simulation time of the MATLAB System block that contains the System object.

## Examples

### Return Current Simulation Time

This example of `stepImpl` returns a count value `y` and the current simulation time `ct`. The simulation time is obtained by calling `getCurrentTime`.

```
function [y,ct] = stepImpl(obj,u)
 y = obj.Count + u;
 obj.Count = y;
 ct = getCurrentTime(obj);
end
```

For a complete class definition, see “Specify Sample Time for MATLAB System Block System Objects”.

“Specify Sample Time for MATLAB System Block System Objects”

# createSampleTime

Create sample time specification object

## Syntax

```
sts = createSampleTime(obj)
sts = createSampleTime(obj, 'Type', Type)
sts = createSampleTime(obj, 'Type', Type, Name, Value)
```

## Description

`sts = createSampleTime(obj)` creates a sample time specification object for inherited sample time for the System object `obj`. Use this sample time specification object in the `getSampleTimeImpl` method of your System object. The sample time specification affects the simulation time when the System object is included in a MATLAB System block. If you do not include this method in your System object definition, the sample time is inherited.

`sts = createSampleTime(obj, 'Type', Type)` creates a sample time specification object with the specified sample time type.

`sts = createSampleTime(obj, 'Type', Type, Name, Value)` creates a sample time specification object with additional options specified by one or more `Name, Value` pair arguments. `Name` is a property name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name-value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

## Dependencies

You can only call `createSampleTime` from the `getSampleTimeImpl` method of your System object.

## Input Arguments

### **obj** – System object

System object

System object that you want to specify the sample time.

### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `'Type', 'Fixed In Minor Step'`

### **Type** – Sample time type

`'Inherited'` (default) | `'Controllable'` | `'Discrete'` | `'Fixed In Minor Step'`

Type of sample time you want the System object to use in Simulink. For descriptions of the different types of sample times, see:

- 'Inherited' - "Inherited Sample Time"
- 'Controllable' - "Controllable Sample Time"
- 'Discrete' - "Discrete Sample Time"
- 'Fixed In Minor Step' - "Fixed-in-Minor-Step"

Example: `createSampleTime('Type','Fixed In Minor Step')`

#### **AllowPropagation — Allow the propagated sample time**

'Controllable' | 'Constant' | 'Continuous' | cell array of character vectors | string array

For Inherited sample time only.

Specify one or more sample times you want to allow your object to use. When the sample time type is set to `Inherited` and the MATLAB System block receives the specified sample time, the block allows the sample time to propagate. You can specify multiple sample time types as a cell array or string array.

Example: `createSampleTime('Type','Inherited','AllowPropagation',{'Controllable','Continuous'})`

#### **AlternatePropagation — Alter the propagated sample time**

'Controllable' | 'Constant' | 'Continuous' | cell array of character vectors | string array

For Inherited sample time only.

Specify one or more sample times you do not want your object to use. When the sample time type is set to `Inherited` and you do not want the MATLAB System block to use the specified inherited sample time type, an alternative sample time is used by the block instead. You can specify multiple sample time types. For each sample time type, Simulink substitutes a different sample time type:

- 'Controllable' — The base rate of the controlled sample is propagated instead. Use this option if your System object depends on having constant time between each sample-time hit.
- 'Constant' — The base rate of the model is propagated instead, either the fastest discrete rate or fixed in minor step.
- 'Continuous' — The fastest discrete rate is propagated instead.

Example:

`createSampleTime('Type','Inherited','AlternatePropagation','Controllable')`

#### **ErrorOnPropagation — Error on the propagated sample time**

'Controllable' | 'Constant' | 'Continuous' | cell array of character vectors | string array

For Inherited sample time only.

Specify one or more sample times you do not want your object to use. When the sample time type is set to `Inherited` and the MATLAB System block receives the specified sample time, Simulink throws an error.

Example:

`createSampleTime('Type','Inherited','ErrorOnPropagation','Controllable')`

#### **SampleTime — Time between samples**

1 (default) | positive number

For Discrete sample time only.

Specify the time between sample hits in Simulink.

Example: `createSampleTime('Type','Discrete','SampleTime',1)`

Data Types: `single` | `double`

### **OffsetTime — Offset from sample time**

0 (default) | nonnegative number less than `SampleTime`

For `Discrete` sample time only.

Specify the offset time for the sample hit. The offset is a time interval indicating an update delay. The block is updated later in the sample interval than other blocks operating at the same sample rate.

The offset time must be nonnegative and less than `SampleTime`.

Example: `createSampleTime('Type','Discrete','SampleTime',2,'OffsetTime',1)`

Data Types: `single` | `double`

### **TickTime — Time between sample time hits**

-1 (default) | positive scalar

Required for `Controllable` sample time only.

Specify the time between controllable sample time hits. The tick time must be a positive scalar.

Example: `createSampleTime('Type','Controllable','TickTime',obj.TickTime)`

Data Types: `single` | `double`

## **Output Arguments**

### **sts — Sample time specification object**

sample time specification object

The sample time specification object. This object has the following properties:

- `Type` — Type of sample time
- `SampleTime` — Time between samples
- `OffsetTime` — Offset from sample time

Use this object as the return value of `getSampleTimeImpl`.

## **Examples**

### **Create Inherited Sample Time Specification Object**

Specify that the MATLAB System block inherits the sample from upstream blocks. Inherited sample time is the default, so no additional arguments are needed.

```
function sts = getSampleTimeImpl(obj)
 sts = createSampleTime(obj);
end
```

### **Create Discrete Sample Time Object**

Specify a discrete sample time specification for the MATLAB System block, including offset time and the sample time.

```
function sts = getSampleTimeImpl(obj)
 sts = createSampleTime(obj, 'Type', 'Discrete', ...
 'SampleTime', 10.2, 'OffsetTime', 0.5);
end
```

## **Version History**

**Introduced in R2017b**

### **See Also**

[getCurrentTime](#) | [getSampleTime](#) | [getSampleTimeImpl](#) | [setNumTicksUntilNextHit](#)

### **Topics**

“Specify Sample Time for MATLAB System Block System Objects”

# setNumTicksUntilNextHit

Set the number of ticks in Simulink sample time

## Syntax

```
setNumTicksUntilNextHit(obj,ticks)
```

## Description

`setNumTicksUntilNextHit(obj,ticks)` sets the number of ticks in Simulink sample time to wait until the next call to `stepImpl`, or `outputImpl/updateImpl`.

## Dependencies

To use this method, set your System object to controllable sample time with `createSampleTime('Type','Controllable')`. Otherwise, your System object gives a compilation error.

You can only call this method from `stepImpl`, `outputImpl`, `updateImpl`, or `resetImpl`.

## Input Arguments

### **obj** — System object

System object

System object that you want to specify the sample time.

### **ticks** — Number of ticks in Simulink sample time

positive integer scalar

Number of ticks in Simulink sample time to wait until the next call to `stepImpl` or `outputImpl/updateImpl`. Specify this number as a positive integer scalar less than `intmax('uint64')`.

The number of sample time ticks to wait until the next hit is persistent. If you don't update this number, Simulink uses the previously set value of number of ticks to wait.

## Version History

Introduced in R2018a

## ModelAdvisor.Preferences class

**Package:** ModelAdvisor

Set Model Advisor window preferences by specifying which folders and tabs to display

### Description

Use instances of this class to set Model Advisor preferences.

### Construction

The constructor `ModelAdvisor.Preferences` creates an instance of this class with default property values.

Create an instance `modelPreferences` of the `ModelAdvisor.Preferences` class.

```
modelPreferences = ModelAdvisor.Preferences;
```

### Properties

#### **DeselectByProduct — Deselect the By Product folder**

(default) | true

Selection of the **By Product** folder in the Model Advisor window. The default value is `true`.

Example: `true`

Data Types: `logical`

#### **ShowAccordion — Display advisors**

(default) | true

Display of the **Code Generation Advisor**, **Upgrade Advisor**, and **Performance Advisor** in the Model Advisor window. You can use these advisors to help configure your model for code generation, upgrade your model for the current release, or improve performance.

Example: `true`

Data Types: `logical`

#### **ShowByProduct — Display the By Product folder**

(default) | true

Display of the **By Product** folder in the Model Advisor window. The default value is `true`.

Example: `true`

Data Types: `logical`

#### **ShowByTask — Display the By Task folder**

(default) | true

Display of the **By Task** folder in the Model Advisor window. The default value is `true`.

Example: `true`

Data Types: `logical`

### **ShowExclusionsInRpt — Include exclusions in report**

(default) | `true`

Include exclusions in the Model Advisor report. The default value is `true`.

Example: `true`

Data Types: `logical`

### **ShowExclusionTab — Display the Exclusions tab**

(default) | `false`

Display of the **Exclusions** tab in the Model Advisor window. The default value is `false`. When you click the **Exclusions** tab, the Model Advisor window displays checks that are excluded from the Model Advisor analysis.

Example: `true`

Data Types: `logical`

### **ShowSourceTab — Display the Source tab**

(default) | `false`

Display of the **Source** tab in the Model Advisor window. The default value is `false`. When you click the **Source** tab, the Model Advisor window displays the check Title, TitleID, and location of the MATLAB source code for the check.

Example: `true`

Data Types: `logical`

## **Examples**

### **Turn Off Display Of By Product Folder**

This example shows how to not display the **By Product** folder in the Model Advisor window:

```
mp = ModelAdvisor.Preferences;
mp.load;
mp.ShowByProduct = false;
mp.save
```

## Simulink.BlockCompDworkData

Provide postcompilation information about block's DWork vector

### Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the “Dwork” on page 5-512 method of a block's run-time object after the model containing the block has been compiled.

### Parent

Simulink.BlockData

### Children

None

### Property Summary

| Name                            | Description                                                                               |
|---------------------------------|-------------------------------------------------------------------------------------------|
| “Usage” on page 5-202           | Usage type of this DWork vector.                                                          |
| “UsedAsDiscState” on page 5-203 | True if this DWork vector is being used to store the values of a block's discrete states. |

### Properties

#### Usage

#### Description

Returns a character vector indicating how this DWork vector is used. Permissible values are:

- DWork
- DState
- Scratch
- Mode

#### Data Type

character vector

#### Access

RW for MATLAB S-function blocks, RO for other blocks.

**UsedAsDiscState****Description**

True if this DWork vector is being used to store the values of a block's discrete states.

**Data Type**

Boolean

**Access**

RW for MATLAB S-Function blocks, R0 for other blocks.

**Version History**

Introduced before R2006a

## Simulink.BlockCompInputPortData

Provide postcompilation information about block input port

### Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the “InputPort” on page 5-513 method of a block's run-time object after the model containing the block has been compiled.

### Parent

Simulink.BlockPortData

### Children

None

### Property Summary

| Name                              | Description                               |
|-----------------------------------|-------------------------------------------|
| “DirectFeedthrough” on page 5-204 | True if this port has direct feedthrough. |
| “Overwritable” on page 5-204      | True if this port is overwritable.        |

### Properties

#### DirectFeedthrough

##### Description

True if this input port has direct feedthrough.

##### Data Type

Boolean

##### Access

RW for MATLAB S functions, RO for other blocks.

#### Overwritable

##### Description

True if this input port is overwritable.

##### Data Type

Boolean

**Access**

RW for MATLAB S functions, R0 for other blocks.

**Version History**

Introduced before R2006a

## Simulink.BlockCompOutputPortData

Provide postcompilation information about block output port

### Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the “OutputPort” on page 5-514 method of a block's run-time object after the model containing the block has been compiled.

### Parent

Simulink.BlockPortData

### Children

None

### Property Summary

| Name                     | Description                                            |
|--------------------------|--------------------------------------------------------|
| “Reusable” on page 5-216 | Specifies whether an output port's memory is reusable. |

### Properties

#### Reusable

##### Description

Specifies whether an output port's memory is reusable. Options are: `NotReusableAndGlobal` and `ReusableAndLocal`.

##### Data Type

character vector

##### Access

RW for MATLAB S functions, RO for other blocks.

# Simulink.BlockData

Provide run-time information about block-related data, such as block parameters

## Description

This class defines properties that are common to objects that provide run-time information about a block's ports and work vectors.

## Parent

None

## Children

Simulink.BlockPortData, Simulink.BlockCompDworkData

## Property Summary

| Name                                     | Description                                       |
|------------------------------------------|---------------------------------------------------|
| "AliasedThroughDataType" on page 5-207   | Fundamental base data type.                       |
| "AliasedThroughDataTypeID" on page 5-208 | Fundamental base data type ID.                    |
| "Complexity" on page 5-208               | Numeric type (real or complex) of the block data. |
| "Data" on page 5-208                     | The block data.                                   |
| "DataAsDouble" on page 5-209             | The block data in double form.                    |
| "Datatype" on page 5-209                 | Data type of the block data.                      |
| "DatatypeID" on page 5-209               | Index of the data type of the block data.         |
| "Dimensions" on page 5-210               | Dimensions of the block data.                     |
| "Name" on page 5-210                     | Name of the block data.                           |
| "Type" on page 5-210                     | Type of block data (e.g., a parameter).           |

## Properties

### AliasedThroughDataType

#### Description

Data type aliases allow a data type (B) to be recursively aliased to another alias type or `BaseType` (A). If alias type A is aliased to another alias type that is aliased to another alias type and so forth, this property allows the alias type to be iteratively searched (aliased through) until the type is no longer an alias type and that final result is the value of the property returned. For example, assume that you have created the Simulink Alias types A and B as follows:

```
A=Simulink.AliasType('double')
```

A =

```
Simulink.AliasType
 Description: ''
 HeaderFile: ''
 BaseType: 'double'
B=Simulink.AliasType('A')

B =
Simulink.AliasType
 Description: ''
 HeaderFile: ''
 BaseType: 'A'
```

If the data type of an item of block data is B, this property returns the base type A instead of B.

**Data Type**

character vector

**Access**

R0

**AliasedThroughDataTypeID****Description**

Index of the data type alias returned by the `AliasedThroughDataType` property.

**Data Type**

integer

**Access**

R0

**Complexity****Description**

Numeric type (real or complex) of the block data.

**Data Type**

character vector

**Access**

RW for MATLAB S functions, R0 for other blocks.

**Data****Description**

The block data.

**Data Type**

The data type specified by the “Datatype” on page 5-209 or “DatatypeID” on page 5-209 properties of this object.

**Access**

RW

**DataAsDouble****Description**

The block data's in double form.

**Data Type**

double

**Access**

R0

**Datatype****Description**

Data type of the values of the block-related object.

**Data Type**

character vector

**Access**

R0

**DatatypeID****Description**

Index of the data type of the values of the block-related object. enter the numeric value for the desired data type, as follows:

| Data Type                           | Value |
|-------------------------------------|-------|
| 'inherited'                         | -1    |
| 'double'                            | 0     |
| 'single'                            | 1     |
| 'int8'                              | 2     |
| 'uint8'                             | 3     |
| 'int16'                             | 4     |
| 'uint16'                            | 5     |
| 'int32'                             | 6     |
| 'uint32'                            | 7     |
| 'boolean' or fixed-point data types | 8     |

**Data Type**

integer

**Access**

RW for MATLAB S functions, R0 for other blocks

**Dimensions****Description**

Dimensions of the block-related object, e.g., parameter or DWork vector.

**Data Type**

array

**Access**

RW for MATLAB S functions, R0 for other blocks

**Name****Description**

Name of block-related object, e.g., a block parameter or DWork vector.

**Data Type**

character vector

**Access**

RW for MATLAB S functions, R0 for other blocks

**Type****Description**

Type of block data. Possible values are:

| Type                          | Description                                                                  |
|-------------------------------|------------------------------------------------------------------------------|
| 'BlockPreCompInputPortData '  | This object contains data for an input port before the model is compiled.    |
| 'BlockPreCompOutputPortData ' | This object contains data for an output port before the model is compiled.   |
| 'BlockCompInputPortData '     | This object contains data for an input port after the model is compiled.     |
| 'BlockCompOutputPortData '    | This object contains data for an output port after the model is compiled.    |
| 'BlockPreCompDworkData '      | This object contains data for a DWork vector before the model is compiled.   |
| 'BlockCompDworkData '         | This object contains data for a DWork vector after the model is compiled.    |
| 'BlockDialogPrmData '         | This object describes a dialog box parameter of a Level-2 MATLAB S-function. |

| Type                      | Description                                                                                      |
|---------------------------|--------------------------------------------------------------------------------------------------|
| 'BlockRuntimePrmData'     | This object describes a run-time parameter of a Level-2 MATLAB S-function.                       |
| 'BlockCompContStatesData' | This object describes the continuous states of the block at the current time step.               |
| 'BlockDerivativesData'    | This object describes the derivatives of the block's continuous states at the current time step. |

**Data Type**

character vector

**Access**

R0

**Version History**

Introduced before R2006a

## Simulink.BlockPortData

Describe block input or output port

### Description

This class defines properties that are common to objects that provide run-time information about a block's ports.

### Parent

Simulink.BlockData

### Children

Simulink.BlockPreCompInputPortData, Simulink.BlockPreCompOutputPortData, Simulink.BlockCompInputPortData, Simulink.BlockCompOutputPortData

### Property Summary

| Name                            | Description                                                                             |
|---------------------------------|-----------------------------------------------------------------------------------------|
| "IsBus" on page 5-212           | True if this port is connected to a bus.                                                |
| "IsSampleHit" on page 5-212     | True if this port produces output or accepts input at the current simulation time step. |
| "SampleTime" on page 5-213      | Sample time of this port.                                                               |
| "SampleTimeIndex" on page 5-213 | Sample time index of this port.                                                         |

### Properties

#### IsBus

##### Description

True if this port is connected to a bus.

##### Data Type

Boolean

##### Access

R0

#### IsSampleHit

##### Description

True if this port produces output or accepts input at the current simulation time step.

**Data Type**

Boolean

**Access**

R0

**SampleTime****Description**

Sample time of this port.

**Data Type**

[period offset] where period and offset are values of type double. See “Specify Sample Time” for more information.

**Access**

RW for MATLAB S functions, R0 for other blocks

**SampleTimeIndex****Description**

Sample time index of this port.

**Data Type**

integer

**Access**

R0

**Version History**

Introduced before R2006a

## Simulink.BlockPreComplInputPortData

Provide precompilation information about block input port

### Description

Simulink software returns an instance of this class when a MATLAB program, e.g., a Level-2 MATLAB S-function, invokes the “InputPort” on page 5-513 method of a block's run-time object before the model containing the block has been compiled.

### Parent

Simulink.BlockPortData

### Children

None

### Property Summary

| Name                              | Description                               |
|-----------------------------------|-------------------------------------------|
| “DirectFeedthrough” on page 5-214 | True if this port has direct feedthrough. |
| “Overwritable” on page 5-214      | True if this port is overwritable.        |

### Properties

#### DirectFeedthrough

##### Description

True if this input port has direct feedthrough.

##### Data Type

Boolean

##### Access

RW for MATLAB S functions, R0 for other blocks

#### Overwritable

##### Description

True if this input port is overwritable.

##### Data Type

Boolean

**Access**

RW for MATLAB S functions, R0 for other blocks

**Version History**

Introduced before R2006a

# Simulink.Breakpoint class

**Package:** Simulink

Store and share data for a breakpoint set, configure the data for ASAP2 and AUTOSAR code generation

## Description

An object of the `Simulink.Breakpoint` class stores breakpoint set data for a lookup table. You can use that data in one or more Prelookup blocks. With the object, you can specify a data type and code generation settings for the breakpoint set and share the set between multiple lookup tables. Use `Simulink.Breakpoint` objects and `Simulink.LookupTable` objects to configure COM\_AXIS code generation for calibration.

The code generated for a `Simulink.Breakpoint` object is an array or a structure with two fields. If you configure the object to appear as a structure, one field stores the specified breakpoint set data and one scalar field stores the number of elements in the breakpoint set data. You can configure the structure type name, the field name, and other characteristics by using the properties of the object.

To package lookup table and breakpoint set data into a single structure in the generated code, for example, for STD\_AXIS code generation, use a `Simulink.LookupTable` object to store all of the data. See “Package Shared Breakpoint and Table Data for Lookup Tables”.

To subclass from `Simulink.Breakpoint` and inherit from this base class, type this syntax as the first line of your class definition file, where *myBreakpoint* is the name of your new class:

```
classdef myBreakpoint < Simulink.Breakpoint
```

For an example on subclassing, see “Define Data Classes”.

If you add properties to the subclass, you can see them by displaying the subclass object at the MATLAB command line. In the property dialog box, these properties display in a new tab.

## Construction

`BpSet = Simulink.Breakpoint` returns a `Simulink.Breakpoint` object named `BpSet` with default property values.

To create a `Simulink.Breakpoint` object by using the Model Explorer, use the button  on the toolbar. The default name for the object is `Object`.

## Property Dialog Box

### Breakpoints

The breakpoint set information. You can configure these characteristics:

#### Support tunable size

Specification to enable tuning the effective size of the table in the generated code. If you select this option, in the generated code, the `Simulink.Breakpoint` object appears as a structure variable. The structure has one field to store the breakpoint vector data and one field to store the number of elements in the breakpoint vector. You can change the value of the second field to adjust the effective size of the table.

If you clear this option, the `Simulink.Breakpoint` object appears in the generated code as a separate array variable instead of a structure.

#### Value

Breakpoint set data. Specify a vector with at least two elements.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector. When you click **Apply** or **OK**, the object executes the expression and uses the result to set the value of this property.

When you set **Data type** to `auto`, to set **Value**, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

You can edit this data by using a more intuitive interface in a lookup table block. See “Import Lookup Table Data from MATLAB”.

#### Data type

Data type of the breakpoint set. The default setting is `auto`, which means that the breakpoint set acquires a data type from the value that you specify in **Value**. If you use an untyped expression such as `[1 2 3]` to set **Value**, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object. Enumerated data types are also supported.

You can explicitly specify an integer data type, half data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

### Dimensions

Dimension lengths of the breakpoint set.

To use symbolic dimensions, specify a character vector. See “Implement Symbolic Dimensions for Array Sizes in Generated Code” (Embedded Coder).

### Min

Minimum value of the elements in the breakpoint set. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

### Max

Maximum value of the elements in the breakpoint set. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

### Stored Int Min

For `Simulink.Breakpoint` objects with a fixed-point data type, the minimum value of the elements in the breakpoint set, specified as a stored integer value. The value is derived from the real-world value **Min**. This property is available only in the property dialog box.

### Stored Int Max

For `Simulink.Breakpoint` objects with a fixed-point data type, the maximum value of the elements in the breakpoint set, specified as a stored integer value. The value is derived from the real-world value **Max**. This property is available only in the property dialog box.

### Unit

Physical unit of the elements in the breakpoint set. You can specify text such as `degC`. See “Unit Specification in Simulink Models”.

### Field name

Name of a structure field in the generated code. This field stores the breakpoint set data. The default value is `BP`. To change the field name, specify text.

This column appears only if you select **Support tunable size**.

### Tunable size name

Name of a structure field in the generated code. This scalar field stores the length of the breakpoint set (the number of elements), which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory. The default name is `N`. To change the field name, specify text.

This column appears only if you select **Support tunable size**.

**Description**

Description of the breakpoint set. You can specify text such as `This breakpoint set represents the pressure input`.

**Data definition: Storage class**

Storage class of the structure variable (if you select **Support tunable size**) or array variable in the generated code. The variable stores the breakpoint set data. The default setting is `Auto`.

For more information about storage classes, see “C Code Generation Configuration for Model Interface Elements” (Simulink Coder).

If you have Embedded Coder, you can choose a custom storage class. For information about custom storage classes, see “Organize Parameter Data into a Structure by Using Struct Storage Class” (Embedded Coder).

**Data definition: Identifier**

Alternative name for the variable in the generated code. The default value is empty, in which case the generated code uses the name of the `Simulink.Breakpoint` object as the name of the variable. To set the identifier, specify text.

To enable this property, set **Data definition: Storage class** to a setting other than `Auto`.

**Data definition: Alignment**

Data alignment boundary in the generated code. The starting memory address for the data allocated for the structure or array variable is a multiple of the value that you specify. The default value is `-1`, which allows the code generator to determine an optimal alignment based on usage.

Specify a positive integer that is a power of 2, not exceeding 128. For more information about using data alignment for code replacement, see “Data Alignment for Code Replacement” (Embedded Coder).

**Struct Type definition: Name**

Name of the structure type that the structure variable uses in the generated code. The default value is empty. Specify text.

This property appears only if you select **Support tunable size**.

**Struct Type definition: Data scope**

Scope of the structure type definition (imported from your handwritten code or exported from the generated code). The default value is `Auto`. When you select `Auto`:

- If you do not specify a value in the **Struct Type definition: Header file** box, the generated code exports the structure type definition to the file `model_types.h`. `model` is the name of the model.
- If you specify a value in the **Struct Type definition: Header file** box, such as `myHdr.h`, the generated code imports the structure type definition from `myHdr.h`.

To explicitly specify the data scope:

- To import the structure type definition into the generated code from your custom code, select `Imported`.
- To export the structure type definition from the generated code, select `Exported`.

Set the data scope of the structure type definition to `Imported` or `Exported` to avoid potential MISRA C:2012 violations.

If you do not specify a value in the **Struct Type definition: Header file** box, the generated code imports or exports the type definition from or to `StructName.h`. `StructName` is the name that you specify with the property **Struct Type definition: Name**.

This property appears only if you select **Support tunable size**.

### **Struct Type definition: Header file**

Name of the header file that contains the structure type definition. You can import the definition from a header file that you create, or export the definition into a generated header file. To control the scope of the structure type, adjust the setting for the **Struct Type definition: Data scope** property.

This property appears only if you select **Support tunable size**.

## **Properties**

### **Breakpoints — Breakpoint set data**

`Simulink.lookuptable.Breakpoint` object

Breakpoint set data, specified as a `Simulink.lookuptable.Breakpoint` object. Use this embedded object to configure the structure field names and characteristics of the breakpoint set data such as breakpoint values, data type, and dimensions.

### **CoderInfo — Code generation settings for variable**

`Simulink.CoderInfo` object

Code generation settings for the structure variable (if you set `SupportTunableSize` to `true`) or array variable (`false`) that stores the breakpoint set data, specified as a `Simulink.CoderInfo` object. You can specify a storage class or custom storage class by using this embedded object. For more information, see `Simulink.CoderInfo`.

### **StructTypeInfo — Settings for structure type in the generated code**

`Simulink.lookuptable.StructTypeInfo` object

Settings for the structure type that the structure variable uses in the generated code, specified as a `Simulink.lookuptable.StructTypeInfo` object.

If you set `SupportTunableSize` to `false`, the `Simulink.Breakpoint` object does not appear in the generated code as a structure. The code generator ignores this property.

### **SupportTunableSize — Option to generate code that enables tunability of table size**

`false` (default) | `true`

Option to generate code that enables tunability of the effective size of the table, specified as `true` or `false`. See the **Support Tunable Size** parameter.

Data Types: `logical`

## **Copy Semantics**

Handle. To learn how handle classes affect copy operations, see `Copying Objects`.

## Examples

### Share Breakpoint Data Between One-Dimensional Lookup Tables

- 1 Create a `Simulink.Breakpoint` object named `myBpSet`.

```
myBpSet = Simulink.Breakpoint
```

- 2 Specify the breakpoint data.

```
myBpSet.Breakpoints.Value = [-2 -1 0 1 2];
```

- 3 Create a `Simulink.LookupTable` object named `FirstLUTObj`.

```
FirstLUTObj = Simulink.LookupTable;
```

- 4 Specify the table data.

```
FirstLUTObj.Table.Value = [1.1 2.2 3.3 4.4 5.5];
```

- 5 Set first `FirstLUTObj` to Reference.

```
FirstLUTObj.BreakpointsSpecification = 'Reference';
```

- 6 Configure the lookup table object to refer to the breakpoint set object.

```
FirstLUTObj.Breakpoints = {'myBpSet'};
```

- 7 Create another `Simulink.LookupTable` object to store a different set of table data. Configure the lookup table object to refer to the same breakpoint set object.

```
SecondLUTObj = Simulink.LookupTable;
SecondLUTObj.Table.Value = [1.2 2.3 3.4 4.5 5.6];
SecondLUTObj.BreakpointsSpecification = 'Reference';
SecondLUTObj.Breakpoints = {'myBpSet'};
```

You can use `FirstLUTObj` and `SecondLUTObj` to specify the table data in two different Interpolation Using Prelookup blocks. Use `myBpSet` to specify the breakpoint set data in one or two Prelookup blocks that provide the inputs for the Interpolation Using Prelookup blocks.

## Limitations

- You cannot generate code according to the `FIX_AXIS` style.
- When blocks in a subsystem use `Simulink.LookupTable` or `Simulink.Breakpoint` objects, you cannot set data type override (see “Control Fixed-Point Instrumentation and Data Type Override”) only on the subsystem. Instead, set data type override on the entire model.

## Version History

Introduced in R2016b

## Simulink.CodeImporter class

**Package:** Simulink

Import custom C/C++ code into Simulink

### Description

Use the `Simulink.CodeImporter` class to import custom C/C++ code into Simulink for modeling, verification, and validation. Instances of this class are used to specify custom code to import into Simulink.

The `Simulink.CodeImporter` class is a handle class.

### Creation

#### Description

`obj = Simulink.CodeImporter()` creates an instance of the `CodeImporter` with the `LibraryFileName` property set to "untitled".

`obj = Simulink.CodeImporter(LibName)`, where `LibName` is a file name chosen by the user and specified as a string or character vector, creates an instance of the `CodeImporter` with the `LibraryFileName` property set to `LibName`.

### Properties

#### **LibraryFileName — Name of Simulink library file and generated artifacts**

"untitled" (default) | string | character vector

Name of Simulink library file and generated artifacts created for the imported code, specified as a string or a character vector. Name must be a valid MATLAB variable name. The same file name is used with different extensions for the data dictionary and other artifacts generated when code is imported.

Example: "pumpController"

Data Types: string | character vector

#### **OutputFolder — Location of generated library file and generated artifacts**

"" (default) | string | character vector

Location of generated library file and generated artifacts, specified as a string or a character vector. If left blank, the current MATLAB folder is used.

File locations that are part of the `CustomCode` property can be specified relative to this folder.

Example: "C:\HeatPump\Controller"

Data Types: string | character vector

**CustomCode — Custom C or C++ code files and associated properties to import**

CustomCode object

C or C++ code files and associated properties to import, specified as an object of class `Simulink.CodeImporter.CustomCode`. Use this property to specify code importing options, such as source and header files, folder paths, libraries, and compiler and linker flags. For information, see `Simulink.CodeImporter.CustomCode`.

Example:

```
%% Create code importer object
obj = Simulink.CodeImporter;

%% Set the custom code to import
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = ["/include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];
obj.CustomCode
```

ans =

CustomCode with properties:

```
 SourceFiles: ["src/pumpController.c" "src/utils.c"]
InterfaceHeaders: "pumpController.h"
 IncludePaths: "./include"
 Libraries: [1x0 string]
 Defines: [1x0 string]
 Language: "C"
 CompilerFlags: [1x0 string]
 LinkerFlags: [1x0 string]
GlobalVariableInterface: 0
FunctionArrayLayout: NotSpecified
```

**ParseInfo — Information regarding parsed custom code**

Simulink.CodeImporter.ParseInfo object

Information regarding the parsed custom code, specified as an object of class `Simulink.CodeImporter.ParseInfo`. This property is read-only. Parsing needs to be successful to obtain information regarding custom code. For information, see `Simulink.CodeImporter.ParseInfo`.

Example:

```
s = obj.parse;
obj.ParseInfo
```

ans =

ParseInfo with properties:

```
 Success: 1
AvailableFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
EntryFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
AvailableTypes: "pump_control_bus"
 Errors: []
```

**Options — Additional options used by Code Importer during import for library creation**

Options object

Additional options used by Code Importer during import for library creation, specified as an object of class `Simulink.CodeImporter.Options`. Use this object to change the default values for the size of an argument passed by a pointer to a function, and the Simulink library browser name. For information, see `Simulink.CodeImporter.Options`.

Example:

```
>> obj.Options
ans =

Options with properties:

 PassByPointerDefaultSize: "-1"
 CreateTestHarness: 0
 LibraryBrowserName: ""
 SimulateInSeparateProcess: 0
 UndefinedFunctionHandling: "FilterOut"

>> obj.Options.LibraryBrowserName = "Controller Library";
>> obj.Options
ans =

Options with properties:

 PassByPointerDefaultSize: "-1"
 CreateTestHarness: 0
 LibraryBrowserName: "Controller Library"
 SimulateInSeparateProcess: 0
 UndefinedFunctionHandling: "FilterOut"
```

**Methods****Public Methods**

|                                      |                                                                                    |
|--------------------------------------|------------------------------------------------------------------------------------|
| <code>parse</code>                   | Analyze custom code for functions, types, global variables, and their dependencies |
| <code>import</code>                  | Import custom code, functions, and types into Simulink                             |
| <code>addToProject</code>            | Add custom code and imported artifacts to MATLAB project                           |
| <code>view</code>                    | Launch Simulink Code Importer wizard                                               |
| <code>save</code>                    | Save import settings to JSON format text file                                      |
| <code>load</code>                    | Load import settings from saved import settings file                               |
| <code>computeInterfaceHeaders</code> | Compute interface headers from specified source files                              |

**Examples****Import Custom Code**

Specify location and options for custom code.

```
%% Create code importer object
obj = Simulink.CodeImporter('PumpController');
```

```

%% Set the custom code to import
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = ["/include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];

%% Specify name for Library Browser
obj.Options.LibraryBrowserName = "Controller Library";

Parse custom code and examine results.

%% Parse custom code
s = obj.parse;
obj.ParseInfo

ans =

 ParseInfo with properties:

 Success: 1
 AvailableFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
 EntryFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
 AvailableTypes: "pump_control_bus"
 Errors: []

Import parsed code into Simulink

%% Import code
s = obj.import;

```

## Version History

Introduced in R2021a

### Topics

“Import Custom C/C++ Code Using the Simulink Code Importer”

# addToProject

**Package:** Simulink

Add custom code and imported artifacts to MATLAB project

## Syntax

```
success = obj.addToProject(ProjectFilePath)
```

## Description

`success = obj.addToProject(ProjectFilePath)`, where `obj` is an object of class `Simulink.CodeImporter` or `sltest.CodeImporter`, adds the specified custom C/C++ code and the artifacts generated when importing custom code (using the `import` method) to an existing MATLAB project. Generated artifacts include a Simulink library and a data dictionary, and for objects of class `sltest.CodeImporter`, a sandbox folder. If you choose to generate a test harness and test files for the imported blocks, generated artifacts also include Simulink Test™ files (Simulink Test license required).

Invoke `addToProject` only after a successful import of custom code.

## Input Arguments

### **ProjectFilePath** — Name of existing MATLAB project

character vector | string scalar

Name of existing MATLAB project, specified as a character vector or string scalar. The path can be a full path or a path relative to the current MATLAB folder. For `addToProject` to be successful, all custom code files and the Simulink library and other generated artifacts must be located in either the same folder as the MATLAB project or in direct or indirect subfolders of that folder.

Data Types: character vector | string scalar

## Output Arguments

### **success** — Success indicator

logical scalar

Success indicator of whether code and artifacts are added to project, returned as a logical scalar. If not successful, Simulink throws an error.

## Version History

Introduced in R2021a

## See Also

`Simulink.CodeImporter`

# computeInterfaceHeaders

**Class:** Simulink.CodeImporter

**Package:** Simulink

Compute interface headers from specified source files

## Syntax

```
listOfHdr = obj.computeInterfaceHeaders()
```

## Description

`listOfHdr = obj.computeInterfaceHeaders()`, where `obj` is an object of class `Simulink.CodeImporter`, computes the interface header information for the custom code specified in the `CustomCode` of `obj`.

## Output Arguments

**listOfHdr** — List of interface header files

string array

List of interface header files computed from specified custom code, returned as a string array. This value can be used to populate the `InterfaceHeader` property of the `CustomCode` property of `obj`.

## Version History

Introduced in R2021b

## See Also

`Simulink.CodeImporter` | `Simulink.CodeImporter.CustomCode`

# import

**Package:** Simulink

Import custom code, functions, and types into Simulink

## Syntax

```
success = obj.import()
success = obj.import(Name1,Value1,...,NameN,ValueN)
```

## Description

`success = obj.import()`, where `obj` is an object of class `Simulink.CodeImporter`, parses the specified custom code and imports it into Simulink with default import options. If the custom code was not previously parsed or if the custom code or the settings of `obj.CustomCode` have changed since the custom code was parsed, then the `ParseInfo` property of `obj` is populated or repopulated with the information resulting from the parse.

`success = obj.import(Name1,Value1,...,NameN,ValueN)` parses the specified custom code and imports it into Simulink with options based on the specified name-value arguments.

## Examples

### Import Custom Code

Specify location and options for custom code, then import the code into Simulink.

```
%% Create code importer object
obj = Simulink.CodeImporter;

%% Set library file name and output folder
obj.LibraryFileName = "pumpController";
obj.OutputFolder = ".";

%% Set the custom code to import
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = ["/include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];

%% Parse custom code and configure function
obj.parse();
fcn = obj.ParseInfo.getFunctions("Controller");
fcn.PortSpecification.ReturnArgument.Label = "control_out";

%% Import function "Controller"
obj.import('Functions', ["Controller"]);
```

## Input Arguments

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose `Name` in quotes.*

Example: `obj.import('Functions',["Controller"],'EntryFunctionsOnly','On');`

### EntryFunctionsOnly — Option to limit import to entry-point functions

'On' (default) | 'Off'

Option to limit import to entry-point functions, specified as 'On' or 'Off'. If specified as 'On', only entry-point functions from the custom code, that is, functions not called by other functions in the custom code, are imported into the Simulink library. Otherwise, all available custom code functions are imported.

Data Types: char | string

### Functions — Functions to import

"" (default) | cell array of character vectors | string array

Functions to import, specified as a cell array of character vectors or a string array. Specify this argument to limit import to the named custom code functions. Otherwise, all available custom code functions or all available entry-point custom code functions are imported.

Data Types: char | string

### Types — Additional types to import

"" (default) | cell array of character vectors | string array

Additional types to import, specified as a cell array of character vectors or a string array. All types required by the imported functions are imported. Additional types are defined in the interface headers.

Data Types: char | string

### Overwrite — Option to overwrite existing Simulink library

'Off' (default) | 'On'

Option to overwrite existing Simulink library with the same name as the name specified in the `LibraryFileName` property, specified as 'On' or 'Off'. If set to 'Off' and there is an existing Simulink library with the same name, custom code is imported into the existing library without changing block settings applied in the library after previous imports of custom code. If set to 'On', the existing library is overwritten by the library created from the custom code import, and any prior changes to the existing library are lost. If there is no existing Simulink library with the same name, a new library is created.

Data Types: char | string

### AddToProject — Option to add custom code and generated artifacts to existing MATLAB project

project file path

Option to add custom code and generated artifacts to existing MATLAB project, specified as a file path. Artifacts include a library file for imported functions and a data dictionary for imported types. If `obj.Options.CreateTestHarness` is set to `true` and Simulink Test is installed, artifacts also include a Simulink Test file.

Data Types: `char` | `string`

## Output Arguments

### **success — Whether import is successful**

logical scalar

Whether import is successful, specified as a logical scalar. Simulink throws an exception if the import is unsuccessful.

## Version History

**Introduced in R2021a**

### See Also

`Simulink.CodeImporter.ParseInfo` | `Simulink.CodeImporter.Options` |  
`Simulink.CodeImporter.CustomCode` | `Simulink.CodeImporter`

# load

**Class:** Simulink.CodeImporter

**Package:** Simulink

Load import settings from saved import settings file

## Syntax

```
success = obj.load(filename)
```

## Description

`success = obj.load(filename)`, where `obj` is an object of class `Simulink.CodeImporter`, loads import settings from a saved import settings JSON file, `filename`, created using the `save` method.

## Input Arguments

**filename** — Name or path of file with saved import settings

character vector | string scalar

Name or path of JSON file with saved import settings, specified as a character vector or string scalar.

Example: `'importsettings.json'`

Data Types: `char` | `string`

## Output Arguments

**success** — Indicator of whether loading import settings is successful

logical scalar

Indicator of whether loading import settings is successful, returned as a logical scalar.

## Version History

Introduced in R2020a

## See Also

`Simulink.CodeImporter`

## parse

**Package:** Simulink

Analyze custom code for functions, types, global variables, and their dependencies

### Syntax

```
success = obj.parse()
success = obj.parse('Force', 'On')
success = obj.parse('Force', 'Off')
```

### Description

`success = obj.parse()`, where `obj` is an object of `Simulink.CodeImporter` or `sltest.CodeImporter` class, parses the custom code, but does not re-parse the custom code if the custom code has been parsed previously and neither the custom code nor the settings of `obj.CustomCode` have changed since the previous parse. Results of a successful parse or error information from an unsuccessful parse are stored in the `ParseInfo` property of `obj`.

`success = obj.parse('Force', 'On')` parses the custom code irrespective of whether any changes have been made since a previous parse.

`success = obj.parse('Force', 'Off')` has the same effect as `success = obj.parse()`.

### Examples

#### Parse Custom Code

```
%% Create code importer object
obj = Simulink.CodeImporter;

%% Set the custom code to import
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = [".include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];

%% Parse custom code
s = obj.parse;
obj.ParseInfo

ans =

 ParseInfo with properties:

 Success: 1
 AvailableFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
 EntryFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
 AvailableTypes: "pump_control_bus"
 Errors: []
```

## Output Arguments

### **success** — Indicator of whether parsing is successful

logical scalar

Indicator of whether parsing is successful, returned as a logical scalar. Simulink throws an exception if parsing is unsuccessful.

## Version History

**Introduced in R2021a**

### **See Also**

`Simulink.CodeImporter`

## save

**Class:** Simulink.CodeImporter

**Package:** Simulink

Save import settings to JSON format text file

### Syntax

```
filepath = obj.save(filename)
filepath = obj.save(filename, 'Overwrite', 'Off')
filepath = obj.save(filename, 'Overwrite', 'On')
```

### Description

`filepath = obj.save(filename)` or `filepath = obj.save(filename, 'Overwrite', 'Off')`, where `obj` is an object of class `Simulink.CodeImporter`, saves import settings in JSON format to the specified file `filename` and returns the full path to the saved file. Import settings include `LibraryFileName`, `OutputFolder`, `CustomCode`, `Options`, selected functions and types, and function configurations. You can subsequently load the settings from this file using the `load` method.

`filepath = obj.save(filename, 'Overwrite', 'On')` overwrites the specified file `filename` if the file already exists.

### Input Arguments

**filename** — Name or path of file to be used to save import settings

character vector | string scalar

Name or path of file to be used to save import settings, specified as a character vector or string scalar.

Example: `'importsettings.json'`

Data Types: `char` | `string`

### Output Arguments

**filepath** — Full path to saved file

character vector

Full path to saved file, returned as a character vector.

## Version History

Introduced in R2020a

**See Also**

Simulink.CodeImporter

## view

**Package:** Simulink

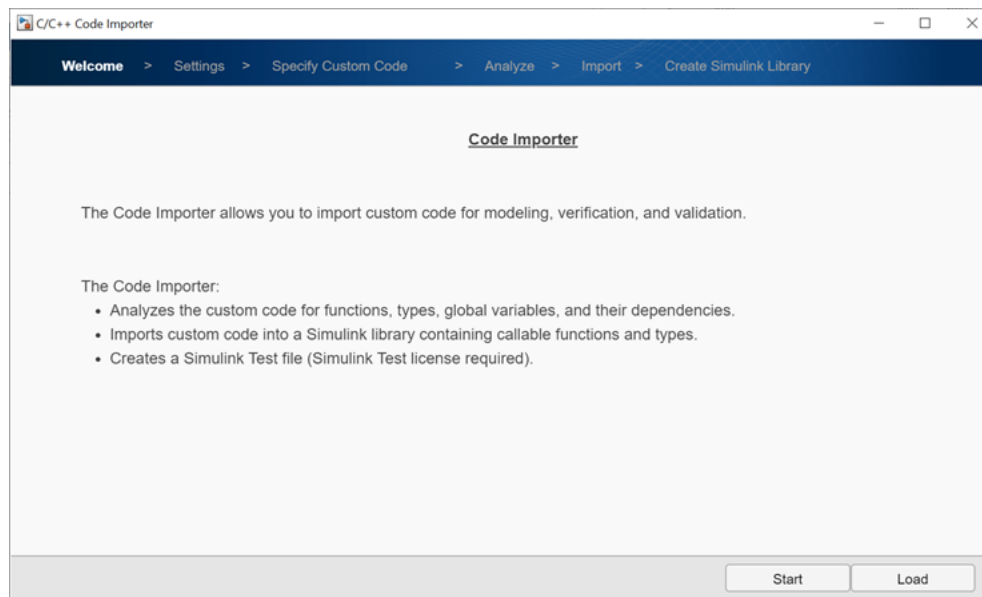

Launch Simulink Code Importer wizard

## Syntax

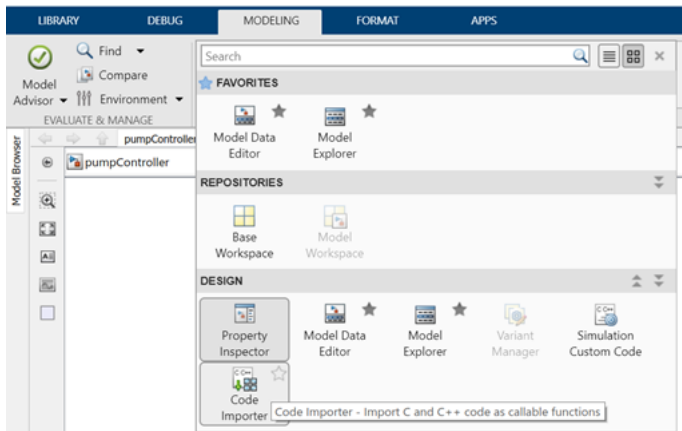

`obj.view`

## Description

`obj.view`, where `obj` is an object of `Simulink.CodeImporter` class, launches the Simulink Code Importer wizard, a graphical user interface for the Simulink Code Importer. A series of screens leads you through the process of creating a Simulink library from your custom code.

**Note** You can also launch the Simulink Code Importer wizard from within Simulink. On the Simulink toolstrip, go to the **Modeling** tab. From **Design**, select Code Importer.

`Simulink.CodeImporter`

## Simulink.CodeImporter.CustomCode class

**Package:** Simulink.CodeImporter

Specify custom code settings for Simulink.CodeImporter and sltest.CodeImporter classes

### Description

The Simulink.CodeImporter.CustomCode class is a handle class.

### Creation

When you create an object of class Simulink.CodeImporter, an object of class Simulink.CodeImporter.CustomCode is automatically created as the CustomCode property of that object. Do not create an object of class Simulink.CodeImporter.CustomCode directly.

### Properties

---

**Note** The first four properties listed below (SourceFiles, InterfaceHeaders, IncludePaths, and Libraries) let you specify file path information about the location of your custom code. To enable portability, specify this information as a file path relative to the folder specified in the OutputFolder property of the relevant Simulink.CodeImporter object rather than as an absolute path.

---

#### SourceFiles — Source files to be imported

cell array of character vectors | string array

Source files to be imported, specified as a cell array of character vector or a string array. Supported files include .c and .cpp files. Each file name can be specified as a path relative to the folder specified in the OutputFolder property of the relevant Simulink.CodeImporter object or as an absolute path.

Providing a value for SourceFiles is optional for Simulink.CodeImporter and optional for sltest.CodeImporter when the TestType is IntegrationTest.

Example: {'foo.c', 'bar.c'}

Example: ['.\\foo.c', '..\\bar.c']

Example: fullfile(pwd, 'Src', 'foo.c')

Data Types: cell array of character vectors | string array

#### InterfaceHeaders — Interface headers to be imported

cell array of character vectors | string array

Interface headers to be imported, specified as a cell array of character vectors or a string array. Supported files include .h and .hpp files. Each file name can be specified as a path relative to the folder specified in the OutputFolder property of the relevant Simulink.CodeImporter object or

as an absolute path. Interface headers should contain the function declarations and type definitions that you want to bring into Simulink. These declarations and definitions are usually contained in the export header of your C code library.

Example: {'foo.h', 'bar.h'}

Example: [".\foo.h", "..\bar.h"]

Example: fullfile(pwd, 'Hdr', 'foo.h')

Data Types: cell array of character vectors | string array

### **IncludePaths — Folders containing included header files**

cell array of character vectors | string array

Folders containing included header files for the parser to find, specified as a cell array of character vectors or a string array. Each folder path can be specified as a path relative to the folder specified in the `OutputFolder` property of the relevant `Simulink.CodeImporter` object or as an absolute path.

Example: {'.', '..\..\'}

Example: [".\Include1", "..\Include2"]

Example: fullfile(pwd, 'Include1')

Data Types: cell array of character vectors | string array

### **Libraries — Libraries that contain custom object code to link**

cell array of character vectors | string array

Libraries that contain custom object code to link, specified as a cell array of character vectors or a string array. Supported files include `.obj`, `.dll`, `.lib`, `.so`, `.o`, `.a`, and `.dylib` files. Each file name can be specified as a path relative to the folder specified in the `OutputFolder` property of the relevant `Simulink.CodeImporter` object or as an absolute path.

Providing libraries is optional.

Example: {'foo.lib', 'foo.dll'}

Example: [".\foo.so", "..\bar.so"]

Data Types: cell array of character vectors | string array

### **Defines — Preprocessor macro definitions to be added to the compiler command line**

cell array of character vectors | string array

Preprocessor macro definitions to be added to the compiler command line, specified as a cell array of character vectors or a string array. `'-D'` is optional in defines.

Example: {'-D DEF1', '-D DEF2'}

Example: ["DEF1", "DEF2"]

Data Types: cell array of character vectors | string array

### **Language — Custom code language**

'C' (default) | 'C++'

Custom code language, specified as `'C'` or `'C++'`. C and C++ are the only supported languages.

Data Types: character vector | string scalar

### **CompilerFlags — Additional compiler flags**

cell array of character vectors | string array

Additional compiler flags to be added to the compiler command line, specified as a cell array of character vectors or a string array.

Example: {'/O2' , '/Og'}

Example: "-g"

Data Types: cell array of character vectors | string array

### **LinkerFlags — Additional linker flags**

cell array of character vectors | string array

Additional linker flags to be added to the linker command line, specified as a cell array of character vectors or a string array.

Example: {'/WX'}

Data Types: cell array of character vectors | string array

### **GlobalVariableInterface — Option to enable global variables as function interfaces**

false (default) | true

Option to enable global variables as function interfaces, specified as a logical scalar. If set to true, global variables accessed by the custom code functions will be treated as function interfaces in the generated Simulink library. See “Call C Caller Block and Specify Ports” and “Enable global variables as function interfaces”.

Data Types: logical scalar

### **FunctionArrayLayout — Default array layout for custom code functions**

NotSpecified (default) | RowMajor | ColumnMajor | Any

Default array layout for custom code functions to use to access input argument arrays, specified as **NotSpecified**, **RowMajor**, **ColumnMajor**, or **Any**. You can override the default for an individual function by using the `ArrayLayout` property of the `Simulink.CodeImporter.Function` object corresponding to that function. Matrix data passed to and from your C functions is converted to the function array layout you specify. See “Integrate C Code Using C Caller Blocks” and “Default function array layout”.

Data Types: enum

## **Examples**

### **Specify Custom Code for Import**

Create an object of class `Simulink.CodeImporter`. Set the properties of its `CustomCode` property to specify custom code to import into Simulink.

```
obj = Simulink.CodeImporter("pumpController");
```

```
obj.OutputFolder = ".";
```

```
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = [".include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];
```

## Version History

Introduced in R2021a

[Simulink.CodeImporter.SimulinkPortSpecification](#)

# Simulink.CodeImporter.Function class

**Package:** Simulink.CodeImporter

Access and configure detailed information about parsed custom code functions

## Description

Access detailed information about parsed custom code functions obtained from `Simulink.CodeImporter` or `sltest.CodeImporter` class instance. Configure information about custom code functions for importing into Simulink.

The `Simulink.CodeImporter.Function` class is a handle class.

## Creation

One or more objects of this class are automatically created when you invoke the `getFunctions` method of an object of class `Simulink.CodeImporter.ParseInfo`. A `Simulink.CodeImporter.Function` object is created for each function in the parsed custom code for which `getFunctions` is invoked. Do not create an object of class `Simulink.CodeImporter.Function` directly.

## Properties

### Name — Function name

string scalar

Function name, returned as a string scalar.

Example: "Controller"

Data Types: string scalar

### CPrototype — C prototype

string scalar

C prototype for function, returned as a string scalar.

Example: "pump\_control\_bus Controller(real\_T Tset, real\_T Troom\_in);"

Data Types: string scalar

### PortSpecification — Port specification of function

SimulinkPortSpecification object

Port specification of function, specified as an object of class `Simulink.CodeImporter.SimulinkPortSpecification`.

### IsEntry — Whether function is entry-point function

logical scalar

Whether function is an entry-point function, returned as a logical scalar. An entry-point function is not called by other functions in the custom code.

### **IsDefined — Whether function is defined**

logical scalar

Whether function is defined, returned as a logical scalar. This scalar indicates whether custom code contains a function body defining the function in addition to a function prototype defined in a header.

### **IsDeterministic — Whether function is deterministic**

logical scalar

Whether function is deterministic, specified as a logical scalar. A deterministic function always produces the same outputs for the same input values. Specifying a function as deterministic enables the corresponding C Caller block to be used in a For Each subsystem and with continuous sample time, and optimizes the use of the block in conditional input branch execution. See “Deterministic functions”.

### **IsStub — Whether function is stubbed**

logical scalar

Whether function is stubbed, returned as a logical scalar. This scalar indicates whether, for a unit test, a stub for undefined symbols was generated for the function (Simulink Test license required).

### **ArrayLayout — Array layout for function**

NotSpecified (default) | ColumnMajor | RowMajor | Any

Array layout for function, returned as NotSpecified, ColumnMajor, RowMajor, or Any. If NotSpecified, then the default setting for the custom code as specified in the FunctionArrayLayout property of the relevant SimulinkCode.CustomCode object is used. Otherwise, the value specified for the function overrides the default.

Data Types: enum

## **Methods**

### **Public Methods**

|                 |                                                                                                                                                                                            |

## **Examples**

## Parse Custom Code Functions

Specify and parse custom code, then query information regarding custom code functions.

```
obj = Simulink.CodeImporter;

%% Set library file name and output folder
obj.LibraryFileName = "pumpController";
obj.OutputFolder = ".";

%% Set the custom code to import
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = [".include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];

%% Parse code
obj.parse;
parseobj = obj.ParseInfo

ans =

 ParseInfo with properties:

 Success: 1
 AvailableFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
 EntryFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
 AvailableTypes: "pump_control_bus"
 Errors: []

fcnobj = parseobj.getFunctions(["Controller"])

fcnobj =

 Function with properties:

 Name: "Controller"
 CPrototype: "pump_control_bus Controller(real_T Tset, real_T Troom_in);"
 PortSpecification: [1x1 Simulink.CodeImporter.SimulinkPortSpecification]
 IsEntry: 1
 IsDefined: 1
 IsStub: 0
 ArrayLayout: NotSpecified
 IsDeterministic: 0
```

## Version History

Introduced in R2021a

 Simulink.CodeImporter.Options | Simulink.CodeImporter.ParseInfo |  
 Simulink.CodeImporter.SimulinkPortSpecification

# Simulink.CodeImporter.Options class

**Package:** Simulink.CodeImporter

Specify additional import options for Simulink.CodeImporter and sltest.CodeImporter classes

## Description

Use the Simulink.CodeImporter class to specify options for importing custom code beyond what is specified in the CustomCode property of the relevant Simulink.CodeImporter object.

The Simulink.CodeImporter.Options class is a handle class.

## Creation

When you create an object of class Simulink.CodeImporter, an object of class Simulink.CodeImporter.Options is automatically created as the Options property of that object. Do not create an object of class Simulink.CodeImporter.Options directly.

## Properties

### PassByPointerDefaultSize — Default size of C argument passed by pointer to function

"-1" (default) | character vector | string scalar

Default size of C argument passed by pointer to function in the generated C Caller block port specifications, specified as a character vector or string scalar. By default, the value is set to "-1", meaning that the size is inherited. A value of "1" indicates that arguments passed by address to functions are scalars, unless you override this setting in the Simulink.CodeImporter.SimulinkPortSpecification corresponding to a particular function.

Data Types: char | string

### CreateTestHarness — Automatic creation of test harness during import

true or 1 (default) | false or 0

Automatic creation of test harness during import, specified as a logical 1 (true) or 0 (false). Specify whether the Simulink Code Importer should automatically create a test harness for each block in the generated Simulink library (Simulink Test license required).

Data Types: logical

### LibraryBrowserName — Name by which generated Simulink library appears in Simulink Library Browser

"" (default) | character vector | string scalar

Name by which generated Simulink library appears in Simulink Library Browser, specified as a character vector or string scalar. By default, the value is an empty string, meaning that the generated library does not appear in the Simulink Library Browser. If you specify a name, the Simulink Code Importer generates the file slblocks.m as part of the artifacts the Code Importer creates.

Example: "Controller Library"

Data Types: char | string

### **SimulateInSeparateProcess — Run custom code in separate process**

false or 0 (default) | true or 1

Run custom code in a separate process outside of MATLAB during model simulation, specified as logical 1 (true) or 0 (false). If this property is false, the custom code runs in the same process as the rest of the model during simulation. Simulations usually run faster, but run-time exceptions in the custom code can cause MATLAB to crash. If the property is true, custom code runs in a separate process during model simulation, which can prevent MATLAB from crashing due to run-time exceptions in the custom code or errors in the interface between Simulink and the custom code.

Data Types: logical

### **UndefinedFunctionHandling — How to manage undefined functions and variables**

"FilterOut" (default) | "ThrowError" | "DoNotDetect" | "UseInterfaceOnly"

How to manage undefined functions and variables, specified as:

| Value              | Purpose                                                                                                                                                                              |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| "FilterOut"        | Filter out undefined functions and variables. Simulink Code Importer does not bring undefined functions and variables into the generated Simulink library.                           |
| "ThrowError"       | Return an error if Simulink Code Importer detects an undefined function or variable.                                                                                                 |
| "DoNotDetect"      | Simulink Code Importer brings undefined functions and variables into the generated Simulink library, but does not automatically generate stub functions and variables equal to zero. |
| "UseInterfaceOnly" | Simulink Code Importer brings undefined functions and variables into the generated Simulink library, and generates stub functions and variables equal to zero.                       |

Data Types: enum

## **Examples**

### **Set Custom Code Options**

Create a Simulink.CodeImporter object and set options.

```
obj = Simulink.CodeImporter;
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = ["/include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];
obj.Options.LibraryBrowserName="Controller Library";
```

obj.Options

```
ans =
```

```
Options with properties:
```

```
 PassByPointerDefaultSize: "-1"
 CreateTestHarness: 1
 LibraryBrowserName: "Controller Library"
 SimulateInSeparateProcess: 0
 UndefinedFunctionHandling: "FilterOut"
```

## Version History

Introduced in R2021a

## Simulink.CodeImporter.ParseInfo class

**Package:** Simulink.CodeImporter

Information about parsed custom code

### Description

The `Simulink.CodeImporter.ParseInfo` class has read-only properties that store more information about the parsed custom code. Parsing needs to be successful to obtain information regarding custom code.

The `Simulink.CodeImporter.ParseInfo` class is a handle class.

### Creation

When you create an object of class `Simulink.CodeImporter`, an object of class `Simulink.CodeImporter.ParseInfo` is automatically created as the `ParseInfo` property of that object. Do not create an object of class `Simulink.CodeImporter.ParseInfo` directly.

### Properties

#### Success — Whether parsing of custom code is successful

`true` | `false`

Whether parsing of custom code is successful, specified as a logical scalar with value `false` before successful parsing of specified custom code, then `true` after successful parsing.

Data Types: `logical` scalar

#### AvailableFunctions — Functions compatible with Simulink in custom code

string array

Functions compatible with Simulink in custom code, returned as a string array.

Example: `["myCustomFcn1", "myCustomFcn2", "myCustomFcn3"]`

Data Types: `string` array

#### EntryFunctions — Entry-point functions in custom code

string array

Entry-point functions in custom code, returned as a string array. Entry-point functions are not called by other custom code functions. `EntryFunctions` is a subset of `AvailableFunctions`.

Example: `["myCustomFcn1", "myCustomFcn3"]`

Data Types: `string` array

#### AvailableTypes — Data types compatible with Simulink in custom code

string array

Data types compatible with Simulink in custom code, returned as a string array. Types are user-defined, such as struct and enum.

Example: ["myStruct1", "myStruct2"]

Data Types: string array

### Errors — Error messages from failed parse

character vector

Error messages from failed parse of the specified custom code (Success is equal to false), returned as a character vector. Multiple error message are concatenated into a single character vector. If the parsing is successful (Success is equal to true), Errors is a null vector.

Data Types: character vector

## Methods

### Public Methods

Simulink.CodeImporter.ParseInfo.getFunctions Obtain detailed information regarding functions in custom code

## Examples

### Parse Custom Code

```
obj = Simulink.CodeImporter;

%% Set library file name and output folder
obj.LibraryFileName = "pumpController";
obj.OutputFolder = ".";

%% Set the custom code to import
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = ["/include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utills.c"];
obj.parse;
obj.ParseInfo

ans =

 ParseInfo with properties:

 Success: 1
 AvailableFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
 EntryFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
 AvailableTypes: "pump_control_bus"
 Errors: []
```

## Version History

Introduced in R2021a

# Simulink.CodeImporter.ParseInfo.getFunctions

**Package:** Simulink.CodeImporter

Obtain detailed information regarding functions in custom code

## Syntax

```
fcnobjs = obj.ParseInfo.getFunctions()
fcnobjs = obj.ParseInfo.getFunctions(fcnlist)
```

## Description

`fcnobjs = obj.ParseInfo.getFunctions()`, where `obj` is an object of class `Simulink.CodeImporter` or `sltest.CodeImporter`, returns an array of objects of class `Simulink.CodeImporter.Function` with detailed information on all Simulink compatible functions in the custom code.

---

**Note** If your code has a function with a pointer output, specify the size of the output by setting the port specification in the returned function object.

---

`fcnobjs = obj.ParseInfo.getFunctions(fcnlist)` returns an array of objects of class `Simulink.CodeImporter.Function` with detailed information on the custom code functions specified in `fcnlist`.

## Examples

### Get Custom Code Function Information

Specify and parse custom code, then query information regarding custom code functions.

```
obj = Simulink.CodeImporter;

%% Set library file name and output folder
obj.LibraryFileName = "pumpController";
obj.OutputFolder = ".";

%% Set the custom code to import
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = [".include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];

%% Parse code
obj.parse;
parseobj = obj.ParseInfo

ans =

 ParseInfo with properties:
```

```

 Success: 1
 AvailableFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
 EntryFunctions: ["Controller" "setFanTempThreshold" "setPumpTempThreshold"]
 AvailableTypes: "pump_control_bus"
 Errors: []

fcnobjs = parseobj.getFunctions()
fcnobjs =

 1×3 Function array with properties:

 Name
 CPrototype
 PortSpecification
 IsEntry
 IsDefined
 IsStub
 ArrayLayout
 IsDeterministic

>> fcnobjs(1)

ans =

 Function with properties:

 Name: "Controller"
 CPrototype: "pump_control_bus Controller(real_T Tset, real_T Troom_in);"
 PortSpecification: [1×1 Simulink.CodeImporter.SimulinkPortSpecification]
 IsEntry: 1
 IsDefined: 1
 IsStub: 0
 ArrayLayout: NotSpecified
 IsDeterministic: 0

```

## Input Arguments

### **fcnlist** — Names of functions

cell array of character vectors | string array

Names of functions in custom code about which to obtain information, specified as a cell array of character vectors or a string array. `fcnlist` must be limited to names contained in `obj.ParseInfo.AvailableFunctions`, that is, functions compatible with Simulink in the specified custom code.

Data Types: cell array of character vectors | string array

## Output Arguments

### **fcnobjs** — Information about functions in custom code

array of `Simulink.CodeImporter.Function` objects

Information about functions in custom code, returned as an array of `Simulink.CodeImporter.Function` objects, where each object corresponds to one function. Each

object includes the function name, C prototype, port specification, whether function is an entry-point function, and whether function is defined in the custom code. See `Simulink.CodeImporter.Function`.

## **Version History**

**Introduced in R2021a**

## **See Also**

`Simulink.CodeImporter.ParseInfo` | `Simulink.CodeImporter`

# Simulink.CodeImporter.SimulinkPortSpecification class

**Package:** Simulink.CodeImporter

Configure port specification for imported custom code

## Description

Configure port specification for custom code function arguments imported as C Caller blocks via `Simulink.CodeImporter` or `sltest.CodeImporter` class instances, that is, configure how C/C++ interfaces map to Simulink interfaces for custom code functions.

This class is analogous to the `FunctionPortSpecification` class that is used to configure C Caller block properties outside the context of the Simulink Code Importer. The properties and methods of this class behave similarly to the like-named properties and methods of the `FunctionPortSpecification` class.

The `SimulinkPortSpecification` class is a handle class.

## Creation

One or more objects of this class are automatically created when you invoke the `getFunctions` method of an object of class `Simulink.CodeImporter.ParseInfo`. One `Simulink.CodeImporter.SimulinkPortSpecification` object is created for each function in the parsed custom code for which `getFunctions` is invoked as the `PortSpecification` property of the `Function` object corresponding to that function. Do not create an object of class `Simulink.CodeImporter.SimulinkPortSpecification` directly.

## Properties

### **InputArguments — Port specification for input arguments**

`FunctionArgument` object

Port specification for input arguments, specified as a `FunctionArgument` Object.

### **ReturnArgument — Port specification for function return argument**

`FunctionArgument` object | scalar

Port specification for function return argument, specified as a scalar or an empty `FunctionArgument` Object.

### **GlobalArguments — Port specification for custom code global variables used as function arguments**

`FunctionArgument` object | scalar

Port specification for custom code global variables used as function arguments, specified as a scalar or an empty `FunctionArgument` Object.

## Methods

### Public Methods

`getGlobalArg` Get an object definition of a global variable in a C Caller block

## Examples

### Configure Port Specifications for Custom Code Library Blocks

Specify and parse custom code, then customize port specification before importing into Simulink.

```

%% Create code importer object
obj = Simulink.CodeImporter;

%% Set library file name and output folder
obj.LibraryFileName = "pumpController";
obj.OutputFolder = ".";

%% Set the custom code to import
obj.CustomCode.InterfaceHeaders = ["pumpController.h"];
obj.CustomCode.IncludePaths = ["/include"];
obj.CustomCode.SourceFiles = ["src/pumpController.c" "src/utils.c"];

%% Parse custom code and configure function
obj.parse();
fcn = obj.ParseInfo.getFunctions("Controller");
fcn.PortSpecification.ReturnArgument.Label = "control_out";

fcn.PortSpecification.ReturnArgument

ans =

 FunctionArgument with properties:

 Name: 'out'
 PortNumber: 1
 Size: '1'
 Type: 'Bus: pump_control_bus'
 Label: 'control_out'
 Scope: 'Output'

```

## Version History

## getGlobalArg

**Class:** Simulink.CodeImporter.SimulinkPortSpecification

**Package:** Simulink.CodeImporter

Get an object definition of a global variable in a C Caller block

### Syntax

```
output_args = getGlobalArg(input_args,Name,Value)
```

### Description

`output_args = getGlobalArg(input_args,Name,Value)` <verb phrase> with additional options specified by one or more `Name,Value` pair arguments.

### Input Arguments

**input\_args** —  
(default) |

Example:

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `string` | `struct` | `table` | `cell` | `function_handle` | `categorical` | `datetime` | `duration` | `calendarDuration` | `fi`  
Complex Number Support: Yes

#### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, . . . ,NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example:

**Name** —  
(default) |

Example:

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `string` | `struct` | `table` | `cell` | `function_handle` | `categorical` | `datetime` | `duration` | `calendarDuration` | `fi`  
Complex Number Support: Yes

# Simulink.data.adapters.BaseMatlabFileAdapter class

**Package:** Simulink.data.adapters

Base class used to define file adapter for reading custom file formats

## Description

The `Simulink.data.adapters.BaseMatlabFileAdapter` class is the base class for custom file adapters that the `loadVariablesFromExternalSource` function uses to load variables from an external source file into a `Simulink.SimulationInput` object. Subclass the `Simulink.data.adapters.BaseMatlabFileAdapter` class to specify how to load data from your custom external data source.

For an example of how to write, test, and register a custom file adapter, see “Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”.

For an example of how to use a custom file adapter, see `loadVariablesFromExternalSource`.

The `Simulink.data.adapters.BaseMatlabFileAdapter` class is a handle class.

## Class Attributes

|                  |      |
|------------------|------|
| Abstract         | true |
| HandleCompatible | true |

For information on class attributes, see “Class Attributes”.

## Properties

### section — Section of external file

adapter name (default) | character array | string

Section of the external file, specified as a character array.

Example: 'tireManufacturer'

### source — External source file

" (default) | character array

External source file, specified as a character array.

Example: 'Tires.xls'

## Methods

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

## close

**Class:** Simulink.data.adapters.BaseMatlabFileAdapter

**Package:** Simulink.data.adapters

Code that executes when connection to external file is closed

### Syntax

```
close(adapterObj)
```

### Description

`close(adapterObj)` executes when the connection to an external source file is closed.

Custom file adapters must define behavior for the `getAdapterName`, `getSupportedExtensions`, and `getData` methods. In addition, you can choose to override the `isSourceValid`, `supportsReading`, `getSectionNames`, `getCurrentChecksum`, `open`, and `close` methods.

### Input Arguments

#### **adapterObj** — Custom file adapter

Simulink.data.adapters.BaseMatlabFileAdapter subclass object

Custom file adapter, specified as an object of a class that derives from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class.

Example: `myCustomFileAdapter`

## Version History

**Introduced in R2022b**

### See Also

### Topics

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

# getAdapterName

**Class:** Simulink.data.adapters.BaseMatlabFileAdapter

**Package:** Simulink.data.adapters

Return display name for file adapter

## Syntax

```
dispName = getAdapterName(adapterObj)
```

## Description

`dispName = getAdapterName(adapterObj)` returns the display name of the file adapter. This name can be used by Simulink to display available adapters or used in an error message.

Custom file adapters must define behavior for the `getAdapterName`, `getSupportedExtensions`, and `getData` methods. In addition, you can choose to override the `isSourceValid`, `supportsReading`, `getSectionNames`, `getCurrentChecksum`, `open`, and `close` methods.

## Input Arguments

### **adapterObj** — Custom file adapter

Simulink.data.adapters.BaseMatlabFileAdapter subclass object

Custom file adapter, specified as an object of a class that derives from the Simulink.data.adapters.BaseMatlabFileAdapter base class.

Example: `myCustomFileAdapter`

## Output Arguments

### **dispName** — Display name of custom file adapter

character array

Display name of the custom file adapter, returned as a character array.

## Attributes

Abstract true

To learn about attributes of methods, see Method Attributes.

## Examples

### **Get Display Name for Custom File Adapter**

Write the function definition for the `getAdapterName` method to return the display name for your custom file adapter. Specify code for the `getAdapterName` method in the class definition file.

In this example, the `getAdapterName` method returns the display name for an adapter that can read data from an XML file.

```
function name = getAdapterName(adapterObj)
 name = 'XML Adapter';
end
```

## Version History

Introduced in R2022b

### See Also

### Topics

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

# getCurrentChecksum

**Class:** Simulink.data.adapters.BaseMatlabFileAdapter

**Package:** Simulink.data.adapters

Return marker for identifying last change to external file

## Syntax

```
currentChecksum = getCurrentChecksum(adapterObj)
```

## Description

`currentChecksum = getCurrentChecksum(adapterObj)` returns a marker for identifying the last change to the external source file. The default implementation returns the timestamp for the last modified date of the file. The cache uses this method to determine if the adapter needs to get updates from the external file.

Custom file adapters must define behavior for the `getAdapterName`, `getSupportedExtensions`, and `getData` methods. In addition, you can choose to override the `isSourceValid`, `supportsReading`, `getSectionNames`, `getCurrentChecksum`, `open`, and `close` methods.

## Input Arguments

### **adapterObj** — Custom file adapter

Simulink.data.adapters.BaseMatlabFileAdapter subclass object

Custom file adapter, specified as an object of a class that derives from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class.

Example: `myCustomFileAdapter`

## Output Arguments

### **currentChecksum** — Current checksum for external file

string | character array

Current checksum for the external file, returned as a string or character array.

## Version History

**Introduced in R2022b**

## See Also

`close` | `getAdapterName` | `getData` | `getSectionNames` | `getSupportedExtensions` | `isSourceValid` | `open` | `supportsReading`

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

## getData

Read external file data into data source workspace

### Syntax

```
diagnostic = getData(adapterObj, sourceWorkspace, prevChecksum, diagnostic)
```

### Description

`diagnostic = getData(adapterObj, sourceWorkspace, prevChecksum, diagnostic)` populates the data from the external source file into a data source workspace.

Custom file adapters must define behavior for the `getAdapterName`, `getSupportedExtensions`, and `getData` methods. In addition, you can choose to override the `isSourceValid`, `supportsReading`, `getSectionNames`, `open`, and `close` methods.

### Input Arguments

#### **adapterObj** — Custom file adapter

`Simulink.data.adapters.BaseMatlabFileAdapter` subclass object

Custom file adapter, specified as an object of a class that derives from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class.

Example: `myCustomFileAdapter`

#### **sourceWorkspace** — Data source workspace

`Simulink.data.DataSourceWorkspace` object

Workspace that contains the data from an external data source, specified as a `Simulink.data.DataSourceWorkspace` object.

#### **prevChecksum** — Previous checksum value

character array | string

Previous checksum value, specified as a character vector or string. By default, the value is the timestamp for the last modified date of the external source file.

#### **diagnostic** — Diagnostic information

structure

Diagnostic information from the adapter, specified as a structure. Specify the error information that your `getData` method returns by setting the fields of the empty `diagnostic` structure that Simulink passes in to the method. The structure has these fields.

| Field             | Description                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AdapterDiagnostic | Type of error, specified as an enumeration value from the enumeration class <code>Simulink.data.adapters.AdapterError</code> . These are the possible enumeration values. <ul style="list-style-type: none"> <li>• NoDiagnostic (default)</li> <li>• GenericFailure</li> <li>• HardError</li> <li>• Inaccessible</li> <li>• AmbiguousSource</li> <li>• NoPermission</li> <li>• UnrecognizedFormat</li> <li>• Unsupported</li> </ul> |
| DiagnosticMessage | Message returned as the error text, specified as a string. When <code>AdapterDiagnostic</code> is set to <code>NoDiagnostic</code> , the value is an empty string.                                                                                                                                                                                                                                                                  |

Data Types: struct

## Output Arguments

### **diagnostic** – Diagnostic information

structure

Diagnostic information from the adapter, specified as a structure. For more information, see the `diagnostic` input argument.

## Attributes

Abstract true

To learn about attributes of methods, see [Method Attributes](#).

## Examples

### **Load Data From External Source File into Workspace**

Write the function definition for the `getData` method to populate the data from the external source file into the data source workspace.

In this example, the `getData` method reads data from an XML file with a format similar to the following.

```
<customerData>
<x>10</x>
<y>15</y>
</customerData>
```

```
function diagnostic = getData(adapterObj, sourceWorkspace, previousChecksum, diagnostic)
 % Each time getData is called on the same source, sourceWorkspace is the same as
 % the last time it was called. Clear it to make sure no old variables exist.
 clearAllVariables(sourceWorkspace);
 dom = xmlread(adapterObj.source);
 tree = dom.getFirstChild;
 if tree.hasChildNodes
 item = tree.getFirstChild;
 while ~isempty(item)
 name = item.getNodeName.toCharArray';
 if isvarname(name)
 value = item.getTextContent;
 setVariable(sourceWorkspace, name, str2num(value));
 end
 item = item.getNextSibling;
 end
 end
end
```

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

# getSectionNames

**Class:** Simulink.data.adapters.BaseMatlabFileAdapter

**Package:** Simulink.data.adapters

Return logical sections for external file

## Syntax

```
sections = getSectionNames(adapterObj,sourceFile)
```

## Description

`sections = getSectionNames(adapterObj,sourceFile)` returns the sections for the external source file. The default implementation returns the adapter name. You can override this method to define logical sections for the data in the external file.

Custom file adapters must define behavior for the `getAdapterName`, `getSupportedExtensions`, and `getData` methods. In addition, you can choose to override the `isSourceValid`, `supportsReading`, `getSectionNames`, `getCurrentChecksum`, `open`, and `close` methods.

## Input Arguments

### **adapterObj** — Custom file adapter

Simulink.data.adapters.BaseMatlabFileAdapter subclass object

Custom file adapter, specified as an object of a class that derives from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class.

Example: `myCustomFileAdapter`

### **sourceFile** — External source file

character array | string

External source file, specified as a character array or string.

## Output Arguments

### **sections** — Section names for the external file

array of strings | cell array of character vectors

Section names for the external file, returned as an array of strings or a cell array of character vectors.

## Version History

**Introduced in R2022b**

**See Also**

**Topics**

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

# getSupportedExtensions

**Class:** Simulink.data.adapters.BaseMatlabFileAdapter

**Package:** Simulink.data.adapters

Return supported file extensions for file adapter

## Syntax

```
fileExtensions = getSupportedExtensions(adapterObj)
```

## Description

`fileExtensions = getSupportedExtensions(adapterObj)` returns the file extensions that are supported by the file adapter.

Custom file adapters must define behavior for the `getAdapterName`, `getSupportedExtensions`, and `getData` methods. In addition, you can choose to override the `isSourceValid`, `supportsReading`, `getSectionNames`, `open`, and `close` methods.

## Input Arguments

### **adapterObj** — Custom file adapter

Simulink.data.adapters.BaseMatlabFileAdapter subclass object

Custom file adapter, specified as an object of a class that derives from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class.

Example: `myCustomFileAdapter`

## Output Arguments

### **fileExtensions** — Supported file extensions for adapter

array of strings | cell array of character vectors

List of supported file extensions for the custom file adapter, returned as a string array or cell array of character vectors.

## Attributes

Abstract true

To learn about attributes of methods, see [Method Attributes](#).

## Examples

### **Get Supported File Extensions for Custom File Adapter**

Write the function definition for the `getSupportedExtensions` method to return the list of supported file extensions for your custom adapter. Simulink uses this function to determine if the adapter can be used to load data from a particular external source file.

In this example, the `getSupportedExtensions` method for an XML file adapter returns only XML in its list of supported extensions.

```
function fileExtensions = getSupportedExtensions(adapterObj)
 fileExtensions = {'.XML'};
end
```

## **Version History**

### **Topics**

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

# isSourceValid

**Class:** Simulink.data.adapters.BaseMatlabFileAdapter

**Package:** Simulink.data.adapters

Validates external file

## Syntax

```
tf = isSourceValid(adapterObj,sourceFile)
```

## Description

`tf = isSourceValid(adapterObj,sourceFile)` validates the external source file. The default implementation validates that the source file exists.

Custom file adapters must define behavior for the `getAdapterName`, `getSupportedExtensions`, and `getData` methods. In addition, you can choose to override the `isSourceValid`, `supportsReading`, `getSectionNames`, `getCurrentChecksum`, `open`, and `close` methods.

## Input Arguments

### **adapterObj** — Custom file adapter

`Simulink.data.adapters.BaseMatlabFileAdapter` subclass object

Custom file adapter, specified as an object of a class that derives from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class.

Example: `myCustomFileAdapter`

### **sourceFile** — External source file

character array | string

External source file, specified as a character array or string.

## Output Arguments

### **tf** — True or false result

1 | 0 | logical array

True or false result, returned as a 1 or 0 of data type `logical` or an array of logical values.

## Version History

**Introduced in R2022b**

## See Also

**Topics**

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

# open

**Class:** Simulink.data.adapters.BaseMatlabFileAdapter

**Package:** Simulink.data.adapters

Code that executes when connection to external file is opened

## Syntax

```
open(adapterObj, sourceFile, section)
```

## Description

`open(adapterObj, sourceFile, section)` executes when the connection to an external source file is first opened. By default, the source file and section name are saved as the properties `source` and `section` in the adapter object.

Custom file adapters must define behavior for the `getAdapterName`, `getSupportedExtensions`, and `getData` methods. In addition, you can choose to override the `isSourceValid`, `supportsReading`, `getSectionNames`, `getCurrentChecksum`, `open`, and `close` methods.

## Input Arguments

### **adapterObj** — Custom file adapter

Simulink.data.adapters.BaseMatlabFileAdapter subclass object

Custom file adapter, specified as an object of a class that derives from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class.

Example: `myCustomFileAdapter`

### **sourceFile** — External source file

character array | string

External source file, specified as a character array or string.

### **section** — Section of external source file

character array | string

Section of the external source file, specified as a character array or string. The section name must be one of the sections returned by the `getSectionNames` method. The default implementation of the `getSectionNames` method returns the adapter name.

## Version History

**Introduced in R2022b**

## See Also

`close` | `getAdapterName` | `getCurrentChecksum` | `getData` | `getSectionNames` | `getSupportedExtensions` | `isSourceValid` | `supportsReading`

**Topics**

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

# supportsReading

**Class:** Simulink.data.adapters.BaseMatlabFileAdapter

**Package:** Simulink.data.adapters

Check if external file has read attributes

## Syntax

```
tf = supportsReading(adapterObj,sourceFile)
```

## Description

`tf = supportsReading(adapterObj,sourceFile)` checks if the external source file has read attributes. The default implementation uses the `isSourceValid` method to check that the file exists and is in the correct format, then checks that the file has read attributes. You can override this method so that multiple adapters can read the same file type but with different headers.

Custom file adapters must define behavior for the `getAdapterName`, `getSupportedExtensions`, and `getData` methods. In addition, you can choose to override the `isSourceValid`, `supportsReading`, `getSectionNames`, `getCurrentChecksum`, `open`, and `close` methods.

## Input Arguments

### **adapterObj** — Custom file adapter

Simulink.data.adapters.BaseMatlabFileAdapter subclass object

Custom file adapter, specified as an object of a class that derives from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class.

Example: `myCustomFileAdapter`

### **sourceFile** — External source file

character array | string

External source file, specified as a character array or string.

## Output Arguments

### **tf** — True or false result

1 | 0 | logical array

True or false result, returned as a 1 or 0 of data type `logical` or an array of logical values.

## Examples

### **Check That External XML File Has Correct Header Information**

Write the function definition for the `supportsReading` method to determine if the external source file supports reading.

In this example, the `supportsReading` method reads data from an XML file with a format similar to the following.

```
<customerData>
<x>10</x>
<y>15</y>
</customerData>
```

The method checks that XML file has read attributes and that it contains the appropriate header information for this adapter.

```
function retVal = supportsReading(adapterObj, source)
 retVal = false;
 % Call base class method to ensure file has read attributes
 if supportsReading@Simulink.data.adapters.BaseMatlabFileAdapter(adapterObj, source)
 dom = xmlread(source);
 tree = dom.getFirstChild;
 if strcmp(tree.getNodeName, "customerData")
 retVal = true;
 end
 end
end
```

# Simulink.dialog.Button class

**Package:** Simulink.dialog

**Superclasses:** Simulink.dialog.Control

Create instance of button dialog control

## Description

The Simulink.dialog.Button class is a handle class that enables you to manage button dialog control.

The Simulink.dialog.Button class is a handle class.

## Properties

### Name — Identifier of button dialog control

'Control' (default) | string scalar | character vector

Identifier of the button dialog control, specified as a string scalar or character vector.

Example: 'Control1'

#### Attributes:

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char | string

### Prompt — Display text of button dialog control

string scalar | character vector

Display text of the button dialog control, specified as a string scalar or character vector.

Example: 'Signal 1'

#### Attributes:

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char | string

### Callback — MATLAB code executed when you click button dialog control

character vector

MATLAB code executed when you click the button dialog control, specified as a character vector.

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char

**FilePath — Filename of image**

string scalar | character vector

Filename of image shown on the button dialog control, specified as a string scalar or character vector. The file must be located on the MATLAB path.

Example: 'model.png'

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char | string

**Row — Placement of button dialog control**

'new' (default) | 'current'

Placement of button dialog control, specified as 'new' or 'current'.

- 'new' — Place the button dialog control in a new row on the mask dialog box.
- 'current' — Place the button dialog control in the same row as the previous dialog control on the mask dialog box.

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char | string

**Enabled — Option to edit button on mask dialog box**

'on' (default) | 'off'

Option to edit the button on the mask dialog box, specified as 'on' or 'off'.

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: logical

**Visible — Option to display button on mask dialog box**

'on' (default) | 'off'

Option to display the button on the mask dialog box, specified as 'on' or 'off'.

Example: 'on'

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: logical

**HorizontalStretch — Option to control horizontal stretch of button dialog control**

'on' (default) | 'off'

Option to control the horizontal stretch of the button dialog control when you resize the mask dialog box, specified as 'on' or 'off'.

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: logical

**Tooltip — Informative message**

string scalar | character vector

Informative message that appears when you point to the button on the mask dialog box, specified as a string scalar or character vector.

Example: 'Click to select'

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char | string

**Alternatives**

You can manage a button dialog control using the **Parameters & Dialog** pane in the **Mask Editor** dialog box. For more information, see “Parameters & Dialog Pane”.

Simulink.dialog.Control | “Create Block Masks”

# Simulink.dialog.Container class

**Package:** Simulink.dialog

**Superclasses:** Simulink.dialog.Control

Create instance of container dialog control

## Description

The `Simulink.dialog.Container` class is a handle class that enables you to manage container dialog controls.

The `Simulink.dialog.Container` class is a handle class.

## Properties

### Name — Identifier of container dialog control

'Container' (default) | string scalar | character vector

Identifier of the container dialog control, specified as a string scalar or character vector.

Example: 'Container1'

#### Attributes:

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char | string

### Enabled — Option to edit parameters in mask dialog box

'on' (default) | 'off'

Option to edit parameters in the mask dialog box, specified as 'on' or 'off'.

- 'on' — You can edit the parameters within the container on a mask dialog box.
- 'off' — You cannot edit the parameters within the container on a mask dialog box.

#### Attributes:

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: logical

### Visible — Option to display container on mask dialog box

'on' (default) | 'off'

Option to display the container on the mask dialog box, specified as 'on' or 'off'.

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: logical

**AlignPrompts — Option to justify text boxes of edit and popup parameters within container dialog control**

'off' (default) | 'on'

Option to justify the text boxes of edit and popup parameters within the container dialog control, specified as 'on' or 'off'.

- 'on' — Justify text boxes within the container dialog based on the longest parameter prompt.
- 'off' — Do not justify text boxes.

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: logical

**DialogControls — Child dialog controls of container dialog control**

character vector

Child dialog controls of the container dialog control, specified as a character vector.

Example: '[1x2 Simulink.dialog.parameter.Edit]'

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char

**Tooltip — Informative message**

string scalar | character vector

Informative message that appears when you point to an instance of the container dialog control, specified as a string scalar or character vector.

Example: 'Signal Attributes'

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char | string

**Methods****Public Methods**

addDialogControl	Add dialog control elements to mask dialog box
getDialogControl	Search for a specific dialog control on the mask
removeDialogControl	Remove dialog control element from mask dialog box

**Alternatives**

You can manage container dialog control elements using the **Property editor** in the **Mask Editor** dialog box. For more information, see “Property editor”.

Simulink.dialog.TabContainer | Simulink.dialog.Control | “Create Block Masks”

## addDialogControl

**Class:** Simulink.dialog.Container

**Package:** Simulink.dialog

Add dialog control elements to mask dialog box

### Syntax

```
successIndicator = maskObj.addDialogControl(controlType,controlIdentifier)
successIndicator = maskObj.addDialogControl(Name,Value)
```

### Description

`successIndicator = maskObj.addDialogControl(controlType,controlIdentifier)` adds dialog control elements like text, hyperlinks, or tabs to mask dialog box. First get the mask object and assign it to the variable `maskObj`

`successIndicator = maskObj.addDialogControl(Name,Value)` specifies the `Name` and `Value` arguments for an element on the mask dialog box. You can specify multiple `Name-Value` pairs.

### Input Arguments

#### **controlType** — Value type of dialog control element

character vector

Type of dialog control element, specified

- 'panel'
- 'group'
- 'tabcontainer'
- 'tab'
- 'collapsiblepanel'
- 'text'
- 'image'
- 'hyperlink'
- 'pushbutton'

#### **controlIdentifier** — Unique identifier for the element

character vector

Specifies the programmatic identifier for the element of mask dialog box. Use a name that is unique and does not have space between words. For more information, see “Variable Names”.

#### **Name-Value Pair Arguments**

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside single quotes ( ' ') and is case-sensitive.

You can specify several name and value pair arguments in any order as Name1, Value1, . . . , NameN, ValueN.

**Type**

Type of control that is used to specify the value of this dialog control element. Type is a required argument. The permitted values are 'panel', 'group', 'tabcontainer', 'tab', 'collapsiblepanel', 'text', 'image', 'hyperlink', and 'pushbutton'. If the parent dialog control type is 'tabcontainer', the child dialog control must be 'tab'.

**Name**

The identifier of the dialog control element. Name is a required argument. This field is available for all dialog control types.

**Prompt**

Text that is displayed in the dialog control element on the Mask dialog box. This field is available for all except for panel and image dialog control types.

**Default:** empty

**Enabled**

Option to specify whether you can set value for the dialog control element. This field is available for all dialog control types.

**Default:** 'on'

**Visible**

Option to set whether the dialog control element is hidden or visible to the user. This field is available for all dialog control types.

**Default:** 'on'

**Callback**

Container for MATLAB code that executes when you edit the dialog control element and click **Apply**. This field is available only for the hyperlink and push button dialog control types.

**Default:** empty

**Row**

Option to set whether the dialog control is placed in the new row or the same row. This field is available for all dialog control types.

**Default:** empty

**FilePath**

Contains the path to an image file. This field is available for image, and push button dialog control types.

**Default:** empty

## Container

Option to specifies a container for the child dialog control. The permitted values are the names of 'panel', 'group', and 'tab' dialog controls.

## Examples

### Add Dialog Control Elements to Mask Dialog Box

Get mask object and add dialog control element to it.

```
% Get mask object on model Engine
maskObj = Simulink.Mask.get('Engine/Gain');

% Add hyperlink to mask dialog box

maskLink = maskObj.addDialogControl('hyperlink','link_1');
maskLink.Prompt = 'Mathworks Home Page';
maskLink.Callback = 'web(''www.mathworks.com'')'

% Alternative method to add hyperlink

maskLink = maskObj.addDialogControl('hyperlink','link_2');
maskLink.Prompt = 'www.mathworks.com';

% Add text to mask dialog box

maskText = maskObj.addDialogControl('text','text_tag');
maskText.Prompt = 'Enable range checking';

% Add button to mask dialog box

maskButton = maskObj.addDialogControl('pushbutton','button_tag');
maskButton.Prompt = 'Compute';
```

### Add Dialog Control Elements to Mask Dialog Box Tabs

Create tabs on the mask dialog box and add elements to these tabs.

```
% Get mask object on a block named 'GainBlock'
maskObj = Simulink.Mask.get('GainBlock/Gain');

% Create a tab container

maskObj.addDialogControl('tabcontainer','allTabs');
tabs = maskObj.getDialogControl('allTabs');

% Create tabs and name them

maskTab1 = tabs.addDialogControl('tab','First');
maskTab1.Prompt = 'First tab';
```

```
maskTab2 = tabs.addDialogControl('tab','Second');
maskTab2.Prompt = 'Second tab';

% Add elements to one of the tabs

firstTab = tabs.getDialogControl('First');
firstTab.addDialogControl('text','textOnFirst');
firstTab.getDialogControl('textOnFirst').Prompt = 'Tab one';
```

### Add Dialog Control Element Using Name-Value Pair

Add dialog control element and specify values for it

```
% Get mask object on model Engine

maskObj = Simulink.Mask.get('Engine/Gain');

% Add a dialog box and specify values for it

maskDialog = maskObj.addDialogControl('Type','text',...
'Prompt','hello','Visible','off');
```

## Version History

Introduced in R2014a

### See Also

[Simulink.dialog.Container](#) | “Create Block Masks”

# Simulink.dialog.Container.getDialogControl

**Package:** Simulink.dialog

Search for a specific dialog control on the mask

## Syntax

```
[control,phandle] = handle.getDialogControl(controlIdentifier)
```

## Description

[control,phandle] = handle.getDialogControl(controlIdentifier), search for a specific child dialog control recursively on the mask dialog box.

## Examples

### Find a dialog control

- Find a dial dialog control on the mask dialog box. maskObj is the handle to the mask object. The getDialogControl method returns the handle to the dialog control (control) and handle to the parent dialog control (phandle).

```
[hdlgctrl, phandle] = maskobj.getDialogControl('Parameter4')
```

```
hdlgctrl =
```

```
Dial with properties:
```

```
 Name: 'Parameter4'
 Scale: 'linear'
 Row: 'new'
HorizontalStretch: 'on'
 Tooltip: ''
```

```
phandle =
```

```
Tab with properties:
```

```
 Name: 'Container6'
 Prompt: 'Main Controls'
 Enabled: 'on'
 Visible: 'on'
 AlignPrompts: 'off'
DialogControls: [1×3 Simulink.dialog.parameter.Control]
```

## Input Arguments

**controlIdentifier** — Name of the dialog control

empty (default)

Name of the dialog control being searched on the mask dialog box specified as a character vector.

Data Types: `char` | `string`

## Output Arguments

### **control** — Handle to the dialog control

empty (default)

Target dialog control being searched on the mask dialog box.

Data Types: `char` | `string`

### **parent** — Handle to the parent dialog control

empty (default)

Parent of the dialog control being searched mask dialog box.

Data Types: `char` | `string`

## Version History

Introduced in R2014a

## See Also

`Simulink.dialog.Container` | “Create Block Masks”

## removeDialogControl

**Class:** Simulink.dialog.Container

**Package:** Simulink.dialog

Remove dialog control element from mask dialog box

### Syntax

```
successIndicator = maskVariable.removeDialogControl(controlIdentifier)
```

### Description

`successIndicator = maskVariable.removeDialogControl(controlIdentifier)` removes dialog control element, specified by `controlIdentifier`, like text, hyperlinks, or tabs from a mask dialog box. First get the mask object and assign it to the variable `maskVariable`.

Successful removal of a dialog control element returns a Boolean value of 1.

### Input Arguments

**controlIdentifier** — Unique identifier for the element

character vector

Programmatic identifier for the dialog control element of mask dialog box, specified as a character vector.

### Examples

#### Remove Dialog Control Element from Mask Dialog Box

```
% Get mask object on the Gain block in the model Engine.
```

```
maskObj = Simulink.Mask.get('Engine/Gain');
```

```
% Remove element named AllTab from mask dialog box.
```

```
maskTab = maskObj.removeDialogControl('AllTab');
```

Create instance of group dialog control

## Description

The `Simulink.dialog.Group` class is a handle class that enables you to manage dialog control elements within groups on a mask dialog box. To manage dialog control elements in groups, get the mask object and use the methods of the `Simulink.dialog.Container` class.

The `Simulink.dialog.Group` class is a handle class.

## Properties

### Name — Identifier of group dialog control

'Container' (default) | string scalar | character vector

Identifier of the group dialog control, specified as a string scalar or character vector.

Example: 'Container1'

#### Attributes:

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char | string

### Prompt — Display text of group dialog control

string scalar | character vector

Display text of the group dialog control, specified as a string scalar or character vector.

Example: 'Signal Attributes'

#### Attributes:

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char | string

### Row — Placement of group dialog control

'new' (default) | 'current'

Placement of group dialog control, specified as 'new' or 'current'.

- 'new' — Place the group dialog control in a new row on the mask dialog box.
- 'current' — Place the group dialog control in the same row as the previous dialog control on the mask dialog box.

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char | string

**Enabled — Option to edit parameters in mask dialog box**

'on' (default) | 'off'

Option to edit parameters in the mask dialog box, specified as 'on' or 'off'.

- 'on' — You can edit the parameters within the group on a mask dialog box.
- 'off' — You cannot edit the parameters within the group on a mask dialog box.

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: logical

**Visible — Option to display group on mask dialog box**

'on' (default) | 'off'

Option to display the group on the mask dialog box, specified as 'on' or 'off'.

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: logical

**AlignPrompts — Option to justify text boxes of edit and popup parameters within group dialog control**

'off' (default) | 'on'

Option to justify the text boxes of edit and popup parameters within the group dialog control, specified as 'on' or 'off'.

- 'on' — Justify text boxes within the group dialog based on the longest parameter prompt.
- 'off' — Do not justify text boxes.

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: logical

**DialogControls — Child dialog controls of group dialog control**

character vector

Child dialog controls of the group dialog control, specified as a character vector.

Example: '[1×2 Simulink.dialog.Control]'

**Attributes:**

GetAccess	public
SetAccess	private
GetObservable	true
SetObservable	true

Data Types: char

**Tooltip — Informative message**

string scalar | character vector

Informative message that appears when you point to an instance of the group dialog control, specified as a string scalar or character vector.

Example: 'Type-A Signals'

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char | string

**Methods****Public Methods**

addDialogControl	Add dialog control elements to mask dialog box
getDialogControl	Search for a specific dialog control on the mask

**Superclasses:** Simulink.dialog.Control

Create instance of hyperlink dialog control

## Description

The `Simulink.dialog.Button` class is a handle class that enables you to manage the hyperlink dialog control.

The `Simulink.dialog.Hyperlink` class is a handle class.

## Properties

### Name — Identifier of hyperlink dialog control

'Control' (default) | string scalar | character vector

Identifier of the hyperlink dialog control, specified as a string scalar or character vector.

Example: 'Control1'

#### Attributes:

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char | string

### Prompt — Display text of hyperlink dialog control

'Add text here and link in callback' (default) | string scalar | character vector

Display text of the hyperlink dialog control, specified as a string scalar or character vector.

Example: 'Signal 1'

#### Attributes:

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char | string

### Callback — MATLAB code executed when you click hyperlink dialog control

character vector

MATLAB code executed when you click the hyperlink dialog control, specified as a character vector.

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char

**Row — Placement of hyperlink dialog control**

'new' (default) | 'current'

Placement of hyperlink dialog control, specified as 'new' or 'current'.

- 'new' — Place the hyperlink dialog control in a new row on the mask dialog box.
- 'current' — Place the hyperlink dialog control in the same row as the previous dialog control on the mask dialog box.

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char | string

**Enabled — Option to edit hyperlink in mask dialog box**

'on' (default) | 'off'

Option to edit the hyperlink on the mask dialog box, specified as 'on' or 'off'.

- 'on' — You can click the hyperlink on a mask dialog box.
- 'off' — You cannot click the hyperlink on a mask dialog box.

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: logical

**Visible — Option to display hyperlink on mask dialog box**

'on' (default) | 'off'

Option to display the hyperlink on the mask dialog box, specified as 'on' or 'off'.

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: `logical`

### **HorizontalStretch** — Option to control horizontal stretch of hyperlink dialog control

'on' (default) | 'off'

Option to control the horizontal stretch of the hyperlink dialog control when you resize the mask dialog box, specified as 'on' or 'off'.

#### **Attributes:**

<code>GetAccess</code>	<code>public</code>
<code>SetAccess</code>	<code>public</code>
<code>GetObservable</code>	<code>true</code>
<code>SetObservable</code>	<code>true</code>

Data Types: `logical`

### **Tooltip** — Informative message

`string scalar` | `character vector`

Informative message that appears when you point to an instance of the hyperlink dialog control, specified as a string scalar or character vector.

Example: 'Click to select'

#### **Attributes:**

<code>GetAccess</code>	<code>public</code>
<code>SetAccess</code>	<code>public</code>
<code>GetObservable</code>	<code>true</code>
<code>SetObservable</code>	<code>true</code>

Data Types: `char` | `string`

## **Alternatives**

You can manage a hyperlink dialog control using the **Parameters & Dialog** pane in the **Mask Editor** dialog box. For more information, see “Parameters & Dialog Pane”.

## **Version History**

**Introduced in R2013b**

`Simulink.dialog.Control` | “Create Block Masks”

## Simulink.dialog.Image class

**Package:** Simulink.dialog

Create an image dialog control

### Description

Use an instance of `Simulink.dialog.Image` class to add an image dialog control.

### Properties

#### Name

Uniquely identifies the dialog control and is a required field.

**Type:** character vector

#### FilePath

Specifies the path to the image file to be displayed on the dialog box.

**Type:** character vector

**Default:** empty

#### Row

Specifies whether dialog control is placed on the current row or on a new row.

**Type:** character vector

**Value:** 'current' | 'new'

**Default:** 'new'

#### Enabled

Indicates whether image is active on the mask dialog box.

**Type:** boolean

**Value:** 'on' | 'off'

**Default:** 'on'

#### Visible

Indicates whether image is displayed on the mask dialog box.

**Type:** boolean

**Value:** 'on' | 'off'

**Default:** 'on'

**See Also**

Simulink.dialog.Control | "Create Block Masks"

## Simulink.dialog.ListBoxControl class

**Package:** Simulink.dialog

**Superclasses:** Simulink.dialog.Control

Control list box programmatically

### Description

The `Simulink.dialog.ListBoxControl` class is a handle class that enables you to perform the following operations:

- Get selected items from the list box.
- Set selected items in the list box.

The `Simulink.dialog.ListBoxControl` class is a handle class.

### Properties

#### Name — Identifier of list box dialog control

'Parameter' (default) | string scalar | character vector

Identifier of the list box dialog control, specified as a string scalar or character vector.

Example: 'Parameter1'

#### Attributes:

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char | string

#### Prompt — Display text of list box dialog control

string scalar | character vector

Display text of the list box dialog control, specified as a string scalar or character vector.

Example: 'Signal Types'

#### Attributes:

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char | string

#### Row — Placement of list box dialog control

'new' (default) | 'current'

Placement of list box dialog control, specified as 'new' or 'current'.

- 'new' — Place the list box dialog control in a new row on the mask dialog box.
- 'current' — Place the list box dialog control in the same row as the previous dialog control on the mask dialog box.

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char | string

**Enabled — Option to edit parameters in mask dialog box**

'on' (default) | 'off'

Option to edit the parameters in the mask dialog box, specified as 'on' or 'off'.

- 'on' — You can select the options in the list box dialog control on a mask dialog box.
- 'off' — You cannot select the options in the list box dialog control on a mask dialog box.

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: logical

**Visible — Option to display list box on mask dialog box**

'on' (default) | 'off'

Option to display the list box on the mask dialog box, specified as 'on' or 'off'.

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: logical

**HorizontalStretch — Option to control horizontal stretch of list box dialog control**

'on' (default) | 'off'

Option to control the horizontal stretch of the list box dialog control when you resize the mask dialog box, specified as 'on' or 'off'.

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: logical

**Tooltip — Informative message**

string scalar | character vector

Informative message that appears when you point to an instance of the list box dialog control, specified as a string scalar or character vector.

Example: 'Select correct options'

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char | string

**Multiselect — Selection of multiple values**

'on' (default) | 'off'

Selection of multiple values, specified as 'on' or 'off'.

- 'on' — You can select multiple values in the list box list.
- 'off' — You cannot select multiple values in the list box list.

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: logical

**Type Options — List of options**

cell array

List of options shown in the list box, specified as a cell array.

Example: Analog Signal, Digital Signal

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: cell

### Callback — MATLAB code executed when you select list box options

character vector

MATLAB code executed when you select the list box options, specified as a character vector.

#### Attributes:

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char

## Methods

### Public Methods

getSelectedItems	Get the values of selected items from a list box
setSelectedItems	Set values for a list box

## Alternatives

You can manage a list box dialog control using the **Property editor** in the **Mask Editor** dialog box. For more information, see “Property editor”.

## Version History

Introduced in R2019a

## See Also

### Topics

“Control Masks Programmatically”

“Create Block Masks”

## getSelectedItems

**Class:** Simulink.dialog.ListBoxControl

**Package:** Simulink.dialog

Get the values of selected items from a list box

### Syntax

```
getItems = listBoxControl.getSelectedItems
```

### Description

`getItems = listBoxControl.getSelectedItems` gets the information of the selected items from the list box.

### Output Arguments

**getItems** — value of selected items

cell array

Value of the selected items, returned as a cell array.

### Examples

```
% Get block mask handle
maskObj = Simulink.Mask.get(gcb);

% Get listbox handle
listBoxControl = maskObj.getDialogControl('Control2');

% Get selected items
getItems = listBoxControl.getSelectedItems;

getItems =
 1×2 cell array
 {'Hello', 'World'}
```

### Version History

Introduced in R2019a

### See Also

Simulink.Mask | “Create Block Masks”

# setSelectedItems

**Class:** Simulink.dialog.ListBoxControl

**Package:** Simulink.dialog

Set values for a list box

## Syntax

```
setItems = listBoxControl.setSelectedItems({string1,'string2',...})
```

## Description

`setItems = listBoxControl.setSelectedItems({string1,'string2',...})` sets the values for the selected items in the list box.

## Input Arguments

### ListControl — List box handle

table object

Handle to the list box, specified as an object. You can use the `getDialogControl` command to get the list box handle. For more information, see `Simulink.dialog.Container.getDialogControl`.

For example, `listboxControl = maskObj.getDialogControl('listboxname')`. Here, `maskObj` is the mask object and `listboxname` is the name of the list box.

Data Types: cell array

### string1 — value to be set

string

Value to be set for selected items in the list box

For example, 'Hello'.

## Examples

```
% Get block mask handle
maskObj = Simulink.Mask.get(gcf);

% Get listbox handle
listboxControl = maskObj.getDialogControl('Control2');

% Set selected items
listboxControl.setSelectedItems({'Hello','World'});
```

## Version History

Introduced in R2019a

Simulink.Mask | “Create Block Masks”

# Simulink.dialog.LookupTableControl class

**Package:** Simulink.dialog

Control mask lookup tables programmatically

## Description

Create an instance of `Simulink.dialog.LookupTableControl` to add values for table and breakpoints data in the lookup table control.

## Properties

### Public Properties

#### **Name — Unique name**

(default) | empty

Specifies unique name for the LUT control.

Data Types: `String`

#### **Prompt — Display text**

(default) | empty

Specifies the text displayed on the lookup table control.

Data Types: `String`

#### **Row — Placement of the LUT control**

(default) | new

Specifies whether dialog control is placed on the current row or on a new row.

Data Types: `Character vector`

#### **Enabled — Is LUT control active**

(default) | on

Indicates whether lookup table control is active on the mask dialog box.

Data Types: `Logical`

#### **Visible — Visibility of LUT control on mask dialog**

(default) | on

Indicates whether lookup table control is displayed on the mask dialog box.

Data Types: `Logical`

#### **HorizontalStretch — Resizing of LUT control along the dialog**

(default) | on

Indicates if lookup table control gets resized along with the dialog.

Data Types: Logical

### **Tooltip — Tooltip text**

(default) | empty

Tool tip text for the lookup table control.

Data Types: String

### **Table — Table data class**

(default) | empty

A class that holds the properties of table data.

Data Types: String

### **Breakpoints — Breakpoint data set class**

(default) | empty

A class that holds the properties of an array of breakpoint data.

Data Types: String

### **LookupTableObject — Name of the object holding data**

(default) | empty

Specifies the name of the Simulink.LookupTable object in the base workspace or model workspace that holds the table and breakpoint data.

Data Types: String

### **DataSpecification — Value array or table object**

(default) | empty

Indicates if the table and breakpoints data is specified explicitly or through a lookup table object.

Data Types: String

## **Examples**

### **Add Table and Breakpoint Data**

```
new_system('LUTexample');
add_block('built-in/subsystem','LUTexample/subsystem');
save_system;
open_system('LUTexample');
maskObj = Simulink.Mask.create(gcf);
bp1 = maskObj.addParameter('Name', 'torque', 'Prompt', 'Torque:', 'Type', 'edit');
bp2 = maskObj.addParameter('Name', 'speed', 'Prompt', 'Engine speed:', 'Type', 'edit');
table = maskObj.addParameter('Name', 'fuelflowtable', 'Prompt', 'Fuel Flow Map:', 'Type', 'edit');
lutControl = maskObj.addDialogControl('Name', 'fuelflowlut', 'Type', 'lookuptablecontrol');
lutControl.Table.Name = 'fuelflowtable';
lutControl.Table.Unit = 'kg/s';
lutControl.Breakpoints(1).Name = 'torque';
lutControl.Breakpoints(1).Unit = 'Nm';
lutControl.Breakpoints(1).FieldName = 'Torque';
lutControl.Breakpoints(2).Name = 'speed';
```

```
lutControl.Breakpoints(2).FieldName = 'Speed';
save_system;
```

## Version History

Introduced in R2021b

### Topics

“Visualize and Plot N-Dimensional Data Using Mask Lookup Table Control”

# Simulink.dialog.LookupTableControlbreakpoints class

**Package:** Simulink.dialog

Control breakpoint data set for mask lookup table

## Description

Create an instance of `Simulink.dialog.LookupTableControl.Breakpoints` to specify the properties of the breakpoint data set in the lookup table control. The value of the `Breakpoints` property is an array of `Simulink.dialog.LookupTableControl.Breakpoints` objects. Each embedded object represents one breakpoint set.

## Properties

### Name — Name of the parameter

(default) | empty

Name of the parameter specifying the breakpoint data.

Data Types: `String`

### Units — Units for the breakpoint data

(default) | empty

Specifies the units for the breakpoint data.

Data Types: `String`

### FieldName — Display name

(default) | empty

Specifies the display name for the breakpoint data.

Data Types: `String`

### Min — Minimum value

(default) | empty

Control the minimum value that can be specified for any cell in the table. This is a read only field and cannot be set through lookup table control.

Data Types: `String`

### Max — Maximum value

(default) | empty

Control the maximum value that can be specified for any cell in the table. This is a read only field and cannot be set through lookup table control.

Data Types: `String`

## Examples

### Add Breakpoint Data Set

```
Set breakpoint properties of Dimension 1.
>>lutControl.Breakpoints(1).Name = 'torque';
>>lutControl.Breakpoints(1).Unit = 'Nm';
>>lutControl.Breakpoints(1).FieldName = 'Torque';
```

```
Set Breakpoint properties of Dimension 2
>>lutControl.Breakpoints(2).Name = 'speed';
>>lutControl.Breakpoints(2).Unit = 'rpm';
>>lutControl.Breakpoints(2).FieldName = 'Speed';
```

## Simulink.dialog.LookupTableControlTable class

**Package:** Simulink.dialog

Control table data for mask lookup table

### Description

Create an instance of `Simulink.dialog.LookupTableControlTable` to specify the properties of the table data in the lookup table control.

### Properties

#### Public Properties

##### **Name — Name of the parameter**

(default) | empty

Name of the parameter specifying the table data.

Data Types: `String`

##### **Units — Units for table data**

(default) | empty

Specifies the units for the table data.

Data Types: `String`

##### **FieldName — Display name**

(default) | empty

Specifies the display name for the table data.

Data Types: `String`

##### **Min — Minimum value**

(default) | empty

Control the minimum value that can be specified for any cell in the table. This is a read only field and cannot be set through lookup table control.

Data Types: `String`

##### **Max — Maximum value**

(default) | empty

Control the maximum value that can be specified for any cell in the table. This is a read only field and cannot be set through lookup table control.

Data Types: `String`

## Examples

### Add Table Data

```
>>lutControl.Table.Name = 'fuelflowtable';
>>lutControl.Table.Unit = 'kg/s' ;
>>lutControl.Table.FieldName = 'Fuel Flow';
```

## Simulink.dialog.Panel class

**Package:** Simulink.dialog

Create an instance of a panel dialog control

### Description

Use an instance of `Simulink.dialog.Panel` class to create an instance of panel dialog control.

### Properties

#### Name

Uniquely identifies the panel dialog control and is a required field.

**Type:** character vector

#### Row

Specifies whether panel is placed on the current row or on a new row.

**Type:** character vector

**Values:** 'current' | 'new'

**Default:** 'new'

#### Enabled

Specifies whether panel is active on the mask dialog box.

**Type:** boolean

**Values:** 'on' | 'off'

**Default:** 'on'

#### Visible

Specifies whether panel is displayed on the mask dialog box.

**Type:** boolean

**Values:** 'on' | 'off'

**Default:** 'on'

#### DialogControls

Specifies the child dialog controls contained in the panel.

**Type:** Simulink.dialog.Control

**Default:** Empty array

## Methods

<code>addDialogControl</code>	Add dialog control elements to mask dialog box
<code>removeDialogControl</code>	Remove dialog control element from mask dialog box

## Simulink.dialog.parameter.Control

Create a parameter dialog control

### Description

Use an instance of `Simulink.dialog.parameter.Control` class to add a parameter dialog control.

### Properties

#### **Name — Name of the dialog control**

empty (default)

Uniquely identifies the dialog control element. This is a required field and has the same value as its underlying parameter name.

Data Types: char

#### **Row — Indicates if the dialog control is placed in a new row**

new (default) | current

Specifies whether the dialog control is placed on the current row or on a new row.

Data Types: char

### Version History

**Introduced in R2014a**

### See Also

# Simulink.dialog.parameter.CustomTable class

**Package:** Simulink.dialog.parameter

Create custom tables programmatically

## Description

Instance of Simulink.dialog.parameter.CustomTable class on a mask object to perform the following operations:

- Create and remove custom tables
- Insert, remove, and get values of columns.
- Insert, remove, swap, and add rows.

## Methods

addColumn	Add new column in the custom table
addRow	Add a new row in the custom table
getChangedCells	Get all the changed cells of a custom table
getColumn	Get the column properties
getNumberOfColumns	Get value of a table cell
getNumberOfRows	Get the number of rows available in a custom table
getSelectedRows	Get all the selected rows of a custom table
getTableCell	Get the properties of a custom table cell
getValue	Get value of a table cell
insertColumn	Insert a column at a specific position in the custom table
insertRow	Insert a row at a specific position in a custom table
removeColumn	Remove an existing column from a specific position in a custom table
removeRow	Remove an existing row from a specific position in a custom table
setTableCell	Set the properties of a custom table cell
swapRows	Swap two existing rows in a custom table

## See Also

### Topics

“Control Masks Programmatically”

“Create Block Masks”

## addColumn

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Add new column in the custom table

### Syntax

```
tableControl.addColumn(Name, Value)
```

### Description

`tableControl.addColumn(Name, Value)` adds a column with the specified properties in the custom table.

### Input Arguments

#### **tableControl** — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `Simulink.dialog.Container.getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: `char` vector | `cell` array

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. `Name` must appear inside quotes. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

### Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Add column.
tableControl.addColumn('Name', 'HDL Name', 'Type', 'edit');
```

## Version History

Introduced in R2019a

## **See Also**

Simulink.mask | “Create Block Masks”

## addRow

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Add a new row in the custom table

### Syntax

```
NewRow = tableControl.addRow(RowValue)
```

### Description

`NewRow = tableControl.addRow(RowValue)` adds a row with the specified properties in the custom table.

### Input Arguments

#### **tableControl** — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `Simulink.dialog.Container.getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: char vector

#### **RowValue** — Row Values for each column

table object

Row values specified for the number of columns available. If five values are provided for `RowValue` in a custom table with five columns, one row is added to the table. If 10 row values are added for such a table, then two rows are added.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: char vector | cell array

### Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Add a row with six column values.
tableControl.addRow('sig5', 'Input', 'Inherit', 'Inherit', 'on', 'Inherit');
```

## **Version History**

**Introduced in R2019a**

### **See Also**

Simulink.mask | “Create Block Masks”

## getChangedCells

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Get all the changed cells of a custom table

### Syntax

```
changedCells = tableControl.getChangedCells()
```

### Description

`changedCells = tableControl.getChangedCells()` gets the properties of a cell in the custom table.

### Output Arguments

**changedCells** — Cells in a custom table whose values have been changed

cell array

Shows the changed cells in a custom table.

### Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Get changed cells.
changedCell = tableControl.getChangedCells();

ans =

 1×4 cell array

 {1×2 double} {1×2 double} {1×2 double} {1×2 double}
Output: Cell Array
Input: None
```

## Version History

Introduced in R2019a

### See Also

`Simulink.mask` | “Create Block Masks”

# getColumn

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Get the column properties

## Syntax

```
FetchColumn = tableControl.getColumn(column)
```

## Description

`FetchColumn = tableControl.getColumn(column)` fetches the information from the specified column of the custom table.

## Input Arguments

### **tableControl** — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `Simulink.dialog.Container.getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: integer

### **columnIndex** — Column Index

string | character array

Index of the column in the custom table.

For example, '4'.

## Output Arguments

### **fetchcolumn** — Column properties

column object

Column object

## Examples

```
% Get block mask handle.
```

```
maskObj = Simulink.Mask.get(gcb);
```

```
% Get custom table handle.
```

```
tableControl = maskObj.getDialogControl('myTable');
```

```
% Get properties of column 3.
tableControl.getColumn(3);
```

```
ans =
```

```
TableParamColumnInfo with properties:
```

```
 Name: 'Data Type'
 Type: 'popup'
 Enabled: 'on'
TypeOptions: {4x1 cell}
```

# getNumberOfColumns

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Get value of a table cell

## Syntax

```
numberOfColumns = tableControl()
```

## Description

`numberOfColumns = tableControl()` gets the number of columns in a custom table.

## Output Arguments

**numberOfColumns** — Table cell value

integer

Number of columns in the custom table returned as an integer.

## Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Get cell value.
numberOfColumns = tableControl.getNumberOfColumns();
```

## Version History

Introduced in R2019a

## See Also

## getNumberOfRows

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Get the number of rows available in a custom table

### Syntax

```
numberOfRows = tableControl()
```

### Description

`numberOfRows = tableControl()` gets the number of rows in a custom table.

### Output Arguments

**numberOfRows** — Number of Rows

integer

Number of rows in the custom table returned as an integer.

### Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Get number of rows.
numberOfRows = tableControl.getNumberOfRows();
```

## Version History

Introduced in R2019a

# getSelectedRows

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Get all the selected rows of a custom table

## Syntax

```
selectedRows = tableControl.getSelectedRows()
```

## Description

`selectedRows = tableControl.getSelectedRows()` fetches the information from the specified column of a custom table.

## Output Arguments

**selectedRows — Row information**

numeric array

Value of the specified rows, returned as a numeric array.

## Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Get selected rows.
selectedRows = tableControl.getSelectedRows();
```

```
ans =
```

```
 3 4
```

## Version History

Introduced in R2019a

## getTableCell

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Get the properties of a custom table cell

### Syntax

```
tableCell = tableControl.getTableCell([rowIdx colIdx])
```

### Description

`tableCell = tableControl.getTableCell([rowIdx colIdx])` gets the properties of a cell in a custom table.

### Input Arguments

#### **tableControl** — Custom table handle

table object

Handle to a custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `Simulink.dialog.Container.getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: numeric array

#### **rowIdx** — Row index

Row index number of the custom table cell for which the value is being fetched.

For example, '3'.

#### **colIdx** — Column index

Column index number of the custom table cell for which the value is being fetched.

For example, '5'.

### Output Arguments

#### **tableCell** — Table cell object

cell object

Properties of the table cell, returned as a cell array.

## Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Get cell properties.
tableCell = tableControl.getTableCell([2 2]);

tableCell =

 CustomTableParamCellObject with properties:

 Value: 'Inherit'
 Type: 'popup'
 Enabled: 'off'
 TypeOptions: {4x1 cell}

tableCell.Value = 'Value'
```

## Version History

**Introduced in R2019a**

### See Also

[Simulink.mask](#) | “Create Block Masks”

## getValue

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Get value of a table cell

### Syntax

```
tableCellValue = tableControl.getValue([rowIdx colIdx])
```

### Description

`tableCellValue = tableControl.getValue([rowIdx colIdx])` gets the value of a cell in a custom table.

### Input Arguments

#### **tableControl** — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `Simulink.dialog.Container.getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: numeric array

#### **rowIdx** — Row index

|

Row index number of the custom table cell for which the value is being fetched.

For example, [2 2].

#### **colIdx** — Column index

|

Column index number of the custom table cell for which the value is being fetched.

For example,[2 2].

### Output Arguments

#### **tableCellValue** — Table cell value

character vector

Value of the table cell, returned as a character vector.

## Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Get cell value.
tableCellValue = tableControl.getValue([2 2]);

ans =
 'Input'
```

## Version History

Introduced in R2019a

### See Also

[Simulink.mask](#) | “Create Block Masks”

## insertColumn

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Insert a column at a specific position in the custom table

### Syntax

```
tableControl.insertColumn(columnIndex[Name,Value])
```

### Description

`tableControl.insertColumn(columnIndex[Name,Value])` inserts a column with the specified properties at a specified index in a custom table.

### Input Arguments

#### **tableControl** — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `Simulink.dialog.Container.getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: char vector | cell array

#### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

#### **Type** — Type of control

edit | checkbox | popup

Type of control that is used to specify the value of this parameter. The permitted values are: edit (default), checkbox, popup.

#### **TypeOptions** — Options that are displayed within a popup control or in a promoted parameter

''

The options that are displayed within a popup control or in a promoted parameter. This field is a cell array.

**Enabled — Specify whether the user can set the value**`'on' | 'off'`

Option to specify whether the user can set parameter value.

**Examples**

```
% Get block mask handle.
```

```
maskObj = Simulink.Mask.get(gcb);
```

```
% Get custom table handle.
```

```
tableControl = maskObj.getDialogControl('myTable');
```

```
% Insert a column at the fifth position.
```

```
tableControl.insertColumn(5, 'Name', 'HDL Name', 'Type', 'edit');
```

**Version History**

**Introduced in R2019a**

**See Also**

`Simulink.mask` | “Create Block Masks”

## insertRow

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Insert a row at a specific position in a custom table

### Syntax

```
InsertedRow = tableControl.insertRow(rowIndex,string1,string2)
```

### Description

`InsertedRow = tableControl.insertRow(rowIndex,string1,string2)` inserts a row with specified properties at the specified index in a custom table.

### Input Arguments

#### **tableControl** — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `Simulink.dialog.Container.getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: char vector | cell array

#### **rowIndex** — Row Index

Index in table at which the new row is to be inserted.

For example, '4'.

### Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Insert Row.
tableControl.insertRow(rowIndex,'insertSig4', 'Input', 'Inherit', 'Inherit', 'on', 'Inherit');
```

## Version History

Introduced in R2019a

## **See Also**

`Simulink.mask` | “Create Block Masks”

## removeColumn

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Remove an existing column from a specific position in a custom table

### Syntax

```
tableControl.removeColumn(columnIndex)
```

### Description

`tableControl.removeColumn(columnIndex)` removes a column from the specified index in a custom table.

### Input Arguments

#### **tableControl** — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `Simulink.dialog.Container.getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: `string`

#### **columnIndex** — Column Index

integer

Column index number of the custom table from which the column is to be removed.

For example, '4'.

### Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcf);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Remove the third column.
tableControl.removeColumn(3);
```

## **Version History**

**Introduced in R2019a**

### **See Also**

Simulink.mask | “Create Block Masks”

## removeRow

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Remove an existing row from a specific position in a custom table

### Syntax

```
tableControl.removeRow(rowIndex)
```

### Description

`tableControl.removeRow(rowIndex)` removes the row from a specified position in a custom table.

### Input Arguments

#### **tableControl** — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `Simulink.dialog.Container.getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: integer

#### **rowIndex** — Row Index

Row index number of the custom table from which the row is to be removed.

For example, '4'.

### Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Remove row with index number 6.
tableControl.removeRow(6);
```

## Version History

**Introduced in R2019a**

## **See Also**

`Simulink.mask` | “Create Block Masks”

## setTableCell

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Set the properties of a custom table cell

### Syntax

```
tableCell = tableControl.setTableCell([rowIdx colIdx], Type, customtable,
Evaluate, off)
```

### Description

`tableCell = tableControl.setTableCell([rowIdx colIdx], Type, customtable, Evaluate, off)` sets the specified properties of a cell in a custom table.

### Input Arguments

#### **tableControl** — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `Simulink.dialog.Container.getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: Numeric Array Name Value Pair

#### **rowIdx** — Row index

Row index number of the custom table cell for which the value is being fetched.

For example, '3'.

#### **colIdx** — Column index

Column index number of the custom table cell for which the value is being fetched.

For example, '5'.

#### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

**Type — Type of control that specifies the value of the parameter**

Type of control that is used to specify the value of this parameter. The permitted values are: edit, checkbox, popup, combobox, listbox, radiobutton, slider, dial, spinbox, unit, textarea, breakpoint, customtable, tree, unit, min, max.

**Value — Value**

The value for the cell is specified. It depends on the Type of the parameter

**Examples**

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Set cell properties.
tableControl.setTableCell([2 2], 'Type','edit','Value','1024');
```

**Version History**

Introduced in R2019a

**See Also**

Simulink.Mask | “Create Block Masks”

## swapRows

**Class:** Simulink.dialog.parameter.CustomTable

**Package:** Simulink.dialog.parameter

Swap two existing rows in a custom table

### Syntax

```
tableControl.swapRows(rowIndex1, rowIndex2)
```

### Description

`tableControl.swapRows(rowIndex1, rowIndex2)` swaps specified rows in a custom table.

### Input Arguments

#### **tableControl** — Custom table handle

table object

Handle to the custom table, specified as an object. You can use the `getDialogControl` command to get the custom table handle. For more information, see `Simulink.dialog.Container.getDialogControl`.

Consider, for example, `tableControl = maskObj.getDialogControl(TableName)`. Here, `maskObj` is the mask object and `TableName` is the name of the custom table.

Data Types: integer

#### **rowIndex1** — Row Index value

integer

Row index number of the first row to be swapped with another row.

For example, '4'.

#### **rowIndex2** — Row Index value

integer

Row index number of the second row to be swapped with another row.

For example, '5'.

### Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get custom table handle.
tableControl = maskObj.getDialogControl('myTable');

% Swap rows 3 and 6.
```

```
tableControl.swapRows(3,6);
```

## **Version History**

## Simulink.dialog.Tab class

**Package:** Simulink.dialog

**Superclasses:** Simulink.dialog.Container, Simulink.dialog.Control

Create instance of tab dialog control

### Description

The `Simulink.dialog.Tab` class is a handle class that enables you to manage dialog control elements in tabs on a mask dialog box. To manage dialog control elements in tabs, get the mask object and use methods of the `Simulink.dialog.Container` class. See [Add Dialog Control Elements to Mask Dialog Box Tabs](#) for more information.

The `Simulink.dialog.Tab` class is a handle class.

### Properties

#### Name — Identifier of tab dialog control

'Container' (default) | string scalar | character vector

Identifier of the tab dialog control, specified as a string scalar or character vector.

Example: 'Container1'

#### Attributes:

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char | string

#### Prompt — Display text of tab dialog control

string scalar | character vector

Display text of the tab dialog control, specified as a string scalar or character vector.

Example: 'Signal Attributes'

#### Attributes:

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char | string

#### Enabled — Option to edit parameters in mask dialog box

'on' (default) | 'off'

Option to edit parameters in the mask dialog box, specified as 'on' or 'off'.

- 'on' — You can edit the parameters within the tab on a mask dialog box.
- 'off' — You cannot view or edit the parameters within the tab on a mask dialog box, although the tab prompt appears.

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: logical

**Visible — Option to display tab on mask dialog box**

'on' (default) | 'off'

Option to display the tab on the mask dialog box, specified as 'on' or 'off'.

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: logical

**AlignPrompts — Option to justify text boxes of edit and popup parameters within tab dialog control**

'off' (default) | 'on'

Option to justify the text boxes of edit and popup parameters within the tab dialog control, specified as 'on' or 'off'.

- 'on' — Justify text boxes within the tab dialog based on the longest parameter prompt.
- 'off' — Do not justify text boxes.

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: logical

**DialogControls — Child dialog controls of tab dialog control**

character vector

Child dialog controls of the tab dialog control, specified as a character vector.

Example: '[1x4 Simulink.dialog.parameter.Control]'

**Attributes:**

GetAccess	public
SetAccess	private
GetObservable	true
SetObservable	true

Data Types: char

**Tooltip — Informative message**

string scalar | character vector

Informative message that appears when you point to an instance of the tab dialog control, specified as a string scalar or character vector.

Example: 'Open to View'

**Attributes:**

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: char | string

**Methods****Public Methods**

addDialogControl	Add dialog control elements to mask dialog box
getDialogControl	Search for a specific dialog control on the mask
removeDialogControl	Remove dialog control element from mask dialog box

**Alternatives**

You can manage tab dialog control elements using the **Property editor** in the **Mask Editor** dialog box. For more information, see “Property editor”.

**Version History**

Introduced in R2013b

**See Also**

Simulink.dialog.Group | Simulink.dialog.Panel | Simulink.dialog.TabContainer | Simulink.dialog.Container | Simulink.dialog.Control | “Create Block Masks”

# Simulink.dialog.TabContainer class

**Package:** Simulink.dialog

Create an instance of a tab container dialog control

## Description

Use an instance of `Simulink.dialog.TabContainer` class to create an instance of tab container dialog control. Tab container dialog box be used to group the tab dialog controls.

## Properties

### Name

Uniquely identifies the tab container dialog control and is a required field.

**Type:** character vector

### Row

Specifies whether tab container is placed on the current row or on a new row.

**Type:** enumerated string

**Values:** 'current' | 'new'

**Default:** 'new'

### Enabled

Specifies whether tab container is active on the mask dialog box.

**Type:** boolean

**Values:** 'on' | 'off'

**Default:** 'on'

### Visible

Specifies whether tab container is displayed on the mask dialog box.

**Type:** boolean

**Values:** 'on' | 'off'

**Default:** 'on'

### DialogControls

Specifies the child dialog controls contained in the group. `Simulink.dialog.TabContainer` class can only contain `Simulink.dialog.Tab` dialog control.

**Type:** Simulink.dialog.Tab

**Default:** Empty array

## Methods

addDialogControl	Add dialog control elements to mask dialog box
removeDialogControl	Remove dialog control element from mask dialog box

## See Also

Simulink.dialog.Group | Simulink.dialog.Panel | Simulink.dialog.Tab |  
Simulink.dialog.Container | Simulink.dialog.Control | "Create Block Masks"

# Simulink.dialog.Text class

**Package:** Simulink.dialog

Create a text dialog control

## Description

Use an instance of `Simulink.dialog.Text` class to add a text dialog control.

## Properties

### Name

Uniquely identifies the dialog control element and is a required field.

**Type:** character vector

### Prompt

Specifies the text displayed on the mask dialog box.

**Type:** character vector

**Default:** empty

### WordWrap

Specifies whether to wrap long text to the next line on the mask dialog box.

**Type:** boolean

**Value:** 'on' | 'off'

**Default:** 'on'

### Row

Specifies whether dialog control is placed on the current row or on a new row.

**Type:** character vector

**Value:** 'current' | 'new'

**Default:** 'new'

### Enabled

Indicates whether dialog control is active on the mask dialog box.

**Type:** boolean

**Value:** 'on' | 'off'

**Default:** 'on'

**Visible**

Indicates whether dialog control is displayed on the mask dialog box.

**Type:** boolean

**Value:** 'on' | 'off'

**Default:** 'on'

**See Also**

`Simulink.dialog.Control` | "Create Block Masks"

# Simulink.dialog.TreeControl class

**Package:** Simulink

Control Tree control programmatically

## Description

Use an instance of `Simulink.dialog.TreeControl` class to perform the following operations:

- Get selected items from the tree
- Set selected items in the tree

## Properties

### Public Properties

#### **Name — Name of the dialog control**

empty (default)

Uniquely identifies the dialog control, specified as a character vector. It is a mandatory field.

Data Types: `string` | `character vector`

#### **Prompt — Display text of the dialog control**

empty (default)

Display text on the tree dialog control, specified as a character vector.

Data Types: `string` | `char`

#### **TreeItems — Elements in the tree**

empty (default)

Items shown in the tree, specified as a cell array.

Data Types: `cell array`

#### **Callback — Callback code executed on invoking dialog control**

empty (default)

MATLAB command to be executed when the dialog control is invoked, specified as character vector.

Data Types: `char` | `String`

#### **Row — Indicates if dialog control is placed in a new row**

`current` (default) | `new`

Indicates whether dialog control is placed on the current row or on a new row, specified as a character vector.

Data Types: `char`

#### **Enabled — Indicates if tree control is active on the mask dialog**

`on` (default) | `off`

Indicates whether tree control is active on the mask dialog box, specified as logical value.

Data Types: `logical`

**Visible — Indicates if tree control is visible on the mask dialog**

on (default) | off

Indicates whether tree control is visible or hidden on the mask dialog box specified as a logical value..

Data Types: `logical`

**Multiselect — Indicates if tree control is enabled for multiple selection**

on (default) | off

Indicates whether tree control is enabled for multiple selection, specified as a logical value.

Data Types: `logical`

**Tooltip — Tooltip for the tree control**

empty (default)

Tooltip for the tree control, specified as a character vector.

Data Types: `char` | `string`

## Methods

### Public Methods

## Version History

Introduced in R2014a

## See Also

`simulink.mask` | “Create Block Masks”

# setSelectedItems(TreeControl)

Set values for a tree

## Syntax

```
treeControl.setSelectedItems({'Node1/ChildNode1','Node1/ChildNode2'})
```

## Description

`treeControl.setSelectedItems({'Node1/ChildNode1','Node1/ChildNode2'})` set the values for the selected items in the tree.

## Input Arguments

### TreeControl — tree handle

table object

Handle to the tree, specified as an object. You can use the `getDialogControl` command to get the tree handle. For more information, see `Simulink.dialog.Container.getDialogControl`.

For example, `treeControl = maskObj.getDialogControl('TreeControl')`. Here, `maskObj` is the mask object and `TreeControl` is the name of the tree.

Data Types: `cell` array

### value — value to be set

cell-array of string

Value to be set for selected items in the tree.

## Examples

```
maskObj = Simulink.Mask.get(gcb);
treeControl = maskObj.getDialogControl('Control2')
```

```
% Set selected items
treeControl.setSelectedItems({'Node1/ChildNode1', 'Node1/ChildNode2'})
```

## Version History

Introduced in R2019b

## See Also

`Simulink.mask` | “Create Block Masks”

## getSelectedItems(TreeControl)

Get the values of selected items from a tree hierarchy

### Syntax

```
selectedItems = treeControl.getSelectedItems()
```

### Description

`selectedItems = treeControl.getSelectedItems()` fetches the information of the selected items in the tree.

### Output Arguments

**selectedItems** — value of selected items

cell array

Value of the selected items, returned as a cell array.

### Examples

```
% Get block mask handle
maskObj = Simulink.Mask.get(gcb);

% Get tree handle
treeControl = maskObj.getDialogControl('TreeControl');
treeControl.getSelectedItems();
```

```
ans =
```

```
4x1 cell array
```

```
 {'Node1/ChildNode1'}
 {'Node1/ChildNode2'}
 {'Node2/ChildNode1'}
 {'Node2/ChildNode2'}
```

### Version History

**Introduced in R2019b**

### See Also

`Simulink.mask` | “Create Block Masks”

# Simulink.GlobalDataTransfer class

**Package:** Simulink

Configure concurrent execution data transfers

## Description

The `Simulink.GlobalDataTransfer` object contains the data transfer information for the concurrent execution of a model. To access the properties of this class, use the `get_param` function to get the handle for this class, and then use dot notation to access the properties. For example:

```
dt=get_param(gcs,'DataTransfer');
dt.DefaultTransitionBetweenContTasks
```

ans =

Ensure deterministic transfer (minimum delay)

## Properties

### DefaultTransitionBetweenSyncTasks

Global setting for data transfer handling option when the source and destination of a signal are in two different and periodic tasks.

Data Type: Enumeration. Can be one of:

- 'Ensure data integrity only'
- 'Ensure deterministic transfer (maximum delay)'
- 'Ensure deterministic transfer (minimum delay)'

Access: Read/write

### DefaultTransitionBetweenContTasks

Global setting for the data transfer handling option for signals that have a continuous sample time.

Data Type: Enumeration. Can be one of:

- 'Ensure data integrity only'
- 'Ensure deterministic transfer (maximum delay)'
- 'Ensure deterministic transfer (minimum delay)'

Access: Read/write

### DefaultExtrapolationMethodBetweenContTasks

Global setting for the data transfer extrapolation method for signals that have a continuous sample time.

Data Type: Enumeration. Can be one of:

- 'None'
- 'Zero Order Hold'
- 'Linear'
- 'Quadratic'

Access: Read/write

## Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects.

## Examples

Access the properties of this class.

```
dt=get_param(gcs, 'DataTransfer');
dt.DefaultTransitionBetweenContTasks
```

```
ans =
```

Ensure deterministic transfer (minimum delay)

“Configure Data Transfer Settings Between Concurrent Tasks”

# Simulink.io.BaseWorkspace class

**Package:** Simulink.io

Read data in format used by base workspace

## Description

Simulink.io.BaseWorkspace inherits from the Simulink.io.FileType base class. It reads data formatted in a format used by the base workspace. Use base workspace file types to move data to and from the base workspace to a function, automated process, or user interface. To import data from the base workspace, use this command.

```
classdef BaseWorkspace < Simulink.io.FileType
```

The Simulink.io.BaseWorkspace class is a handle class.

## Class Attributes

Abstract	false
HandleCompatible	true

For information on class attributes, see “Class Attributes”.

## Properties

### iofile.BaseWorkspace — Base workspace reader

character array

Base workspace reader, specified as a character array.

#### Attributes:

GetAccess	public
SetAccess	public

Data Types: char | string

## Methods

### Specialized Operators and Functions

These methods specialize standard MATLAB operators and functions for objects in this class.

isFileSupported	This method always returns true because it operates only on data in the base workspace.
getFileTypeId	This method returns the base workspace file reader description.

## Examples

## Read Data in Base Workspace Format

Read data in base workspace format from file, `foo.mat`.

Set up a timeseries variable, `ts`. If `ts` is a variable in the workspace, the object ignores `fileName`.

```
ts = timeseries([0;9]);
```

Set up reader.

```
aReader = Simulink.io.BaseWorkspace();
resultOfWhos = whos(aReader);
```

Load the reader, which has no inputs.

```
varsOnFileStruct = load(aReader);
```

Load one variable.

```
var = loadAVariable(aReader, 'ts');
```

Import the file.

```
importedVars = import(aReader);
```

Export to a file.

```
ds = Simulink.SimulationData.Dataset;
ds = ds.addElement(timeseries([1:10]',[1:10]'), 'Signal1');
ds = ds.addElement(timeseries([1:10]',[11:20]'), 'Signal2');
ds = ds.addElement(timeseries([1:10]',[21:30]'), 'Signal3');
%filePath is ignored, must be provided because the API ruleset
filePath = '';
didWrite = aReader.export(filePath, {'ds'}, {ds}, 0);
```

## Version History

Introduced in R2021a

### Topics

“Import Custom File Type”

“Create Custom File Type for Import to Signal Editor”

# Simulink.io.FileType class

**Package:** Simulink.io

Base class for file type readers for Simulink interfaces such as Signal Editor

## Description

Simulink.io.FileType is the base class for Simulink.io.FileType objects. In your class definition file, you must subclass your object from this base class. Simulink requires direct inheritance from FileType. Subclassing allows you to use the implementation methods and service methods provided by this class to build your object. Type this syntax as the first line of your class definition file to directly inherit from the Simulink.io.FileType base class, where ObjectName is the name of your object:

```
classdef ObjectName < Simulink.io.FileType
```

The Simulink.io.FileType class is a handle class.

## Class Attributes

Abstract	true
HandleCompatible	true

For information on class attributes, see “Class Attributes”.

## Properties

### FileName — File name

character array

File name of file that contains custom signals for import to Signal Editor, specified as a character array.

### Attributes:

GetAccess	public
SetAccess	public

## Methods

### Public Methods

exportImpl	Export signals to file
Simulink.io.FileType.getFileTypeDescription	Get custom file reader description
Simulink.io.FileType.isFileSupported	Check if file type is supported in Simulink
Simulink.io.FileType.isInput	Check if input is acceptable Simulink input
Simulink.io.FileType.isSimulinkParameter	Check if input is Simulink parameter
loadImpl	Load signal names from custom FileType object
loadAVariableImpl	Load specified variable from MAT-file
validateFileNameImpl	Validate contents of custom MAT-file

whosImpl

Determine contents of MAT-file associated with Simulink.io.FileType object

**Specialized Operators and Functions**

These methods specialize standard MATLAB operators and functions for objects in this class.

export	<p>This method calls the <code>exportImpl</code> method.</p> <p>From Signal Editor, write the structure of signals to a MAT-file. The structure must contain two cell arrays; one for signal names and one for signal values. Specify if the method appends to or overwrites the contents of the MAT-file. The method indicates if it succeeded in writing to the MAT-file and returns any error messages.</p>
import	<p><code>[importedData, warnStr ] = import(reader)</code></p> <p>To import custom signals for a custom file type, identify the custom file type <code>reader</code> as a <code>Simulink.io.FileType</code> object. The method returns the found variable as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”. The method returns a structure with two fields, <code>Data</code> and <code>Name</code>. <code>Data</code> is a cell array of signals and <code>Name</code> is a cell array of character vectors of the corresponding signal names.</p>
importAVariable	<p><code>varOut = importAVariable(reader,variableName)</code></p> <p>To import a specified variable for a custom file type, identify the custom file type reader as a <code>Simulink.io.FileType</code> object. Use <code>VariableName</code>, specified as a character array, to extract the desired signal from the file of custom format signals. The method returns the found variable, returned as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”.</p>
load	<p>This method calls the <code>loadImpl</code> method.</p> <p>Load the signal listed in the custom file type.</p>
loadAVariable	<p>This method calls the <code>loadAVariableImpl</code> method.</p> <p>Validate the format of the signals in the custom MAT-file <code>fileName</code> with the associated <code>Simulink.io.FileType</code> reader.</p>

<code>validateFileName</code>	This method calls the <code>validateFileNameImpl</code> method.  Validate the format of the signals in the custom MAT-file <code>fileName</code> with the associated <code>Simulink.io.FileType</code> reader.
<code>whos</code>	This method calls the <code>whosImpl</code> method.  Return the contents of the custom file type MAT-file.

## Examples

### Subclass FileType

Define a `Simulink.io.FileType` class.

```
classdef MySignalMatFile < Simulink.io.FileType
end
```

### Interact with FileType Using Specialized Functions

Interact with `FileType` using specialized functions. This example refers to the `open('Simulink.io.CreateSignals')` sample file.

Get contents of `foo.mat`.

```
fileName = 'foo.mat';
aReader = Simulink.io.CreateSignals(fileName);
resultOfWhos = whos(aReader);
```

Import custom signals from `foo.mat`.

```
aFileType = Simulink.io.CreateSignals('foo.mat');
out = import(aFileType);
```

Load the custom signals in `foo.mat`.

```
aFileType = Simulink.io.CreateSignals('foo.mat');
out = load(aFileType);
```

Load a variable from `foo.mat`.

```
aFileType = Simulink.io.CreateSignals('foo.mat');
out = loadAVariable(aFileType, 'bar');
```

Export the signals from Signal Editor.

```
ds = Simulink.SimulationData.Dataset;
ds = ds.addElement(timeseries([1:10]', [1:10]'), 'Siganl1');
ds = ds.addElement(timeseries([1:10]', [11:20]'), 'Siganl2');
ds = ds.addElement(timeseries([1:10]', [21:30]'), 'Siganl3');
```

```
aReader = Simulink.io.CreateSignals('myFileToExport.mat');
didWrite = aReader.export(filePath,{'ds'},{ds},0);
```

# exportImpl

**Class:** Simulink.io.FileType

**Package:** Simulink.io

Export signals to file

## Syntax

```
[didWrite,errMsg] = exportImpl(exportFileName,varNames,varValues,isAppend)
```

## Description

`[didWrite,errMsg] = exportImpl(exportFileName,varNames,varValues,isAppend)` exports signals from Signal Editor using the specified variables and returns `didWrite` and `errMsg` and saves them to `exportFileName`.

## Input Arguments

### **exportFileName** — File name for exported signals

character array

File name for exported signals, specified as a character array.

Data Types: `char`

### **varNames** — Signal names

cell array of character vectors

Signal names, specified as a cell array of character vectors.

Data Types: `cell`

### **varValues** — Signal values

cell array of signal variables

Signal values associated with the signals in `varNames`, specified as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”.

Data Types: `cell`

### **isAppend** — Append or overwrite signal file

false or 0 (default) | true or 1

Append or overwrite signal file, specified as true (1) or false (0).

Data Types: `logical`

## Output Arguments

### **didWrite** — Whether signals were successfully written

false or 0 | true or 1

Whether the signals were successfully written to `exportFileName`, returned as true (1) or false (0).

### **errMsg — Error message**

character array

Error message, indicating errors with the reporting process, returned as a character array.

## Examples

### **Subclass FileType Class and Implement exportImpl Method**

Subclass `FileType` class and implement `exportImpl` method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement the static method `exportImpl`.

methods

```
function [didWrite,errMsg] = exportImpl(obj,fileName,cellOfVarNames, ...
 cellOfVarValues,isAppend)
 didWrite = false;
 errMsg = '';

 saveStruct = struct;

 for k = 1: length (cellOfVarNames)
 saveStruct.(cellOfVarNames{k}) = cellOfVarValues{k};
 end

 try
 if isAppend
 save(fileName,'-struct','saveStruct','-append');
 else
 save(fileName,'-struct','saveStruct');
 end
 didWrite = true;
 catch ME
 % Optional, return errMsg or throw hard error.
 % Returning an error message allows your automated
 % processes to carry on while allowing you to report the
 % error at a later time.
 errMsg = ME.message;
 end
end
end
end
```

# Simulink.io.FileType.getFileTypeDescription

**Class:** Simulink.io.FileType

**Package:** Simulink.io

Get custom file reader description

## Syntax

```
FileReaderDescription = getFileTypeDescription()
```

## Description

FileReaderDescription = getFileTypeDescription() returns the file reader description.

## Output Arguments

### FileReaderDescription — FileType description

character array

FileType description, returned as a character array. When writing the file type description, consider describing the data layout of the file.

## Examples

### Subclass FileType Class and Implement getFileTypeDescription Method

Subclass FileType class and implement the getFileTypeDescription method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement the static method getFileTypeDescription.

```
methods (Static)
```

```
 function aFileReaderDescription = getFileTypeDescription()
 aFileReaderDescription = ['Return a char array describing your reader.'];
 end
end

## Simulink.io.FileType.isFileSupported

**Class:** Simulink.io.FileType

**Package:** Simulink.io

Check if file type is supported in Simulink

### Syntax

```
isSupported = isFileSupported(fullFile)
```

### Description

`isSupported = isFileSupported(fullFile)` checks if the file located at `fullFile` is supported in Simulink.

### Input Arguments

**fullFile** — Fully qualified file name

character array

Fully qualified file name, specified as a character array.

Example: `C:\mydir\mySignals.csv`

Data Types: `char`

### Output Arguments

**isSupported** — File supported indicator

true (1) | false (0)

File support indicator, returned as true (1) or false (0).

### Examples

#### Subclass FileType Class and Implement isFileSupported Method

Subclass `FileType` class and implement the `isFileSupported` method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement the static method `isFileSupported`.

```
methods (Static)
```

```
function isSupported = isFileSupported(fileLocation)
 isSupported = false;
 if exist(fileLocation, 'file')
 isSupported = true;
 end
```

end  
end

## Simulink.io.FileType.isInput

**Class:** Simulink.io.FileType

**Package:** Simulink.io

Check if input is acceptable Simulink input

### Syntax

```
isSimulinkInput = Simulink.io.FileType.isInput(ts)
```

### Description

`isSimulinkInput = Simulink.io.FileType.isInput(ts)` checks if the `ts` argument is a MATLAB variable that can be used as Simulink simulation input.

### Input Arguments

#### **ts** — Simulink input

MATLAB variable

Simulink input, specified as a MATLAB variable. This variable must be an acceptable Simulink input, such as the data formats listed at “Data Format or Type”.

Example: `timeseries([0;9])`

Data Types: `char` | `string`

### Output Arguments

#### **isSimulinkInput** — File input indicator

't' (true) | 'f' (false)

File input indicator, returned as 't' (true) or 'f' (false).

### Examples

#### **Check Appropriateness of Input**

Check if the `timeseries` `ts` is an input supported by Simulink.

Create `timeseries` variable `ts`.

```
ts = timeseries([sin(0:.01:100)'])
```

```
timeseries
```

Common Properties:

```
 Name: 'unnamed'
```

```
 Time: [10001x1 double]
```

```
TimeInfo: [1x1 tsdata.timemetadata]
Data: [10001x1 double]
DataInfo: [1x1 tsdata.datametadata]
```

More properties, Methods

Check if *ts* is accepted by Simulink.

```
Simulink.io.FileType.isInput(ts)
```

```
ans =
```

```
logical
```

```
1
```

## Simulink.io.FileType.isSimulinkParameter

**Class:** Simulink.io.FileType

**Package:** Simulink.io

Check if input is Simulink parameter

### Syntax

```
isParameter = Simulink.io.FileType.isSimulinkParameter(aParam)
```

### Description

`isParameter = Simulink.io.FileType.isSimulinkParameter(aParam)` checks if the `aParam` argument is a supported Simulink.Parameter type:

- Simulink.Simulation.ModelParameter
- Simulink.Simulation.BlockParameter
- Simulink.Simulation.Variable
- Simulink.op.ModelOperatingPoint

### Input Arguments

**aParam — Simulink parameter**

vector of Simulink parameters | Simulink parameter as scalar

Simulink parameter, specified as a vector or scalar of one of these types:

- Simulink.Simulation.ModelParameter (can be scalar or vector)
- Simulink.Simulation.BlockParameter (can be scalar or vector)
- Simulink.Simulation.Variable (can be scalar or vector)
- Simulink.op.ModelOperatingPoint (must be scalar)

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical | char | string | struct | table | cell | function\_handle | categorical | datetime | duration | calendarDuration | fi

Complex Number Support: Yes

### Output Arguments

**isParameter — Simulink parameter indicator**

true (1) | false (0)

Simulink parameter indicator, returned as true (1) or false (0).

### Examples

## Check if Input Parameter Is Simulink Parameter

Check if the parameter *aParam* is a Simulink parameter.

Create parameter *aParam*.

```
aParam = Simulink.Simulation.BlockParameter('f/g', 'Gain', '5')
```

```
aParam =
```

```
BlockParameter with properties:
```

```
BlockPath: 'f/g'
Name: 'Gain'
Value: '5'
```

Check if the parameter *aParam* is a Simulink parameter.

```
Simulink.io.FileType.isSimulinkParameter(aParam)
```

```
ans =
```

```
logical
```

```
1
```

## loadAVariableImpl

**Class:** Simulink.io.FileType

**Package:** Simulink.io

Load specified variable from MAT-file

### Syntax

```
varOut = loadAVariableImpl(MATfile,varName)
```

### Description

`varOut = loadAVariableImpl(MATfile,varName)` loads the specified variable from the MAT-file.

### Input Arguments

**MATfile — File name of MAT-file**

character array

File name of the MAT-file that contains signals to load, specified as a character array.

Data Types: char

**varName — Variable name**

character array

Variable name to load, specified as a character array.

Data Types: char

### Output Arguments

**varOut — Found variable**

cell array of signal variables

Found variables to load, returned as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”.

### Examples

**Subclass FileType Class and Implement loadAVariableImpl Method**

Subclass `FileType` class and implement `loadAVariableImpl` method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement the static method `loadAVariableImpl`.

```
methods
```

```
function structOut = loadAVariableImpl(obj,varName)

## loadImpl

**Class:** Simulink.io.FileType

**Package:** Simulink.io

Load signal names from custom FileType object

### Syntax

```
matFileData = loadImpl(reader)
```

### Description

`matFileData = loadImpl(reader)` loads the signal names listed in the custom FileType object.

### Run-Time Details

`loadImpl` is called via `load` when you run the `Simulink.io.FileType` object. You can also run the application, which calls `load`. For details, see “Create Custom File Type for Import to Signal Editor”.

### Input Arguments

**reader — Signals to load**

`Simulink.io.FileType`

Signals to load, specified as a `Simulink.io.FileType` object.

Data Types: `char`

### Output Arguments

**matFileData — Signals**

cell array of signal variables

Variables of signals to load, returned as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”.

### Examples

#### Subclass FileType Class and Implement loadImpl Method

Subclass `FileType` class and implement the `loadImpl` method.

## validateFileNameImpl

**Class:** Simulink.io.FileType

**Package:** Simulink.io

Validate contents of custom MAT-file

### Syntax

```
validateFileNameImpl(reader, fileName)
```

### Description

`validateFileNameImpl(reader, fileName)` validates the format of the signals in the custom MAT-file `fileName` with the associated `Simulink.io.FileType` reader.

### Input Arguments

**reader — Reader**

`Simulink.io.FileType` object

Reader, specified as a `Simulink.io.FileType` object.

**fileName — File name of MAT-file**

character array

File name of a MAT-file that contains custom signals, specified as a character array.

Data Types: `char`

### Examples

#### Subclass FileType Class and Implement validateFileNameImpl Method

Subclass `FileType` class and implement the `validateFileNameImpl` method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement static method `validateFileNameImpl`.

```
function validateFileNameImpl(aFile, filename) %#ok<INUSL>
%validateFileNameImpl

[-, ~, fileExt] = fileparts(filename);
isSupported = strcmpi(fileExt, '.mat');

if ~isSupported
 error('This file format is not supported by application. ');
end
```

## whosImpl

**Class:** Simulink.io.FileType

**Package:** Simulink.io

Determine contents of MAT-file associated with Simulink.io.FileType object

### Syntax

```
signals = whosImpl(reader)
```

### Description

`signals = whosImpl(reader)` returns a structure containing the contents of the MAT-file associated with the `Simulink.io.FileType` object.

### Run-Time Details

`whosImpl` is called via `whos` when you run the application. For details, see “Create Custom File Type for Import to Signal Editor”.

### Input Arguments

#### **reader — Reader**

`Simulink.io.FileType` object

Reader, specified as a `Simulink.io.FileType` object.

### Output Arguments

#### **signals — Contents of MAT-file**

array of structures

Contents of the MAT-file, returned as an array of structures. This structure has a signal name [ 'char array' ] and an optional signal type of a supported type. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”.

### Examples

#### **Subclass FileType Class and Implement whosImpl Method**

Subclass `FileType` class and implement the `whosImpl` method.

```
classdef MySignalMatFile < Simulink.io.FileType
```

Implement the static method `whosImpl`.

methods

## Simulink.io.MatFile class

**Package:** Simulink.io

Read data in MAT-file format

### Description

`Simulink.io.MatFile` inherits from the `Simulink.io.FileType` base class. The class reads data formatted in a format used by MAT-files. To import data from a MAT-file, use this class.

```
classdef MatFile < Simulink.io.FileType
```

The `Simulink.io.MatFile` class is a handle class.

### Class Attributes

Abstract	false
HandleCompatible	true

For information on class attributes, see “Class Attributes”.

### Properties

#### `iofile.STAMatFile` – MAT-file reader

character array

MAT-file reader, specified as a character array.

#### Attributes:

GetAccess	public
SetAccess	public

Data Types: char | string

### Methods

#### Specialized Operators and Functions

These methods specialize standard MATLAB operators and functions for objects in this class.

<code>isFileSupported</code>	This method always returns <code>true</code> because it operates only on data in the MAT-file.
<code>getFileDescription</code>	This method returns the MAT-file reader description for MAT-files containing data with loading and logging signal formats that Simulink supports.

### Examples

## Read Data in MAT-File Format

Read data in MAT-file format from the file `foo.mat`.

```
fileName = 'foo.mat';
aReader = Simulink.io.MatFile(fileName);
resultOfWhos = whos(aReader);
```

Load the reader, which has no inputs.

```
varsOnFileStruct = load(aReader);
```

Load one variable.

```
var = loadAVariable(aReader, 'ts');
```

Import all the variables from the MAT-file, `foo.mat`.

```
importedVars = import(aReader);
```

Export the dataset to a MAT-file named `bar.mat`.

```
ds = Simulink.SimulationData.Dataset;
ds = ds.addElement(timeseries([1:10]', [1:10]'), 'Signal1');
ds = ds.addElement(timeseries([1:10]', [11:20]'), 'Signal2');
ds = ds.addElement(timeseries([1:10]', [21:30]'), 'Signal3');
```

```
filePath = 'bar.mat';
didWrite = aReader.export(filePath, {'ds'}, {ds}, 0);
```

## Simulink.io.ModelWorkspace class

**Package:** Simulink.io

Read data in format used by model workspace

### Description

Simulink.io.ModelWorkspace inherits from the Simulink.io.FileType base class. It reads data formatted in a format used by the model workspace. Use model workspace file types to move data to and from the model workspace to a function, an automated process, or a user interface. To import data from the model workspace, use this command.

```
classdef ModelWorkspace < Simulink.io.FileType
```

The Simulink.io.ModelWorkspace class is a handle class.

### Class Attributes

Abstract	false
HandleCompatible	true

For information on class attributes, see “Class Attributes”.

### Properties

#### DataSource — Source for initializing variables in model workspace

'Model File' (default) | 'MAT-File' | 'MATLAB Code' | 'MATLAB File'

Source for initializing the variables in the model workspace, specified as one of these character vectors:

- 'Model File' — The variables are stored in the model file. When you save the model, you also save the variables.
- 'MATLAB Code' — The variables are created by MATLAB code that you write and store in the model file.
- 'MAT-File' — The variables are stored in a MAT-file, which you can manage and manipulate separately from the model file.
- 'MATLAB File' — The variables are created by MATLAB code in a script file, which you can manage and manipulate separately from the model file.

#### Attributes:

GetAccess	public
SetAccess	public

Data Types: char | string

#### FileName — Name of external file that stores or creates variables

'' (empty character vector) (default) | character vector

Name of the external file that stores or creates variables, specified as a character vector. To enable this property, set `DataSource` to 'MAT-File' or 'MATLAB File'.

**Attributes:**

GetAccess public  
SetAccess public

Data Types: char | string

**MATLABCode — MATLAB code for initializing variables**

' ' (empty character vector) (default) | character vector

MATLAB code for initializing variables, specified as a character vector. To enable this property, set `DataSource` to 'MATLAB Code'.

**Attributes:**

GetAccess public  
SetAccess public

Data Types: char | string

## Methods

### Specialized Operators and Functions

These methods specialize standard MATLAB operators and functions for objects in this class.

<code>isFileSupported</code>	This method always returns true because it operates only on data in the base workspace.
<code>getFileTypeIdDescription</code>	This method returns the base workspace file reader description.

## Examples

### Read Data in Model Workspace Format

Set up `myExample` to use with the model workspace and perform basic operations.

Set up the model workspace for the `myExample`. Assign `timeseries([1;3])` as the value of `aSignal`.

```
myExample;

mWS = get_param('myExample','ModelWorkspace');
assignin(mWS, 'aSignal', timeseries([1;3]));
```

Determine the contents of the MAT-file `aFileType` associated with the `Simulink.io.ModelWorkspace` object.

```
aFileType = Simulink.io.ModelWorkspace('myExample.slx');
```

```
%whos on file
out = whos(aFileType)
```

```
out =

 struct with fields:

 name: 'aSignal'
 type: 'Signal'
```

Load signal names from the `aFileType` of the `myExample` model workspace.

```
aFileType = Simulink.io.ModelWorkspace('myExample.slx');
%load
out = load(aFileType)
```

```
out =

 struct with fields:

 aSignal: [1x1 timeseries]
```

```
aFileType = Simulink.io.ModelWorkspace('myExample.slx');
%import all
out = import(aFileType)
```

```
out =

 struct with fields:

 Data: {[1x1 timeseries]}
 Names: {'aSignal'}
```

```
out =

 struct with fields:

 Data: {[1x1 timeseries]}
 Names: {'aSignal'}
```

Import the specified variable `aSignal` from the model workspace.

```
aFileType = Simulink.io.ModelWorkspace('myExample.slx');
var = importAVariable(aFileType, 'aSignal')
```

```
timeseries

 Common Properties:
 Name: 'unnamed'
 Time: [2x1 double]
 TimeInfo: [1x1 tsdata.timemetadata]
 Data: [2x1 double]

## Simulink.io.PluggableNamespace class

**Package:** Simulink.io

Register Simulink.io.FileType objects from different name space

### Description

Use the Simulink.io.PluggableNamespace class interface to implement a name space to register Simulink.io.FileType objects from custom name spaces.

In your class definition file, you must subclass your object from this base class. Simulink requires direct inheritance from PluggableNamespace.

The process to contain the new class is similar to the one to create a custom file type. To contain your class, create a folder and add that folder path to the MATLAB path. In that folder, create a +Simulink folder, and inside that folder, create a +io folder.

To examine issues with the registration of these objects, use the Simulink.io.getFileTypeDiagnostics function.

The Simulink.io.PluggableNamespace class is a handle class.

### Class Attributes

Abstract	false
HandleCompatible	true

For information on class attributes, see “Class Attributes”.

## Creation

### Description

`classdef SimulinkIOPlugin < Simulink.io.PluggableNamespace` creates a name space.

### Properties

#### NameSpace — Name space to register

character array

Name space to register, specified as a character array.

Example: `Namespace = 'Simulink.io'`

#### Attributes:

GetAccess	public
-----------	--------

Data Types:

## Examples

### Create Pluggable Name Space

Create a pluggable name space, MyNamespace.

Inherit from the `Simulink.io.PluggableNamespace` base class.

```
classdef MyNamespace < Simulink.io.PluggableNamespace
```

Implement the property, `Namespace`, as `MyNamespace`.

```
 properties (Access = public, Constant)
 Namespace = 'MyNamespace';
 end
end
```

You can now create a folder on the MATLAB path, create a folder such as `+MyNamespace` and place your file types in that folder.

## Version History

**Introduced in R2021a**

### Methods

#### Specialized Operators and Functions

These methods specialize standard MATLAB operators and functions for objects in this class.

export	<p>This method calls the <code>exportImpl</code> method.</p> <p>From Signal Editor, write the structure of signals to a MAT-file. The structure must contain two cell arrays; one for signal names and one for signal values. Specify if the method appends to or overwrites the contents of the MAT-file. The method indicates if it succeeded in writing to the MAT-file and returns any error messages.</p>
import	<p><code>[importedData, warnStr ] = import(reader)</code></p> <p>To import custom signals for a custom file type, identify the custom file type <i>reader</i> as a <code>Simulink.io.FileType</code> object. The method returns the found variable as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”. The method returns a structure with two fields, <code>Data</code> and <code>Name</code>. <code>Data</code> is a cell array of signals and <code>Name</code> is a cell array of character vectors of the corresponding signal names.</p>
importAVariable	<p><code>varOut = importAVariable(reader,variableName)</code></p> <p>To import a specified variable for a custom file type, identify the custom file type reader as a <code>Simulink.io.FileType</code> object. Use <i>VariableName</i>, specified as a character array, to extract the desired signal from the file of custom format signals. The method returns the found variable, returned as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”.</p>
load	<p>This method calls the <code>loadImpl</code> method.</p> <p>Load the signal listed in the custom file type.</p>
loadAVariable	<p>This method calls the <code>loadAVariableImpl</code> method.</p> <p>Validate the format of the signals in the custom MAT-file <code>fileName</code> with the associated <code>Simulink.io.FileType</code> reader.</p>
validateFileName	<p>This method calls the <code>validateFileNameImpl</code> method.</p> <p>Validate the format of the signals in the custom MAT-file <code>fileName</code> with the associated <code>Simulink.io.FileType</code> reader.</p>

whos	This method calls the whosImpl method.  Return the contents of the custom file type MAT-file.
------	-----------------------------------------------------------------------------------------------------

## Examples

### Interact with SignalBuilderSpreadsheet Using Specialized Functions

Interact with FileType using specialized functions. This example refers to the open('Simulink.io.CreateSignals') sample file.

Get contents of Signal Builder format foo.xlsx spreadsheet.

```
fileName = 'foo.xlsx';
aReader = Simulink.io.SignalBuilderSpreadsheet(fileName);
resultOfWhos = whos(aReader);
```

Load the custom signals in foo.xlsx.

```
fileName = 'foo.xlsx';

aReader = Simulink.io.SignalBuilderSpreadsheet(fileName);
varsOnFileStruct = load(aReader, 'myGroup1');
```

Load a variable from foo.xlsx.

```
fileName = 'foo.xlsx';

aReader = Simulink.io.SignalBuilderSpreadsheet(fileName);
var = loadAVariable(aReader, 'myGroup1');
```

Import custom signals from foo.xlsx.

```
fileName = 'foo.xlsx';

aReader = Simulink.io.SignalBuilderSpreadsheet(fileName);
importedVars = import(aReader, 'myGroup1');
```

Export the signals from Signal Editor.

```
ds = Simulink.SimulationData.Dataset;
ds = ds.addElement(timeseries([1:10]', [1:10]'), 'Signal1'); %#ok<*NBRAK>
ds = ds.addElement(timeseries([1:10]', [11:20]'), 'Signal2');
ds = ds.addElement(timeseries([1:10]', [21:30]'), 'Signal3');

aReader = Simulink.io.SignalBuilderSpreadsheet('myFileToExport.xls');
didWrite = aReader.export(filePath, {'ds'}, {ds}, 0);
```

## Simulink.io.SLDVMatFile class

**Package:** Simulink.io

Read Simulink Design Verifier format data in MAT-file

### Description

The `Simulink.io.SLDVMatFile` class inherits from the `Simulink.io.MatFile` reader class, which inherits from the `Simulink.io.FileType` base class. This class reads the data in the `sldvData` structure used by Simulink Design Verifier. The data is contained in a MAT-file. To import data from a MAT-file that contains the `sldvData` structure, use this class.

```
classdef Simulink.io.SLDVMatFile < Simulink.io.MatFile
```

The `Simulink.io.SLDVMatFile` class is a `handle` class.

### Class Attributes

Abstract false

HandleCompatible true

For information on class attributes, see “Class Attributes”.

### Properties

#### FileName — Simulink Design Verifier data format reader

character array

Simulink Design Verifier data format reader, specified as a character array.

#### Specialized Operators and Functions

These methods specialize standard MATLAB operators and functions for objects in this class.

export	Not available.
--------	----------------

import	<pre>[importedData, warnStr ] = import(reader)</pre> <p>To import custom signals for a custom file type, identify the custom file type <i>reader</i> as a <code>Simulink.io.FileType</code> object. The method returns the found variable as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”. The method returns a structure with two fields, <code>Data</code> and <code>Name</code>. <code>Data</code> is a cell array of signals. <code>Name</code> is a cell array of character vectors of the corresponding signal names.</p>
importAVariable	<pre>varOut = importAVariable(reader,variableName)</pre> <p>To import a specified variable for a custom file type, identify the custom file type reader as a <code>Simulink.io.FileType</code> object. Use <i>VariableName</i>, specified as a character array, to extract the desired signal from the file of custom format signals. The method returns the found variable, returned as a cell array of signal variables of supported types. For more information on supported types, see “Choose a Base Workspace and MAT-File Format”.</p>
load	<p>This method calls the <code>loadImpl</code> method.</p> <p>Load the signal listed in the custom file type.</p>
loadAVariable	<p>This method calls the <code>loadAVariableImpl</code> method.</p> <p>Validate the format of the signals in the custom MAT-file <code>fileName</code> with the associated <code>Simulink.io.FileType</code> reader.</p>
validateFileName	<p>This method calls the <code>validateFileNameImpl</code> method.</p> <p>Validate the format of the signals in the custom MAT-file <code>fileName</code> with the associated <code>Simulink.io.FileType</code> reader.</p>
whos	<p>This method calls the <code>whosImpl</code> method.</p> <p>Return the list of <code>sldvData</code> structure datasets.</p>

## Examples

## Read Data in Simulink Design Verifier MAT-File Format

List the test cases in a Simulink Design Verifier MAT-file. The `whos()` method returns a structure with the fields `name` and `type`. The structure contains the names of all the test cases in the `sldvData` structure file along with the type `Dataset`.

```
fileName = 'foo.mat';
aReader = Simulink.io.SLDVMatFile(fileName);
resultOfWhos = whos(aReader);
```

Load the data. The `load()` method converts the test case data in the `sldvData` structure into `Simulink.SimulationData.Dataset` objects. The result is a structure where each field is the name of the test case and the value is the corresponding dataset object.

```
loadedVars = load(aReader);
```

Import the data. Similarly to `load()`, the `import()` method converts the test case data in the `sldvData` structure into `Simulink.SimulationData.Dataset` objects. The result is a structure with fields `Data` and `Names`. The `Names` field contains the name of the test cases. The `Data` field contains the corresponding dataset objects.

```
importedVars = import(aReader);
```

# Simulink.LookupTable class

**Package:** Simulink

Store and share lookup table and breakpoint data, configure data for ASAP2 and AUTOSAR code generation

## Description

An object of the `Simulink.LookupTable` class stores lookup table and breakpoint data. You can use that data in a lookup table block such as the n-D Lookup Table block. With the object, you can specify data types and code generation settings for the table and the breakpoint sets.

When you store all of the table and breakpoint set data in a single `Simulink.LookupTable` object, all of the data appears in a single structure in the generated code. To configure `STD_AXIS` code generation for calibration, use this technique.

To share a breakpoint set between multiple lookup tables, for example for `COM_AXIS` code generation, use a `Simulink.Breakpoint` object in one or more Prelookup blocks. Use `Simulink.LookupTable` objects in Interpolation Using Prelookup blocks. Then, configure the lookup table objects to refer to the breakpoint object. For more information, see “Package Shared Breakpoint and Table Data for Lookup Tables”.

To subclass from `Simulink.LookupTable` and inherit from this base class, type this syntax as the first line of your class definition file, where *myLookuptable* is the name of your new class:

```
classdef myLookuptable < Simulink.LookupTable
```

For an example on subclassing, see “Define Data Classes”.

If you add properties to the subclass, you can see them by displaying the subclass object at the MATLAB command line. In the property dialog box, these properties display in a new tab.

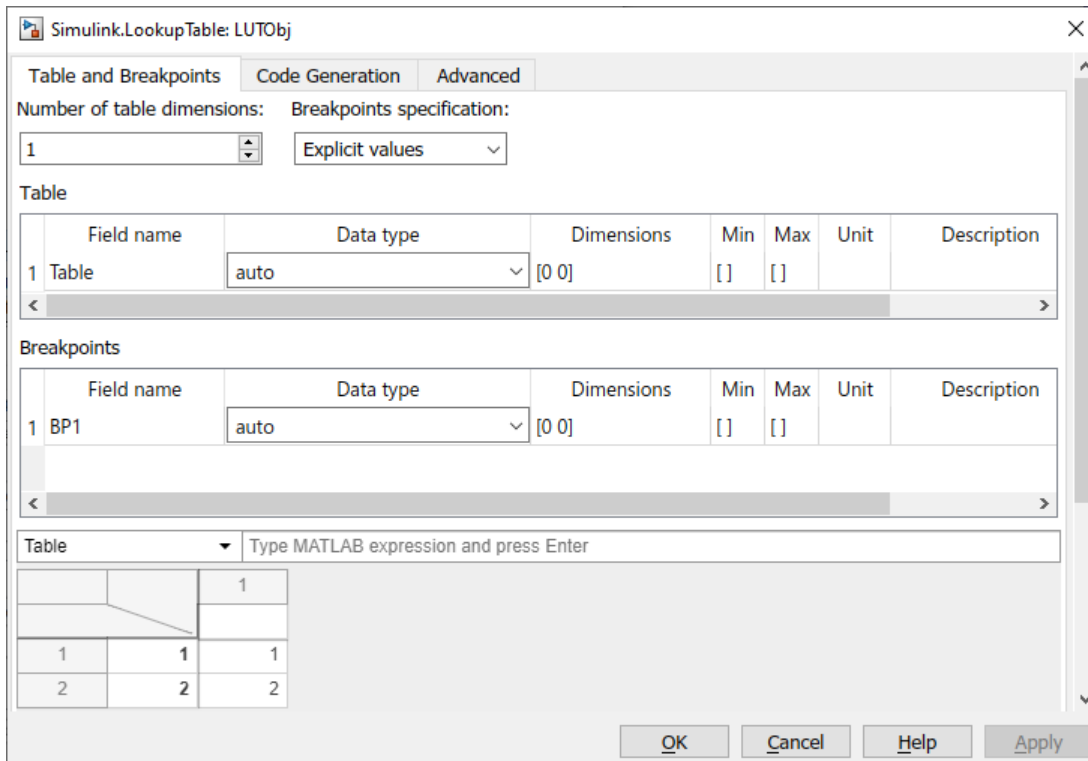

## Construction

`LUTObj = Simulink.LookupTable` returns a `Simulink.LookupTable` object `LUTObj` with default property values.

To create a `Simulink.LookupTable` object by using the Model Explorer, use the button  on the toolbar. The default name for the object is `Object`.

## Property Dialog Box

Setting **Breakpoints specification** to `Explicit` values (default) displays this view of the property dialog box.

The bottom of the dialog box contains the table and breakpoint data values. For more information on this tabular area, see “Edit Lookup Table Data with Lookup Table Spreadsheet”. The contents of this table are equivalent to the **Value** property, visible when the **Breakpoints specification** property is set to Even spacing or Reference.

### Table and Breakpoints

#### Number of table dimensions

Number of dimensions of the lookup table. Specify an integer value up to 30 (inclusive). For example, to represent a three-dimensional lookup table, specify the integer 3.

#### Breakpoints specification

Source for the information of the breakpoint sets, specified as **Explicit values** (default), **Reference**, or **Even spacing**.

- To store all of the table and breakpoint set data in the `Simulink.LookupTable` object, set **Breakpoints specification** to **Explicit values**.

The `Simulink.LookupTable` object appears in the generated code as a single structure variable.

- To store the table data in the `Simulink.LookupTable` object and store the breakpoint set data in `Simulink.Breakpoint` objects, set **Breakpoints specification** to **Reference**.

The `Simulink.LookupTable` object appears in the generated code as a separate array variable that contains the table data. Each `Simulink.Breakpoint` object appears as a separate array or structure variable that contains the breakpoint set data.

- To store the table data and evenly spaced breakpoints in the `Simulink.LookupTable` object, set **Breakpoints specification** to `Even spacing`. Use the **First point** and **Spacing** parameters to generate a set of evenly spaced breakpoints.

**Note** When **Breakpoints specification** is set to `Explicit values` or `Even spacing`, you can change the order of the tunable size, breakpoint, and table entries in a lookup table object-generated structure.

## Table

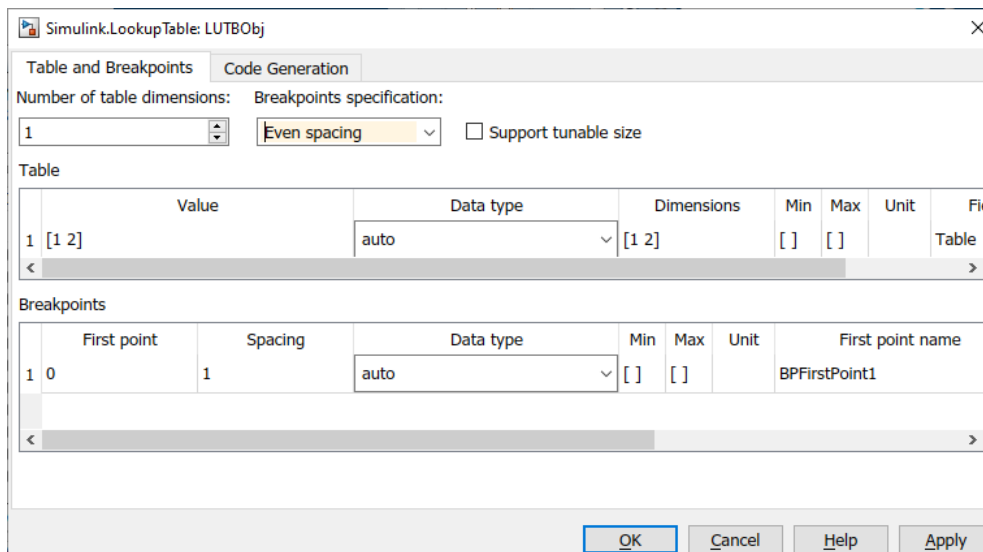

Information for the table data. You can configure these characteristics:

### Value

Table data. Specify a numeric vector or multidimensional array with at least two elements.

The **Value** table data is the same as the contents of the tabular interface visible at the bottom of the dialog box when the **Breakpoints specification** property is set to `Explicit values`. For more information on this tabular area, see “Edit Lookup Table Data with Lookup Table Spreadsheet”.

**Note** This property appears only if **Breakpoints specification** is set to `Even spacing` or `Reference`.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector or multidimensional array. When you click **Apply** or **OK**, the object executes the expression and uses the result to set the value of this property.

When you set **Data type** to `auto`, to set **Value**, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

When you specify table data with three or more dimensions, **Value** displays the data as an expression that contains a call to the `reshape` function. To edit the values in the data, modify

the first argument of the `reshape` call, which contains all of the values in a serialized vector. When you add or remove elements along a dimension, you must also correct the argument that represents the length of the modified dimension.

You can edit this data by using a more intuitive interface in a lookup table block. See “Import Lookup Table Data from MATLAB”.

#### Data type

Data type of the table data. The default setting is `auto`, which means that the table data acquire a data type from the value that you specify in **Value**. If you use an untyped expression such as `[1 2 3]` to set **Value**, the table data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the table data use the data type specified by the expression or object. Enumerated data types are also supported.

You can explicitly specify an integer data type, half data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

#### Dimensions

Dimension lengths of the lookup table data.

To use symbolic dimensions, specify a character vector. See “Implement Symbolic Dimensions for Array Sizes in Generated Code” (Embedded Coder).

#### Min

Minimum value of the elements in the table data. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

#### Max

Maximum value of the elements in the table data. The default value is empty, `[]`. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

#### Stored Int Min

For `Simulink.LookupTable` objects with a fixed-point data type, the minimum value of the elements in the table data, specified as a stored integer value. The value is derived from the real-world value **Min**. This property is available only in the property dialog box.

#### Stored Int Max

For `Simulink.LookupTable` objects with a fixed-point data type, the maximum value of the elements in the table data, specified as a stored integer value. The value is derived from the real-world value **Max**. This property is available only in the property dialog box.

#### Unit

Physical units of the elements in the lookup table. You can specify text such as `degC`. See “Unit Specification in Simulink Models”.

**Field name**

Name of a structure field in the generated code. This field stores the table data if you configure the `Simulink.LookupTable` object to appear in the generated code as a structure. The default value is `Table`. To change the field name, specify `text`.

**Description**

Description of the lookup table. You can specify text such as `This lookup table describes the action of a pump`.

**Breakpoints**

Breakpoint set information. Each row is one breakpoint set. To configure additional breakpoint sets, specify an integer value in the **Number of table dimensions** box.

For the breakpoint sets, you can configure these characteristics:

**Value**

Data for the breakpoint set. Specify a numeric vector with at least two elements.

---

**Note** This property appears only if **Breakpoints specification** is set to `Even spacing` or `Reference`. The **Value** breakpoint set data is the same as the contents of the tabular interface visible at the bottom of the dialog box when the **Breakpoints specification** property is set to `Explicit values`. For more information on this tabular area, see “Edit Lookup Table Data with Lookup Table Spreadsheet”.

---

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector. When you click **Apply** or **OK**, the object executes the expression and uses the result to set the value of this property.

When you set **Data type** to `auto`, to set **Value**, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

You can edit this data by using a more intuitive interface in a lookup table block. See “Import Lookup Table Data from MATLAB”.

**Data type**

Data type of the breakpoint set. The default setting is `auto`, which means that the breakpoint set acquires a data type from the value that you specify in **Value**. If you use an untyped expression such as `[1 2 3]` to set **Value**, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object.

You can explicitly specify an integer data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

**Dimensions**

Dimension lengths of the breakpoint set.

To use symbolic dimensions, specify a character vector. See “Implement Symbolic Dimensions for Array Sizes in Generated Code” (Embedded Coder).

**Min**

Minimum value of the elements in the breakpoint set. The default value is empty, [ ]. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

**Max**

Maximum value of the elements in the breakpoint set. The default value is empty, [ ]. You can specify a numeric, real value.

For more information about how Simulink uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

**Unit**

Physical unit of the elements in the breakpoint set. You can specify text such as degF. See “Unit Specification in Simulink Models”.

**Field name**

Name of a structure field in the generated code. This field stores the breakpoint set data. The default value is BP1 for the first breakpoint set and BP2 for the second set. To change the field name, specify text.

**Tunable size name**

Name of a structure field in the generated code. This field stores the length (number of elements) of the breakpoint set, which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory. The default name is N1 for the first breakpoint set and N2 for the second set. To change the field name, specify text.

This column appears only if you select **Support tunable size**.

**Description**

Description of the breakpoint set. You can specify text such as This breakpoint set represents the pressure input.

**First point**

First point in evenly spaced breakpoint data. This parameter is available when **Breakpoints specification** is set to Even spacing.

**Spacing**

Spacing between points in evenly spaced breakpoint data. This parameter is available when **Breakpoints specification** is set to Even spacing.

**Name**

Name of the Simulink.Breakpoint object that stores the information for this breakpoint set.

This column appears only if you set **Breakpoints specification** to Reference.

**First point name**

Name of the Simulink.Breakpoint object that stores the information for the first point. This parameter is available when **Breakpoints specification** is set to Even spacing.

### Spacing name

Name of the `Simulink.Breakpoint` object that stores the information for the spacing. This parameter is available when **Breakpoints specification** is set to `Even spacing`.

### Table and breakpoint value edit area

Information for table and breakpoint data. You can enter a MATLAB expression in the associated text box or add data directly in the accompanying table. Select the desired data type:

- Select table elements
- Use standard keyboard shortcuts such as:
  - Copy — **Ctrl+C**
  - Paste — **Ctrl+V**
  - Undo — **Ctrl+Z**
  - Delete
  - Redo — **Shift+Ctrl+Z**

Entering or manipulating data in the table is simple and intuitive. Like Microsoft Excel spreadsheets, you can work with the table with operations such as:

- **Table** — Table data. Specify a numeric vector or multidimensional array with at least two elements.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector or multidimensional array. When you press **Enter**, the object executes the expression and uses the result to set the value of this property.

When you specify table data with three or more dimensions, the table displays the data as an expression that contains a call to the `reshape` function. To edit the values in the data, modify the first argument of the `reshape` call, which contains all of the values in a serialized vector. When you add or remove elements along a dimension, you must also correct the argument that represents the length of the modified dimension.

You can edit this data using a more intuitive interface in a lookup table block. See “Import Lookup Table Data from MATLAB”.

- **BPN** — Data for the breakpoint set.

Specify a numeric vector with at least two elements.

You can also use an expression with mathematical operators such as `sin(1:0.5:30)` as long as the expression returns a numeric vector. When you press **Enter**, the object executes the expression and uses the result to set the value of this property.

You can edit this data by using a more intuitive interface in a lookup table block. See “Import Lookup Table Data from MATLAB”.

## Code Generation

### Data definition: Storage class

Storage class of the structure variable (if you set **Breakpoints specification** to `Explicit values` or `Even spacing`) or array variable (`Reference`) in the generated code. The variable stores the table data and, if the variable is a structure, the breakpoint set data. The default setting is `Auto`.

For more information about storage classes, see “C Code Generation Configuration for Model Interface Elements” (Simulink Coder).

If you have Embedded Coder, you can choose a custom storage class. For information about custom storage classes, see “Organize Parameter Data into a Structure by Using Struct Storage Class” (Embedded Coder).

#### Data definition: Identifier

Alternative name for the structure variable (if you set **Breakpoints specification** to `Explicit values` or `Even spacing`) or array variable (`Reference`) in the generated code. The default value is empty, in which case the generated code uses the name of the `Simulink.LookupTable` object as the name of the structure or array variable. To set the identifier, specify text.

To enable this property, set **Data definition: Storage class** to a setting other than `Auto`.

#### Data definition: Alignment

Data alignment boundary in the generated code. The starting memory address for the data allocated for the structure or array variable is a multiple of the value that you specify. The default value is `-1`, which allows the code generator to determine an optimal alignment based on usage.

Specify a positive integer that is a power of 2, not exceeding 128. For more information about using data alignment for code replacement, see “Data Alignment for Code Replacement” (Embedded Coder).

#### Struct Type definition: Name

Name of the structure type that the structure variable uses in the generated code. The default value is empty. Specify text.

This property appears only if you set **Breakpoints specification** to `Explicit values` or `Even spacing`.

#### Struct Type definition: Data scope

Scope of the structure type definition (imported from your custom code or exported from the generated code). The default value is `Auto`. When you select `Auto`:

- If you do not specify a value in the **Struct Type definition: Header file** box, the generated code exports the structure type definition to the file `modelName_types.h`. `modelName` is the name of the model.
- If you specify a value in the **Struct Type definition: Header file** box, such as `myHdr.h`, the generated code imports the structure type definition from `myHdr.h`.

To explicitly specify the data scope:

- To import the structure type definition into the generated code from your custom code, select `Imported`.
- To export the structure type definition from the generated code, select `Exported`.

Set the data scope of the structure type definition to `Imported` or `Exported` to avoid potential MISRA C:2012 violations.

If you do not specify a value in the **Struct Type definition: Header file** box, the generated code imports or exports the type definition from or to `StructName.h`. `StructName` is the name that you specify by using the property **Struct Type definition: Name**.

This property appears only if you set **Breakpoints specification** to `Explicit` values or `Even spacing`.

Struct Type definition: Header file

Name of the header file that contains the structure type definition. You can import the definition from a header file that you create, or export the definition into a generated header file. To control the scope of the structure type, adjust the setting for the **Struct Type definition: Data scope** property.

This property appears only if you set **Breakpoints specification** to `Explicit` values or `Even spacing`.

## Advanced

Support tunable size

Specification to enable tuning the effective size of the table in the generated code. In the code, the structure that corresponds to the object has an extra field for each breakpoint vector. Each extra field stores the length of the corresponding breakpoint vector. You can change the value of each field to adjust the effective size of the table. For more information on breakpoint and table sizes, see “Breakpoint and Table Size Features in Lookup Tables”.

This property appears only if you set **Breakpoints specification** to `Explicit` values or `Even spacing`. Selecting **Allow multiple instances of this type to have different table and breakpoint sizes** automatically selects this property.

---

**Note** If you store breakpoint data in `Simulink.Breakpoint` objects by setting **Breakpoints specification** to `Reference`, to enable tuning of the table size in the generated code, use the **Support tunable size** property of each `Simulink.Breakpoint` object.

---

Allow multiple instances of this type to have different table and breakpoint sizes

Specification to configure a Lookup Table object to support differently sized tables and breakpoints that have the same structure type. For example, assume two 1-D lookup table objects are configured as shown and have the same struct type name.

- Lookup table with tables and breakpoints of size [1x4]
- Lookup table with tables and breakpoints of size [1x6]

To enable a model with two blocks containing these objects to simulate, select the **Allow multiple instances of this type to have different table and breakpoint sizes** check box. For code generation with Simulink Coder, the software generates a common struct type with pointer typed member fields for the two objects to represent the table and breakpoint data.

This property appears only if you set **Breakpoints specification** to `Explicit` values or `Even spacing`.

For more information on breakpoint and table sizes, see “Breakpoint and Table Size Features in Lookup Tables”.

## Properties

### Breakpoints — Breakpoint set information

vector of `Simulink.lookuptable.Breakpoint` objects | cell array of character vectors

Breakpoint set information, specified as a vector of `Simulink.lookuptable.Breakpoint` objects, a cell array of character vectors, or a vector of `Simulink.lookuptable.Evenspacing` objects.

If you use a vector of `Simulink.lookuptable.Breakpoint` objects, each object represents a breakpoint set. To use a vector of `Simulink.lookuptable.Breakpoint` objects, set the property `BreakpointsSpecification` to 'Explicit values'.

If you use a cell array of character vectors, each character vector represents the name of a `Simulink.Breakpoint` object. To use a cell array of character vectors, set the property `BreakpointsSpecification` to 'Reference'.

If you use a vector of `Simulink.lookuptable.Evenspacing` objects, each object represents a breakpoint set. To use a vector of `Simulink.lookuptable.Evenspacing` objects, set the property `BreakpointsSpecification` to 'Even Spacing'.

### **BreakpointsSpecification — Source of breakpoint set information**

'Explicit values' (default) | 'Reference' | 'Even spacing'

Source of the breakpoint set information, specified as 'Explicit values' (default), 'Even spacing', or 'Reference'. See the **Breakpoints > Specification** parameter.

Data Types: char

### **CoderInfo — Code generation settings for structure or array variable**

`Simulink.CoderInfo` object

Code generation settings for the structure variable (if you set `BreakpointsSpecification` to 'Explicit values' or 'Even spacing') or array variable ('Reference') that stores the lookup table and breakpoint sets, specified as a `Simulink.CoderInfo` object. You can specify a storage class or custom storage class by using this embedded object. See `Simulink.CoderInfo`.

### **StructTypeInfo — Settings for structure type in the generated code**

`Simulink.lookuptable.StructTypeInfo` object

Settings for the structure type that the structure variable uses in the generated code, specified as a `Simulink.lookuptable.StructTypeInfo` object.

If you set `BreakpointsSpecification` to 'Reference', the `Simulink.LookupTable` object does not appear in the generated code as a structure. The code generator ignores this property.

### **SupportTunableSize — Option to generate code that enables tunability of table size**

false (default) | true

Option to generate code that enables tunability of the effective size of the table, specified as true or false. See the **Support Tunable Size** parameter.

Data Types: logical

### **Table — Information for table data**

`Simulink.lookuptable.Table` object

Information for the table data, specified as a `Simulink.lookuptable.Table` object.

## **Copy Semantics**

Handle. To learn how handle classes affect copy operations, see Copying Objects.

## Examples

### Represent a One-Dimensional Lookup Table

- 1 Create a `Simulink.LookupTable` object named `LUTObj`.

```
LUTObj = Simulink.LookupTable;
```

- 2 Specify the table data.

```
LUTObj.Table.Value = [1.1 2.2 3.3 4.4 5.5];
```

- 3 Specify the breakpoint set data.

```
LUTObj.Breakpoints(1).Value = [-2 -1 0 1 2];
```

- 4 Specify a name for the structure type in the generated code.

```
LUTObj.StructTypeInfo.Name = 'myLUTStruct';
```

You can use `LUTObj` in a 1-D Lookup Table block dialog box. In the block, set **Data specification** to `Lookup table object` and **Name** to `LUTObj`.

To view the data, use the property dialog as described in “Edit Lookup Table Data with Lookup Table Spreadsheet”.

### Represent a Two-Dimensional Lookup Table

- 1 Create a `Simulink.LookupTable` object named `LUTObj`.

```
LUTObj = Simulink.LookupTable;
```

- 2 Specify the table data.

```
LUTObj.Table.Value = [1.1 2.2 3.3 4.4 5.5; ...
 6.6 7.7 8.8 9.9 10.1];
```

- 3 Specify the breakpoint set data. In the `Breakpoints` property, use the vector index 2 to set the values in the second breakpoint set.

```
LUTObj.Breakpoints(1).Value = [-1 1];
```

```
LUTObj.Breakpoints(2).Value = [-2 -1 0 1 2];
```

`LUTObj` creates a `Simulink.lookuptable.Breakpoint` object as the second vector element in the value of the `Breakpoints` property. Except for the `Value` property, the new object has default property values.

- 4 Specify a name for the structure type in the generated code.

```
LUTObj.StructTypeInfo.Name = 'myLUTStruct';
```

You can use `LUTObj` in a 2-D Lookup Table block dialog box.

To view the data, use the property dialog as described in “Edit Lookup Table Data with Lookup Table Spreadsheet”.

### Evenly Space Every Second Value Starting from 1

To evenly space every second value starting from 1, use the `Breakpoint` object.

- 1 Create a `Simulink.LookupTable` object named `LUTObj`.

```
LUTObj=Simulink.LookupTable
```

```
LUTObj =
```

```
LookupTable with properties:
```

```

 Table: [1x1 Simulink.lookuptable.Table]
BreakpointsSpecification: 'Explicit values'
 Breakpoints: [1x1 Simulink.lookuptable.Breakpoint]
SupportTunableSize: 0
 CoderInfo: [1x1 Simulink.CoderInfo]
 StructTypeInfo: [1x1 Simulink.lookuptable.StructTypeInfo]
```

- 2 Set up the breakpoint property to even spacing.

```
LUTObj.BreakpointsSpecification='Even spacing'
```

```
LUTObj =
```

```
LookupTable with properties:
```

```

 Table: [1x1 Simulink.lookuptable.Table]
BreakpointsSpecification: 'Even spacing'
 Breakpoints: [1x1 Simulink.lookuptable.Evenspacing]
SupportTunableSize: 0
 CoderInfo: [1x1 Simulink.CoderInfo]
 StructTypeInfo: [1x1 Simulink.lookuptable.StructTypeInfo]
```

- 3 Get the properties of the breakpoint.

```
LUTObj.Breakpoints(1)
```

```
ans =
```

```
Evenspacing with properties:
```

```

 FirstPoint: 0
 Spacing: 1
 DataType: 'auto'
 Min: []
 Max: []
 Unit: ''
 FirstPointName: 'BPFirstPoint1'
 SpacingName: 'BPSpacing1'
 TunableSizeName: 'N1'
 Description: ''
```

- 4 To set the first point property, use the Breakpoint object `FirstPoint` property.

```
LUTObj.Breakpoints(1).FirstPoint=1
```

- 5 To set the spacing property, use the Breakpoint object.

```
LUTObj.Breakpoints(1).Spacing=2
```

- 6 Get the properties of the breakpoint.

```
LUTObj.Breakpoints(1)
```

```
ans =
```

```
 Evenspacing with properties:
```

```
 FirstPoint: 1
 Spacing: 2
 DataType: 'auto'
 Min: []
 Max: []
 Unit: ''
 FirstPointName: 'BPFirstPoint1'
 SpacingName: 'BPSpacing1'
TunableSizeName: 'N1'
 Description: ''
```

### Control Code Generation for Lookup Table and Breakpoint Sets

Create a `Simulink.LookupTable` object named `LUTObj`.

```
LUTObj = Simulink.LookupTable;
```

Specify the table data.

```
LUTObj.Table.Value = [1.00 2.25 3.50 4.75 6.00; ...
 7.25 8.50 9.75 11.00 12.25];
```

Specify the breakpoint set data. In the `Breakpoints` property, use the array index 2 to create an additional `Simulink.lookuptable.BreakpointInfo` object, which represents the second breakpoint set.

```
LUTObj.Breakpoints(1).Value = [-1 1];
```

```
LUTObj.Breakpoints(2).Value = [-2 -1 0 1 2];
```

Specify data types for the lookup table and each breakpoint set.

```
LUTObj.Table.DataType = 'fixdt(1,16,2)';
```

```
LUTObj.Breakpoints(1).DataType = 'int16';
```

```
LUTObj.Breakpoints(2).DataType = 'int16';
```

Specify unique names for the structure fields that store the table data and breakpoint sets in the generated code.

```
LUTObj.Table.FieldName = 'myTable';
```

```
LUTObj.Breakpoints(1).FieldName = 'myBPSet1';
```

```
LUTObj.Breakpoints(2).FieldName = 'myBPSet2';
```

Export the structure variable definition from the generated code by using the storage class `ExportedGlobal`.

```
LUTObj.CoderInfo.StorageClass = 'ExportedGlobal';
```

Name the structure type in the generated code `LUTStructType`. Export the structure type definition to a generated header file named `myLUTHdr.h`.

```
LUTObj.StructTypeInfo.Name = 'LUTStructType';
LUTObj.StructTypeInfo.DataScope = 'Exported';
LUTObj.StructTypeInfo.HeaderFileName = 'myLUTHdr.h';
```

In an n-D Lookup Table block in a model, set **Data specification** to `Lookup table object` and **Name** to `LUTObj`.

```
load_system('myModel_LUTObj')
set_param('myModel_LUTObj/Lookup Table', 'DataSpecification', 'Lookup table object', ...
 'LookupTableObject', 'LUTObj')
```

Generate code from the model.

```
slbuild('myModel_LUTObj')

Starting build procedure for: myModel_LUTObj
Generated code for 'myModel_LUTObj' is up to date because no structural, parameter or code re
Successful completion of code generation for: myModel_LUTObj
```

Build Summary

```
0 of 1 models built (1 models already up to date)
Build duration: 0h 0m 2.141s
```

The generated code defines the structure type `LUTStructType` in the generated header file `myLUTHdr.h`.

```
file = fullfile('myModel_LUTObj_ert_rtw', 'myLUTHdr.h');
rtwdemodbtype(file, 'typedef struct {', '} LUTStructType;', 1, 1)

typedef struct {
 int16_T myBPSet1[2];
 int16_T myBPSet2[5];
 int16_T myTable[10];
} LUTStructType;
```

The code uses the global structure variable `LUTObj` to store the table and breakpoint set data. The table data is scaled based on the specified fixed-point data type.

```
file = fullfile('myModel_LUTObj_ert_rtw', 'myModel_LUTObj.c');
rtwdemodbtype(file, 'LUTStructType LUTObj = {', '/* Variable: LUTObj', 1, 1)

LUTStructType LUTObj = {
 { -1, 1 },

 { -2, -1, 0, 1, 2 },

 { 4, 29, 9, 34, 14, 39, 19, 44, 24, 49 }
}; /* Variable: LUTObj
```

## Limitations

When blocks in a subsystem use `Simulink.LookupTable` or `Simulink.Breakpoint` objects, you cannot set data type override only on the subsystem. Instead, set data type override on the entire model.

## Version History

### Introduced in R2016b

### R2022b: New Advanced Tab

*Behavior changed in R2022b*

- The **Support tunable size** property has been moved to the new **Advanced** tab.
- To configure a Lookup Table object to support differently sized tables and breakpoints, select the new **Allow multiple instances of this type to have different table and breakpoint sizes** check box.

## Simulink.lookuptable.Breakpoint class

**Package:** Simulink.lookuptable

Configure breakpoint set data for lookup table object

### Description

An object of the `Simulink.lookuptable.Breakpoint` class stores breakpoint set information for a lookup table. The object resides in the `Breakpoints` property of a `Simulink.LookupTable` object or `Simulink.Breakpoint` object.

You can use `Simulink.LookupTable` and `Simulink.Breakpoint` objects to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

To represent multiple breakpoint sets for a multidimensional lookup table, store a vector of `Simulink.lookuptable.Breakpoint` objects in the `Breakpoints` property of a `Simulink.LookupTable` object.

To share a breakpoint set between multiple lookup tables, use a `Simulink.Breakpoint` object to store and configure the breakpoint set information. Use the object in a `Prelookup` block and create `Simulink.LookupTable` objects to use in `Interpolation Using Prelookup` blocks.

### Construction

When you create a `Simulink.LookupTable` object or `Simulink.Breakpoint` object, a `Simulink.lookuptable.Breakpoint` object appears as the value of the `Breakpoints` property.

To create more `Simulink.lookuptable.Breakpoint` objects for a `Simulink.LookupTable` object, use this technique:

Access the `Breakpoints` property by specifying a vector index.

To create a `Simulink.lookuptable.Breakpoint` object, you can set the value of any of the object properties. The `Simulink.LookupTable` object creates the `Simulink.lookuptable.Breakpoint` object with default property values, and sets the property that you specified.

The value of the `Breakpoints` property is an array of `Simulink.lookuptable.Breakpoint` objects. Each embedded object represents one breakpoint set.

For example, suppose that you create a `Simulink.LookupTable` object named `LUTObj`. To create more breakpoint sets, access the `Breakpoints` property by specifying vector indices:

```
LUTObj.Breakpoints(1).Value = [-1 1];
LUTObj.Breakpoints(2).Value = [-2 -1 0 1 2];
LUTObj.Breakpoints(3).Value = [-5 -3 0 3 5];
```

The object `LUTObj` creates additional `Simulink.lookuptable.Breakpoint` objects and sets the `Value` property of each object. `LUTObj` now stores information for three breakpoint sets.

## Properties

### Data Type — Data type of breakpoint set elements

'auto' (default) | character vector

Data type of breakpoint set elements, specified as a character vector. You can explicitly specify an integer, half data type, a floating-point, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

The default value, 'auto', means that the breakpoint set acquires a data type from the value that you specify in the `Value` property. If you use an untyped expression such as `[1 2 3]` to set `Value`, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Example: 'int16'

Example: 'myTypeAlias'

Data Types: char

### Description — Description of breakpoint set

' ' (default) | character vector

Description of the breakpoint set, specified as a character vector.

Example: 'This breakpoint set represents the pressure input.'

Data Types: char

### Dimensions — Dimension lengths of breakpoint set

[0 0] (default) | numeric vector

Dimension lengths of the breakpoint set, returned as a numeric vector or specified as a character vector.

To use symbolic dimensions, specify a character vector.

### FieldName — Name of structure field that stores breakpoint set data

'BP' (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the breakpoint set data.

The code generator uses this property only under these circumstances, which cause the breakpoint data to appear in the generated code as a structure field:

- The `Simulink.lookupable.Breakpoint` object exists in a `Simulink.LookupTable` object and in the `Simulink.LookupTable` object you set `BreakpointsSpecification` to 'Explicit values'.
- The `Simulink.lookupable.Breakpoint` object exists in a `Simulink.Breakpoint` object and in the `Simulink.Breakpoint` object you set `SupportTunableSize` to `true`.

Example: 'MyBkptSet1'

Data Types: char

**Max — Maximum value of breakpoint set elements**

[] (default) | numeric double value

Maximum value of the elements of the breakpoint set, specified as a numeric, real value of the data type double.

Example: 17.23

Data Types: double

**Min — Minimum value of breakpoint set elements**

[] (default) | numeric double value

Minimum value of the elements of the breakpoint set, specified as a numeric, real value of the data type double.

Example: -52.6

Data Types: double

**TunableSizeName — Name of structure field that stores length of breakpoint set**

'N' (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the length of the breakpoint set, which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory.

The code generator uses this property only under these circumstances, which enable a tunable table size in the generated code:

- The `Simulink.lookuptable.Breakpoint` object exists in a `Simulink.LookupTable` object and in the `Simulink.LookupTable` object you set:
  - `BreakpointsSpecification` to 'Explicit values'.
  - `SupportTunableSize` to true.
- The `Simulink.lookuptable.Breakpoint` object exists in a `Simulink.Breakpoint` object and in the `Simulink.Breakpoint` object you set `SupportTunableSize` to true.

Example: 'LengthForDim1'

Data Types: char

**Unit — Physical unit of breakpoint set**

' ' (default) | character vector

Physical unit of the elements of the breakpoint set, specified as a character vector.

Example: 'inches'

Data Types: char

**Value — Breakpoint set data**

[] (default) | numeric vector

The breakpoint set data, specified as a numeric vector with at least two elements. To control the data type of the breakpoint set, use the `DataType` property of the `Simulink.lookupable.Breakpoint` object.

When you set `DataType` to 'auto', to set the `Value` property, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

Example: `[10 20 30]`

Data Types: `single` | `double` | `half` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fi`

## Copy Semantics

`Simulink.LookupTable` | `Simulink.Breakpoint`

## Simulink.lookupable.Evenspacing class

**Package:** Simulink.lookupable

Configure even spacing set data for lookup table object

### Description

An object of the Simulink.lookupable.Evenspacing class stores event spacing set information for a lookup table. The object resides in the Evenspacing property of a Simulink.LookupTable object.

You can use Simulink.LookupTable objects to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

To represent multiple breakpoint sets for a multidimensional lookup table, store a vector of Simulink.lookupable.Evenspacing objects in the Evenspacing property of a Simulink.LookupTable object.

### Construction

When you create a Simulink.LookupTable object and set BreakpointSpecification to 'Even spacing', a Simulink.lookupable.Evenspacing object appears as the value of the Breakpoints property.

To create more Simulink.lookupable.Evenspacing objects for a Simulink.LookupTable object, use this technique:

Access the Breakpoints property by specifying a vector index.

To create a Simulink.lookupable.Evenspacing object, you can set the value of any of the object properties. The Simulink.LookupTable object creates the Simulink.lookupable.Evenspacing object with default property values, and sets the property that you specified.

The value of the Breakpoints property is an array of Simulink.lookupable.Evenspacing objects. Each embedded object represents one breakpoint set.

For example, suppose that you create a Simulink.LookupTable object named myLUTObj. To create more breakpoint sets, access the Breakpoints property by specifying scalar indices for FirstPoint and Spacing properties. To create more even spacing breakpoint sets, update the object with this pair of properties:

```
LUTObj.Breakpoints(1).FirstPoint=-1;
LUTObj.Breakpoints(1).Spacing=2;
LUTObj.Breakpoints(1).FirstPoint=-2;
LUTObj.Breakpoints(1).Spacing=1;
LUTObj.Breakpoints(1).FirstPoint=-5;
LUTObj.Breakpoints(1).Spacing=2;
```

The object `myLUTObj` creates additional `Simulink.lookupable.Evenspacing` objects and sets the `FirstPoint` and `Spacing` properties of each object. `LUTObj` now stores information for three breakpoint sets.

## Properties

### FirstPoint — First point in evenly spaced breakpoint data

[] (default) | numeric scalar

First point in evenly spaced breakpoint data, specified as a numeric scalar. To control the data type of the breakpoint set, use the `DataType` property of the `Simulink.lookupable.Evenspacing` object.

When you set `DataType` to 'auto', to set the `FirstPoint` property, use a typed expression such as `single(1)` or use the `fi` constructor to embed a `fi` object.

Example: -1

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fi`

### Spacing — Spacing between points in evenly spaced breakpoint data

[] (default) | numeric, positive, monotonically increasing scalar

Spacing between points in evenly spaced breakpoint data, specified as a numeric scalar. To control the data type of the breakpoint set, use the `DataType` property of the `Simulink.lookupable.Evenspacing` object.

When you set `DataType` to 'auto', to set the `Spacing` property, use a typed expression such as `single(1)` or use the `fi` constructor to embed an `fi` object.

Example: -1

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `uint8` | `uint16` | `uint32` | `fi`

### DataType — Data type of breakpoint set elements

'auto' (default) | character vector

Data type of breakpoint set elements, specified as a character vector. You can explicitly specify an integer, a floating-point, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

The default value, 'auto', means that the breakpoint set acquires a data type from the value that you specify in the `Value` property. If you use an untyped expression such as `[1 2 3]` to set `Value`, the breakpoint data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the breakpoint data use the data type specified by the expression or object.

For more information about data types in Simulink, see "Data Types Supported by Simulink". To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see "Control Data Types of Lookup Table Objects" (Simulink Coder).

Example: 'int16'

Example: 'myTypeAlias'

Data Types: `char`

**Min — Minimum value of breakpoint set elements**

[] (default) | numeric double value

Minimum value of the elements of the breakpoint set, specified as a numeric, real value of the data type `double`.

Example: `-52.6`

Data Types: `double`

**Max — Maximum value of breakpoint set elements**

[] (default) | numeric double value

Maximum value of the elements of the breakpoint set, specified as a numeric, real value of the data type `double`.

Example: `17.23`

Data Types: `double`

**Unit — Physical unit of breakpoint set**

' ' (default) | character vector

Physical unit of the elements of the breakpoint set, specified as a character vector.

Example: `'inches'`

Data Types: `char`

**FirstPointName — Name of the Simulink.LookupTable.Evenspacing object that stores the information for the first point**

'BPFIRSTPOINT1' (default) | character vector

Name of the `Simulink.Breakpoint` object that stores the information for the first point, specified as a character vector. Generated code uses this name to display the first point.

Example: `'myFirstPointName'`

Data Types: `char`

**SpacingName — Name of the Simulink.LookupTable.Evenspacing object that stores the information for the spacing**

'auto' (default) | character vector

Name of the `Simulink.Breakpoint` object that stores the information for the spacing, specified as a character vector. Generated code uses this name to display the spacing.

Example: `'mySpacing'`

Data Types: `char`

**TunableSizeName — Name of structure field that stores length of breakpoint set**

'N' (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the length of the breakpoint set, which the generated code algorithm uses to determine the size of the table. To tune the effective size of the table during code execution, change the value of this structure field in memory.

The code generator uses the property only under these circumstances, which enable a tunable table size in the generated code:

- The `Simulink.lookupable.Evenspacing` object exists in a `Simulink.LookupTable` object, in which you set `BreakpointsSpecification` to `'Even spacing'` and `SupportTunableSize` to `true`.

Example: `'LengthForDim1'`

Data Types: `char`

### **Description — Description of breakpoint set**

`''` (default) | character vector

Description of the breakpoint set, specified as a character vector.

Example: `'This breakpoint set represents the pressure input.'`

Data Types: `char`

### **Copy Semantics**

`Simulink.LookupTable` | `Simulink.lookupable.Breakpoint`

## Simulink.lookupable.StructTypeInfo class

**Package:** Simulink.lookupable

Configure settings for structure type that lookup table object uses in the generated code

### Description

An object of the Simulink.lookupable.StructTypeInfo class controls the structure type that the generated code creates to store data for lookup table objects. The Simulink.lookupable.StructTypeInfo object resides in the StructTypeInfo property of a Simulink.LookupTable object or Simulink.Breakpoint object. Use these parent objects to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

A Simulink.LookupTable object appears as a structure in the generated code when you set the Specification property to 'Explicit values'. A Simulink.Breakpoint object appears as a structure in the generated code when you set the SupportTunableSize property to true.

### Construction

When you create a Simulink.LookupTable or Simulink.Breakpoint object, a Simulink.lookupable.StructTypeInfo object appears as the value of the StructTypeInfo property.

### Properties

#### DataScope — Scope of structure type definition

'Auto' (default) | 'Exported' | 'Imported'

Scope of structure type definition, specified as a character vector.

Set the data scope to Imported or Exported to avoid potential MISRA C:2012 violations.

Data Types: char

#### HeaderFileName — Name of header file that contains structure type definition

'' (default) | character vector

Name of the header file that contains the structure type definition, specified as a character vector.

Example: 'myHdr.h'

Data Types: char

#### Name — Name of structure type

'' (default) | character vector

Name of the structure type, specified as a character vector.

Data Types: char

## **Copy Semantics**

## Simulink.lookuptable.Table class

**Package:** Simulink.lookuptable

Configure table data for lookup table object

### Description

An object of the `Simulink.lookuptable.Table` class stores table information for a lookup table. The object resides in the `Table` property of a `Simulink.LookupTable` object. You can use the `Simulink.LookupTable` object to store and configure a lookup table for ASAP2 and AUTOSAR code generation.

### Construction

When you create a `Simulink.LookupTable` object, a `Simulink.lookuptable.Table` object appears as the value of the `Table` property.

### Properties

#### Data Type — Data type of table data elements

'auto' (default) | character vector

Data type of the table data elements, specified as a character vector. You can explicitly specify an integer data type, half data type, a floating-point data type, a fixed-point data type, or a data type expression such as the name of a `Simulink.AliasType` object.

The default value, 'auto', means that the table data acquire a data type from the value that you specify in the `Value` property. If you use an untyped expression such as `[1 2 3]` to set `Value`, the table data use the data type `double`. If you specify a typed expression such as `single([1 2 3])` or an `fi` object, the table data use the data type specified by the expression or object.

For more information about data types in Simulink, see “Data Types Supported by Simulink”. To decide how to control the data types of table and breakpoint data in `Simulink.LookupTable` and `Simulink.Breakpoint` objects, see “Control Data Types of Lookup Table Objects” (Simulink Coder).

Example: 'int16'

Example: 'myTypeAlias'

Data Types: char

#### Description — Description of table data

' ' (default) | character vector

Description of the table data, specified as a character vector.

Example: 'This lookup table describes the action of a pump.'

Data Types: char

#### Dimensions — Dimension lengths of table data

[0 0] (default) | numeric vector

Dimension lengths of the table data, returned as a numeric vector or specified as a character vector.

To use symbolic dimensions, specify a character vector.

### **FieldName** — Name of a structure field in the generated code

'Table' (default) | character vector

Name of a structure field in the generated code, specified as a character vector. This field stores the table data if you configure the `Simulink.LookupTable` object to appear in the generated code as a structure.

Example: 'MyPumpTable'

Data Types: char

### **Max** — Maximum value of table data elements

[] (default) | numeric double value

Maximum value of the elements of the table data, specified as a numeric, real value of the data type `double`.

Example: 17.23

Data Types: double

### **Min** — Minimum value of table data elements

[] (default) | numeric double value

Minimum value of the elements of the table data, specified as a numeric, real value of the data type `double`.

Example: -52.6

Data Types: double

### **Unit** — Physical unit of table elements

' ' (default) | character vector

Physical unit of the elements of the table data, specified as a character vector.

Example: 'degC'

Data Types: char

### **Value** — Table data

[] (default) | numeric vector or multidimensional array

The table data, specified as a numeric vector or multidimensional array with at least two elements. To control the data type of the table data, use the `DataType` property of the `Simulink.lookupTable.Table` object.

When you set `DataType` to 'auto', to set the `Value` property, use a typed expression such as `single([1 2 3])` or use the `fi` constructor to embed an `fi` object.

Example: [10 20 30; 40 50 60]

Data Types: single | double | half | int8 | int16 | int32 | uint8 | uint16 | uint32 | fi

## **Copy Semantics**

Value. To learn how value classes affect copy operations, see Copying Objects.

## **Version History**

**Introduced in R2016b**

# Simulink.Mask class

**Package:** Simulink

Control masks programmatically

## Description

Use an instance of the `Simulink.Mask` class to perform the following operations:

- Create, copy, and delete masks.
- Create, edit, and delete mask parameters.
- Determine the block that owns the mask.
- Obtain workspace variables defined for a mask.

## Properties

### Type — Mask type of block

character vector (default) | string

Mask type of the associated block is specified as a character vector or string.

Data Types: `char` | `string`

### Description — Description of block

character vector (default) | string

Description of the block, specified as a character vector or string.

Data Types: `char` | `string`

### Help — Help text for the masked block

character vector (default) | string

Help text for the masked block, specified as a character vector or string.

Data Types: `char` | `string`

### Initialization — Initialization commands

character vector (default) | string

Initialization commands for the masked block, specified as a character vector or string.

Data Types: `char` | `string`

### SelfModifiable — Option to allow block to modify its contents

off (default) | on

Option to allow the block to modify its contents, specified as a logical.

Data Types: `logical`

### Display — MATLAB code for block icon

character vector (default) | string

MATLAB code for the block icon, specified as a character vector or string.

Data Types: `char` | `string`

#### **IconFrame — Visibility of block frame**

`off` (default) | `on`

Visibility of the block frame, specified as a logical value.

Data Types: `logical`

#### **IconOpaque — Option to make the icon opaque**

`opaque` (default) | `transparent`

Option to make the icon opaque, specified as a logical.

- **Opaque:** Make the icon opaque.
- **Transparent:** Make the icon transparent.

Data Types: `logical`

#### **RunInitForIconRedraw — Option to run initialization before executing drawing commands**

`auto` (default) | `on` | `off`

Option to run mask initialization commands before executing the mask icon commands, specified as enumerated data type.

Data Types: `enum`

#### **IconRotate — Option to rotate icon with block**

`none` (default) | `port`

Option to rotate icon along with block, specified as enumerated data type.

Data Types: `enum`

#### **PortRotate — Port rotation type**

`default` (default) | `physical`

Port rotation type, specified as enumerated data type. Set this property to `default` to reorder ports after a clockwise rotation to maintain a left-to-right port numbering order for ports along the top and bottom of the block and a top-to-bottom port numbering order for ports along the left and right sides of the block. Set this property to `physical` to rotate ports with the block without reordering them after a clockwise rotation.

Data Types: `enum`

#### **IconUnits — Units for drawing commands**

`autoscale` (default) | `pixels` | `normalized`

Units for drawing commands, specified as enumerated type. `autoscale` scales the icon to fit the block frame. `normalized` draws the icon within a block frame whose bottom-left corner is (0,0) and whose top-right corner is (1,1). Only X and Y values from 0 through 1 appear. When the block is resized, the icon is also resized. `pixels` draws the icon with X and Y values expressed in pixels. The icon is not automatically resized when the block is resized.

Data Types: `enum`

**SaveCallbackFileWithModel — Option to save callback file with the model**

off (default) | on

Use this option to save the callback file along with the model, if you have mask initialization code and callback code in a separate MAT file, specified as a logical value.

Data Types: logical

**CallbackFile — Name of callback file**

empty (default) | character vector | string

Name of the callback file containing the mask initialization code and callback code, specified as a character vector or string.

Data Types: char | string

**Parameters — Mask parameter properties**

Simulink.MaskParameterobject (default)

Mask parameter properties, specified as a Simulink.MaskParameter object.

**PortIdentifiers — Port identifier properties**

Simulink.Mask.PortIdentifiers object (default)

Port identifier properties, specified as a Simulink.Mask.PortIdentifiers object.

**ParameterConstraints — Parameter constraints properties Object of**

Simulink.Mask.Constraints object (default)

Option to add or remove parameter constraint rule, specified as a Simulink.Mask.Constraints object.

**CrossParameterConstraints — Constraints between parameters**

Simulink.Mask.CrossParameterConstraints (default)

Constraints between parameters, specified as Simulink.Mask.CrossParameterConstraints.

**PortConstraints — Port constraints properties**

Simulink.Mask.PortConstraint object (default)

Option to add or remove port constraints, specified as a Simulink.Mask.PortConstraint object.

**CrossPortConstraints — Cross port constraints properties**

Simulink.Mask.CrossPortConstraint object (default)

Option to add or remove constraints on ports of the masked block, specified as a Simulink.Mask.CrossPortConstraint object.

**Methods****Public Methods**

addCrossParameterConstraint	Add cross-parameter constraint
addCrossPortConstraint	Create cross-port constraint among ports of the same masked block
addParameter	Add a parameter to a mask

addParameterConstraint	Add parameter constraint to a mask
addPortConstraint	Create port constraint on a mask object
addPortConstraintAssociation	Associate port constraints to port identifiers
addPortIdentifier	Creates a port identifier to identify port in mask
addCrossParameterConstraint	Add cross-parameter constraint
Simulink.Mask.copy	Copy a mask from one block to another
Simulink.Mask.create	Create a mask on a Simulink block
delete	Unmask a block and delete the mask from memory
get	Returns mask from a specified block
getPortConstraintAssociation	Displays port identifiers associated with port constraint
getAssociatedParametersOfConstraint	Get mask parameters associated with a constraint
getCrossParameterConstraint	Get cross-parameter constraint
getCrossPortConstraint	Display attributes of cross-port constraint
getDialogControl	Search for a specific dialog control on the mask
getOwner	Determine the block that owns a mask
getParameter	Get mask parameter by name
getParameterConstraint	Get mask parameter constraint properties
getPortConstraint	Displays attributes of specified port constraint
getPortConstraintAssociation	Displays port identifiers associated with port constraint
getPortIdentifier	Displays attributes of specified port identifier
getWorkspaceVariables	Get all the variables defined in the mask workspace for a masked block
numParameters	Display number of parameters in a mask
removeAllCrossParameterConstraints	Delete all cross-parameter constraints from a mask
removeAllParameterConstraints	Delete all mask parameter constraints
removeAllParameters	Remove all existing parameters from a mask
removeAllCrossPortConstraints	Remove all cross-port constraints from mask object
removeAllPortConstraintAssociation	Removes the associations of all port constraints from mask
removeAllPortConstraints	Remove all port constraints on masked block
removeAllPortIdentifiers	Removes all port identifiers from mask object
removeCrossParameterConstraint	Delete a cross-parameter constraint
removeCrossPortConstraint	Remove cross-port constraint
removeDialogControl	Remove dialog control element from mask dialog box
removeParameter	Remove parameter from mask dialog box
removeParameterConstraint	Delete a mask parameter constraint
removePortConstraint	Remove specified port constraint
removePortIdentifier	Removes specified port identifier from mask object
removePortConstraintAssociation	Remove association between port constraint and port identifiers
set	Set properties of an existing mask

## Version History

Introduced in R2010a

# addCrossParameterConstraint

**Class:** Simulink.Mask

**Package:** Simulink

Add cross-parameter constraint

## Syntax

```
CrossConstraint = maskObj.addCrossParameterConstraint(Name,Value)
```

## Description

`CrossConstraint = maskObj.addCrossParameterConstraint(Name,Value)` adds a constraint among parameters of a mask.

## Input Arguments

### **maskObj** — Block mask handle

mask object

Block mask handle, specified as a mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `get`.

Data Types: `char` | `cell`

### **Name-Value Pair Arguments**

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the property name and `Value` is the corresponding value. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

### **Name** — Cross-parameter constraint name

character vector | string

Cross-parameter constraint name, specified as a character vector. Must be a valid MATLAB value.

### **Rule** — Cross-parameter constraint rule

MATLAB expression | string

Cross-parameter constraint rule, specified as a valid MATLAB expression that returns logical true or false. You can specify multiple rules by separating them with a logical operators like `&&`. For example, `parameter1 > parameter2 && parameter2 > parameter3`. Here, `parameter1`, `parameter2` and `parameter3` are parameters of a mask.

### **ErrorMessage** — Error message

character vector | string

Optional field. Specifies the error message to be displayed when the cross parameter constraint rule is not satisfied. You can specify the error message as character vector or as a message catalog ID. If you use the message catalog ID to specify an error, the error message must not have any holes in it. Simulink displays a default error message if no user-defined error message is found.

## Output Arguments

### CrossConstraint — Cross parameter constraint

cell array

Handle to the cross-parameter constraint, returned as a cell array.

## Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Add cross parameter constraint.
CrossConstraint = maskObj.addCrossParameterConstraint('Name','crossconstraint1',...
'MATLABexpression','upperbound > lowerbound','ErrorMessage','Incorrect value specified.')

ans =

 CrossParameterConstraints with properties:
 Name: 'crossconstraint1'
MATLABexpression: 'upperbound > lowerbound'
 ErrorMessage: 'Incorrect value specified.'
```

## Version History

Introduced in R2018a

### See Also

`Simulink.mask` | “Create Block Masks”

# addDialogControl

Add dialog control elements to mask dialog box

## Syntax

```
maskObj.addDialogControl(controlType,controlIdentifier)
successIndicator= maskObj.addDialogControl(Name,Value)
```

## Description

`maskObj.addDialogControl(controlType,controlIdentifier)` adds dialog control elements like text, hyperlinks, or tabs to mask dialog box. First get the mask object and assign it to the variable `maskObj`.

`successIndicator= maskObj.addDialogControl(Name,Value)` adds dialog control elements specified by one or more `Name,Value` pair arguments. You can specify multiple `Name-Value` pairs.

## Input Arguments

### **controlType** — Value type of dialog control element

panel | group | tabcontainer | tab | collapsiblepanel | text | image | webbrowser | pushbutton | ...

Type of dialog control element, specified as character vector or string

Data Types: char | string

### **controlIdentifier** — Unique identifier for the element

character vector | string scalar

Programmatic identifier for the element of mask dialog box is specified as a character vector or string. Use a name that is unique and does not have a space between words. For more information, see "Variable Names".

Data Types: char | string

### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

### **Type** — Type of dialog control element

empty (default) | panel | group | tabcontainer | tab | collapsiblepanel | text | image

Type of control that is used to specify the value of this dialog control element. Type is a required argument. The permitted values are `''`, `'hyperlink'`, and `'pushbutton'`.

Data Types: char | string

**Name — Identifier name for the dialog control element**

character vector (default) | string

The identifier of the dialog control element specified as a character vector or string. Name is a required argument. This field is available for all dialog control types.

Data Types: char | string

**Prompt — Display text in the dialog control element**

character vector (default) | string

Text that is displayed in the dialog control element on the Mask dialog box specified as a character vector or string. This field is available for all except for panel and image dialog control types.

Data Types: char | string

**Tooltip — Tooltip for the dialog control element**

character vector (default) | string

Text that is displayed in the dialog control element on the Mask dialog box. This field is available for all except for panel and image dialog control types.

Data Types: char | string

**Enabled — Option to specify whether to set the value for the dialog control element or not**

on | off

Option to specify whether you can set value for the dialog control element. This field is available for all dialog control types.

Data Types: logical

**Visible — Hide or Unhide the dialog control element in the dialog box**

on | off

Option to set whether the dialog control element is hidden or visible to the user. This field is available for all dialog control types.

Data Types: logical

**Callback — MATLAB code that executes when the dialog control element is edited**

character vector | string

Container for MATLAB code that executes when you edit the dialog control element and click **Apply**. This field is available only for the hyperlink and push button dialog control types.

Data Types: char | string

**Row — Option to set the dialog control in the same row or new row**

character vector | string

Option to set whether the dialog control is placed in the new row or the same row. This field is available for all dialog control types.

Data Types: logical

**Filepath — Path to an image file**

character vector | string

Contains the path to an image file. This field is available for image, and push button dialog control types.

Data Types: char | string

### Container — Option to specify container for the child dialog control

character vector | string

Option to specify a container for the child dialog control. The permitted values are the names of 'panel', 'group', and 'tab' dialog controls.

Data Types: logical

## Examples Add Dialog Control Elements to Mask Dialog Box

Get mask object and add dialog control element to it.

```
% Get mask object on model Engine
new_system('Engine');
add_block('built-in/Gain','Engine/gain');
save_system;
open_system('Engine');
maskObj = Simulink.Mask.create(gcf);
save_system;
% Add hyperlink to mask dialog box

maskLink = maskObj.addDialogControl('hyperlink','link');
maskLink.Prompt = 'Mathworks Home Page';
maskLink.Callback = 'web(''www.mathworks.com'')'

maskLink =
 Hyperlink with properties:
 Name: 'link'
 Prompt: 'Mathworks Home Page'
 Callback: 'web(''www.mathworks.com'')'
 Row: 'new'
 Enabled: 'on'
 Visible: 'on'
 HorizontalStretch: 'on'
 Tooltip: ''

% Add text to mask dialog box
maskText = maskObj.addDialogControl('text','text_tag');
maskText.Prompt = 'Enable range checking';

% Add button to mask dialog box
maskButton = maskObj.addDialogControl('pushbutton','button_tag');
maskButton.Prompt = 'Compute';
save_system;
```

### Add Dialog Control Elements to Mask Dialog Box Tabs

Create tabs on the mask dialog box and add elements to these tabs.

```
% Get mask object on a block named 'GainBlock'
add_block('built-in/Gain','Engine/gain1');
```

```
maskObj = Simulink.Mask.create(gcb);
maskObj = Simulink.Mask.get(gcb);

% Create a tab container

maskObj.addDialogControl('tabcontainer','allTabs');
tabs = maskObj.getDialogControl('allTabs');

% Create tabs and name them

maskTab1 = tabs.addDialogControl('tab','First');
maskTab1.Prompt = 'First tab';

maskTab2 = tabs.addDialogControl('tab','Second');
maskTab2.Prompt = 'Second tab';

% Add elements to one of the tabs

firstTab = tabs.getDialogControl('First');
firstTab.addDialogControl('text','textOnFirst');
firstTab.getDialogControl('textOnFirst').Prompt = 'Tab one';
save_system;
```

### **Add Dialog Control Element Using Name-Value Pair**

Add dialog control element and specify values for it.

```
% Get mask object on model Engine

add_block('built-in/Gain','Engine/gain2');
maskObj = Simulink.Mask.create(gcb);
maskObj = Simulink.Mask.get(gcb);

% Add a dialog box and specify values for it

maskDialog = maskObj.addDialogControl('Name','abc','Type','text','Prompt','hello','Visible','off');
save_system;
```

## **Version History**

**Introduced in R2014a**

### **See Also**

[Simulink.mask](#) | “Create Block Masks” | [Control Masks Programmatically](#)

# Simulink.Mask.addParameter

**Package:** Simulink

Add a parameter to a mask

## Syntax

```
maskobj = Simulink.Mask.get(blockName)
maskobj.addParameter(Name,Value)
```

## Description

`maskobj = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`maskobj.addParameter(Name,Value)` appends a parameter to the mask. If you do not specify name-value pairs as arguments with this command, Simulink generates name for the mask parameter with control type set to `edit`.

## Examples

### Add Popup Parameter

Step 1: Get mask as an object using a masked block's path.

```
new_system('paramexample');
add_block('built-in/subsystem','paramexample/subsystem');
save_system;
open_system('paramexample');
p= Simulink.Mask.create(gcf);
```

Step 2: Add a parameter to the mask without specifying name-value pairs for parameter attributes.

```
p.addParameter;
```

Step 3: Add a mask parameter of type popup that cannot be evaluated.

```
p.addParameter('Type','popup','TypeOptions',{'Red' 'Blue' 'Green'},'Evaluate','off');
save_system;
```

## Input Arguments

**blockName** — Handle or path to block

empty (default)

Handle or path to the block inside the model, specified as a character vector.

Data Types: char | string

**Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, . . . , NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Example: “Add Popup Parameter” on page 5-439

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

**Type — Type of parameter**

`edit (default) | checkbox | popup | combobox | listbox | promote`

Type of parameter, specified as character vector.

Data Types: `char` | `string`

**TypeOptions — Type options of parameter**

`edit (default) | checkbox | slider | dial | unit | min | max | promote | ...`

The options that are displayed within a popup or combobox or listbox parameter, specified as a cell array.

Data Types: `cell`

**Name — Name of mask parameter**

`character vector (default) | ...`

The name of the mask parameter, specified as a character vector. This name is assigned to the mask workspace variable created for this parameter.

Data Types: `char` | `string`

**Prompt — Display name for mask parameter**

`character vector (default) | ...`

Display name for the mask parameter, specified as a character vector. This name appears as the label associated with the parameter on the mask dialog.

Data Types: `char` | `string`

**Value — Mask parameter value**

`character vector (default) | ...`

The default value of the mask parameter in the Mask Parameters dialog. Type specific, depends on the Type of the parameter, specified as a character vector.

Data Types: `char` | `string`

**Evaluate — Option to evaluate mask parameter**

`on (default) | off`

Option to evaluate mask parameter, specified as a logical.

Data Types: `logical`

**Tunable — Option to change mask parameter during simulation**

`on (default) | off`

Option to change the mask parameter during simulation, specified as logical value.

Data Types: `logical`

**Enabled — Option to enable mask parameter**

on (default) | off

Option to enable the mask parameter in the mask dialog, specified as a logical.

Data Types: `logical`

**Visible — Option to show mask parameter in mask dialog**

on (default) | off

Option to show the mask parameter in the mask dialog, specified as a logical.

Data Types: `logical`

**Callback — Callback code for the mask parameter**

character vector (default)

Callback code for the mask parameter, specified as a character vector. The callback code executes when a user changes the parameter value in the mask dialog box.

Data Types: `char`

**ShowTooltip — Option to enable tooltips for mask parameter**

on (default) | off

Option to enable tooltips for the mask parameter, specified as a logical value.

Data Types: `logical`

**Alias — Alternative name for mask parameter**

empty (default) | ...

Alternative name for the mask parameter is specified as character vector.

Data Types: `char` | `string`

**DialogControl — Layout options**

empty (default) | ...

Layout options for the parameter in the mask dialog, specified as a character vector. The location of the parameter in the mask dialog such as the row location, prompt location is specified. Additionally horizontal stretch or shrink of the mask parameter is also specified.

Data Types: `char` | `string`

## Version History

Introduced in R2014a

`Simulink.mask` | “Create Block Masks”

# addParameterConstraint

**Class:** Simulink.Mask

**Package:** Simulink

Add parameter constraint to a mask

## Syntax

```
paramConstraint = maskObj.addParameterConstraint(Name,Value)
```

## Description

`paramConstraint = maskObj.addParameterConstraint(Name,Value)` adds a constraint to the specified mask. Constraints can only be associated to the **Edit** type mask parameters.

## Input Arguments

### **maskObj** — Block mask handle

mask object

Block mask handle, specified as a mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `get`

Data Types: `char` | `cell`

### **Name-Value Pair Arguments**

Specify optional comma-separated pairs of `Name, Value` arguments. `Name` is the argument name and `Value` is the corresponding value. You can specify several name and value pair arguments in any order as `Name1, Value1, ..., NameN, ValueN`.

### **Name** — Mask constraint name

character vector | string

Required field. Must be a valid MATLAB name. Specifies a name for the mask parameter constraint.

### **Parameters** — Mask parameter name

cell array of character vector | string

Optional field. Specifies the **Edit** mask parameter name to which you want to associate the constraint.

### **Rules** — Rule for mask parameter constraint

`Data Type` | `Dimension` | `Complexity` | `Sign` | `Finiteness` | `Minimum` | `Maximum` | `CustomConstraint`

Required field. Rules are defined within curly braces. A constraint can have single or multiple rules.

## Name-Value Pairs for Rules

Name	Value
DataType	double, single, numeric, integer, int8, uint8, int16, uint16, int32, uint32, boolean, enum, fixdt
Dimension	scalar, row vector, column vector, 2-D matrix, n-D matrix
Complexity	real, complex
Sign	positive, negative, zero
Finiteness	finite, inf, -inf, NaN
Minimum	character vector
Maximum	character vector
CustomConstraint	Valid MATLAB expression returning logical true or false.
CustomErrorMessage	character vector or a message catalog ID. If you use the message catalog ID to specify an error, the error message must not have any holes in it. This error message is specifically for custom constraint validation failure.

## Output Arguments

### paramConstraint — Mask parameter constraint

character vector | string

Handle to the mask parameter constraint, returned as a character vector. You can associate a constraint to the mask parameter either during or after creating the constraint.

## Examples

### Create Mask Constraint

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Create mask constraint
paramConstraint = maskObj.addParameterConstraint('Name','const2',...
'Parameters',{'Parameter1'}, 'Rules', {'DataTypes', {'uint8','uint16'}})

paramConstraint =

 Constraints with properties:

 Name: 'const2'
 ConstraintRules: [1x1 Simulink.Mask.ParameterConstraintRules]
```

## Version History

Introduced in R2018a

**See Also**

"Create Block Masks" | [Simulink.Mask](#)

# Simulink.Mask.copy

**Package:** Simulink

Copy a mask from one block to another

## Syntax

```
pSource = Simulink.Mask.get(srcBlockName)
pDest = Simulink.Mask.create(destBlockName)
pDest.copy(pSource)
```

## Description

`pSource = Simulink.Mask.get(srcBlockName)` gets the mask on the source block specified by `srcBlockName` as a mask object.

`pDest = Simulink.Mask.create(destBlockName)` creates an empty mask on the destination block specified by `destBlockName`.

`pDest.copy(pSource)` overwrites the destination mask with the source mask.

## Examples

### Copy Mask

Step 1: Create an empty mask on the destination block using the block's path.

```
new_system('mymodel');
add_block('built-in/subsystem', 'mymodel/subsystem');
open_system('mymodel');
pDest=Simulink.Mask.create('mymodel/subsystem');
```

Step 2: Get source mask as an object using the source block's path.

```
add_block('built-in/gain', 'mymodel/gain');
Simulink.Mask.create('mymodel/gain');
pSource = Simulink.Mask.get('mymodel/gain');
```

Step 3: Make the destination mask a copy of the source mask.

```
pDest.copy(pSource);
save_system;
```

## Input Arguments

**srcBlockName** — Handle or path to the source block  
empty (default)

Handle to the source block or the path to the source block inside the model is specified as character vector.

Data Types: `char` | `string`

**destBlockName** — Handle or path to the destination block

empty (default)

The handle to the destination block or the path to the destination block inside the model.

---

**Note** The destination block should have an empty mask. Otherwise, the copied mask will overwrite the non-empty mask.

---

Data Types: `char` | `string`

**pSource** — Mask object of source block

empty (default)

Mask object of the source block.

---

**Note** The destination block should have an empty mask. Otherwise, the copied mask will overwrite the non-empty mask.

---

Data Types: `char` | `string`

## Version History

Introduced in R2006a

### See Also

`Simulink.mask` | “Create Block Masks”

# Simulink.Mask.create

**Package:** Simulink

Create a mask on a Simulink block

## Syntax

```
maskobj= Simulink.Mask.create(blockName)
```

## Description

`maskobj= Simulink.Mask.create(blockName)` creates an empty mask on the block specified by `blockName`. If the specified block is already masked, an error message appears.

## Examples

### Create a Mask on a Block

Create a mask using a block's handle.

---

**Note** In the model, select the block to be masked.

---

```
maskobj = Simulink.Mask.create(gcf);
```

Create a mask using the block's path.

```
maskobj = Simulink.Mask.create('myModel/Subsystem');
```

## Input Arguments

**blockName** — Handle or path to block

empty (default)

Handle or path to the block inside the model, specified as a character vector.

Data Types: `char` | `string`

## Version History

Introduced in R2010a

## See Also

`Simulink.mask` | "Create Block Masks"

## Simulink.Mask.delete

**Package:** Simulink

Unmask a block and delete the mask from memory

### Syntax

```
maskobj = Simulink.Mask.get(blockName)
maskobj.delete
```

### Description

`maskobj = Simulink.Mask.get(blockName)` gets the mask on the block specified by the `blockName`.

`maskobj.delete` unmask the block and deletes the mask from memory.

### Examples

#### Remove Mask on the Block

Get mask as an object using the masked block's path.

```
maskobj = Simulink.Mask.get('myModel/Subsystem');
```

Unmask the block using the mask object and delete the mask from memory.

```
maskobj.delete;
```

### Input Arguments

**blockName** — Handle or path to the block

empty (default)

The handle to the block or the path to the block inside the model, specified as a character vector.

Data Types: `char` | `string`

### Version History

**Introduced in R2010a**

### See Also

`Simulink.mask` | "Create Block Masks"

# get

**Class:** Simulink.Mask

**Package:** Simulink

Returns mask from a specified block

## Syntax

```
maskObj = Simulink.Mask.get(blockName)
```

## Description

`maskObj = Simulink.Mask.get(blockName)` gets the mask on the specified block as a mask object. If the specified block is not masked, a null value returns.

## Input Arguments

**blockName — Handle or path to the block**

character vector (default) | string

The path or handle to the block is specified as a character vector or string.

Data Types: char | string

## Examples

Get mask from the block using block path.

```
openExample('simulink_masking/MaskLookupTableControlExample')
Simulink.Mask.get('slexMaskLookupTableControlExample/
LUT Control with Explicit Data');
```

Get mask from the block using block handle

---

**Note** In the model, select the masked block.

---

```
Simulink.Mask.get(gcb);
```

## Version History

**Introduced in R2014a**

## See Also

"Create Block Masks" | Simulink.mask

## getAssociatedParametersOfConstraint

**Class:** Simulink.Mask

**Package:** Simulink

Get mask parameters associated with a constraint

### Syntax

```
maskParam = maskObj.getAssociatedParametersOfConstraint(paramConstraintName)
```

### Description

`maskParam = maskObj.getAssociatedParametersOfConstraint(paramConstraintName)` gets the parameters that are associated with a mask constraint.

### Input Arguments

**maskObj — Block mask handle**

mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `get`.

Data Types: `char` | `cell`

**paramConstraintName — Mask constraint name**

character vector | string

Name of the constraint for which you want to find the associated mask parameters, specified as character vector.

### Output Arguments

**maskParam — Mask parameter name**

cell array of character vector

Mask parameter, specified as a cell array.

### Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Find parameters associated with the constraint.
maskParam = maskObj.getAssociatedParametersOfConstraint('const3')

ans =

 1×1 cell array
```

```
{'Parameter1'}
```

## **Version History**

**Introduced in R2018a**

### **See Also**

`simulink.mask` | “Create Block Masks”

## getCrossParameterConstraint

**Class:** Simulink.Mask

**Package:** Simulink

Get cross-parameter constraint

### Syntax

```
CrossConstraint = maskObj.getCrossParameterConstraint(CrossConstraintName)
```

### Description

`CrossConstraint = maskObj.getCrossParameterConstraint(CrossConstraintName)` gets the properties of a cross parameter constraint on a mask. Apply a cross-parameter constraint to specify rules between mask parameter values.

### Input Arguments

**maskObj — Block mask handle**

mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `get`.

Data Types: `char` | `cell`

**CrossConstraintName — Cross-constraint name**

character vector | string

Name of the cross-parameter constraint for which you get the constraint properties, specified as the mask object.

### Output Arguments

**CrossConstraint — Cross-constraint property**

cell array

Cross-parameter constraint properties, returned as a cell array.

### Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get cross constraint.
CrossConstraint = maskObj.getCrossParameterConstraint('crossparam1')

ans =
```

```
CrossParameterConstraints with properties:
 Name: 'crossparam1'
 Rule: 'Parameter2 > Parameter3'
 ErrorMessage: ''
```

## **Version History**

**Introduced in R2018a**

### **See Also**

`simulink.mask` | “Create Block Masks”

# Simulink.Mask.getDialogControl

**Package:** Simulink

Search for a specific dialog control on the mask

## Syntax

```
[control,phandle] = maskobj.getDialogControl(cname)
```

## Description

[control,phandle] = maskobj.getDialogControl(cname), search for a specific child dialog control recursively on the mask dialog.

## Examples

### Find a dialog control

- Find a text dialog control on the mask dialog box. maskObj is the handle to the mask object. The getDialogControl method returns the handle to the dialog control (hdlgctrl ) and handle to the parent dialog control (phandle ).

## Input Arguments

**cname** — Name of the dialog control

empty (default)

Name of the dialog control being searched on the mask dialog, specified as a character vector.

Data Types: char | string

## Output Arguments

**control** — Handle to the dialog control

empty (default)

Target dialog control being searched on the mask dialog.

Data Types: char | string

**phandle** — Handle to the parent dialog control

empty (default)

Parent of the dialog control being searched mask dialog.

Data Types: char | string

## Version History

Introduced in R2010a

## **See Also**

Simulink.Mask | “Create Block Masks”

# Simulink.Mask.getOwner

**Package:** Simulink

Determine the block that owns a mask

## Syntax

```
maskobj = Simulink.Mask.get(blockName)
maskobj.getOwner
```

## Description

`maskobj = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`maskobj.getOwner` returns the interface to the block that owns the mask.

## Examples

### Get Interface to the Block Owning the Mask

Get mask as an object using a masked block's path.

```
maskobj = Simulink.Mask.get('myModel/Subsystem');
```

Get the interface to the block that owns the mask.

```
maskobj.getOwner;
```

## Input Arguments

**blockName** — Handle or path to block

empty (default)

Handle or path to the block inside the model, specified as a character vector.

Data Types: `char` | `string`

## Version History

**Introduced in R2014a**

## See Also

`Simulink.mask` | "Create Block Masks"

# getParameter

**Class:** Simulink.Mask

**Package:** Simulink

Get mask parameter by name

## Syntax

```
param = maskObj.getParameter(paramName)
```

## Description

`param = maskObj.getParameter(paramName)` returns an array of mask parameters.

## Input Arguments

**paramName — Name of the parameter**

character vector (default) | string

Name of the parameter specified as a character vector or string.

Example:

Data Types: char | string

## Examples

- 1 Get mask as an object using a masked block's path.

```
p = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Get a mask parameter by using its name.

```
param = p.getParameter('intercept');
```

## Version History

Introduced in R2014a

## See Also

`simulink.mask` | “Create Block Masks”

## getParameterConstraint

**Class:** Simulink.Mask

**Package:** Simulink

Get mask parameter constraint properties

### Syntax

```
paramConstraint = maskObj.getParameterConstraint(paramConstraintName)
```

### Description

`paramConstraint = maskObj.getParameterConstraint(paramConstraintName)` gets the properties of a mask parameter constraint.

### Input Arguments

**maskObj** — Block mask handle

mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `get`.

Data Types: char | cell

**paramConstraintName** — Mask constraint name

character vector | string

Name of the constraint of which you want get the properties, specified as character vector.

### Output Arguments

**paramConstraint** — Mask constraint property

cell array of character vector

Constraint properties, returned as a cell array.

### Examples

```
% Get block mask handle.
```

```
maskObj = Simulink.Mask.get(gcf);
```

```
% Find parameters associated with the constraint.
```

```
paramConstraint = maskObj.getParameterConstraint('const3')
```

```
ans =
```

```
 Constraints with properties:
```

Name: 'const3'  
ConstraintRules: [1×2 Simulink.Mask.ParameterConstraintRules]

## **Version History**

**Introduced in R2018a**

### **See Also**

`simulink.mask` | “Create Block Masks”

# Simulink.Mask.getWorkspaceVariables

**Package:** Simulink

Get all the variables defined in the mask workspace for a masked block

## Syntax

```
maskobj = Simulink.Mask.get(blockName)
variables = maskobj.getWorkspaceVariables
```

## Description

`maskobj = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`variables = maskobj.getWorkspaceVariables` returns as a structure all the variables defined in the mask workspace for the masked block.

## Examples

### Get Mask Workspace Variables

- 1 Get mask object using a block path.

```
maskobj = Simulink.Mask.get('setmaskparameter/Subsystem');
```

- 2 Get all the variables defined in the mask workspace for the masked block.

```
variables = maskobj.getWorkspaceVariables
```

```
variables =
```

```
struct with fields:
```

```
 Name: 'Parameter1'
```

```
 Value: 0
```

## Input Arguments

**blockName** — Name of block

empty (default)

Handle or path to the block inside the model.

Data Types: char | string

## Version History

Introduced in R2006a

## **See Also**

Simulink.Mask | “Create Block Masks”

## Simulink.Mask.numParameters

**Package:** Simulink

Display number of parameters in a mask

### Syntax

```
maskobj = Simulink.Mask.get(blockName)
maskobj.numParameters
```

### Description

`maskobj = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`maskobj.numParameters` returns the number of parameters in the mask.

### Examples

#### Get Number of Parameters from Mask

- 1 Get mask object using block path.

```
maskobj = Simulink.Mask.get('myModel/Subsystem');
```

- 2 Get the number of parameters in the mask.

```
maskobj.numParameters;
```

```
ans =
```

```
13
```

### Input Arguments

**blockName** — Handle or path to the block name

empty (default)

The handle to the block or the path to the block inside the model specified as a character vector.

Data Types: char | string

### Version History

Introduced in R2014a

### See Also

`Simulink.mask` | “Create Block Masks”

# Simulink.Mask.ParameterCondition class

Create mask parameter conditions

## Description

Create an instance of the `Simulink.Mask.ParameterCondition` class to create mask parameter conditions for constraints.

## Properties

### Public Properties

#### Name — Name of mask parameter

character vector (default)

Name of the mask parameter present in the mask object, specified as a string.

Data Types: `string`

#### Value — Possible values for mask parameter

character vector (default)

List of possible values for the mask parameter, specified as a cell array.

Data Types: `cell`

## Methods

### Public Methods

<code>addParameterCondition</code>	Creates a mask parameter condition for constraint
<code>getParameterCondition</code>	Returns parameter condition associated with constraint
<code>removeParameterCondition</code>	Removes specified parameter condition on constraint
<code>removeAllParameterCondition</code>	Removes all parameter conditions from constraint

## Version History

Introduced in R2022a

## Topics

“Validate Input and Output Port Signals Using Port Constraints”

## Simulink.Mask.PortConstraintRule class

Create instance of `Simulink.Mask.PortConstraintRule` to define rules of port constraint

### Description

Define the `DataType`, `Dimension`, and `Complexity` rules for a port constraint. Port signal values are validated against these rules.

### Properties

#### Public Properties

##### **DataType — Permitted data types**

cell array (default) | string

Permitted data types, specified as a cell array. The allowed values are `int`, `double`, `fixed point` and so on.

Data Types: string

##### **Dimension — Permitted dimension for port signals**

cell array of character vector (default) | string

The allowed values in the array are `scalar`, `vector`, `2dmatrix`, `ndmatrix`, `rowvector`, and `colvector`.

Data Types: cell

##### **Complexity — Complexity of port signal**

character vector (default) | string

The allowed complexity, specified as a cell array. The allowed values in the array are `real` and `complex`.

##### **FixedPointConstraint — Fixed point constraints of port signal**

character vector (default)

Set the `Signedness`, `bias`, `Wordlength`, and `Scaling` for `fixed point` data type.

### Methods

#### Public Methods

`setRule` Create rules that are validated against data at port

`removeRule` Remove all datatype, complexity, and dimension attributes of port constraint rule

## Version History

**Introduced in R2022a**

## Simulink.Mask.PortConstraint class

Create mask port constraints programmatically

### Description

Use an instance of the `Simulink.Mask.PortConstraint` class to add or remove port constraints on a masked block.

### Properties

#### Public Properties

##### Name — Name of the constraint

(default) | character vector

Name of the port constraint specified as a string.

Data Types: `char`

##### ParameterConditions — Mask parameter conditions

(default) | `Simulink.Mask.ParameterCondition` object

Mask parameter conditions are specified as an array of `Simulink.Mask.ParameterCondition` object. The port constraints are active on the associated port only when the port satisfies all the parameter conditions.

##### Rule — Datatype, complexity, and dimension associated with the constraint

(default) | `Simulink.Mask.PortConstraintRule` object

The allowed datatype, complexity, and dimension associated with the constraint, specified as a `PortConstraintRule` object.

Data Types: `string`

##### DiagnosticLevel — Type of diagnostic message

`error` (default) | `warning`

The type of diagnostic message displayed when validation condition fails specified as `error` or `warning`.

Data Types: `char`

##### DiagnosticMessage — Diagnostic message

(default) | character vector

The diagnostic message that is displayed when the validation fails, specified as a character vector.

Data Types: `character vector`

## Methods

### Public Methods

<code>addPortConstraint</code>	Create port constraint on a mask object
<code>getPortConstraint</code>	Displays attributes of specified port constraint
<code>removePortConstraint</code>	Remove specified port constraint
<code>removeAllPortConstraint</code>	Remove all port constraints on masked block

## Version History

Introduced in R2022a

## Simulink.Mask.PortIdentifier class

Create port identifiers to identify ports of block in mask object

### Description

Create an instance of `Simulink.Mask.PortIdentifier` to create and set the properties for the port identifier on a masked block.

### Properties

#### Public Properties

##### Name — Name for the port identifier

empty character vector (default)

Name of the port identifier, specified as a character vector. This name uniquely identifies the port identifier in the mask.

Data Types: `char`

##### Type — Type of port

input (default) | output

Type of the port, specified as either `Input` or `Output`.

Data Types: `string`

##### IdentifierType — Type of identifier

index (default) | name

Type of identifier, specified as `name` or `index`. Specify `name` if you want to identify the ports using a name, otherwise specify `index`, if you want to identify the ports using a port index.

Data Types: `string`

##### Identifier — Port identifier appearing in block

character vector (default)

Port identifier appearing in the block, specified as a character vector. If the `IdentifierType` is `index`, you can specify the identifiers in one of these formats:

- **Index:** The index to associate the port with the port identifier. For example, '3' associates port '3' with the port identifier.
- **Lower port index:Upper port index:** The lower port index and upper port index to associate all the ports between the indices with the port identifier. For example, '2:4' associates ports 2, 3, and 4 with the port identifier.
- **List of port indices:** The ports separated by comma to associate the ports with the port identifier. For example, '3,5,7'. This associates the ports 3, 5, and 7 with the port identifier. Duplicates are not allowed.

- : The name of the port is specified.

Port name: String: If IdentifierType is name, this parameter is the name of the port.

Data Types: string | char

## Methods

### Public Methods

addPortIdentifier	Creates a port identifier to identify port in mask
getPortIdentifier	Displays attributes of specified port identifier
removePortIdentifier	Removes specified port identifier from mask object
removeAllPortIdentifiers	Removes all port identifiers from mask object

## Version History

Introduced in R2022a

## removeAllCrossParameterConstraints

**Class:** Simulink.Mask

**Package:** Simulink

Delete all cross-parameter constraints from a mask

### Syntax

```
maskObj.removeAllCrossParameterConstraints()
```

### Description

`maskObj.removeAllCrossParameterConstraints()` deletes all cross-constraints from a mask.

### Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Remove all cross constraints from the mask.
maskObj.removeAllCrossParameterConstraints()
```

### Version History

Introduced in R2018a

# removeAllParameterConstraints

**Class:** Simulink.Mask

**Package:** Simulink

Delete all mask parameter constraints

## Syntax

```
maskObj.removeAllParameterConstraints()
```

## Description

`maskObj.removeAllParameterConstraints()` deletes all the parameter constraints from a mask.

## Input Arguments

**maskObj** — Block mask handle

mask object

Handle to the block mask. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information see, [get](#)

## Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcf);

% Remove all constraints from the mask.
maskObj.removeAllParameterConstraints()
```

## Version History

Introduced in R2018a

## See Also

[simulink.mask](#) | “Create Block Masks”

# Simulink.Mask.removeAllParameters

**Package:** Simulink

Remove all existing parameters from a mask

## Syntax

```
maskobj = Simulink.Mask.get(blockName)
maskobj.removeAllParameters
```

## Description

`maskobj = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`maskobj.removeAllParameters` deletes all existing parameters from the mask.

## Examples

### Remove all Parameters from the Mask

Get mask object using block path.

```
maskobj = Simulink.Mask.get('myModel/Subsystem');
```

Delete all existing parameters from the mask.

```
maskobj.removeAllParameters;
```

## Input Arguments

**blockName** — Handle or path to block

empty (default)

The handle to the block or the path to the block inside the model, specified as a character vector.

Data Types: `char` | `string`

## Version History

**Introduced in R2014a**

## See Also

`Simulink.mask` | “Create Block Masks”

# removeCrossParameterConstraint

**Class:** Simulink.Mask

**Package:** Simulink

Delete a cross-parameter constraint

## Syntax

```
maskObj.removeCrossParameterConstraint(CrossConstraint)
```

## Description

`maskObj.removeCrossParameterConstraint(CrossConstraint)` deletes the specified cross-constraint.

## Input Arguments

**maskObj** — Block mask handle

mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `get`.

Data Types: `char` | `cell`

**CrossConstraint** — Cross constraint name

character vector | string

Name of the cross-constraint to be removed, specified as character vector.

## Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Remove cross-constraint of name 'const1'.
maskObj.removeCrossParameterConstraint('const1')
```

## Version History

Introduced in R2018a

## See Also

`simulink.mask` | “Create Block Masks”

# removeDialogControl

**Class:** Simulink.Mask

**Package:** Simulink

Remove dialog control element from mask dialog box

## Syntax

```
successIndicator = maskVariable.removeDialogControl(controlIdentifier)
```

## Description

`successIndicator = maskVariable.removeDialogControl(controlIdentifier)` removes dialog control element, specified by `controlIdentifier`, like text, hyperlinks, or tabs from a mask dialog box. First get the mask object and assign it to the variable `maskVariable`.

Successful removal of a dialog control element returns a Boolean value of 1.

## Input Arguments

**controlIdentifier** — Unique identifier for the element

character vector | string scalar

Programmatic identifier for the dialog control element of mask dialog box.

## Examples

### Remove Dialog Control Element from Mask Dialog Box

```
% Get mask object on the Gain block in the model Engine.
```

```
maskObj = Simulink.Mask.get('Engine/Gain');
```

```
% Remove element named AllTab from mask dialog box.
```

```
p = maskObj.removeDialogControl('AllTab');
```

## Version History

**Introduced in R2013b**

## See Also

`simulink.mask` | “Create Block Masks”

# removeParameter

**Class:** Simulink.Mask

**Package:** Simulink

Remove parameter from mask dialog box

## Syntax

```
successIndicator = maskObj.removeParameter(controlIdentifier)
```

## Description

`successIndicator = maskObj.removeParameter(controlIdentifier)` removes parameter, specified by `controlIdentifier`, like edit, check box, popup from an existing mask dialog box. First get the mask object and assign it to the variable `maskObj`.

Successful removal of a parameter returns a Boolean value of 1.

## Input Arguments

**controlIdentifier** — Unique identifier for the parameter

character vector | string scalar

Programmatic identifier for the parameter of mask dialog box, specified as a character vector.

## Examples

### Remove Parameter from Mask Dialog Box

```
% Get mask object on the Gain block in the model Engine.
maskObj = Simulink.Mask.get('Engine/Gain');

% Remove parameter named checkbox1 from mask dialog box.
p = maskObj.removeParameter('checkbox1');
```

---

**Note** You can also use the index number as the `controlIdentifier`.

---

## Version History

Introduced in R2012b

## See Also

Simulink.mask | “Create Block Masks”

## removeParameterConstraint

**Class:** Simulink.Mask

**Package:** Simulink

Delete a mask parameter constraint

### Syntax

```
maskObj.removeParameterConstraint(paramConstraint)
```

### Description

`maskObj.removeParameterConstraint(paramConstraint)` deletes the specified mask parameter constraint.

### Input Arguments

**maskObj** — Block mask handle

mask object

Handle to the block mask, specified as mask object. You can use the `Simulink.Mask.get` command to get the block mask handle. For more information, see `get`.

Data Types: `char` | `cell`

**paramConstraint** — Mask constraint name

character vector | string

Name of the mask parameter constraint to be deleted, specified as character vector.

### Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Remove mask constraint with name 'const1'.
maskObj.removeParameterConstraint('const1')
```

### Version History

Introduced in R2018a

### See Also

`simulink.mask` | “Create Block Masks”

# Simulink.Mask.set

**Package:** Simulink

Set properties of an existing mask

## Syntax

```
maskobj = Simulink.Mask.get(blockName)
maskobj.set(Name,Value)
```

## Description

`maskobj = Simulink.Mask.get(blockName)` gets the mask on the block specified by `blockName` as a mask object.

`maskobj.set(Name,Value)` sets mask properties that you specify using name-value pairs as arguments.

## Examples

### Set properties of an existing masked block

Get mask as an object using a masked block's path.

```
maskobj = Simulink.Mask.get('setparameter/Subsystem');
```

Modify the mask so that its mask icon is transparent and its documentation summarizes what it does.

```
maskobj.set('IconOpaque','off','Type','Random number generator',...
'Description','This block generates random numbers.');
```

## Input Arguments

### **blockName** — Handle or path of the block

empty (default)

Handle or the path to the block inside the model.

Data Types: `char` | `string`

### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example:

**Type — Mask type of block**

character vector (default) | string

Mask type of the associated block is specified as a character vector or string.

Data Types: char | string

**Description — Description of block**

character vector (default) | string

Description of the block, specified as a character vector or string.

Data Types: char | string

**Help — Help text for the masked block**

character vector (default) | string

Help text for the masked block, specified as a character vector or string.

Data Types: char | string

**Initialization — Initialization commands**

character vector (default) | string

Initialization commands for the masked block, specified as a character vector or string.

Data Types: char | string

**SelfModifiable — Option to allow block to modify its contents**

off (default) | on

Option to allow the block to modify its contents, specified as a logical.

Data Types: logical

**Display — MATLAB code for block icon**

character vector (default) | string

MATLAB code for the block icon, specified as a character vector or string.

Data Types: char | string

**IconFrame — Visibility of block frame**

off (default) | on

Visibility of the block frame, specified as a logical value.

Data Types: logical

**IconOpaque — Option to make the icon opaque**

opaque (default) | transparent

Option to make the icon opaque, specified as a logical.

- **Opaque:** Make the icon opaque.
- **Transparent:** Make the icon transparent.

Data Types: string | char

**RunInitForIconRedraw — Option to run initialization before executing drawing commands**

auto (default) | on | off

Option to run mask initialization commands before executing the mask icon commands, specified as enumerated data type.

Data Types: enum

**IconRotate — Option to rotate icon with block**

none (default) | port

Option to rotate icon along with block, specified as enumerated data type.

Data Types: enum

**PortRotate — Port rotation type**

default (default) | physical

Port rotation type, specified as enumerated data type. Set this property to `default` to reorder ports after a clockwise rotation to maintain a left-to-right port numbering order for ports along the top and bottom of the block and a top-to-bottom port numbering order for ports along the left and right sides of the block. Set this property to `physical` to rotate ports with the block without reordering them after a clockwise rotation.

Data Types: enum

**IconUnits — Units for drawing commands**

autoscale (default) | pixels | normalized

Units for drawing commands, specified as enumerated type. `autoscale` scales the icon to fit the block frame. `normalized` draws the icon within a block frame whose bottom-left corner is (0,0) and whose top-right corner is (1,1). Only X and Y values from 0 through 1 appear. When the block is resized, the icon is also resized. `pixels` draws the icon with X and Y values expressed in pixels. The icon is not automatically resized when the block is resized.

Data Types: enum

**SaveCallbackFileWithModel — Option to save callback file along with the model**

off (default) | on

Use this option to save the callback file along with the model, if you have mask initialization code and callback code in a separate MAT file, specified as a logical value.

Data Types: logical

**Callbackfile — Name of callback file**

empty (default) | character vector | string

Name of the callback file containing the mask initialization code and callback code, specified as a character vector or string.

Data Types: char | string

**Parameters — Mask parameter properties**

Simulink.MaskParameterobject (default)

Mask parameter properties, specified as a `Simulink.MaskParameter` object.

Data Types: object

**PortIdentifiers — Port identifier properties**

`Simulink.Mask.PortIdentifiers` object (default)

Port identifier properties, specified as a `Simulink.Mask.PortIdentifiers` object.

Data Types: object

**ParameterConstraints — Parameter constraints properties Object of**

`Simulink.Mask.Constraints` object (default)

Option to add or remove parameter constraint rule, specified as a `Simulink.Mask.Constraints` object.

Data Types: object

**CrossParameterConstraints — Constraints between parameters**

`Simulink.Mask.CrossParameterConstraints` (default)

Constraints between parameters, specified as `Simulink.Mask.CrossParameterConstraints`.

Data Types: object

**PortConstraints — Port constraints properties**

`Simulink.Mask.PortConstraint` object (default)

Option to add or remove port constraints, specified as a `Simulink.Mask.PortConstraint` object.

Data Types: object

**CrossPortConstraints — Cross port constraints properties**

`Simulink.Mask.CrossPortConstraint` object (default)

Option to add or remove constraints on ports of the masked block, specified as a `Simulink.Mask.CrossPortConstraint` object.

Data Types: object

## Version History

Introduced in R2014a

### See Also

`Simulink.mask` | “Create Block Masks”

# Simulink.Mask.Constraints class

**Package:** Simulink.Mask

Create mask parameter constraint

## Description

Use an instance of the `Simulink.Mask.Constraints` to add or remove a mask parameter constraint rule.

The `Simulink.Mask.Constraints` class is a handle class.

## Properties

### Name — Name of mask parameter constraint

string scalar | character vector

Name of the mask parameter constraint, specified as a string scalar or character vector.

Example: 'evenNumberConstraint'

#### Attributes:

GetAccess	public
SetAccess	public
GetObservable	true
SetObservable	true

Data Types: string | char

### ConstraintRules — Rules to create mask parameter constraint

`Simulink.Mask.ParameterConstraintRules` object

Rules to create the mask parameter constraints, specified as a `Simulink.Mask.ParameterConstraintRules` object. For more information, see “Rule Attributes”

#### Attributes:

GetAccess	public
SetAccess	private
GetObservable	true
SetObservable	true

Data Types: `Simulink.Mask.ParameterConstraintRules` object

## Methods

### Public Methods

<code>addParameterConstraintRule</code>	Add rules to a parameter constraint
<code>removeParameterConstraintRule</code>	Delete a mask parameter constraint rule

## **Alternatives**

You can manage mask parameter constraints using **Constraints** in the **Mask Editor** dialog box. For more information, see “Validating Mask Parameters Using Constraints”.

## **Version History**

“Validating Mask Parameters Using Constraints”

# addParameterConstraintRule

**Class:** Simulink.Mask.Constraints

**Package:** Simulink.Mask

Add rules to a parameter constraint

## Syntax

```
paramConstRule = paramConstraint.addParameterConstraintRule(Name,Value)
```

## Description

`paramConstRule = paramConstraint.addParameterConstraintRule(Name,Value)` adds rule to a parameter constraint.

## Input Arguments

### **paramConstraint** — Handle to mask constraint

constraint object

Handle to the mask parameter constraint for which you want to add constraint rules, specified as constraint object.

Data Types: char | cell

### **Name-Value Pair Arguments**

Specify optional comma-separated pairs of `Name`, `Value` arguments. `Name` is the argument name and `Value` is the corresponding value. You can specify several name and value pair arguments in any order as `Name1,Value1,...,NameN,ValueN`.

### **Name-Value Pair for Rules**

Name	Value
DataType	double, single, numeric, integer, int8, uint8, int16, uint16, int32, uint32, boolean, enum, fixdt
Dimension	scalar, row vector, column vector, 2-d matrix, n-d matrix
Complexity	real, complex
Sign	positive, negative, zero
Finiteness	finite, inf, -inf, NaN
Minimum	string
Maximum	string
CustomConstraint	Valid MATLAB expression

## Output Arguments

### **paramConstRule** — Mask constraint rule

cell array

Mask constraint rule, specified as a cell array.

## Examples

```
% Get mask constraint handle
paramConstraint = maskObj.getParameterConstraint('const3');

% Add rules to the constraint.
paramConstRule = paramConstraint.addParameterConstraintRule('DataType','int8')
```

ans =

ParameterConstraintRules with properties:

```
 DataType: 'int8'
 Dimension: {0×1 cell}
 Complexity: {0×1 cell}
 Sign: {0×1 cell}
 Finiteness: {0×1 cell}
 Minimum: ''
 Maximum: ''
 CustomConstraint: ''
```

# removeParameterConstraintRule

**Class:** Simulink.Mask.Constraints

**Package:** Simulink.Mask

Delete a mask parameter constraint rule

## Syntax

```
paramConstraint.removeParameterConstraintRule(RuleIndex)
```

## Description

`paramConstraint.removeParameterConstraintRule(RuleIndex)` deletes the specified constraint rule from a mask parameter constraint.

## Input Arguments

**paramConstraint** — Handle to constraint

constraint object

Handle to mask parameter constraint of which you want to remove constraint rule, specified as an object.

Data Types: char | cell

**RuleIndex** — Constraint rule index

integer

Index number of the mask constraint rule, specified as an integer.

## Examples

```
% Get block mask handle.
maskObj = Simulink.Mask.get(gcb);

% Get mask constraint handle.
paramConstraint = maskObj.getParameterConstraint('const3');

% Remove mask constraint rule.
paramConstraint.removeParameterConstraintRule(1)
```

## Simulink.Mask.EnumerationBase class

Derive an enumeration class to hold numeric values of any datatype

### Description

The members of the enumeration class derived from `Simulink.Mask.EnumerationBase` can hold values of any numeric datatype. The datatype of the enumeration members should be consistent.

### Methods

#### Public Methods

<code>getValueArrayName</code>	Simulink creates an internal array which holds the value corresponding to each enumeration members. You can customize the name of the array as the return value of the function.
<code>addClassNameToEnumNames</code>	This method belongs to <code>Simulink.IntEnumType</code> . Override this function to return true to prefix the member name with the class name, false otherwise.

### Examples

#### Derive an enumeration class from `Simulink.Mask.EnumerationBase`

```
classdef XFactor < Simulink.Mask.EnumerationBase
 enumeration
 alpha(.001, 'alpha (.001)')
 beta(.0001, 'beta (.0001)')
 gamma(.00001, 'gamma (.00001)')
 end
end
```

### Version History

Introduced in R2021a

### See Also

`Simulink.Mask.EnumerationTypeOptions`

### Topics

“Tune Mask Popup Parameters by Referencing an External Enumeration File”

# Simulink.Mask.EnumerationTypeOptions class

Parse information from enumeration file derived from `Simulink.IntEnumType` and `Simulink.Mask.EnumerationBase`

## Description

Create an instance of `Simulink.Mask.EnumerationTypeOptions` to parse the information from the enumeration file into the object.

## Creation

```
enumObj = Simulink.Mask.EnumerationTypeOptions('ExternalEnumerationClass', 'XFactor')
```

## Properties

### Public Properties

#### ExternalEnumerationClass — Reference external enumeration class

empty (default) | Name of the enumeration file

This property holds the name of the enumeration class file.

Data Types: char

#### EnumerationMembers — Contains the information parsed from the enumeration file

empty (default) | MemberName | DescriptiveName | Value

This property holds the member name, display name, and numeric value specified in the enumeration file.

Data Types: `Simulink.Mask.EnumerationMember`

## Examples

### Display the properties of the enumeration members

```
>> obj = Simulink.Mask.EnumerationTypeOptions('ExternalEnumerationClass', 'XFactor')
```

```
obj =
 EnumerationTypeOptions with properties:
```

```
ExternalEnumerationClass: 'XFactor'
 EnumerationMembers: [1x3 Simulink.Mask.EnumerationMember]
```

```
>> obj.EnumerationMembers(1)
```

```
ans =
 EnumerationMember with properties:
```

```
MemberName: 'alpha'
DescriptiveName: 'alpha (.001)'
Value: 1.0000e-03
```

---

**Note** The properties are read only. You can modify the enumeration file to change the properties of the enumeration members .

“Tune Mask Popup Parameters by Referencing an External Enumeration File”

# Simulink.MaskParameter class

**Package:** Simulink

Control mask parameters programmatically

## Description

Use an instance of `Simulink.MaskParameter` to set the properties of a mask parameter.

## Properties

### Type — Mask parameter type

edit (default) | checkbox | popup | combobox | listbox | promote

Mask parameter type, specified as character vector

Data Types: char | string

### TypeOptions — Type options of parameter

edit (default) | checkbox | slider | dial | unit | min | max | promote | ...

Type options of a popup or combobox or listbox parameter, specified as a cell array.

Data Types: cell

### Name — Name of mask parameter

character vector (default)

Name of the mask parameter, specified as a character vector. This name is assigned to the mask workspace variable created for the mask parameter. The mask parameter name must not match the built-in parameter name.

Data Types: char

### Prompt — Display name for mask parameter

character vector (default)

Display name for the mask parameter, specified as a character vector. This name appears as the label associated with the parameter on the mask dialog.

Data Types: char

### Value — Mask parameter value

character vector (default)

Mask parameter value, specified as a character vector. For example, the default value for `Checkbox` is 'on' while the default value for `Listbox` is { ' ' } and accepts a cell array of character vectors.

Data Types: char

### Evaluate — Option to evaluate mask parameter

on (default) | off

Option to evaluate mask parameter, specified as a logical.

Data Types: `logical`

**Tunable — Option to change mask parameter during simulation**

`on` (default) | `off`

Option to change the mask parameter during simulation, specified as logical value.

Data Types: `logical`

**NeverSave — Option to save mask parameter value in model file**

`off` (default) | `on`

Option to save the mask parameter value in the model file, specified as a logical.

Data Types: `logical`

**Hidden — Option to hide mask parameter**

`off` (default) | `on`

Option to hide the mask parameter in the mask dialog, specified as a logical.

Data Types: `logical`

**ReadOnly — Option to edit mask parameter**

`off` (default) | `on`

Option to edit the mask parameter in the mask dialog, specified as a logical.

Data Types: `logical`

**Enabled — Option to enable mask parameter**

`on` (default) | `off`

Option to enable the mask parameter in the mask dialog, specified as a logical.

Data Types: `logical`

**Visible — Option to show mask parameter in mask dialog**

`on` (default) | `off`

Option to show the mask parameter in the mask dialog, specified as a logical.

Data Types: `logical`

**ShowTooltip — Option to enable tooltips for mask parameter**

`on` (default) | `off`

Option to enable tooltips for the mask parameter, specified as a logical.

Data Types: `logical`

**Callback — Callback code for the mask parameter**

character vector (default)

Callback code for the mask parameter, specified as a character vector. The callback code executes when a user changes the parameter value in the mask dialog box.

Data Types: `char`

**TabName — Name of tab container**

character vector (default)

Name of the tab container in which the mask parameter is displayed in the mask dialog box, specified as a character vector.

Data Types: char

**Alias — Alternative name for mask parameter**

character vector (default)

Alternative name for the mask parameter, specified as a character vector.

Data Types: char

**DialogControl — Layout options**

character vector (default)

Layout options for the parameter in the mask dialog, specified as a character vector. The location of the parameter in the mask dialog such as the row location, prompt location is specified. Additionally horizontal stretch or shrink of the mask parameter is also specified.

Data Types: char

**ConstraintName — Constraint associated with the parameter**

character vector (default)

Constraint associated with the mask parameter, specified as a character vector. To associate a constraint programmatically the constraint must be already available. To associate a constraint in a MAT file, use the format <matfilename>:<constraintname>.

Data Types: char

“Control Masks Programmatically” | “Create Block Masks”

# Simulink.MaskParameter.set

**Package:** Simulink

Set properties of mask parameters

## Syntax

```
maskobj.Parameters.set(Name,Value)
```

## Description

`maskobj.Parameters.set(Name,Value)` sets the properties of a mask parameter.

## Examples

### Set the Values of Mask Parameter

- 1 Get mask as an object using a masked block's path.

```
maskobj = Simulink.Mask.get('setmaskparameter/Subsystem');
```

- 2 Get mask parameter

```
parameters = maskobj.Parameters(1);
```

- 3 Edit mask parameter so it is of type popup, cannot be evaluated.

```
maskobj.Parameters.set('Type','popup','TypeOptions',
{'Red' 'Blue' 'Green'},'Evaluate','off')
```

## Input Arguments

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: "Set the Values of Mask Parameter" on page 5-492

### Type — Type of parameter

`edit` (default) | `checkbox` | `popup` | `combobox` | `listbox` | `promote`

Type of parameter, specified as character vector.

Data Types: `char` | `string`

### TypeOptions — Type options of parameter

`edit` (default) | `checkbox` | `slider` | `dial` | `unit` | `min` | `max` | `promote` | ...

The options that are displayed within a popup or combobox or listbox parameter, specified as a cell array.

Data Types: `cell`

**Name — Name of mask parameter**

character vector (default)

The name of the mask parameter, specified as a character vector. This name is assigned to the mask workspace variable created for this parameter.

Data Types: `char` | `string`

**Prompt — Display name for mask parameter**

character vector (default)

Display name for the mask parameter, specified as a character vector. This name appears as the label associated with the parameter on the mask dialog.

Data Types: `char` | `string`

**Value — Mask parameter value**

character vector (default)

The default value of the mask parameter in the Mask Parameters dialog. Type specific, depends on the Type of the parameter, specified as a character vector.

Data Types: `char` | `string`

**Evaluate — Option to evaluate mask parameter**

`on` (default) | `off`

Option to evaluate mask parameter, specified as a logical.

Data Types: `logical`

**Tunable — Option to change mask parameter during simulation**

`on` (default) | `off`

Option to change the mask parameter during simulation, specified as logical value.

Data Types: `logical`

**NeverSave — Option to save mask parameter value in model file**

`off` (default) | `on`

Option to save the mask parameter value in the model file, specified as a logical.

Data Types: `logical`

**Hidden — Option to hide mask parameter**

`off` (default) | `on`

Option to hide the mask parameter in the mask dialog, specified as a logical.

Data Types: `logical`

**ReadOnly — Option to edit mask parameter**

`off` (default) | `on`

Option to edit the mask parameter in the mask dialog, specified as a logical.

Data Types: `logical`

**Enabled — Option to enable mask parameter**

`on (default) | off`

Option to enable the mask parameter in the mask dialog, specified as a logical.

Data Types: `logical`

**Visible — Option to show mask parameter in mask dialog**

`on (default) | off`

Option to show the mask parameter in the mask dialog, specified as a logical.

Data Types: `logical`

**ShowTooltip — Option to enable tooltips for mask parameter**

`on (default) | off`

Option to enable tooltips for the mask parameter, specified as a logical value.

Data Types: `logical`

**Callback — Callback code for the mask parameter**

`character vector (default)`

Callback code for the mask parameter, specified as a character vector. The callback code executes when a user changes the parameter value in the mask dialog box.

Data Types: `char`

**Alias — Alternative name for mask parameter**

`empty (default)`

Alternative name for the mask parameter is specified as character vector.

Data Types: `char | string`

**DialogControl — Layout options**

`character vector (default)`

Layout options for the parameter in the mask dialog, specified as a character vector. The location of the parameter in the mask dialog such as the row location, prompt location is specified. Additionally horizontal stretch or shrink of the mask parameter is also specified.

Data Types: `char | string`

# Simulink.MSFcnRunTimeBlock

Get run-time information about Level-2 MATLAB S-function block

## Description

This class allows a Level-2 MATLAB S-function or other MATLAB program to obtain information from Simulink software and provide information to Simulink software about a Level-2 MATLAB S-Function block. Simulink software creates an instance of this class for each Level-2 MATLAB S-Function block in a model. Simulink software passes the object to the callback methods of Level-2 MATLAB S-functions when it updates or simulates a model, allowing the callback methods to get and provide block-related information to Simulink software. See “Write Level-2 MATLAB S-Functions” for more information.

You can also use instances of this class in MATLAB programs to obtain information about Level-2 MATLAB S-Function blocks during a simulation. See “Access Block Data During Simulation” for more information.

The Level-2 MATLAB S-function template *matlabroot/toolbox/simulink/blocks/msfuntmpl.m* shows how to use a number of the following methods.

## Parent Class

Simulink.RunTimeBlock

## Derived Classes

None

## Property Summary

Name	Description
“AllowSignalsWithMoreThan2D” on page 5-497	enable Level-2 MATLAB S-function to use multidimensional signals.
“DialogPrmsTunable” on page 5-497	Specifies which of the S-function's dialog parameters are tunable.
“NextTimeHit” on page 5-497	Time of the next sample hit for variable sample time S-functions.

## Method Summary

Name	Description
“AutoRegRuntimePrms” on page 5-497	Register this block's dialog parameters as run-time parameters.

Name	Description
"AutoUpdateRuntimePrms" on page 5-498	Update this block's run-time parameters.
"IsDoingConstantOutput" on page 5-498	Determine whether the current simulation stage is the constant sample time stage.
"IsMajorTimeStep" on page 5-499	Determine whether the current simulation time step is a major time step.
"IsSampleHit" on page 5-499	Determine whether the current simulation time is one at which a task handled by this block is active.
"IsSpecialSampleHit" on page 5-499	Determine whether the current simulation time is one at which multiple tasks handled by this block are active.
"RegBlockMethod" on page 5-500	Register a callback method for this block.
"RegisterDataTypeFxpBinaryPoint" on page 5-500	Register fixed-point data type with binary point-only scaling.
"RegisterDataTypeFxpFSlopeFixexpBias" on page 5-501	Register fixed-point data type with [Slope Bias] scaling specified in terms of fractional slope, fixed exponent, and bias.
"RegisterDataTypeFxpSlopeBias" on page 5-502	Register data type with [Slope Bias] scaling.
"SetAccelRunOnTLC" on page 5-503	Specify whether to use this block's TLC file to generate the simulation target for the model that uses it.
"SetPreCompInpPortInfoToDynamic" on page 5-504	Set precompiled attributes of this block's input ports to be inherited.
"SetPreCompOutPortInfoToDynamic" on page 5-504	Set precompiled attributes of this block's output ports to be inherited.
"SetPreCompPortInfoToDefaults" on page 5-504	Set precompiled attributes of this block's ports to the default values.
"SetSimViewingDevice" on page 5-504	Specify whether block is a viewer.
"SupportsMultipleExecInstances" on page 5-505	
"WriteRTWParam" on page 5-505	Write custom parameter information to Simulink Coder file.

## Properties

### AllowSignalsWithMoreThan2D

#### Description

Allow Level-2 MATLAB S-functions to use multidimensional signals. You must set the AllowSignalsWithMoreThan2D property in the setup method.

#### Data Type

Boolean

#### Access

RW

### DialogPrmsTunable

#### Description

Specifies whether a dialog parameter of the S-function is tunable. Tunable parameters are registered as run-time parameters when you call the “AutoRegRuntimePrms” on page 5-497 method. Note that SimOnlyTunable parameters are not registered as run-time parameters. For example, the following lines initializes three dialog parameters where the first is tunable, the second in not tunable, and the third is tunable only during simulation.

```
block.NumDialogPrms = 3;
block.DialogPrmsTunable = {'Tunable', 'Nontunable', 'SimOnlyTunable'};
```

#### Data Type

array

#### Access

RW

### NextTimeHit

#### Description

Time of the next sample hit for variable sample-time S-functions.

#### Data Type

double

#### Access

RW

## Methods

### AutoRegRuntimePrms

#### Purpose

Register a block's tunable dialog parameters as run-time parameters.

**Syntax**

```
AutoRegRuntimePrms;
```

**Description**

The default names for the MATLAB S-Function tunable parameters are `MSFcnParameter`, `MSFcnParameter1`, ... `MSFcnParameterN`. You can assign other names by passing a cell array to `AutoRegRuntimePrms`. Use `AutoRegRuntimePrms` in the `PostPropagationSetup` method to register this block's tunable dialog parameters as run-time parameters.

**AutoUpdateRuntimePrms****Purpose**

Update a block's run-time parameters.

**Syntax**

```
AutoUpdateRuntimePrms;
```

**Description**

Automatically update the values of the run-time parameters during a call to `ProcessParameters`.

See the S-function `matlabroot/toolbox/simulink/simdemos/simfeatures/adapt_lms.m` in the Simulink model `sldemo_msfcn_lms` for an example.

**IsDoingConstantOutput****Purpose**

Determine whether this is in the constant sample time stage of a simulation.

**Syntax**

```
bVal = IsDoingConstantOutput;
```

**Description**

Returns true if this is the constant sample time stage of a simulation, i.e., the stage at the beginning of a simulation where Simulink software computes the values of block outputs that cannot change during the simulation (see “Constant Sample Time”). Use this method in the `Outputs` method of an S-function with port-based sample times to avoid unnecessarily computing the outputs of ports that have constant sample time, i.e., `[inf, 0]`.

```
function Outputs(block)
.
.
 if block.IsDoingConstantOutput
 ts = block.OutputPort(1).SampleTime;
 if ts(1) == Inf
 %% Compute port's output.
 end
 end
 end
.
.
%% end of Outputs
```

See “Specifying Port-Based Sample Times” for more information.

**IsMajorTimeStep****Purpose.**

Determine whether current time step is a major or a minor time step.

**Syntax**

```
bVal = IsMajorTimeStep;
```

**Description**

Returns true if the current time step is a major time step; false, if it is a minor time step. This method can be called only from the `Outputs` or `Update` methods.

**IsSampleHit****Purpose**

Determine whether the current simulation time is one at which a task handled by this block is active.

**Syntax**

```
bVal = IsSampleHit(stIdx);
```

**Arguments**

`stIdx`

Global index of the sample time to be queried.

**Description**

Use in `Outputs` or `Update` block methods when the MATLAB S-function has multiple sample times to determine whether a sample hit has occurred at `stIdx`. The sample time index `stIdx` is a global index for the Simulink model. For example, consider a model that contains three sample rates of 0.1, 0.2, and 0.5, and a MATLAB S-function block that contains two rates of 0.2 and 0.5. In the MATLAB S-function, `block.IsSampleHit(0)` returns true for the rate 0.1, not the rate 0.2.

This block method is similar to `ssIsSampleHit` for C-MeX S-functions, however `ssIsSampleHit` returns values based on only the sample times contained in the S-function. For example, if the model described above contained a C-MeX S-function with sample rates of 0.2 and 0.5, `ssIsSampleHit(S,0,tid)` returns true for the rate of 0.2.

Use port-based sample times to avoid using the global sample time index for multi-rate systems (see `Simulink.BlockPortData`).

**IsSpecialSampleHit****Purpose**

Determine whether the current simulation time is one at which multiple tasks implemented by this block are active.

**Syntax**

```
bVal = IsSpecialSampleHit(stIdx1,stIdx1);
```

**Arguments**

stIdx1

Index of sample time of first task to be queried.

stIdx2

Index of sample time of second task to be queried.

**Description**

Use in `Outputs` or `Update` block methods to ensure the validity of data shared by multiple tasks running at different rates. Returns true if a sample hit has occurred at `stIdx1` and a sample hit has also occurred at `stIdx2` in the same time step (similar to `ssIsSpecialSampleHit` for C-Mex S-functions).

When using the `IsSpecialSampleHit` macro, the slower sample time must be an integer multiple of the faster sample time.

**RegBlockMethod****Purpose**

Register a block callback method.

**Syntax**

```
RegBlockMethod(methName, methHandle);
```

**Arguments**

methName

Name of method to be registered.

methHandle

MATLAB function handle of the callback method to be registered.

**Description**

Registers the block callback method specified by `methName` and `methHandle`. Use this method in the `setup` function of a Level-2 MATLAB S-function to specify the block callback methods that the S-function implements.

**RegisterDataTypeFxpBinaryPoint****Purpose**

Register fixed-point data type with binary point-only scaling.

**Syntax**

```
dtID = RegisterDataTypeFxpBinaryPoint(isSigned, wordLength, fractionalLength, obeyDataTypeOverride);
```

**Arguments**

isSigned

true if the data type is signed.

false if the data type is unsigned.

**wordLength**

Total number of bits in the data type, including any sign bit.

**fractionalLength**

Number of bits in the data type to the right of the binary point.

**obeyDataTypeOverride**

`true` indicates that the **Data Type Override** setting for the subsystem is to be obeyed. Depending on the value of **Data Type Override**, the resulting data type could be `Double`, `Single`, `ScaledDouble`, or the fixed-point data type specified by the other arguments of the function.

`false` indicates that the **Data Type Override** setting is to be ignored.

**Description**

This method registers a fixed-point data type with Simulink software and returns a data type ID. The data type ID can be used to specify the data types of input and output ports, run-time parameters, and DWork states. It can also be used with all the standard data type access methods defined for instances of this class, such as "DatatypeSize" on page 5-511.

Use this function if you want to register a fixed-point data type with binary point-only scaling. Alternatively, you can use one of the other fixed-point registration functions:

- Use "RegisterDataTypeFxpFSlopeFixexpBias" on page 5-501 to register a data type with [Slope Bias] scaling by specifying the word length, fractional slope, fixed exponent, and bias.
- Use "RegisterDataTypeFxpSlopeBias" on page 5-502 to register a data type with [Slope Bias] scaling.

If the registered data type is not one of the Simulink built-in data types, a Fixed-Point Designer license is checked out.

**RegisterDataTypeFxpFSlopeFixexpBias****Purpose**

Register fixed-point data type with [Slope Bias] scaling specified in terms of fractional slope, fixed exponent, and bias

**Syntax**

```
dtID = RegisterDataTypeFxpFSlopeFixexpBias(isSigned, wordLength,
fractionalSlope, fixedexponent, bias, obeyDataTypeOverride);
```

**Arguments****isSigned**

`true` if the data type is signed.

`false` if the data type is unsigned.

**wordLength**

Total number of bits in the data type, including any sign bit.

**fractionalSlope**

Fractional slope of the data type.

`fixedexponent`

exponent of the slope of the data type.

`bias`

Bias of the scaling of the data type.

`obeyDataTypeOverride`

`true` indicates that the **Data Type Override** setting for the subsystem is to be obeyed. Depending on the value of **Data Type Override**, the resulting data type could be `True Doubles`, `True Singles`, `ScaledDouble`, or the fixed-point data type specified by the other arguments of the function.

`false` indicates that the **Data Type Override** setting is to be ignored.

### Description

This method registers a fixed-point data type with Simulink software and returns a data type ID. The data type ID can be used to specify the data types of input and output ports, run-time parameters, and DWork states. It can also be used with all the standard data type access methods defined for instances of this class, such as “DatatypeSize” on page 5-511.

Use this function if you want to register a fixed-point data type by specifying the word length, fractional slope, fixed exponent, and bias. Alternatively, you can use one of the other fixed-point registration functions:

- Use “RegisterDataTypeFxpBinaryPoint” on page 5-500 to register a data type with binary point-only scaling.
- Use “RegisterDataTypeFxpSlopeBias” on page 5-502 to register a data type with [Slope Bias] scaling.

If the registered data type is not one of the Simulink built-in data types, a Fixed-Point Designer license is checked out.

### RegisterDataTypeFxpSlopeBias

#### Purpose

Register data type with [Slope Bias] scaling.

#### Syntax

```
dtID = RegisterDataTypeFxpSlopeBias(isSigned, wordLength, totalSlope, bias, obeyDataTypeOverride);
```

#### Arguments

`isSigned`

`true` if the data type is signed.

`false` if the data type is unsigned.

`wordLength`

Total number of bits in the data type, including any sign bit.

`totalSlope`

Total slope of the scaling of the data type.

**bias**

Bias of the scaling of the data type.

**obeyDataTypeOverride**

`true` indicates that the **Data Type Override** setting for the subsystem is to be obeyed. Depending on the value of **Data Type Override**, the resulting data type could be `True Doubles`, `True Singles`, `ScaledDouble`, or the fixed-point data type specified by the other arguments of the function.

`false` indicates that the **Data Type Override** setting is to be ignored.

### Description

This method registers a fixed-point data type with Simulink software and returns a data type ID. The data type ID can be used to specify the data types of input and output ports, run-time parameters, and DWork states. It can also be used with all the standard data type access methods defined for instances of this class, such as “DatatypeSize” on page 5-511.

Use this function if you want to register a fixed-point data type with [Slope Bias] scaling. Alternatively, you can use one of the other fixed-point registration functions:

- Use “RegisterDataTypeFxpBinaryPoint” on page 5-500 to register a data type with binary point-only scaling.
- Use “RegisterDataTypeFxpFSlopeFixexpBias” on page 5-501 to register a data type by specifying the word length, fractional slope, fixed exponent, and bias

If the registered data type is not one of the Simulink built-in data types, a Fixed-Point Designer license is checked out.

### SetAccelRunOnTLC

#### Purpose

Specify whether to use block's TLC file to generate code for the Accelerator mode of Simulink software.

#### Syntax

```
SetAccelRunOnTLC(bVal);
```

#### Arguments

`bVal`

May be `'true'` (use TLC file) or `'false'` (run block in interpreted mode).

#### Description

Specify if the block should use its TLC file to generate code that runs with the accelerator. If this option is `'false'`, the block runs in interpreted mode. See the S-function `msfcn_times_two.m` in the Simulink model `msfcndemo_timestwo` for an example.

---

**Note** The default JIT Accelerator mode does not support inlining of user-written TLC S-Functions. Please see “How Acceleration Modes Work” and “Control S-Function Execution” for more information.

---

**SetPreCompInPortInfoToDynamic****Purpose**

Set precompiled attributes of this block's input ports to be inherited.

**Syntax**

```
SetPreCompInPortInfoToDynamic;
```

**Description**

Initialize the compiled information (dimensions, data type, complexity, and sampling mode) of this block's input ports to be inherited. See the S-function *matlabroot/toolbox/simulink/simdemos/simfeatures/adapt\_lms.m* in the Simulink model *sldemo\_msfcn\_lms* for an example.

**SetPreCompOutPortInfoToDynamic****Purpose**

Set precompiled attributes of this block's output ports to be inherited.

**Syntax**

```
SetPreCompOutPortInfoToDynamic;
```

**Description**

Initialize the compiled information (dimensions, data type, complexity, and sampling mode) of the block's output ports to be inherited. See the S-function *matlabroot/toolbox/simulink/simdemos/simfeatures/adapt\_lms.m* in the Simulink model *sldemo\_msfcn\_lms* for an example.

**SetPreCompPortInfoToDefaults****Purpose**

Set precompiled attributes of this block's ports to the default values.

**Syntax**

```
SetPreCompPortInfoToDefaults;
```

**Description**

Initialize the compiled information (dimensions, data type, complexity, and sampling mode) of the block's ports to the default values. By default, a port accepts a real scalar sampled signal with a data type of double.

**SetSimViewingDevice****Purpose**

Specify whether this block is a viewer.

**Syntax**

```
SetSimViewingDevice(bVal);
```

**Arguments**

bVal

May be 'true' (is a viewer) or 'false' (is not a viewer).

**Description**

Specify if the block is a viewer/scope. If this flag is specified, the block will be used only during simulation and automatically stubbed out in generated code.

**SupportsMultipleExecInstances****Purpose**

Specify whether or not a For Each Subsystem supports an S-function inside of it.

**Syntax**

```
SupportsMultipleExecInstances(bVal);
```

**Arguments**

bVal

May be 'true' (S-function is supported) or 'false' (S-function is not supported).

**Description**

Specify if an S-function can operate within a For Each Subsystem.

**WriteRTWParam****Purpose**

Write a custom parameter to the Simulink Coder information file used for code generation.

**Syntax**

```
WriteRTWParam(pType, pName, pVal)
```

**Arguments**

pType

Type of the parameter to be written. Valid values are 'string' and 'matrix'.

pName

Name of the parameter to be written.

pVal

Value of the parameter to be written.

**Description**

Use in the `WriteRTW` method of the MATLAB S-function to write out custom parameters. These parameters are generally settings used to determine how code should be generated in the TLC file for the S-function. See the S-function `matlabroot/toolbox/simulink/simdemos/simfeatures/adapt_lms.m` in the Simulink model `sldemo_msfcn_lms` for an example.

# Simulink.RunTimeBlock

Allow Level-2 MATLAB S-function and other MATLAB programs to get information about block while simulation is running

## Description

This class allows a Level-2 MATLAB S-function or other MATLAB program to obtain information about a block. Simulink software creates an instance of this class or a derived class for each block in a model. Simulink software passes the object to the callback methods of Level-2 MATLAB S-functions when it updates or simulates a model, allowing the callback methods to get block-related information from and provide such information to Simulink software. See “Write Level-2 MATLAB S-Functions” in Writing S-Functions for more information. You can also use instances of this class in MATLAB programs to obtain information about blocks during a simulation. See “Access Block Data During Simulation” for more information.

**Note** Simulink.RunTimeBlock objects do not support MATLAB sparse matrices. For example, the following line of code attempts to assign a sparse identity matrix to the run-time object's output port data. This line of code in a Level-2 MATLAB S-function produces an error:

```
block.Outputport(1).Data = speye(10);
```

## Parent Class

None

## Derived Classes

Simulink.MSFcnRunTimeBlock

## Property Summary

Name	Description
“BlockHandle” on page 5-508	Block's handle.
“CurrentTime” on page 5-508	Current simulation time.
“NumDworks” on page 5-508	Number of discrete work vectors used by the block.
“NumOutputPorts” on page 5-509	Number of block output ports.
“NumContStates” on page 5-509	Number of block's continuous states.
“NumDworkDiscStates” on page 5-509	Number of block's discrete states
“NumDialogPrms” on page 5-509	Number of parameters that can be entered on S-function block's dialog box.
“NumInputPorts” on page 5-510	Number of block's input ports.

Name	Description
"NumRuntimePrms" on page 5-510	Number of run-time parameters used by block.
"SampleTimes" on page 5-510	Sample times at which block produces outputs.

## Method Summary

Name	Description
"ContStates" on page 5-510	Get a block's continuous states.
"DataTypeIsFixedPoint" on page 5-511	Determine whether a data type is fixed point.
"DatatypeName" on page 5-511	Get name of a data type supported by this block.
"DatatypeSize" on page 5-511	Get size of a data type supported by this block.
"Derivatives" on page 5-512	Get a block's continuous state derivatives.
"DialogPrm" on page 5-512	Get a parameter entered on an S-function block's dialog box.
"Dwork" on page 5-512	Get one of a block's DWork vectors.
"FixedPointNumericType" on page 5-513	Determine the properties of a fixed-point data type.
"InputPort" on page 5-513	Get one of a block's input ports.
"OutputPort" on page 5-514	Get one of a block's output ports.
"RuntimePrm" on page 5-514	Get one of the run-time parameters used by a block.

## Properties

### BlockHandle

#### Description

Block's handle.

#### Access

R0

### CurrentTime

#### Description

Current simulation time.

#### Access

R0

### NumDworks

#### Description

Number of data work vectors.

**Access**

RW

**See Also**

ssGetNumDWork

**NumOutputPorts****Description**

Number of output ports.

**Access**

RW

**See Also**

ssGetNumOutputPorts

**NumContStates****Description**

Number of continuous states.

**Access**

RW

**See Also**

ssGetNumContStates

**NumDworkDiscStates****Description**

Number of discrete states. In a MATLAB S-function, you need to use DWorks to set up discrete states.

**Access**

RW

**See Also**

ssGetNumDiscStates

**NumDialogPrms****Description**

Number of parameters declared on the block's dialog. In the case of the S-function, it returns the number of parameters listed as a comma-separated list in the **S-function parameters** dialog field.

**Access**

RW

**See Also**

ssGetNumSFcnParams

**NumInputPorts****Description**

Number of input ports.

**Access**

RW

**See Also**

ssGetNumInputPorts

**NumRuntimePrms****Description**

Number of run-time parameters used by this block. See “Create and Update S-Function Run-Time Parameters” for more information.

**Access**

RW

**See Also**

ssGetNumSFcnParams

**SampleTimes****Description**

Block's sample times.

**Access**

RW for MATLAB S-functions, RO for all other blocks.

**Methods****ContStates****Purpose**

Get a block's continuous states.

**Syntax**

```
states = ContStates();
```

**Description**

Get vector of continuous states.

**See Also**

ssGetContStates

**DataTypesFixedPoint****Purpose**

Determine whether a data type is fixed point.

**Syntax**

```
bVal = DataTypeIsFixedPoint(dtID);
```

**Arguments**

dtID

Integer value specifying the ID of a data type.

**Description**

Returns `true` if the specified data type is a fixed-point data type.

**DatatypeName****Purpose**

Get the name of a data type.

**Syntax**

```
name = DatatypeName(dtID);
```

**Arguments**

dtID

Integer value specifying ID of a data type.

**Description**

Returns the name of the data type specified by `dtID`.

**See Also**

“DatatypeSize” on page 5-511

**DatatypeSize****Purpose**

Get the size of a data type.

**Syntax**

```
size = DatatypeSize(dtID);
```

**Arguments**

dtID

Integer value specifying the ID of a data type.

**Description**

Returns the size of the data type specified by dtID.

**See Also**

“DatatypeName” on page 5-511

**Derivatives****Purpose**

Get derivatives of a block's continuous states.

**Syntax**

```
derivs = Derivatives();
```

**Description**

Get vector of state derivatives.

**See Also**

ssGetdX

**DialogPrm****Purpose**

Get an S-function's dialog parameters.

**Syntax**

```
param = DialogPrm(pIdx);
```

**Arguments**

pIdx

Integer value specifying the index of the parameter to be returned.

**Description**

Get the specified dialog parameter. In the case of the S-function, each DialogPrm corresponds to one of the elements in the comma-separated list of parameters in the **S-function parameters** dialog field.

**See Also**

ssGetSFcnParam, “RuntimePrm” on page 5-514

**Dwork****Purpose**

Get one of a block's DWork vectors.

**Syntax**

```
dworkObj = Dwork(dwIdx);
```

**Arguments**

dwIdx

Integer value specifying the index of a work vector.

**Description**

Get information about the DWork vector specified by dwIdx where dwIdx is the index number of the work vector. This method returns an object of type `Simulink.BlockCompDworkData`.

**See Also**

ssGetDWork

**FixedPointNumericType****Purpose**

Get the properties of a fixed-point data type.

**Syntax**

```
eno = FixedPointNumericType(dtID);
```

**Arguments**

dtID

Integer value specifying the ID of a fixed-point data type.

**Description**

Returns an object of `embedded.Numeric` class that contains the attributes of the specified fixed-point data type.

---

**Note** `embedded.Numeric` is also the class of the `numerictype` objects created by Fixed-Point Designer software. For information on the properties defined by `embedded.Numeric` class, see “`numerictype` Object Properties” (Fixed-Point Designer).

---

**InputPort****Purpose**

Get an input port of a block.

**Syntax**

```
port = InputPort(pIdx);
```

**Arguments**

pIdx

Integer value specifying the index of an input port.

**Description**

Get the input port specified by pIdx, where pIdx is the index number of the input port. For example,

```
port = rto.InputPort(1)
```

returns the first input port of the block represented by the run-time object `rto`.

This method returns an object of type `Simulink.BlockPreCompInputPortData` or `Simulink.BlockCompInputPortData`, depending on whether the model that contains the port is uncompiled or compiled. You can use this object to get and set the input port's uncompiled or compiled properties, respectively.

**See Also**

`ssGetInputPortSignalPtrs`, `Simulink.BlockPreCompInputPortData`, `Simulink.BlockCompInputPortData`, “OutputPort” on page 5-514

**OutputPort****Purpose**

Get an output port of a block.

**Syntax**

```
port = OutputPort(pIdx);
```

**Arguments**

`pIdx`

Integer value specifying the index of an output port.

**Description**

Get the output port specified by `pIdx`, where `pIdx` is the index number of the output port. For example,

```
port = rto.OutputPort(1)
```

returns the first output port of the block represented by the run-time object `rto`.

This method returns an object of type `Simulink.BlockPreCompOutputPortData` or `Simulink.BlockCompOutputPortData`, depending on whether the model that contains the port is uncompiled or compiled, respectively. You can use this object to get and set the output port's uncompiled or compiled properties, respectively.

**See Also**

`ssGetInputPortSignalPtrs`, `Simulink.BlockPreCompOutputPortData`, `Simulink.BlockCompOutputPortData`

**RuntimePrm****Purpose**

Get an S-function's run-time parameters.

**Syntax**

```
param = RuntimePrm(pIdx);
```

**Arguments**

pIdx

Integer value specifying the index of a run-time parameter.

**Description**

Get the run-time parameter whose index is pIdx. This run-time parameter is a Simulink.BlockData on page 5-207 object of type Simulink.BlockRunTimePrmData.

**See Also**

ssGetRunTimeParamInfo

**Version History**

Introduced before R2006a

## Simulink.SampleTime class

**Package:** Simulink

Object containing sample time information

### Description

The `SampleTime` class represents the sample time information associated with an individual sample time.

Use the methods `Simulink.Block.getSampleTimes` and `Simulink.BlockDiagram.getSampleTimes` to retrieve the values of the `SampleTime` properties for a block and for a block diagram, respectively.

### Properties

#### Value

A two-element array of doubles that contains the period and offset of the sample time

#### Description

A  $1 \times n$  character array that describes the sample time type

#### ColorRGBValue

A  $1 \times 3$  array of doubles that contains the red, green and blue (RGB) values of the sample time color

#### Annotation

A  $1 \times n$  character array that represents the annotation of a specific sample time (for example, 'D1')

#### OwnerBlock

For asynchronous and variable sample times, `OwnerBlock` is a character vector containing the full path to the block that controls the sample time. For all other types of sample times, it is an empty character vector.

#### ComponentSampleTimes

If the sample time is an async union or if the sample time is hybrid and the component sample times are available, then the array `ComponentSampleTimes` contains `Simulink.SampleTime` objects.

### Copy Semantics

Value. To learn how value classes affect copy operations, see [Copying Objects in the MATLAB Programming Fundamentals documentation](#).

### Examples

Retrieve the sample time information for the 'vdp' model.

```
ts = Simulink.BlockDiagram.getSampleTimes('vdp')
```

Simulink returns:

```
ts =
```

```
1x2 Simulink.SampleTime
Package: Simulink
```

Properties:

```
Value
Description
ColorRGBValue
Annotation
OwnerBlock
ComponentSampleTimes
```

Methods

To examine the values of the properties:

```
ts(1), ts(2)
```

```
ans =
```

```
Simulink.SampleTime
Package: Simulink
```

Properties:

```
Value: [0 0]
Description: 'Continuous'
ColorRGBValue: [0 0 0]
Annotation: 'Cont'
OwnerBlock: []
ComponentSampleTimes: {}
```

Methods

```
ans =
```

```
Simulink.SampleTime
Package: Simulink
```

Properties:

```
Value: [Inf 0]
Description: 'Constant'
ColorRGBValue: [1 0.2600 0.8200]
Annotation: 'Inf'
OwnerBlock: []
ComponentSampleTimes: {}
```

Methods

[Simulink.Block.getSampleTimes](#) | [Simulink.BlockDiagram.getSampleTimes](#)

## simulink.schedule.OrderedSchedule class

**Package:** simulink.schedule

Creates an OrderedSchedule object containing priority order of the partitions of a model

### Description

The `simulink.schedule.OrderedSchedule` object is a representation of the execution order of the partitions of the specified model. Access this object as a model parameter with `get_param`. You can use the `OrderedSchedule` object to modify the schedule of the partitions of the model through the command line.

You can use `set_param` to apply the schedule to the model.

### Creation

`get_param mdl, 'Schedule')` creates an `OrderedSchedule` object for the specified model, `mdl`.

### Properties

#### Order — Priority order of the partitions

table

Priority order of the partitions, specified as a table where:

- The row names are names of the partitions.
- The first column is the index of the partition. Modify the index to change the order of the partitions.
- The second column shows the type of the partitions.
- The third column shows the trigger of the partition. This column lists either the sample time of the partitions, or the hit times at which the partitions execute.

#### RateSections — Sections of the order table

array

`RateSections` is an array of objects containing a portion of the order table with a single rate. Use `RateSections` to easily modify the order of the execution of partitions within valid groups.

#### Description — Description of the OrderedSchedule object

string

Purpose of an individual schedule object, specified as a string.

#### Events — Schedule Editor events

array

Schedule Editor events that may be triggers for aperiodic partitions. Schedule Editor events are sent by Stateflow chart and by Input Events in Simulink, specified as an array of `simulink.schedule.Event` objects.

## Examples

### Create and Analyze Random Schedules for a Model Using the Schedule Editor API

This example uses the Schedule Editor API to perform operations on the schedule. Then it uses a function to generate random schedules and analyze them in Simulation Data Inspector

#### Open the Model and get the Schedule Object

Open a model of a Throttle Position Control system and use `get_param` to obtain the `simulink.schedule.OrderedSchedule` object. This object contains the current schedule.

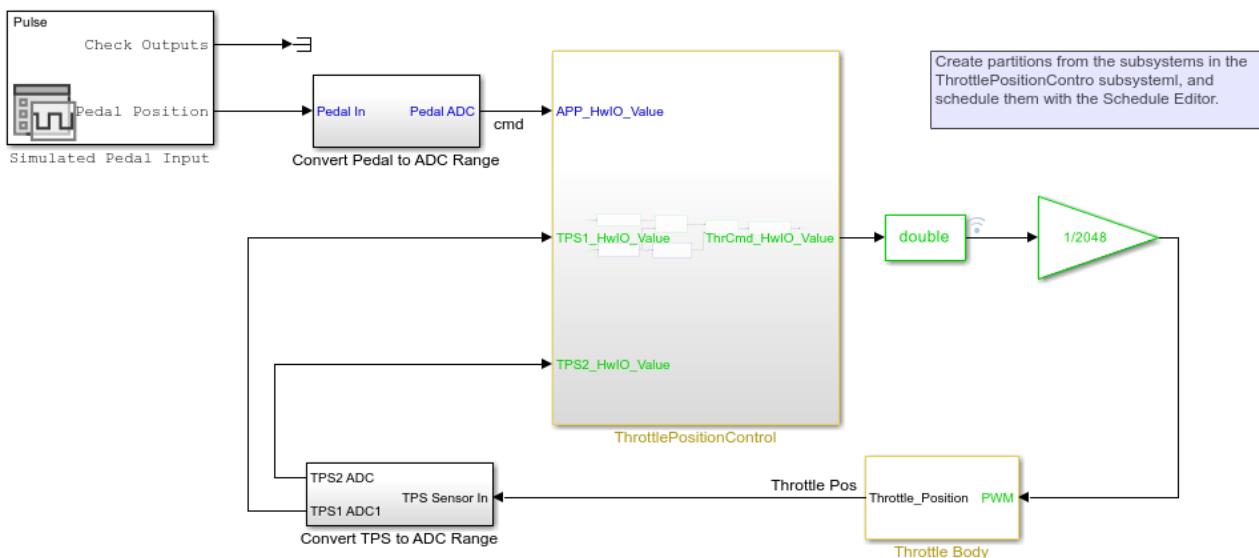

```
model = 'ScheduleEditorAPIWithSubsystemPartitions';
open_system(model);
schedule = get_param(model, 'Schedule')
```

schedule =

OrderedSchedule with properties:

```
Order: [9x3 table]
RateSections: [3x1 simulink.schedule.RateSection]
Events: [0x1 simulink.schedule.Event]
Description: ''
```

### Schedule Subsystem Partitions with the Schedule Editor

Copyright 2022 The MathWorks, Inc.

### Examine the Schedule Object

The schedule object has an `Order` property that contains the execution order of the partitions in the model. The `Order` property displays a table that contains partition names, their index, type, and their trigger.

```
schedule.Order
```

```
ans =
```

```
9x3 table
```

	Index	Type	Trigger
Cont	1	Periodic	"0"
TPSSecondaryRun5ms	2	Periodic	"0.005"
MonitorRun5ms	3	Periodic	"0.005"
ControllerRun5ms	4	Periodic	"0.005"
ActuatorRun5ms	5	Periodic	"0.005"
D2	6	Periodic	"0.005"
D3	7	Periodic	"0.01"
APPSnsrRun	8	Periodic	"0.01"
TPSPPrimaryRun10ms	9	Periodic	"0.01"

Use the index variable in the `Order` table to change the execution order of the model

```
schedule.Order.Index('ActuatorRun5ms') = 2;
schedule.Order
```

```
ans =
```

```
9x3 table
```

	Index	Type	Trigger
Cont	1	Periodic	"0"
ActuatorRun5ms	2	Periodic	"0.005"
TPSSecondaryRun5ms	3	Periodic	"0.005"
MonitorRun5ms	4	Periodic	"0.005"
ControllerRun5ms	5	Periodic	"0.005"
D2	6	Periodic	"0.005"
D3	7	Periodic	"0.01"
APPSnsrRun	8	Periodic	"0.01"
TPSPPrimaryRun10ms	9	Periodic	"0.01"

Any moves within the `Order` property that are made to modify the schedule should result in valid schedule. To perform the schedule modifications and valid moves easier, each partition is grouped with partitions of the same rate in the `RateSections` property. Each element of the `RateSection` property contains an order table with partitions of the same rate.

```
schedule.RateSections(2)
schedule.RateSections(2).Order
```

```
ans =
```

```
RateSection with properties:
```

```
Rate: "0.005"
Order: [5x3 table]
```

```
ans =
```

```
5x3 table
```

	Index	Type	Trigger
ActuatorRun5ms	2	Periodic	"0.005"
TPSSecondaryRun5ms	3	Periodic	"0.005"
MonitorRun5ms	4	Periodic	"0.005"
ControllerRun5ms	5	Periodic	"0.005"
D2	6	Periodic	"0.005"

Use the index variable to move the partitions within RateSections.

```
schedule.RateSections(2).Order.Index('ActuatorRun5ms') = 5;
schedule.Order
```

```
ans =
```

```
9x3 table
```

	Index	Type	Trigger
Cont	1	Periodic	"0"
TPSSecondaryRun5ms	2	Periodic	"0.005"
MonitorRun5ms	3	Periodic	"0.005"
ControllerRun5ms	4	Periodic	"0.005"
ActuatorRun5ms	5	Periodic	"0.005"
D2	6	Periodic	"0.005"
D3	7	Periodic	"0.01"
APPSnsrRun	8	Periodic	"0.01"
TPSPPrimaryRun10ms	9	Periodic	"0.01"

### Create a Function to Generate Random Schedules

In this section, we create three different functions: `randomSchedule`, `generateSimulationInputs` and `simulateRandomSchedules`

`randomSchedule` function is used to create random schedules by using random permutations of index modifications in the `schedule` object. Using the `Order` and the `RateSections` properties of the `schedule` object, partitions in the schedules are moved around in different, random combinations. With these randomly created schedules, models are simulated and compared to study the effect of different schedules on simulation. In the function `randomSchedule`, the input is the model name. Then use `get_param` to obtain the `simulink.schedule.OrderedSchedule` object of

the model. The schedule object and its properties are used to modify and randomize the schedules. Create a variable `firstExecutionOrder` for the first rate section of the model. The `rateSections(1).ExecutionOrder = [firstExecutionOrder(1,:); reSchedule(firstExecutionOrder(2:end,:))]` line of code calls the function `reSchedule` which creates random permutations of the indexes.

type `randomSchedule`

```
function schedule = randomSchedule(model)
 % schedule = randomSchedule(model) Produces a
 % simulink.schedule.OrderedSchedule that has a randomized permutation
 % of the model's original execution order schedule

 arguments
 model char = bdroot
 end

 schedule = get_param(model, 'Schedule');

 rateSections = schedule.RateSections;
 firstOrder = rateSections(1).Order;

 % This assumes that the slowest discrete rate is at index 1. This may
 % not be the case for all models (ex. JMAAB-B).
 rateSections(1).Order = [firstOrder(1,:); reSchedule(firstOrder(2:end,:))];

 for i=2:length(rateSections)
 rateSections(i).Order = reSchedule(rateSections(i).Order);
 end

 schedule.RateSections = rateSections;
end

function out = reSchedule(in)
 numPartitions = height(in);
 in.Index = in.Index(randperm(numPartitions));
 out = in;
end
```

To analyze the effects of different schedules on the model, simulate the model with the different schedules. In this function, create an array of `Simulink.SimulationInput` objects. Through this array of `Simulink.SimulationInput` objects, you can apply the schedules to the model with the `setModelParameters` method of the `Simulink.SimulationInput` object.

type `generateSimulationInputs`

```
function in = generateSimulationInputs(model, numSimulations)
 % in = generateSimulationInputs(model, numSimulations) Generates
 % numSimulations Simulink.SimulationInput objects each containing a
 % different, randomized execution order schedule
 arguments
 model char = bdroot
 numSimulations double = 10
 end

 in(numSimulations) = Simulink.SimulationInput();
```

```

 in = in.setModelName(model);
 for idx = 1:numSimulations
 in(idx) = in(idx).setModelParameter('Schedule', randomSchedule(model));
 end
end

```

In the last function, use the array of `Simulink.SimulationInput` objects to run multiple simulations. Once the simulations are complete, you can plot the output of all the simulations in Simulation Data Inspector.

type `simulateRandomSchedules`

```

function out = simulateRandomSchedules(model, numSimulations)
 % out = simulateRandomSchedules(model, numSimulations) Simulates a
 % model numSimulations number of times. Each simulation has a
 % randomized execution order schedule.
 arguments
 model char = bdroot
 numSimulations double = 10
 end

 in = generateSimulationInputs(model, numSimulations);
 out = sim(in);
 plot(out);
end

```

### Execute the Functions

Now run the above functions for the `ScheduleEditorAPIWithSubsystemPartitions` model. First, use the `randomSchedule` function to create randomly generated schedules, then, use the `generateSimulationInputs` function to generate an array of `Simulink.SimulationInput` objects, and use the `simulateRandomSchedule` function to simulate the model with different schedules and plot their results for comparison. Let's run simulations with 15 randomly generated schedules.

```
simulateRandomSchedules(model, 15)
```

```

[04-Mar-2023 02:35:56] Running simulations...
[04-Mar-2023 02:36:03] Completed 1 of 15 simulation runs

# Simulink.sdi.constraints.MatchesSignal class

**Package:** Simulink.sdi.constraints

**Superclasses:** matlab.unittest.constraints.Constraint

Constraint that compares time series data with tolerances using the Simulation Data Inspector

## Description

Use the `Simulink.sdi.constraints.MatchesSignal` constraint to compare time series data against an expected value as part of a test. You can configure the constraint to use a combination of absolute, relative, and time tolerance values for the comparison. You can also specify additional options to configure the comparison behavior using a `Simulink.sdi.constraints.MatchesSignalOptions` object or using one or more name-value pair arguments on page 5-525. For more information about how tolerances and alignment options affect comparisons, see “How the Simulation Data Inspector Compares Data”.

---

**Note** The `MatchesSignal` constraint uses the Simulation Data Inspector to perform comparisons and requires a license for one of these products:

- Simulink
  - Signal Processing Toolbox™
  - MATLAB Coder
  - Fixed-Point Designer
- 

## Creation

### Description

`MatchesSignal(expVal)` creates a constraint that determines whether time series data representing an actual value matches the data specified by the expected value, `expVal` on page 5-0 .

`MatchesSignal(expVal, Name, Value)` creates a constraint with additional properties on page 5-527 specified by one or more `Name, Value` pair arguments.

### Input Arguments

#### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, . . . , NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose `Name` in quotes.*

Example: `'IgnoringDataTypes', true`

**IgnoringDataTypes — Constraint behavior when data types do not match**`false (default) | true`

Configure constraint sensitivity to the actual value having a different data type from the expected value.

- `false` — The constraint checks whether the expected value and actual value data types match.
- `true` — The constraint is insensitive to data type mismatches between the expected value and actual value.

Example: `'IgnoringDataTypes', true`

**IgnoringSignalsNotAligned — Constraint behavior when signals do not align**`false (default) | true`

Configure constraint sensitivity to one or more signals not aligning between the expected value and actual value.

- `false` — The constraint checks for signals that do not align between the expected value and actual value.
- `true` — The constraint is insensitive to one or more signals not aligning between the expected value and actual value.

Example: `'IgnoringSignalsNotAligned', true`

**IgnoringExtraData — Constraint behavior when the actual value covers a different time interval from the expected value**`false (default) | true`

Configure the constraint sensitivity to the actual value containing data outside of the time interval defined by the expected value.

- `false` — The constraint checks whether the actual value contains data outside the time interval defined by the expected value.
- `true` — The constraint is insensitive to the actual value containing data outside the time interval defined by the expected value.

Example: `'IgnoringExtraData', true`

**AligningBy — Signal alignment criteria**`string array`

Alignment criteria for the comparison. When the expected value contains more than one signal, the Simulation Data Inspector comparison algorithm aligns signals for comparison between the expected and actual values. By default, the Simulation Data Inspector aligns by data source, then by block path, then by SID, and then by signal name. For details about the Simulation Data Inspector alignment algorithm, see “How the Simulation Data Inspector Compares Data”.

Specify alignment criteria as a string array with one or more of these options listed in the order in which you want them considered:

- `BlockPath` — The path to the source block for the signal.
- `SID` — Automatically assigned Simulink identifier.

- `SignalName` — The name of the signal.
- `DataSource` — Path of the variable.

Example: `'AligningBy', ["SignalName", "BlockPath"]` specifies signal alignment by signal name and then by block path.

## Properties

### Expected — Expected value to use as the baseline for the comparison

time series data | string scalar | character array

Expected value to use as the baseline for the comparison. The data for the expected value must pair data values with time. The data can be in any format supported by the Simulation Data Inspector. The Simulation Data Inspector requires data in a format that associates sample values with time. Supported formats include `timeseries`, `Structure with time`, and `Dataset`.

You can specify the expected value for the constraint using a variable in the workspace that contains the data or by specifying the full path or file name of a file that contains the data, as a string scalar or a character array.

#### Attributes:

<code>GetAccess</code>	<code>public</code>
<code>SetAccess</code>	<code>immutable</code>

### MatchesSignalOptions — Constraint comparison configuration options

`Simulink.sdi.constraints.MatchesSignalOptions`

`Simulink.sdi.constraints.MatchesSignalOptions` object that specifies options to configure the comparison for the constraint. By default, the comparison uses the default alignment settings for the Simulation Data Inspector and has strict acceptance criteria, meaning that the comparison does not ignore any checks. You can use the `MatchesSignalOptions` property to configure how the constraint aligns signals in the expected and actual runs and whether tests using the constraint are sensitive to:

- The actual value having a different data type from the expected value.
- One or more signals not aligning between the expected and actual runs.
- The actual value containing data outside the time interval defined by the expected value.

You can specify the `MatchesSignalOptions` property for the constraint using individual name-value pair arguments on page 5-525 or using the name-value pair `'WithOptions'` with a `Simulink.sdi.constraints.MatchesSignalOptions` object as the value. When you specify the `MatchesSignalOptions` property using a `MatchesSignalOptions` object, you can use a single name-value pair to configure all the options for comparisons that use the constraint.

#### Attributes:

<code>GetAccess</code>	<code>public</code>
<code>SetAccess</code>	<code>immutable</code>

Data Types: `Simulink.sdi.constraints.MatchesSignalOptions`

### AbsTol — Absolute tolerance for comparison

0 (default) | scalar

Absolute tolerance for comparisons using the constraint. For details about how the Simulation Data Inspector uses tolerance values in comparisons, see “How the Simulation Data Inspector Compares Data”.

Example: 0.1

Example: 2

**Attributes:**

GetAccess	public
SetAccess	immutable

Data Types: double

**RelTol — Relative tolerance for comparison**

0 (default) | scalar

Relative tolerance for comparisons using the constraint. For example, specify 0.1 to use a 10% tolerance for the comparison. For details about how the Simulation Data Inspector uses tolerance values in comparisons, see “How the Simulation Data Inspector Compares Data”.

Example: 0.05

**Attributes:**

GetAccess	public
SetAccess	immutable

Data Types: double

**TimeTol — Time tolerance for comparison**

0 (default) | scalar

Time tolerance for comparisons using the constraint, in seconds. For details about how the Simulation Data Inspector uses tolerance values in comparisons, see “How the Simulation Data Inspector Compares Data”.

Example: 0.001

**Attributes:**

GetAccess	public
SetAccess	immutable

Data Types: double

## Examples

### Create Tests for Time Series Comparisons

This example shows how to use the `Simulink.sdi.constraints.MatchesSignal` constraint to compare time series data using data generated in the workspace. You can use the `MatchesSignal` constraint to compare data from many sources, including measured test data in a file and logged simulation outputs.

When you use the `MatchesSignal` constraint, you can specify absolute, relative, and time tolerances to use in the comparison. The `MatchesSignal` constraint uses the Simulation Data Inspector comparison algorithm, which includes steps for alignment and synchronization. For more information about the algorithm, see “How the Simulation Data Inspector Compares Data”.

The `MatchesSignal` constraint uses the Simulation Data Inspector for the time series comparison and requires one of these products:

- Simulink®
- Signal Processing Toolbox™
- MATLAB Coder™
- Fixed-Point Designer™

### Create Time Series Data

This example generates workspace data in `timeseries` format for illustrative purposes only. You can use the `MatchesSignal` constraint to compare data from other sources, such as simulation outputs or a file containing test data, and the constraint can compare time series data in any format supported by the Simulation Data Inspector.

In this example, the first signal is a `timeseries` object containing data for a sine wave with the name `Wave Data`.

```
time = 0:0.1:20;
sig1vals = sin(2*pi/5*time);
sig1_ts = timeseries(sig1vals,time);
sig1_ts.Name = 'Wave Data';
```

The second signal is also a sine wave at the same frequency, with a slight attenuation and sampled at a different rate. Because the comparison algorithm for the `MatchesSignal` constraint includes a synchronization step, comparing these two signals with different time vectors does not always result in a test failure. The second signal is also named `Wave Data` so the alignment algorithm can pair the signals for comparison.

```
time2 = 0:0.05:20;
sig2vals = 0.98*sin(2*pi/5*time2);
sig2_ts = timeseries(sig2vals,time2);
sig2_ts.Name = 'Wave Data';
```

### Create a Test Case and Compare the Signals

This example uses an interactive test for illustrative purposes. You can use the `MatchesSignal` constraint with other types of unit tests in the MATLAB testing framework. For example, to write class-based unit tests, see “Write Simple Test Case Using Classes”.

Create a `TestCase` instance for interactive use.

```
import matlab.unittest.TestCase

testCase = TestCase.forInteractiveUse;
```

Compare `sig1_ts` and `sig2_ts` using the `MatchesSignal` constraint. Use `sig1_ts` for the expected value in the instance of the `MatchesSignal` constraint.

```

import Simulink.sdi.constraints.MatchesSignal

testCase.verifyThat(sig2_ts,MatchesSignal(sig1_ts));
Verification failed.

Framework Diagnostic:

MatchesSignal(<Value>) failed.
--> The following aligned signals did not match:

 Name ActualSignals ExpectedSignals
 ----- -
 Wave Data <Actual>.Data <Expected>.Data

Comparison results have been saved to:
--> C:\TEMP\Bdoc23a_2213998_3568\ib570499\25\comparisonResults_d00018a9-61f2-4ce0-98df-5f3f62

Stack Information:

In C:\TEMP\Bdoc23a_2213998_3568\ib570499\25\tp056c2d8e\simulink-ex22803619\TestTimeSeriesData
In B:\matlab\toolbox\matlab\codetools\embeddedoutputs\+matlab\+internal\+editor\evaluateRegion
In B:\matlab\toolbox\matlab\codetools\embeddedoutputs\+matlab\+internal\+editor\EvaluationOutput
In B:\matlab\toolbox\matlab\codetools\+matlab\+internal\+liveeditor\@LiveEditorUtilities\execute
In B:\matlab\tools\examples\exampletools\+mwtools\liveCodeToDocbook.m (doRun) at 431
In B:\matlab\tools\examples\exampletools\+mwtools\liveCodeToDocbook.m (doRunConvert) at 346
In B:\matlab\tools\examples\exampletools\+mwtools\liveCodeToDocbook.m (liveCodeToDocbook) at
In B:\matlab\tools\build_using_matlab\BML.m (BML) at 13

```

The diagnostic information shows that the verification failed. When a test fails, the comparison results and original run data are saved in a Simulation Data Inspector session file. Click the link for the MLDATX file to open the session in the Simulation Data Inspector, where you can investigate the data compared by the test and the comparison results. When you inspect the results, you can see the attenuation creates the difference and causes the comparison to fail.

Specify an absolute tolerance of `0.02` for the instance of the `MatchesSignal` constraint to use in the comparison.

```
testCase.verifyThat(sig2_ts,MatchesSignal(sig1_ts,'AbsToL',0.02));
```

Verification passed.

### Configure MatchesSignal Constraint Behavior

This example shows how to configure the comparison behavior of a `Simulink.sdi.constraints.MatchesSignal` constraint using a `Simulink.sdi.constraints.MatchesSignalOptions` object. You can use a `MatchesSignalOptions` object to configure multiple comparison properties with a single name-value pair input in the construction of the `MatchesSignal` instance.

### Create Time Series Data

This example creates workspace data to use for illustrative purposes only. You can use the `MatchesSignal` constraint to compare data from other sources, such as simulation outputs or a file containing test data, and the constraint can compare time series data in any format supported by the Simulation Data Inspector.

In this example, the first signal is a `timeseries` object with the name `Wave Data` that contains data for a sine wave.

```
time = 0:0.1:20;
sig1vals = sin(2*pi/5*time);
sig1_ts = timeseries(sig1vals,time);
sig1_ts.Name = 'Wave Data';
```

The second signal is also a sine wave at the same frequency, with a slight attenuation and sampled at a different rate. Because the comparison algorithm for the `MatchesSignal` constraint includes a synchronization step, comparing these two signals with different time vectors does not necessarily result in a test failure. The second signal is cast to `single` data type and also named `Wave Data` so the alignment algorithm can pair the signals for comparison.

```
time2 = 0:0.1:22;
sig2vals = single(0.98*sin(2*pi/5*time2));
sig2_ts = timeseries(sig2vals,time2);
sig2_ts.Name = 'Wave Data';
```

### Configure a `MatchesSignal` Instance and Compare the Data

You can use a `MatchesSignalOptions` object to specify how an instance of the `MatchesSignal` constraint handles conditions such as mismatched data types and how signals are aligned between the actual and expected data sets. You can specify the properties of the `MatchesSignalOptions` object to suit the test you want to write. For example, if you want your test to compare data of varying types and a data type match is not functionally relevant, you could set the `IgnoreDataTypes` property to `true`.

Create a `MatchesSignalOptions` object to create a `MatchesSignal` instance that ignores data type mismatches and data samples outside the time interval the actual and expected signals share.

```
import Simulink.sdi.constraints.MatchesSignalOptions
opts = MatchesSignalOptions('IgnoringDataTypes',true,'IgnoringExtraData',true);
```

Create a `TestCase` instance for interactive use and compare `sig1_ts` and `sig2_ts` using the `MatchesSignal` constraint, the `MatchesSignalOptions` object, and an absolute tolerance of `0.02`.

```
import matlab.unittest.TestCase
testCase = TestCase.forInteractiveUse;

import Simulink.sdi.constraints.MatchesSignal
testCase.verifyThat(sig2_ts,MatchesSignal(sig1_ts,'AbsTol',0.02,'WithOptions',opts))
```

Verification passed.

The test passes. When you run the same test again without the options defined by the `MatchesSignalOptions` object, the test fails due to the mismatched data types.

```
testCase.verifyThat(sig2_ts,MatchesSignal(sig1_ts,'AbsTol',0.02))
```

Verification failed.

```

Framework Diagnostic:

MatchesSignal(<Value>,'AbsTol',0.02) failed.
--> Data types do not match for the following aligned signals:
```

Name	ActualSignals	ActualDataType	ExpectedSignals	ExpectedDataType
Wave Data	<Actual>.Data	single	<Expected>.Data	double

-----  
Stack Information:  
-----

```

In C:\TEMP\Bdoc23a_2213998_3568\ib570499\35\tpa88bc75b\simulink-ex71177165\ConfigureMatchesS

```

## Version History

### Introduced in R2019a

#### **R2020a: Enhanced diagnostic information**

*Behavior changed in R2020a*

Starting in R2020a, when a test that uses the `Simulink.sdi.constraints.MatchesSignal` constraint fails, the diagnostic information provides a path and link to a Simulation Data Inspector session file that includes the comparison results and the original data compared by the test. Open the session file to inspect the data and comparison results in the Simulation Data Inspector.

In previous releases, the diagnostic information included a path and link to a static image of the comparison results. The diagnostic information no longer includes the image.

# Simulink.sdi.constraints.MatchesSignalOptions class

**Package:** Simulink.sdi.constraints

Specify comparison options for Simulink.sdi.MatchesSignal constraint

## Description

Use a Simulink.sdi.constraints.MatchesSignalOptions object to configure the comparison behavior and acceptance criteria for an instance of the Simulink.sdi.constraints.MatchesSignal constraint.

---

**Note** The MatchesSignal constraint uses the Simulation Data Inspector to perform comparisons and requires a license for one of these products:

- Simulink
  - Signal Processing Toolbox
  - MATLAB Coder
  - Fixed-Point Designer
- 

## Creation

### Description

MatchesSignalOptions creates an instance of the Simulink.sdi.constraints.MatchesSignalOptions class with properties that correspond to a constraint that does not ignore any checks and uses the default alignment settings for the Simulation Data Inspector.

MatchesSignalOptions(Name, Value) creates an instance of the Simulink.sdi.constraints.MatchesSignalOptions class with comparison behavior using properties on page 5-534 specified by one or more Name, Value pair arguments.

## Properties

### IgnoreDataTypes — Constraint behavior when data types do not match

false (default) | true

Constraint sensitivity to the actual value having a different data type from the expected value.

- false — The constraint checks whether the expected value and actual value data types match.
- true — The constraint is insensitive to data type mismatches between the expected value and actual value.

You can specify the IgnoreDataTypes property in the constructor using the 'IgnoringDataTypes' name-value pair argument.

**Attributes:**

GetAccess	public
SetAccess	public

**IgnoreSignalsNotAligned — Constraint behavior when signals do not align**

false (default) | true

Constraint sensitivity to one or more signals not aligning between the expected value and actual value.

- `false` — The constraint checks for signals that do not align between the expected value and actual value.
- `true` — The constraint is insensitive to one or more signals not aligning between the expected value and actual value.

You can specify the `IgnoreSignalsNotAligned` property in the constructor using the `'IgnoringSignalsNotAligned'` name-value pair argument.

**Attributes:**

GetAccess	public
SetAccess	public

**IgnoreExtraData — Constraint behavior when the actual value covers a different time interval from the expected value**

false (default) | true

Constraint sensitivity to the actual value containing data outside of the time interval defined by the expected value.

- `false` — The constraint checks whether the actual value contains data outside the time interval defined by the expected value.
- `true` — The constraint is insensitive to the actual value containing data outside the time interval defined by the expected value.

You can specify the `IgnoreExtraData` property in the constructor using the `'IgnoringExtraData'` name-value pair argument.

**Attributes:**

GetAccess	public
SetAccess	public

**Alignment — Signal alignment criteria**

string array

Alignment criteria for the comparison. When the expected value contains more than one signal, the Simulation Data Inspector comparison algorithm aligns signals for comparison between the expected and actual values. By default, the Simulation Data Inspector aligns by data source, then by block path, then by SID, and then by signal name. For details about the Simulation Data Inspector alignment algorithm, see “How the Simulation Data Inspector Compares Data”.

Specify alignment criteria as a string array with one or more of these options listed in the order in which you want them considered:

- `BlockPath` — The path to the source block for the signal.
- `SID` — Automatically assigned Simulink identifier.
- `SignalName` — The name of the signal.
- `DataSource` — Path of the variable.

You can specify the `Alignment` property in the constructor using the `'AligningBy'` name-value pair argument.

## Examples

### Configure `MatchesSignal` Constraint Behavior

This example shows how to configure the comparison behavior of a `Simulink.sdi.constraints.MatchesSignal` constraint using a `Simulink.sdi.constraints.MatchesSignalOptions` object. You can use a `MatchesSignalOptions` object to configure multiple comparison properties with a single name-value pair input in the construction of the `MatchesSignal` instance.

### Create Time Series Data

This example creates workspace data to use for illustrative purposes only. You can use the `MatchesSignal` constraint to compare data from other sources, such as simulation outputs or a file containing test data, and the constraint can compare time series data in any format supported by the Simulation Data Inspector.

In this example, the first signal is a `timeseries` object with the name `Wave Data` that contains data for a sine wave.

```
time = 0:0.1:20;
sig1vals = sin(2*pi/5*time);
sig1_ts = timeseries(sig1vals,time);
sig1_ts.Name = 'Wave Data';
```

The second signal is also a sine wave at the same frequency, with a slight attenuation and sampled at a different rate. Because the comparison algorithm for the `MatchesSignal` constraint includes a synchronization step, comparing these two signals with different time vectors does not necessarily result in a test failure. The second signal is cast to `single` data type and also named `Wave Data` so the alignment algorithm can pair the signals for comparison.

```
time2 = 0:0.1:22;
sig2vals = single(0.98*sin(2*pi/5*time2));
sig2_ts = timeseries(sig2vals,time2);
sig2_ts.Name = 'Wave Data';
```

### Configure a `MatchesSignal` Instance and Compare the Data

You can use a `MatchesSignalOptions` object to specify how an instance of the `MatchesSignal` constraint handles conditions such as mismatched data types and how signals are aligned between the actual and expected data sets. You can specify the properties of the `MatchesSignalOptions` object to suit the test you want to write. For example, if you want your test to compare data of varying types and a data type match is not functionally relevant, you could set the `IgnoreDataTypes` property to `true`.

Create a `MatchesSignalOptions` object to create a `MatchesSignal` instance that ignores data type mismatches and data samples outside the time interval the actual and expected signals share.

```
import Simulink.sdi.constraints.MatchesSignalOptions
opts = MatchesSignalOptions('IgnoringDataTypes',true,'IgnoringExtraData',true);
```

Create a `TestCase` instance for interactive use and compare `sig1_ts` and `sig2_ts` using the `MatchesSignal` constraint, the `MatchesSignalOptions` object, and an absolute tolerance of `0.02`.

```
import matlab.unittest.TestCase
testCase = TestCase.forInteractiveUse;
```

```
import Simulink.sdi.constraints.MatchesSignal
testCase.verifyThat(sig2_ts,MatchesSignal(sig1_ts,'AbsTol',0.02,'WithOptions',opts))
```

Verification passed.

The test passes. When you run the same test again without the options defined by the `MatchesSignalOptions` object, the test fails due to the mismatched data types.

```
testCase.verifyThat(sig2_ts,MatchesSignal(sig1_ts,'AbsTol',0.02))
```

Verification failed.

```

Framework Diagnostic:

```

```
MatchesSignal(<Value>,'AbsTol',0.02) failed.
```

```
--> Data types do not match for the following aligned signals:
```

Name	ActualSignals	ActualDataType	ExpectedSignals	ExpectedDataType
Wave Data	<Actual>.Data	single	<Expected>.Data	double

```

Stack Information:

```

# Simulink.sdi.DatasetRef class

**Package:** Simulink.sdi

Access data in Simulation Data Inspector repository

## Description

The `Simulink.sdi.DatasetRef` object provides access to data in the Simulation Data Inspector without loading the entire set of data into memory. The object is compatible with the `Simulink.SimulationData.DatasetRef` class.

## Construction

`dsr_array = Simulink.sdi.DatasetRef` constructs an array that contains a `Simulink.sdi.DatasetRef` object that corresponds to each run in the Simulation Data Inspector.

`dsr_array = Simulink.sdi.DatasetRef(domain)` creates an array of `DatasetRef` objects that contains a `Simulink.sdi.DatasetRef` object for each run, with the contents of each run limited to the specified domain.

`dsr = Simulink.sdi.DatasetRef(runID)` creates a `Simulink.sdi.DatasetRef` object that references the run specified by the run identifier, `runID`.

`dsr = Simulink.sdi.DatasetRef(runID, domain)` creates a `Simulink.sdi.DatasetRef` object that references the run specified by `runID` with contents specified by `domain`.

`dsr = Simulink.sdi.DatasetRef(runID, domain, repositoryPath)` creates a `Simulink.sdi.DatasetRef` object that references the run specified by the run identifier, `runID`. The `DatasetRef` object contains the contents specified by `domain` from the repository specified by `repositoryPath`.

## Input Arguments

### **domain — Data to reference in DatasetRef object**

'signals' | 'outports' | 'dsm' | 'state' | 'param' | ...

Data to reference in `DatasetRef` object, specified as one of the following:

- 'signals' — Signals produced by signal logging.
- 'outports' — Model output signals, represented by top-level Output blocks.
- 'dsm' — Data Store Memory blocks.
- 'state' — Simulink states.
- 'param' — Parameter data for block parameters and variables tuned using dashboard blocks.
- 'sf\_data' — Stateflow local data.
- 'sf\_state' — Stateflow states.
- 'sf\_state\_child' — Stateflow child activity.
- 'sf\_state\_leaf' — Stateflow leaf activity.

- 'slt\_verify' — Assertion blocks and verify assessments in Simulink Test.

**runID — Run identifier**

integer

Specifies the run containing the data for the `Simulink.sdi.DatasetRef` object.

**repositoryPath — Path containing the run**

string | character vector

Specifies the location of the run containing the data for the `Simulink.sdi.DatasetRef` object.

## Properties

**Name — Run name**

character vector

The name of the run that corresponds with the `Simulink.sdi.DatasetRef` object.

Example: 'Run 1'

**Run — Simulink.sdi.Run object**`Simulink.sdi.Run` object

`Simulink.sdi.Run` object associated with the `Simulink.sdi.DatasetRef` object.

**numElements — Number of top-level elements in run**`Simulink.sdi.Run` object

Number of top-level elements in the `Simulink.sdi.Run` object associated with the `Simulink.sdi.DatasetRef` object.

## Methods

<code>compare</code>	Compare runs with <code>DatasetRef</code> objects
<code>getAsDatastore</code>	Retrieve element as <code>sdidatastore</code> object
<code>getElement</code>	Retrieve <code>DatasetRef</code> element by index
<code>getElementNames</code>	Get character vectors of element names
<code>getSignal</code>	Return <code>Signal</code> object
<code>plot</code>	Open the Simulation Data Inspector to view and compare data

## Copy Semantics

Handle. To learn how handle classes affect copy operations, see [Copying Objects](#).

## Examples

**Compare Runs with the `Simulink.sdi.DatasetRef` Object**

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl_demo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sldemo_absbrake to create a run of logged signals
load_system('ex_sldemo_absbrake')
sim('ex_sldemo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell
 {'yout'}
 {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
 Ww: [1x1 timeseries]
 Vs: [1x1 timeseries]
 Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

## Version History

**Topics**

“Inspect and Compare Data Programmatically”

# compare

**Class:** Simulink.sdi.DatasetRef

**Package:** Simulink.sdi

Compare runs with DatasetRef objects

## Syntax

```
[matches, mismatches, results] = dsrObj.compare(other)
```

## Description

`[matches, mismatches, results] = dsrObj.compare(other)` returns the number of matches, number of mismatches, and comparison results for a comparison of data in a `Simulink.sdi.DatasetRef` object. The comparison results are returned as a `Simulink.sdi.DiffRunResult` object.

## Input Arguments

### **other** — Comparison data

MAT-file | variable

Comparison data, which can come from another `Simulink.sdi.DatasetRef` object, a Dataset in the workspace, or a MAT-file.

Example: 'data.mat'

Example: var

## Output Arguments

### **matches** — Number of matching signals

integer

Number of signals that matched within tolerance in the comparison.

### **mismatches** — Number of mismatched signals

integer

Number of signals that did not match within tolerance in the comparison.

### **results** — Simulink.sdi.DiffRunResult object with comparison results

Simulink.sdi.DiffRunResult object

Results of the comparison, returned in a `Simulink.sdi.DiffRunResult` object.

## Examples

### Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl-demo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl-demo_absbrake to create a run of logged signals
load_system('ex_sl-demo_absbrake')
sim('ex_sl-demo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell
 {'yout'}
 {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
 Ww: [1x1 timeseries]
 Vs: [1x1 timeseries]
 Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sl-demo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sl-demo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

## Alternatives

Using the Simulation Data Inspector API, you could create runs for the data you want to compare and use `Simulink.sdi.compareRuns` for the comparison. You can also view runs created from simulation, import data to runs, and compare runs with the Simulation Data Inspector UI.

## Version History

Introduced in R2017b

## getAsDatastore

**Class:** Simulink.sdi.DatasetRef

**Package:** Simulink.sdi

Retrieve element as sdatastore object

### Syntax

```
[elementDatastore, name, index] = SDIDatasetRef.getAsDatastore(arg)
```

### Description

`[elementDatastore, name, index] = SDIDatasetRef.getAsDatastore(arg)` returns the requested element as a `matlab.io.datastore.sdatastoreobject`, along with the element name and index.

### Input Arguments

**arg — Element selection criterion**

integer | character vector

Search criterion used to retrieve the element from the `Simulink.sdi.DatasetRef` object. For name-based searches, specify `arg` as a character vector. For index-based searches, `arg` is an integer, representing the index of the desired element.

Example: 'MySignal'

Example: 3

### Output Arguments

**elementDatastore — Element as sdatastore**

sdatastore object

Element as `matlab.io.datastore.sdatastore` object.

**name — Element name**

character vector

The name of the element.

**index — Element index in DatasetRef object**

integer

The index of the element in the `Simulink.sdi.DatasetRef` object.

## Examples

### Create an sddatastore Object for a Signal

This example shows how to create a sddatastore object for a signal in a Simulink.sdi.DatasetRef object.

```
% Simulate model sldemo_fuelsys to create a run of logged signals
sim('sldemo_fuelsys')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
fuelRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = fuelRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 16x1 cell
 {'CheckRange' }
 {'air_fuel_ratio' }
 {'speed' }
 {'map' }
 {'ego' }
 {'throttle' }
 {'fuel' }
 {'EGO Fault Switch:1' }
 {'Engine Speed Fault Switch:1' }
 {'MAP Fault Switch:1' }
 {'Throttle Angle Fault Switch:1'}
 {'ego_sw' }
 {'engine_speed' }
 {'speed_sw' }
 {'map_sw' }
 {'throttle_sw' }

% Get sddatastore object for fuel signal
fuel_ds = run_DSRef.getAsDatastore(10);
```

### Alternatives

You can construct a sddatastore object for a specified signal using matlab.io.datastore.sddatastore.

## Version History

Introduced in R2017b

# getElement

**Class:** Simulink.sdi.DatasetRef

**Package:** Simulink.sdi

Retrieve DatasetRef element by index

## Syntax

```
[element, name, index] = SDIdatasetRef.getElement(index)
```

## Description

`[element, name, index] = SDIdatasetRef.getElement(index)` returns the element within the Run in the Simulink.sdi.DatasetRef object at the specified index.

## Input Arguments

**index** — Index of element

integer

Location of the element in the Simulink.sdi.DatasetRef object.

## Output Arguments

**element** — Run element in the DatasetRef object

signal

Element from the run in the Simulink.sdi.DatasetRef object.

**name** — Element name

character vector

Name of the element retrieved from the Simulink.sdi.DatasetRef object.

**index** — Location of element

integer

Location of the element within the Simulink.sdi.DatasetRef object.

## Examples

### Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the Simulink.sdi.DatasetRef object by comparing two runs of the `ex_sl-demo-absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl-demo-absbrake to create a run of logged signals
load_system('ex_sl-demo-absbrake')
sim('ex_sl-demo-absbrake')
```

```
% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell
 {'yout'}
 {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
 Ww: [1x1 timeseries]
 Vs: [1x1 timeseries]
 Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_sldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_sldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

## getElementNames

**Class:** Simulink.sdi.DatasetRef

**Package:** Simulink.sdi

Get character vectors of element names

### Syntax

```
names = dsrObj.getElementNames
```

### Description

`names = dsrObj.getElementNames` returns a cell array of character vectors containing the names of the elements in `dsrObj`.

### Output Arguments

**names — Element names**

cell array

Names of the top level elements in the `Simulink.sdi.DatasetRef` object in a cell array.

### Examples

#### Compare Runs with the Simulink.sdi.DatasetRef Object

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl_demo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl_demo_absbrake to create a run of logged signals
load_system('ex_sl_demo_absbrake')
sim('ex_sl_demo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell
 {'yout'}
 {'slp' }
```

```
% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
 Ww: [1x1 timeseries]
 Vs: [1x1 timeseries]
 Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_slldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_slldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot
```

### Topics

“Inspect and Compare Data Programmatically”

## getSignal

**Class:** Simulink.sdi.DatasetRef

**Package:** Simulink.sdi

Return Signal object

### Syntax

```
sigObj = SDIDatasetRef.getSignal(searchArg)
```

### Description

`sigObj = SDIDatasetRef.getSignal(searchArg)` returns the `Simulink.sdi.Signal` object corresponding to the search argument, `searchArg`.

### Input Arguments

#### **searchArg — Search parameter**

character vector | integer

The search parameters to select the `Simulink.sdi.Signal` object. The `searchArg` can be a character vector or string targeting a signal name or an integer for an index-based search.

Example: 'throttle'

Example: 2

### Output Arguments

#### **sigObj — Simulink.sdi.Signal object**

`Simulink.sdi.Signal` object

The `Simulink.sdi.Signal` object corresponding to the search query.

### Examples

#### **Compare Runs with the Simulink.sdi.DatasetRef Object**

This example shows how to work with the `Simulink.sdi.DatasetRef` object by comparing two runs of the `ex_sl-demo_absbrake` system with different desired slip ratios.

```
% Simulate model ex_sl-demo_absbrake to create a run of logged signals
load_system('ex_sl-demo_absbrake')
sim('ex_sl-demo_absbrake')

% Get the runID
runIDs = Simulink.sdi.getAllRunIDs;
runID = runIDs(end);

% Get the run object
```

```

brakeRun = Simulink.sdi.getRun(runID);

% Make a Simulink.sdi.DatasetRef object
run_DSRef = brakeRun.getDatasetRef;

% Get the names of the elements in the object
names = run_DSRef.getElementNames

names = 2x1 cell
 {'yout'}
 {'slp' }

% Get yout bus
[yout, name, index] = run_DSRef.getElement(1);

% View signals in outputs
outputs = yout.Values

outputs = struct with fields:
 Ww: [1x1 timeseries]
 Vs: [1x1 timeseries]
 Sd: [1x1 timeseries]

% Get slp signal
slp = run_DSRef.getSignal('slp');

% Plot signal
slp.Checked = 'true';

% Create another run for a different Desired relative slip
set_param('ex_slldemo_absbrake/Desired relative slip', 'Value', '0.25')
sim('ex_slldemo_absbrake')
DSR_Runs = Simulink.sdi.DatasetRef;

% Compare the results from the two runs
[matches, mismatches, diffResult] = run_DSRef.compare(DSR_Runs(2));

% Open the Simulation Data Inspector to view signals
run_DSRef.plot

```

## Alternatives

If the signal is a top-level element in the `Simulink.sdi.DatasetRef` object, you can use the `getElement` method to get the `Simulink.sdi.Signal` object by index.

## Version History

Introduced in R2017b

# Simulink.sdi.WorkerRun class

**Package:** Simulink.sdi

Access simulation data from parallel workers

## Description

The `Simulink.sdi.WorkerRun` class provides access to run data generated on Parallel Computing Toolbox parallel workers. Create a `Simulink.sdi.WorkerRun` object on the worker, and then use the object to access data in your local MATLAB session.

## Construction

`workerRun = Simulink.sdi.WorkerRun(runID)` creates a `Simulink.sdi.WorkerRun` object with the run identifier specified by `runID`.

`workerRun = Simulink.sdi.WorkerRun.getLatest` creates a `Simulink.sdi.WorkerRun` object of the most recent run.

## Input Arguments

### **runID — Run identifier**

integer

Run identifier

## Methods

<code>getDataset</code>	Create Dataset of worker run data
<code>getDatasetRef</code>	Create DatasetRef for worker run
<code>getLatest</code>	Create worker run for latest run
<code>getLocalRun</code>	Create local run from worker run

## Copy Semantics

Handle. To learn how handle classes affect copy operations, see [Copying Objects](#).

## Examples

### **Access Data from a Parallel Simulation**

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

## Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')
```

```
% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

## Initialize Parallel Workers

Use `gcp` to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd
```

```
% Load system and select signals to log
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)
```

```
end
```

## Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7
```

```
% Select value for Ts
Ts_val = Ts_vals(index);

% Change the filter time constant and simulate
modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
modelWorkspace.assignin('Ts', Ts_val)
sim('slexAircraftExample')
```

```

 % Create a worker run for each simulation
 workerRun(index) = Simulink.sdi.WorkerRun.getLatest

end

spmd

 % Remove temporary directories
 cd(workDir)
 rmdir(tempDir, 's')
 rmpath(workDir)

```

```
end
```

### Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;
```

```
for a = 1:7
 ds(a) = workerRun(a).getDataset;
end
```

```
ds(1)
```

```
ans =
Simulink.SimulationData.Dataset '' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	alpha, rad	...rcraftExample/Aircraft Dynamics Model
2	[1x1 Signal]	Stick	slexAircraftExample/Pilot

- Use braces { } to access, modify, or add elements using index.

### Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
 datasetRef(b) = workerRun(b).getDatasetRef;
end
```

```
end
```

```
datasetRef(1)
```

```
ans =
DatasetRef with properties:

 Name: 'Run 3: slexAircraftExample'
 Run: [1x1 Simulink.sdi.Run]
 numElements: 2
```

### Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local Run objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

 Runs(c) = workerRun(c).getLocalRun;
 Ts_val_str = num2str(Ts_vals(c));
 desc = strcat('Ts = ', Ts_val_str);
 Runs(c).Description = desc;
 Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

### Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

### Alternatives

You can also access, view, and analyze simulation data from Parallel Computing Toolbox workers using the Simulation Data Inspector UI.

## Version History

**Introduced in R2017b**

`Simulink.sdi.Run`

### Topics

“Inspect and Compare Data Programmatically”

# getDataset

**Class:** Simulink.sdi.WorkerRun

**Package:** Simulink.sdi

Create Dataset of worker run data

## Syntax

```
dataset = workerRun.getDataset
dataset = workerRun.getDataset(domain)
```

## Description

`dataset = workerRun.getDataset` returns a `Simulink.SimulationData.Dataset` object of the data corresponding to the `Simulink.sdi.WorkerRun` object.

`dataset = workerRun.getDataset(domain)` returns a `Simulink.SimulationData.Dataset` object of the data corresponding to the `Simulink.sdi.WorkerRun` object limited to the scope specified by `domain`.

## Input Arguments

**domain — Scope specifier**

'signals' | 'outports'

Scope limiting argument that selects the data to return in the `Simulink.SimulationData.Dataset` object.

- 'signals' limits the data returned in the Dataset to signals in the WorkerRun.
- 'outports' limits the data returned in the Dataset to output data in the WorkerRun.

## Output Arguments

**dataset — Simulink.SimulationData.Dataset object**

`Simulink.SimulationData.Dataset` object

`Simulink.SimulationData.Dataset` object containing the data from the `Simulink.sdi.WorkerRun` object.

## Examples

### Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

## Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')
```

```
% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

## Initialize Parallel Workers

Use `gcp` to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd
```

```
% Load system and select signals to log
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)
```

```
end
```

## Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7
```

```
% Select value for Ts
Ts_val = Ts_vals(index);

% Change the filter time constant and simulate
modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
modelWorkspace.assignin('Ts', Ts_val)
sim('slexAircraftExample')
```

```

% Create a worker run for each simulation
workerRun(index) = Simulink.sdi.WorkerRun.getLatest

end

spmd

% Remove temporary directories
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)

```

```
end
```

### Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;
```

```
for a = 1:7
 ds(a) = workerRun(a).getDataset;
end
```

```
ds(1)
```

```
ans =
Simulink.SimulationData.Dataset '' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	alpha, rad	...rcraftExample/Aircraft Dynamics Model

- Use braces { } to access, modify, or add elements using index.

### Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
 datasetRef(b) = workerRun(b).getDatasetRef;
end
```

```
datasetRef(1)
```

```
ans =
DatasetRef with properties:

 Name: 'Run 3: slexAircraftExample'
 Run: [1x1 Simulink.sdi.Run]
numElements: 2
```

### Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local Run objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

 Runs(c) = workerRun(c).getLocalRun;
 Ts_val_str = num2str(Ts_vals(c));
 desc = strcat('Ts = ', Ts_val_str);
 Runs(c).Description = desc;
 Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

### Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

# getDatasetRef

**Class:** Simulink.sdi.WorkerRun

**Package:** Simulink.sdi

Create DatasetRef for worker run

## Syntax

```
datasetRef = workerRun.getDatasetRef
datasetRef = workerRun.getDatasetRef(domain)
```

## Description

`datasetRef = workerRun.getDatasetRef` returns a `Simulink.SimulationData.DatasetRef` object referencing the data in the `Simulink.sdi.WorkerRun` object, `workerRun`.

`datasetRef = workerRun.getDatasetRef(domain)` returns a `Simulink.SimulationData.DatasetRef` object referencing the data in the `Simulink.sdi.WorkerRun` object, `workerRun`, limited to the scope specified by `domain`.

## Input Arguments

**domain — Scope limiting input**

'signals' | 'outports'

Scope limiting argument that selects the data to reference in the `Simulink.SimulationData.DatasetRef` object.

- 'signals' limits the data referenced in the `DatasetRef` to signals in the `WorkerRun`.
- 'outports' limits the data referenced in the `DatasetRef` to output data in the `WorkerRun`.

## Output Arguments

**datasetRef — Simulink.SimulationData.DatasetRef object**

`Simulink.sdi.DatasetRef` object

`Simulink.sdi.DatasetRef` object referencing the data in the Parallel Computing Toolbox worker run.

## Examples

### Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

## Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')
```

```
% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

## Initialize Parallel Workers

Use `gcp` to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

```
Starting parallel pool (parpool) using the 'local' profile ...
connected to 4 workers.
```

```
spmd
```

```
% Load system and select signals to log
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)
```

```
end
```

## Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spmd` segment to remove the temporary directories from the workers.

```
parfor index = 1:7
```

```
% Select value for Ts
Ts_val = Ts_vals(index);

% Change the filter time constant and simulate
modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
modelWorkspace.assignin('Ts', Ts_val)
sim('slexAircraftExample')
```

```

% Create a worker run for each simulation
workerRun(index) = Simulink.sdi.WorkerRun.getLatest

end

spmd

% Remove temporary directories
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)

```

```
end
```

### Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;
```

```
for a = 1:7
 ds(a) = workerRun(a).getDataset;
```

```
end
```

```
ds(1)
```

```
ans =
Simulink.SimulationData.Dataset '' with 2 elements
```

		Name	BlockPath
1	[1x1 Signal]	alpha, rad	...rcraftExample/Aircraft Dynamics Model
2	[1x1 Signal]	Stick	slexAircraftExample/Pilot

- Use braces { } to access, modify, or add elements using index.

### Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```
for b = 1:7
 datasetRef(b) = workerRun(b).getDatasetRef;
```

```
end
```

```
datasetRef(1)
```

```
ans =
DatasetRef with properties:

 Name: 'Run 3: slexAircraftExample'
 Run: [1x1 Simulink.sdi.Run]
numElements: 2
```

### Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local Run objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```
for c = 1:7

 Runs(c) = workerRun(c).getLocalRun;
 Ts_val_str = num2str(Ts_vals(c));
 desc = strcat('Ts = ', Ts_val_str);
 Runs(c).Description = desc;
 Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end
```

### Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

```
Simulink.sdi.cleanupWorkerResources
```

## Version History

Introduced in R2017b

### Topics

“Inspect and Compare Data Programmatically”

# Simulink.sdi.WorkerRun.getLatest

**Class:** Simulink.sdi.WorkerRun

**Package:** Simulink.sdi

Create worker run for latest run

## Syntax

```
runObj = Simulink.sdi.WorkerRun.getLatest
```

## Description

`runObj = Simulink.sdi.WorkerRun.getLatest` creates a `Simulink.sdi.WorkerRun` object for the latest run on a Parallel Computing Toolbox worker.

## Output Arguments

**runObj** — Local Simulink.sdi.Run object

Simulink.sdi.WorkerRun object

Simulink.sdi.WorkerRun object to access the data from the latest Parallel Computing Toolbox worker run.

## Examples

### Access Data from a Parallel Simulation

This example executes parallel simulations of the model `slexAircraftExample` with different input filter time constants and shows several ways to access the data using the Simulation Data Inspector programmatic interface.

#### Setup

Start by ensuring the Simulation Data Inspector is empty and Parallel Computing Toolbox support is configured to import runs created on local workers automatically. Then, create a vector of filter parameter values to use in each simulation.

```
% Make sure the Simulation Data Inspector is empty, and PCT support is
% enabled.
Simulink.sdi.clear
Simulink.sdi.enablePCTSupport('local')
```

```
% Define Ts values
Ts_vals = [0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1];
```

#### Initialize Parallel Workers

Use `gcp` to create a pool of local workers to run parallel simulations if you don't already have one. In an `spmd` code block, load the `slexAircraftExample` model and select signals to log. To avoid data concurrency issues using `sim` in `parfor`, create a temporary directory for each worker to use during simulations.

```
p = gcp;
```

Starting parallel pool (parpool) using the 'local' profile ...  
connected to 4 workers.

```
spm
```

```
% Load system and select signals to log
load_system('slexAircraftExample')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Pilot', 1, 'on')
Simulink.sdi.markSignalForStreaming('slexAircraftExample/Aircraft Dynamics Model', 4, 'on')

% Create temporary directory on each worker
workDir = pwd;
addpath(workDir)
tempDir = tempname;
mkdir(tempDir)
cd(tempDir)
```

```
end
```

### Run Parallel Simulations

Use `parfor` to run the seven simulations in parallel. Select the value for `Ts` for each simulation, and modify the value of `Ts` in the model workspace. Then, run the simulation and build an array of `Simulink.sdi.WorkerRun` objects to access the data with the Simulation Data Inspector. After the `parfor` loop, use another `spm` segment to remove the temporary directories from the workers.

```
parfor index = 1:7
```

```
% Select value for Ts
Ts_val = Ts_vals(index);

% Change the filter time constant and simulate
modelWorkspace = get_param('slexAircraftExample', 'modelworkspace');
modelWorkspace.assignin('Ts', Ts_val)
sim('slexAircraftExample')

% Create a worker run for each simulation
workerRun(index) = Simulink.sdi.WorkerRun.getLatest
```

```
end
```

```
spm
```

```
% Remove temporary directories
cd(workDir)
rmdir(tempDir, 's')
rmpath(workDir)
```

```
end
```

### Get Dataset Objects from Parallel Simulation Output

The `getDataset` method puts the data from a `WorkerRun` into a `Dataset` object so you can easily post-process.

```
ds(7) = Simulink.SimulationData.Dataset;
```

```

for a = 1:7
 ds(a) = workerRun(a).getDataset;
end
ds(1)

ans =
Simulink.SimulationData.Dataset '' with 2 elements

 Name BlockPath

1 [1x1 Signal] alpha, rad ...rcraftExample/Aircraft Dynamics Model
2 [1x1 Signal] Stick slexAircraftExample/Pilot

- Use braces { } to access, modify, or add elements using index.

```

### Get DatasetRef Objects from Parallel Simulation Output

For big data workflows, use the `getDatasetRef` method to reference the data associated with the `WorkerRun`.

```

for b = 1:7
 datasetRef(b) = workerRun(b).getDatasetRef;
end

datasetRef(1)

ans =
DatasetRef with properties:

 Name: 'Run 3: slexAircraftExample'
 Run: [1x1 Simulink.sdi.Run]
 numElements: 2

```

### Process Parallel Simulation Data in the Simulation Data Inspector

You can also create local `Run` objects to analyze and visualize your data using the Simulation Data Inspector API. This example adds a tag indicating the filter time constant value for each run.

```

for c = 1:7

 Runs(c) = workerRun(c).getLocalRun;
 Ts_val_str = num2str(Ts_vals(c));
 desc = strcat('Ts = ', Ts_val_str);
 Runs(c).Description = desc;
 Runs(c).Name = strcat('slexAircraftExample run Ts=', Ts_val_str);

end

```

### Clean Up Worker Repositories

Clean up the files used by the workers to free up disk space for other simulations you want to run on your worker pool.

Simulink.sdi.cleanupWorkerResources

# Simulink.sfunction.Analyzer class

**Package:** Simulink.sfunction

Create a Simulink S-function analyzer object

## Description

This class enables you to perform checks on S-functions within a model or a library. These checks include MEX compiler setup check, source code check, MEX-file check, parameter robustness check for S-functions. The check result can be accessed either from a MATLAB structure or an HTML report.

The S-function analyzer checks the source code of the S-functions based on the S-function names. The S-function source code can be automatically included in the analysis if the source file is a single .c or .cpp file in the MATLAB path that has the same name as the S-function. Otherwise, the build information can be specified through the S-function Analyzer APIs. If no source code is available on the specified path, the analysis is skipped.

## Construction

`sfunAnalyzer = Simulink.sfunction.Analyzer(model)` creates a `Simulink.sfunction.Analyzer` object with the model you specify. In this case, the source code for the S-function can be automatically included in the analysis if the source code file is a single .c or .cpp file in the MATLAB path that has the same name as the S-function. For example, if the specified model contains an S-function called `mysfun`, and the source file for `mysfun` is a single file `mysfun.c` in the MATLAB path, a `Simulink.sfunction.analyzer.BuildInfo` object is automatically created and included in the analysis.

`sfunAnalyzer = Simulink.sfunction.Analyzer(model, 'BuildInfo', {bdInfo})` creates a `Simulink.sfunction.Analyzer` object with the model and a `Simulink.sfunction.analyzer.BuildInfo` object named `bdInfo`.

`sfunAnalyzer = Simulink.sfunction.Analyzer(model, 'Options', {opts})` creates a `Simulink.sfunction.Analyzer` object with the model and a `Simulink.sfunction.analyzer.Options` object named `opts`.

## Input Arguments

### **model** — Specify a model in the path

character vector | string

Names of the model in the path, specified as a string or character vector.

### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: 'BuildInfo', {buildInfo}

### **BuildInfo — Specify the buildinfo object**

cell array

A cell array of buildinfo objects. See `Simulink.sfunction.analyzer.BuildInfo` for more information.

### **Options — Specify the S-function analyzer running options**

object

An object to specify S-function analyzer running options. These checks include Polyspace Code Prover™ and parameter robustness checks. See `Simulink.sfunction.analyzer.Options` for more information.

## **Methods**

<code>generateReport</code>	Generate an HTML report of S-function checks
<code>run</code>	Perform checks on S-functions

## **Version History**

**Introduced in R2017b**

### **See Also**

`run` | `generateReport` | `Simulink.sfunction.analyzer.BuildInfo` | `Simulink.sfunction.analyzer.Options` | `findSfunctions`

# findSfunctions

Find and return all eligible S-functions in a model

## Syntax

```
sfuns = Simulink.sfunction.analyzer.findSfunctions(model)
```

## Description

`sfuns = Simulink.sfunction.analyzer.findSfunctions(model)` returns all eligible S-functions in a model for the S-function checks. Rules are applied to filter out all ineligible S-functions.

## Input Arguments

**model** — A Simulink model or library in path

character vector | string vector

A Simulink model or library in path specified as a string or a character vector.

## Output Arguments

**sfuns** — A list of all eligible S-functions

cell array of character vectors

Eligible S-functions in the model, specified as a cell array of character vectors.

## Version History

Introduced in R2017b

## run

**Class:** Simulink.sfunction.Analyzer

**Package:** Simulink.sfunction

Perform checks on S-functions

### Syntax

```
result = run()
```

### Description

`result = run()` returns a struct containing the result from the analyzer checks. An example result struct has the following fields:

```
TimeGenerated: '19-Jul-2017 19:25:32'
Platform: 'win64'
Release: '(R2017b)'
SimulinkVersion: '9.0'
ExemptedBlocks: {}
MexConfiguration: [1x1 mex.CompilerConfiguration]
Data: [4x4 struct]
```

### Output Arguments

**result** — Sfunction.Analyzer structure

MATLAB structure

MATLAB structure containing the result of S-function analyzer.

## Simulink.sfunction.analyzer.BuildInfo class

**Package:** Simulink.sfunction.analyzer

Create an object to represent build information

### Description

Simulink.sfunction.analyzer.BuildInfo object captures the build information for S-functions, such as source files, header files, and linking libraries, for use with the Simulink.sfunction.Analyzer class.

### Construction

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile)` creates a Simulink.sfunction.analyzer.BuildInfo object.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'SrcPath', {srcpaths}, 'ExtraSrcFileList', {srcfilelist})` creates a Simulink.sfunction.analyzer.BuildInfo object for a C-MEX S-function source file, a list of extra source files located in the specified path.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'ObjFileList', {objfilelist})` creates a Simulink.sfunction.analyzer.BuildInfo object for C-MEX S-function source file and list of extra objective code files.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'IncPaths', {incpathslist})` creates a Simulink.sfunction.analyzer.BuildInfo object for C-MEX S-function source file and paths to the folders including header files.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'LibFileList', {libfilelist}, 'LibPaths', {libpaths})` creates a Simulink.sfunction.analyzer.BuildInfo object for C-MEX S-function source file and library files and library file paths used for building.

`bdInfo = Simulink.sfunction.analyzer.BuildInfo(SfcnFile, 'PreProcDefList', {preprocdir})` creates a Simulink.sfunction.analyzer.BuildInfo object for C-MEX S-function source file and pre-processor directives list.

### Input Arguments

#### **SfcnFile** — S-function source file

character vector | string

S-function source file having the same name as the S-function.

#### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: 'SrcPath', {srcpath}

### **SrcPath — Source file path**

cell array of character vectors | string

Search paths to extra S-function source files that are referenced by SfcnFile, specified as a cell array or a string.

### **ExtraSrcFileList — Extra source file list**

cell array of character vectors | string

List of extra S-function source files, specified as a cell array or string.

### **ObjFileList — Extra objective code**

cell array

List of objective files used for building, specified as a cell array.

### **IncPaths — Search paths for header files**

cell array of character vectors | string

Specify paths to include folders for header files, specified as a cell array or a string.

### **LibFileList — External libraries list**

cell array of character vectors | string

List of external library files used for building, specified as a cell array or string.

### **LibPaths — Search paths for external libraries**

cell array of character vectors | string

Search paths for external library files used for building, specified as a cell array or a string.

### **PreProcDefList — Preprocessor directives**

cell array of character vectors | string

List of the preprocessor directives, specified as a cell array or a string.

## **Output Arguments**

### **bdInfo — BuildInfo object**

object

Build information for the S-functions supplied to the S-function analyzer. Returns a `simulink.sfunction.analyzer.BuildInfo` object.

## **Examples**

Create a `bdInfo` object for an S-function `mysfun` that includes a source file `mysfun.c`:

### **Basic Use**

```
bdInfo = Simulink.sfunction.analyzer.BuildInfo('mysfun.c');
```

The output `bdInfo` has the following fields:

```
bdInfo =
 BuildInfo with properties:
 SfcnFile: 'mysfun.c'
 SfcnName: 'mysfun'
 SrcType: 'C'
 SrcPaths: {}
 ExtraSrcFileList: {}
 ObjFileList: {}
 IncPaths: {}
 LibFileList: {}
 LibPaths: {}
 PreProcDefList: {}
```

### Advanced Use

Create a `bdInfo` object for an S-function `mysfun` that includes a source file `mysfun.c` and also includes:

- List of extra source files, `extra1.c` and `extra2.c`
- Paths to source file folders, `/path1` and `/path2`.
- List of objective files, `o1.obj` and `o2.obj`.
- List of library files, `l1.lib` and `l2.lib`.
- Library paths, `/libpath1`.
- Pre-processor running directives, `-DDEBUG`.

```
Simulink.sfunction.analyzer.BuildInfo('mysfun.c',...
 'ExtraSrcFileList',{extra1.c,extra2.c},... %specify extra s
 'SrcPaths',{/path1,/path2},... %specify paths t
 'ObjFileList',{o1.obj,o2.obj},... %specify object
 'LibFileList',{l1.lib,l2.lib},... %specify library
 'LibPaths',{/libpath1},... %specify library
 'PreProcDefList',{DEBUG}); %specify preproc
```

## Version History

# Simulink.sfunction.analyzer.Options class

**Package:** Simulink.sfunction.analyzer

Create an object to specify options for running S-function checks

## Description

Simulink.sfunction.analyzer.Options object is created through the constructor Simulink.sfunction.analyzer.Options(). Simulink.sfunction.analyzer.Options object captures the options for running S-function checks. These checks include whether to enable Polyspace and Parameter Robustness checks, maximum model simulation time and output path for result report.

## Construction

opts= Simulink.sfunction.analyzer.Options() returns a options object with these property values:

```

 EnablePolyspace: 0
 EnableRobustness: 0
 EnableUsePublishedOnly: 0
 ReportPath: pwd
 ModelSimTimeOut: 10

```

## Properties

### EnablePolyspace — Polyspace Code Prover check

False (default) | True

Boolean type check to determine whether to include Polyspace Code Prover check.

---

**Note** These checks usually take some time to run.

---

### EnableRobustness — Parameter robustness check

False (default) | True

Boolean type check to indicate whether to include Robustness checks.

---

**Note** These checks usually take some time to run.

---

### ReportPath — Generated report directory

current working directory (default) | character array

Path to the generated report directory.

### ModelSimTimeOut — Maximum model simulation time

10 (default) | scalar

Maximum model simulation time in seconds.

**EnableUsePublishedOnly — Check for use of only documented APIs**

False (default) | True

Check to indicate if any undocumented S-function APIs are used in the code.

## **Version History**

**Introduced in R2017b**

# Simulink.Simulation.BlockParameter class

**Package:** Simulink.Simulation

Block parameters in Simulink.SimulationInput objects

## Description

The `Simulink.Simulation.BlockParameter` object specifies the block parameter, path of the block, and the value of the block parameter used by the `Simulink.SimulationInput` object during simulation.

In most cases, there is no need to create an object of this class directly. It is recommended that you use the `setBlockParameter` method on the `Simulink.SimulationInput` object to add a block parameter to the `Simulink.SimulationInput` object.

## Creation

`bp = Simulink.Simulation.BlockParameter('BlockPath', 'Name', 'Value')` creates a `Simulink.Simulation.BlockParameter` object, `bp`, that specifies the block parameter, `Name`, with a `Value` on its path, `BlockPath`.

## Properties

### **BlockPath — Path of the block**

character vector

Path of the block, specified as a character vector.

### **Name — Name of the block parameter**

character vector

Name of the block parameter, specified as a character vector.

### **Value — Value of the block parameter**

character vector

Value of the block parameter, specified as a character vector.

## Version History

# Simulink.Simulation.Future class

**Package:** Simulink.Simulation

Create Future object for simulation

## Description

Create a `Simulink.Simulation.Future` object when you execute `parsim` with the `'RunInBackground'` argument set to `'on'`. The `parsim` command runs multiple simulations in parallel using the inputs specified with an array of `Simulink.SimulationInput` objects. You can use this object to monitor the status of ongoing simulations, fetch outputs of completed simulations, or cancel ongoing simulations.

The `parsim` command uses the Parallel Computing Toolbox license to run the simulations in parallel. `parsim` runs the simulations in serial if a parallel pool cannot be created or if Parallel Computing Toolbox is not used.

## Construction

`future = parsim(in, 'RunInBackground', 'on')` creates a `Simulink.Simulation.Future` object, `future`, while running multiple simulations in parallel using the inputs specified in the `Simulink.SimulationInput` object, `in`.

### Input Arguments

**in** — `Simulink.SimulationInput` object array

object (default) | array

A `Simulink.SimulationInput` object or an array of `Simulink.SimulationInput` objects is used to run multiple simulations. Specify parameters and values of a model to run multiple simulations without making it dirty.

Example: `in = Simulink.SimulationInput('vdp'), in(1:10) = Simulink.SimulationInput('vdp')`

**'RunInBackground'** — `parsim` argument to enable `RunInBackground`

'off' (default) | 'on'

Set to `'on'`, to run simulations asynchronously, keeping the MATLAB command prompt available.

## Properties

**Diary** — Log of outputs from the simulation

text file

Text log of outputs from the simulation.

This property is read-only.

**ID** — Numeric identifier of the future object

scalar integer

ID of the `future` object, specified as a scalar integer.

This property is read-only.

### Read — Whether the outputs have been read

1 | 0

Whether a call to `fetchNext` or `fetchOutputs` has read the outputs in the `Simulink.Simulation.Future` object array, specified as 1 if true and 0 if false.

This property is read-only.

### State — Current state of future object array

'pending' | 'queued' | 'running' | 'finished' | 'failed' | 'unavailable'

Current state of future object array, specified as 'pending', 'queued', 'running', 'finished', 'failed', or 'unavailable'.

This property is read-only.

## Methods

Method	Purpose
<code>cancel</code>	Cancel a pending, queued, or running <code>Simulink.Simulation.Future</code> object
<code>fetchNext</code>	Fetch next available unread output from <code>Simulink.Simulation.Future</code> object array
<code>fetchOutputs</code>	Retrieve <code>Simulink.SimulationOutput</code> from <code>Simulink.Simulation.Future</code>
<code>wait</code>	Wait for <code>Simulink.Simulation.Future</code> objects to complete simulation

## Examples

### Create a `Simulink.Simulation.Future` Object

This example shows how to create a `Simulink.Simulation.Future` object array and use it to retrieve outputs and see the status of simulations.

This example runs several simulations of the `vdp` model, varying the value of the gain `Mu`.

Open the model and define a vector of `Mu` values.

```
open_system('vdp');
Mu_Values = [0.5:0.25:5];
MuVal_length = length(Mu_Values);
```

Using `Mu_Values`, initialize an array of `Simulink.SimulationInput` objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1
 in(i) = Simulink.SimulationInput('vdp');
```

```
 in(i) = in(i).setBlockParameter('vdp/Mu',...
 'Gain',num2str(Mu_Values(i)));
end
```

Simulate the model using `parsim`. Set it to 'RunInBackground', to be able to use the command prompt, while simulations are running.

```
Future = parsim(in, 'RunInBackground', 'on');
```

Use the `fetchNext` method on Future simulations.

```
for i = 1:MuVal_length
 [completedIdx, simOut] = fetchNext(Future)
end
```

## Version History

Introduced in R2018a

### See Also

#### Functions

`parsim` | `batchsim` | `batch` | `cancel` | `fetchNext` | `fetchOutputs` | `wait`

#### Classes

`Simulink.SimulationInput`

## cancel

Cancel a pending, queued, or running `Simulink.Simulation.Future` object

### Syntax

```
cancel(Future)
```

### Description

`cancel(Future)` stops the objects of the `Simulink.Simulation.Future` array, `Future`, that are currently in 'pending', 'queued', or 'running' state. For elements of the Futures in the 'finished' state, no action is taken.

### Examples

#### Cancel Simulations of Future Objects

This example shows how to use the `cancel` method on an array of future objects to stop the simulations.

This example runs several simulations of the `vdp` model, varying the value of the gain `Mu`.

Open the model and define a vector of `Mu` values.

```
open_system('vdp');
Mu_Values = [0.5:0.25:1000];
MuVal_length = length(Mu_Values)
```

Using `Mu_Values`, initialize an array of `Simulink.SimulationInput` objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1
 in(i) = Simulink.SimulationInput('vdp');
 in(i) = in(i).setBlockParameter('vdp/Mu', ...
 'Gain', num2str(Mu_Values(i)));
end
```

Simulate the model using `parsim`. Set to 'RunInBackground' to enable the use the command prompt, while simulations are running.

```
Future = parsim(in, 'RunInBackground', 'on');
```

Now, assume that you want to run simulations with different values of `Mu` and cancel the ongoing simulations.

---

`cancel(Future)`

## Input Arguments

**Future** — `Simulation.Simulink.Future` object

array

Array of `Simulation.Simulink.Future` objects. To create `Future`, run `parsim` with `'RunInBackground'` option set to `'on'`.

Example: `Future = parsim(in, 'RunInBackground', 'on')`

## Version History

Introduced in R2018a

## See Also

### Functions

`parsim` | `batchsim` | `batch` | `fetchOutputs` | `fetchNext` | `wait`

### Classes

`Simulink.Simulation.Future` | `Simulink.SimulationInput`

## fetchNext

Fetch next available unread output from `Simulink.Simulation.Future` object array

### Syntax

```
[idx,simOut] = fetchNext(Future)
[idx,simOut] = fetchNext(Future, Timeout)
```

### Description

`[idx,simOut] = fetchNext(Future)` waits for the unread element of `Simulink.Simulation.Future` array, `Future`, to reach a 'finished' state. It returns the index of the simulation that finished, and the corresponding `Simulink.SimulationOutput` object.

`[idx,simOut] = fetchNext(Future, Timeout)` waits for a maximum of `Timeout` seconds for a result to become available. If the timeout expires before any result is available, `simOut` is returned as an empty array.

An error is reported if there are no elements in `Future` with property `Read` as false. You can check for any unread futures using `anyUnread = ~all([F.Read])`.

`fetchNext` displays an error if any element of `Future` with a 'finished' state encounters an error during execution. The `Read` property of that element becomes `true` allowing any subsequent call to `fetchNext` to proceed.

### Examples

#### Create a Simulink.Simulation.Future Object

This example shows how to create a `Simulink.Simulation.Future` object array and use it to retrieve outputs and see the status of simulations.

This example runs several simulations of the `vdp` model, varying the value of the gain `Mu`.

Open the model and define a vector of `Mu` values.

```
open_system('vdp');
Mu_Values = [0.5:0.25:5];
MuVal_length = length(Mu_Values);
```

Using `Mu_Values`, initialize an array of `Simulink.SimulationInput` objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1
 in(i) = Simulink.SimulationInput('vdp');
 in(i) = in(i).setBlockParameter('vdp/Mu',...
 'Gain',num2str(Mu_Values(i)));
end
```

Simulate the model using `parsim`. Set it to 'RunInBackground' to be able to use the command prompt, while simulations are running.

```
Future = parsim(in, 'RunInBackground', 'on');
```

Use the `fetchNext` method on `Future`.

```
for i = 1:MuVal_length
 [completedIdx, simOut] = fetchNext(Future)
end
```

## Input Arguments

### Future — Simulation.Simulink.Future object

array

Array of `Simulation.Simulink.Future` objects. To create `Future`, run `parsim` with 'RunInBackground' option set to 'on'.

Example: `Future = parsim(in, 'RunInBackground', 'on')`

### Timeout — Number of seconds specified for fetchNext to time out

scalar

Specify a `Timeout` for `fetchNext` to retrieve the results from the `Simulation.Simulink.Future` array, `Future`.

Example: `[idx, simOut] = fetchNext(Future, 45)`

## Output Arguments

### idx — Index of the simulation

integer

When `fetchNext` method is used on an array of `Simulation.Simulink.Future` objects, it returns the index of the simulation whose output is being retrieved.

### simOut — Simulation object containing logged simulation results

object | array

Array of `Simulink.SimulationOutput` objects that contain all of the logged simulation results. The size of the array is equal to the size of the array of `Simulink.SimulationInput` objects.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You define the model time, states, and output that are logged using the **Data Import/Export** pane of the Model Configuration Parameters dialog box. You can log signals using blocks such as the To Workspace and Scope blocks. The **Viewers & Generators Manager** tool can directly log signals.

## Version History

## fetchOutputs

Retrieve `Simulink.SimulationOutput` from `Simulink.Simulation.Future` objects

### Syntax

```
simOut = fetchOutputs(Future)
```

### Description

`simOut = fetchOutputs(Future)` fetches the output from an array of `Simulink.Simulation.Future` objects, `Future`, after each element of `Future` is in a 'finished' state. `fetchOutputs` returns an array of `Simulink.SimulationOutput` objects.

### Examples

#### Create a Future and Retrieve Outputs Using fetchOutputs

This example shows how to use the `fetchOutputs` method on an array of future objects to retrieve a `Simulink.SimulationOutput` array.

This example runs several simulations of the `vdp` model, varying the value of the gain `Mu`.

Open the model and define a vector of `Mu` values.

```
open_system('vdp');
Mu_Values = [0.5,0.75,1,1.25];
MuVal_length = length(Mu_Values);
```

Using `Mu_Values`, initialize an array of `Simulink.SimulationInput` objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1
 in(i) = Simulink.SimulationInput('vdp');
 in(i) = in(i).setBlockParameter('vdp/Mu',...
 'Gain',num2str(Mu_Values(i)));
end
```

Simulate the model using `parsim`. Set to 'RunInBackground' to enable the use of command prompt, while simulations are running.

```
Future = parsim(in,'RunInBackground','on');
```

Use the `fetchOutputs` method on `Future`

```
simOut = fetchOutputs(Future)
```

```
simOut =
1x4 Simulink.SimulationOutput array
```

## Input Arguments

### **Future** — `Simulation.Simulink.Future` object

array

Array of `Simulation.Simulink.Future` objects. To create, `Future`, run `parsim` with 'RunInBackground' option set to 'on'.

Example: `Future = parsim(in, 'RunInBackground', 'on')`

## Output Arguments

### **simOut** — Simulation object containing logged simulation results

object

Array of `Simulink.SimulationOutput` objects that contain all of the logged simulation results. The size of the array is equal to the size of the array of `Simulink.SimulationInput` objects.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You define the model time, states, and output that are logged using the **Data Import/Export** pane of the Model Configuration Parameters dialog box. You can log signals using blocks such as the To Workspace and Scope blocks. The **Viewers & Generators Manager** tool can directly log signals.

### Classes

`Simulink.Simulation.Future` | `Simulink.SimulationInput`

## wait

Wait for `Simulink.Simulation.Future` objects to complete simulation

### Syntax

```
Ok = wait(Future)
```

### Description

`Ok = wait(Future)` blocks the command prompt until each element of the `Simulink.Simulation.Future` array, `Future` is in a 'finished' state.

### Examples

#### Wait for the Future Array to Complete Simulations

This example shows how to use the `wait` method on an array of future objects.

This example runs several simulations of the `vdp` model, varying the value of the gain `Mu`.

Open the model and define a vector of `Mu` values.

```
open_system('vdp');
Mu_Values = [0.5:0.25:5];
MuVal_length = length(Mu_Values);
```

Using `Mu_Values`, initialize an array of `Simulink.SimulationInput` objects. To preallocate the array, a loop index is made to start from the largest value.

```
for i = MuVal_length:-1:1
 in(i) = Simulink.SimulationInput('vdp');
 in(i) = in(i).setBlockParameter('vdp/Mu',...
 'Gain',num2str(Mu_Values(i)));
end
```

Simulate the model using `parsim`. Set to 'RunInBackground' to enable the use of command prompt while the simulations are running and to create an array of `Simulink.Simulation.Future` objects.

```
Future = parsim(in,'RunInBackground','on');
```

Use the `wait` method on `Future` to block the execution.

```
Ok = wait(Future)
```

### Input Arguments

**Future** — `Simulation.Simulink.Future` object

array

Array of `Simulation.Simulink.Future` objects. To create `Future`, run `parsim` with `'RunInBackground'` option set to `'on'`.

Example: `Future = parsim(in, 'RunInBackground', 'on')`

## Output Arguments

### **Ok — Whether the wait is completed successfully**

1 | 0

`Ok` is `true` if the wait completes successfully, `false` if any of the `Future` objects failed execution or were canceled. Specified as 1 if true, 0 if false.

# Simulink.Simulation.Job class

**Package:** Simulink

Execute `batchsim` to create a `Simulink.Simulation.Job` object, `simJob`

## Description

Execute `batchsim` command with a parallel pool to create a `Simulink.Simulation.Job` object. The `batchsim` command offloads multiple simulations to run in batch using the inputs specified with an array of `Simulink.SimulationInput` objects. You can use this object to monitor the status of a batch job, fetch outputs of a completed batch job, or cancel one or more jobs.

The `batchsim` command uses the Parallel Computing Toolbox™ license to run the simulations on compute cluster. If a parallel pool cannot be created `batchsim` runs the simulations in serial. In the absence of Parallel Computing Toolbox license, `batchsim` errors out.

## Construction

`simJob = batchsim(in)` creates a `Simulink.Simulation.Job` object, `simJob`, while running multiple simulations in batches on a compute cluster using the inputs specified in the `Simulink.SimulationInput` object, `in`.

`createSimulationJob(batchJob)` creates a `Simulink.Simulation.Job` object from a `parallel.job` object, `batchJob`. Use the `createSimulationJob` command to retrieve the job object returned by the `batchsim` command.

## Input Arguments

### **in** — `Simulink.SimulationInput` object array

object (default) | array

A `Simulink.SimulationInput` object or an array of `Simulink.SimulationInput` objects used to run multiple simulations. Specify parameters and values of a model to run multiple simulations without making it dirty.

Example: `in = Simulink.SimulationInput('vdp'), in(1:10) = Simulink.SimulationInput('vdp')`

## Properties

### **AdditionalPaths** — Folders to add to MATLAB search path of workers

character vector | string | string array | array of character vectors

Specified folders to add to MATLAB search path of parallel workers.

This property is read-only.

### **AttachedFiles** — Files and folders sent to the workers

character vector | string | string array | array of character vectors

Files and folders to send to the parallel workers.

This property is read-only.

**AutoAddClientPath — Whether user-added entries on client path are added to each worker path**

true (default) | false

Whether user-added entries on the client path are added to each parallel worker path at the start of the batch job, specified as true or false.

**CreateDateTime — Date and time of simJob creation**

datetime object

Date and time at which the batch job was created, specified as a datetime object.

This property is read-only.

**EnvironmentVariables — Environment variables sent to the workers**

character vector | string | string array | array of character vectors

Defines the names of environment variables that are copied from a client session to the parallel workers.

This property is read-only after job submission.

**FinishDateTime — Date and time of simJob completion**

datetime object

Date and time at when the batch job completes execution, specified as a datetime object.

This property is read-only.

**ID — Numeric identifier of the simJob object**

scalar integer

ID of the future object, specified as a scalar integer.

This property is read-only.

**Name — simJob name**

string | character vector

Name of the job object, specified as a string.

**Parent — Cluster object containing simJob**

parallel.cluster object

Cluster object that contains the Simulink.Simulation.Job object, simJob.

**SimulationInputs — Array of Simulink.Simulation.Input objects**

Simulink.Simulation.Input object | Array

Array of Simulink.Simulation.Input objects used for simulations for simJob.

**StartDateTime — Date and time when simJob starts running**

datetime object

Date and time when the `Simulink.Simulation.Job` starts running, specified as a `datetime` object.

This property is read-only.

#### State — Current state of future object array

'pending' | 'queued' | 'running' | 'finished' | 'failed'

Current state of future object array, specified as 'pending', 'queued', 'running', 'finished', or 'failed'.

This property is read-only.

#### SubmitDateTime — Date and time of simJob submission

`datetime` object

Date and time when the `Simulink.Simulation.Job` is submitted, specified as a `datetime` object.

This property is read-only.

#### Tag — Label associated with simJob

string

Label associated with `Simulink.Simulation.Job` object.

#### Type — Job Type

independent | pool

Type of the `Simulink.Simulation.Job` object, specified as `independent` or `pool`.

#### UserData — Data associated with simJob

string

Stores any data associated with a job object. The data is stored in a client MATLAB session, and is not available on the workers.

#### UserName — Name of the user who creates the simJob object

string | character vector

Name of the user who creates the `Simulink.Simulation.Job` object.

## Methods

Method	Purpose
<code>cancel</code>	Cancel a pending, queued, or running <code>Simulink.Simulation.Job</code> object
<code>diary</code>	Display or save Command Window text of batch job
<code>fetchOutputs</code>	Retrieve an array of <code>Simulink.SimulationOutput</code> objects from all simulations in <code>Simulink.Simulation.Job</code>
<code>listAutoAttachedFiles</code>	List of files automatically attached to job, task, or parallel pool
<code>wait</code>	Wait for <code>Simulink.Simulation.Job</code> object to change state

## Examples

### Run Parallel Simulations With `batchsim` to Create `Simulink.Simulation.Job`

This example shows how to run parallel simulations in batch using the `sldemo_househeat` model. `batchsim` offloads simulations to the compute cluster, enabling you to carry out other tasks while the batch job is processing, or close the client MATLAB and access the batch job later.

Observe the model behavior for different temperature set points.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using the `setPointValues`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
 in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point',...
 'Value',num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job ID to access the job object later from any machine. `NumWorkers` displays how many workers are running the simulations - the number of workers specified in the 'Pool' argument plus an additional head worker.

```
simJob = batchsim(in, 'Pool',3)

 ID: 1
 Type: pool
 NumWorkers: 4
 Username: #####
 State: running
 SubmitDateTime: ##-###-#### #:##:##
 StartDateTime:
Running Duration: 0 days 0h 0m 0s
```

## Version History

Introduced in R2018b

## See Also

## cancel

**Package:** Simulink

Cancel a pending, queued, or running `Simulink.Simulation.Job` object

### Syntax

```
cancel(simJob)
cancel(simJob, 'Message')
```

### Description

`cancel(simJob)` stops the `Simulink.Simulation.Job` object, `simJob`, that is currently in 'pending', 'queued', or 'running' state.

`cancel(simJob, 'Message')` stops the `Simulink.Simulation.Job` object, `simJob`, that is in 'pending', 'queued', or 'running' state and displays a user-specified message.

The `State` property of `Simulink.Simulation.Job` object is set to finished, and other pending simulations are canceled. Canceling a job object disables you to fetch results from it. A canceled job object cannot be started again.

---

**Note** On canceling the job, the results of the completed simulations in the job are also lost.

---

## Examples

### Cancel a Batch Job

This example shows how to use the `cancel` method on a `simJob` object to stop simulations. The example runs several simulations of the `vdp` model, varying the value of the gain `Mu`.

1. Open the model and define a vector of `Mu` values.

```
open_system('vdp');
mu_Values = [0.5:0.25:1000];
muVal_Length = length(mu_Values);
```

2. Using `mu_Values`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:muVal_Length) = Simulink.SimulationInput('vdp');
for i = 1:1:muVal_Length
 in(i).setBlockParameter('vdp/Mu', ...
 'Gain', num2str(mu_Values(i)));
end
```

3. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The simulations are offloaded onto the default cluster profile.

```
simJob = batchsim(in, 'Pool',3);
```

4. Now, assume that you want to run simulations with different values of Mu and cancel the ongoing simulations.

```
cancel(simJob)
```

## Input Arguments

**simJob** — **Simulink.Simulation.Job** object  
object

A `Simulink.Simulation.Job` object. To create a `simJob`, run `batchsim`.

Example: `simJob = batchsim(in, 'Pool',6)`

## Version History

## diary

**Package:** Simulink

Display or save Command Window text of `Simulink.Simulation.Job` object

### Syntax

```
diary(simJob)
diary(simJob, 'filename')
```

### Description

`diary(simJob)` displays the Command Window output from the `Simulink.Simulation.Job` object, `simJob`, in the MATLAB Command Window. The Command Window output is captured only if the `batchsim` command includes the `'CaptureDiary'` argument with a value of `true`.

`diary(simJob, 'filename')` causes the Command Window output from the batch job to be appended to the specified file. Open the file, `filename`, with any text editor.

### Examples

#### Display the Diary of `simJob`

This example uses `sldemo_househeat` model to show how to display the diary of the `Simulink.Simulation.Job` object, `simJob`. To create a `simJob`, you run parallel simulations using the `batchsim` command.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using `setPointValues`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
 in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point',...
 'Value', num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job ID to access the job object later from any machine. `NumWorkers` displays how many workers are running the simulations - the number of workers specified in the `'Pool'` argument plus an additional head worker.

```

simJob = batchsim(in, 'Pool',3)

 ID: 1
 Type: pool
 NumWorkers: 4
 Username: #####
 State: running
 SubmitDateTime: ##-###-#### #:##:##
 StartDateTime:
 Running Duration: 0 days 0h 0m 0s

```

5. Use the `diary` method of the `Simulink.Simulation.Job` object to display the output of the batch job in the MATLAB command window.

Note that the diary is not displayed here because this is an example model.

```
diary(simJob)
```

## Input Arguments

**simJob** — `Simulink.Simulation.Job` object  
object

A `Simulink.Simulation.Job` object. To create a `simJob`, run `batchsim`.

Example: `simJob = batchsim(in, 'Pool',4)`

**'filename'** — File to append with Command Window output text  
string

Specify a file to append with Command Window output text from the `Simulink.Simulation.Job` object.

Example: `diary(simJob, 'abc.txt')`

## fetchOutputs

**Package:** Simulink

Retrieve an array of `Simulink.SimulationOutput` objects from all simulations in `Simulink.Simulation.Job`

### Syntax

```
out = fetchOutputs(simJob)
```

### Description

`out = fetchOutputs(simJob)` returns an array of `Simulink.SimulationOutput` objects containing the results of the simulations in a batch job, `simJob`.

`fetchOutputs` reports an error if the job is not in the 'finished' state, or if one of its simulations encounters an error during execution. Use the `wait` method to wait for the job to complete before fetching outputs.

### Examples

#### Fetch Outputs of the Batch Simulations

This example shows how to run parallel simulations in batch and fetch the resulting `Simulink.SimulationOutput` objects from the `Simulink.Simulation.Job` object. `batchsim` command offloads simulations to the compute cluster, enabling you to carry out other tasks while the batch job is processing, or close the client MATLAB and access the batch job later.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using `setPointValues`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
 in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point',...
 'Value',num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job ID to access the job object later from any machine. `NumWorkers` displays

how many workers are running the simulations - the number of workers specified in the 'Pool' argument plus an additional head worker.

```
simJob = batchsim(in, 'Pool', 3)
```

```

 ID: 1
 Type: pool
 NumWorkers: 4
 Username: #####
 State: running
 SubmitDateTime: ##-##-#### #:##:##
 StartDateTime:
 Running Duration: 0 days 0h 0m 0s

```

5. Access the results of the batch job using the `fetchOutputs` method. `fetchOutputs` returns an array of `Simulink.SimulationOutput` objects. You can fetch outputs only once `simJob` is in finished state.

```
out = fetchOutputs(simJob)
```

```
1x11 Simulink.SimulationOutput array
```

## Input Arguments

**simJob** — `Simulink.Simulation.Job` object  
object

A `Simulink.Simulation.Job` object. To create `simJob`, run `batchsim`.

Example: `simJob = batchsim(in, 'Pool', 4)`

## Output Arguments

**out** — Simulation object containing logged simulation results  
object

Array of `Simulink.SimulationOutput` objects that contain all of the logged simulation results. The size of the array is equal to the size of the array of `Simulink.SimulationInput` objects passed to `batchsim`.

All simulation outputs (logged time, states, and signals) are returned in a single `Simulink.SimulationOutput` object. You define the model time, states, and output that are logged using the **Data Import/Export** pane of the Model Configuration Parameters dialog box. You can log signals using blocks such as the To Workspace and Scope blocks. The **Signal & Scope Manager** tool can directly log signals.

## Version History

# getSimulationJobs

Get all `Simulink.Simulation.Job` objects from cluster

## Syntax

```
jobs = getSimulationJobs(myCluster)
```

## Description

`jobs = getSimulationJobs(myCluster)` returns an array of `Simulink.Simulation.Job` objects that correspond to the jobs created by executing of `batchsim` on cluster, `myCluster`.

## Examples

### Get a Simulink.Simulation.Job Object from the Cluster

This example shows how to access a `batchsim` job that was submitted to a cluster. Assume that `myCluster` is a `parallel.Cluster` object on which the `Simulink.Simulation.Job` object is running.

```
jobs = getSimulationJobs(myCluster)
```

1×2 Job array:

	ID	Type	State	FinishDateTime	Username
1	3	pool	queued		#####
2	4	pool	queued		#####

The output displays all the `Simulink.Simulation.Job` objects on cluster, `myCluster`.

## Input Arguments

**myCluster** — `parallel.Cluster` object

object

Cluster object representing parallel cluster compute resources.

## Output Arguments

**jobs** — Array of `Simulink.Simulation.Job` objects

array

Array of `Simulink.Simulation.Job` objects submitted by executing `batchsim` command.

## **Version History**

**Introduced in R2018b**

# listAutoAttachedFiles

**Package:** Simulink

List of files automatically attached to the `Simulink.Simulation.Job` object or parallel pool

## Syntax

```
listAutoAttachedFiles(simJob)
```

## Description

`listAutoAttachedFiles(simJob)` performs a dependency analysis on the `Simulink.Simulation.Job` job object, `simJob`. Then it displays a list of the code files that are already attached or are going to be automatically attached to the job object, `simJob`.

## Examples

### Run Parallel Simulations with `batchsim` and List Attached Files

This example shows how to run parallel simulations in batch and list any attached files. `batchsim` offloads simulations to the compute cluster, enabling you to carry out other tasks while the batch job is processing, or close the client MATLAB and access the batch job later.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using the `setPointValues`, initialize an array of `Simulink.SimulationInput` objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
 in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point',...
 'Value',num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job ID to access the job object later from any machine. `NumWorkers` displays how many workers are running the simulations - the number of workers specified in the `'Pool'` argument plus an additional head worker.

```
simJob = batchsim(in,'Pool',3)
```

```
 ID: 1
 Type: pool
```

```
 NumWorkers: 4
 Username: #####
 State: running
 SubmitDateTime: ##-##-#### #:##:##
 StartDateTime:
Running Duration: 0 days 0h 0m 0s
```

If `AutoAttachFiles` property of `Simulink.Simulation.Job` is set to true in the cluster profile, then the job running on the cluster has the necessary code files automatically attached to it. Use the `listAutoAttachedFiles` method to view the attached files.

Note that the list of attached files is not displayed here because this is an example model.

```
listAutoAttachedFiles(simJob)
```

## Input Arguments

**simJob** — `Simulink.Simulation.Job` object  
object

A `Simulink.Simulation.Job` object. To create a `simJob`, run `batchsim`.

Example: `simJob = batchsim(in,'Pool',4)`

## Version History

**Introduced in R2018b**

# wait

**Package:** Simulink

Wait for Simulink.Simulation.Job object to change state

## Syntax

```
wait(simJob)
wait(simJob,'stateOfJob')
wait(simJob,'stateOfJob',timeout)
```

## Description

`wait(simJob)` blocks execution in a client session until the job identified by the object `simJob` reaches the 'finished' state or fails. This occurs when all the simulations finish execution on the workers.

`wait(simJob,'stateOfJob')` blocks execution in the client session until the specified job object changes state to the value of 'state'. The valid states to wait for are 'queued', 'running', and 'finished'. If the object is currently or has already been in the specified state, `wait` is not performed and execution returns immediately. For example, if you execute `wait(simJob,'queued')` for a job already in the 'finished' state, the call returns immediately.

`wait(simJob,'stateOfJob',timeout)` blocks execution until either the job reaches the specified 'state', or timeout seconds elapse, whichever happens first.

## Examples

### Wait for Simulations in simJob to Finish

This example shows uses the `sldemo_househeat` model to show how to wait for the batch simulations to finish.

1. Open the model.

```
open_system('sldemo_househeat');
```

2. Define a set of values for different temperatures.

```
setPointValues = 65:2:85;
spv_Length = length(setPointValues);
```

3. Using the `setPointValues`, initialize an array of Simulink.SimulationInput objects.

```
in(1:spv_Length) = Simulink.SimulationInput('sldemo_househeat');
for i = 1:1:spv_Length
 in(i) = in(i).setBlockParameter('sldemo_househeat/Set Point',...
 'Value',num2str(setPointValues(i)));
end
```

4. Specify the pool size of the number of workers to use. In addition to the number of workers used to run simulations in parallel, a head worker is required. In this case, assume that three workers are available to run a batch job for the parallel simulations. The job object returns useful metadata as shown. You can use the job ID to access the job object later from any machine. `NumWorkers` displays how many workers are running the simulations - the number of workers specified in the 'Pool' argument plus an additional head worker.

```
simJob = batchsim(in, 'Pool', 3)

 ID: 1
 Type: pool
 NumWorkers: 4
 Username: #####
 State: running
 SubmitDateTime: ##-##-#### #:##:##
 StartDateTime:
 Running Duration: 0 days 0h 0m 0s
```

5. Now, wait for the job to finish before retrieving the outputs.

```
wait(simJob)
```

## Input Arguments

**simJob** — `Simulink.Simulation.Job` object  
object

A `Simulink.Simulation.Job` object. To create a `simJob`, run `batchsim`.

Example: `simJob = batchsim(in, 'Pool', '5')`

**'stateOfJob'** — Value of the simulation job object State property to wait for  
'pending' | 'queued' | 'running' | 'finished' | 'failed' | 'unavailable'

Value of the State property of `Simulink.Simulation.Job` object to wait for.

Example: `wait(simJob, 'queued')`

**timeout** — Maximum time to wait, in seconds  
object

Specify a timeout for `wait` to block execution in seconds.

Example: `wait(simJob, 5)`

## Simulink.Simulation.Variable class

**Package:** Simulink.Simulation

Variables in Simulink.SimulationInput objects

### Description

The Simulink.Simulation.Variables object specifies the variable and its value used by the Simulink.SimulationInput object during simulation. By default, this object overrides variables that already exist in the base workspace or the data dictionary.

In most cases, there is no need to create an object of this class directly. To add a variable to the Simulink.SimulationInput object use the setVariable method on the Simulink.SimulationInput object.

### Creation

`var = Simulink.Simulation.Variable(variableName,Value)` creates a Simulink.Simulation.Variables object, var, that specifies the variable and its value.

`var = Simulink.Simulation.Variable(variableName,Value,'Workspace',WorkspaceName)` creates a Simulink.Simulation.Variables object, var, that specifies the variable defined in the specified workspace, WorksapceName and its value. Workspace can either be a model's name to indicate that the variable is in a model workspace or 'global-workspace' to indicate that it is either in the base workspace or in a data dictionary.

### Properties

**variableName — Name of the variable**

character vector

Name of the variable, specified as a character vector.

**Value — Value of the variable**

character vector

Value of the variable, specified as a character vector.

**WorkspaceName — Name of the variable**

character vector

Name of the workspace that the variable is defined in, specified as a character vector.

## Simulink.SimulationData.BlockPath class

**Package:** Simulink.SimulationData

Fully specified Simulink block path

### Description

Simulink creates block path objects when creating dataset objects for signal logging and data store logging. `Simulink.SimulationData.Signal` and `Simulink.SimulationData.DataStoreMemory` objects include block path objects.

You can create a block path that you can use with the `getElement` method to access a specific dataset element. If you want to create a dataset in MATLAB to use as a baseline to compare against a signal logging or data store logging dataset, then you need to create the block paths as part of that dataset.

The `Simulink.SimulationData.BlockPath` class is very similar to the `Simulink.BlockPath` class.

You do not have to have Simulink installed to use the `Simulink.SimulationData.BlockPath` class. However, you must have Simulink installed to use the `Simulink.BlockPath` class. If you have Simulink installed, consider using `Simulink.BlockPath` instead of `Simulink.SimulationData.BlockPath`, because the `Simulink.BlockPath` class includes a method for checking the validity of block path objects without you having to update the model diagram.

### Property Summary

Name	Description
SubPath	Individual component within the block specified by the block path

### Method Summary

Name	Description
BlockPath	Create a block path.
convertToCell	Convert a block path to a cell array of character vectors.
getBlock	Get a single block path in the model reference hierarchy.
getLength	Get the length of the block path.

### Properties

#### SubPath

##### Description

Represents an individual component within the block specified by the block path.

For example, if the block path refers to a Stateflow chart, you can use SubPath to indicate the chart signals. For example:

```
Block Path:
 'sf_car/shift_logic'

SubPath:
 'gear_state.first'
```

### Data Type

character vector

### Access

RW

## Methods

### BlockPath

#### Purpose

Create block path

#### Syntax

```
blockpath_object = Simulink.SimulationData.BlockPath()
blockpath_object = Simulink.SimulationData.BlockPath(blockpath)
blockpath_object = Simulink.SimulationData.BlockPath(paths)
blockpath_object = Simulink.SimulationData.BlockPath(paths, subpath)
```

#### Input Arguments

**blockpath**

The block path object that you want to copy.

**paths**

A character vector or cell array of character vectors that Simulink uses to build the block path.

Specify each character vector in order, from the top model to the specific block for which you are creating a block path.

Each character vector must be a path to a block within the Simulink model. The block must be:

- A block in a single model
- A Model block (except for the last character vector, which may be a block other than a Model block)
- A block that is in a model that is referenced by a Model block that is specified in the previous character vector

**subpath**

A character vector that represents an individual component within a block.

**Output Arguments**

`blockpath_object`

The block path that you create.

**Description**

`blockpath_object = Simulink.SimulationData.BlockPath()` creates an empty block path.

`blockpath_object = Simulink.SimulationData.BlockPath(blockpath)` creates a copy of the block path of the block path object that you specify with the `source_blockpath` argument.

`blockpath = Simulink.SimulationData.BlockPath(paths)` creates a block path from the character vector or cell array of character vectors that you specify with the `paths` argument. Each character vector represents a path at a level of model hierarchy.

`blockpath = Simulink.SimulationData.BlockPath(paths, subpath)` creates a block path from the character vector or cell array of character vectors that you specify with the `paths` argument and creates a path for the individual component (for example, a signal) of the block.

**Example**

Create a block path object called `bp1`, using a cell array of character vectors representing elements of the block path.

```
bp1 = Simulink.SimulationData.BlockPath(...
{'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/Fahrenheit to Celsius', ...
'sldemo_mdref_F2C/Gain1'})
```

The resulting block path reflects the model reference hierarchy for the block path.

`bp1 =`

```
Simulink.BlockPath
Package: Simulink
```

```
Block Path:
'sldemo_mdref_depgraph/thermostat'
'sldemo_mdref_heater/Fahrenheit to Celsius'
'sldemo_mdref_F2C/Gain1'
```

**convertToCell****Purpose**

Convert block path to cell array of character vectors

**Syntax**

```
cellarray = blockPathObject.convertToCell()
```

**Output Arguments**

`cellarray`

The cell array of character vectors representing the elements of the block path.

**Description**

`cellarray = blockPathObject.convertToCell()` converts a block path to a cell array of character vectors.

**Examples**

```
bp1 = Simulink.SimulationData.BlockPath(...
{'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/Fahrenheit to Celsius', ...
'sldemo_mdref_F2C/Gain1'})
cellarray_for_bp1 = bp1.convertToCell()
```

The result is a cell array representing the elements of the block path.

```
cellarray_for_bp1 =
 'sldemo_mdref_depgraph/thermostat'
 'sldemo_mdref_heater/Fahrenheit to Celsius'
 'sldemo_mdref_F2C/Gain1'
```

**getBlock****Purpose**

Get single block path in model reference hierarchy

**Syntax**

```
block = blockPathObject.getBlock(index)
```

**Input Arguments**

`index`

The index of the block for which you want to get the block path. The index reflects the level in the model reference hierarchy. An index of 1 represents a block in the top-level model, an index of 2 represents a block in a model referenced by the block of index 1, and an index of *n* represents a block that the block with index *n*-1 references.

**Output Arguments**

`block`

The block representing the level in the model reference hierarchy specified by the `index` argument.

**Description**

`blockpath = Simulink.SimulationData.BlockPath.getBlock(index)` returns the block path of the block specified by the `index` argument.

**Example**

Get the block for the second level in the model reference hierarchy.

```
bp1 = Simulink.SimulationData.BlockPath(...
{'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/Fahrenheit to Celsius', ...
```

```
'sldemo_mdref_F2C/Gain1'})
blockpath = bp1.getBlock(2)
```

The result is the thermostat block, which is at the second level in the block path hierarchy.

```
blockpath =
sldemo_mdref_heater/Fahrenheit to Celsius
```

### **getLength**

#### **Purpose**

Get length of block path

#### **Syntax**

```
length = blockPathObject.getLength()
```

#### **Output Arguments**

length

The length of the block path. The length is the number of levels in the model reference hierarchy.

#### **Description**

`length = Simulink.SimulationData.BlockPath.getLength()` returns a numeric value that corresponds to the number of levels in the model reference hierarchy for the block path.

#### **Example**

Get the length of block path bp1.

```
bp1 = Simulink.SimulationData.BlockPath(...
{ 'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/Fahrenheit to Celsius', ...
'sldemo_mdref_F2C/Gain1' })
length_bp1 = bp1.getLength()
```

The result reflects that the block path has three elements.

```
length_bp1 =
3
```

## **Version History**

# Simulink.SimulationData.DataStoreMemory

Container for data store logging information

## Description

Simulink uses `Simulink.SimulationData.DataStoreMemory` objects to store logging information from Data Store Memory blocks during simulation. The objects contain information about the blocks that write to the data store.

## Property Summary

Name	Description
BlockPath on page 5-629	Location of Data Store Memory block for the logged data store
DSMWriterBlockPaths on page 5-629	Location of Data Store Write blocks that write to the data store
DSMWriters on page 5-630	Data Store Write blocks for each signal value
Name on page 5-630	Name of the data store dataset
Scope on page 5-630	Scope of the data store: 'local' or 'global'
Values on page 5-630	Time and data that were logged

## Properties

### BlockPath

#### Description

Location of Data Store Memory block for the logged data store.

#### Data Type

character vector

#### Access

RW

### DSMWriterBlockPaths

#### Description

Location of blocks that write to the data store. Each element of the array contains the full block path of one writer block.

#### Data Type

Vector of `Simulink.SimulationData.BlockPath` objects

**Access**

R0

**DSM Writers****Description**

The number of writes in the data store.

The *n*th element of `DSM Writers` contains the index of the element in `DSM WriterBlockPaths` that contains the block path of the writer that performed the *n*th write to `Values`.

**Data Type**

Integer vector

**Access**

R0

**Name****Description**

Name of the data store dataset

**Data Type**

character vector

**Access**

R0

**Scope****Description**

Scope of the data store: 'local' or 'global'

**Data Type**

character vector

**Access**

RW

**Values****Description**

Time and data that were logged

**Data Type**

MATLAB timeseries

**Access**

RW

## **Topics**

“Log Data Stores”

## plot

**Package:** Simulink.SimulationData

Plot simulation results in Simulation Data Inspector

### Syntax

```
plot(simRes)
runObj = plot(simRes)
```

### Description

`plot(simRes)` plots the simulation results in the object `simRes` in the **Simulation Data Inspector** and opens the Simulation Data Inspector. You can use the `plot` function to plot simulation results stored in these objects:

- `Simulink.SimulationOutput`
- `Simulink.SimulationData.DataStoreMemory`
- `Simulink.SimulationData.Parameter`
- `Simulink.SimulationData.Signal`
- `Simulink.SimulationData.State`
- `Stateflow.SimulationData.Data`
- `Stateflow.SimulationData.State`
- `sltest.Assessment`

When the input object contains fewer than eight signals, the Simulation Data Inspector layout changes to 1-by- $n$ , where  $n$  is the number of signals, and each subplot displays one signal. When the simulation results contain more than eight signals to plot, the Simulation Data Inspector layout changes to 1-by-1, and the plot displays the first signal.

When some or all of the data in a `Simulink.SimulationOutput` object is in a Simulation Data Inspector run, the `plot` function opens the Simulation Data Inspector and plots all the signals in the run. When the `SimulationOutput` object does not correspond to a run in the Simulation Data Inspector, the `plot` function imports the data into a new run.

When you use the `plot` function to plot a single signal, the `plot` function always imports the data for the signal into a new run.

These objects also have plot functions that plot data in the Simulation Data Inspector:

- `Simulink.SimulationData.Dataset`
- `Simulink.SimulationData.DatasetRef`

`runObj = plot(simRes)` returns the `Simulink.sdi.Run` object that corresponds to the plotted data.

## Examples

### Plot Simulation Output Data

The model `ex_vdp_simout_plot` is configured to log signals, outputs, and states and return all logged data as a single simulation output. You can use the `plot` function to plot the simulation results in the Simulation Data Inspector.

Simulate the model. The model logs data using the `Dataset` format, so all the logged data streams to the Simulation Data Inspector during simulation.

```
open_system('ex_vdp_simout_plot')
out = sim('ex_vdp_simout_plot');
```

Use the `plot` function to plot all the simulation results in the Simulation Data Inspector. The Simulation Data Inspector updates to a 1-by-8 layout and plots one signal on each subplot.

```
plot(out)
```

You can also use the `plot` function to plot data for a single signal or a subset of the simulation results. When you plot the data for a single signal, the Simulation Data Inspector always imports the data for the signal into a new run.

The `Simulink.SimulationOutput` object contains a property for each logging variable. Access the signal logging data in the property `logouts`.

```
logouts = out.logouts;
```

Then, use the `get` function for the `Dataset` object to access the data for the first element, which contains the data for a single logged signal.

```
sig1 = get(logouts,1);
```

When you plot the data for the signal, the Simulation Data Inspector imports the signal into a new run, updates the layout to 1-by-1, and plots the signal.

```
plot(sig1)
```

## Input Arguments

### **simRes** — Object that contains simulation data to plot

`Simulink.SimulationOutput` | `Simulink.SimulationData.DataStoreMemory` |  
`Simulink.SimulationData.Parameter` | `Simulink.SimulationData.Signal` |  
`Simulink.SimulationData.State` | `sltest.Assessment` |  
`Stateflow.SimulationData.Data` | `Stateflow.SimulationData.State`

Object that contains simulation data plot, specified in one of these forms:

- `Simulink.SimulationOutput` object
- `Simulink.SimulationData.DataStoreMemory` object
- `Simulink.SimulationData.Parameter` object
- `Simulink.SimulationData.Signal` object

- `Simulink.SimulationData.State` object
- `Stateflow.SimulationData.Data` object
- `Stateflow.SimulationData.State` object
- `sltest.Assessment` object

Example: `plot(out)` plots the contents of the `Simulink.SimulationOutput` object out in the Simulation Data Inspector and opens the Simulation Data Inspector.

## Output Arguments

### **runObj** — Run that corresponds to plotted data

`Simulink.sdi.Run` object

Run that corresponds to plotted data, returned as a `Simulink.sdi.Run` object.

## Version History

Introduced in R2019b

# Simulink.SimulationData.State class

**Package:** Simulink.SimulationData

State logging element

## Description

Simulink uses `Simulink.SimulationData.State` objects to store state logging information during simulation. The objects contain state information about which block the state data is coming from and the type of state.

## Properties

### Name — Name of state element to use for name-based access

character vector

Name of state element to use for name-based access, specified as a character vector. If you do not specify a name, 'CSTATE' or 'DSTATE' is used, depending on whether it is a continuous or discrete state.

### BlockPath — Block path for state source block

a `Simulink.SimulationData.BlockPath` object

Block path for state source block, specified as a `Simulink.SimulationData.BlockPath` object

### Label — Type of state

'CSTATE' | 'DSTATE'

Type of state, returned as 'CSTATE' or 'DSTATE'. Read-only property.

- 'CSTATE' - Continuous state
- 'DSTATE' - Discrete state

### Values — State element information

single MATLAB timeseries object | a structure of MATLAB timeseries objects

State element information, specified as a single MATLAB timeseries object or as a structure of MATLAB timeseries objects.

## Methods

`plot` Plot simulation results in Simulation Data Inspector

## Examples

## Access Final State Information Saved Using the Dataset Format

This example shows how to save final state information using the Dataset format and then access the state data after simulation.

Load the model `vdp` and configure the model to log final states using the Dataset format. This example uses the default final states variable name, `xFinal`.

```
load_system('vdp');
set_param('vdp', 'SaveFinalState', 'on', 'SaveFormat', 'Dataset');
```

Simulate the model.

```
out = sim('vdp');
```

By default, models create a single simulation output that contains all logged data in a `Simulink.SimulationOutput` object. Get the `xFinal` Dataset object from the `SimulationOutput` object. The `xFinal` Dataset object contains data for two states.

```
xFinal = get(out, 'xFinal')
```

```
xFinal =
Simulink.SimulationData.Dataset 'xFinal' with 2 elements
```

	Name	BlockPath
1	[1x1 State]	' ' vdp/x1
2	[1x1 State]	' ' vdp/x2

- Use braces `{ }` to access, modify, or add elements using index.

Examine the data for the state that corresponds to the `x1` block.

```
state_x1 = get(xFinal, 1)
```

```
state_x1 =
Simulink.SimulationData.State

Properties:
 Name: ''
 BlockPath: [1x1 Simulink.SimulationData.BlockPath]
 Label: CSTATE
 Values: [1x1 timeseries]
```

Methods, Superclasses

## Version History

Introduced in R2015a

## See Also

`Simulink.SimulationData.Dataset`

**Topics**

“Save Block States and Simulation Operating Points”

## Simulink.SimulationData.Unit class

**Package:** Simulink.SimulationData

Store units for simulation data

### Description

Simulink creates `Simulink.SimulationData.Unit` objects to store unit information for signals when:

- Performing signal logging, which uses the `Dataset` format
- Logging root Output blocks, if in **Configurations Parameters** you select the **Output** parameter and set **Format** to `Dataset`
- Logging to a To Workspace block or To File block, if you set the **Save format** block parameter to the default of `Timeseries`

### Construction

`unitsObj = Simulink.SimulationData.Unit(unitName)` creates a `Simulink.SimulationData.Unit` object with the unit that you specify.

### Input Arguments

**unitName** — Name of logging data units

character vector

Name of logging data units, specified as a character vector.

### Output Arguments

**unitObj** — Logging data units

`Simulink.SimulationData.Unit` object

Logging data units, returned as a `Simulink.SimulationData.Unit` object.

### Properties

**Name** — Name of the units

character vector

Name of the units, specified as a character vector.

### Methods

Method	Purpose
<code>setName</code>	Specify name of logging data unit

## Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects.

## Examples

### Create and Use Inches Logging Units

Create a `Simulink.SimulationData.Unit` object representing inches.

```
inchesUnit = Simulink.SimulationData.Unit('inches');
```

Create a MATLAB `timeseries` object and set its `Units` field to the `Simulink.SimulationData.Unit` object.

```
ts = timeseries(1:10);
ts.DataInfo.Units = inchesUnit;
ts.DataInfo.Units
```

```
ans =
```

```
Units with properties:
```

```
 Name: 'inches'
```

## setName

**Class:** Simulink.SimulationData.Unit

**Package:** Simulink.SimulationData

Specify name of logging data units

### Syntax

```
unitObject = setName(unitObj,unitName)
```

### Description

`unitObject = setName(unitObj,unitName)` sets the name for the `Simulink.SimulationData.Unit` object to the name specified in `unitName`.

### Input Arguments

**unitObj — Logging data unit object to name**

`Simulink.SimulationData.Unit` object

Logging data unit object to name, specified as a `Simulink.SimulationData.Unit` object.

**unitName — Name of logging data unit**

character vector

Name of logging data unit, specified as a character vector.

### Output Arguments

**name — Name of logging data units**

character vector

Name of logging data units, returned as a character vector.

### Examples

**Name a Logging Data Unit Object**

```
inchesUnit = Simulink.SimulationData.Unit('in');
inchesUnit = setName(inchesUnit,'inches')
```

```
inchesUnit =
```

```
 Units with properties:
```

Name: 'inches'

## Simulink.SimulationMetadata class

**Package:** Simulink

Access metadata of simulation runs

### Description

The `SimulationMetadata` class contains information about a simulation run including:

- Model information
- Timing information
- Execution and diagnostic information
- Custom character vector to tag the simulation
- Custom data to describe the simulation

`SimulationMetadata` packages this information with the `SimulationOutput` object. To use `SimulationMetadata`, use one of these approaches:

- In **Configuration Parameters > Data Import/Export**, under **Save options**, select **Single simulation output**.
- Use `set_param` to set `ReturnWorkspaceOutputs` to on.

```
set_param(model_name, 'ReturnWorkspaceOutputs', 'on');
```

To retrieve the `SimulationMetadata` object, use the `getSimulationMetadata` method on a `SimulationOutput` object.

### Properties

#### **ModelInfo — Information about the model and simulation operating environment**

structure

The `ModelInfo` structure has these fields.

Field Name	Type	Description
<code>ModelName</code>	char	Name of the model
<code>ModelVersion</code>	char	Version of the model
<code>ModelFilePath</code>	char	Absolute location of the <code>.mdl/.slx</code> file
<code>UserID</code>	char	System user ID of the machine used for the simulation
<code>MachineName</code>	char	Hostname of the machine used for the simulation
<code>Platform</code>	char	Operating system of the machine used for the simulation

Field Name	Type	Description
ModelStructuralChecksum	4-by-1 uint32	Structural checksum of the model calculated after an update diagram
SimulationMode	char	Simulation mode
StartTime	double	Simulation start time
StopTime	double	Time at which the simulation was terminated
SolverInfo	structure	Solver information: <ul style="list-style-type: none"> <li>Fixed-step solvers - Solver type, name, and fixed step size</li> <li>Variable solvers - Solver type, name, and max step size (initial setting)</li> </ul>
SimulinkVersion	structure	Version of Simulink
LoggingInfo	structure	Metadata about logging to persistent storage: <ul style="list-style-type: none"> <li>LoggingToFile field — Indicates whether logging to persistent storage is enabled ('on' or 'off')</li> <li>LoggingFileName field — Specifies the resolved file name for the persistent storage MAT-file (if LoggingToFile is 'on').</li> </ul>

### ExecutionInfo — Structure to store information about a simulation run

structure

Structure to store information about a simulation run, including the reason a simulation stopped and any diagnostics reported during the simulation. The structure has these fields.

Field Name	Type	Description
StopEvent	Nontranslated character vector	Reason the simulation stopped, represented by one of the following: <ul style="list-style-type: none"> <li>• ReachedStopTime - Simulation stopped upon reaching stop time and no errors were reported during execution. StopEvent has value ReachedStopTime, even if errors are reported in the stop callbacks, which are executed after the simulation ends.</li> <li>• ModelStop - Simulation stopped by a block or by solver before reaching stop time.</li> <li>• StopCommand - Simulation stopped manually by clicking the <b>Stop</b> button or using the set_param command.</li> <li>• DiagnosticError - Simulation stopped because an error was reported during simulation.</li> <li>• KeyboardControlC - Simulation stopped using keystroke Ctrl+C.</li> <li>• PauseCommand - Simulation paused manually by clicking the <b>Pause</b> button or using the set_param command.</li> <li>• ConditionalPause - Simulation paused using a conditional breakpoint.</li> <li>• PauseTime - Simulation paused at or after specified pause time.</li> <li>• StepForward - Simulation paused after clicking step forward.</li> <li>• StepBackward - Simulation paused after clicking step backward.</li> <li>• Timeout - Simulation stopped because execution time exceeded timeout specified by Timeout.</li> </ul>
StopEventSource	Simulink.SimulationData.BlockPath	Source of stop event, if it is a valid Simulink object.
StopEventDescription	Translated character vector	Superset of information stored in StopEvent and StopEventSource.

Field Name	Type	Description
ErrorDiagnostic	struct	<p>Error reported during simulation, represented by the following fields:</p> <ul style="list-style-type: none"> <li>• <b>Diagnostic</b> - MSLDiagnostic object that includes object paths, ID, message, cause, and stack.</li> <li>• <b>SimulationPhase</b> - Represented by one of these: Initialization, Execution, or Termination.</li> <li>• <b>SimulationTime</b> - Simulation time represented as a double, if reported during Execution; else, represented as [].</li> </ul> <p>By passing the name-value pair 'CaptureErrors', 'on' to the sim command, errors generated during simulation are reported in ExecutionInfo.ErrorDiagnostic. The sim command does not capture generated errors.</p>
WarningDiagnostics	Array of struct	<p>Array of all warnings reported during the simulation. Each array item is represented by the following fields:</p> <ul style="list-style-type: none"> <li>• <b>Diagnostic</b> - MSLDiagnostic object that includes object paths, ID, message, cause, and stack.</li> <li>• <b>SimulationPhase</b> - Represented as: Initialization, Execution, or Termination.</li> <li>• <b>SimulationTime</b> - Simulation time represented as a double, if reported during Execution; else, represented as [].</li> </ul>

### TimingInfo — Structure to store profiling information about the simulation

structure

Structure to store profiling information about the simulation, including the time stamps for the start and end of the simulation. The structure has these fields.

Field Name	Type	Description
WallClockTimestampStart	character vector	Wall clock time when the simulation started, in YYYY-MM-DD HH:MI:SS format with microsecond resolution
WallClockTimestampStop	character vector	Wall clock time when the simulation stopped, in YYYY-MM-DD HH:MI:SS format with microsecond resolution

Field Name	Type	Description
InitializationElapsedWallTime	double	Time spent before execution, in seconds
ExecutionElapsedWallTime	double	Time spent during execution, in seconds
TerminationElapsedWallTime	double	Time spent after execution, in seconds
TotalElapsedWallTime	double	Total time spent in initialization, execution, and termination, in seconds
ProfilerData	Simulink.profiler.Data	Profiling results of the model, returned as a Simulink.profiler.Data object  <b>Note</b> The ProfilerData field is shown only when the Profile and ReturnWorkspaceOutputs model parameters are enabled

The ExecutionElapsedWallTime does not include time that the simulation is paused. For example, when you step through a simulation, the simulation pauses after each step, and the ExecutionElapsedWallTime does not count the time the simulation is paused between steps. When you step through a simulation with stepping back enabled, the ExecutionElapsedWallTime does include the time required to step back in the simulation.

#### UserString — Custom character vector to describe the simulation

character vector

Use Simulink.SimulationOutput.setUserString to directly store a character vector in the SimulationMetadata object that is contained in the SimulationOutput object.

#### UserData — Custom data to store in SimulationMetadata object that is contained in the SimulationOutput object

character vector

Use Simulink.SimulationOutput.setUserData to store custom data in the SimulationMetadata object that is contained in the SimulationOutput object.

## Copy Semantics

Value. To learn how value classes affect copy operations, see Copying Objects.

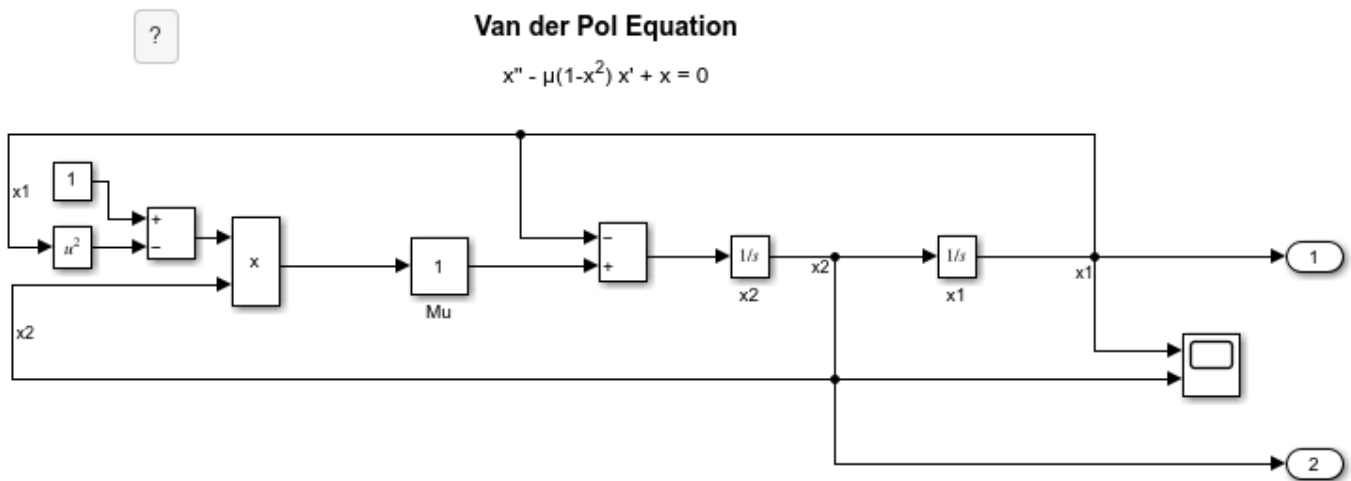

## Examples

### Get a SimulationMetadata Object for vdp Simulation

Simulate the vdp model. Retrieve metadata from a SimulationMetadata object of the simulation.

Simulate the vdp model. Save the results of the Simulink.SimulationOutput object in simout.

```
open_system('vdp');
simout = sim(bdroot, 'ReturnWorkspaceOutputs', 'on');
```

Copyright 2004-2022 The MathWorks, Inc.

Retrieve metadata information about this simulation using `mData`. This is the `SimulationMetadata` object that `simout` contains.

```
mData=simout.getSimulationMetadata()
```

```
mData =
```

SimulationMetadata with properties:

```
 ModelInfo: [1x1 struct]
 TimingInfo: [1x1 struct]
 ExecutionInfo: [1x1 struct]
 UserString: ''
 UserData: []
```

Store custom data or string in simout.

```
simout=simout.setUserData(struct('param1','value1','param2','value2','param3','value3'));
simout=simout.setUserString('Store first simulation results');
```

Retrieve the custom data you stored from mData.

```
mData=simout.getSimulationMetadata()
disp(mData.UserData)
```

mData =

SimulationMetadata with properties:

```
 ModelInfo: [1x1 struct]
 TimingInfo: [1x1 struct]
 ExecutionInfo: [1x1 struct]
 UserString: 'Store first simulation results'
 UserData: [1x1 struct]

 param1: 'value1'
 param2: 'value2'
 param3: 'value3'
```

Retrieve the custom string you stored from mData.

```
mData=simout.getSimulationMetadata()
disp(mData.UserString)
```

```
% Copyright 2018-2022 The MathWorks, Inc.
```

mData =

SimulationMetadata with properties:

```
 ModelInfo: [1x1 struct]
 TimingInfo: [1x1 struct]
 ExecutionInfo: [1x1 struct]
 UserString: 'Store first simulation results'
 UserData: [1x1 struct]
```

Store first simulation results

# Simulink.SuppressedDiagnostic class

**Package:** Simulink

Suppress diagnostic messages from a specified block

## Description

A `Simulink.SuppressedDiagnostic` object contains information related to diagnostic warnings or errors that are suppressed from being thrown during simulation.

## Construction

The Diagnostic Viewer in Simulink includes an option to suppress certain diagnostics. This feature enables you to suppress warnings or errors for specific objects in your model. Click the **Suppress** button next to the warning in the Diagnostic Viewer to suppress the warning from the specified source. This action creates a `Simulink.SuppressedDiagnostic` object. You can access this object at the MATLAB command line using the `Simulink.getSuppressedDiagnostics` function. You can add a comment for the suppressed diagnostic. You can restore the diagnostic by clicking **Restore**.

`DiagnosticObject = Simulink.SuppressedDiagnostic(source, message_id)` creates a suppressed diagnostic object. The object suppresses all instances of diagnostics represented by `message_id` thrown by the blocks specified by `source`.

## Input Arguments

**source** — System, block, or model object throwing diagnostic

model | subsystem | block path | block handle

The source of the diagnostic, specified as a model, subsystem, block path, block handle, cell array of block paths, or cell array of block handles.

To get the block path, use the `gcb` function.

To get the block handle, use the `getSimulinkBlockHandle` function.

Data Types: `char` | `cell` | `string`

**message\_id** — message identifier of diagnostic

message identifier

The message identifier of the diagnostic, specified as a character vector or string. You can find the message identifier of diagnostics thrown during simulation by accessing the `ExecutionInfo` property of the `Simulink.SimulationMetadata` object associated with a simulation. You can also use the `lastwarn` function.

Data Types: char | string

## Properties

### **Comments — Comments associated with the suppression object**

character vector

Comments associated with the suppression object, specified as a character vector. This property is optional.

Data Types: char

### **ID — Message identifier of the diagnostic that was suppressed**

character vector

The message identifier of the diagnostic that was suppressed, specified as a character vector.

Data Types: char

### **LastModified — Date and time the suppression object was last modified**

character vector

Date and time the suppression object was last modified, specified as a character vector. This property is read-only.

Data Types: char

### **LastModifiedBy — Name of the user who was last to add or edit the suppression object**

character vector

Name of the user who last added or edited the suppression object, specified as a character vector. This property is optional.

Data Types: char

### **Source — block path of the source of the diagnostic**

character vector

The block path of the model object that has a suppressed diagnostic, specified as a character vector.

Data Types: char

## Methods

restore Remove specified diagnostic suppressions

suppress Suppress diagnostic specified by Simulink.SuppressedDiagnostic object

## Copy Semantics

Handle. To learn how handle classes affect copy operations, see Copying Objects.

## Examples

## Create a Simulink.SuppressedDiagnostic Object

To create and then restore a diagnostic suppression, use `getDiagnosticObjects.m`, `suppressor_script.m`, and the `Suppressor_CLI_Demo.slx` model. The `getDiagnosticObjects.m` function queries the simulation metadata to access diagnostics that were thrown during simulation. The `suppressor_script.m` script contains the commands for suppressing and restoring diagnostics to the `Suppressor_CLI_Demo` model. Open the model. To access `Simulink.SimulationMetadata` class, set the `ReturnWorkspaceOutputs` parameter value to 'on'. Simulate the model.

```
model = 'Suppressor_CLI_Demo';
open_system(model);
set_param(model, 'ReturnWorkspaceOutputs', 'on');
out = sim(model);
```

Create a `Simulink.SuppressedDiagnostic` object, suppression to suppress the parameter precision loss warning thrown by the Constant block, one.

```
suppression = Simulink.SuppressedDiagnostic('Suppressor_CLI_Demo/one', ...
 'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

The parameter precision loss warning is no longer thrown in future simulations of this model. Add accountability information to the object by editing the `LastModifiedBy` and `Comments` properties of the object.

```
suppression.LastModifiedBy = 'John Doe';
suppression.Comments = 'Reviewed: Joe Schmoe'
```

You can restore the diagnostic using the `restore` method.

```
restore(suppression);
```

## Version History

Introduced in R2016b

Property Attributes

## restore

**Class:** Simulink.SuppressedDiagnostic

**Package:** Simulink

Remove specified diagnostic suppressions

### Syntax

```
restore(SuppressedDiagnostic)
```

### Description

`restore(SuppressedDiagnostic)` removes the specified suppressed diagnostic object.

### Input Arguments

**SuppressedDiagnostic** — Suppressed diagnostic object to restore

Simulink.SuppressedDiagnostic object

Simulink.SuppressedDiagnostic object

### Examples

#### Restore A Suppressed Diagnostic

To create and then restore a diagnostic suppression, use `getDiagnosticObjects.m`, `suppressor_script.m`, and the `Suppressor_CLI_Demo.slx` model. The `getDiagnosticObjects.m` function queries the simulation metadata to access diagnostics that were thrown during simulation. The `suppressor_script.m` script contains the commands for suppressing and restoring diagnostics to the `Suppressor_CLI_Demo` model. Open the model. To access `Simulink.SimulationMetadata` class, set the `ReturnWorkspaceOutputs` parameter value to `'on'`. Simulate the model.

```
model = 'Suppressor_CLI_Demo';
open_system(model);
set_param(model, 'ReturnWorkspaceOutputs', 'on');
out = sim(model);
```

Create a `Simulink.suppressDiagnostic` object, `suppression` to suppress the parameter precision loss warning from the Constant block, `one`.

```
suppression = Simulink.SuppressedDiagnostic('Suppressor_CLI_Demo/one', ...
 'SimulinkFixedPoint:util:fxpParameterPrecisionLoss');
```

You can restore the diagnostic using the `restore` method.

```
restore(suppression);
```

## Restore All Suppressed Diagnostics

To restore all suppressed diagnostics associated with a model, use `getDiagnosticObjects.m`, `suppressor_script.m`, and the `Suppressor_CLI_Demo.slx` model. The `getDiagnosticObjects.m` function queries the simulation metadata to access diagnostics that were thrown during simulation. The `suppressor_script.m` script contains the commands for suppressing and restoring diagnostics to the `Suppressor_CLI_Demo` model. Open the model. To access `Simulink.SimulationMetadata` class, set the `ReturnWorkspaceOutputs` parameter value to 'on'. Simulate the model.

```
model = 'Suppressor_CLI_Demo';
open_system(model);
set_param(model, 'ReturnWorkspaceOutputs', 'on');
out = sim(model);
```

Use the `Simulink.suppressDiagnostic` function to suppress the parameter precision loss and parameter underflow warnings from the Constant block, one.

```
diags = {'SimulinkFixedPoint:util:fxpParameterPrecisionLoss', 'SimulinkFixedPoint:util:fxpParameterUnderflowWarning'};
Simulink.suppressDiagnostic('Suppressor_CLI_Demo/one', diags);
```

Use the `Simulink.getSuppressedDiagnostics` function to get all suppressions associated with the model, returned as an array of `Simulink.SuppressedDiagnostic` objects.

```
suppressed_diagnostics =
Simulink.getSuppressedDiagnostics('Suppressor_CLI_Demo');
```

Restore all diagnostics using the `restore` method and iterating through the `suppressed_diagnostics` array.

```
for iter = 1:numel(suppressed_diagnostics)
 restore(suppressed_diagnostics(iter));
end
```

# Simulink.Variant class

**Package:** Simulink

Specify conditions that control variant selection

## Description

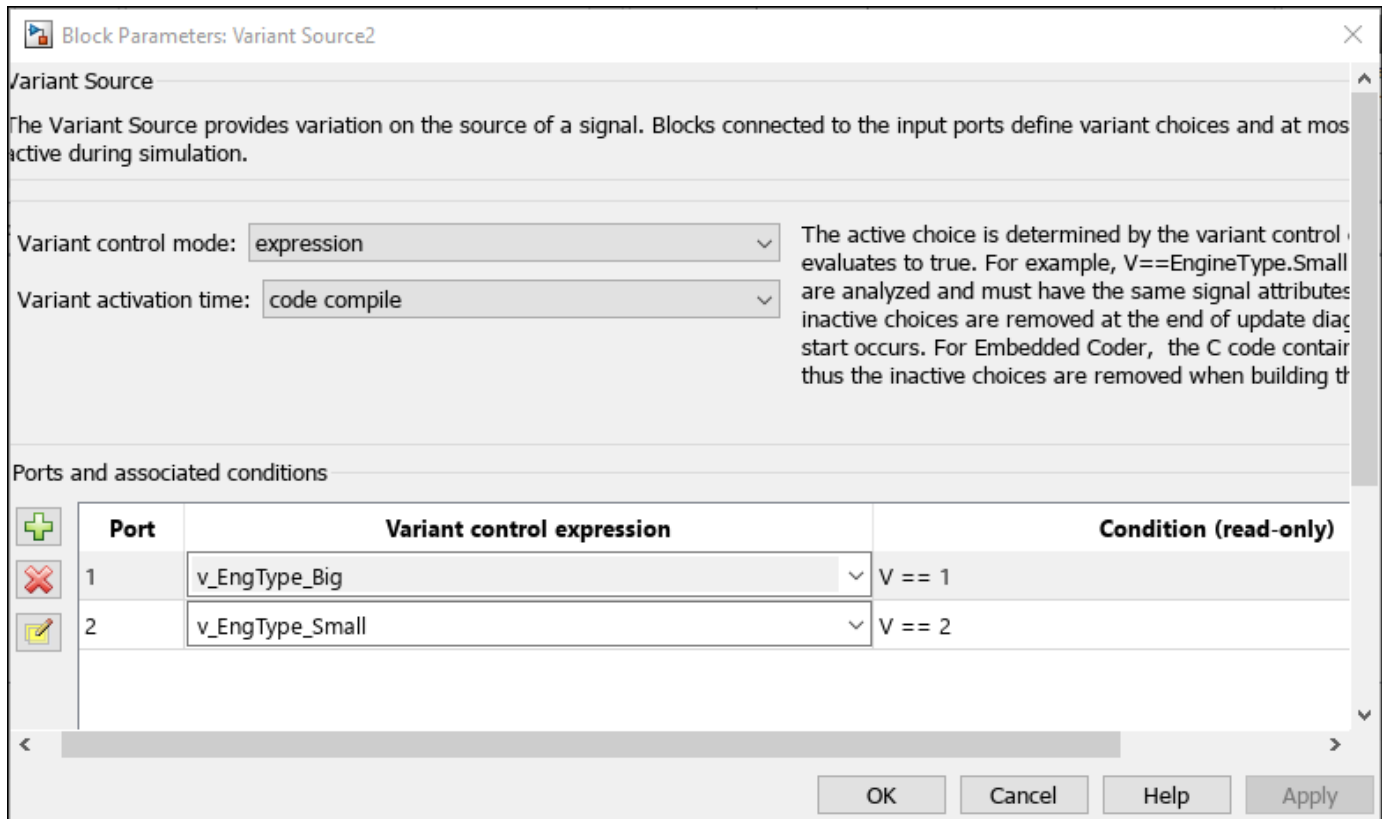

In a model that contains variant blocks, you must associate each variant choice with a variant control. During simulation, Simulink evaluates the variant controls of all variant choices and activates the choice that corresponds to the variant control that evaluates to `true`.

You can specify the variant control in the form of a Boolean condition expression, such as `A == 1` and `A==1 && B == 2`. In these expressions, the variant control variables `A` and `B` can be MATLAB variables, `Simulink.Parameter` objects, or `Simulink.VariantControl` objects. For more information, see “Switch Between Choices Using Condition Expressions in Variant Blocks”.

Create an object of the `Simulink.Variant` class to represent a Boolean variant condition expression. You can define the object in the base workspace or in a data dictionary and use the object as the variant control for a choice in a variant block. Using `Simulink.Variant` objects lets you reuse common variant conditions across models and improves the readability of variant condition expressions.

In this example, `Simulink.Variant` objects are used as variant controls in a Variant Source block.

```
v_EngType_Big = Simulink.Variant('V == 1');
v_EngType_Small = Simulink.Variant('V == 2');
```

**Note**

- Defining variant controls using `Simulink.Variant` objects in the mask or model workspace is not supported. For more information on storage locations for variant control variables, see “Storage Locations for Variant Control Variables (Operands) in Variant Blocks”.
- Using `Simulink.Variant` objects within structures is not supported.

## Creation

**Description**

`variantControl = Simulink.Variant(conditionExpression)` creates a variant control and sets the `Condition` property to `conditionExpression`.

## Properties

**Condition — Variant condition expression**

' ' (default) | character vector | string

Variant condition expression, specified as a character vector or string. The expression must evaluate to a Boolean value and can contain one or more of these operands and operators.

**Operands**

- Scalar literal values that represent integer or enumerated values
- Variable names that resolve to one of these types:
  - MATLAB variables
  - Simulink.VariantControl objects
  - Simulink.Parameter objects with integer, enumerated data type, or scalar literal values
  - Simulink.Variant objects

## Operators

- Parentheses for grouping
- Arithmetic, relational, logical, or bitwise operators

For information on the supported types of operators and operands in a variant condition expression, see “Types of Variant Control Variables (Operands) in Variant Blocks” and “Types of Operators in Variant Blocks for Different Activation Times”.

Example: `'(Fuel==2 || Emission==1) && Ratio==2'`

### Attributes:

GetAccess	public
SetAccess	public

Data Types: `char | string`

## Examples

### Create Variant Controls Using MATLAB Variables

Use MATLAB variables when you want to simulate the model but are not considering code generation.

Create MATLAB variables with scalar literal values.

```
Fuel = 3;
Emission = 2;
Ratio = 3;
```

Define conditional expressions using the variables and create variant controls.

```
Variant1 = Simulink.Variant('Fuel==3 && Emission==2');
Variant2 = Simulink.Variant('(Fuel==2 || Emission==1) && Ratio==2');
Variant3 = Simulink.Variant('Fuel==3 || Ratio==4');
```

### Create Variant Controls Using Simulink.Parameter Objects

To generate preprocessor conditionals for code generation, use Simulink.Parameter objects.

Create variant Simulink.Parameter objects with scalar literal values.

```
Fuel = Simulink.Parameter(3);
Emission = Simulink.Parameter(2);
Ratio = Simulink.Parameter(3);
```

Specify the custom storage class for these objects as `ImportedDefine` so that the values are specified by an external header file. Other valid values for the custom storage class are `Define` and `CompilerFlag`.

---

**Note** If you generate code with variant activation time set to `startup`, specify the supported custom storage class for the objects. For more information on built-in and custom storage classes supported with `startup` activation time see “Storage Classes for Different Variant Activation Times”.

---

```
Fuel.CoderInfo.StorageClass = 'Custom';
Fuel.CoderInfo.CustomStorageClass = 'ImportedDefine';

Emission.CoderInfo.StorageClass = 'Custom';
Emission.CoderInfo.CustomStorageClass = 'ImportedDefine';

Ratio.CoderInfo.StorageClass = 'Custom';
Ratio.CoderInfo.CustomStorageClass = 'ImportedDefine';
```

Define conditional expressions using the variables and create variant controls.

```
Variant1 = Simulink.Variant('Fuel==3 && Emission==2');
Variant2 = Simulink.Variant('(Fuel==2 || Emission==1) && Ratio==2');
Variant3 = Simulink.Variant('Fuel==3 || Ratio==4');
```

### Create Variant Controls Using `Simulink.VariantControl` Objects

You can associate a variant control variable of type `Simulink.VariantControl` with a variant activation time. For an example, see “`Simulink.VariantControl` Variables for Coherent Switching of Choices in Variant Blocks” on page 5-763.

Create `Simulink.VariantControl` objects with scalar literal values.

```
Fuel = Simulink.VariantControl('Value', 3, 'ActivationTime', 'update diagram');
Emission = Simulink.VariantControl('Value', 2, 'ActivationTime', 'update diagram');
Ratio = Simulink.VariantControl('Value', 3, 'ActivationTime', 'update diagram');
```

Define conditional expressions using the variables and create variant controls.

```
Variant1 = Simulink.Variant('Fuel==3 && Emission==2');
Variant2 = Simulink.Variant('(Fuel==2 || Emission==1) && Ratio==2');
Variant3 = Simulink.Variant('Fuel==3 || Ratio==4');
```

### `Simulink.Variant` Objects for Variant Condition Reuse of Variant Blocks

After identifying the variant values that your model requires, you can construct complex variant conditions to control the activation of your variant blocks by defining variant conditions as `Simulink.Variant` objects. `Simulink.Variant` objects enable you to reuse common variant conditions across models and help you encapsulate complex variant condition expressions.

You can specify the whole of a variant condition expression or only the variant control variable inside the `Condition` property of the `Simulink.Variant` object.

**Note:**

- You can define a variant control variable of type `Simulink.Variant` only in the base workspace or in a data dictionary. Defining variant controls using `Simulink.Variant` objects in the mask or model workspace is not supported. For more information on storage locations for variant control variables, see “Storage Locations for Variant Control Variables (Operands) in Variant Blocks”.
- Using `Simulink.Variant` within structures is not supported.

Open the `slexVariantSubsystems` model.

```
open_system('slexVariantSubsystems');
```

```
VSS_MODE = 2
```

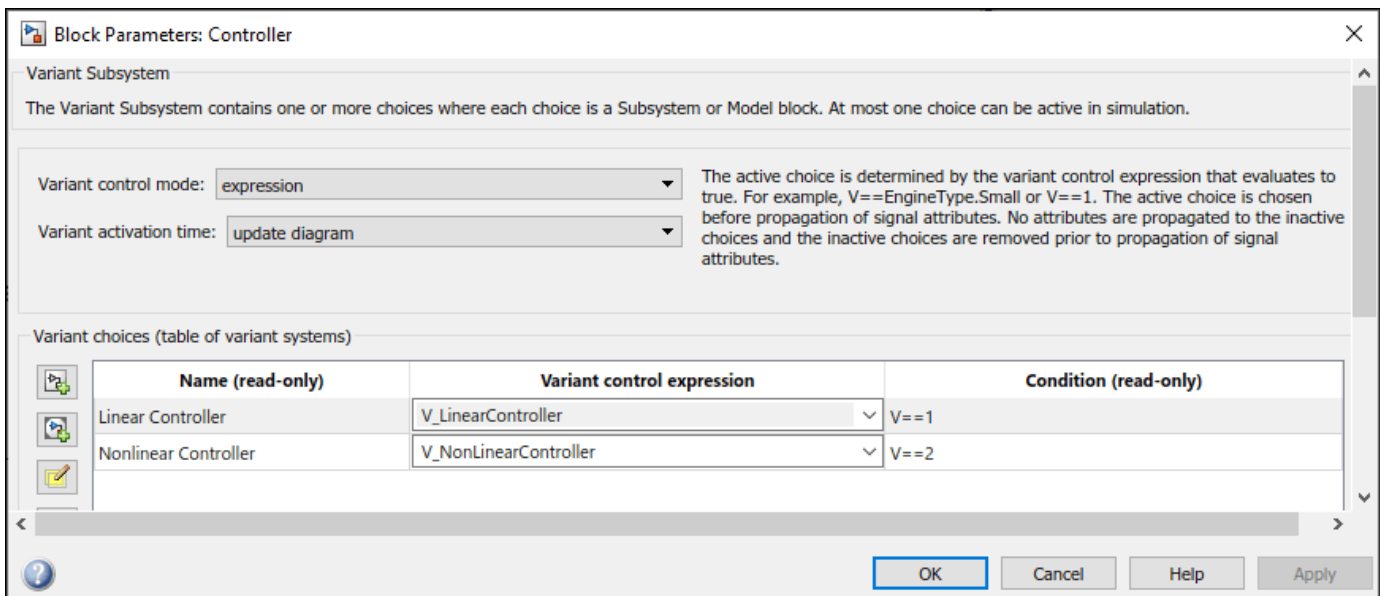

In the MATLAB® Command Window, define variant control expressions in `Simulink.Variant` objects.

```
V_LinearController = Simulink.Variant('V==1');
V_NonLinearController = Simulink.Variant('V==2');
```

Specify the `Simulink.Variant` objects as the variant control variables in the block parameters dialog box of the Controller block.

```
set_param('slexVariantSubsystems/Controller/Linear Controller', 'VariantControl', 'V_LinearController');
set_param('slexVariantSubsystems/Controller/Nonlinear Controller', 'VariantControl', 'V_NonLinearController');
```

Open the Block Parameters dialog box for the Controller block in the model. The **Condition** column of the **Variant Choices** table automatically shows the Boolean conditions that the `Simulink.Variant` objects represent.

Set the value of variant control variable `V` as 1 and simulate the model.

```
V = 1;
sim('slexVariantSubsystems');
```

During simulation, the Linear Controller block becomes active. Double-click the Controller block to see the active choice. Using this approach, you can develop complex variant condition expressions that are reusable.

# Simulink.VariantBank class

**Package:** Simulink

Group all variant parameter values in structure array in generated code

## Description

Use the `Simulink.VariantBank` class to group variant parameters (`Simulink.VariantVariable` objects) with the same variant conditions into a structure in generated code called a variant parameter bank.

To add a variant parameter to a variant parameter bank, set the `Bank` property of the `Simulink.VariantVariable` object to the name of the `Simulink.VariantBank` object. To specify code generation properties for a variant parameter bank, use the `Simulink.VariantBankCoderInfo` class.

When you generate code using Embedded Coder, `Simulink.VariantVariable` objects that are part of the same variant parameter bank appear in a structure. This structure is named according to the `Name` property of the parameter bank object. The code contains an array of this structure type and groups the choice values from the variant parameters based on the variant conditions specified for the parameter bank. Each set of values becomes an element of the structure array. The code uses a pointer variable to access the active set of values from the structure array. The code initializes this pointer based on variant conditions in the `model_initialize` function.

Variant parameter bank switching using a pointer variable avoids copying the choice values into the main program memory and improves the efficiency and readability of the generated code. Additionally, you can set code generation properties for the variant parameter bank, which allows you to customize code placement and specify the memory section to place the parameter values in the compiled code.

For information on code generation with variant parameter banks, see “Extended Capabilities” on page 5-0 .

---

**Note** You can use variant parameter banks only with variant parameters that have the variant activation time set to `startup`.

You must have Embedded Coder to switch variant parameter banks in generated code.

---

## Creation

### Description

`varparambank = Simulink.VariantBank` returns a `Simulink.VariantBank` object with default property values.

`varparambank = Simulink.VariantBank(Name=Value)` returns a `Simulink.VariantBank` object and sets properties using one or more name-value arguments.

## Properties

### Name — Name of variant parameter bank

' ' (default) | string | character vector

Name of the variant parameter bank, specified as a string or character vector.

In the code generated using Embedded Coder, this property is the name of the structure that represents the variant parameter bank.

Example: "EngineParams"

#### Attributes:

GetAccess	public
SetAccess	public

Data Types: string | char

### Description — Description of variant parameter bank

' ' (default) | string | character vector

Description of the variant parameter bank, specified as a string or character vector.

In the code generated using Embedded Coder, this description appears as a comment for the variant parameter bank structure type.

Example: "Engine parameters"

#### Attributes:

GetAccess	public
SetAccess	public

Data Types: string | char

### VariantConditions — List of variant conditions for variant parameter bank

[] (default) | cell array

List of variant conditions for the variant parameter bank, specified as a cell array of strings. These conditions must match the variant conditions of the `Simulink.VariantVariable` objects in this parameter bank, except any default variant choice specified using the `(default)` keyword.

When you use Embedded Coder, the generated code groups the choice values from the variant parameters in the parameter bank based on these variant conditions. Each set of these grouped values becomes an element of a structure array. During model initialization, Simulink selects the active set of parameter values from the structure array based on the variant condition that evaluates to `true`.

---

**Note** Variant parameter banks do not support the `(default)` variant condition in the `VariantConditions` property.

---

Example: {'V == 1', 'V == 2'}

**Attributes:**

GetAccess	public
SetAccess	public

Data Types: cell

**BankCoderInfo — Name of Simulink.VariantBankCoderInfo object**

'' (default) | string | character vector

Name of a `Simulink.VariantBankCoderInfo` object, specified as a string or character vector. You can use this object to specify code generation attributes for the variant parameter bank, including filenames for code placement and memory section to place parameter values.

---

**Note** You must not specify storage class using the `Specification` property of a `Simulink.VariantVariable` object if the object is part of a variant parameter bank. Use the `Simulink.VariantBankCoderInfo` class instead.

---

Example: 'vparambankcoderinfo'

**Attributes:**

GetAccess	public
SetAccess	public

Data Types: string | char

**Examples****Group Variant Parameter Values in Code Using Variant Parameter Bank**

This example shows you how to group variant parameters in the generated code by adding them to the same variant parameter bank (`Simulink.VariantBank`).

Create a variant parameter bank.

```
EngineParams = Simulink.VariantBank(Name='EngineParams', Description='Engine parameters', ...
 VariantConditions={'V == EngType.Small', 'V == EngType.Big'}
```

Create a variant control variable `V` using the `Simulink.VariantControl` class. The `Value` property of this object allows you to select an active value for a variant parameter and the `ActivationTime` property allows you to specify a variant activation time. Use this variable to specify the variant condition expression for the choice values of a variant parameter.

Create two variant parameter objects `K1` and `K2` and associate them with the variant parameter bank `EngineParams`.

Use the name of the variant parameter bank to set the `Bank` property of a `Simulink.VariantVariable` object. The generated code groups the `Simulink.VariantVariable` objects that share the same `Bank` property in the same structure.

```
V = Simulink.VariantControl(Value=EngType.Small, ActivationTime='startup');
K1 = Simulink.VariantVariable(Choices={'V == EngType.Small', 3, 'V == EngType.Big', 6}, Bank='Eng
K2 = Simulink.VariantVariable(Choices={'V == EngType.Small', [3, 6, 9], 'V == EngType.Big', [5, 1
```

To additionally specify code generation properties for a variant parameter bank, use the `Simulink.VariantBankCoderInfo` class.

### Specify Code Generation Properties for Variant Parameter Banks

Create a variant parameter bank.

```
EngineParams = Simulink.VariantBank(Name='EngineParams', ...
 Description='Engine parameters', ...
 VariantConditions={'V == EngType.Small', 'V == EngType.Big'});
```

To specify code generation properties for the variant parameter bank, create an object of the `Simulink.VariantBankCoderInfo` class.

You can control code placement by specifying the `HeaderFile` and `DefinitionFile` properties. You can specify the memory section to place the parameter values in the compiled code by providing code statements in the `PreStatement` and `PostStatement` properties.

```
EngineParamsCoderInfo = Simulink.VariantBankCoderInfo(HeaderFile='vparams.h', ...
 DefinitionFile='vparams.c', ...
 PreStatement='#pragma data_seg(.mydata)', ...
 PostStatement="#pragma end");
```

Use the name of the `Simulink.VariantBankCoderInfo` object to set the `BankCoderInfo` property of the variant bank object.

```
EngineParams.BankCoderInfo = 'EngineParamsCoderInfo';
```

Create a variant control variable `V` using the `Simulink.VariantControl` class. The `Value` property of this object allows you to select an active value for a variant parameter and the `ActivationTime` property allows you to specify a variant activation time. Use this variable to specify the variant condition expression for the choice values of a variant parameter.

Create two variant parameter objects `K1` and `K2` with variant activation time `startup` and associate them with the variant parameter bank `EngineParams`.

```
V = Simulink.VariantControl(Value=EngType.Small, ...
 ActivationTime='startup');
K1 = Simulink.VariantVariable(Choices={'V == EngType.Small', 3, 'V == EngType.Big', 6}, ...
 Bank='EngineParams');
K2 = Simulink.VariantVariable(Choices={'V == EngType.Small', [3, 6, 9], 'V == EngType.Big', [5, 1
 Bank='EngineParams');
```

Generate code from the model using Embedded Coder™. For information on how to generate code, see “Generate Code Using Embedded Coder” (Embedded Coder).

Because `K1` and `K2` have variant activation time set to `startup`, the code contains a structure `EngineParams`. The name of this structure is the same as the `Name` property of the parameter bank object. The structure definition is in the header file `vparams.h` and the structure array is in the definition file `vparams.c`.

```

/* vparams.h */

/* Variant parameter bank: EngineParams, for system '<Root>' */
typedef struct {
real_T K2[3]; /* Variable: K2
 * Referenced by: '<Root>/Gain1'
 */
real_T K1; /* Variable: K1
 * Referenced by: '<Root>/Gain'
 */
} EngineParams;

/* Variant parameter bank: EngineParams */

/* Variant parameter bank section */
#pragma data_seg(.mydata)

extern EngineParams EngineParams_ptr_impl[2];
extern EngineParams *EngineParams_ptr;

#pragma end

```

A structure array `EngineParams_ptr_impl` of type `EngineParams` contains choice values of `K1` and `K2`. The number of elements in the array depends on the number of variant conditions that you specify in the `VariantConditions` property of the parameter bank object.

```

/* vparams.c */

#pragma data_seg(.mydata)
EngineParams EngineParams_ptr_impl[2] = {
{
/* Variable: K2
 * Referenced by: '<Root>/Gain1'
 */
{ 5.0, 10.0, 15.0 },

/* Variable: K1
 * Referenced by: '<Root>/Gain'
 */
6.0
}, {
/* Variable: K2
 * Referenced by: '<Root>/Gain1'
 */
{ 3.0, 6.0, 9.0 },

/* Variable: K1
 * Referenced by: '<Root>/Gain'
 */
3.0
}
};

EngineParams *EngineParams_ptr = &EngineParams_ptr_impl[1];

#pragma end

```

The `var_param_bank_initialize` function initializes the structure pointer variable `EngineParams_ptr`. The code uses the pointer variable to access the active value set from the array based on variant conditions.

```
/* model.c */

/* Model step function */
void var_param_bank_step(void)
{
 /* Output: '<Root>/Out2' incorporates:
 * Gain: '<Root>/Gain1'
 * Inport: '<Root>/Input1'
 */
 var_param_bank_Y.Out2[0] = EngineParams_ptr->K2[0] * var_param_bank_U.Input1;
 var_param_bank_Y.Out2[1] = EngineParams_ptr->K2[1] * var_param_bank_U.Input1;
 var_param_bank_Y.Out2[2] = EngineParams_ptr->K2[2] * var_param_bank_U.Input1;

 /* Output: '<Root>/Out1' incorporates:
 * Gain: '<Root>/Gain'
 * Inport: '<Root>/Input'
 */
 var_param_bank_Y.Out1 = EngineParams_ptr->K1 * var_param_bank_U.Input;
}

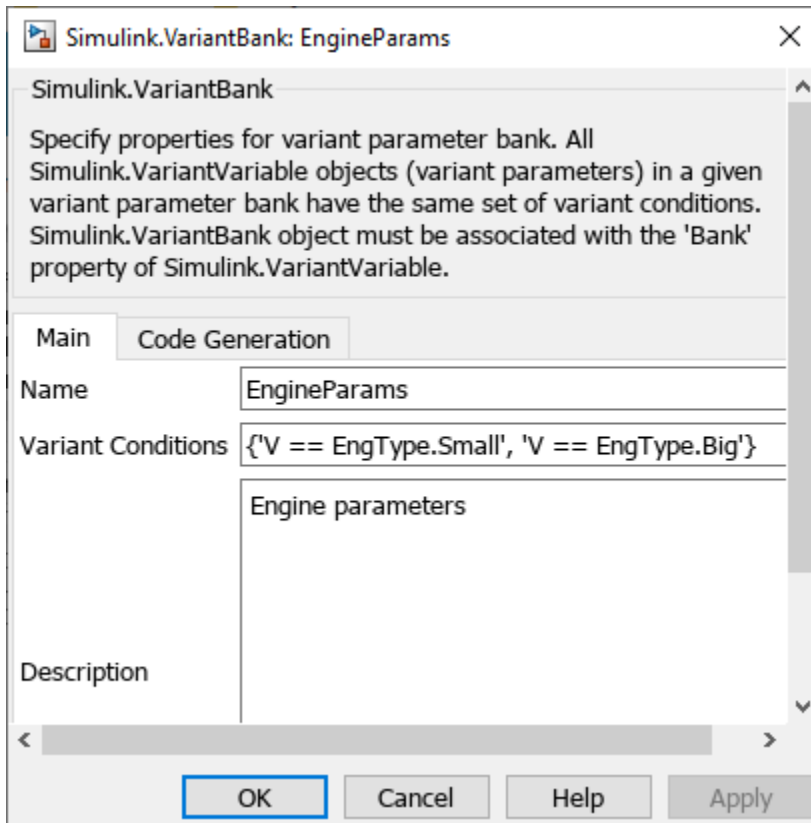

/* Model initialize function */
void var_param_bank_initialize(void)
{
 /* Variant Parameters startup activation time */
 if (V == EngType_Big) {
 EngineParams_ptr = &EngineParams_ptr_impl[0U];
 } else if (V == EngType_Small) {
 EngineParams_ptr = &EngineParams_ptr_impl[1U];
 }
 var_param_startupVariantChecker();
}
```

## Limitations

- Variant parameter banks do not support code generation for external mode operation over `tcpip` or `serial` protocols. These model configuration parameter settings in the **Code Generation > Interface** category correspond to this mode — **External mode** parameter set to `On` and **Transport layer** parameter set to `tcpip` or `serial`.
- Variant parameter banks do not support model hierarchies that contain referenced models.
- Variant parameters that are part of a variant parameter bank do not support AUTOSAR code generation.

## Tips

To modify a `Simulink.VariantBank` object, double-click the object to open the `Simulink.VariantBank` dialog box.

## Version History

Introduced in R2023a

## Extended Capabilities

### C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

For variant parameters that are part of a variant parameter bank and have startup activation time:

- Simulink Coder:

The generated code contains inlined values of the variant parameters in the `model_initialize` function.

- Embedded Coder:

The generated code contains the choice values grouped into a structure array based on the variant conditions. The code uses a pointer variable to access values from the structure array.

- Code generation with C++ class interface:

When you use Embedded Coder to generate C++ code with the **Code interface packaging** model configuration parameter set to `C++ class`, the **Include model types in model class** parameter has no effect on the generated code. Regardless of the setting of this parameter, the code generator places the type definitions of variant parameter banks in a separate header file.

- Code generation when variant parameter contains default variant condition:

A `Simulink.VariantVariable` object that is part of a variant bank allows the (default) variant condition for its choice conditions. However, a variant parameter bank does not support (default) in its `VariantConditions` property.

Consider this example with two variant parameters K1 and K2 that are part of the same variant bank. K1 defines a value for the condition `V == EngType.Small` and a value for the (default) condition. Similarly, K2 defines values for the variant conditions `V == EngType.Big` and (default).

```
% Define variant parameter bank
EngineParams = Simulink.VariantBank('Name','EngineParams', 'Description', ...
 'Engine parameters', 'VariantConditions', {'V == EngType.Small', 'V == EngType.Big'});

% Define Bank CoderInfo
EngineParamsCoderInfo = Simulink.VariantBankCoderInfo('HeaderFile','vparams.h',...
 'DefinitionFile','vparams.cpp', 'PreStatement', '#pragma data_seg(.mydata)');
EngineParams.BankCoderInfo = 'EngineParamsCoderInfo';

% Define variant parameters
V = Simulink.VariantControl('Value', EngType.Small, 'ActivationTime', 'startup');
K1 = Simulink.VariantVariable('Choices', {'V == EngType.Small', 3, '(default)', 6},...
 'Bank', 'EngineParams');
K2 = Simulink.VariantVariable("Choices", {'(default)', [3,6,9], 'V == EngType.Big', [5,10,15]},...
 'Bank', 'EngineParams');
```

When you generate code using Embedded Coder, the structure array contains the default value if a value corresponding to a parameter bank variant condition is not found in the variant parameter.

```
//vparams.cpp
EngineParams EngineParams_ptr_impl[2] = {
 {
 // Variable: K2
 // Referenced by: '<Root>/Gain1'

 { 5.0, 10.0, 15.0 },

 // Variable: K1
 // Referenced by: '<Root>/Gain'

 6.0
 }, {
 // Variable: K2
 // Referenced by: '<Root>/Gain1'

 { 3.0, 6.0, 9.0 },

 // Variable: K1
 // Referenced by: '<Root>/Gain'

 3.0
 }
};
```

## Simulink.VariantBankCoderInfo class

**Package:** Simulink

Specify code generation properties for variant parameter bank

### Description

Use the `Simulink.VariantBankCoderInfo` class to specify code generation properties for `Simulink.VariantBank` objects. You can use this class to customize code placement and specify the memory section to place variant parameter values in compiled code.

To specify code generation properties for a variant parameter bank, create an object of the `Simulink.VariantBankCoderInfo` class. Use the name of this object to set the `BankCoderInfo` property of the `Simulink.VariantBank` object.

---

**Note** You cannot specify storage class using the `Specification` property of a `Simulink.VariantVariable` object if the object is part of a variant parameter bank.

---

### Creation

#### Description

`varParamBankCoderInfo = Simulink.VariantBankCoderInfo` returns a `Simulink.VariantBankCoderInfo` object with default property values.

`varParamBankCoderInfo = Simulink.VariantBankCoderInfo(Name=Value)` returns a `Simulink.VariantBankCoderInfo` object and sets properties using one or more name-value arguments.

### Properties

#### HeaderFile — Name of header file

' ' (default) | string | character vector

Name of the header file where the code generator places the type definition and data declarations of the variant parameter bank, specified as a string or character vector.

Example: `'variant_params.h'`

#### Attributes:

<code>GetAccess</code>	<code>public</code>
<code>SetAccess</code>	<code>public</code>

Data Types: string | char

#### DefinitionFile — Name of definition file

' ' (default) | string | character vector

Name of the definition file where the code generator places the structure array containing the variant parameter choice values, specified as a string or character vector.

Example: 'variant\_params.c'

**Attributes:**

GetAccess	public
SetAccess	public

Data Types: string | char

**PreStatement — Code to insert before variant parameter bank data definition or declarations**

' ' (default) | string | character vector

Code to insert before the variant parameter bank data definition or declarations in the header or definition file, respectively, specified as a string or character vector.

Example: '#pragma data\_seg(".mydata")'

**Attributes:**

GetAccess	public
SetAccess	public

Data Types: string | char

**PostStatement — Code to insert after variant parameter bank data definition or declarations**

' ' (default) | string | character vector

Code to insert after the variant parameter bank data definition or declarations in the header or definition file, respectively, specified as a string or character vector.

Example: '#pragma end'

**Attributes:**

GetAccess	public
SetAccess	public

Data Types: string | char

## Examples

### Specify Code Generation Properties for Variant Parameter Banks

Create a variant parameter bank.

```
EngineParams = Simulink.VariantBank(Name='EngineParams', ...
 Description='Engine parameters', ...
 VariantConditions={'V == EngType.Small', 'V == EngType.Big'});
```

To specify code generation properties for the variant parameter bank, create an object of the Simulink.VariantBankCoderInfo class.

You can control code placement by specifying the `HeaderFile` and `DefinitionFile` properties. You can specify the memory section to place the parameter values in the compiled code by providing code statements in the `PreStatement` and `PostStatement` properties.

```
EngineParamsCoderInfo = Simulink.VariantBankCoderInfo(HeaderFile='vparams.h', ...
 DefinitionFile='vparams.c', ...
 PreStatement='#pragma data_seg(.mydata)', ...
 PostStatement="#pragma end");
```

Use the name of the `Simulink.VariantBankCoderInfo` object to set the `BankCoderInfo` property of the variant bank object.

```
EngineParams.BankCoderInfo = 'EngineParamsCoderInfo';
```

Create a variant control variable `V` using the `Simulink.VariantControl` class. The `Value` property of this object allows you to select an active value for a variant parameter and the `ActivationTime` property allows you to specify a variant activation time. Use this variable to specify the variant condition expression for the choice values of a variant parameter.

Create two variant parameter objects `K1` and `K2` with variant activation time `startup` and associate them with the variant parameter bank `EngineParams`.

```
V = Simulink.VariantControl(Value=EngType.Small, ...
 ActivationTime='startup');
K1 = Simulink.VariantVariable(Choices={'V == EngType.Small', 3, 'V == EngType.Big', 6}, ...
 Bank='EngineParams');
K2 = Simulink.VariantVariable(Choices={'V == EngType.Small', [3, 6, 9], 'V == EngType.Big', [5, 6]}, ...
 Bank='EngineParams');
```

Generate code from the model using Embedded Coder™. For information on how to generate code, see “Generate Code Using Embedded Coder” (Embedded Coder).

Because `K1` and `K2` have variant activation time set to `startup`, the code contains a structure `EngineParams`. The name of this structure is the same as the `Name` property of the parameter bank object. The structure definition is in the header file `vparams.h` and the structure array is in the definition file `vparams.c`.

```
/* vparams.h */

/* Variant parameter bank: EngineParams, for system '<Root>' */
typedef struct {
 real_T K2[3]; /* Variable: K2
 * Referenced by: '<Root>/Gain1'
 */
 real_T K1; /* Variable: K1
 * Referenced by: '<Root>/Gain'
 */
} EngineParams;

/* Variant parameter bank: EngineParams */

/* Variant parameter bank section */
#pragma data_seg(.mydata)

extern EngineParams EngineParams_ptr_impl[2];
extern EngineParams *EngineParams_ptr;

#pragma end
```

A structure array `EngineParams_ptr_impl` of type `EngineParams` contains choice values of `K1` and `K2`. The number of elements in the array depends on the number of variant conditions that you specify in the `VariantConditions` property of the parameter bank object.

```

/* vparams.c */

#pragma data_seg(.mydata)
EngineParams EngineParams_ptr_impl[2] = {
{
/* Variable: K2
* Referenced by: '<Root>/Gain1'
*/
{ 5.0, 10.0, 15.0 },

/* Variable: K1
* Referenced by: '<Root>/Gain'
*/
6.0
}, {
/* Variable: K2
* Referenced by: '<Root>/Gain1'
*/
{ 3.0, 6.0, 9.0 },

/* Variable: K1
* Referenced by: '<Root>/Gain'
*/
3.0
}
};

EngineParams *EngineParams_ptr = &EngineParams_ptr_impl[1];

#pragma end

```

The `var_param_bank_initialize` function initializes the structure pointer variable `EngineParams_ptr`. The code uses the pointer variable to access the active value set from the array based on variant conditions.

```

/* model.c */

/* Model step function */
void var_param_bank_step(void)
{
/* Output: '<Root>/Out2' incorporates:
* Gain: '<Root>/Gain1'
* Inport: '<Root>/Input1'
*/
var_param_bank_Y.Out2[0] = EngineParams_ptr->K2[0] * var_param_bank_U.Input1;
var_param_bank_Y.Out2[1] = EngineParams_ptr->K2[1] * var_param_bank_U.Input1;
var_param_bank_Y.Out2[2] = EngineParams_ptr->K2[2] * var_param_bank_U.Input1;

/* Output: '<Root>/Out1' incorporates:
* Gain: '<Root>/Gain'
* Inport: '<Root>/Input'
*/
var_param_bank_Y.Out1 = EngineParams_ptr->K1 * var_param_bank_U.Input;
}

```

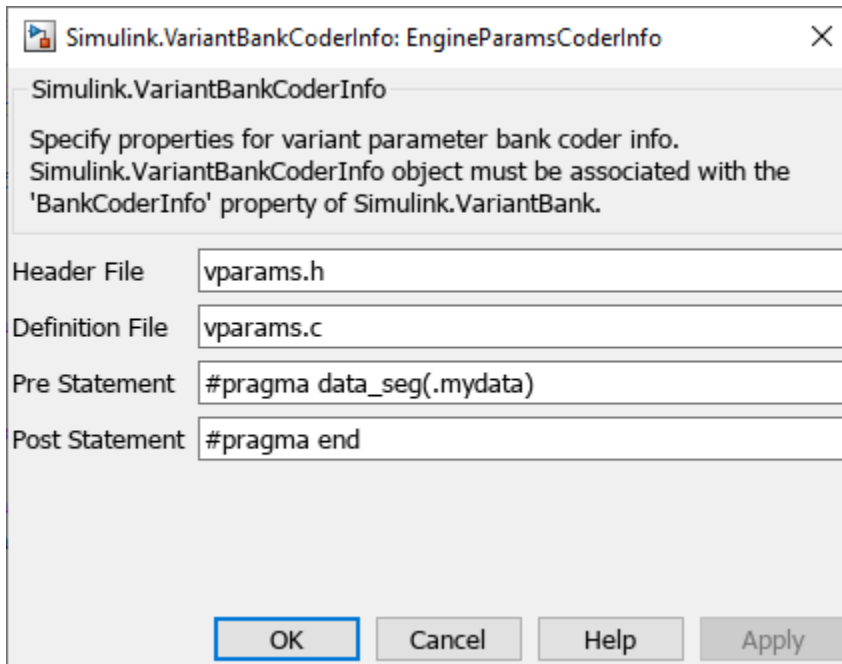

```

/* Model initialize function */
void var_param_bank_initialize(void)
{
 /* Variant Parameters startup activation time */
 if (V == EngType_Big) {
 EngineParams_ptr = &EngineParams_ptr_impl[0U];
 } else if (V == EngType_Small) {
 EngineParams_ptr = &EngineParams_ptr_impl[1U];
 }
 var_param_startupVariantChecker();
}

```

## Tips

To modify a `Simulink.VariantBankCoderInfo` object, double-click the object to open the `Simulink.VariantBankCoderInfo` dialog box.

# Simulink.VariantConfigurationAnalysis class

**Package:** Simulink

Analyze variant configurations programmatically

## Description

---

**Note** This class requires Variant Manager for Simulink.

---

Use the `Simulink.VariantConfigurationAnalysis` class to analyze variant configurations for a model by specifying either named variant configurations or variable groups. The class returns a variant configuration analysis object and has methods that can be used to:

- Get the list of active blocks in a variant configuration.
- Find blocks that are active across all variant configurations.
- Find blocks that are inactive in all variant configurations.
- Get the list of blocks that differ in active choice between variant configurations.
- Get the list of dependent models for a variant configuration.
- Get the list of dependent libraries that are used in a variant configuration.
- View the variant configuration analysis report.
- Hide the variant configuration analysis report.
- View variant conditions on a block in a given variant configuration.

## Creation

`varConfigObj = Simulink.VariantConfigurationAnalysis(model,Name,Value)` returns a variant configuration analysis object for the model specified by `model` and sets the `ModelName` and `Configurations` properties.

### Input Arguments

#### Name-Value Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `'NamedConfigurations', {'config1', 'config2'}`

#### **NamedConfigurations — Names of variant configurations**

string | cell array of strings

Names of variant configurations, specified as a string or a cell array of strings. Use this argument to perform the analysis by specifying named variant configurations defined for the model.

You can use Variant Manager to create named variant configurations for a model, save them in a variant configuration object of type `Simulink.VariantConfigurationData`, and associate this object with the model. You can specify one or more configuration names defined in this variant configuration object for the analysis.

---

**Note** If the model is associated with a variant configuration object, then the `VariantConfigurationObject` model parameter contains the name of the corresponding variant configuration object.

---

Example: `NamedConfigurations={'config1', 'config2'}`

### VariableGroups — Variant control variable names and values

struct array

Variant control variable names and values, specified as a struct array. Use this argument to perform the analysis by specifying values for the variant control variables used by the model.

You can specify multiple variable groups that represent the different variant configurations to be analyzed. In each variable group, you must specify the variant control variables and their values that must be used for the analysis.

To define the variable groups, provide a struct array with these fields:

- **Name** — Name of variable group
- **VariantControls** — Cell array with variant control variable names and their values

Example: `'VariableGroups',[struct('Name', 'V1W1',... 'VariantControls', {'V',1,'W',1})),struct('Name', 'V1W2',... 'VariantControls', {'V',1,'W',2})]`

---

**Note** Specifying both `NamedConfigurations` and `VariableGroups` is not supported.

---

## Properties

### ModelName — Name of the model

character vector

Name of model to be analyzed, specified as a character vector.

Example: `'slxVariantReducer'`

#### Attributes:

GetAccess	public
SetAccess	private

Data Types: character vector

**Configurations — Names of variant configurations or variable groups**

cell array of strings

Names of variant configurations or variable groups to be analyzed, specified as a cell array of strings.

Example: {'config1', 'config2'}

**Attributes:**

GetAccess	public
SetAccess	private

Data Types: character vector

**Methods****Public Methods**

getActiveBlocks	List of active blocks in a named variant configuration
getAlwaysActiveBlocks	List of blocks that are always active across named variant configurations
getBlockDifferences	List of blocks that differ in their active choice between multiple named variant configurations
getDependentLibraries	List of libraries that are used in a named variant configuration
getDependentModels	List of dependent models that are used in a named variant configuration
getNeverActiveBlocks	List of blocks that are inactive in named variant configurations
getVariantCondition	Variant condition on a block in a named variant configuration
hideUI	Hide variant configuration analysis report for a model
showUI	Show variant configuration analysis report for a model

**Examples****Create Variant Configuration Analysis Object for Model**

Create a variant configuration analysis object by specifying either named variant configurations or variable groups.

Open the model `slexVariantReducer`.

```
open_system('slexVariantReducer');
```

The model has two named variant configurations, `config1` and `config2`. The named configurations are saved in a variant configuration object, `slexVariantReducer_config`, associated with the model.

Analyze the model using the named configurations.

```
VarConfigObjnc = Simulink.VariantConfigurationAnalysis('slexVariantReducer', ...
 'NamedConfigurations',{'config1', 'config2'})
```

```
VarConfigObjnc =
 VariantConfigurationAnalysis with properties:
```

```
 ModelName: 'slexVariantReducer'
 Configurations: {'config1' 'config2'}
```

Next, specify variable groups for analysis.

The `slexVariantReducer` model contains two variant control variables V and W.

Analyze the model using two variable groups, V1W1 and V2W2:

```
VarConfigObjvg = Simulink.VariantConfigurationAnalysis(...
 'slexVariantReducer',...
 'VariableGroups',[struct('Name','V1W1','VariantControls',{ 'V',1,'W',1})
 struct('Name','V1W2','VariantControls',{ 'V',1,'W',2})])
```

```
VarConfigObjvg =
 VariantConfigurationAnalysis with properties:
```

```
 ModelName: 'slexVariantReducer'
 Configurations: {'V1W1' 'V1W2'}
```

## getActiveBlocks

**Class:** Simulink.VariantConfigurationAnalysis

**Package:** Simulink

List of active blocks in a named variant configuration

### Syntax

```
activeBlocks = varConfigObj.getActiveBlocks(configName)
```

### Description

Use this method to find the active blocks in a named variant configuration after analyzing it using the `Simulink.VariantConfigurationAnalysis` class. You must create a variant configuration analysis object of type `Simulink.VariantConfigurationAnalysis` for a model and use it to analyze the required named variant configurations for that model before calling the `getActiveBlocks` method.

---

**Note** This method requires Variant Manager for Simulink.

---

`activeBlocks = varConfigObj.getActiveBlocks(configName)` returns the list of active blocks in the variant configuration named `configName`. `varConfigObj` is the `VariantConfigurationAnalysis` object for a model.

### Input Arguments

**configName** — Name of variant configuration

character vector | string

Name of the variant configuration for which you want to find the active blocks, specified as a character vector. You must analyze this configuration using the `Simulink.VariantConfigurationAnalysis` class first.

### Output Arguments

**activeBlocks** — List of active blocks

cell array

List of active blocks in the input variant configuration, returned as a cell array.

### Examples

#### Analyze Variant Configurations Programmatically

This example shows how to use the `Simulink.VariantConfigurationAnalysis` class to analyze variant configurations programmatically.

To analyze variant configurations using Variant Manager, see “Analyze Variant Configurations in Models Containing Variant Blocks”.

Open the model `slexVariantConfigurationAnalysis`.

```
open_system('slexVariantConfigurationAnalysis');
```

You can provide either a list of named variant configurations or the variable groups to analyze to the `Simulink.VariantConfigurationAnalysis` class. The operation returns a variant configuration analysis object for the model.

```
varConfigObjNamedConfig = Simulink.VariantConfigurationAnalysis('slexVariantConfigurationAnalysis',
 'NamedConfigurations', {'VendorACtrlLinear', ...
 'VendorACtrlNonLinear', 'VendorACtrlFuzzy'})
```

```
varConfigObjNamedConfig =
 VariantConfigurationAnalysis with properties:
```

```
 ModelName: 'slexVariantConfigurationAnalysis'
 Configurations: {'VendorACtrlFuzzy' 'VendorACtrlLinear' 'VendorACtrlNonLinear'}
```

```
varConfigObjVarGroup = Simulink.VariantConfigurationAnalysis('slexVariantConfigurationAnalysis',
 'VariableGroups', [struct('Name', 'VendorANonLinear',...
 'VariantControls', {'CONTROLLER', 1, 'EXTERNAL_SENSOR', 1, 'ORDER', 1,
 struct('Name', 'VendorALinear',...
 'VariantControls', {'CONTROLLER', 0, 'EXTERNAL_SENSOR', 1, 'ORDER', 1
```

You can use the variant configuration analysis object to analyze the variant configurations using different methods specified in the following steps.

Get the list of active blocks in the variant configuration `VendorACtrlLinear`.

```
activeblocks = varConfigObjNamedConfig.getActiveBlocks('VendorACtrlLinear');
```

Get the list of blocks that are always active across all the named variant configurations that have been analyzed.

```
alwaysActiveBlocks = varConfigObjNamedConfig.getAlwaysActiveBlocks();
```

Get the list of blocks that are active in some of the analyzed variant configurations and inactive in other configurations.

```
getBlockDifferences = varConfigObjNamedConfig.getBlockDifferences();
```

Get the list of dependent libraries for a variant configuration.

```
dependentLibraries = varConfigObjNamedConfig.getDependentLibraries('VendorACtrlNonLinear');
```

Get the list of dependent models for a variant configuration.

```
dependentModels = varConfigObjNamedConfig.getDependentModels('VendorACtrlFuzzy');
```

Get the list of blocks that are inactive in all the named variant configurations that have been analyzed.

```
neverActiveBlocks = varConfigObjNamedConfig.getNeverActiveBlocks();
```

Get the variant condition on a block in a named variant configuration.

```
variantCondition = varConfigObjNamedConfig.getVariantCondition('VendorACtrlNonLinear',...
'slexVariantConfigurationAnalysis/Controller/NonLinear');
```

Show the variant configuration analysis report for a model after analyzing it.

```
varConfigObjNamedConfig.showUI();
```

Hide the variant configuration analysis report for a model after analyzing it.

```
varConfigObjNamedConfig.hideUI();
```

# getAlwaysActiveBlocks

**Class:** Simulink.VariantConfigurationAnalysis

**Package:** Simulink

List of blocks that are always active across named variant configurations

## Syntax

```
alwaysActiveBlocks = varConfigObj.getAlwaysActiveBlocks()
```

## Description

Use this method to find the blocks that are always active across all named variant configurations after analyzing them using the `Simulink.VariantConfigurationAnalysis` class. You must create a variant configuration analysis object of type `Simulink.VariantConfigurationAnalysis` for a model and use it to analyze the required named variant configurations for that model before calling the `getAlwaysActiveBlocks` method.

---

**Note** This method requires Variant Manager for Simulink.

---

`alwaysActiveBlocks = varConfigObj.getAlwaysActiveBlocks()` returns the list of blocks that are always active across all the named variant configurations that have been analyzed using a `VariantConfigurationAnalysis` object. `varConfigObj` is the `VariantConfigurationAnalysis` object for a model.

## Output Arguments

**alwaysActiveBlocks** — List of blocks that are always active

cell array

List of blocks that are active across all the named variant configurations that are analyzed, returned as a cell array.

## Examples

### Analyze Variant Configurations Programmatically

This example shows how to use the `Simulink.VariantConfigurationAnalysis` class to analyze variant configurations programmatically.

To analyze variant configurations using Variant Manager, see “Analyze Variant Configurations in Models Containing Variant Blocks”.

Open the model `slexVariantConfigurationAnalysis`.

```
open_system('slexVariantConfigurationAnalysis');
```

You can provide either a list of named variant configurations or the variable groups to analyze to the `Simulink.VariantConfigurationAnalysis` class. The operation returns a variant configuration analysis object for the model.

```
varConfigObjNamedConfig = Simulink.VariantConfigurationAnalysis('slexVariantConfigurationAnalysis',
 'NamedConfigurations', {'VendorACtrlLinear', ...
 'VendorACtrlNonLinear', 'VendorACtrlFuzzy'})
```

```
varConfigObjNamedConfig =
 VariantConfigurationAnalysis with properties:

 ModelName: 'slexVariantConfigurationAnalysis'
 Configurations: {'VendorACtrlFuzzy' 'VendorACtrlLinear' 'VendorACtrlNonLinear'}
```

```
varConfigObjVarGroup = Simulink.VariantConfigurationAnalysis('slexVariantConfigurationAnalysis',
 'VariableGroups', [struct('Name', 'VendorANonLinear', ...
 'VariantControls', {'CONTROLLER', 1, 'EXTERNAL_SENSOR', 1, 'ORDER', 1},
 struct('Name', 'VendorALinear', ...
 'VariantControls', {'CONTROLLER', 0, 'EXTERNAL_SENSOR', 1, 'ORDER', 1})])
```

You can use the variant configuration analysis object to analyze the variant configurations using different methods specified in the following steps.

Get the list of active blocks in the variant configuration `VendorACtrlLinear`.

```
activeBlocks = varConfigObjNamedConfig.getActiveBlocks('VendorACtrlLinear');
```

Get the list of blocks that are always active across all the named variant configurations that have been analyzed.

```
alwaysActiveBlocks = varConfigObjNamedConfig.getAlwaysActiveBlocks();
```

Get the list of blocks that are active in some of the analyzed variant configurations and inactive in other configurations.

```
getBlockDifferences = varConfigObjNamedConfig.getBlockDifferences();
```

Get the list of dependent libraries for a variant configuration.

```
dependentLibraries = varConfigObjNamedConfig.getDependentLibraries('VendorACtrlNonLinear');
```

Get the list of dependent models for a variant configuration.

```
dependentModels = varConfigObjNamedConfig.getDependentModels('VendorACtrlFuzzy');
```

Get the list of blocks that are inactive in all the named variant configurations that have been analyzed.

```
neverActiveBlocks = varConfigObjNamedConfig.getNeverActiveBlocks();
```

Get the variant condition on a block in a named variant configuration.

```
variantCondition = varConfigObjNamedConfig.getVariantCondition('VendorACtrlNonLinear', ...
 'slexVariantConfigurationAnalysis/Controller/NonLinear');
```

Show the variant configuration analysis report for a model after analyzing it.

```
varConfigObjNamedConfig.showUI();
```

Hide the variant configuration analysis report for a model after analyzing it.

```
varConfigObjNamedConfig.hideUI();
```

## getBlockDifferences

**Class:** Simulink.VariantConfigurationAnalysis

**Package:** Simulink

List of blocks that differ in their active choice between multiple named variant configurations

### Syntax

```
getBlockDifferences = varConfigObj.getBlockDifferences()
```

### Description

Use this method to find the blocks that differ in their active choice between all named variant configurations after analyzing them using the `Simulink.VariantConfigurationAnalysis` class. You must create a variant configuration analysis object of type `Simulink.VariantConfigurationAnalysis` for a model and use it to analyze the required named variant configurations for that model before calling the `getBlockDifferences` method.

---

**Note** This method requires Variant Manager for Simulink.

---

`getBlockDifferences = varConfigObj.getBlockDifferences()` returns a list of blocks that are active in some of the analyzed variant configurations and inactive in other configurations. `varConfigObj` is the `VariantConfigurationAnalysis` object for a model.

### Output Arguments

**getBlockDifferences** — List of blocks that differ in active choice

cell array

List of blocks that differ in active choice between variant configurations, returned as a cell array.

### Examples

#### Analyze Variant Configurations Programmatically

# getDependentLibraries

**Class:** Simulink.VariantConfigurationAnalysis

**Package:** Simulink

List of libraries that are used in a named variant configuration

## Syntax

```
dependentLibraries = varConfigObj.getDependentLibraries(configName)
```

## Description

Use this method to find the libraries used in a named variant configuration after analyzing it using the `Simulink.VariantConfigurationAnalysis` class. You must create a variant configuration analysis object of type `Simulink.VariantConfigurationAnalysis` for a model and use it to analyze the required named variant configurations for that model before calling the `getDependentLibraries` method.

---

**Note** This method requires Variant Manager for Simulink.

---

`dependentLibraries = varConfigObj.getDependentLibraries(configName)` returns a list of libraries that are used in the variant configuration named `configName`. `varConfigObj` is the `VariantConfigurationAnalysis` object for a model.

## Input Arguments

**configName — Name of variant configuration**

character vector | string

Name of the variant configuration for which you want to find the dependent libraries, specified as a character vector. You must analyze this configuration using the `Simulink.VariantConfigurationAnalysis` class first.

## Output Arguments

**dependentLibraries — List of libraries**

cell array

List of dependent libraries, returned as a cell array.

## Examples

### Analyze Variant Configurations Programmatically

## getDependentModels

**Class:** Simulink.VariantConfigurationAnalysis

**Package:** Simulink

List of dependent models that are used in a named variant configuration

### Syntax

```
dependentModels = varConfigObj.getDependentModels(configName)
```

### Description

Use this method to find the dependent models used in a named variant configuration after analyzing it using the `Simulink.VariantConfigurationAnalysis` class. You must create a variant configuration analysis object of type `Simulink.VariantConfigurationAnalysis` for a model and use it to analyze the required named variant configurations for that model before calling the `getDependentModels` method.

---

**Note** This method requires Variant Manager for Simulink.

---

`dependentModels = varConfigObj.getDependentModels(configName)` returns a list of dependent models that are used in the variant configuration named `configName`. `varConfigObj` is the `VariantConfigurationAnalysis` object for a model.

### Input Arguments

**configName — Variant configuration name**

character vector | string

Name of the variant configuration for which you want to find the dependent models, specified as a character vector. You must analyze this configuration using the `Simulink.VariantConfigurationAnalysis` class first.

### Output Arguments

**dependentModels — List of models**

cell array

List of dependent models, returned as a cell array.

### Examples

#### Analyze Variant Configurations Programmatically

This example shows how to use the `Simulink.VariantConfigurationAnalysis` class to analyze variant configurations programmatically.

To analyze variant configurations using Variant Manager, see “Analyze Variant Configurations in Models Containing Variant Blocks”.

Open the model `slexVariantConfigurationAnalysis`.

```
open_system('slexVariantConfigurationAnalysis');
```

You can provide either a list of named variant configurations or the variable groups to analyze to the `Simulink.VariantConfigurationAnalysis` class. The operation returns a variant configuration analysis object for the model.

```
varConfigObjNamedConfig = Simulink.VariantConfigurationAnalysis('slexVariantConfigurationAnalysis',
 'NamedConfigurations', {'VendorACtrlLinear', ...
 'VendorACtrlNonLinear', 'VendorACtrlFuzzy'})
```

```
varConfigObjNamedConfig =
 VariantConfigurationAnalysis with properties:
```

```
 ModelName: 'slexVariantConfigurationAnalysis'
 Configurations: {'VendorACtrlFuzzy' 'VendorACtrlLinear' 'VendorACtrlNonLinear'}
```

```
varConfigObjVarGroup = Simulink.VariantConfigurationAnalysis('slexVariantConfigurationAnalysis',
 'VariableGroups', [struct('Name', 'VendorANonLinear',...
 'VariantControls', {'CONTROLLER', 1, 'EXTERNAL_SENSOR', 1, 'ORDER', 1,
 struct('Name', 'VendorALinear',...
 'VariantControls', {'CONTROLLER', 0, 'EXTERNAL_SENSOR', 1, 'ORDER', 1
```

You can use the variant configuration analysis object to analyze the variant configurations using different methods specified in the following steps.

Get the list of active blocks in the variant configuration `VendorACtrlLinear`.

```

# getNeverActiveBlocks

**Class:** Simulink.VariantConfigurationAnalysis

**Package:** Simulink

List of blocks that are inactive in named variant configurations

## Syntax

```
getNeverActiveBlocks = varConfigObj.getNeverActiveBlocks()
```

## Description

Use this method to find the blocks that are always inactive across all named variant configurations after analyzing them using the `Simulink.VariantConfigurationAnalysis` class. You must create a variant configuration analysis object of type `Simulink.VariantConfigurationAnalysis` for a model and use it to analyze the required named variant configurations for that model before calling the `getNeverActiveBlocks` method.

---

**Note** This method requires Variant Manager for Simulink.

---

`getNeverActiveBlocks = varConfigObj.getNeverActiveBlocks()` returns a list of blocks that are inactive in all the named variant configurations that have been analyzed using a `VariantConfigurationAnalysis` object. `varConfigObj` is the `VariantConfigurationAnalysis` object for a model.

## Output Arguments

**neverActiveBlocks** — List of never active blocks

cell array

List of blocks that are never active in all the named variant configurations that are analyzed, returned as a cell array.

## Examples

### Analyze Variant Configurations Programmatically

This example shows how to use the `Simulink.VariantConfigurationAnalysis` class to analyze variant configurations programmatically.

To analyze variant configurations using Variant Manager, see “Analyze Variant Configurations in Models Containing Variant Blocks”.

Open the model `slexVariantConfigurationAnalysis`.

```
open_system('slexVariantConfigurationAnalysis');
```

You can provide either a list of named variant configurations or the variable groups to analyze to the `Simulink.VariantConfigurationAnalysis` class. The operation returns a variant configuration analysis object for the model.

```
varConfigObjNamedConfig = Simulink.VariantConfigurationAnalysis('slexVariantConfigurationAnalysis',
 'NamedConfigurations', {'VendorACtrlLinear', ...
 'VendorACtrlNonLinear', 'VendorACtrlFuzzy'})
```

```
varConfigObjNamedConfig =
 VariantConfigurationAnalysis with properties:
```

```
 ModelName: 'slexVariantConfigurationAnalysis'
 Configurations: {'VendorACtrlFuzzy' 'VendorACtrlLinear' 'VendorACtrlNonLinear'}
```

```
varConfigObjVarGroup = Simulink.VariantConfigurationAnalysis('slexVariantConfigurationAnalysis',
 'VariableGroups', [struct('Name', 'VendorANonLinear', ...
 'VariantControls', {'CONTROLLER', 1, 'EXTERNAL_SENSOR', 1, 'ORDER', 1},

## getVariantCondition

**Class:** Simulink.VariantConfigurationAnalysis

**Package:** Simulink

Variant condition on a block in a named variant configuration

### Syntax

```
variantCondition = varConfigObj.getVariantCondition(configName,blockName)
```

### Description

Use this method to find the variant condition on a block in a named variant configuration after analyzing it using the `Simulink.VariantConfigurationAnalysis` class. You must create a variant configuration analysis object of type `Simulink.VariantConfigurationAnalysis` for a model and use it to analyze the required named variant configurations for that model before calling the `getVariantCondition` method.

---

**Note** This method requires Variant Manager for Simulink.

---

`variantCondition = varConfigObj.getVariantCondition(configName,blockName)`, returns the variant condition on the block `blockName` in the named variant configuration `configName`. `varConfigObj` is the `VariantConfigurationAnalysis` object for a model.

### Input Arguments

**configName — Name of variant configuration**

character vector | string

Name of the variant configuration, specified as a character vector. You must analyze this configuration using the `Simulink.VariantConfigurationAnalysis` class first.

**blockName — Name of block**

character vector | string

Name of the block for which you want to find the variant condition, specified as character vector of block path.

### Output Arguments

**variantCondition — Variant condition on a block**

cell array

Variant condition on the block in the given variant configuration, returned as cell array.

### Examples

## Analyze Variant Configurations Programmatically

This example shows how to use the `Simulink.VariantConfigurationAnalysis` class to analyze variant configurations programmatically.

To analyze variant configurations using Variant Manager, see “Analyze Variant Configurations in Models Containing Variant Blocks”.

Open the model `slexVariantConfigurationAnalysis`.

```
open_system('slexVariantConfigurationAnalysis');
```

You can provide either a list of named variant configurations or the variable groups to analyze to the `Simulink.VariantConfigurationAnalysis` class. The operation returns a variant configuration analysis object for the model.

```
varConfigObjNamedConfig = Simulink.VariantConfigurationAnalysis('slexVariantConfigurationAnalysis',

# hideUI

**Class:** Simulink.VariantConfigurationAnalysis

**Package:** Simulink

Hide variant configuration analysis report for a model

## Syntax

```
varConfigObj.hideUI()
```

## Description

Use this method to hide the variant configuration analysis report for a model after analyzing it using the Simulink.VariantConfigurationAnalysis class.

---

**Note** This method requires Variant Manager for Simulink.

---

varConfigObj.hideUI() hides the variant configuration analysis report. varConfigObj is the VariantConfigurationAnalysis object for a model.

## Examples

### Analyze Variant Configurations Programmatically

This example shows how to use the Simulink.VariantConfigurationAnalysis class to analyze variant configurations programmatically.

To analyze variant configurations using Variant Manager, see “Analyze Variant Configurations in Models Containing Variant Blocks”.

Open the model `slexVariantConfigurationAnalysis`.

```
open_system('slexVariantConfigurationAnalysis');
```

You can provide either a list of named variant configurations or the variable groups to analyze to the Simulink.VariantConfigurationAnalysis class. The operation returns a variant configuration analysis object for the model.

```
varConfigObjNamedConfig = Simulink.VariantConfigurationAnalysis('slexVariantConfigurationAnalysis',
 'NamedConfigurations', {'VendorACtrlLinear', ...
 'VendorACtrlNonLinear', 'VendorACtrlFuzzy'})
```

```
varConfigObjNamedConfig =
 VariantConfigurationAnalysis with properties:
```

```
 ModelName: 'slexVariantConfigurationAnalysis'
 Configurations: {'VendorACtrlFuzzy' 'VendorACtrlLinear' 'VendorACtrlNonLinear'}
```

```
varConfigObjVarGroup = Simulink.VariantConfigurationAnalysis('slexVariantConfigurationAnalysis',
 'VariableGroups', [struct('Name', 'VendorANonLinear',...
 'VariantControls', {'CONTROLLER', 1, 'EXTERNAL_SENSOR', 1, 'ORDER', 1
 struct('Name', 'VendorALinear',...
 'VariantControls', {'CONTROLLER', 0, 'EXTERNAL_SENSOR', 1, 'ORDER', 1
```

You can use the variant configuration analysis object to analyze the variant configurations using different methods specified in the following steps.

Get the list of active blocks in the variant configuration `VendorACtrlLinear`.

```
activeblocks = varConfigObjNamedConfig.getActiveBlocks('VendorACtrlLinear');
```

Get the list of blocks that are always active across all the named variant configurations that have been analyzed.

```
alwaysActiveBlocks = varConfigObjNamedConfig.getAlwaysActiveBlocks();
```

Get the list of blocks that are active in some of the analyzed variant configurations and inactive in other configurations.

```
getBlockDifferences = varConfigObjNamedConfig.getBlockDifferences();
```

Get the list of dependent libraries for a variant configuration.

```
dependentLibraries = varConfigObjNamedConfig.getDependentLibraries('VendorACtrlNonLinear');
```

Get the list of dependent models for a variant configuration.

```
dependentModels = varConfigObjNamedConfig.getDependentModels('VendorACtrlFuzzy');
```

Get the list of blocks that are inactive in all the named variant configurations that have been analyzed.

```
neverActiveBlocks = varConfigObjNamedConfig.getNeverActiveBlocks();
```

Get the variant condition on a block in a named variant configuration.

```
variantCondition = varConfigObjNamedConfig.getVariantCondition('VendorACtrlNonLinear',...
 'slexVariantConfigurationAnalysis/Controller/NonLinear');
```

Show the variant configuration analysis report for a model after analyzing it.

```
varConfigObjNamedConfig.showUI();
```

Hide the variant configuration analysis report for a model after analyzing it.

```
varConfigObjNamedConfig.hideUI();
```

## Version History

Introduced in R2019b

## showUI

**Class:** Simulink.VariantConfigurationAnalysis

**Package:** Simulink

Show variant configuration analysis report for a model

### Syntax

```
varConfigObj.showUI()
```

### Description

Use this method to show the variant configuration analysis report for a model after analyzing it using the Simulink.VariantConfigurationAnalysis class.

---

**Note** This method requires Variant Manager for Simulink.

---

varConfigObj.showUI() shows the variant analysis report. varConfigObj is the VariantConfigurationAnalysis object for a model.

### Examples

#### Analyze Variant Configurations Programmatically

This example shows how to use the Simulink.VariantConfigurationAnalysis class to analyze variant configurations programmatically.

To analyze variant configurations using Variant Manager, see “Analyze Variant Configurations in Models Containing Variant Blocks”.

Open the model `slexVariantConfigurationAnalysis`.

```
open_system('slexVariantConfigurationAnalysis');
```

You can provide either a list of named variant configurations or the variable groups to analyze to the Simulink.VariantConfigurationAnalysis class. The operation returns a variant configuration analysis object for the model.

```
varConfigObjNamedConfig = Simulink.VariantConfigurationAnalysis('slexVariantConfigurationAnalysis',
 'NamedConfigurations', {'VendorACtrlLinear', ...
 'VendorACtrlNonLinear', 'VendorACtrlFuzzy'})
```

```
varConfigObjNamedConfig =
 VariantConfigurationAnalysis with properties:
```

```
 ModelName: 'slexVariantConfigurationAnalysis'
 Configurations: {'VendorACtrlFuzzy' 'VendorACtrlLinear' 'VendorACtrlNonLinear'}
```

```
varConfigObjVarGroup = Simulink.VariantConfigurationAnalysis('slexVariantConfigurationAnalysis',
 'VariableGroups', [struct('Name', 'VendorANonLinear',...
 'VariantControls', {'CONTROLLER', 1, 'EXTERNAL_SENSOR', 1, 'ORDER', 1
 struct('Name', 'VendorALinear',...
 'VariantControls', {'CONTROLLER', 0, 'EXTERNAL_SENSOR', 1, 'ORDER', 1
```

You can use the variant configuration analysis object to analyze the variant configurations using different methods specified in the following steps.

Get the list of active blocks in the variant configuration VendorACtrlLinear.

```
activeblocks = varConfigObjNamedConfig.getActiveBlocks('VendorACtrlLinear');
```

Get the list of blocks that are always active across all the named variant configurations that have been analyzed.

```
alwaysActiveBlocks = varConfigObjNamedConfig.getAlwaysActiveBlocks();
```

Get the list of blocks that are active in some of the analyzed variant configurations and inactive in other configurations.

```
getBlockDifferences = varConfigObjNamedConfig.getBlockDifferences();
```

Get the list of dependent libraries for a variant configuration.

```
dependentLibraries = varConfigObjNamedConfig.getDependentLibraries('VendorACtrlNonLinear');
```

Get the list of dependent models for a variant configuration.

```
dependentModels = varConfigObjNamedConfig.getDependentModels('VendorACtrlFuzzy');
```

Get the list of blocks that are inactive in all the named variant configurations that have been analyzed.

```
neverActiveBlocks = varConfigObjNamedConfig.getNeverActiveBlocks();
```

Get the variant condition on a block in a named variant configuration.

```
variantCondition = varConfigObjNamedConfig.getVariantCondition('VendorACtrlNonLinear',...
'slexVariantConfigurationAnalysis/Controller/NonLinear');
```

Show the variant configuration analysis report for a model after analyzing it.

```
varConfigObjNamedConfig.showUI();
```

Hide the variant configuration analysis report for a model after analyzing it.

```
varConfigObjNamedConfig.hideUI();
```

# Simulink.VariantConfigurationData class

**Package:** Simulink

Create variant configurations programmatically

## Description

---

**Note** This class requires Variant Manager for Simulink.

---

Use the `Simulink.VariantConfigurationData` class to create a variant configuration data object that stores a collection of variant configurations, constraints, and the name of a preferred variant configuration for a model. The class has methods that enable you to:

- Define new variant configurations.
- Add variant control variables to variant configurations.
- Create a copy of a variant configuration.
- Define constraints to check for invalid variant configurations.
- Delete existing variant configurations, constraints, and control variables.
- Set a specific configuration as the preferred variant configuration.

## Creation

### Description

`varconfigdataObj = Simulink.VariantConfigurationData` creates an empty variant configuration data object.

`varconfigdataObj = Simulink.VariantConfigurationData(Name=Value)` creates a variant configuration data object and sets “Properties” on page 5-709 using one or more name-value arguments.

## Properties

### Configurations — Set of variant configurations

structure | array of structures

Set of variant configurations in the variant configuration data object, specified as an array of structures with the following fields:

Field	Type	Description
Name	character vector	Name of the configuration. The value must be a unique and valid MATLAB variable name.
Description	character vector	Description of the configuration

Field	Type	Description
ControlVariables	structure	<p>Variant control variable names and their values, specified as a structure or array of structures with the fields:</p> <ul style="list-style-type: none"> <li>• <b>Name</b> — Name of the control variable, specified as a character vector</li> <li>• <b>Value</b> — Value of the control variable, specified as any of these data types: <ul style="list-style-type: none"> <li>• Normal MATLAB variable</li> <li>• <code>Simulink.Parameter</code></li> <li>• <code>Simulink.VariantControl</code> whose <code>Value</code> is a normal MATLAB variable</li> <li>• <code>Simulink.VariantControl</code> whose <code>Value</code> is a <code>Simulink.Parameter</code></li> </ul> </li> <li>• <b>Source</b> — Source of the control variable, specified as a character vector. Source must be 'base workspace' or the name of a data dictionary.</li> </ul> <p>Example:  <code>ctrlVarStruct=struct(Name='ControllerType.Linear',Value='NoiseType.NoNoise',Source='plant.slidd');</code></p> <p>For an example that shows the use of different types of variant control variables, see “Use Variant Control Variables in Variant Blocks”.</p>

**Attributes:**

<code>GetAccess</code>	<code>public</code>
<code>SetAccess</code>	<code>private</code>

Data Types: `struct`**Constraints — Constraints for variant configurations**

structure | array of structures

Constraints that must be met by all variant configurations in the variant configuration data object, specified as a structure array with the fields:

- **Name** — Name of the constraint, specified as a character vector. The value must be a unique and valid MATLAB variable name.
- **Condition** — Boolean expression that must evaluate to true to satisfy the constraint, be defined using variant control variables, and be specified as a character vector.
- **Description** — Description of the constraint, specified as a character vector.

**Attributes:**

<code>GetAccess</code>	<code>public</code>
<code>SetAccess</code>	<code>private</code>

Data Types: struct

### **PreferredConfiguration — Name of preferred variant configuration**

character vector

Name of the preferred variant configuration, specified as a character vector. Use this property to indicate the configuration that is suited for the model for common workflows. The value must be the name of a variant configuration present in the variant configuration data object.

#### **Attributes:**

GetAccess	public
SetAccess	public

Data Types: char

## **Methods**

### **Public Methods**

addConfiguration	Add new variant configuration to variant configuration data object
addComponentConfiguration	Associate top-model variant configuration with variant configuration of referenced model
addConstraint	Add constraint to variant configuration data object
addControlVariables	Add variant control variables to named variant configuration in variant configuration data object
addCopyOfConfiguration	Add copy of existing variant configuration to variant configuration data object
convertDefaultToPreferred	Convert default variant configuration to preferred variant configuration
getConfiguration	Get specific variant configuration from variant configuration data object
getPreferredConfiguration	Get name of preferred variant configuration for variant configuration data object
setPreferredConfiguration	Set name of preferred variant configuration for variant configuration data object
removeConfiguration	Remove variant configuration from variant configuration data object
removeComponentConfiguration	Remove association between variant configurations of top-level model and referenced model
removeConstraint	Remove constraint from variant configuration data object
removeControlVariable	Remove variant control variable from variant configuration

### **Specialized Operators and Functions**

These methods specialize standard MATLAB operators and functions for objects in this class.

intersect	<p><code>vcdC = intersect(vcdA,vcdB)</code></p> <p>Find the intersection of variant configuration data objects <code>vcdA</code> and <code>vcdB</code>. This method returns a variant configuration data object, <code>vcdC</code>, with the common variant configurations present in <code>vcdA</code> and <code>vcdB</code>. The intersection is found by matching the variant control variables and their values.</p> <p>Constraints in <code>vcdC</code> are formed as follows. Consider the case where <code>vcdA</code> and <code>vcdB</code> have two constraints each.</p> <ul style="list-style-type: none"><li>• <code>vcdA</code>: <code>constraintA1</code>, <code>constraintA2</code></li><li>• <code>vcdB</code>: <code>constraintB1</code>, <code>constraintB2</code></li></ul> <p>Then, <code>vcdC</code> has these constraints:</p> <ul style="list-style-type: none"><li>• <code>constraintC1</code>: <code>constraintA1 &amp;&amp; (constraintB1 &amp;&amp; constraintB2)</code></li><li>• <code>constraintC2</code>: <code>constraintA2 &amp;&amp; (constraintB1 &amp;&amp; constraintB2)</code></li></ul> <p>The constraint conditions formed by logical AND, OR, and NOT operations are simplified by default using boolean algebra arithmetic, and symbols can be reordered.</p> <p><code>vcdC = intersect(vcdA, vcdB, SimplifyConditions=false)</code> returns a variant configuration data object <code>vcdC</code> in which constraint conditions are not simplified to simpler expressions.</p> <p>The remaining properties of <code>vcdC</code> are the same as <code>vcdA</code>, and items in <code>vcdC</code> appear in the same order as they appear in <code>vcdA</code>.</p>
-----------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

setdiff	<p><code>vcdC = setdiff(vcdA,vcdB)</code></p> <p>Find the difference of variant configuration data objects <code>vcdA</code> and <code>vcdB</code>. This method returns a variant configuration data object <code>vcdC</code> that contains configurations that are in <code>vcdA</code> but not in <code>vcdB</code>. The result is found based on the differences in the values of variant control variables.</p> <p>Constraints in <code>vcdC</code> are formed as follows. Consider the case where <code>vcdA</code> and <code>vcdB</code> have two constraints each.</p> <ul style="list-style-type: none"><li>• <code>vcdA</code> : <code>constraintA1, constraintA2</code></li><li>• <code>vcdB</code> : <code>constraintB1, constraintB2</code></li></ul> <p>Then, <code>vcdC</code> has these constraints:</p> <ul style="list-style-type: none"><li>• <code>constraintC1: constraintA1 &amp;&amp; ~(constraintB1 &amp;&amp; constraintB2)</code></li><li>• <code>constraintC2: constraintA2 &amp;&amp; ~(constraintB1 &amp;&amp; constraintB2)</code></li></ul> <p>The constraint conditions formed by logical AND, OR, and NOT operations are simplified by default using boolean algebra arithmetic, and symbols can be reordered.</p> <p><code>vcdC = setdiff(vcdA, vcdB, SimplifyConditions=false)</code> returns a variant configuration data object <code>vcdC</code> in which constraint conditions are not simplified.</p> <p>The remaining properties of <code>vcdC</code> are the same as <code>vcdA</code>, and items in <code>vcdC</code> appear in the same order as they appear in <code>vcdA</code>.</p>
---------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

union	<p><code>vcdC = union(vcdA,vcdB)</code></p> <p>Find the union of variant configuration data objects <code>vcdA</code> and <code>vcdB</code>. This method returns a variant configuration data object <code>vcdC</code> that contains configurations from both <code>vcdA</code> and <code>vcdB</code>, with no duplicates. The union is found by matching the variant control variables and their values.</p> <p>Constraints in <code>vcdC</code> are formed as follows. Consider the case where <code>vcdA</code> and <code>vcdB</code> have two constraints each.</p> <ul style="list-style-type: none"> <li>• <code>vcdA : constraintA1, constraintA2</code></li> <li>• <code>vcdB : constraintB1, constraintB2</code></li> </ul> <p>Then, <code>vcdC</code> has these constraints:</p> <ul style="list-style-type: none"> <li>• <code>constraintC1: constraintA1    (constraintB1 &amp;&amp; constraintB2)</code></li> <li>• <code>constraintC2: constraintA2    (constraintB1 &amp;&amp; constraintB2)</code></li> </ul> <p>The constraint conditions formed by logical AND, OR, and NOT operations are simplified by default using boolean algebra arithmetic, and symbols can be reordered.</p> <p><code>vcdC = union(vcdA, vcdB, SimplifyConditions=false)</code> returns a variant configuration data object <code>vcdC</code> in which constraint conditions are not simplified to simpler expressions.</p> <p>The remaining properties of <code>vcdC</code> are the same as <code>vcdA</code>, and items in <code>vcdC</code> appear in the same order as they appear in <code>vcdA</code>, then <code>vcdB</code>.</p>
unique	<p><code>uniquedVCD = unique(vcd)</code></p> <p>Find unique configurations in the variant configuration data object <code>vcd</code>.</p> <p>Duplicate configurations in <code>vcd</code> are removed based on values of variant control variables. Duplicate constraints in <code>vcd</code> are removed based on the constraint conditions.</p>

## Examples

### Create Variant Configuration Data Object

This example shows how to create an instance of the `Simulink.VariantConfigurationData` class and set these class properties:

- `Configurations (struct)`
- `Constraints (struct)`
- `PreferredConfiguration (char)`

## Define New Variant Configuration

Define a new variant configuration to add to the variant configuration data object.

The `VariantConfigurations` property in the `Simulink.VariantConfigurationData` class has these fields:

- Name (char)
- ControlVariables (struct)
- Description (char)
- Create a struct for the `ControlVariables` field that contains the variant control variables and values for the new configuration.

```
ctrlVarStruct = struct(Name='ControllerType.Linear',Value='NoiseType.NoNoise',Source='plant.sldd
```

- Create a struct for the new variant configuration.

```
configStruct = struct(Name='LinInterExpNoNoise',ControlVariables=ctrlVarStruct, ...
 Description='Linear Internal Experimental Plant Controller');
```

## Define Constraints

Define any constraints applicable for all the variant configurations in the variant configuration data object.

```
constrStruct = struct(Name='PlantLocation',Condition= ...
 '(PlantLoc==PlantLocation.Internal) || (PlantLoc==PlantLocation.External)', ...
 Description='Plant location constraint');
```

## Create Variant Configuration Data Object

Create the object by adding variant configurations, global constraints, and the name of the preferred configuration.

```
vcdo = Simulink.VariantConfigurationData(Configurations=configStruct,Constraints=constrStruct,
 PreferredConfiguration='LinInterExpNoNoise')
```

```
vcdo =
 VariantConfigurationData with properties:

 Configurations: [1x1 struct]
 Constraints: [1x1 struct]
 PreferredConfiguration: 'LinInterExpNoNoise'
```

## Associate Variant Configuration Data Object With Model

You can associate `vcdo` with a Simulink® model using the `VariantConfigurationObject` model parameter, for example:

```
set_param("<model_name>",VariantConfigurationObject="vcdo");
```

## Tips

You can edit a variant configuration object from the base workspace or data dictionary without launching Variant Manager. Double-click the object that is present in the base workspace or in the

**Configurations** section of the data dictionary in the Model Explorer. This action launches the `Simulink.VariantConfigurationData` property dialog box. This dialog box functions as a standalone variant manager and allows you to modify variant configurations, control variables, and constraints in the variant configuration object.

## Version History

**Introduced in R2013b**

### R2022b: New add-on required

*Behavior changed in R2022b*

You must install the Variant Manager for Simulink software support package to use this class and its methods.

### R2022b: New capabilities

- Support for set operations:

You can use the `intersect`, `setdiff`, `union`, and `unique` methods in `Simulink.VariantConfigurationData` class to perform set operations on variant configuration data objects. See “Specialized Operators and Functions” on page 5-711.

- New `PreferredConfiguration` property:

You can set any of the named configurations defined for a model as the `PreferredConfiguration` to indicate the configuration that is suited for the model for common workflows. This configuration is not applied automatically when compiling or simulating a model. You must apply the preferred configuration explicitly on the model, if required.

If the variant configuration data object (`vcd`) for your model has an existing `DefaultConfiguration`, you can convert it to `PreferredConfiguration` using this command:

```
vcd.convertDefaultToPreferred(model);
```

To apply the `PreferredConfiguration` on your model before compiling or simulating the model, use this command:

```
Simulink.VariantManager.applyConfiguration(model, ...
vcd.getPreferredConfigurationName());
```

### R2022b: `DefaultConfigurationName` and `SubModelConfiguration` properties will be removed

*Warns starting in R2022b*

- The `DefaultConfigurationName` property will be removed. Use the `PreferredConfiguration` property instead. Setting a default variant configuration for a variant configuration data object is not recommended. Previously, if you had set a default configuration, compiling or simulating the model automatically activated the default configuration irrespective of the variant control variable values in the base workspace or data dictionary used by the model. Now, this behavior is not applicable and setting the `DefaultConfigurationName` property has no effect.

If the variant configuration data object (vcd) for your model has an existing `DefaultConfiguration`, you can convert it to `PreferredConfiguration` using the `convertDefaultToPreferred` method.

- The `SubModelConfiguration` property will be removed. The variant configurations for a top-level model must also define the variant control variables used by any referenced components in the model hierarchy, such as referenced models. This approach helps to maintain a single consistent definition for a variant control across the hierarchy.

If the referenced component has named variant configurations of its own, you can use them to set up the corresponding variant control variables in the top-level model configuration. For more information, see “Compose Variant Configurations for Top Model Using Referenced Model Configurations”.

For existing models with an associated variant configuration object, variant control variables in the referenced model configuration will be automatically migrated to the configuration of the top-level model. You must save the variant configuration object using Variant Manager to fix related warnings.

Scripts that use these properties run with a warning.

### **R2022b: Methods to be removed**

*Not recommended starting in R2022b*

These methods will be removed in a future release. Scripts that use these methods run with a warning.

To be Removed	Recommended Replacement
<code>validateModel</code>	<code>Simulink.VariantManager.activateModel</code>
<code>getFor</code>	<code>Simulink.VariantManager.getConfigurationData</code>
<code>addSubModelConfigurations</code>	<code>Simulink.VariantConfigurationData.addComponentConfigurations</code>
<code>removeSubModelConfiguration</code>	<code>Simulink.VariantConfigurationData.removeComponentConfiguration</code>
<code>getDefaultConfiguration</code>	<code>Simulink.VariantConfigurationData.getPreferredConfiguration</code>
<code>setDefaultConfigurationName</code>	<code>Simulink.VariantConfigurationData.setPreferredConfiguration</code>

### **R2022b: Change in the format of errors output argument of `validateModel` method**

*Behavior changed in R2022b*

The fields `Type`, `Source`, `PathInModel`, and `PathInHierarchy` have been removed from the structure named `Errors` within the second output argument, `errors`. For an example, see “Compatibility Considerations When Using Variant Manager for Simulink Support Package”.

## **See Also**

## **Topics**

“Variant Manager for Simulink”

“Compatibility Considerations When Using Variant Manager for Simulink Support Package”  
“Variant Configurations”  
“Create and Activate Variant Configurations”

# addComponentConfiguration

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

Associate top-model variant configuration with variant configuration of referenced model

## Syntax

```
addComponentConfiguration(vcdTop, ConfigurationName=topConfig, ComponentName=
refmdl, ComponentConfigurationName=refConfig)
addComponentConfiguration(vcdTop, ConfigurationName=topConfig, ComponentName=
refmdl, ComponentConfigurationName=refConfig, PopulateControlVariables=false)
```

## Description

Consider a variant model that has predefined variant configurations and also has a referenced model in its model hierarchy. In Variant Manager, a variant configuration for a top-level model must also define the variant control variables used by any referenced components in the model hierarchy, such as referenced models. If the referenced component defines its own variant configurations, you can use them to set up the control variables in the top-level configuration.

Use the `addComponentConfiguration` method to associate a variant configuration of the referenced model with a variant configuration of the top-level model. This operation adds the control variables present in the specified component configuration to the top-level model configuration. This method thus allows you to author a top-model configuration using referenced component configurations. For more information on this workflow, see “Compose Variant Configurations for Top Model Using Referenced Model Configurations”.

---

**Note** This method requires Variant Manager for Simulink.

---

`addComponentConfiguration(vcdTop, ConfigurationName=topConfig, ComponentName=refmdl, ComponentConfigurationName=refConfig)` associates the variant configuration `refConfig` of the referenced model `refmdl` with the top-level variant configuration `topConfig` that is present in the variant configuration data object `vcdTop`.

This operation populates variant control variables from `refConfig` to `topConfig`; that is `topConfig` contains all variant control variables that are in `refConfig`, these variables are set to the same values as in `refConfig`, and they are also marked as read-only in the top-level configuration in the Variant Manager user interface. To populate variant control variables, `refmdl` is loaded. The operation also checks that there are no conflicts in existing variant control variable definitions of `topConfig` if it is associated with other referenced model configurations.

`addComponentConfiguration(vcdTop, ConfigurationName=topConfig, ComponentName=refmdl, ComponentConfigurationName=refConfig, PopulateControlVariables=false)` associates `refConfig` with `topConfig` but does not populate variant control variables from `refConfig` to `topConfig`. Use this syntax if you do not want to update existing control variable values in `topConfig` but only indicate that they come from `refConfig`. By default, `PopulateControlVariables` is set to `true`.

## Input Arguments

### **vcdTop** — Name of variant configuration object of top-level model

character vector | string

Name of the variant configuration data object of the top-level model, specified as a character vector or string.

Example: "vcdo"

Data Types: char | string

### **topConfig** — Name of top-level variant configuration

character vector | string

Name of the top-level variant configuration present in `vcdTop` to which the referenced component configuration `refConfig` is associated, specified as a character vector or string.

Example: "LinInterExpNoNoise"

Data Types: char | string

### **refmdl** — Name of referenced component

character vector | string

Name of the referenced component, such as a referenced model, specified as a character vector or string.

Example: "slexVariantManagementExternalPlantMdlRef"

Data Types: char | string

### **refConfig** — Name of referenced component configuration

character vector | string

Name of the referenced component configuration to associate with the top-level configuration `topConfig`, specified as a character vector or string.

Example: "HighFid"

Data Types: char | string

## Examples

### **Add Component Variant Configuration to Top-Model Variant Configuration**

Consider the `slexVariantManagement` model, which is associated with the variant configuration object `vcd`. The model has a referenced model named `slexVariantManagementExternalPlantMdlRef` in its hierarchy that has a predefined variant configuration named `LowFid`.

This command associates `LowFid` with the variant configuration named `NonLinExterLowFid` present in `vcd` and populates the variant control variables from `LowFid` to `NonLinExterLowFid`.

```
addComponentConfiguration(vcd, ConfigurationName="NonLinExterLowFid",...
 ComponentName="slexVariantManagementExternalPlantMdlRef", ComponentConfigurationName="LowFid");
```

This command associates LowFid with NonLinExterLowFid but does not update existing control variable values in NonLinExterLowFid.

```
addComponentConfiguration(vcd, ConfigurationName="NonLinExterLowFid",...
 ComponentName="slexVariantManagementExternalPlantMdlRef", ComponentConfigurationName="LowFid", PopulateControlVariables=false);
```

## Version History

### Introduced in R2022b

### R2022b: Recommended over addSubModelConfigurations

The addSubModelConfigurations method will be removed in a future release. Use the Simulink.VariantConfigurationData.addComponentConfiguration method instead.

“Variant Manager for Simulink”

“Create and Activate Variant Configurations”

# addConfiguration

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

Add new variant configuration to variant configuration data object

## Syntax

```
vcdataObj.addConfiguration(name)
vcdataObj.addConfiguration(name,description)
vcdataObj.addConfiguration(name,description,controlVars)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`vcdataObj.addConfiguration(name)` adds a new variant configuration with the given name to the variant configuration data object `vcdataObj`, which is an object of the `Simulink.VariantConfigurationData` class.

`vcdataObj.addConfiguration(name,description)` adds a new variant configuration with a given name and optional description to the variant configuration data object.

`vcdataObj.addConfiguration(name,description,controlVars)` adds a new variant configuration with a given name, optional description, and control variables to the variant configuration data object.

## Input Arguments

### **name — Name of variant configuration**

character vector | string

Name of the new variant configuration that you want to add to the variant configuration data object, specified as a character vector or string.

Example: 'LinInterExpNoNoise'

Data Types: char | string

### **description — Description of variant configuration**

character vector | string

Description of the variant configuration, specified as a character vector or string.

Example: 'Linear configuration with internal plant'

Data Types: char | string

### **controlVars — Control variables in variant configuration**

structure | array of structure

Variant control variable names and their values, specified as a structure or array of structures with fields:

- **Name** — Name of the control variable, specified as a character vector
- **Value** — Value of the control variable, specified as any of these data types:
  - Normal MATLAB variable
  - `Simulink.Parameter`
  - `Simulink.VariantControl` with value as normal MATLAB variable
  - `Simulink.VariantControl` with value as `Simulink.Parameter`
- **Source** — Source of the control variable, specified as a character vector. Source must be 'base workspace' or the name of a data dictionary.

Example:

```
ctrlVarStruct=struct(Name='Noise',Value='NoiseType.NoNoise',Source='plant.sld
d');
```

For an example that shows the use of different types of variant control variables, see “Use Variant Control Variables in Variant Blocks”.

Data Types: struct

## Examples

### Add Variant Configuration

This example shows how to add a new variant configuration to a variant configuration data object.

Create an empty `Simulink.VariantConfigurationData` object.

```
vardataObj = Simulink.VariantConfigurationData
vardataObj =
 VariantConfigurationData with properties:
 Configurations: [1x0 struct]
 Constraints: [1x0 struct]
 PreferredConfiguration: ''
```

Create a struct with the control variable names and values for the new configuration.

```
% Define a variant control variable
PlantLoc = Simulink.VariantControl('Value', 1, 'ActivationTime', 'code compile');
% Create a variant control variable structure
ctrlVarStruct = struct(Name='PlantLoc', Value=PlantLoc, Source='topdata.sldd')

ctrlVarStruct = struct with fields:
 Name: 'PlantLoc'
 Value: [1x1 Simulink.VariantControl]
 Source: 'topdata.sldd'
```

Add the new configuration to `vardataObj`.

```
vardataObj.addConfiguration('LinInterExpNoNoise', 'Linear Internal Experimental Plant Controller
```

# addConstraint

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

Add constraint to variant configuration data object

## Syntax

```
vcdataObj.addConstraint(nameOfConstraint)
vcdataObj.addConstraint(nameOfConstraint,condition)
vcdataObj.addConstraint(nameOfConstraint,condition,description)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`vcdataObj.addConstraint(nameOfConstraint)` adds a constraint with the given name to `vcdataObj`, which is an object of the `Simulink.VariantConfigurationData` class.

You can use constraints to check if all the variant configurations present in `vcdataObj` satisfy certain conditions. The constraint must be specified as a valid Boolean condition expression. Simulink evaluates these constraints during variant configuration activation, model compilation, simulation, and code generation workflows.

`vcdataObj.addConstraint(nameOfConstraint,condition)` adds a new constraint with the given name and condition expression to `vcdataObj`.

`vcdataObj.addConstraint(nameOfConstraint,condition,description)` adds a new constraint with the given name, condition expression, and description to `vcdataObj`.

## Input Arguments

### **nameOfConstraint** — Name of constraint

character vector | string

Name of the constraint, specified as a character vector or string.

Example: "LinInternal"

Data Types: char | string

### **condition** — Boolean condition expression

character vector | string

Boolean condition expression that is defined in terms of variant control variables, specified as a character vector or string. The expression must evaluate to true to satisfy the constraint.

Example: "~((Ctrl==ControllerType.Linear) && (PlantLoc==PlantLocation.External))"

Data Types: char | string

**description — Description of constraint**

character vector | string

Description of the constraint, specified as a character vector or string.

Example: "Linear controller must not have an external plant"

Data Types: char | string

## Examples

### Add Constraint

Add a new constraint to a variant configuration data object.

Create an empty `Simulink.VariantConfigurationData` object.

```
vcd = Simulink.VariantConfigurationData;
```

Add a constraint named `LinInternal` to the variant configuration data object `vcdataObj`.

```
vcd.addConstraint(Name = "LinInternal", ...
Condition = "~((Ctrl == ControllerType.Linear) && (PlantLoc == PlantLocation.External))", ...
Description = "Linear controller must not have an external plant");
```

## Version History

Introduced in R2013b

# addControlVariables

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

Add variant control variables to named variant configuration in variant configuration data object

## Syntax

```
vcdataObj.addControlVariables(nameOfConfiguration,variantControlVars)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`vcdataObj.addControlVariables(nameOfConfiguration,variantControlVars)` adds variant control variables to the specified variant configuration in `vcdataObj`, which is an object of the `Simulink.VariantConfigurationData` class.

## Input Arguments

### **nameOfConfiguration** — Name of variant configuration

character vector | string

Name of the variant configuration to which the variant control variables must be added, specified as a character vector or string. This configuration must be present in the variant configuration data object, `vcdataObj`.

Example: "LinInterExpNoNoise"

Data Types: char | string

### **variantControlVars** — Variant control variable names and values

structure | array of structures

Variant control variable names and their values, specified as a structure or array of structures with fields:

- **Name** — Name of the control variable, specified as a character vector
- **Value** — Value of the control variable, specified as any of these data types:
  - Normal MATLAB variable
  - `Simulink.Parameter`
  - `Simulink.VariantControl` with value as normal MATLAB variable
  - `Simulink.VariantControl` with value as `Simulink.Parameter`
- **Source** — Source of the control variable, specified as a character vector. Source must be 'base workspace' or the name of a data dictionary.

Example:

```
ctrlVarStruct=struct(Name='Noise',Value='NoiseType.NoNoise',Source='plant.sld
d');
```

For an example that shows the use of different types of variant control variables, see “Use Variant Control Variables in Variant Blocks”.

Data Types: struct

## Examples

### Add Control Variables

This example shows how to add new variant control variables to an existing variant configuration in a variant configuration data object.

Create an empty Simulink.VariantConfigurationData object.

```
vardataObj = Simulink.VariantConfigurationData

vardataObj =
 VariantConfigurationData with properties:
 Configurations: [1x0 struct]
 Constraints: [1x0 struct]
 PreferredConfiguration: ''
```

Create a variant configuration and add it to the variant configuration data object.

```
% Define a variant control variable
PlantLoc = Simulink.VariantControl('Value', 1, 'ActivationTime', 'code compile');
% Create a variant control variable structure
ctrlVarStruct = struct(Name = 'PlantLoc', Value = PlantLoc, Source = 'topdata.sldd')

ctrlVarStruct = struct with fields:
 Name: 'PlantLoc'
 Value: [1x1 Simulink.VariantControl]
 Source: 'topdata.sldd'
```

```
% Add a variant configuration to vardataObj
vardataObj.addConfiguration('LinInterExpNoNoise', 'Linear Internal Experimental Plant Controller')
```

Create a new variant control variable of type Simulink.VariantControl.

```
% Create a new variant control variable
SmartSensorMod = Simulink.VariantControl('Value', 2, 'ActivationTime', 'code compile');
newControlVarStruct = struct(Name = 'SmartSensorMod', Value = SmartSensorMod, Source = 'topdata.sldd')

newControlVarStruct = struct with fields:
 Name: 'SmartSensorMod'
 Value: [1x1 Simulink.VariantControl]
 Source: 'topdata.sldd'
```

Add the control variable to the existing variant configuration, LinInterExpNoNoise.

```
vardataObj.addControlVariables('LinInterExpNoNoise', newControlVarStruct);
```

## Version History

Introduced in R2013b

# addCopyOfConfiguration

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

Add copy of existing variant configuration to variant configuration data object

## Syntax

```
vcdataObj.addCopyOfConfiguration(nameofExistingConfig)
vcdataObj.addCopyOfConfiguration(nameofExistingConfig,nameofNewConfig)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`vcdataObj.addCopyOfConfiguration(nameofExistingConfig)` adds a copy of an existing variant configuration to `vcdataObj`, which is an object of the `Simulink.VariantConfigurationData` class. This syntax gives the new configuration a default name based on the name of the configuration that is copied.

`vcdataObj.addCopyOfConfiguration(nameofExistingConfig,nameofNewConfig)` adds a copy of an existing variant configuration to the variant configuration data object and gives the specified name to the new configuration.

## Input Arguments

**nameofExistingConfig** — Name of an existing configuration

character vector | string

Name of the existing variant configuration that must be copied, specified as a character vector or string. This configuration must exist in the variant configuration data object `vcdataObj`.

Example: "LinInterExpNoNoise"

Data Types: char | string

**nameofNewConfig** — Name to be used for copied configuration

character vector | string

Name to be used for the copied configuration, specified as a character vector or string.

Example: "LinInterExpNoise"

Data Types: char | string

## Examples

## Copy Variant Configuration

Add a copy of the existing variant configuration `LinInterExpNoNoise` to `vcdataObj` and name the copy as `LinInterExpNoise`.

```
vcdataObj.addCopyOfConfiguration("LinInterExpNoNoise","LinInterExpNoise");
```

## Version History

Introduced in R2013b

"Variant Manager for Simulink"

## addSubModelConfigurations

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

(To be removed) Add to a variant configuration the names of the configurations to be used for referenced models

---

**Note** `addSubModelConfigurations` will be removed in a future release. For more information, see “Version History”.

---

### Syntax

```
vcdataObj.addSubModelConfigurations(nameOfConfiguration,
subModelConfigurations)
```

### Description

`vcdataObj.addSubModelConfigurations(nameOfConfiguration, subModelConfigurations)` associates a variant configuration in `vcdataObj` with the configurations that must be used for referenced models. `vcdataObj` is an object of the `Simulink.VariantConfigurationData` class and represents the variant configuration object of the parent model. `subModelConfigurations` specifies names of the variant configurations to be used for referenced models.

### Input Arguments

**nameOfConfiguration** — Name of variant configuration of top level model

character vector | string

Name of variant configuration of top level model, specified as a character vector or string.

Example: "LinInterExpNoNoise"

Data Types: char | string

**subModelConfigurations** — List of referenced models and their variant configurations

vector of structures

Vector of structures containing fields: `ModelName`, `ConfigurationName`. The names of referenced models must be unique and valid MATLAB variable names and configuration names must be valid MATLAB variables.

Example: `[struct('ModelName', 'slexVariantManagementExternalPlantMdlRef', ...  
'ConfigurationName', 'LowFid')]`

Data Types: struct

## Version History

### **addSubModelConfigurations will be removed**

*Warns starting in R2022b*

The `addSubModelConfigurations` will be removed in a future release. Scripts which use this method continue to work with a warning.

Use the `Simulink.VariantConfiguratonData.addComponentConfiguration` or add the variant control variables used by referenced components in the model hierarchy to the variant configurations of the top-level model instead.

For existing models with an associated variant configuration object, variant control variables in the referenced model configuration will be automatically migrated to the configuration of the top-level model. You must save the variant configuration object using Variant Manager to fix related warnings.

For more information on setting up variant control variables for referenced components, see “Compose Variant Configurations for Top Model Using Referenced Model Configurations”.

## Version History

**Introduced in R2013b**

### **See Also**

`Simulink.VariantConfigurationData | removeSubModelConfiguration | addControlVariables | removeControlVariable`

## convertDefaultToPreferred

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

Convert default variant configuration to preferred variant configuration

### Syntax

```
vcdataObj.convertDefaultToPreferred()
vcdataObj.convertDefaultToPreferred(model, Name=Value)
```

### Description

Setting a default variant configuration for a variant configuration data object is not recommended. If the variant configuration data object associated with your model has an existing default configuration, you can convert it to the preferred variant configuration using this method.

---

**Note** This method requires Variant Manager for Simulink.

---

`vcdataObj.convertDefaultToPreferred()` sets the existing `DefaultConfiguration` property of `vcdataObj` to its `PreferredConfiguration` property and then clears the `DefaultConfiguration` property. `vcdataObj` is an object of the `Simulink.VariantConfigurationData` class.

`vcdataObj.convertDefaultToPreferred(model, Name=Value)` sets the existing `DefaultConfiguration` property of `vcdataObj` to its `PreferredConfiguration` property and clears the `DefaultConfiguration`. It additionally updates the model callback functions specified using `Name=Value` arguments to activate the preferred variant configuration on the model.

The preferred variant configuration is not applied automatically when compiling or simulating a model. You must apply the preferred configuration explicitly on the model, if required. To additionally activate the preferred configuration on the model, you can set the `Name=Value` arguments in this method to add commands to the `PostLoadFcn` or `InitFcn` callbacks or both.

### Input Arguments

**model** — Name of model

character vector | string

Name of the model, specified as a character vector or string.

Example: "slexVariantManagement"

Data Types: char | string

## Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Example: `AddActivateToPostLoadFcn = true`

### AddActivateToPostLoadFcn — Option to activate preferred configuration using PostLoadFcn callback of the model

`false` or `0` (default) | `true` or `1`

Option to add commands to the `PostLoadFcn` callback to activate the preferred configuration on the model, specified as a numeric or logical `1` (`true`) or `0` (`false`).

Example: `true`

Data Types: `logical`

### AddActivateToInitFcn — Option to activate preferred configuration using InitFcn callback of the model

`false` or `0` (default) | `true` or `1`

Option to add commands to the `InitFcn` callback to activate the preferred configuration on the model, specified as a numeric or logical `1` (`true`) or `0` (`false`).

Example: `true`

Data Types: `logical`

## Examples

### Convert Default to Preferred Configuration

Convert an existing default configuration of a variant configuration data object to its preferred configuration.

Convert the `DefaultConfiguration` of a variant configuration data object `vcdataObj` to its `PreferredConfiguration` and clear the `DefaultConfiguration`.

```
vcdataObj.convertDefaultToPreferred();
```

Convert the configuration and update the `PostLoadFcn` callback of the model to activate the preferred configuration:

```
vcdataObj.convertDefaultToPreferred(model, ...
AddActivateToPostLoadFcn = true);
```

Convert the configuration and update the `InitFcn` callback of the model to activate the preferred configuration:

```
vcdataObj.convertDefaultToPreferred(model, ...
AddActivateToInitFcn = true);
```

Convert the configuration and update both the `PostLoadFcn` and `InitFcn` callbacks of the model to activate the preferred configuration:

```
vcdataObj.convertDefaultToPreferred(model, ...
 AddActivateToPostLoadFcn = true, AddActivateToInitFcn = true);
```

## **Version History**

# getConfiguration

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

Get specific variant configuration from variant configuration data object

## Syntax

```
config_struct = vcdatabj.getConfiguration(nameOfConfiguration)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`config_struct = vcdatabj.getConfiguration(nameOfConfiguration)` returns the specified variant configuration from `vcdatabj`, which is an object of the `Simulink.VariantConfigurationData` class.

## Input Arguments

**nameOfConfiguration** — Name of variant configuration to be returned

character vector | string

Name of the variant configuration to be returned, specified as a character vector or string.

Example: "LinInterExpNoNoise"

Data Types: char | string

## Output Arguments

**config\_struct** — Variant configuration

structure

Variant configuration, returned as a structure with the following fields:

Field	Type	Description
Name	char	Name of the configuration.
Description	char	Description of the configuration
ControlVariables	structure	The variant control variable names and their values, returned as a <code>struct</code> .

## Examples

**Get Variant Configuration**

Get the variant configuration named `LinInterExpNoNoise` from the variant configuration data object `vardataObj`.

```
vardataObj.getVariantConfiguration("LinInterExpNoNoise");
```

**Version History**

**Introduced in R2013b**

# getDefaultConfiguration

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

(To be removed) Returns default variant configuration, if any, for a variant configuration data object

---

**Note** getDefaultConfiguration will be removed in a future release. For more information, see "Version History".

---

## Syntax

```
vcdataObj.getDefaultConfiguration
```

## Description

vcdataObj.getDefaultConfiguration returns the default variant configuration for vcdataObj, which is an object of the Simulink.VariantConfigurationData class. If no default variant configuration is defined, then [] is returned.

---

**Note** Setting a default variant configuration for a variant configuration data object is not recommended. Activate and validate the model using a specific variant configuration instead. If you set a default configuration, compiling or simulating the model will apply the default configuration irrespective of the variant control variable values in the base workspace or data dictionary associated with the model.

---

## Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the variant configuration named LinInterExp
vcdataObj.addConfiguration('LinInterExp',...
 'Linear Internal Experimental Plant Controller');

% Add the variant configuration LinInterStd
vcdataObj.addConfiguration('LinInterStd',...
 'Linear Internal Standard Plant Controller');

% Set LinExtExp as the default variant configuration
vcdataObj.setDefaultConfigurationName('LinInterExp');

% Obtain the default variant configuration
defvc = vcdataObj.getDefaultConfiguration
```

## Version History

**getDefaultConfiguration will be removed**

*Warns starting in R2022b*

The `getDefaultConfiguration` method will be removed in a future release. Scripts which use this method continue to work with a warning.

Setting a default variant configuration for a variant configuration data object is not recommended. If the variant configuration data object associated with your model has an existing default configuration, you can convert it to the preferred variant configuration using the `convertDefaultToPreferred` method.

## **Version History**

**Introduced in R2013b**

# getFor

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

(To be removed) Get the variant configuration data object associated with a model

---

**Note** getFor will be removed in a future release. Use Simulink.VariantManager.getConfigurationData instead.

---

## Syntax

```
vardatObj = Simulink.VariantConfigurationData.getFor(modelName)
```

## Description

vardatObj = Simulink.VariantConfigurationData.getFor(modelName) returns the variant configuration data object for a model. If no object is associated with the model, then [] is returned.

## Input Arguments

### modelName — Model name

character vector

Model name specified as character vector.

Example: "slexVariantManagement"

Data Types: char

## Output Arguments

### vardatObj — Variant configuration data object

VariantConfigurationData

Variant configuration data object associated with the model, returned as object of Simulink.VariantConfigurationData class.

## Version History

Introduced in R2013b

### R2022b: getFor will be removed

Warns starting in R2022b

The getFor will be removed in a future release. To find the variant configuration data object associated with a model, use the Simulink.VariantManager.getConfigurationData method. Scripts which use this method continue to work with a warning.

# getPreferredConfiguration

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

Get name of preferred variant configuration for variant configuration data object

## Syntax

```
configname = vcdataObj.getPreferredConfiguration()
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`configname = vcdataObj.getPreferredConfiguration()` gets the name of the preferred variant configuration for the `Simulink.VariantConfigurationData` object `vcdataObj`.

## Output Arguments

**configname** — Name of preferred variant configuration

character vector | string

Name of the preferred variant configuration, returned as a character vector or string.

Data Types: `char` | `string`

## Examples

### Get Name of Preferred Variant Configuration for VariantConfigurationData Object

Open the model `slexVariantManagement`.

```
model = 'slexVariantManagement';
open_system(model);
```

Get the variant configuration data object associated with the model.

```
vcdataobj = Simulink.VariantManager.getConfigurationData(model);
```

Get the name of the preferred variant configuration for the variant configuration data object.

```
configname = vcdataobj.getPreferredConfiguration();
```

# removeComponentConfiguration

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

Remove association between variant configurations of top-level model and referenced model

## Syntax

```
removeComponentConfiguration(vcdTop, ConfigurationName=
topConfig, ComponentName=refmdl)
```

## Description

Consider a model that has predefined variant configurations and also has a referenced model in its model hierarchy. The referenced model defines its own variant configurations. While authoring the variant configurations for the top-level model, you might associate a referenced model configuration with a top-level variant configuration to populate the corresponding control variables in the top-level configuration. Use the `removeComponentConfiguration` method to remove this association. For more information on the workflow, see “Compose Variant Configurations for Top Model Using Referenced Model Configurations”.

---

**Note** This method requires Variant Manager for Simulink.

---

`removeComponentConfiguration(vcdTop, ConfigurationName=topConfig, ComponentName=refmdl)` removes an existing association between a variant configuration of the referenced model `refmdl` and the top-level variant configuration `topConfig` that is present in the variant configuration data object `vcdTop`. This operation also makes variant control variables in `topConfig` populated using the referenced model configuration writeable in the Variant Manager user interface. You can modify these variables in `topConfig` independently of their values in the referenced model configuration.

## Input Arguments

**vcdTop** — Name of variant configuration object of top-level model

character vector | string

Name of the variant configuration data object of the top-level model, specified as a character vector or string.

Example: "vcdo"

Data Types: char | string

**topConfig** — Name of top-level variant configuration

character vector | string

Name of the top-level variant configuration present in `vcdTop` from which the referenced component configuration is disassociated, specified as a character vector or string.

Example: "LinInterExpNoNoise"

Data Types: char | string

### **refmdl — Name of referenced component**

character vector | string

Name of the referenced component, such as a referenced model, specified as a character vector or string.

Example: "slexVariantManagementExternalPlantMdlRef"

Data Types: char | string

## **Examples**

### **Remove Association Between Variant Configurations of Top-Level Model and Referenced Model**

Consider the `slexVariantManagement` model, which is associated with the variant configuration object `vcd`. The model has a referenced model named `slexVariantManagementExternalPlantMdlRef` in its hierarchy that uses a predefined variant configuration named `LowFid`. This command disassociates `LowFid` from the variant configuration named `NonLinExterLowFid` present in `vcd`.

```
removeComponentConfiguration(vcd, ConfigurationName="NonLinExterLowFid",
 ComponentName="slexVariantManagementExternalPlantMdlRef");
```

## **Version History**

**Introduced in R2022b**

### **R2022b: Recommended over `removeSubModelConfiguration`**

The `removeSubModelConfiguration` method will be removed in a future release. Use the `Simulink.VariantConfigurationData.removeComponentConfiguration` method instead.

# removeConfiguration

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

Remove variant configuration from variant configuration data object

## Syntax

```
vcdataObj.removeConfiguration(nameOfConfiguration)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`vcdataObj.removeConfiguration(nameOfConfiguration)` removes the configuration from the variant configuration data object `vcdataObj`, which is an object of the `Simulink.VariantConfigurationData` class.

## Input Arguments

**nameOfConfiguration** — Name of the configuration to be removed

character vector | string

Name of the configuration to be removed, specified as a character vector or string.

Example: "LinInterExpNoNoise"

Data Types: char | string

## Examples

### Remove Variant Configuration

Remove a variant configuration named `LinInterExpNoNoise` from the variant configuration data object `vcdataObj`.

```
vcdataObj.removeConfiguration("LinInterExpNoNoise");
```

## Version History

Introduced in R2013b

# removeConstraint

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

Remove constraint from variant configuration data object

## Syntax

```
vcdataObj.removeConstraint(constrName)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`vcdataObj.removeConstraint(constrName)` removes the specified model-wide constraint from the variant configuration data object `vcdataObj`, which is an object of the `Simulink.VariantConfigurationData` class.

## Input Arguments

**constrName** — Name of constraint

character vector | string

Name of the constraint that must be removed, specified as a character vector or string. This constraint must be present in the variant configuration data object `vcdataObj`.

Example: "PlantLocConstraint"

Data Types: char | string

## Examples

### Remove Constraint

Remove a constraint named `PlantLocConstraint` from the variant configuration data object `vcdataObj`:

```
constr_struct=vcdataObj.removeGlobalConstraint("PlantLocConstraint");
```

## Version History

Remove variant control variable from variant configuration

## Syntax

```
vcdataObj.removeControlVariable(nameOfConfiguration,nameOfControlVariable)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`vcdataObj.removeControlVariable(nameOfConfiguration,nameOfControlVariable)` removes the specified variant control variable from the specified variant configuration in `vcdataObj`, which is an object of the `Simulink.VariantConfigurationData` class.

## Input Arguments

### **nameOfConfiguration** — Name of variant configuration

character vector | string

Name of the variant configuration from which the control variable must be removed, specified as a character vector or string. The configuration name must be present in the variant configuration data object.

Example: "LinInterExpNoNoise"

Data Types: char | string

### **nameOfControlVariable** — Name of control variable

character vector | string

Name of the control variable to be removed from the variant configuration, specified as a character vector or string.

Example: "PlantLoc"

Data Types: char | string

## Examples

### **Remove Control Variable**

Remove a control variable named `PlantLoc` from the variant configuration `LinInterExpNoNoise`.

```
vcdataObj.removeControlVariable("LinInterExpNoNoise","PlantLoc");
```

## **Version History**

**Introduced in R2013b**

# removeSubModelConfiguration

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

(To be removed) Remove from a variant configuration, the configuration to be used for a referenced model

---

**Note** removeSubModelConfiguration will be removed in a future release. For more information, see "Version History".

---

## Syntax

```
vcdataObj.removeSubModelConfiguration(nameOfConfiguration,nameOfSubModel)
```

## Description

vcdataObj.removeSubModelConfiguration(nameOfConfiguration,nameOfSubModel), removes the configuration specified for a referenced model.

## Input Arguments

**nameOfConfiguration — Name of referenced model configuration to be removed**

character vector | string

Name of referenced model configuration to be removed, specified as a character vector or string.

Example: "HighFidelityConfig"

Data Types: char | string

**nameOfSubModel — Name of referenced model from which the configuration must be removed**

character vector | string

Name of referenced model from which the configuration must be removed, specified as a character vector or string.

Example: "ExternalPlantMdlRef"

Data Types: char | string

## Version History

**Introduced in R2013b**

**R2022b: removeSubModelConfiguration will be removed**

*Warns starting in R2022b*

The removeSubModelConfiguration will be removed in a future release. Use the Simulink.VariantConfiguratonData.removeComponentConfigurationmethod instead.

For more information on setting up variant control variables for referenced components, see “Referenced Component Configurations”.

**See Also**

`Simulink.VariantConfigurationData | addSubModelConfigurations`

# setDefaultConfigurationName

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

(To be removed) Set name of the default variant configuration for a variant configuration data object

---

**Note** setDefaultConfigurationName will be removed in a future release. For more information, see “Version History”.

---

## Syntax

```
vcdataObj.setDefaultConfigurationName(nameOfConfiguration)
```

## Description

`vcdataObj.setDefaultConfigurationName(nameOfConfiguration)` sets the default configuration name for `vcdataObj`, which is an object of the `Simulink.VariantConfigurationData` class. `vcdataObj` must contain a variant configuration named `nameOfConfiguration`. If an empty value is passed, then the default configuration name is cleared.

---

**Note** Setting a default variant configuration for a variant configuration data object is not recommended. Activate and validate the model using a specific variant configuration instead. If you set a default configuration, compiling or simulating the model will apply the default configuration irrespective of the variant control variable values in the global workspace.

---

## Input Arguments

**nameOfConfiguration** — Name of configuration that must be set as default

character vector | string

Name of configuration that must be set as default, specified as a character vector or string.

Example: "LinInterExpNoNoise"

Data Types: char | string

## Examples

```
% Define the variant configuration data object
vcdataObj = Simulink.VariantConfigurationData;

% Add the LinInterExp variant configuration
vcdataObj.addConfiguration('LinInterExp',...
 'Linear Internal Experimental Plant Controller');

% Set the configuration LinInterExp as default
vcdataObj.setDefaultConfigurationName('LinInterExp');
```

```
% Obtain the default variant configuration
dconfig = vcdataObj.getDefaultConfiguration
```

## Version History

### Introduced in R2013b

#### **R2022b: setDefaultConfigurationName will be removed**

*Warns starting in R2022b*

The `setDefaultConfigurationName` method will be removed in a future release. Scripts which use this method continue to work with a warning.

Setting a default variant configuration for a variant configuration data object is not recommended. If the variant configuration data object associated with your model has an existing default configuration, you can convert it to the preferred variant configuration using the `convertDefaultToPreferred` method.

### See Also

`Simulink.VariantConfigurationData | getDefaultConfiguration`

# setPreferredConfiguration

vcdataObj.setPreferredConfiguration(nameOfConfiguration)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`vcdataObj.setPreferredConfiguration(nameOfConfiguration)` sets the name of the preferred variant configuration for the `Simulink.VariantConfigurationData` object `vcdataObj` to `nameOfConfiguration`.

## Input Arguments

**nameOfConfiguration** — Name of preferred variant configuration

character vector | string

Name of the preferred variant configuration, specified as a character vector or string.

Example: "LinInterExpNoNoise"

Data Types: char | string

## Examples

### Set Name of Preferred Variant Configuration

Open the model `slexVariantManagement`.

```
model = 'slexVariantManagement';
open_system(model);
```

Get the variant configuration data object associated with the model.

```
vcdataobj = Simulink.VariantManager.getConfigurationData(model);
```

Set the name of the preferred variant configuration for the variant configuration data object.

```
vcdataobj.setPreferredConfiguration("LinInterExpNoNoise");
```

Apply the preferred variant configuration and compile the model.

```
Simulink.VariantManager.applyConfiguration(model, 'Configuration', vcdatabj.getPreferredConfigurationName);
set_param(model, 'SimulationCommand', 'Update');
```

## Version History

Introduced in R2022b

# validateModel

**Class:** Simulink.VariantConfigurationData

**Package:** Simulink

(To be removed) Validate and activate variant blocks in a model hierarchy

---

**Note** `validateModel` will be removed in a future release. Use `Simulink.VariantManager.activateModel` instead.

---

## Syntax

```
[valid,errors] = vcdObj.validateModel(modelName)
[valid,errors] = vcdObj.validateModel(modelName,configName)
```

## Description

The `validateModel` method allows you to validate and activate a variant configuration on a model hierarchy. You can activate a named variant configuration defined for the model or the global workspace configuration (temporary configuration in the base workspace or data dictionary used by the model).

The process validates if the variant elements in the model such as variant blocks, variant controls, constraints, and the variant configuration are set up correctly. Activating a configuration:

- Checks if applicable constraints are satisfied
- Applies the variant control variable values defined in the configuration on the model
- Pushes the variant control variable values to the base workspace or data dictionary used by the model, for use in simulation and code generation workflows

`[valid,errors] = vcdObj.validateModel(modelName)`, where `vcdObj` is an object of the `Simulink.VariantConfigurationData` class, returns the result of validating and activating the global workspace configuration on the model hierarchy. The variant control variables must be defined in the base workspace or data dictionary used by the model.

`[valid,errors] = vcdObj.validateModel(modelName,configName)` returns the result of validating and activating the specified named variant configuration on the model hierarchy.

---

**Note** Activation of a variant configuration performed by this method differs from the Simulink update diagram process. See “Differences Between Variant Manager Activation and Update Diagram Process”.

For more information on the types of variant configurations, see .

---

## Input Arguments

**modelName** — Name of the model

character vector

Name of the model, specified as character vector.

Example: "slexVariantManagement"

Data Types: char

### **configName — Name of the variant configuration**

character vector

Name of the variant configuration to be validated and activated, specified as character vector.

Example: "LinInterExpNoNoise"

Data Types: char

## **Output Arguments**

### **valid — True or false result**

1 | 0

True or false result, returned as a 1 or 0 of data type logical.

### **errors — List of errors**

structure

List of errors, returned as an  $M \times 1$  structure where  $M$  is the number of models with errors. The structure has these fields:

Field	Type	Description
Model	char	Name of the model
Errors	structure	An $M \times 1$ structure where $M$ is the number of errors in the model. The structure has these fields: <ul style="list-style-type: none"> <li>• Message</li> <li>• MessageID</li> </ul>

## **Version History**

**Introduced in R2013b**

### **R2022b: validateModel will be removed**

*Warns starting in R2022b*

The `validateModel` will be removed in a future release. To validate and activate a variant configuration on a model, use the `Simulink.VariantManager.activateModel` method. Scripts which use this method continue to work with a warning.

### **R2022b: Change in the format of errors output argument**

The fields `Type`, `Source`, `PathInModel`, and `PathInHierarchy` have been removed from the structure named `Errors` within the second output argument, `errors`.

“Variant Manager for Simulink”

## Simulink.VariantControl class

**Package:** Simulink

Create a variant control variable object

### Description

The `Simulink.VariantControl` class creates a variant control variable object to associate the value of a variant control variable with a variant activation time. Use the `Simulink.VariantControl` object to determine the active choices of variant blocks and variant parameters during simulation.

### Creation

`variantControlVariable = Simulink.VariantControl` creates a variant control variable object with no value and 'ActivationTime' set to 'update diagram'.

`variantControlVariable = Simulink.VariantControl(Name, Value)` creates a variant control variable object as specified by `Name`, `Value` pair arguments. Using this syntax, you create an object and associate its value with a variant activation time.

### Input Arguments

#### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: 'Value', 1, 'ActivationTime', 'update diagram'

#### Value — Value of variant control variable object

scalar variable | enumerated type | `Simulink.Parameter`

Value of variant control variable object, specified as scalar variables, enumerated types, or `Simulink.Parameter` object.

Example: 'Value', 1

#### ActivationTime — Activation time of active value

'update diagram' (default) | 'update diagram analyze all choices' | 'code compile' | 'startup'

Simulink can set active choice of the variant blocks or variant parameters at different stages of the simulation and code generation workflow. Based on the stage you specify using this property, Simulink determines if the generated code must contain only the active choice or both active and inactive choices. The property also determines whether to analyze all the choices for incompatibilities in signal attributes. For more information on variant activation time, see “Activate Variant During Different Stages of Simulation and Code Generation Workflow”.

When you specify the variant activation time as:

- `'update diagram'` -- Simulink does not analyze the choices for incompatibilities in signal attributes. It generates code only for the active choice.
- `'update diagram analyze all choices'` -- Simulink analyzes both active and inactive choices for incompatibilities in signal attributes, however it generates code only for the active choice.
- `'code compile'` -- Simulink analyzes both active and inactive choices of variant blocks or variant parameters for incompatibilities in signal attributes and it also generates code for both active and inactive choices. The choices are enclosed in C preprocessor conditional statements `#if` and `#endif` that are conditionally compiled when you compile the generated code.
- `'startup'` -- Simulink analyzes both active and inactive choices of variant blocks and variant parameters for incompatibilities in signal attributes and it also generates code for both active and inactive choices. The choices are enclosed in regular `if` conditions inside the `model_initialize` function of the generated code that are conditionally evaluated when you run the executable that is built from the code.

Example: `'ActivationTime', 'code compile'`

## Methods

### Specialized Operators and Functions

These methods specialize standard MATLAB operators and functions for objects in this class.

<code>ne</code>	Compare if the inputs are not equal.
<code>eq</code>	Compares if the inputs are equal.
<code>not</code>	Returns logical NOT of input.

## Examples

### Simulink.VariantControl Variables for Coherent Switching of Choices in Variant Blocks

You can associate a variant control variable of type `Simulink.VariantControl` with a variant activation time. `Simulink.VariantControl` variant control variables help you switch variant elements such as blocks and parameters coherently.

Consider a group of blocks that represents a design choice, with each block having the same variant control variable of type `Simulink.VariantControl`. If you set the variant activation time of these blocks to `inherit` from `Simulink.VariantControl`, the blocks inherit the activation time from the variant control variable. As a result, all the blocks have the same activation time and are activated simultaneously to generate rational simulation results and valid code.

You can define `Simulink.VariantControl` type of control variables in storage locations as listed in “Storage Locations for Variant Control Variables (Operands) in Variant Blocks”.

Open the `slexVariantSubsystems` model.

```
open_system('slexVariantSubsystems');
```

```
VSS_MODE = 2
```

In the block parameters dialog box of the Controller block:

1. Specify the variant controls, `V == 1` and `V == 2`.

```
set_param('slexVariantSubsystems/Controller/Linear Controller', 'VariantControl', 'V==1')
set_param('slexVariantSubsystems/Controller/Nonlinear Controller', 'VariantControl', 'V==2')
```

2. Set **Variant activation time** to inherit from `Simulink.VariantControl` to inherit the activation time from V.

```
set_param('slexVariantSubsystems/Controller', 'VariantActivationTime', 'inherit from Simulink.Va
```

In the base workspace, define a `Simulink.VariantControl` object, V. Set its value to 1, variant activation time to `update diagram`, and then simulate the model.

```
V = Simulink.VariantControl('Value', 1, 'ActivationTime', 'update diagram')
```

```
V =
 VariantControl with properties:
 Value: 1
 ActivationTime: 'update diagram'
```

During simulation, the Controller block inherits the `update diagram` activation time from V and the Linear Controller block becomes active.

Double-click the Controller block to see the active choice.

```
sim('slexVariantSubsystems');
```

If you change the value of V to 2, the Nonlinear Controller block becomes active during simulation. You can change the value of V using this command or from `Simulink.VariantControl` dialog box.

```
V.Value = 2;
sim('slexVariantSubsystems');
```

If you change the variant activation time of V to update diagram analyze all choices, the Controller block inherits the update diagram analyze all choices activation time from V. You can observe the inherited activation time using CompiledVariantActivationTime.

```
V.ActivationTime = 'update diagram analyze all choices';
sim ('slexVariantSubsystems');
get_param('slexVariantSubsystems/Controller', 'CompiledVariantActivationTime')

ans =
'update diagram analyze all choices'
```

### Numeric Variant Control Values for Rapid Prototyping of Variant Parameters

Numeric values allow you to rapidly prototype variant values when you are still building your model. Numeric values help you focus more on building your variant values than on developing the expressions that activate those choices.

You can define numeric control values in locations listed in “Storage Locations for Variant Control Variables (Operands) in Variant Parameters”.

Open the slexVariantParameters model.

```
open_system('slexVariantParameters')
```

In the MATLAB Editor, specify variant choices in their simplest form as numeric values in Simulink.VariantVariable objects K1 and K2.

```
K1 = Simulink.VariantVariable('Choices',{ 'V==1', 3.5, 'V==2', 8.5})
```

```
K1 =
VariantVariable with 2 choices:
```

Condition	Value
V == 1	3.5000
V == 2	8.5000

```
Specification: ''
```

```
Bank: ''
```

Use getChoice, setChoice, addChoice, removeChoice to access, modify, add or remove choices

```
K2 = Simulink.VariantVariable('Choices',{ 'V==1', 4.5, 'V==2', 9.5})
```

```
K2 =
VariantVariable with 2 choices:
```

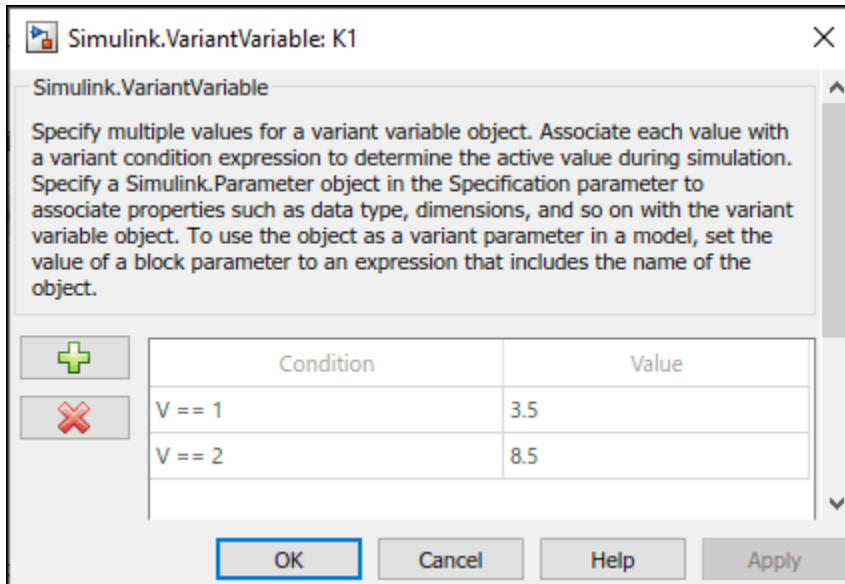

Condition	Value
V == 1	4.5000
V == 2	9.5000

```
Specification: ''
```

Bank: ''

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

Once you successfully create the `Simulink.VariantVariable` objects, you can modify them by using the methods described in “Public Methods” on page 5-811 or from the `VariantVariable` dialog box.

Activate one of the variant values by defining a control variable, `V`, and setting its value to 1 in a `Simulink.VariantControl` object.

```
V = Simulink.VariantControl('Value', 1, 'ActivationTime', 'update diagram')
```

```
V =
 VariantControl with properties:
 Value: 1
 ActivationTime: 'update diagram'
```

When you simulate the model, the condition `V == 1` evaluates to `true`. `K1` is assigned a value of 3.5 and `K2` is assigned a value of 8.5.

```
sim('slexVariantParameters')
```

If you change the value of `V` to 2, Simulink® sets the value of `K1` and `K2` to 4.5 and 9.5 during simulation. You can change the value of `V` using this command or from `Simulink.VariantControl` dialog box.

```
V.Value = 2;
sim('slexVariantParameters')
```

## Enumerated Types to Improve Code Readability of Variant Control Variables of Variant Parameters

Use enumerated types to give meaningful names to integers used as variant control values. For more information on enumerated type data, see “Use Enumerated Data in Simulink Models”.

In the MATLAB® Editor, define the classes that map enumerated values to meaningful names.

Open the `slexVariantParameters` model.

```
open_system('slexVariantParameters')
```

Specify the variant condition expressions `V == EngType.Small` and `V == EngType.Big` in `Simulink.VariantVariable` objects `K1` and `K2`.

```
K1 = Simulink.VariantVariable('Choices', {'V == EngType.Small',3.5,'V == EngType.Big',8.5})
```

```
K1 =
VariantVariable with 2 choices:
```

Condition	Value
<code>V == EngType.Big</code>	8.5000
<code>V == EngType.Small</code>	3.5000

```
Specification: ''
```

```
Bank: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

```
K2 = Simulink.VariantVariable('Choices', {'V == EngType.Small',4.5,'V == EngType.Big',9.5})
```

```
K2 =
VariantVariable with 2 choices:
```

Condition	Value
<code>V == EngType.Big</code>	9.5000
<code>V == EngType.Small</code>	4.5000

```
Specification: ''
```

```
Bank: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

Here, `EngType` is an integer-based enumeration class that is derived from the built-in data type, `int32`. The class has two enumeration values, `Small` and `Big`. These enumerated values have underlying integer values 1 and 2. In this example, the enumeration class is defined in the base workspace. You can choose to define the class in other storage locations as listed in “Storage Locations for Variant Control Variables (Operands) in Variant Blocks”.

```
type EngType.m
```

```
classdef EngType < Simulink.IntEnumType
 enumeration
```

```

 Small (1)
 Big (2)
 end
 methods (Static)
 function retVal = addClassNameToEnumNames()
 % ADDCLASSNAMETOENUMNAMES Specifies whether to add the class name
 % as a prefix to enumeration member names in generated code.
 % Return true or false.
 % If you do not define this method, no prefix is added.
 retVal = true;
 end
 end
end
end

```

Once you successfully create the `Simulink.VariantVariable` objects, you can modify them by using the methods described in “Public Methods” on page 5-811 or from the `VariantVariable` dialog box.

Activate one of the variant values by defining the control variable `V` and setting its value to `EngType.Small` in `Simulink.VariantControl` object `V`.

```
V = Simulink.VariantControl('Value',EngType.Small,'ActivationTime','code compile')
```

```
V =
 VariantControl with properties:
 Value: Small
 ActivationTime: 'code compile'
```

When you simulate the model, the condition `V == 1` evaluates to `true`. `K1` is assigned a value of 3.5, and `K2` is assigned a value of 8.5.

```
sim('slexVariantParameters')
```

If you change the value of V to 2, Simulink® sets the value of K1 and K2 to 4.5 and 9.5 during simulation. You can change the value of V using this command or from Simulink.VariantControl dialog box.

```
V.Value = 2
```

```
V =
 VariantControl with properties:

 Value: 2
 ActivationTime: 'code compile'
```

```
sim ('slexVariantParameters')
```

The code that you generate using enumerated types contains the names of the values rather than integers.

```
% slexVariantParameters_private.h
% #if V == EngType_Big || V == EngType_Small
% /* Variable: K1 Referenced by: '<Root>/Gain' */
% #if V == EngType_Big
% #define rtCP_Gain_K1 (8.5)
% #elif V == EngType_Small
% #define rtCP_Gain_K1 (3.5)
% #endif
% #endif
%
% #if V == EngType_Big || V == EngType_Small
% /* Variable: K2 Referenced by: '<Root>/Gain1' */
% #if V == EngType_Big
% #define rtCP_Gain1_K2 (9.5)
% #elif V == EngType_Small
% #define rtCP_Gain1_K2 (4.5)
% #endif
% #endif
% #endif
% #endif /* RTW_HEADER_slexVariantParameters_private_h_ */
```

Note that for variant parameters with “startup” activation time, only enumerations that are defined using these techniques are supported:

- Using the function `Simulink.defineIntEnumType`
- By subclassing built-in integer data types `int8`, `int16`, `int32`, `uint8`, or `uint16`, or by subclassing `Simulink.IntEnumType`

These enumerations are also supported when permanently stored in a Simulink® data dictionary. See “Enumerations in Data Dictionary”.

### Simulink.Parameter Type of Variant Control Variables for Code Generation of Variant Parameters

If you intend to generate code for a model containing variant parameters, specify variant control variables as `Simulink.Parameter` objects. `Simulink.Parameter` objects allow you to specify other attributes, such as data type and storage class, and control the appearance and placement of variant control variables in generated code.

- You can define a variant control variable of type `Simulink.Parameter` only in the base workspace or in a data dictionary. Defining `Simulink.Parameter` type of variant control variables in the mask or model workspace is not supported. For more information on storage locations for variant control variables, see “Storage Locations for Variant Control Variables (Operands) in Variant Parameters”.
- `Simulink.Parameter` objects within structures and that have data types other than `Simulink.Bus` objects are not supported.

Open the `slexVariantParameters` model.

```
open_system('slexVariantParameters')
```

In the MATLAB Editor, define a `Simulink.Parameter` object.

```
VSS_MODE = Simulink.Parameter;
VSS_MODE.Value = 1;
VSS_MODE.DataType = 'int32';
VSS_MODE.CoderInfo.StorageClass = 'Custom';
VSS_MODE.CoderInfo.CustomStorageClass = 'Define';
VSS_MODE.CoderInfo.CustomAttributes.HeaderFile = 'demo_macros.h';
```

Variant control variables defined as `Simulink.Parameter` objects can have any of the storage classes listed in “Storage Classes for Different Variant Activation Times” (Embedded Coder).

You can also convert a scalar variant control variable into a `Simulink.Parameter` object. For more information, see “Convert Variant Control Variables into `Simulink.Parameter` Objects”.

Specify the object as a variant control in `Simulink.VariantVariable` objects K1 and K2.

```
K1 = Simulink.VariantVariable('Choices',{ 'V == 1', 3.5, 'V == 2', 8.5})
```

```
K1 =
VariantVariable with 2 choices:
```

Condition	Value
V == 1	3.5000
V == 2	8.5000

```
Specification: ''
```

```
Bank: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

```
K2 = Simulink.VariantVariable('Choices',{ 'V == 1', 4.5, 'V == 2', 9.5})
```

```
K2 =
VariantVariable with 2 choices:
```

Condition	Value
V == 1	4.5000
V == 2	9.5000

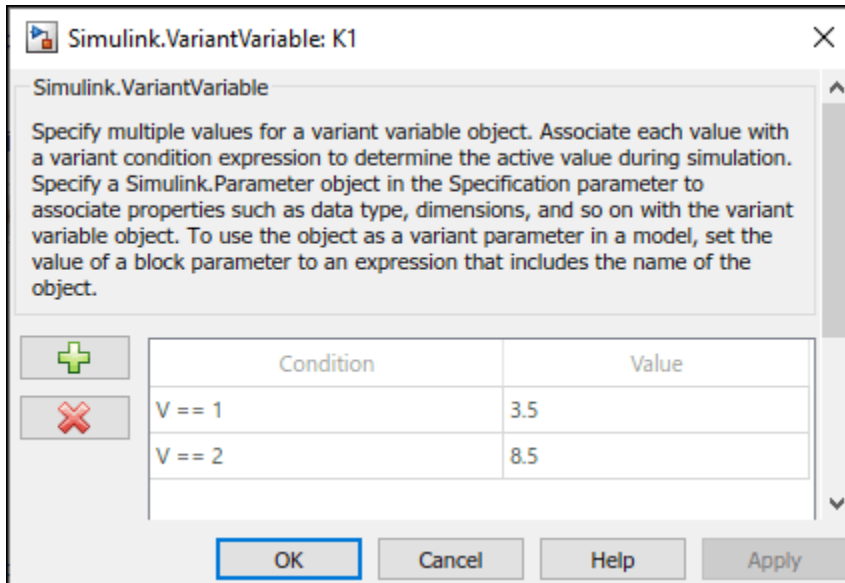

```
Specification: ''
```

Bank: ''

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

Once you successfully create the `Simulink.VariantVariable` objects, you can modify them by using the methods described in “Public Methods” on page 5-811 or from the `VariantVariable` dialog box.

Activate one of the variant values by defining a control variable `V` and setting its value to `VSS_MODE` in a `Simulink.VariantControl` object.

```
V = Simulink.VariantControl('Value',VSS_MODE,'ActivationTime','code compile')
```

```
V =
 VariantControl with properties:
 Value: [1x1 Simulink.Parameter]
 ActivationTime: 'code compile'
```

When you simulate the model, the condition `V == 1` evaluates to `true`. `K1` is assigned a value of 3.5, and `K2` is assigned a value of 8.5.

```
sim('slexVariantParameters')
```

If you change the value of `VSS_MODE` to 2, Simulink® sets the value of `K1` and `K2` to 4.5 and 9.5 during simulation. You can change the value of `V` using this command or from `Simulink.VariantControl` dialog box.

```
VSS_MODE.Value = 2;
V.Value = VSS_MODE;
sim('slexVariantParameters')
```

Generate code from the model. For information on how to generate code, see “Generate Code Using Embedded Coder” (Embedded Coder)

The generated code contains both `Linear` and `Nonlinear` choices in preprocessor conditionals `#if` and `#elif` because of the code compile activation time. The variant control variable `V` is defined using a macro — `#define` directive — in the header file `demo_macros.h`. You can control the appearance and placement of `V` in the generated code and prevent optimizations from eliminating storage for `V` using the storage class property. For more information, see “Storage Classes for Different Variant Activation Times” (Embedded Coder).

```
% demo_macros.h
% /* Exported data define */
%
% /* Definition for custom storage class: Define */
% #define V 2 /* Referenced by:
% * '<Root>/Gain'
% * '<Root>/Gain1'
% */
% #endif /* RTW_HEADER_demo_macros_h_ */
%
% /*
```

## Version History

Introduced in R2021a

## Extended Capabilities

### C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

# Simulink.VariantManager class

**Package:** Simulink

Access Variant Manager functionality programmatically

## Description

---

**Note** This class requires Variant Manager for Simulink.

---

The variant manager class provides a set of methods to access Variant Manager functionality from the MATLAB command line. Use an instance of `Simulink.VariantManager` class to:

- Apply a variant configuration to a model.
- Validate and activate a variant configuration in a model.
- Automatically generate all possible variant configurations for a model.
- Generate a reduced model for specified variant configurations.
- Get the `VariantConfigurationData` object associated with a model.
- Get the name of the preferred variant configuration for a model.
- Find variant control variables used in variant control expressions in a model.
- Convert a Variant Subsystem block to a Variant Assembly Subsystem block.
- Convert Subsystem or Model block to a Variant Subsystem block.
- Display or control the behavior of the variant condition legend.

## Methods

### Public Methods

<code>Simulink.VariantManager.activateModel</code>	Validate and activate variant blocks in model hierarchy
<code>Simulink.VariantManager.applyConfiguration</code>	Apply specified variant configuration to model
<code>Simulink.VariantManager.convertToVariant</code>	Convert Subsystem or Model blocks to Variant Subsystem block
<code>Simulink.VariantManager.convertToVariantAssemblySubsystem</code>	Convert Variant Subsystem block to Variant Assembly Subsystem block
<code>Simulink.VariantManager.findVariantControlVars</code>	Find variables used in variant control expressions
<code>Simulink.VariantManager.generateConfigurations</code>	Generate variant configurations automatically
<code>Simulink.VariantManager.getConfigurationData</code>	Get variant configuration data object associated with model
<code>Simulink.VariantManager.getPreferredConfigurationName</code>	Get name of preferred variant configuration for model

Simulink.VariantManager.reduceModel  
Simulink.VariantManager.variantLegend

Generate reduced model for  
specified variant configurations  
Display or control behavior of  
variant condition legend

## Examples

### Find Variant Control Variables for Model

This example shows how to find the variant control variables used in a model.

Open the model `slexVariantManagement`.

```
model = 'slexVariantManagement';
open_system(model);
```

Find the variant control variables.

```
vars = Simulink.VariantManager.findVariantControlVars(model)
```

```
vars=6x1 struct array with fields:
 Name
 Value
 Exists
 Source
 SourceType
```

## Version History

### Introduced in R2016a

#### R2022b: New add-on required

*Behavior changed in R2022b*

You must install the Variant Manager for Simulink software support package to use this class. The methods listed in the “Public Methods” on page 5-773 section except the `convertToVariant`, `convertToVariantAssemblySubsystem`, and `variantLegend` methods need the support package.

#### R2022b: New methods

The class has these new methods:

- `Simulink.VariantManager.activateModel`
- `Simulink.VariantManager.applyConfiguration`
- `Simulink.VariantManager.generateConfigurations`
- `Simulink.VariantManager.getPreferredConfigurationName`
- `Simulink.VariantManager.getConfigurationData`

## **See Also**

[“Compatibility Considerations When Using Variant Manager for Simulink Support Package”](#)

# Simulink.VariantManager.activateModel

**Class:** Simulink.VariantManager

**Package:** Simulink

Validate and activate variant blocks in model hierarchy

## Syntax

```
Simulink.VariantManager.activateModel(modelName)
```

```
Simulink.VariantManager.activateModel(modelName, Configuration=configName)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

The `Simulink.VariantManager.activateModel` method allows you to validate and activate a variant configuration on the given model and any referenced components in the model hierarchy. You can activate a named variant configuration defined for the model or the global workspace configuration (temporary configuration in the base workspace or data dictionary used by the model).

The process validates if the variant elements in the model, such as variant blocks, variant controls, constraints, and the variant configuration, are set up correctly. When you activate a configuration using this method, it:

- Checks if applicable constraints are satisfied
- Pushes the variant control variable values to the base workspace or data dictionary used by the model, for use in simulation and code generation workflows
- Reports an error if the activation fails

`Simulink.VariantManager.activateModel(modelName)` validates and activates the global workspace configuration on the model hierarchy. The variant control variables must be defined in the base workspace or data dictionary used by the model.

`Simulink.VariantManager.activateModel(modelName, Configuration=configName)` validates and activates the specified named variant configuration on the model hierarchy.

---

**Note** Activation of a variant configuration performed by this method differs from the Simulink update diagram process. See “Differences Between Variant Manager Activation and Update Diagram Process”.

---

## Input Arguments

**modelName — Name of model**

character vector | string

Name of the model, specified as a character vector or string.

Example: "slexVariantManagement"

Data Types: char | string

### **configName — Name of variant configuration**

character vector | string

Name of the variant configuration to be validated and activated, specified as a character vector or string.

Example: "LinInterExpNoNoise"

Data Types: char | string

## **Examples**

### **Validate and Activate Variant Configurations**

This example shows how to validate and activate a variant configuration programmatically.

To activate a variant configuration from Variant Manager, see “Create and Activate Variant Configurations”.

Open the model `slexVariantManagement`.

```
open_system('slexVariantManagement');
```

Activate and validate the model using the variant control variables and their values currently present in the base workspace or data dictionary used by the model.

```
Simulink.VariantManager.activateModel('slexVariantManagement')
```

Activate and validate the model using the variant configuration `LinInterExpNoNoise`.

```
Simulink.VariantManager.activateModel ...
('slexVariantManagement', Configuration = "LinInterExpNoNoise")
```

## **Version History**

**Introduced in R2022b**

### **R2022b: Recommended over validateModel**

The `validateModel` method will be removed in a future release. Use the `Simulink.VariantManager.activateModel` method instead.

### **See Also**

“Variant Configurations”

# Simulink.VariantManager.applyConfiguration

**Class:** Simulink.VariantManager

**Package:** Simulink

Apply specified variant configuration to model

## Syntax

```
Simulink.VariantManager.applyConfiguration(model, Configuration=configname)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`Simulink.VariantManager.applyConfiguration(model, Configuration=configname)` applies the variant configuration specified by `configname` to the model `model` and any referenced components in the model hierarchy.

The variant configuration named `configname` must be present in the `VariantConfigurationData` object associated with `model`. The operation exports the variant control variables defined in the specified configuration to the base workspace or data dictionary used by the model.

This method allows you to quickly switch the variant configuration for a model. The method does not validate the configuration. To validate and activate a model using a specific configuration or using the currently applied configuration, use the `Simulink.VariantManager.activateModel` method.

## Input Arguments

### **model** — Name of model

character vector | string

Name of the model to which the specified variant configuration must be applied, specified as a character vector or string.

Example: "slexVariantManagement"

Data Types: char | string

### **configname** — Name of variant configuration

character vector | string

Name of the variant configuration that must be applied to the model, specified as a character vector or string.

Example: "Config1"

Data Types: char | string

## Examples

### **Apply Variant Configuration to Model**

Open the model `slexVariantManagement`.

```
model='slexVariantManagement';
open_system(model);
```

The model has multiple named variant configurations stored in the variant configuration data object `vcd` associated with the model.

Apply the configuration `LinInterExpNoNoise` to the model.

```
Simulink.VariantManager.applyConfiguration(model,Configuration="LinInterExpNoNoise");
```

# Simulink.VariantManager.convertToVariantAssemblySubsystem

**Class:** Simulink.VariantManager

**Package:** Simulink

Convert Variant Subsystem block to Variant Assembly Subsystem block

## Syntax

```
Simulink.VariantManager.convertToVariantAssemblySubsystem(blockPathOrHandle)
Simulink.VariantManager.convertToVariantAssemblySubsystem(blockPathOrHandle,
Name=Value)
```

## Description

`Simulink.VariantManager.convertToVariantAssemblySubsystem(blockPathOrHandle)` converts the Variant Subsystem block `blockPathOrHandle` to a Variant Assembly Subsystem block. Use this syntax if the variant control mode of the Variant Subsystem block is `label` and has only Model blocks and Subsystem Reference blocks as its variant choices.

`Simulink.VariantManager.convertToVariantAssemblySubsystem(blockPathOrHandle, Name=Value)` converts the Variant Subsystem block `blockPathOrHandle` to a Variant Assembly Subsystem block as specified by one or more Name-Value arguments. Use this syntax if the variant control mode of the Variant Subsystem block is `expression` or has at least one Subsystem block as its variant choice.

## Input Arguments

### **blockPathOrHandle — Path or handle of Variant Subsystem block to convert**

character vector | string scalar | double scalar

Path or handle of the Variant Subsystem block to convert to a Variant Assembly Subsystem block, specified as a character vector or a string scalar (for a block path) or double scalar (for a handle).

Example: `'slexVariantSubsystem/Controller'`

Data Types: `char` | `string` | `double`

### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Example:

```
Simulink.VariantManager.convertToVariantAssemblySubsystem('slexVariantAssemblySubsystem/Controller', VariantControlVariableName = 'EngType', EnumerationClassFilePath = 'ControllerType.m', SubsystemFilesFolderPath = 'ControllerChoices') converts the Variant Subsystem block Controller to a Variant Assembly Subsystem block.
```

**VariantControlVariableName — Valid MATLAB variable name or structure field name**

character vector | string scalar

Valid MATLAB variable name or structure field name to be created, specified as a string scalar or a character vector. For the naming rules, see “Variable Names” and “Generate Field Names from Variables”.

During simulation, Simulink uses the value of this parameter to determine the active variant choice of the converted Variant Assembly Subsystem block.

Example: 'EngType'

**Dependencies**

Use this argument if `VariantControlMode` of the Variant Subsystem block is set to `expression`.

Data Types: `char` | `string`

**EnumerationClassFilePath — Absolute or relative path to MATLAB class file**

character vector | string scalar

Absolute or relative path to the MATLAB class file to be created, specified as a string scalar or a character vector. During the block conversion, Simulink defines an enumeration class in the specified enumeration class file with the variant choices of the converted Variant Assembly Subsystem block as its members.

Example: 'ControllerType.m'

**Dependencies**

Use this argument if the `VariantControlMode` of the Variant Subsystem block is set to `expression`.

Data Types: `char` | `string`

**SubsystemFilesFolderPath — Absolute or relative folder path**

character vector | string scalar

Absolute or relative folder path where the Subsystem Reference choices of the converted Variant Assembly Subsystem block must be saved as subsystem files, specified as a string scalar or a character vector.

Example: `SubsystemFilesFolderPath = 'ControllerChoices'`

**Dependencies**

Use this argument if the Variant Subsystem block has at least one Subsystem block as its variant choice.

Data Types: `char` | `string`

**Examples****Convert Variant Subsystem Block with Expressions to Variant Assembly Subsystem Block Programmatically**

This example explains how to convert a Variant Subsystem block to a Variant Assembly Subsystem block using the `Simulink.VariantManager.convertToVariantAssemblySubsystem` method.

The Variant Assembly Subsystem block has the same variant choices as the Variant Subsystem block. However, the subsystem choices are converted to Subsystem Reference choices and saved as subsystem files during block conversion.

1. Consider the Controller block in the `slexVariantSubsystems` model. The Controller block is a Variant Subsystem block that is to be converted to a Variant Assembly Subsystem block.

```
modelName = 'slexVariantSubsystems';
open_system(modelName);
```

```
VSS_MODE = 2
```

```
vssBlockPath = [modelName, '/Controller'];
```

2. Set the variant control mode of the Controller block to expression.

```
set_param(vssBlockPath, 'VariantControlMode', 'expression');
```

3. To convert the Controller block to a Variant Assembly Subsystem block, use the `convertToVariantAssemblySubsystem` method. During the conversion,

- The subsystem choices `Linear_Controller` and `Nonlinear_Controller` are converted to Subsystem Reference blocks because the Variant Assembly Subsystem block does not support subsystem choices. The name of the Subsystem Reference blocks are the same as the subsystem blocks and are saved in the subsystem files `Linear_Controller.slx` and `Nonlinear_Controller.slx` in the folder that you specify. For more information on how Simulink converts the subsystem blocks to Subsystem Reference blocks, see “Convert an Existing Subsystem to a Referenced Subsystem”.
- An enumeration class `controllerClass` is created in the folder that you specify. The `controllerClass` class has `Linear_Controller` and `Nonlinear_Controller` choices as its members.

You may need to resolve any issues with the folders you specify for the enumeration class and subsystem files.

- If either folder does not exist in the file system, Simulink creates the folder by using the `mkdir` command and then adds it to the MATLAB path.
- If either folder contains files with the same names as the enumeration class or subsystem files, Simulink overwrites them.

```
vcvName = 'EngType';
enumClassFilePath = 'controllerClass.m';
Simulink.VariantManager.convertToVariantAssemblySubsystem(vssBlockPath, VariantControlVariableName);
```

After successfully converting the Controller block to a Variant Assembly Subsystem block, observe the expressions in **Variant control expression** for each variant choice. Simulink generates the expressions with the “Variant control variable” on page 1-0 on the left side and the members of the “Variant choices enumeration” on page 1-0 on the right side. Both sides of the expression are related by `==`. When an expression evaluates to `true` during simulation, the corresponding variant choice becomes active.

4. Set `Linear_Controller` active by specifying the value of `EngType` to `controllerClass.Linear_Controller` and simulate the model. During simulation, the control expression `EngType == controllerClass.Linear_Controller` evaluates to `true` and `Linear_Controller` becomes active.

```
EngType = controllerClass.Linear_Controller;
sim(modelName);
```

For information on how to use Variant Assembly Subsystem blocks, see “Add or Remove Variant Choices of Variant Assembly Subsystem Blocks Using External Files”.

### Convert Variant Subsystem Block with Labels to Variant Assembly Subsystem Block Programmatically

This example explains how to convert a Variant Subsystem block to a Variant Assembly Subsystem using the `Simulink.VariantManager.convertToVariantAssemblySubsystem` method. The Variant Assembly Subsystem block has the same variant choices as the Variant Subsystem block. However, the subsystem choices are converted to Subsystem Reference choices and saved as subsystem files during block conversion.

1. Consider the `Controller` block in the `slexVariantSubsystems` model. The `Controller` block is a Variant Subsystem block that is to be converted to a Variant Assembly Subsystem block.

```
modelName = 'slexVariantSubsystems';
open_system(modelName);
```

```
VSS_MODE = 2
```

```
vssBlockPath = [modelName, '/Controller'];
```

2. Set the variant control mode of the `Controller` block to `label`.

```
set_param(vssBlockPath, 'VariantControlMode', 'label');
```

3. To convert the `Controller` block to a Variant Assembly Subsystem block, use the `convertToVariantAssemblySubsystem` method. During the conversion, the subsystem choices `Linear_Controller` and `Nonlinear_Controller` are converted to Subsystem Reference blocks because the Variant Assembly Subsystem block does not support subsystem choices. The name of the newly created Subsystem Reference blocks are the same as the subsystem blocks and are saved in the subsystem files `Linear_Controller.slx` and `Nonlinear_Controller.slx` in the folder that you specify. For more information on how Simulink converts the subsystem blocks to Subsystem Reference blocks, see “Convert an Existing Subsystem to a Referenced Subsystem”.

You may need to resolve any issues with the folders you specify for the subsystem files.

- If the specified folder does not exist in the file system, Simulink creates the folder by using `mkdir` command.
- If the specified folder contains files with the same name as the new subsystem files, Simulink overwrites them.

```
Simulink.VariantManager.convertToVariantAssemblySubsystem(vssBlockPath, SubsystemFilesFolderPath);
```

After successfully converting the `Controller` block to a Variant Assembly Subsystem block, observe the expression in the “Variant choices specifier” on page 1-0 parameter. The expression is of the form `{'Linear_Controller', 'Nonlinear_Controller'}`, where `Linear_Controller` and `Nonlinear_Controller` are the variant choices of the converted block. To add or remove variant choices from the `Controller` block, change the specifier as described in “Add or Remove Variant Choices of Variant Assembly Subsystem Blocks Using External Files”.

4. To simulate the model for `Linear_Controller`, set the value of **Label mode active choice** to `Linear_Controller` and simulate the model.

```
set_param(vssBlockPath, 'LabelModeActiveChoice', 'Linear_Controller');
sim(modelName);
```

## Limitations

Only Variant Subsystem blocks with the **Variant control mode** set to `label` or `expression` can be converted to a Variant Assembly Subsystem block.

## Alternatives

You can convert a Variant Subsystem block to a Variant Assembly Subsystem block through the block dialog. For more information, see “Convert Variant Subsystem to Variant Assembly Subsystem”.

## Version History

**Introduced in R2022b**

### **R2023a: Support for expression mode added**

You can convert a Variant Subsystem block in `expression` mode to a Variant Assembly Subsystem block.

## Topics

“Add or Remove Variant Choices of Variant Assembly Subsystem Blocks Using External Files”

## Simulink.VariantManager.convertToVariant

**Class:** Simulink.VariantManager

**Package:** Simulink

Convert Subsystem or Model blocks to Variant Subsystem block

### Syntax

```
variant_subsystem = Simulink.VariantManager.convertToVariant(
blockPathOrHandle)
```

### Description

`variant_subsystem = Simulink.VariantManager.convertToVariant(blockPathOrHandle)` converts a Subsystem block or Model block to a Variant Subsystem block. A Variant Subsystem can contain a combination of Subsystem blocks, Model blocks, or Subsystem Reference blocks as choices.

### Input Arguments

**blockPathOrHandle — Subsystem or Model block to convert**

block path | block handle

The Subsystem or Model block to convert to a Variant Subsystem block, specified as a block path or handle. Specify a block path as a character vector and a block handle as a scalar.

Example: 'mdlVar1/VariantModelBlock1'

### Output Arguments

**variant\_subsystem — Handle of Variant Subsystem block**

scalar

The block handle of the Variant Subsystem block created by the conversion, returned as a scalar.

### Examples

#### Convert Subsystem block or Model block to Variant Subsystem

Convert the Subsystem block Controller in the f14 model to a Variant Subsystem block.

```
open_system('f14');
Simulink.VariantManager.convertToVariant('f14/Controller');
```

Convert the Model block CounterA in the sldemo\_mdref\_basic model to a Variant Subsystem block.

```
openExample('simulink_features/ComponentBasedModelingWithModelReferenceExample');
Simulink.VariantManager.convertToVariant('sldemo_mdref_basic/CounterA');
```

## Limitations

The `convertToVariant` method does not support Subsystem blocks in a Simscape model that has Editing Mode set to **Restricted**.

## Alternatives

### Simulink Editor

In the Simulink Editor, right-click the Subsystem or Model block and select **Subsystems & Model Reference > Convert to > Variant Subsystem**.

## Version History

Introduced in R2017b

# Simulink.VariantManager.findVariantControlVars

**Class:** Simulink.VariantManager

**Package:** Simulink

Find variables used in variant control expressions

## Syntax

```
vars = Simulink.VariantManager.findVariantControlVars(model)
vars = Simulink.VariantManager.findVariantControlVars(model,
'SearchReferencedModels','off')
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`vars = Simulink.VariantManager.findVariantControlVars(model)` returns the variant control variables used by variant blocks and variant parameters in the model, `Model`. If the variant control is a `Simulink.Variant` object, then the variables are retrieved from the variant condition within the object.

`vars = Simulink.VariantManager.findVariantControlVars(model, 'SearchReferencedModels','off')` disables the search in referenced models. By default, this search is enabled across the model hierarchy.

## Input Arguments

**model** — Model name

character vector | string

Model name for which variant control variables must be found, specified as a character vector or string.

Data Types: char | string

**'SearchReferencedModels'** — Option to search in referenced models

'on' (default) | 'off'

Option to search in referenced models within the given model, specified as 'on' or 'off'. By default, search is enabled for referenced models.

## Output Arguments

**vars** — Variant control variables for model

structure

Variant control variables for model, returned as an  $N$ -by-1 structure with the following fields:

- **Name** — Name of the variable used in the variant control expression.
- **Value** — Value of the variable. This field is 0 if the variable is not defined in the base workspace or data dictionary used by the model.
- **Exists** — Logical value that indicates if the variable is defined in the base workspace or data dictionary used by the model. If the variable is defined, this value is `true`; otherwise `false`.
- **Source** — Value is either `base workspace` or the *name* of the data dictionary where the variable is stored.
- **SourceType** — Value is either `base workspace` or `data dictionary` depending on where the variable is stored.

## Examples

### Find Variant Control Variables for Model

This example shows how to find the variant control variables used in a model.

Open the model `slexVariantManagement`.

```
model = 'slexVariantManagement';
open_system(model);
```

Find the variant control variables.

```
vars = Simulink.VariantManager.findVariantControlVars(model)
```

```
vars=6x1 struct array with fields:
 Name
 Value
 Exists
 Source
 SourceType
```

## Version History

## Simulink.VariantManager.generateConfigurations

**Class:** Simulink.VariantManager

**Package:** Simulink

Generate variant configurations automatically

### Syntax

```
vcdataobj = Simulink.VariantManager.generateConfigurations(modelName)
[vcdataobj,configsInfo] = Simulink.VariantManager.generateConfigurations(
modelName,Name=Value)
```

### Description

`vcdataobj = Simulink.VariantManager.generateConfigurations(modelName)` generates variant configurations for the given model. The method returns a variant configuration data object `vcdataobj` that contains the generated configurations.

`[vcdataobj,configsInfo] = Simulink.VariantManager.generateConfigurations(modelName,Name=Value)` generates variant configurations for the given model `modelName` as specified by optional `Name=Value` arguments.

If `Precondition` is specified and the `AddPreconditionAsConstraint` argument is set to `true`, the corresponding condition is defined as a global constraint in the output object `vcdataobj`. The optional `configsInfo` output contains information on the validity of the generated configurations.

### Input Arguments

#### **modelName — Name of the model**

string | character vector

Name of the model, specified as a character vector or string.

Example: "slexVariantManagement"

Data Types: char | string

#### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Example:

```
vcdataobj=Simulink.VariantManager.generateConfigurations("slexVariantManagemen
t", Precondition={'Ctrl == ControllerType.Linear', 'PlantLoc ==
PlantLocation.Internal'}, AddPreconditionAsConstraint=true, Validity="valid")
```

#### **Precondition — Conditions that must be satisfied by generated configurations**

character vector | cell array of character vectors

Conditions that must be satisfied by the generated configurations, specified as a character vector or cell array of character vectors containing valid Boolean expressions. You can use preconditions to limit the combinations of control variables to consider at a time or to apply constraints based on requirements.

Example: {'Ctrl == ControllerType.Linear', 'PlantLoc == PlantLocation.Internal'}

Data Types: char | cell

### AddPreconditionAsConstraint — Option to export preconditions as constraints

false or 0 (default) | true or 1

Option to export preconditions as constraints in the output variant configuration data object `vcdataobj` specified as a numeric or logical 1 (true) or 0 (false). If false, the predicate conditions are not added to `vcdataobj`. If true, the conditions are added as constraints that must be satisfied by all configurations in `vcdataobj`.

### Validity — Type of configurations to include in the output

"valid-unique" (default) | "valid" | "all"

Type of configurations to include in the output, specified as `valid-unique`, `valid`, or `all`.

The configurations generated by this method can include invalid configurations that might result in compilation errors or duplicate configurations that are functionally equivalent and hence produce similar results. Use this argument to specify which of these configurations to retain in the output.

- `valid-unique` — Include only valid configurations without any duplicates that are functionally equivalent. Two variant configurations are functionally equivalent if they result in same set of active blocks in the model. This option generates a minimal set of configurations with maximum coverage.

If a configuration has functional equivalents, this option lists one of those equivalent configurations also in the result with the **Validity Status** value as `EquivalentK`. *K* is an annotation to identify a group of equivalent configurations, for example, `Equivalent1`.

- `valid` — Include only valid configurations.

These configurations might include duplicate configurations that are functionally equivalent. Functional duplicates might occur due to the structure of a model resulting in the same variant paths being active for different variant control values. This option generates the full set of configurations with repetitive coverage.

- `all` — Include valid, invalid, and duplicate configurations.

An invalid configuration violates variant semantics and causes an error during the update diagram process. For example, you have a configuration that deactivates all choices in an inline variant block. However, this block has the **Allow zero variant control** set to `off`, which contradicts the deactivation and causes an error.

For any validity option, the method generates only those configurations that satisfy the specified preconditions.

Example: "valid"

### ExcludeVariantConfigurationData — Configurations and constraints that do not need to be generated

character vector

Name of a variant configuration data object of type `Simulink.VariantConfigurationData` that contains the configurations that do not need to be generated, specified as a character vector. This also excludes any constraints present in the variant configuration data object. Use this option to augment existing configurations for a model or to generate configurations incrementally.

Example: `'vcataObjIgnore'`

## Output Arguments

### **vcdataobj** — Variant configuration data object

`Simulink.VariantConfigurationData`

Variant configuration data object that contains the generated variant configurations for the given model, returned as an object of type `Simulink.VariantConfigurationData`. If `Precondition` is provided and `AddPreconditionAsConstraint` is set to `true`, the corresponding conditions are defined as model-wide constraints in this object.

### **configsInfo** — Name and validity of configurations

structure array

Name and validity of generated configurations, returned as a structure array with the fields:

- **Name** — Name of the generated configuration
- **ValidityStatus** — Validity of the generated configuration that indicates whether a configuration is unique, a functional equivalent, or an invalid one, specified as one of these values:
  - **Unique** — Configuration is valid and unique without any functional duplicates.
  - **Equivalent $K$**  — Configuration is valid and is a functional equivalent of another configuration.  $K$  is an annotation to identify a group of equivalent configurations, for example, **Equivalent1**.
  - **Invalid** — Configuration is not valid.

For example, consider a variant configuration object `vcdataobj` with six generated configurations. The generated configurations have validity as follows:

- `VConfig1` is valid and has no functional duplicates.
- `VConfig3` is invalid.
- `VConfig2` and `VConfig5` are valid and equivalent.
- `VConfig4` and `VConfig6` are valid and equivalent.

Then, `configsInfo` is a 1-by-6 structure array:

```
'VConfig1' 'Unique'
'VConfig2' 'Equivalent1'
'VConfig3' 'Invalid'
'VConfig4' 'Equivalent2'
'VConfig5' 'Equivalent1'
'VConfig6' 'Equivalent2'
```

Data Types: `struct`

## Limitations

- The auto-generation process supports only `==`, `~=`, `&&`, `||`, and `~` operators in the variant control expressions of variant blocks and in the preconditions. If the variant control expressions use other operators such as arithmetic or relational operators, the configurations that can activate those variant choices might not get generated.
- The process does not support generating variant configurations for these modeling elements:
  - Variant blocks with a **Variant control expression** that contains noninteger double values, structure fields, or `Simulink.Parameter` objects with value set to an expression of type `slexpr`
  - Variant parameter objects of type `Simulink.VariantVariable`
  - Model that represents a library or subsystem
- For variant blocks with the **Variant control mode** parameter set to `label`, the variant control labels are strings, not variables. Hence they are not present in the generated configurations.
- For Variant Subsystem blocks, these conditions also apply:
  - If the **Variant control mode** parameter is set to `label`, only the variations present in the active label path are considered when you generate configurations.

Consider this model hierarchy for a model with a Variant Subsystem block in `label` mode. The active choice for the variant subsystem is the Subsystem block, which has its variant control set to a label, `SUB1`. The variant control variable `A` is used by the active choice and is considered when you generate configurations. The process does not consider the control variable `B` because it is in the inactive choice of the variant subsystem.

Name	Variant Control	Condition
✓ mLabelMode		
✓ Variant Subsystem		
✓ <input type="checkbox"/> Subsystem	SUB1	(N/A)
✓ Variant Source		
✗ Input 1	PORT_1	(N/A)
✗ Input 2	PORT_2	(N/A)
✓ <input checked="" type="checkbox"/> Variant Source1		
✗ Input 1	A==1	(N/A)
✗ Input 2	A==2	(N/A)
✓ <input type="checkbox"/> Subsystem1	SUB2	(N/A)
✓ <input checked="" type="checkbox"/> Variant Sink		
✗ Output 1	B==1	(N/A)
✗ Output 2	B==2	(N/A)

Here is the list of all generated configurations.

Name	Data Type	Values
A	double	[1, 2]

—	Name	A
<input checked="" type="checkbox"/>	VarConf_1_E1	1
<input checked="" type="checkbox"/>	VarConf_2_E1	2

- If the **Variant control mode** parameter is set to `sim codegen switching`, only the variations present in the `sim choice` are considered when you generate configurations. For the variant controls present in the codegen hierarchy, only the default values are included in the generated configurations.

Consider this model hierarchy for a model with a Variant Subsystem block in `sim codegen switching` mode. The `sim choice` for the variant subsystem is the Subsystem block. The variant control variable B present in this choice is considered when you generate configurations. The process only considers the default value for the control variable C because it is in the codegen choice of the variant subsystem.

Name	Variant Control	Condition
<ul style="list-style-type: none"> <li>mSimCodegenWithUDAAC           <ul style="list-style-type: none"> <li>Variant Subsystem               <ul style="list-style-type: none"> <li>Subsystem (sim) (N/A)                   <ul style="list-style-type: none"> <li>Variant Sink                       <ul style="list-style-type: none"> <li>Output 1 (B==1) — B is in sim choice</li> <li>Output 2 (B==2) (N/A)</li> </ul> </li> </ul> </li> <li>Subsystem1 (codegen) (N/A)                   <ul style="list-style-type: none"> <li>Variant Source                       <ul style="list-style-type: none"> <li>Input 1 (C==1) — C is in codegen choice</li> <li>Input 2 (C==2) (N/A)</li> </ul> </li> </ul> </li> </ul> </li> </ul> </li> </ul>		

Here is the list of all generated configurations.

Name	Data Type	Values
B	double	[1, 2]
C	double	[1]

—	Name	B	C
<input checked="" type="checkbox"/>	VarConf_1_E1	1	1
<input checked="" type="checkbox"/>	VarConf_2_E2	2	1

- If the **Variant activation time** is set to `update diagram`, only the variations in the active choice are considered for generating configurations.

## Examples

### Generate Variant Configurations Programmatically

This example shows how to generate variant configurations for a model programmatically.

To generate variant configurations from Variant Manager, see “Generate Variant Configurations Automatically”.

This command returns valid variant configurations for the model `slexVariantManagement` that satisfy the conditions specified on the variant control variables `Ctrl` and `PlantLoc`.

```
model = "slexVariantManagement";
open_system(model);
[vcdataobj,configsInfo] = Simulink.VariantManager.generateConfigurations ...
(model, Precondition = {'Ctrl == ControllerType.Linear', 'PlantLoc == PlantLocation.Internal'},
AddPreconditionAsConstraint = true, Validity = "valid");
```

Activating the model for the current state of the model.

An update diagram operation is required to generate variant configurations.

Performing update diagram for the model.

Evaluating 96 potential combinations to generate...

Number of generated configurations: 16

Created snapshot of the model at 'C:\TEMP\Bdoc23a\_2213998\_3568\ib570499\23\tp4d276709\simulink\_va

The variant configuration data object `vcdataobj` stores all the valid configurations. The structure array `configsInfo` provides information on the validity status of generated configurations.

To return only valid and functionally unique configurations, set `Validity` to `valid-unique`.

```
[vcdataobj,configsInfo] = Simulink.VariantManager.generateConfigurations(model,...
Precondition = {'Ctrl == ControllerType.Linear', 'PlantLoc == PlantLocation.Internal'}, ...
AddPreconditionAsConstraint = true, Validity = "valid-unique");
```

Activating the model for the current state of the model.

An update diagram operation is required to generate variant configurations.

Performing update diagram for the model.

Evaluating 96 potential combinations to generate...

Number of generated configurations: 3

Created snapshot of the model at 'C:\TEMP\Bdoc23a\_2213998\_3568\ib570499\23\tp4d276709\simulink\_va

To return all generated configurations, including invalid configurations, set `Validity` to `all`.

```
[vcdataobj,configsInfo] = Simulink.VariantManager.generateConfigurations(model,...
Precondition = {'Ctrl == ControllerType.Linear', 'PlantLoc == PlantLocation.Internal'}, ...
AddPreconditionAsConstraint = true, Validity = "all");
```

Activating the model for the current state of the model.

An update diagram operation is required to generate variant configurations.

Performing update diagram for the model.

Evaluating 96 potential combinations to generate...

Number of generated configurations: 16

Created snapshot of the model at 'C:\TEMP\Bdoc23a\_2213998\_3568\ib570499\23\tp4d276709\simulink\_va

## Tips

You can use the `intersect`, `setdiff`, `union`, and `unique` methods in the `Simulink.VariantConfigurationData` class to perform set operations on variant configuration data objects. See “Specialized Operators and Functions” on page 5-711.

# Simulink.VariantManager.getConfigurationData

**Class:** Simulink.VariantManager

**Package:** Simulink

Get variant configuration data object associated with model

## Syntax

```
vcdo = Simulink.VariantManager.getConfigurationData(model)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`vcdo = Simulink.VariantManager.getConfigurationData(model)` returns the variant configuration data object associated with the model `model`.

## Input Arguments

**model** — Name of model

character vector | string

Name of the model, specified as a character vector or string.

Example: "slexVariantManagement"

Data Types: char | string

## Output Arguments

**vcdo** — Variant configuration data object

Simulink.VariantConfigurationData object

Variant configuration data object associated with the model, returned as an object of the Simulink.VariantConfigurationData class.

## Examples

### Get Variant Configuration Object for Model

Open the model `slexVariantManagement`.

```
model = 'slexVariantManagement';
open_system(model);
```

Get the existing variant configuration object for the model.

```
Simulink.VariantManager.getConfigurationData(model)
```

```
ans =
 VariantConfigurationData with properties:
 Configurations: [1x6 struct]
 Constraints: [1x1 struct]
 PreferredConfiguration: ''
```

Get the name of variant configuration object associated with the model.

```
get_param(model, 'VariantConfigurationObject')
```

```
ans =
'vcd'
```

## Version History

Introduced in R2022b

**R2022b: Recommended over getFor**

The `getFor` method will be removed in a future release. Use the `Simulink.VariantManager.getConfigurationData` method instead.

# Simulink.VariantManager.getPreferredConfigurationName

**Class:** Simulink.VariantManager

**Package:** Simulink

Get name of preferred variant configuration for model

## Syntax

```
configname = Simulink.VariantManager.getPreferredConfigurationName(model)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`configname = Simulink.VariantManager.getPreferredConfigurationName(model)` returns the name of the preferred variant configuration for the model `model`.

## Input Arguments

**model** — Name of model

character vector | string

Name of the model, specified as a character vector or string.

Example: "slexVariantManagement"

Data Types: char

## Output Arguments

**configname** — Name of preferred variant configuration

character vector

Name of the preferred variant configuration, returned as a character vector.

## Examples

### Get Name of Preferred Variant Configuration for Model

Open the model `slexVariantManagement`.

```
model = 'slexVariantManagement';
open_system(model);
```

Get the name of the preferred variant configuration for the variant configuration data object associated with this model.

```
configname = Simulink.VariantManager.getPreferredConfigurationName(model);
```

# Simulink.VariantManager.reduceModel

**Class:** Simulink.VariantManager

**Package:** Simulink

Generate reduced model for specified variant configurations

## Syntax

```
Simulink.VariantManager.reduceModel(model)
Simulink.VariantManager.reduceModel(model,Name,Value)
```

## Description

---

**Note** This method requires Variant Manager for Simulink.

---

`Simulink.VariantManager.reduceModel(model)` generates a reduced model from the input model `model`.

By default, the current values of variant control variables in the base workspace or data dictionary of the input model are used for reduction. The reduction process retains the variant configurations corresponding to these values and removes the inactive model components. The reduced artifacts are generated in a folder named `./reducedModel` within the input model folder. The name of the reduced model and any reduced referenced model is the original model name suffixed with `_r`, by default.

`Simulink.VariantManager.reduceModel(model,Name,Value)` allows you to specify additional reduction options using one or more `Name,Value` arguments.

## Input Arguments

**model** — Name of model to be reduced

string | character vector

Name of the model to be reduced, specified as a string or character vector.

### Name-Value Pair Arguments

Specify optional `Name,Value` arguments. `Name` is the argument name and `Value` is the corresponding value. You can specify several name and value arguments in any order as `Name1,Value1,...,NameN,ValueN`.

**NamedConfigurations** — Names of variant configurations to be retained

string | character vector | cell array of strings | cell array of character vectors

Names of variant configurations to be retained in the reduced model, specified as a string, a character vector, a cell array of strings, or a cell array of character vectors. These named variant configurations must be present in the variant configuration data object (of type `Simulink.VariantConfigurationData`) associated with the model.

Example: 'NamedConfigurations', 'C1'

Example: 'NamedConfigurations', {'C2'}

Data Types: char | string | cell

### VariableGroups — Groups of variant control variables and their values

cell array

Variant control variables and their values that must be used for reduction, specified as a cell array containing the variable names and values.

---

**Note** Specifying both `VariableGroups` and `NamedConfigurations` is not supported.

---

You can create multiple named variable groups for a model. To specify names for the variable groups, specify a `struct` array with the fields `Name` and `VariantControls`. `Name` denotes the name of the variable group, and `VariantControls` must be a cell array with variant control variable names and their corresponding values. For example:

```
Simulink.VariantManager.reduceModel('slexVariantReducer',...
'VariableGroups', struct('Name', 'Group1', 'VariantControls', {{'V',1,'W',[1 2]}}));
```

Example: 'VariableGroups', {{'V',1,'W',1},{'V',2,'W',2}}

Data Types: cell

### FullRangeVariables — Variables for which full range must be considered for reduction

cell array

Variables for which their full range must be considered for reduction, specified as a cell array of variant control variable names and their corresponding values. This option allows you to reduce a model for all valid values of the specified variant control variables. You must also provide a reference value for this variant control variable for which the model compiles successfully.

For example, consider a variant control variable, `W`, that is specified as a full-range variant control variable. `W` uses a reference value of `1`. The reduction process considers `V=1` and all valid values of `W`. To perform full-range analysis, Variant Reducer compiles the model once using the values `{'V',1,'W',1}`.

```
Simulink.VariantManager.reduceModel('slexVariantReducer',...
'VariableGroups',{'V',1},...
'FullRangeVariables',{'W',1});
```

Data Types: cell

### CompileMode — Compilation mode

'sim' (default) | 'codegen'

Compilation mode, specified as 'sim' or 'codegen'. These options indicate whether the model should be compiled for simulation or code generation mode, respectively, as part of reduction. If the model contains variant blocks with the **Variant control mode** parameter set to `sim` or `codegen`, you can specify the value as `codegen` to retain the code generation branches of the blocks in the reduced model. For the default value `sim`, Variant Reducer compiles and retains the simulation branches in the top-level model.

### ExcludeFiles — List of files to exclude during reduction

cell array of character vectors

List of any dependent Simulink data dictionary files (\*.sldd) and MAT-files (\*.mat) outside the MATLAB root folder to exclude during reduction, specified as a cell array of character vectors.

You can also provide wildcard characters, for example {'\*.sldd'}.

Example: {'topData.sldd'}

Data Types: cell

### **OutputFolder — Folder to place reduced model and related artifacts**

string | character vector

Folder to place the reduced models and related artifacts, specified as a character vector or string. By default, the reduced models are generated in a folder named ./reducedModel within the original model folder.

### **PreserveSignalAttributes — Option to preserve signal attributes in reduced model**

true or 1 (default) | false or 0

Option to preserve signal attributes in the reduced model, specified as a numeric or logical 1 (true) or 0 (false). When the value is true, Variant Reducer preserves the compiled signal attributes from the original model by adding signal specification blocks at appropriate block ports in the reduced model. Compiled signal attributes include signal data types, signal dimensions, and compiled sample times.

### **Verbose — Option to display detailed reduction steps**

false or 0 (default) | true or 1

Option to display detailed reduction steps, specified as a numeric or logical 1 (true) or 0 (false). When the value is true, Variant Reducer displays details of the steps performed during model reduction.

### **ModelSuffix — Suffix to append to name of reduced model**

'\_r' (default) | character vector

Suffix to append to the name of the reduced model and the related artifacts, specified as a character vector.

### **GenerateSummary — Option to generate summary HTML file**

false or 0 (default) | true or 1

Option to generate a summary HTML file, specified as a numeric or logical 1 (true) or 0 (false). When the value is true, Variant Reducer generates an HTML file with details about the reduced model and any modifications that may be required for masks and callbacks.

---

**Note** To generate a summary, you must have a Simulink Report Generator™ license.

---

## **Limitations**

For information on modifications made to model components during reduction and limitations of the reduction process, see “Considerations and Limitations for Variant Reduction”.

## Examples

### Reduce Variant Model Programmatically

Open the models `slexVariantReducer` and `sldemo_variant_subsystems`.

```
open_system('slexVariantReducer');
open_system('sldemo_variant_subsystems');
```

Reduce the `sldemo_variant_subsystems` model based on the variant control variable values in the base workspace.

```
Simulink.VariantManager.reduceModel('sldemo_variant_subsystems');
```

```
Successfully created reduced model
'C:\TEMP\Bdoc23a_2213998_3568\ib570499\23\tp4d276709\simulink_variants-ex20490563\reducedModel\s'
```

Reduce the model based on the variant control variable values in the base workspace, and place the reduced model in the specified output directory.

```
Simulink.VariantManager.reduceModel('sldemo_variant_subsystems', ...
 'OutputFolder', 'outdir1');
```

```
Successfully created reduced model
'C:\TEMP\Bdoc23a_2213998_3568\ib570499\23\tp4d276709\simulink_variants-ex20490563\outdir1\sldemo_'
```

Reduce the model by specifying named variant configurations present in the variant configuration data object associated with the model.

```
Simulink.VariantManager.reduceModel('slexVariantReducer', ...
 'NamedConfigurations', {'config1', 'config2'});
```

```
Successfully created reduced model
'C:\TEMP\Bdoc23a_2213998_3568\ib570499\23\tp4d276709\simulink_variants-ex20490563\reducedModel\s'
```

Reduce the model by specifying variant control variables and their values.

This syntax specifies two configurations for reduction corresponding to  $\{V==1, W==1\}$  and  $\{V==2, W==2\}$ .

```
Simulink.VariantManager.reduceModel('slexVariantReducer', ...
 'VariableGroups', {'V', 1, 'W', 1}, {'V', 2, 'W', 2});
```

```
Successfully created reduced model
'C:\TEMP\Bdoc23a_2213998_3568\ib570499\23\tp4d276709\simulink_variants-ex20490563\reducedModel\s'
```

Reduce the model by specifying configurations in the form of a structure of variant control variables.

This syntax specifies four configurations for reduction corresponding to  $\{V==1, W==1\}$ ,  $\{V==1, W==2\}$ ,  $\{V==2, W==1\}$ , and  $\{V==2, W==2\}$ .

```
Simulink.VariantManager.reduceModel('slexVariantReducer', ...
 'VariableGroups', {'V', [1 2], 'W', [1 2]});
```

```
Successfully created reduced model
'C:\TEMP\Bdoc23a_2213998_3568\ib570499\23\tp4d276709\simulink_variants-ex20490563\reducedModel\s'
```

Reduce the model by specifying names for variable groups.

This syntax specifies two named variable groups, Group1 and Group2.

The reduced model has named configurations with the same name as the named variable groups, along with a suffix. In this case, the reduced model has three configurations named Group1\_1, Group1\_2, and Group2\_1 corresponding to {V==1, W==1}, {V==1, W==2}, and {V==2, W==1}, respectively.

```
Simulink.VariantManager.reduceModel('slexVariantReducer',...
 'VariableGroups', [struct('Name', 'Group1', 'VariantControls', {{'V', 1, 'W', [1 2]}}),...
 struct('Name', 'Group2', 'VariantControls', {{'V', 2, 'W', 2}})]);
```

Successfully created reduced model

'C:\TEMP\Bdoc23a\_2213998\_3568\ib570499\23\tp4d276709\simulink\_variants-ex20490563\reducedModel\s

Reduce the model by specifying a variant control variable as a full-range variable.

This syntax specifies W as a full-range variant control variable with a reference value of 1. The reduction process considers four configurations corresponding to {V==1, W==1}, {V==1, W==2}, {V==1, W==3}, and {V==1, W==0}.

```
Simulink.VariantManager.reduceModel('slexVariantReducer',...
 'VariableGroups', {'V', 1},...
 'FullRangeVariables', {'W', 1});
```

Successfully created reduced model

'C:\TEMP\Bdoc23a\_2213998\_3568\ib570499\23\tp4d276709\simulink\_variants-ex20490563\reducedModel\s

Reduce the model by specifying the compilation mode as code generation.

```
Simulink.VariantManager.reduceModel...
 ('slexVariantReducer', 'NamedConfigurations', {'config1'},...
 'CompileMode', 'codegen');
```

Successfully created reduced model

'C:\TEMP\Bdoc23a\_2213998\_3568\ib570499\23\tp4d276709\simulink\_variants-ex20490563\reducedModel\s

Reduce the model and generate a variant reducer summary report after reduction. This operation requires a Simulink® Report Generator™ license.

This command generates the summary and saves it to the path outdir2\variantReducerRpt.

```
Simulink.VariantManager.reduceModel...
 ('slexVariantReducer', 'NamedConfigurations', {'config1'},...
 'GenerateSummary', true, 'OutputFolder', 'outdir2');
```

Successfully created reduced model

'C:\TEMP\Bdoc23a\_2213998\_3568\ib570499\23\tp4d276709\simulink\_variants-ex20490563\outdir2\slexVa

## Version History

Introduced in R2016a

### R2022b: Exclude dependent files during reduction

The ExcludeFiles argument allows you to exclude Simulink data dictionary files (\*.sldd) and MAT-files (\*.mat) outside the MATLAB root folder during reduction.

**R2022b: Simulink Design Verifier license requirement removed**

*Behavior changed in R2022b*

The `reduceModel` method no longer requires a Simulink Design Verifier license. The functionality is available as part of the Variant Manager for Simulink support package.

# Simulink.VariantManager.variantLegend

**Class:** Simulink.VariantManager

**Package:** Simulink

Display or control behavior of variant condition legend

## Syntax

```
Simulink.VariantManager.variantLegend(modelName,action)
```

## Description

Simulink.VariantManager.variantLegend(modelName,action) displays or performs a specified action on the variant condition legend.

## Input Arguments

**modelName — Model for which the variant legend is displayed**

character vector | string

Model for which the variant legend is displayed, specified as a character vector or a string.

**action — Task to be performed on the variant legend**

'open' | 'print' | 'showCodeConditions' | 'close'

Task to be performed on the variant condition legend for the model, specified as:

- 'open' — Displays the variant condition legend for a model. The model must be open. If the legend is opened for the first time, the model is updated.
- 'print' — Prints the data in the variant condition legend. The legend must be open. There is no preview before printing the legend.
- 'showCodeConditions' — Displays code generation conditions column in the variant condition legend. The legend must be open. showCodeConditions is used as a name-value pair and accepts 'on' or 'off' as its values.
- 'close' — Closes the variant condition legend belonging to the specified model.

## Examples

### Open Variant Legend

Open the sldemo\_variant\_subsystems model.

```
model = 'sldemo_variant_subsystems';
open_system(model);
```

Display the variant condition legend for the model.

```
Simulink.VariantManager.variantLegend(model, 'open');
```

Display the code generation conditions column in the variant condition legend.

```
Simulink.VariantManager.variantLegend(model, 'showCodeConditions', 'on');
```

# Simulink.VariantVariable class

**Package:** Simulink

Create a variant parameter object

## Description

The `Simulink.VariantVariable` class creates a variant parameter object. Variant parameter objects enable you to vary the values of block parameters in a Simulink model conditionally.

You can specify multiple values for a variant parameter object. You can also specify properties such as dimension, data type, and so on. Each value of the variant parameter object is associated with a variant condition expression. After creating the object, you can use it to set the value of block parameters in a model, such as the **Gain** parameter of a Gain block. During simulation, the value associated with the variant condition that evaluates to `true` becomes the active value of that parameter. The values associated with the conditions that evaluate to `false` become inactive.

Before you create a new `Simulink.VariantVariable` object, create a `Simulink.VariantControl` object representing the variant control variable to be used in the `Simulink.VariantVariable` object.

---

**Note** You can create the variant parameter object only in the base workspace or in a data dictionary.

To edit a variant parameter object, you can double-click the object from the workspace or data dictionary to open the `Simulink.VariantVariable` dialog box.

Variant Conditions Legend does not display the variant conditions for variant parameters. Use the **Variant Parameters** tab in the Variant Manager window to view the variant parameters present in the base workspace or data dictionaries associated with the model and to edit the variant condition and value of the choices.

---

## Creation

`P = Simulink.VariantVariable` creates an empty variant parameter object.

`P = Simulink.VariantVariable(Name, Value)` creates a variant parameter object and sets Properties using one or more `Name, Value` arguments. Using this syntax, you can specify multiple values for the object and associate each value with a variant condition expression. You can also specify other properties of the object such as data types, storage class, dimensions, and so on.

## Properties

### Specification — Properties of variant parameter object

`Simulink.Parameter` object name

Properties of variant parameter object such as data type, dimensions, storage class, and so on, specified as the `Simulink.Parameter` object. The default storage class of a `Simulink.Parameter` object is `Auto`. If you specify the storage class as `Auto`, the value of the object is inlined to the literal

value in the generated code. If you specify the storage class of the object anything other than `Auto`, the object is represented as tunable parameters using symbolic names in the generated code. For more information, see “Options to Represent Variant Parameters in Generated Code” (Embedded Coder).

---

**Note** Specifying storage class using the `Specification` property is not supported if the `Simulink.VariantVariable` object is part of a variant parameter bank (`Simulink.VariantBank`).

---

Example: `'Specification', 'Pspec'`

**Attributes:**

<code>GetAccess</code>	<code>public</code>
<code>SetAccess</code>	<code>public</code>

**Choices — Variant conditions and values**

cell array

Variant conditions and values, specified as a cell array. During simulation, when a variant condition evaluates to `true`, its associated value becomes active. When a variant condition evaluates to `false`, its associated value becomes inactive. No two values of the same variant parameter must be associated with the same variant condition.

You can specify the variant condition as boolean MATLAB expressions that contain one or more operands and operators. See “Types of Variant Control Variables (Operands) in Variant Parameters” and “Types of Operators in Variant Parameters”.

You can specify values of numeric, enumerated, or `Simulink.Parameter` type. See, “Numeric Variant Control Values for Rapid Prototyping of Variant Parameters”, “Improve Code Readability of Variant Parameters Using Enumerated Types”, and “Reuse Variant Parameter Values from Handwritten Code Using `Simulink.Parameter` Variables”.

You can specify one of the choice values as a default value for the variant parameter by setting its variant condition as `(default)`. Simulink uses the default value for the variant parameter when none of the other variant conditions evaluate to `true`.

Example: `'Choices', {'V == 1', 4.5, 'V==2', 9.5}`

Example: `'Choices', {'V == 1', 3, '(default)', 6}`

**Attributes:**

<code>GetAccess</code>	<code>private</code>
<code>SetAccess</code>	<code>private</code>

**Bank — Name of variant parameter bank**

" (default) | string | character vector

Name of variant parameter bank (`Simulink.VariantBank`) object, specified as a string or character vector.

With Embedded Coder, you can group variant parameters in the generated code by adding them to the same variant parameter bank. The variant parameters must have `startup` activation time and

must have the same set of variant conditions. Use the `Simulink.VariantBank` class to create a variant parameter bank object and set the `Bank` property of the `Simulink.VariantVariable` object to the name of the variant parameter bank. For more information, see `Simulink.VariantBank`.

Example: 'Bank', 'EngineParams'

#### Attributes:

<code>GetAccess</code>	<code>public</code>
<code>SetAccess</code>	<code>public</code>

Data Types: `string` | `char`

## Methods

### Public Methods

<code>addChoice</code>	Add choices to variant parameter object
<code>getChoice</code>	Return choices of variant parameter object
<code>setChoice</code>	Modify existing choices of variant parameter object
<code>removeChoice</code>	Remove choices from variant parameter object

### Specialized Operators and Functions

These methods specialize standard MATLAB operators and functions for objects in this class.

<code>bitcmp</code>	Performs bit-wise complement on input.
<code>eq</code>	Compares if the inputs are equal.
<code>gt</code>	Compares if the first input is greater than the second input.
<code>mrdivide</code>	Divides the first input by the second input.
<code>or</code>	Performs a logical OR on inputs.
<code>uminus</code>	Negates the input.
<code>bitor</code>	Performs bit-wise OR on inputs.
<code>ge</code>	Compares if the first input is greater than or equal to the second input.
<code>le</code>	Compares if the first input is less than or equal to the second input.
<code>mtimes</code>	Multiplies the inputs.
<code>plus</code>	Adds the inputs.
<code>uplus</code>	Returns the value of the input.
<code>and</code>	Performs logical AND on inputs.
<code>bitshift</code>	Shift bits by specified number of places.
<code>lt</code>	Compares if the first input is less than the second input.
<code>ne</code>	Compares if the inputs are not equal.
<code>bitand</code>	Performs bit-wise AND on inputs.

<code>bitxor</code>	Performs bit-wise XOR on inputs.
<code>minus</code>	Subtracts the second input from the first input.
<code>not</code>	Returns logical NOT of input.

## Examples

### Numeric Variant Control Values for Rapid Prototyping of Variant Parameters

Numeric values allow you to rapidly prototype variant values when you are still building your model. Numeric values help you focus more on building your variant values than on developing the expressions that activate those choices.

You can define numeric control values in locations listed in “Storage Locations for Variant Control Variables (Operands) in Variant Parameters”.

Open the `slexVariantParameters` model.

```
open_system('slexVariantParameters')
```

In the MATLAB Editor, specify variant choices in their simplest form as numeric values in `Simulink.VariantVariable` objects K1 and K2.

```
K1 = Simulink.VariantVariable('Choices',{ 'V==1', 3.5, 'V==2', 8.5})
```

```
K1 =
VariantVariable with 2 choices:
```

Condition	Value
V == 1	3.5000
V == 2	8.5000

```
Specification: ''
```

```
Bank: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

```
K2 = Simulink.VariantVariable('Choices',{ 'V==1', 4.5, 'V==2', 9.5})
```

```
K2 =
VariantVariable with 2 choices:
```

Condition	Value
V == 1	4.5000
V == 2	9.5000

```
Specification: ''
```

```
Bank: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

Once you successfully create the `Simulink.VariantVariable` objects, you can modify them by using the methods described in “Public Methods” on page 5-811 or from the `VariantVariable` dialog box.

Activate one of the variant values by defining a control variable, `V`, and setting its value to 1 in a `Simulink.VariantControl` object.

```
V = Simulink.VariantControl('Value', 1, 'ActivationTime', 'update diagram')
```

```
V =
VariantControl with properties:

Value: 1
ActivationTime: 'update diagram'
```

When you simulate the model, the condition `V == 1` evaluates to `true`. `K1` is assigned a value of 3.5 and `K2` is assigned a value of 8.5.

```
sim('slexVariantParameters')
```

If you change the value of `V` to 2, Simulink® sets the value of `K1` and `K2` to 4.5 and 9.5 during simulation. You can change the value of `V` using this command or from `Simulink.VariantControl` dialog box.

```
V.Value = 2;
sim('slexVariantParameters')
```

### Simulink.Parameter Type of Variant Control Variables for Code Generation of Variant Parameters

If you intend to generate code for a model containing variant parameters, specify variant control variables as `Simulink.Parameter` objects. `Simulink.Parameter` objects allow you to specify

other attributes, such as data type and storage class, and control the appearance and placement of variant control variables in generated code.

- You can define a variant control variable of type `Simulink.Parameter` only in the base workspace or in a data dictionary. Defining `Simulink.Parameter` type of variant control variables in the mask or model workspace is not supported. For more information on storage locations for variant control variables, see “Storage Locations for Variant Control Variables (Operands) in Variant Parameters”.
- `Simulink.Parameter` objects within structures and that have data types other than `Simulink.Bus` objects are not supported.

Open the `slexVariantParameters` model.

```
open_system('slexVariantParameters')
```

In the MATLAB Editor, define a `Simulink.Parameter` object.

```
VSS_MODE = Simulink.Parameter;
VSS_MODE.Value = 1;
VSS_MODE.DataType = 'int32';
VSS_MODE.CoderInfo.StorageClass = 'Custom';
VSS_MODE.CoderInfo.CustomStorageClass = 'Define';
VSS_MODE.CoderInfo.CustomAttributes.HeaderFile = 'demo_macros.h';
```

Variant control variables defined as `Simulink.Parameter` objects can have any of the storage classes listed in “Storage Classes for Different Variant Activation Times” (Embedded Coder).

You can also convert a scalar variant control variable into a `Simulink.Parameter` object. For more information, see “Convert Variant Control Variables into `Simulink.Parameter` Objects”.

Specify the object as a variant control in `Simulink.VariantVariable` objects K1 and K2.

```
K1 = Simulink.VariantVariable('Choices',{'V == 1', 3.5, 'V == 2', 8.5})
```

```
K1 =
VariantVariable with 2 choices:
```

Condition	Value
V == 1	3.5000
V == 2	8.5000

```
Specification: ''
```

```
Bank: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

```
K2 = Simulink.VariantVariable('Choices',{'V == 1', 4.5, 'V == 2', 9.5})
```

```
K2 =
VariantVariable with 2 choices:
```

Condition	Value
V == 1	4.5000

```
V == 2 9.5000
```

```
Specification: ''
```

```
Bank: ''
```

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

Once you successfully create the `Simulink.VariantVariable` objects, you can modify them by using the methods described in “Public Methods” on page 5-811 or from the `VariantVariable` dialog box.

Activate one of the variant values by defining a control variable `V` and setting its value to `VSS_MODE` in a `Simulink.VariantControl` object.

```
V = Simulink.VariantControl('Value',VSS_MODE,'ActivationTime','code compile')
```

```
V =
VariantControl with properties:
```

```
Value: [1x1 Simulink.Parameter]
ActivationTime: 'code compile'
```

When you simulate the model, the condition `V == 1` evaluates to `true`. `K1` is assigned a value of 3.5, and `K2` is assigned a value of 8.5.

```
sim('slexVariantParameters')
```

If you change the value of `VSS_MODE` to 2, Simulink® sets the value of `K1` and `K2` to 4.5 and 9.5 during simulation. You can change the value of `V` using this command or from `Simulink.VariantControl` dialog box.

```
VSS_MODE.Value = 2;
V.Value = VSS_MODE;
sim('slexVariantParameters')
```

Generate code from the model. For information on how to generate code, see “Generate Code Using Embedded Coder” (Embedded Coder)

The generated code contains both `Linear` and `Nonlinear` choices in preprocessor conditionals `#if` and `#elif` because of the code `compile` activation time. The variant control variable `V` is defined using a macro — `#define` directive — in the header file `demo_macros.h`. You can control the appearance and placement of `V` in the generated code and prevent optimizations from eliminating storage for `V` using the storage class property. For more information, see “Storage Classes for Different Variant Activation Times” (Embedded Coder).

```
% demo_macros.h
% /* Exported data define */
%
% /* Definition for custom storage class: Define */
% #define V 2 /* Referenced by:
% * '<Root>/Gain'
% * '<Root>/Gain1'
% */
% #endif /* RTW_HEADER_demo_macros_h_ */
%
% /*
```

### Simulink.Variant Objects for Variant Condition Reuse of Variant Parameters

After identifying the variant values that your model requires, you can construct complex variant conditions to control the activation of your variant parameter values by defining variant conditions as `Simulink.Variant` objects. `Simulink.Variant` objects enable you to reuse common variant conditions across models and help you encapsulate complex variant condition expressions.

- You can define a variant control variable of type `Simulink.Variant` only in the base workspace or in a data dictionary. Defining `Simulink.Variant` type of variant control variables in the mask or model workspace is not supported. For more information on storage locations for variant control variables, see “Storage Locations for Variant Control Variables (Operands) in Variant Parameters”.
- `Simulink.Variant` within structures are not supported.

Open the `slexVariantParameters` model.

```
open_system('slexVariantParameters')
```

In the MATLAB® Editor, encapsulate variant control expressions as `Simulink.Variant` objects.

```
LinearController=Simulink.Variant('V==1');
NonLinearController=Simulink.Variant('V==2');
```

Specify the `Simulink.Variant` objects as the variant controls in a `Simulink.VariantVariable` objects `K1` and `K2`.

```
K1 = Simulink.VariantVariable('Choices',{'LinearController',3.5,'NonLinearController',8.5})
```

```
K1 =
VariantVariable with 2 choices:
```

Condition	Value
-----------	-------

LinearController	3.5000
NonLinearController	8.5000

Specification: ''

Bank: ''

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

```
K2 = Simulink.VariantVariable('Choices',{'LinearController',4.5,'NonLinearController',9.5})
```

K2 =  
VariantVariable with 2 choices:

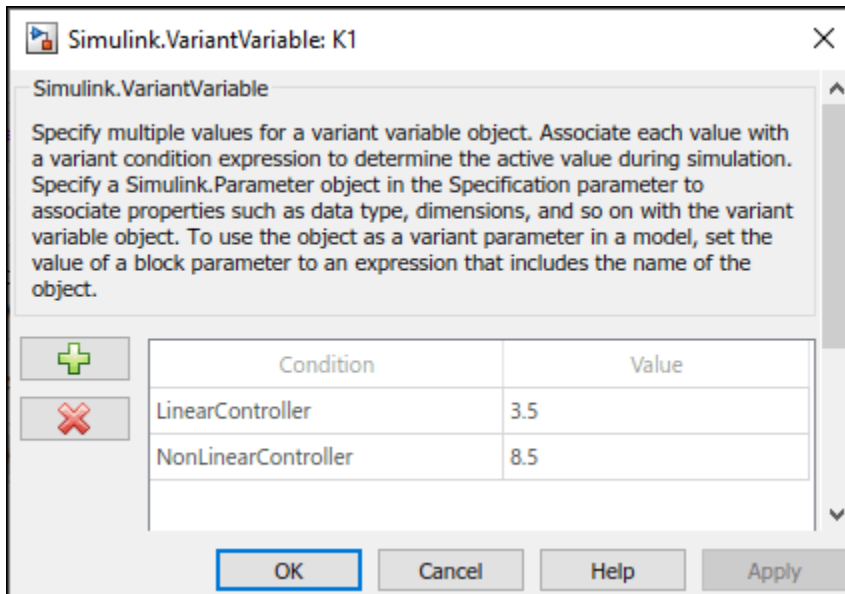

Condition	Value
LinearController	4.5000
NonLinearController	9.5000

Specification: ''

Bank: ''

Use `getChoice`, `setChoice`, `addChoice`, `removeChoice` to access, modify, add or remove choices

Once you successfully create the `Simulink.VariantVariable` objects, you can modify them by using the methods described in “Public Methods” on page 5-811 or from the `VariantVariable` dialog box.

Activate one of the variant values by defining a `Simulink.VariantControl` object `V` and setting its value to 1.

```
V = Simulink.VariantControl('Value',1,'ActivationTime','update diagram')
```

```
V =
 VariantControl with properties:

 Value: 1
 ActivationTime: 'update diagram'
```

When you simulate the model, the condition `V == 1` evaluates to `true`. `K1` is assigned a value of 3.5, and `K2` is assigned a value of 8.5.

```
sim('slexVariantParameters')
```

If you change the value of `V` to 2, Simulink® sets the value of `K1` and `K2` to 4.5 and 9.5 during simulation. You can change the value of `V` using this command or from `Simulink.VariantControl` dialog box.

```
V.Value = 2;
sim('slexVariantParameters')
```

Using this approach, you can develop complex variant condition expressions that are reusable.

## Limitations

- Variant parameters that are part of a variant parameter bank do not support AUTOSAR code generation.

## Version History

Introduced in R2021a

### R2023a: New Bank property

You can use the `Bank` property to add a `Simulink.VariantVariable` object to a variant parameter bank (`Simulink.VariantBank`).

## Extended Capabilities

### C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

- For variant parameters associated with the `startup` activation time, you can generate code for both active and inactive choices by installing Simulink Coder or Embedded Coder.
- For variant parameters associated with the `code compile` activation time:
  - You must install Simulink Coder to generate code for only active values of variant parameters. Generating code using Simulink Coder is supported only if values of a variant parameter have same dimension.
  - You must install Embedded Coder to generate code for both active and inactive values of variant parameters. Generating code using Embedded Coder is supported for variant parameters values having same and different dimensions.

- When you generate code using Embedded Coder, you can group variant parameters that have the same set of variant conditions and use `startup` activation time into a structure array in the generated code. Use the `Simulink.VariantBank` class to group variant parameters into a variant parameter bank and use the `Simulink.VariantBankCoderInfo` class to specify code generation properties for the variant parameter bank.

For more information on code generation with variant parameters, see “Options to Represent Variant Parameters in Generated Code” (Embedded Coder).

## SubsystemReference class

Control subsystem reference programmatically

### Description

Use the methods of `Simulink.SubsystemReference` to query and control the subsystem reference blocks.

### Methods

#### Public Methods

<code>convertAllSubsystemReferenceBlockToSubsystem</code>	Converts all subsystem reference blocks to regular Subsystem blocks
<code>convertSubsystemReferenceBlockToSubsystem</code>	Converts a subsystem reference block to a regular Subsystem block
<code>convertSubsystemToSubsystemReference</code>	Converts a Subsystem block to subsystem reference
<code>getActiveInstances</code>	Returns all the active instances of subsystem references
<code>getAllDirtyInstances</code>	Returns child Subsystem block diagrams that are referred in the given block diagram and are also being edited
<code>getAllInstances</code>	Returns all subsystem reference blocks inside a block diagram
<code>getAllReferencedSubsystemBlockDiagrams</code>	Returns all the child Subsystem block diagrams for a given block diagram
<code>getNearestParentSubsystemReferenceBlock</code>	Returns the nearest parent subsystem reference for a block
<code>getSystemOwningTheLock</code>	Returns the system that has acquired the lock for editing
<code>isSystemLocked</code>	Checks if the system is locked due to an edit or update to the subsystem reference
<code>Simulink.SubsystemReference.generateSignatures</code>	Generate unit test signatures of subsystem file
<code>Simulink.SubsystemReference.getUnitTestNames</code>	Return names of unit tests of subsystem file

Simulink.SubsystemReference.removeSignatures	Remove previously generated unit test signatures of subsystem file
Simulink.SubsystemReference.showSignatureDiffDialogForSS	Open dialog to show difference in signatures of two subsystem blocks
Simulink.SubsystemReference.showSignatureDiffDialogForUnitTests	Open dialog to show difference in signatures of subsystem reference instance with unit test signatures

## Version History

Introduced in R2022a

## Simulink.Mask.CrossPortConstraint class

**Package:** Simulink

Creates cross-port constraint among ports of the same masked block

### Description

Use an instance of `Simulink.Mask.CrossPortConstraint` to create a cross-port constraint among ports of same masked block.

### Properties

#### **Name — Name of cross-port constraint**

character vector (default)

Name of the cross-port constraint, specified as a character vector.

Data Types: `char` | `string`

#### **Rule — Rule for constraint**

Same Dimension (default) | Same Datatype

Rule for the cross-port constraint, specified as a character vector.

Data Types: `char` | `string`

#### **ParameterConditions — Parameter conditions for cross-port constraint**

`Simulink.Mask.ParameterCondition` object (default)

Mask parameter conditions, specified as an object of `Simulink.Mask.ParameterCondition`.

Data Types: `char` | `string`

#### **Associations — Associate port identifiers to the cross-port constraints**

cell array (default)

Associate port identifiers with cross-port constraints, specified as a cell array. Separate identifiers with commas.

Data Types: `cell`

#### **DiagnosticLevel — Type of diagnostic message**

`error` (default) | `warning`

Type of diagnostic message displayed when validation condition fails, specified as `error` or `warning`.

Data Types: `char` | `string`

#### **DiagnosticMessage — Diagnostic message**

`error` (default) | `warning`

Diagnostic message to display when validation fails, specified as character vector.

Data Types: `char` | `string`

## Methods

### Public Methods

<code>addCrossPortConstraint</code>	Create cross-port constraint among ports of the same masked block
<code>getCrossPortConstraint</code>	Display attributes of cross-port constraint
<code>removeCrossPortConstraint</code>	Remove cross-port constraint
<code>removeAllCrossPortConstraints</code>	Remove all cross-port constraints from mask object

## Version History

Introduced in R2023a

## Simulink.SharedConstraintFile class

**Package:** Simulink

Constraints that needs to be saved in an XML file

### Description

Use an instance of `Simulink.Mask.SharedConstraintFile` to create constraint in an XML file. You can create constraints in a file and share it across multiple parameters.

### Properties

#### Public Properties

##### **FileName — Name of file**

empty (default)

Name of the XML file where the constraints are stored, specified as a character vector.

Data Types: `char` | `string`

##### **Constraints — Object of Simulink.Mask.Constraints**

`Simulink.Mask.Constraints` object (default)

Create shared constraints in an XML file, specified as an object of `Simulink.Mask.Constraints`.

Data Types: `cell` array

### Methods

#### Public Methods

<code>addConstraint</code>	Add constraint to XML file
<code>saveConstraint</code>	Saves the constraint in the XML file
<code>removeConstraint</code>	Remove specified constraint from XML file

### Version History

Introduced in R2023a

### See Also

`Simulink.Mask.Constraints.convertMatToXML` | `addConstraint` | `saveConstraint` | `removeConstraint`

## **Programmatic Model Editor Appearance Parameters**

Use the following parameters to control how your model appears in the Simulink editor. To query and/or modify the value of a parameter, use `get_param` or `set_param`.

**Model Appearance Parameters**

Parameter	Description	Values
BlockNameDataTip	Specifies whether to display the block name as a data tip. In the Simulink Editor, in the <b>Debug</b> tab, select <b>Information Overlays &gt; Name in Tooltip</b> .	'on'   {'off'}
BlockParametersDataTip	Specifies whether to display a block parameter in a data tip.  In the Simulink Editor, in the <b>Debug</b> tab, select <b>Information Overlays &gt; Parameters in Tooltip</b> .	'on'   {'off'}
BlockDescription-StringDataTip	Specifies whether to display the user description for a block as a data tip.  In the Simulink Editor, in the <b>Debug</b> tab, select <b>Information Overlays &gt; Description in Tooltip</b> .	'on'   {'off'}
BrowserLookUnderMasks	Show masked subsystems in the Model Browser.  On the <b>Modeling</b> tab, select <b>Environment &gt; Model Browser</b> . In the <b>Model Browser</b> pane, click  and select <b>Systems with Mask Parameters</b> .	'on'   {'off'}
BrowserShowLibraryLinks	Show library links in the Model Browser.  On the <b>Modeling</b> tab, select <b>Environment &gt; Model Browser</b> . In the <b>Model Browser</b> pane, click  and select <b>Library Links</b> .	'on'   {'off'}
CompiledModelBlockNormalModeVisibility	For a top model that is being simulated or that is in a compiled state, return information about which Model blocks have normal mode visibility enabled.	Return values indicate which Model blocks have normal mode visibility enabled.

Parameter	Description	Values
DefaultAnnotationFontName DefaultBlockFontName DefaultLineFontName	Name of font to use for new annotation text, block text, or signal line labels and on existing annotations, block names, or signal lines whose FontName property is set to 'auto'.  To set, on the <b>Format</b> tab, click the <b>Font Properties</b> button arrow, then click <b>Fonts for Model</b> .	character vector
DefaultAnnotationFontSize DefaultBlockFontSize DefaultLineFontSize	Size of font to use for new annotation text, block text, or signal line labels and on existing annotations, blocks, or signal lines whose FontSize property is set to -1.  To set, on the <b>Format</b> tab, click the <b>Font Properties</b> button arrow, then click <b>Fonts for Model</b> .	positive integer
DefaultAnnotationFontAngle DefaultBlockFontAngle DefaultLineFontAngle	Angle of font for new annotation text, block text, or signal line labels and on existing annotations, blocks, or signal lines whose FontAngle property is set to 'auto'.  To set, on the <b>Format</b> tab, click the <b>Font Properties</b> button arrow, then click <b>Fonts for Model</b> .	{'normal'}   'italic'
DefaultAnnotationFontWeight DefaultBlockFontWeight DefaultLineFontWeight	Weight of font for new annotation text, block text, or signal line labels and on existing annotations, blocks, or signal lines whose FontWeight property is set to 'auto'.  To set, on the <b>Format</b> tab, click the <b>Font Properties</b> button arrow, then click <b>Fonts for Model</b> .	{'normal'}   'bold'
HideAutomaticNames	Hides block names given automatically by the Simulink Editor. See "Hide or Display Block Names".	{'on'}   'off'

Parameter	Description	Values
LineUpdate	<p>Specifies when to update line routing to avoid overlapping lines and obstacles in the model.</p> <p>When set to the default 'deferred', scripts postpone line routing until they pause or complete. To perform deferred line routing within a script, you can use function <code>Simulink.BlockDiagram.routeLine</code>.</p>	{'deferred'}   'none'   'immediate'
ModelBrowserVisibility	<p>Show the Model Browser.</p> <p>In the Simulink Editor, in the <b>Modeling</b> tab, select <b>Environment &gt; Model Browser</b>.</p>	'on'   {'off'}
ModelBrowserWidth	<p>Width of the Model Browser pane in the model window. To display the Model Browser pane, see the <code>ModelBrowserVisibility</code> parameter.</p>	integer — {200}
ModelBlockNormalModeVisibility	<p>Use with <code>set_param</code> to set normal mode visibility on for the specified Model blocks.</p> <p>You can set this parameter with the Model Block Normal Mode Visibility dialog box. For details, see “Specify the Instance Having Normal Mode Visibility”.</p>	<p>With <code>set_param</code>, use an array of <code>Simulink.BlockPath</code> objects or cell array of cell arrays of character vectors of paths to blocks or models.</p> <p>With <code>set_param</code>, an empty array specifies to use the Simulink default selection for the instance to have normal mode visibility enabled.</p>
ModelBlockNormalModeVisibilityBlockPath	<p>Return information about which Model blocks have normal mode visibility enabled. Use with a model that you are editing.</p>	<p>Return values indicate which Model blocks have normal mode visibility enabled. See “Simulate Multiple Referenced Model Instances in Normal Mode”.</p>
PortDataTypeDisplayFormat	<p>When you display port data types in a model, choose whether to display data type aliases, base data types, or both.</p> <p>In the Simulink Editor, in the <b>Debug</b> tab, set by <b>Information Overlays &gt; Base Data Types</b> and <b>Information Overlays &gt; Alias Data Types</b>.</p>	{'AliasTypeOnly'}   'BaseTypeOnly'   'BaseAndAliasTypes'

Parameter	Description	Values
ReqHilite	Highlights all the blocks in the Simulink diagram that have requirements associated with them.  In the Simulink Editor, in the <b>Apps</b> tab, under <b>Verification, Validation, and Test</b> , click <b>Requirements Viewer</b> . The <b>Requirements Viewer</b> tab appears. Click <b>Highlight Links</b> .	'on'   {'off'}
SampleTimeAnnotations	In the Simulink Editor, in the <b>Debug</b> tab, select <b>Information Overlays &gt; Text</b> .	'on'   {'off'}
SampleTimeColors	In the Simulink Editor, in the <b>Debug</b> tab, select <b>Information Overlays &gt; Colors</b> .	'on'   {'off'}
ScreenColor	Background color of the model window.  In the Simulink Editor, on the <b>Format</b> tab, set <b>Background</b> .	'black'   {'white'}   'red'   'green'   'blue'   'cyan'   'magenta'   'yellow'   'gray'   'lightBlue'   'orange'   'darkGreen'   [r,g,b,a] where r, g, b, and a are the red, green, blue, and alpha values of the color normalized to the range 0.0 to 1.0. The alpha value is ignored.
ShowLinearization-Annotations	Toggles linearization icons in the model.	{'on'}   'off'
ShowLineDimensions	Show signal dimensions on this model's block diagram.  In the Simulink Editor, on the <b>Debug</b> tab, select <b>Information Overlays &gt; Signal Dimensions</b> .	'on'   {'off'}
ShowLoopsOnError	Highlight invalid loops graphically.	{'on'}   'off'
ShowModelReferenceBlockIO	Toggles display of I/O mismatch on block.  In the Simulink Editor, in the <b>Debug</b> tab, select <b>Information Overlays &gt; Ref. Model I/O Mismatch</b> .	'on'   {'off'}
ShowModelReference-BlockVersion	Toggles display of version on block.  In the Simulink Editor, in the <b>Debug</b> tab, select <b>Information Overlays &gt; Ref. Model Version</b> .	'on'   {'off'}

Parameter	Description	Values
ShowPageBoundaries	<p>Toggles display of page boundaries on the Simulink Editor canvas.</p> <p>In the Simulink Editor, in the <b>Simulation</b> tab, select <b>Print &gt; Show Page Boundaries</b>.</p>	'on'   {'off'}
ShowPortDataTypes	<p>Show data types of ports on this model's block diagram.</p> <p>In the Simulink Editor, in the <b>Debug</b> tab, select <b>Information Overlays &gt; Base Data Types</b>.</p>	'on'   {'off'}
ShowPortUnits	<p>Show units of ports, subsystem, and model block icons on the model block diagram.</p> <p>In the Simulink Editor, in the <b>Debug</b> tab, select <b>Information Overlays &gt; Port Units</b>.</p>	'on'   {'off'}
ShowStorageClass	<p>Show storage classes of signals on this model's block diagram.</p> <p>In the Simulink Editor, in the <b>Debug</b> tab, select <b>Information Overlays &gt; Storage Class</b>.</p>	'on'   {'off'}
ShowTestPointIcons	<p>Show test point icons on this model's block diagram.</p> <p>In the Simulink Editor, in the <b>Debug</b> tab, select <b>Information Overlays &gt; Log &amp; Testpoint</b>.</p>	{'on'}   'off'
ShowViewerIcons	<p>Show viewer icons on this model's block diagram.</p> <p>In the Simulink Editor, in the <b>Debug</b> tab, select <b>Information Overlays &gt; Viewers</b>.</p>	{'on'}   'off'
ZoomFactor	<p>Zoom factor of the Simulink Editor window expressed as a percentage of normal (100%) or by the keywords FitSystem or FitSelection.</p> <p>In the Simulink Editor, on the <b>Modeling</b> tab, select one of the options under <b>Environment &gt; Zoom</b>.</p>	{'100'}   'FitSystem'   'FitSelection'

<b>Parameter</b>	<b>Description</b>	<b>Values</b>
WideLines	Draws lines that carry vector or matrix signals wider than lines that carry scalar signals.  In the Simulink Editor, on the <b>Debug</b> tab, select <b>Information Overlays &gt; Nonscalar Signals</b> .	'on'   {'off'}

## **Common Block Properties**

This table lists the properties common to all Simulink blocks, including block callback properties (see “Customize Model Behavior with Callbacks”). Examples of commands that change these properties follow this table (see “Examples of Setting Block Properties” on page 6-23).

## Common Block Properties

Property	Description	Values
AncestorBlock	Name of the library block that the block is linked to (for blocks with a disabled link).	character vector
AttributesFormatString	Block annotation text (corresponds to block properties).	character vector
BackgroundColor	Block background color.	color value   '[r,g,b]'   '[r,g,b,a]'  r, g, and b, are the red, green, blue values of the color in the range 0.0 to 1.0. If specified, the alpha value (a) is ignored.  Possible color values are 'black', 'white', 'red', 'green', 'blue', 'cyan', 'magenta', 'yellow', 'gray', 'lightBlue', 'orange', 'darkGreen'.
BlockDescription	Block description shown at the top of the block parameters dialog box or property inspector.	character array
BlockType	Block type (read-only).	character array
BlockKeywords	Associates one or more keywords with a custom library block.	character vector   string scalar   string array
ClipboardFcn	Function called when block is copied to the clipboard ( <b>Ctrl+C</b> ) or when the menu item <b>Copy</b> is selected.	function   character vector
CloseFcn	Function called when <code>close_system</code> is run on block.	function   character vector
Commented	Exclude block from simulation.	{'off'}   'on'   'through'
CompiledBusType	Returns whether the signal connected to a port is not a bus, is a virtual, or is a nonvirtual bus (read-only).  Specify a port or line handle when using <code>get_param</code> . For example:  <pre>ports = get_param(gcb, 'PortHandles'); feval(gcs, [], [], [], 'compile'); bt = get_param(ports.Outputport, 'CompiledBusType')</pre> See "Display Bus Information".	'NOT_BUS'   'VIRTUAL_BUS'   'NON_VIRTUAL_BUS'

Property	Description	Values
CompiledIsActive	<p>Specifies whether the block status is active at compile time.</p> <p>CompiledIsActive returns off if any one of these conditions is true at compile time:</p> <ul style="list-style-type: none"> <li>Block is an inactive path of an inline variant.</li> <li>Block is an inactive choice of a variant subsystem.</li> <li>Block is in a subsystem that is commented out.</li> <li>Block is inactive due to a condition propagated from a variant subsystem.</li> </ul> <p>CompiledisActive returns off for inactive choices and returns on for active choices of a variant subsystem.</p>	'off'   'on'
CompiledPortComplexSignals	<p>Complexity of port signals after updating diagram. You must compile the model before querying this property. For example:</p> <pre>vdp([], [], [], 'compile'); d = get_param(gcb, 'CompiledPortComplexSignals'); vdp([], [], [], 'term');</pre>	structure array
CompiledPortDataTypes	<p>Data types of port signals after updating diagram. You must compile the model before querying this property. See CompiledPortComplexSignals .</p>	structure array
CompiledPortDesignMin	<p>Design minimum of port signals after updating diagram. You must compile the model before querying this property. For example:</p> <pre>feval(gcs, [], [], [], 'compile'); ports = get_param(gcb, 'PortHandles'); min = get_param(ports.Outputport, 'CompiledPortDesignMin'); feval(model, [], [], [], 'term');</pre>	structure array
CompiledPortDesignMax	<p>Design maximum of port signals at compile time. You must compile the model before querying this property. For example:</p> <pre>feval(gcs, [], [], [], 'compile'); ports = get_param(gcb, 'PortHandles'); max = get_param(ports.Outputport, 'CompiledPortDesignMax'); feval(model, [], [], [], 'term');</pre>	structure array
CompiledPortDimensions	<p>Dimensions of port signals after updating diagram. You must compile the model before querying this property. For details, see “Get Compiled Port Dimensions”.</p>	numeric array

Property	Description	Values
CompiledPortDimensionsMode	Indication whether the port signal has a variable size (after updating diagram). You must compile the model before querying this property. See “Determine Whether Signal Line Has Variable Size”.	double number. 0 indicates the signal does not have a variable size. 1 indicates the signal has a variable size.
CompiledPortFrameData	Frame mode of port signals after updating diagram. You must compile the model before querying this property.	structure array
CompiledPortUnits	Structure array of block port units (after updating diagram). You must compile the model before querying this property.	structure array
CompiledPortWidths	Structure of port widths after updating diagram. You must compile the model before querying this property.	structure array
CompiledSampleTime	Block sample time after updating diagram. You must compile the model before querying this property.	vector [sample time, offset time] or cell {[sample time 1, offset time 1]; [sample time 2, offset time 2];..... [sample time n, offset time n]}
ContinueFcn	Function called at the restart of a simulation (after a pause).	function   character vector
CopyFcn	Function called when block is copied. See “Block Callbacks” for details.	function   character vector
DataTypeOverrideCompiled	For internal use.	
DeleteFcn	Function called when block is deleted. See “Block Callbacks” for details.	MATLAB expression
DestroyFcn	Function called when block is destroyed. See “Block Callbacks” for details.	MATLAB expression
Description	Description of block. Set by the <b>Description</b> field in the <b>General</b> pane of the Block Properties dialog box.	text and tokens
Diagnostics	For internal use.	
DialogParameters	List of names/attributes of block-specific parameters for an unmasked block, or mask parameters for a masked block.	structure
DropShadow	Display drop shadow.	{'off'}   'on'
ExtModeLogging-Supported	Enable a block to support uploading of signal data in external mode, for example, with a scope block.	{'off'}   'on'
ExtModeLogging-Trig	Enable a block to act as the trigger block for external mode signal uploading.	{'off'}   'on'

Property	Description	Values
ExtModeUploadOption	Enable a block to upload signal data in external mode when the <b>Select all</b> check box on the External Signal & Triggering dialog box is not selected. A value of <code>log</code> indicates the block uploads signals. A value of <code>none</code> indicates the block does not upload signals. The value <code>monitor</code> is currently not in use. If the <b>Select all</b> check box on the External Signal & Triggering dialog box is selected, it overrides this parameter setting.	{'none'}   'log'   'monitor'
FontAngle	Font angle.	'normal'   'italic'   'oblique'   {'auto'}
FontName	Font name.	character array
FontSize	Font size. A value of -1 specifies that this block inherits the font size specified by the <code>DefaultBlockFontSize</code> model parameter.	real {'-1'}
FontWeight	Font weight.	'light'   'normal'   'demi'   'bold'   {'auto'}
ForegroundColor	Foreground color of block icon.	color value   '[r,g,b]'   '[r,g,b,a]'  r, g, and b, are the red, green, blue values of the color in the range 0.0 to 1.0. The value changes if it is too similar to the canvas color ( <code>ScreenColor</code> parameter). Use <code>get_param</code> to return the actual value. If specified, the alpha value (a) is ignored.  Possible color values are 'black', 'white', 'red', 'green', 'blue', 'cyan', 'magenta', 'yellow', 'gray', 'lightBlue', 'orange', 'darkGreen'.
Handle	Block handle.	real
HideAutomaticName	Specify whether the block name given automatically by the Simulink Editor displays in the model. To hide automatic names, use the default setting of 'on'. (The <code>HideAutomaticNames</code> parameter for the model must also be set to 'on'.) Set to 'off' to display the name, and also set the block <code>ShowName</code> parameter to 'on'. Blocks whose <code>ShowName</code> parameter is 'off' are hidden regardless of this setting. For more information on how the parameters interact, see "Hide or Display Block Names".	{'on'}   'off'

Property	Description	Values
HiliteAncestors	For internal use.	
InitFcn	Initialization function for a block. Created on the <b>Callbacks</b> pane of the Model Properties dialog box. For more information, see “Create Model Callbacks”.  On non-masked blocks, updating the diagram or running the simulation call this function.	MATLAB expression
InputSignalNames	Names of input signals.	cell array
IntrinsicDialogParameters	List of names/attributes of block-specific parameters (regardless of whether the block is masked or unmasked). Use instead of <code>DialogParameters</code> if you want block-specific parameters for masked or unmasked blocks.	structure
IOSignalStrings	Block paths to objects that are connected to the Viewers & Generators Manager. Simulink software saves these paths when the model is saved.	list
IOType	Viewers & Generators Manager type. For internal use.	
IsStateOwnerBlock	Indicates whether the block is a supported state owner block that can be used with the State Reader and State Writer blocks (read-only). See State Reader and State Writer.	'off'   'on'
LibraryVersion	For a linked block, the initial value of this property is the <code>ModelVersion</code> of the library at the time the link was created. The value updates with increments in the model version of the library.	character vector — {'1.1'}
LineHandles	Handles of lines connected to block.	structure
LinkData	Array of details about changes to the blocks inside the link that differ between a parameterized link and its library, listing the block names and parameter values. Use [] to reset to deparameterized, for example, <code>set_param(gcb, 'linkData', [])</code> .	cell array
LinkStatus	Link status of block. Updates out-of-date linked blocks when queried using <code>get_param</code> .  See “Control Linked Block Programmatically”.	'none'   'resolved'   'unresolved'   'implicit'   'inactive'   'restore'   'propagate'   'propagateHierarchy'   'restoreHierarchy'
LoadFcn	Function called when block is loaded.	MATLAB expression

Property	Description	Values
MinMaxOverflow-Logging_Compiled	For internal use.	
ModelCloseFcn	Function called when model is closed. The <code>ModelCloseFcn</code> is called prior to the block <code>DeleteFcn</code> and <code>DestroyFcn</code> callbacks, if either are set.	MATLAB expression
ModelParamTable-Info	For internal use.	
MoveFcn	Function called when block is moved.	MATLAB expression
Name	Block or signal name.  To specify a signal name, use the corresponding port or line handle.  <code>ports = get_param(gcf, 'PortHandles');</code> <code>set_param(ports.Outport(1), 'Name', 'NewName');</code>  To propagate the signal name, compile the model. In the Simulink Toolstrip, on the <b>Modeling</b> tab, click <b>Update Model</b> .  Alternatively, to name an output signal of a block, you can use <code>SignalNameFromLabel</code> .	character vector
NameChangeFcn	Function called when block name is changed.	MATLAB expression
NamePlacement	Position of block name.	{'normal'}   'alternate'
ObjectParameters	Names/attributes of block parameters.	structure
OpenFcn	Function called when this Block Parameters dialog box opens.	MATLAB expression
Orientation	Where block faces.	{'right'}   'left'   'up'   'down'
OutputSignalNames	Names of output signals.	cell array
Parent	Name of the system that owns the block.	character vector {'untitled'}
ParentCloseFcn	Function called when parent subsystem is closed. The <code>ParentCloseFcn</code> of blocks at the root model level is not called when the model is closed.	MATLAB expression
PauseFcn	Function called at the pause of a simulation.	function   character vector

Property	Description	Values
PortConnectivity	<p>The value of this property is an array of structures, each of which describes one of the block input or output ports. Each port structure has the following fields:</p> <ul style="list-style-type: none"> <li>• <b>Type</b> Specifies the port type and/or number. The value of this field can be: <ul style="list-style-type: none"> <li>• <math>n</math>, where <math>n</math> is the number of the port for data ports</li> <li>• 'enable' if the port is an enable port</li> <li>• 'trigger' if the port is a trigger port</li> <li>• 'state' for state ports</li> <li>• 'ifaction' for action ports</li> <li>• 'LConn#' for a left connection port where # is the port number</li> <li>• 'RConn#' for a right connection port where # is the port number</li> <li>• 'event' for reinitialize event ports of subsystems</li> </ul> </li> <li>• <b>Position</b> The value of this field is a two-element vector, <math>[x\ y]</math>, that specifies the port position.</li> <li>• <b>SrcBlock</b> Handle of the block connected to this port. This field is null for output ports and -1 for unconnected input ports. SrcBlock property is a valid source handle for Variant Subsystem blocks.</li> <li>• <b>SrcPort</b> Number of the port connected to this port, starting at zero. This field is null for both output ports and unconnected input ports.</li> <li>• <b>DstBlock</b> Handle of the block to which this port is connected. This field is null for input ports and contains a 1-by-0 empty matrix for unconnected output ports.</li> </ul>	structure array

Property	Description	Values
	<ul style="list-style-type: none"> <li>• <b>DstPort</b></li> </ul> <p>Number of the port to which this port is connected, starting at zero. This field is null for input ports and contains a 1-by-0 empty matrix for unconnected output ports. For Simscape blocks, the field contains port handles.</p>	
PortHandles	<p>The value of this property is a structure that specifies the handles of the block ports. The structure has the following fields:</p> <ul style="list-style-type: none"> <li>• <b>Inport</b> Handles of the input ports.</li> <li>• <b>Outport</b> Handles of the output ports.</li> <li>• <b>Enable</b> Handle of the enable port.</li> <li>• <b>Trigger</b> Handle of the trigger port.</li> <li>• <b>State</b> Handle of the state port.</li> <li>• <b>LConn</b> Handles of the left connection ports (for blocks that support Physical Modeling tools).</li> <li>• <b>RConn</b> Handles of the right connection ports (for blocks that support Physical Modeling tools).</li> <li>• <b>Ifaction</b> Handle of the action port.</li> <li>• <b>Reset</b> Handle of the reset port.</li> <li>• <b>Event</b> Handles of the subsystem reinitialize event ports.</li> </ul>	structure array

Property	Description	Values
PortRotationType	Type of port rotation used by this block (read-only).	'default'   'physical'
Ports	<p>A vector that specifies the number of each kind of port this block has. The order of the vector elements corresponds to the following port types:</p> <ul style="list-style-type: none"> <li>• Inport</li> <li>• Outport</li> <li>• Enable</li> <li>• Trigger</li> <li>• State</li> <li>• LConn</li> <li>• RConn</li> <li>• Ifaction</li> <li>• Reset</li> <li>• Event</li> </ul>	vector
Position	<p>Position of block in model window.</p> <p>To help with block alignment, the position you set can differ from the actual block position by a few pixels. Use <code>get_param</code> to return the actual position.</p>	<p>vector of coordinates, in pixels: [left top right bottom]</p> <p>The origin is the upper-left corner of the Simulink Editor canvas before any canvas resizing. Supported coordinates are between -1073740824 and 1073740823, inclusive. Positive values are to the right of and down from the origin. Negative values are to the left of and up from the origin.</p>
PostSaveFcn	Function called after the block is saved.	MATLAB expression
PreCopyFcn	Function called before the block is copied. See "Block Callbacks" for details.	MATLAB expression
PreDeleteFcn	Function called before the block is deleted. See "Block Callbacks" for details.	MATLAB expression
PreSaveFcn	Function called before the block is saved. See "Block Callbacks" for details.	MATLAB expression
Priority	Specifies the block order of execution relative to other blocks in the same model. Set by the <b>Priority</b> field on the <b>General</b> pane of the Block Properties dialog box.	character vector { ' ' }
ReferenceBlock	Name of the library block to which this block links.	character vector { ' ' }
RequirementInfo	For internal use.	

Property	Description	Values
RTWData	User specified data, used by Simulink Coder software. Intended only for use with user written S-functions. See the section “S-Function RTWdata” (Simulink Coder) for details.	
SampleTime	Value of the sample time parameter. See “Specify Sample Time” for more details.	character vector
Selected	Status of whether or not block is selected.	{'on'}   'off'
ShowName	Display or hide block name.  To display a block name given by the Simulink Editor (automatic names), set the block 'HideAutomaticName' parameter to 'off' and ShowName to 'on'. To hide an automatic block name given by the Editor, set ShowName to 'on', HideAutomaticName to 'on', and HideAutomaticNames on the model to 'on'. For more information on how the parameters interact, see “Hide or Display Block Names”.	{'on'}   'off'
SignalHierarchy	If the signal is a bus, returns the name and hierarchy of the signals in the bus (read-only).  Specify a port or line handle when using <code>get_param</code> . For example:  <pre>ports = get_param(gcb, 'PortHandles'); feval(gcs, [], [], [], 'compile'); sh = get_param(ports.Outputport, 'SignalHierarchy')</pre> See “Display Bus Information”.	values reflect the structure of the signal that you specify
StartFcn	Function called at the start of a simulation.	MATLAB expression
StatePerturbationForJacobian	State perturbation size to use during linearization. See “Change Perturbation Level of Blocks Perturbed During Linearization” (Simulink Control Design) for details.	character vector
StaticLinkStatus	Link status of block. Does not update out-of-date linked blocks when queried using <code>get_param</code> . See also <code>LinkStatus</code> .	'none'   'resolved'   'unresolved'   'implicit'   'inactive'   'restore'   'propagate'   'propagateHierarchy'   'restoreHierarchy'
StopFcn	Function called at the termination of a simulation.	MATLAB expression

Property	Description	Values
Tag	Text that appears in the block label that Simulink software generates. Set by the <b>Tag</b> field on the <b>General</b> pane of the Block Properties dialog box.	character vector {''}
Type	Simulink object type (read-only).	'block'
UndoDeleteFcn	Function called when block deletion is undone.	MATLAB expression
UserData	User-specified data that can have any MATLAB data type.	{''}
UserDataPersistent	Status of whether or not UserData will be saved in the model file.	'on'   {'off'}
VariantConfigurationObject	Specifies the variant configuration object that is associated with the model. See “Save and Reuse Variant Configurations Using Variant Configuration Data Object”.	{''} The value is an empty character vector if no configuration object is associated; otherwise, it is the name of a Simulink.VariantConfigurationData object.

## Examples of Setting Block Properties

These examples illustrate how to change common block properties.

This command changes the orientation of the Gain block in the mymodel system so it faces the opposite direction (right to left).

```
set_param('mymodel/Gain','Orientation','left')
```

This command associates an OpenFcn callback with the Gain block in the mymodel system.

```
set_param('mymodel/Gain','OpenFcn','my_open_cb')
```

This command sets the Position property of the Gain block in the mymodel system. The block is 75 pixels wide by 25 pixels high.

```
set_param('mymodel/Gain','Position',[50 250 125 275])
```

## Block-Specific Parameters

To write scripts that create and modify models, you can use the `get_param` and `set_param` functions to query and modify the properties and parameters of a block or diagram. Use the tables to determine the programmatic name of a parameter or property in a block dialog box.

## Programmatic Parameters of Blocks and Models

Programmatic parameters that describe a model are model parameters. Parameters that describe a block are block parameters. Parameters that are common to all Simulink blocks are common block parameters (see “Common Block Properties” on page 6-12). Many blocks also have unique block-specific parameters. A masked block can have mask parameters (see “Mask Parameters” on page 6-128).

The model and block properties also include callbacks, which are commands that execute when a certain model or block event occurs. These events include opening a model, simulating a model, copying a block, opening a block, etc. See “Model, Block, and Port Callbacks”.

---

**Tip** For block parameters that accept array values, the number of elements in the array cannot exceed what `int_T` can represent. This limitation applies to both simulation and Simulink Coder code generation.

---

The maximum number of characters that a parameter edit field can contain is 49,000.

---

## Block-Specific Parameters and Programmatic Equivalents

The tables list block-specific parameters for Simulink blocks. The type of the block appears in parentheses after the block name. Some Simulink blocks work as masked subsystems. The tables indicate masked blocks by adding the designation “masked subsystem” after the block type.

The type listed for nonmasked blocks is the value of the `BlockType` parameter (see “Common Block Properties” on page 6-12). The type listed for masked blocks is the value of the `MaskType` parameter (see “Mask Parameters” on page 6-128).

The **Dialog Box Prompt** column indicates the text of the prompt for the parameter in the block dialog box. The **Values** column shows the type of value required (scalar, vector, variable), the possible values (separated with a vertical line), and the default value (enclosed in braces).

## Continuous Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Derivative (Derivative)		
CoefficientInTFApproximation	Coefficient $c$ in the transfer function approximation $s/(c*s+1)$ used for linearization	{'inf'}
Integrator (Integrator)		
ExternalReset	External reset	{'none'}   'rising'   'falling'   'either'   'level'   'level hold'
InitialConditionSource	Initial condition source	{'internal'}   'external'
InitialCondition	Initial condition	scalar or vector — {'0'}
LimitOutput	Limit output	{'off'}   'on'
UpperSaturationLimit	Upper saturation limit	scalar or vector — {'inf'}
LowerSaturationLimit	Lower saturation limit	scalar or vector — {'-inf'}
ShowSaturationPort	Show saturation port	{'off'}   'on'
ShowStatePort	Show state port	{'off'}   'on'
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'}   {'-1'}   any real scalar or vector
IgnoreLimit	Ignore limit and reset when linearizing	{'off'}   'on'
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
ContinuousStateAttributes	State Name	{' '}   user-defined
WrapState	Wrap state	{'off'}   'on'
WrappedStateUpperValue	Upper value of wrapped state	scalar or vector — {'pi'}
WrappedStateLowerValue	Lower value of wrapped state	scalar or vector — {'-pi'}
Second-Order Integrator (SecondOrderIntegrator)		
ICSourceX	Initial condition source $x$	{'internal'}   'external'
ICX	Initial condition $x$	scalar or vector — {'0'}
LimitX	Limit $x$	{'off'}   'on'
UpperLimitX	Upper limit $x$	scalar or vector — {'inf'}
LowerLimitX	Lower limit $x$	scalar or vector — {'-inf'}
WrapStateX	Enable wrapping of $x$	{'off'}   'on'
WrappedUpperValueX	Upper value for wrapping $x$	scalar or vector — {'pi'}
WrappedLowerValueX	Lower value for wrapping $x$	scalar or vector — {'-pi'}
AbsoluteToleranceX	Absolute tolerance $x$	character vector, scalar, or vector — {'auto'}   {'-1'}   any real scalar or vector
StateNameX	State name $x$	{ }   user-defined

Block (Type)/Parameter	Dialog Box Prompt	Values
ICSourceDXDT	Initial condition source dx/dt	{'internal'}   'external'
ICDXDT	Initial condition dx/dt	scalar or vector — {'0'}
LimitDXDT	Limit dx/dt	{'off'}   'on'
UpperLimitDXDT	Upper limit dx/dt	scalar or vector — {'inf'}
LowerLimitDXDT	Lower limit dx/dt	scalar or vector — {'-inf'}
AbsoluteToleranceDXDT	Absolute tolerance dx/dt	character vector, scalar, or vector — {'auto'}   {'-1'}   any real scalar or vector
StateNameDXDT	State name dx/dt	{ }   user-defined
ExternalReset	External reset	{'none'}   'rising'   'falling'   'either'
ZeroCross	Enable zero-crossing detection	{'on'}   'off'
ReinitDXDTwhenXreachesSaturation	Reinitialize dx/dt when x reaches saturation	{'off'}   'on'
IgnoreStateLimitsAndResetForLinearization	Ignore state limits and the reset for linearization	{'off'}   'on'
ShowOutput	Show output	{'both'}   'x'   'dxdt'
State-Space (StateSpace)		
A	A	matrix — {'1'}
B	B	matrix — {'1'}
C	C	matrix — {'1'}
D	D	matrix — {'1'}
InitialCondition	Initial conditions	vector — {'0'}
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'}   {'-1'}   any real scalar or vector
ContinuousStateAttributes	State Name	{' '}   user-defined
Transfer Fcn (TransferFcn)		
Numerator	Numerator coefficients	vector or matrix — {'[1]'}
Denominator	Denominator coefficients	vector — {'[1 1]'}
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'}   {'-1'}   any real scalar or vector
ContinuousStateAttributes	State Name	{' '}   user-defined
Transport Delay (TransportDelay)		
DelayTime	Time delay	scalar or vector — {'1'}
InitialOutput	Initial output	scalar or vector — {'0'}
BufferSize	Initial buffer size	scalar — {'1024'}
FixedBuffer	Use fixed buffer size	{'off'}   'on'

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
TransDelayFeedthrough	Direct feedthrough of input during linearization	{'off'}   'on'
PadeOrder	Pade order (for linearization)	{'0'}
Variable Time Delay (VariableTimeDelay)		
VariableDelayType	Select delay type	'Variable transport delay'   {'Variable time delay'}
MaximumDelay	Maximum delay	scalar or vector — {'10'}
InitialOutput	Initial output	scalar or vector — {'0'}
MaximumPoints	Initial buffer size	scalar — {'1024'}
FixedBuffer	Use fixed buffer size	{'off'}   'on'
ZeroDelay	Handle zero delay	{'off'}   'on'
TransDelayFeedthrough	Direct feedthrough of input during linearization	{'off'}   'on'
PadeOrder	Pade order (for linearization)	{'0'}
ContinuousStateAttributes	State Name	{' '}   user-defined
Variable Transport Delay (VariableTransportDelay)		
VariableDelayType	Select delay type	{'Variable transport delay'}   'Variable time delay'
MaximumDelay	Maximum delay	scalar or vector — {'10'}
InitialOutput	Initial output	scalar or vector — {'0'}
MaximumPoints	Initial buffer size	scalar — {'1024'}
FixedBuffer	Use fixed buffer size	{'off'}   'on'
TransDelayFeedthrough	Direct feedthrough of input during linearization	{'off'}   'on'
PadeOrder	Pade order (for linearization)	{'0'}
AbsoluteTolerance	Absolute tolerance	character vector, scalar, or vector — {'auto'}   {'-1'}   any positive real scalar or vector
ContinuousStateAttributes	State Name	{' '}   user-defined
Zero-Pole (ZeroPole)		
Zeros	Zeros	vector — {'[1]'} vector — {'[0 -1]'} vector — {'[1]'} character vector, scalar, or vector — {'auto'}   {'-1'}   any positive real scalar or vector
Poles	Poles	
Gain	Gain	
AbsoluteTolerance	Absolute tolerance	
ContinuousStateAttributes	State Name	{' '}   user-defined

**Logic and Bit Operations Library Block Parameters**

Block (Type)/Parameter	Dialog Box Prompt	Values
Bit Clear (Bit Clear) (masked subsystem)		
iBit	Index of bit (0 is least significant)	{'0'}
Bit Set (Bit Set) (masked subsystem)		
iBit	Index of bit (0 is least significant)	{'0'}
Bitwise Operator (S-Function) (Bitwise Operator) (masked subsystem)		
logicop	Operator	{'AND'   'OR'   'NAND'   'NOR'   'XOR'   'NOT'}
UseBitMask	Use bit mask ...	'off'   {'on'}
NumInputPorts	Number of input ports	{'1'}
BitMask	Bit Mask	{'bin2dec('11011001')'}
BitMaskRealWorld	Treat mask as	'Real World Value'   {'Stored Integer'}
Combinatorial Logic (CombinatorialLogic)		
TruthTable	Truth table	{'[0 0;0 1;0 1;1 0;0 1;1 0;1 0;1 1]'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Compare To Constant (Compare To Constant) (masked subsystem)		
relop	Operator	'=='   '~='   '<'   {'<='}   '>='   '>'
const	Constant value	{'3.0'}
OutDataTypeStr	Output data type	{'boolean'}   'uint8'
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
Compare To Zero (Compare To Zero) (masked subsystem)		
relop	Operator	'=='   '~='   '<'   {'<='}   '>='   '>'
OutDataTypeStr	Output data type	{'boolean'}   'uint8'
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
Detect Change (Detect Change) (masked subsystem)		
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'}   'uint8'
Detect Decrease (Detect Decrease) (masked subsystem)		
vinit	Initial condition	{'0.0'}
OutDataTypeStr	Output data type	{'boolean'}   'uint8'
Detect Fall Negative (Detect Fall Negative) (masked subsystem)		
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'}   'uint8'
Detect Fall Nonpositive (Detect Fall Nonpositive) (masked subsystem)		

Block (Type)/Parameter	Dialog Box Prompt	Values
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'}   'uint8'
Detect Increase (Detect Increase) (masked subsystem)		
vinit	Initial condition	{'0.0'}
OutDataTypeStr	Output data type	{'boolean'}   'uint8'
Detect Rise Nonnegative (Detect Rise Nonnegative) (masked subsystem)		
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'}   'uint8'
Detect Rise Positive (Detect Rise Positive) (masked subsystem)		
vinit	Initial condition	{'0'}
OutDataTypeStr	Output data type	{'boolean'}   'uint8'
Extract Bits (Extract Bits) (masked subsystem)		
bitsToExtract	Bits to extract	{'Upper half'}   'Lower half'   'Range starting with most significant bit'   'Range ending with least significant bit'   'Range of bits'
numBits	Number of bits	{'8'}
bitIdxRange	Bit indices ([start end], 0-based relative to LSB)	{'[0 7]'}
outScalingMode	Output scaling mode	{'Preserve fixed-point scaling'}   'Treat bit field as an integer'
Interval Test (Interval Test) (masked subsystem)		
IntervalClosedRight	Interval closed on right	'off'   {'on'}
uplimit	Upper limit	{'0.5'}
IntervalClosedLeft	Interval closed on left	'off'   {'on'}
lowlimit	Lower limit	{'-0.5'}
OutDataTypeStr	Output data type	{'boolean'}   'uint8'
Interval Test Dynamic (Interval Test Dynamic) (masked subsystem)		
IntervalClosedRight	Interval closed on right	'off'   {'on'}
IntervalClosedLeft	Interval closed on left	'off'   {'on'}
OutDataTypeStr	Output data type	{'boolean'}   'uint8'
Logical Operator (Logic)		
Operator	Operator	{'AND'}   'OR'   'NAND'   'NOR'   'XOR'   'NXOR'   'NOT'
Inputs	Number of input ports	{'2'}

Block (Type)/Parameter	Dialog Box Prompt	Values
IconShape	Icon shape	{'rectangular'}   'distinctive'
SampleTime	Sample time (-1 for inherited)	{'-1'}
AllPortsSameDT	Require all inputs and output to have the same data type	{'off'}   'on'
OutDataTypeStr	Output data type	'Inherit: Logical (see Configuration Parameters: Optimization)'   {'boolean'}   'fixdt(1,16)'
<b>Relational Operator (RelationalOperator)</b>		
Operator	Relational operator	'=='   '~='   '<'   {'<='}   '>='   '>'   'isInf'   'isNaN'   'isFinite'
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have the same data type	{'off'}   'on'
OutDataTypeStr	Output data type	'Inherit: Logical (see Configuration Parameters: Optimization)'   {'boolean'}   'fixdt(1,16)'
<b>Shift Arithmetic (ArithShift)</b>		
BitShiftNumberSource	Bits to shift > Source	{'Dialog'}   'Input port'
BitShiftDirection	Bits to shift > Direction	'Left'   'Right'   {'Bidirectional'}
BitShiftNumber	Bits to shift > Number	{'8'}
BinPtShiftNumber	Binary points to shift > Number	{'0'}
DiagnosticFor00RShift	Diagnostic for out-of-range shift value	{'None'}   'Warning'   'Error'
Check00RBitShift	Check for out-of-range 'Bits to shift' in generated code	{'off'}   'on'
nBitShiftRight	Deprecated in R2011a	
nBinPtShiftRight	Deprecated in R2011a	

## Lookup Table Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Cosine (Cosine) (masked subsystem)		
Formula	Output formula	'sin(2*pi*u)'   {'cos(2*pi*u)'}   'exp(j*2*pi*u)'   'sin(2*pi*u) and cos(2*pi*u)'
NumDataPoints	Number of data points for lookup table	{'(2^5)+1'}
OutputWordLength	Output word length	{'16'}
InternalRulePriority	Internal rule priority for lookup table	{'Speed'}   'Precision'
Direct Lookup Table (n-D) (LookupNDDirect)		
NumberOfTableDimensions	Number of table dimensions	'1'   {'2'}   '3'   '4'
InputsSelectThisObjectFromTable	Inputs select this object from table	{'Element'}   'Vector'   '2-D Matrix'
TableIsInput	Make table an input	{'off'}   'on'
Table	Table data	{'[4 5 6;16 19 20;10 18 23]}'}
DiagnosticForOutOfRangeInput	Diagnostic for out-of-range input	'None'   {'Warning'}   'Error'
SampleTime	Sample time (-1 for inherited)	{'-1'}
TableMin	Table minimum	{'[]}'}
TableMax	Table maximum	{'[]}'}
TableDataTypeStr	Table data type	{'Inherit: Inherit from 'Table data''}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'boolean'   'fixdt(1,16)'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'}   'on'
maskTabDims	Deprecated in R2009b	
explicitNumDims	Deprecated in R2009b	
outDims	Deprecated in R2009b	
tabIsInput	Deprecated in R2009b	
mxTable	Deprecated in R2009b	
clipFlag	Deprecated in R2009b	
samptime	Deprecated in R2009b	
Interpolation Using Prelookup (Interpolation_n-D)		
NumberOfTableDimensions	Number of table dimensions	'1'   {'2'}   '3'   '4'

Block (Type)/Parameter	Dialog Box Prompt	Values
Table	Table data > Value	{'sqrt([1:11]' * [1:11])'}
TableSource	Table data > Source	{'Dialog'}   'Input port'
TableSpecification	Specification	{'Explicit values'}     'Lookup table object'  To set this parameter from 'Explicit values' to 'Lookup table object', use the same call to set_param to set the parameter LookupTableObject. For example:  <pre>set_param('myModel/myInterpBlock',... 'TableSpecification',... 'Lookup table object',... 'LookupTableObject','myLUTObject')</pre>
LookupTableObject	Name of lookup table object	{''}
InterpMethod	Interpolation method	'Flat'   {'Linear point-slope'}   'Nearest'   'Linear Lagrange'
ExtrapMethod	Extrapolation method	'Clip'   {'Linear'}
ValidIndexMayReachLast	Valid index input may reach last index	{'off'}   'on'
DiagnosticForOutOfRangeInput	Diagnostic for out-of-range input	{'None'}   'Warning'   'Error'
RemoveProtectionIndex	Remove protection against out-of-range index in generated code	{'off'}   'on'
NumSelectionDims	Number of sub-table selection dimensions	{'0'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
TableDataTypeStr	Table data > Data Type	'Inherit: Inherit from 'Table data''   {'Inherit: Same as output'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16)'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
TableMin	Table data > Minimum	{'[]'}
TableMax	Table data > Maximum	{'[]'}
IntermediateResultsDataTy peStr	Intermediate results > Data Type	{'Inherit: Inherit via internal rule'}   'Inherit: Same as output'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output > Data Type	'Inherit: Inherit via back propagation'   {'Inherit: Inherit from table data'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
OutMin	Output > Minimum	{'[]'}
OutMax	Output > Maximum	{'[]'}
InternalRulePriority	Internal rule priority	{'Speed'}   'Precision'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'}   'on'
CheckIndexInCode	Deprecated in R2011a	
n-D Lookup Table, 1-D Lookup Table, 2-D Lookup Table (Lookup_n-D)		
NumberOfTableDimensions	Number of table dimensions	'1'   '2'   '3'   '4'. Default is '1' for 1-D Lookup Table, '2' for 2-D Lookup Table, '3' for n-D Lookup Table.
DataSpecification	(n-D Lookup Table) Data specification	{'Table and breakpoints'}   'Lookup table object'  To set this parameter from 'Table and breakpoints' to 'Lookup table object', use the same call to set_param to set the parameter LookupTableObject. For example:  set_param('myModel/myLookupBlock',... 'DataSpecification','Lookup table... object',... 'LookupTableObject','myLUTObject')
LookupTableObject	Name of lookup table object.	{''}
Table	Table data	{'reshape(repmat([4 5 6;16 19 20;10 18 23],1,2),[3,3,2])'}
BreakpointsSpecification	Breakpoints specification	{'Explicit values'}   'Even spacing'
BreakpointsFor-Dimension1FirstPoint	First point	{'1'}
BreakpointsFor-Dimension2FirstPoint	First point	{'1'}

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
BreakpointsFor-Dimension3FirstPoint	First point	{'1'}
...	...	...
BreakpointsFor-Dimension30FirstPoint	First point	{'1'}
BreakpointsFor-Dimension1Spacing	Spacing	{'1'}
BreakpointsFor-Dimension2Spacing	Spacing	{'1'}
BreakpointsFor-Dimension3Spacing	Spacing	{'1'}
...	...	...
BreakpointsFor-Dimension30Spacing	Spacing	{'1'}
BreakpointsForDimension1	Breakpoints 1	{'[10,22,31]}'}
BreakpointsForDimension2	Breakpoints 2	{'[10,22,31]}'}
BreakpointsForDimension3	Breakpoints 3	{'[5, 7]}'}
...	...	...
BreakpointsForDimension30	Breakpoints 30	{'[1:3]}'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InterpMethod	Interpolation method	'Flat'   'Nearest'   {'Linear point-slope'}   'Linear Lagrange'   'Cubic spline'
ExtrapMethod	Extrapolation method	'Clip'   {'Linear'}   'Cubic spline'
UseLastTableValue	Use last table value for inputs at or above last breakpoint	{'off'}   'on'
DiagnosticForOutOfRangeInput	Diagnostic for out-of-range input	{'None'}   'Warning'   'Error'
RemoveProtectionInput	Remove protection against out-of-range input in generated code	{'off'}   'on'
IndexSearchMethod	Index search method	'Evenly spaced points'   'Linear search'   {'Binary search'}
BeginIndexSearchUsingPreviousIndexResult	Begin index search using previous index result	{'off'}   'on'
UseOneInputPortForAllInputData	Use one input port for all input data	{'off'}   'on'
SupportTunableTableSize	Support tunable table size in code generation	{'off'}   'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
MaximumIndicesForEachDimension	Maximum indices for each dimension	{'[]'}
TableDataTypeStr	Table data > Data Type	'Inherit: Inherit from 'Table data''   {'Inherit: Same as output'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16)'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
TableMin	Table data > Minimum	{'[]'}
TableMax	Table data > Maximum	{'[]'}
BreakpointsForDimension1DataTypeStr	Breakpoints 1 > Data Type	{'Inherit: Same as corresponding input'}   'Inherit: Inherit from 'Breakpoint data''   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16)'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
BreakpointsForDimension1Min	Breakpoints 1 > Minimum	{'[]'}
BreakpointsForDimension1Max	Breakpoints 1 > Maximum	{'[]'}
BreakpointsForDimension2DataTypeStr	Breakpoints 2 > Data Type	{'Inherit: Same as corresponding input'}   'Inherit: Inherit from 'Breakpoint data''   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16)'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
BreakpointsForDimension2Min	Breakpoints 2 > Minimum	{'[]'}
BreakpointsForDimension2Max	Breakpoints 2 > Maximum	{'[]'}
...	...	...
BreakpointsForDimension30DataTypeStr	Breakpoints 30 > Data Type	{'Inherit: Same as corresponding input'}   'Inherit: Inherit from 'Breakpoint data''   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16)'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
BreakpointsForDimension30 Min	Breakpoints 30 > Minimum	{'[]'}
BreakpointsForDimension30 Max	Breakpoints 30 > Maximum	{'[]'}
FractionDataTypeStr	Fraction > Data Type	{'Inherit: Inherit via internal rule'}   'double'   'single'   'fixdt(1,16,0)'
IntermediateResults DataTypeStr	Intermediate results > Data Type	'Inherit: Inherit via internal rule'   {'Inherit: Same as output'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
OutDataTypeStr	Output > Data Type	'Inherit: Inherit via back propagation'   'Inherit: Inherit from table data'   {'Inherit: Same as first input'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
OutMin	Output > Minimum	{'[]'}
OutMax	Output > Maximum	{'[]'}
InternalRulePriority	Internal rule priority	{'Speed'}   'Precision'
InputSameDT	Require all inputs to have the same data type	'off'   {'on'}
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   'Floor'   'Nearest'   'Round'   {'Simplest'}   'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'}   'on'
ProcessOutOfRangeInput	Deprecated in R2009b	
Lookup Table Dynamic (Lookup Table Dynamic) (masked subsystem)		
LookUpMeth	Lookup Method	'Interpolation-Extrapolation'   {'Interpolation-Use End Values'}   'Use Input Nearest'   'Use Input Below'   'Use Input Above'

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Output data type	{'fixdt('double')}   'Inherit: Inherit via back propagation'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'boolean'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
OutputDataTypeScaling Mode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'}   'on'
Prelookup (PreLookup)		
BreakpointsSpecification	Specification	{'Explicit values'}   'Even spacing'   'Breakpoint object'  To set this parameter from 'Explicit values' or 'Even spacing' to 'Breakpoint object', use the same call to set_param to set the parameter BreakpointObject. For example:  set_param('myModel/myPrelookupBlock', ... 'BreakpointsSpecification', ... 'Breakpoint object', ... 'BreakpointObject', 'myBPObject')
BreakpointObject	Name of breakpoint object	{''}
BreakpointsFirstPoint	First point	{'10'}
BreakpointsSpacing	Spacing	{'10'}
BreakpointsNumPoints	Number of points	{'11'}
BreakpointsData	Value	{'[10:10:110]'}
BreakpointsDataSource	Source	{'Dialog'}   'Input port'
IndexSearchMethod	Index search method	'Evenly spaced points'   'Linear search'   {'Binary search'}
BeginIndexSearchUsing PreviousIndexResult	Begin index search using previous index result	{'off'}   'on'

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
OutputOnlyTheIndex	Output only the index	{'off'}   'on'
ExtrapMethod	Extrapolation method	'Clip'   {'Linear'}
UseLastBreakpoint	Use last breakpoint for input at or above upper limit	{'off'}   'on'
DiagnosticForOutOfRange Input	Diagnostic for out-of-range input	{'None'}   'Warning'   'Error'
RemoveProtectionInput	Remove protection against out-of-range input in generated code	{'off'}   'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
BreakpointDataTypeStr	Breakpoint > Data Type	{'Inherit: Same as input'}   'Inherit: Inherit from Breakpoint data'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16)'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
BreakpointMin	Breakpoint > Minimum	{'[]'}
BreakpointMax	Breakpoint > Maximum	{'[]'}
IndexDataTypeStr	Index > Data Type	'int8'   'uint8'   'int16'   'uint16'   'int32'   {'uint32'}   'fixdt(1,16)'
FractionDataTypeStr	Fraction > Data Type	{'Inherit: Inherit via internal rule'}   'double'   'single'   'fixdt(1,16,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
ProcessOutOfRangeInput	Deprecated in R2011a	
Sine (Sine) (masked subsystem)		
Formula	Output formula	{'sin(2*pi*u)'}   'cos(2*pi*u)'   'exp(j*2*pi*u)'   'sin(2*pi*u) and cos(2*pi*u)'
NumDataPoints	Number of data points for lookup table	{'(2^5)+1'}
OutputWordLength	Output word length	{'16'}
InternalRulePriority	Internal rule priority for lookup table	{'Speed'}   'Precision'

## Math Operations Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Abs (Abs)		
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via internal rule'   'Inherit: Inherit via back propagation'   {'Inherit: Same as input'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'}   'on'
Add (Sum)		
IconShape	Icon shape	{'rectangular'}   'round'
Inputs	List of signs	{'++'}
CollapseMode	Sum over	{'All dimensions'}   'Specified dimension'
CollapseDim	Dimension	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have the same data type	{'off'}   'on'
AccumDataTypeStr	Accumulator data type	{'Inherit: Inherit via internal rule'}   'Inherit: Same as first input'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'}   'Inherit: Inherit via back propagation'   'Inherit: Same as first input'   'Inherit: Same as accumulator'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
LockScale	Lock data type settings against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'}   'on'
Algebraic Constraint (Algebraic Constraint)		
Constraint	Constraint on input signal	{'f(z) = 0'}   'f(z) = z'
Solver	Algebraic Loop Solver	{'auto'}   'Trust Region'   'Line Search'
Tolerance	Solver Tolerance	{'auto'}
InitialGuess	Initial guess	{'0'}
Assignment (Assignment)		
NumberOfDimensions	Number of output dimensions	{'1'}
IndexMode	Index mode	'Zero-based'   {'One-based'}
OutputInitialize	Initialize output (Y)	{'Initialize using input port <Y0>'}   'Specify size for each dimension in table'
IndexOptionArray	Index Option	'Assign all'   {'Index vector (dialog)'}   'Index vector (port)'   'Starting index (dialog)'   'Starting index (port)'
IndexParamArray	Index	cell array
OutputSizeArray	Output Size	cell array

Block (Type)/Parameter	Dialog Box Prompt	Values
DiagnosticForDimensions	Action if any output element is not assigned	'Error'   'Warning'   {'None'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
IndexOptions	See the <b>IndexOptionArray</b> parameter for more information.	
Indices	See the <b>IndexParamArray</b> parameter for more information.	
OutputSizes	See the <b>OutputSizeArray</b> parameter for more information.	
Bias (Bias)		
Bias	Bias	{'0.0'}
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'}   'on'
Complex to Magnitude-Angle (ComplexToMagnitudeAngle)		
Output	Output	'Magnitude'   'Angle'   {'Magnitude and angle'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Complex to Real-Imag (ComplexToRealImag)		
Output	Output	'Real'   'Imag'   {'Real and imag'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Divide (Product)		
Inputs	Number of inputs	{'*/'}
Multiplication	Multiplication	{'Element-wise(.*)' }   'Matrix(*)'
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have same data type	{'off'}   'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'}   'Inherit: Inherit via back propagation'   'Inherit: Same as first input'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'}   'on'
Dot Product (DotProduct)		
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have same data type	'off'   {'on'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'}   'Inherit: Inherit via back propagation'   'Inherit: Same as first input'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
OutputDataTypeScaling Mode	Deprecated in R2007b	
OutDataType	Deprecated in R2007b	
OutScaling	Deprecated in R2007b	
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'}   'on'
Find (Find)		
IndexOutputFormat	Index output format	{'Linear indices'}   'Subscripts'
NumberOfInputDimensions	Number of input dimensions	integer — {'1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
IndexMode	Index mode	{'Zero-based'}   'One-based'
ShowOutputForNonzero InputValues	Show output port for nonzero input values	{'off'}   'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'}   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16)'
Gain (Gain)		
Gain	Gain	{'1'}
Multiplication	Multiplication	{'Element-wise(K.*u)'}   'Matrix(K*u)'   'Matrix(u*K)'   'Matrix(K*u) (u vector)'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'}   'Inherit: Inherit via back propagation'   'Inherit: Same as input'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'}   'on'
ParamMin	Parameter minimum	{'[]'}
ParamMax	Parameter maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
ParamDataTypeStr	Parameter data type	{'Inherit: Inherit via internal rule'}   'Inherit: Same as input'   'Inherit: Inherit from 'Gain''   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16)'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
<b>Magnitude-Angle to Complex (MagnitudeAngleToComplex)</b>		
Input	Input	'Magnitude'   'Angle'   {'Magnitude and angle'}
ConstantPart	Magnitude or Angle	{'0'}
ApproximationMethod	Approximation method	{'None'}   'CORDIC'
NumberOfIterations	Number of iterations	{'11'}
ScaleReciprocalGainFactor	Scale output by reciprocal of gain factor	'off'   {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
<b>Math Function (Math)</b>		
Operator	Function	{'exp'}   'log'   '10^u'   'log10'   'magnitude^2'   'square'   'pow'   'conj'   'reciprocal'   'hypot'   'rem'   'mod'   'transpose'   'hermitian'
OutputSignalType	Output signal type	{'auto'}   'real'   'complex'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via internal rule'   'Inherit: Inherit via back propagation'   {'Inherit: Same as first input'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	'off'   {'on'}
Matrix Concatenate (Concatenate)		
NumInputs	Number of inputs	{'2'}
Mode	Mode	'Vector'   {'Multidimensional array'}
ConcatenateDimension	Concatenate dimension	{'2'}
MinMax (MinMax)		
Function	Function	{'min'}   'max'
Inputs	Number of input ports	{'1'}
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have the same data type	{'off'}   'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'}   'Inherit: Inherit via back propagation'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'}   'on'
MinMax Running Resetable (MinMax Running Resetable) (masked subsystem)		

Block (Type)/Parameter	Dialog Box Prompt	Values
Function	Function	{'min'}   'max'
vinit	Initial condition	{'0.0'}
Permute Dimensions (PermuteDimensions)		
Order	Order	{'[2,1]}'}
Polynomial (Polyval)		
coefs	Polynomial Coefficients	{'[ +2.081618890e-019, -1.441693666e-014, +4.719686976e-010, -8.536869453e-006, +1.621573104e-001, -8.087801117e+001 ]'}
Product (Product)		
Inputs	Number of inputs	{'2'}
Multiplication	Multiplication	{'Element-wise(*)'}   'Matrix(*)'
CollapseMode	Multiply over	{'All dimensions'}   'Specified dimension'
CollapseDim	Dimension	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all inputs to have same data type	{'off'}   'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'}   'Inherit: Inherit via back propagation'   'Inherit: Same as first input'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   'Floor'   'Nearest'   'Round'   'Simplest'   {'Zero'}
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'}   'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
Product of Elements (Product)		
Inputs	Number of inputs	{ '*' }
Multiplication	Multiplication	{ 'Element-wise(.*)' }   'Matrix(*)'
CollapseMode	Multiply over	{ 'All dimensions' }   'Specified dimension'
CollapseDim	Dimension	{ '1' }
SampleTime	Sample time (-1 for inherited)	{ '-1' }
InputSameDT	Require all inputs to have same data type	{ 'off' }   'on'
OutMin	Output minimum	{ '[]' }
OutMax	Output maximum	{ '[]' }
OutDataTypeStr	Output data type	{ 'Inherit: Inherit via internal rule' }   'Inherit: Inherit via back propagation'   'Inherit: Same as first input'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{ 'off' }   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   { 'Floor' }   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{ 'off' }   'on'
Real-Imag to Complex (RealImagToComplex)		
Input	Input	'Real'   'Imag'   { 'Real and imag' }
ConstantPart	Real part or Imag part	{ '0' }
SampleTime	Sample time (-1 for inherited)	{ '-1' }
Reciprocal Sqrt (Sqrt)		
Operator	Function	'sqrt'   'signedSqrt'   { 'rSqrt' }
OutputSignalType	Output signal type	{ 'auto' }   'real'   'complex'

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via internal rule'   'Inherit: Inherit via back propagation'   {'Inherit: Same as first input'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	'off'   {'on'}
IntermediateResults DataTypeStr	Intermediate results data type	{'Inherit: Inherit via internal rule'}   'Inherit: Inherit from input'   'Inherit: Inherit from output'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
AlgorithmType	Method	'Exact'   {'Newton-Raphson'}
Iterations	Number of iterations	{'3'}
Reshape (Reshape)		
OutputDimensionality	Output dimensionality	{'1-D array'}   'Column vector (2-D)'   'Row vector (2-D)'   'Customize'   'Derive from reference input port'
OutputDimensions	Output dimensions	{'[1,1]}'}
Rounding Function (Rounding)		

Block (Type)/Parameter	Dialog Box Prompt	Values
Operator	Function	{'floor'}   'ceil'   'round'   'fix'
SampleTime	Sample time (-1 for inherited)	{'-1'}
Sign (Signum)		
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Signed Sqrt (Sqrt)		
Operator	Function	'sqrt'   {'signedSqrt'}   'rSqrt'
OutputSignalType	Output signal type	{'auto'}   'real'   'complex'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	'Inherit: Inherit via internal rule'   'Inherit: Inherit via back propagation'   {'Inherit: Same as first input'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	'off'   {'on'}
IntermediateResults DataTypeStr	Intermediate results data type	{'Inherit: Inherit via internal rule'}   'Inherit: Inherit from input'   'Inherit: Inherit from output'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
AlgorithmType	Method	{'Exact'}   'Newton-Raphson'
Iterations	Number of iterations	{'3'}
Sine Wave Function (Sin)		
SineType	Sine type	{'Time based'}   'Sample based'
TimeSource	Time	'Use simulation time'   {'Use external signal'}
Amplitude	Amplitude	{'1'}
Bias	Bias	{'0'}
Frequency	Frequency	{'1'}
Phase	Phase	{'0'}
Samples	Samples per period	{'10'}
Offset	Number of offset samples	{'0'}
SampleTime	Sample time	{'0'}
VectorParams1D	Interpret vector parameters as 1-D	'off'   {'on'}
Slider Gain (Slider Gain) (masked subsystem)		
low	Low	{'0'}
gain	Gain	{'1'}
high	High	{'2'}
Sqrt (Sqrt)		
Operator	Function	{'sqrt'}   'signedSqrt'   'rSqrt'
OutputSignalType	Output signal type	{'auto'}   'real'   'complex'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
weightValue	Weight value	{'1.0'}
TsampMathImp	Implement using	{'Online Calculations'}   'Offline Scaling Adjustment'
OutDataTypeStr	Output data type	{'Inherit via internal rule'}   'Inherit via back propagation'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'}   'on'
OutputDataTypeScaling Mode	Deprecated in R2009b	
DoSatur	Deprecated in R2009b	

**Model Verification Library Block Parameters**

Block (Type)/Parameter	Dialog Box Prompt	Values
Assertion (Assertion)		
Enabled	Enable assertion	'off'   {'on'}
AssertionFailFcn	Simulation callback when assertion fails	{''}
StopWhenAssertionFail	Stop simulation when assertion fails	'off'   {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Check Dynamic Gap (Checks_DGap) (masked subsystem)		
enabled	Enable assertion	'off'   {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off'   {'on'}
export	Output assertion signal	{'off'}   'on'
icon	Select icon type	{'graphic'}   'text'
Check Dynamic Range (Checks_DRange) (masked subsystem)		
enabled	Enable assertion	'off'   {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off'   {'on'}
export	Output assertion signal	{'off'}   'on'
icon	Select icon type	{'graphic'}   'text'
Check Static Gap (Checks_SGap) (masked subsystem)		
max	Upper bound	{'100'}
max_included	Inclusive upper bound	'off'   {'on'}
min	Lower bound	{'0'}
min_included	Inclusive lower bound	'off'   {'on'}
enabled	Enable assertion	'off'   {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off'   {'on'}
export	Output assertion signal	{'off'}   'on'
icon	Select icon type	{'graphic'}   'text'
Check Static Range (Checks_SRange) (masked subsystem)		
max	Upper bound	{'100'}
max_included	Inclusive upper bound	'off'   {'on'}
min	Lower bound	{'0'}
min_included	Inclusive lower bound	'off'   {'on'}

Block (Type)/Parameter	Dialog Box Prompt	Values
enabled	Enable assertion	'off'   {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off'   {'on'}
export	Output assertion signal	{'off'}   'on'
icon	Select icon type	{'graphic'}   'text'
Check Discrete Gradient (Checks_Gradient) (masked subsystem)		
gradient	Maximum gradient	{'1'}
enabled	Enable assertion	'off'   {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off'   {'on'}
export	Output assertion signal	{'off'}   'on'
icon	Select icon type	{'graphic'}   'text'
Check Dynamic Lower Bound (Checks_DMin) (masked subsystem)		
Enabled	Enable assertion	'off'   {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off'   {'on'}
export	Output assertion signal	{'off'}   'on'
icon	Select icon type	{'graphic'}   'text'
Check Dynamic Upper Bound (Checks_DMax) (masked subsystem)		
enabled	Enable assertion	'off'   {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off'   {'on'}
export	Output assertion signal	{'off'}   'on'
icon	Select icon type	{'graphic'}   'text'
Check Input Resolution (Checks_Resolution) (masked subsystem)		
resolution	Resolution	{'1'}
enabled	Enable assertion	'off'   {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off'   {'on'}
export	Output assertion signal	{'off'}   'on'
Check Static Lower Bound (Checks_SMin) (masked subsystem)		
min	Lower bound	{'0'}
min_included	Inclusive boundary	'off'   {'on'}

Block (Type)/Parameter	Dialog Box Prompt	Values
enabled	Enable assertion	'off'   {'on'}
callback	Simulation callback when assertion fails (optional)	{''}
stopWhenAssertionFail	Stop simulation when assertion fails	'off'   {'on'}
export	Output assertion signal	{'off'}   'on'

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
CMTag20	CMTag20	{''}
Timed-Based Linearization (Timed Linearization) (masked subsystem)		
LinearizationTime	Linearization time	{'1'}
SampleTime	Sample time (of linearized model)	{'0'}
Trigger-Based Linearization (Triggered Linearization) (masked subsystem)		
TriggerType	Trigger type	{'rising'}   'falling'   'either'   'function-call'
SampleTime	Sample time (of linearized model)	{'0'}

## Ports &amp; Subsystems Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Action Port (ActionPort)		
InitializeStates	States when execution is resumed	{'held'}   'reset'
PropagateVarSize	Propagate sizes of variable-size signals	{'Only when execution is resumed'}   'During execution'
Atomic Subsystem (SubSystem)		
ShowPortLabels	Show port labels  <b>Note</b> The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none'   {'FromPortIcon'}   'FromPortBlockName'   'SignalName'   'off'   'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'}   'ReadOnly'   'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'}   'ExplicitOnly'   'None'
TreatAsAtomicUnit	Treat as atomic unit	'off'   {'on'}
TreatAsGroupedWhenPropagatingVariantConditions	Treat as grouped when propagating variant conditions	'off'   {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'}   'on'
CheckFcnCallInpInsideContextMsg	Warn if function-call inputs are context-specific	{'off'}   'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Function packaging	{'Auto'}   'Inline'   'Nonreusable function'   'Reusable function'
RTWFcnNameOpts	Function name options	{'Auto'}   'Use subsystem name'   'User specified'
RTWFcnName	Function name	{''}
RTWFileNameOpts	File name options	{'Auto'}   'Use subsystem name'   'Use function name'   'User specified'
RTWFileName	File name (no extension)	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
FunctionInterfaceSpec	Function interface  This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'void_void'}   'Allow arguments (Optimized)'   'Allow arguments (Match graphical interface)'
FunctionWithSeparateData	"Function with separate data" on page 1-0  This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'off'}   'on'
RTWMemSecFuncInitTerm	"Memory section for initialize/terminate functions" on page 1-0  This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'}   'Default'   list of memory sections from model's package
RTWMemSecFuncExecute	"Memory section for execution functions" on page 1-0  This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'}   'Default'   list of memory sections from model's package
RTWMemSecDataConstants	"Memory section for constants" on page 1-0  This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'}   'Default'   list of memory sections from model's package
RTWMemSecDataInternal	"Memory section for internal data" on page 1-0  This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'}   'Default'   list of memory sections from model's package
RTWMemSecDataParameters	"Memory section for parameters" on page 1-0  This parameter requires a license for Embedded Coder software and an ERT-based system target file.	{'Inherit from model'}   'Default'   list of memory sections from model's package
DataTypeOverride	No dialog box prompt  Specifies data type used to override fixed-point data types. Set by <b>Data type override</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'ScaledDouble'   'Double'   'Single'   'Off'

Block (Type)/Parameter	Dialog Box Prompt	Values
MinMaxOverflowLogging	No dialog box prompt  Setting for fixed-point instrumentation. Set by <b>Fixed-point instrumentation mode</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'MinMaxAndOverflow'   'OverflowOnly'   'ForceOff'
SimViewingDevice	No dialog box prompt  If set to 'on', designates the block as a Signal Viewing Subsystem — an atomic subsystem that encapsulates processing and viewing of signals received from the target system in External mode. For more information, see “Signal Viewing Subsystems” (Simulink Coder).	{'off'}   'on'
IsSubsystemVirtual		boolean — {'off'}   'on'  Read-only
Code Reuse Subsystem (SubSystem)		
ShowPortLabels	Show port labels  <b>Note</b> The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none'   {'FromPortIcon'}   'FromPortBlockName'   'SignalName'   'off'   'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'}   'ReadOnly'   'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'}   'ExplicitOnly'   'None'
TreatAsAtomicUnit	Treat as atomic unit	'off'   {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'}   'on'
CheckFcnCallInpInsideContextMsg	Warn if function-call inputs are context-specific	{'off'}   'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWSystemCode	Function packaging	'Auto'   'Inline'   'Nonreusable function'   {'Reusable function'}
RTWFcnNameOpts	Function name options	'Auto'   {'Use subsystem name'}   'User specified'

DataTypeOverride	No dialog box prompt  Specifies data type used to override fixed-point data types. Set by <b>Data type override</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'ScaledDouble'   'Double'   'Single'   'Off'
MinMaxOverflowLogging	No dialog box prompt  Setting for fixed-point instrumentation. Set by <b>Fixed-point instrumentation mode</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'MinMaxAndOverflow'   'OverflowOnly'   'ForceOff'

Block (Type)/Parameter	Dialog Box Prompt	Values
IsSubsystemVirtual		boolean — {'off'}   'on' Read-only
If (If)		
NumInputs	Number of inputs	{'1'}
IfExpression	If expression (e.g., $u1 \sim= 0$ )	{'u1 > 0'}
ElseIfExpressions	Elseif expressions (comma-separated list, e.g., $u2 \sim= 0, u3(2) < u2$ )	{' '}
ShowElse	Show else condition	'off'   {'on'}
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
If Action Subsystem (SubSystem)		
ShowPortLabels	Show port labels  <b>Note</b> The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none'   {'FromPortIcon'}   'FromPortBlockName'   'SignalName'   'off'   'on'
BlockChoice	Block choice	{' '}
TemplateBlock	Template block	{' '}
MemberBlocks	Member blocks	{' '}
Permissions	Read/Write permissions	{'ReadWrite'}   'ReadOnly'   'NoReadOrWrite'
ErrorFcn	Name of error callback function	{' '}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'}   'ExplicitOnly'   'None'
TreatAsAtomicUnit	Treat as atomic unit	'off'   {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'}   'on'
CheckFcnCallInpInsideContextMsg	Warn if function-call inputs are context-specific	{'off'}   'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Function packaging	{'Auto'}   'Inline'   'Nonreusable function'   'Reusable function'
RTWFcnNameOpts	Function name options	{'Auto'}   'Use subsystem name'   'User specified'
RTWFcnName	Function name	{' '}

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWFileNameOpts	File name options	{'Auto'}   'Use subsystem name'   'Use function name'   'User specified'
RTWFileName	File name (no extension)	{''}
DataTypeOverride	No dialog box prompt  Specifies data type used to override fixed-point data types. Set by <b>Data type override</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'ScaledDouble'   'Double'   'Single'   'Off'
MinMaxOverflowLogging	No dialog box prompt  Setting for fixed-point instrumentation. Set by <b>Fixed-point instrumentation mode</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'MinMaxAndOverflow'   'OverflowOnly'   'Off'
IsSubsystemVirtual		boolean — {'off'}   'on'  Read-only
<b>In1 (Inport)</b>		
Port	Port number	{'1'}
IconDisplay	Icon display	'Signal name'   {'Port number'}   'Port number and signal name'
LatchByDelayingOutsideSignal	Latch input by delaying outside signal	{'off'}   'on'
LatchInputForFeedbackSignals	Latch input for feedback signals of function-call subsystem outputs	{'off'}   'on'
Interpolate	Interpolate data	'off'   {'on'}
UseBusObject	Specify properties via bus object	{'off'}   'on'
BusObject	Bus object for specifying bus properties	{'BusObject'}
BusOutputAsStruct	Output as nonvirtual bus	{'off'}   'on'
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Data type	{'Inherit: auto'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'boolean'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
Unit	Specify physical unit of the input signal to the block.	{'inherit'}   '<Enter unit>'
UnitNoProp	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	'<Enter unit>'
SignalType	Signal type	{'auto'}   'real'   'complex'
<b>Model (ModelReference)</b>		
ModelNameDialog	The name of the referenced model exactly as you typed it in, with any surrounding white space removed. When you set ModelNameDialog programmatically or interactively, Simulink automatically sets the values of ModelName and ModelFile based on the value of ModelNameDialog.	{'<Enter Model Name>'}
ModelName	The value of ModelNameDialog stripped of any file name extension that you provided. For backward compatibility, setting ModelName programmatically actually sets ModelNameDialog, which then sets ModelName as described. You cannot use get_param to obtain the ModelName of a protected model, because the name without a suffix would be ambiguous. Use get_param on ModelFile instead. You can test ProtectedModel to determine programmatically whether a referenced model is protected.	character vector — Set automatically when ModelNameDialog is set.

Block (Type)/Parameter	Dialog Box Prompt	Values
ModelFile	The value of ModelNameDialog with a file name extension. The suffix of the first match Simulink finds becomes the suffix of ModelFile. Setting ModelFile programmatically actually sets ModelNameDialog, which then sets ModelFile as described.	character vector — Set automatically when ModelNameDialog is set.
ProtectedModel	Read-only boolean indicating whether the model referenced by the block is protected (on) or unprotected (off).	boolean — 'off'   'on' — Set automatically when ModelNameDialog is set.
InstanceParameters	Structure array of instance-specific parameters on the Model block.	structure with fields: Name, Value, Path, and Argument.
ParameterArgumentNames	Names of instance-specific parameters that the referenced model defines. Corresponds to the <b>Name</b> column in the table on the <b>Instance parameters</b> tab.	{ '' }
ParameterArgumentValues	Values for model arguments. Corresponds to the <b>Value</b> column in the table on the <b>Instance parameters</b> tab.	structure with no fields
SimulationMode	Specifies whether to simulate the model by generating and executing code or by interpreting the model in Simulink software.	{ 'Normal' }   'Accelerator'   'Software-in-the-loop (SIL)'   'Processor-in-the-loop (PIL)'
DefaultDataLogging		{ 'off' }   'on'
Out1 (Output)		
Port	Port number	{ '1' }
IconDisplay	Icon display	'Signal name'   { 'Port number' }   'Port number and signal name'
UseBusObject	Specify properties via bus object	{ 'off' }   'on'
BusObject	Bus object for validating input bus	{ 'BusObject' }
BusOutputAsStruct	Output as nonvirtual bus in parent model	{ 'off' }   'on'
PortDimensions	Port dimensions (-1 for inherited)	{ '-1' }
VarSizeSig	Variable-size signal	{ 'Inherit' }   'No'   'Yes'
SampleTime	Sample time (-1 for inherited)	{ '-1' }
OutMin	Minimum	{ [] }
OutMax	Maximum	{ [] }

Block (Type)/Parameter	Dialog Box Prompt	Values
OutDataTypeStr	Data type	{'Inherit: auto'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'boolean'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'   'Bus: <object name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
Unit	Specify physical unit of the input signal to the block. For a list of acceptable units, see Allowed Units.	{'inherit'}   '<Enter unit>'
UnitNoProp	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	'<Enter unit>'
SignalObject	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “Design Data Interface by Configuring Inport and Outport Blocks” (Simulink Coder).	Simulink.Signal object  Object of a class that is derived from Simulink.Signal
StorageClass	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “Design Data Interface by Configuring Inport and Outport Blocks” (Simulink Coder).	{'Auto'}   'Model default'   'ExportedGlobal'   'ImportedExtern'   'ImportedExternPointer'   'Custom'
SignalName	Signal name	character vector
SignalType	Signal type	{'auto'}   'real'   'complex'
OutputWhenDisabled	Output when disabled	{'held'}   'reset'
InitialOutput	Initial output	{'[]'}
MustResolveToSignalObject	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “For Signals”.	{'off'}   'on'
Subsystem (SubSystem)		

Block (Type)/Parameter	Dialog Box Prompt	Values
ShowPortLabels	Show port labels  <b>Note</b> The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none'   {'FromPortIcon'}   'FromPortBlockName'   'SignalName'   'off'   'on'
BlockChoice	Block choice	{''}
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'}   'ReadOnly'   'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'}   'ExplicitOnly'   'None'
TreatAsAtomicUnit	Treat as atomic unit	{'off'}   'on'
TreatAsGroupedWhenPropagatingVariantConditions	Treat as grouped when propagating variant conditions	'off'   {'on'}
VariantControl	Variant control	{'Variant'}   '(default)'
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'}   'on'
CheckFcnCallInpInsideContextMsg	Warn if function-call inputs are context-specific	{'off'}   'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Code generation function packaging	{'Auto'}   'Inline'   'Nonreusable function'   'Reusable function'
RTWFcnNameOpts	Code generation function name options	{'Auto'}   'Use subsystem name'   'User specified'
RTWFcnName	Code generation function name	{''}
RTWFileNameOpts	Code generation file name options	{'Auto'}   'Use subsystem name'   'Use function name'   'User specified'
RTWFileName	Code generation file name (no extension)	{''}
DataTypeOverride	Specifies data type used to override fixed-point data types. Set by <b>Data type override</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'ScaledDouble'   'Double'   'Single'   'Off'

Block (Type)/Parameter	Dialog Box Prompt	Values
MinMaxOverflowLogging	No dialog box prompt  Setting for fixed-point instrumentation. Set by <b>Fixed-point instrumentation mode</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'MinMaxAndOverflow'   'OverflowOnly'   'ForceOff'
IsSubsystemVirtual		boolean — {'on'}   'off'  Read-only
Virtual	For internal use	
Switch Case (SwitchCase)		
CaseConditions	Case conditions (e.g., {1,[2,3]})	{' {1}'}
ShowDefaultCase	Show default case	'off'   {'on'}
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
SampleTime	Sample time (-1 for inherited)	{' -1'}
CaseShowDefault	Deprecated in R2009b	
Switch Case Action Subsystem (SubSystem)		
ShowPortLabels	Show port labels  <b>Note</b> The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none'   {'FromPortIcon'}   'FromPortBlockName'   'SignalName'   'off'   'on'

RTWFileNameOpts	Code generation file name options	{'Auto'}   'Use subsystem name'   'Use function name'   'User specified'

Block (Type)/Parameter	Dialog Box Prompt	Values
RTWFileName	Code generation file name (no extension)	{''}
DataTypeOverride	No dialog box prompt  Specifies data type used to override fixed-point data types. Set by <b>Data type override</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'ScaledDouble'   'Double'   'Single'   'Off'
MinMaxOverflowLogging	No dialog box prompt  Setting for fixed-point instrumentation. Set by <b>Fixed-point instrumentation mode</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'MinMaxAndOverflow'   'OverflowOnly'   'ForceOff'
IsSubsystemVirtual		boolean — {'off'}   'on'  Read-only
Unit Conversion		
OutDataTypeStr	Output data type	{'Inherit via internal rule'}   'Inherit via back propagation'
Unit System Configuration		
AllowAllUnitSystems	Allow or restrict unit systems.	boolean — {'on'}   'off'
UnitSystems	Displays allowed unit system.	cell array of character vectors — {'SI', 'English', 'SI (extended)', 'CGS'}
While Iterator (WhileIterator)		
MaxIters	Maximum number of iterations (-1 for unlimited)	{'5'}
WhileBlockType	While loop type	{'while'}   'do-while'
ResetStates	States when starting	{'held'}   'reset'
ShowIterationPort	Show iteration number port	{'off'}   'on'
OutputDataType	Output data type	{'int32'}   'int16'   'int8'   'double'
While Iterator Subsystem (SubSystem)		
ShowPortLabels	Show port labels  <b>Note</b> The values 'off' and 'on' are for backward compatibility only and should not be used in new models or when updating existing models.	'none'   {'FromPortIcon'}   'FromPortBlockName'   'SignalName'   'off'   'on'
BlockChoice	Block choice	{''}

Block (Type)/Parameter	Dialog Box Prompt	Values
TemplateBlock	Template block	{''}
MemberBlocks	Member blocks	{''}
Permissions	Read/Write permissions	{'ReadWrite'}   'ReadOnly'   'NoReadOrWrite'
ErrorFcn	Name of error callback function	{''}
PermitHierarchicalResolution	Permit hierarchical resolution	{'All'}   'ExplicitOnly'   'None'
TreatAsAtomicUnit	Treat as atomic unit	'off'   {'on'}
MinAlgLoopOccurrences	Minimize algebraic loop occurrences	{'off'}   'on'
CheckFcnCallInpInsideContextMsg	Warn if function-call inputs are context-specific	{'off'}   'on'
SystemSampleTime	Sample time (-1 for inherited)	{'-1'}
RTWSystemCode	Code generation function packaging	{'Auto'}   'Inline'   'Nonreusable function'   'Reusable function'
RTWFcnNameOpts	Code generation function name options	{'Auto'}   'Use subsystem name'   'User specified'
RTWFcnName	Code generation function name	{''}
RTWFileNameOpts	Code generation file name options	{'Auto'}   'Use subsystem name'   'Use function name'   'User specified'
RTWFileName	Code generation file name (no extension)	{''}
DataTypeOverride	No dialog box prompt  Specifies data type used to override fixed-point data types. Set by <b>Data type override</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'ScaledDouble'   'Double'   'Single'   'Off'
MinMaxOverflowLogging	No dialog box prompt  Setting for fixed-point instrumentation. Set by <b>Fixed-point instrumentation mode</b> on the Fixed-Point Tool.	{'UseLocalSettings'}   'MinMaxAndOverflow'   'OverflowOnly'   'ForceOff'
IsSubsystemVirtual		boolean — {'off'}   'on'  Read-only
Variant Subsystem (Subsystem)		
Variant	No dialog box prompt  Check if the subsystem is a Variant Subsystem block.	boolean — {'off'}   'on'  Read-only

Block (Type)/Parameter	Dialog Box Prompt	Values
VariantChoices	No dialog box prompt  List of variant choices in a Variant Subsystem block.	{ ' ' }  The value is an empty structure array if the block is not a Variant Subsystem block. Otherwise, the value is a structure array with fields: Name and BlockName.  Read-only
VariantControl	Variant control for the choice block of a Variant Subsystem block.	{ ' ' }  The value is an empty character vector if the block is not a variant choice. Otherwise, the value is the variant control for the choice block.
VariantControlMode	Specifies the mode used to determine the active variant choice.	{'expression'}   'label'   'sim codegen switching'
LabelModeActiveChoice	Specifies the variant control label of the active choice for the Variant Subsystem block when VariantControlMode is specified as label.	{ ' ' }  The value is an empty character vector if the VariantControlMode for the Variant Subsystem block is not label. Otherwise, the value is the variant control label for the active choice.
TreatAsGroupedWhenPropagatingVariantConditions	No dialog box prompt  Specifies if the subsystem is treated as a group when propagating variant conditions.	boolean — {'on'}   'off'
GeneratePreprocessorConditionals	No dialog box prompt  Specifies if all the choices are to be analyzed and if preprocessor conditionals should be generated.	boolean — {'off'}   'on'
PropagateVariantConditions	Specifies if variant conditions on the ports inside the Variant Subsystem block should be propagated outside the block.  <b>Note</b> Use the “Propagate conditions outside of variant subsystem” on page 1-0 parameter instead.	boolean — {'off'}   'on'
AllowZeroVariantControls	Specifies if the Variant Subsystem block is allowed to have no active choices.	boolean — {'off'}   'on'

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
Variant Activation Time	Specifies when the active choice of a Variant Subsystem block is set.  The <b>Variant activation time</b> parameter is available only when you set the <b>Variant control mode</b> parameter to expression or sim codegen switching.	{'update diagram'}   'update diagram analyze all choices'   'code compile'

## Signal Attributes Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Bus to Vector (BusToVector)		
Data Type Conversion (DataTypeConversion)		
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via back propagation'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'boolean'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
ConvertRealWorld	Input and output to have equal	{'Real World Value (RWV)'   'Stored Integer (SI)'}   'Stored Integer (SI)'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'}   'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
Data Type Conversion Inherited (Conversion Inherited) (masked subsystem)		
ConvertRealWorld	Input and Output to have equal	{'Real World Value'}   'Stored Integer'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
DoSatur	Saturate to max or min when overflows occur	{'off'}   'on'
Data Type Duplicate (DataTypeDuplicate)		
NumInputPorts	Number of input ports	{'2'}
Data Type Propagation (Data Type Propagation) (masked subsystem)		
PropDataTypeMode	1. Propagated data type	'Specify via dialog'   {'Inherit via propagation rule'}
PropDataType	1.1. Propagated data type (e.g., fixdt(1,16), fixdt('single'))	{'fixdt(1,16)'}   'fixdt('single')'

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
IfRefDouble	1.1. If any reference input is double, output is	{'double'}   'single'
IfRefSingle	1.2. If any reference input is single, output is	'double'   {'single'}
IsSigned	1.3. Is-Signed	'IsSigned1'   'IsSigned2'   {'IsSigned1 or IsSigned2'}   'TRUE'   'FALSE'
NumBitsBase	1.4.1. Number-of-Bits: Base	'NumBits1'   'NumBits2'   {'max([NumBits1 NumBits2])'}   'min([NumBits1 NumBits2])'   'NumBits1+NumBits2'
NumBitsMult	1.4.2. Number-of-Bits: Multiplicative adjustment	{'1'}
NumBitsAdd	1.4.3. Number-of-Bits: Additive adjustment	{'0'}
NumBitsAllowFinal	1.4.4. Number-of-Bits: Allowable final values	{'1:128'}
PropScalingMode	2. Propagated scaling	'Specify via dialog'   {'Inherit via propagation rule'}   'Obtain via best precision'
PropScaling	2.1. Propagated scaling: Slope or [Slope Bias] ex. 2 <sup>-9</sup>	{'2 <sup>-10</sup> '}
ValuesUsedBestPrec	2.1. Values used to determine best precision scaling	{'[5 -7]'}
SlopeBase	2.1.1. Slope: Base	'Slope1'   'Slope2'   'max([Slope1 Slope2])'   {'min([Slope1 Slope2])'}   'Slope1*Slope2'   'Slope1/Slope2'   'PosRange1'   'PosRange2'   'max([PosRange1 PosRange2])'   'min([PosRange1 PosRange2])'   'PosRange1*PosRange2'   'PosRange1/PosRange2'
SlopeMult	2.1.2. Slope: Multiplicative adjustment	{'1'}
SlopeAdd	2.1.3. Slope: Additive adjustment	{'0'}

Block (Type)/Parameter	Dialog Box Prompt	Values
BiasBase	2.2.1. Bias: Base	{'Bias1'}   'Bias2'   'max([Bias1 Bias2])'   'min([Bias1 Bias2])'   'Bias1*Bias2'   'Bias1/Bias2'   'Bias1+Bias2'   'Bias1-Bias2'
BiasMult	2.2.2. Bias: Multiplicative adjustment	{'1'}
BiasAdd	2.2.3. Bias: Additive adjustment	{'0'}
Data Type Scaling Strip (Scaling Strip) (masked subsystem)		
IC (InitialCondition)		
Value	Initial value	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Probe (Probe)		
ProbeWidth	Probe width	'off'   {'on'}
ProbeSampleTime	Probe sample time	'off'   {'on'}
ProbeComplexSignal	Detect complex signal	'off'   {'on'}
ProbeSignalDimensions	Probe signal dimensions	'off'   {'on'}
ProbeFramedSignal	Detect framed signal	'off'   {'on'}
ProbeWidthDataType	Data type for width	{'double'}   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'Same as input'
ProbeSampleTimeDataType	Data type for sample time	{'double'}   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'Same as input'
ProbeComplexityDataType	Data type for signal complexity	{'double'}   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'boolean'   'Same as input'
ProbeDimensionsDataType	Data type for signal dimensions	{'double'}   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'Same as input'
ProbeFrameDataType	Data type for signal frames	{'double'}   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'boolean'   'Same as input'
Rate Transition (RateTransition)		

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
Integrity	Ensure data integrity during data transfer	'off'   {'on'}
Deterministic	Ensure deterministic data transfer (maximum delay)	'off'   {'on'}
InitialCondition	Initial conditions	{'0'}
OutPortSampleTimeOpt	Output port sample time options	{'Specify'}   'Inherit'   'Multiple of input port sample time'
OutPortSampleTimeMultiple	Sample time multiple (>0)	{'1'}
OutPortSampleTime	Output port sample time	{'-1'}
<b>Signal Conversion (SignalConversion)</b>		
ConversionOutput	Output	{'Signal copy'}   'Virtual bus'   'Nonvirtual bus'
OutDataTypeStr	Data type	{'Inherit: auto'}   'Bus: <object name>'
OverrideOpt	Exclude this block from 'Block reduction' optimization	{'off'}   'on'
<b>Signal Specification (SignalSpecification)</b>		
Dimensions	Dimensions (-1 for inherited)	{'-1'}
VarSizeSig	Variable-size signal	{'Inherit'}   'No'   'Yes'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'boolean'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'   'Bus: <object name>'
BusOutputAsStruct	Require nonvirtual bus	{'off'}   'on'
Unit	Specify physical unit of the input signal to the block. For a list of acceptable units, see Allowed Units.	{'inherit'}   '<Enter unit>'
UnitNoProp	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	'<Enter unit>'

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
SignalType	Signal type	{'auto'}   'real'   'complex'
Weighted Sample Time (SampleTimeMath)		
TsampMathOp	Operation	'+'   '-'   '*'   '/'   {'Ts Only'}   '1/Ts Only'
weightValue	Weight value	{'1.0'}
TsampMathImp	Implement using	{'Online Calculations'}   'Offline Scaling Adjustment'
OutDataTypeStr	Output data type	{'Inherit via internal rule'}   'Inherit via back propagation'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'}   'on'
OutputDataTypeScaling Mode	Deprecated in R2009b	
DoSatur	Deprecated in R2009b	
Width (Width)		
OutputDataTypeScaling Mode	Output data type mode	{'Choose intrinsic data type'}   'Inherit via back propagation'   'All ports same datatype'
DataType	Output data type	{'double'}   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'

## Signal Routing Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Bus Assignment (BusAssignment)		
AssignedSignals	Elements that are being assigned	{ '' }
InputSignals	Elements in the bus	matrix — { '{' } }
Bus Creator (BusCreator)		
InheritFromInputs	Use names from inputs instead of from bus object	{ 'on' }   'off'  If set to 'on', overrides bus signal names from inputs. Otherwise, inherits bus signal names from a bus object.
Inputs	Number of inputs	{ '2' }
DisplayOption		'none'   'signals'   { 'bar' }
NonVirtualBus	Output as nonvirtual bus	{ 'off' }   'on'
OutDataTypeStr	Data type	{ 'Inherit: auto' }   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'boolean'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'   'Bus: <object name>'
Bus Selector (BusSelector)		
OutputSignals	Selected elements	character vector — in the form 'signal1,signal2'
OutputAsBus	Output as bus	{ 'off' }   'on'
InputSignals	Signals in bus	matrix — { '{' } }
Data Store Memory (DataStoreMemory)		
DataStoreName	Data store name	{ 'A' }
ReadBeforeWriteMsg	Detect read before write	'none'   { 'warning' }   'error'
WriteAfterWriteMsg	Detect write after write	'none'   { 'warning' }   'error'
WriteAfterReadMsg	Detect write after read	'none'   { 'warning' }   'error'
InitialValue	Initial value	{ '0' }
StateMustResolveToSignalObject	Data store name must resolve to Simulink signal object	{ 'off' }   'on'
DataLogging	Log Signal Data	'off'   { 'on' }
DataLoggingNameMode	Logging Name	{ 'SignalName' }   'Custom'
DataLoggingName	Logging Name	{ '' }
DataLoggingLimitDataPoints	Limit data points to last	'off'   { 'on' }
DataLoggingMaxPoints	Limit data points to last	non-zero integer {5000}

Block (Type)/Parameter	Dialog Box Prompt	Values
DataLoggingDecimateData	Decimation	'off'   {'on'}
DataLoggingLimitDataPoints	Decimation	non-zero integer {2}
StateStorageClass	Storage class	{'Auto'}   'Model default'   'ExportedGlobal'   'ImportedExtern'   'ImportedExternPointer'   'Custom'
StateSignalObject	Signal object class Storage class	Simulink.Signal object Object of a class that is derived from Simulink.Signal
RTWStateStorageTypeQualifier	Code generation type qualifier	{''}
VectorParams1D	Interpret vector parameters as 1-D	'off'   {'on'}
ShowAdditionalParam	Show additional parameters	{'off'}   'on'
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'boolean'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
SignalType	Signal type	{'auto'}   'real'   'complex'
Data Store Read (DataStoreRead)		
DataStoreElements	Corresponds to the parameters on the <b>Element Selection</b> tab of the block dialog box. See "Specification using the command line".	
DataStoreName	Data store name	{'A'}
SampleTime	Sample time	{'0'}
Data Store Write (DataStoreWrite)		
DataStoreElements	Corresponds to the parameters on the <b>Element Assignment</b> tab of the block dialog box. See "Specification using the command line".	

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
DataStoreName	Data store name	{'A'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
Demux (Demux)		
Outputs	Number of outputs	{'2'}
DisplayOption	Display option	'none'   {'bar'}
Environment Controller (Environment Controller) (masked subsystem)		
From (From)		
GotoTag	Goto tag	{'A'}
IconDisplay	Icon display	'Signal name'   {'Tag'}   'Tag and signal name'
Goto (Goto)		
GotoTag	Goto tag	{'A'}
IconDisplay	Icon display	'Signal name'   {'Tag'}   'Tag and signal name'
TagVisibility	Tag visibility	{'local'}   'scoped'   'global'
Goto Tag Visibility (GotoTagVisibility)		
GotoTag	Goto tag	{'A'}
Index Vector (MultiPortSwitch)		
DataPortOrder	Data port order	{'Zero-based contiguous'}   'One-based contiguous'   'Specify indices'
Inputs	Number of data ports	{'1'}
zeroidx	Deprecated in R2010a	
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all data port inputs to have the same data type	{'off'}   'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'}   'Inherit: Inherit via back propagation'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'

Block (Type)/Parameter	Dialog Box Prompt	Values
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnIntegerOverflow	Saturate on integer overflow	{'off'}   'on'
AllowDiffInputSizes	Allow different data input sizes (Results in variable-size output signal)	{'off'}   'on'
Manual Switch (Manual Switch) (masked subsystem)		
varsize	Allow different input sizes (Results in variable-size output signal)	{'off'}   'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
Merge (Merge)		
Inputs	Number of inputs	{'2'}
InitialOutput	Initial output	{'[]'}
AllowUnequalInputPortWidths	Allow unequal port widths	{'off'}   'on'
InputPortOffsets	Input port offsets	{'[]'}
Multiport Switch (MultiPortSwitch)		
DataPortOrder	Data port order	'Zero-based contiguous'   {'One-based contiguous'}   'Specify indices'
Inputs	Number of data ports	{'3'}
zeroidx	Deprecated in R2010a	
DataPortIndices	Data port indices	{'1,2,3'}
DataPortForDefault	Data port for default case	{'Last data port'}   'Additional data port'
DiagnosticForDefault	Diagnostic for default case	'None'   'Warning'   {'Error'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
InputSameDT	Require all data port inputs to have the same data type	{'off'}   'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'}   'Inherit: Inherit via back propagation'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'

Block (Type)/Parameter	Dialog Box Prompt	Values
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'}   'on'
AllowDiffInputSizes	Allow different data input sizes (Results in variable-size output signal)	{'off'}   'on'
Mux (Mux)		
Inputs	Number of inputs	{'2'}
DisplayOption	Display option	'none'   'signals'   {'bar'}
UseBusObject	For internal use	
BusObject	For internal use	
NonVirtualBus	For internal use	
Selector (Selector)		
NumberOfDimensions	Number of input dimensions	{'1'}
IndexMode	Index mode	'Zero-based'   {'One-based'}
IndexOptionArray	Index Option	'Select all'   {'Index vector (dialog)'}   'Index vector (port)'   'Starting index (dialog)'   'Starting index (port)'
IndexParamArray	Index	cell array
OutputSizeArray	Output Size	cell array
InputPortWidth	Input port size	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
IndexOptions	See the <b>IndexOptionArray</b> parameter for more information.	
Indices	See the <b>IndexParamArray</b> parameter for more information.	
OutputSizes	See the <b>IndexParamArray</b> parameter for more information.	
Switch (Switch)		
Criteria	Criteria for passing first input	{'u2 >= Threshold'}   'u2 > Threshold'   'u2 ~= 0'
Threshold	Threshold	{'0'}
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
SampleTime	Sample time (-1 for inherited)	{'-1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
InputSameDT	Require all data port inputs to have the same data type	{'off'}   'on'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit via internal rule'}   'Inherit: Inherit via back propagation'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
RndMeth	Integer rounding mode	'Ceiling'   'Convergent'   {'Floor'}   'Nearest'   'Round'   'Simplest'   'Zero'
SaturateOnInteger Overflow	Saturate on integer overflow	{'off'}   'on'
AllowDiffInputSizes	Allow different input sizes (Results in variable-size output signal)	{'off'}   'on'
Variant Source (VariantSource)		
VariantControls	Variant control	{'Variant'}   '(default)'
LabelModeActiveChoice	Label mode active choice	{''}
AllowZeroVariantControls	Allow zero active variant controls	{'off'}   'on'
ShowConditionOnBlock	Show variant condition on block	{'off'}   'on'
VariantActivationTime	Variant activation time	'update diagram'   'update diagram analyze all choices'   'code compile'
CompiledActiveVariantControl		string – {''}  The value is a empty string if no variant is active; or the name of the active variant. Compile the model before querying this property.
CompiledActiveVariantPort		string – {'-1'}  The value is -1 if no variant is active; or the index of the active variant. Compile the model before querying this property.
Variant Sink (VariantSink)		

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
VariantControls	Variant control	{'Variant'}   '(default)'
LabelModeActiveChoice	Label mode active choice	{''}
AllowZeroVariantControls	Allow zero active variant controls	{'off'}   'on'
ShowConditionOnBlock	Show variant condition on block	{'off'}   'on'
VariantActivationTime	Variant activation time	'update diagram'   'update diagram analyze all choices'   'code compile'
CompiledActiveVariantControl		string – {''}  The value is a empty string if no variant is active; or the name of the active variant. Compile the model before querying this property.
CompiledActiveVariantPort		string – {'-1'}  The value is -1 if no variant is active; or the index of the active variant. Compile the model before querying this property.
Vector Concatenate (Concatenate)		
NumInputs	Number of inputs	{'2'}
Mode	Mode	{'Vector'}   'Multidimensional array'

## Sinks Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Display (Display)		
Numeric display format	Format	{'short'}   'long'   'short_e'   'long_e'   'bank'   'hex (Stored Integer)'   'binary (Stored Integer)'   'decimal (Stored Integer)'   'octal (Stored Integer)'
Decimation	Decimation	{'1'}
Floating	Floating display	{'off'}   'on'
SampleTime	Sample time (-1 for inherited)	{'-1'}
Floating Scope (Scope)		
Floating		'off'   {'on'}
Location		vector — {'[376 294 700 533]'}
Open		{'off'}   'on'
NumInputPorts		Do not change this parameter with the command-line. To add inputs, use the signal selector button  .
TickLabels		'on'   'off'   {'OneTimeTick'}
ZoomMode		{'on'}   'xonly'   'yonly'
AxesTitles		character vector
Grid		'off'   {'on'}   'xonly'   'yonly'
TimeRange		{'auto'}
YMin		{'-5'}
YMax		{'5'}
SaveToWorkspace		{'off'}   'on'
SaveName		{'ScopeData'}
DataFormat		{'StructureWithTime'}   'Structure'   'Array'
LimitDataPoints		'off'   {'on'}
MaxDataPoints		{'5000'}
Decimation		{'1'}
SampleInput		{'off'}   'on'
SampleTime		{'0'}
Out1 (Output)		

Block (Type)/Parameter	Dialog Box Prompt	Values
Port	Port number	{'1'}
IconDisplay	Icon display	'Signal name'   {'Port number'}   'Port number and signal name'
BusOutputAsStruct	Output as nonvirtual bus in parent model	{'off'}   'on'
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
VarSizeSig	Variable-size signal	{'Inherit'}   'No'   'Yes'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'boolean'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'   'Bus: <object name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
SignalObject	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “Design Data Interface by Configuring Inport and Outport Blocks” (Simulink Coder).	Simulink.Signal object Object of a class that is derived from Simulink.Signal
StorageClass	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “Design Data Interface by Configuring Inport and Outport Blocks” (Simulink Coder).	{'Auto'}   'Model default'   'ExportedGlobal'   'ImportedExtern'   'ImportedExternPointer'   'Custom'
SignalName	Signal name	character vector
SignalType	Signal type	{'auto'}   'real'   'complex'
OutputWhenDisabled	Output when disabled	{'held'}   'reset'
InitialOutput	Initial output	{'[]'}

Block (Type)/Parameter	Dialog Box Prompt	Values
MustResolveToSignalObject	This parameter does not appear in the block dialog box. Use the Model Data Editor instead. See “For Signals”.	{'off'}   'on'
Scope (Scope)		
Floating		{'off'}   'on'
Location		vector — {'[188 390 512 629]'}
Open		{'off'}   'on'
NumInputPorts		Do not change this parameter with the set_param command. Instead, use the TimeScopeConfiguration object or <b>Number of Input Ports</b> parameter in the Scope block.
TickLabels		'on'   'off'   {'OneTimeTick'}
ZoomMode		{'on'}   'xonly'   'yonly'
AxesTitles		character vector
Grid		'off'   {'on'}   'xonly'   'yonly'
TimeRange		{'auto'}
YMin		{'-5'}
YMax		{'5'}
SaveToWorkspace		{'off'}   'on'
SaveName		{'ScopeData1'}
DataFormat		{'StructureWithTime'}   'Structure'   'Array'
LimitDataPoints		'off'   {'on'}
MaxDataPoints		{'5000'}
Decimation		{'1'}
SampleInput		{'off'}   'on'
SampleTime		{'0'}
Stop Simulation		
Terminator		
To File (ToFile)		
FileName	File name	{'untitled.mat'}
MatrixName	Variable name	{'ans'}
SaveFormat	Save format	{'Timeseries'}   'Array'
Decimation	Decimation	{'1'}

Block (Type)/Parameter	Dialog Box Prompt	Values
SampleTime	Sample time (-1 for inherited)	{'-1'}
To Workspace (ToWorkspace)		
VariableName	Variable name	{'simout'}
MaxDataPoints	Limit data points to last	{'inf'}
Decimation	Decimation	{'1'}
SampleTime	Sample time (-1 for inherited)	{'-1'}
SaveFormat	Save format	{'Timeseries'}   'Structure With Time'   'Structure'   'Array'
FixptAsFi	Log fixed-point data as a fi object	{'off'}   'on'

## Sources Library Block Parameters

Block (Type)/Parameter	Dialog Box Prompt	Values
Band-Limited White Noise (Band-Limited White Noise) (masked subsystem)		
Cov	Noise power	{' [0.1] '}
Ts	Sample time	{'0.1'}
seed	Seed	{' [23341] '}
VectorParams1D	Interpret vector parameters as 1-D	'off'   {'on'}
Chirp Signal (chirp) (masked subsystem)		
f1	Initial frequency	{'0.1'}
T	Target time	{'100'}
f2	Frequency at target time	{'1'}
VectorParams1D	Interpret vectors parameters as 1-D	'off'   {'on'}
Clock (Clock)		
DisplayTime	Display time	{'off'}   'on'
Decimation	Decimation	{'10'}
Constant (Constant)		
Value	Constant value	{'1'}
VectorParams1D	Interpret vector parameters as 1-D	'off'   {'on'}
SampleTime	Sampling time	{'Sample based'}   'Frame based'
OutMin	Output minimum	{'[]'}
OutMax	Output maximum	{'[]'}
OutDataTypeStr	Output data type	{'Inherit: Inherit from 'Constant value''}   'Inherit: Inherit via back propagation'   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'boolean'   'fixdt(1,16)'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'}
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
SampleTime	Sample time	{'inf'}
FramePeriod	Frame period	{'inf'}
Counter Free-Running (Counter Free-Running) (masked subsystem)		
NumBits	Number of Bits	{'16'}

Block (Type)/Parameter	Dialog Box Prompt	Values
tsamp	Sample time	{'-1'}
Counter Limited (Counter Limited) (masked subsystem)		
uplimit	Upper limit	{'7'}
tsamp	Sample time	{'-1'}
Digital Clock (DigitalClock)		
SampleTime	Sample time	{'1'}
Enumerated Constant (Enumerated Constant) (masked subsystem)		
OutDataTypeStr	Output data type	{'Enum: SLDemoSign'}
Value	Value	{'SLDemoSign.Positive'}   'SLDemoSign.Zero'   'SLDemoSign.Negative'
SampleTime	Sample time	{'inf'}
From File (FromFile)		
FileName	File name	{'untitled.mat'}
ExtrapolationBeforeFirstDataPoint	Data extrapolation before first data point	{'Linear extrapolation'}   'Hold first value'   'Ground value'
InterpolationWithinTimeRange	Data interpolation within time range	{'Linear interpolation'}   'Zero order hold'
ExtrapolationAfterLastDataPoint	Data extrapolation after last data point	{'Linear extrapolation'}   'Hold last value'   'Ground value'
SampleTime	Sample time	{'0'}
From Workspace (FromWorkspace)		
VariableName	Data	{'simin'}
OutDataTypeStr	Output Data type	{'Inherit: auto'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'boolean'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'   'Bus: <object name>'
SampleTime	Sample time	{'0'}
Interpolate	Interpolate data	'off'   {'on'}
ZeroCross	Enable zero-crossing detection	'off'   {'on'}
OutputAfterFinalValue	Form output after final data value by	{'Extrapolation'}   'Setting to zero'   'Holding final value'   'Cyclic repetition'

Block (Type)/Parameter	Dialog Box Prompt	Values
Ground		
In1 (Inport)		
Port	Port number	{'1'}
IconDisplay	Icon display	'Signal name'   {'Port number'}   'Port number and signal name'
BusOutputAsStruct	Output as nonvirtual bus	{'off'}   'on'
PortDimensions	Port dimensions (-1 for inherited)	{'-1'}
VarSizeSig	Variable-size signal	{'Inherit'}   'No'   'Yes'
SampleTime	Sample time (-1 for inherited)	{'-1'}
OutMin	Minimum	{'[]'}
OutMax	Maximum	{'[]'}
OutDataTypeStr	Data type	{'Inherit: auto'}   'double'   'single'   'int8'   'uint8'   'int16'   'uint16'   'int32'   'uint32'   'int64'   'uint64'   'boolean'   'fixdt(1,16,0)'   'fixdt(1,16,2^0,0)'   'Enum: <class name>'   'Bus: <object name>'
LockScale	Lock output data type setting against changes by the fixed-point tools	{'off'}   'on'
Unit	Specify physical unit of the input signal to the block. For a list of acceptable units, see Allowed Units.	{'inherit'}   '<Enter unit>'
UnitNoProp	Specify physical unit of the input signal to the block without propagation. For a list of acceptable units, see Allowed Units.	'<Enter unit>'
SignalType	Signal type	{'auto'}   'real'   'complex'
LatchByDelayingOutsideSignal	Latch input by delaying outside signal	{'off'}   'on'
LatchInputForFeedbackSignals	Latch input for feedback signals of function-call subsystem outputs	{'off'}   'on'
OutputFunctionCall	Output a function-call trigger signal	{'off'}   'on'
Interpolate	Interpolate data	'off'   {'on'}
Pulse Generator (DiscretePulseGenerator)		

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
PulseType	Pulse type	{'Time based'}   'Sample based'

vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay Enabled Resettable External IC (Unit Delay Enabled Resettable External Initial Condition) (masked subsystem)		
tsamp	Sample time	{'-1'}
Unit Delay External IC (Unit Delay External Initial Condition) (masked subsystem)		
tsamp	Sample time	{'-1'}
Unit Delay Resettable (Unit Delay Resettable) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay Resettable External IC (Unit Delay Resettable External Initial Condition) (masked subsystem)		
tsamp	Sample time	{'-1'}
Unit Delay With Preview Enabled (Unit Delay With Preview Enabled) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay With Preview Enabled Resettable (Unit Delay With Preview Enabled Resettable) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay With Preview Enabled Resettable External RV (Unit Delay With Preview Enabled Resettable External RV) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay With Preview Resettable (Unit Delay With Preview Resettable) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}
Unit Delay With Preview Resettable External RV (Unit Delay With Preview Resettable External RV) (masked subsystem)		
vinit	Initial condition	{'0.0'}
tsamp	Sample time	{'-1'}

**Additional Math: Increment - Decrement Library Block Parameters**

<b>Block (Type)/Parameter</b>	<b>Dialog Box Prompt</b>	<b>Values</b>
Decrement Real World (Real World Value Decrement) (masked subsystem)		
Decrement Stored Integer (Stored Integer Value Decrement) (masked subsystem)		
Decrement Time To Zero (Decrement Time To Zero) (masked subsystem)		
Decrement To Zero (Decrement To Zero) (masked subsystem)		
Increment Real World (Real World Value Increment) (masked subsystem)		
Increment Stored Integer (Stored Integer Value Increment) (masked subsystem)		

## Mask Parameters

### About Mask Parameters

This section lists parameters that describe masked blocks. You can use these descriptive parameters with `get_param` and `set_param` to obtain and specify the properties of a block mask.

The descriptive mask parameters listed in this section apply to all masks, and provide access to all mask properties. Be careful not to confuse these descriptive mask parameters with the mask-specific parameters defined for an individual mask in the Mask Editor **Parameters** pane.

See “Masking Fundamentals” and “Mask Editor Overview” for information about block masks and the Mask Editor.

## Mask Parameters

Parameter	Description/Prompt	Values
Mask	Turns mask on or off.	{'on'}   'off'
MaskCallbackString	Mask parameter callbacks that are executed when the respective parameter is changed on the dialog. Set by the <b>Dialog callback</b> field on the <b>Parameters</b> pane of the Mask Editor dialog box.  For more information, see “Mask Callback Code”.	pipe-delimited character vector {' '}
MaskCallbacks	Cell array version of MaskCallbackString.	cell array {' []'}
MaskDescription	Block description. Set by the <b>Mask description</b> field on the <b>Documentation</b> pane of the Mask Editor dialog box.	character vector {' '}
MaskDisplay	Drawing commands for the block icon. Set by the <b>Icon Drawing commands</b> field on the <b>Icon &amp; Ports</b> pane of the Mask Editor dialog box.	character vector {' '}
MaskEditorHandle	For internal use only.	
MaskEnableString	Option that determines whether a parameter is greyed out in the dialog. Set by the <b>Enable parameter</b> check box on the <b>Parameters</b> pane of the Mask Editor dialog box.	pipe-delimited character vector {' '}
MaskEnables	Cell array version of MaskEnableString.	cell array of character vectors, each either 'on' or 'off' {' []'}
MaskHelp	Block help. Set by the <b>Mask help</b> field on the <b>Documentation</b> pane of the Mask Editor dialog box.	character vector {' '}
MaskIconFrame	Set the visibility of the icon frame (Visible is on, Invisible is off). Set by the <b>Block Frame</b> option on the <b>Icon &amp; Ports</b> pane of the Mask Editor dialog box.	{'on'}   'off'
MaskIconOpaque	Set the transparency of the icon. Set by the <b>Icon Transparency</b> option on the <b>Icon &amp; Ports</b> pane of the Mask Editor dialog box.	{'opaque'}   'transparent'   'opaque-with-ports'

Parameter	Description/Prompt	Values
MaskIconRotate	Set the rotation of the icon (Rotates is on, Fixed is off). Set by the <b>Icon Rotation</b> option on the <b>Icon &amp; Ports</b> pane of the Mask Editor dialog box.	'on'   {'off'}
MaskIconUnits	Set the units for the drawing commands. Set by the <b>Icon Units</b> option on the <b>Icon &amp; Ports</b> pane of the Mask Editor dialog box.	'pixel'   {'autoscale'}   'normalized'
MaskInitialization	Initialization commands. Set by the <b>Initialization commands</b> field on the <b>Initialization</b> pane of the Mask Editor dialog box.	MATLAB command {' '}
MaskNames	Cell array of mask dialog parameter names. Set inside the <b>Variable</b> column in the <b>Parameters</b> pane of the Mask Editor dialog box.	matrix {' []'}
MaskPortRotate	Specify the port rotation policy for the masked block. Set in the <b>Port Rotation</b> area on the <b>Icon &amp; Ports</b> pane of the Mask Editor dialog box.  For more information, see “Configure Model Layout”.	{'default'}   'physical'
MaskPrompts	List of dialog parameter prompts (see below). Set inside the <b>Dialog parameters</b> area on the <b>Parameters</b> pane of the Mask Editor dialog box.	cell array of character vectors {' []'}
MaskPromptString	List of dialog parameter prompts (see below). Set inside the <b>Dialog parameters</b> area on the <b>Parameters</b> pane of the Mask Editor dialog box.	character vector {' '}
MaskPropertyName	Pipe-delimited version of MaskNames.	character vector {' '}
MaskRunInitForIconRedraw	Specifies whether Simulink must run mask initialization before executing the mask icon commands.	{'auto'}   'on'   'off'
MaskSelfModifiable	Indicates that the block can modify itself. Set by the <b>Allow library block to modify its contents</b> check box on the <b>Initialization</b> pane of the Mask Editor dialog box.	'on'   {'off'}

Parameter	Description/Prompt	Values
MaskStyles	Determines whether the dialog parameter is a check box, edit field, or pop-up list. Set by the <b>Type</b> column in the <b>Parameters</b> pane of the Mask Editor dialog box.	cell array {' [] '} edit, checkbox, popup, combobox, radiobutton, slider, dial, spinbox, unit, textarea, customtable, unidt, min, max.
MaskStyleString	Comma-separated version of MaskStyles.	character vector { ' ' }
MaskTabNameString	For internal use only.	
MaskTabNames	For internal use only.	
MaskToolTipsDisplay	Determines which mask dialog parameters to display in the tooltip for this masked block. Specify as a cell array of 'on' or 'off' values, each of which indicates whether to display the parameter named at the corresponding position in the cell array returned by MaskNames.	cell array of 'on' and 'off' {''}
MaskToolTipString	Comma-delimited version of MaskToolTipsDisplay.	character vector { ' ' }
MaskTunableValues	Allows the changing of mask dialog values during simulation. Set by the <b>Tunable</b> column in the <b>Parameters</b> pane of the Mask Editor dialog box.	cell array of character vectors { ' [] ' }
MaskTunableValueString	Comma-delimited character vector version of MaskTunableValues.	delimited character vector { ' ' }
MaskType	Mask type. Set by the <b>Mask type</b> field on the <b>Documentation</b> pane of the Mask Editor dialog box.	character vector { 'Stateflow' }
MaskValues	Dialog parameter values.	cell array { ' [] ' }
MaskValueString	Delimited character vector version of MaskValues.	delimited character vector { ' ' }
MaskVarAliases	Specify aliases for a block's mask parameters. The aliases must appear in the same order as the parameters appear in the block's MaskValues parameter.	cell array { ' [] ' }
MaskVarAliasString	For internal use only.	
MaskVariables	List of the dialog parameters' variables (see below). Set inside the <b>Dialog parameters</b> area on the <b>Parameters</b> pane of the Mask Editor dialog box.	character vector { ' ' }

Parameter	Description/Prompt	Values
MaskVisibilities	Specifies visibility of parameters. Set with the <b>Show parameter</b> check box in the <b>Options for selected parameter</b> area on the <b>Parameters</b> pane of the Mask Editor dialog box.	matrix {' []'}
MaskVisibilityString	Delimited character vector version of MaskVisibilities.	character vector {' '}
MaskWSVariables	List of the variables defined in the mask workspace (read only).	matrix {' []'}

See Control Masks Programmatically, for more information on setting the mask parameters from the MATLAB command line.

## Breakpoints List

View, configure, and manage breakpoints for debugging models

### Description

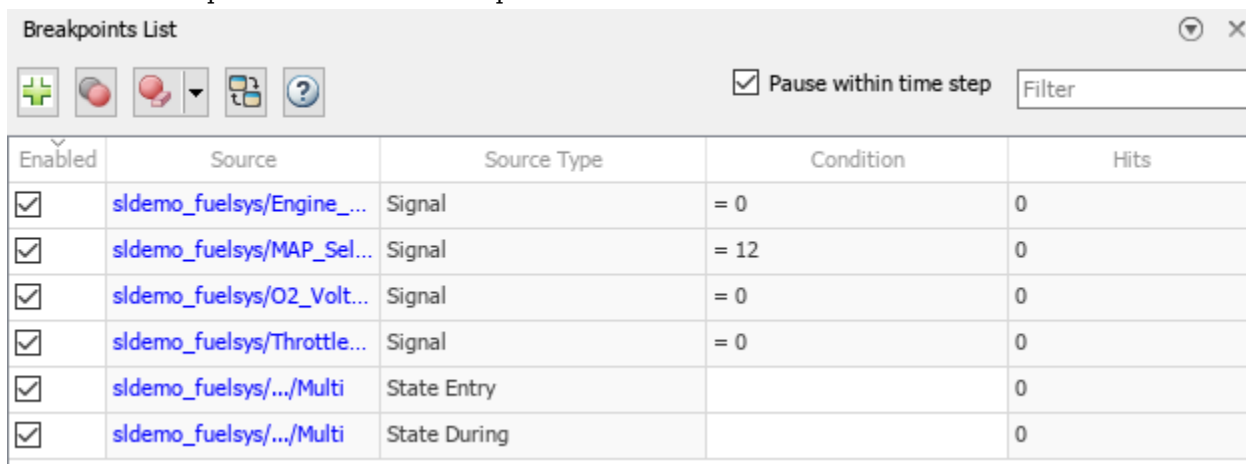

The Breakpoints List provides information about all breakpoints configured in your model, including breakpoints in Stateflow charts and source code for MATLAB Function blocks. The Breakpoints List displays breakpoints configured throughout the model hierarchy.

Using the Breakpoints List, you can:

- View all breakpoints in the model along with breakpoint information, such as the breakpoint source.
- Navigate to the location of each breakpoint in the model hierarchy.
- Enable and disable individual breakpoints or all breakpoints.
- Delete breakpoints.
- Specify when the simulation pauses after encountering the condition for a breakpoint.

By default, the simulation pauses within a time step as soon as the condition for a breakpoint is met. When you pause within time steps, you can step through the simulation one block at a time. Pausing within a time step gives you more granular control over how to progress the simulation and facilitates debugging iterative subsystems.

Breakpoints are not saved as part of the model.

Enabled	Source	Source Type	Condition	Hits
<input checked="" type="checkbox"/>	sldemo_fuelsys/Engine_...	Signal	= 0	0
<input checked="" type="checkbox"/>	sldemo_fuelsys/MAP_Sel...	Signal	= 12	0
<input checked="" type="checkbox"/>	sldemo_fuelsys/O2_Volt...	Signal	= 0	0
<input checked="" type="checkbox"/>	sldemo_fuelsys/Throttle...	Signal	= 0	0
<input checked="" type="checkbox"/>	sldemo_fuelsys/.../Multi	State Entry		0
<input checked="" type="checkbox"/>	sldemo_fuelsys/.../Multi	State During		0

### Open the Breakpoints List

- Simulink Toolstrip: On the **Debug** tab, click **Breakpoints List**.
- Simulink Editor: Click the breakpoint icon on a signal that has a breakpoint.

When you open the Breakpoints List by clicking a breakpoint, the row for the breakpoint you clicked is highlighted purple in the table.

## Examples

### Add Signal Breakpoints

A signal breakpoint causes the simulation to pause when the signal value satisfies the specified condition.

Add a signal breakpoint using the Simulink Toolstrip.

- 1 Select a signal in your model.
- 2 On the **Debug** tab, click **Add Breakpoint**.
- 3 In the Add Breakpoint dialog box, specify the condition for the breakpoint. From the drop-down list, select the relational operator for the condition. Then, in the text box, specify the value.

For example, to pause the simulation when the signal value is equal to 0, select the equals (=) relational operator and enter 0 in the text box.

- 4 Click **OK**.

The red circle on the signal line indicates that a breakpoint is configured for that signal.

Add another breakpoint using the context menu for the signal.

- 1 Select a signal in the model.
- 2 Right-click the selected signal.
- 3 From the context menu, select **Add Breakpoint**
- 4 In the Add Breakpoint dialog box, specify the condition for the breakpoint.

For example, to pause the simulation when the signal value is greater than 5, select the greater than (>) relational operator and enter 5 in the text box.

- 5 Click **OK**.

### View and Manage Breakpoints

After adding breakpoints to your model, you can use the Breakpoints List to view and manage the breakpoints throughout your model.

To open the Breakpoints List, on the **Debug** tab, click **Breakpoints List**. The Breakpoints List opens docked at the bottom of the Simulink Editor. The table lists all the breakpoints configured in the model hierarchy, including breakpoints in Stateflow charts, along with information about each breakpoint.

Enabled	Source	Source Type	Condition	Hits
<input checked="" type="checkbox"/>	sldemo_fuelsys/Engine_...	Signal	= 0	0
<input checked="" type="checkbox"/>	sldemo_fuelsys/MAP_Sel...	Signal	= 12	0
<input checked="" type="checkbox"/>	sldemo_fuelsys/O2_Volt...	Signal	= 0	0
<input checked="" type="checkbox"/>	sldemo_fuelsys/Throttle...	Signal	= 0	0
<input checked="" type="checkbox"/>	sldemo_fuelsys/.../Multi	State Entry		0
<input checked="" type="checkbox"/>	sldemo_fuelsys/.../Multi	State During		0

Using the Breakpoints List, you can enable and disable individual breakpoints or all breakpoints. The simulation pauses when the condition for an enabled breakpoint is met and ignores disabled breakpoints. You can enable and disable breakpoints during and between debugging sessions. To enable or disable an individual breakpoint, use the check box in the **Enabled** column of the table. To enable or disable all breakpoints in the model hierarchy, click Enable or disable all breakpoints

The table summarizes how a breakpoint appears in the block diagram based on its status.

Breakpoint Appearance	Breakpoint Status
	Enabled
	Hit
	Disabled
	Invalid

You can also delete breakpoints.

- To delete an individual breakpoint, pause on the row for the breakpoint, then click Delete breakpoint .
- To delete multiple breakpoints, select the breakpoints to delete in the table. Then, click Delete selected breakpoints .
- To delete all breakpoints, click the Delete selected breakpoints button arrow and select **Delete all breakpoints**.

Breakpoints are not saved as part of the model.

### Navigate to Breakpoints in Model

Using the Breakpoints List, you can navigate easily to each breakpoint in the model and determine which row of the Breakpoints List contains information about a given breakpoint.

To navigate to a specific breakpoint from the Breakpoints List, click the hyperlink for the breakpoint in the table. A new tab opens in the Simulink Editor to show the component that contains the breakpoint. The source for the breakpoint is highlighted purple.

The screenshot displays the Simulink Editor interface for the 'Fuel Rate Control Subsystem'. The model includes several blocks: 'sensors', 'control\_logic', 'airflow\_calc', and 'fuel\_calc'. A signal line from the 'control\_logic' block to the 'fuel\_calc' block is highlighted in purple. Below the model, the 'Breakpoints List' window is open, showing a table of breakpoints. The row for 'sldemo\_fuelsys/fuel\_rate\_control/control\_logic:3' is highlighted in purple, indicating it is the selected breakpoint.

Enabled	Source	Source Type	Condition	Hits
<input checked="" type="checkbox"/>	<a href="#">sldemo_fuelsys/Engine_Speed_Selector:1</a>	Signal	= 0	0
<input checked="" type="checkbox"/>	<a href="#">sldemo_fuelsys/MAP_Selector:1</a>	Signal	= 12	0
<input checked="" type="checkbox"/>	<a href="#">sldemo_fuelsys/O2_Voltage_Selector:1</a>	Signal	= 0	0
<input checked="" type="checkbox"/>	<a href="#">sldemo_fuelsys/Throttle_Angle_Selector:1</a>	Signal	= 0	0
<input checked="" type="checkbox"/>	<a href="#">sldemo_fuelsys/fuel_rate_control/control_logic:3</a>	Signal	> 1	0
<input checked="" type="checkbox"/>	<a href="#">sldemo_fuelsys/.../Multi</a>	State Entry		0
<input checked="" type="checkbox"/>	<a href="#">sldemo_fuelsys/.../Multi</a>	State During		0

To get more information about a breakpoint you find as you navigate through your model, click the breakpoint . The row for that breakpoint in the Breakpoints List is highlighted purple.

- “Debug Simulation Using Signal Breakpoints”
- “Debug Simulation of Iterator Subsystem”
- “Step Through Simulation”
- “Display Port Values for Debugging”
- “How Fast Restart Improves Iterative Simulations”

## Parameters

### Debugging Behavior

**Pause within time step** — Option to disable low-level debugging  
on (default) | off

By default, models are configured to enable low-level debugging, where the simulation pauses within a time step, as soon as the condition for a breakpoint is met. When you clear this parameter, the simulation pauses at the end of the time step where the condition for a breakpoint is met.

Low-level debugging is supported only for normal mode simulations. This option has no effect on accelerator and rapid accelerator simulations.

When you enable low-level debugging, you have more options on the **Debug** tab for controlling how to step through the simulation.

Stepping Option	Description	Availability
<p><b>Continue</b></p> 	Run until breakpoint pauses simulation.	Always available
<p><b>Step Forward</b></p> 	Progress simulation to the end of the next time step.	
<p><b>Step Back</b></p> 	<p>Step simulation to the start of the previous time step.</p> <p>To use this option, you must enable stepping back before starting the simulation. For more information, see <b>Simulation Stepping Options</b>.</p>	Available only when you enable stepping back using the <b>Simulation Stepping Options</b>
<p><b>Step Over</b></p> 	Step simulation to just before the next block output method executes.	
<p><b>Step In</b></p> 	<p>Step into Model block, atomic subsystem, MATLAB Function block, or Stateflow chart.</p> <p>When the next block to execute is not a Model block, atomic subsystem, or MATLAB Function block and the simulation is not paused on a Stateflow chart, the <b>Step In</b> button takes the same action as the <b>Step Over</b> button.</p>	Available only when paused within a time step

Stepping Option	Description	Availability
<b>Step Out</b>  Step Out	Steps out of Model block, atomic subsystem, or Stateflow chart.  When the next block to execute is not a Model block or atomic subsystem and the simulation is not paused on a Stateflow chart, the <b>Step In</b> button takes the same action as the <b>Step Over</b> button.	

**Active breakpoints** — Option to enable and disable breakpoints  
on (default) | off

Using the check box next to each breakpoint in the Breakpoints List, you can enable and disable individual breakpoints during and between debugging sessions. When the check box is selected, the breakpoint is active, and the simulation pauses when the condition for the breakpoint is met. When the check box is cleared, the breakpoint is inactive, and the simulation does not pause because of that breakpoint.

To enable or disable all breakpoints configured in the model, click Enable or disable all breakpoints .

### Signal Breakpoints

**Signal breakpoint** — Breakpoints configured for one or more signals in model  
Simulink signal breakpoint

The Breakpoints List contains a row for each signal breakpoint you configure in the model. Each signal breakpoint has a condition, and the simulation pauses when the signal value satisfies that condition. The condition consists of a relational operator, such as equals (=) or greater than (>), and a value. For example, for a signal breakpoint condition of > 1, the simulation pauses when the signal value is greater than one.

Signal breakpoints are supported for only Simulink signals and are not supported for other types of signals, such as Simscape signals.

Signal breakpoints are supported only for real scalar signals with these data types:

- double
- single
- int
- Boolean
- Fixed-point

For fixed-point signals, the software uses the converted double signal value to check for the breakpoint condition.

These additional limitations for port value labels also apply for signal breakpoints “Port Value Label Limitations”.

## Model Breakpoints

**Zero crossing** — Option to pause simulation when zero crossing detected  
off (default) | on

By default, no model breakpoints are configured for a model. To add the zero-crossing breakpoint to a model, on the **Debug** tab, click the button arrow next to **Add Breakpoint** and select **Zero Crossing**. After you add the zero-crossing breakpoint, you can enable and disable the zero-crossing breakpoint from the Breakpoints List during and between debugging sessions for the model.

When the simulation pauses due to an active zero-crossing breakpoint, the Simulink Editor opens a tab to display the subsystem or model that contains the block where the zero crossing occurred and highlights the block in green.

**NaN or Inf Value** — Option to pause simulation when nonfinite value computed  
off (default) | on

By default, no model breakpoints are configured for a model. To add the NaN or Inf value breakpoint to a model, on the **Debug** tab, click the button arrow next to **Add Breakpoint** and select **NaN or Inf Value**. After you add the NaN or Inf value breakpoint, you can enable and disable the NaN or Inf value breakpoint from the Breakpoints List during and between debugging sessions for the model.

When the NaN or Inf value breakpoint is enabled for a model, the simulation pauses when a computation results in a NaN or Inf value. NaN or Inf values can occur when the computation result is infinite or outside of the range of values supported by the machine running the simulation.

When the simulation pauses due to an active NaN or Inf breakpoint, the Simulink Editor opens a tab to display the subsystem or model that contains the block where the NaN or Inf value occurred and highlights the block in green.

Use the NaN or Inf value breakpoint to help locate the site of computational errors in a model.

## Tips

- For debugging in simulation, use normal mode.
- To view signal values in the model while debugging, use port value labels. To add a port value label for a signal, select the signal. Then, on the **Debug** tab, in the **Tools** section, next to **Output Values**, click Show Output Value of selected signal . For more information, see “Display Port Values for Debugging”.
- To save time when iteratively debugging, consider enabling fast restart. With fast restart enabled, the model compiles only the first time you simulate. Subsequent simulations take less time by skipping the compilation phase. While fast restart is enabled, you can modify the model only in ways that do not require compiling the model. For more information, see “How Fast Restart Improves Iterative Simulations”.
- While paused within a time step, you can use some of the programmatic debugging functions, including the `disp` function, to get more information about the system behavior.
- By default, the Breakpoints List opens as a pane at the bottom of the Simulink Editor. You can reposition the Breakpoints List to suit your workflow.
  - To dock the Breakpoints List to a different part of the Simulink Editor, drag the pane to another part of the window.

- To minimize the Breakpoints List, click the arrow  in the upper right and select **Minimize**.
- To use the Breakpoints List as a separate window, drag the pane out of the Simulink Editor or click the arrow  in the upper right and select **Undock**.
- The stepping and breakpoint options in the Simulink Editor do not have a programmatic equivalent available in the software. The Simulink debugging programmatic interface includes options for setting breakpoints and stepping through simulations. However, the behavior of these functions is not identical to the behavior of the stepping options in the Simulink Editor. For more information about programmatic debugging, see “Simulink Debugging Programmatic Interface”.

## Create Signal

Create signal in Live Editor

### Description

The **Create Signal** task lets you create numerical, logical, and enumeration data. The task automatically generates MATLAB code for your live script.

Using this task, you can interactively draw and refine numerical data values for vectors, timeseries, timetables, and data arrays using:

- Pointer
- Keyboard
- Touchscreen

By default, the live task creates a workspace variable, `createdSignal`.

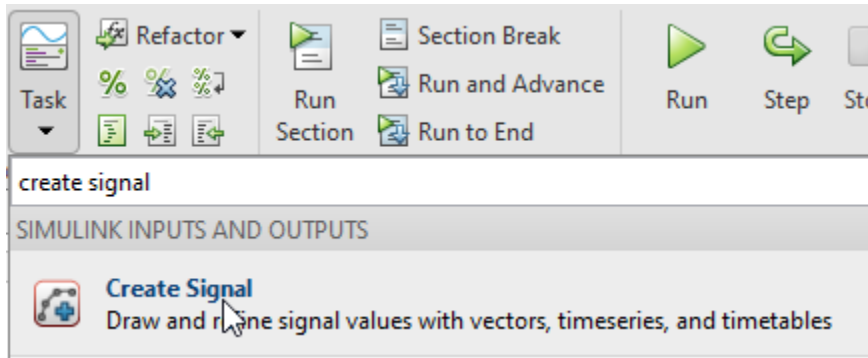

For general information about Live Editor tasks, see “Add Interactive Tasks to a Live Script”.

## Open the Task

To add the **Create Signal** task to a live script in the MATLAB Editor:

- On the Live Editor tab, select **Task > Create Signal**.
- In a code block in the script, type a relevant keyword, such as `create signal`, `vector`, `timeseries`, `timetable`, `input`, `signal`, or `source`. From the selected completions, select **Create Signal**.

## Parameters

**Select type of signal** — Type of data to create

Numerical | Logical | Enumeration

Type of data to create, specified as Numerical, Logical, or Enumeration.

**Select output format** — Type of created data

Timeseries (default) | Data array | Timeseries | Timetable | Vector

Data type of the created data, specified as Timeseries, Data array, Timeseries, and Timetable.

**Create signal values** — Options to interactively create signals

palette of mouse and touchscreen actions

Interactively create signals using the palette of mouse and touchscreen actions. The interactively created data is plotted in the plot area. You can refine this data or create new data by:

- Editing the data in the **Time Data** table using the keyboard
- Manipulating the points in the plot using the pointer or touchscreen

Action	Keyboard	Pointer	Multi-Touch
Insert point	<b>Ctrl+P</b>	Click 	Tap
Insert line	<b>Ctrl+L</b>	Click 	Pan and pinch
Select a point	<b>Ctrl+T</b>	Click  , then click and select point or area  To select all areas, double-click	Pan and pinch  To select all areas, double-tap
Move a point	<b>Ctrl+M</b>	Click  and drag	Tap and move
Continuously delete points on a line		Click 	

Action	Keyboard	Pointer	Multi-Touch
Draw		Click 	Pan
Zoom in, zoom out		Click  or 	
Home		Click 	
Pan in x-axis, y, and x- and y-axes		Click 	
Expand along x-axis	<b>Ctrl</b> +pointer pan		Pry x-axis
Expand along y-axis	<b>Shift</b> +pointer pan		Pry y-axis
Snap X or Y to tick			
Snap X or Y to grid			

**Advanced properties** — Advanced properties for data  
 Row | Column | variable name | time unit | enumeration

Set up the properties for your data. The data properties depend on the **Select type of signal** and **Select output format** settings. Depending on these settings, you can set properties such as:

- Vector type
- Data type
- Variable names
- Time units

**Plot** — Option to plot data  
 off | on

To plot the data, select the **Plot** check box. The plot displays to the right.

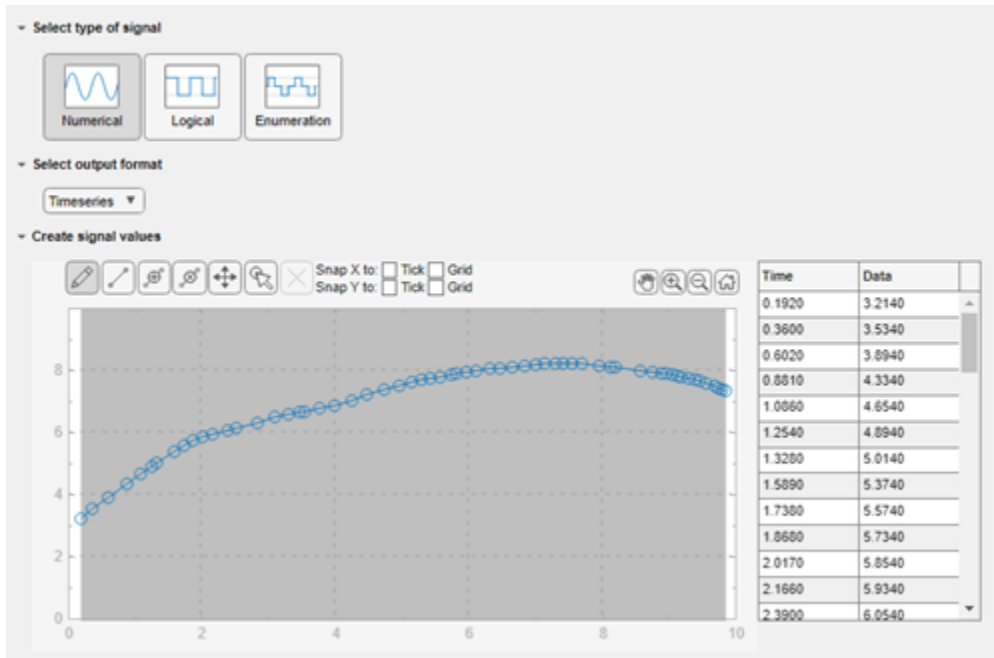

## Examples

### Create Signals Using Live Editor Task

This example shows how to use the **Create Signal** Live Editor task to create numerical data by drawing an arc. By default, **Create Signal** creates a variable named `createdSignal` in the workspace with a numerical signal type and outputs data in the `timeseries` format.

In the **Create signal values** section, click  , then left-click and drag to create a line of data points.

To the right of the window, observe the time and data points that result from the drawing.

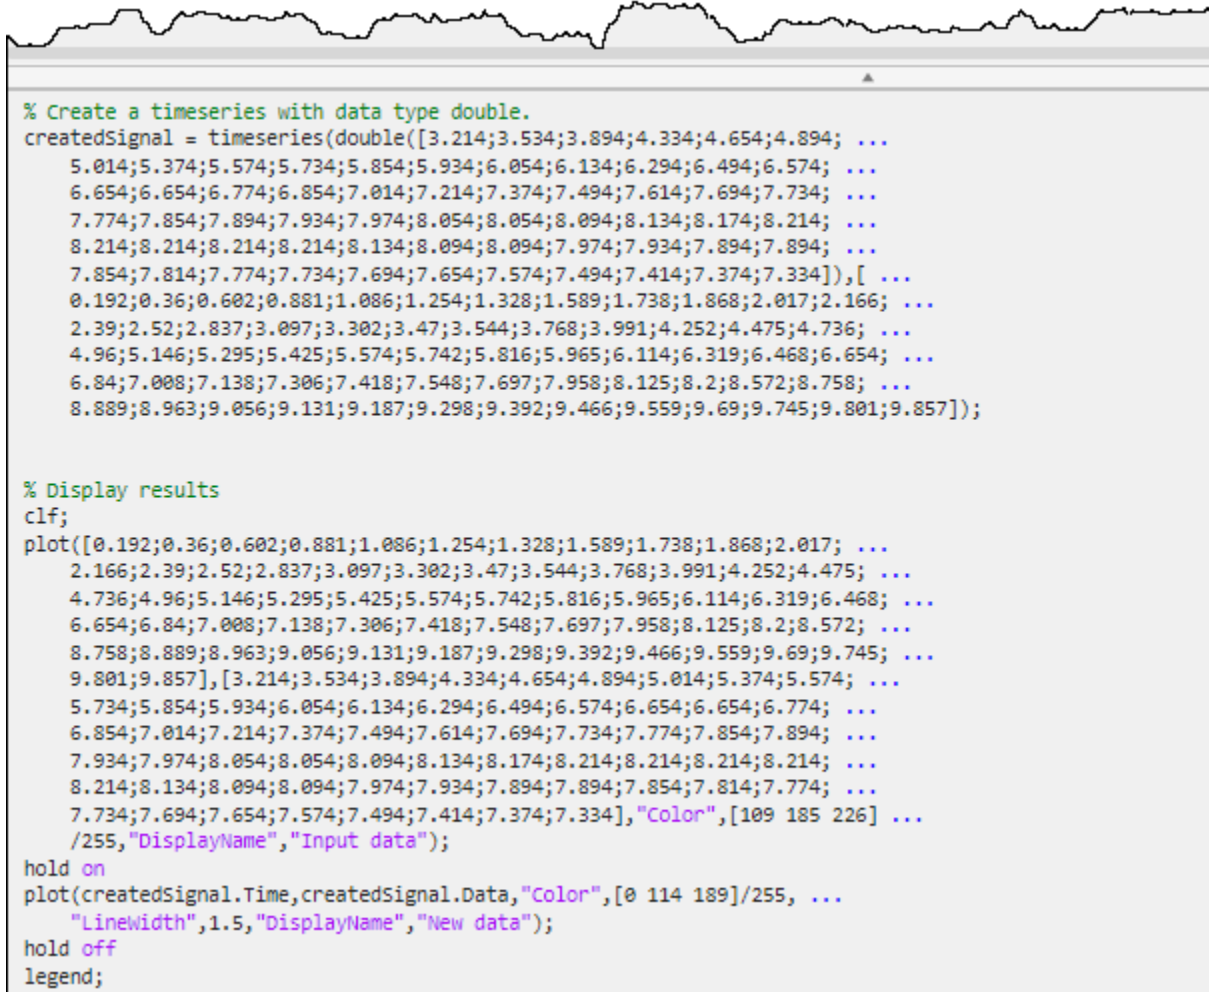

To view a plot of the line, in the **Display results** section, click **Plot**. The plot displays to the right.

To see the code that this task generates, expand the task display by clicking  at the bottom of the task parameter area.

You can use the `createdSignal` timeseries object data in many of the cases where you want to input data, for example, to import to Root Inport Mapper or to work with source blocks. To save this task, save the live script.

### Create Signals Using Live Editor Task for Input Port

This example shows how to use the **Create Signal** Live Editor task to create numerical data for an inport port in a model. by drawing an arc. By default, **Create Signal** creates a variable named `createdSignal` in the workspace with a numerical signal type and outputs data in the `timeseries` format.

In the **Create signal values** section, click , then left-click and drag to create a line of data points.

To the right of the window, observe the time and data points that result from the drawing.

To view a plot of the line, in the **Display results** section, click **Plot**. The plot displays to the right.

At the bottom of the live task, add the code to open the CreateSignalInport model, set the createdSignal variable to the input, load the input from the workspace, and simulate the model.

```

 Plot

model = "CreateSignalInport";
open_system(model);

set_param('CreateSignalInport','ExternalInput','createdSignal');
set_param('CreateSignalInport','LoadExternalInput','on');
sim("CreateSignalInport.slx");

```

In the live task, click **Run**.

In the model, open the Scope block.

# MATLAB Function Block Editor

Create, edit, and debug MATLAB code in MATLAB Function blocks

## Description

The **MATLAB Function Block Editor** allows you to view, edit, and create the MATLAB functions for a MATLAB Function block. When you update the MATLAB code, the software updates the MATLAB Function block with input and output ports that match the input and output arguments in the MATLAB function. The **MATLAB Function Block Editor** opens in the **Simulink Editor**.

## Open the MATLAB Function Block Editor

- Double-click a MATLAB Function block.
- Select a MATLAB Function block and, in the **Function** tab, click **Open in Simulink**.

## Examples

## Open and Use the MATLAB Function Block Editor

Add a MATLAB Function to your model to open the **MATLAB Function Block Editor**.

- 1 In the **Simulation** tab, click **Library Browser**. Select **Simulink > User-Defined Functions**. Drag a MATLAB Function block to the Simulink canvas.
- 2 Double-click the block to open the **MATLAB Function Block Editor**. Replace the function body code with the following:

```
y = 2*u;
```

- 3 Return to the model by clicking the Up to Parent button . Add a Sine Wave block as the input signal and add a Scope block to capture the input and output of the MATLAB Function block.

- 4 Run the simulation and open the Scope block to see the effects of the code.

## Redefine the Function Header

Rename the default function and adjust function arguments to automatically update the block inports, outports, and block icon.

- 1 Create a new MATLAB Function block and open the **MATLAB Function Block Editor**.
- 2 In the function header, change the text to:
 

```
function [x y] = test_function(u1, u2)
```
- 3 Return to the model window. The name on the block icon is now `test_function`, and the block has two input ports for **u1** and **u2**, and two output ports **x** and **y**.

## Add Variables with the Symbols Pane

Add function arguments and content to the MATLAB Function block by using the **Symbols** pane.

- 1 Create a new MATLAB Function block and double-click the block to open the **MATLAB Function Block Editor**.
- 2 Open the **Symbols** pane and Property Inspector. In the **Function** tab, click **Edit Data**.
- 3 In the **Symbols** pane, click the Create Data button .
- 4 Select the new data and adjust the properties in the Property Inspector.

For more information, see “Create and Define MATLAB Function Block Variables”.

## Add Breakpoints to Debug a Function

You can add breakpoints to debug MATLAB Function blocks.

- 1 Create a new MATLAB Function block and open the **MATLAB Function Block Editor**.
- 2 Enter the following code:

```
function [mult,add,subtract] = number_operations(u1,u2)

add = u1 + u2;
subtract = u1 - u2;
mult = u1 * u2;
```

- 3 Click line numbers 3 and 4 to add two breakpoints. The line numbers highlight in red.
- 4 Run the simulation. The simulation stops at the first breakpoint. Click the **Continue** button to simulate until the next breakpoint. If the last breakpoint has been reached, click **Continue** to advance to the next time step.

## Investigate Code by Running a Report

Run a report on your MATLAB function code to find information on variables and help detect warnings and errors.

- 1 Create a new MATLAB Function block and open the **MATLAB Function Block Editor**.
- 2 Enter the following code:

```
function [mult,add,subtract] = number_operations(u1,u2)

add = u1 + u2;
subtract = u1 - u2;
mult = u1 * u2;
```

- 3 Click the Function Report button .
- 4 The report lists variables in the **Variables** tab at the bottom. Click any of the variable names to highlight instances where the variable appears in the code.
- 5 In the function code, point to or click any variable or expression to see a dialog box with more information.
  - “Debug MATLAB Function Blocks”
  - “Implement MATLAB Functions in Simulink with MATLAB Function Blocks”
  - “Call MATLAB Function Files in MATLAB Function Blocks”

## Parameters

### Prepare

**Edit Data** — Opens the Symbols pane and Property Inspector button

Opens the **Symbols** pane and the Property Inspector. Click the button to define function variables and edit properties.

## Navigate

**Go To** — Goes to specified code  
button

Goes to specified code, including functions and line numbers.

**Find** — Finds and replaces code in function  
button

Finds specified text written in the **MATLAB Function Block Editor**. You can also use the **Ctrl+F** keyboard shortcut. If you want to find and replace code, use the **Ctrl+H** keyboard shortcut. This parameter has the same functionality as the MATLAB Editor. For more information, see “Find and Replace Text in Files and Go to Location”.

## Code

**Refactor** — Converts selected code to a function  
button

Converts selected code to a function. Use this feature on code that is not already contained in a function. You can create a separate file for the function code or you can convert code into a local function.

- 1 To convert code and save it in a separate m-file, select the code and click **Refactor > Convert to Function**. The code saves as a m-file and the **MATLAB Function Block Editor** calls the code by the name you specify. To run the model without error, the m-file must be on the path.
- 2 To convert code into a local function, select the code and click **Refactor > Convert to Local Function**. The **MATLAB Function Block Editor** creates a local function at the bottom of the code and replaces the selected code with a function call to the local function.

**Comment** — Comments out code  
button

Comments out code. Select the lines you want to comment and click the Comment button . The button adds one % to the selected lines each time you press it. You can also select the code and use the **Ctrl+R** keyboard shortcut.

**Uncomment** — Removes comments from code  
button

Removes comments from code. Select the lines you want to uncomment and click the Uncomment button . The button removes one % from the selected lines each time you press it. You can also select the code and use the **Ctrl+T** keyboard shortcut.

**Wrap Comments** — Wraps comments  
button

Wraps comments. Select the lines you want to comment and click the Wrap comments button .

The **MATLAB Function Block Editor** does not wrap comments with:

- 1 Code section titles (comments that begin with %%).
- 2 Long contiguous text, such as URLs.
- 3 Bulleted list items (text that begins with \* or #) onto the preceding line.

**Smart Indent** — Formats code with smart indenting  
button

Formats code with smart indenting. Smart indenting automatically formats code to improve code readability, such as when you use functions or logical statements. To manually deploy smart

indenting, select the lines of code and click the Smart Indent button . By default, the **MATLAB Function Block Editor** automatically uses smart indenting. For more information, see “Edit and Format Code”.

**Increase Indent** — Increases the code indent  
button

Increases the code indent by one tab indent. To increase the indent, select the lines of code and click the Increase Indent button .

**Decrease Indent** — Decreases the code indent  
button

Decreases the code indent by one tab indent if the code is indented. To decrease the indent, select the lines code and click the Decrease Indent button .

**Specify fixed-point data** — Builds fi object constructors  
button

Builds fi object constructors with a user interface. To open the interface, click the Specify fixed-point data button . Click the arrow next to the icon to select additional fi constructors. For more information, see “Building fimath Object Constructors in a GUI” (Fixed-Point Designer). This features requires a Fixed-Point Designer license.

## Compile

**Update Model** — Updates the model and checks for errors  
button

Updates the model and checks for errors. Expand the menu under **Update Model** to select from two options.

- **Update Model:** Compiles the model and checks for static errors.
- **Refresh blocks:** Updates the model blocks to reflect changes made.

You can also use the **Ctrl+Shift+D** keyboard shortcut to update the model. For more information, see “Simulation Phases in Dynamic Systems”.

## Simulate

**Stop Time** — Specifies the simulation stop time  
10 (default) | scalar

Specifies the simulation stop time.

**Simulation Mode** — Changes the simulation mode  
menu item

Changes the simulation mode. You can select from **Normal**, **Accelerator** or **Rapid Accelerator**. For more information, see “Choosing a Simulation Mode”.

**Fast Restart** — Enables fast restart  
"off" (default) | "on"

Enables fast restart for model simulation. Fast restart can improve performance by preventing compiling. For more information, see “Get Started with Fast Restart”.

**Step Back** — Steps back in simulation  
button

Steps back in simulation. You must enable this option using the Simulation Stepping Options dialog box. If you have not enabled stepping back, the button opens the Simulation Stepping Options dialog box. For more information, see **Simulation Stepping Options**.

**Run** — Runs the simulation  
button

Runs the simulation. You can run a single simulation, or run multiple simulations by creating design studies with **Multiple Simulations** and selecting **Run All** from the drop down. Adjust the time pacing by selecting **Simulation Pacing** from the drop down.

**Step Forward** — Step forward in simulation  
button

Steps forward in simulation. For more information, see “How Stepping Through Simulation Works”.

**Stop** — Stops the simulation  
button

Stops the simulation.

### Debug Code

**Step over** — Steps over the breakpoint during debugging  
button

Steps over the breakpoint during debugging in the MATLAB Function block. When you press the button, the debugger steps past function calls and does not enter called functions for line-by-line execution. You can use this button only after simulation stops at a breakpoint.

**Step In** — Goes to next line of code during debugging  
button

Goes to next line of code during debugging in the MATLAB Function block. If the line calls a local function, step into the first line of the local function. You can use this button only after simulation stops at a breakpoint.

**Step out** — Exits line-by-line function execution during debugging  
button

Exits line-by-line function execution during debugging of the current function or local function. If in a local function, the debugger continues to the line following the call to this local function. You can use this button only after simulation stops at a breakpoint.

### **Report**

**Function Report** — Opens a report button

Opens a report that contains information about the MATLAB Function. You can use this report to find information about variables and expressions in the code. For more information, see “MATLAB Function Reports”.

## **Version History**

**Introduced in R2011a**

### **R2022a: Symbols pane replaces Ports and Data Manager**

*Behavior changed in R2022a*

The Ports and Data Manager has been removed. To manage variables, function call outputs, and input triggers in MATLAB Function blocks, use the **Symbols** pane and the Property Inspector.

### **R2021b: MATLAB Function Block Editor in Simulink window**

The **MATLAB Function Block Editor** opens in the same Simulink window as the parent model of the MATLAB Function block. Previously, when you opened a function in the **MATLAB Function Block Editor**, the editor opened in the MATLAB window.

“Implement MATLAB Functions in Simulink with MATLAB Function Blocks”

“Call MATLAB Function Files in MATLAB Function Blocks”

# Finder

Find and optionally replace values in Simulink models, libraries, and subsystems

## Description

Use the Finder to search Simulink models, libraries, and subsystems for elements that contain the search string that you enter.

The search can match the string anywhere in the element, such as in the name or in the parameter values. You can customize the search to look only in certain types of elements or for elements with specific parameter settings.

From the search results, you can select and navigate to elements. You can also replace found instances of the search string with another string.

By default, the Finder searches all model elements in the current system, its referenced models, its linked blocks, and its masked systems for case-insensitive partial or full matches.

Finder: Search from top model

Find

×
Find
Result 1 of 67

Name	Type	Propert...	Label S...	Script	Description
▼  sldemo_fuelsys	Model				
▼  Dashboard	Subsystem				
 Engine <b>Speed</b> (rpm)	Annotation				
 Engine <b>Speed</b>	Annotation				
▼  fuel_rate_control	Subsystem				
▼  control_logic	Subsystem				
▼  Speed.speed_estimate	Subsystem				
 <b>Speed</b> Estimation	Annotation				
▼  <b>Speed</b> Estimation	Lookup_n-D				
 Table data:	Property	<b>Speed</b> Est			
 <b>speed</b>	Output				
▼  Saturation	Saturate				

## Open the Finder

- In the Simulink Toolstrip, on the **Modeling** tab, click **Find**.
- In the Simulink quick access toolbar, click the **Find** button .

If the **Find** button  is not in the quick access toolbar, click the **Common Controls** button  and select the **Find** check box.

- With the Simulink Editor selected, press **Ctrl+F**.

## Examples

### Search One Level of Model

In this example, you search the top level of the `sldemo_fuelsys` model for any model element that contains the number 2.

- 1 Open the “Model a Fault-Tolerant Fuel Control System” on page 13-124 example model `sldemo_fuelsys`.

```
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
sldemo_fuelsys
```

- 2 Open the Finder. On the **Modeling** tab, click **Find**.

- 3 Click the **Change the search scope**  button arrow and select **Search this level only**.

- 4 In the search box, enter 2.

Model elements that contain the search string appear in a table. The first element in the table is selected.

- 5 To move to the next element, click the down arrow .
- 6 Use the up and down arrows to move through the rest of the found elements. Alternatively, scroll through the table and click an element to select it.

### Perform Advanced Search

When a search returns too many results, use the advanced search settings to narrow your search.

The advanced search settings allow you to:

- Include only the elements you are interested in, such as blocks, annotations, or signals.
- Omit block parameter values from the search.
- Search for case-sensitive matches.
- Search for exact matches.
- Search using regular expressions.
- Omit masked systems, linked blocks, and referenced models from the search.
- Search based on property values such as `BlockDescription` or `BlockType`.

In this example, you search the `sldemo_fuelsys` model for all elements that contain the string `speed`. You then use the **Advanced settings** pane to refine your results.

- 1 Open the “Model a Fault-Tolerant Fuel Control System” on page 13-124 example model `sldemo_fuelsys`.

```
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
sldemo_fuelsys
```

- 2 Open the Finder. On the **Modeling** tab, click **Find**.
- 3 Enter the search string. For example, enter **speed**.

Model elements that contain the search string appear in a table. The first element in the table is selected.

Alternatively, you can enter the search string after you specify the search settings

- 4 Click the **Advanced settings** button .

The **Advanced Settings** pane opens.

- 5 Specify the advanced settings you want. For example, in the **Property:Value** section, change **BlockDescription** to **BlockType**. In the corresponding text box, type **Constant** and click the **Add property and value** button .

---

**Note** In the **Property:Value** section, if you want to search based on a property that is not in the list, select **Other**, then enter the full programmatic name of the property. To find the programmatic name, in the Property Inspector, pause on the property. You cannot use regular expressions or partial matches for the property name.

---

6 Click **Find** to find results that match the updated search criteria.

To restore the default advanced settings, click **Reset**.

### Find and Replace Text

You can find and replace text using the Finder.

For search results to support replacement:

- You must have write access for the field.
- The field value must be the same as when you performed the search.
- The text formatting must be plain.

In this example, you search the `sldemo_fuelsys` model for the string `rad` and replace `rad` with `deg`.

1 Open the “Model a Fault-Tolerant Fuel Control System” on page 13-124 example model `sldemo_fuelsys`.

```
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
sldemo_fuelsys
```

2 Open the Finder. On the **Modeling** tab, click **Find**.

3 In the search box, enter the search string. For example, enter `rad`.

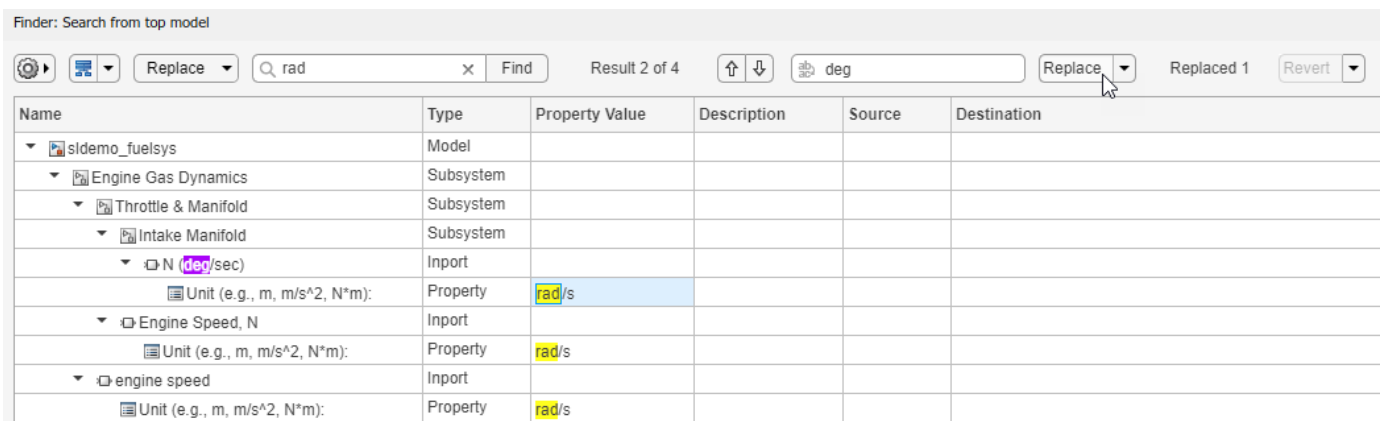

Model elements that contain the search string appear in a table.

4 To the left of the search box, click the **Find** button arrow, and select **Replace**.

Replace options appear in the Finder.

5 In the text box next to the **Replace** button, enter the replacement string. For example, enter `deg`.

6 Select the instance you want to replace, then click **Replace**.

Finder: Search from top model

Replace [x] rad Find Result 2 of 4 [up/down] [replace] deg Replace Replaced 1 Revert

Name	Type	Property Value	Description	Source	Destination
▼ sldemo_fuelsys	Model				
▼ Engine Gas Dynamics	Subsystem				
▼ Throttle & Manifold	Subsystem				
▼ Intake Manifold	Subsystem				
▼ N (deg/sec)	Input				
Unit (e.g., m, m/s^2, N*m):	Property	rad/s			
▼ Engine Speed, N	Input				
Unit (e.g., m, m/s^2, N*m):	Property	rad/s			
▼ engine speed	Input				
Unit (e.g., m, m/s^2, N*m):	Property	rad/s			

Alternatively, replace all instances of the found string by clicking **Replace > Replace All**.

**Note** If you stop the replacement operation before it completes, the completed replacements do not revert.

- 7 To view a replacement in the model, double-click the row that corresponds to the replaced element.

If you want to revert replacements, you must revert them before you perform another search or close the Finder. To revert replacements, select the instance to revert, then click **Revert**. Alternatively, click the **Revert** button arrow and select **Revert All**. The Finder applies the inverse replacements to restore the original values.

- Model Data Editor

## Limitations

You cannot use the Finder to replace code in a Test Sequence block.

## Tips

- To select the starting point for your search, use the Model Browser.
- To go to and select the element in the model, double-click an item in the list.
- To search for any model elements that match the search criteria, enter an asterisk (\*) in the search box.
- To search for a string that contains a colon, escape the colon using a backslash (for example, `Earth\ : a planet`), or use single or double quotes around the expression (for example, `'Earth: a planet'` or `"Earth: a planet"`).
- You can interact with search results while the search runs. However, you can sort the results only after the search is complete.
- To stop a search and view partial search results, in the Finder, click the **Stop** button.
- For table display options, pause on the **Name** heading and click the arrow that appears. The menu provides options to expand, collapse, and sort results. To sort the table based on another column, pause on the corresponding table heading and click the arrow that appears.

## Version History

Introduced in R2016b

### Topics

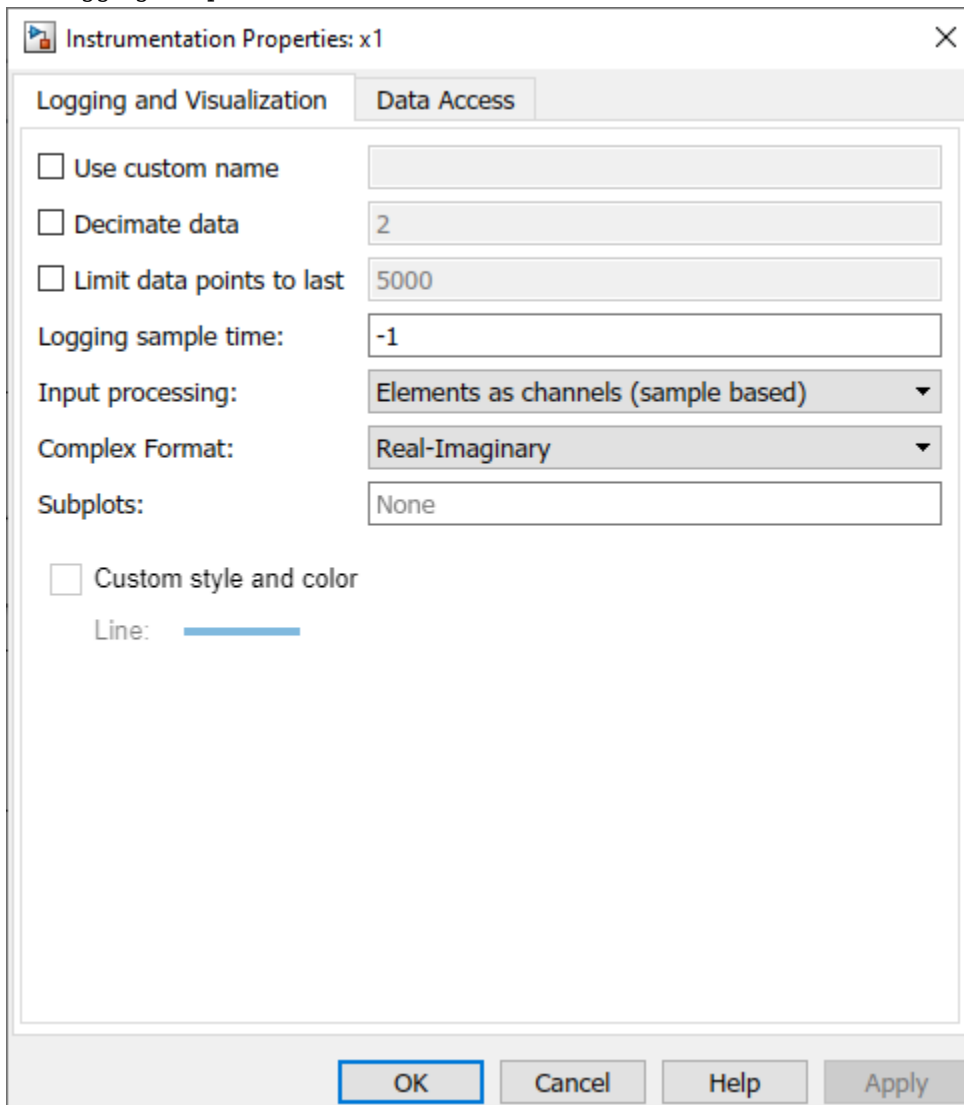

Model Data Editor

## Instrumentation Properties

View and edit logging and visualization properties for logged signal

### Description

Use the Instrumentation Properties dialog box to configure logging and visualization settings for logged signals, including a data access callback function to process logged data during simulation and logging sample time.

### Open the Instrumentation Properties

- Right-click the logging badge on a signal that is marked for logging and select **Properties**.

## Parameters

### Logging and Visualization

**Use custom name** — Signal logging name

string | character vector

Select this option to specify a name for logged signal data that is different from the name of the signal in the model. By default, logged signal data uses the name of the signal specified in the model.

The **Use custom name** property is the same as the **Logging name** property that you configure using the **Signal Properties** dialog box.

### Programmatic Use

To specify the logging name programmatically, use the `set_param` function to configure the `DataLoggingNameMode` and `DataLoggingName` parameters for the port handle that corresponds to the block output port that produces the signal. For an example, see “Name a Signal Programmatically”.

**Parameter:** `DataLoggingNameMode`

**Value:** 'SignalName' | 'Custom'

**Default:** 'SignalName'

**Parameter:** `DataLoggingName`

**Type:** string | character vector

**Decimate data** — Option to log every  $n$ th sample value

'off' (default) | 'on'

When you want to reduce the effective sample rate for logged data, select **Decimate data** and specify the desired decimation factor in the text box. For example, if you specify a decimation factor of 2, every other signal value is logged.

Consider data requirements for each signal before reducing the number of data points logged in simulation. Decimation can cause aliasing if the effective sample rate is too low.

For more information, see “Specify Signal Values to Log” and “Limit the Size of Logged Data”.

### Programmatic Use

To configure this option programmatically, use the `set_param` function to configure the `DataLoggingDecimateData` and `DataLoggingDecimation` parameters for the port handle that corresponds to the block output port that produces the signal.

**Parameter:** `DataLoggingDecimateData`

**Value:** 'on' | 'off'

**Default:** 'off'

**Parameter:** `DataLoggingDecimation`

**Value:** numeric scalar

**Type:** string | character vector

**Default:** '2'

**Limit data points to last** — Option to log only last  $n$  data points

'off' (default) | 'on'

When you only want to save or analyze the data from the end of a simulation, you can configure logging to capture only the last  $n$  signal values. Select **Limit data points to last** and specify the number of data points you want to log.

When you only log the last simulation values, dashboard blocks and the Simulation Data Inspector do not display data during simulation. Consider data requirements for each signal before you reduce the number of data points logged in simulation.

For more information, see “Specify Signal Values to Log” and “Limit the Size of Logged Data”.

### Programmatic Use

To configure this option programmatically, use the `set_param` function to specify the `DataLoggingLimitDataPoints` and `DataLoggingMaxPoints` parameters for the port handle that corresponds to the block output port that produces the signal.

**Parameter:** `DataLoggingLimitDataPoints`

**Value:** 'on' | 'off'

**Default:** 'off'

**Parameter:** `DataLoggingMaxPoints`

**Value:** numeric scalar

**Type:** string | character vector

**Default:** '5000'

### Logging sample time — Sample time for logged signal data

-1 (default) | scalar

Specify the sample time to use for logging the data for the selected signal. By default, the logging sample time is inherited (-1) from the block that produces the signal. For continuous logging sample time, specify the value as 0. To use a discrete sample time for logging data, specify the sampling interval as a scalar.

Setting the sample time for a logged signal in the Signal Properties dialog box:

- Separates design and testing because you do not need to insert a Rate Transition block to have a consistent sample time for logged signals
- Reduces the amount of logged data for a continuous time signal, for which setting decimation is not relevant
- Eliminates the need to post-process logged signal data for signals with different sample times

Specifying a logging sample time may add a new sample time to the model. When you specify a logging sample time, the model calculates a value for the exact time hits. When you use a fixed-step solver, the logging sample time you specify must be a multiple of the base rate for the model.

Specifying a sample time for signal logging does not affect the simulation result. However, it is possible that the signal logging output for a logged signal varies depending on whether you specify a sample rate. For example, the interpolation method can differ depending on whether you specify a sample time for signal logging.

If you simulate in software-in-the-loop (SIL) mode, signal logging ignores the sample time you specify for logged signals.

Do not specify a sample time for:

- Frame-based signals

- Signals inside conditional subsystems or conditional referenced models

The **Logging sample time** property is the same as the **Sample time** property you configure using the **Signal Properties** dialog box.

#### Programmatic Use

To configure this option programmatically, use the `set_param` function to configure the `DataLoggingSampleTime` parameter for the port handle that corresponds to the block output port that produces the signal.

**Parameter:** `DataLoggingSampleTime`

**Value:** numeric scalar

**Type:** string | character vector

**Default:** `'-1'`

**Input processing** — Option to log data as samples or as frames

`Elements as channels (sample based) (default) | Columns as channels (frame based)`

Specify how multidimensional data is logged and interpreted by the Simulation Data Inspector. By default, signals are logged as sample-based, with each element in a multidimensional sample treated as a channel.

When logging a frame-based signal, set **Input processing** to `Columns as channels (frame based)`. A frame-based signal buffers a batch of samples to create a frame of data. When you log the data as frame-based, each column in a sample is treated as a channel, and the row dimension is treated as evenly-spaced samples within the channel.

You can also remove the buffering from a frame-based signal after simulation using the Simulation Data Inspector. For more information, see “Convert Representation of Frame-Based Data”.

#### Programmatic Use

To programmatically configure or access the **Input processing** property for a logged signal, use the `Simulink.sdi.setSignalInputProcessingMode` function and the `Simulink.sdi.getSignalInputProcessingMode` function.

**Complex format** — Option to specify how complex signal is displayed in Simulation Data Inspector  
`Real-Imaginary (default) | Magnitude-Phase | Magnitude | Phase`

Complex signal data is logged as a single signal. Use the **Complex format** property to specify how to display a complex signal in the Simulation Data Inspector. By specifying the complex format in the Instrumentation Properties, you save the preference in the model so logged data is displayed consistently for each simulation. You can also modify the complex format for a signal in the Simulation Data Inspector, after data is logged from simulation or imported.

For all complex formats, you plot the complex signal as one signal. Some formats display components of the plotted signal as separate traces.

- **Real-Imaginary** — Plot real and imaginary components as separate traces.

The signal line color specifies the color of the real component. The imaginary component uses a different shade of the specified line color.

- **Magnitude-Phase** — Plot magnitude and phase components as separate traces.

The signal line color specifies the color of the magnitude component. The phase component uses a different shade of the specified line color.

- **Magnitude** — Plot only the magnitude component.
- **Phase** — Plot only the phase component.

**Subplots** — Option to plot signals in Simulation Data Inspector from model  
scalar between 1 and 64

When you specify a value for the **Subplots** property, the signal is plotted on the corresponding subplot or subplots in the Simulation Data Inspector. You can use this property to save a plotting configuration in the model. However, the property does not affect the subplot layout in the Simulation Data Inspector or clear signals that are already plotted.

**Custom style and color** — Option to configure signal line style and color in model  
'off' (default) | 'on'

When enabled, you can configure the line style and color used to display the signal in the Simulation Data Inspector and on Dashboard Scope blocks and save the preference in the model so the signal is displayed consistently across MATLAB sessions.

Specifying the line style and color in the model does not prevent you from changing the line style and color in the Simulation Data Inspector. The Dashboard Scope block and the Simulation Data Inspector always display a signal using the line style and color specified in the logged signal properties, as displayed in the **Properties** pane in the Simulation Data Inspector.

**Line** — Line style, color, and width for Simulation Data Inspector and Dashboard Scope blocks  
line style, width, and color

Set the line style, width, and color used to display the signal on Dashboard Scope blocks and in the Simulation Data Inspector.

Specifying the line style and color in the model does not prevent you from changing the line style and color in the Simulation Data Inspector. The Dashboard Scope block and the Simulation Data Inspector always display a signal using the line style and color specified in the logged signal properties, as displayed in the **Properties** pane in the Simulation Data Inspector.

### Dependencies

To enable the **Line** property, select **Custom style and color**.

### Data Access

**Enable run-time data access** — Option to stream signal data to MATLAB function during simulation  
'on' (default) | 'off'

When enabled, you can specify a data access callback function that processes or visualizes the logged signal data during simulation. The function receives data in packets asynchronously throughout the simulation, and the function executes each time it receives new data. For more information, see "Access Data in a MATLAB Function During Simulation".

**Function name** — MATLAB function that receives signal data during simulation  
name of MATLAB function

Name of the data access callback function that processes or visualizes signal data during simulation. The data access callback function always receives signal data as the first argument and may also receive simulation time and a function parameter as additional arguments. When the function

receives all three arguments, simulation time is the second argument. For more information, see “Access Data in a MATLAB Function During Simulation”.

For more information about writing MATLAB functions, see “Create Functions in Files”.

### Dependencies

To enable the **Function name** property, select **Enable run-time data access**.

**Include simulation time** — Option to send simulation time to MATLAB function  
'on' (default) | 'off'

Option to send simulation time along with signal data to the data access callback function during simulation. The data access callback function always receives signal data as the first argument and may also receive simulation time and a function parameter as additional arguments. When a function receives all three arguments, simulation time is the second argument. For more information, see “Access Data in a MATLAB Function During Simulation”.

### Dependencies

To enable the **Include simulation time** property, select **Enable run-time data access**.

**Function parameter** — Option to use parameter to identify data source  
numeric | text

When you specify a value for the **Function parameter**, the data access callback receives the specified value as a second or third argument depending on whether time is included with data sent to the callback function. When you use the same data access callback function to process data for more than one signal, specify a function parameter to identify which signal data the function receives in a given call. For more information, see “Access Data in a MATLAB Function During Simulation”.

### Dependencies

To enable the **Function parameter** property, select **Enable run-time data access**.

# Library Browser

Find and add blocks to model

## Description

The Library Browser displays a tree view of the Simulink libraries on your system. Use the Library Browser to add blocks and annotations to your model. To browse the items that you can add to your model, expand the libraries in the tree. To search for a library item with key words or phrases, use the search box at the top of the Library Browser. To add an item to your model, drag it into your model, or right-click it and select the option to add it to your model.

By default, the Library Browser is docked as a panel in the Simulink window so that the Library Browser window stays to one side of the model and does not cover areas in the model canvas where you want to add items. When you have multiple Simulink windows open, you can open a Library Browser in each one.

You can use the Library Browser in docked mode or in standalone mode.

A Library Browser that is not docked is in standalone mode.

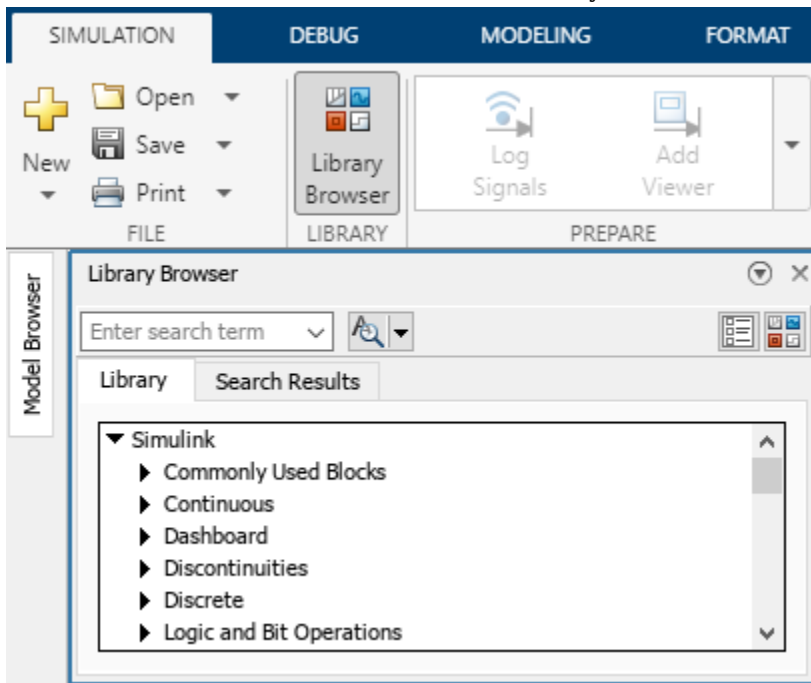

Use standalone mode to:

- Add the same items to many Simulink windows.
- View the Library Browser in full-screen mode.

- Open, close, hide, or position the Library Browser programmatically.
- Browse the libraries without opening a Simulink model.

To open a Library Browser in standalone mode, on the Library Browser in docked mode, click the Launch standalone library browser button .

For information on standalone mode, see [Library Browser in Standalone Mode](#).

## Open the Library Browser

In the Simulink Toolstrip, on the **Simulation** tab, click **Library Browser**. The Library Browser opens in docked mode.

---

### Note

- If you have multiple Simulink windows open, you can open a Library Browser in each one by clicking **Library Browser** in the toolstrip of the respective window.
  - To open or close the Library Browser programmatically, open the Library Browser in standalone mode. The `sLibraryBrowser` function does not act on the Library Browser in docked mode.
- 

## Examples

### Library Browser Keyboard Shortcuts

You can use these keyboard shortcuts to interact with the **Library Browser** in docked mode.

Task	Shortcut
Open Library Browser in docked mode	Select the Simulink window, then press <b>Ctrl+Shift+L</b>
Find a block	<b>Ctrl+F</b> or <b>F3</b>
Open <b>Search Results</b> tab and move to page you visited before current page	<b>Alt</b> +left arrow
Open <b>Search Results</b> tab and move to page you visited after current page	<b>Alt</b> +right arrow
Insert selected block in model that Library Browser is docked to	<b>Ctrl+I</b>
Refresh libraries	<b>F5</b>

**Note** When you use the keyboard shortcuts on a Mac:

- Press **command** (⌘) instead of **Ctrl**.
- Press **option** instead of **Alt**.

### Navigate Levels of Library Browser Tree

To navigate the Library Browser in docked mode, expand the hierarchy of libraries in the tree on the libraries pane.

You can have multiple libraries expanded at once.

When you expand a library, the library contents appear in the tree underneath the library name.

Library contents can be any combination of blocks, annotations, and sublibraries.

### Search for Library Items by Keyword

To search for a library item using key words or phrases, use the search box at the top of the Library Browser.

- 1 In the search box, type the search term or select it from the list of recent search terms.

To search for an annotation, type any of the text from the annotation or its description.

- 2 To use regular expressions, case-sensitive search, or whole-word search, click the **Search for subsystems, blocks, and annotations** button and select the search options you want to use.

- 3 Press **Enter** to start the search. The **Search Results** tab displays the search results, grouped by library.

If there are more than 100 search results, the results take up multiple pages in the blocks pane. To navigate to the previous or next page of results, use the arrows in the upper left corner of the Library Browser window.

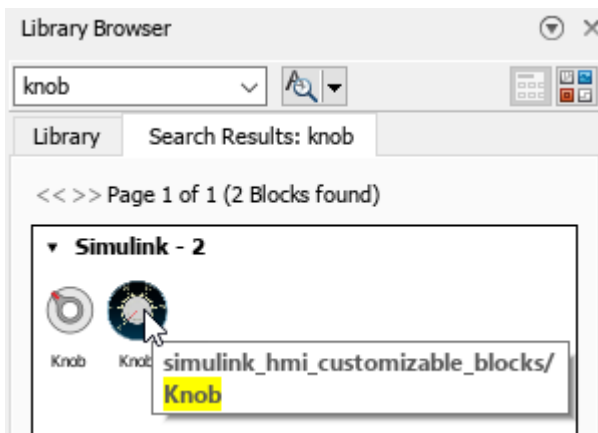

To see where the search string matches, pause on a block.

To return to browsing the library tree, click the **Library** tab.

As an example, search for the customizable Knob block.

- 1 In the search box at the top of the Library Browser, enter the keyword knob.
- 2 Press **Enter**. The **Search Results** tab opens and shows two Knob blocks.
- 3 Pause over the two blocks to find out which is the customizable Knob block. When you pause over the customizable Knob block, this text appears: `simulink_hmi_customizable_blocks/`Knob.

### View Library Item Documentation or Block Parameters

To see a description of the functionality of a library item, pause on the item.

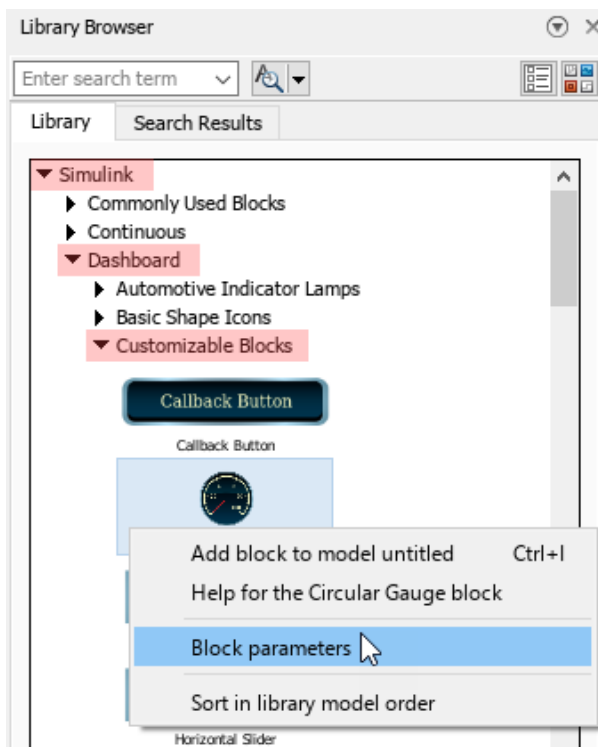

To open the help documentation for an item, right-click the item icon and select **Help** for the item.

To preview the parameters of a library block before you add it to your model, right-click the block icon and select **Block Parameters**. The Block Parameters dialog box opens.

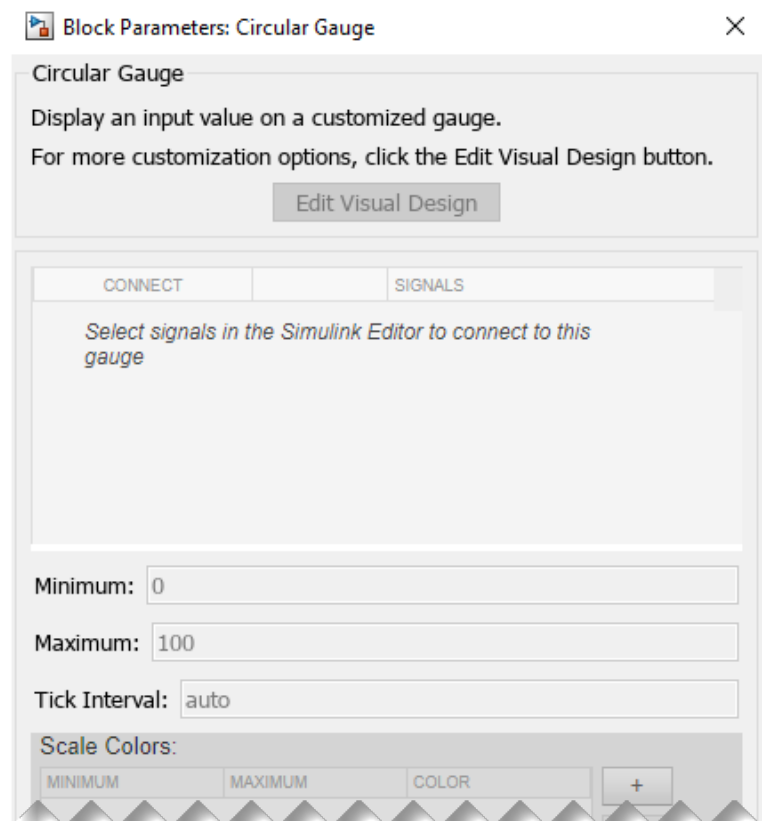

**Note** You cannot set values for any of the parameters when you open the Block Parameters dialog box from the Library Browser. To set values, add the block to your model and then double-click the block in the canvas.

As an example, open the Block Parameters dialog box of the Circular Gauge block.

- 1 In the Library Browser tree, expand the **Simulink** library.
- 2 In the **Simulink** library, expand the **Dashboard** sublibrary.
- 3 In the **Dashboard** sublibrary, expand the **Customizable Blocks** sublibrary.
- 4 In the **Customizable Blocks** sublibrary, right-click the Circular Gauge block icon and select **Block Parameters**. In the Block Parameters dialog box, you can see which parameters you can set. For example, you can customize the maximum, minimum, and tick interval on the scale of the Circular Gauge block.

Library Browser

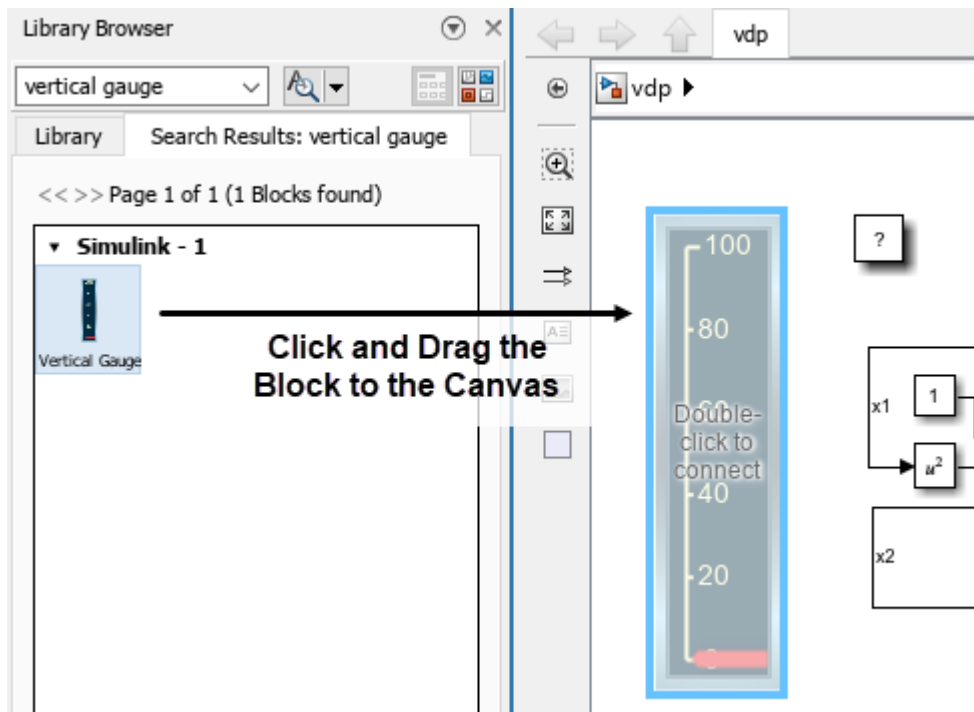

Block Parameters Dialog Box  
for the Circular Gauge Block

## Add Blocks and Annotations to Model from Library Browser

To add blocks and annotations from the **Library Browser** to an open model, drag the block or annotation from the Library Browser to the Simulink canvas.

As an example, add a customizable Vertical Gauge block to an open model.

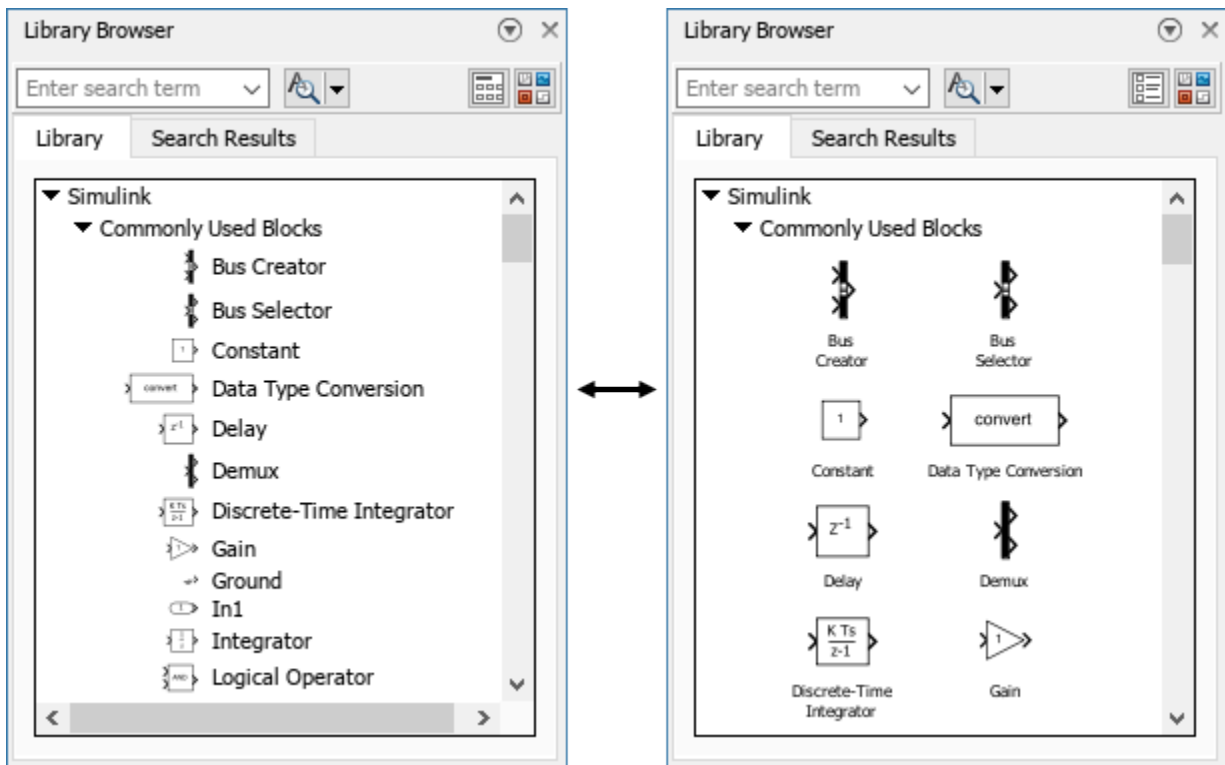

- 1 In the search box at the top of the Library Browser, enter `vertical gauge`.
- 2 Press **Enter**. The **Search Results** tab opens and shows the Vertical Gauge block.
- 3 Click and drag the Vertical Gauge block to the canvas.

## Customize Library Browser Appearance

When you resize the Library Browser, the library contents flow to match the width of the window.

Use the layout button to switch between viewing the blocks in a single column  or in a responsive layout that adapts the number of columns to the browser width .

You can also programmatically customize the appearance of the Library Browser.

- Set the sort priority to change the order of the libraries in the tree.
- Hide libraries.
- Deactivate libraries.
- Expand or collapse libraries in the tree.
- For more information, see “Customize Library Browser Appearance”.

### Sort Libraries and Library Contents

The libraries and library contents are first sorted by sort priority and then by sorting order.

Libraries appear in ascending order of sort priority. By default, the **Simulink** library has a sort priority of -1, and all other libraries have a sort priority of 0. For more information about sort priority, see “Customize Library Browser Appearance”.

By default, the sorting order is alphabetical. Sublibraries appear first, then subsystems, then blocks, and then annotations.

You can change the sorting order of library items to model order, which is the order set by the library developer. Typically, model order sorts the contents according to functionality and groups related blocks together.

---

**Note** In docked mode, you can only change the sorting order of the library items. For libraries and sublibraries, the sorting order is always alphabetical.

---

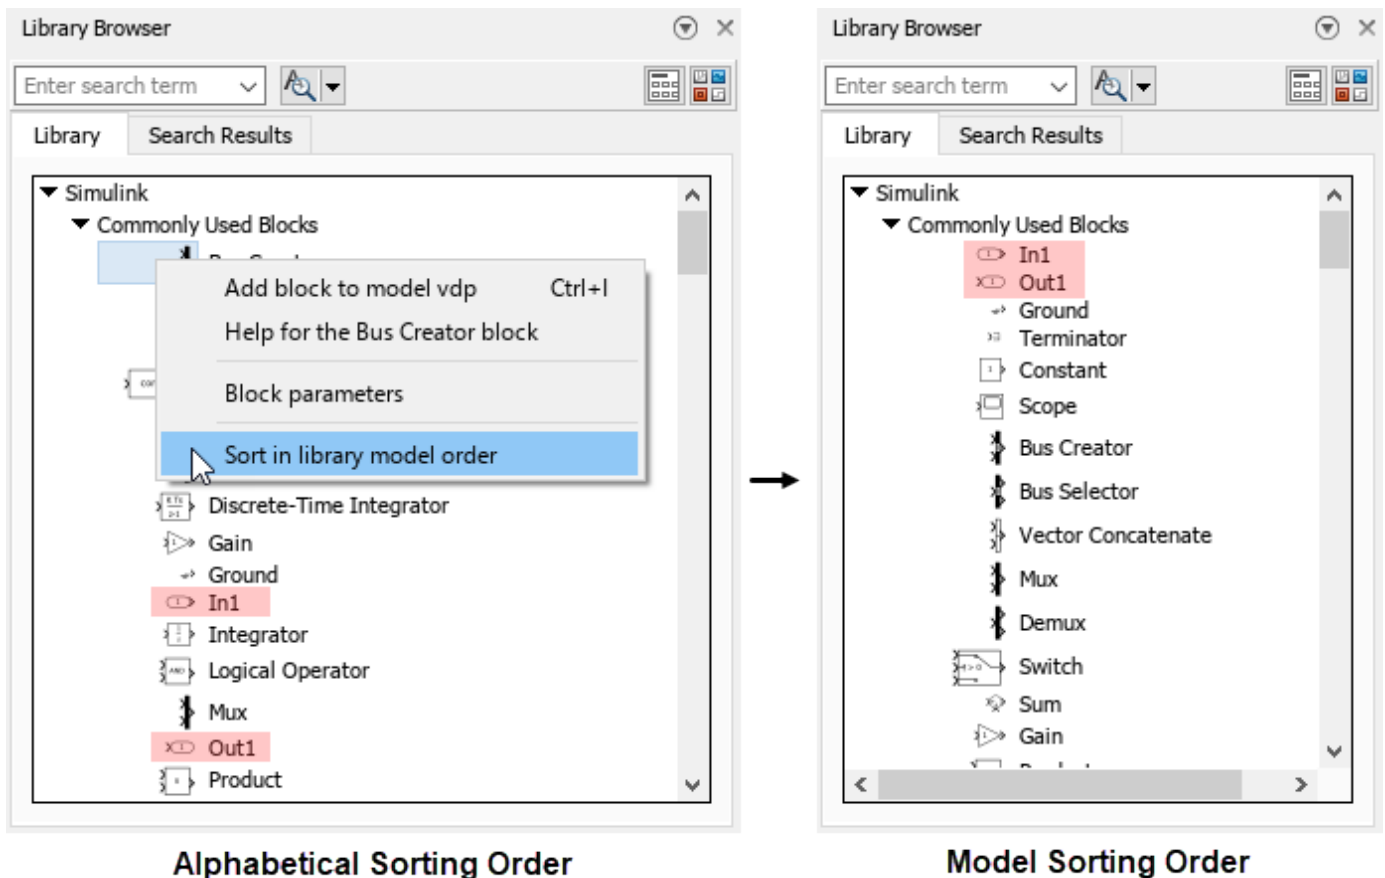

To switch from alphabetical order to model order in docked mode, right-click the item icon in the tree and select **Sort in library model order**. This setting is preserved from session to session.

To return to the alphabetical order, right-click the item icon in the tree and select **Sort in alphabetical order**.

Some libraries do not follow the sorting order. For example, in the Simulink library, the **Quick Insert** library appears as the last item regardless of the sorting option you choose.

As an example, sort the contents of the **Commonly Used Blocks** sublibrary in model order.

- 1 In the Library Browser tree, expand the **Simulink** library.
- 2 In the **Simulink** library, expand the **Commonly Used Blocks** sublibrary.
- 3 In the **Commonly Used Blocks** sublibrary, right-click the icon of any item, for example the Bus Creator block icon, and select **Sort in library model order**. The order of the library changes to model order. In model order, related blocks are grouped together. For example, the In1 and Out1 blocks are far apart when the **Commonly Used Blocks** sublibrary is in alphabetical order but follow each other when the sublibrary is in model order.

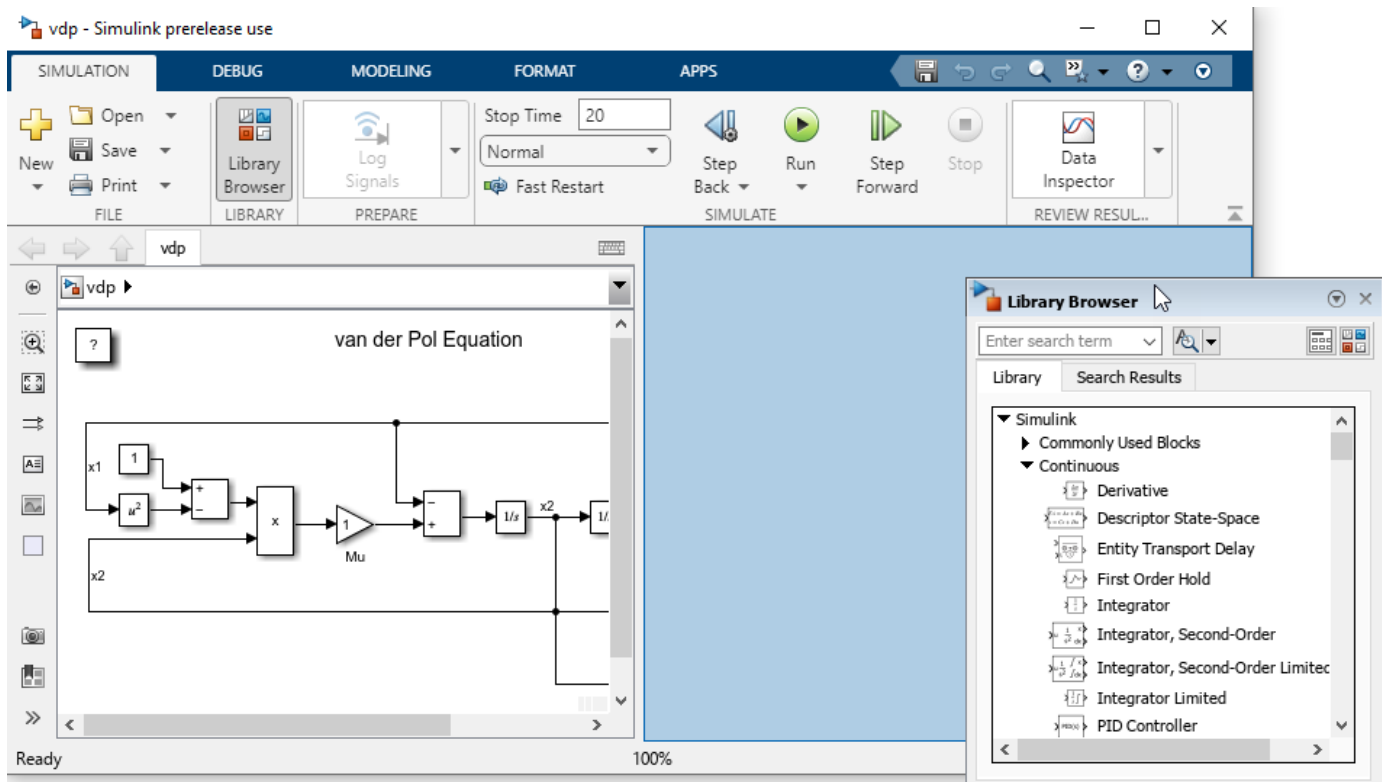

## Position the Library Browser

In docked mode, the default position of the **Library Browser** is on the left side of the Simulink window.

You can position the Library Browser on the left side, the right side, or the bottom of a Simulink window.

To move the Library Browser to a different position, click and drag the top of the Library Browser window to the left, right, or bottom of the Simulink window. Release the Library Browser over the blue area that appears.

## Minimize Library Browser

To minimize the Library Browser in docked mode, click the **Minimize** button arrow  at the top right of the Library Browser window and select **Minimize**.

To temporarily expand the Library Browser when it is minimized, at the left edge of the Simulink window, click the **Library Browser** tab. The Library Browser expands. If you click the canvas, the Library Browser minimizes again.

To restore the expanded view, click the **Restore** button arrow  at the top right of the Library Browser window and select **Restore**. The Library Browser no longer minimizes when you click the canvas.

As an example, minimize the Library Browser, temporarily expand the Library Browser to add a Constant block to the model, and then minimize the Library Browser again.

- 1 To minimize the **Library Browser**, click the **Minimize** button arrow  at the top right of the Library Browser window and select **Minimize**. The Library Browser window disappears.
- 2 To temporarily expand the Library Browser, at the left edge of the Simulink window, click the **Library Browser** tab. The **Library Browser** window reappears.

- 3 In the tree, expand the **Simulink** library and the **Commonly Used Blocks** sublibrary.
- 4 From the **Commonly Used Blocks** sublibrary, click and drag the Constant block to the canvas.
- 5 To minimize the **Library Browser**, click anywhere in the canvas.

### Create Custom Libraries

You can create your own libraries and, optionally, have them appear in the Library Browser.

For more information, see “Create Custom Library”.

For an example of how to create a custom block library and a custom block sublibrary, see “Add Libraries to Library Browser”.

### Refresh Library Browser

Refresh your Library Browser if you:

- Modify existing libraries or resave them in .slx file format.
- Move or delete your library files.

- Add a library.
- Change your Library Browser customizations. See “Customize Library Browser Appearance”.

To refresh the libraries displayed in the Library Browser after you have added, deleted, resaved, or modified the contents of libraries, right-click in the libraries pane and select **Refresh Library Browser**. The Library Browser updates to display any libraries or blocks added to or deleted from the MATLAB path since the Library Browser was last opened or refreshed.

To refresh the libraries displayed in the Library Browser after you have changed your Library Browser customizations, enter this command in the MATLAB Command Window:

```
sl_refresh_customizations
```

For an example of how to refresh the Library Browser after adding a new library, see “Customize Library Browser Appearance”.

## Limitations

These functions do not act on a docked Library Browser:

- `getPosition`
- `hide`
- `LibraryBrowser.LibraryBrowser2`
- `setPosition`
- `show`
- `slLibraryBrowser`

You cannot use the `LibraryBrowser.LBStandalone` object to act on a docked Library Browser.

To use these functions and the `LibraryBrowser.LBStandalone` object, open the Library Browser in Standalone Mode.

## Version History

**Introduced before R2006a**

### **R2022b: Docked Simulink Library Browser**

Starting in R2022b, the **Library Browser** button in the Simulink Toolstrip opens a Library Browser that is docked as a panel in the Simulink window. The Library Browser is docked so that the Library Browser window stays to one side of the model and does not cover areas in the model canvas where you want to add items.

When you have multiple Simulink windows open, you can open a docked Library Browser in each one by clicking the **Library Browser** button of the respective window.

## Library Browser in Standalone Mode

Use standalone Library Browser to find and add blocks to model

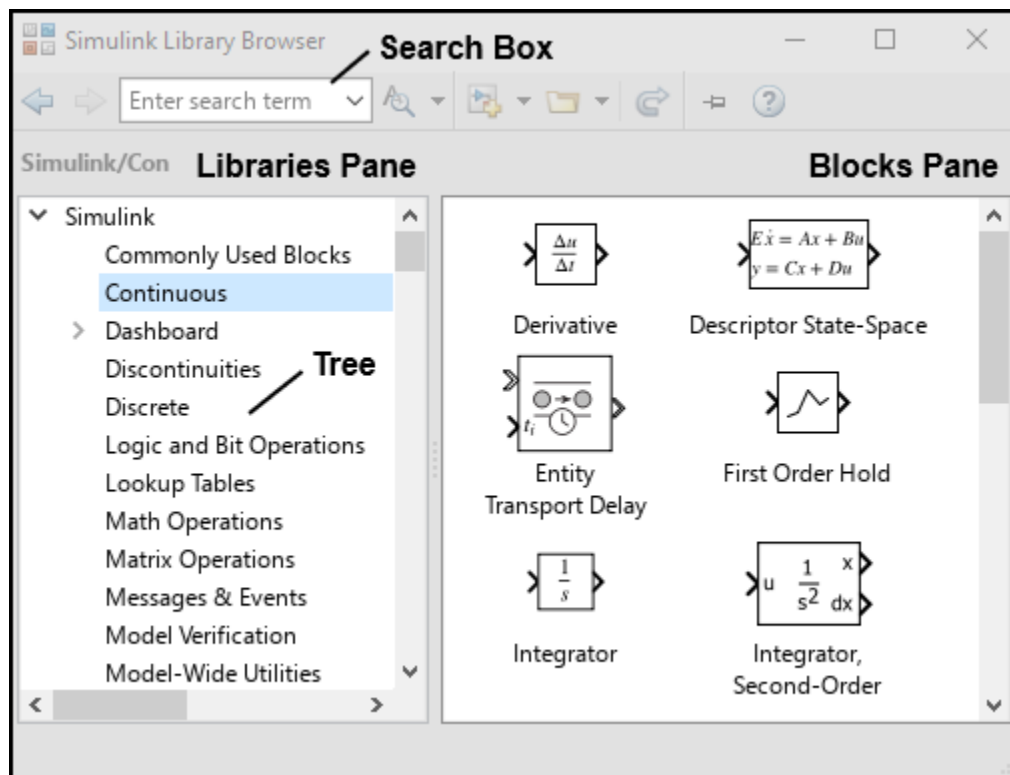

### Description

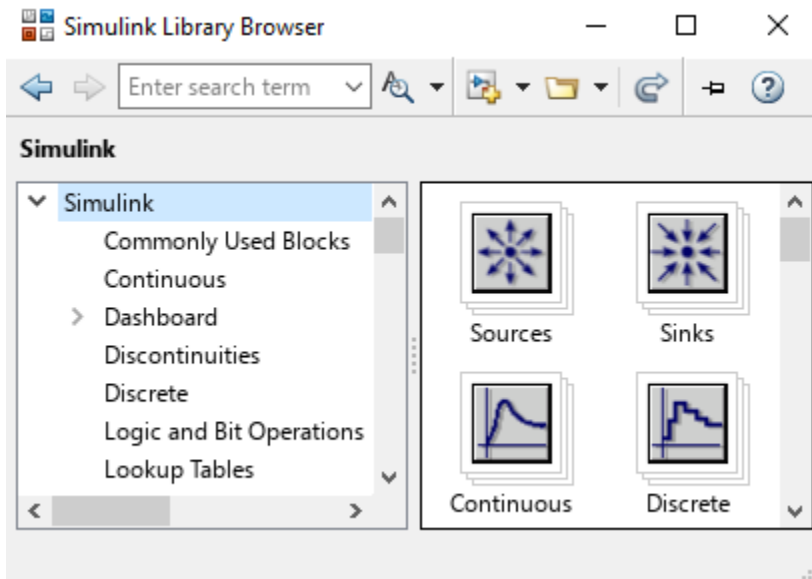

You can use the Library Browser in docked mode or in standalone mode. By default, the Library Browser is in docked mode, so the Library Browser window stays to one side of the model and does not cover areas in the model canvas where you want to add items. A Library Browser that is not docked is in standalone mode.

Use standalone mode to:

- Add the same items to many Simulink windows.
- View the Library Browser in full-screen mode.
- Open, close, hide, or position the Library Browser programmatically.
- Browse the libraries without opening a Simulink model.

For an introduction to the Library Browser and more information about docked mode, see Library Browser.

## Open the Library Browser in Standalone Mode

- Open from Library Browser in docked mode: Click the Launch standalone library browser button .
- Open from MATLAB Command Window: Enter `slLibraryBrowser('open')`.

---

**Note** You can only open one Library Browser in standalone mode.

---

## Examples

### Library Browser Keyboard Shortcuts

You can use these keyboard shortcuts to interact with the **Library Browser** in standalone mode.

Task	Shortcut
Move selection down	Down arrow
Move selection up	Up arrow
Expand a library	Right arrow
Collapse a library	Left arrow
Navigate to parent library	<b>Esc</b>
Move to page you visited before current page	<b>Alt+left arrow</b>
Move to page you visited after current page	<b>Alt+right arrow</b>

Task	Shortcut
Insert selected block in active model	<b>Ctrl+I</b>
<b>Note</b> If no model is open, <b>Add block to a new model</b> creates new model and adds the selected block to it.	
Find a block	<b>Ctrl+F</b> or <b>F3</b>
Navigate from search result to library containing block	<b>Ctrl+R</b>
Refresh libraries	<b>F5</b>
Increase zoom	<b>Ctrl+Plus (+)</b>
Decrease zoom	<b>Ctrl+Minus (-)</b>
Reset zoom to default	<b>Alt+1</b>
Close Library Browser	<b>Ctrl+W</b>

**Note** When you use the keyboard shortcuts on a Mac:

- Press **command** (⌘) instead of **Ctrl**.
- Press **option** instead of **Alt**.

### Navigate Levels of Library Browser Tree

To navigate the Library Browser in standalone mode, expand the hierarchy of libraries in the tree on the libraries pane.

You can have multiple libraries expanded at once.

To view the contents of a library, click the library name in the tree. The library contents appear in the blocks pane of the Library Browser window.

Library contents can be any combination of blocks, annotations, and libraries that are at a lower level in the hierarchy.

To select the parent library of the open library, right-click on any item in the open library and click **Go to parent**.

### Search for Library Items by Keyword

To search for a library item using key words or phrases, use the search box at the top of the Library Browser.

- 1 In the search box, type the search term or select it from the list of recent search terms.

To search for an annotation, type any of the text from the annotation or its description.

- 2 To use regular expressions, case-sensitive search, or whole-word search, click the **Search for subsystems, blocks, and annotations** button and select the search options you want to use.

- 3 Press **Enter** to start the search. The blocks pane displays the search results, grouped by library.

If there are more than 100 search results, the results take up multiple pages in the blocks pane. To navigate to the previous or next page of results, use the arrows in the upper left corner of the Library Browser window.

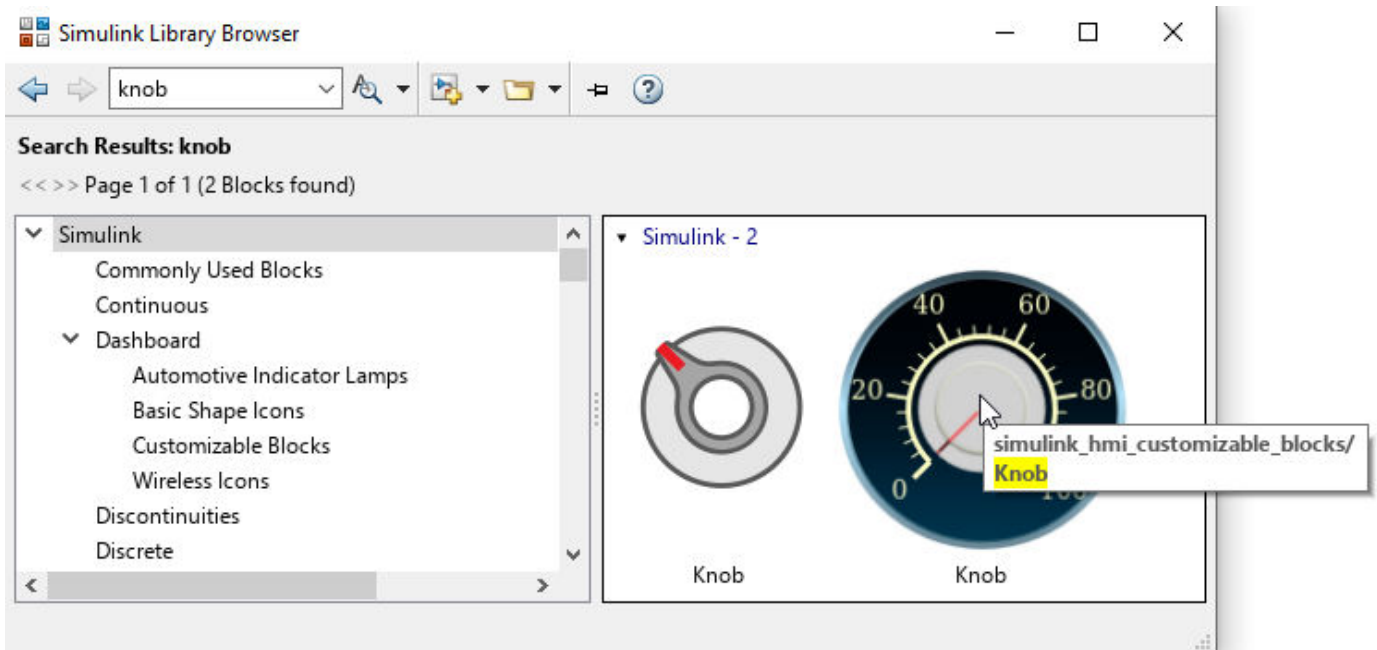

To see where the search string matches, pause on a block.

To navigate to the library that contains an item in the search results, right-click the item and select **Select in library view**.

As an example, search for the customizable Knob block.

- 1 In the search box at the top of the Library Browser, enter the keyword knob.
- 2 Press **Enter**. The blocks pane shows the search results, which are two Knob blocks.
- 3 Pause over the two blocks to find out which is the customizable Knob block. When you pause over the customizable Knob block, this text appears: `simulink_hmi_customizable_blocks/Knob`.

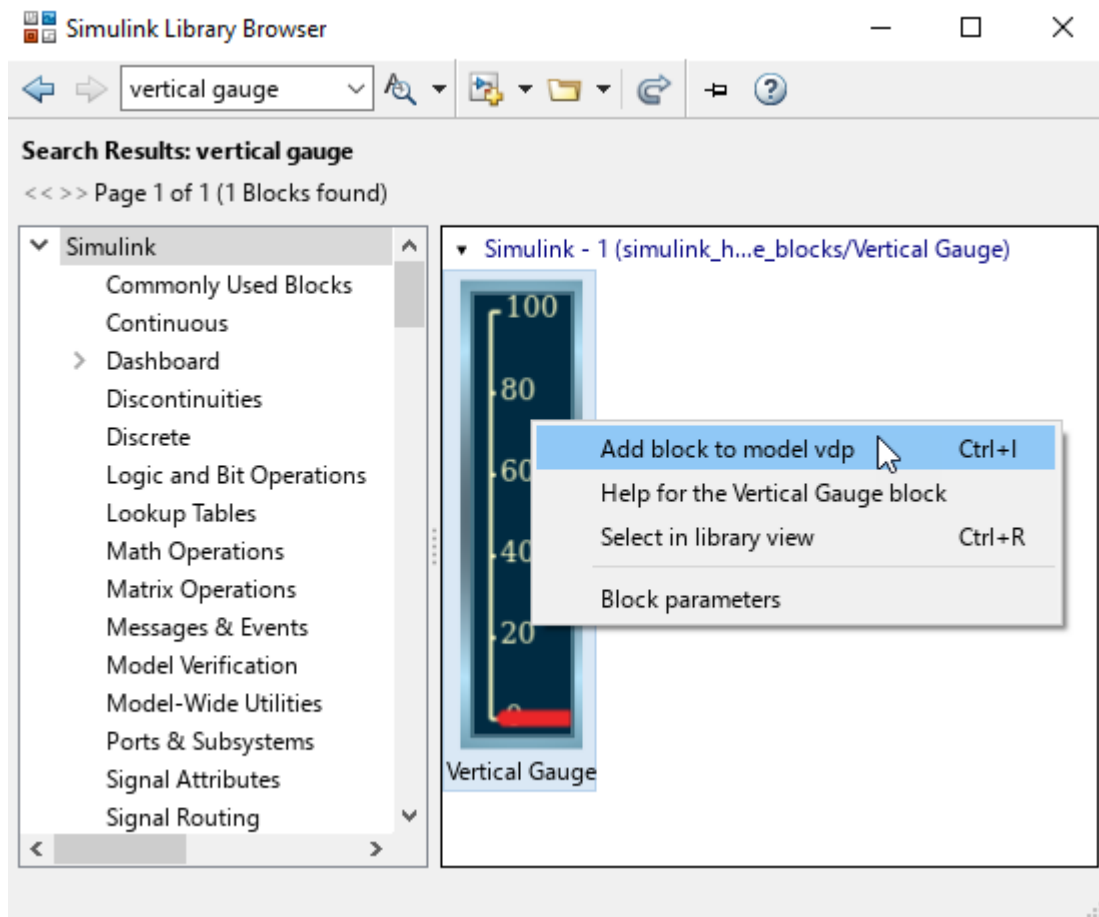

### Add Blocks and Annotations to Model from Library Browser

To add blocks and annotations from the **Library Browser** to an open model, right-click the block or annotation and select **Add block to model** or **Add block to a new model**. If no model is open, the **Add block to a new model** creates a model and adds the block to it.

Blocks that you have recently added to your model from the Library Browser appear in the **Recently Used** library at the bottom of the tree.

As an example, add a customizable Vertical Gauge block to an open model.

- 1 In the search box at the top of the Library Browser, enter `vertical gauge`.
- 2 Press **Enter**. The block pane shows the Vertical Gauge block.
- 3 Right-click the Vertical Gauge block and select **Add block to model**.

### Customize Library Browser Appearance

When you resize the libraries panel, the library contents flow to match the width of the window.

You can also programmatically customize the appearance of the Library Browser.

- Set the sort priority to change the order of the libraries in the tree.
- Hide libraries.
- Deactivate libraries.
- Expand or collapse libraries in the tree.

For more information and examples, see “Customize Library Browser Appearance”.

### Sort Libraries and Library Contents

The libraries and library contents are first sorted by sort priority and then by sorting order.

Libraries appear in ascending order of sort priority. By default, the Simulink library has a sort priority of -1, and all other libraries have a sort priority of 0. For more information about sort priority, see “Customize Library Browser Appearance”.

By default, the sorting order is alphabetical. Sublibraries appear first, then subsystems, then blocks, and then annotations.

You can change the sorting order to model order, the order set by the library developer. Typically, model order sorts the contents according to functionality and group related blocks together.

---

**Note** In standalone mode, you can only change the sorting order in the blocks pane. The sorting order of the tree is always alphabetical.

---

To switch from alphabetical order to model order in standalone mode, right-click the blocks pane or a library item in the blocks pane and select **Sort in library model order**. This setting is preserved from session to session.

To return to the alphabetical order, right-click the blocks pane or a library item in the blocks pane and select **Sort in alphabetical order**.

Some libraries do not follow the sorting order. For example, in the Simulink library, the **Quick Insert** library appears as the last item regardless of the sorting option you choose.

As an example, sort the contents of the **Simulink** library in model order.

- 1 In the Library Browser tree, select the **Simulink** library.
- 2 In the **Simulink** library, right-click any sublibrary, for example the **Dashboard** library, and select **Sort in library model order**. The order of the library changes to model order. In model order, related libraries are grouped together. For example, the **Continuous** and **Discrete** sublibraries have two other sublibraries between them when the **Simulink** library is in alphabetical order but follow each other when the sublibrary is in model order.

### Keep Library Browser in Front of Other Windows

To keep the Library Browser in front of other Simulink windows, in the Library Browser toolbar, click

**Stay on Top** .

To turn off this setting, click **Stay on Top** again.

For information on how to turn on this setting programmatically, see “Keep Library Browser in Front of Other Windows” on page 2-344.

## Programmatic Use

`libraryhandle = sLibraryBrowser` creates the Library Browser object `LibraryBrowser.LBStandalone` and returns the object handle.

When you use `sLibraryBrowser` to get the object handle:

- If the Library Browser is open in standalone mode, the Library Browser window moves in front of all other Simulink windows.
- If the Library Browser is not open in standalone mode, the Library Browser opens in standalone mode.

`sLibraryBrowser('close')` closes the Library Browser in standalone mode.

`sLibraryBrowser('open')` opens the Library Browser in standalone mode.

`sLibraryBrowser('noshow')` loads the Library Browser in memory without making it visible. Use this command to quickly open the Library Browser programmatically in standalone mode.

## Version History

**Introduced before R2006a**

### **R2022b: Docked Simulink Library Browser**

Starting in R2022b, the **Library Browser** button in the Simulink Toolstrip opens a Library Browser that is docked as a panel in the Simulink window. The Library Browser is docked so that the Library Browser window stays to one side of the model and does not cover areas in the model canvas where you want to add items.

When you have multiple Simulink windows open, you can open a docked Library Browser in each one by clicking the **Library Browser** button of the respective window.

# Model Data Editor

Inspect and edit data items (signals, parameters, and states) in a table that you can sort, group, and filter

## Description

The **Model Data Editor** enables you to inspect and edit data items such as signals, block parameters (for example, the **Gain** parameter of a Gain block), and data stores in a list that you can sort, group, and filter. You can then configure properties and parameters, such as data types and dimensions, without having to locate the items in the block diagram.

Use the Model Data Editor to configure multiple signals, states, and algorithmic parameters. The Model Data Editor can set only certain parameters and properties such as data types, initial values, and physical units. To work with one model element at a time, open the **Property Inspector**. To perform batch operations, open the Model Data Editor.

For information about setting block properties and parameters, see “Signal Properties”.

When creating and debugging a model, you can configure multiple data items at once by selecting the corresponding signals and blocks in the block diagram. Work with the selected items in the Model Data Editor instead of opening individual dialog boxes. Use this technique to more quickly view and compare properties of multiple signals that are close to each other in the diagram, for example, in a subsystem.

Use the Model Data Editor to configure:

- Instrumentation for signals and data stores, which allows you to view and collect the simulation values. For example, you can log signals to compare data in the Simulation Data Inspector.
- Design attributes such as data type, minimum and maximum value, and physical units. You can use these attributes to:
  - Specify the values of numeric block parameters.
  - Control the interaction (interface) between components through Inport and Outport blocks and data stores (see “Configure Data Interfaces”).
  - Specify the dimensions of nonscalar signals in a model.

---

**Note** The Model Data Editor does not show information about data items in referenced models (which you reference with Model blocks). To work with data items in a referenced model, open the Model Data Editor in that model.

---

## Columns in the Data Table

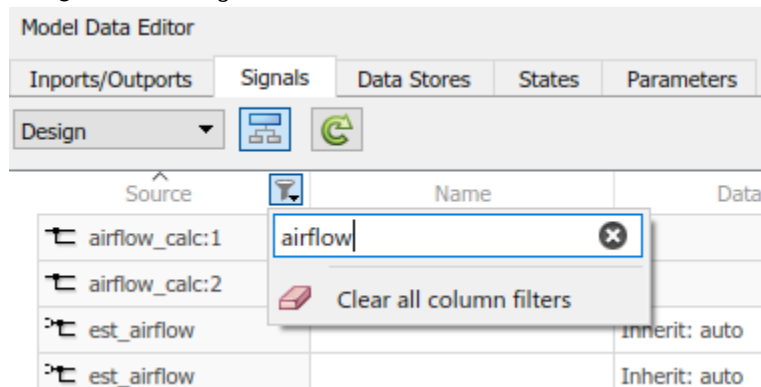

Use this table to find more information about the purpose of the columns in the Model Data Editor.

Column Name	Purpose and More Information
<b>Source</b>	Shows the name of the block that defines the data item. For signals, also shows the number of the block port that generates the signal.  For workspace variables, shows the name of the workspace or data dictionary that contains the variable.
<b>Signal Name</b> or <b>Name</b>	Sets the name of the signal, state, or data store. For information about naming signals, see “Signal Names and Labels”.  For parameters, displays the programmatic name of each parameter.  For workspace variables, sets the name of the variable.
<b>Data Type</b>	“Control Data Types of Signals” and “Control Block Parameter Data Types”
<b>Min and Max</b>	“Specify Signal Ranges” and “Specify Minimum and Maximum Values for Block Parameters”
<b>Dimensions</b>	“Determine Signal Dimensions”
<b>Complexity</b>	Sets the numeric complexity of the data item.
<b>Sample Time</b>	“What Is Sample Time?”
<b>Unit</b>	“Unit Specification in Simulink Models”
<b>Test Point</b>	“Configure Signals as Test Points”
<b>Log Data</b>	“Iterate Model Design Using the Simulation Data Inspector”
<b>Resolve</b>	Corresponds to the <b>Signal name must resolve to Simulink signal object</b> check box in the Signal Properties dialog box and similar check boxes in block dialog boxes for states and data stores. See “Use Signal Objects”.
<b>Shared</b>	Corresponds to the <b>Share across model instances</b> parameter of the Data Store Memory block. See Data Store Memory.
<b>Initial Value</b>	Sets the initial value of the state or data store. See “Initialize Signal Values”.
<b>Value</b>	“Set Block Parameter Values”
<b>Argument</b>	Configures a variable in a model workspace as a model argument. See “Parameterize Instances of a Reusable Referenced Model”.
<b>Path</b>	Shows the location of the block in the model and provides a link to the block in the Simulink Editor. Visible when you click the <b>Change Scope</b> button.

## Two Entries Per Cell in the Data Table

When a cell contains two entries (for instance, in the **Data Type** column), the entry on the right side of the cell indicates compiled information. The compiled information shows you the value that the data item uses for simulation.

For example, the default data type setting for most signals in a model is `Inherit: Inherit via internal rule`. With this setting, after you update the block diagram, Simulink chooses a specific data type, such as `single`, for the signal to use for simulation. In the Model Data Editor, the cell in the **Data Type** column shows `Inherit: Inherit via internal rule` on the left side and `single` on the right side.

## Open the Model Data Editor

- In the Simulink Toolstrip, on the **Modeling** tab, click **Model Data Editor**.
- While in the Simulink Editor, press **Ctrl+Shift+E**.

## Examples

### Configure Distant Data Items

In this example, use the Model Data Editor to log signals in different subsystems and referenced models so you can inspect their data using the **Simulation Data Inspector**.

The “Using a Data Dictionary to Manage the Data for a Fuel Control System” on page 13-139 example model `sldemo_fuelsys_dd` represents the fueling system of a vehicle engine. The referenced model `sldemo_fuelsys_dd_controller` controls the rate of fuel flow to the engine.

First, explore the example models.

- 1 Open the example model `sldemo_fuelsys_dd` and the referenced model `sldemo_fuelsys_dd_controller`.

```
openExample('simulink_automotive/UseDDForFuelContSysExample')
sldemo_fuelsys_dd
sldemo_fuelsys_dd_controller
```

- 2 Navigate to the `airflow_calc` subsystem.

The Pumping Constant block contains a lookup table that describes the performance of a fuel pump. You can stream the output of this block to the Simulation Data Inspector.

- 3 Navigate to the root of the model and into the `fuel_calc` subsystem.
- 4 Navigate into the `feedforward_fuel_rate` subsystem.

The Output block named `ff_fuel_rate` passes feedforward information to the fuel rate control algorithm.

- 5 Navigate back to the `fuel_calc` subsystem and into the `switchable_compensation` subsystem.

The Inport block named `ff_fuel_rate` carries the feedforward information. You can stream the output of this Inport block.

Then, log signals for data inspection.

- 1 Navigate to the root of the `sldemo_fuelsys_dd_controller` model.
- 2 In the Model Data Editor, inspect the **Signals** tab.
- 3 Set the **Change view** drop-down to Instrumentation.

- 4 Activate the **Change scope** button  to display the contents of the subsystems.

The Model Data Editor identifies all the signals in the model. The **Path** column appears.

- 5 In the **Filter Contents** box, type `ff_fuel_rate`.

The Model Data Editor updates the list of signals to include only those named `ff_fuel_rate`. You can click the link in the **Path** column to view where the signal resides within the model.

- 6 Select the **Log Data** check box for the signal whose path is `sldemo_fuelsys_dd_controller/fuel_calc/switchable_compensation`.

This instructs Simulink to send the data for the logged signals to the Simulation Data Inspector.

- 7 Filter the signals again using the text `Pumping Constant`.

The table contains one row that corresponds to the output of the Pumping Constant block.

- 8 Select the **Log Data** check box for the `Pumping Constant` signal.
- 9 Simulate the system model, `sldemo_fuelsys_dd`. During the simulation, double-click a Manual Switch block, such as `Engine Speed Selector`, to disturb the fuel control system.

- 10 When the simulation finishes, the **Simulation Data Inspector** button  is highlighted. This indicates that there is data to inspect and compare. Click the **Simulation Data Inspector** button.

- 11 In the left pane, expand the **Run** node that corresponds to the simulation run and select the check boxes for the signals whose data you want to inspect and compare.

The Simulation Data Inspector presents the values for the selected signals on the same graph.

## Find and Organize Data by Filtering, Sorting, and Grouping

In the example model `sldemo_fuelsys_dd_controller`, variables and parameter objects set the values of block parameters. The variables and objects reside in a data dictionary. Use the Model Data Editor to display these dictionary entries together in a group.

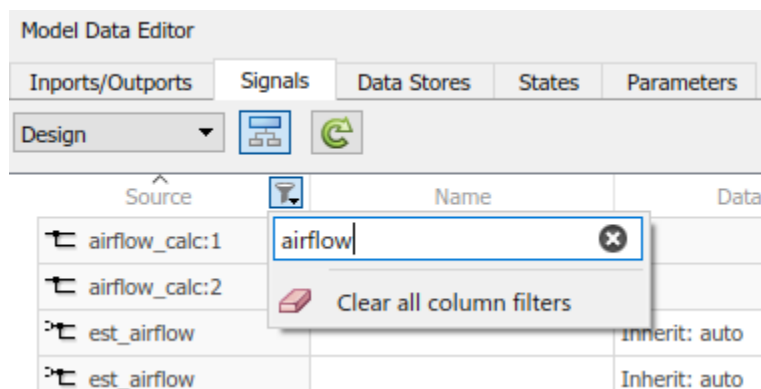

- 1 Open the `sldemo_fuelsys_dd_controller` model.
- 2 In the example model, open the Model Data Editor and select the **Parameters** tab.
- 3 Activate the **Change scope** button to display the contents of the subsystems.
- 4 Click the **Show/refresh additional information** button to display rows that correspond to the dictionary entries.
- 5 Right-click the **Source** column header and select **Group by This Column**.

The Model Data Editor groups the list by block or workspace (including a group for the dictionary entries).

- 6 Find the group labeled **Source: Dictionary**. Now, you can use the Model Data Editor to inspect and modify the attributes of the variables and objects in the dictionary.

The Model Data Editor allows you to filter a list of data items by using one or a combination of these methods:

- To filter the data table through a text search, use the **Filter contents** box.
- To filter based on the blocks or signals that you select in the model, next to the **Filter contents** box, click the **Filter using selection** button. Then, as you click blocks and signals in the model, the Model Data Editor shows you only the rows that are relevant to that block or signal. If you lasso multiple blocks or signals, the Model Data Editor shows only the rows that are relevant to those model elements.
- To filter based on column-specific criteria, point to a column header and click the filter icon . As you type in the text box, the editor applies a substring filter to the column contents. After the filter is applied, the column displays a smaller filter icon  next to the column header. To edit a filter, remove a filter, or remove all column filters, click this icon.

## Select Multiple Data Items from Block Diagram

In the example model `sldemo_househeat`, use the Model Data Editor to log the signals in the Heater subsystem for inspection using the **Simulation Data Inspector**.

- 1 Open the `sldemo_househeat` model.
- 2 In the `sldemo_househeat` model, open the Heater subsystem.
- 3 Open the Model Data Editor and select the **Signals** tab.

The Model Data Editor identifies all the signals in the subsystem.

- 4 In the Model Data Editor, set the **Change view** drop-down list to **Instrumentation**.
- 5 Using the Simulink Editor, select all the signals in the subsystem. Optionally, do not select the output of the Constant block because the signal value does not change during the simulation.

In response, the Model Data Editor highlights the rows that correspond to the signals you selected.

- 6 In the Model Data Editor, for any of the signals, click the check box in the **Log Data** column.

The Model Data Editor selects the check box for all of the selected signals.

- 7 Simulate the model.
- 8 Open the Simulation Data Inspector and, in the leftmost pane, expand the **Run** node that corresponds to the simulation run. Select the check boxes for the signals whose values you want to inspect and compare.

### Interact with a Model That Uses Workspace Variables

When you use workspace variables (such as numeric MATLAB variables and `Simulink.AliasType` objects) to share settings between data items, you can interact with those variables through the Model Data Editor. You do not need to work outside the Editor to configure the data items. In the Editor, click the **Show/refresh additional information** button, which finds variables that the model uses by updating the block diagram.

This example shows how to work with objects that a model uses to set block parameter values. You modify the value of a variable that the model `sldemo_fuelsys` uses.

- 1 Open the “Model a Fault-Tolerant Fuel Control System” on page 13-124 example model `sldemo_fuelsys`.

```
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
sldemo_fuelsys
```

- 2 Open the Model Data Editor **Parameters** tab.
- 3 In the Model Data Editor, click the **Show/refresh additional information** button.

The data table now contains rows that correspond to variables and objects that the model uses.

- 4 In the model, navigate into the `fuel_rate_control` subsystem and then the `airflow_calc` subsystem.
- 5 In the Model Data Editor, next to the **Filter contents** box, select the **Filter using selection** button.

With this button selected, when you select a block or signal in the block diagram, the data table shows only the data items and workspace variables that are relevant to that block or signal.

- 6 In the model, click the lookup table block labeled **Pumping Constant**.

The Model Data Editor shows that the block uses three workspace variables. The block acquires some breakpoint values from the variable `SpeedVect`.

Now, you can use the columns in the Model Data Editor to configure the properties of SpeedVect.

You can further interact with a variable to:

- Configure other properties that the columns do not represent:
  - 1** In the model, open the Property Inspector. On the **Modeling** tab, under **Design**, click **Property Inspector**.
  - 2** In the Model Data Editor, select the row that corresponds to the target variable or object. If the Property Inspector does not respond, select a different row and then select the target row again.
  - 3** Use the Property Inspector to configure the target properties.
- Move the variable between workspaces and data dictionaries and configure the variable alongside other variables. Use the Model Explorer. To open the Model Explorer, in the Model Data Editor data table, double-click the icon in the leftmost column. For more information about using the Model Explorer, see “Edit and Manage Workspace Variables by Using Model Explorer”.
- Rename a variable everywhere it is used by blocks in Simulink models. In the Model Data Editor, right-click the variable and select **Rename All**. You can rename only variables that the function `Simulink.findVars` supports.
- Find blocks that use a specific variable. In the Model Data Editor, right-click the variable and select **Find Where Used**.

### Inspect Individual Data Item

To focus on an individual data item, use one of these techniques:

- In the Model Data Editor, next to the **Filter contents** box, select the **Filter using selection** button. Then, in the model, click the block or signal that corresponds to the data item.

Use this technique to configure the item by using the columns in the data table.

- In the model, open the Property Inspector. On the **Modeling** tab, under **Design**, click **Property Inspector**. Then, in the data table, click the target row. The Property Inspector shows the properties of the data item. If the Property Inspector does not respond when you click the target row, click a different row and then click the target row again.

Use this technique to inspect all of the properties that the Model Data Editor can access at once (in other words, the union of the columns available in the **Design** and **Instrumentation** views).

- In the model, open the Property Inspector. Then, in the data table, for the target row, double-click the cell in the leftmost column (the icon). In the model, select the highlighted block or signal.

Use this technique to inspect all properties, including those that the Model Data Editor cannot access.

### Navigate from Model Data Editor to Block Diagram

To navigate from a data item in the Model Data Editor to the block in the diagram that owns the data item, double-click the icon in the left-most column. The Simulink Editor then focuses on the relevant

block. Use this technique to navigate to blocks when you select **Change scope** to view the contents of subsystems below the current system.

- “Use the Model Data Editor for Batch Editing”
- “Using a Data Dictionary to Manage the Data for a Fuel Control System” on page 13-139

## Limitations

- You cannot access these attributes by using the Model Data Editor:
    - Any settings related to code generation. Instead, use the Code Mappings editor or code mappings API.
    - For mask parameters:
      - Any settings for tunable mask parameters other than the parameter value.
      - Any settings for nontunable mask parameters.
- Note that some built-in blocks are masked and can have tunable or nontunable mask parameters.
- Any settings for parameters of Simscape blocks.
  - Any settings for data items in referenced models. Instead, open the Model Data Editor in the referenced models.
  - Any settings for variables that are not defined in the base workspace, a model workspace, or a data dictionary. For example, you cannot access the attributes of variables created by mask initialization code.
  - On the **Parameters** tab, the data type, minimum value, and maximum value of a Constant block. Use the **Signals** tab instead.

For some settings that you cannot access with the Model Data Editor, you can use the **Property Inspector** instead. Open the Property Inspector and select the target data item in the model, not in the Model Data Editor. For mask parameters, use the mask dialog box or the Mask Editor as described in “Masking Fundamentals”.

- The Model Data Editor does not show Stateflow data. However, the Model Data Editor shows the data for Simulink functions that you define inside Stateflow charts.

To manage Stateflow data, events, and messages in a chart, see “Manage Symbols in the Stateflow Editor” (Stateflow).

- On the **Parameters** tab, these variables are not available:
  - Variables used by non-tunable block parameters. For example, the minimum and maximum parameters on a Gain block or the `Sample time` on a Constant block.
  - Variant control variables
  - Variables used for symbolic dimensions

## Version History

# Model Explorer

View, modify, and add elements of Simulink models, Stateflow charts, and workspace variables

## Description

Use the Model Explorer to view, modify, and add elements of Simulink models, Stateflow charts, and workspace variables.

The Model Explorer lets you focus on specific elements (for example, blocks, signals, and properties) without navigating through the model or chart.

Use the Model Explorer to search for:

- Variables in workspaces and data dictionaries
- Variable usage in a model
- Instances of a type of block
- Block parameters and parameter values

You can combine search criteria and iteratively refine the results. Search in the Model Explorer for model elements, starting with the node you select in the model hierarchy. You can search the entire model, in a particular system, or in a system and all the systems below it in the hierarchy. Using your search results, you can apply changes to multiple elements at once.

To manipulate model data (block parameters, signals, and states) in a searchable, sortable table, consider using the **Model Data Editor**. You can specify data attributes such as parameter values, signal names, and initial values for states.

To create, modify, and view the entries in a data dictionary, use the Model Explorer. See “Edit and Manage Workspace Variables by Using Model Explorer” and “View and Revert Changes to Dictionary Data”.

## Open the Model Explorer

- In the Simulink Toolstrip, on the **Modeling** tab, click **Model Explorer**.
- In an open model in the Simulink Editor, right-click a block and select **Explore**.
- In an open Stateflow chart, right-click the drawing area and select **Explore**.

## Examples

### Add Objects to a Model, Chart, or Workspace

You can use the Model Explorer to add many kinds of objects to a model, chart, or workspace. The types of objects that you can add depend on the node that you select in the **Model Hierarchy** pane.

Use toolbar buttons or the **Add** menu to add objects. The **Add** menu lists the types of objects you can add.

### Cut, Copy, and Paste Objects Between Workspaces

You can cut, copy, and paste objects from one workspace into another workspace.

- 1 In the **Contents** pane, perform one of these actions:
  - Right-click the workspace object you want to cut or copy. Select **Cut** or **Copy**.
  - Click the workspace object you want to cut or copy. In the **Edit** menu, select **Cut** or **Copy**.
  - Click the workspace object you want to cut or copy. In the toolbar, click the **Cut** button  or **Copy** button .
- 2 To paste the workspace object that you cut or copied, in the **Model Hierarchy** pane:
  - Right-click the workspace into which you want to paste the object, and select **Paste**.
  - Click the workspace into which you want to paste the object. In the **Edit** menu, select **Paste**.
  - Click the workspace into which you want to paste the object. In the toolbar, click the **Paste** button .

When you copy and paste (or drag and drop), you can manage the resolution of name conflicts. In the dialog box, choose an action for each item whose name conflicts with an existing item.

- **Skip** — Default action when the conflicting items have the same value.
- **Replace** — Default action when the conflicting items have different values.
- **Keep both** — Preserve both copies. The name given to the copied item follows the naming rules that are used in the MATLAB workspace.

If the source and destination are the same, the software resolves the name conflict by following the naming rules that are used in the MATLAB workspace.

You can also cut, copy, and paste by selecting an object and performing drag and drop operations.

## Edit Object Properties

You can edit object properties in the Model Explorer.

In the **Contents** pane, first select the row that contains the value, and then click the value. Change the value of the selected property by typing or selecting a new value.

To assign the same property value to multiple objects in the **Contents** pane, select the objects and then change one of the values of the selected objects. The Model Explorer assigns the new property value to all of the selected objects.

Alternatively, you can edit values for model elements in the **Dialog** pane. To display the **Dialog** pane, click **View > Show Dialog Pane**.

To edit workspace variables, such as arrays or structures, you can use the Variable Editor.

To open a properties dialog box for an object, in the **Model Hierarchy** pane, right-click the object and select **Properties**. Alternatively, click an object and from the **Edit** menu, select **Properties**.

## Search and Refine Search Results

To find objects that might not be currently displayed, search.

In this example, you search for elements that have an **Integer rounding mode** parameter. You then refine the results to include only n-D Lookup table blocks. You can use the search results to find out more about how these values are set or make batch changes to the elements found by the search.

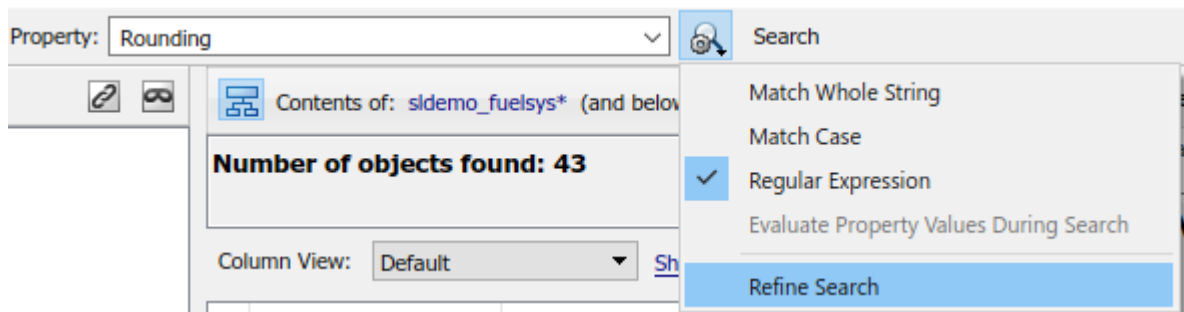

- 1 Open the “Model a Fault-Tolerant Fuel Control System” on page 13-124 example model `sldemo_fuelsys`.
 

```
openExample('simulink_automotive/ModelingAFaultTolerantFuelControlSystemExample')
sldemo_fuelsys
```
- 2 On the **Modeling** tab, click **Model Explorer**.
- 3 To specify the scope of the search, use the **Model Hierarchy** pane in combination with the **View > Show Current System and Below** setting. For example, to search the current system and loaded systems below it, select the `sldemo_fuelsys` node and enable **View > Show Current System and Below**.
- 4 Display the search bar by enabling **View > Toolbars > Search Bar**.
- 5 In the search bar, set:
  - **Search** to by Property Name
  - **Property** to Rounding

Rounding is the programmatic name for the **Integer rounding mode** parameter. Block reference pages list the programmatic name for a parameter in the parameter description.

- 6 Click **Search**. In the **Search Results** box, results appear. You can go to an item by clicking the link to the path.

- 7 Refine the search. In the search bar, click the **Search Options** button  and select **Refine Search**.

The search button label changes to **Refine**. Additional search criteria act on the previous set of results.

- 8 Set **Search** to by **Block Type** and set **Type** to **Lookup\_n-D**. Click **Refine**.
- 9 To work further with the values, click **Show Details**.

Suppose the property you are interested in learning more about or acting on is **Rounding**. First, add a column for it. Select **Rounding** from the list (you can enter it in the **Find Properties** box to locate it quickly), and click the **Display property as column in view** button .

A column for **Rounding** appears in the search results. For any column, you can view, sort, and change values for multiple items. For example, to change the **Rounding** values on all of the n-D Lookup Table blocks in this search, select all the items in the list. In the **Rounding** column, click any cell and select a new value from the list (for example, **Floor**).

**Tip** To view a summary of the search options that you used, expand the **Number of objects found** box by clicking the **Show Search Details** button .

You can use the Model Explorer to create, modify, and view the entries in a data dictionary. See “Edit and Manage Workspace Variables by Using Model Explorer” and “View and Revert Changes to Dictionary Data”.

## Display Partial or Whole Model Hierarchy Contents

By default, the Model Explorer displays objects for the system that you select in the **Model Hierarchy** pane. It does not display data for child systems. You can override that setting, so that the Model Explorer displays objects for the whole hierarchy of the currently selected system.

To toggle between displaying only the current system and displaying the whole system hierarchy of the current system, use one of these techniques:

- Select **View > Show Current System and Below**.
- Click the **Show contents of current system and below** button  at the top of the **Contents** pane.

When you select the **Show Current System and Below** option:

- The **Model Hierarchy** pane highlights the current system and its child systems.
- After the path in the **Contents** pane, the text (and below) appears.

Loading very large models for the current system and below can be slow. To stop the loading process at any time, either click the **Show contents of current system only** button or click another node in the tree hierarchy.

If you show the current system and below, you might want to change the view to better reflect the displayed system contents.

The setting for the **Show Current System and Below** option is persistent across Simulink sessions.

---

**Note** To open a graphical object (for example, a model, subsystem, or chart) in a Simulink Editor window from the Model Explorer, right-click the object in the **Model Hierarchy** pane, then select **Open**.

---

## Display Linked Library Subsystems and Masked Subsystems

By default, the Model Explorer does not display the contents of linked library subsystems or masked subsystems in the **Model Hierarchy** pane.

To display the contents of linked library subsystems or masked subsystems, use one of these approaches:

- At the top of the **Model Hierarchy** pane, click the **Show/Hide Library Links** button  or the **Show/Hide Masked Subsystems** button .
- From the **View** menu, select **Show Library Links** or **Show Masked Subsystems**.

Linked subsystems and masked subsystems are visible in the **Contents** pane, regardless of how you configure the **Model Hierarchy** pane.

---

**Note** Search does not find elements in linked library or masked subsystems that are not displayed in the **Model Hierarchy** pane.

---

For subsystems that are both linked and masked, how you set the linked subsystems and masked subsystems options affects which subsystems appear in the **Model Hierarchy** pane, as described in the following table.

Settings	Subsystems Displayed in the Model Hierarchy Pane
<b>Show Library Links</b> <b>Hide Masked Subsystems</b>	Only library-linked, unmasked subsystems
<b>Hide Library Links</b> <b>Show Masked Subsystems</b>	Only masked subsystems that are not library-linked subsystems
<b>Show Library Links</b> <b>Show Masked Subsystems</b>	All library-linked or masked subsystems

### Expand and Edit Referenced Models

To browse a model that includes Model blocks, you can expand the **Model Hierarchy** pane nodes of the Model blocks.

To browse a model referenced by a Model block:

- 1 Right-click the referenced model node in the **Model Hierarchy** pane.
- 2 Select **Open Model**.

The referenced model opens as a top model and appears as a separate node in the **Model Hierarchy** pane. While you can expand the Model block node and display the corresponding contents, you must use the node that corresponds to the referenced model to edit them.

For example, the `sldemo_mdref_depgraph` model includes Model blocks that reference other models. If you open the `sldemo_mdref_depgraph` model and expand that model node in the **Model Hierarchy** pane, you see that the model contains several Model blocks, including `heat2cost`.

If you right-click the `heat2cost` Model block node and select **Open Model**, the **Contents** pane displays the objects in the `heat2cost` Model block. You can expand the `heat2cost` node.

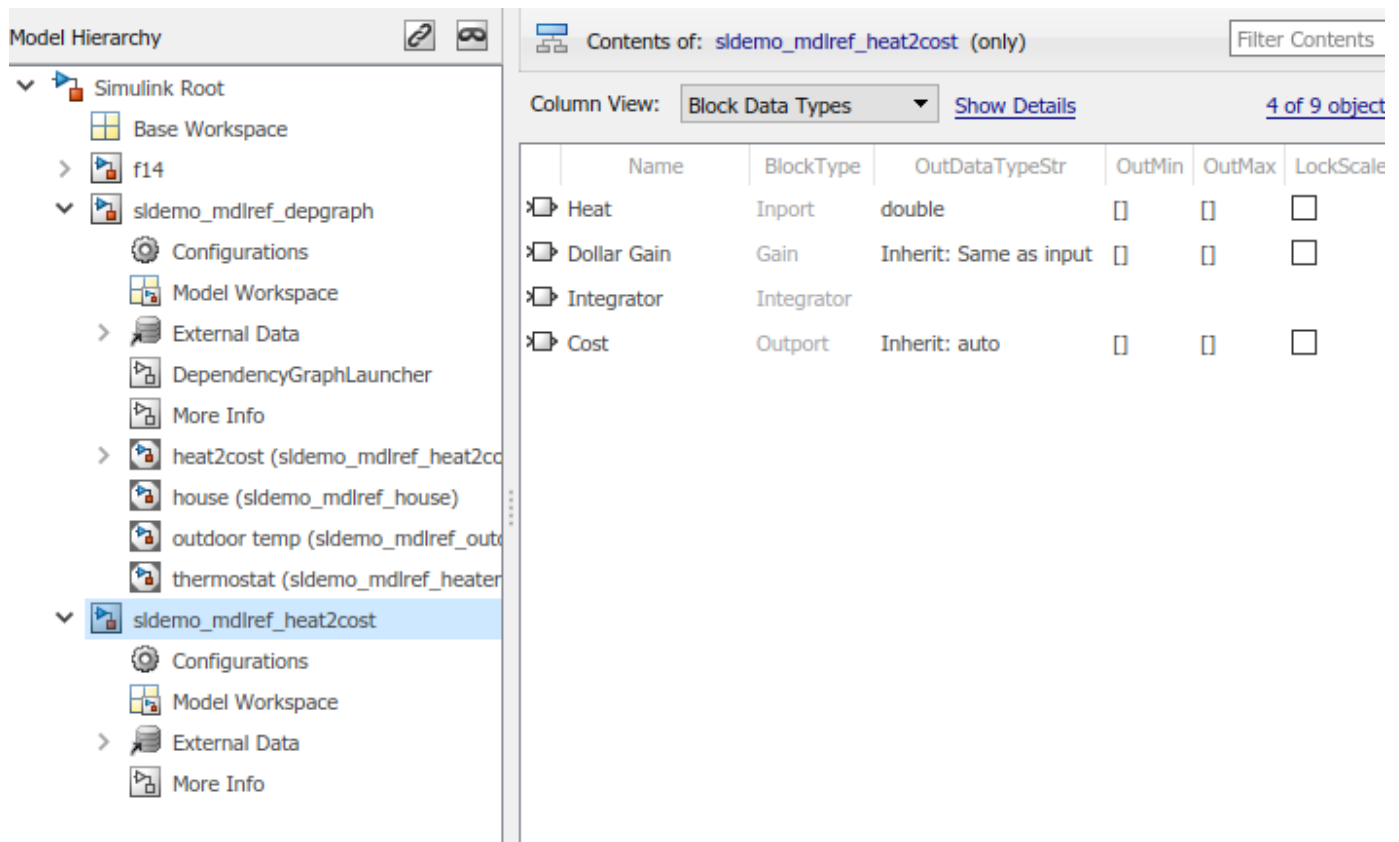

The screenshot displays the Simulink Model Hierarchy and Column View panes. The Model Hierarchy pane on the left shows a tree structure starting with 'Simulink Root', followed by 'Base Workspace', 'f14', and 'sldemo\_mdref\_depgraph'. Under 'sldemo\_mdref\_depgraph', there are several sub-items including 'Configurations', 'Model Workspace', 'External Data', 'DependencyGraphLauncher', 'More Info', and 'heat2cost (sldemo\_mdref\_heat2cc)'. The 'heat2cost' node is expanded, showing its own 'Model Workspace' and 'More Info' sub-items, as well as 'house (sldemo\_mdref\_house)', 'outdoor temp (sldemo\_mdref\_outdoor temp)', and 'thermostat (sldemo\_mdref\_thermostat)'. The 'sldemo\_mdref\_heat2cost' node is also visible at the bottom of the hierarchy.

The Column View pane on the right shows the contents of the selected model, 'sldemo\_mdref\_depgraph/heat2cost (only)'. The column view is set to 'Block Data Types' and shows a table with the following columns: Name, BlockType, OutDataTypeStr, OutMin, OutMax, and Loc. The table lists the following blocks:

Name	BlockType	OutDataTypeStr	OutMin	OutMax	Loc
Model Workspace					
Heat	Inport	double			<input type="checkbox"/>
Dollar Gain	Gain	Inherit: Same as input			<input type="checkbox"/>
Integrator	Integrator				
Cost	Output	Inherit: auto			<input type="checkbox"/>

You can browse the contents of the referenced model, but you cannot edit the objects in the Model block.

To edit the referenced model, expand the referenced model node in the **Model Hierarchy** pane, and then access the properties of objects in the referenced model. For example, expand the `sldemo_mdref_heat2cost` node.

Model Hierarchy

- Simulink Root
  - Base Workspace
  - f14
    - sldemo\_mdref\_depgraph
      - Configurations
      - Model Workspace
      - External Data
      - DependencyGraphLauncher
      - More Info
      - heat2cost (sldemo\_mdref\_heat2cc)
        - house (sldemo\_mdref\_house)
        - outdoor temp (sldemo\_mdref\_outd)
          - thermostat (sldemo\_mdref\_heater)
            - sldemo\_mdref\_heat2cost
              - Configurations
              - Model Workspace
              - External Data

Column View: **Block Data Types** [Show Details](#) 4 of 9 object

Name	BlockType	OutDataTypeStr	OutMin	OutMax	LockScale
Heat	Inport	double	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Dollar Gain	Gain	Inherit: Same as input	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Integrator	Integrator				
Cost	Outport	Inherit: auto	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

For information about referenced models, see “Model Reference Basics”.

## Change Font Size

You can change the font size in the Model Explorer panes.

To increase the font size, press **Ctrl+Plus (+)**. Alternatively, from the Model Explorer **View** menu, select **Increase Font Size**.

To decrease the font size, press **Ctrl+Minus (-)**. Alternatively, from the Model Explorer **View** menu, select **Decrease Font Size**.

The changes remain in effect for the Model Explorer and in Simulink dialog boxes across Simulink sessions.

## Create Views

If a default view that ships with the Model Explorer does not meet your needs, you can modify or create a view.

To open the View Manager dialog box, select **View > Column View > Manage Views**.

To copy and rename an existing view:

- 1 In the View Manager dialog box, select the view that you want to use as the starting point for your new view.
- 2 Click the **Copy** button.

A new row appears at the bottom of the View Manager table. The new row contains the name of the view you copied, followed by a number in parentheses. For example, if you copy the Stateflow view, the initial name of the copied view is Stateflow (1).

To create a new view, in the View Manager dialog box, click the **New** button. A new view row appears at the bottom of the View Manager table.

After you create a view, you can name and describe the view:

- 1 Double-click the name of the view in the **View** column and enter a name for the view.
- 2 Double-click the text in the **Description** column and enter a description for the view.
- 3 Click **OK**.

### **Customize Views and Filter Contents**

You can control the information the **Contents** pane displays and directly manipulate column headings.

To control which property columns to display, use the **View > Column View** option.

To control which types of objects to display, use the **View > Row Filter** option.

To focus on specific objects in the **Contents** pane, based on a search string, filter contents.

As you customize the table represented by the current view, you change the current view definition. The Model Explorer saves the following changes to the table as part of the column view definition:

- Grouping by property
- Sorting in a column
- Changing the order of property columns
- Adding a property column
- Hiding and removing property columns

When you change from one view to another view, the Model Explorer saves any customizations that you have made to the previous view.

For example, suppose you set **Column View** to **Block Data Types** view and you hide the **LockScale** property column. If you then switch to use the **Data Objects** view, and later use the **Block Data Types** view again, the **Block Data Types** view no longer includes the **LockScale** column that you hid.

At the end of a Simulink session, the Model Explorer saves the view customizations that you made during that session. When you reopen the Model Explorer, Simulink uses the customized view, and maintains any changes that you made to the view in the previous session.

If you modify a default view that ships with the Model Explorer, you can reset it to factory settings. With the default view as the current view, in the **Contents** pane, click **Show Details**, then click **Options > Reset This View to Factory Settings**.

To reset the factory settings for *all* default views in one step, in the View Manager dialog box, click the **Options > Reset All Views to Factory Settings**.

---

**Note** When you reset all views, the Model Explorer removes all the custom views you have created. Before you reset views to factory settings, export any views that you will want to use in the future. For more information, see “Manage Views” on page 7-75.

---

## Manage Views

In the View Manager, you can delete, reposition, export, and import views for use by the Model Explorer.

To open the View Manager, select **View > Column View > Manage Views**.

To delete a view from the **Column View** list of views:

- 1 In the View Manager dialog box, select one or more views that you want to remove from the list.
- 2 Click the **Delete** button or press the **Delete** key.
- 3 Click **OK**.

Deleting a view using the View Manager dialog box permanently deletes that view from the Model Explorer interface. If you think you or someone else might want to use a view again, consider exporting the view before you delete it.

To change the position of a view in the **Column View** list:

- 1 In the View Manager dialog box, select one or more views that you wish to move up or down in the table of views.
- 2 Click the up or down arrow buttons to the right of the table. Repeat this step until the view appears where you want it to be in the table.
- 3 Click **OK**.

To export views that you or others can then import:

- 1 In the View Manager dialog box, select one or more views that you want to export.
- 2 Click the **Export** button. The Export Views dialog box opens with check marks next to the views that you selected.
- 3 Click **OK**. An Export to File Name dialog box opens.

Navigate to the folder where you want to export the view. By default, the Model Explorer exports views to the current folder in MATLAB.

- 4 Specify the file name for the exported view. The file is saved as a **.mat** file.
- 5 Click **OK**.

To import view files for use by the Model Explorer:

- 1 In the View Manager dialog box, click **Import**. The Select .mat File to Import dialog box opens.
- 2 Navigate to the folder that contains the view you want to import.
- 3 Select the MAT-file containing the view that you want to import and click **Open**. A confirmation dialog box opens. Click **OK** to import the view.

The imported views are added at the bottom of the View Manager table. The Model Explorer automatically renames the view if a name conflict occurs.

- Model Data Editor

## Parameters

### Search Bar

**Search** — Specify the type of objects or properties to include in the search  
by Name | by Property Name | by Property Value | by Block Type | ...

Open the search bar by selecting **View > Toolbars > Search Bar**.

Use the **Search** setting to specify the type of objects or properties to include in the search.

Search Type Option	Description
by Name	Searches a model or chart for all objects that have the specified string in the name of the object.
by Property Name	Searches for objects that have a specified property. Specify the target property name from a list of properties that objects in the search domain can have.
by Property Value	Searches for objects with a property value that matches the value you specify. Specify the name of the property, the value to be matched, and the type of match (for example, equals, less than, or greater than).
by Block Type	Searches for blocks of a specified block type. Select the target block type from the list of types contained in the currently selected model.
by Stateflow Type	Searches for Stateflow objects of a specified type.
for Variable Usage	Searches for blocks that use variables defined in a workspace. Select the base workspace or a model workspace (model name) and, optionally, the name of a variable.
for Referenced Variables	Searches for variables that a model or block uses. Specify the name of the model or block in the <b>by System</b> field. The model or block must be in the <b>Model Hierarchy</b> pane.
for Unused Variables	Searches for variables that are defined in a workspace but not used by any model or block. Select the name of the workspace from the drop-down list for the <b>in Workspace</b> field.
for Library Links	Searches for library links in the current model.
by Class	Searches for Simulink objects of a specified class.

Search Type Option	Description
for Fixed Point Capable	Searches a model for all blocks that support fixed-point computations.
for Model References	Searches a model for references to other models.
by Dialog Prompt	Searches a model for all objects whose dialogs contain the prompt you specify.
by String	Searches a model for all objects in which the string you specify occurs.

### Search Options — Specify search strings

name | property | type | variables | ...

Use search option settings to specify the scope of the search.

Search Option	Description
<b>Match Whole String</b>	Do not allow partial string matches (for example, do not allow sub to match substring).
<b>Match Case</b>	Considers case when matching strings (for example, Gain does not match gain).
<b>Regular Expression</b>	Considers a string to be matched as a regular expression.
<b>Evaluate Property Values During Search</b>	This option applies only for searches by property value. If enabled, Model Explorer evaluates the value of each property as a MATLAB expression and compares the result to the search value. If this option is disabled, the Model Explorer compares the unevaluated property value to the search value.
<b>Refine Search</b>	Enables you to search the initial search results. The second search operation searches for objects that meet both the original and the new search criteria.

By default, search strings are case-insensitive and are treated as regular expressions. The search allows partial string matches. You cannot use wildcard characters in search strings. For example, if you enter \*1 as a name search string, you get no search results unless there is an item whose name starts with the characters \*1. If there is an out1 item, the search results do not include that item.

### Model Hierarchy Pane

**Simulink Root** — Display display nodes representing the MATLAB workspace, Simulink models, and Stateflow charts

node structure

Expand **Simulink Root** to display nodes representing the MATLAB workspace, Simulink models, and Stateflow charts that are in the current session.

**Base Workspace** — MATLAB workspace

node structure

**Base Workspace** represents the MATLAB workspace. The MATLAB workspace is the base workspace for Simulink models and Stateflow charts. Variables defined in this workspace are visible to all open models and charts.

Expanding a model or chart node in the **Model Hierarchy** pane displays nodes representing the following elements, as applicable, for the models and charts you have open.

Node	Description
Configurations	Select the <b>Configurations</b> node to show the model's configuration sets and configuration references in the <b>Contents</b> pane. For information about adding, deleting, saving, and moving configuration sets, see “Manage Configuration Sets for a Model”.
Model Workspace	For information about how to use the Model Explorer to work with model workspace variables, see these topics: <ul style="list-style-type: none"> <li>“Edit and Manage Workspace Variables by Using Model Explorer”</li> <li>“Model Workspaces”</li> </ul>
External data	Expand the <b>External Data</b> node to display external data sources for the model, including the base workspace (if access is enabled), and data dictionaries.
Top-level subsystems	Expand a node representing a subsystem to display underlying subsystems.
Model blocks	Expand model blocks to show contents of referenced models.
Stateflow charts	<ul style="list-style-type: none"> <li>Expand a node representing a Stateflow chart to display the top-level states of the chart.</li> <li>Expand a node representing a state to display its substates.</li> </ul>

### Contents Pane

**Contents Pane** — Describe contents of node table

The **Contents** pane displays one of two tables containing information about models and charts, depending on the tab that you select:

- The **Contents** tab displays an object property table for the node that you select in the **Model Hierarchy** pane.
- The **Search Results** tab displays the search results table.

You can also click **Show Details** to add and modify the columns that appear in the tables.

The **Contents** pane displays a table of model and chart object data.

In the **Contents** tab and in the **Search Results** tab:

- Table columns correspond to object properties (for example, **Name** and **BlockType**).

The table displays the first two columns (the object icon and the **Name** property) persistently, so that these columns remain visible regardless of how far you scroll to the right.

- Table rows correspond to objects (for example, blocks, and states).

The objects and properties displayed in the **Contents** pane depend on:

- The column view that you select in the **Column View** menu
- The node that you select in the **Model Hierarchy** pane
- The kind of object (for example, subsystem or chart) that you select in the **Model Hierarchy** pane
- The **View > Row Filter** options that you select

The link next to **Contents of** at the top of the **Contents** pane links to the currently selected node in the **Model Hierarchy** pane. The model data displayed in the **Contents** pane reflects the setting of the **Current System and Below** option.

### **Column View** — Named set of properties

properties

The Model Explorer uses views to specify sets of property columns to display in the **Contents** pane.

Each kind of node in the **Model Hierarchy** pane displays specific properties in the **Contents** pane. For example, a Simulink model or subsystem node displays properties such as:

- `BlockType` (block type)
- `OutDataTypeStr` (output data type)
- `OutMin` (minimum value for the block output)

Generally, a column view does not contain the total set of properties for all the objects in a node. Specifying a subset of properties to display can streamline the task of exploring and editing model and chart object properties and increase the density of the data displayed in the **Contents** pane.

You can use a view to capture the following characteristics of the model information to show in the Model Explorer:

- Properties that you want to display in the **Contents** pane
- The layout of the **Contents** pane (for example, grouping by property, the order of property columns, and sorting)

You can use views in the following ways:

- Use the standard views that ship with the Model Explorer
- Customize the standard views
- Create your own views

The first time you open the Model Explorer, Simulink automatically applies one of the standard views to the node you select in the **Model Hierarchy** pane. The Model Explorer applies a view based on the kind of node you select.

The Model Explorer assigns one of four categories of nodes in the **Model Hierarchy** pane. The Model Explorer initially associates a default view with each node category. The node categories are:

Node Category	Kinds of Hierarchy Nodes Included	Initial Associated View
Simulink	Models, subsystems, and root level models	Block Data Types
Workspace	Base and model workspace objects	Data Objects
Stateflow	Stateflow charts and states	Stateflow
Configurations	Configurations section node	Configurations
Other	Objects that do not fit into one of the first three categories; for example, configuration sets	Default

The **Column View** field at the top of the **Contents** pane displays the view that the Model Explorer is currently using.

In the **Contents** pane, from the **Column View** list, you can select a different view. If you select a different view, then the Model Explorer associates that view with the category of the current node. For example, suppose the selected node in the **Model Hierarchy** pane is a Simulink model, and the current view is **Data Objects**. If you change the view to **Signals**, then when you select another Simulink model node, the Model Explorer uses the **Signals** view.

By default, the Model Explorer automatically applies a view based on the category of node that you select and the last view used for that node. You can manually select a view from the **Column View** list that better meets your current task.

You can shift from the default mode of having the Model Explorer automatically apply views to a mode in which you must manually select a view to change views.

To enable the manual view selection mode:

- 1 Select **View > Column View > Manage Views**.

The View Manager dialog box opens.

- 2 In the View Manager dialog box, click the **Options** button and clear **Change View Automatically**.

In the manual view selection mode, if you switch to a different kind of node in the **Model Hierarchy** pane that has a different view associated with it, the **Contents** pane displays a yellow informational bar suggesting a view to use.

You can manage views (for example, create a new view or export a view) using the View Manager dialog box. To open the View Manager dialog box, select the **Manage Views** option from either:

- The **View > Column View** menu
- The options listed when you click the **Options** button in the column view details section

The View Manager dialog box displays a list of defined views and provides tools for you to manage views.

You can manage views in several ways, including creating, deleting, reordering, exporting, importing, and resetting views.

**Tip Interface** — Display or hide tips

tip field

The tip interface appears immediately above the table in the **Contents** pane. It does not appear if, in the View Manager dialog box, you clear **Options > Change View Automatically**. The tip interface displays a link for changing the current view to a suggested view. To choose the suggested view displayed in the tip bar, click the link. To hide the currently displayed tip, from the menu button on the right side of the tip bar, select **Hide This Tip**.

Initially, the suggested view is the default view associated with a node. If you associate a different view with a node category, then the tip suggests the most recently selected view when you select similar nodes.

To change from manual specification of views to automatic specification, from the tip interface, select the down arrow and **Change View Automatically**.

To enable the tip interface, in the **View** menu, select **Column View > Manage Views**. In the View Manager, enable **Options > Change View Automatically**.

**Dialog Pane****Dialog Pane** — Display properties of objects

dialog pane

Use the **Dialog** pane to view and change properties of objects that you select in the **Model Hierarchy** pane or in the **Contents** pane.

By default, the **Dialog** pane appears to the right of the **Contents** pane. To show or hide the **Dialog** pane, use one of these approaches:

- From the **View** menu, select **Show Dialog Pane**.
- From the main toolbar, click the **Dialog View** button .

To edit property values using the **Dialog** pane:

- 1 In the **Contents** pane, select an object (such as a block or signal). The **Dialog** pane displays the properties of the object you selected.
- 2 Change a property (for example, the port number of an Outport block).
- 3 Click **Apply** to accept the change, or click **Revert** to return to the original value.

By default, clicking outside the **Dialog** pane when a field has unapplied changes causes the Apply Changes dialog box to appear. Click **Apply** to accept the changes or **Ignore** to revert to the original settings.

To prevent the Apply Changes dialog box from displaying:

- 1 In the dialog box, click the **In the future Apply or Ignore (whichever I select) without asking** check box.
- 2 If you want Simulink to apply changes without warning you, press **Apply**. If you want Simulink to ignore changes without warning you, press **Ignore**.

To restore the **Apply Changes** dialog box, from the **Tools** menu, select **Prompt if dialog has unapplied changes**.

When you select a numeric MATLAB variable or a `Simulink.Parameter` object in a model workspace, the **Argument** check box appears in the **Dialog** pane. This check box configures the variable or object as a model argument. See “Parameterize Instances of a Reusable Referenced Model”.

## **Programmatic Use**

`daexplr` opens the Model Explorer.

# Model Reference Conversion Advisor

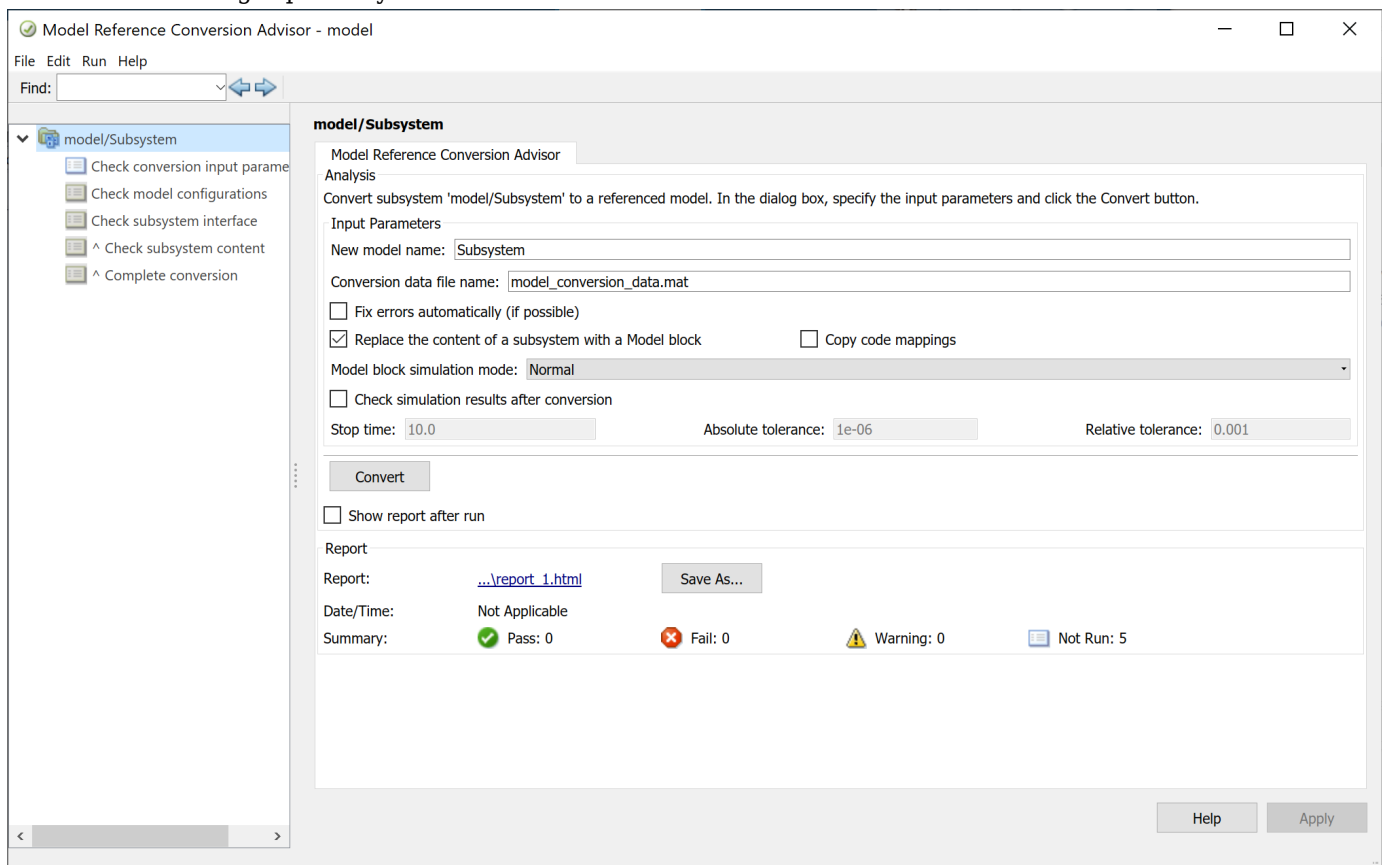

Convert subsystems to referenced models

## Description

The Model Reference Conversion Advisor converts subsystems, including conditional and referenced subsystems, to referenced models.

Converting subsystems to referenced models is beneficial for modeling large, complex systems and for team-based development. Many large models use a combination of subsystems and referenced models. To decide whether to convert a subsystem to a referenced model, see “Choose Among Types of Model Components”.

When the conversion encounters an issue, the Model Reference Conversion Advisor helps you review and fix the issue. Preparing the contents of a Subsystem block can eliminate or reduce the number of issues. Addressing these issues in the model editing environment can be more efficient than switching repeatedly between the Model Reference Conversion Advisor and the Simulink Editor.

## Open the Model Reference Conversion Advisor

- In the Simulink Editor, select a Subsystem block. In the Simulink Toolstrip, perform one of these actions.
  - On the **Subsystem Block** tab, select **Convert > Model Block**.
  - On the **Modeling** tab, in the **Component** gallery, select **Convert to Model Block**.
- In the MATLAB Command Window, use the `Simulink.SubSystem.convertToModelReference` function with the 'UseConversionAdvisor' argument set to true.

## Examples

### Set Subsystem Conversion Options

Specify input parameters that determine the output of the conversion and control whether the advisor automatically attempts to fix conversion errors.

When you open the advisor, in the left pane, the top node is selected. This node identifies the Subsystem block that the advisor will convert to a referenced model and provides conversion input parameters. You can use the default parameter values or change the values to customize the conversion.

For information about specific parameters, see “Parameters” on page 7-0 .

### Automatically Convert Subsystem to Referenced Model

The Model Reference Conversion Advisor can step through each check automatically.

- 1 After you configure the subsystem conversion options, click **Convert**.

The Model Reference Conversion Advisor steps through each check automatically.
- 2 Address any issues that the advisor reports. The advisor provides a **Fix** button for any issues it can fix automatically.
- 3 After you address the reported issues, click **Continue**.

After the Model Reference Conversion Advisor successfully runs all checks, it completes the conversion.

### Check Conversion Input Parameters

Verify that all conversion input parameters are valid.

For information about specific parameters, see “Parameters” on page 7-0 .

- 1 In the left pane, select the **Check conversion input parameters** node.
- 2 Click the **Run This Task** button.
- 3 Address any issues that the advisor reports. The advisor provides a **Fix** button for any issues it can fix automatically.

- 4 After you address the reported issues, click **Continue**.

### Check Model Configurations

Verify that the model configurations meet model referencing requirements. This check identifies model configuration parameter settings that are not valid for model references.

- 1 In the left pane, select the **Check model configurations** node.
- 2 Click the **Run This Task** button.
- 3 Address any issues that the advisor reports. The advisor provides a **Fix** button for any issues it can fix automatically.
- 4 After you address the reported issues, click **Continue**.

### Check Subsystem Interface

Verify whether the subsystem interface meets model reference requirements.

- 1 In the left pane, select the **Check subsystem interface** node.
- 2 Click the **Run This Task** button.

The advisor verifies that the type of subsystem is one that the advisor can convert. Then, it verifies that the interfaces to specific types of subsystems, such as masked subsystems, meet conversion requirements.

- 3 Address any issues that the advisor reports. The advisor provides a **Fix** button for any issues it can fix automatically.
- 4 After you address the reported issues, click **Continue**.

### Check Subsystem Content

Verify whether the subsystem content meets model reference requirements.

- 1 In the left pane, select the **Check subsystem content** node.
- 2 Click the **Run This Task** button.

The advisor checks whether the model compiles successfully. Upon successful compilation, the advisor checks whether the blocks in the subsystem meet the requirements for conversion.

- 3 Address any issues that the advisor reports. The advisor provides a **Fix** button for any issues it can fix automatically.
- 4 After you address the reported issues, click **Continue**.

### Complete Conversion

After all checks run successfully, complete the conversion.

- 1 In the left pane, select the **Complete conversion** node.
- 2 Click the **Run This Task** button.

The Model Reference Conversion Advisor:

- Creates a referenced model from the subsystem.
- Creates the `Simulink.Bus` objects, `Simulink.Signal` objects, and tunable parameters that the referenced model requires.
- By default, replaces the Subsystem block with a Model block that references the new model.
- Inserts the Model block in a Subsystem block if the automatic fixes added ports to the Model block interface.
- Creates an HTML conversion summary report in the `s\prj` folder. This report summarizes the results of the conversion process, including the results of the fixes that the advisor performed. This report also describes the elements that the advisor copies.
- Optionally checks the consistency of simulation results before and after conversion.
- Copies the following elements from the original model to the new referenced model.
  - **Configuration set** — If the parent model uses:
    - A configuration set that is not a referenced configuration set, the advisor copies the entire configuration set to the referenced model
    - A referenced configuration set, then both the parent and referenced models use the same referenced configuration set
  - **Variables** — The advisor copies only the model workspace variables that the subsystem used in the original model to the model workspace of the referenced model. If the model that contained the subsystem uses a data dictionary, then the referenced model uses the same data dictionary.
  - **Requirements links** — The advisor copies requirements links created with Requirements Toolbox™ software to the Model block from the original Subsystem block.

If you are not satisfied with the conversion results, you can restore the model to its initial state. After you successfully run the **Complete conversion** check, use the **Click here to restore the original model** link.

If you selected **Check simulation results after conversion**, you can view the results by using the **Click here to view the comparison results** link.

### Compare Simulation Results Before and After Conversion

If you selected **Check simulation results after conversion**, the Model Reference Conversion Advisor provides a comparison of top-model simulation results before and after conversion.

After you successfully run the **Complete conversion** check, click **Click here to view the comparison results**. The results display in the **Simulation Data Inspector**. A green check mark indicates that simulation results are within tolerance between the baseline model and the model with the new referenced model.

For more information, see “Compare Simulation Data”.

- “Convert Subsystem to Referenced Model” on page 13-427

## Parameters

**New model name** — Unique name for model file

text

The default new model name is a unique name on the MATLAB path that is based on the Subsystem block name.

The model name cannot exceed 59 characters. For more information, see “Choose Valid Model File Names”.

### Tips

If you receive an error that the referenced model exists, use this parameter to specify a new model name.

**Conversion data file name** — Unique name for conversion data file

text

The conversion data file stores any variables or objects created during the conversion.

By default, the filename begins with the model name and ends with `_conversion_data.mat`. For example, for a subsystem in a model named `myModel`, the default conversion filename is `myModel_conversion_data.mat`.

You can save the conversion data in a MAT file (`.mat`) or a script (`.m`). If you use a `.m` file extension, the file serializes all variables.

### Dependencies

To enable this parameter, the top model must not use a data dictionary.

**Fix errors automatically (if possible)** — Option to apply available fixes  
`off` (default) | `on`

By default, if an advisor check finds an error that the advisor can fix, the advisor provides a **Fix** button. Click it to have the advisor fix the issue.

Select this parameter to have the advisor fix all the conversion errors it can without displaying the **Fix** button.

**Replace the content of a subsystem with a Model block** — Option to replace subsystem with referenced model  
`on` (default) | `off`

By default, the advisor updates the original model by inserting a Model block. The advisor action depends on whether you use the automatic fix options.

- If you use the automatic fixes, then the advisor replaces the Subsystem block with a Model block unless the automatic fixes change the input or output ports. If the ports change, the advisor includes the contents of the subsystem in a Model block and inserts it into the Subsystem block.
- If you do not use the automatic fixes, then the advisor replaces the Subsystem block with a Model block.

Clear this parameter to have the advisor open a new Simulink Editor window that contains only a Model block that references the newly created model. The advisor does not update the original model in the other Simulink Editor window.

**Copy code mappings** — Option to copy code mapping information to new model  
`off` (default) | `on`

Select this parameter to copy the code mapping information from the parent model to the new, converted referenced model.

Code mapping information includes configurations of model data elements for code generation. This parameter does not affect simulation.

For more information, see “Convert Subsystem to Referenced Model and Generate Code” (Simulink Coder).

**Model block simulation mode** — Simulation mode for model reference instance  
`Normal` (default) | `Accelerator` | `Software-in-the-loop (SIL)`

The Model block simulation mode controls the simulation mode for the corresponding instance of the referenced model. Another Model block that references the same model can specify a different simulation mode for its instance of the referenced model.

- **Normal** — Execute the referenced model interpretively, as if the referenced model is an atomic subsystem implemented directly within the parent model.
- **Accelerator** — Create a MEX file for the referenced model. Then, execute the referenced model by running the S-function.
- **Software-in-the-loop (SIL)** — This option requires an Embedded Coder license. Generate production code based on the Model block **Code interface** parameter setting. The code is compiled for and executed on the host platform.

The corners of the Model block indicate the simulation mode of the Model block. For normal mode, the corners have empty triangles. For accelerator mode, the corner triangles are filled in. For SIL mode, the corners are filled in and the word (SIL) appears on the block icon.

The simulation mode of a parent model can override the simulation mode of a Model block. For more information, see “Choose Simulation Modes for Model Hierarchies”.

**Check simulation results after conversion** — Comparison of top-model simulation results before and after conversion

off (default) | on

Select this parameter to compare top-model simulation results before and after conversion.

To see the results after the conversion is complete, click **View comparison results**. The Simulation Data Inspector displays the results of the comparison.

For more information, see “Compare Simulation Results Before and After Conversion”.

### Tips

Before you perform the conversion:

- Enable signal logging for the subsystem output signals of interest.
- Set the **Model block simulation mode** option in the advisor to the same simulation mode as the original model.
- Specify the **Stop time**, **Absolute tolerance**, and **Relative tolerance**.

### Dependencies

To enable this option, select **Replace the content of a subsystem with a Model block**.

**Stop time** — Simulation stop time

positive scalar

By default, the advisor uses the stop time of the top model, unless the stop time of the top model is `inf`. If the stop time of the top model is `inf`, the advisor uses a default stop time of 10.

### Dependencies

To enable this parameter, select **Check simulation results after conversion**.

**Absolute tolerance** — Absolute tolerance for simulation comparison

1e-06 (default) | positive scalar

The absolute tolerance is the largest acceptable solver error, as the value of the measured signal approaches zero. The simulation results before conversion establish the baseline. The simulation results after conversion must be within the tolerance.

#### **Dependencies**

To enable this parameter, select **Check simulation results after conversion**.

**Relative tolerance** — Relative tolerance for simulation comparison  
0.001 (default) | positive scalar

The relative tolerance is the largest acceptable solver error, relative to the size of each signal during each time step. The simulation results before conversion establish the baseline. The simulation results after conversion must be within the tolerance.

The default value (0.001) means that the compared signal is accurate to within 0.1% of the baseline signal.

#### **Dependencies**

To enable this parameter, select **Check simulation results after conversion**.

**Show report after run** — Option to open conversion report upon completion  
off (default) | on

After the conversion completes, the HTML conversion summary report appears in the `s\prj` folder. This report summarizes the conversion setup and results, including the results of the fixes that the advisor performed. This report also describes the elements that the advisor copies.

Select this parameter to open the conversion report after the conversion completes.

## **Limitations**

The Model Reference Conversion Advisor does not support conversion for some types of subsystems. For example:

- Subsystem blocks with Simscape Multibody components that cross the subsystem boundary
- Asynchronous subsystems — To convert asynchronous subsystems to referenced models that accept asynchronous function calls, see “Asynchronous Support Limitations” (Simulink Coder).

## **Version History**

**Introduced in R2014a**

### **R2020b: Copy code mappings from parent model to referenced model**

Starting in R2020b, you can copy code mappings from the parent model to the newly created referenced model. To copy the code mappings, select the **Copy code mappings** parameter in the **Model Reference Conversion Advisor**.

### **R2023a: Copy service interface code mappings from parent model to referenced model**

Service interface code mappings were introduced in R2022b. Starting in R2023a, you can copy service interface code mappings from the parent model to the newly created referenced model. To copy the mappings, select the **Copy code mappings** parameter in the **Model Reference Conversion Advisor**. To learn more about service interface code mappings, see “C Service Interfaces” (Embedded Coder). To learn more about code mapping configurations, see “Define Service Interfaces, Storage Classes, Memory Sections, and Function Templates for Software Architecture” (Embedded Coder).

## Multiple Simulations

Run multiple simulations from the Simulink Editor

### Description

**Multiple Simulations** panel allows you to setup multiple simulations for a block parameter that you want to vary, for example, for a parameter sweep, or Monte-Carlo simulations. You can pick the block parameter of interest from the model canvas and specify values that you want to use for the simulations. You can also specify variables for the simulations. With the **Multiple Simulations** panel, you can provide configurations such as **Use Parallel** to run your simulations in parallel. To run the simulations that you have set up, first, select the design study, then click the **Run All** button in the **Simulation** section on the Simulink toolstrip. Once the simulations are complete, you can view and manage the results in **Simulation Manager**.

## Open the Multiple Simulations

- To open the **Multiple Simulations** panel, navigate to the **Prepare** section on the Simulink

toolstrip. In the **Inputs & Parameter Tuning** section, click **Multiple Simulations**

## Examples

- "Multiple Simulations Panel: Simulate for Different Values of Stiffness for a Vehicle Dynamics System"

## Programmatic Use

`parsim(in)` is the command line equivalent syntax for the command line.

## More About

### Design Study

In the panel, you can click the right most button to create a new design study. A new design study object is added to the panel. The name of this design study is automatically populated. To change the name, double click on the name and enter your preferred name. A design study is an object that allows you to set up simulations. Once you configure and set up the values for the simulations, you can select this design study and click **Run All** on the Simulink toolstrip to run the simulations.

# Performance Advisor

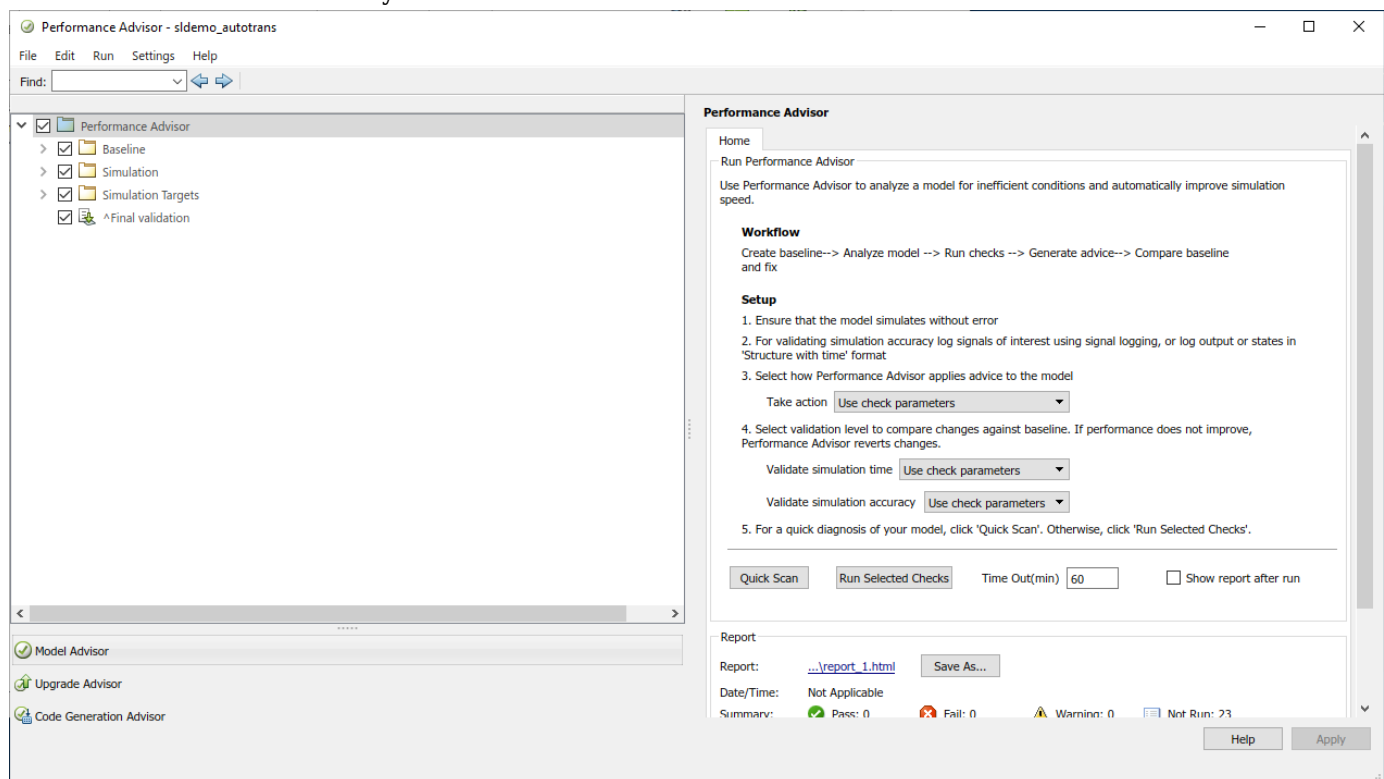

Run checks on model to improve simulation performance

## Description

The Performance Advisor checks for configuration settings that slow down simulation and produces a report of suggested changes. You can configure the Performance Advisor to apply changes suggested in the report automatically, or you can make changes to your model manually. When you configure the Performance Advisor to apply changes automatically, the Performance Advisor verifies that the change improves performance without affecting results before applying the change.

When you use the Performance Advisor to modify your model, the Performance Advisor does not save the changes automatically. You must save the model.

The Performance Advisor analyzes only the top model and does not traverse model reference boundaries or library links.

## Open the Performance Advisor

- Simulink Toolstrip: On the **Debug** tab, click **Performance Advisor**.
- MATLAB Command Window: Enter `performanceadvisor(modelName)`, where `modelName` specifies the name or handle for the model you want to analyze. If the model is not already open, the function opens the model as well as the Performance Advisor.

## **Examples**

# Property Inspector

Edit parameters and properties for any Simulink model element

## Description

The Simulink **Property Inspector** enables you to use a single interface to edit parameters and properties for any model element.

You can leave the Property Inspector open as you build your model, and it updates with your selection. You can use the Property Inspector to edit:

- Block parameters and properties
- Stateflow elements
- Annotations, areas, and images
- Signals
- Model properties

When you open the Property Inspector, it opens as a pane in the current Simulink Editor window. You can drag the Property Inspector from the default location and dock it in another location in the editor. The down arrow to the right of the pane title provides options to undock, minimize, and open help for the pane.

The Property Inspector lets you quickly set parameters and properties as you work. Values take effect when you set them. For more information on setting block parameters and properties, see “Add Blocks to Models”.

---

**Note** You can alternatively open a dialog box for a selected model element by right-clicking and selecting an item such as **Properties**, or for blocks, **Block Parameters**. Double-clicking a block generally opens a block dialog box. (Use one of the menu commands on Subsystem and Model blocks.)

The Property Inspector and dialog boxes operate on a single selected element. The main difference is that the Property Inspector updates with each selection, and the dialog box shows settings for only the element you opened it from. For this reason, the dialog box is useful if:

- You are moving through the model hierarchy and want to see or set element parameters or properties as you navigate the model.
  - You want to compare the parameters or properties of similar elements.
  - The settings are advanced and appear only in the dialog box.
-

## Open the Property Inspector

- In the Simulink Toolstrip, on the **Modeling** tab, in the **Design** gallery, select **Property Inspector**.
- While in the Simulink Editor, press **Ctrl+Shift+I**.

## Examples

### Set Block Parameter Value

You can set parameters on most blocks. Parameters allow you to specify how a block operates in the model.

- 1 Open the vdp model.  
vdp
- 2 Open the Property Inspector. On the **Modeling** tab, in the **Design** gallery, click **Property Inspector**.
- 3 In the model, select the Gain block named Mu.
- 4 In the Property Inspector, set the **Gain** parameter to 2, then press **Enter**.

## Version History

Introduced in R2016b

## Referenced Files Pane

View, save, and close referenced subsystems and models

### Description

The **Referenced Files** pane allows you to view, save, and close referenced subsystems and models in the corresponding model hierarchy.

The **Referenced Files** pane shows a flat list of model and subsystem files that are loaded and referenced by the model hierarchy. Opening the top model in the model hierarchy does not load the referenced models in the model hierarchy. Load referenced models by opening them in the Simulink Editor or by using a function such as `load_system`. Referenced subsystems load when you load the models that reference them.

When you save a model using the **Referenced Files** pane, you also save the models it references. When you close a model using the **Referenced Files** pane, you also close the models it references that are not open in another model hierarchy. Before you can close a modified model, you must choose whether to save the corresponding changes, which include changes to the model workspace.

### Open the Referenced Files Pane

- On the **Modeling** tab, in the **Design** gallery, click **Referenced Files**.
- If a referenced file in the model hierarchy has been modified, on the **Simulation** tab, click the **Save All** button arrow, then click **Save Referenced Files > Manage Referenced Files**.
- Navigate into a referenced model in the model hierarchy. The **Referenced Files** pane opens as a tab on the left side of the Simulink Editor unless you have previously hidden the pane.

### Examples

#### Individually Save and Close Referenced Models

Save and discard changes to individual referenced models in a model hierarchy.

Open the top model in a model hierarchy that contains multiple referenced models.

sldemo\_mdref\_depgraph

On the Simulink Toolstrip **Modeling** tab, in the **Design** gallery, click **Referenced Files**.

The **Referenced Files** pane opens. It does not show any referenced subsystems or models. The `sldemo_mdref_depgraph` model does not reference any subsystems, but it references multiple models. The referenced models must be loaded to appear in the **Referenced Files** pane.

Double-click the block named thermostat.

The `sldemo_mdref_heater` model loads and opens. When **Show Only Modified Files** in the **Filter contents** list (☰) is cleared, this model appears in the **Referenced Files** pane. Otherwise, you must modify the file before it appears.

Modify `sldemo_mdref_heater` by moving a block.

Next to the model name, the dirty flag (\*) indicates that the model has unsaved changes.

Double-click the block named Fahrenheit to Celsius.

The sldemo\_mdref\_F2C model loads and opens.

Modify sldemo\_mdref\_F2C by moving a block.

Next to the model name, the dirty flag (\*) indicates that the model has unsaved changes.

Suppose you want to keep your changes to sldemo\_mdref\_F2C, and you want to discard your changes to sldemo\_mdref\_heater.

If you select sldemo\_mdref\_heater and click **Close**, you receive a message asking whether to save the changes to sldemo\_mdref\_heater and sldemo\_mdref\_F2C before closing both models. Unless a referenced model is open in another model hierarchy, closing its parent model closes the referenced model.

To keep your changes to sldemo\_mdref\_F2C, select it in the **Referenced Files** pane and click **Save**. Then, select sldemo\_mdref\_heater and click **Close**.

# Root Inport Mapper

Import, visualize, and map signal and bus data to root-level inports

## Description

The **Root Inport Mapper** lets you import, visualize, and map signal and bus data to root-level inports.

## Open the Root Inport Mapper

- Inport block: Open the block dialog box and click **Connect Inputs**.
- Simulink Editor:
  - 1 Click on the Inport block in a model. In the Simulink Editor toolbar:
    - a Click the **Root Inport** tab.
    - b Click **Connect Inputs**.
- Simulink Editor toolbar:
  - 1 In the **Prepare** section of the **Simulation** tab, click the expander.
  - 2 Click **Inputs & Parameter Tuning > Connect Inputs**.
- Simulink Editor toolbar:

- 1 In the **Prepare** section of the **Simulation** tab, click the expander.
  - 2 Click **Configuration & Simulation > Model Settings**.
  - 3 In the **Data Import/Export** pane,click the **Input** check box.
  - 4 Click **Connect Inputs**.
- Simulink Editor canvas:
    - 1 Right-click the canvas.
    - 2 Select **Model Configuration Parameters**.
    - 3 In the **Data Import/Export** pane,click the **Input** check box.
    - 4 Click **Connect Inputs**.

## Examples

### Root Inport Mapper Keyboard Shortcuts

The Root Inport Mapper uses these keyboard shortcuts.

Action	Menu Action	Keyboard Shortcut
Open file.	<b>Open</b>	<b>Ctrl+O</b>
Save file.	<b>Save</b>	<b>Ctrl+S</b>
Link from spreadsheet.	<b>From Spreadsheet</b>	<b>Ctrl+Shift+X</b>
Link from MAT-file.	<b>From MAT-File</b>	<b>Ctrl+Shift+L</b>
Link from workspace.	<b>From Workspace</b>	<b>Ctrl+Shift+B</b>
Create and edit new scenario in MAT-file.	<b>Signals &gt; New MAT-File</b>	<b>Ctrl+N</b>
Edit scenario in MAT-file.	<b>Signals &gt; Edit MAT-File</b>	<b>Ctrl+E</b>
Check readiness of all mapped scenario datasets.	<b>Check Readiness &gt; Map All</b>	<b>Ctrl+Shift+A</b>
Check readiness of the mapped datasets of the currently selected scenarios.	<b>Check Readiness &gt; Map Selected</b>	<b>Ctrl+Shift+S</b>
Check readiness of the mapped disconnected datasets.	<b>Check Readiness &gt; Map Unconnected</b>	<b>Ctrl+Shift+U</b>
Check readiness of the mapped datasets that previously failed a mapping.	<b>Check Readiness &gt; Map Failed</b>	<b>Ctrl+Shift+F</b>
Check readiness of the mapped datasets that previously caused warnings.	<b>Check Readiness &gt; Map Warned</b>	<b>Ctrl+Shift+Y</b>
Apply to model.	<b>Apply to Model</b>	<b>Ctrl+M</b>
Generate and open MATLAB batch simulation file.	<b>Generate Script</b>	<b>Ctrl+G</b>
Unlink all scenarios.	<b>Unlink all scenarios</b>	<b>Ctrl+U</b>

Action	Menu Action	Keyboard Shortcut
Unlink selected scenarios.	<b>Unlink selected scenarios</b>	<b>Ctrl+I</b>

### Use the Root Inport Mapper

Follow this workflow to get started using the Root Inport Mapper.

Create signal data in the MATLAB workspace.

For a Simulink model, import the data from the workspace. You can visualize the data you import.

Map the data to root-level inports.

Simulate the model.

Save the Root Inport Mapper scenario.

### Choose Map Mode

To specify how you want the Root Inport Mapper tool to map the signal data to a model, select from these map modes in the **Map Configuration** section of the toolbar.

Goal	Map Mode
Assign signals to ports according to the name of the root-inport block. If the name of a signal or bus element matches the name of a root-input port block, the data is mapped to the corresponding port.	<b>Block Name</b>
Assign signals to ports according to the block path of the root-input port block. If the block path of a signal matches the block path of a root-inport block, the data is mapped to the corresponding port.	<b>Block Path</b>
Assign signals to ports according to the name of the signal on the port. If the signal name of a data element matches the name of a signal at a port, the signal is mapped to the corresponding port.	<b>Signal Name</b>
Assign sequential port numbers to the imported data, starting at 1. Map signals to the corresponding input ports.  If there is more data than input ports, the remaining data is mapped to enable and then trigger input ports.  If the data is not in the form of a dataset, it is processed in the order in which it appears in the data file.	<b>Port Order</b>

Goal	Map Mode
Assign signals to ports according to the definitions in a custom file. To create a custom map mode, see “Create and Use Custom Map Modes”.	<b>Custom</b>

The Root Inport Mapper tool supports the MATLAB data types or formats described in the table for imported signal data. For each data type, you can use the map modes indicated in the table.

Data Formats	Block Name	Block Path	Signal Name	Port Order	Custom
Simulink.SimulationData.Dataset	✓	✓	✓	✓	✓
MATLAB timeseries	✓		✓	✓	✓
MATLAB timetable	✓		✓	✓	✓
Simulink.SimulationData.Signal	✓	✓	✓	✓	✓
Stateflow.SimulationData.State	✓	✓	✓	✓	✓
Structure with time and structure without time				✓	
Data array				✓	
Array of buses	✓		✓	✓	✓
Asynchronous function-call signal	✓		✓	✓	✓

- “Create Harness-Free Models with MAT File Input Data” on page 13-361
- “Interface Specification Using Bus Objects” on page 13-420
- “Map Data Using Root Inport Mapper Tool”
- Multi-Input Root Inport Mapping

## Parameters

### File

**Open** — Open existing Root Inport Mapper scenario button

Open an existing scenario from a previous Root Inport Mapper session. If you are working in another scenario, the Root Inport Mapper tool displays a message.

To...	Click...
Open a new scenario. Remove the existing scenario without saving it.	<b>No</b>
Cancel opening a scenario.	<b>Cancel</b>
To save the existing scenario, click <b>Yes</b> . Then click the <b>Open</b> button again to open an existing scenario.	<b>Yes</b>

**Save** — Save current Root Inport Mapper scenario  
button

Save current Root Inport Mapper scenario to a .mldatx file.

#### Link

**From Spreadsheet** — Import from spreadsheet  
button

Import Simulink data from spreadsheet.

**From MAT-file** — Import from MAT-file  
button

Import Simulink data from MAT-file.

**From Workspace** — Import from base workspace  
button

Import Simulink data from base workspace.

#### Edit

**Signals** — Edit signals using Signal Editor tool  
button

Start Signal Editor to edit signals from an existing scenario MAT-file or create a new MAT-file to contain new scenarios and signals.

#### Map Configuration

**Map Mode** — Select map mode  
button

Select map mode according to the desired action.

Goal	Map Mode
Assign signals to ports according to the name of the root-inport block. If the name of a signal or bus element matches the name of a root-input port block, the data is mapped to the corresponding port.	<b>Block Name</b>
Assign signals to ports according to the block path of the root-input port block. If the block path of a signal matches the block path of a root-inport block, the data is mapped to the corresponding port.	<b>Block Path</b>
Assign signals to ports according to the name of the signal on the port. If the signal name of a data element matches the name of a signal at a port, the signal is mapped to the corresponding port.	<b>Signal Name</b>
Assign sequential port numbers to the imported data, starting at 1. Map signals to the corresponding input ports.  If there is more data than input ports, the remaining data is mapped to enable and then trigger input ports.  If the data is not in the form of a dataset, it is processed in the order in which it appears in the data file.	<b>Port Order</b>
Assign signals to ports according to the definitions in a custom file. To create a custom map mode, see “Create and Use Custom Map Modes”.	<b>Custom</b>

**Custom Map** — Specify custom map mode file  
button

Specify custom map mode file. For more information on custom map mode files. see “Create and Use Custom Map Modes”.

**Options** — Select mapping options  
button

Select mapping options according to the desired action.

Goal	Option
Update the model and review the data types of root-level input ports and imported data.	<b>Update Model Automatically.</b> Compare the signal data and input port parameters to the root-level port and display the results. If you do not select this option, the tool maps the imported data to the root-level input port but does not update the model.

Goal	Option
Use strong data typing when mapping data from spreadsheets.	<b>Use Strong Data Typing with Spreadsheets.</b> Clear this check box to allow the Root Inport Mapper tool to automatically convert spreadsheet input signals to the data types of the corresponding root inports. The Root Inport Mapper tool can cast the spreadsheet data to only these data types: <code>double</code> , <code>single</code> , <code>int8</code> , <code>uint8</code> , <code>int16</code> , <code>uint16</code> , <code>int32</code> , and <code>uint32</code> . If you select this check box or if the root input port is not one of these data types, you may receive a data type mismatch error.
Import bus data that is only partially defined.	<b>Allow Partial Specification of Buses.</b> Confirm that any partially specified bus data you import maps properly to root-level input ports.
Identify unassigned root input ports and detect incomplete input data sets.	<b>Notify of Missing Signals.</b> Show inputs with missing signals.

### Map to Model

**Check Map Readiness** — Specify subset of scenarios to map  
button

Specify subset of scenarios to map according to the desired action.

Goal	Option
Map all the scenario datasets (default).	<b>Map All</b>
Map the datasets of the scenarios currently selected in the <b>Scenario Dataset</b> section.	<b>Map Selected</b>
Map the disconnected datasets.	<b>Map Unconnected</b>
Map datasets that previously failed a mapping.	<b>Map Failed</b>
Map datasets that previously caused warnings.	<b>Map Warned</b>

**Apply to Model** — Apply data to model  
button

Apply data to model. Clicking this button selects the **Input** check box in the **Data Import/Export** pane in the model Configuration Parameters dialog box. It also sets the **Input** value to the imported data variables.

### Script

**Generate Script** — Generate batch simulation file  
button

Generate a batch simulation file to run the mappings that you have set up. You can then run the script in the MATLAB Editor.

## More About

### Supported Microsoft Excel File Formats

You can use the Root Inport Mapper tool to import data from Excel spreadsheets. You can also use the Root Inport Mapper tool to import signal data in CSV files on a Windows system with Microsoft Office installed.

The Root Inport Mapper tool does not support Excel spreadsheet charts.

- Use sheet names that follow MATLAB variable name rules. If you import from a sheet whose name does not follow these rules, the Root Inport Mapper tool uses a modified sheet name. This modified sheet name follows the MATLAB variable name rules. For example, if you have a sheet name `Group Name`, the Root Inport Mapper uses the modified name `GroupName`.
- Use the first row of a sheet to specify signal names. Either specify a signal name for every signal or do not specify any signal names. If you do not specify any signal names, the tool assigns signal names using the format `Signal#`.
- For time values, use the first column of the remaining rows. The time values must increase for each row.
- Put signal values in the remaining columns.
- During import, the Root Inport Mapper tool converts formatted numbers from Excel spreadsheets to doubles.
- The Root Inport Mapper tool does not support block path map mode for spreadsheets.

This example of a Microsoft Excel spreadsheet is set up for root-inport mapping.

- The sheet name is `sigData`, which is a valid MATLAB variable name.
- The first row contains the signal names `signal1`, `signal2`, and `signal3`.
- The first column has six time values that increase for each row.
- In each row with a time value, columns to the right of the first column contain signal data values for each signal.

	A	B	C	D	E
1		signal1	signal2	signal3	
2	0	2	4	6	
3	1	3	5	7	
4	2	2	4	6	
5	3	4	6	8	
6	4	5	7	9	
7	5	6	8	10	
8					
9

## Schedule Editor

View and edit the schedule of model components (partitions)

### Description

The Schedule Editor is a scheduling tool that represents the components in the model known as partitions, the data connections between them, and the order of those partitions.

Partitions are the components of the model that execute independently as tasks. The data connections between the partitions show the flow of the data between those partitions. The scheduling of these partitions is based on the rates and the events in the model. This schedule is shown in the **Order** table in the Schedule Editor.

Using the Schedule Editor, you can:

- Create partitions and specify their order.
- Edit and analyze the schedule of the executable partitions without disturbing the structure of the model.
- Visualize how Simulink executes partitions.

Changes made in the Schedule Editor affect both, simulation and code generation.

### Using the Schedule Editor

The Schedule Editor consists of two parts representing two different views of partitions in the model:

- A graph that shows the partitions and the data connections between them.

- A table that shows the order in which the partitions execute.

ORDER		
Order	Name	Trigger
1	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: black; margin-right: 5px;"></div> <span>Cont <i>implicit</i></span> </div> <div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: red; margin-right: 5px;"></div> <span>D1 <i>implicit</i></span> </div>	0 0.001
2	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> <span>D2 <i>implicit</i></span> </div>	0.005
3	▶ ThrottleControl.APPSnsrRun	
4	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> <span>ThrottleControl.ActuatorRun5ms</span> </div>	0.005
5	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> <span>ThrottleControl.TPSSecondaryRun5ms</span> </div>	0.005
6	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> <span>ThrottleControl.MonitorRun5ms</span> </div>	0.005
7	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> <span>ThrottleControl.ControllerRun5ms</span> </div>	0.005
8	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: blue; margin-right: 5px;"></div> <span>D3 <i>implicit</i></span> </div>	0.01
9	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: blue; margin-right: 5px;"></div> <span>ThrottleControl.TPSPPrimaryRun10ms</span> </div>	0.01

Changing one of the views impacts the other.

To use the Schedule Editor, select **Schedule Editor** in the **Design** section of the **Modeling** tab. If the model is already partitioned, you can open the Schedule Editor by clicking the  badge, which appears above the blocks. To see the default partitions present in the model in the Schedule Editor, update the diagram by clicking the  icon on the toolbar or by selecting **Ctrl+D**. As you create partitions in the model and update the diagram, partitions appear in the Schedule Editor.

To check how the partitions map to the model, right-click the partitions and select **Show Source**. The Simulink model window appears with every block corresponding to the partition highlighted.

## Order

The **Order** shows the order in which the partitions execute. To change the order, you can drag and drop the partitions. You can also use the **Up** and **Down** arrows on the toolbar. Partitions are sorted based on their rates. You can only reorder the partitions with the same rate. Clicking a partition in the **Order**, highlights the corresponding partition in the graph. On changing the order, the connections that are affected by this specified change get highlighted.

3	▶ ThrottleControl.APPSnsrRun	
4	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> <span>ThrottleControl.ActuatorRun5ms</span> </div>	0.005
5	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> <span>ThrottleControl.TPSSecondaryRun5ms</span> </div>	0.005
6	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> <span>ThrottleControl.MonitorRun5ms</span> </div>	0.005
7	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: green; margin-right: 5px;"></div> <span>ThrottleControl.ControllerRun5ms</span> </div>	0.005
8	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: blue; margin-right: 5px;"></div> <span>D3 <i>implicit</i></span> </div>	0.01
9	<div style="display: flex; gap: 5px;"> <div style="width: 10px; height: 10px; background-color: blue; margin-right: 5px;"></div> <span>ThrottleControl.TPSPPrimaryRun10ms</span> </div>	0.01

## Connections

Connections between the partitions show data dependencies. You can right-click the connections between the partitions to change the constraints on data connections. The different types of connections illustrate how the partitions behave with each other.

The types of connections are:

- **Dependency** — Indicates that the source always runs before the destination. The dependency connection is a solid line.

- **Delay** — Indicates that the destination runs before the source. When the destination runs before the source, a scheduling delay is introduced. The delay connection is a dashed line.

You can put these types of constraints on connections:

- **Allow Delay** — Inserts a delay when required. When you specify this constraint for a connection, Simulink inserts a delay for that connection only when necessary. The unlock icon on the connections signifies an allowed delay. When you select this constraint on a connection, Simulink prefers these connections to be turned into a delay if necessary over other connections.

This constraint is displayed as one of these options.

- **Prevent Delay** — Prevents delay from being inserted in the connection. When you specify this constraint for a connection, Simulink ensures that the connection is a dependency. The lock icon on the connection indicates that the connection is locked as a dependency and is not changed to a delay.

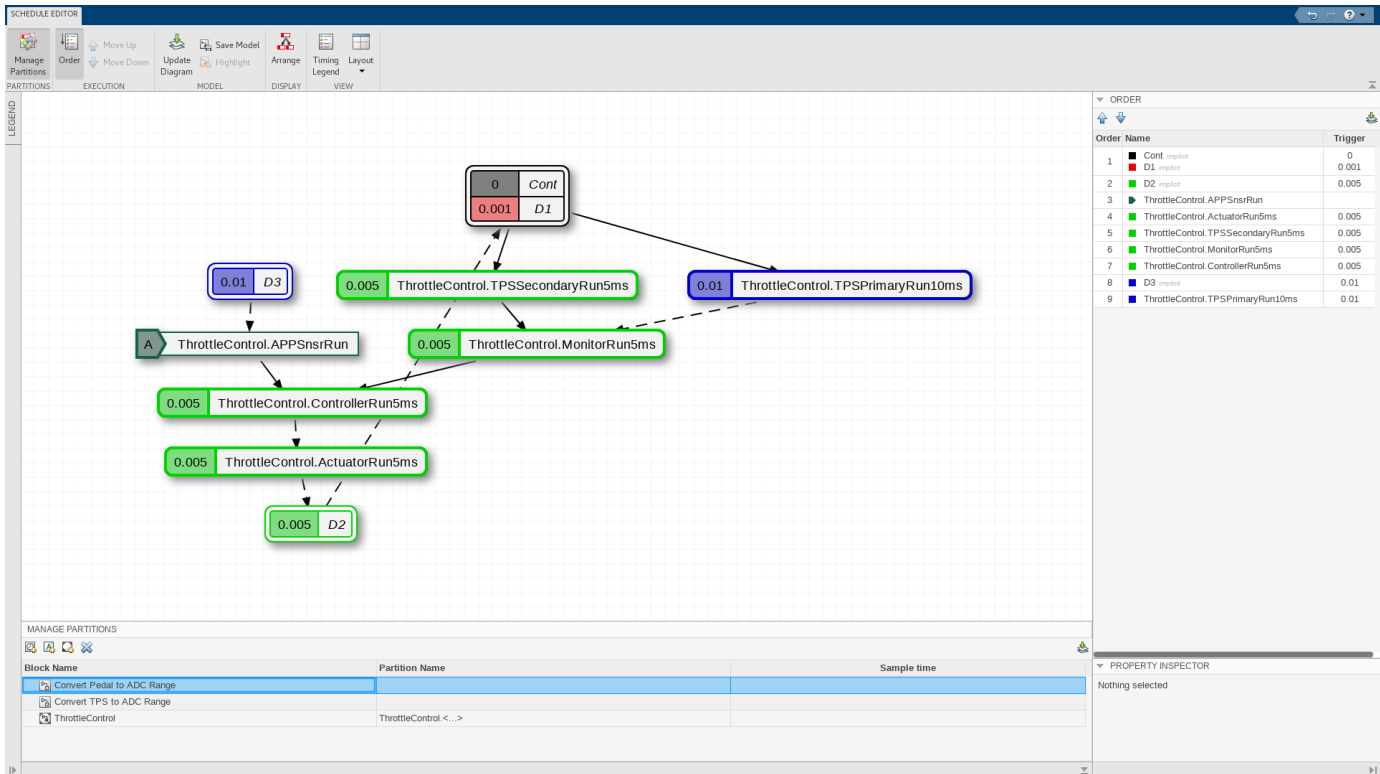

## Events

The **Events** panel allows you to manage events in the Schedule Editor. The events in the Schedule Editor can bind with aperiodic partitions to schedule their execution. You can create events in the Schedule Editor and use these events to send from Stateflow to schedule execution of an aperiodic partition. To send the events from the Stateflow chart, use the `send(eventName)` command.

In the **Events** panel, you can see the listeners and the broadcasters of the event. The icon 

denotes the listeners, and the icon  denotes the broadcasters. When you bind the aperiodic partition with an event, the aperiodic partition executes when that event is sent. The broadcaster of the event shows you the path of the Stateflow chart that sends the event.

Click the icon  to create an event in the Schedule Editor, and select a listener partition from the drop down. You can also bind an event by dragging and dropping the event over a valid aperiodic partition. When an event is bound to a partition, the event name appears on the left side of the partition and in, the **Trigger** column of the **Order** table.

Order	Name	Trigger
1	Cont implicit	0
2	D1 implicit	0.001
3	ThrottleControl.APPSnsrRun	0.005
4	ThrottleControl.ActuatorRun5ms	0.005
5	ThrottleControl.TPSSecondaryRun5ms	0.005
6	ThrottleControl.MonitorRun5ms	0.005
7	ThrottleControl.ControllerRun5ms	0.005
8	D3 implicit	0.01
9	ThrottleControl.TPSPrimaryRun10ms	0.01

## Open the Schedule Editor

- Simulink: In the **Modeling** tab, expand the **Design** section and select **Schedule Editor** from **System Design**.
- Simulink model: Click the badge on the partitioned blocks.

## Examples

- “Schedule an Export-Function Model Using the Schedule Editor”
- “Schedule a Rate-Based Model Using the Schedule Editor”
- “Events in Schedule Editor”

## Parameters

### Manage Partitions

**Partition Name** — Name of the partitions  
character vector

Name of the partitions created. Double-click the name to edit and use the enter key to save the partition name.

**Sample Time** — Sample time for partitions to execute  
discrete value | variable

Sample time at which the partitions execute. The sample time is a discrete value or a defined variable that contains a discrete value.

### **Property Inspector**

**Hit times** — Times for aperiodic partitions to execute  
vector

Times at which the aperiodic partitions execute, specified as a vector of discrete values.

**Connections** — Data connections between partitions  
Auto (default) | Delay | Dependency | Prevent Delays | Allow Delays

Dependency between the partitions is shown as a solid line. A delay between the partitions is shown as a dashed line. The arrow tail and head denote the source and destination, respectively.

Specify constraints on the connections by right-clicking the lines and selecting the constraint type.

## **More About**

### **Order**

By default, the **Order** table is expanded. **Order** shows the order of partition execution. Edit the order by dragging the partitions or using the **Up** and **Down** arrows on the toolbar.

### **Manage Partitions**

By default, the **Manage Partitions** panel is collapsed. Expand the panel to create partitions, edit names and/or sample times of the existing partitions, and remove existing partitions. Changes made in the **Manage Partitions** panel take effect after updating the diagram.

### **Property Inspector**

The **Property Inspector** shows information about the selected partition. It shows the rate at which the partition executes and the connections on that partition. Enter the **Hit times** when you select an aperiodic partition in the **Property Inspector**.

### **Arrange**

The **Arrange** button organizes the partition graph.

### **Layout**

By default, the **Order** panel and the **Property Inspector** panel are expanded. From the **Layout** dropdown, select the preferred panels to be expanded as per preference. Clearing the panels collapses them.

## Events

From the **Events** panel, you can manage events in the Schedule Editor. In the **Events** panel, you can see the listeners and the broadcasters of the event. The icon  denotes the listeners, and the icon  denotes the broadcasters.

## Version History

**Introduced in R2019a**

## Sequence Viewer

Visualize messages, events, states, transitions, and functions

### Description

The Sequence Viewer visualizes message flow, function calls, and state transitions.

Use the Sequence Viewer to see the interchange of messages, events, function calls in Simulink models, Simulink behavior models in System Composer and between Stateflow charts in Simulink models.

In the Sequence Viewer window, you can view event data related to Stateflow chart execution and the exchange of messages between Stateflow charts. The Sequence Viewer window shows messages as they are created, sent, forwarded, received, and destroyed at different times during model execution. The Sequence Viewer window also displays state activity, transitions, and function calls to Stateflow graphical functions, Simulink functions, and MATLAB functions. For more information, see “Use the Sequence Viewer to Visualize Messages, Events, and Entities”.

---

**Note** The Sequence Viewer does not display function calls generated by MATLAB Function blocks and S-functions.

---

### Open the Sequence Viewer

- Simulink Toolstrip: On the **Simulation** tab, in the **Review Results** section, click **Sequence Viewer**.

## Examples

### Using the Sequence Viewer Tool

- 1 To activate logging events, in the Simulink Toolstrip, under the **Simulation** tab, in the **Prepare** section, click **Log Events**.
  - 2 Simulate your model.
  - 3 To open the tool, in the Simulink Toolstrip, under the **Simulation** tab, in the **Review Results** section, click **Sequence Viewer**.
- “Use the Sequence Viewer to Visualize Messages, Events, and Entities”
  - “Simulink Messages Overview”

## Parameters

**Time Precision for Variable Step** — Digits for time increment precision  
3 (default) | scalar

Number of digits for time increment precision. When using a variable step solver, change this parameter to adjust the time precision for the sequence viewer. By default the block supports 3 digits of precision. Minimum and maximum precision are 1 and 16, respectively.

Suppose the block displays two events that occur at times 0.1215 and 0.1219. Displaying these two events precisely requires 4 digits of precision. If the precision is 3, then the block displays two events at time 0.121.

#### Programmatic Use

**Block Parameter:** SequenceViewerTimePrecision

**Type:** character vector

**Values:** '3' | scalar

**Default:** '3'

**History** — Maximum number of previous events to display  
1000 (default) | scalar

Total number of events before the last event to display. Minimum and maximum number of events are 0 and 25000, respectively.

For example, if **History** is 5 and there are 10 events in your simulation, then the block displays 6 events, including the last event and the five events prior the last event. Earlier events are not displayed. The time ruler is greyed to indicate the time between the beginning of the simulation and the time of the first displayed event.

Each send, receive, drop, or function call event is counted as one event, even if they occur at the same simulation time.

#### Programmatic Use

**Block Parameter:** SequenceViewerHistory

**Type:** character vector

**Values:** '1000' | scalar  
**Default:** '1000'

## **Version History**

**Introduced in R2020b**

# Signal Editor

Create and edit input signals

## Description

The **Signal Editor** lets you create and edit input signals that you can organize for multiple simulations.

## Open the Signal Editor

- MATLAB Command Window: Enter `signalEditor`.
- Root Inport Mapper: To create a MAT-file for your new signal data, select **Signals > New MAT-File**. To link in an existing signal data file from an existing scenario and edit the signals in that file, use the **Signals > Edit MAT-File**.
- Signal Editor block: Click .
- Simulink Editor toolstrip:
  - 1 In the **Prepare** section of the **Simulation** tab, click the expander.
  - 2 Click **Inputs & Parameter Tuning > Signal Editor**.

## Examples

### Mouse, Keyboard, and Touchscreen Shortcuts

You can use these keyboard shortcuts to interact with the **Signal Editor**.

This table shows edit actions:

Action	Keyboard	Mouse	Multi-Touch
Insert point	<b>Ctrl+P</b>	Click 	Tap
Insert line	<b>Ctrl+L</b>	Click 	Pan and pinch
Draw	<b>Ctrl+D</b>	Click and draw	Pan
Select a point	<b>Ctrl+T</b>	Click  , then click and select point or area  To select all areas, double-click	Pan and pinch  To select all areas, double-tap
Move a point	<b>Ctrl+M</b>	Click  and drag	Tap and move
Change data of a point		Click 	
Continuously delete points on a line		Click 	
Fit to view if zoom action is selected		Three mouse clicks	Triple tap
Zoom out if zoom action is selected		Two mouse clicks	Double tap
Expand along the x-axis		<b>Ctrl</b> +mouse pan	Pry x-axis
Expand along the y-axis		<b>Shift</b> +mouse pan	Pry y-axis

This table shows zoom actions:

Type of Zoom or Pan	Action
Zoom in along the T and Y axes.	Click 
Zoom in along the time axis. After selecting the icon, on the graph, drag the mouse to select an area to enlarge.	Click 
Zoom in along the data value axis. After selecting the icon, on the graph, drag the mouse to select an area to enlarge.	Click 
Zoom only in x while zooming in xy.	Zoom in xy while pressing <b>Ctrl</b>

Type of Zoom or Pan	Action
Zoom only in y while zooming in xy.	Zoom in xy while pressing <b>Shift</b>
Zoom out from the graph.	Click 
Fit the plot to the graph. After selecting the icon, click the graph to enlarge the plot to fill the graph.	Click 
Pan the graph up, down, left, or right. Select the icon. On the graph, hold the left mouse button and move the mouse to the area of the graph that you want to view.	Click 

### Snap to Grid for Alignment

You can use these alignment commands to snap to the plot grid for accuracy.

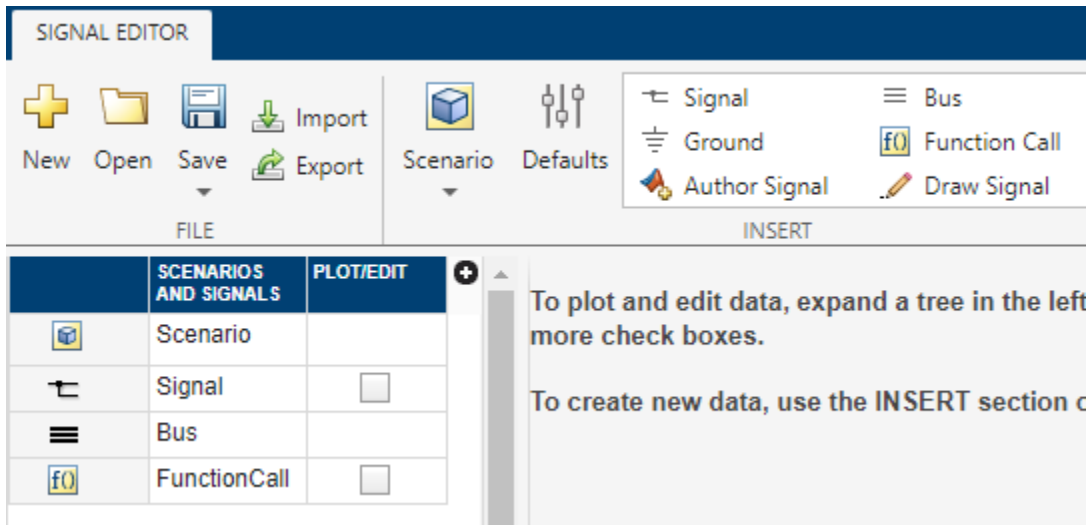

Alignment actions:

Action	Snap to Grid
Snap values to x grid lines for point and line insertion and movement and zooming.	<b>Snap X to Grid</b>
Snap values to y grid lines for point and line insertion and movement and zooming.	<b>Snap Y to Grid</b>
Snap values to x minor grid lines for point and line insertion and movement and zooming.	<b>Snap X to Tick</b>
Snap values to y grid lines for point and line insertion and movement and zooming.	<b>Snap Y to Tick</b>
Snap to incremental value in X grid.	<b>Snap X to Increment</b>
Snap to incremental value in Y grid.	<b>Snap Y to Increment</b>
Turn plot markers on and off.	<b>Markers</b>

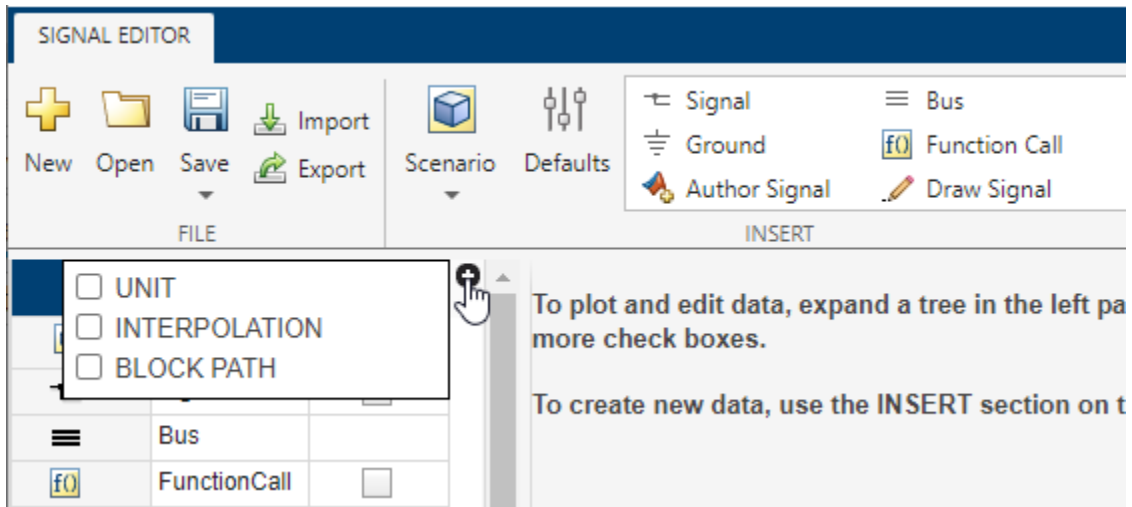

### Change Signal Names and Hierarchy Orders

In the **Scenarios and Signals** section, you can change signal names and hierarchy order, create duplicates of signals, and delete signals. Simulink ignores leading and trailing spaces in signal names.

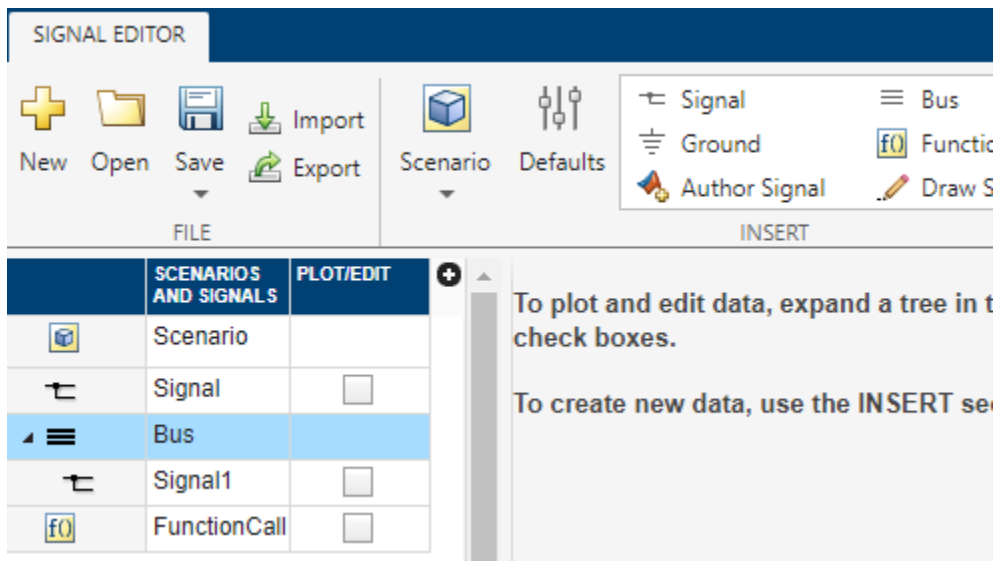

To change a signal name, double-click the name and enter a new name.

To change the unit or interpolation of a signal, click the plus sign, then select the **Unit** or **Interpolation** check boxes.

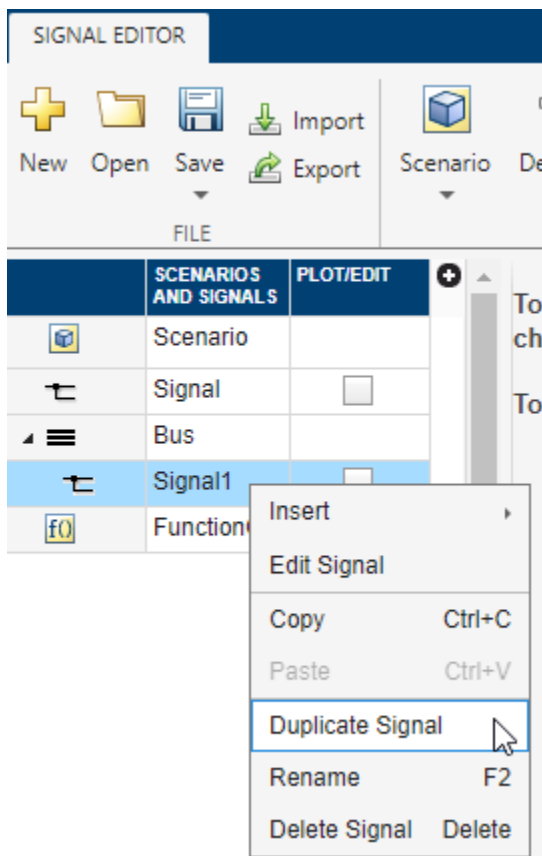

To change the order of a signal in the hierarchy, drag and release the signal. For example, you can drag and release signals into a bus.

Alternatively, in the **Adjust** section, use the **Move Up** and **Move Down** buttons.

To copy a signal and paste it under the original, right-click the signal and select **Duplicate Signal**.

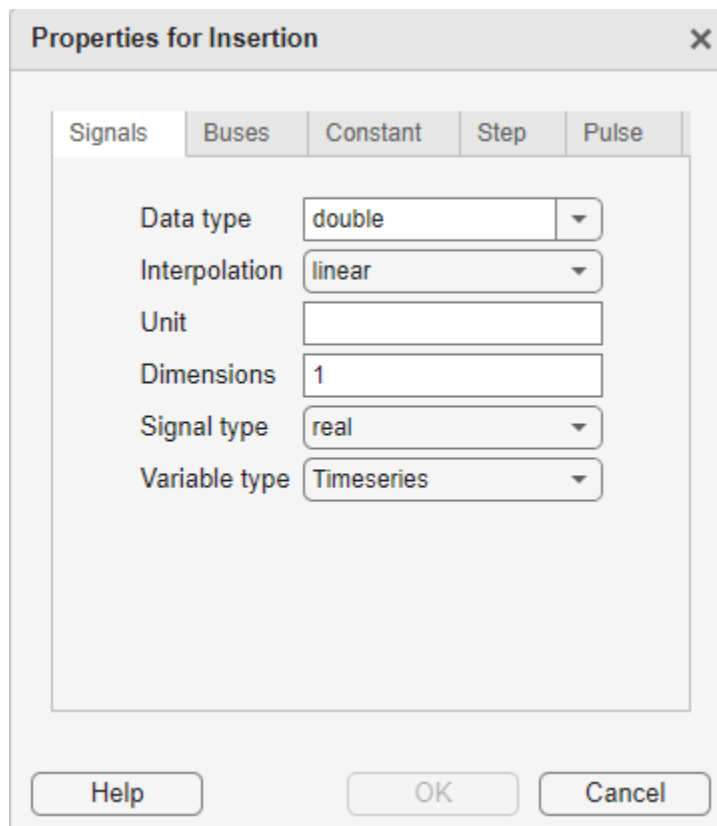

Alternatively, in the **Adjust** section, use the **Duplicate** button. You can also adjust the default properties of the signal you duplicate. For more information, see “Create Signals with the Same Properties” on page 7-126.

To copy a signal and paste it elsewhere in hierarchy, select **Copy** and then **Paste**.

### Create Signals with the Same Properties

To create signals of the same predefined type, in the **Adjust** section, use the **Duplicate** button. To

change the predefined signal type, click the **Defaults** icon, . A Default Properties for Insertion dialog box opens.

On the **Signals** tab:

- **Data type** — From the drop-down list, select the signal data type.

**Enumeration** — When you select the Enum data type, this parameter displays. Enter the class name of your enumeration.

If you define an enumeration class that contains the same integer value multiple times, the Signal Editor treats the first enumeration value as the canonical value and equates all subsequent instances of the same underlying integer to the enumerated name. In this example, `Red(118)` is canonical, so `Pink` equals `Red`.

```

classdef(Enumeration) hEnumColors_duplicateValues < Simulink.IntEnumType
 enumeration
 Red(118)
 Yellow(-14)
 Blue(90)
 Green(87)
 White(-14)
 Black(198)
 Brown(90)
 Pink(118)
 Purple(90)
 end
 methods (Static = true)
 function retVal = getDefaultValue()
 retVal = hEnumColors_duplicateValues.Blue;
 end
 end
end
end

```

- **Interpolation** — From the drop-down list, select `linear` or `zero order hold`.
- **Unit** — Enter an appropriate unit expression. For a suggested list of unit expressions, see `Allowed Units`.
- **Dimensions** — Enter the number of dimensions for the signal.
- **Signal type** — From the list, select `real` or `complex`.
- **Variable type** — From the list, select `Timeseries` (default), `Timetable`, `Logged timeseries`, or `Logged timetable`.

`Logged timeseries` and `logged timetables` objects are `Simulink.SimulationData.Signal` objects whose `Value` property is of data type `timeseries` or `timetable`.

On the **Buses** tab:

- **Bus object** — From the list, select the bus object for which to define the dimensions. If you leave the **Bus object** parameter at the default `<object name>`, the Signal Editor adds empty buses.
- **Dimensions** — Enter the number of dimensions for the bus object.

On the **Constant** tab:

- **Value** — Enter constant value to output.
- **Time** — Enter sample time.

On the **Step** tab:

- **Initial value** — Enter output value before step.
- **Final value** — Enter output value after step.
- **Start time** — Enter time when step starts.
- **Step time** — Enter time increment when step occurs.
- **Step final time** — Enter final step time.

On the **Pulse** tab:

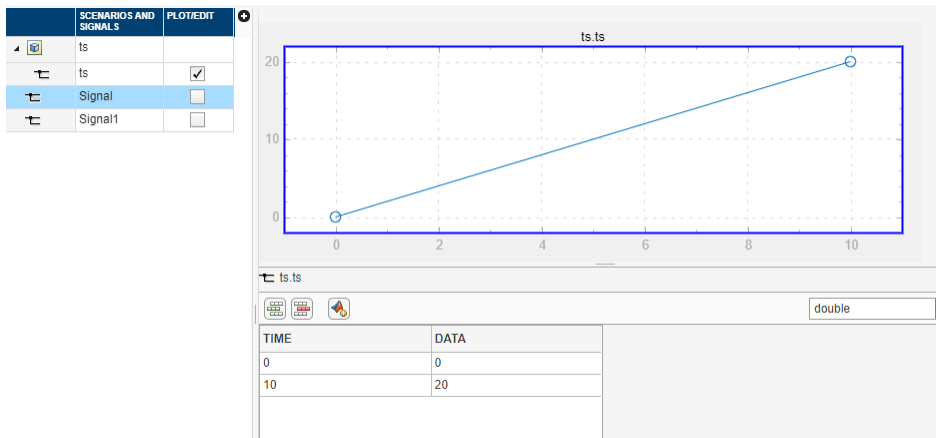

- **Initial value** — Enter initial default value of signal.
- **Value at trigger** — Enter value of signal at pulse trigger.
- **Pulse duration** — Enter length of time of pulse.
- **Step time** — Enter time when step occurs.

- **Trigger time** — Enter time when pulse trigger occurs.

### Work with Data in Signals

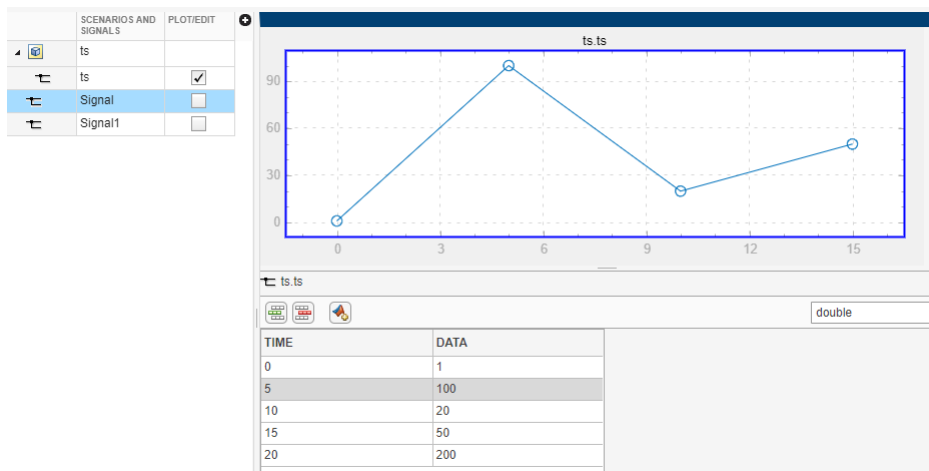

This example describes how to add and delete data to the signals in the linked scenario. To create a model and data to work with, see “Add Signals to Scenarios”.

In the Signal Editor, in the **Scenarios and Signals** section, click the plot check box for the signal *ts*.

Add data to the signal *ts*.

- 1 Click the add row icon  and add signals. To add a signal row between other signals, click the signal above and click the add row icon.
- 2 When done, click **Apply** to update the plot.

Remove the time 20 line from the signal. Select 20 and click .

Alternatively, if you want to replace all the signal data for `ts` with a signal defined with signal notations, click the replace button  and use the Author and Replace Signal Data dialog box to define new data.

- “Create and Edit Signal Data”
- How to Import and Export Excel Files in Signal Editor
- How to Create Freehand Input Signals in the Signal Editor in Simulink

## Parameters

### File

**New** — Start new Signal Editor session  
button

Open a new Signal Editor session.

**Open** — Open MAT-file containing signals  
button

Open MAT-file containing signals to be displayed and edited in Signal Editor.

**Save** — Save signal data to MAT-file  
button

Save the contents of Signal Editor.

### Insert

**Scenario** — Create scenario  
button

Create scenario to contain signals.

**Defaults** — Change predefine signal types and properties  
button

Change the predefined signal type and properties by clicking .

**Signal** — Insert basic signal  
button

Insert basic signal by clicking . For more information, see “Work with Basic Signal Data”.

**Function Call** — Insert function-call signal  
button

Insert function-call signal by clicking .

If you need a function-call signal for a root inport with explicit periodic sample time, insert a ground signal instead. Simulink then executes the function-call automatically.

**Constant** — Instant constant signal  
button

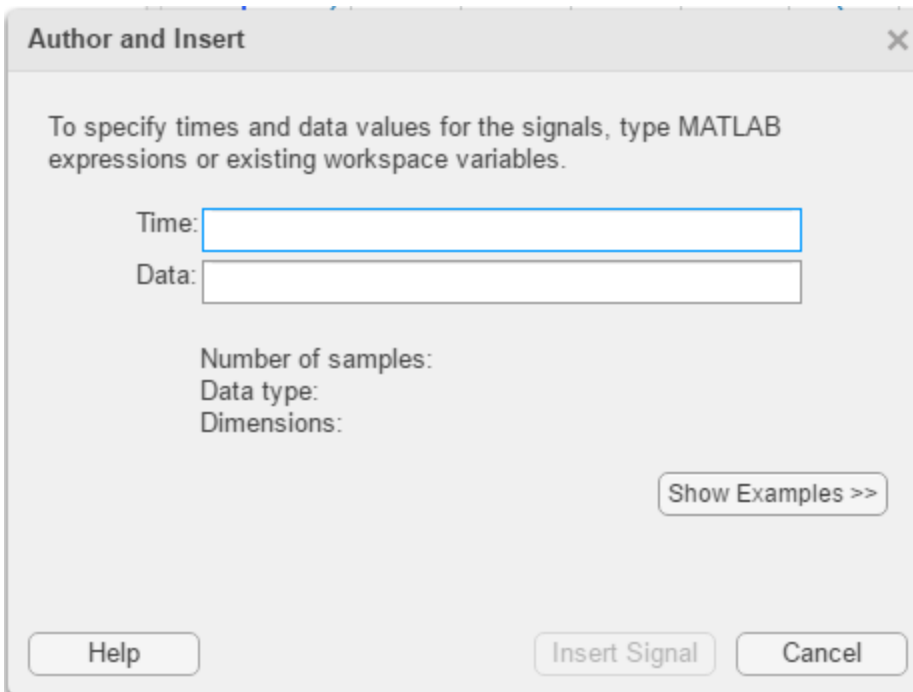

Insert constant signal with value of 1 by clicking .

**Bus** — Insert bus  
button

Insert bus by clicking . To the bus you can add signals using any of the other signal insertions techniques.

**Author Signal** — Author signal using MATLAB expressions or workspace variables  
button

Author signal using MATLAB expressions or workspace variables by clicking . The dialog box displays:

**Author and Insert**

To specify times and data values for the signals, type MATLAB expressions or existing workspace variables.

Time:

Data:

Number of samples:  
Data type:  
Dimensions:

Show Examples >>

Help      Insert Signal      Cancel

- **Time** — Enter the range of time for the data.
- **Data** — Enter the MATLAB expression for the signal.
- **Data type** — Select or enter the signal data type.
  - double
  - single
  - int8

- uint8
- int16
- uin16
- int32
- uint32
- boolean
- fixdt(1,16)
- fixdt(1,16,0)
- fixdt(1,16,2^0,0)
- string
- Enum: <class name>

If you enter your time and data and then select a fixed-point data type, the Signal Editor displays a fixed-point proposed data type for your data.

- To help you select a fixed-point data type, click the **Show Histogram** button

( **Show Histogram**). Clicking this button displays a plot of the signal data using the selected fixed-point data type. The graph displays:

Column	Information
Values	The negative, positive, and zero signal values.
Potential Overflows	Bins the signal values that may overflow.
In-Range	Bins the signal values that are within acceptable range.
Potential Underflows	Bins the signal values that may underflow.

To see the difference that a data type may have on the histogram, select:

- User Specified
- Binary Scaling
- Slope & Bias Scaling

For more information, see “Histogram Plot of Signal” (Fixed-Point Designer).

- To apply the proposed fixed-point data type to your data, click the **Use proposed data type** button (.

For more information, see “Create Signals with MATLAB Expressions and Variables”.

**Step** — Insert step waveform signal  
button

Insert step waveform signal with an initial value of 0 and a final value of 1 by clicking .

**Ground** — Insert ground signal  
button

Insert ground signal by clicking  .

**Draw Signal** — Insert graphically-generated signal  
button

Insert graphically-generated signal by clicking  .

**Pulse** — Insert pulse waveform signal  
button

Insert pulse signal waveform signal with an initial value of 0, trigger value of 1, and initial pulse duration of 1 by clicking  .

### **Adjust**

**Duplicate** — Copy signal  
button

Copy signal and paste it under original signal.

**Move Up** — Move signal up the signal hierarchy  
button

Move signal up the signal hierarchy in a bus or scenario by clicking the signal and then clicking **Move Up**.

**Move Down** — Move signal down the signal hierarchy  
button

Move signal down the signal hierarchy in a bus or scenario by clicking the signal and then clicking **Move Down**.

**Delete** — Delete signal  
button

Delete signal by selecting one or more signals and clicking  .

## **Programmatic Use**

signalEditor opens the Signal Editor from the MATLAB Command Window.

# Signal Logging Selector

View signal logging configuration and override signal logging settings

## Description

The Signal Logging Selector in Simulink allows you to view a signal logging configuration, including signal logging override settings. You can also use the Simulink Signal Logging Selector to override signal logging settings without changing the model in the Simulink Editor. When you override signal logging settings, you select a subset of signals to log from a superset of signals marked for logging in the model without changing the model itself. Overriding signal logging settings allows you to reduce memory overhead and avoid recompiling a model. For more information about overriding signal logging properties, see “Override Signal Logging Settings”.

## Open the Signal Logging Selector

- Simulink Toolstrip: On the **Modeling** tab, click **Model Settings**. Then, click **Configure Signals to Log**.
- MATLAB Command Window: Enter `Simulink.SimulationData.signalLoggingSelector mdl`, where `mdl` is the name of the

model for which you want to open the Signal Logging Selector dialog box, specified as a character vector.

## Examples

- “View Logging Configuration Using the Signal Logging Selector”
- “Override Signal Logging Settings with Signal Logging Selector”

## Version History

**Introduced in R2011a**

### Topics

- “View Logging Configuration Using the Signal Logging Selector”
- “Override Signal Logging Settings with Signal Logging Selector”

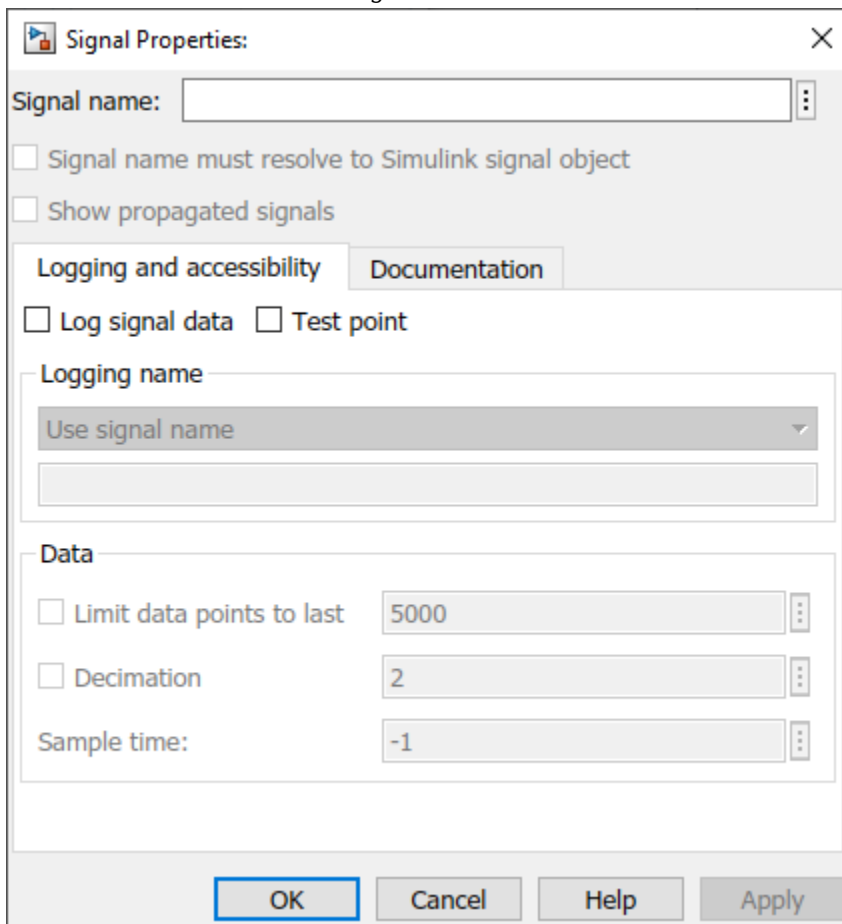

# Signal Properties

View and edit signal properties

## Description

Use the Signal Properties dialog box to view and edit properties for signals in your model. Using the Signal Properties dialog box, you can mark a signal for logging, specify a signal name, and configure logging options, including which data points to log and the logging sample time.

When your model is configured for concurrent execution, the Signal Properties dialog box also includes a **Data Transfer** tab. For more information, see “Configure Data Transfer Settings Between Concurrent Tasks” and “Configure Your Model for Concurrent Execution”.

## Open the Signal Properties

- Right-click a signal line in the model and select **Properties**.
- When you select a signal line in your model, the Signal Properties are available in the Property Inspector.

## Parameters

### Signal Name Properties

**Signal name** — Signal name  
string | character vector

Specify a name for the signal as a character vector or string.

When you select **Signal name must resolve to Simulink signal object**, the name must match the name of a `Simulink.Signal` object in the base workspace, the model workspace, or a data dictionary. The signal name can implicitly resolve to a `Simulink.Signal` object when you do not select **Signal name must resolve to Simulink signal object**. For more information, see “Explicit and Implicit Symbol Resolution”.

By default, the name for logged signal data matches the signal name specified in the model. To use a different name for the logged signal data, specify the name for the logged data using the **Logging Name** property.

### Programmatic Use

To specify a signal name programmatically, use the `set_param` function to set the `Name` property for the line handle that corresponds to the signal or the port handle that corresponds to the block output port that produces the signal. For an example, see “Name a Signal Programmatically”.

**Parameter:** Name

**Type:** string | character vector

**Signal name must resolve to Simulink signal object** — Explicit signal name resolution  
'off' (default) | 'on'

When enabled, the signal name specified in the Signal Properties dialog box must match the name of a `Simulink.Signal` object in the base workspace, the model workspace, or a data dictionary. When disabled, the signal name can implicitly resolve to a `Simulink.Signal` object. For more information, see “Explicit and Implicit Symbol Resolution”.

By default, signals that require resolution to a `Simulink.Signal` object are marked with the signal resolution icon to the left of the signal label. For more information, see “Signal to Object Resolution Indicator”.

### Programmatic Use

To configure this option for a signal programmatically, use the `set_param` function to set the `MustResolveToSignalObject` property for the port handle that corresponds to the block output port that produces the signal. For an example, see “Use Signal Objects”.

**Parameter:** `MustResolveToSignalObject`

**Value:** 'on' | 'off'

**Default:** 'off'

**Show propagated signals** — Option to display propagated signal name  
'off' (default) | 'on'

When a downstream signal originates from a block that supports signal label propagation, you can enable this option on the downstream signal line to display the propagated signal name as a label on the signal line.

For example, the output signal from the Subsystem block is configured for signal label propagation. The propagated signal label `<const>` comes from the name of the upstream Constant block output signal `const`.

For more information see, “Signal Label Propagation”.

### Tips

To display propagated signal labels for all signals, in the Simulink Editor, on the **Debug** tab, select **Information Overlays**, then select **Propagated Signal Labels**.

### Dependencies

The **Show propagated signals** property is only available for signals produced by blocks that support signal label propagation.

### Programmatic Use

To configure a signal to display its propagated name programmatically, use the `set_param` function to specify the value of the `ShowPropagatedSignals` property for the port handle that corresponds to the block output port that produces the signal. For an example, see “Display Propagated Signal Labels”.

**Parameter:** `ShowPropagatedSignals`

**Value:** `'on'` | `'off'`

**Default:** `'off'`

### Logging and Accessibility

#### Log signal data — Signal logging

`'off'` (default) | `'on'`

Select this option to mark a signal for logging. When the **Signal logging** option in the model configuration parameters is enabled, data for signals marked for logging is sent to the workspace and the Simulation Data Inspector during simulation. For more information, see “Save Signal Data Using Signal Logging”.

### Programmatic Use

You can control whether to log a signal programmatically using the `Simulink.sdi.markSignalForStreaming` function or by using the `set_param` function to configure the `DataLogging` property of the port handle that corresponds to the block output port that produces the signal.

**Parameter:** `DataLogging`

**Value:** `'on'` | `'off'`

**Default:** `'off'`

#### Test point — Test point designation

`'off'` (default) | `'on'`

When enabled, the signal is designated as a test point. For more information, see “Configure Signals as Test Points”.

#### Programmatic Use

To designate a signal as a test point programmatically, use the `set_param` function to specify the value of the `TestPoint` property for the port handle that corresponds to port that produces the signal.

**Parameter:** `TestPoint`

**Value:** 'on' | 'off'

**Default:** 'off'

**Logging Name** — Name for logged signal data

'SignalName' (default) | 'Custom'

Specify a name for the logged signal data. By default, logged signal data uses the name of the signal specified in the model.

To specify a logging name for a signal that is different from the name of the signal in the model, select `Custom` and specify the logging name in the text box.

#### Dependencies

To enable the **Logging Name** property, select **Log signal data**.

#### Programmatic Use

To specify the logging name programmatically, use the `set_param` function to configure the `DataLoggingNameMode` and `DataLoggingName` parameters for the port handle that corresponds to the block output port that produces the signal.

**Parameter:** `DataLoggingNameMode`

**Value:** 'SignalName' | 'Custom'

**Default:** 'SignalName'

**Parameter:** `DataLoggingName`

**Type:** string | character vector

**Limit data points to last** — Option to log only last  $n$  data points

'off' (default) | 'on'

When you only want to save or analyze the data from the end of a simulation, you can configure logging to capture only the last  $n$  signal values. Select **Limit data points to last** and specify the number of data points you want to log.

When you only log the last simulation values, dashboard blocks and the Simulation Data Inspector do not display data during simulation. Consider data requirements for each signal before you reduce the number of data points logged in simulation.

For more information, see “Specify Signal Values to Log” and “Limit the Size of Logged Data”.

#### Dependencies

To enable the **Limit data points to last** property, select **Log signal data**.

### Programmatic Use

To configure this option programmatically, use the `set_param` function to configure the `DataLoggingLimitDataPoints` and `DataLoggingMaxPoints` parameters for the port handle that corresponds to the block output port that produces the signal.

**Parameter:** `DataLoggingLimitDataPoints`

**Value:** 'on' | 'off'

**Default:** 'off'

**Parameter:** `DataLoggingMaxPoints`

**Value:** numeric scalar

**Type:** string | character vector

**Default:** '5000'

**Decimation** — Option to log every *n*th data point

'off' (default) | 'on'

When you want to reduce the effective sample rate for logged data, select **Decimation** and specify the desired decimation factor in the text box. For example, if you specify a decimation factor of 2, every other signal value is logged.

Consider data requirements for each signal before reducing the number of data points logged in simulation. Decimation can cause aliasing if the effective sample rate is too low.

For more information, see “Specify Signal Values to Log” and “Limit the Size of Logged Data”.

### Dependencies

To enable the **Decimation** property, select **Log signal data**.

### Programmatic Use

To configure this option programmatically, use the `set_param` function to configure the `DataLoggingDecimateData` and `DataLoggingDecimation` parameters for the port handle that corresponds to the block output port that produces the signal.

**Parameter:** `DataLoggingDecimateData`

**Value:** 'on' | 'off'

**Default:** 'off'

**Parameter:** `DataLoggingDecimation`

**Value:** numeric scalar

**Type:** string | character vector

**Default:** '2'

**Sample time** — Logging sample time

-1 (default) | scalar

Specify the sample time to use for logging the data for the selected signal. By default, the logging sample time is inherited (-1) from the block that produces the signal. For continuous logging sample time, specify the value as 0. To use a discrete sample time for logging data, specify the sampling interval as a scalar.

Setting the sample time for a logged signal in the Signal Properties dialog box:

- Separates design and testing because you do not need to insert a Rate Transition block to have a consistent sample time for logged signals

- Reduces the amount of logged data for a continuous time signal, for which setting decimation is not relevant
- Eliminates the need to post-process logged signal data for signals with different sample times

Specifying a logging sample time may add a new sample time to the model. When you specify a logging sample time, the model calculates a value for the exact time hits. When you use a fixed-step solver, the logging sample time you specify must be a multiple of the base rate for the model.

Specifying a sample time for signal logging does not affect the simulation result. However, it is possible that the signal logging output for a logged signal varies depending on whether you specify a sample rate. For example, the interpolation method can differ depending on whether you specify a sample time for signal logging.

If you simulate in software-in-the-loop (SIL) mode, signal logging ignores the sample time you specify for logged signals.

Do not specify a sample time for:

- Frame-based signals
- Signals inside conditional subsystems or conditional referenced models

The **Sample time** property is the same as the **Logging sample time** property you configure using the **Instrumentation Properties** dialog box.

#### Dependencies

To enable the **Sample time** property, select **Log signal data**.

#### Programmatic Use

To configure this option programmatically, use the `set_param` function to configure the `DataLoggingSampleTime` parameter for the port handle that corresponds to the block output port that produces the signal.

**Parameter:** `DataLoggingSampleTime`

**Value:** numeric scalar

**Type:** string | character vector

**Default:** ' -1 '

#### Documentation

##### Description — Signal description

string | character vector

You can provide a description of the signal that shows in the **Info** tab of the Property Inspector when the signal is selected.

The description specified in the Signal Properties dialog box does not appear in generated code. To provide a signal description that becomes a comment in generated code, use a `Simulink.Signal` object.

#### Programmatic Use

To configure this option programmatically, use the `set_param` function to configure the `Description` parameter for the port handle that corresponds to the block output port that produces the signal.

**Parameter:** Description

**Type:** string | character vector

**Document link** — Link to documentation about signal

MATLAB expression

Specify a MATLAB expression that opens documentation for the signal. For example, you can call the `web` function to open an HTML file. When you specify a value for the **Document link** property, you can click the **Document link** field label to open the document.

#### **Programmatic Use**

To programmatically specify a document link, use the `set_param` property to specify the `DocumentLink` property of the port handle that corresponds to the block output port that produces the signal.

**Parameter:** `DocumentLink`

**Type:** string | character vector

# Simulation Data Inspector

Inspect and compare data and simulation results to validate and iterate model designs

## Description

The Simulation Data Inspector visualizes and compares multiple kinds of data.

Using the Simulation Data Inspector, you can inspect and compare time series data at multiple stages of your workflow. This example workflow shows how the Simulation Data Inspector supports all stages of the design cycle:

**1** “View Data in the Simulation Data Inspector”

Run a simulation in a model configured to log data to the Simulation Data Inspector, or import data from the workspace or a MAT-file. You can view and verify model input data or inspect logged simulation data while iteratively modifying your model diagram, parameter values, or model configuration.

**2** “Inspect Simulation Data”

Plot signals on multiple subplots, zoom in and out on specified plot axes, and use data cursors to understand and evaluate the data. “Create Plots Using the Simulation Data Inspector” to tell your story.

**3** “Compare Simulation Data”

Compare individual signals or simulation runs and analyze your comparison results with relative, absolute, and time tolerances. The compare tools in the Simulation Data Inspector facilitate iterative design and allow you to highlight signals that do not meet your tolerance requirements. For more information about the comparison operation, see “How the Simulation Data Inspector Compares Data”.

**4** “Save and Share Simulation Data Inspector Data and Views”

Share your findings with others by saving Simulation Data Inspector data and views.

You can also harness the capabilities of the Simulation Data Inspector from the command line. For more information, see “Inspect and Compare Data Programmatically”.

## Open the Simulation Data Inspector

- Simulink Toolstrip: On the **Simulation** tab, under **Review Results**, click **Data Inspector**.
- Click the streaming badge on a signal to open the Simulation Data Inspector and plot the signal.
- MATLAB command prompt: Enter `Simulink.sdi.view`.

## Examples

### Apply a Tolerance to a Signal in Multiple Runs

You can use the Simulation Data Inspector programmatic interface to modify a parameter for the same signal in multiple runs. This example adds an absolute tolerance of  $0.1$  to a signal in all four runs of data.

First, clear the workspace and load the Simulation Data Inspector session with the data. The session includes logged data from four simulations of a Simulink® model of a longitudinal controller for an aircraft.

```
Simulink.sdi.clear
Simulink.sdi.load('AircraftExample.mldatx');
```

Use the `Simulink.sdi.getRunCount` function to get the number of runs in the Simulation Data Inspector. You can use this number as the index for a for loop that operates on each run.

```
count = Simulink.sdi.getRunCount;
```

Then, use a for loop to assign the absolute tolerance of  $0.1$  to the first signal in each run.

```
for a = 1:count
 runID = Simulink.sdi.getRunIDByIndex(a);
 aircraftRun = Simulink.sdi.getRun(runID);
 sig = getSignalByIndex(aircraftRun,1);
 sig.AbsTol = 0.1;
end
```

- “View Data in the Simulation Data Inspector”
- “Inspect Simulation Data”
- “Compare Simulation Data”
- “Iterate Model Design Using the Simulation Data Inspector”

## Programmatic Use

`Simulink.sdi.view` opens the Simulation Data Inspector from the MATLAB command line.

## Version History

Introduced in R2010b

# Simulation Manager

Monitor multiple simulations and visualize the simulation data

## Description

**Simulation Manager** allows you to monitor the status of multiple simulations. Using this tool, you can:

- View the progress of the simulations in a high-level grid view or a detailed list view.
- Find the simulations that error out and view diagnostics for each simulation.
- Visualize simulation data to analyze the trends across the simulations.
- Select a simulation run and open the model in Simulink, with all of the simulation settings applied to the model.
- View simulation results in the Simulation Data Inspector.
- Abort simulations.

The Simulation Manager allows you to monitor multiple simulations, in serial or in parallel, and their progress. You can view the details of every run, such as parameters, elapsed time, and diagnostics. The Simulation Manager provides the option to analyze and compare your logged signal results in the **Simulation Data Inspector**. Through Simulation Manager, you can select a run and apply its values to the model.

With the command line API for running multiple simulations, for the parameter to show up in plots in Simulation Manager use the `setVariable` method on the `Simulink.SimulationInput` object.

## Open the Simulation Manager

- `parsim` and `simfunctions` — Set the argument `ShowSimulationManager` to `on` while using `Simulink.SimulationInput` object to run simulations. For more information, see `Simulink.SimulationInput`.

```
out = parsim(in, 'ShowSimulationManager', 'on')
```

```
out = sim(in, 'ShowSimulationManager', 'on')
```

- To open a saved Simulation Manager session, navigate to the folder where the file is saved and double click the `.mldatx` Simulation Manager file.

```
open filename.mldatx
```

- To open a Simulation Manager with the `Simulink.SimulationInput` object, `in`, and a `Simulink.SimulationOutput` object, `out`, of a completed run, use the `openSimulationManager` command.

```
openSimulationManager(in, out)
```

## Examples

### Open Simulation Manager

Open the model `sldemo_suspn_3dof` and create a set of sweep values.

```
mdl = 'sldemo_suspn_3dof';
openExample(mdl);
Cf_sweep = Cf*(0.05:0.1:0.95);
numSims = length(Cf_sweep);
```

To modify the block parameter **Road-Suspension Interaction** with the sweep values, create an array of `Simulink.SimulationInput` objects.

```
in(1:numSims) = Simulink.SimulationInput(mdl);
for i = 1:numSims
 in(i) = setBlockParameter(in(i), [mdl '/Road-Suspension Interaction'], 'Cf', num2str(Cf_sweep(i)));
end
```

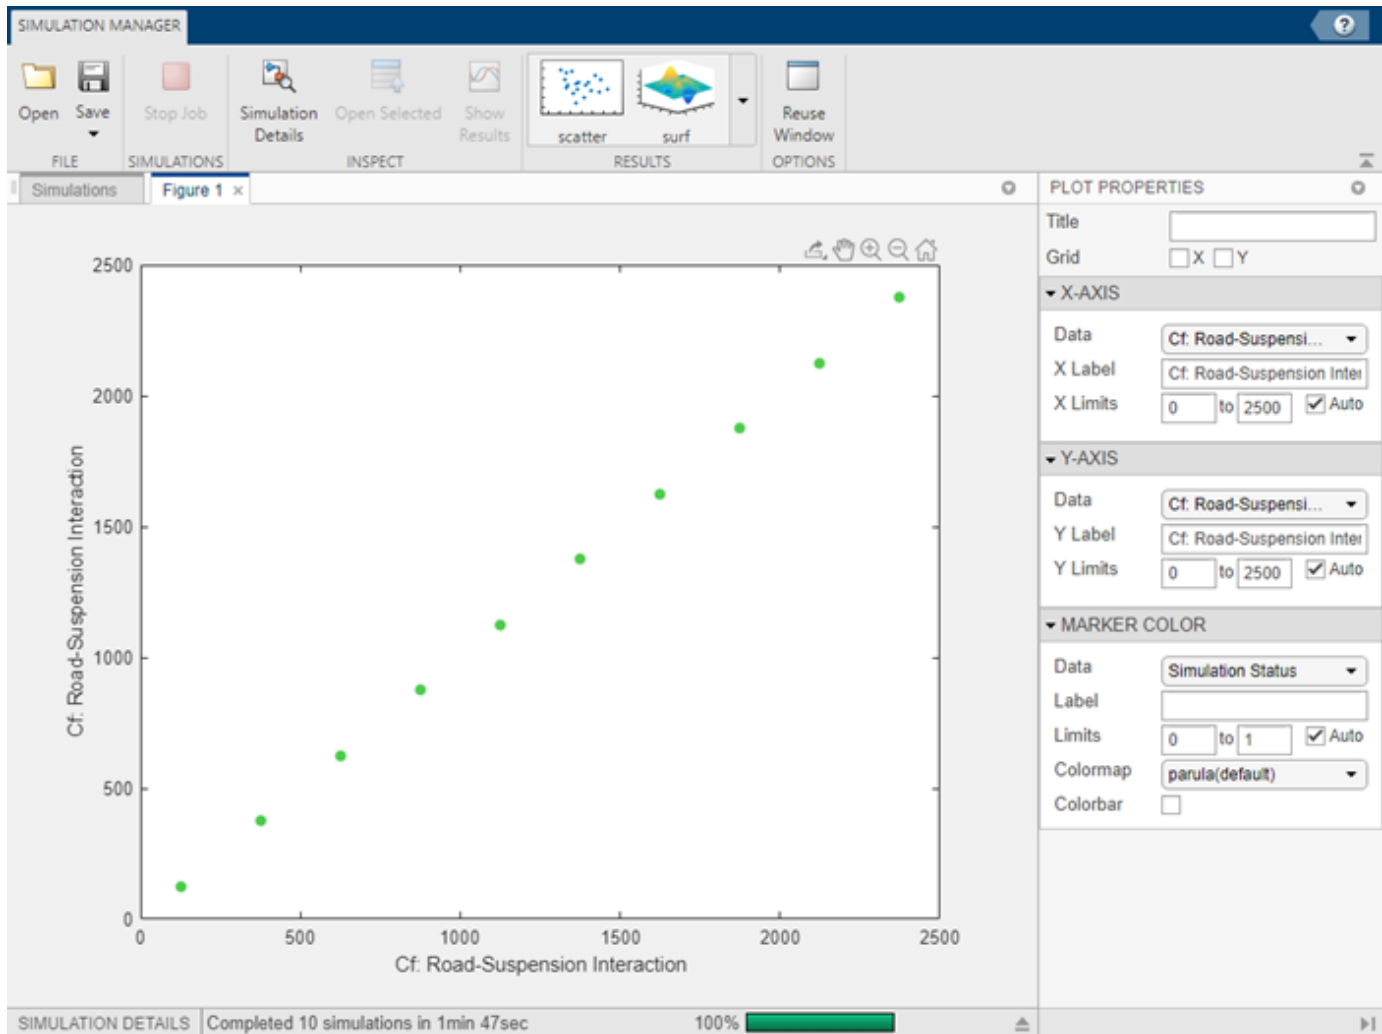

Run multiple simulations and open the Simulation Manager.

```
out = parsim(in, 'ShowSimulationManager', 'on')
```

In the absence of Parallel Computing Toolbox, the simulations run in serial.

### Using Simulation Manager

Once you run the `parsim` command, the Simulation Manager UI opens up as follows:

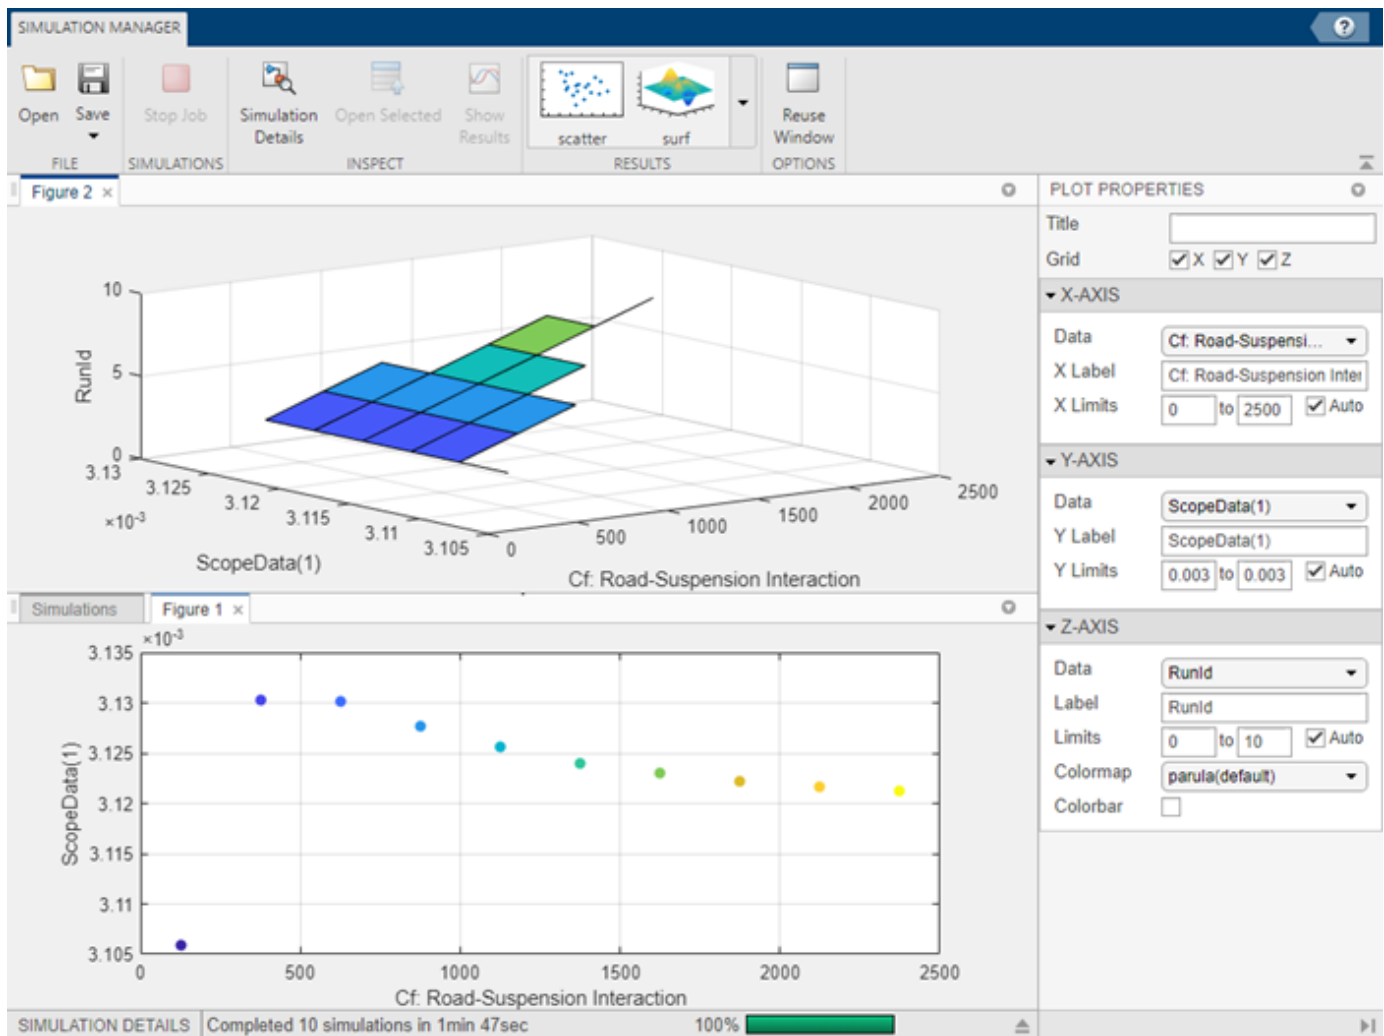

### Plot results

In the **Figure 1** tab, you can view the default scatter plot where the parameter Cf is plotted against itself. Use the **Plot Properties** to edit the plot. Add grid lines for X and Y by checking the corresponding boxes. You can also change the data that is displayed on X- and Y- axes and the Marker Color. Change the data on y-axis by selecting ScopeData (1) from the **Data** drop-down. Set the Marker Color Data field to RunID.

To add another figure to the Simulation Manager, click **surf** or **scatter** plot and add plots as desired. In this example, click **surf** plot, located in the **Results** section of the toolbar. Drag the **Figure 2** tab to view the two plots together.

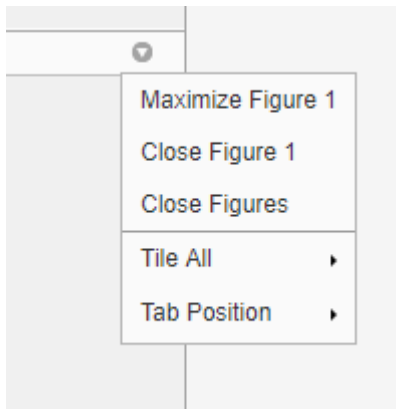

Plots in the Simulation Manager support numeric arrays and datasets.

Adding multiple plots to the Simulation Manager enables you to observe the simulation data in different ways. Using the results, you can analyze and study the design space of the parameters and their behavior.

You can modify the configuration of the plot layouts by clicking the down arrow on the right corner of the plot.

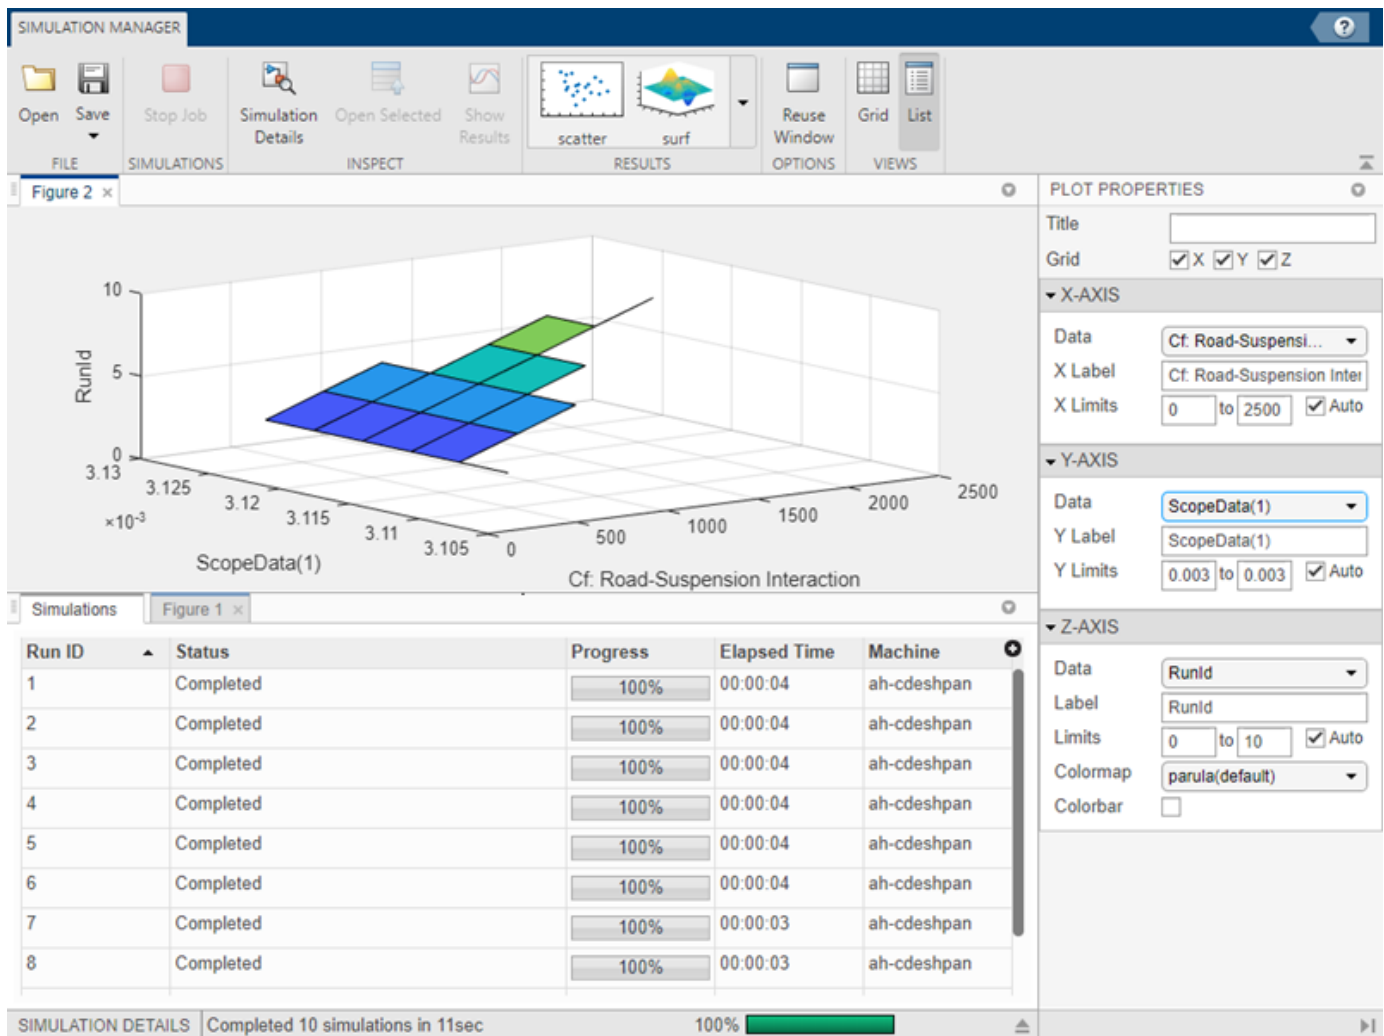

- **Tile All** — Choose a layout for multiple plots.
- **Tab Position** — Select where to display the figure tab.

#### **View the Status**

To view the status of the simulations in list and grid views, click the **Simulations** tab next to **Figure 1**. Toggle between the **List** and **Grid** in the **Views** section of the toolbar. The list view shows a tabular view of the simulations with certain details, such as status, parameters and timing information. For large number of simulations, choose grid view for a compact view of the status of the simulations.

The status bar at the bottom of the window shows the progress of the simulations.

You can view all the multiple simulations in a detailed list view. This view gives you an option to add or delete columns. Use the  button to choose which columns to display. You can also sort the columns based on your preference.

Click a specific run to view more details about it.. The simulation details appear at the bottom of the window.

To show or hide the details of the selected simulation, toggle the **Simulation Details** button, .

**Open Selected** button, , allows you to open the model with the specifications of the selected run.

You can view the results of one or more runs in the Simulation Data Inspector by clicking the **Show Results** button, . Clicking **Show Results** creates a Simulation Data Inspector run from the `Simulink.SimulationOutput` object and is displayed in Simulation Data Inspector.

To abort the job while the simulations are running, you can use the **Stop Job** button, .

### Save the Session

To save the Simulation Manager session, click the **Save** button on the toolbar. The saved session contains all the simulation data and the plot configurations and layout. To reopen the saved Simulation Manager session, navigate to the folder where the file is saved and double-click the `.mlatx` Simulation Manager file.

The **Reuse Window**, , button enables you to reuse the plot layout and configurations for new multiple simulations run with a different set of data. If the button is toggled off, a new window opens with each set of simulations. If the button is toggled on, the new simulations reuse the existing window preserving all plot configurations and layouts.

To reopen a saved file, use the **Open** button, navigate to the file location and double click the file.

## Simulation Stepping Options

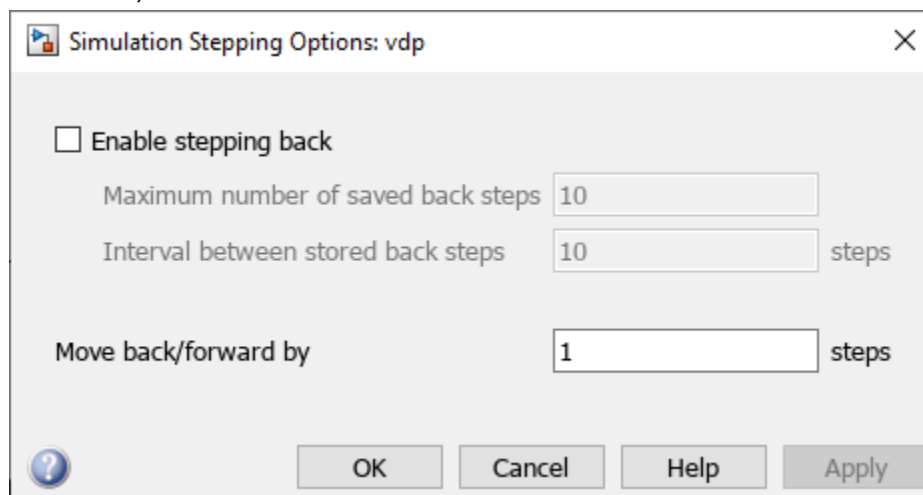

Enable stepping back and configure number of time steps to move when stepping through simulation

### Description

You can use the **Step Forward** and **Step Back** buttons to step through major time steps of a simulation to analyze and debug models. Use the Simulation Stepping Options dialog box to configure how many major time steps the simulation moves when you click **Step Forward** or **Step Back** and to enable stepping back. You can step backward in time in a simulation only after you enable stepping back using the Simulation Stepping Options.

You can adjust the simulation stepping options during simulation to balance simulation performance against the granularity of steps based on the runtime behavior of the system.

Rapid accelerator simulations do not support stepping forward or backward. To step through a simulation, use normal or accelerator mode.

### Open the Simulation Stepping Options

- Simulink Toolstrip: On the **Simulation** tab or the **Debug** tab, click the **Step Back** button.
- Simulink Toolstrip: On the **Simulation** tab or the **Debug** tab, click the **Step Back** button arrow and select **Configure Simulation Stepping**.

### Examples

- “Step Through Simulation”
- “How Stepping Through Simulation Works”
- “Display Port Values for Debugging”

## Parameters

**Enable stepping back** — Option to step backward in simulation

off (default) | on

Select this option to enable stepping backward as well as forward in time during simulation. When you select this option, you can configure how the software saves data during simulation to support stepping back.

**Maximum number of saved back steps** — Size of buffer that stores snapshots for stepping back

10 (default) | positive integer

Specify how many simulation snapshots to save to support stepping back. A simulation snapshot contains all the information required to restore the state of the simulation.

Simulation snapshots are stored in memory and are not accessible in the workspace during or after simulation. Saving more snapshots increases the amount of memory the simulation uses and can slow the speed of the simulation.

### Dependencies

To enable this parameter, select **Enable stepping back**.

**Interval between stored back steps** — Number of major time steps between saved snapshots

10 (default) | positive integer

Specify the number of major time steps between each simulation snapshot the software saves to support stepping back.

### Dependencies

To enable this parameter, select **Enable stepping back**.

**Move back/forward by** — Number of major time steps to step

1 (default) | positive integer

Specify the number of major time steps to step through each time you press the **Step Forward** or **Step Back** button.

## Tips

- To inspect signal values while stepping through the simulation, display port value labels on signals. Select a signal. Then, on the **Debug** tab, under **Tools**, in the **Output Values** button group, click Show Output Value of selected signal .
- To start stepping through a normal or accelerator mode simulation that is already running, pause the simulation. Then, use the **Step Forward** and **Step Backward** buttons.
- To start stepping from a specific time within a simulation, specify a pause time. On the **Debug** tab, under **Breakpoints**, specify the **Pause Time** in seconds. When you start the simulation by clicking **Run**, the simulation runs until the specified time and pauses. From there, you can step through the simulation.

- To debug the behavior of a model around a point of interest, you can add a signal breakpoint and specify the condition such that the simulation pauses at the time of interest. Then, use the **Step Forward** and **Step Backward** buttons. For more information about setting breakpoints in your model, see **Breakpoints List**.
- The stepping and breakpoint options in the Simulink Editor do not have a programmatic equivalent available in the software. The Simulink debugging programmatic interface includes options for setting breakpoints and stepping through simulations. However, the behavior of these functions is not identical to the behavior of the stepping options in the Simulink Editor. For more information about programmatic debugging, see “Simulink Debugging Programmatic Interface”.

# Simulink Editor

Create models and set model properties

## Description

The Simulink Editor allows you to create and configure system models.

The Simulink Editor is a tool for building models. In addition to providing standard methods for working with diagrams in a vector graphics editor, the editor provides shortcuts that help you to add and connect blocks. The Simulink Editor also gives you access to the tools you need for technical operations such as importing data, simulating your model, and analyzing model performance.

## Open the Simulink Editor

- Create a model. On the MATLAB **Home** tab, click **Simulink** and choose a model template.

Alternatively, if you already have the Library Browser open, click the **New Model** button .

- Open an existing model. To open recent models, on the MATLAB **Home** tab, click **Simulink**.

Alternatively, if you know the name of the model you want to open, enter the name in the MATLAB Command Window, such as `vdp`.

**Tip** The first model that you open in a MATLAB session takes longer to open than subsequent models. By default, MATLAB does not start Simulink until you open the first model to reduce MATLAB startup time and avoid unnecessary system memory use.

To speed up opening the first model, you can configure MATLAB startup to also start Simulink. For more information on how to start Simulink without opening models or the Library Browser, see the [start\\_simulink](#) reference page.

---

## Examples

### Interactively Build Models

When you build a model in the Simulink Editor, you use common techniques for working with graphics objects.

Actions you can perform in the Simulink Editor include:

- Selecting using click, shift-click, and dragging
- Resizing objects using handles and moving objects by dragging
- Cutting, copying, and pasting
- Undoing and redoing up to 101 operations

---

**Note** After you undo or redo block parameter changes, a visual cue appears that shows the current values of the affected parameters. Some parameter changes are not affected by the undo or redo commands. After you undo or redo changes to block parameters, use the cue to see the parameters affected.

A small subset of parameters cannot be undone. Changing these parameters clears the undo history when you make the change in the Property Inspector or in the block dialog box.

---

You can also zoom and scroll the editing area. On the **Modeling** tab, select **Environment > Zoom**, and select the zoom or view you want to use. If you are using a supported touch display platform, you can pinch to zoom and swipe to scroll. The supported touch display devices include Microsoft Windows platforms with a Windows 7 certified or Windows 8 certified touch display and Macintosh platforms with an Apple Magic Trackpad.

The editor supports additional shortcuts for scrolling that are unique to Simulink. Shortcuts and other interactive model building techniques are summarized in “Keyboard Shortcuts and Mouse Actions for Simulink Modeling”.

### Detect Model Design Errors

The Simulink Editor can provide you with visual cues for some model design issues. Highlighted blocks alert you to issues. To see a description of the issue, pause on a highlighted block and click the error or warning symbol.

Similar to the Diagnostic Viewer, if an error or warning has a predefined fix, the notification dialog box lists actions and may include a **Fix** button to apply these changes.

Simulink can detect block errors and warnings, such as:

- Goto and From block mismatches.
- Duplicate data store blocks. The value of the Duplicate data store names parameter determines whether to display a warning or an error symbol.

The **Errors and Warnings** option is enabled by default. To turn off this option, in the **Debug** tab, select **Diagnostics > Edit-Time Errors & Warnings**.

### Explore Model Hierarchy

Use the Model Browser to navigate a model hierarchy using a tree structure. The browser helps you to understand the organization of your model and explore systems within systems.

To display the Model Browser, in the Simulink Editor, in the **Modeling** tab, select **Environment > Model Browser**. You can toggle the Model Browser display by clicking the **Hide/Show Model Browser** control .

In the Model Browser, you can specify whether to display blocks that are linked to a library or to masked subsystems. Click  and select **Library Links** or **Systems with Mask Parameters**. For information on these types of blocks, see “Linked Blocks” and “Masking Fundamentals”.

### Set Properties and Parameters

As you build a model, you can set parameters and properties on model elements. For example, you can set parameters and properties for blocks that affect how the block functions. You can also set properties on Stateflow charts, signal lines, visual elements such as annotations, and on the model.

Based on your workflow and goals, set parameters and properties using:

- The **Property Inspector**, which stays open in the editor as you work and updates based on the current selection

- A dialog box that is associated with an element, such as a specific block
- The **Model Data Editor**, which stays open and displays information about signals, states, and algorithmic block parameters (for instances, gains and filter coefficients) in a table

For blocks whose parameter value appears on the block icon, you can select the block, pause on the value, and edit the value directly. For more information, see “Edit Block Parameters”.

- “Create a Simple Model”

## Parameters

**Toolstrip** — Access and discover Simulink capabilities  
**Simulation** | **Debug** | **Modeling** | **Format** | **Apps**

To support common user workflow tasks, tabs called **Simulation**, **Debug**, **Modeling**, **Format**, and **Apps** provide functionality corresponding to each task.

The **Apps** tab provides a gallery of applications from the Simulink family of products. Apps may open a new contextual tab, a separate window, or they may be a shortcut to the configuration parameters.

After you open a gallery, you can mark buttons as favorites. Buttons that are favorites appear at the top of the gallery for quicker access. You can drag these buttons to reorder them.

When you select a model component, a contextual tab displays tools to assist you. For example, when you select a Subsystem block, the **Subsystem Block** tab appears. If you select a Stateflow chart, the **State Chart** tab appears. When the block or chart is no longer selected, the contextual tabs disappear.

The preferences folder saves the product-specific tabs that you have open for a model. Open tabs that require a license checkout do not persist after you close the model.

To add custom tabs to the Simulink Toolstrip, see “Create Custom Simulink Toolstrip Tabs”.

The quick access toolbar contains frequently used options such as save, undo, and redo. To customize the quick access toolbar, see “Access Frequently Used Features and Commands in Simulink”.

Commands also appear on context menus. Context menus appear when you right-click a model element or a blank area of the editor. For example, if you right-click a block, the menus display the commands relevant for working on blocks, such as clipboard and alignment operations. Some commands appear only on a context menu.

**Palette** — Access additional shortcuts along the left side of the editor  
 icons

The palette along the left side of the editor provides shortcuts to commands you can use to modify the model appearance and navigate the model. For example, the palette includes a shortcut for adding annotations and other visuals, like boxed-in areas for labeling the model. It also provides a zoom button for zooming on a particular part of the model.

**Hide/Show Explorer Bar** — Hide or display a bar that shows where you are in the model hierarchy  
 off (default) | on

The **Hide/Show Explorer Bar** button in the upper left corner of the editor window displays a bar that shows where you are in the model hierarchy.

**Hide/Show Model Browser** — Hide or display a hierarchical view of the model  
off (default) | on

The **Hide/Show Model Browser** button displays the **Model Browser** pane. You can use this pane to view and navigate a hierarchical view of the model.

**Show Perspectives Views** — Enable code, requirements, and interface perspectives  
off (default) | on

The icon in the lower-right corner opens additional views of the model. One such view is the interface view, which helps you to trace model interfaces. Click the control to see these views.

**Model Data Access** — Retrieve model data  
off (default) | on

A badge in the lower-left corner indicates that a model has external data sources, such as a data dictionary, or that there is data in the model workspace. Click the badge, then use the menu to navigate to these data sources.

- To open the Model Explorer with the **Model Workspace** node selected, click the **Model Workspace** link.
- To open the Model Explorer with the **External Data** node for the model selected, click the **External Data** link.
- To add or change a linked data dictionary, click the gear icon to open the **External Data** tab of the Model Properties dialog box.

## Programmatic Use

`simulink` opens the Simulink Start Page. Select a model or template to open the Simulink Editor.

# Simulink Fundamentals

Self-paced, interactive course available as part of Online Training Suite subscription or for individual purchase

## Description

Simulink Fundamentals is a self-paced, interactive course that is included with the Online Training Suite. If you do not have access to the Online Training Suite, you can purchase access to the course.

Simulink Fundamentals builds upon concepts covered in **Simulink Onramp**. To get the most out of Simulink Fundamentals, take Simulink Onramp first. Simulink Onramp is a free, self-paced, interactive course that offers a quick and high-level introduction to Simulink.

Simulink Fundamentals is a comprehensive course that teaches you to:

- Use the Simulink environment.
- Model continuous and discrete dynamic systems.
- Organize growing models in subsystems that create visual and functional hierarchy.
- Componentize models by referencing other models and creating libraries.
- Optimize simulation performance.

Simulink Fundamentals uses tasks to teach concepts incrementally, such as through a real-life example with a 3D printer. You receive automated assessments and feedback after submitting tasks. Your progress is saved when you exit the course, so you can complete the course in multiple sessions.

The screenshot displays the Simulink Fundamentals training interface. On the left, the 'Training - Tasks' pane shows 'Task 1' with instructions: 'As you work through this module, you will build different representations of the nozzle logic system. The blocks at right represent most of an algorithm that compares both the current (simulated) X and Y position of the nozzle with the desired position. In this task, you will add the last piece of the logic: a check that an external control signal is true at the specified time steps.' Below this, it says 'In this training environment, clicking Submit will simulate and submit your model for grading. If you wish to simulate your model before grading, you can use the Run button in the Simulink toolstrip.' A 'TASK' box instructs: 'Complete the algorithm by adding a Logical Operator block from the Simulink library to your model. Leave the default Operator, AND, selected. Connect the block to the unconnected'.

The central workspace shows a Simulink model titled 'SimulinkFundamentals'. It features a 'Nozzle Algorithm' subsystem. Inputs include 'Reference signals' (desired\_x, desired\_y) and 'Simulated sensor data' (meas\_x, meas\_y). The algorithm contains an 'Evaluate\_and' block, a summing junction for 'des\_pos', a gain block '1/4', a 'pos\_err' block, and a '≤< tol' block. Outputs include 'nozzle\_cmd', 'meas\_pos', and 'x\_pos' (selected).

On the right, the 'Training - Assessment' pane lists requirements:
 

- Does the model contain the following block? Logical Operator
- Are the following blocks connected correctly? Logical Operator, Scope
- Are the following blocks connected correctly? From Workspace, Logical Operator
- Are the following blocks connected correctly? Compare To Constant, Logical Operator

## Open the Simulink Fundamentals

- Simulink Start Page: On the **Learn** tab, click the button that appears when you pause on any of the items in the **Simulink Fundamentals** group.

- MATLAB Command Window: Enter `learning.simulink.launchOnramp("slbe")`.

---

**Note** If you do not have access to the Simulink Fundamentals course, explore access options at Self-Paced Online Courses.

---

# Simulink Onramp

Free, self-paced, interactive Simulink course

## Description

Simulink Onramp is a free, self-paced, interactive course that helps you get started with Simulink.

After completing Simulink Onramp, you will be able to create, modify, and troubleshoot Simulink models that simulate dynamic systems and perform basic signal analysis.

Simulink Onramp teaches you to:

- Use Simulink blocks and signals.
- Visualize signal values during simulation.
- Apply math and logic operators for algorithms.
- Access help from documentation.
- Use MATLAB variables and functions in Simulink.
- Model dynamic, discrete-time, and continuous-time systems in Simulink.
- Set simulation duration.

Simulink Onramp uses tasks to teach concepts incrementally, such as through real-life examples with automotive performance modes, a thermostat, and a peregrine falcon dive. You receive automated assessments and feedback after submitting tasks. Your progress is saved when you exit the course, so you can complete the course in multiple sessions.

The screenshot displays the Simulink Onramp interface with three main panels:

- Task 1 (Left Panel):** Titled "1.2 Running Simulations", it contains instructions for connecting a signal line labeled 'velocity' to a Signal Assessment block. It includes a "TASK" section with detailed instructions and buttons for "Hint", "See Solution", "Reset", "Submit", and "Next task".
- Simulink Model (Center Panel):** Shows a block diagram for a falling object with air drag. The model includes a gravitational force input of 9.81, a drag force coefficient of 0.05, a mass block (1/mass), an integrator block (1/s), and a velocity output. The governing equations are  $\Sigma F = ma$  and  $-mg + \alpha v^2 = ma$ . A Signal Assessment block is connected to the velocity output.
- Task 1 Signal (Right Panel):** A plot showing the signal value over time. The y-axis is labeled "Value" and ranges from 0 to -15. The x-axis is labeled "Time" and ranges from 0 to 10. The plot shows a blue curve representing "My signal" that starts at 0 and decays towards a steady-state value of approximately -14.5. A legend indicates "Signal requirement" (orange line) and "My signal" (blue line). Below the plot, there is a "Requirements" section with a green checkmark and the text "Does the connected signal meet the requirement?".

## Open the Simulink Onramp

- **Simulink Start Page:** On the **Learn** tab, click the **Launch** button that appears when you pause on **Simulink Onramp**.
- **Simulink block diagram:** On the quick access toolbar, click **Help > Learn Simulink**.

- MATLAB Command Window: Enter `learning.simulink.launchOnramp("simulink")`.

---

**Note** If you do not have a Simulink license, you can take the course at Self-Paced Online Courses.

# Simulink Preferences

Settings for Simulink Editor and model files

## Description

Use Simulink Preferences to specify Simulink editing environment options and default behaviors. Your settings affect the behavior of all Simulink models, including those currently open and all subsequent models. Your preference settings are preserved for the next time you use the software.

Use the Simulink Preferences window to:

- Set preferences for generated file folders
- Set background colors for print or export
- Set model block, callback, and sample time legend display
- Configure Simulink Editor
- Set preferences for file change, autosave, version notifications, and other behaviors relating to model files

---

**Note** To remove items that appear in the Simulink Toolstrip and context menus, see “Disable Simulink Toolstrip and Context Menu Actions”.

---

## Open the Simulink Preferences

- Simulink Toolstrip: On the **Modeling** tab, in the **Evaluate and Manage** section, select **Environment > Simulink Preferences**.
- MATLAB Command Window: Enter `slprivate('showprefs')`.

## Examples

### Show Callback Tracing for Double Mass-Spring System

Callbacks are commands you can define that execute in response to a specific modeling action, for example, opening a model or stopping a simulation. When you enable **Show Callback Tracing** in Simulink Preferences, the MATLAB Command Window displays callbacks as they are invoked. For more information on callbacks, see “Customize Model Behavior with Callbacks”.

Display the callback that runs when you open the “Double Spring Mass System” on page 13-67 model. The example model represents a double spring-mass-damper system with a periodically varying forcing function.

- 1 Open Simulink Preferences. In the Simulink Toolstrip of any open model window, on the **Modeling** tab, in the **Evaluate and Manage** section, select **Environment > Simulink Preferences**.
- 2 In Simulink Preferences, on the **General** Pane, select **Show Callback Tracing**.
- 3 Click **Apply**.
- 4 If the Double Spring Mass System model is open, close it.
- 5 Open the Double Spring Mass System model.

```
openExample('simulink_general/sldemo_dblcart1Example')
```

```
Evaluating callback 'PostLoadFcn' for sldemo_dblcart1
Callback: crtanim2([],[],[],0,1);
```

The invoked callback is a **PostLoadFcn** callback that runs the `crtanim2` function.

- 6 You can use the information about the type of callback to find where the commands that it executes are specified. To do so for this example, right-click the canvas and select **Model Properties**.
- 7 On the **Callbacks** tab, select **PostLoadFcn\***. The right pane of the Model Properties dialog box shows the callback that ran when the model opened.

### Turn Off Display of Variable Values in Block Parameters Dialog Box

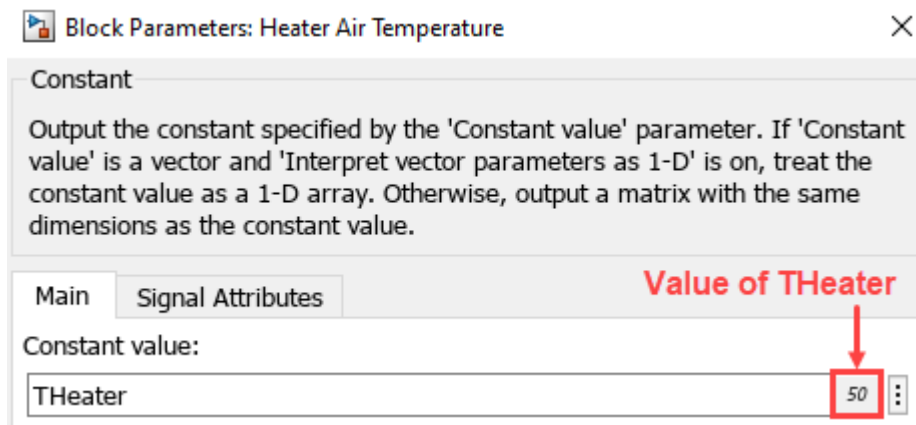

By default, when you specify a block parameter as a variable, the text box in the Block Parameters dialog box where you specify the parameter displays the value of the variable. You can use the display to obtain the value that a variable has at a certain point during simulation, and to debug your model.

You can use Simulink Preferences to turn the display off, for example when you are demonstrating a model and the value of the variable is confidential, or when the display gives away the answer to a problem that your students or trainees are supposed to solve.

In this example, view and then turn off the display of the heater air temperature in the “Thermal Model of a House” on page 13-21 model. The heater air temperature is specified as the variable THeater in the Heater subsystem.

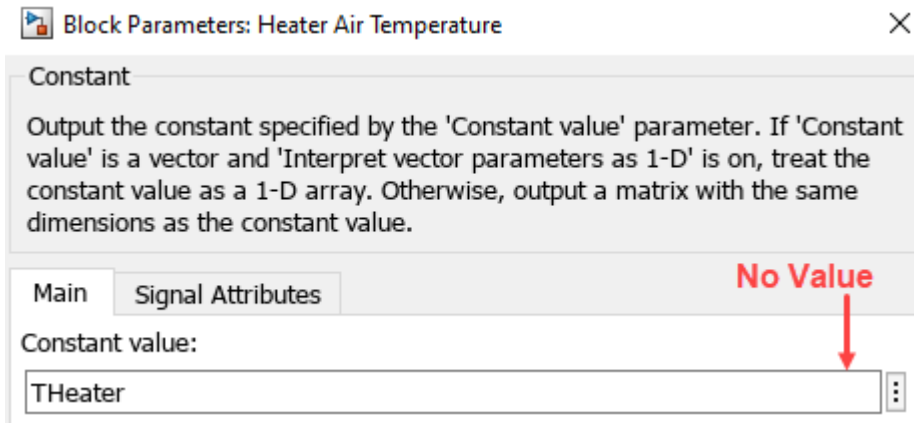

- 1 To open the model, use this command.  

```
openExample('simulink_general/sldemo_househeatExample')
```
- 2 To open the Heater subsystem, double-click the Subsystem block.
- 3 To see the value of the THeater variable, double-click the Heater Air Temperature block. The Block Parameters dialog box opens.
- 4 The **Constant value** text box displays the name of the variable on the left and the value of the variable on the right.

- 5 Close the Block Parameters dialog box.

- 6 Open Simulink Preferences. In the Simulink Toolstrip, on the **Modeling** tab, in the **Evaluate and Manage** section, select **Environment > Simulink Preferences**.
- 7 In Simulink Preferences, on the **Editor** Pane, turn off **Display value of parameter when specified using variables**.
- 8 Click **Apply**.
- 9 In the model, double-click the Heater Air Temperature block. The Block Parameters dialog box opens. The **Constant value** text box no longer displays a value.

## Parameters

### General Pane

**Simulation cache folder** — Path to simulation cache folder  
pwd (default)

Simulink cache files contain build artifacts that can speed up simulation and code generation. For more information, see “Share Simulink Cache Files for Faster Simulation” and “Manage Build Process Folders” (Simulink Coder).

The cache files are stored in the simulation cache folder. The simulation cache folder is a root folder.

Specify the path to the simulation cache folder as a character vector.

You can specify an absolute or relative path to the folder. For example:

- 'C:\Work\mymodelsimcache' and '/mywork/mymodelsimcache' specify absolute paths.
- 'mymodelsimcache' is a path relative to the current working folder (pwd). The software converts a relative path to an absolute path when you set the preference. For example, if pwd is '/mywork', the result is '/mywork/mymodelsimcache'.
- './test/mymodelsimcache' is a path relative to 'pwd'. If 'pwd' is '/mywork', the result is '/test/mymodelsimcache'.

Example: 'C:\Work\mymodelsimcache'

### Programmatic Use

**Parameter:** CacheFolder

**Type:** character vector

**Default:** 'pwd'

**Code generation folder** — Path to code generation folder

pwd (default)

The Simulink Coder build process uses system target files to generate production code from a Simulink model. For more information, see “Manage Build Process Folders” (Simulink Coder).

The production code is stored in the code generation folder. The code generation folder is a root folder.

Specify the path to the code generation folder as a character vector.

You can specify an absolute or relative path to the folder. For example:

- 'C:\Work\mycode\mycode' and '/mywork/mycode' specify absolute paths.
- 'mycode' is a path relative to the current working folder (pwd). The software converts a relative path to an absolute path when you set the preference. For example, if pwd is '/mywork', the result is '/mywork/mycode'.
- '../test/mycode' is a path relative to 'pwd'. If 'pwd' is '/mywork', the result is '/test/mycode'.

Example: 'C:\Work\mycode'

#### Programmatic Use

**Parameter:** CodeGenFolder

**Type:** character vector

**Default:** 'pwd'

**Code generation folder structure** — Structure of code generation folder

Model specific (default) | Target environment subfolder

The Simulink Coder build process uses system target files to generate production code from a Simulink model. For more information, see “Manage Build Process Folders” (Simulink Coder).

The production code is stored in the code generation folder. The code generation folder is a root folder.

Select the structure of the code generation folder.

- **Model specific**— Store the code in folders named after the model.
- **Target environment subfolder**— Store the code in folders named after the target environment for which the model was configured.

#### Programmatic Use

**Parameter:** CodeGenFolderStructure

**Values:** 'ModelSpecific' | 'TargetEnvironmentSubfolder'

**Default:** 'ModelSpecific'

**Print** — Canvas (background) color of printed models

White (default) | Match Canvas Color

Specify whether the color of the model canvas is white when printed or matches the color of the digital model. For more information on printing models, see “Print Model Diagrams”.

**Programmatic Use****Parameter:** PrintBackgroundColorMode**Values:** 'White' | 'MatchCanvas'**Default:** 'White'**Export** — Canvas (background) color of models exported to different file format

Match Canvas Color (default) | White | Transparent

Specify whether the color of the model canvas when exported to a different file format matches the color of the digital model, is white, or is transparent. For example, you can export models to the .png format with a transparent background. For more information on exporting a model to a different file format, see “Print Models to Image File Formats”.

- Match Canvas Color— Match the canvas color of the model.
- White— Use a white canvas.
- Transparent— Use a transparent canvas so that whatever is behind the canvas is visible.

**Programmatic Use****Parameter:** ExportBackgroundColorMode**Values:** 'MatchCanvas' | 'White' | 'Transparent'**Default:** 'MatchCanvas'**Clipboard** — Canvas (background) color of models exported to different application

Match Canvas Color (default) | White | Transparent

Specify whether the color of the model canvas when exported to a different application matches the color of the digital model, is white, or is transparent. For more information on exporting a model to a different application, see “Copy Diagrams as Images”.

- Match Canvas Color— Match the canvas color of the model.
- White— Use a white canvas.
- Transparent— Use a transparent canvas, so that whatever is behind the canvas image shows through.

**Programmatic Use****Parameter:** ClipboardBackgroundColorMode**Values:** 'MatchCanvas' | 'White' | 'Transparent'**Default:** 'MatchCanvas'**Show callback tracing** — Option to display model callbacks

Off (default) | On

Specify whether to display the model callbacks that Simulink invokes when simulating a model. Enabling **Show callback tracing** displays the callbacks in the MATLAB Command Window as they are invoked. For an example, see “Show Callback Tracing for Double Mass-Spring System” on page 7-168.

**Programmatic Use****Parameter:** CallbackTracing**Values:** 'off' | 'on'**Default:** 'off'

**Open the sample time legend when the sample time display changes** — Option to display sample time legend when sample time display changes

On (default) | Off

Specify whether to display the sample time legend whenever you change the sample time display. To change the display, in the Simulink Toolstrip, on the **Debug** tab, in the **Diagnostics** section, click **Information Overlays**. In the **Sample Time** section, select **Colors**, **Text**, or both. For more information on the sample time legend, see “View Sample Time Information”.

#### Programmatic Use

**Parameter:** OpenLegendWhenChangingSampleTimeDisplay

**Values:** 'on' | 'off'

**Default:** 'on'

#### Editor Pane

**Use classic diagram theme** — Option to use pre-R2012b visual theme in editor

Off (default) | On

Option to view diagrams in the Simulink Editor with the visual theme from before R2012b. To use the visual theme from before R2012b, set **Use classic diagram theme** to On. To use the visual theme introduced in R2012b, set **Use classic diagram theme** to Off.

---

**Note** Content preview does not display when Use classic diagram theme is enabled.

---

#### Programmatic Use

To programmatically specify whether to use the visual theme introduced in R2012b in the editor, set the `EditorModernTheme` parameter. To use the visual theme from before R2012b, set `EditorModernTheme` to 'off'. To use the visual theme introduced in R2012b, set `EditorModernTheme` to 'on'.

**Parameter:** EditorModernTheme

**Values:** 'on' | 'off'

**Default:** 'on'

**Line crossing style** — Change default display for signal lines that cross

Tunnel (default) | Line Hop | None

Change the default display for signal lines that cross.

- **Tunnel**— Causes straight signal lines that cross each other but are not connected to display a slight gap before and after the vertical line where it intersects the horizontal line.
- **Line Hop**— Shows a bend where the vertical line intersects the horizontal line. Simulink adjusts the side the bend appears on to avoid overlapping with a block icon. If having the bend on either side overlaps with a block, Simulink uses a solid line.

**None**— Uses solid lines. This format can improve performance slightly for updating very large models. With the **Use classic diagram theme** preference enabled, Simulink uses a solid line.

#### Programmatic Use

**Parameter:** EditorPathXStyle

**Values:** 'grad\_pin' | 'hop' | 'none'

**Default:** 'grad\_pin'

**Scroll wheel controls zooming** — Option to use scroll wheel to zoom

On (default) | Off

Option to use the scroll wheel to zoom without pressing the **Ctrl** key modifier. If you enable **Scroll wheel controls zooming** on macOS platforms with an Apple Magic Trackpad, a panning gesture causes zooming. For more information on zooming, see “Zoom and Pan”.

**Programmatic Use**

**Parameter:** EditorScrollWheelZooms

**Values:** 'on' | 'off'

**Default:** 'on'

**Content preview displays for new hierarchical elements** — Option to display preview of contents on cover of hierarchical elements

On (default) | Off

Specify whether the cover of hierarchical model elements should display a preview of the contents of the elements. For example, a Subsystem block can display a preview of the model that it contains. The setting only applies to elements that are added to the model after the setting is enabled.

**Programmatic Use**

**Parameter:** EditorContentPreviewDefaultOn

**Values:** 'on' | 'off'

**Default:** 'on'

**Enable smart editing features** — Option to display model callbacks

On (default) | Off

Specify whether to enable the use of these smart editing cues to perform common model editing tasks quickly:

- Quick insert — Add a block to a model by typing a block name.
- Tear-off block addition — Add a complementary block from a block tear-off cue. For example, when you add a GoTo block, you can use a tear-off to add a corresponding From block.
- Multiselection actions — Perform actions from the prompt that appears when you select multiple blocks.
- Single-selection actions — Perform actions from the prompt that appears when you select a block or a signal.

**Programmatic Use**

**Parameter:** EditorSmartEditing

**Values:** 'on' | 'off'

**Default:** 'on'

**Edit key parameter when adding new blocks** — Option to edit key block parameter when adding block to model

On (default) | Off

Specify whether to be prompted to enter a key parameter when you add a block to a model.

**Programmatic Use**

**Parameter:** EditorSmartEditingHotParam

**Values:** 'on' | 'off'

**Default:** 'on'

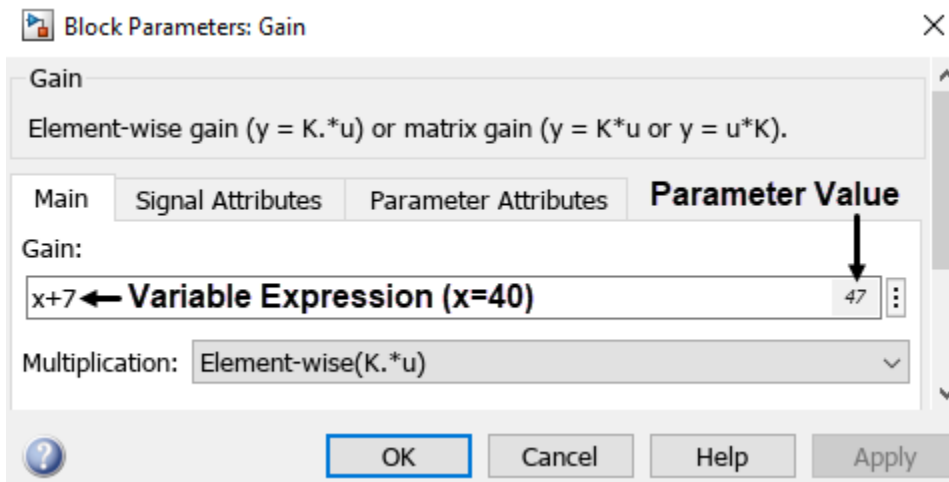

**Use docked Diagnostic Viewer** — Option to open Diagnostic Viewer docked in model window  
On (default) | Off

Specify whether the Diagnostic Viewer should open docked in the Simulink model window. To open the Diagnostic Viewer, in the Simulink Toolstrip, on the **Debug** tab, in the **Diagnostics** section, click **Diagnostics** and select Diagnostic Viewer.

**Display value of parameter when specified using variables** — Option to evaluate parameter specified as variable or variable expression  
On (default) | Off

When you specify the value of a Simulink parameter as a variable or as an expression that contains variables, the Block Parameters dialog box and the Property Inspector can display the value of the variable or expression. The text box where you enter the parameter value displays the variable or expression on the left and the value on the right. For more information, see “View Values of Parameters Set as Variables”. For an example, see “Turn Off Display of Variable Values in Block Parameters Dialog Box” on page 7-169.

Specify whether to enable the display of parameter values.

### Model File Pane

**File format for new models and libraries** — Save new models and libraries in the SLX or MDL format  
SLX (default) | MDL

Specify the default file format for new models and libraries.

- SLX— Save new models and libraries in SLX format
- MDL— Save new models and libraries in MDL format

### Programmatic Use

**Parameter:** ModelFileFormat

**Values:** 'mdl' | 'slx'

**Default:** slx

**Save a thumbnail image inside SLX files** — Save model screenshot to display in Current Folder browser preview pane  
On (default) | Off

Specify whether to save a small screenshot of the model with the SLX file to display in the Current Folder browser preview pane.

---

**Tip** If your model is large and you want to reduce the time the model takes to save, clear this parameter to avoid saving thumbnail model images.

---

**Programmatic Use**

**Parameter:** SaveSLXThumbnail

**Default:** on

**Values:** 'on' | 'off'

**Updating or simulating the model** — Option to receive notification if model has changed on disk when updating or simulating the model  
On (default) | Off

Specify whether to notify if a different MATLAB session changes the model on disk while you are updating or simulating the model. When **Updating or simulating the model** is enabled, use **Action** in **Model File Preferences** to specify the action to take if the model has changed. For more information, see “Model File Change Notification”.

---

**Tip** To programmatically check whether the model has changed on disk since it was loaded, use the function `slIsFileChangedOnDisk`.

---

**Programmatic Use**

**Parameter:** MDLFileChangedOnDiskChecks

**Type:** struct, field name: CheckWhenUpdating

**Values:** true | false | 1 | 0

**Default:** true

**Action** — Action to take if file has changed on disk

Warning (default) | Error | Reload model (if unmodified) | Show prompt dialog

Select the action to take if the file has changed on disk since it was loaded. This parameter is enabled by the **Updating or simulating the model** parameter.

- **Warning**— Displays a warning in the MATLAB Command Window.
- **Error**— Displays an error. If simulating programmatically, the error appears in the MATLAB Command Window. If simulating interactively, the error appears in a Simulation Diagnostics window.
- **Reload model (if unmodified)**— Reloads if the model is unmodified. If the model is modified, the prompt dialog box appears.
- **Show prompt dialog**— Shows prompt dialog box in which you can choose to close and reload or ignore the changes.

For more information, see “Model File Change Notification”.

---

**Tip** To programmatically check whether the model has changed on disk since it was loaded, use the function `slIsFileChangedOnDisk`.

---

**Programmatic Use**

**Parameter:** `MdlFileChangedOnDiskHandling`

**Values:** 'Warning' | 'Error' | 'Reload model (if unmodified)' | 'Show prompt dialog'

**Default:** 'Warning'

**First editing the model** — Option to receive notification if model has changed on disk when editing the model

On (default) | Off

Specify whether to notify if a different MATLAB session changes the model on disk while, for example, you are editing the model. For more information, see “Model File Change Notification”.

Any interactive operation that modifies the block diagram, for example, adding a block, causes a warning dialog box to appear.

Any programmatic operation that causes the block diagram to be modified, for example, a call to `set_param`, causes a warning in the MATLAB Command Window.

---

**Tip** To programmatically check whether the model has changed on disk since it was loaded, use the function `slIsFileChangedOnDisk`.

---

**Programmatic Use**

**Parameter:** `MDLFileChangedOnDiskChecks`

**Type:** struct, field name: `CheckWhenEditing`

**Values:** true | false | 1 | 0

**Default:** true

**Saving the model** — Option to receive notification if model has changed on disk when saving the model

On (default) | Off

Specify whether to notify if a different MATLAB session changes the model on disk while you are saving the model.

When the notification is enabled, saving the model in the Simulink Editor causes a dialog box to appear. In the dialog box, you can choose to overwrite or save with a new name.

The `save_system` function displays an error, unless you use the `OverwriteIfChangedOnDisk` option.

For more information, see “Model File Change Notification”.

---

**Tip** To programmatically check whether the model has changed on disk since it was loaded, use the function `slIsFileChangedOnDisk`.

---

**Programmatic Use**

**Parameter:** `MDLFileChangedOnDiskChecks`

**Type:** struct, field name: CheckWhenSaving

**Values:** true | false | 1 | 0

**Default:** true

**Save before updating or simulating the model** — Option to autosave before updating or simulating model

On (default) | Off

Specify whether to automatically save a backup copy of the model before updating or simulating.

The copy is saved in the same directory as the model, with the name *MyModel.slx.autosave* or *MyModel.mdl.autosave*.

---

### Note

- If you open or load a model that has a more recent autosave copy available, then after the model loads, a dialog box prompts to restore, ignore, or discard the autosave copy. If multiple models are involved, then the Model Recovery dialog box appears.
- For each model listed, you can select a check box to specify any of these options. Alternatively, click the **Restore All**, **Delete All** or **Ignore All** button to select that option for all listed models.

Option	Result
<b>Restore</b>	Overwrite the original model file with the autosave copy and delete the autosave copy. Simulink will close the model and reload from the restored file. If you select the check box to <b>Keep a copy of original model file</b> , you can save copies of the original model files named <i>MyModel.slx.original</i> or <i>MyModel.mdl.original</i> .
<b>Delete Autosave</b>	Delete the autosave copy.
<b>Ignore</b>	Leave the model and the autosave copy untouched. This setting is the default. The next time you open the model, the Model Recovery dialog will reappear and you can choose to restore or delete autosave files.

- Closing a modified model deletes any autosave copy.
- Autosave does not occur for models that are part of the MATLAB installation, so you will not create autosave copies of those models.
- Autosave does not occur if the autosave file or location is read-only.
- Autosave does not occur in the Parallel Computing Toolbox.
- If a segmentation violation occurred, then the last autosave file for the model reflects the state of the autosave data prior to the segmentation violation. Because Simulink models might be corrupted by a segmentation violation, Simulink does not autosave a model after a segmentation violation occurs.

---

### Programmatic Use

**Parameter:** AutoSaveOptions

**Type:** struct, field name: SaveOnModelUpdate

**Values:** true | false | 1 | 0

**Default:** true

**Save backup when overwriting a file created in an older version of Simulink —**

Option to save copy of file created in older version of Simulink before overwriting

On (default) | Off

Specify whether to automatically save a backup copy of the model when overwriting with a newer version of Simulink.

The backup copy is saved in the same directory as the model, with the name *MyModel.slx.Version* or *MyModel.mdl.Version*, where *Version* is the last version that saved the model, e.g., R2010a.

---

**Tip** To recover the original model, rename the backup copy to *MyModel.mdl* or *MyModel.slx* by deleting the *Version* suffix.

---

**Programmatic Use**

**Parameter:** AutoSaveOptions

**Type:** struct, field name: SaveBackupOnVersionUpgrade

**Values:** true | false | 1 | 0

**Default:** true

**Notify when loading an old model —** Option to notify when model being loaded was last saved in older MATLAB version

Off (default) | On

Specify whether to be notified when loading a model last saved in a older version of Simulink software. The notification appears in the MATLAB Command Window.

---

**Tip**

- Run the Upgrade Advisor to convert the block diagram to the format of the current version of Simulink software.
  - For advice on upgrading a model to the current version of Simulink, see “Model Upgrades”.
- 

**Programmatic Use**

**Parameter:** NotifyIfLoadOldModel

**Values:** 'on' | 'off'

**Default:** off

**Do not load models created with a newer version of Simulink —** Option to prevent models created in newer version of Simulink from loading

On (default) | Off

Specify whether to load a model last saved in a newer version of Simulink software.

- When this option is selected and you try to load a model last saved in a newer version of Simulink, the model does not load, and an error message appears in the MATLAB Command Window.
- When this option is cleared and you try to load a model last saved in a newer version of Simulink, the model loads, and a warning message appears in the MATLAB Command Window.

**Tip** If possible, use the **Save As** command to convert the block diagram to the format of the desired version of the Simulink software. The **Save As** command allows you to save a model created with the latest version of the Simulink software in formats used by earlier versions. See “Export Model to Previous Version of Simulink”.

---

**Programmatic Use**

**Parameter:** `ErrorIfLoadNewModel`

**Values:** 'on' | 'off'

**Default:** on

**Do not load models that are shadowed on the MATLAB path** — Option to prevent models with same name as other models higher on MATLAB path from loading

Off (default) | On

Specify whether to load a model that is shadowed by another file of the same name higher on the MATLAB path.

- When the option is enabled and you try to load a shadowed model, the model does not load, and an error message appears in the MATLAB Command Window.

The option applies when you try to open or load a model or library by either:

- Selecting a file in the current folder browser
- Calling `open_system` or `load_system` with a path to a file in a different folder to the current folder
- When the option is not enabled and you try to load a shadowed model, the model loads, and a warning message appears in the MATLAB Command Window.

**Programmatic Use**

**Parameter:** `ErrorIfLoadShadowedModel`

**Values:** 'on' | 'off'

**Default:** off

**Verify digital signature of protected model before opening** — Option to verify signature before opening protected model

Off (default) | On

Specify whether to verify the signature on a protected model before opening the model.

When enabled, you cannot load a protected model that does not have a verified digital signature.

An error message appears if the signature verification process finds any of the these conditions:

- The protected model was changed after it was signed.
- The protected model was not signed.
- The protected model was signed with an expired certificate.
- The protected model was self-signed with a certificate issued by the author.
- The protected model was signed with a missing or invalid certificate.
- The certificate in your system certificate authority store is missing or invalid.
- The model was signed with an invalid key.

Verification does not check if the certificate expired or was revoked after the protected model was signed.

Verification runs when you try to open or load a protected model by:

- Simulating or generating code for a model that references the protected model
- Performing an action that updates the diagram for a model that references the protected model
- Opening the web view of the protected model
- Opening the protected model report

You can suppress the diagnostic for an unverified protected model when the error message appears in the **Diagnostic Viewer**. The error cannot be suppressed if the signature is not valid because model was changed after it was signed.

#### Programmatic Use

**Parameter:** ProtectedModelValidateCertificate

**Values:** 'on' | 'off'

**Default:** off

**Notify when opening a model in an unopened project** — Option to open project when opening associated model

On (default) | Off

Specify whether opening a model prompts you to open the project that contains a model.

For more information on projects, see “Create a Project from a Model”.

## Programmatic Use

To get the value that a preference is set to programmatically, use `get_param(Object, ParameterName, ...ParameterNameN)`. For example:

```
get_param(0, 'EditorModernTheme')
```

To set preferences programmatically, set the root parameter using `set_param(Object, ParameterName, Value, ...ParameterNameN, ValueN)`. For example:

```
set_param(0, 'EditorModernTheme', 'off')
```

---

**Note** Parameters set programmatically do not persist between Simulink sessions.

---

## Version History

Introduced before R2006a

**R2022b: Simulink Block Parameters dialog box and Property Inspector display values of variables**

Starting in R2022b, when you specify the value of a Simulink parameter as a variable or as an expression that contains variables, the Block Parameters dialog box and the Property Inspector display the value of the variable or the expression.

The text box where you enter the parameter value displays the variable or expression on the left and the value on the right.

To turn the value display off, in the Simulink Toolstrip, on the **Modeling** tab, in the **Evaluate and Manage** section, open the **Environment** menu and select Simulink Preferences. On the **Editor** tab, clear Display value of parameter when specified using variables.

# Simulink Profiler

Identify sources of simulation slowdowns

## Description

Use the **Simulink Profiler** to examine model and block execution and identify issues that can contribute to poor simulation performance.

The screenshot displays the Simulink Profiler interface. The main window shows a Simulink model titled "Anti-Windup PID Control Example". The model consists of a reference input  $r(t)$  entering a summing junction, followed by a PID controller block, a saturation block labeled "Plant Actuator" with input  $u(t)$  and output  $SAT(u)$ , a first-order process block with transfer function  $\frac{1}{10s + 1}$ , a dead time block, and finally an output block labeled "yout".

The Profiler Report pane at the bottom shows the following data:

Path	Time Plot (Dark Band = Self Time)	Total Time (s)	Self Time (s)	Number of Calls
sldemo_antiwindup	[Bar chart]	4.247	1.198	18013
Scope	[Bar chart]	2.398	2.398	6004
Scope1	[Bar chart]	0.642	0.642	6004
PID Controller	[Bar chart]	0.004	0.000	0
Filter	[Bar chart]	0.001	0.000	0
Integrator	[Bar chart]	0.001	0.000	0
D Gain	[Bar chart]	0.000	0.000	0
I Gain	[Bar chart]	0.000	0.000	0
N Gain	[Bar chart]	0.000	0.000	0

A tooltip for the Integrator block shows: Self Time (dark band): 0.000, Total Time: 0.001.

The Property Inspector pane on the right provides a detailed breakdown of the simulation phases and self-time for the model:

Exec Node	Time (s)	Calls
simulationPhase	0.767	1
initializationPhase	0.338	1
terminationPhase	0.034	1
sldemo_antiwindup...	0.019	1
sldemo_antiwindup...	0.014	1
solverPhase	0.007	2000
sldemo_antiwindup...	0.006	2001
simulate(sldemo_a...	0.004	1
sldemo_antiwindup...	0.003	4000
ode3.Integrate	0.002	2000
sldemo_antiwindup...	0.002	1
sldemo_antiwindup...	0.001	5999
sldemo_antiwindup...	0.001	2001
sldemo_antiwindup...	0.001	1
sldemo_antiwindup...	0.000	1
reset	0.000	1
sldemo_antiwindup...	0.000	1
sldemo_antiwindup...	0.000	1

## Open the Simulink Profiler

- 1 Open a model.
- 2 On the **Debug** tab, select **Performance Advisor > Simulink Profiler**.
- 3 On the **Profile** tab, click **Profile**.

When simulation is complete, the **Profiler Report** pane opens and displays the simulation profile for the model. You can share the results of the Profiling Run by exporting the report to HTML, as well as by saving the profiling data to a MAT file.

The screenshot displays the Simulink Profiler interface for a model named 'sldemo\_antiwindup'. The main window shows a block diagram of an Anti-Windup PID Control system. The diagram includes a reference input  $r(t)$ , a summing junction, a PID controller block, a saturation block labeled 'Plant Actuator' with input  $u(t)$  and output  $SAT(u)$ , a first-order process block with transfer function  $\frac{1}{10s + 1}$ , a dead time block, and an output  $y(t)$  labeled 'yout'. The model is titled 'Anti-Windup PID Control Example' and includes a copyright notice for The MathWorks, Inc. (2009-2020).

The Profiler Report (sldemo\_antiwindup @ 21-Dec-2020 12:39:31) is shown at the bottom. It includes a table with the following columns: Path, Time Plot (Dark Band = Self Time), Total Time (s), Self Time (s), and Number of Calls. The 'sldemo\_antiwindup' path is expanded, showing sub-paths like Scope, PID Controller, Filter, Integrator, D Gain, I Gain, and N Gain. A tooltip for the I Gain block shows 'Self Time (dark band): 0.000' and 'Total Time: 0.001'.

On the right, the Property Inspector shows the Simulink Profiler details for 'sldemo\_antiwindup'. It provides a 'Total Time Breakdown' and a 'Self Time Breakdown' table. The total time is 4.247 s, consisting of 1.198 s of self time and 3.049 s of children's total time. The self time breakdown table is as follows:

Exec Node	Time (s)	Calls
simulationPhase	0.767	1
initializationPhase	0.338	1
terminationPhase	0.034	1
sldemo_antiwindup...	0.019	1
sldemo_antiwindup...	0.014	1
solverPhase	0.007	2000
sldemo_antiwindup...	0.006	2001
simulate(sldemo_a...	0.004	1
sldemo_antiwindup...	0.003	4000
ode3.Integrate	0.002	2000
sldemo_antiwindup...	0.002	1
sldemo_antiwindup...	0.001	5999
sldemo_antiwindup...	0.001	2001
sldemo_antiwindup...	0.001	1
sldemo_antiwindup...	0.000	1
reset	0.000	1
sldemo_antiwindup...	0.000	1
sldemo_antiwindup...	0.000	1

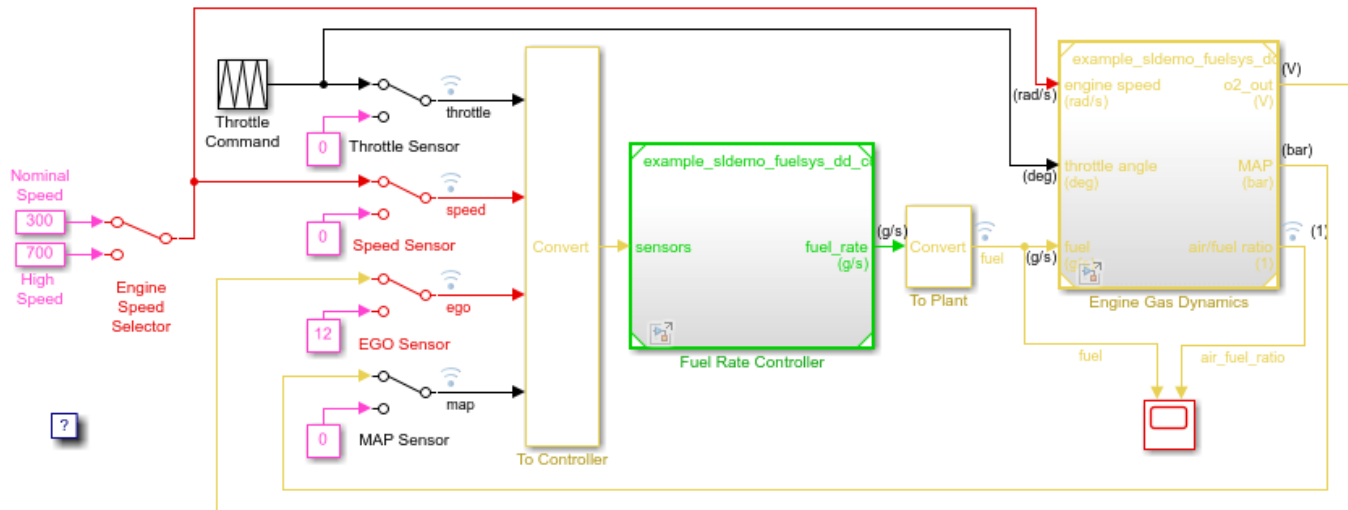

## Examples

### Identify Performance Slowdowns Using the Simulink Profiler

This example shows how to use the Simulink Profiler to track down the source of a simulation slowdown in your model.

This example uses a modified version of the `sldemo_fuelssystem_dd` model, (the Modeling a Fault-Tolerant Fuel Control System example) model with a slowdown artificially inserted.

## Fault-Tolerant Fuel Control System

The sensor switches simulate any combination of sensor failures.  
The Engine Speed Selector switch simulates different engine speeds (rad/s).

Copyright 1990-2017 The MathWorks, Inc.

Open the profiler for your model from the **Debug** tab by selecting **Performance Advisor > Simulink Profiler**.

The screenshot shows the MATLAB/Simulink Profiler interface. The main workspace displays a Simulink model titled "Fault-Tolerant Fuel Control System". The model includes blocks for "Throttle Command", "Throttle Sensor", "Speed Sensor", "EGO Sensor", "MAP Sensor", "Fuel Rate Controller", and "Engine Gas Dynamics". The Profiler Report pane is open at the bottom, showing a table with the following columns: Path, Time Plot (Dark Band = Self Time), Total Time (s), Self Time (s), and Number of Calls. The status bar at the bottom indicates "Ready", "81%", and "FixedStepAuto".

Copyright 1990-2017 The MathWorks, Inc.

Click **Profile** to profile the model. When simulation completes, the Profiler Report pane opens.

Observe that the Engine Gas Dynamics block takes a large portion of the total profiling time (177.759s out of 231.443s) of the top model. This is a useful place to start looking for the problematic block in the model.

**Profiler Report (profiling\_example\_fuelcontrol\_model @ 21-Dec-2020 13:13:27)**

Path	Time Plot (Dark Band = Self Time)	Total Time (s)	Self Time (s)	Number of Calls
profiling_example_fuelcontrol_model	[Bar]	198.379	16.524	9000015
Engine Gas Dynamics	[Bar]	160.690	7.286	8000014
Throttle Command	[Bar]	12.096	0.000	0
To Controller	[Bar]	2.553	0.000	0
Scope	[Bar]	2.194	2.194	1000004
EGO Sensor	[Bar]	1.058	1.058	2000009
MAP Sensor	[Bar]	0.930	0.930	4000009

**Property Inspector: Simulink Profiler**

Detail: Engine Gas Dynamics

**Total Time Breakdown for Engine Gas Dynamics:**  
 160.690 s (Total Time) = 7.286 s (Self Time) + 153.404 s (Total Time of children)

Note: Model hierarchy view does not include compile time

**Self Time Breakdown for Engine Gas Dynamics:**

Exec Node	Time (s)	Calls
ModelReferen...	2.825	2000000
ModelReferen...	1.801	1000001
ModelReferen...	1.368	1000001
ModelReferen...	1.065	2999999
ToAsyncQueu...	0.223	1000001
ModelReferen...	0.002	1
ModelReferen...	0.001	1
ModelReferen...	0.001	1
ModelReferen...	0.001	1
ToAsyncQueu...	0.000	1
ModelReferen...	0.000	1
ModelReferen...	0.000	1
ModelReferen...	0.000	1
ToAsyncQueu...	0.000	1
ModelReferen...	0.000	1
ToAsyncQueu...	0.000	1
ToAsyncQueu...	0.000	1

Recursively expand the block hierarchy view. By default, the profiler sorts the blocks at the same level of the model in descending order of **Total Time(s)**.

The screenshot displays the Simulink Profiler interface for a model named 'profiling\_example\_fuelcontrol\_model'. The main workspace shows a block diagram of a 'Fault-Tolerant Fuel Control System'. The diagram includes a 'Throttle Command' block, an 'Engine Speed Selector' block, a 'Throttle Sensor' block, a 'Speed Sensor' block, an 'EGO Sensor' block, a 'MAP Sensor' block, a 'Fuel Rate Controller' block, and an 'Engine Gas Dynamics' block. The sensors are connected to the controller, which outputs fuel and air/fuel ratio to the engine dynamics block. A text box in the diagram states: 'The sensor switches simulate any combination of sensor failures. The Engine Speed Selector switch simulates different engine speeds (rad/s). Copyright 1990-2017 The MathWorks, Inc.'

The Profiler Report window at the bottom shows the following data:

Path	Time Plot (Dark Band = Self Time)	Total Time (s)	Self Time (s)	Number of Calls
profiling_example_fuelcontrol_model	[Bar chart]	198.379	16.524	9000015
Engine Gas Dynamics	[Bar chart]	160.690	7.286	8000014
Mixing & Combustion	[Bar chart]	127.246	0.000	0
EGO Sensor	[Bar chart]	124.698	0.371	1000006
For Iterator Subsystem	[Bar chart]	122.215	55.689	1000004
In1	[Bar chart]	66.526	66.526	500000501
For Iterator	[Bar chart]	0.000	0.000	1

The Property Inspector window on the right shows the 'Simulink Profiler' details for the 'Engine Gas Dynamics' block. It provides a 'Total Time Breakdown for Engine Gas Dynamics' and a 'Self Time Breakdown for Engine Gas Dynamics'.

Exec Node	Time (s)	Calls
ModelReferen...	2.825	2000000
ModelReferen...	1.801	1000001
ModelReferen...	1.368	1000001
ModelReferen...	1.065	2999999
ToAsyncQueu...	0.223	1000001
ModelReferen...	0.002	1
ModelReferen...	0.001	1
ModelReferen...	0.001	1
ModelReferen...	0.001	1
ToAsyncQueu...	0.000	1
ModelReferen...	0.000	1
ModelReferen...	0.000	1
ModelReferen...	0.000	1
ToAsyncQueu...	0.000	1
ModelReferen...	0.000	1
ToAsyncQueu...	0.000	1

Observe that the For Iterator subsystem accounts for approximately 98% of the execution time of the EGO Sensor subsystem. It is highly probable that this is the source of the slow performance of the model.

The screenshot shows the Simulink Profiler interface. The main workspace displays a block diagram with a 'For Iterator' block and a 'double (V)' block. The Profiler Report (profiling\_example\_fuelcontrol\_model @ 21-Dec-2020 13:13:27) is visible at the bottom, showing a table of performance metrics. The Property Inspector on the right shows details for the 'In1' block, including a total time breakdown and a self-time breakdown table.

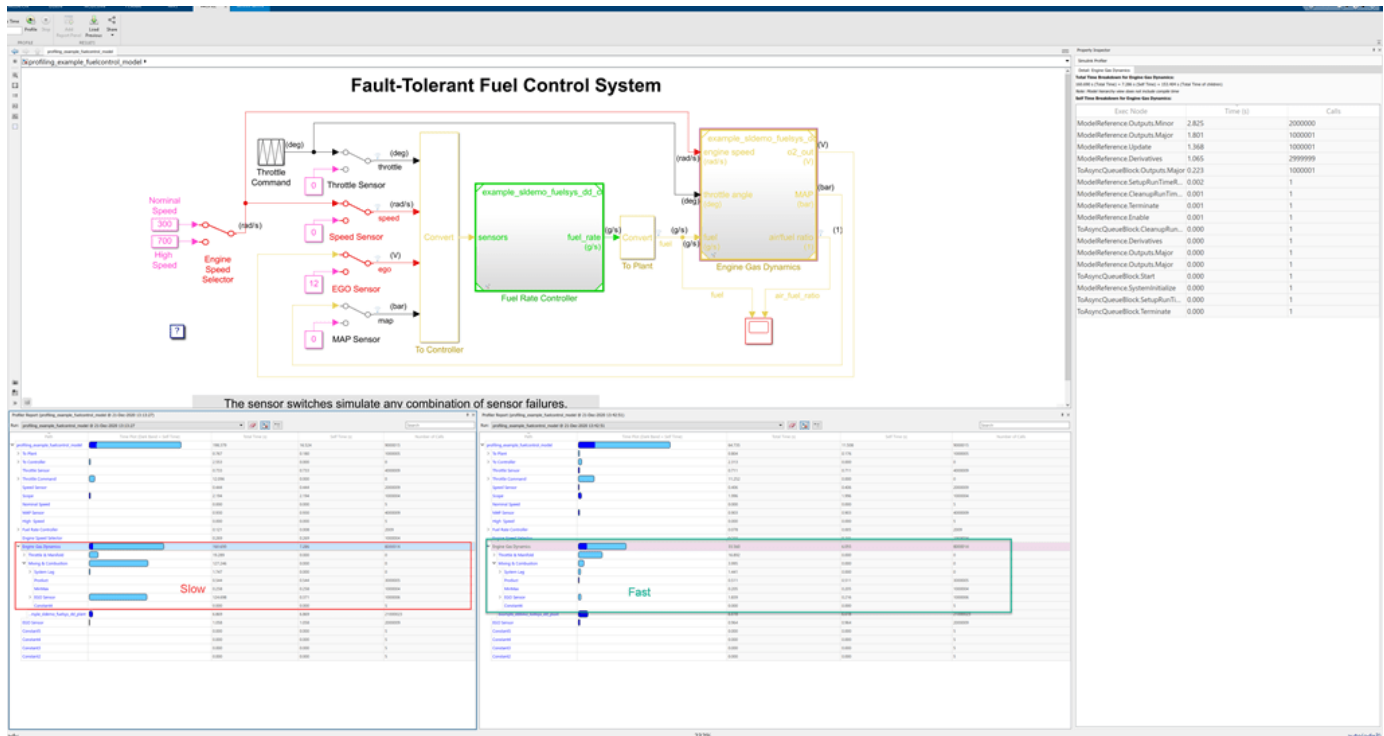

Path	Time Plot (Dark Band = Self Time)	Total Time (s)	Self Time (s)	Number of Calls
EGO Sensor	[Time Plot]	124.698	0.371	1000006
For Iterator Subsystem	[Time Plot]	122.215	55.689	1000004
In1	[Time Plot]	66.526	66.526	50000501
For Iterator	[Time Plot]	0.000	0.000	1
EGO Sensor	[Time Plot]	2.111	2.111	2000013
System Lag	[Time Plot]	1.747	0.000	0
Product	[Time Plot]	0.544	0.544	3000005

Exec Node	Time (s)	Calls
Inport.Output...	66.526	500000...
Inport.Cleanu...	0.000	1

Delete the block, reconnect the broken signal, and profile the model again. You should see significantly faster simulation times.

To compare the results between the two runs, click **Add Report Panel** and select the previous run from the **Run** list.

You can share the results of a selected run as an HTML report or as a MAT file. To share the profiler report, from the **Share** menu, select **Generate Report** for an HTML report or **Export** to save the results in a MAT file. The profiling results are exported to the current working folder in MATLAB™.

To view the generated report, you can open it in a supported web browser or use the built-in browser by passing the file path to the web command. If you have MATLAB Report Generator™ installed, you can also use rptview to view the report.

The screenshot shows the Simulink Profiler interface. On the left, a table lists the execution stack with columns for Path, Total Time (s), Self Time (s), and Number of Calls. A 'Generate report' dialog box is open, and a 'Web Browser' window displays the generated report.

# Solver Profiler

Identify solver performance bottlenecks

## Description

Use the Solver Profiler to examine solver and model behavior to identify issues that can contribute to poor simulation performance.

Use the Solver Profiler to analyze a model for patterns that affect its simulation. The Solver Profiler presents graphical and statistical information about the simulation, solver settings, events, and errors. You can use this data to identify locations in the model that caused simulation bottlenecks.

In addition, there are multiple factors that can limit the simulation speed. The Solver Profiler logs and reports all the major events that occur when simulating a model:

- Zero-crossing events
- Solver exception events
- Solver reset events
- Jacobian computation events

These events are common and necessary for an accurate simulation. However, they do incur computational cost and frequent occurrences can slow down or even stall the simulation.

### Available actions

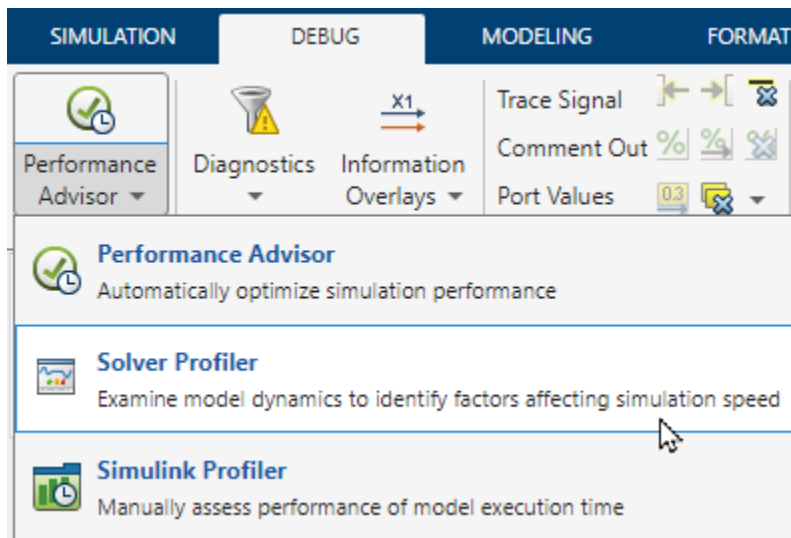

- **Trace**
- **Configure**
- **Explore**

### Information Panes

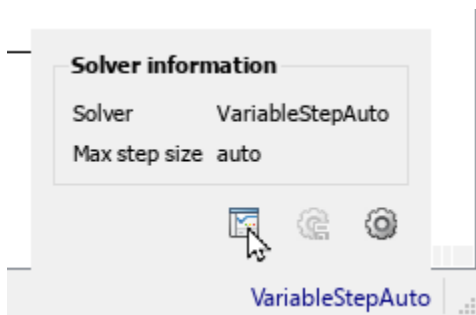

- **Statistics**
- **Step Size**
- **Suggestions**

## Open the Solver Profiler

- Simulink Toolstrip: On the **Debug** tab, in the **Performance** section, click **Performance Advisor** , then select **Solver Profiler**.

- Solver information menu: To open the Solver information menu, click the hyperlink on the right of the status bar at the bottom of the Simulink Editor. Then, click Solver Profiler .

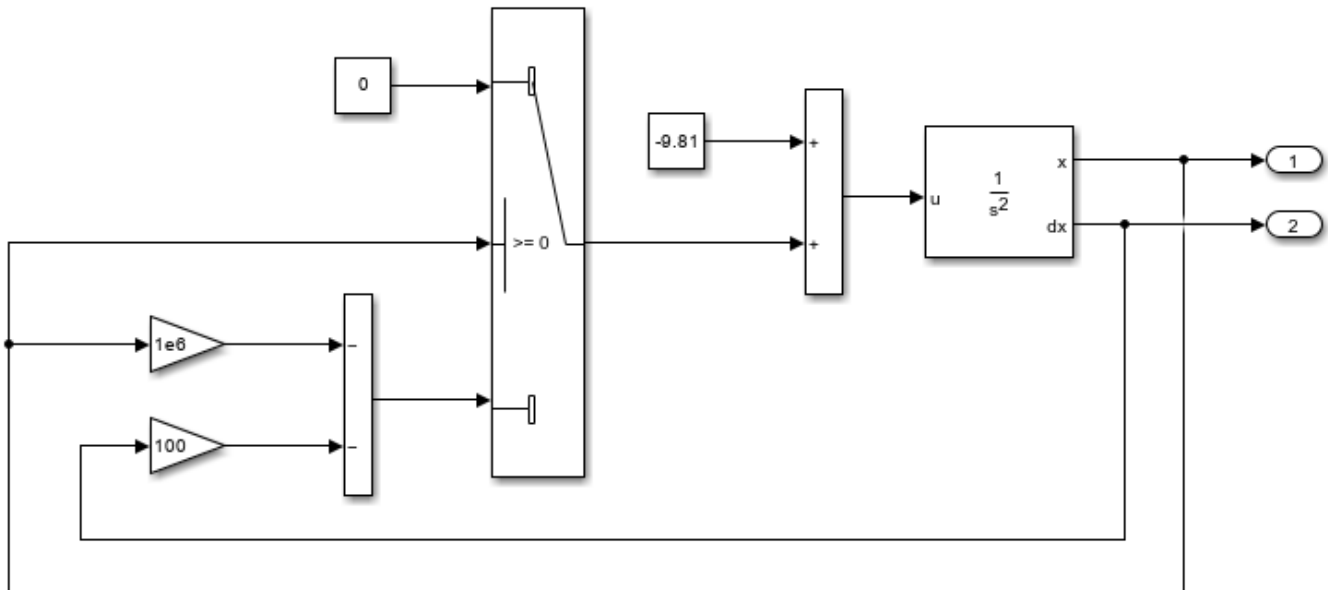

## Examples

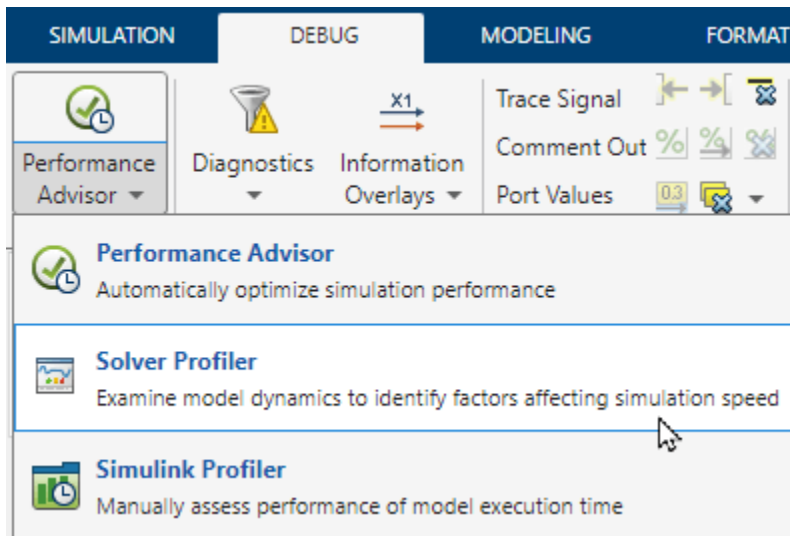

### Identify Source of Zero Crossing Event

Use the Solver Profiler to locate the source of zero crossings that occur in simulation for a model of a bouncing ball.

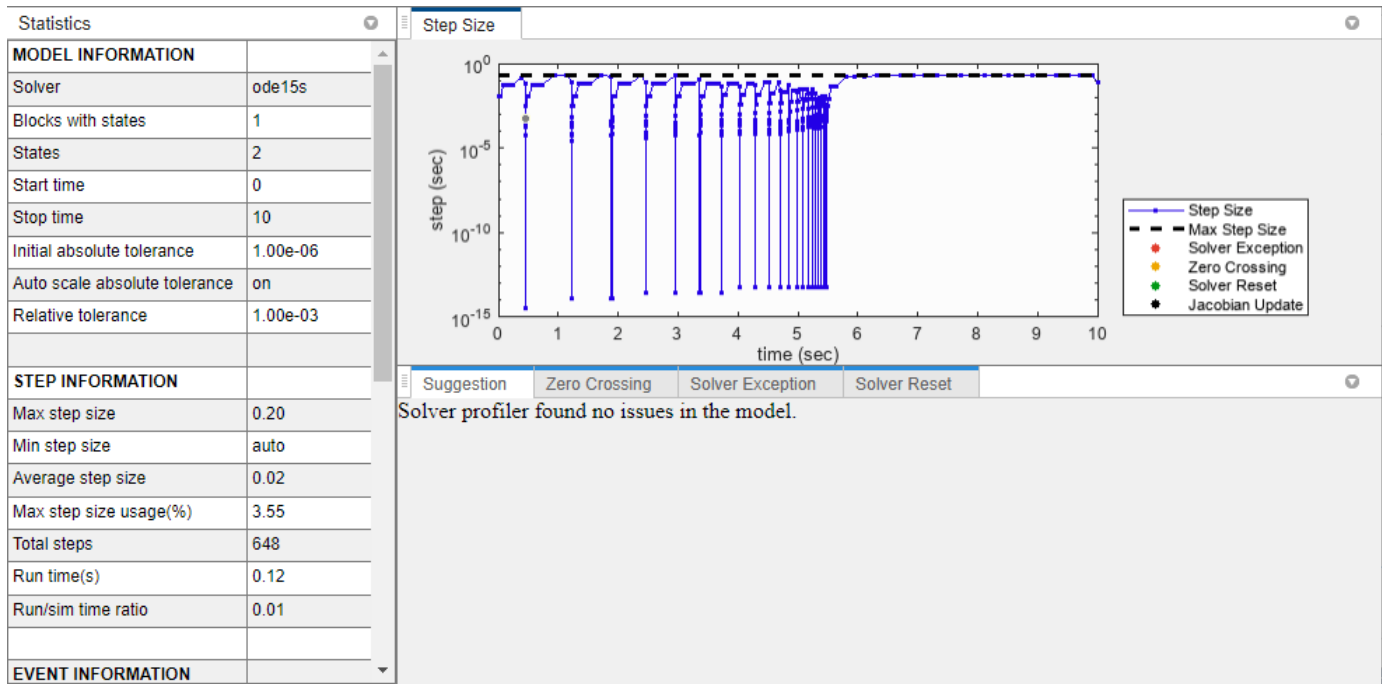

Open the model BouncingBallWithSwitch.

Open the Solver Profiler. In the Simulink™ Toolstrip, on the **Debug** tab, in the **Performance** section, click the **Performance Advisor** button arrow. Then, select **Solver Profiler**.

In the Solver Profiler, click **Run**. The Solver Profiler simulates the model and collects information about solver events that occur. When the simulation completes, the Solver Profiler displays information in the **Statistics** pane and a plot of the step size calculated for each step of the simulation.

In the **Statistics** pane, scroll down to view the event information, which shows that 45 zero-crossing events occurred during simulation from one source.

EVENT INFORMATION	
Zero crossing source	1
Zero crossing source triggered	1
Total zero crossing	45
Total jacobian update	46
Total solver reset	46

To view information about the source of the zero-crossing events, select the **Zero Crossing** tab. The zero crossing events come from the Switch block.

Suggestion		Zero Crossing	Solver Exception	Solver Reset
<b>Number</b>	<b>Block</b>			
45	BouncingBallWithSwitch/Switch			

To annotate the plot of the step sizes with the zero-crossing events, in the **Statistics** pane, click the value for the **Total Zero Crossings** row. The yellow dots indicate when each zero crossing occurred. Where the zero crossings occurred, the step size decreased significantly.

To highlight in the block diagram the Switch block that produced the zero crossings, in the **Zero Crossing** tab, select the block path. Then, in the States Explorer Toolstrip, in the **Trace** section, click **Highlight Block**.

- “Examine Model Dynamics Using Solver Profiler”
- “Solver Resets”
- “Zero-Crossing Events”
- “Solver Exception Events”
- “Jacobian Logging and Analysis”

## Parameters

### Configure

#### **From** — Profiler start time

model start time (default) | scalar

Time, in seconds, of the simulation that the profiler starts analyzing the model. This is not the same as the start time of the simulation.

#### **To** — Profiler stop time

model stop time (default) | scalar

Time, in seconds, of the simulation to which the profiler should profile the model. By default, the analysis continues until the end of the simulation. Changing this parameter does not change the stop time of the model which you specify in the Model Configuration Parameters.

A value less than the configured stop time of the model stops the profiling and simulation at `StopTime`.

#### **Buffer** — Memory impact of logging

50000 (default) | positive scalar

Maximum number of events that are logged. If the number of logged events reaches this value and memory is available, increase `BufferSize`. If memory is limited, consider lowering the value.

#### **Continuous States** — Save model states to file

off (default) | on

By default, the profiler does not save the states of the model. Enabling this parameter configures the profiler to save the states to the profiler data MAT file.

If you select this parameter, it will enable the States explorer.

#### **Simscape States** — Save Simscape states to file

off (default) | on

Enable this parameter to save Simscape states to the profiler data MAT file.

If you select this parameter, it will enable the Simscape explorer.

#### **Zero Crossing** — Save zero crossing data to file

off (default) | on

Enable this parameter to save zero crossing information to the profiler data MAT file

If you select this parameter, it will enable the Zero-Crossing explorer.

#### **Model Jacobian** — Save model Jacobian

off (default) | on

Option to log the solver Jacobian matrices to memory. This option is useful for simulations that use implicit solvers. For a comparison of solvers, see “Compare Solvers”.

For a more detailed explanation of the solver Jacobian, see “Choose a Jacobian Method for an Implicit Solver”.

**Simscape Stiffness** — Log stiffness analysis of Simscape states

array

Log stiffness analysis Simscape states, specified as an array. This parameter provides an array of time points that you want to log the Simscape Stiffness states to the profiler data MAT file. Enable this parameter to show Simscape Stiffness tab in the Suggestion Pane.

Enable this parameter to log the stiffness analysis of Simscape states to the profiler data MAT file. For more information on Simscape representation of stiffness and other physical system concepts, see “How Simscape Models Represent Physical Systems” (Simscape)

**Rule Customization** — Change thresholds for profiler rules

off (default) | on

Click **Rule Customization** in the Solver Profiler to access the rule set. You can change the thresholds for most of these rules and also select which rules you want to apply selectively during a simulation run.

To modify a rule, enable its customization and then enter a desired threshold value.

Rule Set: ssc\_pneumatic\_actuator

Restore to Default

If simulation hangs or pauses, show suggestions when:

- Ratio of solver exceptions to number of steps exceeds 30 %
- Ratio of zero crossing events to number of steps exceeds 30 %
- Ratio of solver reset events to number of steps exceeds 30 %

Over the entire simulation, show suggestions when:

- There are any DAE newton iteration exceptions during simulation
- There is coupling between integration and discrete rates/zc
- Ratio of solver reset events to number of steps exceeds 50 %
- Number of solver exception in one second simulation time exceeds 100
- Number of zero crossing in one second simulation time exceeds 100
- Percentage of steps with max step size exceeds 35 %

Custom Rule

[Empty text field] ...

**Custom Rule Set**

You can override the settings on the **Rule Set** dialog box by specifying a custom rule set.

Create a rule set as a MATLAB script and specify the path to the script in the **Custom Rule Set** section of the **Rule Set** dialog box.

A simple rule set example looks as follows:

```
function diagnosticsString = customRule(profilerData)
 if isempty(profilerData.zcEvents)
 diagnosticsString{1} = 'No zero crossing event detected.';
 else
 diagnosticsString{1} = 'Zero-crossing events detected.';
 end
end
```

The input to the function is an array of structures called `profilerData`. This array of structures organizes all the information that the Solver Profiler collects during a profiling run. It contains the following substructures.

Substructure	Fields
<code>stateInfo</code> : Stores information on block states	<ul style="list-style-type: none"> <li><code>name</code>: Block name</li> <li><code>value</code>: State values</li> <li><code>blockIdx</code>: Block ID</li> </ul>
<code>blockInfo</code> : Cross-reference of blocks and state IDs	<ul style="list-style-type: none"> <li><code>name</code>: Block name</li> <li><code>stateIdx</code>: State ID</li> </ul>
<code>zcSrcInfo</code> : Stores information on blocks causing zero crossing events	<ul style="list-style-type: none"> <li><code>name</code>: Block name</li> <li><code>blockIdx</code>: Block ID</li> </ul>
<code>zcEvents</code> : Cross-reference of the time stamps of zero crossing events and the corresponding state IDs	<ul style="list-style-type: none"> <li><code>t</code>: Event timestamp</li> <li><code>srcIdx</code>: Block ID</li> </ul>
<code>exceptionEvents</code> : Cross-reference of exception event timestamps, the ID of the corresponding state that caused the event, and the cause.	<ul style="list-style-type: none"> <li><code>t</code>: Event timestamp</li> <li><code>stateIdx</code>: State ID</li> <li><code>cause</code>: Cause of exception</li> </ul>
<code>resetTime</code> : Stores timestamps of solver resets.	None
<code>tout</code> : Stores simulation times.	None

**View**

**Solver Exception** — Show solver exception events

off (default) | on

Enable this parameter to highlight solver exception events in the Step Size plot of the Solver Profiler.

**Solver Reset** — Show solver reset events

off (default) | on

Enable this parameter to highlight solver reset events in the Step Size plot of the Solver Profiler.

**Jacobian Update** — Show Jacobian update events

off (default) | on

Enable this parameter to highlight Jacobian update events in the Step Size plot of the Solver Profiler.

**Zero Crossing** — Show zero crossing events

off (default) | on

Enable this parameter to highlight zero crossing events in the Step Size plot of the Solver Profiler.

# State Explorer

Visualize states in model

## Description

Use the **State Explorer** to view individual state dynamics of your model

## Open the State Explorer

- Profile the model using the **Solver Profiler**. Ensure that the **Continuous States** parameter is enabled.
- Select **States** in the **Explore** section of the **Solver Profiler** toolbar.

## Examples

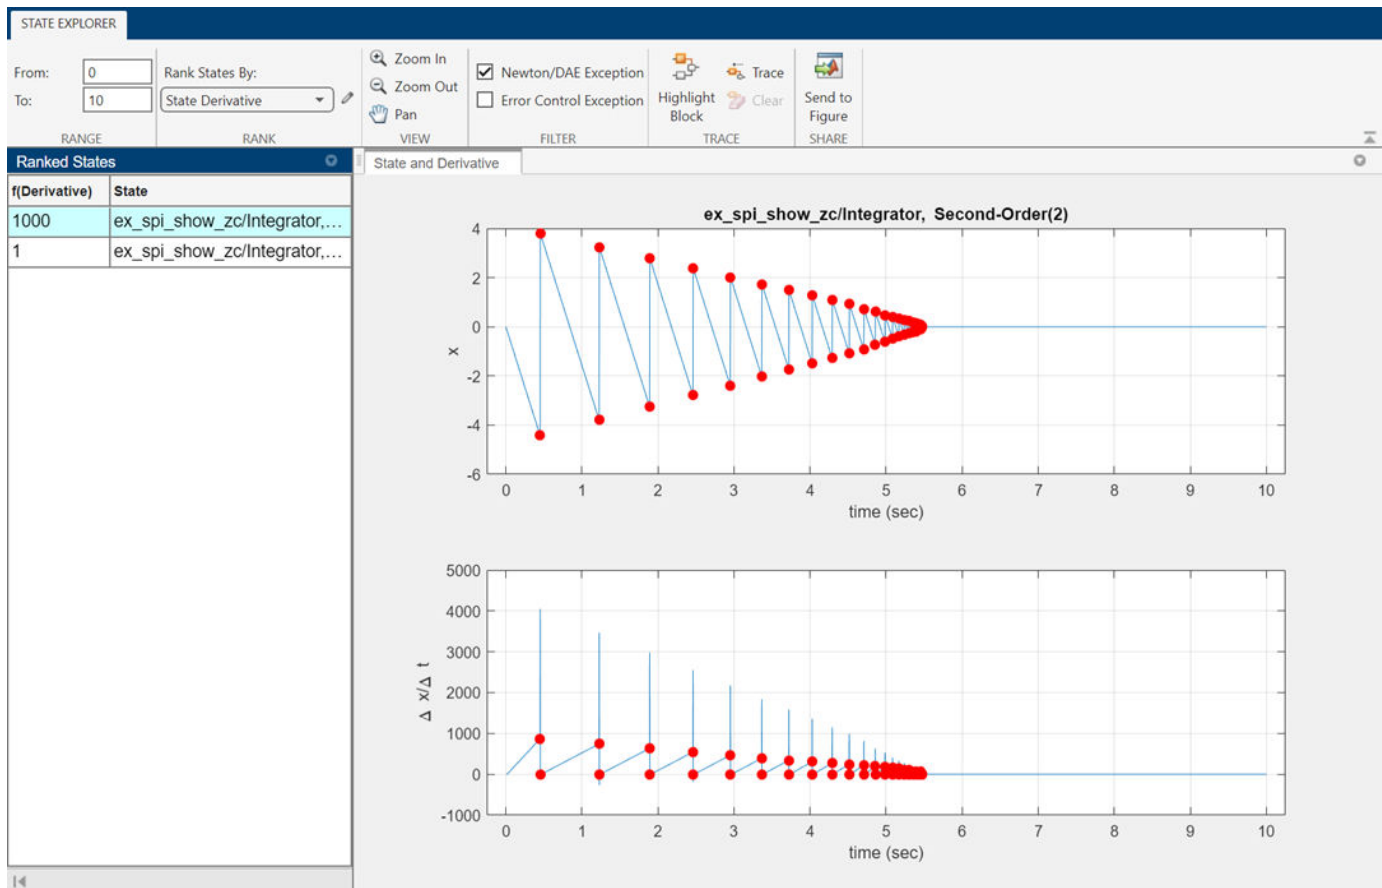

### Interactively Explore States

This example shows how to use State Explorer to explore Newton Exceptions.

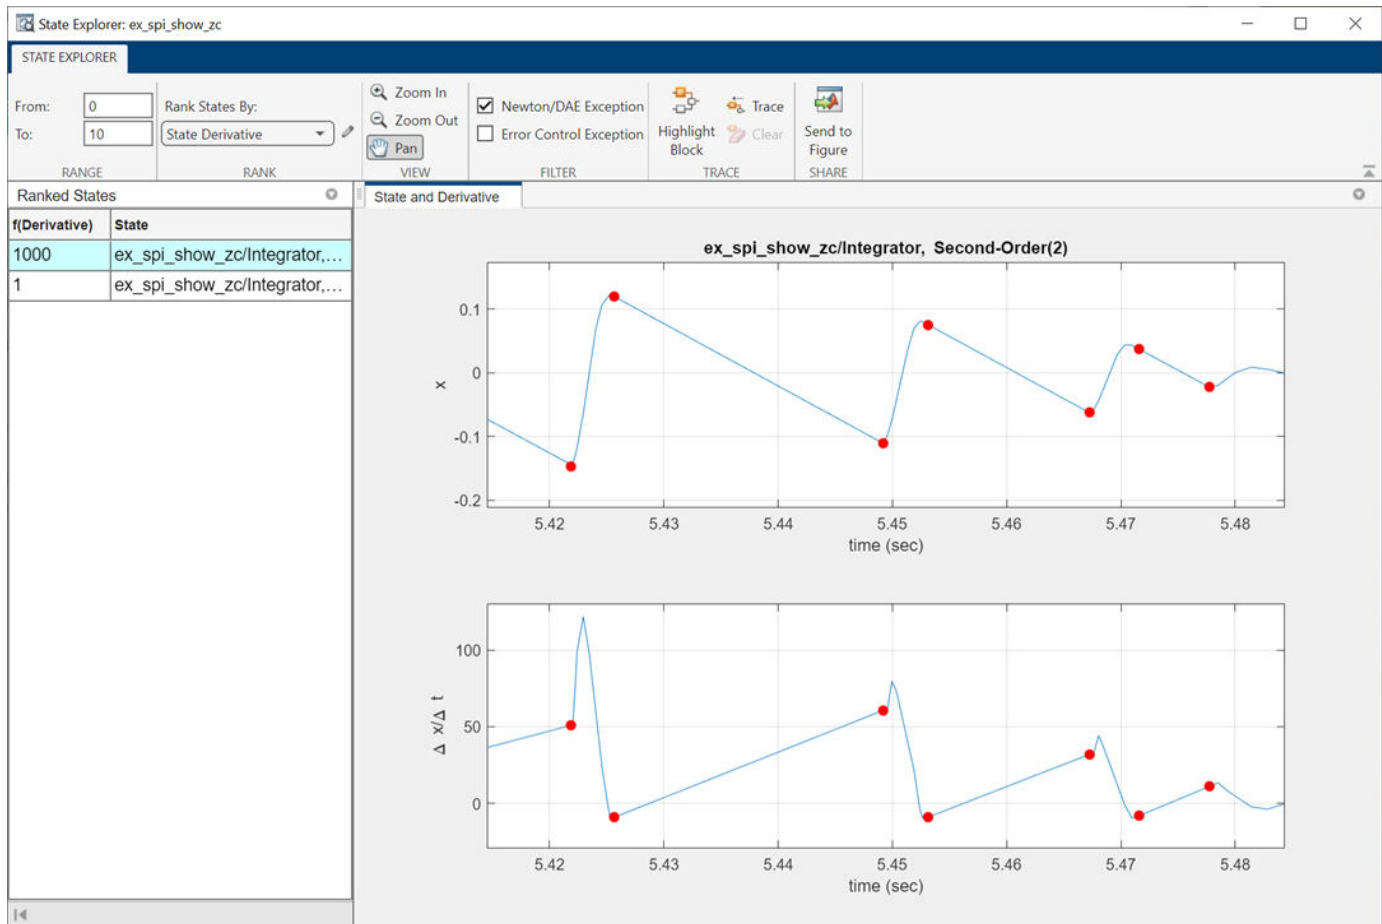

To begin, open the model `BouncingBallWithSwitch`, click **Debug**, open the drop down menu of **Performance Advisor**, select Solver Profiler.

Enable the “Continuous States” on page 7-0 parameter in the **Configure** section of the toolstrip and run Solver Profiler.

When profiling has completed, launch State Explorer. Select **Newton/DAE Exception** in the **Filter** section of the State Explorer toolstrip.

There is an increase in the density of Newton exceptions through the simulation. Zoom in on the State plot between the 5 and 6 second mark.

A closer examination reveals that each bounce causes two Newton iterations to switch from positive to negative corresponding to two zero crossing events. For more details, see “Interactively Explore Zero Crossings” on page 7-211. Around 5.48 seconds, the bouncing ball being simulated in the model comes to ‘rest’, hence the isolated single Newton iteration exception.

## Type Editor

Create, modify, and manage types, such as bus objects

### Description

The Type Editor lets you interactively create, modify, and manage types.

The supported types are:

- `Simulink.Bus` objects with `Simulink.BusElement` objects
- `Simulink.ConnectionBus` objects with `Simulink.ConnectionElement` objects
- `Simulink.ValueType` objects
- `Simulink.AliasType` objects
- `Simulink.NumericType` objects
- `Simulink.data.dictionary.EnumTypeDefinition` objects in data dictionaries

The **Sources** pane provides available sources, which are the MATLAB base workspace and open data dictionaries. The objects that you create are stored in the selected source. In the toolstrip, you can create or open a data dictionary. You can also import objects defined by a MAT file, function, or script into the base workspace.

The **Contents** pane provides an interactive table with information about the objects, such as hierarchy and properties. You can select which columns appear in the table by using the **Columns** list in the toolstrip. Use the table to:

- Filter objects — Enter a universal filter or a column-specific filter.
- Edit objects — Double-click a value in the table and enter a new value. When you enter a value that is not supported, a diagnostic message appears in this pane.
- Batch edit objects — Select objects of the same type that you want to edit. Double-click a value of one of the selected objects and enter a new value. The new value applies to all selected objects.
- Navigate among types — Right-click an object that references another object and select **Go to**. Alternatively, click an object to highlight its referenced object. Use this navigation to bring you to the editable instance of a bus object and its elements.
- Reorder bus element objects — Drag the bus element objects to a new position or use the **Move Up** and **Move Down** buttons in the toolstrip.
- Cut, copy, and paste objects — Use keyboard shortcuts or the corresponding buttons in the toolstrip.
- Delete objects — Press the **Delete** key or click the **Delete** button in the toolstrip. When you delete a bus object, you also delete the bus element objects it contains. Update any blocks that specify the deleted object. To find where a bus object is used in a model, see “Finding Blocks That Use a Specific Variable”.

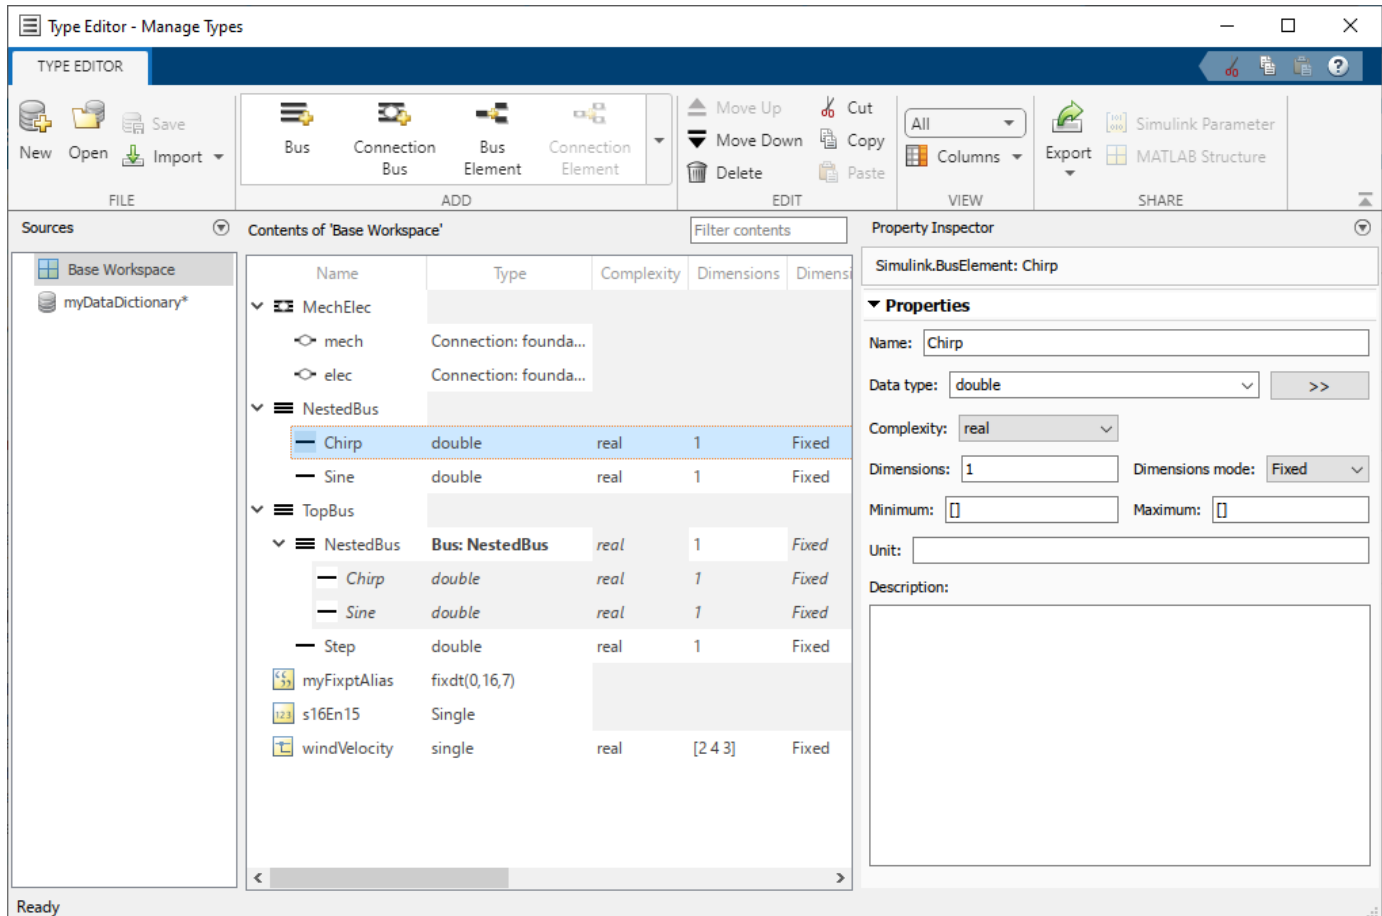

---

**Note** Changes that create, reorder, or delete objects take effect immediately in the base workspace. The **Contents** pane of the Type Editor does not support undo or redo actions.

---

The **Property Inspector** pane lets you focus on one object at a time and edit the object properties. When you enter a value that is not supported, a diagnostic message appears in this pane. To undo or redo a change, right-click the corresponding box. Then, select **Undo** or **Redo**.

The Type Editor can export object definitions to a MAT file (.mat) or function (.m). It can also create a MATLAB structure or Simulink.Parameter object from a Simulink.Bus object. You can find these actions in the **Share** section of the toolstrip.

## Open the Type Editor

- Simulink Toolstrip: On the **Modeling** tab, in the **Design** gallery, click **Type Editor**.
- MATLAB Command Window: Enter `typeeditor`.
- Model Explorer: In a bus object dialog box, click **Launch Type Editor**.
- MATLAB Workspace: Double-click a bus object, alias type, or value type.

## Examples

### Create Bus Objects Using Type Editor

Suppose you want to define an interface for a model with a `Simulink.Bus` object. For this example, the interface receives signals named `sine`, `chirp`, `constant`, `pulse`, and `saw`. You want the

interface to group all the signals. Within that group, you want the interface to group the sinusoidal and nonsinusoidal signals.

You can create the objects in the base workspace or a data dictionary. In the **Sources** pane, select the location to contain the new objects.

- To create a data dictionary, in the Type Editor toolstrip, click **New**. In the dialog box, specify a name for the data dictionary. Then, click **Save**.
- To open a data dictionary, in the Type Editor toolstrip, click **Open**. In the dialog box, specify the data dictionary that you want to open. Then, click **Open**.

Create three `Simulink.Bus` objects.

- 1 In the toolstrip, in the **Add** gallery, click **Bus** three times to create three `Bus` objects.
- 2 Name the objects `interface`, `sinusoidal`, and `nonsinusoidal`. Double-click each object name in the table and enter the new name, or use the **Property Inspector** pane.

Add `Simulink.BusElement` objects to the `Bus` objects.

- 1 Select the object named `interface`, and add three `BusElement` objects to it. In the toolstrip, click **Bus Element** three times.
- 2 Name the elements `constant`, `sinusoidal_bus`, and `nonsinusoidal_bus`. Double-click each object name in the table and enter the new name or use the **Property Inspector** pane.
- 3 Similarly, select the `sinusoidal` bus object and add two elements to it named `sine` and `chirp`.
- 4 Select the `nonsinusoidal` bus object and add two elements to it named `pulse` and `saw`.

Any element in a bus can be another bus, which can in turn contain subordinate buses, to any depth. To mimic this bus hierarchy, a bus-element object can specify a bus object data type.

Nest the `Bus` objects named `sinusoidal` and `nonsinusoidal` in the `Bus` object named `interface`.

- 1 For the object named `sinusoidal_bus`, set **Data Type** to `Bus: sinusoidal`.
- 2 For the object named `nonsinusoidal_bus`, set **Data Type** to `Bus: nonsinusoidal`.

The object named `interface` now matches the desired hierarchy for the component interface. To specify the object at a component interface, you can specify it as the data type of In Bus Element, Inport, Out Bus Element, and Outport blocks.

### Create Alias, Numeric, Value, and Enumerated Types Using Type Editor

In the **Sources** pane, select the location to contain the new objects.

You can create `Simulink.AliasType`, `Simulink.NumericType`, and `Simulink.ValueType` objects in the base workspace or a data dictionary. You can create `Simulink.data.dictionary.EnumTypeDefinition` objects only in a data dictionary.

- To create a data dictionary, in the Type Editor toolstrip, click **New**. In the dialog box, specify a name for the data dictionary. Then, click **Save**.
- To open a data dictionary, in the Type Editor toolstrip, click **Open**. In the dialog box, specify the data dictionary that you want to open. Then, click **Open**.

In the Type Editor toolbar, in the **Add** gallery, select one of these options:

- **Alias Type** — Create a `Simulink.AliasType` object.
- **Numeric Type** — Create a `Simulink.NumericType` object.
- **Value Type** — Create a `Simulink.ValueType` object.
- **Enum Type** — Create a `Simulink.data.dictionary.EnumTypeDefinition` object.

The new object appears in the **Contents** pane.

### Modify Objects Using Type Editor

You can use the Type Editor to modify objects in the base workspace and data dictionaries.

To edit one or more objects of the same type in the Type Editor:

- 1 Select the objects that you want to update.
  - To select multiple noncontiguous objects, hold **Ctrl** and select each element.
  - To select multiple contiguous objects, hold **Shift** and select the first and last element.
  - To select all objects, first select one object. Then, press **Ctrl+A**.
- 2 In the **Contents** pane, double-click the property value that you want to change for all the selected objects of the same type. Then, enter the new value.

When you commit the new value, the change applies to all the selected objects that are the same type of object.

You can also edit one object at a time in the **Property Inspector** pane. Some object properties are available only in the **Property Inspector** pane.

For a bus object, edit the properties of the bus object and its elements at the top level, not where the bus object is specified as a data type. Right-click the dimmed object and select **Go to** to bring you to the editable instance of the object.

To reorder bus object elements, select and drag the elements to a new position or use the **Move Up** and **Move Down** buttons in the toolbar.

You can edit contents in the filtered view just like the unfiltered view. Elements that no longer match the filter disappear from the table. Conversely, if some activity outside the Type Editor changes a filtered object so that it passes the current filter, the object immediately becomes visible.

Operations affect only the available objects. An object that a filter hides is unaffected by the operation. To act on all available objects, clear the filter.

### Save Objects Using Type Editor

When you create or modify objects in the base workspace or a data dictionary, save the objects for future use. If blocks specify these objects, the objects are required for simulation.

The Type Editor can save objects in a MAT file (`.mat`), MATLAB function (`.m`), or data dictionary (`.sldd`).

To save the objects that are in the base workspace:

- 1 In the **Sources** pane, select the base workspace.
- 2 In the toolbar, click the **Export** button arrow. Then, select an option, which creates a MAT file or MATLAB function.

For MATLAB functions, you have the option to save the objects in a compressed cell format or a more readable object format.

- 3 In the Export dialog box, specify the file name, then click **Save**.

Alternatively, cut or copy the objects from the base workspace. Then, paste them in a data dictionary.

To save the objects that are in a data dictionary:

- 1 In the **Sources** pane, select the modified data dictionary.
- 2 In the toolbar, click **Save**. Alternatively, right-click the data dictionary and select **Save changes**.

### **Manage Objects Using Type Editor**

You can use the Type Editor to manage objects from multiple sources.

You can import objects from a function, script, or MAT file.

- 1 In the toolbar, click the **Import** button arrow, then select one of the options.
- 2 In the Import into Base Workspace dialog box, select the file that defines the objects and click **Open**.

The import loads the complete contents of the file, not just the objects. The table displays the available objects in alphabetical order.

You can also open a data dictionary to manage its objects.

- 1 In the toolbar, click **Open**.
- 2 In the Open dialog box, select the data dictionary that defines the objects and click **Open**.

Use filters to quickly find objects by name or property value. The filter can be a search term or regular expression. For information about regular expressions, see “Regular Expressions”.

To quickly find objects with a `double` data type, type `double` in either the **Filter contents** box or the **Filter by DataType** box that appears when you pause on the **DataType** column heading and click the button that appears. As you type, the table updates dynamically to show only the objects whose names or property values match the filter and their parents. The comparison is not case-sensitive.

### **Initialize Buses and Arrays of Buses Using Type Editor**

You can use the Type Editor to create MATLAB structures for initialization.

Suppose you have a `Simulink.Bus` object named `MyData` that contains two elements named `temperature` and `pressure`.

- `temperature` — Signal with a data type of `int16`
- `pressure` — Nested array of buses with a data type of `Bus: PressureBus` and dimensions specified as `[1 3]`

The nested Bus object named `PressureBus` has two elements named `s1` and `s2`.

Name	DataType	Dimensions
MyData		
— temperature	int16	1
— pressure	Bus: PressureBus	[1 3]
— s1	double	1
— s2	double	1
PressureBus		
— s1	double	1
— s2	double	1

Select the Bus object named `MyData`. Then, in the toolstrip, click **MATLAB Structure**.

Specify a name and location for the new MATLAB structure.

The MATLAB structure specifies an initial condition of 0 for each element.

```
MyData_MATLABStruct = struct;
MyData_MATLABStruct.temperature = int16(0);
MyData_MATLABStruct.pressure = struct;
MyData_MATLABStruct.pressure(1).s1 = 0;
MyData_MATLABStruct.pressure(1).s2 = 0;
MyData_MATLABStruct.pressure(2).s1 = 0;
MyData_MATLABStruct.pressure(2).s2 = 0;
MyData_MATLABStruct.pressure(3).s1 = 0;
MyData_MATLABStruct.pressure(3).s2 = 0;
```

Optionally, change the initial conditions of the structure elements.

Use the MATLAB structure to specify the **Initial condition** parameter of a block such as a Unit Delay block.

To create a MATLAB structure for a top-level Bus object that defines an array of buses, use the `Simulink.Bus.createMATLABStruct` function.

## Tips

- In the **Contents** pane, display only the columns that are relevant to you. For example, if your focus is simulation, in the Type Editor toolstrip, in the **View** section, change the column display from `All` to `Value`. If your focus is code generation, change the column display to `Code`. Alternatively, individually select which table columns appear with the **Columns** list.
- A bus object cannot directly or indirectly reference itself. If you define a circular structure, the Type Editor keeps the original data type of the element that would have completed the circle.

- When you have a model that creates a bus with a Bus Creator block, you can use the `Simulink.Bus.createObject` function to create the corresponding objects instead of creating each `Simulink.Bus` and `Simulink.BusElement` object individually.

## Version History

Introduced before R2006a

### **R2022b: `buseditor` function is not recommended**

*Not recommended starting in R2022b*

Starting in R2022b, the Bus Editor is called the Type Editor to reflect that it now supports value types, alias types, numeric types, and enumerations in addition to bus objects. While there are no plans to remove the `buseditor` function, the `typeeditor` function is now the recommended function to open the tool.

### **R2022a: Custom import and export functions are not supported**

Starting in R2022a, the Bus Editor loads faster and has an updated interface for creating, modifying, and managing bus objects. However, the Bus Editor no longer supports custom import and export functions.

Remove the `cm.BusEditorCustomizer.importCallbackFcn` and `cm.BusEditorCustomizer.exportCallbackFcn` registration functions from the `sl_customization` function. To eliminate both customizations in one operation for a customization manager object named `cm`, use this command.

```
cm.BusEditorCustomizer.clear
```

For more information about customizations, see “Register Customizations with Simulink”.

# Zero Crossing Explorer

Visualize and interactively explore zero-crossing events

## Description

Use the **Zero Crossing Explorer** to visualize and analyze zero crossing events that occur for each state in your model.

## Open the Zero Crossing Explorer

- Profile the model using the **Solver Profiler**. Ensure that the **Zero Crossing** parameter is enabled.
- Select **Zero Crossing** in the **Explore** section of the **Solver Profiler** toolstrip.

## Examples

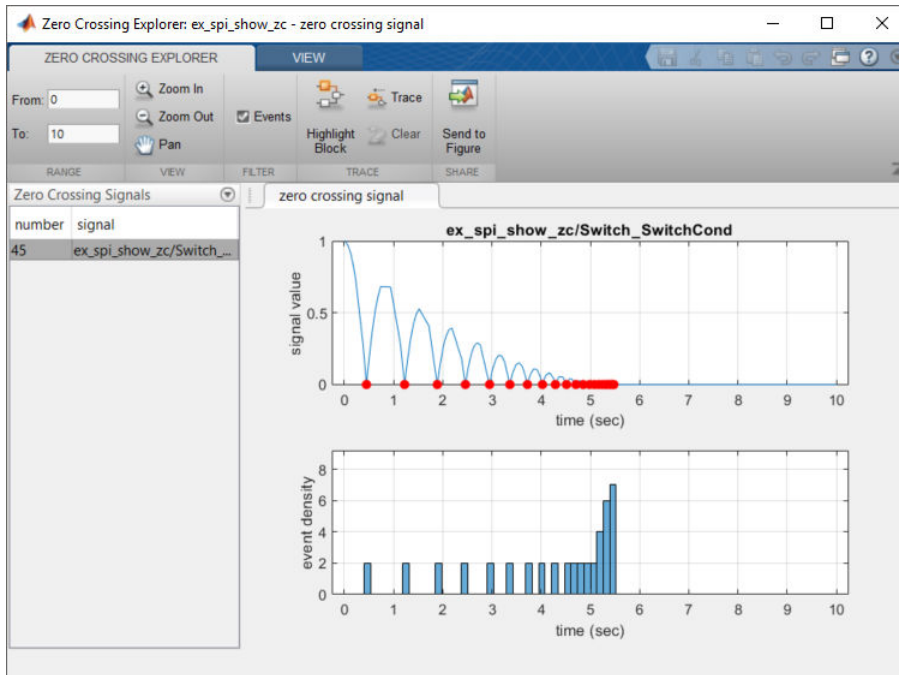

### Interactively Explore Zero Crossings

Use the **Zero Crossing Explorer** to examine clusters of zero crossing events

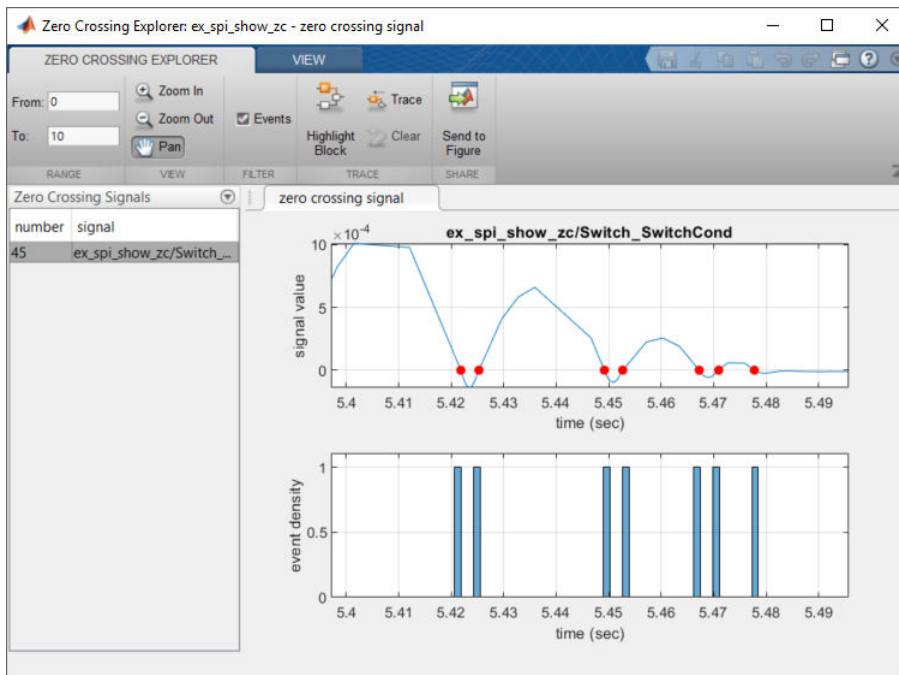

Open the model BouncingBallWithSwitch and launch the **Solver Profiler**.

Enable the **Zero Crossing** parameter in the **Configure** section of the toolstrip and run the **Solver Profiler**.

When profiling has completed, launch the **Zero Crossing Explorer**

There is an increase in the density of zero crossing events halfway through the simulation. Zoom in on the **event density** plot between the 5 and 6 second mark.

A closer examination reveals that each bounce corresponds to two zero crossings — from positive to negative and vice-versa. This is an artefact of numerically solving state dynamics that approach 0 value. Around 5.48 seconds, the ball being simulated in the model comes to 'rest', hence the isolated single zero crossing event.

- “Zero-Crossing Events”
- “Zero-Crossing Detection”

## **Version History**

**Introduced in R2019a**

# Objects

---

## LibraryBrowser.LBStandalone

Display, hide, size, and position Simulink Library Browser

### Description

Use `LibraryBrowser.LBStandalone` objects to programmatically display, hide, size, position, and refresh the Simulink Library Browser in standalone mode. For more information, see `Library Browser in Standalone Mode`, `show`, `hide`, `getPosition`, `setPosition`, and `refresh`. To interact with a `LibraryBrowser.LBStandalone` object, create and get the handle of the object, then set the object properties or run the object functions.

### Creation

To create and get the handle of the Library Browser object, use either `sLibraryBrowser` or `LibraryBrowser.LibraryBrowser2`.

---

**Note** When you use the `sLibraryBrowser` to get the handle:

- If the Library Browser is open in standalone mode, the Library Browser window moves in front of all other Simulink windows.
  - If the Library Browser is not open in standalone mode, the Library Browser opens in standalone mode.
- 

### Properties

#### **IsOnTop — Always put Library Browser window on top**

false or 0 (default) | true or 1

Always put the Library Browser window on top of other Simulink Editor windows, specified as a numeric or logical 1 (true) or 0 (false).

### Object Functions

<code>refresh</code>	Refresh Simulink Library Browser
<code>show</code>	Display Simulink Library Browser
<code>hide</code>	Hide Simulink Library Browser
<code>getPosition</code>	Get position of Simulink Library Browser
<code>setPosition</code>	Set position of Simulink Library Browser

### Examples

## Keep Library Browser in Front of Other Windows

Create and get the handle of the `LibraryBrowser.LBStandalone` object that lets you programmatically access the Library Browser.

```
lb = LibraryBrowser.LibraryBrowser2;
```

Set the `IsOnTop` property of the Library Browser to 1 (true), using dot notation to access the property.

```
lb.IsOnTop = 1;
```

## Limitations

The `LibraryBrowser.LBStandalone` object does not allow you to programmatically act on a docked Library Browser. To use the `LibraryBrowser.LBStandalone` object, open the Library Browser in standalone mode by clicking the Launch standalone library browser button .

## Version History

### Introduced in R2014b

### R2016b: `LibraryBrowser.LBStandalone` object replaces `LibraryBrowser.LibraryBrowser2` object

*Behavior changed in R2016b*

In previous releases, these two commands returned a `LibraryBrowser.LibraryBrowser2` object:

```
lb = sLibraryBrowser
lb = LibraryBrowser.LibraryBrowser2
```

Starting in R2016b, each command returns a `LibraryBrowser.LBStandalone` object. The functions to access Library Browser operations such as `show` and `refresh` support `LibraryBrowser.LBStandalone` objects.

## getPosition

**Package:** LibraryBrowser

Get position of Simulink Library Browser

### Syntax

```
position = getPosition(lb)
```

### Description

`position = getPosition(lb)` returns the position of the Simulink Library Browser in standalone mode. For more information on standalone mode, see [Library Browser in Standalone Mode](#).

### Examples

#### Get Position of Library Browser

```
lb = LibraryBrowser.LibraryBrowser2;
getPosition(lb)
```

```
ans =
```

```
 50 279 600 600
```

### Input Arguments

#### lb — Simulink Library Browser

LibraryBrowser.LBStandalone object

Simulink Library Browser, specified as a `LibraryBrowser.LBStandalone` object.

### Output Arguments

#### position — Position of Library Browser

numeric array

Position of Library Browser, returned as a numeric array of integers, in pixels: upper-left x-coordinate, upper-left y-coordinate, width, and height.

### Limitations

The `getPosition` function does not act on a docked Library Browser. To use the `getPosition` function, open the Library Browser in standalone mode by clicking the Launch standalone library browser button .

## **Version History**

Introduced in R2016b

setPosition | sLibraryBrowser | LibraryBrowser.LibraryBrowser2 | hide | show | refresh

# hide

**Package:** LibraryBrowser

Hide Simulink Library Browser

## Syntax

```
hide(lb)
```

## Description

`hide(lb)` hides the Simulink Library Browser in standalone mode. For more information on standalone mode, see Library Browser in Standalone Mode.

## Examples

### Hide Library Browser

```
lb = LibraryBrowser.LibraryBrowser2;
hide(lb)
```

## Input Arguments

### lb — Simulink Library Browser

LibraryBrowser.LBStandalone object

Simulink Library Browser, specified as a `LibraryBrowser.LBStandalone` object.

## Limitations

The `hide` function does not act on a docked Library Browser. To use the `hide` function, open the Library Browser in standalone mode by clicking the Launch standalone library browser button .

## Version History

setPosition | refresh

## refresh

**Package:** LibraryBrowser

Refresh Simulink Library Browser

### Syntax

```
refresh(lb)
```

### Description

`refresh(lb)` updates the Simulink Library Browser with changes that affect it. Examples include adding a library to the Library Browser, removing a library from the Library Browser, and making changes to your custom libraries, `slblocks` function, or `sl_customization.m` file.

### Examples

#### Refresh Library Browser

Refresh the Library Browser when you have made any changes that affect libraries on your MATLAB path that are registered in the Library Browser.

```
lb = LibraryBrowser.LibraryBrowser2;
refresh(lb)
```

### Input Arguments

#### **lb** — Simulink Library Browser

LibraryBrowser.LBStandalone object

Simulink Library Browser, specified as a `LibraryBrowser.LBStandalone` object.

## Version History

Introduced in R2016b

## setPosition

**Package:** LibraryBrowser

Set position of Simulink Library Browser

### Syntax

```
setPosition(lb,position)
```

### Description

`setPosition(lb,position)` sets the position of the Simulink Library Browser in standalone mode. For more information on standalone mode, see [Library Browser in Standalone Mode](#).

### Examples

#### Set Position of Library Browser

```
lb = LibraryBrowser.LibraryBrowser2;
setPosition(lb,[70 250 500 500])
```

### Input Arguments

#### **lb** — Simulink Library Browser

`LibraryBrowser.LBStandalone` object

Simulink Library Browser, specified as a `LibraryBrowser.LBStandalone` object.

#### **position** — New position of Library Browser

numeric array

New position of Library Browser, specified as a numeric array of integers, in pixels: upper-left x-coordinate, upper-left y-coordinate, width, and height.

Data Types: double

### Limitations

The `setPosition` function does not act on a docked Library Browser. To use the `setPosition` function, open the Library Browser in standalone mode by clicking the Launch standalone library browser button .

## Stateflow.EMChart

Stateflow interface to MATLAB Function block

### Description

Use `Stateflow.EMChart` objects to configure MATLAB Function blocks through the Stateflow programmatic interface. For more information, see “Overview of the Stateflow API” (Stateflow).

---

**Tip** You can also configure the properties of a MATLAB Function block programmatically by using a `MATLABFunctionConfiguration` object. This object provides a direct interface to the properties of a MATLAB Function block. For more information, see “Configure MATLAB Function Blocks Programmatically”.

---

### Creation

Each MATLAB Function block has its own `Stateflow.EMChart` object. When you add a MATLAB Function block to a Simulink model, a `Stateflow.EMChart` object is automatically created for it. For example, you can use the function `add_block` to add a MATLAB Function with the name `MATLAB Function` to a model called `myModel`:

```
add_block("simulink/User-Defined Functions/MATLAB Function", ...
 "myModel/MATLAB Function")
```

Then, to access the `Stateflow.EMChart` object, call the `find` function for the loaded system:

```
block = find(get_param("myModel", "Object"), ...
 "-isa", "Stateflow.EMChart", "Name", "MATLAB Function");
```

### Properties

Stateflow API objects have properties that correspond to the values you set in the Stateflow Editor. To access or modify a property, use dot notation. To access or modify multiple properties for multiple API objects, use the `get` and `set` functions, respectively. For more information, see “Modify Properties and Call Functions of Stateflow Objects” (Stateflow).

#### Content

##### Name — Name of MATLAB Function block

"MATLAB Function" (default) | string scalar | character vector

Name of the MATLAB Function block, specified as a string scalar or character vector.

##### Script — Code for MATLAB Function block

string scalar | character vector

Code for the MATLAB Function block, specified as a string scalar or character vector. To enter multiple lines of code, you can:

- Call the MATLAB function `sprintf` and use `\n` to insert newline characters:

```
str = sprintf("function y=f(x)\ny=x+1;\nend");
block.Script = str;
```

- Enter a concatenated text expression that uses the function `newline` to create newline characters:

```
str = "function y=f(x)" + newline + ...
 "y=x+1;" + newline + ...
 "end";
block.Script = str;
```

### **SupportVariableSizing** — Whether MATLAB Function block supports variable-size data

true or 1 (default) | false or 0

Whether the MATLAB Function block supports variable-size data, specified as a numeric or logical 1 (true) or 0 (false). For more information, see “Declare Variable-Size MATLAB Function Block Variables”.

### **AllowDirectFeedthrough** — Whether MATLAB Function block supports direct feedthrough semantics

true or 1 (default) | false or 0

Whether the MATLAB Function block supports direct feedthrough semantics, specified as a numeric or logical 1 (true) or 0 (false). For more information, see “Allow direct feedthrough”.

### **VectorOutputs1D** — Whether MATLAB Function block outputs column vectors as one-dimensional data

false or 0 (default) | true or 1

Whether the MATLAB Function block outputs column vectors as one-dimensional data, specified as a numeric or logical 0 (false) or 1 (true). For more information, see “Interpret output column vectors as one-dimensional data”.

### **TreatDimensionOfLengthOneAsFixedSize** — Whether MATLAB Function block output variables with at least one dimension of length 1 are fixed size

true or 1 (default) | false or 0

Whether MATLAB Function block output variables with at least one dimension of length 1 are fixed size, specified as a numeric or logical 0 (false) or 1 (true). When this property is true, the object sets variables that are variable size in the block with a dimension of 1 to fixed size. When this property is false, variables in the block that have the **Variable size** property enabled are always variable size. Prior to R2023a, the object treats variables with at least one dimension of length 1 as fixed size.

This property only affects output variables that have the **Variable size** property enabled. See “Variable size”.

## **Interface**

### **Inputs** — Input arguments

array of Stateflow.Data objects

This property is read-only.

Input arguments of the MATLAB Function block, specified as an array of `Stateflow.Data` objects. The value of this property depends on the inputs defined in the `Script` property for the block.

### **Outputs — Output arguments**

array of `Stateflow.Data` objects

This property is read-only.

Output arguments of the MATLAB Function block, specified as an array of `Stateflow.Data` objects. The value of this property depends on the outputs defined in the `Script` property for the block.

### **Discrete and Continuous-Time Semantics**

#### **ChartUpdate — Activation method for MATLAB Function block**

"INHERITED" (default) | "CONTINUOUS" | "DISCRETE"

Activation method for the MATLAB Function block, specified as "CONTINUOUS", "DISCRETE", or "INHERITED". For more information, see "Update method".

#### **SampleTime — Sample time for activating MATLAB Function block**

"-1" (default) | string scalar | character vector

Sample time for activating the MATLAB Function block, specified as a string scalar or character vector. This property applies only when the `ChartUpdate` property for the MATLAB function is "DISCRETE".

### **Integer and Fixed-Point Data**

#### **SaturateOnIntegerOverflow — Whether data saturates on integer overflow**

true or 1 (default) | false or 0

Whether the data in the MATLAB Function block saturates on integer overflow, specified as a numeric or logical 1 (true) or 0 (false). When this property is disabled, the data in the function wraps on integer overflow. For more information, see "Saturate on integer overflow".

#### **TreatAsFi — Inherited Simulink signals to treat as fi objects**

"Fixed-point" (default) | "Fixed-point & Integer"

Inherited Simulink signals to treat as Fixed-Point Designer `fi` objects, specified as one of these values:

- "Fixed-point" — The MATLAB Function block treats all fixed-point inputs as `fi` objects.
- "Fixed-point & Integer" — The MATLAB Function block treats all fixed-point and integer inputs as `fi` objects.

#### **EmlDefaultFimath — Default fimath properties**

"Same as MATLAB Default" (default) | "Other:UserSpecified"

Default `fimath` properties for the MATLAB Function block, specified as one of these values:

- "Same as MATLAB Default" — Use the same `fimath` properties as the current default `fimath` object.
- "Other:UserSpecified" — Use the `InputFimath` property to specify the default `fimath` object.

**InputFimath — Default fimath object**

string scalar | character vector

Default `fimath` object, specified as a string scalar or character vector. When the `EmlDefaultFimath` property for the MATLAB Function block is "Other:UserSpecified", you can use this property to:

- Enter an expression that constructs a `fimath` object.
- Enter the variable name for a `fimath` object in the MATLAB or model workspace.

**Hierarchy****Machine — Machine that contains MATLAB Function block**

Stateflow.Machine object

This property is read-only.

Machine that contains the MATLAB Function block, specified as a `Stateflow.Machine` object.

**Path — Location of MATLAB Function block in model hierarchy**

string scalar | character vector

This property is read-only.

Location of the MATLAB Function block in the model hierarchy, specified as a character vector.

**Dirty — Whether MATLAB Function block has changed**

true or 1 | false or 0

Whether the MATLAB Function block has changed after being opened or saved, specified as a numeric or logical 1 (true) or 0 (false).

**Locked — Whether MATLAB Function block is locked**

false or 0 (default) | true or 1

Whether the MATLAB Function block is locked, specified as a numeric or logical 1 (true) or 0 (false). Enable this property to prevent changes in the MATLAB Function block.

**Iced — Whether MATLAB Function block is locked**

false or 0 (default) | true or 1

This property is read-only.

Whether the MATLAB Function block is locked, specified as a numeric or logical 1 (true) or 0 (false). This property is equivalent to the property `Locked`, but is used internally to prevent changes in the MATLAB Function block during simulation.

**Identification****Description — Description**

"" (default) | string scalar | character vector

Description for the MATLAB Function block, specified as a string scalar or character vector.

**Document — Document link**

"" (default) | string scalar | character vector

Document link for the MATLAB Function block, specified as a string scalar or character vector.

### Tag — User-defined tag

[] (default) | any data type

User-defined tag for the MATLAB Function block, specified as data of any type.

### Id — Unique identifier

scalar

This property is read-only.

Unique identifier, specified as an integer scalar. Use this property to distinguish the MATLAB Function block from other objects in the model. The value of this property is reassigned every time you start a new MATLAB session and may be recycled after an object is deleted.

## Object Functions

find	Identify specified objects in hierarchy
getChildren	Identify children of object
dialog	Open properties dialog box
view	Display object in editing environment

## Examples

### Program MATLAB Function Block

Access the Stateflow.EMChart object for a MATLAB Function block named My Function in a model called myModel.

```
block = find(get_param(gcs,"Object"), ...
 "-isa","Stateflow.EMChart","Path","myModel/My Function");
```

Store the MATLAB code to calculate the mean and standard deviation for a vector of values as a string scalar.

```
str = "function [mean,stdev] = stats(vals)" + newline + ...
 "% Calculates a statistical mean and a standard" + newline + ...
 "% deviation for the values in vals." + newline + newline + ...
 "len = length(vals);" + newline + ...
 "mean = avg(vals,len);" + newline + ...
 "stdev = sqrt(sum(((vals-avg(vals,len)).^2))/len);" + newline + ...
 "plot(vals,""-+");" + newline + newline + ...
 "function mean = avg(array,size)" + newline + ...
 "mean = sum(array)/size;";
```

Populate the block with code by modifying the Script property of the corresponding Stateflow.EMChart object.

```
block.Script = str;
```

Open the function in the **MATLAB Function Block Editor**.

```
view(block)
```

The editor shows this code.

```
function [mean,stdev] = stats(vals)
% Calculates a statistical mean and a standard
% deviation for the values in vals.

len = length(vals);
mean = avg(vals,len);
stdev = sqrt(sum(((vals-avg(vals,len)).^2))/len);
plot(vals,"-+");

function mean = avg(array,size)
mean = sum(array)/size;
```

### Import Code from MATLAB Function

Open a Simulink model called myModel.

```
open_system("myModel")
```

Add a MATLAB Function block to myModel named My Function.

```
blockPath = "myModel/My Function";
add_block("simulink/User-Defined Functions/MATLAB Function",blockPath)
```

Populate the block with code from the MATLAB function myFunction.m.

```
block = find(get_param("myModel","Object"),"-isa", ...
 "Stateflow.EMChart","Path",blockPath);
block.Script = fileread("myFunction.m");
```

### Find Number of MATLAB Function Blocks in Model

Open a Simulink model called myModel.

```
open_system("myModel")
```

Find the MATLAB Function blocks in the model.

```
blocks = find(get_param("myModel","Object"),"-isa","Stateflow.EMChart");
```

Count the number of blocks.

```
numel(blocks)
```

## Version History

Introduced in R2011a

**R2023a: Set output variables of any dimension as variable size**

You can now set output variables of any dimension to be variable size by setting the `TreatDimensionOfLengthOneAsFixedSize` property to `false`. Prior to R2023a, the object treats variables with at least one dimension of length 1 as fixed size.

### **R2021b: Change to output column vectors**

You can output column vectors in MATLAB Function blocks as two-dimensional or one-dimensional data with the `VectorOutputs1D` property.

Before R2021b, MATLAB Function blocks always output column vectors as one-dimensional data. After R2021b, MATLAB Function blocks output column vectors as two-dimensional data by default. To maintain the original behavior of the block, set the `VectorOutputs1D` property to `true`.

# Simulink.AliasType

Create alias for signal and parameter data type

## Description

Use a `Simulink.AliasType` to create an alias of a built-in data type such as `int8`.

The name of the object is the alias. The data type to which an alias refers, such as `int8`, is the base type. Alias names cannot be:

- Built-in data types, including:
  - Floating-point types: `half`, `single`, `double`
  - Integer types: `int8`, `uint8`, `int16`, `uint16`, `int32`, `uint32`, `int64`, or `uint64`.
  - `string`
- Fixed-Point Designer types beginning with `sfix`, `ufix`, or `flt`.
- `boolean`

You create the object in the base workspace or a data dictionary. To use the alias, you use the name of the object to set data types for signals, states, and parameters in a model.

Using aliases to specify signal and parameter data types can greatly simplify global changes to the data types that a model specifies. In particular, changing the data type of all signals, states, and parameters whose data type is specified by an alias requires changing only the base type of the alias. By contrast, changing the data types of signals, states, and parameters whose data types are specified by an actual type name requires respecifying the data type of each signal and parameter individually.

You can use objects of this class to create an alias for Simulink built-in data types, fixed-point data types, enumerated data types, `Simulink.NumericType` objects, and other `Simulink.AliasType` objects. The code that you generate from a model (Simulink Coder) uses the alias only if you use an ERT-based system target file (Embedded Coder).

Alternatively, to define and name a numeric data type, you can use an object of the class `Simulink.NumericType`.

## Creation

You can create a `Simulink.AliasType` object several ways.

- Interactively create a data type alias using the **Type Editor** or **Model Explorer**.
- Generate data type aliases that correspond to `typedef` statements in your external C code using the `Simulink.importExternalCTypes` function.
- Programmatically create a data type alias using the `Simulink.AliasType` function described here.

---

**Note** You must create data type aliases in the MATLAB workspace or in a data dictionary. You cannot create an alias in a model workspace.

---

## Syntax

```
aliasObj = Simulink.AliasType
aliasObj = Simulink.AliasType(baseType)
```

### Description

`aliasObj = Simulink.AliasType` returns a `Simulink.AliasType` object with default property values.

`aliasObj = Simulink.AliasType(baseType)` returns a `Simulink.AliasType` object and initializes the value of the `BaseType` property by using `baseType`.

## Properties

To interactively edit the properties of a `Simulink.AliasType` object, use the **Type Editor**.

### BaseType — Name of base data type

'double' (default) | character vector | string scalar

Name of the base data type that this alias renames, specified as a character vector or string scalar. You can specify the name of a standard data type, such as `int8` or `half`, or the name of a custom data type, such as the name of another `Simulink.AliasType` object or the name of an enumeration.

To specify a fixed-point data type, you can use a call to the `fixdt` function, such as `'fixdt(0,16,7)'`. To specify the characteristics of the type interactively, expand the Data Type Assistant and set **Mode** to `Fixed point`. For information about using the Data Type Assistant, see “Specify Data Types Using Data Type Assistant”.

You can, with one exception, specify a nonstandard data type, e.g., a data type defined by a `Simulink.NumericType` object, by specifying the data type name. The exception is a `Simulink.NumericType` object whose `DataTypeMode` is `Fixed-point: unspecified scaling`.

---

**Note** `Fixed-point: unspecified scaling` is a partially specified type whose definition is completed by the block that uses the `Simulink.NumericType` object. Forbidding its use in alias types avoids creating aliases that have different base types depending on where they are used.

---

Example: `'int8'`

Example: `'myOtherAlias'`

Data Types: `char` | `string`

### DataScope — Specification to generate or import type definition in the generated code

'Auto' (default) | 'Exported' | 'Imported'

Specification to generate or import the type definition (`typedef`) in the generated code (Simulink Coder), specified as `'Auto'`, `'Exported'`, or `'Imported'`.

The table shows the effect of each option.

Value	Action
'Auto' (default)	<p>If no value is specified for <code>HeaderFile</code>, export the type definition to <code>model_types.h</code>, where <code>model</code> is the model name. If you have an Embedded Coder license, and you have specified a data type replacement, then export the type definition to <code>rtwtypes.h</code>.</p> <p>If a value is specified for <code>HeaderFile</code>, import the data type definition from the specified header file.</p>
'Exported'	Export the data type definition to a header file, which can be specified in the <code>HeaderFile</code> property. If no value is specified for <code>HeaderFile</code> , the header file name defaults to <code>type.h</code> . <code>type</code> is the data type name.
'Imported'	Import the data type definition from a header file, which can be specified in the <code>HeaderFile</code> property. If no value is specified for <code>HeaderFile</code> , the header file name defaults to <code>type.h</code> . <code>type</code> is the data type name.

Set the data scope to `Imported` or `Exported` to avoid potential MISRA C:2012 violations.

For more information, see “Control File Placement of Custom Data Types” (Embedded Coder).

#### Description — Custom description of data type alias

' ' (empty character vector) (default) | character vector

Custom description of the data type alias, specified as a character vector.

Example: 'This type alias corresponds to a floating-point implementation.'

Data Types: char

#### HeaderFile — Name of header file that contains type definition in the generated code

' ' (empty character vector) (default) | character vector

Name of the header file that contains the type definition (`typedef`) in the generated code, specified as a character vector.

If this property is specified, the specified name is used during code generation for importing or exporting. If this property is empty, the value defaults to `type.h` if `DataScope` is `'Imported'` or `'Exported'`, or defaults to `model_types.h` if `DataScope` is `'Auto'`.

By default, the generated `#include` directive uses the preprocessor delimiter `"` instead of `<` and `>`. To generate the directive `#include <myTypes.h>`, specify `HeaderFile` as `'<myTypes.h>'`.

For more information, see “Control File Placement of Custom Data Types” (Embedded Coder).

Corresponds to **Header file** in the property dialog box.

Example: 'myHdr.h'

Example: 'myHdr'

Example: 'myHdr.hpp'

Data Types: char

## Examples

### Create Alias for Enumerated Data Type

To create an alias for an enumerated type called `SLDemoSign`:

```
myEnumAlias = Simulink.AliasType('Enum: SLDemoSign');
```

### Create Alias for Fixed-Point Data Type

To create an alias for a fixed-point data type by using a `Simulink.AliasType` object, set the `BaseType` property of the object by using a call to the `fixdt` function. The value of `BaseType` must be specified as a character vector.

For example, this code creates an alias for an unsigned fixed-point data type with word length 16 and fraction length 7.

```
myFixptAlias = Simulink.AliasType;
myFixptAlias.BaseType = 'fixdt(0,16,7)';
```

## Version History

Introduced before R2006a

## Extended Capabilities

### C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

A `Simulink.AliasType` object appears in the generated code as a `typedef` statement. The generated code uses the named type to define and declare data (variables).

The `Simulink.AliasType` class does not support multiword base data types for code generation.

### Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

# Simulink.Annotation

Create and specify properties of text, image, and area annotations

## Description

Annotations are visual elements that you can use to add descriptive notes and callouts to your model. You can programmatically access and modify them as `Simulink.Annotation` objects.

To get an existing `Simulink.Annotation` object, select the annotation. Then, use the `getCurrentAnnotation` function.

## Creation

You can create a `Simulink.Annotation` object in multiple ways.

- To programmatically create an Annotation object, use the `Simulink.Annotation` function described on this page.
- To interactively create an Annotation object, see “Annotate Models”.

## Syntax

```
a = Simulink.Annotation(sys,name)
a = Simulink.Annotation(path,Name,Value)
```

### Description

`a = Simulink.Annotation(sys,name)` creates an annotation with the specified name and default properties in the specified system or subsystem.

`a = Simulink.Annotation(path,Name,Value)` creates an annotation with properties on page 8-26 specified using name-value pairs. For example, `Simulink.Annotation('model/annotation','BackgroundColor','yellow')` creates an annotation with a yellow background. You can specify multiple name-value pairs. Enclose each property name in quotes.

### Input Arguments

#### **sys** — System or subsystem to contain annotation

character vector | string scalar

System or subsystem to contain annotation, specified as a character vector or string scalar.

Data Types: `char` | `string`

#### **name** — Name of new annotation

character vector

Name of new annotation, specified as a character vector.

Data Types: `char`

**path — Path to new annotation**

character vector | string scalar

Path to new annotation, specified as a character vector or string scalar composed of the system name and the annotation name.

Example: `Simulink.Annotation('model/annotation')`Data Types: `char` | `string`**Properties****Interaction****Selected — Option to select annotation**

'off' (default) | on/off logical value

Option to select or deselect the annotation, specified as 'on' or 'off', or numeric or logical 1 (true) or 0 (false). A value of 'on' is equivalent to true, and 'off' is equivalent to false. Thus, you can use the value of this property as a logical value. The value is stored as an on/off logical value of type `OnOffSwitchState`.

- 'on' — Select annotation.
- 'off' — Remove selection from annotation.

Data Types: `logical` | `char` | `string`**Text****Name — Text of annotation**

character vector | string scalar

Text of annotation, specified as a character vector or string scalar.

Same as Text.

Data Types: `char` | `string`**Text — Text of annotation**

character vector | string scalar

Text of annotation, specified as a character vector or string scalar.

Same as Name.

Data Types: `char` | `string`**Interpreter — Option to format text style**

'off' (default) | 'rich' | 'tex'

Option to format text style, specified as 'off' for plain text, 'rich' for rich text, or 'tex' for text that contains LaTeX commands. When you format a plain text annotation using the formatting toolbar, the annotation becomes a rich text annotation.

**TeXMode — Option to render TeX markup**

'off' (default) | on/off logical value

Option to render TeX markup, specified as 'on' or 'off', or numeric or logical 1 (true) or 0 (false). A value of 'on' is equivalent to true, and 'off' is equivalent to false. Thus, you can use the value of this property as a logical value. The value is stored as an on/off logical value of type OnOffSwitchState.

- 'on' — Render TeX markup.
- 'off' — Do not render TeX markup.

### MarkupType — Option to make markup annotation

'model' (default) | 'markup'

Option to make markup annotation, specified as 'model' or 'markup'.

---

**Note** Set the 'ShowMarkup' model parameter to 'on' to show markup annotations or 'off' to hide markup annotations.

---

## Font

### FontName — Font name

'auto' (default) | character vector | string scalar

This property affects only plain text annotations.

Font name, specified as a character vector or string scalar. The default value, 'auto', uses the default font specified for annotations in the Font Styles dialog box. To open the Font Styles dialog box, on the **Format** tab, click the **Font Properties** button arrow, then click **Fonts for Model**.

Data Types: char | string

### FontSize — Font size, in points

-1 (default) | numeric scalar

This property affects only plain text annotations.

Font size, in points, specified as a numeric scalar. The default value, -1, uses the default font size for annotations specified in the Font Styles dialog box. To open the Font Styles dialog box, on the **Format** tab, click the **Font Properties** button arrow, then click **Fonts for Model**.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

### FontWeight — Character thickness

'auto' (default) | 'normal' | 'bold' | 'light' | 'demi'

This property affects only plain text annotations.

Character thickness, specified as one of the values listed in the table.

Value	Description
'auto'	The default weight for annotations specified in the Font Styles dialog box. To open the Font Styles dialog box, on the <b>Format</b> tab, click the <b>Font Properties</b> button arrow, then click <b>Fonts for Model</b> .

Value	Description
'normal'	Normal font weight.
'bold'	Bold font weight.
'light'	Not recommended.
'demi'	Not recommended.

#### FontAngle – Angle of annotation font

'auto' (default) | 'normal' | 'italic' | 'oblique'

This property affects only plain text annotations.

Angle of annotation font, specified as one of the values listed in the table.

Value	Description
'auto'	The default font angle specified for annotations in the Font Styles dialog box. To open the Font Styles dialog box, on the <b>Format</b> tab, click the <b>Font Properties</b> button arrow, then click <b>Fonts for Model</b> .
'normal'	Normal font.
'italic'	Italic font.
'oblique'	Oblique font (usually the same as italic font).

#### Colors and Effects

##### BackgroundCoLor – Background color of annotation

'white' (default) | RGB value array | 'automatic' (transparent) | 'black' | 'red' | 'green' | 'blue' | ...

Background color of annotation, specified as one of the values listed in this table.

Value	Description
'automatic'	Transparent
'black'	Black
'white'	White
'red'	Red
'green'	Green
'blue'	Blue
'cyan'	Cyan
'magenta'	Magenta
'yellow'	Yellow
'gray'	Gray
'lightBlue'	Light blue
'orange'	Orange

Value	Description
'darkGreen'	Dark green
RGB value array, specified as '[r,g,b]' where r, g, and b are the red, green, and blue values of the color normalized to the range 0.0 to 1.0.	Fully opaque custom color

Data Types: char | string

### ForegroundColor — Foreground color of annotation

'black' (default) | RGB value array | 'white' | 'red' | 'green' | 'blue' | ...

Foreground color of annotation, specified as one of the values listed in this table.

Value	Description
'black'	Black
'white'	White
'red'	Red
'green'	Green
'blue'	Blue
'cyan'	Cyan
'magenta'	Magenta
'yellow'	Yellow
'gray'	Gray
'lightBlue'	Light blue
'orange'	Orange
'darkGreen'	Dark green
RGB value array, specified as '[r,g,b]' where r, g, and b are the red, green, and blue values of the color normalized to the range 0.0 to 1.0.	Fully opaque custom color

Data Types: char | string

### DropShadow — Option to display drop shadow

'off' (default) | on/off logical value

Option to display drop shadow, specified as 'on' or 'off', or numeric or logical 1 (true) or 0 (false). A value of 'on' is equivalent to true, and 'off' is equivalent to false. Thus, you can use the value of this property as a logical value. The value is stored as an on/off logical value of type OnOffSwitchState.

- 'on' — Display drop shadow.
- 'off' — Do not display drop shadow.

### Size and Position

#### FixedHeight — Option to control annotation height

'off' (default) | on/off logical value

Option to control annotation height, specified as 'on' or 'off', or numeric or logical 1 (true) or 0 (false). A value of 'on' is equivalent to true, and 'off' is equivalent to false. Thus, you can use the value of this property as a logical value. The value is stored as an on/off logical value of type OnOffSwitchState.

- 'on' — The annotation does not resize to accommodate text changes. The visible text may be truncated.
- 'off' — The annotation automatically resizes to accommodate text changes.

Interactively resizing the annotation sets this parameter to 'on'.

### VerticalAlignment — Vertical anchor point of annotation

'top' (default) | 'middle' | 'bottom' | 'cap' | 'baseline'

Vertical anchor point of annotation, specified as one of the values listed in this table.

Value	Description
'top'	The top of the annotation remains fixed as the annotation grows or shrinks.
'middle'	The middle of the annotation remains fixed as the annotation grows or shrinks.
'bottom'	The bottom of the annotation remains fixed as the annotation grows or shrinks.
'cap'	Not recommended.
'baseline'	Not recommended.

### Dependencies

To enable VerticalAlignment, set FixedHeight to 'off'.

### FixedWidth — Option to control annotation width

'off' (default) | on/off logical value

Option to control annotation width, specified as 'on' or 'off', or numeric or logical 1 (true) or 0 (false). A value of 'on' is equivalent to true, and 'off' is equivalent to false. Thus, you can use the value of this property as a logical value. The value is stored as an on/off logical value of type OnOffSwitchState.

- 'on' — The annotation does not resize to accommodate text changes. When text cannot fit inside the annotation bounds, it wraps onto the next line.
- 'off' — The annotation automatically resizes to accommodate text changes.

Interactively resizing the annotation sets this parameter to 'on'.

### HorizontalAlignment — Horizontal alignment of text within annotation

'left' (default) | 'center' | 'right'

Horizontal alignment of text within annotation, specified as one of the values listed in the table.

Value	Result
'left'	Text in the annotation is left justified.

Value	Result
'center'	Text in the annotation is centered.
'right'	Text in the annotation is right justified.

### InternalMargins — Space between bounding box and borders

[0 0 0 0] (default) | 1x4 array

Space between bounding box of text and borders of annotation, specified as a 1x4 array. The array provides the space between the text and each side of the annotation. The elements of the array specify the space at the left, top, right, and bottom sides in order ([left top right bottom]).

Supported coordinates are between -1073740824 and 1073740823, inclusive.

Data Types: double

### Position — Location of annotation

[0 0 28 14] (default) | 1x4 array

Location of annotation, specified as a 1x4 array. The array provides the locations of the annotation sides, in pixels. The elements of the array specify the locations of the left, top, right, and bottom sides in order ([left top right bottom]).

The origin is the upper-left corner of the Simulink Editor canvas before any canvas resizing. Positive values are to the right of and down from the origin. Negative values are to the left of and up from the origin. Supported coordinates are between -1073740824 and 1073740823, inclusive.

### Dependencies

- To programmatically move the location of the right side without moving the left side the same amount, `FixedWidth` must be set to 'on'.
- To programmatically move the location of the bottom side without moving the top side the same amount, `FixedHeight` must be set to 'on'.

Data Types: double

### Metadata

#### Description — Description of annotation

character vector | string scalar

Description of annotation, specified as a character vector or string scalar.

Data Types: char | string

#### Tag — Text tag for annotation

character vector | string scalar

Text tag for annotation, specified as a character vector or string scalar.

Data Types: char | string

#### UserData — Data to associate with annotation

user data

Data to associate with annotation.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `string` | `struct` | `table` | `cell` | `function_handle` | `categorical` | `datetime` | `duration` | `calendarDuration` | `fi`

## Callback Functions

### ClickFcn — MATLAB code that executes when you click annotation

character vector | string scalar

MATLAB code that executes when you click annotation, specified as a character vector or string scalar.

For more information, see “Add Hyperlinks to Annotations”.

### Dependencies

When `UseDisplayTextAsClickCallback` is set to `'on'`, the `ClickFcn` value matches the `Name` and `Text` value.

Data Types: `char` | `string`

### UseDisplayTextAsClickCallback — Option to use text as click function

`'off'` (default) | on/off logical value

Option to use text as click function, specified as `'on'` or `'off'`, or numeric or logical 1 (`true`) or 0 (`false`). A value of `'on'` is equivalent to `true`, and `'off'` is equivalent to `false`. Thus, you can use the value of this property as a logical value. The value is stored as an on/off logical value of type `OnOffSwitchState`.

- `'on'` — Clicking the annotation runs the annotation text specified by `Text`, which is interpreted as a valid MATLAB expression.
- `'off'` — Clicking the annotation runs the function specified by `ClickFcn`, if available. If a click function is not specified, clicking the annotation does not run a function.

For more information, see “Add Hyperlinks to Annotations”.

### LoadFcn — MATLAB code to execute when model containing annotation loads

character vector | string scalar

MATLAB code to execute when model containing annotation is loaded, specified as a character vector or string scalar. For more information, see “Add Hyperlinks to Annotations”.

Data Types: `char` | `string`

### DeleteFcn — MATLAB code to execute before programmatically deleting annotation

character vector | string scalar

MATLAB code to execute before programmatically deleting annotation, specified as a character vector or string scalar.

For more information, see “Add Hyperlinks to Annotations”.

Data Types: `char` | `string`

**Information (Read-Only)****Type — Annotation type**`'annotation'` (default)

This property is read-only.

Annotation type, returned as `'annotation'`.

**AnnotationType — Type of annotation**`'note_annotation' | 'area_annotation' | 'image_annotation'`

This property is read-only.

Type of annotation, specified as `'note_annotation'` for a text-based note, `'area_annotation'` for an area, or `'image_annotation'` for an image.

To programmatically create an area, see “Create Area Programmatically”.

To programmatically create an image-only annotation, see `setImage`.

**IsImage — Check whether annotation is image-only annotation**`'off'` (default) | `'on'`

This property is read-only.

Check whether annotation is an image-only annotation, returned as `'on'` or `'off'`.

**PlainText — Text in annotation**`vector`

This property is read-only.

Text in annotation, without formatting, returned as a vector.

**Handle — Annotation handle**`double`

This property is read-only.

Annotation handle, returned as a double.

**Parent — System that contains annotation**`character vector`

This property is read-only.

System that contains annotation, returned as a character vector.

**Path — Path to annotation**`character vector`

This property is read-only.

Path to annotation, returned as a character vector.

## Object Functions

view	Find annotation
setImage	Specify image to display as annotation
delete	Delete annotation

## Examples

### Create Annotation Programmatically

Programmatically create, modify, and view an annotation.

Open a new model.

```
open_system(new_system)
```

Create an annotation with default properties using the `Simulink.Annotation` function.

```
a = Simulink.Annotation(gcs, 'This is an annotation.');
```

After creating the annotation, use dot notation to set property values. For example, apply an 18-point font and light blue background to the annotation.

```
a.FontSize = 18;
a.BackgroundColor = 'lightBlue';
```

To view and briefly highlight the new annotation, use the `view` function.

```
view(a)
```

### Create Annotation with Custom Properties

Programmatically create an annotation with custom properties.

Open a model.

```
new_system('CreateAnnotationModel')
open_system('CreateAnnotationModel')
```

Create an annotation with custom properties specified as comma-separated pairs consisting of the property and value by using the `Simulink.Annotation` function. For example, apply an 18-point font and light blue background to the annotation.

```
a = Simulink.Annotation('CreateAnnotationModel/This is an annotation.', ...
 'FontSize', 18, 'BackgroundColor', 'lightblue');
```

## Tips

- To programmatically modify an existing annotation, use the `find_system` function to get the annotation handle, then use the `get_param` function to get the object. For example:

```
h = find_system(gcs, 'FindAll', 'on', 'Type', 'annotation');
a1 = get_param(h(1), 'Object');
```

- If an annotation invoked a currently executing callback function, use the `getCallbackAnnotation` to determine which annotation invoked it. The function returns the corresponding `Annotation` object. This function is also useful if you write a callback function in a separate MATLAB file that contains multiple callback calls.

## Alternative Functionality

You also can create annotations using the `add_block` function. For example:

- `add_block('built-in/Note','model/This is a note.', 'BackgroundColor', 'yellow')` creates a note annotation with a yellow background.
- `add_block('built-in/Area','model/This is an Area.', 'Position', [120, 100, 230, 200])` creates an area annotation at the specified position.

To interactively create an annotation and edit its properties, see “Annotate Models”.

## Version History

**Introduced before R2006a**

`add_block` | `getCallbackAnnotation` | `find_system`

### Topics

“Annotate Models”

“Create and Edit Annotations Programmatically”

## delete

**Package:** Simulink

Delete annotation

### Syntax

```
delete(a)
```

### Description

`delete(a)` deletes the specified annotation.

### Examples

#### Delete Annotation

Programmatically delete an annotation.

Open the vdp model.

```
vdp
```

To get the handles for the annotations in the model, use the `find_system` function.

```
h = find_system(gcs, 'FindAll', 'on', 'Type', 'annotation');
```

To identify the annotations, query the text inside the annotations.

```
get_param(h, 'PlainText')

ans = 2x1 cell
 {'Copyright 2004-2020 The MathWorks, Inc.'}
 {'van der Pol Equation'}
```

To delete the title of the model ('van der Pol Equation'), get the `Simulink.Annotation` object that corresponds to the second handle.

```
a = get_param(h(2), 'Object');
```

Delete the annotation from the model.

```
delete(a)
```

### Input Arguments

#### **a** — Annotation

`Simulink.Annotation` object

Annotation, specified as a `Simulink.Annotation` object.

## **Version History**

## setImage

**Package:** Simulink

Specify image to display as annotation

### Syntax

```
setImage(a, img)
```

### Description

`setImage(a, img)` changes the annotation to display only the specified image.

### Examples

#### Add Image to Model

Add an image to your model, such as a logo, by creating an image-only annotation.

Open a new model and create an annotation in it.

```
open_system(new_system)
a = Simulink.Annotation(gcs, 'This is an annotation.');
```

Change the annotation to display only the specified image.

```
img = fullfile(matlabroot, 'toolbox', 'matlab', 'imagesci', 'peppers.png');
setImage(a, img)
```

### Input Arguments

#### **a** — Annotation

Simulink.Annotation object

Annotation, specified as a Simulink.Annotation object.

#### **img** — Image filename

character vector | string scalar

Image filename, specified as a character vector or string scalar. The filename must contain the file extension and can include a partial path, complete path, relative path, or no path.

Data Types: char | string

## Simulink.BlockPath

Fully specified Simulink block path

### Description

A `Simulink.BlockPath` object represents a fully specified block path that uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times.

### Creation

Use either the `Simulink.BlockPath` or `gcbp` function to create a `Simulink.BlockPath` object. To get a `Simulink.BlockPath` object for the most recently clicked or loaded block, use the `gcbp` function.

### Syntax

```
bp = Simulink.BlockPath
bp = Simulink.BlockPath(blockpath)
bp = Simulink.BlockPath(paths)
bp = Simulink.BlockPath(paths, subpath)
```

#### Description

`bp = Simulink.BlockPath` creates an empty `BlockPath` object.

`bp = Simulink.BlockPath(blockpath)` creates a copy of the specified `BlockPath` object.

`bp = Simulink.BlockPath(paths)` creates a `BlockPath` object from the specified character vector or cell array of character vectors. Each character vector represents a path at a level of the model hierarchy. Simulink builds the full block path based on the character vectors.

`bp = Simulink.BlockPath(paths, subpath)` additionally specifies an individual component of the block, such as a signal, that you specify with the `subpath` argument.

#### Input Arguments

##### **blockpath** — Existing `BlockPath` object

`BlockPath` object

Existing `BlockPath` object that you want to copy, specified as a `BlockPath` object.

##### **paths** — Paths used to build block path

character vector | cell array of character vectors

Paths used to build the block path, specified as a character vector or cell array of character vectors.

Specify each character vector in order, from the top model to the specific block for which you are creating a `BlockPath` object.

Each character vector must be a path to a block within the Simulink model. The block must be:

- A block in a single model
- A Model block (except for the last character vector, which may be a block other than a Model block)
- A block in the model referenced by the Model block that the previous character vector specifies

### subpath — Individual component of block

character vector

Individual component of a block, such as a signal, specified as a character vector.

## Properties

### SubPath — Component of block

' ' (default) | character vector

Component of the block, specified as a character vector that provides the block path. For example, if the block path refers to a Stateflow chart, you can use `SubPath` to indicate the chart signals.

Example: `'gear_state.first'`

Data Types: `char`

## Object Functions

<code>convertToCell</code>	Convert block path to cell array of character vectors
<code>getBlock</code>	Get single block path in model reference hierarchy
<code>getLength</code>	Get number of hierarchy levels in block path
<code>open</code>	Open specified model, library, subsystem, or block
<code>validate</code>	Determine whether block path represents valid block hierarchy

## Examples

### Create Simulink.BlockPath Object Using Cell Array

Create a block path object called `bp2`, using a cell array of character vectors representing elements of the block path.

```
sldemo_mdref_depgraph
bp2 = Simulink.BlockPath({'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/Fahrenheit to Celsius', ...
'sldemo_mdref_F2C/Gain1'})
```

`bp2 =`

```
Simulink.BlockPath
Package: Simulink
```

```
Block Path:
sldemo_mdref_depgraph/thermostat
sldemo_mdref_heater/Fahrenheit to Celsius
sldemo_mdref_F2C/Gain1
```

The resulting block path reflects the model reference hierarchy for the block path.

## **Version History**

**Introduced in R2010b**

#### **Functions**

`gcbp`

# convertToCell

**Package:** Simulink

Convert block path to cell array of character vectors

## Syntax

```
cellarray = convertToCell(bp)
```

## Description

`cellarray = convertToCell(bp)` converts a block path to a cell array of character vectors.

## Examples

### Create Cell Array that Represents Block Path

Open the example model, which references multiple models.

```
sldemo_mdref_depgraph
```

Create a `Simulink.BlockPath` object.

```
bp = Simulink.BlockPath({'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/Fahrenheit to Celsius', ...
'sldemo_mdref_F2C/Gain1'});
```

Create a cell array that represents the elements of the block path.

```
cellarray = convertToCell(bp)
```

```
cellarray =
```

```
3x1 cell array
```

```
 {'sldemo_mdref_depgraph/thermostat' }
 {'sldemo_mdref_heater/Fahrenheit to Celsius'}
 {'sldemo_mdref_F2C/Gain1' }
```

## Input Arguments

### bp — Fully specified block path

`Simulink.BlockPath` object

Fully specified block path, specified as a `Simulink.BlockPath` object. This block path uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times.

## **Output Arguments**

### **cellarray — Block path elements**

cell array of character vectors

Block path elements, returned as a cell array of character vectors.

## **Version History**

**Introduced in R2010b**

## **See Also**

### **Objects**

Simulink.BlockPath

### **Functions**

getBlock | getLength | open | validate

# getBlock

**Package:** Simulink

Get single block path in model reference hierarchy

## Syntax

```
block = getBlock(bp,index)
```

## Description

`block = getBlock(bp,index)` returns the block path of the block at the level of the model reference hierarchy specified by the `index` argument.

## Examples

### Get Block Path for Specified Model Hierarchy Level

Open the example model, which references multiple models.

```
sldemo_mdhref_depgraph
```

Create a `Simulink.BlockPath` object.

```
bp = Simulink.BlockPath({'sldemo_mdhref_depgraph/thermostat', ...
'sldemo_mdhref_heater/Fahrenheit to Celsius', ...
'sldemo_mdhref_F2C/Gain1'});
```

Get the block for the second level in the model reference hierarchy.

```
blockpath = getBlock(bp,2)
```

```
blockpath =
```

```
 'sldemo_mdhref_heater/Fahrenheit to Celsius'
```

Get the block for the third level in the model reference hierarchy.

```
blockpath = getBlock(bp,3)
```

```
blockpath =
```

```
 'sldemo_mdhref_F2C/Gain1'
```

## Input Arguments

**bp** — Fully specified block path

`Simulink.BlockPath` object

Fully specified block path, specified as a `Simulink.BlockPath` object. This block path uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times.

**index — Index of block**

integer

Index of the block for which you want to get the block path, specified as an integer. The index reflects the level in the model reference hierarchy. For example:

- An index of 1 represents a block in the top model.
- An index of 2 represents a block in the model that is referenced by the Model block of index 1.
- An index of n represents a block in the model that is referenced by the Model block of index n - 1.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

**Output Arguments****block — Block path of block**

character vector

Block path of the block at the level of the model reference hierarchy specified by the `index` argument, returned as a character vector.

**Version History**

**Introduced in R2010b**

**See Also****Objects**

`Simulink.BlockPath`

**Functions**

`convertToCell` | `getLength` | `open` | `validate`

# getLength

**Package:** Simulink

Get number of hierarchy levels in block path

## Syntax

```
length = getLength(bp)
```

## Description

`length = getLength(bp)` returns a numeric value that corresponds to the number of levels in the model reference hierarchy for the block path.

## Examples

### Get Number of Hierarchy Levels in Block Path

Create a `Simulink.BlockPath` object that represents a referenced model within a model hierarchy.

```
load_system('sldemo_mdhref_depgraph')
bp = Simulink.BlockPath({'sldemo_mdhref_depgraph/thermostat', ...
'sldemo_mdhref_heater/Fahrenheit to Celsius'});
```

Get the number of hierarchy levels in the block path for the `Simulink.BlockPath` object.

```
length = getLength(bp)
```

```
length =
```

```
2
```

## Input Arguments

### **bp** — Fully specified block path

`Simulink.BlockPath` object

Fully specified block path, specified as a `Simulink.BlockPath` object. This block path uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times.

## Output Arguments

### **length** — Length of block path

integer

Length of the block path, returned as an integer. The length is the number of levels in the model reference hierarchy.

## **Version History**

**Introduced in R2010b**

### **See Also**

#### **Objects**

Simulink.BlockPath

#### **Functions**

convertToCell | getBlock | open | validate

# open

**Package:** Simulink

Open specified model, library, subsystem, or block

## Syntax

```
open(bp)
open(bp, Name, Value)
```

## Description

`open(bp)` opens the specified model, library, subsystem, or block. This is equivalent to double-clicking the model or library in the Current Folder browser or the subsystem or block in the Simulink Editor.

`open(bp, Name, Value)` opens the specified model, library, subsystem, or block with additional options.

## Examples

### Open Referenced Model in Context of Model Hierarchy

Create a `Simulink.BlockPath` object that represents a referenced model within a model hierarchy.

```
load_system('sldemo_mdhref_depgraph')
bp = Simulink.BlockPath({'sldemo_mdhref_depgraph/thermostat', ...
 'sldemo_mdhref_heater/Fahrenheit to Celsius'});
```

Open the referenced model specified by `bp` in the context of the model hierarchy.

```
open(bp)
```

### Open Referenced Model in New Window

Open the `sldemo_mdhref_depgraph` model.

```
sldemo_mdhref_depgraph
```

Create a `Simulink.BlockPath` object that represents a referenced model within a model hierarchy.

```
bp = Simulink.BlockPath({'sldemo_mdhref_depgraph/thermostat', ...
 'sldemo_mdhref_heater/Fahrenheit to Celsius'})
```

Open the referenced model specified by `bp` in a new window.

```
open(bp, 'OpenType', 'new-window')
```

## Input Arguments

### bp — Fully specified block path

Simulink.BlockPath object

Fully specified block path, specified as a Simulink.BlockPath object. This block path uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times.

### Name-Value Pair Arguments

Specify optional pairs of arguments as Name1=Value1, ..., NameN=ValueN, where Name is the argument name and Value is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `open(bp, 'OpenType', 'new-window')`

### OpenType — Option to open object in new tab or window

'current-tab' (default) | 'new-tab' | 'new-window'

Option to open object in a new tab or window, specified as the comma-separated pair consisting of 'OpenType' and 'current-tab', 'new-tab', or 'new-window'. This option determines whether the subsystem or model specified by a Simulink.BlockPath object opens in the current window and tab, a new tab, or a new window, respectively.

Data Types: char | string

### Force — Option to open object under block mask

'off' (default) | 'on'

Option to open the object under the block mask, specified as the comma-separated pair consisting of 'Force' and 'off' or 'on'. When this argument is set to 'off', the function opens the block mask. When this argument is set to 'on', the function opens the dialog box of the block under the mask or opens the masked system in a new tab, which is equivalent to the **Look Under Mask** menu item. It forces the Simulink.BlockPath object to open, regardless of the block mask.

Data Types: char | string

## Version History

Introduced in R2019a

## See Also

### Objects

Simulink.BlockPath

### Functions

open\_system | validate

# validate

**Package:** Simulink

Determine whether block path represents valid block hierarchy

## Syntax

```
validate(bp)
```

## Description

`validate(bp)` determines whether the block path represents a valid block hierarchy. If the block path is invalid, the function returns an error. The function checks that:

- All elements in the block path represent valid blocks
- Each element except the last is a valid Model block and references the model of the following element

## Examples

### Validate Block Path

Create a `Simulink.BlockPath` object that incorrectly represents a referenced model within a model hierarchy.

```
load_system('sldemo_mdref_depgraph')
bp = Simulink.BlockPath({'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/F2C'});
```

Check whether the block path is valid.

```
validate(bp);
```

The function returns an error because the block path is invalid. It does not specify the name of a block in the `sldemo_mdref_heater` model.

Create a `Simulink.BlockPath` object that correctly represents the referenced model within a model hierarchy.

```
bp = Simulink.BlockPath({'sldemo_mdref_depgraph/thermostat', ...
'sldemo_mdref_heater/Fahrenheit to Celsius'});
```

Check whether the block path is valid.

```
validate(bp);
```

The block path is valid, so the function does not return an error.

## Input Arguments

### **bp — Fully specified block path**

`Simulink.BlockPath` object

Fully specified block path, specified as a `Simulink.BlockPath` object. This block path uniquely identifies a block within a model hierarchy, even when the model hierarchy references the same model multiple times.

## Version History

**Introduced in R2010b**

# Simulink.Bus

Specify properties of buses

## Description

A `Simulink.Bus` object, when used with `Simulink.BusElement` objects, specifies and validates the properties of a bus and its elements. When you simulate or update a model, the software checks whether buses connected to blocks match the `Simulink.Bus` objects that the blocks specify.

A bus object specifies only the architectural properties of a bus. For example, a bus object can specify element names, hierarchy, order, and data types. A bus object is analogous to a struct in C code because it defines the members of the bus but does not create the bus. A bus object is also similar to a cable connector. The connector defines all the pins and their configuration and controls what types of wires can be connected to it. Similarly, a bus object defines the configuration and properties of the signals that the associated bus must have.

`Simulink.Bus` objects contain `Simulink.BusElement` objects. Each bus element object specifies the properties of a signal in a bus, such as its name, data type, and dimension. The order of the bus element objects in the bus object defines the order of the signals in the bus.

A bus object can specify properties that were not defined by constituent signals, but were left to be inherited.

To create and modify bus objects in the base workspace or a data dictionary, you can use the **Type Editor**, **Model Explorer**, or MATLAB commands. You cannot store `Simulink.Bus` objects in model workspaces.

To use `Simulink.Bus` objects in a model, see “Specify Bus Properties with Simulink.Bus Object Data Types”.

## Creation

You can create a `Simulink.Bus` object in multiple ways.

- To interactively create a `Simulink.Bus` object, use the **Type Editor** or **Model Explorer**.
- To programmatically create a `Simulink.Bus` object with default properties, use the `Simulink.Bus` function described below.
- To programmatically create `Simulink.Bus` objects from blocks in a model, MATLAB data, and external C code, see “Programmatically Create Simulink Bus Objects”.

## Syntax

```
name = Simulink.Bus
```

### Description

`name = Simulink.Bus` returns a `Simulink.Bus` object with default property values. The name of the object is the name of the MATLAB variable to which you assign the object.

## Properties

### Description — Bus description

' ' (default) | character vector | string scalar

Bus description, specified as a character vector or string scalar. Use the description to document information about the object, such as the kind of signal it applies to or where the object is used. This information does not affect Simulink processing.

Data Types: char | string

### Elements — Elements of bus

empty array (default) | array of `Simulink.BusElement` objects

Elements of bus, specified as an array of `Simulink.BusElement` objects. Each bus element object defines the name, data type, dimensions, and other properties of a signal within the bus. For more information, see `Simulink.BusElement`.

### DataScope — Data type definition mode in generated code

'Auto' (default) | 'Exported' | 'Imported'

Data type definition mode in generated code, specified as 'Auto', 'Exported', or 'Imported'. This property specifies whether during code generation the data type definition is imported from, or exported to, the header file specified with the `HeaderFile` property.

Value	Action
'Auto' (default)	Import the data type definition from the specified header file. If you do not specify the header file, export the data type definition to the default header file.
'Exported'	Export the data type definition to the specified header file or default header file.
'Imported'	Import the data type definition from the specified header file or default header file.

---

**Note** To import enum or struct types that are not declared with a typedef statement:

- Include (`#include`) the header file containing the declaration in the **Simulation Target** configuration parameters.
  - Ensure that **Import custom code** in the **Simulation Target** configuration parameters is selected. This parameter is selected by default.
- 

To avoid potential MISRA C:2012 violations, set the data scope to `Imported` or `Exported`.

Data Types: char | string

### HeaderFile — C header file used with data type definition

' ' (default) | character vector | string scalar

C header file used with data type definition, specified as a character vector or string scalar. Based on the value of the `DataScope` property, import the data type definition from or export the data type

definition to the header file. The Simulink Coder software uses this property for code generation. Simulink software ignores this property.

By default, the generated `#include` directive uses the preprocessor delimiter `"` instead of `<` and `>`. To generate the directive `#include <myTypes.h>`, specify `HeaderFile` as `<myTypes.h>`.

Data Types: `char` | `string`

### Alignment – Data alignment boundary

`-1` (default) | integer

Data alignment boundary, specified as an integer, in number of bytes. The Simulink Coder software uses this property for code generation. Simulink software ignores this property.

The starting memory address for the data allocated for the bus is a multiple of the `Alignment` setting. If the object occurs in a context that requires alignment, you must specify an `Alignment` value with a positive integer that is a power of 2, not exceeding 128.

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64`

### PreserveElementDimensions – Specification to preserve dimensions of multidimensional bus elements

`'false'` (default) | `'true'`

Specification for the code generator to preserve dimensions of multidimensional bus elements in the generated code, specified as `'false'` or `'true'`. For more information, see “Preserve Dimensions of Bus Elements in Generated Code” (Embedded Coder).

Data Types: `logical`

## Object Functions

`getNumLeafBusElements`    Number of leaf elements in `Simulink.Bus` object  
`getLeafBusElements`        Leaf elements in `Simulink.Bus` object

## Examples

### Create Bus Objects from Bus Element Objects

Create a hierarchy of `Simulink.Bus` objects using arrays of `Simulink.BusElement` objects.

Create an array that contains two `BusElement` objects, named `Chirp` and `Sine`, in the base workspace.

```
elems(1) = Simulink.BusElement;
elems(1).Name = 'Chirp';

elems(2) = Simulink.BusElement;
elems(2).Name = 'Sine';
```

Array indexing lets you create and access the elements of the array. Dot notation lets you access property values of the elements.

Create a `Bus` object, named `Sinusoidal`, that contains the elements defined in the `elems` array.

```
Sinusoidal = Simulink.Bus;
Sinusoidal.Elements = elems;
```

To create a hierarchy of Bus objects, create another Bus object to reference the Bus object named `Sinusoidal`.

Create an array that contains two `BusElement` objects, named `NestedBus` and `Step`. Specify the Bus object named `Sinusoidal` as the data type of the `NestedBus` element.

```
clear elems

elems(1) = Simulink.BusElement;
elems(1).Name = 'NestedBus';
elems(1).DataType = 'Bus: Sinusoidal';

elems(2) = Simulink.BusElement;
elems(2).Name = 'Step';
```

Create a Bus object, named `TopBus`, that contains the elements defined in the `elems` array.

```
TopBus = Simulink.Bus;
TopBus.Elements = elems;
```

You can view the hierarchy of the created objects in the **Type Editor**.

```
typeeditor
```

### Inspect Bus Objects Programmatically

While the Type Editor lets you inspect a hierarchy of `Simulink.Bus` objects interactively, you can also inspect the objects programmatically.

Open the example. Then, load the bus objects by running the function named `busObjectDefinition`.

```
busObjectDefinition
```

Two bus objects appear in the base workspace.

### Inspect Top-Level Bus Object

Inspect the top-level bus object, which is named `TopBus`.

```
TopBus
```

```
TopBus =
 Bus with properties:

 Description: ''
 DataScope: 'Auto'
 HeaderFile: ''
 Alignment: -1
 PreserveElementDimensions: 0
 Elements: [2x1 Simulink.BusElement]
```

Based on the value of the `Elements` property, `TopBus` contains two `Simulink.BusElement` objects.

Inspect the elements of `TopBus`.

`TopBus.Elements(1)`

```
ans =
 BusElement with properties:

 Name: 'NestedBus'
 Complexity: 'real'
 Dimensions: 1
 DataType: 'Bus: Sinusoidal'
 Min: []
 Max: []
 DimensionsMode: 'Fixed'
 Unit: ''
 Description: ''
```

Based on the value of the `DataType` property, the first element represents a nested bus object named `Sinusoidal`.

`TopBus.Elements(2)`

```
ans =
 BusElement with properties:

 Name: 'Step'
 Complexity: 'real'
 Dimensions: 1
 DataType: 'double'
 Min: []
 Max: []
 DimensionsMode: 'Fixed'
 Unit: ''
 Description: ''
```

Based on the values of the `Name` and `DataType` properties, the second element represents a signal named `Step`.

### Inspect Nested Bus Object

Inspect the elements of the nested `Simulink.Bus` object named `Sinusoidal`.

`Sinusoidal`

```
Sinusoidal =
 Bus with properties:

 Description: ''
 DataScope: 'Auto'
 HeaderFile: ''
 Alignment: -1
 PreserveElementDimensions: 0
 Elements: [2x1 Simulink.BusElement]
```

Based on the value of the `Elements` property, `Sinusoidal` contains two `Simulink.BusElement` objects.

Inspect the elements of `Sinusoidal`.

```
Sinusoidal.Elements(1)
```

```
ans =
 BusElement with properties:

 Name: 'Chirp'
 Complexity: 'real'
 Dimensions: 1
 DataType: 'double'
 Min: []
 Max: []
 DimensionsMode: 'Fixed'
 Unit: ''
 Description: ''
```

```
Sinusoidal.Elements(2)
```

```
ans =
 BusElement with properties:

 Name: 'Sine'
 Complexity: 'real'
 Dimensions: 1
 DataType: 'double'
 Min: []
 Max: []
 DimensionsMode: 'Fixed'
 Unit: ''
 Description: ''
```

Based on the values of the `Name` and `DataType` properties, the elements represent two signals: `Chirp` and `Sine`.

### Inspect Leaf Elements of Bus Objects

To directly inspect the leaf elements of a bus object, use the `getNumLeafBusElements` and `getLeafBusElements` object functions.

To get the number of leaf elements in `TopBus`, use the `getNumLeafBusElements` object function.

```
num = getNumLeafBusElements(TopBus)

num = 3
```

To get information about the leaf elements in `TopBus`, use the `getLeafBusElements` object function. For example, inspect the first element of `TopBus`.

```
leaf = getLeafBusElements(TopBus);
leaf(1)

ans =
 BusElement with properties:
```

```
Name: 'Chirp'
Complexity: 'real'
Dimensions: 1
 DataType: 'double'
 Min: []
 Max: []
DimensionsMode: 'Fixed'
 Unit: ''
Description: ''
```

## getLeafBusElements

**Package:** Simulink

Leaf elements in Simulink.Bus object

### Syntax

```
getLeafBusElements(busObj)
```

### Description

`getLeafBusElements(busObj)` returns the leaf elements in the specified `Simulink.Bus` object.

A leaf element of a bus object is any element of the bus object that is not defined by another bus object. For example, a signal or message can be a leaf element of a bus object.

### Examples

#### Get Information about Leaf Elements in Bus Object

Any element that is not defined by a bus object is a leaf element. For example, signals can be leaf elements of a bus object.

Load a bus object into the base workspace by running the function named `busObjectDefinition`.

```
busObjectDefinition
```

The top-level bus object, named `TopBus`, defines a signal named `Step` and a nested bus object. The nested bus object defines two signals: `Chirp` and `Sine`.

Get information about the leaf elements in `TopBus`.

```
leaf = getLeafBusElements(TopBus)
```

```
leaf =
 3x1 BusElement array with properties:
```

```
 Min
 Max
 DimensionsMode
 Description
 Unit
 Name
 DataType
 Complexity
 Dimensions
```

Get the properties of a leaf element.

```
leaf(1)
```

```
ans =
 BusElement with properties:

 Name: 'Chirp'
 Complexity: 'real'
 Dimensions: 1
 DataType: 'double'
 Min: []
 Max: []
 DimensionsMode: 'Fixed'
 Unit: ''
 Description: ''
```

## Input Arguments

### **busObj** — Bus definition

`Simulink.Bus` object

Bus definition, specified as a `Simulink.Bus` object. The top-level bus object and each nested bus object must be in the base workspace.

## Tips

Use the `getLeafBusElements` function to determine the data type, complexity, and dimensions of MATLAB timeseries objects needed to create a structure of timeseries objects from a bus.

## Version History

**Introduced in R2010b**

“Load Bus Data to Root-Level Input Ports”

## getNumLeafBusElements

**Package:** Simulink

Number of leaf elements in Simulink.Bus object

### Syntax

```
getNumLeafBusElements(busObj)
```

### Description

`getNumLeafBusElements(busObj)` returns the number of leaf elements in the specified Simulink.Bus object.

A leaf element of a bus object is any element of the bus object that is not defined by another bus object. For example, a signal or message can be a leaf element of a bus object.

### Examples

#### Get Number of Leaf Elements in Bus Object

Load a bus object into the base workspace by running the function named `busObjectDefinition`.

```
busObjectDefinition
```

The top-level bus object, named `TopBus`, defines a signal named `Step` and a nested bus object. The nested bus object defines two signals: `Chirp` and `Sine`.

Get the number of leaf elements in `TopBus`.

```
num = getNumLeafBusElements(TopBus)
```

```
num = 3
```

`TopBus` has three leaf elements: `Step`, `Chirp`, and `Sine`.

### Input Arguments

#### **busObj** — Bus definition

Simulink.Bus object

Bus definition, specified as a Simulink.Bus object. The top-level bus object and each nested bus object must be in the base workspace.

### Tips

Use the `getNumLeafBusElements` function to determine the number of MATLAB timeseries objects needed to create a structure of timeseries objects from a bus.

# Simulink.BusElement

Specify properties of elements of buses

## Description

A `Simulink.BusElement` object is an element of a `Simulink.Bus` object that validates the properties of an element in a bus. When you simulate or update a model, the software checks whether the properties specified by the object match the properties specified by the corresponding bus elements.

You can specify a bus object, but not a bus element object, as a data type.

To create and modify `Simulink.Bus` and `Simulink.BusElement` objects in the base workspace or a data dictionary, you can use the **Type Editor**, **Model Explorer**, or MATLAB commands. You cannot store Bus objects in model workspaces.

## Creation

You can create a `Simulink.BusElement` object in multiple ways.

- To interactively create a `Simulink.BusElement` object, use the **Type Editor** or **Model Explorer**.
- To programmatically create a default `Simulink.BusElement` object, use the `Simulink.BusElement` function (described here).
- To programmatically create `Simulink.BusElement` objects from blocks in a model, MATLAB data, and external C code, see “Programmatically Create Simulink Bus Objects”.

## Syntax

```
be = Simulink.BusElement
```

### Description

`be = Simulink.BusElement` returns a bus element object with default property values.

## Properties

### Name — Name of element

'a' (default) | character vector

Name of element, specified as a character vector.

To validate the properties of a signal against a `Simulink.BusElement` object, the signal name must be a valid identifier that starts with an alphabetic character or underscore (`_`), followed by alphanumeric characters or underscores.

Data Types: `char` | `string`

**Complexity — Numeric type of element**

'real' (default) | 'complex'

Numeric type of the element, specified as 'real' or 'complex'.

**Dependencies**

The software ignores the value of this property when `DataType` specifies a `Simulink.ValueType` or `Simulink.Bus` object. The software uses the complexity specified by the `Simulink.ValueType` object or the `Simulink.BusElement` objects in the `Simulink.Bus` object instead.

Data Types: char | string

**Dimensions — Dimensions of element**

1 (default) | scalar | vector

Dimensions of element, specified as a scalar or vector.

To use symbolic dimensions in generated code, see “Implement Symbolic Dimensions for Array Sizes in Generated Code” (Embedded Coder).

**Dependencies**

The software ignores the value of this property when `DataType` specifies a `Simulink.ValueType` object. The software uses the dimensions specified by the `Simulink.ValueType` object instead.

Data Types: double

**DataType — Data type of element**

'double' (default) | character vector | string scalar

Data type of element, specified as a character vector or string scalar.

The **Data Type Assistant** helps you set data attributes. To use the **Data Type Assistant**, click **Show**

**data type assistant** . For more information, see “Specify Data Types Using Data Type Assistant”.

You can specify any of these options:

- Built-in Simulink data type — For example, specify 'single' or 'uint8'. See “Data Types Supported by Simulink”.
- Fixed-point data type — Use the `fixdt` function. For example, specify 'fixdt(1,16,0)'.
- Enumerated data type — Use the name of the type preceded by `Enum:`. For example, specify 'Enum: myEnumType'.
- Bus data type — Use the name of the `Simulink.Bus` object preceded by `Bus:`. For example, specify 'Bus: myBusObject'.
- Value type — Use the name of the `Simulink.ValueType` object preceded by `ValueType:`. For example, specify 'ValueType: windVelocity'.
- Custom data type — Use a MATLAB expression that specifies the type. For example, you can specify a `Simulink.NumericType` object whose `DataTypeMode` property is set to a value other than 'Fixed-point: unspecified scaling'.

Specifying a `Simulink.Bus` object allows you to create Bus objects that specify hierarchical buses, that is, buses that contain other buses.

When you specify a `Simulink.ValueType` or `Simulink.Bus` object as the data type, some properties of the `Simulink.BusElement` object are ignored. For example, the `Min`, `Max`, and `Unit` properties of the `Simulink.BusElement` object are ignored. The software uses the corresponding properties of the `Simulink.ValueType` object or `Simulink.BusElement` objects in the `Simulink.Bus` object instead.

Data Types: `char` | `string`

### **Min — Minimum value of element**

`[]` (default) | scalar

Minimum value of the element, specified as a scalar. This value must be a finite real double scalar or, if the element is a bus, the value must be empty, `[]`.

#### **Dependencies**

The software ignores the value of this property when `DataType` specifies a `Simulink.ValueType` or `Simulink.Bus` object. The software uses the minimum values specified by the `Simulink.ValueType` object or the `Simulink.BusElement` objects in the `Simulink.Bus` object instead.

Data Types: `double`

### **Max — Maximum value of element**

`[]` (default) | scalar

Maximum value of the element, specified as a scalar. This value must be a finite real double scalar or, if the element is a bus, the value must be empty, `[]`.

#### **Dependencies**

The software ignores the value of this property when `DataType` specifies a `Simulink.ValueType` or `Simulink.Bus` object. The software uses the maximum values specified by the `Simulink.ValueType` object or the `Simulink.BusElement` objects in the `Simulink.Bus` object instead.

Data Types: `double`

### **DimensionsMode — Specify how to handle size of element**

`'Fixed'` (default) | `'Variable'`

Specify how to handle size of element, specified as `'Fixed'` or `'Variable'`.

#### **Dependencies**

The software ignores the value of this property when `DataType` specifies a `Simulink.ValueType` or `Simulink.Bus` object. The software uses the dimensions modes specified by the `Simulink.ValueType` object or the `Simulink.BusElement` objects in the `Simulink.Bus` object instead.

Data Types: `char` | `string`

### **Unit — Physical unit for expressing element**

`' '` (default) | character vector

Physical unit for expressing element, specified as a character vector.

For more information, see “Unit Specification in Simulink Models”.

Example: 'inches'

### Dependencies

The software ignores the value of this property when `DataType` specifies a `Simulink.ValueType` or `Simulink.Bus` object. The software uses the units specified by the `Simulink.ValueType` object or the `Simulink.BusElement` objects in the `Simulink.Bus` object instead.

Data Types: `char` | `string`

### Description — Bus element description

' ' (default) | character vector

Bus element description, specified as a character vector. Use the description to document information about the `BusElement` object, such as the kind of signal it applies to. This information does not affect Simulink processing.

### Dependencies

The software ignores the value of this property when `DataType` specifies a `Simulink.ValueType` object. The software uses the description of the `Simulink.ValueType` object instead.

Data Types: `char` | `string`

## Examples

### Create Bus Objects from Bus Element Objects

Create a hierarchy of `Simulink.Bus` objects using arrays of `Simulink.BusElement` objects.

Create an array that contains two `BusElement` objects, named `Chirp` and `Sine`, in the base workspace.

```
elems(1) = Simulink.BusElement;
elems(1).Name = 'Chirp';

elems(2) = Simulink.BusElement;
elems(2).Name = 'Sine';
```

Array indexing lets you create and access the elements of the array. Dot notation lets you access property values of the elements.

Create a `Bus` object, named `Sinusoidal`, that contains the elements defined in the `elems` array.

```
Sinusoidal = Simulink.Bus;
Sinusoidal.Elements = elems;
```

To create a hierarchy of `Bus` objects, create another `Bus` object to reference the `Bus` object named `Sinusoidal`.

Create an array that contains two `BusElement` objects, named `NestedBus` and `Step`. Specify the `Bus` object named `Sinusoidal` as the data type of the `NestedBus` element.

```
clear elems

elems(1) = Simulink.BusElement;
```

```
elems(1).Name = 'NestedBus';
elems(1).DataType = 'Bus: Sinusoidal';

elems(2) = Simulink.BusElement;
elems(2).Name = 'Step';
```

Create a Bus object, named `TopBus`, that contains the elements defined in the `elems` array.

```
TopBus = Simulink.Bus;
TopBus.Elements = elems;
```

You can view the hierarchy of the created objects in the **Type Editor**.

typeeditor

## Version History

### Introduced before R2006a

#### **R2020b: Simulink.BusElement objects no longer support the SampleTime property**

*Errors starting in R2020b*

The `SampleTime` property of `Simulink.BusElement` objects is no longer supported.

`BusElement` objects that specify a sample time cause an error during compile. To remove the sample time specification from a `BusElement` object, set its `SampleTime` to `-1`.

`Simulink.Bus.cellToObject` continues to accept cell arrays that specify sample time for bus elements. `Simulink.Bus.objectToCell`, `Simulink.Bus.save`, and `Simulink.Bus.createObject` continue to return cell arrays or arrays that include the sample time when it is noninherited. When the sample time is inherited (`-1`), they omit it. Similarly, the **Type Editor** and **Model Explorer** omit the sample time when it is inherited.

To specify the sample time for an element of a bus, use the `SampleTime` block parameter of corresponding blocks. For example, you can use `In Bus Element`, `Out Bus Element`, and `Signal Specification` blocks to specify sample time.

#### **R2016b: Simulink.BusElement objects will no longer support the SamplingMode property**

*Not recommended starting in R2016b*

In R2016b, the `SamplingMode` property of `Simulink.BusElement` objects was removed. Scripts that use the `SamplingMode` property of `Simulink.BusElement` objects continue to work. `Simulink.Bus.cellToObject` continues to require the `SamplingMode` field and `Simulink.Bus.objectToCell` continues to include the sampling mode in the output cell arrays.

In a future release, support for the `SamplingMode` property will be removed.

To specify whether a signal is sample-based or frame-based, define the sampling mode of input signals at the block level instead of at the signal level.

## Simulink.CoderInfo

Specify information needed to generate code for signal, state, or parameter data

### Description

Use a `Simulink.CoderInfo` object to specify code generation settings for signal, state, and parameter data in a model.

The software creates a `Simulink.CoderInfo` object for each data object that you create. Data objects represent signal, state, or parameter data. The `Simulink.CoderInfo` object exists in the `CoderInfo` property of each data object.

Data objects include objects of these classes:

- `Simulink.Parameter`
- `Simulink.Signal`
- `Simulink.LookupTable`
- `Simulink.Breakpoint`
- `Simulink.DualScaledParameter`

Use the properties of the `Simulink.CoderInfo` object to configure the representation of the parent data object in the generated code.

You can set the properties of a `Simulink.CoderInfo` object through the `CoderInfo` property or the property dialog box of the parent data object. For example, the following MATLAB expression sets the `StorageClass` property of a `Simulink.CoderInfo` object used by a signal object named `mysignal`.

```
mysignal.CoderInfo.StorageClass = 'ExportedGlobal';
```

### Creation

When you create a data object, the software sets the value of the `CoderInfo` property by creating a `Simulink.CoderInfo` object. You do not need to create a `Simulink.CoderInfo` object explicitly.

### Properties

#### Identifier — Alternative name for code generation

`''` (empty character vector) (default) | character vector

Alternative name for the data in the generated code, specified as a character vector.

Example: `'myOtherName'`

Data Types: `char`

#### Alignment — Data alignment boundary

`-1` (default) | positive integer

Data alignment boundary for this data, specified as a positive integer that is a power of 2, not exceeding 128. Specify an integer number of double data type. See “Data Alignment for Code Replacement” (Embedded Coder) for more information.

Example: 8

Data Types: double

Complex Number Support: Yes

### **CustomAttributes — Custom storage class attributes of this data**

SimulinkCSC.AttribClass\_Simulink\_Default object (default) | custom attributes object

Custom storage class attributes of this data, returned as a custom attributes object. You must set the property `StorageClass` to 'Custom' to enable this property.

Depending on the custom storage class that you apply by using the `CustomStorageClass` property of the `Simulink.CoderInfo` object, Simulink sets the value of this property by creating a custom attributes object. Then, you can set the values of the properties of the custom attributes object. See “Organize Parameter Data into a Structure by Using Struct Storage Class” (Embedded Coder) for more information.

### **CustomStorageClass — Custom storage class of this data**

'Default' (default) | character vector

Custom storage class of this data, specified as a character vector. You must set the property `StorageClass` to 'Custom' to enable this property.

For a list of valid custom storage classes (Embedded Coder) when you create the data object from the `Simulink` package, see “Choose Storage Class for Controlling Data Representation in Generated Code” (Embedded Coder).

Example: 'ExportToFile'

Data Types: char

### **StorageClass — Storage class of this data**

'Auto' (default) | character vector

Storage class of this data, specified as a character vector. For more information, see “C Code Generation Configuration for Model Interface Elements” (Simulink Coder).

The storage class of a `Simulink.Signal` object in a model workspace must be 'Auto'.

Example: 'ExportedGlobal'

Data Types: char

## Examples

### Configure Code Generation Settings Programmatically

For examples that show how to configure code generation settings for a data item programmatically, see “C Code Generation Configuration for Model Interface Elements” (Simulink Coder) and “Organize Parameter Data into a Structure by Using Struct Storage Class” (Embedded Coder).

## Version History

# Simulink.ConfigSet

Model configuration set

## Description

Use the `Simulink.ConfigSet` object to access a model configuration set. Get information about your configuration set and manage configuration parameters.

The `Simulink.ConfigSet` object is a `handle` object.

## Creation

Use the `getActiveConfigSet` function to get the active configuration set for a model. Use the `getConfigSet` function to get a model configuration set by name.

## Properties

### Description — Description of the configuration set

character vector

Description of the configuration set, specified as a character vector. Use the description to provide additional information about a configuration set, such as its purpose.

### Name — Name of the configuration set

character vector

Name of the configuration set, specified by a character vector. This name represents the configuration set in the Model Explorer.

## Object Functions

<code>copy</code>	Copy configuration set or reference
<code>getFullName</code>	
<code>getModel</code>	
<code>get_param</code>	Get parameter names and values
<code>isActive</code>	
<code>isValidParam</code>	
<code>saveAs</code>	
<code>setPropEnabled</code>	
<code>set_param</code>	Set Simulink parameter value

## Examples

### Get the Active Configuration Set for a Model

Open the model `vdp` and get the active configuration set.

```
vdp
configSetObj = getActiveConfigSet('vdp');
```

## Version History

Introduced in R2006a

# Simulink.ConfigSetRef

Link model to freestanding configuration set

## Description

Use the ConfigSetRef object to allow a model to reference configuration sets that are not saved in a model.

The Simulink.ConfigSetRef object is a handle object.

## Creation

Create a ConfigSetRef object by using the getConfigSet function to call a model configuration reference by name.

## Properties

### Description — Description of configuration reference

character vector

Description of the configuration reference, specified as a character vector. Use this property to provide additional information about a configuration reference, such as its purpose. This field can remain blank.

### Name — Name of configuration reference

character vector

Name of the configuration reference, specified as a character vector. This name represents the configuration reference in the Model Explorer.

### SourceName — Variable that contains referenced configuration set

character vector

Name of the variable in the workspace or the data dictionary that contains the referenced configuration set, specified as a character vector.

## Object Functions

copy	Copy configuration set or reference
getFullName	
getModel	
get_param	Get parameter names and values
getRefConfigSet	
isActive	
refresh	

## Examples

## Create and Reference a Freestanding Configuration Set

Use a `ConfigSetRef` object to allow a model to use a freestanding configuration set, which is not associated with a model.

Open the model `vdp`. Create a freestanding configuration set by copying the configuration set of the model.

```
model = 'vdp';
open_system(model)

freeConfigSet = copy(getActiveConfigSet(model));
```

Create a configuration reference. To point the reference to your freestanding configuration, set the `SourceName` property to `freeConfigSet`, the base workspace variable that represents your configuration. Name the reference `vdpConfigRef`.

```
configRef = Simulink.ConfigSetRef;
set_param(configRef, 'SourceName', 'freeConfigSet');
set_param(configRef, 'Name', 'vdpConfigRef');
```

Attach the configuration reference to the `vdp` model and activate it.

```
attachConfigSet('vdp', configRef);
setActiveConfigSet('vdp', 'vdpConfigRef');
```

## Version History

Introduced in R2007a

## copy

Copy configuration set or reference

### Syntax

```
copyCs = copy(cs)
```

### Description

`copyCs = copy(cs)` returns a copy of a configuration set or configuration reference.

### Examples

#### Attach New Configuration Set to a Model

Create a copy of a configuration set and attach it to a model.

Get the active configuration set for your model.

```
activeConfig = getActiveConfigSet ('vdp');
```

Copy the active configuration set.

```
develConfig = copy(activeConfig);
```

Give the copied configuration set a name.

```
develConfig.Name = 'develConfig';
```

Attach the new configuration set to the model.

```
attachConfigSet('vdp',develConfig);
```

### Input Arguments

#### **cs** — Configuration set

`ConfigSet` object | `ConfigSetRef` object

Configuration set object to copy, specified as a `ConfigSet` object or a `Simulink.ConfigSetRef` object.

### Output Arguments

#### **copyCs** — Copy of configuration set

`ConfigSet` object

A copy of the configuration set, returned as a `ConfigSet` object or a `ConfigSetRef` object.

# Symbol

C Function block data symbol

## Description

Define C Function block symbols and their properties.

## Creation

Access a `Symbol` object through one of the following methods.

- `addSymbol` function
- `getSymbol` function
- Access the `Symbols` property of a `SymbolSpec` object.

## Properties

### Name — Symbol name in source code

character vector

Symbol name in source code, specified as a character vector.

Data Types: character

### PortNumber — Port number

scalar integer

Port number, specified as a scalar integer. For input and output symbols, `PortNumber` indicates the port index on the block. For parameter symbols, `PortNumber` indicates the order that the symbol appears in the block parameter mask.

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64

### Size — Size dimensions of the symbol

'1' (default) | character vector

Size of the symbol data specified as a character vector containing a scalar integer. The C Function block supports only scalars and vectors. Matrices and higher-dimension arrays are not supported. You can use a size expression to define the size of an output. Use -1 to inherit size.

Data Types: character

### Type — Data type of symbol

'double' (default) | character vector

Data type of the symbol, specified as a character vector that evaluates to a numeric data type, or as a `Simulink.AliasType` object.

Example: `mySymbol.DataType = 'int32'`

Data Types: char

### Scope — Scope of the symbol

'Input' (default) | 'Output' | 'Persistent' | 'Parameter' | 'Constant'

Scope of the symbol, specified as one of the following values.

- **Input** — Input symbol to the C Function block.
- **Output** — Output symbol to the C Function block.
- **Parameter** — Define a symbol as parameter. The parameter name is defined by the `Label` property of the symbol.
- **Persistent** — Define a symbol as persistent data.
- You can define a void pointer using the `Persistent` scope in the C Function block. A *void pointer* is a pointer that can store any type of data that you create or allocate.
- **Constant** — Define a symbol as constant using value-size or numeric expressions.

Data Types: character

### Label — Symbol label

character vector

Symbol label, specified as a character vector. For symbols with their scope set to `Input` or `Output`, this label appears as the port name on the block. For symbols with their scope set to `Parameter`, this label is the label that appears on the block parameter mask. If the scope is `Constant`, the label is the constant expression. You cannot define a label for `Persistent` symbols.

Data Types: character

# SymbolSpec

Query and configure C Function block data symbols

## Description

Use the SymbolSpec object to query and configure C Function block symbol definitions and their properties.

## Creation

### Syntax

```
myCFunctionObj = get_param(CFcnBlk, 'SymbolSpec')
```

### Description

`myCFunctionObj = get_param(CFcnBlk, 'SymbolSpec')` creates a C Function block symbol configuration object for the specified C Function block.

### Input Arguments

#### **CFcnBlk** — C Function block

character vector

C Function block path specified as a character vector, or a handle to the C Function block.

## Properties

### **Symbols** — Symbols defined in the C Function block

Symbol object | array of Symbol objects

The symbols defined in the C Function block, specified as a Symbol object, or an array of Symbol objects.

Symbol objects define the properties of each symbol in the C Function block.

## Object Functions

<code>addSymbol</code>	Add a symbol object definition to a C Function block
<code>getSymbol</code>	Get a symbol object definition of a C Function block
<code>deleteSymbol</code>	Delete a symbol object definition from a C Function block

## Version History

Introduced in R2020a

# addSymbol

**Package:** Simulink.CFunctionBlock

Add a symbol object definition to a C Function block

## Syntax

```
mySymbol = addSymbol(mySymbolSpec)
mySymbol = addSymbol(mySymbolSpec, name)
```

## Description

`mySymbol = addSymbol(mySymbolSpec)` creates a `Symbol` object, `mySymbol`, and adds the symbol to the `SymbolSpec` object, `mySymbolSpec`.

`mySymbol = addSymbol(mySymbolSpec, name)` creates a `Symbol` object, `mySymbol`, with the `Name` property specified by `name` and adds the symbol to the `SymbolSpec` object `mySymbolSpec`.

## Examples

### Specify and Edit Symbol Attributes Used in a C Function Block

Access and edit the properties of a symbol used in a C Function block.

Obtain the `SymbolSpec` object of the C Function block in your model using `get_param`. For example, select the C Function block in the model canvas and enter the following at the command line.

```
mySymbolSpec = get_param(gcb, 'SymbolSpec');
```

Use the `addSymbol` function to specify a new parameter symbol, `myParam`, in your C Function block code.

```
myParam = addSymbol(mySymbolSpec, 'myParam')
```

The `Symbol` object, `myParam`, uses default properties. Specify the scope of the symbol using the `Scope` property.

```
myParam.Scope = 'Parameter';
```

You can use the `getSymbol` function to access symbols specified for the block. For example, access the parameter symbol you added.

```
myParam = getSymbol(mySymbolSpec, 'myParam');
```

Edit the label of the parameter in the Block Parameters dialog using the `Label` property.

```
myParam.Label = 'Amplitude';
```

To delete a symbol from the `SymbolSpec` object, use the `deleteSymbol` function.

```
deleteSymbol(mySymbolSpec, 'myParam');
```

## Input Arguments

### **mySymbolSpec** — Symbol specifications of C Function block

SymbolSpec object

Symbol specifications of C Function block, specified as a SymbolSpec object.

### **name** — Name of symbol

character vector

Name of the symbol, specified as a character vector.

Data Types: character

## Output Arguments

### **mySymbol** — Symbol

Symbol object

Symbol added to the C Function block, returned as a Symbol object. The Symbol object has default properties, except when you specify a name for the symbol in the input arguments. You can edit the properties of the Symbol object after creation.

## Version History

Introduced in R2020a

# getSymbol

**Package:** Simulink.CFunctionBlock

Get a symbol object definition of a C Function block

## Syntax

```
mySymbol = getSymbol(mySymbolSpec, name)
```

## Description

`mySymbol = getSymbol(mySymbolSpec, name)` returns the `Symbol` object with the `Name` property specified by `name` associated with the `SymbolSpec` object.

## Examples

### Specify and Edit Symbol Attributes Used in a C Function Block

Access and edit the properties of a symbol used in a C Function block.

Obtain the `SymbolSpec` object of the C Function block in your model using `get_param`. For example, select the C Function block in the model canvas and enter the following at the command line.

```
mySymbolSpec = get_param(gcf, 'SymbolSpec');
```

Use the `addSymbol` function to specify a new parameter symbol, `myParam`, in your C Function block code.

```
myParam = addSymbol(mySymbolSpec, 'myParam')
```

The `Symbol` object, `myParam`, uses default properties. Specify the scope of the symbol using the `Scope` property.

```
myParam.Scope = 'Parameter';
```

You can use the `getSymbol` function to access symbols specified for the block. For example, access the parameter symbol you added.

```
myParam = getSymbol(mySymbolSpec, 'myParam');
```

Edit the label of the parameter in the Block Parameters dialog using the `Label` property.

```
myParam.Label = 'Amplitude';
```

To delete a symbol from the `SymbolSpec` object, use the `deleteSymbol` function.

```
deleteSymbol(mySymbolSpec, 'myParam');
```

## Input Arguments

### **mySymbolSpec** — Symbol specifications of C Function block

SymbolSpec object

Symbol specifications of C Function block, specified as a SymbolSpec object.

### **name** — Name of symbol

character vector

Name of the symbol, specified as a character vector.

Data Types: character

## Output Arguments

### **mySymbol** — Symbol

Symbol object

Symbol associated with the C Function block, returned as a Symbol object.

## Version History

Introduced in R2020a

Delete a symbol object definition from a C Function block

## Syntax

```
deleteSymbol(mySymbolSpec, name)
```

## Description

`deleteSymbol(mySymbolSpec, name)` deletes the `Symbol` object with the `Name` property specified by `name` from the `SymbolSpec` object.

## Examples

### Specify and Edit Symbol Attributes Used in a C Function Block

Access and edit the properties of a symbol used in a C Function block.

Obtain the `SymbolSpec` object of the C Function block in your model using `get_param`. For example, select the C Function block in the model canvas and enter the following at the command line.

```
mySymbolSpec = get_param(gcf, 'SymbolSpec');
```

Use the `addSymbol` function to specify a new parameter symbol, `myParam`, in your C Function block code.

```
myParam = addSymbol(mySymbolSpec, 'myParam')
```

The `Symbol` object, `myParam`, uses default properties. Specify the scope of the symbol using the `Scope` property.

```
myParam.Scope = 'Parameter';
```

You can use the `getSymbol` function to access symbols specified for the block. For example, access the parameter symbol you added.

```
myParam = getSymbol(mySymbolSpec, 'myParam');
```

Edit the label of the parameter in the Block Parameters dialog using the `Label` property.

```
myParam.Label = 'Amplitude';
```

To delete a symbol from the `SymbolSpec` object, use the `deleteSymbol` function.

```
deleteSymbol(mySymbolSpec, 'myParam');
```

## Input Arguments

### **mySymbolSpec** — Symbol specifications of C Function block

SymbolSpec object

Symbol specifications of C Function block, specified as a SymbolSpec object.

### **name** — Name of symbol

character vector

Name of the symbol to delete, specified as a character vector.

Data Types: character

# Simulink.ConnectionBus

Specify properties of physical connection buses

## Description

A `Simulink.ConnectionBus` object is a data type that, when used with `Simulink.ConnectionElement` objects, lets you design rigid interface specifications for Simscape conserving connections. When you apply such rigid specification to a Simscape Bus or Connection Port block, the block ports become typed by the interface and do not accept connections to a different domain type.

A `ConnectionBus` object specifies the architectural properties of an interface, such as element names, hierarchy, and domain types. A `ConnectionBus` object is similar to a cable connector. The connector defines all the pins and their configuration and controls what types of wires can be connected to it. Similarly, a `ConnectionBus` object defines the configuration and domain types of the ports of the associated Simscape Bus or Connection Port blocks.

`ConnectionBus` objects contain `Simulink.ConnectionElement` objects. Each `ConnectionElement` object specifies the properties of a port in a connection bus, such as its name and domain type. To create nested connection buses, specify a `ConnectionElement` on the parent bus and set its type as the child `ConnectionBus` object.

To create and modify `ConnectionBus` objects in the base workspace or a data dictionary, you can use the **Type Editor**, the **Model Explorer**, or MATLAB commands. You cannot store `ConnectionBus` objects in model workspaces.

To simulate a model containing blocks that use a `ConnectionBus` object, that `ConnectionBus` object must be in the base workspace or in a data dictionary. You save and load `ConnectionBus` objects similar to `Simulink.Bus` objects. For more information, see “Determine How to Manage `Simulink.Bus` Objects”.

To apply an existing connection bus specification to a Simscape Bus or Connection Port block, use the **Connection type** parameter and select the bus name from the drop-down list.

## Creation

### Syntax

```
name = Simulink.ConnectionBus
```

### Description

`name = Simulink.ConnectionBus` returns a `ConnectionBus` object with default property values. The name of the `ConnectionBus` object is the name of the MATLAB variable to which you assign the `ConnectionBus` object.

## Properties

### Description — Connection bus description

' ' (default) | character vector

Connection bus description, specified as a character vector. Use the description to document information about the `ConnectionBus` object, such as the application it is used for or domain types of its ports. This information does not affect Simulink processing.

Data Types: `char` | `string`

### Elements — Elements of connection bus

empty array (default) | array of `Simulink.ConnectionElement` objects

Elements of connection bus, specified as an array of `Simulink.ConnectionElement` objects. Each `ConnectionElement` object defines the properties of a conserving connection within the bus, such as its name and domain type. For more information, see `Simulink.ConnectionElement`.

## Examples

### Create Connection Bus and Connection Element Objects Using MATLAB Commands

Define a rigid interface with one mechanical translational and one electrical port by creating a `ConnectionBus` object containing a two-element array of `ConnectionElement` objects. Array indexing lets you create and access multiple elements in an array. Dot notation lets you access property values.

Create a `ConnectionBus` object called `MechElec`:

```
MechElec = Simulink.ConnectionBus
```

```
MechElec =
```

```
ConnectionBus with properties:
```

```
Description: ''
Elements: [0x0 Simulink.ConnectionElement]
```

By default, the connection bus has no description and an empty array of connection elements.

Use the dot notation to fill in the description:

```
MechElec.Description = 'Rigid interface with one mechanical and one electrical port'
```

```
MechElec =
```

```
ConnectionBus with properties:
```

```
Description: 'Rigid interface with one mechanical and one electrical port'
Elements: [0x0 Simulink.ConnectionElement]
```

Create a `ConnectionElement` object to define the mechanical translational port:

```
mech = Simulink.ConnectionElement
```

```

mech =

ConnectionElement with properties:

 Name: 'a'
 Type: 'Connection: <domain name>'
 Description: ''

```

This command creates a `ConnectionElement` object with default properties.

Change the `ConnectionElement` name to `mech`:

```
mech.Name = 'mech'
```

```

mech =

ConnectionElement with properties:

 Name: 'mech'
 Type: 'Connection: <domain name>'
 Description: ''

```

Specify the domain type for the connection:

```
mech.Type = 'Connection: foundation.mechanical.translational.translational'
```

```

mech =

ConnectionElement with properties:

 Name: 'mech'
 Type: 'Connection: foundation.mechanical.translational.translational'
 Description: ''

```

For a list of Foundation domain types, see “Domain-Specific Line Styles” (Simscape).

Optionally, fill in the port description:

```
mech.Description = 'Mechanical translational port'
```

```

mech =

ConnectionElement with properties:

 Name: 'mech'
 Type: 'Connection: foundation.mechanical.translational.translational'
 Description: 'Mechanical translational port'

```

Similarly, create another `ConnectionElement` object to define the electrical port:

```

elec = Simulink.ConnectionElement;
elec.Name = 'elec';
elec.Type = 'Connection: foundation.electrical.electrical';
elec.Description = 'Electrical port'

```

```

elec =

ConnectionElement with properties:

 Name: 'elec'

```

```
 Type: 'Connection: foundation.electrical.electrical'
 Description: 'Electrical port'
```

Add the two elements to the `ConnectionBus` object:

```
MechElec.Elements = [mech elec]
```

```
MechElec =
```

```
 ConnectionBus with properties:
```

```
 Description: 'Rigid interface containing one mechanical and one electrical port'
 Elements: [2x1 Simulink.ConnectionElement]
```

You can view the created objects in the **Type Editor**:

```
typeeditor
```

## Alternatives

To interactively create a `ConnectionBus` object, use the **Type Editor** or the **Model Explorer**.

## Version History

**Introduced in R2021b**

`Simulink.ConnectionElement` | `Simulink.Bus` | `Simulink.BusElement`

### Topics

“Design Rigid Interface Specifications for Conserving Connections” (Simscape)

# Simulink.ConnectionElement

Specify properties of elements of physical connection buses

## Description

A `Simulink.ConnectionElement` object is an element of a `Simulink.ConnectionBus` object. It validates the properties of a physical connection port.

`ConnectionElement` objects exist only within the `ConnectionBus` object. You can specify a `ConnectionBus` object, but not a `ConnectionElement` object, as a data type.

When you simulate or update a model, Simulink checks whether the ports connected to Simscape Bus or Connection Port blocks with rigid interface specifications match the properties of the corresponding `ConnectionElement` objects.

To create and modify `ConnectionBus` and `ConnectionElement` objects in the base workspace or a data dictionary, you can use the **Type Editor**, the **Model Explorer**, or MATLAB commands. You cannot store `ConnectionBus` and `ConnectionElement` objects in model workspaces.

## Creation

### Syntax

```
ce = Simulink.ConnectionElement
```

### Description

`ce = Simulink.ConnectionElement` returns a `ConnectionElement` object with default property values.

## Properties

### Name — Name of element

'a' (default) | character vector

Name of element, specified as a character vector. The element name must be a valid MATLAB identifier that starts with an alphabetic character or underscore (`_`), followed by alphanumeric characters or underscores.

Data Types: `char` | `string`

### Type — Connection type of element

'Connection: <domain name>' (default) | registered Simscape domain | Simscape Multibody conserving connection type | `ConnectionBus` object present in the base workspace or a data dictionary

Connection type of element, specified as a Simscape Foundation domain name, a custom domain name registered in your MATLAB session, or a Simscape Multibody conserving connection type.

For a list of Foundation domains, see “Domain-Specific Line Styles” (Simscape).

Selecting a `ConnectionBus` object present in the base workspace or a data dictionary lets you create nested connection buses.

If you create `ConnectionElement` objects interactively, by using the **Type Editor** or the **Model Explorer**, the drop-down list automatically contains all the valid domain and connection types.

Data Types: `char` | `string`

### Description — Connection element description

' ' (default) | character vector

Connection element description, specified as a character vector. Use the description to document information about the `ConnectionElement` object, such as the domain type. This information does not affect Simulink processing.

Data Types: `char` | `string`

## Examples

### Create Connection Bus and Connection Element Objects Using MATLAB Commands

Define a rigid interface with one mechanical translational and one electrical port by creating a `ConnectionBus` object containing a two-element array of `ConnectionElement` objects. Array indexing lets you create and access multiple elements in an array. Dot notation lets you access property values.

Create a `ConnectionBus` object called `MechElec`:

```
MechElec = Simulink.ConnectionBus
```

```
MechElec =
```

```
ConnectionBus with properties:
```

```
 Description: ''
 Elements: [0x0 Simulink.ConnectionElement]
```

By default, the connection bus has no description and an empty array of connection elements.

Use the dot notation to fill in the description:

```
MechElec.Description = 'Rigid interface with one mechanical and one electrical port'
```

```
MechElec =
```

```
ConnectionBus with properties:
```

```
 Description: 'Rigid interface with one mechanical and one electrical port'
 Elements: [0x0 Simulink.ConnectionElement]
```

Create a `ConnectionElement` object to define the mechanical translational port:

```
mech = Simulink.ConnectionElement
```

```

mech =

ConnectionElement with properties:

 Name: 'a'
 Type: 'Connection: <domain name>'
 Description: ''

```

This command creates a `ConnectionElement` object with default properties.

Change the `ConnectionElement` name to `mech`:

```
mech.Name = 'mech'
```

```

mech =

ConnectionElement with properties:

 Name: 'mech'
 Type: 'Connection: <domain name>'
 Description: ''

```

Specify the domain type for the connection:

```
mech.Type = 'Connection: foundation.mechanical.translational.translational'
```

```

mech =

ConnectionElement with properties:

 Name: 'mech'
 Type: 'Connection: foundation.mechanical.translational.translational'
 Description: ''

```

For a list of Foundation domain types, see “Domain-Specific Line Styles” (Simscape).

Optionally, fill in the port description:

```
mech.Description = 'Mechanical translational port'
```

```

mech =

ConnectionElement with properties:

 Name: 'mech'
 Type: 'Connection: foundation.mechanical.translational.translational'
 Description: 'Mechanical translational port'

```

Similarly, create another `ConnectionElement` object to define the electrical port:

```

elec = Simulink.ConnectionElement;
elec.Name = 'elec';
elec.Type = 'Connection: foundation.electrical.electrical';
elec.Description = 'Electrical port'

```

```

elec =

ConnectionElement with properties:

 Name: 'elec'

```

```
 Type: 'Connection: foundation.electrical.electrical'
 Description: 'Electrical port'
```

Add the two elements to the `ConnectionBus` object:

```
MechElec.Elements = [mech elec]
```

```
MechElec =
```

```
 ConnectionBus with properties:
```

```
 Description: 'Rigid interface containing one mechanical and one electrical port'
 Elements: [2x1 Simulink.ConnectionElement]
```

You can view the created objects in the **Type Editor**:

```
typeeditor
```

## Alternatives

To interactively create a `ConnectionElement` object, use the **Type Editor** or the **Model Explorer**.

# FunctionPortSpecification

Query and configure C Caller block properties

## Description

Query and configure the C Caller block function definition and return argument. Configure the C Caller block input arguments programmatically.

## Creation

`myCCallerObj = get_param(gcb, 'FunctionPortSpecification')` creates a C Caller block configuration object for the selected C Caller block.

## Properties

### CPrototype — C function mapping to the C Caller block

character vector

Displays the mapping of the C function input to the C Caller block in the model. You cannot edit this property using the command line. To edit the C function mapping, edit the source code of the C Caller block.

Example: `real_T add(real_T u1, real_T u2);`

Data Types: char

### InputArguments — List of function input arguments

FunctionArgument object

Returns the list of function input arguments in a “FunctionArgument Object” on page 8-99.

### ReturnArgument — List of function output arguments

FunctionArgument scalar

Returns a scalar or an empty “FunctionArgument Object” on page 8-99.

Data Types: char

### GlobalArguments — List of global arguments

FunctionArgument scalar

Returns a scalar or an empty “FunctionArgument Object” on page 8-99.

Data Types: char

### FunctionArgument Object

The `FunctionArgument` is a class that carries port specification information of a C Caller block programmatically. The `FunctionArgument` object has these properties:

- 1 **Name** — Name of the variable in the source code, specified as a character vector. This property is read-only.
- 2 **PortNumber** — Port number of the InputArgument that has been edited, specified as uint32. This property is read-only.
- 3 **Size** — Size of the Simulink port dimensions specified as a character vector. You can edit this property if it is allowed in the function definition.
- 4 **Type** — Simulink data type for the specified port specified as a character vector. You can edit this property if it is allowed in the function definition.
- 5 **Label** — Port label on the Simulink block specified as a character vector. You can change the port label programmatically, for example:

```
myCCallerObj.my_CCaller.InputArguments(1).Label = 'inputport1'
```

```
my_CCallerObj =
```

```
FunctionPortSpecification with properties:
```

```
 CPrototype: 'real_T add(real_T u1, real_T u2);'
 InputArguments: [1x2 Simulink.CustomCode.FunctionArgument]
 ReturnArgument: [1x1 Simulink.CustomCode.FunctionArgument]
 GlobalArguments: [1x0 Simulink.CustomCode.FunctionArgument]
```

- 6 **Scope** — Mapping of the Simulink scope to the input argument specified as a character vector. If the variable is defined as a constant qualifier, the argument can be an input or a parameter. If no constant qualifier exists, you can change an output argument to an input, inputoutput, or to a parameter. If your scope fits any of the scenarios above, you can change it programmatically:

```
my_CCallerObj.InputArguments(1).Scope = 'parameter'
```

```
my_CCallerObj =
```

```
FunctionPortSpecification with properties:
```

```
 CPrototype: 'extern real_T add(real_T u1, real_T u2);'
 InputArguments: [1x2 Simulink.CustomCode.FunctionArgument]
 ReturnArgument: [1x1 Simulink.CustomCode.FunctionArgument]
 GlobalArguments: [1x0 Simulink.CustomCode.FunctionArgument]
```

## Object Functions

`getGlobalArg` Get an object definition of a global variable in a C Caller block

## Examples

### Create a C Caller Configuration Object

This example creates a C Caller configuration object using the 'slexCCallerExample' demo model.

```
my_CCallerObj = get_param('slexCCallerExample/C Caller','FunctionPortSpecification')
```

```
my_CCallerObj =
```

```
FunctionPortSpecification with properties:
```

```
 CPrototype: 'real_T add(real_T u1, real_T u2);'
```

```
InputArguments: [1x2 Simulink.CustomCode.FunctionArgument]
ReturnArgument: [1x1 Simulink.CustomCode.FunctionArgument]
GlobalArguments: [1x0 Simulink.CustomCode.FunctionArgument]
```

Create a `FunctionArgument` object for the 1st input port:

```
inargone = my_CCallerObj.InputArguments(1)
inargone =
```

FunctionArgument with properties:

```
 Name: 'u1'
PortNumber: 1
 Size: '1'
 Type: 'double'
 Label: 'u1'
 Scope: 'Parameter'
```

Change the label for the first input port:

```
inargone.Label = 'inputport1'
inargone =
```

FunctionArgument with properties:

```
 Name: 'u1'
PortNumber: 1
 Size: '1'
 Type: 'double'
 Label: 'inputport1'
 Scope: 'Parameter'
```

## Version History

## getGlobalArg

**Package:** Simulink.CustomCode

Get an object definition of a global variable in a C Caller block

### Syntax

```
GlobalArg = PortSpecObj.getGlobalArg(globalVariableName)
```

### Description

`GlobalArg = PortSpecObj.getGlobalArg(globalVariableName)`, where `PortSpecObj` is an object of class `FunctionPortSpecification` or `Simulink.CodeImporter.SimulinkPortSpecification`, creates a `FunctionArgument` on page 8-99 object. To use global variables in a model that uses C Caller blocks, turn on the **Enable custom code globals as function interface** setting from **Configuration Parameters > Simulation Target**.

### Examples

#### Create Handle to Global Variable in C Caller Block

Access the properties of a global variable used in a C Caller block.

Create a `FunctionPortSpecification` object.

```
myFunctionPortSpecObject = get_param(gcb, 'FunctionPortSpecification')
```

Query and create a `FunctionArgument` object for the global argument.

```
myGlobalVariable = myFunctionPortSpecObject.getGlobalArg('myGlobalVariableName')
```

```
myGlobalVariable =
```

```
FunctionArgument with properties:
```

```
 Name: 'myGlobalVarPort'
PortNumber: 1
 Size: '1'
 Type: 'double'
 Label: 'myGlobalVarPort'
 Scope: 'Input'
```

### Input Arguments

**globalVariableName** — Name of global variable

character vector | string scalar

Name of global variable, specified as a character vector.

Data Types: char

## Output Arguments

### **GlobalArg** — Global argument object

FunctionArgument object

Global argument object associated with the C Caller block, returned as a FunctionArgument object.

## Version History

**Introduced in R2020b**

# Simulink.data.adapters.AdapterDataTester

Test custom external file adapter

## Description

A `Simulink.data.adapters.AdapterDataTester` object provides functions for testing a custom external file adapter derived from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class.

## Creation

### Syntax

```
adapterTester = Simulink.data.adapters.AdapterDataTester(adapterObj, source, section)
```

### Description

`adapterTester = Simulink.data.adapters.AdapterDataTester(adapterObj, source, section)` creates a `Simulink.data.adapters` object that can test an instance of an adapter derived from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class. With this adapter tester you can test the `getData` method for your custom file adapter.

### Input Arguments

#### **adapterObj** — Custom file adapter

`BaseMatlabFileAdapter` subclass object

Custom file adapter, specified as an object of a class that derives from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class.

Example: `myCustomFileAdapter`

#### **source** — External source file

character array

External source file, specified as a character array.

Example: `'Tires.xls'`

#### **section** — Section of external file

adapter name (default) | character array | string

Section of the external file source, specified as a character array or string.

Example: `'tireManufacturer'`

## Properties

### WorkspaceVariables — Workspace variables

containers.Map object

This property is read-only.

Workspace variables, specified as a `containers.Map` object. Simulink populates the map object when you call the object function `readFromSource`. The keys to the map object are the workspace variable names..

## Object Functions

`clear` Clear variables from file adapter tester object  
`readFromSource` Test custom file adapter by reading from source

## Examples

### Create External File Adapter Tester

Create a `Simulink.data.adapters.AdapterDataTester` object to test the `getData` method of an XML file adapter derived from a `Simulink.data.adapters.BaseMatlabFileAdapter` base class. For an example of an XML file adapter, see .

The `getData` method reads data from an XML file `test.xml` in the following format.

```
<customerData>
<x>10</x>
<y>15</y>
</customerData>
```

Create an instance of your file adapter.

```
adapterInstance = myXMLAdapter;
```

Create an instance of the file adapter tester object using the test file specified above.

```
adapterTester = Simulink.data.adapters.AdapterDataTester(adapterInstance, 'test.xml', 'XML Adapter');
```

Use `adapterTester` to read the data from your XML file. Then, check the data in the `WorkspaceVariables` property.

```
readFromSource(adapterTester);
variables = adapterTester.WorkspaceVariables
```

```
variables =
 Map with properties:
 Count: 2
 KeyType: char
 ValueType: double
```

Check the data in the `WorkspaceVariables` map object.

```
variables.keys
```

```
ans =
 1x2 cell array
 {"x"} {"y"}
```

Finally, clear the workspace variables.

```
clear(adapterTester);
```

After clearing the variables, you can make changes to your XML file and use the same adapter to read the file again.

```
readFromSource(adapterTester);
```

## **Version History**

“Create External File Adapter for Loading Variables into `Simulink.SimulationInput` Object”

# clear

**Package:** Simulink.data.adapters

Clear variables from file adapter tester object

## Syntax

```
clear(testerObj)
```

## Description

`clear(testerObj)` clears the workspace variables from the `Simulink.data.adapters.AdapterDataTester` object `testerObj`. The tester object provides functions for testing a custom external file adapter derived from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class.

## Examples

### Clear Variables from XML File Adapter Tester

Clear the workspace variables from a `Simulink.data.adapters.AdapterDataTester` object after using the object to test an XML file adapter derived from a `Simulink.data.adapters.BaseMatlabFileAdapter` base class. For an example of an XML file adapter, see .

The example uses an XML file `test.xml` with the following format.

```
<customerData>
<x>10</x>
<y>15</y>
</customerData>
```

Create an instance of your file adapter.

```
adapterInstance = myXMLAdapter;
```

Create an instance of the file adapter tester object using the test file specified above.

```
adapterTester = Simulink.data.adapters.AdapterDataTester(adapterInstance, 'test.xml', 'XML Adapter
```

Use `adapterTester` to read the data from your XML file. Then, check the data in the `WorkspaceVariables` property.

```
readFromSource(adapterTester);
variables = adapterTester.WorkspaceVariables
```

```
variables =
 Map with properties:
 Count: 2
 KeyType: char
 ValueType: double
```

Check the data in the WorkspaceVariables map object.

```
variables.keys
```

```
ans =
 1x2 cell array
 {"x"} {"y"}
```

Finally, clear the workspace variables.

```
clear(adapterTester);
```

## Input Arguments

### **testerObj** – File adapter tester

`Simulink.data.adapters.AdapterDataTester` object

File adapter tester, specified as a `Simulink.data.adapters.AdapterDataTester` object.

## Version History

# readFromSource

**Package:** Simulink.data.adapters

Test custom file adapter by reading from source

## Syntax

```
readFromSource(testerObj)
```

## Description

`readFromSource(testerObj)` tests the `getData` method of a custom external file adapter derived from the `Simulink.data.adapters.BaseMatlabFileAdapter` base class. When you create the `Simulink.data.adapters.AdapterDataTester` object, `testerObj`, you open a connection to a test file by using an instance of a custom file adapter. The object function reads data from that test file.

## Examples

### Test Custom XML File Adapter

Use a `Simulink.data.adapters.AdapterDataTester` object to test the `getData` method of an XML file adapter derived from a `Simulink.data.adapters.BaseMatlabFileAdapter` base class. For an example of an XML file adapter, see .

The `getData` method reads data from an XML file `test.xml` with the following format.

```
<customerData>
<x>10</x>
<y>15</y>
</customerData>
```

Create an instance of your file adapter.

```
adapterInstance = myXMLAdapter;
```

Create an instance of the file adapter tester object using the test file specified above.

```
adapterTester = Simulink.data.adapters.AdapterDataTester(adapterInstance, 'test.xml', 'XML Adapter');
```

Use `adapterTester` to read the data from your XML file. Then, check the data in the `WorkspaceVariables` property.

```
readFromSource(adapterTester);
variables = adapterTester.WorkspaceVariables
```

```
variables =
 Map with properties:
 Count: 2
 KeyType: char
 ValueType: double
```

Check the data in the WorkspaceVariables map object.

```
variables.keys
```

```
ans =
 1x2 cell array
 {"x"} {"y"}
```

Finally, clear the workspace variables.

```
clear(adapterTester);
```

## Input Arguments

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

# Simulink.data.DataSourceWorkspace

Contains data for external data source

## Description

A `Simulink.data.DataSourceWorkspace` object is a handle object that can contain data from an external data source.

When you load data from an external source, for example by using the `loadVariablesFromExternalSource` function, Simulink passes a reference to a `Simulink.data.DataSourceWorkspace` object to the custom file adapter that can read that external file format. The file adapter, derived from the `Simulink.data.adapters.BaseMatlabFileAdapter` class, loads the data into the workspace in the form of MATLAB variables and data objects. The workspace object acts as a cache for Simulink and can run a MATLAB script, similar to a base workspace. Symbol resolution includes symbols in the workspace. See `run`.

## Creation

Only Simulink can create and manage a `Simulink.data.DataSourceworkspace` object, but you can create another handle for the workspace object by assignment.

```
copyWks = dsWks
```

```
copyWks =
DataSourceWorkspace with no properties
```

To test a custom file adapter without creating a data source workspace, use the `Simulink.data.adapters.AdapterDataTester` object.

## Object Functions

<code>clearVariables</code>	Clear specified variables from data source workspace
<code>clearAllVariables</code>	Clear variables from data source workspace
<code>getVariable</code>	Return value of variable in data source workspace
<code>getVariables</code>	Return values of variables in data source workspace
<code>hasVariables</code>	Check if variables exist in data source workspace
<code>listVariables</code>	List variables in data source workspace
<code>run</code>	Execute the specified MATLAB script in data source workspace
<code>setVariable</code>	Set variable in data source workspace
<code>setVariables</code>	Set variables in data source workspace

## Examples

### Load Data from External Source File into Workspace

Define a `getData` method for an XML file adapter to populate the data from an XML file into the data source workspace that Simulink passes to the method.

This `getData` method reads an XML file in the following format:

```
<customerData>
<x>10</x>
<y>15</y>
</customerData>
```

```
function diagnostic = getData(adapterObj, sourceWorkspace, previousChecksum, diagnostic)
 % Each time getData is called on the same source, sourceWorkspace is the same as
 % the last time it was called. Clear it to make sure no old variables exist.
 clearAllVariables(sourceWorkspace);
 dom = xmlread(adapterObj.source);
 tree = dom.getFirstChild;
 if tree.hasChildNodes
 item = tree.getFirstChild;
 while ~isempty(item)
 name = item.getNodeName.toCharArray';
 if isvarname(name)
 value = item.getTextContent;
 setVariable(sourceWorkspace, name, str2num(value));
 end
 item = item.getNextSibling;
 end
 end
end
```

## Version History

Introduced in R2022b

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

# clearAllVariables

**Package:** Simulink.data

Clear variables from data source workspace

## Syntax

```
clearAllVariables(dsWks)
```

## Description

`clearAllVariables(dsWks)` clears the variables from the data source workspace represented by the `Simulink.data.DataSourceWorkspace` object `dsWks`.

## Examples

### Clear All Variables From Data Source Workspace

Add some variables to a data source workspace.

```
setVariable(sourceWorkspace, 'b', 2);
setVariables(sourceWorkspace, ["c" "d"], {3,4});
setVariables(sourceWorkspace, {'e', 'f'}, {5,6});
```

Now return the list of variables that are contained in the workspace.

```
vars = listVariables(sourceWorkspace);
vars
```

```
vars
 5x1 string array

 "b"
 ... "c"
 ... "d"
 "e"
 "f"
```

Clear the variables from the workspace.

```
clearAllVariables(sourceWorkspace);
```

Now return the list of variables again and confirm that the workspace is empty.

```
vars = listVariables(sourceWorkspace);
vars
```

vars  
0x1 empty string array

## Input Arguments

### **dsWks — Data source workspace**

Simulink.data.DataSourceWorkspace object

Data source workspace, specified as a Simulink.data.DataSourceWorkspace object.

## Version History

Introduced in R2022b

# clearVariables

**Package:** Simulink.data

Clear specified variables from data source workspace

## Syntax

```
clearVariables(dsWks, varNames)
```

## Description

`clearVariables(dsWks, varNames)` clears the specified variables from the data source workspace represented by the `Simulink.data.DataSourceWorkspace` object `dsWks`.

## Examples

### Clear Specified Variables From a Data Source Workspace

Add some variables to a data source workspace.

```
setVariable(sourceWorkspace, 'b', 2);
setVariables(sourceWorkspace, ["c" "d"], {3,4});
setVariables(sourceWorkspace, {'e', 'f'}, {5,6});
```

Remove variables c and d from the workspace.

```
clearVariables(sourceWorkspace, ["c" "d"]);
```

Now return the list of variables in the workspace and check that variables c and d are no longer there.

```
vars = listVariables(sourceWorkspace);
vars
```

```
vars
 3x1 string array

 "b"
 "e"
 "f"
```

## Input Arguments

**dsWks** — Data source workspace

`Simulink.data.DataSourceWorkspace` object

Data source workspace, specified as a `Simulink.data.DataSourceWorkspace` object.

**varNames** — Variable names

string array | cell array of character arrays

Variable names, specified as a string array or cell array of character vectors.

Example: ["c" "d"]

Example: {'e', 'f'}

# getVariable

**Package:** Simulink.data

Return value of variable in data source workspace

## Syntax

```
varValue = getVariable(dsWks,varName)
```

## Description

`varValue = getVariable(dsWks,varName)` returns the value of the variable `varName` that exists in the data source workspace represented by the `Simulink.data.DataSourceWorkspace` object `dsWks`.

## Examples

### Get Value of Variable in Data Source Workspace

Set the value of variable `b` in a data source workspace.

```
setVariable(sourceWorkspace, 'b', 2);
```

Now return that variable and store the value in another variable `c`.

```
c = getVariable(sourceWorkspace, 'b');
c
```

```
ans =
```

```
2
```

## Input Arguments

### **dsWks** — Data source workspace

`Simulink.data.DataSourceWorkspace` object

Data source workspace, specified as a `Simulink.data.DataSourceWorkspace` object.

### **varName** — Variable name

string | character array

Variable name, specified as a string or character array.

Example: "x"

Data Types: char | string

## Output Arguments

### **varValue** — Variable value

number, structure, or other MATLAB value

Variable value, returned as a number, structure, or other MATLAB value.

## Version History

**Introduced in R2022b**

### See Also

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

# getVariables

**Package:** Simulink.data

Return values of variables in data source workspace

## Syntax

```
varValues = getVariables(dsWks,varNames)
```

## Description

`varValues = getVariables(dsWks,varNames)` returns the values of the variables `varNames` that exist in the data source workspace represented by the `Simulink.data.DataSourceWorkspace` object `dsWks`.

## Examples

### Get Values of Variables in Data Source Workspace

Set the value of variables `c` and `d` in a data source workspace.

```
setVariables(sourceWorkspace,["c" "d"], {3,4});
```

Now return the variables.

```
getVariables(sourceWorkspace,["c" "d"])
```

```
ans =
```

```
1x2 cell array
```

```
 {[3]} {[4]}
```

## Input Arguments

### **dsWks** — Data source workspace

`Simulink.data.DataSourceWorkspace` object

Data source workspace, specified as a `Simulink.data.DataSourceWorkspace` object.

### **varNames** — Variable names

string array | cell array of character vectors

Variable names, specified as a string array or cell array of character vectors.

Example: `["c" "d"]`

Example: `{'e', 'f'}`

## Output Arguments

### **varValues** — Variable values

cell array of numbers, structures, or other MATLAB values

Variable values, returned as a cell array of numbers, structures, or other MATLAB values. The dimensions of the cell array match the dimensions of `varNames`.

## Version History

Introduced in R2022b

### See Also

“Create External File Adapter for Loading Variables into `Simulink.SimulationInput` Object”

# hasVariables

**Package:** Simulink.data

Check if variables exist in data source workspace

## Syntax

```
varExists = hasVariables(dsWks,varNames)
```

## Description

`varExists = hasVariables(dsWks,varNames)` checks if the specified variables exist in the data source workspace represented by the `Simulink.data.DataSourceWorkspace` object `dsWks`.

## Examples

### Check if Specified Variables Exist in Data Source Workspace

Add some variables to a data source workspace.

```
setVariable(sourceWorkspace,'b',2);
setVariables(sourceWorkspace,['c' 'd'],{3,4});
setVariables(sourceWorkspace',{'e','f'},{5,6});
```

Check if variable `b` is in the data source workspace.

```
retVal = hasVariables(sourceWorkspace,'b');
retVal
```

```
retVal =
 true
```

Now check if the variables `a` and `e` are in the data source workspace.

```
retVal = hasVariables(sourceWorkspace,['a' 'e']);
retVal
```

```
retVal =
 1x2 logical array

 0 1
```

## Input Arguments

**dsWks** — Data source workspace

`Simulink.data.DataSourceWorkspace` object

Data source workspace, specified as a `Simulink.data.DataSourceWorkspace` object.

**varNames** — Variable names

string array | cell array of character vectors

Variable names, specified as a string array or cell array of character vectors.

Example: ["c" "d"]

Example: {'e', 'f'}

## Output Arguments

### **varExists** — True or false result

logical array

True or false result, returned as a logical array. Dimensions of the logical array match the dimensions of varNames.

## Version History

**Introduced in R2022b**

### See Also

### Topics

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

# listVariables

**Package:** Simulink.data

List variables in data source workspace

## Syntax

```
varNames = listVariables(dsWks)
```

## Description

`varNames = listVariables(dsWks)` lists the variables contained in the data source workspace represented by the `Simulink.data.DataSourceWorkspace` object `dsWks`.

## Examples

### List Variables in Data Source Workspace

Add some variables to a data source workspace.

```
setVariable(sourceWorkspace, 'b', 2);
setVariables(sourceWorkspace, ['c' 'd'], {3,4});
setVariables(sourceWorkspace, {'e', 'f'}, {5,6});
```

Now return that list of variables and store the list in another variable `vars`.

```
vars = listVariables(sourceWorkspace);
vars
```

```
vars
 5x1 string array

 "b"
 "c"
 "d"
 "e"
 "f"
```

## Input Arguments

### **dsWks** — Data source workspace

`Simulink.data.DataSourceWorkspace` object

Data source workspace, specified as a `Simulink.data.DataSourceWorkspace` object.

## Output Arguments

### **varNames** — Variable names

array of strings | cell array of character vectors

Variable names, returned as an array of strings or cell array of character vectors.

## **Version History**

**Introduced in R2022b**

### **See Also**

[clearVariables](#) | [clearAllVariables](#) | [getVariable](#) | [getVariables](#) | [hasVariables](#) | [run](#) | [setVariable](#) | [setVariables](#) | [Simulink.data.adapters.BaseMatlabFileAdapter](#)

### **Topics**

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

## run

**Package:** Simulink.data

Execute the specified MATLAB script in data source workspace

### Syntax

```
run(dsWks,mscript)
```

### Description

`run(dsWks,mscript)` executes the specified MATLAB script in the data source workspace represented by the `Simulink.data.DataSourceWorkspace` object `dsWks`.

While executing a script on the data source workspace, MATLAB temporarily changes the current folder to the folder that contains the script.

### Examples

#### Execute Script in Data Source Workspace

Write a short script that sets some variables in a data source workspace.

```
% myscript.m
x = 10;
p = p+1;
```

Before running the script, check the current value of variable `p` in the data source workspace object `sourceWorkspace`.

```
getVariable(sourceWorkspace,'p')
```

```
2
```

Also check the value of variable `x`.

```
getVariable(sourceWorkspace,'x')
```

```
Error: undefined variable 'x'
```

The output shows that `x` is not yet defined in the workspace.

Now run the script `myscript.m` and check the values of `p` and `x` again.

```
run(sourceWorkspace,'myscript.m');
getVariables(sourceWorkspace,['p' 'x'])
```

```
ans =
```

```
1x2 cell array
```

```
{{3}} {{10}}
```

## Input Arguments

### **dsWks — Data source workspace**

Simulink.data.DataSourceWorkspace object

Data source workspace, specified as a Simulink.data.DataSourceWorkspace object.

### **mscript — MATLAB script**

character vector | string scalar

MATLAB script, specified as a character vector or string scalar. The script must be a .m or .mlx file on the MATLAB path.

Example: 'mfun.m'

## Version History

**Introduced in R2022b**

### **See Also**

### **Topics**

“Create External File Adapter for Loading Variables into Simulink.SimulationInput Object”

# setVariable

**Package:** Simulink.data

Set variable in data source workspace

## Syntax

```
setVariable(dsWks, varName, varValue)
```

## Description

`setVariable(dsWks, varName, varValue)` assigns `varValue` to the variable `varName` in the data source workspace represented by the `Simulink.data.DataSourceWorkspace` object `dsWks`.

## Examples

### Modify Variable in Data Source Workspace

Define a `getData` method for an XML file adapter to read the data from an XML file and then use the `setVariable` function to populate the data into the data source workspace that Simulink passes to the method.

This `getData` method reads an XML file in the following format.

```
<customerData>
<x>10</x>
<y>15</y>
</customerData>
```

```
function diagnostic = getData(adapterObj, sourceWorkspace, previousChecksum, diagnostic)
 % Each time getData is called on the same source, sourceWorkspace is the same as
 % the last time it was called. Clear it to make sure no old variables exist.
 clearAllVariables(sourceWorkspace);
 dom = xmlread(adapterObj.source);
 tree = dom.getFirstChild;
 if tree.hasChildNodes
 item = tree.getFirstChild;
 while ~isempty(item)
 name = item.getNodeName.toCharArray';
 if isvarname(name)
 value = item.getTextContent;
 setVariable(sourceWorkspace, name, str2num(value));
 end
 item = item.getNextSibling;
 end
 end
```

```
end
end
```

## Input Arguments

### **dsWks — Data source workspace**

Simulink.data.DataSourceWorkspace object

Data source workspace, specified as a Simulink.data.DataSourceWorkspace object.

### **varName — Variable name**

string | character array

Variable name specified as a string or character array.

Example: "x"

Data Types: char | string

### **varValue — Variable value**

scalar

Variable value, specified as a scalar.

Example: 2

## Version History

**Introduced in R2022b**

# setVariables

**Package:** Simulink.data

Set variables in data source workspace

## Syntax

```
setVariables(dsWks, varNames, varValues)
```

## Description

`setVariables(dsWks, varNames, varValues)` assigns the values `varValues` to the variables `varNames` in the data source workspace represented by the `Simulink.data.DataSourceWorkspace` object `dsWks`.

## Examples

### Set Variables in Data Source Workspace

Specify values for multiple variables in a `DataSourceWorkspace` object.

```
setVariables(sourceWorkspace, ["c" "d"], {3,4})
```

## Input Arguments

### **dsWks** — Data source workspace

`Simulink.data.DataSourceWorkspace` object

Data source workspace, specified as a `Simulink.data.DataSourceWorkspace` object.

### **varNames** — Variable names

string array | cell array of character vectors

Variable names, specified as a string array or cell array of character vectors.

Example: ["c" "d"]

Example: {'e', 'f'}

### **varValues** — Variable values

cell array of scalars

Variable values, specified as a cell array of scalars. The dimensions of the cell array must match the dimensions of `varNames`.

Example: {3,4}

# Simulink.data.Dictionary

Configure data dictionary

## Description

A `Simulink.data.Dictionary` object represents a data dictionary. The object allows you to perform operations on the data dictionary such as save or discard changes, import data from the base workspace, and add other data dictionaries as references.

## Creation

The functions `Simulink.data.dictionary.create` and `Simulink.data.dictionary.open` create a `Simulink.data.Dictionary` object.

## Properties

### **DataSources — Referenced data dictionaries**

cell array of character vectors

This property is read-only.

Referenced data dictionaries by file name, returned as a cell array of character vectors. This property only lists directly referenced dictionaries whose parent is the `Simulink.data.Dictionary` object.

### **EnableAccessToBaseWorkspace — Specify whether models can use design data in the base workspace**

`false` (default) | `true`

Whether linked models can use design data in the base workspace, specified as `true` or `false`.

To determine whether a dictionary provides access to the base workspace (including through referenced dictionaries), query the `HasAccessToBaseWorkspace` property.

For more information about this property, including restrictions that limit your ability to interact with base workspace data through the dictionary, see “Continue to Use Shared Data in the Base Workspace”.

Data Types: `logical`

### **HasAccessToBaseWorkspace — Query whether models can use design data in the base workspace**

`0` (default) | `1`

This property is read-only.

Query whether models can use design data in the base workspace, returned as `1` (true) or `0` (false). If the dictionary or a referenced dictionary has the `EnableAccessToBaseWorkspace` property set to `true`, this property returns `1`.

Use this property to determine whether models that link to the dictionary can use design data in the base workspace. You do not need to query each referenced dictionary to determine whether it has the `EnableAccessToBaseWorkspace` property set to `true`.

Data Types: `logical`

### **HasUnsavedChanges** — Indicator of unsaved changes

0 | 1

This property is read-only.

Indicator of unsaved changes to the data dictionary, returned as 0 or 1. The value is 1 if changes have been made since last data dictionary save and 0 if not.

### **NumberOfEntries** — Total number of entries in data dictionary

integer

This property is read-only.

Total number of entries in data dictionary, including those in referenced dictionaries, returned as an integer.

## **Object Functions**

<code>addDataSource</code>	Add reference data dictionary to parent data dictionary
<code>close</code>	Close connection between data dictionary and <code>Simulink.data.Dictionary</code> object
<code>discardChanges</code>	Discard changes to data dictionary
<code>exportToVersion</code>	Export a <code>Simulink.data.Dictionary</code> object to a previous version
<code>filepath</code>	Full path and file name of data dictionary
<code>getSection</code>	Return <code>Simulink.data.dictionary.Section</code> object to represent data dictionary section
<code>hide</code>	Remove data dictionary from Model Explorer
<code>importEnumTypes</code>	Import enumerated type definitions to data dictionary
<code>importFromBaseWorkspace</code>	Import base workspace variables to data dictionary
<code>listEntry</code>	List data dictionary entries
<code>removeDataSource</code>	Remove reference data dictionary from parent data dictionary
<code>saveChanges</code>	Save changes to data dictionary
<code>show</code>	Show data dictionary in Model Explorer

## **Examples**

### **Create New Data Dictionary and Data Dictionary Object**

Create a data dictionary file `myNewDictionary.sldd` and a `Simulink.data.Dictionary` object representing the new data dictionary. Assign the object to variable `ddl`.

```
ddl = Simulink.data.dictionary.create('myNewDictionary.sldd')
```

```
ddl =
```

```
data dictionary with properties:
```

```
 DataSources: {0x1 cell}
```

```
HasUnsavedChanges: 0
NumberOfEntries: 0
```

## Open Existing Data Dictionary

Create a `Simulink.data.Dictionary` object representing the existing data dictionary `myDictionary_ex_API.sldd`. Assign the object to variable `dd2`.

```
dd2 = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
```

```
dd2 =
```

```
Dictionary with properties:
```

```
 DataSources: {'myRefDictionary_ex_API.sldd'}
HasUnsavedChanges: 0
 NumberOfEntries: 4
```

## Version History

Introduced in R2015a

### See Also

`Simulink.data.dictionary.open` | `Simulink.data.dictionary.create` |  
`Simulink.data.dictionary.Section` | `Simulink.data.dictionary.Entry`

### Topics

“Store Data in Dictionary Programmatically”

“What Is a Data Dictionary?”

# addDataSource

**Package:** Simulink.data

Add reference data dictionary to parent data dictionary

## Syntax

```
addDataSource(dictionaryObj, refDictionaryFile)
```

## Description

`addDataSource(dictionaryObj, refDictionaryFile)` adds a data dictionary, `refDictionaryFile`, as a reference dictionary to a parent dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object.

The parent dictionary contains all the entries that are defined in the referenced dictionary until the referenced dictionary is removed from the parent dictionary. The `DataSource` property of an entry indicates the dictionary that defines the entry.

## Examples

### Add a Reference Data Dictionary to a Parent Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Add the data dictionary `mySubDictionary_ex_API.sldd` as a reference dictionary to `myDictionary_ex_API.sldd`.

```
addDataSource(myDictionaryObj, 'mySubDictionary_ex_API.sldd');
```

Confirm the addition by viewing the `DataSources` property of variable `myDictionaryObj`. The property returns the name of the newly referenced dictionary.

```
myDictionaryObj.DataSources
```

```
ans =
```

```
 'myRefDictionary_ex_API.sldd'
 'mySubDictionary_ex_API.sldd'
```

## Input Arguments

### `dictionaryObj` — Parent data dictionary

`Simulink.data.Dictionary` object

Parent data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for

example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

### **refDictionaryFile** – File name of data dictionary to reference

character vector

File name of data dictionary to reference, specified as a character vector that includes the `.sldd` extension. The data dictionary file must be on your MATLAB path.

Example: `'mySubDictionary_ex_API.sldd'`

Data Types: `char`

## **Alternatives**

You can use the Model Explorer window to manage reference dictionaries. See “Partition Dictionary Data Using Referenced Dictionaries” for more information.

## **Version History**

**Introduced in R2015a**

## **See Also**

`Simulink.data.Dictionary` | `removeDataSource`

## **Topics**

“Store Data in Dictionary Programmatically”

## close

**Package:** Simulink.data

Close connection between data dictionary and Simulink.data.Dictionary object

### Syntax

```
close(dictionaryObj)
```

### Description

`close(dictionaryObj)` closes the connection between the Simulink.data.Dictionary object `dictionaryObj` and the data dictionary it represents. `dictionaryObj` remains as a Simulink.data.Dictionary object but no longer represents any data dictionary.

### Examples

#### Close Connection Between Data Dictionary Object and Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a Simulink.data.Dictionary object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Remove connection between `myDictionaryObj` and `myDictionary_ex_API.sldd`.

```
close(myDictionaryObj);
```

### Input Arguments

#### **dictionaryObj** — Target Simulink.data.Dictionary object

handle to Simulink.data.Dictionary object

Target Simulink.data.Dictionary object, specified as a handle to the object.

### Tips

- Use the `close` function in a custom MATLAB function to disassociate a Simulink.data.Dictionary object from a data dictionary. Custom MATLAB functions can create and store variables and objects in function workspaces but cannot delete those variables and objects.
- The `close` function does not affect the content or the state of the represented data dictionary. The function does not discard unsaved changes to the represented dictionary or entries. You can save or discard them later.

## Version History

**Introduced in R2015a**

## **See Also**

Simulink.data.Dictionary

## **Topics**

“Store Data in Dictionary Programmatically”

## discardChanges

**Package:** Simulink.data

Discard changes to data dictionary

### Syntax

```
discardChanges(dictionaryObj)
```

### Description

`discardChanges(dictionaryObj)` discards all changes made to the specified data dictionary since the last time changes to the dictionary were saved using the `saveChanges` function. `discardChanges` also discards changes made to referenced data dictionaries. The changes to the target dictionary and its referenced dictionaries are permanently lost.

### Examples

#### Discard Changes to Data Dictionary

Create a `Simulink.data.Dictionary` object representing the data dictionary `myDictionary_ex_API.sldd` and assign the object to variable `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
 DataSources: {'myRefDictionary_ex_API.sldd'}
 HasUnsavedChanges: 0
 NumberOfEntries: 4
```

Make a change to `myDictionary_ex_API.sldd` by adding an entry named `myNewEntry` with value 237. View the `HasUnsavedChanges` property of `myDictionaryObj` to confirm a change was made.

```
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
addEntry(dDataSectObj, 'myNewEntry', 237);
myDictionaryObj
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
 DataSources: {'myRefDictionary_ex_API.sldd'}
 HasUnsavedChanges: 1
 NumberOfEntries: 5
```

Discard all changes to `myDictionary_ex_API.sldd`. The `HasUnsavedChanges` property of `myDictionaryObj` indicates changes were discarded.

```
discardChanges(myDictionaryObj)
myDictionaryObj

myDictionaryObj =

 Dictionary with properties:

 DataSourcees: {'myRefDictionary_ex_API.slidd'}
 HasUnsavedChanges: 0
 NumberOfEntries: 4
```

## Input Arguments

### **dictionaryObj** — Target data dictionary

Simulink.data.Dictionary object

Target data dictionary, specified as a Simulink.data.Dictionary object. Before you use this function, represent the target dictionary with a Simulink.data.Dictionary object by using, for example, the Simulink.data.dictionary.create or Simulink.data.dictionary.open function.

## Alternatives

You can use the Model Explorer window to discard changes to data dictionaries. See “View and Revert Changes to Dictionary Entries” for more information.

## Version History

Introduced in R2015a

## See Also

saveChanges | Simulink.data.Dictionary

## Topics

## exportToVersion

**Package:** Simulink.data

Export a Simulink.data.Dictionary object to a previous version

### Syntax

```
Simulink.data.Dictionary.exportToVersion(dictionaryObj, target_folder, version)
```

### Description

Simulink.data.Dictionary.exportToVersion(dictionaryObj, target\_folder, version) exports the data dictionary dictionaryObj to the folder target\_folder in a format that the specified previous Simulink version can load. The function also exports references to the specified folder. The file names of the dictionary and its references are preserved.

### Examples

#### Export a Data Dictionary to a Previous Version

Represent the data dictionary sldemo\_fuelsys\_dd\_controller.sldd with a Simulink.data.Dictionary object named myDictionaryObj.

```
openExample('sldemo_fuelsys_dd_controller');
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

Export the data dictionary to a previous version of Simulink.

```
exportToVersion(myDictionaryObj, 'myR2018aFolder', 'R2018a');
```

### Input Arguments

#### dictionaryObj — Data dictionary

Simulink.data.Dictionary object

Data dictionary, specified as a Simulink.data.Dictionary object. Before you use this function, represent the target dictionary with a Simulink.data.Dictionary object by using, for example, the Simulink.data.dictionary.create or Simulink.data.dictionary.open function.

#### target\_folder — Folder for dictionary

string scalar | character vector

Target folder for the new version of the dictionary, specified as a character vector or string scalar.

Example: 'myR2018aFolder'

Data Types: char | string

#### version — MATLAB release name

string scalar | character vector

MATLAB release name, specified as a character vector or string scalar, which specifies a previous Simulink version. The release name is not case sensitive.

`Simulink.data.Dictionary.exportToVersion` exports the data dictionary to a format that the specified previous Simulink version can load. The value must be R2014a or later. You cannot export to your current version.

Example: 'R2018a'

Data Types: char | string

## **Version History**

**Introduced in R2018b**

## filepath

**Package:** Simulink.data

Full path and file name of data dictionary

### Syntax

```
dictionaryFilePath = filepath(dictionaryObj)
```

### Description

`dictionaryFilePath = filepath(dictionaryObj)` returns the full path and file name of the data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object.

### Examples

#### Return Path of Data Dictionary File

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Return the full path of `myDictionary_ex_API.sldd` and assign it to variable `myDictionaryFilePath`.

```
myDictionaryFilePath = filepath(myDictionaryObj)
```

```
myDictionaryFilePath =
```

```
C:\Users\jsmith\myDictionary_ex_API.sldd
```

### Input Arguments

#### **dictionaryObj** — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

## Version History

Introduced in R2015a

### See Also

`Simulink.data.Dictionary`

## getSection

**Package:** Simulink.data

Return Simulink.data.dictionary.Section object to represent data dictionary section

### Syntax

```
sectionObj = getSection(dictionaryObj,sectionName)
```

### Description

sectionObj = getSection(dictionaryObj,sectionName) returns a Simulink.data.dictionary.Section object representing one section, sectionName, of a data dictionary dictionaryObj, a Simulink.data.Dictionary object.

When you access the **Embedded Coder** section of a data dictionary, getSection returns a coder.Dictionary object representing the Embedded Coder Dictionary in the data dictionary.

### Examples

#### Create New Data Dictionary Section Object

Open the data dictionary myDictionary\_ex\_API.sldd and represent it with a Simulink.data.Dictionary object named myDictionaryObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Represent the Design Data section of the data dictionary myDictionary\_ex\_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
dDataSectObj = getSection(myDictionaryObj, 'Design Data')
```

```
dDataSectObj =
```

```
 Section with properties:
```

```
 Name: 'Design Data'
```

### Input Arguments

#### dictionaryObj — Data dictionary containing target section

Simulink.data.Dictionary object

Data dictionary containing target section, specified as a Simulink.data.Dictionary object. Before you use this function, represent the dictionary with a Simulink.data.Dictionary object by using, for example, the Simulink.data.dictionary.create or Simulink.data.dictionary.open function.

#### sectionName — Name of target data dictionary section

character vector

Name of target data dictionary section, specified as a character vector.

Example: 'Design Data'

Example: 'Configurations'

Example: 'EmbeddedCoder'

Data Types: char

## **Version History**

`Simulink.data.Dictionary` | `Simulink.data.dictionary.Section`

### **Topics**

“Store Data in Dictionary Programmatically”

## hide

**Package:** Simulink.data

Remove data dictionary from Model Explorer

### Syntax

```
hide(dictionaryObj)
```

### Description

`hide(dictionaryObj)` removes the data dictionary `dictionaryObj` from the **Model Hierarchy** pane of Model Explorer. The target dictionary no longer appears as a node in the model hierarchy tree. Use this function when you are finished working with a data dictionary and want to reduce clutter in the Model Explorer.

### Examples

#### Hide Data Dictionary from Model Explorer

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Open Model Explorer and display the new data dictionary as the selected tree node in the **Model Hierarchy** pane.

```
show(myDictionaryObj)
```

With Model Explorer open, at the MATLAB command prompt, call the `hide` function to observe the removal of `myDictionary_ex_API.sldd` from the model hierarchy tree.

```
hide(myDictionaryObj)
```

### Input Arguments

#### **dictionaryObj** — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

### Tips

- To add a data dictionary as a node in the model hierarchy tree in Model Explorer, use the `show` function or use the interface to open and view the dictionary in Model Explorer.

- The hide function does not affect the content of the target dictionary.

## Alternatives

You can remove a data dictionary from the **Model Hierarchy** pane of Model Explorer by right-clicking the dictionary tree node and selecting **Close**.

## Version History

**Introduced in R2015a**

## Topics

“Store Data in Dictionary Programmatically”

# importEnumTypes

**Package:** Simulink.data

Import enumerated type definitions to data dictionary

## Syntax

```
importedTypes = importEnumTypes(dictionaryObj,targetTypes)
[importedTypes,importFailures] = importEnumTypes(dictionaryObj,targetTypes)
```

## Description

`importedTypes = importEnumTypes(dictionaryObj,targetTypes)` imports to the data dictionary `dictionaryObj` the definitions of one or more enumerated types `targetTypes`. `importEnumTypes` does not import MATLAB variables created using enumerated types but instead, in support of those variables, imports the definitions of the types. The target data dictionary stores the definition of a successfully imported type as an entry. This syntax returns a list of the names of successfully imported types. `importEnumTypes` saves changes made to the target dictionary, so before you use `importEnumTypes`, confirm that unsaved changes are acceptable.

`[importedTypes,importFailures] = importEnumTypes(dictionaryObj,targetTypes)` additionally returns a list of any target types that were not successfully imported. You can inspect the list to determine the reason for each failure.

## Examples

### Import Enumerated Data to Data Dictionary

Create a data dictionary `myNewDictionary.sldd` in your current working folder and a `Simulink.data.Dictionary` object representing the new data dictionary. Assign the object to the variable `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.create('myNewDictionary.sldd');
```

Run the script in the MATLAB file `myDataEnum_ex_API.m`. The file defines an enumerated type named `InstrumentTypes` using the `Simulink.defineIntEnumType` function and creates three variables based on the new type. Then, import the new variables from the base workspace to `myDictionary_ex_API.sldd`.

```
myDataEnum_ex_API
importFromBaseWorkspace(myDictionaryObj,'varList',...
{'firstEnumVariable','secondEnumVariable','thirdEnumVariable'});
```

Clear the imported variables from the base workspace. Before you can import an enumerated data type definition to the target data dictionary, you must clear the base workspace of any variables created using the target type.

```
clear firstEnumVariable
clear secondEnumVariable
clear thirdEnumVariable
```

Import the data type definition to `myDictionary_ex_API.slidd`.

```
importEnumTypes(myDictionaryObj, {'InstrumentTypes'})

ans =

 className: 'InstrumentTypes'
 renamedFiles: {}
```

## Input Arguments

### **dictionaryObj** — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

### **targetTypes** — Enumerated type definitions to import

cell array of character vectors | string array

Enumerated type definitions to import, specified as a cell array of character vectors or a string array. If any target types are defined using `classdef` blocks in MATLAB files or P-files, the files must be available on your MATLAB path so that `importEnumTypes` can disable them.

Example: `{'myEnumType'}`

Example: `{'myFirstEnumType', 'mySecondEnumType', 'myThirdEnumType'}`

Data Types: `cell`

## Output Arguments

### **importedTypes** — Target types successfully imported

array of structures

Target enumerated type definitions successfully imported, returned as an array of structures. Each structure in the array represents one imported type. The `className` field of each structure identifies a type by name and the `renamedFiles` field identifies any renamed MATLAB files or P-files.

### **importFailures** — Target types not imported

array of structures

Enumerated type definitions targeted but not imported, returned as an array of structures. Each structure in the array represents one type not imported. The `className` field of each structure identifies a type by name and the `reason` field explains the failure.

## Tips

- Before you can import an enumerated data type definition to a data dictionary, you must clear the base workspace of any variables created using the target type.
- You can define an enumerated type using a `classdef` block in a MATLAB file or a P-file. `importEnumTypes` imports type definitions directly from these files if you specify the names of

the types to import using the input argument `targetTypes` and if the files defining the types are on your MATLAB path.

- To avoid conflicting definitions for imported types, `importEnumTypes` renders MATLAB files or P-files ineffective by appending `.save` to their names. The `.save` extensions cause variables to rely on the definitions in the target data dictionary and not on the definitions in the files. You can remove the `.save` extensions to restore the files to their original state.
- You can use `importEnumTypes` to import enumerated types defined using the `Simulink.defineIntEnumType` function. Because such types are not defined using MATLAB files or P-files, `importEnumTypes` does not rename any files.
- Use the function `Simulink.findVars` to generate a list of the enumerated types that are used by a model. Then, use the list with `importEnumTypes` to import the definitions of the types to a data dictionary. See “Enumerations in Data Dictionary” for more information.

## Version History

Introduced in R2015a

# importFromBaseWorkspace

**Package:** Simulink.data

Import base workspace variables to data dictionary

## Syntax

```
importedVars = importFromBaseWorkspace(dictionaryObj)
importedVars = importFromBaseWorkspace(dictionaryObj,Name,Value)
[importedVars,existingVars] = importFromBaseWorkspace(____)
[importedVars,existingVars,unsupportedVars] = importFromBaseWorkspace(____)
```

## Description

`importedVars = importFromBaseWorkspace(dictionaryObj)` imports all variables from the MATLAB base workspace to the data dictionary `dictionaryObj` without overwriting existing entries in the dictionary. If any base workspace variables are already in the dictionary, the function present a warning and a list.

This syntax returns a list of names of the successfully imported variables. A variable is considered successfully imported only if `importFromBaseWorkspace` assigns the value of the variable to the corresponding entry in the target data dictionary.

`importedVars = importFromBaseWorkspace(dictionaryObj,Name,Value)` imports base workspace variables to a data dictionary, with additional options specified by one or more `Name,Value` pair arguments.

`[importedVars,existingVars] = importFromBaseWorkspace(____)` additionally returns a list of variables that were not overwritten. Use this syntax if `existingVarsAction` is set to 'none', the default value, which prevents existing dictionary entries from being overwritten.

`[importedVars,existingVars,unsupportedVars] = importFromBaseWorkspace(____)` additionally returns a list of unsupported variables that were not imported. When there are unsupported variables in the base workspace, if you call this function without the `unsupportedVars` output argument, Simulink reports a warning.

## Examples

### Import All Base Workspace Variables to Data Dictionary

In the MATLAB base workspace, create variables to import.

```
a = 'Char Variable';
myVariable = true;
fuelFlow = 324;
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import all base workspace variables to the data dictionary and return a list of successfully imported variables. If any base workspace variables are already in `myDictionary_ex_API.sldd`, `importFromBaseWorkspace` presents a warning and a list of the affected variables.

```
importFromBaseWorkspace(myDictionaryObj);
```

```
Warning: The following variables were not imported because
they already exist in the dictionary:
 fuelFlow
```

### Specify Variables to Import to Data Dictionary from Base Workspace

In the MATLAB base workspace, create variables to import.

```
b = 'Char Variable';
mySecondVariable = true;
airFlow = 324;
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import only the new base workspace variables to the data dictionary.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', ...
{'b', 'mySecondVariable', 'airFlow'});
```

### Import Variables from Base Workspace and Overwrite Conflicts

In the MATLAB base workspace, create a variable to import.

```
fuelFlow = 324;
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`. `myDictionary_ex_API.sldd` already contains an entry called `fuelFlow`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the variable `fuelFlow` and overwrite the corresponding entry in `myDictionary_ex_API.sldd`.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', {'fuelFlow'}, ...
'existingVarsAction', 'overwrite');
```

`importFromBaseWorkspace` assigns the value of the base workspace variable `fuelFlow` to the value of the corresponding entry in `myDictionary_ex_API.sldd`.

### Return Variables Not Imported to Data Dictionary from Base Workspace

Return a list of variables that are not imported from the MATLAB base workspace because they are already in the target data dictionary.

In the MATLAB base workspace, create variables to import.

```
fuelFlow = 324;
myNewVariable = 'This is a character vector.'
```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`. `myDictionary_ex_API.sldd` already contains an entry called `fuelFlow`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the variables `fuelFlow` and `myNewVariable` to the data dictionary. Specify names for the output arguments of `importFromBaseWorkspace` to return the names of successfully and unsuccessfully imported variables.

```
[importedVars,existingVars] = importFromBaseWorkspace(myDictionaryObj,...
'varList',{'fuelFlow','myNewVariable'})
```

```
importedVars =
 'myNewVariable'
```

```
existingVars =
 'fuelFlow'
```

`importFromBaseWorkspace` does not import the variable `fuelFlow` because it is already in the target data dictionary.

## Input Arguments

### **dictionaryObj** — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

### **Name-Value Pair Arguments**

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `'varList',{'fuelFlow'}, 'existingVarsAction','overwrite'` imports the variable `fuelFlow` and overwrites the corresponding entry in the data dictionary.

### **clearWorkspaceVars** — Flag to clear base workspace of imported variables

false (default) | true

Flag to clear the base workspace of any successfully imported variables, specified as the comma-separated pair consisting of `'clearWorkspaceVars'` and `true` or `false`.

Example: `'clearWorkspaceVars',true`

Data Types: `logical`

### **existingVarsAction — Action to take for existing dictionary variables**

`'none'` (default) | `'error'` | `'overwrite'`

Action to take for existing dictionary variables, specified as the comma-separated pair consisting of `'existingVarsAction'` and `'none'`, `'error'`, or `'overwrite'`.

If you specify `'none'`, `importFromBaseWorkspace` attempts to import target variables but does not import or make any changes to variables that are already in the data dictionary.

If you specify `'error'`, `importFromBaseWorkspace` returns an error, without importing any variables, if any target variables are already in the data dictionary.

If you specify `'overwrite'`, `importFromBaseWorkspace` imports all target variables and overwrites any variables that are already in the data dictionary.

Example: `'existingVarsAction','error'`

Data Types: `char`

### **varList — Variables to import**

cell array of character vectors | string array

Names of specific base workspace variables to import, specified as the comma-separated pair consisting of `'varList'` and a cell array of character vectors or a string array. If you want to import only one variable, specify the name inside a cell array. If you do not specify `'varList'`, `importFromBaseWorkspace` imports all variables from the MATLAB base workspace.

Example: `'varList',{'a','myVariable','fuelFlow'}`

Example: `'varList',{'fuelFlow'}`

Data Types: `cell`

## **Output Arguments**

### **importedVars — Successfully imported variables**

cell array of character vectors

Names of successfully imported variables, returned as a cell array of character vectors. A variable is considered successfully imported only if `importFromBaseWorkspace` assigns the value of the variable to the corresponding entry in the target data dictionary.

### **existingVars — Existing variables that were not imported**

cell array of character vectors

Names of target variables that were not imported due to their existence in the target data dictionary, returned as a cell array of character vectors. `existingVars` has content only if `'existingVarsAction'` is set to `'none'` which is also the default. In that case `importFromBaseWorkspace` imports only variables that are not already in the target data dictionary.

### **unsupportedVars — Unsupported variables that were not imported**

cell array of character vectors

Names of unsupported target variables that were not imported, returned as a cell array of character vectors. If this output argument is not included in the function call when there are unsupported variables, Simulink reports a warning. For the types of variables that can be imported into a data dictionary, see “Valid Design Data Classes”.

## Tips

- `importFromBaseWorkspace` can import MATLAB variables created from enumerated data types but cannot import the definitions of the enumerated types. Use the `importEnumTypes` function to import enumerated data type definitions to a data dictionary. If you import variables of enumerated data types to a data dictionary but do not import the enumerated type definitions, the dictionary is less portable and might not function properly if used by someone else.
- If the value of a variable is a `timeseries` object (which a data dictionary cannot store) or a structure with fields identical to a `timeseries` object, `importFromBaseWorkspace` cannot import the variable.

## Alternatives

- When you use the Simulink Editor to link a model to a data dictionary, you can choose to import model variables from the base workspace. See “Migrate Single Model to Use Dictionary” for more information.
- You can also use the Model Explorer window to drag-and-drop variables from the base workspace into a data dictionary.

## Version History

**Introduced in R2015a**

## Topics

“Store Data in Dictionary Programmatically”

## listEntry

**Package:** Simulink.data

List data dictionary entries

### Syntax

```
listEntry(dictionaryObj)
listEntry(dictionaryObj,Name,Value)
```

### Description

`listEntry(dictionaryObj)` displays in the MATLAB Command Window a table of information about all the entries in the data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object. The displayed information includes the name of each entry, the name of the section containing each entry, the status of each entry, the date and time each entry was last modified, the last user name to modify each entry, and the class of the value each entry contains. By default, the function sorts the list of entries alphabetically by entry name.

`listEntry(dictionaryObj,Name,Value)` displays the entries in a data dictionary with additional options specified by one or more `Name,Value` pair arguments.

To return the value of a data dictionary entry at the command prompt, use the `getValue` method of a `Simulink.data.dictionary.Entry` object. See “Store Data in Dictionary Programmatically”.

To get a list of entries in a dictionary section, returned as an array of `Simulink.data.dictionary.Entry` objects, use the `find` method of a `Simulink.data.dictionary.Section` object with no arguments.

### Examples

#### List All Entries in Data Dictionary

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
openExample('sldemo_fuelsys_dd_controller');
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List all the entries in the data dictionary.

```
listEntry(myDictionaryObj)
```

#### Sort List of Data Dictionary Entries in Descending Order

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
openExample('sldemo_fuelsys_dd_controller');
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List all the entries in the data dictionary and sort the list in descending order by entry name.

```
listEntry(myDictionaryObj, 'Ascending', false)
```

### Filter List of Data Dictionary Entries by Name

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
openExample('sldemo_fuelsys_dd_controller');
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List only the entries in the data dictionary whose names begin with `max`.

```
listEntry(myDictionaryObj, 'Name', 'max*')
```

### Sort List of Data Dictionary Entries by Time of Modification

Represent the data dictionary `sldemo_fuelsys_dd_controller.sldd` with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
openExample('sldemo_fuelsys_dd_controller');
myDictionaryObj = Simulink.data.dictionary.open('sldemo_fuelsys_dd_controller.sldd');
```

List all the entries in the dictionary and sort the list by the date and time each entry was last modified.

```
listEntry(myDictionaryObj, 'SortBy', 'LastModified')
```

## Input Arguments

### `dictionaryObj` — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

*Before R2021a, use commas to separate each name and value, and enclose `Name` in quotes.*

Example: `'SortBy', 'LastModified'` sorts the entries in the data dictionary by the date and time each entry was last modified.

### Ascending — Sort order of list

`true` (default) | `false`

Sort order of the list of data dictionary entries, specified as the comma-separated pair consisting of 'Ascending' and true or false. If you specify false, `listEntry` sorts the list in descending order.

Example: 'Ascending', false

Data Types: logical

### **Class — Criteria to filter list by class**

character vector

Criteria to filter the list of data dictionary entries by class, specified as the comma-separated pair consisting of 'Class' and a character vector identifying a valid class. The function lists only entries whose values are of the specified class.

Example: 'Class', 'Simulink.Parameter'

Data Types: char

### **LastModifiedBy — Criteria to filter list by user name of last modifier**

character vector

Criteria to filter the list of data dictionary entries by the user name of the last user to modify each entry, specified as the comma-separated pair consisting of 'LastModifiedBy' and a character vector identifying the specified user name. The function lists only entries that were last modified by the specified user name.

Example: 'LastModifiedBy', 'jsmith'

Data Types: char

### **Limit — Maximum number of entries to list**

integer

Maximum number of entries to list, specified as the comma-separated pair consisting of 'Limit' and an integer. The function lists up to the specified number of entries starting from the top of the sorted and filtered list.

Example: 'Limit', 9

Data Types: double

### **Name — Criteria to filter list by entry name**

character vector

Criteria to filter the list of data dictionary entries by entry name, specified as the comma-separated pair consisting of 'Name' and a character vector defining the filter criteria. You can use an asterisk character, \*, as a wildcard to represent any number of characters. The function lists only entries whose names match the filter criteria.

Example: 'Name', 'fuelFlow'

Example: 'Name', 'fuel\*'

Data Types: char

### **Section — Criteria to filter list by data dictionary section**

character vector

Criteria to filter the list of data dictionary entries by section, specified as the comma-separated pair consisting of 'Section' and a character vector identifying the target section. The function lists only entries that are contained in the target section.

Example: 'Section','Design Data'

### **SortBy — Flag to sort list by specific property**

'Name' (default) | 'Section' | 'LastModified' | 'LastModifiedBy'

Flag to sort the list of data dictionary entries by a specific property, specified as the comma-separated pair consisting of 'SortBy' and a character vector identifying a property in the list of entries. Valid properties include 'Name', 'Section', 'LastModified', and 'LastModifiedBy'.

Example: 'SortBy','LastModifiedBy'

“What Is a Data Dictionary?”

## removeDataSource

**Package:** Simulink.data

Remove reference data dictionary from parent data dictionary

### Syntax

```
removeDataSource(dictionaryObj, refDictionaryFile)
```

### Description

`removeDataSource(dictionaryObj, refDictionaryFile)` removes a referenced data dictionary, `refDictionaryFile`, from a parent dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object.

The parent dictionary no longer contains the entries that are defined in the referenced dictionary.

### Examples

#### Remove Referenced Data Dictionary from Parent Data Dictionary

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`. The `DataSources` property of `myDictionaryObj` indicates `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd')
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
 DataSources: {'myRefDictionary_ex_API.sldd'}
HasUnsavedChanges: 0
 NumberOfEntries: 4
```

Remove `myRefDictionary_ex_API.sldd` from `myDictionary_ex_API.sldd`.

```
removeDataSource(myDictionaryObj, 'myRefDictionary_ex_API.sldd');
```

View the properties of the `Simulink.data.Dictionary` object `myDictionaryObj`, which represents the parent data dictionary. The `DataSources` property confirms the removal of `myRefDictionary_ex_API.sldd`.

```
myDictionaryObj
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
 DataSources: {0x1 cell}
```

```
HasUnsavedChanges: 1
NumberOfEntries: 3
```

## Input Arguments

### **dictionaryObj** — Parent data dictionary

Simulink.data.Dictionary object

Parent data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

### **refDictionaryFile** — File name of referenced data dictionary

character vector

File name of referenced data dictionary, specified as a character vector that includes the `.sldd` extension. The data dictionary file must be on your MATLAB path.

Example: `'myRefDictionary_ex_API.sldd'`

Data Types: `char`

## Alternatives

You can use Model Explorer to manage reference dictionaries. See “Partition Dictionary Data Using Referenced Dictionaries” for more information.

## Version History

Introduced in R2015a

`Simulink.data.Dictionary` | `addDataSource`

## Topics

“Store Data in Dictionary Programmatically”

## saveChanges

**Package:** Simulink.data

Save changes to data dictionary

### Syntax

```
saveChanges(dictionaryObj)
```

### Description

`saveChanges(dictionaryObj)` saves all changes made to a data dictionary `dictionaryObj`, a `Simulink.data.Dictionary` object. `saveChanges` also saves changes made to referenced data dictionaries. The previous states of the target dictionary and its referenced dictionaries are permanently lost.

### Examples

#### Save Changes to Data Dictionary

Create a new data dictionary `myNewDictionary.sldd` and represent the Design Data section with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.create('myNewDictionary.sldd')
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

```
myDictionaryObj =
```

```
data dictionary with properties:
```

```
 DataSources: {0x1 cell}
 HasUnsavedChanges: 0
 NumberOfEntries: 0
```

Change `myNewDictionary.sldd` by adding an entry named `myNewEntry` with value 237. View the `HasUnsavedChanges` property of `myDictionaryObj` to confirm a change was made.

```
addEntry(dDataSectObj, 'myNewEntry', 237);
myDictionaryObj
```

```
myDictionaryObj =
```

```
Dictionary with properties:
```

```
 DataSources: {0x1 cell}
 HasUnsavedChanges: 1
 NumberOfEntries: 1
```

Save all changes to `myNewDictionary.sldd`. The `HasUnsavedChanges` property of `myDictionaryObj` indicates changes were saved.

```
saveChanges(myDictionaryObj)
myDictionaryObj

myDictionaryObj =

 Dictionary with properties:
 DataSources: {0x1 cell}
 HasUnsavedChanges: 0
 NumberOfEntries: 1
```

## Input Arguments

### **dictionaryObj** — Target data dictionary

Simulink.data.Dictionary object

Target data dictionary, specified as a Simulink.data.Dictionary object. Before you use this function, represent the target dictionary with a Simulink.data.Dictionary object by using, for example, the Simulink.data.dictionary.create or Simulink.data.dictionary.open function.

## Alternatives

You can use Model Explorer to save changes to a data dictionary by right-clicking on the dictionary tree node in the **Model Hierarchy** pane and selecting **Save Changes**.

## Version History

Introduced in R2015a

## See Also

Simulink.data.Dictionary | discardChanges

## Topics

“Store Data in Dictionary Programmatically”

## show

**Package:** Simulink.data

Show data dictionary in Model Explorer

### Syntax

```
show(dictionaryObj)
show(dictionaryObj, openModelExplorer)
```

### Description

`show(dictionaryObj)` opens Model Explorer and displays the data dictionary `dictionaryObj` as the selected tree node in the **Model Hierarchy** pane.

`show(dictionaryObj, openModelExplorer)` enables you to add the target dictionary to the **Model Hierarchy** pane without opening Model Explorer.

### Examples

#### Show Data Dictionary in Model Explorer

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Open Model Explorer and display `myDictionary_ex_API` as the selected node of the model hierarchy tree in the **Model Hierarchy** pane.

```
show(myDictionaryObj)
```

#### Add Data Dictionary to Model Hierarchy Tree

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Add `myDictionary_ex_API.sldd` to the model hierarchy tree without opening Model Explorer.

```
show(myDictionaryObj, false)
```

You can confirm the addition of `myDictionary_ex_API` to the model hierarchy tree by manually opening Model Explorer.

## Input Arguments

### **dictionaryObj** — Target data dictionary

`Simulink.data.Dictionary` object

Target data dictionary, specified as a `Simulink.data.Dictionary` object. Before you use this function, represent the target dictionary with a `Simulink.data.Dictionary` object by using, for example, the `Simulink.data.dictionary.create` or `Simulink.data.dictionary.open` function.

### **openModelExplorer** — Flag to open Model Explorer

`true` (default) | `false`

Flag to open Model Explorer, specified as `true` or `false`.

Data Types: `logical`

## Tips

- Use the `hide` function to remove a data dictionary from the tree in the **Model Hierarchy** pane of Model Explorer. The dictionary does not appear in the hierarchy again until you use the `show` function or you open and view the dictionary in the Model Explorer using the interface.

## Version History

Introduced in R2015a

`Simulink.data.Dictionary` | `hide`

## Topics

“Store Data in Dictionary Programmatically”

# Simulink.data.dictionary.Entry

Configure data dictionary entry

## Description

An object of the `Simulink.data.dictionary.Entry` class represents one entry of a data dictionary. The object allows you to perform operations such as assign the entry a value or change the name of the entry.

Before you can create a new `Simulink.data.dictionary.Entry` object, you must create a `Simulink.data.dictionary.Section` object representing the data dictionary section that contains the target entry. However, once created, the `Simulink.data.dictionary.Entry` object exists independently of the `Simulink.data.dictionary.Section` object. Use the function `getSection` to create a `Simulink.data.dictionary.Section` object.

## Creation

### Syntax

#### Description

The functions `addEntry`, `getEntry`, and `find` create `Simulink.data.dictionary.Entry` objects.

## Properties

### DataSource — File name of containing data dictionary

character vector

File name of containing data dictionary, specified as a character vector. Changes you make to this property affect the represented data dictionary entry.

Example: `'myDictionary.sldd'`

Data Types: `char`

### LastModified — Date and time of last modification

character vector

Date and time of last modification to entry, returned in Coordinated Universal Time (UTC) as a character vector. This property is read only.

### LastModifiedBy — Name of last user to modify entry

character vector

Name of last user to modify entry, returned as a character vector. This property is read only.

### Name — Name of entry

character vector

Name of entry, specified as a character vector. Changes you make to this property affect the represented data dictionary entry.

Data Types: char

### Status — State of entry

'New' | 'Modified' | 'Unchanged' | 'Deleted'

State of entry, returned as 'New', 'Modified', 'Unchanged', or 'Deleted'. The state is valid since the last data dictionary save. If the state is 'Deleted', the represented entry was deleted from its data dictionary. This property is read only.

## Object Functions

deleteEntry	Delete data dictionary entry
discardChanges	Discard changes to data dictionary entry
find	Search in array of data dictionary entries
getValue	Return value of data dictionary entry
setValue	Set value of data dictionary entry
showChanges	Display changes made to data dictionary entry

## Examples

### Add Entry to Data Dictionary and Modify its Value

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Add an entry `myEntry` with value 27 to the Design Data section of `myDictionary_ex_API.sldd`. Assign the returned `Simulink.data.dictionary.Entry` object to variable `e`.

```
e = addEntry(dDataSectObj, 'myEntry', 27)
```

```
e =
```

Entry with properties:

```
 Name: 'myEntry'
 Value: 27
 DataSource: 'myDictionary_ex_API.sldd'
 LastModified: '2014-Aug-26 18:42:08.439709'
 LastModifiedBy: 'jsmith'
 Status: 'New'
```

Change the value of `myEntry` from 27 to the character vector 'My New Value'.

```
setValue(e, 'My New Value')
```

```
e
```

```
e =
```

Entry with properties:

```

 Name: 'myEntry'
 Value: 'My New Value'
 DataSource: 'myDictionary_ex_API.sldd'
 LastModified: '2014-Aug-26 18:45:58.336598'
 LastModifiedBy: 'jsmith'
 Status: 'New'

```

### Return Value of Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```

myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');

```

Return the value of the entry `fuelFlow` and assign the value to the variable `fuelFlowValue`.

```
fuelFlowValue = getValue(fuelFlowObj)
```

```
fuelFlowValue =
```

```
237
```

### Move Entry Within Data Dictionary Hierarchy

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`. `myDictionary_ex_API.sldd` references the data dictionary `myRefDictionary_ex_API.sldd`.

```

myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');

```

Create a `Simulink.data.dictionary.Entry` object representing the entry `fuelFlow`, which resides in `myDictionary_ex_API.sldd`. Assign the object to variable `e`.

```
e = getEntry(dDataSectObj, 'fuelFlow')
```

```
e =
```

```
Entry with properties:
```

```

 Name: 'fuelFlow'
 Value: 237
 DataSource: 'myDictionary_ex_API.sldd'
 LastModified: '2014-Sep-05 13:12:06.099278'
 LastModifiedBy: 'jsmith'
 Status: 'Unchanged'

```

Migrate the entry `fuelFlow` to the reference data dictionary `myRefDictionary_ex_API.sldd` by modifying the `DataSource` property of `e`.

```
e.DataSource = 'myRefDictionary_ex_API.sldd'
```

```
e =
```

```
Entry with properties:
```

```
Name: 'fuelFlow'
Value: 237
DataSource: 'myRefDictionary_ex_API.sldd'
LastModified: '2014-Sep-05 13:12:06.099278'
LastModifiedBy: 'jsmith'
Status: 'Modified'
```

Because myDictionary\_ex\_API.sldd references myRefDictionary\_ex\_API.sldd, both dictionaries belong to the same dictionary hierarchy, allowing you to migrate the entry fuelFlow between them.

## Version History

**Introduced in R2015a**

# deleteEntry

**Package:** Simulink.data.dictionary

Delete data dictionary entry

## Syntax

```
deleteEntry(entryObj)
```

## Description

`deleteEntry(entryObj)` deletes the data dictionary entry represented by `entryObj`, a `Simulink.data.dictionary.Entry` object. The represented entry no longer exists in the data dictionary that defined it.

The function sets the `Status` properties of any `Simulink.data.dictionary.Entry` objects representing the deleted entry to 'Deleted'. You can access only the `Status` properties of the objects.

## Examples

### Delete Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Delete the entry `fuelFlow` from the data dictionary `myDictionary_ex_API.sldd`. `myDictionary_ex_API.sldd` no longer contains the `fuelFlow` entry.

```
deleteEntry(fuelFlowObj)
```

## Input Arguments

### **entryObj** — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

## Alternatives

You can use the Model Explorer window to view the contents of a data dictionary and delete entries.

## **Version History**

Introduced in R2015a

### **See Also**

Simulink.data.dictionary.Entry | addEntry

### **Topics**

“Store Data in Dictionary Programmatically”

## discardChanges

**Package:** Simulink.data.dictionary

Discard changes to data dictionary entry

### Syntax

```
discardChanges(entryObj)
```

### Description

`discardChanges(entryObj)` discards all changes made to the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object, since the last time the containing data dictionary was saved using the `saveChanges` function. The changes to the entry are permanently lost.

### Examples

#### Discard Changes to Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Change the entry `fuelFlow` by assigning it the new value 493. Confirm a change was made by viewing the `Status` property of `fuelFlowObj`.

```
setValue(fuelFlowObj, 493);
fuelFlowObj
```

```
fuelFlowObj =
```

```
Entry with properties:
```

```
 Name: 'fuelFlow'
 Value: 493
 DataSource: 'myDictionary_ex_API.sldd'
 LastModified: '2014-Sep-05 13:14:30.661978'
 LastModifiedBy: 'jsmith'
 Status: 'Modified'
```

Discard all changes to the entry `fuelFlow`. The `Status` property of `fuelFlowObj` shows that changes were discarded.

```
discardChanges(fuelFlowObj)
fuelFlowObj
```

```
fuelFlowObj =
```

```
Entry with properties:
```

```
Name: 'fuelFlow'
Value: 237
DataSource: 'myDictionary_ex_API.slidd'
LastModified: '2014-Sep-05 13:12:06.099278'
LastModifiedBy: 'jsmith'
Status: 'Unchanged'
```

## Input Arguments

### **entryObj** — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

## Tips

- You can use the `discardChanges` function or the `saveChanges` function with an entire data dictionary, discarding or saving changes to all entries in the dictionary at once. However, only the `discardChanges` function can additionally operate on individual entries. You cannot use the `saveChanges` function to save changes to individual entries.

## Alternatives

You can use Model Explorer and the Comparison Tool to discard changes to data dictionary entries. See “View and Revert Changes to Dictionary Entries” for more information.

## Version History

**Introduced in R2015a**

`Simulink.data.dictionary.Entry` | `saveChanges`

## Topics

“Store Data in Dictionary Programmatically”

## find

**Package:** Simulink.data.dictionary

Search in array of data dictionary entries

### Syntax

```
foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN)
foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN,options)
```

### Description

`foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN)` searches the array of data dictionary entries `targetEntries` using search criteria `PName1,PValue1,...,PNameN,PValueN`, and returns an array of entries matching the criteria. This syntax matches the search criteria with the properties of the target entries, which are `Simulink.data.dictionary.Entry` objects, but not with the properties of their values. See `Simulink.data.dictionary.Entry` for a list of data dictionary entry properties.

`foundEntries = find(targetEntries,PName1,PValue1,...,PNameN,PValueN,options)` searches for data dictionary entries using additional search options. For example, you can match the search criteria with the values of the target entries.

### Examples

#### Search Data Dictionary Entry Values for Specific Class

Search in an array of data dictionary entries `myEntryObjs` for entries whose values are objects of the class `Simulink.Parameter`.

```
foundEntries = find(myEntryObjs,'-value','-class','Simulink.Parameter')
```

#### Search Data Dictionary Entries for Modifying User

Search in an array of data dictionary entries `myEntryObjs` for entries that were last modified by the user `jsmith`.

```
foundEntries = find(myEntryObjs,'LastModifiedBy','jsmith')
```

#### Search Data Dictionary Entries Using Multiple Criteria

Search in an array of data dictionary entries `myEntryObjs` for entries that were last modified by the user `jsmith` or whose names begin with `fuel`.

```
foundEntries = find(myEntryObjs, 'LastModifiedBy', 'jsmith', '-or', ...
'-regexp', 'Name', 'fuel*')
```

### Search Data Dictionary Entries Using Regular Expressions

Search in an array of data dictionary entries `myEntryObjs` for entries whose names begin with `Press`.

```
foundEntries = find(myEntryObjs, '-regexp', 'Name', 'Press*')
```

### Search Data Dictionary Entries for Specific Value

Search in an array of data dictionary entries `myEntryObjs` for entries whose values are 273. If you find more than one entry, store the entries in an array called `foundEntries`.

```
foundEntries = [];
for i = 1:length(myEntryObjs)
 if getValue(myEntryObjs(i)) == 237
 foundEntries = [foundEntries myEntryObjs(i)];
 end
end
```

### Search Data Dictionary Entry Values for Specific Property

Search in an array of data dictionary entries `myEntryObjs` for entries whose values have a property `DataType`.

```
foundEntries = find(myEntryObjs, '-value', '-property', 'DataType')
```

## Input Arguments

### **targetEntries** — Data dictionary entries to search

array of `Simulink.data.dictionary.Entry` objects

Data dictionary entries to search, specified as an array `Simulink.data.dictionary.Entry` objects. Before you use this function, represent the target entries with `Simulink.data.dictionary.Entry` objects by using, for example, the `getEntry` function.

Example: `[myEntryObj1, myEntryObj2, myEntryObj3]`

### **PName1, PValue1, ..., PNameN, PValueN** — Search criteria

name-value pairs representing properties

Search criteria, specified as one or more name-value pairs representing names and values of properties of the target data dictionary entries. For a list of the properties of a data dictionary entry, see `Simulink.data.dictionary.Entry`. If you specify more than one name-value pair, the returned entries meet all of the criteria.

If you include the `'-value'` option to search in the values of the target entries, the search criteria apply to the values of the entries rather than to the entries themselves.

Example: 'LastModifiedBy','jsmith'

Example: 'DataSource','myRefDictionary\_ex\_API.sldd'

### options – Additional search options

supported option codes

Additional search options, specified as one or more of the following supported option codes.

'-value'	This option causes <code>find</code> to search only in the values of the target data dictionary entries. Specify this option before any other search criteria or <code>options</code> arguments.
'-and', '-or', '-xor', or '-not' logical operators	These options modify or combine multiple search criteria or other option codes.
'-property', <code>propertyName</code>	This name-value pair causes <code>find</code> to search for entries or values that have the property <code>propertyName</code> regardless of the value of the property. Specify <code>propertyName</code> as a character vector.
'-class', <code>className</code>	This name-value pair causes <code>find</code> to search for entries or values that are objects of the class <code>className</code> . Specify <code>className</code> as a character vector.
'-isa', <code>className</code>	This name-value pair causes <code>find</code> to search for entries or values that are objects of the class or of any subclass derived from the class <code>className</code> . Specify <code>className</code> as a character vector.
'-regexp'	This option allows you to use regular expressions in your search criteria. This option affects only search criteria that follow '-regexp'.

Example: '-value'

Example: '-value', '-property', 'CoderInfo'

Example: '-value', '-class', 'Simulink.Parameter'

## Output Arguments

### foundEntries – Data dictionary entries matching search criteria

array of `Simulink.data.dictionary.Entry` objects

Data dictionary entries matching the specified search criteria, returned as an array of `Simulink.data.dictionary.Entry` objects.

## Version History

Introduced in R2015a

### See Also

`Simulink.data.dictionary.Entry` | `find`

**Topics**

“Store Data in Dictionary Programmatically”

## getValue

**Package:** Simulink.data.dictionary

Return value of data dictionary entry

### Syntax

```
entryValue = getValue(entryObj)
```

### Description

`entryValue = getValue(entryObj)` returns the value of the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

### Examples

#### Return Value of Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Return the value of the entry `fuelFlow` and assign the value to variable `fuelFlowValue`.

```
fuelFlowValue = getValue(fuelFlowObj)
```

```
fuelFlowValue =
```

```
 237
```

### Input Arguments

#### **entryObj** — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

## Version History

**Introduced in R2015a**

**See Also**

Simulink.data.dictionary.Entry | setValue

**Topics**

“Store Data in Dictionary Programmatically”

## setValue

**Package:** Simulink.data.dictionary

Set value of data dictionary entry

### Syntax

```
setValue(entryObj, newValue)
```

### Description

`setValue(entryObj, newValue)` assigns the value `newValue` to the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

### Examples

#### Set Value of Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Set the value of the entry `fuelFlow` to 493. Then, view the `Value` property of `fuelFlowObj` to observe the change.

```
setValue(fuelFlowObj, 493)
fuelFlowObj
```

```
fuelFlowObj =
```

```
Entry with properties:
```

```
 Name: 'fuelFlow'
 Value: 493
 DataSource: 'myDictionary_ex_API.sldd'
 LastModified: '2014-Sep-05 13:37:22.161124'
 LastModifiedBy: 'jsmith'
 Status: 'Modified'
```

### Input Arguments

**entryObj** — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

### **newValue — Value to assign to data dictionary entry**

MATLAB expression

Value to assign to data dictionary entry, specified as a MATLAB expression. The expression must return a value that is supported by the data dictionary section that contains the entry.

Example: `27.5`

Example: `myBaseWorkspaceVariable`

Example: `Simulink.Parameter`

## **Alternatives**

You can use the Model Explorer window to view and change the values of data dictionary entries.

## **Version History**

**Introduced in R2015a**

## **See Also**

`Simulink.data.dictionary.Entry` | `getValue`

## **Topics**

“Store Data in Dictionary Programmatically”

## showChanges

**Package:** Simulink.data.dictionary

Display changes made to data dictionary entry

### Syntax

```
showChanges(entryObj)
```

### Description

`showChanges(entryObj)` opens the Comparison Tool to show changes made to the data dictionary entry `entryObj`, a `Simulink.data.dictionary.Entry` object. The Comparison Tool displays the properties of `entryObj` as they were when the data dictionary was last saved and as they were when the `showChanges` function was called.

### Examples

#### View Unsaved Changes to Data Dictionary Entry

Represent the data dictionary entry `fuelFlow` with a `Simulink.data.dictionary.Entry` object named `fuelFlowObj`. `fuelFlow` is defined in the data dictionary `myDictionary_ex_API.sldd`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
fuelFlowObj = getEntry(dDataSectObj, 'fuelFlow');
```

Make a change to the entry `fuelFlow` by assigning it the new value 494.

```
setValue(fuelFlowObj, 494);
```

Observe the unsaved change to the entry `fuelFlow`. The Comparison Tool opens and compares side by side the current state of the entry with its most recently saved state.

```
showChanges(fuelFlowObj)
```

### Input Arguments

#### **entryObj** — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, specified as a `Simulink.data.dictionary.Entry` object. Before you use this function, represent the target entry with a `Simulink.data.dictionary.Entry` object by using, for example, the `getEntry` function.

### Alternatives

You can use Model Explorer and the Comparison Tool to view changes to data dictionary entries. See “View and Revert Changes to Dictionary Entries” for more information.

*"Store Data in Dictionary Programmatically"*

# Simulink.data.dictionary.EnumTypeDefinition

Store enumerated type definition in data dictionary

## Description

A `Simulink.data.dictionary.EnumTypeDefinition` object defines an enumerated data type in a data dictionary. You store the object in a data dictionary entry so models linked to the dictionary can use the enumerated type definition.

In the MATLAB base workspace, `Simulink.data.dictionary.EnumTypeDefinition` objects retain information about an enumerated type but do not define the type for use by other variables or by models.

## Creation

You can create a `Simulink.data.dictionary.EnumTypeDefinition` object several ways.

- Interactively create a `Simulink.data.dictionary.EnumTypeDefinition` object using the **Type Editor** or **Model Explorer**.
- Import the definitions of enumerated types to a data dictionary using the `importEnumTypes` function. Simulink creates a `Simulink.data.dictionary.EnumTypeDefinition` object in the dictionary for each imported definition. The dictionary stores each object in an individual entry.
- Programmatically create a `Simulink.data.dictionary.EnumTypeDefinition` object using the `Simulink.data.dictionary.EnumTypeDefinition` function described here.

## Syntax

`Simulink.data.dictionary.EnumTypeDefinition`

### Description

The `Simulink.data.dictionary.EnumTypeDefinition` function creates a `Simulink.data.dictionary.EnumTypeDefinition` object with default property values and a single enumeration member that has underlying integer value 0.

## Properties

### AddClassNameToEnumNames — Flag to control enumeration identifiers in generated code

`false` (default) | `true`

Flag to prefix enumerations with the class name in generated code, specified as `true` or `false`.

If you specify `true`, when you generate code the identifier of each enumeration member begins with the name of the enumeration class. For example, an enumeration class `LEDcolor` with enumeration members `GREEN` and `RED` defines the enumeration members in generated code as `LEDcolor_GREEN` and `LEDcolor_RED`.

Data Types: logical

### DataScope — Flag to control data type definition in generated code

'Auto' (default) | 'Imported' | 'Exported'

Flag to control data type definition in generated code, specified as 'Auto', 'Imported', or 'Exported'. The table describes the behavior of generated code for each value.

Value	Action
Auto (default)	<p>If you do not specify the property <code>Headerfile</code>, export the data type definition to <code>model_types.h</code>, where <code>model</code> is the model name.</p> <p>If you specify <code>Headerfile</code>, import the data type definition from the specified header file.</p>
Exported	<p>Export the data type definition to a separate header file.</p> <p>If you do not specify the property <code>Headerfile</code>, the header file name defaults to <code>type.h</code>, where <code>type</code> is the data type name.</p>
Imported	<p>Import the data type definition from a separate header file.</p> <p>If you do not specify the property <code>Headerfile</code>, the header file name defaults to <code>type.h</code>, where <code>type</code> is the data type name.</p>

### DefaultValue — Default enumeration member

'' (default) | character vector

Default enumeration member, specified as a character vector. Specify `DefaultValue` as the name of an enumeration member you have already defined.

When you create a `Simulink.data.dictionary.EnumTypeDefinition` object, `DefaultValue` is an empty character vector, `''`, and Simulink uses the first enumeration member as the default member.

Example: `'enumMember1'`

### Description — Description of enumerated data type in generated code

'' (default) | character vector

Description of the enumerated data type, specified as a character vector. Use this property to explain the purpose of the type in generated code.

Example: `'Two possible colors of LED indicator: GREEN and RED.'`

Data Types: char

### HeaderFile — Name of header file defining enumerated data type in generated code

'' (default) | character vector

Name of the header file that defines the enumerated data type in generated code, specified as a character vector. Use a `.h` extension to specify the file name.

If you do not specify `HeaderFile`, generated code uses a default header file name that depends on the value of the `DataScope` property .

Example: `'myTypeIncludeFile.h'`

Data Types: `char`

### **StorageType — Data type of underlying integer values**

`''` (default) | character vector

Data type of the integer values underlying the enumeration members, specified as a character vector. Generated code stores the underlying integer values using the data type you specify.

You can specify one of these supported integer types:

- `'int8'`
- `'int16'`
- `'int32'`
- `'uint8'`
- `'uint16'`
- `'uint32'`

To store the underlying integer values in generated code using the native integer type of the target hardware, specify `StorageType` as an empty character vector, `''`, which is the default value.

Example: `'int16'`

`''`

## **Object Functions**

<code>appendEnumeral</code>	Add enumeration member to enumerated data type definition in data dictionary
<code>removeEnumeral</code>	Remove enumeration member from enumerated data type definition in data dictionary

## **Examples**

### **Programmatically Create Enumerated Type Definition in Data Dictionary**

Create an object that can store the definition of an enumerated type. By default, the new type defines a single enumeration member `enum1` with underlying integer value 0.

```
myColors = Simulink.data.dictionary.EnumTypeDefinition
```

```
myColors =
```

```
 Simulink.data.dictionary.EnumTypeDefinition
 enum1
```

Add some enumeration members to the definition of the type.

```

appendEnumeral(myColors, 'Orange', 1, '')
appendEnumeral(myColors, 'Black', 2, '')
appendEnumeral(myColors, 'Cyan', 3, '')
myColors

myColors =

 Simulink.data.dictionary.EnumTypeDefinition
 enum1
 Orange
 Black
 Cyan

```

Remove the default enumeration member `enum1`. Since `enum1` is the first enumeration member in the list, identify it with index 1.

```

removeEnumeral(myColors, 1)
myColors

myColors =

 Simulink.data.dictionary.EnumTypeDefinition
 Orange
 Black
 Cyan

```

Customize the enumerated type by configuring the properties of the object representing it.

```

myColors.Description = 'These are my favorite colors.';
myColors.DefaultValue = 'Cyan';
myColors.HeaderFile = 'colorsType.h';

```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the object that defines the enumerated type `myColors` to the dictionary.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', {'myColors'});
```

## Alternatives

You can use Model Explorer to add and modify enumerated data types stored in a data dictionary.

## Version History

Introduced in R2015a

## appendEnumeral

**Package:** Simulink.data.dictionary

Add enumeration member to enumerated data type definition in data dictionary

### Syntax

```
appendEnumeral(typeObj,memberName,memberValue,memberDesc)
```

### Description

`appendEnumeral(typeObj,memberName,memberValue,memberDesc)` adds an enumeration member to the enumerated type definition stored by `typeObj`, a `Simulink.data.dictionary.EnumTypeDefinition` object.

### Examples

#### Programmatically Create Enumerated Type Definition in Data Dictionary

Create an object that can store the definition of an enumerated type. By default, the new type defines a single enumeration member `enum1` with underlying integer value 0.

```
myColors = Simulink.data.dictionary.EnumTypeDefinition
```

```
myColors =
```

```
 Simulink.data.dictionary.EnumTypeDefinition
 enum1
```

Add some enumeration members to the definition of the type.

```
appendEnumeral(myColors,'Orange',1,'')
appendEnumeral(myColors,'Black',2,'')
appendEnumeral(myColors,'Cyan',3,'')
myColors
```

```
myColors =
```

```
 Simulink.data.dictionary.EnumTypeDefinition
 enum1
 Orange
 Black
 Cyan
```

Remove the default enumeration member `enum1`. Since `enum1` is the first enumeration member in the list, identify it with index 1.

```
removeEnumeral(myColors,1)
myColors
```

```
myColors =
```

```

Simulink.data.dictionary.EnumTypeDefinition
 Orange
 Black
 Cyan

```

Customize the enumerated type by configuring the properties of the object representing it.

```

myColors.Description = 'These are my favorite colors.';
myColors.DefaultValue = 'Cyan';
myColors.HeaderFile = 'colorsType.h';

```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the object that defines the enumerated type `myColors` to the dictionary.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', {'myColors'});
```

## Input Arguments

### **typeObj** — Target enumerated type definition

`Simulink.data.dictionary.EnumTypeDefinition` object

Target enumerated type definition, specified as a `Simulink.data.dictionary.EnumTypeDefinition` object.

### **memberName** — Name of new enumeration member

character vector

Name of the new enumeration member, specified as a character vector.

Example: 'myNewEnumMember'

Data Types: char

### **memberValue** — Integer value underlying new enumeration member

integer

Integer value underlying the new enumeration member, specified as an integer.

The definition of the enumeration class determines the integer data type used in generated code to store the underlying values of enumeration members.

Example: 3

Data Types: single | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | double

### **memberDesc** — Description of new enumeration member

character vector

Description of the new enumeration member, specified as a character vector.

If you do not want to supply a description for the enumeration member, use an empty character vector.

Example: 'Enumeration member number 1.'

Example: ''

Data Types: char

## **Alternatives**

You can use Model Explorer to add enumeration members to the enumerated data type represented by a `Simulink.data.dictionary.EnumTypeDefinition` object.

## **Version History**

**Introduced in R2015a**

## **See Also**

`Simulink.data.dictionary.EnumTypeDefinition` | `removeEnumeral`

## **Topics**

“Store Data in Dictionary Programmatically”

“Use Enumerated Data in Simulink Models”

# removeEnumeral

**Package:** Simulink.data.dictionary

Remove enumeration member from enumerated data type definition in data dictionary

## Syntax

```
removeEnumeral(typeObj,memberNum)
```

## Description

`removeEnumeral(typeObj,memberNum)` removes an enumeration member from the enumerated type definition stored by `typeObj`, a `Simulink.data.dictionary.EnumTypeDefinition` object.

## Examples

### Programmatically Create Enumerated Type Definition in Data Dictionary

Create an object that can store the definition of an enumerated type. By default, the new type defines a single enumeration member `enum1` with underlying integer value 0.

```
myColors = Simulink.data.dictionary.EnumTypeDefinition
myColors =
 Simulink.data.dictionary.EnumTypeDefinition
 enum1
```

Add some enumeration members to the definition of the type.

```
appendEnumeral(myColors,'Orange',1,'')
appendEnumeral(myColors,'Black',2,'')
appendEnumeral(myColors,'Cyan',3,'')
myColors
myColors =
 Simulink.data.dictionary.EnumTypeDefinition
 enum1
 Orange
 Black
 Cyan
```

Remove the default enumeration member `enum1`. Since `enum1` is the first enumeration member in the list, identify it with index 1.

```
removeEnumeral(myColors,1)
myColors
myColors =
```

```

Simulink.data.dictionary.EnumTypeDefinition
 Orange
 Black
 Cyan

```

Customize the enumerated type by configuring the properties of the object representing it.

```

myColors.Description = 'These are my favorite colors.';
myColors.DefaultValue = 'Cyan';
myColors.HeaderFile = 'colorsType.h';

```

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Import the object that defines the enumerated type `myColors` to the dictionary.

```
importFromBaseWorkspace(myDictionaryObj, 'varList', {'myColors'});
```

## Input Arguments

### **typeObj** — Target enumerated type definition

`Simulink.data.dictionary.EnumTypeDefinition` object

Target enumerated type definition, specified as a `Simulink.data.dictionary.EnumTypeDefinition` object.

### **memberNum** — Index of target enumeration member

integer

Index of target enumeration member, specified as an integer.

The first enumeration member in an enumerated type definition has index 1. For example, suppose an enumerated type `BasicColors` has this definition:

```

myColors =
 Simulink.data.dictionary.EnumTypeDefinition
 Orange
 Black
 Cyan

```

To remove the enumeration member `Black`, specify `memberNum` as 2. To remove the enumeration member `Cyan`, specify 3.

Do not specify `memberNum` using the integer value underlying an enumeration member. The integer value underlying the member is not equivalent to the index of the member.

Example: 3

```
Data Types: single | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | double
```

## Alternatives

You can use Model Explorer to remove enumeration members from the enumerated data type represented by a `Simulink.data.dictionary.EnumTypeDefinition` object.

## **Version History**

**Introduced in R2015a**

*"Use Enumerated Data in Simulink Models"*

# Simulink.data.dictionary.Section

Configure data dictionary section

## Description

An object of the `Simulink.data.dictionary.Section` class represents one section of a data dictionary, such as Design Data or Configurations. The object allows you to perform operations on the section such as add or delete entries and import data from files.

Before you can create a `Simulink.data.dictionary.Section` object, you must create a `Simulink.data.Dictionary` object representing the target data dictionary. Once created, the `Simulink.data.dictionary.Section` object exists independently of the `Simulink.data.Dictionary` object.

You cannot use the data dictionary programmatic interface (see “Store Data in Dictionary Programmatically”) to access the **Embedded Coder** section of a data dictionary. Instead, see Embedded Coder Dictionary (Embedded Coder).

## Creation

### Syntax

#### Description

The function `getSection` creates a `Simulink.data.dictionary.Section` object.

## Properties

### Name — Name of data dictionary section

character vector

Name of data dictionary section, returned as a character vector. This property is read only.

## Object Functions

<code>addEntry</code>	Add new entry to data dictionary section
<code>assignin</code>	Assign value to data dictionary entry
<code>deleteEntry</code>	Delete data dictionary entry
<code>evalin</code>	Evaluate MATLAB expression in data dictionary section
<code>exist</code>	Check existence of data dictionary entry
<code>exportToFile</code>	Export data dictionary entries from section to MAT-file or MATLAB file
<code>find</code>	Search in data dictionary section
<code>getEntry</code>	Create <code>Simulink.data.dictionary.Entry</code> object to represent data dictionary entry
<code>importFromFile</code>	Import variables from MAT-file or MATLAB file to data dictionary section

## Examples

## Create New Data Dictionary Section Object

Open the data dictionary `myDictionary_ex_API.sldd` and represent it with a `Simulink.data.Dictionary` object named `myDictionaryObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
```

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
dDataSectObj = getSection(myDictionaryObj, 'Design Data')
```

```
dDataSectObj =
```

```
 Section with properties:
```

```
 Name: 'Design Data'
```

## Version History

**Introduced in R2015a**

### See Also

`getSection` | `Simulink.data.Dictionary`

### Topics

“Store Data in Dictionary Programmatically”

“What Is a Data Dictionary?”

## addEntry

**Package:** Simulink.data.dictionary

Add new entry to data dictionary section

### Syntax

```
addEntry(sectionObj,entryName,entryValue)
entryObj = addEntry(sectionObj,entryName,entryValue)
```

### Description

`addEntry(sectionObj,entryName,entryValue)` adds an entry, with name `entryName` and value `entryValue`, to the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object.

`entryObj = addEntry(sectionObj,entryName,entryValue)` returns a `Simulink.data.dictionary.Entry` object representing the newly added data dictionary entry.

### Examples

#### Add Entry to Design Data Section of Data Dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Add an entry to the Design Data section of `myDictionary_ex_API.sldd` an entry `myNewEntry` with value 237.

```
addEntry(dDataSectObj,'myNewEntry',237)
```

#### Add New Simulink.Parameter Object to Data Dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Add an entry to the Design Data section of `myDictionary_ex_API.sldd`. Name the new entry `myNewParam` and assign a `Simulink.Parameter` object to the value.

```
addEntry(dDataSectObj,'myNewParam',Simulink.Parameter)
```

The expression `Simulink.Parameter` constructs a new `Simulink.Parameter` object, and the `addEntry` function assigns the object to the value of the new data dictionary entry `myNewParam`.

## Input Arguments

### **sectionObj** — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

### **entryName** — Name of new data dictionary entry

character vector

Name of new data dictionary entry, specified as a character vector.

Example: `'myNewEntry'`

Data Types: `char`

### **entryValue** — Value of new data dictionary entry

MATLAB expression

Value of new data dictionary entry, specified as a MATLAB expression that returns any valid data dictionary content.

Example: `27.5`

Example: `myBaseWorkspaceVariable`

Example: `Simulink.Parameter`

## Tips

- `addEntry` returns an error if the entry name you specify with `entryName` is already the name of an entry in the target data dictionary section or in the same section of any referenced dictionaries.

## Alternatives

You can use Model Explorer to add entries to a data dictionary in the same way you can use it to add variables to a model workspace or the base workspace.

## Version History

Introduced in R2015a

## See Also

`Simulink.data.dictionary.Section` | `Simulink.data.dictionary.Entry` | `assignin`

## Topics

“Store Data in Dictionary Programmatically”

## assignin

**Package:** Simulink.data.dictionary

Assign value to data dictionary entry

### Syntax

```
assignin(sectionObj,entryName,entryValue)
```

### Description

`assignin(sectionObj,entryName,entryValue)` assigns the value `entryValue` to the data dictionary entry `entryName` in the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object. If an entry with the specified name is not in the target section, `assignin` creates the entry with the specified name and value.

If an entry with the name specified by input argument `entryName` is not defined in the target data dictionary section but is defined in a referenced dictionary, `assignin` does not create a new entry in the target section but operates on the entry in the referenced dictionary.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

### Examples

#### Assign Value to Data Dictionary Entry

Assign a value to a data dictionary entry by operating on a `Simulink.data.dictionary.Section` object.

Represent the Design Data section of the data dictionary `myDictionary_ex_API.slidd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.slidd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Assign the value 237 to an entry `myAssignedEntry` in the data dictionary `myDictionary_ex_API.slidd`. If an entry named `myAssignedEntry` is not in `myDictionary_ex_API.slidd`, create it.

```
assignin(dDataSectObj,'myAssignedEntry',237)
```

### Input Arguments

**sectionObj** — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

**entryName — Name of target data dictionary entry**

character vector

Name of target data dictionary entry, specified as a character vector. If a matching entry does not already exist, the function creates a new entry using the specified name.

Example: 'myEntry'

Data Types: char

**entryValue — Value to assign to data dictionary entry**

MATLAB expression

Value to assign to data dictionary entry, specified as a MATLAB expression that returns any valid data dictionary content.

Example: 27.5

Example: myBaseWorkspaceVariable

Example: Simulink.Parameter

**Alternatives**

You can use the Model Explorer window to view and change the values of data dictionary entries.

**Version History**

Introduced in R2015a

**See Also**

`Simulink.data.dictionary.Section | setValue`

**Topics**

“Store Data in Dictionary Programmatically”

## deleteEntry

**Package:** Simulink.data.dictionary

Delete data dictionary entry

### Syntax

```
deleteEntry(sectionObj,entryName)
deleteEntry(sectionObj,entryName,'DataSource',dictionaryName)
```

### Description

`deleteEntry(sectionObj,entryName)` deletes a data dictionary entry `entryName` from the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object. If there are multiple entries with the specified name in a hierarchy of reference dictionaries, the function deletes all the entries. If you represent a data dictionary entry with one or more `Simulink.data.dictionary.Entry` objects and later delete the entry using the `deleteEntry` function, the objects remain with their `Status` property set to 'Deleted'.

`deleteEntry(sectionObj,entryName,'DataSource',dictionaryName)` deletes an entry that is defined in the data dictionary `DictionaryName`. Use this syntax to uniquely identify an entry that is defined more than once in a hierarchy of referenced data dictionaries.

### Examples

#### Delete Entry from Data Dictionary Section

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`. The Design Data section of `myDictionary_ex_API.sldd` already contains an entry named `fuelFlow`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Delete the entry `fuelFlow` from the data dictionary `myDictionary_ex_API.sldd`. `myDictionary_ex_API.sldd` no longer contains the `fuelFlow` entry.

```
deleteEntry(dDataSectObj,'fuelFlow')
```

#### Delete Entry from Reference Data Dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Delete the entry `myRefEntry` from the data dictionary `myRefDictionary_ex_API.sldd`. `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`, and `myRefDictionary_ex_API.sldd` defines an entry `myRefEntry`.

```
deleteEntry(dDataSectObj, 'myRefEntry', 'DataSource', ...
'myRefDictionary_ex_API.sldd')
```

## Input Arguments

### **sectionObj** — Target data dictionary section

Simulink.data.dictionary.Section object

Target data dictionary section, specified as a Simulink.data.dictionary.Section object. Before you use this function, represent the target section with a Simulink.data.dictionary.Section object by using, for example, the getSection function.

### **entryName** — Name of target data dictionary entry

character vector

Name of target data dictionary entry, specified as a character vector.

Example: 'myEntry'

Data Types: char

### **dictionaryName** — Name of data dictionary that defines target entry

character vector

File name of data dictionary that defines the target entry, specified as a character vector including the .sldd extension.

Example: 'mySubDictionary\_ex\_API.sldd'

Data Types: char

## Alternatives

You can use the Model Explorer window to delete entries from a data dictionary in the same way you can delete variables from a model workspace or the base workspace.

## Version History

**Introduced in R2015a**

## See Also

Simulink.data.dictionary.Section | addEntry | Simulink.data.dictionary.Entry

## Topics

“Store Data in Dictionary Programmatically”

## evalin

**Package:** Simulink.data.dictionary

Evaluate MATLAB expression in data dictionary section

### Syntax

```
returnValue = evalin(sectionObj,expression)
```

### Description

`returnValue = evalin(sectionObj,expression)` evaluates a MATLAB expression in the data dictionary section `sectionObj` and returns the values returned by `expression`.

To programmatically access variables for the purpose of sweeping block parameter values, consider using `Simulink.SimulationInput` objects instead of modifying the variables through the programmatic interface of the data dictionary. See “Optimize, Estimate, and Sweep Block Parameter Values”.

### Examples

#### List All Entries in Data Dictionary Section

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Execute the `whos` command in the Design Data section of `myDictionary_ex_API.sldd`.

```
evalin(dDataSectObj,'whos')
```

Name	Size	Bytes	Class	Attributes
fuelFlow	1x1	8	double	
myRefEntry	1x1	1	logical	
parameterGain37	1x1	112	Simulink.Parameter	

### Input Arguments

#### `sectionObj` — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

#### `expression` — MATLAB expression to evaluate

character vector

MATLAB expression to evaluate, specified as a character vector.

Example: 'a = 5.3'

Example: 'whos'

Example: 'CurrentSpeed.Value = 290.73'

Data Types: char

## Tips

- `evalin` allows you to treat a data dictionary section as a MATLAB workspace. You can think of entries contained in the section as workspace variables you can manipulate with MATLAB expressions.

## Version History

**Introduced in R2015a**

## See Also

`Simulink.data.dictionary.Section` | `Simulink.data.evalinGlobal`

## Topics

“Store Data in Dictionary Programmatically”

## exist

**Package:** Simulink.data.dictionary

Check existence of data dictionary entry

### Syntax

```
doesExist = exist(sectionObj,entryName)
```

### Description

`doesExist = exist(sectionObj,entryName)` determines if the data dictionary section `sectionObj` contains an entry by the name of `entryName` and returns an indication.

### Examples

#### Determine if Data Dictionary Entry Exists

Determine if an entry exists in a data dictionary by searching for the name of the entry

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Determine if an entry `fuelFlow` exists in the Design Data section of `myDictionary_ex_API.sldd`.

```
exist(dDataSectObj,'fuelFlow')
```

```
ans =
```

```
1
```

Determine if an entry `myEntry` exists in the Design Data section of `myDictionary_ex_API.sldd`.

```
exist(dDataSectObj,'myEntry')
```

```
ans =
```

```
0
```

### Input Arguments

#### **sectionObj** — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

**entryName — Name of target entry**

character vector

Name of target entry, specified as a character vector.

Example: 'myEntry'

Data Types: char

**Output Arguments****doesExist — Indication of entry existence**

0 | 1

Indication of entry existence, returned as 0 if false and 1 if true.

**Tips**

- `exist` also determines if a matching entry exists in the same section of any referenced data dictionaries. For example, if `sectionObj` represents the Design Data section of a data dictionary `myDictionary_ex_API.sldd`, `exist` searches the Design Data section of `myDictionary_ex_API.sldd` and the Design Data sections of any dictionaries referenced by `myDictionary_ex_API.sldd`.

**Alternatives**

You can use Model Explorer to search a data dictionary for an entry.

**Version History**

Introduced in R2015a

**See Also**

`Simulink.data.dictionary.Section | find | Simulink.data.existsInGlobal`

**Topics**

“Store Data in Dictionary Programmatically”

## exportToFile

**Package:** Simulink.data.dictionary

Export data dictionary entries from section to MAT-file or MATLAB file

### Syntax

```
exportToFile(sectionObj, fileName)
```

### Description

`exportToFile(sectionObj, fileName)` exports to a MAT or MATLAB file all the values of the entries contained in the data dictionary section `sectionObj`, a `Simulink.data.dictionary.Section` object. `exportToFile` exports the values of all entries, including those defined in referenced dictionaries.

### Examples

#### Export Data Dictionary Entries to MAT or MATLAB Files

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`. Represent the Configurations section of `myDictionary_ex_API.sldd` with an object named `configSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
configSectObj = getSection(myDictionaryObj, 'Configurations');
```

Export the entries from the Design Data section of `myDictionary_ex_API.sldd` to a MATLAB file in your current working folder.

```
exportToFile(dDataSectObj, 'myDictionaryDesignData.m')
```

Export the entries from the Configurations section of `myDictionary_ex_API.sldd` to a MAT-file in your current working folder.

```
exportToFile(configSectObj, 'myDictionaryConfigurations.mat')
```

```
Exported 1 entries from scope 'Configurations'
to MAT-file myDictionaryConfigurations.mat.
```

### Input Arguments

#### **sectionObj** — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

**fileName — Name of MAT or MATLAB file**

character vector

Name of target MAT or MATLAB file, specified as a character vector. `exportToFile` supplies a file extension `.mat` if you do not specify an extension.

Example: `'myNewFile.mat'`

Example: `'myNewFile.m'`

Data Types: `char`

**Limitation**

The `exportToFile` method does not export enumerated data types (which are stored as `Simulink.data.dictionary.EnumTypeDefinition` objects). To transfer or copy an enumerated type from one dictionary to another, use the `getEntry` and `addEntry` methods of `Simulink.data.dictionary.Section` objects.

**Alternatives**

You can use Model Explorer to export data dictionary entries to a file. See “Export Design Data from Dictionary” for more information.

**Version History**

Introduced in R2015a

**See Also**

`Simulink.data.dictionary.Section` | `importFromFile`

**Topics**

“Store Data in Dictionary Programmatically”

## find

**Package:** Simulink.data.dictionary

Search in data dictionary section

### Syntax

```
foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN)
foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN,options)
```

### Description

`foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN)` searches the data dictionary section `sectionObj` using search criteria `PName1,PValue1,...,PNameN,PValueN`, and returns an array of matching entries that were found in the target section. This syntax matches the search criteria with the properties of the entries in the target section but not with the properties of their values. See `Simulink.data.dictionary.Entry` for a list of data dictionary entry properties.

`foundEntries = find(sectionObj,PName1,PValue1,...,PNameN,PValueN,options)` searches for data dictionary entries using additional search options. For example, you can match the search criteria with the values of the entries in the target section.

### Examples

#### Return Array of All Entries in Data Dictionary Section

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Return all of the entries stored in the Design Data section of the data dictionary `myDictionary_ex_API.sldd`.

```
allEntries = find(dDataSectObj)
```

#### Search Data Dictionary Section for Specific Class

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries whose values are objects of the `Simulink.Parameter` class.

```
foundEntries = find(dDataSectObj, '-value', '-class', 'Simulink.Parameter')
```

### Search Data Dictionary Section for Modifying User

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries that were last modified by the user `jsmith`.

```
foundEntries = find(dDataSectObj, 'LastModifiedBy', 'jsmith')
```

### Search Data Dictionary Section Using Multiple Criteria

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries that were last modified by the user `jsmith` or whose names begin with `fuel`.

```
foundEntries = find(dDataSectObj, 'LastModifiedBy', 'jsmith', '-or', ...
'-regexp', 'Name', 'fuel*')
```

### Search Data Dictionary Section Using Regular Expressions

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries whose names begin with `fuel`.

```
foundEntries = find(dDataSectObj, '-regexp', 'Name', 'fuel*')
```

### Search Data Dictionary Section for Specific Value

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Return all of the entries stored in the Design Data section of the data dictionary `myDictionary_ex_API.sldd`.

```
allEntries = find(dDataSectObj);
```

Find the entries with value 237. If you find more than one entry, store the entries in an array called `foundEntries`.

```
foundEntries = [];
for i = 1:length(allEntries)
 if getValue(allEntries(i)) == 237
 foundEntries = [foundEntries allEntries(i)];
 end
end
```

### Search Data Dictionary Section for Specific Property

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj, 'Design Data');
```

Search in the Design Data section of `myDictionary_ex_API.sldd` for entries whose values have a property `DataType`.

```
foundEntries = find(dDataSectObj, '-value', '-property', 'DataType')
```

## Input Arguments

### `sectionObj` — Data dictionary section to search

`Simulink.data.dictionary.Section` object

Data dictionary section to search, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

### `PName1, PValue1, . . . , PNameN, PValueN` — Search criteria

name-value pairs representing properties

Search criteria, specified as one or more name-value pairs representing names and values of properties of the entries in the target data dictionary section. For a list of the properties of a data dictionary entry, see `Simulink.data.dictionary.Entry`. If you specify more than one name-value pair, the returned entries meet all of the criteria.

If you include the `'-value'` option to search in the values of the entries, the search criteria apply to the values of the entries rather than to the entries themselves.

Example: `'LastModifiedBy', 'jsmith'`

Example: `'DataSource', 'myRefDictionary_ex_API.sldd'`

### `options` — Additional search options

supported option codes

Additional search options, specified as one or more of the following supported option codes.

'-value'	This option causes <code>find</code> to search only in the values of the entries in the target data dictionary section. Specify this option before any other search criteria or options arguments.
'-and', '-or', '-xor', '-not' logical operators	These options modify or combine multiple search criteria or other option codes.
'-property', <code>propertyName</code>	This name-value pair causes <code>find</code> to search for entries or values that have the property <code>propertyName</code> regardless of the value of the property. Specify <code>propertyName</code> as a character vector.
'-class', <code>className</code>	This name-value pair causes <code>find</code> to search for entries or values that are objects of the class <code>className</code> . Specify <code>className</code> as a character vector.
'-isa', <code>className</code>	This name-value pair causes <code>find</code> to search for entries or values that are objects of the class or of any subclass derived from the class <code>className</code> . Specify <code>className</code> as a character vector.
'-regexp'	This option allows you to use regular expressions in your search criteria. This option affects only search criteria that follow '-regexp'.

Example: '-value'

Example: '-value', '-property', 'CoderInfo'

Example: '-value', '-class', 'Simulink.Parameter'

## Output Arguments

### **foundEntries** — Data dictionary entries matching search criteria

array of `Simulink.data.dictionary.Entry` objects

Data dictionary entries matching the specified search criteria, returned as an array of `Simulink.data.dictionary.Entry` objects.

## Alternatives

You can use Model Explorer to search a data dictionary for entries using arbitrary criteria.

## Version History

Introduced in R2015a

## See Also

`Simulink.data.dictionary.Section` | `exist` | `Simulink.data.dictionary.Entry` | `find`

## Topics

“Store Data in Dictionary Programmatically”

## getEntry

**Package:** Simulink.data.dictionary

Create Simulink.data.dictionary.Entry object to represent data dictionary entry

### Syntax

```
entryObj = getEntry(sectionObj,entryName)
entryObj = getEntry(sectionObj,entryName,'DataSource',dictionaryName)
```

### Description

entryObj = getEntry(sectionObj,entryName) returns an array of Simulink.data.dictionary.Entry objects representing data dictionary entries entryName found in the data dictionary section sectionObj, a Simulinkdata.dictionary.Section object. getEntry returns multiple objects if multiple entries have the specified name in a reference hierarchy of data dictionaries.

entryObj = getEntry(sectionObj,entryName,'DataSource',dictionaryName) returns an object representing a data dictionary entry that is defined in the data dictionary dictionaryName. Use this syntax to uniquely identify an entry that is defined more than once in a hierarchy of referenced data dictionaries.

### Examples

#### Set Value of Data Dictionary Entry

Represent the Design Data section of the data dictionary myDictionary\_ex\_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Represent the data dictionary entry fuelFlow with a Simulink.data.dictionary.Entry object named fuelFlowObj. fuelFlow is defined in the data dictionary myDictionary\_ex\_API.sldd.

```
fuelFlowObj = getEntry(dDataSectObj,'fuelFlow');
```

Set the value of the entry fuelFlow to 493.

```
setValue(fuelFlowObj,493)
```

#### Set Value of Entry in Reference Dictionary

Represent the Design Data section of the data dictionary myDictionary\_ex\_API.sldd with a Simulink.data.dictionary.Section object named dDataSectObj.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Represent the data dictionary entry `myRefEntry` with a `Simulink.data.dictionary.Entry` object named `refEntryObj`. `myDictionary_ex_API.sldd` references `myRefDictionary_ex_API.sldd`, and `myRefDictionary_ex_API.sldd` defines an entry `myRefEntry`.

```
refEntryObj = getEntry(dDataSectObj, 'myRefEntry', 'DataSource', ...
 'myRefDictionary_ex_API.sldd');
```

Set the value of the entry `myRefEntry` to 493.

```
setValue(refEntryObj, 493)
```

## Input Arguments

### **sectionObj** — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

### **entryName** — Name of target data dictionary entry

character vector

Name of target data dictionary entry, specified as a character vector.

Example: `'myEntry'`

Data Types: `char`

### **dictionaryName** — Name of data dictionary containing target entry

character vector

File name of data dictionary containing the target entry, specified as a character vector including the `.sldd` extension.

Example: `'mySubDictionary_ex_API.sldd'`

Data Types: `char`

## Output Arguments

### **entryObj** — Target data dictionary entry

`Simulink.data.dictionary.Entry` object

Target data dictionary entry, returned as one or more `Simulink.data.dictionary.Entry` objects.

## Version History

Introduced in R2015a

## See Also

`Simulink.data.dictionary.Section` | `addEntry` | `Simulink.data.dictionary.Entry` | `getValue`

# importFromFile

**Package:** Simulink.data.dictionary

Import variables from MAT-file or MATLAB file to data dictionary section

## Syntax

```
importedVars = importFromFile(sectionObj,fileName)
importedVars = importFromFile(sectionObj,fileName,'existingVarsAction',
existAction)
[importedVars,existingVars] = importFromFile(__)
```

## Description

`importedVars = importFromFile(sectionObj,fileName)` imports variables defined in the MAT-file or MATLAB file `fileName` to the data dictionary section `sectionObj` without overwriting any variables that are already in the target section. If any variables are already in the target section, the function displays a warning and a list in the MATLAB Command Window. This syntax returns a list of variables that were successfully imported. A variable is considered successfully imported only if `importFromFile` assigns the value of the variable to the corresponding entry in the target data dictionary.

`importedVars = importFromFile(sectionObj,fileName,'existingVarsAction',existAction)` imports variables that are already in the target section by taking a specified action `existAction`. For example, you can choose to use the variable values in the target file to overwrite the corresponding values in the target section.

`[importedVars,existingVars] = importFromFile( __ )` returns a list of variables in the target section that were not overwritten. Use this syntax if `existingVarsAction` is set to 'none', the default value, which prevents existing dictionary entries from being overwritten.

## Examples

### Import to Data Dictionary from File

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Import all variables contained in the file `myData_ex_API.m` to the data dictionary and return a list of successfully imported variables. If any variables are already in `myDictionary_ex_API.sldd`, `importFromFile` returns a warning and a list of the affected variables.

```
importFromFile(dDataSectObj,'myData_ex_API.m')
```

```
Warning: The following variables were not imported because
they already exist in the dictionary:
 fuelFlow
```

```
ans =

 'myFirstEntry'
 'mySecondEntry'
 'myThirdEntry'
```

### Import Variables from File and Overwrite Conflicts

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Import all variables contained in the file `myData_ex_API.m` to the data dictionary, overwrite any variables that are already in the dictionary, and return a list of successfully imported variables.

```
importFromFile(dDataSectObj,'myData_ex_API.m','existingVarsAction','overwrite')

ans =

 'fuelFlow'
 'myFirstEntry'
 'mySecondEntry'
 'myThirdEntry'
```

### Return Variables Not Imported to Data Dictionary from File

Return a list of variables that are not imported from a file because they are already in the target data dictionary

Represent the Design Data section of the data dictionary `myDictionary_ex_API.sldd` with a `Simulink.data.dictionary.Section` object named `dDataSectObj`.

```
myDictionaryObj = Simulink.data.dictionary.open('myDictionary_ex_API.sldd');
dDataSectObj = getSection(myDictionaryObj,'Design Data');
```

Import all variables contained in the file `myData_ex_API.m` to the data dictionary. Specify names for the output arguments of `importFromFile` to return the names of successfully and unsuccessfully imported variables.

```
[importedVars,existingVars] = importFromFile(dDataSectObj,'myData_ex_API.m')

importedVars =

 'myFirstEntry'
 'mySecondEntry'
 'myThirdEntry'

existingVars =

 'fuelFlow'
```

`importFromFile` does not import the variable `fuelFlow` because it is already in the target data dictionary.

## Input Arguments

### **sectionObj** — Target data dictionary section

`Simulink.data.dictionary.Section` object

Target data dictionary section, specified as a `Simulink.data.dictionary.Section` object. Before you use this function, represent the target section with a `Simulink.data.dictionary.Section` object by using, for example, the `getSection` function.

### **fileName** — Name of MAT or MATLAB file

character vector

Name of target MAT or MATLAB file, specified as a character vector. `importFromFile` automatically supplies a file extension `.mat` if you do not specify an extension.

Example: `'myFile.mat'`

Example: `'myFile.m'`

Data Types: `char`

### **existAction** — Action to take for existing dictionary variables

`'none'` (default) | `'overwrite'` | `'error'`

Action to take for existing dictionary variables, specified as `'none'`, `'overwrite'`, or `'error'`.

If you specify `'none'`, `importFromFile` attempts to import target variables but does not import or make any changes to variables that are already in the data dictionary section.

If you specify `'overwrite'`, `importFromFile` imports all target variables and overwrites any variables that are already in the data dictionary section.

If you specify `'error'`, `importFromFile` returns an error, without importing any variables, if any target variables are already in the data dictionary section.

Example: `'overwrite'`

Data Types: `char`

## Output Arguments

### **importedVars** — Successfully imported variables

cell array of character vectors

Names of successfully imported variables, returned as a cell array of character vectors. A variable is considered successfully imported only if `importFromFile` assigns its value to the corresponding entry in the target data dictionary.

### **existingVars** — Variables that were not imported

cell array of character vectors

Names of target variables that were not imported due to their existence in the target data dictionary, returned as a cell array of character vectors. `existingVars` has content only if `existAction` is set

to 'none', which is also the default. In that case `importFromFile` imports only variables that are not already in the target data dictionary.

## Tips

- `importFromFile` can import MATLAB variables created from enumerated data types but cannot import the definitions of the enumerated types. Use the `importEnumTypes` function to import enumerated data type definitions to a data dictionary. If you import variables of enumerated data types to a data dictionary but do not import the enumerated type definitions, the dictionary is less portable and might not function properly if used by someone else.

## Alternatives

You can use the Model Explorer to import variables to a data dictionary from a file. See “Import Data to Dictionary from File” for more information.

## Version History

**Introduced in R2015a**

# Simulink.DualScaledParameter

Specify name, value, units, and other properties of Simulink dual-scaled parameter

## Description

Use `Simulink.DualScaledParameter` so that you can define an object that stores two scaled values of the same physical value.

For example, for temperature measurement, you can store a Fahrenheit scale and a Celsius scale with conversion defined by a computation method that you provide. Given one scaled value, the `Simulink.DualScaledParameter` computes the other scaled value using the computation method.

A dual-scaled parameter inherits some properties from the `Simulink.Parameter` class. A dual-scaled parameter has:

- A calibration value. The value that you prefer to use.
- A main value. The real-world value that Simulink uses.
- An internal stored integer value. The value that is used in the embedded code.

You can use `Simulink.DualScaledParameter` objects in your model for both simulation and code generation. The parameter computes the internal value before code generation via the computation method. This offline computation results in leaner generated code.

If you provide the calibration value, the parameter computes the main value using the computation method. This method can be a first-order rational function.

$$y = \frac{ax + b}{cx + d}$$

- $x$  is the calibration value.
- $y$  is the main value.
- $a$  and  $b$  are the coefficients of the CalToMain compute numerator.
- $c$  and  $d$  are the coefficients of the CalToMain compute denominator.

If you provide the calibration minimum and maximum values, the parameter computes minimum and maximum values of the main value. Simulink performs range checking of parameter values. The software alerts you when the parameter object value lies outside a range that corresponds to its specified minimum and maximum values and data type.

## Creation

Create a `Simulink.DualScaledParameter` object:

- By using the **Model Data Editor**. Instead of creating a `Simulink.Parameter` object, create a `Simulink.DualScaledParameter` object.
- By using the **Model Explorer**:

- 1 In the **Model Hierarchy** pane, select a workspace or data dictionary.
  - 2 On the toolbar, select **Add > Add Custom**.
  - 3 In the Model Explorer — Select Object dialog box, set **Object class** to `Simulink.DualScaledParameter`.
- By using the `Simulink.DualScaledParameter` function, described below.

## Syntax

```
DSParam = Simulink.DualScaledParameter
```

## Description

`DSParam = Simulink.DualScaledParameter` returns a `Simulink.DualScaledParameter` object with default property values.

## Properties

For information about properties in the property dialog box of a `Simulink.DualScaledParameter` object, see “`Simulink.DualScaledParameter` Property Dialog Box”.

### CalibrationValue — Calibration value of this parameter

[ ] (default) | finite, real, double number

Calibration value of this parameter, specified as a finite, real, double number. This value represents the value that you prefer to use.

Before specifying `CalibrationValue`, you must specify `CalToMainCompuNumerator` and `CalToMainCompuDenominator` to define the computation method. The parameter uses the computation method and the calibration value to calculate the main value that Simulink uses.

Corresponds to **Calibration value** in the property dialog box.

Example: 5.34

Data Types: double

### CalibrationMin — Calibration minimum value of this parameter

[ ] (default) | finite, real, double, scalar number

Calibration minimum value of this parameter, specified as a finite, real, double, scalar number. The default value, [ ], means the minimum is unspecified.

Before specifying `CalibrationMin`, you must specify `CalToMainCompuNumerator` and `CalToMainCompuDenominator` to define the computation method. The parameter uses the computation method and the calibration minimum value to calculate the minimum or maximum value that Simulink uses. A first order rational function is strictly monotonic, either increasing or decreasing. If it is increasing, setting the calibration minimum sets the main minimum value. If it is decreasing, setting the calibration minimum sets the main maximum.

If the parameter value is less than the minimum value or if the minimum value is outside the range of the parameter data type, Simulink generates a warning. In these cases, when updating the diagram or starting a simulation, Simulink generates an error.

Corresponds to **Calibration minimum** in the property dialog box.

Example: 10.51

Data Types: double

### **CalibrationMax — Calibration maximum value of this parameter**

[ ] (default) | finite, real, double, scalar number

Calibration maximum value of this parameter, specified as a finite, real, double, scalar number. The default value, [ ], means the maximum is unspecified.

Before specifying `CalibrationMax`, you must specify `CalToMainCompuNumerator` and `CalToMainCompuDenominator` to define the computation method. The parameter uses the computation method and the calibration maximum value to calculate the corresponding maximum or minimum value that Simulink uses. A first order rational function is strictly monotonic, either increasing or decreasing. If it is increasing, setting the calibration maximum sets the main maximum value. If it is decreasing, setting the calibration maximum sets the main minimum.

If the parameter value is less than the minimum value or if the minimum value is outside the range of the parameter data type, Simulink generates a warning. In these cases, when updating the diagram or starting a simulation, Simulink generates an error.

Corresponds to **Calibration maximum** in the property dialog box.

Example: -10.51

Data Types: double

### **CalToMainCompuNumerator — Numerator coefficients of the computation method**

[ ] (default) | finite, real, double scalar | finite, real, double vector

Numerator coefficients of the computation method, specified as a scalar number or vector of values for the numerator coefficients *a* and *b* of the first-order linear equation:

$$y = \frac{ax + b}{cx + d}$$

The default value is [ ] (unspecified). Specify finite, real, double scalar values for *a* and *b*. For example, [1 1] or, for reciprocal scaling, 1.

Once you have applied `CalToMainCompuNumerator`, you cannot change it.

Corresponds to **CalToMain compute numerator** in the property dialog box.

Example: [1 1]

Example: 1

Data Types: double

### **CalToMainCompuDenominator — Denominator coefficients of the computation method**

[ ] (default) | finite, real, double scalar | finite, real, double vector

Denominator coefficients of the computation method, specified as a scalar number or vector of values for the denominator coefficients *c* and *d* of the first-order linear equation:

$$y = \frac{ax + b}{cx + d}$$

The default value is `[]` (unspecified). Specify finite, real, double scalar values for `c` and `d`. For example, `[1 1]`.

Once you have applied `CalToMainCompuDenominator`, you cannot change it.

Corresponds to **CalToMain compute denominator** in the property dialog box.

Example: `[1 1]`

Data Types: `double`

### **CalibrationName — Name of the calibration parameter**

`''` (empty character vector) (default) | character vector

Name of the calibration parameter, specified as a character vector.

Corresponds to **Calibration name** in the property dialog box.

Example: `'This is a calibration parameter.'`

Data Types: `char`

### **CalibrationDocUnits — Measurement units for this calibration parameter's value**

`''` (empty character vector) (default) | character vector

Measurement units for this calibration parameter's value, specified as a character vector.

Corresponds to **Calibration units** in the property dialog box.

Example: `'Fahrenheit'`

Data Types: `char`

### **IsConfigurationValid — Information about validity of configuration**

`true` (default) | `false`

This property is read-only.

Information about the validity of the object configuration, returned as `true` (valid) or `false` (invalid). If Simulink detects an issue with the configuration, it sets this field to `false` and provides information in the `DiagnosticMessage` property.

Corresponds to **Is configuration valid** in the property dialog box.

Data Types: `logical`

### **DiagnosticMessage — Diagnostic information about invalid configuration**

`''` (empty character vector) (default) | character vector

This property is read-only.

Diagnostic information about an invalid object configuration, returned as a character vector. If you specify invalid property settings, Simulink displays a message in this field. Use the diagnostic information to help you fix an invalid configuration issue.

Corresponds to **Diagnostic message** in the property dialog box.

Data Types: `char`

## Examples

### Create and Update a Dual-Scaled Parameter

Create a `Simulink.DualScaledParameter` object that stores a temperature as both Fahrenheit and Celsius.

Create a `Simulink.DualScaledParameter` object.

```
Temp = Simulink.DualScaledParameter;
```

Set the computation method that converts between Fahrenheit and Celsius.

```
Temp.CalToMainCompuNumerator = [1 -32];
Temp.CalToMainCompuDenominator = [1.8];
```

Set the value of the temperature that you want to see in Fahrenheit.

```
Temp.CalibrationValue = 212
```

```
Temp =
```

```
DualScaledParameter with properties:
```

```

 CalibrationValue: 212
 CalibrationMin: []
 CalibrationMax: []
 CalToMainCompuNumerator: [1 -32]
 CalToMainCompuDenominator: 1.8000
 CalibrationName: ''
 CalibrationDocUnits: ''
 IsConfigurationValid: 1
 DiagnosticMessage: ''
 Value: 100
 CoderInfo: [1x1 Simulink.CoderInfo]
 Description: ''
 DataType: 'auto'
 Min: []
 Max: []
 Unit: ''
 Complexity: 'real'
 Dimensions: [1 1]
```

The `Simulink.DualScaledParameter` calculates `Temp.Value` which is the value that Simulink uses. `Temp.CalibrationValue` is 212 (degrees Fahrenheit), so `Temp.Value` is 100 (degrees Celsius).

Name the value and specify the units.

```
Temp.CalibrationName = 'TempF';
Temp.CalibrationDocUnits = 'Fahrenheit';
```

Set calibration minimum and maximum values.

```
Temp.CalibrationMin = 0;
Temp.CalibrationMax = 300;
```

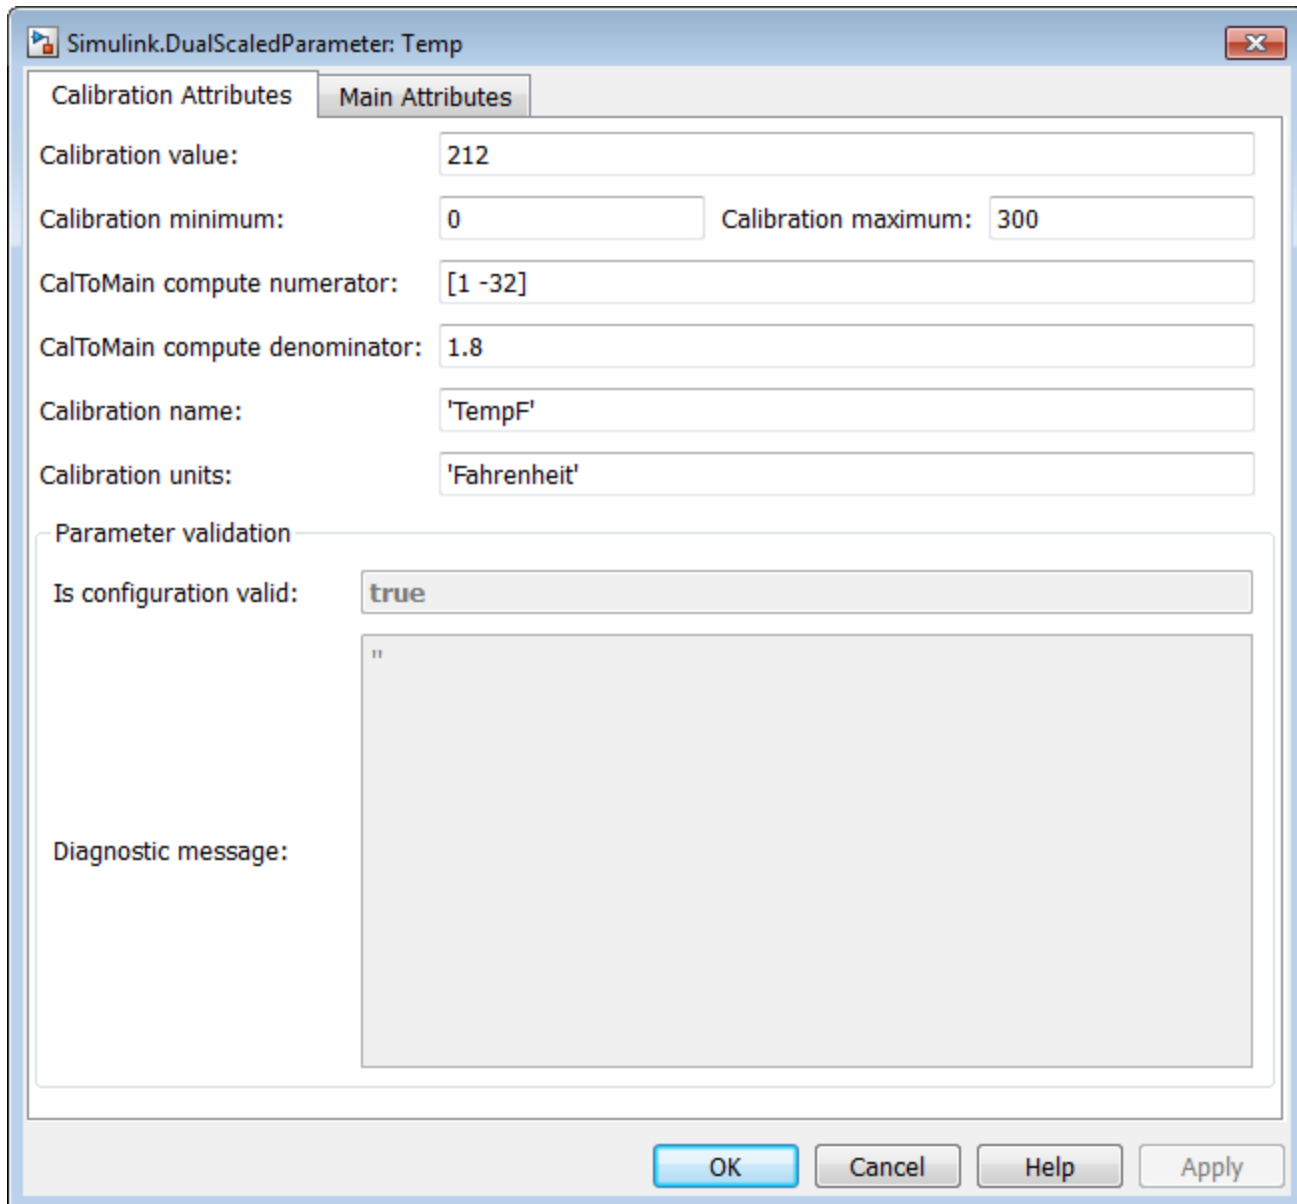

If you specify a calibration value outside this allowable range, Simulink generates a warning.

Specify the units that Simulink uses.

```
Temp.Unit = 'degC';
```

Open the Simulink.DualScaledParameter dialog box.

open `Temp`

The **Calibration Attributes** tab displays the calibration value and the computation method that you specified.

In the dialog box, click the **Main Attributes** tab.

The screenshot shows the 'Main Attributes' tab of the 'Simulink.DualScaledParameter: Temp' dialog box. The 'Value' field is set to 100. The 'Data type' is set to 'auto'. The 'Dimensions' are [1 1] and the 'Complexity' is 'real'. The 'Minimum' is -17.7778 and the 'Maximum' is 148.889. The 'Unit' is 'degC'. Under 'Code generation options', the 'Storage class' is set to 'Auto'. There is a 'Description' text area at the bottom, which is currently empty. At the bottom of the dialog are 'OK', 'Cancel', 'Help', and 'Apply' buttons.

This tab displays information about the value used by Simulink.

## Version History

Introduced in R2013b

## Extended Capabilities

### C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

To control the appearance of a `Simulink.DualScaledParameter` object in the generated code, use the **Storage class** property, which the object inherits from `Simulink.Parameter`.

**Fixed-Point Conversion**

Design and simulate fixed-point systems using Fixed-Point Designer™.

# simulink.event.InputWrite

Trigger event when input port value updates

## Description

Use a `simulink.event.InputWrite` object to configure a root input port to trigger a schedule event each time the port value updates. By configuring event triggers on input ports, you can model and simulate quality of service effects.

You can trigger one or more model partitions in a rate-based system based on the flow of data into an input port in the top model or on a model reference interface. The `EventTriggers` parameter of an Inport or In Bus Element block stores the event trigger objects associated with the port. Each event trigger maps an input event to the name of the schedule event it triggers. The schedule for the model specifies the partition to execute in response to the schedule event. The table summarizes the event triggers you can configure on input ports. For each input port, you can configure one event trigger for each input event.

Input Event	Input Event Description	Event Trigger Object
Input write	Value for input port updates.	<code>simulink.event.InputWrite</code>
Input write timeout	Input port value does not update within a specified amount of time.	<code>simulink.event.InputWriteTimeout</code>
Input write lost	Input port value update overwrites unprocessed data.	<code>simulink.event.InputWriteLost</code>

To configure the schedule for your model, use the **Schedule Editor**.

## Creation

You can configure the event triggers for an input port programmatically or interactively.

- When you configure the input port programmatically, create and configure the event trigger object yourself using the `simulink.event.InputWrite` function.
- When you configure the input port interactively using the Block Parameters dialog box or the Property Inspector, the software creates and configures the event trigger object.

## Syntax

```
inputWrite = simulink.event.InputWrite
```

### Description

`inputWrite = simulink.event.InputWrite` creates the event trigger object `inputWrite` that you can use to configure an input port to trigger a specified schedule event each time the port value updates.

## Properties

### EventName — Event to trigger when input port value updates

'Auto' (default) | string | character vector

Event to trigger when input port value updates, specified as a string or a character vector. The event name must be 'Auto' or the name of an event defined in the Schedule Editor.

By default, the event name is 'Auto'. When you update or compile a model that has an input port configured with an InputWrite event trigger with the event name 'Auto', the software:

- 1 Creates a schedule event that is scoped to the block. For example, for a block named Inport, the software creates the event Inport.InputWrite.

This event appears in the **Events** panel in the Schedule Editor with other events defined for the model.

- 2 Configures the listener for the event as the aperiodic partition connected to the input port, if the input port is connected to an aperiodic partition.

To configure a different listener for the event, use the **Schedule Editor**.

Example: `inWrite.EventName = "myEvent"` configures the event trigger object `inWrite` to trigger the event `myEvent` that is defined in the Schedule Editor.

Data Types: `char` | `string`

## Examples

### Trigger Partition Each Time Input Port Value Updates

Open the model `ScaleInput`. The model loads external input data into a subsystem. The subsystem contains a Gain block that multiplies the subsystem input by two.

```
mdl = "ScaleInput";
open_system(mdl)
```

Create a `timeseries` object with input data for the model. The input data represents a line with a slope of one sampled every second for ten seconds.

```
sampleTime = 1;
numSteps = 11;
time = sampleTime*(0:numSteps-1);
time = time';
```

```
data = time;
```

```
lineTS = timeseries(data,time);
```

Configure the model to load the `timeseries` object.

```
set_param mdl, "LoadExternalInput", "on"
set_param mdl, "ExternalInput", "lineTS"
```

Simulate the model. By default, the maximum step size for the simulation is calculated such that the simulation takes 50 steps, resulting in a time step every 0.2 seconds.

```
out = sim mdl;
```

Configure the model to execute the partition only when the value of the input port updates.

Configure the subsystem to execute as an aperiodic partition. In the Block Parameters dialog box or the Property Inspector, select **Treat as atomic unit**, then from the **Schedule as** list, select **Aperiodic partition**. Alternatively, use the `set_param` function to configure the `TreatAsAtomicUnit` and `ScheduleAs` parameters.

```
set_param("ScaleInput/Subsystem", "TreatAsAtomicUnit", "on")
set_param("ScaleInput/Subsystem", "ScheduleAs", "Aperiodic partition")
```

Add an input write event trigger to the Inport block. In the Block Parameters dialog box, on the

**Execution** tab, click Add event trigger , then select **Input Write** from the list. Alternatively, create a `simulink.event.InputWrite` object and use the `set_param` function to configure the `EventTriggers` parameter.

```
inputWrite = simulink.event.InputWrite;
set_param("ScaleInput/Inport", "EventTriggers", {inputWrite})
```

Update the block diagram by pressing **Ctrl+D** or by using the `set_param` function. By default, the input write event trigger is configured to trigger the **Auto** event. When you update the block diagram or compile the model, the software creates the event `Inport.InputWrite` that is scoped to the Inport block and configures the partition connected to the Inport block as the listener for the event.

```
set_param mdl, "SimulationCommand", "update")
```

Simulate the model again. Because input port data drives the partition execution, the simulation takes a step only when the input value updates.

```
out = sim mdl;
```

# simulink.event.InputWriteLost

Trigger event when input port value update overwrites unprocessed data

## Description

Use a `simulink.event.InputWriteLost` object to configure a root input port to trigger a schedule event each time a value update on the input port overwrites unprocessed data. By configuring event triggers on input ports, you can model and simulate quality of service effects.

You can trigger one or more model partitions in a rate-based system based on the flow of data into an input port in the top model or on a model reference interface. The `EventTriggers` parameter of an Inport or In Bus Element block stores the event trigger objects associated with the port. Each event trigger maps an input event to the name of the schedule event it triggers. The schedule for the model specifies the partition to execute in response to the schedule event. The table summarizes the event triggers you can configure on input ports. For each input port, you can configure one event trigger for each input event.

Input Event	Input Event Description	Event Trigger Object
Input write	Value for input port updates.	<code>simulink.event.InputWrite</code> <code>e</code>
Input write timeout	Input port value does not update within a specified amount of time.	<code>simulink.event.InputWrite</code> <code>Timeout</code>
Input write lost	Input port value update overwrites unprocessed data.	<code>simulink.event.InputWrite</code> <code>Lost</code>

To configure the schedule for your model, use the **Schedule Editor**.

## Creation

You can configure the event triggers for an input port programmatically or interactively.

- When you configure an event trigger programmatically, create and configure the event trigger object yourself using the `simulink.event.InputWriteLost` function.
- When you configure an event trigger interactively by using the Block Parameters dialog box or the Property Inspector, the software creates and configures the event trigger object.

## Syntax

```
writeLost = simulink.event.InputWriteLost
```

### Description

`writeLost = simulink.event.InputWriteLost` creates the event trigger `writeLost` that you can use to configure an input port to trigger a specified schedule event each time an update of the input port value overwrites unprocessed data.

## Properties

### EventName — Event to trigger when input port value update overwrites unprocessed data

'Auto' (default) | string | character vector

Event to trigger when input port value update overwrites unprocessed data, specified as a string or a character vector. The event name must be 'Auto' or the name of an event defined in the Schedule Editor.

By default, the event name is 'Auto'. When you update or compile a model that has an input port configured with an `InputWriteTimeout` event trigger with the event name 'Auto', the software creates a schedule event that is scoped to the block. For example, for a block named `Inport`, the software creates the event `Inport.InputWriteLost`. Use the **Schedule Editor** to configure the listener for the event.

Example: `inLost.EventName = "myEvent"` configures the event trigger object `inLost` to trigger the event `myEvent` that is defined in the Schedule Editor.

Data Types: `char` | `string`

## Examples

### Trigger Partition Each Time Sample Overwritten in Queue

Configure a model to execute a partition each time an incoming value overwrites unprocessed data in a queue.

Open the model `SampleLost`. The model contains the subsystem `Sensors` that models transmitting data from a single sensor every 0.1 seconds. A `Queue` block stores the sensor messages, and the model reference `SinkSystem` reads the sensor data from the queue. The model is configured to log events so you can visualize how messages propagate through the system using the Sequence Viewer.

```
mdl = "SampleLost";
open_system(mdl)
```

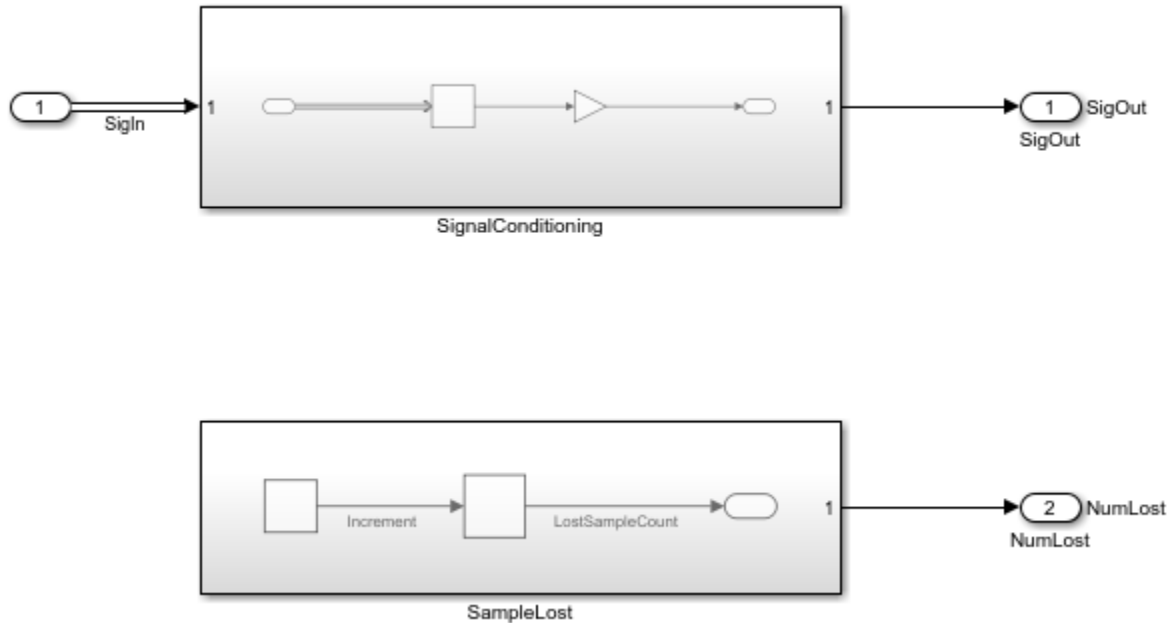

The referenced model `SinkSystem` contains two subsystems:

- The `SignalConditioning` subsystem receives messages of sensor data from the queue and scales the data using a `Gain` block.

- The SampleLost subsystem contains a Constant block with a value of 1 connected to an Accumulator block.

Configure the subsystem `SignalConditioning` as a periodic partition that receives a message from the queue every 0.5 seconds.

- In the Block Parameters dialog box or the Property Inspector, select **Treat as atomic unit**.
- From the **Schedule as** list, select `Periodic` partition.
- Specify the partition name as `SignalConditioning`.
- Specify the sample time as 0.5.

Alternatively, use the `set_param` function to configure the `TreatAsAtomicUnit`, `ScheduleAs`, `PartitionName`, and `SystemSampleTime` parameters.

```
load_system("SinkSystem");
set_param("SinkSystem/SignalConditioning", "TreatAsAtomicUnit", "on", ...
 "ScheduleAs", "Periodic partition", ...
 "PartitionName", "SignalConditioning", ...
 "SystemSampleTime", "0.5");
```

Configure the subsystem `SampleLost` as an aperiodic partition.

- In the Block Parameters dialog box or the Property Inspector, select **Treat as atomic unit**.
- From the **Schedule as** list, select `Aperiodic` partition.
- Specify the partition name as `SampleLost`.

Alternatively, use the `set_param` function to configure the `TreatAsAtomicUnit`, `ScheduleAs`, and `PartitionName` parameters.

```
set_param("SinkSystem/SampleLost", "TreatAsAtomicUnit", "on", ...
 "ScheduleAs", "Aperiodic partition", ...
 "PartitionName", "SampleLost")
```

Configure the input port for the model reference SinkSystem with an input write lost event trigger.

- 1 In the Block Parameters dialog box, on the **Execution** tab, click Add event trigger.
- 2 From the list, select Input Write Lost.

Alternatively, create and configure a `simulink.event.InputWriteLost` object. Then, configure the `EventTriggers` parameter of the input port using the `set_param` function.

```
inLost = simulink.event.InputWriteLost;
set_param("SinkSystem/Inport", "EventTriggers", {inLost})
```

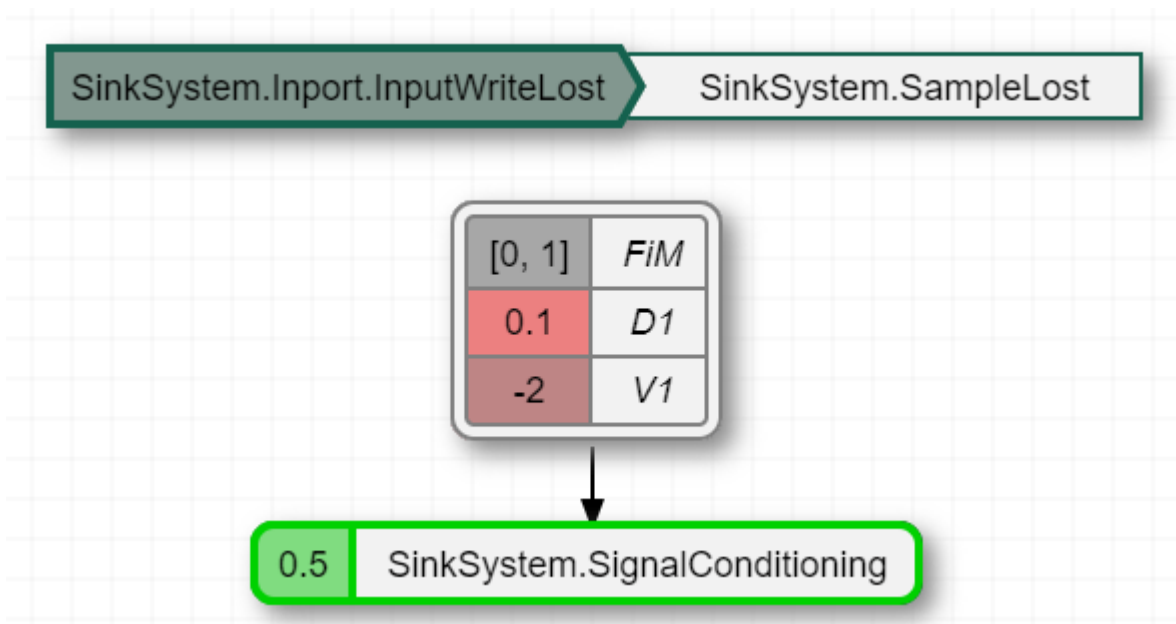

Update the block diagram by pressing **Ctrl+D** or by using the `set_param` function. By default, the event trigger is configured to trigger the Auto event. When you update the block diagram or compile the model, the software creates the event `SampleLost.Inport.InputWriteLost` that is scoped to the Inport block in the model reference.

```
set_param mdl, "SimulationCommand", "update")
```

Configure the model so the `SampleLost.Inport.InputWriteLost` event triggers the `SampleLost` partition.

- 1 Open the Schedule Editor. In the model, click the badge  on one of the partitioned subsystems. Alternatively, from the Block Parameters dialog box for the Inport block, on the **Execution** tab, click **Open Schedule Editor**.
- 2 To expand the **Events** pane, click Expand Side .
- 3 Select the `SampleLost.Inport.InputWriteLost` event. Then, drag it into the Schedule Editor canvas and release it on the `SampleLost` partition.

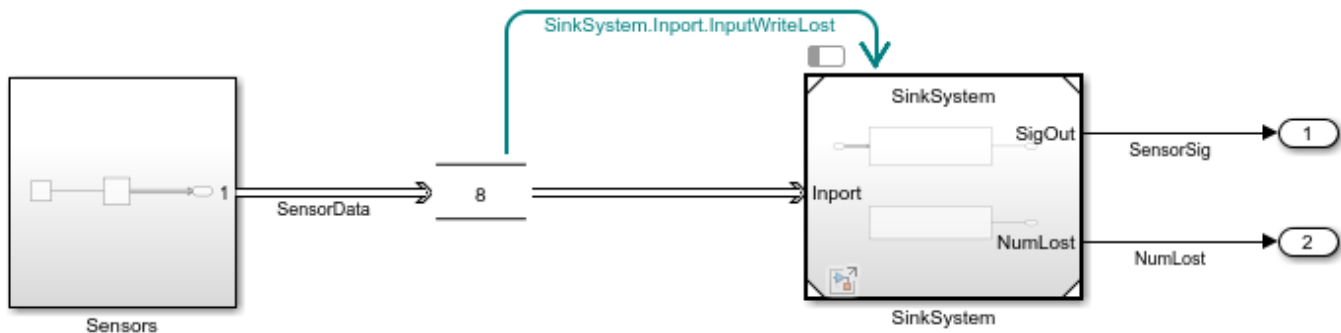

Alternatively, use the `get_param` function to get the schedule for the model. Then, using the `Order` property of the schedule, specify the trigger for the `SampleLost` partition and use the `set_param` function to specify the modified schedule as the schedule for the model.

```

sched = get_param mdl, "Schedule";
sched.Order.Trigger("SinkSystem.SampleLost") = "SinkSystem.Inport.InputWriteLost";
set_param(mdl, "Schedule", sched)

```

Simulate the model.

```
out = sim mdl;
```

Use the Simulation Data Inspector and the Sequence Viewer to analyze how the sensor data moves through the system. On the **Simulation** tab, under **Review Results**, click **Data Inspector** and **Sequence Viewer**.

To plot the data, display markers, and add cursors in the Simulation Data Inspector, load the view `SampleLostView` using the `Simulink.sdi.loadView` function.

```
Simulink.sdi.loadView("SampleLostView.mldatx")
```

Use the cursors to analyze the data.

A sensor sample overwrites data in the queue for the first time when the sensor system writes the eleventh sample into the queue. The sensor writes into the queue before the sink system reads a value from the queue for the third time, so the queue size of 8 is no longer sufficient.

The sink system reading the third value frees up space in the queue so no input write lost event occurs on the next time step, 1.1. Then, starting with time 1.2, four input write lost events occur in sequence as the sensor system continues writing values into the queue. The sink system pulls another value at time 1.5, freeing space in the queue. This pattern continues for the rest of the simulation.

The sequence viewer denotes overwritten queue values with a closed black circle.

## simulink.event.InputWriteTimeout

Trigger event when input port value does not update within specified time

### Description

Use a `simulink.event.InputWrite` object to configure a root input port to trigger a schedule event when the input port value does not update within a specified amount of time. By configuring event triggers on input ports, you can model and simulate quality of service effects.

You can trigger one or more model partitions in a rate-based system based on the flow of data into an input port in the top model or on a model reference interface. The `EventTriggers` parameter of an Inport or In Bus Element block stores the event trigger objects associated with the port. Each event trigger maps an input event to the name of the schedule event it triggers. The schedule for the model specifies the partition to execute in response to the schedule event. The table summarizes the event triggers you can configure on input ports. For each input port, you can configure one event trigger for each input event.

Input Event	Input Event Description	Event Trigger Object
Input write	Value for input port updates.	<code>simulink.event.InputWrite</code>
Input write timeout	Input port value does not update within a specified amount of time.	<code>simulink.event.InputWriteTimeout</code>
Input write lost	Input port value update overwrites unprocessed data.	<code>simulink.event.InputWriteLost</code>

To configure the schedule for your model, use the **Schedule Editor**.

### Creation

You can configure the event triggers for an input port programmatically or interactively.

- When you configure an event trigger programmatically, create and configure the event trigger object yourself using the `simulink.event.InputWriteTimeout` function.
- When you configure an event trigger interactively by using the Block Parameters dialog box or the Property Inspector, the software creates and configures the event trigger object.

### Syntax

```
writeTimeout = simulink.event.InputWriteTimeout
```

### Description

`writeTimeout = simulink.event.InputWriteTimeout` creates the event trigger `writeTimeout` that you can use to configure an input port to trigger a specified schedule event each time the input port value does not update within the specified amount of time.

## Properties

### EventName — Event to trigger when input port value does not update within specified time

'Auto' (default) | string | character vector

Event to trigger when input port value does not update within specified time, specified as a string or a character vector. The event name must be 'Auto' or the name of an event defined in the Schedule Editor.

By default, the event name is 'Auto'. When you update or compile a model that has an input port configured with an `InputWriteTimeout` event trigger with the event name 'Auto', the software creates a schedule event that is scoped to the block. For example, for a block named `Inport`, the software creates the event `Inport.InputWriteTimeout`. Use the **Schedule Editor** to configure the listener for the event.

Example: `inTimeout.EventName = "myEvent"` configures the event trigger object `inTimeout` to trigger the event `myEvent` that is defined in the Schedule Editor.

Data Types: char | string

### Timeout — Time limit for update of input port value

' ' (default) | string | character vector

Time limit for update of input port value, specified as a string or a character vector that defines a positive numeric value.

Example: `inTimeout.Timeout = "1"` configures the event trigger object `inTimeout` with a timeout of one second.

Data Types: char | string

## Examples

### Trigger Partition When Input Value Becomes Stale

Configure a model to execute a partition when the input value does not update within ten seconds.

Open the model `InputTimeout`. The model contains an input port that loads external data into two subsystems.

```
mdl = "InputTimeout";
open_system(mdl);
```

Configure the model to allow multiple partitions to access the model inputs and outputs. Both subsystems need to use the input port value, and each subsystem will execute at its own rate.

- 1 On the **Modeling** tab, under **Setup**, click **Model Settings**.
- 2 In the Configuration Parameters dialog box, on the **Solver** pane, expand **Solver details**.
- 3 Under **Tasking and sample time options**, select **Allow multiple tasks to access inputs and outputs**.

Alternatively, use the `set_param` function to configure the `AllowMultiTaskInputOutput` parameter.

```
set_param mdl, "AllowMultiTaskInputOutput", "on")
```

Configure the subsystem `SampleSignal` as a periodic partition that samples the input signal every second.

- 1 In the Block Parameters dialog box or the Property Inspector, select **Treat as atomic unit**.
- 2 From the **Schedule as** list, select `Periodic` partition.
- 3 Specify the partition name as `SampleSignal`.
- 4 Specify the sample time as 1.

Alternatively, use the `set_param` function to configure the `TreatAsAtomicUnit`, `ScheduleAs`, `PartitionName`, and `SystemSampleTime` parameters.

```
set_param("InputTimeout/SampleSignal", "TreatAsAtomicUnit", "on", ...
 "ScheduleAs", "Periodic partition", ...
 "PartitionName", "SampleSignal", ...
 "SystemSampleTime", "1")
```

Configure the subsystem `InputTimeout` as an aperiodic partition.

- 1 In the Block Parameters dialog box or the Property Inspector, select **Treat as atomic unit**.
- 2 From the **Schedule as** list, select `Aperiodic` partition.
- 3 Specify the partition name as `InputTimeout`.

Alternatively, use the `set_param` function to configure the `TreatAsAtomicUnit`, `ScheduleAs`, and `PartitionName` parameters.

```
set_param("InputTimeout/InputTimeout", "TreatAsAtomicUnit", "on", ...
 "ScheduleAs", "Aperiodic partition", ...
 "PartitionName", "InputTimeout")
```

Configure the input port with an input write timeout event trigger.

- 1 In the Block Parameters dialog box, on the **Execution** tab, click Add event trigger.
- 2 From the list, select **Input Write Timeout**.
- 3 In the **Timeout** column of the table, specify the timeout as 10.

Alternatively, create and configure a `simulink.event.InputWriteTimeout` object. Then, configure the `EventTriggers` parameter of the input port using the `set_param` function.

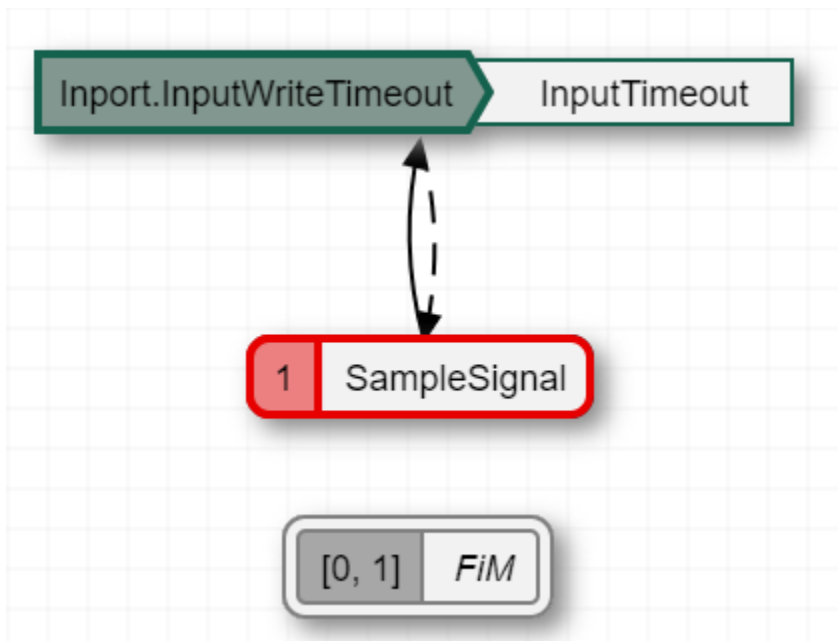

```
inTimeout = simulink.event.InputWriteTimeout;
inTimeout.Timeout = "10";
set_param("InputTimeout/Inport", "EventTriggers", {inTimeout})
```

Update the block diagram by pressing **Ctrl+D** or by using the `set_param` function. By default, the event trigger is configured to trigger the **Auto** event. When you update the block diagram or compile the model, the software creates the event `Inport.InputWriteTimeout` that is scoped to the `Inport` block.

```
set_param mdl, "SimulationCommand", "update")
```

Configure the model schedule such that the `Inport.InputWriteTimeout` event triggers the `InputTimeout` partition.

- 1 Open the Schedule Editor. In the model, click the badge on one of the partitioned subsystems . Alternatively, from the Block Parameters dialog box for the `Inport` block, on the **Execution** tab, click **Open Schedule Editor** .
- 2 To expand the **Events** pane, click **Expand Side** .
- 3 Select the `Inport.InputWriteTimeout` event. Then, drag it into the Schedule Editor canvas and release it on the `InputTimeout` partition.

In the Schedule Editor, click **Update Diagram**. The block diagram updates to reflect the binding of the `Inport.InputWriteTimeout` event to the `InputTimeout` partition.

Alternatively, use the `get_param` function to get the schedule for the model. Then, using the `Order` property of the schedule, specify the trigger for the `InputTimeout` partition and use the `set_param` function to specify the modified schedule as the schedule for the model.

```
sched = get_param mdl, "Schedule";
sched.Order.Trigger("InputTimeout") = "Inport.InputWriteTimeout";
set_param(mdl, "Schedule", sched)
```

Create a `timeseries` object that contains input data with sample values separated by an increasing time interval.

```
time = [0 1 3 5 8 13 21 34 55 89 144];
data = (0:10)';
inp = timeseries(data,time);
```

Configure the model to load the input data.

```
set_param mdl, "LoadExternalInput", "on", ...
 "ExternalInput", "inp")
```

Simulate the model.

```
out = sim mdl;
```

The InputTimeout partition executes only when the input value does not update for at least ten seconds.

### Objects

simulink.event.InputWrite | simulink.event.InputWriteLost

# Simulink.FindOptions

Specify options for finding blocks in models and subsystems

## Description

`Simulink.FindOptions` objects allow you to constrain a search with the `Simulink.findBlocks` and `Simulink.findBlocksOfType` functions.

## Creation

### Syntax

```
f = Simulink.FindOptions
f = Simulink.FindOptions(Name,Value)
```

### Description

`f = Simulink.FindOptions` creates a `FindOptions` object that uses the default search options.

`f = Simulink.FindOptions(Name,Value)` sets properties on page 8-244 using name-value pairs. For example, `Simulink.FindOptions('SearchDepth',1)` creates a `FindOptions` object with a search depth of 1. You can specify multiple name-value pairs. Enclose each property name in single quotes.

## Properties

### CaseSensitive — Option to match case when searching

`true` (default) | `false`

Option to match case when searching, specified as `true` for case-sensitive search or `false` for case-insensitive search.

Data Types: `logical`

### FollowLinks — Option for search to follow library links

`false` (default) | `true`

Option for search to follow library links, specified as `true` or `false`. If `true`, search follows links into library blocks.

Data Types: `logical`

### IncludeCommented — Option for search to include commented blocks

`true` (default) | `false`

Option for search to include commented blocks, specified as `true` or `false`.

Data Types: `logical`

**LookUnderMasks — Options to search masked blocks**`'all'` (default) | `'none'` | `'functional'` | `'graphical'`

Options to search masked blocks, specified as:

- `'all'` — Search in all masked blocks.
- `'none'` — Prevent searching in masked systems.
- `'functional'` — Include masked subsystems that do not have dialogs.
- `'graphical'` — Include masked subsystems that do not have workspaces or dialogs.

Data Types: `char` | `string`**Variants — Options to search variant subsystems**`'AllVariants'` (default) | `'ActiveVariants'` | `'ActivePlusCodeVariants'`

---

**Note** The `Variants` argument will be removed. Use `MatchFilter` instead. For more information, see [Compatibility Considerations](#) on page 8-248.

---

Options to search variant subsystems, specified as:

- `'AllVariants'` — Search all variant choices.
- `'ActiveVariants'` — Search only active variant choices.
- `'ActivePlusCodeVariants'` — Search all variant choices in the Variant Subsystem that are active in simulation and is part of the generated code.

This search constraint applies only to Variant Subsystem blocks that have the **Variant control mode** set to `expression` or `label`. Use the `Simulink.FindOptions` object with the `MatchFilter` option to operate on all types of variant blocks.

Data Types: `char` | `string`**MatchFilter — Option to match and filter elements in search**

function handle

Option to match and filter elements such as blocks, system, lines, ports, and annotations in a search, specified as function handle. Use `MatchFilter` to determine whether elements should be included or skipped in a search.

The option:

- Allows you to filter elements with custom filter functions
- Avoids processing elements when filters do not match
- Applies complex filters on blocks, lines, or annotations, to filter the results internally

The named function must be defined within a MATLAB program file. The function takes the handle of the element as input and returns two outputs.

```
function [match, prune] = func(element)
```

- The input `element` is the handle of the block being processed.

- The first output, `match`, is a logical value. If `false`, search skips the element.
- The second output, `prune`, is an optional logical value that only applies when `element` is a subsystem. The default value is `false`. If this value is set to `true`, the entire subsystem is omitted from the search.

Example: Use `MatchFilter` to find all `Gain` blocks in the model `vdp` with a gain value between 1 and 10.

```
function match = gainOneToTen(blk)
match = false;
if strcmp(get_param(blk,'Type'),'block') ...
 && strcmp(get_param(blk,'BlockType'),'Gain')
 gainValue = str2double(get_param(blk, 'Gain'));
 match = gainValue >= 1 && gainValue <= 10;
end
end

load_system('vdp');
findOptObj = Simulink.FindOptions('MatchFilter', @gainOneToTen);
blks=getfullname((Simulink.findBlocks('vdp',findOptObj)));
```

**Variants:** Simulink provides these built-in match filter functions to find variant blocks that are active in simulation or part of the generated code.

- `Simulink.match.activeVariants` — Filter function to find blocks that are active in simulation after model compilation
- `Simulink.match.codeCompileVariants` — Filter function to find blocks that are part of generated code after model compilation
- `Simulink.match.allVariants` — Filter function to find all blocks irrespective of whether the block is active or inactive due to variants.

---

**Note** To get correct results, you must **compile the model** before using `Simulink.match.activeVariants` and `Simulink.match.codeCompileVariants` filters. If the model is not compiled, these filters return all blocks in the model.

---

Example: Use the `Simulink.match.activeVariants` option to find active variants in a model:

```
openExample('simulink_variants/BuiltInMatchFiltersWithfindsystemForVariantBlocksExample');
model='sldemo_variant_subsystems';
load_system(model);
assignin('base','VSS_MODE',2);
set_param(model, 'SimulationCommand', 'update');
findOptObj= Simulink.FindOptions('MatchFilter', @Simulink.match.activeVariants);
blks=getfullname((Simulink.findBlocks(model,findOptObj)))
```

Example: Use the `Simulink.match.codeCompileVariants` option to find variant choices that are part of the generated C code:

```
openExample('simulink_variants/BuiltInMatchFiltersWithfindsystemForVariantBlocksExample');
load_system('sldemo_variant_subsystems');
assignin('base','VSS_MODE',2);
sldemo_variant_subsystems([], [], [], 'compileForCodegen');
findOptObj = Simulink.FindOptions('MatchFilter', @Simulink.match.codeCompileVariants);
```

```
blks=getfullname((Simulink.findBlocks('sldemo_variant_subsystems',findOptObj)));
sldemo_variant_subsystems([], [], [], 'term');
```

Example: Use the `Simulink.match.allVariants()` option to find all blocks in a model.

```
openExample('simulink_variants/BuiltInMatchFiltersWithfindsystemForVariantBlocksExample');
model='sldemo_variant_subsystems';
load_system(model);
findOptObj= Simulink.FindOptions('MatchFilter', @Simulink.match.allVariants);
blks=getfullname((Simulink.findBlocks(model,findOptObj)))
```

### RegExp — Option to treat search text as regular expression

false (default) | true

Option to treat search text as a regular expression, specified as `true` or `false`. To learn more about MATLAB regular expressions, see “Regular Expressions”.

Data Types: `logical`

### SearchDepth — Levels in model to search

-1 (default) | positive integer

Levels in model to search, specified as a positive integer. The default (-1) is to search all levels. Specify:

- 1 — Search in the top-level system.
- 2 — Search the top-level system and its children, 3 to search an additional level, and so on.

Data Types: `int32`

## Examples

### Specify Search Options

Create a `Simulink.FindOptions` object that specifies a search depth of 1.

```
f = Simulink.FindOptions('SearchDepth',1);
```

Using the `FindOptions` object, search for all blocks in the subsystem named `Unlocked`, but not in any of its children.

```
openExample('sldemo_clutch');
bh = Simulink.findBlocks('sldemo_clutch/Unlocked',f);
```

The `Simulink.findBlocks` function returns the block handles.

To get the block path, use the `getfullname` function.

```
bp = getfullname(bh)
```

```
bp =
```

```
20x1 cell array
```

```
{'sldemo_clutch/Unlocked/Tfmaxk' }
{'sldemo_clutch/Unlocked/Tin' }
{'sldemo_clutch/Unlocked/Enable' }
{'sldemo_clutch/Unlocked/E_Sum' }
```

```

{'sldemo_clutch/Unlocked/Engine↔Damping' }
{'sldemo_clutch/Unlocked/Engine↔Inertia' }
{'sldemo_clutch/Unlocked/Engine↔Integrator' }
{'sldemo_clutch/Unlocked/Goto' }
{'sldemo_clutch/Unlocked/Goto1' }
{'sldemo_clutch/Unlocked/Max↔Dynamic↔Friction↔Torque'}
{'sldemo_clutch/Unlocked/V_Sum' }
{'sldemo_clutch/Unlocked/Vehicle↔Damping' }
{'sldemo_clutch/Unlocked/Vehicle↔Inertia' }
{'sldemo_clutch/Unlocked/Vehicle↔Integrator' }
{'sldemo_clutch/Unlocked/W_Slip' }
{'sldemo_clutch/Unlocked/slip direction' }
{'sldemo_clutch/Unlocked/w0' }
{'sldemo_clutch/Unlocked/w0 ' }
{'sldemo_clutch/Unlocked/we' }
{'sldemo_clutch/Unlocked/wv' }

```

## Version History

### Introduced in R2018a

#### R2022a: New built-in match filter to find all variant blocks

You can use the built-in match filter, `Simulink.match.allVariants`, to find all the blocks in a variant model regardless of whether the block is active or inactive due to variants. This filter is the recommended replacement for the `AllVariants` option.

To be removed	Recommended Replacement
<code>findOptObj= Simulink.FindOptions('Variants', 'AllVariants');</code>	<code>findOptObj= Simulink.FindOptions('MatchFilter', ... @Simulink.match.allVariants);</code>

#### R2021a: Variants option will be removed

*Warns starting in R2021a*

The `Variants` option will be removed from `Simulink.FindOptions` in a future release. Scripts that use the `Variants` option continue to work with a warning.

Using the `Simulink.FindOptions` object with the `Variants` argument produces inconsistent search results. `Simulink.FindOptions` is used at edit-time, but to determine whether a block is active in a model with all types of variant blocks, you need to compile the model.

To find variant blocks that are active during simulation or code generation, compile the model and use the `Simulink.FindOptions` object with the `MatchFilter` option.

This table lists the recommended replacement for different values of the `Variants` option.

To Be Removed	Recommended Replacement
<code>findOptObj= Simulink.FindOptions('Variants', 'ActiveVariants');</code>	<code>set_param(model, 'SimulationCommand', 'update');</code> <code>findOptObj= Simulink.FindOptions('MatchFilter', ... @Simulink.match.activeVariants);</code>

To Be Removed	Recommended Replacement
<pre>findOptObj= Simulink.FindOptions('Variants' 'ActivePlusCodeVariants');</pre>	<pre>model([], [], [], 'compileForCodegen'); findOptObj = Simulink.FindOptions('MatchFilter', ... @Simulink.match.codeCompileVariants); blks=getfullname((Simulink.findBlocks(model, findOptObj))); model([], [], [], 'term');</pre>

When you use the `Simulink.FindOptions` object, you cannot specify both of the `MatchFilter` and `Variants` arguments.

This command produces an error.

```
f = Simulink.FindOptions('MatchFilter',...
@Simulink.match.activeVariants, 'Variants', 'ActiveVariants');
blocks=Simulink.findBlocks('sldemo_variant_subsystems',f)
```

### R2020b: Filter elements during search with MatchFilter

To match and filter model elements during a search, you can define a custom filter function and pass the function handle as value to the `MatchFilter` option.

To find variant blocks that are active in a simulation or part of the generated code, you can use the built-in match filter functions, `Simulink.match.activeVariants`, `Simulink.match.codeCompileVariants`, and `Simulink.match.allVariants`, after compiling the model.

# Simulink.HMI.InstrumentedSignals

Save and restore signal logging specification

## Description

A `Simulink.HMI.InstrumentedSignals` object acts as a specification for logged signals in a model, including signals in subsystems, library instances, and Stateflow charts. You can get a `Simulink.HMI.InstrumentedSignals` object for the logging configuration in your model using the `get_param` function with the `InstrumentedSignals` model parameter. You can save several logging configurations as `Simulink.HMI.InstrumentedSignals` objects and easily swap the logging configuration for your model using `set_param`.

---

**Note** An `InstrumentedSignals` object for a model does not include signals logged inside referenced models. To get a list of logged signals in a referenced model, create an `InstrumentedSignals` object for the referenced model.

---

## Creation

The `get_param` function returns a `Simulink.HMI.InstrumentedSignals` object for the `InstrumentedSignals` model parameter.

## Properties

### Model — Model name

character vector

Name of the model that corresponds to the list of logged signals.

Example: 'sldemo\_fuelsys'

### Count — Number of logged signals

integer

Number of logged signals in the model.

Example: 10

Data Types: `uint32`

## Examples

### Save and Restore a Set of Logged Signals

This example shows how to use the `Simulink.HMI.InstrumentedSignals` object to save a set of logged signals to restore after running a simulation with a different signal logging configuration.

## Save the Initial Signal Logging Configuration

This example uses the `sldemo_fuelsys` model, which is configured to log 10 signals. Open the model and use the `get_param` function to get a `Simulink.HMI.InstrumentedSignals` object representing the signal logging configuration.

```
load_system sldemo_fuelsys

initSigs = get_param('sldemo_fuelsys','InstrumentedSignals');
```

You can save the initial signal logging configuration in a MAT-file for later use.

```
save initial_instSigs.mat initSigs
```

## Remove All Logging Badges

To return to a baseline of no logged signals, you can use the `set_param` function to remove all logging badges from signals in your model. Then, you can easily select a different configuration of signals to log in the Simulink™ Editor or using the `Simulink.sdi.markSignalForStreaming` function.

```
set_param('sldemo_fuelsys','InstrumentedSignals',[])
```

## Restore Saved Logging Configuration

After working with a different set of logged signals, you can restore a saved configuration using the `Simulink.HMI.InstrumentedSignals` object. For example, if you saved the logging configuration to a MAT-file, you can load the MAT-file contents into the workspace and use the `set_param` function to restore the previously saved logging configuration.

```
load initial_instSigs.mat

set_param('sldemo_fuelsys','InstrumentedSignals',initSigs)
```

## Simulink.HMI.ParamSourceInfo

Information about Dashboard block variable and parameter connections

### Description

Use a `Simulink.HMI.ParamSourceInfo` object to connect a Dashboard block to a variable or parameter programmatically using the `set_param` function. The `get_param` function returns a `Simulink.HMI.ParamSourceInfo` object when you use the function to query the connection information for a Dashboard block connected to a variable or parameter.

The `Simulink.HMI.ParamSourceInfo` object contains four properties. Some of the properties apply to connecting Dashboard blocks to parameters, and some apply for connecting Dashboard blocks to variables. Not all fields have a value for a connection because a given Dashboard block connects to either a parameter or a variable.

### Creation

#### Syntax

```
paramSourceInfo = Simulink.HMI.ParamSourceInfo
```

#### Description

`paramSourceInfo = Simulink.HMI.ParamSourceInfo` creates the empty `Simulink.HMI.ParamSourceInfo` object, `paramSourceInfo`.

### Properties

#### **BlockPath — Path to the block associated with the parameter or variable**

`Simulink.BlockPath`

`Simulink.BlockPath` object for the block associated with the parameter or variable. You can create a `Simulink.BlockPath` object for a block by passing a character array describing the path to `Simulink.BlockPath`. You can get a character array describing the block path for a selected block using the `gcb` function.

Example: `Simulink.BlockPath('vdp/Mu')`

#### **ParamName — Name of the connected tunable block parameter**

character array

Name of the connected tunable block parameter, specified as a character array. A `Simulink.HMI.ParamSourceInfo` object connected to a variable does not have a value for the `ParamName` property.

Example: `Gain`

#### **VarName — Name of the connected variable**

character array

Name of the connected variable, specified as a character array. A `Simulink.HMI.ParamSourceInfo` object connected to a tunable parameter does not have a value for the `VarName` property.

Example: `Mu`

### **Element — Element of nonscalar variable or parameter value to connect**

character array

Element of nonscalar variable or parameter value to connect, specified as a character array.

When the value of the variable or parameter you want to tune using a dashboard block is nonscalar, use the `Element` property to specify the scalar element of the nonscalar value that you want to tune. To connect to a scalar element in a vector or matrix, specify the element index. To connect to an element of a bus or structure, specify the element in the context of the bus or structure hierarchy by using dots to indicate different levels in the hierarchy, and omit the top level. The value of the `VarName` property or the `ParamName` property specifies the top level.

Example: `3` connects the block to the third element of the variable specified by the `VarName` property or the parameter specified by the `ParamName` property.

Example: `(3,2)` connects the block to the element in the third row and second column of the variable specified by the `VarName` property or the parameter specified by the `ParamName` property.

Example: `a.b` connects the block to element `b` of the nested structure or bus `a` within the value of the variable specified by the `VarName` property or the parameter specified by the `ParamName` property.

### **WksType — Source workspace for the connected variable**

'base' | 'model' | data dictionary file path

Source workspace for the connected variable, specified as a character array. The source workspace can be the base workspace, model workspace, or a data dictionary. When the source workspace is a data dictionary, the `WksType` property value is the file path for the data dictionary, specified as a character array. A `Simulink.HMI.ParamSourceInfo` object connected to a tunable parameter does not have a value for the `WksType` property.

Example: `'modelData.sldd'`

## **Examples**

### **Programmatically Add and Connect a Dashboard Block**

This example shows how to programmatically add Dashboard blocks to a model and connect them to elements in the model. The example adds a Dashboard Scope block and a Slider block to the `vdp` model and connects and configures the blocks.

#### **Add Blocks**

Use the `add_block` function to add a Dashboard Scope block and a Slider block to the `vdp` model. This example also specifies the position of the blocks.

```
mdl = "vdp";
open_system(mdl)

scopePos = [750 85 990 295];
```

```
sliderPos =[765 -5 1005 135];

add_block("simulink_hmi_blocks/Dashboard Scope","vdp/Dashboard Scope",...
 "Position",scopePos)
add_block("simulink_hmi_blocks/Slider","vdp/Slider","Position",sliderPos)

set_param mdl,"location",[25 25 1133 671]);
```

### Connect the Dashboard Scope Block

Use a cell array of `Simulink.HMI.SignalSpecification` objects to connect the Dashboard block to the x1 and x2 signals. The `Simulink.HMI.SignalSpecification` object specifies a connected signal using the block path and port index for the source of the signal. The default value for the `OutputPortIndex` is 1, so this example does not specify the output port for the x1 and x2 signals.

```
x1_sigSpec = Simulink.HMI.SignalSpecification;
x1_sigSpec.BlockPath = Simulink.BlockPath("vdp/x1");

x2_sigSpec = Simulink.HMI.SignalSpecification;
x2_sigSpec.BlockPath = Simulink.BlockPath("vdp/x2");

connection_dashboardScope = {x1_sigSpec x2_sigSpec};
```

Use the `set_param` function to configure the connected signals for the Dashboard Scope block.

```
set_param("vdp/Dashboard Scope","Binding",connection_dashboardScope)
```

### Connect and Configure the Slider Block

Use a `Simulink.HMI.ParamSourceInfo` object and the `set_param` function to connect the Slider block to the Gain parameter of the Mu block. To connect a parameter, the `Simulink.HMI.ParamSourceInfo` needs to specify the block path for the block that corresponds to the parameter and the name of the parameter.

```
slider_param = Simulink.HMI.ParamSourceInfo;
slider_param.BlockPath = Simulink.BlockPath("vdp/Mu");
slider_param.ParamName = 'Gain';

set_param("vdp/Slider","Binding",slider_param)
```

Configure the scale for the slider for a range of 1 to 10 with a tick mark spacing of 1.

```
slider_limits = [1 1 10];

set_param("vdp/Slider","Limits",slider_limits)
```

## Version History

Introduced in R2019a

# Simulink.HMI.SignalSpecification

Programmatically connect a Dashboard block to a signal

## Description

Use a `Simulink.HMI.SignalSpecification` object to programmatically connect a Dashboard block to a signal.

The `SignalSpecification` object contains the block path, port index, and frame processing mode for a signal. To connect a Dashboard block to a signal, specify the corresponding `SignalSpecification` object as the value for the `Binding` parameter for the block using the `set_param` function.

## Creation

### Syntax

```
sigSpec = Simulink.HMI.SignalSpecification
```

### Description

`sigSpec = Simulink.HMI.SignalSpecification` creates an empty `Simulink.HMI.SignalSpecification` object. Specify the block path and port index that correspond to the origin of the signal you want to connect.

## Properties

### BlockPath — Path of the block with the signal as an output

`Simulink.BlockPath` (default) | character vector

Block path for the block that has the signal you want to connect as an output, specified as a character vector or a `Simulink.BlockPath` object.

Example: `sigSpec.BlockPath = 'vdp/Mu';`

Example: `sigSpec.BlockPath = myBlockPath;`

### OutputPortIndex — Block output port corresponding to the signal

1 (default) | scalar

Output port index corresponding to the signal, specified as a scalar, real integer.

Example: `sigSpec.OutputPortIndex = 2;`

### FrameProcessingMode — Processing mode for the signal data

"sample" (default) | "frame"

Processing mode for the signal data, specified as `sample` or `frame`.

- `sample` — Each element in a sample of the signal is processed as a channel.
- `frame` — Each column in a sample of the signal is processed as a channel.

Example: `sigSpec.FrameProcessingMode = "frame";`

---

**Note** Only the Dashboard Scope block supports frame-based data.

---

## Examples

### Programmatically Add and Connect a Dashboard Block

This example shows how to programmatically add Dashboard blocks to a model and connect them to elements in the model. The example adds a Dashboard Scope block and a Slider block to the `vdp` model and connects and configures the blocks.

#### Add Blocks

Use the `add_block` function to add a Dashboard Scope block and a Slider block to the `vdp` model. This example also specifies the position of the blocks.

```
mdl = "vdp";
open_system(mdl)

scopePos = [750 85 990 295];
sliderPos = [765 -5 1005 135];

add_block("simulink_hmi_blocks/Dashboard Scope","vdp/Dashboard Scope",...
 "Position",scopePos)
add_block("simulink_hmi_blocks/Slider","vdp/Slider","Position",sliderPos)

set_param(mdl,"location",[25 25 1133 671]);
```

#### Connect the Dashboard Scope Block

Use a cell array of `Simulink.HMI.SignalSpecification` objects to connect the Dashboard block to the `x1` and `x2` signals. The `Simulink.HMI.SignalSpecification` object specifies a connected signal using the block path and port index for the source of the signal. The default value for the `OutputPortIndex` is 1, so this example does not specify the output port for the `x1` and `x2` signals.

```
x1_sigSpec = Simulink.HMI.SignalSpecification;
x1_sigSpec.BlockPath = Simulink.BlockPath("vdp/x1");

x2_sigSpec = Simulink.HMI.SignalSpecification;
x2_sigSpec.BlockPath = Simulink.BlockPath("vdp/x2");

connection_dashboardScope = {x1_sigSpec x2_sigSpec};
```

Use the `set_param` function to configure the connected signals for the Dashboard Scope block.

```
set_param("vdp/Dashboard Scope","Binding",connection_dashboardScope)
```

#### Connect and Configure the Slider Block

Use a `Simulink.HMI.ParamSourceInfo` object and the `set_param` function to connect the Slider block to the `Gain` parameter of the `Mu` block. To connect a parameter, the

Simulink.HMI.ParamSourceInfo needs to specify the block path for the block that corresponds to the parameter and the name of the parameter.

```
slider_param = Simulink.HMI.ParamSourceInfo;
slider_param.BlockPath = Simulink.BlockPath("vdp/Mu");
slider_param.ParamName = 'Gain';
```

```
set_param("vdp/Slider","Binding",slider_param)
```

Configure the scale for the slider for a range of 1 to 10 with a tick mark spacing of 1.

```
slider_limits = [1 1 10];
set_param("vdp/Slider","Limits",slider_limits)
```

# MATLABFunctionConfiguration

MATLAB Function block property configuration

## Description

The MATLABFunctionConfiguration object controls the MATLAB Function block properties such as the description, sample time, and function script.

---

**Tip** You can also configure a MATLAB Function block programmatically by using a Stateflow.EMChart object. This object provides access to the inputs, outputs, and properties of a MATLAB Function block. For more information, see “Configure MATLAB Function Blocks Programmatically”.

---

## Creation

Each MATLAB Function block has its own MATLABFunctionConfiguration object. To access this object, use the `get_param` function. For example, if the model `myModel` contains a MATLAB Function block called `MATLAB Function`, enter:

```
config = get_param("myModel/MATLAB Function", ...
 "MATLABFunctionConfiguration");
```

## Properties

### Path — Path of block relative to model

string scalar | character vector

Path of the MATLAB Function block relative to the model, specified as a string scalar or character vector.

Data Types: string | char

### FunctionScript — Code for MATLAB Function block

string scalar | character vector

Code for the MATLAB Function block, specified as a string scalar or character vector.

Data Types: string | char

### UpdateMethod — Update method for MATLAB Function block

"Inherited" (default) | "Discrete" | "Continuous"

Update method for the MATLAB Function block, specified as one of these values:

- "Inherited" — The input signal at the trigger port determines when the block is updated during a simulation. A signal from a connected Simulink block triggers the port. If `UpdateMethod` is changed to "Inherited", `Sample Time` is automatically set to -1.

- "Discrete" — The Simulink model generates an implicit event at regular time intervals to awaken the block at the rate you specify in the `SampleTime` property. Other blocks in the model can have different sample times.
- "Continuous" — The MATLAB Function block updates at major time steps only, although it computes outputs and local continuous variables during minor and major time steps. If the `UpdateMethod` is changed to "Continuous", `SampleTime` is automatically set to 0.

When you set `UpdateMethod` to "Inherited" or "Continuous" and attempt to change `SampleTime`, Simulink displays a warning and ignores the input sample time.

Data Types: enumerated

### **SampleTime — Sample time**

"-1" (default) | "0" | string scalar | character vector

Sample time of the MATLAB Function block, specified as a string scalar or character vector. Sample time is only valid when `UpdateMethod` is set to "Discrete". If `UpdateMethod` is set to "Continuous" or "Inherited", any changes made to the sample time are ignored.

Data Types: string | char

### **Description — Description**

string scalar | character vector

Description of the MATLAB Function block, specified as a string scalar or character vector.

Data Types: string | char

### **DocumentLink — Documentation link**

string scalar | character vector

Documentation link for the MATLAB Function block, specified as a string scalar or character vector.

Data Types: string | char

### **SupportVariableSizing — Whether MATLAB Function block supports variable-size data**

true or 1 (default) | false or 0

Whether the MATLAB Function block supports variable-size data, specified as a numeric or logical 1 (true) or 0 (false).

Data Types: logical

### **AllowDirectFeedthrough — Whether MATLAB Function block supports direct feedthrough semantics**

true or 1 (default) | false or 0

Whether the MATLAB Function block supports direct feedthrough semantics, specified as a numeric or logical 1 (true) or 0 (false). The block has direct feedthrough if the output of the block directly depends on the input of the block. The block does not have direct feedthrough if the outputs of the block depend on the internal states and properties rather than the input of the block.

Data Types: logical

### **VectorOutputs1D — Whether MATLAB Function block outputs column vectors as one-dimensional data**

false or 0 (default) | true or 1

Whether the MATLAB Function block outputs column vectors as one-dimensional data, specified as a numeric or logical 0 (`false`) or 1 (`true`). When enabled, the block converts vectors of size  $N$ -by-1 to one-dimensional signals with a signal size equal to  $N$ .

Data Types: `logical`

#### **TreatDimensionOfLengthOneAsFixedSize** — Whether MATLAB Function block output variables with at least one dimension of length 1 are fixed size

`true` or 1 (default) | `false` or 0

Whether MATLAB Function block output variables with at least one dimension of length 1 are fixed size, specified as a numeric or logical 0 (`false`) or 1 (`true`). When this property is `true`, the object sets variables that are variable size in the block with a dimension of 1 to fixed size. When this property is `false`, variables in the block that have the **Variable size** property enabled are always variable size. Prior to R2023a, the object treats variables with at least one dimension of length 1 as fixed size.

This property only affects output variables that have the **Variable size** property enabled. See “Variable size”.

#### **SaturateonIntegerOverflow** — Whether data saturates on integer overflow

`true` or 1 (default) | `false` or 0

Whether the data in the MATLAB Function block saturates on integer overflow, specified as a numeric or logical 1 (`true`) or 0 (`false`). If this setting is set to `true`, the overflows saturate to either the minimum or maximum value that the data type can represent. If the setting is `false`, the overflow wraps to the appropriate value that the data type can represent. If your model has a possible overflow and you want to apply saturation protection in your generated code, it is recommended to enable this setting. If you have performance restrictions or are not concerned with integer overflow, you can disable this setting.

Data Types: `logical`

#### **TreatAsFi** — Inherited signals to treat as fi objects

"FixedPoint" (default) | "FixedPointAndInteger"

Inherited Simulink signals to treat as Fixed-Point Designer `fi` objects, specified as one of these values:

- "FixedPoint" — The MATLAB Function block treats all fixed-point inputs as `fi` objects.
- "FixedPointAndInteger" — The MATLAB Function block treats all fixed-point and integer inputs as `fi` objects.

To learn more about `fi` objects, see “Set `fi` Object Properties” (Fixed-Point Designer).

Data Types: `enumerated`

#### **FimathMode** — Default fimath properties

"SameAsMATLAB" (default) | "UserSpecified"

Default `fimath` properties for the MATLAB Function block, specified as one of these values:

- "SameAsMATLAB" — Use the same `fimath` properties as the current default `fimath` object.
- "UserSpecified" — Use the `Fimath` property to specify the default `fimath` object.

To learn more about fixed-point math, see `fimath`.

Data Types: enumerated

### **Fimath — Default fimath object**

string scalar | character vector

Default `fimath` object, specified as a string scalar or character vector. When the `FimathMode` property for the MATLAB Function block is "UserSpecified", you can use this property to:

- Enter an expression that constructs a `fimath` object.
- Enter the variable name for a `fimath` object in the MATLAB or model workspace.

To learn more about `fimath` object properties, see "fimath Object Properties" (Fixed-Point Designer).

Data Types: string | char

## **Object Functions**

`openReport`    Open MATLAB function report  
`closeReport`    Close MATLAB function report  
`getReport`      Generate MATLAB function report

## **Examples**

### **Configure MATLAB Function Block Properties**

Access the `MATLABFunctionConfiguration` object for the MATLAB Function block in the model `call_stats_block1` described in "Implement MATLAB Functions in Simulink with MATLAB Function Blocks".

```
config = get_param("call_stats_block1/MATLAB Function", ...
 "MATLABFunctionConfiguration");
```

Set the value of the `Description` property.

```
config.Description = "Calculate the mean and standard deviation for a vector of values.";
```

### **Create Custom Report for MATLAB Function Block**

Access the `MATLABFunctionConfiguration` object for the MATLAB Function block in the model `call_stats_block2` described in "Implement MATLAB Functions in Simulink with MATLAB Function Blocks".

```
config = get_param("call_stats_block2/MATLAB Function", ...
 "MATLABFunctionConfiguration");
```

Create the `MATLABFunctionReport` object for the MATLAB Function block.

```
report = getReport(config);
```

Access the `coder.Function` objects in the report.

```
functions = report.Functions;
```

Create a custom report that lists the functions and variables in the MATLAB Function block.

```
for i = 1:numel(functions)
 fprintf("Function %s uses these variables:\n", functions(i).Name)
 variables = functions(i).Variables;
 for j = 1:numel(variables)
 fprintf("%d. %s -- %s\n", j, variables(j).Name, variables(j).Scope)
 end
 fprintf("\n")
end
```

Function stats uses these variables:

1. mean -- Output
2. stdev -- Output
3. vals -- Input
4. len -- Local

Function avg uses these variables:

1. mean -- Output
2. array -- Input
3. size -- Input

## Version History

### Introduced in R2019b

#### **R2023a: Set output variables of any dimension as variable size**

You can now set output variables of any dimension to be variable size by setting the `TreatDimensionOfLengthOneAsFixedSize` property to `false`. Prior to R2023a, the object treats variables with at least one dimension of length 1 as fixed size.

#### **R2021b: Change to output column vectors**

You can output column vectors in MATLAB Function blocks as two-dimensional or one-dimensional data with the `VectorOutputs1D` property.

Before R2021b, MATLAB Function blocks always output column vectors as one-dimensional data. After R2021b, MATLAB Function blocks output column vectors as two-dimensional data by default. To maintain the original behavior of the block, set the `VectorOutputs1D` property to `true`.

#### **R2021a: Programmatically access MATLAB function reports**

You can access MATLAB function reports for MATLAB Function blocks by calling these functions on `MATLABFunctionConfiguration` objects:

- `openReport` opens the MATLAB function report for the block.
- `closeReport` closes the MATLAB function report for the block.
- `getReport` returns a `MATLABFunctionReport` object for the block. You can query report information from this object by accessing its `'Functions'` property, which is an array of `coder.Function` objects.

3. vals -- Input
4. len -- Local

Function avg uses these variables:

1. mean -- Output
2. array -- Input
3. size -- Input

## Input Arguments

### **config** — MATLAB Function block property configuration

MATLABFunctionConfiguration object

MATLAB Function block property configuration, specified as a MATLABFunctionConfiguration object.

## Tips

The first time that you create a MATLABFunctionReport object or open the MATLAB function report, Simulink automatically updates your model. If you make subsequent changes to the MATLAB code in the block, you must update your model before you generate a new MATLABFunctionReport object. Otherwise, the object does not reflect your changes. From the **Modeling** tab, select **Update Model**, or use the **Ctrl+D** keyboard shortcut. If you are in the **MATLAB Function Block Editor**, update the model by using the **Ctrl+Shift+D** keyboard shortcut instead.

# MATLABFunctionReport

MATLAB function report

## Description

Use MATLABFunctionReport objects to access information about the functions and variables used by MATLAB Function blocks.

## Creation

To create a MATLABFunctionReport object for a MATLAB Function block, call the `getReport` function on the MATLABFunctionConfiguration object for the block. For example, if the model `myModel` contains a MATLAB Function block called `MATLAB Function`, enter:

```
config = get_param("myModel/MATLAB Function", ...
 "MATLABFunctionConfiguration");
report = getReport(config);
```

## Properties

### Functions — Functions in block

array of `coder.Function` objects

This property is read-only.

Functions in the MATLAB Function block, specified as an array of `coder.Function` objects. The array contains one `coder.Function` object for each function in the block. Use these objects to access information such as the name, scope, and type of the variables used by each function. For more information, see `coder.Function` Properties.

Data Types: `coder.Function`

## Examples

### Create Custom Report for MATLAB Function Block

Access the MATLABFunctionConfiguration object for the MATLAB Function block in the model `call_stats_block2` described in “Implement MATLAB Functions in Simulink with MATLAB Function Blocks”.

```
config = get_param("call_stats_block2/MATLAB Function", ...
 "MATLABFunctionConfiguration");
```

Create the MATLABFunctionReport object for the MATLAB Function block.

```
report = getReport(config);
```

Access the `coder.Function` objects in the report.

```
functions = report.Functions;
```

Create a custom report that lists the functions and variables in the MATLAB Function block.

```
for i = 1:numel(functions)
 fprintf("Function %s uses these variables:\n", functions(i).Name)
 variables = functions(i).Variables;
 for j = 1:numel(variables)
 fprintf("%d. %s -- %s\n", j, variables(j).Name, variables(j).Scope)
 end
 fprintf("\n")
end
```

Function stats uses these variables:

1. mean -- Output
2. stdev -- Output
3. vals -- Input
4. len -- Local

Function avg uses these variables:

1. mean -- Output
2. array -- Input
3. size -- Input

## Tips

The first time that you create a `MATLABFunctionReport` object or open the MATLAB function report, Simulink automatically updates your model. If you make subsequent changes to the MATLAB code in the block, you must update your model before you generate a new `MATLABFunctionReport` object. Otherwise, the object does not reflect your changes. From the **Modeling** tab, select **Update Model**, or use the **Ctrl+D** keyboard shortcut. If you are in the **MATLAB Function Block Editor**, update the model by using the **Ctrl+Shift+D** keyboard shortcut instead.

## Simulink.MDLInfo

Extract SLX, SLXP, or MDL file information without loading file

### Description

`Simulink.MDLInfo` objects extract information from an SLX, SLXP or MDL file without loading it into memory.

To extract the description and metadata from a file without creating an `MDLInfo` object, use the `Simulink.MDLInfo.getDescription` and `Simulink.MDLInfo.getMetadata` functions, respectively.

### Creation

#### Syntax

```
info = Simulink.MDLInfo(file)
```

#### Description

`info = Simulink.MDLInfo(file)` creates an `MDLInfo` object called `info` and populates the properties with the information from the specified model file.

#### Input Arguments

##### **file** — Name of SLX, SLXP, or MDL file

character vector | string scalar

Name of the SLX, SLXP, or MDL file, specified as a character vector or string scalar.

The file name can include a partial path, complete path, relative path, or no path. When you do not provide a path, the file extension is optional.

To avoid unexpected results caused by shadowed files that share a name, specify a fully qualified file name.

Example: `Simulink.MDLInfo('vdp')`

Example: `Simulink.MDLInfo('mymodel.slx')`

Example: `Simulink.MDLInfo('mydir/mymodel.slx')`

Example: `Simulink.MDLInfo('C:/mydir/mymodel.slx')`

Data Types: `char` | `string`

## Properties

### File Name and Contents

#### **BlockDiagramName** — Name of block diagram

character vector

This property is read-only.

Name of the block diagram, returned as a character vector.

The name of the block diagram matches the file name, but without an extension.

Data Types: `char`

#### **BlockDiagramType** — Type of file

character vector

This property is read-only.

Type of file, returned as a character vector.

Data Types: `char`

#### **FileName** — Fully qualified file name

character vector

This property is read-only.

Fully qualified file name, returned as a character vector.

Data Types: `char`

#### **Interface** — Description of inputs, outputs, and references

structure

This property is read-only.

Description of inputs, outputs, and references, returned as a structure.

The structure includes the names and attributes of the top-level ports, model references, and subsystem references.

Data Types: `struct`

#### **IsLibrary** — True or false result

1 | 0

This property is read-only.

True or false result, returned as a 1 or 0 of data type `logical`.

- 1 (`true`) — File is a library.
- 0 (`false`) — File is not a library.

Data Types: `logical`

## User-Specified Information

### Description — User-specified description

character vector

This property is read-only.

User-specified description for the file, returned as a character vector.

#### Tips

- To extract the description without loading the model or creating an `MDLInfo` object, use the `Simulink.MDLInfo.getDescription` function.
- To view the description without loading the model or creating an `MDLInfo` object, in the MATLAB Command Window, enter:

```
help 'mymodelName'
```

- To view the description for an open model, open the **Description** tab in the Model Properties dialog box.

Data Types: `char`

### Metadata — Names and values of arbitrary data

structure

This property is read-only.

Names and values of arbitrary data associated with the file, returned as a structure.

The structure fields can be character vectors, numeric matrices of type `double`, or more structures.

#### Tips

To extract the metadata structure without loading the model or creating an `MDLInfo` object, use the `Simulink.MDLInfo.getMetadata` function.

Data Types: `struct`

## Save Information

### ReleaseUpdateLevel — Release update used to save file

positive integer

This property is read-only.

Release update used to save the file, returned as a positive integer.

- 0 — The file was saved in a general release, for example, 'R2020a', or was saved in a release before R2020a.
- Positive integer — The file was saved in an update release, for example, 2, if the model was saved in 'R2020a Update 2'.

Data Types: `int32`

### LastModifiedBy — Name of user who last saved file

character vector

This property is read-only.

Name of the user who last saved the file, returned as a character vector.

Data Types: char

#### **LastSavedArchitecture — Platform used to save file**

character vector

This property is read-only.

Platform used to save the file, returned as a character vector.

Example: 'glnxa64'

Data Types: char

#### **ModelVersion — Version number**

character vector

This property is read-only.

Version number of the file, returned as a character vector.

Data Types: char

#### **ReleaseName — MATLAB release used to save file**

character vector

This property is read-only.

MATLAB release used to save the file, returned as a character vector.

Example: 'R2020a'

Data Types: char

#### **SavedCharacterEncoding — Character encoding**

character vector

This property is read-only.

Character encoding when the file was saved, returned as a character vector.

Example: 'UTF-8'

Data Types: char

#### **SimulinkVersion — Simulink version number used to save file**

character vector

This property is read-only.

Simulink version number used to save the file, returned as a character vector.

Example: '10.1'

Data Types: char

## Examples

### Get Model Information

Create a `Simulink.MDLInfo` object that corresponds to the `vdp.slx` file.

```
info = Simulink.MDLInfo('vdp.slx');
```

Get information about the file, such as the type of file, by using dot notation to access the property values.

```
type = info.BlockDiagramType
```

```
type =
```

```
 'Model'
```

`vdp` is a model file.

### Find Referenced Models Without Loading Top Model

Get information about the `sldemo_mdhref_depgraph` model.

```
info = Simulink.MDLInfo('sldemo_mdhref_depgraph');
```

Get the interface information.

```
info.Interface
```

```
ans =
```

```
 struct with fields:
```

```

 Inports: [0x1 struct]
 Outports: [0x1 struct]
 Trigports: [0x1 struct]
 Enableports: [0x1 struct]
 ModelVersion: '1.84'
 SubsystemReferences: {0x1 cell}
 ModelReferences: {4x1 cell}
 ParameterArgumentNames: ''
 TestPointedSignals: [0x1 struct]
 ProvidedFunctions: [0x1 struct]
 IsExportFunctionModel: 0
 IsArchitectureModel: 0
 IsAUTOSARArchitectureModel: 0
 ResetEvents: [0x1 struct]
 HasInitializeEvent: 0
 HasTerminateEvent: 0
 PreCompExecutionDomainType: 'Unset'
 ParameterArguments: [0x1 struct]
 ExternalFileReference: [4x1 struct]
```

Get the referenced models.

```
info.Interface.ModelReferences
```

```
ans =

4x1 cell array

{'sldemo_mdhref_depgraph/heat2cost|sldemo_mdhref_heat2cost' }
{'sldemo_mdhref_depgraph/house|sldemo_mdhref_house' }
{'sldemo_mdhref_depgraph/outdoor temp|sldemo_mdhref_outdoor_temp'}
{'sldemo_mdhref_depgraph/thermostat|sldemo_mdhref_heater' }
```

## Add and Check File Metadata

Create a structure that contains metadata information.

```
m.TestStatus = 'untested';
m.ExpectedCompletionDate = '01/01/2011';
```

Create a model, update the 'Metadata' parameter, and save the metadata in the model.

```
new_system('MDLInfoMetadataModel')
set_param('MDLInfoMetadataModel','Metadata',m)
save_system('MDLInfoMetadataModel')
```

Check the model for metadata by using an MDLInfo object.

```
info = Simulink.MDLInfo('MDLInfoMetadataModel');
info.Metadata
```

```
ans =

struct with fields:

 TestStatus: 'untested'
 ExpectedCompletionDate: '01/01/2011'
```

# Simulink.ModelAdvisor

Run Model Advisor from MATLAB file

## Description

To run the Model Advisor, use instances of this object in MATLAB programs. For example, you can perform a standard set of checks.

Many `Simulink.ModelAdvisor` object functions require or return IDs. An *ID* is a unique identifier for a Model Advisor check, task, or group. IDs must remain constant. A `Simulink.ModelAdvisor` object includes functions that enable you to retrieve the ID or IDs for:

- All checks, tasks, and groups
- Checks belonging to groups and tasks
- The active check
- Selected checks, tasks, and groups

To find check IDs in the Model Advisor, use the check context menu.

Find	Action
Check ID	<ol style="list-style-type: none"> <li>1 In the left pane of the Model Advisor, select the check.</li> <li>2 Right-click the check name and select <b>Send Check ID to Workspace</b>. The ID is displayed in the Command Window and sent to the base workspace.</li> </ol>
Check IDs for selected checks in a folder	<ol style="list-style-type: none"> <li>1 In the left pane of the Model Advisor, select the checks for which you want IDs. Clear the other checks in the folder.</li> <li>2 Right-click the folder and select <b>Send Check ID to Workspace</b>. An array of the selected check IDs are sent to the base workspace.</li> </ol>

If you have a Simulink Check license, consider using the `ModelAdvisor.run` function or the `Advisor.Application.run` function instead of the `Simulink.ModelAdvisor.runCheck` or `runTask` functions.

Consider using `Advisor.Application` object if you have a large model with subsystems and model references. `Advisor.Application` does not run checks on library models. If you want to run checks on multiple independent models that are not in a model reference hierarchy or you want to leverage parallel processing, use `ModelAdvisor.run` to run Model Advisor checks on your model.

## Creation

### Syntax

```
ma = Simulink.ModelAdvisor.getModelAdvisor(system)
```

## Description

MATLAB creates an instance of this object for each model that you open in the current MATLAB session. To get a handle to a model's Model Advisor object, execute this command: `ma = Simulink.ModelAdvisor.getModelAdvisor(system)` where `system` is the name of the model or subsystem that you want to check. Your program can then use the Model Advisor object functions to initialize and run the Model Advisor checks.

## Input Arguments

### **system** — Model or subsystem name

character vector

Model or subsystem that the Model Advisor checks.

Data Types: `char`

## Properties

### **EmitInputParametersToReport** — Display check input parameters in Model Advisor report

`true` (default) | `false`

A value of `true` displays input parameters in the Model Advisor report. A value of `false` does not display input parameters in the Model Advisor report.

Data Types: `char`

## Object Functions

<code>closeReport</code>	Close Model Advisor report
<code>deselectCheck</code>	Clear Model Advisor check
<code>deselectCheckAll</code>	Clear Model Advisor checks
<code>deselectCheckForGroup</code>	Clear Model Advisor checks for groups
<code>deselectCheckForTask</code>	Clear Model Advisor checks that belong to a specified task or set of tasks
<code>deselectTask</code>	Clear Model Advisor checks that belong to a specified task or set of tasks
<code>deselectTaskAll</code>	Clear all Model Advisor tasks
<code>displayReport</code>	Display report in Model Advisor window
<code>exportReport</code>	Create copy of Model Advisor report
<code>filterResultWithExclusion</code>	Filter excluded objects
<code>getBaselineMode</code>	Determine whether Model Advisor is in baseline data generation mode
<code>getCheckAll</code>	Get check IDs of all Model Advisor checks
<code>getCheckForGroup</code>	Get checks belonging to Model Advisor check group
<code>getCheckForTask</code>	Get checks belonging to a task
<code>getCheckResult</code>	Get Model Advisor check results
<code>getCheckResultData</code>	Obtain Model Advisor check result data
<code>getCheckResultStatus</code>	Obtain Model Advisor check result status
<code>getGroupAll</code>	Get all groups of checks that Model Advisor runs
<code>getInputParameters</code>	Get Model Advisor check input parameters
<code>getSelectedCheck</code>	Get currently selected Model Advisor checks
<code>getSelectedSystem</code>	Get system that Model Advisor targets
<code>getSelectedTask</code>	Get selected Model Advisor tasks
<code>getTaskAll</code>	Get tasks run by Model Advisor
<code>runCheck</code>	Run currently selected checks
<code>runTask</code>	Run currently selected tasks

<code>selectCheck</code>	Select checks
<code>selectCheckAll</code>	Select all checks
<code>selectCheckForGroup</code>	Select check group
<code>selectCheckForTask</code>	Select checks for a specific task or tasks
<code>selectTask</code>	Select Model Advisor task
<code>selectTaskAll</code>	Select all Model Advisor tasks
<code>setActionEnable</code>	Set status for check action
<code>setBaselineMode</code>	Set Model Advisor baseline mode
<code>setCheckErrorSeverity</code>	Set severity of check failure
<code>setCheckResult</code>	Set result for currently running check
<code>setCheckResultData</code>	Set result data for currently running check
<code>setCheckResultStatus</code>	Set status for currently running check
<code>setInputParameters</code>	Specify input parameters
<code>verifyCheckRan</code>	Verify that Model Advisor ran a set of checks
<code>verifyCheckResult</code>	Generate baseline Model Advisor check results file or compare current check results to baseline check results
<code>verifyCheckResultStatus</code>	Verify that a model passed or failed a set of checks
<code>verifyHTML</code>	Generate baseline Model Advisor report or compare current report to baseline report

# closeReport

**Package:** Simulink

Close Model Advisor report

## Syntax

```
closeReport(ma)
```

## Description

For a Model Advisor object, use the `closeReport(ma)` function to close a Model Advisor Report.

## Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to close the corresponding Model Advisor report.

## Version History

Introduced in R2006a

## See Also

`Simulink.ModelAdvisor`

## deselectCheck

**Package:** Simulink

Clear Model Advisor check

### Syntax

```
output = deselectCheck(ma,checkID)
```

### Description

For a Model Advisor object, use the `output = deselectCheck(ma,checkID)` function to clear a Model Advisor check. This function cannot clear disabled checks.

### Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object that you want to clear Model Advisor check(s).

**checkID — Check IDs associated with Model Advisor check(s)**

character vector | cell array of character vectors

Model Advisor Check IDs for which you want to clear from the Model Advisor.

Example: 'mathworks.design.UnconnectedLinesPorts'

### Output Arguments

**output — Logical value**

boolean

A logical value indicating whether Simulink cleared the specified check. A value of 1 indicates success. A value of 0 indicates that Simulink was not able to clear the specified check.

## Version History

Introduced in R2006a

### See Also

`Simulink.ModelAdvisor`

# deselectCheckAll

**Package:** Simulink

Clear Model Advisor checks

## Syntax

```
output = deselectCheckAll(ma)
```

## Description

For a Model Advisor object, use the `output = deselectCheckAll(ma)` function to clear all selected Model Advisor checks. This function cannot clear disabled checks.

## Input Arguments

**ma** — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to clear all selected Model Advisor checks.

## Output Arguments

**output** — Logical value

`boolean`

A logical value indicating whether Simulink cleared all selected checks. A value of 1 indicates success. A value of 0 indicates that Simulink did not clear all checks.

## Version History

**Introduced in R2006a**

## See Also

`Simulink.ModelAdvisor`

# deselectCheckForGroup

**Package:** Simulink

Clear Model Advisor checks for groups

## Syntax

```
output = deselectCheckForGroup(ma,groupName)
```

## Description

For a Model Advisor object, use the `output = deselectCheckForGroup(ma,groupName)` function to clear all selected Model Advisor checks for one or more groups. To locate the group name, use the `getGroupAll` function.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to clear all selected Model Advisor checks for one or more groups.

**groupName — Check group names**

character vector | cell array of character vectors

Name of group or groups that contain the selected Model Advisor checks that you want to clear.

## Output Arguments

**output — Logical value**

boolean

A logical value indicating whether Simulink cleared the checks for the specified group. A value of 1 indicates success. A value of 0 indicates that Simulink did not clear the specified checks.

## Version History

Introduced in R2006a

## See Also

Simulink.ModelAdvisor

# deselectCheckForTask

**Package:** Simulink

Clear Model Advisor checks that belong to a specified task or set of tasks

## Syntax

```
output = deselectCheckForTask(ma,task)
```

## Description

For a Model Advisor object, use the `output = deselectCheckForTask(ma,task)` function to clear all selected Model Advisor checks for one or more tasks. To locate the task name, use the `getTaskAll` function.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to clear all selected Model Advisor checks for a task or tasks.

**task — Task name**

character vector | cell array of character vectors

Name of task or tasks that contain selected Model Advisor checks that you want to clear.

## Output Arguments

**output — Logical value**

boolean

A logical value indicating whether Simulink cleared the checks for the specified group. A value of 1 indicates success. A value of 0 indicates that Simulink did not clear the specified checks.

## Version History

Introduced in R2006a

## See Also

Simulink.ModelAdvisor

# deselectTask

**Package:** Simulink

Clear Model Advisor checks that belong to a specified task or set of tasks

## Syntax

```
output = deselectTask(ma,task)
```

## Description

For a Model Advisor object, use the `output = deselectTask(ma,task)` function to clear all selected Model Advisor checks for one or more tasks. To locate the task name, use the `getTaskAll` function.

## Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to clear all selected Model Advisor checks for a task or tasks

**task — Task name**

character vector | cell array of character vectors

Name of task or tasks that contain selected Model Advisor checks that you want to clear.

## Output Arguments

**output — Logical value**

boolean

A logical value indicating whether Simulink removed the checks for the specified task. A value of 1 indicates success. A value of 0 indicates that Simulink was not able to clear the checks for the specified task.

## Version History

**Introduced in R2006a**

## See Also

`Simulink.ModelAdvisor`

# deselectTaskAll

**Package:** Simulink

Clear all Model Advisor tasks

## Syntax

```
output = deselectTaskAll(ma)
```

## Description

For a Model Advisor object, use the `output = deselectTaskAll(ma)` function to clear all selected Model Advisor checks for all tasks.

## Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to clear all selected Model Advisor checks for all tasks

## Output Arguments

**output — Logical value**

`boolean`

A logical value indicating whether Simulink cleared the checks for all tasks. A value of 1 indicates success. A value of 0 indicates that Simulink did not clear the checks.

## Version History

**Introduced in R2006a**

## See Also

`Simulink.ModelAdvisor`

# displayReport

**Package:** Simulink

Display report in Model Advisor window

## Syntax

```
displayReport(ma)
```

## Description

For a Model Advisor object, use the `displayReport(ma)` function to display a Model Advisor report in the Model Advisor window. The report includes the most recent results of running checks on the system corresponding to the Model Advisor object and the current selection status of checks, groups, and tasks for the system.

## Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to open the corresponding Model Advisor report.

## Version History

**Introduced in R2006a**

## See Also

`Simulink.ModelAdvisor`

# exportReport

**Package:** Simulink

Create copy of Model Advisor report

## Syntax

```
[output, message] = exportReport(ma, destination)
```

## Description

For a Model Advisor object, use the `[output, message] = exportReport(ma, destination)` function to create a copy of a Model Advisor report. The report includes the most recent results of running checks on the system corresponding to the Model Advisor object and the current selection status of checks, groups, and tasks for the system.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to export the corresponding Model Advisor report.

**destination — Path name**

character vector

Path name to report file location.

## Output Arguments

**output — Logical value**

boolean

A logical value indicating whether Simulink created a report in location that you specify by `destination` input argument. A value of 1 indicates success. A value of 0 indicates that Simulink did not create a copy of the report in the specified location.

**message — Reason why report was not created**

character vector

This output argument is empty if a report is created. If a report was not created, this argument contains the reason why.

## Version History

Introduced in R2006a

**See Also**

Simulink.ModelAdvisor

# filterResultWithExclusion

**Package:** Simulink

Filter excluded objects

## Syntax

```
filteredResultHandles = filterResultWithExclusion(ma,ResultHandles)
```

## Description

Use the `filteredResultHandles = filterResultWithExclusion(ma,ResultHandles)` function to filter objects that have exclusions enabled and cause a check warning or failure.

This function is intended for excluding objects from custom checks that you create by using the Model Advisor customization API, available with Simulink Check.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to filter objects causing exclusion enabled checks to warn or fail.

**ResultHandles — Array of model objects causing a check warning or failure**

array of model objects

Array of objects causing a check warning or failure.

## Output Arguments

**filteredResultHandles — Array of objects causing a check warning or failure**

array of objects

An array of objects causing exclusion enabled checks to warn or fail.

## Version History

Introduced in R2006a

“Exclude Blocks From Custom Checks” (Simulink Check)

## getBaselineMode

**Package:** Simulink

Determine whether Model Advisor is in baseline data generation mode

### Syntax

```
mode = getBaselineMode(ma)
```

### Description

`mode = getBaselineMode(ma)` returns true if the Model Advisor is in baseline data mode. Baseline data mode causes the verification functions of the Model Advisor, for example, `verifyHTML`, to generate baseline data.

### Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to determine if it is in baseline data mode.

### Output Arguments

**mode — Boolean value indicating baseline mode**

0 (default)

A value of 1 indicates that the Model Advisor is in baseline data generation mode.

## Version History

**Introduced in R2006a**

### See Also

`Simulink.ModelAdvisor`

# getCheckAll

**Package:** Simulink

Get check IDs of all Model Advisor checks

## Syntax

```
CheckIDs = getCheckAll(ma)
```

## Description

The `CheckIDs = getCheckAll(ma)` function returns a cell array of character vectors specifying the Check IDs of all checks that the Model Advisor performs.

## Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to get the Check IDs of all checks that the Model Advisor performs.

## Output Arguments

**CheckIDs — Model Advisor Check IDs**

cell array of character vectors

Cell array of character vectors specifying the Check IDs of all Model Advisor checks.

## Version History

**Introduced in R2006a**

## See Also

`Simulink.ModelAdvisor`

# getCheckForGroup

**Package:** Simulink

Get checks belonging to Model Advisor check group

## Syntax

```
groupChecks = getCheckForGroup(ma,groupName)
```

## Description

For a Model Advisor object, use the `groupChecks = getCheckForGroup(ma,groupName)` method to get all of the Model Advisor checks in a group. To locate the group name, use the `getGroupAll` method.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to get all of the Model Advisor checks corresponding to a check group.

**groupName — Check group name**

character vector

Name of group that contains the Model Advisor checks.

Example: 'Simulink Coder'

## Output Arguments

**groupChecks — Model Advisor checks**

cell array of character vectors

Checks that belong to a Model Advisor group.

## Version History

Introduced in R2006a

## See Also

Simulink.ModelAdvisor

# getCheckForTask

**Package:** Simulink

Get checks belonging to a task

## Syntax

```
taskChecks = getCheckForTask(ma,taskID)
```

## Description

For a Model Advisor object, use the `taskChecks = getCheckForTask(ma,taskID)` function to get all of the Model Advisor checks that are part of a task. To locate the task name, use the `getTaskAll` function.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to get all of the Model Advisor checks that are part of a task.

**taskID — Task name**

character vector

Name of task that contains the Model Advisor checks.

Example: `'_SYSTEM_By Task_Modeling_Physical_Systems'`

## Output Arguments

**taskChecks — Model Advisor checks**

cell array of character vectors

Checks that are part of a Model Advisor task

## Version History

Introduced in R2006a

## See Also

Simulink.ModelAdvisor

# getCheckResult

**Package:** Simulink

Get Model Advisor check results

## Syntax

```
results = getCheckResult(ma,checkID)
```

## Description

For a Model Advisor object, use the `results = getCheckResult(ma,checkID)` function to get the results of running a check or set of checks.

This function enables you to access results generated by custom checks that you create using the Model Advisor customization API, an optional feature available with Simulink Check software. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to obtain check results.

**checkID — Check IDs associated with Model Advisor check**

character vector|cell array of character vectors

Model Advisor Check IDs for which you want to obtain results.

Example: 'mathworks.design.UnconnectedLinesPorts'

## Output Arguments

**results — Check results**

cell array

Cell array of check results. The result format depends on the check data.

## Version History

**Introduced in R2006a**

## See Also

Simulink.ModelAdvisor

# getCheckResultData

**Package:** Simulink

Obtain Model Advisor check result data

## Syntax

```
results = getCheckResultData(ma,checkID)
```

## Description

For a Model Advisor object, use the `results = getCheckResultData(ma,checkID)` function to get the check result data for a specified set of checks. You set the check result data for a check by using `setCheckResultData` in the check callback function.

This function enables you to access results generated by custom checks that you create using the Model Advisor customization API, an optional feature available with Simulink Check software. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to obtain check result data.

**checkID — Check IDs associated with Model Advisor checks**

character vector | cell array of character vectors

Model Advisor Check IDs that you want to obtain results

Example: 'mathworks.design.UnconnectedLinesPorts'

## Output Arguments

**results — Check results**

cell array

Data from a check result or cell array of data from check results. The data format depends on the checks that generate the data.

## Version History

Introduced in R2006a

## See Also

Simulink.ModelAdvisor

# getCheckResultStatus

**Package:** Simulink

Obtain Model Advisor check result status

## Syntax

```
status = getCheckResultStatus(ma,checkID)
```

## Description

After running a set of checks, use the `status = getCheckResultStatus(ma,checkID)` function to determine whether these checks passed or failed.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to determine whether a check or set of checks passed or failed.

**checkID — Model Advisor Check IDs**

character vector | cell array of character vectors

Model Advisor Check IDs for which you want to obtain results.

Example: 'mathworks.design.UnconnectedLinesPorts'

## Output Arguments

**status — Pass or fail**

Boolean | cell array of Boolean values

Boolean value or cell array of Boolean values indicating the pass or fail status of a check or set of checks.

## Version History

Introduced in R2006a

## See Also

Simulink.ModelAdvisor

# getGroupAll

**Package:** Simulink

Get all groups of checks that Model Advisor runs

## Syntax

```
groupChecks = getGroupAll(ma)
```

## Description

For a Model Advisor object, use the `groupChecks = getGroupAll(ma)` function to get all groups of checks that the Model Advisor runs.

## Input Arguments

**ma** — Model Advisor object

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to determine all Model Advisor check groups.

## Output Arguments

**groupChecks** — Model Advisor check groups

cell array of character vectors

IDs of check groups that the Model Advisor runs.

## Version History

Introduced in R2006a

## See Also

Simulink.ModelAdvisor

# getInputParameters

**Package:** Simulink

Get Model Advisor check input parameters

## Syntax

```
params = getInputParameters(ma,CheckID)
```

## Description

Use the `params = getInputParameters(ma,CheckID)` function to get the input parameters for a Model Advisor check.

This function enables you to access custom checks that you create using Simulink Check. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

## Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you determine the input parameters for specific Model Advisor check.

**CheckID — Model Advisor check**

character vector

Model Advisor check ID for which to obtain its input parameters. If you use the function inside a check callback function, you can omit this argument.

Example: 'mathworks.design.UnconnectedLinesPorts'

## Output Arguments

**params — Input parameters**

cell array of `ModelAdvisor.InputParameter` objects

Cell array that contains the `ModelAdvisor.InputParameter` objects for a Model Advisor check.

## Version History

Introduced in R2006a

## See Also

`Simulink.ModelAdvisor`

**Topics**

“Run Model Advisor Checks”

# getListViewParameters

**Package:** Simulink

Get Model Advisor checklist parameters displayed in checklist view

## Syntax

```
params = getListViewParameters(ma,CheckID)
```

## Description

Use the `params = getListViewParameters(ma,CheckID)` function to get the list view of parameters for a Model Advisor check.

This function enables you to access custom checks that you create by using Simulink Check. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you determine the list view of parameters for a specific Model Advisor check.

**CheckID — Model Advisor check**

character vector

Name of Model Advisor check for which to obtain its parameters in list view. You can omit this argument if you use the function inside a check callback function.

Example: 'mathworks.design.UnconnectedLinesPorts'

## Output Arguments

**params — Input parameters**

cell array of ModelAdvisor.ListViewParameter objects

Cell array that contains the ModelAdvisor.ListViewParameter objects for a Model Advisor check.

## Version History

Introduced in R2006a

## See Also

Simulink.ModelAdvisor | ModelAdvisor.ListViewParameter

# getSelectedCheck

**Package:** Simulink

Get currently selected Model Advisor checks

## Syntax

```
CheckIDs = getSelectedCheck(ma)
```

## Description

Use the `CheckIDs = getSelectedCheck(ma)` function to obtain the selected Model Advisor checks for a corresponding `Simulink.ModelAdvisor` object.

## Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to obtain the selected Model Advisor checks.

## Output Arguments

**CheckIDs — Model Advisor checks**

cell array of character vectors

Check IDs of currently selected Model Advisor checks.

## Version History

**Introduced in R2006a**

## See Also

`Simulink.ModelAdvisor`

## getSelectedSystem

**Package:** Simulink

Get system that Model Advisor targets

### Syntax

```
system = getSelectedSystem(ma)
```

### Description

Use the `system = getSelectedSystem(ma)` function to obtain the model or subsystem that is the target of the `Simulink.ModelAdvisor` object.

### Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to obtain the model or subsystem that the object targets.

### Output Arguments

**system — Model or subsystem**

character vector

Name of the model or subsystem that the `ModelAdvisor` object `ma` targets.

## Version History

**Introduced in R2006a**

### See Also

`Simulink.ModelAdvisor`

# getSelectedTask

**Package:** Simulink

Get selected Model Advisor tasks

## Syntax

```
TaskIDs = getSelectedTask(ma)
```

## Description

Use the `TaskIDs = getSelectedTask(ma)` function to obtain the tasks that are selected for the `Simulink.ModelAdvisor` object `ma`.

## Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to obtain the currently selected tasks.

## Output Arguments

**TaskIDs — Model Advisor Task IDs**

cell array of character vectors

Cell array of selected Task IDs for the `Simulink.ModelAdvisor` object that you specify as an input.

## Version History

**Introduced in R2006a**

## See Also

`Simulink.ModelAdvisor`

## getTaskAll

**Package:** Simulink

Get tasks run by Model Advisor

### Syntax

```
TaskIDs = getTaskAll(ma)
```

### Description

Use the `TaskIDs = getTaskAll(ma)` function to obtain the tasks that are run for the `Simulink.ModelAdvisor` object `ma`.

### Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to obtain the tasks that the Model Advisor ran.

### Output Arguments

**TaskIDs — Model Advisor Task IDs**

cell array of character vectors

Cell array of Task IDs that are run for the `Simulink.ModelAdvisor` object that you specify as an input.

## Version History

**Introduced in R2006a**

### See Also

`Simulink.ModelAdvisor`

# runCheck

**Package:** Simulink

Run currently selected checks

## Syntax

```
success = runCheck(ma,checkID)
```

## Description

The `success = runCheck(ma,checkID)` function runs selected Model Advisor checks. Invoking this function is equivalent to selecting the **Run Checks** button on the Model Advisor.

If you have a Simulink Check license, consider using the `ModelAdvisor.run` function or the `Advisor.Application.run` function instead of the `Simulink.ModelAdvisor.runCheck` or `runTask` functions.

Consider using `Advisor.Application` class if you have a large model with subsystems and model references. `Advisor.Application` does not run checks on library models. If you want to run checks on multiple independent models that are not in a model reference hierarchy or you want to leverage parallel processing, use `ModelAdvisor.run` to run Model Advisor checks on your model.

## Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to run Model Advisor.

**checkID — Model Advisor check IDs**

character vector | cell array of character vectors

If you want to run the Model Advisor on a subset of the currently selected Model Advisor checks, specify this optional input parameter.

Example: `'mathworks.design.UnconnectedLinesPorts'`

## Output Arguments

**success — Boolean value indicating whether the Model Advisor ran on selected checks**

Boolean

Boolean value that indicates whether the Model Advisor ran on the selected checks. A value of 1 indicates that the Model Advisor successfully ran on the selected checks. A value of 0 indicates that the Model Advisor did not run on the selected checks.

## Version History

Introduced in R2006a

**See Also**

Simulink.ModelAdvisor

# runTask

**Package:** Simulink

Run currently selected tasks

## Syntax

```
success = runTask(ma)
```

## Description

The `success = runTask(ma)` function runs selected Model Advisor tasks. Invoking this function is equivalent to the **Run Checks** button on the Model Advisor.

If you have a Simulink Check license, consider using the `ModelAdvisor.run` function or the `Advisor.Application.run` function instead of the `Simulink.ModelAdvisor.runCheck` or `runTask` functions.

Consider using `Advisor.Application` class if you have a large model with subsystems and model references. `Advisor.Application` does not run checks on library models. If you want to run checks on multiple independent models that are not in a model reference hierarchy or you want to leverage parallel processing, use `ModelAdvisor.run` to run Model Advisor checks on your model.

## Input Arguments

**ma** — Model Advisor object

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to run the Model Advisor.

## Output Arguments

**success** — Boolean value indicating whether the Model Advisor ran selected tasks

Boolean

Boolean value that indicates whether the Model Advisor ran on the selected tasks. A value of 1 indicates that the Model Advisor successfully ran on the selected tasks. A value of 0 indicates that the Model Advisor did not run on the selected tasks.

## Version History

Introduced in R2006a

## See Also

`Simulink.ModelAdvisor`

## selectCheck

**Package:** Simulink

Select checks

### Syntax

```
success = selectCheck(ma,checkID)
```

### Description

The `success = selectCheck(ma,checkID)` function selects Model Advisor checks.

### Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to select Model Advisor checks.

**checkID — Model Advisor Check IDs**

character vector | cell array of character vectors

Model Advisor checks for you to select.

Example: 'mathworks.design.UnconnectedLinesPorts'

### Output Arguments

**success — Boolean value indicating whether the Model Advisor selected the checks**

Boolean

Boolean value that indicates whether the Model Advisor selected the checks. A value of 1 indicates that the Model Advisor successfully selected the specified checks. A value of 0 indicates that the Model Advisor did not select the specified checks.

## Version History

Introduced in R2006a

# selectCheckAll

**Package:** Simulink

Select all checks

## Syntax

```
success = selectCheckAll(ma)
```

## Description

The `success = selectCheckAll(ma)` function selects all Model Advisor checks.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to select all Model Advisor checks.

## Output Arguments

**success — Boolean value indicating whether all Model Advisor checks are selected**

Boolean

Boolean value that indicates whether all Model Advisor checks are selected. A value of 1 indicates that the Model Advisor successfully selected all checks. A value of 0 indicates that the Model Advisor did not select all checks.

## Version History

**Introduced in R2006a**

## See Also

Simulink.ModelAdvisor

# selectCheckForGroup

**Package:** Simulink

Select check group

## Syntax

```
success = selectCheckForGroup(ma,groupName)
```

## Description

The `success = selectCheckForGroup(ma,groupName)` function selects all Model Advisor checks in the group that you specify.

## Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to select the Model Advisor checks.

**groupName — Check group name**

character vector | cell array of character vectors

Name of groups that contain the Model Advisor checks that you want to select.

## Output Arguments

**success — Boolean value indicating whether the Model Advisor selected the checks**

Boolean

Boolean value that indicates whether the Model Advisor selected the checks. A value of 1 indicates that the Model Advisor successfully selected the specified checks. A value of 0 indicates that the Model Advisor did not select the specified checks.

## Version History

Introduced in R2006a

## See Also

`Simulink.ModelAdvisor`

# selectCheckForTask

**Package:** Simulink

Select checks for a specific task or tasks

## Syntax

```
success = selectCheckForTask(ma,taskIDs)
```

## Description

Use the `success = selectCheckForTask(ma,taskIDs)` function to select the checks for a task or tasks.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to select checks for a specific task or tasks.

**taskIDs — Model Advisor Task IDs**

cell array of character vectors | character vector

Cell array of Task IDs for the Simulink.ModelAdvisor object that you specify as an input.

## Output Arguments

**success — Boolean value indicating whether the checks are selected**

Boolean

Boolean value that indicates whether the Model Advisor successfully selected the checks for the specified task or tasks. A value of 1 indicates that the Model Advisor successfully selected the checks. A value of 0 indicates that the Model Advisor did not select the checks.

## Version History

Introduced in R2006a

## See Also

Simulink.ModelAdvisor

## selectTask

**Package:** Simulink

Select Model Advisor task

### Syntax

```
success = selectTask(ma, TaskIDs)
```

### Description

The `success = selectTask(ma, TaskIDs)` function selects the Model Advisor tasks.

### Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to select Model Advisor tasks.

**TaskIDs — Model Advisor Task IDs**

cell array of character vectors

Cell array of Task IDs that you want to select for the Simulink.ModelAdvisor object, which you specify as an input.

### Output Arguments

**success — Boolean value indicating whether Model Advisor selected tasks**

Boolean

Boolean value that indicates whether the Model Advisor selected tasks. A value of 1 indicates that the Model Advisor successfully selected the tasks. A value of 0 indicates that the Model Advisor did not select the tasks.

## Version History

Introduced in R2006a

Simulink.ModelAdvisor

# selectTaskAll

**Package:** Simulink

Select all Model Advisor tasks

## Syntax

```
success = selectTaskAll(ma)
```

## Description

The `success = selectTaskAll(ma)` function selects all Model Advisor tasks.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to select the Model Advisor tasks.

## Output Arguments

**success — Boolean value indicating whether Model Advisor selected tasks**

Boolean

Boolean value that indicates whether the Model Advisor selected tasks. A value of 1 indicates that the Model Advisor successfully selected the tasks. A value of 0 indicates that the Model Advisor did not select the tasks.

## Version History

**Introduced in R2006a**

Simulink.ModelAdvisor

## setActionEnable

**Package:** Simulink

Set status for check action

### Syntax

```
setActionEnable(ma, value)
```

### Description

The `setActionEnable(ma, value)` function enables or disables the Action box. Only a check callback function can invoke this function.

This function enables you to access custom checks that you create by using the Model Advisor customization API, an optional feature that is available with Simulink Check software. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

### Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to set check action status.

**value — Boolean value indicating whether to enable or disable the Model Advisor Action box**

Boolean

Boolean value that indicates whether to enable or disable Model Advisor **Action** box. To enable the box, specify a value of `true`. To disable the box, specify a value of `false`.

### Version History

Introduced in R2006a

### See Also

Simulink.ModelAdvisor

# setBaselineMode

**Package:** Simulink

Set Model Advisor baseline mode

## Syntax

```
setBaselineMode(ma,mode)
```

## Description

Use the `setBaselineMode(ma,mode)` function to set the Model Advisor baseline mode. Baseline mode causes the Model Advisor verify methods to generate baseline comparison data for verifying the results of a Model Advisor run.

## Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to set the baseline mode.

**mode — Boolean value indicating the Model Advisor baseline mode**

`Boolean`

Boolean value that indicates the Model Advisor baseline mode. A value of `true` indicates that baseline mode is on. A value of `false` indicates that baseline mode is off.

## Version History

**Introduced in R2006a**

## See Also

`Simulink.ModelAdvisor`

## setCheckErrorSeverity

**Package:** Simulink

Set severity of check failure

### Syntax

```
setCheckErrorSeverity(ma, value)
```

### Description

Use the `setCheckErrorSeverity(ma, value)` function to set the check error severity for the currently running check. Only the callback function of a check can invoke this function.

This function enables you to access custom checks that you create by using the Model Advisor customization API, an optional feature that is available with Simulink Check software. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

### Input Arguments

***ma* — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to set the check error severity for the currently running check.

***value* — Integer indicating severity of failure**

0 (default) | integer

A value of 0 indicates a warning check result. A value of 1 indicates a failed check result.

### Version History

Introduced in R2006a

### See Also

`Simulink.ModelAdvisor`

# setCheckResult

**Package:** Simulink

Set result for currently running check

## Syntax

```
success = setCheckResult(ma,result)
```

## Description

Use the `success = setCheckResult(ma,result)` function to set the check result for the currently running check. Only the callback function of a check can invoke this function.

This function enables you to access custom checks that you create using the Model Advisor customization API, an optional feature that is available with Simulink Check software. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to set the result for the currently running check.

**result — Result to be set**

character vector | cell array of character vectors

Character vector or cell array that specifies the result of the currently running check.

## Output Arguments

**success — Boolean value indicating whether the result is set**

Boolean

Boolean value that indicates whether the Model Advisor successfully set the result for the currently running check. A value of 1 indicates that the Model Advisor successfully set the result. A value of 0 indicates that the Model Advisor did not set the result.

## Version History

Introduced in R2006a

## See Also

Simulink.ModelAdvisor

# setCheckResultData

**Package:** Simulink

Set result data for currently running check

## Syntax

```
success = setCheckResultData(ma,data)
```

## Description

Use the `success = setCheckResultData(ma,data)` function to set the check result data for the currently running check. Only the callback function of a check can invoke this function.

This function enables you to access custom checks that you create with the Model Advisor customization API, an optional feature that is available with Simulink Check software. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

## Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to set result data for the currently running check.

**data — Result data**

cell array of character vectors

Result data that you specify for a custom check.

## Output Arguments

**success — Boolean value indicating whether result data is set**

`Boolean`

`Boolean` value that indicates whether the Model Advisor successfully set result data for the currently running check. A value of 1 indicates that the Model Advisor successfully set the data. A value of 0 indicates that the Model Advisor did not set the data.

## Version History

Introduced in R2006a

## See Also

`Simulink.ModelAdvisor`

# setCheckResultStatus

**Package:** Simulink

Set status for currently running check

## Syntax

```
success = setCheckResultStatus(ma,status)
```

## Description

The `success = setCheckResultStatus(ma,status)` function sets the status for the currently running check. Only the callback function of a check can invoke this function.

This function enables you to access custom checks that you create with the Model Advisor customization API, an optional feature that is available with Simulink Check software. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to set the status for the currently running check.

**status — Status of currently running check**

Char | Boolean

For char type inputs, `pass` | `fail` | `warn` values indicate the status of the check that just ran. If you use `char` as input parameter, you do not need to update the severity of the error using the `setCheckErrorSeverity` function.

Boolean value that indicates the status of the check that just ran. A value of `true` indicates that the check passed. A value of `false` indicates that the check failed.

## Output Arguments

**success — Boolean value indicating whether the Model Advisor successfully set the status**

Boolean

Boolean value that indicates whether the Model Advisor successfully set the status of the currently running check. A value of 1 indicates that the Model Advisor successfully set the status. A value of 0 indicates that the Model Advisor did not set the status.

## Version History

**Introduced in R2006a**

**See Also**

Simulink.ModelAdvisor

# setInputParameters

**Package:** Simulink

Specify input parameters

## Syntax

```
success = setInputParameters(ma, checkID, InputParameters)
```

## Description

Use the `success = setInputParameters(ma, checkID, InputParameters)` function to specify input parameters for a Model Advisor check.

This function enables you to access custom checks that you create using Simulink Check. For more information, see “Define Custom Model Advisor Checks” (Simulink Check) .

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which to specify the input parameters for the specific Model Advisor check.

**checkID — Model Advisor check**

character vector

Model Advisor check ID to which the input parameters apply. If you use this method inside a current active check function, you can omit this argument.

Example: 'mathworks.design.UnconnectedLinesPorts'

**InputParameters — Input parameters**

cell array of ModelAdvisor.InputParameter objects

Cell array that contains the ModelAdvisor.InputParameter objects for a Model Advisor check.

## Output Arguments

**success — Boolean value indicating whether the input parameters were specified for check**

Boolean

Boolean value that indicates whether the Model Advisor specified the input parameters. A value of 1 indicates that the Model Advisor successfully specified the input parameters for the check. A value of 0 indicates that the Model Advisor did not specify the input parameters.

## Version History

Introduced in R2006a

# setListViewParameters

**Package:** Simulink

Specify list-view parameters for check

## Syntax

```
setListViewParameters(ma,checkID, params)
```

## Description

The `setListViewParameters(ma,checkID, params)` function sets the list-view parameters for a check. Only the callback function of a check can invoke this function.

This function enables you to access custom checks that you create with the Model Advisor customization API, an optional feature that is available with Simulink Check software. For more information, see “Define Custom Model Advisor Checks” (Simulink Check).

## Input Arguments

**ma — Model Advisor object**

`Simulink.ModelAdvisor` object

`Simulink.ModelAdvisor` object for which you want to set list-view parameters.

**checkID — Model Advisor Check ID**

character vector

Character vector specifying the identifier for a Model Advisor check.

**params — Cell array of `ModelAdvisor.ListViewParameter` objects**

`ModelAdvisor.ListViewParameter` objects

Set the list-view parameters for the check.

## Version History

**Introduced in R2006a**

## See Also

`Simulink.ModelAdvisor` | `ModelAdvisor.ListViewParameter`

# verifyCheckRan

**Package:** Simulink

Verify that Model Advisor ran a set of checks

## Syntax

```
[success, missingChecks, additionalChecks]= verifyCheckRan(ma,CheckIDs)
```

## Description

Use the `[success, missingChecks, additionalChecks]= verifyCheckRan(ma,CheckIDs)` function to verify that the Model Advisor ran a set of checks.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to verify that a set of checks ran

**CheckIDs — Model Advisor Check IDs**

cell array of character vectors

Cell array of character vectors specifying the identifiers of Model Advisor checks that you want to verify have run.

## Output Arguments

**success — Boolean value indicating whether the Model Advisor ran checks**

Boolean

Boolean value that indicates whether the Model Advisor successfully ran a set of checks. A value of 1 indicates that the Model Advisor successfully ran the checks. A value of 0 indicates that the Model Advisor did not run the checks.

**missingChecks — Cell array of Check IDs**

cell array of character vectors

Cell array of character vectors specifying the identifiers of specified Model Advisor checks that did not run.

**additionalChecks — Model Advisor Check IDs**

cell array of character vectors

Cell array of character vectors specifying the identifiers of unspecified Model Advisor checks that ran.

## **Version History**

Introduced in R2006a

Simulink.ModelAdvisor

# verifyCheckResult

**Package:** Simulink

Generate baseline Model Advisor check results file or compare current check results to baseline check results

## Syntax

```
[success, message]= verifyCheckResult(ma,baseline,CheckIDs)
```

## Description

Use the `[success, message]= verifyCheckResult(ma,baseline,CheckIDs)` function to generate a baseline Model Advisor check results file or compare to current check results to baseline check results. If the Model Advisor is in baseline mode, this function stores the most recent results of running the checks that you specify by the `CheckIDs` argument in a MAT-file. For the MAT-file, use the location that you specify by using the `baseline` input argument.

To generate a baseline report, put the Model Advisor in baseline mode. Then invoke this function with the `baseline` argument set to the location where you want to store the baseline results. To perform a current-to-baseline report comparison, first check that the Model Advisor is not in baseline mode. Then, invoke this function with the path of the baseline report as the value of the `baseline` input argument.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to verify that a set of checks ran.

**baseline — Path of the baseline check results MAT-file**

character vector

To perform a current-to-baseline report comparison, make sure that the Model Advisor is not in baseline mode and specify a path to the baseline report.

**CheckIDs — Model Advisor Check IDs**

cell array of character vectors

Cell array of character vectors specifying the identifiers of Model Advisor checks that you want to verify by using check results.

## Output Arguments

**success — Boolean value indicating whether the function succeeded**

Boolean

Boolean value that indicates whether the function ran successfully. A value of 1 indicates that the function verified that the current check results match the baseline results. A value of 0 indicates that

the Model Advisor did not verify check results. If the function is unable to store the check results at the specified location, it returns false in the output variable success. The reason for the failure is in the message argument.

**message — Error message**

character vector

Error message indicating why Simulink did not verify check result.

## **Version History**

**Introduced in R2006a**

### **See Also**

Simulink.ModelAdvisor

# verifyCheckResultStatus

**Package:** Simulink

Verify that a model passed or failed a set of checks

## Syntax

```
[success message]= verifyCheckResultStatus(ma, baseline, checkIDs)
```

## Description

Use the `[success message]= verifyCheckResultStatus(ma, baseline, checkIDs)` function to verify that a model has passed or failed a set of checks.

Before invoking the `verifyCheckResultStatus` function, run the checks that you specify with `checkIDs`. Then use the `getCheckResultStatus` function to obtain the boolean values for the `baseline` argument.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to verify that a set of checks passed.

**baseline — Statuses from running most recent round of checks**

Cell array of Boolean variables

Statuses from the most recent checks run that you specify by Check IDs.

**checkIDs — Model Advisor Check IDs**

cell array of character vectors

Cell array of character vectors specifying the identifiers of Model Advisor checks that you want to verify have run.

## Output Arguments

**success — Boolean value indicating whether the check statuses match the baseline**

Boolean

Boolean value that indicates whether the statuses match the baseline. A value of 1 indicates that the statuses match. A value of 0 indicates that the statuses do not match the baseline.

**message — Message indicating status**

character vector

Message indicating whether the function successfully verified the check result statuses.

## **Version History**

Introduced in R2006a

### **See Also**

Simulink.ModelAdvisor

# verifyHTML

**Package:** Simulink

Generate baseline Model Advisor report or compare current report to baseline report

## Syntax

```
[success message]= verifyHTML(ma,baseline)
```

## Description

Use the `[success message]= verifyHTML(ma,baseline)` function to generate a Model Advisor report or to compare a current report to a baseline report.

This function enables you to compare a Model Advisor report with a baseline report to determine if they differ. You can use this function to generate the baseline report and perform current-to-baseline report comparisons. To generate a baseline report, use the `setBaselineMode` function to put the Model Advisor in baseline mode. Invoke this function with the `baseline` argument set to the location where you want to store the baseline report. To perform a current-to-baseline report comparison, first make sure that the Model Advisor is not in baseline mode. Then, invoke this function with the path of the baseline report as the value of the `baseline` input argument.

## Input Arguments

**ma — Model Advisor object**

Simulink.ModelAdvisor object

Simulink.ModelAdvisor object for which you want to generate a baseline report or compare current report to baseline report

**baseline — Path of Model Advisor report**

character vector

Path to baseline Model Advisor report

## Output Arguments

**success — Boolean value indicating whether the function is successful**

Boolean

Boolean value that indicates whether the function is successful. If the Model Advisor is in baseline mode, this function stores the most recently generated Model Advisor report at the location specified by the `baseline` input argument. If the function is unable to store a copy of the report at the specified location, it returns `false` in the output variable `success`. The reason for the failure is in the output variable `message`. If the Model Advisor is not in baseline mode, this function compares the report most recently generated by the Model Advisor with the report specified by `baseline`. If the current report has the same content as the baseline report, this function returns `true` as the value of the `success` output variable.

**message — Message indicating status**

character vector

Message indicating whether the Model Advisor is able to successfully store a report.

## Simulink.ModelDataLogs

(Not recommended) Access signal data logs for data logged using ModelDataLogs format

---

**Note** The ability to log and load data using the ModelDataLogs format has been removed. Use another supported format, such as Dataset format, instead. For more information, see “Compatibility Considerations”.

---

### Description

The Simulink.ModelDataLogs object contains all data logged from simulation in a model that logs data using the ModelDataLogs format.

### Creation

Prior to R2016a, you could configure a model to log data using the ModelDataLogs format. Simulating a model with the **Signal logging format** parameter set to ModelDataLogs created a Simulink.ModelDataLogs object that contained the data for all logged signals. You could specify the name for the ModelDataLogs object using the **Signal logging name** parameter.

### Properties

#### Logged Data Properties

The Simulink.ModelDataLogs object contains properties with the signal data logged from simulation. The number, type, and names of the properties that contain logged data depend on the structure of the model and the logging configuration.

Property Name Source	Logged Data Source	Value
Model name	Top model or model reference	Simulink.ModelDataLogs
Subsystem name	Subsystem	Simulink.SubsysDataLogs
Signal name	Signal	Simulink.Timeseries
Mux or virtual bus name	Mux or virtual bus	Simulink.TSArray
Bus object	Nonvirtual bus	Simulink.TSArray

The hierarchy of ModelDataLogs and SubsysDataLogs objects in a ModelDataLogs object matches the hierarchy of the model. The hierarchy of a Simulink.TSArray object for a bus matches the bus hierarchy.

#### Model Properties

##### Name — Model or Model block name

character vector

Model or Model block name, returned as a character vector. For the top model, the Name property value is the name of the model. For a referenced model, the Name property value is the name of the Model block that references the model.

## Object Functions

convertToDataset	(Not recommended) Convert data logged using ModelDataLogs format to Dataset format
unpack	(Not recommended) Extract signal data from ModelDataLogs, SubsysDataLogs, or TSError object into workspace variables
who	(Not recommended) List names of objects inside ModelDataLogs, SubsysDataLogs, or TSError object
whos	(Not recommended) List name and type of objects inside ModelDataLogs, SubsysDataLogs, or TSError object

## Examples

### Access Data Using Names with Spaces or New Lines

Property names in a ModelDataLogs object can have spaces or new line characters when a logged signal:

- Has a name that includes a space or new line character
- Is unnamed and originates in a block with a name that includes a space or new line character
- Exists in a subsystem or referenced model, and the name of the subsystem, Model block, or of any upstream block in the model hierarchy includes a space or new line character

This model logs signals with names that include spaces or new line characters.

```
logout
```

```
logout =
```

```
Simulink.ModelDataLogs (model_name):
 Name Elements Simulink Class
```

```

('x y') 1 Timeseries
('a
b') 1 Timeseries
('SL_Sine
Wave1') 1 Timeseries

```

You cannot access elements of the `ModelDataLogs` object by using tab completion or by typing the name after a dot. The MATLAB parser interprets the space or new line character as a separator between identifiers. For example, this code results in an error.

```

logout.x y
??? logout.x y
 |
Error: Unexpected MATLAB expression.

```

To access an element with a name that includes a space, enclose the name in single quotes.

```

logout.('x y')

 Name: 'x y'
 BlockPath: 'model_name/Sine'
 PortIndex: 1
 SignalName: 'x y'
 ParentName: 'x y'
 TimeInfo: [1x1 Simulink.TimeInfo]
 Time: [51x1 double]
 Data: [51x1 double]

```

To access an element with a name that includes a new line character, construct the element name by concatenating a new line character in the appropriate location.

```

cr=sprintf('\n')
logout.(['a' cr 'b'])

```

## Version History

### Introduced before R2006a

#### **R2022b: Loading data saved in the ModelDataLogs format no longer supported**

*Errors starting in R2022b*

Starting in R2022b, you can no longer load data stored in the `ModelDataLogs` format, including data stored in `Simulink.Timeseries`, `Simulink.TSArray`, and `Simulink.SubsysDataLogs` objects.

You can convert data stored in the `ModelDataLogs` format to the `Dataset` format. For more information, see “Convert Data to Dataset Format”.

#### **R2021a: Loading data saved in the ModelDataLogs format will not be supported**

*Warns starting in R2021a*

When you load data that uses the `ModelDataLogs` format as input for simulation, the software issues a warning that support for loading data in the `ModelDataLogs` format will be removed in a future release.

#### **R2020b: Loading data saved in the ModelDataLogs format will not be supported**

*Not recommended starting in R2020b*

In a future release, the ability to load data that uses the `ModelDataLogs` format as input for simulation will be removed.

### **R2016a: Logging data using `ModelDataLogs` format no longer supported**

Starting in R2016a, you can no longer log data using the `ModelDataLogs` format, and signal logging always uses the `Dataset` format. When you open a model from a previous release that had logged data using the `ModelDataLogs` format, the model configuration parameters are updated to log data using the `Dataset` format instead.

You can still use and access data logged using the `ModelDataLogs` format in previous releases, including data in `Simulink.SubsysDataLogs`, `Simulink.TSArray`, and `Simulink.Timeseries` objects. You can also convert data saved in the `ModelDataLogs` format to the `Dataset` format, which can simplify data processing. For more information, see “Convert Data to Dataset Format”.

### **Topics**

“Convert Data to Dataset Format”

## convertToDataset

**Package:** Simulink

(Not recommended) Convert data logged using ModelDataLogs format to Dataset format

---

**Note** The ability to log and load data using the ModelDataLogs format has been removed. Use another supported format, such as Dataset, instead. For more information, see “Compatibility Considerations”.

---

### Syntax

```
ds = convertToDataset mdlObj, dsName)
```

### Description

`ds = convertToDataset(mdlObj, dsName)` converts the data in the `Simulink.ModelDataLogs` object `mdlObj` to a `Simulink.SimulationData.Dataset` with the name specified by `dsName`. The output `ds` is a `Dataset` object that contains a flat list with an element for each `Simulink.Timeseries`, `Simulink.ModelDataLogs`, `Simulink.TSArray`, and `Simulink.SubsysDataLogs` object inside `mdlObj`.

You can also use the `Simulink.SimulationData.Dataset` function to convert data from the `ModelDataLogs` format to the `Dataset` format.

### Input Arguments

**mdlObj — Data to convert**

`Simulink.ModelDataLogs` object

Data to convert, specified as a `Simulink.ModelDataLogs` object.

**dsName — Name of Dataset object to contain converted data**

character vector

Name of `Dataset` object to contain converted data, specified as a character vector.

### Output Arguments

**ds — Converted data**

`Simulink.Simulationdata.Dataset` object

Converted data, returned as a `Simulink.Simulationdata.Dataset` object.

## Limitations

Source of Simulink.ModelDataLogs Data	Conversion Limitation
Model reference	Conversion fails if any ancestor of the model reference is not on the MATLAB path.  Conversion might fail if the model reference or any ancestors of the model reference have changed since the Simulink.ModelDataLogs object was created. For example, adding, deleting, or renaming a block after the object was created can cause conversion to fail.
Variant model or subsystem	Conversion fails if the current active variant is not the same as the active variant when the Simulink.ModelDataLogs object was created.
Frame signal	Not supported.
Mux block	Conversion produces a different Dataset object than logging the output using the Dataset format would produce.
Stateflow chart	Not supported.

## Version History

### Introduced in R2011a

#### **R2022b: Loading data saved in the ModelDataLogs format no longer supported**

*Errors starting in R2022b*

Starting in R2022b, you can no longer load data stored in the ModelDataLogs format, including data stored in Simulink.Timeseries, Simulink.TSArray, and Simulink.SubsysDataLogs objects.

You can convert data stored in the ModelDataLogs format to the Dataset format. For more information, see “Convert Data to Dataset Format”.

#### **R2021a: Loading data saved in the ModelDataLogs format will not be supported**

*Warns starting in R2021a*

When you load data that uses the ModelDataLogs format as input for simulation, the software issues a warning that support for loading data in the ModelDataLogs format will be removed in a future release.

#### **R2020b: Loading data saved in the ModelDataLogs format will not be supported**

*Not recommended starting in R2020b*

In a future release, the ability to load data that uses the ModelDataLogs format as input for simulation will be removed.

#### **R2016a: Logging data using ModelDataLogs format no longer supported**

Starting in R2016a, you can no longer log data using the ModelDataLogs format, and signal logging always uses the Dataset format. When you open a model from a previous release that had logged

data using `ModelDataLogs` format, the model configuration parameters are updated to log data using the `Dataset` format instead.

You can still use and access data logged using the `ModelDataLogs` format in previous releases, including data in `Simulink.SubsysDataLogs`, `Simulink.TSArray`, and `Simulink.Timeseries` objects. You can also convert data saved in the `ModelDataLogs` format to the `Dataset` format, which can simplify data processing. For more information, see “Convert Data to Dataset Format”.

# unpack

**Package:** Simulink

(Not recommended) Extract signal data from `ModelDataLogs`, `SubsysDataLogs`, or `TSArray` object into workspace variables

---

**Note** The ability to log and load data using the `ModelDataLogs` format has been removed. Use another supported format, such as `Dataset` format, instead. For more information, see “Compatibility Considerations”.

---

## Syntax

```
unpack(logs)
unpack(logs, opt)
```

## Description

`unpack(logs)` extracts the top-level contents of the data logging object `logs` into one or more workspace variables.

`unpack(logs, opt)` extracts the contents specified by `opt` from the data logging object `logs` into one or more workspace variables.

## Input Arguments

### logs — Object from which to extract logged data

`Simulink.ModelDataLogs` object | `Simulink.TSArray` object | `Simulink.SubsysDataLogs` object

Object from which to extract logged data, specified as a `Simulink.ModelDataLogs` object, a `Simulink.SubsysDataLogs` object, or a `Simulink.TSArray` object.

### opt — Logged data to extract into workspace variables

'systems' | 'all'

Logged data to unpack into workspace, specified as 'systems' or 'all'.

- 'systems' — Extract `Simulink.Timeseries` and `Simulink.TSArray` objects from `Simulink.ModelDataLogs` or `Simulink.SubsysDataLogs` object. `Simulink.Timeseries` objects are not extracted from `Simulink.TSArray` objects, and intermediate `Simulink.ModelDataLogs` and `Simulink.SubsysDataLogs` objects are not extracted to the workspace.
- 'all' — Extract `Simulink.Timeseries` objects from all `Simulink.ModelDataLogs`, `Simulink.SubsysDataLogs`, and `Simulink.TSArray` objects.

# Simulink.ModelWorkspace

Interact with the model workspace of a model programmatically

## Description

Use a `Simulink.ModelWorkspace` object to interact with a model workspace. For example, you can add and remove variables, set the data source of the workspace, and save changes to the workspace.

For more information, see “Model Workspaces”.

## Creation

To create a `Simulink.ModelWorkspace`, use the `get_param` function to query the value of the model parameter `ModelWorkspace`. For example, to create an object named `mdlWks` that represents the model workspace of a model named `myModel.slx`:

```
mdlWks = get_param('myModel', 'ModelWorkspace')
```

## Properties

### DataSource — Source for initializing variables in model workspace

'Model File' (default) | 'MAT-File' | 'MATLAB Code' | 'MATLAB File'

Source for initializing the variables in the model workspace, specified as one of these character vectors:

- 'Model File' — The variables are stored in the model file. When you save the model, you also save the variables.
- 'MATLAB Code' — The variables are created by MATLAB code that you write and store in the model file.
- 'MAT-File' — The variables are stored in a MAT-file, which you can manage and manipulate separately from the model file.
- 'MATLAB File' — The variables are created by MATLAB code in a script file, which you can manage and manipulate separately from the model file.

Data Types: char

### FileName — Name of external file that stores or creates variables

' ' (empty character vector) (default) | character vector

Name of the external file that stores or creates variables, specified as a character vector. To enable this property, set `DataSource` to 'MAT-File' or 'MATLAB File'.

Example: 'myFile.mat'

Example: 'myFile.m'

Data Types: char

**MATLABCode — MATLAB code for initializing variables**

' ' (empty character vector) (default) | character vector

MATLAB code for initializing variables, specified as a character vector. To enable this property, set `DataSource` to 'MATLAB Code'.

Example: `sprintf('% Create variables that this model uses.\n\nK = 0.00983;\n\nP = Simulink.Parameter(5);')`

Data Types: char

**Object Functions**

<code>getVariable</code>	Return value of variable in the model workspace of a model
<code>getVariablePart</code>	Get value of variable property in model workspace
<code>setVariablePart</code>	Set property of variable in model workspace
<code>hasVariable</code>	Determine whether variable exists in the model workspace of a model
<code>whos</code>	Return list of variables in the model workspace of a model
<code>saveToSource</code>	Save model workspace changes to the external data source of the model workspace
<code>save</code>	Save contents of model workspace to a MAT-file
<code>reload</code>	Reinitialize variables from the data source of a model workspace
<code>evalin</code>	Evaluate expression in the model workspace of a model
<code>clear</code>	Clear variables from the model workspace of a model
<code>assignin</code>	Assign value to variable in the model workspace of a model

**Examples****Interact With Model Workspace Programmatically**

Create a variable in the model workspace of a model. Then, modify the variable and query the variable value to confirm the modification.

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object `mdlWks` that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a variable named `myVar` with value 5.12 in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
```

Apply a new value, 7.22. To do so, first create a temporary copy of the variable by using the `getVariable` function. Then, modify the copy and use it to overwrite the original variable in the model workspace.

```
temp = getVariable(mdlWks, 'myVar');
temp = 7.22;
assignin(mdlWks, 'myVar', temp)
```

Confirm the new value by querying the value of the variable.

```
getVariable(mdlWks, 'myVar')
```

ans =

7.2200

## **Version History**

# assignin

**Package:** Simulink

Assign value to variable in the model workspace of a model

## Syntax

```
assignin mdlWks, varName, varValue)
```

## Description

`assignin(mdlWks, varName, varValue)` assigns the value `varValue` to the MATLAB variable `varName` in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`. If the variable does not exist, `assignin` creates it.

## Examples

### Assign Value to Variable in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a variable named `myVar` with value `5.12` in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
```

## Input Arguments

### **mdlWks** — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

### **varName** — Name of target variable

character vector

Name of the target variable, specified as a character vector.

Example: `'myVar'`

Data Types: `char`

### **varValue** — Value to assign to target variable

valid value

Value to assign to the target variable, specified as a valid value. For example, you can specify a literal number, a structure, or an expression that evaluates to a valid value.

If you specify the name of a handle object, such as a `Simulink.Parameter` object, use the `copy` function to create a separate copy of the object.

Example: `5.12`

Example: `struct('a',5.12,'b',7.22)`

Example: `Simulink.Parameter(5.12)`

Example: `copy(myExistingParameterObject)`

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `char` | `string` | `struct` | `table` | `cell` | `categorical` | `datetime` | `duration` | `calendarDuration` | `fi`

Complex Number Support: Yes

## Version History

Introduced before R2006a

### See Also

`Simulink.ModelWorkspace`

## clear

**Package:** Simulink

Clear variables from the model workspace of a model

### Syntax

```
clear mdlWks
```

### Description

`clear mdlWks` removes all variables from the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

### Examples

#### Clear Variables From Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a variable named `myVar` with value `5.12` in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
```

Clear all variables from the model workspace, including `myVar`.

```
clear(mdlWks)
```

### Input Arguments

**mdlWks** — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

### Version History

Introduced before R2006a

### See Also

`Simulink.ModelWorkspace`

# evalin

**Package:** Simulink

Evaluate expression in the model workspace of a model

## Syntax

```
result = evalin mdlWks, expression)
```

## Description

`result = evalin(mdlWks, expression)` evaluates the expression `expression` in the model workspace represented by the `Simulink.ModelWorkspace` object represented by `mdlWks`. The function returns the result of the expression in `result`.

---

**Note** For setting and getting variable properties in the model workspace, consider using `setVariablePart` and `getVariablePart` instead of `evalin` because:

- The functions do not create new variables or cause unintended results.
- `getVariablePart` does not dirty the model.

For information on these alternatives, see `Simulink.ModelWorkspace`.

---

## Examples

### Evaluate Expression in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create some variables in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
assignin(mdlWks, 'myOtherVar', 7.22)
```

Evaluate the expression `myLastVar = myVar + myOtherVar` in the model workspace. The expression creates another variable, `myLastVar`, whose value is the sum of the first two variables.

```
evalin(mdlWks, 'myLastVar = myVar + myOtherVar');
```

## Input Arguments

**mdlWks** — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

**expression — Expression to evaluate**

character vector

Expression to evaluate, specified as a character vector.

Example: `'myLastVar = myVar + myOtherVar'`

Data Types: `char`

## **Output Arguments**

**result — Result of expression**

number, structure, or other MATLAB value

Result of the evaluated expression, returned as a number, structure, or other MATLAB value.

## **Version History**

**Introduced before R2006a**

### **See Also**

`Simulink.ModelWorkspace`

# getVariable

**Package:** Simulink

Return value of variable in the model workspace of a model

## Syntax

```
varValue = getVariable mdlWks, varName)
```

## Description

`varValue = getVariable(mdlWks, varName)` returns the value of the variable whose name is `varName` that exists in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

If the value of the target variable is a handle to a handle object (such as `Simulink.Parameter`), `getVariable` returns a copy of the handle. Changes you make to the variable in the model workspace or to the returned variable (`variableValue`) affect both variables.

To return a deep copy of the handle object, use the `copy` method of the object. To modify a handle object that you store in a model workspace, it is a best practice to use both the `getVariable` and `assignin` methods (see “Modify Property Value of Handle Object” on page 8-355).

## Examples

### Return Value of Variable in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a variable named `myVar` in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
```

Return the value of the new variable. Store the value in another variable named `varValue`.

```
varValue = getVariable(mdlWks, 'myVar');
```

### Modify Property Value of Handle Object

Modify a property of the `Simulink.Parameter` object `K`, which is defined in model `mdl.slx`. When you call `getVariable`, use the `copy` method because `Simulink.Parameter` is a handle class.

```
wksp = get_param mdl, 'ModelWorkspace';
value = copy(getVariable(wksp, 'K'));
```

```
value.DataType = 'single';
assignin(wksp, 'K', value);
```

## Input Arguments

### **mdlWks** — Target model workspace

Simulink.ModelWorkspace object

Target model workspace, specified as a Simulink.ModelWorkspace object.

### **varName** — Name of target variable

character vector

Name of the target variable, specified as a character vector.

Example: 'myVariable'

Data Types: char

## Output Arguments

### **varValue** — Value of target variable

number, structure, or other MATLAB value

Value of the target variable, returned as a number, structure, or other MATLAB value.

## Version History

Introduced in R2012a

## See Also

`get_param` | Simulink.ModelWorkspace

# getVariablePart

**Package:** Simulink

Get value of variable property in model workspace

## Syntax

```
varValue = getVariablePart mdlWks, varName.Property)
```

## Description

`varValue = getVariablePart(mdlWks, varName.Property)` returns the value of the variable property named `varName.Property` that exists in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

If the value of the variable property is a handle to a handle object (such as `Simulink.Parameter`), `getVariablePart` returns a copy of the handle.

Using `getVariablePart` is preferable to using `evalin` for getting variable properties in the model workspace because:

- The function does not dirty the model.
- Use of the function does not result in the creation of a new variable or other unintended results.

## Examples

### Return Value of Variable Properties in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a structure named `myStruct` with fields `a`, `b`, and `c`.

```
aStruct.a = 10;
aStruct.b = {1,2,3,4,5};
aStruct.c = Simulink.Parameter(7);
mdlWks.assignin('myStruct', aStruct);
```

Return the values of the structure fields. Store the values in `varValuea`, `varValueb`, and `varValuec`.

```
varValuea = getVariablePart mdlWks, 'myStruct.a');
varValueb = getVariablePart mdlWks, 'myStruct.b{1}';
varValuec = getVariablePart mdlWks, 'myStruct.c.Value');
```

## Input Arguments

### **mdlWks** — Target model workspace

Simulink.ModelWorkspace object

Target model workspace, specified as a Simulink.ModelWorkspace object.

### **varName.Property** — Name of target variable property

character vector

Name of the target variable property, specified as a character vector.

Example: 'myVariable.Property'

Data Types: char

## Output Arguments

### **varValue** — Value of variable property

number, structure, or other MATLAB value

Value of the variable property, returned as a number, structure, or other MATLAB value.

If the value of the variable property is a handle to a handle object (such as Simulink.Parameter), getVariablePart returns a copy of the handle.

## Version History

**Introduced in R2018b**

Simulink.ModelWorkspace

# hasVariable

**Package:** Simulink

Determine whether variable exists in the model workspace of a model

## Syntax

```
varExists = hasVariable mdlWks, varName)
```

## Description

`varExists = hasVariable(mdlWks, varName)` returns 1 if a variable whose name is `varName` exists in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

## Examples

### Determine Existence of Variable in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a variable named `myVar` in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
```

Determine whether a variable named `myVar` exists in the model workspace.

```
exists = hasVariable(mdlWks, 'myVar')
```

```
exists =
 1
```

## Input Arguments

### **mdlWks** — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

### **varName** — Name of target variable

character vector

Name of the target variable, specified as a character vector.

Example: `'myVariable'`

Data Types: char

## **Output Arguments**

**varExists** — Indication of existence

1 | 0

Indication of variable existence, returned as 1 (true) or 0.

## **Version History**

**Introduced in R2012a**

### **See Also**

`get_param` | `Simulink.ModelWorkspace`

# reload

**Package:** Simulink

Reinitialize variables from the data source of a model workspace

## Syntax

```
reload mdlWks
```

## Description

`reload(mdlWks)` reinitializes the variables in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`. When you set the `DataSource` property of the model workspace to `'MAT-File'`, `'MATLAB File'`, or `'MATLAB Code'`, `reload` overwrites variables that exist in the model workspace by loading the associated MAT-file or by running the associated MATLAB code.

## Examples

### Reinitialize Variables in a Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Configure the model workspace to use some MATLAB code as a data source.

```
mdlWks.DataSource = 'MATLAB Code';
mdlWks.MATLABCode = sprintf('myVar = 5.12;\nmyOtherVar = 7.22;');
```

Create variables in the model workspace by executing the MATLAB code.

```
reload(mdlWks)
```

Assign new values to the variables in the model workspace.

```
assignin(mdlWks, 'myVar', 5.22)
assignin(mdlWks, 'myOtherVar', 7.33)
```

Overwrite the new values with the values specified by the MATLAB code.

```
reload(mdlWks)
```

Confirm that the variables have the values specified by the MATLAB code.

```
myVarValue = getVariable(mdlWks, 'myVar')
myOtherVarValue = getVariable(mdlWks, 'myOtherVar')
```

```
myVarValue =
```

```
 5.1200
```

```
myOtherVarValue =
```

```
 7.2200
```

## **Input Arguments**

**mdlWks** — Target model workspace

Simulink.ModelWorkspace object

Target model workspace, specified as a Simulink.ModelWorkspace object.

## **Version History**

**Introduced before R2006a**

## **See Also**

Simulink.ModelWorkspace

## save

**Package:** Simulink

Save contents of model workspace to a MAT-file

### Syntax

```
save mdlWks, fileName)
```

### Description

`save mdlWks, fileName)` saves the variables in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks` to the MAT-file specified by `fileName`.

When you set the `DataSource` property of the model workspace to 'MAT-File' or 'MATLAB File', to save to the file that acts as the external data source of the model, use `saveToSource` instead of `save`.

### Examples

#### Save Contents of Model Workspace to MAT-File

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create some variables in the model workspace.

```
assignin mdlWks, 'myVar', 5.12
assignin mdlWks, 'myOtherVar', 7.22)
```

Save the variables to a new MAT-file named `myVars.mat`.

```
save mdlWks, 'myVars.mat')
```

The MAT-file appears in your current folder.

### Input Arguments

**mdlWks** — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

**fileName** — Name of target MAT-file

character vector

Name of the target MAT-file, specified as a character vector.

Example: 'myFile.mat'

Data Types: char

## **Version History**

**Introduced before R2006a**

## **See Also**

Simulink.ModelWorkspace

# saveToSource

**Package:** Simulink

Save model workspace changes to the external data source of the model workspace

## Syntax

```
saveToSource mdlWks
```

## Description

`saveToSource mdlWks` saves the variables in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks` to the MAT-file or script file specified by the `FileName` property of the model workspace.

When you set the `DataSource` property of the model workspace to 'MAT-File' or 'MATLAB File', the `FileName` property specifies the name of the file that acts as the external data source of the workspace. As you make changes to the variables in the model workspace, use `saveToSource` to permanently save the changes in the external data source.

## Examples

### Save Variables to External Data Source of Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create some variables in the model workspace.

```
assignin mdlWks, 'myVar', 5.12
assignin mdlWks, 'myOtherVar', 7.22
```

Configure the model workspace to use a MAT-file named `myVars.mat` as the data source.

```
mdlWks.DataSource = 'MAT-File';
mdlWks.FileName = 'myVars.mat';
```

Save the variables to the external data source (the MAT-file).

```
saveToSource mdlWks
```

The file appears in your current folder.

## **Input Arguments**

**mdlWks — Target model workspace**

Simulink.ModelWorkspace object

Target model workspace, specified as a Simulink.ModelWorkspace object.

## **Version History**

**Introduced before R2006a**

## **See Also**

Simulink.ModelWorkspace

# setVariablePart

**Package:** Simulink

Set property of variable in model workspace

## Syntax

```
varValue = setVariablePart mdlWks, varName.Property, varValue)
```

## Description

`varValue = setVariablePart(mdlWks, varName.Property, varValue)` assigns `varValue` to the MATLAB variable property `varName.Property` in the model workspace represented by the Simulink.ModelWorkspace object `mdlWks`.

Using `setVariablePart` is preferable to using `evalin` for assigning variable properties in the model workspace because the `setVariablePart` function does not create a new variable or cause unintended results.

## Examples

### Assign Value to Variable Properties in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a Simulink.ModelWorkspace object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create a structure named `myStruct` with fields `a`, `b`, and `c`.

```
aStruct.a = 10;
aStruct.b = {1,2,3,4,5};
aStruct.c = Simulink.Parameter(7);
mdlWks.assignin('myStruct', aStruct);
```

Assign new values to the structure fields.

```
setVariablePart(mdlWks, 'myStruct.a', 2);
setVariablePart(mdlWks, 'myStruct.b{1}', 2);
setVariablePart(mdlWks, 'myStruct.c', Simulink.Parameter(2));
```

Return the new values of the structure fields. Store the values in `varValuea`, `varValueb`, and `varValuec`.

```
varValuea = getVariablePart mdlWks, 'myStruct.a')
varValueb = getVariablePart mdlWks, 'myStruct.b{1}')
varValuec = getVariablePart mdlWks, 'myStruct.c.Value')
```

## Input Arguments

### **mdlWks** — Target model workspace

Simulink.ModelWorkspace object

Target model workspace, specified as a Simulink.ModelWorkspace object.

### **varName.Property** — Name of target variable property

character vector

Name of the target variable property, specified as a character vector.

Example: 'myVariable.Property'

Data Types: char | string

### **varValue** — Value to assign to variable property

valid value

Value to assign to the value property, specified as a valid value. For example, you can specify a literal number, a structure, or an expression that evaluates to a valid value.

If you specify the name of a handle object, such as a Simulink.Parameter object, use the copy function to create a separate copy of the object.

Example: 5.12

Example: struct('a',5.12,'b',7.22)

Example: Simulink.Parameter(5.12)

Example: copy(myExistingParameterObject)

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical | char | string | struct | table | cell | categorical | datetime | duration | calendarDuration | fi

Complex Number Support: Yes

Simulink.ModelWorkspace

# whos

**Package:** Simulink

Return list of variables in the model workspace of a model

## Syntax

```
varList = whos mdlWks)
```

## Description

`varList = whos(mdlWks)` returns a list of the variables in the model workspace represented by the `Simulink.ModelWorkspace` object `mdlWks`.

## Examples

### Return List of Variables in Model Workspace

Open the example model `vdp`.

```
open_system('vdp')
```

Create a `Simulink.ModelWorkspace` object that represents the model workspace of `vdp`.

```
mdlWks = get_param('vdp', 'ModelWorkspace');
```

Create some variables in the model workspace.

```
assignin(mdlWks, 'myVar', 5.12)
assignin(mdlWks, 'myOtherVar', 7.22)
```

Display a list of the variables in the model workspace.

```
whos(mdlWks)
```

Name	Size	Bytes	Class	Attributes
myOtherVar	1x1	8	double	
myVar	1x1	8	double	

## Input Arguments

**mdlWks** — Target model workspace

`Simulink.ModelWorkspace` object

Target model workspace, specified as a `Simulink.ModelWorkspace` object.

## **Output Arguments**

### **varList — List of variables**

nested structure array

List of variables, returned as a nested structure array. For details about the information in the list, see `whos`.

## **Version History**

**Introduced before R2006a**

`Simulink.ModelWorkspace`

# Simulink.NumericType

Specify floating-point, integer, or fixed-point data type

## Description

Use a `Simulink.NumericType` object to set and share numeric data types for signal, state, and parameter data in a model.

- 1 Create an instance of this class in the MATLAB base workspace, a model workspace, or a data dictionary. To create a numeric type in a model workspace, you must clear the **Is alias** property.
- 2 Set the properties of the object to create a custom floating point, integer, or fixed point data type.
- 3 Assign the data type to all signals and parameters of your model that you want to conform to the data type.

Assigning a data type in this way allows you to change the data types of the signals and parameters in your model by changing the properties of the object that describe them. You do not have to change the model itself.

To rename a data type in a model and in the code that you generate from a model (by generating a typedef statement), you can use a `Simulink.AliasType` object.

## Creation

You can create a `Simulink.NumericType` object several ways.

- Interactively create a `Simulink.NumericType` object using the **Type Editor** or **Model Explorer**.
- Programmatically create a `Simulink.NumericType` object using the `Simulink.NumericType` function described here.

## Syntax

```
typeObj = Simulink.NumericType
```

### Description

`typeObj = Simulink.NumericType` returns a `Simulink.NumericType` object with default property values.

## Properties

### Bias — Bias for slope and bias scaling

0 (default) | real number

Bias for slope and bias scaling of a fixed-point data type (Fixed-Point Designer), specified as a real number.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

Example: 3

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

### DataScope — Specification to generate or import type definition in the generated code

'Auto' (default) | 'Exported' | 'Imported'

Specification to generate or import the type definition (typedef) in the generated code (Simulink Coder), specified as 'Auto', 'Exported', or 'Imported'.

The table shows the effect of each option.

Value	Action
'Auto' (default)	If no value is specified for <code>HeaderFile</code> , export the type definition to <code>model_types.h</code> . <code>model</code> is the model name. If a value is specified for <code>HeaderFile</code> , import the data type definition from the specified header file.
'Exported'	Export the data type definition to a header file, which can be specified in the <code>HeaderFile</code> property. If no value is specified for <code>HeaderFile</code> , the header file name defaults to <code>type.h</code> . <code>type</code> is the data type name.
'Imported'	Import the data type definition from a header file, which can be specified in the <code>HeaderFile</code> property. If no value is specified for <code>HeaderFile</code> , the header file name defaults to <code>type.h</code> . <code>type</code> is the data type name.

Set the data scope to `Imported` or `Exported` to avoid potential MISRA C:2012 violations.

For more information, see “Control File Placement of Custom Data Types” (Embedded Coder).

### DataTypeMode — Mode of numeric data type

'Double' (default) | 'Single' | 'Half' | 'Boolean' | 'Fixed-point: unspecified scaling' | 'Fixed-point: binary point scaling' | 'Fixed-point: slope and bias scaling'

Mode of the numeric data type, specified as one of these character vectors:

- 'Double' — Same as the MATLAB `double` type.
- 'Single' — Same as the MATLAB `single` type.
- 'Half' — Half-precision floating-point type.
- 'Boolean' — Same as the MATLAB `boolean` type.
- 'Fixed-point: unspecified scaling' — A fixed-point data type with unspecified scaling.
- 'Fixed-point: binary point scaling' — A fixed-point data type with binary-point scaling.
- 'Fixed-point: slope and bias scaling' — A fixed-point data type with slope and bias scaling.

Selecting a half-precision or fixed-point data type mode can, depending on the other dialog box options that you select, cause the model to run only on systems that have a Fixed-Point Designer license.

Data Types: char

### **DataTypeOverride — Data type override mode**

'Inherit' (default) | 'Off'

Data type override mode, specified as 'Inherit' or 'Off'.

- If you specify 'Inherit', the data type override setting for the context in which this numeric type is used (block, signal, Stateflow chart in Simulink) applies to this numeric type.
- If you specify 'Off', data type override does not apply to this numeric type.

For more information about data type override, see “Control Data Type Override”.

Data Types: char

### **Description — Custom description of data type**

' ' (empty character vector) (default) | character vector

Custom description of the data type, specified as a character vector.

Example: 'This is a floating-point data type.'

Data Types: char

### **FixedExponent — Exponent for binary point scaling**

0 (default) | real number

Exponent for binary point scaling, specified as a real number. Setting this property causes Simulink software to set the `FractionLength` and `Slope` properties accordingly, and vice versa. This property applies only if the `DataTypeMode` is `Fixed-point: binary point scaling` or `Fixed-point: slope and bias scaling`.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

This property must be set programmatically.

Example: -8

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical

### **FractionLength — Bit length of the fractional portion of a fixed-point number**

0 (default) | real integer

Bit length of the fractional portion of a fixed-point number (Fixed-Point Designer), specified as a real integer. This property equals `-FixedExponent`. Setting this property causes Simulink software to set the `FixedExponent` property accordingly, and vice versa.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

Example: 8

Data Types: single | double | int8 | int16 | int32 | int64 | uint8 | uint16 | uint32 | uint64 | logical

**HeaderFile — Name of header file that contains type definition in the generated code**

'' (empty character vector) (default) | character vector

Name of the header file that contains the type definition (typedef) in the generated code, specified as a character vector.

If this property is specified, the specified name is used during code generation for importing or exporting. If this property is empty, the value defaults to `type.h` if `DataScope` equals 'Imported' or 'Exported', or defaults to `model_types.h` if `DataScope` equals 'Auto'.

By default, the generated `#include` directive uses the preprocessor delimiter `"` instead of `<` and `>`. To generate the directive `#include <myTypes.h>`, specify `HeaderFile` as `'<myTypes.h>'`.

For more information, see “Control File Placement of Custom Data Types” (Embedded Coder).

Example: `'myHdr.h'`

Example: `'myHdr'`

Example: `'myHdr.hpp'`

Data Types: `char`

**IsAlias — Specification to create data type alias using object name**`false` (default) | `true`

Specification to create a data type alias by using the name of the object, specified as `true` (yes) or `false` (no).

If you specify `true`, the object acts as a data type alias in a similar manner to a `Simulink.AliasType` object. For more information, see “Manage Replacement of Simulink Data Types in Generated Code” (Embedded Coder).

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

**Signedness — Signedness of fixed-point data type**

'Signed' (default) | 'Unsigned' | 'Auto'

Signedness of a fixed-point data type (Fixed-Point Designer), specified as 'Signed' (signed), 'Unsigned' (unsigned), or 'Auto' (inherit signedness).

Data Types: `char`

**SignednessBool — Signedness of fixed-point data type**`false` | `true`

Signedness of a fixed-point data type (Fixed-Point Designer), specified as a Boolean.

Data Types: `logical`

**Slope — Slope for slope and bias scaling of fixed-point data type** $2^0$  (default) | real number

Slope for slope and bias scaling of a fixed-point data type (Fixed-Point Designer), specified as a real number.

This property equals `SlopeAdjustmentFactor * 2^FixedExponent`. If `SlopeAdjustmentFactor` is 1.0, Simulink software displays the value of this field as

$2^{\text{SlopeAdjustmentFactor}}$ . Otherwise, it displays it as a numeric value. Setting this property causes Simulink software to set the `FixedExponent` and `SlopeAdjustmentFactor` properties accordingly, and vice versa.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

This property appears only if `DataTypeMode` is `Fixed-point: slope and bias scaling`.

Example: 5.2

Example:  $2^9$

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

### **SlopeAdjustmentFactor — Slope for slope and bias scaling of fixed-point data type**

1 (default) | real number

Slope for slope and bias scaling of a fixed-point data type (Fixed-Point Designer), specified as a real number in the range [1, 2).

Setting this property causes Simulink software to adjust the `Slope` property accordingly, and vice versa. This property applies only if `DataTypeMode` is `Fixed-point: slope and bias scaling`.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

This property must be set programmatically.

Example: 1.7

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

### **WordLength — Word size of fixed-point or integer data type**

16 (default) | integer

Word size of a fixed-point (Fixed-Point Designer) or integer data type, specified as an integer number of bits.

This property appears only if `DataTypeMode` is `Fixed-point`.

If you use a number with a data type other than `double` to set the value, Simulink converts the value to `double`.

Example: 8

Data Types: `single` | `double` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical`

## **Object Functions**

<code>isboolean</code>	Determine whether numeric type represents the Boolean data type <code>boolean</code>
<code>isdouble</code>	Determine whether numeric type represents the double-precision, floating-point data type <code>double</code>
<code>isfixed</code>	Determine whether numeric type represents a fixed-point data type

<code>isfloat</code>	Determine whether numeric type represents a floating-point data type
<code>isscalingbinarypoint</code>	Determine whether fixed-point numeric type has binary-point scaling
<code>isscalingslopebias</code>	Determine whether numeric type represents a fixed-point data type with slope-and-bias scaling
<code>isscalingunspecified</code>	Determine whether numeric type represents a data type with unspecified scaling
<code>issingle</code>	Determine whether numeric type represents the single-precision, floating-point data type <code>single</code>
<code>ishalf</code>	Determine whether numeric type represents the half-precision, floating-point data type <code>half</code>

## Examples

### Share a Data Type Between Separate Algorithms, Data Paths, Models, and Bus Elements

See “Share a Data Type Between Separate Algorithms, Data Paths, Models, and Bus Elements”.

## Version History

Introduced before R2006a

## Extended Capabilities

### C/C++ Code Generation

Generate C and C++ code using MATLAB® Coder™.

When you select the **Is alias** property, a `Simulink.NumericType` object appears in the generated code as a typedef statement. The generated code uses the named type to define and declare data (variables).

### Fixed-Point Conversion

Design and simulate fixed-point systems using Fixed-Point Designer™.

# isboolean

**Package:** Simulink

Determine whether numeric type represents the Boolean data type `boolean`

## Syntax

```
indication = isboolean(numericType)
```

## Description

`indication = isboolean(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents the Boolean data type `boolean` and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

## Input Arguments

**numericType — Target numeric type**

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

## Output Arguments

**indication — Indication of whether target object represents boolean**

1 | 0

Indication of whether the target object represents `boolean`, returned as 1 (true) or 0 (false).

## Version History

**Introduced in R2010b**

## See Also

`Simulink.NumericType`

# isdouble

**Package:** Simulink

Determine whether numeric type represents the double-precision, floating-point data type `double`

## Syntax

```
indication = isdouble(numericType)
```

## Description

`indication = isdouble(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents the double-precision, floating-point data type `double` and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

## Input Arguments

**numericType** — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

## Output Arguments

**indication** — Indication of whether target object represents double

1 | 0

Indication of whether the target object represents double, returned as 1 (true) or 0 (false).

## Version History

**Introduced in R2010b**

# isfixed

**Package:** Simulink

Determine whether numeric type represents a fixed-point data type

## Syntax

```
indication = isfixed(numericType)
```

## Description

`indication = isfixed(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents a fixed-point data type and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

## Input Arguments

**numericType** — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

## Output Arguments

**indication** — Indication of whether target object represents a fixed-point type

1 | 0

Indication of whether the target object represents a fixed-point type, returned as 1 (true) or 0 (false).

## Version History

**Introduced in R2010b**

# isfloat

**Package:** Simulink

Determine whether numeric type represents a floating-point data type

## Syntax

```
indication = isfloat(numericType)
```

## Description

`indication = isfloat(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents a floating-point data type such as `double`, `single`, or `half`, and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

## Input Arguments

**numericType — Target numeric type**

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

## Output Arguments

**indication — Indication of whether target object represents a floating-point type**

1 | 0

Indication of whether the target object represents a floating-point type, returned as 1 (true) or 0 (false).

## Version History

**Introduced in R2010b**

# ishalf

**Package:** Simulink

Determine whether numeric type represents the half-precision, floating-point data type `half`

## Syntax

```
indication = ishalf(numericType)
```

## Description

`indication = ishalf(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents the half-precision, floating-point data type `half` and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

## Input Arguments

**numericType — Target numeric type**

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

## Output Arguments

**indication — Indication of whether target object represents half**

1 | 0

Indication of whether the target object represents `half`, returned as 1 (true) or 0 (false).

## Version History

**Introduced in R2020b**

# isscalingbinarypoint

**Package:** Simulink

Determine whether fixed-point numeric type has binary-point scaling

## Syntax

```
indication = isscalingbinarypoint(numericType)
```

## Description

`indication = isscalingbinarypoint(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents a fixed-point data type with binary-point scaling and 0 (false) otherwise. A numeric type object can use binary-point scaling if you explicitly specify it or if you specify trivial slope-and-bias scaling (the slope is an integer power of two and the bias is zero).

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

## Input Arguments

**numericType** — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

## Output Arguments

**indication** — Indication of whether target object represents fixed-point type with binary-point scaling

1 | 0

Indication of whether the target object represents a fixed-point type with binary-point scaling, returned as 1 (true) or 0 (false).

## Version History

**Introduced in R2010b**

## See Also

# isscalingslopebias

**Package:** Simulink

Determine whether numeric type represents a fixed-point data type with slope-and-bias scaling

## Syntax

```
indication = isscalingslopebias(numericType)
```

## Description

`indication = isscalingslopebias(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents a fixed-point data type with nontrivial slope-and-bias scaling and 0 (false) otherwise. A slope-and-bias fixed-point type has trivial scaling if the slope is an integer power of two and the bias is zero.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

## Input Arguments

**numericType** — Target numeric type

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

## Output Arguments

**indication** — Indication of whether target object represents fixed-point type with slope-and-bias scaling

1 | 0

Indication of whether the target object represents a fixed-point type with nontrivial slope-and-bias scaling, returned as 1 (true) or 0 (false).

## Version History

Introduced in R2010b

# isscalingunspecified

**Package:** Simulink

Determine whether numeric type represents a data type with unspecified scaling

## Syntax

```
indication = isscalingunspecified(numericType)
```

## Description

`indication = isscalingunspecified(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents a fixed-point or scaled double data type with unspecified scaling and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

## Input Arguments

**numericType — Target numeric type**

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

## Output Arguments

**indication — Indication of whether target object represents a type with unspecified scaling**

1 | 0

Indication of whether the target object represents a type with unspecified scaling, returned as 1 (true) or 0 (false).

## Version History

**Introduced in R2010b**

# issingle

**Package:** Simulink

Determine whether numeric type represents the single-precision, floating-point data type `single`

## Syntax

```
indication = issingle(numericType)
```

## Description

`indication = issingle(numericType)` returns 1 (true) if the `Simulink.NumericType` object `numericType` represents the single-precision, floating-point data type `single` and 0 (false) otherwise.

In Simulink, a `Simulink.NumericType` object represents a data type that you can share between different data items in a model. For more information, see `Simulink.NumericType`.

## Input Arguments

**numericType — Target numeric type**

`Simulink.NumericType` object

Target numeric type, specified as a `Simulink.NumericType` object.

## Output Arguments

**indication — Indication of whether target object represents single**

1 | 0

Indication of whether the target object represents `single`, returned as 1 (true) or 0 (false).

# Simulink.op.ModelOperatingPoint

Complete information that represents model operating point in simulation

## Description

A `Simulink.op.ModelOperatingPoint` object contains a complete representation of a model operating point that you can use to specify the initial state for a simulation. For example, when you run a set of simulations for a model of a system that has a startup phase or initialization behavior, you can simulate the model through the end of the startup or initialization phase once, save the model operating point, then run a set of simulations that use the operating point as the initial state. If you do not modify the model, simulating a model using a `Simulink.op.ModelOperatingPoint` object as the initial state produces the same results as a simulation with no initial state specified.

The operating point for a model represents the model state in simulation, including logged block states, hidden block states, the state of the solver and execution engine, and output values for some blocks. For more information, see “Use Model Operating Point for Faster Simulation Workflow”.

## Creation

A model configured to save the final operating point creates a `Simulink.op.ModelOperatingPoint` object when the simulation completes or when you pause or stop the simulation. To configure a model to save the final operating point:

- 1 On the **Modeling** tab, click **Model Settings**.
- 2 In the Configuration Parameters dialog box, select **Data Import/Export**.
- 3 Select **Final states** and **Save final operating point**.

By default, the `Simulink.op.ModelOperatingPoint` object is saved using a variable called `xFinal`. To save the operating point using a different variable name, specify the variable name you want to use in the **Final states** text box.

When you return simulation results using a single simulation output, the `Simulink.op.ModelOperatingPoint` object is returned as part of the `Simulink.SimulationOutput` object that contains all the simulation data.

## Properties

### **description** — Description of saved operating point

string | character vector

Description of saved operating point, specified as a string or a character vector. The `ModelOperatingPoint` object has a default description that includes the name of the model and the simulation time at which the operating point was saved.

Example: Operating point of the model 'vdp' at simulation time  
3.2137655751098118

**Tips**

The simulation time at which the model operating point was saved is also stored in the `snapshotTime` property.

**LoggedStates — Operating point information for built-in blocks**

`Simulink.SimulationData.Dataset` object | structure

Operating point information for built-in blocks, specified as a `Simulink.SimulationData.Dataset` object or a structure.

The format of the data in the `loggedStates` property for a `ModelOperatingPoint` object created from simulation depends on the format used for logging states and output data. To configure the format for logging states and outputs, use the Configuration Parameters dialog box. On the **Modeling** tab, click **Model Settings**. Then, on the **Data Import/Export** pane, select a value for the **Format** parameter.

Format parameter value	Format of loggedStates property value
Dataset	<code>Simulink.SimulationData.Dataset</code> object
<ul style="list-style-type: none"> <li>• Structure with time</li> <li>• Structure</li> <li>• Array</li> </ul>	Structure that contains block states data

**Tips**

- The `loggedStates` property contains the operating point information for built-in blocks and S-functions that do not implement custom operating point behavior. To access or modify the operating point information for a Stateflow chart, a MATLAB System block, or an S-function with a custom operating point implementation, use the `get` and `set` functions.
- Not all operating point information for built-in blocks is exposed in the `loggedStates` property for viewing or editing. For example, the `loggedStates` property does not include operating point information for:
  - Blocks inside For Each subsystems
  - Simscape blocks
  - Blocks inside referenced models that execute in accelerator mode
- You cannot change the format for the data in the `loggedStates` property after a `ModelOperatingPoint` object is created.

**snapshotTime — Simulation time at which operating point was saved**

double

This property is read-only.

Simulation time at which operating point was saved, returned as a double.

**startTime — Start time of simulation that created operating point**

double

This property is read-only.

Start time of simulation that created operating point, returned as a double.

## Object Functions

`get` Get operating point information for Stateflow chart, MATLAB System block, or S-function  
`set` Set operating point information for Stateflow chart, MATLAB System block, or S-function

## Examples

### Save and Restore Model Operating Point

Open the model `sldemo_tonegen`.

```
model = "sldemo_tonegen";
open_system(model);
```

Create a `Simulink.SimulationInput` object to specify parameter values to use in simulation.

```
simIn = Simulink.SimulationInput(model);
```

Configure the simulation to stop after ten seconds and save the final operating point in a variable named `finalOP`.

```
simIn = setModelParameter(simIn, "StopTime", "10", ...
 "SaveFinalState", "on", "SaveOperatingPoint", "on", ...
 "FinalStateName", "finalOP");
```

Simulate the model using the settings configured on the `SimulationInput` object.

```
out = sim(simIn);
```

Access the saved operating point, returned as part of the single `Simulink.SimulationOutput` object.

```
finalOP = out.finalOP
```

```
finalOP =
 Simulink.op.ModelOperatingPoint

 Operating point of the model 'sldemo_tonegen' at simulation time 10.
```

#### Properties

```
loggedStates
description
startTime (Read-only)
snapshotTime (Read-only)
```

#### Methods

```
get
set
```

Create a `SimulationInput` object to configure another simulation that uses the operating point saved from the first simulation.

```
simIn2 = Simulink.SimulationInput(model);
```

Configure the model to simulate to a stop time of twenty seconds.

```
simIn2 = setModelParameter(simIn2, "StopTime", "20");
```

Use the `setInitialState` function to specify the initial state for the simulation using the `Simulink.op.ModelOperatingPoint` object saved from the first simulation.

```
simIn2 = setInitialState(simIn2, finalOP);
```

Simulate the model from the initial operating point.

```
out2 = sim(simIn2);
```

## Tips

When you want to save an operating point from a simulation, disable **Block reduction** before simulating the model.

## Version History

### Introduced in R2019a

#### **R2019a: Simulink.SimState.ModelSimState is renamed to Simulink.op.ModelOperatingPoint**

*Behavior changed in R2019a*

The `Simulink.SimState.ModelSimState` object, which was introduced in R2009a, is renamed and replaced with the `Simulink.op.ModelOperatingPoint` object. You can still use simulation snapshots from a previous release that you captured and saved as `ModelSimState` objects. When you load the object into the workspace or a model, the object is replaced with a `ModelOperatingPoint` object that contains the same data.

In most cases, you do not need to update scripts in response to this change. The `ModelOperatingPoint` object has the same properties as the `ModelSimState` object. The `setBlockSimState` and `getBlockSimState` functions continue to work but are not recommended. Instead, use the `get` and `set` functions for the `ModelOperatingPoint` object.

## get

**Package:** Simulink.op

Get operating point information for Stateflow chart, MATLAB System block, or S-function

### Syntax

```
op = get(modelOP,blockPath)
```

### Description

`op = get(modelOP,blockPath)` returns the operating point information `op` for the model element at the specified path `blockPath`. Use the `get` function to access operating point information for:

- Stateflow charts
- MATLAB System blocks
- S-functions with custom operating point implementation

To access the state for a built-in block, use the `loggedStates` property of the `Simulink.op.ModelOperatingPoint` object.

### Examples

#### Get Operating Point for Stateflow Chart

To get the operating point for a Stateflow chart that is inside a referenced model, specify the full path to the chart relative to the top model.

```
model = 'sldemo_fuelsys_dd';
opt = struct('SaveFinalState','on','SaveOperatingPoint','on','StopTime','1');
simOut = sim(model,opt);
modelOp = simOut.xFinal;
blockPath = 'sldemo_fuelsys_dd/Fuel Rate Controller|sldemo_fuelsys_dd_controller/control_logic';
chartOp = get(modelOp,blockPath)
```

### Input Arguments

#### **modelOP** — Model operating point

`Simulink.op.ModelOperatingPoint` object

Model operating point, specified as a `Simulink.op.ModelOperatingPoint` object.

#### **blockPath** — Path to model element whose operating point you want to access

string | character vector

Path to model element whose operating point you want to access, specified as a string or a character vector.

You cannot access or modify operating point information for Stateflow charts, MATLAB System blocks, or S-functions inside referenced models simulated using accelerator mode.

## Output Arguments

### op — Element operating point

Stateflow.op.BlockOperatingPoint object | S-function operating point | MATLAB System block operating point

Element operating point, returned as a Stateflow.op.BlockOperatingPoint object, an S-function operating point, or a MATLAB System block operating point.

#### Tips

- For more information about working with operating points for Stateflow charts, see “Save and Restore Operating Points for Stateflow Charts” (Stateflow).
- Use the `ssSetOperatingPointVisibility` function to specify whether operating point information for an S-function is accessible from the `ModelOperatingPoint` object.

## Version History

Introduced in R2019a

### R2019a: Simulink.SimState.ModelSimState is renamed to Simulink.op.ModelOperatingPoint

*Behavior changed in R2019a*

The `Simulink.SimState.ModelSimState` object, which was introduced in R2009a, is renamed and replaced with the `Simulink.op.ModelOperatingPoint` object. You can still use simulation snapshots from a previous release that you captured and saved as `ModelSimState` objects. When you load the object into the workspace or a model, the object is replaced with a `ModelOperatingPoint` object that contains the same data.

In most cases, you do not need to update scripts in response to this change. The `ModelOperatingPoint` object has the same properties as the `ModelSimState` object. The `setBlockSimState` and `getBlockSimState` functions continue to work but are not recommended. Instead, use the `get` and `set` functions for the `ModelOperatingPoint` object.

# set

**Package:** Simulink.op

Set operating point information for Stateflow chart, MATLAB System block, or S-function

## Syntax

```
set(modelOP,blockPath,op)
```

## Description

`set(modelOP,blockPath,op)` sets the operating point `op` for the model element at the specified path `blockPath`. Use the `set` function to specify operating point information for:

- Stateflow charts
- MATLAB System blocks
- S-functions with custom operating point implementation

To modify the operating point information for a built-in block, use the `loggedStates` property for the `Simulink.op.ModelOperatingPoint` object.

## Examples

### Set Operating Point for Stateflow Chart

Specify the operating point for the Stateflow chart 'mymodel/chart' as the contents of the variable `newChartOperPoint`.

```
newOperPoint = set(myOperPoint,'mymodel/chart',newChartOperPoint)
```

## Input Arguments

### **modelOP** — Model operating point

`Simulink.op.ModelOperatingPoint` object

Model operating point, specified as a `Simulink.op.ModelOperatingPoint` object.

### **blockPath** — Path to element whose operating point you want to modify

string | character vector

Path to element whose operating point you want to modify, specified as a string or a character vector.

You cannot access or modify operating point information for Stateflow charts, MATLAB System blocks, or S-functions inside model references that execute in accelerator mode.

### **op** — Operating point information to set

`Stateflow.op.BlockOperatingPoint` object | S-function operating point | MATLAB System block operating point

Operating point information to set, specified as a `Stateflow.op.BlockOperatingPoint` object, an S-function operating point, or a MATLAB System block operating point.

#### Tips

- For more information about working with operating points for Stateflow charts, see “Save and Restore Operating Points for Stateflow Charts” (Stateflow).
- Use the `ssSetOperatingPointVisibility` function to specify whether operating point information for an S-function is accessible from the `ModelOperatingPoint` object.

# Simulink.Parameter

Store, share, and configure parameter values

## Description

Create a `Simulink.Parameter` object to set the value of one or more block parameters in a model, such as the **Gain** parameter of a Gain block. You create the object in a workspace or in a data dictionary. Set the parameter value in the object, then reference the object from the block.

Use a `Simulink.Parameter` object to:

- Share a value among multiple block parameters.
- Represent an engineering constant or a tunable calibration parameter.
- Separate a parameter value from its data type and other properties.
- Configure parameter data for code generation.

The `Value` property of the object stores the parameter value. To use the object in a model, set the value of a block parameter to an expression that includes the name of the object. Omit the `Value` property from the expression. For more information, see “Use Parameter Objects”.

For more information about block parameters, see “Set Block Parameter Values” and “How Generated Code Stores Internal Signal, State, and Parameter Data” (Simulink Coder).

To configure a `Simulink.Parameter` object as a model argument, the object must be in a model workspace. In a dialog box such as the Model Explorer, select **Argument** for the parameter object. For more information, see “Parameterize Instances of a Reusable Referenced Model”.

## Creation

Create a `Simulink.Parameter` object:

- Directly from a block dialog box or the Property Inspector. See “Create, Edit, and Manage Workspace Variables”.
- By using the Model Data Editor. Inspect the **Parameters** tab. Right-click the row that contains a variable, and from the context menu, select **Convert to parameter object**.
- By using the Model Explorer. See “Create Data Objects from Built-In Data Class Package Simulink”.
- By using the `Simulink.Parameter` function described below.

## Syntax

```
paramObj = Simulink.Parameter
paramObj = Simulink.Parameter(paramValue)
```

## Description

`paramObj = Simulink.Parameter` returns a `Simulink.Parameter` object with default property values.

`paramObj = Simulink.Parameter(paramValue)` returns a `Simulink.Parameter` object and initializes the `Value` property to `paramValue`.

## Properties

### Value — Value to use in block parameters

[ ] (default) | numeric | boolean | enum | structure | scalar | array | character value | <mathematical expression>

Value to use in block parameters, specified as any of these valid values:

- Numeric value
- Boolean value
- Instance of enumerated type
- Structure
- Scalar or array
- Mathematical expression (see “Set Variable Value by Using a Mathematical Expression”)

If you use a `Simulink.Parameter` object to set the block parameter value in a reusable referenced model, you can compile and simulate the model as a referenced model with the value for the object left empty (`Value` set to [ ]) as long as you provide an explicit value somewhere in the parent model reference hierarchy. In this case, you cannot simulate the model directly. When the value is empty, you must provide the `DataType` and `Dimensions` for the object. Although you have specified an empty value, the software still synthesizes a `Value` by using one of these:

- `Max`
- `Min`, if you have not specified `Max`
- `1`, if you have not specified either `Min` or `Max`

See “Parameterize Instances of a Reusable Referenced Model”.

You can also use MATLAB syntax to specify the value.

Example Expression	Description
<code>15.23</code>	Specifies a scalar value
<code>[3 4; 9 8]</code>	Specifies a matrix
<code>3+2i</code>	Specifies a complex value
<code>struct('A',20,'B',5)</code>	Specifies a structure with two fields, A and B, with double-precision values 20 and 5.  Organize block parameters into structures (see “Organize Related Block Parameter Definitions in Structures”) or initialize the signal elements in a bus (see “Specify Initial Conditions for Bus Elements”).

Example Expression	Description
<code>slexpr('myVar + myOtherVar')</code>	Specifies the expression <code>myVar + myOtherVar</code> where <code>myVar</code> and <code>myOtherVar</code> are other MATLAB variables or parameter objects. The software preserves this mathematical relationship between the object and the variables.

To use a `Simulink.Parameter` object to store a value of a particular numeric data type, specify the ideal value with the `Value` property and control the data type with the `DataType` property.

If you set the `Value` property by using a typed expression such as `single(32.5)`, the `DataType` property changes to reflect the new type. A best practice is to use an expression that is not typed to avoid accumulating numerical error through repeated quantizations or data type saturation, especially for fixed-point data types.

Example: `3.15`

Example: `1.2 + 3.2i`

Example: `true`

Example: `myEnumType.myEnumValue`

Example: `struct('field1',15,'field2',7.32)`

Example: `slexpr('myVar + myOtherVar')`

### Tips

- To more easily edit a large vector, 2-D matrix, or structure that you store in a `Simulink.Parameter` object, use the Variable Editor. See “Create, Edit, and Manage Workspace Variables”.
- When you specify an array with three or more dimensions interactively, such as by using the Model Explorer, this property displays the array as an expression that contains a call to the `reshape` function. To edit the values in the array, modify the first argument of the `reshape` call, which contains all of the array values in a serialized vector. When you add or remove elements along a dimension, you must also correct the argument that represents the length of the modified dimension.

Data Types: `double` | `single` | `int8` | `int16` | `int32` | `int64` | `uint8` | `uint16` | `uint32` | `uint64` | `logical` | `struct` | `fi` | `enum`

Complex Number Support: Yes

### CoderInfo — Specifications for generating code for parameter object

`Simulink.CoderInfo` object

This property is read-only.

Specifications for generating code for the parameter object, returned as a `Simulink.CoderInfo` object.

Modify the properties of the `Simulink.CoderInfo` object that this property contains.

For example, the `StorageClass` property of the `Simulink.CoderInfo` object determines how Simulink code generation toolboxes allocate memory for the parameter object in the generated code. For more information, see “C Code Generation Configuration for Model Interface Elements” (Simulink Coder) and “Choose Storage Class for Controlling Data Representation in Generated Code” (Embedded Coder).

**Description — Custom description of parameter object**`' ' (default) | character vector | string scalar`

Custom description of the parameter object, specified as a character vector. Use this property to document the significance that the parameter object has in your algorithm.

If you have an Embedded Coder license, you can configure this description to appear in the generated code as a comment. See Simulink data object descriptions (Embedded Coder).

Example: `'This parameter represents the maximum rotation speed of the engine.'`

**Dependencies**

The software ignores the value of this property when `DataType` specifies a `Simulink.ValueType` object. The software uses the description of the `Simulink.ValueType` object instead.

Data Types: `char` | `string`

**DataType — Data type of parameter value**`'auto' (default) | character vector | string scalar`

Data type of the parameter value in the `Value` property, specified as `'auto'` or a character vector. When you simulate the model or generate code, the software casts the value to the specified data type.

If you specify `'auto'`, the default setting, the parameter object uses the same data type as the block parameters that use the object. See “Reduce Maintenance Effort with Data Type Inheritance”.

When you set the `Value` property to something other than a double number, the object typically sets the `DataType` property based on the value of the `Value` property. For example, when you set the `Value` property to `int8(5)`, the object sets the value of the `DataType` property to `'int8'`.

To explicitly specify a built-in data type (see “Data Types Supported by Simulink”), specify one of these options:

- `'double'`
- `'single'`
- `'half'`
- `'int8'`
- `'uint8'`
- `'int16'`
- `'uint16'`
- `'int32'`
- `'uint32'`
- `'int64'`
- `'uint64'`
- `'boolean'`

To specify a fixed-point data type, use the `fixdt` function. For example, specify `'fixdt(1,16,5)'`.

If you use a `Simulink.AliasType` or `Simulink.NumericType` object to create and share custom data types in your model, specify the name of the object.

To specify an enumerated data type, use the name of the type preceded by `Enum:`. For example, specify `'Enum: myEnumType'`.

To specify a `Simulink.ValueType` object as the data type, use the name of the object preceded by `ValueType:`. For example, specify `'ValueType: myValueType'`.

When you store a structure or array of structures in the `Value` property of the object, the object sets the `DataType` property to `'struct'`. To specify a `Simulink.Bus` object as the data type, use the name of the bus object preceded by `Bus:`. For example, specify `'Bus: myBusObject'`.

When you specify a `Simulink.ValueType` or `Simulink.Bus` object as the data type, some properties of the `Simulink.Parameter` object are ignored. For example, the `Min`, `Max`, and `Unit` properties of the `Simulink.Parameter` object are ignored. The software uses the corresponding properties of the `Simulink.ValueType` object or `Simulink.BusElement` objects in the `Simulink.Bus` object instead.

Example: `'auto'`

Example: `'int8'`

Example: `'fixdt(1,16,5)'`

Example: `'myAliasTypeObject'`

Example: `'Enum: myEnumType'`

Example: `'ValueType: myValueType'`

Example: `'Bus: myBusObject'`

### Tips

When you edit the data type interactively, to display the **Data Type Assistant**, click the **Show data**

**type assistant** button . For more information, see “Specify Data Types Using Data Type Assistant”.

Data Types: `char` | `string`

### Min — Minimum value of parameter

`[]` (default) | `real double scalar`

Minimum value that the `Value` property of the object can store, specified as a `real double scalar`.

The default value is empty, which means the parameter value does not have a minimum.

If you store a complex number in the `Value` property, the `Min` property applies separately to the real and imaginary parts.

If `Value` is less than the minimum value or if the minimum value is outside the range of the object data type, the software generates a warning. When updating the diagram or starting a simulation, the software generates an error.

For more information about how the software uses this property, see “Specify Minimum and Maximum Values for Block Parameters”

Example: `-0.92`

**Dependencies**

The software ignores the value of this property when either of these options apply:

- `Value` specifies a structure.

To specify minimum values for the structure, set `DataType` to a `Simulink.Bus` object and specify a minimum value for each field by using the corresponding `Simulink.BusElement` objects in the `Simulink.Bus` object. See “Control Field Data Types and Characteristics by Creating Parameter Object”.

- `DataType` specifies a `Simulink.ValueType` or `Simulink.Bus` object.

The software uses the minimum values specified by the `Simulink.ValueType` object or the `Simulink.BusElement` objects in the `Simulink.Bus` object instead.

**Tips**

For parameter objects with a fixed-point data type, dialog boxes show the **Stored Integer Minimum** property, which is the minimum value that the parameter can have, specified as a stored integer value. The value is derived from the real-world minimum value.

Data Types: `double`

**Max — Maximum value of parameter**

[ ] (default) | real `double` scalar

Maximum value that the `Value` property of the object can store, specified as a real `double` scalar.

The default value is empty, which means the parameter value does not have a maximum.

If you store a complex number in the `Value` property, the `Max` property applies separately to the real and imaginary parts.

If `Value` is greater than the maximum value or if the maximum value is outside the range of the object data type, the software generates a warning. When updating the diagram or starting a simulation, the software generates an error.

For more information about how the software uses this property, see “Specify Minimum and Maximum Values for Block Parameters”.

Example: 5.32

**Dependencies**

The software ignores the value of this property when either of these options apply:

- `Value` specifies a structure.

To specify maximum values for the structure, set `DataType` to a `Simulink.Bus` object and specify a maximum value for each field by using the corresponding `Simulink.BusElement` objects in the `Simulink.Bus` object. See “Control Field Data Types and Characteristics by Creating Parameter Object”.

- `DataType` specifies a `Simulink.ValueType` or `Simulink.Bus` object.

The software uses the maximum values specified by the `Simulink.ValueType` object or the `Simulink.BusElement` objects in the `Simulink.Bus` object instead.

**Tips**

For parameter objects with a fixed-point data type, dialog boxes show the **Stored Integer Maximum** property, which is the maximum value that the parameter can have, specified as a stored integer value. The value is derived from the real-world maximum value.

Data Types: double

**Unit — Physical unit of parameter value**

' ' (default) | character vector | string scalar

Physical unit of parameter value, specified as a character vector that describes a valid unit. For more information, see “Unit Specification in Simulink Models”.

Example: 'degC'

**Dependencies**

The software ignores the value of this property when `DataType` specifies a `Simulink.ValueType` or `Simulink.Bus` object. The software uses the units specified by the `Simulink.ValueType` object or the `Simulink.BusElement` objects in the `Simulink.Bus` object instead.

Data Types: char | string

**Complexity — Numeric complexity of parameter value**

'real' (default) | 'complex'

Numeric complexity of the parameter value, specified as either 'real' or 'complex'. For `Simulink.Parameter` objects in the model workspace, use this property to configure the complexity of a model argument. See “Parameterize Instances of a Reusable Referenced Model”.

For numeric values, the software derives the complexity from the parameter value that you specify in the `Value` property. In this case, changing the complexity results in error.

**Dependencies**

The software ignores the value of this property when any of these options apply:

- `Value` specifies a mathematical expression.
- `Value` specifies a structure.

To specify complexity for the structure, set `DataType` to a `Simulink.Bus` object and specify a complexity for each field by using the corresponding `Simulink.BusElement` objects in the `Simulink.Bus` object. See “Control Field Data Types and Characteristics by Creating Parameter Object”.

- `DataType` specifies a `Simulink.ValueType` or `Simulink.Bus` object.

The software uses the complexity specified by the `Simulink.ValueType` object or the `Simulink.BusElement` objects in the `Simulink.Bus` object instead.

**Dimensions — Dimensions of parameter value**

[0 0] (default) | row vector | character vector | string scalar

Dimensions of the value stored in the `Value` property, specified as a row vector, character vector, or string scalar.

When you set the `Value` property of the object, the object sets the value of the `Dimensions` property to a `double` row vector. The vector is the same vector that the `size` function returns.

If you are configuring the object as a model argument, and you intend to provide a value for the object elsewhere in the parent model reference hierarchy, you can leave the `Value` property empty (set to `[]`) and set the `Dimensions` and `Data Type` properties explicitly. See “Parameterize Instances of a Reusable Referenced Model”.

To use symbolic dimensions, specify a character vector. See “Implement Symbolic Dimensions for Array Sizes in Generated Code” (Embedded Coder).

Example: `[1 3]`

Example: `'[1 myDimParam]'`

### Dependencies

- To enable this property, `Value` must be empty (`[]`). Otherwise, the software derives the dimensions from the `Value` property. For example, a value of `[3 4;9 8]` has dimensions `[2 2]`.
- The software ignores the value of this property when `Data Type` specifies a `Simulink.ValueType` object. The software uses the dimensions specified by the `Simulink.ValueType` object instead.

Data Types: `double` | `char` | `string`

## Examples

### Use Parameter Object to Set Value of Gain Parameter

In the MATLAB Command Window, create a `Simulink.Parameter` object.

```
myParam = Simulink.Parameter;
```

Assign a numeric value to the `Value` property.

```
myParam.Value = 15.23;
```

Specify the minimum and maximum values the parameter can take with the `Min` and `Max` properties.

```
myParam.Min = 10.11;
```

```
myParam.Max = 25.27;
```

Open a new Simulink model. Add a Gain block and set its **Gain** parameter to `myParam`. During simulation, the **Gain** parameter uses the value `15.23`.

### Change Value Stored by Parameter Object

In the MATLAB Command Window, create a `Simulink.Parameter` object that stores the value `2.52`.

```
myParam = Simulink.Parameter(2.52);
```

Change the value by accessing the `Value` property of the object. This technique preserves the values of the other properties of the object.

```
myParam.Value = 1.13;
```

### Create Parameter Object with Specific Numeric Data Type

To reduce model maintenance, you can leave the `DataType` property at its default value, `auto`. The parameter object acquires a data type from the block parameter that uses the object.

To reduce the risk of the data type changing when you make changes to signal data types and other data types in your model, you can explicitly specify a data type for the parameter object. For example, when you generate code that exports parameter data to your custom code, explicitly specify a data type for the object.

In the MATLAB Command Window, create a `Simulink.Parameter` object that stores the value 18.25.

```
myParam = Simulink.Parameter(18.25);
```

The expression `18.25` returns the number 18.25 with the double-precision, floating-point data type `double`. The `Value` property stores the number 18.25 with double precision.

Use the `DataType` property to specify the single-precision data type `single`.

```
myParam.DataType = 'single';
```

When you simulate or generate code, the object casts the value of the `Value` property, 18.25, to the data type specified by the `DataType` property, `single`.

### Set Parameter Value to a Mathematical Expression

This example shows how to set the value of a parameter object, `myParam`, to the sum of two other variables, `myVar` and `myOtherVar`. With this technique, when you change the values of the independent variables, the software immediately calculates the new value of the parameter object.

Create the two independent variables.

```
myVar = 5.2;
myOtherVar = 9.8;
```

Create the parameter object.

```
myParam = Simulink.Parameter;
```

Set the value of the parameter object to the expression `myVar + myOtherVar`.

```
myParam.Value = slexpr('myVar + myOtherVar')
```

When you simulate or generate code, the expression evaluates to 15.

# Simulink.profiler.Data

Programmatically access Simulink Profiler information

## Description

The `Simulink.profiler.Data` object provides access to simulation profiling metadata.

## Creation

Access the `Simulink.profiler.Data` object from the `SimulationMetadata.TimingInfo` field of the `Simulink.SimulationOutput` object.

## Properties

### **run** — Profiling session identifier

character vector | string scalar

This is a read only property.

Identifier of the profiling session, returned as a character vector or string scalar.

Example: `'vdp @ 21-Nov-2019 13:48:00'`

Data Types: `char` | `string`

### **UserString** — User documentation of profiling session

"" (default) | character vector | string scalar

Use the `UserString` field to document relevant information about the current profiling session

Example: `profilingData.UserString = "Updated gain to reduce chatter.";`

Data Types: `char` | `string`

### **rootUINode** — Block hierarchy of the model

`Simulink.profiler.UINode` object

Block hierarchy of the model, returned as a `Simulink.profiler.UINode` object with the following fields:

Field	Value	Description
<code>totalTime</code>	double	Execution time of the block, as well as its children.
<code>selfTime</code>	double	Execution time of the block, excluding its children
<code>numberOfCalls</code>	double	Number of times the block was executed during the simulation.

Field	Value	Description
children	Simulink.profiler.UINode array	Contents of the current block
path	string scalar	Path of the block relative to the top level of the model.  <b>Note</b> The path of the rootUINode field is the name of the model

A `Simulink.profiler.UINode` object corresponds to a row in the block hierarchy view of the Simulink Profiler.

### rootExecNode — Execution stack of the model

`Simulink.profiler.ExecNode`

Execution phases of the model, returned as a `Simulink.profiler.ExecNode` object with the following fields:

Field	Value	Description
totalTime	double	Execution time of the stack element, as well as its children.
selfTime	double	Execution time of the stack element, excluding its children
numberOfCalls	double	Number of times the stack element was executed during the simulation.
location		Specific phase of the model's execution
children	Simulink.profiler.ExecNode array	Similar tasks corresponding to the execution phase of the parent.
objectPath	string scalar	Path of the model element corresponding to the current element of the execution stack.  <b>Note</b> The <code>objectPath</code> field of the <code>rootExecNode</code> is the name of the model

A `Simulink.profiler.ExecNode` object corresponds to a row in the execution stack view of the Simulink Profiler.

## Simulink.sdi.CustomSnapshot

Specify settings for snapshot without opening or affecting the Simulation Data Inspector

### Description

Use a `Simulink.sdi.CustomSnapshot` object to specify settings for a snapshot without opening the Simulation Data Inspector or affecting an open session. Creating a snapshot using a `Simulink.sdi.CustomSnapshot` object is the best option for fully scripted workflows. You can specify the snapshot dimensions in pixels, the subplot layout, and limits for the  $x$ - and  $y$ - axes. You can use the `clearSignals` and `plotOnSubplot` functions to plot signals you want to include in the snapshot. To capture the snapshot, you can pass the `Simulink.sdi.CustomSnapshot` object as the value for the `settings` name-value argument for the `Simulink.sdi.snapshot` object or use the `snapshot` function.

### Creation

#### Syntax

```
snap = Simulink.sdi.CustomSnapshot
```

#### Description

`snap = Simulink.sdi.CustomSnapshot` creates a `Simulink.sdi.CustomSnapshot` object.

### Properties

#### Width — Image width in pixels

600 (default) | scalar

Image width in pixels, specified as a scalar. The width of the snapshot is constrained by monitor resolution.

Example: 750

#### Height — Image height in pixels

400 (default) | scalar

Image height in pixels, specified as a scalar. The height of the snapshot is constrained by monitor resolution.

Example: 500

#### Rows — Number of subplot rows

1 (default) | scalar

Number of subplot rows, specified as a scalar between 1 and 8, inclusive. Use `Rows` and `Columns` to set your desired subplot layout.

When you use the `plotComparison` function to plot comparison results onto a `Simulink.sdi.CustomSnapshot` object, the number of rows is 2.

Example: 2

### Columns — Number of subplot columns

1 (default) | scalar

Number of subplot columns, specified as a scalar between 1 and 8, inclusive. Use `Rows` and `Columns` to set your desired subplot layout.

When you use the `plotComparison` function to plot comparison results onto a `Simulink.sdi.CustomSnapshot` object, the number of columns is 1.

Example: 3

### TimeSpan — Time axis limits

2x1 matrix

Time axis limits, specified as a 2x1 matrix. The time axis limits in the snapshot are the same for all subplots. By default, the time axis adjusts to accommodate the largest time range of the plotted signals.

When you use the `plotComparison` function to plot comparison results onto a `Simulink.sdi.CustomSnapshot` object, a fit-to-view is performed to determine the axis limits.

Example: [0 20]

### YRange — y-axis limits

cell array

y-axis limits, specified as a cell array of 1-by-2 matrices specifying the y-axis limits for all subplots in the custom snapshot. By default, `YRange` is [-3 3] for all subplots.

When you use the `plotComparison` function to plot comparison results onto a `Simulink.sdi.CustomSnapshot` object, a fit-to-view is performed to determine the axis limits.

Example: {[ -10 10], [0 100]}

## Object Functions

<code>clearSignals</code>	Clear signals plotted on subplots of <code>Simulink.sdi.CustomSnapshot</code> object
<code>plotOnSubPlot</code>	Plot signals on <code>Simulink.sdi.CustomSnapshot</code> object subplots
<code>snapshot</code>	Create custom snapshot
<code>plotComparison</code>	Plot comparison results on <code>Simulink.sdi.CustomSnapshot</code> objects

## Examples

### Copy View Settings to Run

Copy view settings from one run to another and create figures using the `Simulink.sdi.CustomSnapshot` object.

### Simulate Model and Get Run Object

Configure the vdp model to save output data. Run a simulation to create data.

```
load_system("vdp")
set_param("vdp", "SaveFormat", "Dataset", "SaveOutput", "on")
set_param("vdp/Mu", "Gain", "1");
sim("vdp");
```

Use the Simulation Data Inspector programmatic interface to access the run data.

```
runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

### Modify Signal View Settings

Use the `Simulink.sdi.Run` object to access signals in the run. Then, modify the signal view settings. This example specifies the line color and style for each signal. The view settings for the run comprise the view settings for each signal and view settings specified for the plot area.

```
sig1 = getSignalByIndex(vdpRun,1);
sig2 = getSignalByIndex(vdpRun,2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = "-.";

sig2.LineColor = [1 0 0];
sig2.LineDashed = ":";
```

### Capture Snapshot from Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;
```

You can use properties of the `Simulink.sdi.CustomSnapshot` object to configure the plot settings, such as the subplot layout and axis limits, and to plot signals. When you use a `Simulink.sdi.CustomSnapshot` object to create your figure, these plot settings do not affect the Simulation Data Inspector.

```
snap.Rows = 2;
snap.YRange = {[-2.25 2.25], [-3 3]};
plotOnSubPlot(snap,1,1,sig1,true)
plotOnSubPlot(snap,2,1,sig2,true)
```

Use the `Simulink.sdi.snapshot` function to generate the figure you specified in the properties of the `Simulink.sdi.CustomSnapshot` object.

```
fig = Simulink.sdi.snapshot("From", "custom", "To", "figure", "Settings", snap);
```

### Copy View Settings to New Simulation Run

Simulate the model again, with a different Mu value. Use the Simulation Data Inspector programmatic interface to access the simulation data.

```
set_param("vdp/Mu", "Gain", "5")
sim("vdp");
```

```
runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);
```

To create a plot of the new output data that looks like the one you created in the previous step, you can copy the view settings to the run in a single line of code using the `Simulink.sdi.copyRunViewSettings` function. This function does not automatically update plot settings in `Simulink.sdi.CustomSnapshot` objects, so specify the input that determines whether the plot updates as `false`.

```
sigIDs = Simulink.sdi.copyRunViewSettings(runID, runID2, false);
```

### Capture Snapshot of New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
clearSignals(snap)
snap.YRange = {[-2.25 2.25], [-8 8]};
```

```
plotOnSubPlot(snap,1,1,sigIDs(1),true)
plotOnSubPlot(snap,2,1,sigIDs(2),true)
```

```
fig = snapshot(snap,"To","figure");
```

# clearSignals

**Package:** Simulink.sdi

Clear signals plotted on subplots of `Simulink.sdi.CustomSnapshot` object

## Syntax

```
clearSignals(snap)
```

## Description

`clearSignals(snap)` clears plotted signals from all subplots in the `Simulink.sdi.CustomSnapshot` object `snap`. Using the `clearSignals` function does not affect any subplots or signals in your open Simulation Data Inspector session.

## Examples

### Copy View Settings to Run

Copy view settings from one run to another and create figures using the `Simulink.sdi.CustomSnapshot` object.

### Simulate Model and Get Run Object

Configure the `vdp` model to save output data. Run a simulation to create data.

```
load_system("vdp")
set_param("vdp", "SaveFormat", "Dataset", "SaveOutput", "on")
set_param("vdp/Mu", "Gain", "1");
sim("vdp");
```

Use the Simulation Data Inspector programmatic interface to access the run data.

```
runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

### Modify Signal View Settings

Use the `Simulink.sdi.Run` object to access signals in the run. Then, modify the signal view settings. This example specifies the line color and style for each signal. The view settings for the run comprise the view settings for each signal and view settings specified for the plot area.

```
sig1 = getSignalByIndex(vdpRun,1);
sig2 = getSignalByIndex(vdpRun,2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = "-.";

sig2.LineColor = [1 0 0];
sig2.LineDashed = ":";
```

### Capture Snapshot from Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;
```

You can use properties of the `Simulink.sdi.CustomSnapshot` object to configure the plot settings, such as the subplot layout and axis limits, and to plot signals. When you use a `Simulink.sdi.CustomSnapshot` object to create your figure, these plot settings do not affect the Simulation Data Inspector.

```
snap.Rows = 2;
snap.YRange = {[-2.25 2.25],[-3 3]};
plotOnSubPlot(snap,1,1,sig1,true)
plotOnSubPlot(snap,2,1,sig2,true)
```

Use the `Simulink.sdi.snapshot` function to generate the figure you specified in the properties of the `Simulink.sdi.CustomSnapshot` object.

```
fig = Simulink.sdi.snapshot("From","custom","To","figure","Settings",snap);
```

### Copy View Settings to New Simulation Run

Simulate the model again, with a different Mu value. Use the Simulation Data Inspector programmatic interface to access the simulation data.

```
set_param("vdp/Mu", "Gain", "5")
sim("vdp");
```

```
runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);
```

To create a plot of the new output data that looks like the one you created in the previous step, you can copy the view settings to the run in a single line of code using the `Simulink.sdi.copyRunViewSettings` function. This function does not automatically update plot settings in `Simulink.sdi.CustomSnapshot` objects, so specify the input that determines whether the plot updates as `false`.

```
sigIDs = Simulink.sdi.copyRunViewSettings(runID, runID2, false);
```

### Capture Snapshot of New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
clearSignals(snap)
snap.YRange = {[-2.25 2.25], [-8 8]};
plotOnSubPlot(snap, 1, 1, sigIDs(1), true)
plotOnSubPlot(snap, 2, 1, sigIDs(2), true)
```

```
fig = snapshot(snap, "To", "figure");
```

## Input Arguments

### snap — Custom snapshot settings

`Simulink.sdi.CustomSnapshot` object

Custom snapshot settings, specified as a `Simulink.sdi.CustomSnapshot` object.

## Version History

Introduced in R2018a

# plotComparison

**Package:** Simulink.sdi

Plot comparison results on Simulink.sdi.CustomSnapshot objects

## Syntax

```
plotComparison(snap,diffSignalResult)
```

## Description

`plotComparison(snap,diffSignalResult)` plots the signal comparison result `diffSignalResult` on the Simulink.sdi.CustomSnapshot object `snap`.

When you use the `plotComparison` function to plot comparison results to a Simulink.sdi.CustomSnapshot object, you can only customize the `Width` and `Height` properties of the Simulink.sdi.CustomSnapshot object. When you take a snapshot of comparison results, the Simulink.sdi.CustomSnapshot object will always have 2×1 subplot layout. A fit-to-view is performed to determine the axis limits.

## Examples

### Capture Snapshot of Comparison Results

You can use the function `plotComparison` to plot comparison results to a Simulink.sdi.CustomSnapshot object. This example uses data collected by simulating a model of an aircraft longitudinal flight control system and captures a snapshot of the contents of the comparison results in the Simulation Data Inspector. When you use a Simulink.sdi.CustomSnapshot object to create the snapshot, you can adjust the look of the figure without affecting the Simulation Data Inspector. For more information about the model, see "Aircraft Longitudinal Flight Control" on page 13-241.

First, load the session file that contains the data to compare. The session file contains data for four simulations of an aircraft longitudinal controller. This example compares data from two runs that use different input filter time constants.

```
Simulink.sdi.load("AircraftExample.mldatx");
```

Access the run IDs that correspond to the last two simulation runs.

```
runIDs = Simulink.sdi.getAllRunIDs;
baselineID = runIDs(end-1);
comparedToID = runIDs(end);
```

Use the `Simulink.sdi.compareRuns` function to compare the last two runs. Specify a global time tolerance of 0.8.

```
diffResult = Simulink.sdi.compareRuns(baselineID,comparedToID,"TimeTol",0.8);
```

Use the `getResultsByName` function to access the comparison results for the `q` rad/sec signal.

```
qResult = getResultsByName(diffResult,"q, rad/sec");
```

Create a `Simulink.sdi.CustomSnapshot` object and plot the comparison results on it. Then, use the `snapshot` function to generate the figure.

```
snap = Simulink.sdi.CustomSnapshot;
plotComparison(snap,qResult);
snapshot(snap,"To","image");
```

## Input Arguments

### **snap** — Custom snapshot settings

`Simulink.sdi.CustomSnapshot` object

Custom snapshot settings, specified as a `Simulink.sdi.CustomSnapshot` object.

### **diffSignalResult** — Signal comparison result

`Simulink.sdi.DiffSignalResult` object

Signal comparison result, specified as a `Simulink.sdi.DiffSignalResult` object.

## Version History

Introduced in R2023a

## See Also

### Objects

`Simulink.sdi.CustomSnapshot` | `Simulink.sdi.DiffSignalResult` |  
`Simulink.sdi.DiffRunResult`

### Functions

`snapshot` | `getResultByIndex`

### Topics

“Compare Simulation Data”

## plotOnSubPlot

**Package:** Simulink.sdi

Plot signals on Simulink.sdi.CustomSnapshot object subplots

### Syntax

```
plotOnSubPlot(snap,r,c,sig,plotMode)
```

### Description

`plotOnSubPlot(snap,r,c,sig,plotMode)` plots the signal `sig` on the subplot in the Simulink.sdi.CustomSnapshot object `snap` specified by the row index `r` and the column index `c` when the plotting mode `plotMode` is true. When `plotMode` is false, `plotOnSubPlot` clears the signal `sig` from the subplot.

### Examples

#### Copy View Settings to Run

Copy view settings from one run to another and create figures using the Simulink.sdi.CustomSnapshot object.

#### Simulate Model and Get Run Object

Configure the vdp model to save output data. Run a simulation to create data.

```
load_system("vdp")
set_param("vdp","SaveFormat","Dataset","SaveOutput","on")
set_param("vdp/Mu","Gain","1");
sim("vdp");
```

Use the Simulation Data Inspector programmatic interface to access the run data.

```
runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

#### Modify Signal View Settings

Use the Simulink.sdi.Run object to access signals in the run. Then, modify the signal view settings. This example specifies the line color and style for each signal. The view settings for the run comprise the view settings for each signal and view settings specified for the plot area.

```
sig1 = getSignalByIndex(vdpRun,1);
sig2 = getSignalByIndex(vdpRun,2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = "-.-";
```

```
sig2.LineColor = [1 0 0];
sig2.LineDashed = ":";
```

### Capture Snapshot from Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;
```

You can use properties of the `Simulink.sdi.CustomSnapshot` object to configure the plot settings, such as the subplot layout and axis limits, and to plot signals. When you use a `Simulink.sdi.CustomSnapshot` object to create your figure, these plot settings do not affect the Simulation Data Inspector.

```
snap.Rows = 2;
snap.YRange = {[-2.25 2.25],[-3 3]};
plotOnSubPlot(snap,1,1,sig1,true)
plotOnSubPlot(snap,2,1,sig2,true)
```

Use the `Simulink.sdi.snapshot` function to generate the figure you specified in the properties of the `Simulink.sdi.CustomSnapshot` object.

```
fig = Simulink.sdi.snapshot("From", "custom", "To", "figure", "Settings", snap);
```

### Copy View Settings to New Simulation Run

Simulate the model again, with a different Mu value. Use the Simulation Data Inspector programmatic interface to access the simulation data.

```
set_param("vdp/Mu", "Gain", "5")
sim("vdp");

runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);
```

To create a plot of the new output data that looks like the one you created in the previous step, you can copy the view settings to the run in a single line of code using the `Simulink.sdi.copyRunViewSettings` function. This function does not automatically update plot settings in `Simulink.sdi.CustomSnapshot` objects, so specify the input that determines whether the plot updates as `false`.

```
sigIDs = Simulink.sdi.copyRunViewSettings(runID, runID2, false);
```

### Capture Snapshot of New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
clearSignals(snap)
snap.YRange = {[-2.25 2.25], [-8 8]};
plotOnSubPlot(snap, 1, 1, sigIDs(1), true)
plotOnSubPlot(snap, 2, 1, sigIDs(2), true)

fig = snapshot(snap, "To", "figure");
```

## Input Arguments

### snap — Custom snapshot settings

`Simulink.sdi.CustomSnapshot` object

Custom snapshot settings, specified as a `Simulink.sdi.CustomSnapshot` object.

### r — Row index

integer

Row index for subplot, specified as an integer between 1 and 8, inclusive.

Example: 2

### c — Column index

integer

Column index for subplot, specified as an integer between 1 and 8, inclusive.

Example: 3

### sig — Signal to plot

`Simulink.sdi.Signal` | signal ID

Signal to plot, specified as a `Simulink.sdi.Signal` object or as a signal ID corresponding to the signal you want to plot.

**plotMode — Plotting mode**`true | false`

Plotting mode, specified as:

- `true` - Plot the signal on the subplot.
- `false` - Clear the signal from the subplot.

Data Types: `logical`

## Version History

# snapshot

**Package:** Simulink.sdi

Create custom snapshot

## Syntax

```
fig = snapshot(snap)
[fig,image] = snapshot(snap)
fig = snapshot(snap,Name,Value)
[fig,image] = snapshot(snap,Name,Value)
```

## Description

`fig = snapshot(snap)` creates a figure according to the properties of the Simulink.sdi.CustomSnapshot object `snap` and returns the handle for the figure `fig`.

`[fig,image] = snapshot(snap)` returns the handle `fig` and an array of image data, `image`.

`fig = snapshot(snap,Name,Value)` creates a figure with additional options specified by one or more `Name,Value` arguments and returns the figure handle.

`[fig,image] = snapshot(snap,Name,Value)` creates a figure with additional options specified by one or more `Name,Value` arguments and returns the figure handle and an array of image data.

## Examples

### Copy View Settings to Run

Copy view settings from one run to another and create figures using the Simulink.sdi.CustomSnapshot object.

### Simulate Model and Get Run Object

Configure the vdp model to save output data. Run a simulation to create data.

```
load_system("vdp")
set_param("vdp","SaveFormat","Dataset","SaveOutput","on")
set_param("vdp/Mu","Gain","1");
sim("vdp");
```

Use the Simulation Data Inspector programmatic interface to access the run data.

```
runIndex = Simulink.sdi.getRunCount;
runID = Simulink.sdi.getRunIDByIndex(runIndex);
vdpRun = Simulink.sdi.getRun(runID);
```

### Modify Signal View Settings

Use the `Simulink.sdi.Run` object to access signals in the run. Then, modify the signal view settings. This example specifies the line color and style for each signal. The view settings for the run comprise the view settings for each signal and view settings specified for the plot area.

```
sig1 = getSignalByIndex(vdpRun,1);
sig2 = getSignalByIndex(vdpRun,2);

sig1.LineColor = [0 0 1];
sig1.LineDashed = "-.";

sig2.LineColor = [1 0 0];
sig2.LineDashed = ":";
```

### Capture Snapshot from Simulation Data Inspector

Create a `Simulink.sdi.CustomSnapshot` object and use the `Simulink.sdi.snapshot` function to programmatically capture a snapshot of the contents of the Simulation Data Inspector.

```
snap = Simulink.sdi.CustomSnapshot;
```

You can use properties of the `Simulink.sdi.CustomSnapshot` object to configure the plot settings, such as the subplot layout and axis limits, and to plot signals. When you use a `Simulink.sdi.CustomSnapshot` object to create your figure, these plot settings do not affect the Simulation Data Inspector.

```
snap.Rows = 2;
snap.YRange = {[-2.25 2.25],[-3 3]};
plotOnSubPlot(snap,1,1,sig1,true)
plotOnSubPlot(snap,2,1,sig2,true)
```

Use the `Simulink.sdi.snapshot` function to generate the figure you specified in the properties of the `Simulink.sdi.CustomSnapshot` object.

```
fig = Simulink.sdi.snapshot("From","custom","To","figure","Settings",snap);
```

### Copy View Settings to New Simulation Run

Simulate the model again, with a different Mu value. Use the Simulation Data Inspector programmatic interface to access the simulation data.

```
set_param("vdp/Mu", "Gain", "5")
sim("vdp");
```

```
runIndex2 = Simulink.sdi.getRunCount;
runID2 = Simulink.sdi.getRunIDByIndex(runIndex2);
run2 = Simulink.sdi.getRun(runID2);
```

To create a plot of the new output data that looks like the one you created in the previous step, you can copy the view settings to the run in a single line of code using the `Simulink.sdi.copyRunViewSettings` function. This function does not automatically update plot settings in `Simulink.sdi.CustomSnapshot` objects, so specify the input that determines whether the plot updates as `false`.

```
sigIDs = Simulink.sdi.copyRunViewSettings(runID, runID2, false);
```

### Capture Snapshot of New Simulation Run

Use the `Simulink.sdi.CustomSnapshot` object to capture a snapshot of the new simulation run. First, clear the signals from the subplots. Then, plot the signals from the new run and capture another snapshot.

```
clearSignals(snap)
snap.YRange = {[-2.25 2.25], [-8 8]};
```

```
plotOnSubPlot(snap,1,1,sigIDs(1),true)
plotOnSubPlot(snap,2,1,sigIDs(2),true)
```

```
fig = snapshot(snap,"To","figure");
```

## Input Arguments

### snap — Custom snapshot settings

Simulink.sdi.CustomSnapshot object

Custom snapshot settings, specified as a Simulink.sdi.CustomSnapshot object.

### Name-Value Pair Arguments

Specify optional pairs of arguments as `Name1=Value1, ..., NameN=ValueN`, where `Name` is the argument name and `Value` is the corresponding value. Name-value arguments must appear after other arguments, but the order of the pairs does not matter.

Example: `snapshot(snap,To="image")`

*Before R2021a, use commas to separate each name and value, and enclose Name in quotes.*

Example: `'To','figure','Props',{'Name','My Data'}`

### To — Type of snapshot to create

"image" (default) | "figure" | "file" | "clipboard"

Type of snapshot to create, specified as:

- `"image"` — Create a figure and return the figure handle and an array of image data. When you specify `"To", "image"`, the `fig` and `image` outputs both have value.
- `"figure"` — Create a figure and return the figure handle. When you specify `"To", "figure"`, the `fig` output has value, and the `image` output is empty.
- `"file"` — Save to a PNG file with the name specified by the `Filename` name-value argument. If you do not specify a `Filename` name-value argument, the file is named `plots.png`. When you specify `"To", "file"`, the `fig` and `image` outputs are both empty.
- `"clipboard"` — Copy the plots to your system clipboard. From the clipboard, you can paste the image into another program, such as Microsoft Word. When you specify `"To", "clipboard"`, the `fig` and `image` outputs are both empty.

Example: `"To", "file"`

Data Types: `char | string`

### **Filename — Name for image file**

`"plots.png"` (default) | character array | string

Name for image file to store the snapshot when you specify `"To", "file"`, specified as a character array or string.

Example: `"Filename", "MyImage.png"`

Data Types: `char | string`

### **Props — Figure properties**

cell array

Figure properties, specified as a cell array. To customize your figure, you can include settings for the figure properties described in Figure Properties.

Example: `"Props", {"Name", "MyData", "NumberTitle", "off"}`

Data Types: `char | string`

## **Output Arguments**

### **fig — Figure handle**

figure handle

Figure handle, specified as a figure handle. When a figure is not created with your specified options, the `fig` output is empty.

### **image — Image data**

array

Image data, returned as an array. The `image` output has value when you use `Simulink.sdi.snapshot` without any input arguments or without a `To` name-value argument and when you specify `'To', 'image'`.

# Simulink.sdi.DiffRunResult

Access run comparison results

## Description

The `Simulink.sdi.DiffRunResult` object provides access to run comparison metadata and comparison results. Use the `getSignalByIndex` function to access the metadata and comparison results for each signal in the run comparison.

## Creation

A `Simulink.sdi.DiffRunResult` object is created when you perform a comparison using the Simulation Data Inspector.

When you compare data using the UI, use the `Simulink.sdi.getCurrentComparison` function to access the results in a `Simulink.sdi.DiffRunResult` object.

Programmatic comparisons using the `Simulink.sdi.compareRuns` function or the `compare` function return a `DiffRunResult` object.

## Properties

### **MatlabVersion — Software version used to create object**

character vector

This property is read-only.

Version of MATLAB used to create the `DiffRunResult` object, returned as a character vector.

### **RunID1 — Baseline run ID**

integer

This property is read-only.

Run identifier for the comparison baseline run, returned as an integer.

### **RunID2 — ID for run to compare**

integer

This property is read-only.

Run identifier of the run to compare, returned as an integer.

### **Count — Number of signals compared**

integer

This property is read-only.

Number of signals that aligned between the two runs in the comparison, returned as an integer. For more information on how signals are aligned for comparisons, see “Signal Alignment”.

**DateCreated — Object creation date**

`datetime`

This property is read-only.

Date and time the `Simulink.sdi.DiffRunResult` object was created, returned as a `datetime` object.

Data Types: `datetime`

**GlobalTolerance — Global tolerance values used for comparison**

`structure`

This property is read-only.

Global tolerance values used for the run comparison, returned as a structure with fields:

- `AbsTol` — Global absolute tolerance used for the run comparison.
- `RelTol` — Global relative tolerance used for the run comparison.
- `TimeTol` — Global time tolerance used for the run comparison.

For more information about how tolerances are used and calculated for comparisons, see “Tolerance Specification”.

**Summary — Comparison results summary**

`structure`

This property is read-only.

Comparison results summary, returned as a structure with a field for each `Status` a signal comparison result could have. The value of each field indicates the number of signals in the run comparison with the corresponding `Status`.

- `WithinTolerance` — Signal comparison completed, and all data points compared fell within the specified tolerance.
- `OutOfTolerance` — Signal comparison completed, and some data points compared fell outside of the specified tolerance.
- `Unaligned` — Signal from the baseline run did not align with a signal in the run to compare.
- `Empty` — Aligned signal in the baseline run or run to compare contains no data.
- `EmptySynced` — Synchronized signal in the baseline run or run to compare contains no data. An empty synchronized signal can mean that the signals do not overlap or, if you specified the intersection synchronization method, that they included none of the same time points.
- `Canceled` — Signal result not computed because the user canceled the comparison.
- `Pending` — Comparison is in progress and the signal result computation has not started.
- `Processing` — Signal result computation in progress.
- `UnitsMismatch` — The signal units in the baseline run and run to compare do not match.
- `DataTypeMismatch` — The signal data types in the baseline run and run to compare do not match. Only results of comparisons configured to check signal data types can have this status.

- **TimeMismatch** — The signal time vectors in the baseline run and run to compare do not match. Only results of comparisons configured to check signal time vectors can have this status.
- **StartStopMismatch** — The signal start and stop times in the baseline run and run to compare do not match. Only results of comparisons configured to check signal start and stop times can have this status.
- **Unsupported** — The Simulation Data Inspector comparison algorithm does not support this type of signal. For example, signals with data types that lose precision when converted to `double` are not supported.

For more information about alignment, tolerances, and synchronization, see “How the Simulation Data Inspector Compares Data”. For more information about how to configure a comparison to check additional metadata, see `Simulink.sdi.compareRuns`.

### Options — Comparison configuration

`n-by-2` cell array

This property is read-only.

Configuration options used for the comparison, returned as an `n-by-2` cell array. Each row in the cell array corresponds to an option used by the comparison. Every comparison requires that aligned signal units match, so the `Options` property always includes a row to indicate that units must match. Other possible configuration options correspond to these name-value pairs for the `Simulink.sdi.compareRuns` function:

- `DataType`
- `Time`
- `StartStop`
- `StopOnFirstMismatch`

### Status — Status of run comparison

`Completed` | `Canceled` | `Stopped`

This property is read-only.

Status of the run comparison, indicating how the comparison ended, returned as one of the following:

- `Completed` — Comparison finished computing all results
- `Canceled` — Comparison ended because the user canceled the comparison operation in the UI
- `Stopped` — Comparison ended because the comparison detected a mismatch and was configured to stop on the first mismatch

### StopReason — Signal result that stopped the run comparison

`Simulink.sdi.DiffSignalResult`

This property is read-only.

Signal result for signal comparison that caused the run comparison to stop without comparing remaining signals, returned as a `Simulink.sdi.DiffSignalResult` object. The `StopReason` property is empty when the comparison completes without detecting a mismatch and when the comparison is not configured to stop on the first mismatch. You can configure a simulation to stop on the first mismatch using the `Simulink.sdi.compareRuns` function and the `'StopOnFirstMismatch'` name-value pair.

## Object Functions

<code>getResultByIndex</code>	Return signal comparison result
<code>getResultsByName</code>	Return signal comparison results based on signal name
<code>saveResult</code>	Save comparison results to an MLDATX file

## Examples

### Analyze Simulation Data Using Signal Tolerances

You can programmatically specify signal tolerance values to use in comparisons performed using the Simulation Data Inspector. In this example, you compare data collected by simulating a model of an aircraft longitudinal flight control system. Each simulation uses a different value for the input filter time constant and logs the input and output signals. You analyze the effect of the time constant change by comparing results using the Simulation Data Inspector and signal tolerances.

First, load the session file that contains the simulation data.

```
Simulink.sdi.load('AircraftExample.mldatx');
```

The session file contains four runs. In this example, you compare data from the first two runs in the file. Access the `Simulink.sdi.Run` objects for the first two runs loaded from the file.

```
runIDs = Simulink.sdi.getAllRunIDs;
runIDs1 = runIDs(end-3);
runIDs2 = runIDs(end-2);
```

Now, compare the two runs without specifying any tolerances.

```
noTolDiffResult = Simulink.sdi.compareRuns(runIDs1,runIDs2);
```

Use the `getResultByIndex` function to access the comparison results for the `q` and `alpha` signals.

```
qResult = getResultByIndex(noTolDiffResult,1);
alphaResult = getResultByIndex(noTolDiffResult,2);
```

Check the `Status` of each signal result to see whether the comparison result fell within our out of tolerance.

```
qResult.Status
```

```
ans =
 ComparisonSignalStatus enumeration
 OutOfTolerance
```

```
alphaResult.Status
```

```
ans =
 ComparisonSignalStatus enumeration
 OutOfTolerance
```

The comparison used a value of 0 for all tolerances, so the `OutOfTolerance` result means the signals are not identical.

You can further analyze the effect of the time constant by specifying tolerance values for the signals. Specify the tolerances by setting the properties for the `Simulink.sdi.Signal` objects that correspond to the signals being compared. Comparisons use tolerances specified for the baseline signals. This example specifies a time tolerance and an absolute tolerance.

To specify a tolerance, first access the `Signal` objects from the baseline run.

```
runTs1 = Simulink.sdi.getRun(runIDTs1);
qSig = getSignalsByName(runTs1,'q, rad/sec');
alphaSig = getSignalsByName(runTs1,'alpha, rad');
```

Specify an absolute tolerance of 0.1 and a time tolerance of 0.6 for the `q` signal using the `AbsTol` and `TimeTol` properties.

```
qSig.AbsTol = 0.1;
qSig.TimeTol = 0.6;
```

Specify an absolute tolerance of 0.2 and a time tolerance of 0.8 for the `alpha` signal.

```
alphaSig.AbsTol = 0.2;
alphaSig.TimeTol = 0.8;
```

Compare the results again. Access the results from the comparison and check the `Status` property for each signal.

```
tolDiffResult = Simulink.sdi.compareRuns(runIDTs1,runIDTs2);
qResult2 = getResultByIndex(tolDiffResult,1);
alphaResult2 = getResultByIndex(tolDiffResult,2);
```

```
qResult2.Status
```

```
ans =
 ComparisonSignalStatus enumeration
```

```
 WithinTolerance
```

```
alphaResult2.Status
```

```
ans =
 ComparisonSignalStatus enumeration
```

```
 WithinTolerance
```

### Configure Comparisons to Check Metadata

You can use the `Simulink.sdi.compareRuns` function to compare signal data and metadata, including data type and start and stop times. A single comparison may check for mismatches in one or more pieces of metadata. When you check for mismatches in signal metadata, the `Summary` property of the `Simulink.sdi.DiffRunResult` object may differ from a basic comparison because the `Status` property for a `Simulink.sdi.DiffSignalResult` object can indicate the metadata mismatch. You can configure comparisons using the `Simulink.sdi.compareRuns` function for imported data and for data logged from a simulation.

This example configures a comparison of runs created from workspace data three ways to show how the Summary of the DiffSignalResult object can provide specific information about signal mismatches.

### Create Workspace Data

The `Simulink.sdi.compareRuns` function compares time series data. Create data for a sine wave to use as the baseline signal, using the `timeseries` format. Give the `timeseries` the name `Wave Data`.

```
time = 0:0.1:20;
sig1vals = sin(2*pi/5*time);
sig1_ts = timeseries(sig1vals,time);
sig1_ts.Name = 'Wave Data';
```

Create a second sine wave to compare against the baseline signal. Use a slightly different time vector and attenuate the signal so the two signals are not identical. Cast the signal data to the `single` data type. Also name this `timeseries` object `Wave Data`. The Simulation Data Inspector comparison algorithm will align these signals for comparison using the name.

```
time2 = 0:0.1:22;
sig2vals = single(0.98*sin(2*pi/5*time2));
sig2_ts = timeseries(sig2vals,time2);
sig2_ts.Name = 'Wave Data';
```

### Create and Compare Runs in the Simulation Data Inspector

The `Simulink.sdi.compareRuns` function compares data contained in `Simulink.sdi.Run` objects. Use the `Simulink.sdi.createRun` function to create runs in the Simulation Data Inspector for the data. The `Simulink.sdi.createRun` function returns the run ID for each created run.

```
runID1 = Simulink.sdi.createRun('Baseline Run','vars',sig1_ts);
runID2 = Simulink.sdi.createRun('Compare to Run','vars',sig2_ts);
```

You can use the `Simulink.sdi.compareRuns` function to compare the runs. The comparison algorithm converts the signal data to the `double` data type and synchronizes the signal data before computing the difference signal.

```
basic_DRR = Simulink.sdi.compareRuns(runID1,runID2);
```

Check the `Summary` property of the returned `Simulink.sdi.DiffRunResult` object to see the result of the comparison.

```
basic_DRR.Summary
ans = struct with fields:
 OutOfTolerance: 1
 WithinTolerance: 0
 Unaligned: 0
 UnitsMismatch: 0
 Empty: 0
 Canceled: 0
 EmptySynced: 0
 DataTypeMismatch: 0
 TimeMismatch: 0
 StartStopMismatch: 0
```

```
Unsupported: 0
```

The difference between the signals is out of tolerance.

### Compare Runs and Check for Data Type Match
