TRUE	Success. Data has been fetched
FALSE	Error occurred
NULL	No more rows/data exists or data truncation occurred

#### Examples

##### Example 20.152. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 150,5";

if ($stmt = $mysqli->prepare($query)) {

    /* execute statement */
    $stmt->execute();

    /* bind result variables */
    $stmt->bind_result($name, $code);

    /* fetch values */
    while ($stmt->fetch()) {
        printf ("%s (%s)\n", $name, $code);
    }

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

**Example 20.153. Procedural style**

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 150,5";
if ($stmt = mysqli_prepare($link, $query)) {

    /* execute statement */
    mysqli_stmt_execute($stmt);

    /* bind result variables */
    mysqli_stmt_bind_result($stmt, $name, $code);

    /* fetch values */
    while (mysqli_stmt_fetch($stmt)) {
        printf ("%s (%s)\n", $name, $code);
    }

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Rockford (USA)
Tallahassee (USA)
Salinas (USA)
Santa Clarita (USA)
Springfield (USA)

```

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli\\_stmt->field\\_count](#)  
[mysqli\\_stmt\\_field\\_count](#)

Returns the number of field in the given statement

**Description**

```

mysqli_stmt {
    int field_count ;
}

```

```

int mysqli_stmt_field_count(mysqli_stmt stmt);

```

**Warning**

This function is currently not documented; only its argument list is available.

**20.11.2.7.13. `stmt::free_result`, `mysqli_stmt_free_result`**

Copyright 1997-2008 the PHP Documentation Group.

- `stmt::free_result`  
`mysqli_stmt_free_result`

Frees stored result memory for the given statement handle

**Description**

Object oriented style (method):

```
void mysqli_stmt::free_result();
```

Procedural style:

```
void mysqli_stmt_free_result(mysqli_stmt stmt);
```

Frees the result memory associated with the statement, which was allocated by `mysqli_stmt_store_result`.

**Parameters**

*stmt* Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

**Return Values**

No value is returned.

**See Also**

`mysqli_stmt_store_result`

**20.11.2.7.14. `mysqli_stmt::get_warnings`, `mysqli_stmt_get_warnings`**

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_stmt::get_warnings`  
`mysqli_stmt_get_warnings`

**Description**

```
object mysqli_stmt::get_warnings(mysqli_stmt stmt);
```

```
object mysqli_stmt_get_warnings(mysqli_stmt stmt);
```

**Warning**

This function is currently not documented; only its argument list is available.

**20.11.2.7.15. `mysqli_stmt->insert_id`, `mysqli_stmt_insert_id`**

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_stmt->insert_id`

`mysqli_stmt_insert_id`

Get the ID generated from the previous INSERT operation

#### Description

```
mysqli_stmt {  
    int insert_id ;  
}
```

```
mixed mysqli_stmt_insert_id(mysqli_stmt stmt);
```

#### Warning

This function is currently not documented; only its argument list is available.

### 20.11.2.7.16. `mysqli_stmt::num_rows`, `mysqli_stmt_num_rows`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_stmt::num_rows`

`mysqli_stmt_num_rows`

Return the number of rows in statements result set

#### Description

Object oriented style (property):

```
mysqli_stmt {  
    int num_rows ;  
}
```

Procedural style :

```
int mysqli_stmt_num_rows(mysqli_stmt stmt);
```

Returns the number of rows in the result set. The use of `mysqli_stmt_num_rows` depends on whether or not you used `mysqli_stmt_store_result` to buffer the entire result set in the statement handle.

If you use `mysqli_stmt_store_result`, `mysqli_stmt_num_rows` may be called immediately.

#### Parameters

*stmt* Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

#### Return Values

An integer representing the number of rows in result set.

#### Examples

##### Example 20.154. Object oriented style

```
<?php  
/* Open a connection */  
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");  
/* check connection */
```

```

if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = $mysqli->prepare($query)) {

    /* execute query */
    $stmt->execute();

    /* store result */
    $stmt->store_result();

    printf("Number of rows: %d.\n", $stmt->num_rows);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>

```

### Example 20.155. Procedural style

```

<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = mysqli_prepare($link, $query)) {

    /* execute query */
    mysqli_stmt_execute($stmt);

    /* store result */
    mysqli_stmt_store_result($stmt);

    printf("Number of rows: %d.\n", mysqli_stmt_num_rows($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Number of rows: 20.

```

#### See Also

#### 20.11.2.7.17. [mysqli\\_stmt->param\\_count](#), [mysqli\\_stmt\\_param\\_count](#)

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_stmt->param_count`

`mysqli_stmt_param_count`

Returns the number of parameter for the given statement

### Description

Object oriented style (property):

```
mysqli_stmt {
    int param_count ;
}
```

Procedural style:

```
int mysqli_stmt_param_count(mysqli_stmt stmt);
```

Returns the number of parameter markers present in the prepared statement.

### Parameters

*stmt*

Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

### Return Values

Returns an integer representing the number of parameters.

### Examples

#### Example 20.156. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($stmt = $mysqli->prepare("SELECT Name FROM Country WHERE Name=? OR Code=?")) {
    $marker = $stmt->param_count;
    printf("Statement has %d markers.\n", $marker);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

#### Example 20.157. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($stmt = mysqli_prepare($link, "SELECT Name FROM Country WHERE Name=? OR Code=?")) {
```

```

$marker = mysqli_stmt_param_count($stmt);
printf("Statement has %d markers.\n", $marker);

/* close statement */
mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
Statement has 2 markers.
```

### See Also

[mysqli\\_prepare](#)

#### 20.11.2.7.18. [mysqli\\_stmt::prepare](#), [mysqli\\_stmt\\_prepare](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli\\_stmt::prepare](#)  
[mysqli\\_stmt\\_prepare](#)

Prepare a SQL statement for execution

### Description

Object oriented style (method)

```
mixed mysqli_stmt::prepare(string query);
```

Procedure style:

```
bool mysqli_stmt_prepare(mysqli_stmt stmt,
string query);
```

Prepares the SQL query pointed to by the null-terminated string query.

The parameter markers must be bound to application variables using [mysqli\\_stmt\\_bind\\_param](#) and/or [mysqli\\_stmt\\_bind\\_result](#) before executing the statement or fetching rows.

### Parameters

*stmt*

Procedural style only: A statement identifier returned by [mysqli\\_stmt\\_init](#).

*query*

The query, as a string. It must consist of a single SQL statement.

You can include one or more parameter markers in the SQL statement by embedding question mark (?) characters at the appropriate positions.

#### Note

You should not add a terminating semicolon or `\g` to the statement.

#### Note

The markers are legal only in certain places in SQL statements. For example, they are allowed in the VALUES() list of an INSERT statement (to specify column values for a row), or in a comparison with a column in a WHERE clause to specify a comparison value.

However, they are not allowed for identifiers (such as table or column names), in the select list that names the columns to be returned by a SELECT statement), or to specify both operands of a binary operator such as the = equal sign. The latter restriction is necessary because it would be impossible to determine the parameter type. In general, parameters are legal only in Data Manipulation Language (DML) statements, and not in Data Definition Language (DDL) statements.

### Return Values

Returns **TRUE** on success or **FALSE** on failure.

### Examples

#### Example 20.158. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$city = "Amersfoort";

/* create a prepared statement */
$stmt = $mysqli->stmt_init();
if ($stmt->prepare("SELECT District FROM City WHERE Name=?") {

    /* bind parameters for markers */
    $stmt->bind_param("s", $city);

    /* execute query */
    $stmt->execute();

    /* bind result variables */
    $stmt->bind_result($district);

    /* fetch value */
    $stmt->fetch();

    printf("%s is in district %s\n", $city, $district);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

#### Example 20.159. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$city = "Amersfoort";

/* create a prepared statement */
$stmt = mysqli_stmt_init($link);
if (mysqli_stmt_prepare($stmt, 'SELECT District FROM City WHERE Name=?') {

    /* bind parameters for markers */
    mysqli_stmt_bind_param($stmt, "s", $city);

    /* execute query */
    mysqli_stmt_execute($stmt);
```

```

/* bind result variables */
mysqli_stmt_bind_result($stmt, $district);

/* fetch value */
mysqli_stmt_fetch($stmt);

printf("%s is in district %s\n", $city, $district);

/* close statement */
mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
Amersfoort is in district Utrecht
```

#### See Also

#### 20.11.2.7.19. [mysqli\\_stmt::reset](#), [mysqli\\_stmt\\_reset](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli\\_stmt::reset](#)

[mysqli\\_stmt\\_reset](#)

Resets a prepared statement

#### Description

Object oriented style (method):

```
bool mysqli_stmt::reset();
```

Procedural style:

```
bool mysqli_stmt_reset(mysqli_stmt stmt);
```

Resets a prepared statement on client and server to state after prepare.

For now this is mainly used to reset data sent with [mysqli\\_stmt\\_send\\_long\\_data](#).

To prepare a statement with another query use function [mysqli\\_stmt\\_prepare](#).

#### Parameters

*stmt*

Procedural style only: A statement identifier returned by [mysqli\\_stmt\\_init](#).

#### Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

#### See Also

`mysqli_prepare`

### 20.11.2.7.20. `mysqli_stmt::result_metadata`, `mysqli_stmt_result_metadata`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_stmt::result_metadata`  
`mysqli_stmt_result_metadata`

Returns result set metadata from a prepared statement

#### Description

Object oriented style (method):

```
mysqli_result mysqli_stmt::result_metadata();
```

Procedural style:

```
mysqli_result mysqli_stmt_result_metadata(mysqli_stmt stmt);
```

If a statement passed to `mysqli_prepare` is one that produces a result set, `mysqli_stmt_result_metadata` returns the result object that can be used to process the meta information such as total number of fields and individual field information.

#### Note

This result set pointer can be passed as an argument to any of the field-based functions that process result set metadata, such as:

- `mysqli_num_fields`
- `mysqli_fetch_field`
- `mysqli_fetch_field_direct`
- `mysqli_fetch_fields`
- `mysqli_field_count`
- `mysqli_field_seek`
- `mysqli_field_tell`
- `mysqli_free_result`

The result set structure should be freed when you are done with it, which you can do by passing it to `mysqli_free_result`

#### Note

The result set returned by `mysqli_stmt_result_metadata` contains only metadata. It does not contain any row results. The rows are obtained by using the statement handle with `mysqli_stmt_fetch`.

#### Parameters

*stmt*

Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

#### Return Values

Returns a result object or `FALSE` if an error occurred.

#### Examples

**Example 20.160. Object oriented style**

```

<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "test");

$mysqli->query("DROP TABLE IF EXISTS friends");
$mysqli->query("CREATE TABLE friends (id int, name varchar(20))");

$mysqli->query("INSERT INTO friends VALUES (1,'Hartmut'), (2, 'Ulf')");

$stmt = $mysqli->prepare("SELECT id, name FROM friends");
$stmt->execute();

/* get resultset for metadata */
$result = $stmt->result_metadata();

/* retrieve field information from metadata result set */
$field = $result->fetch_field();

printf("Fieldname: %s\n", $field->name);

/* close resultset */
$result->close();

/* close connection */
$mysqli->close();
?>

```

**Example 20.161. Procedural style**

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

mysqli_query($link, "DROP TABLE IF EXISTS friends");
mysqli_query($link, "CREATE TABLE friends (id int, name varchar(20))");

mysqli_query($link, "INSERT INTO friends VALUES (1,'Hartmut'), (2, 'Ulf')");

$stmt = mysqli_prepare($link, "SELECT id, name FROM friends");
mysqli_stmt_execute($stmt);

/* get resultset for metadata */
$result = mysqli_stmt_result_metadata($stmt);

/* retrieve field information from metadata result set */
$field = mysqli_fetch_field($result);

printf("Fieldname: %s\n", $field->name);

/* close resultset */
mysqli_free_result($result);

/* close connection */
mysqli_close($link);
?>

```

**See Also**

[mysqli\\_prepare](#)  
[mysqli\\_free\\_result](#)

**20.11.2.7.21. [mysqli\\_stmt::send\\_long\\_data](#), [mysqli\\_stmt\\_send\\_long\\_data](#)**

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli\\_stmt::send\\_long\\_data](#)  
[mysqli\\_stmt\\_send\\_long\\_data](#)

Send data in blocks

## Description

Object oriented style (method)

```
bool mysqli_stmt::send_long_data(int param_nr,  
                                string data);
```

Procedural style:

```
bool mysqli_stmt_send_long_data(mysqli_stmt stmt,  
                                int param_nr,  
                                string data);
```

Allows to send parameter data to the server in pieces (or chunks), e.g. if the size of a blob exceeds the size of [max\\_allowed\\_packet](#). This function can be called multiple times to send the parts of a character or binary data value for a column, which must be one of the TEXT or BLOB datatypes.

## Parameters

<i>stmt</i>	Procedural style only: A statement identifier returned by <a href="#">mysqli_stmt_init</a> .
<i>param_nr</i>	Indicates which parameter to associate the data with. Parameters are numbered beginning with 0.
<i>data</i>	A string containing data to be sent.

## Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

## Examples

### Example 20.162. Object oriented style

```
<?php  
$stmt = $mysqli->prepare("INSERT INTO messages (message) VALUES (?)");  
$null = NULL;  
$stmt->bind_param("b", $null);  
$fp = fopen("messages.txt", "r");  
while (!feof($fp)) {  
    $stmt->send_long_data(0, fread($fp, 8192));  
}  
fclose($fp);  
$stmt->execute();  
?>
```

## See Also

### 20.11.2.7.22. [mysqli\\_stmt::sqlstate](#), [mysqli\\_stmt\\_sqlstate](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli\\_stmt::sqlstate](#)  
[mysqli\\_stmt\\_sqlstate](#)

Returns SQLSTATE error from previous statement operation

## Description

Object oriented style (property):

```
mysqli_stmt {
    string sqlstate ;
}
```

Procedural style:

```
string mysqli_stmt_sqlstate(mysqli_stmt stmt);
```

Returns a string containing the SQLSTATE error code for the most recently invoked prepared statement function that can succeed or fail. The error code consists of five characters. '00000' means no error. The values are specified by ANSI SQL and ODBC. For a list of possible values, see <http://dev.mysql.com/doc/mysql/en/error-handling.html>.

### Parameters

*stmt* Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

### Return Values

Returns a string containing the SQLSTATE error code for the last error. The error code consists of five characters. '00000' means no error.

### Notes

#### Note

Note that not all MySQL errors are yet mapped to SQLSTATE's. The value `HY000` (general error) is used for un-mapped errors.

### Examples

#### Example 20.163. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCountry LIKE Country");
$mysqli->query("INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = $mysqli->prepare($query)) {

    /* drop table */
    $mysqli->query("DROP TABLE myCountry");

    /* execute query */
    $stmt->execute();

    printf("Error: %s.\n", $stmt->sqlstate);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

#### Example 20.164. Procedural style

```

<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCountry LIKE Country");
mysqli_query($link, "INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = mysqli_prepare($link, $query)) {

    /* drop table */
    mysqli_query($link, "DROP TABLE myCountry");

    /* execute query */
    mysqli_stmt_execute($stmt);

    printf("Error: %s.\n", mysqli_stmt_sqlstate($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
Error: 42S02.
```

#### See Also

[mysqli\\_stmt\\_errno](#)  
[mysqli\\_stmt\\_error](#)

### 20.11.2.7.23. [mysqli\\_stmt::store\\_result](#), [mysqli\\_stmt\\_store\\_result](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli\\_stmt::store\\_result](#)  
[mysqli\\_stmt\\_store\\_result](#)

Transfers a result set from a prepared statement

#### Description

Object oriented style (method):

```
bool mysqli_stmt::store_result();
```

Procedural style:

```
bool mysqli_stmt_store_result(mysqli_stmt $stmt);
```

You must call [mysqli\\_stmt\\_store\\_result](#) for every query that successfully produces a result set ([SELECT](#), [SHOW](#), [DESCRIBE](#), [EXPLAIN](#)), and only if you want to buffer the complete result set by the client, so that the subsequent [mysqli\\_stmt\\_fetch](#) call returns buffered data.

#### Note

It is unnecessary to call `mysqli_stmt_store_result` for other queries, but if you do, it will not harm or cause any notable performance in all cases. You can detect whether the query produced a result set by checking if `mysqli_stmt_result_metadata` returns NULL.

### Parameters

*stmt* Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

### Return Values

Returns `TRUE` on success or `FALSE` on failure.

### Examples

#### Example 20.165. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = $mysqli->prepare($query)) {

    /* execute query */
    $stmt->execute();

    /* store result */
    $stmt->store_result();

    printf("Number of rows: %d.\n", $stmt->num_rows);

    /* free result */
    $stmt->free_result();

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

#### Example 20.166. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = mysqli_prepare($link, $query)) {

    /* execute query */
    mysqli_stmt_execute($stmt);

    /* store result */
    mysqli_stmt_store_result($stmt);

    printf("Number of rows: %d.\n", mysqli_stmt_num_rows($stmt));

    /* free result */
    mysqli_stmt_free_result($stmt);

    /* close statement */
    mysqli_stmt_close($stmt);
}
```

```
}  
/* close connection */  
mysqli_close($link);  
?>
```

The above example will output:

```
Number of rows: 20.
```

    array mysqli_result::fetch_fields();  
  
    object mysqli_result::fetch_object(string class_name,  
                                       array params);  
  
    mixed mysqli_result::fetch_row();  
  
    int mysqli_num_fields(mysqli_result result);
```

```

bool mysqli_result::field_seek(int fieldnr);

void mysqli_result::free();

array mysqli_fetch_lengths(mysqli_result result);

int mysqli_num_rows(mysqli_result result);
}

```

### 20.11.2.8.1. `mysqli_result->current_field`, `mysqli_field_tell`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_result->current_field`  
`mysqli_field_tell`  
Get current field offset of a result pointer

#### Description

Object oriented style (property):

```

mysqli_result {
    int current_field ;
}

```

Procedural style:

```
int mysqli_field_tell(mysqli_result result);
```

Returns the position of the field cursor used for the last `mysqli_fetch_field` call. This value can be used as an argument to `mysqli_field_seek`.

#### Parameters

*result* Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

#### Return Values

Returns current offset of field cursor.

#### Examples

##### Example 20.167. Object oriented style

```

<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = $mysqli->query($query)) {
    /* Get field information for all columns */
    while ($finfo = $result->fetch_field()) {
        /* get fieldpointer offset */
        $currentfield = $result->current_field;
    }
}

```

```

        printf("Column %d:\n", $currentfield);
        printf("Name:      %s\n", $finfo->name);
        printf("Table:     %s\n", $finfo->table);
        printf("max. Len:  %d\n", $finfo->max_length);
        printf("Flags:    %d\n", $finfo->flags);
        printf("Type:     %d\n\n", $finfo->type);
    }
    $result->close();
}

/* close connection */
mysqli->close();
?>

```

### Example 20.168. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = mysqli_query($link, $query)) {

    /* Get field information for all fields */
    while ($finfo = mysqli_fetch_field($result)) {

        /* get fieldpointer offset */
        $currentfield = mysqli_field_tell($result);

        printf("Column %d:\n", $currentfield);
        printf("Name:      %s\n", $finfo->name);
        printf("Table:     %s\n", $finfo->table);
        printf("max. Len:  %d\n", $finfo->max_length);
        printf("Flags:    %d\n", $finfo->flags);
        printf("Type:     %d\n\n", $finfo->type);
    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Column 1:
Name:     Name
Table:    Country
max. Len: 11
Flags:    1
Type:     254

Column 2:
Name:     SurfaceArea
Table:    Country
max. Len: 10
Flags:    32769
Type:     4

```

## 20.11.2.8.2. `mysqli_result::data_seek`, `mysqli_data_seek`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_result::data_seek`

`mysqli_data_seek`

Adjusts the result pointer to an arbitrary row in the result

### Description

Object oriented style (method):

```
bool mysqli_result::data_seek(int offset);
```

Procedural style:

```
bool mysqli_data_seek(mysqli_result result,
                      int offset);
```

The `mysqli_data_seek` function seeks to an arbitrary result pointer specified by the *offset* in the result set.

### Parameters

<i>result</i>	Procedural style only: A result set identifier returned by <code>mysqli_query</code> , <code>mysqli_store_result</code> or <code>mysqli_use_result</code> .
<i>offset</i>	The field offset. Must be between zero and the total number of rows minus one ( <code>0(mysqli_num_rows - 1)</code> ).

### Return Values

Returns `TRUE` on success or `FALSE` on failure.

### Notes

#### Note

This function can only be used with buffered results attained from the use of the `mysqli_store_result` or `mysqli_query` functions.

### Examples

#### Example 20.169. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";
if ($result = $mysqli->query($query)) {

    /* seek to row no. 400 */
    $result->data_seek(399);

    /* fetch row */
    $row = $result->fetch_row();

    printf("City: %s Countrycode: %s\n", $row[0], $row[1]);

    /* free result set*/
    $result->close();
}
```

```

/* close connection */
mysqli->close();
?>

```

### Example 20.170. Procedural style

```

<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";

if ($result = mysqli_query($link, $query)) {

    /* seek to row no. 400 */
    mysqli_data_seek($result, 399);

    /* fetch row */
    $row = mysqli_fetch_row($result);

    printf ("City: %s Countrycode: %s\n", $row[0], $row[1]);

    /* free result set*/
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

City: Benin City Countrycode: NGA

```

```

#### 20.11.2.8.3. [mysqli\\_result::fetch\\_all](#), [mysqli\\_fetch\\_all](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli\\_result::fetch\\_all](#)
- [mysqli\\_fetch\\_all](#)

Fetches all result rows as an associative array, a numeric array, or both

#### Description

Object oriented style (method):

```
mixed mysqli_result::fetch_all(int resulttype);
```

Procedural style:

```
mixed mysqli_fetch_all(mysqli_result result,
    int resulttype);
```

Available only with `mysqlnd`.

#### Parameters

<code>result</code>	Procedural style only: A result set identifier returned by <code>mysqli_query</code> , <code>mysqli_store_result</code> or <code>mysqli_use_result</code> .
<code>resulttype</code>	This optional parameter is a constant indicating what type of array should be produced from the current row data. The possible values for this parameter are the constants <code>MYSQLI_ASSOC</code> , <code>MYSQLI_NUM</code> , or <code>MYSQLI_BOTH</code> . Defaults to <code>MYSQLI_NUM</code> .

#### Return Values

Returns an array of associative or numeric arrays holding result rows.

#### See Also

`mysqli_fetch_array`  
`mysqli_query`

### 20.11.2.8.4. `mysqli_result::fetch_array`, `mysqli_fetch_array`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_result::fetch_array`  
`mysqli_fetch_array`  
Fetch a result row as an associative, a numeric array, or both

#### Description

Object oriented style (method):

```
mixed mysqli_result::fetch_array(int resulttype);
```

Procedural style:

```
mixed mysqli_fetch_array(mysqli_result result,
    int resulttype);
```

Returns an array that corresponds to the fetched row or `NULL` if there are no more rows for the resultset represented by the `result` parameter.

`mysqli_fetch_array` is an extended version of the `mysqli_fetch_row` function. In addition to storing the data in the numeric indices of the result array, the `mysqli_fetch_array` function can also store the data in associative indices, using the field names of the result set as keys.

#### Note

Field names returned by this function are *case-sensitive*.

#### Note

This function sets `NULL` fields to the PHP `NULL` value.

If two or more columns of the result have the same field names, the last column will take precedence and overwrite the earlier data.

In order to access multiple columns with the same name, the numerically indexed version of the row must be used.

### Parameters

<i>result</i>	Procedural style only: A result set identifier returned by <code>mysqli_query</code> , <code>mysqli_store_result</code> or <code>mysqli_use_result</code> .
<i>resulttype</i>	This optional parameter is a constant indicating what type of array should be produced from the current row data. The possible values for this parameter are the constants <code>MYSQLI_ASSOC</code> , <code>MYSQLI_NUM</code> , or <code>MYSQLI_BOTH</code> . Defaults to <code>MYSQLI_BOTH</code> .  By using the <code>MYSQLI_ASSOC</code> constant this function will behave identically to the <code>mysqli_fetch_assoc</code> , while <code>MYSQLI_NUM</code> will behave identically to the <code>mysqli_fetch_row</code> function. The final option <code>MYSQLI_BOTH</code> will create a single array with the attributes of both.

### Return Values

Returns an array of strings that corresponds to the fetched row or `NULL` if there are no more rows in resultset.

### Examples

#### Example 20.171. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID LIMIT 3";
$result = $mysqli->query($query);

/* numeric array */
$row = $result->fetch_array(MYSQLI_NUM);
printf ("%s (%s)\n", $row[0], $row[1]);

/* associative array */
$row = $result->fetch_array(MYSQLI_ASSOC);
printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);

/* associative and numeric array */
$row = $result->fetch_array(MYSQLI_BOTH);
printf ("%s (%s)\n", $row[0], $row["CountryCode"]);

/* free result set */
$result->close();

/* close connection */
$mysqli->close();
?>
```

#### Example 20.172. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID LIMIT 3";
$result = mysqli_query($link, $query);

/* numeric array */
$row = mysqli_fetch_array($result, MYSQLI_NUM);
printf ("%s (%s)\n", $row[0], $row[1]);
```

```

/* associative array */
$row = mysqli_fetch_array($result, MYSQLI_ASSOC);
printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);

/* associative and numeric array */
$row = mysqli_fetch_array($result, MYSQLI_BOTH);
printf ("%s (%s)\n", $row[0], $row["CountryCode"]);

/* free result set */
mysqli_free_result($result);

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Kabul (AFG)
Qandahar (AFG)
Herat (AFG)

```

### 20.11.2.8.5. `mysqli_result::fetch_assoc`, `mysqli_fetch_assoc`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_result::fetch_assoc`  
`mysqli_fetch_assoc`  
Fetch a result row as an associative array

#### Description

Object oriented style (method):

```
array mysqli_result::fetch_assoc();
```

Procedural style:

```
array mysqli_fetch_assoc(mysqli_result result);
```

Returns an associative array that corresponds to the fetched row or `NULL` if there are no more rows.

#### Note

Field names returned by this function are *case-sensitive*.

#### Note

This function sets `NULL` fields to the PHP `NULL` value.

#### Parameters

*result*

Procedural style only: A result set identifier returned by `mysqli_query`,

`mysqli_store_result` or `mysqli_use_result`.

## Return Values

Returns an associative array of strings representing the fetched row in the result set, where each key in the array represents the name of one of the result set's columns or `NULL` if there are no more rows in resultset.

If two or more columns of the result have the same field names, the last column will take precedence. To access the other column(s) of the same name, you either need to access the result with numeric indices by using `mysqli_fetch_row` or add alias names.

## Examples

### Example 20.173. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = $mysqli->query($query)) {

    /* fetch associative array */
    while ($row = $result->fetch_assoc()) {
        printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);
    }

    /* free result set */
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

### Example 20.174. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = mysqli_query($link, $query)) {

    /* fetch associative array */
    while ($row = mysqli_fetch_assoc($result)) {
        printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);
    }

    /* free result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Pueblo (USA)
Arvada (USA)
Cape Coral (USA)
Green Bay (USA)
Santa Clara (USA)
```

```

**20.11.2.8.6. `mysqli_result::fetch_field_direct`, `mysqli_fetch_field_direct`**

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_result::fetch_field_direct`

```
mysqli_fetch_field_direct
```

Fetch meta-data for a single field

**Description**

Object oriented style (method):

```
object mysqli_result::fetch_field_direct(int fieldnr);
```

Procedural style:

```
object mysqli_fetch_field_direct(mysqli_result result,
                                int fieldnr);
```

Returns an object which contains field definition informations from specified resultset.

**Parameters**

*result* Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

*fieldnr* The field number. This value must be in the range from 0 to `number of fields - 1`.

**Return Values**

Returns an object which contains field definition information or `FALSE` if no field information for specified `fieldnr` is available.

**Table 20.14. Object attributes**

Attribute	Description
name	The name of the column
orgname	Original column name if an alias was specified
table	The name of the table this field belongs to (if not calculated)
orgtable	Original table name if an alias was specified
def	The default value for this field, represented as a string
max_length	The maximum width of the field for the result set.
length	The width of the field, as specified in the tabl definition.

Attribute	Description
charsetnr	The character set number for the field.
flags	An integer representing the bit-flags for the field.
type	The data type used for this field
decimals	The number of decimals used (for integer fields)

## Examples

### Example 20.175. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Name LIMIT 5";

if ($result = $mysqli->query($query)) {

    /* Get field information for column 'SurfaceArea' */
    $finfo = $result->fetch_field_direct(1);

    printf("Name:      %s\n", $finfo->name);
    printf("Table:      %s\n", $finfo->table);
    printf("max. Len: %d\n", $finfo->max_length);
    printf("Flags:       %d\n", $finfo->flags);
    printf("Type:        %d\n", $finfo->type);

    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

### Example 20.176. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Name LIMIT 5";

if ($result = mysqli_query($link, $query)) {

    /* Get field information for column 'SurfaceArea' */
    $finfo = mysqli_fetch_field_direct($result, 1);

    printf("Name:      %s\n", $finfo->name);
    printf("Table:      %s\n", $finfo->table);
    printf("max. Len: %d\n", $finfo->max_length);
    printf("Flags:       %d\n", $finfo->flags);
    printf("Type:        %d\n", $finfo->type);

    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Name:      SurfaceArea
Table:    Country
max. Len: 10
Flags:    32769
Type:     4
```

**See Also**

```

```

**20.11.2.8.7. `mysqli_result::fetch_field`, `mysqli_fetch_field`**

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_result::fetch_field`  
`mysqli_fetch_field`

Returns the next field in the result set

**Description**

Object oriented style (method):

```
object mysqli_result::fetch_field();
```

Procedural style:

```
object mysqli_fetch_field(mysqli_result result);
```

Returns the definition of one column of a result set as an object. Call this function repeatedly to retrieve information about all columns in the result set.

**Parameters**

*result* Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

**Return Values**

Returns an object which contains field definition information or `FALSE` if no field information is available.

**Table 20.15. Object properties**

Property	Description
name	The name of the column
orgname	Original column name if an alias was specified
table	The name of the table this field belongs to (if not calculated)
orgtable	Original table name if an alias was specified
def	The default value for this field, represented as a string
max_length	The maximum width of the field for the result set.
length	The width of the field, as specified in the table definition.
charsetnr	The character set number for the field.
flags	An integer representing the bit-flags for the field.

Property	Description
type	The data type used for this field
decimals	The number of decimals used (for integer fields)

## Examples

### Example 20.177. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";
if ($result = $mysqli->query($query)) {

    /* Get field information for all columns */
    while ($finfo = $result->fetch_field()) {

        printf("Name:      %s\n", $finfo->name);
        printf("Table:     %s\n", $finfo->table);
        printf("max. Len:  %d\n", $finfo->max_length);
        printf("Flags:      %d\n", $finfo->flags);
        printf("Type:       %d\n\n", $finfo->type);
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

### Example 20.178. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";
if ($result = mysqli_query($link, $query)) {

    /* Get field information for all fields */
    while ($finfo = mysqli_fetch_field($result)) {

        printf("Name:      %s\n", $finfo->name);
        printf("Table:     %s\n", $finfo->table);
        printf("max. Len:  %d\n", $finfo->max_length);
        printf("Flags:      %d\n", $finfo->flags);
        printf("Type:       %d\n\n", $finfo->type);
    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Name:      Name
Table:     Country
max. Len:  11
```

```

Flags: 1
Type: 254

Name: SurfaceArea
Table: Country
max. Len: 10
Flags: 32769
Type: 4

```

**See Also**

```

mysqli_num_fields

```

**20.11.2.8.8. `mysqli_result::fetch_fields`, `mysqli_fetch_fields`**

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_result::fetch_fields`

```
mysqli_fetch_fields
```

Returns an array of objects representing the fields in a result set

**Description**

Object oriented style (method):

```
array mysqli_result::fetch_fields();
```

Procedural Style:

```
array mysqli_fetch_fields(mysqli_result result);
```

This function serves an identical purpose to the `mysqli_fetch_field` function with the single difference that, instead of returning one object at a time for each field, the columns are returned as an array of objects.

**Parameters**

*result* Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

**Return Values**

Returns an array of objects which contains field definition information or `FALSE` if no field information is available.

**Table 20.16. Object properties**

Property	Description
name	The name of the column
orgname	Original column name if an alias was specified
table	The name of the table this field belongs to (if not calculated)
orgtable	Original table name if an alias was specified
def	The default value for this field, represented as a string
max_length	The maximum width of the field for the result set.
length	The width of the field, as specified in the table definition.

Property	Description
charsetnr	The character set number for the field.
flags	An integer representing the bit-flags for the field.
type	The data type used for this field
decimals	The number of decimals used (for integer fields)

## Examples

### Example 20.179. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = $mysqli->query($query)) {

    /* Get field information for all columns */
    $finfo = $result->fetch_fields();

    foreach ($finfo as $val) {
        printf("Name:      %s\n", $val->name);
        printf("Table:     %s\n", $val->table);
        printf("max. Len:  %d\n", $val->max_length);
        printf("Flags:    %d\n", $val->flags);
        printf("Type:     %d\n\n", $val->type);
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

### Example 20.180. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = mysqli_query($link, $query)) {

    /* Get field information for all columns */
    $finfo = mysqli_fetch_fields($result);

    foreach ($finfo as $val) {
        printf("Name:      %s\n", $val->name);
        printf("Table:     %s\n", $val->table);
        printf("max. Len:  %d\n", $val->max_length);
        printf("Flags:    %d\n", $val->flags);
        printf("Type:     %d\n\n", $val->type);
    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```

Name:      Name
Table:    Country
max. Len: 11
Flags:    1
Type:     254

Name:      SurfaceArea
Table:    Country
max. Len: 10
Flags:    32769
Type:     4

```

**20.11.2.8.9. [mysqli\\_result::fetch\\_object](#), [mysqli\\_fetch\\_object](#)**

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli\\_result::fetch\\_object](#)  
[mysqli\\_fetch\\_object](#)

Returns the current row of a result set as an object

**Description**

Object oriented style (method):

```
object mysqli_result::fetch_object(string class_name,
                                  array params);
```

Procedural style:

```
object mysqli_fetch_object(mysqli_result result,
                           string class_name,
                           array params);
```

The [mysqli\\_fetch\\_object](#) will return the current row result set as an object where the attributes of the object represent the names of the fields found within the result set.

**Parameters**

- |                   |  |
|-------------------|--|
| <i>result</i>     | Procedural style only: A result set identifier returned by <a href="#">mysqli_query</a> , <a href="#">mysqli_store_result</a> or <a href="#">mysqli_use_result</a> . |
| <i>class_name</i> | The name of the class to instantiate, set the properties of and return. If not specified, a <a href="#">stdClass</a> object is returned.                             |
| <i>params</i>     | An optional array of parameters to pass to the constructor for <i>class_name</i> objects.  |

**Return Values**

Returns an object with string properties that corresponds to the fetched row or [NULL](#) if there are no more rows in resultset.

**Note**

Field names returned by this function are *case-sensitive*.

**Note**

This function sets NULL fields to the PHP `NULL` value.

**ChangeLog**

Version	Description
5.0.0	Added the ability to return as a different object.

**Examples****Example 20.181. Object oriented style**

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = $mysqli->query($query)) {

    /* fetch object array */
    while ($obj = $result->fetch_object()) {
        printf ("%s (%s)\n", $obj->Name, $obj->CountryCode);
    }

    /* free result set */
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

**Example 20.182. Procedural style**

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = mysqli_query($link, $query)) {

    /* fetch associative array */
    while ($obj = mysqli_fetch_object($result)) {
        printf ("%s (%s)\n", $obj->Name, $obj->CountryCode);
    }

    /* free result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Pueblo (USA)
Arvada (USA)
Cape Coral (USA)
Green Bay (USA)
Santa Clara (USA)
```

**See Also**

```
mysqli_fetch_array
mysqli_fetch_assoc
mysqli_fetch_row
mysqli_query
mysqli_data_seek
```

**20.11.2.8.10. `mysqli_result::fetch_row`, `mysqli_fetch_row`**

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_result::fetch_row`

```
mysqli_fetch_row
```

Get a result row as an enumerated array

**Description**

Object oriented style (method):

```
mixed mysqli_result::fetch_row();
```

Procedural style:

```
mixed mysqli_fetch_row(mysqli_result result);
```

Fetches one row of data from the result set and returns it as an enumerated array, where each column is stored in an array offset starting from 0 (zero). Each subsequent call to this function will return the next row within the result set, or `NULL` if there are no more rows.

**Parameters**

*result* Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

**Return Values**

`mysqli_fetch_row` returns an array of strings that corresponds to the fetched row or `NULL` if there are no more rows in result set.

**Note**

This function sets NULL fields to the PHP `NULL` value.

**Examples****Example 20.183. Object oriented style**

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}
```

```

}
$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";
if ($result = $mysqli->query($query)) {
    /* fetch object array */
    while ($row = $result->fetch_row()) {
        printf ("%s (%s)\n", $row[0], $row[1]);
    }
    /* free result set */
    $result->close();
}
/* close connection */
$mysqli->close();
?>

```

### Example 20.184. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");
/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}
$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";
if ($result = mysqli_query($link, $query)) {
    /* fetch associative array */
    while ($row = mysqli_fetch_row($result)) {
        printf ("%s (%s)\n", $row[0], $row[1]);
    }
    /* free result set */
    mysqli_free_result($result);
}
/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Pueblo (USA)
Arvada (USA)
Cape Coral (USA)
Green Bay (USA)
Santa Clara (USA)

```

#### 20.11.2.8.11. [mysqli\\_result->field\\_count](#), [mysqli\\_num\\_fields](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli\\_result->field\\_count](#)

`mysqli_num_fields`

Get the number of fields in a result

**Description**

Object oriented style (property):

```
mysqli_result {
    int field_count ;
}
```

Procedural style:

```
int mysqli_num_fields(mysqli_result result);
```

Returns the number of fields from specified result set.

**Parameters**

`result` Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

**Return Values**

The number of fields from a result set.

**Examples****Example 20.185. Object oriented style**

```
<?php
$link = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($result = $link->query("SELECT * FROM City ORDER BY ID LIMIT 1")) {

    /* determine number of fields in result set */
    $field_cnt = $result->field_count;

    printf("Result set has %d fields.\n", $field_cnt);

    /* close result set */
    $result->close();
}

/* close connection */
$link->close();
?>
```

**Example 20.186. Procedural style**

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}
```

```

if ($result = mysqli_query($link, "SELECT * FROM City ORDER BY ID LIMIT 1")) {
    /* determine number of fields in result set */
    $field_cnt = mysqli_num_fields($result);

    printf("Result set has %d fields.\n", $field_cnt);

    /* close result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
Result set has 5 fields.
```

### See Also

[mysqli\\_fetch\\_field](#)

## 20.11.2.8.12. [mysqli\\_result::field\\_seek](#), [mysqli\\_field\\_seek](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli\\_result::field\\_seek](#)

[mysqli\\_field\\_seek](#)

Set result pointer to a specified field offset

### Description

Object oriented style (method):

```
bool mysqli_result::field_seek(int fieldnr);
```

Procedural style:

```
bool mysqli_field_seek(mysqli_result result,
                       int fieldnr);
```

Sets the field cursor to the given offset. The next call to [mysqli\\_fetch\\_field](#) will retrieve the field definition of the column associated with that offset.

#### Note

To seek to the beginning of a row, pass an offset value of zero.

### Parameters

*result* Procedural style only: A result set identifier returned by [mysqli\\_query](#), [mysqli\\_store\\_result](#) or [mysqli\\_use\\_result](#).

*fieldnr* The field number. This value must be in the range from 0 to `number of fields - 1`.

### Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

## Examples

### Example 20.187. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";
if ($result = $mysqli->query($query)) {

    /* Get field information for 2nd column */
    $result->field_seek(1);
    $finfo = $result->fetch_field();

    printf("Name:      %s\n", $finfo->name);
    printf("Table:     %s\n", $finfo->table);
    printf("max. Len:  %d\n", $finfo->max_length);
    printf("Flags:     %d\n", $finfo->flags);
    printf("Type:      %d\n\n", $finfo->type);

    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

### Example 20.188. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";
if ($result = mysqli_query($link, $query)) {

    /* Get field information for 2nd column */
    mysqli_field_seek($result, 1);
    $finfo = mysqli_fetch_field($result);

    printf("Name:      %s\n", $finfo->name);
    printf("Table:     %s\n", $finfo->table);
    printf("max. Len:  %d\n", $finfo->max_length);
    printf("Flags:     %d\n", $finfo->flags);
    printf("Type:      %d\n\n", $finfo->type);

    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Name:      SurfaceArea
Table:     Country
max. Len:  10
Flags:     32769
Type:      4
```

- [mysqli\\_result::free](#)  
[mysqli\\_free\\_result](#)

Frees the memory associated with a result

**Description**

Object oriented style (all methods are equivalent):

```
void mysqli_result::free();
```

```
void mysqli_result::close();
```

```
void mysqli_result::free_result();
```

Procedural style:

```
void mysqli_free_result(mysqli_result result);
```

Frees the memory associated with the result.

**Note**

You should always free your result with [mysqli\\_free\\_result](#), when your result object is not needed anymore.

**Parameters**

[result](#) Procedural style only: A result set identifier returned by [mysqli\\_query](#), [mysqli\\_store\\_result](#) or [mysqli\\_use\\_result](#).

**Return Values**

No value is returned.

**See Also**

[mysqli\\_query](#)  
[mysqli\\_stmt\\_store\\_result](#)  
[mysqli\\_store\\_result](#)  
[mysqli\\_use\\_result](#)

**20.11.2.8.14. [mysqli\\_result->lengths](#), [mysqli\\_fetch\\_lengths](#)**

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli\\_result->lengths](#)  
[mysqli\\_fetch\\_lengths](#)

Returns the lengths of the columns of the current row in the result set

## Description

Object oriented style (property):

```
mysqli_result {
    array lengths ;
}
```

Procedural style:

```
array mysqli_fetch_lengths(mysqli_result result);
```

The `mysqli_fetch_lengths` function returns an array containing the lengths of every column of the current row within the result set.

## Parameters

*result* Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

## Return Values

An array of integers representing the size of each column (not including any terminating null characters). `FALSE` if an error occurred.

`mysqli_fetch_lengths` is valid only for the current row of the result set. It returns `FALSE` if you call it before calling `mysqli_fetch_row/array/object` or after retrieving all rows in the result.

## Examples

### Example 20.189. Object oriented style

```
<?php
$link = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT * from Country ORDER BY Code LIMIT 1";
if ($result = $mysqli->query($query)) {
    $row = $result->fetch_row();

    /* display column lengths */
    foreach ($result->lengths as $i => $val) {
        printf("Field %2d has Length %2d\n", $i+1, $val);
    }
    $result->close();
}

/* close connection */
$link->close();
?>
```

### Example 20.190. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}
```

```

$query = "SELECT * from Country ORDER BY Code LIMIT 1";
if ($result = mysqli_query($link, $query)) {
    $row = mysqli_fetch_row($result);

    /* display column lengths */
    foreach (mysqli_fetch_lengths($result) as $i => $val) {
        printf("Field %2d has Length %2d\n", $i+1, $val);
    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Field 1 has Length 3
Field 2 has Length 5
Field 3 has Length 13
Field 4 has Length 9
Field 5 has Length 6
Field 6 has Length 1
Field 7 has Length 6
Field 8 has Length 4
Field 9 has Length 6
Field 10 has Length 6
Field 11 has Length 5
Field 12 has Length 44
Field 13 has Length 7
Field 14 has Length 3
Field 15 has Length 2

```

### 20.11.2.8.15. `mysqli_result->num_rows`, `mysqli_num_rows`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_result->num_rows`  
`mysqli_num_rows`

Gets the number of rows in a result

#### Description

Object oriented style (property):

```

mysqli_result {
    int num_rows ;
}

```

Procedural style:

```

int mysqli_num_rows(mysqli_result result);

```

Returns the number of rows in the result set.

The use of `mysqli_num_rows` depends on whether you use buffered or unbuffered result sets. In case you use unbuffered result-sets `mysqli_num_rows` will not correct the correct number of rows until all the rows in the result have been retrieved.

#### Parameters

*result*

Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

**Return Values**

Returns number of rows in the result set.

**Note**

If the number of rows is greater than maximal int value, the number will be returned as a string.

**Examples****Example 20.191. Object oriented style**

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($result = $mysqli->query("SELECT Code, Name FROM Country ORDER BY Name")) {

    /* determine number of rows result set */
    $row_cnt = $result->num_rows;

    printf("Result set has %d rows.\n", $row_cnt);

    /* close result set */
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

**Example 20.192. Procedural style**

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($result = mysqli_query($link, "SELECT Code, Name FROM Country ORDER BY Name")) {

    /* determine number of rows result set */
    $row_cnt = mysqli_num_rows($result);

    printf("Result set has %d rows.\n", $row_cnt);

    /* close result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Result set has 239 rows.
```

#### Description

```
bool mysqli_disable_rpl_parse(mysqli link);
```

##### Warning

This function is currently not documented; only its argument list is available.

##### Warning

This function has been *DEPRECATED* and *REMOVED* as of PHP 5.3.0.

#### 20.11.2.10.6. `mysqli_enable_reads_from_master`

[Copyright 1997-2008 the PHP Documentation Group.](#)

- `mysqli_enable_reads_from_master`

Enable reads from master

#### Description

```
bool mysqli_enable_reads_from_master(mysqli link);
```

##### Warning

This function is currently not documented; only its argument list is available.

##### Warning

This function has been *DEPRECATED* and *REMOVED* as of PHP 5.3.0.

#### 20.11.2.10.7. `mysqli_enable_rpl_parse`

[Copyright 1997-2008 the PHP Documentation Group.](#)

- `mysqli_enable_rpl_parse`

Enable RPL parse

#### Description

```
bool mysqli_enable_rpl_parse(mysqli link);
```

##### Warning

This function is currently not documented; only its argument list is available.

##### Warning

This function has been *DEPRECATED* and *REMOVED* as of PHP 5.3.0.

#### 20.11.2.10.8. `mysqli_escape_string`

[Copyright 1997-2008 the PHP Documentation Group.](#)

- `mysqli_escape_string`

Alias of `mysqli_real_escape_string`

**Description**

This function is an alias of `mysqli_real_escape_string`.

**See Also**

`mysqli_real_escape_string`

**20.11.2.10.9. `mysqli_execute`**

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_execute`

Alias for `mysqli_stmt_execute`

**Description**

This function is an alias of `mysqli_stmt_execute`.

**Notes****Note**

`mysqli_execute` is deprecated and will be removed.

**See Also**

`mysqli_stmt_execute`

**20.11.2.10.10. `mysqli_fetch`**

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_fetch`

Alias for `mysqli_stmt_fetch`

**Description**

This function is an alias of `mysqli_stmt_fetch`.

**Notes****Note**

`mysqli_fetch` is deprecated and will be removed.

**See Also**

`mysqli_stmt_fetch`

**20.11.2.10.11. `mysqli_get_metadata`**

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_get_metadata`

Alias for `mysqli_stmt_result_metadata`

**Description**

This function is an alias of `mysqli_stmt_result_metadata`.

**Notes****Note**

`mysqli_get_metadata` is deprecated and will be removed.

**See Also**

`mysqli_stmt_result_metadata`

**20.11.2.10.12. `mysqli_master_query`**

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_master_query`

Enforce execution of a query on the master in a master/slave setup

**Description**

```
bool mysqli_master_query(mysqli link,  
                        string query);
```

**Warning**

This function is currently not documented; only its argument list is available.

**Warning**

This function has been *DEPRECATED* and *REMOVED* as of PHP 5.3.0.

**20.11.2.10.13. `mysqli_param_count`**

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_param_count`

Alias for `mysqli_stmt_param_count`

**Description**

This function is an alias of `mysqli_stmt_param_count`.

**Notes****Note**

`mysqli_param_count` is deprecated and will be removed.

**See Also**

`mysqli_stmt_param_count`

**20.11.2.10.14. `mysqli_report`**

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_report`

Enables or disables internal report functions

**Description**

```
bool mysqli_report(int flags);
```

`mysqli_report` is a powerful function to improve your queries and code during development and testing phase. Depending on the flags it reports errors from `mysqli` function calls or queries which don't use an index (or use a bad index).

### Parameters

*flags*

**Table 20.17. Supported flags**

Name	Description
<code>MYSQLI_REPORT_OFF</code>	Turns reporting off
<code>MYSQLI_REPORT_ERROR</code>	Report errors from <code>mysqli</code> function calls
<code>MYSQLI_REPORT_STRICT</code>	Report warnings from <code>mysqli</code> function calls
<code>MYSQLI_REPORT_INDEX</code>	Report if no index or bad index was used in a query
<code>MYSQLI_REPORT_ALL</code>	Set all options (report all)

### Return Values

Returns `TRUE` on success or `FALSE` on failure.

### Examples

#### Example 20.193. Object oriented style

```
<?php
/* activate reporting */
mysqli_report(MYSQLI_REPORT_ALL);

$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* this query should report an error */
$result = $mysqli->query("SELECT Name FROM Nonexistingtable WHERE population > 50000");

/* this query should report a warning */
$result = $mysqli->query("SELECT Name FROM City WHERE population > 50000");
$result->close();

$mysqli->close();
?>
```

### See Also

[mysqli\\_dump\\_debug\\_info](#)

#### 20.11.2.10.15. `mysqli_rpl_parse_enabled`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_rpl_parse_enabled`

Check if RPL parse is enabled

**Description**

```
int mysqli_rpl_parse_enabled(mysqli link);
```

**Warning**

This function is currently not documented; only its argument list is available.

**Warning**

This function has been *DEPRECATED* and *REMOVED* as of PHP 5.3.0.

**20.11.2.10.16. [mysqli\\_rpl\\_probe](#)**

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli\\_rpl\\_probe](#)

RPL probe

**Description**

```
bool mysqli_rpl_probe(mysqli link);
```

**Warning**

This function is currently not documented; only its argument list is available.

**Warning**

This function has been *DEPRECATED* and *REMOVED* as of PHP 5.3.0.

**20.11.2.10.17. [mysqli\\_rpl\\_query\\_type](#), [mysqli->rpl\\_query\\_type](#)**

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli\\_rpl\\_query\\_type](#)

[mysqli->rpl\\_query\\_type](#)

Returns RPL query type

**Description**

Procedural style:

```
int mysqli_rpl_query_type(mysqli link,
                          string query);
```

Object oriented style (method)

```
mysqli {
    int rpl_query_type(string query);
}
```

Returns [MYSQLI\\_RPL\\_MASTER](#) , [MYSQLI\\_RPL\\_SLAVE](#) or [MYSQLI\\_RPL\\_ADMIN](#) depending on a query type. [INSERT](#), [UPDATE](#) and similar are *master* queries, [SELECT](#) is *slave*, and [FLUSH](#), [REPAIR](#) and similar are *admin*.

**Warning**

This function is currently not documented; only its argument list is available.

**Warning**

This function has been *DEPRECATED* and *REMOVED* as of PHP 5.3.0.

#### 20.11.2.10.18. `mysqli_send_long_data`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_send_long_data`  
Alias for `mysqli_stmt_send_long_data`

##### Description

This function is an alias of `mysqli_stmt_send_long_data`.

##### Notes

##### Note

`mysqli_send_long_data` is deprecated and will be removed.

##### See Also

`mysqli_stmt_send_long_data`

#### 20.11.2.10.19. `mysqli_send_query`, `mysqli->send_query`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_send_query`  
`mysqli->send_query`  
Send the query and return

##### Description

Procedural style:

```
bool mysqli_send_query(mysqli link,  
                       string query);
```

Object oriented style (method)

```
mysqli {  
    bool send_query(string query);  
}
```

##### Warning

This function is currently not documented; only its argument list is available.

##### Warning

This function has been *DEPRECATED* and *REMOVED* as of PHP 5.3.0.

#### 20.11.2.10.20. `mysqli_set_opt`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_set_opt`  
Alias of `mysqli_options`

**Description**

This function is an alias of `mysqli_options`.

**20.11.2.10.21. `mysqli_slave_query`**

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_slave_query`

Force execution of a query on a slave in a master/slave setup

**Description**

```
bool mysqli_slave_query(mysqli link,
                        string query);
```

**Warning**

This function is currently not documented; only its argument list is available.

**Warning**

This function has been *DEPRECATED* and *REMOVED* as of PHP 5.3.0.

**20.11.3. MySQL Functions (PDO\_MYSQL)**

Copyright 1997-2008 the PHP Documentation Group.

PDO\_MYSQL is a driver that implements the [PHP Data Objects \(PDO\) interface](#) to enable access from PHP to MySQL 3.x, 4.x and 5.x databases.

PDO\_MYSQL will take advantage of native prepared statement support present in MySQL 4.1 and higher. If you're using an older version of the mysql client libraries, PDO will emulate them for you.

**Warning**

Beware: Some MySQL table types (storage engines) do not support transactions. When writing transactional database code using a table type that does not support transactions, MySQL will pretend that a transaction was initiated successfully. In addition, any DDL queries issued will implicitly commit any pending transactions.

The constants below are defined by this driver, and will only be available when the extension has been either compiled into PHP or dynamically loaded at runtime. In addition, these driver-specific constants should only be used if you are using this driver. Using mysql-specific attributes with the postgres driver may result in unexpected behaviour. `PDO::getAttribute` may be used to obtain the `PDO_ATTR_DRIVER_NAME` attribute to check the driver, if your code can run against multiple drivers.

`PDO::MYSQL_ATTR_USE_BUFFERED_QUERY` (integer) If this attribute is set to `TRUE` on a `PDOStatement`, the MySQL driver will use the buffered versions of the MySQL API. If you're writing portable code, you should use `PDOStatement::fetchAll` instead.

**Example 20.194. Forcing queries to be buffered in mysql**

```
<?php
if ($db->getAttribute(PDO::ATTR_DRIVER_NAME) == 'mysql') {
    $stmt = $db->prepare('select * from foo',
        array(PDO::MYSQL_ATTR_USE_BUFFERED_QUERY => true));
} else {
    die("my application only works with mysql; I should use \$stmt->fetchAll() instead");
}
?>
```

`PDO::MYSQL_ATTR_LOCAL_INFILE` (integer) Enable `LOAD LOCAL INFILE`.

<code>PDO::MYSQL_ATTR_INIT_COMMAND</code> (integer)	Command to execute when connecting to the MySQL server. Will automatically be re-executed when reconnecting.
<code>PDO::MYSQL_ATTR_READ_DEFAULT_FILE</code> (integer)	Read options from the named option file instead of from <code>my.cnf</code> .
<code>PDO::MYSQL_ATTR_READ_DEFAULT_GROUP</code> (integer)	Read options from the named group from <code>my.cnf</code> or the file specified with <code>MYSQL_READ_DEFAULT_FILE</code> .
<code>PDO::MYSQL_ATTR_MAX_BUFFER_SIZE</code> (integer)	Maximum buffer size. Defaults to 1 MiB.
<code>PDO::MYSQL_ATTR_DIRECT_QUERY</code> (integer)	Perform direct queries, don't use prepared statements.

### 20.11.3.1. PDO\_MYSQL DSN

Copyright 1997-2008 the PHP Documentation Group.

- `PDO_MYSQL DSN`

Connecting to MySQL databases

#### Description

The `PDO_MYSQL` Data Source Name (DSN) is composed of the following elements:

DSN prefix	The DSN prefix is <code>mysql:</code> .
<code>host</code>	The hostname on which the database server resides.
<code>port</code>	The port number where the database server is listening.
<code>dbname</code>	The name of the database.
<code>unix_socket</code>	The MySQL Unix socket (shouldn't be used with <code>host</code> or <code>port</code> ).

#### Examples

#### Example 20.195. PDO\_MYSQL DSN examples

The following example shows a `PDO_MYSQL` DSN for connecting to MySQL databases:

```
mysql:host=localhost;dbname=testdb
```

More complete examples:

```
mysql:host=localhost;port=3307;dbname=testdb
mysql:unix_socket=/tmp/mysql.sock;dbname=testdb
```

### 20.11.4. Connector/PHP

The MySQL Connector/PHP is a version of the `mysql` and `mysql_i` extensions for PHP optimized for the Windows operating system. Later versions of the main PHP `mysql/mysql_i` drivers are compatible with Windows and a separate, Windows specific driver is no longer required.

For PHP for all platforms, including Windows, you should use the `mysql` or `mysql_i` extensions shipped with the PHP sources. See [Section 20.11, "MySQL PHP API"](#).

### 20.11.5. Common Problems with MySQL and PHP

- **Error: Maximum Execution Time Exceeded:** This is a PHP limit; go into the `php.ini` file and set the maximum execution time up from 30 seconds to something higher, as needed. It is also not a bad idea to double the RAM allowed per script to 16MB instead of 8MB.
- **Fatal error: Call to unsupported or undefined function mysql\_connect() in ...:** This means that your PHP version isn't compiled with MySQL support. You can either compile a dynamic MySQL module and load it into PHP or recompile PHP with built-in MySQL support. This process is described in detail in the PHP manual.
- **Error: Undefined reference to 'uncompress':** This means that the client library is compiled with support for a compressed client/server protocol. The fix is to add `-lz` last when linking with `-lmysqlclient`.
- **Error: Client does not support authentication protocol:** This is most often encountered when trying to use the older `mysql` extension with MySQL 4.1.1 and later. Possible solutions are: downgrade to MySQL 4.0; switch to PHP 5 and the newer `mysqli` extension; or configure the MySQL server with `--old-passwords`. (See [Section B.1.2.4](#), “Client does not support authentication protocol”, for more information.)

Those with PHP4 legacy code can make use of a compatibility layer for the old and new MySQL libraries, such as this one: <http://www.coggeshall.org/oss/mysq2i>.

## 20.11.6. Enabling Both `mysql` and `mysqli` in PHP

If you're experiencing problems with enabling both the `mysql` and the `mysqli` extension when building PHP on Linux yourself, you should try the following procedure.

1. Configure PHP like this:

```
./configure --with-mysqli=/usr/bin/mysql_config --with-mysql=/usr
```

2. Edit the `Makefile` and search for a line that starts with `EXTRA_LIBS`. It might look like this (all on one line):

```
EXTRA_LIBS = -lcrypt -lcrypt -lmysqlclient -lz -lresolv -lm -ldl -lnsl  
-lxml2 -lz -lm -lxml2 -lz -lm -lmysqlclient -lz -lcrypt -lnsl -lm  
-lxml2 -lz -lm -lcrypt -lxml2 -lz -lm -lcrypt
```

Remove all duplicates, so that the line looks like this (all on one line):

```
EXTRA_LIBS = -lcrypt -lcrypt -lmysqlclient -lz -lresolv -lm -ldl -lnsl  
-lxml2
```

3. Build and install PHP:

```
make  
make install
```

### MySQL Enterprise

MySQL Enterprise subscribers will find more information about the `mysqli` extension in the Knowledge Base articles found at [mysqli](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

## 20.12. MySQL Perl API

The Perl `DBI` module provides a generic interface for database access. You can write a DBI script that works with many different database engines without change. To use DBI, you must install the `DBI` module, as well as a DataBase Driver (DBD) module for each type of server you want to access. For MySQL, this driver is the `DBD: :mysql` module.

Perl DBI is the recommended Perl interface. It replaces an older interface called `mysqlperl`, which should be considered obsolete.

Installation instructions for Perl DBI support are given in [Section 2.15](#), “Perl Installation Notes”.

DBI information is available at the command line, online, or in printed form:

- Once you have the `DBI` and `DBD: :mysql` modules installed, you can get information about them at the command line with the `perldoc` command:

```
shell> perldoc DBI
shell> perldoc DBI:FAQ
shell> perldoc DBD:mysql
```

You can also use [pod2man](#), [pod2html](#), and so forth to translate this information into other formats.

- For online information about Perl DBI, visit the DBI Web site, <http://dbi.perl.org/>. That site hosts a general DBI mailing list. Sun Microsystems, Inc. hosts a list specifically about `DBD:mysql`; see [Section 1.5.1, “MySQL Mailing Lists”](#).
- For printed information, the official DBI book is *Programming the Perl DBI* (Alligator Descartes and Tim Bunce, O'Reilly & Associates, 2000). Information about the book is available at the DBI Web site, <http://dbi.perl.org/>.

For information that focuses specifically on using DBI with MySQL, see *MySQL and Perl for the Web* (Paul DuBois, New Riders, 2001). This book's Web site is <http://www.kitebird.com/mysql-perl/>.

## 20.13. MySQL C++ API

`MySQL++` is a MySQL API for C++. Warren Young has taken over this project. More information can be found at <http://tangentsoft.net/mysql++/doc>.

### MySQL Enterprise

MySQL Enterprise subscribers will find more information about using C++ with the MySQL API in the MySQL Knowledge Base articles found at [C++](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

## 20.14. MySQL Python API

`MySQLdb` provides MySQL support for Python, compliant with the Python DB API version 2.0. It can be found at <http://sourceforge.net/projects/mysql-python/>.

### MySQL Enterprise

MySQL Enterprise subscribers will find more information about using Python with the MySQL API in the MySQL Knowledge Base articles found at [Python](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

## 20.15. MySQL Ruby APIs

Two APIs available for Ruby programmers. The MySQL/Ruby API is based on the `libmysql` API library. The Ruby/MySQL API is written to use the native MySQL network protocol (a native driver).

For more information on Ruby, see [Ruby Programming Language](#).

For information on installing and using the MySQL/Ruby API, see [Section 20.15.1, “The MySQL/Ruby API”](#).

For information on installing and using the Ruby/MySQL API, see [Section 20.15.2, “The Ruby/MySQL API”](#).

### 20.15.1. The MySQL/Ruby API

The MySQL/Ruby module provides access to MySQL databases using Ruby through `libmysql`.

For information on installing the module, and the functions exposed, see [MySQL/Ruby](#).

### 20.15.2. The Ruby/MySQL API

The Ruby/MySQL module provides access to MySQL databases using Ruby through a native driver interface using the MySQL network protocol.

For information on installing the module, and the functions exposed, see [Ruby/MySQL](#).

## 20.16. MySQL Tcl API

`MySQLtcl` is a simple API for accessing a MySQL database server from the Tcl programming language. It can be found at <http://www.xdobry.de/mysqltcl/>.

## 20.17. MySQL Eiffel Wrapper

Eiffel MySQL is an interface to the MySQL database server using the Eiffel programming language, written by Michael Ravits. It can be found at <http://efsa.sourceforge.net/archive/ravits/mysql.htm>.

---

# Chapter 21. Extending MySQL

## 21.1. MySQL Internals

This chapter describes a lot of things that you need to know when working on the MySQL code. If you plan to contribute to MySQL development, want to have access to the bleeding-edge versions of the code, or just want to keep track of development, follow the instructions in [Section 2.10.3, “Installing from the Development Source Tree”](#). If you are interested in MySQL internals, you should also subscribe to our `internals` mailing list. This list has relatively low traffic. For details on how to subscribe, please see [Section 1.5.1, “MySQL Mailing Lists”](#). All developers at MySQL AB are on the `internals` list and we help other people who are working on the MySQL code. Feel free to use this list both to ask questions about the code and to send patches that you would like to contribute to the MySQL project!

### 21.1.1. MySQL Threads

The MySQL server creates the following threads:

- Connection manager threads handle client connection requests on the network interfaces that the server listens to. On all platforms, one manager thread handles TCP/IP connection requests. On Unix, this manager thread also handles Unix socket file connection requests. On Windows, a manager thread handles shared-memory connection requests, and another handles named-pipe connection requests. The server does not create threads to handle interfaces that it does not listen to. For example, a Windows server that does not have support for named-pipe connections enabled does not create a thread to handle them.
- Connection manager threads associate each client connection with a thread dedicated to it that handles authentication and request processing for that connection. Manager threads create a new thread when necessary but try to avoid doing so by consulting the thread cache first to see whether it contains a thread that can be used for the connection. When a connection ends, its thread is returned to the thread cache if the cache is not full.

For information about tuning the parameters that control thread resources, see [Section 7.5.7, “How MySQL Uses Threads for Client Connections”](#).

- On a master replication server, connections from slave servers are handled like client connections: There is one thread per connected slave.
- On a slave replication server, an I/O thread is started to connect to the master server and read updates from it. An SQL thread is started to apply updates read from the master. These two threads run independently and can be started and stopped independently.
- A signal thread handles all signals. This thread also normally handles alarms and calls `process_alarm()` to force timeouts on connections that have been idle too long.
- If `InnoDB` is used, there will be 4 additional threads by default. Those are file I/O threads, controlled by the `innodb_file_io_threads` parameter. See [Section 13.6.3, “InnoDB Startup Options and System Variables”](#).
- If `mysqld` is compiled with `-DUSE_ALARM_THREAD`, a dedicated thread that handles alarms is created. This is only used on some systems where there are problems with `sigwait()` or if you want to use the `thr_alarm()` code in your application without a dedicated signal handling thread.
- If the server is started with the `--flush_time=val` option, a dedicated thread is created to flush all tables every `val` seconds.
- Each table for which `INSERT DELAYED` statements are issued gets its own thread. See [Section 12.2.5.2, “INSERT DELAYED Syntax”](#).
- If the event scheduler is active, there is one thread for the scheduler, and a thread for each event currently running. See [Section 18.4.1, “Event Scheduler Overview”](#).

`mysqladmin processlist` only shows the connection, `INSERT DELAYED`, replication, and event threads.

#### MySQL Enterprise

For expert advice on thread management subscribe to the MySQL Enterprise Monitor. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

### 21.1.2. MySQL Test Suite

The test system that is included in Unix source and binary distributions makes it possible for users and developers to perform regression tests on the MySQL code. These tests can be run on Unix.

You can also write your own test cases. For information about the MySQL Test Framework, including system requirements, see the manual available at <http://dev.mysql.com/doc/>.

The current set of test cases doesn't test everything in MySQL, but it should catch most obvious bugs in the SQL processing code, operating system or library issues, and is quite thorough in testing replication. Our goal is to have the tests cover 100% of the code. We welcome contributions to our test suite. You may especially want to contribute tests that examine the functionality critical to your system because this ensures that all future MySQL releases work well with your applications.

The test system consists of a test language interpreter (`mysqltest`), a Perl script to run all tests (`mysql-test-run.pl`), the actual test cases written in a special test language, and their expected results. To run the test suite on your system after a build, type `make test` from the source root directory, or change location to the `mysql-test` directory and type `./mysql-test-run.pl`. If you have installed a binary distribution, change location to the `mysql-test` directory under the installation root directory (for example, `/usr/local/mysql/mysql-test`), and run `./mysql-test-run.pl`. All tests should succeed. If any do not, feel free to try to find out why and report the problem if it indicates a bug in MySQL. See [Section 1.6, “How to Report Bugs or Problems”](#).

If one test fails, you should run `mysql-test-run.pl` with the `--force` option to check whether any other tests fail.

If you have a copy of `mysqld` running on the machine where you want to run the test suite, you do not have to stop it, as long as it is not using ports `9306` or `9307`. If either of those ports is taken, you should set the `MTR_BUILD_THREAD` environment variable to an appropriate value, and the test suite will use a different set of ports for master, slave, NDB, and Instance Manager). For example:

```
shell> export MTR_BUILD_THREAD=31
shell> ./mysql-test-run.pl [options] [test_name]
```

In the `mysql-test` directory, you can run an individual test case with `./mysql-test-run.pl test_name`.

If you have a question about the test suite, or have a test case to contribute, send an email message to the MySQL [internals](#) mailing list. See [Section 1.5.1, “MySQL Mailing Lists”](#). This list does not accept attachments, so you should FTP all the relevant files to: <ftp://ftp.mysql.com/pub/mysql/upload/>

## 21.2. The MySQL Plugin Interface

MySQL 5.1 and up supports a plugin API that allows the loading and unloading of server components at runtime, without restarting the server. The components supported by this operation include, but are not limited to, full-text parser plugins, storage-engines and server extensions. In MySQL 5.1, the storage engines can be included in the server as `opplugins`.

Full-text parser plugins can be used to replace or augment the built-in full-text parser. For example, a plugin can parse text into words using rules that differ from those used by the built-in parser. This can be useful if you need to parse text with characteristics different from those expected by the built-in parser.

The plugin interface is intended as the successor to the older user-defined function (UDF) interface. The plugin interface eventually will include an API for creating UDFs, and it is intended this plugin UDF API will replace the older non-plugin UDF API. After that point, it will be possible for UDFs to be revised for use as plugin UDFs so that they can take advantage of the better security and versioning capabilities of the plugin API. Eventually, support for the older UDF API will be phased out.

The plugin interface requires the `plugin` table in the `mysql` database. This table is created as part of the MySQL installation process. If you are upgrading from a version older than MySQL 5.1, you should run the `mysql_upgrade` command to create this table. See [Section 4.4.8, “mysql\\_upgrade — Check Tables for MySQL Upgrade”](#).

For more information on the Plugin API and how it can be used with storage engines, see [MySQL Internals: Custom Engine](#).

### 21.2.1. Characteristics of the Plugin Interface

In some respects, the plugin API is similar to the older user-defined function (UDF) API that it supersedes, but the plugin API has several advantages over the older interface:

- The plugin framework is extendable to accommodate different kinds of plugins.

Some aspects of the plugin API are common to all types of plugins, but the API also allows for type-specific interface elements so that different types of plugins can be created. A plugin with one purpose can have an interface most appropriate to its own requirements and not the requirements of some other plugin type.

Although only the interface for full-text parser plugins is implemented currently, others can be added, such as an interface for UDF plugins.

- The plugin API includes versioning information.

The version information included in the plugin API enables a plugin library and each plugin that it contains to be self-identifying with respect to the API version that was used to build the library. If the API changes over time, the version numbers will change, but a server can examine a given plugin library's version information to determine whether it supports the plugins in the library.

There are two types of version numbers. The first is the version for the general plugin framework itself. Each plugin library includes this kind of version number. The second type of version applies to individual plugins. Each specific type of plugin has a version for its interface, so each plugin in a library has a type-specific version number. For example, library containing a full-text parsing plugin has a general plugin API version number, and the plugin has a version number specific to the full-text plugin interface.

- Plugin security is improved relative to the UDF interface.

The older interface for writing non-plugin UDFs allowed libraries to be loaded from any directory searched by the system's dynamic linker, and the symbols that identified the UDF library were relatively non-specific. The newer rules are more strict. A plugin library must be installed in a specific dedicated directory for which the location is controlled by the server and cannot be changed at runtime. Also, the library must contain specific symbols that identify it as a plugin library. The server will not load something as a plugin if it was not built as a plugin.

The newer plugin interface eliminates the security issues of the older UDF interface. When a UDF plugin type is implemented, that will allow non-plugin UDFs to be brought into the plugin framework and the older interface to be phased out.

The plugin implementation includes the following components:

Source files (the locations given indicate where the files are found in a MySQL source distribution):

- `include/mysql/plugin.h` exposes the public plugin API. This file should be examined by anyone who wants to write a plugin library.
- `sql/sql_plugin.h` and `sql/sql_plugin.cc` comprise the internal plugin implementation. These files need not be consulted by plugin writers. They may be of interest for those who want to know more about how the server handles plugins.

System table:

- The `plugin` table in the `mysql` database lists each installed plugin and is required for plugin use. For new MySQL installations, this table is created during the installation process. If you are upgrading from a version older than MySQL 5.1, you should run `mysql_upgrade` to update your system tables and create the `plugin` table (see [Section 4.4.8](#), “`mysql_upgrade` — Check Tables for MySQL Upgrade”).

SQL statements:

- `INSTALL PLUGIN` registers a plugin in the `plugin` table and loads the plugin code.
- `UNINSTALL PLUGIN` unregisters a plugin from the `plugin` table and unloads the plugin code.
- The `WITH PARSER` clause for full-text index creation associates a full-text parser plugin with a given `FULLTEXT` index.
- `SHOW PLUGINS` displays information about known plugins. The `PLUGINS` table in `INFORMATION_SCHEMA` also contains plugin information.

System variable:

- `plugin_dir` indicates the location of the directory where all plugins must be installed. The value of this variable can be specified at server startup with a `--plugin_dir=path` option.

## 21.2.2. Full-Text Parser Plugins

MySQL has a built-in parser that it uses by default for full-text operations (parsing text to be indexed, or parsing a query string to determine the terms to be used for a search). For full-text processing, “parsing” means extracting words from text or a query string based on rules that define which character sequences make up a word and where word boundaries lie.

When parsing for indexing purposes, the parser passes each word to the server, which adds it to a full-text index. When parsing a query string, the parser passes each word to the server, which accumulates the words for use in a search.

The parsing properties of the built-in full-text parser are described in [Section 11.8, “Full-Text Search Functions”](#). These properties include rules for determining how to extract words from text. The parser is influenced by certain system variables such as `ft_min_word_len` and `ft_max_word_len` that cause words shorter or longer to be excluded, and by the stopword list that identifies common words to be ignored.

The plugin API enables you to provide a full-text parser of your own so that you have control over the basic duties of a parser. A parser plugin can operate in either of two roles:

- The plugin can replace the built-in parser. In this role, the plugin reads the input to be parsed, splits it up into words, and passes the words to the server (either for indexing or for word accumulation).

One reason to use a parser this way is that you need to use different rules from those of the built-in parser for determining how to split up input into words. For example, the built-in parser considers the text “case-sensitive” to consist of two words “case” and “sensitive,” whereas an application might need to treat the text as a single word.

- The plugin can act in conjunction with the built-in parser by serving as a front end for it. In this role, the plugin extracts text from the input and passes the text to the parser, which splits up the text into words using its normal parsing rules. In particular, this parsing will be affected by the `ft_***` system variables and the stopword list.

One reason to use a parser this way is that you need to index content such as PDF documents, XML documents, or `.doc` files. The built-in parser is not intended for those types of input but a plugin can pull out the text from these input sources and pass it to the built-in parser.

It is also possible for a parser plugin to operate in both roles. That is, it could extract text from non-plaintext input (the front end role), and also parse the text into words (thus replacing the built-in parser).

A full-text plugin is associated with full-text indexes on a per-index basis. That is, when you install a parser plugin initially, that does not cause it to be used for any full-text operations. It simply becomes available. For example, a full-text parser plugin becomes available to be named in a `WITH PARSE` clause when creating individual `FULLTEXT` indexes. To create such an index at table-creation time, do this:

```
CREATE TABLE t
(
  doc CHAR(255),
  FULLTEXT INDEX (doc) WITH PARSE my_parser
);
```

Or you can add the index after the table has been created:

```
ALTER TABLE t ADD FULLTEXT INDEX (doc) WITH PARSE my_parser;
```

The only SQL change for associating the parser with the index is the `WITH PARSE` clause. Searches are specified as before, with no changes needed for queries.

When you associate a parser plugin with a `FULLTEXT` index, the plugin is required for using the index. If the parser plugin is dropped, any index associated with it becomes unusable. Any attempt to use it a table for which a plugin is not available results in an error, although `DROP TABLE` is still possible.

## 21.2.3. Writing Plugins

This section describes the general and type-specific parts of the plugin API. It also provides a step-by-step guide to creating a plugin library. For example plugin source code, see the `plugin/fulltext` directory of a MySQL source distribution.

You can write plugins in C or C++ (or another language that can use C calling conventions). Plugins are loaded and unloaded dynamically, so your operating system must support dynamic loading and you must have compiled `mysqld` dynamically (not statically).

A plugin contains code that becomes part of the running server, so when you write a plugin, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to plugins that were originally written for older servers. For information about these constraints, see [Section 2.10.2, “Typical configure Options”](#), and [Section 2.10.4, “Dealing with Problems Compiling MySQL”](#).

### 21.2.3.1. General Plugin Structures and Functions

Every plugin must have a general plugin declaration. The declaration corresponds to the `st_mysql_plugin` structure in the `plugin.h` file:

```
struct st_mysql_plugin
{
    int type;           /* the plugin type (a MYSQL_XXX_PLUGIN value) */
    void *info;        /* pointer to type-specific plugin descriptor */
    const char *name;  /* plugin name */
    const char *author; /* plugin author (for SHOW PLUGINS) */
    const char *descr; /* general descriptive text (for SHOW PLUGINS ) */
    int license;       /* the plugin license (PLUGIN_LICENSE_XXX) */
    int (*init)(void *); /* the function to invoke when plugin is loaded */
    int (*deinit)(void *); /* the function to invoke when plugin is unloaded */
    unsigned int version; /* plugin version (for SHOW PLUGINS) */
    struct st_mysql_show_var *status_vars;
    void * __reserved1; /* placeholder for system variables */
    void * __reserved2; /* placeholder for config options */
};
```

The `st_mysql_plugin` structure is common to every type of plugin. Its members should be filled in as follows:

- `type`

The plugin type. This must be one of the plugin-type values from `plugin.h`. For a full-text parser plugin, the `type` value is `MYSQL_FTPARSER_PLUGIN`.

- `info`

A pointer to the descriptor for the plugin. Unlike the general plugin declaration structure, this descriptor's structure depends on the particular type of plugin. Each descriptor has a version number that indicates the API version for that type of plugin, plus any other members needed. The descriptor for full-text plugins is described in [Section 21.2.3.2, “Type-Specific Plugin Structures and Functions”](#).

- `name`

The plugin name. This is the name that will be listed in the `plugin` table and by which you refer to the plugin in SQL statements such as `INSTALL PLUGIN` and `UNINSTALL PLUGIN`.

- `author`

The plugin author. This can be whatever you like.

- `descr`

A general description of the plugin. This can be whatever you like.

- `license`

The plugin license type. The value can be one of `PLUGIN_LICENSE_PROPRIETARY`, `PLUGIN_LICENSE_GPL`, or `PLUGIN_LICENSE_BSD`.

- `init`

A once-only initialization function. This is executed when the plugin is loaded, which happens for `INSTALL PLUGIN` or, for plugins listed in the `plugin` table, at server startup. The function takes no arguments. It returns zero for success and nonzero for failure. If an `init` function is unneeded for a plugin, it can be specified as 0.

- `deinit`

A once-only deinitialization function. This is executed when the plugin is unloaded, which happens for `UNINSTALL PLUGIN` or, for plugins listed in the `plugin` table, at server shutdown. The function takes no arguments. It returns zero for success and nonzero for failure. If a `deinit` function is unneeded for a plugin, it can be specified as 0.

- `version`

The plugin version number. When the plugin is installed, this value can be retrieved from the `INFORMATION_SCHEMA.PLUGINS` table. The value includes major and minor numbers. If you write the value as a hex constant, the format is `0xMMNN`, where `MM` and `NN` are the major and minor numbers, respectively. For example, `0x0302` represents version 3.2.

- `status_vars`

A pointer to a structure for status variables associated with the plugin, or 0 if there are no such variables. When the plugin is installed, these variables are displayed in the output of the `SHOW STATUS` statement.

- `__reserved1`, `__reserved2`

These are placeholders for the future. Currently, they should be set to `NULL`.

The `init` and `deinit` functions in the general plugin declaration are invoked only when loading and unloading the plugin. They have nothing to do with use of the plugin such as happens when an SQL statement causes the plugin to be invoked.

The `status_vars` member, if not 0, points to an array of `st_mysql_show_var` structures, each of which describes one status variable, followed by a structure with all members set to 0. The `st_mysql_show_var` structure has this definition:

```
struct st_mysql_show_var {
    const char *name;
    char *value;
    enum enum_mysql_show_type type;
};
```

When the plugin is installed, the plugin name and the `name` value are joined with an underscore to form the name displayed by `SHOW STATUS`.

The following table shows the allowable status variable `type` values and what the corresponding variable should be.

Type	Meaning
<code>SHOW_BOOL</code>	Pointer to a boolean variable
<code>SHOW_INT</code>	Pointer to an integer variable
<code>SHOW_LONG</code>	Pointer to a long integer variable
<code>SHOW_LONGLONG</code>	Pointer to a longlong integer variable
<code>SHOW_CHAR</code>	A string
<code>SHOW_CHAR_PTR</code>	Pointer to a string
<code>SHOW_ARRAY</code>	Pointer to another <code>st_mysql_show_var</code> array
<code>SHOW_FUNC</code>	Pointer to a function

For the `SHOW_FUNC` type, the function is called and fills in its `out` parameter, which then provides information about the variable to be displayed. The function has this signature:

```
#define SHOW_VAR_FUNC_BUFF_SIZE 1024
typedef int (*mysql_show_var_func) (void *thd,
    struct st_mysql_show_var *out,
    char *buf);
```

Plugins should consider the `thd` parameter to be read only.

### 21.2.3.2. Type-Specific Plugin Structures and Functions

In the `st_mysql_plugin` structure that defines a plugin's general declaration, the `info` member points to a type-specific plugin descriptor. For a full-text parser plugin, the descriptor corresponds to the `st_mysql_ftparser` structure in the `plugin.h` file:

```
struct st_mysql_ftparser
{
    int interface_version;
    int (*parse)(MYSQL_FTPARSER_PARAM *param);
    int (*init)(MYSQL_FTPARSER_PARAM *param);
    int (*deinit)(MYSQL_FTPARSER_PARAM *param);
};
```

As shown by the structure definition, the descriptor has a version number (`MYSQL_FTPARSER_INTERFACE_VERSION` for full-text parser plugins) and contains pointers to three functions. The `init` and `deinit` members should point to a function or be set to 0 if the function is not needed. The `parse` member must point to the function that performs the parsing.

A full-text parser plugin is used in two different contexts, indexing and searching. In both contexts, the server calls the initialization and deinitialization functions at the beginning and end of processing each SQL statement that causes the plugin to be invoked. However, during statement processing, the server calls the main parsing function in context-specific fashion:

- For indexing, the server calls the parser for each column value to be indexed.
- For searching, the server calls the parser to parse the search string. The parser might also be called for rows processed by the

statement. In natural language mode, there is no need for the server to call the parser. For boolean mode phrase searches or natural language searches with query expansion, the parser is used to parse column values for information that is not in the index. Also, if a boolean mode search is done for a column that has no `FULLTEXT` index, the built-in parser will be called. (Plugins are associated with specific indexes. If there is no index, no plugin is used.)

Note that the plugin declaration in the plugin library descriptor has initialization and deinitialization functions, and so does the plugin descriptor to which it points. These pairs of functions have different purposes and are invoked for different reasons:

- For the plugin declaration in the plugin library descriptor, the initialization and deinitialization functions are invoked when the plugin is loaded and unloaded.
- For the plugin descriptor, the initialization and deinitialization functions are invoked per SQL statement for which the plugin is used.

Each interface function named in the plugin descriptor should return zero for success or nonzero for failure, and each of them receives an argument that points to a `MYSQL_FTPARSER_PARAM` structure containing the parsing context. The structure has this definition:

```
typedef struct st_mysql_ftparser_param
{
    int (*mysql_parse)(struct st_mysql_ftparser_param *,
                     char *doc, int doc_len);
    int (*mysql_add_word)(struct st_mysql_ftparser_param *,
                        char *word, int word_len,
                        MYSQL_FTPARSER_BOOLEAN_INFO *boolean_info);
    void *ftparser_state;
    void *mysql_ftparam;
    struct charset_info_st *cs;
    char *doc;
    int length;
    int flags;
    enum enum_ftparser_mode mode;
} MYSQL_FTPARSER_PARAM;
```

### Note

The definition shown is current as of MySQL 5.1.12. It is incompatible with versions of MySQL 5.1 older than 5.1.12.

The structure members are used as follows:

- `mysql_parse`

A pointer to a callback function that invokes the server's built-in parser. Use this callback when the plugin acts as a front end to the built-in parser. That is, when the plugin parsing function is called, it should process the input to extract the text and pass the text to the `mysql_parse` callback.

The first parameter for this callback function should be the `param` value itself:

```
param->mysql_parse(param, ...);
```

A front end plugin can extract text and pass it all at once to the built-in parser, or it can extract and pass text to the built-in parser a piece at a time. However, in this case, the built-in parser treats the pieces of text as though there are implicit word breaks between them.

- `mysql_add_word`

A pointer to a callback function that adds a word to a full-text index or to the list of search terms. Use this callback when the parser plugin replaces the built-in parser. That is, when the plugin parsing function is called, it should parse the input into words and invoke the `mysql_add_word` callback for each word.

The first parameter for this callback function should be the `param` value itself:

```
param->mysql_add_word(param, ...);
```

- `ftparser_state`

This is a generic pointer. The plugin can set it to point to information to be used internally for its own purposes.

- `mysql_ftparam`

This is set by the server. It is passed as the first argument to the `mysql_parse` or `mysql_add_word` callback.

- `cs`

A pointer to information about the character set of the text, or 0 if no information is available.

- `doc`

A pointer to the text to be parsed.

- `length`

The length of the text to be parsed, in bytes.

- `flags`

Parser flags. This is zero if there are no special flags. Currently, the only nonzero flag is `MYSQL_FTFLAGS_NEED_COPY`, which means that `mysql_add_word()` must save a copy of the word (that is, it cannot use a pointer to the word because the word is in a buffer that will be overwritten.) This member was added in MySQL 5.1.12.

This flag might be set or reset by MySQL before calling the parser plugin, by the parser plugin itself, or by the `mysql_parse()` function.

- `mode`

The parsing mode. This value will be one of the following constants:

- `MYSQL_FTPARSER_SIMPLE_MODE`

Parse in fast and simple mode, which is used for indexing and for natural language queries. The parser should pass to the server only those words that should be indexed. If the parser uses length limits or a stopword list to determine which words to ignore, it should not pass such words to the server.

- `MYSQL_FTPARSER_WITH_STOPWORDS`

Parse in stopword mode. This is used in boolean searches for phrase matching. The parser should pass all words to the server, even stopwords or words that are outside any normal length limits.

- `MYSQL_FTPARSER_FULL_BOOLEAN_INFO`

Parse in boolean mode. This is used for parsing boolean query strings. The parser should recognize not only words but also boolean-mode operators and pass them to the server as tokens via the `mysql_add_word` callback. To tell the server what kind of token is being passed, the plugin needs to fill in a `MYSQL_FTPARSER_BOOLEAN_INFO` structure and pass a pointer to it.

If the parser is called in boolean mode, the `param->mode` value will be `MYSQL_FTPARSER_FULL_BOOLEAN_INFO`. The `MYSQL_FTPARSER_BOOLEAN_INFO` structure that the parser uses for passing token information to the server looks like this:

```
typedef struct st_mysql_ftparser_boolean_info
{
    enum enum_ft_token_type type;
    int yesno;
    int weight_adjust;
    bool wasign;
    bool trunc;
    /* These are parser state and must be removed. */
    byte prev;
    byte *quot;
} MYSQL_FTPARSER_BOOLEAN_INFO;
```

The parser should fill in the structure members as follows:

- `type`

The token type. This should be one of values shown in the following table.

Type	Meaning
<code>FT_TOKEN_EOF</code>	End of data
<code>FT_TOKEN_WORD</code>	A regular word

<code>FT_TOKEN_LEFT_PAREN</code>	The beginning of a group or subexpression
<code>FT_TOKEN_RIGHT_PAREN</code>	The end of a group or subexpression
<code>FT_TOKEN_STOPWORD</code>	A stopword

- `yesno`

Whether the word must be present for a match to occur. 0 means that the word is optional but increases the match relevance if it is present. Values larger than 0 mean that the word must be present. Values smaller than 0 mean that the word must not be present.

- `weight_adjust`

A weighting factor that determines how much a match for the word counts. It can be used to increase or decrease the word's importance in relevance calculations. A value of zero indicates no weight adjustment. Values greater than or less than zero mean higher or lower weight, respectively. The examples at [Section 11.8.2, “Boolean Full-Text Searches”](#), that use the `<` and `>` operators illustrate how weighting works.

- `wasign`

The sign of the weighting factor. A negative value acts like the `~` boolean-search operator, which causes the word's contribution to the relevance to be negative.

- `trunc`

Whether matching should be done as if the boolean-mode `*` truncation operator had been given.

Plugins should not use the `prev` and `quot` members of the `MYSQL_FTPARSER_BOOLEAN_INFO` structure.

### 21.2.3.3. Creating a Plugin Library

This section provides a step-by-step procedure for creating a plugin library. It shows how to develop a library that contains a full-text parsing plugin named `simple_parser`. This plugin performs parsing based on simpler rules than those used by the MySQL built-in full-text parser: Words are non-empty runs of whitespace characters.

Each plugin library has the following contents:

- A plugin library descriptor that indicates the version number of the general plugin API that the library uses and that contains a general declaration for each plugin in the library.
- Each plugin general declaration contains information that is common to all types of plugin: A value that indicates the plugin type; the plugin name, author, description, and license type; and pointers to the initialization and deinitialization functions that the server invokes when it loads and unloads the plugin.
- The plugin general declaration also contains a pointer to a type-specific plugin descriptor. The structure of these descriptors can vary from one plugin type to another, because each type of plugin can have its own API. A plugin descriptor contains a type-specific API version number and pointers to the functions that are needed to implement that plugin type. For example, a full-text parser plugin has initialization and deinitialization functions, and a main parsing function. The server invokes these functions when it uses the plugin to parse text.
- The plugin library contains the interface functions that are referenced by the library descriptor and by the plugin descriptors.

The easiest way to follow the instructions in this section is to use the source code in the `plugin/fulltext` directory of a MySQL source distribution. The instructions assume that you make a copy of that directory and use it to build the plugin library. To make a copy of the directory, use the following commands, which assume that the MySQL source tree is in a directory named `mysql-5.1` under your current directory:

```
shell> mkdir fulltext_plugin
shell> cp mysql-5.1/plugin/fulltext/* fulltext_plugin
```

After copying the source files, use the following procedure to create a plugin library:

1. Change location into the `fulltext_plugin` directory:

```
shell> cd fulltext_plugin
```

- The plugin source file should include the header files that the plugin library needs. The `plugin.h` file is required, and the library might require other files as well. For example:

```
#include <stdlib.h>
#include <ctype.h>
#include <mysql/plugin.h>
```

- Set up the plugin library file descriptor.

Every plugin library must include a library descriptor that must define two symbols:

- `_mysql_plugin_interface_version` specifies the version number of the general plugin framework. This is given by the `MYSQL_PLUGIN_INTERFACE_VERSION` symbol, which is defined in the `plugin.h` file.
- `_mysql_plugin_declarations` defines an array of plugin declarations, terminated by a declaration with all members set to 0. Each declaration is an instance of the `st_mysql_plugin` structure (also defined in `plugin.h`). There must be one of these for each plugin in the library.

If the server does not find these two symbols in a library, it does not accept it as a legal plugin library and rejects it with an error. This prevents use of a library for plugin purposes unless it was built specifically as a plugin library.

The standard (and most convenient) way to define the two required symbols is by using the `mysql_declare_plugin` and `mysql_declare_plugin_end` macros from the `plugin.h` file:

```
mysql_declare_plugin
... one or more plugin declarations here ...
mysql_declare_plugin_end;
```

For example, the library descriptor for a library that contains a single plugin named `simple_parser` looks like this:

```
mysql_declare_plugin
{
    MYSQL_FTPARSER_PLUGIN,      /* type */
    &simple_parser_descriptor,   /* descriptor */
    "simple_parser",            /* name */
    "MySQL AB",                /* author */
    "Simple Full-Text Parser", /* description */
    PLUGIN_LICENSE_GPL,        /* plugin license */
    simple_parser_plugin_init,  /* init function (when loaded) */
    simple_parser_plugin_deinit, /* deinit function (when unloaded) */
    0x0001,                    /* version */
    simple_status               /* status variables */
}
mysql_declare_plugin_end;
```

For a full-text parser plugin, the type must be `MYSQL_FTPARSER_PLUGIN`. This is the value that identifies the plugin as being legal for use in a `WITH PARSER` clause when creating a `FULLTEXT` index. (No other plugin type is legal for this clause.)

The `mysql_declare_plugin` and `mysql_declare_plugin_end` macros are defined in `plugin.h` like this:

```
#ifndef MYSQL_DYNAMIC_PLUGIN
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS) \
int VERSION= MYSQL_PLUGIN_INTERFACE_VERSION; \
int PSIZE= sizeof(struct st_mysql_plugin); \
struct st_mysql_plugin DECLS[]= {
#else
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS) \
int _mysql_plugin_interface_version= MYSQL_PLUGIN_INTERFACE_VERSION; \
int _mysql_sizeof_struct_st_plugin= sizeof(struct st_mysql_plugin); \
struct st_mysql_plugin _mysql_plugin_declarations[]= {
#endif

#define mysql_declare_plugin(NAME) \
__MYSQL_DECLARE_PLUGIN(NAME, \
    builtin_ ## NAME ## _plugin_interface_version, \
    builtin_ ## NAME ## _sizeof_struct_st_plugin, \
    builtin_ ## NAME ## _plugin)

#define mysql_declare_plugin_end ,{0,0,0,0,0,0,0,0,0}
```

One point to note about those definitions is that the `_mysql_plugin_interface_version` symbol is defined only if the `MYSQL_DYNAMIC_PLUGIN` symbol is defined. This means that you'll need to provide `-DMYSQL_DYNAMIC_PLUGIN` as part of the compilation command when you build the plugin.

When the macros are used as just shown, they expand to the following code, which defines both of the required symbols (`_mysql_plugin_interface_version` and `_mysql_plugin_declarations`):

```

int _mysql_plugin_interface_version = MYSQL_PLUGIN_INTERFACE_VERSION;
struct st_mysql_plugin _mysql_plugin_declarations[] = {
{
    MYSQL_FTPARSER_PLUGIN,      /* type */
    &simple_parser_descriptor,  /* descriptor */
    "simple_parser",            /* name */
    "MySQL AB",                /* author */
    "Simple Full-Text Parser", /* description */
    PLUGIN_LICENSE_GPL,        /* plugin license */
    simple_parser_plugin_init, /* init function (when loaded) */
    simple_parser_plugin_deinit, /* deinit function (when unloaded) */
    0x0001,                    /* version */
    simple_status               /* status variables */
}
, {0,0,0,0,0,0,0,0}
};
    
```

The preceding example declares a single plugin in the library descriptor, but it is possible to declare multiple plugins. List the declarations one after the other between `mysql_declare_plugin` and `mysql_declare_plugin_end`, separated by commas.

MySQL plugins can be written in C or C++ (or another language that can use C calling conventions). One feature of C++ is that you can use non-constant variables to initialize global structures. However, if you write a C++ plugin, you should not use this feature. Members of structures such as the `st_mysql_plugin` structure should be initialized with constant variables. See the discussion at the end of this section that describes some legal and illegal initializers for plugins.

#### 4. Set up the plugin descriptor.

Each plugin declaration in the library descriptor points to a type-specific descriptor for the corresponding plugin. In the `simple_parser` declaration, that descriptor is indicated by `&simple_parser_descriptor`. The descriptor specifies the version number for the full-text plugin interface (as given by `MYSQL_FTPARSER_INTERFACE_VERSION`), and the plugin's parsing, initialization, and deinitialization functions:

```

static struct st_mysql_ftparser simple_parser_descriptor =
{
    MYSQL_FTPARSER_INTERFACE_VERSION, /* interface version */
    simple_parser_parse,              /* parsing function */
    simple_parser_init,               /* parser init function */
    simple_parser_deinit              /* parser deinit function */
};
    
```

#### 5. Set up the plugin interface functions.

The general plugin declaration in the library descriptor names the initialization and deinitialization functions that the server should invoke when it loads and unloads the plugin. For `simple_parser`, these functions do nothing but return zero to indicate that they succeeded:

```

static int simple_parser_plugin_init(void)
{
    return(0);
}

static int simple_parser_plugin_deinit(void)
{
    return(0);
}
    
```

Because those functions do not actually do anything, you could omit them and specify 0 for each of them in the plugin declaration.

The type-specific plugin descriptor for `simple_parser` names the initialization, deinitialization, and parsing functions that the server invokes when the plugin is used. For `simple_parser`, the initialization and deinitialization functions do nothing:

```

static int simple_parser_init(MYSQL_FTPARSER_PARAM *param)
{
    return(0);
}

static int simple_parser_deinit(MYSQL_FTPARSER_PARAM *param)
{
    return(0);
}
    
```

Here too, because those functions do nothing, you could omit them and specify 0 for each of them in the plugin descriptor.

The main parsing function, `simple_parser_parse()`, acts as a replacement for the built-in full-text parser, so it needs to split text into words and pass each word to the server. The parsing function's first argument is a pointer to a structure that contains the parsing context. This structure has a `doc` member that points to the text to be parsed, and a `length` member that in-

dicates how long the text is. The simple parsing done by the plugin considers non-empty runs of whitespace characters to be words, so it identifies words like this:

```
static int simple_parser_parse(MYSQL_FTPARSER_PARAM *param)
{
    char *end, *start, *docend= param->doc + param->length;

    for (end= start= param->doc;; end++)
    {
        if (end == docend)
        {
            if (end > start)
                add_word(param, start, end - start);
            break;
        }
        else if (isspace(*end))
        {
            if (end > start)
                add_word(param, start, end - start);
            start= end + 1;
        }
    }
    return(0);
}
```

As the parser finds each word, it invokes a function `add_word()` to pass the word to the server. `add_word()` is a helper function only; it is not part of the plugin interface. The parser passes the parsing context pointer to `add_word()`, as well as a pointer to the word and a length value:

```
static void add_word(MYSQL_FTPARSER_PARAM *param, char *word, size_t len)
{
    MYSQL_FTPARSER_BOOLEAN_INFO bool_info=
        { FT_TOKEN_WORD, 0, 0, 0, 0, ' ', 0 };
    param->mysql_add_word(param, word, len, &bool_info);
}
```

For boolean-mode parsing, `add_word()` fills in the members of the `bool_info` structure as described in [Section 21.2.3.2, “Type-Specific Plugin Structures and Functions”](#).

6. Set up the status variables, if there are any. For the `simple_parser` plugin, the following status variable array sets up one status variable with a value that is static text, and another with a value that is stored in a long integer variable:

```
long number_of_calls= 0;
struct st_mysql_show_var simple_status[]=
{
    {"static", (char *)"just a static text", SHOW_CHAR},
    {"called", (char *)&number_of_calls, SHOW_LONG},
    {0,0,0}
};
```

When the plugin is installed, the plugin name and the `name` value are joined with an underscore to form the name displayed by `SHOW STATUS`. For the array just shown, the resulting status variable names are `simple_parser_static` and `simple_parser_called`. This convention means that you can easily display the variables for a plugin using its name:

```
mysql> SHOW STATUS LIKE 'simple_parser%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| simple_parser_static | just a static text |
| simple_parser_called | 0 |
+-----+-----+
```

7. Compile the plugin library as a shared library and install it in the plugin directory.

### Note

As mentioned earlier, be sure to specify `-DMYSQL_DYNAMIC_PLUGIN` as part of the compilation command when you build the plugin.

The procedure for compiling shared objects varies from system to system. If you build your library using the GNU autotools, `libtool` should be able to generate the correct compilation commands for your system. If the library is named `mypluglib`, you should end up with a shared object file that has a name something like `libmypluglib.so`. (The file name might have a different extension on your system.)

To use the autotools, you'll need to make a few changes to the configuration files at this point to enable the plugin to be compiled and installed. Assume that your MySQL distribution is installed at a base directory of `/usr/local/mysql` and that its header files are located in the `include` directory under the base directory.

Edit `Makefile.am`, which should look something like this:

```
#Makefile.am example for a plugin
pkglibdir=$(libdir)/mysql
INCLUDES= -I$(top_builddir)/include -I$(top_srcdir)/include
#noinst_LTLIBRARIES= mypluglib.la
pkglib_LTLIBRARIES= mypluglib.la
mypluglib_la_SOURCES= plugin_example.c
mypluglib_la_LDFLAGS= -module -rpath $(pkglibdir)
mypluglib_la_CFLAGS= -DMYSQL_DYNAMIC_PLUGIN
```

The `mypluglib_la_CFLAGS` line takes care of passing the `-DMYSQL_DYNAMIC_PLUGIN` flag to the compilation command.

Adjust the `INCLUDES` line to specify the path name to the installed MySQL header files. Edit it to look like this:

```
INCLUDES= -I/usr/local/mysql/include
```

Make sure that the `noinst_LTLIBRARIES` line is commented out or remove it. Make sure that the `pkglib_LTLIBRARIES` line is not commented out; it enables the `make install` command.

Set up the files needed for the `configure` command, invoke it, and run `make`:

```
shell> autoreconf --force --install --symlink
shell> ./configure --prefix=/usr/local/mysql
shell> make
```

The `--prefix` option to `configure` indicates the MySQL base directory under which the plugin should be installed. You can see what value to use for this option with `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'basedir';
+-----+-----+
| Variable_name | Value                               |
+-----+-----+
| base          | /usr/local/mysql                   |
+-----+-----+
```

The location of the plugin directory where you should install the library is given by the `plugin_dir` system variable. For example:

```
mysql> SHOW VARIABLES LIKE 'plugin_dir';
+-----+-----+
| Variable_name | Value                               |
+-----+-----+
| plugin_dir    | /usr/local/mysql/lib/mysql/plugin  |
+-----+-----+
```

To install the plugin library, use `make`:

```
shell> make install
```

Verify that `make install` installed the plugin library in the proper directory. After installing it, make sure that the library permissions allow it to be executed by the server.

8. Register the plugin with the server.

The `INSTALL PLUGIN` statement causes the server to list the plugin in the `plugin` table and to load the plugin code from the library file. Use that statement to register `simple_parser` with the server, and then verify that the plugin is listed in the `plugin` table:

```
mysql> INSTALL PLUGIN simple_parser SONAME 'libmypluglib.so';
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT * FROM mysql.plugin;
+-----+-----+
| name          | dl                               |
+-----+-----+
| simple_parser | libmypluglib.so                 |
+-----+-----+
1 row in set (0.00 sec)
```

9. Try the plugin.

Create a table that contains a string column and associate the parser plugin with a `FULLTEXT` index on the column:

```
mysql> CREATE TABLE t (c VARCHAR(255),
-> FULLTEXT (c) WITH PARSER simple_parser);
Query OK, 0 rows affected (0.01 sec)
```

Insert some text into the table and try some searches. These should verify that the parser plugin treats all non-whitespace characters as word characters:

```
mysql> INSERT INTO t VALUES
-> ('latin1_general_cs is a case-sensitive collation'),
-> ('I\'d like a case of oranges'),
-> ('this is sensitive information'),
-> ('another row'),
-> ('yet another row');
Query OK, 5 rows affected (0.02 sec)
Records: 5 Duplicates: 0 Warnings: 0
```

```
mysql> SELECT c FROM t;
+-----+
| c |
+-----+
| latin1_general_cs is a case-sensitive collation |
| I'd like a case of oranges |
| this is sensitive information |
| another row |
| yet another row |
+-----+
5 rows in set (0.00 sec)
```

```
mysql> SELECT MATCH(c) AGAINST('case') FROM t;
+-----+
| MATCH(c) AGAINST('case') |
+-----+
| 0 |
| 1.2968142032623 |
| 0 |
| 0 |
| 0 |
+-----+
5 rows in set (0.00 sec)
```

```
mysql> SELECT MATCH(c) AGAINST('sensitive') FROM t;
+-----+
| MATCH(c) AGAINST('sensitive') |
+-----+
| 0 |
| 1.3253291845322 |
| 0 |
| 0 |
+-----+
5 rows in set (0.01 sec)
```

```
mysql> SELECT MATCH(c) AGAINST('case-sensitive') FROM t;
+-----+
| MATCH(c) AGAINST('case-sensitive') |
+-----+
| 1.3109166622162 |
| 0 |
| 0 |
| 0 |
| 0 |
+-----+
5 rows in set (0.01 sec)
```

```
mysql> SELECT MATCH(c) AGAINST('I\'d') FROM t;
+-----+
| MATCH(c) AGAINST('I\'d') |
+-----+
| 0 |
| 1.2968142032623 |
| 0 |
| 0 |
| 0 |
+-----+
5 rows in set (0.01 sec)
```

Note how neither “case” nor “insensitive” match “case-insensitive” the way that they would for the built-in parser.

MySQL plugins can be written in C or C++ (or another language that can use C calling conventions). One feature of C++ is that you can use non-constant variables to initialize global structures. However, if you write a C++ plugin, you should not use this feature. Members of structures such as the `st_mysql_plugin` structure should be initialized with constant variables. The `simple_parser` descriptor shown earlier is allowable in a C++ plugin because it satisfies that requirement:

```
mysql_declare_plugin
{
    MYSQL_FTPARSER_PLUGIN, /* type */
    &simple_parser_descriptor, /* descriptor */
    "simple_parser", /* name */
}
```

```

"MySQL AB",          /* author          */
"Simple Full-Text Parser", /* description    */
PLUGIN_LICENSE_GPL, /* plugin license */
simple_parser_plugin_init, /* init function (when loaded) */
simple_parser_plugin_deinit, /* deinit function (when unloaded) */
0x0001,             /* version        */
simple_status        /* status variables */
}
mysql_declare_plugin_end;

```

Here is another valid way to write the descriptor. It uses constant variables to indicate the plugin name, author, and description:

```

const char *simple_parser_name = "simple_parser";
const char *simple_parser_author = "MySQL AB";
const char *simple_parser_description = "Simple Full-Text Parser";

mysql_declare_plugin
{
    MYSQL_FTPARSER_PLUGIN, /* type          */
    &simple_parser_descriptor, /* descriptor    */
    simple_parser_name, /* name          */
    simple_parser_author, /* author        */
    simple_parser_description, /* description   */
    PLUGIN_LICENSE_GPL, /* plugin license */
    simple_parser_plugin_init, /* init function (when loaded) */
    simple_parser_plugin_deinit, /* deinit function (when unloaded) */
    0x0001, /* version        */
    simple_status /* status variables */
}
mysql_declare_plugin_end;

```

However, the following descriptor is invalid. It uses structure members to indicate the plugin name, author, and description, but structures are not considered constant initializers in C++:

```

typedef struct
{
    const char *name;
    const char *author;
    const char *description;
} plugin_info;

plugin_info parser_info = {
    "simple_parser",
    "MySQL AB",
    "Simple Full-Text Parser"
};

mysql_declare_plugin
{
    MYSQL_FTPARSER_PLUGIN, /* type          */
    &simple_parser_descriptor, /* descriptor    */
    parser_info.name, /* name          */
    parser_info.author, /* author        */
    parser_info.description, /* description   */
    PLUGIN_LICENSE_GPL, /* plugin license */
    simple_parser_plugin_init, /* init function (when loaded) */
    simple_parser_plugin_deinit, /* deinit function (when unloaded) */
    0x0001, /* version        */
    simple_status /* status variables */
}
mysql_declare_plugin_end;

```

## 21.3. Adding New Functions to MySQL

There are three ways to add new functions to MySQL:

- You can add functions through the user-defined function (UDF) interface. User-defined functions are compiled as object files and then added to and removed from the server dynamically using the `CREATE FUNCTION` and `DROP FUNCTION` statements. See [Section 12.5.3.1, “CREATE FUNCTION Syntax”](#).
- You can add functions as native (built-in) MySQL functions. Native functions are compiled into the `mysqld` server and become available on a permanent basis.
- Another way to add functions is by creating stored functions. These are written using SQL statements rather than by compiling object code. The syntax for writing stored functions is not covered here. See [Section 18.2, “Using Stored Routines \(Procedures and Functions\)”](#).

Each method of creating compiled functions has advantages and disadvantages:

- If you write user-defined functions, you must install object files in addition to the server itself. If you compile your function into the server, you don't need to do that.
- Native functions require you to modify a source distribution. UDFs do not. You can add UDFs to a binary MySQL distribution. No access to MySQL source is necessary.
- If you upgrade your MySQL distribution, you can continue to use your previously installed UDFs, unless you upgrade to a newer version for which the UDF interface changes. For native functions, you must repeat your modifications each time you upgrade.

Whichever method you use to add new functions, they can be invoked in SQL statements just like native functions such as `ABS()` or `SOUNDEX()`.

See [Section 8.2.4, “Function Name Parsing and Resolution”](#), for the rules describing how the server interprets references to different kinds of functions.

The following sections describe features of the UDF interface, provide instructions for writing UDFs, discuss security precautions that MySQL takes to prevent UDF misuse, and describe how to add native MySQL functions.

For example source code that illustrates how to write UDFs, take a look at the `sql/udf_example.c` file that is provided in MySQL source distributions.

### 21.3.1. Features of the User-Defined Function Interface

The MySQL interface for user-defined functions provides the following features and capabilities:

- Functions can return string, integer, or real values and can accept arguments of those same types.
- You can define simple functions that operate on a single row at a time, or aggregate functions that operate on groups of rows.
- Information is provided to functions that enables them to check the number, types, and names of the arguments passed to them.
- You can tell MySQL to coerce arguments to a given type before passing them to a function.
- You can indicate that a function returns `NULL` or that an error occurred.

### 21.3.2. Adding a New User-Defined Function

For the UDF mechanism to work, functions must be written in C or C++ and your operating system must support dynamic loading. The MySQL source distribution includes a file `sql/udf_example.c` that defines 5 new functions. Consult this file to see how UDF calling conventions work. UDF-related symbols and data structures are defined in the `include/mysql_com.h` header file. (You need not include this header file directly because it is included by `mysql.h`.)

A UDF contains code that becomes part of the running server, so when you write a UDF, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the `libc++` library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to UDFs that were originally written for older servers. For information about these constraints, see [Section 2.10.2, “Typical configure Options”](#), and [Section 2.10.4, “Dealing with Problems Compiling MySQL”](#).

To be able to use UDFs, you need to link `mysqld` dynamically. Don't configure MySQL using `-with-mysqld-ldflags=-all-static`. If you want to use a UDF that needs to access symbols from `mysqld` (for example, the `metaphone` function in `sql/udf_example.c` that uses `default_charset_info`), you must link the program with `-rdynamic` (see `man dlopen`). If you plan to use UDFs, the rule of thumb is to configure MySQL with `-with-mysqld-ldflags=-rdynamic` unless you have a very good reason not to.

For each function that you want to use in SQL statements, you should define corresponding C (or C++) functions. In the following discussion, the name “xxx” is used for an example function name. To distinguish between SQL and C/C++ usage, `XXX()` (uppercase) indicates an SQL function call, and `xxx()` (lowercase) indicates a C/C++ function call.

The C/C++ functions that you write to implement the interface for `XXX()` are:

- `xxx()` (required)

The main function. This is where the function result is computed. The correspondence between the SQL function data type and the return type of your C/C++ function is shown here.

SQL Type	C/C++ Type
STRING	char *
INTEGER	long long
REAL	double

It is also possible to declare a `DECIMAL` function, but currently the value is returned as a string, so you should write the UDF as though it were a `STRING` function. `ROW` functions are not implemented.

- `xxx_init()` (optional)

The initialization function for `xxx()`. It can be used for the following purposes:

- To check the number of arguments to `XXX()`.
- To check that the arguments are of a required type or, alternatively, to tell MySQL to coerce arguments to the types you want when the main function is called.
- To allocate any memory required by the main function.
- To specify the maximum length of the result.
- To specify (for `REAL` functions) the maximum number of decimal places in the result.
- To specify whether the result can be `NULL`.

- `xxx_deinit()` (optional)

The deinitialization function for `xxx()`. It should deallocate any memory allocated by the initialization function.

When an SQL statement invokes `XXX()`, MySQL calls the initialization function `xxx_init()` to let it perform any required setup, such as argument checking or memory allocation. If `xxx_init()` returns an error, MySQL aborts the SQL statement with an error message and does not call the main or deinitialization functions. Otherwise, MySQL calls the main function `xxx()` once for each row. After all rows have been processed, MySQL calls the deinitialization function `xxx_deinit()` so that it can perform any required cleanup.

For aggregate functions that work like `SUM()`, you must also provide the following functions:

- `xxx_clear()`

Reset the current aggregate value but do not insert the argument as the initial aggregate value for a new group.

- `xxx_add()`

Add the argument to the current aggregate value.

MySQL handles aggregate UDFs as follows:

1. Call `xxx_init()` to let the aggregate function allocate any memory it needs for storing results.
2. Sort the table according to the `GROUP BY` expression.
3. Call `xxx_clear()` for the first row in each new group.
4. Call `xxx_add()` for each row that belongs in the same group.
5. Call `xxx()` to get the result for the aggregate when the group changes or after the last row has been processed.
6. Repeat 3-5 until all rows has been processed
7. Call `xxx_deinit()` to let the UDF free any memory it has allocated.

All functions must be thread-safe. This includes not just the main function, but the initialization and deinitialization functions as well, and also the additional functions required by aggregate functions. A consequence of this requirement is that you are not al-

lowed to allocate any global or static variables that change! If you need memory, you should allocate it in `xxx_init()` and free it in `xxx_deinit()`.

### 21.3.2.1. UDF Calling Sequences for Simple Functions

This section describes the different functions that you need to define when you create a simple UDF. [Section 21.3.2, “Adding a New User-Defined Function”](#), describes the order in which MySQL calls these functions.

The main `xxx()` function should be declared as shown in this section. Note that the return type and parameters differ, depending on whether you declare the SQL function `XXX()` to return `STRING`, `INTEGER`, or `REAL` in the `CREATE FUNCTION` statement:

For `STRING` functions:

```
char *xxx(UDF_INIT *initid, UDF_ARGS *args,
         char *result, unsigned long *length,
         char *is_null, char *error);
```

For `INTEGER` functions:

```
long long xxx(UDF_INIT *initid, UDF_ARGS *args,
             char *is_null, char *error);
```

For `REAL` functions:

```
double xxx(UDF_INIT *initid, UDF_ARGS *args,
          char *is_null, char *error);
```

`DECIMAL` functions return string values and should be declared the same way as `STRING` functions. `ROW` functions are not implemented.

The initialization and deinitialization functions are declared like this:

```
my_bool xxx_init(UDF_INIT *initid, UDF_ARGS *args, char *message);
void xxx_deinit(UDF_INIT *initid);
```

The `initid` parameter is passed to all three functions. It points to a `UDF_INIT` structure that is used to communicate information between functions. The `UDF_INIT` structure members follow. The initialization function should fill in any members that it wishes to change. (To use the default for a member, leave it unchanged.)

- `my_bool maybe_null`

`xxx_init()` should set `maybe_null` to 1 if `xxx()` can return `NULL`. The default value is 1 if any of the arguments are declared `maybe_null`.

- `unsigned int decimals`

The number of decimal digits to the right of the decimal point. The default value is the maximum number of decimal digits in the arguments passed to the main function. For example, if the function is passed `1.34`, `1.345`, and `1.3`, the default would be 3, because `1.345` has 3 decimal digits.

For arguments that have no fixed number of decimals, the `decimals` value is set to 31, which is 1 more than the maximum number of decimals allowed for the `DECIMAL`, `FLOAT`, and `DOUBLE` data types.

A `decimals` value of 31 is used for arguments in cases such as a `FLOAT` or `DOUBLE` column declared without an explicit number of decimals (for example, `FLOAT` rather than `FLOAT(10,3)`) and for floating-point constants such as `1345E-3`. It is also used for string and other non-number arguments that might be converted within the function to numeric form.

The value to which the `decimals` member is initialized is only a default. It can be changed within the function to reflect the actual calculation performed. The default is determined such that the largest number of decimals of the arguments is used. If the number of decimals is 31 for even one of the arguments, that is the value used for `decimals`.

- `unsigned int max_length`

The maximum length of the result. The default `max_length` value differs depending on the result type of the function. For string functions, the default is the length of the longest argument. For integer functions, the default is 21 digits. For real functions, the default is 13 plus the number of decimal digits indicated by `initid->decimals`. (For numeric functions, the length includes any sign or decimal point characters.)

If you want to return a blob value, you can set `max_length` to 65KB or 16MB. This memory is not allocated, but the value is

used to decide which data type to use if there is a need to temporarily store the data.

- `char *ptr`

A pointer that the function can use for its own purposes. For example, functions can use `initid->ptr` to communicate allocated memory among themselves. `xxx_init()` should allocate the memory and assign it to this pointer:

```
initid->ptr = allocated_memory;
```

In `xxx()` and `xxx_deinit()`, refer to `initid->ptr` to use or deallocate the memory.

- `my_bool const_item`

`xxx_init()` should set `const_item` to 1 if `xxx()` always returns the same value and to 0 otherwise.

### 21.3.2.2. UDF Calling Sequences for Aggregate Functions

This section describes the different functions that you need to define when you create an aggregate UDF. [Section 21.3.2, “Adding a New User-Defined Function”](#), describes the order in which MySQL calls these functions.

- `xxx_reset()`

This function is called when MySQL finds the first row in a new group. It should reset any internal summary variables and then use the given `UDF_ARGS` argument as the first value in your internal summary value for the group. Declare `xxx_reset()` as follows:

```
void xxx_reset(UDF_INIT *initid, UDF_ARGS *args,
              char *is_null, char *error);
```

`xxx_reset()` is not needed or used in MySQL 5.1, in which the UDF interface uses `xxx_clear()` instead. However, you can define both `xxx_reset()` and `xxx_clear()` if you want to have your UDF work with older versions of the server. (If you do include both functions, the `xxx_reset()` function in many cases can be implemented internally by calling `xxx_clear()` to reset all variables, and then calling `xxx_add()` to add the `UDF_ARGS` argument as the first value in the group.)

- `xxx_clear()`

This function is called when MySQL needs to reset the summary results. It is called at the beginning for each new group but can also be called to reset the values for a query where there were no matching rows. Declare `xxx_clear()` as follows:

```
void xxx_clear(UDF_INIT *initid, char *is_null, char *error);
```

`is_null` is set to point to `CHAR(0)` before calling `xxx_clear()`.

If something went wrong, you can store a value in the variable to which the `error` argument points. `error` points to a single-byte variable, not to a string buffer.

`xxx_clear()` is required by MySQL 5.1.

- `xxx_add()`

This function is called for all rows that belong to the same group. You should use it to add the value in the `UDF_ARGS` argument to your internal summary variable.

```
void xxx_add(UDF_INIT *initid, UDF_ARGS *args,
            char *is_null, char *error);
```

The `xxx()` function for an aggregate UDF should be declared the same way as for a non-aggregate UDF. See [Section 21.3.2.1, “UDF Calling Sequences for Simple Functions”](#).

For an aggregate UDF, MySQL calls the `xxx()` function after all rows in the group have been processed. You should normally never access its `UDF_ARGS` argument here but instead return a value based on your internal summary variables.

Return value handling in `xxx()` should be done the same way as for a non-aggregate UDF. See [Section 21.3.2.4, “UDF Return Values and Error Handling”](#).

The `xxx_reset()` and `xxx_add()` functions handle their `UDF_ARGS` argument the same way as functions for non-aggregate

UDFs. See [Section 21.3.2.3, “UDF Argument Processing”](#).

The pointer arguments to `is_null` and `error` are the same for all calls to `xxx_reset()`, `xxx_clear()`, `xxx_add()` and `xxx()`. You can use this to remember that you got an error or whether the `xxx()` function should return `NULL`. You should not store a string into `*error`! `error` points to a single-byte variable, not to a string buffer.

`*is_null` is reset for each group (before calling `xxx_clear()`). `*error` is never reset.

If `*is_null` or `*error` are set when `xxx()` returns, MySQL returns `NULL` as the result for the group function.

### 21.3.2.3. UDF Argument Processing

The `args` parameter points to a `UDF_ARGS` structure that has the members listed here:

- `unsigned int arg_count`

The number of arguments. Check this value in the initialization function if you require your function to be called with a particular number of arguments. For example:

```
if (args->arg_count != 2)
{
    strcpy(message, "XXX() requires two arguments");
    return 1;
}
```

For other `UDF_ARGS` member values that are arrays, array references are zero-based. That is, refer to array members using index values from 0 to `args->arg_count - 1`.

- `enum Item_result *arg_type`

A pointer to an array containing the types for each argument. The possible type values are `STRING_RESULT`, `INT_RESULT`, `REAL_RESULT`, and `DECIMAL_RESULT`.

To make sure that arguments are of a given type and return an error if they are not, check the `arg_type` array in the initialization function. For example:

```
if (args->arg_type[0] != STRING_RESULT ||
    args->arg_type[1] != INT_RESULT)
{
    strcpy(message, "XXX() requires a string and an integer");
    return 1;
}
```

Arguments of type `DECIMAL_RESULT` are passed as strings, so you should handle them the same way as `STRING_RESULT` values.

As an alternative to requiring your function's arguments to be of particular types, you can use the initialization function to set the `arg_type` elements to the types you want. This causes MySQL to coerce arguments to those types for each call to `xxx()`. For example, to specify that the first two arguments should be coerced to string and integer, respectively, do this in `xxx_init()`:

```
args->arg_type[0] = STRING_RESULT;
args->arg_type[1] = INT_RESULT;
```

Exact-value decimal arguments such as `1.3` or `DECIMAL` column values are passed with a type of `DECIMAL_RESULT`. However, the values are passed as strings. If you want to receive a number, use the initialization function to specify that the argument should be coerced to a `REAL_RESULT` value:

```
args->arg_type[2] = REAL_RESULT;
```

- `char **args`

`args->args` communicates information to the initialization function about the general nature of the arguments passed to your function. For a constant argument `i`, `args->args[i]` points to the argument value. (See below for instructions on how to access the value properly.) For a non-constant argument, `args->args[i]` is 0. A constant argument is an expression that uses only constants, such as `3` or `4*7-2` or `SIN(3.14)`. A non-constant argument is an expression that refers to values that may change from row to row, such as column names or functions that are called with non-constant arguments.

For each invocation of the main function, `args->args` contains the actual arguments that are passed for the row currently being processed.

If argument `i` represents `NULL`, `args->args[i]` is a null pointer (0). If the argument is not `NULL`, functions can refer to it

as follows:

- An argument of type `STRING_RESULT` is given as a string pointer plus a length, to allow handling of binary data or data of arbitrary length. The string contents are available as `args->args[i]` and the string length is `args->lengths[i]`. Do not assume that the string is null-terminated.
- For an argument of type `INT_RESULT`, you must cast `args->args[i]` to a `long long` value:

```
long long int_val;
int_val = *((long long*) args->args[i]);
```

- For an argument of type `REAL_RESULT`, you must cast `args->args[i]` to a `double` value:

```
double real_val;
real_val = *((double*) args->args[i]);
```

- For an argument of type `DECIMAL_RESULT`, the value is passed as a string and should be handled like a `STRING_RESULT` value.
- `ROW_RESULT` arguments are not implemented.
- `unsigned long *lengths`

For the initialization function, the `lengths` array indicates the maximum string length for each argument. You should not change these. For each invocation of the main function, `lengths` contains the actual lengths of any string arguments that are passed for the row currently being processed. For arguments of types `INT_RESULT` or `REAL_RESULT`, `lengths` still contains the maximum length of the argument (as for the initialization function).

- `char *maybe_null`

For the initialization function, the `maybe_null` array indicates for each argument whether the argument value might be null (0 if no, 1 if yes).

- `char **attributes`

`args->attributes` communicates information about the names of the UDF arguments. For argument `i`, the attribute name is available as a string in `args->attributes[i]` and the attribute length is `args->attribute_lengths[i]`. Do not assume that the string is null-terminated.

By default, the name of a UDF argument is the text of the expression used to specify the argument. For UDFs, an argument may also have an optional `[AS] alias_name` clause, in which case the argument name is `alias_name`. The `attributes` value for each argument thus depends on whether an alias was given.

Suppose that a UDF `my_udf()` is invoked as follows:

```
SELECT my_udf(expr1, expr2 AS alias1, expr3 alias2);
```

In this case, the `attributes` and `attribute_lengths` arrays will have these values:

```
args->attributes[0] = "expr1"
args->attribute_lengths[0] = 5

args->attributes[1] = "alias1"
args->attribute_lengths[1] = 6

args->attributes[2] = "alias2"
args->attribute_lengths[2] = 6
```

- `unsigned long *attribute_lengths`

The `attribute_lengths` array indicates the length of each argument name.

### 21.3.2.4. UDF Return Values and Error Handling

The initialization function should return `0` if no error occurred and `1` otherwise. If an error occurs, `xxx_init()` should store a null-terminated error message in the `message` parameter. The message is returned to the client. The message buffer is `MYSQL_ERRMSG_SIZE` characters long, but you should try to keep the message to less than 80 characters so that it fits the width of a standard terminal screen.

The return value of the main function `xxx()` is the function value, for `long long` and `double` functions. A string function should return a pointer to the result and set `*length` to the length (in bytes) of the return value. For example:

```
memcpy(result, "result string", 13);
*length = 13;
```

MySQL passes a buffer to the `xxx()` function via the `result` parameter. This buffer is sufficiently long to hold 255 characters, which can be multi-byte characters. The `xxx()` function can store the result in this buffer if it fits, in which case the return value should be a pointer to the buffer. If the function stores the result in a different buffer, it should return a pointer to that buffer.

If your string function does not use the supplied buffer (for example, if it needs to return a string longer than 255 characters), you must allocate the space for your own buffer with `malloc()` in your `xxx_init()` function or your `xxx()` function and free it in your `xxx_deinit()` function. You can store the allocated memory in the `ptr` slot in the `UDF_INIT` structure for reuse by future `xxx()` calls. See Section 21.3.2.1, “UDF Calling Sequences for Simple Functions”.

To indicate a return value of `NULL` in the main function, set `*is_null` to 1:

```
*is_null = 1;
```

To indicate an error return in the main function, set `*error` to 1:

```
*error = 1;
```

If `xxx()` sets `*error` to 1 for any row, the function value is `NULL` for the current row and for any subsequent rows processed by the statement in which `XXX()` was invoked. (`xxx()` is not even called for subsequent rows.)

### 21.3.2.5. Compiling and Installing User-Defined Functions

Files implementing UDFs must be compiled and installed on the host where the server runs. This process is described below for the example UDF file `sql/udf_example.c` that is included in the MySQL source distribution.

The immediately following instructions are for Unix. Instructions for Windows are given later in this section.

The `udf_example.c` file contains the following functions:

- `metaphon()` returns a metaphon string of the string argument. This is something like a soundex string, but it is more tuned for English.
- `myfunc_double()` returns the sum of the ASCII values of the characters in its arguments, divided by the sum of the length of its arguments.
- `myfunc_int()` returns the sum of the length of its arguments.
- `sequence([const int])` returns a sequence starting from the given number or 1 if no number has been given.
- `lookup()` returns the IP number for a host name.
- `reverse_lookup()` returns the host name for an IP number. The function may be called either with a single string argument of the form `'xxx.xxx.xxx.xxx'` or with four numbers.

A dynamically loadable file should be compiled as a sharable object file, using a command something like this:

```
shell> gcc -shared -o udf_example.so udf_example.c
```

If you are using `gcc` with `configure` and `libtool` (which is how MySQL is configured), you should be able to create `udf_example.so` with a simpler command:

```
shell> make udf_example.la
```

After you compile a shared object containing UDFs, you must install it and tell MySQL about it. Compiling a shared object from `udf_example.c` using `gcc` directly produces a file named `udf_example.so`. Compiling the shared object using `make` produces a file named something like `udf_example.so.0.0.0` in the `.libs` directory (the exact name may vary from platform to platform). Copy the shared object to the server's plugin directory and name it `udf_example.so`. This directory is given by the value of the `plugin_dir` system variable.

#### Note

This is a change in MySQL 5.1. For earlier versions of MySQL, the shared object can be located in any directory that is searched by your system's dynamic linker.

On some systems, the `ldconfig` program that configures the dynamic linker does not recognize a shared object unless its name begins with `lib`. In this case you should rename a file such as `udf_example.so` to `libudf_example.so`.

On Windows, you can compile user-defined functions by using the following procedure:

1. You need to obtain the Bazaar source repository for MySQL 5.1. See [Section 2.10.3, “Installing from the Development Source Tree”](#).
2. You must obtain the CMake build utility from <http://www.cmake.org>. (Version 2.4.2 or later is required).
3. In the source repository, look in the `sql` directory. There are files named `udf_example.def` and `udf_example.c` there. Copy both files from this directory to your working directory.
4. Create a CMake `makefile` (`CMakeLists.txt`) with these contents:

```
PROJECT(udf_example)

# Path for MySQL include directory
INCLUDE_DIRECTORIES("c:/mysql/include")

ADD_DEFINITIONS("-DHAVE_DLOPEN")
ADD_LIBRARY(udf_example MODULE udf_example.c udf_example.def)
TARGET_LINK_LIBRARIES(udf_example wsock32)
```

5. Create the VC project and solution files:

```
cmake -G "<Generator>"
```

Invoking `cmake --help` shows you a list of valid Generators.

6. Create `udf_example.dll`:

```
devenv udf_example.sln /build Release
```

After the shared object file has been installed, notify `mysqld` about the new functions with these statements:

```
mysql> CREATE FUNCTION metaphon RETURNS STRING SONAME 'udf_example.dll';
mysql> CREATE FUNCTION myfunc_double RETURNS REAL SONAME 'udf_example.dll';
mysql> CREATE FUNCTION myfunc_int RETURNS INTEGER SONAME 'udf_example.dll';
mysql> CREATE FUNCTION sequence RETURNS INTEGER SONAME 'udf_example.dll';
mysql> CREATE FUNCTION lookup RETURNS STRING SONAME 'udf_example.dll';
mysql> CREATE FUNCTION reverse_lookup
-> RETURNS STRING SONAME 'udf_example.dll';
mysql> CREATE AGGREGATE FUNCTION avgcost
-> RETURNS REAL SONAME 'udf_example.dll';
```

Functions can be deleted using `DROP FUNCTION`:

```
mysql> DROP FUNCTION metaphon;
mysql> DROP FUNCTION myfunc_double;
mysql> DROP FUNCTION myfunc_int;
mysql> DROP FUNCTION sequence;
mysql> DROP FUNCTION lookup;
mysql> DROP FUNCTION reverse_lookup;
mysql> DROP FUNCTION avgcost;
```

The `CREATE FUNCTION` and `DROP FUNCTION` statements update the `func` system table in the `mysql` database. The function's name, type and shared library name are saved in the table. You must have the `INSERT` and `DELETE` privileges for the `mysql` database to create and drop functions.

You should not use `CREATE FUNCTION` to add a function that has previously been created. If you need to reinstall a function, you should remove it with `DROP FUNCTION` and then reinstall it with `CREATE FUNCTION`. You would need to do this, for example, if you recompile a new version of your function, so that `mysqld` gets the new version. Otherwise, the server continues to use the old version.

An active function is one that has been loaded with `CREATE FUNCTION` and not removed with `DROP FUNCTION`. All active functions are reloaded each time the server starts, unless you start `mysqld` with the `--skip-grant-tables` option. In this case, UDF initialization is skipped and UDFs are unavailable.

If the new function will be referred to in statements that will be replicated to slave servers, you must ensure that every slave server also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

### 21.3.2.6. User-Defined Function Security Precautions

MySQL takes the following measures to prevent misuse of user-defined functions.

You must have the `INSERT` privilege to be able to use `CREATE FUNCTION` and the `DELETE` privilege to be able to use `DROP FUNCTION`. This is necessary because these statements add and delete rows from the `mysql.func` table.

UDFs should have at least one symbol defined in addition to the `xxx` symbol that corresponds to the main `xxx()` function. These auxiliary symbols correspond to the `xxx_init()`, `xxx_deinit()`, `xxx_reset()`, `xxx_clear()`, and `xxx_add()` functions. `mysqld` also supports an `--allow-suspicious-udfs` option that controls whether UDFs that have only an `xxx` symbol can be loaded. By default, the option is off, to prevent attempts at loading functions from shared object files other than those containing legitimate UDFs. If you have older UDFs that contain only the `xxx` symbol and that cannot be recompiled to include an auxiliary symbol, it may be necessary to specify the `--allow-suspicious-udfs` option. Otherwise, you should avoid enabling this capability.

UDF object files cannot be placed in arbitrary directories. They must be located in the server's plugin directory. This directory is given by the value of the `plugin_dir` system variable.

#### Note

This is a change in MySQL 5.1. For earlier versions of MySQL, the shared object can be located in any directory that is searched by your system's dynamic linker.

### 21.3.3. Adding a New Native Function

To add a new native MySQL function, use the procedure described here, which requires that you use a source distribution. You cannot add native functions to a binary distribution because it is necessary to modify MySQL source code and compile MySQL from the modified source. If you migrate to another version of MySQL (for example, when a new version is released), you must repeat the procedure with the new version.

If the new native function will be referred to in statements that will be replicated to slave servers, you must ensure that every slave server also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

To add a new native function, follow these steps to modify source files in the `sql` directory. For MySQL 5.1, the first two steps apply only as of 5.1.13. For older versions, see the instructions in the corresponding section of the MySQL 5.0 manual.

1. Create a subclass for the function in `item_create.cc`:
  - If the function takes a fixed number of arguments, create a subclass of `Create_func_arg0`, `Create_func_arg1`, `Create_func_arg2`, or `Create_func_arg3`, respectively, depending on whether the function takes zero, one, two, or three arguments. For examples, see the `Create_func_uuid`, `Create_func_abs`, `Create_func_pow`, and `Create_func_lpad` classes.
  - If the function takes a variable number of arguments, create a subclass of `Create_native_func`. For an example, see `Create_func_concat`.
2. To provide a name by which the function can be referred to in SQL statements, register the name in `item_create.cc` by adding a line to this array:

```
static Native_func_registry func_array[]
```

You can register several names for the same function. For example, see the lines for `"LCASE"` and `"LOWER"`, which are aliases for `Create_func_lcase`.

3. In `item_func.h`, declare a class inheriting from `Item_num_func` or `Item_str_func`, depending on whether your function returns a number or a string.
4. In `item_func.cc`, add one of the following declarations, depending on whether you are defining a numeric or string function:

```
double Item_func_newname::val()
longlong Item_func_newname::val_int()
String *Item_func_newname::Str(String *str)
```

If you inherit your object from any of the standard items (like `Item_num_func`), you probably only have to define one of these functions and let the parent object take care of the other functions. For example, the `Item_str_func` class defines a `val()` function that executes `atof()` on the value returned by `::str()`.

5. If the function is non-deterministic, include the following statement in the item constructor to indicate that function results

should not be cached:

```
current_thd->lex->safe_to_cache_query=0;
```

A function is non-deterministic if, given fixed values for its arguments, it can return different results for different invocations.

6. You should probably also define the following object function:

```
void Item_func_newname::fix_length_and_dec()
```

This function should at least calculate `max_length` based on the given arguments. `max_length` is the maximum number of characters the function may return. This function should also set `maybe_null = 0` if the main function can't return a `NULL` value. The function can check whether any of the function arguments can return `NULL` by checking the arguments' `maybe_null` variable. Look at `Item_func_mod::fix_length_and_dec` for a typical example of how to do this.

All functions must be thread-safe. In other words, do not use any global or static variables in the functions without protecting them with mutexes.

If you want to return `NULL` from `::val()`, `::val_int()`, or `::str()`, you should set `null_value` to 1 and return 0.

For `::str()` object functions, there are additional considerations to be aware of:

- The `String *str` argument provides a string buffer that may be used to hold the result. (For more information about the `String` type, take a look at the `sql_string.h` file.)
- The `::str()` function should return the string that holds the result, or `(char*) 0` if the result is `NULL`.
- All current string functions try to avoid allocating any memory unless absolutely necessary!

## 21.4. Adding New Procedures to MySQL

In MySQL, you can define a procedure in C++ that can access and modify the data in a query before it is sent to the client. The modification can be done on a row-by-row or `GROUP BY` level.

We have created an example procedure to show you what can be done.

Additionally, we recommend that you take a look at `mysqlua`. With this you can use the LUA language to load a procedure at runtime into `mysqld`.

### 21.4.1. PROCEDURE ANALYSE

```
analyse([max_elements[,max_memory]])
```

This procedure is defined in the `sql/sql_analyse.cc` file. It examines the result from a query and returns an analysis of the results that suggests optimal data types for each column. To obtain this analysis, append `PROCEDURE ANALYSE` to the end of a `SELECT` statement:

```
SELECT ... FROM ... WHERE ... PROCEDURE ANALYSE([max_elements,[max_memory]])
```

For example:

```
SELECT col1, col2 FROM table1 PROCEDURE ANALYSE(10, 2000);
```

The results show some statistics for the values returned by the query, and propose an optimal data type for the columns. This can be helpful for checking your existing tables, or after importing new data. You may need to try different settings for the arguments so that `PROCEDURE ANALYSE()` does not suggest the `ENUM` data type when it is not appropriate.

The arguments are optional and are used as follows:

- `max_elements` (default 256) is the maximum number of distinct values that `analyse` notices per column. This is used by `analyse` to check whether the optimal data type should be of type `ENUM`; if there are more than `max_elements` distinct values, then `ENUM` is not a suggested type.
- `max_memory` (default 8192) is the maximum amount of memory that `analyse` should allocate per column while trying to

find all distinct values.

## 21.4.2. Writing a Procedure

For the moment, the only documentation for this is the source.

You can find all information about procedures by examining the following files:

- `sql/sql_analyse.cc`
- `sql/procedure.h`
- `sql/procedure.cc`
- `sql/sql_select.cc`

## 21.5. Debugging and Porting MySQL

This appendix helps you port MySQL to other operating systems. Do check the list of currently supported operating systems first. See [Section 2.1.1, “Operating Systems Supported by MySQL Community Server”](#). If you have created a new port of MySQL, please let us know so that we can list it here and on our Web site (<http://www.mysql.com/>), recommending it to other users.

Note: If you create a new port of MySQL, you are free to copy and distribute it under the GPL license, but it does not make you a copyright holder of MySQL.

A working POSIX thread library is needed for the server. On Solaris 2.5 we use Sun PThreads (the native thread support in 2.4 and earlier versions is not good enough), on Linux we use LinuxThreads by Xavier Leroy, <[Xavier.Leroy@inria.fr](mailto:Xavier.Leroy@inria.fr)>.

The hard part of porting to a new Unix variant without good native thread support is probably to port MIT-pthreads. See [mit-pthreads/README](#) and Programming POSIX Threads (<http://www.humanfactor.com/pthreads/>).

Up to MySQL 4.0.2, the MySQL distribution included a patched version of Chris Provenzano's Pthreads from MIT (see the MIT Pthreads Web page at <http://www.mit.edu/afs/sipb/project/pthreads/> and a programming introduction at [http://www.mit.edu:8001/people/proven/IAP\\_2000/](http://www.mit.edu:8001/people/proven/IAP_2000/)). These can be used for some operating systems that do not have POSIX threads. See [Section 2.10.5, “MIT-pthreads Notes”](#).

It is also possible to use another user level thread package named FSU Pthreads (see <http://moss.csc.ncsu.edu/~mueller/pthreads/>). This implementation is being used for the SCO port.

See the `thr_lock.c` and `thr_alarm.c` programs in the `mysys` directory for some tests/examples of these problems.

Both the server and the client need a working C++ compiler. We use `gcc` on many platforms. Other compilers that are known to work are SPARCworks, Sun Forte, Irix `cc`, HP-UX `aCC`, IBM AIX `x1C_r`, Intel `ecc/icc` and Compaq `cxx`.

### Important

If you are trying to build MySQL 5.1 with `icc` on the IA64 platform, and need support for MySQL Cluster, you should first ensure that you are using `icc` version 9.1.043 or later. (For details, see [Bug#21875](#).)

To compile only the client use `./configure --without-server`.

There is currently no support for only compiling the server, nor is it likely to be added unless someone has a good reason for it.

If you want/need to change any `Makefile` or the configure script you also need GNU Automake and Autoconf. See [Section 2.10.3, “Installing from the Development Source Tree”](#).

All steps needed to remake everything from the most basic files.

```
/bin/rm */.deps/*.P
/bin/rm -f config.cache
aclocal
autoheader
aclocal
automake
autoconf
./configure --with-debug=full --prefix='your installation directory'

# The makefiles generated above need GNU make 3.75 or newer.
# (called gmake below)
gmake clean all install init-db
```

If you run into problems with a new port, you may have to do some debugging of MySQL! See [Section 21.5.1, “Debugging a MySQL Server”](#).

### Note

Before you start debugging `mysqld`, first get the test programs `mysys/thr_alarm` and `mysys/thr_lock` to work. This ensures that your thread installation has even a remote chance to work!

## 21.5.1. Debugging a MySQL Server

If you are using some functionality that is very new in MySQL, you can try to run `mysqld` with the `--skip-new` (which disables all new, potentially unsafe functionality) or with `--safe-mode` which disables a lot of optimization that may cause problems. See [Section B.1.4.2, “What to Do If MySQL Keeps Crashing”](#).

If `mysqld` doesn't want to start, you should verify that you don't have any `my.cnf` files that interfere with your setup! You can check your `my.cnf` arguments with `mysqld --print-defaults` and avoid using them by starting with `mysqld --no-defaults ...`.

If `mysqld` starts to eat up CPU or memory or if it “hangs,” you can use `mysqladmin processlist status` to find out if someone is executing a query that takes a long time. It may be a good idea to run `mysqladmin -i10 processlist status` in some window if you are experiencing performance problems or problems when new clients can't connect.

The command `mysqladmin debug` dumps some information about locks in use, used memory and query usage to the MySQL log file. This may help solve some problems. This command also provides some useful information even if you haven't compiled MySQL for debugging!

If the problem is that some tables are getting slower and slower you should try to optimize the table with `OPTIMIZE TABLE` or `myisamchk`. See [Chapter 5, \*MySQL Server Administration\*](#). You should also check the slow queries with `EXPLAIN`.

You should also read the OS-specific section in this manual for problems that may be unique to your environment. See [Section 2.13, “Operating System-Specific Notes”](#).

### 21.5.1.1. Compiling MySQL for Debugging

If you have some very specific problem, you can always try to debug MySQL. To do this you must configure MySQL with the `--with-debug` or the `--with-debug=full` option. You can check whether MySQL was compiled with debugging by doing: `mysqld --help`. If the `--debug` flag is listed with the options then you have debugging enabled. `mysqladmin ver` also lists the `mysqld` version as `mysql ... --debug` in this case.

If you are using `gcc`, the recommended `configure` line is:

```
CC=gcc CFLAGS="-O2" CXX=gcc CXXFLAGS="-O2 -felide-constructors \
-fno-exceptions -fno-rtti" ./configure --prefix=/usr/local/mysql \
--with-debug --with-extra-charsets=complex
```

This avoids problems with the `libstdc++` library and with C++ exceptions (many compilers have problems with C++ exceptions in threaded code) and compile a MySQL version with support for all character sets.

If you suspect a memory overrun error, you can configure MySQL with `--with-debug=full`, which installs a memory allocation (`SAFEMALLOC`) checker. However, running with `SAFEMALLOC` is quite slow, so if you get performance problems you should start `mysqld` with the `--skip-safemalloc` option. This disables the memory overrun checks for each call to `malloc()` and `free()`.

If `mysqld` stops crashing when you compile it with `--with-debug`, you probably have found a compiler bug or a timing bug within MySQL. In this case, you can try to add `-g` to the `CFLAGS` and `CXXFLAGS` variables above and not use `--with-debug`. If `mysqld` dies, you can at least attach to it with `gdb` or use `gdb` on the core file to find out what happened.

When you configure MySQL for debugging you automatically enable a lot of extra safety check functions that monitor the health of `mysqld`. If they find something “unexpected,” an entry is written to `stderr`, which `mysqld_safe` directs to the error log! This also means that if you are having some unexpected problems with MySQL and are using a source distribution, the first thing you should do is to configure MySQL for debugging! (The second thing is to send mail to a MySQL mailing list and ask for help. See [Section 1.5.1, “MySQL Mailing Lists”](#). If you believe that you have found a bug, please use the instructions at [Section 1.6, “How to Report Bugs or Problems”](#)).

In the Windows MySQL distribution, `mysqld.exe` is by default compiled with support for trace files.

### 21.5.1.2. Creating Trace Files

If the `mysqld` server doesn't start or if you can cause it to crash quickly, you can try to create a trace file to find the problem.

To do this, you must have a `mysqld` that has been compiled with debugging support. You can check this by executing `mysqld -V`. If the version number ends with `-debug`, it is compiled with support for trace files. (On Windows, the debugging server is named `mysqld-debug` rather than `mysqld` as of MySQL 4.1.)

Start the `mysqld` server with a trace log in `/tmp/mysqld.trace` on Unix or `C:\mysqld.trace` on Windows:

```
shell> mysqld --debug
```

On Windows, you should also use the `--standalone` flag to not start `mysqld` as a service. In a console window, use this command:

```
C:\> mysqld-debug --debug --standalone
```

After this, you can use the `mysql.exe` command-line tool in a second console window to reproduce the problem. You can stop the `mysqld` server with `mysqladmin shutdown`.

Note that the trace file become **very big!** If you want to generate a smaller trace file, you can use debugging options something like this:

```
mysqld --debug=d,info,error,query,general,where:0,/tmp/mysqld.trace
```

This only prints information with the most interesting tags to the trace file.

If you make a bug report about this, please only send the lines from the trace file to the appropriate mailing list where something seems to go wrong! If you can't locate the wrong place, you can ftp the trace file, together with a full bug report, to <ftp://ftp.mysql.com/pub/mysql/upload/> so that a MySQL developer can take a look at it.

The trace file is made with the **DBUG** package by Fred Fish. See [Section 21.5.3, "The DBUG Package"](#).

### 21.5.1.3. Using `pdb` to create a Windows crashdump

Starting with MySQL 5.1.12 the Program Database files (extension `pdb`) are included in the Noinstall distribution of MySQL. These files provide information for debugging your MySQL installation in the event of a problem.

The PDB file contains more detailed information about `mysqld` and other tools that enables more detailed trace and dump files to be created. You can use these with Dr Watson, `WinDbg` and Visual Studio to debug `mysqld`.

For more information on PDB files, see [Microsoft Knowledge Base Article 121366](#). For more information on the debugging options available, see [Debugging Tools for Windows](#).

Dr Watson is installed with all Windows distributions, but if you have installed Windows development tools, Dr Watson may have been replaced with `WinDbg`, the debugger included with Visual Studio, or the debugging tools provided with Borland or Delphi.

To generate a crash file using Dr Watson, follow these steps:

1. Start Dr Watson by running `drwtsn32.exe` interactively using the `-i` option:

```
C:\> drwtsn32 -i
```

2. Set the **LOG FILE PATH** to the directory where you want to store trace files.
3. Make sure **DUMP ALL THREAD CONTEXTS** and **APPEND TO EXISTING LOG FILE**.
4. Uncheck **DUMP SYMBOL TABLE**, **VISUAL NOTIFICATION**, **SOUND NOTIFICATION** and **CREATE CRASH DUMP FILE**.
5. Set the **NUMBER OF INSTRUCTIONS** to a suitable value to capture enough calls in the stacktrace. A value of at 25 should be enough.

Note that the file generated can be very large.

### 21.5.1.4. Debugging `mysqld` under `gdb`

On most systems you can also start `mysqld` from `gdb` to get more information if `mysqld` crashes.

With some older `gdb` versions on Linux you must use `run --one-thread` if you want to be able to debug `mysqld` threads. In this case, you can only have one thread active at a time. We recommend you to upgrade to `gdb 5.1` ASAP as thread debugging works much better with this version!

NPTL threads (the new thread library on Linux) may cause problems while running `mysqld` under `gdb`. Some symptoms are:

- `mysqld` hangs during startup (before it writes `ready for connections`).
- `mysqld` crashes during a `pthread_mutex_lock()` or `pthread_mutex_unlock()` call.

In this case, you should set the following environment variable in the shell before starting `gdb`:

```
LD_ASSUME_KERNEL=2.4.1
export LD_ASSUME_KERNEL
```

When running `mysqld` under `gdb`, you should disable the stack trace with `--skip-stack-trace` to be able to catch segfaults within `gdb`.

In MySQL 4.0.14 and above you should use the `--gdb` option to `mysqld`. This installs an interrupt handler for `SIGINT` (needed to stop `mysqld` with `^C` to set breakpoints) and disable stack tracing and core file handling.

It is very hard to debug MySQL under `gdb` if you do a lot of new connections the whole time as `gdb` doesn't free the memory for old threads. You can avoid this problem by starting `mysqld` with `thread_cache_size` set to a value equal to `max_connections + 1`. In most cases just using `--thread_cache_size=5` helps a lot!

If you want to get a core dump on Linux if `mysqld` dies with a `SIGSEGV` signal, you can start `mysqld` with the `--core-file` option. This core file can be used to make a backtrace that may help you find out why `mysqld` died:

```
shell> gdb mysqld core
gdb> backtrace full
gdb> quit
```

See [Section B.1.4.2, “What to Do If MySQL Keeps Crashing”](#).

If you are using `gdb` 4.17.x or above on Linux, you should install a `.gdb` file, with the following information, in your current directory:

```
set print sevenbit off
handle SIGUSR1 nostop noprint
handle SIGUSR2 nostop noprint
handle SIGWAITING nostop noprint
handle SIGLWP nostop noprint
handle SIGPIPE nostop
handle SIGALRM nostop
handle SIGHUP nostop
handle SIGTERM nostop noprint
```

If you have problems debugging threads with `gdb`, you should download `gdb` 5.x and try this instead. The new `gdb` version has very improved thread handling!

Here is an example how to debug `mysqld`:

```
shell> gdb /usr/local/libexec/mysqld
gdb> run
...
backtrace full # Do this when mysqld crashes
```

Include the above output in a bug report, which you can file using the instructions in [Section 1.6, “How to Report Bugs or Problems”](#).

If `mysqld` hangs you can try to use some system tools like `strace` or `/usr/proc/bin/pstack` to examine where `mysqld` has hung.

```
strace /tmp/log libexec/mysqld
```

If you are using the Perl `DBI` interface, you can turn on debugging information by using the `trace` method or by setting the `DBI_TRACE` environment variable.

### 21.5.1.5. Using a Stack Trace

On some operating systems, the error log contains a stack trace if `mysqld` dies unexpectedly. You can use this to find out where (and maybe why) `mysqld` died. See [Section 5.2.2, “The Error Log”](#). To get a stack trace, you must not compile `mysqld` with the `-fomit-frame-pointer` option to `gcc`. See [Section 21.5.1.1, “Compiling MySQL for Debugging”](#).

A stack trace in the error log looks something like this:

```
mysqld got signal 11;
Attempting backtrace. You can use the following information
to find out where mysqld died. If you see no messages after
this, something went terribly wrong...

stack_bottom = 0x41fd0110 thread_stack 0x40000
mysqld(my_print_stacktrace+0x32)[0x9da402]
mysqld(handle_segfault+0x28a)[0x6648e9]
/lib/libpthread.so.0[0x7f1a5af000f0]
/lib/libc.so.6(strcmp+0x2)[0x7f1a5a10f0f2]
mysqld(_Z21check_change_passwordP3THDPKcS2_Pcj+0x7c)[0x7412cb]
mysqld(_ZN16set_var_password5checkEP3THD+0xd0)[0x688354]
mysqld(_Z17sql_set_variablesP3THDP4ListI12set_var_baseE+0x68)[0x688494]
mysqld(_Z21mysql_execute_commandP3THD+0x41a0)[0x67a170]
mysqld(_Z11mysql_parseP3THDPKcjPS2_+0x282)[0x67f0ad]
mysqld(_Z16dispatch_command19enum_server_commandP3THDPcj+0xbb7)[0x67fdf8]
mysqld(_Z10do_commandP3THD+0x24d)[0x6811b6]
mysqld(handle_one_connection+0x11c)[0x66e05e]
```

If resolution of function names for the trace fails, the trace contains less information:

```
mysqld got signal 11;
Attempting backtrace. You can use the following information
to find out where mysqld died. If you see no messages after
this, something went terribly wrong...

stack_bottom = 0x41fd0110 thread_stack 0x40000
[0x9da402]
[0x6648e9]
[0x7f1a5af000f0]
[0x7f1a5a10f0f2]
[0x7412cb]
[0x688354]
[0x688494]
[0x67a170]
[0x67f0ad]
[0x67fdf8]
[0x6811b6]
[0x66e05e]
```

In the latter case, you can use the [resolve\\_stack\\_dump](#) utility to determine where `mysqld` died by using the following procedure:

1. Copy the numbers from the stack trace to a file, for example `mysqld.stack`. The numbers should not include the surrounding square brackets:

```
0x9da402
0x6648e9
0x7f1a5af000f0
0x7f1a5a10f0f2
0x7412cb
0x688354
0x688494
0x67a170
0x67f0ad
0x67fdf8
0x6811b6
0x66e05e
```

2. Make a symbol file for the `mysqld` server:

```
shell> nm -n libexec/mysqld > /tmp/mysqld.sym
```

If `mysqld` is not linked statically, use the following command instead:

```
shell> nm -D -n libexec/mysqld > /tmp/mysqld.sym
```

If you want to decode C++ symbols, use the `--demangle`, if available, to `nm`. If your version of `nm` does not have this option, you will need to use the `c++filt` command after the stack dump has been produced to demangle the C++ names.

3. Execute the following command:

```
shell> resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack
```

If you were not able to include demangled C++ names in your symbol file, process the `resolve_stack_dump` output using `c++filt`:

```
shell> resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack | c++filt
```

This prints out where `mysqld` died. If that does not help you find out why `mysqld` died, you should create a bug report and include the output from the preceding command with the bug report.

However, in most cases it does not help us to have just a stack trace to find the reason for the problem. To be able to locate the bug or provide a workaround, in most cases we need to know the statement that killed `mysqld` and preferably a test case so that we can repeat the problem! See [Section 1.6, “How to Report Bugs or Problems”](#).

### 21.5.1.6. Using Server Logs to Find Causes of Errors in `mysqld`

Note that before starting `mysqld` with the general query log enabled, you should check all your tables with `myisamchk`. See [Chapter 5, \*MySQL Server Administration\*](#).

If `mysqld` dies or hangs, you should start `mysqld` with the general query log enabled. See [Section 5.2.3, “The General Query Log”](#). When `mysqld` dies again, you can examine the end of the log file for the query that killed `mysqld`.

If you use the default general query log file, the log is stored in the database directory as `host_name.log`. In most cases it is the last query in the log file that killed `mysqld`, but if possible you should verify this by restarting `mysqld` and executing the found query from the `mysql` command-line tools. If this works, you should also test all complicated queries that didn't complete.

You can also try the command `EXPLAIN` on all `SELECT` statements that takes a long time to ensure that `mysqld` is using indexes properly. See [Section 12.3.2, “EXPLAIN Syntax”](#).

You can find the queries that take a long time to execute by starting `mysqld` with the slow query log enabled. See [Section 5.2.5, “The Slow Query Log”](#).

If you find the text `mysqld restarted` in the error log file (normally named `hostname.err`) you probably have found a query that causes `mysqld` to fail. If this happens, you should check all your tables with `myisamchk` (see [Chapter 5, \*MySQL Server Administration\*](#)), and test the queries in the MySQL log files to see whether one fails. If you find such a query, try first upgrading to the newest MySQL version. If this doesn't help and you can't find anything in the `mysql` mail archive, you should report the bug to a MySQL mailing list. The mailing lists are described at <http://lists.mysql.com/>, which also has links to online list archives.

If you have started `mysqld` with `--myisam-recover`, MySQL automatically checks and tries to repair `MyISAM` tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file `'Warning: Checking table ...'` which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further. See [Section 5.1.2, “Server Command Options”](#).

It is not a good sign if `mysqld` did die unexpectedly, but in this case, you should not investigate the `Checking table...` messages, but instead try to find out why `mysqld` died.

### 21.5.1.7. Making a Test Case If You Experience Table Corruption

If you get corrupted tables or if `mysqld` always fails after some update commands, you can test whether this bug is reproducible by doing the following:

- Take down the MySQL daemon (with `mysqladmin shutdown`).
- Make a backup of the tables (to guard against the very unlikely case that the repair does something bad).
- Check all tables with `myisamchk -s database/*.MYI`. Repair any wrong tables with `myisamchk -r database/table.MYI`.
- Make a second backup of the tables.
- Remove (or move away) any old log files from the MySQL data directory if you need more space.
- Start `mysqld` with the binary log enabled. If you want to find a query that crashes `mysqld`, you should start the server with both the general query log enabled as well. See [Section 5.2.3, “The General Query Log”](#), and [Section 5.2.4, “The Binary Log”](#).
- When you have gotten a crashed table, stop the `mysqld server`.
- Restore the backup.
- Restart the `mysqld` server **without** the binary log enabled.
- Re-execute the commands with `mysqlbinlog binary-log-file | mysql`. The binary log is saved in the MySQL database directory with the name `hostname-bin.NNNNNN`.

- If the tables are corrupted again or you can get `mysqld` to die with the above command, you have found reproducible bug that should be easy to fix! FTP the tables and the binary log to <ftp://ftp.mysql.com/pub/mysql/upload/> and report it in our bugs database using the instructions given in Section 1.6, “How to Report Bugs or Problems”. (Please note that the `/pub/mysql/upload/` FTP directory is not listable, so you'll not see what you've uploaded in your FTP client.) If you are a support customer, you can use the MySQL Customer Support Center <https://support.mysql.com/> to alert the MySQL team about the problem and have it fixed as soon as possible.

You can also use the script `mysql_find_rows` to just execute some of the update statements if you want to narrow down the problem.

## 21.5.2. Debugging a MySQL Client

To be able to debug a MySQL client with the integrated debug package, you should configure MySQL with `--with-debug` or `--with-debug=full`. See Section 2.10.2, “Typical configure Options”.

Before running a client, you should set the `MYSQL_DEBUG` environment variable:

```
shell> MYSQL_DEBUG=d:t:O,/tmp/client.trace
shell> export MYSQL_DEBUG
```

This causes clients to generate a trace file in `/tmp/client.trace`.

If you have problems with your own client code, you should attempt to connect to the server and run your query using a client that is known to work. Do this by running `mysql` in debugging mode (assuming that you have compiled MySQL with debugging on):

```
shell> mysql --debug=d:t:O,/tmp/client.trace
```

This provides useful information in case you mail a bug report. See Section 1.6, “How to Report Bugs or Problems”.

If your client crashes at some 'legal' looking code, you should check that your `mysql.h` include file matches your MySQL library file. A very common mistake is to use an old `mysql.h` file from an old MySQL installation with new MySQL library.

## 21.5.3. The DBUG Package

The MySQL server and most MySQL clients are compiled with the DBUG package originally created by Fred Fish. When you have configured MySQL for debugging, this package makes it possible to get a trace file of what the program is debugging. See Section 21.5.1.2, “Creating Trace Files”.

This section summarizes the argument values that you can specify in debug options on the command line for MySQL programs that have been built with debugging support. For more information about programming with the DBUG package, see the DBUG manual in the `dbug` directory of MySQL source distributions. It is best to use a recent distribution to get the most updated DBUG manual.

You use the debug package by invoking a program with the `--debug="..."` or the `-#...` option.

Most MySQL programs have a default debug string that is used if you don't specify an option to `--debug`. The default trace file is usually `/tmp/program_name.trace` on Unix and `\program_name.trace` on Windows.

The debug control string is a sequence of colon-separated fields as follows:

```
<field_1>:<field_2>:...:<field_N>
```

Each field consists of a mandatory flag character followed by an optional “,” and comma-separated list of modifiers:

```
flag[,modifier,modifier,...,modifier]
```

The following table shows the currently recognized flag characters.

Flag	Description
d	Enable output from DBUG_<N> macros for the current state. May be followed by a list of keywords which selects output only for the DBUG macros with that keyword. An empty list of keywords implies output for all macros.
D	Delay after each debugger output line. The argument is the number of tenths of seconds to delay, subject to machine capabilities. For example, <code>-#D, 20</code> specifies a delay of two seconds.
f	Limit debugging, tracing, and profiling to the list of named functions. Note that a null list disables all functions. The appropriate <code>d</code> or <code>t</code> flags must still be given; this flag only limits their actions if they are enabled.
F	Identify the source file name for each line of debug or trace output.

<b>i</b>	Identify the process with the PID or thread ID for each line of debug or trace output.
<b>g</b>	Enable profiling. Create a file called <code>dbugmon.out</code> containing information that can be used to profile the program. May be followed by a list of keywords that select profiling only for the functions in that list. A null list implies that all functions are considered.
<b>L</b>	Identify the source file line number for each line of debug or trace output.
<b>n</b>	Print the current function nesting depth for each line of debug or trace output.
<b>N</b>	Number each line of debug output.
<b>o</b>	Redirect the debugger output stream to the specified file. The default output is <code>stderr</code> .
<b>O</b>	Like <code>o</code> , but the file is really flushed between each write. When needed, the file is closed and reopened between each write.
<b>p</b>	Limit debugger actions to specified processes. A process must be identified with the <code>DEBUG_PROCESS</code> macro and match one in the list for debugger actions to occur.
<b>P</b>	Print the current process name for each line of debug or trace output.
<b>r</b>	When pushing a new state, do not inherit the previous state's function nesting level. Useful when the output is to start at the left margin.
<b>S</b>	Do function <code>_sanity(_file_, _line_)</code> at each debugged function until <code>_sanity()</code> returns something that differs from 0. (Mostly used with <code>safemalloc</code> to find memory leaks)
<b>t</b>	Enable function call/exit trace lines. May be followed by a list (containing only one modifier) giving a numeric maximum trace level, beyond which no output occurs for either debugging or tracing macros. The default is a compile time option.

Some examples of debug control strings that might appear on a shell command line (the `-#` is typically used to introduce a control string to an application program) are:

```
-#d:t
-#d:f,main,subr1:F:L:t,20
-#d,input,output,files:n
-#d:t:i:0,\\mysqld.trace
```

In MySQL, common tags to print (with the `d` option) are `enter`, `exit`, `error`, `warning`, `info`, and `loop`.

## 21.5.4. Comments about RTS Threads

I have tried to use the RTS thread packages with MySQL but stumbled on the following problems:

They use old versions of many POSIX calls and it is very tedious to make wrappers for all functions. I am inclined to think that it would be easier to change the thread libraries to the newest POSIX specification.

Some wrappers are currently written. See `mysys/my_pthread.c` for more info.

At least the following should be changed:

`pthread_get_specific` should use one argument. `sigwait` should take two arguments. A lot of functions (at least `pthread_cond_wait`, `pthread_cond_timedwait()`) should return the error code on error. Now they return `-1` and set `errno`.

Another problem is that user-level threads use the `ALRM` signal and this aborts a lot of functions (`read`, `write`, `open`...). MySQL should do a retry on interrupt on all of these but it is not that easy to verify it.

The biggest unsolved problem is the following:

To get thread-level alarms I changed `mysys/thr_alarm.c` to wait between alarms with `pthread_cond_timedwait()`, but this aborts with error `EINTR`. I tried to debug the thread library as to why this happens, but couldn't find any easy solution.

If someone wants to try MySQL with RTS threads I suggest the following:

- Change functions MySQL uses from the thread library to POSIX. This shouldn't take that long.
- Compile all libraries with the `-DHAVE_rts_threads`.
- Compile `thr_alarm`.
- If there are some small differences in the implementation, they may be fixed by changing `my_pthread.h` and `my_pthread.c`.

- Run `thr_alarm`. If it runs without any “warning,” “error,” or aborted messages, you are on the right track. Here is a successful run on Solaris:

```

Main thread: 1
Thread 0 (5) started
Thread: 5 Waiting
process_alarm
Thread 1 (6) started
Thread: 6 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 1 (1) sec
Thread: 6 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 2 (2) sec
Thread: 6 Simulation of no alarm needed
Thread: 6 Slept for 0 (3) sec
Thread: 6 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 4 (4) sec
Thread: 6 Waiting
process_alarm
thread_alarm
Thread: 5 Slept for 10 (10) sec
Thread: 5 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 5 (5) sec
Thread: 6 Waiting
process_alarm
process_alarm
...
thread_alarm
Thread: 5 Slept for 0 (1) sec
end

```

## 21.5.5. Differences Between Thread Packages

MySQL is very dependent on the thread package used. So when choosing a good platform for MySQL, the thread package is very important.

There are at least three types of thread packages:

- User threads in a single process. Thread switching is managed with alarms and the threads library manages all non-thread-safe functions with locks. Read, write and select operations are usually managed with a thread-specific select that switches to another thread if the running threads have to wait for data. If the user thread packages are integrated in the standard libs (FreeBSD and BSDI threads) the thread package requires less overhead than thread packages that have to map all unsafe calls (MIT-pthreads, FSU Pthreads and RTS threads). In some environments (for example, SCO), all system calls are thread-safe so the mapping can be done very easily (FSU Pthreads on SCO). Downside: All mapped calls take a little time and it is quite tricky to be able to handle all situations. There are usually also some system calls that are not handled by the thread package (like MIT-pthreads and sockets). Thread scheduling isn't always optimal.
- User threads in separate processes. Thread switching is done by the kernel and all data are shared between threads. The thread package manages the standard thread calls to allow sharing data between threads. LinuxThreads is using this method. Downside: Lots of processes. Thread creating is slow. If one thread dies the rest are usually left hanging and you must kill them all before restarting. Thread switching is somewhat expensive.
- Kernel threads. Thread switching is handled by the thread library or the kernel and is very fast. Everything is done in one process, but on some systems, `ps` may show the different threads. If one thread aborts, the whole process aborts. Most system calls are thread-safe and should require very little overhead. Solaris, HP-UX, AIX and OSF/1 have kernel threads.

In some systems kernel threads are managed by integrating user level threads in the system libraries. In such cases, the thread switching can only be done by the thread library and the kernel isn't really “thread aware.”

---

# Appendix A. MySQL 5.1 Frequently Asked Questions

## A.1. MySQL 5.1 FAQ — General

### Questions

- [22.1.1](#): Which version of MySQL is production-ready (GA)?
- [22.1.2](#): Can MySQL 5.1 do subqueries?
- [22.1.3](#): Can MySQL 5.1 perform multiple-table inserts, updates, and deletes?
- [22.1.4](#): Does MySQL 5.1 have a Query Cache? Does it work on Server, Instance or Database?
- [22.1.5](#): Does MySQL 5.1 have Sequences?
- [22.1.6](#): Does MySQL 5.1 have a `NOW( )` function with fractions of seconds?
- [22.1.7](#): Does MySQL 5.1 work with multi-core processors?
- [22.1.8](#): Is there a hot backup tool for MyISAM like InnoDB Hot Backup?
- [22.1.9](#): Have there been there any improvements in error reporting when foreign keys fail? Does MySQL now report which column and reference failed?
- [22.1.10](#): Can MySQL 5.1 perform ACID transactions?

### Questions and Answers

#### 22.1.1: Which version of MySQL is production-ready (GA)?

Currently, both MySQL 5.0 and MySQL 5.1 are supported for production use.

MySQL 5.0 achieved General Availability (GA) status with MySQL 5.0.15, which was released for production use on 19 October 2005.

MySQL 5.1 achieved General Availability (GA) status with MySQL 5.1.30, which was released for production use on 14 November 2008.

Development work on MySQL 5.4 has started; currently, MySQL 5.4 is in beta status.

Development work on MySQL 6.0 has started; currently, MySQL 6.0 is in alpha status.

#### 22.1.2: Can MySQL 5.1 do subqueries?

Yes. See [Section 12.2.9](#), “Subquery Syntax”.

#### 22.1.3: Can MySQL 5.1 perform multiple-table inserts, updates, and deletes?

Yes. For the syntax required to perform multiple-table updates, see [Section 12.2.11](#), “UPDATE Syntax”; for that required to perform multiple-table deletes, see [Section 12.2.2](#), “DELETE Syntax”.

A multiple-table insert can be accomplished using a trigger whose `FOR EACH ROW` clause contains multiple `INSERT` statements within a `BEGIN . . . END` block. See [Section 18.3](#), “Using Triggers”.

#### 22.1.4: Does MySQL 5.1 have a Query Cache? Does it work on Server, Instance or Database?

Yes. The query cache operates on the server level, caching complete result sets matched with the original query string. If an exactly identical query is made (which often happens, particularly in web applications), no parsing or execution is necessary; the result is sent directly from the cache. Various tuning options are available. See [Section 7.5.5](#), “The MySQL Query Cache”.

#### 22.1.5: Does MySQL 5.1 have Sequences?

No. However, MySQL has an `AUTO_INCREMENT` system, which in MySQL 5.1 can also handle inserts in a multi-master replication setup. With the `auto_increment_increment` and `auto_increment_offset` system variables, you can set each server to generate auto-increment values that don't conflict with other servers. The `auto_increment_increment` value should be greater than the number of servers, and each server should have a unique offset.

**22.1.6: Does MySQL 5.1 have a `NOW()` function with fractions of seconds?**

No. This is on the MySQL roadmap as a “rolling feature”. This means that it is not a flagship feature, but will be implemented, development time permitting. Specific customer demand may change this scheduling.

However, MySQL does parse time strings with a fractional component. See [Section 10.3.2, “The `TIME` Type”](#).

**22.1.7: Does MySQL 5.1 work with multi-core processors?**

Yes. MySQL is fully multi-threaded, and will make use of multiple CPUs, provided that the operating system supports them.

**22.1.8: Is there a hot backup tool for MyISAM like InnoDB Hot Backup?**

This is currently under development for a future MySQL release.

**22.1.9: Have there been any improvements in error reporting when foreign keys fail? Does MySQL now report which column and reference failed?**

The foreign key support in [InnoDB](#) has seen improvements in each major version of MySQL. Foreign key support generic to all storage engines is scheduled for MySQL 6.x; this should resolve any inadequacies in the current storage engine specific implementation.

**22.1.10: Can MySQL 5.1 perform ACID transactions?**

Yes. All current MySQL versions support transactions. The [InnoDB](#) storage engine offers full ACID transactions with row-level locking, multi-versioning, non-locking repeatable reads, and all four SQL standard isolation levels.

The [NDB](#) storage engine supports the [READ COMMITTED](#) transaction isolation level only.

## A.2. MySQL 5.1 FAQ — Storage Engines

### Questions

- [22.2.1](#): Where can I obtain complete documentation for MySQL storage engines and the pluggable storage engine architecture?
- [22.2.2](#): Are there any new storage engines in MySQL 5.1?
- [22.2.3](#): Have any storage engines been removed in MySQL 5.1?
- [22.2.4](#): What are the unique benefits of the [ARCHIVE](#) storage engine?
- [22.2.5](#): Do the new features in MySQL 5.1 apply to all storage engines?

### Questions and Answers

**22.2.1: Where can I obtain complete documentation for MySQL storage engines and the pluggable storage engine architecture?**

See [Chapter 13, \*Storage Engines\*](#). That chapter contains information about all MySQL storage engines except for the [NDB](#) storage engine used for MySQL Cluster; [NDB](#) is covered in [MySQL Cluster NDB 6.X/7.X](#).

**MySQL Enterprise**

For expert advice about the storage engine(s) most suitable to your circumstances subscribe to the MySQL Enterprise Monitor. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

**22.2.2: Are there any new storage engines in MySQL 5.1?**

Yes, the [IBMDB2I](#) storage engine is included in the IBM i5/OS (TAR packages) and IBM i5/OS (SAVF packages). Also, there have been significant improvements in existing storage engines, in particular for the [NDB](#) storage engine that forms the basis for MySQL Cluster.

The Falcon storage engine is available in MySQL 6.0. See [MySQL 6.0 Reference Manual](#).

**22.2.3: Have any storage engines been removed in MySQL 5.1?**

Yes. MySQL 5.1 no longer supports the [BDB](#) storage engine. Any existing [BDB](#) tables should be converted to another storage engine before upgrading to MySQL 5.1.

**22.2.4: What are the unique benefits of the [ARCHIVE](#) storage engine?**

The [ARCHIVE](#) storage engine is ideally suited for storing large amounts of data without indexes; it has a very small footprint, and performs selects using table scans. See [Section 13.11](#), “[The ARCHIVE Storage Engine](#)”, for details.

#### **22.2.5: Do the new features in MySQL 5.1 apply to all storage engines?**

The general new features such as views, stored procedures, triggers, [INFORMATION\\_SCHEMA](#), precision math ([DECIMAL](#) column type), and the [BIT](#) column type, apply to all storage engines. There are also additions and changes for specific storage engines.

## **A.3. MySQL 5.1 FAQ — Server SQL Mode**

### **Questions**

- [22.3.1](#): What are server SQL modes?
- [22.3.2](#): How many server SQL modes are there?
- [22.3.3](#): How do you determine the server SQL mode?
- [22.3.4](#): Is the mode dependent on the database or connection?
- [22.3.5](#): Can the rules for strict mode be extended?
- [22.3.6](#): Does strict mode impact performance?
- [22.3.7](#): What is the default server SQL mode when My SQL 5.1 is installed?

### **Questions and Answers**

#### **22.3.1: What are server SQL modes?**

Server SQL modes define what SQL syntax MySQL should support and what kind of data validation checks it should perform. This makes it easier to use MySQL in different environments and to use MySQL together with other database servers. The MySQL Server apply these modes individually to different clients. For more information, see [Section 5.1.7](#), “[Server SQL Modes](#)”.

#### **22.3.2: How many server SQL modes are there?**

Each mode can be independently switched on and off. See [Section 5.1.7](#), “[Server SQL Modes](#)”, for a complete list of available modes.

#### **22.3.3: How do you determine the server SQL mode?**

You can set the default SQL mode (for `mysqld` startup) with the `--sql-mode` option. Using the statement `SET [GLOBAL|SESSION] sql_mode='modes'`, you can change the settings from within a connection, either locally to the connection, or to take effect globally. You can retrieve the current mode by issuing a `SELECT @@sql_mode` statement.

#### **22.3.4: Is the mode dependent on the database or connection?**

A mode is not linked to a particular database. Modes can be set locally to the session (connection), or globally for the server. you can change these settings using `SET [GLOBAL|SESSION] sql_mode='modes'`.

#### **22.3.5: Can the rules for strict mode be extended?**

When we refer to *strict mode*, we mean a mode where at least one of the modes [TRADITIONAL](#), [STRICT\\_TRANS\\_TABLES](#), or [STRICT\\_ALL\\_TABLES](#) is enabled. Options can be combined, so you can add additional restrictions to a mode. See [Section 5.1.7](#), “[Server SQL Modes](#)”, for more information.

#### **22.3.6: Does strict mode impact performance?**

The intensive validation of input data that some settings requires more time than if the validation is not done. While the performance impact is not that great, if you do not require such validation (perhaps your application already handles all of this), then MySQL gives you the option of leaving strict mode disabled. However — if you do require it — strict mode can provide such validation.

#### **22.3.7: What is the default server SQL mode when My SQL 5.1 is installed?**

By default, no special modes are enabled. See [Section 5.1.7](#), “[Server SQL Modes](#)”, for information about all available modes and MySQL's default behavior.

## A.4. MySQL 5.1 FAQ — Stored Procedures and Functions

### Questions

- [22.4.1](#): Does MySQL 5.1 support stored procedures and functions?
- [22.4.2](#): Where can I find documentation for MySQL stored procedures and stored functions?
- [22.4.3](#): Is there a discussion forum for MySQL stored procedures?
- [22.4.4](#): Where can I find the ANSI SQL 2003 specification for stored procedures?
- [22.4.5](#): How do you manage stored routines?
- [22.4.6](#): Is there a way to view all stored procedures and stored functions in a given database?
- [22.4.7](#): Where are stored procedures stored?
- [22.4.8](#): Is it possible to group stored procedures or stored functions into packages?
- [22.4.9](#): Can a stored procedure call another stored procedure?
- [22.4.10](#): Can a stored procedure call a trigger?
- [22.4.11](#): Can a stored procedure access tables?
- [22.4.12](#): Do stored procedures have a statement for raising application errors?
- [22.4.13](#): Do stored procedures provide exception handling?
- [22.4.14](#): Can MySQL 5.1 stored routines return result sets?
- [22.4.15](#): Is `WITH RECOMPILE` supported for stored procedures?
- [22.4.16](#): Is there a MySQL equivalent to using `mod_plsql` as a gateway on Apache to talk directly to a stored procedure in the database?
- [22.4.17](#): Can I pass an array as input to a stored procedure?
- [22.4.18](#): Can I pass a cursor as an `IN` parameter to a stored procedure?
- [22.4.19](#): Can I return a cursor as an `OUT` parameter from a stored procedure?
- [22.4.20](#): Can I print out a variable's value within a stored routine for debugging purposes?
- [22.4.21](#): Can I commit or roll back transactions inside a stored procedure?
- [22.4.22](#): Do MySQL 5.1 stored procedures and functions work with replication?
- [22.4.23](#): Are stored procedures and functions created on a master server replicated to a slave?
- [22.4.24](#): How are actions that take place inside stored procedures and functions replicated?
- [22.4.25](#): Are there special security requirements for using stored procedures and functions together with replication?
- [22.4.26](#): What limitations exist for replicating stored procedure and function actions?
- [22.4.27](#): Do the preceding limitations affect MySQL's ability to do point-in-time recovery?
- [22.4.28](#): What is being done to correct the aforementioned limitations?

### Questions and Answers

#### **22.4.1: Does MySQL 5.1 support stored procedures and functions?**

Yes. MySQL 5.1 supports two types of stored routines — stored procedures and stored functions.

#### **22.4.2: Where can I find documentation for MySQL stored procedures and stored functions?**

See [Section 18.2, “Using Stored Routines \(Procedures and Functions\)”](#).

**22.4.3: Is there a discussion forum for MySQL stored procedures?**

Yes. See <http://forums.mysql.com/list.php?98>.

**22.4.4: Where can I find the ANSI SQL 2003 specification for stored procedures?**

Unfortunately, the official specifications are not freely available (ANSI makes them available for purchase). However, there are books — such as *SQL-99 Complete, Really* by Peter Gulutzan and Trudy Pelzer — which give a comprehensive overview of the standard, including coverage of stored procedures.

**22.4.5: How do you manage stored routines?**

It is always good practice to use a clear naming scheme for your stored routines. You can manage stored procedures with `CREATE [FUNCTION|PROCEDURE]`, `ALTER [FUNCTION|PROCEDURE]`, `DROP [FUNCTION|PROCEDURE]`, and `SHOW CREATE [FUNCTION|PROCEDURE]`. You can obtain information about existing stored procedures using the `ROUTINES` table in the `INFORMATION_SCHEMA` database (see [Section 19.14](#), “The `INFORMATION_SCHEMA` `ROUTINES` Table”).

**22.4.6: Is there a way to view all stored procedures and stored functions in a given database?**

Yes. For a database named `dbname`, use this query on the `INFORMATION_SCHEMA.ROUTINES` table:

```
SELECT ROUTINE_TYPE, ROUTINE_NAME
FROM INFORMATION_SCHEMA.ROUTINES
WHERE ROUTINE_SCHEMA= 'dbname' ;
```

For more information, see [Section 19.14](#), “The `INFORMATION_SCHEMA` `ROUTINES` Table”.

The body of a stored routine can be viewed using `SHOW CREATE FUNCTION` (for a stored function) or `SHOW CREATE PROCEDURE` (for a stored procedure). See [Section 12.5.5.11](#), “`SHOW CREATE PROCEDURE` Syntax”, for more information.

**22.4.7: Where are stored procedures stored?**

In the `proc` table of the `mysql` system database. However, you should not access the tables in the system database directly. Instead, use `SHOW CREATE FUNCTION` to obtain information about stored functions, and `SHOW CREATE PROCEDURE` to obtain information about stored procedures. See [Section 12.5.5.11](#), “`SHOW CREATE PROCEDURE` Syntax”, for more information about these statements.

You can also query the `ROUTINES` table in the `INFORMATION_SCHEMA` database — see [Section 19.14](#), “The `INFORMATION_SCHEMA` `ROUTINES` Table”, for information about this table.

**22.4.8: Is it possible to group stored procedures or stored functions into packages?**

No. This is not supported in MySQL 5.1.

**22.4.9: Can a stored procedure call another stored procedure?**

Yes.

**22.4.10: Can a stored procedure call a trigger?**

A stored procedure can execute an SQL statement, such as an `UPDATE`, that causes a trigger to activate.

**22.4.11: Can a stored procedure access tables?**

Yes. A stored procedure can access one or more tables as required.

**22.4.12: Do stored procedures have a statement for raising application errors?**

Not in MySQL 5.1. The SQL standard `SIGNAL` and `RESIGNAL` statements are implemented in MySQL 6.0.

**22.4.13: Do stored procedures provide exception handling?**

MySQL implements `HANDLER` definitions according to the SQL standard. See [Section 12.8.4.2](#), “`DECLARE` for `Handlers`”, for details.

**22.4.14: Can MySQL 5.1 stored routines return result sets?**

*Stored procedures* can, but stored functions cannot. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You need to use the MySQL 4.1 (or above) client-server protocol for this to work. This means that — for instance — in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

**22.4.15: Is `WITH RECOMPILE` supported for stored procedures?**

Not in MySQL 5.1.

**22.4.16: Is there a MySQL equivalent to using `mod_plsql` as a gateway on Apache to talk directly to a stored procedure in the database?**

There is no equivalent in MySQL 5.1.

**22.4.17: Can I pass an array as input to a stored procedure?**

Not in MySQL 5.1.

**22.4.18: Can I pass a cursor as an `IN` parameter to a stored procedure?**

In MySQL 5.1, cursors are available inside stored procedures only.

**22.4.19: Can I return a cursor as an `OUT` parameter from a stored procedure?**

In MySQL 5.1, cursors are available inside stored procedures only. However, if you do not open a cursor on a `SELECT`, the result will be sent directly to the client. You can also `SELECT INTO` variables. See [Section 12.2.8, “SELECT Syntax”](#).

**22.4.20: Can I print out a variable's value within a stored routine for debugging purposes?**

Yes, you can do this in a *stored procedure*, but not in a stored function. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You will need to use the MySQL 4.1 (or above) client-server protocol for this to work. This means that — for instance — in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

**22.4.21: Can I commit or roll back transactions inside a stored procedure?**

Yes. However, you cannot perform transactional operations within a stored function.

**22.4.22: Do MySQL 5.1 stored procedures and functions work with replication?**

Yes, standard actions carried out in stored procedures and functions are replicated from a master MySQL server to a slave server. There are a few limitations that are described in detail in [Section 18.6, “Binary Logging of Stored Programs”](#).

**22.4.23: Are stored procedures and functions created on a master server replicated to a slave?**

Yes, creation of stored procedures and functions carried out through normal DDL statements on a master server are replicated to a slave, so the objects will exist on both servers. `ALTER` and `DROP` statements for stored procedures and functions are also replicated.

**22.4.24: How are actions that take place inside stored procedures and functions replicated?**

MySQL records each DML event that occurs in a stored procedure and replicates those individual actions to a slave server. The actual calls made to execute stored procedures are not replicated.

Stored functions that change data are logged as function invocations, not as the DML events that occur inside each function.

**22.4.25: Are there special security requirements for using stored procedures and functions together with replication?**

Yes. Because a slave server has authority to execute any statement read from a master's binary log, special security constraints exist for using stored functions with replication. If replication or binary logging in general (for the purpose of point-in-time recovery) is active, then MySQL DBAs have two security options open to them:

1. Any user wishing to create stored functions must be granted the `SUPER` privilege.
2. Alternatively, a DBA can set the `log_bin_trust_function_creators` system variable to 1, which enables anyone with the standard `CREATE ROUTINE` privilege to create stored functions.

**22.4.26: What limitations exist for replicating stored procedure and function actions?**

Non-deterministic (random) or time-based actions embedded in stored procedures may not replicate properly. By their very nature, randomly produced results are not predictable and cannot be exactly reproduced, and therefore, random actions replicated to a slave will not mirror those performed on a master. Note that declaring stored functions to be `DETERMINISTIC` or setting the `log_bin_trust_function_creators` system variable to 0 will not allow random-valued operations to be invoked.

In addition, time-based actions cannot be reproduced on a slave because the timing of such actions in a stored procedure is not reproducible through the binary log used for replication. It records only DML events and does not factor in timing constraints.

Finally, non-transactional tables for which errors occur during large DML actions (such as bulk inserts) may experience replication issues in that a master may be partially updated from DML activity, but no updates are done to the slave because of the errors that

occurred. A workaround is for a function's DML actions to be carried out with the `IGNORE` keyword so that updates on the master that cause errors are ignored and updates that do not cause errors are replicated to the slave.

#### **22.4.27: Do the preceding limitations affect MySQL's ability to do point-in-time recovery?**

The same limitations that affect replication do affect point-in-time recovery.

#### **22.4.28: What is being done to correct the aforementioned limitations?**

As of MySQL 5.1.5, you can choose either statement-based replication or row-based replication. The original replication implementation is based on statement-based binary logging. Row-based binary logging resolves the limitations mentioned earlier.

Beginning with MySQL 5.1.8, *mixed* replication is also available (by starting the server with `--binlog-format=mixed`). This hybrid, “smart” form of replication “knows” whether statement-level replication can safely be used, or row-level replication is required.

For additional information, see [Section 16.1.2, “Replication Formats”](#).

## **A.5. MySQL 5.1 FAQ — Triggers**

### **Questions**

- [22.5.1](#): Where can I find the documentation for MySQL 5.1 triggers?
- [22.5.2](#): Is there a discussion forum for MySQL Triggers?
- [22.5.3](#): Does MySQL 5.1 have statement-level or row-level triggers?
- [22.5.4](#): Are there any default triggers?
- [22.5.5](#): How are triggers managed in MySQL?
- [22.5.6](#): Is there a way to view all triggers in a given database?
- [22.5.7](#): Where are triggers stored?
- [22.5.8](#): Can a trigger call a stored procedure?
- [22.5.9](#): Can triggers access tables?
- [22.5.10](#): Can triggers call an external application through a UDF?
- [22.5.11](#): Is it possible for a trigger to update tables on a remote server?
- [22.5.12](#): Do triggers work with replication?
- [22.5.13](#): How are actions carried out through triggers on a master replicated to a slave?

### **Questions and Answers**

#### **22.5.1: Where can I find the documentation for MySQL 5.1 triggers?**

See [Section 18.3, “Using Triggers”](#).

#### **22.5.2: Is there a discussion forum for MySQL Triggers?**

Yes. It is available at <http://forums.mysql.com/list.php?99>.

#### **22.5.3: Does MySQL 5.1 have statement-level or row-level triggers?**

In MySQL 5.1, all triggers are `FOR EACH ROW` — that is, the trigger is activated for each row that is inserted, updated, or deleted. MySQL 5.1 does not support triggers using `FOR EACH STATEMENT`.

#### **22.5.4: Are there any default triggers?**

Not explicitly. MySQL does have specific special behavior for some `TIMESTAMP` columns, as well as for columns which are defined using `AUTO_INCREMENT`.

#### **22.5.5: How are triggers managed in MySQL?**

In MySQL 5.1, triggers can be created using the `CREATE TRIGGER` statement, and dropped using `DROP TRIGGER`. See [Section 12.1.19, “CREATE TRIGGER Syntax”](#), and [Section 12.1.30, “DROP TRIGGER Syntax”](#), for more about these statements.

Information about triggers can be obtained by querying the `INFORMATION_SCHEMA.TRIGGERS` table. See [Section 19.16, “The INFORMATION\\_SCHEMA TRIGGERS Table”](#).

#### 22.5.6: Is there a way to view all triggers in a given database?

Yes. You can obtain a listing of all triggers defined on database `dbname` using a query on the `INFORMATION_SCHEMA.TRIGGERS` table such as the one shown here:

```
SELECT TRIGGER_NAME, EVENT_MANIPULATION, EVENT_OBJECT_TABLE, ACTION_STATEMENT
FROM INFORMATION_SCHEMA.TRIGGERS
WHERE TRIGGER_SCHEMA='dbname';
```

For more information about this table, see [Section 19.16, “The INFORMATION\\_SCHEMA TRIGGERS Table”](#).

You can also use the `SHOW TRIGGERS` statement, which is specific to MySQL. See [Section 12.5.5.40, “SHOW TRIGGERS Syntax”](#).

#### 22.5.7: Where are triggers stored?

Triggers for a table are currently stored in `.TRG` files, with one such file one per table.

#### 22.5.8: Can a trigger call a stored procedure?

Yes.

#### 22.5.9: Can triggers access tables?

A trigger can access both old and new data in its own table. A trigger can also affect other tables, but it is not permitted to modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.

#### 22.5.10: Can triggers call an external application through a UDF?

Yes. For example, a trigger could invoke the `sys_exec()` UDF available at MySQL Forge here: <http://forge.mysql.com/projects/project.php?id=211>

#### 22.5.11: Is it possible for a trigger to update tables on a remote server?

Yes. A table on a remote server could be updated using the `FEDERATED` storage engine. (See [Section 13.10, “The FEDERATED Storage Engine”](#)).

#### 22.5.12: Do triggers work with replication?

Yes. However, the way in which they work depends whether you are using MySQL's “classic” statement-based replication available in all versions of MySQL, or the row-based replication format introduced in MySQL 5.1.

When using statement-based replication, triggers on the slave are executed by statements that are executed on the master (and replicated to the slave).

When using row-based replication, triggers are not executed on the slave due to statements that were run on the master and then replicated to the slave. Instead, when using row-based replication, the changes caused by executing the trigger on the master are applied on the slave.

For more information, see [Section 16.3.1.26, “Replication and Triggers”](#).

#### 22.5.13: How are actions carried out through triggers on a master replicated to a slave?

Again, this depends on whether you are using statement-based or row-based replication.

**Statement-based replication.** First, the triggers that exist on a master must be re-created on the slave server. Once this is done, the replication flow works as any other standard DML statement that participates in replication. For example, consider a table `EMP` that has an `AFTER` insert trigger, which exists on a master MySQL server. The same `EMP` table and `AFTER` insert trigger exist on the slave server as well. The replication flow would be:

1. An `INSERT` statement is made to `EMP`.
2. The `AFTER` trigger on `EMP` activates.
3. The `INSERT` statement is written to the binary log.

4. The replication slave picks up the `INSERT` statement to `EMP` and executes it.
5. The `AFTER` trigger on `EMP` that exists on the slave activates.

**Row-based replication.** When you use row-based replication, the changes caused by executing the trigger on the master are applied on the slave. However, the triggers themselves are not actually executed on the slave under row-based replication. This is because, if both the master and the slave applied the changes from the master and — in addition — the trigger causing these changes were applied on the slave, the changes would in effect be applied twice on the slave, leading to different data on the master and the slave.

In most cases, the outcome is the same for both row-based and statement-based replication. However, if you use different triggers on the master and slave, you cannot use row-based replication. (This is because the row-based format replicates the changes made by triggers executing on the master to the slaves, rather than the statements that caused the triggers to execute, and the corresponding triggers on the slave are not executed.) Instead, any statements causing such triggers to be executed must be replicated using statement-based replication.

For more information, see [Section 16.3.1.26, “Replication and Triggers”](#).

## A.6. MySQL 5.1 FAQ — Views

### Questions

- [22.6.1](#): Where can I find documentation covering MySQL Views?
- [22.6.2](#): Is there a discussion forum for MySQL Views?
- [22.6.3](#): What happens to a view if an underlying table is dropped or renamed?
- [22.6.4](#): Does MySQL 5.1 have table snapshots?
- [22.6.5](#): Does MySQL 5.1 have materialized views?
- [22.6.6](#): Can you insert into views that are based on joins?

### Questions and Answers

#### 22.6.1: Where can I find documentation covering MySQL Views?

See [Section 18.5, “Using Views”](#).

#### 22.6.2: Is there a discussion forum for MySQL Views?

Yes. See <http://forums.mysql.com/list.php?100>

#### 22.6.3: What happens to a view if an underlying table is dropped or renamed?

After a view has been created, it is possible to drop or alter a table or view to which the definition refers. To check a view definition for problems of this kind, use the `CHECK TABLE` statement. (See [Section 12.5.2.3, “CHECK TABLE Syntax”](#).)

#### 22.6.4: Does MySQL 5.1 have table snapshots?

No.

#### 22.6.5: Does MySQL 5.1 have materialized views?

No.

#### 22.6.6: Can you insert into views that are based on joins?

It is possible, provided that your `INSERT` statement has a column list that makes it clear there is only one table involved.

You *cannot* insert into multiple tables with a single insert on a view.

## A.7. MySQL 5.0 FAQ — `INFORMATION_SCHEMA`

### Questions

---

- [22.7.1](#): Where can I find documentation for the MySQL `INFORMATION_SCHEMA` database?
- [22.7.2](#): Is there a discussion forum for `INFORMATION_SCHEMA`?
- [22.7.3](#): Where can I find the ANSI SQL 2003 specification for `INFORMATION_SCHEMA`?
- [22.7.4](#): What is the difference between the Oracle Data Dictionary and MySQL's `INFORMATION_SCHEMA`?
- [22.7.5](#): Can I add to or otherwise modify the tables found in the `INFORMATION_SCHEMA` database?

### Questions and Answers

#### 22.7.1: Where can I find documentation for the MySQL `INFORMATION_SCHEMA` database?

See [Chapter 19, `INFORMATION\_SCHEMA` Tables](#)

#### 22.7.2: Is there a discussion forum for `INFORMATION_SCHEMA`?

See <http://forums.mysql.com/list.php?101>.

#### 22.7.3: Where can I find the ANSI SQL 2003 specification for `INFORMATION_SCHEMA`?

Unfortunately, the official specifications are not freely available. (ANSI makes them available for purchase.) However, there are books available — such as *SQL-99 Complete, Really* by Peter Gulutzan and Trudy Pelzer — which give a comprehensive overview of the standard, including `INFORMATION_SCHEMA`.

#### 22.7.4: What is the difference between the Oracle Data Dictionary and MySQL's `INFORMATION_SCHEMA`?

Both Oracle and MySQL provide metadata in tables. However, Oracle and MySQL use different table names and column names. MySQL's implementation is more similar to those found in DB2 and SQL Server, which also support `INFORMATION_SCHEMA` as defined in the SQL standard.

#### 22.7.5: Can I add to or otherwise modify the tables found in the `INFORMATION_SCHEMA` database?

No. Since applications may rely on a certain standard structure, this should not be modified. For this reason, *we cannot support bugs or other issues which result from modifying `INFORMATION_SCHEMA` tables or data.*

## A.8. MySQL 5.1 FAQ — Migration

### Questions

- [22.8.1](#): Where can I find information on how to migrate from MySQL 5.0 to MySQL 5.1?
- [22.8.2](#): How has storage engine (table type) support changed in MySQL 5.1 from previous versions?

### Questions and Answers

#### 22.8.1: Where can I find information on how to migrate from MySQL 5.0 to MySQL 5.1?

For detailed upgrade information, see [Section 2.12.1, “Upgrading MySQL”](#). We recommend that you do not skip a major version when upgrading, but rather complete the process in steps, upgrading from one major version to the next in each step. This may seem more complicated, but it will you save time and trouble — if you encounter problems during the upgrade, their origin will be easier to identify, either by you or — if you have a MySQL Network subscription — by MySQL support.

#### 22.8.2: How has storage engine (table type) support changed in MySQL 5.1 from previous versions?

Storage engine support has changed as follows:

- Support for `ISAM` tables was removed in MySQL 5.0 and you should now use the `MyISAM` storage engine in place of `ISAM`. To convert a table `tblname` from `ISAM` to `MyISAM`, simply issue a statement such as this one:

```
ALTER TABLE tblname ENGINE=MYISAM;
```

- Internal `RAID` for `MyISAM` tables was also removed in MySQL 5.0. This was formerly used to allow large tables in file systems that did not support file sizes greater than 2GB. All modern file systems allow for larger tables; in addition, there are now other solutions such as `MERGE` tables and views.

- The `VARCHAR` column type now retains trailing spaces in all storage engines.
- `MEMORY` tables (formerly known as `HEAP` tables) can also contain `VARCHAR` columns.

## A.9. MySQL 5.1 FAQ — Security

### Questions

- [22.9.1](#): Where can I find documentation that addresses security issues for MySQL?
- [22.9.2](#): Does MySQL 5.1 have native support for SSL?
- [22.9.3](#): Is SSL support be built into MySQL binaries, or must I recompile the binary myself to enable it?
- [22.9.4](#): Does MySQL 5.1 have built-in authentication against LDAP directories?
- [22.9.5](#): Does MySQL 5.1 include support for Roles Based Access Control (RBAC)?

### Questions and Answers

#### 22.9.1: Where can I find documentation that addresses security issues for MySQL?

The best place to start is [Section 5.3, “General Security Issues”](#).

Other portions of the MySQL Documentation which you may find useful with regard to specific security concerns include the following:

- [Section 5.3.1, “General Security Guidelines”](#).
- [Section 5.3.2, “Making MySQL Secure Against Attackers”](#).
- [Section B.1.4.1, “How to Reset the Root Password”](#).
- [Section 5.3.5, “How to Run MySQL as a Normal User”](#).
- [Section 21.3.2.6, “User-Defined Function Security Precautions”](#).
- [Section 5.3.3, “Security-Related `mysqld` Options”](#).
- [Section 5.3.4, “Security Issues with `LOAD DATA LOCAL`”](#).
- [Section 2.11, “Post-Installation Setup and Testing”](#).
- [Section 2.13.1.11, “SELinux Notes”](#).
- [Section 5.5.7.1, “Basic SSL Concepts”](#).

#### MySQL Enterprise

The MySQL Enterprise Monitor enforces best practices for maximizing the security of your servers. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

#### 22.9.2: Does MySQL 5.1 have native support for SSL?

Most 5.1 binaries have support for SSL connections between the client and server. We can't currently build with the new YaSSL library everywhere, as it is still quite new and does not compile on all platforms yet. See [Section 5.5.7, “Using SSL for Secure Connections”](#).

You can also tunnel a connection via SSH, if (for instance) if the client application doesn't support SSL connections. For an example, see [Section 5.5.8, “Connecting to MySQL Remotely from Windows with SSH”](#).

#### 22.9.3: Is SSL support be built into MySQL binaries, or must I recompile the binary myself to enable it?

Most 5.1 binaries have SSL enabled for client-server connections that are secured, authenticated, or both. However, the YaSSL library currently does not compile on all platforms. See [Section 5.5.7, “Using SSL for Secure Connections”](#), for a complete listing of supported and unsupported platforms.

**22.9.4: Does MySQL 5.1 have built-in authentication against LDAP directories?**

No. Support for external authentication methods is on the MySQL roadmap as a “rolling feature”, which means that we plan to implement it in the future, but we have not yet determined when this will be done.

**22.9.5: Does MySQL 5.1 include support for Roles Based Access Control (RBAC)?**

No. Support for roles is on the MySQL roadmap as a “rolling feature”, which means that we plan to implement it in the future, but we have not yet determined when this will be done.

## A.10. MySQL 5.1 FAQ — MySQL Cluster

In the following section, we answer questions that are frequently asked about MySQL Cluster and the `NDBCLUSTER` storage engine.

### Questions

- [22.10.1](#): Which versions of the MySQL software support Cluster? Do I have to compile from source?
- [22.10.2](#): What happened to MySQL Cluster NDB 6.4?
- [22.10.3](#): What do “NDB” and “NDBCLUSTER” mean?
- [22.10.4](#): What is the difference between using MySQL Cluster *vs* using MySQL replication?
- [22.10.5](#): Do I need to do any special networking to run MySQL Cluster? How do computers in a cluster communicate?
- [22.10.6](#): How many computers do I need to run a MySQL Cluster, and why?
- [22.10.7](#): What do the different computers do in a MySQL Cluster?
- [22.10.8](#): When I run the `SHOW` command in the MySQL Cluster management client, I see a line of output that looks like this:  

```
id=2 @10.100.10.32 (Version: 5.1.34-ndb-6.3.26, Nodegroup: 0, Master)
```

What is a “master node”, and what does it do? How do I configure a node so that it is the master?

## Questions and Answers

### 22.10.1: Which versions of the MySQL software support Cluster? Do I have to compile from source?

Beginning with MySQL 5.1.24, MySQL Cluster is no longer supported in standard MySQL Server 5.1 releases. Instead, MySQL Cluster is now released as a separate product. Currently, two MySQL Cluster release series are available:

- **MySQL Cluster NDB 6.2.** This series is Generally Available (GA) and can be used in production. However, MySQL Cluster NDB 6.3 is also now available as GA, so you are encouraged to upgrade existing deployments and to use MySQL Cluster NDB 6.3 for new MySQL Cluster deployments. The latest MySQL Cluster NDB 6.2 sources and binaries can be obtained from <http://dev.mysql.com/downloads/cluster6.2.html>.
- **MySQL Cluster NDB 6.3.** This series is now Generally Available (GA) for use in production. The latest MySQL Cluster NDB 6.3 sources and binaries can be obtained from <http://dev.mysql.com/downloads/cluster>.
- **MySQL Cluster NDB 7.0.** This series is now in Beta development phase. It is not yet certified for use in production, but is available if you wish to preview and test new features. The latest MySQL Cluster NDB 7.0 sources can be obtained from <http://dev.mysql.com/downloads/cluster>.

We encourage you to use MySQL Cluster NDB 6.3 for new MySQL Cluster deployments, and to upgrade to this release series if you are using a previous version of MySQL with clustering support. For an overview of improvements in MySQL Cluster NDB 6.3, see [Features Added in MySQL Cluster NDB 6.3](#).

For information about new features and other improvements made in MySQL Cluster NDB 7.0, see [Features Added in MySQL Cluster NDB 7.0](#).

You can determine whether your MySQL Server has `NDBCLUSTER` support using either of the statements `SHOW VARIABLES LIKE 'have_%%'` or `SHOW ENGINES`.

### 22.10.2: What happened to MySQL Cluster NDB 6.4?

Because of the number and impact of new features introduced into MySQL Cluster following the General Availability of MySQL Cluster NDB 6.3, it was decided that the following release series represented a “major” new release series rather than a “minor” one, and should be known as MySQL Cluster 7.0.

The earliest development versions of MySQL Cluster NDB 7.0 were originally designated “MySQL Cluster 6.4”, and the first four releases in this series were identified as MySQL Cluster NDB 6.4.0 through NDB 6.4.3. MySQL Cluster NDB 7.0.4 is the fifth MySQL Cluster NDB 7.0 release; it is the successor to MySQL Cluster NDB 6.4.3.

For more information about MySQL Cluster NDB 7.0, see [Features Added in MySQL Cluster NDB 7.0](#), and [Changes in MySQL Cluster NDB 7.0](#).

**22.10.3: What do “NDB” and “NDBCLUSTER” mean?**

“NDB” stands for “Network Database”. `NDB` and `NDBCLUSTER` are both names for the storage engine that enables clustering support in MySQL. Either name is equally correct; both names appear in our documentation, and either name can be used in the `ENGINE` option of a `CREATE TABLE` statement for creating a MySQL Cluster table.

**22.10.4: What is the difference between using MySQL Cluster vs using MySQL replication?**

In traditional MySQL replication, a master MySQL server updates one or more slaves. Transactions are committed sequentially, and a slow transaction can cause the slave to lag behind the master. This means that if the master fails, it is possible that the slave might not have recorded the last few transactions. If a transaction-safe engine such as `InnoDB` is being used, a transaction will either be complete on the slave or not applied at all, but replication does not guarantee that all data on the master and the slave will be consistent at all times. In MySQL Cluster, all data nodes are kept in synchrony, and a transaction committed by any one data node is committed for all data nodes. In the event of a data node failure, all remaining data nodes remain in a consistent state.

In short, whereas standard MySQL replication is *asynchronous*, MySQL Cluster is *synchronous*.

We have implemented (asynchronous) replication for MySQL Cluster in MySQL 5.1 and MySQL Cluster NDB 6.x. *MySQL Cluster Replication* (also sometimes known as “geo-replication”) includes the capability to replicate both between two MySQL Clusters, and from a MySQL Cluster to a non-Cluster MySQL server. See [MySQL Cluster Replication](#), for more information.

**22.10.5: Do I need to do any special networking to run MySQL Cluster? How do computers in a cluster communicate?**

MySQL Cluster is intended to be used in a high-bandwidth environment, with computers connecting via TCP/IP. Its performance depends directly upon the connection speed between the cluster's computers. The minimum connectivity requirements for MySQL Cluster include a typical 100-megabit Ethernet network or the equivalent. We recommend you use gigabit Ethernet whenever available.

The faster SCI protocol is also supported, but requires special hardware. See [Using High-Speed Interconnects with MySQL Cluster](#), for more information about SCI.

**22.10.6: How many computers do I need to run a MySQL Cluster, and why?**

A minimum of three computers is required to run a viable cluster. However, the minimum **recommended** number of computers in a MySQL Cluster is four: one each to run the management and SQL nodes, and two computers to serve as data nodes. The purpose of the two data nodes is to provide redundancy; the management node must run on a separate machine to guarantee continued arbitration services in the event that one of the data nodes fails.

To provide increased throughput and high availability, you should use multiple SQL nodes (MySQL Servers connected to the cluster). It is also possible (although not strictly necessary) to run multiple management servers.

**22.10.7: What do the different computers do in a MySQL Cluster?**

A MySQL Cluster has both a physical and logical organization, with computers being the physical elements. The logical or functional elements of a cluster are referred to as *nodes*, and a computer housing a cluster node is sometimes referred to as a *cluster host*. There are three types of nodes, each corresponding to a specific role within the cluster. These are:

- **Management node.** This node provides management services for the cluster as a whole, including startup, shutdown, backups, and configuration data for the other nodes. The management node server is implemented as the application `ndb_mgmd`; the management client used to control MySQL Cluster is `ndb_mgm`.
- **Data node.** This type of node stores and replicates data. Data node functionality is handled by instances of the `NDB` data node process `ndbd`.
- **SQL node.** This is simply an instance of MySQL Server (`mysqld`) that is built with support for the `NDBCLUSTER` storage engine and started with the `--ndb-cluster` option to enable the engine and the `--ndb-connectstring` option to enable it to connect to a MySQL Cluster management server. For more about these options, see [mysqld Command Options for MySQL Cluster](#).

**Note**

An *API node* is any application that makes direct use of Cluster data nodes for data storage and retrieval. An SQL node can thus be considered a type of API node that uses a MySQL Server to provide an SQL interface to the Cluster. You can write such applications (that do not depend on a MySQL Server) using the NDB API, which supplies a direct, object-oriented transaction and scanning interface to MySQL Cluster data; see [The NDB API](#), for more information.

**22.10.8: When I run the `SHOW` command in the MySQL Cluster management client, I see a line of output that looks like this:**

```
id=2 @10.100.10.32 (Version: 5.1.34-ndb-6.3.26, Nodegroup: 0, Master)
```

### What is a “master node”, and what does it do? How do I configure a node so that it is the master?

The simplest answer is, “It's not something you can control, and it's nothing that you need to worry about in any case, unless you're a software engineer writing or analyzing the MySQL Cluster source code”.

If you don't find that answer satisfactory, here's a longer and more technical version:

A number of mechanisms in MySQL Cluster require distributed coordination among the data nodes. These distributed algorithms and protocols include global checkpointing, DDL (schema) changes, and node restart handling. To make this coordination simpler, the data nodes “elect” one of their number to be a “master”. There is no user-facing mechanism for influencing this selection, which is completely automatic; the fact that it *is* automatic is a key part of MySQL Cluster's internal architecture.

When a node acts as a master for any of these mechanisms, it is usually the point of coordination for the activity, and the other nodes act as “servants”, carrying out their parts of the activity as directed by the master. If the node acting as master fails, then the remaining nodes elect a new master. Tasks in progress that were being coordinated by the old master may either fail or be continued by the new master, depending on the actual mechanism involved.

It is possible for some of these different mechanisms and protocols to have different master nodes, but in general the same master is chosen for all of them. The node indicated as the master in the output of `SHOW` in the management client is actually the `DICT` master (see [The DBDICT Block](#), in the *MySQL Cluster API Developer Guide*, for more information), responsible for coordinating DDL and metadata activity.

MySQL Cluster is designed in such a way that the choice of master has no discernable effect outside the cluster itself. For example, the current master does not have significantly higher CPU or resource usage than the other data nodes, and failure of the master should not have a significantly different impact on the cluster than the failure of any other data node.

### 22.10.9: With which operating systems can I use Cluster?

MySQL Cluster is supported on most Unix-like operating systems, including Linux, Mac OS X, Solaris, and HP-UX. Beginning with MySQL Cluster NDB 6.4, it is also possible to run MySQL Cluster on Windows platforms. We are continuing to work on providing MySQL Cluster support for additional platforms; eventually we intend to offer MySQL Cluster on all platforms for which MySQL itself is supported.

For more detailed information concerning the level of support which is offered for MySQL Cluster on various operating system versions, OS distributions, and hardware platforms, please refer to <http://www.mysql.com/support/supportedplatforms/cluster.html>.

### 22.10.10: What are the hardware requirements for running MySQL Cluster?

MySQL Cluster should run on any platform for which `NDBCLUSTER`-enabled binaries are available. For data nodes, faster CPUs and more memory are likely to improve performance, and 64-bit CPUs are likely to be more effective than 32-bit processors. There must be sufficient memory on machines used for data nodes to hold each node's share of the database (see *How much RAM do I Need?* for more information). Nodes can communicate via a standard TCP/IP network and hardware. For SCI support, special networking hardware is required (see [Using High-Speed Interconnects with MySQL Cluster](#)).

### 22.10.11: How much RAM do I need to use MySQL Cluster? Is it possible to use disk memory at all?

In MySQL 5.0 and earlier, MySQL Cluster was in-memory only. This meant that all table data (including indexes) was stored in RAM. If your data took up 1 GB of space and you wanted to replicate it once in the cluster, you needed 2 GB of memory to do so (1 GB per replica). This was in addition to the memory required by the operating system and any applications running on the cluster computers. This is still true of in-memory tables.

If a data node's memory usage exceeds what is available in RAM, then the system will attempt to use swap space up to the limit set for `DataMemory`. However, this will at best result in severely degraded performance, and may cause the node to be dropped due to slow response time (missed heartbeats). We do not recommend on relying on disk swapping in a production environment for this reason. In any case, once the `DataMemory` limit is reached, any operations requiring additional memory (such as inserts) will fail.

`NDBCLUSTER` in MySQL Cluster NDB 6.x includes support for Disk Data, which helps to alleviate these issues. See [MySQL Cluster Disk Data Tables](#), for more information.

You can use the following formula for obtaining a rough estimate of how much RAM is needed for each data node in the cluster:

```
(SizeofDatabase × NumberOfReplicas × 1.1 ) / NumberOfDataNodes
```

To calculate the memory requirements more exactly requires determining, for each table in the cluster database, the storage space required per row (see [Section 10.5, “Data Type Storage Requirements”](#), for details), and multiplying this by the number of rows. You must also remember to account for any column indexes as follows:

- Each primary key or hash index created for an `NDBCLUSTER` table requires 21–25 bytes per record. These indexes use `In-`

[dexMemory](#).

- Each ordered index requires 10 bytes storage per record, using [DataMemory](#).
- Creating a primary key or unique index also creates an ordered index, unless this index is created with `USING HASH`. In other words:
  - A primary key or unique index on a Cluster table normally takes up 31 to 35 bytes per record.
  - However, if the primary key or unique index is created with `USING HASH`, then it requires only 21 to 25 bytes per record.

Note that creating MySQL Cluster tables with `USING HASH` for all primary keys and unique indexes will generally cause table updates to run more quickly — in some cases by as much as 20 to 30 percent faster than updates on tables where `USING HASH` was not used in creating primary and unique keys. This is due to the fact that less memory is required (because no ordered indexes are created), and that less CPU must be utilized (because fewer indexes must be read and possibly updated). However, it also means that queries that could otherwise use range scans must be satisfied by other means, which can result in slower selects.

When calculating Cluster memory requirements, you may find useful the `ndb_size.pl` utility which is available in recent MySQL 5.1 releases. This Perl script connects to a current (non-Cluster) MySQL database and creates a report on how much space that database would require if it used the `NDBCLUSTER` storage engine. For more information, see `ndb_size.pl`.

It is especially important to keep in mind that *every MySQL Cluster table must have a primary key*. The `NDB` storage engine creates a primary key automatically if none is defined, and this primary key is created without `USING HASH`.

To determine how much memory is being used for storage of Cluster indexes at any given time, you can check the Cluster log for the warnings which are written to it when 80% of available [DataMemory](#) or [IndexMemory](#) is in use, and again when use reaches 85%, 90%, and so on. Beginning with MySQL Cluster NDB 6.2.3 and 6.3.0, you can use the `REPORT MemoryUsage` command in the cluster management client to obtain a real-time report of the amount of memory used to store MySQL Cluster data and indexes. For more information about this command, see

#### **22.10.12: What file systems can I use with MySQL Cluster? What about network file systems or network shares?**

Generally, any file system that is native to the host operating system should work well with MySQL Cluster. If you find that a given file system works particularly well (or not so especially well) with MySQL Cluster, we invite you to discuss your findings in the [MySQL Cluster Forums](#).

For Windows, we recommend that you use `NTFS` file systems for MySQL Cluster, just as we do for standard MySQL. We do not test MySQL Cluster with `FAT` or `VFAT` file systems. Because of this, we do not recommend their use with MySQL or MySQL Cluster.

MySQL Cluster is implemented as a shared-nothing solution; the idea behind this is that the failure of a single piece of hardware should not cause the failure of multiple cluster nodes, or possibly even the failure of the cluster as a whole. For this reason, the use of network shares or network file systems is not supported for MySQL Cluster. This also applies to shared storage devices such as SANs.

#### **22.10.13: Can I run MySQL Cluster nodes inside virtual machines (such as those created by VirtualBox, VMWare, Parallels, or Xen)?**

This is possible but not recommended for a production environment.

We have found that running MySQL Cluster processes inside a virtual machine can give rise to issues with timing and disk subsystems that have a strong negative impact on the operation of the cluster. The behavior of the cluster is often unpredictable in these cases.

If an issue can be reproduced outside the virtual environment, then we may be able to provide assistance. Otherwise, we cannot support it at this time.

#### **22.10.14: I am trying to populate a MySQL Cluster database. The loading process terminates prematurely and I get an error message like this one: `ERROR 1114: THE TABLE 'MY_CLUSTER_TABLE' IS FULL` Why is this happening?**

The cause is very likely to be that your setup does not provide sufficient RAM for all table data and all indexes, *including the primary key required by the `NDB` storage engine and automatically created in the event that the table definition does not include the definition of a primary key*.

It is also worth noting that all data nodes should have the same amount of RAM, since no data node in a cluster can use more memory than the least amount available to any individual data node. For example, if there are four computers hosting Cluster data nodes, and three of these have 3GB of RAM available to store Cluster data while the remaining data node has only 1GB RAM, then each data node can devote at most 1GB to MySQL Cluster data and indexes.

#### **22.10.15: MySQL Cluster uses TCP/IP. Does this mean that I can run it over the Internet, with one or more nodes in remote**

**locations?**

It is *very* unlikely that a cluster would perform reliably under such conditions, as MySQL Cluster was designed and implemented with the assumption that it would be run under conditions guaranteeing dedicated high-speed connectivity such as that found in a LAN setting using 100 Mbps or gigabit Ethernet — preferably the latter. We neither test nor warrant its performance using anything slower than this.

In addition, it is *extremely* important to keep in mind that communications between the nodes in a MySQL Cluster are not secure; they are neither encrypted nor safeguarded by any other protective mechanism. The most secure configuration for a cluster is in a private network behind a firewall, with no direct access to any Cluster data or management nodes from outside. (For SQL nodes, you should take the same precautions as you would with any other instance of the MySQL server.) For more information, see [MySQL Cluster Security Issues](#).

**22.10.16: Do I have to learn a new programming or query language to use MySQL Cluster?**

No. Although some specialized commands are used to manage and configure the cluster itself, only standard (My)SQL queries and commands are required for the following operations:

- Creating, altering, and dropping tables (including Disk Data tables and related objects)
- Inserting, updating, and deleting table data
- Creating, changing, and dropping primary and unique indexes

Some specialized configuration parameters and files are required to set up a MySQL Cluster — see [MySQL Cluster Configuration Files](#), for information about these.

A few simple commands are used in the MySQL Cluster management client (`ndb_mgm`) for tasks such as starting and stopping cluster nodes. See [Commands in the MySQL Cluster Management Client](#).

**22.10.17: How do I find out what an error or warning message means when using MySQL Cluster?**

There are two ways in which this can be done:

- From within the `mysql` client, use `SHOW ERRORS` or `SHOW WARNINGS` immediately upon being notified of the error or warning condition. Errors and warnings also be displayed in MySQL Query Browser.
- From a system shell prompt, use `perror --ndb error_code`.

**22.10.18: Is MySQL Cluster transaction-safe? What isolation levels are supported?**

*Yes:* For tables created with the `NDBCLUSTER` storage engine, transactions are supported. Currently, MySQL Cluster supports only the `READ COMMITTED` transaction isolation level.

**22.10.19: What storage engines are supported by MySQL Cluster?**

Clustering with MySQL is supported only by the `NDBCLUSTER` storage engine (also called `NDB`). That is, in order for a table to be shared between nodes in a MySQL Cluster, the table must be created using `ENGINE=NDBCLUSTER` (or the equivalent option `ENGINE=NDB`).

It is possible to create tables using other storage engines (such as `MyISAM` or `InnoDB`) on a MySQL server being used with a MySQL Cluster, but these non-`NDBCLUSTER` tables do *not* participate in clustering; such a table is strictly local to the individual MySQL server instance on which it is created.

**22.10.20: In the event of a catastrophic failure — say, for instance, the whole city loses power and my UPS fails — would I lose all my data?**

All committed transactions are logged. Therefore, although it is possible that some data could be lost in the event of a catastrophe, this should be quite limited. Data loss can be further reduced by minimizing the number of operations per transaction. (It is not a good idea to perform large numbers of operations per transaction in any case.)

**22.10.21: Is it possible to use `FULLTEXT` indexes with MySQL Cluster?**

`FULLTEXT` indexing is not supported by any storage engine other than `MyISAM`. We are working to add this capability to MySQL Cluster tables in a future release.

**22.10.22: Can I run multiple nodes on a single computer?**

It is possible but not always advisable. One of the chief reasons to run a cluster is to provide redundancy. To obtain the full benefits of this redundancy, each node should reside on a separate machine. If you place multiple nodes on a single machine and that machine fails, you lose all of those nodes. For this reason, if you do run multiple data nodes on a single machine, it is *extremely* important that they be set up in such a way that the failure of this machine does not cause the loss of all the data nodes in a given node group.

Given that MySQL Cluster can be run on commodity hardware loaded with a low-cost (or even no-cost) operating system, the expense of an extra machine or two is well worth it to safeguard mission-critical data. It also worth noting that the requirements for a cluster host running a management node are minimal. This task can be accomplished with a 200 MHz Pentium CPU and sufficient RAM for the operating system plus a small amount of overhead for the `ndb_mgmd` and `ndb_mgm` processes.

It is acceptable to run multiple cluster data nodes on a single host that has multiple CPUs, cores, or both. Beginning with MySQL Cluster NDB 6.4, there is also a special multi-threaded version of the data node binary intended for use on such systems. For more information, see [ndbmt.d](#).

It is also possible in some cases to run data nodes and SQL nodes concurrently on the same machine; how well such an arrangement performs is dependent on a number of factors such as number of cores and CPUs as well as the amount of disk and memory available to the data node and SQL node processes, and you must take these factors into account when planning such a configuration.

#### **22.10.23: Can I add data nodes to a MySQL Cluster without restarting it?**

Beginning with MySQL Cluster NDB 6.4, it is possible to add new data nodes to a running MySQL Cluster without taking it offline. For more information, see [Adding MySQL Cluster Data Nodes Online](#).

For other types of MySQL Cluster nodes, a rolling restart is all that is required (see [Performing a Rolling Restart of a MySQL Cluster](#)).

In MySQL Cluster NDB 6.3 and earlier, it was not possible to add new data nodes without shutting down and restarting the MySQL Cluster.

#### **22.10.24: Are there any limitations that I should be aware of when using MySQL Cluster?**

Limitations on [NDB](#) tables in MySQL 5.1 (including MySQL Cluster NDB 6.x) include the following:

- Temporary tables are not supported; a `CREATE TEMPORARY TABLE` statement using `ENGINE=NDB` or `ENGINE=NDBCLUSTER` fails with an error.
- The only types of user-defined partitioning supported for `NDBCLUSTER` tables are `KEY` and `LINEAR KEY`. (Beginning with MySQL 5.1.12, attempting to create an `NDB` table using any other partitioning type fails with an error.)
- `FULLTEXT` indexes and index prefixes are not supported. Only complete columns may be indexed.
- Spatial indexes are not supported (although spatial columns can be used). See [Section 11.13, “Spatial Extensions”](#).
- Prior to MySQL Cluster NDB 6.3.19, the `NDBCLUSTER` storage engine did not support partial transactions or partial rollbacks of transactions. Beginning with MySQL Cluster NDB 6.3.19, this limitation has been removed, and the behavior of `NDBCLUSTER` is now in line with that of other transactional storage engines (such as `InnoDB`) that can roll back individual statements.
- The maximum number of attributes allowed per table is 128, and attribute names cannot be any longer than 31 characters. For each table, the maximum combined length of the table and database names is 122 characters.
- The maximum size for a table row is 8 kilobytes, not counting `BLOB` values. There is no set limit for the number of rows per table. Table size limits depend on a number of factors, in particular on the amount of RAM available to each data node.
- The `NDBCLUSTER` engine does not support foreign key constraints. As with `MyISAM` tables, if these are specified in a `CREATE TABLE` or `ALTER TABLE` statement, they are ignored.

For a complete listing of limitations in MySQL Cluster, see [Known Limitations of MySQL Cluster](#).

#### **22.10.25: How do I import an existing MySQL database into a MySQL Cluster?**

You can import databases into MySQL Cluster much as you would with any other version of MySQL. Other than the limitations mentioned elsewhere in this FAQ, the only other special requirement is that any tables to be included in the cluster must use the `NDB` storage engine. This means that the tables must be created with `ENGINE=NDB` or `ENGINE=NDBCLUSTER`.

It is also possible to convert existing tables using other storage engines to `NDBCLUSTER` using one or more `ALTER TABLE` statement. However, the definition of the table must be compatible with the `NDBCLUSTER` storage engine prior to making the conver-

sion.

See [Known Limitations of MySQL Cluster](#), for details.

#### 22.10.26: How do cluster nodes communicate with one another?

Cluster nodes can communicate via any of three different transport mechanisms: TCP/IP, SHM (shared memory), and SCI (Scalable Coherent Interface). Where available, SHM is used by default between nodes residing on the same cluster host; however, this is considered experimental. SCI is a high-speed (1 gigabit per second and higher), high-availability protocol used in building scalable multi-processor systems; it requires special hardware and drivers. See [Using High-Speed Interconnects with MySQL Cluster](#), for more about using SCI as a transport mechanism for MySQL Cluster.

#### 22.10.27: What is an *arbiter*?

If one or more nodes in a cluster fail, it is possible that not all cluster nodes will be able to “see” one another. In fact, it is possible that two sets of nodes might become isolated from one another in a network partitioning, also known as a “split brain” scenario. This type of situation is undesirable because each set of nodes tries to behave as though it is the entire cluster.

When cluster nodes go down, there are two possibilities. If more than 50% of the remaining nodes can communicate with each other, we have what is sometimes called a “majority rules” situation, and this set of nodes is considered to be the cluster. The arbiter comes into play when there is an even number of nodes: in such cases, the set of nodes to which the arbiter belongs is considered to be the cluster, and nodes not belonging to this set are shut down.

The preceding information is somewhat simplified. A more complete explanation taking into account node groups follows:

When all nodes in at least one node group are alive, network partitioning is not an issue, because no one portion of the cluster can form a functional cluster. The real problem arises when no single node group has all its nodes alive, in which case network partitioning (the “split-brain” scenario) becomes possible. Then an arbiter is required. All cluster nodes recognize the same node as the arbiter, which is normally the management server; however, it is possible to configure any of the MySQL Servers in the cluster to act as the arbiter instead. The arbiter accepts the first set of cluster nodes to contact it, and tells the remaining set to shut down. Arbiter selection is controlled by the `ArbitrationRank` configuration parameter for MySQL Server and management server nodes. (See [Defining a MySQL Cluster Management Server](#), for details.)

The role of arbiter does not in and of itself impose any heavy demands upon the host so designated, and thus the arbiter host does not need to be particularly fast or to have extra memory especially for this purpose.

#### 22.10.28: What data types are supported by MySQL Cluster?

MySQL Cluster NDB 6.x, supports all of the usual MySQL data types, including those associated with MySQL’s spatial extensions; however, the `NDBCLUSTER` storage engine does not support spatial indexes. (Spatial indexes are supported only by `MyISAM`; see [Section 11.13, “Spatial Extensions”](#), for more information.) In addition, there are some differences with regard to indexes when used with `NDBCLUSTER` tables.

##### Note

MySQL Cluster Disk Data tables (that is, tables created with `TABLESPACE ... STORAGE DISK ENGINE=NDBCLUSTER`) have only fixed-width rows. This means that (for example) each Disk Data table record containing a `VARCHAR(255)` column requires space for 255 characters (as required for the character set and collation being used for the table), regardless of the actual number of characters stored therein.

See [Known Limitations of MySQL Cluster](#), for more information about these issues.

#### 22.10.29: How do I start and stop MySQL Cluster?

It is necessary to start each node in the cluster separately, in the following order:

1. Start the management node, using the `ndb_mgmd` command.

You must include the `-f` or `--config-file` option to tell the management node where its configuration file can be found. Beginning with MySQL Cluster NDB 6.4, the management server must also know where it is to keep its configuration cache.

2. Start each data node with the `ndbd` command. (Beginning with MySQL Cluster NDB 6.4, the `ndbmt` command can be used on computers with multiple CPUs, multiple cores, or both.)

Each data node must be started with the `-c` or `--connect-string` option so that the data node knows how to connect to the management server.

3. Start each MySQL Server (SQL node) using your preferred startup script, such as `mysqld_safe`.

Each MySQL Server must be started with the `--ndbcluster` and `--ndb-connectstring` options. These options cause `mysqld` to enable `NDBCLUSTER` storage engine support and how to connect to the management server.

Each of these commands must be run from a system shell on the machine housing the affected node. (You do not have to be physically present at the machine — a remote login shell can be used for this purpose.) You can verify that the cluster is running by starting the NDB management client `ndb_mgm` on the machine housing the management node and issuing the `SHOW` or `ALL STATUS` command.

To shut down a running cluster, issue the command `SHUTDOWN` in the management client. Alternatively, you may enter the following command in a system shell:

```
shell> ndb_mgm -e "SHUTDOWN"
```

(The quotation marks are optional; in addition, the `SHUTDOWN` command is not case-sensitive.)

Either of these commands causes the `ndb_mgm`, `ndb_mgm`, and any `ndbd` processes to terminate gracefully. MySQL servers running as Cluster SQL nodes can be stopped using `mysqladmin shutdown`.

For more information, see [Commands in the MySQL Cluster Management Client](#), and [Safe Shutdown and Restart of MySQL Cluster](#).

### **22.10.30: What happens to MySQL Cluster data when the cluster is shut down?**

The data that was held in memory by the MySQL Cluster data nodes is written to disk, and is reloaded into memory the next time that the cluster is started.

### **22.10.31: Is it a good idea to have more than one management node for a MySQL Cluster?**

It can be helpful as a fail-safe. Only one management node controls the cluster at any given time, but it is possible to configure one management node as primary, and one or more additional management nodes to take over in the event that the primary management node fails.

See [MySQL Cluster Configuration Files](#), for information on how to configure MySQL Cluster management nodes.

### **22.10.32: Can I mix different kinds of hardware and operating systems in one MySQL Cluster?**

Yes, as long as all machines and operating systems have the same “endianness” (all big-endian or all little-endian). We are working to overcome this limitation in a future MySQL Cluster release.

It is also possible to use software from different MySQL Cluster releases on different nodes. However, we support this only as part of a rolling upgrade procedure (see [Performing a Rolling Restart of a MySQL Cluster](#)).

### **22.10.33: Can I run two data nodes on a single host? Two SQL nodes?**

Yes, it is possible to do this. In the case of multiple data nodes, it is advisable (but not required) for each node to use a different data directory. If you want to run multiple SQL nodes on one machine, each instance of `mysqld` must use a different TCP/IP port. However, running more than one cluster node of a given type per machine is generally not encouraged or supported for production use.

We also advise against running data nodes and SQL nodes together on the same host, since the `ndbd` and `mysqld` processes may compete for memory.

### **22.10.34: Can I use host names with MySQL Cluster?**

Yes, it is possible to use DNS and DHCP for cluster hosts. However, if your application requires “five nines” availability, we recommend using fixed (numeric) IP addresses. Making communication between Cluster hosts dependent on services such as DNS and DHCP introduces additional potential points of failure.

### **22.10.35: Does MySQL Cluster support IPv6?**

Beginning with MySQL Cluster NDB 6.4, IPv6 is supported for connections between SQL nodes (MySQL servers). However, connections between all other types of nodes must use IPv4.

In practical terms, this means that you can use IPv6 for replication between MySQL Clusters, but connections between nodes in the same MySQL Cluster must use IPv4. For more information, see [Known Issues in MySQL Cluster Replication](#).

### **22.10.36: How do I handle MySQL users in a MySQL Cluster having multiple MySQL servers?**

MySQL user accounts and privileges are not automatically propagated between different MySQL servers accessing the same MySQL Cluster. Therefore, you must make sure that these are copied between the SQL nodes yourself. You can do this manually, or automate the task with scripts.

#### **Warning**

Do not attempt to work around this issue by converting the MySQL system tables to use the `NDBCLUSTER` storage engine. Only the `MyISAM` storage engine is supported for these tables.

### 22.10.37: How do I continue to send queries in the event that one of the SQL nodes fails?

MySQL Cluster does not provide any sort of automatic failover between SQL nodes. Your application must be prepared to handle any loss of SQL nodes and to fail over between them.

## A.11. MySQL 5.1 FAQ — MySQL Chinese, Japanese, and Korean Character Sets

This set of Frequently Asked Questions derives from the experience of MySQL's Support and Development groups in handling many inquiries about CJK (Chinese-Japanese-Korean) issues.

### Questions

- [22.11.1](#): What CJK character sets are available in MySQL?
- [22.11.2](#): I have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters?
- [22.11.3](#): What problems should I be aware of when working with the Big5 Chinese character set?
- [22.11.4](#): Why do Japanese character set conversions fail?
- [22.11.5](#): What should I do if I want to convert SJIS 81CA to cp932?
- [22.11.6](#): How does MySQL represent the Yen (¥) sign?
- [22.11.7](#): Do MySQL plan to make a separate character set where 5C is the Yen sign, as at least one other major DBMS does?
- [22.11.8](#): Of what issues should I be aware when working with Korean character sets in MySQL?
- [22.11.9](#): Why do I get `DATA TRUNCATED` error messages?
- [22.11.10](#): Why does my GUI front end or browser not display CJK characters correctly in my application using Access, PHP, or another API?
- [22.11.11](#): I've upgraded to MySQL 5.1. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?
- [22.11.12](#): Why do some `LIKE` and `FULLTEXT` searches with CJK characters fail?
- [22.11.13](#): How do I know whether character `X` is available in all character sets?
- [22.11.14](#): Why don't CJK strings sort correctly in Unicode? (I)
- [22.11.15](#): Why don't CJK strings sort correctly in Unicode? (II)
- [22.11.16](#): Why are my supplementary characters rejected by MySQL?
- [22.11.17](#): Shouldn't it be “CJKV”?
- [22.11.18](#): Does MySQL allow CJK characters to be used in database and table names?
- [22.11.19](#): Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?
- [22.11.20](#): Where can I get help with CJK and related issues in MySQL?

### Questions and Answers

#### 22.11.1: What CJK character sets are available in MySQL?

The list of CJK character sets may vary depending on your MySQL version. For example, the `eurjpm` character set was not supported prior to MySQL 5.0.3. However, since the name of the applicable language appears in the `DESCRIPTION` column for every entry in the `INFORMATION_SCHEMA.CHARACTER_SETS` table, you can obtain a current list of all the non-Unicode CJK character sets using this query:

```
mysql> SELECT CHARACTER_SET_NAME, DESCRIPTION
-> FROM INFORMATION_SCHEMA.CHARACTER_SETS
-> WHERE DESCRIPTION LIKE '%Chinese%'
```

```

-> OR DESCRIPTION LIKE '%Japanese%'
-> OR DESCRIPTION LIKE '%Korean%'
-> ORDER BY CHARACTER_SET_NAME;

```

CHARACTER_SET_NAME	DESCRIPTION
big5	Big5 Traditional Chinese
cp932	SJIS for Windows Japanese
euc_jpms	UJIS for Windows Japanese
euckr	EUC-KR Korean
gb2312	GB2312 Simplified Chinese
gbk	GBK Simplified Chinese
sjis	Shift-JIS Japanese
ujis	EUC-JP Japanese

8 rows in set (0.01 sec)

(See [Section 19.9, “The INFORMATION\\_SCHEMA CHARACTER\\_SETS Table”](#), for more information.)

MySQL supports the two common variants of the *GB* (*Guojia Biaozhun*, or *National Standard*, or *Simplified Chinese*) character sets which are official in the People's Republic of China: `gb2312` and `gbk`. Sometimes people try to insert `gbk` characters into `gb2312`, and it works most of the time because `gbk` is a superset of `gb2312` — but eventually they try to insert a rarer Chinese character and it doesn't work. (See [Bug#16072](#) for an example).

Here, we try to clarify exactly what characters are legitimate in `gb2312` or `gbk`, with reference to the official documents. Please check these references before reporting `gb2312` or `gbk` bugs.

- For a complete listing of the `gb2312` characters, ordered according to the `gb2312_chinese_ci` collation: [gb2312](#)
- MySQL's `gbk` is in reality “Microsoft code page 936”. This differs from the official `gbk` for characters `A1A4` (middle dot), `A1AA` (em dash), `A6E0–A6F5`, and `A8BB–A8C0`. For a listing of the differences, see <http://recode.progiciels-bpi.ca/showfile.html?name=dist/libiconv/gbk.h>.
- For a listing of `gbk`/Unicode mappings, see <http://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WINDOWS/CP936.TXT>.
- For MySQL's listing of `gbk` characters, see [gbk](#).

### 22.11.2: I have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters?

This problem is usually due to a setting in MySQL that doesn't match the settings for the application program or the operating system. Here are some common steps for correcting these types of issues:

- *Be certain of what MySQL version you are using.*

Use the statement `SELECT VERSION()`; to determine this.

- *Make sure that the database is actually using the desired character set.*

People often think that the client character set is always the same as either the server character set or the character set used for display purposes. However, both of these are false assumptions. You can make sure by checking the result of `SHOW CREATE TABLE tablename` or — better — yet by using this statement:

```

SELECT character_set_name, collation_name
FROM information_schema.columns
WHERE table_schema = your_database_name
AND table_name = your_table_name
AND column_name = your_column_name;

```

- *Determine the hexadecimal value of the character or characters that are not being displayed correctly.*

You can obtain this information for a column `column_name` in the table `table_name` using the following query:

```

SELECT HEX(column_name)
FROM table_name;

```

`3F` is the encoding for the `?` character; this means that `?` is the character actually stored in the column. This most often happens because of a problem converting a particular character from your client character set to the target character set.

- *Make sure that a round trip possible — that is, when you select `literal` (or `_introducer hexadecimal-value`), you obtain `literal` as a result.*

For example, the Japanese *Katakana* character *Pe* (ペ) exists in all CJK character sets, and has the code point value (hexadecimal coding) `0x30da`. To test a round trip for this character, use this query:

```
SELECT 'ㄹ' AS `ㄹ`; /* or SELECT _ucs2 0x30da; */
```

If the result is not also ㄹ, then the round trip has failed.

For bug reports regarding such failures, we might ask you to follow up with `SELECT HEX('ㄹ');`. Then we can determine whether the client encoding is correct.

- *Make sure that the problem is not with the browser or other application, rather than with MySQL.*

Use the `mysql` client program (on Windows: `mysql.exe`) to accomplish this task. If `mysql` displays correctly but your application doesn't, then your problem is probably due to system settings.

To find out what your settings are, use the `SHOW VARIABLES` statement, whose output should resemble what is shown here:

```
mysql> SHOW VARIABLES LIKE 'char%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| character_set_client | utf8 |
| character_set_connection | utf8 |
| character_set_database | latin1 |
| character_set_filesystem | binary |
| character_set_results | utf8 |
| character_set_server | latin1 |
| character_set_system | utf8 |
| character_sets_dir | /usr/local/mysql/share/mysqlCharsets/ |
+-----+-----+
8 rows in set (0.03 sec)
```

These are typical character-set settings for an international-oriented client (notice the use of `utf8` Unicode) connected to a server in the West (`latin1` is a West Europe character set and a default for MySQL).

Although Unicode (usually the `utf8` variant on Unix, and the `ucs2` variant on Windows) is preferable to Latin, it is often not what your operating system utilities support best. Many Windows users find that a Microsoft character set, such as `cp932` for Japanese Windows, is suitable.

If you cannot control the server settings, and you have no idea what your underlying computer is, then try changing to a common character set for the country that you're in (`euckr` = Korea; `gb2312` or `gbk` = People's Republic of China; `big5` = Taiwan; `sjis`, `ujis`, `cp932`, or `eucjpms` = Japan; `ucs2` or `utf8` = anywhere). Usually it is necessary to change only the client and connection and results settings. There is a simple statement which changes all three at once: `SET NAMES`. For example:

```
SET NAMES 'big5';
```

Once the setting is correct, you can make it permanent by editing `my.cnf` or `my.ini`. For example you might add lines looking like these:

```
[mysqld]
character-set-server=big5
[client]
default-character-set=big5
```

It is also possible that there are issues with the API configuration setting being used in your application; see *Why does my GUI front end or browser not display CJK characters correctly...?* for more information.

### 22.11.3: What problems should I be aware of when working with the Big5 Chinese character set?

MySQL supports the Big5 character set which is common in Hong Kong and Taiwan (Republic of China). MySQL's `big5` is in reality Microsoft code page 950, which is very similar to the original `big5` character set. We changed to this character set starting with MySQL version 4.1.16 / 5.0.16 (as a result of [Bug#12476](#)). For example, the following statements work in current versions of MySQL, but not in old versions:

```
mysql> CREATE TABLE big5 (BIG5 CHAR(1) CHARACTER SET BIG5);
Query OK, 0 rows affected (0.13 sec)

mysql> INSERT INTO big5 VALUES (0xf9dc);
Query OK, 1 row affected (0.00 sec)

mysql> SELECT * FROM big5;
+-----+
| big5 |
+-----+
| 嫻 |
+-----+
1 row in set (0.02 sec)
```

A feature request for adding `HKSCS` extensions has been filed. People who need this extension may find the suggested patch for

[Bug#13577](#) to be of interest.

#### 22.11.4: Why do Japanese character set conversions fail?

MySQL supports the `sjis`, `ujis`, `cp932`, and `ujis` character sets, as well as Unicode. A common need is to convert between character sets. For example, there might be a Unix server (typically with `sjis` or `ujis`) and a Windows client (typically with `cp932`).

In the following conversion table, the `ucs2` column represents the source, and the `sjis`, `cp932`, `ujis`, and `ujis` columns represent the destinations — that is, the last 4 columns provide the hexadecimal result when we use `CONVERT(ucs2)` or we assign a `ucs2` column containing the value to an `sjis`, `cp932`, `ujis`, or `ujis` column.

Character Name	ucs2	sjis	cp932	ujis	ujis
BROKEN BAR	00A6	3F	3F	8FA2C3	3F
FULLWIDTH BROKEN BAR	FFE4	3F	FA55	3F	8FA2
YEN SIGN	00A5	3F	3F	20	3F
FULLWIDTH YEN SIGN	FFE5	818F	818F	A1EF	3F
TILDE	007E	7E	7E	7E	7E
OVERLINE	203E	3F	3F	20	3F
HORIZONTAL BAR	2015	815C	815C	A1BD	A1BD
EM DASH	2014	3F	3F	3F	3F
REVERSE SOLIDUS	005C	815F	5C	5C	5C
FULLWIDTH ""	FF3C	3F	815F	3F	A1C0
WAVE DASH	301C	8160	3F	A1C1	3F
FULLWIDTH TILDE	FF5E	3F	8160	3F	A1C1
DOUBLE VERTICAL LINE	2016	8161	3F	A1C2	3F
PARALLEL TO	2225	3F	8161	3F	A1C2
MINUS SIGN	2212	817C	3F	A1DD	3F
FULLWIDTH HYPHEN-MINUS	FF0D	3F	817C	3F	A1DD
CENT SIGN	00A2	8191	3F	A1F1	3F
FULLWIDTH CENT SIGN	FFE0	3F	8191	3F	A1F1
POUND SIGN	00A3	8192	3F	A1F2	3F
FULLWIDTH POUND SIGN	FFE1	3F	8192	3F	A1F2
NOT SIGN	00AC	81CA	3F	A2CC	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA	3F	A2CC

Now consider the following portion of the table.

	ucs2	sjis	cp932
NOT SIGN	00AC	81CA	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA

This means that MySQL converts the `NOT SIGN` (Unicode `U+00AC`) to `sjis` code point `0x81CA` and to `cp932` code point `3F`. (`3F` is the question mark (“?”) — this is what is always used when the conversion cannot be performed.

#### 22.11.5: What should I do if I want to convert SJIS 81CA to cp932?

Our answer is: “?”. There are serious complaints about this: many people would prefer a “loose” conversion, so that `81CA` (`NOT SIGN`) in `sjis` becomes `81CA` (`FULLWIDTH NOT SIGN`) in `cp932`. We are considering a change to this behavior.

#### 22.11.6: How does MySQL represent the Yen (¥) sign?

A problem arises because some versions of Japanese character sets (both `sjis` and `ujis`) treat `5C` as a *reverse solidus* (`\` — also known as a backslash), and others treat it as a yen sign (¥).

MySQL follows only one version of the JIS (Japanese Industrial Standards) standard description. In MySQL, `5C` is always the *reverse solidus* (`\`).

#### 22.11.7: Do MySQL plan to make a separate character set where 5C is the Yen sign, as at least one other major DBMS does?

This is one possible solution to the Yen sign issue; however, this will not happen in MySQL 5.1 or 6.0.

### 22.11.8: Of what issues should I be aware when working with Korean character sets in MySQL?

In theory, while there have been several versions of the `euckr` (*Extended Unix Code Korea*) character set, only one problem has been noted.

We use the “ASCII” variant of EUC-KR, in which the code point `0x5c` is REVERSE SOLIDUS, that is `\`, instead of the “KS-Roman” variant of EUC-KR, in which the code point `0x5c` is `₩` (`₩`). This means that you cannot convert Unicode `U+20A9` to `euckr`:

```
mysql> SELECT
->     CONVERT('₩' USING euckr) AS euckr,
->     HEX(CONVERT('₩' USING euckr)) AS hexeuckr;
+-----+-----+
| euckr | hexeuckr |
+-----+-----+
| ?     | 3F       |
+-----+-----+
1 row in set (0.00 sec)
```

MySQL's graphic Korean chart is here: [euckr](#).

### 22.11.9: Why do I get `DATA TRUNCATED` error messages?

For illustration, we'll create a table with one Unicode (`ucs2`) column and one Chinese (`gb2312`) column.

```
mysql> CREATE TABLE ch
->     (ucs2 CHAR(3) CHARACTER SET ucs2,
->     gb2312 CHAR(3) CHARACTER SET gb2312);
Query OK, 0 rows affected (0.05 sec)
```

We'll try to place the rare character `ㄹ` in both columns.

```
mysql> INSERT INTO ch VALUES ('AㄹB','AㄹB');
Query OK, 1 row affected, 1 warning (0.00 sec)
```

Ah, there is a warning. Use the following statement to see what it is:

```
mysql> SHOW WARNINGS;
+-----+-----+-----+
| Level | Code | Message
+-----+-----+-----+
| Warning | 1265 | Data truncated for column 'gb2312' at row 1
+-----+-----+-----+
1 row in set (0.00 sec)
```

So it is a warning about the `gb2312` column only.

```
mysql> SELECT ucs2,HEX(ucs2),gb2312,HEX(gb2312) FROM ch;
+-----+-----+-----+-----+
| ucs2 | HEX(ucs2) | gb2312 | HEX(gb2312) |
+-----+-----+-----+-----+
| AㄹB | 00416C4C0042 | A?B | 413F42 |
+-----+-----+-----+-----+
1 row in set (0.00 sec)
```

There are several things that need explanation here.

1. The fact that it is a “warning” rather than an “error” is characteristic of MySQL. We like to try to do what we can, to get the best fit, rather than give up.
2. The `ㄹ` character isn't in the `gb2312` character set. We described that problem earlier.
3. Admittedly the message is misleading. We didn't “truncate” in this case, we replaced with a question mark. We've had a complaint about this message (See [Bug#9337](#)). But until we come up with something better, just accept that error/warning code 2165 can mean a variety of things.
4. With `SQL_MODE=TRADITIONAL`, there would be an error message, but instead of error 2165 you would see: `ERROR 1406 (22001): Data too long for column 'gb2312' at row 1`.

### 22.11.10: Why does my GUI front end or browser not display CJK characters correctly in my application using Access, PHP, or another API?

Obtain a direct connection to the server using the `mysql` client (Windows: `mysql.exe`), and try the same query there. If `mysql` responds correctly, then the trouble may be that your application interface requires initialization. Use `mysql` to tell you what character set or sets it uses with the statement `SHOW VARIABLES LIKE 'char%'`. If you are using Access, then you are most likely connecting with MyODBC. In this case, you should check [Section 20.1.4](#), “Connector/ODBC Configuration”. If, for in-

stance, you use `big5`, you would enter `SET NAMES 'big5'`. (Note that no `;` is required in this case). If you are using ASP, you might need to add `SET NAMES` in the code. Here is an example that has worked in the past:

```
<%
Session.CodePage=0
Dim strConnection
Dim Conn
strConnection="driver={MySQL ODBC 3.51 Driver};server=server;uid=username;" \
& "pwd=password;database=database;stmt=SET NAMES 'big5';"
Set Conn = Server.CreateObject("ADODB.Connection")
Conn.Open strConnection
%>
```

In much the same way, if you are using any character set other than `latin1` with Connector/NET, then you must specify the character set in the connection string. See [Section 20.2.4.2, “Connecting to MySQL Using Connector/NET”](#), for more information.

If you are using PHP, try this:

```
<?php
$link = mysql_connect($host, $usr, $pwd);

mysql_select_db($db);

if( mysql_error() ) { print "Database ERROR: " . mysql_error(); }
mysql_query("SET NAMES 'utf8'", $link);
?>
```

In this case, we used `SET NAMES` to change `character_set_client` and `character_set_connection` and `character_set_results`.

We encourage the use of the newer `mysqli` extension, rather than `mysql`. Using `mysqli`, the previous example could be rewritten as shown here:

```
<?php
$link = new mysqli($host, $usr, $pwd, $db);

if( mysqli_connect_errno() )
{
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$link->query("SET NAMES 'utf8'");
?>
```

Another issue often encountered in PHP applications has to do with assumptions made by the browser. Sometimes adding or changing a `<meta>` tag suffices to correct the problem: for example, to insure that the user agent interprets page content as `UTF-8`, you should include `<meta http-equiv="Content-Type" content="text/html; charset=utf-8">` in the `<head>` of the HTML page.

If you are using Connector/J, see [Section 20.4.4.4, “Using Character Sets and Unicode”](#).

### 22.11.11: I've upgraded to MySQL 5.1. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?

In MySQL Version 4.0, there was a single “global” character set for both server and client, and the decision as to which character to use was made by the server administrator. This changed starting with MySQL Version 4.1. What happens now is a “handshake”, as described in [Section 9.1.4, “Connection Character Sets and Collations”](#):

When a client connects, it sends to the server the name of the character set that it wants to use. The server uses the name to set the `character_set_client`, `character_set_results`, and `character_set_connection` system variables. In effect, the server performs a `SET NAMES` operation using the character set name.

The effect of this is that you cannot control the client character set by starting `mysqld` with `-character-set-server=utf8`. However, some of our Asian customers have said that they prefer the MySQL 4.0 behavior. To make it possible to retain this behavior, we added a `mysqld` switch, `--character-set-client-handshake`, which can be turned off with `--skip-character-set-client-handshake`. If you start `mysqld` with `-skip-character-set-client-handshake`, then, when a client connects, it sends to the server the name of the character set that it wants to use — however, *the server ignores this request from the client*.

By way of example, suppose that your favorite server character set is `latin1` (unlikely in a CJK area, but this is the default value). Suppose further that the client uses `utf8` because this is what the client's operating system supports. Now, start the server with `latin1` as its default character set:

```
mysqld --character-set-server=latin1
```

And then start the client with the default character set `utf8`:

```
mysql --default-character-set=utf8
```

The current settings can be seen by viewing the output of `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'char%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| character_set_client | utf8 |
| character_set_connection | utf8 |
| character_set_database | latin1 |
| character_set_filesystem | binary |
| character_set_results | utf8 |
| character_set_server | latin1 |
| character_set_system | utf8 |
| character_sets_dir | /usr/local/mysql/share/mysqlCharsets/ |
+-----+-----+
8 rows in set (0.01 sec)
```

Now stop the client, and then stop the server using `mysqldadmin`. Then start the server again, but this time tell it to skip the handshake like so:

```
mysqld --character-set-server=utf8 --skip-character-set-client-handshake
```

Start the client with `utf8` once again as the default character set, then display the current settings:

```
mysql> SHOW VARIABLES LIKE 'char%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| character_set_client | latin1 |
| character_set_connection | latin1 |
| character_set_database | latin1 |
| character_set_filesystem | binary |
| character_set_results | latin1 |
| character_set_server | latin1 |
| character_set_system | utf8 |
| character_sets_dir | /usr/local/mysql/share/mysqlCharsets/ |
+-----+-----+
8 rows in set (0.01 sec)
```

As you can see by comparing the differing results from `SHOW VARIABLES`, the server ignores the client's initial settings if the `--skip-character-set-client-handshake` is used.

#### 22.11.12: Why do some `LIKE` and `FULLTEXT` searches with CJK characters fail?

There is a very simple problem with `LIKE` searches on `BINARY` and `BLOB` columns: we need to know the end of a character. With multi-byte character sets, different characters might have different octet lengths. For example, in `utf8`, `A` requires one byte but `Æ` requires three bytes, as shown here:

```
+-----+-----+
| OCTET_LENGTH(_utf8 'A') | OCTET_LENGTH(_utf8 'Æ') |
+-----+-----+
| 1 | 3 |
+-----+-----+
1 row in set (0.00 sec)
```

If we don't know where the first character ends, then we don't know where the second character begins, in which case even very simple searches such as `LIKE '_A%'` fail. The solution is to use a regular CJK character set in the first place, or to convert to a CJK character set before comparing.

This is one reason why MySQL cannot allow encodings of non-existent characters. If it is not strict about rejecting bad input, then it has no way of knowing where characters end.

For `FULLTEXT` searches, we need to know where words begin and end. With Western languages, this is rarely a problem because most (if not all) of these use an easy-to-identify word boundary — the space character. However, this is not usually the case with Asian writing. We could use arbitrary halfway measures, like assuming that all Han characters represent words, or (for Japanese) depending on changes from Katakana to Hiragana due to grammatical endings. However, the only sure solution requires a comprehensive word list, which means that we would have to include a dictionary in the server for each Asian language supported. This is simply not feasible.

#### 22.11.13: How do I know whether character `X` is available in all character sets?

The majority of simplified Chinese and basic non-halfwidth Japanese *Kana* characters appear in all CJK character sets. This stored procedure accepts a `UCS-2` Unicode character, converts it to all other character sets, and displays the results in hexadecimal.

```
DELIMITER //
CREATE PROCEDURE p_convert(ucs2_char CHAR(1) CHARACTER SET ucs2)
BEGIN
CREATE TABLE tj
(ucs2 CHAR(1) character set ucs2,
utf8 CHAR(1) character set utf8,
big5 CHAR(1) character set big5,
cp932 CHAR(1) character set cp932,
eucjpms CHAR(1) character set eucjpms,
euckr CHAR(1) character set euckr,
gb2312 CHAR(1) character set gb2312,
```

```

gbk CHAR(1) character set gbk,
sjis CHAR(1) character set sjis,
ujis CHAR(1) character set ujis);

INSERT INTO tj (ucs2) VALUES (ucs2_char);

UPDATE tj SET utf8=ucs2,
             big5=ucs2,
             cp932=ucs2,
             eucjpms=ucs2,
             euckr=ucs2,
             gb2312=ucs2,
             gbk=ucs2,
             sjis=ucs2,
             ujis=ucs2;

/* If there is a conversion problem, UPDATE will produce a warning. */

SELECT hex(ucs2) AS ucs2,
       hex(utf8) AS utf8,
       hex(big5) AS big5,
       hex(cp932) AS cp932,
       hex(eucjpms) AS eucjpms,
       hex(euckr) AS euckr,
       hex(gb2312) AS gb2312,
       hex(gbk) AS gbk,
       hex(sjis) AS sjis,
       hex(ujis) AS ujis
FROM tj;

DROP TABLE tj;

END//

```

The input can be any single `ucs2` character, or it can be the code point value (hexadecimal representation) of that character. For example, from Unicode's list of `ucs2` encodings and names (<http://www.unicode.org/Public/UNIDATA/UnicodeData.txt>), we know that the *Katakana* character *Pe* appears in all CJK character sets, and that its code point value is `0x30da`. If we use this value as the argument to `p_convert()`, the result is as shown here:

```

mysql> CALL p_convert(0x30da)//
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| ucs2 | utf8 | big5 | cp932 | eucjpms | euckr | gb2312 | gbk | sjis | ujis |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| 30DA | E3839A | C772 | 8379 | A5DA | ABDA | A5DA | A5DA | 8379 | A5DA |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
1 row in set (0.04 sec)

```

Since none of the column values is `3F` — that is, the question mark character (?) — we know that every conversion worked.

#### 22.11.14: Why don't CJK strings sort correctly in Unicode? (I)

Sometimes people observe that the result of a `utf8_unicode_ci` or `ucs2_unicode_ci` search, or of an `ORDER BY` sort is not what they think a native would expect. Although we never rule out the possibility that there is a bug, we have found in the past that many people do not read correctly the standard table of weights for the Unicode Collation Algorithm. MySQL uses the table found at <http://www.unicode.org/Public/UCA/4.0.0/allkeys-4.0.0.txt>. This is not the first table you will find by navigating from the [unicode.org](http://www.unicode.org) home page, because MySQL uses the older 4.0.0 “allkeys” table, rather than the more recent 4.1.0 table. This is because we are very wary about changing ordering which affects indexes, lest we bring about situations such as that reported in [Bug#16526](#), illustrated as follows:

```

mysql< CREATE TABLE tj (s1 CHAR(1) CHARACTER SET utf8 COLLATE utf8_unicode_ci);
Query OK, 0 rows affected (0.05 sec)

mysql> INSERT INTO tj VALUES ('が'),('か');
Query OK, 2 rows affected (0.00 sec)
Records: 2 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM tj WHERE s1 = 'か';
+-----+
| s1 |
+-----+
| が |
| か |
+-----+
2 rows in set (0.00 sec)

```

The character in the first result row is not the one that we searched for. Why did MySQL retrieve it? First we look for the Unicode code point value, which is possible by reading the hexadecimal number for the `ucs2` version of the characters:

```

mysql> SELECT s1, HEX(CONVERT(s1 USING ucs2)) FROM tj;
+-----+-----+
| s1 | HEX(CONVERT(s1 USING ucs2)) |
+-----+-----+
| が | 304C |
| か | 304B |
+-----+-----+
2 rows in set (0.03 sec)

```

Now we search for `304B` and `304C` in the `4.0.0 allkeys` table, and find these lines:

```
304B ; [.1E57.0020.000E.304B] # HIRAGANA LETTER KA
304C ; [.1E57.0020.000E.304B][.0000.0140.0002.3099] # HIRAGANA LETTER GA; QOCM
```

The official Unicode names (following the “#” mark) tell us the Japanese syllabary (Hiragana), the informal classification (letter, digit, or punctuation mark), and the Western identifier (*KA* or *GA*, which happen to be voiced and unvoiced components of the same letter pair). More importantly, the *primary weight* (the first hexadecimal number inside the square brackets) is `1E57` on both lines. For comparisons in both searching and sorting, MySQL pays attention to the primary weight only, ignoring all the other numbers. This means that we are sorting `が` and `カ` correctly according to the Unicode specification. If we wanted to distinguish them, we'd have to use a non-UCA (Unicode Collation Algorithm) collation (`utf8_bin` or `utf8_general_ci`), or to compare the `HEX()` values, or use `ORDER BY CONVERT(s1 USING sjis)`. Being correct “according to Unicode” isn't enough, of course: the person who submitted the bug was equally correct. We plan to add another collation for Japanese according to the JIS X 4061 standard, in which voiced/unvoiced letter pairs like *KA/GA* are distinguishable for ordering purposes.

### 22.11.15: Why don't CJK strings sort correctly in Unicode? (II)

If you are using Unicode (`ucs2` or `utf8`), and you know what the Unicode sort order is (see [Section A.11, “MySQL 5.1 FAQ — MySQL Chinese, Japanese, and Korean Character Sets”](#)), but MySQL still seems to sort your table incorrectly, then you should first verify the table character set:

```
mysql> SHOW CREATE TABLE t\G
***** 1. row *****
Table: t
Create Table: CREATE TABLE `t` (
  `s1` char(1) CHARACTER SET ucs2 DEFAULT NULL
) ENGINE=MyISAM DEFAULT CHARSET=latin1
1 row in set (0.00 sec)
```

Since the character set appears to be correct, let's see what information the `INFORMATION_SCHEMA.COLUMNS` table can provide about this column:

```
mysql> SELECT COLUMN_NAME, CHARACTER_SET_NAME, COLLATION_NAME
-> FROM INFORMATION_SCHEMA.COLUMNS
-> WHERE COLUMN_NAME = 's1'
-> AND TABLE_NAME = 't';
+-----+-----+-----+
| COLUMN_NAME | CHARACTER_SET_NAME | COLLATION_NAME |
+-----+-----+-----+
| s1          | ucs2              | ucs2_general_ci |
+-----+-----+-----+
1 row in set (0.01 sec)
```

(See [Section 19.3, “The INFORMATION\\_SCHEMA COLUMNS Table”](#), for more information.)

You can see that the collation is `ucs2_general_ci` instead of `ucs2_unicode_ci`. The reason why this is so can be found using `SHOW CHARSET`, as shown here:

```
mysql> SHOW CHARSET LIKE 'ucs2%';
+-----+-----+-----+-----+
| Charset | Description | Default collation | Maxlen |
+-----+-----+-----+-----+
| ucs2    | UCS-2 Unicode | ucs2_general_ci   | 2      |
+-----+-----+-----+-----+
1 row in set (0.00 sec)
```

For `ucs2` and `utf8`, the default collation is “general”. To specify a Unicode collation, use `COLLATE ucs2_unicode_ci`.

### 22.11.16: Why are my supplementary characters rejected by MySQL?

Before MySQL 6.0.4, MySQL does not support supplementary characters — that is, characters which need more than 3 bytes — for `UTF-8`. We support only what Unicode calls the *Basic Multilingual Plane / Plane 0*. Only a few very rare Han characters are supplementary; support for them is uncommon. This has led to reports such as that found in [Bug#12600](#), which we rejected as “not a bug”. With `utf8`, we must truncate an input string when we encounter bytes that we don't understand. Otherwise, we wouldn't know how long the bad multi-byte character is.

One possible workaround is to use `ucs2` instead of `utf8`, in which case the “bad” characters are changed to question marks; however, no truncation takes place. You can also change the data type to `BLOB` or `BINARY`, which perform no validity checking.

As of MySQL 6.0.4, Unicode support is extended to include supplementary characters by means of additional Unicode character sets: `utf16`, `utf32`, and 4-byte `utf8`. These character sets support supplementary Unicode characters outside the Basic Multilingual Plane (BMP).

### 22.11.17: Shouldn't it be “CJKV”?

No. The term “CJKV” (*Chinese Japanese Korean Vietnamese*) refers to Vietnamese character sets which contain Han (originally Chinese) characters. MySQL has no plan to support the old Vietnamese script using Han characters. MySQL does of course support the modern Vietnamese script with Western characters.

[Bug#4745](#) is a request for a specialized Vietnamese collation, which we might add in the future if there is sufficient demand for it.

**22.11.18: Does MySQL allow CJK characters to be used in database and table names?**

This issue is fixed in MySQL 5.1, by automatically rewriting the names of the corresponding directories and files.

For example, if you create a database named 精 on a server whose operating system does not support CJK in directory names, MySQL creates a directory named @0w@00a5@00ae. which is just a fancy way of encoding E6A5AE — that is, the Unicode hexadecimal representation for the 精 character. However, if you run a `SHOW DATABASES` statement, you can see that the database is listed as 精.

**22.11.19: Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?**

A Simplified Chinese version of the Manual, current for MySQL 5.1.12, can be found at <http://dev.mysql.com/doc/>. The Japanese translation of the MySQL 4.1 manual can be downloaded from <http://dev.mysql.com/doc/>.

**22.11.20: Where can I get help with CJK and related issues in MySQL?**

The following resources are available:

- A listing of MySQL user groups can be found at <http://dev.mysql.com/user-groups/>.
- You can contact a sales engineer at the MySQL KK Japan office using any of the following:

```
Tel: +81(0)3-5326-3133
Fax: +81(0)3-5326-3001
Email: dsaito@mysql.com
```

- View feature requests relating to character set issues at <http://tinyurl.com/y6xcuf>.
- Visit the MySQL [Character Sets, Collation, Unicode Forum](#). We are also in the process of adding foreign-language forums at <http://forums.mysql.com/>.

## A.12. MySQL 5.1 FAQ — Connectors & APIs

For common questions, issues, and answers relating to the MySQL Connectors and other APIs, see the following areas of the Manual:

- [Section 20.10.10, “Common Questions and Problems When Using the C API”](#)
- [Section 20.11.5, “Common Problems with MySQL and PHP”](#)
- [Section 20.1.7, “Connector/ODBC Notes and Tips”](#)
- [Section 20.2.4, “Connector/NET Programming”](#)
- [Section 20.4.5, “Connector/J Notes and Tips”](#)
- [Section 20.5.6, “Connector/MXJ Notes and Tips”](#)

## A.13. MySQL 5.1 FAQ — Replication

For answers to common queries and question regarding Replication within MySQL, see [Section 16.3.4, “Replication FAQ”](#).

## A.14. MySQL 5.1 FAQ — MySQL, DRBD, and Heartbeat

### A.14.1. Distributed Replicated Block Device (DRBD)

In the following section, we provide answers to questions that are most frequently asked about Distributed Replicated Block Device (DRBD).

#### Questions

- [22.14.1.1: What is DRBD?](#)
- [22.14.1.2: What are “Block Devices”?](#)

- [22.14.1.3](#): How is DRBD licensed?
- [22.14.1.4](#): Where can I download DRBD?
- [22.14.1.5](#): If I find a bug in DRBD, to whom do I submit the issue?
- [22.14.1.6](#): Where can I get more technical and business information concerning MySQL and DRBD?

### Questions and Answers

#### 22.14.1.1: What is DRBD?

DRBD is an acronym for Distributed Replicated Block Device. DRBD is an open source Linux kernel block device which leverages synchronous replication to achieve a consistent view of data between two systems, typically an Active and Passive system. DRBD currently supports all the major flavors of Linux and comes bundled in several major Linux distributions. The DRBD project is maintained by [LINBIT](#).

#### 22.14.1.2: What are “Block Devices”?

A *block device* is the type of device used to represent storage in the Linux Kernel. All physical disk devices present a block device interface. Additionally, virtual disk systems like LVM or DRBD present a block device interface. In this way, the file system or other software that might want to access a disk device can be used with any number of real or virtual devices without having to know anything about their underlying implementation details.

#### 22.14.1.3: How is DRBD licensed?

DRBD is licensed under the GPL.

#### 22.14.1.4: Where can I download DRBD?

Please see <http://www.drbd.org/download/packages/>.

#### 22.14.1.5: If I find a bug in DRBD, to whom do I submit the issue?

Bug reports should be submitted to the DRBD mailing list. Please see <http://lists.linbit.com/>.

#### 22.14.1.6: Where can I get more technical and business information concerning MySQL and DRBD?

Please visit <http://mysql.com/drbd/>.

## A.14.2. Linux Heartbeat

In the following section, we provide answers to questions that are most frequently asked about Linux Heartbeat.

### Questions

- [22.14.2.1](#): What is Linux Heartbeat?
- [22.14.2.2](#): How is Linux Heartbeat licensed?
- [22.14.2.3](#): Where can I download Linux Heartbeat?
- [22.14.2.4](#): If I find a bug with Linux Heartbeat, to whom do I submit the issue?

### Questions and Answers

#### 22.14.2.1: What is Linux Heartbeat?

The Linux-HA project (<http://www.linux-ha.org/>) offers a high availability solution commonly referred to as Linux Heartbeat. Linux Heartbeat ships as part of several Linux distributions, as well as within several embedded high availability systems. This solution can also be used for other applications besides databases servers, such as mail servers, web servers, file servers, and DNS servers.

Linux Heartbeat implements a heartbeat-protocol. A heartbeat-protocol means that messages are sent at regular intervals between two or more nodes. If a message is not received from a node within a given interval, then it is assumed the node has failed and some type of failover or recovery action is required. Linux Heartbeat is typically configured to send these heartbeat messages over standard Ethernet interfaces, but it does also support other methods, such as serial-line links.

**22.14.2.2: How is Linux Heartbeat licensed?**

Linux Heartbeat is licensed under the GPL.

**22.14.2.3: Where can I download Linux Heartbeat?**

Please see <http://linux-ha.org/download/index.html>.

**22.14.2.4: If I find a bug with Linux Heartbeat, to whom do I submit the issue?**

Bug reports should be submitted to <http://www.linux-ha.org/ClusterResourceManager/BugReports>.

## A.14.3. DRBD Architecture

In the following section, we provide answers to questions that are most frequently asked about DRBD Architecture.

### Questions

- [22.14.3.1: Is an Active/Active option available for MySQL with DRBD?](#)
- [22.14.3.2: What MySQL storage engines are supported with DRBD?](#)
- [22.14.3.3: How long does a failover take?](#)
- [22.14.3.4: How long does it take to resynchronize data after a failure?](#)
- [22.14.3.5: Are there any situations where you shouldn't use DRBD?](#)
- [22.14.3.6: Are there any limitations to DRBD?](#)
- [22.14.3.7: Where can I find more information on sample architectures?](#)

### Questions and Answers

**22.14.3.1: Is an Active/Active option available for MySQL with DRBD?**

Currently, MySQL does not support Active/Active configurations using DRBD “out of the box”.

**22.14.3.2: What MySQL storage engines are supported with DRBD?**

All of the MySQL transactional storage engines are supported by DRBD, including InnoDB and Falcon. For archived or read-only data, MyISAM or Archive can also be used.

**22.14.3.3: How long does a failover take?**

Failover time is dependent on many things, some of which are configurable. After activating the passive host, MySQL will have to start and run a normal recovery process. If the InnoDB log files have been configured to a large size and there was heavy write traffic, this may take a reasonably long period of time. However, under normal circumstances, failover tends to take less than a minute.

**22.14.3.4: How long does it take to resynchronize data after a failure?**

Resynchronization time depends on how long the two machines are out of communication and how much data was written during that period of time. Resynchronization time is a function of data to be synced, network speed and disk speed. DRBD maintains a bitmap of changed blocks on the primary machine, so only those blocks that have changed will need to be transferred.

**22.14.3.5: Are there any situations where you shouldn't use DRBD?**

See [When Not To Use DRBD](#).

**22.14.3.6: Are there any limitations to DRBD?**

See [DRBD limitations \(or are they?\)](#).

**22.14.3.7: Where can I find more information on sample architectures?**

For an example of a Heartbeat R1-compatible resource configuration involving a MySQL database backed by DRBD, see [DRBD User's Guide](#).

For an example of the same DRBD-backed configuration for a MySQL database in a Heartbeat CRM cluster, see [DRBD User's Guide](#).

## A.14.4. DRBD and MySQL Replication

In the following section, we provide answers to questions that are most frequently asked about MySQL Replication Scale-out.

### Questions

- [22.14.4.1](#): What is the difference between MySQL Cluster and DRBD?
- [22.14.4.2](#): What is the difference between MySQL Replication and DRBD?
- [22.14.4.3](#): How can I combine MySQL Replication scale-out with DRBD?

### Questions and Answers

#### 22.14.4.1: What is the difference between MySQL Cluster and DRBD?

Both MySQL Cluster and DRBD replicate data synchronously. MySQL Cluster leverages a shared-nothing storage architecture in which the cluster can be architected beyond an Active/Passive configuration. DRBD operates at a much lower level within the “stack”, at the disk I/O level. For a comparison of various high availability features between these two options, please refer to [Chapter 14, High Availability and Scalability](#).

#### 22.14.4.2: What is the difference between MySQL Replication and DRBD?

MySQL Replication replicates data asynchronously while DRBD replicates data synchronously. Also, MySQL Replication replicates MySQL statements, while DRBD replicates the underlying block device that stores the MySQL data files. For a comparison of various high availability features between these two options, please refer to the high availability comparison grid, [Chapter 14, High Availability and Scalability](#).

#### 22.14.4.3: How can I combine MySQL Replication scale-out with DRBD?

MySQL Replication is typically deployed in a Master to many Slaves configuration. In this configuration, having many Slaves provides read scalability. DRBD is used to provide high-availability for the Master MySQL Server in an Active/Passive configuration. This provides for automatic failover, safeguards against data loss, and automatically synchronizes the failed MySQL Master after a failover.

The most likely scenario in which MySQL Replication scale-out can be leveraged with DRBD is in the form of attaching replicated MySQL “read-slaves” off of the Active-Master MySQL Server, shown in [Figure A.1, “Active-Master MySQL server”](#). Since DRBD replicates an entire block device, master information such as the binary logs are also replicated. In this way, all of the slaves can attach to the Virtual IP Address managed by Linux Heartbeat. In the event of a failure, the asynchronous nature of MySQL Replication allows the slaves to continue with the new Active machine as their master with no intervention needed.

### Figure A.1. Active-Master MySQL server

## A.14.5. DRBD and File Systems

In the following section, we provide answers to questions that are most frequently asked about DRBD and file systems.

### Questions

- [22.14.5.1](#): Can XFS be used with DRBD?

### Questions and Answers

#### 22.14.5.1: Can XFS be used with DRBD?

Yes. XFS uses dynamic block size, thus DRBD 0.7 or later is needed.

## A.14.6. DRBD and LVM

In the following section, we provide answers to questions that are most frequently asked about DRBD and LVM.

### Questions

- [22.14.6.1](#): Can I use DRBD on top of LVM?
- [22.14.6.2](#): Can I use LVM on top of DRBD?
- [22.14.6.3](#): Can I use DRBD on top of LVM while at the same time running LVM on top of that DRBD?

### Questions and Answers

#### 22.14.6.1: Can I use DRBD on top of LVM?

Yes, DRBD supports on-line resizing. If you enlarge your logical volume that acts as a backing device for DRBD, you can enlarge DRBD itself too, and of course your file system if it supports resizing.

#### 22.14.6.2: Can I use LVM on top of DRBD?

Yes, you can use DRBD as a Physical Volume (PV) for LVM. Depending on the default LVM configuration shipped with your dis-

tribution, you may need to add the `/dev/drbd*` device files to the `filter` option in your `lvm.conf` so LVM scans your DRBDs for PV signatures.

#### **22.14.6.3: Can I use DRBD on top of LVM while at the same time running LVM on top of that DRBD?**

This requires careful tuning of your LVM configuration to avoid duplicate PV scans, but yes, it is possible.

### **A.14.7. DRBD and Virtualization**

In the following section, we provide answers to questions that are most frequently asked about DRBD and virtualization.

#### **Questions**

- [22.14.7.1: Can I use DRBD with OpenVZ?](#)
- [22.14.7.2: Can I use DRBD with Xen and/or KVM?](#)

#### **Questions and Answers**

##### **22.14.7.1: Can I use DRBD with OpenVZ?**

See [http://wiki.openvz.org/HA\\_cluster\\_with\\_DRBD\\_and\\_Heartbeat](http://wiki.openvz.org/HA_cluster_with_DRBD_and_Heartbeat).

##### **22.14.7.2: Can I use DRBD with Xen and/or KVM?**

Yes. If you are looking for professional consultancy or expert commercial support for Xen- or KVM-based virtualization clusters with DRBD, contact LINBIT (<http://www.linbit.com>).

### **A.14.8. DRBD and Security**

In the following section, we provide answers to questions that are most frequently asked about DRBD and security.

#### **Questions**

- [22.14.8.1: Can I encrypt/compress the exchanged data?](#)
- [22.14.8.2: Does DRBD do mutual node authentication?](#)

#### **Questions and Answers**

##### **22.14.8.1: Can I encrypt/compress the exchanged data?**

Yes. But there is no option within DRBD to allow for this. You'll need to leverage a VPN and the network layer should do the rest.

##### **22.14.8.2: Does DRBD do mutual node authentication?**

Yes, starting with DRBD 8 shared-secret mutual node authentication is supported.

### **A.14.9. DRBD and System Requirements**

In the following section, we provide answers to questions that are most frequently asked about DRBD and System Requirements.

#### **Questions**

- [22.14.9.1: What other packages besides DRBD are required?](#)
- [22.14.9.2: How many machines are required to set up DRBD?](#)
- [22.14.9.3: Does DRBD only run on Linux?](#)

#### **Questions and Answers**

##### **22.14.9.1: What other packages besides DRBD are required?**

When using pre-built binary packages, none except a matching kernel, plus packages for `glibc` and your favorite shell. When

compiling DRBD from source additional prerequisite packages may be required. They include but are not limited to:

- glib-devel
- openssl
- devel
- libgcrypt-devel
- glib2-devel
- pkgconfig
- ncurses-devel
- rpm-build
- rpm-devel
- redhat-rpm-config
- gcc
- gcc-c++
- bison
- flex
- gnutls-devel
- lm\_sensors-devel
- net-snmp-devel
- python-devel
- bzip2-devel
- libselinux-devel
- perl-DBI
- libnet

Pre-built x86 and x86\_64 packages for specific kernel versions are available with a support subscription from LINBIT. Please note that if the kernel is upgraded, DRBD must be as well.

#### **22.14.9.2: How many machines are required to set up DRBD?**

Two machines are required to achieve the minimum degree of high availability. Although at any one given point in time one will be primary and one will be secondary, it is better to consider the machines as part of a mirrored pair without a “natural” primary machine.

#### **22.14.9.3: Does DRBD only run on Linux?**

DRBD is a Linux Kernel Module, and can work with many popular Linux distributions. DRBD is currently not available for non-Linux operating systems.

## **A.14.10. DRBD and Support and Consulting**

In the following section, we provide answers to questions that are most frequently asked about DRBD and resources.

### **Questions**

- [22.14.10.1](#): Does MySQL offer professional consulting to help with designing a DRBD system?
- [22.14.10.2](#): Does MySQL offer support for DRBD and Linux Heartbeat from MySQL?

- [22.14.10.3](#): Are pre-built binaries or RPMs available?
- [22.14.10.4](#): Does MySQL have documentation to help me with the installation and configuration of DRBD and Linux Heartbeat?
- [22.14.10.5](#): Is there a dedicated discussion forum for MySQL High-Availability?
- [22.14.10.6](#): Where can I get more information about MySQL for DRBD?

### Questions and Answers

#### **22.14.10.1: Does MySQL offer professional consulting to help with designing a DRBD system?**

Yes. MySQL offers consulting for the design, installation, configuration, and monitoring of high availability DRBD. For more information concerning a High Availability Jumpstart, please see: <http://www.mysql.com/consulting/packaged/scaleout.html>.

#### **22.14.10.2: Does MySQL offer support for DRBD and Linux Heartbeat from MySQL?**

Yes. Support for DRBD and Linux Heartbeat is available with an add-on subscription to MySQL Enterprise called “DRBD for MySQL”. For more information about support options for DRBD see: <http://mysql.com/products/enterprise/features.html>.

For the list of supported Linux distributions, please see: <http://www.mysql.com/support/supportedplatforms/enterprise.html>.

#### **Note**

DRBD is only available on Linux. DRBD is not available on Windows, MacOS, Solaris, HP-UX, AIX, FreeBSD, or other non-Linux platforms.

#### **22.14.10.3: Are pre-built binaries or RPMs available?**

Yes. “DRBD for MySQL” is an add-on subscription to MySQL Enterprise, which provides pre-built binaries for DRBD. For more information, see: <http://mysql.com/products/enterprise/features.html>.

#### **22.14.10.4: Does MySQL have documentation to help me with the installation and configuration of DRBD and Linux Heartbeat?**

For MySQL-specific DRBD documentation, see [Section 14.1, “Using MySQL with DRBD”](#).

For general DRBD documentation, see [DRBD User's Guide](#).

#### **22.14.10.5: Is there a dedicated discussion forum for MySQL High-Availability?**

Yes, <http://forums.mysql.com/list.php?144>.

#### **22.14.10.6: Where can I get more information about MySQL for DRBD?**

For more information about MySQL for DRBD, including a technical white paper please see: [DRBD for MySQL High Availability](#).

---

# Appendix B. Errors, Error Codes, and Common Problems

This appendix lists common problems and errors that may occur and potential resolutions, in addition to listing the errors that may appear when you call MySQL from any host language. The first section covers problems and resolutions. Detailed information on errors is provided; The first list displays server error messages. The second list displays client program messages.

## MySQL Enterprise

The MySQL Enterprise Monitor provides a “Virtual DBA” to assist with problem solving. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

## B.1. Problems and Common Errors

This section lists some common problems and error messages that you may encounter. It describes how to determine the causes of the problems and what to do to solve them.

### B.1.1. How to Determine What Is Causing a Problem

When you run into a problem, the first thing you should do is to find out which program or piece of equipment is causing it:

- If you have one of the following symptoms, then it is probably a hardware problems (such as memory, motherboard, CPU, or hard disk) or kernel problem:
  - The keyboard doesn't work. This can normally be checked by pressing the Caps Lock key. If the Caps Lock light doesn't change, you have to replace your keyboard. (Before doing this, you should try to restart your computer and check all cables to the keyboard.)
  - The mouse pointer doesn't move.
  - The machine doesn't answer to a remote machine's pings.
  - Other programs that are not related to MySQL don't behave correctly.
  - Your system restarted unexpectedly. (A faulty user-level program should never be able to take down your system.)

In this case, you should start by checking all your cables and run some diagnostic tool to check your hardware! You should also check whether there are any patches, updates, or service packs for your operating system that could likely solve your problem. Check also that all your libraries (such as `glibc`) are up to date.

It is always good to use a machine with ECC memory to discover memory problems early.

- If your keyboard is locked up, you may be able to recover by logging in to your machine from another machine and executing `kbd_mode -a`.
- Please examine your system log file (`/var/log/messages` or similar) for reasons for your problem. If you think the problem is in MySQL, you should also examine MySQL's log files. See [Section 5.2, “MySQL Server Logs”](#).
- If you don't think you have hardware problems, you should try to find out which program is causing problems. Try using `top`, `ps`, Task Manager, or some similar program, to check which program is taking all CPU or is locking the machine.
- Use `top`, `df`, or a similar program to check whether you are out of memory, disk space, file descriptors, or some other critical resource.
- If the problem is some runaway process, you can always try to kill it. If it doesn't want to die, there is probably a bug in the operating system.

If after you have examined all other possibilities and you have concluded that the MySQL server or a MySQL client is causing the problem, it is time to create a bug report for our mailing list or our support team. In the bug report, try to give a very detailed description of how the system is behaving and what you think is happening. You should also state why you think that MySQL is causing the problem. Take into consideration all the situations in this chapter. State any problems exactly how they appear when you examine your system. Use the “copy and paste” method for any output and error messages from programs and log files.

Try to describe in detail which program is not working and all symptoms you see. We have in the past received many bug reports that state only “the system doesn't work.” This doesn't provide us with any information about what could be the problem.

If a program fails, it is always useful to know the following information:

- Has the program in question made a segmentation fault (did it dump core)?
- Is the program taking up all available CPU time? Check with `top`. Let the program run for a while, it may simply be evaluating something computationally intensive.
- If the `mysqld` server is causing problems, can you get any response from it with `mysqladmin -u root ping` or `mysqladmin -u root processlist`?
- What does a client program say when you try to connect to the MySQL server? (Try with `mysql`, for example.) Does the client jam? Do you get any output from the program?

When sending a bug report, you should follow the outline described in [Section 1.6, “How to Report Bugs or Problems”](#).

## B.1.2. Common Errors When Using MySQL Programs

This section lists some errors that users frequently encounter when running MySQL programs. Although the problems show up when you try to run client programs, the solutions to many of the problems involves changing the configuration of the MySQL server.

### B.1.2.1. Access denied

An `Access denied` error can have many causes. Often the problem is related to the MySQL accounts that the server allows client programs to use when connecting. See [Section 5.4, “The MySQL Access Privilege System”](#), and [Section 5.4.7, “Causes of Access-Denied Errors”](#).

### B.1.2.2. Can't connect to [local] MySQL server

A MySQL client on Unix can connect to the `mysqld` server in two different ways: By using a Unix socket file to connect through a file in the file system (default `/tmp/mysql.sock`), or by using TCP/IP, which connects through a port number. A Unix socket file connection is faster than TCP/IP, but can be used only when connecting to a server on the same computer. A Unix socket file is used if you don't specify a host name or if you specify the special host name `localhost`.

If the MySQL server is running on Windows, you can connect via TCP/IP. If the server is started with the `-enable-named-pipe` option, you can also connect with named pipes if you run the client on the host where the server is running. The name of the named pipe is `MySQL` by default. If you don't give a host name when connecting to `mysqld`, a MySQL client first tries to connect to the named pipe. If that doesn't work, it connects to the TCP/IP port. You can force the use of named pipes on Windows by using `.` as the host name.

The error (2002) `Can't connect to ...` normally means that there is no MySQL server running on the system or that you are using an incorrect Unix socket file name or TCP/IP port number when trying to connect to the server. You should also check that the TCP/IP port you are using has not been blocked by a firewall or port blocking service.

The error (2003) `Can't connect to MySQL server on 'server' (10061)` indicates that the network connection has been refused. You should check that there is a MySQL server running, that it has network connections enabled, and that the network port you specified is the one configured on the server.

Start by checking whether there is a process named `mysqld` running on your server host. (Use `ps xa | grep mysqld` on Unix or the Task Manager on Windows.) If there is no such process, you should start the server. See [Section 2.11.2.3, “Starting and Troubleshooting the MySQL Server”](#).

If a `mysqld` process is running, you can check it by trying the following commands. The port number or Unix socket file name might be different in your setup. `host_ip` represents the IP number of the machine where the server is running.

```
shell> mysqladmin version
shell> mysqladmin variables
shell> mysqladmin -h `hostname` version variables
shell> mysqladmin -h `hostname` --port=3306 version
shell> mysqladmin -h host_ip version
shell> mysqladmin --protocol=SOCKET --socket=/tmp/mysql.sock version
```

Note the use of backticks rather than forward quotes with the `hostname` command; these cause the output of `hostname` (that is, the current host name) to be substituted into the `mysqladmin` command. If you have no `hostname` command or are running on Windows, you can manually type the host name of your machine (without backticks) following the `-h` option. You can also try `-h 127.0.0.1` to connect with TCP/IP to the local host.

Make sure that the server has not been configured to ignore network connections or (if you are attempting to connect remotely) that it has not been configured to listen only locally on its network interfaces. If the server was started with `--skip-networking`, it will not accept TCP/IP connections at all. If the server was started with `--bind-address=127.0.0.1`, it will listen for TCP/IP connections only locally on the loopback interface and will not accept remote connections.

Check to make sure that there is no firewall blocking access to MySQL. Your firewall may be configured on the basis of the application being executed, or the port number used by MySQL for communication (3306 by default). Under Linux or Unix, check your IP tables (or similar) configuration to ensure that the port has not been blocked. Under Windows, applications such as ZoneAlarm or the Windows XP personal firewall may need to be configured not to block the MySQL port.

Here are some reasons the `Can't connect to local MySQL server` error might occur:

- `mysqld` is not running on the local host. Check your operating system's process list to ensure the `mysqld` process is present.
- You're running a MySQL server on Windows with many TCP/IP connections to it. If you're experiencing that quite often your clients get that error, you can find a workaround here: [Section B.1.2.2.1, "Connection to MySQL Server Failing on Windows"](#).
- You are running on a system that uses MIT-pthreads. If you are running on a system that doesn't have native threads, `mysqld` uses the MIT-pthreads package. See [Section 2.1.1, "Operating Systems Supported by MySQL Community Server"](#). However, not all MIT-pthreads versions support Unix socket files. On a system without socket file support, you must always specify the host name explicitly when connecting to the server. Try using this command to check the connection to the server:

```
shell> mysqladmin -h `hostname` version
```

- Someone has removed the Unix socket file that `mysqld` uses (`/tmp/mysql.sock` by default). For example, you might have a `cron` job that removes old files from the `/tmp` directory. You can always run `mysqladmin version` to check whether the Unix socket file that `mysqladmin` is trying to use really exists. The fix in this case is to change the `cron` job to not remove `mysql.sock` or to place the socket file somewhere else. See [Section B.1.4.5, "How to Protect or Change the MySQL Unix Socket File"](#).
- You have started the `mysqld` server with the `--socket=/path/to/socket` option, but forgotten to tell client programs the new name of the socket file. If you change the socket path name for the server, you must also notify the MySQL clients. You can do this by providing the same `--socket` option when you run client programs. You also need to ensure that clients have permission to access the `mysql.sock` file. To find out where the socket file is, you can do:

```
shell> netstat -ln | grep mysql
```

See [Section B.1.4.5, "How to Protect or Change the MySQL Unix Socket File"](#).

- You are using Linux and one server thread has died (dumped core). In this case, you must kill the other `mysqld` threads (for example, with `kill` or with the `mysql_zap` script) before you can restart the MySQL server. See [Section B.1.4.2, "What to Do If MySQL Keeps Crashing"](#).
- The server or client program might not have the proper access privileges for the directory that holds the Unix socket file or the socket file itself. In this case, you must either change the access privileges for the directory or socket file so that the server and clients can access them, or restart `mysqld` with a `--socket` option that specifies a socket file name in a directory where the server can create it and where client programs can access it.

If you get the error message `Can't connect to MySQL server on some_host`, you can try the following things to find out what the problem is:

- Check whether the server is running on that host by executing `telnet some_host 3306` and pressing the Enter key a couple of times. (3306 is the default MySQL port number. Change the value if your server is listening to a different port.) If there is a MySQL server running and listening to the port, you should get a response that includes the server's version number. If you get an error such as `telnet: Unable to connect to remote host: Connection refused`, then there is no server running on the given port.
- If the server is running on the local host, try using `mysqladmin -h localhost variables` to connect using the Unix socket file. Verify the TCP/IP port number that the server is configured to listen to (it is the value of the `port` variable.)
- If you are running under Linux and Security-Enhanced Linux (SELinux) is enabled, make sure you have disabled SELinux protection for the `mysqld` process.

### B.1.2.2.1. Connection to MySQL Server Failing on Windows

When you're running a MySQL server on Windows with many TCP/IP connections to it, and you're experiencing that quite often your clients get a `Can't connect to MySQL server` error, the reason might be that Windows doesn't allow for enough ephemeral (short-lived) ports to serve those connections.

By default, Windows allows 5000 ephemeral (short-lived) TCP ports to the user. After any port is closed it will remain in a

`TIME_WAIT` status for 120 seconds. This status allows the connection to be reused at a much lower cost than reinitializing a brand new connection. However, the port will not be available again until this time expires.

With a small stack of available TCP ports (5000) and a high number of TCP ports being open and closed over a short period of time along with the `TIME_WAIT` status you have a good chance for running out of ports. There are two ways to address this problem:

- Reduce the number of TCP ports consumed quickly by investigating connection pooling or persistent connections where possible
- Tune some settings in the Windows registry (see below)

**IMPORTANT: The following procedure involves modifying the Windows registry. Before you modify the registry, make sure to back it up and make sure that you understand how to restore the registry if a problem occurs. For information about how to back up, restore, and edit the registry, view the following article in the Microsoft Knowledge Base: <http://support.microsoft.com/kb/256986/EN-US/>.**

1. Start Registry Editor (`Regedt32.exe`).
2. Locate the following key in the registry:

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters
```

3. On the `Edit` menu, click `Add Value`, and then add the following registry value:

```
Value Name: MaxUserPort
Data Type: REG_DWORD
Value: 65534
```

This sets the number of ephemeral ports available to any user. The valid range is between 5000 and 65534 (decimal). The default value is 0x1388 (5000 decimal).

4. On the `Edit` menu, click `Add Value`, and then add the following registry value:

```
Value Name: TcpTimedWaitDelay
Data Type: REG_DWORD
Value: 30
```

This sets the number of seconds to hold a TCP port connection in `TIME_WAIT` state before closing. The valid range is between 0 (zero) and 300 (decimal). The default value is 0x78 (120 decimal).

5. Quit Registry Editor.
6. Reboot the machine.

Note: Undoing the above should be as simple as deleting the registry entries you've created.

### B.1.2.3. Lost connection to MySQL server

There are three likely causes for this error message.

Usually it indicates network connectivity trouble and you should check the condition of your network if this error occurs frequently. If the error message includes “during query,” this is probably the case you are experiencing.

Sometimes the “during query” form happens when millions of rows are being sent as part of one or more queries. If you know that this is happening, you should try increasing `net_read_timeout` from its default of 30 seconds to 60 seconds or longer, sufficient for the data transfer to complete.

More rarely, it can happen when the client is attempting the initial connection to the server. In this case, if your `connect_timeout` value is set to only a few seconds, you may be able to resolve the problem by increasing it to ten seconds, perhaps more if you have a very long distance or slow connection. You can determine whether you are experiencing this more uncommon cause by using `SHOW GLOBAL STATUS LIKE 'Aborted_connects'`. It will increase by one for each initial connection attempt that the server aborts. You may see “reading authorization packet” as part of the error message; if so, that also suggests that this is the solution that you need.

If the cause is none of those just described, you may be experiencing a problem with `BLOB` values that are larger than `max_allowed_packet`, which can cause this error with some clients. Sometime you may see “packet too large” as part of the error message, and that confirms that you need to increase `max_allowed_packet`.

### B.1.2.4. Client does not support authentication protocol

MySQL 5.1 uses an authentication protocol based on a password hashing algorithm that is incompatible with that used by older (pre-4.1) clients. If you upgrade the server from 4.0, attempts to connect to it with an older client may fail with the following message:

```
shell> mysql
Client does not support authentication protocol requested
by server; consider upgrading MySQL client
```

To solve this problem, you should use one of the following approaches:

- Upgrade all client programs to use a 4.1.1 or newer client library.
- When connecting to the server with a pre-4.1 client program, use an account that still has a pre-4.1-style password.
- Reset the password to pre-4.1 style for each user that needs to use a pre-4.1 client program. This can be done using the `SET PASSWORD` statement and the `OLD_PASSWORD()` function:

```
mysql> SET PASSWORD FOR
-> 'some_user'@'some_host' = OLD_PASSWORD('newpwd');
```

Alternatively, use `UPDATE` and `FLUSH PRIVILEGES`:

```
mysql> UPDATE mysql.user SET Password = OLD_PASSWORD('newpwd')
-> WHERE Host = 'some_host' AND User = 'some_user';
mysql> FLUSH PRIVILEGES;
```

Substitute the password you want to use for “`newpwd`” in the preceding examples. MySQL cannot tell you what the original password was, so you’ll need to pick a new one.

- Tell the server to use the older password hashing algorithm:
  1. Start `mysqld` with the `--old-passwords` option.
  2. Assign an old-format password to each account that has had its password updated to the longer 4.1 format. You can identify these accounts with the following query:

```
mysql> SELECT Host, User, Password FROM mysql.user
-> WHERE LENGTH>Password) > 16;
```

For each account record displayed by the query, use the `Host` and `User` values and assign a password using the `OLD_PASSWORD()` function and either `SET PASSWORD` or `UPDATE`, as described earlier.

#### Note

In older versions of PHP, the `mysql` extension does not support the authentication protocol in MySQL 4.1.1 and higher. This is true regardless of the PHP version being used. If you wish to use the `mysql` extension with MySQL 4.1 or newer, you may need to follow one of the options discussed above for configuring MySQL to work with old clients. The `mysqli` extension (stands for “MySQL, Improved”; added in PHP 5) is compatible with the improved password hashing employed in MySQL 4.1 and higher, and no special configuration of MySQL need be done to use this MySQL client library. For more information about the `mysqli` extension, see <http://php.net/mysqli>.

It may also be possible to compile the older `mysql` extension against the new MySQL client library. This is beyond the scope of this Manual; consult the PHP documentation for more information. You also be able to obtain assistance with these issues in our [MySQL with PHP forum](#).

For additional background on password hashing and authentication, see [Section 5.5.6.3, “Password Hashing in MySQL”](#).

### B.1.2.5. Password Fails When Entered Interactively

MySQL client programs prompt for a password when invoked with a `--password` or `-p` option that has no following password value:

```
shell> mysql -u user_name -p
Enter password:
```

On some systems, you may find that your password works when specified in an option file or on the command line, but not when

you enter it interactively at the `Enter password:` prompt. This occurs when the library provided by the system to read passwords limits password values to a small number of characters (typically eight). That is a problem with the system library, not with MySQL. To work around it, change your MySQL password to a value that is eight or fewer characters long, or put your password in an option file.

### B.1.2.6. Host '`host_name`' is blocked

If you get the following error, it means that `mysqld` has received many connect requests from the host '`host_name`' that have been interrupted in the middle:

```
Host 'host_name' is blocked because of many connection errors.
Unblock with 'mysqladmin flush-hosts'
```

The number of interrupted connect requests allowed is determined by the value of the `max_connect_errors` system variable. After `max_connect_errors` failed requests, `mysqld` assumes that something is wrong (for example, that someone is trying to break in), and blocks the host from further connections until you execute a `mysqladmin flush-hosts` command or issue a `FLUSH HOSTS` statement. See [Section 5.1.3, “Server System Variables”](#).

By default, `mysqld` blocks a host after 10 connection errors. You can adjust the value by starting the server like this:

```
shell> mysqld_safe --max_connect_errors=10000 &
```

If you get this error message for a given host, you should first verify that there isn't anything wrong with TCP/IP connections from that host. If you are having network problems, it does you no good to increase the value of the `max_connect_errors` variable.

### B.1.2.7. Too many connections

If you get a `Too many connections` error when you try to connect to the `mysqld` server, this means that all available connections are in use by other clients.

The number of connections allowed is controlled by the `max_connections` system variable. Beginning with MySQL 5.1.15, its default value is 151 to improve performance when MySQL is used with the Apache Web server. (Previously, the default was 100.) If you need to support more connections, you should set a larger value for this variable.

#### MySQL Enterprise

Subscribers to the MySQL Enterprise Monitor receive advice on dynamically configuring the `max_connections` variable — avoiding failed connection attempts. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

`mysqld` actually allows `max_connections+1` clients to connect. The extra connection is reserved for use by accounts that have the `SUPER` privilege. By granting the `SUPER` privilege to administrators and not to normal users (who should not need it), an administrator can connect to the server and use `SHOW PROCESSLIST` to diagnose problems even if the maximum number of unprivileged clients are connected. See [Section 12.5.5.31, “SHOW PROCESSLIST Syntax”](#).

The maximum number of connections MySQL can support depends on the quality of the thread library on a given platform. Linux or Solaris should be able to support 500-1000 simultaneous connections, depending on how much RAM you have and what your clients are doing. Static Linux binaries provided by Sun Microsystems, Inc. can support up to 4000 connections.

### B.1.2.8. Out of memory

If you issue a query using the `mysql` client program and receive an error like the following one, it means that `mysql` does not have enough memory to store the entire query result:

```
mysql: Out of memory at line 42, 'malloc.c'
mysql: needed 8136 byte (8k), memory in use: 12481367 bytes (12189k)
ERROR 2008: MySQL client ran out of memory
```

To remedy the problem, first check whether your query is correct. Is it reasonable that it should return so many rows? If not, correct the query and try again. Otherwise, you can invoke `mysql` with the `--quick` option. This causes it to use the `mysql_use_result()` C API function to retrieve the result set, which places less of a load on the client (but more on the server).

### B.1.2.9. MySQL server has gone away

This section also covers the related `Lost connection to server during query` error.

The most common reason for the `MySQL server has gone away` error is that the server timed out and closed the connection. In this case, you normally get one of the following error codes (which one you get is operating system-dependent).

Error Code	Description
<code>CR_SERVER_GONE_ERROR</code>	The client couldn't send a question to the server.
<code>CR_SERVER_LOST</code>	The client didn't get an error when writing to the server, but it didn't get a full answer (or any answer) to the question.

By default, the server closes the connection after eight hours if nothing has happened. You can change the time limit by setting the `wait_timeout` variable when you start `mysqld`. See [Section 5.1.3, “Server System Variables”](#).

If you have a script, you just have to issue the query again for the client to do an automatic reconnection. This assumes that you have automatic reconnection in the client enabled (which is the default for the `mysql` command-line client).

Some other common reasons for the `MySQL server has gone away` error are:

- You (or the db administrator) has killed the running thread with a `KILL` statement or a `mysqladmin kill` command.
- You tried to run a query after closing the connection to the server. This indicates a logic error in the application that should be corrected.
- A client application running on a different host does not have the necessary privileges to connect to the MySQL server from that host.
- You got a timeout from the TCP/IP connection on the client side. This may happen if you have been using the commands: `mysql_options(..., MYSQL_OPT_READ_TIMEOUT, ...)` or `mysql_options(..., MYSQL_OPT_WRITE_TIMEOUT, ...)`. In this case increasing the timeout may help solve the problem.
- You have encountered a timeout on the server side and the automatic reconnection in the client is disabled (the `reconnect` flag in the `MYSQL` structure is equal to 0).
- You are using a Windows client and the server had dropped the connection (probably because `wait_timeout` expired) before the command was issued.

The problem on Windows is that in some cases MySQL doesn't get an error from the OS when writing to the TCP/IP connection to the server, but instead gets the error when trying to read the answer from the connection.

Prior to MySQL 5.1.8, even if the `reconnect` flag in the `MYSQL` structure is equal to 1, MySQL does not automatically reconnect and re-issue the query as it doesn't know if the server did get the original query or not.

The solution to this is to either do a `mysql_ping()` on the connection if there has been a long time since the last query (this is what `MyODBC` does) or set `wait_timeout` on the `mysqld` server so high that it in practice never times out.

- You can also get these errors if you send a query to the server that is incorrect or too large. If `mysqld` receives a packet that is too large or out of order, it assumes that something has gone wrong with the client and closes the connection. If you need big queries (for example, if you are working with big `BLOB` columns), you can increase the query limit by setting the server's `max_allowed_packet` variable, which has a default value of 1MB. You may also need to increase the maximum packet size on the client end. More information on setting the packet size is given in [Section B.1.2.10, “Packet too large”](#).

An `INSERT` or `REPLACE` statement that inserts a great many rows can also cause these sorts of errors. Either one of these statements sends a single request to the server irrespective of the number of rows to be inserted; thus, you can often avoid the error by reducing the number of rows sent per `INSERT` or `REPLACE`.

- You also get a lost connection if you are sending a packet 16MB or larger if your client is older than 4.0.8 and your server is 4.0.8 and above, or the other way around.
- It is also possible to see this error if host name lookups fail (for example, if the DNS server on which your server or network relies goes down). This is because MySQL is dependent on the host system for name resolution, but has no way of knowing whether it is working — from MySQL's point of view the problem is indistinguishable from any other network timeout.

You may also see the `MySQL server has gone away` error if MySQL is started with the `--skip-networking` option.

Another networking issue that can cause this error occurs if the MySQL port (default 3306) is blocked by your firewall, thus preventing any connections at all to the MySQL server.

- You can also encounter this error with applications that fork child processes, all of which try to use the same connection to the MySQL server. This can be avoided by using a separate connection for each child process.
- You have encountered a bug where the server died while executing the query.

You can check whether the MySQL server died and restarted by executing `mysqladmin version` and examining the server's uptime. If the client connection was broken because `mysqld` crashed and restarted, you should concentrate on finding the reason for the crash. Start by checking whether issuing the query again kills the server again. See [Section B.1.4.2, “What to Do If MySQL Keeps Crashing”](#).

You can get more information about the lost connections by starting `mysqld` with the `--log-warnings=2` option. This logs some of the disconnected errors in the `hostname.err` file. See [Section 5.2.2, “The Error Log”](#).

If you want to create a bug report regarding this problem, be sure that you include the following information:

- Indicate whether the MySQL server died. You can find information about this in the server error log. See [Section B.1.4.2, “What to Do If MySQL Keeps Crashing”](#).
- If a specific query kills `mysqld` and the tables involved were checked with `CHECK TABLE` before you ran the query, can you provide a reproducible test case? See [MySQL Internals: Porting](#).
- What is the value of the `wait_timeout` system variable in the MySQL server? (`mysqladmin variables` gives you the value of this variable.)
- Have you tried to run `mysqld` with the general query log enabled to determine whether the problem query appears in the log? (See [Section 5.2.3, “The General Query Log”](#).)

See also [Section B.1.2.11, “Communication Errors and Aborted Connections”](#), and [Section 1.6, “How to Report Bugs or Problems”](#).

### B.1.2.10. Packet too large

A communication packet is a single SQL statement sent to the MySQL server, a single row that is sent to the client, or a binary log event sent from a master replication server to a slave.

The largest possible packet that can be transmitted to or from a MySQL 5.1 server or client is 1GB.

When a MySQL client or the `mysqld` server receives a packet bigger than `max_allowed_packet` bytes, it issues a `Packet too large` error and closes the connection. With some clients, you may also get a `Lost connection to MySQL server during query` error if the communication packet is too large.

Both the client and the server have their own `max_allowed_packet` variable, so if you want to handle big packets, you must increase this variable both in the client and in the server.

If you are using the `mysql` client program, its default `max_allowed_packet` variable is 16MB. To set a larger value, start `mysql` like this:

```
shell> mysql --max_allowed_packet=32M
```

That sets the packet size to 32MB.

The server's default `max_allowed_packet` value is 1MB. You can increase this if the server needs to handle big queries (for example, if you are working with big BLOB columns). For example, to set the variable to 16MB, start the server like this:

```
shell> mysqld --max_allowed_packet=16M
```

You can also use an option file to set `max_allowed_packet`. For example, to set the size for the server to 16MB, add the following lines in an option file:

```
[mysqld]
max_allowed_packet=16M
```

It is safe to increase the value of this variable because the extra memory is allocated only when needed. For example, `mysqld` allocates more memory only when you issue a long query or when `mysqld` must return a large result row. The small default value of the variable is a precaution to catch incorrect packets between the client and server and also to ensure that you do not run out of memory by using large packets accidentally.

You can also get strange problems with large packets if you are using large BLOB values but have not given `mysqld` access to enough memory to handle the query. If you suspect this is the case, try adding `ulimit -d 256000` to the beginning of the `mysqld_safe` script and restarting `mysqld`.

### B.1.2.11. Communication Errors and Aborted Connections

The server error log can be a useful source of information about connection problems. See [Section 5.2.2, “The Error Log”](#). If you start the server with the `--log-warnings` option, you might find messages like this in your error log:

```
010301 14:38:23 Aborted connection 854 to db: 'users' user: 'josh'
```

If a client successfully connects but later disconnects improperly or is terminated, the server increments the `Aborted_clients` status variable, and logs an `ABORTED CONNECTION` message to the error log. The cause can be any of the following:

- The client program did not call `mysql_close()` before exiting.
- The client had been sleeping more than `wait_timeout` or `interactive_timeout` seconds without issuing any requests to the server. See [Section 5.1.3, “Server System Variables”](#).
- The client program ended abruptly in the middle of a data transfer.

If a client is unable even to connect, the server increments the `Aborted_connects` status variable. Unsuccessful connect attempts can occur for the following reasons:

- A client doesn't have privileges to connect to a database.
- A client uses an incorrect password.
- A connection packet doesn't contain the right information.
- It takes more than `connect_timeout` seconds to get a connect packet. See [Section 5.1.3, “Server System Variables”](#).

If these kinds of things happen, it might indicate that someone is trying to break into your server! Messages for these types of problems are logged to the general query log if it is enabled.

#### MySQL Enterprise

For reasons of security and performance the advisors provided by the MySQL Enterprise Monitor pay special attention to the `Aborted_connects` status variable. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

Other reasons for problems with aborted clients or aborted connections:

- Use of Ethernet protocol with Linux, both half and full duplex. Many Linux Ethernet drivers have this bug. You should test for this bug by transferring a huge file via FTP between the client and server machines. If a transfer goes in burst-pause-burst-pause mode, you are experiencing a Linux duplex syndrome. The only solution is switching the duplex mode for both your network card and hub/switch to either full duplex or to half duplex and testing the results to determine the best setting.
- Some problem with the thread library that causes interrupts on reads.
- Badly configured TCP/IP.
- Faulty Ethernets, hubs, switches, cables, and so forth. This can be diagnosed properly only by replacing hardware.
- The `max_allowed_packet` variable value is too small or queries require more memory than you have allocated for `mysqld`. See [Section B.1.2.10, “Packet too large”](#).

See also [Section B.1.2.9, “MySQL server has gone away”](#).

### B.1.2.12. The table is full

The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. The following table lists some examples of operating system file-size limits. This is only a rough guide and is not intended to be definitive. For the most up-to-date information, be sure to check the documentation specific to your operating system.

Operating System	File-size Limit
Win32 w/ FAT/FAT32	2GB/4GB
Win32 w/ NTFS	2TB (possibly larger)
Linux 2.2-Intel 32-bit	2GB (LFS: 4GB)

Linux 2.4+	(using ext3 file system) 4TB
Solaris 9/10	16TB
MacOS X w/ HFS+	2TB
NetWare w/NSS file system	8TB

Windows users, please note that FAT and VFAT (FAT32) are *not* considered suitable for production use with MySQL. Use NTFS instead.

On Linux 2.2, you can get [MyISAM](#) tables larger than 2GB in size by using the Large File Support (LFS) patch for the ext2 file system. Most current Linux distributions are based on kernel 2.4 or higher and include all the required LFS patches. On Linux 2.4, patches also exist for ReiserFS to get support for big files (up to 2TB). With JFS and XFS, petabyte and larger files are possible on Linux.

For a detailed overview about LFS in Linux, have a look at Andreas Jaeger's *Large File Support in Linux* page at [http://www.suse.de/~aj/linux\\_lfs.html](http://www.suse.de/~aj/linux_lfs.html).

If you do encounter a full-table error, there are several reasons why it might have occurred:

- The [InnoDB](#) storage engine maintains [InnoDB](#) tables within a tablespace that can be created from several files. This allows a table to exceed the maximum individual file size. The tablespace can include raw disk partitions, which allows extremely large tables. The maximum tablespace size is 64TB.

If you are using [InnoDB](#) tables and run out of room in the [InnoDB](#) tablespace. In this case, the solution is to extend the [InnoDB](#) tablespace. See [Section 13.6.5, “Adding, Removing, or Resizing InnoDB Data and Log Files”](#).

- You are using [MyISAM](#) tables on an operating system that supports files only up to 2GB in size and you have hit this limit for the data file or index file.
- You are using a [MyISAM](#) table and the space required for the table exceeds what is allowed by the internal pointer size. [MyISAM](#) allows data and index files to grow up to 256TB by default, but this limit can be changed up to the maximum allowable size of 65,536TB ( $256^7 - 1$  bytes).

If you need a [MyISAM](#) table that is larger than the default limit and your operating system supports large files, the [CREATE TABLE](#) statement supports [AVG\\_ROW\\_LENGTH](#) and [MAX\\_ROWS](#) options. See [Section 12.1.17, “CREATE TABLE Syntax”](#). The server uses these options to determine how large a table to allow.

If the pointer size is too small for an existing table, you can change the options with [ALTER TABLE](#) to increase a table's maximum allowable size. See [Section 12.1.7, “ALTER TABLE Syntax”](#).

```
ALTER TABLE tbl_name MAX_ROWS=1000000000 AVG_ROW_LENGTH=nnn;
```

You have to specify [AVG\\_ROW\\_LENGTH](#) only for tables with [BLOB](#) or [TEXT](#) columns; in this case, MySQL can't optimize the space required based only on the number of rows.

To change the default size limit for [MyISAM](#) tables, set the [mysam\\_data\\_pointer\\_size](#), which sets the number of bytes used for internal row pointers. The value is used to set the pointer size for new tables if you do not specify the [MAX\\_ROWS](#) option. The value of [mysam\\_data\\_pointer\\_size](#) can be from 2 to 7. A value of 4 allows tables up to 4GB; a value of 6 allows tables up to 256TB.

You can check the maximum data and index sizes by using this statement:

```
SHOW TABLE STATUS FROM db_name LIKE 'tbl_name';
```

You also can use [mysamchk -dv /path/to/table-index-file](#). See [Section 12.5.5, “SHOW Syntax”](#), or [Section 4.6.3, “mysamchk — MyISAM Table-Maintenance Utility”](#).

Other ways to work around file-size limits for [MyISAM](#) tables are as follows:

- If your large table is read only, you can use [mysampack](#) to compress it. [mysampack](#) usually compresses a table by at least 50%, so you can have, in effect, much bigger tables. [mysampack](#) also can merge multiple tables into a single table. See [Section 4.6.5, “mysampack — Generate Compressed, Read-Only MyISAM Tables”](#).
- MySQL includes a [MERGE](#) library that allows you to handle a collection of [MyISAM](#) tables that have identical structure as a single [MERGE](#) table. See [Section 13.7, “The MERGE Storage Engine”](#).
- You are using the [NDB](#) storage engine, in which case you need to increase the values for the [DataMemory](#) and [In-](#)

`dexMemory` configuration parameters in your `config.ini` file. See [MySQL Cluster Data Node Configuration Parameters](#).

- You are using the `MEMORY (HEAP)` storage engine; in this case you need to increase the value of the `max_heap_table_size` system variable. See [Section 5.1.3, “Server System Variables”](#).

### B.1.2.13. Can't create/write to file

If you get an error of the following type for some queries, it means that MySQL cannot create a temporary file for the result set in the temporary directory:

```
Can't create/write to file '\sqla3fe_0.ism'.
```

The preceding error is a typical message for Windows; the Unix message is similar.

One fix is to start `mysqld` with the `--tmpdir` option or to add the option to the `[mysqld]` section of your option file. For example, to specify a directory of `C:\temp`, use these lines:

```
[mysqld]
tmpdir=C:/temp
```

The `C:\temp` directory must exist and have sufficient space for the MySQL server to write to. See [Section 4.2.3.2, “Using Option Files”](#).

Another cause of this error can be permissions issues. Make sure that the MySQL server can write to the `tmpdir` directory.

Check also the error code that you get with `pererror`. One reason the server cannot write to a table is that the file system is full:

```
shell> pererror 28
OS error code 28: No space left on device
```

If you get an error of the following type during startup, it indicates that the file system and/or directory used for storing data files is write protected. Providing the write error is to a test file, This error is not serious and can be safely ignored.

```
Can't create test file /usr/local/mysql/data/master.lower-test
```

### B.1.2.14. Commands out of sync

If you get `Commands out of sync; you can't run this command now` in your client code, you are calling client functions in the wrong order.

This can happen, for example, if you are using `mysql_use_result()` and try to execute a new query before you have called `mysql_free_result()`. It can also happen if you try to execute two queries that return data without calling `mysql_use_result()` or `mysql_store_result()` in between.

### B.1.2.15. Ignoring user

If you get the following error, it means that when `mysqld` was started or when it reloaded the grant tables, it found an account in the `user` table that had an invalid password.

```
Found wrong password for user 'some_user'@'some_host'; ignoring user
```

As a result, the account is simply ignored by the permission system.

The following list indicates possible causes of and fixes for this problem:

- You may be running a new version of `mysqld` with an old `user` table. You can check this by executing `mysqlshow mysql user` to see whether the `Password` column is shorter than 16 characters. If so, you can correct this condition by running the `scripts/add_long_password` script.
- The account has an old password (eight characters long). Update the account in the `user` table to have a new password.
- You have specified a password in the `user` table without using the `PASSWORD()` function. Use `mysql` to update the account in the `user` table with a new password, making sure to use the `PASSWORD()` function:

```
mysql> UPDATE user SET Password=PASSWORD('newpwd')
-> WHERE User='some_user' AND Host='some_host';
```

### B.1.2.16. Table '*tbl\_name*' doesn't exist

If you get either of the following errors, it usually means that no table exists in the default database with the given name:

```
Table 'tbl_name' doesn't exist
Can't find file: 'tbl_name' (errno: 2)
```

In some cases, it may be that the table does exist but that you are referring to it incorrectly:

- Because MySQL uses directories and files to store databases and tables, database and table names are case sensitive if they are located on a file system that has case-sensitive file names.
- Even for file systems that are not case sensitive, such as on Windows, all references to a given table within a query must use the same lettercase.

You can check which tables are in the default database with `SHOW TABLES`. See [Section 12.5.5, “SHOW Syntax”](#).

### B.1.2.17. Can't initialize character set

You might see an error like this if you have character set problems:

```
MySQL Connection Failed: Can't initialize character set charset_name
```

This error can have any of the following causes:

- The character set is a multi-byte character set and you have no support for the character set in the client. In this case, you need to recompile the client by running `configure` with the `--with-charset=charset_name` or `role="configure"--with-extra-charsets=charset_name` option. See [Section 2.10.2, “Typical configure Options”](#).

All standard MySQL binaries are compiled with `--with-extra-charsets=complex`, which enables support for all multi-byte character sets. See [Section 9.2, “The Character Set Used for Data and Sorting”](#).

- The character set is a simple character set that is not compiled into `mysqld`, and the character set definition files are not in the place where the client expects to find them.

In this case, you need to use one of the following methods to solve the problem:

- Recompile the client with support for the character set. See [Section 2.10.2, “Typical configure Options”](#).
- Specify to the client the directory where the character set definition files are located. For many clients, you can do this with the `--character-sets-dir` option.
- Copy the character definition files to the path where the client expects them to be.

### B.1.2.18. '*FILE*' NOT FOUND and Similar Errors

If you get `ERROR '...' not found (errno: 23), Can't open file: ... (errno: 24)`, or any other error with `errno 23` or `errno 24` from MySQL, it means that you haven't allocated enough file descriptors for the MySQL server. You can use the `pererror` utility to get a description of what the error number means:

```
shell> pererror 23
OS error code 23: File table overflow
shell> pererror 24
OS error code 24: Too many open files
shell> pererror 11
OS error code 11: Resource temporarily unavailable
```

The problem here is that `mysqld` is trying to keep open too many files simultaneously. You can either tell `mysqld` not to open so many files at once or increase the number of file descriptors available to `mysqld`.

To tell `mysqld` to keep open fewer files at a time, you can make the table cache smaller by reducing the value of the `table_open_cache` system variable (the default value is 64). Reducing the value of `max_connections` also reduces the number of open files (the default value is 100).

To change the number of file descriptors available to `mysqld`, you can use the `--open-files-limit` option to `mysqld_safe` or set the `open_files_limit` system variable. See [Section 5.1.3, “Server System Variables”](#). The easiest way

to set these values is to add an option to your option file. See [Section 4.2.3.2, “Using Option Files”](#). If you have an old version of `mysqld` that doesn't support setting the open files limit, you can edit the `mysqld_safe` script. There is a commented-out line `ulimit -n 256` in the script. You can remove the “#” character to uncomment this line, and change the number `256` to set the number of file descriptors to be made available to `mysqld`.

`--open-files-limit` and `ulimit` can increase the number of file descriptors, but only up to the limit imposed by the operating system. There is also a “hard” limit that can be overridden only if you start `mysqld_safe` or `mysqld` as `root` (just remember that you also need to start the server with the `--user` option in this case so that it does not continue to run as `root` after it starts up). If you need to increase the operating system limit on the number of file descriptors available to each process, consult the documentation for your system.

### Note

If you run the `tcsh` shell, `ulimit` does not work! `tcsh` also reports incorrect values when you ask for the current limits. In this case, you should start `mysqld_safe` using `sh`.

## B.1.2.19. Table-Corruption Issues

If you have started `mysqld` with `--myisam-recover`, MySQL automatically checks and tries to repair MyISAM tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file 'Warning: Checking table ...' which is followed by 'Warning: Repairing table' if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further.

See also [Section 5.1.2, “Server Command Options”](#), and [Section 21.5.1.7, “Making a Test Case If You Experience Table Corruption”](#).

## B.1.3. Installation-Related Issues

### B.1.3.1. Problems Linking to the MySQL Client Library

When you are linking an application program to use the MySQL client library, you might get undefined reference errors for symbols that start with `mysql_`, such as those shown here:

```
/tmp/ccFKsdPa.o: In function `main':
/tmp/ccFKsdPa.o(.text+0xb): undefined reference to `mysql_init'
/tmp/ccFKsdPa.o(.text+0x31): undefined reference to `mysql_real_connect'
/tmp/ccFKsdPa.o(.text+0x57): undefined reference to `mysql_real_connect'
/tmp/ccFKsdPa.o(.text+0x69): undefined reference to `mysql_error'
/tmp/ccFKsdPa.o(.text+0x9a): undefined reference to `mysql_close'
```

You should be able to solve this problem by adding `-Ldir_path -lmysqlclient` at the end of your link command, where `dir_path` represents the path name of the directory where the client library is located. To determine the correct directory, try this command:

```
shell> mysql_config --libs
```

The output from `mysql_config` might indicate other libraries that should be specified on the link command as well.

If you get `undefined reference` errors for the `uncompress` or `compress` function, add `-lz` to the end of your link command and try again.

If you get `undefined reference` errors for a function that should exist on your system, such as `connect`, check the manual page for the function in question to determine which libraries you should add to the link command.

You might get `undefined reference` errors such as the following for functions that don't exist on your system:

```
mF_format.o(.text+0x201): undefined reference to `__lxstat'
```

This usually means that your MySQL client library was compiled on a system that is not 100% compatible with yours. In this case, you should download the latest MySQL source distribution and compile MySQL yourself. See [Section 2.10, “MySQL Installation Using a Source Distribution”](#).

You might get undefined reference errors at runtime when you try to execute a MySQL program. If these errors specify symbols that start with `mysql_` or indicate that the `mysqlclient` library can't be found, it means that your system can't find the shared `libmysqlclient.so` library. The fix for this is to tell your system to search for shared libraries where the library is located. Use whichever of the following methods is appropriate for your system:

- Add the path to the directory where `libmysqlclient.so` is located to the `LD_LIBRARY_PATH` environment variable.

- Add the path to the directory where `libmysqlclient.so` is located to the `LD_LIBRARY` environment variable.
- Copy `libmysqlclient.so` to some directory that is searched by your system, such as `/lib`, and update the shared library information by executing `ldconfig`.

Another way to solve this problem is by linking your program statically with the `-static` option, or by removing the dynamic MySQL libraries before linking your code. Before trying the second method, you should be sure that no other programs are using the dynamic libraries.

### B.1.3.2. Problems with File Permissions

If you have problems with file permissions, the `UMASK` environment variable might be set incorrectly when `mysqld` starts. For example, MySQL might issue the following error message when you create a table:

```
ERROR: Can't find file: 'path/with/filename.frm' (Errcode: 13)
```

The default `UMASK` value is `0660`. You can change this behavior by starting `mysqld_safe` as follows:

```
shell> UMASK=384 # = 600 in octal
shell> export UMASK
shell> mysqld_safe &
```

By default, MySQL creates database directories with an access permission value of `0700`. You can modify this behavior by setting the `UMASK_DIR` variable. If you set its value, new directories are created with the combined `UMASK` and `UMASK_DIR` values. For example, if you want to give group access to all new directories, you can do this:

```
shell> UMASK_DIR=504 # = 770 in octal
shell> export UMASK_DIR
shell> mysqld_safe &
```

MySQL assumes that the value for `UMASK` or `UMASK_DIR` is in octal if it starts with a zero.

See [Section 2.14, “Environment Variables”](#).

## B.1.4. Administration-Related Issues

### B.1.4.1. How to Reset the Root Password

If you have never set a `root` password for MySQL, the server does not require a password at all for connecting as `root`. However, it is recommended to set a password for each account. See [Section 5.3.1, “General Security Guidelines”](#).

If you set a `root` password previously, but have forgotten what it was, you can set a new password. The next two sections show procedures for Windows and Unix systems, respectively.

#### B.1.4.1.1. Resetting the Root Password on Windows Systems

Use the following procedure for resetting the password for any MySQL `root` accounts on Windows:

1. Log on to your system as Administrator.
2. Stop the MySQL server if it is running. For a server that is running as a Windows service, go to the Services manager:

```
Start Menu -> Control Panel -> Administrative Tools -> Services
```

Then find the MySQL service in the list, and stop it.

If your server is not running as a service, you may need to use the Task Manager to force it to stop.

3. Create a text file and place the following statements in it. Replace the password with the password that you want to use.

```
UPDATE mysql.user SET Password=PASSWORD('MyNewPass') WHERE User='root';
FLUSH PRIVILEGES;
```

The `UPDATE` and `FLUSH` statements each must be written on a single line. The `UPDATE` statement resets the password for all existing `root` accounts, and the `FLUSH` statement tells the server to reload the grant tables into memory.

4. Save the file. For this example, the file will be named `C:\mysql-init.txt`.

5. Open a console window to get to the command prompt:

```
Start Menu -> Run -> cmd
```

6. Start the MySQL server with the special `--init-file` option:

```
C:\> C:\mysql\bin\mysqld --init-file=C:\mysql-init.txt
```

If you installed MySQL to a location other than `C:\mysql`, adjust the command accordingly.

The server executes the contents of the file named by the `--init-file` option at startup, changing each `root` account password.

You can also add the `--console` option to the command if you want server output to appear in the console window rather than in a log file.

If you installed MySQL using the MySQL Installation Wizard, you may need to specify a `--defaults-file` option:

```
C:\> "C:\Program Files\MySQL\MySQL Server 5.1\bin\mysqld.exe"
--defaults-file="C:\Program Files\MySQL\MySQL Server 5.1\my.ini"
--init-file=C:\mysql-init.txt
```

The appropriate `--defaults-file` setting can be found using the Services Manager:

```
Start Menu -> Control Panel -> Administrative Tools -> Services
```

Find the MySQL service in the list, right-click on it, and choose the `Properties` option. The `Path to executable` field contains the `--defaults-file` setting.

7. After the server has started successfully, delete `C:\mysql-init.txt`.
8. Stop the MySQL server, then restart it in normal mode again. If you run the server as a service, start it from the Windows Services window. If you start the server manually, use whatever command you normally use.

You should now be able to connect to MySQL as `root` using the new password.

### B.1.4.1.2. Resetting the Root Password on Unix Systems

#### MySQL Enterprise

For expert advice on security-related issues, subscribe to the MySQL Enterprise Monitor. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

Use the following procedure for resetting the password for any MySQL `root` accounts on Unix. The instructions assume that you will start the server so that it runs using the Unix login account that you normally use for running the server. For example, if you run the server using the `mysql` login account, you should log in as `mysql` before using the instructions. (Alternatively, you can log in as `root`, but in this case you *must* start `mysqld` with the `--user=mysql` option. If you start the server as `root` without using `--user=mysql`, the server may create `root`-owned files in the data directory, such as log files, and these may cause permission-related problems for future server startups. If that happens, you will need to either change the ownership of the files to `mysql` or remove them.)

1. Log on to your system as the Unix `mysql` user that the `mysqld` server runs as.
2. Locate the `.pid` file that contains the server's process ID. The exact location and name of this file depend on your distribution, host name, and configuration. Common locations are `/var/lib/mysql/`, `/var/run/mysqld/`, and `/usr/local/mysql/data/`. Generally, the file name has an extension of `.pid` and begins with either `mysqld` or your system's host name.

You can stop the MySQL server by sending a normal `kill` (not `kill -9`) to the `mysqld` process, using the path name of the `.pid` file in the following command:

```
shell> kill `cat /mysql-data-directory/host_name.pid`
```

Note the use of backticks rather than forward quotes with the `cat` command; these cause the output of `cat` to be substituted into the `kill` command.

3. Create a text file and place the following statements in it. Replace the password with the password that you want to use.

```
UPDATE mysql.user SET Password=PASSWORD('MyNewPass') WHERE User='root';
```

```
FLUSH PRIVILEGES;
```

The `UPDATE` and `FLUSH` statements each must be written on a single line. The `UPDATE` statement resets the password for all existing `root` accounts, and the `FLUSH` statement tells the server to reload the grant tables into memory.

4. Save the file. For this example, the file will be named `/home/me/mysql-init`. The file contains the password, so it should not be saved where it can be read by other users.
5. Start the MySQL server with the special `--init-file` option:

```
shell> mysqld_safe --init-file=/home/me/mysql-init &
```

The server executes the contents of the file named by the `--init-file` option at startup, changing each `root` account password.

6. After the server has started successfully, delete `/home/me/mysql-init`.

You should now be able to connect to MySQL as `root` using the new password.

Alternatively, on any platform, you can set the new password using the `mysql` client (but this approach is less secure):

1. Stop `mysqld` and restart it with the `--skip-grant-tables` option.
2. Connect to the `mysqld` server with this command:

```
shell> mysql
```

3. Issue the following statements in the `mysql` client. Replace the password with the password that you want to use.

```
mysql> UPDATE mysql.user SET Password=PASSWORD('MyNewPass')
-> WHERE User='root';
mysql> FLUSH PRIVILEGES;
```

You should now be able to connect to MySQL as `root` using the new password.

### B.1.4.2. What to Do If MySQL Keeps Crashing

Each MySQL version is tested on many platforms before it is released. This doesn't mean that there are no bugs in MySQL, but if there are bugs, they should be very few and can be hard to find. If you have a problem, it always helps if you try to find out exactly what crashes your system, because you have a much better chance of getting the problem fixed quickly.

First, you should try to find out whether the problem is that the `mysqld` server dies or whether your problem has to do with your client. You can check how long your `mysqld` server has been up by executing `mysqladmin version`. If `mysqld` has died and restarted, you may find the reason by looking in the server's error log. See [Section 5.2.2, "The Error Log"](#).

On some systems, you can find in the error log a stack trace of where `mysqld` died that you can resolve with the `resolve_stack_dump` program. See [MySQL Internals: Porting](#). Note that the variable values written in the error log may not always be 100% correct.

Many server crashes are caused by corrupted data files or index files. MySQL updates the files on disk with the `write()` system call after every SQL statement and before the client is notified about the result. (This is not true if you are running with `--delay-key-write`, in which case data files are written but not index files.) This means that data file contents are safe even if `mysqld` crashes, because the operating system ensures that the unflushed data is written to disk. You can force MySQL to flush everything to disk after every SQL statement by starting `mysqld` with the `--flush` option.

The preceding means that normally you should not get corrupted tables unless one of the following happens:

- The MySQL server or the server host was killed in the middle of an update.
- You have found a bug in `mysqld` that caused it to die in the middle of an update.
- Some external program is manipulating data files or index files at the same time as `mysqld` without locking the table properly.
- You are running many `mysqld` servers using the same data directory on a system that doesn't support good file system locks (normally handled by the `lockd` lock manager), or you are running multiple servers with external locking disabled.

- You have a crashed data file or index file that contains very corrupt data that confused `mysqld`.
- You have found a bug in the data storage code. This isn't likely, but it is at least possible. In this case, you can try to change the storage engine to another engine by using `ALTER TABLE` on a repaired copy of the table.

Because it is very difficult to know why something is crashing, first try to check whether things that work for others crash for you. Please try the following things:

- Stop the `mysqld` server with `mysqladmin shutdown`, run `myisamchk --silent --force */*.MYI` from the data directory to check all MyISAM tables, and restart `mysqld`. This ensures that you are running from a clean state. See [Chapter 5, MySQL Server Administration](#).
- Start `mysqld` with the general query log enabled (see [Section 5.2.3, “The General Query Log”](#)). Then try to determine from the information written to the log whether some specific query kills the server. About 95% of all bugs are related to a particular query. Normally, this is one of the last queries in the log file just before the server restarts. See [Section 5.2.3, “The General Query Log”](#). If you can repeatedly kill MySQL with a specific query, even when you have checked all tables just before issuing it, then you have been able to locate the bug and should submit a bug report for it. See [Section 1.6, “How to Report Bugs or Problems”](#).
- Try to make a test case that we can use to repeat the problem. See [MySQL Internals: Porting](#).
- Try running the tests in the `mysql-test` directory and the MySQL benchmarks. See [Section 21.1.2, “MySQL Test Suite”](#). They should test MySQL rather well. You can also add code to the benchmarks that simulates your application. The benchmarks can be found in the `sql-bench` directory in a source distribution or, for a binary distribution, in the `sql-bench` directory under your MySQL installation directory.
- Try the `fork_big.pl` script. (It is located in the `tests` directory of source distributions.)
- If you configure MySQL for debugging, it is much easier to gather information about possible errors if something goes wrong. Configuring MySQL for debugging causes a safe memory allocator to be included that can find some errors. It also provides a lot of output about what is happening. Reconfigure MySQL with the `--with-debug` or `--with-debug=full` option to [configure](#) and then recompile. See [MySQL Internals: Porting](#).
- Make sure that you have applied the latest patches for your operating system.
- Use the `--skip-external-locking` option to `mysqld`. On some systems, the `lockd` lock manager does not work properly; the `--skip-external-locking` option tells `mysqld` not to use external locking. (This means that you cannot run two `mysqld` servers on the same data directory and that you must be careful if you use `myisamchk`. Nevertheless, it may be instructive to try the option as a test.)
- Have you tried `mysqladmin -u root processlist` when `mysqld` appears to be running but not responding? Sometimes `mysqld` is not comatose even though you might think so. The problem may be that all connections are in use, or there may be some internal lock problem. `mysqladmin -u root processlist` usually is able to make a connection even in these cases, and can provide useful information about the current number of connections and their status.
- Run the command `mysqladmin -i 5 status` or `mysqladmin -i 5 -r status` in a separate window to produce statistics while you run your other queries.
- Try the following:
  1. Start `mysqld` from `gdb` (or another debugger). See [MySQL Internals: Porting](#).
  2. Run your test scripts.
  3. Print the backtrace and the local variables at the three lowest levels. In `gdb`, you can do this with the following commands when `mysqld` has crashed inside `gdb`:

```
backtrace
info local
up
info local
up
info local
```

With `gdb`, you can also examine which threads exist with `info threads` and switch to a specific thread with `thread N`, where `N` is the thread ID.

- Try to simulate your application with a Perl script to force MySQL to crash or misbehave.
- Send a normal bug report. See [Section 1.6, “How to Report Bugs or Problems”](#). Be even more detailed than usual. Because

MySQL works for many people, it may be that the crash results from something that exists only on your computer (for example, an error that is related to your particular system libraries).

- If you have a problem with tables containing dynamic-length rows and you are using only `VARCHAR` columns (not `BLOB` or `TEXT` columns), you can try to change all `VARCHAR` to `CHAR` with `ALTER TABLE`. This forces MySQL to use fixed-size rows. Fixed-size rows take a little extra space, but are much more tolerant to corruption.

The current dynamic row code has been in use for several years with very few problems, but dynamic-length rows are by nature more prone to errors, so it may be a good idea to try this strategy to see whether it helps.

- Do not rule out your server hardware when diagnosing problems. Defective hardware can be the cause of data corruption. Particular attention should be paid to your memory and disk subsystems when troubleshooting hardware.

### B.1.4.3. How MySQL Handles a Full Disk

This section describes how MySQL responds to disk-full errors (such as “no space left on device”), and to quota-exceeded errors (such as “write failed” or “user block limit reached”).

This section is relevant for writes to `MyISAM` tables. It also applies for writes to binary log files and binary log index file, except that references to “row” and “record” should be understood to mean “event.”

When a disk-full condition occurs, MySQL does the following:

- It checks once every minute to see whether there is enough space to write the current row. If there is enough space, it continues as if nothing had happened.
- Every 10 minutes it writes an entry to the log file, warning about the disk-full condition.

To alleviate the problem, you can take the following actions:

- To continue, you only have to free enough disk space to insert all records.
- To abort the thread, you must use `mysqladmin kill`. The thread is aborted the next time it checks the disk (in one minute).
- Other threads might be waiting for the table that caused the disk-full condition. If you have several “locked” threads, killing the one thread that is waiting on the disk-full condition allows the other threads to continue.

Exceptions to the preceding behavior are when you use `REPAIR TABLE` or `OPTIMIZE TABLE` or when the indexes are created in a batch after `LOAD DATA INFILE` or after an `ALTER TABLE` statement. All of these statements may create large temporary files that, if left to themselves, would cause big problems for the rest of the system. If the disk becomes full while MySQL is doing any of these operations, it removes the big temporary files and mark the table as crashed. The exception is that for `ALTER TABLE`, the old table is left unchanged.

#### MySQL Enterprise

For early notification of possible problems with your MySQL configuration subscribe to the MySQL Enterprise Monitor. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

### B.1.4.4. Where MySQL Stores Temporary Files

MySQL uses the value of the `TMPDIR` environment variable as the path name of the directory in which to store temporary files. If you don't have `TMPDIR` set, MySQL uses the system default, which is normally `/tmp`, `/var/tmp`, or `/usr/tmp`. If the file system containing your temporary file directory is too small, you can use the `--tmpdir` option to `mysqld` to specify a directory in a file system where you have enough space.

In MySQL 5.1, the `--tmpdir` option can be set to a list of several paths that are used in round-robin fashion. Paths should be separated by colon characters (“:”) on Unix and semicolon characters (“;”) on Windows, NetWare, and OS/2.

#### Note

To spread the load effectively, these paths should be located on different *physical* disks, not different partitions of the same disk.

If the MySQL server is acting as a replication slave, you should not set `--tmpdir` to point to a directory on a memory-based file system or to a directory that is cleared when the server host restarts. A replication slave needs some of its temporary files to survive a machine restart so that it can replicate temporary tables or `LOAD DATA INFILE` operations. If files in the temporary file direct-

ory are lost when the server restarts, replication fails.

MySQL creates all temporary files as hidden files. This ensures that the temporary files are removed if `mysqld` is terminated. The disadvantage of using hidden files is that you do not see a big temporary file that fills up the file system in which the temporary file directory is located.

#### MySQL Enterprise

Advisors provided by the MySQL Enterprise Monitor automatically detect excessive temporary table storage to disk. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

When sorting (`ORDER BY` or `GROUP BY`), MySQL normally uses one or two temporary files. The maximum disk space required is determined by the following expression:

```
(length of what is sorted + sizeof(row pointer))
* number of matched rows
* 2
```

The row pointer size is usually four bytes, but may grow in the future for really big tables.

For some `SELECT` queries, MySQL also creates temporary SQL tables. These are not hidden and have names of the form `SQL_*`.

`ALTER TABLE` creates a temporary table in the same directory as the original table.

### B.1.4.5. How to Protect or Change the MySQL Unix Socket File

The default location for the Unix socket file that the server uses for communication with local clients is `/tmp/mysql.sock`. (For some distribution formats, the directory might be different, such as `/var/lib/mysql` for RPMs.)

On some versions of Unix, anyone can delete files in the `/tmp` directory or other similar directories used for temporary files. If the socket file is located in such a directory on your system, this might cause problems.

On most versions of Unix, you can protect your `/tmp` directory so that files can be deleted only by their owners or the superuser (`root`). To do this, set the `sticky` bit on the `/tmp` directory by logging in as `root` and using the following command:

```
shell> chmod +t /tmp
```

You can check whether the `sticky` bit is set by executing `ls -ld /tmp`. If the last permission character is `t`, the bit is set.

Another approach is to change the place where the server creates the Unix socket file. If you do this, you should also let client programs know the new location of the file. You can specify the file location in several ways:

- Specify the path in a global or local option file. For example, put the following lines in `/etc/my.cnf`:

```
[mysqld]
socket=/path/to/socket

[client]
socket=/path/to/socket
```

See Section 4.2.3.2, “Using Option Files”.

- Specify a `--socket` option on the command line to `mysqld_safe` and when you run client programs.
- Set the `MYSQL_UNIX_PORT` environment variable to the path of the Unix socket file.
- Recompile MySQL from source to use a different default Unix socket file location. Define the path to the file with the `--with-unix-socket-path` option when you run `configure`. See Section 2.10.2, “Typical configure Options”.

You can test whether the new socket location works by attempting to connect to the server with this command:

```
shell> mysqladmin --socket=/path/to/socket version
```

### B.1.4.6. Time Zone Problems

If you have a problem with `SELECT NOW()` returning values in UTC and not your local time, you have to tell the server your current time zone. The same applies if `UNIX_TIMESTAMP()` returns the wrong value. This should be done for the environment in which the server runs; for example, in `mysqld_safe` or `mysql.server`. See Section 2.14, “Environment Variables”.

You can set the time zone for the server with the `--timezone=timezone_name` option to `mysqld_safe`. You can also set it

by setting the `TZ` environment variable before you start `mysqld`.

The allowable values for `--timezone` or `TZ` are system-dependent. Consult your operating system documentation to see what values are acceptable.

## B.1.5. Query-Related Issues

### B.1.5.1. Case Sensitivity in String Searches

For nonbinary strings (`CHAR`, `VARCHAR`, `TEXT`), string searches use the collation of the comparison operands. For binary strings (`BINARY`, `VARBINARY`, `BLOB`), comparisons use the numeric values of the bytes in the operands; this means that for alphabetic characters, comparisons will be case sensitive.

A comparison between a nonbinary string and binary string is treated as a comparison of binary strings.

Simple comparison operations (`>=`, `>`, `=`, `<`, `<=`, sorting, and grouping) are based on each character's "sort value." Characters with the same sort value are treated as the same character. For example, if "e" and "é" have the same sort value in a given collation, they compare as equal.

The default character set and collation are `latin1` and `latin1_swedish_ci`, so nonbinary string comparisons are case insensitive by default. This means that if you search with `col_name LIKE 'a%'`, you get all column values that start with `A` or `a`. To make this search case sensitive, make sure that one of the operands has a case sensitive or binary collation. For example, if you are comparing a column and a string that both have the `latin1` character set, you can use the `COLLATE` operator to cause either operand to have the `latin1_general_cs` or `latin1_bin` collation:

```
col_name COLLATE latin1_general_cs LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_general_cs
col_name COLLATE latin1_bin LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_bin
```

If you want a column always to be treated in case-sensitive fashion, declare it with a case sensitive or binary collation. See [Section 12.1.17, "CREATE TABLE Syntax"](#).

To cause a case-sensitive comparison of nonbinary strings to be case insensitive, use `COLLATE` to name a case-insensitive collation. The strings in the following example normally are case sensitive, but `COLLATE` changes the comparison to be case insensitive:

```
mysql> SET @s1 = 'MySQL' COLLATE latin1_bin,
->      @s2 = 'mysql' COLLATE latin1_bin;
mysql> SELECT @s1 = @s2;
+-----+
| @s1 = @s2 |
+-----+
|          0 |
+-----+
mysql> SELECT @s1 COLLATE latin1_swedish_ci = @s2;
+-----+
| @s1 COLLATE latin1_swedish_ci = @s2 |
+-----+
|                                  1 |
+-----+
```

A binary string is case sensitive in comparisons. To compare the string as case insensitive, convert it to a nonbinary string and use `COLLATE` to name a case-insensitive collation:

```
mysql> SET @s = BINARY 'MySQL';
mysql> SELECT @s = 'mysql';
+-----+
| @s = 'mysql' |
+-----+
|          0 |
+-----+
mysql> SELECT CONVERT(@s USING latin1) COLLATE latin1_swedish_ci = 'mysql';
+-----+
| CONVERT(@s USING latin1) COLLATE latin1_swedish_ci = 'mysql' |
+-----+
|                                  1 |
+-----+
```

To determine whether a value will compare as a nonbinary or binary string, use the `COLLATION()` function. This example shows that `VERSION()` returns a string that has a case-insensitive collation, so comparisons are case insensitive:

```
mysql> SELECT COLLATION(VERSION());
+-----+
| COLLATION(VERSION()) |
+-----+
| utf8_general_ci     |
+-----+
```

For binary strings, the collation value is `binary`, so comparisons will be case sensitive. One context in which you will see `binary` is for compression and encryption functions, which return binary strings as a general rule: string:

```
mysql> SELECT COLLATION(ENCRYPT('x')), COLLATION(SHA1('x'));
+-----+-----+
| COLLATION(ENCRYPT('x')) | COLLATION(SHA1('x')) |
+-----+-----+
| binary                 | binary                 |
+-----+-----+
```

### B.1.5.2. Problems Using `DATE` Columns

The format of a `DATE` value is `'YYYY-MM-DD'`. According to standard SQL, no other format is allowed. You should use this format in `UPDATE` expressions and in the `WHERE` clause of `SELECT` statements. For example:

```
mysql> SELECT * FROM tbl_name WHERE date >= '2003-05-05';
```

As a convenience, MySQL automatically converts a date to a number if the date is used in a numeric context (and vice versa). It is also smart enough to allow a “relaxed” string form when updating and in a `WHERE` clause that compares a date to a `TIMESTAMP`, `DATE`, or `DATETIME` column. (“Relaxed form” means that any punctuation character may be used as the separator between parts. For example, `'2004-08-15'` and `'2004#08#15'` are equivalent.) MySQL can also convert a string containing no separators (such as `'20040815'`), provided it makes sense as a date.

When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` to a constant string with the `<`, `<=`, `=`, `>=`, `>`, or `BETWEEN` operators, MySQL normally converts the string to an internal long integer for faster comparison (and also for a bit more “relaxed” string checking). However, this conversion is subject to the following exceptions:

- When you compare two columns
- When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` column to an expression
- When you use any other comparison method than those just listed, such as `IN` or `STRCMP()`.

For these exceptional cases, the comparison is done by converting the objects to strings and performing a string comparison.

To keep things safe, assume that strings are compared as strings and use the appropriate string functions if you want to compare a temporal value to a string.

The special date `'0000-00-00'` can be stored and retrieved as `'0000-00-00'`. When using a `'0000-00-00'` date through MyODBC, it is automatically converted to `NULL` in MyODBC 2.50.12 and above, because ODBC can't handle this kind of date.

Because MySQL performs the conversions described above, the following statements work:

```
mysql> INSERT INTO tbl_name (idate) VALUES (19970505);
mysql> INSERT INTO tbl_name (idate) VALUES ('19970505');
mysql> INSERT INTO tbl_name (idate) VALUES ('97-05-05');
mysql> INSERT INTO tbl_name (idate) VALUES ('1997.05.05');
mysql> INSERT INTO tbl_name (idate) VALUES ('1997 05 05');
mysql> INSERT INTO tbl_name (idate) VALUES ('0000-00-00');

mysql> SELECT idate FROM tbl_name WHERE idate >= '1997-05-05';
mysql> SELECT idate FROM tbl_name WHERE idate >= 19970505;
mysql> SELECT MOD(idate,100) FROM tbl_name WHERE idate >= 19970505;
mysql> SELECT idate FROM tbl_name WHERE idate >= '19970505';
```

However, the following does not work:

```
mysql> SELECT idate FROM tbl_name WHERE STRCMP(idate,'20030505')=0;
```

`STRCMP()` is a string function, so it converts `idate` to a string in `'YYYY-MM-DD'` format and performs a string comparison. It does not convert `'20030505'` to the date `'2003-05-05'` and perform a date comparison.

If you are using the `ALLOW_INVALID_DATES` SQL mode, MySQL allows you to store dates that are given only limited checking: MySQL requires only that the day is in the range from 1 to 31 and the month is in the range from 1 to 12.

This makes MySQL very convenient for Web applications where you obtain year, month, and day in three different fields and you want to store exactly what the user inserted (without date validation).

If you are not using the `NO_ZERO_IN_DATE` SQL mode, the day or month part can be zero. This is convenient if you want to store a birthdate in a `DATE` column and you know only part of the date.

If you are not using the `NO_ZERO_DATE` SQL mode, MySQL also allows you to store `'0000-00-00'` as a “dummy date.” This is in some cases more convenient than using `NULL` values.

If the date cannot be converted to any reasonable value, a `0` is stored in the `DATE` column, which is retrieved as `'0000-00-00'`. This is both a speed and a convenience issue. We believe that the database server's responsibility is to retrieve the same date you stored (even if the data was not logically correct in all cases). We think it is up to the application and not the server to check the dates.

If you want MySQL to check all dates and accept only legal dates (unless overridden by `IGNORE`), you should set `sql_mode` to `"NO_ZERO_IN_DATE,NO_ZERO_DATE"`.

### B.1.5.3. Problems with `NULL` Values

The concept of the `NULL` value is a common source of confusion for newcomers to SQL, who often think that `NULL` is the same thing as an empty string `' '`. This is not the case. For example, the following statements are completely different:

```
mysql> INSERT INTO my_table (phone) VALUES (NULL);
mysql> INSERT INTO my_table (phone) VALUES ('');
```

Both statements insert a value into the `phone` column, but the first inserts a `NULL` value and the second inserts an empty string. The meaning of the first can be regarded as “phone number is not known” and the meaning of the second can be regarded as “the person is known to have no phone, and thus no phone number.”

To help with `NULL` handling, you can use the `IS NULL` and `IS NOT NULL` operators and the `IFNULL()` function.

In SQL, the `NULL` value is never true in comparison to any other value, even `NULL`. An expression that contains `NULL` always produces a `NULL` value unless otherwise indicated in the documentation for the operators and functions involved in the expression. All columns in the following example return `NULL`:

```
mysql> SELECT NULL, 1+NULL, CONCAT('Invisible',NULL);
```

If you want to search for column values that are `NULL`, you cannot use an `expr = NULL` test. The following statement returns no rows, because `expr = NULL` is never true for any expression:

```
mysql> SELECT * FROM my_table WHERE phone = NULL;
```

To look for `NULL` values, you must use the `IS NULL` test. The following statements show how to find the `NULL` phone number and the empty phone number:

```
mysql> SELECT * FROM my_table WHERE phone IS NULL;
mysql> SELECT * FROM my_table WHERE phone = '';
```

See [Section 3.3.4.6, “Working with `NULL` Values”](#), for additional information and examples.

You can add an index on a column that can have `NULL` values if you are using the `MyISAM`, `InnoDB`, or `MEMORY` storage engine. Otherwise, you must declare an indexed column `NOT NULL`, and you cannot insert `NULL` into the column.

When reading data with `LOAD DATA INFILE`, empty or missing columns are updated with `' '`. If you want a `NULL` value in a column, you should use `\N` in the data file. The literal word “`NULL`” may also be used under some circumstances. See [Section 12.2.6, “LOAD DATA INFILE Syntax”](#).

When using `DISTINCT`, `GROUP BY`, or `ORDER BY`, all `NULL` values are regarded as equal.

When using `ORDER BY`, `NULL` values are presented first, or last if you specify `DESC` to sort in descending order.

Aggregate (summary) functions such as `COUNT()`, `MIN()`, and `SUM()` ignore `NULL` values. The exception to this is `COUNT(*)`, which counts rows and not individual column values. For example, the following statement produces two counts. The first is a count of the number of rows in the table, and the second is a count of the number of non-`NULL` values in the `age` column:

```
mysql> SELECT COUNT(*), COUNT(age) FROM person;
```

For some data types, MySQL handles `NULL` values specially. If you insert `NULL` into a `TIMESTAMP` column, the current date and time is inserted. If you insert `NULL` into an integer or floating-point column that has the `AUTO_INCREMENT` attribute, the next number in the sequence is inserted.

### B.1.5.4. Problems with Column Aliases

You can use an alias to refer to a column in `GROUP BY`, `ORDER BY`, or `HAVING` clauses. Aliases can also be used to give columns better names:

```
SELECT SQRT(a*b) AS root FROM tbl_name GROUP BY root HAVING root > 0;
SELECT id, COUNT(*) AS cnt FROM tbl_name GROUP BY id HAVING cnt > 0;
SELECT id AS 'Customer identity' FROM tbl_name;
```

Standard SQL doesn't allow you to refer to a column alias in a `WHERE` clause. This restriction is imposed because when the `WHERE` code is executed, the column value may not yet be determined. For example, the following query is illegal:

```
SELECT id, COUNT(*) AS cnt FROM tbl_name WHERE cnt > 0 GROUP BY id;
```

The `WHERE` statement is executed to determine which rows should be included in the `GROUP BY` part, whereas `HAVING` is used to decide which rows from the result set should be used.

### B.1.5.5. Rollback Failure for Non-Transactional Tables

If you receive the following message when trying to perform a `ROLLBACK`, it means that one or more of the tables you used in the transaction do not support transactions:

```
Warning: Some non-transactional changed tables couldn't be rolled back
```

These non-transactional tables are not affected by the `ROLLBACK` statement.

If you were not deliberately mixing transactional and non-transactional tables within the transaction, the most likely cause for this message is that a table you thought was transactional actually is not. This can happen if you try to create a table using a transactional storage engine that is not supported by your `mysqld` server (or that was disabled with a startup option). If `mysqld` doesn't support a storage engine, it instead creates the table as a `MyISAM` table, which is non-transactional.

You can check the storage engine for a table by using either of these statements:

```
SHOW TABLE STATUS LIKE 'tbl_name';
SHOW CREATE TABLE tbl_name;
```

See [Section 12.5.5.38, “SHOW TABLE STATUS Syntax”](#), and [Section 12.5.5.12, “SHOW CREATE TABLE Syntax”](#).

You can check which storage engines your `mysqld` server supports by using this statement:

```
SHOW ENGINES;
```

You can also use the following statement, and check the value of the variable that is associated with the storage engine in which you are interested:

```
SHOW VARIABLES LIKE 'have_%';
```

For example, to determine whether the `InnoDB` storage engine is available, check the value of the `have_innodb` variable.

See [Section 12.5.5.17, “SHOW ENGINES Syntax”](#), and [Section 12.5.5.41, “SHOW VARIABLES Syntax”](#).

#### MySQL Enterprise

Ensure that your data is adequately protected by subscribing to the MySQL Enterprise Monitor. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

### B.1.5.6. Deleting Rows from Related Tables

If the total length of the `DELETE` statement for `related_table` is more than 1MB (the default value of the `max_allowed_packet` system variable), you should split it into smaller parts and execute multiple `DELETE` statements. You probably get the fastest `DELETE` by specifying only 100 to 1,000 `related_column` values per statement if the `related_column` is indexed. If the `related_column` isn't indexed, the speed is independent of the number of arguments in the `IN` clause.

### B.1.5.7. Solving Problems with No Matching Rows

If you have a complicated query that uses many tables but that doesn't return any rows, you should use the following procedure to find out what is wrong:

1. Test the query with `EXPLAIN` to check whether you can find something that is obviously wrong. See [Section 12.3.2, “EXPLAIN Syntax”](#).
2. Select only those columns that are used in the `WHERE` clause.

3. Remove one table at a time from the query until it returns some rows. If the tables are large, it is a good idea to use `LIMIT 10` with the query.
4. Issue a `SELECT` for the column that should have matched a row against the table that was last removed from the query.
5. If you are comparing `FLOAT` or `DOUBLE` columns with numbers that have decimals, you can't use equality (`=`) comparisons. This problem is common in most computer languages because not all floating-point values can be stored with exact precision. In some cases, changing the `FLOAT` to a `DOUBLE` fixes this. See [Section B.1.5.8, “Problems with Floating-Point Comparisons”](#).
6. If you still can't figure out what is wrong, create a minimal test that can be run with `mysql test < query.sql` that shows your problems. You can create a test file by dumping the tables with `mysqldump --quick db_name tbl_name_1 ... tbl_name_n > query.sql`. Open the file in an editor, remove some insert lines (if there are more than needed to demonstrate the problem), and add your `SELECT` statement at the end of the file.

Verify that the test file demonstrates the problem by executing these commands:

```
shell> mysqladmin create test2
shell> mysql test2 < query.sql
```

Attach the test file to a bug report, which you can file using the instructions in [Section 1.6, “How to Report Bugs or Problems”](#).

### B.1.5.8. Problems with Floating-Point Comparisons

Floating-point numbers sometimes cause confusion because they are approximate. That is, they are not stored as exact values inside computer architecture. What you can see on the screen usually is not the exact value of the number. The `FLOAT` and `DOUBLE` data types are such. For `DECIMAL` columns, MySQL performs operations with a precision of 65 decimal digits, which should solve most common inaccuracy problems.

The following example demonstrates the problem using `DOUBLE`. It shows that are calculations that are done using floating-point operations are subject to floating-point error.

```
mysql> CREATE TABLE t1 (i INT, d1 DOUBLE, d2 DOUBLE);
mysql> INSERT INTO t1 VALUES (1, 101.40, 21.40), (1, -80.00, 0.00),
-> (2, 0.00, 0.00), (2, -13.20, 0.00), (2, 59.60, 46.40),
-> (2, 30.40, 30.40), (3, 37.00, 7.40), (3, -29.60, 0.00),
-> (4, 60.00, 15.40), (4, -10.60, 0.00), (4, -34.00, 0.00),
-> (5, 33.00, 0.00), (5, -25.80, 0.00), (5, 0.00, 7.20),
-> (6, 0.00, 0.00), (6, -51.40, 0.00);

mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b
-> FROM t1 GROUP BY i HAVING a <> b;
```

i	a	b
1	21.4	21.4
2	76.8	76.8
3	7.4	7.4
4	15.4	15.4
5	7.2	7.2
6	-51.4	0

The result is correct. Although the first five records look like they should not satisfy the comparison (the values of `a` and `b` do not appear to be different), they may do so because the difference between the numbers shows up around the tenth decimal or so, depending on factors such as computer architecture or the compiler version or optimization level. For example, different CPUs may evaluate floating-point numbers differently.

If columns `d1` and `d2` had been defined as `DECIMAL` rather than `DOUBLE`, the result of the `SELECT` query would have contained only one row — the last one shown above.

The correct way to do floating-point number comparison is to first decide on an acceptable tolerance for differences between the numbers and then do the comparison against the tolerance value. For example, if we agree that floating-point numbers should be regarded the same if they are same within a precision of one in ten thousand (0.0001), the comparison should be written to find differences larger than the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) > 0.0001;

+-----+-----+-----+
| i | a | b |
+-----+-----+-----+
| 6 | -51.4 | 0 |
+-----+-----+-----+
1 row in set (0.00 sec)
```

Conversely, to get rows where the numbers are the same, the test should find differences within the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) <= 0.0001;
+----+-----+-----+
| i  | a     | b     |
+----+-----+-----+
| 1  | 21.4  | 21.4  |
| 2  | 76.8  | 76.8  |
| 3  | 7.4   | 7.4   |
| 4  | 15.4  | 15.4  |
| 5  | 7.2   | 7.2   |
+----+-----+-----+
5 rows in set (0.03 sec)
```

## B.1.6. Optimizer-Related Issues

MySQL uses a cost-based optimizer to determine the best way to resolve a query. In many cases, MySQL can calculate the best possible query plan, but sometimes MySQL doesn't have enough information about the data at hand and has to make "educated" guesses about the data.

For the cases when MySQL does not do the "right" thing, tools that you have available to help MySQL are:

- Use the `EXPLAIN` statement to get information about how MySQL processes a query. To use it, just add the keyword `EXPLAIN` to the front of your `SELECT` statement:

```
mysql> EXPLAIN SELECT * FROM t1, t2 WHERE t1.i = t2.i;
```

`EXPLAIN` is discussed in more detail in [Section 12.3.2, "EXPLAIN Syntax"](#).

- Use `ANALYZE TABLE tbl_name` to update the key distributions for the scanned table. See [Section 12.5.2.1, "ANALYZE TABLE Syntax"](#).
- Use `FORCE INDEX` for the scanned table to tell MySQL that table scans are very expensive compared to using the given index:

```
SELECT * FROM t1, t2 FORCE INDEX (index_for_column)
WHERE t1.col_name=t2.col_name;
```

`USE INDEX` and `IGNORE INDEX` may also be useful. See [Section 12.2.8.2, "Index Hint Syntax"](#).

- Global and table-level `STRAIGHT_JOIN`. See [Section 12.2.8, "SELECT Syntax"](#).
- You can tune global or thread-specific system variables. For example, start `mysqld` with the `-max-seeks-for-key=1000` option or use `SET max_seeks_for_key=1000` to tell the optimizer to assume that no key scan causes more than 1,000 key seeks. See [Section 5.1.3, "Server System Variables"](#).

### MySQL Enterprise

For expert advice on configuring MySQL servers for optimal performance, subscribe to the MySQL Enterprise Monitor. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

## B.1.7. Table Definition-Related Issues

### B.1.7.1. Problems with `ALTER TABLE`

`ALTER TABLE` changes a table to the current character set. If you get a duplicate-key error during `ALTER TABLE`, the cause is either that the new character sets maps two keys to the same value or that the table is corrupted. In the latter case, you should run `REPAIR TABLE` on the table.

If `ALTER TABLE` dies with the following error, the problem may be that MySQL crashed during an earlier `ALTER TABLE` operation and there is an old table named `A-xxx` or `B-xxx` lying around:

```
Error on rename of './database/name.frm'
to './database/B-xxx.frm' (Errcode: 17)
```

In this case, go to the MySQL data directory and delete all files that have names starting with `A-` or `B-`. (You may want to move them elsewhere instead of deleting them.)

`ALTER TABLE` works in the following way:

- Create a new table named `A-xxx` with the requested structural changes.
- Copy all rows from the original table to `A-xxx`.
- Rename the original table to `B-xxx`.
- Rename `A-xxx` to your original table name.
- Delete `B-xxx`.

If something goes wrong with the renaming operation, MySQL tries to undo the changes. If something goes seriously wrong (although this shouldn't happen), MySQL may leave the old table as `B-xxx`. A simple rename of the table files at the system level should get your data back.

If you use `ALTER TABLE` on a transactional table or if you are using Windows or OS/2, `ALTER TABLE` unlocks the table if you had done a `LOCK TABLE` on it. This is done because `InnoDB` and these operating systems cannot drop a table that is in use.

### B.1.7.2. How to Change the Order of Columns in a Table

First, consider whether you really need to change the column order in a table. The whole point of SQL is to abstract the application from the data storage format. You should always specify the order in which you wish to retrieve your data. The first of the following statements returns columns in the order `col_name1, col_name2, col_name3`, whereas the second returns them in the order `col_name1, col_name3, col_name2`:

```
mysql> SELECT col_name1, col_name2, col_name3 FROM tbl_name;
mysql> SELECT col_name1, col_name3, col_name2 FROM tbl_name;
```

If you decide to change the order of table columns anyway, you can do so as follows:

1. Create a new table with the columns in the new order.
2. Execute this statement:

```
mysql> INSERT INTO new_table
-> SELECT columns-in-new-order FROM old_table;
```

3. Drop or rename `old_table`.
4. Rename the new table to the original name:

```
mysql> ALTER TABLE new_table RENAME old_table;
```

`SELECT *` is quite suitable for testing queries. However, in an application, you should *never* rely on using `SELECT *` and retrieving the columns based on their position. The order and position in which columns are returned does not remain the same if you add, move, or delete columns. A simple change to your table structure could cause your application to fail.

### B.1.7.3. TEMPORARY Table Problems

The following list indicates limitations on the use of `TEMPORARY` tables:

- A `TEMPORARY` table can only be of type `MEMORY`, `MyISAM`, `MERGE`, or `InnoDB`.

Temporary tables are not supported for MySQL Cluster.

- You cannot refer to a `TEMPORARY` table more than once in the same query. For example, the following does not work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

This error also occurs if you refer to a temporary table multiple times in a stored function under different aliases, even if the references occur in different statements within the function.

- The `SHOW TABLES` statement does not list `TEMPORARY` tables.
- You cannot use `RENAME` to rename a `TEMPORARY` table. However, you can use `ALTER TABLE` instead:

```
mysql> ALTER TABLE orig_name RENAME new_name;
```

- There are known issues in using temporary tables with replication. See [Section 16.3.1, “Replication Features and Issues”](#), for more information.

## B.1.8. Known Issues in MySQL

This section is a list of the known issues in recent versions of MySQL.

For information about platform-specific issues, see the installation and porting instructions in [Section 2.13, “Operating System-Specific Notes”](#), and [MySQL Internals: Porting](#).

### B.1.8.1. Open Issues in MySQL

The following problems are known and fixing them is a high priority:

#### C API

- [Bug#40552](#): Race condition around default\_directories in load\_defaults()
  - **Target fix:** 5.1
- [Bug#26077](#): 'reap' command fetches first command issued by send, not the most recent
  - **Target fix:** 5.1
- [Bug#43560](#): client crashes in mysql\_stmt\_execute/mysql\_stmt\_close after connection loss
  - **Target fix:** 5.1
- [Bug#42675](#): Dangling pointer leads to a client crash (mysys/my\_error.c patch enclosed)
  - **Target fix:** 5.1
- [Bug#27475](#): mysql\_fetch\_field do **NOT** report correctly certain field types
  - **Target fix:** 5.1
- [Bug#43397](#): mysql headers redefine pthread\_mutex\_init unnecessarily
  - **Target fix:** 5.1

#### Client

- [Bug#35934](#): mysql\_upgrade calls mysqlcheck with insufficient parameters
  - **Target fix:** 5.1
- [Bug#34129](#): mysqldumpslow does not aggregate times
  - **Target fix:** 5.1
- [Bug#39852](#): bug in mysql\_setpermission
  - **Target fix:** 5.1
- [Bug#44278](#): mysqlhotcopy unable to backup schema with a hyphen in its name
  - **Target fix:** 5.1
- [Bug#40395](#): mysqladmin -i delay extended-status does not iterate with -r
  - **Target fix:** 5.1
- [Bug#42941](#): --database paramater to mysqlbinlog fails with RBR

- **Target fix:** 5.1
- [Bug#34861](#): mysqldump with --tab gives weird output for triggers.
  - **Target fix:** 5.1
- [Bug#36391](#): mysqlbinlog creates invalid charset statements
  - **Target fix:** 5.1

## Server

- [Bug#42640](#): mysqld crashes when unsafe statements are executed (`STRICT_TRANS_TABLES` mode)
  - **Target fix:** 5.1.35
- [Bug#42610](#): Dynamic plugin broken in 5.1.31
  - **Target fix:** 5.1.33
- [Bug#44521](#): Prepared Statement: `CALL p()` - crashes: ``! thd->main_da.is_sent'` failed et.al.
  - **Target fix:** 5.1
- [Bug#41078](#): With `CURSOR_TYPE_READ_ONLY` `mysql_stmt_fetch()` returns short string value.
  - **Target fix:** 5.1
- [Bug#41004](#): `events_scheduling` times out sporadically on pushbuild
  - **Target fix:** 5.1
- [Bug#35068](#): Assertion fails when reading from `i_s.tables` and there is incorrect merge table
  - **Target fix:** 5.1
- [Bug#38883](#): `thd_security_context` is not thread safe, crashes?
  - **Target fix:** 5.1
- [Bug#38941](#): fast mutexes in MySQL 5.1 have mutex contention when calling `random()`
  - **Target fix:** 5.1
- [Bug#40877](#): multi statement execution fails in 5.1.30
  - **Target fix:** 5.1
- [Bug#39494](#): please support >4GB `key_buffer_size` on windows
  - **Target fix:** 5.1
- [Bug#31616](#): `div_precision_increment` description looks wrong
  - **Target fix:** 5.1
- [Bug#43354](#): Use key hint can crash server in explain extended query
  - **Target fix:** 5.1
- [Bug#40757](#): server crash after failed plugin/engine initialization
  - **Target fix:** 5.1
- [Bug#40536](#): `SELECT` is blocked by `INSERT DELAYED` waiting on upgrading lock, even with `low_pri`
  - **Target fix:** 5.1
- [Bug#43827](#): Server closes connections and restarts

- **Target fix:** 5.1
- [Bug#22891](#): session level max\_allowed\_packet can be set but is ignored
  - **Target fix:** 5.1
- [Bug#40949](#): Debug version of MySQL server crashes when run `OPTIMIZE` on compressed table.
  - **Target fix:** 5.1
- [Bug#41030](#): Wrong meta data (incorrect fieldlen)
  - **Target fix:** 5.1
- [Bug#42563](#): Message tells me to repair table though Storage Engine doesn't allow me to.
  - **Target fix:** 5.1

#### Server: Archive

- [Bug#37719](#): Crash if rename Archive table to same name with different case and then select
  - **Target fix:** 5.1
- [Bug#32880](#): Repairing Archive table fails with internal error 144
  - **Target fix:** 5.1

#### Server: CSV

- [Bug#41441](#): repair csv table crashes debug server
  - **Target fix:** 5.1.31

#### Server: Charsets

- [Bug#33094](#): Error in upgrading from 5.0 to 5.1 when table contains triggers
  - **Target fix:** 5.1.31
- [Bug#41385](#): Crash when attempting to repair a #mysql50# upgraded table with triggers.
  - **Target fix:** 5.1.31
- [Bug#40053](#): 'check table .. for upgrade' doesn't detect collation change made in 5.1.24-rc
  - **Already fixed in:** 5.1.30
- [Bug#32831](#): libmysql should be built with all charsets
  - **Target fix:** 5.1
- [Bug#41084](#): full-text index added to custom `UCA` collation not working
  - **Target fix:** 5.1
- [Bug#45012](#): `my_like_range_cp932` generates invalid string
  - **Target fix:** 5.1
- [Bug#43593](#): dump/backup/restore/upgrade tools fails
  - **Target fix:** 5.1

#### Server: Compiling

- [Bug#42524](#): Function `pthread_setschedprio()` is defined but seems broken on i5/OS `PASE`
  - **Target fix:** 5.1.32
- [Bug#26760](#): SSL support missing from 5.1.15-0 x86\_64 Client Programs?
  - **Target fix:** 5.1.31
- [Bug#43715](#): Link errors when trying to link `mysql_embedded.exe`
  - **Target fix:** 5.1
- [Bug#43449](#): Undefined symbol `__1cG__CrunMex_rethrow_q6F_v_` when compiling using Sun Studio
  - **Target fix:** 5.1
- [Bug#42872](#): In MySQL 5.1.31, unrecognized `--with-innodb`, `--with-partition`, `--with-federated`
  - **Target fix:** 5.1
- [Bug#39996](#): 5.1 fails to compile on Windows 32-bit with VS2005
  - **Target fix:** 5.1
- [Bug#45113](#): `mysql_config` returns incorrect path if built with prefix `!= execprefix`
  - **Target fix:** 5.1
- [Bug#25404](#): `mysql_config` need several issues corrected
  - **Target fix:** 5.1
- [Bug#38364](#): `gen_lex_hash` segmentation fault in debug build
  - **Target fix:** 5.1
- [Bug#42733](#): type-punning warnings when compiling MySQL with `-O2/-O3 -Wall` and `gcc 4.x`
  - **Target fix:** 5.1
- [Bug#39102](#): `valgrind` build does not compile in `realpath`, which make `DATA/INDEX DIR` fail
  - **Target fix:** 5.1
- [Bug#39802](#): On Windows, 32-bit `time_t` should be enforced
  - **Target fix:** 5.1
- [Bug#31506](#): detection of function's availability is wrong in `configure.in`
  - **Target fix:** 5.1
- [Bug#38697](#): `utf8_general_cs` cannot be used with Windows?
  - **Target fix:** 5.1
- [Bug#39279](#): `mysqld` Linux-ia64 binary depends on two versions of `libunwind`
  - **Target fix:** 5.1
- [Bug#42071](#): Obsoleted `configure` options were still used in the official compiling.
  - **Target fix:** 5.1
- [Bug#39571](#): `abi_check`: Does not create all prerequisites
  - **Target fix:** 5.1
- [Bug#42141](#): Compiler crash in `"mf_format.c"` when optimizing for 64 bit
  - **Target fix:** 5.1

- [Bug#42721](#): configure.in invokes 'nm' directly
  - **Target fix:** 5.1
- [Bug#39288](#): MySQL Embedded server (libmysqld.a) is built without -fPIC flag
  - **Target fix:** 5.1

#### Server: Config Wizard

- [Bug#42386](#): MySQL .msi installer does not start configuration wizard on Vista when prompted
  - **Target fix:** 5.1.33
- [Bug#43282](#): Change installation path. mysql.exe not found
  - **Target fix:** 5.1
- [Bug#37294](#): Windows .msi - 'Repair' option doesn't back out as expected
  - **Target fix:** 5.1
- [Bug#42388](#): MySQL .msi uninstall process is an 'Unidentified Program' on Vista
  - **Target fix:** 5.1
- [Bug#44428](#): Cannot recreate instance after clean install (apply security settings fails)
  - **Target fix:** 5.1
- [Bug#38723](#): MySQL Configuration Wizard on Vista unreadable
  - **Target fix:** 5.1

#### Server: DB2SE for IBM i

- [Bug#45197](#): cp1250 character set with IBMDB2I generates 2027 error
  - **Target fix:** 5.1
- [Bug#44856](#): IBMDB2I gives misleading 2504 error
  - **Target fix:** 5.1
- [Bug#44337](#): Select query using index merge fails with MCH3601
  - **Target fix:** 5.1
- [Bug#44022](#): `CREATE TABLE` sometimes fails silently for IBMDB2I engine
  - **Target fix:** 5.1
- [Bug#44811](#): Tests with utf8 charset fail with ibmdb2i on 64bit MySQL
  - **Target fix:** 5.1

#### Server: DB2SE for iOS

- [Bug#44025](#): Some schema names longer than 8 characters not supported by IBMDB2I
  - **Target fix:** 5.1
- [Bug#44020](#): Unicode Swedish collations not working with IBMDB2I
  - **Target fix:** 5.1

**Server: DDL**

- [Bug#37016](#): `TRUNCATE TABLE` removes some rows but not all
  - **Target fix:** 5.1.31
- [Bug#23113](#): Different behavior on altering `ENUM` fields between 5.0 and 5.1
  - **Already fixed in:** 5.1.30
- [Bug#39372](#): "Smart" `ALTER TABLE` not so smart after all.
  - **Target fix:** 5.1
- [Bug#41465](#): confusing error message when comment is too long
  - **Target fix:** 5.1
- [Bug#39200](#): optimize table does not recognize `ROW_FORMAT=COMPRESSED`
  - **Target fix:** 5.1
- [Bug#40886](#): `ALTER TABLE` statements appear to randomly fail on Mac OS 10.4
  - **Target fix:** 5.1
- [Bug#42226](#): `ALTER DATABASE` returns `OK` even when there are errors
  - **Target fix:** 5.1
- [Bug#40277](#): `SHOW CREATE VIEW` returns invalid `SQL`
  - **Target fix:** 5.1
- [Bug#35796](#): `SHOW CREATE TABLE` and default value for `BIT` field
  - **Target fix:** 5.1
- [Bug#41041](#): Obsolete debug code can be used to crash server
  - **Target fix:** 5.1

**Server: DML**

- [Bug#39920](#): MySQL cannot deal with Leap Second expression in string literal.
  - **Target fix:** 5.0.74
- [Bug#44743](#): Join in combination with concat does not always work
  - **Target fix:** 5.1
- [Bug#41156](#): List of derived tables acts like a chain of mutually-nested subqueries
  - **Target fix:** 5.1
- [Bug#40384](#): Gap in auto\_increment sequence when inserts fire a trigger
  - **Target fix:** 5.1
- [Bug#41371](#): Select returns 1 row with condition "col is not null and col is null"
  - **Target fix:** 5.1
- [Bug#45168](#): assertion with `convert()` and empty set value
  - **Target fix:** 5.1
- [Bug#33717](#): `INSERT...(default)` fails for enum. Crashes `CSV` tables, loads spaces for `MyISAM`

- **Target fix:** 5.1
- [Bug#38693](#): leaked memory with blobs!
  - **Target fix:** 5.1
- [Bug#44306](#): Assertion fail on duplicate key error in 'INSERT ... SELECT' statements
  - **Target fix:** 5.1
- [Bug#33844](#): Server crashes when client dies during `LOAD DATA INFILE`
  - **Target fix:** 5.1
- [Bug#40745](#): Error during `WHERE` clause calculation in `UPDATE` leads to an assertion failure
  - **Target fix:** 5.1
- [Bug#43385](#): Cannot `ALTER DATABASE ... UPGRADE DATA DIRECTORY NAME` when Views exist
  - **Target fix:** 5.1
- [Bug#40127](#): Multiple table `DELETE IGNORE` hangs on foreign key constraint violation on 5.0
  - **Target fix:** 5.1

#### Server: Errors

- [Bug#41121](#): "Statement is not safe to log in statement format" is prints table name only
  - **Target fix:** 5.1
- [Bug#41077](#): Warning contains wrong future version
  - **Target fix:** 5.1

#### Server: FTS

- [Bug#39746](#): Debug flag breaks struct definition (server crash)
  - **Target fix:** 5.1
- [Bug#28234](#): global/session scope - documentation vs implementation
  - **Target fix:** 5.1
- [Bug#42907](#): Multi-term boolean fulltext query containing a single quote fails in 5.1.x
  - **Target fix:** 5.1
- [Bug#39640](#): `ftb_query_add_word` does not recognise `MYSQL_FTFLAGS_NEED_COPY`
  - **Target fix:** 5.1

#### Server: GIS

- [Bug#31435](#): `ha_innodb.cc:3983: ulint convert_search_mode_to_innbase(ha_rkey_function): Asse`
  - **Target fix:** 5.1

#### Server: General

- [Bug#43748](#): crash when non-super user tries to kill the replication threads

- **Target fix:** 5.1.34
- [Bug#41456](#): `SET PASSWORD` hates `CURRENT_USER()`
  - **Target fix:** 5.1.31
- [Bug#41363](#): crash of `mysqld` on windows with aggregate in case
  - **Target fix:** 5.1.31
- [Bug#40104](#): regression with table names?
  - **Target fix:** 5.1
- [Bug#10206](#): InnoDB: Transaction requiring `Max_BinLog_Cache_size > 4GB` always rollback.
  - **Target fix:** 5.1
- [Bug#37284](#): Crash in `Field_string::type()`
  - **Target fix:** 5.1
- [Bug#41710](#): MySQL 5.1.30 crashes on the latest OpenSolaris 10
  - **Target fix:** 5.1
- [Bug#30261](#): "`mysqld --help`" no longer possible for root
  - **Target fix:** 5.1
- [Bug#38477](#): `my_pthread_setprio` can change dispatch class on Solaris, not just priority
  - **Target fix:** 5.1
- [Bug#44367](#): valgrind warnings with `find_in_set()` functions
  - **Target fix:** 5.1
- [Bug#38249](#): `innodb_log_arch_dir` still in support files
  - **Target fix:** 5.1
- [Bug#45195](#): valgrind warnings about uninitialized values in `store_record_in_cache()`
  - **Target fix:** 5.1
- [Bug#44664](#): valgrind warning for `COMMIT_AND_CHAIN` and `ROLLBACK_AND_CHAIN`
  - **Target fix:** 5.1
- [Bug#39265](#): `SQL_MODE OLD_NOT_NULL_CHECK_BEHAVIOUR` for backward compatibility
  - **Target fix:** 5.1
- [Bug#43962](#): "Packets out of order" calling a `SHOW TABLE STATUS`
  - **Target fix:** 5.1
- [Bug#34043](#): Server loops excessively in `_checkchunk()` when `safemalloc` is enabled
  - **Target fix:** 5.1
- [Bug#42158](#): leak: `SSL_get_peer_certificate()` doesn't have matching `X509_free()`
  - **Target fix:** 5.1
- [Bug#36751](#): Segmentation fault in `ctype-bin.c:308`; Linux 86\_64, `with-max-indexes=128`
  - **Target fix:** 5.1
- [Bug#40862](#): `main.subselect_notembedded` test case fails

- **Target fix:** 5.1
- [Bug#42957](#): no results from select where .. (col=col and col=col) or ... (false expression)
  - **Target fix:** 5.1
- [Bug#44358](#): valgrind errors with decode() function
  - **Target fix:** 5.1
- [Bug#40915](#): Events takes mutex in wrong order which can easily lead to deadlocks
  - **Target fix:** 5.1
- [Bug#44736](#): mySQLd\_safe's my\_which() is broken and doesn't find 'logger'
  - **Target fix:** 5.1
- [Bug#44638](#): mySQL\_upgrade, mySQLcheck output instance unclear
  - **Target fix:** 5.1
- [Bug#44365](#): valgrind warnings with encrypt() function
  - **Target fix:** 5.1
- [Bug#42146](#): DATETIME fractional seconds parse error
  - **Target fix:** 5.1
- [Bug#39178](#): Server crash in YaSSL with non-RSA-requesting client if server uses RSA key
  - **Target fix:** 5.1
- [Bug#44164](#): TL\_WRITE has no description in lock\_descriptions[]
  - **Target fix:** 5.1
- [Bug#40657](#): assertion with out of range variables and traditional sql\_mode
  - **Target fix:** 5.1
- [Bug#41612](#): resolve\_stack\_dump does not decode 5.1 stack trace
  - **Target fix:** 5.1

**Server: I\_S**

- [Bug#39541](#): CHECK TABLE on information\_schema myisam tables produces error
  - **Target fix:** 5.0.74
- [Bug#39955](#): SELECT on INFORMATION\_SCHEMA.GLOBAL\_VARIABLES takes too long
  - **Target fix:** 5.1
- [Bug#35275](#): INFORMATION\_SCHEMA.TABLES.CREATE\_OPTIONS omits KEY\_BLOCK\_SIZE
  - **Target fix:** 5.1
- [Bug#38918](#): selecting from information\_schema.columns is disproportionately slow
  - **Target fix:** 5.1
- [Bug#42758](#): INFORMATION\_SCHEMA.COLUMNS is inconsistent
  - **Target fix:** 5.1
- [Bug#38909](#): CREATE\_OPTIONS in information\_schema produces wrong results

- **Target fix:** 5.1
- [Bug#35789](#): wrong datatypes for collation and charset columns in [EVENTS](#), [ROUTINES](#), [TRIGGERS](#)
  - **Target fix:** 5.1

**Server: InnoDB**

- [Bug#39320](#): assert btr/btr0pcur.c line 217 -innodb\_locks\_unsafe\_for\_binlog or read committed
  - **Target fix:** 5.1.35
- [Bug#40386](#): Not flushing query cache after truncate
  - **Target fix:** 5.1.31
- [Bug#40360](#): Binlog related errors with binlog off
  - **Already fixed in:** 5.1.30
- [Bug#42400](#): InnoDB autoinc code can't handle floating-point columns
  - **Target fix:** 5.1
- [Bug#39438](#): Testcase for [Bug#39436](#) crashes on 5.1 in `fil_space_get_latch`
  - **Target fix:** 5.1
- [Bug#42101](#): Race condition in `innodb_commit_concurrency`
  - **Target fix:** 5.1
- [Bug#36169](#): create innodb compressed table with too large row size crashed
  - **Target fix:** 5.1
- [Bug#45097](#): Hang during recovery, redo logs for doublewrite buffer pages
  - **Target fix:** 5.1
- [Bug#44320](#): InnoDB: missing `DB_ROLL_PTR` in Table Monitor `COLUMNS` output
  - **Target fix:** 5.1
- [Bug#42152](#): Race condition in `lock_is_table_exclusive()`
  - **Target fix:** 5.1
- [Bug#39830](#): Table autoinc value not updated on first insert
  - **Target fix:** 5.1
- [Bug#38231](#): InnoDB crash in `lock_reset_all_on_table()` on `TRUNCATE + LOCK / UNLOCK`
  - **Target fix:** 5.1
- [Bug#38189](#): `innodb_stats_on_metadata` missing
  - **Target fix:** 5.1
- [Bug#44030](#): Error: (1500) Couldn't read the `MAX(ID)` autoinc value from the index (`PRIMARY`)
  - **Target fix:** 5.1
- [Bug#36411](#): "Failed to read auto-increment value from storage engine" in 5.1.24 auto-inc
  - **Target fix:** 5.1
- [Bug#43203](#): Overflow from auto incrementing causes server segv

- **Target fix:** 5.1
- [Bug#40369](#): `dtype_get_sql_null_size()` returns 0 or 1, not the size
  - **Target fix:** 5.1
- [Bug#39793](#): Foreign keys not constructed when column has a '#' in a comment or default value
  - **Target fix:** 5.1
- [Bug#42075](#): `dict_load_indexes` failure in `dict_load_table` will corrupt the dictionary cache
  - **Target fix:** 5.1
- [Bug#43660](#): `SHOW INDEXES/ANALYZE` does **NOT** update cardinality for indexes of InnoDB table
  - **Target fix:** 5.1
- [Bug#39648](#): Replication failure on `RBR` + InnoDB + 2 bit fields + `LIMIT` + no `PK`
  - **Target fix:** 5.1
- [Bug#42279](#): Race condition in `btr_search_drop_page_hash_when_freed()`
  - **Target fix:** 5.1
- [Bug#37885](#): `row_search_for_mysql` may gap lock unnecessarily with `SQL` comments in query
  - **Target fix:** 5.1
- [Bug#35498](#): Cannot get table `test/table1` auto-incrementer value in `::info`
  - **Target fix:** 5.1
- [Bug#42714](#): `AUTO_INCREMENT` errors in 5.1.31
  - **Target fix:** 5.1
- [Bug#41671](#): Semi-consistent read does not unlock rows in `READ COMMITTED` mode
  - **Target fix:** 5.1
- [Bug#32430](#): 'show innodb status' causes errors Invalid (old?) table or database name in logs
  - **Target fix:** 5.1

**Server: InnoDB Plugin**

- [Bug#37788](#): InnoDB Plugin: `AUTO_INCREMENT` wrong for compressed tables
  - **Target fix:** 5.1

**Server: Installing**

- [Bug#17270](#): mysql client tool could not find `../share/charsets` folder and fails.
  - **Target fix:** 5.1
- [Bug#41828](#): `mysql_install_db` misses `mysqld` options when using `--basedir`
  - **Target fix:** 5.1
- [Bug#41313](#): network administrator does not have `TRIGGER` and `EVENT` privileges
  - **Target fix:** 5.1
- [Bug#41998](#): Solaris 10 postinstall script fails to copy from wrong dir

- **Target fix:** 5.1

#### Server: Locking

- [Bug#41348](#): `INSERT INTO tbl SELECT * FROM temp_tbl` overwrites locking type of temp table
  - **Target fix:** 5.1.31
- [Bug#45066](#): `FLUSH TABLES WITH READ LOCK` deadlocks against `LOCK TABLE`
  - **Target fix:** 5.1
- [Bug#41110](#): crash with handler command when used concurrently with alter table
  - **Target fix:** 5.1
- [Bug#41140](#): Failure of replication on triggered insert if `innodb_autoinc_lock_mode > 0`
  - **Target fix:** 5.1
- [Bug#44672](#): Assertion failed: `thd->transaction.xid_state.xid.is_null()`
  - **Target fix:** 5.1
- [Bug#39843](#): `DELETE` requires write access to table in subquery in where clause
  - **Target fix:** 5.1
- [Bug#33278](#): `ANALYZE TABLE` in InnoDB holds exclusive locks on subsequent execution
  - **Target fix:** 5.1

#### Server: Logging

- [Bug#43885](#): `main.variables-big` fails because of warnings within the server log
  - **Target fix:** 5.1
- [Bug#37132](#): Logging to `slow_log` table fails with very slow queries
  - **Target fix:** 5.1
- [Bug#40281](#): partitioning the general log table crashes the server
  - **Target fix:** 5.1

#### Server: Memory

- [Bug#39886](#): Table full for `MEMORY` table is not written into error log
  - **Target fix:** 5.1

#### Server: Merge

- [Bug#40675](#): MySQL 5.1 crash with index merge algorithm and Merge tables
  - **Target fix:** 5.1.33
- [Bug#36171](#): `CREATE TEMPORARY TABLE` and `MERGE` engine
  - **Target fix:** 5.1
- [Bug#41305](#): server crashes when inserting duplicate row into a merge table

- **Target fix:** 5.1
- [Bug#44040](#): MySQL allows creating a `MERGE` table upon VIEWS but crashes when using it
  - **Target fix:** 5.1
- [Bug#41941](#): Failed `OPTIMIZE TABLE` is logged to binary log for `MERGE` engine
  - **Target fix:** 5.1
- [Bug#41212](#): crash after race condition between merge table and table\_cache evictions
  - **Target fix:** 5.1

**Server: MyISAM**

- [Bug#41574](#): `REPAIR TABLE`: crashes for compressed tables
  - **Target fix:** 5.1.31
- [Bug#40321](#): ha\_myisam::info could update rec\_per\_key incorrectly
  - **Target fix:** 5.1
- [Bug#40634](#): table scan temporary table is 4x slower due to mmap instead of caching
  - **Target fix:** 5.1
- [Bug#35111](#): Truncate a MyISAM partitioned table does not reset the auto\_increment value.
  - **Target fix:** 5.1
- [Bug#38848](#): myisam\_use\_mmap causes widespread myisam corruption on windows
  - **Target fix:** 5.1
- [Bug#37756](#): enabling fulltext indexes with myisam\_repair\_threads > 1 causes crash
  - **Target fix:** 5.1
- [Bug#43940](#): 64-bit windows myisamchk doesn't support key\_buffer\_size > 4G
  - **Target fix:** 5.1
- [Bug#37631](#): Incorrect key file for table after upgrading from 5.0 to 5.1
  - **Target fix:** 5.1
- [Bug#40827](#): Killing insert-select to MyISAM can cause table corruption
  - **Target fix:** 5.1

**Server: Optimizer**

- [Bug#37362](#): Crash in do\_field\_eq
  - **Target fix:** 5.1.36
- [Bug#34773](#): query with explain extended and derived table / other table crashes server
  - **Target fix:** 5.1.31
- [Bug#38842](#): Fix for 25951 seems incorrect
  - **Target fix:** 5.0.74
- [Bug#37742](#): `HA_EXTRA_KEYREAD` flag is set when key contains only prefix of requested column

- **Target fix:** 5.1
- [Bug#28554](#): Optimizer wrongly prefers index for (col = value) over (PK <= value)
  - **Target fix:** 5.1
- [Bug#44886](#): SIGSEGV in test\_if\_skip\_sort\_order() - uninitialized variable used as subscript
  - **Target fix:** 5.1
- [Bug#41543](#): Assertion `m\_status == DA\_ERROR' failed in Diagnostics\_area::sql\_errno
  - **Target fix:** 5.1
- [Bug#37936](#): ASSERT\_COLUMN\_MARKED\_FOR\_WRITE in Field\_datetime::store , Field\_varstring::store
  - **Target fix:** 5.1
- [Bug#37822](#): Correlated subquery with IN and IS UNKNOWN provides wrong result
  - **Target fix:** 5.1
- [Bug#36259](#): Optimizing with ORDER BY
  - **Target fix:** 5.1
- [Bug#31399](#): Wrong query result when doing join buffering over BIT fields
  - **Target fix:** 5.1
- [Bug#39433](#): poor optimized query
  - **Target fix:** 5.1

#### Server: Options

- [Bug#43835](#): SHOW VARIABLES does not include 0 for slave\_skip\_errors
  - **Target fix:** 5.1

#### Server: Packaging

- [Bug#43153](#): Version comment is too long
  - **Target fix:** 5.1.34
- [Bug#40845](#): Win inst shows screens with wrong naming "MySQL Monitoring and Advisory Service"
  - **Target fix:** 5.1.31
- [Bug#41838](#): shared-compat packages missing for Enterprise 5.1 builds
  - **Target fix:** 5.1.31
- [Bug#34025](#): mysql\_config is not returning -ldl lib flag needed when using embedded server
  - **Target fix:** 5.1.31
- [Bug#39074](#): Binaries do not work on Solaris 10 older than U5
  - **Already fixed in:** 5.1.30
- [Bug#31143](#): mysqlslap.exe (and other) missing in windows install packages
  - **Target fix:** 5.1
- [Bug#43918](#): Generated version string is too long for the binlog

- **Target fix:** 5.1
- [Bug#44496](#): No "MySQL Manual" in Install-Package
  - **Target fix:** 5.1
- [Bug#39641](#): mysql\_config --plugindir links to /usr/local/mysql/lib/plugin in tar.gz packages
  - **Target fix:** 5.1
- [Bug#39443](#): .pdb-files not delivered with 5.1.28
  - **Target fix:** 5.1
- [Bug#41577](#): improper value in example config file
  - **Target fix:** 5.1
- [Bug#44353](#): build-v9.bat is missing in source archive
  - **Target fix:** 5.1
- [Bug#41189](#): No debug symbols in 5.1.30 build for Mac OS X (mysql-5.1.30-osx10.5-x86.dmg)
  - **Target fix:** 5.1
- [Bug#37697](#): make\_binary\_distribution places files in wrong path
  - **Target fix:** 5.1

#### Server: Parser

- [Bug#39559](#): dump of stored procedures / functions with C-style comment can't be read back
  - **Target fix:** 5.1
- [Bug#45010](#): invalid memory reads during parsing some strange statements
  - **Target fix:** 5.1
- [Bug#25250](#): alter table allows simultaneous drop/add foreign keys
  - **Target fix:** 5.1
- [Bug#38159](#): Function parsing problem generates misleading error message
  - **Target fix:** 5.1
- [Bug#43746](#): YACC return wrong query string when parse 'load data infile' sql statement
  - **Target fix:** 5.1

#### Server: Partition

- [Bug#40954](#): Crash in MyISAM index code with concurrency test using partitioned tables
  - The crash is observed with queries of the form "SELECT \* FROM part\_table WHERE a < const ORDER BY a" or "SELECT \* FROM part\_table WHERE a <> ORDER BY a" where a is an indexed column used as the partition key. The crash can be avoided by 'limiting' the where clause with a very low value as in: "SELECT \* FROM part\_table WHERE a < const AND a > -1000 ORDER BY a" or "SELECT \* FROM part\_table WHERE a <> AND a > -1000 ORDER BY a"
    - **Target fix:** 5.1.31
- [Bug#39434](#): ALTER TABLE CHECK/OPTIMIZE/ANALYZE PARTITION work on non-partitioned table
  - **Target fix:** 5.1.31

- [Bug#14326](#): No formatting of `SHOW CREATE TABLE` output
  - **Target fix:** 5.1.31
- [Bug#37721](#): `ORDER BY` when `WHERE` contains non-partitioned index column
  - **Target fix:** 5.1.31
- [Bug#40176](#): Combination of event, trigger and partitioning breaks auto increment
  - **Target fix:** 5.1.31
- [Bug#40494](#): `MYSQL` server crashes on range access with partitioning and order by
  - **Already fixed in:** 5.1.30
- [Bug#40972](#): Partition pruning can lead to crash for bad dates
  - **Target fix:** 5.1
- [Bug#40515](#): Query on a partitioned table does not return 'lock wait timeout exceeded'
  - **Target fix:** 5.1
- [Bug#42849](#): innodb crash with varying `time_zone` on partitioned timestamp primary key
  - **Target fix:** 5.1
- [Bug#40389](#): `REORGANIZE PARTITION` crashes when only using one partition
  - **Target fix:** 5.1
- [Bug#44821](#): select distinct on partitioned table returns wrong results
  - **Target fix:** 5.1
- [Bug#44653](#): Server crash noticed when executing random queries with partitions.
  - **Target fix:** 5.1
- [Bug#36001](#): Partitions: spelling and using some error messages
  - **Target fix:** 5.1
- [Bug#36312](#): InnoDB `DATA_FREE` BUG?
  - **Target fix:** 5.1
- [Bug#37453](#): Dropping/creating index on partitioned table with InnoDB Plugin locks table
  - **Target fix:** 5.1
- [Bug#42944](#): partition not pruned correctly
  - **Target fix:** 5.1
- [Bug#39084](#): Getting intermittent errors with statement-based binary logging
  - **Target fix:** 5.1
- [Bug#38719](#): Partitioning returns a different error code for a duplicate key error
  - **Target fix:** 5.1
- [Bug#30102](#): rename table does corrupt tables with partition files on failure
  - **Target fix:** 5.1

**Server: Privileges**

- [Bug#37191](#): Failed assertion in `CREATE VIEW`
  - **Target fix:** 5.1
- [Bug#30305](#): Create routine in wrong context in `SHOW PRIVILEGES`
  - **Target fix:** 5.1

#### Server: Query Cache

- [Bug#43758](#): Query cache can lock up threads in 'freeing items' state
  - **Target fix:** 5.1.36
- [Bug#43861](#): `main.query_cache_28249` fails sporadically
  - **Target fix:** 5.1
- [Bug#41098](#): Query Cache returns wrong result with concurrent insert
  - **Target fix:** 5.1

#### Server: RBR

- [Bug#42977](#): RBR logs for rows with more than 250 column results in corrupt binlog.
  - **Target fix:** 5.1.34
- [Bug#41986](#): Replication slave does not pick up proper `AUTO_INCREMENT` value for InnoDB tables
  - **Target fix:** 5.1.31
- [Bug#40221](#): Replication failure on RBR + UPDATE the primary key
  - **Target fix:** 5.1.31
- [Bug#40004](#): Replication failure with no PK + no indexes
  - **Already fixed in:** 5.1.30
- [Bug#39934](#): Slave stops for engine that only support row-based logging
  - **Target fix:** 5.1
- [Bug#40278](#): Replication failure on RBR + MyISAM + SAVEPOINTS
  - **Target fix:** 5.1
- [Bug#39701](#): Mixed binlog format does not switch to row mode on `LOAD_FILE`
  - **Target fix:** 5.1
- [Bug#31502](#): 5.1.20 -> 5.1.22 Slave crashes if it gets an event w/ data for non-existent column
  - **Target fix:** 5.1
- [Bug#45243](#): crash on win in sql thread `clear_tables_to_lock()` -> `free()`
  - **Target fix:** 5.1
- [Bug#38230](#): Differences between master and slave after UPDATE or DELETE with LIMIT with pk
  - **Target fix:** 5.1
- [Bug#39753](#): Replication failure on MIXED + bit + myisam + no PK
  - **Target fix:** 5.1

- [Bug#42914](#): non-updated blob columns are included in [RBR](#) binlog record.
  - **Target fix:** 5.1
- [Bug#42749](#): infinite loop writing to row based binlog - processlist shows "freeing items"
  - **Target fix:** 5.1

#### Server: Replication

- [Bug#40116](#): Uncommitted changes are replicated and stay on slave after rollback on master
  - **Target fix:** 5.1.31
- [Bug#40482](#): server/mysqlbinlog crashes when reading invalid Incident\_log\_event
  - **Target fix:** 5.1
- [Bug#43579](#): mysql\_upgrade tries to alter log tables on replicated database
  - **Target fix:** 5.1
- [Bug#42851](#): Spurious "Statement is not safe to log in statement format." warnings
  - **Target fix:** 5.1
- [Bug#45242](#): crash on win in mysql\_close() -> free()
  - **Target fix:** 5.1
- [Bug#41980](#): [SBL](#), [INSERT .. SELECT .. LIMIT = ERROR](#), even when @@SQL\_LOG\_BIN is 0 !
  - **Target fix:** 5.1
- [Bug#40796](#): Crash due to heap corruption in rpl.rpl\_extraColmaster\_myisam
  - **Target fix:** 5.1
- [Bug#34739](#): unexpected binlog file name when --log-bin is set to a directory name
  - **Target fix:** 5.1
- [Bug#38174](#): secure-file-priv breaks [LOAD DATA INFILE](#) replication in statement mode
  - **Target fix:** 5.1
- [Bug#35583](#): mysqlbinlog replay fails with [ERROR 1146](#) when temp tables are used
  - **Target fix:** 5.1
- [Bug#40013](#): mixed replication: row based format could lead to stale tmp tables on the slave
  - **Target fix:** 5.1
- [Bug#44179](#): reset slave crashes in my\_error when reset\_logs returns non-zero
  - **Target fix:** 5.1
- [Bug#36763](#): [TRUNCATE TABLE](#) fails to replicate when stmt-based binlogging is not supported.
  - **Target fix:** 5.1
- [Bug#34628](#): [LOAD DATA CONCURRENT INFILE](#) drops [CONCURRENT](#) in binary log
  - **Target fix:** 5.1
- [Bug#38934](#): slave slave until does not work with --replicate-same-server-id
  - **Target fix:** 5.1

- [Bug#41948](#): Query\_log\_event constructor needlessly contorted
  - **Target fix:** 5.1
- [Bug#44181](#): `CHANGE MASTER` complains Could not initialize master info
  - **Target fix:** 5.1
- [Bug#34541](#): mysqlbinlog prints 'set;' in stm mode after changing autocommit mode
  - **Target fix:** 5.1
- [Bug#39526](#): sql\_mode not retained in binary log for `CREATE PROCEDURE`
  - **Target fix:** 5.1
- [Bug#31240](#): load data infile replication between (4.0 or 4.1) and 5.1 fails
  - **Target fix:** 5.1
- [Bug#38205](#): Row-based Replication (RBR) causes inconsistencies: `HA_ERR_FOUND_DUPP_KEY`
  - **Target fix:** 5.1
- [Bug#45238](#): `rpl_slave_skip`, `rpl_change_master` failed (lost connection) for `STOP SLAVE`
  - **Target fix:** 5.1
- [Bug#44442](#): Incident events are silent in mysqlbinlog output
  - **Target fix:** 5.1
- [Bug#22504](#): load data infile sql statement in replication architecture get error
  - **Target fix:** 5.1
- [Bug#42861](#): Assigning invalid directories to `--slave-load-tmpdir` crashes the slave
  - **Target fix:** 5.1
- [Bug#42829](#): binlogging enabled for all schemas regardless of `binlog-db-db` / `binlog-ignore-db`
  - **Target fix:** 5.1

## B.1.8.2. Additional Known Issues

The following problems are also known and fixing them is also a high priority:

- MySQL Cluster fails to recover from an out-of-disk failure when using disk data. ([Bug#17614](#))
- Subquery optimization for `IN` is not as effective as for `=`.
- Even if you use `lower_case_table_names=2` (which enables MySQL to remember the case used for databases and table names), MySQL does not remember the case used for database names for the function `DATABASE()` or within the various logs (on case-insensitive systems).
- Dropping a `FOREIGN KEY` constraint doesn't work in replication because the constraint may have another name on the slave.
- `REPLACE` (and `LOAD DATA` with the `REPLACE` option) does not trigger `ON DELETE CASCADE`.
- `DISTINCT` with `ORDER BY` doesn't work inside `GROUP_CONCAT()` if you don't use all and only those columns that are in the `DISTINCT` list.
- If one user has a long-running transaction and another user drops a table that is updated in the transaction, there is small chance that the binary log may contain the `DROP TABLE` command before the table is used in the transaction itself. We plan to fix this by having the `DROP TABLE` command wait until the table is not being used in any transaction.
- When inserting a big integer value (between  $2^{63}$  and  $2^{64}-1$ ) into a decimal or string column, it is inserted as a negative value because the number is evaluated in a signed integer context.
- `FLUSH TABLES WITH READ LOCK` does not block `COMMIT` if the server is running without binary logging, which may cause a problem (of consistency between tables) when doing a full backup.
- `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` may cause problems on tables for which you are using `INSERT DELAYED`.
- Performing `LOCK TABLE ...` and `FLUSH TABLES ...` doesn't guarantee that there isn't a half-finished transaction in progress on the table.
- Replication uses query-level logging: The master writes the executed queries to the binary log. This is a very fast, compact, and efficient logging method that works perfectly in most cases.

It is possible for the data on the master and slave to become different if a query is designed in such a way that the data modification is non-deterministic (generally not a recommended practice, even outside of replication).

For example:

- `CREATE ... SELECT` or `INSERT ... SELECT` statements that insert zero or `NULL` values into an `AUTO_INCREMENT` column.
- `DELETE` if you are deleting rows from a table that has foreign keys with `ON DELETE CASCADE` properties.
- `REPLACE ... SELECT`, `INSERT IGNORE ... SELECT` if you have duplicate key values in the inserted data.

**If and only if the preceding queries have no `ORDER BY` clause guaranteeing a deterministic order.**

For example, for `INSERT ... SELECT` with no `ORDER BY`, the `SELECT` may return rows in a different order (which results in a row having different ranks, hence getting a different number in the `AUTO_INCREMENT` column), depending on the choices made by the optimizers on the master and slave.

A query is optimized differently on the master and slave only if:

- The table is stored using a different storage engine on the master than on the slave. (It is possible to use different storage engines on the master and slave. For example, you can use `InnoDB` on the master, but `MyISAM` on the slave if the slave has less available disk space.)
- MySQL buffer sizes (`key_buffer_size`, and so on) are different on the master and slave.
- The master and slave run different MySQL versions, and the optimizer code differs between these versions.

This problem may also affect database restoration using `mysqlbinlog|mysql`.

The easiest way to avoid this problem is to add an `ORDER BY` clause to the aforementioned non-deterministic queries to ensure that the rows are always stored or modified in the same order.

In future MySQL versions, we will automatically add an `ORDER BY` clause when needed.

The following issues are known and will be fixed in due time:

- Log file names are based on the server host name (if you don't specify a file name with the startup option). You have to use options such as `--log-bin=old_host_name-bin` if you change your host name to something else. Another option is to rename the old files to reflect your host name change (if these are binary logs, you need to edit the binary log index file and fix the binlog names there as well). See [Section 5.1.2, “Server Command Options”](#).
- `mysqlbinlog` does not delete temporary files left after a `LOAD DATA INFILE` command. See [Section 4.6.7, “mysqlbinlog — Utility for Processing Binary Log Files”](#).
- `RENAME` doesn't work with `TEMPORARY` tables or tables used in a `MERGE` table.
- Due to the way table format (`.frm`) files are stored, you cannot use character 255 (`CHAR(255)`) in table names, column names, or enumerations. This is scheduled to be fixed in version 5.1 when we implement new table definition format files.
- When using `SET CHARACTER SET`, you can't use translated characters in database, table, and column names.
- You can't use “\_” or “%” with `ESCAPE` in `LIKE ... ESCAPE`.
- You cannot build the server in another directory when using MIT-pthreads. Because this requires changes to MIT-pthreads, we are not likely to fix this. See [Section 2.10.5, “MIT-pthreads Notes”](#).
- `BLOB` and `TEXT` values can't reliably be used in `GROUP BY`, `ORDER BY` or `DISTINCT`. Only the first `max_sort_length` bytes are used when comparing `BLOB` values in these cases. The default value of `max_sort_length` is 1024 and can be changed at server startup time or at runtime.
- Numeric calculations are done with `BIGINT` or `DOUBLE` (both are normally 64 bits long). Which precision you get depends on the function. The general rule is that bit functions are performed with `BIGINT` precision, `IF()` and `ELT()` with `BIGINT` or `DOUBLE` precision, and the rest with `DOUBLE` precision. You should try to avoid using unsigned long long values if they resolve to be larger than 63 bits (9223372036854775807) for anything other than bit fields.
- You can have up to 255 `ENUM` and `SET` columns in one table.
- In `MIN()`, `MAX()`, and other aggregate functions, MySQL currently compares `ENUM` and `SET` columns by their string value rather than by the string's relative position in the set.
- `mysqld_safe` redirects all messages from `mysqld` to the `mysqld` log. One problem with this is that if you execute `mysqladmin refresh` to close and reopen the log, `stdout` and `stderr` are still redirected to the old log. If you use the general query log extensively, you should edit `mysqld_safe` to log to `host_name.err` instead of `host_name.log` so that you can easily reclaim the space for the old log by deleting it and executing `mysqladmin refresh`.
- In an `UPDATE` statement, columns are updated from left to right. If you refer to an updated column, you get the updated value instead of the original value. For example, the following statement increments `KEY` by 2, not 1:
 

```
mysql> UPDATE tbl_name SET KEY=KEY+1,KEY=KEY+1;
```
- You can refer to multiple temporary tables in the same query, but you cannot refer to any given temporary table more than once. For example, the following doesn't work:
 

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```
- The optimizer may handle `DISTINCT` differently when you are using “hidden” columns in a join than when you are not. In a join, hidden columns are counted as part of the result (even if they are not shown), whereas in normal queries, hidden columns don't participate in the `DISTINCT` comparison. We will probably change this in the future to never compare the hidden columns when executing `DISTINCT`.

An example of this is:

```
SELECT DISTINCT mp3id FROM band_downloads
WHERE userid = 9 ORDER BY id DESC;
```

and

```
SELECT DISTINCT band_downloads.mp3id
FROM band_downloads,band_mp3
```

```
WHERE band_downloads.userid = 9
AND band_mp3.id = band_downloads.mp3id
ORDER BY band_downloads.id DESC;
```

In the second case, using MySQL Server 3.23.x, you may get two identical rows in the result set (because the values in the hidden `id` column may differ).

Note that this happens only for queries where that do not have the `ORDER BY` columns in the result.

- If you execute a `PROCEDURE` on a query that returns an empty set, in some cases the `PROCEDURE` does not transform the columns.
- Creation of a table of type `MERGE` doesn't check whether the underlying tables are compatible types.
- If you use `ALTER TABLE` to add a `UNIQUE` index to a table used in a `MERGE` table and then add a normal index on the `MERGE` table, the key order is different for the tables if there was an old, non-`UNIQUE` key in the table. This is because `ALTER TABLE` puts `UNIQUE` indexes before normal indexes to be able to detect duplicate keys as early as possible.

## B.2. Types of Error Values

When an error occurs in MySQL, the server returns two types of error values:

- A MySQL-specific error code. This value is numeric. It is not portable to other database systems.
- An SQLSTATE value. The value is a five-character string (for example, `'42S02'`). The values are specified by ANSI SQL and ODBC and are more standardized.

When an error occurs, you can access the MySQL error code, the SQLSTATE value, and a string containing an error message using C API functions:

- MySQL error code: Call `mysql_errno()`
- SQLSTATE value: Call `mysql_sqlstate()`
- Error message: Call `mysql_error()`

For prepared statements, the corresponding error functions are `mysql_stmt_errno()`, `mysql_stmt_sqlstate()`, and `mysql_stmt_error()`. All error functions are described in [Section 20.10, “MySQL C API”](#).

The first two characters of an SQLSTATE value indicate the error class:

- `'00'` indicates success.
- `'01'` indicates a warning.
- `'02'` indicates “not found.” These values are relevant only within the context of cursors and are used to control what happens when a cursor reaches the end of a data set.
- Other values indicate an exception.

## B.3. Server Error Codes and Messages

MySQL programs have access to several types of error information when the server returns an error. For example, the `mysql` client program displays errors using the following format:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

The message displayed contains three types of information:

- A numeric error code (`1146`). This number is MySQL-specific and is not portable to other database systems.

- A five-character SQLSTATE value ('42S02'). The values are specified by ANSI SQL and ODBC and are more standardized. Not all MySQL error numbers are mapped to SQLSTATE error codes. The value 'HY000' (general error) is used for unmapped errors.
- A string that provides a textual description of the error.

Server error information comes from the following source files. For details about the way that error information is defined, see the MySQL Internals manual, available at <http://dev.mysql.com/doc/>.

- Error message information is listed in the `share/errmsg.txt` file. `%d` and `%s` represent numbers and strings, respectively, that are substituted into the Message values when they are displayed.
- The Error values listed in `share/errmsg.txt` are used to generate the definitions in the `include/mysqld_error.h` and `include/mysqld_ename.h` MySQL source files.
- The SQLSTATE values listed in `share/errmsg.txt` are used to generate the definitions in the `include/sql_state.h` MySQL source file.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

  - Error: 1459 SQLSTATE: HY000 (ER\_TABLE\_NEEDS\_UPGRADE)

Message: Table upgrade required. Please do "REPAIR TABLE `%s`" or dump/reload to fix it!

  - Error: 1460 SQLSTATE: 42000 (ER\_SP\_NO\_AGGREGATE)

Message: AGGREGATE is not supported for stored functions

  - Error: 1461 SQLSTATE: 42000 (ER\_MAX\_PREPARED\_STMT\_COUNT\_REACHED)

Message: Can't create more than max\_prepared\_stmt\_count statements (current value: %lu)

  - Error: 1462 SQLSTATE: HY000 (ER\_VIEW\_RECURSIVE)

Message: `%s`.`%s` contains view recursion

  - Error: 1463 SQLSTATE: 42000 (ER\_NON\_GROUPING\_FIELD\_USED)

Message: non-grouping field '%s' is used in %s clause

  - Error: 1464 SQLSTATE: HY000 (ER\_TABLE\_CANT\_HANDLE\_SPKEYS)

Message: The used table type doesn't support SPATIAL indexes

  - Error: 1465 SQLSTATE: HY000 (ER\_NO\_TRIGGERS\_ON\_SYSTEM\_SCHEMA)

Message: Triggers can not be created on system tables

  - Error: 1466 SQLSTATE: HY000 (ER\_REMOVED\_SPACES)

Message: Leading spaces are removed from name '%s'

  - Error: 1467 SQLSTATE: HY000 (ER\_AUTOINC\_READ\_FAILED)

Message: Failed to read auto-increment value from storage engine

  - Error: 1468 SQLSTATE: HY000 (ER\_USERNAME)

Message: user name

  - Error: 1469 SQLSTATE: HY000 (ER\_HOSTNAME)

Message: host name

  - Error: 1470 SQLSTATE: HY000 (ER\_WRONG\_STRING\_LENGTH)

Message: String '%s' is too long for %s (should be no longer than %d)

  - Error: 1471 SQLSTATE: HY000 (ER\_NON\_INSERTABLE\_TABLE)

Message: The target table %s of the %s is not insertable-into

  - Error: 1472 SQLSTATE: HY000 (ER\_ADMIN\_WRONG\_MRG\_TABLE)

Message: Table '%s' is differently defined or of non-MyISAM type or doesn't exist

  - Error: 1473 SQLSTATE: HY000 (ER\_TOO\_HIGH\_LEVEL\_OF\_NESTING\_FOR\_SELECT)

Message: Too high level of nesting for select

  - Error: 1474 SQLSTATE: HY000 (ER\_NAME\_BECOMES\_EMPTY)

Message: Name '%s' has become "

  - Error: 1475 SQLSTATE: HY000 (ER\_AMBIGUOUS\_FIELD\_TERM)

Message: First character of the FIELDS TERMINATED string is ambiguous; please use non-optional and non-empty FIELDS ENCLOSED BY

- Error: 1476 SQLSTATE: HY000 (ER\_FOREIGN\_SERVER\_EXISTS)  
 Message: The foreign server, %s, you are trying to create already exists.
- Error: 1477 SQLSTATE: HY000 (ER\_FOREIGN\_SERVER\_DOESNT\_EXIST)  
 Message: The foreign server name you are trying to reference does not exist. Data source error: %s
- Error: 1478 SQLSTATE: HY000 (ER\_ILLEGAL\_HA\_CREATE\_OPTION)  
 Message: Table storage engine '%s' does not support the create option '%s'
- Error: 1479 SQLSTATE: HY000 (ER\_PARTITION\_REQUIRES\_VALUES\_ERROR)  
 Message: Syntax error: %s PARTITIONING requires definition of VALUES %s for each partition
- Error: 1480 SQLSTATE: HY000 (ER\_PARTITION\_WRONG\_VALUES\_ERROR)  
 Message: Only %s PARTITIONING can use VALUES %s in partition definition
- Error: 1481 SQLSTATE: HY000 (ER\_PARTITION\_MAXVALUE\_ERROR)  
 Message: MAXVALUE can only be used in last partition definition
- Error: 1482 SQLSTATE: HY000 (ER\_PARTITION\_SUBPARTITION\_ERROR)  
 Message: Subpartitions can only be hash partitions and by key
- Error: 1483 SQLSTATE: HY000 (ER\_PARTITION\_SUBPART\_MIX\_ERROR)  
 Message: Must define subpartitions on all partitions if on one partition
- Error: 1484 SQLSTATE: HY000 (ER\_PARTITION\_WRONG\_NO\_PART\_ERROR)  
 Message: Wrong number of partitions defined, mismatch with previous setting
- Error: 1485 SQLSTATE: HY000 (ER\_PARTITION\_WRONG\_NO\_SUBPART\_ERROR)  
 Message: Wrong number of subpartitions defined, mismatch with previous setting
- Error: 1486 SQLSTATE: HY000 (ER\_CONST\_EXPR\_IN\_PARTITION\_FUNC\_ERROR)  
 Message: Constant/Random expression in (sub)partitioning function is not allowed
- Error: 1487 SQLSTATE: HY000 (ER\_NO\_CONST\_EXPR\_IN\_RANGE\_OR\_LIST\_ERROR)  
 Message: Expression in RANGE/LIST VALUES must be constant
- Error: 1488 SQLSTATE: HY000 (ER\_FIELD\_NOT\_FOUND\_PART\_ERROR)  
 Message: Field in list of fields for partition function not found in table
- Error: 1489 SQLSTATE: HY000 (ER\_LIST\_OF\_FIELDS\_ONLY\_IN\_HASH\_ERROR)  
 Message: List of fields is only allowed in KEY partitions
- Error: 1490 SQLSTATE: HY000 (ER\_INCONSISTENT\_PARTITION\_INFO\_ERROR)  
 Message: The partition info in the frm file is not consistent with what can be written into the frm file
- Error: 1491 SQLSTATE: HY000 (ER\_PARTITION\_FUNC\_NOT\_ALLOWED\_ERROR)  
 Message: The %s function returns the wrong type
- Error: 1492 SQLSTATE: HY000 (ER\_PARTITIONS\_MUST\_BE\_DEFINED\_ERROR)  
 Message: For %s partitions each partition must be defined

- Error: 1493 SQLSTATE: HY000 ([ER\\_RANGE\\_NOT\\_INCREASING\\_ERROR](#))  
 Message: VALUES LESS THAN value must be strictly increasing for each partition
- Error: 1494 SQLSTATE: HY000 ([ER\\_INCONSISTENT\\_TYPE\\_OF\\_FUNCTIONS\\_ERROR](#))  
 Message: VALUES value must be of same type as partition function
- Error: 1495 SQLSTATE: HY000 ([ER\\_MULTIPLE\\_DEF\\_CONST\\_IN\\_LIST\\_PART\\_ERROR](#))  
 Message: Multiple definition of same constant in list partitioning
- Error: 1496 SQLSTATE: HY000 ([ER\\_PARTITION\\_ENTRY\\_ERROR](#))  
 Message: Partitioning can not be used stand-alone in query
- Error: 1497 SQLSTATE: HY000 ([ER\\_MIX\\_HANDLER\\_ERROR](#))  
 Message: The mix of handlers in the partitions is not allowed in this version of MySQL
- Error: 1498 SQLSTATE: HY000 ([ER\\_PARTITION\\_NOT\\_DEFINED\\_ERROR](#))  
 Message: For the partitioned engine it is necessary to define all %s
- Error: 1499 SQLSTATE: HY000 ([ER\\_TOO\\_MANY\\_PARTITIONS\\_ERROR](#))  
 Message: Too many partitions (including subpartitions) were defined
- Error: 1500 SQLSTATE: HY000 ([ER\\_SUBPARTITION\\_ERROR](#))  
 Message: It is only possible to mix RANGE/LIST partitioning with HASH/KEY partitioning for subpartitioning
- Error: 1501 SQLSTATE: HY000 ([ER\\_CANT\\_CREATE\\_HANDLER\\_FILE](#))  
 Message: Failed to create specific handler file
- Error: 1502 SQLSTATE: HY000 ([ER\\_BLOB\\_FIELD\\_IN\\_PART\\_FUNC\\_ERROR](#))  
 Message: A BLOB field is not allowed in partition function
- Error: 1503 SQLSTATE: HY000 ([ER\\_UNIQUE\\_KEY\\_NEED\\_ALL\\_FIELDS\\_IN\\_PF](#))  
 Message: A %s must include all columns in the table's partitioning function
- Error: 1504 SQLSTATE: HY000 ([ER\\_NO\\_PARTS\\_ERROR](#))

- Error: 1629 SQLSTATE: HY000 ([ER\\_TOO\\_LONG\\_FIELD\\_COMMENT](#))

Message: Comment for field '%s' is too long (max = %lu)

## B.4. Client Error Codes and Messages

Client error information comes from the following source files:

- The Error values and the symbols in parentheses correspond to definitions in the `include/errmsg.h` MySQL source file.
- The Message values correspond to the error messages that are listed in the `libmysql/errmsg.c` file. `%d` and `%s` represent numbers and strings, respectively, that are substituted into the messages when they are displayed.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: 2000 ([CR\\_UNKNOWN\\_ERROR](#))

Message: Unknown MySQL error

- Error: 2001 ([CR\\_SOCKET\\_CREATE\\_ERROR](#))

Message: Can't create UNIX socket (%d)

- Error: 2002 ([CR\\_CONNECTION\\_ERROR](#))

- Message: Can't connect to local MySQL server through socket '%s' (%d)
- Error: 2003 (CR\_CONN\_HOST\_ERROR)  
Message: Can't connect to MySQL server on '%s' (%d)
- Error: 2004 (CR\_IPSOCK\_ERROR)  
Message: Can't create TCP/IP socket (%d)
- Error: 2005 (CR\_UNKNOWN\_HOST)  
Message: Unknown MySQL server host '%s' (%d)
- Error: 2006 (CR\_SERVER\_GONE\_ERROR)  
Message: MySQL server has gone away
- Error: 2007 (CR\_VERSION\_ERROR)  
Message: Protocol mismatch; server version = %d, client version = %d
- Error: 2008 (CR\_OUT\_OF\_MEMORY)  
Message: MySQL client ran out of memory
- Error: 2009 (CR\_WRONG\_HOST\_INFO)  
Message: Wrong host info
- Error: 2010 (CR\_LOCALHOST\_CONNECTION)  
Message: Localhost via UNIX socket
- Error: 2011 (CR\_TCP\_CONNECTION)  
Message: %s via TCP/IP
- Error: 2012 (CR\_SERVER\_HANDSHAKE\_ERR)  
Message: Error in server handshake
- Error: 2013 (CR\_SERVER\_LOST)  
Message: Lost connection to MySQL server during query
- Error: 2014 (CR\_COMMANDS\_OUT\_OF\_SYNC)  
Message: Commands out of sync; you can't run this command now
- Error: 2015 (CR\_NAMEDPIPE\_CONNECTION)  
Message: Named pipe: %s
- Error: 2016 (CR\_NAMEDPIPEWAIT\_ERROR)  
Message: Can't wait for named pipe to host: %s pipe: %s (%lu)
- Error: 2017 (CR\_NAMEDPIPEOPEN\_ERROR)  
Message: Can't open named pipe to host: %s pipe: %s (%lu)
- Error: 2018 (CR\_NAMEDPIPESETSTATE\_ERROR)  
Message: Can't set state of named pipe to host: %s pipe: %s (%lu)
- Error: 2019 (CR\_CANT\_READ\_CHARSET)  
Message: Can't initialize character set %s (path: %s)
- Error: 2020 (CR\_NET\_PACKET\_TOO\_LARGE)

Message: Got packet bigger than 'max\_allowed\_packet' bytes

- Error: 2021 (CR\_EMBEDDED\_CONNECTION)

Message: Embedded server

- Error: 2022 (CR\_PROBE\_SLAVE\_STATUS)

Message: Error on SHOW SLAVE STATUS:

- Error: 2023 (CR\_PROBE\_SLAVE\_HOSTS)

Message: Error on SHOW SLAVE HOSTS:

- Error: 2024 (CR\_PROBE\_SLAVE\_CONNECT)

Message: Error connecting to slave:

- Error: 2025 (CR\_PROBE\_MASTER\_CONNECT)

Message: Error connecting to master:

- Error: 2026 (CR\_SSL\_CONNECTION\_ERROR)

Message: SSL connection error

- Error: 2027 (CR\_MALFORMED\_PACKET)

Message: Malformed packet

- Error: 2028 (CR\_WRONG\_LICENSE)

Message: This client library is licensed only for use with MySQL servers having '%s' license

- Error: 2029 (CR\_NULL\_POINTER)

Message: Invalid use of null pointer

- Error: 2030 (CR\_NO\_PREPARE\_STMT)

Message: Statement not prepared

- Error: 2031 (CR\_PARAMS\_NOT\_BOUND)

Message: No data supplied for parameters in prepared statement

- Error: 2032 (CR\_DATA\_TRUNCATED)

Message: Data truncated

- Error: 2033 (CR\_NO\_PARAMETERS\_EXISTS)

Message: No parameters exist in the statement

- Error: 2034 (CR\_INVALID\_PARAMETER\_NO)

Message: Invalid parameter number

- Error: 2035 (CR\_INVALID\_BUFFER\_USE)

Message: Can't send long data for non-string/non-binary data types (parameter: %d)

- Error: 2036 (CR\_UNSUPPORTED\_PARAM\_TYPE)

Message: Using unsupported buffer type: %d (parameter: %d)

- Error: 2037 (CR\_SHARED\_MEMORY\_CONNECTION)

Message: Shared memory: %s

- Error: 2038 (CR\_SHARED\_MEMORY\_CONNECT\_REQUEST\_ERROR)

- Message: Can't open shared memory; client could not create request event (%lu)
- Error: 2039 (CR\_SHARED\_MEMORY\_CONNECT\_ANSWER\_ERROR)  
Message: Can't open shared memory; no answer event received from server (%lu)
- Error: 2040 (CR\_SHARED\_MEMORY\_CONNECT\_FILE\_MAP\_ERROR)  
Message: Can't open shared memory; server could not allocate file mapping (%lu)
- Error: 2041 (CR\_SHARED\_MEMORY\_CONNECT\_MAP\_ERROR)  
Message: Can't open shared memory; server could not get pointer to file mapping (%lu)
- Error: 2042 (CR\_SHARED\_MEMORY\_FILE\_MAP\_ERROR)  
Message: Can't open shared memory; client could not allocate file mapping (%lu)
- Error: 2043 (CR\_SHARED\_MEMORY\_MAP\_ERROR)  
Message: Can't open shared memory; client could not get pointer to file mapping (%lu)
- Error: 2044 (CR\_SHARED\_MEMORY\_EVENT\_ERROR)  
Message: Can't open shared memory; client could not create %s event (%lu)
- Error: 2045 (CR\_SHARED\_MEMORY\_CONNECT\_ABANDONED\_ERROR)  
Message: Can't open shared memory; no answer from server (%lu)
- Error: 2046 (CR\_SHARED\_MEMORY\_CONNECT\_SET\_ERROR)  
Message: Can't open shared memory; cannot send request event to server (%lu)
- Error: 2047 (CR\_CONN\_UNKNOW\_PROTOCOL)  
Message: Wrong or unknown protocol
- Error: 2048 (CR\_INVALID\_CONN\_HANDLE)  
Message: Invalid connection handle
- Error: 2049 (CR\_SECURE\_AUTH)  
Message: Connection using old (pre-4.1.1) authentication protocol refused (client option 'secure\_auth' enabled)
- Error: 2050 (CR\_FETCH\_CANCELED)  
Message: Row retrieval was canceled by mysql\_stmt\_close() call
- Error: 2051 (CR\_NO\_DATA)  
Message: Attempt to read column without prior row fetch
- Error: 2052 (CR\_NO\_STMT\_METADATA)  
Message: Prepared statement contains no metadata
- Error: 2053 (CR\_NO\_RESULT\_SET)  
Message: Attempt to read a row while there is no result set associated with the statement
- Error: 2054 (CR\_NOT\_IMPLEMENTED)  
Message: This feature is not implemented yet
- Error: 2055 (CR\_SERVER\_LOST\_EXTENDED)  
Message: Lost connection to MySQL server at '%s', system error: %d
- Error: 2056 (CR\_STMT\_CLOSED)

Message: Statement closed indirectly because of a preceding %s() call

- Error: 2057 (CR\_NEW\_STMT\_METADATA)

Message: The number of columns in the result set differs from the number of bound buffers. You must reset the statement, rebind the result set columns, and execute the statement again

---

## Appendix C. MySQL Change History

This appendix lists the changes from version to version in the MySQL source code through the latest version of MySQL 5.1, which is currently MySQL 5.1.32. Starting with MySQL 5.0, we began offering a new version of the Manual for each new series of MySQL releases (5.0, 5.1, and so on). For information about changes in previous release series of the MySQL database software, see the corresponding version of this Manual. For information about legacy versions of the MySQL software through the 4.1 series, see *MySQL 3.23, 4.0, 4.1 Reference Manual*.

We update this section as we add new features in the 5.1 series, so that everybody can follow the development process.

Note that we tend to update the manual at the same time we make changes to MySQL. If you find a recent version of MySQL listed here that you can't find on our download page (<http://dev.mysql.com/downloads/>), it means that the version has not yet been released.

The date mentioned with a release version is the date of the last Bazaar ChangeSet on which the release was based, not the date when the packages were made available. The binaries are usually made available a few days after the date of the tagged ChangeSet, because building and testing all packages takes some time.

The manual included in the source and binary distributions may not be fully accurate when it comes to the release changelog entries, because the integration of the manual happens at build time. For the most up-to-date release changelog, please refer to the online version instead.

### C.1. Changes in release 5.1.x-maria (Development)

An overview of which features were added in MySQL 5.1 can be found here: [Section 1.4.1, “What Is New in MySQL 5.1”](#).

For a full list of changes, please refer to the changelog sections for each individual 5.1.x-maria release.

#### C.1.1. Changes in MySQL 5.1.27-maria (Not yet released)

The following changes apply only to builds of MySQL 5.1.27 that include the `MARIA` storage engine.

Functionality added or changed:

- **Important Note:** When MySQL is built with the `Maria` engine, all internal temporary on disk tables will use the `Maria` engine. Using `Maria` temporary tables in place of `MyISAM` tables should result in a performance gain.

#### C.1.2. Changes in MySQL 5.1.26-maria (Not yet released)

The following changes apply only to builds of MySQL 5.1.26 that include the `MARIA` storage engine.

#### C.1.3. Changes in MySQL 5.1.25-maria (Not yet released)

The following changes apply only to builds of MySQL 5.1.25 that include the `MARIA` storage engine.

Functionality added or changed:

- **Important Note:** The behavior of `CHECKSUM TABLE` has been modified so that the checksum operates consistently within all engines by default, unless you use the `--old` option.

If you run `mysqld --old` option, then:

- If table is `MyISAM` with an old-style checksum (5.0), then `CHECKSUM TABLE` returns the 5.0 checksum.
- If the `QUICK` option is specified to `CHECKSUM TABLE`, `NULL` is returned instead.
- When the `EXTENDED` option is specified, the checksum is calculated by looping over all the rows and calculates the checksum using the 5.0 algorithm.

If you run `mysqld` without the `--old` option, then:

- If the table is `MyISAM` with the new-style live checksum (5.1), then the live checksum is returned.
- If the `QUICK` option to `OPTIMIZE TABLE`, `NULL` is returned.

- When the `EXTENDED` option is specified, the checksum is calculated by looping over all the rows and calculating the checksum using the 5.1 algorithm.

In addition, if you run `CHECKSUM TABLE` on `MyISAM` tables with `VARCHAR` columns, using `ROW_FORMAT=fixed` and row-level checksums enabled, then a warning will be raised that the table must be repaired using `REPAIR TABLE` to build the new checksum.

To ensure that tables moved from a MySQL 5.1 environment to MySQL 5.1-maria, or MySQL 6.0 environment, you should run `mysqld` with the `--old` and run `CHECKSUM TABLE ... EXTENDED` to compare using the 5.0 algorithm.

## C.1.4. Changes in MySQL 5.1.24-maria (Not yet released)

The following changes apply only to builds of MySQL 5.1.24 that include the `MARIA` storage engine.

Bugs fixed:

- When creating tables not using the `Maria` engine, it would be possible to create a table using the `TRANSACTIONAL` option, even though this option is not supported by non-`Maria` tables. A warning will now be produced when using these options, but the option will still be recorded within the options for the table to allow for correct modification during `ALTER TABLE` operations. ([Bug#34395](#))

## C.2. Changes in release 5.1.x (Production)

An overview of which features were added in MySQL 5.1 can be found here: [Section 1.4.1, “What Is New in MySQL 5.1”](#).

For a full list of changes, please refer to the changelog sections for each individual 5.1.x release.

For changes relating to MySQL Cluster NDB 6.x, see [Changes in MySQL Cluster NDB 6.X](#) and [7.X](#).

### C.2.1. Changes in MySQL 5.1.36 (Not yet released)

Functionality added or changed:

- **Important Change: Replication:** Previously, incident log events were represented as comments in the output from `mysqlbinlog`, making them effectively silent when playing back the binlog.

(An incident log event represents an incident that could cause the contents of the database to change without that event being recorded in the binary log.)

This meant that, if the SQL were applied to a server, it could potentially lead to the master and the slave having different data. To make it possible to handle incident log events without breaking applications that expect the previous behavior, the nonsense statement `RELOAD DATABASE` is added to the SQL output for that incident log event, which causes an error.

To use this functionality currently requires hand editing of the dump file and handling of each case on an individual basis by a database administrator before applying the output to a server. ([Bug#44442](#))

- The time zone tables for Windows available at [timezones.html](#) have been updated. ([Bug#39923](#))

Bugs fixed:

- **Replication:** When using row-based logging, the length of an event for which the field metadata exceeded 255 bytes in size was incorrectly calculated. This could lead to corruption of the binary log, or cause the server to hang. ([Bug#42749](#))

See also [Bug#44548](#), [Bug#44672](#), [Bug#44752](#).

- **Replication:** The warning `STATEMENT IS NOT SAFE TO LOG IN STATEMENT FORMAT`, issued in situations when it cannot be determined that a statement or other database event can be written reliably to the binary log using the statement-based format, has been changed to `STATEMENT MAY NOT BE SAFE TO LOG IN STATEMENT FORMAT`. ([Bug#42415](#))
- **Replication:** When stopping and restarting the slave while it was replicating temporary tables, the slave server could crash or raise an assertion failure. This was due to the fact that, although temporary tables were saved between slave thread restarts, the reference to the thread being used (`table->in_use`) was not being properly updated when restarting, continuing to reference the old thread instead of the new one. This issue affected statement-based replication only. ([Bug#41725](#))

- `ALTER TABLE` on a view crashed the server. (Bug#44860)
- `UNCOMPRESSED_LENGTH()` returned a garbage result when passed a string shorter than 5 bytes. Now `UNCOMPRESSED_LENGTH()` returns `NULL` and generates a warning. (Bug#44796)
- Several Valgrind warnings were silenced. (Bug#44774, Bug#44792)
- Selecting `RAND(N)` function where `N` is a column of a `constant` table (table with a single row) failed with a `SIGFPE` signal. (Bug#44768)
- Conversion of a string to a different character set could use the same buffer for input and output, leading to incorrect results or warnings. (Bug#44743, Bug#44766)
- `mysqld_safe` could fail to find the `logger` program. (Bug#44736)
- A Valgrind warning related to transaction processing was silenced. (Bug#44664)
- `innochecksum` could incorrectly determine the input file name from the arguments. (Bug#44484)
- Incorrect time was reported at the end of `mysqldump` output. (Bug#44424)
- Caching of `GROUP BY` expressions could lead to mismatches between compile-time and runtime calculations and cause a server crash. (Bug#44399)
- Lettercase conversion in multibyte `cp932` or `sjis` character sequences could produce incorrect results. (Bug#44352)
- `InnoDB` was missing `DB_ROLL_PTR` information in Table Monitor `COLUMNS` output. (Bug#44320)
- Assertion failure could occur for duplicate-key errors in `INSERT INTO ... SELECT` statements. (Bug#44306)
- On 64-bit Windows systems, `myisamchk` did not handle `key_buffer_size` values larger than 4GB. (Bug#43940)
- `EXPLAIN EXTENDED` could crash for `UNION` queries in which the last `SELECT` was not parenthesized and included an `ORDER BY` clause. (Bug#43612)
- Multiple-table updates for `InnoDB` tables could produce incorrect results. (Bug#43580)
- For `DELETE` statements with `ORDER BY var`, where `var` was a global system variable with a `NULL` value, the server could crash. (Bug#42778)
- Builds linked against OpenSSL had a memory leak in association with use of X509 certificates. (Bug#42158)
- There was a race condition when changing `innodb_commit_concurrency` at runtime from zero to nonzero or from nonzero to zero. Now this variable cannot be changed at runtime from zero to nonzero or vice versa. The value can still be changed from one nonzero value to another. (Bug#42101)
- `SELECT ... INTO @var` could produce values different from `SELECT ...` without the `INTO` clause. (Bug#42009)
- `mysql_zap` did not work on Mac OS X. (Bug#41883)
- For views created with a column list clause, column aliases were not substituted when selecting through the view using a `HAVING` clause. (Bug#40825)
- A multiple-table `DELETE` involving a table self-join could cause a server crash. (Bug#39918)
- Creating an `InnoDB` table with a comment containing a '#' character caused foreign key constraints to be omitted. (Bug#39793)
- The `mysql` option `--ignore-spaces` was non-functional. (Bug#39101)
- If a query was such as to produce the error `1054 Unknown column '...' in 'field list'`, using `EXPLAIN EXTENDED` with the query could cause a server crash. (Bug#37362)
- If the `MYSQL_HISTFILE` environment variable was set to `/dev/null`, the `mysql` client overwrote the `/dev/null` device file as a normal file. (Bug#34224)
- `mysqld_safe` mishandled certain parameters if they contained spaces. (Bug#33685)
- `mysqladmin kill` did not work for thread IDs larger than 32 bits. (Bug#32457)
- Several client programs failed to interpret `--skip-password` as “send no password.” (Bug#28479)

- Output from `mysql --html` did not encode the `<`, `>`, or `&` characters. (Bug#27884)
- `mysql_convert_table_format` did not prevent converting tables to `MEMORY` or `BLACKHOLE` tables, which could result in data loss. (Bug#27149)

## C.2.2. Changes in MySQL 5.1.35 (Not yet released)

Bugs fixed:

- **Important Change: Replication:** The transactional behavior of `STOP SLAVE` has changed. Formerly, it took effect immediately, even inside a transaction; now, it waits until the current replication event group (if any) has finished executing, or until the user issues a `KILL QUERY` or `KILL CONNECTION` statement.

This was done in order to solve the problem encountered when replication was stopped while a non-transactional slave was replicating a transaction on the master. (It was impossible to roll back a mixed-engines transaction when one of the engines was non-transactional, which meant that the slave could not safely re-apply any transaction that had been interrupted by `STOP SLAVE`.) (Bug#319, Bug#38205)

See also Bug#43217.

- **Partitioning:** When a value was equal to a `PARTITION ... VALUES LESS THAN (value)` value other than `MAX-VALUE`, the corresponding partition was not pruned. (Bug#42944)
- **Replication:** Unrelated errors occurring during the execution of `RESET SLAVE` could cause the slave to crash. (Bug#44179)
- **Replication:** The `--slave-skip-errors` option had no effect when using row-based logging format. (Bug#39393)
- **Replication:** The following errors were not correctly reported:
  - Failures during slave thread initialization
  - Failures while initializing the relay log position (immediately following the starting of the slave thread)
  - Failures while processing queries passed through the `--init_slave` option.

Information about these types of failures can now be found in the output of `SHOW SLAVE STATUS`. (Bug#38197)

- **Replication:** Killing the thread executing a DDL statement, after it had finished its execution but before it had written the binlog event, caused the error code in the binlog event to be set (incorrectly) to `ER_SERVER_SHUTDOWN` or `ER_QUERY_INTERRUPTED`, which caused replication to fail. (Bug#37145)

See also Bug#27571, Bug#22725.

- **Replication:** Column aliases used inside subqueries were ignored in the binary log. (Bug#35515)
- Valgrind warnings for the `DECODE()`, `ENCRYPT()`, and `FIND_IN_SET()` functions were corrected. (Bug#44358, Bug#44365, Bug#44367)
- On Windows, entries for `build-vs9.bat` and `build-vs9_x64.bat` were missing in `win/Makefile.am`. (Bug#44353)
- Incomplete cleanup of `JOIN_TAB::select` during the filesort of rows for a `GROUP BY` clause inside a subquery caused a server crash. (Bug#44290)
- Not all lock types had proper descriptive strings, resulting in garbage output from `mysqladmin debug`. (Bug#44164)
- Use of `HANDLER` statements with `INFORMATION_SCHEMA` tables caused a server crash. Now `HANDLER` is prohibited with such tables. (Bug#44151)
- Invoking `SHOW TABLE STATUS` from within a stored procedure could cause a `Packets out of order` error. (Bug#43962)
- `myisamchk` could display a negative `Max keyfile length` value. (Bug#43950)
- On 64-bit systems, a `key_buffer_size` value larger than 4GB could cause MyISAM index corruption. (Bug#43932)
- `mysqld_multi` incorrectly passed `--no-defaults` to `mysqld_safe`. (Bug#43876)
- `SHOW VARIABLES` did not properly display the value of `slave_skip_errors`. (Bug#43835)

- On Windows, a server crash occurred for attempts to insert a floating-point value into a `CHAR` column with a maximum length less than the converted floating-point value length. (Bug#43833)
- Incorrect initialization of `MyISAM` table indexes could cause incorrect query results. (Bug#43737)
- `libmysqld` crashed when it was reinitialized. (Bug#43706, Bug#44091)
- `InnoDB` uses random numbers to generate dives into indexes for calculating index cardinality. However, under certain conditions, the algorithm did not generate random numbers, so `ANALYZE TABLE` did not update cardinality estimates properly. A new algorithm has been introduced with better randomization properties, together with a system variable, `innodb_use_legacy_cardinality_algorithm`, that controls which algorithm to use. The default value of the variable is 1 (`ON`), to use the original algorithm for compatibility with existing applications. The variable can be set to 0 (`OFF`) to use the new algorithm with improved randomness. (Bug#43660)
- `UNION` of floating-point numbers did unnecessary rounding. (Bug#43432)
- `ALTER DATABASE ... UPGRADE DATA DIRECTORY NAME` failed when the database contained views. (Bug#43385)
- Certain statements might open a table and then wait for an impending global read lock without noticing whether they hold a table being waiting for by the global read lock, causing a hang. Affected statements are `SELECT ... FOR UPDATE`, `LOCK TABLES ... WRITE`, `TRUNCATE TABLE`, and `LOAD DATA INFILE`. (Bug#43230)
- Using an XML function such as `ExtractValue()` more than once in a single query could produce erroneous results. (Bug#43183)  
See also Bug#43937.
- Full-text prefix searches could hang the connection and cause 100% CPU consumption. (Bug#42907)
- `InnoDB` had excessive contention for a character set mutex. (Bug#42649)
- Incorrect elevation of warning messages to error messages for unsafe statements caused a server crash. (Bug#42640)
- `CHECK TABLE` suggested use of `REPAIR TABLE` for corrupt tables for storage engines not supported by `REPAIR TABLE`. Now `CHECK TABLE` suggests that the user dump and reload the table. (Bug#42563)
- Compressing a table with the `mysampack` utility caused the server to produce Valgrind warnings when it opened the table. (Bug#41541)
- For a `MyISAM` table with `DELAY_KEY_WRITE` enabled, the index file could be corrupted without the table being marked as crashed if the server was killed. (Bug#41330)
- Killing an `INSERT ... SELECT` statement for a `MyISAM` table could cause table corruption if the table had indexes. (Bug#40827)
- A multiple-table `DELETE IGNORE` statement involving a foreign key constraint caused an assertion failure. (Bug#40127)
- Multiple-table `UPDATE` statements did not properly activate triggers. (Bug#39953)
- The `mysql_setpermission` operation for removing database privileges removed global privileges instead. (Bug#39852)
- A stored routine contain a C-style comment could not be dumped and reloaded. (Bug#39559)
- In an `UPDATE` or `DELETE` via a secondary index, `InnoDB` did not store the cursor position. This made `InnoDB` crash in semi-consistent read while attempting to unlock a non-matching record. (Bug#39320)
- The functions listed in Section 11.13.4.2.3, “Creating Geometry Values Using MySQL-Specific Functions”, previously accepted WKB arguments and returned WKB values. They now accept WKB or geometry arguments and return geometry values.  
The functions listed in Section 11.13.4.2.2, “Creating Geometry Values Using WKB Functions”, previously accepted WKB arguments and returned geometry values. They now accept WKB or geometry arguments and return geometry values. (Bug#38990)
- On Windows, running the server with `mysam_use_mmap` enabled caused `MyISAM` table corruption. (Bug#38848)
- `CHECK TABLE` did not properly check whether `MyISAM` tables created by servers from MySQL 4.0 or older needed to be upgraded. This could cause problems upgrading to MySQL 5.1 or higher. (Bug#37631)
- An `UPDATE` statement that updated a column using the same `DES_ENCRYPT()` value for each row actually updated different rows with different values. (Bug#35087)

- For shared-memory connections, the read and write methods did not properly handle asynchronous close events, which could lead to the client locking up waiting for a server response. For example, a call to `mysql_real_query()` would block forever on the client side if the executed statement was aborted on the server side. Thanks to Armin Schöffmann for the bug report and patch. (Bug#33899)
- `CHECKSUM TABLE` was not killable with `KILL QUERY`. (Bug#33146)
- `myisamchk` and `myisampack` were not being linked with the library that enabled support for `*` filename pattern expansion. (Bug#29248)
- For InnoDB tables that have their own `.ibd` tablespace file, a superfluous `ibuf cursor restoration fails!` message could be written to the error log. This warning has been suppressed. (Bug#27276)
- `COMMIT` did not delete savepoints if there were no changes in the transaction. (Bug#26288)
- Several memory allocation functions were not being checked for out-of-memory return values. (Bug#25058)

### C.2.3. Changes in MySQL 5.1.34 (02 April 2009)

Support Ending for AIX 5.2: Per the [MySQL Support Lifecycle policy](#) regarding ending support for OS versions that have reached vendor end of life, we plan to discontinue building or supporting MySQL binaries for AIX 5.2 as of April 30, 2009. This release of MySQL 5.1 (5.1.34) is the last MySQL 5.1 release with support for AIX 5.2. For more information, see the March 24, 2009 note at [MySQL Product Support EOL Announcements](#).

Functionality added or changed:

- The `optimizer_switch` system variable is now available to control optimizations that can be switched on and off. See [Section 7.2.18, “Using optimizer\\_switch to Control the Optimizer”](#).

Bugs fixed:

- **Replication: Important Note:** Binary logging with `--binlog_format=ROW` failed when a change to be logged included more than 251 columns. This issue was not known to occur with mixed-format or statement-based logging. (Bug#42977)

See also [Bug#42914](#).

- **Replication:** Assigning an invalid directory for the `--slave-load-tmpdir` caused the replication slave to crash. (Bug#42861)
- **Replication:** The `mysql.procs_priv` system table was not replicated. (Bug#42217)
- **Replication:** An `INSERT DELAYED` into a `TIMESTAMP` column issued concurrently with an insert on the same column not using `DELAYED`, but applied after the other insert, was logged using the same timestamp as generated by the other (non-`DELAYED`) insert. (Bug#41719)
- **Replication:** The `MIXED` binary logging format did not switch to row-based mode for statements containing the `LOAD_FILE()` function. (Bug#39701)
- **Replication:** When the server SQL mode included `IGNORE_SPACE`, statement-based replication of `LOAD DATA INFILE ... INTO tbl_name` failed because the statement was read incorrectly from the binary log; a trailing space was omitted, causing the statement to fail with a syntax error when run on the slave. (Bug#22504)

See also [Bug#43746](#).

- An attempt by a user who did not have the `SUPER` privilege to kill a system thread could cause a server crash. (Bug#43748)
- On Windows, incorrectly specified link dependencies in `CMakeLists.txt` resulted in link errors for `mysql_embedded`, `mysqltest_embedded`, and `mysql_client_test_embedded`. (Bug#43715)
- `mysql` crashed if a request for the current database name returned an empty result, such as after the client has executed a preceding `SET sql_select_limit=0` statement. (Bug#43254)
- If the value of the `version_comment` system variable was too long, the `mysql` client displayed a truncated startup message. (Bug#43153)
- Queries of the following form returned an empty result:

```
SELECT ... WHERE ... (col=col AND col=col) OR ... (false expression)
```

(Bug#42957)

- The `strings/CHARSET_INFO.txt` file was not included in source distributions. (Bug#42937)
- A dangling pointer in `mysys/my_error.c` could lead to client crashes. (Bug#42675)
- Passing an unknown time zone specification to `CONVERT_TZ()` resulted in a memory leak. (Bug#42502)
- With more than two arguments, `LEAST()`, `GREATEST()`, and `CASE` could unnecessarily return `Illegal mix of collations` errors. (Bug#41627)
- The `mysql` client could misinterpret its input if a line was longer than an internal buffer. (Bug#41486)
- In the `help` command output displayed by `mysql`, the description for the `\c (clear)` command was misleading. (Bug#41268)
- The `load_defaults()`, `my_search_option_files()` and `my_print_default_files()` functions in the C client library were subject to a race condition in multi-threaded operation. (Bug#40552)
- If `--basedir` was specified, `mysqld_safe` did not use it when attempting to locate `my_print_defaults`. (Bug#39326)
- When MySQL was configured with the `--with-max-indexes=128` option, `mysqld` crashed. (Bug#36751)
- Setting the `join_buffer_size` variable to its minimum value produced spurious warnings. (Bug#36446)
- The use of `NAME_CONST()` can result in a problem for `CREATE TABLE ... SELECT` statements when the source column expressions refer to local variables. Converting these references to `NAME_CONST()` expressions can result in column names that are different on the master and slave servers, or names that are too long to be legal column identifiers. A workaround is to supply aliases for columns that refer to local variables.

Now a warning is issued in such cases that indicate possible problems. (Bug#35383)

- An attempt to check or repair an ARCHIVE table that had been subjected to a server crash returned a 144 internal error. The data appeared to be irrecoverable. (Bug#32880)
- The `Time` column for `SHOW PROCESSLIST` output and the value of the `TIME` column of the `INFORMATION_SCHEMA.PROCESSLIST` table now can have negative values. Previously, the column was unsigned and negative values were displayed incorrectly as large positive values. Negative values can occur if a thread alters the time into the future with `SET TIMESTAMP = value` or the thread is executing on a slave and processing events from a master that has its clock set ahead of the slave. (Bug#22047)
- Restoring a `mysqldump` dump file containing `FEDERATED` tables failed because the file contained the data for the table. Now only the table definition is dumped (because the data is located elsewhere). (Bug#21360)

## C.2.4. Changes in MySQL 5.1.33 (13 March 2009)

Support Ending for AIX 5.2: Per the [MySQL Support Lifecycle policy](#) regarding ending support for OS versions that have reached vendor end of life, we plan to discontinue building or supporting MySQL binaries for AIX 5.2 as of April 30, 2009. The next release of MySQL 5.1 (5.1.34) will be the last MySQL 5.1 release with support for AIX 5.2. For more information, see the March 24, 2009 note at [MySQL Product Support EOL Announcements](#).

Functionality added or changed:

- `mysql-test-run.pl` now supports an `--experimental=file_name` option. It enables you to specify a file that contains a list of test cases that should be displayed with the `[ exp-fail ]` code rather than `[ fail ]` if they fail. (Bug#42888)
- The MD5 algorithm now uses the Xfree implementation. (Bug#42434)
- The query cache now checks whether a `SELECT` statement begins with `SQL_NO_CACHE` to determine whether it can skip checking for the query result in the query cache. This is not supported when `SQL_NO_CACHE` occurs within a comment. (Bug#37416)

Bugs fixed:

- **Partitioning:** A duplicate key error raised when inserting into a partitioned table used a different error code from that returned by such an error raised when inserting into a table that was not partitioned. (Bug#38719)

See also [Bug#28842](#).

- **Partitioning:** Several error messages relating to partitioned tables were incorrect or missing. (Bug#36001)
- **Replication:** When `--binlog_format` was set to `STATEMENT`, a statement unsafe for statement-based logging caused an error or warning to be issued even if `sql_log_bin` was set to 0. (Bug#41980)
- **Replication:** When using `MIXED` replication format and temporary tables were created in statement-based mode, but a later operation in the same session caused a switch to row-based mode, the temporary tables were not dropped on the slave at the end of the session. (Bug#40013)

See also [Bug#43046](#).

This regression was introduced by [Bug#20499](#).

- **Replication:** When using the `MIXED` replication format, `UPDATE` and `DELETE` statements that searched for rows where part of the key had nullable `BIT` columns failed. This occurred because operations that inserted the data were replicated as statements, but `UPDATE` and `DELETE` statements affecting the same data were replicated using row-based format.

This issue did not occur when using statement-based replication (only) or row-based replication (only). (Bug#39753)

See also [Bug#39648](#).

- **Replication:** The server SQL mode in effect when a stored procedure was created was not retained in the binary log. This could cause a `CREATE PROCEDURE` statement that succeeded on the master to fail on the slave.

This issue was first noticed when a stored procedure was created when `ANSI_QUOTES` was in effect on the master, but could possibly cause failed `CREATE PROCEDURE` statements and other problems on the slave when using other server SQL modes as well. (Bug#39526)

- **Replication:** If `--secure-file-priv` was set on the slave, it was unable to execute `LOAD DATA INFILE` statements sent from the master when using mixed-format or statement-based replication.

As a result of this fix, this security restriction is now ignored on the slave in such cases; instead the slave checks whether the files were created and should be read by the slave in its `--slave-load-tmpdir`. (Bug#38174)

- **Replication:** Server IDs greater than 2147483647 ( $2^{32} - 1$ ) were represented by negative numbers in the binary log. (Bug#37313)
- **Replication:** When its disk becomes full, a replication slave may wait while writing the binary log, relay log or `MyISAM` tables, continuing after space has been made available. The error message provided in such cases was not clear about the frequency with which checking for free space is done (once every 60 seconds), and how long the server waits after space has been freed before continuing (also 60 seconds); this caused users to think that the server had hung.

These issues have been addressed by making the error message clearer, and dividing it into two separate messages:

1. The error message `DISK IS FULL WRITING 'FILENAME' (ERRCODE: ERROR_CODE). WAITING FOR SOMEONE TO FREE SPACE...` (EXPECT UP TO 60 SECS DELAY FOR SERVER TO CONTINUE AFTER FREEING DISK SPACE) is printed only once.
2. The warning `RETRY IN 60 SECS, MESSAGE REPRINTED IN 600 SECS` is printed once every for every 10 times that the check for free space is made; that is, the check is performed once each 60 seconds, but the reminder that space needs to be freed is printed only once every 10 minutes (600 seconds).

(Bug#22082)

- **Replication:** The statements `DROP PROCEDURE IF EXISTS` and `DROP FUNCTION IF EXISTS` were not written to the binary log if the procedure or function to be dropped did not exist. (Bug#13684)

See also [Bug#25705](#).

- The IBM DB2i storage engine has been added to this release for the IBM i Series platform. For more information, see [The IBM-MDB2I Storage Engine](#). (Bug#44217)
- On 64-bit debug builds, code in `safemalloc` resulted in errors due to use of a 32-bit value for 64-bit allocations.

)

- `make distcheck` failed to properly handle subdirectories of `storage/ndb`. (Bug#43614)
- Use of `USE INDEX` hints could cause `EXPLAIN EXTENDED` to crash. (Bug#43354)
- For `InnoDB` tables, overflow in an `AUTO_INCREMENT` column could cause a server crash. (Bug#43203)
- On 32-bit Windows, `mysqld` could not use large buffers due to a 2GB user mode address limit. (Bug#43082)
- `stderr` should be unbuffered, but when the server redirected `stderr` to a file, it became buffered. (Bug#42790)
- The `DATA_TYPE` column of the `INFORMATION_SCHEMA.COLUMNS` table displayed the `UNSIGNED` attribute for floating-point data types. (The column should contain only the data type name.) (Bug#42758)
- For `InnoDB` tables, spurious duplicate-key errors could occur when inserting into an `AUTO_INCREMENT` column. (Bug#42714)
- `mysqldump` included views that were excluded with the `--ignore-table` option. (Bug#42635)
- An earlier bug fix resulted in the problem that the `InnoDB` plugin could not be used with a server that was compiled with the built-in `InnoDB`. To handle this two changes were made:
  - The server now supports an `--ignore-builtin-innodb` option that causes the server to behave as if the built-in `InnoDB` is not present. This option causes other `InnoDB` options not to be recognized.
  - For the `INSTALL PLUGIN` statement, the server reads option (`my.cnf`) files just as during server startup. This enables the plugin to pick up any relevant options from those files. Consequently, a plugin no longer is started with each option set to its default value.

Because of this change, it is possible to add plugin options to an option file even before loading a plugin (if the `loose` prefix is used). It is also possible to uninstall a plugin, edit `my.cnf`, and install the plugin again. Restarting the plugin this way enables it to the new option values without a server restart.

### Note

`InnoDB` Plugin versions 1.0.4 and higher will take advantage of this bug fix. Although the `InnoDB` Plugin is source code compatible with multiple MySQL releases, a given binary `InnoDB` Plugin can be used only with a specific MySQL release. When `InnoDB` Plugin 1.0.4 is released, it is expected to be compiled for MySQL 5.1.34. For 5.1.33, you can use `InnoDB` Plugin 1.0.3, but you must build from source.

(Bug#42610)

This regression was introduced by Bug#29263.

- With the `ONLY_FULL_GROUP_BY` SQL mode enabled, some legal queries failed. (Bug#42567)
- Tables could enter open table cache for a thread without being properly cleaned up, leading to a server crash. (Bug#42419)
- For `InnoDB` tables, inserting into floating-point `AUTO_INCREMENT` columns failed. (Bug#42400)
- The `InnoDB btr_search_drop_page_hash_when_freed()` function had a race condition. (Bug#42279)
- For `InnoDB` tables, there was a race condition for `ALTER TABLE`, `OPTIMIZE TABLE`, `CREATE INDEX`, and `DROP INDEX` operations when periodically checking whether table copying can be committed. (Bug#42152)
- Parsing of the optional microsecond component of `DATETIME` values did not fail gracefully when that component width was larger than the allowed six places. (Bug#42146)
- In `InnoDB` recovery after a server crash, table lookup could fail and corrupt the data dictionary cache. (Bug#42075)
- `mysqldumpslow` parsed the `--debug` and `--verbose` options incorrectly. (Bug#42027)
- Queries that used the loose index scan access method could return no rows. (Bug#41610)
- In `InnoDB` recovery after a server crash, rollback of a transaction that updated a column from `NULL` to `NULL` could cause another crash. (Bug#41571)
- The error message for a too-long column comment was `Unknown error` rather than a more appropriate message. (Bug#41465)

- Use of `SELECT *` allowed users with rights to only some columns of a view to access all columns. (Bug#41354)
- If the tables underlying a `MERGE` table had a primary key but the `MERGE` table itself did not, inserting a duplicate row into the `MERGE` table caused a server crash. (Bug#41305)
- The server did not robustly handle problems hang if a table opened with `HANDLER` needed to be re-opened because it had been altered to use a different storage engine that does not support `HANDLER`. The server also failed to set an error if the re-open attempt failed. These problems could cause the server to crash or hang. (Bug#41110, Bug#41112)
- `SELECT` statements executed concurrently with `INSERT` statements for a `MyISAM` table could cause incorrect results to be returned from the query cache. (Bug#41098)
- For prepared statements, multibyte character sets were not taking into account when calculating `max_length` for string values and `mysql_stmt_fetch()` could return truncated strings. (Bug#41078)
- Deprecation warnings that referred to MySQL 5.2 were changed to refer to MySQL 6.0. (Bug#41077)
- For user-defined variables in a query result, incorrect length values were returned in the result metadata. (Bug#41030)
- On Windows, starting the server with an invalid value for `innodb_flush_method` caused a crash. (Bug#40757)
- MySQL 5.1 crashed with index merge algorithm and merge tables.  
A query in the `MyISAM` merge table caused a crash if the index merge algorithm was being used. (Bug#40675)
- With strict SQL mode enabled, setting a system variable to an out-of-bounds value caused an assertion failure. (Bug#40657)
- Table temporary scans were slower than necessary due to use of `mmap` rather than caching, even with the `myisam_use_mmap` system variable disabled. (Bug#40634)
- For a view that references a table in another database, `mysqldump` wrote the view name qualified with the current database name. This makes it impossible to reload the dump file into a different database. (Bug#40345)
- On platforms where long and pointer variables have different sizes, `MyISAM` could copy key statistics incorrectly, resulting in a server crash or incorrect cardinality values. (Bug#40321)
- `DELETE` tried to acquire write (not read) locks for tables accessed within a subquery of the `WHERE` clause. (Bug#39843)
- `perror` did not produce correct output for error codes 153 to 163. (Bug#39370)
- Several functions in `libmysqld` called `exit()` when an error occurred rather than returning an error to the caller. (Bug#39289)
- The `innodb_log_arch_dir` system variable is no longer available but was present in some of the sample option files included with MySQL distributions (such as `my-huge.cnf`). The line was present as a comment but uncommenting it would cause server startup failure so the line has been removed. (Bug#38249)
- Setting a savepoint with the same name as an existing savepoint incorrectly deleted any other savepoints that had been set in the meantime. For example, setting savepoints named `a`, `b`, `c`, `b` resulted in savepoints `a`, `b`, rather than the correct savepoints `a`, `c`, `b`. (Bug#38187)
- `--help` output for `myisamchk` did not list the `--HELP` option. (Bug#38103)
- Comparisons between row constructors, such as `(a, b) = (c, d)` resulted in unnecessary `Illegal mix of collations` errors for string columns. (Bug#37601)
- If a user created a view that referenced tables for which the user had disjoint privileges, an assertion failure occurred. (Bug#37191)
- An argument to the `MATCH()` function that was an alias for an expression other than a column name caused a server crash. (Bug#36737)
- The `event`, `general_log`, and `slow_log` tables in the `mysql` database store `server_id` values, but did not use an `UNSIGNED` column and thus were not able to store the full range of ID values. (Bug#36540)
- On Windows, the `_PC` macro in `my_global.h` was causing problems for modern compilers. It has been removed because it is no longer used. (Bug#34309)
- For `DROP FUNCTION` with names that were qualified with a database name, the database name was handled in case-sensitive fashion even with `lower_case_table_names` set to 1. (Bug#33813)

- `mysqldump --compatible=mysql40` emitted statements referring to the `character_set_client` system variable, which is unknown before MySQL 4.1. Now the statements are enclosed in version-specific comments. (Bug#33550)
- Detection by `configure` of several functions such as `setsockopt()`, `bind()`, `sched_yield()`, and `gtty()` could fail. (Bug#31506)
- Use of MBR spatial functions such as `MBRTouches()` with columns of InnoDB tables caused a server crash rather than an error. (Bug#31435)
- The `mysql` client mishandled input parsing if a `delimiter` command was not first on the line. (Bug#31060)
- `SHOW PRIVILEGES` listed the `CREATE ROUTINE` privilege as having a context of `Functions, Procedures`, but it is a database-level privilege. (Bug#30305)
- `mysqld --help` did not work as `root`. (Bug#30261)
- `CHECK TABLE`, `REPAIR TABLE`, `ANALYZE TABLE`, and `OPTIMIZE TABLE` erroneously reported a table to be corrupt if the table did not exist or the statement was terminated with `KILL`. (Bug#29458)
- `SHOW TABLE STATUS` could fail to produce output for tables with non-ASCII characters in their name. (Bug#25830)
- Allocation of stack space for error messages could be too small on HP-UX, leading to stack overflow crashes. (Bug#21476)
- Floating-point numbers could be handled with different numbers of digits depending on whether the text or prepared-statement protocol was used. (Bug#21205)
- Incorrect length metadata could be returned for `LONG TEXT` columns when a multibyte server character set was used. (Bug#19829)
- `ROUND()` sometimes returned different results on different platforms. (Bug#15936)

## C.2.5. Changes in MySQL 5.1.32 (14 February 2009)

Functionality added or changed:

- The `libedit` library was upgraded to version 2.11. (Bug#42433)

Bugs fixed:

- **Security Fix:** Using an XPath expression employing a scalar expression as a `FilterExpr` with `ExtractValue()` or `UpdateXML()` caused the server to crash. Such expressions now cause an error instead. (Bug#42495)
- **Incompatible Change:** The fix for Bug#33699 introduced a change to the `UPDATE` statement such that assigning `NULL` to a `NOT NULL` column caused an error even when strict SQL mode was not enabled. The original behavior before was that such assignments caused an error only in strict SQL mode, and otherwise set the column to the implicit default value for the column data type and generated a warning. (For information about implicit default values, see Section 10.1.4, “Data Type Default Values”.)

The change caused compatibility problems for applications that relied on the original behavior. It also caused replication problems between servers that had the original behavior and those that did not, for applications that assigned `NULL` to `NOT NULL` columns in `UPDATE` statements without strict SQL mode enabled. This change has been reverted so that `UPDATE` again had the original behavior. Problems can still occur if you replicate between servers that have the modified `UPDATE` behavior and those that do not. (Bug#39265)

- **Replication:** `START SLAVE UNTIL` did not work correctly with `--replicate-same-server-id` enabled; when started with this option, the slave did not perform events recorded in the relay log and that originated from a different master.

Log rotation events are automatically generated and written when rotating the binary log or relay log. Such events for relay logs are usually ignored by the slave SQL thread because they have the same server ID as that of the slave. However, when `--replicate-same-server-id` was enabled, the rotation event for the relay log was treated as if it originated on the master, because the log's name and position were incorrectly updated. This caused the `MASTER_POS_WAIT()` function always to return `NULL` and thus to fail. (Bug#38734, Bug#38934)

- **Replication:** `TRUNCATE` statements failed to replicate when statement-based binary logging mode was not available. The issue was observed when using InnoDB with the transaction isolation level set to `READ UNCOMMITTED` (thus forcing InnoDB not to allow statement-based logging). However, the same behavior could be reproduced using any transactional storage engine supporting only row-based logging, regardless of the isolation level. This was due to two separate problems:

1. An error was printed by `InnoDB` for `TRUNCATE` when using statement-based logging mode where the transaction isolation level was set to `READ COMMITTED` or `READ UNCOMMITTED`, because `InnoDB` permits statement-based replication for DML statements. However, `TRUNCATE` is not transactional; since it is the equivalent of `DROP TABLE` followed by `CREATE TABLE`, it is actually DDL, and should therefore be allowed to be replicated as a statement.
2. `TRUNCATE` was not logged in mixed mode because of the error just described; however, this error was not reported to the client.

As a result of this fix, `TRUNCATE` is now treated as DDL for purposes of binary logging and replication; that is, it is always logged as a statement and so no longer causes an error when replicated using a transactional storage engine such as `InnoDB`. (Bug#36763)

See also Bug#42643.

- **Replication:** `mysqlbinlog` replay of `CREATE TEMPORARY TABLE ... LIKE` statements and of `TRUNCATE` statements used on temporary tables failed with Error 1146 (`TABLE ... DOESN'T EXIST`). (Bug#35583)
- **Replication:** In statement mode, `mysqlbinlog` failed to issue a `SET @@autocommit` statement when the autocommit mode was changed. (Bug#34541)
- **Replication:** `LOAD DATA INFILE` statements did not replicate correctly from a master running MySQL 4.1 to a slave running MySQL 5.1 or later. (Bug#31240)
- The use by `libedit` of the `__weak_reference()` macro caused compilation failure on FreeBSD. (Bug#42817)
- A `'%'` character in SQL statements could cause the server to crash. (Bug#42634)
- An optimization introduced for Bug#37553 required an explicit cast to be added for some uses of `TIMEDIFF()` because automatic casting could produce incorrect results. (It was necessary to use `TIME(TIMEDIFF(...))`.) (Bug#42525)
- On the IBM i5 platform, the MySQL configuration process caused the system version of `pthread_setschedprio()` to be used. This function returns `SIGILL` on i5 because it is not supported, causing the server to crash. Now the `my_pthread_setprio()` function in the `mysys` library is used instead. (Bug#42524)
- The SSL certificates included with MySQL distributions were regenerated because the previous ones had expired. (Bug#42366)
- User variables within triggers could cause a crash if the `mysql_change_user()` C API function was invoked. (Bug#42188)
- Dependent subqueries such as the following caused a memory leak proportional to the number of outer rows:

```
SELECT COUNT(*) FROM t1, t2 WHERE t2.b
  IN (SELECT DISTINCT t2.b FROM t2 WHERE t2.b = t1.a);
```

(Bug#42037)

- Some queries using `NAME_CONST(... COLLATE ...)` led to a server crash due to a failed type cast. (Bug#42014)
- On Mac OS X, some of the universal client libraries were not actually universal and were missing code for one or more architectures. (Bug#41940)
- String reallocation could cause memory overruns. (Bug#41868)
- `mysql_install_db` did not pass some relevant options to `mysqld`. (Bug#41828)
- Setting `innodb_locks_unsafe_for_binlog` should be equivalent to setting the transaction isolation level to `READ COMMITTED`. However, if both of those things were done, non-matching semi-consistently read rows were not unlocked when they should have been. (Bug#41671)
- `REPAIR TABLE` crashed for compressed `MyISAM` tables. (Bug#41574)
- For a `TIMESTAMP NOT NULL DEFAULT ...` column, storing `NULL` as the return value from some functions caused a “cannot be NULL” error. `NULL` returns now correctly cause the column default value to be stored. (Bug#41370)
- The server cannot execute `INSERT DELAYED` statements when statement-based binary logging is enabled, but the error message displayed only the table name, not the entire statement. (Bug#41121)
- `FULLTEXT` indexes did not work for Unicode columns that used a custom UCA collation. (Bug#41084)
- The Windows installer displayed incorrect product names in some images. (Bug#40845)

- Changing `innodb_thread_concurrency` at runtime could cause errors. (Bug#40760)
- `SELECT` statements could be blocked by `INSERT DELAYED` statements that were waiting for a lock, even with `low_priority_updates` enabled. (Bug#40536)
- For InnoDB tables that used `ROW_FORMAT=REDUNDANT`, storage size of `NULL` columns could be determined incorrectly. (Bug#40369)
- The query cache stored only partial query results if a statement failed while the results were being sent to the client. This could cause other clients to hang when trying to read the cached result. Now if a statement fails, the result is not cached. (Bug#40264)
- When a `MEMORY` table became full, the error generated was returned to the client but was not written to the error log. (Bug#39886)
- With row-based binary logging, replication of InnoDB tables containing `NULL`-valued `BIT` columns could fail. (Bug#39648)
- The expression `ROW(...) IN (SELECT ... FROM DUAL)` always returned `TRUE`. (Bug#39069)
- The greedy optimizer could cause a server crash due to improper handling of nested outer joins. (Bug#38795)
- Use of `COUNT(DISTINCT)` prevented `NULL` testing in the `HAVING` clause. (Bug#38637)
- The `innodb_stats_on_metadata` system variable was not displayed by `SHOW VARIABLES` and was not settable at runtime. (Bug#38189)
- Enabling the `sync_frm` system variable had no effect on the handling of `.frm` files for views. (Bug#38145)
- For comparison of `NULL` to a subquery result inside `IS NULL`, the comparison could evaluate to `NULL` rather than to `TRUE` or `FALSE`. This occurred for expressions such as:
 

```
SELECT ... WHERE NULL IN (SELECT ...) IS NULL
```

 (Bug#37822)
- Setting `myisam_repair_threads` greater than 1 caused a server crash for table repair or alteration operations for MyISAM tables with multiple `FULLTEXT` indexes. (Bug#37756)
- The `mysql` client sometimes improperly interpreted string escape sequences in non-string contexts. (Bug#36391)
- The query cache stored packets containing the server status of the time when the cached statement was run. This might lead to an incorrect transaction status on the client side if a statement was cached during a transaction and later served outside a transaction context (or vice versa). (Bug#36326)
- If the system time was adjusted backward during query execution, the apparent execution time could be negative. But in some cases these queries would be written to the slow query log, with the negative execution time written as a large unsigned number. Now statements with apparent negative execution time are not written to the slow query log. (Bug#35396)
- `libmysqld` was not built with all character sets. (Bug#32831)
- For `mysqld_multi`, using the `--mysqld=mysqld_safe` option caused the `--defaults-file` and `--defaults-extra-file` options to behave the same way. (Bug#32136)
- Attempts to open a valid `MERGE` table sometimes resulted in a `ER_WRONG_MRG_TABLE` error. This happened after failure to open an invalid `MERGE` table had also generated an `ER_WRONG_MRG_TABLE` error. (Bug#32047)
- For Solaris package installation using `pkgadd`, the postinstall script failed, causing the system tables in the `mysql` database not to be created. (Bug#31164)
- If the default database was dropped, the value of `character_set_database` was not reset to `character_set_server` as it should have been. (Bug#27208)

## C.2.6. Release Notes for MySQL Enterprise 5.1.31sp1 [QSP] (19 March 2009)

This is a *Service Pack* release of the MySQL Enterprise Server 5.1.

This section documents all changes and bugfixes that have been applied since the last MySQL Enterprise Server release (5.1.31).

If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see [ht-](#)

[tp://www.mysql.com/products/enterprise/advisors.html](http://www.mysql.com/products/enterprise/advisors.html).

Functionality added or changed:

- The `libedit` library was upgraded to version 2.11. ([Bug#42433](#))

Bugs fixed:

- **Security Fix:** Using an XPath expression employing a scalar expression as a `FilterExpr` with `ExtractValue()` or `UpdateXML()` caused the server to crash. Such expressions now cause an error instead. ([Bug#42495](#))
- On the IBM i5 platform, the MySQL configuration process caused the system version of `pthread_setschedprio()` to be used. This function returns `SIGILL` on i5 because it is not supported, causing the server to crash. Now the `my_pthread_setprio()` function in the `mysys` library is used instead. ([Bug#42524](#))
- The SSL certificates included with MySQL distributions were regenerated because the previous ones had expired. ([Bug#42366](#))
- User variables within triggers could cause a crash if the `mysql_change_user()` C API function was invoked. ([Bug#42188](#))
- Some queries using `NAME_CONST( . . . COLLATE . . . )` led to a server crash due to a failed type cast. ([Bug#42014](#))

## C.2.7. Changes in MySQL 5.1.31 (19 January 2009)

Functionality added or changed:

- A new status variable, `Queries`, indicates the number of statements executed by the server. This includes statements executed within stored programs, unlike the `Questions` variable which includes only statements sent to the server by clients. ([Bug#41131](#))
- Performance of `SELECT *` retrievals from `INFORMATION_SCHEMA.COLUMNS` was improved slightly. ([Bug#38918](#))
- Previously, index hints did not work for `FULLTEXT` searches. Now they work as follows:

For natural language mode searches, index hints are silently ignored. For example, `IGNORE INDEX ( i )` is ignored with no warning and the index is still used.

For boolean mode searches, index hints with `FOR ORDER BY` or `FOR GROUP BY` are silently ignored. Index hints with `FOR JOIN` or no `FOR` modifier are honored. In contrast to how hints apply for non-`FULLTEXT` searches, the hint is used for all phases of query execution (finding rows and retrieval, grouping, and ordering). This is true even if the hint is given for a non-`FULLTEXT` index. ([Bug#38842](#))

Bugs fixed:

- **Important Change: Replication:** If a trigger was defined on an `InnoDB` table and this trigger updated a non-transactional table, changes performed on the `InnoDB` table were replicated and were visible on the slave before they were committed on the master, and were not rolled back on the slave after a successful rollback of those changes on the master.

As a result of the fix for this issue, the semantics of mixing non-transactional and transactional tables in a transaction in the first statement of a transaction have changed. Previously, if the first statement in a transaction contained non-transactional changes, the statement was written directly to the binary log. Now, any statement appearing after a `BEGIN` (or immediately following a `COMMIT` if `AUTOCOMMIT = 0`) is always considered part of the transaction and cached. This means that non-transactional changes do not propagate to the slave until the transaction is committed and thus written to the binary log.

See [Section 16.3.1.25, “Replication and Transactions”](#), for more information about this change in behavior. ([Bug#40116](#))

- **Partitioning: Replication:** Changing the transaction isolation level while replicating partitioned `InnoDB` tables could cause statement-based logging to fail. ([Bug#39084](#))
- **Partitioning:** A comparison with an invalid `DATE` value in a query against a partitioned table could lead to a crash of the MySQL server.

### Note

Invalid `DATE` and `DATETIME` values referenced in the `WHERE` clause of a query on a partitioned table are treated as

■ **NULL.** See [Section 17.4, “Partition Pruning”](#), for more information.

([Bug#40972](#))

- **Partitioning:** This bug was introduced in MySQL 5.1.29. ([Bug#40954](#))  
This regression was introduced by [Bug#30573](#), [Bug#33257](#), [Bug#33555](#).
- **Partitioning:** With `READ COMMITTED` transaction isolation level, `InnoDB` uses a semi-consistent read that releases non-matching rows after MySQL has evaluated the `WHERE` clause. However, this was not happening if the table used partitions. ([Bug#40595](#))
- **Partitioning:** A query that timed out when run against a partitioned table failed silently, without providing any warnings or errors, rather than returning `LOCK WAIT TIMEOUT EXCEEDED`. ([Bug#40515](#))
- **Partitioning:** `ALTER TABLE ... REORGANIZE PARTITION` could crash the server when the number of partitions was not changed. ([Bug#40389](#))  
See also [Bug#41945](#).
- **Partitioning:** For a partitioned table having an `AUTO_INCREMENT` column: If the first statement following a start of the server or a `FLUSH TABLES` statement was an `UPDATE` statement, the `AUTO_INCREMENT` column was not incremented correctly. ([Bug#40176](#))
- **Partitioning:** The server attempted to execute the statements `ALTER TABLE ... ANALYZE PARTITION`, `ALTER TABLE ... CHECK PARTITION`, `ALTER TABLE ... OPTIMIZE PARTITION`, and `ALTER TABLE ... REORGANIZE PARTITION` on tables that were not partitioned. ([Bug#39434](#))  
See also [Bug#20129](#).
- **Partitioning:** The value of the `CREATE_COLUMNS` column in `INFORMATION_SCHEMA.TABLES` was not `partitioned` for partitioned tables. ([Bug#38909](#))
- **Partitioning:** When executing an `ORDER BY` query on a partitioned `InnoDB` table using an index that was not in the partition expression, the results were sorted on a per-partition basis rather than for the table as a whole. ([Bug#37721](#))
- **Partitioning:** Dropping or creating an index on a partitioned table managed by the `InnoDB` Plugin locked the table. ([Bug#37453](#))
- **Partitioning:** Partitioned table checking sometimes returned a warning with an error code of 0, making proper response to errors impossible. The fix also renders the error message subject to translation in non-English deployments. ([Bug#36768](#))
- **Partitioning:** `SHOW TABLE STATUS` could show a nonzero value for the `Mean record length` of a partitioned `InnoDB` table, even if the table contained no rows. ([Bug#36312](#))
- **Partitioning:** When `SHOW CREATE TABLE` was used on a partitioned table, all of the table's `PARTITION` and `SUBPARTITION` clauses were output on a single line, making it difficult to read or parse. ([Bug#14326](#))
- **Replication:** Per-table `AUTO_INCREMENT` option values were not replicated correctly for `InnoDB` tables. ([Bug#41986](#))
- **Replication:** Some `log_event` types did not skip the post-header when reading. ([Bug#41961](#))
- **Replication:** Attempting to read a binary log containing an `Incident_log_event` having an invalid incident number could cause the debug server to crash. ([Bug#40482](#))
- **Replication:** When using row-based replication, an update of a primary key that was rolled back on the master due to a duplicate key error was not rolled back on the slave. ([Bug#40221](#))
- **Replication:** When rotating relay log files, the slave deletes relay log files and then edits the relay log index file. Formerly, if the slave shut down unexpectedly between these two events, the relay log index file could then reference relay logs that no longer existed. Depending on the circumstances, this could when restarting the slave cause either a race condition or the failure of replication. ([Bug#38826](#), [Bug#39325](#))
- **Replication:** With row-based replication, `UPDATE` and `DELETE` statements using `LIMIT` and a table's primary key could produce different results on the master and slave. ([Bug#38230](#))
- `resolve_stack_dump` was unable to resolve the stack trace format produced by `mysqld` in MySQL 5.1 and up (see [Section 21.5.1.5, “Using a Stack Trace”](#)). ([Bug#41612](#))
- In example option files provided in MySQL distributions, the `thread_stack` value was increased from 64K to 128K. ([Bug#41577](#))

- The optimizer could ignore an error and rollback request during a filesort, causing an assertion failure. (Bug#41543)
- `DATE_FORMAT()` could cause a server crash for year-zero dates. (Bug#41470)
- `SET PASSWORD` caused a server crash if the account name was given as `CURRENT_USER()`. (Bug#41456)
- When a repair operation was carried out on a `CSV` table, the debug server crashed. (Bug#41441)
- When substituting system constant functions with a constant result, the server was not expecting `NULL` function return values and could crash. (Bug#41437)
- Queries such as `SELECT ... CASE AVG(...) WHEN ...` that used aggregate functions in a `CASE` expression crashed the server. (Bug#41363)
- `INSERT INTO .. SELECT ... FROM` and `CREATE TABLE ... SELECT ... FROM` a `TEMPORARY` table could inadvertently change the locking type of the temporary table from a write lock to a read lock, causing statement failure. (Bug#41348)
- The `INFORMATION_SCHEMA.SCHEMA_PRIVILEGES` table was limited to 7680 rows. (Bug#41079)
- In debug builds, obsolete debug code could be used to crash the server. (Bug#41041)
- Some queries that used a “range checked for each record” scan could return incorrect results. (Bug#40974)
- Certain `SELECT` queries could fail with a `Duplicate entry` error. (Bug#40953)
- For debug servers, `OPTIMIZE TABLE` on a compressed table caused a server crash. (Bug#40949)
- Accessing user variables within triggers could cause a server crash. (Bug#40770)
- `IF(..., CAST(longtext_val AS UNSIGNED), signed_val)` as an argument to an aggregate function could cause an assertion failure. (Bug#40761)
- For single-table `UPDATE` statements, an assertion failure resulted from a runtime error in a stored function (such as a recursive function call or an attempt to update the same table as in the `UPDATE` statement). (Bug#40745)
- `TRUNCATE TABLE` for an `InnoDB` table did not flush cached queries for the table. (Bug#40386)
- Prepared statements allowed invalid dates to be inserted when the `ALLOW_INVALID_DATES` SQL mode was not enabled. (Bug#40365)
- `mc.exe` is no longer needed to compile MySQL on Windows. This makes it possible to build MySQL from source using Visual Studio Express 2008. (Bug#40280)
- The `'` character was incorrectly disallowed in table names. (Bug#40104)
- Support for the `revision` field in `.frm` files has been removed. This addresses the downgrading problem introduced by the fix for Bug#17823. (Bug#40021)
- Retrieval speed from the following `INFORMATION_SCHEMA` tables was improved by shortening the `VARIABLE_VALUE` column to 1024 characters: `GLOBAL_VARIABLES`, `SESSION_VARIABLES`, `GLOBAL_STATUS`, and `SESSION_STATUS`.  
As a result of this change, any variable value longer than 1024 characters will be truncated with a warning. This affects only the `init_connect` system variable. (Bug#39955)
- For an `InnoDB` table, `DROP TABLE` or `ALTER TABLE ... DISCARD TABLESPACE` could take a long time or cause a server crash. (Bug#39939)
- If the operating system is configured to return leap seconds from OS time calls or if the MySQL server uses a time zone definition that has leap seconds, functions such as `NOW()` could return a value having a time part that ends with `:59:60` or `:59:61`. If such values are inserted into a table, they would be dumped as is by `mysqldump` but considered invalid when reloaded, leading to backup/restore problems.  
Now leap second values are returned with a time part that ends with `:59:59`. This means that a function such as `NOW()` can return the same value for two or three consecutive seconds during the leap second. It remains true that literal temporal values having a time part that ends with `:59:60` or `:59:61` are considered invalid.  
For additional details about leap-second handling, see Section 9.7.2, “Time Zone Leap Second Support”. (Bug#39920)
- The server could crash during a sort-order optimization of a dependent subquery. (Bug#39844)

- For a server started with the `--temp-pool` option on Windows, temporary file creation could fail. This option now is ignored except on Linux systems, which was its original intended scope. (Bug#39750)
- `ALTER TABLE` on a table with `FULLTEXT` index that used a pluggable `FULLTEXT` parser could cause debug servers to crash. (Bug#39746)
- With the `ONLY_FULL_GROUP_BY` SQL mode enabled, the check for non-aggregated columns in queries with aggregate functions, but without a `GROUP BY` clause was treating all the parts of the query as if they were in the select list. This is fixed by ignoring the non-aggregated columns in the `WHERE` clause. (Bug#39656)
- The server crashed if an integer field in a CSV file did not have delimiting quotes. (Bug#39616)
- The `do_abi_check` program run during the build process depends on `mysql_version.h` but that file was not created first, resulting in build failure. (Bug#39571)
- `CHECK TABLE` failed for `MyISAM INFORMATION_SCHEMA` tables. (Bug#39541)
- On 64-bit Windows systems, the server accepted `key_buffer_size` values larger than 4GB, but allocated less. (For example, specifying a value of 5GB resulted in 1GB being allocated.) (Bug#39494)
- `InnoDB` could hang trying to open an adaptive hash index. (Bug#39483)
- Following `ALTER TABLE ... DISCARD TABLESPACE` for an `InnoDB` table, an attempt to determine the free space for the table before the `ALTER TABLE` operation had completely finished could cause a server crash. (Bug#39438)
- Use of the `PACK_KEYS` or `MAX_ROWS` table option in `ALTER TABLE` should have triggered table reconstruction but did not. (Bug#39372)
- The server returned a column type of `VARBINARY` rather than `DATE` as the result from the `COALESCE()`, `IFNULL()`, `IF()`, `GREATEST()`, or `LEAST()` functions or `CASE` expression if the result was obtained using `filesort` in an anonymous temporary table during the query execution. (Bug#39283)
- A server built using `yaSSL` for SSL support would crash if configured to use an RSA key and a client sent a cipher list containing a non-RSA key as acceptable. (Bug#39178)
- When built with `Valgrind`, the server failed to access tables created with the `DATA DIRECTORY` or `INDEX DIRECTORY` table option. (Bug#39102)
- With binary logging enabled `CREATE VIEW` was subject to possible buffer overwrite and a server crash. (Bug#39040)
- The fast mutex implementation was subject to excessive lock contention. (Bug#38941)
- Use of `InnoDB` monitoring (`SHOW ENGINE INNODB STATUS` or one of the `InnoDB` Monitor tables) could cause a server crash due to invalid access to a shared variable in a concurrent environment. (Bug#38883)
- `InnoDB` could fail to generate `AUTO_INCREMENT` values after an `UPDATE` statement for the table. (Bug#38839)
- If delayed insert failed to upgrade the lock, it did not free the temporary memory storage used to keep newly constructed `BLOB` values in memory, resulting in a memory leak. (Bug#38693)
- On Windows, a five-second delay occurred at shutdown of applications that used the embedded server. (Bug#38522)
- On Solaris, a scheduling policy applied to the main server process could be unintentionally overwritten in client-servicing threads. (Bug#38477)
- Building MySQL on FreeBSD would result in a failure during the `gen_lex_hash` phase of the build. (Bug#38364)
- On Windows, the embedded server would crash in `mysql_library_init()` if the language file was missing. (Bug#38293)
- A mix of `TRUNCATE TABLE` with `LOCK TABLES` and `UNLOCK TABLES` for an `InnoDB` could cause a server crash. (Bug#38231)
- The `ExtractValue()` function did not work correctly with XML documents containing a `DOCTYPE` declaration. (Bug#38227)
- Queries with a `HAVING` clause could return a spurious row. (Bug#38072)
- The Event Scheduler no longer logs “started in thread” or “executed” successfully messages to the error log. (Bug#38066)
- Use of spatial data types in prepared statements could cause memory leaks or server crashes. (Bug#37956, Bug#37671)

- An error in a debugging check caused crashes in debug servers. ([Bug#37936](#))
  - A `SELECT` with a `NULL NOT IN` condition containing a complex subquery from the same table as in the outer select caused an assertion failure. ([Bug#37894](#))
  - The presence of a `/ * . . . */` comment preceding a query could cause `InnoDB` to use unnecessary gap locks. ([Bug#37885](#))
  - Use of an uninitialized constant in `EXPLAIN` evaluation caused an assertion failure. ([Bug#37870](#))
  - When using `ALTER TABLE` on an `InnoDB` table, the `AUTO_INCREMENT` value could be changed to an incorrect value. ([Bug#37788](#))
  - Primary keys were treated as part of a covering index even if only a prefix of a key column was used. ([Bug#37742](#))
  - Renaming an `ARCHIVE` table to the same name with different lettercase and then selecting from it could cause a server crash. ([Bug#37719](#))
  - The `MONTHNAME()` and `DAYNAME()` functions returned a binary string, so that using `LOWER()` or `UPPER()` had no effect. Now `MONTHNAME()` and `DAYNAME()` return a value in `character_set_connection` character set. ([Bug#37575](#))
  - `TIMEDIFF()` was erroneously treated as always returning a positive result. Also, `CAST()` of `TIME` values to `DECIMAL` dropped the sign of negative values. ([Bug#37553](#))
- See also [Bug#42525](#).
- `SHOW PROCESSLIST` displayed “copy to tmp table” when no such copy was occurring. ([Bug#37550](#))
  - `mysqlcheck` used `SHOW FULL TABLES` to get the list of tables in a database. For some problems, such as an empty `.frm` file for a table, this would fail and `mysqlcheck` then would neglect to check other tables in the database. ([Bug#37527](#))
  - Updating a view with a subquery in the `CHECK` option could cause an assertion failure. ([Bug#37460](#))
  - Statements that displayed the value of system variables (for example, `SHOW VARIABLES`) expect variable values to be encoded in `character_set_system`. However, variables set from the command line such as `basedir` or `datadir` were encoded using `character_set_filesystem` and not converted correctly. ([Bug#37339](#))
  - `CREATE INDEX` could crash with `InnoDB` plugin 1.0.1. ([Bug#37284](#))
  - Certain boolean-mode `FULLTEXT` searches that used the truncation operator did not return matching records and calculated relevance incorrectly. ([Bug#37245](#))
  - On a 32-bit server built without big tables support, the offset argument in a `LIMIT` clause might be truncated due to a 64-bit to 32-bit cast. ([Bug#37075](#))
  - For an `InnoDB` table with a `FOREIGN KEY` constraint, `TRUNCATE TABLE` may be performed using row by row deletion. If an error occurred during this deletion, the table would be only partially emptied. Now if an error occurs, the truncation operation is rolled back and the table is left unchanged. ([Bug#37016](#))
  - The code for the `ut_usecetime()` function in `InnoDB` did not handle errors from the `gettimeofday()` system call. Now it retries `gettimeofday()` several times and updates the value of the `InnoDB_row_lock_time_max` status variable only if `ut_usecetime()` was successful. ([Bug#36819](#))
  - Use of `CONVERT()` with `GROUP BY` to convert numeric values to `CHAR` could return truncated results. ([Bug#36772](#))
  - The `mysql` client, when built with Visual Studio 2005, did not display Japanese characters. ([Bug#36279](#))
  - `CREATE INDEX` for `InnoDB` tables could under very rare circumstances cause the server to crash.. ([Bug#36169](#))
  - A read past the end of the string could occur while parsing the value of the `--innodb-data-file-path` option. ([Bug#36149](#))
  - Setting the `slave_compressed_protocol` system variable to `DEFAULT` failed in the embedded server. ([Bug#35999](#))
  - For upgrades to MySQL 5.1 or higher, `mysql_upgrade` did not re-encode database or table names that contained non-alphanumeric characters. (They would still appear after the upgrade with the `#mysql150#` prefix described in [Section 8.2.3, “Mapping of Identifiers to File Names”](#).) To correct this problem, it was necessary to run `mysqlcheck -all-databases --check-upgrade --fix-db-names --fix-table-names` manually. `mysql_upgrade` now runs that command automatically after performing the initial upgrade. ([Bug#35934](#))
  - `SHOW CREATE TABLE` did not display a printable value for the default value of `BIT` columns. ([Bug#35796](#))

- The columns that store character set and collation names in several `INFORMATION_SCHEMA` tables were lengthened because they were not long enough to store some possible values: `SCHEMATA`, `TABLES`, `COLUMNS`, `CHARACTER_SETS`, `COLLATIONS`, and `COLLATION_CHARACTER_SET_APPLICABILITY`. (Bug#35789)
- The `max_length` metadata value was calculated incorrectly for the `FORMAT()` function, which could cause incorrect result set metadata to be sent to clients. (Bug#35558)
- InnoDB was not updating the `Handler_delete` or `Handler_update` status variables. (Bug#35537)
- InnoDB could fail to generate `AUTO_INCREMENT` values if rows previously had been inserted containing literal values for the `AUTO_INCREMENT` column. (Bug#35498, Bug#36411, Bug#39830)
- The `CREATE_OPTIONS` column for `INFORMATION_SCHEMA.TABLES` did not display the `KEY_BLOCK_SIZE` option. (Bug#35275)
- Selecting from an `INFORMATION_SCHEMA` table into an incorrectly defined `MERGE` table caused an assertion failure. (Bug#35068)
- `perror` on Windows did not know about Win32 system error codes. (Bug#34825)
- `EXPLAIN EXTENDED` evaluation of aggregate functions that required a temporary table caused a server crash. (Bug#34773)
- `SHOW GLOBAL STATUS` shows values that aggregate the session status values for all threads. This did not work correctly for the embedded server. (Bug#34517)
- `mysqldumpslow` did not aggregate times. (Bug#34129)
- `mysql_config` did not output `-ldl` (or equivalent) when needed for `--libmysql-dlibs`, so its output could be insufficient to build applications that use the embedded server. (Bug#34025)
- The `mysql` client incorrectly parsed statements containing the word “delimiter” in mid-statement.

This fix is different from the one applied for this bug in MySQL 5.1.26. (Bug#33812)

See also Bug#38158.

- For a stored procedure containing a `SELECT * ... RIGHT JOIN` query, execution failed for the second call. (Bug#33811)
- Previously, use of index hints with views (which do not have indexes) produced the error `ERROR 1221 (HY000): INCORRECT USAGE OF USE/IGNORE INDEX AND VIEW`. Now this produces `ERROR 1176 (HY000): KEY '...' DOESN'T EXIST IN TABLE '...'`, the same error as for base tables without an appropriate index. (Bug#33461)
- Three conditions were discovered that could cause an upgrade from MySQL 5.0 to 5.1 to fail: 1) Triggers associated with a table that had a `#mysql150#` prefix in the name could cause assertion failure. 2) `ALTER DATABASE ... UPGRADE DATA DIRECTORY NAME` failed for databases that had a `#mysql150#` prefix if there were triggers in the database. 3) `mysqlcheck --fix-table-name` didn't use UTF8 as the default character set, resulting in parsing errors for tables with non-latin symbols in their names and trigger definitions. (Bug#33094, Bug#41385)
- Execution of a prepared statement that referred to a system variable caused a server crash. (Bug#32124)
- Some division operations produced a result with incorrect precision. (Bug#31616)
- Queries executed using join buffering of `BIT` columns could produce incorrect results. (Bug#31399)
- `ALTER TABLE CONVERT TO CHARACTER SET` did not convert `TINYTEXT` or `MEDIUMTEXT` columns to a longer text type if necessary when converting the column to a different character set. (Bug#31291)
- Server variables could not be set to their current values on Linux platforms. (Bug#31177)

See also Bug#6958.

- For installation on Solaris using `pkgadd` packages, the `mysql_install_db` script was generated in the `scripts` directory, but the temporary files used during the process were left there and not deleted. (Bug#31052)
- Static storage engines and plugins that were disabled and dynamic plugins that were installed but disabled were not listed in the `INFORMATION_SCHEMA` appropriate `PLUGINS` or `ENGINES` table. (Bug#29263)
- Some `SHOW` statements and retrievals from the `INFORMATION_SCHEMA` `TRIGGERS` and `EVENTS` tables used a temporary table and incremented the `Created_tmp_disk_tables` status variable, due to the way that `TEXT` columns are handled. The `TRIGGERS.SQL_MODE`, `TRIGGERS.DEFINER`, and `EVENTS.SQL_MODE` columns now are `VARCHAR` to avoid this problem. (Bug#29153)

- For several read only system variables that were viewable with `SHOW VARIABLES`, attempting to view them with `SELECT @@var_name` or set their values with `SET` resulted in an `unknown system variable` error. Now they can be viewed with `SELECT @@var_name` and attempting to set their values results in a message indicating that they are read only. (Bug#28234)
- On Windows, Visual Studio does not take into account some x86 hardware limitations, which led to incorrect results converting large `DOUBLE` values to unsigned `BIGINT` values. (Bug#27483)
- SSL support was not included in some “generic” RPM packages. (Bug#26760)
- The `Questions` status variable is intended as a count of statements sent by clients to the server, but was also counting statements executed within stored routines. (Bug#24289)
- Setting the session value of the `max_allowed_packet` or `net_buffer_length` system variable was allowed but had no effect. The session value of these variables is now read only. (Bug#22891)
- A race condition between the `mysqld.exe` server and the Windows service manager could lead to inability to stop the server from the service manager. (Bug#20430)
- On Windows, moving an `InnoDB .ibd` file and then symlinking to it in the database directory using a `.sym` file caused a server crash. (Bug#11894)

## C.2.8. Changes in MySQL 5.1.30 (14 November 2008 General Availability)

Bugs fixed:

- **Partitioning:** A `SELECT` using a range `WHERE` condition with an `ORDER BY` on a partitioned table caused a server crash. (Bug#40494)
- **Replication:** Row-based replication failed with non-partitioned `MyISAM` tables having no indexes. (Bug#40004)
- With statement-based binary logging format and a transaction isolation level of `READ COMMITTED` or stricter, `InnoDB` printed an error because statement-based logging might lead to inconsistency between master and slave databases. However, this error was printed even when binary logging was not enabled (in which case, no such inconsistency can occur). (Bug#40360)
- The `CHECK TABLE ... FOR UPGRADE` statement did not check for incompatible collation changes made in MySQL 5.1.24 (Bug#27877). This also affects `mysqlcheck` and `mysql_upgrade`, which cause that statement to be executed. See Section 2.12.3, “Checking Whether Table Indexes Must Be Rebuilt”.

Prior to this fix, a binary upgrade (performed without dumping tables with `mysqldump` before the upgrade and reloading the dump file after the upgrade) would corrupt tables that have indexes that use the `utf8_general_ci` or `ucs2_general_ci` collation for columns that contain 'ß' LATIN SMALL LETTER SHARP S (German). After the fix, `CHECK TABLE ... FOR UPGRADE` properly detects the problem and warns about tables that need repair.

However, the fix is not backward compatible and can result in a downgrading problem under these circumstances:

1. Perform a binary upgrade to a version of MySQL that includes the fix.
2. Run `CHECK TABLE ... FOR UPGRADE` (or `mysqlcheck` or `mysql_upgrade`) to upgrade tables.
3. Perform a binary downgrade to a version of MySQL that does not include the fix.

The solution is to dump tables with `mysqldump` before the downgrade and reload the dump file after the downgrade. Alternatively, drop and recreate affected indexes. (Bug#40053)

- Some recent releases for Solaris 10 were built on Solaris 10 U5, which included a new version of `libnsl.so` that does not work on U4 or earlier. To correct this, Solaris 10 builds now are created on machines that do not have that upgraded `libnsl.so`, so that they will work on Solaris 10 installations both with and without the upgraded `libnsl.so`. (Bug#39074)
- XA transaction rollbacks could result in corrupted transaction states and a server crash. (Bug#28323)
- `ALTER TABLE` for an `ENUM` column could change column values. (Bug#23113)

## C.2.9. Changes in MySQL 5.1.29 (11 October 2008)

Functionality added or changed:

- **Important Change:** The `--skip-thread-priority` option is now deprecated in MySQL 5.1 and is removed in MySQL 6.0 such that the server won't change the thread priorities by default. Giving threads different priorities might yield marginal improvements in some platforms (where it actually works), but it might instead cause significant degradation depending on the thread count and number of processors. Meddling with the thread priorities is not a safe bet as it is very dependent on the behavior of the CPU scheduler and system where MySQL is being run. ([Bug#35164](#), [Bug#37536](#))
- **Important Change:** The `--log` option now is deprecated and will be removed (along with the `log` system variable) in the future. Instead, use the `--general_log` option to enable the general query log and the `--general_log_file=file_name` option to set the general query log file name. The values of these options are available in the `general_log` and `general_log_file` system variables, which can be changed at runtime.  
  
Similar changes were made for the `--log-slow-queries` option and `log_slow_queries` system variable. You should use the `--slow_query_log` and `--slow_query_log_file=file_name` options instead (and the `slow_query_log` and `slow_query_log_file` system variables).
- The `BUILD/compile-solaris-*` scripts now compile MySQL with the `mtmalloc` library rather than `malloc`. ([Bug#38727](#))

Bugs fixed:

- **Incompatible Change: Replication:** The default binary logging mode has been changed from `MIXED` to `STATEMENT` for compatibility with MySQL 5.0. ([Bug#39812](#))
- **Incompatible Change:** `CHECK TABLE ... FOR UPGRADE` did not check for incompatible collation changes made in MySQL 5.1.21 ([Bug#29499](#)) and 5.1.23 ([Bug#27562](#), [Bug#29461](#)). This also affects `mysqlcheck` and `mysql_upgrade`, which cause that statement to be executed. See [Section 2.12.3, "Checking Whether Table Indexes Must Be Rebuilt"](#). ([Bug#39585](#))  
  
See also [Bug#40984](#).
- **Incompatible Change:** In connection with view creation, the server created `arc` directories inside database directories and maintained useless copies of `.frm` files there. Creation and renaming procedures of those copies as well as creation of `arc` directories has been discontinued.

This change does cause a problem when downgrading to older server versions which manifests itself under these circumstances:

1. Create a view `v_orig` in MySQL 5.1.29 or higher.
2. Rename the view to `v_new` and then back to `v_orig`.
3. Downgrade to an older 5.1.x server and run `mysql_upgrade`.
4. Try to rename `v_orig` to `v_new` again. This operation fails.

As a workaround to avoid this problem, use either of these approaches:

- Dump your data using `mysqldump` before downgrading and reload the dump file after downgrading.
- Instead of renaming a view after the downgrade, drop it and recreate it.

The downgrade problem introduced by the fix for this bug has been addressed as [Bug#40021](#). ([Bug#17823](#))

- **Important Change: Replication:** The `SUPER` privilege is now required to change the session value of `binlog_format` as well as its global value. For more information about `binlog_format`, see [Section 16.1.2, "Replication Formats"](#). ([Bug#39106](#))
- **Partitioning: Replication:** Replication to partitioned `MyISAM` tables could be slow with row-based binary logging. ([Bug#35843](#))
- **Partitioning:** If an error occurred when evaluating a column of a partitioned table for the partitioning function, the row could be inserted anyway. ([Bug#38083](#))
- **Partitioning:** Using `INSERT ... SELECT` to insert records into a partitioned `MyISAM` table could fail if some partitions were empty and others are not. ([Bug#38005](#))
- **Partitioning:** Ordered range scans on partitioned tables were not always handled correctly. In some cases this caused some rows to be returned twice. The same issue also caused `GROUP BY` query results to be aggregated incorrectly. ([Bug#30573](#), [Bug#33257](#), [Bug#33555](#))

- **Replication:** Server code used in binary logging could in some cases be invoked even though binary logging was not actually enabled, leading to asserts and other server errors. ([Bug#38798](#))
- **Replication:** Replication of `BLACKHOLE` tables did not work with row-based binary logging. ([Bug#38360](#))
- **Replication:** In some cases, a replication master sent a special event to a reconnecting slave to keep the slave's temporary tables, but they still had references to the “old” slave SQL thread and used them to access that thread's data. ([Bug#38269](#))
- **Replication:** Replication filtering rules were inappropriately applied when executing `BINLOG` pseudo-queries. One way in which this problem showed itself was that, when replaying a binary log with `mysqlbinlog`, RBR events were sometimes not executed if the `--replicate-do-db` option was specified. Now replication rules are applied only to those events executed by the slave SQL thread. ([Bug#36099](#))
- **Replication:** For a `CREATE TABLE ... SELECT` statement that creates a table in a database other than the current one, the table could be created in the wrong database on replication slaves if row-based binary logging is used. ([Bug#34707](#))
- **Replication:** A statement did not always commit or roll back correctly when the server was shut down; the error could be triggered by having a failing `UPDATE` or `INSERT` statement on a transactional table, causing an implicit rollback. ([Bug#32709](#))  
See also [Bug#38262](#).
- The Sun Studio compiler failed to build debug versions of the server due to use of features specific to `gcc`. ([Bug#39451](#))
- For a `TIMESTAMP` column in an `InnoDB` table, testing the column with multiple conditions in the `WHERE` clause caused a server crash. ([Bug#39353](#))
- References to local variables in stored procedures are replaced with `NAME_CONST(name, value)` when written to the binary log. However, an “illegal mix of collation” error might occur when executing the log contents if the value's collation differed from that of the variable. Now information about the variable collation is written as well. ([Bug#39182](#))
- Queries of the form `SELECT ... REGEXP BINARY NULL` could lead to a hung or crashed server. ([Bug#39021](#))
- Statements of the form `INSERT ... SELECT .. ON DUPLICATE KEY UPDATE col_name = DEFAULT` could result in a server crash. ([Bug#39002](#))
- Column names constructed due to wild-card expansion done inside a stored procedure could point to freed memory if the expansion was performed after the first call to the stored procedure. ([Bug#38823](#))
- Repeated `CREATE TABLE ... SELECT` statements, where the created table contained an `AUTO_INCREMENT` column, could lead to an assertion failure. ([Bug#38821](#))
- For deadlock between two transactions that required a timeout to resolve, all server tables became inaccessible for the duration of the deadlock. ([Bug#38804](#))
- When inserting a string into a duplicate-key error message, the server could improperly interpret the string, resulting in a crash. ([Bug#38701](#))
- A race condition between threads sometimes caused unallocated memory to be addressed. ([Bug#38692](#))
- A server crash resulted from concurrent execution of a multiple-table `UPDATE` that used a `NATURAL` or `USING` join together with `FLUSH TABLES WITH READ LOCK` or `ALTER TABLE` for the table being updated. ([Bug#38691](#))
- On ActiveState Perl, `mysql-test-run.pl --start-and-exit` started but did not exit. ([Bug#38629](#))
- An uninitialized variable in the query profiling code was corrected (detected by Valgrind). ([Bug#38560](#))
- A server crash resulted from execution of an `UPDATE` that used a derived table together with `FLUSH TABLES`. ([Bug#38499](#))
- Stored procedures involving substrings could crash the server on certain platforms due to invalid memory reads. ([Bug#38469](#))
- The handlerton-to-plugin mapping implementation did not free handler plugin references when the plugin was uninstalled, resulting in a server crash after several install/uninstall cycles. Also, on Mac OS X, the server crashed when trying to access an `EXAMPLE` table after the `EXAMPLE` plugin was installed. ([Bug#37958](#))
- The server crashed if an argument to a stored procedure was a subquery that returned more than one row. ([Bug#37949](#))
- When analyzing the possible index use cases, the server was incorrectly reusing an internal structure, leading to a server crash. ([Bug#37943](#))
- Access checks were skipped for `SHOW PROCEDURE STATUS` and `SHOW FUNCTION STATUS`, which could lead to a server crash or insufficient access checks in subsequent statements. ([Bug#37908](#))

- The `<=>` operator could return incorrect results when comparing `NULL` to `DATE`, `TIME`, or `DATETIME` values. (Bug#37526)
- The combination of a subquery with a `GROUP BY`, an aggregate function calculated outside the subquery, and a `GROUP BY` on the outer `SELECT` could cause the server to crash. (Bug#37348)
- The `NO_BACKSLASH_ESCAPES` SQL mode was ignored for `LOAD DATA INFILE` and `SELECT INTO ... OUTFILE`. The setting is taken into account now. (Bug#37114)
- In some cases, references to views were confused with references to anonymous tables and privilege checking was not performed. (Bug#36086)
- For crash reports on Windows, symbol names in stack traces were not correctly resolved. (Bug#35987)
- `ALTER EVENT` changed the `PRESERVE` attribute of an event even when `PRESERVE` was not specified in the statement. (Bug#35981)
- Host name values in SQL statements were not being checked for `'@'`, which is illegal according to RFC952. (Bug#35924)
- `mysql_install_db` failed on machines that had the host name set to `localhost`. (Bug#35754)
- Dynamic plugins failed to load on i5/OS. (Bug#35743)
- With the `PAD_CHAR_TO_FULL_LENGTH` SQL mode enabled, a `ucs2 CHAR` column returned additional garbage after trailing space characters. (Bug#35720)
- With binary logging enabled, `CREATE TABLE ... SELECT` failed if the source table was a log table. (Bug#34306)
- A trigger for an `InnoDB` table activating multiple times could lead to `AUTO_INCREMENT` gaps. (Bug#31612)
- `mysqldump` could fail to dump views containing a large number of columns. (Bug#31434)
- The server could improperly type user-defined variables used in the select list of a query. (Bug#26020)
- For access to the `INFORMATION_SCHEMA.VIEWS` table, the server did not check the `SHOW VIEW` and `SELECT` privileges, leading to inconsistency between output from that table and the `SHOW CREATE VIEW` statement. (Bug#22763)
- `mysqld_safe` would sometimes fail to remove the pid file for the old `mysql` process after a crash. As a result, the server would fail to start due to a false `A mysqld process already exists...` error. (Bug#11122)

## C.2.10. Changes in MySQL 5.1.28 (28 August 2008)

Functionality added or changed:

- **Important Change:** `mysqlbinlog` now supports `--verbose` and `--base64-output=DECODE-ROWS` options to display row events as commented SQL statements. (The default otherwise is to display row events encoded as base-64 strings using `BINLOG` statements.) See Section 4.6.7.2, “`mysqlbinlog` Row Event Display”. (Bug#31455)
- MySQL source distributions are now available in Zip format. (Bug#27742)
- Added the `SHOW PROFILES` and `SHOW PROFILE` statements to display statement profile data, and the accompanying `INFORMATION_SCHEMA.PROFILING` table. Profiling is controlled via the `profiling` and `profiling_history_size` session variables. see Section 12.5.5.33, “`SHOW PROFILES` Syntax”, and Section 19.26, “The `INFORMATION_SCHEMA.PROFILING` Table”. (Community contribution by Jeremy Cole)

The profiling feature is enabled via the `--enable-community-features` and `--enable-profiling` options to `configure`. These options are enabled by default; to disable them, use `--disable-community-features` and `--disable-profiling`. (Bug#24795)

Bugs fixed:

- **Important Change: Security Fix:** Additional corrections were made for the symlink-related privilege problem originally addressed in MySQL 5.1.24. The original fix did not correctly handle the data directory path name if it contained symlinked directories in its path, and the check was made only at table-creation time, not at table-opening time later. (Bug#32167, CVE-2008-2079)

See also Bug#39277.

- **Security Enhancement:** The server consumed excess memory while parsing statements with hundreds or thousands of nested boolean conditions (such as `OR (OR ... (OR ... ))`). This could lead to a server crash or incorrect statement execution, or cause other client statements to fail due to lack of memory. The latter result constitutes a denial of service. (Bug#38296)
- **Incompatible Change:** There were some problems using `DllMain()` hook functions on Windows that automatically do global and per-thread initialization for `libmysqld.dll`:
  - Per-thread initialization: MySQL internally counts the number of active threads, which causes a delay in `my_end()` if not all threads have exited. But there are threads that can be started either by Windows internally (often in TCP/IP scenarios) or by users. Those threads do not necessarily use `libmysql.dll` functionality but still contribute to the open-thread count. (One symptom is a five-second delay in times for PHP scripts to finish.)
  - Process-initialization: `my_init()` calls `WSAStartup` that itself loads DLLs and can lead to a deadlock in the Windows loader.

To correct these problems, DLL initialization code now is not invoked from `libmysql.dll` by default. To obtain the previous behavior (DLL initialization code will be called), set the `LIBMYSQL_DLLINIT` environment variable to any value. This variable exists only to prevent breakage of existing Windows-only applications that do not call `mysql_thread_init()` and work okay today. Use of `LIBMYSQL_DLLINIT` is discouraged and is removed in MySQL 6.0. (Bug#37226, Bug#33031)

- **Incompatible Change:** Some performance problems of `SHOW ENGINE INNODB STATUS` were reduced by removing `used cells` and `Total number of lock structs in row lock hash table` from the output. Now these values are present only if the `UNIV_DEBUG` symbol is defined at MySQL build time. (Bug#36941, Bug#36942)
- **Incompatible Change:** `SHOW STATUS` took a lot of CPU time for calculating the value of the `InnoDB_buffer_pool_pages_latched` status variable. Now this variable is calculated and included in the output of `SHOW STATUS` only if the `UNIV_DEBUG` symbol is defined at MySQL build time. (Bug#36600)
- **Incompatible Change:** An additional correction to the original MySQL 5.1.23 fix was made to normalize directory names before adding them to the list of directories. This prevents `/etc/` and `/etc` from being considered different, for example. (Bug#20748)

See also Bug#38180.

- **Partitioning:** When a partitioned table had a `TIMESTAMP` column defined with `CURRENT_TIMESTAMP` as the default but with no `ON UPDATE` clause, the column's value was incorrectly set to `CURRENT_TIMESTAMP` when updating across partitions. (Bug#38272)
- **Partitioning:** `myisamchk` failed with an assertion error when analyzing a partitioned `MyISAM` table. (Bug#37537)
- **Partitioning:** A `LIST` partitioned `MyISAM` table returned erroneous results when an index was present on a column in the `WHERE` clause and `NOT IN` was used on that column.

Searches using the index were also much slower then if the index were not present. (Bug#35931)

- **Partitioning:** `SELECT COUNT(*)` was not correct for some partitioned tables using a storage engine that did not support `HA_STATS_RECORDS_IS_EXACT`. Tables using the `ARCHIVE` storage engine were known to be affected.

This was because `ha_partition::records()` was not implemented, and so the default `handler::records()` was used in its place. However, this is not correct behavior if the storage engine does not support `HA_STATS_RECORDS_IS_EXACT`.

The solution was to implement `ha_partition::records()` as a wrapper around the underlying partition records.

As a result of this fix, the `rows` column in the output of `EXPLAIN PARTITIONS` now includes the total number of records in the partitioned table. (Bug#35745)

- **Partitioning:** `MyISAM` recovery enabled with the `--myisam-recover` option did not work for partitioned `MyISAM` tables. (Bug#35161)
- **Partitioning:** When one user was in the midst of a transaction on a partitioned table, a second user performing an `ALTER TABLE` on this table caused the server to hang. (Bug#34604)
- **Replication:** Some kinds of internal errors, such as `OUT OF MEMORY` errors, could cause the server to crash when replicating statements with user variables.

certain internal errors. (Bug#37150)

- **Replication:** Row-based replication did not correctly copy `TIMESTAMP` values from a big-endian storage engine to a little-endian storage engine. (Bug#37076)

- **Replication:** `INSTALL PLUGIN` and `UNINSTALL PLUGIN` caused row-based replication to fail.

### Note

These statements are not replicated; however, when using row-based logging, the changes they introduce in the `mysql` system tables are written to the binary log.

([Bug#35807](#))

- Server-side cursors were not initialized properly, which could cause a server crash. ([Bug#38486](#))
- A server crash or Valgrind warnings could result when a stored procedure selected from a view that referenced a function. ([Bug#38291](#))
- A failure to clean up binary log events was corrected (detected by Valgrind). ([Bug#38290](#))
- Incorrect handling of aggregate functions when loose index scan was used caused a server crash. ([Bug#38195](#))
- Queries containing a subquery with `DISTINCT` and `ORDER BY` could cause a server crash. ([Bug#38191](#))
- Over-aggressive lock acquisition by `InnoDB` when calculating free space for tablespaces could result in performance degradation when multiple threads were executing statements on multi-core machines. ([Bug#38185](#))
- The fix for [Bug#20748](#) caused a problem such that on Unix, MySQL programs looked for options in `~/my.cnf` rather than the standard location of `~/my.cnf`. ([Bug#38180](#))
- If the table definition cache contained tables with many `BLOB` columns, much memory could be allocated to caching `BLOB` values. Now a size limit on the cached `BLOB` values is enforced. ([Bug#38002](#))
- For `InnoDB` tables, `ORDER BY ... DESC` sometimes returned results in ascending order. ([Bug#37830](#))
- If a table has a `BIT NOT NULL` column `c1` with a length shorter than 8 bits and some additional `NOT NULL` columns `c2, ...`, and a `SELECT` query has a `WHERE` clause of the form `(c1 = constant) AND c2 ...`, the query could return an unexpected result set. ([Bug#37799](#))
- The server returned unexpected results if a right side of the `NOT IN` clause consisted of the `NULL` value and some constants of the same type. For example, this query might return 3, 4, 5, and so forth if a table contained those values:

```
SELECT * FROM t WHERE NOT t.id IN (NULL, 1, 2);
```

([Bug#37761](#))

- Setting the session value of the `innodb_table_locks` system variable caused a server crash. ([Bug#37669](#))
- Nesting of `IF()` inside of `SUM()` could cause an extreme server slowdown. ([Bug#37662](#))
- Killing a query that used an `EXISTS` subquery as the argument to `SUM()` or `AVG()` caused a server crash. ([Bug#37627](#))
- When using indexed `ORDER BY` sorting, incorrect query results could be produced if the optimizer switched from a covering index to a non-covering index. ([Bug#37548](#))
- After `TRUNCATE TABLE` for an `InnoDB` table, inserting explicit values into an `AUTO_INCREMENT` column could fail to increment the counter and result in a duplicate-key error for subsequent insertion of `NULL`. ([Bug#37531](#))
- Within stored programs or prepared statements, `REGEXP` could return incorrect results due to improper initialization. ([Bug#37337](#))
- For a `MyISAM` table with `CHECKSUM = 1` and `ROW_FORMAT = DYNAMIC` table options, a data consistency check (maximum record length) could fail and cause the table to be marked as corrupted. ([Bug#37310](#))
- The `max_length` result set metadata value was calculated incorrectly under some circumstances. ([Bug#37301](#))
- If the length of a field was 3, internal `InnoDB` to integer type conversion didn't work on big-endian machines in the `row_search_autoinc_column()` function. ([Bug#36793](#))
- A query which had an `ORDER BY DESC` clause that is satisfied with a reverse range scan could cause a server crash for some specific CPU/compiler combinations. ([Bug#36639](#))
- The `CSV` storage engine returned success even when it failed to open a table's data file. ([Bug#36638](#))
- `SELECT DISTINCT` from a simple view on an `InnoDB` table, where all selected columns belong to the same unique index

- key, returned incorrect results. ([Bug#36632](#))
- Dumping information about locks in use by sending a `SIGHUP` signal to the server or by invoking the `mysqladmin debug` command could lead to a server crash in debug builds or to undefined behavior in production builds. ([Bug#36579](#))
  - If initialization of an `INFORMATION_SCHEMA` plugin failed, `INSTALL PLUGIN` freed some internal plugin data twice. ([Bug#36399](#))
  - For `InnoDB` tables, the `DATA_FREE` column of the `INFORMATION_SCHEMA.TABLES` displayed free space in kilobytes rather than bytes. Now it displays bytes. ([Bug#36278](#))
  - When the fractional part in a multiplication of `DECIMAL` values overflowed, the server truncated the first operand rather than the longest. Now the server truncates so as to produce more precise multiplications. ([Bug#36270](#))
  - The `mysql` client failed to recognize comment lines consisting of `--` followed by a newline. ([Bug#36244](#))
  - The server could crash with an assertion failure (or cause the client to get a “Packets out of order” error) when the expected query result was that it should terminate with a “Subquery returns more than 1 row” error. ([Bug#36135](#))
  - The `UUID()` function returned UUIDs with the wrong time; this was because the offset for the time part in UUIDs was miscalculated. ([Bug#35848](#))
  - The `configure` script did not allow `utf8_hungarian_ci` to be specified as the default collation. ([Bug#35808](#))
  - On 64-bit systems, assigning values of  $2^{63} - 1$  or larger to `key_buffer_size` caused memory overruns. ([Bug#35616](#))
  - For `InnoDB` tables, `REPLACE` statements used “traditional” style locking, regardless of the setting of `innodb_autoinc_lock_mode`. Now `REPLACE` works the same way as “simple inserts” instead of using the old locking algorithm. (`REPLACE` statements are treated in the same way as `INSERT` statements.) ([Bug#35602](#))
  - Freeing of an internal parser stack during parsing of complex stored programs caused a server crash. ([Bug#35577](#), [Bug#37269](#), [Bug#37228](#))
  - `mysqlbinlog` left temporary files on the disk after shutdown, leading to the pollution of the temporary directory, which eventually caused `mysqlbinlog` to fail. This caused problems in testing and other situations where `mysqlbinlog` might be invoked many times in a relatively short period of time. ([Bug#35543](#))
  - Index scans performed with the `sort_union()` access method returned wrong results, caused memory to be leaked, and caused temporary files to be deleted when the limit set by `sort_buffer_size` was reached. ([Bug#35477](#), [Bug#35478](#))
  - Table checksum calculation could cause a server crash for `FEDERATED` tables with `BLOB` columns containing `NULL` values. ([Bug#34779](#))
  - A significant slowdown occurred when many `SELECT` statements that return many rows from `InnoDB` tables were running concurrently. ([Bug#34409](#))
  - `mysql_install_db` failed if the server was running with an SQL mode of `TRADITIONAL`. This program now resets the SQL mode internally to avoid this problem. ([Bug#34159](#))
  - Changes to build files were made to enable the MySQL distribution to compile on Microsoft Visual C++ Express 2008. ([Bug#33907](#))
  - Fast `ALTER TABLE` operations were not fast for columns that used multibyte character sets. ([Bug#33873](#))
  - The internal functions `my_getsystemtime()`, `my_micro_time()`, and `my_micro_time_and_time()` did not work correctly on Windows. One symptom was that uniqueness of `UUID()` values could be compromised. ([Bug#33748](#))
  - Cached queries that used 256 or more tables were not properly cached, so that later query invalidation due to a `TRUNCATE TABLE` for one of the tables caused the server to hang. ([Bug#33362](#))
  - `mysql_upgrade` attempted to use the `/proc` file system even on systems that do not have it. ([Bug#31605](#))
  - `mysql_install_db` failed if the default storage engine was `NDB`. Now it explicitly uses `MyISAM` as the storage engine when running `mysqld --bootstrap`. ([Bug#31315](#))
  - Several MySQL programs could fail if the `HOME` environment variable had an empty value. ([Bug#30394](#))
  - On NetWare, `mysql_install_db` could appear to execute normally even if it failed to create the initial databases. ([Bug#30129](#))
  - The Serbian translation for the `ER_INCORRECT_GLOBAL_LOCAL_VAR` error was corrected. ([Bug#29738](#))

- `TRUNCATE TABLE` for `InnoDB` tables returned a count showing too many rows affected. Now the statement returns 0 for `InnoDB` tables. ([Bug#29507](#))
- The `BUILD/check-cpu` build script failed if `gcc` had a different name (such as `gcc.real` on Debian). ([Bug#27526](#))
- In some cases, the parser interpreted the `;` character as the end of input and misinterpreted stored program definitions. ([Bug#26030](#))
- The `FLUSH PRIVILEGES` statement did not produce an error when it failed. ([Bug#21226](#))
- After executing a prepared statement that accesses a stored function, the next execution would fail to find the function if the stored function cache was flushed in the meantime. ([Bug#12093](#), [Bug#21294](#))

## C.2.11. Changes in MySQL 5.1.27 (Not released)

Functionality added or changed:

- `mysqltest` now installs signal handlers and generates a stack trace if it crashes. ([Bug#37003](#))
- `mysql-test-run.pl` now supports `--client-bindir` and `--client-libdir` options for specifying the directory where client binaries and libraries are located. ([Bug#34995](#))

Bugs fixed:

- **Partitioning: Incompatible Change:** On Mac OS X with `lower_case_table_names = 2`, the server could not read partitioned tables whose names contained uppercase letters.

Partitioned tables using mixed case names should be renamed or dropped before upgrading to this version of the server on Mac OS X. ([Bug#37402](#))

- **Partitioning: Important Note:** The statements `ANALYZE TABLE`, `CHECK TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` are now supported for partitioned tables.

Also as a result of this fix, the following statements which were disabled in MySQL 5.1.24 have been re-enabled:

- `ALTER TABLE ... ANALYZE PARTITION`
- `ALTER TABLE ... CHECK PARTITION`
- `ALTER TABLE ... OPTIMIZE PARTITION`
- `ALTER TABLE ... REPAIR PARTITION`

([Bug#20129](#))

See also [Bug#39434](#).

- **Replication:** Issuing a `DROP DATABASE` while any temporary tables were open caused the server to switch to statement-based mode. ([Bug#38773](#))
- **Replication:** The `--replicate-*-table` options were not evaluated correctly when replicating multi-table updates.

As a result of this fix, replication of multi-table updates no longer fails when an update references a missing table but does not update any of its columns. ([Bug#37051](#))

- The fix for [Bug#33812](#) had the side effect of causing the `mysql` client not to be able to read some dump files produced with `mysqldump`. To address this, that fix was reverted. ([Bug#38158](#))

## C.2.12. Changes in MySQL 5.1.26 (30 June 2008)

Functionality added or changed:

- **Important Change: Incompatible Change:** The `FEDERATED` storage engine is now disabled by default in binary distributions. The engine is still available and can be enabled by starting the server with the `--federated` option. ([Bug#37069](#))

- `mysqltest` was changed to be more robust in the case of a race condition that can occur for rapid disconnect/connect sequences with the server. The account used by `mysqltest` could reach its allowed simultaneous-sessions user limit if the connect attempt occurred before the server had fully processed the preceding disconnect. `mysqltest` now checks specifically for a user-limits error when it connects; if that error occurs, it delays briefly before retrying. (Bug#23921)

Bugs fixed:

- **Replication:** Row-based replication broke for `utf8 CHAR` columns longer than 85 characters. (Bug#37426)
- **Replication:** Performing an insert on a table having an `AUTO_INCREMENT` column and an `INSERT` trigger that was being replicated from a master running MySQL 5.0 or any version of MySQL 5.1 up to and including MySQL 5.1.11 to a slave running MySQL 5.1.12 or later caused the replication slave to crash. (Bug#36443)

See also Bug#33029.

- Some binary distributions had a duplicate “-64bit” suffix in the file name. (Bug#37623)
- `NOT IN` subqueries that selected `MIN()` or `MAX()` values but produced an empty result could cause a server crash. (Bug#37004)
- `ha_innodb.so` was incorrectly installed in the `lib/mysql` directory rather than in `lib/mysql/plugin`. (Bug#36434)
- An empty bit-string literal (`b''`) caused a server crash. Now the value is parsed as an empty bit value (which is treated as an empty string in string context or 0 in numeric context). (Bug#35658)
- The code for detecting a byte order mark (BOM) caused `mysql` to crash for empty input. (Bug#35480)
- The `mysql` client incorrectly parsed statements containing the word “delimiter” in mid-statement.

The fix for this bug had the side effect of causing the problem reported in Bug#38158, so it was reverted in MySQL 5.1.27. (Bug#33812)

## C.2.13. Changes in MySQL 5.1.25 (28 May 2008)

Functionality added or changed:

- **Incompatible Change:** A change has been made to the way that the server handles prepared statements. This affects prepared statements processed at the SQL level (using the `PREPARE` statement) and those processed using the binary client-server protocol (using the `mysql_stmt_prepare()` C API function).

Previously, changes to metadata of tables or views referred to in a prepared statement could cause a server crash when the statement was next executed, or perhaps an error at execute time with a crash occurring later. For example, this could happen after dropping a table and recreating it with a different definition.

Now metadata changes to tables or views referred to by prepared statements are detected and cause automatic reparation of the statement when it is next executed. Metadata changes occur for DDL statements such as those that create, drop, alter, rename, or truncate tables, or that analyze, optimize, or repair tables. Reparation also occurs after referenced tables or views are flushed from the table definition cache, either implicitly to make room for new entries in the cache, or explicitly due to `FLUSH TABLES`.

Reparation is automatic, but to the extent that it occurs, performance of prepared statements is diminished.

Table content changes (for example, with `INSERT` or `UPDATE`) do not cause reparation, nor do `SELECT` statements.

An incompatibility with previous versions of MySQL is that a prepared statement may now return a different set of columns or different column types from one execution to the next. For example, if the prepared statement is `SELECT * FROM t1`, altering `t1` to contain a different number of columns causes the next execution to return a number of columns different from the previous execution.

Older versions of the client library cannot handle this change in behavior. For applications that use prepared statements with the new server, an upgrade to the new client library is strongly recommended.

Along with this change to statement reparation, the default value of the `table_definition_cache` system variable has been increased from 128 to 256. The purpose of this increase is to lessen the chance that prepared statements will need reparation due to referred-to tables/views having been flushed from the cache to make room for new entries.

A new status variable, `Com_stmt_reprepare`, has been introduced to track the number of reparations. (Bug#27420,

[Bug#27430](#), [Bug#27690](#))

- **Important Change:** Some changes were made to `CHECK TABLE ... FOR UPGRADE` and `REPAIR TABLE` with respect to detection and handling of tables with incompatible `.frm` files (files created with a different version of the MySQL server). These changes also affect `mysqlcheck` because that program uses `CHECK TABLE` and `REPAIR TABLE`, and thus also `mysql_upgrade` because that program invokes `mysqlcheck`.
  - If your table was created by a different version of the MySQL server than the one you are currently running, `CHECK TABLE ... FOR UPGRADE` indicates that the table has an `.frm` file with an incompatible version. In this case, the result set returned by `CHECK TABLE` contains a line with a `Msg_type` value of `error` and a `Msg_text` value of `Table upgrade required. Please do "REPAIR TABLE `tbl_name`" to fix it!`
  - `REPAIR TABLE` without `USE_FRM` upgrades the `.frm` file to the current version.
  - If you use `REPAIR TABLE ...USE_FRM` and your table was created by a different version of the MySQL server than the one you are currently running, `REPAIR TABLE` will not attempt to repair the table. In this case, the result set returned by `REPAIR TABLE` contains a line with a `Msg_type` value of `error` and a `Msg_text` value of `Failed repairing incompatible .FRM file.`

Previously, use of `REPAIR TABLE ...USE_FRM` with a table created by a different version of the MySQL server risked the loss of all rows in the table.

([Bug#36055](#))

- `mysql_upgrade` now has a `--tmpdir` option to enable the location of temporary files to be specified. ([Bug#36469](#))
- `mysqldump` now adds the `LOCAL` qualifier to the `FLUSH TABLES` statement that is sent to the server when the `--master-data` option is enabled. This prevents the `FLUSH TABLES` statement from replicating to slaves, which is disadvantageous because it would cause slaves to block while the statement executes. ([Bug#35157](#))

See also [Bug#38303](#).

Bugs fixed:

- **Important Change:** The server no longer issues warnings for truncation of excess spaces for values inserted into `CHAR` columns. This reverts a change in the previous release that caused warnings to be issued. ([Bug#30059](#))
- **Replication:** `CREATE PROCEDURE` and `CREATE FUNCTION` statements containing extended comments were not written to the binary log correctly, causing parse errors on the slave. ([Bug#36570](#))

See also [Bug#32575](#).

- **Replication:** When flushing tables, there was a slight chance that the flush occurred between the processing of one table map event and the next. Since the tables were opened one by one, subsequent locking of tables would cause the slave to crash. This problem was observed when replicating `NDBCLUSTER` or `InnoDB` tables, when executing multi-table updates, and when a trigger or a stored routine performed an (additional) insert on a table so that two tables were effectively being inserted into in the same statement. ([Bug#36197](#))
- **Replication:** `CREATE VIEW` statements containing extended comments were not written to the binary log correctly, causing parse errors on the slave. Now, all comments are stripped from such statements before being written to the binary log. ([Bug#32575](#))

See also [Bug#36570](#).

- On Windows 64-bit systems, temporary variables of `long` types were used to store `ulong` values, causing key cache initialization to receive distorted parameters. The effect was that setting `key_buffer_size` to values of 2GB or more caused memory exhaustion to due allocation of too much memory. ([Bug#36705](#))
- Multiple-table `UPDATE` statements that used a temporary table could fail to update all qualifying rows or fail with a spurious duplicate-key error. ([Bug#36676](#))
- A `REGEXP` match could return incorrect rows when the previous row matched the expression and used `CONCAT( )` with an empty string. ([Bug#36488](#))
- `mysqltest` ignored the value of `--tmpdir` in one place. ([Bug#36465](#))
- When updating an existing instance (for example, from MySQL 5.0 to 5.1, or 5.1 to 6.0), the Instance Configuration Wizard unnecessarily prompted for a `root` password when there was an existing `root` password. ([Bug#36305](#))

- Conversion of a `FLOAT ZEROFILL` value to string could cause a server crash if the value was `NULL`. (Bug#36139)
- On Windows, the installer attempted to use JScript to determine whether the target data directory already existed. On Windows Vista x64, this resulted in an error because the installer was attempting to run the JScript in a 32-bit engine, which wasn't registered on Vista. The installer no longer uses JScript but instead relies on a native WiX command. (Bug#36103)
- `mysqltest` was performing escape processing for the `--replace_result` command, which it should not have been. (Bug#36041)
- An error in calculation of the precision of zero-length items (such as `NULL`) caused a server crash for queries that employed temporary tables. (Bug#36023)
- For `EXPLAIN EXTENDED`, execution of an uncorrelated `IN` subquery caused a crash if the subquery required a temporary table for its execution. (Bug#36011)
- The `MERGE` storage engine did a table scan for `SELECT COUNT(*)` statements when it could calculate the number of records from the underlying tables. (Bug#36006)
- The server crashed inside `NOT IN` subqueries with an impossible `WHERE` or `HAVING` clause, such as `NOT IN (SELECT ... FROM t1, t2, ... WHERE 0)`. (Bug#36005)
- The Event Scheduler was not designed to work under the embedded server. It is now disabled for the embedded server, and the `event_scheduler` system variable is not displayed. (Bug#35997)
- Grouping or ordering of long values in unindexed `BLOB` or `TEXT` columns with the `gbk` or `big5` character set crashed the server. (Bug#35993)
- `SET GLOBAL debug=''` resulted in a Valgrind warning in `DbugParse()`, which was reading beyond the end of the control string. (Bug#35986)
- The “prefer full scan on clustered primary key over full scan of any secondary key” optimizer rule introduced by Bug#26447 caused a performance regression for some queries, so it has been disabled. (Bug#35850)
- The server ignored any covering index used for `ref` access of a table in a query with `ORDER BY` if this index was incompatible with the `ORDER BY` list and there was another covering index compatible with this list. As a result, suboptimal execution plans were chosen for some queries that used an `ORDER BY` clause. (Bug#35844)
- `mysql_upgrade` did not properly update the `mysql.event` table. (Bug#35824)
- An incorrect error and message was produced for attempts to create a `MyISAM` table with an index (`.MYI`) file name that was already in use by some other `MyISAM` table that was open at the same time. For example, this might happen if you use the same value of the `INDEX DIRECTORY` table option for tables belonging to different databases. (Bug#35733)
- Enabling the `read_only` system variable while autocommit mode was enabled caused `SELECT` statements for transactional storage engines to fail. (Bug#35732)
- The combination of `GROUP_CONCAT()`, `DISTINCT`, and `LEFT JOIN` could crash the server when the right table is empty. (Bug#35298)
- Some binaries produced stack corruption messages due to being built with versions of `bison` older than 2.1. Builds are now created using `bison` 2.3. (Bug#34926)
- The `log_output` system variable could be set to an illegal value. (Bug#34820)
- On Windows 64-bit builds, an apparent compiler bug caused memory overruns for code in `innobase/mem/*`. Removed optimizations so as not to trigger this problem. (Bug#34297)
- Several additional configuration scripts in the `BUILD` directory now are included in source distributions. These may be useful for users who wish to build MySQL from source. (See Section 2.10.3, “Installing from the Development Source Tree”, for information about what they do.) (Bug#34291)
- Executing a `FLUSH PRIVILEGES` statement after creating a temporary table in the `mysql` database with the same name as one of the MySQL system tables caused the server to crash.

**Note**

While it is possible to shadow a system table in this way, the temporary table exists only for the current user and connection, and does not effect any user privileges. (Bug#33275)

- `UNION` constructs cannot contain `SELECT ... INTO` except in the final `SELECT`. However, if a `UNION` was used in a sub-

query and an `INTO` clause appeared in the top-level query, the parser interpreted it as having appeared in the `UNION` and raised an error. (Bug#32858)

- Assignment of relative path names to `general_log_file` or `slow_query_log_file` did not always work. (Bug#32748)
- The `mysql.servers` table was not created during installation on Windows. (Bug#28680, Bug#32797)
- The `jp` test suite was not working. (Bug#28563)
- The internal `init_time()` library function was renamed to `my_init_time()` to avoid conflicts with external libraries. (Bug#26294)
- The parser used signed rather than unsigned values in some cases that caused legal lengths in column declarations to be rejected. (Bug#15776)

## C.2.14. Changes in MySQL 5.1.24 (08 April 2008)

Functionality added or changed:

- **Important Change: MySQL Cluster: Packaging:** Beginning with this release, standard MySQL 5.1 binaries are no longer built with support for the `NDBCLUSTER` storage engine, and the `NDBCLUSTER` code included in 5.1 mainline sources is no longer guaranteed to be maintained or supported. Those using MySQL Cluster in MySQL 5.1.23 and earlier MySQL 5.1 mainline releases should upgrade to MySQL Cluster NDB 6.2.15 or a later MySQL Cluster NDB 6.2 or 6.3 release. (Bug#36193)
- **Important Change:** The `FEDERATED` storage engine is not included in binary distributions of MySQL 5.1.24. (It will be included again in 5.1.25.)
- **Replication:** Introduced the `slave_exec_mode` system variable to control whether idempotent or strict mode is used for replication conflict resolution. Idempotent mode suppresses duplicate-key, no-key-found, and some other errors, and is needed for circular replication, multi-master replication, and some other complex replication setups when using MySQL Cluster. Strict mode is the default. (Bug#31609)
- **Replication:** When running the server with `--binlog-format=MIXED` or `--binlog-format=STATEMENT`, a query that referred to a system variable used the slave's value when replayed on the slave. This meant that, if the value of a system variable was inserted into a table, the slave differed from the master. Now, statements that refer to a system variable are marked as “unsafe”, which means that:
  - When the server is using `--binlog-format=MIXED`, the row-based format is used automatically to replicate these statements.
  - When the server is using `--binlog-format=STATEMENT`, these statements produce a warning. (Bug#31168)

See also Bug#34732.

- The `PROCESS` privilege now is required to start or stop the `InnoDB` monitor tables (see Section 13.6.13.2, “`SHOW ENGINE INNODB STATUS` and the `InnoDB` Monitors”). Previously, no privilege was required. (Bug#34053)
- For binary `.tar.gz` packages, `mysqld` and other binaries now are compiled with debugging symbols included to enable easier use with a debugger. If you do not need debugging symbols and are short on disk space, you can use `strip` to remove the symbols from the binaries. (Bug#33252)
- Formerly, when the MySQL server crashed, the generated stack dump was numeric and required external tools to properly resolve the names of functions. This is not very helpful to users having a limited knowledge of debugging techniques. In addition, the generated stack trace contained only the names of functions and was formatted differently for each platform due to different stack layouts.

Now it is possible to take advantage of newer versions of the GNU C Library provide a set of functions to obtain and manipulate stack traces from within the program. On systems that use the ELF binary format, the stack trace contains important information such as the shared object where the call was generated, an offset into the function, and the actual return address. Having the function name also makes possible the name demangling of C++ functions.

The library generates meaningful stack traces on the following platforms: i386, x86\_64, PowerPC, IA64, Alpha, and S390. On other platforms, a numeric stack trace is still produced, and the use of the `resolve_stack_dump` utility is still required. (Bug#31891)

- `mysqltest` now has `mkdir` and `rmdir` commands for creating and removing directories. (Bug#31004)

- The server uses less memory when loading privileges containing table grants. (Patch provided by Google.) ([Bug#25175](#))
- Added the `Uptime_since_flush_status` status variable, which indicates the number of seconds since the most recent `FLUSH STATUS` statement. (Community contribution by Jeremy Cole) ([Bug#24822](#))
- `SHOW OPEN TABLES` now supports `FROM` and `LIKE` clauses. ([Bug#12183](#))
- The new read-only global system variables `report_host`, `report_password`, `report_port`, and `report_user` system variables provide runtime access to the values of the corresponding `--report-host`, `--report-password`, `--report-port`, and `--report-user` options.
- Formerly it was possible to specify an `innodb_flush_method` value of `fdatasync` to obtain the default flush behavior of using `fdatasync()` for flushing. This is no longer possible because it can be confusing that a value of `fdatasync` causes use of `fsync()` rather than `fdatasync()`.
- The use of InnoDB hash indexes now can be controlled by setting the new `innodb_adaptive_hash_index` system variable at server startup. By default, this variable is enabled. See [Section 13.6.10.4, “Adaptive Hash Indexes”](#).

#### Bugs fixed:

- **Important Change: Security Fix:** It was possible to circumvent privileges through the creation of `MyISAM` tables employing the `DATA DIRECTORY` and `INDEX DIRECTORY` options to overwrite existing table files in the MySQL data directory. Use of the MySQL data directory in `DATA DIRECTORY` and `INDEX DIRECTORY` is now disallowed. This is now also true of these options when used with partitioned tables and individual partitions of such tables.

#### Note

Additional fixes were made in MySQL 5.1.28.

([Bug#32167](#), [CVE-2008-2079](#))

See also [Bug#39277](#).

- **Security Fix:** A client that connects to a malicious server could be tricked by the server into sending files from the client host to the server. This occurs because the `libmysqlclient` client library would respond to a `FETCH LOCAL FILE` request from the server even if the request is sent for statements from the client other than `LOAD DATA LOCAL INFILE`. The client library has been modified to respond to a `FETCH LOCAL FILE` request from the server only if it is sent in response to a `LOAD DATA LOCAL INFILE` statement from the client.

The client library now also checks whether `CLIENT_LOCAL_FILE` is set and refuses to send a local file if not.

#### Note

Binary distributions ship with the `local-infile` capability enabled. Applications that do not use this functionality should disable it to be safe.

([Bug#29605](#))

- **Important Change: Security Enhancement:** On Windows Vista and Windows Server 2008, a user without administrative privileges does not have write permissions to the `Program Files` directory where MySQL and the associated data files are normally installed. Using data files located in the standard `Program Files` installation directory could therefore cause MySQL to fail, or lead to potential security issues in an installed instance.

To address the problem, on Windows XP, Windows Vista and Windows Server 2008, the datafiles and data file configuration are now set to the Microsoft recommended `AppData` folder. The `AppData` folder is typically located within the user's home directory.

#### Important

When upgrading an existing 5.1.23 or 6.0.4 installation of MySQL you must take a backup of your data and configuration file (`my.ini`) before installing the new version. To migrate your data, either extract the data and re-import (using `mysqldump`, then upgrade and re-import using `mysql`), or back up your data, upgrade to the new version, and copy your existing data files from your old `datadir` directory to the new directory located within `AppData`.

Failure to back up your data and follow these procedures may lead to data loss.

([Bug#34593](#))

- **Incompatible Change:** In MySQL 5.1.23, the `last_errno` and `last_error` members of the `NET` structure in

`mysql_com.h` were renamed to `client_last_errno` and `client_last_error`. This was found to cause problems for connectors that use the internal `NET` structure for error handling. The change has been reverted. (Bug#34655)

See also Bug#12713.

- **Incompatible Change:** It was possible to use `FRAC_SECOND` as a synonym for `MICROSECOND` with `DATE_ADD()`, `DATE_SUB()`, and `INTERVAL`; now, using `FRAC_SECOND` with anything other than `TIMESTAMPADD()` or `TIMESTAMPDIFF()` produces a syntax error.

It is now possible (and preferable) to use `MICROSECOND` with `TIMESTAMPADD()` and `TIMESTAMPDIFF()`, and `FRAC_SECOND` is now deprecated. (Bug#33834)

- **Incompatible Change:** The `UPDATE` statement allowed `NULL` to be assigned to `NOT NULL` columns (the implicit default value for the column data type was assigned). This was changed so that on error occurs.

This change was reverted, because the original report was determined not to be a bug: Assigning `NULL` to a `NOT NULL` column in an `UPDATE` statement should produce an error only in strict SQL mode and set the column to the implicit default with a warning otherwise, which was the original behavior. See Section 10.1.4, “Data Type Default Values”, and Bug#39265. (Bug#33699)

- **Incompatible Change:** For packages that are built within their own prefix (for example, `/usr/local/mysql`) the plugin directory will be `lib/plugin`. For packages that are built to be installed into a system-wide prefix (such as RPM packages with a prefix of `/usr`), the plugin directory will be `lib/mysql/plugin` to ensure a clean `/usr/lib` hierarchy. In both cases, the `$pkglibdir` configuration setting is used at build time to set the plugin directory.

The current plugin directory location is available as the value of the `plugin_dir` system variable as before, but the `mysql_config` script now has a `--plugindir` option that can be used externally to the server by third-party plugin writers to obtain the default plugin directory path name and configure their installation directory appropriately. (Bug#31736)

- **Incompatible Change:** The `utf8_general_ci` and `ucs2_general_ci` collations did not sort the letter "U+00DF SHARP S" equal to 's'.

As a result of this bug fix, indexes must be rebuilt for columns that use the `utf8_general_ci` or `ucs2_general_ci` collation for columns that contain SHARP S. See Section 2.12.3, “Checking Whether Table Indexes Must Be Rebuilt”. (Bug#27877)

See also Bug#37046.

- **Important Change: Replication:** When the master crashed during an update on a transactional table while in `autocommit` mode, the slave failed. This fix causes every transaction (including `autocommit` transactions) to be recorded in the binlog as starting with a `BEGIN` and ending with a `COMMIT` or `ROLLBACK`. (Bug#26395)
- **Important Change:** InnoDB free space information is now shown in the `Data_free` column of `SHOW TABLE STATUS` and in the `DATA_FREE` column of the `INFORMATION_SCHEMA.TABLES` table. (Bug#32440)

See also Bug#11379.

- **Important Change:** The server handled truncation of values having excess trailing spaces into `CHAR`, `VARCHAR`, and `TEXT` columns in different ways. This behavior has now been made consistent for columns of all three of these types, and now follows the existing behavior of `VARCHAR` columns in this regard; that is, a `Note` is always issued whenever such truncation occurs.

This change does not affect columns of these three types when using a binary encoding; `BLOB` columns are also unaffected by the change, since they always use a binary encoding. (Bug#30059)

- **Important Change:** An `AFTER UPDATE` trigger was not invoked when the `UPDATE` did not make any changes to the table for which the trigger was defined. Now `AFTER UPDATE` triggers behave the same in this regard as do `BEFORE UPDATE` triggers, which are invoked whether the `UPDATE` makes any changes in the table or not. (Bug#23771)
- **Partitioning: Important Note:** The following statements did not function correctly with corrupted or crashed tables and have been disabled:

- `ALTER TABLE ... ANALYZE PARTITION`
- `ALTER TABLE ... CHECK PARTITION`
- `ALTER TABLE ... OPTIMIZE PARTITION`
- `ALTER TABLE ... REPAIR PARTITION`

`ALTER TABLE ... REBUILD PARTITION` is unaffected by this change and continues to be available. This statement and

`ALTER TABLE ... REORGANIZE PARTITION` may be used to analyze and optimize partitioned tables, since these operations cause the partition files to be rebuilt. (Bug#20129)

See also Bug#39434.

- **Replication: Important Note:** Network timeouts between the master and the slave could result in corruption of the relay log. This fix rectifies a long-standing replication issue when using unreliable networks, including replication over wide area networks such as the Internet. If you experience reliability issues and see many `YOU HAVE AN ERROR IN YOUR SQL SYNTAX` errors on replication slaves, we strongly recommend that you upgrade to a MySQL version which includes this fix. (Bug#26489)
- **Partitioning:** In some cases, matching rows from a partitioned `MyISAM` using a `BIT` column as the primary key were not found by queries. (Bug#34358)
- **Partitioning:** Enabling `innodb_file_per_table` produced problems with partitioning and tablespace operations on partitioned `InnoDB` tables, in some cases leading to corrupt partitions or causing the server to crash. (Bug#33429)
- **Partitioning:** A table defined using `PARTITION BY KEY` and having a `BIT` column referenced in the partitioning key did not behave correctly; some rows could be inserted into the wrong partition, causing wrong results to be returned from queries. (Bug#33379)
- **Partitioning:** For `InnoDB` tables, there was a race condition involving the data dictionary and repartitioning. (Bug#33349)
- **Partitioning:** When `ALTER TABLE DROP PARTITION` was executed on a table on which there was a trigger, the statement failed with an error. This occurred even if the trigger did not reference any tables. (Bug#32943)
- **Partitioning:** Currently, all partitions of a partitioned table must use the same storage engine. One may optionally specify the storage engine on a per-partition basis; however, where this is the done, the storage engine must be the same as used by the table as a whole. `ALTER TABLE` did not enforce these rules correctly, the result being that inaccurate error messages were shown when trying to use the statement to change the storage engine used by an individual partition or partitions. (Bug#31931)
- **Partitioning:** Using the `DATA DIRECTORY` and `INDEX DIRECTORY` options for partitions with `CREATE TABLE` or `ALTER TABLE` statements appeared to work on Windows, although they are not supported by MySQL on Windows systems, and subsequent attempts to use the tables referenced caused errors. Now these options are disabled on Windows, and attempting to use them generates a warning. (Bug#30459)
- **Replication:** The failure of a `CREATE TABLE ... ENGINE=InnoDB ... SELECT` statement caused the slave to lose data. (Bug#35762)
- **Replication:** When using row-based replication, a slave could crash at startup because it received a row-based replication event that `InnoDB` could not handle due to an incorrect test of the query string provided by MySQL, which was `NULL` for row-based replication events. (Bug#35226)
- **Replication:** `insert_id` was not written to the binary log for inserts into `BLACKHOLE` tables. (Bug#35178)
- **Replication:** When using statement-based replication and a `DELETE, UPDATE, or INSERT ... SELECT` statement using a `LIMIT` clause is encountered, a warning that the statement is not safe to replicate in statement mode is now issued; when using `MIXED` mode, the statement is now replicated using the row-based format. (Bug#34768)
- **Replication:** `mysqlbinlog` did not output the values of `auto_increment_increment` and `auto_increment_offset` when both were equal to their default values (for both of these variables, the default is 1). This meant that a binary log recorded by a client using the defaults for both variables and then replayed on another client using its own values for either or both of these variables produced erroneous results. (Bug#34732)

See also Bug#31168.

- **Replication:** When the Windows version of `mysqlbinlog` read 4.1 binlogs containing `LOAD DATA INFILE` statements, it output backslashes as path separators, causing problems for client programs expecting forward slashes. In such cases, it now converts `\\` to `/` in directory paths. (Bug#34355)
- **Replication:** `SHOW SLAVE STATUS` failed when slave I/O was about to terminate. (Bug#34305)
- **Replication:** The character sets and collations used for constant identifiers in stored procedures were not replicated correctly. (Bug#34289)
- **Replication:** `mysqlbinlog` from a 5.1 or later MySQL distribution could not read binary logs generated by a 4.1 server when the logs contained `LOAD DATA INFILE` statements. (Bug#34141)

This regression was introduced by Bug#32407.

- **Replication:** A `CREATE USER, DROP USER, or RENAME USER` statement that fails on the master, or that is a duplicate of any of these statements, is no longer written to the binlog; previously, either of these occurrences could cause the slave to fail.

([Bug#33862](#))

See also [Bug#29749](#).

- **Replication:** `SHOW BINLOG EVENTS` could fail when the binlog contained one or more events whose size was close to the value of `max_allowed_packet`. ([Bug#33413](#))
- **Replication:** An extraneous `ROLLBACK` statement was written to the binary log by a connection that did not use any transactional tables. ([Bug#33329](#))
- **Replication:** `mysqlbinlog` failed to release all of its memory after terminating abnormally. ([Bug#33247](#))
- **Replication:** When a stored routine or trigger, running on a master that used MySQL 5.0 or MySQL 5.1.11 or earlier, performed an insert on an `AUTO_INCREMENT` column, the `insert_id` value was not replicated correctly to a slave running MySQL 5.1.12 or later (including any MySQL 6.0 release). ([Bug#33029](#))

See also [Bug#19630](#).

- **Replication:** The error message generated due to lack of a default value for an extra column was not sufficiently informative. ([Bug#32971](#))
- **Replication:** When a user variable was used inside an `INSERT` statement, the corresponding binlog event was not written to the binlog correctly. ([Bug#32580](#))
- **Replication:** When using row-based replication, deletes from a table with a foreign key constraint failed on the slave. ([Bug#32468](#))
- **Replication:** The `--base64-output` option for `mysqlbinlog` was not honored for all types of events. This interfered in some cases with performing point-in-time recovery. ([Bug#32407](#))
- **Replication:** SQL statements containing comments using `--` syntax were not replayable by `mysqlbinlog`, even though such statements replicated correctly. ([Bug#32205](#))
- **Replication:** When using row-based replication from a master running MySQL 5.1.21 or earlier to a slave running 5.1.22 or later, updates of integer columns failed on the slave with `ERROR IN UNKNOWN EVENT: ROW APPLICATION FAILED`. ([Bug#31583](#))

This regression was introduced by [Bug#21842](#).

- **Replication:** Replicating write, update, or delete events from a master running MySQL 5.1.15 or earlier to a slave running 5.1.16 or later caused the slave to crash. ([Bug#31581](#))
- **Replication:** When using row-based replication, the slave stopped when attempting to delete non-existent rows from a slave table without a primary key. In addition, no error was reported when this occurred. ([Bug#31552](#))
- **Replication:** Errors due to server ID conflicts were reported only in the slave's error log; now these errors are also shown in the `Server_IO_State` column in the output of `SHOW SLAVE STATUS`. ([Bug#31316](#))
- **Replication:** `STOP SLAVE` did not stop connection attempts properly. If the IO slave thread was attempting to connect, `STOP SLAVE` waited for the attempt to finish, sometimes for a long period of time, rather than stopping the slave immediately. ([Bug#31024](#))

See also [Bug#30932](#).

- **Replication:** Issuing a `DROP VIEW` statement caused replication to fail if the view did not actually exist. ([Bug#30998](#))
- **Replication:** Replication of `LOAD DATA INFILE` could fail when `read_buffer_size` was larger than `max_allowed_packet`. ([Bug#30435](#))
- **Replication:** Replication crashed with the NDB storage engine when `mysqld` was started with `-character-set-server=ucs2`. ([Bug#29562](#))
- **Replication:** The effects of scheduled events were not always correctly reproduced on the slave when using row-based replication. ([Bug#29020](#))
- **Replication:** Setting `server_id` did not update its value for the current session. ([Bug#28908](#))
- **Replication:** Some older servers wrote events to the binary log using different numbering from what is currently used, even though the file format number in the file is the same. Slaves running MySQL 5.1.18 and later could not read these binary logs properly. Binary logs from these older versions now are recognized and event numbers are mapped to the current numbering so

that they can be interpreted properly. ([Bug#27779](#), [Bug#32434](#))

This regression was introduced by [Bug#22583](#).

- **Replication:** `MASTER_POS_WAIT()` did not return `NULL` when the server was not a slave. ([Bug#26622](#))
- **Replication:** The inspecific error message `WRONG PARAMETERS TO FUNCTION REGISTER_SLAVE` resulted when `START SLAVE` failed to register on the master due to excess length of any the slave server options `--report-host`, `--report-user`, or `--report-password`. An error message specific to each of these options is now returned in such cases. The new error messages are:
  - `FAILED TO REGISTER SLAVE: TOO LONG 'REPORT-HOST'`
  - `FAILED TO REGISTER SLAVE: TOO LONG 'REPORT-USER'`
  - `FAILED TO REGISTER SLAVE; TOO LONG 'REPORT-PASSWORD'`([Bug#22989](#))

See also [Bug#19328](#).

- **Replication:** `START SLAVE UNTIL MASTER_LOG_POS=position` issued on a slave that was using `-log-slave-updates` and that was involved in circular replication would cause the slave to run and stop one event later than that specified by the value of `position`. ([Bug#13861](#))
- **Replication:** `PURGE BINARY LOGS TO` and `PURGE BINARY LOGS BEFORE` did not handle missing binary log files correctly or in the same way. Now for both of these statements, if any files listed in the `.index` file are missing from the file system, the statement fails with an error.
- Manually replacing a binary log file with a directory having the same name caused an error that was not handled correctly. ([Bug#35675](#))
- Using `LOAD DATA INFILE` with a view could crash the server. ([Bug#35469](#))
- Selecting from `INFORMATION_SCHEMA.REFERENTIAL_CONSTRAINTS` could cause a server crash. ([Bug#35406](#))

See also [Bug#35108](#).

- For a `TEMPORARY` table, `DELETE` with no `WHERE` clause could fail when preceded by `DELETE` statements with a `WHERE` clause. ([Bug#35392](#))
- If the server crashed with an `InnoDB` error due to unavailability of undo slots, errors could persist during rollback when the server was restarted: There are two `UNDO` slot caches (for `INSERT` and `UPDATE`). If all slots end up in one of the slot caches, a request for a slot from the other slot cache would fail. This can happen if the request is for an `UPDATE` slot and all slots are in the `INSERT` slot cache, or vice versa. ([Bug#35352](#))
- In some cases, when too many clients tried to connect to the server, the proper `SQLSTATE` code was not returned. ([Bug#35289](#))
- Memory-allocation failures for attempts to set `key_buffer_size` to large values could result in a server crash. ([Bug#35272](#))
- For `InnoDB` tables, `ALTER TABLE DROP` failed if the name of the column to be dropped began with “foreign”. ([Bug#35220](#))
- Queries could return different results depending on whether `ORDER BY` columns were indexed. ([Bug#35206](#))
- When a view containing a reference to `DUAL` was created, the reference was removed when the definition was stored, causing some queries against the view to fail with invalid SQL syntax errors. ([Bug#35193](#))
- `SELECT ... FROM INFORMATION_SCHEMA.REFERENTIAL_CONSTRAINTS` caused the server to crash if the table referenced by a foreign key had been dropped. This issue was observed on Windows platforms only. ([Bug#35108](#))

See also [Bug#35406](#).

- Debugging symbols were missing for some executables in Windows binary distributions. ([Bug#35104](#))
- Non-connection threads were being counted in the value of the `Max_used_connections` status variable. ([Bug#35074](#))
- A query that performed a `ref_or_null` join where the second table used a key having one or columns that could be `NULL` and had a column value that was `NULL` caused the server to crash. ([Bug#34945](#))

This regression was introduced by [Bug#12144](#).

- For some queries, the optimizer used an ordered index scan for `GROUP BY` or `DISTINCT` when it was supposed to use a loose

index scan, leading to incorrect results. (Bug#34928)

- Creating a foreign key on an `InnoDB` table that was created with an explicit `AUTO_INCREMENT` value caused that value to be reset to 1. (Bug#34920)
- `mysqldump` failed to return an error code when using the `--master-data` option without binary logging being enabled on the server. (Bug#34909)
- Under some circumstances, the value of `mysql_insert_id()` following a `SELECT ... INSERT` statement could return an incorrect value. This could happen when the last `SELECT ... INSERT` did not involve an `AUTO_INCREMENT` column, but the value of `mysql_insert_id()` was changed by some previous statements. (Bug#34889)
- Table and database names were mixed up in some places of the subquery transformation procedure. This could affect debugging trace output and further extensions of that procedure. (Bug#34830)
- If `fsync()` returned `ENOLCK`, `InnoDB` could treat this as fatal and cause abnormal server termination. `InnoDB` now retries the operation. (Bug#34823)
- `CREATE SERVER` and `ALTER SERVER` could crash the server if out-of-memory conditions occurred. (Bug#34790)
- `DROP SERVER` does not release memory cached for server structures created by `CREATE SERVER`, so repeated iterations of these statements resulted in a memory leak. `FLUSH PRIVILEGES` now releases the memory allocated for `CREATE SERVER`. (Bug#34789)
- A malformed URL used for a `FEDERATED` table's `CONNECTION` option value in a `CREATE TABLE` statement was not handled correctly and could crash the server. (Bug#34788)
- Queries such as `SELECT ROW(1, 2) IN (SELECT t1.a, 2) FROM t1 GROUP BY t1.a` (combining row constructors and subqueries in the `FROM` clause) could lead to assertion failure or unexpected error messages. (Bug#34763)
- Using `NAME_CONST()` with a negative number and an aggregate function caused MySQL to crash. This could also have a negative impact on replication. (Bug#34749)
- A memory-handling error associated with use of `GROUP_CONCAT()` in subqueries could result in a server crash. (Bug#34747)
- For an indexed integer column `col_name` and a value `N` that is one greater than the maximum value allowed for the data type of `col_name`, conditions of the form `WHERE col_name < N` failed to return rows where the value of `col_name` is `N - 1`. (Bug#34731)
- A server running with the `--debug` option could attempt to dereference a null pointer when opening tables, resulting in a crash. (Bug#34726)
- Assigning an “incremental” value to the `debug` system variable did not add the new value to the current value. For example, if the current `debug` value was `'T'`, the statement `SET debug = '+P'` resulted in a value of `'P'` rather than the correct value of `'P:T'`. (Bug#34678)
- For debug builds, reading from `INFORMATION_SCHEMA.TABLES` or `INFORMATION_SCHEMA.COLUMNS` could cause assertion failures. This could happen under rare circumstances when `INFORMATION_SCHEMA` fails to get information about a table (for example, when a connection is killed). (Bug#34656)
- Executing a `TRUNCATE` statement on a table having both a foreign key reference and a `DELETE` trigger crashed the server. (Bug#34643)
- Some subqueries using an expression that included an aggregate function could fail or in some cases lead to a crash of the server. (Bug#34620)
- Dangerous pointer arithmetic crashed the server on some systems. (Bug#34598)
- Creating a view inside a stored procedure could lead to a crash of the MySQL Server. (Bug#34587)
- A server crash could occur if `INFORMATION_SCHEMA` tables built in memory were swapped out to disk during query execution. (Bug#34529)
- `CAST(AVG(arg) AS DECIMAL)` produced incorrect results for non-`DECIMAL` arguments. (Bug#34512)
- The per-thread debugging settings stack was not being deallocated before thread termination, resulting in a stack memory leak. (Bug#34424)
- Executing an `ALTER VIEW` statement on a table crashed the server. (Bug#34337)
- `InnoDB` could crash if overflow occurred for an `AUTO_INCREMENT` column. (Bug#34335)

- For InnoDB, exporting and importing a table could corrupt TINYBLOB columns, and a subsequent ALTER TABLE could corrupt TINYTEXT columns as well. (Bug#34300)
  - DEFAULT 0 was not allowed for the YEAR data type. (Bug#34274)
  - Under some conditions, a SET GLOBAL innodb\_commit\_concurrency or SET GLOBAL innodb\_autoextend\_increment statement could fail. (Bug#34223)
  - mysqldump attempts to set the character\_set\_results system variable after connecting to the server. This failed for pre-4.1 servers that have no such variable, but mysqldump did not account for this and 1) failed to dump database contents; 2) failed to produce any error message alerting the user to the problem. (Bug#34192)
  - Use of stored functions in the WHERE clause for SHOW OPEN TABLES caused a server crash. (Bug#34166)
  - For a FEDERATED table with an index on a nullable column, accessing the table could crash a server, return an incorrect result set, or return ERROR 1030 (HY000): Got error 1430 from storage engine. (Bug#33946)
  - Passing anything other than an integer to a LIMIT clause in a prepared statement would fail. (This limitation was introduced to avoid replication problems; for example, replicating the statement with a string argument would cause a parse failure in the slave). Now, arguments to the LIMIT clause are converted to integer values, and these converted values are used when logging the statement. (Bug#33851)
  - An internal buffer in mysql was too short. Overextending it could cause stack problems or segmentation violations on some architectures. (This is not a problem that could be exploited to run arbitrary code.) (Bug#33841)
  - A query using WHERE (column1='string1' AND column2=constant1) OR (column1='string2' AND column2=constant2), where coll used a binary collation and string1 matched string2 except for case, failed to match any records even when matches were found by a query using the equivalent clause WHERE column2=constant1 OR column2=constant2. (Bug#33833)
  - Large unsigned integers were improperly handled for prepared statements, resulting in truncation or conversion to negative numbers. (Bug#33798)
  - Reuse of prepared statements could cause a memory leak in the embedded server. (Bug#33796)
  - The server crashed when executing a query that had a subquery containing an equality X=Y where Y referred to a named select list expression from the parent select. The server crashed when trying to use the X=Y equality for ref-based access. (Bug#33794)
  - Some queries using a combination of IN, CONCAT( ), and an implicit type conversion could return an incorrect result. (Bug#33764)
  - In some cases a query that produced a result set when using ORDER BY ASC did not return any results when this was changed to ORDER BY DESC. (Bug#33758)
  - Disabling concurrent inserts caused some cacheable queries not to be saved in the query cache. (Bug#33756)
  - ORDER BY ... DESC sorts could produce misordered results. (Bug#33697)
  - The server could crash when REPEAT or another control instruction was used in conjunction with labels and a LEAVE instruction. (Bug#33618)
  - The parser allowed control structures in compound statements to have mismatched beginning and ending labels. (Bug#33618)
  - make\_binary\_distribution passed the --print-libgcc-file option to the C compiler, but this does not work with the ICC compiler. (Bug#33536)
  - Threads created by the event scheduler were incorrectly counted against the max\_connections thread limit, which could lead to client lockout. (Bug#33507)
  - Dropping a function after dropping the function's creator could cause the server to crash. (Bug#33464)
  - Certain combinations of views, subselects with outer references and stored routines or triggers could cause the server to crash. (Bug#33389)
  - SET GLOBAL myisam\_max\_sort\_file\_size=DEFAULT set myisam\_max\_sort\_file\_size to an incorrect value. (Bug#33382)
- See also Bug#31177.
- ENUM- or SET-valued plugin variables could not be set from the command line. (Bug#33358)

- Loading plugins via command-line options to `mysqld` could cause an assertion failure. (Bug#33345)
- `SLEEP(0)` failed to return on 64-bit Mac OS X due to a bug in `pthread_cond_timedwait()`. (Bug#33304)
- Using **Control-R** in the `mysql` client caused it to crash. (Bug#33288)
- For `MyISAM` tables, `CHECK TABLE` (non-`QUICK`) and any form of `REPAIR TABLE` incorrecly treated rows as corrupted under the combination of the following conditions:
  - The table had dynamic row format
  - The table had a `CHAR` (not `VARCHAR`) column longer than 127 bytes (for multi-byte character sets this could be less than 127 characters)
  - The table had rows with a significant length of more than 127 bytes significant length in that `CHAR` column (that is, a byte beyond byte position 127 must be a non-space character)

This problem affected `CHECK TABLE`, `REPAIR TABLE`, `OPTIMIZE TABLE`, `ALTER TABLE`. `CHECK TABLE` reported and marked the table as crashed if any row was present that fulfilled the third condition. The other statements deleted these rows. (Bug#33222)

- Granting the `UPDATE` privilege on one column of a view caused the server to crash. (Bug#33201)
- For `DECIMAL` columns used with the `ROUND(X,D)` or `TRUNCATE(X,D)` function with a non-constant value of `D`, adding an `ORDER BY` for the function result produced misordered output. (Bug#33143)

See also Bug#33402, Bug#30617.

- The `CSV` engine did not honor update requests for `BLOB` columns when the new column value had the same length as the value to be updated. (Bug#33067)
- After receiving a `SIGHUP` signal, the server could crash, and user-specified log options were ignored when reopening the logs. (Bug#33065)
- When MySQL was built with OpenSSL, the SSL library was not properly initialized with information of which endpoint it was (server or client), causing connection failures. (Bug#33050)
- Under some circumstances a combination of aggregate functions and `GROUP BY` in a `SELECT` query over a view could lead to incorrect calculation of the result type of the aggregate function. This in turn could lead to incorrect results, or to crashes on debug builds of the server. (Bug#33049)
- For `DISTINCT` queries, 4.0 and 4.1 stopped reading joined tables as soon as the first matching row was found. However, this optimization was lost in MySQL 5.0, which instead read all matching rows. This fix for this regression may result in a major improvement in performance for `DISTINCT` queries in cases where many rows match. (Bug#32942)

- Repeated creation and deletion of views within prepared statements could eventually crash the server. (Bug#32890)

See also Bug#34587.

- Incorrect assertions could cause a server crash for `DELETE` triggers for transactional tables. (Bug#32790)
- In some cases where setting a system variable failed, no error was sent to the client, causing the client to hang. (Bug#32757)
- Enabling the `PAD_CHAR_TO_FULL_LENGTH` SQL mode caused privilege-loading operations (such as `FLUSH PRIVILEGES`) to include trailing spaces from grant table values stored in `CHAR` columns. Authentication for incoming connections failed as a result. Now privilege loading does not include trailing spaces, regardless of SQL mode. (Bug#32753)
- The `SHOW ENGINE INNODB STATUS` and `SHOW ENGINE INNODB MUTEX` statements incorrecly required the `SUPER` privilege rather than the `PROCESS` privilege. (Bug#32710)
- Inserting strings with a common prefix into a table that used the `ucs2` character set corrupted the table. (Bug#32705)
- Tables in the `mysql` database that stored the current `sql_mode` value as part of stored program definitions were not updated with newer mode values (`NO_ENGINE_SUBSTITUTION`, `PAD_CHAR_TO_FULL_LENGTH`). This causes various problems defining stored programs if those modes were included in the current `sql_mode` value. (Bug#32633)
- A view created with a string literal for one of the columns picked up the connection character set, but not the collation. Comparison to that field therefore used the default collation for that character set, causing an error if the connection collation was not compatible with the default collation. The problem was caused by text literals in a view being dumped with a character set introducer even when this was not necessary, sometimes leading to a loss of collation information. Now the character set introducer is dumped only if it was included in the original query. (Bug#32538)

See also [Bug#21505](#).

- Queries using `LIKE` on tables having indexed `CHAR` columns using either of the `euojpms` or `ujis` character sets did not return correct results. ([Bug#32510](#))
- Executing a prepared statement associated with a materialized cursor sent to the client a metadata packet with incorrect table and database names. The problem occurred because the server sent the name of the temporary table used by the cursor instead of the table name of the original table.  
  
The same problem occurred when selecting from a view, in which case the name of the table name was sent, rather than the name of the view. ([Bug#32265](#))
- `InnoDB` adaptive hash latches could be held too long, resulting in a server crash. This fix may also provide significant performance improvements on systems on which many queries using `filesort` with temporary tables are being performed. ([Bug#32149](#))
- On Windows, `mysqltest_embedded.exe` did not properly execute the `send` command. ([Bug#32044](#))
- A variable named `read_only` could be declared even though that is a reserved word. ([Bug#31947](#))
- On Windows, the build process failed with four parallel build threads. ([Bug#31929](#))
- Queries testing numeric constants containing leading zeroes against `ZEROFILL` columns were not evaluated correctly. ([Bug#31887](#))
- If an error occurred during file creation, the server sometimes did not remove the file, resulting in an unused file in the file system. ([Bug#31781](#))
- The `mysqld` crash handler failed on Windows. ([Bug#31745](#))
- When upgrading from MySQL 5.1.19 to any version between MySQL 5.1.20 to MySQL 5.1.23, the MySQL Instance Configuration Wizard would fail to account for the change in name for the `mysqld-nt.exe` to `mysqld.exe`, causing MySQL to fail to start properly after the upgrade. ([Bug#31674](#))
- The server returned the error message `OUT OF MEMORY; RESTART SERVER AND TRY AGAIN` when the actual problem was that the sort buffer was too small. Now an appropriate error message is returned in such cases. ([Bug#31590](#))
- A table having an index that included a `BLOB` or `TEXT` column, and that was originally created with a MySQL server using version 4.1 or earlier, could not be opened by a 5.1 or later server. ([Bug#31331](#))
- The `-`, `*`, and `/` operators and the functions `POW()` and `EXP()` could misbehave when used with floating-point numbers. Previously they might return `+INF`, `-INF`, or `NaN` in cases of numeric overflow (including that caused by division by zero) or when invalid arguments were used. Now `NULL` is returned in all such cases. ([Bug#31236](#))
- The `mysql_change_user()` C API function caused global `Com_XXX` status variable values to be incorrect. ([Bug#31222](#))
- When sorting privilege table rows, the server treated escaped wildcard characters (`\%` and `\_`) the same as unescaped wildcard characters (`%` and `_`), resulting in incorrect row ordering. ([Bug#31194](#))
- On Windows, `SHOW PROCESSLIST` could display process entries with a `State` value of `*** DEAD ***`. ([Bug#30960](#))
- `ROUND(X,D)` or `TRUNCATE(X,D)` for non-constant values of `D` could crash the server if these functions were used in an `ORDER BY` that was resolved using `filesort`. ([Bug#30889](#))
- Resetting the query cache by issuing a `SET GLOBAL query_cache_size=0` statement caused the server to crash if it concurrently was saving a new result set to the query cache. ([Bug#30887](#))
- Manifest problems prevented `MySQLInstanceConfig.exe` from running on Windows Vista. ([Bug#30823](#))
- If an alias was used to refer to the value returned by a stored function within a subselect, the outer select recognized the alias but failed to retrieve the value assigned to it in the subselect. ([Bug#30787](#))
- Binary logging for a stored procedure differed depending on whether or not execution occurred in a prepared statement. ([Bug#30604](#))
- An orphaned PID file from a no-longer-running process could cause `mysql.server` to wait for that process to exit even though it does not exist. ([Bug#30378](#))
- The `Table_locks_waited` waited variable was not incremented in the cases that a lock had to be waited for but the waiting thread was killed or the request was aborted. ([Bug#30331](#))

- The `Com_create_function` status variable was not incremented properly. (Bug#30252)
- View metadata returned from `INFORMATION_SCHEMA.VIEWS` was changed by the fix for Bug#11986, causing the information returned in MySQL 5.1 to differ from that returned in 5.0. (Bug#30217)
- `mysqld` displayed the `--enable-pstack` option in its help message even if MySQL was configured without `--with-pstack`. (Bug#29836)
- The `mysql_config` command would output `CFLAGS` values that were incompatible with C++ for the HP-UX platform. (Bug#29645)
- Views were treated as insertable even if some base table columns with no default value were omitted from the view definition. (This is contrary to the condition for insertability that a view must contain all columns in the base table that do not have a default value.) (Bug#29477)
- `myisamchk` always reported the character set for a table as `latin1_swedish_ci (8)` regardless of the table's actual character set. (Bug#29182)
- `InnoDB` could return an incorrect rows-updated value for `UPDATE` statements. (Bug#29157)
- The MySQL preferences pane did not work to start or stop MySQL on Mac OS X 10.5 (Leopard). (Bug#28854)
- For upgrading to a new major version using RPM packages (such as 4.1 to 5.0), if the installation procedure found an existing MySQL server running, it could fail to shut down the old server, but also erroneously removed the server's socket file. Now the procedure checks for an existing server package from a different vendor or major MySQL version. In such case, it refuses to install the server and recommends how to safely remove the old packages before installing the new ones. (Bug#28555)
- `mysqlhotcopy` silently skipped databases with names consisting of two alphanumeric characters. (Bug#28460)
- No information was written to the general query log for the `COM_STMT_CLOSE`, `COM_STMT_RESET`, and `COM_STMT_SEND_LONG_DATA` commands. (These occur when a client invokes the `mysql_stmt_close()`, `mysql_stmt_reset()` and `mysql_stmt_send_long_data()` C API functions.) (Bug#28386)
- Previously, the parser accepted the ODBC `{ OJ ... LEFT OUTER JOIN ... }` syntax for writing left outer joins. The parser now allows `{ OJ ... }` to be used to write other types of joins, such as `INNER JOIN` or `RIGHT OUTER JOIN`. This helps with compatibility with some third-party applications, but is not official ODBC syntax. (Bug#28317)
- The `FEDERATED` storage engine did not perform identifier quoting for column names that are reserved words when sending statements to the remote server. (Bug#28269)
- The SQL parser did not accept an empty `UNION=()` clause. This meant that, when there were no underlying tables specified for a `MERGE` table, `SHOW CREATE TABLE` and `mysqldump` both output statements that could not be executed.  
  
Now it is possible to execute a `CREATE TABLE` or `ALTER TABLE` statement with an empty `UNION=()` clause. However, `SHOW CREATE TABLE` and `mysqldump` do not output the `UNION=()` clause if there are no underlying tables specified for a `MERGE` table. This also means it is now possible to remove the underlying tables for a `MERGE` table using `ALTER TABLE ... UNION=()`. (Bug#28248)
- It was possible to exhaust memory by repeatedly running `index_merge` queries and never performing any `FLUSH TABLES` statements. (Bug#27732)
- When `utf8` was set as the connection character set, using `SPACE()` with a non-Unicode column produced an error. (Bug#27580)  
  
See also Bug#23637.
- The parser rules for the `SHOW PROFILE` statement were revised to work with older versions of `bison`. (Bug#27433)
- `resolveip` failed to produce correct results for host names that begin with a digit. (Bug#27427)
- In `ORDER BY` clauses, mixing aggregate functions and non-grouping columns is not allowed if the `ONLY_FULL_GROUP_BY` SQL mode is enabled. However, in some cases, no error was thrown because of insufficient checking. (Bug#27219)
- For the `--record_log_pos` option, `mysqlhotcopy` now determines the slave status information from the result of `SHOW SLAVE STATUS` by using the `Relay_Master_Log_File` and `Exec_Master_Log_Pos` values rather than the `Master_Log_File` and `Read_Master_Log_Pos` values. This provides a more accurate indication of slave execution relative to the master. (Bug#27101)
- The MySQL Instance Configuration Wizard would not allow you to choose a service name, even though the criteria for the service name were valid. The code that checks the name has been updated to support the correct criteria of any string less than 256 character and not containing either a forward or backward slash character. (Bug#27013)

- Memory corruption, a crash of the MySQL server, or both, could take place if a low-level I/O error occurred while an `ARCHIVE` table was being opened. (Bug#26978)
- `DROP DATABASE` failed for attempts to drop databases with names that contained the legacy `#mysql150#` name prefix. (Bug#26703)
- `config-win.h` unconditionally defined `bool` as `BOOL`, causing problems on systems where `bool` is 1 byte and `BOOL` is 4 bytes. (Bug#26461)
- On Windows, for distributions built with debugging support, `mysql` could crash if the user typed Control-C. (Bug#26243)
- The XPath `boolean()` function did not cast string and nodeset values correctly in some cases. It now returns `TRUE` for any non-empty string or nodeset and 0 for a `NULL` string, as specified in the XPath standard.. (Bug#26051)
- When symbolic links were disabled, either with a server startup option or by enabling the `NO_DIR_IN_CREATE` SQL mode, `CREATE TABLE` silently ignored the `DATA DIRECTORY` and `INDEX DIRECTORY` table options. Now the server issues a warning if symbolic links are disabled when these table options are used. (Bug#25677)
- Attempting to create an index with a prefix on a `DECIMAL` column appeared to succeed with an inaccurate warning message. Now, this action fails with the error `INCORRECT PREFIX KEY; THE USED KEY PART ISN'T A STRING, THE USED LENGTH IS LONGER THAN THE KEY PART, OR THE STORAGE ENGINE DOESN'T SUPPORT UNIQUE PREFIX KEYS.` (Bug#25426)
- `mysqlcheck -A -r` did not correctly identify all tables that needed repairing. (Bug#25347)
- On Windows, an error in `configure.js` caused installation of source distributions to fail. (Bug#25340)
- The `Qcache_free_blocks` status variable did not display a value of 0 if the query cache was disabled. (Bug#25132)
- The client library had no way to return an error if no connection had been established. This caused problems such as `mysql_library_init()` failing silently if no `errmsg.sys` file was available. (Bug#25097)
- On Mac OS X, the StartupItem for MySQL did not work. (Bug#25008)
- For Windows 64-bit builds, enabling shared-memory support caused client connections to fail. (Bug#24992)
- `mysql` did not use its completion table. Also, the table contained few entries. (Bug#24624)
- If a user installed MySQL Server and set a password for the `root` user, and then uninstalled and reinstalled MySQL Server to the same location, the user could not use the MySQL Instance Config wizard to configure the server because the uninstall operation left the previous data directory intact. The config wizard *assumed* that any new install (not an upgrade) would have the default data directory where the `root` user has no password. The installer now writes a registry key named `FoundExistingDataDir`. If the installer finds an existing data directory, the key will have a value of 1, otherwise it will have a value of 0. When `MySQLInstanceConfig.exe` is run, it will attempt to read the key. If it can read the key, and the value is 1 and there is no existing instance of the server (indicating a new installation), the Config Wizard will allow the user to input the old password so the server can be configured. (Bug#24215)
- Logging of statements to log tables was incorrect for statements that contained `utf8`-incompatible binary strings. Incompatible sequences are hex-encoded now. (Bug#23924)
- The MySQL header files contained some duplicate macro definitions that could cause compilation problems. (Bug#23839)
- `SHOW COLUMNS` on a `TEMPORARY` table caused locking issues. (Bug#23588)
- For distributions compiled with the bundled `libedit` library, there were difficulties using the `mysql` client to enter input for non-ASCII or multi-byte characters. (Bug#23097)
- `pererror` reported incomplete or inaccurate information. (Bug#23028, Bug#25177)
- `InnoDB` exhibited thread thrashing with more than 50 concurrent connections under an update-intensive workload. (Bug#22868)
- After stopping and starting the event scheduler, disabled events could remain in the execution queue. (Bug#22738)
- The server produced a confusing error message when attempting to open a table that required a storage engine that was not loaded. (Bug#22708)
- For views or stored programs created with an invalid `DEFINER` value, the error message was confusing (did not tie the problem to the `DEFINER` clause) and has been improved. (Bug#21854)
- Warnings for deprecated syntax constructs used in stored routines make sense to report only when the routine is being created, but they were also being reported when the routine was parsed for loading into the execution cache. Now they are reported only

at routine creation time. ([Bug#21801](#))

- On Mac OS X, `mysqld` did not react to Ctrl-C when run under `gdb`, even when run with the `--gdb` option. ([Bug#21567](#))
- `CREATE ... SELECT` did not always set `DEFAULT` column values in the new table. ([Bug#21380](#))
- `mysql_config` output did not include `-lmygcc` on some platforms when it was needed. ([Bug#21158](#))
- `mysql-stress-test.pl` and `mysqld_multi.server.sh` were missing from some binary distributions. ([Bug#21023](#), [Bug#25486](#))
- The `BENCHMARK()` function, invoked with more than 2147483648 iterations (the size of a signed 32-bit integer), terminated prematurely. ([Bug#20752](#))
- `mysqldumpslow` returned a confusing error message when no configuration file was found. ([Bug#20455](#))
- `MySQLInstanceConfig.exe` could lose the `innodb_data_home_dir` setting when reconfiguring an instance. ([Bug#19797](#))
- `DROP DATABASE` did not drop orphaned `FOREIGN KEY` constraints. ([Bug#18942](#))
- `CREATE TABLE` allowed 0 as the default value for a `TIMESTAMP` column when the server was running in `NO_ZERO_DATE` mode. ([Bug#18834](#))
- A `SET` column whose definition specified 64 elements could not be updated using integer values. ([Bug#15409](#))
- If a `SELECT` calls a stored function in a transaction, and a statement within the function fails, that statement should roll back. Furthermore, if `ROLLBACK` is executed after that, the entire transaction should be rolled back. Before this fix, the failed statement did not roll back when it failed (even though it might ultimately get rolled back by a `ROLLBACK` later that rolls back the entire transaction). ([Bug#12713](#))

See also [Bug#34655](#).

- The parser incorrectly allowed `SQLSTATE '00000'` to be specified for a condition handler. (This is incorrect because the condition must be a failure condition and `'00000'` indicates success.) ([Bug#8759](#))
- `MySQLInstanceConfig.exe` did not save the `innodb_data_home_dir` value to the `my.ini` file under certain circumstances. ([Bug#6627](#))

## C.2.15. Changes in MySQL 5.1.23 (29 January 2008)

Functionality added or changed:

- **Important Change: Partitioning: Security Fix:** It was possible, by creating a partitioned table using the `DATA DIRECTORY` and `INDEX DIRECTORY` options to gain privileges on other tables having the same name as the partitioned table. As a result of this fix, any table-level `DATA DIRECTORY` or `INDEX DIRECTORY` options are now ignored for partitioned tables. ([Bug#32091](#), [CVE-2007-5970](#))

See also [Bug#29325](#), [Bug#32111](#).

- **Incompatible Change:** In MySQL 5.1.6, when log tables were implemented, the default log destination for the general query and slow query log was `TABLE`. This default has been changed to `FILE`, which is compatible with MySQL 5.0, but incompatible with earlier releases of MySQL 5.1 from 5.1.6 to 5.1.20. If you are upgrading from MySQL 5.0 to 5.1.21 or higher, no logging option changes should be necessary. However, if you are upgrading from 5.1.6 through 5.1.20 to 5.1.21 or higher and were using `TABLE` logging, use the `--log-output=TABLE` option explicitly to preserve your server's table-logging behavior.

The MySQL 5.1.23 fix is in addition to a fix in 5.1.21 because it turned out that the default was set in two places, only one of which was fixed the first time. ([Bug#29993](#))

- **Incompatible Change**

The parser accepted statements that contained `/* ... */` that were not properly closed with `*/`, such as `SELECT 1 /* + 2`. Statements that contain unclosed `/*`-comments now are rejected with a syntax error.

This fix has the potential to cause incompatibilities. Because of [Bug#26302](#), which caused the trailing `*/` to be truncated from comments in views, stored routines, triggers, and events, it is possible that objects of those types may have been stored with definitions that now will be rejected as syntactically invalid. Such objects should be dropped and re-created so that their definitions do not contain truncated comments. ([Bug#28779](#))

- **MySQL Cluster:** The following improvements have been made in the `ndb_size.pl` utility:
  - The script can now be used with multiple databases; lists of databases and tables can also be excluded from analysis.
  - Schema name information has been added to index table calculations.
  - The database name is now an optional parameter, the exclusion of which causes all databases to be examined.
  - If selecting from `INFORMATION_SCHEMA` fails, the script now attempts to fall back to `SHOW TABLES`.
  - A `--real_table_name` option has been added; this designates a table to handle unique index size calculations.
  - The report title has been amended to cover cases where more than one database is being analyzed.Support for a `--socket` option was also added.  
For more information, see `ndb_size.pl`. ([Bug#28683](#), [Bug#28253](#))
- **MySQL Cluster:** Mapping of NDB error codes to MySQL storage engine error codes has been improved. ([Bug#28423](#))
- **MySQL Cluster:** The output from the cluster management client showing the progress of data node starts has been improved. ([Bug#23354](#))
- **Partitioning:** Error messages for partitioning syntax errors have been made more descriptive. ([Bug#29368](#))
- **Replication:** Replication of the following SQL functions now switches to row-based logging in `MIXED` mode, and generates a warning in `STATEMENT` mode:
  - `USER()`
  - `CURRENT_USER()` and its alias `CURRENT_USER`
  - `FOUND_ROWS()`
  - `ROW_COUNT()`See [Section 5.2.4.3, “Mixed Binary Logging Format”](#), for more information. ([Bug#12092](#), [Bug#28086](#), [Bug#30244](#))
- `mysqltest` now has a `change_user` command to change the user for the current connection. (It invokes the `mysql_change_user()` C API function.) ([Bug#31608](#))
- `mysql-test-run.pl` now allows a suite name prefix to be specified in command-line arguments that name test cases. The test name syntax now is `[suite_name.]test_name[.suffix]`. For example, `mysql-test-run.pl binlog.mytest` runs the `mytest.test` test in the `binlog` test suite. ([Bug#31400](#))
- The `--event-scheduler` option without a value disabled the event scheduler. Now it enables the event scheduler. ([Bug#31332](#))
- `mysqldump` produces a `-- Dump completed on DATE` comment at the end of the dump if `--comments` is given. The date causes dump files for identical data take at different times to appear to be different. The new options `--dump-date` and `--skip-dump-date` control whether the date is added to the comment. `--skip-dump-date` suppresses date printing. The default is `--dump-date` (include the date in the comment). ([Bug#31077](#))
- Server parser performance was improved for expression parsing by lowering the number of state transitions and reductions needed. ([Bug#30625](#))
- Server parser performance was improved for identifier lists, expression lists, and UDF expression lists. ([Bug#30333](#))
- Server parser performance was improved for boolean expressions. ([Bug#30237](#))
- The `LAST_EXECUTED` column of the `INFORMATION_SCHEMA.EVENTS` table now indicates when the event started executing rather than when it finished executing. As a result, the `ENDS` column is never less than `LAST_EXECUTED`. ([Bug#29830](#))
- The `mysql_odbc_escape_string()` C API function has been removed. It has multi-byte character escaping issues, doesn't honor the `NO_BACKSLASH_ESCAPES` SQL mode and is not needed anymore by Connector/ODBC as of 3.51.17. ([Bug#29592](#))
- If a `MyISAM` table is created with no `DATA DIRECTORY` option, the `.MYD` file is created in the database directory. By default, if `MyISAM` finds an existing `.MYD` file in this case, it overwrites it. The same applies to `.MYI` files for tables created with no `INDEX DIRECTORY` option. To suppress this behavior, start the server with the new `--keep_files_on_create` option, in which case `MyISAM` will not overwrite existing files and returns an error instead. ([Bug#29325](#))

- The default value of the `connect_timeout` system variable was increased from 5 to 10 seconds. This might help in cases where clients frequently encounter errors of the form `Lost connection to MySQL server at 'XXX', system error: errno.` (Bug#28359)
- MySQL now can be compiled with `gcc 4.2.x`. There was a problem involving a conflict with the `min()` and `max()` macros in `my_global.h`. (Bug#28184)
- `mysql-test-run.pl` now supports a `--combination` option for specifying options to the `mysqld` server. This option is similar to `--mysqld` but should be given two or more times. `mysql-test-run.pl` executes multiple test runs, using the options for each instance of `--combination` in successive runs.

For test runs specific to a given test suite, an alternative to the use of `--combination` is to create a `combinations` file in the suite directory. The file should contain a section of options for each test run.

- The argument for the `mysql-test-run.pl --do-test` and `--skip-test` options is now interpreted as a Perl regular expression if there is a pattern metacharacter in the argument value. This allows more flexible specification of which tests to perform or skip.

Bugs fixed:

- **Security Fix: Replication:** It was possible for any connected user to issue a `BINLOG` statement, which could be used to escalate privileges.

Use of the `BINLOG` statement now requires the `SUPER` privilege. (Bug#31611, CVE-2007-6313)

- **Security Fix:** Three vulnerabilities in `yaSSL` versions 1.7.5 and earlier were discovered that could lead to a server crash or execution of unauthorized code. The exploit requires a server with `yaSSL` enabled and `TCP/IP` connections enabled, but does not require valid `MySQL` account credentials. The exploit does not apply to `OpenSSL`.

#### Note

The proof-of-concept exploit is freely available on the Internet. Everyone with a vulnerable `MySQL` configuration is advised to upgrade *immediately*.

(Bug#33814, CVE-2008-0226, CVE-2008-0227)

- **Security Fix:** Using `RENAME TABLE` against a table with explicit `DATA DIRECTORY` and `INDEX DIRECTORY` options can be used to overwrite system table information by replacing the symbolic link points. the file to which the symlink points.

`MySQL` will now return an error when the file to which the symlink points already exists. (Bug#32111, CVE-2007-5969)

- **Security Fix:** `ALTER VIEW` retained the original `DEFINER` value, even when altered by another user, which could allow that user to gain the access rights of the view. Now `ALTER VIEW` is allowed only to the original definer or users with the `SUPER` privilege. (Bug#29908)
- **Security Fix:** When using a `FEDERATED` table, the local server could be forced to crash if the remote server returned a result with fewer columns than expected. (Bug#29801)
- **Security Enhancement:** It was possible to force an error message of excessive length which could lead to a buffer overflow. This has been made no longer possible as a security precaution. (Bug#32707)
- **Incompatible Change:** It is no longer possible to create `CSV` tables with `NULL` columns. However, for backwards compatibility, you can continue to use such tables that were created in previous `MySQL` releases. (Bug#32050)
- **Incompatible Change:** With `ONLY_FULL_GROUP_BY` SQL mode enabled, queries such as `SELECT a FROM t1 HAVING COUNT(*) > 2` were not being rejected as they should have been.

This fix results in the following behavior:

- There is a check against mixing group and non-group columns *only* when `ONLY_FULL_GROUP_BY` is enabled.
- This check is done both for the select list and for the `HAVING` clause if there is one.

This behavior differs from previous versions as follows:

- Previously, the `HAVING` clause was not checked when `ONLY_FULL_GROUP_BY` was enabled; now it is checked.
- Previously, the select list was checked even when `ONLY_FULL_GROUP_BY` was not enabled; now it is checked only when `ONLY_FULL_GROUP_BY` is enabled.

([Bug#31794](#))

- **Incompatible Change:** Inserting a row with a `NULL` value for a `DATETIME` column results in a `CSV` file that the storage engine cannot read.

All `CSV` tables now need to be defined with each column marked as `NOT NULL`. An error is raised if you try to create a `CSV` table with columns that are not defined with `NOT NULL`. ([Bug#31473](#), [Bug#32817](#))

- **Incompatible Change:** `SET PASSWORD` statements now cause an implicit commit, and thus are prohibited within stored functions and triggers. ([Bug#30904](#))
- **Incompatible Change:** The `mysql_install_db` script could fail to locate some components (including `resolveip`) during execution if the `--basedir` option was specified on the command-line or within the `my.cnf` file. This was due to a conflict when comparing the compiled-in values and the supplied values.

The `--source-install` command-line option to the script has been removed and replaced with the `--srcdir` option. `mysql_install_db` now locates components either using the compiled-in options, the `--basedir` option or `--srcdir` option. ([Bug#30759](#))

- **Incompatible Change:** Multiple-table `DELETE` statements containing ambiguous aliases could have unintended side effects such as deleting rows from the wrong table. Example:

```
DELETE FROM t1 AS a2 USING t1 AS a1 INNER JOIN t2 AS a2;
```

Now alias declarations can be declared only in the `table_references` part. Elsewhere in the statement, alias references are allowed but not alias declarations. Statements containing aliases that are no longer allowed must be rewritten. ([Bug#30234](#))

See also [Bug#27525](#).

- **Incompatible Change:** Within a stored routine, it is no longer allowable to declare a cursor for a `SHOW` or `DESCRIBE` statement. This happened to work in some instances, but is no longer supported. In many cases, a workaround for this change is to use the cursor with a `SELECT` query to read from an `INFORMATION_SCHEMA` table that produces the same information as the `SHOW` statement. ([Bug#29223](#))
- **Incompatible Change:** It was possible to create a view having a column whose name consisted of an empty string or space characters only.

One result of this bug fix is that aliases for columns in the view `SELECT` statement are checked to ensure that they are legal column names. In particular, the length must be within the maximum column length of 64 characters, not the maximum alias length of 256 characters. This can cause problems for replication or loading dump files. For additional information and workarounds, see [Section D.4, "Restrictions on Views"](#). ([Bug#27695](#))

See also [Bug#31202](#).

- **Incompatible Change:** Several type-preserving functions and operators returned an incorrect result type that does not match their argument types: `COALESCE()`, `IF()`, `IFNULL()`, `LEAST()`, `GREATEST()`, `CASE`. These now aggregate using the precise SQL types of their arguments rather than the internal type. In addition, the result type of the `STR_TO_DATE()` function is now `DATETIME` by default. ([Bug#27216](#))
- **Incompatible Change:** `GRANT` and `REVOKE` statements now cause an implicit commit, and thus are prohibited within stored functions and triggers. ([Bug#21975](#), [Bug#21422](#), [Bug#17244](#))
- **Incompatible Change:** It was possible for option files to be read twice at program startup, if some of the standard option file locations turned out to be the same directory. Now duplicates are removed from the list of files to be read.

Also, users could not override system-wide settings using `~/my.cnf` because `SYSCONFDIR/my.cnf` was read last. The latter file now is read earlier so that `~/my.cnf` can override system-wide settings.

The fix for this problem had a side effect such that on Unix, MySQL programs looked for options in `~/my.cnf` rather than the standard location of `~/my.cnf`. That problem was addressed as [Bug#38180](#). ([Bug#20748](#))

- **Incompatible Change:** A number of problems existed in the implementation of `MERGE` tables that could cause problems. The problems are summarized below:
  - [Bug#26379](#) - Combination of `FLUSH TABLE` and `REPAIR TABLE` corrupts a `MERGE` table. This was caused in a number of situations:
    1. A thread trying to lock a `MERGE` table performs busy waiting while `REPAIR TABLE` or a similar table administration task is ongoing on one or more of its MyISAM tables.

2. A thread trying to lock a `MERGE` table performs busy waiting until all threads that did `REPAIR TABLE` or similar table administration tasks on one or more of its MyISAM tables in `LOCK TABLES` segments do `UNLOCK TABLES`. The difference against problem #1 is that the busy waiting takes place after the administration task. It is terminated by `UNLOCK TABLES` only.
  3. Two `FLUSH TABLES` within a `LOCK TABLES` segment can invalidate the lock. This does not require a `MERGE` table. The first `FLUSH TABLES` can be replaced by any statement that requires other threads to reopen the table. In 5.0 and 5.1 a single `FLUSH TABLES` can provoke the problem.
- [Bug#26867](#) - Simultaneously executing `LOCK TABLES` and `REPAIR TABLE` on a `MERGE` table would result in memory/cpu hogging.

Trying DML on a `MERGE` table, which has a child locked and repaired by another thread, made an infinite loop in the server.

- [Bug#26377](#) - Deadlock with `MERGE` and `FLUSH TABLE`  
Locking a `MERGE` table and its children in parent-child order and flushing the child deadlocked the server.
- [Bug#25038](#) - Waiting `TRUNCATE`  
Truncating a `MERGE` child, while the `MERGE` table was in use, let the truncate fail instead of waiting for the table to become free.
- [Bug#25700](#) - `MERGE` base tables get corrupted by `OPTIMIZE/ANALYZE/REPAIR TABLE`  
Repairing a child of an open `MERGE` table corrupted the child. It was necessary to `FLUSH` the child first.
- [Bug#30275](#) - `MERGE` tables: `FLUSH TABLES` or `UNLOCK TABLES` causes server to crash.  
Flushing and optimizing locked `MERGE` children crashed the server.
- [Bug#19627](#) - temporary merge table locking  
Use of a temporary `MERGE` table with non-temporary children could corrupt the children.  
Temporary tables are never locked. Creation of tables with non-temporary children of a temporary `MERGE` table is now prohibited.
- [Bug#27660](#) - `Falcon`: `MERGE` table possible  
It was possible to create a `MERGE` table with non-`MyISAM` children.
- [Bug#30273](#) - `MERGE` tables: Can't lock file (errno: 155)  
This was a Windows-only bug. Table administration statements sometimes failed with "Can't lock file (errno: 155)".

The fix introduces the following changes in behavior:

- This patch changes the behavior of temporary `MERGE` tables. Temporary `MERGE` must have temporary children. The old behavior was wrong. A temporary table is not locked. Hence even non-temporary children were not locked. See [Bug#19627](#).
- You cannot change the union list of a non-temporary `MERGE` table when `LOCK TABLES` is in effect. The following does *not* work:

```
CREATE TABLE m1 ... ENGINE=MRG_MYISAM ...;
LOCK TABLES t1 WRITE, t2 WRITE, m1 WRITE;
ALTER TABLE m1 ... UNION=(t1,t2) ...;
```

However, you can do this with a temporary `MERGE` table.

- You cannot create a `MERGE` table with `CREATE ... SELECT`, neither as a temporary `MERGE` table, nor as a non-temporary `MERGE` table. For example, `CREATE TABLE m1 ... ENGINE=MRG_MYISAM ... SELECT ...;` causes the error message: `TABLE IS NOT BASE TABLE`.

([Bug#19627](#), [Bug#25038](#), [Bug#25700](#), [Bug#26377](#), [Bug#26379](#), [Bug#26867](#), [Bug#27660](#), [Bug#30275](#), [Bug#30491](#))

- **Important Change: MySQL Cluster:** `AUTO_INCREMENT` columns had the following problems when used in `NDB` tables:
  - The `AUTO_INCREMENT` counter was not updated correctly when such a column was updated.

- `AUTO_INCREMENT` values were not prefetched beyond statement boundaries.
- `AUTO_INCREMENT` values were not handled correctly with `INSERT IGNORE` statements.
- After being set, `ndb_autoincrement_prefetch_sz` showed a value of 1, regardless of the value it had actually been set to.

As part of this fix, the behavior of `ndb_autoincrement_prefetch_sz` has changed. Setting this to less than 32 no longer has any effect on prefetching within statements (where IDs are now always obtained in batches of 32 or more), but only between statements. The default value for this variable has also changed, and is now 1. ([Bug#25176](#), [Bug#31956](#), [Bug#32055](#))

- **Partitioning: Important Note:** An apostrophe or single quote character (') used in the `DATA DIRECTORY`, `INDEX DIRECTORY`, or `COMMENT` for a `PARTITION` clause caused the server to crash. When used as part of a `CREATE TABLE` statement, the crash was immediate. When used in an `ALTER TABLE` statement, the crash did not occur until trying to perform a `SELECT` or DML statement on the table. In either case, the server could not be completely restarted until the `.FRM` file corresponding to the newly created or altered table was deleted.

### Note

Upgrading to the current (or later) release solves this problem only for tables that are newly created or altered. Tables created or altered in previous versions of the server to include ' characters in `PARTITION` options must still be removed by deleting the corresponding `.FRM` files and re-creating them afterwards.

([Bug#30695](#))

- **Important Note:** The `RENAME DATABASE` statement was removed and replaced with `ALTER DATABASE db_name UPGRADE DATA DIRECTORY NAME`. The `RENAME DATABASE` statement was intended for upgrading database directory names to the encoding format used in 5.1 for representing identifiers in the file system (see [Section 8.2.3](#), “Mapping of Identifiers to File Names”). However, the statement was found to be dangerous because it could result in loss of database contents. See [Section 12.1.32](#), “`RENAME DATABASE Syntax`”, and [Section 12.1.1](#), “`ALTER DATABASE Syntax`”. ([Bug#17565](#), [Bug#21741](#), [Bug#28360](#))

- **Replication: MySQL Cluster:** Row-based replication from or to a big-endian machine where the table used the `NDB` storage engine failed, if the same table on the other machine was either non-`NDB` or the other machine was little-endian. ([Bug#29549](#), [Bug#30790](#))

See also [Bug#24231](#), [Bug#30024](#), [Bug#30133](#), [Bug#30134](#).

- **MySQL Cluster:** An improperly reset internal signal was observed as a hang when using events in the `NDB` API but could result in various errors. ([Bug#33206](#))
- **MySQL Cluster:** Incorrectly handled parameters could lead to a crash in the Transaction Coordinator during a node failure, causing other data nodes to fail. ([Bug#33168](#))
- **MySQL Cluster:** A memory leak occurred if a subscription start request was received by the subscription manager before the node making the request was fully connected to the cluster. ([Bug#32652](#))
- **MySQL Cluster:** A local checkpoint could sometimes be started before the previous LCP was restorable from a global checkpoint. ([Bug#32519](#))
- **MySQL Cluster:** High numbers of API nodes on a slow or congested network could cause connection negotiation to time out prematurely, leading to the following issues:
  - Excessive retries
  - Excessive CPU usage
  - Partially connected API nodes([Bug#32359](#))
- **MySQL Cluster:** When a `mysqld` acting as a cluster SQL node starts the `NDBCLUSTER` storage engine, there is a delay during which some necessary data structures cannot be initialized until after it has connected to the cluster, and all MySQL Cluster tables should be opened as read-only. This worked correctly when the `NDB` binlog thread was running, but when it was not running, Cluster tables were not opened as read-only even when the data structures had not yet been set up. ([Bug#32275](#), [Bug#33763](#))
- **MySQL Cluster:** The failure of a master node could lead to subsequent failures in local checkpointing. ([Bug#32160](#))
- **MySQL Cluster:** The management server was slow to respond when no data nodes were connected to the cluster. This was most noticeable when running `SHOW` in the management client. ([Bug#32023](#))

- **MySQL Cluster:** An error with an `if` statement in `sql/ha_ndbcluster.cc` could potentially lead to an infinite loop in case of failure when working with `AUTO_INCREMENT` columns in `NDB` tables. (Bug#31810)
- **MySQL Cluster:** The `NDB` storage engine code was not safe for strict-alias optimization in `gcc` 4.2.1. (Bug#31761)
- **MySQL Cluster:** It was possible in some cases for a node group to be “lost” due to missed local checkpoints following a system restart. (Bug#31525)
- **MySQL Cluster:** A query against a table with `TEXT` or `BLOB` columns that would return more than a certain amount of data failed with `GOT ERROR 4350 'TRANSACTION ALREADY ABORTED' FROM NDBCLUSTER`. (Bug#31482)

This regression was introduced by Bug#29102.

- **MySQL Cluster:** `NDB` tables having names containing non-alphanumeric characters (such as “\$”) were not discovered correctly. (Bug#31470)
- **MySQL Cluster:** A node failure during a local checkpoint could lead to a subsequent failure of the cluster during a system restart. (Bug#31257)
- **MySQL Cluster:** A cluster restart could sometimes fail due to an issue with table IDs. (Bug#30975)
- **MySQL Cluster:** When handling `BLOB` columns, the addition of read locks to the lock queue was not handled correctly. (Bug#30764)
- **MySQL Cluster:** Discovery of `NDB` tables did not work correctly with `INFORMATION_SCHEMA`. (Bug#30667)
- **MySQL Cluster:** A file system close operation could fail during a node or system restart. (Bug#30646)
- **MySQL Cluster:** Transaction timeouts were not handled well in some circumstances, leading to excessive number of transactions being aborted unnecessarily. (Bug#30379)
- **MySQL Cluster:** The cluster management client could not connect, and would hang instead. This issue affected Mac OS X 64-bit only. (Bug#30366)
- **MySQL Cluster:** Attempting to restore a backup made on a cluster host using one endian to a machine using the other endian could cause the cluster to fail. (Bug#29674)
- **MySQL Cluster:** Log event requests to `ndb_mgmd` could time out, causing it to fail. (Bug#29621)
- **MySQL Cluster:** In some cases, the cluster management server logged entries multiple times following a restart of `mgmd`. (Bug#29565)
- **MySQL Cluster:** `ndb_mgm --help` did not display any information about the `-a` option. (Bug#29509)
- **MySQL Cluster:** An interpreted program of sufficient size and complexity could cause all cluster data nodes to shut down due to buffer overruns. (Bug#29390)
- **MySQL Cluster:** `ndb_size.pl` failed on tables with `FLOAT` columns whose definitions included commas (for example, `FLOAT(6,2)`). (Bug#29228)
- **MySQL Cluster:** The error message for `NDB` error code 275 (`OUT OF TRANSACTION RECORDS FOR COMPLETE PHASE`) was missing. (Bug#29139)
- **MySQL Cluster:** Reads on `BLOB` columns were not locked when they needed to be to guarantee consistency. (Bug#29102)

See also Bug#31482.

- **MySQL Cluster:** A query using joins between several large tables and requiring unique index lookups failed to complete, eventually returning `UNKNOWN ERROR` after a very long period of time. This occurred due to inadequate handling of instances where the Transaction Coordinator ran out of `TransactionBufferMemory`, when the cluster should have returned `NDB` error code 4012 (`REQUEST NDBD TIME-OUT`). (Bug#28804)
- **MySQL Cluster:** There was a short interval during the startup process prior to the beginning of heartbeat detection such that, were an API or management node to reboot or a network failure to occur, data nodes could not detect this, with the result that there could be a lingering connection. (Bug#28445)
- **MySQL Cluster:** The description of the `--print` option provided in the output from `ndb_restore --help` was incorrect. (Bug#27683)
- **MySQL Cluster:** Restoring a backup made on a cluster host using one endian to a machine using the other endian failed for `BLOB` and `DATETIME` columns. (Bug#27543, Bug#30024)

- **MySQL Cluster:** An invalid subselect on an `NDB` table could cause `mysqld` to crash. (Bug#27494)
- **MySQL Cluster:** An attempt to perform a `SELECT ... FROM INFORMATION_SCHEMA.TABLES` whose result included information about `NDB` tables for which the user had no privileges crashed the MySQL Server on which the query was performed. (Bug#26793)
- **MySQL Cluster:** Performing `DELETE` operations after a data node had been shut down could lead to inconsistent data following a restart of the node. (Bug#26450)
- **MySQL Cluster:** `UPDATE IGNORE` could sometimes fail on `NDB` tables due to the use of uninitialized data when checking for duplicate keys to be ignored. (Bug#25817)
- **MySQL Cluster:** The cluster log was formatted inconsistently and contained extraneous newline characters. (Bug#25064)
- **MySQL Cluster:** A restart of the cluster failed when more than 1 REDO phase was in use. (Bug#22696)
- **MySQL Cluster:** When inserting a row into an `NDB` table with a duplicate value for a non-primary unique key, the error issued would reference the wrong key.

This improves on an initial fix for this issue made in MySQL 5.1.13. (Bug#21072)

- **MySQL Cluster:** An insufficiently descriptive and potentially misleading Error 4006 (`CONNECT FAILURE - OUT OF CONNECTION OBJECTS...`) was produced when either of the following two conditions occurred:
    1. There were no more transaction records in the transaction coordinator
    2. An `NDB` object in the `NDB` API was initialized with insufficient parallelism
 Separate error messages are now generated for each of these two cases. (Bug#11313)
  - **Partitioning: Replication:** Replication of partitioned tables using the `InnoDB` storage engine failed with `binlog-format=ROW` or `binlog-format=MIXED`. (Bug#28430)
  - **Partitioning:** It was possible to partition a table to which a foreign key referred. (Bug#32948)
  - **Partitioning:** A query of the form `SELECT col1 FROM table GROUP BY (SELECT col2 FROM table LIMIT 1)` against a partitioned `table` having a `SET` column crashed the server. (Bug#32772)
  - **Partitioning:** `SHOW CREATE TABLE` misreported the value of `AUTO_INCREMENT` for partitioned tables using either of the `InnoDB` or `ARCHIVE` storage engines. (Bug#32247)
  - **Partitioning:** Selecting from `INFORMATION_SCHEMA.PARTITIONS` while partition management statements (for example, `ALTER TABLE ... ADD PARTITION`) were executing caused the server to crash. (Bug#32178)
  - **Partitioning:** An error in the internal function `mysql_unpack_partition()` led to a fatal error in subsequent calls to `open_table_from_share()`. (Bug#32158)
  - **Partitioning:** Repeated updates of a table that was partitioned by `KEY` on a `TIMESTAMP` column eventually crashed the server. (Bug#32067)
  - **Partitioning:** Changing the storage engine used by a table having subpartitions led to a server crash. (Bug#31893)
  - **Partitioning:** `ORDER BY ... DESC` did not always work correctly when selecting from partitioned tables. (Bug#31890)
- See also Bug#31001.
- **Partitioning:** Selecting from a table partitioned by `KEY` on a `VARCHAR` column whose size was greater than 65530 caused the server to crash. (Bug#31705)
  - **Partitioning:** `INSERT DELAYED` on a partitioned table crashed the server. The server now rejects the statement with an error. (Bug#31210)
  - **Partitioning:** Using `ALTER TABLE` to partition an existing table having an `AUTO_INCREMENT` column could crash the server. (Bug#30878)
- This regression was introduced by Bug#27405.
- **Partitioning:** `ALTER TABLE ... COALESCE PARTITION` on a table partitioned by `[LINEAR] HASH` or `[LINEAR] KEY` caused the server to crash. (Bug#30822)
  - **Partitioning:** `LIKE` queries on tables partitioned by `KEY` and using third-party storage engines could return incomplete results. (Bug#30480)

See also [Bug#29320](#), [Bug#29493](#), [Bug#30563](#).

- **Partitioning:** It was not possible to insert the greatest possible value for a given data type into a partitioned table. For example, consider a table defined as shown here:

```
CREATE TABLE t (c BIGINT UNSIGNED)
PARTITION BY RANGE(c) (
PARTITION p0 VALUES LESS THAN MAXVALUE
);
```

The largest possible value for a `BIGINT UNSIGNED` column is 18446744073709551615, but the statement `INSERT INTO t VALUES (18446744073709551615);` would fail, even though the same statement succeeded were `t` not a partitioned table.

In other words, `MAXVALUE` was treated as being equal to the greatest possible value, rather than as a least upper bound. ([Bug#29258](#))

- **Cluster Replication: Replication:** A node failure during replication could lead to buckets out of order; now active subscribers are checked for, rather than empty buckets. ([Bug#31701](#))
- **Cluster Replication: Replication:** Incorrect handling of `INSERT` plus `DELETE` operations with regard to local checkpoints caused data node failures in multi-master replication setups. ([Bug#30914](#))
- **Replication:** When dropping a database containing a stored procedure while using row-based replication, the delete of the stored procedure from the `mysql.proc` table was recorded in the binary log following the `DROP DATABASE` statement. To correct this issue, `DROP DATABASE` now uses statement-based replication. ([Bug#32435](#))
- **Replication:** It was possible for the name of the relay log file to exceed the amount of memory reserved for it, possibly leading to a crash of the server. ([Bug#31836](#))

See also [Bug#28597](#).

- **Replication:** Corruption of log events caused the server to crash on 64-bit Linux systems having 4 GB of memory or more. ([Bug#31793](#))
- **Replication:** Trying to replicate an update of a row that was missing on the slave led to a failure on the slave. ([Bug#31702](#))
- **Replication:** Use of the `@@hostname` system variable in inserts in `mysql_system_tables_data.sql` did not replicate. The workaround is to select its value into a user variable (which does replicate) and insert that. ([Bug#31167](#))
- **Replication:** Table names were displayed as binary “garbage” characters in slave error messages. The issue was observed on 64-bit Windows but may have effected other platforms. ([Bug#30854](#))
- **Replication:** One thread could read uninitialized memory from the stack of another thread. This issue was only known to occur in a `mysqld` process acting as both a master and a slave. ([Bug#30752](#))
- **Replication:** It was possible to set `SQL_SLAVE_SKIP_COUNTER` such that the slave would jump into the middle of a transaction. This fix improves on one made for this bug in MySQL 5.1.20; the previous fix insured that the slave could not be made to jump into the middle of an event group, but the slave failed to recognize that `BEGIN`, `COMMIT`, and `ROLLBACK` statements could begin or end an event group. ([Bug#28618](#))

See also [Bug#12691](#).

- **Replication:** Due a previous change in how the default name and location of the binary log file were determined, replication failed following some upgrades. ([Bug#28597](#), [Bug#28603](#))

See also [Bug#31836](#).

This regression was introduced by [Bug#20166](#).

- **Replication:** Stored procedures having `BIT` parameters were not replicated correctly. ([Bug#26199](#))
- **Replication:** Issuing `SHOW SLAVE STATUS` as `mysqld` was shutting down could cause a crash. ([Bug#26000](#))
- **Replication:** If a temporary error occurred inside an event group on an event that was not the first event of the group, the slave could get caught in an endless loop because the retry counter was reset whenever an event was executed successfully. ([Bug#24860](#))

See also [Bug#12691](#), [Bug#23171](#).

- **Replication:** An `UPDATE` statement using a stored function that modified a non-transactional table was not logged if it failed. This caused the copy of the non-transactional table on the master have a row that the copy on the slave did not.

In addition, when an `INSERT ... ON DUPLICATE KEY UPDATE` statement encountered a duplicate key constraint, but the `UPDATE` did not actually change any data, the statement was not logged. As a result of this fix, such statements are now treated the same for logging purposes as other `UPDATE` statements, and so are written to the binary log. (Bug#23333)

See also [Bug#12713](#).

- **Replication:** A replication slave sometimes failed to reconnect because it was unable to run `SHOW SLAVE HOSTS`. It was not necessary to run this statement on slaves (since the master should track connection IDs), and the execution of this statement by slaves was removed. (Bug#21132)

See also [Bug#13963](#), [Bug#21869](#).

- **Replication:** A replication slave sometimes stopped for changes that were idempotent (that is, such changes should have been considered “safe”), even though it should have simply noted that the change was already done, and continued operation. (Bug#19958)
- **Replication:** Replicating from a master table to a slave table where the size of a `CHAR` or `VARCHAR` column was a different size would cause `mysqld` to crash. For more information on replicating with different column definitions, see [Section 16.3.1.4, “Replication with Differing Tables on Master and Slave”](#).
- **Cluster Replication:** A replication slave could return “garbage” data that was not in recognizable row format due to a problem with the internal `all_set()` method. (Bug#33375)
- **Cluster Replication:** Memory was mistakenly freed for `NdbBlob` objects when adding an index while replicating the cluster, which could cause `mysqld` to crash. (Bug#33142)

See also [Bug#18106](#).

- **Cluster Replication:** Under certain conditions, the slave stopped processing relay logs. This resulted in the logs never being cleared and the slave eventually running out of disk space. (Bug#31958)
- **Cluster Replication:** Replicating `NDB` tables with extra `VARCHAR` columns on the master caused the slave to fail. (Bug#31646)

See also [Bug#29549](#).

- **Cluster Replication:** When the master `mysqld` crashed or was restarted, no `LOST_EVENTS` entry was made in the binlog. (Bug#31484)

See also [Bug#21494](#).

- **Cluster Replication:** An issue with the `mysql.ndb_apply_status` table could cause `NDB` schema autodiscovery to fail in certain rare circumstances. (Bug#20872)
- **Cluster API:** A call to `CHECK_TIMEDOUT_RET()` in `mgmapi.cpp` should have been a call to `DBG_CHECK_TIMEDOUT_RET()`. (Bug#30681)
- **API:** When the language option was not set correctly, API programs calling `mysql_server_init()` crashed. This issue was observed only on Windows platforms. (Bug#31868)
- Corrected a typecast involving `bool` on Mac OS X 10.5 (Leopard), which evaluated differently from earlier Mac OS X versions. (Bug#38217)

- Use of uninitialized memory for `filesort` in a subquery caused a server crash. (Bug#33675)
- `CREATE TABLE ... SELECT` created tables that for date columns used the obsolete `Field_date` type instead of `Field_newdate`. (Bug#33256)
- Some valid `SELECT` statements could not be used as views due to incorrect column reference resolution. (Bug#33133)
- The fix for [Bug#11230](#) and [Bug#26215](#) introduced a significant input-parsing slowdown for the `mysql` client. This has been corrected. (Bug#33057)
- The correct data type for a `NULL` column resulting from a `UNION` could be determined incorrectly in some cases: 1) Not correctly inferred as `NULL` depending on the number of selects; 2) Not inferred correctly as `NULL` if one select used a subquery. (Bug#32848)
- For queries containing `GROUP_CONCAT(DISTINCT col_list ORDER BY col_list)`, there was a limitation that the `DISTINCT` columns had to be the same as `ORDER BY` columns. Incorrect results could be returned if this was not true. (Bug#32798)

- `SHOW EVENTS` and selecting from the `INFORMATION_SCHEMA.EVENTS` table failed if the current database was `INFORMATION_SCHEMA`. (Bug#32775)
- Use of the `cp932` character set with `CAST()` in an `ORDER BY` clause could cause a server crash. (Bug#32726)
- A subquery using an `IS NULL` check of a column defined as `NOT NULL` in a table used in the `FROM` clause of the outer query produced an invalid result. (Bug#32694)
- `mysqld_safe` looked for error messages in the wrong location. (Bug#32679)
- Specifying a non-existent column for an `INSERT DELAYED` statement caused a server crash rather than producing an error. (Bug#32676)
- An issue with the `NO_ENGINE_SUBSTITUTION sql_mode` database can cause the creation of stored routines to fail. If you are having problems with creating stored routines while using this `sql_mode` value, remove this value from your `sql_mode` setting. (Bug#32633)
- Use of `CLIENT_MULTI_QUERIES` caused `libmysqld` to crash. (Bug#32624)
- The `INTERVAL()` function incorrectly handled `NULL` values in the value list. (Bug#32560)
- Use of a `NULL`-returning `GROUP BY` expression in conjunction with `WITH ROLLUP` could cause a server crash. (Bug#32558)  
See also Bug#31095.
- `ORDER BY UpdateXML(...)` caused the server to crash in queries where `UpdateXML()` returned `NULL`. (Bug#32557)
- A `SELECT ... GROUP BY bit_column` query failed with an assertion if the length of the `BIT` column used for the `GROUP BY` was not an integer multiple of 8. (Bug#32556)
- Using `SELECT INTO OUTFILE` with 8-bit `ENCLOSED BY` characters led to corrupted data when the data was reloaded using `LOAD DATA INFILE`. This was because `SELECT INTO OUTFILE` failed to escape the 8-bit characters. (Bug#32533)
- For `FLUSH TABLES WITH READ LOCK`, the server failed to properly detect write-locked tables when running with low-priority updates, resulting in a crash or deadlock. (Bug#32528)
- The rules for valid column names were being applied differently for base tables and views. (Bug#32496)
- A query of the form `SELECT @user_variable := constant AS alias FROM table GROUP BY alias WITH ROLLUP` crashed the server. (Bug#32482)
- Sending several `KILL QUERY` statements to target a connection running `SELECT SLEEP()` could freeze the server. (Bug#32436)
- `ssl-cipher` values in option files were not being read by `libmysqlclient`. (Bug#32429)
- Repeated execution of a query containing a `CASE` expression and numerous `AND` and `OR` relations could crash the server. The root cause of the issue was determined to be that the internal `SEL_ARG` structure was not properly initialized when created. (Bug#32403)
- Referencing within a subquery an alias used in the `SELECT` list of the outer query was incorrectly permitted. (Bug#32400)
- If a global read lock acquired with `FLUSH TABLES WITH READ LOCK` was in effect, executing `ALTER TABLE` could cause a server crash. (Bug#32395)
- An `ORDER BY` query on a view created using a `FEDERATED` table as a base table caused the server to crash. (Bug#32374)
- The `mysqldump` utility did not print enough version information about itself at the top of its output. The output now shows the same information as `mysqldump` invoked with the `-V` option, namely the `mysqldump` version number, the MySQL server version, and the distribution. (Bug#32350)
- Comparison of a `BIGINT NOT NULL` column with a constant arithmetic expression that evaluated to `NULL` mistakenly caused the error `COLUMN '...' CANNOT BE NULL` (error 1048). (Bug#32335)
- Assigning a 65,536-byte string to a `TEXT` column (which can hold a maximum of 65,535 bytes) resulted in truncation without a warning. Now a truncation warning is generated. (Bug#32282)
- The `LAST_DAY()` function returns a `DATE` value, but internally the value did not have the time fields zeroed and calculations involving the value could return incorrect results. (Bug#32270)
- `MIN()` and `MAX()` could return incorrect results when an index was present if a loose index scan was used. (Bug#32268)

- Some uses of user variables in a query could result in a server crash. (Bug#32260)
- Memory corruption could occur due to large index map in `Range checked for each record` status reported by `EXPLAIN SELECT`. The problem was based in an incorrectly calculated length of the buffer used to store a hexadecimal representation of an index map, which could result in buffer overrun and stack corruption under some circumstances. (Bug#32241)
- Various test program cleanups were made: 1) `mytest` and `libmysqltest` were removed. 2) `bug25714` displays an error message when invoked with incorrect arguments or the `--help` option. 3) `mysql_client_test` exits cleanly with a proper error status. (Bug#32221)
- The default grant tables on Windows contained information for host `production.mysql.com`, which should not be there. (Bug#32219)
- Under certain conditions, the presence of a `GROUP BY` clause could cause an `ORDER BY` clause to be ignored. (Bug#32202)
- For comparisons of the form `date_col OP datetime_const` (where `OP` is `=`, `<`, `>`, `<=`, or `>=`), the comparison is done using `DATETIME` values, per the fix for Bug#27590. However that fix caused any index on `date_col` not to be used and compromised performance. Now the index is used again. (Bug#32198)
- `DATETIME` arguments specified in numeric form were treated by `DATE_ADD()` as `DATE` values. (Bug#32180)
- Killing a statement could lead to a race condition in the server. (Bug#32148)
- `InnoDB` does not support `SPATIAL` indexes, but could crash when asked to handle one. Now an error is returned. (Bug#32125)
- The server crashed on optimizations involving a join of `INT` and `MEDIUMINT` columns and a system variable in the `WHERE` clause. (Bug#32103)
- `mysql-test-run.pl` used the `--user` option when starting `mysqld`, which produces warnings if the current user is not `root`. Now `--user` is added only for `root`. (Bug#32078)
- `mysqlslap` was missing from the MySQL 5.1.22 Linux RPM packages. (Bug#32077)
- With `lower_case_table_names` set, `CREATE TABLE LIKE` was treated differently by `libmysqld` than by the non-embedded server. (Bug#32063)
- Within a subquery, `UNION` was handled differently than at the top level, which could result in incorrect results or a server crash. (Bug#32036, Bug#32051)
- On 64-bit platforms, assignments of values to enumeration-valued storage engine-specific system variables were not validated and could result in unexpected values. (Bug#32034)
- A `DELETE` statement with a subquery in the `WHERE` clause would sometimes ignore an error during subquery evaluation and proceed with the delete operation. (Bug#32030)
- Using dates in the range `'0000-00-01'` to `'0000-00-99'` range in the `WHERE` clause could result in an incorrect result set. (These dates are not in the supported range for `DATE`, but different results for a given query could occur depending on position of records containing the dates within a table.) (Bug#32021)
- User-defined functions are not loaded if the server is started with the `--skip-grant-tables` option, but the server did not properly handle this case and issued an `OUT OF MEMORY` error message instead. (Bug#32020)
- If a user-defined function was used in a `SELECT` statement, and an error occurred during UDF initialization, the error did not terminate execution of the `SELECT`, but rather was converted to a warning. (Bug#32007)
- `HOUR()`, `MINUTE()`, and `SECOND()` could return nonzero values for `DATE` arguments. (Bug#31990)
- Changing the SQL mode to cause dates with “zero” parts to be considered invalid (such as `'1000-00-00'`) could result in indexed and non-indexed searches returning different results for a column that contained such dates. (Bug#31928)
- The server used unnecessarily large amounts of memory when user variables were used as an argument to `CONCAT()` or `CONCAT_WS()`. (Bug#31898)
- In debug builds, testing the result of an `IN` subquery against `NULL` caused an assertion failure. (Bug#31884)
- `mysql-test-run.pl` sometimes set up test scenarios in which the same port number was passed to multiple servers, causing one of them to be unable to start. (Bug#31880)
- `SHOW CREATE TRIGGER` caused a server crash. (Bug#31866)

- The server crashed after insertion of a negative value into an `AUTO_INCREMENT` column of an `InnoDB` table. (Bug#31860)
- For `libmysqld` applications, handling of `mysql_change_user()` calls left some pointers improperly updated, leading to server crashes. (Bug#31850)
- Using `ORDER BY` led to the wrong result when using the `ARCHIVE` on a table with a `BLOB` when the table cache was full. The table could also be reported as crashed after the query had completed, even though the table data was intact. (Bug#31833)
- Comparison results for `BETWEEN` were different from those for operators like `<` and `>` for `DATETIME`-like values with trailing extra characters such as `'2007-10-01 00:00:00 GMT-6'`. `BETWEEN` treated the values as `DATETIME`, whereas the other operators performed a binary-string comparison. Now they all uniformly use a `DATETIME` comparison, but generate warnings for values with trailing garbage. (Bug#31800)
- Name resolution for correlated subqueries and `HAVING` clauses failed to distinguish which of two was being performed when there was a reference to an outer aliased field. This could result in error messages about a `HAVING` clause for queries that had no such clause. (Bug#31797)
- The server could crash during `filesort` for `ORDER BY` based on expressions with `INET_NTOA()` or `OCT()` if those functions returned `NULL`. (Bug#31758)
- For tables with certain definitions, `UPDATE` statements could fail to find the correct record to update and report an error when the record did in fact exist. (Bug#31747)
- For a fatal error during a filesort in `find_all_keys()`, the error was returned without the necessary handler uninitialization, causing an assertion failure. (Bug#31742)
- `mysqldslap` failed to commit after the final record load. (Bug#31704)
- The examined-rows count was not incremented for `const` queries. (Bug#31700)
- The server crashed if a thread was killed while locking the `general_log` table at the beginning of statement processing. (Bug#31692)
- The `mysql_change_user()` C API function was subject to buffer overflow. (Bug#31669)
- For `SELECT ... INTO OUTFILE`, if the `ENCLOSED BY` string is empty and the `FIELDS TERMINATED BY` string started with a special character (one of `n`, `t`, `r`, `b`, `0`, `Z`, or `N`), every occurrence of the character within field values would be duplicated. (Bug#31663)
- `SHOW COLUMNS` and `DESCRIBE` displayed `null` as the column type for a view with no valid definer. This caused `mysqldump` to produce a non-reloadable dump file for the view. (Bug#31662)
- The `mysqlbug` script did not include the correct values of `CFLAGS` and `CXXFLAGS` that were used to configure the distribution. (Bug#31644)
- Queries that include a comparison of an `INFORMATION_SCHEMA` table column to `NULL` caused a server crash. (Bug#31633)
- `EXPLAIN EXTENDED` for `SELECT` from `INFORMATION_SCHEMA` tables caused an assertion failure. (Bug#31630)
- `ucs2` does not work as a client character set, but attempts to use it as such were not rejected. Now `character_set_client` cannot be set to `ucs2`. This also affects statements such as `SET NAMES` and `SET CHARACTER SET`. (Bug#31615)
- A buffer used when setting variables was not dimensioned to accommodate the trailing `'\0'` byte, so a single-byte buffer overrun was possible. (Bug#31588)
- `HAVING` could treat lettercase of table aliases incorrectly if `lower_case_table_names` was enabled. (Bug#31562)
- Spurious duplicate-key errors could occur for multiple-row inserts into an `InnoDB` table that activate a trigger. (Bug#31540)
- Using `ALTER EVENT` to rename a disabled event caused it to become enabled. (Bug#31539)
- The fix for Bug#24989 introduced a problem such that a `NULL` thread handler could be used during a rollback operation. This problem is unlikely to be seen in practice. (Bug#31517)
- The length of the result from `IFNULL()` could be calculated incorrectly because the sign of the result was not taken into account. (Bug#31471)
- Queries that used the `ref` access method or index-based subquery execution over indexes that have `DECIMAL` columns could fail with an error `Column col_name cannot be null`. (Bug#31450)

- `InnoDB` now tracks locking and use of tables by MySQL only after a table has been successfully locked on behalf of a transaction. Previously, the locked flag was set and the table in-use counter was updated before checking whether the lock on the table succeeded. A subsequent failure in obtaining a lock on the table led to an inconsistent state as the table was neither locked nor in use. (Bug#31444)
  - `SELECT 1 REGEX NULL` caused an assertion failure for debug servers. (Bug#31440)
  - The `UpdateXML()` function did not check for the validity of all its arguments; in some cases, this could lead to a crash of the server. (Bug#31438)
  - The `mysql_change_user()` C API function caused advisory locks (obtained with `GET_LOCK()`) to malfunction. (Bug#31418)
  - NDB libraries and include files were missing from some binary `tar` file distributions. (Bug#31414)
  - Executing `RENAME` while tables were open for use with `HANDLER` statements could cause a server crash. (Bug#31409)
  - `mysql-test-run.pl` tried to create files in a directory where it could not be expected to have write permission. `mysqltest` created `.reject` files in a directory other than the one where test results go. (Bug#31398)
  - For a table that had been opened with `HANDLER` and marked for reopening after being closed with `FLUSH TABLES, DROP TABLE` did not properly discard the handler. (Bug#31397)
  - Automatically allocated memory for string options associated with a plugin was not freed if the plugin did not get installed. (Bug#31382)
  - `INFORMATION_SCHEMA.TABLES` was returning incorrect information. (Bug#31381)
  - `DROP USER` caused an increase in memory usage. (Bug#31347)
  - For `InnoDB` tables with `READ COMMITTED` isolation level, semi-consistent reads used for `UPDATE` statements skipped rows locked by another transaction, rather than waiting for the locks to be released. Consequently, rows that possibly should have been updated were never examined. (Bug#31310)
  - For an almost-full `MyISAM` table, an insert that failed could leave the table in a corrupt state. (Bug#31305)
  - `myisamchk --unpack` could corrupt a table that when unpacked has static (fixed-length) row format. (Bug#31277)
  - `CONVERT(val, DATETIME)` would fail on invalid input, but processing was not aborted for the `WHERE` clause, leading to a server crash. (Bug#31253)
  - Allocation of an insufficiently large group-by buffer following creation of a temporary table could lead to a server crash. (Bug#31249)
  - Use of `DECIMAL(n, n) ZEROFILL` in `GROUP_CONCAT()` could cause a server crash. (Bug#31227)
  - When a `TIMESTAMP` with a nonzero time part was converted to a `DATE` value, no warning was generated. This caused index lookups to assume that this is a valid conversion and was returning rows that match a comparison between a `TIMESTAMP` value and a `DATE` keypart. Now a warning is generated so that `TIMESTAMP` with a nonzero time part will not match `DATE` values. (Bug#31221)
  - Server variables could not be set to their current values on Linux platforms. (Bug#31177)
- See also [Bug#6958](#).
- With small values of `myisam_sort_buffer_size`, `REPAIR TABLE` for `MyISAM` tables could cause a server crash. (Bug#31174)
  - If `MAKETIME()` returned `NULL` when used in an `ORDER BY` that was evaluated using `filesort`, a server crash could result. (Bug#31160)
  - Data in `BLOB` or `GEOMETRY` columns could be cropped when performing a `UNION` query. (Bug#31158)
  - `LAST_INSERT_ID()` execution could be handled improperly in subqueries. (Bug#31157)
  - An assertion designed to detect a bug in the `ROLLUP` implementation would incorrectly be triggered when used in a subquery context with non-cacheable statements. (Bug#31156)
  - Selecting spatial types in a `UNION` could cause a server crash. (Bug#31155)
  - Use of `GROUP_CONCAT(DISTINCT bit_column)` caused an assertion failure. (Bug#31154)

- The server crashed in the parser when running out of memory. Memory handling in the parser has been improved to gracefully return an error when out-of-memory conditions occur in the parser. ([Bug#31153](#))
- MySQL declares a `UNIQUE` key as a `PRIMARY` key if it doesn't have `NULL` columns and is not a partial key, and the `PRIMARY` key must always be the first key. However, in some cases, a non-first key could be reported as `PRIMARY`, leading to an assert failure by `InnoDB`. This is fixed by correcting the key sort order. ([Bug#31137](#))
- `mysqldump` failed to handle databases containing a `'` character in the name. ([Bug#31113](#))
- Starting the server using `--read-only` and with the Event Scheduler enabled caused it to crash.

**Note**

This issue occurred only when the server had been built with certain nonstandard combinations of `configure` options.

([Bug#31111](#))

- `GROUP BY NULL WITH ROLLUP` could cause a server crash. ([Bug#31095](#))

See also [Bug#32558](#).

- A rule to prefer `filesort` over an indexed `ORDER BY` when accessing all rows of a table was being used even if a `LIMIT` clause was present. ([Bug#31094](#))
- `REGEXP` operations could cause a server crash for character sets such as `ucs2`. Now the arguments are converted to `utf8` if possible, to allow correct results to be produced if the resulting strings contain only 8-bit characters. ([Bug#31081](#))
- Expressions of the form `WHERE col NOT IN (col, ...)`, where the same column was named both times, could cause a server crash in the optimizer. ([Bug#31075](#))
- Internal conversion routines could fail for several multi-byte character sets (`big5`, `cp932`, `euckr`, `gb2312`, `sjis`) for empty strings or during evaluation of `SOUNDS LIKE`. ([Bug#31069](#), [Bug#31070](#))
- Many nested subqueries in a single query could lead to excessive memory consumption and possibly a crash of the server. ([Bug#31048](#))
- Using `ORDER BY` with `ARCHIVE` tables caused a server crash. ([Bug#31036](#))
- A server crash could occur when a non-`DETERMINISTIC` stored function was used in a `GROUP BY` clause. ([Bug#31035](#))
- The `MOD()` function and the `%` operator crashed the server for a divisor less than 1 with a very long fractional part. ([Bug#31019](#))
- Transactions were committed prematurely when `LOCK TABLE` and `SET autocommit = 0` were used together. ([Bug#30996](#))
- On Windows, the `pthread_mutex_trylock()` implementation was incorrect. ([Bug#30992](#))
- A character set introducer followed by a hexadecimal or bit-value literal did not check its argument and could return an ill-formed result for invalid input. ([Bug#30986](#))
- `CHAR(str USING charset)` did not check its argument and could return an ill-formed result for invalid input. ([Bug#30982](#))
- The result from `CHAR(str USING ucs2)` did not add a leading 0x00 byte for input strings with an odd number of bytes. ([Bug#30981](#))
- The `GeomFromText()` function could cause a server crash if the first argument was `NULL` or the empty string. ([Bug#30955](#))
- `MAKEDATE()` incorrectly moved year values in the 100-200 range into the 1970-2069 range. (This is legitimate for 00-99, but three-digit years should be used unchanged.) ([Bug#30951](#))
- When invoked with constant arguments, `STR_TO_DATE()` could use a cached value for the format string and return incorrect results. ([Bug#30942](#))
- `GROUP_CONCAT()` returned `' , '` rather than an empty string when the argument column contained only empty strings. ([Bug#30897](#))
- For `MEMORY` tables, lookups for `NULL` values in `BTREE` indexes could return incorrect results. ([Bug#30885](#))

- A server crash could occur if a stored function that contained a `DROP TEMPORARY TABLE` statement was invoked by a `CREATE TEMPORARY TABLE` statement that created a table of the same name. (Bug#30882)
- Calling `NAME_CONST()` with non-constant arguments triggered an assertion failure. Non-constant arguments are now disallowed. (Bug#30832)
- For a spatial column with a regular (non-`SPATIAL`) index, queries failed if the optimizer tried to use the index. (Bug#30825)
- Values for the `--tc-heuristic-recover` option incorrectly were treated as values for the `--myisam-stats-method` option. (Bug#30821)
- `INFORMATION_SCHEMA.SCHEMATA` was returning incorrect information. (Bug#30795)
- The optimizer incorrectly optimized conditions out of the `WHERE` clause in some queries involving subqueries and indexed columns. (Bug#30788)
- Improper calculation of `CASE` expression results could lead to value truncation. (Bug#30782)
- On Windows, the `pthread_mutex_trylock()` implementation was incorrect. One symptom was that invalidating the query cache could cause a server crash. (Bug#30768)
- A multiple-table `UPDATE` involving transactional and non-transactional tables caused an assertion failure. (Bug#30763)
- User-supplied names foreign key names might not be set to the right key, leading to foreign keys with no name. (Bug#30747)
- Under some circumstances, `CREATE TABLE ... SELECT` could crash the server or incorrectly report that the table row size was too large. (Bug#30736)
- Using the `MIN()` or `MAX()` function to select one part of a multi-part key could cause a crash when the function result was `NULL`. (Bug#30715)
- The embedded server did not properly check column-level privileges. (Bug#30710)
- `INFORMATION_SCHEMA.VIEWS.VIEW_DEFINITION` was incorrect for views that were defined to select from other `INFORMATION_SCHEMA` tables. (Bug#30689)
- Issuing an `ALTER SERVER` statement to update the settings for a `FEDERATED` server would cause the `mysqld` to crash. (Bug#30671)
- The optimizer could ignore `ORDER BY` in cases when the result set is ordered by `filesort`, resulting in rows being returned in incorrect order. (Bug#30666)
- A different execution plan was displayed for `EXPLAIN` than would actually have been used for the `SELECT` because the test of sort keys for `ORDER BY` did not consider keys mentioned in `IGNORE KEYS FOR ORDER BY`. (Bug#30665)
- The `thread_handling` system variable was treated as having a `SESSION` value and as being settable at runtime. Now it has only a `GLOBAL` read-only value. (Bug#30651)
- On Windows, `LIMIT` arguments greater than  $2^{32}$  did not work correctly. (Bug#30639)
- `MyISAM` tables could not exceed 4294967295 ( $2^{32} - 1$ ) rows on Windows. (Bug#30638)
- A failed `HANDLER ... READ` operation could leave the table in a locked state. (Bug#30632)
- `mysql-test-run.pl` could not run `mysqld` with `root` privileges. (Bug#30630)
- The `mysqld_safe` script contained a syntax error. (Bug#30624)
- The optimization that uses a unique index to remove `GROUP BY` did not ensure that the index was actually used, thus violating the `ORDER BY` that is implied by `GROUP BY`. (Bug#30596)
- `SHOW STATUS LIKE 'Ssl_cipher_list'` from a MySQL client connected via SSL returned an empty string rather than a list of available ciphers. (Bug#30593)
- For `MEMORY` tables, `DELETE` statements that remove rows based on an index read could fail to remove all matching rows. (Bug#30590)
- Using `GROUP BY` on an expression of the form `timestamp_col DIV number` caused a server crash due to incorrect calculation of number of decimals. (Bug#30587)
- Executing a `SELECT COUNT(*)` query on an `InnoDB` table partitioned by `KEY` that used a `DOUBLE` column as the partition-

ing key caused the server to crash. ([Bug#30583](#))

- The options available to the `CHECK TABLE` statement were also allowed in `OPTIMIZE TABLE` and `ANALYZE TABLE` statements, but caused corruption during their execution. These options were never supported for these statements, and an error is now raised if you try to apply these options to these statements. ([Bug#30495](#))
- A self-referencing trigger on a partitioned table caused the server to crash instead of failing with an error. ([Bug#30484](#))
- The `mysql_change_user()` C API function did not correctly reset the character set variables to the values they had just after initially connecting. ([Bug#30472](#))
- When expanding a `*` in a `USING` or `NATURAL` join, the check for table access for both tables in the join was done using only the grant information of the first table. ([Bug#30468](#))
- When casting a string value to an integer, cases where the input string contained a decimal point and was long enough to overrun the `unsigned long long` type were not handled correctly. The position of the decimal point was not taken into account which resulted in miscalculated numbers and incorrect truncation to appropriate SQL data type limits. ([Bug#30453](#))
- Versions of `mysqldump` from MySQL 4.1 or higher tried to use `START TRANSACTION WITH CONSISTENT SNAPSHOT` if the `--single-transaction` and `--master-data` options were given, even with servers older than 4.1 that do not support consistent snapshots. ([Bug#30444](#))
- With `libmysqld`, use of prepared statements and the query cache at the same time caused problems. ([Bug#30430](#))
- Issuing a `DELETE` statement having both an `ORDER BY` clause and a `LIMIT` clause could cause `mysqld` to crash. ([Bug#30385](#))
- For `CREATE ... SELECT ... FROM`, where the resulting table contained indexes, adding `SQL_BUFFER_RESULT` to the `SELECT` part caused index corruption in the table. ([Bug#30384](#))
- The `Last_query_cost` status variable value can be computed accurately only for simple “flat” queries, not complex queries such as those with subqueries or `UNION`. However, the value was not consistently being set to 0 for complex queries. ([Bug#30377](#))
- The optimizer made incorrect assumptions about the value of the `is_member` value for user-defined functions, sometimes resulting in incorrect ordering of UDF results. ([Bug#30355](#))
- Queries that had a `GROUP BY` clause and selected `COUNT(DISTINCT bit_column)` returned incorrect results. ([Bug#30324](#))
- Some valid `euc-kr` characters having the second byte in the ranges `[0x41..0x5A]` and `[0x61..0x7A]` were rejected. ([Bug#30315](#))
- When loading a dynamic plugin on FreeBSD, the plugin would fail to load. This was due to a build error where the required symbols would be not exported correctly. ([Bug#30296](#))
- Simultaneous `ALTER TABLE` statements for `BLACKHOLE` tables caused 100% CPU use due to locking problems. ([Bug#30294](#))
- Setting certain values on a table using a spatial index could cause the server to crash. ([Bug#30286](#))
- Tables with a `GEOMETRY` column could be marked as corrupt if you added a non-`SPATIAL` index on a `GEOMETRY` column. ([Bug#30284](#))
- Flushing a merge table between the time it was opened and its child table were actually attached caused the server to crash. ([Bug#30273](#))

This regression was introduced by [Bug#26379](#).

- The query cache does not support retrieval of statements for which column level access control applies, but the server was still caching such statements, thus wasting memory. ([Bug#30269](#))
- Using `DISTINCT` or `GROUP BY` on a `BIT` column in a `SELECT` statement caused the column to be cast internally as an integer, with incorrect results being returned from the query. ([Bug#30245](#))
- `GROUP BY` on `BIT` columns produced incorrect results. ([Bug#30219](#))
- Short-format `mysql` commands embedded within `/*! ... */` comments were parsed incorrectly by `mysql`, which discarded the rest of the comment including the terminating `*/` characters. The result was a malformed (unclosed) comment. Now `mysql` does not discard the `*/` characters. ([Bug#30164](#))

- If the server crashed during an `ALTER TABLE` statement, leaving a temporary file in the database directory, a subsequent `DROP DATABASE` statement failed due to the presence of the temporary file. (Bug#30152)
- When `mysqldump` wrote `DROP DATABASE` statements within version-specific comments, it included the terminating semicolon in the wrong place, causing following statements to fail when the dump file was reloaded. (Bug#30126)
- It was not possible for client applications to distinguish between auto-set and auto-updated `TIMESTAMP` column values.  
To rectify this problem, a new `ON_UPDATE_NOW_FLAG` flag is set by `Field_timestamp` constructors whenever a column should be set to `NOW` on `UPDATE`, and the `get_schema_column_record()` function now reports whether a timestamp column is set to `NOW` on `UPDATE`. In addition, such columns now display `on update CURRENT_TIMESTAMP` in the `Extra` column in the output from `SHOW COLUMNS`. (Bug#30081)
- Some `INFORMATION_SCHEMA` tables are intended for internal use, but could be accessed by using `SHOW` statements. (Bug#30079)
- On some 64-bit systems, inserting the largest negative value into a `BIGINT` column resulted in incorrect data. (Bug#30069)
- `mysqlslap` did not properly handle multiple result sets from stored procedures. (Bug#29985)
- Specifying the `--without-geometry` option for `configure` caused server compilation to fail. (Bug#29972)
- Statements within stored procedures ignored the value of the `low_priority_updates` system variable. (Bug#29963)

See also Bug#26162.

- With auto-reconnect enabled, row fetching for a prepared statement could crash after reconnect occurred because loss of the statement handler was not accounted for. (Bug#29948)
- `mysqldump --skip-events --all-databases` dumped data from the `mysqld.event` table, and when restoring from this dump, events were created in spite of the `--skip-events` option. (Bug#29938)
- When `mysqlslap` was given a query to execute from a file via a `--query=file_name` option, it executed the query one too many times. (Bug#29803)
- `configure` did not find `nss` on some Linux platforms. (Bug#29658)
- It was possible when creating a partitioned table using `CREATE TABLE ... SELECT` to refer in the `PARTITION BY` clause to columns in the table being selected from, which could cause the server to crash. An example of such a statement is:

```
CREATE TABLE t1 (b INT)
PARTITION BY RANGE(t2.b) (
  PARTITION p1 VALUES LESS THAN (10),
  PARTITION p2 VALUES LESS THAN (20)
)
SELECT * FROM t2;
```

The fix is to disallow references in `PARTITION BY` clauses to columns not in the table being created. (Bug#29444)

- If a view used a function in its `SELECT` statement, the columns from the view were not inserted into the `INFORMATION_SCHEMA.COLUMNS` table. (Bug#29408)
- The `mysql` client program now ignores Unicode byte order mark (BOM) characters at the beginning of input files. Previously, it read them and sent them to the server, resulting in a syntax error.

Presence of a BOM does not cause `mysql` to change its default character set. To do that, invoke `mysql` with an option such as `--default-character-set=utf8`. (Bug#29323)

- For transactional tables, an error during a multiple-table `DELETE` statement did not roll back the statement. (Bug#29136)
- The `log` and `log_slow_queries` system variables were displayed by `SHOW VARIABLES` but could not be accessed in expressions as `@@log` and `@@log_slow_queries`. Also, attempting to set them with `SET` produced an incorrect `Unknown system variable` message. Now these variables are treated as synonyms for `general_log` and `slow_query_log`, which means that they can be accessed in expressions and their values can be changed with `SET`. (Bug#29131)
- Denormalized double-precision numbers cannot be handled properly by old MIPS processors. For IRIX, this is now handled by enabling a mode to use a software workaround. (Bug#29085)
- `SHOW VARIABLES` did not display the `relay_log`, `relay_log_index`, or `relay_log_info_file` system variables. (Bug#28893)
- When doing a `DELETE` on a table that involved a `JOIN` with `MyISAM` or `MERGE` tables and the `JOIN` referred to the same table, the operation could fail reporting `ERROR 1030 (HY000): Got error 134 from storage engine`. This was because scans on the table contents would change because of rows that had already been deleted. (Bug#28837)

- Killing an SSL connection on platforms where MySQL is compiled with `-DSIGNAL_WITH_VIO_CLOSE` (Windows, Mac OS X, and some others) could crash the server. (Bug#28812)
- `SHOW VARIABLES` did not correctly display the value of the `thread_handling` system variable. (Bug#28785)
- On Windows, `mysql_upgrade` created temporary files in `C:\` and did not clean them up. (Bug#28774)
- Index hints specified in view definitions were ignored when using the view to select from the base table. (Bug#28702)
- Views do not have indexes, so index hints do not apply. Use of index hints when selecting from a view is now disallowed. (Bug#28701)
- After changing the SQL mode to a restrictive value that would make already-inserted dates in a column be considered invalid, searches returned different results depending on whether the column was indexed. (Bug#28687)
- When running the MySQL Instance Configuration Wizard, a race condition could exist that would fail to connect to a newly configured instance. This was because `mysqld` had not completed the startup process before the next stage of the installation process. (Bug#28628)
- A `SELECT` in one connection could be blocked by `INSERT ... ON DUPLICATE KEY UPDATE` in another connection even when `low_priority_updates` is set. (Bug#28587)
- `mysql_upgrade` could run binaries dynamically linked against incorrect versions of shared libraries. (Bug#28560)
- The result from `CHAR( )` was incorrectly assumed in some contexts to return a single-byte result. (Bug#28550)
- `mysqldump` reversed the event name and program name in one of its error messages. (Bug#28535)
- If a `LIMIT` clause was present, the server could fail to consider indexes that could be used for `ORDER BY` or `GROUP BY`. (Bug#28404)
- The parser confused user-defined function (UDF) and stored function creation for `CREATE FUNCTION` and required that there be a default database when creating UDFs, although there is no such requirement. (Bug#28318, Bug#29816)
- Fast-mutex locking was not thread-safe and optimization-safe on some platforms, which could cause program failures such as out-of-memory errors. (Bug#28284)
- The result of a comparison between `VARBINARY` and `BINARY` columns differed depending on whether the `VARBINARY` column was indexed. (Bug#28076)
- The metadata in some `MYSQL_FIELD` members could be incorrect when a temporary table was used to evaluate a query. (Bug#27990)
- Partition pruning was not used for queries having `<=` or `>=` conditions in the `WHERE` clause on a table using `TO_DAYS( )` in the partitioning expression. (Bug#27927)
- `mysqlbinlog` produced incorrectly formatted `DATETIME` and `TIMESTAMP` values. (Bug#27894)
- Failure to log to the `general_log` or `slow_log` log tables were not logged to the error log at all or were logged incorrectly. (Bug#27858)
- An `ORDER BY` at the end of a `UNION` affected individual `SELECT` statements rather than the overall query result. (Bug#27848)
- `comp_err` created files with permissions such that they might be inaccessible during `make install` operations. (Bug#27789)
- `SHOW COLUMNS` returned `NULL` instead of the empty string for the `Default` value of columns that had no default specified. (Bug#27747)
- With recent versions of `DBD::mysql`, `mysqlhotcopy` generated table names that were doubly qualified with the database name. (Bug#27694)
- The anonymous accounts were not being created during MySQL installation. (Bug#27692)
- Some `SHOW` statements and `INFORMATION_SCHEMA` queries could expose information not allowed by the user's access privileges. (Bug#27629)
- `ALTER TABLE tbl_name ROW_FORMAT=format_type` did not cause the table to be rebuilt. (Bug#27610)
- A race condition between killing a statement and the thread executing the statement could lead to a situation such that the bin-

ary log contained an event indicating that the statement was killed, whereas the statement actually executed to completion. (Bug#27571)

- Some character mappings in the `ascii.xml` file were incorrect.

As a result of this bug fix, indexes must be rebuilt for columns that use the `ascii_general_ci` collation for columns that contain any of these characters: `'`', '['', '\', ']', '~'`. See Section 2.12.3, “Checking Whether Table Indexes Must Be Rebuilt”. (Bug#27562)

- Some queries using the `NAME_CONST()` function failed to return either a result or an error to the client, causing it to hang. This was due to the fact that there was no check to insure that both arguments to this function were constant expressions. (Bug#27545, Bug#32559)
- With the `read_only` system variable enabled, `CREATE DATABASE` and `DROP DATABASE` were allowed to users who did not have the `SUPER` privilege. (Bug#27440)
- For an event with an `ON COMPLETION` value of `PRESERVE`, an `ALTER EVENT` statement that specified no `ON COMPLETION` option caused the value to become `NOT PRESERVE`. (Bug#27407)
- MySQL failed to generate or retrieve an `AUTO_INCREMENT` primary key for `InnoDB` tables with user-defined partitioning. (Bug#27405)
- Changes to the `sql_mode` system variable were not tracked by `INSERT DELAYED`. (Bug#27358)
- A `SELECT` with more than 31 nested dependent subqueries returned an incorrect result. (Bug#27352)
- The `ExtractValue()` and `UpdateXML()` functions performed extremely slowly for large amounts of XML data (greater than 64 KB). These functions now execute approximately 2000 times faster than previously. (Bug#27287)
- On Windows, writes to the debug log were using `freopen()` instead of `fflush()`, resulting in slower performance. (Bug#27099)
- For a table that used different full-text parsers for different `FULLTEXT` indexes, `SHOW CREATE TABLE` displayed the first parser name for all of them. (Bug#27040)
- `STR_TO_DATE()` displayed an error message that referred to `STR_TO_TIME()`. (Bug#27014)
- The `mysql_insert_id()` C API function sometimes returned different results for `libmysqld` and `libmysqlclient`. (Bug#26921)
- Symbolic links on Windows could fail to work. (Bug#26811)
- `mysqld` sometimes miscalculated the number of digits required when storing a floating-point number in a `CHAR` column. This caused the value to be truncated, or (when using a debug build) caused the server to crash. (Bug#26788)

See also Bug#12860.

- `LOAD DATA INFILE` ran very slowly when reading large files into partitioned tables. (Bug#26527)
- It makes no sense to attempt to use `ALTER TABLE ... ORDER BY` to order an `InnoDB` table if there is a user-defined clustered index, because rows are always ordered by the clustered index. Such attempts now are ignored and produce a warning.

Also, in some cases, `InnoDB` incorrectly used a secondary index when the clustered index would produce a faster scan. `EXPLAIN` output now indicates use of the clustered index (for tables that have one) as lines with a `type` value of `index`, a `key` value of `PRIMARY`, and without `Using index` in the `Extra` value. (Bug#26447)

See also Bug#35850.

- Using `HANDLER` to open a table having a storage engine not supported by `HANDLER` properly returned an error, but also improperly prevented the table from being dropped by other connections. (Bug#25856)
- For a prepared statement `stmt`, changing the default database following `PREPARE stmt` but before `EXECUTE stmt` caused `stmt` to be recorded incorrectly in the binary log. (Bug#25843)
- `CREATE TABLE LIKE` did not work when the source table was an `INFORMATION_SCHEMA` table. (Bug#25629)
- Threads that were calculating the estimated number of records for a range scan did not respond to the `KILL` statement. That is, if a `range` join type is possible (even if not selected by the optimizer as a join type of choice and thus not shown by `EXPLAIN`), the query in the `statistics` state (shown by the `SHOW PROCESSLIST`) did not respond to the `KILL` statement. (Bug#25421)

- For InnoDB tables, `CREATE TABLE a AS SELECT * FROM A` would fail. (Bug#25164)
- For `mysql --show-warnings`, warnings were in some cases not displayed. (Bug#25146)
- The `returns` column of the `mysql.proc` table was `CHAR(64)`, which is not long enough to store long data types such as `ENUM` types. The column has been changed to `LONGBLOB` and a warning is generated if truncation occurs when storing a row into the `proc` table. (Bug#24923)
- If the expected precision of an arithmetic expression exceeded the maximum precision supported by MySQL, the precision of the result was reduced by an unpredictable or arbitrary amount, rather than to the maximum precision. In some cases, exceeding the maximum supported precision could also lead to a crash of the server. (Bug#24907)
- For Vista installs, `MySQLInstanceConfig.exe` did not add the default MySQL port to the firewall exceptions. It now provides a checkbox that enables the user a choice of whether to do this. (Bug#24853)
- A `CREATE TRIGGER` statement could cause a deadlock or server crash if it referred to a table for which a table lock had been acquired with `LOCK TABLES`. (Bug#23713)
- For storage engines that do not redefine `handler::index_next_same()` and are capable of indexes, statements that include a `WHERE` clause might select incorrect data. (Bug#22351)
- The parser treated the `INTERVAL()` function incorrectly, leading to situations where syntax errors could result depending on which side of an arithmetic operator the function appeared. (Bug#22312)
- Entries in the general query log were truncated at 1000 characters. (Bug#21557)
- A memory leak occurred when `CREATE TEMPORARY TABLE ... SELECT` was invoked from a stored function that in turn was called from `CREATE TABLE ... SELECT`. (Bug#21136)
- It was possible to execute `CREATE TABLE t1 ... SELECT ... FROM t2` with the `CREATE` privilege for `t1` and `SELECT` privilege for `t2`, even in the absence of the `INSERT` privilege for `t1`. (Bug#20901)
- Worked around an `icc` problem with an incorrect machine instruction being generated in the context of software pre-fetching after a subroutine got in-lined. (Upgrading to `icc 10.0.026` makes the workaround unnecessary.) (Bug#20803)
- If a column selected by a view referred to a stored function, the data type reported for the column in `INFORMATION_SCHEMA.COLUMNS` could be incorrect. (Bug#20550)
- The `mysql_change_user()` C API function changed the value of the `sql_big_selects` session variable. (Bug#20023)  
See also Bug#40363.
- Host names sometimes were treated as case sensitive in account-management statements (`CREATE USER`, `GRANT`, `REVOKE`, and so forth). (Bug#19828)
- Issuing an SQL `KILL` of the active connection caused an error on Mac OS X. (Bug#19723)
- The `readline` library has been updated to version 5.2. This addresses issues in the `mysql` client where history and editing within the client would fail to work as expected. (Bug#18431)
- The `-lmtmalloc` library was removed from the output of `mysql_config` on Solaris, as it caused problems when building `DBD:mysql` (and possibly other applications) on that platform that tried to use `dlopen()` to access the client library. (Bug#18322)
- `MySQLInstanceConfig.exe` failed to grant certain privileges to the `'root'@'%'` account. (Bug#17303)
- The `Aborted_clients` status variable was incremented twice if a client exited without calling `mysql_close()`. (Bug#16918)
- Use of `GRANT` statements with grant tables from an old version of MySQL could cause a server crash. (Bug#16470)
- Clients were ignoring the TCP/IP port number specified as the default port via the `--with-tcp-port` configuration option. (Bug#15327)
- Parameters of type `DATETIME` or `DATE` in stored procedures were silently converted to `VARBINARY`. (Bug#13675)
- Zero-padding of exponent values was not the same across platforms. (Bug#12860)
- Values of types `REAL ZEROFILL`, `DOUBLE ZEROFILL`, `FLOAT ZEROFILL`, were not zero-filled when converted to a character representation in the C prepared statement API. (Bug#11589)

- `mysql` stripped comments from statements sent to the server. Now the `--comments` or `--skip-comments` option can be used to control whether to retain or strip comments. The default is `--skip-comments`. (Bug#11230, Bug#26215)
  - Several buffer-size system variables were either being handled incorrectly for large values (for settings larger than 4GB, they were truncated to values less than 4GB without a warning), or were limited unnecessarily to 4GB even on 64-bit systems. The following changes were made:
    - For `key_buffer_size`, values larger than 4GB are allowed on 64-bit platforms.
    - For `join_buffer_size`, `sort_buffer_size`, and `myisam_sort_buffer_size`, values larger than 4GB are allowed on 64-bit platforms (except Windows, for which large values are truncated to 4GB with a warning).
- In addition, settings for `read_buffer_size` and `read_rnd_buffer_size` are limited to 2GB on all platforms. Larger values are truncated to 2GB with a warning. (Bug#5731, Bug#29419, Bug#29446)
- Executing `DISABLE KEYS` and `ENABLE KEYS` on a non-empty table would cause the size of the index file for the table to grow considerable. This was because the `DISABLE KEYS` operation would only mark the existing index, without deleting the index blocks. The `ENABLE KEYS` operation would re-create the index, adding new blocks, while the previous index blocks would remain. Existing indexes are now dropped and recreated when the `ENABLE KEYS` statement is executed. (Bug#4692)
  - Grant table checks failed in `libmysqld`.

## C.2.16. Changes in MySQL 5.1.22 (24 September 2007 Release Candidate)

Functionality added or changed:

- There is a new `innodb_autoinc_lock_mode` system variable to configure the locking behavior that InnoDB uses for generating auto-increment values. The default behavior now is slightly different from before, which involves a minor incompatibility for multiple-row inserts that specify an explicit value for the auto-increment column in some but not all rows. See Section 13.6.4.3, “`AUTO_INCREMENT` Handling in InnoDB”.

Bugs fixed:

- **MySQL Cluster: Replication:** (Replication): Multi-master replication setups did not handle `--log-slave-updates` correctly. (Bug#30017)
- **MySQL Cluster:** Backups of `TIMESTAMP` columns made with `ndb_restore` on a MySQL Cluster using data nodes hosts of one endian could not be used to restore the cluster's data to data node hosts of the other endian. (Bug#30134)
- **Replication:** Row-based replication from a pre-5.1.22 MySQL Server to a MySQL 5.1.22 was unstable due to an uninitialized variable. (Bug#31076)
- **Replication:** Operations that used the time zone replicated the time zone only for successful operations, but did not replicate the time zone for errors that need to know it. (Bug#29536)
- For an InnoDB table if a `SELECT` was ordered by the primary key and also had a `WHERE field = value` clause on a different field that was indexed, a `DESC` order instruction would be ignored. (Bug#31001)
- `mysql_install_db` could fail to find its message file. (Bug#30678)
- Memory corruption occurred for some queries with a top-level `OR` operation in the `WHERE` condition if they contained equality predicates and other sargable predicates in disjunctive parts of the condition. (Bug#30396)
- `CONNECTION_ID()` always returned 0 for the embedded server (`libmysqld`). (Bug#30389)
- The server created temporary tables for filesort operations in the working directory, not in the directory specified by the `tmpdir` system variable. (Bug#30287)
- Using `KILL QUERY` or `KILL CONNECTION` to kill a `SELECT` statement caused a server crash if the query cache was enabled. (Bug#30201)
- `mysqldump` from the MySQL 5.1.21 distribution could not be used to create a dump from a MySQL 5.1.20 or older server. (Bug#30123)
- Under some circumstances, a UDF initialization function could be passed incorrect argument lengths. (Bug#29804)
- When using a combination of `HANDLER . . . READ` and `DELETE` on a table, MySQL continued to open new copies of the ta-

ble every time, leading to an exhaustion of file descriptors. (Bug#29474)

This regression was introduced by Bug#21587.

- The `mysql_list_fields()` C API function incorrectly set `MYSQL_FIELD::decimals` for some view columns. (Bug#29306)
- Tables using the InnoDB storage engine incremented `AUTO_INCREMENT` values incorrectly with `ON DUPLICATE KEY UPDATE`. (Bug#28781)
- Non-range queries of the form `SELECT ... FROM ... WHERE keypart1=constant, ..., keypartN=constant ORDER BY ... FOR UPDATE` sometimes were unnecessarily blocked waiting for a lock if another transaction was using `SELECT ... FOR UPDATE` on the same table. (Bug#28570)
- On Windows, symbols for yaSSL and taocrypt were missing from `mysqlclient.lib`, resulting in unresolved symbol errors for clients linked against that library. (Bug#27861)
- Read lock requests that were blocked by a pending write lock request were not allowed to proceed if the statement requesting the write lock was killed. (Bug#21281)

## C.2.17. Changes in MySQL 5.1.21 (16 August 2007)

This is a new Beta development release, fixing recently discovered bugs.

### Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

### Note

Subsequent to release, it was discovered that on some platforms, `mysql_install_db` could fail to find its message file, resulting in error messages of the following form:

```
shell> mysql_install_db
Installing MySQL system tables...
070830 9:33:24 [ERROR] Can't find messagefile 'path/share/english/errmsg.sys'
070830 9:33:24 [ERROR] Aborting
```

To deal with this problem, specify a `--language` option to specify the proper path name to the language file directory. For example:

```
shell> mysql_install_db --language=/path/to/share/english/
```

This problem is corrected in MySQL 5.1.22.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible Change:** In MySQL 5.1.6, when log tables were implemented, the default log destination for the general query and slow query log was `TABLE`. This default has been changed to `FILE`, which is compatible with MySQL 5.0, but incompatible with earlier releases of MySQL 5.1 from 5.1.6 to 5.1.20. If you are upgrading from MySQL 5.0 to 5.1.21 or higher, no logging option changes should be necessary. However, if you are upgrading from 5.1.6 through 5.1.20 to 5.1.21 or higher and were using `TABLE` logging, use the `--log-output=TABLE` option explicitly to preserve your server's table-logging behavior.

A further fix for this issue was made in MySQL 5.1.23. (Bug#29993)

- **Incompatible Change:** The `innodb_log_arch_dir` system variable (which has been deprecated since MySQL 5.0.24) has been removed and should no longer be used.
- **Incompatible Change:** On Windows only, the `mysqld-nt` has been removed from this release and all future releases. The

`mysqld` server now includes named-pipe support as standard, and you do not have to use the `mysqld-nt` version to enable named-pipe support.

- **Important Change:** The default `mysqld_safe` logging behavior now is `--skip-syslog` rather than `--syslog`, which is compatible with the default behavior of writing an error log file for releases prior to 5.1.20.
- **Replication:** The SQL thread on a slave now is always allowed to enter `InnoDB` even if this would exceed the limit imposed by the `innodb_thread_concurrency` system variable. In cases of high load on the slave server (when `innodb_thread_concurrency` is reached), this change helps the slave stay more up to date with the master; in the previous behavior, the SQL thread was competing for resources with all client threads active on the slave server. (Bug#25078)
- **Replication:** Replication between master and slaves now supports different column numbers within a table on both master and slave. The rules for replication where the table definitions are different has also changed. This supercedes the functionality for replication from the master table to a slave table with more columns that was added in MySQL 5.1.12. For more information, see [Section 16.3.1.4, “Replication with Differing Tables on Master and Slave”](#).
- Several programs now accept `--debug-check` and `--debug-info` options: `mysql`, `mysqladmin`, `mysqlbinlog`, `mysqlcheck`, `mysqldump`, `mysqlimport`, `mysqlshow`, `mysqlslap`, `mysqltest`, `mysql_upgrade`. (Note: `mysql`, `mysqladmin`, `mysqlcheck`, `mysqldump`, `mysqlimport`, `mysqlshow`, and `mysqltest` already accepted `--debug-info`.) `--debug-check` prints debugging information at program exit. `--debug-info` is similar but also prints memory and CPU usage statistics. This patch also corrects a problem for `mysql` that `--debug-info` did not display statistics at exit time. (Bug#30127)
- The `--syslog` option that was introduced in 5.1.20 for `mysqld_safe` (to send error output to `syslog`) did not work correctly: Error output was buffered and not logged immediately. This has been corrected. In addition, some feature changes were made:

### Important

The default `mysqld_safe` logging behavior now is `--skip-syslog` rather than `--syslog`, which is compatible with the default behavior of writing an error log file for releases prior to 5.1.20.

- A new option, `--syslog-tag=tag`, modifies the default tags written by `mysqld_safe` and `mysqld` to `syslog` to be `mysqld_safe-tag` and `mysqld-tag` rather than the default tags of `mysqld_safe` and `mysqld`. (Bug#29992)
- Transaction support in the `FEDERATED` storage engine has been disabled due to issues with multiple active transactions and sessions on the same `FEDERATED` table. (Bug#29875)
- Previously, prepared statements processed using `PREPARE` and `EXECUTE` were not subject to caching in the query cache if they contained any `?` parameter markers. This limitation has been lifted. (Bug#29318)
- It is now possible to set `long_query_time` in microseconds or to 0. Setting this value to 0 causes all queries to be recorded in the slow query log.

Currently, fractional values can be used only when logging to files. We plan to provide this functionality for logging to tables when time-related data types are enhanced to support microsecond resolution. (Bug#25412)

- `INFORMATION_SCHEMA` implementation changes were made that optimize certain types of queries for `INFORMATION_SCHEMA` tables so that they execute more quickly. [Section 7.2.20, “INFORMATION\\_SCHEMA Optimization”](#), provides guidelines on how to take advantage of these optimizations by writing queries that minimize the need for the server to access the file system to obtain the information contained in `INFORMATION_SCHEMA` tables. By writing queries that enable the server to avoid directory scans or opening table files, you will obtain better performance. (Bug#19588)
- Log table locking was redesigned, eliminating several lock-related problems:
  - Truncating `mysql.slow_log` in a stored procedure after use of a cursor caused the thread to lock.
  - Flushing a log table resulted in unnecessary warnings.
  - The server would hang when performing concurrent `ALTER TABLE` or `TRUNCATE TABLE` statements against the log tables.
  - Changing the value of the `general_log` system variable while a global read lock was in place resulted in deadlock.

The changes provide better-defined interface characteristics. See [Section 5.2.1, “Selecting General Query and Slow Query Log Output Destinations”](#). (Bug#17876, Bug#23044, Bug#25422, Bug#29129)

- Added the `--commit`, `--detach`, `--post-system`, and `--pre-system` options for `mysqlslap`.

- A new option, `--syslog-tag=tag`, modifies the default tags written by `mysqld_safe` and `mysqld` to syslog to be `mysqld_safe-tag` and `mysqld-tag` rather than the default tags of `mysqld_safe` and `mysqld`.
- Two options relating to slow query logging have been added for `mysqld`. `--log-slow-slave-statements` causes slow statements executed by a replication slave to be written to the slow query log; `min_examined_row_limit` can be used to cause queries which examine fewer than the stated number of rows not to be logged.

Bugs fixed:

- **Incompatible Change:** Failure to consider collation when comparing space characters could result in incorrect index entry order, leading to incorrect comparisons, inability to find some index values, misordered index entries, misordered `ORDER BY` results, or tables that `CHECK TABLE` reports as having corrupt indexes.

As a result of this bug fix, indexes must be rebuilt for columns that use any of these character sets: `uucjpm8`, `uuc_kr`, `gb2312`, `latin7`, `macce`, `ujis`. See [Section 2.12.3, “Checking Whether Table Indexes Must Be Rebuilt”](#). (Bug#29461)

- **Incompatible Change:** Several issues were identified for stored programs (stored procedures and functions, triggers, and events) and views containing non-ASCII symbols. These issues involved conversion errors due to incomplete character set information when translating these objects to and from stored format, such as:
  - Parsing the original object definition so that it can be stored.
  - Compiling the stored definition into executable form when the object is invoked.
  - Retrieval of object definitions from `INFORMATION_SCHEMA` tables.
  - Displaying the object definition in `SHOW` statements. This issue also affected `mysqldump`, which uses `SHOW`.

The fix for the problems is to store character set information from the object creation context so that this information is available when the object needs to be used later. The context includes the client character set, the connection character set and collation, and the collation of the database with which the object is associated.

As a result of the patch, several tables have new columns:

- In the `mysql` database, the `proc` and `event` tables now have these columns: `character_set_client`, `collation_connection`, `db_collation`, `body_utf8`.
- In `INFORMATION_SCHEMA`, the `VIEWS` table now has these columns: `CHARACTER_SET_CLIENT`, `COLLATION_CONNECTION`. The `ROUTINES`, `TRIGGERS`, and `EVENTS` tables now have these columns: `CHARACTER_SET_CLIENT`, `COLLATION_CONNECTION`, `DATABASE_COLLATION`.

These columns store the session values of the `character_set_client` and `collation_connection` system variables, and the collation of the database with which the object is associated. The values are those in effect at object creation time. (The saved database collation is not the value of the `collation_database` system variable, which applies to the default database; the database that contains the object is not necessarily the default database.)

Several `SHOW` statements now display additional columns corresponding to the new table columns. These statements are: `SHOW CREATE EVENT`, `SHOW CREATE FUNCTION`, `SHOW CREATE PROCEDURE`, `SHOW CREATE VIEW`, `SHOW EVENTS`, `SHOW FUNCTION STATUS`, `SHOW PROCEDURE STATUS`, `SHOW TRIGGERS`.

A new statement, `SHOW CREATE TRIGGER` is introduced and is used by `mysqldump` for producing `CREATE TRIGGER` statements.

Subsequent to the patch just described, it was discovered that the patch broke `mysql_upgrade`; this has been corrected.

### Important

The fixes for the problems just describe affect *all* existing stored programs and views. (For example, you will see warnings about “no creation context.”) To avoid warnings from the server about the use of old definitions from any release prior to 5.1.21, you should dump stored programs and views with `mysqldump` after upgrading to 5.1.21, and then reload them to recreate them with new definitions. Invoke `mysqldump` with a `--default-character-set` option that names the non-ASCII character set that was used for the definitions when the objects were originally defined.

(Bug#25221, Bug#21249, Bug#30027, Bug#16291, Bug#11986, Bug#25212, Bug#19443, Bug#30029)

- **MySQL Cluster: Replication:** (Replication): Inconsistencies could occur between the master and the slave when replicating Disk Data tables. (Bug#19259, Bug#19227)

- **MySQL Cluster:** `DELETE FROM table WHERE primary_key IN (value_list)`, where the `value_list` contained more than one value, called from an `AFTER DELETE` trigger on an NDB table, caused `mysqld` to crash. (Bug#30337)
- **MySQL Cluster:** When restarting a data node, queries could hang during that node's start phase 5, and continue only after the node had entered phase 6. (Bug#29364)
- **MySQL Cluster:** Replica redo logs were inconsistently handled during a system restart. (Bug#29354)
- **MySQL Cluster:** When a node failed to respond to a `COPY_GCI` signal as part of a global checkpoint, the master node was killed instead of the node that actually failed. (Bug#29331)
- **MySQL Cluster:** An invalid comparison made during `REDO` validation that could lead to an `ERROR WHILE READING REDO LOG` condition. (Bug#29118)
- **MySQL Cluster:** The wrong data pages were sometimes invalidated following a global checkpoint. (Bug#29067)
- **MySQL Cluster:** If at least 2 files were involved in `REDO` invalidation, then file 0 of page 0 was not updated and so pointed to an invalid part of the redo log. (Bug#29057)
- **MySQL Cluster:** If a storage engine has its own logging capability, then any statement using both this engine and some other engine not having its own logging could not be correctly logged, due to the fact that entries from one engine could be logged before entries from the other engine were. This did not generate any error messages when it occurred.

Now, if multiple storage engines are used in a statement and at least one of them has its own logging capability, then an error message is generated and the statement is not executed.

### Note

Currently, the only storage engine to have its own logging capability is `NDBCLUSTER`.

(Bug#28722)

- **MySQL Cluster:** Warnings and errors generated by `ndb_config --config-file=file` were sent to `stdout`, rather than to `stderr`. (Bug#25941)
- **MySQL Cluster:** When a cluster backup was terminated using the `ABORT BACKUP` command in the management client, a misleading error message `BACKUP ABORTED BY APPLICATION: PERMANENT ERROR: INTERNAL ERROR` was returned. The error message returned in such cases now reads `BACKUP ABORTED BY USER REQUEST`. (Bug#21052)
- **MySQL Cluster:** Large file support did not work in AIX server binaries. (Bug#10776)
- **Replication:** The thread ID was not reset properly after execution of `mysql_change_user()`, which could cause replication failure when replicating temporary tables. (Bug#29734)
- **Replication:** Storage engine error conditions in row-based replication were not correctly reported to the user. (Bug#29570)
- **Replication:** `INSERT DELAYED` statements on a master server are replicated as non-`DELAYED` inserts on slaves (which is normal, to preserve serialization), but the inserts on the slave did not use concurrent inserts. Now `INSERT DELAYED` on a slave is converted to a concurrent insert when possible, and to a normal insert otherwise. (Bug#29152)
- **Replication:** An error that happened inside `INSERT`, `UPDATE`, or `DELETE` statements performed from within a stored function or trigger could cause inconsistency between master and slave servers. (Bug#27417)
- **Replication:** Slave servers could incorrectly interpret an out-of-memory error from the master and reconnect using the wrong binary log position. (Bug#24192)
- **Replication:** Using the `READ COMMITTED` transaction isolation level caused mixed and statement-based replication to fail. (Bug#23051)
- **Disk Data:** Performing Disk Data schema operations during a node restart could cause forced shutdowns of other data nodes. (Bug#29501)
- **Disk Data:** When dropping a page, the stack's bottom entry could sometime be left "cold" rather than "hot", violating the rules for stack pruning. (Bug#29176)
- **Disk Data:** Disk data meta-information that existed in `ndbd` might not be visible to `mysqld`. (Bug#28720)
- **Disk Data:** The number of free extents was incorrectly reported for some tablespaces. (Bug#28642)
- **Cluster Replication:** When executing a statement where `binlog_format = statement`, the result of the statement was logged both as a statement and as rows. (Bug#29222)

- **Cluster Replication:** `mysqld` would segfault on startup when the `NDB` storage engine was enabled and the default character set was a strictly multi-byte character set such as UCS2.

This issue does *not* apply to character sets that can contain single-byte characters in addition to multi-byte characters such as UTF-8.

Additional issues remain with regard to the use of multi-byte character sets in MySQL Cluster Replication; see [Known Issues in MySQL Cluster Replication](#), for more information. (Bug#27404)

- Prepared statements containing `CONNECTION_ID()` could be written improperly to the binary log. (Bug#30200)
- Use of local variables with non-ASCII names in stored procedures crashed the server. (Bug#30120)
- On Windows, client libraries lacked symbols required for linking. (Bug#30118)
- `--myisam-recover=''` (empty option value) did not disable `MyISAM` recovery. (Bug#30088)
- For the `SHOW TABLE TYPES` statement, the server sent incorrect output to clients, possibly causing them to crash. (Bug#30036)
- The `IS_UPDATABLE` column in the `INFORMATION_SCHEMA.VIEWS` table was not always set correctly. (Bug#30020)
- `SHOW` statements were being written to the slow query log that should not have been. (Bug#30000)
- `REPAIR TABLE ... USE_FRM` could corrupt tables. (Bug#29980)
- For `MyISAM` tables on Windows, `INSERT`, `DELETE`, or `UPDATE` followed by `ALTER TABLE` within `LOCK TABLES` could cause table corruption. (Bug#29957)
- `LOCK TABLES` did not pre-lock tables used in triggers of the locked tables. Unexpected locking behavior and statement failures similar to `FAILED: 1100: TABLE 'xx' WAS NOT LOCKED WITH LOCK TABLES` could result. (Bug#29929)
- `INSERT ... VALUES(CONNECTION_ID(), ...)` statements were written to the binary log in such a way that they could not be properly restored. (Bug#29928)
- Adding `DISTINCT` could cause incorrect rows to appear in a query result. (Bug#29911)
- On Windows, the CMake build process did not produce the embedded server library or related binaries. (Bug#29903)
- Using the `DATE()` function in a `WHERE` clause did not return any records after encountering `NULL`. However, using `TRIM` or `CAST` produced the correct results. (Bug#29898)
- `SESSION_USER()` returned garbage data (rather than the correct value of the empty string) when executed by a slave SQL thread. (Bug#29878)
- Very long prepared statements in stored procedures could cause a server crash. (Bug#29856)
- If query execution involved a temporary table, `GROUP_CONCAT()` could return a result with an incorrect character set. (Bug#29850)
- If one thread was performing concurrent inserts, other threads reading from the same table using equality key searches could see the index values for new rows before the data values had been written, leading to reports of table corruption. (Bug#29838)
- Repeatedly accessing a view in a stored procedure (for example, in a loop) caused a small amount of memory to be allocated per access. Although this memory is deallocated on disconnect, it could be a problem for a long running stored procedures that make repeated access of views. (Bug#29834)
- `mysqldump` produced output that incorrectly discarded the `NO_AUTO_VALUE_ON_ZERO` value of the `sql_mode` variable after dumping triggers. (Bug#29788)
- An assertion failure occurred within `yaSSL` for very long keys. (Bug#29784)
- For `MEMORY` tables, the `index_merge` union access method could return incorrect results. (Bug#29740)
- Comparison of `TIME` values using the `BETWEEN` operator led to string comparison, producing incorrect results in some cases. Now the values are compared as integers. (Bug#29739)
- For a table with a `DATE` column `date_col` such that selecting rows with `WHERE date_col = 'date_val 00:00:00'` yielded a non-empty result, adding `GROUP BY date_col` caused the result to be empty. (Bug#29729)
- In some cases, `INSERT INTO ... SELECT ... GROUP BY` could insert rows even if the `SELECT` by itself produced an

- empty result. ([Bug#29717](#))
- Single-row inserts could report a row count greater than one. ([Bug#29692](#))
  - For the embedded server, the `mysql_stmt_store_result()` C API function caused a memory leak for empty result sets. ([Bug#29687](#))
  - `EXPLAIN` produced `Impossible where` for statements of the form `SELECT ... FROM t WHERE c=0`, where `c` was an `ENUM` column defined as a primary key. ([Bug#29661](#))
  - On Windows, `ALTER TABLE` hung if records were locked in share mode by a long-running transaction. ([Bug#29644](#))
  - `mysqld_safe` produced error messages and did not create the error log file under some circumstances. ([Bug#29634](#))
  - On 64-bit platforms, the filesort code (for queries with `GROUP BY` or `ORDER BY`) could crash due to an incorrect pointer size. ([Bug#29610](#))
  - A left join between two views could produce incorrect results. ([Bug#29604](#))
  - Certain statements with unions, subqueries, and joins could result in huge memory consumption. ([Bug#29582](#))
  - Clients using SSL could hang the server. ([Bug#29579](#))
  - A slave running with `--log-slave-updates` would fail to write `INSERT DELAY IGNORE` statements to its binary log, resulting in different binary log contents on the master and slave. ([Bug#29571](#))
  - An incorrect result was returned when comparing string values that were converted to `TIME` values with `CAST()`. ([Bug#29555](#))
  - `gcov` coverage-testing information was not written if the server crashed. ([Bug#29543](#))
  - In the `ascii` character set, conversion of `DEL (0x7F)` to Unicode incorrectly resulted in `QUESTION MARK (0x3F)` rather than `DEL`. ([Bug#29499](#))
  - A field packet with `NULL` fields caused a `libmysqlclient` crash. ([Bug#29494](#))
  - On Windows, the `mysql` client died if the user entered a statement and Return after entering Control-C. ([Bug#29469](#))
  - The full-text parser could enter an infinite loop if it encountered an illegal multi-byte sequence or a sequence that has no mapping to Unicode. ([Bug#29464](#))
  - Searching a `FULLTEXT` index for a word with the boolean mode truncation operator could cause an infinite loop. ([Bug#29445](#))
  - Corrupt data resulted from use of `SELECT ... INTO OUTFILE 'file_name' FIELDS ENCLOSED BY 'c'`, where `c` is a digit or minus sign, followed by `LOAD DATA INFILE 'file_name' FIELDS ENCLOSED BY 'c'`. ([Bug#29442](#))
  - Killing an `INSERT DELAYED` thread caused a server crash. ([Bug#29431](#))
  - Use of `SHOW BINLOG EVENTS` for a non-existent log file followed by `PURGE BINARY LOGS` caused a server crash. ([Bug#29420](#))
  - Assertion failure could occur for grouping queries that employed `DECIMAL` user variables with assignments to them. ([Bug#29417](#))
  - For `CAST(expr AS DECIMAL(M,D))`, the limits of 65 and 30 on the precision (`M`) and scale (`D`) were not enforced. ([Bug#29415](#))
  - Deleting from a `CSV` table could corrupt it. ([Bug#29411](#))
  - Results for a select query that aliases the column names against a view could duplicate one column while omitting another. This bug could occur for a query over a multiple-table view that includes an `ORDER BY` clause in its definition. ([Bug#29392](#))
  - `mysqldump` created a stray file when a given a too-long file name argument. ([Bug#29361](#))
  - The special “zero” `ENUM` value was coerced to the normal empty string `ENUM` value during a column-to-column copy. This affected `CREATE ... SELECT` statements and `SELECT` statements with aggregate functions on `ENUM` columns in the `GROUP BY` clause. ([Bug#29360](#))
  - Inserting a negative number into a `CSV` table could corrupt it. ([Bug#29353](#))
  - Optimization of queries with `DETERMINISTIC` stored functions in the `WHERE` clause was ineffective: A sequential scan was

always used. (Bug#29338)

- MyISAM corruption could occur with the `cp932_japanese_ci` collation for the `cp932` character set due to incorrect comparison for trailing space. (Bug#29333)
- For updates to InnoDB tables, a `TIMESTAMP` column with the `ON UPDATE CURRENT_TIMESTAMP` attribute could be updated even when no values actually changed. (Bug#29310)
- `FULLTEXT` indexes could be corrupted by certain `gbk` characters. (Bug#29299)
- `SELECT ... INTO OUTFILE` followed by `LOAD DATA` could result in garbled characters when the `FIELDS ENCLOSED BY` clause named a delimiter of `'0'`, `'b'`, `'n'`, `'r'`, `'t'`, `'N'`, or `'Z'` due to an interaction of character encoding and doubling for data values containing the enclosed-by character. (Bug#29294)
- Sort order of the collation wasn't used when comparing trailing spaces. This could lead to incorrect comparison results, incorrectly created indexes, or incorrect result set order for queries that include an `ORDER BY` clause. (Bug#29261)
- `CHECK TABLE` could erroneously report table corruption for a `CSV` table if multiple threads were modifying the table at the same time. (Bug#29253)
- Many threads accessing a `CSV` table simultaneously could cause an assertion failure. (Bug#29252)
- If an `ENUM` column contained `' '` as one of its members (represented with numeric value greater than 0), and the column contained error values (represented as 0 and displayed as `' '`), using `ALTER TABLE` to modify the column definition caused the 0 values to be given the numeric value of the nonzero `' '` member. (Bug#29251)
- Calling `mysql_options()` after `mysql_real_connect()` could cause clients to crash. (Bug#29247)
- `CHECK TABLE` for `ARCHIVE` tables could falsely report table corruption or cause a server crash. (Bug#29207)
- Mixing binary and `utf8` columns in a union caused field lengths to be calculated incorrectly, resulting in truncation. (Bug#29205)
- `AsText()` could fail with a buffer overrun. (Bug#29166)
- Under some circumstances, a `SELECT ... FROM mysql.event` could cause the server to crash. (Bug#29156)
- InnoDB refused to start on some versions of FreeBSD with LinuxThreads. This is fixed by enabling file locking on FreeBSD. (Bug#29155)
- `LOCK TABLES` was not atomic when more than one InnoDB tables were locked. (Bug#29154)
- `mysqld` failed to exit during shutdown. (Bug#29133)
- A network structure was initialized incorrectly, leading to embedded server crashes. (Bug#29117)
- An assertion failure occurred if a query contained a conjunctive predicate of the form `view_column = constant` in the `WHERE` clause and the `GROUP BY` clause contained a reference to a different view column. The fix also enables application of an optimization that was being skipped if a query contained a conjunctive predicate of the form `view_column = constant` in the `WHERE` clause and the `GROUP BY` clause contained a reference to the same view column. (Bug#29104)
- A maximum of 4TB InnoDB free space was reported by `SHOW TABLE STATUS`, which is incorrect on systems with more than 4TB space. (Bug#29097)
- If an `INSERT INTO ... SELECT` statement inserted into the same table that the `SELECT` retrieved from, and the `SELECT` included `ORDER BY` and `LIMIT` clauses, different data was inserted than the data produced by the `SELECT` executed by itself. (Bug#29095)
- Queries that performed a lookup into a `BINARY` index containing key values ending with spaces caused an assertion failure for debug builds and incorrect results for non-debug builds. (Bug#29087)
- The semantics of `BIGINT` depended on platform-specific characteristics. (Bug#29079)
- A byte-order issue in writing a spatial index to disk caused bad index files on some systems. (Bug#29070)
- Creation of a legal stored procedure could fail if no default database had been selected. (Bug#29050)
- `REPLACE`, `INSERT IGNORE`, and `UPDATE IGNORE` did not work for `FEDERATED` tables. (Bug#29019)
- Inserting into InnoDB tables and executing `RESET MASTER` in multiple threads cause assertion failure in debug server binaries. (Bug#28983)

- Updates to a `CSV` table could cause a server crash or update the table with incorrect values. (Bug#28971)
- For a `ucs2` column, `GROUP_CONCAT()` did not convert separators to the result character set before inserting them, producing a result containing a mixture of two different character sets. (Bug#28925)
- Dropping the definer of an active event caused the server to crash. (Bug#28924)
- For a join with `GROUP BY` and/or `ORDER BY` and a view reference in the `FROM` list, the query metadata erroneously showed empty table aliases and database names for the view columns. (Bug#28898)
- Creating an event using `ON SCHEDULE AT CURRENT_TIMESTAMP + INTERVAL ...` could in some cases cause `mysqld` to crash. (Bug#28881)
- Coercion of ASCII values to character sets that are a superset of ASCII sometimes was not done, resulting in `ILLEGAL MIX OF COLLATIONS` errors. These cases now are resolved using repertoire, a new string expression attribute (see Section 9.1.7, “String Repertoire”). (Bug#28875)
- Executing `ALTER EVENT` on an event whose definer's event creation privileges had been revoked cause the server to crash. (Bug#28873)
- `ALTER VIEW` is not supported as a prepared statement but was not being rejected. `ALTER VIEW` is now prohibited as a prepared statement or when called within stored routines. (Bug#28846)
- In strict SQL mode, errors silently stopped the SQL thread even for errors named using the `--slave-skip-errors` option. (Bug#28839)
- Fast `ALTER TABLE` (that works without rebuilding the table) acquired duplicate locks in the storage engine. In `MyISAM`, if `ALTER TABLE` was issued under `LOCK TABLE`, it caused all data inserted after `LOCK TABLE` to disappear. (Bug#28838)
- Runtime changes to the `log_queries_not_using_indexes` system variable were ignored. (Bug#28808)
- Selecting a column not present in the selected-from table caused an extra error to be produced by `SHOW ERRORS`. (Bug#28677)
- Creating an event to be executed at a time close to the end of the allowed range (2038-01-19 03:14:07 UTC) would cause the server to crash. (Bug#28641)
- For a statement of the form `CREATE t1 SELECT integer_constant`, the server created the column using the `DECIMAL` data type for large negative values that are within the range of `BIGINT`. (Bug#28625)
- Starting the server with an `innodb_force_recovery` value of 4 did not work. (Bug#28604)
- For `InnoDB` tables, MySQL unnecessarily sorted records in certain cases when the records were retrieved by `InnoDB` in the proper order already. (Bug#28591)
- `mysql_install_db` could fail to find script files that it needs. (Bug#28585)
- If a stored procedure was created and invoked prior to selecting a default database with `USE`, a `NO DATABASE SELECTED` error occurred. (Bug#28551)
- On Mac OS X, shared-library installation path names were incorrect. (Bug#28544)
- Using the `--skip-add-drop-table` option with `mysqldump` generated incorrect SQL if the database included any views. The recreation of views requires the creation and removal of temporary tables. This option suppressed the removal of those temporary tables. The same applied to `--compact` since this option also invokes `--skip-add-drop-table`. (Bug#28524)
- `mysqlbinlog --hexdump` generated incorrect output due to omission of the “#” comment character for some comment lines. (Bug#28293)
- `InnoDB` could crash if the server was shut down while `innodb_table_monitor` was running. (Bug#28254)
- A race condition in the interaction between `MyISAM` and the query cache code caused the query cache not to invalidate itself for concurrently inserted data. (Bug#28249)
- A duplicate-key error message could display an incorrect key value when not all columns of the key were used to select rows for update. (Bug#28158)
- Indexing column prefixes in `InnoDB` tables could cause table corruption. (Bug#28138)
- Index creation could fail due to truncation of key values to the maximum key length rather than to a multiple of the maximum

- character length. ([Bug#28125](#))
- Instance Manager had a race condition when it received a shutdown request while a guarded `mysqld` instance was starting such that it could fail to stop the `mysqld` instance. ([Bug#28030](#))
  - `SELECT . . . FOR UPDATE` with partitioned tables could cause a server crash. ([Bug#28026](#))
  - On Windows, Instance Manager would crash if an instance object failed to initialize during startup. This could happen if an incorrect `mysqld` path was supplied in the configuration file. ([Bug#28012](#))
  - The `LOCATE ( )` function returned `NULL` if any of its arguments evaluated to `NULL`. Likewise, the predicate, `LOCATE(str, NULL) IS NULL`, erroneously evaluated to `FALSE`. ([Bug#27932](#))
  - Dropping a user-defined function could cause a server crash if the function was still in use by another thread. ([Bug#27564](#))
  - For some event-creation problems, the server displayed messages that implied the problems were errors when they were only warnings. ([Bug#27406](#))
  - Unsafe aliasing in the source caused a client library crash when compiled with `gcc 4` at high optimization levels. ([Bug#27383](#))
  - Index-based range reads could fail for comparisons that involved contraction characters (such as `ch` in Czech or `ll` in Spanish). ([Bug#27345](#))
  - Aggregations in subqueries that refer to outer query columns were not always correctly referenced to the proper outer query. ([Bug#27333](#))
  - Error returns from the `time ( )` system call were ignored. ([Bug#27198](#))
  - Phantom reads could occur under `InnoDB SERIALIZABLE` isolation level. ([Bug#27197](#))
  - The `SUBSTRING ( )` function returned the entire string instead of an empty string when it was called from a stored procedure and when the length parameter was specified by a variable with the value “ 0 ”. ([Bug#27130](#))
  - Some functions when used in partitioning expressions could cause `mysqld` to crash. ([Bug#27084](#))
  - The server acquired a global mutex for temporary tables, although such tables are thread-specific. This affected performance by blocking other threads. ([Bug#27062](#))
  - `FEDERATED` tables had an artificially low maximum of key length. ([Bug#26909](#))
  - Updates to rows in a partitioned table could update the wrong column. ([Bug#26827](#))
  - Index creation could corrupt the table definition in the `.frm` file: 1) A table with the maximum number of key segments and maximum length key name would have a corrupted `.frm` file, due to incorrect calculation of the total key length. 2) `MyISAM` would reject a table with the maximum number of keys and the maximum number of key segments in all keys. (It would allow one less than this total maximum.) Now `MyISAM` accepts a table defined with the maximum. ([Bug#26642](#))
  - The Windows implementation of `pthread_join ( )` was incorrect and could cause crashes. ([Bug#26564](#))
  - After the first read of a `TEMPORARY` table, `CHECK TABLE` could report the table as being corrupt. ([Bug#26325](#))
  - If an operation had an `InnoDB` table, and two triggers, `AFTER UPDATE` and `AFTER INSERT`, competing for different resources (such as two distinct `MyISAM` tables), the triggers were unable to execute concurrently. In addition, `INSERT` and `UPDATE` statements for the `InnoDB` table were unable to run concurrently. ([Bug#26141](#))
  - A number of unsupported constructs — including prohibited constructs, the `UCASE ( )` function, and nested function calls — were permitted in partitioning expressions. ([Bug#26082](#), [Bug#18198](#), [Bug#29308](#))
  - `ALTER DATABASE` did not require at least one option. ([Bug#25859](#))
  - The index merge union access algorithm could produce incorrect results with `InnoDB` tables. The problem could also occur for queries that used `DISTINCT`. ([Bug#25798](#))
  - When using a `FEDERATED` table, the value of `LAST_INSERT_ID ( )` would not correctly update the C API interface, which would affect the autogenerated ID returned both through the C API and the MySQL protocol, affecting Connectors that used the protocol and/or C API. ([Bug#25714](#))
  - The server was blocked from opening other tables while the `FEDERATED` engine was attempting to open a remote table. Now the server does not check the correctness of a `FEDERATED` table at `CREATE TABLE` time, but waits until the table actually is accessed. ([Bug#25679](#))

- Under ActiveState Perl, `mysql-test-run.pl` could kill itself when attempting to kill other processes. (Bug#25657)
- Several `InnoDB` assertion failures were corrected. (Bug#25645)
- A query with `DISTINCT` in the select list to which the loose-scan optimization for grouping queries was applied returned an incorrect result set when the query was used with the `SQL_BIG_RESULT` option. (Bug#25602)
- For a multiple-row insert into a `FEDERATED` table that refers to a remote transactional table, if the insert failed for a row due to constraint failure, the remote table would contain a partial commit (the rows preceding the failed one) instead of rolling back the statement completely. This occurred because the rows were treated as individual inserts.

Now `FEDERATED` performs bulk-insert handling such that multiple rows are sent to the remote table in a batch. This provides a performance improvement and enables the remote table to perform statement rollback properly should an error occur. This capability has the following limitations:

- The size of the insert cannot exceed the maximum packet size between servers. If the insert exceeds this size, it is broken into multiple packets and the rollback problem can occur.
- Bulk-insert handling does not occur for `INSERT ... ON DUPLICATE KEY UPDATE`.

(Bug#25513)

- The `FEDERATED` storage engine failed silently for `INSERT ... ON DUPLICATE KEY UPDATE` if a duplicate key violation occurred. `FEDERATED` does not support `ON DUPLICATE KEY UPDATE`, so now it correctly returns an `ER_DUP_KEY` error if a duplicate key violation occurs. (Bug#25511)
- In a stored function or trigger, when `InnoDB` detected deadlock, it attempted rollback and displayed an incorrect error message (`EXPLICIT OR IMPLICIT COMMIT IS NOT ALLOWED IN STORED FUNCTION OR TRIGGER`). Now `InnoDB` returns an error under these conditions and does not attempt rollback. Rollback is handled outside of `InnoDB` above the function/trigger level. (Bug#24989)
- Dropping a temporary `InnoDB` table that had been locked with `LOCK TABLES` caused a server crash. (Bug#24918)
- On Windows, executables did not include Vista manifests. (Bug#24732)

See also Bug#22563.

- If MySQL/`InnoDB` crashed very quickly after starting up, it would not force a checkpoint. In this case, `InnoDB` would skip crash recovery at next startup, and the database would become corrupt. Now, if the redo log scan at `InnoDB` startup goes past the last checkpoint, crash recovery is forced. (Bug#23710)
- `SHOW INNODB STATUS` caused an assertion failure under high load. (Bug#22819)
- `SHOW BINLOG EVENTS` displayed incorrect values of `End_log_pos` for events associated with transactional storage engines. (Bug#22540)
- When determining which transaction to kill after deadlock has been detected, `InnoDB` now adds the number of locks to a transaction's weight, and avoids killing transactions that have modified non-transactional tables. This should reduce the likelihood of killing long-running transactions containing `SELECT ... FOR UPDATE` or `INSERT/REPLACE INTO ... SELECT` statements, and of causing partial updates if the target is a `MyISAM` table. (Bug#21293)
- `InnoDB` displayed an incorrect error message when a `CREATE TABLE` statement exceeded the `InnoDB` maximum allowable row size. (Bug#21101)
- Under heavy load with a large query cache, invalidating part of the cache could cause the server to freeze (that is, to be unable to service other operations until the invalidation was complete). (Bug#21074)
- On Windows, the server used 10MB of memory for each connection thread, resulting in memory exhaustion. Now each thread uses 1MB. (Bug#20815)
- `InnoDB` produced an unnecessary (and harmless) warning: `InnoDB: Error: trying to declare trx to enter InnoDB, but InnoDB: it already is declared`. (Bug#20090)
- If a slave timed out while registering with the master to which it was connecting, auto-reconnect failed thereafter. (Bug#19328)
- If `InnoDB` reached its limit on the number of concurrent transactions (1023), it wrote a descriptive message to the error log but returned a misleading error message to the client, or an assertion failure occurred. (Bug#18828)
- Under ActiveState Perl, `mysql-test-run.pl` would not run. (Bug#18415)
- The server crashed when the size of an `ARCHIVE` table grew larger than 2GB. (Bug#15787)

- `SQL_BIG_RESULT` had no effect for `CREATE TABLE ... SELECT SQL_BIG_RESULT ...` statements. (Bug#15130)
  - On 64-bit Windows systems, the Config Wizard failed to complete the setup because 64-bit Windows does not resolve dynamic linking of the 64-bit `libmysql.dll` to a 32-bit application like the Config Wizard. (Bug#14649)
  - `mysql_setpermission` tried to grant global-only privileges at the database level. (Bug#14618)
  - For the general query log, logging of prepared statements executed via the C API differed from logging of prepared statements performed with `PREPARE` and `EXECUTE`. Logging for the latter was missing the `Prepare` and `Execute` lines. (Bug#13326)
  - The `TABLE_COMMENT` column of `INFORMATION_SCHEMA.TABLES` and the `Comment` column in the output of `SHOW TABLE STATUS` displayed extraneous information for `InnoDB` and `NDBCLUSTER` tables. (Bug#11379)
- See also Bug#32440.
- The server returned data from `SHOW CREATE TABLE` statement or a `SELECT` statement on an `INFORMATION_SCHEMA` table using the `binary` character set. (Bug#10491)
  - Backup software can cause `ERROR_SHARING_VIOLATION` or `ERROR_LOCK_VIOLATION` conditions during file operations. `InnoDB` now retries forever until the condition goes away. (Bug#9709)

## C.2.18. Changes in MySQL 5.1.20 (25 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

### Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible Change:** It is no longer possible to partition the log tables. (Bug#27816)
- **Incompatible Change:** `mysqld_safe` now supports error logging to `syslog` on systems that support the `logger` command. The new `--syslog` and `--skip-syslog` options can be used instead of the `--log-error` option to control logging behavior, as described in Section 4.3.2, “`mysqld_safe` — MySQL Server Startup Script”. The default is to use `syslog`, which differs from the previous default behavior of writing an error log file.

Currently, logging to `syslog` may fail to operate correctly in some cases, so we recommend that you use `--skip-syslog` or `--log-error`. To maintain the older behavior if you were using no error-logging option, use `--skip-syslog`. If you were using `--log-error`, continue to use it.

Note: In 5.1.21, the default is changed to `--skip-syslog`, which is compatible with releases prior to 5.1.20. (Bug#4858)

- **Important Change: MySQL Cluster:** The `TimeBetweenWatchdogCheckInitial` configuration parameter was added to allow setting of a separate watchdog timeout for memory allocation during startup of the data nodes. See [Defining MySQL Cluster Data Nodes](#), for more information. (Bug#28899)
- **MySQL Cluster:** The cluster management client now stores command history between sessions. (Bug#29073)
- **MySQL Cluster:** `auto_increment_increment` and `auto_increment_offset` are now supported for `NDB` tables. (Bug#26342)
- **MySQL Cluster:** The server source tree now includes scripts to simplify building MySQL with SCI support. For more information about SCI interconnects and these build scripts, see [Configuring MySQL Cluster to use SCI Sockets](#). (Bug#25470)
- **MySQL Cluster:** A new configuration parameter `ODirect` causes `NDB` to attempt using `O_DIRECT` writes for LCP, backups, and redo logs, often lowering CPU usage.
- **Replication:** The `sql_mode`, `foreign_key_checks`, `unique_checks`, character set/collations, and

`sql_auto_is_null` session variables are written to the binary log and honored during replication. See [Section 5.2.4, “The Binary Log”](#).

- If a `MERGE` table cannot be opened or used because of a problem with an underlying table, `CHECK TABLE` now displays information about which table caused the problem. ([Bug#26976](#))
- User variables and stored procedure variables are now supported for use in XPath expressions employed as arguments to the `ExtractValue()` and `UpdateXML()` functions.

This means that:

- XPath can now be used to load data from XML files using virtually any format, and so able to import data from most third party software which either has XML export functionality, or uses XML natively as a storage format.
- Various complex conditions can be put on rows and columns, so one can filter for desired rows (or skip unwanted rows) when loading XML.
- Various types of preprocessing using SQL functions are now possible when loading XML. For example, you can concatenate two XML tag or attribute values into a single column value using `CONCAT()`, or remove some parts of the data using `REPLACE()`.

See [Section 11.10, “XML Functions”](#), for more information. ([Bug#26518](#))

- Binary distributions for some platforms did not include shared libraries; now shared libraries are shipped for all platforms except AIX 5.2 64-bit. *Exception:* The library for the `libmysqld` embedded server is not shared except on Windows. ([Bug#16520](#), [Bug#26767](#), [Bug#13450](#))
- Added a new `PAD_CHAR_TO_FULL_LENGTH` SQL mode. By default, trailing spaces are trimmed from `CHAR` column values on retrieval. If `PAD_CHAR_TO_FULL_LENGTH` is enabled, trimming does not occur and retrieved `CHAR` values are padded to their full length. This mode does not apply to `VARCHAR` columns, for which trailing spaces are retained on retrieval.
- XPath can now be used to load data from XML files using virtually any format, and so able to import data from most third party software which either has XML export functionality, or uses XML natively as a storage format.
- Various complex conditions can be put on rows and columns, so one can filter for desired rows (or skip unwanted rows) when loading XML.
- Various types of preprocessing using SQL functions are now possible when loading XML. For example, you can concatenate two XML tag or attribute values into a single column value using `CONCAT()`, or remove some parts of the data using `REPLACE()`.

Bugs fixed:

- **Security Fix:** A malformed password packet in the connection protocol could cause the server to crash. Thanks for Dormando for reporting this bug, and for providing details and a proof of concept. ([Bug#28984](#), [CVE-2007-3780](#))
- **Security Fix:** `CREATE TABLE LIKE` did not require any privileges on the source table. Now it requires the `SELECT` privilege.

In addition, `CREATE TABLE LIKE` was not isolated from alteration by other connections, which resulted in various errors and incorrect binary log order when trying to execute concurrently a `CREATE TABLE LIKE` statement and either DDL statements on the source table or DML or DDL statements on the target table. ([Bug#23667](#), [Bug#25578](#), [CVE-2007-3781](#))

- **Incompatible Change:** Some error codes had error numbers in MySQL 5.1 different from the numbers in MySQL 5.0. In MySQL 5.1, error numbers have been changed to match the MySQL 5.0 values: Error codes with value of 1458 or higher have changed in MySQL 5.1 now. Client applications designed to work with MySQL 5.1 with hard-coded error code values (for example, in statements such as `if (mysql_errno(mysql) == 1463) { ... }`) need to be updated in the source code. All clients designed to work with MySQL 5.1 that test error codes (for example, in statements such as `if (mysql_errno(mysql) == ER_VIEW_RECURSIVE) { ... }`) should be recompiled. Existing 5.0 clients should now work, without changes or recompilation, against servers for MySQL 5.1.20 or higher. ([Bug#29245](#))
- **Incompatible Change:** When `mysqldump` was run with the `--delete-master-logs` option, binary log files were deleted before it was known that the dump had succeeded, not after. (The method for removing log files used `RESET MASTER` prior to the dump. This also reset the binary log sequence numbering to `.000001`.) Now `mysqldump` flushes the logs (which creates a new binary log number with the next sequence number), performs the dump, and then uses `PURGE BINARY LOGS` to remove the log files older than the new one. This also preserves log numbering because the new log with the next number is generated and only the preceding logs are removed. However, this may affect applications if they rely on the log numbering sequence being reset. ([Bug#24733](#))

- **Incompatible Change:** The use of an `ORDER BY` or `DISTINCT` clause with a query containing a call to the `GROUP_CONCAT()` function caused results from previous queries to be redisplayed in the current result. The fix for this includes replacing a `BLOB` value used internally for sorting with a `VARCHAR`. This means that for long results (more than 65,535 bytes), it is possible for truncation to occur; if so, an appropriate warning is issued. (Bug#23856, Bug#28273)
  - **MySQL Cluster: Replication:** (Replication): A replicated unique key allowed duplicate key inserts on the slave. (Bug#27044)
  - **MySQL Cluster:** Memory corruption could occur due to a problem in the `DBTUP` kernel block. (Bug#29229)
  - **MySQL Cluster:** A query having a large `IN(...)` or `NOT IN(...)` list in the `WHERE` condition on an `NDB` table could cause `mysqld` to crash. (Bug#29185)
  - **MySQL Cluster:** In the event that two data nodes in the same node group and participating in a GCP crashed before they had written their respective `PO.sysfile` files, `QMGR` could refuse to start, issuing an invalid `INSUFFICIENT NODES FOR RESTART` error instead. (Bug#29167)
  - **MySQL Cluster:** Attempting to restore a `NULL` row to a `VARBINARY` column caused `ndb_restore` to fail. (Bug#29103)
  - **MySQL Cluster:** `ndb_error_reporter` now preserves timestamps on files. (Bug#29074)
  - **MySQL Cluster:** It is now possible to set the maximum size of the allocation unit for table memory using the `MaxAllocate` configuration parameter. (Bug#29044)
  - **MySQL Cluster:** When shutting down `mysqld`, the `NDB` binlog process was not shut down before log cleanup began. (Bug#28949)
  - **MySQL Cluster:** `ndb_mgm` could hang when connecting to a non-existent host. (Bug#28847)
  - **MySQL Cluster:** A regression in the heartbeat monitoring code could lead to node failure under high load. This issue affected MySQL 5.1.19 and MySQL Cluster NDB 6.1.10 only. (Bug#28783)
  - **MySQL Cluster:** A corrupt schema file could cause a `FILE ALREADY OPEN` error. (Bug#28770)
  - **MySQL Cluster:** Having large amounts of memory locked caused swapping to disk. (Bug#28751)
  - **MySQL Cluster:** Setting `InitialNoOpenFiles` equal to `MaxNoOfOpenFiles` caused an error. This was due to the fact that the actual value of `MaxNoOfOpenFiles` as used by the cluster was offset by 1 from the value set in `config.ini`. (Bug#28749)
  - **MySQL Cluster:** LCP files were not removed following an initial system restart. (Bug#28726)
  - **MySQL Cluster:** `UPDATE IGNORE` statements involving the primary keys of multiple tables could result in data corruption. (Bug#28719)
  - **MySQL Cluster:** A race condition could result when non-master nodes (in addition to the master node) tried to update active status due to a local checkpoint (that is, between `NODE_FAILREP` and `COPY_GCIREQ` events). Now only the master updates the active status. (Bug#28717)
  - **MySQL Cluster:** A fast global checkpoint under high load with high usage of the redo buffer caused data nodes to fail. (Bug#28653)
  - **MySQL Cluster:** The management client's response to `START BACKUP WAIT COMPLETED` did not include the backup ID. (Bug#27640)
  - **Cluster Replication: Replication:** When replicating `MyISAM` or `InnoDB` tables to a MySQL Cluster, it was not possible to determine exactly what had been applied following a shutdown of the slave cluster or `mysqld` process. (Bug#26783)
  - **Replication:** `DROP USER` statements that named multiple users, only some of which could be dropped, were replicated incorrectly. (Bug#29030)
  - **Replication:** Using events in replication could cause the slave to crash. (Bug#28953)
  - **Replication:** It was possible to set `SQL_SLAVE_SKIP_COUNTER` such that the slave would jump into the middle of an event group. (Bug#28618)
- See also Bug#12691.
- **Replication:** The result of executing of a prepared statement created with `PREPARE s FROM "SELECT 1 LIMIT ?"` was not replicated correctly. (Bug#28464)
  - **Replication:** Recreating a view that already exists on the master would cause a replicating slave to terminate replication with a

'different error message on slave and master' error. ([Bug#28244](#))

- **Replication:** Binary logging of prepared statements could produce syntactically incorrect queries in the binary log, replacing some parameters with variable names rather than variable values. This could lead to incorrect results on replication slaves. ([Bug#26842](#), [Bug#12826](#))
- **Replication:** Connections from one `mysqld` server to another failed on Mac OS X, affecting replication and `FEDERATED` tables. ([Bug#26664](#))

See also [Bug#29083](#).

- **Replication:** When using transactions and replication, shutting down the master in the middle of a transaction would cause all slaves to stop replicating. ([Bug#22725](#))
- **Replication:** Using `CREATE TABLE LIKE ...` would raise an assertion when replicated to a slave. ([Bug#18950](#))
- **Disk Data:** When loading data into a cluster following a version upgrade, the data nodes could forcibly shut down due to page and buffer management failures (that is, `ndbrequire` failures in `PGMAN`). ([Bug#28525](#))
- **Disk Data:** Repeated `INSERT` and `DELETE` operations on a Disk Data table having one or more large `VARCHAR` columns could cause data nodes to fail. ([Bug#20612](#))
- **Cluster API:** The timeout set using the MGM API `ndb_mgm_set_timeout()` function was incorrectly interpreted as seconds rather than as milliseconds. ([Bug#29063](#))
- **Cluster API:** An invalid error code could be set on transaction objects by `BLOB` handling code. ([Bug#28724](#))
- The `TRUNCATE` statement was handled differently by the server when row-based logging was in effect, even though the bin-logging format in effect does not effect the fact that `TRUNCATE` is always logged as a statement. ([Bug#29130](#))
- If one of the queries in a `UNION` used the `SQL_CACHE` option and another query in the `UNION` contained a nondeterministic function, the result was still cached. For example, this query was incorrectly cached:

```
SELECT NOW() FROM t1 UNION SELECT SQL_CACHE 1 FROM t1;
```

([Bug#29053](#))

- Long path names for internal temporary tables could cause stack overflows. ([Bug#29015](#))
- Using an `INTEGER` column from a table to `ROUND()` a number produced different results than using a constant with the same value as the `INTEGER` column. ([Bug#28980](#))
- If a program binds a given number of parameters to a prepared statement handle and then somehow changes `stmt->param_count` to a different number, `mysql_stmt_execute()` could crash the client or server. ([Bug#28934](#))
- Queries using UDFs or stored functions were cached. ([Bug#28921](#))
- `INSERT .. ON DUPLICATE KEY UPDATE` could under some circumstances silently update rows when it should not have. ([Bug#28904](#))
- Queries that used `UUID()` were incorrectly allowed into the query cache. (This should not happen because `UUID()` is non-deterministic.) ([Bug#28897](#))
- Using a `VIEW` created with a non-existing `DEFINER` could lead to incorrect results under some circumstances. ([Bug#28895](#))
- For `InnoDB` tables that use the `utf8` character set, incorrect results could occur for DML statements such as `DELETE` or `UPDATE` that use an index on character-based columns. ([Bug#28878](#))

See also [Bug#29449](#), [Bug#30485](#), [Bug#31395](#).

This regression was introduced by [Bug#13195](#).

- Non-`utf8` characters could get mangled when stored in `CSV` tables. ([Bug#28862](#))
- On Windows, `USE_TLS` was not defined for `mysqlclient.lib`. ([Bug#28860](#))
- In MySQL 5.1.15, a new error code `ER_DUP_ENTRY_WITH_KEY_NAME` (1582) was introduced to replace `ER_DUP_ENTRY` (1062) so that the key name could be provided instead of the key number. This was unnecessary, so `ER_DUP_ENTRY` is used again and the key name is printed. The incompatibility introduced in 5.1.15 no longer applies. ([Bug#28842](#))
- A subquery with `ORDER BY` and `LIMIT 1` could cause a server crash. ([Bug#28811](#))

- Running `SHOW TABLE STATUS` while performing a high number of inserts on partitioned tables with a great many partitions could cause the server to crash. (Bug#28806)
- Using `BETWEEN` with non-indexed date columns and short formats of the date string could return incorrect results. (Bug#28778)
- Selecting `GEOMETRY` columns in a `UNION` caused a server crash. (Bug#28763)
- When constructing the path to the original `.frm` file, `ALTER ... RENAME` was unnecessarily (and incorrectly) lowercasing the entire path when not on a case-insensitive file system, causing the statement to fail. (Bug#28754)
- The `binlog_format` system variable value was empty if the server was started with binary logging disabled. Now it is set to `MIXED`. (Bug#28752)
- Searches on indexed and non-indexed `ENUM` columns could return different results for empty strings. (Bug#28729)
- Executing `EXPLAIN EXTENDED` on a query using a derived table over a grouping subselect could lead to a server crash. This occurred only when materialization of the derived tables required creation of an auxiliary temporary table, an example being when a grouping operation was carried out with usage of a temporary table. (Bug#28728)
- The result of evaluation for a view's `CHECK OPTION` option over an updated record and records of merged tables was arbitrary and dependant on the order of records in the merged tables during the execution of the `SELECT` statement. (Bug#28716)
- The “manager thread” of the LinuxThreads implementation was unintentionally started before `mysqld` had dropped privileges (to run as an unprivileged user). This caused signaling between threads in `mysqld` to fail when the privileges were finally dropped. (Bug#28690)
- Setting an interval of `EVERY 0 SECOND` for a scheduled event caused the server to crash. (Bug#28666)
- For debug builds, `ALTER TABLE` could trigger an assertion failure due to occurrence of a deadlock when committing changes. (Bug#28652)
- Attempting to create an index on a `BIT` column failed after modifying the column. (Bug#28631)
- After an upgrade, the names of stored routines referenced by views were no longer displayed by `SHOW CREATE VIEW`. (Bug#28605)  
This regression was introduced by Bug#23491.
- Conversion of U+00A5 YEN SIGN and U+203E OVERLINE from `ucs2` to `ujis` produced incorrect results. (Bug#28600)
- Killing from one connection a long-running `EXPLAIN QUERY` started from another connection caused `mysqld` to crash. (Bug#28598)
- `SHOW GLOBAL VARIABLES` repeated some variable names. (Bug#28580)
- When one thread attempts to lock two (or more) tables and another thread executes a statement that aborts these locks (such as `REPAIR TABLE`, `OPTIMIZE TABLE`, or `CHECK TABLE`), the thread might get a table object with an incorrect lock type in the table cache. The result is table corruption or a server crash. (Bug#28574)
- Outer join queries with `ON` conditions over constant outer tables did not return `NULL`-complemented rows when conditions were evaluated to `FALSE`. (Bug#28571)
- An update on a multiple-table view with the `CHECK OPTION` clause and a subquery in the `WHERE` condition could cause an assertion failure. (Bug#28561)
- Calling the `UpdateXML()` function using invalid XPath syntax caused memory corruption possibly leading to a crash of the server. (Bug#28558)
- `PURGE MASTER LOGS BEFORE (subquery)` caused a server crash. Subqueries are forbidden in the `BEFORE` clause now. (Bug#28553)
- `mysqldump` calculated the required memory for a hex-blob string incorrectly causing a buffer overrun. This in turn caused `mysqldump` to crash silently and produce incomplete output. (Bug#28522)
- When upgrading from MySQL 5.1.17 to 5.1.18, `mysql_upgrade` and `mysql_fix_privilege_tables` did not upgrade the system tables relating to the Event Scheduler correctly. (Bug#28521)
- Passing a `DECIMAL` value as a parameter of a statement prepared with `PREPARE` resulted in an error. (Bug#28509)
- `mysql_affected_rows()` could return an incorrect result for `INSERT ... ON DUPLICATE KEY UPDATE` if the

`CLIENT_FOUND_ROWS` flag was set. (Bug#28505)

- A query that grouped by the result of an expression returned a different result when the expression was assigned to a user variable. (Bug#28494)
- Subselects returning `LONG` values in MySQL versions later than 5.0.24a returned `LONGLONG` prior to this. The previous behavior was restored. (Bug#28492)

This regression was introduced by Bug#19714.

- Performing `ALTER TABLE ... ADD PARTITION` or `ALTER TABLE DROP PARTITION` could result in inconsistent data, or cause the server to crash, if done concurrently with other accesses to the table. (Bug#28477, Bug#28488)
- Forcing the use of an index on a `SELECT` query when the index had been disabled would raise an error without running the query. The query now executes, with a warning generated noting that the use of a disabled index has been ignored. (Bug#28476)
- The query `SELECT '2007-01-01' + INTERVAL column_name DAY FROM table_name` caused `mysqld` to fail. (Bug#28450)
- A server crash could happen under rare conditions such that a temporary table outgrew heap memory reserved for it and the remaining disk space was not big enough to store the table as a `MyISAM` table. (Bug#28449)
- Using `ALTER TABLE` to move columns resulted only in the columns being renamed. The table contents were not changed. (Bug#28427)
- The test case for `mysqldump` failed with `bin-log` disabled. (Bug#28372)
- Attempting to `LOAD_FILE` from an empty floppy drive under Windows, caused the server to hang. For example, if you opened a connection to the server and then issued the command `SELECT LOAD_FILE('a:test');`, with no floppy in the drive, the server was inaccessible until the modal pop-up dialog box was dismissed. (Bug#28366)
- `mysqltest` used a too-large stack size on PPC/Debian Linux, causing thread-creation failure for tests that use many threads. (Bug#28333)
- When using a `MEMORY` table on Mac OS X, dropping a table and then creating a table with the same name could cause the information of the deleted table to remain accessible, leading to index errors. (Bug#28309)
- The `IS_UPDATABLE` column in the `INFORMATION_SCHEMA.VIEWS` table was not always set correctly. (Bug#28266)
- For `CAST()` of a `NULL` value with type `DECIMAL`, the return value was incorrectly initialized, producing a runtime error for binaries built using Visual C++ 2005. (Bug#28250)
- When the query cache was fully used, issuing `RENAME DATABASE` or `RENAME SCHEMA` could cause the server to hang, with 100% CPU usage. (Bug#28211)
- The `Bytes_received` and `Bytes_sent` status variables could hold only 32-bit values (not 64-bit values) on some platforms. (Bug#28149)
- Some valid identifiers were not parsed correctly. (Bug#28127)
- Storing a large number into a `FLOAT` or `DOUBLE` column with a fixed length could result in incorrect truncation of the number if the column's length was greater than 31. (Bug#28121)
- Sending debugging information from a dump of the Event Scheduler to `COM_DEBUG` could cause the server to crash. (Bug#28075)
- The `PARTITION_COMMENT` column of the `INFORMATION_SCHEMA.PARTITIONS` table had the wrong default value. (Bug#28007)
- `DECIMAL` values beginning with nine 9 digits could be incorrectly rounded. (Bug#27984)
- For attempts to open a non-existent table, the server should report `ER_NO_SUCH_TABLE` but sometimes reported `ER_TABLE_NOT_LOCKED`. (Bug#27907)
- Following an invalid call to `UpdateXML()`, calling the function again (even if valid) crashed the server. (Bug#27898)
- A stored program that uses a variable name containing multibyte characters could fail to execute. (Bug#27876)
- The server made strong assumptions about the structure of the `general_log` and `slow_log` log tables: It supported only the table structure defined in the `mysql` database creation scripts. The server also allowed limited `ALTER TABLE` operations

on the log tables, but adding an `AUTO_INCREMENT` column did not properly initialize the column, and subsequent inserts into the table could fail to generate correct sequence numbers. Now an `ALTER TABLE` statement that adds an `AUTO_INCREMENT` column populates the column correctly. In addition, when the server writes a log table row, it will set columns not present in the original table structure to their default values. (Bug#27857)

- `ON` conditions from `JOIN` expressions were ignored when checking the `CHECK OPTION` clause while updating a multiple-table view that included such a clause. (Bug#27827)
  - On some systems, `udf_example.c` returned an incorrect result length. Also on some systems, `mysql-test-run.pl` could not find the shared object built from `udf_example.c`. (Bug#27741)
  - The modification of a table by a partially completed multi-column update was not recorded in the binlog, rather than being marked by an event and a corresponding error code. (Bug#27716)
  - `SHOW ENGINES` and queries on `INFORMATION_SCHEMA.ENGINES` did not use the same values for representing the same storage engine states. (Bug#27684)
  - `HASH` indexes on `VARCHAR` columns with binary collations did not ignore trailing spaces from strings before comparisons. This could result in duplicate records being successfully inserted into a `MEMORY` table with unique key constraints. A consequence was that internal `MEMORY` tables used for `GROUP BY` calculation contained duplicate rows that resulted in duplicate-key errors when converting those temporary tables to `MyISAM`, and that error was incorrectly reported as a `table is full` error. (Bug#27643)
  - An error occurred trying to connect to `mysqld-debug.exe`. (Bug#27597)
  - A stack overrun could occur when storing `DATETIME` values using repeated prepared statements. (Bug#27592)
  - If a stored function or trigger was killed, it aborted but no error was thrown, allowing the calling statement to continue without noticing the problem. This could lead to incorrect results. (Bug#27563)
  - When `ALTER TABLE` was used to add a new `DATE` column with no explicit default value, `'0000-00-00'` was used as the default even if the SQL mode included the `NO_ZERO_DATE` mode to prohibit that value. A similar problem occurred for `DATETIME` columns. (Bug#27507)
  - `ALTER TABLE ... ENABLE KEYS` could cause `mysqld` to crash when executed on a table containing on a `MyISAM` table containing billions of rows. (Bug#27029)
  - Binary content `0x00` in a `BLOB` column sometimes became `0x5C 0x00` following a dump and reload, which could cause problems with data using multi-byte character sets such as `GBK` (Chinese). This was due to a problem with `SELECT INTO OUTFILE` whereby `LOAD DATA` later incorrectly interpreted `0x5C` as the second byte of a multi-byte sequence rather than as the `SOLIDUS` (“\”) character, used by MySQL as the escape character. (Bug#26711)
  - The server crashed when attempting to open a table having a `#mysql150#` prefix in the database or table name. The server now will not open such tables. (This prefix is reserved by `mysql_upgrade` for accessing 5.0 tables that have names not yet encoded for 5.1.) (Bug#26402)
  - A `FLUSH TABLES WITH READ LOCK` statement followed by a `FLUSH LOGS` statement caused a deadlock if the general log or the slow query log was enabled. (Bug#26380)
  - The query `SELECT /*2*/ user, host, db, info FROM INFORMATION_SCHEMA.PROCESSLIST WHERE (command!='Daemon' || user='event_scheduler') AND (info IS NULL OR info NOT LIKE '%processlist%') ORDER BY INFO` yielded inconsistent results. (Bug#26338)
  - For a given user variable `@v`, the statements `SELECT @v` and `CREATE TABLE ... AS SELECT @v` did not return the same data type. (Bug#26277)
  - Statements within triggers ignored the value of the `low_priority_updates` system variable. (Bug#26162)
- See also Bug#29963.
- The embedded server library displayed error messages at startup if the `mysql.plugin` table was not present. This no longer occurs. (Bug#25800)
  - On Windows, an application that called `mysql_thread_init()` but forgot to call `mysql_thread_end()` would get this error: `ERROR IN MY_THREAD_GLOBAL_END()`. (Bug#25621)
  - Embedded `/* ... */` comments were handled incorrectly within the definitions of stored programs and views, resulting in malformed definitions (the trailing `*/` was stripped). This also affected binary log contents. (Bug#25411, Bug#26302)
  - Due to a race condition, executing `FLUSH PRIVILEGES` in one thread could cause brief table unavailability in other threads. (Bug#24988)

- In `SHOW SLAVE STATUS` output, `Last_Errno` and `Last_Error` were not set after `master_retry_count` errors had occurred. To provide additional information, the statement now displays four additional columns:
  - `Last_IO_Errno`: The number of the last error that caused the I/O thread to stop
  - `Last_IO_Error`: A description of the last error that caused the I/O thread to stop
  - `Last_SQL_Errno`: The number of the last error that caused the SQL thread to stop
  - `Last_SQL_Error`: A description of the last error that caused the SQL thread to stop

Also, `Last_Errno` and `Last_Error` now are aliases for `Last_SQL_Errno` and `Last_SQL_Error`. (Bug#24954)

- A too-long `shared-memory-base-name` value could cause a buffer overflow and crash the server or clients. (Bug#24924)
- When `mysqld` was run as a Windows service, shared memory objects were not created in the global namespace and could not be used by clients to connect. (Bug#24731)
- On some Linux distributions where LinuxThreads and NPTL `glibc` versions both are available, statically built binaries can crash because the linker defaults to LinuxThreads when linking statically, but calls to external libraries (such as `libnss`) are resolved to NPTL versions. This cannot be worked around in the code, so instead if a crash occurs on such a binary/OS combination, print an error message that provides advice about how to fix the problem. (Bug#24611)
- A number of `SHOW` statements caused `mysqld` to crash on recent versions of Solaris. This issue is believed to be present only in MySQL 5.1.12 and later. (Bug#23810)
- The server deducted some bytes from the `key_cache_block_size` option value and reduced it to the next lower 512 byte boundary. The resulting block size was not a power of two. Setting the `key_cache_block_size` system variable to a value that is not a power of two resulted in `MyISAM` table corruption. (Bug#23068, Bug#28478, Bug#25853)
- Conversion errors could occur when constructing the condition for an `IN` predicate. The predicate was treated as if the affected column contains `NULL`, but if the `IN` predicate is inside `NOT`, incorrect results could be returned. (Bug#22855)
- Linux binaries were unable to dump core after executing a `setuid()` call. (Bug#21723)
- Stack overflow caused server crashes. (Bug#21476)
- The server was ignoring the return value of the `parse()` function for full-text parser plugins. (Bug#18839)
- Granting access privileges to an individual table where the database or table name contained an underscore would fail. (Bug#18660)
- The `-lmtmalloc` library was removed from the output of `mysql_config` on Solaris, as it caused problems when building `DBD:mysql` (and possibly other applications) on that platform that tried to use `dlopen()` to access the client library. (Bug#18322)
- The `check-cpu` script failed to detect AMD64 Turion processors correctly. (Bug#17707)
- When using `mysqlbinlog` with `--read-from-remote-server` to load the data direct from a remote MySQL server would cause a core dump when dumping certain binary log events. (Bug#17654)
- Trying to shut down the server following a failed `LOAD DATA INFILE` caused `mysqld` to crash. (Bug#17233)
- The omission of leading zeros in dates could lead to erroneous results when these were compared with the output of certain date and time functions. (Bug#16377)
- Using up-arrow for command-line recall in `mysql` could cause a segmentation fault. (Bug#10218)
- The result for `CAST()` when casting a value to `UNSIGNED` was limited to the maximum signed `BIGINT` value (9223372036854775808), rather than the maximum unsigned value (18446744073709551615). (Bug#8663)
- The internal functions for table preparation, creation, and alteration were not re-execution friendly, causing problems in code that: repeatedly altered a table; repeatedly created and dropped a table; opened and closed a cursor on a table, altered the table, and then reopened the cursor; used `ALTER TABLE` to change a table's current `AUTO_INCREMENT` value; created indexes on `utf8` columns.

Re-execution of `CREATE DATABASE`, `CREATE TABLE`, and `ALTER TABLE` statements in stored routines or as prepared statements also caused incorrect results or crashes. (Bug#4968, Bug#6895, Bug#19182, Bug#19733, Bug#22060, Bug#24879)

## C.2.19. Changes in MySQL 5.1.19 (25 May 2007)

This is a new Beta development release, fixing recently discovered bugs.

### Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible Change:** `INSERT DELAYED` is now downgraded to a normal `INSERT` if the statement uses functions that access tables or triggers, or that is called from a function or a trigger.

This was done to resolve the following interrelated issues:

- The server could abort or deadlock for `INSERT DELAYED` statements for which another insert was performed implicitly (for example, via a stored function that inserted a row).
- A trigger using an `INSERT DELAYED` caused the error `INSERT DELAYED CAN'T BE USED WITH TABLE ... BECAUSE IT IS LOCKED WITH LOCK TABLES` although the target table was not actually locked.
- `INSERT DELAYED` into a table with a `BEFORE INSERT` or `AFTER INSERT` trigger gave an incorrect `NEW` pseudo-column value and caused the server to deadlock or abort.

([Bug#21483](#))

See also [Bug#20497](#), [Bug#21714](#).

- **MySQL Cluster:** Formerly, restoring a cluster backup made on a MySQL 5.0 Cluster to a 5.1 cluster using a 5.1 version of `ndb_restore` did not resize `VARCHAR` columns as might be expected; now, the default behavior of `ndb_restore` in such cases is to resize the `VARCHAR` columns. This changed default behavior can be overridden using the `--no-upgrade` (or `-u`) option when invoking `ndb_restore`. ([Bug#22240](#))
- The `BLACKHOLE` storage engine now supports `INSERT DELAYED`. Previously, `INSERT DELAYED` statements for `BLACKHOLE` tables were not supported, and caused the server to crash. ([Bug#27998](#))
- A new status variable, `Com_call_procedure`, indicates the number of calls to stored procedures. ([Bug#27994](#))
- The `BLACKHOLE` storage engine now supports `LOCK TABLES` and `UNLOCK TABLES`. ([Bug#26241](#))
- `GLOBAL_STATUS`
- `GLOBAL_VARIABLES`
- `SESSION_VARIABLES`
- The data type used for the `VARIABLE_VALUE` column of the following `INFORMATION_SCHEMA` tables has been changed to `VARCHAR`:
  - `GLOBAL_STATUS`
  - `SESSION_STATUS`
  - `GLOBAL_VARIABLES`
  - `SESSION_VARIABLES`
 For more information, see [Section 19.24](#), “The `INFORMATION_SCHEMA GLOBAL_STATUS` and `SESSION_STATUS` Tables”, and [Section 19.25](#), “The `INFORMATION_SCHEMA GLOBAL_VARIABLES` and `SESSION_VARIABLES` Tables”.
- See also [Bug#26994](#).
- `SESSION_STATUS`

Bugs fixed:

- **Security Fix:** UDFs are supposed to be loadable only from the plugin directory, but this restriction was not being enforced. (Bug#28341)
- **Security Fix:** Use of a view could allow a user to gain update privileges for tables in other databases. (Bug#27878, CVE-2007-3782)
- **MySQL Cluster:** When an API node sent more than 1024 signals in a single batch, NDB would process only the first 1024 of these, and then hang. (Bug#28443)
- **MySQL Cluster:** A delay in obtaining `AUTO_INCREMENT` IDs could lead to excess temporary errors. (Bug#28410)
- **MySQL Cluster:** Local checkpoint files relating to dropped NDB tables were not removed. (Bug#28348)
- **MySQL Cluster:** Multiple operations involving deletes followed by reads were not handled correctly.

### Note

This issue could also affect MySQL Cluster Replication.

(Bug#28276)

- **MySQL Cluster:** Repeated insertion of data generated by `mysqldump` into NDB tables could eventually lead to failure of the cluster. (Bug#27437)
- **MySQL Cluster:** Restarting a data node caused SQL nodes to log repeatedly and unnecessarily the status of the event buffer, causing a memory leak of approximately 4 MB for each `mysqld` process each time this occurred.  
(This issue was known to occur in MySQL 5.1.16 and later only.) (Bug#27292)
- **MySQL Cluster:** `ndb_mgmd` failed silently when the cluster configuration file contained invalid `[tcp]` entries. (Bug#27207)
- **MySQL Cluster:** `ndb_connectstring` did not appear in the output of `SHOW VARIABLES`. (Bug#26675)
- **MySQL Cluster:** A failure to release internal resources following an error could lead to problems with single user mode. (Bug#25818)
- **MySQL Cluster:** DDL operations were not supported on a partially started cluster. (Bug#24631)
- **Disk Data:** Extremely large inserts into Disk Data tables could lead to data node failure in some circumstances. (Bug#27942)
- **Cluster API:** In a multi-operation transaction, a delete operation followed by the insertion of an implicit `NULL` failed to overwrite an existing value. (Bug#20535)
- Some `ALTER TABLE` statements that worked in MySQL 5.0 did not work in 5.1. (Bug#28415)
- `mysql_upgrade` failed if certain SQL modes were set. Now it sets the mode itself to avoid this problem. (Bug#28401)
- A query with a `NOT IN` subquery predicate could cause a crash when the left operand of the predicate evaluated to `NULL`. (Bug#28375)
- A buffer overflow could occur when using `DECIMAL` columns on Windows operating systems. (Bug#28361)
- `libmysql.dll` could not be dynamically loaded on Windows. (Bug#28358)
- Grouping queries with correlated subqueries in `WHERE` conditions could produce incorrect results. (Bug#28337)
- `EXPLAIN` for a query on an empty table immediately after its creation could result in a server crash. (Bug#28272)
- Comparing a `DATETIME` column value with a user variable yielded incorrect results. (Bug#28261)
- Portability problems caused by use of `isinf()` were corrected. (Bug#28240)
- When dumping procedures, `mysqldump --compact` generated output that restored the session variable `sql_mode` without first capturing it. When dumping routines, `mysqldump --compact` neither set nor retrieved the value of `sql_mode`. (Bug#28223)
- Comparison of the string value of a date showed as unequal to `CURTIME()`. Similar behavior was exhibited for `DATETIME` values. (Bug#28208)

- For `InnoDB`, in some rare cases the optimizer preferred a more expensive `ref` access to a less expensive range access. (Bug#28189)
- Comparisons of `DATE` or `DATETIME` values for the `IN()` function could yield incorrect results. (Bug#28133)
- It was not possible to use the value `-9223372036854775808` (that is, `-MAXVALUE + 1`) when specifying a `LIST` partition. (Bug#28005)
- The server could hang for `INSERT IGNORE ... ON DUPLICATE KEY UPDATE` if an update failed. (Bug#28000)
- `CAST()` to `DECIMAL` did not check for overflow. (Bug#27957)
- The second execution of a prepared statement from a `UNION` query with `ORDER BY RAND()` caused the server to crash. This problem could also occur when invoking a stored procedure containing such a query. (Bug#27937)
- Views ignored precision for `CAST()` operations. (Bug#27921)
- Changes to some system variables should invalidate statements in the query cache, but invalidation did not happen. (Bug#27792)
- `LOAD DATA` did not use `CURRENT_TIMESTAMP` as the default value for a `TIMESTAMP` column for which no value was provided. (Bug#27670)
- Selecting `MIN()` on an indexed column that contained only `NULL` values caused `NULL` to be returned for other result columns. (Bug#27573)
- Using a `TEXT` local variable in a stored routine in an expression such as `SET var = SUBSTRING(var, 3)` produced an incorrect result. (Bug#27415)
- The error message for error number `137` did not report which database/table combination reported the problem. (Bug#27173)
- A large filesort could result in a division by zero error and a server crash. (Bug#27119)
- Some `InnoDB` variables were missing from the output of `mysqld --verbose --help`. (Bug#26987)
- Flow control optimization in stored routines could cause exception handlers to never return or execute incorrect logic. (Bug#26977)
- Some test suite files were missing from some MySQL-test packages. (Bug#26609)
- Running `CHECK TABLE` concurrently with a `SELECT`, `INSERT` or other statement on Windows could corrupt a MyISAM table. (Bug#25712)
- Concurrent execution of `CREATE TABLE ... SELECT` and other statements involving the target table suffered from various race conditions, some of which might have led to deadlocks. (Bug#24738)
- An attempt to execute `CREATE TABLE ... SELECT` when a temporary table with the same name already existed led to the insertion of data into the temporary table and creation of an empty non-temporary table. (Bug#24508)
- A statement of the form `CREATE TABLE IF NOT EXISTS t1 SELECT f1() AS i` failed with a deadlock error if the stored function `f1()` referred to a table with the same name as the to-be-created table. Now it correctly produces a message that the table already exists. (Bug#22427)
- Quoted labels in stored routines were mishandled, rendering the routines unusable. (Bug#21513)
- `CURDATE()` is less than `NOW()`, either when comparing `CURDATE()` directly (`CURDATE() < NOW()` is true) or when casting `CURDATE()` to `DATE` (`CAST(CURDATE() AS DATE) < NOW()` is true). However, storing `CURDATE()` in a `DATE` column and comparing `col_name < NOW()` incorrectly yielded false. This is fixed by comparing a `DATE` column as `DATETIME` for comparisons to a `DATETIME` constant. (Bug#21103)
- `CREATE TABLE IF NOT EXISTS ... SELECT` caused a server crash if the target table already existed and had a `BEFORE INSERT` trigger. (Bug#20903)
- Deadlock occurred for attempts to execute `CREATE TABLE IF NOT EXISTS ... SELECT` when `LOCK TABLES` had been used to acquire a read lock on the target table. (Bug#20662, Bug#15522)
- For dates with 4-digit year parts less than 200, an incorrect implicit conversion to add a century was applied for date arithmetic performed with `DATE_ADD()`, `DATE_SUB()`, `+ INTERVAL`, and `- INTERVAL`. (For example, `DATE_ADD('0050-01-01 00:00:00', INTERVAL 0 SECOND)` became `'2050-01-01 00:00:00'`.) (Bug#18997)

- Changing the size of a key buffer that is under heavy use could cause a server crash. The fix partially removes the limitation that `LOAD INDEX INTO CACHE` fails unless all indexes in a table have the same block size. Now the statement fails only if `IGNORE LEAVES` is specified. (Bug#17332)

## C.2.20. Changes in MySQL 5.1.18 (08 May 2007)

This is a new Beta development release, fixing recently discovered bugs.

### Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible Change: MySQL Cluster:** The internal specifications for columns in NDB tables has changed to allow compatibility with future MySQL Cluster releases that are expected to implement online adding and dropping of columns. This change is not backward compatible with earlier versions of MySQL Cluster.

See the related note in [MySQL Cluster 5.1 and MySQL Cluster NDB 6.x/7.x Upgrade and Downgrade Compatibility](#), for important information prior to upgrading a MySQL Cluster to MySQL 5.1.18 or later from MySQL 5.1.17 or earlier.

See also [Bug#28205](#).

- **Incompatible Change: Replication:** The `INFORMATION_SCHEMA.EVENTS` and `mysql.event` tables have been changed to facilitate replication of events. When upgrading to MySQL 5.1.18, you must run `mysql_upgrade` prior to working with events. Until you have done so, any statement relating to the Event Scheduler or these tables (including `SHOW EVENTS`) will fail with the errors `EXPECTED FIELD STATUS AT POSITION 12 TO HAVE TYPE ENUM ('ENABLED', 'SLAVESIDE_DISABLED', 'DISABLED')`, `FOUND ENUM('ENABLED', 'DISABLED')` and `TABLE MYSQL.EVENT IS DAMAGED. CAN NOT OPEN`.

These changes were made as part of fixes for the following bugs:

- The effects of scheduled events were not replicated (that is, binary logging of scheduled events did not work).
- Effects of scheduled events on a replication master were both replicated and executed on the slave, causing double execution of events.
- `CREATE FUNCTION` statements and their effects were not replicated correctly.

For more information, see [Section 16.3.1.7, “Replication of Invoked Features”](#). (Bug#17857, Bug#16421, Bug#20384, Bug#17671)

- **Cluster Replication: Incompatible Change:** The definition of the `mysql.ndb_apply_status` table has changed such that an online upgrade is not possible from MySQL 5.1.17 or earlier for a replication slave cluster; you must shut down all SQL nodes as part of the upgrade procedure. See [MySQL Cluster 5.1 and MySQL Cluster NDB 6.x/7.x Upgrade and Downgrade Compatibility](#) before upgrading for details.

For more information about the changes to `mysql.ndb_apply_status` see [MySQL Cluster Replication Schema and Tables](#).

- **Incompatible Change:** Prior to this release, when `DATE` values were compared with `DATETIME` values, the time portion of the `DATETIME` value was ignored, or the comparison could be performed as a string compare. Now a `DATE` value is coerced to the `DATETIME` type by adding the time portion as `00:00:00`. To mimic the old behavior, use the `CAST()` function as shown in this example: `SELECT date_col = CAST(NOW() AS DATE) FROM tablei`. (Bug#28929)
- **Important Change:** When upgrading to MySQL 5.1.18 or later from a previous MySQL version and scheduled events have been used, the upgrade utilities do not accommodate changes in event-related system tables. As a workaround, you can dump events before the upgrade, then restore them from the dump afterwards. This issue was fixed in MySQL 5.1.20.

See also [Bug#28521](#).

- **MySQL Cluster:** The behavior of the `ndb_restore` utility has been changed as follows:
  - It is now possible to restore selected databases or tables using `ndb_restore`.
  - Several options have been added for use with `ndb_restore --print_data` to facilitate the creation of structured data dump files. These options can be used to make dumps made using `ndb_restore` more like those produced by `mysqldump`.

For details of these changes, see `ndb_restore`. ([Bug#26899](#), [Bug#26900](#))
- **MySQL Cluster:** The following changes were made in the `ndb_size.pl` utility:
  - When `ndb_size.pl` calculates a value for a given configuration parameter that is less than the default value, it now suggests the default value instead.
  - The dependency on `HTML::Template` was removed, with the result that the file `ndb_size.tmpl` is no longer needed or included. ([Bug#24227](#), [Bug#24228](#))
- **Cluster Replication: Replication:** Some circular replication setups are now supported for MySQL Cluster. See [Known Issues in MySQL Cluster Replication](#), for detailed information. ([Bug#17095](#), [Bug#25688](#))
- **Cluster API:** The MGM API now supports explicit setting of network timeouts using the `ndb_mgm_set_timeout()` function. A utility function `ndb_mgm_number_of_mgrmd_in_connect_string()` is also implemented to facilitate calculation of timeouts based on the number of management servers in the cluster.
 

For more information, see `ndb_mgm_set_timeout()`, and `ndb_mgm_number_of_mgrmd_in_connect_string()`.
- `mysqld_multi` now understands the `--no-defaults`, `--defaults-file`, and `--defaults-extra-file` options. The `--config-file` option is deprecated; if given, it is treated like `--defaults-extra-file`. ([Bug#27390](#))
- If a set function `S` with an outer reference `S(outer_ref)` cannot be aggregated in the outer query against which the outer reference has been resolved, MySQL interprets `S(outer_ref)` the same way that it would interpret `S(const)`. However, standard SQL requires throwing an error in this situation. An error now is thrown for such queries if the `ANSI SQL` mode is enabled. ([Bug#27348](#))
- Several additional data types are supported for columns in `INFORMATION_SCHEMA` tables: `DATE`, `TIME`, `BLOB`, `FLOAT`, and all integer types. ([Bug#27047](#))
- The output of `mysql --xml` and `mysqldump --xml` now includes a valid XML namespace. ([Bug#25946](#))
- If you use SSL for a client connection, you can tell the client not to authenticate the server certificate by specifying neither `--ssl-ca` nor `--ssl-capath`. The server still verifies the client according to any applicable requirements established via `GRANT` statements for the client, and it still uses any `--ssl-ca/--ssl-capath` values that were passed to server at startup time. ([Bug#25309](#))
- Added a `MASTER_SSL_VERIFY_SERVER_CERT` option for the `CHANGE MASTER TO` statement, and a `Master_Ssl_Verify_Server_Cert` output column to the `SHOW SLAVE STATUS` statement. The option value also is written to the `master.info` file. ([Bug#19991](#))
- The `innodb_log_archive` system variable has been removed. The impact of this change should be low because the variable was unused, anyway.
- Added the `--auto-generate-sql-add-autoincrement`, `--auto-generate-sql-execute-number`, `--auto-generate-sql-guid-primary`, `--auto-generate-sql-secondary-indexes`, `--auto-generate-sql-unique-query-number`, `--auto-generate-sql-unique-write-number`, `--post-query`, and `--pre-query`, options for `mysqldslap`. Removed the `--lock-directory`, `--slave`, and `--use-threads` options.
- Added `--write-binlog` option for `mysqlbinlog`. This option is enabled by default, but can be given as `--skip-write-binlog` to cause `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` statements generated by `mysqlcheck` not to be written to the binary log. ([Bug#26262](#))
- New command-line options: To alleviate ambiguities in variable names, all variables related to plugins can be specified using a `plugin` part in the name. For example, every time where we used to have `innodb` in the command-line options, you can now write `plugin-innodb`:

```
--skip-plugin-innodb
--plugin-innodb-buffer-pool-size=#
```

Furthermore, this is the preferred syntax. It helps to avoid ambiguities when a plugin, say, `wait`, has an option called `timeout`. `--wait-timeout` will still set a system variable, but `--plugin-wait-timeout` will set the plugin variable. Also, there is a new command-line option `--plugin-load` to install or load plugins at initialization time without using the `mysql.plugin` table.

- The plugin interface and its handling of system variables was changed. Command-line options such as `--skip-innodb` now cause an error if `InnoDB` is not built-in or plugin-loaded. You should use `--loose-skip-innodb` if you do not want any error even if `InnoDB` is not available. The `--loose` prefix modifier should be used for all command-line options where you are uncertain whether the plugin exists and when you want the operation to proceed even if the option is necessarily ignored due to the absence of the plugin. (For a description of how `--loose` works, see [Section 4.2.3.1, “Using Options on the Command Line”](#).)
- Storage engine plugins may now be uninstalled at run time. However, a plugin is not actually uninstalled until after its reference count drops to zero. The `default_storage_engine` system variable consumes a reference count, so uninstalling will not complete until said reference is removed.
- The `mysql_create_system_tables` script was removed because `mysql_install_db` no longer uses it in MySQL 5.1.
- Renamed the `old_mode` system variable to `old`.

Bugs fixed:

- **Security Fix:** The requirement of the `DROP` privilege for `RENAME TABLE` was not enforced. ([Bug#27515](#), [CVE-2007-2691](#))
- **Security Fix:** If a stored routine was declared using `SQL SECURITY INVOKER`, a user who invoked the routine could gain privileges. ([Bug#27337](#), [CVE-2007-2692](#))
- **Security Fix:** A user with only the `ALTER` privilege on a partitioned table could obtain information about the table that should require the `SELECT` privilege. ([Bug#23675](#), [CVE-2007-2693](#))
- **MySQL Cluster: Replication:** (Replication): An `UPDATE` on the master became a `DELETE` on slaves. ([Bug#27378](#))
- **MySQL Cluster:** The cluster waited 30 seconds instead of 30 milliseconds before reading table statistics. ([Bug#28093](#))
- **MySQL Cluster:** Under certain rare circumstances, `ndbd` could get caught in an infinite loop when one transaction took a read lock and then a second transaction attempted to obtain a write lock on the same tuple in the lock queue. ([Bug#28073](#))
- **MySQL Cluster:** Under some circumstances, a node restart could fail to update the Global Checkpoint Index (GCI). ([Bug#28023](#))
- **MySQL Cluster:** `INSERT IGNORE` wrongly ignored `NULL` values in unique indexes. ([Bug#27980](#))
- **MySQL Cluster:** The name of the month “March” was given incorrectly in the cluster error log. ([Bug#27926](#))
- **MySQL Cluster:** `NDB` tables having `MEDIUMINT AUTO_INCREMENT` columns were not restored correctly by `ndb_restore`, causing spurious duplicate key errors. This issue did not affect `TINYINT`, `INT`, or `BIGINT` columns with `AUTO_INCREMENT`. ([Bug#27775](#))
- **MySQL Cluster:** `NDB` tables with indexes whose names contained space characters were not restored correctly by `ndb_restore` (the index names were truncated). ([Bug#27758](#))
- **MySQL Cluster:** An `INSERT` followed by a delete `DELETE` on the same `NDB` table caused a memory leak. ([Bug#27756](#))  
This regression was introduced by [Bug#20612](#).
- **MySQL Cluster:** It was not possible to add a unique index to an `NDB` table while in single user mode. ([Bug#27710](#))
- **MySQL Cluster:** Under certain rare circumstances performing a `DROP TABLE` or `TRUNCATE` on an `NDB` table could cause a node failure or forced cluster shutdown. ([Bug#27581](#))
- **MySQL Cluster:** Memory usage of a `mysqld` process grew even while idle. ([Bug#27560](#))
- **MySQL Cluster:** Using more than 16GB for `DataMemory` caused problems with variable-size columns. ([Bug#27512](#))
- **MySQL Cluster:** A data node failing while another data node was restarting could leave the cluster in an inconsistent state. In certain rare cases, this could lead to a race condition and the eventual forced shutdown of the cluster. ([Bug#27466](#))

- **MySQL Cluster:** When using the `MemReportFrequency` configuration parameter to generate periodic reports of memory usage in the cluster log, `DataMemory` usage was not always reported for all data nodes. (Bug#27444)
- **MySQL Cluster:** When trying to create an `NDB` table after the server was started with `--ndbcluster` but without `--ndb-connectstring`, `mysqld` produced a memory allocation error. (Bug#27359)
- **MySQL Cluster:** Performing a delete followed by an insert during a local checkpoint could cause a `ROWID ALREADY ALLOCATED` error. (Bug#27205)
- **MySQL Cluster:** In an `NDB` table having a `TIMESTAMP` column using `DEFAULT CURRENT_TIMESTAMP`, that column would assume a random value when another column in the same row was updated. (Bug#27127)
- **MySQL Cluster:** Error messages displayed when running in single user mode were inconsistent. (Bug#27021)
- **MySQL Cluster:** On Solaris, the value of an `NDB` table column declared as `BIT(33)` was always displayed as 0. (Bug#26986)
- **MySQL Cluster:** Performing `ALTER TABLE ... ENGINE=MERGE` on an `NDB` table caused `mysqld` to crash. (Bug#26898)
- **MySQL Cluster:** The `NDBCLUSTER` table handler did not set bits in null bytes correctly. (Bug#26591)
- **MySQL Cluster:** In some cases, `AFTER UPDATE` and `AFTER DELETE` triggers on `NDB` tables that referenced subject table did not see the results of operation which caused invocation of the trigger, but rather saw the row as it was prior to the update or delete operation.

This was most noticeable when an update operation used a subquery to obtain the rows to be updated. An example would be `UPDATE tbl1 SET col2 = val1 WHERE tbl1.col1 IN (SELECT col3 FROM tbl2 WHERE col4 = val2)` where there was an `AFTER UPDATE` trigger on table `tbl1`. In such cases, the trigger would fail to execute.

The problem occurred because the actual update or delete operations were deferred to be able to perform them later as one batch. The fix for this bug solves the problem by disabling this optimization for a given update or delete if the table has an `AFTER` trigger defined for this operation. (Bug#26242)

- **MySQL Cluster:** Joins on multiple tables containing `BLOB` columns could cause data nodes run out of memory, and to crash with the error `NDBOBJECTIDMAP: :EXPAND UNABLE TO EXPAND`. (Bug#26176)
- **MySQL Cluster:** `START BACKUP NOWAIT` caused a spurious `OUT OF BACKUP RECORD` error in the management client (`START BACKUP` and `START BACKUP WAIT STARTED` performed normally). (Bug#25446)
- **MySQL Cluster:** Adding of indexes online failed for `NDB` tables having `BLOB` or `TEXT` columns. (Bug#25431)
- **MySQL Cluster:** When a cluster data node suffered a “hard” failure (such as a power failure or loss of a network connection) TCP sockets to the missing node were maintained indefinitely. Now socket-based transporters check for a response and terminate the socket if there is no activity on the socket after 2 hours. (Bug#24793)
- **MySQL Cluster:** The `ndb_resize.pl` utility did not calculate memory usage for indexes correctly. (Bug#24229)
- **MySQL Cluster:** While a data node was stopped, dropping a table then creating an index on a different table caused that node to fail during restart. This was due to the re-use of the dropped table's internal ID for the index without verifying that the index now referred to a different database object. (Bug#21755)
- **MySQL Cluster:** When trying to create tables on an SQL node not connected to the cluster, a misleading error message `TABLE 'TBL_NAME' ALREADY EXISTS` was generated. The error now generated is `COULD NOT CONNECT TO STORAGE ENGINE`. (Bug#11217, Bug#18676)
- **Cluster Replication: Replication:** An SQL node acting as a replication master server could be a single point of failure; that is, if it failed, the replication slave had no way of knowing this, which could result in a mismatch of data between the master and the slave. (Bug#21494)
- **Replication:** Out-of-memory errors were not reported. Now they are written to the error log. (Bug#26844)
- **Replication:** Improved out-of-memory detection when sending logs from a master server to slaves, and log a message when allocation fails. (Bug#26837)
- **Replication:** Aborting a statement on the master that applied to a non-transactional statement broke replication. The statement was written to the binary log but not completely executed on the master. Slaves receiving the statement executed it completely, resulting in loss of data synchrony. Now an error code is written to the error log so that the slaves stop without executing the aborted statement. (That is, replication stops, but synchrony to the point of the stop is preserved and you can investigate the problem.) (Bug#26551)

- **Replication:** When `RAND()` was called multiple times inside a stored procedure, the server did not write the correct random seed values to the binary log, resulting in incorrect replication. (Bug#25543)
- **Replication:** `GRANT` statements were not replicated if the server was started with the `--replicate-ignore-table` or `--replicate-wild-ignore-table` option. (Bug#25482)
- **Replication:** Restoration of the default database after stored routine or trigger execution on a slave could cause replication to stop if the database no longer existed. (Bug#25082)
- **Replication:** If a rotate event occurred in the middle of a non-transaction group, the group position would be updated by the rotate event indicating an illegal group start position that was effectively inside a group. This can happen if, for example, a rotate occurs between an `Intvar` event and the associated `Query` event, or between the table map events and the rows events when using row-based replication. (Bug#23171)
- **Replication:** Row-based replication of `MyISAM` to non-`MyISAM` tables did not work correctly for `BIT` columns. This has been corrected, but the fix introduces an incompatibility into the binary log format. (The incompatibility is corrected by the fix for Bug#27779.) (Bug#22583)
- **Cluster Replication: Disk Data:** An issue with replication of Disk Data tables could in some cases lead to node failure. (Bug#28161)
- **Disk Data:** Changes to a Disk Data table made as part of a transaction could not be seen by the client performing the changes until the transaction had been committed. (Bug#27757)
- **Disk Data:** When in single user mode, it was possible to create log file groups and tablespaces from any SQL node connected to the cluster. (Bug#27712)
- **Disk Data:** `CREATE TABLE ... LIKE disk_data_table` created an in-memory `NDB` table. (Bug#25875)
- **Disk Data:** When restarting a data node following the creation of a large number of Disk Data objects (approximately 200 such objects), the cluster could not assign a node ID to the restarting node. (Bug#25741)
- **Disk Data:** Creating an excessive number of Disk Data tables (1000 or more) could cause data nodes to fail. (Bug#24951)
- **Disk Data:** Changing a column specification or issuing a `TRUNCATE` statement on a Disk Data table caused the table to become an in-memory table.  
This fix supersedes an incomplete fix that was made for this issue in MySQL 5.1.15. (Bug#24667, Bug#25296)
- **Disk Data:** Setting the value of the `UNDO_BUFFER_SIZE` to 64K or less in a `CREATE LOGFILE GROUP` statement led to failure of cluster data nodes. (Bug#24560)
- **Disk Data:** Creating an excessive number of data files for a single tablespace caused data nodes to crash. (Bug#24521)
- **Disk Data:** It was possible to drop the last remaining datafile in a tablespace using `ALTER TABLESPACE`, even when there was still an empty table using the tablespace.

**Note**

The datafile could be not dropped if the table still contained any rows, so this bug involved no loss of data.

(Bug#21699)

- **Cluster Replication:** Some queries that updated multiple tables were not backed up correctly. (Bug#27748)
- **Cluster Replication:** It was possible for API nodes to begin interacting with the cluster subscription manager before they were fully connected to the cluster. (Bug#27728)
- **Cluster Replication:** Under very high loads, checkpoints could be read or written with checkpoint indexes out of order. (Bug#27651)
- **Cluster Replication:** Trying to replicate a large number of frequent updates with a relatively small relay log (`max-relay-log-size` set to 1M or less) could cause the slave to crash. (Bug#27529)
- **Cluster Replication:** Setting `sql_log_bin` to zero did not disable binary logging.

This issue affected only the `NDB` storage engine. (Bug#27076)

- **Cluster API:** For `BLOB` reads on operations with lock mode `LM_CommittedRead`, the lock mode was not upgraded to `LM_Read` before the state of the `BLOB` had already been calculated. The `NDB` API methods affected by this problem included the following:

- `NdbOperation::readTuple()`
  - `NdbScanOperation::readTuples()`
  - `NdbIndexScanOperation::readTuples()` (Bug#27320)
  - **Cluster API:** Using `NdbBlob::writeData()` to write data in the middle of an existing blob value (that is, updating the value) could overwrite some data past the end of the data to be changed. (Bug#27018)
  - A performance degradation was observed for outer join queries to which a not-exists optimization was applied. (Bug#28188)
  - `SELECT * INTO OUTFILE ... FROM INFORMATION_SCHEMA.SCHEMATA` failed with an `ACCESS DENIED` error, even for a user who had the `FILE` privilege. (Bug#28181)
  - Early `NULL`-filtering optimization did not work for `eq_ref` table access. (Bug#27939)
  - Non-grouped columns were allowed by `*` in `ONLY_FULL_GROUP_BY` SQL mode. (Bug#27874)
  - Some equi-joins containing a `WHERE` clause that included a `NOT IN` subquery caused a server crash. (Bug#27870)
  - An error message suggested the use of `mysql_fix_privilege_tables` after an upgrade, but the recommended program is now `mysql_upgrade`. (Bug#27818)
  - Debug builds on Windows generated false alarms about uninitialized variables with some Visual Studio runtime libraries. (Bug#27811)
  - Certain queries that used uncorrelated scalar subqueries caused `EXPLAIN` to crash. (Bug#27807)
  - Performing a `UNION` on two views that had `ORDER BY` clauses resulted in an `Unknown column` error. (Bug#27786)
  - `mysql_install_db` is supposed to detect existing system tables and create only those that do not exist. Instead, it was exiting with an error if tables already existed. (Bug#27783)
  - The `LEAST()` and `GREATEST()` functions compared `DATE` and `DATETIME` values as strings, which in some cases could lead to an incorrect result. (Bug#27759)
  - A memory leak in the event scheduler was uncovered by Valgrind. (Bug#27733)
  - `mysqld` did not check the length of option values and could crash with a buffer overflow for long values. (Bug#27715)
  - Comparisons using row constructors could fail for rows containing `NULL` values. (Bug#27704)
  - `mysqldump` could not connect using SSL. (Bug#27669)
  - `SELECT DISTINCT` could return incorrect results if the select list contained duplicated columns. (Bug#27659)
  - On Linux, the server could not create temporary tables if `lower_case_table_names` was set to 1 and the value of `tmpdir` was a directory name containing any uppercase letters. (Bug#27653)
  - For InnoDB tables, a multiple-row `INSERT` of the form `INSERT INTO t (id...) VALUES (NULL...) ON DUPLICATE KEY UPDATE id=VALUES(id)`, where `id` is an `AUTO_INCREMENT` column, could cause `ERROR 1062 (23000): Duplicate entry...` errors or lost rows. (Bug#27650)
  - When MySQL logged slow query information to a `CSV` table, it used an incorrect formula to calculate the `query_time` and `lock_time` values. (Bug#27638)
  - The XML output representing an empty result was an empty string rather than an empty `<resultset/>` element. (Bug#27608)
  - Comparison of a `DATE` with a `DATETIME` did not treat the `DATE` as having a time part of `00:00:00`. (Bug#27590)
- See also [Bug#32198](#).
- With `NO_AUTO_VALUE_ON_ZERO` SQL mode enabled, `LOAD DATA` operations could assign incorrect `AUTO_INCREMENT` values. (Bug#27586)
  - Group relay log rotation updated only the log position and not the name, causing the slave to stop. (Bug#27583)
  - Incorrect results could be returned for some queries that contained a select list expression with `IN` or `BETWEEN` together with an `ORDER BY` or `GROUP BY` on the same expression using `NOT IN` or `NOT BETWEEN`. (Bug#27532)

- The fix for [Bug#17212](#) provided correct sort order for misordered output of certain queries, but caused significant overall query performance degradation. (Results were correct (good), but returned much more slowly (bad).) The fix also affected performance of queries for which results were correct. The performance degradation has been addressed. ([Bug#27531](#))
- The `CRC32()` function returns an unsigned integer, but the metadata was signed, which could cause certain queries to return incorrect results. (For example, queries that selected a `CRC32()` value and used that value in the `GROUP BY` clause.) ([Bug#27530](#))
- An interaction between `SHOW TABLE STATUS` and other concurrent statements that modify the table could result in a divide-by-zero error and a server crash. ([Bug#27516](#))
- Evaluation of an `IN()` predicate containing a decimal-valued argument caused a server crash. ([Bug#27513](#), [Bug#27362](#), [CVE-2007-2583](#))
- A race condition between `DROP TABLE` and `SHOW TABLE STATUS` could cause the latter to display incorrect information. ([Bug#27499](#))
- In out-of-memory conditions, the server might crash or otherwise not report an error to the Windows event log. ([Bug#27490](#))
- Passing nested row expressions with different structures to an `IN` predicate caused a server crash. ([Bug#27484](#))
- The `decimal.h` header file was incorrectly omitted from binary distributions. ([Bug#27456](#))
- With `innodb_file_per_table` enabled, attempting to rename an InnoDB table to a non-existent database caused the server to exit. ([Bug#27381](#))
- Nested aggregate functions could be improperly evaluated. ([Bug#27363](#))
- A stored function invocation in the `WHERE` clause was treated as a constant. ([Bug#27354](#))
- For the `INFORMATION_SCHEMA_SESSION_STATUS` and `GLOBAL_STATUS` tables, some status values were incorrectly converted to the data type of the `VARIABLE_VALUE` column. ([Bug#27327](#))
- Failure to allocate memory associated with `transaction_prealloc_size` could cause a server crash. ([Bug#27322](#))
- A subquery could get incorrect values for references to outer query columns when it contained aggregate functions that were aggregated in outer context. ([Bug#27321](#))
- The server did not shut down cleanly. ([Bug#27310](#))
- In a view, a column that was defined using a `GEOMETRY` function was treated as having the `LONGBLOB` data type rather than the `GEOMETRY` type. ([Bug#27300](#))
- `mysqldump` crashed if it got no data from `SHOW CREATE PROCEDURE` (for example, when trying to dump a routine defined by a different user and for which the current user had no privileges). Now it prints a comment to indicate the problem. It also returns an error, or continues if the `--force` option is given. ([Bug#27293](#))
- Queries containing subqueries with `COUNT(*)` aggregated in an outer context returned incorrect results. This happened only if the subquery did not contain any references to outer columns. ([Bug#27257](#))
- Use of an aggregate function from an outer context as an argument to `GROUP_CONCAT()` caused a server crash. ([Bug#27229](#))
- String truncation upon insertion into an integer or year column did not generate a warning (or an error in strict mode). ([Bug#27176](#), [Bug#26359](#))
- `mysqlbinlog` produced different output with the `-R` option than without it. ([Bug#27171](#))
- Storing `NULL` values in spatial fields caused excessive memory allocation and crashes on some systems. ([Bug#27164](#))
- Row equalities in `WHERE` clauses could cause memory corruption. ([Bug#27154](#))
- `ON DUPLICATE KEY UPDATE` failed for a table partitioned by `KEY` on a primary key `VARCHAR` column. ([Bug#27123](#))
- `GROUP BY` on a `ucs2` column caused a server crash when there was at least one empty string in the column. ([Bug#27079](#))
- Duplicate members in `SET` or `ENUM` definitions were not detected. Now they result in a warning; if strict SQL mode is enabled, an error occurs instead. ([Bug#27069](#))
- For `FEDERATED` tables, `SHOW CREATE TABLE` could fail when the table name was longer than the connection name. ([Bug#27036](#))

- `mysql_install_db` could terminate with an error after failing to determine that a system table already existed. (Bug#27022)
- In a `MEMORY` table, using a `BTREE` index to scan for updatable rows could lead to an infinite loop. (Bug#26996)
- `make_win_bin_dist` neglected to copy some required `MyISAM` table files. (Bug#26922)
- For `InnoDB` tables having a clustered index that began with a `CHAR` or `VARCHAR` column, deleting a record and then inserting another before the deleted record was purged could result in table corruption. (Bug#26835)
- `mysqldump` would not dump a view for which the `DEFINER` no longer exists. (Bug#26817)
- Duplicates were not properly identified among (potentially) long strings used as arguments for `GROUP_CONCAT(DISTINCT)`. (Bug#26815)
- `ALTER VIEW` requires the `CREATE VIEW` and `DROP` privileges for the view. However, if the view was created by another user, the server erroneously required the `SUPER` privilege. (Bug#26813)
- If the name of a table given to `myisamchk -rq` was a packed table and the name included the `.MYI` extension, `myisamchk` incorrectly created a file with a `.MYI.MYI` extension. (Bug#26782)
- Creating a temporary table with `InnoDB` when using the one-file-per-table setting, and when the host file system for temporary tables was `tmpfs`, would cause an assertion within `mysqld`. This was due to the use of `O_DIRECT` when opening the temporary table file. (Bug#26662)
- `mysql_upgrade` did not detect failure of external commands that it runs. (Bug#26639)
- The range optimizer could cause the server to run out of memory. (Bug#26625)
- The range optimizer could consume a combinatorial amount of memory for certain classes of `WHERE` clauses. (Bug#26624)
- `mysqldump` could crash or exhibit incorrect behavior when some options were given very long values, such as `--fields-terminated-by="some very long string"`. The code has been cleaned up to remove a number of fixed-sized buffers and to be more careful about error conditions in memory allocation. (Bug#26346)
- A possible buffer overflow in `SHOW PROCEDURE CODE` was removed. (Bug#26303)
- The `FEDERATED` engine did not allow the local and remote tables to have different names. (Bug#26257)
- The temporary file-creation code was cleaned up on Windows to improve server stability. (Bug#26233)
- For `MyISAM` tables, `COUNT(*)` could return an incorrect value if the `WHERE` clause compared an indexed `TEXT` column to the empty string (' '). This happened if the column contained empty strings and also strings starting with control characters such as tab or newline. (Bug#26231)
- For `INSERT INTO ... SELECT` where index searches used column prefixes, insert errors could occur when key value type conversion was done. (Bug#26207)
- `mysqlbinlog --base64-output` produced invalid SQL. (Bug#26194)
- For `DELETE FROM tbl_name ORDER BY col_name` (with no `WHERE` or `LIMIT` clause), the server did not check whether `col_name` was a valid column in the table. (Bug#26186)
- Executing an `INSERT ... SELECT ... FROM INFORMATION_SCHEMA.GLOBAL_STATUS` statement from within an event caused a server crash. (Bug#26174)
- `mysqldump` could not dump log tables. (Bug#26121)
- On Windows, trying to use backslash (\) characters in paths for `DATA DIRECTORY` and `INDEX DIRECTORY` when creating partitioned tables caused MySQL to crash.  
  
(You must use / characters when specifying paths for these options, regardless of platform. See [Section 17.1, "Overview of Partitioning in MySQL"](#), for an example using absolute paths for `DATA DIRECTORY` and `INDEX DIRECTORY` when creating a partitioned table on Windows.) (Bug#26074, Bug#25141)
- `mysqldump` crashed for `MERGE` tables if the `--complete-insert (-c)` option was given. (Bug#25993)
- Index hints (`USE INDEX`, `IGNORE INDEX`, `FORCE INDEX`) cannot be used with `FULLTEXT` indexes, but were not being ignored. (Bug#25951)
- Setting a column to `NOT NULL` with an `ON DELETE SET NULL` clause foreign key crashes the server. (Bug#25927)

- Corrupted `MyISAM` tables that have different definitions in the `.frm` and `.MYI` tables might cause a server crash. (Bug#25908)
- If `CREATE TABLE t1 LIKE t2` failed due to a full disk, an empty `t2.frm` file could be created but not removed. This file then caused subsequent attempts to create a table named `t2` to fail. This is easily corrected at the file system level by removing the `t2.frm` file manually, but now the server removes the file if the create operation does not complete successfully. (Bug#25761)
- In certain situations, `MATCH ... AGAINST` returned false hits for `NULL` values produced by `LEFT JOIN` when no full-text index was available. (Bug#25729)
- Concurrent `CREATE SERVER` and `ALTER SERVER` statements could cause a deadlock. (Bug#25721)
- `CREATE SERVER`, `DROP SERVER`, and `ALTER SERVER` did not require any privileges. Now these statements require the `SUPER` privilege. (Bug#25671)
- On Windows, connection handlers did not properly decrement the server's thread count when exiting. (Bug#25621)
- `OPTIMIZE TABLE` might fail on Windows when it attempts to rename a temporary file to the original name if the original file had been opened, resulting in loss of the `.MYD` file. (Bug#25521)
- For `SHOW ENGINE INNODB STATUS`, the `LATEST DEADLOCK INFORMATION` was not always cleared properly. (Bug#25494)
- `mysql_stmt_fetch()` did an invalid memory deallocation when used with the embedded server. (Bug#25492)
- `mysql_upgrade` did not pass a password to `mysqlcheck` if one was given. (Bug#25452)
- On Windows, `mysql_upgrade` was sensitive to lettercase of the names of some required components. (Bug#25405)
- During a call to `mysql_change_user()`, when authentication fails or the database to change to is unknown, a subsequent call to any function that does network communication leads to packets out of order. This problem was introduced in MySQL 5.1.14. (Bug#25371)
- Difficult repair or optimization operations could cause an assertion failure, resulting in a server crash. (Bug#25289)
- For storage engines that allow the current auto-increment value to be set, using `ALTER TABLE ... ENGINE` to convert a table from one such storage engine to another caused loss of the current value. (For storage engines that do not support setting the value, it cannot be retained anyway when changing the storage engine.) (Bug#25262)
- Duplicate entries were not assessed correctly in a `MEMORY` table with a `BTREE` primary key on a `utf8 ENUM` column. (Bug#24985)
- Several math functions produced incorrect results for large unsigned values. `ROUND()` produced incorrect results or a crash for a large number-of-decimals argument. (Bug#24912)
- The result set of a query that used `WITH ROLLUP` and `DISTINCT` could lack some rollup rows (rows with `NULL` values for grouping attributes) if the `GROUP BY` list contained constant expressions. (Bug#24856)
- Selecting the result of `AVG()` within a `UNION` could produce incorrect values. (Bug#24791)
- For queries that used `ORDER BY` with `InnoDB` tables, if the optimizer chose an index for accessing the table but found a covering index that enabled the `ORDER BY` to be skipped, no results were returned. (Bug#24778)
- The `NO_DIR_IN_CREATE` server SQL mode was not enforced for partitioned tables. (Bug#24633)
- `MBRDisjoint()`, `MBRequal()`, `MBRIntersects()`, `MBROverlaps()`, `MBRTouches()`, and `MBRWithin()` were inadvertently omitted from recent versions of MySQL (5.1.14 to 5.1.17). (Bug#24588)
- Access via `my_pread()` or `my_pwrite()` to table files larger than 2GB could fail on some systems. (Bug#24566)
- `MBROverlaps()` returned incorrect values in some cases. (Bug#24563)
- A problem in handling of aggregate functions in subqueries caused predicates containing aggregate functions to be ignored during query execution. (Bug#24484)
- The `MERGE` storage engine could return incorrect results when several index values that compare equality were present in an index (for example, `'gross'` and `'gross '`, which are considered equal but have different lengths). (Bug#24342)
- Some upgrade problems are detected and better error messages suggesting that `mysql_upgrade` be run are produced. (Bug#24248)

- The test for the `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` option for `mysql_options()` was performed incorrectly. Also changed as a result of this bug fix: The `arg` option for the `mysql_options()` C API function was changed from `char *` to `void *`. (Bug#24121)
- Some views could not be created even when the user had the requisite privileges. (Bug#24040)
- The values displayed for the `InnoDB_row_lock_time`, `InnoDB_row_lock_time_avg`, and `InnoDB_row_lock_time_max` status variables were incorrect. (Bug#23666)
- Using `CAST()` to convert `DATETIME` values to numeric values did not work. (Bug#23656)
- A damaged or missing `mysql.event` table caused `SHOW VARIABLES` to fail. (Bug#23631)
- `SHOW CREATE VIEW` qualified references to stored functions in the view definition with the function's database name, even when the database was the default database. This affected `mysqldump` (which uses `SHOW CREATE VIEW` to dump views) because the resulting dump file could not be used to reload the database into a different database. `SHOW CREATE VIEW` now suppresses the database name for references to functions in the default database. (Bug#23491)
- An `INTO OUTFILE` clause is allowed only for the final `SELECT` of a `UNION`, but this restriction was not being enforced correctly. (Bug#23345)
- The `AUTO_INCREMENT` value would not be correctly reported for `InnoDB` tables when using `SHOW CREATE TABLE` statement or `mysqldump` command. (Bug#23313)
- With the `NO_AUTO_VALUE_ON_ZERO` SQL mode enabled, `LAST_INSERT_ID()` could return 0 after `INSERT ... ON DUPLICATE KEY UPDATE`. Additionally, the next rows inserted (by the same `INSERT`, or the following `INSERT` with or without `ON DUPLICATE KEY UPDATE`), would insert 0 for the auto-generated value if the value for the `AUTO_INCREMENT` column was `NULL` or missing. (Bug#23233)
- Implicit conversion of `9912101` to `DATE` did not match `CAST(9912101 AS DATE)`. (Bug#23093)
- `SELECT COUNT(*)` from a table containing a `DATETIME NOT NULL` column could produce spurious warnings with the `NO_ZERO_DATE` SQL mode enabled. (Bug#22824)
- Using `SET GLOBAL` to change the `lc_time_names` system variable had no effect on new connections. (Bug#22648)
- `SOUNDEX()` returned an invalid string for international characters in multi-byte character sets. (Bug#22638)
- A multiple-table `UPDATE` could return an incorrect rows-matched value if, during insertion of rows into a temporary table, the table had to be converted from a `MEMORY` table to a `MyISAM` table. (Bug#22364)
- `COUNT(decimal_expr)` sometimes generated a spurious truncation warning. (Bug#21976)
- `yaSSL` crashed on pre-Pentium Intel CPUs. (Bug#21765)
- A slave that used `--master-ssl-cipher` could not connect to the master. (Bug#21611)
- Database and table names have a maximum length of 64 characters (even if they contain multi-byte characters), but were truncated to 64 bytes.

**Note**

This improves on a previous fix made for this bug in MySQL 5.1.12.

(Bug#21432)

- `InnoDB`: The first read statement, if served from the query cache, was not consistent with the `READ COMMITTED` isolation level. (Bug#21409)
- On Windows, if the server was installed as a service, it did not auto-detect the location of the data directory. (Bug#20376)
- Changing a `utf8` column in an `InnoDB` table to a shorter length did not shorten the data values. (Bug#20095)
- In some cases, the optimizer preferred a range or full index scan access method over lookup access methods when the latter were much cheaper. (Bug#19372)
- Conversion of `DATETIME` values in numeric contexts sometimes did not produce a double (`YYYYMMDDHHMMSS.uuuuuu`) value. (Bug#16546)
- `INSERT...ON DUPLICATE KEY UPDATE` could cause `Error 1032: Can't find record in ...` for inserts into an `InnoDB` table unique index using key column prefixes with an underlying `utf8` string column. (Bug#13191)

- Having the `EXECUTE` privilege for a routine in a database should make it possible to `USE` that database, but the server returned an error instead. This has been corrected. As a result of the change, `SHOW TABLES` for a database in which you have only the `EXECUTE` privilege returns an empty set rather than an error. (Bug#9504)

## C.2.21. Changes in MySQL 5.1.17 (04 April 2007)

This is a new Beta development release, fixing recently discovered bugs.

### Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible Change:** Scheduled events now use the MySQL server time zone to determine their schedules, rather than UTC as in previous releases. Because of this change, scheduled event metadata now includes time zone information, which can be seen in the `TIME_ZONE` column of the `INFORMATION_SCHEMA.EVENTS` table and the `Time zone` column in the output of the `SHOW EVENTS` statement. These columns have been added in this release, along with a `time_zone` column in the `mysql.event` table. Due to these changes, events created in previous versions of MySQL cannot be created, viewed, or used until `mysql.event` has been upgraded. (Bug#16420)
- **Important Change: Replication:** The following options for controlling replication master configuration on a slave are now deprecated.

- `--master-host`
- `--master-user`
- `--master-password`
- `--master-port`
- `--master-connect-retry`
- `--master-ssl`
- `--master-ssl-ca`
- `--master-ssl-capath`
- `--master-ssl-cert`
- `--master-ssl-cipher`
- `--master-ssl-key`

To change the master configuration on a slave you should use the `CHANGE MASTER TO` statement.

See also [Bug#21490](#).

- **Important Change:** The `CREATE EVENT` and `ALTER EVENT` statements now support a `DEFINER` clause, similar to that used in the `CREATE TRIGGER` statement.
- See [Section 12.1.11, “CREATE EVENT Syntax”](#), for detailed information. (Bug#16425)
- **MySQL Cluster:** Added the `--skip-table-check` option (short form `-s`) for `ndb_restore`, which causes the restoration process to ignore any changes that may have occurred in table schemas after the backup was made. Previously, this was the default behavior.

See `ndb_restore`, for more information. (Bug#24363)

- Added a `--no-beep` option to `mysqladmin`. It suppresses the warning beep that is emitted by default for errors such as a failure to connect to the server. (Bug#26964)
- Added the `--service-startup-timeout` option for `mysql.server` to specify how long to wait for the server to start. If the server does not start within the timeout period, `mysql.server` exits with an error. (Bug#26952)
- Prefix lengths for columns in `SPATIAL` indexes can no longer be specified. For tables created in older versions of MySQL that have `SPATIAL` indexes containing prefixed columns, dumping and reloading the table causes the indexes to be created with no prefixes. (The full column width of each column is indexed.) (Bug#26794)
- Added the `innodb_stats_on_metadata` system variable to enable control over whether `InnoDB` performs statistics gathering when metadata statements are executed. See [Section 13.6.3, “InnoDB Startup Options and System Variables”](#). (Bug#26598)
- Statements that affect `mysql` database tables now are written to the binary log using the following rules:
  - Data manipulation statements such as `INSERT` that change data in `mysql` database tables directly are logged according to the settings of the `binlog_format` system variable.
  - Statements such as `GRANT` that change the `mysql` database indirectly are logged as statements regardless of the value of `binlog_format`.

For more details, see [Section 5.2.4.4, “Logging Format for Changes to `mysql` Database Tables”](#). (Bug#25091)

- The server now includes a timestamp in error messages that are logged as a result of unhandled signals (such as `mysqld got signal 11` messages). (Bug#24878)
- The syntax for index hints has been extended to enable more fine-grained control over the optimizer's selection of an execution plan for various phases of query processing. See [Section 12.2.8.2, “Index Hint Syntax”](#). (Bug#21174)
- Added the `--secure-file-priv` option for `mysqld`, which limits the effect of the `LOAD_FILE()` function and the `LOAD DATA` and `SELECT ... INTO OUTFILE` statements to work only with files in a given directory. (Bug#18628)
- Prepared statements now use the query cache under the conditions described in [Section 7.5.5.1, “How the Query Cache Operates”](#). (Bug#735)
- Added the `thread_handling` system variable to control whether the server use a single thread or one thread per connection. The `--one-thread` option now is deprecated; use `--thread_handling=one-thread` instead.
- Statements such as `GRANT` that change the `mysql` database indirectly are logged as statements regardless of the value of `binlog_format`.
- Added the read-only `hostname` system variable, which the server sets at startup to the server host name.
- Online (non-copying) `ADD INDEX` and `DROP INDEX` operations are now performed on dynamic (variable-width) columns. Renaming of `NDB` and `MyISAM` tables and of columns in such tables is now performed without copying or locking the tables. As a result, these operations are now performed much more quickly than previously.  
  
See [Section 12.1.7, “ALTER TABLE Syntax”](#), [Section 12.1.13, “CREATE INDEX Syntax”](#), and [Section 12.1.24, “DROP INDEX Syntax”](#), for more information.
- Data manipulation statements such as `INSERT` that change data in `mysql` database tables directly are logged according to the settings of the `binlog_format` system variable.
- Added the `old_mode` system variable to cause the server to revert to certain behaviors present in older versions. Currently, this variable affects handling of index hints. See [Section 12.2.8.2, “Index Hint Syntax”](#).

Bugs fixed:

- **Incompatible Change:** `INSERT DELAYED` statements are not supported for `MERGE` tables, but the `MERGE` storage engine was not rejecting such statements, resulting in table corruption. Applications previously using `INSERT DELAYED` into `MERGE` table will break when upgrading to versions with this fix. To avoid the problem, remove `DELAYED` from such statements. (Bug#26464)
- **Important Note:** The parser accepted invalid code in SQL condition handlers, leading to server crashes or unexpected execution behavior in stored programs. Specifically, the parser allowed a condition handler to refer to labels for blocks that enclose the handler declaration. This was incorrect because block label scope does not include the code for handlers declared within the labeled block.

The parser now rejects this invalid construct, but if you perform a binary upgrade (without dumping and reloading your databases), existing handlers that contain the construct are still invalid and should be rewritten *even if they appear to function as you expect*.

To find affected handlers, use `mysqldump` to dump all stored procedures and functions, triggers, and events. Then attempt to reload them into an upgraded server. Handlers that contain illegal label references will be rejected.

For more information about condition handlers and writing them to avoid invalid jumps, see [Section 12.8.4.2, “DECLARE for Handlers”](#). (Bug#26503)

- **MySQL Cluster:** It was not possible to set `LockPagesInMainMemory` equal to 0. (Bug#27291)
- **MySQL Cluster:** A race condition could sometimes occur if the node acting as master failed while node IDs were still being allocated during startup. (Bug#27286)
- **MySQL Cluster:** When a data node was taking over as the master node, a race condition could sometimes occur as the node was assuming responsibility for handling of global checkpoints. (Bug#27283)
- **MySQL Cluster:** After putting the cluster in single user mode from one MySQL server, trying to drop an NDB table from a second MySQL server also connected to the cluster would cause the second MySQL server to hang. (Bug#27254)
- **MySQL Cluster:** `mysqld` could crash shortly after a data node failure following certain DML operations. (Bug#27169)
- **MySQL Cluster:** (Disk Data): Under some circumstances, a data node could fail during restart while flushing Disk Data UNDO logs. (Bug#27102)
- **MySQL Cluster:** The same failed request from an API node could be handled by the cluster multiple times, resulting in reduced performance. (Bug#27087)
- **MySQL Cluster:** The failure of a data node while restarting could cause other data nodes to hang or crash. (Bug#27003)
- **MySQL Cluster:** Creating a table on one SQL node while in single user mode caused other SQL nodes to crash. (Bug#26997)
- **MySQL Cluster:** `mysqld` processes would sometimes crash under high load. (Bug#26825)
- **MySQL Cluster:** Using only the `--print_data` option (and no other options) with `ndb_restore` caused `ndb_restore` to fail. (Bug#26741)

This regression was introduced by [Bug#14612](#).

- **MySQL Cluster:** The output from `ndb_restore --print_data` was incorrect for a backup made of a database containing tables with `TINYINT` or `SMALLINT` columns. (Bug#26740)
- **MySQL Cluster:** An infinite loop in an internal logging function could cause trace logs to fill up with `UNKNOWN SIGNAL TYPE` error messages and thus grow to unreasonable sizes. (Bug#26720)
- **MySQL Cluster:** An invalid pointer was returned following a `FSCLOSECONF` signal when accessing the REDO logs during a node restart or system restart. (Bug#26515)
- **MySQL Cluster:** The management client command `node_id STATUS` displayed the message `Node node_id: not connected` when `node_id` was not the node ID of a data node.

#### Note

The `ALL STATUS` command in the cluster management client still displays status information for data nodes only. This is by design. See [Commands in the MySQL Cluster Management Client](#), for more information.

(Bug#21715)

- **MySQL Cluster:** When performing an upgrade or downgrade, no specific error information was made available when trying to upgrade data nodes or SQL nodes before upgrading management nodes. (Bug#21296)
- **MySQL Cluster:** Some values of `MaxNoOfTables` caused the error `JOB BUFFER CONGESTION` to occur. (Bug#19378)
- **Replication:** A multiple-row delayed insert with an auto-increment column could cause duplicate entries to be created on the slave in a replication environment. (Bug#26116, Bug#25507)
- **Replication:** Duplicating the usage of a user variable in a stored procedure or trigger would not be replicated correctly to the slave. (Bug#25167)

- **Replication:** `DROP TRIGGER` statements would not be filtered on the slave when using the `replication-wild-do-table` option. (Bug#24478)
- **Replication:** For `INSERT ... ON DUPLICATE KEY UPDATE` statements where some `AUTO_INCREMENT` values were generated automatically for inserts and some rows were updated, one auto-generated value was lost per updated row, leading to faster exhaustion of the range of the `AUTO_INCREMENT` column.  
  
Because the original problem can affect replication (different values on master and slave), it is recommended that the master and its slaves be upgraded to the current version. (Bug#24432)
- **Replication:** Replication between master and slave would infinitely retry binary log transmission where the `max_allowed_packet` on the master was larger than that on the slave if the size of the transfer was between these two values. (Bug#23775)
- **Replication:** Loading data using `LOAD DATA INFILE` may not replicate correctly (due to character set incompatibilities) if the `character_set_database` variable is set before the data is loaded. (Bug#15126)
- **Replication:** User defined variables used within stored procedures and triggers are not replicated correctly when operating in statement-based replication mode. (Bug#14914, Bug#20141)
- **Disk Data:** A memory overflow could occur with tables having a large amount of data stored on disk, or with queries using a very high degree of parallelism on Disk Data tables. (Bug#26514)
- **Disk Data:** Use of a tablespace whose `INITIAL_SIZE` was greater than 1 GB could cause the cluster to crash. (Bug#26487)
- **Disk Data:** Creating multiple Disk Data tables using different tablespaces could sometimes cause the cluster to fail. (Bug#25992)
- **Disk Data:** `ALTER TABLE ... ADD COLUMN ...` on a Disk Data table moved data for existing non-indexed columns from the tablespace into memory. (Bug#25880)
- **Disk Data:** `DROP INDEX` on a Disk Data table did not always move data from memory into the tablespace. (Bug#25877)
- **Disk Data:** When creating a log file group, setting `INITIAL_SIZE` to less than `UNDO_BUFFER_SIZE` caused data nodes to crash. (Bug#25743)
- **Cluster Replication:** The simultaneous failure of a data node and an SQL node could cause replication to fail. (Bug#27005)
- **Cluster API:** A delete operation using a scan followed by an insert using a scan could cause a data node to fail. (Bug#27203)
- **Cluster API:** (Cluster APIs): `NAND` and `NOR` operations with `NdbScanFilter` did not perform correctly. (Bug#24568)
- **Cluster API:** You can now use the `ndb_mgm_check_connection()` function to determine whether a management server is running. See `ndb_mgm_check_connection()`.
- **MyISAM** tables converted to `ARCHIVE` were excessively large. (Bug#27533)
- `SELECT ... INTO OUTFILE` with a long `FIELDS ENCLOSED BY` value could crash the server. (Bug#27231)
- An `INSERT ... ON DUPLICATE KEY UPDATE` statement might modify values in a table but not flush affected data from the query cache, causing subsequent selects to return stale results. This made the combination of query cache plus `ON DUPLICATE KEY UPDATE` very unreliable. (Bug#27210)

See also [Bug#27006](#), [Bug#27033](#).

This regression was introduced by [Bug#19978](#).

- For `INSERT ... ON DUPLICATE KEY UPDATE` statements on tables containing `AUTO_INCREMENT` columns, `LAST_INSERT_ID()` was reset to 0 if no rows were successfully inserted or changed. “Not changed” includes the case where a row was updated to its current values, but in that case, `LAST_INSERT_ID()` should not be reset to 0. Now `LAST_INSERT_ID()` is reset to 0 only if no rows were successfully inserted or touched, whether or not touched rows were changed. (Bug#27033)

See also [Bug#27210](#), [Bug#27006](#).

This regression was introduced by [Bug#19978](#).

- Invalid optimization of pushdown conditions for queries where an outer join was guaranteed to read only one row from the outer table led to results with too few rows. (Bug#26963)
- For `MERGE` tables defined on underlying tables that contained a short `VARCHAR` column (shorter than four characters), using

- `ALTER TABLE` on at least one but not all of the underlying tables caused the table definitions to be considered different from that of the `MERGE` table, even if the `ALTER TABLE` did not change the definition. (Bug#26881)
- Use of a subquery containing `GROUP BY` and `WITH ROLLUP` caused a server crash. (Bug#26830)
  - Setting `event_scheduler = 1` or `event_scheduler = ON` caused the server to crash if the server had been started with `--skip-grant-tables`. Starting the server with `--skip-grant-tables` now causes `event_scheduler` to be set to `DISABLED` automatically, overriding any other value that may have been set. (Bug#26807)
  - Added support for `--debugger=dbx` for `mysql-test-run.pl` and added support for `--debugger=devenv`, `--debugger=DevEnv`, and `--debugger=/path/to/devenv`. (Bug#26792)
  - A result set column formed by concatenation of string literals was incomplete when the column was produced by a subquery in the `FROM` clause. (Bug#26738)
  - SSL connections failed on Windows. (Bug#26678)
  - When using the result of `SEC_TO_TIME()` for time value greater than 24 hours in an `ORDER BY` clause, either directly or through a column alias, the rows were sorted incorrectly as strings. (Bug#26672)
  - Use of a subquery containing a `UNION` with an invalid `ORDER BY` clause caused a server crash. (Bug#26661)
  - In some error messages, inconsistent format specifiers were used for the translations in different languages. `comp_err` (the error message compiler) now checks for mismatches. (Bug#26571)
  - Views that used a scalar correlated subquery returned incorrect results. (Bug#26560)
  - `UNHEX()` `IS NULL` comparisons failed when `UNHEX()` returned `NULL`. (Bug#26537)
  - On 64-bit Windows, large timestamp values could be handled incorrectly. (Bug#26536)
  - `SHOW CREATE EVENT` failed to display the `STARTS` and `ENDS` clauses for an event defined with `STARTS NOW()`, `ENDS NOW()`, or both. (Bug#26429)
  - If the server was started with `--skip-grant-tables`, selecting from `INFORMATION_SCHEMA` tables causes a server crash. (Bug#26285)
  - For some values of the position argument, the `INSERT()` function could insert a NUL byte into the result. (Bug#26281)
  - For an `INSERT` statement that should fail due to a column with no default value not being assigned a value, the statement succeeded with no error if the column was assigned a value in an `ON DUPLICATE KEY UPDATE` clause, even if that clause was not used. (Bug#26261)
  - `INSERT DELAYED` statements inserted incorrect values into `BIT` columns. (Bug#26238)
  - A query of type `index_merge`, and with a `WHERE` clause having the form `WHERE indexed_column_1=value_1 OR indexed_column_2=value_2` on a partitioned table caused the server to crash. (Bug#26117)
  - `BENCHMARK()` did not work correctly for expressions that produced a `DECIMAL` result. (Bug#26093)
  - For `MEMORY` tables, extending the length of a `VARCHAR` column with `ALTER TABLE` might result in an unusable table. (Bug#26080)
  - The server could hang during binary log rotation. (Bug#26079)
  - `LOAD DATA INFILE` sent an okay to the client before writing the binary log and committing the changes to the table had finished, thus violating ACID requirements. (Bug#26050)
  - `X() IS NULL` and `Y() IS NULL` comparisons failed when `X()` and `Y()` returned `NULL`. (Bug#26038)
  - Indexes on `TEXT` columns were ignored when `ref` accesses were evaluated. (Bug#25971)
  - If a thread previously serviced a connection that was killed, excessive memory and CPU use by the thread occurred if it later serviced a connection that had to wait for a table lock. (Bug#25966)
  - `VIEW` restrictions were applied to `SELECT` statements after a `CREATE VIEW` statement failed, as though the `CREATE` had succeeded. (Bug#25897)
  - Several deficiencies in resolution of column names for `INSERT ... SELECT` statements were corrected. (Bug#25831)
  - Inserting `utf8` data into a `TEXT` column that used a single-byte character set could result in spurious warnings about truncated

data. ([Bug#25815](#))

- On Windows, debug builds of `mysqld` could fail with heap assertions. ([Bug#25765](#))
- In certain cases it could happen that deleting a row corrupted an `RTREE` index. This affected indexes on spatial columns. ([Bug#25673](#))
- Using `mysqlbinlog` on a binary log would crash if there were a large number of row-based events related to a single statement. ([Bug#25628](#))
- Expressions involving `SUM()`, when used in an `ORDER BY` clause, could lead to out-of-order results. ([Bug#25376](#))
- Use of a `GROUP BY` clause that referred to a stored function result together with `WITH ROLLUP` caused incorrect results. ([Bug#25373](#))
- A stored procedure that made use of cursors failed when the procedure was invoked from a stored function. ([Bug#25345](#))
- On Windows, the server exhibited a file-handle leak after reaching the limit on the number of open file descriptors. ([Bug#25222](#))
- The `REPEAT()` function did not allow a column name as the `count` parameter. ([Bug#25197](#))
- A reference to a non-existent column in the `ORDER BY` clause of an `UPDATE ... ORDER BY` statement could cause a server crash. ([Bug#25126](#))
- A view on a join is insertable for `INSERT` statements that store values into only one table of the join. However, inserts were being rejected if the inserted-into table was used in a self-join because MySQL incorrectly was considering the insert to modify multiple tables of the view. ([Bug#25122](#))
- Creating a table with latin characters in the name caused the output of `SHOW FULL TABLES` to have `ERROR` for the table type. ([Bug#25081](#))
- MySQL would not compile when configured using `--without-query-cache`. ([Bug#25075](#))
- It was not possible to use XPath keywords as tag names for expressions used in the `ExtractValue()` function. ([Bug#24747](#))
- Increasing the width of a `DECIMAL` column could cause column values to be changed. ([Bug#24558](#))
- `IF(expr, unsigned_expr, unsigned_expr)` was evaluated to a signed result, not unsigned. This has been corrected. The fix also affects constructs of the form `IS [NOT] {TRUE|FALSE}`, which were transformed internally into `IF()` expressions that evaluated to a signed result.

For existing views that were defined using `IS [NOT] {TRUE|FALSE}` constructs, there is a related implication. The definitions of such views were stored using the `IF()` expression, not the original construct. This is manifest in that `SHOW CREATE VIEW` shows the transformed `IF()` expression, not the original one. Existing views will evaluate correctly after the fix, but if you want `SHOW CREATE VIEW` to display the original construct, you must drop the view and re-create it using its original definition. New views will retain the construct in their definition. ([Bug#24532](#))

- `SHOW ENGINE MUTEX STATUS` failed to produce an `UNKNOWN TABLE ENGINE` error.  
See [Section 12.5.5.16, “SHOW ENGINE Syntax”](#). ([Bug#24392](#))
- A user-defined variable could be assigned an incorrect value if a temporary table was employed in obtaining the result of the query used to determine its value. ([Bug#24010](#))
- `mysqlimport` used a variable of the wrong type for the `--use-threads` option, which could cause a crash on some architectures. ([Bug#23814](#))
- Queries that used a temporary table for the outer query when evaluating a correlated subquery could return incorrect results. ([Bug#23800](#))
- On Windows, debug builds of `mysqlbinlog` could fail with a memory error. ([Bug#23736](#))
- When using certain server SQL modes, the `mysql.proc` table was not created by `mysql_install_db`. ([Bug#23669](#))
- `DOUBLE` values such as `20070202191048.000000` were being treated as illegal arguments by `WEEK()`. ([Bug#23616](#))
- The server could crash if two or more threads initiated query cache resize operation at moments very close in time. ([Bug#23527](#))

- `NOW()` returned the wrong value in statements executed at server startup with the `--init-file` option. (Bug#23240)
- Setting the `slow_query_log_file` system variable caused log output to go to the general log, not the slow query log. (Bug#23225)
- When nesting stored procedures within a trigger on a table, a false dependency error was thrown when one of the nested procedures contained a `DROP TABLE` statement. (Bug#22580)
- Instance Manager did not remove the angel PID file on a clean shutdown. (Bug#22511)
- `EXPLAIN EXTENDED` did not show `WHERE` conditions that were optimized away. (Bug#22331)
- `IN ((subquery))`, `IN (((subquery)))`, and so forth, are equivalent to `IN (subquery)`, which is always interpreted as a table subquery (so that it is allowed to return more than one row). MySQL was treating the “over-parenthesized” subquery as a single-row subquery and rejecting it if it returned more than one row. This bug primarily affected automatically generated code (such as queries generated by Hibernate), because humans rarely write the over-parenthesized forms. (Bug#21904)
- An `INSERT` trigger invoking a stored routine that inserted into a table other than the one on which the trigger was defined would fail with a `TABLE '...' DOESN'T EXIST` referring to the second table when attempting to delete records from the first table. (Bug#21825)
- `CURDATE()` is less than `NOW()`, either when comparing `CURDATE()` directly (`CURDATE() < NOW()` is true) or when casting `CURDATE()` to `DATE` (`CAST(CURDATE() AS DATE) < NOW()` is true). However, storing `CURDATE()` in a `DATE` column and comparing `col_name < NOW()` incorrectly yielded false. This is fixed by comparing a `DATE` column as `DATETIME` for comparisons to a `DATETIME` constant. (Bug#21103)
- When a stored routine attempted to execute a statement accessing a non-existent table, the error was not caught by the routine's exception handler. (Bug#20713, Bug#8407)
- For a stored procedure containing a `SELECT` statement that used a complicated join with an `ON` expression, the expression could be ignored during re-execution of the procedure, yielding an incorrect result. (Bug#20492)
- The conditions checked by the optimizer to allow use of indexes in `IN` predicate calculations were unnecessarily tight and were relaxed. (Bug#20420)
- When a `TIME_FORMAT()` expression was used as a column in a `GROUP BY` clause, the expression result was truncated. (Bug#20293)
- The creation of MySQL system tables was not checked for by `mysql-test-run.pl`. (Bug#20166)
- For index reads, the `BLACKHOLE` engine did not return end-of-file (which it must because `BLACKHOLE` tables contain no rows), causing some queries to crash. (Bug#19717)
- For `expr IN(value_list)`, the result could be incorrect if `BIGINT UNSIGNED` values were used for `expr` or in the value list. (Bug#19342)
- When attempting to call a stored procedure creating a table from a trigger on a table `tbl` in a database `db`, the trigger failed with `ERROR 1146 (42S02): TABLE 'db.tbl' DOESN'T EXIST`. However, the actual reason that such a trigger fails is due to the fact that `CREATE TABLE` causes an implicit `COMMIT`, and so a trigger cannot invoke a stored routine containing this statement. A trigger which does so now fails with `ERROR 1422 (HY000): EXPLICIT OR IMPLICIT COMMIT IS NOT ALLOWED IN STORED FUNCTION OR TRIGGER`, which makes clear the reason for the trigger's failure. (Bug#18914)
- While preparing prepared statements, the server acquired unnecessary table write locks. (Bug#18326)
- The update columns for `INSERT ... SELECT ... ON DUPLICATE KEY UPDATE` could be assigned incorrect values if a temporary table was used to evaluate the `SELECT`. (Bug#16630)
- For `SUBSTRING()` evaluation using a temporary table, when `SUBSTRING()` was used on a `LONGTEXT` column, the `max_length` metadata value of the result was incorrectly calculated and set to 0. Consequently, an empty string was returned instead of the correct result. (Bug#15757)
- Local variables in stored routines or triggers, when declared as the `BIT` type, were interpreted as strings. (Bug#12976)
- For some operations, system tables in the `mysql` database must be accessed. For example, the `HELP` statement requires the contents of the server-side help tables, and `CONVERT_TZ()` might need to read the time zone tables. However, to perform such operations while a `LOCK TABLES` statement is in effect, the server required you to also lock the requisite system tables explicitly or a lock error occurred:

```
mysql> LOCK TABLE t1 READ;
Query OK, 0 rows affected (0.02 sec)
mysql> HELP HELP;
```

```
ERROR 1100 (HY000) at line 4: Table 'help_topic' was not
locked with LOCK TABLES
```

Now, the server implicitly locks the system tables for reading as necessary so that you need not lock them explicitly. These tables are treated as just described:

```
mysql.help_category
mysql.help_keyword
mysql.help_relation
mysql.help_topic
mysql.proc
mysql.time_zone
mysql.time_zone_leap_second
mysql.time_zone_name
mysql.time_zone_transition
mysql.time_zone_transition_type
```

If you want to explicitly place a `WRITE` lock on any of those tables with a `LOCK TABLES` statement, the table must be the only one locked; no other table can be locked with the same statement. ([Bug#9953](#))

## C.2.22. Changes in MySQL 5.1.16 (26 February 2007)

This is a new Beta development release, fixing recently discovered bugs.

### Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

### Note

After release, a trigger failure problem was found to have been introduced. ([Bug#27006](#)) Users affected by this issue should upgrade to MySQL 5.1.17, which corrects the problem.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Cluster API: Incompatible Change:** The `AbortOption` type is now a member of the `NdbOperation` class; its values and behavior have also changed. `NdbTransaction::AbortOption` can no longer be used, and applications written against the NDB API may need to be rewritten and recompiled to accommodate these changes. For more information about this change, see [The NdbOperation::AbortOption Type](#).

This also affects the behavior of the `NdbTransaction::execute()` method, which now reports failure only if the transaction was actually aborted. See [NdbTransaction::execute\(\)](#), for more information.

- **MySQL Cluster:** Previously, when a data node failed more than 8 times in succession to start, this caused a forced shutdown of the cluster. Now, when a data node fails to start 7 consecutive times, the node will not start again until it is started with the `-initial` option, and a warning to this effect is written to the error log. ([Bug#25984](#))
- **MySQL Cluster:** In the event that all cluster management and API nodes are configured with `ArbitrationRank = 0`, `ndb_mgmd` now issues the following warning when starting: `CLUSTER CONFIGURATION WARNING: NEITHER MGM NOR API NODES ARE CONFIGURED WITH ARBITRATOR, MAY CAUSE COMPLETE CLUSTER SHUTDOWN IN CASE OF HOST FAILURE.` ([Bug#23546](#))
- **MySQL Cluster:** A number of new and more descriptive error messages covering transporter errors were added. ([Bug#22025](#))
- **MySQL Cluster:** A new configuration parameter `MemReportFrequency` allows for additional control of data node memory usage. Previously, only warnings at predetermined percentages of memory allocation were given; setting this parameter allows for that behavior to be overridden. For more information, see [Defining MySQL Cluster Data Nodes](#).
- **Cluster API:** A new `ndb_mgm_get_clusterlog_loglevel()` function was added to the MGM API.

For more information, see `ndb_mgm_get_clusterlog_loglevel()`.

- The `localhost` anonymous user account created during MySQL installation on Windows now has no global privileges. Formerly this account had all global privileges. For operations that require global privileges, the `root` account can be used instead. (Bug#24496)
- In the `INFORMATION_SCHEMA.REFERENTIAL_CONSTRAINTS` table, the `UNIQUE_CONSTRAINT_NAME` column incorrectly named the referenced table. Now it names the referenced constraint, and a new column, `REFERENCED_TABLE_NAME`, names the referenced table. (Bug#21713)
- `RAND()` now allows non-constant initializers (such as a column name) as its argument. In this case, the seed is initialized with the value for each invocation of `RAND()`. (One implication of this is that for equal argument values, `RAND()` will return the same value each time.) (Bug#6172)
- Added the `--auto-generate-sql-load-type` and `--auto-generate-sql-write-number` options for `mysqslap`.
- The bundled yaSSL library was upgraded to version 1.5.8.

## Bugs fixed:

- **Security Fix:** Using an `INFORMATION_SCHEMA` table with `ORDER BY` in a subquery could cause a server crash.  
We would like to thank Oren Isacson of Flowgate Security Consulting and Stefan Streichsbier of SEC Consult for informing us of this problem. (Bug#24630, Bug#26556, CVE-2007-1420)
- **Partitioning: MySQL Cluster:** A query with an `IN` clause against an `NDB` table employing explicit user-defined partitioning did not always return all matching rows. (Bug#25821)
- **MySQL Cluster: Replication:** (Replication): Under some circumstances, the binary log thread could shut down while the slave SQL thread was still using it. (Bug#26015, Bug#26019)
- **MySQL Cluster: Replication:** (Replication): The error message `LAST_ERRNO: 4294967295, ERROR IN WRITE_ROWS EVENT` now supplies a valid error code. (Bug#19896)
- **MySQL Cluster:** An inadvertent use of unaligned data caused `ndb_restore` to fail on some 64-bit platforms, including Sparc and Itanium-2. (Bug#26739)
- **MySQL Cluster:** The `InvalidUndoBufferSize` error used the same error code (763) as the `IncompatibleVersions` error. `InvalidUndoBufferSize` now uses its own error code (779). (Bug#26490)
- **MySQL Cluster:** The failure of a data node when restarting it with `--initial` could lead to failures of subsequent data node restarts. (Bug#26481)
- **MySQL Cluster:** Takeover for local checkpointing due to multiple failures of master nodes was sometimes incorrectly handled. (Bug#26457)
- **MySQL Cluster:** The `LockPagesInMainMemory` parameter was not read until after distributed communication had already started between cluster nodes. When the value of this parameter was 1, this could sometimes result in data node failure due to missed heartbeats. (Bug#26454)
- **MySQL Cluster:** Under some circumstances, following the restart of a management node, all data nodes would connect to it normally, but some of them subsequently failed to log any events to the management node. (Bug#26293)
- **MySQL Cluster:** Condition pushdown did not work with prepared statements. (Bug#26225)
- **MySQL Cluster:** A memory leak could cause problems during a node or cluster shutdown or failure. (Bug#25997)
- **MySQL Cluster:** No appropriate error message was provided when there was insufficient REDO log file space for the cluster to start. (Bug#25801)
- **MySQL Cluster:** An `UPDATE` using an `IN` clause on an `NDB` table on which there was a trigger caused `mysqld` to crash. (Bug#25522)
- **MySQL Cluster:** A memory allocation failure in `SUMA` (the cluster Subscription Manager) could cause the cluster to crash. (Bug#25239)
- **MySQL Cluster:** The `ndb_size.tmp1` file (necessary for using the `ndb_size.pl` script) was missing from binary distributions. (Bug#24191)
- **MySQL Cluster:** The message `ERROR 0 IN READAUTOINCREMENTVALUE(): NO ERROR` was written to the error log whenever

er `SHOW TABLE STATUS` was performed on a Cluster table that did not have an `AUTO_INCREMENT` column.

### Note

This improves on and supersedes an earlier fix that was made for this issue in MySQL 5.1.12.

([Bug#21033](#))

- **MySQL Cluster:** When a node failed due to there being insufficient disk space to perform a local checkpoint, there was no indication that this was the source of the problem. Such a condition now produces an appropriate error message. ([Bug#20121](#))
- **MySQL Cluster:** In the event that cluster backup parameters such as `BackupWriteSize` were incorrectly set, no appropriate error was issued to indicate that this was the case. ([Bug#19146](#))
- **Replication:** If a slave server closed its relay log (for example, due to an error during log rotation), the I/O thread did not recognize this and still tried to write to the log, causing a server crash. ([Bug#10798](#))
- **Cluster API: Disk Data:** A delete and a read performed in the same operation could cause one or more data nodes to crash. This could occur when the operation affected more than 5 columns concurrently, or when one or more of the columns was of the `VARCHAR` type and was stored on disk. ([Bug#25794](#))
- **Cluster API:** After defining a delete operation (using `NdbOperation::deleteTuple()`) on a non-existent primary key of a table having a `BLOB` or `TEXT` column, invoking `NdbTransaction::execute()` caused the calling application to enter an endless loop rather than raising an error.

This issue also affected `ndb_restore`; when restoring tables containing `BLOB` or `TEXT` columns, this could cause it to consume all available memory and then crash. ([Bug#24028](#))

See also [Bug#27308](#), [Bug#30177](#).

- **Cluster API:** `libndbclient.so` was not versioned. ([Bug#13522](#))
- Using `ORDER BY` or `GROUP BY` could yield different results when selecting from a view and selecting from the underlying table. ([Bug#26209](#))
- `DISTINCT` queries that were executed using a loose scan for an `InnoDB` table that had been emptied caused a server crash. ([Bug#26159](#))
- A `WHERE` clause that used `BETWEEN` for `DATETIME` values could be treated differently for a `SELECT` and a view defined as that `SELECT`. ([Bug#26124](#))
- Collation for `LEFT JOIN` comparisons could be evaluated incorrectly, leading to improper query results. ([Bug#26017](#))
- The `WITH CHECK OPTION` clause for views was ignored for updates of multiple-table views when the updates could not be performed on fly and the rows to update had to be put into temporary tables first. ([Bug#25931](#))
- `LOAD DATA INFILE` did not work with pipes. ([Bug#25807](#))
- The `SEC_TO_TIME()` and `QUARTER()` functions sometimes did not handle `NULL` values correctly. ([Bug#25643](#))
- View definitions that used the `!` operator were treated as containing the `NOT` operator, which has a different precedence and can produce different results. ([Bug#25580](#))
- An error in the name resolution of nested `JOIN ... USING` constructs was corrected. ([Bug#25575](#))
- `GROUP BY` and `DISTINCT` did not group `NULL` values for columns that have a `UNIQUE` index. ([Bug#25551](#))
- The `--with-readline` option for `configure` did not work for commercial source packages, but no error message was printed to that effect. Now a message is printed. ([Bug#25530](#))
- A yaSSL program named `test` was installed, causing conflicts with the `test` system utility. It is no longer installed. ([Bug#25417](#))
- For a `UNIQUE` index containing many `NULL` values, the optimizer would prefer the index for `col IS NULL` conditions over other more selective indexes. ([Bug#25407](#))
- An `AFTER UPDATE` trigger on an `InnoDB` table with a composite primary key caused the server to crash. ([Bug#25398](#))
- Passing a `NULL` value to a user-defined function from within a stored procedure crashes the server. ([Bug#25382](#))
- `perror` crashed on some platforms due to failure to handle a `NULL` pointer. ([Bug#25344](#))

- `mysql.server stop` timed out too quickly (35 seconds) waiting for the server to exit. Now it waits up to 15 minutes, to ensure that the server exits. (Bug#25341)
- A query that contained an `EXIST` subquery with a `UNION` over correlated and uncorrelated `SELECT` queries could cause the server to crash. (Bug#25219)
- `mysql_kill()` caused a server crash when used on an SSL connection. (Bug#25203)
- `yaSSL` was sensitive to the presence of whitespace at the ends of lines in PEM-encoded certificates, causing a server crash. (Bug#25189)
- A query with `ORDER BY` and `GROUP BY` clauses where the `ORDER BY` clause had more elements than the `GROUP BY` clause caused a memory overrun leading to a crash of the server. (Bug#25172)
- Use of `ON DUPLICATE KEY UPDATE` defeated the usual restriction against inserting into a join-based view unless only one of the underlying tables is used. (Bug#25123)
- `ALTER TABLE ... ENABLE KEYS` acquired a global lock, preventing concurrent execution of other statements that use tables. (Bug#25044)
- `OPTIMIZE TABLE` caused a race condition in the I/O cache. (Bug#25042)
- A return value of `-1` from user-defined handlers was not handled well and could result in conflicts with server code. (Bug#24987)
- Certain joins using `Range checked for each record` in the query execution plan could cause the server to crash. (Bug#24776)
- `ALTER TABLE` caused loss of `CASCADE` clauses for `InnoDB` tables. (Bug#24741)
- If an `ORDER BY` or `GROUP BY` list included a constant expression being optimized away and, at the same time, containing single-row subselects that returned more than one row, no error was reported. If a query required sorting by expressions containing single-row subselects that returned more than one row, execution of the query could cause a server crash. (Bug#24653)
- For `ALTER TABLE`, using `ORDER BY expression` could cause a server crash. Now the `ORDER BY` clause allows only column names to be specified as sort criteria (which was the only documented syntax, anyway). (Bug#24562)
- Within stored routines or prepared statements, inconsistent results occurred with multiple use of `INSERT ... SELECT ... ON DUPLICATE KEY UPDATE` when the `ON DUPLICATE KEY UPDATE` clause erroneously tried to assign a value to a column mentioned only in its `SELECT` part. (Bug#24491)
- Expressions of the form `(a, b) IN (SELECT a, MIN(b) FROM t GROUP BY a)` could produce incorrect results when column `a` of table `t` contained `NULL` values while column `b` did not. (Bug#24420)
- If a prepared statement accessed a view, access to the tables listed in the query after that view was checked in the security context of the view. (Bug#24404)
- A nested query on a partitioned table returned fewer records than on the corresponding non-partitioned table, when the subquery affected more than one partition. (Bug#24186)
- Expressions of the form `(a, b) IN (SELECT c, d ...)` could produce incorrect results if `a`, `b`, or both were `NULL`. (Bug#24127)
- Queries that evaluate `NULL IN (SELECT ... UNION SELECT ...)` could produce an incorrect result (`FALSE` instead of `NULL`). (Bug#24085)
- Some `UPDATE` statements were slower than in previous versions when the search key could not be converted to a valid value for the type of the search column. (Bug#24035)
- `ISNULL( DATE(NULL) )` and `ISNULL( CAST(NULL AS DATE) )` erroneously returned false. (Bug#23938)
- Within a stored routine, accessing a declared routine variable with `PROCEDURE ANALYSE()` caused a server crash. (Bug#23782)
- For an `InnoDB` table with any `ON DELETE` trigger, `TRUNCATE TABLE` mapped to `DELETE` and activated triggers. Now a fast truncation occurs and triggers are not activated. .

**Important**

As a result of this fix, `TRUNCATE TABLE` now requires the `DROP` privilege rather than the `DELETE` privilege.

(Bug#23556)

- With `ONLY_FULL_GROUP_BY` enables, the server was too strict: Some expressions involving only aggregate values were rejected as non-aggregate (for example, `MAX(a) - MIN(a)`). (Bug#23417)
- The arguments to the `ENCODE()` and the `DECODE()` functions were not printed correctly, causing problems in the output of `EXPLAIN EXTENDED` and in view definitions. (Bug#23409)
- Some queries against `INFORMATION_SCHEMA` that used subqueries failed. . (Bug#23299)
- `readline` detection did not work correctly on NetBSD. (Bug#23293)
- The number of `setsockopt()` calls performed for reads and writes to the network socket was reduced to decrease system call overhead. (Bug#22943)
- Storing values specified as hexadecimal values 64 or more bits long in `BIT(64)`, `BIGINT`, or `BIGINT UNSIGNED` columns did not raise any warning or error if the value was out of range. (Bug#22533)
- Type conversion errors during formation of index search conditions were not correctly checked, leading to incorrect query results. (Bug#22344)
- For the `IF()` and `COALESCE()` function and `CASE` expressions, large unsigned integer values could be mishandled and result in warnings. (Bug#22026)
- Inserting `DEFAULT` into a column with no default value could result in garbage in the column. Now the same result occurs as when inserting `NULL` into a `NOT NULL` column. (Bug#20691)
- Indexes disabled with `ALTER TABLE ... DISABLE KEYS` could in some cases be used by specifying `FORCE INDEX`. (Bug#20604)
- If a duplicate key value was present in the table, `INSERT ... ON DUPLICATE KEY UPDATE` reported a row count indicating that a record was updated, even when no record actually changed due to the old and new values being the same. Now it reports a row count of zero. (Bug#19978)

See also [Bug#27006](#), [Bug#27033](#), [Bug#27210](#).

- `ORDER BY` values of the `DOUBLE` or `DECIMAL` types could change the result returned by a query. (Bug#19690)
- The `readline` library wrote to uninitialized memory, causing `mysql` to crash. (Bug#19474)
- Use of already freed memory caused SSL connections to hang forever. (Bug#19209)
- The server might fail to use an appropriate index for `DELETE` when `ORDER BY`, `LIMIT`, and a non-restricting `WHERE` are present. (Bug#17711)
- The optimizer used a filesort rather than a `const` table read in some cases when the latter was possible. (Bug#16590)
- To enable installation of MySQL RPMs on Linux systems running RHEL 4 (which includes SE-Linux) additional information was provided to specify some actions that are allowed to the MySQL binaries. (Bug#12676)
- `CONNECTION` is no longer treated as a reserved word. (Bug#12204)
- The presence of `ORDER BY` in a view definition prevented the `MERGE` algorithm from being used to resolve the view even if nothing else in the definition required the `TEMPTABLE` algorithm. (Bug#12122)

## C.2.23. Changes in MySQL 5.1.15 (25 January 2007)

This is a new Beta development release, fixing recently discovered bugs.

### Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please

consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible Change: MySQL Cluster:** The `LockPagesInMainMemory` configuration parameter has changed its type and possible values. For more information, see [LockPagesInMainMemory](#).

### Important

The values `true` and `false` are no longer accepted for this parameter. If you were using this parameter and had it set to `false` in a previous release, you must change it to `0`. If you had this parameter set to `true`, you should instead use `1` to obtain the same behavior as previously, or `2` to take advantage of new functionality introduced with this release, as described in the section cited above.

([Bug#25686](#))

- **Incompatible Change:** `InnoDB` rolls back only the last statement on a transaction timeout. A new option, `-innodb_rollback_on_timeout`, causes `InnoDB` to abort and roll back the entire transaction if a transaction timeout occurs (the same behavior as in MySQL 5.0.13 and earlier). ([Bug#24200](#))
- **Incompatible Change:** Previously, the `DATE_FORMAT()` function returned a binary string. Now it returns a string with a character set and collation given by `character_set_connection` and `collation_connection` so that it can return month and weekday names containing non-ASCII characters. ([Bug#22646](#))
- **Incompatible Change:** The following conditions apply to enabling the `read_only` system variable:
  - If you attempt to enable `read_only` while you have any explicit locks (acquired with `LOCK TABLES` or have a pending transaction, an error will occur.
  - If other clients hold explicit table locks or have pending transactions, the attempt to enable `read_only` blocks until the locks are released and the transactions end. While the attempt to enable `read_only` is pending, requests by other clients for table locks or to begin transactions also block until `read_only` has been set.
  - `read_only` can be enabled while you hold a global read lock (acquired with `FLUSH TABLES WITH READ LOCK`) because that does not involve table locks.

Previously, the attempt to enable `read_only` would return immediately even if explicit locks or transactions were pending, so some data changes could occur for statements executing in the server at the same time. ([Bug#22009](#), [Bug#11733](#))

- **Incompatible Change:** Previously, the `ARCHIVE` storage engine created a metadata file with an extension of `.ARM` for each table. The engine no longer creates this file.
- **Important Change:** When using `MERGE` tables the definition of the `MERGE` table and the `MyISAM` tables are checked each time the tables are opened for access (including any `SELECT` or `INSERT` statement. Each table is compared for column order, types, sizes and associated. If there is a difference in any one of the tables then the statement will fail.
- **Important Change:** Previously, duplicate-key errors were indicated by the `ER_DUP_ENTRY` error code (1062). This code is no longer used. Instead, the server returns `ER_DUP_ENTRY_WITH_KEY_NAME` (1582), and the error message indicates the name of the index for which the duplicate occurred. Applications that test for duplicate keys should look for both error codes if they need to be compatible with current and older servers.

See also [Bug#28842](#).

- **MySQL Cluster:** The `NDB` storage engine could leak memory during file operations. ([Bug#21858](#))
- **Replication:** Calling a non-deterministic stored routine when using statement-based replication now throws an error. Formerly, defining such a stored routine would cause an error to be thrown. ([Bug#16456](#))
- On Unix, when searching the standard locations for option files, MySQL programs now also look for `/etc/mysql/my.cnf` after checking for `/etc/my.cnf` and before checking the remaining locations. ([Bug#25104](#))
- The default value of the `max_connections` variable has been increased to 151 in order that Websites running on Apache and using MySQL will not have more processes trying to access MySQL than the default number of connections available.

(The maximum number of Apache processes is determined by the Apache `MaxClient`, which defaults to 256, but is usually set to 150 in the `httpd.conf` commonly distributed with Apache. For more information about `MaxClient`, see [http://httpd.apache.org/docs/2.2/mod/mpm\\_common.html#maxclients](http://httpd.apache.org/docs/2.2/mod/mpm_common.html#maxclients).) ([Bug#23883](#))

- The `Com_create_user` status variable was added (for counting `CREATE USER` statements). ([Bug#22958](#))

- The `--memlock` option relies on system calls that are unreliable on some operating systems. If a crash occurs, the server now checks whether `--memlock` was specified and if so issues some information about possible workarounds. (Bug#22860)
- The (undocumented) `UNIQUE_USERS()` and `GROUP_UNIQUE_USERS()` functions were removed. (Bug#22687)
- Partitioning of tables using the `FEDERATED` storage engine is no longer permitted. Attempting to create such a table or to modify an existing table so that it uses both partitioning and `FEDERATED` now fails with an error. (Bug#22451)
- The `--skip-thread-priority` option now is enabled by default for binary Mac OS X distributions. Use of thread priorities degrades performance on Mac OS X. (Bug#18526)
- `read_only` can be enabled while you hold a global read lock (acquired with `FLUSH TABLES WITH READ LOCK`) because that does not involve table locks.
- The bundled yaSSL library was upgraded to version 1.5.0.
- Remote servers for use with the `FEDERATED` storage engine now can be managed with the new `CREATE/ALTER/DROP SERVER` syntax.
- Added the `--disable-grant-options` option to `configure`. If `configure` is run with this option, the `--bootstrap`, `--skip-grant-tables`, and `--init-file` options for `mysqld` are disabled and cannot be used. For Windows, the `configure.js` script recognizes the `DISABLE_GRANT_OPTIONS` flag, which has the same effect.
- If other clients hold explicit table locks or have pending transactions, the attempt to enable `read_only` blocks until the locks are released and the transactions end. While the attempt to enable `read_only` is pending, requests by other clients for table locks or to begin transactions also block until `read_only` has been set.
- If you attempt to enable `read_only` while you have any explicit locks (acquired with `LOCK TABLES` or have a pending transaction, an error will occur.

#### Bugs fixed:

- **Incompatible Change:** For `ENUM` columns that had enumeration values containing commas, the commas were mapped to `0xff` internally. However, this rendered the commas indistinguishable from true `0xff` characters in the values. This no longer occurs. However, the fix requires that you dump and reload any tables that have `ENUM` columns containing any true `0xff` values. Dump the tables using `mysqldump` with the current server before upgrading from a version of MySQL 5.1 older than 5.1.15 to version 5.1.15 or newer. (Bug#24660)
- **Partitioning: MySQL Cluster:** Non-32-bit, non-aligned columns were not handled correctly in explicitly partitioned `NDB` tables. (Bug#25587)
- **MySQL Cluster: Replication:** (Replication): Connecting a `mysqld` to a cluster where not all nodes were running, starting the remaining cluster nodes, and then disconnecting from the cluster caused the `mysqld` process to crash. (Bug#25387)
- **MySQL Cluster:** It was not possible to create an `NDB` table with a key on two `VARCHAR` columns where both columns had a storage length in excess of 256. (Bug#25746)
- **MySQL Cluster:** Hosts in clusters with large numbers of nodes could experience excessive CPU usage while obtaining configuration data. (Bug#25711)
- **MySQL Cluster:** In some circumstances, shutting down the cluster could cause connected `mysqld` processes to crash. (Bug#25668)
- **MySQL Cluster:** Some aggregate queries such as `SELECT COUNT(*)` performed a table scan on `NDB` tables rather than checking table statistics, causing such queries to perform much more slowly in MySQL Cluster 5.1 than in 5.0. (Bug#25567)
- **MySQL Cluster:** Memory allocations for `TEXT` columns were calculated incorrectly, resulting in space being wasted and other issues. (Bug#25562)
- **MySQL Cluster:** The failure of a master node during a node restart could lead to a resource leak, causing later node failures. (Bug#25554)
- **MySQL Cluster:** The failure of a node during a local checkpoint could lead to other node failures. (Bug#25468)
- **MySQL Cluster:** A node shutdown occurred if the master failed during a commit. (Bug#25364)
- **MySQL Cluster:** Creating a non-unique index with the `USING HASH` clause silently created an ordered index instead of issuing a warning. (Bug#24820)

- **MySQL Cluster:** `ndb_config` failed when trying to use 2 management servers and node IDs. (Bug#23887)
- **MySQL Cluster:** When a data node was shut down using the management client `STOP` command, a connection event (`NDB_LE_Connected`) was logged instead of a disconnection event (`NDB_LE_Disconnected`). (Bug#22773)
- **MySQL Cluster:** The management server did not handle logging of node shutdown events correctly in certain cases. (Bug#22013)
- **MySQL Cluster:** `SELECT` statements with a `BLOB` or `TEXT` column in the selected column list and a `WHERE` condition including a primary key lookup on a `VARCHAR` primary key produced empty result sets. (Bug#19956)
- **MySQL Cluster:** When stopping and restarting multiple data nodes, the last node to be restarted would sometimes hang in Phase 100. (Bug#19645)
- **Replication:** Using row-based replication to replicate to a table having at least one extra `BIT` column with a default value on the slave as compared to the master could cause the slave to fail. (Bug#24490)
- **Replication:** When `SET PASSWORD` was written to the binary log double quotes were included in the statement. If the slave was running in with the server SQL mode set to `ANSI_QUOTES`, then the event failed, which halted the replication process. (Bug#24158)
- **Replication:** A stored procedure, executed from a connection using a binary character set, and which wrote multibyte data, would write incorrectly escaped entries to the binary log. This caused syntax errors, and caused replication to fail. (Bug#23619, Bug#24492)
- **Replication:** Using `CREATE TABLE ... SELECT` and rolling back the transaction would leave an empty table on the master, but the instructions would not be recorded in the binary log and therefore replicated to the slave. This would result in a difference between the master and slave databases. An implicit commit has been added to ensure consistency. (Bug#22865)
- **Replication:** Changes to the `lc_time_names` system variable were not replicated. (Bug#22645)
- **Replication:** For `SET`, `SELECT`, and `DO` statements that invoked a stored function from a database other than the default database, the function invocation could fail to be replicated. (Bug#19725)
- **Disk Data:** Following 3 or more missed local checkpoints by a cluster node, a restart of the node caused incorrect undo information to be used for Disk Data tables. (Bug#25636)
- **Disk Data:** `MEDIUMTEXT` columns of Disk Data tables were stored in memory rather than on disk, even if the columns were not indexed. (Bug#25001)
- **Disk Data:** Performing a node restart with a newly dropped Disk Data table could lead to failure of the node during the restart. (Bug#24917)
- **Disk Data:** Changing a column specification or issuing a `TRUNCATE` statement on a Disk Data table caused the table to become an in-memory table. (Bug#24667, Bug#25296)
- **Disk Data:** When restoring from backup a cluster containing any Disk Data tables with hidden primary keys, a node failure resulted which could lead to a crash of the cluster. (Bug#24166)
- **Disk Data:** Repeated `CREATE`, `DROP`, or `TRUNCATE` in various combinations with system restarts between these operations could lead to the eventual failure of a system restart. (Bug#21948)
- **Disk Data:** Extents that should have been available for re-use following a `DROP TABLE` operation were not actually made available again until after the cluster had performed a local checkpoint. (Bug#17605)
- **Cluster Replication:** Certain errors in replication setups could lead to unexpected node failures. (Bug#25755)
- **Cluster Replication:** Connecting an API node to the cluster during a node restart while performing database operations could cause the restarting node to fail. (Bug#25329)
- **Cluster Replication:** Following a restart of the master cluster, the latest GCI was set to 0 upon reconnection to the slave. (Bug#21806)
- **Cluster API:** Deletion of an `Ndb_cluster_connection` object took a very long time. (Bug#25487)
- **Cluster API:** Invoking the `NdbTransaction::execute()` method using execution type `Commit` and abort option `AO_IgnoreError` could lead to a crash of the transaction coordinator (DBTC). (Bug#25090)
- **Cluster API:** A unique index lookup on a non-existent tuple could lead to a data node timeout (error 4012). (Bug#25059)
- **Cluster API:** When using the `NdbTransaction::execute()` method, a very long timeout (greater than 5 minutes) could

result if the last data node being polled was disconnected from the cluster. (Bug#24949)

- **Cluster API:** Due to an error in the computation of table fragment arrays, some transactions were not executed from the correct starting point. (Bug#24914)
- `mysqltest_embedded` crashed at startup. (Bug#25890)
- Referencing an ambiguous column alias in an expression in the `ORDER BY` clause of a query caused the server to crash. (Bug#25427)
- A number of issues were uncovered by Valgrind. (Bug#25396)
- Using a view in combination with a `USING` clause caused column aliases to be ignored. (Bug#25106)
- A multiple-table `DELETE QUICK` could sometimes cause one of the affected tables to become corrupted. (Bug#25048)
- An assertion failed incorrectly for prepared statements that contained a single-row uncorrelated subquery that was used as an argument of the `IS NULL` predicate. (Bug#25027)
- In the `INFORMATION_SCHEMA.KEY_COLUMN_USAGE` table, the value displayed for the `REFERENCED_TABLE_NAME` column was the table name as encoded for disk storage, not the actual table name. (Bug#25026)
- The `REPEAT()` function could return `NULL` when passed a column for the count argument. (Bug#24947)
- `mysql_upgrade` failed if the `--password` (or `-p`) option was given. (Bug#24896)
- Accessing a fixed record format table with a crashed key definition results in server/`myisamchk` segmentation fault. (Bug#24855)
- `mysqld_multi` and `mysqlaccess` looked for option files in `/etc` even if the `--sysconfdir` option for `configure` had been given to specify a different directory. (Bug#24780)
- If there was insufficient memory available to `mysqld`, this could sometimes cause the server to hang during startup. (Bug#24751)
- Optimizations that are legal only for subqueries without tables and `WHERE` conditions were applied for any subquery without tables. (Bug#24670)
- Under certain rare circumstances, local checkpoints were not performed properly, leading to an inability to restart one or more data nodes. (Bug#24664)
- A workaround was implemented to avoid a race condition in the NPTL `pthread_exit()` implementation. (Bug#24507)
- Under some circumstances, a `REORGANIZE PARTITION` statement could crash `mysqld`. (Bug#24502)
- `mysqltest` crashed with a stack overflow. (Bug#24498)
- Attempts to access a `MyISAM` table with a corrupt column definition caused a server crash. (Bug#24401)
- `ALTER ENABLE KEYS` or `ALTER TABLE DISABLE KEYS` combined with another `ALTER TABLE` option other than `RENAME TO` did nothing. In addition, if `ALTER TABLE` was used on a table having disabled keys, the keys of the resulting table were enabled. (Bug#24395)
- When opening a corrupted `.frm` file during a query, the server crashes. (Bug#24358)
- The `--extern` option for `mysql-test-run.pl` did not function correctly. (Bug#24354)
- Some joins in which one of the joined tables was a view could return erroneous results or crash the server. (Bug#24345)
- The `mysql.server` script used the `source` command, which is less portable than the `.` command; it now uses `.` instead. (Bug#24294)
- A view was not handled correctly if the `SELECT` part contained “\z”. (Bug#24293)
- `mysql_install_db` did not create the `mysql.plugin` table if strict SQL mode was enabled. (Bug#24270)
- A query using `WHERE unsigned_column NOT IN ('negative_value')` could cause the server to crash. (Bug#24261)
- `ALTER TABLE` statements that performed both `RENAME TO` and `{ENABLE|DISABLE} KEYS` operations caused a server crash. (Bug#24219)

- A `FETCH` statement using a cursor on a table which was not in the table cache could sometimes cause the server to crash. (Bug#24117)
- Hebrew-to-Unicode conversion failed for some characters. Definitions for the following Hebrew characters (as specified by the ISO/IEC 8859-8:1999) were added: LEFT-TO-RIGHT MARK (LRM), RIGHT-TO-LEFT MARK (RLM) (Bug#24037)
- On HP-UX, `mysqltest` (non-thread-safe) crashed due to being linked against a thread-safe `libmysys` library. (Bug#23984)
- The server was built even when `configure` was run with the `--without-server` option. (Bug#23973)  
See also Bug#32898.
- The MySQL 5.1.12 binaries for Windows were missing the `FEDERATED`, `EXAMPLE`, and `BLACKHOLE` storage engines. (Bug#23900)
- `ROW_COUNT()` did not work properly as an argument to a stored procedure. (Bug#23760)
- When reading from the standard input on Windows, `mysqlbinlog` opened the input in text mode rather than binary mode and consequently misinterpreted some characters such as Control-Z. (Bug#23735)
- `OPTIMIZE TABLE` tried to sort R-tree indexes such as spatial indexes, although this is not possible (see Section 12.5.2.5, “`OPTIMIZE TABLE Syntax`”). (Bug#23578)
- The row count for `MyISAM` tables was not updated properly, causing `SHOW TABLE STATUS` to report incorrect values. (Bug#23526)
- The Instance Manager `DROP INSTANCE` command did not work. (Bug#23476)
- User-defined variables could consume excess memory, leading to a crash caused by the exhaustion of resources available to the `MEMORY` storage engine, due to the fact that this engine is used by MySQL for variable storage and intermediate results of `GROUP BY` queries. Where `SET` had been used, such a condition could instead give rise to the misleading error message `YOU MAY ONLY USE CONSTANT EXPRESSIONS WITH SET`, rather than `OUT OF MEMORY (NEEDED NNNNNN BYTES)`. (Bug#23443)
- A table created with the `ROW_FORMAT = FIXED` table option lost the option if an index was added or dropped with `CREATE INDEX` or `DROP INDEX`. (Bug#23404)
- A deadlock could occur, with the server hanging on `Closing tables`, with a sufficient number of concurrent `INSERT DELAYED`, `FLUSH TABLES`, and `ALTER TABLE` operations. (Bug#23312)
- Accuracy was improved for comparisons between `DECIMAL` columns and numbers represented as strings. (Bug#23260)
- The Instance Manager `STOP INSTANCE` command took too much time and caused Instance Manager to be unresponsive. (Bug#23215)
- If there was insufficient memory to store or update a blob record in a `MyISAM` table then the table will marked as crashed. (Bug#23196)
- A compressed `MyISAM` table that became corrupted could crash `myisamchk` and possibly the MySQL Server. (Bug#23139)
- `CREATE TABLE ... SELECT` statements were not rolled back correctly. As part of the fix, such a statement now causes an implicit commit before and after it is executed. However, it does not cause a commit when used to create a temporary table. (Bug#22864)
- `mysql_upgrade` failed when called with a `--basedir` path name containing spaces. (Bug#22801)
- Using `INSTALL PLUGIN` followed by a restart of the server caused an error due to memory not being properly initialized. (Bug#22694)
- `SET lc_time_names = value` allowed only exact literal values, not expression values. (Bug#22647)
- A partitioned table that used the `DATA DIRECTORY` option, where the data directory was the same as the directory in which the table definition file resided, became corrupted following `ALTER TABLE ENGINE=ARCHIVE`. This was actually due to an issue with the `ARCHIVE` storage engine, and not with partitioned tables in general. (Bug#22634)
- The `STDDEV()` function returned a positive value for data sets consisting of a single value. (Bug#22555)
- `SHOW COLUMNS` reported some `NOT NULL` columns as `NULL`. (Bug#22377)
- A server crash occurred when using `LOAD DATA` to load a table containing a `NOT NULL` spatial column, when the statement did not load the spatial column. Now a `NULL supplied to NOT NULL column` error occurs. (Bug#22372)

- An `ALTER TABLE` statement that used a `RENAME` clause in combination with a `MODIFY` or `CHANGE` that did not actually change the table (for example, when it changed a column's type from `INT` to `INT`). The behavior caused by this bug differed according to whether or not the storage engine used by the table was transactional or non-transactional. For transactional tables (such as those using the `InnoDB` storage engine), the statement simply failed; for non-transactional tables (such as those using the `MyISAM` storage engine), the `ALTER TABLE` statement succeeding renaming the table, but subsequent `SELECT` statements against the renamed table would fail. ([Bug#22369](#))
- The Instance Manager `STOP INSTANCE` command could not be applied to instances in the `Crashed`, `Failed`, or `Abandoned` state. ([Bug#22306](#))
- `DATE_ADD()` requires complete dates with no “zero” parts, but sometimes did not return `NULL` when given such a date. ([Bug#22229](#))
- Some small double precision numbers (such as `1.00000001e-300`) that should have been accepted were truncated to zero. ([Bug#22129](#))
- Changing the value of `MI_KEY_BLOCK_LENGTH` in `myisam.h` and recompiling MySQL resulted in a `myisamchk` that saw existing `MyISAM` tables as corrupt. ([Bug#22119](#))
- For a non-existent table, `DROP TEMPORARY TABLE` failed with an incorrect error message if `read_only` was enabled. ([Bug#22077](#))
- A crash of the MySQL Server could occur when unpacking a `BLOB` column from a row in a corrupted `MyISAM` table. This could happen when trying to repair a table using either `REPAIR TABLE` or `myisamchk`; it could also happen when trying to access such a “broken” row using statements like `SELECT` if the table was not marked as crashed. ([Bug#22053](#))
- The code for generating `USE` statements for binary logging of `CREATE PROCEDURE` statements resulted in confusing output from `mysqlbinlog` for `DROP PROCEDURE` statements. ([Bug#22043](#))
- `STR_TO_DATE()` returned `NULL` if the format string contained a space following a non-format character. ([Bug#22029](#))
- It was possible to use `DATETIME` values whose year, month, and day parts were all zeroes but whose hour, minute, and second parts contained nonzero values, an example of such an illegal `DATETIME` being `'0000-00-00 11:23:45'`.

**Note**

This fix was reverted in MySQL 5.1.18.

([Bug#21789](#))

See also [Bug#25301](#).

- SSL connections could hang at connection shutdown. ([Bug#21781](#), [Bug#24148](#))
- `yaSSL` crashed on pre-Pentium Intel CPUs. ([Bug#21765](#))
- Using `FLUSH TABLES` in one connection while another connection is using `HANDLER` statements caused a server crash.

**Note**

This fix was reverted in MySQL 5.1.22

([Bug#21587](#))

See also [Bug#29474](#).

- The `FEDERATED` storage engine did not support the `euckr` character set. ([Bug#21556](#))
- `InnoDB` crashed while performing XA recovery of prepared transactions. ([Bug#21468](#))
- It was possible to set the backslash character (“\”) as the delimiter character using `DELIMITER`, but not actually possible to use it as the delimiter. ([Bug#21412](#))
- Using `ALTER TABLE` to convert a `CSV` table containing `NULL` values to `MyISAM` resulted in warnings. ([Bug#21328](#))
- When updating a table that used a `JOIN` of the table itself (for example, when building trees) and the table was modified on one side of the expression, the table would either be reported as crashed or the wrong rows in the table would be updated. ([Bug#21310](#))
- `mysqld_error.h` was not installed when only the client libraries were built. ([Bug#21265](#))

- **InnoDB**: During a restart of the MySQL Server that followed the creation of a temporary table using the **InnoDB** storage engine, MySQL failed to clean up in such a way that **InnoDB** still attempted to find the files associated with such tables. (Bug#20867)
- Selecting into variables sometimes returned incorrect wrong results. (Bug#20836)
- Queries of the form `SELECT ... WHERE string = ANY(...)` failed when the server used a single-byte character set and the client used a multi-byte character set. (Bug#20835)  
  
See also Bug#34760.
- `mysql_fix_privilege_tables.sql` altered the `table_privs.table_priv` column to contain too few privileges, causing loss of the `CREATE VIEW` and `SHOW VIEW` privileges. (Bug#20589)
- A stored routine containing semicolon in its body could not be reloaded from a dump of a binary log. (Bug#20396)
- `SELECT ... FOR UPDATE`, `SELECT ... LOCK IN SHARE MODE`, `DELETE`, and `UPDATE` statements executed using a full table scan were not releasing locks on rows that did not satisfy the `WHERE` condition. (Bug#20390)
- The `BUILD/check-cpu` script did not recognize Celeron processors. (Bug#20061)
- Unsigned `BIGINT` values treated as signed values by the `MOD()` function. (Bug#19955)
- Compiling PHP 5.1 with the MySQL static libraries failed on some versions of Linux. (Bug#19817)
- The `DELIMITER` statement did not work correctly when used in an SQL file run using the `SOURCE` statement. (Bug#19799)
- `mysqltest` incorrectly tried to retrieve result sets for some queries where no result set was available. (Bug#19410)
- `VARBINARY` column values inserted on a MySQL 4.1 server had trailing zeroes following upgrade to MySQL 5.0 or later. (Bug#19371)
- Some `CASE` statements inside stored routines could lead to excessive resource usage or a crash of the server. (Bug#19194, Bug#24854)
- Instance Manager could crash during shutdown. (Bug#19044)
- `myisampack` wrote to unallocated memory, causing a crash. (Bug#17951)
- `FLUSH LOGS` or `mysqladmin flush-logs` caused a server crash if the binary log was not open. (Bug#17733)
- `mysql_fix_privilege_tables` did not accept a password containing embedded space or apostrophe characters. (Bug#17700)
- No warning was issued for use of the `DATA DIRECTORY` or `INDEX DIRECTORY` table options on a platform that does not support them. (Bug#17498)
- The `FEDERATED` storage engine did not support the `utf8` character set. (Bug#17044)
- The optimizer removes expressions from `GROUP BY` and `DISTINCT` clauses if they happen to participate in `expression = constant` predicates of the `WHERE` clause, the idea being that, if the expression is equal to a constant, then it cannot take on multiple values. However, for predicates where the expression and the constant item are of different result types (for example, when a string column is compared to 0), this is not valid, and can lead to invalid results in such cases. The optimizer now performs an additional check of the result types of the expression and the constant; if their types differ, then the expression is not removed from the `GROUP BY` list. (Bug#15881)
- When a prepared statement failed during the prepare operation, the error code was not cleared when it was reused, even if the subsequent use was successful. (Bug#15518)
- Dropping a user-defined function sometimes did not remove the UDF entry from the `mysql.proc` table. (Bug#15439)
- Inserting a row into a table without specifying a value for a `BINARY(N) NOT NULL` column caused the column to be set to spaces, not zeroes. (Bug#14171)
- On Windows, the `SLEEP()` function could sleep too long, especially after a change to the system clock. (Bug#14094, Bug#24686, Bug#17635)
- `mysqldump --order-by-primary` failed if the primary key name was an identifier that required quoting. (Bug#13926)
- Subqueries of the form `NULL IN (SELECT ...)` returned invalid results. (Bug#8804, Bug#23485)

## C.2.24. Changes in MySQL 5.1.14 (05 December 2006)

This is a new Beta development release, fixing recently discovered bugs.

### Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Cluster Replication: Incompatible Change:** Two major changes have taken place with regard to the MySQL Cluster system tables. These are:
  1. The `cluster` database is no longer used. The tables formerly found in the `cluster` database are now in the `mysql` database, and have been renamed as `ndb_binlog_index`, `ndb_apply_status`, and `ndb_schema`.
  2. The `mysql.ndb_apply_status` and `mysql.ndb_schema` tables (formerly `cluster.apply_status` and `cluster.schema`) are now created by `ndb_restore`, in the event that they do not already exist on the slave cluster.

### Note

When upgrading from versions of MySQL previous to 5.1.14 to 5.1.14 or later, `mysql_fix_privilege_tables` merely creates a new `mysql.ndb_binlog_index` table, but does not remove the existing `cluster` database (or, if upgrading from MySQL 5.1.7 or earlier, the existing `cluster_replication` database), nor any of the tables in it.

For more information, see [MySQL Cluster Replication Schema and Tables](#). (Bug#14612)

- **Cluster Replication: Incompatible Change:** The `cluster` database is no longer used. The tables formerly found in the `cluster` database are now in the `mysql` database, and have been renamed as `ndb_binlog_index`, `ndb_apply_status`, and `ndb_schema`.
- **Incompatible Change:** The `prepared_stmt_count` system variable has been converted to the `Prepared_stmt_count` global status variable (viewable with the `SHOW GLOBAL STATUS` statement). (Bug#23159)
- **Incompatible Change:** Previously, you could create a user-defined function (UDF) or stored function with the same name as a built-in function, but could not invoke the UDF. Now an error occurs if you try to create such a UDF. The server also now generates a warning if you create a stored function with the same name as a built-in function. It is not considered an error to create a stored function with the same name as a built-in function because you can invoke the function using `db_name.func_name()` syntax. However, the server now generates a warning in this case.

See [Section 8.2.4, “Function Name Parsing and Resolution”](#), for the rules describing how the server interprets references to different kinds of functions. (Bug#22619, Bug#18239)

- **MySQL Cluster:** Backup messages are now printed to the Cluster log. (Bug#24544)
- **MySQL Cluster:** Setting the configuration parameter `LockPagesInMainMemory` had no effect. (Bug#24461)
- **MySQL Cluster:** The error message `MANAGEMENT SERVER CLOSED CONNECTION`, when recorded in the MySQL error log, now includes a timestamp indicating when the error took place. (Bug#21519)
- **MySQL Cluster:** It is now possible to create a unique hashed index on a column that is not defined as `NOT NULL`.

### Note

This change applies only to tables using the `NDB` storage engine.

Unique indexes on columns in `NDB` tables do not store null values because they are mapped to primary keys in an internal index table (and primary keys cannot contain nulls).

Normally, an additional ordered index is created when one creates unique indexes on `NDB` table columns; this can be used to search for `NULL` values. However, if `USING HASH` is specified when such an index is created, no ordered index is created.

The reason for permitting unique hash indexes with null values is that, in some cases, the user wants to save space if a large number of records are pre-allocated but not fully initialized. This also assumes that the user will *not* try to search for null values. Since MySQL does not support indexes that are not allowed to be searched in some cases, the `NDB` storage engine uses a full table scan with pushed conditions for the referenced index columns to return the correct result.

A warning is returned if one creates a unique nullable hash index, since the query optimizer should be provided a hint not to use it with `NULL` values if this can be avoided. ([Bug#21507](#))

- **MySQL Cluster:** (Disk Data): The output of `mysqldump` now includes by default all tablespace and logfile group definitions used by any tables or databases that are dumped.

### Note

The working of the `--all-tablespaces` or `-Y` option for `mysqldump` remains unaffected by this change.

([Bug#20839](#))

- `DROP TRIGGER` now supports an `IF EXISTS` clause. ([Bug#23703](#))
- Direct and indirect usage of stored routines, user-defined functions, and table references is now prohibited in `CREATE EVENT` and `ALTER EVENT` statements.

See [Section 12.1.11, “CREATE EVENT Syntax”](#), and [Section 12.1.2, “ALTER EVENT Syntax”](#), for more specific information. ([Bug#22830](#))

- The XPath operators `<` and `>`, as implemented in the `ExtractValue()` function, operated in reverse.

With this fix, all standard XPath comparison operators should now be supported correctly for use with the `ExtractValue()` and `UpdateXML()` functions. ([Bug#22823](#))

- For the `mysql` client, display of result set metadata now is enabled with the `--column-type-info` option rather than with `--debug-info/-T`.
- `mysqladmin`, `mysqlcheck`, `mysqldump`, `mysqlimport`, and `mysqlshow` now accept the `--debug-info` option, which displays debugging information and memory and CPU usage statistics at program exit.

### Bugs fixed:

- **MySQL Cluster: Replication:** (Replication): If errors occurred during purging of the binary logs, extraneous rows could remain left in the `binlog_index` table. ([Bug#15021](#))
- **MySQL Cluster:** The failure of a data node failure during a schema operation could lead to additional node failures. ([Bug#24752](#))
- **MySQL Cluster:** A committed read could be attempted before a data node had time to connect, causing a timeout error. ([Bug#24717](#))
- **MySQL Cluster:** The simultaneous shutdown of `mysqld` and `ndbd` processes caused unnecessary locking. ([Bug#24655](#))
- **MySQL Cluster:** The failure of the master node in a node group during the allocation of node IDs could cause `ndb_mgmd` to hang. ([Bug#24543](#))
- **MySQL Cluster:** In certain rare cases, a data node could crash due to a typographical error in the MySQL Cluster source code. ([Bug#24476](#))
- **MySQL Cluster:** Creating a new tables containing a `BLOB` column when the server was short of memory could cause the server to crash. ([Bug#24470](#))
- **MySQL Cluster:** Sudden disconnection of an SQL or data node could lead to shutdown of data nodes with the error `FAILED NDBREQUIRE`. ([Bug#24447](#))
- **MySQL Cluster:** Any statement following the execution of `CREATE TABLE ... LIKE ndb_table` (where `ndb_table` was a table using the `NDB` storage engine), would cause the `mysql` client to hang. ([Bug#24301](#))
- **MySQL Cluster:** (Disk Data): Excessive fragmentation of Disk Data files (including log files and data files) could occur dur-

ing the course of normal use. (Bug#24143)

- **MySQL Cluster:** When the management client command `ALL RESTART -i` was executed while one data node was not running, all data nodes in the cluster were shut down. (Bug#24105)
- **MySQL Cluster:** A query using an index scan followed by a delete operation, and then a rollback could cause one or more data nodes to crash. (Bug#24039)
- **MySQL Cluster:** (Disk Data): Under some circumstances, a `DELETE` from a Disk Data table could cause `mysqld` to crash. (Bug#23542)
- **MySQL Cluster:** It was possible for the sum of the `MaxNoOfTables`, `MaxNoOfOrderedIndexes`, and `MaxNoOfUniqueHashIndexes` configuration parameters, plus the number of system tables to exceed the maximum value for a `UInt32` number. In such a case, the cluster's data nodes failed to start, and no reason for this could easily be determined from the error messages provided. (Bug#22548)
- **MySQL Cluster:** A value equal to or greater than the allowed maximum for `LongMessageBuffer` caused all data nodes to crash. (Bug#22547)
- **MySQL Cluster:** Multiple occurrences of error conditions were logged with duplicated error messages rather than being reported with a single error message stating that the error was encountered *N* times. (Bug#22313)
- **MySQL Cluster:** Given a table `mytbl` in a database `mydb` on a MySQL Server acting as an SQL node in a MySQL Cluster, then, following multiple `ALTER TABLE mytbl ENGINE=engine` statements — first, to change the storage engine used for a table to `NDB`, and then again to change the table to use a non-`NDB` storage engine — a `DROP DATABASE mydb` statement executed on any SQL node in the cluster would cause `mydb` to be dropped on *all* SQL nodes in the cluster, even if `mydb` contained non-`NDB` tables. (Bug#21495)
- **MySQL Cluster:** An incorrect error message was displayed in the event that the value of the `MaxNoOfOrderedIndexes` parameter was set too low. (Bug#20065)
- **MySQL Cluster:** An incorrect error message was displayed in the event that the value of the `DataMemory` parameter was insufficient for the amount of data to be stored by the cluster. (Bug#19808)
- **MySQL Cluster:** Some values of `MaxNoOfTriggers` could cause the server to become inaccessible following startup of the data nodes. (Bug#19454)
- **MySQL Cluster:** If the value set for `MaxNoOfAttributes` is excessive, a suitable error message is now returned. (Bug#19352)
- **MySQL Cluster:** Different error messages were returned for similar cases involving failure to allocate memory for Cluster operations. (Bug#19203)
- **MySQL Cluster:** A unique constraint violation was not ignored by an `UPDATE IGNORE` statement when the constraint violation occurred on a non-primary key. (Bug#18487, Bug#24303)
- **Replication:** With row-based binary logging, replicated multiple-statement transaction deadlocks did not return the correct error code, causing the slave SQL thread to stop rather than roll back and re-execute. (Bug#23831)
- **Replication:** Changes to character set variables prior to an action on a replication-ignored table were forgotten by slave servers. (Bug#22877)
- **Replication:** On slave servers, transactions that exceeded the lock wait timeout failed to roll back properly. (Bug#20697)
- **Replication:** SQL statements close to the size of `max_allowed_packet` could produce binary log events larger than `max_allowed_packet` that could not be read by slave servers. (Bug#19402)
- **Disk Data:** `ndb_restore` sometimes failed when attempting to restore Disk Data tables due to data node failure caused by accessing uninitialized memory. (Bug#24331)
- **Disk Data:** It was possible to execute a statement for creating a Disk Data table that referred to a non-existent tablespace, in which case the table created was actually an in-memory `NDB` table. Such a statement now fails instead, with an appropriate error message. (Bug#23576)
- **Cluster API:** Using `BIT` values with any of the comparison methods of the `NdbScanFilter` class caused data nodes to fail. (Bug#24503)
- **Cluster API:** Some MGM API function calls could yield incorrect return values in certain cases where the cluster was operating under a very high load, or experienced timeouts in inter-node communications. (Bug#24011)
- In some cases, a function that should be parsed as a user-defined function was parsed as a stored function. (Bug#24736)

- Some unnecessary Valgrind warnings were removed from the server. ([Bug#24488](#), [Bug#24533](#))
- The server source code had multiple exportable definitions of the `field_in_record_is_null()` function. These are now all declared `static`. ([Bug#24190](#))
- The loose index scan optimization for `GROUP BY` with `MIN` or `MAX` was not applied within other queries, such as `CREATE TABLE ... SELECT ...`, `INSERT ... SELECT ...`, or in the `FROM` clauses of subqueries. ([Bug#24156](#))
- Subqueries for which a pushed-down condition did not produce exactly one key field could cause a server crash. ([Bug#24056](#))
- The size of `MEMORY` tables and internal temporary tables was limited to 4GB on 64-bit Windows systems. ([Bug#24052](#))
- `LAST_DAY('0000-00-00')` could cause a server crash. ([Bug#23653](#))
- A trigger that invoked a stored function could cause a server crash when activated by different client connections. ([Bug#23651](#))
- The stack size for NetWare binaries was increased to 128KB to prevent problems caused by insufficient stack size. ([Bug#23504](#))
- If elements in a non-top-level `IN` subquery were accessed by an index and the subquery result set included a `NULL` value, the quantified predicate that contained the subquery was evaluated to `NULL` when it should return a non-`NULL` value. ([Bug#23478](#))
- When applying the `group_concat_max_len` limit, `GROUP_CONCAT()` could truncate multi-byte characters in the middle. ([Bug#23451](#))
- `mysql_affected_rows()` could return values different from `mysql_stmt_affected_rows()` for the same sequence of statements. ([Bug#23383](#))
- Calculation of `COUNT(DISTINCT)`, `AVG(DISTINCT)`, or `SUM(DISTINCT)` when they are referenced more than once in a single query with `GROUP BY` could cause a server crash. ([Bug#23184](#))
- With row-based binary logging, for `CREATE TABLE IF NOT EXISTS LIKE temporary_table` statements, the `IF NOT EXISTS` clause was not logged. ([Bug#22762](#))
- `BENCHMARK()`, `ENCODE()`, `DECODE()`, and `FORMAT()` could only accept a constant for some parameters, and could not be used in prepared statements. ([Bug#22684](#))
- Queries using a column alias in an expression as part of an `ORDER BY` clause failed, an example of such a query being `SELECT mycol + 1 AS mynum FROM mytable ORDER BY 30 - mynum`. ([Bug#22457](#))
- Using `EXPLAIN` caused a server crash for queries that selected from `INFORMATION_SCHEMA` in a subquery in the `FROM` clause. ([Bug#22413](#))
- Instance Manager option-parsing code caused memory-allocation errors. ([Bug#22242](#))
- Trailing spaces were not removed from Unicode `CHAR` column values when used in indexes. This resulted in excessive usage of storage space, and could affect the results of some `ORDER BY` queries that made use of such indexes.

**Note**

When upgrading, it is necessary to re-create any existing indexes on Unicode `CHAR` columns in order to take advantage of the fix. This can be done by using a `REPAIR TABLE` statement on each affected table.

([Bug#22052](#))

- With row-based binary logging, `CREATE TABLE IF NOT EXISTS SELECT` statements were not logged properly. ([Bug#22027](#))
- In some cases, the parser failed to distinguish a user-defined function from a stored function. ([Bug#21809](#))
- Inserting a default or invalid value into a spatial column could fail with `Unknown error` rather than a more appropriate error. ([Bug#21790](#))
- Evaluation of subqueries that require the filesort algorithm were allocating and freeing the `sort_buffer_size` buffer many times, resulting in slow performance. Now the buffer is allocated once and reused. ([Bug#21727](#))
- Through the C API, the member strings in `MYSQL_FIELD` for a query that contains expressions may return incorrect results. ([Bug#21635](#))
- View columns were always handled as having implicit derivation, leading to `illegal mix of collation errors` for some views in `UNION` operations. Now view column derivation comes from the original expression given in the view defini-

tion. (Bug#21505)

- `INET_ATON()` returned a signed `BIGINT` value, not an unsigned value. (Bug#21466)
- For debug builds, `mysqladmin shutdown` displayed an extraneous `skipped 9 bytes from file: socket (3)` message. (Bug#21428)
- For renaming of views, encoding of table name to file names was not performed. (Bug#21370)
- `CREATE FUNCTION X()` and `CREATE FUNCTION Y()` failed with a syntax error instead of warning the user that these function names are already used (for GIS functions). (Bug#21025)
- `CONCURRENT` did not work correctly for `LOAD DATA INFILE`. (Bug#20637)
- With `lower_case_table_names` set to 1, `SHOW CREATE TABLE` printed incorrect output for table names containing Turkish I (LATIN CAPITAL LETTER I WITH DOT ABOVE). (Bug#20404)
- A query with a subquery that references columns of a view from the outer `SELECT` could return an incorrect result if used from a prepared statement. (Bug#20327)
- For queries that select from a view, the server was returning `MYSQL_FIELD` metadata inconsistently for view names and table names. For view columns, the server now returns the view name in the `table` field and, if the column selects from an underlying table, the table name in the `org_table` field. (Bug#20191)
- Invalidating the query cache caused a server crash for `INSERT INTO ... SELECT` statements that selected from a view. (Bug#20045)
- For a cast of a `DATETIME` value containing microseconds to `DECIMAL`, the microseconds part was truncated without generating a warning. Now the microseconds part is preserved. (Bug#19491)
- The server could send incorrect column count information to the client for queries that produce a larger number of columns than can fit in a two-byte number. (Bug#19216)
- For some problems relating to character set conversion or incorrect string values for `INSERT` or `UPDATE`, the server was reporting truncation or length errors instead. (Bug#18908)
- Constant expressions and some numeric constants used as input parameters to user-defined functions were not treated as constants. (Bug#18761)
- Attempting to use a view containing `DEFINER` information for a non-existent user resulted in an error message that revealed the definer account. Now the definer is revealed only to superusers. Other users receive only an `access denied` message. (Bug#17254)
- `IN()` and `CHAR()` can return `NULL`, but did not signal that to the query processor, causing incorrect results for `IS NULL` operations. (Bug#17047)
- Warnings were generated when explicitly casting a character to a number (for example, `CAST('x' AS SIGNED)`), but not for implicit conversions in simple arithmetic operations (such as `'x' + 0`). Now warnings are generated in all cases. (Bug#11927)
- Metadata for columns calculated from scalar subqueries was limited to integer, double, or string, even if the actual type of the column was different. (Bug#11032)

## C.2.25. Changes in MySQL 5.1.13 (Not released)

This is a new Beta development release, fixing recently discovered bugs.

### Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible Change:** The number of function names affected by `IGNORE_SPACE` was reduced significantly in MySQL 5.1.13, from about 200 to about 30. (For details about `IGNORE_SPACE`, see [Section 8.2.4, “Function Name Parsing and Resolution”](#).) This change improves the consistency of parser operation. However, it also introduces the possibility of incompatibility for old SQL code that relies on the following conditions:

- `IGNORE_SPACE` is disabled.
- The presence or absence of whitespace following a function name is used to distinguish between a built-in function and stored function that have the same name (for example, `PI()` versus `PI ()`).

For functions that are no longer affected by `IGNORE_SPACE` as of MySQL 5.1.13, that strategy no longer works. Either of the following approaches can be used if you have code that is subject to the preceding incompatibility:

- If a stored function has a name that conflicts with a built-in function, refer to the stored function with a schema name qualifier, regardless of whether whitespace is present. For example, write `schema_name.PI()` or `schema_name.PI ()`.
- Alternatively, rename the stored function to use a non-conflicting name and change invocations of the function to use the new name.

([Bug#21114](#))

- **Incompatible Change:** The `innodb_buffer_pool_awe_mem_mb` system variable has been removed and should no longer be used.
- **MySQL Cluster:** A change in the interfaces for the `INFORMATION_SCHEMA.FILES` table has made the table accessible to storage engines other than `NDB`. ([Bug#23013](#))
- Binary distributions of MySQL 5.1.12 were built without support for partitioning. This has been corrected except for NetWare. ([Bug#23949](#))
- If the user specified the server options `--max-connections=N` or `--table-open-cache=M`, a warning would be given in some cases that some values were recalculated, with the result that `--table-open-cache` could be assigned greater value.

In such cases, both the warning and the increase in the `--table-open-cache` value were completely harmless. Note also that it is not possible for the MySQL Server to predict or to control limitations on the maximum number of open files, since this is determined by the operating system.

The value of `--table-open-cache` is no longer increased automatically, and a warning is now given only if some values had to be decreased due to operating system limits. ([Bug#21915](#))

- For the `CALL` statement, stored procedures that take no arguments now can be invoked without parentheses. That is, `CALL p()` and `CALL p` are equivalent. ([Bug#21462](#))
- `mysql_upgrade` now passes all the parameters specified on the command line to both `mysqlcheck` and `mysql` using the `upgrade_defaults` file. ([Bug#20100](#))
- `mysqldump --single-transaction` now uses `START TRANSACTION /*!40100 WITH CONSISTENT SNAPSHOT */` rather than `BEGIN` to start a transaction, so that a consistent snapshot will be used on those servers that support it. ([Bug#19660](#))

Bugs fixed:

- **MySQL Cluster:** Backup of a cluster failed if there were any tables with 128 or more columns. ([Bug#23502](#))
- **MySQL Cluster:** Cluster backups failed when there were more than 2048 schema objects in the cluster. ([Bug#23499](#))
- **MySQL Cluster:** Restoring a cluster failed if there were any tables with 128 or more columns. ([Bug#23494](#))
- **MySQL Cluster:** The management client command `ALL DUMP 1000` would cause the cluster to crash if data nodes were connected to the cluster but not yet fully started. ([Bug#23203](#))
- **MySQL Cluster:** `INSERT ... ON DUPLICATE KEY UPDATE` on an `NDB` table could lead to deadlocks and memory leaks. ([Bug#23200](#))
- **MySQL Cluster:** An `NDB` source file included a `memset()` call with reversed arguments. ([Bug#23169](#))

- **MySQL Cluster:** If a node restart could not be performed from the REDO log, no node takeover took place. This could cause partitions to be left empty during a system restart. ([Bug#22893](#))
- **MySQL Cluster:** Multiple node restarts in rapid succession could cause a system restart to fail , or induce a race condition. ([Bug#22892](#), [Bug#23210](#))
- **MySQL Cluster:** Attempting to create a unique constraint with `USING HASH` on an `NDB` table caused `mysqld` to crash. ([Bug#21873](#))
- **MySQL Cluster:** When inserting a row into an `NDB` table with a duplicate value for a non-primary unique key, the error issued would reference the wrong key. ([Bug#21072](#))
- **MySQL Cluster:** Aborting a cluster backup too soon after starting it caused a forced shutdown of the data nodes. ([Bug#19148](#))
- **Replication:** Column names were not quoted properly for replicated views. ([Bug#19736](#))
- **Replication:** Transient errors in replication from master to slave may trigger multiple `Got fatal error 1236: 'bin-log truncated in the middle of event'` errors on the slave. ([Bug#4053](#))
- **Disk Data:** In the event of an aborted multiple update, the space in the Disk Data log buffer to be freed as a result was actually freed twice, which could eventually lead to a crash. ([Bug#23430](#))
- **Cluster API:** When multiple processes or threads in parallel performed the same ordered scan with exclusive lock and updated the retrieved records, the scan could skip some records, which as a result were not updated. ([Bug#20446](#))
- There was a race condition in the `InnoDB fil_flush_file_spaces()` function. ([Bug#24098](#))
- yaSSL-related memory leaks were detected by Valgrind. ([Bug#23981](#))
- MySQL 5.0.26 introduced an ABI incompatibility, which this release reverts. Programs compiled against 5.0.26 are not compatible with any other version and must be recompiled. ([Bug#23427](#))
- `M % 0` returns `NULL`, but `( M % 0 ) IS NULL` evaluated to false. ([Bug#23411](#))
- For not-yet-authenticated connections, the `Time` column in `SHOW PROCESSLIST` was a random value rather than `NULL`. ([Bug#23379](#))
- `InnoDB` crashed when trying to display an error message about a foreign key constraint violation when the two tables are in different schemas. ([Bug#23368](#))
- MySQL failed to build on Linux/Alpha. ([Bug#23256](#))  
This regression was introduced by [Bug#21250](#).
- If `COMPRESS()` returned `NULL`, subsequent invocations of `COMPRESS()` within a result set or within a trigger also returned `NULL`. ([Bug#23254](#))
- Insufficient memory (`myisam_sort_buffer_size`) could cause a server crash for several operations on `MyISAM` tables: repair table, create index by sort, repair by sort, parallel repair, bulk insert. ([Bug#23175](#))
- The column default value in the output from `SHOW COLUMNS` or `SELECT FROM INFORMATION_SCHEMA.COLUMNS` was truncated to 64 characters. ([Bug#23037](#))
- `mysql` did not check for errors when fetching data during result set printing. ([Bug#22913](#))
- The return value from `my_seek()` was ignored. ([Bug#22828](#))
- Use of `SQL_BIG_RESULT` did not influence the sort plan for query execution. ([Bug#22781](#))
- The optimizer failed to use equality propagation for `BETWEEN` and `IN` predicates with string arguments. ([Bug#22753](#))
- The `Handler_rollback` status variable sometimes was incremented when no rollback had taken place. ([Bug#22728](#))
- The `Host` column in `SHOW PROCESSLIST` output was blank when the server was started with the `--skip-grant-tables` option. ([Bug#22723](#))
- If a table contains an `AUTO_INCREMENT` column, inserting into an insertable view on the table that does not include the `AUTO_INCREMENT` column should not change the value of `LAST_INSERT_ID()`, because the side effects of inserting default values into columns not part of the view should not be visible. MySQL was incorrectly setting `LAST_INSERT_ID()` to zero. ([Bug#22584](#))

- The optimizer used the `ref` join type rather than `eq_ref` for a simple join on strings. (Bug#22367)
- Some queries that used `MAX()` and `GROUP BY` could incorrectly return an empty result. (Bug#22342)
- If an `init_connect` SQL statement produced an error, the connection was silently terminated with no error message. Now the server writes a warning to the error log. (Bug#22158)
- An unhandled `NULL` pointer caused a server crash. (Bug#22138)
- Incorrect warnings occurred for use of `CREATE TABLE ... LIKE` or `REPAIR TABLE` with the log tables. (Bug#21966)
- The optimizer sometimes mishandled R-tree indexes for `GEOMETRY` data types, resulting in a server crash. (Bug#21888)
- Use of a DES-encrypted SSL certificate file caused a server crash. (Bug#21868)
- Use of `PREPARE` with a `CREATE PROCEDURE` statement that contained a syntax error caused a server crash. (Bug#21856)
- Adding a day, month, or year interval to a `DATE` value produced a `DATE`, but adding a week interval produced a `DATETIME` value. Now all produce a `DATE` value. (Bug#21811)
- Use of a subquery that invoked a function in the column list of the outer query resulted in a memory leak. (Bug#21798)
- It was not possible to do an atomic rename of the log tables without the possibility of losing rows. Now you can do this:

```
USE mysql;
CREATE TABLE IF NOT EXISTS general_log2 LIKE general_log;
RENAME TABLE general_log TO general_log_backup, general_log2 TO general_log;
```

(Bug#21785, Bug#17544)

- Within a prepared statement, `SELECT (COUNT(*) = 1)` (or similar use of other aggregate functions) did not return the correct result for statement re-execution. (Bug#21354)
- Within a stored routine, a view definition cannot refer to routine parameters or local variables. However, an error did not occur until the routine was called. Now it occurs during parsing of the routine creation statement.

### Note

A side effect of this fix is that if you have already created such routines, an error will occur if you execute `SHOW CREATE PROCEDURE` or `SHOW CREATE FUNCTION`. You should drop these routines because they are erroneous.

(Bug#20953)

- In `mysql`, invoking `connect` or `\r` with very long `db_name` or `host_name` parameters caused buffer overflow. (Bug#20894)
- `WITH ROLLUP` could group unequal values. (Bug#20825)
- Range searches on columns with an index prefix could miss records. (Bug#20732)
- The server did not allocate sufficient memory for some queries for which a `DISTINCT` to `GROUP BY` conversion is possible and an `ORDER BY` clause is present, resulting in a server crash. (Bug#20503)
- `LIKE` searches failed for indexed `utf8` character columns. (Bug#20471)
- With `sql_mode = TRADITIONAL`, MySQL incorrectly aborted on warnings within stored routines and triggers. (Bug#20028)
- `mysqldump --xml` produced invalid XML for `BLOB` data. (Bug#19745)
- The range analysis optimizer did not take into account predicates for which an index could be used after reading `const` tables. In some cases this resulted in non-optimal execution plans. (Bug#19579)
- `FLUSH INSTANCES` in Instance Manager triggered an assertion failure. (Bug#19368)
- For a debug server, a reference to an undefined user variable in a prepared statement executed with `EXECUTE` caused an assertion failure. (Bug#19356)
- Within a trigger for a base table, selecting from a view on that base table failed. (Bug#19111)
- The value of the `warning_count` system variable was not being calculated correctly (also affecting `SHOW COUNT(*) WARNINGS`). (Bug#19024)

- `DELETE IGNORE` could hang for foreign key parent deletes. (Bug#18819)
- InnoDB used table locks (not row locks) within stored functions. (Bug#18077)
- `mysql` would lose its connection to the server if its standard output was not writable. (Bug#17583)
- At shutdown, Instance Manager told guarded server instances to stop, but did not wait until they actually stopped. (Bug#17486)
- `mysql-test-run` did not work correctly for RPM-based installations. (Bug#17194)
- A client library crash was caused by executing a statement such as `SELECT * FROM t1 PROCEDURE ANALYSE()` using a server side cursor on a table `t1` that does not have the same number of columns as the output from `PROCEDURE ANALYSE()`. (Bug#17039)
- The `WITH CHECK OPTION` for a view failed to prevent storing invalid column values for `UPDATE` statements. (Bug#16813)
- InnoDB showed substandard performance with multiple queries running concurrently. (Bug#15815)
- `ALTER TABLE` was not able to rename a view. (Bug#14959)
- Statements such as `DROP PROCEDURE` and `DROP VIEW` were written to the binary log too late due to a race condition. (Bug#14262)
- A literal string in a `GROUP BY` clause could be interpreted as a column name. (Bug#14019)
- Entries in the slow query log could have an incorrect `Rows_examined` value. (Bug#12240)
- Lack of validation for input and output `TIME` values resulted in several problems: `SEC_TO_TIME()` in some cases did not clip large values to the `TIME` range appropriately; `SEC_TO_TIME()` treated `BIGINT UNSIGNED` values as signed; only truncation warnings were produced when both truncation and out-of-range `TIME` values occurred. (Bug#11655, Bug#20927)
- Several string functions could return incorrect results when given very large length arguments. (Bug#10963)
- `FROM_UNIXTIME()` did not accept arguments up to `POWER(2, 31) - 1`, which it had previously. (Bug#9191)
- `OPTIMIZE TABLE` with `myisam_repair_threads > 1` could result in MyISAM table corruption. (Bug#8283)

## C.2.26. Changes in MySQL 5.1.12 (24 October 2006)

This is a new Beta development release, fixing recently discovered bugs.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible Change: MySQL Cluster:** MySQL Cluster node and system restarts formerly required that all fragments use the same local checkpoint (LCP); beginning with this version, it is now possible for different fragments to use different LCPs during restarts. This means that data node file systems must be rebuilt as part of any upgrade to this version by restarting all data nodes with the `--initial` option.

See [MySQL Cluster 5.1 and MySQL Cluster NDB 6.x/7.x Upgrade and Downgrade Compatibility](#), and related sections of the Manual before upgrading a MySQL Cluster to version 5.1.12 or later. (Bug#21478, Bug#21271)

- **Incompatible Change:** In the `INFORMATION_SCHEMA.EVENTS` table, the `EVENT_DEFINITION` column now contains the SQL executed by a scheduled event.

The `EVENT_BODY` column now contains the language used for the statement or statements shown in `EVENT_DEFINITION`. In MySQL 5.1, the value shown in `EVENT_BODY` is always `SQL`.

These changes were made to bring this table into line with the `INFORMATION_SCHEMA.ROUTINES` table, and that table's `ROUTINE_BODY` and `ROUTINE_DEFINITION` columns. (Bug#16992)

- **Incompatible Change:** Support for the BerkeleyDB (BDB) engine has been dropped from this release. Any existing tables that are in BDB format will not be readable from within MySQL from 5.1.12 or newer. You should convert your tables to another storage engine *before* upgrading to 5.1.12.

Because of this change, the `SHOW [BDB] LOGS` statement has been dropped.

- **Incompatible Change:** A number of MySQL constructs are now prohibited in partitioning expressions, beginning with this release. These include the following:
  - A number of MySQL functions. For a complete list of these, see [Section 17.5.3, “Partitioning Limitations Relating to Functions”](#).
  - The bit operators `|`, `&`, `^`, `<<`, `>>`, and `~`.
  - Nested function calls.
  - Calls to stored routines, UDFs, or plugins.
  - Character-to-integer conversions involving non-8-bit character sets or any of the `latin1_german2_ci`, `latin2_czech_cs`, or `cp1250_czech_cs` collations.

These restrictions were added in part as a result of [Bug#18198](#) and related bug reports.

For more information about these and other restrictions on partitioned tables in MySQL, see [Section 17.5, “Restrictions and Limitations on Partitioning”](#).

- **Incompatible Change:** The permitted values for and behaviour of the `event_scheduler` system variable have changed. Permitted values are now `ON`, `OFF`, and `DISABLED`, with `OFF` being the default. It is not possible to change its value to or from `DISABLED` while the server is running.

For details, see [Section 18.4.1, “Event Scheduler Overview”](#).

- **Incompatible Change:** The plugin interface has changed: The `st_mysql_plugin` structure has a new `license` member to indicate the license type. (The allowable values are defined in `mysql/plugin.h`.) This change is not backward compatible, so the API version (`MYSQL_PLUGIN_INTERFACE_VERSION`) has changed. For additional information, see [Section 21.2.3, “Writing Plugins”](#).

- **Incompatible Change:** The full-text parser plugin interface has changed in two ways:

- The `MYSQL_FTPARSER_PARAM` structure has a new `flags` member. This is zero if there are no special flags, or `MYSQL_FTFLAGS_NEED_COPY`, which means that `mysql_add_word()` must save a copy of the word (that is, it cannot use a pointer to the word because the word is in a buffer that will be overwritten.)

This flag might be set or reset by MySQL before calling the parser plugin, by the parser plugin itself, or by the `mysql_parse()` function.

- The `mysql_parse()` and `mysql_add_word()` functions now take a `MYSQL_FTPARSER_PARAM` as their first argument, not a `MYSQL_FTPARSER_PARAM::mysql_ftparam` as before.

These changes are not backward compatible, so the API version (`MYSQL_FTPARSER_INTERFACE_VERSION`) has changed. For additional information, see [Section 21.2.3, “Writing Plugins”](#).

- **Incompatible Change:** Storage engines can be pluggable at runtime, so the distinction between disabled and invalid storage engines no longer applies. This affects the `NO_ENGINE_SUBSTITUTION` SQL mode, as described in [Section 5.1.7, “Server SQL Modes”](#).
- **Incompatible Change:** The namespace for scheduled events has changed, such that events are no longer unique to individual users. This also means that a user with the `EVENT` privilege on a given database can now view, alter, or drop any events defined on that database.

If you used scheduled events in an earlier MySQL 5.1 release, you should rename any of them having the same name and defined on the same database but belonging to different users — so that all events in a given database have unique names — before upgrading to 5.1.12 (or newer).

For additional information, see [Section 18.4.6, “The Event Scheduler and MySQL Privileges”](#).

- **Important Change: Partitioning: MySQL Cluster:** It is no longer possible to create Cluster tables using any partitioning type other than `[LINEAR] KEY`. Attempting to do so now raises an error.
- **Important Change: MySQL Cluster:** `LOAD DATA INFILE` no longer causes an implicit commit for all storage engines. It now causes an implicit commit only for tables using the `NDB` storage engine. ([Bug#11151](#))
- **Important Change: MySQL Cluster:** The status variables `Ndb_connected_host` and `Ndb_connected_port` were renamed to `Ndb_config_from_host` and `Ndb_config_from_port`, respectively.

- **Important Change: Replication:** The default value for the `--binlog-format` server option is now `MIXED`.
- **MySQL Cluster:** The `ndb_config` utility now accepts `-c` as a short form of the `--ndb-connectstring` option. (Bug#22295)
- **MySQL Cluster:** Added the `--bind-address` option for `ndbd`. This allows a data node process to be bound to a specific network interface. (Bug#22195)
- **MySQL Cluster:** The `Ndb_number_of_storage_nodes` system variable was renamed to `Ndb_number_of_data_nodes`. (Bug#20848)
- **MySQL Cluster:** The `HELP` command in the Cluster management client now provides command-specific help. For example, `HELP RESTART` in `ndb_mgm` provides detailed information about the `RESTART` command. (Bug#19620)
- **MySQL Cluster:** A number of erroneous, misleading, or missing error messages have been corrected. (Bug#17297, Bug#19543)
- **MySQL Cluster:** Backup messages are no longer printed to the cluster log.
- **MySQL Cluster:** Added the `--ndb-use-copying-alter-table` option to `mysqld` to provide a fallback in case of problems with online `ALTER TABLE` operations on `NDB` tables.
- **Replication:** The default binary log format (as used during replication) is now Mixed based, automatically using a combination of row-based and statement based log events as appropriate.
- **Cluster API:** Two new `NDB` API methods — `aggregate()` and `validate()` — were added to the `NdbDictionary::Object::Table` class. See `Table::aggregate()`, and `Table::validate()`, for more information. This was done to rectify the following issues:
  - Under some conditions, the data distribution could become unbalanced in a MySQL Cluster with 2 or more node groups following the creation of a new table.
  - Data was stored unevenly between partitions due to all `BLOB` data being placed in partition 0. (Bug#21690)
- The number of `InnoDB` threads is no longer limited to 1,000 on Windows. (Bug#22268)
- The `STATE` column of the `INFORMATION_SCHEMA.PROCESSLIST` table was increased from 30 to 64 characters to accommodate longer state values. (Bug#21652)
- `mysqldump` now has a `--flush-privileges` option. It causes `mysqldump` to emit a `FLUSH PRIVILEGES` statement after dumping the `mysql` database. This option should be used any time the dump contains the `mysql` database and any other database that depends on the data in the `mysql` database for proper restoration. (Bug#21424)
- `mysqlslap` threads now try to connect up to 10 times if the initial connect attempt fails. (Bug#21297)
- For `mysqldump`, the output generated by the server when using the `--xml` option has changed with regard to null values. It now matches the output from `mysqldump --xml`. That is, a column containing a `NULL` value is now reported as
 

```
<field name="column_name" xsi:nil="true" />
```

 whereas a column containing the string value `'NULL'` is reported as
 

```
<field name="column_name">NULL</field>
```

 and a column containing an empty string is reported as
 

```
<field name="column_name">>/field>
```

 (Bug#21263)
- The `mysqld` and `mysqlmanager` man pages have been reclassified from volume 1 to volume 8. (Bug#21220)
- `InnoDB` now honors `IGNORE INDEX`. Previously using `IGNORE INDEX` in cases where an index sort would be slower than a filesort had no effect when used with `InnoDB` tables. (Bug#21174)
- `TIMESTAMP` columns that are `NOT NULL` now are reported that way by `SHOW COLUMNS` and `INFORMATION_SCHEMA`. (Bug#20910)
- Memory consumption of the `InnoDB` data dictionary cache was roughly halved by cleaning up the data structures.

)

- The `BINARY` keyword now is forbidden as a data type attribute in stored routines (for example, `DECLARE v1 VARCHAR(25) BINARY`), because `DECLARE` does not support collations, and in this context `BINARY` specifies the binary collation of the variable's character set. (Bug#20701)
- The following statements now can be executed as prepared statements (using `PREPARE` plus `EXECUTE`):

```
CACHE INDEX
CHANGE MASTER
CHECKSUM {TABLE | TABLES}
{CREATE | RENAME | DROP} DATABASE
{CREATE | RENAME | DROP} USER
FLUSH {TABLE | TABLES | TABLES WITH READ LOCK | HOSTS | PRIVILEGES
      | LOGS | STATUS | MASTER | SLAVE | DES_KEY_FILE | USER_RESOURCES}
GRANT
REVOKE
KILL
LOAD INDEX INTO CACHE
RESET {MASTER | SLAVE | QUERY CACHE}
SHOW BINLOG EVENTS
SHOW CREATE {PROCEDURE | FUNCTION | EVENT | TABLE | VIEW}
SHOW {AUTHORS | CONTRIBUTORS | WARNINGS | ERRORS}
SHOW {MASTER | BINARY} LOGS
SHOW {MASTER | SLAVE} STATUS
SLAVE {START | STOP}
INSTALL PLUGIN
UNINSTALL PLUGIN
```

(Bug#20665)

- In the `INFORMATION_SCHEMA.ROUTINES` table the `ROUTINE_DEFINITION` column now is defined as `NULL` rather than `NOT NULL`. Also, `NULL` rather than the empty string is returned as the column value if the user does not have sufficient privileges to see the routine definition. (Bug#20230)
- The `mysqldumpslow` script has been moved from client RPM packages to server RPM packages. This corrects a problem where `mysqldumpslow` could not be used with a client-only RPM install, because it depends on `my_print_defaults` which is in the server RPM. (Bug#20216)
- The MySQL distribution now compiles on UnixWare 7.13. (Bug#20190)
- `configure` now defines the symbol `DEBUG_ON` in `config.h` to indicate whether the source tree is configured to be compiled with debugging support. (Bug#19517)
- `TEXT` and `BLOB` columns do not support `DEFAULT` values. However, when a default of `' '` was specified, the specification was silently ignored. This now results in a warning, or an error in strict mode. (Bug#19498)
- For `mysqlshow`, if a database name argument contains wildcard characters (such as `"_"`) but matches a single database name exactly, treat the name as a literal name. This allows a command such as `mysqlshow information_schema` work without having to escape the wildcard character. (Bug#19147)
- The source distribution has been updated so that the UDF example can be compiled under Windows with CMake. See Section 21.3.2.5, "Compiling and Installing User-Defined Functions". (Bug#19121)
- The default value of the `tmp_table_size` system variable was lowered from 32MB to 16MB because it is bounded by the value of `max_heap_table_size`, which has a default of 16MB. (Bug#18875)
- Log table changes: By default, the log tables use the `CSV` storage engine, as before. But now the log tables can be altered to use the `MyISAM` storage engine. You cannot use `ALTER TABLE` to alter a log table that is in use. The log must be disabled first. No engines other than `CSV` or `MyISAM` are legal for the log tables. The use of `DROP TABLE` for log tables is similarly restricted: It cannot be used to drop a log table that is in use. The log must be disabled first. (These changes also correct a deadlock that occurred for an attempt to drop an in-use log table.) (Bug#18559)
- Added the `--set-charset` option to `mysqlbinlog` to allow the character set to be specified for processing binary log files. (Bug#18351)
- The `ExtractValue()` function now produces an error when passed an XML fragment that is not well-formed. (Previously, the function allowed invalid XML fragments to be used.) (Bug#18201)
- On Windows, typing Control-C while a query was running caused the `mysql` client to crash. Now it causes `mysql` to attempt to kill the current statement. If this cannot be done, or Control-C is typed again before the statement is killed, `mysql` exits. (In other words, `mysql`'s behavior with regard to Control-C is now the same as it is on Unix platforms.) (Bug#17926)

See also Bug#1989.

- The bundled yaSSL library licensing has added a FLOSS exception similar to MySQL to resolve licensing incompatibilities with MySQL. (See the [extra/yassl/FLOSS-EXCEPTIONS](#) file in a MySQL source distribution for details.) (Bug#16755)
- `SHOW CREATE TABLE` now shows constraints for InnoDB tables. (Bug#16614)
- `EXPLAIN EXTENDED` now shows a `filtered` column that is an estimated percentage of the examined rows that will be joined with the previous tables. This was added while dealing with a problem of MySQL choosing the wrong index for some queries. (Bug#14940)
- The `mysql` client now allows `\l` in the `prompt` command argument to insert the current delimiter into the prompt. (Bug#14448)
- The `mysql` client used the default character set if it automatically reconnected to the server, which is incorrect if the character set had been changed. To enable the character set to remain synchronized on the client and server, the `mysql` command `charset` (or `\C`) that changes the default character set and now also issues a `SET NAMES` statement. The changed character set is used for reconnects. (Bug#11972)
- The `LEFT()` and `RIGHT()` functions return `NULL` if any argument is `NULL`. (Bug#11728)
- If a `DROP VIEW` statement named multiple views, it stopped with an error if a non-existent view was named and did not drop the remaining views. Now it continues on and reports an error at the end, similar to `DROP TABLE`. (Bug#11551)
- For a successful dump, `mysqldump` now writes a SQL comment to the end of the dump file in the following format:

```
-- Dump completed on YYYY-MM-DD hh:mm:ss
```

(Bug#10877)

- There were several issues regarding how `SHOW STATUS` affected some status variables and logging which could impact monitoring the MySQL Server. The behavior of this statement has been modified in two ways:
  - `SHOW STATUS` is no longer logged to the slow query log.
  - `SHOW STATUS` no longer updates any session status variables, except for `com_show_status`.

However, `SHOW STATUS` continues to update *global* status variables to allow monitoring of what the server is actually doing. This is because `SHOW STATUS` creates temporary tables that may affect performance if it is called excessively often. (Bug#10210)

See also Bug#19764.

- For spatial data types, the server formerly returned these as `VARSTRING` values with a binary collation. Now the server returns spatial values as `BLOB` values. (Bug#10166)
- The `LOAD DATA FROM MASTER` and `LOAD TABLE FROM MASTER` statements are deprecated. See [Section 12.6.2.2, “LOAD DATA FROM MASTER Syntax”](#), for recommended alternatives. (Bug#9125, Bug#20596, Bug#14399, Bug#12187, Bug#15025, Bug#18822)
- For the `mysql` client, typing Control-C causes `mysql` to attempt to kill the current statement. If this cannot be done, or Control-C is typed again before the statement is killed, `mysql` exits. Previously, Control-C caused `mysql` to exit in all cases. (Bug#1989)
- It is no longer possible to create partitioned tables using the `CSV` storage engine.
- Binary MySQL distributions no longer include a `mysqld-max` server. Instead, distributions contain a binary that includes the features previously included in the `mysqld-max` binary.
- `SHOW STATUS` is no longer logged to the slow query log.
- Program Database files (extension `pdf`) are now included by default in Windows distributions. These can be used to help diagnose problems with `mysqld` and other tools. See [Section 21.5.1, “Debugging a MySQL Server”](#).
- `INFORMATION_SCHEMA` contains new tables, `GLOBAL_STATUS`, `SESSION_STATUS`, `GLOBAL_VARIABLES`, and `SESSION_VARIABLES`, that correspond to the output from the `SHOW {GLOBAL|SESSION} STATUS` and `SHOW {GLOBAL|SESSION} VARIABLES` statements.
- `SHOW STATUS` no longer updates any session status variables, except for `com_show_status`.
- A new system variable, `lc_time_names`, specifies the locale that controls the language used to display day and month names and abbreviations. This variable affects the output from the `DATE_FORMAT()`, `DAYNAME()` and `MONTHNAME()` functions. See [Section 9.8, “MySQL Server Locale Support”](#).

- Using `--with-debug` to configure MySQL with debugging support enables you to use the `--debug="d,parser_debug"` option when you start the server. This causes the Bison parser that is used to process SQL statements to dump a parser trace to the server's standard error output. Typically, this output is written to the error log.
- The bundled yaSSL library was upgraded to version 1.3.7.
- The Instance Manager `--passwd` option has been renamed to `--print-password-line`. Other options were added to enable management of the IM password file from the command line: `--add-user`, `--drop-user`, `--edit-user`, `--list-users`, `--check-password-file`, `--clean-password-file`, `--username`, and `--password`. The `--mysqld-safe-compatible` option was added to cause the Instance Manner to act similarly to `mysqld_safe`.
- Added the `SHOW CONTRIBUTORS` statement.
- The general query log and slow query logs now can be enabled or disabled at runtime with the `general_log` and `slow_query_log` system variables, and the name of the log files can be changed by setting the `general_log_file` and `slow_query_log_file` system variables. See [Section 5.2.3, “The General Query Log”](#), and [Section 5.2.5, “The Slow Query Log”](#).

## Bugs fixed:

- **Security Fix:** A stored routine created by one user and then made accessible to a different user using `GRANT EXECUTE` could be executed by that user with the privileges of the routine's definer. ([Bug#18630](#), [CVE-2006-4227](#))
- **Security Fix:** On Linux, and possibly other platforms using case-sensitive file systems, it was possible for a user granted rights on a database to create or access a database whose name differed only from that of the first by the case of one or more letters. ([Bug#17647](#), [CVE-2006-4226](#))
- **Security Fix:** If a user has access to `MyISAM` table `t`, that user can create a `MERGE` table `m` that accesses `t`. However, if the user's privileges on `t` are subsequently revoked, the user can continue to access `t` by doing so through `m`. If this behavior is undesirable, you can start the server with the new `--skip-merge` option to disable the `MERGE` storage engine. ([Bug#15195](#), [CVE-2006-4031](#))

- **Incompatible Change:** For `utf8` columns, the full-text parser incorrectly considered several non-word punctuation and whitespace characters as word characters, causing some searches to return incorrect results.

The fix involves a change to the full-text parser, so any tables that have `FULLTEXT` indexes on `utf8` columns must be repaired with `REPAIR TABLE`:

```
REPAIR TABLE tbl_name QUICK;
```

([Bug#19580](#))

- **MySQL Cluster: Packaging:** The `ndb_mgm` program was included in both the `MySQL-ndb-tools` and `MySQL-ndb-management` RPM packages, resulting in a conflict if both were installed. Now `ndb_mgm` is included only in `MySQL-ndb-tools`. ([Bug#21058](#))
- **MySQL Cluster: Replication:** A `DELETE FROM table` with no `WHERE` clause (deleting all rows) running concurrently with `INSERT` statements on a storage engine with row-level locking (such as `NDB`) could produce inconsistent results when using statement-based replication. ([Bug#19066](#))
- **MySQL Cluster: Replication:** (Replication): A node failure could send duplicate events, causing a `mysqld` replicating tables containing `BLOBs` to crash.
- **MySQL Cluster:** (NDB API): Inactivity timeouts for scans were not correctly handled. ([Bug#23107](#))
- **MySQL Cluster:** Inserting into an `NDB` table failed when the table had no primary key but had a unique key added after table was created on one or more `NOT NULL` columns. This occurred when the unique key had been adding using either `ALTER TABLE` or `CREATE UNIQUE KEY`. ([Bug#22838](#))
- **MySQL Cluster:** (NDB API): Attempting to read a non-existent tuple using `Commit` mode for `NdbTransaction::execute()` caused node failures. ([Bug#22672](#))
- **MySQL Cluster:** The `--help` output from `NDB` binaries did not include file-related options. ([Bug#21994](#))
- **MySQL Cluster:** Setting `TransactionDeadlockDetectionTimeout` to a value greater than 12000 would cause scans to deadlock, time out, fail to release scan records, until the cluster ran out of scan records and stopped processing. ([Bug#21800](#))
- **MySQL Cluster:** A scan timeout returned Error 4028 (`NODE FAILURE CAUSED ABORT OF TRANSACTION`) instead of Error 4008 (`NODE FAILURE CAUSED ABORT OF TRANSACTION...`). ([Bug#21799](#))

- **MySQL Cluster:** The node recovery algorithm was missing a version check for tables in the `ALTER_TABLE_COMMITTED` state (as opposed to the `TABLE_ADD_COMMITTED` state, which has the version check). This could cause inconsistent schemas across nodes following node recovery. (Bug#21756)
- **MySQL Cluster:** A memory leak occurred when running `ndb_mgm -e "SHOW"`. (Bug#21670)
- **MySQL Cluster:** The server provided a non-descriptive error message when encountering a fatally corrupted REDO log. (Bug#21615)
- **MySQL Cluster:** The output for the `--help` option used with NDB executable programs (such as `ndbd`, `ndb_mgm`, `ndb_restore`, `ndb_config`, and others mentioned in [MySQL Cluster Programs](#)) referred to the `Ndb.cfg` file, instead of to `my.cnf`. (Bug#21585)
- **MySQL Cluster:** A partial rollback could lead to node restart failures. (Bug#21536)
- **MySQL Cluster:** Partition distribution keys were updated only for the primary and starting replicas during node recovery. This could lead to node failure recovery for clusters having an odd number of replicas.

**Note**

We recommend values for `NumberOfReplicas` that are even powers of 2, for best results.

(Bug#21535)

- **MySQL Cluster:** The `ndb_mgm` management client did not set the exit status on errors, always returning 0 instead. (Bug#21530)
- **MySQL Cluster:** The failure of a unique index read due to an invalid schema version could be handled incorrectly in some cases, leading to unpredictable results. (Bug#21384)
- **MySQL Cluster:** Attempting to create an NDB table on a MySQL server with an existing non-Cluster table with the same name in the same database could result in data loss or corruption. Now, if such a table is encountered during autodiscovery, a warning is written to the error log of the affected `mysqld`, and the local table is overwritten. (Bug#21378)
- **MySQL Cluster:** Cluster logs were not rotated following the first rotation cycle. (Bug#21345)
- **MySQL Cluster:** In a cluster with more than 2 replicas, a manual restart of one of the data nodes could fail and cause the other nodes in the same node group to shut down. (Bug#21213)
- **MySQL Cluster:** The `ndb_size.pl` script did not account for `TEXT` and `BLOB` column values correctly. (Bug#21204)
- **MySQL Cluster:** Some queries involving joins on very large NDB tables could crash the MySQL server. (Bug#21059)
- **MySQL Cluster:** Condition pushdown did not work correctly with `DATETIME` columns. (Bug#21056)
- **MySQL Cluster:** Responses to the `ALL DUMP 1000` management client command were printed multiple times in the cluster log for each cluster node. (Bug#21044)
- **MySQL Cluster:** The message `ERROR 0 IN READAUTOINCREMENTVALUE(): NO ERROR` was written to the error log whenever `SHOW TABLE STATUS` was performed on a Cluster table that did not have an `AUTO_INCREMENT` column. (Bug#21033)
- **MySQL Cluster:** Restarting a data node while DDL operations were in progress on the cluster could cause other data nodes to fail. This could also lead to `mysqld` hanging or crashing under some circumstances. (Bug#21017, Bug#21050)
- **MySQL Cluster:** In some situations with a high disk-load, writing of the redo log could hang, causing a crash with the error message `GCP STOP DETECTED`. (Bug#20904)
- **MySQL Cluster:** A race condition could in some circumstances following a `DROP TABLE`. (Bug#20897)
- **MySQL Cluster:** Under some circumstances, local checkpointing would hang, keeping any unstarted nodes from being started. (Bug#20895)
- **MySQL Cluster:** When the redo buffer ran out of space, a `POINTER TOO LARGE` error was raised and the cluster could become unusable until restarted with `--initial`. (Bug#20892)
- **MySQL Cluster:** A vague error message was returned when reading both schema files during a restart of the cluster. (Bug#20860)
- **MySQL Cluster:** The repeated creating and dropping of a table would eventually lead to NDB Error 826, `TOO MANY TABLES AND ATTRIBUTES ... INSUFFICIENT SPACE`. (Bug#20847)

- **MySQL Cluster:** When attempting to restart the cluster following a data import, the cluster failed during Phase 4 of the restart with `ERROR 2334: JOB BUFFER CONGESTION`. (Bug#20774)
- **MySQL Cluster:** `REPLACE` statements did not work correctly on an `NDB` table having both a primary key and a unique key. In such cases, proper values were not set for columns which were not explicitly referenced in the statement. (Bug#20728)
- **MySQL Cluster:** The server did not honor the value set for `ndb_cache_check_time` in the `my.cnf` file. (Bug#20708)
- **MySQL Cluster:** Truncating a table on one `mysqld` caused other `mysqld` processes connected to the cluster to return `ERROR 1412 (HY000): TABLE DEFINITION HAS CHANGED, PLEASE RETRY TRANSACTION` on subsequent queries. (Bug#20705)
- **MySQL Cluster:** Using an invalid node ID with the management client `STOP` command could cause `ndb_mgm` to hang. (Bug#20575)
- **MySQL Cluster:** Renaming of table columns was not supported as fast as `ALTER TABLE` for `NDB` tables. (Bug#20456)
- **MySQL Cluster:** `ndb_size.pl` and `ndb_error_reporter` were missing from RPM packages. (Bug#20426)
- **MySQL Cluster:** Running `ndbd --nowait-nodes=id` where `id` was the node ID of a node that was already running would fail with an invalid error message. (Bug#20419)
- **MySQL Cluster:** Data nodes added while the cluster was running in single user mode were all assigned node ID 0, which could later cause multiple node failures. Adding nodes while in single user mode is no longer possible. (Bug#20395)
- **MySQL Cluster:** The `ndb_mgm` client command `ALL CLUSTERLOG STATISTICS=15` had no effect. (Bug#20336)
- **MySQL Cluster:** (Direct APIs): `NdbScanOperation::readTuples()` and `NdbIndexScanOperation::readTuples()` ignored the `batch` parameter. (Bug#20252)
- **MySQL Cluster:** A node failure during a scan could sometime cause the node to crash when restarting too quickly following the failure. (Bug#20197)
- **MySQL Cluster:** The failure of a data node when preparing to commit a transaction (that is, while the node's status was `CS_PREPARE_TO_COMMIT`) could cause the failure of other cluster data nodes. (Bug#20185)
- **MySQL Cluster:** `SHOW ENGINE NDB STATUS` could sometimes return an incorrect value of 0 for the latest epoch, which could cause problems with synchronizing the binlog. (Bug#20142)
- **MySQL Cluster:** An internal formatting error caused some management client error messages to be unreadable. (Bug#20016)
- **MySQL Cluster:** Creating tables with variable-size columns caused `DataMemory` to be used but not freed when the tables were dropped. (Bug#20007)
- **MySQL Cluster:** Renaming a table in such a way as to move it to a different database failed to move the table's indexes. (Bug#19967)
- **MySQL Cluster:** Running management client commands while `mgmd` was in the process of disconnecting could cause the management server to fail. (Bug#19932)
- **MySQL Cluster:** Under certain conditions, a starting node could miss transactions, leading to inconsistencies between the primary and backup replicas. (Bug#19929)
- **MySQL Cluster:** An uncommitted row could sometimes be checkpointed and thus incorrectly included in a backup. (Bug#19928)
- **MySQL Cluster:** In some cases where `SELECT COUNT(*)` from an `NDB` table should have yielded an error, `MAX_INT` was returned instead. (Bug#19914)
- **MySQL Cluster:** `TEXT` columns in Cluster tables having both an explicit primary key and a unique key were not correctly updated by `REPLACE` statements. (Bug#19906)
- **MySQL Cluster:** The cluster's data nodes failed while trying to load data when `NoOfFrangmentLogFiles` was set equal to 1. (Bug#19894)
- **MySQL Cluster:** Following the restart of a management node, the Cluster management client did not automatically reconnect. (Bug#19873)
- **MySQL Cluster:** Restoring a backup with `ndb_restore` failed when the backup had been taken from a cluster whose `DataMemory` had been completely used up. (Bug#19852)
- **MySQL Cluster:** Error messages given when trying to make online changes to parameters such as `NoOfReplicas` that can

only be changed via a complete shutdown and restart of the cluster did not indicate the true nature of the problem. (Bug#19787)

- **MySQL Cluster:** Under some circumstances, repeated DDL operations on one `mysqld` could cause failure of a second `mysqld` attached to the same cluster. (Bug#19770)
- **MySQL Cluster:** `ndb_restore` did not always make clear that it had recovered successfully from temporary errors while restoring a cluster backup. (Bug#19651)
- **MySQL Cluster:** Resources for unique indexes on Cluster table columns were incorrectly allocated, so that only one-fourth as many unique indexes as indicated by the value of `UniqueHashIndexes` could be created. (Bug#19623)
- **MySQL Cluster:** `LOAD DATA LOCAL` failed to ignore duplicate keys in Cluster tables. (Bug#19496)
- **MySQL Cluster:** For `ndb_mgmd`, Valgrind revealed problems with a memory leak and a dependency on an uninitialized variable. (Bug#19318, Bug#20333)
- **MySQL Cluster:** A `DELETE` of many rows immediately followed by an `INSERT` on the same table could cause the `ndbd` process on the backup replica to crash. (Bug#19293)
- **MySQL Cluster:** An excessive number of `ALTER TABLE` operations could cause the cluster to fail with NDB error code 773 (`OUT OF STRING MEMORY, PLEASE MODIFY STRINGMEMORY`). (Bug#19275)
- **MySQL Cluster:** A problem with error handling when `ndb_use_exact_count` was enabled could lead to incorrect values returned from queries using `COUNT()`. A warning is now returned in such cases. (Bug#19202)
- **MySQL Cluster:** In rare situations with resource shortages, a crash could result from insufficient `IndexScanOperations`. (Bug#19198)
- **MySQL Cluster:** Running out of `DataMemory` could sometimes crash `ndbd` and `mysqld` processes. (Bug#19185)
- **MySQL Cluster:** It was possible to use port numbers greater than 65535 for `ServerPort` in the `config.ini` file. (Bug#19164)
- **MySQL Cluster:** `ndb_mgm -e show | head` would hang after displaying the first 10 lines of output. (Bug#19047)
- **MySQL Cluster:** The error returned by the cluster when too many nodes were defined did not make clear the nature of the problem. (Bug#19045)
- **MySQL Cluster:** The management client `ALL STOP` command shut down `mgmd` processes (as well as `ndbd` processes). (Bug#18966)
- **MySQL Cluster:** `TRUNCATE TABLE` failed to reset the `AUTO_INCREMENT` counter. (Bug#18864)
- **MySQL Cluster:** Restarting a failed node could sometimes crash the cluster. (Bug#18782)
- **MySQL Cluster:** Trying to create or drop a table while a node was restarting caused the node to crash. This is now handled by raising an error. (Bug#18781)
- **MySQL Cluster:** Repeated `CREATE - INSERT - DROP` operations on tables could in some circumstances cause the MySQL table definition cache to become corrupt, so that some `mysqld` processes could access table information but others could not. (Bug#18595)
- **MySQL Cluster:** A `CREATE TABLE` statement involving foreign key constraints raised an error rather than being silently ignored (see Section 12.1.17, “`CREATE TABLE Syntax`”).

This bug affected Cluster in MySQL 5.1 only. (Bug#18483)

- **MySQL Cluster:** The server failed with a non-descriptive error message when out of data memory. (Bug#18475)
- **MySQL Cluster:** For NDB and possibly `InnoDB` tables, a `BEFORE UPDATE` trigger could insert incorrect values. (Bug#18437)
- **MySQL Cluster:** The `DATA_LENGTH` and `AVG_ROW_LENGTH` columns of the `INFORMATION_SCHEMA.TABLES` table did not report the size of variable-width column values correctly.

See Section 19.2, “The `INFORMATION_SCHEMA.TABLES` Table”, for more information. (Bug#18413)

- **MySQL Cluster:** `SELECT ... FOR UPDATE` failed to lock the selected rows. (Bug#18184)
- **MySQL Cluster:** (Disk Data): Deletes from Disk Data tables used a non-optimal scan to find the rows to be deleted, resulting in poor performance. The fix causes disk order rather than memory order to be used, and can improve performance of Disk

Data deletes by up to ~300% in some cases. ([Bug#17929](#))

- **MySQL Cluster:** `pererror` did not properly report NDB error codes. ([Bug#16561](#))
- **MySQL Cluster:** A problem with takeover during a system restart caused ordered indexes to be rebuilt incorrectly. This also adversely affected MySQL Cluster Replication. ([Bug#15303](#))
- **MySQL Cluster:** A cluster data node could crash when an ordered index became full before the table containing the index was full. ([Bug#14935](#))
- **MySQL Cluster:** The management client `ALL STATUS` command could sometimes report the status of some data nodes incorrectly. ([Bug#13985](#))
- **MySQL Cluster:** New `mysqld` processes were allowed to connect without a restart of the cluster, causing the cluster to crash. ([Bug#13266](#))
- **MySQL Cluster:** Cluster system status variables were not updated properly. ([Bug#11459](#))
- **MySQL Cluster:** (NDBAPI): Update operations on blobs were not checked for illegal operations.

### Note

Read locks with blob update operations are now upgraded from read committed to read shared.

- **MySQL Cluster:** The loss of one or more data nodes could sometimes cause `ndb_mgmd` to use a high amount of CPU (15 percent or more, as opposed to 1 to 2 percent normally).
- **Partitioning:** Old partition and subpartition files were not always removed following `ALTER TABLE ... REORGANIZE PARTITION` statements. ([Bug#20770](#))
- **Cluster Replication: Replication:** In some cases, a large number of MySQL servers sending requests to the cluster simultaneously could cause the cluster to crash. This could also be triggered by many NDB API clients making simultaneous event subscriptions or unsubscriptions. ([Bug#20683](#))
- **Cluster Replication: Replication:** Data definition and data manipulation statements on different tables were not serialised correctly in the binary log. For example, there was no guarantee that a `CREATE TABLE` statement and an update on a different table would occur in the same order in the binary log as they did on the cluster being replicated. ([Bug#18947](#))
- **Replication:** `BIT` columns were not replicated properly under row-based replication. ([Bug#22550](#))
- **Replication:** For row-based replication, log rotation could occur at an improper time. ([Bug#21474](#))
- **Replication:** In mixed-format binary logging mode, stored functions, triggers, and views that use functions in their body that require row-based logging did not replicate reliably because the logging did not switch from statement-based to row-based format. For example, `INSERT INTO t SELECT FROM v`, where `v` is a view that selects `UUID()` could cause problems. This limitation has been removed. ([Bug#20930](#))
- **Replication:** A race condition during slave server shutdown caused an assert failure. ([Bug#20850](#))
- **Replication:** With mixed-format binary logging, `INSERT DELAYED` statements were logged using statement-based logging, and they did not replicate properly for statements that used values such as `UUID()`, `RAND()`, or user-defined variables that require row-based logging. To correct this, the `DELAYED` handler thread now switches to row-based logging if the logging format is mixed. ([Bug#20633](#), [Bug#20649](#))
- **Replication:** With the `auto_increment_increment` system variable set larger than 1, if the next generated `AUTO_INCREMENT` value would be larger than the column's maximum value, the value would be clipped down to that maximum value and inserted, even if the resulting value would not be in the generated sequence. This could cause problems for master-master replication. Now the server clips the value down to the previous value in the sequence, which correctly produces a duplicate-key error if that value already exists in the column. ([Bug#20524](#))
- **Replication:** In mixed binary logging mode, a temporary switch from statement-based logging to row-based logging occurs when storing a row that uses a function such as `UUID()` into a temporary table. However, temporary table changes are not written to the binary log under row-based logging, so the row does not exist on the slave. A subsequent select from the temporary table to a non-temporary table using statement-based logging works correctly on the master, but not on the slave where the row does not exist. Replication no longer switches back from row-based logging to statement-based logging until there are no temporary tables for the session. ([Bug#20499](#))
- **Replication:** `CREATE PROCEDURE`, `CREATE FUNCTION`, `CREATE TRIGGER`, and `CREATE VIEW` statements containing multi-line comments (`/* ... */`) could not be replicated. ([Bug#20438](#))
- **Replication:** A stored procedure that used `LAST_INSERT_ID()` did not replicate properly using statement-based binary log-

ging. ([Bug#20339](#))

- **Replication:** When using row based replication, a `CREATE TABLE ... SELECT` statement was replicated, even if the table creation failed on the master (for example, due to a duplicate key failure). ([Bug#20265](#))
- **Replication:** If a table on a slave server had a higher `AUTO_INCREMENT` counter than the corresponding master table (even though all rows of the two tables were identical), in some cases `REPLACE` or `INSERT ... ON DUPLICATE KEY UPDATE` would not replicate properly using statement-based logging. (Different values would be inserted on the master and slave.) ([Bug#20188](#))
- **Replication:** Shutting down a slave in a replication scenario where temporary tables are in use would cause the slave to produce a core dump. ([Bug#19881](#))
- **Replication:** The effect of a stored function or trigger that caused `AUTO_INCREMENT` values to be generated for multiple tables was not logged properly if statement-based logging was used. Only the first table's value was logged, causing replication to fail. Under mixed logging format, this is dealt with by switching to row-based logging for the function or trigger. For statement-based logging, this remains a problem. ([Bug#19630](#))
- **Replication:** For row-based replication, the `BINLOG` statement did not lock tables properly, causing a crash for some table types. ([Bug#19459](#))
- **Replication:** Column names supplied for a view created on a master server could be lost on a slave server. ([Bug#19419](#))
- **Replication:** The dropping of a temporary table whose name contained a backtick (``) character was not correctly written to the binary log, which also caused it not to be replicated correctly. ([Bug#19188](#))
- **Replication:** With row-based replication, replicating a statement to a slave where the table had additional columns relative to the master table did not work. ([Bug#19069](#))
- **Replication:** Valgrind revealed several issues with `mysqld` that were corrected: A dangling stack pointer being overwritten; possible uninitialized data in a string comparison; memory corruption in replication slaves when switching databases; `syscall()` write parameter pointing to an uninitialized byte. ([Bug#19022](#), [Bug#20579](#), [Bug#20769](#), [Bug#20783](#), [Bug#20791](#))
- **Replication:** A redundant table map event could be generated in the binary log when there were no actual changes to a table being replicated. In addition, a slave failed to stop when attempting to replicate a table that did not exist on the slave. ([Bug#18948](#))
- **Replication:** Row-based replication failed when the query cache was enabled on the slave. ([Bug#17620](#))
- **Replication:** Compilation on Windows would fail if row based replication was disabled using `--without-row-based-replication`. ([Bug#16837](#))
- **Replication:** An invalid `GRANT` statement for which `Ok` was returned on a replication master caused an error on the slave and replication to fail. ([Bug#6774](#))
- **Disk Data:** On some platforms, `ndbd` compiled with `gcc 4` would crash when attempting to run `CREATE LOGFILE GROUP`. ([Bug#21981](#))
- **Disk Data:** Trying to create a Disk Data table using a non-existent tablespace or to drop a non-existent data file from a tablespace produced an uninformative error message. ([Bug#21751](#))
- **Disk Data:** Errors could occur when dropping a data file during a node local checkpoint. ([Bug#21710](#))
- **Disk Data:** Creating a tablespace and log file group, then attempting to restart the cluster without using the `--initial` option and without having created any Disk Data tables could cause a forced shutdown of the cluster and raise a configuration error. ([Bug#21172](#))
- **Disk Data:** `mysqldump` did not back up tablespace or log file group information for Disk Data tables correctly.  
Specifically, `UNDO_BUFFER_SIZE` and `INITIAL_SIZE` values were misreported. This meant that trying to restore from such a backup would produce error 1296: `GOT ERROR 1504 'OUT OF LOGBUFFER MEMORY' FROM NDB`. ([Bug#20809](#))
- **Disk Data:** Running a large number of scans on Disk Data could cause subsequent scans to perform poorly. ([Bug#20334](#))
- **Disk Data:** `INFORMATION_SCHEMA.FILES` records for UNDO files showed incorrect values in the `EXTENT_SIZE`, `FREE_EXTENTS`, and `TOTAL_EXTENTS` columns. ([Bug#20073](#))
- **Disk Data:** A data file created for one tablespace could be dropped using `ALTER TABLESPACE ... DROP DATAFILE` using a different tablespace. ([Bug#20053](#))
- **Disk Data:** Trying to create Disk Data tables when running the cluster in diskless mode caused cluster data nodes to crash.

**Note**

Disk Data tables are now disabled when running in diskless mode.

([Bug#20008](#))

- **Disk Data:** An issue with disk allocation could sometimes cause a forced shutdown of the cluster when running a mix of memory and Disk Data tables. ([Bug#18780](#))
- **Disk Data:** The failure of a `CREATE TABLESPACE` or `CREATE LOGFILE GROUP` statement did not revert all changes made prior to the point of failure. ([Bug#16341](#))
- **Cluster Replication:** One or more of the `mysqld` processes could fail when subjecting a Cluster replication setup with multiple `mysqld` processes on both the master and slave clusters to high loads. ([Bug#19768](#))
- **Cluster API:** The `storage/ndb` directory was missing from the server binary distribution, making it impossible to compile NDB API and MGM API applications. This directory can be found as `/usr/include/storage/ndb` after installing that distribution. ([Bug#21955](#))
- **Cluster API:** Invoking the MGM API function `ndb_mgm_listen_event()` caused a memory leak. ([Bug#21671](#))
- **Cluster API:** The inclusion of `my_config.h` in `NdbApi.h` required anyone wishing to write NDB API applications against MySQL 5.1 to have a complete copy of the 5.1 sources. ([Bug#21253](#))
- **Cluster API:** The MGM API function `ndb_logevent_get_fd()` was not implemented. ([Bug#21129](#))
- **Cluster API:** The `NdbOperation::getBlobHandle()` method, when called with the name of a non-existent column, caused a segmentation fault. ([Bug#21036](#))
- `ALTER EVENT` statements including only a `COMMENT` clause failed with a syntax error on two platforms: Linux for S/390, and OS X 10.4 for 64-bit PPC. ([Bug#23423](#))
- When `event_scheduler` was set to `DISABLED`, its value was not displayed correctly by `SHOW VARIABLES` or `SELECT @@global.event_scheduler`. ([Bug#22662](#))
- `ALTER EVENT` in the body of a stored procedure led to a crash when the procedure was called. This affected only those `ALTER EVENT` statements which changed the interval of the event. ([Bug#22397](#))
- The optimizer could make an incorrect index choice for indexes with a skewed key distribution. ([Bug#22393](#))
- Deleting entries from a large `MyISAM` index could cause index corruption when it needed to shrink. Deletes from an index can happen when a record is deleted, when a key changes and must be moved, and when a key must be un-inserted because of a duplicate key. This can also happen in `REPAIR TABLE` when a duplicate key is found and in `myisamchk` when sorting the records by an index. ([Bug#22384](#))
- Instance Manager had a race condition involving `mysqld` PID file removal. ([Bug#22379](#))
- `yaSSL` had a conflicting definition for `socklen_t` on `hurd-i386` systems. ([Bug#22326](#))
- Conversion of values inserted into a `BIT` column could affect adjacent columns. ([Bug#22271](#))
- Some Linux-x86\_64-icc packages (of previous releases) mistakenly contained 32-bit binaries. Only `ICC` builds are affected, not `gcc` builds. Solaris and FreeBSD x86\_64 builds are not affected. ([Bug#22238](#))
- `mysql_com.h` unnecessarily referred to the `ulong` type. ([Bug#22227](#))
- The source distribution would not build on Windows due to a spurious dependency on `ib_config.h`. ([Bug#22224](#))
- Execution of a prepared statement that uses an `IN` subquery with aggregate functions in the `HAVING` clause could cause a server crash. ([Bug#22085](#))
- The `CSV` storage engine failed to detect some table corruption. ([Bug#22080](#))
- Using `GROUP_CONCAT()` on the result of a subquery in the `FROM` clause that itself used `GROUP_CONCAT()` could cause a server crash. ([Bug#22015](#))
- Running `SHOW MASTER LOGS` at the same time as binary log files were being switched would cause `mysqld` to hang. ([Bug#21965](#))
- `libmysqlclient` defined a symbol `BN_bin2bn` which belongs to OpenSSL. This could break applications that also linked

against OpenSSL's `libcrypto` library. The fix required correcting an error in a build script that was failing to add rename macros for some functions. (Bug#21930)

- `character_set_results` can be `NULL` to signify “no conversion,” but some code did not check for `NULL`, resulting in a server crash. (Bug#21913)
- A misleading error message was displayed when attempting to define a unique key that was not valid for a partitioned table. (Bug#21862)
- A query that used `GROUP BY` and an `ALL` or `ANY` quantified subquery in a `HAVING` clause could trigger an assertion failure. (Bug#21853)
- An `InnoDB` mutex was not acquired and released under the same condition, leading to deadlock in some rare situations involving XA transactions. (Bug#21833)
- A `NUL` byte within a prepared statement string caused the rest of the string not to be written to the query log, allowing logging to be bypassed. (Bug#21813)
- `COUNT( *)` queries with `ORDER BY` and `LIMIT` could return the wrong result.

### Note

This problem was introduced by the fix for Bug#9676, which limited the rows stored in a temporary table to the `LIMIT` clause. This optimization is not applicable to non-group queries with aggregate functions. The current fix disables the optimization in such cases.

(Bug#21787)

- Using `DROP TABLE` with concurrent queries causes `mysqld` to crash. (Bug#21784)
- `INSERT ... SELECT` sometimes generated a spurious `Column count doesn't match value count` error. (Bug#21774)
- `UPGRADE` was treated as a reserved word, although it is not. (Bug#21772)
- A function result in a comparison was replaced with a constant by the optimizer under some circumstances when this optimization was invalid. (Bug#21698)
- Selecting from `INFORMATION_SCHEMA.FILES` could crash the server. (Bug#21676)
- Errors could be generated during the execution of certain prepared statements that ran queries on partitioned tables. (Bug#21658)
- The presence of a subquery in the `ON` clause of a join in a view definition prevented the `MERGE` algorithm from being used for the view in cases where it should be allowed. (Bug#21646)
- When records are merged from the insert buffer and the page needs to be reorganized, `InnoDB` used incorrect column length information when interpreting the records of the page. This caused a server crash due to apparent corruption of secondary indexes in `ROW_FORMAT=COMPACT` that contain prefix indexes of fixed-length columns. Data files should not be corrupted, but the crash was likely to repeat every time the server was restarted. (Bug#21638)
- For character sets having a `mbmaxlen` value of 2, any `ALTER TABLE` statement changed `TEXT` columns to `MEDIUMTEXT`. (Bug#21620)
- `mysql` displayed an empty string for `NULL` values. (Bug#21618)
- Selecting from a `MERGE` table could result in a server crash if the underlying tables had fewer indexes than the `MERGE` table itself. (Bug#21617, Bug#22937)
- A loaded storage engine plugin did not load after a server restart. (Bug#21610)
- For `INSERT ... ON DUPLICATE KEY UPDATE`, use of `VALUES(col_name)` within the `UPDATE` clause sometimes was handled incorrectly. (Bug#21555)
- Subqueries with aggregate functions but no `FROM` clause could return incorrect results. (Bug#21540)
- `mysqldump` incorrectly tried to use `LOCK TABLES` for tables in the `INFORMATION_SCHEMA` database. (Bug#21527)
- The server could crash for the second execution of a function containing a `SELECT` statement that uses an aggregating `IN` subquery. (Bug#21493)

- Memory overruns could occur for certain kinds of subqueries. ([Bug#21477](#))
- A `DATE` can be represented as an integer (such as `20060101`) or as a string (such as `'2006.01.01'`). When a `DATE` (or `TIME`) column is compared in one `SELECT` against both representations, constant propagation by the optimizer led to comparison of `DATE` as a string against `DATE` as an integer. This could result in integer comparisons such as `2006` against `20060101`, erroneously producing a false result. ([Bug#21475](#))
- `myisam_ftdump` produced bad counts for common words. ([Bug#21459](#))
- Adding `ORDER BY` to a `SELECT DISTINCT(expr)` query could produce incorrect results. ([Bug#21456](#))
- The URL into the online manual that is printed in the stack trace message by the server was out of date. ([Bug#21449](#))
- Database and table names have a maximum length of 64 characters (even if they contain multi-byte characters), but were truncated to 64 bytes.

**Note**

An additional fix was made in MySQL 5.1.18.

([Bug#21432](#))

- With `max_sp_recursion` set to 0, a stored procedure that executed a `SHOW CREATE PROCEDURE` statement for itself triggered a recursion limit exceeded error, though the statement involves no recursion. ([Bug#21416](#))
- After `FLUSH TABLES WITH READ LOCK` followed by `UNLOCK TABLES`, attempts to drop or alter a stored routine failed with an error that the routine did not exist, and attempts to execute the routine failed with a lock conflict error. ([Bug#21414](#))
- On 64-bit Windows, a missing table generated error 1017, not the correct value of 1146. ([Bug#21396](#))
- Table aliases in multiple-table `DELETE` statements sometimes were not resolved. ([Bug#21392](#))
- The optimizer sometimes produced an incorrect row-count estimate after elimination of `const` tables. This resulted in choosing extremely inefficient execution plans in some cases when distribution of data in joins were skewed. ([Bug#21390](#))
- For multiple-table `UPDATE` statements, storage engines were not notified of duplicate-key errors. ([Bug#21381](#))
- Using relative paths for `DATA DIRECTORY` or `INDEX DIRECTORY` with a partitioned table generated a warning rather than an error, and caused “junk” files to be created in the server's data directory. ([Bug#21350](#))
- Using `EXPLAIN PARTITIONS` with a query on a table whose partitioning expression was based on the value of a `DATE` column could sometimes cause the server to crash. ([Bug#21339](#))
- The feature of being able to recover a temporary table named `#sql_id` in InnoDB by creating a table named `rsql_id_recover_innodb_tmp_table` was broken by the introduction of the new identifier encoding in MySQL 5.1.6 ([Bug#21313](#))
- It was possible for a stored routine with a non-`latin1` name to cause a stack overrun. ([Bug#21311](#))
- A query result could be sorted improperly when using `ORDER BY` for the second table in a join. ([Bug#21302](#))
- Query results could be incorrect if the `WHERE` clause contained `t.key_part NOT IN (val_list)`, where `val_list` is a list of more than 1000 constants. ([Bug#21282](#))
- Queries that used the `index_merge` and `sort_union` methods to access an InnoDB table could produce inaccurate results. This issue was introduced in MySQL 5.1.10 when a new handler and bitmap interface was implemented. ([Bug#21277](#))
- For user-defined functions created with `CREATE FUNCTION`, the `DEFINER` clause is not legal, but no error was generated. ([Bug#21269](#))
- The `SELECT` privilege was required for an insert on a view, instead of the `INSERT` privilege. ([Bug#21261](#))  
This regression was introduced by [Bug#20989](#).
- `mysql_config --libmysqld-libs` did not produce any SSL options necessary for linking `libmysqld` with SSL support enabled. ([Bug#21239](#))
- Subqueries on `INFORMATION_SCHEMA` tables could erroneously return an empty result. ([Bug#21231](#))
- `mysql_upgrade` created temporary files in a possibly insecure way. ([Bug#21224](#))

- When `DROP DATABASE` or `SHOW OPEN TABLES` was issued while concurrently in another connection issuing `DROP TABLE`, `RENAME TABLE`, `CREATE TABLE LIKE` or any other statement that required a name lock, the server crashed. (Bug#21216, Bug#19403)
- The `--master-data` option for `mysqldump` requires certain privileges, but `mysqldump` generated a truncated dump file without producing an appropriate error message or exit status if the invoking user did not have those privileges. (Bug#21215)
- Using `ALTER TABLE ... REORGANIZE PARTITIONS` to reduce the number of subpartitions to 1 caused the server to crash. (Bug#21210)
- In the package of pre-built time zone tables that is available for download at <http://dev.mysql.com/downloads/timezones.html>, the tables now explicitly use the `utf8` character set so that they work the same way regardless of the system character set value. (Bug#21208)
- Under heavy load (executing more than 1024 simultaneous complex queries), a problem in the code that handles internal temporary tables could lead to writing beyond allocated space and memory corruption.  
  
Use of more than 1024 simultaneous cursors server wide also could lead to memory corruption. This applies to both stored procedure cursors and C API cursors. (Bug#21206)
- When run with the `--use-threads` option, `mysqlimport` returned a random exit code. (Bug#21188)
- A subquery that uses an index for both the `WHERE` and `ORDER BY` clauses produced an empty result. (Bug#21180)
- Running `SHOW TABLE STATUS` on any InnoDB table having at least one record could crash the server. Note that this was not due to any issue in the InnoDB storage engine, but rather with `AUTO_INCREMENT` handling in the partitioning code — however, the table did not have to have an `AUTO_INCREMENT` column for the bug to manifest. (Bug#21173)
- Some prepared statements caused a server crash when executed a second time. (Bug#21166)
- The optimizer assumed that if `(a=x AND b=x)` is true, `(a=x AND b=x) AND a=b` is also true. But that is not always so if `a` and `b` have different data types. (Bug#21159)
- Some `ALTER TABLE` statements affecting a table's subpartitioning could hang. (Bug#21143)
- Certain malformed `INSERT` statements could crash the `mysql` client. (Bug#21142)
- `SHOW INNODB STATUS` contained some duplicate output. (Bug#21113)
- InnoDB was slow with more than 100,000 `.idb` files. (Bug#21112)
- Creating a `TEMPORARY` table with the same name as an existing table that was locked by another client could result in a lock conflict for `DROP TEMPORARY TABLE` because the server unnecessarily tried to acquire a name lock. (Bug#21096)
- Performing an `INSERT` on a view that was defined using a `SELECT` that specified a collation and a column alias caused the server to crash. (Bug#21086)
- Incorrect results could be obtained from re-execution of a parametrized prepared statement or a stored routine with a `SELECT` that uses `LEFT JOIN` with a second table having only one row. (Bug#21081)
- `ALTER VIEW` did not retain existing values of attributes that had been originally specified but were not changed in the `ALTER VIEW` statement. (Bug#21080)
- The `mysam_stats_method` variable was mishandled when set from an option file or on the command line. (Bug#21054)
- With `query_cache_type` set to 0, `RESET QUERY CACHE` was very slow and other threads were blocked during the operation. Now a cache reset is faster and non-blocking. (Bug#21051)
- `mysql` crashed for very long arguments to the `connect` command. (Bug#21042)
- When creating a table using `CREATE ... SELECT` and a stored procedure, there would be a mismatch between the binary log and transaction cache which would cause a server crash. (Bug#21039)
- A query using `WHERE column = constant OR column IS NULL` did not return consistent results on successive invocations. The `column` in each part of the `WHERE` clause could be either the same column, or two different columns, for the effect to be observed. (Bug#21019)
- `mysqldump` sometimes did not select the correct database before trying to dump views from it, resulting in an empty result set that caused `mysqldump` to die with a segmentation fault. (Bug#21014)
- Performance during an import on a table with a trigger that called a stored procedure was severely degraded. (Bug#21013)

- `mysql_upgrade` produced a malformed `upgrade_defaults` file by overwriting the `[client]` group header with a `password` option. This prevented `mysqlcheck` from running successfully when invoked by `mysql_upgrade`. (Bug#21011)

- A query of the form shown here caused the server to crash:

```
SELECT * FROM t1 NATURAL JOIN (
  t2 JOIN (
    t3 NATURAL JOIN t4,
    t5 NATURAL JOIN t6
  )
  ON (t3.id3 = t2.id3 AND t5.id5 = t2.id5)
);
```

(Bug#21007)

- A `SELECT` that used a subquery in the `FROM` clause that did not select from a table failed when the subquery was used in a join. (Bug#21002)
- `REPLACE . . . SELECT` for a view required the `INSERT` privilege for tables other than the table being modified. (Bug#20989)
- `STR_TO_DATE()` sometimes would return `NULL` if the `%D` format specifier was not the last specifier in the format string. (Bug#20987)
- A query using `WHERE NOT (column < ANY (subquery))` yielded a different result from the same query using the same `column` and `subquery` with `WHERE (column > ANY (subquery))`. (Bug#20975)
- Under certain circumstances, `AVG(key_val)` returned a value but `MAX(key_val)` returned an empty set due to incorrect application of `MIN()/MAX()` optimization. (Bug#20954)
- Closing of temporary tables failed if binary logging was not enabled. (Bug#20919)
- Use of zero-length variable names caused a server crash. (Bug#20908)
- Building `mysql` on Windows with CMake 2.4 would fail to create `libmysqld` correctly. (Bug#20907)
- Creating a partitioned table that used the `InnoDB` storage engine and then restarting `mysqld` with `--skip-innodb` caused MySQL to crash. (Bug#20871)
- For certain queries, the server incorrectly resolved a reference to an aggregate function and crashed. (Bug#20868)
- If the binary logging format was changed between the times when a locked table was modified and when it was unlocked, the binary log contents were incorrect. (Bug#20863)
- It was possible to provide the `ExtractValue()` function with input containing “tags” that were not valid XML; for example, it was possible to use tag names beginning with a digit, which are disallowed by the W3C's XML 1.0 specification. Such cases caused the function to return “junk” output rather than an error message signalling the user as to the true nature of the problem. (Bug#20854)
- `InnoDB` (Partitioning): Updating an `InnoDB` table using `HASH` partitioning with a composite primary key would cause the server to hang. (Bug#20852)
- `mysqldump` did not add version-specific comments around `WITH PARSER` and `TABLESPACE . . . STORAGE DISK` clauses for `CREATE TABLE` statements, causing dump files from servers where these features were in use to fail when loaded into older servers. (Bug#20841)
- For multiple `INSERT DELAYED` statements executed in a batch by the delayed-insert handler thread, not all rows were written to the binary log. (Bug#20821)
- The `ExtractValue()` function did not accept XML tag names containing a period (`.`) character. (Bug#20795)
- Using aggregate functions in subqueries yielded incorrect results under certain circumstances due to incorrect application of `MIN()/MAX()` optimization. (Bug#20792)
- On Windows, inserting into a `MERGE` table after renaming an underlying `MyISAM` table caused a server crash. (Bug#20789)
- Within stored routines, some error messages were printed incorrectly. A non-null-terminated string was passed to a message-printing routine that expected a null-terminated string. (Bug#20778)
- Merging multiple partitions having subpartitions into a single partition with subpartitions, or splitting a single partition having subpartitions into multiple partitions with subpartitions, could sometimes crash the server. These issues were associated with a

failure reported in the `partition_range` test. ([Bug#20767](#), [Bug#20893](#), [Bug#20766](#), [Bug#21357](#))

- Searches against a `ZEROFILL` column of a partitioned table could fail when the `ZEROFILL` column was part of the table's partitioning key. ([Bug#20733](#))
- If a column definition contained a character set declaration, but a `DEFAULT` value began with an introducer, the introducer character set was used as the column character set. ([Bug#20695](#))
- An `UPDATE` that referred to a key column in the `WHERE` clause and activated a trigger that modified the column resulted in a loop. ([Bug#20670](#))
- Issuing a `SHOW CREATE FUNCTION` or `SHOW CREATE PROCEDURE` statement without sufficient privileges could crash the `mysql` client. ([Bug#20664](#))
- `INSERT DELAYED` did not honor `SET INSERT_ID` or the `auto_increment_*` system variables. ([Bug#20627](#), [Bug#20830](#))
- A buffer overwrite error in Instance Manager caused a crash. ([Bug#20622](#))
- Loading a plugin caused any an existing plugin with the same name to be lost. ([Bug#20615](#))
- A query selecting records from a single partition of a partitioned table and using `ORDER BY ic DESC` (where `ic` represents an indexed column) could cause errors or crash the server. ([Bug#20583](#))
- If the `auto_increment_offset` setting causes MySQL to generate a value larger than the column's maximum possible value, the `INSERT` statement is accepted in strict SQL mode, whereas but should fail with an error. ([Bug#20573](#))
- In a view defined with `SQL SECURITY DEFINER`, the `CURRENT_USER()` function returned the invoker, not the definer. ([Bug#20570](#))
- The `fill_help_tables.sql` file did not contain a `SET NAMES 'utf8'` statement to indicate its encoding. This caused problems for some settings of the MySQL character set such as `big5`. ([Bug#20551](#))
- Scheduled events that invoked stored procedures executing DDL operations on partitioned tables could crash the server. ([Bug#20548](#))
- Users who had the `SHOW VIEW` privilege for a view and privileges on one of the view's base tables could not see records in `INFORMATION_SCHEMA` tables relating to the base table. ([Bug#20543](#))
- The `fill_help_tables.sql` file did not load properly if the `ANSI_QUOTES` SQL mode was enabled. ([Bug#20542](#))
- The `MD5()`, `SHA1()`, and `ENCRYPT()` functions should return a binary string, but the result sometimes was converted to the character set of the argument. `MAKE_SET()` and `EXPORT_SET()` now use the correct character set for their default separators, resulting in consistent result strings which can be coerced according to normal character set rules. ([Bug#20536](#))
- If a partitioned `InnoDB` table contained an `AUTO_INCREMENT` column, a `SHOW` statement could cause an assertion failure with more than one connection. ([Bug#20493](#))
- Using `EXPLAIN PARTITIONS` with a `UNION` query could crash the server. This could occur whether or not the query actually used any partitioned tables. ([Bug#20484](#))
- Creation of a view as a join of views or tables could fail if the views or tables are in different databases. ([Bug#20482](#))
- `SELECT` statements using `GROUP BY` against a view could have missing columns in the output when there was a trigger defined on one of the base tables for the view. ([Bug#20466](#))
- For connections that required a `SUBJECT` value, a check was performed to verify that the value was correct, but the connection was not refused if not. ([Bug#20411](#))
- `mysql_upgrade` was missing from binary MySQL distributions. ([Bug#20403](#), [Bug#18516](#), [Bug#20556](#))
- Some user-level errors were being written to the server's error log, which is for server errors. ([Bug#20402](#))
- Using `ALTER TABLE ... ENGINE = x`, where `x` was not a storage engine supported by the server, would cause `mysqld` to crash. ([Bug#20397](#))
- User names have a maximum length of 16 characters (even if they contain multi-byte characters), but were being truncated to 16 bytes. ([Bug#20393](#))
- Some queries using `ORDER BY ... DESC` on subpartitioned tables could crash the server. ([Bug#20389](#))

- `mysqlslap` did not enable the `CLIENT_MULTI_RESULTS` flag when connecting, which is necessary for executing stored procedures. (Bug#20365)
- Queries using an indexed column as the argument for the `MIN()` and `MAX()` functions following an `ALTER TABLE ... DISABLE KEYS` statement returned `GOT ERROR 124 FROM STORAGE ENGINE` until `ALTER TABLE ... ENABLE KEYS` was run on the table. (Bug#20357)
- When a statement used a stored function that inserted into an `AUTO_INCREMENT` column, the generated `AUTO_INCREMENT` value was not written into the binary log, so a different value could in some cases be inserted on the slave. (Bug#20341)
- Partitions were represented internally as the wrong data type, which led in some cases to failures of queries such as `SELECT COUNT(*) FROM INFORMATION_SCHEMA.PARTITIONS WHERE PARTITION_NAME = 'partition_name'`. (Bug#20340)
- `PROCEDURE ANALYSE()` returned incorrect values of `M FLOAT(M, D)` and `DOUBLE(M, D)`. (Bug#20305)
- Defining a table partitioned by `LIST` with a single `PARTITION ... VALUES IN (NULL)` clause could lead to server crashes, particularly with queries having `WHERE` conditions comparing the partitioning key with a constant. (Bug#20268, Bug#19801)
- Partition pruning could cause incorrect results from queries, such missing rows, when the partitioning expression relied on a `BIGINT UNSIGNED` column. (Bug#20257)
- For a `MyISAM` table locked with `LOCK TABLES ... WRITE`, queries optimized using the `index_merge` method did not show rows inserted with the lock in place. (Bug#20256)
- `mysqldump` produced a malformed dump file when dumping multiple databases that contained views. (Bug#20221)
- Running `InnoDB` with many concurrent threads could cause memory corruption and a seg fault due to a bug introduced in MySQL 5.1.11. (Bug#20213)
- `SUBSTRING()` results sometimes were stored improperly into a temporary table when multi-byte character sets were used. (Bug#20204)
- The thread for `INSERT DELAYED` rows was maintaining a separate `AUTO_INCREMENT` counter, resulting in incorrect values being assigned if `DELAYED` and non-`DELAYED` inserts were mixed. (Bug#20195)
- The `--default-storage-engine` server option did not work. (Bug#20168)
- For a table having `LINEAR HASH` subpartitions, the `LINEAR` keyword did not appear in the `SUBPARTITION_METHOD` column of the `INFORMATION_SCHEMA.PARTITIONS` table. (Bug#20161)
- For a `DATE` parameter sent via a `MYSQL_TIME` data structure, `mysql_stmt_execute()` zeroed the hour, minute, and second members of the structure rather than treating them as read-only. (Bug#20152)
- `pererror` crashed on Solaris due to `NULL` return value of `strerror()` system call. (Bug#20145)
- `FLUSH TABLES` followed by a `LOCK TABLES` statement to lock a log table and a non-log table caused an infinite loop and high CPU use. Now `FLUSH TABLES` ignores log tables. To flush the log tables, use `FLUSH LOGS` instead. (Bug#20139)
- On Linux, `libmysqlclient` when compiled with yaSSL using the `icc` compiler had a spurious dependency on C++ libraries. (Bug#20119)
- For an `ENUM` column that used the `ucs2` character set, using `ALTER TABLE` to modify the column definition caused the default value to be lost. (Bug#20108)
- For `mysql`, escaping with backslash sometimes did not work. (Bug#20103)
- Queries on tables that were partitioned by `KEY` and had a `VARCHAR` column as the partitioning key produced an empty result set. (Bug#20086)
- A number of dependency issues in the RPM `bench` and `test` packages caused installation of these packages to fail. (Bug#20078)
- Use of `MIN()` or `MAX()` with `GROUP BY` on a `ucs2` column could cause a server crash. (Bug#20076)
- `mysqld --flush` failed to flush `MyISAM` table changes to disk following an `UPDATE` statement for which no updated column had an index. (Bug#20060)
- In MySQL 5.1.11, the `--with-openssl` and `--with-yassl` options were replaced by `--with-ssl`. But no message was issued if the old options were given. Now `configure` produces a message indicating that the new option should be used

and exits. ([Bug#20002](#))

- When a statement is executed that does not generate any rows, an extra table map event and associated binrows event would be generated and written to the binary log. ([Bug#19995](#))
- Join conditions using index prefixes on `utf8` columns of `InnoDB` tables incorrectly ignored rows where the length of the actual value was greater than the length of the index prefix. ([Bug#19960](#))
- `AUTHORS` and `CONTRIBUTORS` were not treated as reserved words. ([Bug#19939](#))
- The `query` command for `mysqltest` did not work. ([Bug#19890](#))
- Identifiers with embedded escape characters were not handled correctly by some `SHOW` statements due to some old code that was doing some extra unescaping. ([Bug#19874](#))
- When executing a `SELECT` with `ORDER BY` on a view that is constructed from a `SELECT` statement containing a stored function, the stored function was evaluated too many times. ([Bug#19862](#))
- Using `SELECT` on a corrupt `MyISAM` table using the dynamic record format could cause a server crash. ([Bug#19835](#))
- Using cursors with `READ COMMITTED` isolation level could cause `InnoDB` to crash. ([Bug#19834](#))
- `CREATE DATABASE`, `RENAME DATABASE`, and `DROP DATABASE` could deadlock in cases where there was a global read lock. ([Bug#19815](#))
- The yaSSL library bundled with `libmysqlclient` had some conflicts with OpenSSL. Now macros are used to rename the conflicting symbols to have a prefix of `ya`. ([Bug#19810](#))
- The `WITH CHECK OPTION` was not enforced when a `REPLACE` statement was executed against a view. ([Bug#19789](#))
- Multiple-table updates with `FEDERATED` tables could cause a server crash. ([Bug#19773](#))
- On 64-bit systems, use of the `cp1250` character set with a primary key column in a `LIKE` clause caused a server crash for patterns having letters in the range 128..255. ([Bug#19741](#))
- `make install` tried to build files that should already have been built by `make all`, causing a failure if installation was performed using a different account than the one used for the initial build. ([Bug#19738](#))
- `InnoDB` unlocked its data directory before committing a transaction, potentially resulting in non-recoverable tables if a server crash occurred before the commit. ([Bug#19727](#))
- An issue with yaSSL prevented Connector/J clients from connecting to the server using a certificate. ([Bug#19705](#))
- For a `MyISAM` table with a `FULLTEXT` index, compression with `myisampack` or a check with `myisamchk` after compression resulted in table corruption. ([Bug#19702](#))
- The `ENGINE` clause was displayed in the output of `SHOW CREATE TABLE` for partitioned tables when the SQL mode included `no_table_options`. ([Bug#19695](#))
- A cast problem caused incorrect results for prepared statements that returned float values when MySQL was compiled with `gcc 4.0`. ([Bug#19694](#))
- `EXPLAIN PARTITIONS` would produce illegible output in the `partitions` column if the length of text to be displayed in that column was too long. This could occur when very many partitions were defined for the table, partitions were given very long names, or due to a combination of the two. ([Bug#19684](#))
- The `mysql_list_fields()` C API function returned the incorrect table name for views. ([Bug#19671](#))
- If a query had a condition of the form `tableX.key = tableY.key`, which participated in equality propagation and also was used for `ref` access, then early `ref`-access `NULL` filtering was not performed for the condition. This could make query execution slower. ([Bug#19649](#))
- Re-execution of a prepared multiple-table `DELETE` statement that involves a trigger or stored function can result in a server crash. ([Bug#19634](#))
- File size specifications for `InnoDB` data files were case sensitive. ([Bug#19609](#))
- `CHECK TABLE` on a `MyISAM` table briefly cleared its `AUTO_INCREMENT` value, while holding only a read lock. Concurrent inserts to that table could use the wrong `AUTO_INCREMENT` value. `CHECK TABLE` no longer modifies the `AUTO_INCREMENT` value. ([Bug#19604](#))

- Some yaSSL public function names conflicted with those from OpenSSL, causing conflicts for applications that linked against both OpenSSL and a version of `libmysqlclient` that was built with yaSSL support. The yaSSL public functions now are renamed to avoid this conflict. (Bug#19575)
- In the `INFORMATION_SCHEMA.FILES` table, the `INITIAL_SIZE`, `MAXIMUM_SIZE`, and `AUTOEXTEND_SIZE` columns incorrectly were being stored as `VARCHAR` rather than `BIGINT`. (Bug#19544)
- InnoDB failed to increment the `handler_read_prev` counter. (Bug#19542)
- Portions of statements related to partitioning were not surrounded by version-specific comments by `mysqldump`, breaking backward compatibility for dump files. (Bug#19488)
- Repeated `DROP TABLE` statements in a stored procedure could sometimes cause the server to crash. (Bug#19399)
- Renaming a database to itself caused a server crash. (Bug#19392)
- Race conditions on certain platforms could cause the Instance Manager to fail to initialize. (Bug#19391)
- When not running in strict mode, the server failed to convert the invalid years portion of a `DATE` or `DATETIME` value to `'0000'` when inserting it into a table.

**Note**

This fix was reverted in MySQL 5.1.18.

(Bug#19370)

See also Bug#25301.

- Use of the `--no-pager` option caused `mysql` to crash. (Bug#19363)
- Multiple calls to a stored procedure that altered a partitioned `MyISAM` table would cause the server to crash. (Bug#19309)
- `ALTER TABLE ... COALESCE PARTITION` did not delete the files associated with the partitions that were removed. (Bug#19305)
- Adding an index to a partitioned table that had been created using `AUTO_INCREMENT = value` caused the `AUTO_INCREMENT` value to be reset. (Bug#19281)
- Multiple-table `DELETE` statements containing a subquery that selected from one of the tables being modified caused a server crash. (Bug#19225)
- The final parenthesis of a `CREATE INDEX` statement occurring in a stored procedure was omitted from the binary log when the stored procedure was called. (Bug#19207)
- An `ALTER TABLE` operation that does not need to copy data, when executed on a table created prior to MySQL 4.0.25, could result in a server crash for subsequent accesses to the table. (Bug#19192)
- SSL connections using yaSSL on OpenBSD could fail. (Bug#19191)
- `ALTER TABLE ... REBUILD PARTITION` could cause the server to hang or crash. (Bug#19122)
- Using `ALTER TABLE` on a subpartitioned table caused the server to crash. (Bug#19067)
- Trying to execute a query having a `WHERE` clause using `int_col = "string_value" OR int_col IS NULL` on a partitioned table whose partitioning or subpartitioning function used the integer column `int_col` would crash the server. (Bug#19055)
- A `SELECT` with a subquery that was bound to the outer query over multiple columns returned different results when a constant was used instead of one of the dependant columns. (Bug#18925)
- It was possible using `ALTER EVENT ... RENAME ...` to move an event to a database on which the user did not have the `EVENT` privilege. (Bug#18897)
- When used in the `DO` clause of a `CREATE EVENT` statement, the statements `CREATE EVENT`, `CREATE FUNCTION`, and `CREATE PROCEDURE` caused the server to crash. (These statements are not permitted inside `CREATE EVENT`.) (Bug#18896, Bug#16409)
- `BIT` columns in a table could cause joins that use the table to fail. (Bug#18895)
- The build process incorrectly tried to overwrite `sql/lex_hash.h`. This caused the build to fail when using a shadow link

- tree pointing to original sources that were owned by another account. ([Bug#18888](#))
- Setting `myisam_repair_threads` caused any repair operation on a `MyISAM` table to fail to update the cardinality of indexes, instead making them always equal to 1. ([Bug#18874](#))
  - The MySQL server startup script `/etc/init.d/mysql` (created from `mysql.server`) is now marked to ensure that the system services `ybind`, `nscd`, `ldap`, and `NTP` are started first (if these are configured on the machine). ([Bug#18810](#))
  - `InnoDB`: Quoted Unicode identifiers were not handled correctly. This included names of tables, columns, and foreign keys. ([Bug#18800](#))
  - Intermediate tables created during the execution of an `ALTER TABLE` statement were visible in the output of `SHOW TABLES`. ([Bug#18775](#))
  - `FEDERATED` tables raised invalid duplicate key errors when attempting on one server to insert rows having the same primary key values as rows that had been deleted from the linked table on the other server. ([Bug#18764](#))
  - Memory used by scheduled events was not freed when the events were dropped. ([Bug#18683](#))
  - The implementation for `UNCOMPRESS()` did not indicate that it could return `NULL`, causing the optimizer to do the wrong thing. ([Bug#18539](#))
  - Referring to a stored function qualified with the name of one database and tables in another database caused a “table doesn't exist” error. ([Bug#18444](#))
  - Identifiers could not contain bytes with a value of 255, though that should be allowed as of the identifier-encoding changes made in MySQL 5.1.6. ([Bug#18396](#))
  - Triggers on tables in the `mysql` database caused a server crash. Triggers for tables in this database now are disallowed. ([Bug#18361](#), [Bug#18005](#))
  - Incorrect type aggregation for `IN()` and `CASE` expressions could lead to an incorrect result. ([Bug#18360](#))
  - The length of the pattern string prefix for `LIKE` operations was calculated incorrectly for multi-byte character sets. As a result, the scanned range was wider than necessary if the prefix contained any multi-byte characters, and rows could be missing from the result set. ([Bug#18359](#), [Bug#16674](#))
  - On Windows, corrected a crash stemming from differences in Visual C runtime library routines from POSIX behavior regarding invalid file descriptors. ([Bug#18275](#))
  - Linking the `pthread` library to single-threaded MySQL libraries caused `dlopen()` to fail at runtime on HP-UX. ([Bug#18267](#))
  - The source distribution failed to compile when configured with the `--with-libwrap` option. ([Bug#18246](#))
  - On Windows, terminating `mysqld` with Control-C could result in a crash during shutdown. ([Bug#18235](#))
  - Selecting data from a `MEMORY` table with a `VARCHAR` column and a `HASH` index over it returned only the first row matched. ([Bug#18233](#))
  - The use of `MIN()` and `MAX()` on columns with an index prefix produced incorrect results in some queries. ([Bug#18206](#))
  - A `UNION` over more than 128 `SELECT` statements that use an aggregate function failed. ([Bug#18175](#))
  - The optimizer did not take advantage of indexes on columns used for the second or third arguments of `BETWEEN`. ([Bug#18165](#))
  - Performing `INSERT ... SELECT ... JOIN ... USING` without qualifying the column names caused `ERROR 1052 "column 'x' in field list is ambiguous"` even in cases where the column references were unambiguous. ([Bug#18080](#))
  - An update that used a join of a table to itself and modified the table on both sides of the join reported the table as crashed. ([Bug#18036](#))
  - Race conditions on certain platforms could cause the Instance Manager to try to restart the same instance multiple times. ([Bug#18023](#))
  - Changing the definition of a `DECIMAL` column with `ALTER TABLE` caused loss of column values. ([Bug#18014](#))
  - For table-format output, `mysql` did not always calculate columns widths correctly for columns containing multi-byte characters in the column name or contents. ([Bug#17939](#))

- The character set was not being properly initialized for `CAST()` with a type like `CHAR(2) BINARY`, which resulted in incorrect results or even a server crash. (Bug#17903)
- Checking a `MyISAM` table (using `CHECK TABLE`) having a spatial index and only one row would wrongly indicate that the table was corrupted. (Bug#17877)
- For a reference to a non-existent index in `FORCE INDEX`, the error message referred to a column, not an index. (Bug#17873)
- A stored procedure that created and invoked a prepared statement was not executed when called in a `mysqld` init-file. (Bug#17843)
- It is possible to create `MERGE` tables into which data cannot be inserted (by not specifying a `UNION` clause. However, when an insert was attempted, the error message was confusing. Now an error occurs indicating that the table is read-only. (Bug#17766)
- Attempting to insert a string of greater than 4096 bytes into a `FEDERATED` table resulted in the error `ERROR 1296 (HY000) AT LINE 2: GOT ERROR 10000 'ERROR ON REMOTE SYSTEM: 1054: UNKNOWN COLUMN 'STRING-VALUE' FROM FEDERATED`. This error was raised regardless of the type of column involved (`VARCHAR`, `TEXT`, and so on.) (Bug#17608)
- If a file name was specified for the `--log` or `--log-slow-queries` options but the server was logging to tables and not files, the server produced no error message. (Bug#17599)
- If the general log table reached a large enough file size (27GB), `SELECT COUNT(*)` on the table caused a server crash. (Bug#17589)
- Using the extended syntax for `TRIM()` — that is, `TRIM(... FROM ...)` — in a `SELECT` statement defining a view caused an invalid syntax error when selecting from the view. (Bug#17526)
- Use of the `--prompt` option or `prompt` command caused `mysql` to be unable to connect to the Instance Manager. (Bug#17485)
- `OPTIMIZE TABLE` and `REPAIR TABLE` yielded incorrect messages or warnings when used on partitioned tables. (Bug#17455)
- `mysqldump` would not dump views that had become invalid because a table named in the view definition had been dropped. Instead, it quit with an error message. Now you can specify the `--force` option to cause `mysqldump` to keep going and write an SQL comment containing the view definition to the dump output. (Bug#17371)
- `N'xxx'` and `_utf8'xxx'` were not treated as equivalent because `N'xxx'` failed to unescape backslashes (`\`) and doubled apostrophe/single quote characters (`'`). (Bug#17313)
- Following a failed attempt to add an index to an `ARCHIVE` table, it was no longer possible to drop the database in which the table had been created. (Bug#17310)
- Assignments of values to variables of type `TEXT` were handled incorrectly in stored routines. (Bug#17225)
- Views created from prepared statements inside of stored procedures were created with a definition that included both `SQL_CACHE` and `SQL_NO_CACHE`. (Bug#17203)
- `mysqldump` wrote an extra pair of `DROP DATABASE` and `CREATE DATABASE` statements if run with the `--add-drop-database` option and the database contained views. (Bug#17201)
- A `TABLE ... DOESN'T EXIST` error could occur for statements that called a function defined in another database. (Bug#17199)
- A prepared statement that altered partitioned table within a stored procedure failed with the error `UNKNOWN PREPARED STATEMENT HANDLER`. (Bug#17138)
- `myisam_ftdump` would fail when trying to open a MyISAM index file that you did not have write permissions to access, even though the command would only be reading from the file. (Bug#17122)
- `ALTER TABLE` on a table created prior to 5.0.3 would cause table corruption if the `ALTER TABLE` did one of the following:
  - Change the default value of a column.
  - Change the table comment.
  - Change the table password.(Bug#17001)

- For statements that have a `DEFINER` clause such as `CREATE TRIGGER` or `CREATE VIEW`, long user names or host names could cause a buffer overflow. (Bug#16899)
- The `PASSWORD()` function returned invalid results when used in some `UNION` queries. (Bug#16881)
- `ORDER BY RAND() LIMIT 1` always set a user variable to the last possible value from the table. (Bug#16861)
- Queries containing a subquery that used aggregate functions could return incorrect results. (Bug#16792)
- Concatenating the results of multiple constant subselects produced incorrect results. (Bug#16716)
- When performing a `GROUP_CONCAT()`, the server transformed `BLOB` columns `VARCHAR` columns, which could cause erroneous results when using Connector/J and possibly other MySQL APIs. (Bug#16712)
- Stored procedures did not use the character set defined for the database in which they were created. (Bug#16676)
- Some server errors were not reported to the client, causing both to try to read from the connection until a hang or crash resulted. (Bug#16581)
- If the files for an open table were removed at the OS level (external to the server), the server exited with an assertion failure. (Bug#16532)
- On Windows, a definition for `mysql_set_server_option()` was missing from the C client library. (Bug#16513)
- `mysqlcheck` tried to check views instead of ignoring them. (Bug#16502)
- Updating a column of a `FEDERATED` table to `NULL` sometimes failed. (Bug#16494)
- For `SELECT ... FOR UPDATE` statements that used `DISTINCT` or `GROUP BY` over all key parts of a unique index (or primary key), the optimizer unnecessarily created a temporary table, thus losing the linkage to the underlying unique index values. This caused a `Result set not updatable` error. (The temporary table is unnecessary because under these circumstances the distinct or grouped columns must also be unique.) (Bug#16458)
- A scheduled event that took longer to execute than the length of time scheduled between successive executions could “skip” executions. For example, an event defined with `EVERY 1 SECOND` — but which required longer than 1 second to complete — might be executed only once every 2 seconds. (Bug#16417)
- A subselect used in the `ON SCHEDULE` clause of a `CREATE EVENT` or `ALTER EVENT` statement caused the server to crash, rather than producing an error as expected. (Bug#16394)
- Grant table modifications sometimes did not refresh the in-memory tables if the host name was `' '` or not specified. (Bug#16297)
- A subquery in the `WHERE` clause of the outer query and using `IN` and `GROUP BY` returned an incorrect result. (Bug#16255)
- A query could produce different results with and without an index, if the `WHERE` clause contained a range condition that used an invalid `DATETIME` constant. (Bug#16249)
- `TIMESTAMPDIFF()` examined only the date and ignored the time when the requested difference unit was months or quarters. (Bug#16226)
- Using tables from MySQL 4.x in MySQL 5.x, in particular those with `VARCHAR` fields and using `INSERT DELAYED` to update data in the table would result in either data corruption or a server crash. (Bug#16218, Bug#17294, Bug#16611)
- The value returned by a stored function returning a string value was not of the declared character set. (Bug#16211)
- The `index_merge/Intersection` optimizer could experience a memory overrun when the number of table columns covered by an index was sufficiently large, possibly resulting in a server crash. (Bug#16201)
- Row equalities (such as `WHERE (a,b) = (c,d)`) were not taken into account by the optimizer, resulting in slow query execution. Now they are treated as conjunctions of equalities between row elements. (Bug#16081)
- Some memory leaks in the `libmysqld` embedded server were corrected. (Bug#16017)
- Values greater than 2 gigabytes used in the `VALUES LESS THAN` clause of a table partitioned by `RANGE` were treated as negative numbers. (Bug#16002)
- A `CREATE TABLE` that produced a `THE PARTITION FUNCTION RETURNS THE WRONG TYPE` error also caused an `INCORRECT INFORMATION IN FILE` to be printed to `STDERR`, and a junk file to be left in the database directory. (Bug#16000)
- The `max_length` metadata value for columns created from `CONCAT()` could be incorrect when the collation of an argument

differed from the collation of the `CONCAT()` itself. In some contexts such as `UNION`, this could lead to truncation of the column contents. (Bug#15962)

- When `NOW()` was used in a `BETWEEN` clause of the definition for a view, it was replaced with a constant in the view. (Bug#15950)
- The server's handling of the number of partitions or subpartitions specified in a `PARTITIONS` or `SUBPARTITIONS` clause was changed. Beginning with this release, the number of partitions must:
  - be a positive, nonzero integer
  - not have any leading zeroes
  - not be an expression

Also beginning with this version, no attempt is made to convert, truncate, or evaluate a `PARTITIONS` or `SUBPARTITIONS` value; instead, the `CREATE TABLE` or `ALTER TABLE` statement containing the `PARTITIONS` or `SUBPARTITIONS` clause now fails with an appropriate error message. (Bug#15890)

- Long multiple-row `INSERT` statements could take a very long time for some multi-byte character sets. (Bug#15811)
- The C API failed to return a status message when invoking a stored procedure. (Bug#15752)
- `mysqlimport` sends a `set @@character_set_database=binary` statement to the server, but this is not understood by pre-4.1 servers. Now `mysqlimport` encloses the statement within a `/*!40101 ... */` comment so that old servers will ignore it. (Bug#15690)
- `DELETE` with `LEFT JOIN` for `InnoDB` tables could crash the server if `innodb_locks_unsafe_for_binlog` was enabled. (Bug#15650)
- `BIN()`, `OCT()`, and `CONV()` did not work with `BIT` values. (Bug#15583)
- Nested natural joins worked executed correctly when executed as a non-prepared statement could fail with an `Unknown column 'col_name' in 'field list'` error when executed as a prepared statement, due to a name resolution problem. (Bug#15355)
- The `MD5()` and `SHA()` functions treat their arguments as case-sensitive strings. But when they are compared, their arguments were compared as case-insensitive strings, which leads to two function calls with different arguments (and thus different results) compared as being identical. This can lead to a wrong decision made in the range optimizer and thus to an incorrect result set. (Bug#15351)
- Invalid escape sequences in option files caused MySQL programs that read them to abort. (Bug#15328)
- `SHOW GRANTS FOR CURRENT_USER` did not return definer grants when executed in `DEFINER` context (such as within a stored procedure defined with `SQL SECURITY DEFINER`), it returned the invoker grants. (Bug#15298)
- The `--collation-server` server option was being ignored. With the fix, if you choose a non-default character set with `--character-set-server`, you should also use `--collation-server` to specify the collation. (Bug#15276)
- Re-executing a stored procedure with a complex stored procedure cursor query could lead to a server crash. (Bug#15217)
- The server crashed if it tried to access a `CSV` table for which the data file had been removed. (Bug#15205)
- When using tables containing `VARCHAR` columns created under MySQL 4.1 with a 5.0 or later server, for some queries the metadata sent to the client could have an empty column name. (Bug#14897)
- An invalid comparison between keys with index prefixes over multi-byte character fields could lead to incorrect result sets if the selected query execution plan used a range scan by an index prefix over a `UTF8` character field. This also caused incorrect results under similar circumstances with many other character sets. (Bug#14896)
- When setting a column to its implicit default value as the result of inserting a `NULL` into a `NOT NULL` column as part of a multi-row insert or `LOAD DATA` operation, the server returned a misleading warning message. (Bug#14770)
- For `BOOLEAN` mode full-text searches on non-indexed columns, `NULL` rows generated by a `LEFT JOIN` caused incorrect query results. (Bug#14708, Bug#25637)
- The parser rejected queries that selected from a table twice using a `UNION` within a subquery. The parser now supports arbitrary subquery, join, and parenthesis operations within `EXISTS` subqueries. A limitation still exists for scalar subqueries: If the subquery contains `UNION`, the first `SELECT` of the `UNION` cannot be within parentheses. For example, `SELECT (SELECT a FROM t1 UNION SELECT b FROM t2)` will work, but `SELECT ((SELECT a FROM t1) UNION (SELECT b FROM t2))` will not. (Bug#14654)

- Using `SELECT` and a table join while running a concurrent `INSERT` operation would join incorrect rows. (Bug#14400)
- Prepared statements caused general log and server memory corruption. (Bug#14346)
- The binary log lacked character set information for table names when dropping temporary tables. (Bug#14157)
- `libmysqld` produced some warnings to `stderr` which could not be silenced. These warnings now are suppressed. (Bug#13717)
- RPM packages had spurious dependencies on Perl modules and other programs. (Bug#13634)
- `InnoDB` locking was improved by removing a gap lock for the case that you try to delete the same row twice within a transaction. (Bug#13544)
- `REPLACE` statements caused activation of `UPDATE` triggers, not `DELETE` and `INSERT` triggers. (Bug#13479)
- The source distribution failed to compile when configured with the `--without-geometry` option. (Bug#12991)
- With settings of `read_buffer_size`  $\geq$  2G and `read_rnd_buffer_size`  $\geq$  2G, `LOAD DATA INFILE` failed with no error message or caused a server crash for files larger than 2GB. (Bug#12982)
- A `B-TREE` index on a `MEMORY` table erroneously reported duplicate entry error for multiple `NULL` values. (Bug#12873)
- Instance Manager didn't close the client socket file when starting a new `mysqld` instance. `mysqld` inherited the socket, causing clients connected to Instance Manager to hang. (Bug#12751)
- On Mac OS X, zero-byte `read()` or `write()` calls to an SMB-mounted file system could return a non-standard return value, leading to data corruption. Now such calls are avoided. (Bug#12620)
- `DATE_ADD()` and `DATE_SUB()` returned `NULL` when the result date was on the day '9999-12-31'. (Bug#12356)
- For very complex `SELECT` statements could create temporary tables that were too large, and for which the temporary files were not removed, causing subsequent queries to fail. (Bug#11824)
- After an `INSERT ... ON DUPLICATE KEY UPDATE` statement that updated an existing row, `LAST_INSERT_ID()` could return a value not in the table. (Bug#11460)
- `USE` did not refresh database privileges when employed to re-select the current database. (Bug#10979)
- The server returns a more informative error message when it attempts to open a `MERGE` table that has been defined to use non-`MyISAM` tables. (Bug#10974)
- The type of the value returned by the `VARIANCE()` function varied according to the type of the input value. The function should always return a `DOUBLE` value. (Bug#10966)
- The same trigger error message was produced under two conditions: The trigger duplicated an existing trigger name, or the trigger duplicated an existing combination of action and event. Now different messages are produced for the two conditions so as to be more informative. (Bug#10946)
- A locking safety check in `InnoDB` reported a spurious error `STORED_SELECT_LOCK_TYPE IS 0 INSIDE ::START_STMT()` for `INSERT ... SELECT` statements in `innodb_locks_unsafe_for_binlog` mode. The safety check was removed. (Bug#10746)
- `CREATE USER` did not respect the 16-character user name limit. (Bug#10668)
- A server or network failure with an open client connection would cause the client to hang even though the server was no longer available.  
  
As a result of this change, the `MYSQL_OPT_READ_TIMEOUT` and `MYSQL_OPT_WRITE_TIMEOUT` options for `mysql_options()` now apply to TCP/IP connections on all platforms. Previously, they applied only to Windows. (Bug#9678)
- `INSERT INTO ... SELECT ... LIMIT 1` could be slow because the `LIMIT` was ignored when selecting candidate rows. (Bug#9676)
- The optimizer could produce an incorrect result after `AND` with collations such as `latin1_german2_ci`, `utf8_czech_ci`, and `utf8_lithianian_ci`. (Bug#9509)
- The `DATA DIRECTORY` table option did not work for `TEMPORARY` tables. (Bug#8706)
- A stored procedure with a `CONTINUE` handler that encountered an error continued to execute a statement that caused an error,

rather with the next statement following the one that caused the error. (Bug#8153)

- For ODBC compatibility, MySQL supports use of `WHERE col_name IS NULL` for `DATE` or `DATETIME` columns that are `NOT NULL`, to allow column values of `'0000-00-00'` or `'0000-00-00 00:00:00'` to be selected. However, this was not working for `WHERE` clauses in `DELETE` statements. (Bug#8143)
- A user variable set to a value selected from an unsigned column was stored as a signed value. (Bug#7498)
- The `--with-collation` option was not honored for client connections. (Bug#7192)
- With `TRADITIONAL` SQL mode, assignment of out-of-bound values and rounding of assigned values was done correctly, but assignment of the same numbers represented as strings sometimes was handled differently. (Bug#6147)
- On an `INSERT` into an updatable but non-insertable view, an error message was issued stating that the view was not updatable. Now the message says the view is not insertable-into. (Bug#5505)
- `EXPLAIN` sometimes returned an incorrect `select_type` for a `SELECT` from a view, compared to the `select_type` for the equivalent `SELECT` from the base table. (Bug#5500)
- Some queries that used `ORDER BY` and `LIMIT` performed quickly in MySQL 3.23, but slowly in MySQL 4.x/5.x due to an optimizer problem. (Bug#4981)
- Incorporated portability fixes into the definition of `__attribute__` in `my_global.h`. (Bug#2717)
- User-created tables having a name beginning with `#sql` were not visible to `SHOW TABLES` and could collide with internal temporary table names. Now they are not hidden and do not collide. (Bug#1405)

## C.2.27. Changes in MySQL 5.1.11 (26 May 2006)

This is a new Beta development release, fixing recently discovered bugs.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Incompatible Change:** The Event Scheduler can now be in one of three states (on, off, or the new suspended state). In addition, due to the fact that `SET GLOBAL event_scheduler;` now acts in a synchronous rather than asynchronous manner, the Event Scheduler thread can be no longer be activated or deactivated at run time.  
  
For more information regarding these changes, see [Section 18.4.1, “Event Scheduler Overview”](#). (Bug#17619)
- **MySQL Cluster:** The limit of 2048 ordered indexes per cluster has been lifted. There is now no upper limit on the number of ordered indexes (including `AUTO_INCREMENT` columns) that may be used. (Bug#14509)
- Added the `log_queries_not_using_indexes` system variable. (Bug#19616)
- Added the `ssl_ca`, `ssl_capath`, `ssl_cert`, `ssl_cipher`, and `ssl_key` system variables, which display the values given via the corresponding command options. See [Section 5.5.7.3, “SSL Command Options”](#). (Bug#19606)
- The `ENABLE KEYS` and `DISABLE KEYS` clauses for the `ALTER TABLE` statement are now supported for partitioned tables. (Bug#19502)
- Added the `--ssl-verify-server-cert` option to MySQL client programs. This option causes the server's Common Name value in its certificate to be verified against the host name used when connecting to the server, and the connection is rejected if there is a mismatch. Added `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` option for the `mysql_options()` C API function to enable this verification. This feature can be used to prevent man-in-the-middle attacks. Verification is disabled by default. (Bug#17208)
- The default for the `innodb_thread_concurrency` system variable was changed to 8. (Bug#15868)
- It is now possible to use `NEW.var_name` values within triggers as `INOUT` parameters to stored procedures. (Bug#14635)
- Added the `--angel-pid-file` option to `mysqlmanager` for specifying the file in which the angel process records its process ID when `mysqlmanager` runs in daemon mode. (Bug#14106)
- Previously, to build MySQL from source with SSL support enabled, you would invoke `configure` with either the -

`-with-openssl` or `--with-yassl` option. Those options both have been replaced by the `--with-ssl` option. By default, `--with-ssl` causes the bundled yaSSL library to be used. To select OpenSSL instead, give the option as `-with-ssl=path`, where `path` is the directory where the OpenSSL header files and libraries are located.

- The `mysql_get_ssl_cipher()` C API function was added.
- `mysql_explain_log` (a third-party program) is no longer included in MySQL distributions.

#### Bugs fixed:

- **Security Fix:** An SQL-injection security hole has been found in multi-byte encoding processing. The bug was in the server, incorrectly parsing the string escaped with the `mysql_real_escape_string()` C API function.

This vulnerability was discovered and reported by Josh Berkus <[josh@postgresql.org](mailto:josh@postgresql.org)> and Tom Lane <[tgl@sss.pgh.pa.us](mailto:tgl@sss.pgh.pa.us)> as part of the inter-project security collaboration of the OSDB consortium. For more information about SQL injection, please see the following text.

**Discussion.** An SQL injection security hole has been found in multi-byte encoding processing. An SQL injection security hole can include a situation whereby when a user supplied data to be inserted into a database, the user might inject SQL statements into the data that the server will execute. With regards to this vulnerability, when character set-unaware escaping is used (for example, `addslashes()` in PHP), it is possible to bypass the escaping in some multi-byte character sets (for example, SJIS, BIG5 and GBK). As a result, a function such as `addslashes()` is not able to prevent SQL-injection attacks. It is impossible to fix this on the server side. The best solution is for applications to use character set-aware escaping offered by a function such as `mysql_real_escape_string()`.

However, a bug was detected in how the MySQL server parses the output of `mysql_real_escape_string()`. As a result, even when the character set-aware function `mysql_real_escape_string()` was used, SQL injection was possible. This bug has been fixed.

**Workarounds.** If you are unable to upgrade MySQL to a version that includes the fix for the bug in `mysql_real_escape_string()` parsing, but run MySQL 5.0.1 or higher, you can use the `NO_BACKSLASH_ESCAPES` SQL mode as a workaround. (This mode was introduced in MySQL 5.0.1.) `NO_BACKSLASH_ESCAPES` enables an SQL standard compatibility mode, where backslash is not considered a special character. The result will be that queries will fail.

To set this mode for the current connection, enter the following SQL statement:

```
SET sql_mode='NO_BACKSLASH_ESCAPES';
```

You can also set the mode globally for all clients:

```
SET GLOBAL sql_mode='NO_BACKSLASH_ESCAPES';
```

This SQL mode also can be enabled automatically when the server starts by using the command-line option `-sql-mode=NO_BACKSLASH_ESCAPES` or by setting `sql-mode=NO_BACKSLASH_ESCAPES` in the server option file (for example, `my.cnf` or `my.ini`, depending on your system). ([Bug#8378](#), [CVE-2006-2753](#))

See also [Bug#8303](#).

- **Partitioning: MySQL Cluster:** `SELECT MIN(unique_column)` from a Cluster table with user-defined partitioning crashed the server. ([Bug#18730](#))
- **MySQL Cluster: Replication:** (Replication): Memory was not freed after some `ALTER TABLE` operations, which could cause `mysqld` processes to crash. ([Bug#19885](#))
- **MySQL Cluster:** Running `ALL START` in the `NDB` management client or restarting multiple nodes simultaneously could under some circumstances cause the cluster to crash. ([Bug#19930](#))
- **MySQL Cluster:** (NDBAPI): On big-endian platforms, `NdbOperation::write_attr()` did not update 32-bit fields correctly. ([Bug#19537](#))
- **MySQL Cluster:** `TRUNCATE` failed on tables having `BLOB` or `TEXT` columns with the error `LOCK WAIT TIMEOUT EXCEEDED`.

#### Note

This issue affected both in-memory and Disk Data tables.

([Bug#19201](#))

- **MySQL Cluster:** `ALTER TABLE ENGINE=...` failed when used to change a MySQL Cluster table having no explicit primary key to use a different storage engine.

**Note**

As a consequence of this fix, `SHOW CREATE TABLE` no longer displays auto-partitioning information for `NDB-CLUSTER` tables.

([Bug#19010](#))

- **MySQL Cluster:** (NDBAPI): The `Ndb::dropEventOperation()` method failed to clean up all objects used, which could cause memory leaks to occur. ([Bug#17610](#))
- **MySQL Cluster:** Using “stale” `mysqld.FRM` files could cause a newly-restored cluster to fail. This situation could arise when restarting a MySQL Cluster using the `--initial` option while leaving connected `mysqld` processes running. ([Bug#16875](#))
- **MySQL Cluster:** A Cluster whose storage nodes were installed from the `MySQL-ndb-storage-*` RPMs could not perform `CREATE` or `ALTER` operations that made use of non-default character sets or collations. ([Bug#14918](#))
- **MySQL Cluster:** Data node failures could cause excessive CPU usage by `ndb_mgmd`. ([Bug#13987](#))
- **Replication:** The embedded server crashed with row-based replication enabled. ([Bug#18518](#))
- **Cluster Replication:** `mysqld` processes did not always detect cluster shutdown, leading to issues with Cluster replication and schema distribution. ([Bug#19395](#))
- The `Data_free` column in the output of `SHOW TABLE STATUS` always displayed 0 for partitioned tables. ([Bug#19501](#))
- Altering a `VARCHAR` column in a `MyISAM` table to make it longer could cause corruption of the following column. ([Bug#19386](#))
- It was not possible to invoke a stored routine containing dynamic SQL from a scheduled event. ([Bug#19264](#))
- Adding an index to a table created using partitioning by `KEY` and the `MEMORY` storage engine caused the server to crash. ([Bug#19140](#))
- Use of uninitialized user variables in a subquery in the `FROM` clause resulted in invalid entries in the binary log. ([Bug#19136](#))
- A `CREATE TABLE` statement that created a table from a materialized view did not inherit default values from the underlying table. ([Bug#19089](#))
- Premature optimization of nested subqueries in the `FROM` clause that refer to aggregate functions could lead to incorrect results. ([Bug#19077](#))
- When creating a table using `CREATE TABLE ... PARTITION BY ... SELECT ...`, the partitioning clause was ignored. ([Bug#19062](#))
- For dates with 4-digit year parts less than 200, an implicit conversion to add a century was applied for date arithmetic performed with `DATE_ADD()`, `DATE_SUB()`, `+ INTERVAL`, and `- INTERVAL`. (For example, `DATE_ADD('0050-01-01 00:00:00', INTERVAL 0 SECOND)` became `'2050-01-01 00:00:00'`.) Now these operations return `NULL` rather than an incorrect non-`NULL` value. ([Bug#18997](#))
- `BLOB` or `TEXT` arguments to or values returned from stored functions were not copied properly if too long and could become garbled. ([Bug#18587](#))
- The client libraries were not compiled for position-independent code on Solaris-SPARC and AMD x86\_64 platforms. ([Bug#18091](#), [Bug#13159](#), [Bug#14202](#))
- Returning the value of a system variable from a stored function caused a server crash. ([Bug#18037](#))
- Revised memory allocation for local objects within stored functions and triggers to avoid memory leak for repeated function or trigger invocation. ([Bug#17260](#))
- Symlinking `.mysql_history` to `/dev/null` to suppress statement history saving by `mysql` did not work. (`mysql` deleted the symlink and recreated `.mysql_history` as a regular file, and then wrote history to it.) ([Bug#16803](#))
- `IS_USED_LOCK()` could return an incorrect connection identifier. ([Bug#16501](#))
- Simultaneous scheduled events whose actions conflicted with one another could crash the server. ([Bug#16428](#))

- Concurrent reading and writing of privilege structures could crash the server. ([Bug#16372](#))
- The server no longer uses a signal handler for signal 0 because it could cause a crash on some platforms. ([Bug#15869](#))
- `EXPLAIN ... SELECT INTO` caused the client to hang. ([Bug#15463](#))
- `CREATE TABLE ... SELECT ...` statements that used a stored function explicitly or implicitly (through a view) resulted in a `Table not locked` error. ([Bug#15137](#), [Bug#12472](#))
- Display better error message for `ALTER TABLE` operations that will result in duplicate keys due to `AUTO_INCREMENT` resequencing. ([Bug#14573](#))
- The result from `CONV()` is a string, but was not always treated the same way as a string when converted to a real value for an arithmetic operation. ([Bug#13975](#))
- Within a trigger, `SET` used the SQL mode of the invoking statement, not the mode in effect at trigger creation time. ([Bug#6951](#))
- Corrected several problems with the treatment of the `--log-error` option by `mysqld_safe`. These problems were manifest as differences from `mysqld` in error log handling.
  - If a file name was given for `--log-error`, `mysqld_safe` ignored it and did not pass it to `mysqld`, which then wrote error information to `stderr` and resulted in incorrect log rotation when `FLUSH LOGS` was used.
  - `mysqld_safe` now adds `.err` to the end of the file name if no extension is present (the same as `mysqld`).
  - `mysqld_safe` treated a relative path name as relative to its own current working directory. Now it treats a relative path name as relative to the data directory (the same as `mysqld`).

In addition, some argument quoting problems were corrected. ([Bug#6061](#))

- The `basedir` and `tmpdir` system variables could not be accessed via `@@var_name` syntax. ([Bug#1039](#))
- `mysqld_safe` treated a relative path name as relative to its own current working directory. Now it treats a relative path name as relative to the data directory (the same as `mysqld`).
- `mysqld_safe` now adds `.err` to the end of the file name if no extension is present (the same as `mysqld`).
- If a file name was given for `--log-error`, `mysqld_safe` ignored it and did not pass it to `mysqld`, which then wrote error information to `stderr` and resulted in incorrect log rotation when `FLUSH LOGS` was used.
- The patch for [Bug#8303](#) broke the fix for [Bug#8378](#) and was reverted.

In string literals with an escape character (`\`) followed by a multi-byte character that had (`\`) as its second byte, the literal was not interpreted correctly. Now only next byte now is escaped, and not the entire multi-byte character. This means it is a strict reverse of the `mysql_real_escape_string()` function.

## C.2.28. Changes in MySQL 5.1.10 (Not released)

### Note

This was an internal release only, and no binaries were published.

MySQL 5.1.10 includes the patches for recently reported security vulnerabilities in the MySQL client-server protocol. We would like to thank Stefano Di Paola <[stefano.dipaola@wisec.it](mailto:stefano.dipaola@wisec.it)> for finding and reporting these to us.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Security Enhancement:** Added the global `max_prepared_stmt_count` system variable to limit the total number of prepared statements in the server. This limits the potential for denial-of-service attacks based on running the server out of memory by preparing huge numbers of statements. The current number of prepared statements is available through the `prepared_stmt_count` system variable. ([Bug#16365](#))
- **MySQL Cluster:** It is now possible to restore a MySQL Cluster backup between big-endian and little-endian machines. ([Bug#19255](#))

- **MySQL Cluster:** It is now possible to perform a partial start of a cluster. That is, it is now possible to bring up the cluster without first running `ndbd --initial` on all configured data nodes. (Bug#18606)
- **MySQL Cluster:** It is now possible to install MySQL with Cluster support to a non-default location and change the search path for font description files using either the `--basedir` or `--character-sets-dir` options. (Previously in MySQL 5.1, `ndbd` searched only the default path for character sets.)
- **Packaging:** The `MySQL-shared-compat-5.1.X-.i386.rpm` shared compatibility RPMs no longer contain libraries for MySQL 5.0. This avoids a conflict because the 5.0 and 5.1 libraries share the same `soname` number. They now contain libraries for MySQL 3.23, 4.0, 4.1, and 5.1. (Bug#19288)
- SQL syntax for prepared statements now supports `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE`. (Bug#19308)
- The `ONLY_FULL_GROUP_BY` SQL mode now also applies to the `HAVING` clause. That is, columns not named in the `GROUP BY` clause cannot be used in the `HAVING` clause if not used in an aggregate function. (Bug#18739)
- XPath expressions passed to the `ExtractValue()` and `UpdateXML()` functions can now include the colon character (“ : ”). This enables use of these functions with XML which employs namespaces. (Bug#18170)
- On Windows, some names such as `nul`, `prn`, and `aux` could not be used as file names because they are reserved as device names. These are now allowable names in MySQL. They are encoded by appending `@@@` to the name when the server creates the corresponding file or directory. This occurs on all platforms for portability of the corresponding database object between platforms. (Bug#17870)
- The bundled yaSSL library was upgraded to version 1.3.5. This improves handling of certain problems with SSL-related command options. (Bug#17737)
- You must now have the `DROP` privilege to drop table partitions. (Bug#17139)
- Server and clients ignored the `--sysconfdir` option that was passed to `configure`. The directory specified by this option, if set, now is used as one of the standard locations in which to look for option files. (Bug#15069)
- In result set metadata, the `MYSQL_FIELD.length` value for `BIT` columns now is reported in number of bits. For example, the value for a `BIT(9)` column is 9. (Formerly, the value was related to number of bytes.) (Bug#13601)
- The following statements now cause an implicit commit: `ANALYZE TABLE`, `CHECK TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE`.
- Added the `KEY_BLOCK_SIZE` table option and index option. This can be used in `CREATE TABLE`, `ALTER TABLE`, and `CREATE INDEX` statements to provide a hint to the storage engine about the size to use for index key blocks. The engine is allowed to change the value if necessary.
- Added the `sql_big_selects` system variable to the output of `SHOW VARIABLES`.
- The `mysql_upgrade` command has been converted from a shell script to a C program, so it is available on non-Unix systems such as Windows. This program should be run for each MySQL upgrade. See Section 4.4.8, “`mysql_upgrade` — Check Tables for MySQL Upgrade”.
- Added the `REFERENTIAL_CONSTRAINTS` table to `INFORMATION_SCHEMA`. It provides information about foreign keys.
- Added the `have_dynamic_loading` system variable that indicates whether the server supports dynamic loading of plugins.
- Added `--debug` option to Instance Manager.
- Binary distributions that include SSL support now are built using yaSSL when possible.

**Bugs fixed:**

- **Security Fix:** A `NUL` byte within a comment in a statement string caused the rest of the string not to be written to the query log, allowing logging to be bypassed. (Bug#17667, CVE-2006-0903)
- **Security Fix:** A malicious client, using specially crafted invalid `COM_TABLE_DUMP` packets was able to trigger an exploitable buffer overflow on the server. Thanks to Stefano Di Paola <stefano.dipaola@wisec.it> for finding and reporting this bug. (CVE-2006-1518)
- **Security Fix:** A malicious client, using specially crafted invalid login or `COM_TABLE_DUMP` packets was able to read uninitialized memory, which potentially, though unlikely in MySQL, could have led to an information disclosure. (.) Thanks to Stefano Di Paola <stefano.dipaola@wisec.it> for finding and reporting this bug. (CVE-2006-1516, CVE-2006-1517)

- **MySQL Cluster: Replication:** (Replication): Delete and update of rows in a table without a primary key failed on the slave. (Bug#17400)
- **MySQL Cluster:** A 5.1.6 or newer server did not read local checkpoints recorded by any other 5.1 version, thus preventing a system restart following an upgrade. (Bug#19333)
- **MySQL Cluster:** Concurrent `INSERT` and `ROLLBACK` statements from different connections could cause node failures. (Bug#19245)
- **MySQL Cluster:** (Disk Data): Running an `INSERT` and a `DELETE` on a Disk Data table in the same transaction could cause a deadlock. (Bug#19244)
- **MySQL Cluster:** Starting `mysqld` without `--log-bin` caused DDL statements on NDB tables to time out. (Bug#19214)
- **MySQL Cluster:** (NDBAPI): Passing a non-existent index name to `NdbIndexScanOperation::setBound()` caused a segmentation fault. (Bug#19088)
- **MySQL Cluster:** `mysql-test-run.pl` started NDB even for test cases that did not need it. (Bug#19083)
- **MySQL Cluster:** Stopping multiple nodes could cause node failure handling not to be completed. (Bug#19039)
- **MySQL Cluster:** The Cluster binlog `mysqld` accepted updates even though the binary log was not set up, which could lead to updates missing from the binary log. (Bug#18932)
- **MySQL Cluster:** `mysqld` could crash when attempting an update if the cluster had failed previously. (Bug#18798)
- **MySQL Cluster:** An `INSERT` or `UPDATE` of more than 128 bytes of data in a 4-replica cluster could cause data nodes to crash. (Bug#18622)
- **MySQL Cluster:** (Disk Data): `CREATE LOGFILE GROUP` accepted values other than NDB or NDBCLUSTER in the `ENGINE` clause. (Bug#18604)
- **MySQL Cluster:** (Disk Data): Omitting the required `ENGINE` clause from a `CREATE LOGFILE GROUP` or `CREATE TABLESPACE` statement caused the server to crash. An appropriate error message is now returned instead. (Bug#18603)
- **MySQL Cluster:** Queries using `ORDER BY pkN` failed against a LIST-partitioned Cluster table having a multi-column primary key, where `pkN` represents one of the columns making up the primary key. (Bug#18598)
- **MySQL Cluster:** A simultaneous `DROP TABLE` and table update operation utilising a table scan could trigger a node failure. (Bug#18597)
- **MySQL Cluster:** Fragment IDs were not logged correctly, causing `ndb_restore_log` to fail. (Bug#18594)
- **MySQL Cluster:** Repeated use of the `SHOW` and `ALL STATUS` commands in the `ndb_mgm` client could cause the `mgmd` process to crash. (Bug#18591)
- **MySQL Cluster:** `ndbd` sometimes failed to start with the error `NODE FAILURE HANDLING NOT COMPLETED` following a graceful restart. (Bug#18550)
- **MySQL Cluster:** `ndb_restore` failed to restore a backup made from a 5.0 cluster to a 5.1 cluster. (Bug#18210)
- **MySQL Cluster:** Adding an index to an unsigned integer column did not work correctly. (Bug#18133)
- **MySQL Cluster:** A `SELECT` from an NDB table with `ORDER BY indexed_column` and a `LIMIT` clause would fail following `ALTER TABLE`. (Bug#18094)
- **MySQL Cluster:** `mysqldump` included in its output data from the internal `cluster` database. (Bug#17840)
- **MySQL Cluster:** Backups could fail for large clusters with many tables, where the number of tables approached `MaxNoOfTables`. (Bug#17607)
- **MySQL Cluster:** Some queries having a `WHERE` clause of the form `c1=val1 OR c2 LIKE 'val2'` were not evaluated correctly. (Bug#17421)
- **MySQL Cluster:** An issue with `ndb_mgmd` prevented more than 27 `mysqld` processes from connecting to a single cluster at one time. (Bug#17150)
- **MySQL Cluster:** In a 2-node cluster with a node failure, restarting the node with a low value for `StartPartialTimeout` could cause the cluster to come up partitioned (“split-brain” issue).

A similar issue could occur when the cluster was first started with a sufficiently low value for this parameter. (Bug#16447,

[Bug#18612](#)

- **MySQL Cluster:** Performing multiple `ALTER TABLE` operations on the same `NDB` table from different `mysqld` processes in the same cluster led to schema versioning errors when trying to access the table again following the restart of one of the `mysqld` processes. ([Bug#16445](#))
- **MySQL Cluster:** On systems with multiple network interfaces, data nodes would get “stuck” in startup phase 2 if the interface connecting them to the management server was working on node startup while the interface interconnecting the data nodes experienced a temporary outage. ([Bug#15695](#))
- **MySQL Cluster:** On slow networks or CPUs, the management client `SHOW` command could sometimes erroneously show all data nodes as being master nodes belonging to nodegroup 0. ([Bug#15530](#))
- **MySQL Cluster:** Unused open handlers for tables in which the metadata had changed were not properly closed. This could result in stale results from `NDB` tables following an `ALTER TABLE` statement. ([Bug#13228](#))
- **MySQL Cluster:** Uninitialized internal variables could lead to unexpected results. ([Bug#11033](#), [Bug#11034](#))
- **MySQL Cluster:** When attempting to create an index on a `BIT` or `BLOB` column, `ERROR 743: UNSUPPORTED CHARACTER SET IN TABLE OR INDEX` was returned instead of `ERROR 906: UNSUPPORTED ATTRIBUTE TYPE IN INDEX`.
- **Cluster Replication: Partitioning:** Attempting to create an index using multiple columns on an explicitly partitioned table in a replicated Cluster database could cause the master `mysqld` process to crash. ([Bug#18284](#))
- **Cluster Replication: Replication:** An issue with replication caused a `mysqld` connected to a replicated cluster to crash when entering single user mode. ([Bug#18535](#))
- **Replication:** `CREATE VIEW` statements would not be replicated to the slave if the `--replicate-wild-ignore-table` rule was enabled. ([Bug#18715](#))
- **Replication:** Updating a field value when also requesting a lock with `GET_LOCK()` would cause slave servers in a replication environment to terminate. ([Bug#17284](#))
- **Replication:** The binary log would create an incorrect `DROP` query when creating temporary tables during replication. ([Bug#17263](#))
- **Disk Data:** Issuing a `CREATE LOGFILE GROUP` statement during the drop of an `NDB` table would cause database corruption. ([Bug#19141](#))
- **Disk Data:** Concurrent table schema operations and operations on log file groups, tablespaces, data files, or undo files could lead to data node failures. ([Bug#18575](#))
- **Cluster Replication:** Using the `--binlog-do-db` option caused problems with `CREATE TABLE` on the cluster acting as the replication master. ([Bug#19492](#))
- **Cluster Replication:** When taking part in Cluster replication of tables containing `BLOB` columns, `mysqld` falsely reported a large memory leak in the replication buffers when there was none. ([Bug#19247](#))
- **Cluster Replication:** Trying to restore the `apply_status` table from a 5.0 cluster backup failed on a 5.1 server. ([Bug#18935](#))
- A compatibility issue with NPTL (Native POSIX Thread Library) on Linux could result in a deadlock with `FLUSH TABLES WITH READ LOCK` under some conditions. ([Bug#20048](#))
- Some outer joins were incorrectly converted to inner joins. ([Bug#19816](#))  
  
This regression was introduced by [Bug#17146](#).
- A view definition that referred to an alias in the `HAVING` clause could be saved in the `.frm` file with the alias replaced by the expression that it referred to, causing failure of subsequent `SELECT * FROM view_name` statements. ([Bug#19573](#))
- `mysql` displayed `NULL` for strings that are empty or contain only spaces. ([Bug#19564](#))
- Selecting from a view that used `GROUP BY` on a non-constant temporal interval (such as `DATE(col) + INTERVAL TIME_TO_SEC(col) SECOND`) could cause a server crash. ([Bug#19490](#))
- An outer join of two views that was written using `{ OJ ... }` syntax could cause a server crash. ([Bug#19396](#))
- An issue with file handling in the partitioning code could cause `mysqld` to crash when started and then stopped within a very short period of time. ([Bug#19313](#))

- `myisamchk` and `myisam_ftdump` should allow either table names or `.MYI` file names as arguments, but allowed only table names. (Bug#19220)
- InnoDB could read a delete mark from its system tables incorrectly. (Bug#19217)
- Executing a `CREATE EVENT` statement could cause 100% CPU usage. (Bug#19170)
- Eliminated some memory corruption problems that resulted in `double free or corruption` errors and a server crash. (Bug#19154)
- Attempting to set the default value of an `ENUM` or `SET` column to `NULL` caused a server crash. (Bug#19145)
- Index corruption could occur in cases when `key_cache_block_size` was not a multiple of the `myisam-block-size` value (for example, with `--key_cache_block_size=1536` and `--myisam-block-size=1024`). (Bug#19079)
- Instance Manager now finds the version numbers, so that it works properly when the executable name isn't the same as what the Instance Manager launched (such as when wrapping a `libtool`-wrapped executable from the source tree). (Bug#19059)
- Some fast `ALTER TABLE` operations (requiring no temporary table) did not work for all tables. (Bug#19011)
- Successive `ALTER TABLE ... DROP PARTITION` statements on the same subpartitioned table could eventually cause the server to crash. (Bug#18962)
- Creating a table in an InnoDB database with a column name that matched the name of an internal InnoDB column (including `DB_ROW_ID`, `DB_TRX_ID`, `DB_ROLL_PTR` and `DB_MIX_ID`) would cause a crash. MySQL now returns Error 1005 `CANNOT CREATE TABLE` with `errno` set to -1. (Bug#18934)
- The parser leaked memory when its stack needed to be extended. (Bug#18930)
- MySQL would not compile on Linux distributions that use the `tinfo` library. (Bug#18912)
- The server attempted to flush uninitialized log tables during `SIGHUP` processing, causing a crash. (Bug#18848)
- For a reference to a non-existent stored function in a stored routine that had a `CONTINUE` handler, the server continued as though a useful result had been returned, possibly resulting in a server crash. (Bug#18787)
- For single-`SELECT` union constructs of the form `(SELECT ... ORDER BY order_list1 [LIMIT n]) ORDER BY order_list2`, the `ORDER BY` lists were concatenated and the `LIMIT` clause was ignored. (Bug#18767)
- Inserts failed with duplicate key errors on a table partitioned using an `AUTO_INCREMENT` column for the partitioning key. (Bug#18753, Bug#18552)
- It was possible to create a `RANGE`-partitioned table with a partition defined using the clause `VALUES LESS THAN (NULL)`, even though such a partition could never contain any values whatsoever. (Bug#18752)
- Delimited identifiers for partitions were not being treated the same as delimited identifiers for other database objects (such as tables and columns) with regard to allowed characters. (Bug#18750)
- Conversion of a number to a `CHAR UNICODE` string returned an invalid result. (Bug#18691)
- If the second or third argument to `BETWEEN` was a constant expression such as `'2005-09-01 - INTERVAL 6 MONTH` and the other two arguments were columns, `BETWEEN` was evaluated incorrectly. (Bug#18618)
- `LOAD DATA FROM MASTER` would fail when trying to load the `INFORMATION_SCHEMA` database from the master, because the `INFORMATION_SCHEMA` system database would already exist on the slave. (Bug#18607)
- Running an `ALTER TABLE` on a partitioned table simultaneously experiencing a high number of concurrent DML statements could crash the server. (Bug#18572)
- A `LOCK TABLES` statement that failed could cause MyISAM not to update table statistics properly, causing a subsequent `CHECK TABLE` to report table corruption. (Bug#18544)
- `mysqltest` incorrectly interpreted some `ER_xxx` error names given in the `error` command. (Bug#18495)
- InnoDB: `ALTER TABLE` to add or drop a foreign key for an InnoDB table had no effect. (Bug#18477)
- InnoDB did not use a consistent read for `CREATE ... SELECT` when `innodb_locks_unsafe_for_binlog` was set. (Bug#18350)
- `DROP DATABASE` did not drop stored routines associated with the database if the database name was longer than 21 characters. (Bug#18344)

- A query on a table partitioned or subpartitioned by `HASH` did not display all results when using a `WHERE` condition involving a column used in the hashing expression. (Bug#18329, Bug#18423)
- In `mysqltest`, `--sleep=0` had no effect. Now it correctly causes `sleep` commands in test case files to sleep for 0 seconds. (Bug#18312)
- `ExtractValue` function did not return character data within `<![CDATA[ ]>` as expected. (Bug#18285)
- A recent change caused the `mysql` client not to display `NULL` values correctly and to display numeric columns left-justified rather than right-justified. The problems have been corrected. (Bug#18265)
- Updates to a `MEMORY` table caused the size of `BTREE` indexes for the table to increase. (Bug#18160)
- A failed `ALTER TABLE` operation could fail to clean up a temporary `.frm` file. (Bug#18129)
- Event-creation statements enclosed in multi-line comments using `/*!version_number ... */` syntax were not parsed correctly. (Bug#18078)
- `SELECT DISTINCT` queries sometimes returned only the last row. (Bug#18068)
- `InnoDB`: A `DELETE` followed by an `INSERT` and then by an `UPDATE` on a partitioned `InnoDB` table caused subsequent queries to return incorrect results. (Bug#17992)
- It was possible to use trailing spaces in the names of partitions and subpartitions. Attempting to do so now raises the error `INCORRECT PARTITION NAME`. (Bug#17973)
- `LIKE` searches failed on a `CHAR` column used as the partitioning column of a table partitioned by `KEY`. (Bug#17946)
- Executing `SELECT` on a large table that had been compressed within `myisampack` could cause a crash. (Bug#17917)
- The `sql_big_selects` system variable was not displayed by `SHOW VARIABLES`. (Bug#17849)
- `REPAIR TABLE` did not restore the length for packed keys in tables created under MySQL 4.x, which caused them to appear corrupt to `CHECK TABLE` but not to `REPAIR TABLE`. (Bug#17810)
- A range access optimizer heuristic was invalid, causing some queries to be much slower in MySQL 5.0 than in 4.0. (Bug#17379, Bug#18940)
- Logging to the `mysql.general_log` and `mysql.slow_log` tables did not work for Windows builds because the `CSV` storage engine was unavailable. The `CSV` engine now is enabled in Windows builds. (Bug#17368)
- If the `WHERE` condition of a query contained an `OR`-ed `FALSE` term, the set of tables whose rows cannot serve for null-complements in outer joins was determined incorrectly. This resulted in blocking possible conversions of outer joins into joins by the optimizer for such queries. (Bug#17164)
- Casting a string to `DECIMAL` worked, but casting a trimmed string (using `LTRIM()` or `RTRIM()`) resulted in loss of decimal digits. (Bug#17043)
- `MyISAM` table deadlock was possible if one thread issued a `LOCK TABLES` request for write locks and then an administrative statement such as `OPTIMIZE TABLE`, if between the two statements another client meanwhile issued a multiple-table `SELECT` for some of the locked tables. (Bug#16986)
- `ALTER TABLE ... REBUILD PARTITION` returned an inaccurate error message. (Bug#16819)
- Use of `--default-storage-engine=innodb` resulted in an error with the server reporting that `InnoDB` was an unknown table type. (Bug#16691)
- `MySQL-shared-compat-5.1.9-0.i386.rpm` incorrectly depended on `glibc` 2.3 and could not be installed on a `glibc` 2.2 system. (Bug#16539)
- The presence of multiple equalities in a condition after reading a constant table could cause the optimizer not to use an index. This resulted in certain queries being much slower than in MySQL 4.1. (Bug#16504)
- Within a trigger, `CONNECTION_ID()` did not return the connection ID of the thread that caused the trigger to be activated. (Bug#16461)
- The XPath `string-length()` function was not implemented for use with `ExtractValue()`. (Bug#16319)
- The `ExtractValue()` function failed with a syntax error when the XPath expression used special characters such as `ñ` (“N-tilde”). (Bug#16233)

- The `sql_notes` and `sql_warnings` system variables were not always displayed correctly by `SHOW VARIABLES` (for example, they were displayed as `ON` after being set to `OFF`). (Bug#16195)
- If the first argument to `BETWEEN` was a `DATE` or `TIME` column of a view and the other arguments were constants, `BETWEEN` did not perform conversion of the constants to the appropriate temporary type, resulting in incorrect evaluation. (Bug#16069)
- After calling `FLUSH STATUS`, the `max_used_connections` variable did not increment for existing connections and connections which use the thread cache. (Bug#15933)
- `DELETE` and `UPDATE` statements that used large `NOT IN (value_list)` clauses could use large amounts of memory. (Bug#15872)
- InnoDB failure to release an adaptive hash index latch could cause a server crash if the query cache was enabled. (Bug#15758)
- `LAST_INSERT_ID()` in a stored function or trigger returned zero. (Bug#15728)
- The `system_time_zone` and `version_*` system variables could not be accessed via `SELECT @@var_name` syntax. (Bug#15684, Bug#12792)
- If the server were built without partition support, it was possible to run partitioning-related statements with no errors or warnings, even though these statements would have no effect. Now such statements are disallowed unless the server has been compiled using the `--with-partition` option. (Bug#15561)
- Use of `CONVERT_TZ()` in a view definition could result in spurious syntax or access errors. (Bug#15153)
- Prevent recursive views caused by using `RENAME TABLE` on a view after creating it. (Bug#14308)
- Some queries were slower in 5.0 than in 4.1 because some 4.1 cost-evaluation code had not been merged into 5.0. (Bug#14292)
- Avoid trying to include `<asm/atomic.h>` when it doesn't work in C++ code. (Bug#13621)
- Running `myisampack` followed by `myisamchk` with the `--unpack` option would corrupt the `auto_increment` key. (Bug#12633)
- Use of `CONVERT_TZ()` in a stored function or trigger (or in a stored procedure called from a stored function or trigger) caused an error. (Bug#11081)
- When `myisamchk` needed to rebuild a table, `AUTO_INCREMENT` information was lost. (Bug#10405)

## C.2.29. Changes in MySQL 5.1.9 (12 April 2006)

This is a new Beta development release, fixing recently discovered bugs.

### Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **MySQL Cluster:** The `NDB` storage engine now supports `CREATE TABLE` statements of arbitrary length. (Previously, `CREATE TABLE` statements for MySQL Cluster tables could contain a maximum of 4096 characters only.) (Bug#17813)
- **MySQL Cluster:** Added the `--nowait-nodes` startup option for `ndbd`, making it possible to skip specified nodes without waiting for them to start when starting the cluster. See [Program Options for ndbd and ndbmtD](#).
- `mysqld_safe` no longer checks for a `mysqld-max` binary. Instead, `mysqld_safe` now checks only for the standard `mysqld` server unless another server binary is specified explicitly via `--mysqld` or `--mysqld-version`. If you previously relied on the implicit invocation of `mysqld-max`, you should use an appropriate option now. (Bug#17861)
- For partitioned tables, the output of `SHOW TABLE STATUS` now shows in the `Engine` column the name of the storage en-

gine used by all partitions for the table; in the `Create_options` column, the output now shows `partitioned` for a partitioned table. This change also affects the values shown in the corresponding columns of the `INFORMATION_SCHEMA.TABLES` table. (Bug#17631)

- `SHOW PLUGIN` was renamed to `SHOW PLUGINS`. `SHOW PLUGIN` now is deprecated and generates a warning. (Bug#17112)
- Large file support was re-enabled for the MySQL server binary for the AIX 5.2 platform. (Bug#13571)
- Binary MySQL distributions now include a `mysqld-max` server, in addition to the usual `mysqld` optimized server and the `mysqld-debug` debugging server.

Bugs fixed:

- **Security Fix:** Invalid arguments to `DATE_FORMAT()` caused a server crash. Thanks to Jean-David Maillefer for discovering and reporting this problem to the Debian project and to Christian Hammers from the Debian Team for notifying us of it. (Bug#20729, CVE-2006-3469)
- **Partitioning: MySQL Cluster:** `BLOB` columns did not work correctly with user-partitioned `NDB` tables. (Bug#16796)
- **MySQL Cluster:** An uninitialized internal variable could lead to unexpected results. (Bug#18831)
- **MySQL Cluster:** `TRUNCATE` did not reset the `AUTO_INCREMENT` counter for `MyISAM` tables when issued inside a stored procedure.

#### Note

This bug did not affect `InnoDB` tables.

In addition, `TRUNCATE` does not reset the `AUTO_INCREMENT` counter for `NDB` tables regardless of when it is called.

(Bug#14945)

See also Bug#18864.

- For full-text searches in boolean mode, and when a full-text parser plugin was used, a `MYSQL_FTPARSER_PARAM::ftparser_state` could have been corrupted by recursive calls to the plugin. (Bug#18836)
- `mysql_reconnect()` sent a `SET NAMES` statement to the server, even for pre-4.1 servers that do not understand the statement. (Bug#18830)
- A query against a partitioned table using `WHERE col IS NULL` could produce incorrect results given the following conditions:
  - The table had partitions and subpartitions
  - The partitioning function depended on a single column `col` of one of the MySQL integer types
  - The partitioning function was not monotonically increasing

The same issue could cause the server to crash when run in debug mode. (Bug#18659)

- Partition pruning did not work properly for some kinds of partitioning and subpartitioning, with certain `WHERE` clauses. (Partitions and subpartitions that should have been marked as used were not so marked.) The error could manifest as incorrect content in `EXPLAIN PARTITIONS` output as well as missing rows in the results of affected queries. (Bug#18558)
- Building the server using `--with-example-storage-engine` failed to enable the `EXAMPLE` storage engine in the server. (Bug#18464)
- If `InnoDB` encountered a `HA_ERR_LOCK_TABLE_FULL` error and rolled back a transaction, the transaction was still written to the binary log. (Bug#18283)
- Complex queries with nested joins could cause a server crash. (Bug#18279)
- `COUNT(*)` on a `MyISAM` table could return different results for the base table and a view on the base table. (Bug#18237)
- `EXTRACT(QUARTER FROM date)` returned unexpected results. (Bug#18100)
- Queries using `WHERE ... IS NULL` returned incorrect results from partitioned tables. (Bug#18070)
- Partition pruning did not perform correctly with partitions on `NULL`, and could potentially crash the server. (Bug#18053)

- `MEDIUMINT` columns were not handled in the same way as other column types by partition pruning. Partition pruning would sometimes use inappropriate columns in performing queries. Both of these issues were rectified as part of the same bug fix. (Bug#18025)
- For tables created in a MySQL 4.1 installation upgraded to MySQL 5.0 and up, multiple-table updates could update only the first matching row. (Bug#16281)
- For `mysql.server`, if the `basedir` option was specified after `datadir` in an option file, the setting for `datadir` was ignored and assumed to be located under `basedir`. (Bug#16240)
- Triggers created in one version of the server could not be dropped after upgrading to a newer version. (Bug#15921)
- `CAST(double AS SIGNED INT)` for large `double` values outside the signed integer range truncated the result to be within range, but the result sometimes had the wrong sign, and no warning was generated. (Bug#15098)
- Quoted values could not be used for partition option values. (Bug#13520)
- Delimited identifiers could not be used in defining partitions. (Bug#13433)
- `mysql_config` returned incorrect libraries on `x86_64` systems. (Bug#13158)
- The server was always built as though `--with-extra-charsets=complex` had been specified. (Bug#12076)

## C.2.30. Changes in MySQL 5.1.8 (Not released)

### Note

This was an internal release only, and no binaries were published.

Functionality added or changed:

- **Cluster Replication: Incompatible Change:** The `cluster_replication` database has been renamed to `cluster`. This will effect replication between MySQL Clusters where one cluster is running MySQL 5.1.8 or later, and the other is running MySQL 5.1.7 or earlier. See [MySQL Cluster Replication](#), and especially [MySQL Cluster Replication Schema and Tables](#).
- **Incompatible Change:** The semantics of `ALTER TABLE t ENGINE=X;` for partitioned tables is changed, and now means that the storage engine used for table `t` is changed to `X`.  
  
The previous statement formerly (prior to MySQL 5.1.8) meant that all partitioning was removed from the table. In order to remove the partitioning of a table, the syntax `ALTER TABLE t REMOVE PARTITIONING;` is introduced. The `REMOVE PARTITIONING` option can be used in combination with existing `ALTER TABLE` options such as those employed for adding or dropping columns or indexes. (Bug#17754)
- **Incompatible Change:** For purposes of determining placement, `RANGE` partitioning now treats `NULL` as less than any other value. (Formerly, `NULL` was treated as equal to zero.) See [Section 17.2.6, “How MySQL Partitioning Handles NULL”](#). (Bug#15447)
- **MySQL Cluster:** The stability of `CREATE` and `DROP` operations on `NDB` tables containing `BLOB` columns has been improved. (Bug#17761)
- **MySQL Cluster:** The `NDBCLUSTER` storage engine now supports `INSERT IGNORE` and `REPLACE` statements. Previously, these statements failed with an error. (Bug#17431)
- **Replication:** Triggers from older servers that included no `DEFINER` clause in the trigger definition now execute with the privileges of the invoker (which on the slave is the slave SQL thread). Previously, replication slaves could not replicate such triggers. (Bug#16266)
- **Replication:** The `binlog_format` system variable now can be set to a third format, `MIXED`, as described in [Section 16.1.2, “Replication Formats”](#).
- **Replication:** The `binlog_format` system variable now is dynamic and can be changed at runtime, as described in [Section 16.1.2, “Replication Formats”](#).
- **Replication:** A slave server may now switch the replication format automatically. This happens when the server is running in either `STATEMENT` or `MIXED` format and encounters a row in the binary log that is written in `ROW` logging format. In that case, the slave switches to row-based replication temporarily for that event, and switches back to the previous format afterwards.

- **Disk Data:** You can now have only one log file group at any one time. See [Section 12.1.14, “CREATE LOGFILE GROUP Syntax”](#). ([Bug#16386](#))
- Builds for Windows, Linux, and Unix (except AIX) platforms now have SSL support enabled, in the server as well as in the client libraries. Because part of the SSL code is written in C++, this does introduce dependencies on the system's C++ runtime libraries in several cases, depending on compiler specifics. ([Bug#18195](#))
- Partition pruning was made more stable, particularly in cases involving queries using tests for NULL values in the WHERE clause against subpartitioned tables which were partitioned by `LIST( some_function(col1, ... ,colN) )`. ([Bug#17891](#))
- The output of `SHOW CREATE EVENT` no longer qualifies the event name with the name of the schem to which the event belongs. ([Bug#17714](#))
- The deprecated constructs in the following table now generate warnings. You should not employ them in new applications, as they are likely to be removed in a future version of MySQL. Use the equivalents shown in the table's second column instead. For the same reason, existing applications that depend on the deprecated constructs should be converted to make use of the current equivalents as soon as possible.

Deprecated / Obsolete:	Current / Preferred:
<code>@@table_type</code>	<code>@@storage_engine</code>
<code>@@log_bin_trust_routine_creators</code>	<code>@@log_bin_trust_function_creators</code>
<code>TIMESTAMP(N)</code>	See <a href="#">Section 11.6, “Date and Time Functions”</a> .
<code>TYPE=</code>	<code>ENGINE=</code>
<code>BACKUP TABLE</code>	<code>mysql-dump</code> , <code>mysql-hotcopy</code> , or MySQL Administrator
<code>RESTORE TABLE, LOAD TABLE FROM MASTER</code>	<code>mysql-dump</code> , <code>mysql</code> , or MySQL Administrator
<code>SHOW TABLE TYPES</code>	<code>SHOW [STORAGE] ENGINES</code>
<code>SHOW INNODB STATUS</code>	<code>SHOW ENGINE INNODB STATUS</code>
<code>SHOW MUTEX STATUS</code>	<code>SHOW ENGINE INNODB MUTEX</code>
<code>SHOW BDB LOGS, SHOW LOGS</code>	<code>SHOW ENGINE BDB LOGS</code>

`SHOW BDB LOGS` and `SHOW LOGS` are removed as of MySQL 5.1.12, and the other deprecated items shown in the table are

removed as of MySQL 5.2.5.

### Important

**TYPE vs ENGINE**. In order not to break legacy applications, support for `TYPE = engine_name` — deprecated since MySQL 4.0 — has been restored, but now generates a warning.

*Beginning with MySQL 5.2.5, `TYPE = engine_name` will no longer be available and will produce a syntax error.*

*You should not use `TYPE` in any new applications, and you should immediately begin conversion of existing applications to use the `ENGINE = engine_name` syntax instead.*

([Bug#17501](#))

- Temporary tables may no longer be partitioned. ([Bug#17497](#))
- More specific error messages are now given when attempting to create an excessive number of partitions or subpartitions. (Previously, no distinction was made between an excessive number of partitions and an excessive number of subpartitions.) ([Bug#17393](#))
- Added the `--events` option to `mysqldump` to enable events to be included in the dump output. ([Bug#16853](#))
- For an event having no `STARTS` time specified when it was created, the `mysql.event` table's `start` column now displays the creation time rather than `NULL`.

In addition, both the `SHOW EVENTS` statement's `Starts` column and the `STARTS` column of the `INFORMATION_SCHEMA.EVENTS` table are now empty rather than `NULL` when `STARTS` was not used in the `CREATE EVENT` statement. ([Bug#16537](#))

- Event names are now case-insensitive. That is (for example), you cannot have events with the names `Myevent` and `MyEvent` belonging to the same database and definer. ([Bug#16415](#))
- Description of the `EVENT` privilege has been changed to `To create, alter, drop, and execute events`. ([Bug#16412](#))
- `MICROSECOND` intervals are no longer allowed for events. ([Bug#16411](#))
- Events no longer support times past the end of the Unix epoch. (Formerly, such dates were interpreted as being at the beginning of the Unix epoch.) ([Bug#16396](#))
- The XPath `last()` function is now implemented for use with `ExtractValue()`. ([Bug#16318](#))
- The `ExtractValue()` function with `contains()` now uses the SQL collation in making comparisons. Previously, comparisons were always binary (that is, case-sensitive). ([Bug#16316](#))
- Names of subpartitions must now be unique for an entire table, and not merely within the same partition. ([Bug#15408](#))
- Added the `--sysdate-is-now` option to `mysqld` to enable `SYSDATE()` to be treated as an alias for `NOW()`. See [Section 11.6, "Date and Time Functions"](#). ([Bug#15101](#))
- `mysqldump` now surrounds the `DEFINER`, `SQL SECURITY DEFINER` and `WITH CHECK OPTION` clauses of a `CREATE VIEW` statement with "not in version" comments to prevent errors in earlier versions of MySQL. ([Bug#14871](#))
- The `mysql_ping` function will now retry if the `reconnect` flag is set and error `CR_SERVER_LOST` is encountered during the first attempt to ping the server. ([Bug#14057](#))
- The `mysqltest` utility now converts all `CR/LF` combinations to `LF` to allow test cases intended for Windows to work properly on UNIX-like systems. ([Bug#13809](#))
- The output from `SHOW CREATE TABLE` is more consistent about using uppercase for keywords. Data types still are in lowercase. ([Bug#10460](#))
- The client API now attempts to reconnect using TCP/IP if the `reconnect` flag is set, as is the case with sockets. ([Bug#2845](#))
- The syntax for `CREATE PROCEDURE` and `CREATE FUNCTION` statements now includes a `DEFINER` clause. The `DEFINER` value specifies the security context to be used when checking access privileges at routine invocation time if the routine has the `SQL SECURITY DEFINER` characteristic. See [Section 12.1.15, "CREATE PROCEDURE and CREATE FUNCTION Syntax"](#), for more information.

When `mysqldump` is invoked with the `--routines` option, it now dumps the `DEFINER` value for stored routines.

Bugs fixed:

- **Partitioning: MySQL Cluster:** Trying to insert a value into a non-existent `LIST` partition of an `NDB` table would cause the server to crash.

#### Note

Beginning with MySQL 5.1.12, user-defined partitioning types other than `KEY` or `LINEAR KEY` were disabled for `NDB` tables.

([Bug#17763](#))

- **Partitioning: MySQL Cluster:** A repeated `SELECT` on a partitioned table that used the `NDB` storage engine could cause the server to crash. ([Bug#17390](#))
- **MySQL Cluster: Replication:** `auto_increment` values were not propagated correctly in statement-based replication. ([Bug#18208](#))
- **MySQL Cluster: Replication:** Memory was mistakenly freed for `NdbRecAttr` objects during addition of an index while replicating the cluster, which could cause `mysqld` to crash. ([Bug#18106](#))
- **MySQL Cluster: Replication:** Row-based replication could fail with tables using `VARCHAR` columns for primary keys and having `BLOB` columns. ([Bug#18067](#))
- **MySQL Cluster: Replication:** (Replication): The binary log on the secondary master was not being set up correctly following a table rename. ([Bug#17838](#))
- **MySQL Cluster:** Attempting to restart a node with dropped events still pending would fail. ([Bug#18491](#))
- **MySQL Cluster:** Two `mysqld` processes starting at the same time could cause a race condition. ([Bug#18472](#))
- **MySQL Cluster:** A timeout in the handling of an `ABORT` condition with more than 32 operations could yield a node failure. ([Bug#18414](#))
- **MySQL Cluster:** Two `mysqld` processes did not synchronise `DROP TABLE` binary log events correctly. ([Bug#18395](#))
- **MySQL Cluster:** A node restart immediately following a `CREATE TABLE` would fail.

#### Important

This fix supports 2-node Clusters only.

([Bug#18385](#))

- **MySQL Cluster:** In event of a node failure during a rollback, a “false” lock could be established on the backup for that node, which lock could not be removed without restarting the node. ([Bug#18352](#))
- **MySQL Cluster:** When multiple node restarts were attempted without allowing each restart to complete, the error message returned was `ARRAY INDEX OUT OF BOUNDS` rather than `TOO MANY CRASHED REPLICAS`. ([Bug#18349](#))
- **MySQL Cluster:** The cluster created a crashed replica of a table having an ordered index — or when logging was not enabled, of a table having a table or unique index — leading to a crash of the cluster following 8 successive restarts. ([Bug#18298](#))
- **MySQL Cluster:** Issuing a `DROP LOGFILE GROUP` statement would cause `ndbd` processes to crash if MySQL had been compiled with `gcc4`. ([Bug#18295](#))
- **MySQL Cluster:** When replacing a failed master node, the replacement node could cause the cluster to crash from a buffer overflow if it had an excessively large amount of data to write to the cluster log. ([Bug#18118](#))
- **MySQL Cluster:** Insufficient `StringBuffer` memory when attempting to create a trigger caused the server to crash. ([Bug#18101](#))
- **MySQL Cluster:** Variable-length columns used as primary keys were not handled correctly. ([Bug#18075](#))
- **MySQL Cluster:** `CREATE UNIQUE INDEX` on a column containing non-unique data could cause one or more `ndbd` nodes to hang or crash. ([Bug#18040](#))
- **MySQL Cluster:** Node recovery of tables with `VARCHAR` columns using character sets was inconsistent, which could cause a number of issues, including the data nodes failing to restart and `ALTER TABLE` statements to hang. ([Bug#18026](#))

- **MySQL Cluster:** A `SELECT ... ORDER BY` query on an explicitly partitioned Cluster table with no explicit indexes would crash the server. (Bug#17899)
- **MySQL Cluster:** `ALTER TABLE ... ADD INDEX` failed with `ERROR 756: INDEX ON DISK COLUMN IS NOT SUPPORTED` when run against a Disk Data table having a primary key. (Bug#17888)
- **MySQL Cluster:** In some cases, a single `ndbd` node failed following a system restart. (Bug#17854)
- **MySQL Cluster:** A simultaneous `RENAME` of several tables was logged multiple times. (Bug#17827)
- **MySQL Cluster:** Trying to perform a `DELETE` from an `NDB` table following a `LOCK TABLES` caused the `ndbd` processes to hang. (Bug#17812)
- **MySQL Cluster:** Trying to update very large partitioned tables using the `NDB` storage engine sometimes caused the server to crash. (Bug#17806, Bug#16385)
- **MySQL Cluster:** Using `ALTER TABLE ... ADD PARTITION` on a table partitioned by `LIST` would cause the client to hang. (Bug#17701)
- **MySQL Cluster:** With a single replica, transactions waiting in the log synchronisation queue were not being restarted, causing them to be aborted. (Bug#17536)
- **MySQL Cluster:** `ALTER TABLE` on a partitioned `NDB` table could cause the server to crash. (Bug#17499)
- **MySQL Cluster:** `DELETE` operations on `NDB` tables could cause memory leaks. (Bug#16874)
- **MySQL Cluster:** Some query cache statistics were not always correctly reported for Cluster tables. (Bug#16795)
- **MySQL Cluster:** Restarting nodes were allowed to start and join the cluster too early. (Bug#16772)
- **MySQL Cluster:** `UNDO_BUFFER_SIZE` was limited to 17 MB. (Bug#16657, Bug#17890)
- **MySQL Cluster:** Inserting and deleting `BLOB` column values while a backup was in process could cause data nodes to shut down. (Bug#14028)
- **Replication:** Replication of data stored in a partitioned table would cause slave servers to issue an assertion and terminate. (Bug#18436)
- **Replication:** Use of `TRUNCATE TABLE` for a `TEMPORARY` table on a master server was propagated to slaves properly, but slaves did not decrement the `Slave_open_temp_tables` counter properly. (Bug#17137)
- **Replication:** Slave servers would retry the execution of an SQL statement an infinite number of times, ignoring the value `SLAVE_TRANSACTION_RETRIES` when using the `NDB` engine. (Bug#16228)
- **Replication:** The `DEFINER` value for stored routines was not replicated. (Bug#15963)
- **Disk Data:** `CREATE UNIQUE INDEX` failed with `ERROR 4243: INDEX NOT FOUND`. (Bug#18039)
- **Disk Data:** It was not possible to create more than 9 tablespaces. (Bug#16913)
- A `SELECT ... ORDER BY ...` from a view defined using a function could crash the server. An example of such a view is `CREATE VIEW v1 AS SELECT SQRT(c1) FROM t1`. (Bug#18386)
- The server would crash when `SHOW STATUS` was called on a server linked with `yaSSL`. (Bug#18310)
- The `ExtractValue()` function did not return an error when passed an invalid XPath string. (Bug#18172)
- Using the `position()` function in the XPath argument to `ExtractValue()` crashed the server. (Bug#18171)
- `REPAIR TABLE`, `OPTIMIZE TABLE`, and `ALTER TABLE` operations on transactional tables (or on tables of any type on Windows) could corrupt triggers associated with those tables. (Bug#18153)
- Connecting to a server with a UCS2 default character set with a client using a non-UCS2 character set crashed the server. (Bug#18004)
- Using `ALTER TABLE ... REBUILD PARTITION` without specifying the name of the partition caused the server to crash, rather than reporting a syntax error. (Bug#17947)
- `ALTER TABLE ... REBUILD PARTITION` with no partition name specified would crash the server. (Bug#17940)
- A query with a `WHERE date_column > date_value` condition failed on a table partitioned by `RANGE`. (Bug#17894)

- Renaming and adding a new column to a partitioned table in the same `ALTER TABLE` statement caused the server to crash. (Bug#17772)
- `MyISAM`: Performing a bulk insert on a table referenced by a trigger would crash the table. (Bug#17764)
- Using triggers with partitioned `InnoDB` tables led to incorrect results. (Bug#17744)
- Updating a view that filters certain rows to set a filtered out row to be included in the table caused infinite loop. For example, if the view has a `WHERE` clause of `salary > 100` then issuing an `UPDATE` statement of `SET salary = 200 WHERE id = 10`, caused an infinite loop. (Bug#17726)
- A security enhancement in Visual Studio 8 could cause a MySQL debug server compiled with it to hang when running `SELECT` queries against partitioned tables. (Bug#17722)
- The `EXAMPLE` storage engine did not work on Windows. (Bug#17721)
- `ALTER TABLE ... REORGANIZE PARTITION` failed with `ERROR ON RENAME OF FILENAME ...` on Windows. (Bug#17720)
- The MySQL server could crash with out of memory errors when performing aggregate functions on a `DECIMAL` column. (Bug#17602)
- `NULL` values were written to the `mysql.slow_log` table incorrectly. (Bug#17600)
- `mysql_fix_privilege_tables` did not create the `mysql.plugin` table. (Bug#17568)
- Improper checking of binary log statements could result in a server crash. (Bug#17457)
- Repeated invocations of a stored procedure containing a `SHOW CREATE EVENT` statement would result in the error `PACKETS OUT OF ORDER`. (Bug#17403)
- For `FEDERATED` tables, a `SELECT` statement with an `ORDER BY` clause did not return rows in the proper order. (Bug#17377)
- `SELECT ... WHERE column LIKE 'A%'`, when `column` had a key and used the `latin2_czech_cs` collation, caused the wrong number of rows to be returned. (Bug#17374)
- Calling `CREATE TABLE` or `ALTER TABLE` twice on a partitioned table in a stored procedure or a prepared statement resulted in errors and sometimes server crashes. (Bug#17290)
- Checks for permissions on database operations could be performed in a case-insensitive manner (a user with permissions on database `MYDATABASE` could by accident get permissions on database `myDataBase`), if the privilege data were still cached from a previous check. (Bug#17279)
- Stored procedures that call UDFs and pass local string variables caused server crashes. (Bug#17261)
- A problem with `NULLs` and interval mapping sometimes caused incorrect results or crashes when trying to use less-than searches on partitioned tables. (Bug#17173)
- Attempting to add a new partition to a table partitioned by a unique key would cause an `OUT OF MEMORY` error. (Bug#17169)
- Creating a table with the same name as the mapped name of another table caused a server crash. For example, if MySQL maps the table name `txu#P#p1` to `txu@0023P@0023p1` on disk, creating another table named `txu@0023P@0023p1` crashed the server. (Bug#17142)
- Trying to add a partition to a table having subpartitions could crash the server. (Bug#17140)
- Attempting to use a conflicting `VALUES` clause in `ALTER TABLE ... ADD PARTITION` caused the server to crash. An example of such a conflicting clause would be that uses `VALUES LESS THAN (constant)` (which indicates a range) with a table that is partitioned by `LIST`. (Bug#17127)
- A failed `ALTER TABLE ... ADD PRIMARY KEY` on a partitioned table would result in bad table metadata and could possibly crash the server. (Bug#17097)
- Stored routine names longer than 64 characters were silently truncated. Now the limit is properly enforced and an error occurs. (Bug#17015)
- Cursors in stored routines could cause a server crash. (Bug#16887)
- Triggers created without `BEGIN` and `END` clauses resulted in “You have an error in your SQL syntax” errors when dumping and replaying a binary log. (Bug#16878)

- Using `ALTER TABLE` to increase the length of a `BINARY(M)` column caused column values to be padded with spaces rather than `0x00` bytes. (Bug#16857)
- `ALTER TABLE ... COALESCE PARTITION` failed with an `OUT OF MEMORY` error. (Bug#16810)
- `ALTER TABLE ... ADD COLUMN ... AFTER ...` failed when used on partitioned tables. (Bug#16806)
- If the server was started with the `--skip-grant-tables` option, it was impossible to create a trigger or a view without explicitly specifying a `DEFINER` clause. (Bug#16777)
- In a highly concurrent environment, a server crash or deadlock could result from execution of a statement that used stored functions or activated triggers coincident with alteration of the tables used by these functions or triggers. (Bug#16593)
- Clients compiled from source with the `--without-readline` did not save command history from session to session. (Bug#16557)
- Using `ORDER BY intvar` within a stored procedure (where `intvar` is an integer variable or expression) would crash the server.

**Note**

The use of an integer `i` in an `ORDER BY i` clause for sorting the result by the `i`<sup>th</sup> column is deprecated (and non-standard). It should *not* be used in new applications. See [Section 12.2.8, “SELECT Syntax”](#).

(Bug#16474)

- Slow queries executed by scheduled events were not being written to the slow query log. (Bug#16426)
- `INSERT` statements executed by scheduled events were not written to the general log. (Bug#16413)
- Repeated invocations of a stored procedure containing a `CREATE EVENT` or `ALTER EVENT` statement would crash the server. (Bug#16408)
- Names of subpartitions were not displayed in the output of `SHOW CREATE TABLE`. (Bug#16370)
- The `ExtractValue()` function would not accept expressions which matched element names containing an underscore character. (Bug#16320)
- The `self()` XPath function was not handled correctly by `ExtractValue()`. (Bug#16315)
- The `ExtractValue()` function allowed the use of the `!` character in identifiers by ignoring the illegal character. This is now correctly reported as a syntax error. (Bug#16313)
- A memory leak caused warnings on slaves for certain statements that executed without warning on the master. (Bug#16175)
- No error was reported when subpartitions were defined for a non-subpartitioned table. (Bug#15961)
- Character set conversion of string constants for `UNION` of constant and table column was not done when it was safe to do so. (Bug#15949)
- The `mysql_close()` C API function leaked handles for shared-memory connections on Windows. (Bug#15846)
- A `SELECT` using a function against a nested view would crash the server. (Bug#15683)
- Setting up subpartitions on at least one but not all the partitions of a partitioned table caused the server to crash. (Bug#15407)
- During conversion from one character set to `ucs2`, multi-byte characters with no `ucs2` equivalent were converted to multiple characters, rather than to `0x003F QUESTION MARK`. (Bug#15375)
- `CREATE TABLE ... PARTITION ... AS SELECT ...` would cause the server to crash. (Bug#15336)
- When attempting to insert a `0` into a `LIST`-partitioned table that had no value-list containing `0`, no error was reported. (Bug#15253)
- `SELECT COUNT(*)` for a `MyISAM` table could return different results depending on whether an index was used. (Bug#14980)
- Stored routines that contained only a single statement were not written properly to the dumpfile when using `mysqldump`. (Bug#14857)
- Execution of a stored function or trigger which inserted data into a table while running concurrent selects on the same table

could result in storing incorrect data in the query cache. (Bug#14767)

- Naming a partition using the characters Ç or ç (“c-cedilla”; Unicode 00C7 or 00E7) made unreadable the table containing the partition. (Bug#14527)
- Searches on indexed columns of partitioned tables failed to find all matching rows following updates of the indexed columns. (Bug#14526)
- Creating a partition which depends on an expression containing a column using the UTF8 character set would cause the server to crash. (Bug#14367)
- On Linux, creation of table partitions failed within a stored procedure. (Bug#14363)
- Invoking more than once a prepared statement that creates a partitioned table would crash the server. (Bug#14350)
- The `RENAME TABLE` statement did not move triggers to the new table. (Bug#13525)
- The server would execute stored routines that had a non-existent definer. (Bug#13198)
- The length of a `VARCHAR()` column that used the `utf8` character set would increase each time the table was re-created in a stored procedure or prepared statement, eventually causing the `CREATE TABLE` statement to fail. (Bug#13134)
- Loading of UDFs in a statically linked MySQL caused a server crash. UDF loading is now blocked if the MySQL server is statically linked. (Bug#11835)
- Setting the `myisam_repair_threads` system variable to a value larger than 1 could cause corruption of large `MyISAM` tables. (Bug#11527)
- Issuing `GRANT EXECUTE` on a procedure would display any warnings related to the creation of the procedure. (Bug#7787)

## C.2.31. Changes in MySQL 5.1.7 (27 February 2006)

Functionality added or changed:

- **Incompatible Change:** The `mysql_stmt_attr_get()` C API function now returns a boolean rather than an unsigned int for `STMT_ATTR_UPDATE_MAX_LENGTH`. (Bug#16144)
- **Incompatible Change:** Due to a change in the naming scheme for partitioning and subpartitioning files, it is not possible for the server to read partitioned tables created in previous MySQL versions. Attempting to read pre-5.1.6 partitioned tables with a MySQL 5.1.7 or later server now generates a suitable warning message.

Two possible workarounds are:

- 1. Create a non-partitioned table with the same table schema using a standard `CREATE TABLE` statement (that is, with no partitioning clauses)
  2. Issue a `SELECT INTO` to copy the data into the non-partitioned table before the upgrade  
Following the upgrade, you can partition the new table using `ALTER TABLE ... PARTITION BY ...`
- Alternatively, you can dump the table using `mysqldump` prior to upgrading and reload it afterwards with `LOAD DATA`. In either case, you should drop the pre-5.1.6 partitioned tables before upgrading to 5.1.6 or later.

### Important

If any partitioned tables that were created prior to MySQL 5.1.6 are present following an upgrade to MySQL 5.1.6 or later, it is also not possible to read from the `INFORMATION_SCHEMA.PARTITIONS` table, nor will you be able to drop those tables or the database or databases in which they are located. In this event, you must:

1. Shut down `mysqld`
2. Manually delete the table, partition, and (if any) subpartition files
3. Restart the MySQL Server

(Bug#13437, Bug#16695)

- **Incompatible Change:** `TYPE = engine_name` is no longer accepted as a synonym for the `ENGINE = engine_name` table option. (`TYPE` has been deprecated since MySQL 4.0.)

- **MySQL Cluster:** Attempting to `SELECT ... FROM INFORMATION_SCHEMA.FILES` now raises a warning in the event that the cluster has crashed. (Bug#17087)
- **Replication:** In row-based replication, when executing a `Rows_log_event`, the associated table was locked, the rows applied and the lock released. This did not work since there are storage engines that count locks and perform an autocommit when the number of locks reach zero. Now we ensure that all table maps come before all `ROWS` events in a statement.
- **Disk Data:** Status messages have been added to `ndb_restore` to enable users to know that data files for Disk Data are being created. (Bug#16873)
- **Cluster Replication:** It is now possible to replicate `NDB` tables having no explicit primary key. See [MySQL Cluster Replication](#).
- Creator privileges are now checked for all events before execution. (Bug#17289)
- `CREATE EVENT`, `DROP EVENT`, and `ALTER EVENT` statements are not allowed in triggers. (Bug#16410)
- The SQL mode in effect at the time an event is created or altered is recorded and used during event execution. (Bug#16407)
- New `charset` command added to `mysql` command-line client. By typing `charset name` or `\C name` (such as `\C UTF8`), the client character set can be changed without reconnecting. (Bug#16217)
- Added the `--wait-timeout` option to `mysqlmanager` to allow configuration of the timeout for dropping an inactive connection, and increased the default timeout from 30 seconds to 28,800 seconds (8 hours). (Bug#15980, Bug#12674)
- All subpartitions within a given partitioned table are now guaranteed to have unique names. (Bug#15408)
- `mysqlimport` now has a `--use-threads=N` option for loading data files in parallel using `N` threads.
- Added the `RENAME DATABASE` statement.
- Added the `PROCESSLIST` table to `INFORMATION_SCHEMA`.
- Several changes were made to make upgrades easier:
  - Added the `mysql_upgrade` program that checks all tables for incompatibilities with the current version of MySQL Server and repairs them if necessary. This program should be run for each MySQL upgrade (rather than `mysql_fix_privilege_tables`). See [Section 4.4.8, “mysql\\_upgrade — Check Tables for MySQL Upgrade”](#).
  - Added the `FOR UPGRADE` option for the `CHECK TABLE` statement. This option checks whether tables are incompatible with the current version of MySQL Server.
  - Added the `--check-upgrade` to `mysqlcheck` that invokes `CHECK TABLE` with the `FOR UPGRADE` option. Added the `--fix-db-names` and `--fix-table-names` options to `mysqlcheck`.
- Removed the `have_isam` and `have_raid` system variables.
- Added the `IN NATURAL LANGUAGE MODE` and `IN NATURAL LANGUAGE MODE WITH QUERY EXPANSION` modifiers for full-text searches. See [Section 11.8, “Full-Text Search Functions”](#).

**Bugs fixed:**

- **MySQL Cluster:** Creating `NDB` tables containing `BLOB` columns but no primary key caused unpredictable behavior. (Bug#17559)
- **MySQL Cluster:** Inserting the output of `REPEAT('some_string', some_int)` into a `BLOB` column resulted in the error `INVALID BLOB ATTRIBUTES OR INVALID BLOB PARTS TABLE`. (Bug#17505)
- **MySQL Cluster:** `ndbd` restarts could sometimes fail due to incorrect memory access. (Bug#17417)
- **MySQL Cluster:** Sharing of table names containing special characters between multiple SQL nodes was not handled correctly when binary logging was enabled (a timeout error resulted). (Bug#17415)
- **MySQL Cluster:** Table definitions were not shared between multiple SQL nodes in a cluster without binary logging being enabled. (Bug#17414)
- **MySQL Cluster:** Cluster log file paths were truncated to 128 characters. They may now be as long as `MAX_PATH` (the maximum path length permitted by the operating system). (Bug#17411)
- **MySQL Cluster:** `SHOW CREATE TABLE` would fail when run against a table created in a different session. (Bug#17340)

- **MySQL Cluster:** Following multiple forced shutdowns and restarts of data nodes, `DROP DATABASE` could fail. (Bug#17325)
- **MySQL Cluster:** The `REDO` log would become corrupted (and thus unreadable) in some circumstances, due to a failure in the query handler. (Bug#17295)
- **MySQL Cluster:** An `UPDATE` with an inner join failed to match any records if both tables in the join did not have a primary key. (Bug#17257)
- **MySQL Cluster:** A `DELETE` with a join in the `WHERE` clause failed to retrieve any records if both tables in the join did not have a primary key. (Bug#17249)
- **MySQL Cluster:** `CREATE TEMPORARY TABLE` of a Cluster table would fail with an `UNSUPPORTED` error or crash the server. (Bug#17210, Bug#16552)
- **MySQL Cluster:** The storage engine did not allow views to be updated. (Bug#17206)
- **MySQL Cluster:** When attempting to import data into an `NDB` table using `LOAD DATA INFILE`, the server would hang in the event of a duplicate key error. (Bug#17154)
- **MySQL Cluster:** In some cases, `LOAD DATA INFILE` did not load all data into `NDB` tables. (Bug#17081)
- **MySQL Cluster:** `CREATE TABLE new_tbl LIKE old_tbl;` failed when `old_tbl` used the `NDB` storage engine. (Bug#17005)
- **MySQL Cluster:** An unhandled resources issue could cause node failure with a `DELETE FROM TABLE` affecting thousands of rows. (Bug#16492)
- **MySQL Cluster:** `UNIQUE` keys in Cluster tables were limited to 225 bytes in length. (Bug#15918)
- **MySQL Cluster:** `REPLACE` failed when attempting to update a primary key value in a Cluster table. (Bug#14007)
- **MySQL Cluster:** No error message was generated for setting `NoOfFragmentLogFiles` too low. (Bug#13966)
- **MySQL Cluster:** No error message was generated for setting `MaxNoOfAttributes` too low. (Bug#13965)
- **MySQL Cluster:** Performing large numbers of data manipulation statements on cluster tables using Disk Data could lead to a server crash.
- **Cluster Replication: Replication:** Row-based replication of a cluster failed to take `--binlog-ignore-db` settings into account. (Bug#17188)
- **Replication:** An `ALTER DATABASE` statement on a replication master crashed the slaves. (Bug#17521)
- **Replication:** For a transaction that used `MyISAM` and `InnoDB` tables, interruption of the transaction due to a dropped connection on a master server caused slaves to lose synchrony. (Bug#16559)
- **Replication:** Previously, a stored function invocation was written to the binary log as `DO func_name()` if the invocation changes data and occurs within a non-logged statement, or if the function invokes a stored procedure that produces an error. These invocations now are logged as `SELECT func_name()` instead for better control over error code checking (slave servers could stop due to detecting a different error than occurred on the master). (Bug#14769)
- **Replication:** `BIT` fields were not properly handled when using row-based replication. (Bug#13418)
- **Disk Data:** In some cases, a cluster using Disk Data tables could not be restarted following a normal shutdown. (Bug#16872)
- **Cluster Replication:** Row-based replication was not set up correctly if a backup was already in progress. For example, connecting a `mysqld` instance to a cluster which was being backed up would result in the message `NDB: SKIPPING SETUP TABLE TBL_NAME` being written to the error log. (Bug#17459)
- **Cluster Replication:** Cluster tables not having an explicit primary key could not be replicated. (Bug#14541)
- Column counts were encoded incorrectly in the binary log for row-based logging format. (Bug#17678)
- Data truncations on non-`UNIQUE` indexes could crash `InnoDB` when using multi-byte character sets. (Bug#17530)
- Execution times for scheduled events were not calculated correctly: the last execution time was used as a base rather than the actual start time. (Bug#17494)
- Creating an event and using a whitespace character other than space following the `DO` keyword caused a server crash. (Bug#17453)

- Partitioning with certain `SUBPARTITION BY HASH` clauses caused an error when querying for a partitioned column using an `IS NULL` comparison. (Bug#17430, Bug#17432)
- Race conditions between event creation, dropping, and execution could result in a server crash or hang. (Bug#17373)
- Trying to create a partitioned table with more than 32 attributes failed. (Bug#17179)
- Attempting to add a new partition to a table partitioned by a unique key would cause an `OUT OF MEMORY` error. (Bug#17169)
- `myisam_ftdump` did not work for `FULLTEXT` indexes associated with a parser plugin. (Bug#17116)
- On Windows platforms, some attempts to create partitioned tables from the command line would cause the `mysql` client to hang. (Bug#17082)
- A `SELECT` from the last partition of a subpartitioned table having a `UNIQUE KEY` could crash the MySQL Server. (Bug#16907)
- Statements that contained Unicode characters were not logged to the log tables correctly. (Bug#16905)
- A `SELECT` on a subpartitioned table having a multiple-column `PRIMARY` or `UNIQUE KEY`, and whose partitioning function used only the first column of the key, could cause `mysqld` to crash. (Bug#16901)
- A `RETURN` statement within a trigger caused a server crash. `RETURN` now is disallowed within triggers. To exit immediately, use `LEAVE`. (Bug#16829)
- Using `REPLACE INTO` on a partitioned table having a primary key would crash the server in the event of a duplicate key error. (Bug#16782)
- `DROP TABLE` would sometimes fail on a table having subpartitions that used the default storage engine. (Bug#16775)
- If the query optimizer transformed a `GROUP BY` clause in a subquery, it did not also transform the `HAVING` clause if there was one, producing incorrect results. (Bug#16603)
- Querying the `INFORMATION_SCHEMA.PARTITIONS` table on a non-max server caused a server crash. This also happened following the creation of a table with a very large number (hundreds) of partitions. (Bug#16591, Bug#17141)
- `SHOW CREATE EVENT` displayed no output. (Bug#16423)
- `DROP DATABASE` did not drop events for the database. (Bug#16406)
- The `mysql_fix_privilege_tables.sql` script did not properly initialize the `Event_priv` column to 'Y' for those accounts that should have the `EVENT` privilege. (Bug#16400)
- `SELECT` with `GROUP BY` on a view could cause a server crash. (Bug#16382)
- MySQL server dropped client connection for certain `SELECT` statements against views defined that used `MERGE` algorithm. (Bug#16260)
- Using an XPath expression containing `=` with `ExtractValue()` caused the server to crash. (Bug#16242)
- When used with the `ExtractValue()` function, an XPath expression having no leading `/` character would crash the server. (Bug#16234)
- Using `GROUP BY` on column used in `WHERE` clause could cause empty set to be returned. (Bug#16203)
- `CAST(... AS TIME)` operations returned different results when using versus not using prepared-statement protocol. (Bug#15805)
- The `SELECT` privilege was required for triggers that performed no selects. (Bug#15196)
- The `UPDATE` privilege was required for triggers that performed no updates. (Bug#15166)
- A statement containing `GROUP BY` and `HAVING` clauses could return incorrect results when the `HAVING` clause contained logic that returned `FALSE` for every row. (Bug#14927)
- Killing a long-running query containing a subquery could cause a server crash. (Bug#14851)
- `SUBSTRING_INDEX()` could yield inconsistent results when applied with the same arguments to consecutive rows in a query. (Bug#14676)
- `SET sql_mode = N`, where  $N > 31$ , did not work properly. (Bug#13897)

- `SHOW CREATE TABLE` produced extraneous spaces following the keywords “`PRIMARY KEY`”. (Bug#13883)
- InnoDB could display an incorrect error message for a cascading update. (Bug#9680)
- `CHECKSUM TABLE` returned different values for MyISAM tables depending on whether the `QUICK` or `EXTENDED` option was used. (Bug#8841)
- `SET TRANSACTION ISOLATION LEVEL` acted like `SET SESSION TRANSACTION ISOLATION LEVEL`. That is, it set the isolation level for longer than the next transaction. (Bug#7955)
- Repeated invocation of `my_init()` and `my_end()` caused corruption of character set data and connection failure. (Bug#6536)

## C.2.32. Changes in MySQL 5.1.6 (01 February 2006)

Functionality added or changed:

- **Incompatible Change:** Words with apostrophes are now matched in a `FULLTEXT` search against non-apostrophe words (for example, a search for `Jerry` will match against the term `Jerry's`). Users upgrading to this version must issue `REPAIR TABLE ... QUICK` statements for tables containing `FULLTEXT` indexes. (Bug#14194)
- **Incompatible Change:** This release introduces the `TRIGGER` privilege. Previously, the `SUPER` privilege was needed to create or drop triggers. Now those operations require the `TRIGGER` privilege. This is a security improvement because you no longer need to grant users the `SUPER` privilege to enable them to create triggers. However, the requirement that the account named in a trigger's `DEFINER` clause must have the `SUPER` privilege has changed to a requirement for the `TRIGGER` privilege. After upgrading, be sure to update your grant tables by running `mysql_upgrade`. This will assign the `TRIGGER` privilege to all accounts that had the `SUPER` privilege. (After updating, you might also consider whether any of those accounts no longer need the `SUPER` privilege.) If you fail to update the grant tables, triggers may fail when activated. (Bug#9412)
- **Incompatible Change:** Before MySQL 5.1.6, the server writes general query log and slow query log entries to log files. As of MySQL 5.1.6, the server's logging capabilities for these logs are more flexible. Log entries can be written to log files (as before) or to the `general_log` and `slow_log` tables in the `mysql` database. If logging is enabled, either or both destinations can be selected. The `--log-output` option controls the destination or destinations of log output. See [Section 5.2.1, “Selecting General Query and Slow Query Log Output Destinations”](#).  
  
If logging is enabled, the default destination now is to log to tables, which differs from earlier versions. If you had the server configured for logging to log files formerly, use `--log-output=FILE` to preserve this behavior after an upgrade to MySQL 5.1.6 or higher.
- **Important Change: MySQL Cluster: Replication:** Replication between MySQL Clusters is now supported. It is now also possible to replicate between a MySQL Cluster and a non-cluster database. See [MySQL Cluster Replication](#), for more information.
- **MySQL Cluster:** Added the `ndb_extra_logging` system variable.
- **MySQL Cluster:** The `NDB` storage engine now supports the `CREATE INDEX` and `DROP INDEX` statements.
- **Packaging:** MySQL 5.1.6 introduces some changes to distribution packaging:
  - Distributions include both a `mysqld` optimized server and `mysqld-debug` debugging server. There is no separate debug distribution.
  - There is no longer a `mysqld-max` server. (Note: This changed in MySQL 5.1.9: The `mysqld-max` server also is included in binary distributions.)
  - Server binaries no longer are stripped, except for RPM distributions.
  - Binary distributions for Unix and Unix-like systems no longer include `safe_mysqld` as a link to `mysqld_safe`. `safe_mysqld` has been deprecated since MySQL 4.0 and now is removed.
- The `mysqldump` utility now supports an option for dumping tablespaces. Use `-Y` or `--all-tablespaces` to enable this functionality. (Bug#16753)
- Partition support is not an “engine”, but it was included in the output of `SHOW ENGINES`. Now it is not. The `have_partition_engine` variable was renamed to `have_partitioning`. (Bug#14355, Bug#16718)
- `ANALYZE TABLE` is now supported for partitioned tables. (Bug#13441)
- Added the `--use-threads` option for `mysqslap`.

- Queries against partitioned tables can now take advantage of partition pruning. In some cases, this can result in query execution that is an order of magnitude faster than the same query against a non-partitioned version of the same table.
- There is no longer a `mysqld-max` server. (Note: This changed in MySQL 5.1.9: The `mysqld-max` server also is included in binary distributions.)
- Added the `FILES` table to `INFORMATION_SCHEMA`.
- Binary distributions for Unix and Unix-like systems no longer include `safe_mysqld` as a link to `mysqld_safe`. `safe_mysqld` has been deprecated since MySQL 4.0 and now is removed.
- Special characters in database and table identifiers now are encoded when creating the corresponding directory names and file names. This relaxes the restrictions on the characters that can appear in identifiers. See [Section 8.2.3, “Mapping of Identifiers to File Names”](#).
- Added the `event_scheduler` system variable.
- MySQL 5.1.6 introduces the *Event Scheduler* which allows one to schedule statements for execution at predetermined times. Events can be transient (one-time-only) or recurrent at regular intervals, and may execute queries and statements permitted in stored routines, including compound statements.

Events can be altered after creation, and dropped when no longer needed.

Information about scheduled events can be obtained using the statements `SHOW EVENTS` and `SHOW CREATE EVENT`, or by querying the `INFORMATION_SCHEMA.EVENTS` table. All of these are available beginning in MySQL 5.1.6.

Users must have the `EVENT` privilege (also added in 5.1.6) to create events.

For more information, see [Section 18.4, “Using the Event Scheduler”](#).

- Distributions include both a `mysqld` optimized server and `mysqld-debug` debugging server. There is no separate debug distribution.
- Server binaries no longer are stripped, except for RPM distributions.
- The `ARCHIVE` storage engine now supports the `AUTO_INCREMENT` column attribute and the `AUTO_INCREMENT` table option. [Section 13.11, “The ARCHIVE Storage Engine”](#).
- Server plugins can register their own status variables to be displayed by the `SHOW STATUS` statement.
- Added the `PARTITIONS` table to `INFORMATION_SCHEMA`.
- Added the `EVENTS` table to `INFORMATION_SCHEMA`.

Bugs fixed:

- **MySQL Cluster:** `NDB` leaked disk space when performing repeated `INSERT` or `DELETE` statements. ([Bug#16771](#))
- **MySQL Cluster:** `ndb_delete_all` ran out of memory when processing tables containing `BLOB` columns. ([Bug#16693](#))
- **MySQL Cluster:** Trying to import too many dumped tables requiring resources beyond those allocated in the cluster configuration file caused the server to crash instead of reporting an insufficient resources error. ([Bug#16455](#))
- **MySQL Cluster:** A `BIT` column whose offset and length totaled 32 caused the cluster to crash. ([Bug#16125](#))
- **MySQL Cluster:** The `ndb_autodiscover` test failed sporadically due to a node not being permitted to connect to the cluster. ([Bug#15619](#))
- **MySQL Cluster:** `NDB` returned an incorrect `CAN'T FIND FILE ERROR` for OS error 24; this has been changed to `TOO MANY OPEN FILES`. ([Bug#15020](#))
- **MySQL Cluster:** `CREATE TABLESPACE` statements were incorrectly parsed on 64-bit platforms. (`INITIAL SIZE size` worked, but `INITIAL SIZE = size` failed.) ([Bug#13556](#))
- **MySQL Cluster:** Using `mysqldump` to obtain a dump of a partitioned table employing the `NDB` storage engine produced a non-functional table creation statement. ([Bug#13155](#))
- **Disk Data:** Tablespaces created using parameters with relatively low values (10 MB or less) produced filesizes much smaller than expected. ([Bug#16742](#))

- **Disk Data:** `NDB` returned the wrong error when the tablespace on disk was full. (Bug#16738)
- **Disk Data:** The error message generated by a failed `ADD UNDOFILE` did not provide any reasons for the failure. (Bug#16267)
- **Disk Data:** `DROP LOGFILE GROUP` corrupted the cluster file system and caused `ndbd` to fail when running more than one node on the same system. (Bug#16193)
- **Cluster API:** Upon the completion of a scan where a key request remained outstanding on the primary replica and a starting node died, the scan did not terminate. This caused incomplete error handling for the failed node. (Bug#15908)
- When the fulltext search parser plugin returned more words than half of the length (in bytes) of the query string, the server would crash. (Bug#16722)
- An indexing error sometimes caused values to be assigned to the wrong `RANGE` partition. (Bug#16684)
- An `INSERT` statement in a stored procedure corrupted the binary log. (Bug#16621)
- Trying to add more than one partition in a single `ALTER TABLE ... ADD PARTITION` statement caused the server to crash. (Bug#16534)
- Parallel builds occasionally failed on Solaris. (Bug#16282)
- Inserting a negative value into an integer column used as the partitioning key for a table partitioned by `HASH` could cause the server to crash. (Bug#15968)
- Creating a partitioned table using a storage engine other than the session default storage engine caused the server to crash. (Bug#15966)
- The error message for specifying values for which no partition exists returned wrong values on certain platforms. (Bug#15910)
- Specifying a value for `--tmpdir` without a trailing slash had unpredictable results. (Bug#15904)
- `STR_TO_DATE(1, NULL)` caused a server crash. (Bug#15828, CVE-2006-3081)
- `ALTER TABLE ... ADD PARTITIONS` on a table with one partition crashed the server. (Bug#15820)
- The `mysql_real_connect()` C API function incorrectly reset the `MYSQL_OPT_RECONNECT` option to its default value. (Bug#15719)
- In some cases the query optimizer did not properly perform multiple joins where inner joins followed left joins, resulting in corrupted result sets. (Bug#15633)
- Certain permission management statements could create a `NULL` host name for a user, resulting in a server crash. (Bug#15598)
- Improper memory handling for stored routine variables could cause memory overruns and binary log corruption. (Bug#15588)
- The absence of a table in the left part of a left or right join was not checked prior to name resolution, which resulted in a server crash. (Bug#15538)
- An `ALTER TABLE ... PARTITION BY ...` statement did not have any effect. (Bug#15523)
- Using `RANGE` partitioning with a `CASE` expression as the partitioning function would cause records to be placed in the wrong partition. (Bug#15393)
- Certain subqueries where the inner query was the result of an aggregate function would return different results with MySQL 5.1 than with MySQL 4.1.  
Subselects could also return wrong results when the query cache and grouping were involved. (Bug#15347)
- Attempting to insert data into a partitioned table that used the `BLACKHOLE` storage engine caused `mysqld` to crash. (Bug#14524)
- A `FULLTEXT` query in a prepared statement could result in unexpected behavior. (Bug#14496)
- With a table partitioned by `LIST`, inserting a value which was smaller than any value shown in the partitioning value-lists could cause the server to crash. (Bug#14365)
- The `DATA DIRECTORY` and `INDEX DIRECTORY` clauses of a `CREATE TABLE` statement involving partitions did not work. (Bug#14354)
- `SHOW CREATE TABLE` did not display the `PARTITIONS` clause for tables partitioned by `HASH` or `KEY`. (Bug#14327)

- `ALTER TABLE ... DROP PARTITION` would truncate all `DATE` column values in the table's remaining partitions to `NULL`. (Bug#13644)
- `ALTER TABLE ... ADD PARTITION` could crash the server or cause an `OUT OF MEMORY` error in some circumstances. (Bug#13447)
- The server would allow foreign keys to be declared in the definition of a partitioned table despite the fact that partitioned tables do not support foreign keys (see Section 17.5, “Restrictions and Limitations on Partitioning”). (Bug#13446)
- A `SELECT` from a key-partitioned table with a multi-column key could cause the server to crash. (Bug#13445)
- Issuing a `TRUNCATE` statement twice in succession on the same partitioned table would cause the server to crash. (Bug#13442)
- Using a `REPLACE` statement on a partitioned table caused the server to crash. (Bug#13440)
- Using an identifier rather than a literal integer value in the `LESS THAN` clause of a range-partitioned table could cause the server to crash and corruption of tables. (Bug#13439)
- Using `ENGINE=...` within a `PARTITION` clause could cause the server to crash. (Bug#13438)
- `CREATE TABLE ... LIKE` did not work if the table whose schema was to be copied was a partitioned table. (Bug#13435)
- Multi-byte path names for `LOAD DATA` and `SELECT ... INTO OUTFILE` caused errors. Added the `character_set_filesystem` system variable, which controls the interpretation of string literals that refer to file names. (Bug#12448)
- Temporary table aliasing did not work inside stored functions. (Bug#12198)
- Using the `TRUNCATE( )` function with a negative number for the second argument on a `BIGINT` column returned incorrect results. (Bug#8461)
- Certain Japanese table names were not properly saved during a `CREATE TABLE` statement. (Bug#3906)

## C.2.33. Changes in MySQL 5.1.5 (10 January 2006)

Functionality added or changed:

- **Replication:** Added the `binlog_format` system variable that controls whether to use row-based or statement-based binary logging. Added the `--binlog-format` and `--binlog-row-event-max-size` server options for binary logging control. See Section 16.1.2, “Replication Formats”.
- Added the `--port-open-timeout` option to `mysqld` to control how many seconds the server should wait for the TCP/IP port to become free if it cannot be opened. (Bug#15591)
- A new statement, `BINLOG`, is generated by `mysqlbinlog` to represent row-based events in binary log files. The statement argument, a base 64-encoded string, is decoded by the server to determine the data change indicated by the corresponding event.
- Added the `--create-schema`, `--lock-directory`, `--number-of-queries`, `--only-print`, `--preserve-schema`, and `--slave` options for `mysqld`.
- If `innodb_locks_unsafe_for_binlog` is enabled or if the transaction isolation mode is `READ COMMITTED`, InnoDB can use “semi-consistent” reads. This affects treatment by `UPDATE` statements for rows that are already locked by another transaction. If a row is locked, InnoDB returns the latest committed version to MySQL so that MySQL can determine whether the row matches the `WHERE` condition of the `UPDATE`. If the row matches (must be updated), MySQL reads the row again and this time InnoDB either locks it or waits for a lock on it.

See also Bug#3300.

- Added the `--base64-output` option to `mysqlbinlog` to print all binary log entries using base64 encoding. This is for debugging only. Logs produced using this option should not be applied on production systems.
- Added the `INFORMATION_SCHEMA PLUGINS` table and the `SHOW PLUGIN` statement.
- Two new Hungarian collations are included: `utf8_hungarian_ci` and `ucs2_hungarian_ci`. These support the correct sort order for Hungarian vowels. However, they do not support the correct order for sorting Hungarian consonant contractions; we expect to fix this issue in a future release.
- Plugins now can have status variables that are displayed in the output from `SHOW STATUS`. See Section 21.2.3, “Writing Plugins”.

- Added the `INFORMATION_SCHEMA ENGINES` table.
- Added the XML functions `ExtractValue()` and `UpdateXML()`. `ExtractValue()` returns the content of a fragment of XML matching a given XPath expression. `UpdateXML()` replaces the element selected from a fragment of XML by an XPath expression supplied by the user with a second XML fragment (also user-supplied), and returns the modified XML. See [Section 11.10, “XML Functions”](#).

Bugs fixed:

- `INSERT DELAYED` caused `mysqld` to crash. ([Bug#16095](#))
- The `--plugin_dir` option was not working. Specifying the parser name for fulltext also did not work correctly. ([Bug#16068](#))
- Attempting to insert into a table partitioned by `LIST` a value less than any specified in one of the table's partition definitions resulted in a server crash. In such cases, `mysqld` now returns `ERROR 1500 (HY000): TABLE HAS NO PARTITION FOR VALUE v`, where `v` is the out-of-range value. ([Bug#15819](#))
- Issuing a `DROP USER` command could cause some users to encounter a `hostname is not allowed to connect to this MySQL server` error. ([Bug#15775](#))
- The output of `mysqldump --triggers` did not contain the `DEFINER` clause in dumped trigger definitions. ([Bug#15110](#))
- The output of `SHOW TRIGGERS` contained extraneous whitespace. ([Bug#15103](#))
- Creating a trigger caused a server crash if the table or trigger database was not known because no default database had been selected. ([Bug#14863](#))
- `InnoDB`: Comparison of indexed `VARCHAR CHARACTER SET ucs2 COLLATE ucs2_bin` columns using `LIKE` could fail. ([Bug#14583](#))
- A `COMMIT` statement followed by a `ALTER TABLE` statement on a BDB table caused server crash. ([Bug#14212](#))
- An `INSERT ... SELECT` statement between tables in a `MERGE` set can return errors when statement involves insert into child table from merge table or vice-versa. ([Bug#5390](#))
- `InnoDB`: A semi-consistent read for an `UPDATE` statement with no index column in the `WHERE` condition locked all the rows in the table. ([Bug#3300](#))

## C.2.34. Changes in MySQL 5.1.4 (21 December 2005)

Functionality added or changed:

- Added the `--server-id` option to `mysqlbinlog` to enable only those events created by the server having the given server ID to be extracted. ([Bug#15485](#))
- It is now possible to build the server such that `MyISAM` tables can support up to 128 keys rather than the standard 64. This can be done by configuring the build using the option `--with-max-indexes=N`, where  $N \leq 128$  is the maximum number of indexes to permit per table. ([Bug#10932](#))
- Added the `myisam_use_mmap` system variable.
- Added the `--bdb-data-direct` and `--bdb-log-direct` server options.
- Added the `mysqslap` program, which is designed to emulate client load for a MySQL server and report the timing of each stage. It works as if multiple clients are accessing the server.
- The bundled `BDB` library was upgraded to version 4.4.16.
- Added the `cp1250_polish_ci` collation for the `cp1250` character set.

Bugs fixed:

- **MySQL Cluster:** The `--ndb` option for `perror` did not function. ([Bug#15486](#))

- **MySQL Cluster:** Using `ORDER BY primary_key_column` when selecting from a table having the primary key on a `VARCHAR` column caused a forced shutdown of the cluster. (Bug#15240, Bug#15682, Bug#14828, Bug#15517)
- Server could not be built on default Debian systems with BDB enabled. (Bug#15734)
- `SHOW ENGINES` output showed the `FEDERATED` engine as `DISABLED` even for builds with `FEDERATED` support. (Bug#15559)
- `BDB`: A `DELETE`, `INSERT`, or `UPDATE` of a `BDB` table could cause the server to crash where the query contained a subquery using an index read. (Bug#15536)
- It was not possible to reorganize a partition reusing a discarded partition name.

Now, for example, you can create a table such as this one:

```
CREATE TABLE t1 (a INT)
PARTITION BY RANGE (a) (
  PARTITION p0 VALUES LESS THAN (10),
  PARTITION p1 VALUES LESS THAN (20),
  PARTITION p2 VALUES LESS THAN MAXVALUE
);
```

and then repartition it as shown here:

```
ALTER TABLE t1 REORGANIZE PARTITION p2 INTO (
  PARTITION p2 VALUES LESS THAN (30)
);
```

Previously, attempting to do so would produce the error `ALL PARTITIONS MUST HAVE UNIQUE NAMES IN THE TABLE`. (Bug#15521)

- The `BLACKHOLE` storage engine did not handle transactions properly: Rolled-back transactions were written to the binary log. Now they are not. (Bug#15406)
- A left join on a column that having a `NULL` value could cause the server to crash. (Bug#15268)
- Selecting from a view processed with the temptable algorithm caused a server crash if the query cache was enabled. (Bug#15119)
- Creating a view that referenced a stored function that selected from a view caused a crash upon selection from the view. (Bug#15096)
- Multiple-table update operations were counting updates and not updated rows. As a result, if a row had several updates it was counted several times for the “rows matched” value but updated only once. (Bug#15028)
- `ROW_COUNT()` returned an incorrect result after `EXECUTE` of a prepared statement. (Bug#14956)
- `ANALYZE TABLE` did not properly update table statistics for a `MyISAM` table with a `FULLTEXT` index containing stopwords, so a subsequent `ANALYZE TABLE` would not recognize the table as having already been analyzed. (Bug#14902)
- Creating a view within a stored procedure could result in an out of memory error or a server crash. (Bug#14885)
- `SELECT` queries that began with an opening parenthesis were not being placed in the query cache. (Bug#14652)
- Space truncation was being ignored when inserting into `BINARY` or `VARBINARY` columns. Now space truncation results in a warning, or an error in strict mode. (Bug#14299)
- The maximum value of `MAX_ROWS` was handled incorrectly on 64-bit systems. (Bug#14155)
- For binary string data types, `mysqldump --hex-blob` produced an illegal output value of `0x` rather than `'`. (Bug#13318)
- Some comparisons for the `IN()` operator were inconsistent with equivalent comparisons for the `=` operator. (Bug#12612)
- Attempts to assign `NULL` to a `NOT NULL` column in strict mode now result in a message of `Column 'col_name' cannot be null`, rather than `Column set to default value; NULL supplied to NOT NULL column 'col_name' at row n`. (Bug#11491)
- `SHOW CREATE DATABASE` was sometimes refused when the client had privileges for the database. (Bug#9785)
- Invalid casts to `DATE` values now result in a message of `Incorrect datetime value`, rather than `Truncated incorrect datetime value`. (Bug#8294)

- `mysql` ignored the `MYSQL_TCP_PORT` environment variable. (Bug#5792)

## C.2.35. Changes in MySQL 5.1.3 (29 November 2005)

Functionality added or changed:

- **Plugin API: Incompatible Change:** MySQL 5.1 adds support for a very flexible plugin API that enables loading and unloading of various components at runtime, without restarting the server. Although the work on this is not finished yet, *plugin full-text parsers* are a first step in this direction. This allows users to implement their own input filter on the indexed text, enabling full-text search capability on arbitrary data such as PDF files or other document formats. A pre-parser full-text plugin performs the actual parsing and extraction of the text and hands it over to the built-in MySQL full-text search. (Author: Sergey Vojtovich)

The plugin API requires the `mysql.plugin` table. When upgrading from an older version of MySQL, you should run the `mysql_fix_privilege_tables` command to create this table. See Section 4.4.4, “`mysql_fix_privilege_tables` — Upgrade MySQL System Tables”.

Plugins are installed in the directory named by the `plugin_dir` system variable. This variable also controls the location from which the server loads user-defined functions (UDFs), which is a change from earlier versions of MySQL. That is, all UDF library files now must be installed in the plugin directory. When upgrading from an older version of MySQL, you must migrate your UDF files to the plugin directory.

- **Incompatible Change:** Renamed the `table_cache` system variable to `table_open_cache`. Any scripts that refer to `table_cache` should be updated to use the new name.
- **MySQL Cluster:** `VARCHAR` columns used in MySQL Cluster tables are now variable-sized; that is, they now only allocate as much space as required to store the data. Previously, a `VARCHAR(n)` column allocated `n+2` bytes (aligned to 4 bytes), regardless of whether the actual inserted value required that much space. (In other words, a `VARCHAR` column always required the same, fixed, amount of storage as a `CHAR` column of the same size.)
- **Partitioning:** allows distributing portions of individual tables across a file system, according to rules which can be set when the table is created. In effect, different portions of a table are stored as separate tables in different locations, but from the user point of view, the partitioned table is still a single table. See Chapter 17, *Partitioning*, for further information on this functionality. (Author: Mikael Ronström)
- `RAND()` no longer allows non-constant initializers. (Prior to MySQL 5.1.3, the effect of non-constant initializers is undefined.) (Bug#6172)
- Added the `table_definition_cache` system variable. If you use a large number of tables, you can create a large table definition cache to speed up opening of tables. The table definition cache takes less space and does not use file descriptors, unlike the normal table cache.
- `SET instance_name.option_name=option_value` sets an option to the specified value and writes it to the config file See Section 4.6.10, “`mysqlmanager` — The MySQL Instance Manager”, for more details on these new commands. (Author: Petr Chardin)
- `SHOW instance_name LOG FILES` provides a listing of all log files used by the instance. (Author: Petr Chardin)
- Added the `SHOW AUTHORS` statement.
- Fast `ALTER TABLE`: Operations that change only table metadata and not table data do not require a temporary table to be used, which improves performance. For example, renaming a column changes only the `.frm` file and no longer uses a temporary table.
- **The Instance Manager (IM)** now has some additional functionality:
  - `SHOW instance_name LOG FILES` provides a listing of all log files used by the instance. (Author: Petr Chardin)
  - `SHOW instance_name LOG {ERROR | SLOW | GENERAL} size` retrieves a part of the specified log file. (Author: Petr Chardin)
  - `SET instance_name.option_name=option_value` sets an option to the specified value and writes it to the config file See Section 4.6.10, “`mysqlmanager` — The MySQL Instance Manager”, for more details on these new commands. (Author: Petr Chardin)
- `SHOW instance_name LOG {ERROR | SLOW | GENERAL} size` retrieves a part of the specified log file. (Author: Petr Chardin)

- Added the `SHOW FUNCTION CODE` and `SHOW PROCEDURE CODE` statements (available only for servers that have been built with debugging support). See [Section 12.5.5.29, “SHOW PROCEDURE CODE Syntax”](#).
- The performance of boolean full-text searches (using the “+” Operator) has been improved. See [Section 11.8, “Full-Text Search Functions”](#), for more details about full-text searching. (Author: Sergey Vojtovich)

Bugs fixed:

- `RESET MASTER` failed to delete log files on Windows. One consequence of this change is that server opens the general query and slow log files in shared mode, so now they can be renamed while the server has them open (something not true in previous versions). ([Bug#13377](#))
- Set functions could not be aggregated in outer subqueries. ([Bug#12762](#))

## C.2.36. Changes in MySQL 5.1.2 (Not released)

Functionality added or changed:

- Added the `bdb_cache_parts` and `bdb_region_size` system variables, and allowed `bdb_cache_size` to be larger than 4GB on systems that support it. ([Bug#14895](#))
- Added `MAXLOCKS`, `MINLOCKS`, `MAXWRITE`, and `MINWRITE` as allowable values of the `--bdb-lock-detect` option. ([Bug#14876](#))
- Added `--replace` to `mysqldump`. This option uses `REPLACE INTO`, rather than `INSERT INTO`, when writing the dump-file.
- Added `Transactions`, `XA`, and `Savepoints` columns to `SHOW ENGINES` output.

Bugs fixed:

- Foreign keys were not properly enforced in `TEMPORARY` tables. Foreign keys now are disallowed in `TEMPORARY` tables. ([Bug#12084](#))

## C.2.37. Changes in MySQL 5.1.1 (Not released)

Bugs fixed:

- **Partitioning: MySQL Cluster:** Specifying the wrong nodegroup in a `CREATE TABLE` statement using partitioning would lead to the table name being locked after the statement failed (that is, the table name could not be re-used). ([Bug#12114](#))
- Using `ORDER BY` in a query with a partitioned table on a 64-bit operating system could crash the server. ([Bug#12116](#))
- Performing a `CREATE TABLE` statement with a `PARTITION BY` clause in a prepared statement could crash a server running in debug mode. ([Bug#12097](#))
- When two threads competed for the same table, a deadlock could occur if one thread also had a lock on another table through `LOCK TABLES` and the thread was attempting to remove the table in some manner while the other thread tried to place locks on both tables. ([Bug#10600](#))

## C.3. MySQL Enterprise Monitor Change History

This appendix lists the changes to the MySQL Enterprise Monitor, beginning with the most recent release. Each release section covers added or changed functionality, bug fixes, and known issues, if applicable. All bug fixes are referenced by bug number and include a link to the bug database. Bugs are listed in order of resolution. To find a bug quickly, search by bug number.

### C.3.1. Changes in MySQL Enterprise Monitor 2.1.0 (Not yet released)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.0.6.

## Functionality added or changed:

- The agent should be able to run as a non-root user. However, the startup scripts always started it as root.

The agent chassis now has a new option `--user` to drop privileges after being started as root. Note, this does not work when not started as superuser, nor on Windows.

A new dialog box has also been added to the agent installer. The dialog has the following text: “The agent does not need to run with root user privileges. The agent will switch to the user account provided below when started by the root user.”

The dialog also has a text field to allow the entry of the user account.

A new parameter was also added to the `mysql-monitor-agent.ini` file. The parameter has the format `user=xxx`, where xxx is the user account to be used. ([Bug#33778](#))

## Bugs fixed:

- The recommendation for the rule `Table Cache Not Optimal` says:

```
Recommended Action
SET GLOBAL table_cache = (64 + 16);
```

But an error was generated on executing that query:

```
mysql> SET GLOBAL table_cache = (64 + 16);
ERROR 1193 (HY000): Unknown system variable 'table_cache'

mysql> select version();
+-----+
| version() |
+-----+
| 5.1.31-log |
+-----+
1 row in set (0.01 sec)
```

([Bug#44602](#))

- The Mac OS X version of the Service Manager uses the system JRE. The system JRE loads the libraries located in `/Library/Java/Extensions`. As libraries in the extensions directory take precedence over other libraries, this caused conflicts when user extension libraries were installed there, as these would be used by the JRE when running Service Manager, instead of the shipped libraries. This happened when Java-related products were installed such as Connector/J, Spring, and Hibernate.

This fix stops user-installed extension libraries from being used when the JRE runs the Service Manager, thus giving a “pristine” environment with no library collisions. ([Bug#44157](#))

- Accessing the Query Analyzer tab caused a full table scan to take place on the MySQL Enterprise Monitor database. ([Bug#43989](#))
- The Replication Group was renamed back to its default name after a new topology was discovered. ([Bug#43816](#))
- A new topology was not discovered after the previous replication group was renamed. ([Bug#43815](#))
- On Unix systems, executing the command:

```
./mysqlmonitorctl.sh stop
```

did not make sure that `mysqld` was shutdown before finishing.

This resulted in a situation such as the following:

```
# /opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh stop
Using CATALINA_BASE: /opt/mysql/enterprise/monitor/apache-tomcat
Using CATALINA_HOME: /opt/mysql/enterprise/monitor/apache-tomcat
Using CATALINA_TMPDIR: /opt/mysql/enterprise/monitor/apache-tomcat/temp
Using JRE_HOME: /opt/mysql/enterprise/monitor-2.0.0.7092/java
Stopping tomcat service ... [ OK ]
/opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh : mysql stopped
```

However, running the following command a few minutes later showed that the MySQL server was still running:

```
# /opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh status
MySQL Network MySQL is running
MySQL Network Tomcat is not running
```

(Bug#43803)

- The MySQL Enterprise Monitor upgrade installer incorrectly replaced the `AdvisorScript.jar` in `<instDir>/apache-tomcat/webapps/ROOT/WEB-INF/lib/` with the default Advisor JAR. (Bug#43773)
- The SNMP trap source IP was always set to 127.0.0.1. (Bug#43738)
- The installer exited with a return code 0, even if an error was detected and reported to the user during the installation.

```
../mysqlmonitor-2.1.0.1015-linux-x86-64bit-installer.bin --mode unattended --installdir
/data0/merlin/monitoring/2.1.0.1015/host/38080 --tomcatport 38080 --tomcatshutdownport
38503 --tomcatsslport 38443 --dbport 33300 --usessl 1 --adminuser **user** --adminpassword **pwd**
Error running /data0/merlin/monitoring/2.1.0.1015/host/38080/mysql/bin/mysql
--defaults-file=/data0/merlin/monitoring/2.1.0.1015/host/38080/mysql/my.cnf -S
/data0/merlin/monitoring/2.1.0.1015/qa-merlin/38080/mysql/tmp/mysql.sock -u root -D mysql
-e "update user set Password = PASSWORD('**pwd**') where User = 'root'; update user set
User = '**user**' where User = 'root';delete from user where User = '';flush privileges;"
: ERROR 2002 (HY000): Can't connect to local MySQL server through socket
'/data0/merlin/monitoring/2.1.0.1015/host/38080/mysql/tmp/mysql.sock' (2)
```

(Bug#43676)

- The agent created the `mysql.inventory` table with an engine type of InnoDB, instead of MyISAM, when InnoDB was specified as the default engine type in `my.cnf`. This happened because the agent did not explicitly specify the table engine type to be of MyISAM. (Bug#43551)
- When a trailing space, or tab character, was added at the end of a parameter in the `config.properties` file, MySQL Enterprise Monitor failed to start and generated the following errors in log:

```
ERROR [Thread-1:org.springframework.web.context.ContextLoader] Context initialization
failed
...
Caused by: java.sql.SQLException: Illegal connection port value '13306'
...
```

Resolving the problem required detailed log analysis because the configuration file did not show any apparent problems. (Bug#43540)

- If a host was not a slave during the initial discovery phase, then it would not be displayed in the Replication tab if it subsequently became a slave.

This was because after the initial discovery phase, if a host did not have `slavestatus` present, no subsequent checks were made to check for the host being a slave. It was therefore missed for the purposes of replication discovery and never showed in the Replication tab. (Bug#42997)

- Heat Chart rules could not be disabled or unscheduled. (Bug#42932)
- There were four columns added to the `SHOW SLAVE STATUS` query in MySQL Server 5.1: `Last_IO_Errno`, `Last_IO_Error`, `Last_SQL_Errno`, and `Last_SQL_Error`.

However, these were not displayed within the Replication tab. (Bug#42811)

- The installer used to upgrade from version 1.3 corrupted passwords containing the “?” character. (Bug#42452)
- Sun multi-core processors caused all cores to be reported on the meta information page.

The larger T-series SPARC processors have 32+ cores. This caused the meta information page in the Dashboard to scroll as it reported each one. (Bug#42355)

- The username field for new users was populated by the last username used.

When creating a new user for the second time in Dashboard, the previously created username appeared in the dialog. (Bug#42314)

- The `my.cnf` file for the Enterprise Monitor internal database had the following configuration item:

```
innodb_autoextend_increment = 50M
```

This generated the error:

```
16:36:23 [Warning] option 'innodb_autoextend_increment': unsigned value 52428800
adjusted to 1000
```

This variable is interpreted as being specified in MB, so 50M would be 50 TB. Such a high value results in the variable being adjusted to 1000 MB.

The value in the configuration file should be:

```
innodb_autoextend_increment = 50
```

([Bug#42096](#))

- A number of Advisor rules had advice text that had not been translated into Japanese. The Advisors that contained untranslated rules included Performance, Schema and Security. ([Bug#42067](#))
- `OM_REFRESH` was not supported by MySQL Proxy, it caused an `abort()`.

```
shell> ./mysql-proxy --proxy-backend-addresses=192.168.250.3:3306
network-mysqld-proxy.c.3524: COM_(0x07) is not handled

([Bug#41991](#))

- The MySQL Enterprise Monitor file `my.cnf` specified an initial size of 500M for the central tablespace. However, `innodb_file_per_table` was used as well, resulting in approximately 500M of space being potentially wasted. ([Bug#41967](#))
- After an error was generated due to an incorrect password while trying to create a new user, the following error was obtained when subsequently attempting to create a valid new user:

```
U0002 You must log in to access the requested resource
```

([Bug#41384](#))

- SNMP trap messages were sending 127.0.0.1 as the IP address, and there was no feature to allow the user to configure the IP address contained in the SNMP message, which would have been useful for troubleshooting. ([Bug#41361](#))
- Allowing the heat chart rules to be set to unscheduled caused the user interface to appear broken. ([Bug#41312](#))
- Graphs were incorrect for data that did not change. The graphs appeared as if no data had been gathered.

The Hit Ratios graph had gaps in it where there had not been any activity on the parameters being monitored. For instance, if MyISAM tables were not used, then no Key Cache hit ratio series was plotted, even though the variables were still being collected. ([Bug#41232](#))

- When creating a new Database Administrator user in FireFox 2 the following error message was generated:

```
U0002 You must log in to access the requested resource.
```

This occurred in a new installation using the default administrator account. No Query Analysis permissions were given. However, the operation worked correctly using the Safari web browser. ([Bug#41032](#))

- The **MANAGE SERVERS** page did not refresh in a manner consistent with other pages. This meant that changes to configuration made by others would not be reflected on the page. Also, changes in the status of the servers were not displayed automatically. ([Bug#40792](#))
- The agent installer for Solaris 8 x86 32-bit was missing. ([Bug#40248](#))

- Even though Query Analysis was disabled through the user interface, the queries that go through the agent were still being collected.

When Query Analysis was turned back on in the user interface, those queries were then displayed. ([Bug#40032](#))

- Alerts sent from MySQL Enterprise Monitor used the GMT timezone, for example:

```
Time: 2008-09-17 19:41:08 GMT
```

That was not convenient for users, as their timezones may not have been GMT. ([Bug#39504](#))

- The MySQL Enterprise Monitor upgrade installer replaced the `my.cnf` file. This resulted in the loss of any changes that had been made to the configuration file. ([Bug#36528](#))
- If the “On Save send test trap” checkbox was checked when the SAVE button was clicked and the locale was set to Japanese, an error occurred. The orange error banner was displayed at the top of the page with the error message in Japanese. ([Bug#32069](#))

### C.3.2. Changes in MySQL Enterprise Monitor 2.0.6 (Not yet released)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.0.5.

Bugs fixed:

- An error was generated when an attempt was made to rename a Replication Group to one that had previously been deleted. ([Bug#43846](#))
- A new topology was not discovered after the previous replication group was renamed. ([Bug#43815](#))
- On Unix systems, executing the command:

```
./mysqlmonitorctl.sh stop
```

did not make sure that `mysqld` was shutdown before finishing.

This resulted in a situation such as the following:

```
# /opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh stop
Using CATALINA_BASE:   /opt/mysql/enterprise/monitor/apache-tomcat
Using CATALINA_HOME:   /opt/mysql/enterprise/monitor/apache-tomcat
Using CATALINA_TMPDIR: /opt/mysql/enterprise/monitor/apache-tomcat/temp
Using JRE_HOME:        /opt/mysql/enterprise/monitor-2.0.0.7092/java
Stopping tomcat service ... [ OK ]
/opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh : mysql stopped
```

However, running the following command a few minutes later showed that the MySQL server was still running:

```
# /opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh status
MySQL Network MySQL is running
MySQL Network Tomcat is not running
```

([Bug#43803](#))

- The MySQL Enterprise Monitor upgrade installer incorrectly replaced the `AdvisorScript.jar` in `<instDir>/apache-tomcat/webapps/ROOT/WEB-INF/lib/` with the default Advisor JAR. ([Bug#43773](#))
- The agent created the `mysql.inventory` table with an engine type of InnoDB, instead of MyISAM, when InnoDB was specified as the default engine type in `my.cnf`. This happened because the agent did not explicitly specify the table engine type to be of MyISAM. ([Bug#43551](#))
- If a host was not a slave during the initial discovery phase, then it would not be displayed in the Replication tab if it subsequently became a slave.

This was because after the initial discovery phase, if a host did not have `slavestatus` present, no subsequent checks were made to check for the host being a slave. It was therefore missed for the purposes of replication discovery and never showed in the Replication tab. ([Bug#42997](#))

### C.3.3. Changes in MySQL Enterprise Monitor 2.0.5 (18th March 2009)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.0.4.

Bugs fixed:

- The FreeBSD 7 Agent was inadvertently a Linux binary.

```
shell> file mysqlmonitoragent-2.0.5.7153-freebsd7-x86-32bit-installer.bin
mysqlmonitoragent-2.0.5.7153-freebsd7-x86-32bit-installer.bin: ELF 32-bit LSB executable,
Intel 80386, version 1 (SYSV), for GNU/Linux 2.2.5, dynamically linked (uses shared libs),
stripped
```

([Bug#44263](#))

- Calling the Agent with the option `--agent-run-os-tests` resulted in a crash. This happened on Linux x86-64 systems. The resultant stack trace was:

```
(ga-merlin)
2009-03-04 16:39:42: (critical) chassis.c:1097: could not raise RLIMIT_NOFILE to 8192,
Invalid argument (22). Current limit still 1024.
sigar-test-all.c.124 (test_sigar_pid_get):
  pid = 5188
sigar-test-all.c.106 (test_sigar_mem_get):
...cut...
sigar-test-all.c.427 (test_sigar_file_system_list_get): (items = 13)
[0]
  fs.dirname = /
  fs.devname = /dev/mapper/vg00-root
  fs.type = local
  fs.sys-type-name = ext3
  fs.type = 2
  fsusage.total = 15481840
  fsusage.free = 14116140
  fsusage.used = 1365700
  fsusage.avail = 13329708
  fsusage.files = 1966080
  fsusage.use_percent = 0.100000
[0]
  diskusage.reads = 315302
  diskusage.writes = 6318240
  diskusage.write_bytes = 25879511040
  diskusage.read_bytes = 6561092608
  diskusage.queue = 47457530080206
Segmentation fault
```

On some systems no output was shown, other than the message “Segmentation fault”. ([Bug#43381](#))

- Following a change in the replication configuration, MySQL Enterprise Monitor did not display the new topology correctly. ([Bug#43240](#))
- When a data collection became invalid, the agent sent NULLs for those collection values. However, the timestamps that it sent with the values were the timestamps from the last valid value that was collected.

Due to key constraints on the Service Manager side, MySQL Enterprise Monitor disregarded anything sent with duplicate timestamps, thus the NULLs received from the agent were never processed. Some mechanisms, such as replication discovery, depend on the NULLs to identify a situation where data has become invalid. ([Bug#43239](#))

- MySQL Enterprise Monitor did not add a log entry each time data was purged. The log entry should have noted how many rows of each type of data were purged (historical data, logs, quan data). ([Bug#43159](#))
- MySQL Enterprise Monitor generated a stack overflow. This was as a result of a bug in Hibernate, which caused Hibernate to enter infinite recursion while trying to load a relationship. ([Bug#43107](#))
- The “Table Cache Set Too Low For Startup” and “Table Cache Not Optimal” rules were not supported on MySQL 5.1 because the `table_cache` system variable was deprecated and replaced with `table_open_cache`. ([Bug#42663](#))
- Migrated server was not completely deleted.

In a Monitor that had been updated from 1.3.2 to 2.0.4, with 2 database servers queued for migration, if a server being migrated was deleted, or a migrated server was deleted, this would not be reflected in the user interface or in the license count, until Tomcat was restarted. ([Bug#42604](#))

- The installer used to upgrade from version 1.3 corrupted passwords containing the “?” character. ([Bug#42452](#))
- Sun multi-core processors caused all cores to be reported on the meta information page.

The larger T-series SPARC processors have 32+ cores. This caused the meta information page in the Dashboard to scroll as it

reported each one. ([Bug#42355](#))

- If an attempt was made to disable a rule using the link next to the rule, the following error message was generated:

```
U0002 You must log in to access the requested resource. Go to login page.
```

However, clicking on the link did not prompt the user to login again. ([Bug#42313](#))

- Changing `ssh-agent` from OpenSSH or specifying a malevolent value of `agent-host-id`, could inject data into the monitored MySQL Server.

For example, setting `agent-host-id` to the value “I’m a test” would result in the following message in the error log:

```
2009-01-23 15:45:11: ((error)) agent_mysql_d.c:281: mysql_real_query('INSERT INTO
mysql.inventory (name, value) VALUES ( 'hostid', 'I'm a test' )') on 'mysql' failed: You
have an error in your SQL syntax; check the manual that corresponds to your MySQL server
version for the right syntax to use near 'm a test' )' at line 1 (mysql-errno = 1064)
```

([Bug#42306](#))

- When `SHOW GLOBAL STATUS` returned a value greater than 214748364, it was sent to the Service Manager as 214748364. ([Bug#42245](#))
- The Agent failed to identify local sockets as local on Mac OS X 10.4.

If the Agent was configured to use a Unix domain socket on Mac OS X 10.4, it did not treat the connection as local and failed to provide CPU and memory information to MySQL Enterprise Monitor. This is shown in the log file:

```
2009-01-20 18:15:02: (message) network-socket.c:752: is-local family 0 != 1
2009-01-20 18:15:02: (message) agent_mysql_d.c:322: [mysql] mysql_d is not local or not
directly connected
```

However, this problem did not happen on Mac OS X 10.5. ([Bug#42220](#))

- Some graphs on the **GRAPH** tab were not updated after the page was refreshed, or UPDATE was clicked.

The only way to get an updated graph was to change the graph size (in pixels) and then click UPDATE. ([Bug#42162](#))

- The `my.cnf` file for the Enterprise Monitor internal database had the following configuration item:

```
innodb_autoextend_increment = 50M
```

This generated the error:

```
16:36:23 [Warning] option 'innodb_autoextend_increment': unsigned value 52428800
adjusted to 1000
```

This variable is interpreted as being specified in MB, so 50M would be 50 TB. Such a high value results in the variable being adjusted to 1000 MB.

The value in the configuration file should be:

```
innodb_autoextend_increment = 50
```

([Bug#42096](#))

- A number of Advisor rules had advice text that had not been translated into Japanese. The Advisors that contained untranslated rules included Performance, Schema and Security. ([Bug#42067](#))
- The Service Manager did not handle the case where the agent failed to supply a valid `master_ip`. The Service Manager would then not restart. The logs contained the following:

```
2009-01-09 14:39:50,472 ERROR [main:org.springframework.web.context.ContextLoader] Context
initialization failed
org.springframework.beans.factory.UnsatisfiedDependencyException: Error creating bean with
name 'serverConnectionMonitor' defined in ServletContext resource
[/WEB-INF/applicationContext.xml]: Unsatisfied dependency expressed through constructor
argument with index 2 of type [com.mysql.etools.monitor.bo.Manager]: Error creating bean
with name 'manager' defined in ServletContext resource [/WEB-INF/applicationContext.xml]:
Invocation of init method failed; nested exception is
com.mysql.etools.monitor.pom.UnsupportedAttributeException:
101c6b5b-15eb-49aa-916c-843c51b28d38: mysql.slavestatus.Master_ip
```

[\(Bug#42005\)](#)

- Having too many users with strong privileges generated Service Manager errors and events failed to be triggered.

If there were approximately 1000 users with full privileges and the value of `group_concat_max_len` was set to 100001, the size of the data that the agent sent to the Service Manager was too large and caused Service Manager errors. Also, the Security event “Account has Strong MySQL privileges” did not trigger. ([Bug#41987](#))

- Query Analyzer's Query Type filter for `SELECT` ignored statements starting with parenthesis.

If you sent a statement through Query Analyzer starting with parenthesis, such as:

```
(SELECT 1 FROM dual);
```

and then attempted to filter for `SELECT` queries only, queries starting with parenthesis were not displayed. ([Bug#41968](#))

- The agent angel process was spawning too soon, which caused a duplicate UUID error.

`g_error()` logged a fatal error, and called `abort()`. This terminated the program. Then the angel respawned with the same UUID, but with a -1 session resync request, which the MEM server denied because the old session was still active. This resulted in a permissions denied error (1142) on the `mysql.inventory` table.

```
2008-12-17 18:58:58: (message) agent_mysqlqd.c:313: [mysql] mysqlqd is local and directly connected
2008-12-17 18:58:58: ((error)) agent_mysqlqd.c:444: [mysql] mysql_real_query("SELECT value
FROM mysql.inventory WHERE name = 'uuid'") failed: SELECT command denied to user
'ent_agent'@'127.0.0.1' for table 'inventory' (errno=1142)
2008-12-17 18:58:58: (debug) chassis.c:282: 15134 returned: 15134
2008-12-17 18:58:58: (message) chassis.c:304: [angel] PID=15134 died on signal=6 (it used
0 kBytes max) ... waiting 3min before restart
2008-12-17 18:59:00: (debug) chassis.c:244: we are the child: 15149
2008-12-17 18:59:00: (message) chassis.c:259: [angel] we try to keep PID=15149 alive
2008-12-17 18:59:00: (debug) chassis.c:277: waiting for 15149
2008-12-17 18:59:00: (message) mysql-proxy 0.7.0 started
2008-12-17 18:59:00: (message) MySQL Monitor Agent 2.0.0.7111 started.
```

[\(Bug#41600\)](#)

- `master_uuid` discovery did not work with MySQL Server versions prior to 5.1. `master_uuid` did not show in any Agent to Monitor communications, and no log or error messages were generated.

However, now the bug has been fixed, an Agent monitoring a 5.0 MySQL Server would register the following in its logs:

```
...
<classname>slavestatus</classname>
<instance>12515cdc-8c00-4223-9d2a-2666a403512c</instance>
<attribute>Master_uuid</attribute>
</target>
<utc>2009-03-03T19:58:05.700Z</utc>
<value>b2fd9f86-6e42-49f2-b930-e8fb3e728179</value>
```

Note the presence of `master_uuid`. ([Bug#41525](#))

- The `master_uuid` was not used for replication topology discovery.

The agent collected `master_uuid` by reading the `master.info` file, and then running a `SELECT` directly against its master. This was to try and read the `mysql.inventory` table on the master to obtain the instance `master_uuid`.

However, this was not being used correctly by the replication topology discovery within the server. ([Bug#41519](#))

- Queries such as `SELECT` against the master `mysql.inventory` was not logged on slave-based agents. This made diagnosing topology discovery issues difficult. ([Bug#41518](#))
- After an error was generated due to an incorrect password while trying to create a new user, the following error was obtained when subsequently attempting to create a valid new user:

```
U0002 You must log in to access the requested resource
```

[\(Bug#41384\)](#)

- Agent startup failed on Solaris 10. The error generated was:

```
# ./mysql-monitor-agent start
Bad string
ERROR! /opt/mysql/enterprise/agent/etc/mysql-monitor-agent.ini has to have a
```

```
[mysql-proxy].pid-file setting
```

This was caused by unexpected behavior of the `tr` command. (Bug#41260)

- On the Query Analysis page, if a query was clicked the minimum displayed was greater than the average. (Bug#41259)
- In some circumstances the agent/proxy ran out of file descriptors, causing secondary failures. It could not recover from that state. The relevant part of the log file is shown here:

```
2008-11-27 11:11:00: (critical) last message repeated 2 times
2008-11-27 11:11:00: (critical) job_collect_os.c:411: sigar_cpu_info_list_get() failed

```

(Bug#41068)

- If an installation of Service Manager 2.0.0.7102 included a `backup` directory, due to a previous upgrade, and was upgraded using at least Service Manager 2.0.0.7103, then the installer displayed an error message and exited.

The error message displayed was:

```
There has been an error.
Error renaming /Applications/mysql/enterprise/monitor/apache-tomcat to
/Applications/mysql/enterprise/monitor/backup/apache-tomcat
The application will exit now
```

(Bug#40996)

- The Agent started without problems and connected to the master. But it was unable to perform a `SELECT` from the table `mysql.inventory` in order to obtain server information. (Bug#40933)
- Canonical Query Text for `Select -1` was displayed as `SELECT -?` instead of `SELECT ?` on the Query Analyzer tab. (Bug#40435)
- The agent installer for Solaris 8 x86 32-bit was missing. (Bug#40248)
- The startup scripts supplied with MySQL Network Monitoring and Advisory tool did not supply all of the LSB `init.d` script options required. A list of the required options can be found at the following website [http://refspecs.freestandards.org/LSB\\_3.1.0/LSB-Core-generic/LSB-Core-generic/iniscriptact.html](http://refspecs.freestandards.org/LSB_3.1.0/LSB-Core-generic/LSB-Core-generic/iniscriptact.html)

The required options missing include `status` and `force-reload`. The option `status` is used by monitoring tools and cluster software such as Red Hat Cluster, to ensure that the service is still running. The `force-reload` option is an alias for restart. (Bug#29848)

- Multiple errors showed in the agent log after issuing a `SHOW INNODB STATUS` statement. The `InnoDB Buffer Pool` graph also went blank. (Bug#27372)

### C.3.4. Changes in MySQL Enterprise Monitor 2.0.4 (5th February 2009)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.0.3.

Bugs fixed:

- The Service Agent did not log connections to, and disconnects from, the monitored database.

This meant it was not possible to check if the Agent was connected to the database by simply looking at the log file. (Bug#42403)

- The Service Agent failed to create the `mysql.inventory` table. The logs displayed the following error message:

```
(critical) (share/mysql-proxy/quan.lua:711) [proxy] please add SELECT permissions for
this user on mysql.inventory to enable the QUAN feature, got Table 'mysql.inventory'
doesn't exist
```

This happened even though the Service Agent used the `root` account. (Bug#42389)

- After installing Service Agent 2.0.4.7138 and then starting it with `--version`, the incorrect version was displayed. Although 2.0.4.7138 was installed, the Service Agent displayed the version number as 2.0.2.7138. (Bug#42263)
- An invalid path was shown in the error message if the upgrade installer failed to find the previous install location.

The error message is shown below, note that the error message displays a different path to that provided by the user:

```
Please specify the directory that contains the previous installation of the MySQL
Enterprise Monitor Agent

Installation directory [/home/mysql/mysql/enterprise/agent]: /var/lib/mysql/agent

Warning: The directory /home/mysql/mysql/enterprise/agent does not contain a
previous installation. Please select the right installation directory.
Press [Enter] to continue :
-----
Please specify the directory that contains the previous installation of the MySQL
Enterprise Monitor Agent
```

(Bug#42200)

- The agent password error in the Service Manager did not log the originating host, making it impossible to determine the agent that failed to log in:

```
ErrorJan 5, 2009 4:56:08 PM<?xml version='1.0'?><exceptions><error><![CDATA[E1702:
IncorrectPasswordException: [agent]]]></error></exceptions>
```

(Bug#42139)

- The Service Manager's JDBC connections did not have `sql_mode` set to include `NO_ENGINE_SUBSTITUTION`. This resulted in the failure of Data Definition Language (DDL) if the Service Manager was inadvertently pointed to an incorrect `mysqld` instance. (Bug#42137)
- A number of Advisor rules had advice text that had not been translated into Japanese. The Advisors that contained untranslated rules included Performance, Schema and Security. (Bug#42067)
- Service Agent configuration files had global read privileges on the filesystem. (Bug#41794)
- When the log files rotated to the maximum allowed by the `log4j` configuration, the metadata contained in the `FileAppender` became out of synchronization due to a logic bug. This caused an assertion error on any subsequent request for the logs tab or data. (Bug#41593)
- SNMP trap messages were sending 127.0.0.1 as the IP address, and there was no feature to allow the user to configure the IP address contained in the SNMP message, which would have been useful for troubleshooting. (Bug#41361)
- On all available test systems, including SUSE Linux Enterprise Server (SLES) 9 and 10 x86-32, x86-64, IA64, and Ubuntu 6.10 x86-64, the agent memory grew incrementally within ~3 hours to ~25M.

The agents then switched to the 'red' condition on the dashboard and no more data was reported. The agent processes were still alive.

This was also present in MySQL Enterprise Monitor version 2.0.0.7111 on Suse 7.3, with the `glibc2.2` x86 agent.

There was no load on the monitored servers, and the problem also occurred when the “self-quan” was not configured. (Bug#41244)

- Although the **MONITOR** tab loaded initially, after a 64-bit MySQL server running a 32-bit MySQL Monitor Agent was clicked, a Null Pointer Exception was generated. (Bug#41164)
- The Service Agent startup configuration did not seem to work and did not generate a log file. (Bug#40583)
- An error generated by a rule failed to clear.

When a rule was created with the `os:disk:fs_used` data item, if the instance was not a valid mount point then the Service Agent reported the error:

```
2008-08-11 17:57:00: (critical) disk-get failed for all: 2
```

Note the above instance was for “all”, and similar results occurred for instance “disk”.

The issue was that upon editing the rule, or even deleting the rule, the agent still showed the above error type. Restarting the agent and the monitoring service failed to remove the error. ([Bug#38709](#))

- If the “On Save send test trap” checkbox was checked when the SAVE button was clicked and the locale was set to Japanese, an error occurred. The orange error banner was displayed at the top of the page with the error message in Japanese. ([Bug#32069](#))

### C.3.5. Changes in MySQL Enterprise Monitor 2.0.3 (23rd January 2009)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.0.2.

Bugs fixed:

- The Service Agent failed to connect to the server, and no error message was displayed in the log file.

However, when the log verbosity level was set to `message`, the following message was recorded:

```
2009-01-12 13:34:43: (warning) agent_mysql.d.c:600: agent connecting to mysql-server
failed: mysql_real_connect(host = '127.0.0.1', port = 3306, socket = ''): Lost connection
to MySQL server at 'reading initial communication packet', system error: 0 (mysql-errno =
2013)
```

([Bug#42044](#))

- There was a mismatch between the contents of an SNMP Trap from MySQL Enterprise Monitor and the definition given in the file `MONITOR.MIB`. ([Bug#41912](#))
- If a copy was made of a standard rule, the resulting Wiki markup was incorrect, resulting in the display of user-interface text containing HTML markup. ([Bug#41375](#))
- Allowing the heat chart rules to be set to unscheduled caused the user interface to appear broken. ([Bug#41312](#))
- When a custom rule requiring disk information was created, for example:

```
[Expression]
%disk_reads% > THRESHOLD

[Thresholds]
Critical Alert: 9000
Warning Alert: 3000
Info Alert: 1000

[Variable Assignment]
variables: %disk_reads%
Data Item: os:disk:disk_reads
Instance: /
```

The following error was written to the file `mysql-service-agent.log`:

```
2007-09-05 17:11:00: (critical) disk-get failed for c0d0p1: 2
```

It therefore appeared that the Service Agent was not able to obtain the required information. ([Bug#30820](#))

### C.3.6. Changes in MySQL Enterprise Monitor 2.0.2 (14th January 2009)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.0.1.

Bugs fixed:

- The COMPLETE SETUP button was missing from the `SETUP` page you were taken to after the current subscription expired. ([Bug#41685](#))
- If the `host-id` of the monitored instance and the `host-id` of the current agent did not match, the agent generated the following error message:

```
Please TRUNCATE TABLE mysql.inventory on this mysql-instance and restart the agent.
```

However, it did not suggest using `sql_log_bin = 0`. This is used for all other actions against this table so that they are not replicated to slaves, each of which has their own copy of this table. (Bug#41673)

- The Agent did not start up when the monitored server had many databases and tables, and was under heavy load. This was because the `trigger_schema` query was taking too long on agent start up. (Bug#41555)
- The Service Agent failed to install on Solaris 10 x86. The following error was generated:

```
Installing
0% _____ 50% _____ 100%
#####
Warning: Problem running post-install step.
Installation may not complete correctly
Error running /usr/local/mysqlagent/bin/mysql-monitor-agent
--defaults-file=/usr/local/mysqlagent/etc/mysql-monitor-agent.ini
--plugins=agent --agent-generate-uuid=true : 2008-12-12 13:06:02: (critical)
Conversion from character set '646' to 'UTF-8' is not supported
2008-12-12 13:06:02: (message) shutting down normally
```

(Bug#41445)

- The console/stdout appender remained in the log4j configuration, which meant that all the MySQL Enterprise Monitor server logs were duplicated to Catalina's stdout, and thus `catalina.out`, which was wasteful, especially as that file was not rotated or managed. (Bug#41439)
- When creating new multiple user accounts, the first attempt worked fine. However, following attempts to create new users did not show the **QUERY ANALYZER OPTIONS** in the **CREATE USER** popup until the role field was changed. (Bug#41430)
- When login privileges were required the Service Manager did not redirect the user to the login page. This resulted in error messages being displayed rather than simply redirecting the user to the login page. This problem typically occurred if it was necessary to restart Tomcat. (Bug#41320)
- The monitor 2.0.0.7105 and 2.0.0.7122 Solaris Intel update installer quits unexpectedly. The installer exits from the GUI in the **BACKUP OF PREVIOUS INSTALLATION** screen, when OpenSolaris is running on top of Sun xVM.

The console output for both installer versions is given below:

```
shell> ./mysqlmonitor-2.0.0.7105-solaris-intel-update-installer.bin
X Error of failed request: BadMatch (invalid parameter attributes)
Major opcode of failed request: 73 (X_GetImage)
Serial number of failed request: 21161
Current serial number in output stream: 21161
```

```
shell> ./mysqlmonitor-2.0.0.7122-solaris-intel-update-installer.bin
X Error of failed request: BadMatch (invalid parameter attributes)
Major opcode of failed request: 73 (X_GetImage)
Serial number of failed request: 21148
Current serial number in output stream: 21148
```

(Bug#41315)

- The **RENAME GROUP** function failed if the new group name was different to the current one only in the case used; for example, if "Merlin" was changed to "MERLIN".

The error generated was:

```
U0105 This group name is already in use. Enter a different name.
```

(Bug#41266)

- The Agent returned an inventory list of all databases and tables. This information was not used by MySQL Enterprise Monitor, other than to populate the `inv_databases` and `inv_tables` tables. For large-scale deployments, where there were many databases and tables, this resulted in redundant XML messages being sent from the Agent to the Service Manager. (Bug#33150)

### C.3.7. Changes in MySQL Enterprise Monitor 2.0.1 (15th December 2008)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.0.0.

Bugs fixed:

- Having an installation with over 420 master binlogs resulted in the `mysql::status` graph not being plotted. (Bug#41314)
- The MySQL Enterprise Monitor installer generated a segfault on RedHat Fedora 10:

```
shell> ./mysqlmonitor-2.0.0.7105-linux-x86-installer.bin
Segmentation fault
```

(Bug#41196)

### C.3.8. Changes in MySQL Enterprise Monitor 2.0.0 (11th December 2008)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 1.3.3.

Functionality added or changed:

- **Important Change:** The `server-name` configuration parameter is deprecated. For compatibility, during an upgrade, the information will be migrated to a `displayname` configuration parameter within the individual instance configuration files. This configuration parameter is provided only for compatibility, as display name information is now stored within the main repository. Support for `displayname` is also deprecated and will be removed in a future release.
- **Important Note:** The rules “32-Bit Binary Running on 64-Bit AMD Or Intel System” and “Key Buffer Size Greater Than 4 GB” occasionally do not evaluate correctly due to timing issues. This causes them to be displayed with the **SEVERITY** level of “Unknown”. This is a known issue and will be resolved in future versions of MySQL Enterprise Monitor.
- **Important Note:** When you start the Merlin 2.0 agent from the command line on Windows, you get the following error dialog:

```
"mysql-proxy.exe - Entry Point Not Found"
"The procedure entry point libiconv_set_relocation_prefix could not be located in the
dynamic link library iconv.dll"
```

If you click OK the agent works fine after that.

This only occurs when starting the agent from the command line, and only when there is another version of one of the DLLs that the agent uses somewhere on the current path. This error can be avoided by opening a command prompt, typing `SET PATH=` to clear the path, and then starting the agent.

- **Important Note:** If you are monitoring one instance of MySQL server (`mysqld`) and then upgrade that MySQL server, the correct version of the MySQL server is not displayed in the Dashboard. This is a known issue that will be fixed in future versions of MySQL Enterprise Monitor.
- The following has been added to the Tomcat `config.properties` properties file:

```
# max connections in the pool for the repository
default.maxActive=70
```

(Bug#40652)

- The dashboard could be used to change the agent password to one containing the `@` character, or other special characters, which subsequently caused errors. To fix this problem, special characters in passwords are now prevented by the dashboard. The list of disallowed special characters can be found at the following location: [http://en.wikipedia.org/wiki/Percent-encoding#Types\\_of\\_URI\\_characters](http://en.wikipedia.org/wiki/Percent-encoding#Types_of_URI_characters) (Bug#37172)
- The **QUERY ANALYSIS** page was missing the **REFRESH** dropdown control that the **MONITOR**, **EVENTS**, and **GRAPHS** pages had at the top. (Bug#36831)
- The User Interface only returned error strings, without any associated error codes. This meant that if the error string was in a language that the user did not understand, it would be very difficult to determine which error actually occurred.

The User Interface now supports error codes, as well as error strings. This change allows easier testing of multiple locales. (Bug#32131)

- The wording was changed on the fading popup subscription alert. The text “account” was changed to “subscription”. (Bug#31492)
- The alert thresholds for the Query Cache Advisor were changed:

	Information	Warning	Critical
From	95	85	75
To	60	50	40

([Bug#30969](#))

- The agent log file name has changed from `mysql-service-agent.log` to `mysql-monitor-agent.log`. The old log file will be retained during a upgrade install.

Bugs fixed:

- Starting a new agent against an instance that contained many databases broke up the initial discovery packet, causing collections such as CPU usage and their graphs to fail. See also [Bug#33150](#) and [Bug#41314](#). ([Bug#41933](#))
- When altering an existing rule you had to add an empty string, "", to any threshold level that was empty. Otherwise, the rule failed to run and the resulting exceptions caused the **EVENTS** page to be unusable due to duplicate key exceptions. ([Bug#41310](#))
- After installing the 2.0.0.7119 Dashboard the following error was generated in the logs:

```
com.opensymphony.xwork2.util.OgnlValueStack Warning Dec 5, 2008 10:41:26 AM Caught
an Ognl exception while getting property titleAddition
```

([Bug#41252](#))

- The `dc_ng_long_now` table became very large partly due to an unused column `begin_time`. ([Bug#41093](#))
- Although there was a unique constraint on the user name, it was not enforced during first-time setup. This resulted in a stack trace being produced, rather than a more user-friendly error message, if the same name was used for the `admin` and `agent` accounts. ([Bug#40870](#))
- MySQL Enterprise Monitor server had stopped sending up/down SNMP traps. ([Bug#40861](#))
- The Query Analyzer's **EXPLAIN QUERY** tab did not have pop up text or a link to the documentation regarding **SELECT** queries. ([Bug#40841](#))
- When you tried to import a Trial-level advisor JAR using a Trial user account, one of the following error messages was generated:

```
U0009 The uploaded Advisor jar was invalid
```

```
U0161 Please import a Platinum level Advisor .jar to use with this Platinum level product key
```

([Bug#40834](#))

- Meta Info on the Dashboard did not display information for the meta data `os_description`. ([Bug#40830](#))
- Attempting to create an alias of statements such as `COMMIT`, `ROLLBACK`, `BEGIN`, resulted in the error:

```
Can't find template commitTxn.st; group hierarchy is [HTMLFormatting]
org.antlr.stringtemplate.StringTemplateGroup.lookupTemplate(StringTemplateGroup.java:507)
```

([Bug#40736](#))

- Trying to upgrade from 2.0.0.7088 to 2.0.0.7092 failed as there was a missing file. When the update program `mysqlmonitor-2.0.0.7092-solaris-intel-update-installer.bin` was run, the file `/tmp/com/mysql/merlin/server/version.props` could not be found. ([Bug#40692](#))
- On OS X with Java 1.5, Tomcat crashed on launch with the error:

```
Invalid memory access of location 00000007 eip=013df179
```

([Bug#40689](#))

- When the agent was installed using the command line installer and `--enableproxy 0` was specified, the installer should have removed `quan.lua` from the `agent-item-files` option in the INI file. ([Bug#40551](#))

- The Agent could not connect to a database with the `hostname` set to `localhost`. Doing so resulted in the error:  

```
(critical) the MySQL server could not be reached at socket '(null)', we will check in 10 seconds
```

  
(Bug#40530)
- The update installer for the 2.0 Monitor did not have an **IS SSL SUPPORT REQUIRED?** checkbox. Therefore, the appropriate SSL connector definition was commented out in the `conf/server.xml` file. (Bug#40414)
- The Service Manager installer did not uninstall or wipe out the previous installation if you answered “Yes” to the question: “The directory you selected already contains a MySQL installation. If you continue installation all data will be lost. Do you wish to continue?” (Bug#40410)
- If you unchecked the **ENABLE PROXY** checkbox on the **QUERY ANALYSIS CONFIGURATION** screen, the agent's INI file still contained proxy configuration data and was not commented out. (Bug#40272)
- As different queries were sent through the agent it used increasing amounts of memory. (Bug#40260)
- The Service Manager installer set the Java Virtual Machine option `HeapDumpPath` to `<install_root>\temp` on Windows and `/tmp` on other platforms. For consistency the `HeapDumpPath` directory should have been set to `<install_root>\tmp` on Windows. (Bug#40215)
- When using the command line agent setup program, a socket file was not accepted for the monitored instance. (Bug#40085)
- The language option when installing the MySQL Enterprise Monitor in Japanese using the command-line installer has been changed from `jp` to `ja`. (Bug#40082)
- When monitoring MySQL 5.1.24 and above, the user used by the agent to connect to the MySQL server for monitoring must have the `PROCESS` privilege. (Bug#40050)
- The check box option string “Is SSL support required?”, on the Tomcat Server Option dialog of the Monitor installation, was not correctly translated into Japanese. (Bug#39814)
- The base application directory for the MySQL Enterprise Dashboard has been updated from `http://localhost:18080/merlin` to `http://localhost:18080/`. (Bug#39403)
- If the Service Manager or the MySQL Server running the Repository crashed, they did not restart automatically. (Bug#39377)
- If the agent crashed, there was no watchdog, angel or keep-alive mechanism to restart the agent and keep it running. (Bug#39374)
- If the MySQL client libraries were located in a non-standard location, the agent 2.0.0.7042 installer failed with a “library not found” error. (Bug#39317)
- For the rule “Server-Enforced Data Integrity Checking Not Strict”, the Recommended Action did not display correctly. It displayed as `SET sql_mode=modes`, rather than `SET [GLOBAL|SESSION] sql_mode=modes`. (Bug#39261)
- A query that was issued through the proxy, and that had an auto-explain performed on that query, did not give the correct response to a subsequent query of `SELECT FOUND_ROWS()`. (Bug#39223)
- It was not possible to establish a connection with the Dashboard using the SSL protocol (`https://`). (Bug#39198)
- When a 1.3 MySQL Enterprise Monitor installation with many rules scheduled was upgraded to 2.0, the upgraded installation was then found to have only the heat chart rules scheduled. (Bug#39043)
- The agent installer did not allow a second agent to be installed on Windows. (Bug#38976)
- The Dashboard incorrectly displayed that insufficient licenses were available, even though sufficient licenses had been purchased. (Bug#38514)
- After running the MySQL Service Agent uninstall program, the file `/etc/init.d/mysql-service-agent` remained present on the server. (Bug#38490)
- The notice fader continued to display English text after you changed the locale to Japanese. (Bug#38460)
- The **SUBSCRIPTION EXPIRED** pop-up window referred to the “Global Preferences” page, instead of the “Global Settings” page. (Bug#38358)
- An inappropriate time zone was used to parse user-entered date and time strings. (Bug#38323)

- A sigar network stats error was generated on the Solaris platform:

```
# /opt/mysql/enterprise/agent/bin/mysql-service-agent --version
MySQL Service Agent - 1.2.0.7879, (glib lib=2.8.5, headers=2.8.5)

SunOS mysqlprd01 5.10 Generic_127127-11 sun4v sparc SUNW,T5240

2008-07-21 10:07:24: (critical) sigar_net_interface_config_primary_get() failed: 6
2008-07-21 10:08:00: (critical) sigar_net_interface_config_primary_get() failed: 6

# /opt/mysql/enterprise/agent/bin/sigar-test-all >/tmp/test.txt
sigar_net_interface_stat_get(e1000g0:2) failed#
```

([Bug#38302](#))

- After deleting a server from the **SETTINGS, MANAGE SERVERS** tab, at the very bottom of the page the **MONITORING X INSTANCES ON X HOST** values did not reflect the deletion. ([Bug#38225](#))
- The MySQL Enterprise Monitor alert “INFO Alert - Users Can View All Databases On MySQL Server (v 1.5 \*)” from the Security advisor was incorrect. This is because the default server behavior allows users to see databases for which they have privileges, not “all databases on server” as suggested by the alert. ([Bug#38052](#))
- The “Maximum Connection Limit Nearing Or Reached” advisor did not generate a new Critical Alert event when there was an open info success event. ([Bug#37816](#))
- The Linux IA64 installer appeared to crash. The installer appeared to crash on RH4\_IA64 if called with option "--version":

```
-----
<INSTALLER> --version
mysqlmonitorage(30704): unaligned access to 0x6000000000a8413c, ip=0x2000000003ddd5f0
mysqlmonitorage(30704): unaligned access to 0x6000000000a84144, ip=0x2000000003ddd5f1
mysqlmonitorage(30704): unaligned access to 0x6000000000a8414c, ip=0x2000000003ddd600
mysqlmonitorage(30704): unaligned access to 0x6000000000a84154, ip=0x2000000003ddd601
MySQL Enterprise Monitor Agent 0.7.0.1737 --- Built on 2008-06-25 19:31:53
-----
```

However, this warning is harmless and will not impact the operation of the agent. ([Bug#37496](#))

- If the log-level option in the agent configuration file was set to an unknown level by mistake, the `init.d` script appeared to enter an infinite loop. ([Bug#37108](#))
- Malformatted server meta information appeared on the Dashboard; **RAM** and **DISK SPACE** appeared under the **CPU** category. ([Bug#36740](#))
- A “rename” link incorrectly appeared next to the **UPGRADE** category on the **MANAGE RULES** page. ([Bug#36584](#))
- In the case where exceptions were passed through to the User Interface, the substituted arguments in the message contained developer-only information. ([Bug#36580](#))
- **AGENT VERSION, LAST MYSQL CONTACT, OS INFO, CPU INFO, and IP ADDRESSES** were all blank on the dashboard when the agent for the selected server was not functioning. ([Bug#36301](#))
- `mysql-monitor-agent` became confused by the `.DS_Store` files that are created on Mac OS X. ([Bug#36216](#))
- The rule “Key Buffer Size Greater Than 4 GB” incorrectly triggered the following alert:

```
CRITICAL ALERT - KEY BUFFER SIZE GREATER THAN 4 GB
```

However, on non-Windows systems, a key buffer size greater than 4 GB is supported. ([Bug#36143](#))

- Since the repository database for MySQL Enterprise Monitor uses InnoDB there was no way to reduce the size of the data files after an old log/event data purge operation. Further, the purge data operation executed once per day, and had no option to trigger the purge operation manually. ([Bug#35971](#))
- On the Graphs page, if all graphs were expanded, then the Time Display interval updated, the page was refreshed with the EXPAND ALL button displayed, even though all the graphs were already expanded. ([Bug#35917](#), [Bug#35133](#))
- The Meta Info area of the Monitor page incorrectly reported the operating system version number for the MySQL version. ([Bug#35836](#))
- The rule “XA Distributed Transaction Support Enabled For InnoDB” incorrectly sent a warning when the binary log was on. ([Bug#35786](#))
- On the Monitor page, the time displayed for `Last MySQL Contact` lagged behind that for `Last Agent Contact` by a

large amount. ([Bug#35774](#))

- MySQL Enterprise Monitor did not update replication settings correctly. After a slave became the master, the Adviser still referred to it as a slave. ([Bug#35771](#))
- The Adviser email suggested using the `--log-queries-not-using-indexes` option. However, this option is not available in MySQL Server versions prior to 4.1. ([Bug#35770](#))
- Thumbnail graphs did not update properly after a time zone change. ([Bug#35756](#))
- If a system had a global `wait_timeout` lower than the general activity of the agent, the agent was disconnected. The monitored server then logged an error and incremented `Aborted_clients`. ([Bug#35648](#))
- Alerts fired after a blackout period based on data collections that happened during the blackout. ([Bug#35617](#))
- The translation of the ADD ROW button on the Rule Definition window was incorrect. ([Bug#35495](#))
- An uninstallation message asked about removing Apache files, even though Apache is no longer used. ([Bug#35154](#))
- After updating from a previous version to the latest 1.3 version, the **QUERY CACHE HAS SUB-OPTIMAL HIT RATE** was still displayed in English after setting the locale to Japanese. Note, the rule was translated correctly if the full installer was used. ([Bug#35134](#))
- The MySQL Enterprise Monitor uninstall dialog box had missing text when using the Japanese locale. ([Bug#34982](#))
- Running the installer with the `--help` option caused an incorrect message to be displayed. ([Bug#34200](#))
- When using the unattended `unInstall` script on Linux together with the option `--env deleteUserData=yes` the correct warning text was displayed. However, this text should not be displayed in unattended mode. Further, the option `--env deleteUserData=yes` was not displayed by the `--help` output. ([Bug#34071](#))
- Platinum Unlimited customers sometimes received a warning stating incorrectly that their subscription supported zero hosts. ([Bug#34010](#))
- Clicking on the resolution notes link for a closed event on the events tab showed incorrect behaviour. The popup initially showed the resolution notes, but when the resolution tab was clicked the notes disappeared and were replaced by an edit box. ([Bug#33935](#))
- The status on the product information page was not translated when the user locale was set to Japanese. ([Bug#32785](#))
- When the locale was set to Japanese, the date picker still had English month titles. ([Bug#32741](#))
- Flashing display of a pop-up used while saving outgoing email settings was caused by problematic initial placement calculations. ([Bug#32579](#))
- AIX 5.2 Agent did not work on AIX 5.3. ([Bug#32414](#))
- When the First Time Setup program was run it did not prompt the user to allow importing an Advisor bundle. ([Bug#32199](#))
- Agent on MacOSX did not read IP addresses for network interfaces correctly, so the monitor displayed empty host IP addresses. ([Bug#32188](#))
- HTML code in queries was not escaped when reporting replication errors, causing the code to be rendered into the page. ([Bug#32186](#))
- The First Run pop-up defaulted to English rather than to the locale set in the browser. ([Bug#32129](#))
- The error dialog box flashed in the upper left corner before being positioned in the center of the screen. This error dialog box now opens in the center of the screen. ([Bug#32068](#))
- The Events list did not take into account Daylight Time and Standard Time when listing events that happened during 1:00am-1:59am. An event that occurred at 1:10am Standard Time was listed before an event that occurred 50 minutes before it at 1:20am Daylight Time. ([Bug#32016](#))
- The pop-up for editing log levels failed to load due to bad instantiation data. ([Bug#32013](#))
- During the repeated hour of Daylight Savings Time (when 2am turns back into 1am), the graphs were not drawing data. Instead, there was a straight line from the point at 1:00 to the second 1:00, which is what happens if there is no data. The repository did, however, have data for this hour. ([Bug#31997](#))
- Only US English was supported for a locale setting. Other English variants are now available for the `locale` setting on the

[General Settings](#) or the [User Preferences](#) pages. (Bug#31801)

- If the user locale was changed the graph cache would continue to display the graph in the last locale until it timed out. (Bug#31680)
- No init script was installed for the MySQL Network Monitoring Service Manager, and so it did not restart automatically on re-boot. (Bug#31676)
- The graph's displayed time was not the local time of the Dashboard corresponding to the requested time on the monitored server. (Bug#31656)
- Saving a rule with a name that already existed resulted in a stack trace in the window, instead of a more user-friendly error message. (Bug#30925)
- The `network.mysql.com` error messages were remapped thereby causing confusion. For example, the following error message:

```
E9000: MYSQL ENTERPRISE CUSTOMER CENTER IS HAVING DIFFICULTIES FETCHING YOUR CONTRACT INFORMATION.
PLEASE CONTACT ENTERPRISE-FEEDBACK@MYSQL.COM FOR ASSISTANCE.
```

Was remapped to:

```
UNABLE TO CONNECT TO VERIFY CREDENTIALS (Bug#30873)
```

- A newly added server showed as “down” in the user interface, and could potentially have sent a false alarm notification. (Bug#30735)
- The information on the [ADVISORS, CHECK FOR UPDATES](#) page did not accurately reflect how many rules and graphs were actually in the database and available to the user. (Bug#29623)
- The agent did not process `SIGHUP`. (Bug#29380)
- Monitor did not have a facility to stop or downgrade an agent collection frequency. (Bug#28589)
- After an agent installation was updated from 1.0.1.4391 to 1.1.0.4899, the version in the [ADD/REMOVE PROGRAMS](#) menu was incorrectly displayed as 1.0.1.4391, even though the update was successful and the file version of `agent.exe` was correctly displayed as 1.1.0.4899. (Bug#27447)
- When viewing the **RESULTS** of an **EVENT** in the **EVENTS** tab of the **DASHBOARD**, the **NOTIFICATIONS** section did not reflect the **NOTIFICATIONS** settings at the time the **EVENT** was triggered, but rather the **NOTIFICATIONS** settings at the time the **EVENT RESULTS** were viewed. (Bug#26349)
- When the Service Agent was remotely monitoring a MySQL server it incorrectly reported that it could collect operating system information. (Bug#22497)
- The Account Without Password advisor did not report all users who were without a password, it only reported one. (Bug#15165)

## C.4. MySQL Connector/ODBC (MyODBC) Change History

### C.4.1. Changes in MySQL Connector/ODBC 5.1.6 (Not yet released)

Bugs fixed:

- Connector/ODBC failed to build with MySQL 5.1.30 due to incorrect use of the data type `bool`. (Bug#42120)
- Calling `SQLDescribeCol()` with a NULL buffer and nonzero buffer length caused a crash. (Bug#41942)
- MySQL Connector/ODBC updated some fields with random values, rather than with `NULL`. (Bug#41256)
- Calling `SQLDriverConnect()` with a `NULL` pointer for the output buffer caused a crash if `SQL_DRIVER_NOPROMPT` was also specified:

```
SQLDriverConnect(dbc, NULL, "DSN=myodbc5", SQL_NTS, NULL, 0, NULL, SQL_DRIVER_NOPROMPT)
```

(Bug#40316)

- Setting the ADO `Recordset` decimal field value to 44.56 resulted in an incorrect value of 445600.0000 being stored when

the record set was updated with the `Update` method. (Bug#39961)

- The `SQLTablesW` API gave incorrect results. For example, table name and table type were returned as `NULL` rather than as the correct values. (Bug#39957)
- MyODBC would crash when a character set was being used on the server that was not supported in the client, for example `cp1251`:

```
[MySQL][ODBC 5.1 Driver][mysqld-5.0.27-community-nt]Restricted data type attribute violation
```

The fix causes MyODBC to return an error message instead of crashing. (Bug#39831)

- When the `SQLTables` method was called with `NULL` passed as the `tablename` parameter, only one row in the `resultset`, with table name of `NULL` was returned, instead of all tables for the given database. (Bug#39561)
- The `SQLGetInfo()` function returned 0 for `SQL_CATALOG_USAGE` information. (Bug#39560)
- MyODBC Driver 5.1.5 was not able to connect if the connection string parameters contained spaces or tab symbols. For example, if the `SERVER` parameter was specified as “SERVER= localhost” instead of “SERVER=localhost” the following error message will be displayed:

```
[MySQL][ODBC 5.1 Driver] Unknown MySQL server host ' localhost' (11001).
```

(Bug#39085)

- The pointer passed to the `SQLDriverConnect` method to retrieve the output connection string length was one greater than it should have been due to the inclusion of the `NULL` terminator. (Bug#38949)
- Data-at-execution parameters were not supported during positioned update. This meant updating a long text field with a cursor update would erroneously set the value to null. This would lead to the error `Column 'column_name' cannot be null` while updating the database, even when `column_name` had been assigned a valid non-null string. (Bug#37649)
- The `SQLDriverConnect` method truncated the `OutputConnectionString` parameter to 52 characters. (Bug#37278)
- The connection string option `Enable Auto-reconnect` did not work. When the connection failed, it could not be restored, and the errors generated were the same as if the option had not been selected. (Bug#37179)
- Insertion of data into a `LONGTEXT` table field did not work. If such an attempt was made the corresponding field would be found to be empty on examination, or contain random characters. (Bug#36071)
- No result record was returned for `SQLGetTypeInfo` for the `TIMESTAMP` data type. An application would receive the result `return code 100 (SQL_NO_DATA_FOUND)`. (Bug#30626)
- It was not possible to use Connector/ODBC to connect to a server using SSL. The following error was generated:

```
Runtime error '-2147467259 (80004005)':
```

```
[MySQL][ODBC 3.51 Driver]SSL connection error.
```

(Bug#29955)

- When the `recordSet.Update` function was called to update an `adLongVarChar` field, the field was updated but the recordset was immediately lost. This happened with driver cursors, whether the cursor was opened in optimistic or pessimistic mode.

When the next update was called the test code would exit with the following error:

```
-2147467259 : Query-based update failed because the row to update could not be found.
```

(Bug#26950)

## C.4.2. Changes in MySQL Connector/ODBC 5.1.5 (18 August 2008)

Bugs fixed:

- ODBC `TIMESTAMP` string format is not handled properly by the MyODBC driver. When passing a `TIMESTAMP` or `DATE` to MyODBC, in the ODBC format: `{d <date>}` or `{ts <timestamp>}`, the string that represents this is copied once into the SQL statement, and then added again, as an escaped string. (Bug#37342)

- The connector failed to prompt for additional information required to create a DSN-less connection from an application such as Microsoft Excel. ([Bug#37254](#))
- `SQLDriverConnect` does not return `SQL_NO_DATA` on cancel. The ODBC documentation specifies that this method should return `SQL_NO_DATA` when the user cancels the dialog to connect. The connector, however, returns `SQL_ERROR`. ([Bug#36293](#))
- Assigning a string longer than 67 characters to the `TableType` parameter resulted in a buffer overrun when the `SQLTables()` function was called. ([Bug#36275](#))
- The ODBC connector randomly uses logon information stored in `odbc-profile`, or prompts the user for connection information and ignores any settings stored in `odbc-profile`. ([Bug#36203](#))
- After having successfully established a connection, a crash occurs when calling `SQLProcedures()` followed by `SQLFreeStmt()`, using the ODBC C API. ([Bug#36069](#))

### C.4.3. Changes in MySQL Connector/ODBC 5.1.4 (15 April 2008)

Bugs fixed:

- Wrong result obtained when using `sum()` on a `decimal(8,2)` field type. ([Bug#35920](#))
- The driver installer could not create a new DSN if many other drivers were already installed. ([Bug#35776](#))
- The `SQLColAttribute()` function returned `SQL_TRUE` when querying the `SQL_DESC_FIXED_PREC_SCALE` (`SQL_COLUMN_MONEY`) attribute of a `DECIMAL` column. Previously, the correct value of `SQL_FALSE` was returned; this is now again the case. ([Bug#35581](#))
- On Linux, `SQLGetDiagRec()` returned `SQL_SUCCESS` in cases when it should have returned `SQL_NO_DATA`. ([Bug#33910](#))
- The driver crashes ODBC Administrator on attempting to add a new DSN. ([Bug#32057](#))

### C.4.4. Changes in MySQL Connector/ODBC 5.1.3 (26 March 2008)

Platform specific notes:

- **Important Change:** You must uninstall previous 5.1.x editions of Connector/ODBC before installing the new version.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.

Bugs fixed:

- **Important Change:** In previous versions, the SSL certificate would automatically be verified when used as part of the Connector/ODBC connection. The default mode is now to ignore the verification of certificates. To enforce verification of the SSL certificate during connection, use the `SSLVERIFY` DSN parameter, setting the value to 1. ([Bug#29955](#), [Bug#34648](#))
- Inserting characters to a UTF8 table using surrogate pairs would fail and insert invalid data. ([Bug#34672](#))
- Installation of Connector/ODBC would fail because it was unable to uninstall a previous installed version. The file being requested would match an older release version than any installed version of the connector. ([Bug#34522](#))
- Using `SqlGetData` in combination with `SQL_C_WCHAR` would return overlapping data. ([Bug#34429](#))
- Descriptor records were not cleared correctly when calling `SQLFreeStmt(SQL_UNBIND)`. ([Bug#34271](#))
- The dropdown selection for databases on a server when creating a DSN was too small. The list size now automatically adjusts up to a maximum size of 20 potential databases. ([Bug#33918](#))

- Microsoft Access would be unable to use `DBEngine.RegisterDatabase` to create a DSN using the Connector/ODBC driver. ([Bug#33825](#))
- Connector/ODBC erroneously reported that it supported the `CAST()` and `CONVERT()` ODBC functions for parsing values in SQL statements, which could lead to bad SQL generation during a query. ([Bug#33808](#))
- Using a linked table in Access 2003 where the table has a `BIGINT` column as the first column in the table, and is configured as the primary key, shows `#DELETED` for all rows of the table. ([Bug#24535](#))
- Updating a `RecordSet` when the query involves a `BLOB` field would fail. ([Bug#19065](#))

## C.4.5. Changes in MySQL Connector/ODBC 5.1.2 (13 February 2008)

MySQL Connector/ODBC 5.1.2-beta, a new version of the ODBC driver for the MySQL database management system, has been released. This release is the second beta (feature-complete) release of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a beta release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data.

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.
- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that uninstall any existing versions of Connector/ODBC 5.1.x before upgrading.

See also [Bug#34571](#).

Functionality added or changed:

- Explicit descriptors are implemented. ([Bug#32064](#))
- A full implementation of `SQLForeignKeys` based on the information available from `INFORMATION_SCHEMA` in 5.0 and later versions of the server has been implemented.
- Changed `SQL_ATTR_PARAMSET_SIZE` to return an error until support for it is implemented.
- Disabled `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` when using an SSL connection.
- `SQLForeignKeys` uses `INFORMATION_SCHEMA` when it is available on the server, which allows more complete information to be returned.

Bugs fixed:

- The `SSLCIPHER` option would be incorrectly recorded within the SSL configuration on Windows. ([Bug#33897](#))
- Within the GUI interface, when connecting to a MySQL server on a non-standard port, the connection test within the GUI would fail. The issue was related to incorrect parsing of numeric values within the DSN when the option was not configured as the last parameter within the DSN. ([Bug#33822](#))
- Specifying a non-existent database name within the GUI dialog would result in an empty list, not an error. ([Bug#33615](#))
- When deleting rows from a static cursor, the cursor position would be incorrectly reported. ([Bug#33388](#))
- `SQLGetInfo()` reported characters for `SQL_SPECIAL_CHARACTERS` that were not encoded correctly. ([Bug#33130](#))
- Retrieving data from a `BLOB` column would fail within `SQLGetData` when the target data type was `SQL_C_WCHAR` due to incorrect handling of the character buffer. ([Bug#32684](#))

- Renaming an existing DSN entry would create a new entry with the new name without deleting the old entry. ([Bug#31165](#))
- Reading a `TEXT` column that had been used to store UTF8 data would result in the wrong information being returned during a query. ([Bug#28617](#))
- `SQLForeignKeys` would return an empty string for the schema columns instead of `NULL`. ([Bug#19923](#))
- When accessing column data, `FLAG_COLUMN_SIZE_S32` did not limit the octet length or display size reported for fields, causing problems with Microsoft Visual FoxPro.

The list of ODBC functions that could have caused failures in Microsoft software when retrieving the length of `LONGBLOB` or `LONGTEXT` columns includes:

- `SQLColumns`
- `SQLColAttribute`
- `SQLColAttributes`
- `SQLDescribeCol`
- `SQLSpecialColumns` (theoretically can have the same problem) ([Bug#12805](#), [Bug#30890](#))
- Dynamic cursors on statements with parameters were not supported. ([Bug#11846](#))
- Evaluating a simple numeric expression when using the OLEDB for ODBC provider and ADO would return an error, instead of the result. ([Bug#10128](#))
- Adding or updating a row using `SQLSetPos()` on a result set with aliased columns would fail. ([Bug#6157](#))

## C.4.6. Changes in MySQL Connector/ODBC 5.1.1 (13 December 2007)

MySQL Connector/ODBC 5.1.1-beta, a new version of the ODBC driver for the MySQL database management system, has been released. This release is the first beta (feature-complete) release of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a beta release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data.

Includes changes from [Connector/ODBC 3.51.21](#) and [3.51.22](#).

Built using MySQL 5.0.52.

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.
- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that un-install any existing versions of Connector/ODBC 5.1.x before upgrading.

See also [Bug#34571](#).

Functionality added or changed:

- **Incompatible Change:** Replaced `myodbc3i` (now `myodbc-installer`) with Connector/ODBC 5.0 version.
- **Incompatible Change:** Removed `monitor` (`myodbc3m`) and `dsn-editor` (`myodbc3c`).
- **Incompatible Change:** Disallow `SET NAMES` in initial statement and in executed statements.

- A wrapper for the `SQLGetPrivateProfileStringW()` function, which is required for Unicode support, has been created. This function is missing from the unixODBC driver manager. (Bug#32685)
- Added MSI installer for Windows 64-bit. (Bug#31510)
- Implemented support for `SQLCancel()`. (Bug#15601)
- Added support for `SQL_NUMERIC_STRUCT`. (Bug#3028, Bug#24920)
- Removed non-threadsafe configuration of the driver. The driver is now always built against the threadsafe version of libmysql.
- Implemented native Windows setup library
- Replaced the internal library which handles creation and loading of DSN information. The new library, which was originally a part of Connector/ODBC 5.0, supports Unicode option values.
- The Windows installer now places files in a subdirectory of the `Program Files` directory instead of the Windows system directory.

#### Bugs fixed:

- The `SET NAMES` statement has been disabled because it causes problems in the ODBC driver when determining the current client character set. (Bug#32596)
- `SQLDescribeColW` returned UTF-8 column as `SQL_VARCHAR` instead of `SQL_WVARCHAR`. (Bug#32161)
- ADO was unable to open record set using dynamic cursor. (Bug#32014)
- ADO applications would not open a `RecordSet` that contained a `DECIMAL` field. (Bug#31720)
- Memory usage would increase considerably. (Bug#31115)
- SQL statements are limited to 64KB. (Bug#30983, Bug#30984)
- `SQLSetPos` with `SQL_DELETE` advances dynamic cursor incorrectly. (Bug#29765)
- Using an ODBC prepared statement with bound columns would produce an empty result set when called immediately after inserting a row into a table. (Bug#29239)
- ADO Not possible to update a client side cursor. (Bug#27961)
- Recordset `Update()` fails when using `adUseClient` cursor. (Bug#26985)
- Connector/ODBC would fail to connect to the server if the password contained certain characters, including the semicolon and other punctuation marks. (Bug#16178)
- Fixed `SQL_ATTR_PARAM_BIND_OFFSET`, and fixed row offsets to work with updatable cursors.
- `SQLSetConnectAttr()` did not clear previous errors, possibly confusing `SQLError()`.
- `SQLError()` incorrectly cleared the error information, making it unavailable from subsequent calls to `SQLGetDiagRec()`.
- NULL pointers passed to `SQLGetInfo()` could result in a crash.
- `SQL_ODBC_SQL_CONFORMANCE` was not handled by `SQLGetInfo()`.
- `SQLCopyDesc()` did not correctly copy all records.
- Diagnostics were not correctly cleared on connection and environment handles.

## C.4.7. Changes in MySQL Connector/ODBC 5.1.0 (10 September 2007)

This release is the first of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is an alpha release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data. Not all of the features planned for the final Connector/ODBC 5.1 release are implemented.

Functionality is based on Connector/ODBC 3.51.20.

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- There are no installer packages for Microsoft Windows x64 Edition.
- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that un-install any existing versions of Connector/ODBC 5.1.x before upgrading.

See also [Bug#34571](#).

Functionality added or changed:

- Added support for Unicode functions (`SQLConnectW`, etc).
- Added descriptor support (`SQLGetDescField`, `SQLGetDescRec`, etc).
- Added support for `SQL_C_WCHAR`.

## C.4.8. Changes in MySQL Connector/ODBC 5.0.12 (Never released)

### Note

Development on Connector/ODBC 5.0.x has ceased. New features and functionality will be incorporated into Connector/ODBC 5.1. See [Section 20.1.2.1, “Connector/ODBC Roadmap”](#).

Bugs fixed:

- Inserting `NULL` values into a `DATETIME` column from Access reports an error. ([Bug#27896](#))
- Tables with `TEXT` columns would be incorrectly identified, returning an `Unknown SQL type - 65535` error. ([Bug#20127](#))

## C.4.9. Changes in MySQL Connector/ODBC 5.0.11 (31 January 2007)

Functionality added or changed:

- Added support for ODBC v2 statement options using attributes.
- Driver now builds and is partially tested under Linux with the iODBC driver manager.

Bugs fixed:

- Connection string parsing for DSN-less connections could fail to identify some parameters. ([Bug#25316](#))
- Updates of `MEMO` or `TEXT` columns from within Microsoft Access would fail. ([Bug#25263](#))
- Transaction support has been added and tested. ([Bug#25045](#))
- Internal function, `my_setpos_delete_ignore()` could cause a crash. ([Bug#22796](#))
- Fixed occasional mis-handling of the `SQL_NUMERIC_C` type.
- Fixed the binding of certain integer types.

## C.4.10. Changes in MySQL Connector/ODBC 5.0.10 (14 December 2006)

Connector/ODBC 5.0.10 is the sixth BETA release.

Functionality added or changed:

- Significant performance improvement when retrieving large text fields in pieces using `SQLGetData()` with a buffer smaller than the whole data. Mainly used in Access when fetching very large text fields. ([Bug#24876](#))
- Added initial unicode support in data and metadata. ([Bug#24837](#))
- Added initial support for removing braces when calling stored procedures and retrieving result sets from procedure calls. ([Bug#24485](#))
- Added loose handling of retrieving some diagnostic data. ([Bug#15782](#))
- Added wide-string type info for `SQLGetTypeInfo()`.

Bugs fixed:

- Editing DSN no longer crashes ODBC data source administrator. ([Bug#24675](#))
- String query parameters are now escaped correctly. ([Bug#19078](#))

### C.4.11. Changes in MySQL Connector/ODBC 5.0.9 (22 November 2006)

Connector/ODBC 5.0.9 is the fifth BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Added support for column binding as `SQL_NUMERIC_STRUCT`.
- Added recognition of `SQL_C_SHORT` and `SQL_C_TINYINT` as C types.

Bugs fixed:

- Fixed wildcard handling of and listing of catalogs and tables in `SQLTables`.
- Added limit of display size when requested via `SQLColAttribute/SQL_DESC_DISPLAY_SIZE`.
- Fixed buffer length return for `SQLDriverConnect`.
- ODBC v2 behaviour in driver now supports ODBC v3 date/time types (since `DriverManager` maps them).
- Catch use of `SQL_ATTR_PARAMSET_SIZE` and report error until we fully support.
- Fixed statistics to fail if it couldn't be completed.
- Corrected retrieval multiple field types bit and blob/text.
- Fixed `SQLGetData` to clear the NULL indicator correctly during multiple calls.

### C.4.12. Changes in MySQL Connector/ODBC 5.0.8 (17 November 2006)

Connector/ODBC 5.0.8 is the fourth BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Also made `SQL_DESC_NAME` only fill in the name if there was a data pointer given, otherwise just the length.

- Fixed display size to be length if max length isn't available.
- Made distinction between [CHAR/BINARY](#) (and VAR versions).
- Wildcards now support escaped chars and underscore matching (needed to link tables with underscores in access).

Bugs fixed:

- Fixed binding using [SQL\\_C\\_LONG](#).
- Fixed using wrong pointer for [SQL\\_MAX\\_DRIVER\\_CONNECTIONS](#) in [SQLGetInfo](#).
- Set default return to [SQL\\_SUCCESS](#) if nothing is done for [SQLSpecialColumns](#).
- Fixed MDiagnostic to use correct v2/v3 error codes.
- Allow [SQLDescribeCol](#) to be called to retrieve the length of the column name, but not the name itself.
- Length now used when handling bind parameter (needed in particular for [SQL\\_WCHAR](#)) - this enables updating char data in MS Access.
- Updated retrieval of descriptor fields to use the right pointer types.
- Fixed handling of numeric pointers in [SQLColAttribute](#).
- Fixed type returned for [MYSQL\\_TYPE\\_LONG](#) to [SQL\\_INTEGER](#) instead of [SQL\\_TINYINT](#).
- Fix size return from [SQLDescribeCol](#).
- Fixed string length to chars, not bytes, returned by [SQLGetDiagRec](#).

### C.4.13. Changes in MySQL Connector/ODBC 5.0.7 (08 November 2006)

Connector/ODBC 5.0.7 is the third BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Added support for [SQLStatistics](#) to [MYODBCShell](#).
- Improved trace/log.

Bugs fixed:

- [SQLBindParameter](#) now handles [SQL\\_C\\_DEFAULT](#).
- Corrected incorrect column index within [SQLStatistics](#). Many more tables can now be linked into MS Access.
- Fixed [SQLDescribeCol](#) returning column name length in bytes rather than chars.

### C.4.14. Changes in MySQL Connector/ODBC 5.0.6 (03 November 2006)

Connector/ODBC 5.0.6 is the second BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Features, limitations and notes on this release

- Connector/ODBC supports both [User](#) and [System](#) DSNs.
- Installation is provided in the form of a standard Microsoft System Installer (MSI).

- You no longer have to have Connector/ODBC 3.51 installed before installing this version.

Bugs fixed:

- You no longer have to have Connector/ODBC 3.51 installed before installing this version.
- Connector/ODBC supports both [User](#) and [System](#) DSNs.
- Installation is provided in the form of a standard Microsoft System Installer (MSI).

### **C.4.15. Changes in MySQL Connector/ODBC 5.0.5 (17 October 2006)**

Connector/ODBC 5.0.5 is the first BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

You no longer have to have Connector/ODBC 3.51 installed before installing this version.

Bugs fixed:

- You no longer have to have Connector/ODBC 3.51 installed before installing this version.

### **C.4.16. Changes in Connector/ODBC 5.0.3 (Connector/ODBC 5.0 Alpha 3) (20 June 2006)**

This is an implementation and testing release, and is not designed for use within a production environment.

Features, limitations and notes on this release:

- The following ODBC API functions have been added in this release:
  - [SQLBindParameter](#)
  - [SQLBindCol](#)

### **C.4.17. Changes in Connector/ODBC 5.0.2 (Never released)**

Connector/ODBC 5.0.2 was an internal implementation and testing release.

### **C.4.18. Changes in Connector/ODBC 5.0.1 (Connector/ODBC 5.0 Alpha 2) (05 June 2006)**

Features, limitations and notes on this release:

- Connector/ODBC 5.0 is Unicode aware.
- Connector/ODBC is currently limited to basic applications. ADO applications and Microsoft Office are not supported.
- Connector/ODBC must be used with a Driver Manager.
- The following ODBC API functions are implemented:
  - [SQLAllocHandle](#)
  - [SQLCloseCursor](#)
  - [SQLColAttribute](#)
  - [SQLColumns](#)
  - [SQLConnect](#)

- `SQLCopyDesc`
- `SQLDisconnect`
- `SQLExecDirect`
- `SQLExecute`
- `SQLFetch`
- `SQLFreeHandle`
- `SQLFreeStmt`
- `SQLGetConnectAttr`
- `SQLGetData`
- `SQLGetDescField`
- `SQLGetDescRec`
- `SQLGetDiagField`
- `SQLGetDiagRec`
- `SQLGetEnvAttr`
- `SQLGetFunctions`
- `SQLGetStmtAttr`
- `SQLGetTypeInfo`
- `SQLNumResultCols`
- `SQLPrepare`
- `SQLRowcount`
- `SQLTables`

The following ODBC API function are implemented, but not yet support all the available attributes/options:

- `SQLSetConnectAttr`
- `SQLSetDescField`
- `SQLSetDescRec`
- `SQLSetEnvAttr`
- `SQLSetStmtAttr`

## C.4.19. Changes in MySQL Connector/ODBC 3.51.27 (20 November 2008)

Bugs fixed:

- The client program hung when the network connection to the server was interrupted. ([Bug#40407](#))
- The connection string option `Enable Auto-reconnect` did not work. When the connection failed, it could not be restored, and the errors generated were the same as if the option had not been selected. ([Bug#37179](#))
- It was not possible to use Connector/ODBC to connect to a server using SSL. The following error was generated:

```
Runtime error '-2147467259 (80004005)':  
[MySQL][ODBC 3.51 Driver]SSL connection error.
```

([Bug#29955](#))

## C.4.20. Changes in MySQL Connector/ODBC 3.51.26 (07 July 2008)

Functionality added or changed:

- There is a new connection option, `FLAG_NO_BINARY_RESULT`. When set this option disables charset 63 for columns with an empty `org_table`. ([Bug#29402](#))

Bugs fixed:

- When an `ADOConnection` is created and attempts to open a schema with `ADOConnection.OpenSchema` an access violation occurs in `myodbc3.dll`. ([Bug#30770](#))
- When `SHOW CREATE TABLE` was invoked and then the field values read, the result was truncated and unusable if the table had many rows and indexes. ([Bug#24131](#))

## C.4.21. Changes in MySQL Connector/ODBC 3.51.25 (11 April 2008)

Bugs fixed:

- The `SQLColAttribute()` function returned `SQL_TRUE` when querying the `SQL_DESC_FIXED_PREC_SCALE` (`SQL_COLUMN_MONEY`) attribute of a `DECIMAL` column. Previously, the correct value of `SQL_FALSE` was returned; this is now again the case. ([Bug#35581](#))
- The driver crashes ODBC Administrator on attempting to add a new DSN. ([Bug#32057](#))
- When accessing column data, `FLAG_COLUMN_SIZE_S32` did not limit the octet length or display size reported for fields, causing problems with Microsoft Visual FoxPro.

The list of ODBC functions that could have caused failures in Microsoft software when retrieving the length of `LONGBLOB` or `LONGTEXT` columns includes:

- `SQLColumns`
- `SQLColAttribute`
- `SQLColAttributes`
- `SQLDescribeCol`
- `SQLSpecialColumns` (theoretically can have the same problem) ([Bug#12805](#), [Bug#30890](#))

## C.4.22. Changes in MySQL Connector/ODBC 3.51.24 (14 March 2008)

Bugs fixed:

- **Security Enhancement:** Accessing a parameter with the type of `SQL_C_CHAR`, but with a numeric type and a length of zero, the parameter marker would get stripped from the query. In addition, an SQL injection was possible if the parameter value had a nonzero length and was not numeric, the text would be inserted verbatim. ([Bug#34575](#))
- **Important Change:** In previous versions, the SSL certificate would automatically be verified when used as part of the Connector/ODBC connection. The default mode is now to ignore the verification of certificates. To enforce verification of the SSL certificate during connection, use the `SSLVERIFY` DSN parameter, setting the value to 1. ([Bug#29955](#), [Bug#34648](#))
- When using ADO, the count of parameters in a query would always return zero. ([Bug#33298](#))
- Using tables with a single quote or other non-standard characters in the table or column names through ODBC would fail. ([Bug#32989](#))

- When using Crystal Reports, table and column names would be truncated to 21 characters, and truncated columns in tables where the truncated name was the duplicated would lead to only a single column being displayed. (Bug#32864)
- `SQLExtendedFetch()` and `SQLFetchScroll()` ignored the rowset size if the `Don't cache result` DSN option was set. (Bug#32420)
- When using the ODBC `SQL_TXN_READ_COMMITTED` option, 'dirty' records would be read from tables as if the option had not been applied. (Bug#31959)
- When creating a System DSN using the ODBC Administrator on Mac OS X, a User DSN would be created instead. The root cause is a problem with the iODBC driver manager used on Mac OS X. The fix works around this issue.

**Note**

ODBC Administrator may still be unable to register a System DSN unless the `/Library/ODBC/odbc.ini` file has the correct permissions. You should ensure that the file is writable by the `admin` group.

(Bug#31495)

- Calling `SQLFetch` or `SQLFetchScroll` would return negative data lengths when using `SQL_C_WCHAR`. (Bug#31220)
- `SQLSetParam()` caused memory allocation errors due to driver manager's mapping of deprecated functions (buffer length - 1). (Bug#29871)
- Static cursor was unable to be used through ADO when dynamic cursors were enabled. (Bug#27351)
- Using `connection.Execute` to create a record set based on a table without declaring the cmd option as `adCmdTable` will fail when communicating with versions of MySQL 5.0.37 and higher. The issue is related to the way that `SQLSTATE` is returned when ADO tries to confirm the existence of the target object. (Bug#27158)
- Updating a `RecordSet` when the query involves a `BLOB` field would fail. (Bug#19065)
- With some connections to MySQL databases using Connector/ODBC, the connection would mistakenly report 'user cancelled' for accesses to the database information. (Bug#16653)

### C.4.23. Changes in MySQL Connector/ODBC 3.51.23 (09 January 2008)

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- There are no installer packages for Microsoft Windows x64 Edition.

Bugs fixed:

- Connector/ODBC would incorrectly return `SQL_SUCCESS` when checking for distributed transaction support. (Bug#32727)
- When using unixODBC or directly linked applications where the thread level is set to less than 3 (within `odbcinst.ini`), a thread synchronization issue would lead to an application crash. This was because `SQLAllocStmt()` and `SQLFreeStmt()` did not synchronize access to the list of statements associated with a connection. (Bug#32587)
- Cleaning up environment handles in multithread environments could result in a five (or more) second delay. (Bug#32366)
- Renaming an existing DSN entry would create a new entry with the new name without deleting the old entry. (Bug#31165)
- Setting the default database using the `DefaultDatabase` property of an ADO `Connection` object would fail with the error `Provider does not support this property`. The `SQLGetInfo()` returned the wrong value for `SQL_DATABASE_NAME` when no database was selected. (Bug#3780)

### C.4.24. Changes in MySQL Connector/ODBC 3.51.22 (13 November 2007)

Functionality added or changed:

- The workaround for this bug was removed due to the fixes in MySQL Server 5.0.48 and 5.1.21.

This regression was introduced by [Bug#10491](#).

Bugs fixed:

- The `English` locale would be used when formatting floating point values. The `C` locale is now used for these values. ([Bug#32294](#))
- When accessing information about supported operations, the driver would return incorrect information about the support for `UNION`. ([Bug#32253](#))
- Unsigned integer values greater than the maximum value of a signed integer would be handled incorrectly. ([Bug#32171](#))
- The wrong result was returned by `SQLGetData()` when the data was an empty string and a zero-sized buffer was specified. ([Bug#30958](#))
- Added the `FLAG_COLUMN_SIZE_S32` option to limit the reported column size to a signed 32-bit integer. This option is automatically enabled for ADO applications to provide a work around for a bug in ADO. ([Bug#13776](#))

## C.4.25. Changes in MySQL Connector/ODBC 3.51.21 (08 October 2007)

Bugs fixed:

- When using a rowset/cursor and add a new row with a number of fields, subsequent rows with fewer fields will include the original fields from the previous row in the final `INSERT` statement. ([Bug#31246](#))
- Uninitiated memory could be used when C/ODBC internally calls `SQLGetFunctions()`. ([Bug#31055](#))
- The wrong `SQL_DESC_LITERAL_PREFIX` would be returned for date/time types. ([Bug#31009](#))
- The wrong `COLUMN_SIZE` would be returned by `SQLGetTypeInfo` for the `TIME` columns (`SQL_TYPE_TIME`). ([Bug#30939](#))
- Clicking outside the character set selection box when configuring a new DSN could cause the wrong character set to be selected. ([Bug#30568](#))
- Not specifying a user in the DSN dialog would raise a warning even though the parameter is optional. ([Bug#30499](#))
- `SQLSetParam()` caused memory allocation errors due to driver manager's mapping of deprecated functions (buffer length - 1). ([Bug#29871](#))
- When using ADO, a column marked as `AUTO_INCREMENT` could incorrectly report that the column allowed `NULL` values. This was due to an issue with `NULLABLE` and `IS_NULLABLE` return values from the call to `SQLColumns()`. ([Bug#26108](#))
- Connector/ODBC would return the wrong the error code when the server disconnects the active connection because the configured `wait_timeout` has expired. Previously it would return `HY000`. Connector/ODBC now correctly returns an `SQLSTATE` of `08S01`. ([Bug#3456](#))

## C.4.26. Changes in MySQL Connector/ODBC 3.51.20 (10 September 2007)

Bugs fixed:

- Using `FLAG_NO_PROMPT` doesn't suppress the dialogs normally handled by `SQLDriverConnect`. ([Bug#30840](#))
- The specified length of the user name and authentication parameters to `SQLConnect()` were not being honored. ([Bug#30774](#))
- The wrong column size was returned for binary data. ([Bug#30547](#))
- `SQLGetData()` will now always return `SQL_NO_DATA_FOUND` on second call when no data left, even if requested size is 0. ([Bug#30520](#))
- `SQLGetConnectAttr()` did not reflect the connection state correctly. ([Bug#14639](#))

- Removed checkbox in setup dialog for `FLAG_FIELD_LENGTH` (identified as `Don't Optimize Column Width` within the GUI dialog), which was removed from the driver in 3.51.18.

## C.4.27. Changes in MySQL Connector/ODBC 3.51.19 (10 August 2007)

Connector/ODBC 3.51.19 fixes a specific issue with the 3.51.18 release. For a list of changes in the 3.51.18 release, see [Section C.4.28, "Changes in MySQL Connector/ODBC 3.51.18 \(08 August 2007\)"](#).

Functionality added or changed:

- Because of [Bug#10491](#) in the server, character string results were sometimes incorrectly identified as `SQL_VARBINARY`. Until this server bug is corrected, the driver will identify all variable-length strings as `SQL_VARCHAR`.

## C.4.28. Changes in MySQL Connector/ODBC 3.51.18 (08 August 2007)

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- Binary packages as disk images with installers are now available for Mac OS X.
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.

Functionality added or changed:

- **Incompatible Change:** The `FLAG_DEBUG` option was removed.
- When connecting to a specific database when using a DSN, the system tables from the `mysql` database are no longer also available. Previously, tables from the `mysql` database (catalog) were listed as `SYSTEM TABLES` by `SQLTables()` even when a different catalog was being queried. ([Bug#28662](#))
- Installed for Mac OS X has been re-instated. The installer registers the driver at a system (not user) level and makes it possible to create both user and system DSNs using the Connector/ODBC driver. The installer also fixes the situation where the necessary drivers would be installed local to the user, not globally. ([Bug#15326](#), [Bug#10444](#))
- Connector/ODBC now supports batched statements. In order to enable cached statement support you must switch enable the batched statement option (`FLAG_MULTI_STATEMENTS`, 67108864, or `ALLOW MULTIPLE STATEMENTS` within a GUI configuration). Be aware that batched statements create an increased chance of SQL injection attacks and you must ensure that your application protects against this scenario. ([Bug#7445](#))
- The `SQL_ATTR_ROW_BIND_OFFSET_PTR` is now supported for row bind offsets. ([Bug#6741](#))
- The `TRACE` and `TRACEFILE` DSN options have been removed. Use the ODBC driver manager trace options instead.

Bugs fixed:

- When using a table with multiple `TIMESTAMP` columns, the final `TIMESTAMP` column within the table definition would not be updateable. Note that there is still a limitation in MySQL server regarding multiple `TIMESTAMP` columns. ([Bug#9927](#)) ([Bug#30081](#))
- Fixed an issue where the `myodbc3i` would update the user ODBC configuration file (`~/Library/ODBC/odbcinst.ini`) instead of the system `/Library/ODBC/odbcinst.ini`. This was caused because `myodbc3i` was not honoring the `s` and `u` modifiers for the `-d` command-line option. ([Bug#29964](#))
- Getting table metadata (through the `SQLColumns()`) would fail, returning a bad table definition to calling applications. ([Bug#29888](#))

- `DATETIME` column types would return `FALSE` in place of `SQL_SUCCESS` when requesting the column type information. (Bug#28657)
- The `SQL_COLUMN_TYPE`, `SQL_COLUMN_DISPLAY` and `SQL_COLUMN_PRECISION` values would be returned incorrectly by `SQLColumns()`, `SQLDescribeCol()` and `SQLColAttribute()` when accessing character columns, especially those generated through `concat()`. The lengths returned should now conform to the ODBC specification. The `FLAG_FIELD_LENGTH` option no longer has any affect on the results returned. (Bug#27862)
- Obtaining the length of a column when using a character set for the connection of `utf8` would result in the length being returned incorrectly. (Bug#19345)
- The `SQLColumns()` function could return incorrect information about `TIMESTAMP` columns, indicating that the field was not nullable. (Bug#14414)
- The `SQLColumns()` function could return incorrect information about `AUTO_INCREMENT` columns, indicating that the field was not nullable. (Bug#14407)
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- `BIT(n)` columns are now treated as `SQL_BIT` data where  $n = 1$  and binary data where  $n > 1$ .
- The wrong value from `SQL_DESC_LITERAL_SUFFIX` was returned for binary fields.
- The `SQL_DATETIME_SUB` column in `SQLColumns()` was not correctly set for date and time types.
- The value for `SQL_DESC_FIXED_PREC_SCALE` was not returned correctly for values in MySQL 5.0 and later.
- The wrong value for `SQL_DESC_TYPE` was returned for date and time types.
- `SQLConnect()` and `SQLDriverConnect()` were rewritten to eliminate duplicate code and ensure all options were supported using both connection methods. `SQLDriverConnect()` now only requires the setup library to be present when the call requires it.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- Binary packages as disk images with installers are now available for Mac OS X.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- The wrong value for `DECIMAL_DIGITS` in `SQLColumns()` was reported for `FLOAT` and `DOUBLE` fields, as well as the wrong value for the scale parameter to `SQLDescribeCol()`, and the `SQL_DESC_SCALE` attribute from `SQLColAttribute()`.
- The `SQL_DATA_TYPE` column in `SQLColumns()` results did not report the correct value for date and time types.

## C.4.29. Changes in MySQL Connector/ODBC 3.51.17 (14 July 2007)

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- Binary packages as disk images with installers are now available for Mac OS X.
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.

Functionality added or changed:

- It is now possible to specify a different character set as part of the DSN or connection string. This must be used instead of the `SET NAMES` statement. You can also configure the character set value from the GUI configuration. ([Bug#9498](#), [Bug#6667](#))
- Fixed calling convention ptr and wrong free in `myodbc3i`, and fixed the null terminating (was only one, not two) when writing DSN to string.
- Dis-allow NULL ptr for null indicator when calling `SQLGetData()` if value is null. Now returns `SQL_ERROR` w/state 22002.
- The setup library has been split into its own RPM package, to allow installing the driver itself with no GUI dependencies.

Bugs fixed:

- `myodbc3i` did not correctly format driver info, which could cause the installation to fail. ([Bug#29709](#))
- Connector/ODBC crashed with Crystal Reports due to a rproblem with `SQLProcedures()`. ([Bug#28316](#))
- Fixed a problem where the GUI would crash when configuring or removing a System or User DSN. ([Bug#27315](#))
- Fixed error handling of out-of-memory and bad connections in catalog functions. This might raise errors in code paths that had ignored them in the past. ([Bug#26934](#))
- For a stored procedure that returns multiple result sets, Connector/ODBC returned only the first result set. ([Bug#16817](#))
- Calling `SQLGetDiagField` with `RecNumber 0`, `DiagIdentifier NOT 0` returned `SQL_ERROR`, preventing access to diagnostic header fields. ([Bug#16224](#))
- Added a new DSN option (`FLAG_ZERO_DATE_TO_MIN`) to retrieve `XXXX-00-00` dates as the minimum allowed ODBC date (`XXXX-01-01`). Added another option (`FLAG_MIN_DATE_TO_ZERO`) to mirror this but for bound parameters. `FLAG_MIN_DATE_TO_ZERO` only changes `0000-01-01` to `0000-00-00`. ([Bug#13766](#))
- If there was more than one unique key on a table, the correct fields were not used in handling `SQLSetPos()`. ([Bug#10563](#))
- When inserting a large `BLOB` field, Connector/ODBC would crash due to a memory allocation error. ([Bug#10562](#))
- The driver was using `mysql_odbc_escape_string()`, which does not handle the `NO_BACKSLASH_ESCAPES` SQL mode. Now it uses `mysql_real_escape_string()`, which does. ([Bug#9498](#))
- `SQLColumns()` did not handle many of its parameters correctly, which could lead to incorrect results. The table name argument was not handled as a pattern value, and most arguments were not escaped correctly when they contained non-alphanumeric characters. ([Bug#8860](#))
- There are no binary packages for Microsoft Windows x64 Edition.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Correctly return error if `SQLBindCol` is called with an invalid column.
- Fixed possible crash if `SQLBindCol()` was not called before `SQLSetPos()`.
- The Mac OS X binary packages are only provided as tarballs, there is no installer.
- The binary packages for Sun Solaris are only provided as tarballs, not the PKG format.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

### C.4.30. Changes in MySQL Connector/ODBC 3.51.16 (14 June 2007)

Functionality added or changed:

- Connector/ODBC now supports using SSL for communication. This is not yet exposed in the setup GUI, but must be enabled through configuration files or the DSN. ([Bug#12918](#))

Bugs fixed:

- Calls to `SQLNativeSql()` could cause stack corruption due to an incorrect pointer cast. ([Bug#28758](#))
- Using cursors on results sets with multi-column keys could select the wrong value. ([Bug#28255](#))
- `SQLForeignKeys` does not escape `_` and `%` in the table name arguments. ([Bug#27723](#))
- When using stored procedures, making a `SELECT` or second stored procedure call after an initial stored procedure call, the second statement will fail. ([Bug#27544](#))
- `SQLTables()` did not distinguish tables from views. ([Bug#23031](#))
- Data in `TEXT` columns would fail to be read correctly. ([Bug#16917](#))
- Specifying strings as parameters using the `adBSTR` or `adVarChar` types, (`SQL_WVARCHAR` and `SQL_WLONGVARCHAR`) would be incorrectly quoted. ([Bug#16235](#))
- `SQL_WVARCHAR` and `SQL_WLONGVARCHAR` parameters were not properly quoted and escaped. ([Bug#16235](#))
- Using `BETWEEN` with date values, the wrong results could be returned. ([Bug#15773](#))
- When using the `Don't Cache Results` (option value `1048576`) with Microsoft Access, the connection will fail using DAO/VisualBasic. ([Bug#4657](#))
- Return values from `SQLTables()` may be truncated. (Bugs #22797)

### C.4.31. Changes in MySQL Connector/ODBC 3.51.15 (07 May 2007)

Bugs fixed:

- Connector/ODBC would incorrectly claim to support `SQLProcedureColumns` (by returning true when queried about `SQL-PROCEDURECOLUMNS` with `SQLGetFunctions`), but this functionality is not supported. ([Bug#27591](#))
- An incorrect transaction isolation level may not be returned when accessing the connection attributes. ([Bug#27589](#))
- Adding a new DSN with the `myodbc3i` utility under AIX would fail. ([Bug#27220](#))
- When inserting data using bulk statements (through `SQLBulkOperations`), the indicators for all rows within the insert would not updated correctly. ([Bug#24306](#))
- Using `SQLProcedures` does not return the database name within the returned resultset. ([Bug#23033](#))
- The `SQLTransact()` function did not support an empty connection handle. ([Bug#21588](#))
- Using `SQLDriverConnect` instead of `SQLConnect` could cause later operations to fail. ([Bug#7912](#))
- When using blobs and parameter replacement in a statement with `WHERE CURSOR OF`, the SQL is truncated. ([Bug#5853](#))
- Connector/ODBC would return too many foreign key results when accessing tables with similar names. ([Bug#4518](#))

### C.4.32. Changes in MySQL Connector/ODBC 3.51.14 (08 March 2007)

Functionality added or changed:

- Use of `SQL_ATTR_CONNECTION_TIMEOUT` on the server has now been disabled. If you attempt to set this attribute on your connection the `SQL_SUCCESS_WITH_INFO` will be returned, with an error number/string of `HYC00: Optional feature not supported`. ([Bug#19823](#))
- Added `auto is null` option to Connector/ODBC option parameters. ([Bug#10910](#))
- Added `auto-reconnect` option to Connector/ODBC option parameters.
- Added support for the `HENV` handlers in `SQLEndTran()`.

Bugs fixed:

- On 64-bit systems, some types would be incorrectly returned. ([Bug#26024](#))
- When retrieving `TIME` columns, C/ODBC would incorrectly interpret the type of the string and could interpret it as a `DATE` type instead. ([Bug#25846](#))
- Connector/ODBC may insert the wrong parameter values when using prepared statements under 64-bit Linux. ([Bug#22446](#))
- Using Connector/ODBC, with `SQLBindCol` and binding the length to the return value from `SQL_LEN_DATA_AT_EXEC` fails with a memory allocation error. ([Bug#20547](#))
- Using `DataAdapter`, Connector/ODBC may continually consume memory when reading the same records within a loop (Windows Server 2003 SP1/SP2 only). ([Bug#20459](#))
- When retrieving data from columns that have been compressed using `COMPRESS( )`, the retrieved data would be truncated to 8KB. ([Bug#20208](#))
- The ODBC driver name and version number were incorrectly reported by the driver. ([Bug#19740](#))
- A string format exception would be raised when using iODBC, Connector/ODBC and the embedded MySQL server. ([Bug#16535](#))
- The `SQLDriverConnect( )` ODBC method did not work with recent Connector/ODBC releases. ([Bug#12393](#))

### C.4.33. Changes in MySQL Connector/ODBC 3.51.13 (Never released)

Connector/ODBC 3.51.13 was an internal implementation and testing release.

### C.4.34. Changes in MySQL Connector/ODBC 3.51.12 (11 February 2005)

Functionality added or changed:

- N/A

Bugs fixed:

- Using stored procedures with ADO, where the `CommandType` has been set correctly to `adCmdStoredProc`, calls to stored procedures would fail. ([Bug#15635](#))
- File DSNs could not be saved. ([Bug#12019](#))
- `SQLColumns( )` returned no information for tables that had a column named using a reserved word. ([Bug#9539](#))

### C.4.35. Changes in MySQL Connector/ODBC 3.51.11 (28 January 2005)

Bugs fixed:

- `mysql_list_dbcolumns( )` and `insert_fields( )` were retrieving all rows from a table. Fixed the queries generated by these functions to return no rows. ([Bug#8198](#))
- `SQLGetTypeInfo( )` returned `tinyblob` for `SQL_VARBINARY` and nothing for `SQL_BINARY`. Fixed to return `varbinary` for `SQL_VARBINARY`, `binary` for `SQL_BINARY`, and `longblob` for `SQL_LONGVARBINARY`. ([Bug#8138](#))

## C.5. MySQL Connector/NET Change History

### C.5.1. Changes in MySQL Connector/NET 6.0.4 (Not yet released beta)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- A SQL query string containing an escaped backslash caused an exception to be generated:

```

Index and length must refer to a location within the string.
Parameter name: length
at System.String.InternalSubStringWithChecks(Int32 startIndex, Int32 length, Boolean
fAlwaysCopy)
at MySql.Data.MySqlClient.MySqlTokenizer.NextParameter()
at MySql.Data.MySqlClient.Statement.InternalBindParameters(String sql,
MySqlParameterCollection parameters, MySqlPacket packet)
at MySql.Data.MySqlClient.Statement.BindParameters()
at MySql.Data.MySqlClient.PreparableStatement.Execute()
at MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
at MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()

```

(Bug#44960)

- The Microsoft Visual Studio solution file `MySQL-VS2005.sln` was invalid. Several projects could not be loaded and thus it was not possible to build Connector/NET from source. (Bug#44822)
- The `DataReader` in Connector/NET 6.0.3 considered a `BINARY(16)` field as a `GUID` with a length of 16. (Bug#44507)
- When creating a new `DataSet` the following error was generated:

```

Failed to open a connection to database.
Cannot load type with name 'MySql.Data.VisualStudio.StoredProcedureColumnEnumerator'

```

(Bug#44460)

- The Connector/NET `MySQLRoleProvider` reported that there were no roles, even when roles existed. (Bug#44414)

## C.5.2. Changes in MySQL Connector/NET 6.0.3 (28 April 2009 beta)

This is a new Beta development release, fixing recently discovered bugs.

Functionality added or changed:

- The `MySqlTokenizer` failed to split fieldnames from values if they were not separated by a space. This also happened if the string contained certain characters. As a result `MySqlCommand.ExecuteNonQuery` raised an index out of range exception.

The resulting errors are illustrated by the following examples. Note, the example statements do not have delimiting spaces around the `=` operator.

```

INSERT INTO anytable SET Text='test--test';

```

The tokenizer incorrectly interpreted the value as containing a comment.

```

UPDATE anytable SET Project='123-456',Text='Can you explain this ?',Duration=15 WHERE
ID=4711;

```

A `MySqlException` was generated, as the `?` in the value was interpreted by the tokenizer as a parameter sign. The error message generated was:

```

Fatal error encountered during command execution.
EXCEPTION: MySqlException - Parameter '?' must be defined.

```

(Bug#44318)

Bugs fixed:

- `MySQL.Data` was not displayed as a Reference inside Microsoft Visual Studio 2008 Professional.

When a new C# project was created in Microsoft Visual Studio 2008 Professional, `MySQL.Data` was not displayed when `REFERENCES`, `ADD REFERENCE` was selected. (Bug#44141)

- Column types for `SchemaProvider` and `ISSchemaProvider` did not match.

When the source code in `SchemaProvider.cs` and `ISSchemaProvider.cs` were compared it was apparent that they were not using the same column types. The base provider used SQL such as `SHOW CREATE TABLE`, while `ISSchemaProvider` used the schema information tables. Column types used by the base class were `INT64` and the column types used by

`ISSchemaProvider` were `UNSIGNED`. ([Bug#44123](#))

### C.5.3. Changes in MySQL Connector/NET 6.0.2 (07 April 2009 beta)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- Connector/Net 6.0.1 did not load in Microsoft Visual Studio 2008 and Visual Studio 2005 Pro.

The following error message was generated:

```
.NET Framework Data Provider for MySQL: The data provider object factory service was not found.
```

([Bug#44064](#))

### C.5.4. Changes in MySQL Connector/NET 6.0.1 (02 April 2009 beta)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- An insert and update error was generated by the decimal data type in the Entity Framework, when a German collation was used. ([Bug#43574](#))
- Generating an Entity Data Model (EDM) schema with a table containing columns with data types `MEDIUMTEXT` and `LONGTEXT` generated a runtime error message "Max value too long or too short for Int32". ([Bug#43480](#))

### C.5.5. Changes in MySQL Connector/NET 6.0.0 (02 March 2009 alpha)

This is a new Alpha development release.

Bugs fixed:

- A null reference exception was generated when `MySqlConnection.ClearPool(connection)` was called. ([Bug#42801](#))

### C.5.6. Changes in MySQL Connector/NET 5.3.0 (Not yet released)

Bugs fixed:

- The Web Provider did not work at all on a remote host, and did not create a database when using `autogenerateschema="true"`. ([Bug#39072](#))
- The Connector/NET installer program ended prematurely without reporting the specific error. ([Bug#39019](#))
- When called with an incorrect password the `MembershipProvider.GetPassword()` method threw a `MySQLException` instead of a `MembershipPasswordException`. ([Bug#38939](#))
- Possible overflow in `MySqlPacket.ReadLong()`. ([Bug#36997](#))
- The `TokenizeSql` method was adding query overhead and causing high CPU utilization for larger queries. ([Bug#36836](#))

### C.5.7. Changes in MySQL Connector/NET 5.2.7 (Not yet released)

Bugs fixed:

- The Microsoft Visual Studio solution file `MySQL-VS2005.sln` was invalid. Several projects could not be loaded and thus it

was not possible to build Connector/NET from source. ([Bug#44822](#))

- The Connector/NET MySQLRoleProvider reported that there were no roles, even when roles existed. ([Bug#44414](#))
- When a TableAdapter was created on a DataSet, it was not possible to use a stored procedure with variables. The following error was generated:

```
The method or operation is not implemented
```

([Bug#39409](#))

## C.5.8. Changes in MySQL Connector/NET 5.2.6 (28 April 2009)

Functionality added or changed:

- A new connection string option has been added: `use affected rows`. When `true` the connection will report changed rows instead of found rows. ([Bug#44194](#))

Bugs fixed:

- Calling `GetSchema()` on `Indexes` or `IndexColumns` failed where index or column names were restricted.

In `SchemaProvider.cs`, methods `GetIndexes()` and `GetIndexColumns()` passed their restrictions directly to `GetTables()`. This only worked if the restrictions were no more specific than `schemaName` and `tableName`. If `IndexName` was given, this was passed to `GetTables()` where it was treated as `TableType`. As a result no tables were returned, unless the index name happened to be `BASE TABLE` or `VIEW`. This meant that both methods failed to return any rows. ([Bug#43991](#))

- `GetSchema("MetaDataCollections")` should have returned a table with a column named "NumberOfRestrictions" not "NumberOfRestriction".

This can be confirmed by referencing the [Microsoft Documentation](#). ([Bug#43990](#))

- Requests sent to the Connector/NET role provider to remove a user from a role failed. The query log showed the query was correctly executed within a transaction which was immediately rolled back. The rollback was caused by a missing call to the `Complete` method of the transaction. ([Bug#43553](#))
- When using `MySQLBulkLoader.Load()`, the text file is opened by `NativeDriver.SendFileToServer`. If it encountered a problem opening the file as a stream, an exception was generated and caught. An attempt to clean up resources was then made in the `finally{}` clause by calling `fs.Close()`, but since the stream was never successfully opened, this was an attempt to execute a method of a null reference. ([Bug#43332](#))
- A null reference exception was generated when `MySQLConnection.ClearPool(connection)` was called. ([Bug#42801](#))
- `MySQLMembershipProvider.ValidateUser` only used the `userId` to validate. However, it should also use the `applicationId` to perform the validation correctly.

The generated query was, for example:

```
SELECT Password, PasswordKey, PasswordFormat, IsApproved, Islockedout
FROM my_aspnet_Membership WHERE userId=13
```

Note that `applicationId` is not used. ([Bug#42574](#))

- There was an error in the `ProfileProvider` class in the `private ProfileInfoCollection GetProfiles()` function. The column of the final table was named "lastUpdatdDate" ('e' is missing) instead of the correct "lastUpdatedDate". ([Bug#41654](#))
- The `GetGuid()` method of `MySQLDataReader` did not treat `BINARY(16)` column data as a GUID. When operating on such a column a `FormatException` exception was generated. ([Bug#41452](#))
- When ASP.NET membership was configured to not require password question and answer using `requiresQuestionAndAnswer="false"`, a `SqlNullValueException` was generated when using `MembershipUser.ResetPassword()` to reset the user password. ([Bug#41408](#))

- If a `Stored Procedure` contained spaces in its parameter list, and was then called from Connector/NET, an exception was generated. However, the same `Stored Procedure` called from the MySQL Query Analyzer or the MySQL Client worked correctly.

The exception generated was:

```
Parameter '0' not found in the collection.
```

([Bug#41034](#))

- The `DATETIME` format contained an erroneous space. ([Bug#41021](#))
- When `MySql.Web.Profile.MySQLProfileProvider` was configured, it was not possible to assign a name other than the default name `MySQLProfileProvider`.

If the name `SCC_MySQLProfileProvider` was assigned, an exception was generated when attempting to use `Page.Context.Profile[ 'custom prop' ]`.

The exception generated was:

```
The profile default provider was not found.
```

Note that the exception stated: 'the profile **default provider...**', even though a different name was explicitly requested. ([Bug#40871](#))

- When `ExecuteNonQuery` was called with a command type of `Stored Procedure` it worked for one user but resulted in a hang for another user with the same database permissions.

However, if `CALL` was used in the command text and `ExecuteNonQuery` was used with a command type of `Text`, the call worked for both users. ([Bug#40139](#))

## C.5.9. Changes in MySQL Connector/NET 5.2.5 (19 November 2008)

Bugs fixed:

- Visual Studio 2008 displayed the following error three times on start-up:

```
"Package Load Failure
Package 'MySql.Data.VisualStudio.MySqlDataProviderPackage, MySql.VisualStudio,
Version=5.2.4, Culture=neutral, PublicKeyToken=null' has failed to load properly (GUID =
{79A115C9-B133-4891-9E7B-242509DAD272}). Please contact the package vendor for
assistance. Application restart is recommended, due to possible environment corruption.
Would you like to disable loading the package in the future? You may use
'devenve/resetskipkpgs' to re-enable package loading."
```

([Bug#40726](#))

## C.5.10. Changes in MySQL Connector/NET 5.2.4 (13 November 2008)

Bugs fixed:

- `MySqlDataReader` did not feature a `GetSByte` method. ([Bug#40571](#))
- When working with stored procedures Connector/NET generated an exception `Unknown "table parameters" in information_schema`. ([Bug#40382](#))
- `GetDefaultCollation` and `GetMaxLength` were not thread safe. These functions called the database to get a set of parameters and cached them in two static dictionaries in the function `InitCollections`. However, if many threads called them they would try to insert the same keys in the collections resulting in duplicate key exceptions. ([Bug#40231](#))
- If connection pooling was not set explicitly in the connection string, Connector/NET added “;Pooling=False” to the end of the connection string when `MySqlCommand.ExecuteReader()` was called.

If connection pooling was explicitly set in the connection string, when `MySqlConnection.Open()` was called it converted “Pooling=True” to “pooling=True”.

If `MySqlCommand.ExecuteReader()` was subsequently called, it concatenated “;Pooling=False” to the end of the connection string. The resulting connection string was thus terminated with “pooling=True;Pooling=False”. This disabled connection pooling completely. (Bug#40091)

- The connection string option `Functions Return String` did not set the correct encoding for the result string. Even though the connection string option `Functions Return String=true` is set, the result of `SELECT DES_DECRYPT()` contained “??” instead of the correct national character symbols. (Bug#40076)
- If, when using the `MySqlConnection` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. (Bug#39817)
- After the `ConnectionString` property was initialized via the public setter of `DbConnectionStringBuilder`, the `GetConnectionString` method of `MySqlConnectionStringBuilder` incorrectly returned `null` when `true` was assigned to the `includePass` parameter. (Bug#39728)
- When using `ProfileProvider`, attempting to update a previously saved property failed. (Bug#39330)
- Reading a negative time value greater than -01:00:00 returned the absolute value of the original time value. (Bug#39294)
- Inserting a negative time value (negative `TimeSpan`) into a `Time` column through the use of `MySqlParameter` caused `MySqlException` to be thrown. (Bug#39275)
- When a data connection was created in the server explorer of Visual Studio 2008 Team, an error was generated when trying to expand stored procedures that had parameters.

Also, if `TABLEADAPTER` was right-clicked and then `ADD, QUERY, USE EXISTING STORED PROCEDURES` selected, if you then attempted to select a stored procedure, the window would close and no error message would be displayed. (Bug#39252)

- The Web Provider did not work at all on a remote host, and did not create a database when using `autogenerateschema=true`. (Bug#39072)
- Connector/NET called hashed password methods not supported in Mono 2.0 Preview 2. (Bug#38895)

## C.5.11. Changes in MySQL Connector/NET 5.2.3 (19 August 2008)

Functionality added or changed:

- Error string was returned after a 28000 second `wait_timeout`. This has been changed to generate a `ConnectionState.Closed` event. (Bug#38119)
- Changed how the procedure schema collection is retrieved. If the connection string contains “`use procedure bodies=true`” then a `SELECT` is performed on the `mysql.proc` table directly, as this is up to 50 times faster than the current Information Schema implementation. If the connection string contains “`use procedure bodies=false`”, then the Information Schema collection is queried. (Bug#36694)
- Changed how the procedure schema collection is retrieved. If `use procedure bodies=true` then the `mysql.proc` table is selected directly as this is up to 50 times faster than the current `information_schema` implementation. If `use procedure bodies=false`, then the `information_schema` collection is queried. (Bug#36694)
- String escaping functionality has been moved from the `MySqlCommand` class to the `MySqlCommandHelper` class, where it can be accessed by the `EscapeString` method. (Bug#36205)

Bugs fixed:

- The `GetOrdinal()` method failed to return the ordinal if the column name string contained an accent. (Bug#38721)
- Connector/Net uninstaller did not clean up all installed files. (Bug#38534)
- There was a short circuit evaluation error in the `MySqlCommand.CheckState()` method. When the statement `connection == null` was true a `NullReferenceException` was thrown and not the expected `InvalidOperationException`. (Bug#38276)
- The provider did not silently create the user if the user did not exist. (Bug#38243)
- Executing a command that resulted in a fatal exception did not close the connection. (Bug#37991)

- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that should be inserted is corrupted and no error is thrown. (Bug#37968)
- In a .NET application MySQL Connector/NET modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

The original connection string:

```
host=localhost;database=test;uid=****;pwd=****;
connect timeout=25; auto enlist=false;pooling=false;
```

The connection string after closing `MySqlDataReader`:

```
host=localhost;database=test;uid=****;pwd=****;
connect timeout=25;auto enlist=false;pooling=false;
Allow User Variables=True;Allow User Variables=False;
Allow User Variables=True;Allow User Variables=False;
```

(Bug#37955)

- Unnecessary network traffic was generated for the normal case where the web provider schema was up to date. (Bug#37469)
- `MySqlReader.GetOrdinal()` performance enhancements break existing functionality. (Bug#37239)
- The `autogenerateschema` option produced tables with incorrect collations. (Bug#36444)
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. (Bug#35459)
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. (Bug#33322)
- Using the MySQL Visual Studio plugin and a MySQL 4.1 server, certain field types (`ENUM`) would not be identified correctly. Also, when looking for tables, the plugin would list all tables matching a wildcard pattern of the database name supplied in the connection string, instead of only tables within the specified database. (Bug#30603)

## C.5.12. Changes in MySQL Connector/NET 5.2.2 (12 May 2008)

Bugs fixed:

- Product documentation incorrectly stated '?' is the preferred parameter marker. (Bug#37349)
- An incorrect value for a bit field would returned in a multi-row query if a preceding value for the field returned `NULL`. (Bug#36313)
- Tables with `GEOMETRY` field types would return an unknown datatype exception. (Bug#36081)
- When using the `MySQLProfileProvider`, setting profile details and then reading back saved data would result in the default values being returned instead of the updated values. (Bug#36000)
- When creating a connection, setting the `ConnectionString` property of `MySqlConnection` to `NULL` would throw an exception. (Bug#35619)
- The `DbCommandBuilder.QuoteIdentifier` method was not implemented. (Bug#35492)
- When using encrypted passwords, the `GetPassword()` function would return the wrong string. (Bug#35336)
- An error would be raised when calling `GetPassword()` with a `NULL` value. (Bug#35332)
- When retrieving data where a field has been identified as containing a GUID value, the incorrect value would be returned when a previous row contained a `NULL` value for that field. (Bug#35041)
- Using the `TableAdapter Wizard` would fail when generating commands that used stored procedures due to the change in supported parameter characters. (Bug#34941)
- When creating a new stored procedured, the new parameter code which allows the use of the @ symbol would interfere with the specification of a `DEFINER`. (Bug#34940)
- When using `SqlDataSource` to open a connection, the connection would not automatically be closed when access had completed. (Bug#34460)

- There was a high level of contention in the connection pooling code that could lead to delays when opening connections and submitting queries. The connection pooling code has been modified to try and limit the effects of the contention issue. ([Bug#34001](#))
- Using the [TableAdaptor](#) wizard in combination with a suitable [SELECT](#) statement, only the associated [INSERT](#) statement would also be created, rather than the required [DELETE](#) and [UPDATE](#) statements. ([Bug#31338](#))
- Fixed problem in datagrid code related to creating a new table. This problem may have been introduced with .NET 2.0 SP1.
- Fixed profile provider that would throw an exception if you were updating a profile that already existed.

### C.5.13. Changes in MySQL Connector/NET 5.2.1 (27 February 2008)

Bugs fixed:

- When using the provider to generate or update users and passwords, the password checking algorithm would not validate the password strength or requirements correctly. ([Bug#34792](#))
- When executing statements that used stored procedures and functions, the new parameter code could fail to identify the correct parameter format. ([Bug#34699](#))
- The installer would fail to the DDEX provider binary if the Visual Studio 2005 component was not selected. The result would lead to Connector/NET not loading properly when using the interface to a MySQL server within Visual Studio. ([Bug#34674](#))
- A number issues were identified in the case, connection and schema areas of the code for [MembershipProvider](#), [RoleProvider](#), [ProfileProvider](#). ([Bug#34495](#))
- When using web providers, the Connector/NET would check the schema and cache the application id, even when the connection string had been set. The effect would be to break the membership provider list. ([Bug#34451](#))
- Attempting to use an isolation level other than the default with a transaction scope would use the default isolation level. ([Bug#34448](#))
- When altering a stored procedure within Visual Studio, the parameters to the procedure could be lost. ([Bug#34359](#))
- A race condition could occur within the procedure cache resulting the cache contents overflowing beyond the configured cache size. ([Bug#34338](#))
- Fixed problem with Visual Studio 2008 integration that caused pop-up menus on server explorer nodes to not function
- The provider code has been updated to fix a number of outstanding issues.

### C.5.14. Changes in MySQL Connector/NET 5.2.0 (11 February 2008)

Functionality added or changed:

- Performing [GetValue\(\)](#) on a field [TINYINT\(1\)](#) returned a [BOOLEAN](#). While not a bug, this caused problems in software that expected an [INT](#) to be returned. A new connection string option [Treat Tiny As Boolean](#) has been added with a default value of [true](#). If set to [false](#) the provider will treat [TINYINT\(1\)](#) as [INT](#). ([Bug#34052](#))
- Added support for [DbDataAdapter UpdateBatchSize](#). Batching is fully supported including collapsing inserts down into the multi-value form if possible.
- DDEX provider now works under Visual Studio 2008 beta 2.
- Added [ClearPool](#) and [ClearAllPools](#) features.

Bugs fixed:

- Some speed improvements have been implemented in the [TokenizeSql](#) process used to identify elements of SQL statements. ([Bug#34220](#))
- When accessing tables from different databases within the same [TransactionScope](#), the same user/password combination would be used for each database connection. Connector/NET does not handle multiple connections within the same transaction scope. An error is now returned if you attempt this process, instead of using the incorrect authorization information.

[Bug#34204](#)

- The status of connections reported through the state change handler was not being updated correctly. ([Bug#34082](#))
- Incorporated some connection string cache optimizations sent to us by Maxim Mass. ([Bug#34000](#))
- In an open connection where the server had disconnected unexpectedly, the status information of the connection would not be updated properly. ([Bug#33909](#))
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This led to updated connection string options not being recognized if they were of a different case than the existing cached values. ([Bug#31433](#))
- Column name metadata was not using the character set as defined within the connection string being used. ([Bug#31185](#))
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. ([Bug#31090](#))
- Commands executed from within the state change handler would fail with a `NULL` exception. ([Bug#30964](#))
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. ([Bug#30116](#))
- Using compression in the MySQL connection with Connector/NET would be slower than using native (uncompressed) communication. ([Bug#27865](#))
- The `MySqlDbType.Datetime` has been replaced with `MySqlDbType.DateTime`. The old format has been obsoleted. ([Bug#26344](#))

## C.5.15. Changes in MySQL Connector/NET 5.1.8 (Not yet released)

Bugs fixed:

- Calling `GetSchema()` on `Indexes` or `IndexColumns` failed where index or column names were restricted.  
  
In `SchemaProvider.cs`, methods `GetIndexes()` and `GetIndexColumns()` passed their restrictions directly to `GetTables()`. This only worked if the restrictions were no more specific than `schemaName` and `tableName`. If `IndexName` was given, this was passed to `GetTables()` where it was treated as `TableType`. As a result no tables were returned, unless the index name happened to be `BASE TABLE` or `VIEW`. This meant that both methods failed to return any rows. ([Bug#43991](#))
- The `DATETIME` format contained an erroneous space. ([Bug#41021](#))
- If connection pooling was not set explicitly in the connection string, Connector/NET added “;Pooling=False” to the end of the connection string when `MySqlCommand.ExecuteReader()` was called.  
  
If connection pooling was explicitly set in the connection string, when `MySqlConnection.Open()` was called it converted “Pooling=True” to “pooling=True”.  
  
If `MySqlCommand.ExecuteReader()` was subsequently called, it concatenated “;Pooling=False” to the end of the connection string. The resulting connection string was thus terminated with “pooling=True;Pooling=False”. This disabled connection pooling completely. ([Bug#40091](#))
- If, when using the `MySqlTransaction` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. ([Bug#39817](#))
- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that should be inserted is corrupted and no error is thrown. ([Bug#37968](#))

## C.5.16. Changes in MySQL Connector/NET 5.1.7 (21 August 2008)

Bugs fixed:

- There was a short circuit evaluation error in the `MySqlCommand.CheckState()` method. When the statement `connection == null` was true a `NullReferenceException` was thrown and not the expected `InvalidOperationException`. ([Bug#38276](#))

- Executing a command that resulted in a fatal exception did not close the connection. ([Bug#37991](#))
- In a .NET application MySQL Connector/NET modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

The original connection string:

```
host=localhost;database=test;uid=*****;pwd=*****;
connect timeout=25; auto enlist=false;pooling=false;
```

The connection string after closing `MySqlDataReader`:

```
host=localhost;database=test;uid=*****;pwd=*****;
connect timeout=25;auto enlist=false;pooling=false;
Allow User Variables=True;Allow User Variables=False;
Allow User Variables=True;Allow User Variables=False;
```

([Bug#37955](#))

- As `MySqlDbType.DateTime` is not available in VB .Net the warning `THE DATETIME ENUM VALUE IS OBSOLETE` was always shown during compilation. ([Bug#37406](#))
- An unknown `MySqlErrorCode` was encountered when opening a connection with an incorrect password. ([Bug#37398](#))
- Documentation incorrectly stated that “the DataColumn class in .NET 1.0 and 1.1 does not allow columns with type of UInt16, UInt32, or UInt64 to be autoincrement columns”. ([Bug#37350](#))
- `SemaphoreFullException` is generated when application is closed. ([Bug#36688](#))
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. ([Bug#35459](#))
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. ([Bug#33322](#))
- Using the MySQL Visual Studio plugin and a MySQL 4.1 server, certain field types (`ENUM`) would not be identified correctly. Also, when looking for tables, the plugin would list all tables matching a wildcard pattern of the database name supplied in the connection string, instead of only tables within the specified database. ([Bug#30603](#))

## C.5.17. Changes in MySQL Connector/NET 5.1.6 (12 May 2008)

Bugs fixed:

- When creating a connection pool, specifying an invalid IP address will cause the entire application to crash, instead of providing an exception. ([Bug#36432](#))
- An incorrect value for a bit field would returned in a multi-row query if a preceding value for the field returned `NULL`. ([Bug#36313](#))
- The `MembershipProvider` will raise an exception when the connection string is configured with `enablePasswordRetrieval = true` and `RequireQuestionAndAnswer = false`. ([Bug#36159](#))
- When calling `GetNumberOfUsersOnline` an exception is raised on the submitted query due to a missing parameter. ([Bug#36157](#))
- Tables with `GEOMETRY` field types would return an unknown datatype exception. ([Bug#36081](#))
- When creating a connection, setting the `ConnectionString` property of `MySqlConnection` to `NULL` would throw an exception. ([Bug#35619](#))
- The `DbCommandBuilder.QuoteIdentifier` method was not implemented. ([Bug#35492](#))
- When using `SqlDataSource` to open a connection, the connection would not automatically be closed when access had completed. ([Bug#34460](#))
- Attempting to use an isolation level other than the default with a transaction scope would use the default isolation level. ([Bug#34448](#))
- When altering a stored procedure within Visual Studio, the parameters to the procedure could be lost. ([Bug#34359](#))

- A race condition could occur within the procedure cache resulting the cache contents overflowing beyond the configured cache size. ([Bug#34338](#))
- Using the `TableAdaptor` wizard in combination with a suitable `SELECT` statement, only the associated `INSERT` statement would also be created, rather than the required `DELETE` and `UPDATE` statements. ([Bug#31338](#))

## C.5.18. Changes in MySQL Connector/NET 5.1.5 (Not yet released)

Functionality added or changed:

- Performing `GetValue()` on a field `TINYINT(1)` returned a `BOOLEAN`. While not a bug, this caused problems in software that expected an `INT` to be returned. A new connection string option `Treat Tiny As Boolean` has been added with a default value of `true`. If set to `false` the provider will treat `TINYINT(1)` as `INT`. ([Bug#34052](#))

Bugs fixed:

- Some speed improvements have been implemented in the `TokenizeSql` process used to identify elements of SQL statements. ([Bug#34220](#))
- When accessing tables from different databases within the same `TransactionScope`, the same user/password combination would be used for each database connection. Connector/NET does not handle multiple connections within the same transaction scope. An error is now returned if you attempt this process, instead of using the incorrect authorization information. ([Bug#34204](#))
- The status of connections reported through the state change handler was not being updated correctly. ([Bug#34082](#))
- Incorporated some connection string cache optimizations sent to us by Maxim Mass. ([Bug#34000](#))
- In an open connection where the server had disconnected unexpectedly, the status information of the connection would not be updated properly. ([Bug#33909](#))
- Connector/NET would fail to compile properly with `nant`. ([Bug#33508](#))
- Problem with membership provider would mean that `FindUserByEmail` would fail with a `MySQLException` because it was trying to add a second parameter with the same name as the first. ([Bug#33347](#))
- Using compression in the MySQL connection with Connector/NET would be slower than using native (uncompressed) communication. ([Bug#27865](#))

## C.5.19. Changes in MySQL Connector/NET 5.1.4 (20 November 2007)

Bugs fixed:

- Setting the size of a string parameter after the value could cause an exception. ([Bug#32094](#))
- Creation of parameter objects with non-input direction using a constructor would fail. This was caused by some old legacy code preventing their use. ([Bug#32093](#))
- A date string could be returned incorrectly by `MySqlDateTime.ToString()` when the date returned by MySQL was `0000-00-00 00:00:00`. ([Bug#32010](#))
- A syntax error in a set of batch statements could leave the data adapter in a state that appears hung. ([Bug#31930](#))
- Installing over a failed uninstall of a previous version could result in multiple clients being registered in the `machine.config`. This would prevent certain aspects of the MySQL connection within Visual Studio to work properly. ([Bug#31731](#))
- Connector/NET would incorrectly report success when enlisting in a distributed transaction, although distributed transactions are not supported. ([Bug#31703](#))
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This led to updated connection string options not being recognized if they were of a different case than the existing cached values. ([Bug#31433](#))

- Trying to use a connection that was not open could return an ambiguous and misleading error message. ([Bug#31262](#))
- Column name metadata was not using the character set as defined within the connection string being used. ([Bug#31185](#))
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. ([Bug#31090](#))
- Commands executed from within the state change handler would fail with a `NULL` exception. ([Bug#30964](#))
- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. ([Bug#30233](#))
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. ([Bug#30116](#))
- Column types with only 1-bit (such as `BOOLEAN` and `TINYINT(1)`) were not returned as boolean fields. ([Bug#27959](#))
- When accessing certain statements, the command would timeout before the command completed. Because this cannot always be controlled through the individual command timeout options, a `default command timeout` has been added to the connection string options. ([Bug#27958](#))
- The server error code was not updated in the `Data[]` hash, which prevented `DbProviderFactory` users from accessing the server error code. ([Bug#27436](#))
- The `MySqlDbType.Datetime` has been replaced with `MySqlDbType.DateTime`. The old format has been obsoleted. ([Bug#26344](#))
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. ([Bug#13991](#))

## C.5.20. Changes in MySQL Connector/NET 5.1.3 (21 September 2007 beta)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. ([Bug#30204](#))
- A `DATE` field would be updated with a date/time value, causing a `MySqlDataAdapter.Update()` exception. ([Bug#30077](#))
- The Saudi Hijri calendar was not supported. ([Bug#29931](#))
- Calling `SHOW CREATE PROCEDURE` for routines with a hyphen in the catalog name produced a syntax error. ([Bug#29526](#))
- Connecting to a MySQL server earlier than version 4.1 would raise a `NullException`. ([Bug#29476](#))
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. ([Bug#29409](#))
- A `FormatException` error would be raised if a parameter had not been found, instead of `Resources.ParameterMustBeDefined`. ([Bug#29312](#))
- An exception would be thrown when using the Manage Role functionality within the web administrator to assign a role to a user. ([Bug#29236](#))
- Using the membership/role providers when `validationKey` or `decryptionKey` parameters are set to `AutoGenerate`, an exception would be raised when accessing the corresponding values. ([Bug#29235](#))
- Certain operations would not check the `UsageAdvisor` setting, causing log messages from the Usage Advisor even when it was disabled. ([Bug#29124](#))
- Using the same connection string multiple times would result in `Database=dbname` appearing multiple times in the resulting string. ([Bug#29123](#))
- *Visual Studio Plugin*: Adding a new query based on a stored procedure that uses the `SELECT` statement would terminate the query/TableAdapter wizard. ([Bug#29098](#))

- Using `TransactionScope` would cause an `InvalidOperationException`. (Bug#28709)

### C.5.21. Changes in MySQL Connector/NET 5.1.2 (18 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- Log messages would be truncated to 300 bytes. (Bug#28706)
- Creating a user would fail due to the application name being set incorrectly. (Bug#28648)
- *Visual Studio Plugin*: Adding a new query based on a stored procedure that used a `UPDATE`, `INSERT` or `DELETE` statement would terminate the query/TableAdapter wizard. (Bug#28536)
- *Visual Studio Plugin*: Query Builder would fail to show `TINYTEXT` columns, and any columns listed after a `TINYTEXT` column correctly. (Bug#28437)
- Accessing the results from a large query when using data compression in the connection would fail to return all the data. (Bug#28204)
- *Visual Studio Plugin*: Update commands would not be generated correctly when using the TableAdapter wizard. (Bug#26347)

### C.5.22. Changes in MySQL Connector/NET 5.1.1 (23 May 2007)

Bugs fixed:

- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. (Bug#28448)
- Installation of the Connector/NET on Windows would fail if VisualStudio had not already been installed. (Bug#28260)
- Connector/NET would look for the wrong table when executing `User.IsRole()`. (Bug#28251)
- Building a connection string within a tight loop would show slow performance. (Bug#28167)
- The `UNSIGNED` flag for parameters in a stored procedure would be ignored when using `MySqlCommandBuilder` to obtain the parameter information. (Bug#27679)
- Using `MySQLDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. (Bug#27668)
- `DATETIME` fields from versions of MySQL before 4.1 would be incorrectly parsed, resulting in an exception. (Bug#23342)
- Fixed password property on `MySqlConnectionStringBuilder` to use `PasswordPropertyText` attribute. This causes dots to show instead of actual password text.

### C.5.23. Changes in MySQL Connector/NET 5.1.0 (01 May 2007)

Functionality added or changed:

- Now compiles for .NET CF 2.0.
- Rewrote stored procedure parsing code using a new SQL tokenizer. Really nasty procedures including nested comments are now supported.
- `GetSchema` will now report objects relative to the currently selected database. What this means is that passing in null as a database restriction will report objects on the currently selected database only.
- Added Membership and Role provider contributed by Sean Wright (thanks!).

### C.5.24. Changes in MySQL Connector/NET 5.0.10 (Not yet released)

Bugs fixed:

---

- If, when using the `MySqlConnection` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. (Bug#39817)
- Executing a command that resulted in a fatal exception did not close the connection. (Bug#37991)
- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that should be inserted is corrupted and no error is thrown. (Bug#37968)
- In a .NET application MySQL Connector/NET modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

The original connection string:

```
host=localhost;database=test;uid=****;pwd=****;
connect timeout=25; auto enlist=false;pooling=false;
```

The connection string after closing `MySqlDataReader`:

```
host=localhost;database=test;uid=****;pwd=****;
connect timeout=25;auto enlist=false;pooling=false;
Allow User Variables=True;Allow User Variables=False;
Allow User Variables=True;Allow User Variables=False;
```

(Bug#37955)

- When creating a connection pool, specifying an invalid IP address will cause the entire application to crash, instead of providing an exception. (Bug#36432)
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. (Bug#35459)
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. (Bug#33322)

## C.5.25. Changes in MySQL Connector/NET 5.0.9 (Not yet released)

Bugs fixed:

- The `DbCommandBuilder.QuoteIdentifier` method was not implemented. (Bug#35492)
- Setting the size of a string parameter after the value could cause an exception. (Bug#32094)
- Creation of parameter objects with non-input direction using a constructor would fail. This was caused by some old legacy code preventing their use. (Bug#32093)
- A date string could be returned incorrectly by `MySqlDateTime.ToString()` when the date returned by MySQL was `0000-00-00 00:00:00`. (Bug#32010)
- A syntax error in a set of batch statements could leave the data adapter in a state that appears hung. (Bug#31930)
- Installing over a failed uninstall of a previous version could result in multiple clients being registered in the `machine.config`. This would prevent certain aspects of the MySQL connection within Visual Studio to work properly. (Bug#31731)
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This led to updated connection string options not being recognized if they were of a different case than the existing cached values. (Bug#31433)
- Column name metadata was not using the character set as defined within the connection string being used. (Bug#31185)
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. (Bug#31090)
- Commands executed from within the state change handler would fail with a `NULL` exception. (Bug#30964)
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. (Bug#30116)
- The server error code was not updated in the `Data[]` hash, which prevented `DbProviderFactory` users from accessing the server error code. (Bug#27436)

- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. ([Bug#13991](#))

## C.5.26. Changes in MySQL Connector/NET 5.0.8 (21 August 2007)

### Note

This version introduces a new installer technology.

Bugs fixed:

- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. ([Bug#30233](#))
- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. ([Bug#30204](#))
- A `DATE` field would be updated with a date/time value, causing a `MySqlDataAdapter.Update()` exception. ([Bug#30077](#))
- Fixed bug where Connector/Net was hand building some date time patterns rather than using the patterns provided under `CultureInfo`. This caused problems with some calendars that do not support the same ranges as Gregorian.. ([Bug#29931](#))
- Calling `SHOW CREATE PROCEDURE` for routines with a hyphen in the catalog name produced a syntax error. ([Bug#29526](#))
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. ([Bug#29409](#))
- A `FormatException` error would be raised if a parameter had not been found, instead of `Resources.ParameterMustBeDefined`. ([Bug#29312](#))
- Certain operations would not check the `UsageAdvisor` setting, causing log messages from the Usage Advisor even when it was disabled. ([Bug#29124](#))
- Using the same connection string multiple times would result in `Database=dbname` appearing multiple times in the resulting string. ([Bug#29123](#))
- Log messages would be truncated to 300 bytes. ([Bug#28706](#))
- Accessing the results from a large query when using data compression in the connection will fail to return all the data. ([Bug#28204](#))
- Fixed problem where `MySqlConnection.BeginTransaction` checked the drivers status var before checking if the connection was open. The result was that the driver could report an invalid condition on a previously opened connection.
- Fixed problem where we were not closing prepared statement handles when commands are disposed. This could lead to using up all prepared statement handles on the server.
- Fixed the database schema collection so that it works on servers that are not properly respecting the `lower_case_table_names` setting.
- Fixed problem where any attempt to not read all the records returned from a select where each row of the select is greater than 1024 bytes would hang the driver.
- Fixed problem where a command timing out just after it actually finished would cause an exception to be thrown on the command timeout thread which would then be seen as an unhandled exception.
- Fixed some serious issues with command timeout and cancel that could present as exceptions about thread ownership. The issue was that not all queries cancel the same. Some produce resultsets while others don't. `ExecuteReader` had to be changed to check for this.

## C.5.27. Changes in MySQL Connector/NET 5.0.7 (18 May 2007)

Bugs fixed:

- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. ([Bug#28448](#))
- Building a connection string within a tight loop would show slow performance. ([Bug#28167](#))
- Using logging (with the `logging=true` parameter to the connection string) would not generate a log file. ([Bug#27765](#))
- The `UNSIGNED` flag for parameters in a stored procedure would be ignored when using `MySQLCommandBuilder` to obtain the parameter information. ([Bug#27679](#))
- Using `MySQLDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. ([Bug#27668](#))
- If you close an open connection with an active transaction, the transaction is not automatically rolled back. ([Bug#27289](#))
- When cloning an open `MySqlConnection` with the `Persist Security Info=False` option set, the cloned connection is not usable because the security information has not been cloned. ([Bug#27269](#))
- Enlisting a null transaction would affect the current connection object, such that further enlistment operations to the transaction are not possible. ([Bug#26754](#))
- Attempting to change the `Connection Protocol` property within a `PropertyGrid` control would raise an exception. ([Bug#26472](#))
- The `charset` property would not be identified during a connection (also affected Visual Studio Plugin). ([Bug#26147](#), [Bug#27240](#))
- The `CreateFormat` column of the `DataTypes` collection did not contain a format specification for creating a new column type. ([Bug#25947](#))
- `DATETIME` fields from versions of MySQL before 4.1 would be incorrectly parsed, resulting in an exception. ([Bug#23342](#))

## C.5.28. Changes in MySQL Connector/NET 5.0.6 (22 March 2007)

Bugs fixed:

- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. ([Bug#27253](#))
- `DESCRIBE . . . .` SQL statement returns byte arrays rather than data on MySQL versions older than 4.1.15. ([Bug#27221](#))
- `cmd.Parameters.RemoveAt("Id")` will cause an error if the last item is requested. ([Bug#27187](#))
- `MySQLParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. ([Bug#27135](#))
- Exception thrown when using large values in `UInt64` parameters. ([Bug#27093](#))
- MySQL Visual Studio Plugin 1.1.2 does not work with Connector/Net 5.0.5. ([Bug#26960](#))

## C.5.29. Changes in MySQL Connector/NET 5.0.5 (07 March 2007)

Functionality added or changed:

- Reverted behavior that required parameter names to start with the parameter marker. We apologize for this back and forth but we mistakenly changed the behavior to not match what `SqlCommand` supports. We now support using either syntax for adding parameters however we also respond exactly like `SqlCommand` in that if you ask for the index of a parameter using a syntax different from when you added the parameter, the result will be -1.
- Assembly now properly appears in the Visual Studio 2005 Add/Remove Reference dialog.
- Fixed problem that prevented use of `SchemaOnly` or `SingleRow` command behaviors with stored procedures or prepared statements.
- Added `MySQLParameterCollection.AddWithValue` and marked the `Add(name, value)` method as obsolete.
- Return parameters created with `DeriveParameters` now have the name `RETURN_VALUE`.
- Fixed problem with parameter name hashing where the hashes were not getting updated when parameters were removed from

the collection.

- Fixed problem with calling stored functions when a return parameter was not given.
- Added `Use Procedure Bodies` connection string option to allow calling procedures without using procedure metadata.

Bugs fixed:

- `MySqlConnection.GetSchema` fails with `NullReferenceException` for Foreign Keys. (Bug#26660)
- Connector/NET would fail to install under Windows Vista. (Bug#26430)
- Opening a connection would be slow due to host name lookup. (Bug#26152)
- Incorrect values/formats would be applied when the `OldSyntax` connection string option was used. (Bug#25950)
- Registry would be incorrectly populated with installation locations. (Bug#25928)
- Times with negative values would be returned incorrectly. (Bug#25912)
- Returned data types of a `DataTypes` collection do not contain the right correct CLR Datatype. (Bug#25907)
- `GetSchema` and `DataTypes` would throw an exception due to an incorrect table name. (Bug#25906)
- `MySqlConnection` throws an exception when connecting to MySQL v4.1.7. (Bug#25726)
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. (Bug#25651)
- When closing and then re-opening a connection to a database, the character set specification is lost. (Bug#25614)
- Filling a table schema through a stored procedure triggers a runtime error. (Bug#25609)
- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, datatype. (Bug#25605)
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. (Bug#25603)
- The `UpdateRowSource.FirstReturnedRecord` method does not work. (Bug#25569)
- When connecting to a MySQL Server earlier than version 4.1, the connection would hang when reading data. (Bug#25458)
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. (Bug#25443)
- When a `MySqlConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. (Bug#24957)
- When connecting to a server, the return code from the connection could be zero, even though the host name was incorrect. (Bug#24802)
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySqlConnection.GetConnection`. (Bug#24373)
- Connector/NET would not compile properly when used with Mono 1.2. (Bug#24263)
- Applications would crash when calling with `CommandType` set to `StoredProcedure`.

### C.5.30. Changes in MySQL Connector/NET 5.0.4 (Not released)

This is a new Beta development release, fixing recently discovered bugs.

### C.5.31. Changes in MySQL Connector/NET 5.0.3 (05 January 2007)

Functionality added or changed:

- Usage Advisor has been implemented. The Usage Advisor checks your queries and will report if you are using the connection inefficiently.
- PerfMon hooks have been added to monitor the stored procedure cache hits and misses.

- The `MySqlCommand` object now supports asynchronous query methods. This is implemented using the `BeginExecuteNonQuery` and `EndExecuteNonQuery` methods.
- Metadata from stored procedures and stored function execution are cached.
- The `CommandBuilder.DeriveParameters` function has been updated to the procedure cache.
- The `ViewColumns.GetSchema` collection has been updated.
- Improved speed and performance by re-architecting certain sections of the code.
- Support for the embedded server and client library have been removed from this release. Support will be added back to a later release.
- The `ShapZipLib` library has been replaced with the deflate support provided within .NET 2.0.
- SSL support has been updated.

#### Bugs fixed:

- Additional text added to error message ([Bug#25178](#))
- An exception would be raised, or the process would hang, if `SELECT` privileges on a database were not granted and a stored procedure was used. ([Bug#25033](#))
- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. ([Bug#25013](#))
- Using `Driver.IsTooOld()` would return the wrong value. ([Bug#24661](#))
- When using a `DBNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DBNull.Value`. ([Bug#24565](#))
- Stored procedure executions are not thread safe. ([Bug#23905](#))
- Deleting a connection to a disconnected server when using the Visual Studio Plugin would cause an assertion failure. ([Bug#23687](#))
- Nested transactions (which are unsupported) do not raise an error or warning. ([Bug#22400](#))

## C.5.32. Changes in MySQL Connector/NET 5.0.2 (06 November 2006)

#### Functionality added or changed:

- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.
- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the number of procedures that are cached by using the `procedure cache` connection string.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/NET 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string properties:

```
ignore prepare=false
```

The default value of this property is true.

#### Bugs fixed:

- One system where IPv6 was enabled, Connector/NET would incorrectly resolve host names. ([Bug#23758](#))

- Column names with accented characters were not parsed properly causing malformed column names in result sets. ([Bug#23657](#))
- An exception would be thrown when calling `GetSchemaTable` and `fields` was null. ([Bug#23538](#))
- A `System.FormatException` exception would be raised when invoking a stored procedure with an `ENUM` input parameter. ([Bug#23268](#))
- During installation, an antivirus error message would be raised (indicating a malicious script problem). ([Bug#23245](#))
- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that Connector/NET 5.0.2 must be installed. ([Bug#23071](#))
- Using Windows Vista (RC2) as a non-privileged user would raise a `Registry key 'Global' access denied`. ([Bug#22882](#))
- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. ([Bug#18186](#))
- Connector/NET did not work as a data source for the `SqlDataSource` object used by ASP.NET 2.0. ([Bug#16126](#))

### C.5.33. Changes in MySQL Connector/NET 5.0.1 (01 October 2006)

Bugs fixed:

- Connector/NET on a Turkish operating system, may fail to execute certain SQL statements correctly. ([Bug#22452](#))
- Starting a transaction on a connection created by `MySql.Data.MySqlClient.MySqlClientFactory`, using `BeginTransaction` without specifying an isolation level, causes the SQL statement to fail with a syntax error. ([Bug#22042](#))
- The `MySqlException` class is now derived from the `DbException` class. ([Bug#21874](#))
- The `#` would not be accepted within column/table names, even though it was valid. ([Bug#21521](#))
- You can now install the Connector/NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. ([Bug#19994](#))
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a Connector/Net exception. ([Bug#18391](#))
- Using `ExecuteScalar` with a datetime field, where the value of the field is "0000-00-00 00:00:00", a `MySqlConversionException` exception would be raised. ([Bug#11991](#))
- An `MySql.Data.Types.MySqlConversionException` would be raised when trying to update a row that contained a date field, where the date field contained a zero value (0000-00-00 00:00:00). ([Bug#9619](#))
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first`. ([Bug#7248](#))
- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. Bug (#14592)

### C.5.34. Changes in MySQL Connector/NET 5.0.0 (08 August 2006)

Functionality added or changed:

- Replaced use of `ICSharpCode` with .NET 2.0 internal deflate support.
- Refactored test suite to test all protocols in a single pass.
- Added usage advisor warnings for requesting column values by the wrong type.
- Reimplemented `PacketReader/PacketWriter` support into `MySQLStream` class.
- Reworked connection string classes to be simpler and faster.
- Added procedure metadata caching.

- Added internal implementation of SHA1 so we don't have to distribute the OpenNetCF on mobile devices.
- Implemented `MySqlClientFactory` class.
- Added perfmon hooks for stored procedure cache hits and misses.
- Implemented classes and interfaces for ADO.Net 2.0 support.
- Added Async query methods.
- Implemented Usage Advisor.
- Completely refactored how column values are handled to avoid boxing in some cases.
- Implemented `MySqlConnectionBuilder` class.

Bugs fixed:

- CommandText: Question mark in comment line is being parsed as a parameter. ([Bug#6214](#))

### C.5.35. Changes in MySQL Connector/NET 1.0.11 (Not yet released)

Bugs fixed:

- Attempting to utilize MySQL Connector .Net version 1.0.10 throws a fatal exception under Mono when pooling is enabled. ([Bug#33682](#))
- Setting the size of a string parameter after the value could cause an exception. ([Bug#32094](#))
- Creation of parameter objects with non-input direction using a constructor would fail. This was caused by some old legacy code preventing their use. ([Bug#32093](#))
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. ([Bug#31090](#))
- Commands executed from within the state change handler would fail with a `NULL` exception. ([Bug#30964](#))
- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. ([Bug#30233](#))
- Using compression in the MySQL connection with Connector/NET would be slower than using native (uncompressed) communication. ([Bug#27865](#))
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. ([Bug#13991](#))

### C.5.36. Changes in MySQL Connector/NET 1.0.10 (24 August 2007)

Bugs fixed:

- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. ([Bug#30204](#))
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server became available while the application was still running. ([Bug#29409](#))
- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. ([Bug#27253](#))
- `MySqlParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. ([Bug#27135](#))
- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, datatype. ([Bug#25605](#))
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. ([Bug#25603](#))

- When a `MySQLConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. (Bug#24957)
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySQLPool.GetConnection`. (Bug#24373)

## C.5.37. Changes in MySQL Connector/NET 1.0.9 (02 February 2007)

Functionality added or changed:

- The `ICSharpCode ZipLib` is no longer used by the Connector, and is no longer distributed with it.
- **Important change:** Binaries for .NET 1.0 are no longer supplied with this release. If you need support for .NET 1.0, you must build from source.
- Improved `CommandBuilder.DeriveParameters` to first try and use the procedure cache before querying for the stored procedure metadata. Return parameters created with `DeriveParameters` now have the name `RETURN_VALUE`.
- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.
- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the number of procedures that are cached by using the `procedure cache` connection string.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/NET 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string properties:

```
ignore prepare=false
```

The default value of this property is true.

Bugs fixed:

- Times with negative values would be returned incorrectly. (Bug#25912)
- `MySQLConnection` throws a `NullReferenceException` and `ArgumentNullException` when connecting to MySQL v4.1.7. (Bug#25726)
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. (Bug#25651)
- When closing and then re-opening a connection to a database, the character set specification is lost. (Bug#25614)
- Trying to fill a table schema through a stored procedure triggers a runtime error. (Bug#25609)
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. (Bug#25443)
- Additional text added to error message. (Bug#25178)
- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. (Bug#25013)
- When connecting to a server, the return code from the connection could be zero, even though the host name was incorrect. (Bug#24802)
- Using `Driver.IsTooOld()` would return the wrong value. (Bug#24661)
- When using a `DBNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DBNull.Value`. (Bug#24565)
- Stored procedure executions are not thread safe. (Bug#23905)
- The `CommandBuilder` would mistakenly add insert parameters for a table column with auto incrementation enabled. (Bug#23862)

- One system where IPv6 was enabled, Connector/NET would incorrectly resolve host names. ([Bug#23758](#))
- Nested transactions do not raise an error or warning. ([Bug#22400](#))
- An `System.OverflowException` would be raised when accessing a varchar field over 255 bytes. Bug (#23749)
- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. (Bug 18186)

### C.5.38. Changes in MySQL Connector/NET 1.0.8 (20 October 2006)

Functionality added or changed:

- Stored procedures are now cached.
- The method for retrieving stored procedured metadata has been changed so that users without `SELECT` privileges on the `mysql.proc` table can use a stored procedure.

Bugs fixed:

- Connector/NET on a Turkish operating system, may fail to execute certain SQL statements correctly. ([Bug#22452](#))
- The `#` would not be accepted within column/table names, even though it was valid. ([Bug#21521](#))
- Calling `Close` on a connection after calling a stored procedure would trigger a `NullReferenceException`. ([Bug#20581](#))
- You can now install the Connector/NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. ([Bug#19994](#))
- The `DiscoverParameters` function would fail when a stored procedure used a `NUMERIC` parameter type. ([Bug#19515](#))
- When running a query that included a date comparison, a `DateReader` error would be raised. ([Bug#19481](#))
- `IDataRecord.GetString` would raise `NullPointerException` for null values in returned rows. Method now throws `SqlNullValueException`. ([Bug#19294](#))
- Parameter substitution in queries where the order of parameters and table fields did not match would substitute incorrect values. ([Bug#19261](#))
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a Connector/Net exception. ([Bug#18391](#))
- An exception would be raised when using an output parameter to a `System.String` value. ([Bug#17814](#))
- CHAR type added to `MySqlDbType`. ([Bug#17749](#))
- A `SELECT` query on a table with a date with a value of `'0000-00-00'` would hang the application. ([Bug#17736](#))
- The `CommandBuilder` ignored `Unsigned` flag at Parameter creation. ([Bug#17375](#))
- When working with multiple threads, character set initialization would generate errors. ([Bug#17106](#))
- When using an unsigned 64-bit integer in a stored procedure, the unsigned bit would be lost stored. ([Bug#16934](#))
- `DataReader` would show the value of the previous row (or last row with non-null data) if the current row contained a `datetime` field with a null value. ([Bug#16884](#))
- Unsigned data types were not properly supported. ([Bug#16788](#))
- The connection string parser did not allow single or double quotes in the password. ([Bug#16659](#))
- The `MySqlDateTime` class did not contain constructors. ([Bug#15112](#))
- Called `MySqlCommandBuilder.DeriveParameters` for a stored procedure that has no paramers would cause an application crash. ([Bug#15077](#))
- Using `ExecuteScalar` with a datetime field, where the value of the field is `"0000-00-00 00:00:00"`, a `MySqlConver-`

`IOException` exception would be raised. (Bug#11991)

- An `MySql.Data.Types.MySqlConversionException` would be raised when trying to update a row that contained a date field, where the date field contained a zero value (0000-00-00 00:00:00). (Bug#9619)
- When using `MySqlDataAdapter`, connections to a MySQL server may remain open and active, even though the use of the connection has been completed and the data received. (Bug#8131)
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first.` (Bug#7248)
- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. Bug (#14592)

### C.5.39. Changes in MySQL Connector/NET 1.0.7 (21 November 2005)

Bugs fixed:

- Unsigned `tinyint` (NET byte) would lead to and incorrectly determined parameter type from the parameter value. (Bug#18570)
- A `#42000Query was empty` exception occurred when executing a query built with `MySqlCommandBuilder`, if the query string ended with a semicolon. (Bug#14631)
- The parameter collection object's `Add()` method added parameters to the list without first checking to see whether they already existed. Now it updates the value of the existing parameter object if it exists. (Bug#13927)
- Added support for the `cp932` character set. (Bug#13806)
- Calling a stored procedure where a parameter contained special characters (such as '@') would produce an exception. Note that `ANSI_QUOTES` had to be enabled to make this possible. (Bug#13753)
- The `Ping()` method did not update the `State` property of the `Connection` object. (Bug#13658)
- Implemented the `MySqlCommandBuilder.DeriveParameters` method that is used to discover the parameters for a stored procedure. (Bug#13632)
- A statement that contained multiple references to the same parameter could not be prepared. (Bug#13541)

### C.5.40. Changes in MySQL Connector/NET 1.0.6 (03 October 2005)

Bugs fixed:

- Connector/NET 1.0.5 could not connect on Mono. (Bug#13345)
- Serializing a parameter failed if the first value passed in was `NULL`. (Bug#13276)
- Field names that contained the following characters caused errors: `()%<>/` (Bug#13036)
- The `nant` build sequence had problems. (Bug#12978)
- The Connector/NET 1.0.5 installer would not install alongside Connector/NET 1.0.4. (Bug#12835)

### C.5.41. Changes in MySQL Connector/NET 1.0.5 (29 August 2005)

Bugs fixed:

- Connector/NET could not connect to MySQL 4.1.14. (Bug#12771)
- With multiple hosts in the connection string, Connector/NET would not connect to the last host in the list. (Bug#12628)
- The `ConnectionString` property could not be set when a `MySqlConnection` object was added with the designer. (Bug#12551, Bug#8724)
- The `cp1250` character set was not supported. (Bug#11621)

- A call to a stored procedure caused an exception if the stored procedure had no parameters. (Bug#11542)
- Certain malformed queries would trigger a `Connection must be valid and open` error message. (Bug#11490)
- Trying to use a stored procedure when `Connection.Database` was not populated generated an exception. (Bug#11450)
- Connector/NET interpreted the new decimal data type as a byte array. (Bug#11294)
- Added support to call a stored function from Connector/NET. (Bug#10644)
- Connection could fail when .NET thread pool had no available worker threads. (Bug#10637)
- Calling `MySqlConnection.clone` when a connection string had not yet been set on the original connection would generate an error. (Bug#10281)
- Decimal parameters caused syntax errors. (Bug#10152, Bug#11550, Bug#10486)
- Parameters were not recognized when they were separated by linefeeds. (Bug#9722)
- The `MySqlCommandBuilder` class could not handle queries that referenced tables in a database other than the default database. (Bug#8382)
- Trying to read a `TIMESTAMP` column generated an exception. (Bug#7951)
- Connector/NET could not work properly with certain regional settings. (WL#8228)

## C.5.42. Changes in MySQL Connector/NET 1.0.4 (20 January 2005)

Bugs fixed:

- `MySqlReader.GetInt32` throws exception if column is unsigned. (Bug#7755)
- Quote character `\222` not quoted in `EscapeString`. (Bug#7724)
- `GetBytes` is working no more. (Bug#7704)
- `MySqlDataReader.GetString(index)` returns non-Null value when field is `Null`. (Bug#7612)
- Clone method bug in `MySqlCommand`. (Bug#7478)
- Problem with Multiple resultsets. (Bug#7436)
- `MySqlAdapter.Fill` method throws error message `Non-negative number required`. (Bug#7345)
- `MySqlCommand.Connection` returns an `IDbConnection`. (Bug#7258)
- Calling `prepare` causing exception. (Bug#7243)
- Fixed problem with shared memory connections.
- Added or filled out several more topics in the API reference documentation.
- Fixed another small problem with prepared statements.
- Fixed problem that causes named pipes to not work with some blob functionality.

## C.5.43. Changes in MySQL Connector/NET 1.0.3 (12 October 2004 gamma)

Bugs fixed:

- Invalid query string when using inout parameters (Bug#7133)
- Inserting `DateTime` causes `System.InvalidCastException` to be thrown. (Bug#7132)
- `MySqlDateTime` in Datatables sorting by Text, not Date. (Bug#7032)
- Exception stack trace lost when re-throwing exceptions. (Bug#6983)

- Errors in parsing stored procedure parameters. ([Bug#6902](#))
- InvalidCast when using `DATE_ADD`-function. ([Bug#6879](#))
- Int64 Support in `MySqlCommand` Parameters. ([Bug#6863](#))
- Test suite fails with MySQL 4.0 because of case sensitivity of table names. ([Bug#6831](#))
- `MySqlDataReader.GetChar(int i)` throws `IndexOutOfRangeException` exception. ([Bug#6770](#))
- Integer "out" parameter from stored procedure returned as string. ([Bug#6668](#))
- An Open Connection has been Closed by the Host System. ([Bug#6634](#))
- Fixed Invalid character set index: 200. ([Bug#6547](#))
- Connections now do not have to give a database on the connection string.
- Installer now includes options to install into GAC and create `START MENU` items.
- Fixed major problem with detecting null values when using prepared statements.
- Fixed problem where multiple resultsets having different numbers of columns would cause a problem.
- Added `ServerThread` property to `MySqlConnection` to expose server thread id.
- Added Ping method to `MySqlConnection`.
- Changed the name of the test suite to `MySql.Data.Tests.dll`.
- Now `SHOW COLLATION` is used upon connection to retrieve the full list of charset ids.
- Made MySQL the default named pipe name.

#### C.5.44. Changes in MySQL Connector/NET 1.0.2 (15 November 2004 gamma)

Bugs fixed:

- Fixed Objects not being disposed ([Bug#6649](#))
- Fixed Charset-map for UCS-2 ([Bug#6541](#))
- Fixed Zero date "0000-00-00" is returned wrong when filling Dataset ([Bug#6429](#))
- Fixed double type handling in `MySqlParameter(string parameterName, object value)` ([Bug#6428](#))
- Fixed Installation directory ignored using custom installation ([Bug#6329](#))
- Fixed #HY000 Illegal mix of collations (latin1\_swedish\_ci,IMPLICIT) and (utf8\_general\_ ([Bug#6322](#))
- Added the TableEditor CS and VB sample
- Added charset connection string option
- Fixed problem with `MySqlBinary` where string values could not be used to update extended text columns
- Provider is now using character set specified by server as default
- Updated the installer to include the new samples
- Fixed problem where setting command text leaves the command in a prepared state
- Fixed Long inserts take very long time (Bu #5453)
- Fixed problem where calling stored procedures might cause an "Illegal mix of collations" problem.

#### C.5.45. Changes in MySQL Connector/NET 1.0.1 (27 October 2004 beta)

Bugs fixed:

- Fixed IndexOutOfBounds when reading BLOB with DataReader with GetString(index) ([Bug#6230](#))
- Fixed GetBoolean returns wrong values ([Bug#6227](#))
- Fixed Method TokenizeSql() uses only a limited set of valid characters for parameters ([Bug#6217](#))
- Fixed NET Connector source missing resx files ([Bug#6216](#))
- Fixed System.OverflowException when using YEAR datatype ([Bug#6036](#))
- Fixed MySqlDateTime sets IsZero property on all subseq.records after first zero found ([Bug#6006](#))
- Fixed serializing of floating point parameters (double, numeric, single, decimal) ([Bug#5900](#))
- Fixed missing Reference in DbType setter ([Bug#5897](#))
- Fixed Parsing the ';' char ([Bug#5876](#))
- Fixed DBNull Values causing problems with retrieving/updating queries. ([Bug#5798](#))
- IsNullable error ([Bug#5796](#))
- Fixed problem where MySqlParameterCollection.Add() would throw unclear exception when given a null value ([Bug#5621](#))
- Fixed construtor initialize problems in MySqlCommand() ([Bug#5613](#))
- Fixed Yet Another "object reference not set to an instance of an object" ([Bug#5496](#))
- Fixed Can't display Chinese correctly ([Bug#5288](#))
- Fixed MySqlDataReader and 'show tables from ...' behavior ([Bug#5256](#))
- Fixed problem in PacketReader where it could try to allocate the wrong buffer size in EnsureCapacity
- Fixed problem where using old syntax while using the interfaces caused problems
- Fixed [Bug#5458](#) Calling GetChars on a longtext column throws an exception
- Added test case for resetting the command text on a prepared command
- Fixed [Bug#5388](#) DataReader reports all rows as NULL if one row is NULL
- Fixed problem where connection lifetime on the connect string was not being respected
- Fixed [Bug#5602](#) Possible bug in MySqlParameter(string, object) constructor
- Field buffers being reused to decrease memory allocations and increase speed
- Fixed [Bug#5392](#) MySqlCommand sees "?" as parameters in string literals
- Added Aggregate function test (wasn't really a bug)
- Using PacketWriter instead of Packet for writing to streams
- Implemented SequentialAccess
- Fixed problem with ConnectionInternal where a key might be added more than once
- Fixed Russian character support as well
- Fixed [Bug#5474](#) cannot run a stored procedure populating mysqlcommand.parameters
- Fixed problem where connector was not issuing a CMD\_QUIT before closing the socket
- Fixed problem where Min Pool Size was not being respected
- Refactored compression code into CompressedStream to clean up NativeDriver
- CP1252 is now used for Latin1 only when the server is 4.1.2 and later

- Fixed [Bug#5469](#) Setting DbType throws NullReferenceException
- Virtualized driver subsystem so future releases could easily support client or embedded server support

## C.5.46. Changes in MySQL Connector/NET 1.0.0 (01 September 2004)

Bugs fixed:

- Thai encoding not correctly supported. ([Bug#3889](#))
- Bumped version number to 1.0.0 for beta 1 release.
- Removed all of the XML comment warnings.
- Added [COPYING.rtf](#) file for use in installer.
- Updated many of the test cases.
- Fixed problem with using compression.
- Removed some last references to ByteFX.

## C.5.47. Changes in MySQL Connector/NET Version 0.9.0 (30 August 2004)

- Added test fixture for prepared statements.
- All type classes now implement a [SerializeBinary](#) method for sending their data to a [PacketWriter](#).
- Added [PacketWriter](#) class that will enable future low-memory large object handling.
- Fixed many small bugs in running prepared statements and stored procedures.
- Changed command so that an exception will not be thrown in executing a stored procedure with parameters in old syntax mode.
- [SingleRow](#) behavior now working right even with limit.
- [GetBytes](#) now only works on binary columns.
- Logger now truncates long sql commands so blob columns do not blow out our log.
- host and database now have a default value of "" unless otherwise set.
- Connection Timeout seems to be ignored. ([Bug#5214](#))
- Added test case for bug# 5051: GetSchema not working correctly.
- Fixed problem where [GetSchema](#) would return false for [IsUnique](#) when the column is key.
- [MySqlDataReader](#) [GetXXX](#) methods now using the field level [MySqlValue](#) object and not performing conversions.
- [DataReader](#) returning NULL for time column. ([Bug#5097](#))
- Added test case for [LOAD DATA LOCAL INFILE](#).
- Added replacetext custom nant task.
- Added [CommandBuilderTest](#) fixture.
- Added Last One Wins feature to [CommandBuilder](#).
- Fixed persist security info case problem.
- Fixed [GetBool](#) so that 1, true, "true", and "yes" all count as true.
- Make parameter mark configurable.
- Added the "old syntax" connection string parameter to allow use of @ parameter marker.

- [MySqlCommandBuilder](#). ([Bug#4658](#))
- [ByteFX.MySqlClient](#) caches passwords if `Persist Security Info` is false. ([Bug#4864](#))
- Updated license banner in all source files to include FLOSS exception.
- Added new `.Types` namespace and implementations for most current MySQL types.
- Added [MySqlField41](#) as a subclass of [MySqlField](#).
- Changed many classes to now use the new `.Types` types.
- Changed type `enum int` to `Int32`, `short` to `Int16`, and `bigint` to `Int64`.
- Added dummy types `UInt16`, `UInt32`, and `UInt64` to allow an unsigned parameter to be made.
- Connections are now reset when they are pulled from the connection pool.
- Refactored auth code in driver so it can be used for both auth and reset.
- Added `UserReset` test in `PoolingTests.cs`.
- Connections are now reset using `COM_CHANGE_USER` when pulled from the pool.
- Implemented `SingleResultSet` behavior.
- Implemented support of unicode.
- Added char set mappings for utf-8 and ucs-2.
- Time fields overflow using `bytefx .net mysql driver` ([Bug#4520](#))
- Modified time test in data type test fixture to check for time spans where hours > 24.
- Wrong string with backslash escaping in `ByteFx.Data.MySqlClient.MySqlParameter`. ([Bug#4505](#))
- Added code to Parameter test case `TestQuoting` to test for backslashes.
- [MySqlCommandBuilder](#) fails with multi-word column names. ([Bug#4486](#))
- Fixed bug in `TokenizeSql` where underscore would terminate character capture in parameter name.
- Added test case for spaces in column names.
- [MySqlDataReader.GetBytes](#) do not work correctly. ([Bug#4324](#))
- Added `GetBytes()` test case to `DataReader` test fixture.
- Now reading all server variables in `InternalConnection.Configure` into `Hashtable`.
- Now using `string[]` for index map in `CharSetMap`.
- Added `CRInSQL` test case for carriage returns in SQL.
- Setting `maxPacketSize` to default value in `Driver.ctor`.
- Setting `MySqlDbType` on a parameter doesn't set generic type. ([Bug#4442](#))
- Removed obsolete data types `Long` and `LongLong`.
- Overflow exception thrown when using "use pipe" on connection string. ([Bug#4071](#))
- Changed "use pipe" keyword to "pipe name" or just "pipe".
- Allow reading multiple resultsets from a single query.
- Added flags attribute to `ServerStatusFlags` enum.
- Changed name of `ServerStatus` enum to `ServerStatusFlags`.
- Inserted data row doesn't update properly.

- Error processing show create table. ([Bug#4074](#))
- Change `Packet.ReadLenInteger` to `ReadPackedLong` and added `packet.ReadPackedInteger` that always reads integers packed with 2,3,4.
- Added `syntax.cs` test fixture to test various SQL syntax bugs.
- Improper handling of time values. Now time value of 00:00:00 is not treated as null. ([Bug#4149](#))
- Moved all test suite files into `TestSuite` folder.
- Fixed bug where null column would move the result packet pointer backward.
- Added new nant build script.
- Clear tablename so it will be regen'ed properly during the next `GenerateSchema`. ([Bug#3917](#))
- `GetValues` was always returning zero and was also always trying to copy all fields rather than respecting the size of the array passed in. ([Bug#3915](#))
- Implemented shared memory access protocol.
- Implemented prepared statements for MySQL 4.1.
- Implemented stored procedures for MySQL 5.0.
- Renamed `MySqlInternalConnection` to `InternalConnection`.
- SQL is now parsed as chars, fixes problems with other languages.
- Added logging and allow batch connection string options.
- `RowUpdating` event not set when setting the `DataAdapter` property. ([Bug#3888](#))
- Fixed bug in char set mapping.
- Implemented 4.1 authentication.
- Improved open/auth code in driver.
- Improved how connection bits are set during connection.
- Database name is now passed to server during initial handshake.
- Changed namespace for client to `MySql.Data.MySqlClient`.
- Changed assembly name of client to `MySql.Data.dll`.
- Changed license text in all source files to GPL.
- Added the `MySqlClient.build` Nant file.
- Removed the mono batch files.
- Moved some of the unused files into `notused` folder so nant build file can use wildcards.
- Implemented shared memory access.
- Major revamp in code structure.
- Prepared statements now working for MySql 4.1.1 and later.
- Finished implementing auth for 4.0, 4.1.0, and 4.1.1.
- Changed namespace from `MySQL.Data.MySQLClient` back to `MySql.Data.MySqlClient`.
- Fixed bug in `CharSetMapping` where it was trying to use text names as ints.
- Changed namespace to `MySQL.Data.MySQLClient`.
- Integrated auth changes from UC2004.

- Fixed bug where calling any of the GetXXX methods on a datareader before or after reading data would not throw the appropriate exception (thanks Luca Morelli).
- Added `TimeSpan` code in `parameter.cs` to properly serialize a timespan object to mysql time format (thanks Gianluca Colombo).
- Added `TimeStamp` to parameter serialization code. Prevented `DataAdapter` updates from working right (thanks Michael King).
- Fixed a misspelling in `MySQLHelper.cs` (thanks Patrick Kristiansen).

## C.5.48. Changes in MySQL Connector/NET Version 0.76

- Driver now using charset number given in handshake to create encoding.
- Changed command editor to point to `MySQLClient.Design`.
- Fixed bug in `Version.isAtLeast`.
- Changed `DBConnectionString` to support changes done to `MySQLConnectionString`.
- Removed `SqlCommandEditor` and `DataAdapterPreviewDialog`.
- Using new long return values in many places.
- Integrated new `CompressedStream` class.
- Changed `ConnectionString` and added attributes to allow it to be used in `MySQLClient.Design`.
- Changed `packet.cs` to support newer lengths in `ReadLenInteger`.
- Changed other classes to use new properties and fields of `MySQLConnectionString`.
- `ConnectionInternal` is now using PING to see whether the server is alive.
- Moved toolbox bitmaps into resource folder.
- Changed `field.cs` to allow values to come directly from row buffer.
- Changed to use the new `driver.Send` syntax.
- Using a new packet queueing system.
- Started work handling the "broken" compression packet handling.
- Fixed bug in `StreamCreator` where failure to connect to a host would continue to loop infinitely (thanks Kevin Casella).
- Improved connectstring handling.
- Moved designers into Pro product.
- Removed some old commented out code from `command.cs`.
- Fixed a problem with compression.
- Fixed connection object where an exception throw prior to the connection opening would not leave the connection in the connecting state (thanks Chris Cline).
- Added GUID support.
- Fixed sequence out of order bug (thanks Mark Reay).

## C.5.49. Changes in MySQL Connector/NET Version 0.75

- Enum values now supported as parameter values (thanks Philipp Sumi).
- Year datatype now supported.

- Fixed compression.
- Fixed bug where a parameter with a `TimeSpan` as the value would not serialize properly.
- Fixed bug where default constructor would not set default connection string values.
- Added some XML comments to some members.
- Work to fix/improve compression handling.
- Improved `ConnectionString` handling so that it better matches the standard set by `SqlClient`.
- A `MySqlException` is now thrown if a user name is not included in the connection string.
- Localhost is now used as the default if not specified on the connection string.
- An exception is now thrown if an attempt is made to set the connection string while the connection is open.
- Small changes to `ConnectionString` docs.
- Removed `MultiHostStream` and `MySqlStream`. Replaced it with `Common/StreamCreator`.
- Added support for Use Pipe connection string value.
- Added Platform class for easier access to platform utility functions.
- Fixed small pooling bug where new connection was not getting created after `IsAlive` fails.
- Added `Platform.cs` and `StreamCreator.cs`.
- Fixed `Field.cs` to properly handle 4.1 style timestamps.
- Changed `Common.Version` to `Common.DBVersion` to avoid name conflict.
- Fixed `field.cs` so that text columns return the right field type.
- Added `MySqlError` class to provide some reference for error codes (thanks Geert Veenstra).

### C.5.50. Changes in MySQL Connector/NET Version 0.74

- Added Unix socket support (thanks Mohammad DAMT).
- Only calling `Thread.Sleep` when no data is available.
- Improved escaping of quote characters in parameter data.
- Removed misleading comments from `parameter.cs`.
- Fixed pooling bug.
- Fixed `ConnectionString` editor dialog (thanks marco p (pomarc)).
- `UserId` now supported in connection strings (thanks Jeff Neeley).
- Attempting to create a parameter that is not input throws an exception (thanks Ryan Gregg).
- Added much documentation.
- Checked in new `MultiHostStream` capability. Big thanks to Dan Guisinger for this, he originally submitted the code and idea of supporting multiple machines on the connect string.
- Added a lot of documentation.
- Fixed speed issue with 0.73.
- Changed to `Thread.Sleep(0)` in `MySqlDataStream` to help optimize the case where it doesn't need to wait (thanks Todd German).
- Prepopulating the idlepools to `MinPoolSize`.

- Fixed `MySqlPool` deadlock condition as well as stupid bug where `CreateNewPooledConnection` was not ever adding new connections to the pool. Also fixed `MySqlStream.ReadBytes` and `ReadByte` to not use `TicksPerSecond` which does not appear to always be right. (thanks Matthew J. Peddlesden)
- Fix for precision and scale (thanks Matthew J. Peddlesden).
- Added `Thread.Sleep(1)` to stream reading methods to be more cpu friendly (thanks Sean McGinnis).
- Fixed problem where `ExecuteReader` would sometime return null (thanks Lloyd Dupont).
- Fixed major bug with null field handling (thanks Naucki).
- Enclosed queries for `max_allowed_packet` and `characterset` inside try catch (and set defaults).
- Fixed problem where socket was not getting closed properly (thanks Steve!).
- Fixed problem where `ExecuteNonQuery` was not always returning the right value.
- Fixed `InternalConnection` to not use `@@session.max_allowed_packet` but use `@@max_allowed_packet`. (Thanks Miguel)
- Added many new XML doc lines.
- Fixed sql parsing to not send empty queries (thanks Rory).
- Fixed problem where the reader was not unpeeking the packet on close.
- Fixed problem where user variables were not being handled (thanks Sami Vaaraniemi).
- Fixed loop checking in the `MySqlPool` (thanks Steve M. Brown)
- Fixed `ParameterCollection.Add` method to match `SqlClient` (thanks Joshua Mouch).
- Fixed `ConnectionString` parsing to handle no and yes for boolean and not lowercase values (thanks Naucki).
- Added `InternalConnection` class, changes to pooling.
- Implemented Persist Security Info.
- Added `security.cs` and `version.cs` to project
- Fixed `DateTime` handling in `Parameter.cs` (thanks Burkhard Perens-Golomb).
- Fixed parameter serialization where some types would throw a cast exception.
- Fixed `DataReader` to convert all returned values to prevent casting errors (thanks Keith Murray).
- Added code to `Command.ExecuteReader` to return null if the initial SQL statement throws an exception (thanks Burkhard Perens-Golomb).
- Fixed `ExecuteScalar` bug introduced with restructure.
- Restructure to allow for `LOCAL DATA INFILE` and better sequencing of packets.
- Fixed several bugs related to restructure.
- Early work done to support more secure passwords in Mysql 4.1. Old passwords in 4.1 not supported yet.
- Parameters appearing after system parameters are now handled correctly (Adam M. (adamml)).
- Strings can now be assigned directly to blob fields (Adam M.).
- Fixed float parameters (thanks Pent).
- Improved Parameter constructor and `ParameterCollection.Add` methods to better match `SqlClient` (thanks Joshua Mouch).
- Corrected `Connection.CreateCommand` to return a `MySqlCommand` type.
- Fixed connection string designer dialog box problem (thanks Abraham Guyt).
- Fixed problem with sending commands not always reading the response packet (thanks Joshua Mouch).

- Fixed parameter serialization where some blobs types were not being handled (thanks Sean McGinnis).
- Removed spurious `MessageBox.show` from `DataReader` code (thanks Joshua Mouch).
- Fixed a nasty bug in the split sql code (thanks everyone!).

### C.5.51. Changes in MySQL Connector/NET Version 0.71

- Fixed bug in `MySqlStream` where too much data could attempt to be read (thanks Peter Belbin)
- Implemented `HasRows` (thanks Nash Pherson).
- Fixed bug where tables with more than 252 columns cause an exception (thanks Joshua Kessler).
- Fixed bug where SQL statements ending in `;` would cause a problem (thanks Shane Krueger).
- Fixed bug in driver where error messages were getting truncated by 1 character (thanks Shane Krueger).
- Made `MySqlException` serializable (thanks Mathias Hasselmann).

### C.5.52. Changes in MySQL Connector/NET Version 0.70

- Updated some of the character code pages to be more accurate.
- Fixed problem where readers could be opened on connections that had readers open.
- Moved test to separate assembly `MySqlClientTests`.
- Fixed stupid problem in driver with sequence out of order (Thanks Peter Belbin).
- Added some pipe tests.
- Increased default max pool size to 50.
- Compiles with Mono 0-24.
- Fixed connection and data reader dispose problems.
- Added `String` datatype handling to parameter serialization.
- Fixed sequence problem in driver that occurred after thrown exception (thanks Burkhard Perens-Golomb).
- Added support for `CommandBehavior.SingleRow` to `DataReader`.
- Fixed command sql processing so quotes are better handled (thanks Theo Spears).
- Fixed parsing of double, single, and decimal values to account for non-English separators. You still have to use the right syntax if you using hard coded sql, but if you use parameters the code will convert floating point types to use `'` appropriately internal both into the server and out.
- Added `MySqlStream` class to simplify timeouts and driver coding.
- Fixed `DataReader` so that it is closed properly when the associated connection is closed. [thanks smishra]
- Made client more `SqlClient` compliant so that `DataReaders` have to be closed before the connection can be used to run another command.
- Improved `DBNull.Value` handling in the fields.
- Added several unit tests.
- Fixed `MySqlException` base class.
- Improved driver coding
- Fixed bug where `NextResult` was returning false on the last resultset.

- Added more tests for MySQL.
- Improved casting problems by equating unsigned 32bit values to Int64 and unsigned 16bit values to Int32, and so forth.
- Added new constructor for `MySQLParameter` for (name, type, size, srccol)
- Fixed bug in `MySQLDataReader` where it didn't check for null fieldlist before returning field count.
- Started adding `MySQLClient` unit tests (added `MySQLClient/Tests` folder and some test cases).
- Fixed some things in Connection String handling.
- Moved `INIT_DB` to `MySQLPool`. I may move it again, this is in preparation of the conference.
- Fixed bug inside `CommandBuilder` that prevented inserts from happening properly.
- Reworked some of the internals so that all three execute methods of `Command` worked properly.
- Fixed many small bugs found during benchmarking.
- The first cut of `CoonnectionPooling` is working. "min pool size" and "max pool size" are respected.
- Work to enable multiple resultsets to be returned.
- Character sets are handled much more intelligently now. The driver queries MySQL at startup for the default character set. That character set is then used for conversions if that code page can be loaded. If not, then the default code page for the current OS is used.
- Added code to save the inferred type in the name,value constructor of `Parameter`.
- Also, inferred type if value of null parameter is changed using `Value` property.
- Converted all files to use proper Camel case. MySQL is now `MySql` in all files. `PgSQL` is now `PgSql`.
- Added attribute to `PgSql` code to prevent designer from trying to show.
- Added `MySQLDbType` property to `Parameter` object and added proper conversion code to convert from `DbType` to `MySQLDbType`).
- Removed unused `ObjectToString` method from `MySQLParameter.cs`.
- Fixed `Add(..)` method in `ParameterCollection` so that it doesn't use `Add(name, value)` instead.
- Fixed `IndexOf` and `Contains` in `ParameterCollection` to be aware that parameter names are now stored without `@`.
- Fixed `Command.ConvertSQLToBytes` so it only allows characters that can be in MySQL variable names.
- Fixed `DataReader` and `Field` so that blob fields read their data from `Field.cs` and `GetBytes` works right.
- Added simple query builder editor to `CommandText` property of `MySQLCommand`.
- Fixed `CommandBuilder` and `Parameter` serialization to account for Parameters not storing `@` in their names.
- Removed `MySQLFieldType` enum from `Field.cs`. Now using `MySQLDbType` enum.
- Added `Designer` attribute to several classes to prevent designer view when using VS.Net.
- Fixed Initial catalog typo in `ConnectionString` designer.
- Removed 3 parameter constructor for `MySQLParameter` that conflicted with (name, type, value).
- Changed `MySQLParameter` so `paramName` is now stored without leading `@` (this fixed null inserts when using designer).
- Changed `TypeConverter` for `MySQLParameter` to use the constructor with all properties.

### C.5.53. Changes in MySQL Connector/NET Version 0.68

- Fixed sequence issue in driver.
- Added `DbParametersEditor` to make parameter editing more like `SqlClient`.

- Fixed `Command` class so that parameters can be edited using the designer
- Update connection string designer to support `Use Compression` flag.
- Fixed string encoding so that European characters will work correctly.
- Creating base classes to aid in building new data providers.
- Added support for UID key in connection string.
- Field, parameter, command now using `DBNull.Value` instead of null.
- `CommandBuilder` using `DBNull.Value`.
- `CommandBuilder` now builds insert command correctly when an `auto_insert` field is not present.
- Field now uses `typeof` keyword to return `System.Types` (performance).

### C.5.54. Changes in MySQL Connector/NET Version 0.65

- `MySQLCommandBuilder` now implemented.
- Transaction support now implemented (not all table types support this).
- `GetSchemaTable` fixed to not use `xsd` (for Mono).
- Driver is now Mono-compatible.
- TIME data type now supported.
- More work to improve Timestamp data type handling.
- Changed signatures of all classes to match corresponding `SqlClient` classes.

### C.5.55. Changes in MySQL Connector/NET Version 0.60

- Protocol compression using `SharpZipLib` ([www.icsharpcode.net](http://www.icsharpcode.net)).
- Named pipes on Windows now working properly.
- Work done to improve `Timestamp` data type handling.
- Implemented `IEnumerable` on `DataReader` so `DataGrid` would work.

### C.5.56. Changes in MySQL Connector/NET Version 0.50

- Speed increased dramatically by removing bugging network sync code.
- Driver no longer buffers rows of data (more ADO.Net compliant).
- Conversion bugs related to `TIMESTAMP` and `DATETIME` fields fixed.

## C.6. MySQL Visual Studio Plugin Change History

### Note

As of Connector/NET 5.1.2 (14 June 2007), the Visual Studio Plugin is part of the main Connector/NET package. For the change history for the Visual Studio Plugin, see [Section C.5, "MySQL Connector/NET Change History"](#).

### C.6.1. Changes in MySQL Visual Studio Plugin 1.0.3 (Not yet released)

Bugs fixed:

- Running queries based on a stored procedure would cause the data set designer to terminate. (Bugs #26364)
- DataSet wizard would show all tables instead of only the tables available within the selected database. (Bugs #26348)

## C.6.2. Changes in MySQL Visual Studio Plugin 1.0.2 (Not yet released)

Bugs fixed:

- The Add Connection dialog of the Server Explorer would freeze when accessing databases with capitalized characters in their name. (Bug#24875)
- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that Connector/NET 5.0.2 must be installed. (Bug#23071)

## C.6.3. Changes in MySQL Visual Studio Plugin 1.0.1 (4 October 2006)

This is a bug fix release to resolve an incompatibility issue with Connector/NET 5.0.1.

It is critical that this release only be used with Connector/NET 5.0.1. After installing Connector/NET 5.0.1, you will need to make a small change in your machine.config file. This file should be located at `%win%\Microsoft.Net\Framework\v2.0.50727\CONFIG\machine.config` (`%win%` should be the location of your Windows folder). Near the bottom of the file you will see a line like this:

```
<add name="MySQL Data Provider" invariant="MySql.Data.MySqlClient"
description=".Net Framework Data Provider for MySQL"
type="MySql.Data.MySqlClient.MySqlClientFactory, MySql.Data" />
```

It needs to be changed to be like this:

```
<add name="MySQL Data Provider" invariant="MySql.Data.MySqlClient"
description=".Net Framework Data Provider for MySQL"
type="MySql.Data.MySqlClient.MySqlClientFactory, MySql.Data,
Version=5.0.1.0, Culture=neutral, PublicKeyToken=c5687fc88969c44d" />
```

## C.6.4. Changes in MySQL Visual Studio Plugin 1.0.0 (4 October 2006)

Bugs fixed:

- Ability to work with MySQL objects (tables, views, stored procedures, etc) from within Server Explorer.
- DDEX (Data Designer Extensibility) compatibility.

## C.7. MySQL Connector/J Change History

### C.7.1. Changes in MySQL Connector/J 5.1.x

#### C.7.1.1. Changes in MySQL Connector/J 5.1.8 (Not yet released)

Bugs fixed:

- The result set returned by `getIndexInfo()` did not have the format defined in the JDBC API specifications. The fourth column, `DATA_TYPE`, of the result set should be of type `BOOLEAN`. Connector/J however returns `CHAR`. (Bug#44869)
- The result set returned by `getTypeInfo()` did not have the format defined in the JDBC API specifications. The second column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug#44868)
- The `DEFERRABILITY` column in database metadata result sets was expected to be of type `SHORT`. However, Connector/J returned it as `INTEGER`.

This affected the following methods: `getImportedKeys()`, `getExportedKeys()`, `getCrossReference()`. (Bug#44867)

- The result set returned by `getColumns()` did not have the format defined in the JDBC API specifications. The fifth column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug#44865)
- The result set returned by `getVersionColumns()` did not have the format defined in the JDBC API specifications. The third column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug#44863)
- The result set returned by `getBestRowIdentifier()` did not have the format defined in the JDBC API specifications. The third column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug#44862)
- Connector/J contains logic to generate a message text specifically for streaming result sets when there are `CommunicationsException` exceptions generated. However, this code was never reached.

In the `CommunicationsException` code:

```
private boolean streamingResultSetInPlay = false;

public CommunicationsException(ConnectionImpl conn, long lastPacketSentTimeMs,
long lastPacketReceivedTimeMs, Exception underlyingException) {

this.exceptionMessage = SQLError.createLinkFailureMessageBasedOnHeuristics(conn,
lastPacketSentTimeMs, lastPacketReceivedTimeMs, underlyingException,
this.streamingResultSetInPlay);
```

`streamingResultSetInPlay` was always false, which in the following code in `SQLError.createLinkFailureMessageBasedOnHeuristics()` never being executed:

```
if (streamingResultSetInPlay) {
    exceptionMessageBuf.append(
        Messages.getString("CommunicationsException.ClientWasStreaming")); //$NON-NLS-1$
} else {
    ...
```

(Bug#44588)

- `Statement.getGeneratedKeys()` retained result set instances until the statement was closed. This caused memory leaks for long-lived statements, or statements used in tight loops. (Bug#44056)
- `LoadBalancingConnectionProxy.doPing()` did not have blacklist awareness.

`LoadBalancingConnectionProxy` implemented `doPing()` to ping all underlying connections, but it threw any exceptions it encountered during this process.

With the global blacklist enabled, it catches these exceptions, adds the host to the global blacklist, and only throws an exception if all hosts are down. (Bug#43421)

- When the MySQL Server was upgraded from 4.0 to 5.0, the Connector/J application then failed to connect to the server. This was because authentication failed when the application ran from EBCDIC platforms such as z/OS. (Bug#43071)
- When connecting with `traceProtocol=true`, no trace data was generated for the server greeting or login request. (Bug#43070)
- A `ConcurrentModificationException` was generated in `LoadBalancingConnectionProxy`:

```
java.util.ConcurrentModificationException
at java.util.HashMap$HashIterator.nextEntry(Unknown Source)
at java.util.HashMap$KeyIterator.next(Unknown Source)
at
com.mysql.jdbc.LoadBalancingConnectionProxy.getGlobalBlacklist(LoadBalancingConnectionProxy.java:520)
at com.mysql.jdbc.RandomBalanceStrategy.pickConnection(RandomBalanceStrategy.java:55)
at
com.mysql.jdbc.LoadBalancingConnectionProxy.pickNewConnection(LoadBalancingConnectionProxy.java:414)
at
com.mysql.jdbc.LoadBalancingConnectionProxy.invoke(LoadBalancingConnectionProxy.java:390)
```

(Bug#42055)

- SQL injection was possible when using a string containing U+00A5 in a client-side prepared statement, and the character set being used was SJIS/Windows-31J. (Bug#41730)
- MySQL Connector/J 5.1.7 was slower than previous versions when the `rewriteBatchedStatements` option was set to `true`.

## ■ Note

The performance regression in `indexOfIgnoreCaseRespectMarker()` has been fixed. It has also been made possible for the driver to rewrite `INSERT` statements with `ON DUPLICATE KEY UPDATE` clauses in them, as long as the `UPDATE` clause contains no reference to `LAST_INSERT_ID()`, as that would cause the driver to return bogus values for `getGeneratedKeys()` invocations. This has resulted in improved performance over version 5.1.7.

(Bug#41532)

- `PreparedStatement.addBatch()` did not check for all parameters being set, which led to inconsistent behavior in `executeBatch()`, especially when rewriting batched statements into multi-value `INSERT`s. (Bug#41161)

### C.7.1.2. Changes in MySQL Connector/J 5.1.7 (21 October 2008)

Functionality added or changed:

- When statements include `ON DUPLICATE UPDATE`, and `rewriteBatchedStatements` is set to true, batched statements are not rewritten into the form `INSERT INTO table VALUES (), (), ()`, instead the statements are executed sequentially.

Bugs fixed:

- `Statement.getGeneratedKeys()` returned two keys when using `ON DUPLICATE KEY UPDATE` and the row was updated, not inserted. (Bug#42309)
- When using the replication driver with `autoReconnect=true`, Connector/J checks in `PreparedStatement.execute` (also called by `CallableStatement.execute`) to determine if the first character of the statement is an “S”, in an attempt to block all statements that are not read-only-safe, for example non-`SELECT` statements. However, this also blocked `CALL`s to stored procedures, even if the stored procedures were defined as `SQL READ DATA` or `NO SQL`. (Bug#40031)
- With large result sets `ResultSet.findColumn` became a performance bottleneck. (Bug#39962)
- Connector/J ignored the value of the MySQL Server variable `auto_increment_increment`. (Bug#39956)
- Connector/J failed to parse `TIMESTAMP` strings for nanos correctly. (Bug#39911)
- When the `LoadBalancingConnectionProxy` handles a `SQLException` with SQL state starting with “08”, it calls `invalidateCurrentConnection`, which in turn removes that `Connection` from `liveConnections` and the `connectionsToHostsMap`, but it did not add the host to the new global blacklist, if the global blacklist was enabled.

There was also the possibility of a `NullPointerException` when trying to update stats, where `connectionsToHostsMap.get(this.currentConn)` was called:

```
int hostIndex = ((Integer) this.hostsToListIndexMap.get(this.connectionsToHostsMap.get(this.currentConn))).intValue
```

This could happen if a client tried to issue a rollback after catching a `SQLException` caused by a connection failure. (Bug#39784)

- When configuring the Java Replication Driver the last slave specified was never used. (Bug#39611)
- When an `INSERT ON DUPLICATE KEY UPDATE` was performed, and the key already existed, the `affected-rows` value was returned as 1 instead of 0. (Bug#39352)
- When using the random load balancing strategy and starting with two servers that were both unavailable, an `IndexOutOfBoundsException` was generated when removing a server from the `whiteList`. (Bug#38782)
- Connector/J threw the following exception when using a read-only connection:

```
java.sql.SQLException: Connection is read-only. Queries leading to data
modification are not allowed.
```

(Bug#38747)

- Connector/J was unable to connect when using a non-latin1 password. (Bug#37570)
- Incorrect result is returned from `isAfterLast()` in streaming `ResultSet` when using `setFetchSize(Integer.MIN_VALUE)`. (Bug#35170)

- When `getGeneratedKeys()` was called on a statement that had not been created with `RETURN_GENERATED_KEYS`, no exception was thrown, and batched executions then returned erroneous values. (Bug#34185)
- The `loadBalance bestResponseTime` blacklists did not have a global state. (Bug#33861)

### C.7.1.3. Changes in MySQL Connector/J 5.1.6 (07 March 2008)

Functionality added or changed:

- Multiple result sets were not supported when using streaming mode to return data. Both normal statements and the result sets from stored procedures now return multiple results sets, with the exception of result sets using registered `OUTPUT` parameters. (Bug#33678)
- XAConnections and datasources have been updated to the JDBC-4.0 standard.
- The profiler event handling has been made extensible via the `profilerEventHandler` connection property.
- Add the `verifyServerCertificate` property. If set to "false" the driver will not verify the server's certificate when `useSSL` is set to "true"

When using this feature, the keystore parameters should be specified by the `clientCertificateKeyStore*` properties, rather than system properties, as the JSSE doesn't it straightforward to have a non-verifying trust store and the "default" key store.

Bugs fixed:

- `DatabaseMetaData.getColumns()` returns incorrect `COLUMN_SIZE` value for `SET` column. (Bug#36830)
- When trying to read `Time` values like "00:00:00" with `ResultSet.getTime(int)` an exception is thrown. (Bug#36051)
- JDBC connection URL parameters is ignored when using `MysqlConnectionPoolDataSource`. (Bug#35810)
- When `useServerPrepStmts=true` and slow query logging is enabled, the connector throws a `NullPointerException` when it encounters a slow query. (Bug#35666)
- When using the keyword "loadbalance" in the connection string and trying to perform load balancing between two databases, the driver appears to hang. (Bug#35660)
- JDBC data type getter method was changed to accept only column name, whereas previously it accepted column label. (Bug#35610)
- Prepared statements from pooled connections caused a `NullPointerException` when `closed()` under JDBC-4.0. (Bug#35489)
- In calling a stored function returning a `bigint`, an exception is encountered beginning:
 

```
java.sql.SQLException: java.lang.NumberFormatException: For input string:
```

 followed by the text of the stored function starting after the argument list. (Bug#35199)
- The JDBC driver uses a different method for evaluating column names in `resultsetmetadata.getColumnname()` and when looking for a column in `resultset.getObject(columnName)`. This causes Hibernate to fail in queries where the two methods yield different results, for example in queries that use alias names:
 

```
SELECT column AS aliasName from table
```

 (Bug#35150)
- `MysqlConnectionPoolDataSource` does not support `ReplicationConnection`. Notice that we implemented `com.mysql.jdbc.Connection` for `ReplicationConnection`, however, only accessors from `ConnectionProperties` are implemented (not the mutators), and they return values from the currently active connection. All other methods from `com.mysql.jdbc.Connection` are implemented, and operate on the currently active connection, with the exception of `resetServerState()` and `changeUser()`. (Bug#34937)
- `ResultSet.getTimestamp()` returns incorrect values for month/day of `TIMESTAMPS` when using server-side prepared statements (not enabled by default). (Bug#34913)

- `RowDataStatic` doesn't always set the metadata in `ResultSetRow`, which can lead to failures when unpacking `DATE`, `TIME`, `DATETIME` and `TIMESTAMP` types when using absolute, relative, and previous result set navigation methods. (Bug#34762)
- When calling `isValid()` on an active connection, if the timeout is nonzero then the `Connection` is invalidated even if the `Connection` is valid. (Bug#34703)
- It was not possible to truncate a `BLOB` using `Blob.truncate()` when using 0 as an argument. (Bug#34677)
- When using a cursor fetch for a statement, the internal prepared statement could cause a memory leak until the connection was closed. The internal prepared statement is now deleted when the corresponding result set is closed. (Bug#34518)
- When retrieving the column type name of a geometry field, the driver would return `UNKNOWN` instead of `GEOMETRY`. (Bug#34194)
- Statements with batched values do not return correct values for `getGeneratedKeys()` when `rewriteBatchedStatements` is set to `true`, and the statement has an `ON DUPLICATE KEY UPDATE` clause. (Bug#34093)
- The internal class `ResultSetInternalMethods` referenced the non-public class `com.mysql.jdbc.CachedResultSetMetaData`. (Bug#33823)
- A `NullPointerException` could be raised when using client-side prepared statements and enabled the prepared statement cache using the `cachePrepStmts`. (Bug#33734)
- Using server side cursors and cursor fetch, the table metadata information would return the data type name instead of the column name. (Bug#33594)
- `ResultSet.getTimestamp()` would throw a `NullPointerException` instead of a `SQLException` when called on an empty `ResultSet`. (Bug#33162)
- Load balancing connection using best response time would incorrectly "stick" to hosts that were down when the connection was first created.

We solve this problem with a black list that is used during the picking of new hosts. If the black list ends up including all configured hosts, the driver will retry for a configurable number of times (the `retriesAllDown` configuration property, with a default of 120 times), sleeping 250ms between attempts to pick a new connection.

We've also went ahead and made the balancing strategy extensible. To create a new strategy, implement the interface `com.mysql.jdbc.BalanceStrategy` (which also includes our standard "extension" interface), and tell the driver to use it by passing in the class name via the `loadBalanceStrategy` configuration property. (Bug#32877)

- During a Daylight Savings Time (DST) switchover, there was no way to store two timestamp/datetime values, as the hours end up being the same when sent as the literal that MySQL requires.

Note that to get this scenario to work with MySQL (since it doesn't support per-value timezones), you need to configure your server (or session) to be in UTC, and tell the driver not to use the legacy date/time code by setting `useLegacyDatetimeCode` to "false". This will cause the driver to always convert to/from the server and client timezone consistently.

This bug fix also fixes Bug#15604, by adding entirely new date/time handling code that can be switched on by `useLegacyDatetimeCode` being set to "false" as a JDBC configuration property. For Connector/J 5.1.x, the default is "true", in trunk and beyond it will be "false" (i.e. the old date/time handling code will be deprecated) (Bug#32577, Bug#15604)

- When unpacking rows directly, we don't hand off error message packets to the internal method which decodes them correctly, so no exception is raised, and the driver then hangs trying to read rows that aren't there. This tends to happen when calling stored procedures, as normal SELECTs won't have an error in this spot in the protocol unless an I/O error occurs. (Bug#32246)
- When using a connection from `ConnectionPoolDataSource`, some `Connection.prepareStatement()` methods would return null instead of the prepared statement. (Bug#32101)
- Using `CallableStatement.setNull()` on a stored function would throw an `ArrayIndexOutOfBoundsException` exception when setting the last parameter to null. (Bug#31823)
- `MysqlValidConnectionChecker` doesn't properly handle connections created using `ReplicationConnection`. (Bug#31790)
- Retrieving the server version information for an active connection could return invalid information if the default character encoding on the host was not ASCII compatible. (Bug#31192)
- Further fixes have been made to this bug in the event that a node is non-responsive. Connector/J will now try a different random node instead of waiting for the node to recover before continuing. (Bug#31053)

- `ResultSet` returned by `Statement.getGeneratedKeys()` is not closed automatically when statement that created it is closed. (Bug#30508)
- `DatabaseMetadata.getColumns()` doesn't return the correct column names if the connection character isn't UTF-8. A bug in MySQL server compounded the issue, but was fixed within the MySQL 5.0 release cycle. The fix includes changes to all the sections of the code that access the server metadata. (Bug#20491)
- Fixed `ResultSetMetadata.getColumnNames()` for result sets returned from `Statement.getGeneratedKeys()` - it was returning null instead of "GENERATED\_KEY" as in 5.0.x.

#### C.7.1.4. Changes in MySQL Connector/J 5.1.5 (09 October 2007)

The following features are new, compared to the 5.0 series of Connector/J

- Support for JDBC-4.0 `NCHAR`, `NVARCHAR` and `NCLOB` types.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query via `SHOW PROCESSLIST` on a MySQL server, or can be extended to support custom persistence of the information via a public interface).
- Support for JDBC-4.0 XML processing via JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.

Functionality added or changed:

- Added `autoSlowLog` configuration property, overrides `slowQueryThreshold*` properties, driver determines slow queries by those that are slower than  $5 * \text{stddev}$  of the mean query time (outside the 96% percentile).

Bugs fixed:

- When a connection is in read-only mode, queries that are wrapped in parentheses were incorrectly identified DML statements. (Bug#28256)

#### C.7.1.5. Changes in MySQL Connector/J 5.1.4 (Not Released)

Only released internally.

#### C.7.1.6. Changes in MySQL Connector/J 5.1.3 (10 September 2007)

The following features are new, compared to the 5.0 series of Connector/J

- Support for JDBC-4.0 `NCHAR`, `NVARCHAR` and `NCLOB` types.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query via `SHOW PROCESSLIST` on a MySQL server, or can be extended to support custom persistence of the information via a public interface).
- Support for JDBC-4.0 XML processing via JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.

Functionality added or changed:

- Connector/J now connects using an initial character set of `utf-8` solely for the purpose of authentication to allow user names or database names in any character set to be used in the JDBC connection URL. (Bug#29853)
- Added two configuration parameters:
  - `blobsAreStrings` — Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.

- `functionsNeverReturnBlobs` — Should the driver always treat data from functions returning `BLOBs` as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- Setting `rewriteBatchedStatements` to `true` now causes CallableStatements with batched arguments to be re-written in the form "CALL (...); CALL (...); ..." to send the batch in as few client-server round trips as possible.
- The driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has `BLOB` or `TEXT` types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property `largeRowSizeThreshold`, which has a default value of 2KB.
- The data (and how it is stored) for `ResultSet` rows are now behind an interface which allows us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.
- Added experimental support for statement "interceptors" via the `com.mysql.jdbc.StatementInterceptor` interface, examples are in `com/mysql/jdbc/interceptors`. Implement this interface to be placed "in between" query execution, so that it can be influenced (currently experimental).
- The driver will automatically adjust the server session variable `net_write_timeout` when it determines its been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (The configuration property is named `netTimeoutForStreamingResults`, with a unit of seconds, the value '0' means the driver will not try and adjust this value).
- JDBC-4.0 ease-of-development features including auto-registration with the `DriverManager` via the service provider mechanism, standardized Connection validity checks and categorized `SQLExceptions` based on recoverability/retry-ability and class of the underlying error.
- `Statement.setQueryTimeout()`s now affect the entire batch for batched statements, rather than the individual statements that make up the batch.
- Errors encountered during `Statement/PreparedStatement/CallableStatement.executeBatch()` when `rewriteBatchStatements` has been set to `true` now return `BatchUpdateExceptions` according to the setting of `continueBatchOnError`.

If `continueBatchOnError` is set to `true`, the update counts for the "chunk" that were sent as one unit will all be set to `EXECUTE_FAILED`, but the driver will attempt to process the remainder of the batch. You can determine which "chunk" failed by looking at the update counts returned in the `BatchUpdateException`.

If `continueBatchOnError` is set to "false", the update counts returned will contain all updates up-to and including the failed "chunk", with all counts for the failed "chunk" set to `EXECUTE_FAILED`.

Since MySQL doesn't return multiple error codes for multiple-statements, or for multi-value `INSERT/REPLACE`, it is the application's responsibility to handle determining which item(s) in the "chunk" actually failed.

- New methods on `com.mysql.jdbc.Statement`: `setLocalInfileInputStream()` and `getLocalInfileInputStream()`:
  - `setLocalInfileInputStream()` sets an `InputStream` instance that will be used to send data to the MySQL server for a `LOAD DATA LOCAL INFILE` statement rather than a `FileInputStream` or `URLInputStream` that represents the path given as an argument to the statement.
 

This stream will be read to completion upon execution of a `LOAD DATA LOCAL INFILE` statement, and will automatically be closed by the driver, so it needs to be reset before each call to `execute*()` that would cause the MySQL server to request data to fulfill the request for `LOAD DATA LOCAL INFILE`.

If this value is set to `NULL`, the driver will revert to using a `FileInputStream` or `URLInputStream` as required.
  - `getLocalInfileInputStream()` returns the `InputStream` instance that will be used to send data in response to a `LOAD DATA LOCAL INFILE` statement.
 

This method returns `NULL` if no such stream has been set via `setLocalInfileInputStream()`.
- Setting `useBlobToStoreUTF8OutsideBMP` to `true` tells the driver to treat `[MEDIUM/LONG]BLOB` columns as `[LONG]VARCHAR` columns holding text encoded in UTF-8 that has characters outside the BMP (4-byte encodings), which MySQL server can't handle natively.

Set `utf8OutsideBmpExcludedColumnNamePattern` to a regex so that column names matching the given regex will still be treated as `BLOBs`. The regex must follow the patterns used for the `java.util.regex` package. The default is to exclude no columns, and include all columns.

Set `utf8OutsideBmpIncludedColumnNamePattern` to specify exclusion rules to `utf8OutsideBmpExcludedColumnNamePattern`. The regex must follow the patterns used for the `java.util.regex` package.

Bugs fixed:

- `setObject(int, Object, int, int)` delegate in `PreparedStatementWrapper` delegates to wrong method. (Bug#30892)
- NPE with null column values when `padCharsWithSpace` is set to true. (Bug#30851)
- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from subqueries and functions were indistinguishable from each other, leading to type-related bugs. (Bug#30664)
- An `ArithmeticException` or `NullPointerException` would be raised when the batch had zero members and `rewriteBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immediately after `clearBatch()`. (Bug#30550)
- Closing a load-balanced connection would cause a `ClassCastException`. (Bug#29852)
- Connection checker for JBoss didn't use same method parameters via reflection, causing connections to always seem "bad". (Bug#29106)
- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3-5.0.5 and 65 for versions newer than 5.0.5. (Bug#28972)
- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.

The fix involves changing the behavior of `noAccessToProcedureBodies`, in that the driver will now report all parameters as "IN" parameters but allow callers to call `registerOutParameter()` on them without throwing an exception. (Bug#28689)

- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. (Bug#27915)
- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. (Bug#27867)
- `Connection.getServerCharacterEncoding()` doesn't work for servers with version  $\geq 4.1$ . (Bug#27182)
- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. (Bug#21116)
- Specifying a "validation query" in your connection pool that starts with `"/ * ping */" _exactly_` will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and when using a `ReplicationConnection` or a `LoadBalancedConnection`, will send the ping across all active connections.

### C.7.1.7. Changes in MySQL Connector/J 5.1.2 (29 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

Functionality added or changed:

- Setting the configuration property `rewriteBatchedStatements` to `true` will now cause the driver to rewrite batched prepared statements with more than 3 parameter sets in a batch into multi-statements (separated by ";") if they are not plain (that is, without `SELECT` or `ON DUPLICATE KEY UPDATE` clauses) `INSERT` or `REPLACE` statements.

### C.7.1.8. Changes in MySQL Connector/J 5.1.1 (22 June 2007)

This is a new Alpha development release, adding new features and fixing recently discovered bugs.

Functionality added or changed:

- **Incompatible Change:** Pulled vendor-extension methods of `Connection` implementation out into an interface to support

`java.sql.Wrapper` functionality from `ConnectionPoolDataSource`. The vendor extensions are javadoc'd in the `com.mysql.jdbc.Connection` interface.

For those looking further into the driver implementation, it is not an API that is used for plugability of implementations inside our driver (which is why there are still references to `ConnectionImpl` throughout the code).

We've also added server and client `prepareStatement()` methods that cover all of the variants in the JDBC API.

`Connection.serverPrepare(String)` has been re-named to `Connection.serverPrepareStatement()` for consistency with `Connection.clientPrepareStatement()`.

- Row navigation now causes any streams/readers open on the result set to be closed, as in some cases we're reading directly from a shared network packet and it will be overwritten by the "next" row.
- Made it possible to retrieve prepared statement parameter bindings (to be used in `StatementInterceptors`, primarily).
- Externalized the descriptions of connection properties.
- The data (and how it is stored) for `ResultSet` rows are now behind an interface which allows us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.
- Similar to `Connection`, we pulled out vendor extensions to `Statement` into an interface named `com.mysql.Statement`, and moved the `Statement` class into `com.mysql.StatementImpl`. The two methods (javadoc'd in `com.mysql.Statement` are `enableStreamingResults()`, which already existed, and `disableStreamingResults()` which sets the statement instance back to the fetch size and result set type it had before `enableStreamingResults()` was called.
- Driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has `BLOB` or `TEXT` types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property `largeRowSizeThreshold`, which has a default value of 2KB.
- Added experimental support for statement "interceptors" via the `com.mysql.jdbc.StatementInterceptor` interface, examples are in `com/mysql/jdbc/interceptors`.

Implement this interface to be placed "in between" query execution, so that you can influence it. (currently experimental).

`StatementInterceptors` are "chainable" when configured by the user, the results returned by the "current" interceptor will be passed on to the next on in the chain, from left-to-right order, as specified by the user in the JDBC configuration property `statementInterceptors`.

- See the sources (fully javadoc'd) for `com.mysql.jdbc.StatementInterceptor` for more details until we iron out the API and get it documented in the manual.
- Setting `rewriteBatchedStatements` to `true` now causes `CallableStatements` with batched arguments to be rewritten in the form `CALL (...); CALL (...); ...` to send the batch in as few client-server round trips as possible.

### C.7.1.9. Changes in MySQL Connector/J 5.1.0 (11 April 2007)

This is the first public alpha release of the current Connector/J 5.1 development branch, providing an insight to upcoming features. Although some of these are still under development, this release includes the following new features and changes (in comparison to the current Connector/J 5.0 production release):

**Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmnts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

#### Note

The disabling of server-side prepared statements does not affect the operation of the connector. However, if you use the `useTimezone=true` connection option and use client-side prepared statements (instead of server-side prepared statements) you should also set `useSSPSCCompatibleTimezoneShift=true`.

Functionality added or changed:

- Refactored `CommunicationsException` into a JDBC-3.0 version, and a JDBC-4.0 version (which extends `SQLRecoverableException`, now that it exists).

#### Note

This change means that if you were catching `com.mysql.jdbc.CommunicationsException` in your applications instead of looking at the `SQLState` class of `08`, and are moving to Java 6 (or newer), you need to change your imports to that exception to be `com.mysql.jdbc.exceptions.jdbc4.CommunicationsException`, as the old class will not be instantiated for communications link-related errors under Java 6.

- Added support for JDBC-4.0 categorized `SQLExceptions`.
- Added support for JDBC-4.0's `NCLOB`, and `NCHAR/NVARCHAR` types.
- `com.mysql.jdbc.java6.javac` — full path to your Java-6 `javac` executable
- Added support for JDBC-4.0's `SQLXML` interfaces.
- Re-worked Ant buildfile to build JDBC-4.0 classes separately, as well as support building under Eclipse (since Eclipse can't mix/match JDKs).

To build, you must set `JAVA_HOME` to `J2SDK-1.4.2` or `Java-5`, and set the following properties on your Ant command line:

- `com.mysql.jdbc.java6.javac` — full path to your Java-6 `javac` executable
- `com.mysql.jdbc.java6.rtfar` — full path to your Java-6 `rt.jar` file
- New feature — driver will automatically adjust session variable `net_write_timeout` when it determines it has been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (configuration property is named `netTimeoutForStreamingResults` value and has a unit of seconds, the value `0` means the driver will not try and adjust this value).
- Added support for JDBC-4.0's client information. The backend storage of information provided via `Connection.setClientInfo()` and retrieved by `Connection.getClientInfo()` is pluggable by any class that implements the `com.mysql.jdbc.JDBC4ClientInfoProvider` interface and has a no-args constructor.

The implementation used by the driver is configured using the `clientInfoProvider` configuration property (with a default of value of `com.mysql.jdbc.JDBC4CommentClientInfoProvider`, an implementation which lists the client information as a comment prepended to every query sent to the server).

This functionality is only available when using Java-6 or newer.

- `com.mysql.jdbc.java6.rtfar` — full path to your Java-6 `rt.jar` file
- Added support for JDBC-4.0's `Wrapper` interface.

## C.7.2. Changes in MySQL Connector/J 5.0.x

### C.7.2.1. Changes in MySQL Connector/J 5.0.8 (09 October 2007)

Functionality added or changed:

- `blobsAreStrings` — Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- Added two configuration parameters:
  - `blobsAreStrings` — Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
  - `functionsNeverReturnBlobs` — Should the driver always treat data from functions returning BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- `functionsNeverReturnBlobs` — Should the driver always treat data from functions returning BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.

- XAConnections now start in auto-commit mode (as per JDBC-4.0 specification clarification).
- Driver will now fall back to sane defaults for `max_allowed_packet` and `net_buffer_length` if the server reports them incorrectly (and will log this situation at `WARN` level, since it is actually an error condition).

#### Bugs fixed:

- Connections established using URLs of the form `jdbc:mysql:loadbalance://` weren't doing failover if they tried to connect to a MySQL server that was down. The driver now attempts connections to the next "best" (depending on the load balance strategy in use) server, and continues to attempt connecting to the next "best" server every 250 milliseconds until one is found that is up and running or 5 minutes has passed.  
  
If the driver gives up, it will throw the last-received `SQLException`. ([Bug#31053](#))
- `setObject(int, Object, int, int)` delegate in `PreparedStatementWrapper` delegates to wrong method. ([Bug#30892](#))
- NPE with null column values when `padCharsWithSpace` is set to true. ([Bug#30851](#))
- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from subqueries and functions were indistinguishable from each other, leading to type-related bugs. ([Bug#30664](#))
- An `ArithmeticException` or `NullPointerException` would be raised when the batch had zero members and `rewriteBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immediately after `clearBatch()`. ([Bug#30550](#))

- Closing a load-balanced connection would cause a `ClassCastException`. ([Bug#29852](#))
- Connection checker for JBoss didn't use same method parameters via reflection, causing connections to always seem "bad". ([Bug#29106](#))
- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3-5.0.5 and 65 for versions newer than 5.0.5. ([Bug#28972](#))
- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.

The fix involves changing the behavior of `noAccessToProcedureBodies`, in that the driver will now report all parameters as "IN" parameters but allow callers to call `registerOutParameter()` on them without throwing an exception. ([Bug#28689](#))

- When a connection is in read-only mode, queries that are wrapped in parentheses were incorrectly identified DML statements. ([Bug#28256](#))
- `UNSIGNED` types not reported via `DBMD.getTypeInfo()`, and capitalization of type names is not consistent between `DBMD.getColumns()`, `RSMD.getColumnTypeName()` and `DBMD.getTypeInfo()`.

This fix also ensures that the precision of `UNSIGNED MEDIUMINT` and `UNSIGNED BIGINT` is reported correctly via `DBMD.getColumns()`. ([Bug#27916](#))

- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. ([Bug#27915](#))
- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. ([Bug#27867](#))
- Cached metadata with `PreparedStatement.execute()` throws `NullPointerException`. ([Bug#27412](#))
- `Connection.getServerCharacterEncoding()` doesn't work for servers with version  $\geq$  4.1. ([Bug#27182](#))
- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. ([Bug#21116](#))
- Specifying a "validation query" in your connection pool that starts with `"/ * ping * /"` \_exactly\_ will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and when using a `ReplicationConnection` or a `LoadBalancedConnection`, will send the ping across all active connections.

## C.7.2.2. Changes in MySQL Connector/J 5.0.7 (20 July 2007)

Functionality added or changed:

- The driver will now automatically set `useServerPrepStmts` to `true` when `useCursorFetch` has been set to `true`, since the feature requires server-side prepared statements in order to function.
- `tcpKeepAlive` - Should the driver set `SO_KEEPALIVE` (default `true`)?
- Give more information in EOFExceptions thrown out of `MysqlIO` (how many bytes the driver expected to read, how many it actually read, say that communications with the server were unexpectedly lost).
- Driver detects when it is running in a ColdFusion MX server (tested with version 7), and uses the configuration bundle `cold-Fusion`, which sets `useDynamicCharsetInfo` to `false` (see previous entry), and sets `useLocalSessionState` and `autoReconnect` to `true`.
- `tcpNoDelay` - Should the driver set `SO_TCP_NODELAY` (disabling the Nagle Algorithm, default `true`)?
- Added configuration property `slowQueryThresholdNanos` - if `useNanosForElapsedTime` is set to `true`, and this property is set to a nonzero value the driver will use this threshold (in nanosecond units) to determine if a query was slow, instead of using millisecond units.
- `tcpRcvBuf` - Should the driver set `SO_RCV_BUF` to the given value? The default value of '0', means use the platform default value for this property.
- Setting `useDynamicCharsetInfo` to `false` now causes driver to use static lookups for collations as well (makes `ResultSetMetadata.isCaseSensitive()` much more efficient, which leads to performance increase for ColdFusion, which calls this method for every column on every table it sees, it appears).
- Added configuration properties to allow tuning of TCP/IP socket parameters:
  - `tcpNoDelay` - Should the driver set `SO_TCP_NODELAY` (disabling the Nagle Algorithm, default `true`)?
  - `tcpKeepAlive` - Should the driver set `SO_KEEPALIVE` (default `true`)?
  - `tcpRcvBuf` - Should the driver set `SO_RCV_BUF` to the given value? The default value of '0', means use the platform default value for this property.
  - `tcpSndBuf` - Should the driver set `SO_SND_BUF` to the given value? The default value of '0', means use the platform default value for this property.
  - `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for `java.net.Socket.setTrafficClass()` for more information.
- Setting the configuration parameter `useCursorFetch` to `true` for MySQL-5.0+ enables the use of cursors that allow `Connector/J` to save memory by fetching result set rows in chunks (where the chunk size is set by calling `setFetchSize()` on a `Statement` or `ResultSet`) by using fully-materialized cursors on the server.
- `tcpSndBuf` - Should the driver set `SO_SND_BUF` to the given value? The default value of '0', means use the platform default value for this property.
- `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for `java.net.Socket.setTrafficClass()` for more information.
- Added new debugging functionality - Setting configuration property `includeInnodbStatusInDeadlockExceptions` to `true` will cause the driver to append the output of `SHOW ENGINE INNODB STATUS` to deadlock-related exceptions, which will enumerate the current locks held inside `InnoDB`.
- Added configuration property `useNanosForElapsedTime` - for profiling/debugging functionality that measures elapsed time, should the driver try to use nanoseconds resolution if available (requires `JDK >= 1.5`)?

#### Note

If `useNanosForElapsedTime` is set to `true`, and this property is set to "0" (or left default), then elapsed times will still be measured in nanoseconds (if possible), but the slow query threshold will be converted from milliseconds to nanoseconds, and thus have an upper bound of approximately 2000 milliseconds (as that threshold is represented as an integer, not a long).

Bugs fixed:

- Don't send any file data in response to `LOAD DATA LOCAL INFILE` if the feature is disabled at the client side. This is to prevent a malicious server or man-in-the-middle from asking the client for data that the client is not expecting. Thanks to Jan Kneschke for discovering the exploit and Andrey "Poohie" Hristov, Konstantin Osipov and Sergei Golubchik for discussions about implications and possible fixes. ([Bug#29605](#))
- Parser in client-side prepared statements runs to end of statement, rather than end-of-line for '#' comments. Also added support for '-' single-line comments. ([Bug#28956](#))
- Parser in client-side prepared statements eats character following '/' if it is not a multi-line comment. ([Bug#28851](#))
- `PreparedStatement.getMetaData()` for statements containing leading one-line comments is not returned correctly.

As part of this fix, we also overhauled detection of DML for `executeQuery()` and `SELECTs` for `executeUpdate()` in plain and prepared statements to be aware of the same types of comments. ([Bug#28469](#))

### C.7.2.3. Changes in MySQL Connector/J 5.0.6 (15 May 2007)

Functionality added or changed:

- Added an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment (This is not for master-slave replication. For that, we suggest you look at [ReplicationConnection](#) or [lbpool](#)).

If the JDBC URL starts with `jdbc:mysql:loadbalance://host-1,host-2,...host-n`, the driver will create an implementation of `java.sql.Connection` that load balances requests across a series of MySQL JDBC connections to the given hosts, where the balancing takes place after transaction commit.

Therefore, for this to work (at all), you must use transactions, even if only reading data.

Physical connections to the given hosts will not be created until needed.

The driver will invalidate connections that it detects have had communication errors when processing a request. A new connection to the problematic host will be attempted the next time it is selected by the load balancing algorithm.

There are two choices for load balancing algorithms, which may be specified by the `loadBalanceStrategy` JDBC URL configuration property:

- `random` — the driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.
- `bestResponseTime` — the driver will route the request to the host that had the best response time for the previous transaction.
- `bestResponseTime` — the driver will route the request to the host that had the best response time for the previous transaction.
- Added configuration property `padCharsWithSpace` (defaults to `false`). If set to `true`, and a result set column has the `CHAR` type and the value does not fill the amount of characters specified in the DDL for the column, the driver will pad the remaining characters with space (for ANSI compliance).
- When `useLocalSessionState` is set to `true` and connected to a MySQL-5.0 or later server, the JDBC driver will now determine whether an actual `commit` or `rollback` statement needs to be sent to the database when `Connection.commit()` or `Connection.rollback()` is called.

This is especially helpful for high-load situations with connection pools that always call `Connection.rollback()` on connection check-in/check-out because it avoids a round-trip to the server.

- Added configuration property `useDynamicCharsetInfo`. If set to `false` (the default), the driver will use a per-connection cache of character set information queried from the server when necessary, or when set to `true`, use a built-in static mapping that is more efficient, but isn't aware of custom character sets or character sets implemented after the release of the JDBC driver.

#### Note

This only affects the `padCharsWithSpace` configuration property and the `ResultSetMetaData.getColumnDisplayWidth()` method.

- New configuration property, `enableQueryTimeouts` (default `true`).

When enabled, query timeouts set via `Statement.setQueryTimeout()` use a shared `java.util.Timer` instance for scheduling. Even if the timeout doesn't expire before the query is processed, there will be memory used by the `TimerTask` for the given timeout which won't be reclaimed until the time the timeout would have expired if it hadn't been cancelled by the driver. High-load environments might want to consider disabling this functionality. (this configuration property is part of the `maxPerformance` configuration bundle).

- Give better error message when "streaming" result sets, and the connection gets clobbered because of exceeding `net_write_timeout` on the server.
- `random` — the driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.
- `com.mysql.jdbc.[NonRegistering]Driver` now understands URLs of the format `jdbc:mysql:replication://` and `jdbc:mysql:loadbalance://` which will create a `ReplicationConnection` (exactly like when using `[NonRegistering]ReplicationDriver`) and an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment, respectively.

In an effort to simplify things, we're working on deprecating multiple drivers, and instead specifying different core behavior based upon JDBC URL prefixes, so watch for `[NonRegistering]ReplicationDriver` to eventually disappear, to be replaced with `com.mysql.jdbc.[NonRegistering]Driver` with the new URL prefix.

- Fixed issue where a failed-over connection would let an application call `setReadOnly(false)`, when that call should be ignored until the connection is reconnected to a writable master unless `failoverReadOnly` had been set to `false`.
- Driver will now use `INSERT INTO ... VALUES (DEFAULT)` form of statement for updatable result sets for `ResultSet.insertRow()`, rather than pre-populating the insert row with values from `DatabaseMetaData.getColumns()` (which results in a `SHOW FULL COLUMNS` on the server for every result set). If an application requires access to the default values before `insertRow()` has been called, the JDBC URL should be configured with `populateInsertRowWithDefaultValues` set to `true`.

This fix specifically targets performance issues with ColdFusion and the fact that it seems to ask for updatable result sets no matter what the application does with them.

- More intelligent initial packet sizes for the "shared" packets are used (512 bytes, rather than 16K), and initial packets used during handshake are now sized appropriately as to not require reallocation.

#### Bugs fixed:

- More useful error messages are generated when the driver thinks a result set is not updatable. (Thanks to Ashley Martens for the patch). ([Bug#28085](#))
- `Connection.getTransactionIsolation()` uses `"SHOW VARIABLES LIKE"` which is very inefficient on MySQL-5.0+ servers. ([Bug#27655](#))
- Fixed issue where calling `getGeneratedKeys()` on a prepared statement after calling `execute()` didn't always return the generated keys (`executeUpdate()` worked fine however). ([Bug#27655](#))
- `CALL /* ... */ some_proc()` doesn't work. As a side effect of this fix, you can now use `/* */` and `#` comments when preparing statements using client-side prepared statement emulation.

If the comments happen to contain parameter markers (?), they will be treated as belonging to the comment (that is, not recognized) rather than being a parameter of the statement.

#### Note

The statement when sent to the server will contain the comments as-is, they're not stripped during the process of preparing the `PreparedStatement` or `CallableStatement`.

([Bug#27400](#))

- `ResultSet.get*()` with a column index < 1 returns misleading error message. ([Bug#27317](#))
- Using `ResultSet.get*()` with a column index less than 1 returns a misleading error message. ([Bug#27317](#))
- Comments in DDL of stored procedures/functions confuse procedure parser, and thus metadata about them can not be created, leading to inability to retrieve said metadata, or execute procedures that have certain comments in them. ([Bug#26959](#))

- Fast date/time parsing doesn't take into account `00:00:00` as a legal value. (Bug#26789)
- `PreparedStatement` is not closed in `BlobFromLocator.getBytes()`. (Bug#26592)
- When the configuration property `useCursorFetch` was set to `true`, sometimes server would return new, more exact metadata during the execution of the server-side prepared statement that enables this functionality, which the driver ignored (using the original metadata returned during `prepare()`), causing corrupt reading of data due to type mismatch when the actual rows were returned. (Bug#26173)
- `CallableStatements` with `OUT/INOUT` parameters that are "binary" (`BLOB`, `BIT`, `(VAR) BINARY`, `JAVA_OBJECT`) have extra 7 bytes. (Bug#25715)
- Whitespace surrounding storage/size specifiers in stored procedure parameters declaration causes `NumberFormatException` to be thrown when calling stored procedure on JDK-1.5 or newer, as the Number classes in JDK-1.5+ are whitespace intolerant. (Bug#25624)
- Client options not sent correctly when using SSL, leading to stored procedures not being able to return results. Thanks to Don Cohen for the bug report, testcase and patch. (Bug#25545)
- `Statement.setMaxRows()` is not effective on result sets materialized from cursors. (Bug#25517)
- `BIT(> 1)` is returned as `java.lang.String` from `ResultSet.getObject()` rather than `byte[]`. (Bug#25328)

### C.7.2.4. Changes in MySQL Connector/J 5.0.5 (02 March 2007)

Functionality added or changed:

- Usage Advisor will now issue warnings for result sets with large numbers of rows. You can configure the trigger value by using the `resultSetSizeThreshold` parameter, which has a default value of 100.
- The `rewriteBatchedStatements` feature can now be used with server-side prepared statements.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

- Improved speed of `datetime` parsing for ResultSets that come from plain or non-server-side prepared statements. You can enable old implementation with `useFastDateParsing=false` as a configuration parameter.
- Usage Advisor now detects empty results sets and does not report on columns not referenced in those empty sets.
- Fixed logging of XA commands sent to server, it is now configurable via `logXACommands` property (defaults to `false`).
- Added configuration property `localSocketAddress`, which is the host name or IP address given to explicitly configure the interface that the driver will bind the client side of the TCP/IP connection to when connecting.
- We've added a new configuration option `treatUtilDateAsTimestamp`, which is `false` by default, as (1) We already had specific behavior to treat `java.util.Date` as a `java.sql.Timestamp` because it is useful to many folks, and (2) that behavior will very likely be required for drivers JDBC-post-4.0.

Bugs fixed:

- Connection property `socketFactory` wasn't exposed via correctly named mutator/accessor, causing data source implementations that use JavaBean naming conventions to set properties to fail to set the property (and in the case of SJAS, fail silently when trying to set this parameter). (Bug#26326)
- A query execution which timed out did not always throw a `MySQLTimeoutException`. (Bug#25836)
- Storing a `java.util.Date` object in a `BLOB` column would not be serialized correctly during `setObject`. (Bug#25787)
- Timer instance used for `Statement.setQueryTimeout()` created per-connection, rather than per-VM, causing memory leak. (Bug#25514)

- `EscapeProcessor` gets confused by multiple backslashes. We now push the responsibility of syntax errors back on to the server for most escape sequences. (Bug#25399)
- `INOUT` parameters in `CallableStatements` get doubly-escaped. (Bug#25379)
- When using the `rewriteBatchedStatements` connection option with `PreparedStatement.executeBatch()` an internal memory leak would occur. (Bug#25073)
- Fixed issue where field-level for metadata from `DatabaseMetaData` when using `INFORMATION_SCHEMA` didn't have references to current connections, sometimes leading to Null Pointer Exceptions (NPEs) when introspecting them via `ResultSetMetaData`. (Bug#25073)
- `StringUtils.indexOfIgnoreCaseRespectQuotes()` isn't case-insensitive on the first character of the target. This bug also affected `rewriteBatchedStatements` functionality when prepared statements did not use uppercase for the `VALUES` clause. (Bug#25047)
- Client-side prepared statement parser gets confused by in-line comments `/*...*/` and therefore cannot rewrite batch statements or reliably detect the type of statements when they are used. (Bug#25025)
- Results sets from `UPDATE` statements that are part of multi-statement queries would cause an `SQLException` error, "Result is from UPDATE". (Bug#25009)
- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly. (Bug#24840)
- Using `DatabaseMetaData.getSQLKeywords()` does not return a all of the of the reserved keywords for the current MySQL version. Current implementation returns the list of reserved words for MySQL 5.1, and does not distinguish between versions. (Bug#24794)
- Calling `Statement.cancel()` could result in a Null Pointer Exception (NPE). (Bug#24721)
- Using `setFetchSize()` breaks prepared `SHOW` and other commands. (Bug#24360)
- Calendars and timezones are now lazily instantiated when required. (Bug#24351)
- Using `DATETIME` columns would result in time shifts when `useServerPrepStmts` was true. The reason was due to different behavior when using client-side compared to server-side prepared statements and the `useJDBCCompliantTimezoneShift` option. This is now fixed if moving from server-side prepared statements to client-side prepared statements by setting `useSSPSCompatibleTimezoneShift` to `true`, as the driver can't tell if this is a new deployment that never used server-side prepared statements, or if it is an existing deployment that is switching to client-side prepared statements from server-side prepared statements. (Bug#24344)
- Connector/J now returns a better error message when server doesn't return enough information to determine stored procedure/function parameter types. (Bug#24065)
- A connection error would occur when connecting to a MySQL server with certain character sets. Some collations/character sets reported as "unknown" (specifically `cias` variants of existing character sets), and inability to override the detected server character set. (Bug#23645)
- Inconsistency between `getSchemas` and `INFORMATION_SCHEMA`. (Bug#23304)
- `DatabaseMetaData.getSchemas()` doesn't return a `TABLE_CATALOG` column. (Bug#23303)
- When using a JDBC connection URL that is malformed, the `NonRegisteringDriver.getPropertyInfo` method will throw a Null Pointer Exception (NPE). (Bug#22628)
- Some exceptions thrown out of `StandardSocketFactory` were needlessly wrapped, obscuring their true cause, especially when using socket timeouts. (Bug#21480)
- When using a server-side prepared statement the driver would send timestamps to the server using nanoseconds instead of milliseconds. (Bug#21438)
- When using server-side prepared statements and timestamp columns, value would be incorrectly populated (with nanoseconds, not microseconds). (Bug#21438)
- `ParameterMetaData` throws `NullPointerException` when prepared SQL has a syntax error. Added `generateSimpleParameterMetadata` configuration property, which when set to `true` will generate metadata reflecting `VARCHAR` for every parameter (the default is `false`, which will cause an exception to be thrown if no parameter metadata for the statement is actually available). (Bug#21267)
- Fixed an issue where `XADataSources` couldn't be bound into JNDI, as the `DataSourceFactory` didn't know how to cre-

ate instances of them.

Other changes:

- Avoid static synchronized code in JVM class libraries for dealing with default timezones.
- Performance enhancement of initial character set configuration, driver will only send commands required to configure connection character set session variables if the current values on the server do not match what is required.
- Re-worked stored procedure parameter parser to be more robust. Driver no longer requires `BEGIN` in stored procedure definition, but does have requirement that if a stored function begins with a label directly after the "returns" clause, that the label is not a quoted identifier.
- Throw exceptions encountered during timeout to thread calling `Statement.execute*( )`, rather than `RuntimeException`.
- Changed cached result set metadata (when using `cacheResultSetMetadata=true`) to be cached per-connection rather than per-statement as previously implemented.
- Reverted back to internal character conversion routines for single-byte character sets, as the ones internal to the JVM are using much more CPU time than our internal implementation.
- When extracting foreign key information from `SHOW CREATE TABLE` in `DatabaseMetaData`, ignore exceptions relating to tables being missing (which could happen for cross-reference or imported-key requests, as the list of tables is generated first, then iterated).
- Fixed some Null Pointer Exceptions (NPEs) when cached metadata was used with `UpdatableResultSets`.
- Take `localSocketAddress` property into account when creating instances of `CommunicationsException` when the underlying exception is a `java.net.BindException`, so that a friendlier error message is given with a little internal diagnostics.
- Fixed cases where `ServerPreparedStatement` weren't using cached metadata when `cacheResultSetMetadata=true` was used.
- Use a `java.util.TreeMap` to map column names to ordinal indexes for `ResultSet.findColumn()` instead of a `HashMap`. This allows us to have case-insensitive lookups (required by the JDBC specification) without resorting to the many transient object instances needed to support this requirement with a normal `HashMap` with either case-adjusted keys, or case-insensitive keys. (In the worst case scenario for lookups of a 1000 column result set, `TreeMaps` are about half as fast wall-clock time as a `HashMap`, however in normal applications their use gives many orders of magnitude reduction in transient object instance creation which pays off later for CPU usage in garbage collection).
- When using cached metadata, skip field-level metadata packets coming from the server, rather than reading them and discarding them without creating `com.mysql.jdbc.Field` instances.

### C.7.2.5. Changes in MySQL Connector/J 5.0.4 (20 October 2006)

Bugs fixed:

- `DBMD.getColumns()` does not return expected `COLUMN_SIZE` for the SET type, now returns length of largest possible set disregarding whitespace or the "," delimiters to be consistent with the ODBC driver. ([Bug#22613](#))
- Added new `_ci` collations to `CharsetMapping` - `utf8_unicode_ci` not working. ([Bug#22456](#))
- Driver was using milliseconds for `Statement.setQueryTimeout()` when specification says argument is to be in seconds. ([Bug#22359](#))
- Workaround for server crash when calling stored procedures via a server-side prepared statement (driver now detects prepare(stored procedure) and substitutes client-side prepared statement). ([Bug#22297](#))
- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). ([Bug#22290](#))
- Newlines causing whitespace to span confuse procedure parser when getting parameter metadata for stored procedures. ([Bug#22024](#))
- When using `information_schema` for metadata, `COLUMN_SIZE` for `getColumns()` is not clamped to range of `java.lang.Integer`

as is the case when not using `information_schema`, thus leading to a truncation exception that isn't present when not using `information_schema`. ([Bug#21544](#))

- Column names don't match metadata in cases where server doesn't return original column names (column functions) thus breaking compatibility with applications that expect 1-1 mappings between `findColumn()` and `rsmd.getColumnname()`, usually manifests itself as "Can't find column ()" exceptions. ([Bug#21379](#))
- Driver now sends numeric 1 or 0 for client-prepared statement `setBoolean()` calls instead of '1' or '0'.
- Fixed configuration property `jdbcCompliantTruncation` was not being used for reads of result set values.
- `DatabaseMetaData` correctly reports `true` for `supportsCatalog*` () methods.
- Driver now supports `{call sp}` (without "()") if procedure has no arguments).

### C.7.2.6. Changes in MySQL Connector/J 5.0.3 (26 July 2006 beta)

Functionality added or changed:

- Added configuration option `noAccessToProcedureBodies` which will cause the driver to create basic parameter metadata for `CallableStatements` when the user does not have access to procedure bodies via `SHOW CREATE PROCEDURE` or selecting from `mysql.proc` instead of throwing an exception. The default value for this option is `false`

Bugs fixed:

- Fixed `Statement.cancel()` causes `NullPointerException` if underlying connection has been closed due to server failure. ([Bug#20650](#))
- If the connection to the server has been closed due to a server failure, then the cleanup process will call `Statement.cancel()`, triggering a `NullPointerException`, even though there is no active connection. ([Bug#20650](#))

### C.7.2.7. Changes in MySQL Connector/J 5.0.2 (11 July 2006)

Bugs fixed:

- `MysqlXaConnection.recover(int flags)` now allows combinations of `XAResource.TMSTARTRSCAN` and `TMENDRSCAN`. To simulate the "scanning" nature of the interface, we return all prepared XIDs for `TMSTARTRSCAN`, and no new XIDs for calls with `TMNOFLAGS`, or `TMENDRSCAN` when not in combination with `TMSTARTRSCAN`. This change was made for API compliance, as well as integration with IBM WebSphere's transaction manager. ([Bug#20242](#))
- Fixed `MysqlValidConnectionChecker` for JBoss doesn't work with `MySQLXADataSources`. ([Bug#20242](#))
- Added connection/datasource property `pinGlobalTxToPhysicalConnection` (defaults to `false`). When set to `true`, when using `XAConnections`, the driver ensures that operations on a given XID are always routed to the same physical connection. This allows the `XAConnection` to support `XA START ... JOIN` after `XA END` has been called, and is also a workaround for transaction managers that don't maintain thread affinity for a global transaction (most either always maintain thread affinity, or have it as a configuration option). ([Bug#20242](#))
- Better caching of character set converters (per-connection) to remove a bottleneck for multibyte character sets. ([Bug#20242](#))
- Fixed `ConnectionProperties` (and thus some subclasses) are not serializable, even though some J2EE containers expect them to be. ([Bug#19169](#))
- Fixed driver fails on non-ASCII platforms. The driver was assuming that the platform character set would be a superset of MySQL's `latin1` when doing the handshake for authentication, and when reading error messages. We now use Cp1252 for all strings sent to the server during the handshake phase, and a hard-coded mapping of the `language` system variable to the character set that is used for error messages. ([Bug#18086](#))
- Fixed can't use `XAConnection` for local transactions when no global transaction is in progress. ([Bug#17401](#))

### C.7.2.8. Changes in MySQL Connector/J 5.0.1 (Not Released)

Not released due to a packaging error

## C.7.2.9. Changes in MySQL Connector/J 5.0.0 (22 December 2005)

Bugs fixed:

- Added support for Connector/MXJ integration via url subprotocol `jdbc:mysql:mxj://...` (Bug#14729)
- Idle timeouts cause `XAConnections` to whine about rolling themselves back. (Bug#14729)
- When fix for Bug#14562 was merged from 3.1.12, added functionality for `CallableStatement`'s parameter metadata to return correct information for `.getParameterClassName()`. (Bug#14729)
- Added service-provider entry to `META-INF/services/java.sql.Driver` for JDBC-4.0 support. (Bug#14729)
- Fuller synchronization of `Connection` to avoid deadlocks when using multithreaded frameworks that multithread a single connection (usually not recommended, but the JDBC spec allows it anyways), part of fix to Bug#14972). (Bug#14729)
- Moved all `SQLException` constructor usage to a factory in `SQLException` (ground-work for JDBC-4.0 `SQLState`-based exception classes). (Bug#14729)
- Removed Java5-specific calls to `BigDecimal` constructor (when result set value is `'', (int)0` was being used as an argument indirectly via method return value. This signature doesn't exist prior to Java5.) (Bug#14729)
- Implementation of `Statement.cancel()` and `Statement.setQueryTimeout()`. Both require MySQL-5.0.0 or newer server, require a separate connection to issue the `KILL QUERY` statement, and in the case of `setQueryTimeout()` creates an additional thread to handle the timeout functionality.

Note: Failures to cancel the statement for `setQueryTimeout()` may manifest themselves as `RuntimeExceptions` rather than failing silently, as there is currently no way to unblock the thread that is executing the query being cancelled due to timeout expiration and have it throw the exception instead. (Bug#14729)

- Return "[VAR]BINARY" for `RSMD.getColumnTypeName()` when that is actually the type, and it can be distinguished (MySQL-4.1 and newer). (Bug#14729)
- Attempt detection of the MySQL type `BINARY` (it is an alias, so this isn't always reliable), and use the `java.sql.Types.BINARY` type mapping for it.
- Added unit tests for `XADatasource`, as well as friendlier exceptions for XA failures compared to the "stock" `XAException` (which has no messages).
- If the connection `useTimezone` is set to `true`, then also respect time zone conversions in escape-processed string literals (for example, `"{ts ...}"` and `"{t ...}"`).
- Don't allow `.setAutoCommit(true)`, or `.commit()` or `.rollback()` on an XA-managed connection as per the JDBC specification.
- `XADatasource` implemented (ported from 3.2 branch which won't be released as a product). Use `com.mysql.jdbc.jdbc2.optional.MysqlXADataSource` as your datasource class name in your application server to utilize XA transactions in MySQL-5.0.10 and newer.
- Moved `-bin-g.jar` file into separate `debug` subdirectory to avoid confusion.
- Return original column name for `RSMD.getColumnLabel()` if the column was aliased, alias name for `.getColumnLabel()` (if aliased), and original table name for `.getTableName()`. Note this only works for MySQL-4.1 and newer, as older servers don't make this information available to clients.
- Setting `useJDBCCompliantTimezoneShift=true` (it is not the default) causes the driver to use GMT for *all* `TIMESTAMP/DATETIME` time zones, and the current VM time zone for any other type that refers to time zones. This feature can not be used when `useTimezone=true` to convert between server and client time zones.
- `PreparedStatement.setString()` didn't work correctly when `sql_mode` on server contained `NO_BACKSLASH_ESCAPES` and no characters that needed escaping were present in the string.
- Add one level of indirection of internal representation of `CallableStatement` parameter metadata to avoid class not found issues on JDK-1.3 for `ParameterMetadata` interface (which doesn't exist prior to JDBC-3.0).

## C.7.3. Changes in MySQL Connector/J 3.1.x

### C.7.3.1. Changes in MySQL Connector/J 3.1.15 (Not yet released)

**Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

Bugs fixed:

- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly. ([Bug#24840](#))

### C.7.3.2. Changes in MySQL Connector/J 3.1.14 (10-19-2006)

Bugs fixed:

- Check and store value for `continueBatchOnError` property in constructor of `Statements`, rather than when executing batches, so that Connections closed out from underneath statements don't cause `NullPointerExceptions` when it is required to check this property. ([Bug#22290](#))
- Fixed [Bug#18258](#) - `DatabaseMetaData.getTables()`, `columns()` with bad catalog parameter threw exception rather than return empty result set (as required by spec). ([Bug#22290](#))
- Driver now sends numeric 1 or 0 for client-prepared statement `setBoolean()` calls instead of '1' or '0'. ([Bug#22290](#))
- Fixed bug where driver would not advance to next host if `roundRobinLoadBalance=true` and the last host in the list is down. ([Bug#22290](#))
- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). ([Bug#22290](#))
- Fixed bug when calling stored functions, where parameters weren't numbered correctly (first parameter is now the return value, subsequent parameters if specified start at index "2"). ([Bug#22290](#))
- Removed logger autodetection altogether, must now specify logger explicitly if you want to use a logger other than one that logs to `STDERR`. ([Bug#21207](#))
- `DDriver` throws `NPE` when tracing prepared statements that have been closed (in `asSQL()`). ([Bug#21207](#))
- `ResultSet.getSomeInteger()` doesn't work for `BIT(>1)`. ([Bug#21062](#))
- Escape of quotes in client-side prepared statements parsing not respected. Patch covers more than bug report, including `NO_BACKSLASH_ESCAPES` being set, and stacked quote characters forms of escaping (that is, " or "). ([Bug#20888](#))
- Fixed can't pool server-side prepared statements, exception raised when re-using them. ([Bug#20687](#))
- Fixed Updatable result set that contains a `BIT` column fails when server-side prepared statements are used. ([Bug#20485](#))
- Fixed updatable result set throws `ClassCastException` when there is row data and `moveToInsertRow()` is called. ([Bug#20479](#))
- Fixed `ResultSet.getShort()` for `UNSIGNED TINYINT` returns incorrect values when using server-side prepared statements. ([Bug#20306](#))
- `ReplicationDriver` does not always round-robin load balance depending on URL used for slaves list. ([Bug#19993](#))
- Fixed calling `toString()` on `ResultSetMetaData` for driver-generated (that is, from `DatabaseMetaData` method calls, or from `GeneratedKeys()`) result sets would raise a `NullPointerException`. ([Bug#19993](#))
- Connection fails to localhost when using timeout and IPv6 is configured. ([Bug#19726](#))
- `ResultSet.getFloatFromString()` can't retrieve values near `Float.MIN/MAX_VALUE`. ([Bug#18880](#))
- Fixed memory leak with `profileSQL=true`. ([Bug#16987](#))
- Fixed `NullPointerException` in `MySQLDataSourceFactory` due to `Reference` containing `RefAddr`s with null content. ([Bug#16791](#))

### C.7.3.3. Changes in MySQL Connector/J 3.1.13 (26 May 2006)

Bugs fixed:

- Fixed `PreparedStatement.setObject(int, Object, int)` doesn't respect scale of `BigDecimal`s. (Bug#19615)
- Fixed `ResultSet.isNull()` returns incorrect value when extracting native string from server-side prepared statement generated result set. (Bug#19282)
- Fixed invalid classname returned for `ResultSetMetaData.getColumnClassName()` for `BIGINT` type. (Bug#19282)
- Fixed case where driver wasn't reading server status correctly when fetching server-side prepared statement rows, which in some cases could cause warning counts to be off, or multiple result sets to not be read off the wire. (Bug#19282)
- Fixed data truncation and `getWarnings()` only returns last warning in set. (Bug#18740)
- Fixed aliased column names where length of name > 251 are corrupted. (Bug#18554)
- Improved performance of retrieving `BigDecimal`, `Time`, `Timestamp` and `Date` values from server-side prepared statements by creating fewer short-lived instances of `Strings` when the native type is not an exact match for the requested type. (Bug#18496)
- Added performance feature, re-writing of batched executes for `Statement.executeBatch()` (for all DML statements) and `PreparedStatement.executeBatch()` (for INSERTs with VALUE clauses only). Enable by using "rewrite-BatchedStatements=true" in your JDBC URL. (Bug#18041)
- Fixed issue where server-side prepared statements don't cause truncation exceptions to be thrown when truncation happens. (Bug#18041)
- Fixed `CallableStatement.registerOutParameter()` not working when some parameters pre-populated. Still waiting for feedback from JDBC experts group to determine what correct parameter count from `getMetaData()` should be, however. (Bug#17898)
- Fixed calling `clearParameters()` on a closed prepared statement causes NPE. (Bug#17587)
- Map "latin1" on MySQL server to CP1252 for MySQL > 4.1.0. (Bug#17587)
- Added additional accessor and mutator methods on `ConnectionProperties` so that `DataSource` users can use same naming as regular URL properties. (Bug#17587)
- Fixed `ResultSet.isNull()` not always reset correctly for booleans when done via conversion for server-side prepared statements. (Bug#17450)
- Fixed `Statement.getGeneratedKeys()` throws `NullPointerException` when no query has been processed. (Bug#17099)
- Fixed updatable result set doesn't return `AUTO_INCREMENT` values for `insertRow()` when multiple column primary keys are used. (the driver was checking for the existence of single-column primary keys and an autoincrement value > 0 instead of a straightforward `isAutoIncrement()` check). (Bug#16841)
- `DBMD.getColumns()` returns wrong type for `BIT`. (Bug#15854)
- `lib-nodist` directory missing from package breaks out-of-box build. (Bug#15676)
- Fixed issue with `ReplicationConnection` incorrectly copying state, doesn't transfer connection context correctly when transitioning between the same read-only states. (Bug#15570)
- No "dos" character set in MySQL > 4.1.0. (Bug#15544)
- `INOUT` parameter does not store `IN` value. (Bug#15464)
- `PreparedStatement.setObject()` serializes `BigInteger` as object, rather than sending as numeric value (and is thus not complementary to `getObject()` on an `UNSIGNED LONG` type). (Bug#15383)
- Fixed issue where driver was unable to initialize character set mapping tables. Removed reliance on `.properties` files to hold this information, as it turns out to be too problematic to code around class loader hierarchies that change depending on how an application is deployed. Moved information back into the `CharsetMapping` class. (Bug#14938)

- Exception thrown for new decimal type when using updatable result sets. ([Bug#14609](#))
- Driver now aware of fix for `BIT` type metadata that went into MySQL-5.0.21 for server not reporting length consistently. ([Bug#13601](#))
- Added support for Apache Commons logging, use `"com.mysql.jdbc.log.CommonsLogger"` as the value for the `"logger"` configuration property. ([Bug#13469](#))
- Fixed driver trying to call methods that don't exist on older and newer versions of Log4j. The fix is not trying to auto-detect presence of log4j, too many different incompatible versions out there in the wild to do this reliably.  
  
If you relied on autodetection before, you will need to add `"logger=com.mysql.jdbc.log.Log4JLogger"` to your JDBC URL to enable Log4J usage, or alternatively use the new `"CommonsLogger"` class to take care of this. ([Bug#13469](#))
- LogFactory now prepends `"com.mysql.jdbc.log"` to log class name if it can't be found as-specified. This allows you to use "short names" for the built-in log factories, for example `"logger=CommonsLogger"` instead of `"logger=com.mysql.jdbc.log.CommonsLogger"`. ([Bug#13469](#))
- `ResultSet.getShort()` for `UNSIGNED TINYINT` returned wrong values. ([Bug#11874](#))

### C.7.3.4. Changes in MySQL Connector/J 3.1.12 (30 November 2005)

Bugs fixed:

- Process escape tokens in `Connection.prepareStatement(...)`. You can disable this behavior by setting the JDBC URL configuration property `processEscapeCodesForPrepStmts` to `false`. ([Bug#15141](#))
- Usage advisor complains about unreferenced columns, even though they've been referenced. ([Bug#15065](#))
- Driver incorrectly closes streams passed as arguments to `PreparedStatement`s. Reverts to legacy behavior by setting the JDBC configuration property `autoClosePstmtStreams` to `true` (also included in the 3-0-Compat configuration "bundle"). ([Bug#15024](#))
- Deadlock while closing server-side prepared statements from multiple threads sharing one connection. ([Bug#14972](#))
- Unable to initialize character set mapping tables (due to J2EE classloader differences). ([Bug#14938](#))
- Escape processor replaces quote character in quoted string with string delimiter. ([Bug#14909](#))
- `DatabaseMetaData.getColumns()` doesn't return `TABLE_NAME` correctly. ([Bug#14815](#))
- `storesMixedCaseIdentifiers()` returns `false` ([Bug#14562](#))
- `storesLowerCaseIdentifiers()` returns `true` ([Bug#14562](#))
- `storesMixedCaseQuotedIdentifiers()` returns `false` ([Bug#14562](#))
- `storesMixedCaseQuotedIdentifiers()` returns `true` ([Bug#14562](#))
- If `lower_case_table_names=0` (on server):
  - `storesLowerCaseIdentifiers()` returns `false`
  - `storesLowerCaseQuotedIdentifiers()` returns `false`
  - `storesMixedCaseIdentifiers()` returns `true`
  - `storesMixedCaseQuotedIdentifiers()` returns `true`
  - `storesUpperCaseIdentifiers()` returns `false`
  - `storesUpperCaseQuotedIdentifiers()` returns `true`([Bug#14562](#))
- `storesUpperCaseIdentifiers()` returns `false` ([Bug#14562](#))
- `storesUpperCaseQuotedIdentifiers()` returns `true` ([Bug#14562](#))
- If `lower_case_table_names=1` (on server):

- `storesLowerCaseIdentifiers()` returns `true`
  - `storesLowerCaseQuotedIdentifiers()` returns `true`
  - `storesMixedCaseIdentifiers()` returns `false`
  - `storesMixedCaseQuotedIdentifiers()` returns `false`
  - `storesUpperCaseIdentifiers()` returns `false`
  - `storesUpperCaseQuotedIdentifiers()` returns `true`
- (Bug#14562)
- `storesLowerCaseQuotedIdentifiers()` returns `true` (Bug#14562)
  - Fixed `DatabaseMetaData.stores*Identifiers()`:
    - If `lower_case_table_names=0` (on server):
      - `storesLowerCaseIdentifiers()` returns `false`
      - `storesLowerCaseQuotedIdentifiers()` returns `false`
      - `storesMixedCaseIdentifiers()` returns `true`
      - `storesMixedCaseQuotedIdentifiers()` returns `true`
      - `storesUpperCaseIdentifiers()` returns `false`
      - `storesUpperCaseQuotedIdentifiers()` returns `true`
    - If `lower_case_table_names=1` (on server):
      - `storesLowerCaseIdentifiers()` returns `true`
      - `storesLowerCaseQuotedIdentifiers()` returns `true`
      - `storesMixedCaseIdentifiers()` returns `false`
      - `storesMixedCaseQuotedIdentifiers()` returns `false`
      - `storesUpperCaseIdentifiers()` returns `false`
      - `storesUpperCaseQuotedIdentifiers()` returns `true`
- (Bug#14562)
- `storesMixedCaseIdentifiers()` returns `true` (Bug#14562)
  - `storesLowerCaseQuotedIdentifiers()` returns `false` (Bug#14562)
  - Java type conversion may be incorrect for `MEDIUMINT`. (Bug#14562)
  - `storesLowerCaseIdentifiers()` returns `false` (Bug#14562)
  - Added configuration property `useGmtMillisForDatetimes` which when set to `true` causes `ResultSet.getDate()`, `ResultSet.getTimestamp()` to return correct millis-since GMT when `ResultSet.getTime()` is called on the return value (currently default is `false` for legacy behavior). (Bug#14562)
  - Extraneous sleep on `autoReconnect`. (Bug#13775)
  - Reconnect during middle of `executeBatch()` should not occur if `autoReconnect` is enabled. (Bug#13255)
  - `maxQuerySizeToLog` is not respected. Added logging of bound values for `execute()` phase of server-side prepared statements when `profileSQL=true` as well. (Bug#13048)
  - OpenOffice expects `DBMD.supportsIntegrityEnhancementFacility()` to return `true` if foreign keys are supported by the datasource, even though this method also covers support for check constraints, which MySQL *doesn't* have. Setting the configuration property `overrideSupportsIntegrityEnhancementFacility` to `true` causes the driver to return `true` for this method. (Bug#12975)
-

- Added `com.mysql.jdbc.testsuite.url.default` system property to set default JDBC url for testsuite (to speed up bug resolution when I'm working in Eclipse). (Bug#12975)
- `logSlowQueries` should give better info. (Bug#12230)
- Don't increase timeout for failover/reconnect. (Bug#6577)
- Fixed client-side prepared statement bug with embedded `?` characters inside quoted identifiers (it was recognized as a placeholder, when it was not).
- Don't allow `executeBatch()` for `CallableStatements` with registered `OUT/INOUT` parameters (JDBC compliance).
- Fall back to platform-encoding for `URLDecoder.decode()` when parsing driver URL properties if the platform doesn't have a two-argument version of this method.

### C.7.3.5. Changes in MySQL Connector/J 3.1.11 (07 October 2005)

Bugs fixed:

- The configuration property `sessionVariables` now allows you to specify variables that start with the “@” sign. (Bug#13453)
- URL configuration parameters don't allow “&” or “=” in their values. The JDBC driver now parses configuration parameters as if they are encoded using the application/x-www-form-urlencoded format as specified by `java.net.URLDecoder` (<http://java.sun.com/j2se/1.5.0/docs/api/java/net/URLDecoder.html>).  
If the “%” character is present in a configuration property, it must now be represented as `%25`, which is the encoded form of “%” when using application/x-www-form-urlencoded encoding. (Bug#13453)
- Workaround for Bug#13374: `ResultSet.getStatement()` on closed result set returns `NULL` (as per JDBC 4.0 spec, but not backward-compatible). Set the connection property `retainStatementAfterResultSetClose` to `true` to be able to retrieve a `ResultSet`'s statement after the `ResultSet` has been closed via `.getStatement()` (the default is `false`, to be JDBC-compliant and to reduce the chance that code using JDBC leaks `Statement` instances). (Bug#13277)
- `ResultSetMetaData` from `Statement.getGeneratedKeys()` caused a `NullPointerException` to be thrown whenever a method that requires a connection reference was called. (Bug#13277)
- Backport of `VAR[BINARY|CHAR] [BINARY]` types detection from 5.0 branch. (Bug#13277)
- Fixed `NullPointerException` when converting `catalog` parameter in many `DatabaseMetaDataMethods` to `byte[]`s (for the result set) when the parameter is `null`. (`null` isn't technically allowed by the JDBC specification, but we've historically allowed it). (Bug#13277)
- Backport of `Field` class, `ResultSetMetaData.getColumnClassName()`, and `ResultSet.getObject(int)` changes from 5.0 branch to fix behavior surrounding `VARCHAR BINARY/VARBINARY` and related types. (Bug#13277)
- Read response in `MysqlIO.sendFileToServer()`, even if the local file can't be opened, otherwise next query issued will fail, because it is reading the response to the empty `LOAD DATA INFILE` packet sent to the server. (Bug#13277)
- When `gatherPerfMetrics` is enabled for servers older than 4.1.0, a `NullPointerException` is thrown from the constructor of `ResultSet` if the query doesn't use any tables. (Bug#13043)
- `java.sql.Types.OTHER` returned for `BINARY` and `VARBINARY` columns when using `DatabaseMetaData.getColumns()`. (Bug#12970)
- `ServerPreparedStatement.getBinding()` now checks if the statement is closed before attempting to reference the list of parameter bindings, to avoid throwing a `NullPointerException`. (Bug#12970)
- Tokenizer for `=` in URL properties was causing `sessionVariables=...` to be parameterized incorrectly. (Bug#12753)
- `cp1251` incorrectly mapped to `win1251` for servers newer than 4.0.x. (Bug#12752)
- `getExportedKeys()` (Bug#12541)
- Specifying a catalog works as stated in the API docs. (Bug#12541)
- Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties. (Bug#12541)

- `getIndexInfo()` ([Bug#12541](#))
- `getProcedures()` (and thus indirectly `getProcedureColumns()`) ([Bug#12541](#))
- `getImportedKeys()` ([Bug#12541](#))
- Specifying "" means “current” catalog, even though this isn't quite JDBC spec compliant, it is there for legacy users. ([Bug#12541](#))
- `getCrossReference()` ([Bug#12541](#))
- Added `Connection.isMasterConnection()` for clients to be able to determine if a multi-host master/slave connection is connected to the first host in the list. ([Bug#12541](#))
- `getColumns()` ([Bug#12541](#))
- Handling of catalog argument in `DatabaseMetaData.getIndexInfo()`, which also means changes to the following methods in `DatabaseMetaData`:
  - `getBestRowIdentifier()`
  - `getColumns()`
  - `getCrossReference()`
  - `getExportedKeys()`
  - `getImportedKeys()`
  - `getIndexInfo()`
  - `getPrimaryKeys()`
  - `getProcedures()` (and thus indirectly `getProcedureColumns()`)
  - `getTables()`

The `catalog` argument in all of these methods now behaves in the following way:

- Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties.
- Specifying "" means “current” catalog, even though this isn't quite JDBC spec compliant, it is there for legacy users.
- Specifying a catalog works as stated in the API docs.
- Made `Connection.clientPrepare()` available from “wrapped” connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances). ([Bug#12541](#))
- `getBestRowIdentifier()` ([Bug#12541](#))
- Made `Connection.clientPrepare()` available from “wrapped” connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances). ([Bug#12541](#))
- `getTables()` ([Bug#12541](#))
- `getPrimaryKeys()` ([Bug#12541](#))
- `Connection.prepareCall()` is database name case-sensitive (on Windows systems). ([Bug#12417](#))
- `explainSlowQueries` hangs with server-side prepared statements. ([Bug#12229](#))
- Properties shared between master and slave with replication connection. ([Bug#12218](#))
- Geometry types not handled with server-side prepared statements. ([Bug#12104](#))
- `maxPerformance.properties` mis-spells “`elideSetAutoCommits`”. ([Bug#11976](#))
- `ReplicationConnection` won't switch to slave, throws “Catalog can't be null” exception. ([Bug#11879](#))

- `Pstmt.setObject(..., Types.BOOLEAN)` throws exception. (Bug#11798)
- Escape tokenizer doesn't respect stacked single quotes for escapes. (Bug#11797)
- `GEOMETRY` type not recognized when using server-side prepared statements. (Bug#11797)
- Foreign key information that is quoted is parsed incorrectly when `DatabaseMetaData` methods use that information. (Bug#11781)
- The `sendBlobChunkSize` property is now clamped to `max_allowed_packet` with consideration of stream buffer size and packet headers to avoid `PacketTooBigExceptions` when `max_allowed_packet` is similar in size to the default `sendBlobChunkSize` which is 1M. (Bug#11781)
- `CallableStatement.clearParameters()` now clears resources associated with `INOUT/OUTPUT` parameters as well as `INPUT` parameters. (Bug#11781)
- Fixed regression caused by fix for Bug#11552 that caused driver to return incorrect values for unsigned integers when those integers were within the range of the positive signed type. (Bug#11663)
- Moved source code to Subversion repository. (Bug#11663)
- Incorrect generation of testcase scripts for server-side prepared statements. (Bug#11663)
- Fixed statements generated for testcases missing `;` for "plain" statements. (Bug#11629)
- Spurious `!` on console when character encoding is `utf8`. (Bug#11629)
- `StringUtils.getBytes()` doesn't work when using multi-byte character encodings and a length in *characters* is specified. (Bug#11614)
- `DBMD.storesLower/Mixed/UpperIdentifiers()` reports incorrect values for servers deployed on Windows. (Bug#11575)
- Reworked `Field` class, `*Buffer`, and `MysqlIO` to be aware of field lengths  $> Integer.MAX\_VALUE$ . (Bug#11498)
- Escape processor didn't honor strings demarcated with double quotes. (Bug#11498)
- Updated `DBMD.supportsCorrelatedQueries()` to return `true` for versions  $> 4.1$ , `supportsGroupByUnrelated()` to return `true` and `getResultSetHoldability()` to return `HOLD_CURSORS_OVER_COMMIT`. (Bug#11498)
- Lifted restriction of changing streaming parameters with server-side prepared statements. As long as *all* streaming parameters were set before execution, `.clearParameters()` does not have to be called. (due to limitation of client/server protocol, prepared statements can not reset *individual* stream data on the server side). (Bug#11498)
- `ResultSet.moveToCurrentRow()` fails to work when preceded by a call to `ResultSet.moveToInsertRow()`. (Bug#11190)
- `VARBINARY` data corrupted when using server-side prepared statements and `.setBytes()`. (Bug#11115)
- `Statement.getWarnings()` fails with NPE if statement has been closed. (Bug#10630)
- Only get `char[]` from SQL in `PreparedStatement.ParseInfo()` when needed. (Bug#10630)

### C.7.3.6. Changes in MySQL Connector/J 3.1.10 (23 June 2005)

Bugs fixed:

- Initial implementation of `ParameterMetadata` for `PreparedStatement.getParameterMetadata()`. Only works fully for `CallableStatements`, as current server-side prepared statements return every parameter as a `VARCHAR` type.
- Fixed connecting without a database specified raised an exception in `MysqlIO.changeDatabaseTo()`.

### C.7.3.7. Changes in MySQL Connector/J 3.1.9 (22 June 2005)

Bugs fixed:

- Production package doesn't include JBoss integration classes. (Bug#11411)
- Removed nonsensical “costly type conversion” warnings when using usage advisor. (Bug#11411)
- Fixed `PreparedStatement.setClob()` not accepting `null` as a parameter. (Bug#11360)
- Connector/J dumping query into `SQLException` twice. (Bug#11360)
- `autoReconnect` ping causes exception on connection startup. (Bug#11259)
- `Connection.setCatalog()` is now aware of the `useLocalSessionState` configuration property, which when set to `true` will prevent the driver from sending `USE ...` to the server if the requested catalog is the same as the current catalog. (Bug#11115)
- `3-0-Compat` — Compatibility with Connector/J 3.0.x functionality (Bug#11115)
- `maxPerformance` — maximum performance without being reckless (Bug#11115)
- `solarisMaxPerformance` — maximum performance for Solaris, avoids syscalls where it can (Bug#11115)
- Added `maintainTimeStats` configuration property (defaults to `true`), which tells the driver whether or not to keep track of the last query time and the last successful packet sent to the server's time. If set to `false`, removes two syscalls per query. (Bug#11115)
- `VARBINARY` data corrupted when using server-side prepared statements and `ResultSet.getBytes()`. (Bug#11115)
- Added the following configuration bundles, use one or many via the `useConfigs` configuration property:
  - `maxPerformance` — maximum performance without being reckless
  - `solarisMaxPerformance` — maximum performance for Solaris, avoids syscalls where it can
  - `3-0-Compat` — Compatibility with Connector/J 3.0.x functionality(Bug#11115)
- Try to handle `OutOfMemoryErrors` more gracefully. Although not much can be done, they will in most cases close the connection they happened on so that further operations don't run into a connection in some unknown state. When an OOM has happened, any further operations on the connection will fail with a “Connection closed” exception that will also list the OOM exception as the reason for the implicit connection close event. (Bug#10850)
- Setting `cachePrepStmts=true` now causes the `Connection` to also cache the check the driver performs to determine if a prepared statement can be server-side or not, as well as caches server-side prepared statements for the lifetime of a connection. As before, the `prepStmtCacheSize` parameter controls the size of these caches. (Bug#10850)
- Don't send `COM_RESET_STMT` for each execution of a server-side prepared statement if it isn't required. (Bug#10850)
- 0-length streams not sent to server when using server-side prepared statements. (Bug#10850)
- Driver detects if you're running MySQL-5.0.7 or later, and does not scan for `LIMIT ?[ , ?]` in statements being prepared, as the server supports those types of queries now. (Bug#10850)
- Reorganized directory layout. Sources now are in `src` folder. Don't pollute parent directory when building, now output goes to `./build`, distribution goes to `./dist`. (Bug#10496)
- Added support/bug hunting feature that generates `.sql` test scripts to `STDERR` when `autoGenerateTestcaseScript` is set to `true`. (Bug#10496)
- `SQLException` is thrown when using property `characterSetResults` with `cp932` or `eucljms`. (Bug#10496)
- The datatype returned for `TINYINT(1)` columns when `tinyIntIsBit=true` (the default) can be switched between `Types.BOOLEAN` and `Types.BIT` using the new configuration property `transformedBitIsBoolean`, which defaults to `false`. If set to `false` (the default), `DatabaseMetaData.getColumns()` and `ResultSetMetaData.getColumnType()` will return `Types.BOOLEAN` for `TINYINT(1)` columns. If `true`, `Types.BOOLEAN` will be returned instead. Regardless of this configuration property, if `tinyIntIsBit` is enabled, columns with the type `TINYINT(1)` will be returned as `java.lang.Boolean` instances from `ResultSet.getObject(...)`, and `ResultSetMetaData.getColumnClassName()` will return `java.lang.Boolean`. (Bug#10485)
- `SQLException` thrown when retrieving `YEAR(2)` with `ResultSet.getString()`. The driver will now always treat `YEAR` types as `java.sql.Dates` and return the correct values for `getString()`. Alternatively, the `yearIsDateType` connection property can be set to `false` and the values will be treated as `SHORTs`. (Bug#10485)

- Driver doesn't support `{?=CALL( . . . )}` for calling stored functions. This involved adding support for function retrieval to `DatabaseMetaData.getProcedures()` and `getProcedureColumns()` as well. (Bug#10310)
- Unsigned `SMALLINT` treated as signed for `ResultSet.getInt()`, fixed all cases for `UNSIGNED` integer values and server-side prepared statements, as well as `ResultSet.getObject()` for `UNSIGNED TINYINT`. (Bug#10156)
- Made `ServerPreparedStatement.asSql()` work correctly so auto-explain functionality would work with server-side prepared statements. (Bug#10155)
- Double quotes not recognized when parsing client-side prepared statements. (Bug#10155)
- Made JDBC2-compliant wrappers public in order to allow access to vendor extensions. (Bug#10155)
- `DatabaseMetaData.supportsMultipleOpenResults()` now returns `true`. The driver has supported this for some time, DBMD just missed that fact. (Bug#10155)
- Cleaned up logging of profiler events, moved code to dump a profiler event as a string to `com.mysql.jdbc.log.LogUtils` so that third parties can use it. (Bug#10155)
- Made `enableStreamingResults()` visible on `com.mysql.jdbc.jdbc2.optional.StatementWrapper`. (Bug#10155)
- Actually write manifest file to correct place so it ends up in the binary jar file. (Bug#10144)
- Added `createDatabaseIfNotExist` property (default is `false`), which will cause the driver to ask the server to create the database specified in the URL if it doesn't exist. You must have the appropriate privileges for database creation for this to work. (Bug#10144)
- Memory leak in `ServerPreparedStatement` if `serverPrepare()` fails. (Bug#10144)
- `com.mysql.jdbc.PreparedStatement.ParseInfo` does unnecessary call to `toCharArray()`. (Bug#9064)
- Driver now correctly uses CP932 if available on the server for Windows-31J, CP932 and MS932 java encoding names, otherwise it resorts to SJIS, which is only a close approximation. Currently only MySQL-5.0.3 and newer (and MySQL-4.1.12 or .13, depending on when the character set gets backported) can reliably support any variant of CP932.
- Overhaul of character set configuration, everything now lives in a properties file.

### C.7.3.8. Changes in MySQL Connector/J 3.1.8 (14 April 2005)

Bugs fixed:

- Should accept `null` for catalog (meaning use current) in DBMD methods, even though it is not JDBC-compliant for legacy's sake. Disable by setting connection property `nullCatalogMeansCurrent` to `false` (which will be the default value in C/J 3.2.x). (Bug#9917)
- Fixed driver not returning `true` for `-1` when `ResultSet.getBoolean()` was called on result sets returned from server-side prepared statements. (Bug#9778)
- Added a `Manifest.MF` file with implementation information to the `.jar` file. (Bug#9778)
- More tests in `Field.isOpaqueBinary()` to distinguish opaque binary (that is, fields with type `CHAR(n)` and `CHARACTER SET BINARY`) from output of various scalar and aggregate functions that return strings. (Bug#9778)
- `DBMD.getTables()` shouldn't return tables if views are asked for, even if the database version doesn't support views. (Bug#9778)
- Should accept `null` for name patterns in DBMD (meaning “%”), even though it isn't JDBC compliant, for legacy's sake. Disable by setting connection property `nullNamePatternMatchesAll` to `false` (which will be the default value in C/J 3.2.x). (Bug#9769)
- The performance metrics feature now gathers information about number of tables referenced in a `SELECT`. (Bug#9704)
- The logging system is now automatically configured. If the value has been set by the user, via the URL property `logger` or the system property `com.mysql.jdbc.logger`, then use that, otherwise, autodetect it using the following steps:
  1. Log4j, if it is available,
  2. Then JDK1.4 logging,

3. Then fallback to our `STDERR` logging.

([Bug#9704](#))

- `Statement.getMoreResults()` could throw NPE when existing result set was `.close()`d. ([Bug#9704](#))
- Stored procedures with `DECIMAL` parameters with storage specifications that contained “,” in them would fail. ([Bug#9682](#))
- `PreparedStatement.setObject(int, Object, int type, int scale)` now uses scale value for `BigDecimal` instances. ([Bug#9682](#))
- Added support for the c3p0 connection pool's (<http://c3p0.sf.net/>) validation/connection checker interface which uses the light-weight `COM_PING` call to the server if available. To use it, configure your c3p0 connection pool's `connectionTesterClassName` property to use `com.mysql.jdbc.integration.c3p0.MySqlConnectionTester`. ([Bug#9320](#))
- `PreparedStatement.getMetaData()` inserts blank row in database under certain conditions when not using server-side prepared statements. ([Bug#9320](#))
- Better detection of `LIMIT` inside/outside of quoted strings so that the driver can more correctly determine whether a prepared statement can be prepared on the server or not. ([Bug#9320](#))
- `Connection.canHandleAsPreparedStatement()` now makes “best effort” to distinguish `LIMIT` clauses with placeholders in them from ones without in order to have fewer false positives when generating work-arounds for statements the server cannot currently handle as server-side prepared statements. ([Bug#9320](#))
- Fixed `build.xml` to not compile `log4j` logging if `log4j` not available. ([Bug#9320](#))
- Added finalizers to `ResultSet` and `Statement` implementations to be JDBC spec-compliant, which requires that if not explicitly closed, these resources should be closed upon garbage collection. ([Bug#9319](#))
- Stored procedures with same name in different databases confuse the driver when it tries to determine parameter counts/types. ([Bug#9319](#))
- A continuation of [Bug#8868](#), where functions used in queries that should return non-string types when resolved by temporary tables suddenly become opaque binary strings (work-around for server limitation). Also fixed fields with type of `CHAR(n) CHARACTER SET BINARY` to return correct/matching classes for `RSMD.getColumnClassName()` and `ResultSet.getObject()`. ([Bug#9236](#))
- Cannot use `UTF-8` for `characterSetResults` configuration property. ([Bug#9206](#))
- `PreparedStatement.addBatch()` doesn't work with server-side prepared statements and streaming `BINARY` data. ([Bug#9040](#))
- `ServerPreparedStatements` now correctly “stream” `BLOB/CLOB` data to the server. You can configure the threshold chunk size using the JDBC URL property `blobSendChunkSize` (the default is 1MB). ([Bug#8868](#))
- `DATE_FORMAT()` queries returned as `BLOBs` from `getObject()`. ([Bug#8868](#))
- Server-side session variables can be preset at connection time by passing them as a comma-delimited list for the connection property `sessionVariables`. ([Bug#8868](#))
- `BlobFromLocator` now uses correct identifier quoting when generating prepared statements. ([Bug#8868](#))
- Fixed regression in `ping()` for users using `autoReconnect=true`. ([Bug#8868](#))
- Check for empty strings (‘ ’) when converting `CHAR/VARCHAR` column data to numbers, throw exception if `emptyStringsConvertToZero` configuration property is set to `false` (for backward-compatibility with 3.0, it is now set to `true` by default, but will most likely default to `false` in 3.2). ([Bug#8803](#))
- `DATA_TYPE` column from `DBMD.getBestRowIdentifier()` causes `ArrayIndexOutOfBoundsException` when accessed (and in fact, didn't return any value). ([Bug#8803](#))
- `DBMD.supportsMixedCase*Identifiers()` returns wrong value on servers running on case-sensitive file systems. ([Bug#8800](#))
- `DBMD.supportsResultSetConcurrency()` not returning `true` for forward-only/read-only result sets (we obviously support this). ([Bug#8792](#))
- Fixed `ResultSet.getTime()` on a `NULL` value for server-side prepared statements throws NPE.

- Made `Connection.ping()` a public method.
- Added support for new precision-math `DECIMAL` type in MySQL 5.0.3 and up.
- Fixed `DatabaseMetaData.getTables()` returning views when they were not asked for as one of the requested table types.

### C.7.3.9. Changes in MySQL Connector/J 3.1.7 (18 February 2005)

Bugs fixed:

- `PreparedStatement` not creating streaming result sets. (Bug#8487)
- Don't pass `NULL` to `String.valueOf()` in `ResultSet.getNativeConvertToString()`, as it stringifies it (that is, returns `null`), which is not correct for the method in question. (Bug#8487)
- Fixed NPE in `ResultSet.realClose()` when using usage advisor and result set was already closed. (Bug#8428)
- `ResultSet.getString()` doesn't maintain format stored on server, bug fix only enabled when `noDatetimeStringSync` property is set to `true` (the default is `false`). (Bug#8428)
- Added support for `BIT` type in MySQL-5.0.3. The driver will treat `BIT(1-8)` as the JDBC standard `BIT` type (which maps to `java.lang.Boolean`), as the server does not currently send enough information to determine the size of a bitfield when < 9 bits are declared. `BIT(>9)` will be treated as `VARBINARY`, and will return `byte[]` when `getObject()` is called. (Bug#8424)
- Added `useLocalSessionState` configuration property, when set to `true` the JDBC driver trusts that the application is well-behaved and only sets autocommit and transaction isolation levels using the methods provided on `java.sql.Connection`, and therefore can manipulate these values in many cases without incurring round-trips to the database server. (Bug#8424)
- Added `enableStreamingResults()` to `Statement` for connection pool implementations that check `Statement.setFetchSize()` for specification-compliant values. Call `Statement.setFetchSize(>=0)` to disable the streaming results for that statement. (Bug#8424)
- `ResultSet.getBigDecimal()` throws exception when rounding would need to occur to set scale. The driver now chooses a rounding mode of “half up” if non-rounding `BigDecimal.setScale()` fails. (Bug#8424)
- Fixed synchronization issue with `ServerPreparedStatement.serverPrepare()` that could cause deadlocks/crashes if connection was shared between threads. (Bug#8096)
- Emulated locators corrupt binary data when using server-side prepared statements. (Bug#8096)
- Infinite recursion when “falling back” to master in failover configuration. (Bug#7952)
- Disable multi-statements (if enabled) for MySQL-4.1 versions prior to version 4.1.10 if the query cache is enabled, as the server returns wrong results in this configuration. (Bug#7952)
- Removed `dontUnpackBinaryResults` functionality, the driver now always stores results from server-side prepared statements as is from the server and unpacks them on demand. (Bug#7952)
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly. (Bug#7952)
- Added `holdResultsOpenOverStatementClose` property (default is `false`), that keeps result sets open over `statement.close()` or new execution on same statement (suggested by Kevin Burton). (Bug#7715)
- Detect new `sql_mode` variable in string form (it used to be integer) and adjust quoting method for strings appropriately. (Bug#7715)
- Timestamps converted incorrectly to strings with server-side prepared statements and updatable result sets. (Bug#7715)
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. (Bug#7686)
- Choose correct “direction” to apply time adjustments when both client and server are in GMT time zone when using `ResultSet.get(..., cal)` and `PreparedStatement.set(..., cal)`. (Bug#4718)
- Remove `_binary` introducer from parameters used as in/out parameters in `CallableStatement`. (Bug#4718)

- Always return `byte[]`s for output parameters registered as `*BINARY`. (Bug#4718)
- By default, the driver now scans SQL you are preparing via all variants of `Connection.prepareStatement()` to determine if it is a supported type of statement to prepare on the server side, and if it is not supported by the server, it instead prepares it as a client-side emulated prepared statement. You can disable this by passing `emulateUnsupportedPstmts=false` in your JDBC URL. (Bug#4718)
- Added `dontTrackOpenResources` option (default is `false`, to be JDBC compliant), which helps with memory use for non-well-behaved apps (that is, applications that don't close `Statement` objects when they should). (Bug#4718)
- Send correct value for “boolean” `true` to server for `PreparedStatement.setObject(n, "true", Types.BIT)`. (Bug#4718)
- Fixed bug with `Connection` not caching statements from `prepareStatement()` when the statement wasn't a server-side prepared statement. (Bug#4718)

### C.7.3.10. Changes in MySQL Connector/J 3.1.6 (23 December 2004)

Bugs fixed:

- `DBMD.getProcedures()` doesn't respect catalog parameter. (Bug#7026)
- Fixed hang on `SocketInputStream.read()` with `Statement.setMaxRows()` and multiple result sets when driver has to truncate result set directly, rather than tacking a `LIMIT n` on the end of it.

### C.7.3.11. Changes in MySQL Connector/J 3.1.5 (02 December 2004)

Bugs fixed:

- Use 1MB packet for sending file for `LOAD DATA LOCAL INFILE` if that is `< max_allowed_packet` on server. (Bug#6537)
- `SUM()` on `DECIMAL` with server-side prepared statement ignores scale if zero-padding is needed (this ends up being due to conversion to `DOUBLE` by server, which when converted to a string to parse into `BigDecimal`, loses all “padding” zeros). (Bug#6537)
- Use `DatabaseMetaData.getIdentifierQuoteString()` when building DBMD queries. (Bug#6537)
- Use our own implementation of buffered input streams to get around blocking behavior of `java.io.BufferedInputStream`. Disable this with `useReadAheadInput=false`. (Bug#6399)
- Make auto-deserialization of `java.lang.Objects` stored in `BLOB` columns configurable via `autoDeserialize` property (defaults to `false`). (Bug#6399)
- `ResultSetMetaData.getColumnDisplaySize()` returns incorrect values for multi-byte charsets. (Bug#6399)
- Re-work `Field.isOpaqueBinary()` to detect `CHAR(n) CHARACTER SET BINARY` to support fixed-length binary fields for `ResultSet.getObject()`. (Bug#6399)
- Failing to connect to the server when one of the addresses for the given host name is IPV6 (which the server does not yet bind on). The driver now loops through *all* IP addresses for a given host, and stops on the first one that `accepts()` a `socket.connect()`. (Bug#6348)
- Removed unwanted new `Throwable()` in `ResultSet` constructor due to bad merge (caused a new object instance that was never used for every result set created). Found while profiling for Bug#6359. (Bug#6225)
- `ServerSidePreparedStatement` allocating short-lived objects unnecessarily. (Bug#6225)
- Use null-safe-equals for key comparisons in updatable result sets. (Bug#6225)
- Fixed too-early creation of `StringBuffer` in `EscapeProcessor.escapeSQL()`, also return `String` when escaping not needed (to avoid unnecessary object allocations). Found while profiling for Bug#6359. (Bug#6225)
- `UNSIGNED BIGINT` unpacked incorrectly from server-side prepared statement result sets. (Bug#5729)
- Added experimental configuration property `dontUnpackBinaryResults`, which delays unpacking binary result set values until they're asked for, and only creates object instances for non-numerical values (it is set to `false` by default). For some

usecase/jvm combinations, this is friendlier on the garbage collector. (Bug#5706)

- Don't throw exceptions for `Connection.releaseSavepoint()`. (Bug#5706)
- Inefficient detection of pre-existing string instances in `ResultSet.getNativeString()`. (Bug#5706)
- Use a per-session `Calendar` instance by default when decoding dates from `ServerPreparedStatements` (set to old, less performant behavior by setting property `dynamicCalendars=true`). (Bug#5706)
- Fixed batched updates with server prepared statements weren't looking if the types had changed for a given batched set of parameters compared to the previous set, causing the server to return the error "Wrong arguments to mysql\_stmt\_execute()". (Bug#5235)
- Handle case when string representation of timestamp contains trailing "." with no numbers following it. (Bug#5235)
- Server-side prepared statements did not honor `zeroDateTimeBehavior` property, and would cause class-cast exceptions when using `ResultSet.getObject()`, as the all-zero string was always returned. (Bug#5235)
- Fix comparisons made between string constants and dynamic strings that are converted with either `toUpperCase()` or `toLowerCase()` to use `Locale.ENGLISH`, as some locales "override" case rules for English. Also use `StringUtils.indexOfIgnoreCase()` instead of `toUpperCase().indexOf()`, avoids creating a very short-lived transient `String` instance.

### C.7.3.12. Changes in MySQL Connector/J 3.1.4 (04 September 2004)

Bugs fixed:

- Fixed `ServerPreparedStatement` to read prepared statement metadata off the wire, even though it is currently a placeholder instead of using `MysqlIO.clearInputStream()` which didn't work at various times because data wasn't available to read from the server yet. This fixes sporadic errors users were having with `ServerPreparedStatements` throwing `ArrayIndexOutOfBoundsExceptions`. (Bug#5032)
- Added three ways to deal with all-zero datetimes when reading them from a `ResultSet`: `exception` (the default), which throws an `SQLException` with an `SQLState` of `S1009`; `convertToNull`, which returns `NULL` instead of the date; and `round`, which rounds the date to the nearest closest value which is `'0001-01-01'`. (Bug#5032)
- The driver is more strict about truncation of numerics on `ResultSet.get*()`, and will throw an `SQLException` when truncation is detected. You can disable this by setting `jdbcCompliantTruncation` to `false` (it is enabled by default, as this functionality is required for JDBC compliance). (Bug#5032)
- You can now use URLs in `LOAD DATA LOCAL INFILE` statements, and the driver will use Java's built-in handlers for retrieving the data and sending it to the server. This feature is not enabled by default, you must set the `allowUrlInLocalInfile` connection property to `true`. (Bug#5032)
- `ResultSet.getObject()` doesn't return type `Boolean` for pseudo-bit types from prepared statements on 4.1.x (shortcut for avoiding extra type conversion when using binary-encoded result sets obscured test in `getObject()` for "pseudo" bit type). (Bug#5032)
- Use `com.mysql.jdbc.Message`'s classloader when loading resource bundle, should fix sporadic issues when the caller's classloader can't locate the resource bundle. (Bug#5032)
- `ServerPreparedStatements` dealing with return of `DECIMAL` type don't work. (Bug#5012)
- Track packet sequence numbers if `enablePacketDebug=true`, and throw an exception if packets received out-of-order. (Bug#4689)
- `ResultSet.isNull()` does not work for primitives if a previous `null` was returned. (Bug#4689)
- Optimized integer number parsing, enable "old" slower integer parsing using JDK classes via `useFastIntParsing=false` property. (Bug#4642)
- Added `useOnlyServerErrorMessages` property, which causes message text in exceptions generated by the server to only contain the text sent by the server (as opposed to the `SQLState`'s "standard" description, followed by the server's error message). This property is set to `true` by default. (Bug#4642)
- `ServerPreparedStatement.execute*()` sometimes threw `ArrayIndexOutOfBoundsException` when unpacking field metadata. (Bug#4642)
- Connector/J 3.1.3 beta does not handle integers correctly (caused by changes to support unsigned reads in `Buf-`

`fer.readInt() -> Buffer.readShort()`. (Bug#4510)

- Added support in `DatabaseMetaData.getTables()` and `getTableTypes()` for views, which are now available in MySQL server 5.0.x. (Bug#4510)
- `ResultSet.getObject()` returns wrong type for strings when using prepared statements. (Bug#4482)
- Calling `MysqlPooledConnection.close()` twice (even though an application error), caused NPE. Fixed. (Bug#4482)

### C.7.3.13. Changes in MySQL Connector/J 3.1.3 (07 July 2004)

Bugs fixed:

- Support new time zone variables in MySQL-4.1.3 when `useTimezone=true`. (Bug#4311)
- Error in retrieval of `mediumint` column with prepared statements and binary protocol. (Bug#4311)
- Support for unsigned numerics as return types from prepared statements. This also causes a change in `ResultSet.getObject()` for the `bigint unsigned` type, which used to return `BigDecimal` instances, it now returns instances of `java.lang.BigInteger`. (Bug#4311)
- Externalized more messages (on-going effort). (Bug#4119)
- Null bitmask sent for server-side prepared statements was incorrect. (Bug#4119)
- Added constants for MySQL error numbers (publicly accessible, see `com.mysql.jdbc.MysqlErrorNumbers`), and the ability to generate the mappings of vendor error codes to SQLStates that the driver uses (for documentation purposes). (Bug#4119)
- Added packet debugging code (see the `enablePacketDebug` property documentation). (Bug#4119)
- Use SQL Standard SQL states by default, unless `useSqlStateCodes` property is set to `false`. (Bug#4119)
- Mangle output parameter names for `CallableStatements` so they will not clash with user variable names.
- Added support for `INOUT` parameters in `CallableStatements`.

### C.7.3.14. Changes in MySQL Connector/J 3.1.2 (09 June 2004)

Bugs fixed:

- Don't enable server-side prepared statements for server version 5.0.0 or 5.0.1, as they aren't compatible with the '4.1.2+' style that the driver uses (the driver expects information to come back that isn't there, so it hangs). (Bug#3804)
- `getWarnings()` returns `SQLWarning` instead of `DataTruncation`. (Bug#3804)
- `getProcedureColumns()` doesn't work with wildcards for procedure name. (Bug#3540)
- `getProcedures()` does not return any procedures in result set. (Bug#3539)
- Fixed `DatabaseMetaData.getProcedures()` when run on MySQL-5.0.0 (output of `SHOW PROCEDURE STATUS` changed between 5.0.0 and 5.0.1). (Bug#3520)
- Added `connectionCollation` property to cause driver to issue `set collation_connection=...` query on connection init if default collation for given charset is not appropriate. (Bug#3520)
- `DBMD.getSQLStateType()` returns incorrect value. (Bug#3520)
- Correctly map output parameters to position given in `prepareCall()` versus. order implied during `registerOutParameter()`. (Bug#3146)
- Cleaned up detection of server properties. (Bug#3146)
- Correctly detect initial character set for servers  $\geq$  4.1.0. (Bug#3146)
- Support placeholder for parameter metadata for server  $\geq$  4.1.2. (Bug#3146)

- Added `gatherPerformanceMetrics` property, along with properties to control when/where this info gets logged (see docs for more info).
- Fixed case when no parameters could cause a `NullPointerException` in `CallableStatement.setOutputParameters()`.
- Enabled callable statement caching via `cacheCallableStmts` property.
- Fixed sending of split packets for large queries, enabled nio ability to send large packets as well.
- Added `.toString()` functionality to `ServerPreparedStatement`, which should help if you're trying to debug a query that is a prepared statement (it shows SQL as the server would process).
- Added `logSlowQueries` property, along with `slowQueriesThresholdMillis` property to control when a query should be considered "slow."
- Removed wrapping of exceptions in `MysqlIO.changeUser()`.
- Fixed stored procedure parameter parsing info when size was specified for a parameter (for example, `char()`, `varchar()`).
- `ServerPreparedStatements` weren't actually de-allocating server-side resources when `.close()` was called.
- Fixed case when no output parameters specified for a stored procedure caused a bogus query to be issued to retrieve out parameters, leading to a syntax error from the server.

### C.7.3.15. Changes in MySQL Connector/J 3.1.1 (14 February 2004 alpha)

Bugs fixed:

- Use DocBook version of docs for shipped versions of drivers. (Bug#2671)
- `NULL` fields were not being encoded correctly in all cases in server-side prepared statements. (Bug#2671)
- Fixed rare buffer underflow when writing numbers into buffers for sending prepared statement execution requests. (Bug#2671)
- Fixed `ConnectionProperties` that weren't properly exposed via accessors, cleaned up `ConnectionProperties` code. (Bug#2623)
- Class-cast exception when using scrolling result sets and server-side prepared statements. (Bug#2623)
- Merged unbuffered input code from 3.0. (Bug#2623)
- Enabled streaming of result sets from server-side prepared statements. (Bug#2606)
- Server-side prepared statements were not returning datatype `YEAR` correctly. (Bug#2606)
- Fixed charset conversion issue in `getTables()`. (Bug#2502)
- Implemented multiple result sets returned from a statement or stored procedure. (Bug#2502)
- Implemented `Connection.prepareCall()`, and `DatabaseMetaData.getProcedures()` and `getProcedureColumns()`. (Bug#2359)
- Merged prepared statement caching, and `.getMetaData()` support from 3.0 branch. (Bug#2359)
- Fixed off-by-1900 error in some cases for years in `TimeUtil.fastDate/TimeCreate()` when unpacking results from server-side prepared statements. (Bug#2359)
- Reset `long binary` parameters in `ServerPreparedStatement` when `clearParameters()` is called, by sending `COM_RESET_STMT` to the server. (Bug#2359)
- `NULL` values for numeric types in binary encoded result sets causing `NullPointerExceptions`. (Bug#2359)
- Display where/why a connection was implicitly closed (to aid debugging). (Bug#1673)
- `DatabaseMetaData.getColumns()` is not returning correct column ordinal info for non-'%' column name patterns. (Bug#1673)
- Fixed `NullPointerException` in `ServerPreparedStatement.setTimestamp()`, as well as year and month

- discrepancies in `ServerPreparedStatement.setTimestamp()`, `setDate()`. (Bug#1673)
- Added ability to have multiple database/JVM targets for compliance and regression/unit tests in `build.xml`. (Bug#1673)
  - Fixed sending of queries larger than 16M. (Bug#1673)
  - Merged fix of datatype mapping from MySQL type `FLOAT` to `java.sql.Types.REAL` from 3.0 branch. (Bug#1673)
  - Fixed NPE and year/month bad conversions when accessing some datetime functionality in `ServerPreparedStatements` and their resultant result sets. (Bug#1673)
  - Added named and indexed input/output parameter support to `CallableStatement`. MySQL-5.0.x or newer. (Bug#1673)
  - `CommunicationsException` implemented, that tries to determine why communications was lost with a server, and displays possible reasons when `.getMessage()` is called. (Bug#1673)
  - Detect collation of column for `RSMD.isCaseSensitive()`. (Bug#1673)
  - Optimized `Buffer.readLenByteArray()` to return shared empty byte array when length is 0.
  - Fix support for table aliases when checking for all primary keys in `UpdatableResultSet`.
  - Unpack “unknown” data types from server prepared statements as `Strings`.
  - Implemented `Statement.getWarnings()` for MySQL-4.1 and newer (using `SHOW WARNINGS`).
  - Ensure that warnings are cleared before executing queries on prepared statements, as-per JDBC spec (now that we support warnings).
  - Correctly initialize datasource properties from JNDI Refs, including explicitly specified URLs.
  - Implemented long data (Blobs, Clobs, InputStreams, Readers) for server prepared statements.
  - Deal with 0-length tokens in `EscapeProcessor` (caused by callable statement escape syntax).
  - `DatabaseMetaData` now reports `supportsStoredProcedures()` for MySQL versions  $\geq 5.0.0$
  - Support for `mysql_change_user()`. See the `changeUser()` method in `com.mysql.jdbc.Connection`.
  - Removed `useFastDates` connection property.
  - Support for NIO. Use `useNIO=true` on platforms that support NIO.
  - Check for closed connection on delete/update/insert row operations in `UpdatableResultSet`.
  - Support for transaction savepoints (MySQL  $\geq 4.0.14$  or 4.1.1).
  - Support “old” `profileSql` capitalization in `ConnectionProperties`. This property is deprecated, you should use `profileSQL` if possible.
  - Fixed character encoding issues when converting bytes to ASCII when MySQL doesn't provide the character set, and the JVM is set to a multi-byte encoding (usually affecting retrieval of numeric values).
  - Centralized setting of result set type and concurrency.
  - Fixed bug with `UpdatableResultSets` not using client-side prepared statements.
  - Default result set type changed to `TYPE_FORWARD_ONLY` (JDBC compliance).
  - Fixed `IllegalAccessError` to `Calendar.getTimeInMillis()` in `DateTimeValue` (for JDK  $< 1.4$ ).
  - Allow contents of `PreparedStatement.setBlob()` to be retained between calls to `.execute*()`.
  - Fixed stack overflow in `Connection.prepareCall()` (bad merge).
  - Refactored how connection properties are set and exposed as `DriverPropertyInfo` as well as `Connection` and `DataSource` properties.
  - Reduced number of methods called in average query to be more efficient.
  - Prepared `Statements` will be re-prepared on auto-reconnect. Any errors encountered are postponed until first attempt to re-execute the re-prepared statement.

### C.7.3.16. Changes in MySQL Connector/J 3.1.0 (18 February 2003 alpha)

Bugs fixed:

- Added `useServerPrepStmts` property (default `false`). The driver will use server-side prepared statements when the server version supports them (4.1 and newer) when this property is set to `true`. It is currently set to `false` by default until all bind/fetch functionality has been implemented. Currently only DML prepared statements are implemented for 4.1 server-side prepared statements.
- Added `requireSSL` property.
- Track open `Statements`, close all when `Connection.close()` is called (JDBC compliance).

## C.7.4. Changes in MySQL Connector/J 3.0.x

### C.7.4.1. Changes in MySQL Connector/J 3.0.17 (23 June 2005)

Bugs fixed:

- Workaround for server [Bug#9098](#): Default values of `CURRENT_*` for `DATE`, `TIME`, `DATETIME`, and `TIMESTAMP` columns can't be distinguished from `string` values, so `UpdatableResultSet.moveToInsertRow()` generates bad SQL for inserting default values. ([Bug#8812](#))
- `NON_UNIQUE` column from `DBMD.getIndexInfo()` returned inverted value. ([Bug#8812](#))
- `EUCKR` charset is sent as `SET NAMES euc_kr` which MySQL-4.1 and newer doesn't understand. ([Bug#8629](#))
- Added support for the `EUC_JP_Solaris` character encoding, which maps to a MySQL encoding of `euc_jpms` (backported from 3.1 branch). This only works on servers that support `euc_jpms`, namely 5.0.3 or later. ([Bug#8629](#))
- Use hex escapes for `PreparedStatement.setBytes()` for double-byte charsets including "aliases" `Windows-31J`, `CP934`, `MS932`. ([Bug#8629](#))
- `DatabaseMetaData.supportsSelectForUpdate()` returns correct value based on server version. ([Bug#8629](#))
- Which requires hex escaping of binary data when using multi-byte charsets with prepared statements. ([Bug#8064](#))
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly. ([Bug#7952](#))
- Backported SQLState codes mapping from Connector/J 3.1, enable with `useSqlStateCodes=true` as a connection property, it defaults to `false` in this release, so that we don't break legacy applications (it defaults to `true` starting with Connector/J 3.1). ([Bug#7686](#))
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. ([Bug#7686](#))
- `MS932`, `SHIFT_JIS`, and `Windows_31J` not recognized as aliases for `sjis`. ([Bug#7607](#))
- Handle streaming result sets with more than 2 billion rows properly by fixing wraparound of row number counter. ([Bug#7601](#))
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. ([Bug#7601](#))
- Escape sequence `{fn convert(..., type)}` now supports ODBC-style types that are prepended by `SQL_`. ([Bug#7601](#))
- Statements created from a pooled connection were returning physical connection instead of logical connection when `getConnection()` was called. ([Bug#7316](#))
- Support new protocol type `MYSQL_TYPE_VARCHAR`. ([Bug#7081](#))
- Added `useOldUTF8Behavior` configuration property, which causes JDBC driver to act like it did with MySQL-4.0.x and earlier when the character encoding is `utf-8` when connected to MySQL-4.1 or newer. ([Bug#7081](#))
- `DatabaseMetaData.getIndexInfo()` ignored `unique` parameter. ([Bug#7081](#))
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. ([Bug#7061](#))

- `PreparedStatement` don't encode Big5 (and other multi-byte) character sets correctly in static SQL strings. ([Bug#7033](#))
- Connections starting up failed-over (due to down master) never retry master. ([Bug#6966](#))
- Adding CP943 to aliases for `sjis`. ([Bug#6549](#), [Bug#7607](#))
- `Timestamp/Time` conversion goes in the wrong “direction” when `useTimeZone=true` and server time zone differs from client time zone. ([Bug#5874](#))

### C.7.4.2. Changes in MySQL Connector/J 3.0.16 (15 November 2004)

Bugs fixed:

- Made `TINYINT(1) -> BIT/Boolean` conversion configurable via `tinyIntIsBit` property (default `true` to be JDBC compliant out of the box). ([Bug#5664](#))
- Off-by-one bug in `Buffer.readString(string)`. ([Bug#5664](#))
- `ResultSet.updateByte()` when on insert row throws `ArrayOutOfBoundsException`. ([Bug#5664](#))
- Fixed regression where `useUnbufferedInput` was defaulting to `false`. ([Bug#5664](#))
- `ResultSet.getTimestamp()` on a column with `TIME` in it fails. ([Bug#5664](#))
- Fixed `DatabaseMetaData.getTypes()` returning incorrect (this is, non-negative) scale for the `NUMERIC` type. ([Bug#5664](#))
- Only set `character_set_results` during connection establishment if server version  $\geq$  4.1.1. ([Bug#5664](#))
- Fixed `ResultSetMetaData.isReadOnly()` to detect non-writable columns when connected to MySQL-4.1 or newer, based on existence of “original” table and column names.
- Re-issue character set configuration commands when re-using pooled connections and/or `Connection.changeUser()` when connected to MySQL-4.1 or newer.

### C.7.4.3. Changes in MySQL Connector/J 3.0.15 (04 September 2004)

Bugs fixed:

- `ResultSet.getMetaData()` should not return incorrectly initialized metadata if the result set has been closed, but should instead throw an `SQLException`. Also fixed for `getRow()` and `getWarnings()` and traversal methods by calling `checkClosed()` before operating on instance-level fields that are nullified during `.close()`. ([Bug#5069](#))
- Use `_binary` introducer for `PreparedStatement.setBytes()` and `set*Stream()` when connected to MySQL-4.1.x or newer to avoid misinterpretation during character conversion. ([Bug#5069](#))
- Parse new time zone variables from 4.1.x servers. ([Bug#5069](#))
- `ResultSet` should release `Field[]` instance in `.close()`. ([Bug#5022](#))
- `RSMD.getPrecision()` returning 0 for non-numeric types (should return max length in chars for nonbinary types, max length in bytes for binary types). This fix also fixes mapping of `RSMD.getColumnType()` and `RSMD.getColumnTypeName()` for the `BLOB` types based on the length sent from the server (the server doesn't distinguish between `TINYBLOB`, `BLOB`, `MEDIUMBLOB` or `LOB` at the network protocol level). ([Bug#4880](#))
- “Production” is now “GA” (General Availability) in naming scheme of distributions. ([Bug#4860](#), [Bug#4138](#))
- `DBMD.getColumns()` returns incorrect JDBC type for unsigned columns. This affects type mappings for all numeric types in the `RSMD.getColumnType()` and `RSMD.getColumnTypeNames()` methods as well, to ensure that “like” types from `DBMD.getColumns()` match up with what `RSMD.getColumnType()` and `getColumnTypeNames()` return. ([Bug#4860](#), [Bug#4138](#))
- Calling `.close()` twice on a `PooledConnection` causes NPE. ([Bug#4808](#))
- `DOUBLE` mapped twice in `DBMD.getTypeInfo()`. ([Bug#4742](#))
- Added FLOSS license exemption. ([Bug#4742](#))

- Removed redundant calls to `checkRowPos()` in `ResultSet`. (Bug#4334)
- Failover for `autoReconnect` not using port numbers for any hosts, and not retrying all hosts.

**Warning**

This required a change to the `SocketFactory connect()` method signature, which is now `public Socket connect(String host, int portNumber, Properties props)`; therefore, any third-party socket factories will have to be changed to support this signature.

(Bug#4334)

- Logical connections created by `MysqlConnectionPoolDataSource` will now issue a `rollback()` when they are closed and sent back to the pool. If your application server/connection pool already does this for you, you can set the `rollbackOnPooledClose` property to `false` to avoid the overhead of an extra `rollback()`. (Bug#4334)
- `StringUtils.escapeEasternUnicodeByteStream` was still broken for GBK. (Bug#4010)

#### C.7.4.4. Changes in MySQL Connector/J 3.0.14 (28 May 2004)

Bugs fixed:

- Fixed URL parsing error.

#### C.7.4.5. Changes in MySQL Connector/J 3.0.13 (27 May 2004)

Bugs fixed:

- `No Database Selected` when using `MysqlConnectionPoolDataSource`. (Bug#3920)
- `PreparedStatement.getGeneratedKeys()` method returns only 1 result for batched insertions. (Bug#3873)
- Using a `MySQLDataSource` without server name fails. (Bug#3848)

#### C.7.4.6. Changes in MySQL Connector/J 3.0.12 (18 May 2004)

Bugs fixed:

- Inconsistent reporting of data type. The server still doesn't return all types for \*BLOBs \*TEXT correctly, so the driver won't return those correctly. (Bug#3570)
- `UpdatableResultSet` not picking up default values for `moveToInsertRow()`. (Bug#3557)
- Not specifying database in URL caused `MalformedURLException` exception. (Bug#3554)
- Auto-convert MySQL encoding names to Java encoding names if used for `characterEncoding` property. (Bug#3554)
- Use `junit.textui.TestRunner` for all unit tests (to allow them to be run from the command line outside of Ant or Eclipse). (Bug#3554)
- Added encoding names that are recognized on some JVMs to fix case where they were reverse-mapped to MySQL encoding names incorrectly. (Bug#3554)
- Made `StringRegressionTest` 4.1-unicode aware. (Bug#3520)
- Fixed regression in `PreparedStatement.setString()` and eastern character encodings. (Bug#3520)
- `DBMD.getSQLStateType()` returns incorrect value. (Bug#3520)
- Renamed `StringUtils.escapeSJISByteStream()` to more appropriate `escapeEasternUnicodeByteStream()`. (Bug#3511)
- `StringUtils.escapeSJISByteStream()` not covering all eastern double-byte charsets correctly. (Bug#3511)
- Return creating statement for `ResultSets` created by `getGeneratedKeys()`. (Bug#2957)

- Use `SET character_set_results` during initialization to allow any charset to be returned to the driver for result sets. (Bug#2670)
- Don't truncate `BLOB` or `CLOB` values when using `getBytes()` and/or `setBinary/CharacterStream()`. (Bug#2670)
- Dynamically configure character set mappings for field-level character sets on MySQL-4.1.0 and newer using `SHOW COLLATION` when connecting. (Bug#2670)
- Map `binary` character set to `US-ASCII` to support `DATETIME` charset recognition for servers  $\geq 4.1.2$ . (Bug#2670)
- Use `charsetnr` returned during connect to encode queries before issuing `SET NAMES` on MySQL  $\geq 4.1.0$ . (Bug#2670)
- Add helper methods to `ResultSetMetaData` (`getColumnCharacterEncoding()` and `getColumnCharacterSet()`) to allow end-users to see what charset the driver thinks it should be using for the column. (Bug#2670)
- Only set `character_set_results` for MySQL  $\geq 4.1.0$ . (Bug#2670)
- Allow `url` parameter for `MysqlDataSource` and `MysqlConnectionPool DataSource` so that passing of other properties is possible from inside appservers.
- Don't escape SJIS/GBK/BIG5 when using MySQL-4.1 or newer.
- Backport documentation tooling from 3.1 branch.
- Added `failOverReadOnly` property, to allow end-user to configure state of connection (read-only/writable) when failed over.
- Allow `java.util.Date` to be sent in as parameter to `PreparedStatement.setObject()`, converting it to a `Timestamp` to maintain full precision. (Bug#103)
- Add unsigned attribute to `DatabaseMetaData.getColumns()` output in the `TYPE_NAME` column.
- Map duplicate key and foreign key errors to `SQLState` of `23000`.
- Backported “change user” and “reset server state” functionality from 3.1 branch, to allow clients of `MysqlConnectionPoolDataSource` to reset server state on `getConnection()` on a pooled connection.

#### C.7.4.7. Changes in MySQL Connector/J 3.0.11 (19 February 2004)

Bugs fixed:

- Return `java.lang.Double` for `FLOAT` type from `ResultSetMetaData.getColumnClassName()`. (Bug#2855)
- Return `[B` instead of `java.lang.Object` for `BINARY`, `VARBINARY` and `LONGVARBINARY` types from `ResultSetMetaData.getColumnClassName()` (JDBC compliance). (Bug#2855)
- Issue connection events on all instances created from a `ConnectionPoolDataSource`. (Bug#2855)
- Return `java.lang.Integer` for `TINYINT` and `SMALLINT` types from `ResultSetMetaData.getColumnClassName()`. (Bug#2852)
- Added `useUnbufferedInput` parameter, and now use it by default (due to JVM issue <http://developer.java.sun.com/developer/bugParade/bugs/4401235.html>) (Bug#2578)
- Fixed failover always going to last host in list. (Bug#2578)
- Detect `on/off` or `1, 2, 3` form of `lower_case_table_names` value on server. (Bug#2578)
- `AutoReconnect` time was growing faster than exponentially. (Bug#2447)
- Trigger a `SET NAMES utf8` when encoding is forced to `utf8` or `utf-8` via the `characterEncoding` property. Previously, only the Java-style encoding name of `utf-8` would trigger this.

#### C.7.4.8. Changes in MySQL Connector/J 3.0.10 (13 January 2004)

Bugs fixed:

- Enable caching of the parsing stage of prepared statements via the `cachePrepStmts`, `prepStmtCacheSize`, and `prepStmtCacheSqlLimit` properties (disabled by default). (Bug#2006)
- Fixed security exception when used in Applets (applets can't read the system property `file.encoding` which is needed for `LOAD DATA LOCAL INFILE`). (Bug#2006)
- Speed up parsing of `PreparedStatements`, try to use one-pass whenever possible. (Bug#2006)
- Fixed exception `Unknown character set 'danish'` on connect with JDK-1.4.0 (Bug#2006)
- Fixed mappings in `SQLException` to report deadlocks with `SQLStates` of `41000`. (Bug#2006)
- Removed static synchronization bottleneck from instance factory method of `SingleByteCharsetConverter`. (Bug#2006)
- Removed static synchronization bottleneck from `PreparedStatement.setTimestamp()`. (Bug#2006)
- `ResultSet.findColumn()` should use first matching column name when there are duplicate column names in `SELECT` query (JDBC-compliance). (Bug#2006)
- `maxRows` property would affect internal statements, so check it for all statement creation internal to the driver, and set to 0 when it is not. (Bug#2006)
- Use constants for `SQLStates`. (Bug#2006)
- Map charset `ko18_ru` to `ko18r` when connected to MySQL-4.1.0 or newer. (Bug#2006)
- Ensure that `Buffer.writeString()` saves room for the `\0`. (Bug#2006)
- `ArrayIndexOutOfBoundsException` when parameter number == number of parameters + 1. (Bug#1958)
- Connection property `maxRows` not honored. (Bug#1933)
- Statements being created too many times in `DBMD.extractForeignKeyFromCreateTable()`. (Bug#1925)
- Support escape sequence `{fn convert ... }`. (Bug#1914)
- Implement `ResultSet.updateClob()`. (Bug#1913)
- Autoreconnect code didn't set catalog upon reconnect if it had been changed. (Bug#1913)
- `ResultSet.getObject()` on `TINYINT` and `SMALLINT` columns should return Java type `Integer`. (Bug#1913)
- Added more descriptive error message `Server Configuration Denies Access to DataSource`, as well as retrieval of message from server. (Bug#1913)
- `ResultSetMetaData.isCaseSensitive()` returned wrong value for `CHAR/VARCHAR` columns. (Bug#1913)
- Added `alwaysClearStream` connection property, which causes the driver to always empty any remaining data on the input stream before each query. (Bug#1913)
- `DatabaseMetaData.getSystemFunction()` returning bad function `VResultsSion`. (Bug#1775)
- Foreign Keys column sequence is not consistent in `DatabaseMetaData.getImported/Exported/CrossReference()`. (Bug#1731)
- Fix for `ArrayIndexOutOfBoundsException` exception when using `Statement.setMaxRows()`. (Bug#1695)
- Subsequent call to `ResultSet.updateFoo()` causes NPE if result set is not updatable. (Bug#1630)
- Fix for 4.1.1-style authentication with no password. (Bug#1630)
- Cross-database updatable result sets are not checked for updatability correctly. (Bug#1592)
- `DatabaseMetaData.getColumns()` should return `Types.LONGVARCHAR` for MySQL `LONGTEXT` type. (Bug#1592)
- Fixed regression of `Statement.getGeneratedKeys()` and `REPLACE` statements. (Bug#1576)
- Barge blobs and split packets not being read correctly. (Bug#1576)
- Backported fix for aliased tables and `UpdatableResultSets` in `checkUpdatability()` method from 3.1 branch. (Bug#1534)

- “Friendlier” exception message for `PacketTooLargeException`. ([Bug#1534](#))
- Don't count quoted IDs when inside a 'string' in `PreparedStatement` parsing. ([Bug#1511](#))

### C.7.4.9. Changes in MySQL Connector/J 3.0.9 (07 October 2003)

Bugs fixed:

- `ResultSet.getString/setString` mashing char 127. ([Bug#1247](#))
- Added property to “clobber” streaming results, by setting the `clobberStreamingResults` property to `true` (the default is `false`). This will cause a “streaming” `ResultSet` to be automatically closed, and any outstanding data still streaming from the server to be discarded if another query is executed before all the data has been read from the server. ([Bug#1247](#))
- Added `com.mysql.jdbc.util.BaseBugReport` to help creation of testcases for bug reports. ([Bug#1247](#))
- Backported authentication changes for 4.1.1 and newer from 3.1 branch. ([Bug#1247](#))
- Made `databaseName`, `portNumber`, and `serverName` optional parameters for `MysqlDataSourceFactory`. ([Bug#1246](#))
- Optimized `CLOB.setCharacterStream()`. ([Bug#1131](#))
- Fixed `CLOB.truncate()`. ([Bug#1130](#))
- Fixed deadlock issue with `Statement.setMaxRows()`. ([Bug#1099](#))
- `DatabaseMetaData.getColumns()` getting confused about the keyword “set” in character columns. ([Bug#1099](#))
- Clip +/- INF (to smallest and largest representative values for the type in MySQL) and NaN (to 0) for `setDouble/setFloat()`, and issue a warning on the statement when the server does not support +/- INF or NaN. ([Bug#884](#))
- Don't fire connection closed events when closing pooled connections, or on `PooledConnection.getConnection()` with already open connections. ([Bug#884](#))
- Double-escaping of `'\'` when charset is SJIS or GBK and `'\'` appears in non-escaped input. ([Bug#879](#))
- When emptying input stream of unused rows for “streaming” result sets, have the current thread `yield()` every 100 rows in order to not monopolize CPU time. ([Bug#879](#))
- Issue exception on `ResultSet.getXXX()` on empty result set (wasn't caught in some cases). ([Bug#848](#))
- Don't hide messages from exceptions thrown in I/O layers. ([Bug#848](#))
- Fixed regression in large split-packet handling. ([Bug#848](#))
- Better diagnostic error messages in exceptions for “streaming” result sets. ([Bug#848](#))
- Don't change timestamp TZ twice if `useTimezone==true`. ([Bug#774](#))
- Don't wrap `SQLExceptions` in `RowDataDynamic`. ([Bug#688](#))
- Don't try and reset isolation level on reconnect if MySQL doesn't support them. ([Bug#688](#))
- The `insertRow` in an `UpdatableResultSet` is now loaded with the default column values when `moveToInsertRow()` is called. ([Bug#688](#))
- `DatabaseMetaData.getColumns()` wasn't returning `NULL` for default values that are specified as `NULL`. ([Bug#688](#))
- Change default statement type/concurrency to `TYPE_FORWARD_ONLY` and `CONCUR_READ_ONLY` (spec compliance). ([Bug#688](#))
- Fix `UpdatableResultSet` to return values for `getXXX()` when on insert row. ([Bug#675](#))
- Support `InnoDB` constraint names when extracting foreign key information in `DatabaseMetaData` (implementing ideas from Parwinder Sekhon). ([Bug#664](#), [Bug#517](#))
- Backported 4.1 protocol changes from 3.1 branch (server-side SQL states, new field information, larger client capability flags, connect-with-database, and so forth). ([Bug#664](#), [Bug#517](#))

- `refreshRow` didn't work when primary key values contained values that needed to be escaped (they ended up being doubly escaped). (Bug#661)
- Fixed `ResultSet.previous()` behavior to move current position to before result set when on first row of result set. (Bug#496)
- Fixed `Statement` and `PreparedStatement` issuing bogus queries when `setMaxRows()` had been used and a `LIMIT` clause was present in the query. (Bug#496)
- Faster date handling code in `ResultSet` and `PreparedStatement` (no longer uses `Date` methods that synchronize on static calendars).
- Fixed test for end of buffer in `Buffer.readString()`.

#### C.7.4.10. Changes in MySQL Connector/J 3.0.8 (23 May 2003)

Bugs fixed:

- Fixed SJIS encoding bug, thanks to Naoto Sato. (Bug#378)
- Fix problem detecting server character set in some cases. (Bug#378)
- Allow multiple calls to `Statement.close()`. (Bug#378)
- Return correct number of generated keys when using `REPLACE` statements. (Bug#378)
- Unicode character 0xFFFF in a string would cause the driver to throw an `ArrayOutOfBoundsException`. (Bug#378)
- Fix row data decoding error when using *very* large packets. (Bug#378)
- Optimized row data decoding. (Bug#378)
- Issue exception when operating on an already closed prepared statement. (Bug#378)
- Optimized usage of `EscapeProcessor`. (Bug#378)
- Use JVM charset with file names and `LOAD DATA [LOCAL] INFILE`.
- Fix infinite loop with `Connection.cleanup()`.
- Changed Ant target `compile-core` to `compile-driver`, and made test suite compilation a separate target.
- Fixed result set not getting set for `Statement.executeUpdate()`, which affected `getGeneratedKeys()` and `getUpdateCount()` in some cases.
- Return list of generated keys when using multi-value `INSERTS` with `Statement.getGeneratedKeys()`.
- Allow bogus URLs in `Driver.getPropertyInfo()`.

#### C.7.4.11. Changes in MySQL Connector/J 3.0.7 (08 April 2003)

Bugs fixed:

- Fixed charset issues with database metadata (charset was not getting set correctly).
- You can now toggle profiling on/off using `Connection.setProfileSql(boolean)`.
- 4.1 Column Metadata fixes.
- Fixed `MysqlPooledConnection.close()` calling wrong event type.
- Fixed `StringIndexOutOfBoundsException` in `PreparedStatement.setClob()`.
- `IOExceptions` during a transaction now cause the `Connection` to be closed.
- Remove synchronization from `Driver.connect()` and `Driver.acceptsUrl()`.

- Fixed missing conversion for `YEAR` type in `ResultSetMetaData.getColumnTypeName()`.
- Updatable `ResultSets` can now be created for aliased tables/columns when connected to MySQL-4.1 or newer.
- Fixed `LOAD DATA LOCAL INFILE` bug when file > `max_allowed_packet`.
- Don't pick up indexes that start with `pri` as primary keys for `DBMD.getPrimaryKeys()`.
- Ensure that packet size from `alignPacketSize()` does not exceed `max_allowed_packet` (JVM bug)
- Don't reset `Connection.isReadOnly()` when autoReconnecting.
- Fixed escaping of `0x5c ('\\')` character for GBK and Big5 charsets.
- Fixed `ResultSet.getTimestamp()` when underlying field is of type `DATE`.
- Throw `SQLExceptions` when trying to do operations on a forcefully closed `Connection` (that is, when a communication link failure occurs).

### C.7.4.12. Changes in MySQL Connector/J 3.0.6 (18 February 2003)

Bugs fixed:

- Backported 4.1 charset field info changes from Connector/J 3.1.
- Fixed `Statement.setMaxRows()` to stop sending `LIMIT` type queries when not needed (performance).
- Fixed `DBMD.getTypeInfo()` and `DBMD.getColumns()` returning different value for precision in `TEXT` and `BLOB` types.
- Fixed `SQLExceptions` getting swallowed on initial connect.
- Fixed `ResultSetMetaData` to return "" when catalog not known. Fixes `NullPointerExceptions` with Sun's `CachedRowSet`.
- Allow ignoring of warning for “non transactional tables” during rollback (compliance/usability) by setting `ignoreNonTxTables` property to `true`.
- Clean up `Statement` query/method mismatch tests (that is, `INSERT` not allowed with `.executeQuery()`).
- Fixed `ResultSetMetaData.isWritable()` to return correct value.
- More checks added in `ResultSet` traversal method to catch when in closed state.
- Implemented `Blob.setBytes()`. You still need to pass the resultant `Blob` back into an updatable `ResultSet` or `PreparedStatement` to persist the changes, because MySQL does not support “locators”.
- Add “window” of different `NULL` sorting behavior to `DBMD.nullsAreSortedAtStart` (4.0.2 to 4.0.10, true; otherwise, no).

### C.7.4.13. Changes in MySQL Connector/J 3.0.5 (22 January 2003)

Bugs fixed:

- Fixed `ResultSet.isBeforeFirst()` for empty result sets.
- Added missing `LONGTEXT` type to `DBMD.getColumns()`.
- Implemented an empty `TypeMap` for `Connection.getTypeMap()` so that some third-party apps work with MySQL (IBM WebSphere 5.0 Connection pool).
- Added update options for foreign key metadata.
- Fixed `Buffer.fastSkipLenString()` causing `ArrayIndexOutOfBoundsException` exceptions with some queries when unpacking fields.
- Quote table names in `DatabaseMetaData.getColumns()`, `getPrimaryKeys()`, `getIndexInfo()`, `getBe-`

`stRowIdentifier()`.

- Retrieve `TX_ISOLATION` from database for `Connection.getTransactionIsolation()` when the MySQL version supports it, instead of an instance variable.
- Greatly reduce memory required for `setBinaryStream()` in `PreparedStatement`s.

#### C.7.4.14. Changes in MySQL Connector/J 3.0.4 (06 January 2003)

Bugs fixed:

- Streamlined character conversion and `byte[]` handling in `PreparedStatement`s for `setByte()`.
- Fixed `PreparedStatement.executeBatch()` parameter overwriting.
- Added quoted identifiers to database names for `Connection.setCatalog`.
- Added support for 4.0.8-style large packets.
- Reduce memory footprint of `PreparedStatement`s by sharing outbound packet with `MySQLIO`.
- Added `strictUpdates` property to allow control of amount of checking for “correctness” of updatable result sets. Set this to `false` if you want faster updatable result sets and you know that you create them from `SELECT` statements on tables with primary keys and that you have selected all primary keys in your query.
- Added support for quoted identifiers in `PreparedStatement` parser.

#### C.7.4.15. Changes in MySQL Connector/J 3.0.3 (17 December 2002)

Bugs fixed:

- Allow user to alter behavior of `Statement/PreparedStatement.executeBatch()` via `continueBatchOnError` property (defaults to `true`).
- More robust escape tokenizer: Recognize `--` comments, and allow nested escape sequences (see `test-suite.EscapeProcessingTest`).
- Fixed `Buffer.isLastDataPacket()` for 4.1 and newer servers.
- `NamedPipeSocketFactory` now works (only intended for Windows), see `README` for instructions.
- Changed `charsToByte` in `SingleByteCharConverter` to be non-static.
- Use non-aliased table/column names and database names to fully qualify tables and columns in `UpdatableResultSet` (requires MySQL-4.1 or newer).
- `LOAD DATA LOCAL INFILE ...` now works, if your server is configured to allow it. Can be turned off with the `allowLoadLocalInfile` property (see the `README`).
- Implemented `Connection.nativeSQL()`.
- Fixed `ResultSetMetaData.getColumnTypeName()` returning `BLOB` for `TEXT` and `TEXT` for `BLOB` types.
- Fixed charset handling in `Fields.java`.
- Because of above, implemented `ResultSetMetaData.isAutoIncrement()` to use `Field.isAutoIncrement()`.
- Substitute `' ? '` for unknown character conversions in single-byte character sets instead of `'\0'`.
- Added `CLIENT_LONG_FLAG` to be able to get more column flags (`isAutoIncrement()` being the most important).
- Honor `lower_case_table_names` when enabled in the server when doing table name comparisons in `DatabaseMetaData` methods.
- `DBMD.getImported/ExportedKeys()` now handles multiple foreign keys per table.
- More robust implementation of updatable result sets. Checks that *all* primary keys of the table have been selected.

- Some MySQL-4.1 protocol support (extended field info from selects).
- Check for connection closed in more `Connection` methods (`createStatement`, `prepareStatement`, `setTransactionIsolation`, `setAutoCommit`).
- Fixed `ResultSetMetaData.getPrecision()` returning incorrect values for some floating-point types.
- Changed `SingleByteCharConverter` to use lazy initialization of each converter.

#### C.7.4.16. Changes in MySQL Connector/J 3.0.2 (08 November 2002)

Bugs fixed:

- Implemented `Clob.setString()`.
- Added `com.mysql.jdbc.MinisAdmin` class, which allows you to send `shutdown` command to MySQL server. This is intended to be used when “embedding” Java and MySQL server together in an end-user application.
- Added SSL support. See [README](#) for information on how to use it.
- All `DBMD` result set columns describing schemas now return `NULL` to be more compliant with the behavior of other JDBC drivers for other database systems (MySQL does not support schemas).
- Use `SHOW CREATE TABLE` when possible for determining foreign key information for `DatabaseMetaData`. Also allows cascade options for `DELETE` information to be returned.
- Implemented `Clob.setCharacterStream()`.
- Failover and `autoReconnect` work only when the connection is in an `autoCommit(false)` state, in order to stay transaction-safe.
- Fixed `DBMD.supportsResultSetConcurrency()` so that it returns `true` for `ResultSet.TYPE_SCROLL_INSENSITIVE` and `ResultSet.CONCUR_READ_ONLY` or `ResultSet.CONCUR_UPDATABLE`.
- Implemented `Clob.setAsciiStream()`.
- Removed duplicate code from `UpdatableResultSet` (it can be inherited from `ResultSet`, the extra code for each method to handle updatability I thought might someday be necessary has not been needed).
- Fixed `UnsupportedEncodingException` thrown when “forcing” a character encoding via properties.
- Fixed incorrect conversion in `ResultSet.getLong()`.
- Implemented `ResultSet.updateBlob()`.
- Removed some not-needed temporary object creation by smarter use of `Strings` in `EscapeProcessor`, `Connection` and `DatabaseMetaData` classes.
- Escape `0x5c` character in strings for the SJIS charset.
- `PreparedStatement` now honors stream lengths in `setBinary/Ascii/Character Stream()` unless you set the connection property `useStreamLengthsInPrepStmts` to `false`.
- Fixed issue with updatable result sets and `PreparedStatements` not working.
- Fixed start position off-by-1 error in `Clob.getSubString()`.
- Added `connectTimeout` parameter that allows users of JDK-1.4 and newer to specify a maximum time to wait to establish a connection.
- Fixed various non-ASCII character encoding issues.
- Fixed `ResultSet.isLast()` for empty result sets (should return `false`).
- Added driver property `useHostsInPrivileges`. Defaults to `true`. Affects whether or not `@hostname` will be used in `DBMD.getColumn/TablePrivileges`.
- Fixed `ResultSet.setFetchDirection(FETCH_UNKNOWN)`.

- Added `queriesBeforeRetryMaster` property that specifies how many queries to issue when failed over before attempting to reconnect to the master (defaults to 50).
- Fixed issue when calling `Statement.setFetchSize()` when using arbitrary values.
- Properly restore connection properties when autoReconnecting or failing-over, including `autoCommit` state, and isolation level.
- Implemented `Clob.truncate()`.

### C.7.4.17. Changes in MySQL Connector/J 3.0.1 (21 September 2002)

Bugs fixed:

- Charsets now automatically detected. Optimized code for single-byte character set conversion.
- Fixed `ResultSetMetaData.isSigned()` for `TINYINT` and `BIGINT`.
- Fixed `RowDataStatic.getAt()` off-by-one bug.
- Fixed `ResultSet.getRow()` off-by-one bug.
- Massive code clean-up to follow Java coding conventions (the time had come).
- Implemented `ResultSet.getCharacterStream()`.
- Added limited `Clob` functionality (`ResultSet.getClob()`, `PreparedStatement.setClob()`, `PreparedStatement.setObject(Clob)`).
- `Connection.isClosed()` no longer “pings” the server.
- `Connection.close()` issues `rollback()` when `getAutoCommit()` is `false`.
- Added `socketTimeout` parameter to URL.
- Added `LOCAL TEMPORARY` to table types in `DatabaseMetaData.getTableTypes()`.
- Added `paranoid` parameter, which sanitizes error messages by removing “sensitive” information from them (such as host names, ports, or user names), as well as clearing “sensitive” data structures when possible.

### C.7.4.18. Changes in MySQL Connector/J 3.0.0 (31 July 2002)

Bugs fixed:

- General source-code cleanup.
- The driver now only works with JDK-1.2 or newer.
- Fix and sort primary key names in `DBMetaData` (SF bugs 582086 and 582086).
- `ResultSet.getTimestamp()` now works for `DATE` types (SF bug 559134).
- Float types now reported as `java.sql.Types.FLOAT` (SF bug 579573).
- Support for streaming (row-by-row) result sets (see [README](#)) Thanks to Doron.
- Testsuite now uses Junit (which you can get from <http://www.junit.org>).
- JDBC Compliance: Passes all tests besides stored procedure tests.
- `ResultSet.getDate/Time/Timestamp` now recognizes all forms of invalid values that have been set to all zeros by MySQL (SF bug 586058).
- Added multi-host failover support (see [README](#)).
- Repackaging: New driver name is `com.mysql.jdbc.Driver`, old name still works, though (the driver is now provided by MySQL-AB).

- Support for large packets (new addition to MySQL-4.0 protocol), see [README](#) for more information.
- Better checking for closed connections in [Statement](#) and [PreparedStatement](#).
- Performance improvements in string handling and field metadata creation (lazily instantiated) contributed by Alex Twisleton-Wykeham-Fiennes.
- JDBC-3.0 functionality including [Statement/PreparedStatement.getGeneratedKeys\(\)](#) and [ResultSet.getURL\(\)](#).
- Overall speed improvements via controlling transient object creation in [MysqlIO](#) class when reading packets.
- **!!! LICENSE CHANGE !!!** The driver is now GPL. If you need non-GPL licenses, please contact me [<mark@mysql.com>](mailto:mark@mysql.com).
- Performance enhancements: Driver is now 50–100% faster in most situations, and creates fewer temporary objects.

## C.7.5. Changes in MySQL Connector/J 2.0.x

### C.7.5.1. Changes in MySQL Connector/J 2.0.14 (16 May 2002)

Bugs fixed:

- [ResultSet.getDouble\(\)](#) now uses code built into JDK to be more precise (but slower).
- Fixed typo for [relaxAutoCommit](#) parameter.
- [LogicalHandle.isClosed\(\)](#) calls through to physical connection.
- Added SQL profiling (to [STDERR](#)). Set [profileSql=true](#) in your JDBC URL. See [README](#) for more information.
- [PreparedStatement](#) now releases resources on [.close\(\)](#). (SF bug 553268)
- More code cleanup.
- Quoted identifiers not used if server version does not support them. Also, if server started with [--ansi](#) or [-sql-mode=ANSI\\_QUOTES](#), “” will be used as an identifier quote character, otherwise “'” will be used.

### C.7.5.2. Changes in MySQL Connector/J 2.0.13 (24 April 2002)

Bugs fixed:

- Fixed unicode chars being read incorrectly. (SF bug 541088)
- Faster blob escaping for [PrepStmt](#).
- Added [setURL\(\)](#) to [MySQLXADataSource](#). (SF bug 546019)
- Added [set/getPortNumber\(\)](#) to [DataSource\(s\)](#). (SF bug 548167)
- [PreparedStatement.toString\(\)](#) fixed. (SF bug 534026)
- More code cleanup.
- Rudimentary version of [Statement.getGeneratedKeys\(\)](#) from JDBC-3.0 now implemented (you need to be using JDK-1.4 for this to work, I believe).
- [DBMetaData.getIndexInfo\(\)](#) - bad PAGES fixed. (SF BUG 542201)
- [ResultSetMetaData.getColumnClassName\(\)](#) now implemented.

### C.7.5.3. Changes in MySQL Connector/J 2.0.12 (07 April 2002)

Bugs fixed:

- Fixed [testsuite.Traversal.afterLast\(\)](#) bug, thanks to Igor Lastric.

- Added new types to `getTypeInfo()`, fixed existing types thanks to Al Davis and Kid Kalanon.
- Fixed time zone off-by-1-hour bug in `PreparedStatement` (538286, 528785).
- Added identifier quoting to all `DatabaseMetaData` methods that need them (should fix 518108).
- Added support for `BIT` types (51870) to `PreparedStatement`.
- `ResultSet.insertRow()` should now detect `auto_increment` fields in most cases and use that value in the new row. This detection will not work in multi-valued keys, however, due to the fact that the MySQL protocol does not return this information.
- Relaxed synchronization in all classes, should fix 520615 and 520393.
- `DataSources` - fixed `setUrl` bug (511614, 525565), wrong datasource class name (532816, 528767).
- Added support for `YEAR` type (533556).
- Fixes for `ResultSet` updatability in `PreparedStatement`.
- `ResultSet`: Fixed updatability (values being set to `null` if not updated).
- Added `getTable/ColumnPrivileges()` to `DBMD` (fixes 484502).
- Added `getIdleFor()` method to `Connection` and `MysqlLogicalHandle`.
- `ResultSet.refreshRow()` implemented.
- Fixed `getRow()` bug (527165) in `ResultSet`.
- General code cleanup.

#### C.7.5.4. Changes in MySQL Connector/J 2.0.11 (27 January 2002)

Bugs fixed:

- Full synchronization of `Statement.java`.
- Fixed missing `DELETE_RULE` value in `DBMD.getImported/ExportedKeys()` and `getCrossReference()`.
- More changes to fix `Unexpected end of input stream` errors when reading `BLOB` values. This should be the last fix.

#### C.7.5.5. Changes in MySQL Connector/J 2.0.10 (24 January 2002)

Bugs fixed:

- Fixed null-pointer-exceptions when using `MysqlConnectionPoolDataSource` with Websphere 4 (bug 505839).
- Fixed spurious `Unexpected end of input stream` errors in `MysqlIO` (bug 507456).

#### C.7.5.6. Changes in MySQL Connector/J 2.0.9 (13 January 2002)

Bugs fixed:

- Fixed extra memory allocation in `MysqlIO.readPacket()` (bug 488663).
- Added detection of network connection being closed when reading packets (thanks to Todd Lizambri).
- Fixed casting bug in `PreparedStatement` (bug 488663).
- `DataSource` implementations moved to `org.gjt.mm.mysql.jdbc2.optional` package, and (initial) implementations of `PooledConnectionDataSource` and `XADataSource` are in place (thanks to Todd Wolff for the implementation and testing of `PooledConnectionDataSource` with IBM WebSphere 4).
- Fixed quoting error with escape processor (bug 486265).

- Removed concatenation support from driver (the `||` operator), as older versions of VisualAge seem to be the only thing that use it, and it conflicts with the logical `|||` operator. You will need to start `mysqld` with the `--ansi` flag to use the `||` operator as concatenation (bug 491680).
- `Ant` build was corrupting included `jar` files, fixed (bug 487669).
- Report batch update support through `DatabaseMetaData` (bug 495101).
- Implementation of `DatabaseMetaData.getExported/ImportedKeys()` and `getCrossReference()`.
- Fixed off-by-one-hour error in `PreparedStatement.setTimestamp()` (bug 491577).
- Full synchronization on methods modifying instance and class-shared references, driver should be entirely thread-safe now (please let me know if you have problems).

### C.7.5.7. Changes in MySQL Connector/J 2.0.8 (25 November 2001)

Bugs fixed:

- `XADataSource/ConnectionPoolDataSource` code (experimental)
- `DatabaseMetaData.getPrimaryKeys()` and `getBestRowIdentifier()` are now more robust in identifying primary keys (matches regardless of case or abbreviation/full spelling of `Primary Key` in `Key_type` column).
- Batch updates now supported (thanks to some inspiration from Daniel Rall).
- `PreparedStatement.setAnyNumericType()` now handles positive exponents correctly (adds `+` so MySQL can understand it).

### C.7.5.8. Changes in MySQL Connector/J 2.0.7 (24 October 2001)

Bugs fixed:

- Character sets read from database if `useUnicode=true` and `characterEncoding` is not set. (thanks to Dmitry Vereshchagin)
- Initial transaction isolation level read from database (if available). (thanks to Dmitry Vereshchagin)
- Fixed `PreparedStatement` generating SQL that would end up with syntax errors for some queries.
- `PreparedStatement.setCharacterStream()` now implemented
- Capitalize type names when `capitalizeTypeNames=true` is passed in URL or properties (for `WebObjects`). (thanks to Anjo Krank)
- `ResultSet.getBlob()` now returns `null` if column value was `null`.
- Fixed `ResultSetMetaData.getPrecision()` returning one less than actual on newer versions of MySQL.
- Fixed dangling socket problem when in high availability (`autoReconnect=true`) mode, and finalizer for `Connection` will close any dangling sockets on GC.
- Fixed time zone issue in `PreparedStatement.setTimestamp()`. (thanks to Erik Olofsson)
- `PreparedStatement.setDouble()` now uses full-precision doubles (reverting a fix made earlier to truncate them).
- Fixed `DatabaseMetaData.supportsTransactions()`, and `supportsTransactionIsolationLevel()` and `getTypeInfo()` `SQL_DATETIME_SUB` and `SQL_DATA_TYPE` fields not being readable.
- Updatable result sets now correctly handle `NULL` values in fields.
- `PreparedStatement.setBoolean()` will use `1/0` for values if your MySQL version is 3.21.23 or higher.
- Fixed `ResultSet.isAfterLast()` always returning `false`.

### C.7.5.9. Changes in MySQL Connector/J 2.0.6 (16 June 2001)

Bugs fixed:

- Fixed `PreparedStatement` parameter checking.
- Fixed case-sensitive column names in `ResultSet.java`.

### C.7.5.10. Changes in MySQL Connector/J 2.0.5 (13 June 2001)

Bugs fixed:

- `ResultSet.insertRow()` works now, even if not all columns are set (they will be set to `NULL`).
- Added `Byte` to `PreparedStatement.setObject()`.
- Fixed data parsing of `TIMESTAMP` values with 2-digit years.
- Added `ISOLATION` level support to `Connection.setIsolationLevel()`
- `DataBaseMetaData.getCrossReference()` no longer `ArrayIndexOOB`.
- `ResultSet.getBoolean()` now recognizes `-1` as `true`.
- `ResultSet` has `+/-Inf/inf` support.
- `getObject()` on `ResultSet` correctly does `TINYINT->Byte` and `SMALLINT->Short`.
- Fixed `ResultSetMetaData.getColumnTypeName` for `TEXT/BLOB`.
- Fixed `ArrayIndexOutOfBounds` when sending large `BLOB` queries. (Max size packet was not being set)
- Fixed `NPE` on `PreparedStatement.executeUpdate()` when all columns have not been set.
- Fixed `ResultSet.getBlob()` `ArrayIndex` out-of-bounds.

### C.7.5.11. Changes in MySQL Connector/J 2.0.3 (03 December 2000)

Bugs fixed:

- Fixed composite key problem with updatable result sets.
- Faster ASCII string operations.
- Fixed off-by-one error in `java.sql.Blob` implementation code.
- Fixed incorrect detection of `MAX_ALLOWED_PACKET`, so sending large blobs should work now.
- Added detection of `-/+INF` for doubles.
- Added `ultraDevHack` URL parameter, set to `true` to allow (broken) Macromedia UltraDev to use the driver.
- Implemented `getBigDecimal()` without scale component for JDBC2.

### C.7.5.12. Changes in MySQL Connector/J 2.0.1 (06 April 2000)

Bugs fixed:

- Columns that are of type `TEXT` now return as `Strings` when you use `getObject()`.
- Cleaned up exception handling when driver connects.
- Fixed `RSMD.isWritable()` returning wrong value. Thanks to Moritz Maass.
- `DatabaseMetaData.getPrimaryKeys()` now works correctly with respect to `key_seq`. Thanks to Brian Slesinsky.

- Fixed many JDBC-2.0 traversal, positioning bugs, especially with respect to empty result sets. Thanks to Ron Smits, Nick Brook, Cessar Garcia and Carlos Martinez.
- No escape processing is done on `PreparedStatement` anymore per JDBC spec.
- Fixed some issues with updatability support in `ResultSet` when using multiple primary keys.

#### **C.7.5.13. Changes in MySQL Connector/J 2.0.0pre5 (21 February 2000)**

- Fixed Bad Handshake problem.

#### **C.7.5.14. Changes in MySQL Connector/J 2.0.0pre4 (10 January 2000)**

- Fixes to `ResultSet` for `insertRow()` - Thanks to Cesar Garcia
- Fix to Driver to recognize JDBC-2.0 by loading a JDBC-2.0 class, instead of relying on JDK version numbers. Thanks to John Baker.
- Fixed `ResultSet` to return correct row numbers
- `Statement.getUpdateCount()` now returns rows matched, instead of rows actually updated, which is more SQL-92 like.

10-29-99

- `Statement/PreparedStatement.getMoreResults()` bug fixed. Thanks to Noel J. Bergman.
- Added `Short` as a type to `PreparedStatement.setObject()`. Thanks to Jeff Crowder
- Driver now automagically configures maximum/preferred packet sizes by querying server.
- Autoreconnect code uses fast ping command if server supports it.
- Fixed various bugs with respect to packet sizing when reading from the server and when alloc'ing to write to the server.

#### **C.7.5.15. Changes in MySQL Connector/J 2.0.0pre (17 August 1999)**

- Now compiles under JDK-1.2. The driver supports both JDK-1.1 and JDK-1.2 at the same time through a core set of classes. The driver will load the appropriate interface classes at runtime by figuring out which JVM version you are using.
- Fixes for result sets with all nulls in the first row. (Pointed out by Tim Endres)
- Fixes to column numbers in `SQLExceptions` in `ResultSet` (Thanks to Blas Rodriguez Somoza)
- The database no longer needs to be specified to connect. (Thanks to Christian Motschke)

#### **C.7.6. Changes in MySQL Connector/J 1.2b (04 July 1999)**

- Better Documentation (in progress), in `doc/mm.doc/book1.html`
- DBMD now allows null for a column name pattern (not in spec), which it changes to '%'
- DBMD now has correct types/lengths for `getXXX()`.
- `ResultSet.getDate()`, `getTime()`, and `getTimestamp()` fixes. (contributed by Alan Wilken)
- `EscapeProcessor` now handles `{ }` and `{ or }` inside quotes correctly. (thanks to Alik for some ideas on how to fix it)
- Fixes to properties handling in `Connection`. (contributed by Juho Tikkala)
- `ResultSet.getObject()` now returns null for NULL columns in the table, rather than bombing out. (thanks to Ben Grosman)

- `ResultSet.getObject()` now returns Strings for types from MySQL that it doesn't know about. (Suggested by Chris Perdue)
- Removed `DataInput/Output` streams, not needed, 1/2 number of method calls per IO operation.
- Use default character encoding if one is not specified. This is a work-around for broken JVMs, because according to spec, EVERY JVM must support "ISO8859\_1", but they do not.
- Fixed `Connection` to use the platform character encoding instead of "ISO8859\_1" if one isn't explicitly set. This fixes problems people were having loading the character- converter classes that didn't always exist (JVM bug). (thanks to Fritz Elfert for pointing out this problem)
- Changed `MysqlIO` to re-use packets where possible to reduce memory usage.
- Fixed escape-processor bugs pertaining to { } inside quotes.

## C.7.7. Changes in MySQL Connector/J 1.2.x and lower

### C.7.7.1. Changes in MySQL Connector/J 1.2a (14 April 1999)

- Fixed character-set support for non-Javasoft JVMs (thanks to many people for pointing it out)
- Fixed `ResultSet.getBoolean()` to recognize 'y' & 'n' as well as '1' & '0' as boolean flags. (thanks to Tim Pizey)
- Fixed `ResultSet.getTimestamp()` to give better performance. (thanks to Richard Swift)
- Fixed `getBytes()` for numeric types. (thanks to Ray Bellis)
- Fixed `DatabaseMetaData.getTypeInfo()` for DATE type. (thanks to Paul Johnston)
- Fixed `EscapeProcessor` for "fn" calls. (thanks to Piyush Shah at locomotive.org)
- Fixed `EscapeProcessor` to not do extraneous work if there are no escape codes. (thanks to Ryan Gustafson)
- Fixed `Driver` to parse URLs of the form "jdbc:mysql://host:port" (thanks to Richard Lobb)

### C.7.7.2. Changes in MySQL Connector/J 1.1i (24 March 1999)

- Fixed Timestamps for `PreparedStatement`s
- Fixed null pointer exceptions in `RSMD` and `RS`
- Re-compiled with jikes for valid class files (thanks ms!)

### C.7.7.3. Changes in MySQL Connector/J 1.1h (08 March 1999)

- Fixed escape processor to deal with unmatched { and } (thanks to Craig Coles)
- Fixed escape processor to create more portable (between DATETIME and TIMESTAMP types) representations so that it will work with BETWEEN clauses. (thanks to Craig Longman)
- `MysqlIO.quit()` now closes the socket connection. Before, after many failed connections some OS's would run out of file descriptors. (thanks to Michael Brinkman)
- Fixed `NullPointerException` in `Driver.getPropertyInfo`. (thanks to Dave Potts)
- Fixes to `MysqlDefs` to allow all \*text fields to be retrieved as Strings. (thanks to Chris at Leverage)
- Fixed `setDouble` in `PreparedStatement` for large numbers to avoid sending scientific notation to the database. (thanks to J.S. Ferguson)
- Fixed `getScale()` and `getPrecision()` in `RSMD`. (contrib'd by James Klicman)
- Fixed `getObject()` when field was DECIMAL or NUMERIC (thanks to Bert Hobbs)

- `DBMD.getTables()` bombed when passed a null table-name pattern. Fixed. (thanks to Richard Lobb)
- Added check for "client not authorized" errors during connect. (thanks to Hannes Wallnoefer)

#### **C.7.7.4. Changes in MySQL Connector/J 1.1g (19 February 1999)**

- Result set rows are now byte arrays. Blobs and Unicode work bidirectionally now. The `useUnicode` and encoding options are implemented now.
- Fixes to `PreparedStatement` to send binary set by `setXXXStream` to be sent untouched to the MySQL server.
- Fixes to `getDriverPropertyInfo()`.

#### **C.7.7.5. Changes in MySQL Connector/J 1.1f (31 December 1998)**

- Changed all `ResultSet` fields to Strings, this should allow Unicode to work, but your JVM must be able to convert between the character sets. This should also make reading data from the server be a bit quicker, because there is now no conversion from `StringBuffer` to `String`.
- Changed `PreparedStatement.streamToString()` to be more efficient (code from Uwe Schaefer).
- URL parsing is more robust (throws SQL exceptions on errors rather than `NullPointerExceptions`)
- `PreparedStatement` now can convert Strings to Time/Date values via `setObject()` (code from Robert Currey).
- IO no longer hangs in `Buffer.readInt()`, that bug was introduced in 1.1d when changing to all byte-arrays for result sets. (Pointed out by Samo Login)

#### **C.7.7.6. Changes in MySQL Connector/J 1.1b (03 November 1998)**

- Fixes to `DatabaseMetaData` to allow both IBM VA and J-Builder to work. Let me know how it goes. (thanks to Jac Kersing)
- Fix to `ResultSet.getBoolean()` for NULL strings (thanks to Barry Lagerweij)
- Beginning of code cleanup, and formatting. Getting ready to branch this off to a parallel JDBC-2.0 source tree.
- Added "final" modifier to critical sections in `MysqlIO` and `Buffer` to allow compiler to inline methods for speed.

9-29-98

- If object references passed to `setXXX()` in `PreparedStatement` are null, `setNull()` is automatically called for you. (Thanks for the suggestion goes to Erik Ostrom)
- `setObject()` in `PreparedStatement` will now attempt to write a serialized representation of the object to the database for objects of `Types.OTHER` and objects of unknown type.
- `Util` now has a static method `readObject()` which given a `ResultSet` and a column index will re-instantiate an object serialized in the above manner.

#### **C.7.7.7. Changes in MySQL Connector/J 1.1 (02 September 1998)**

- Got rid of "ugly hack" in `MysqlIO.nextRow()`. Rather than catch an exception, `Buffer.isLastDataPacket()` was fixed.
- `Connection.getCatalog()` and `Connection.setCatalog()` should work now.
- `Statement.setMaxRows()` works, as well as setting by property `maxRows`. `Statement.setMaxRows()` overrides `maxRows` set via properties or url parameters.
- Automatic re-connection is available. Because it has to "ping" the database before each query, it is turned off by default. To use it, pass in "autoReconnect=true" in the connection URL. You may also change the number of reconnect tries, and the initial timeout value via "maxReconnects=n" (default 3) and "initialTimeout=n" (seconds, default 2) parameters. The timeout is an ex-

ponential backoff type of timeout; for example, if you have initial timeout of 2 seconds, and maxReconnects of 3, then the driver will timeout 2 seconds, 4 seconds, then 16 seconds between each re-connection attempt.

### C.7.7.8. Changes in MySQL Connector/J 1.0 (24 August 1998)

- Fixed handling of blob data in Buffer.java
- Fixed bug with authentication packet being sized too small.
- The JDBC Driver is now under the LGPL

8-14-98

- Fixed Buffer.readLenString() to correctly read data for BLOBS.
- Fixed PreparedStatement.stringToStream to correctly read data for BLOBS.
- Fixed PreparedStatement.setDate() to not add a day. (above fixes thanks to Vincent Partington)
- Added URL parameter parsing (?user=... and so forth).

### C.7.7.9. Changes in MySQL Connector/J 0.9d (04 August 1998)

- Big news! New package name. Tim Endres from ICE Engineering is starting a new source tree for GNU GPL'd Java software. He's graciously given me the org.gjt.mm package directory to use, so now the driver is in the org.gjt.mm.mysql package scheme. I'm "legal" now. Look for more information on Tim's project soon.
- Now using dynamically sized packets to reduce memory usage when sending commands to the DB.
- Small fixes to getTypeInfo() for parameters, and so forth.
- DatabaseMetaData is now fully implemented. Let me know if these drivers work with the various IDEs out there. I've heard that they're working with JBuilder right now.
- Added JavaDoc documentation to the package.
- Package now available in .zip or .tar.gz.

### C.7.7.10. Changes in MySQL Connector/J 0.9 (28 July 1998)

- Implemented getTypeInfo(). Connection.rollback() now throws an SQLException per the JDBC spec.
- Added PreparedStatement that supports all JDBC API methods for PreparedStatement including InputStreams. Please check this out and let me know if anything is broken.
- Fixed a bug in ResultSet that would break some queries that only returned 1 row.
- Fixed bugs in DatabaseMetaData.getTables(), DatabaseMetaData.getColumns() and DatabaseMetaData.getCatalogs().
- Added functionality to Statement that allows executeUpdate() to store values for IDs that are automatically generated for AUTO\_INCREMENT fields. Basically, after an executeUpdate(), look at the SQLWarnings for warnings like "LAST\_INSERTED\_ID = 'some number', COMMAND = 'your SQL query'". If you are using AUTO\_INCREMENT fields in your tables and are executing a lot of executeUpdate(s) on one Statement, be sure to clearWarnings() every so often to save memory.

### C.7.7.11. Changes in MySQL Connector/J 0.8 (06 July 1998)

- Split MysqlIO and Buffer to separate classes. Some ClassLoaders gave an IllegalAccessException error for some fields in those two classes. Now mm.mysql works in applets and all classloaders. Thanks to Joe Ennis <jce@mail.boone.com> for pointing out the problem and working on a fix with me.

### C.7.7.12. Changes in MySQL Connector/J 0.7 (01 July 1998)

- Fixed DatabaseMetadata problems in `getColumns()` and bug in switch statement in the Field constructor. Thanks to Costin Manolache <costin@tdiinc.com> for pointing these out.

### C.7.7.13. Changes in MySQL Connector/J 0.6 (21 May 1998)

- Incorporated efficiency changes from Richard Swift <Richard.Swift@kanatek.ca> in `MysqlIO.java` and `ResultSet.java`:
- We're now 15% faster than gwe's driver.
- Started working on `DatabaseMetaData`.
- The following methods are implemented:
  - `getTables()`
  - `getTableTypes()`
  - `getColumns()`
  - `getCatalogs()`

## C.8. MySQL Connector/MXJ Change History

### C.8.1. Changes in MySQL Connector/MXJ 5.0.6 (04 May 2007)

Functionality added or changed:

- Updated internal jar file names to include version information and be more consistent with Connector/J jar naming. For example, `connector-mxj.jar` is now `mysql-connector-mxj-${mxj-version}.jar`.
- Updated commercial license files.
- Added copyright notices to some classes which were missing them.
- Added `InitializeUser` and `QueryUtil` classes to support new feature.
- Added new tests for initial-user & expanded some existing tests.
- `ConnectorMXJUrlTestExample` and `ConnectorMXJObjectTestExample` now demonstrate the initialization of user/password and creating the initial database (rather than using "test").
- Added new connection property `initialize-user` which, if set to `true` will remove the default, un-passworded anonymous and root users, and create the user/password from the connection url.
- Removed obsolete field `SimpleMysqlJDynamicMBean.lastInvocation`.
- Clarified code in `DefaultsMap.entrySet()`.
- Removed obsolete `PatchedStandardSocketFactory` java file.
- Added `main(String[])` to `com/mysql/management/AllTestsSuite.java`.
- Errors reading `portFile` are now reported using `stacktrace(err)`, previously `System.err` was used.
- `portFile` now contains a new-line to be consistent with `pidFile`.
- Fixed where `versionString.trim()` was ignored.
- Removed references to `File.deleteOnExit`, a warning is printed instead.

Bugs fixed:

- Changed tests to shutdown mysqld prior to deleting files.
- Fixed port file to always be written to datadir.
- Added os.name-os.arch to resource directory mapping properties file.
- Swapped out commercial binaries for v5.0.40.
- Delete `portFile` on shutdown.
- Moved `platform-map.properties` into `db-files.jar`.
- Clarified the startup max wait numbers.
- Updated `build.xml` in preparation for next beta build.
- Removed `use-default-architecture` property replaced.
- Added null-check to deal with C/MXJ being loaded by the bootstrap classloaders with JVMs for which `getClassLoader()` returns null.
- Added robustness around reading portfile.
- Removed `PatchedStandardSocketFactory` (fixed in Connector/J 5.0.6).
- Refactored duplication from tests and examples to `QueryUtil`.
- Removed obsolete `InitializePasswordExample`

## C.8.2. Changes in MySQL Connector/MXJ 5.0.5 (14 March 2007)

Bugs fixed:

- Moved `MysqldFactory` to main package.
- Reformatting: Added newlines some files which did not end in them.
- Swapped out commercial binaries for v5.0.36.
- Found and removed dynamic linking in `mysql_kill`; updated solution.
- Changed protected constructor of `SimpleMysqldDynamicMBean` from taking a `MysqldResource` to taking a `MysqldFactory`, in order to lay groundwork for addressing BUG discovered by Andrew Rubinger. See: [MySQL Forums](#) (Actual testing with JBoss, and filing a bug, is still required.)
- `build.xml: usage` now slightly more verbose; some reformatting.
- Now incorporates Reggie Bennett's `SafeTerminateProcess` and only calls the unsafe `TerminateProcess` as a final last resort.
- New windows `kill.exe` fixes bug where mysqld was being force terminated. Issue reported by bruno haleblan and others, see: [MySQL Forums](#).
- Replaced `Boolean.parseBoolean` with JDK 1.4 compliant `valueOf`.
- Changed `connector-mxj.properties` default mysql version to 5.0.37.
- In testing so far mysqld reliably shuts down cleanly much faster.
- Added testcase to `com.mysql.management.jmx.AcceptanceTest` which demonstrates that `dataDir` is a mutable MBean property.
- Updated `build.xml` in prep for next release.
- Changed `SimpleMysqldDynamicMBean` to create `MysqldResource` on demand in order to allow setting of `datadir`. (Rubinger bug groundwork).
- Clarified the synchronization of `MysqldResource` methods.

- `SIGHUP` is replaced with `MySQLShutdown<PID>` event.
- Clarified the immutability of `baseDir`, `dataDir`, `pidFile`, `portFile`.
- Added 5.1.15 binaries to the repository.
- Removed 5.1.14 binaries from the repository.
- Added `getDataDir()` to interface `MySqlResourceI`.
- Added 5.1.14 binaries to repository.
- Replaced windows `kill.exe` resource with re-written version specific to `mysqld`.
- Added Patched `StandardSocketFactory` from Connector/J 5-0 HEAD.
- Ensured 5.1.14 compatibility.
- Swapped out gpl binaries for v5.0.37.
- Removed 5.0.22 binaries from the repository.

### C.8.3. Changes in MySQL Connector/MXJ 5.0.4 (28 January 2007)

Bugs fixed:

- Allow multiple calls to start server from URL connection on non-3306 port. ([Bug#24004](#))
- Updated `build.xml` to build to handle with different gpl and commercial `mysqld` version numbers.
- Only populate the options map from the help text if specifically requested or in the MBean case.
- Introduced property for Linux & WinXX to default to 32bit versions.
- Swapped out gpl binaries for v5.0.27.
- Swapped out commercial binaries for v5.0.32.
- Moved `mysqld` binary resourced into separate jar file NOTICE: `CLASSPATH` will now need to `connector-mxj-db-files.jar`.
- Minor test robustness improvements.
- Moved default version string out of java class into a text editable properties file (`connector-mxj.properties`) in the resources directory.
- Fixed test to be tollerant of `/tmp` being a symlink to `/foo/tmp`.

### C.8.4. Changes in MySQL Connector/MXJ 5.0.3 (24 June 2006)

Bugs fixed:

- Removed unused imports, formatted code, made minor edits to tests.
- Removed "TeeOutputStream" - no longer needed.
- Swapped out the `mysqld` binaries for MySQL v5.0.22.

### C.8.5. Changes in MySQL Connector/MXJ 5.0.2 (15 June 2006)

Bugs fixed:

- Replaced string parsing with JDBC connection attempt for determining if a `mysqld` is "ready for connections" `CLASSPATH` will now need to include Connector/J jar.

- "platform" directories replace spaces with underscores
- extracted array and list printing to ListToString utility class
- Swapped out the mysqld binaries for MySQL v5.0.21
- Added trace level logging with Aspect/J. `CLASSPATH` will now need to include `lib/aspectjrt.jar`
- reformatted code
- altered to be "basedir" rather than "port" oriented.
- help parsing test reflects current help options
- insulated users from problems with "." in basedir
- swapped out the mysqld binaries for MySQL v5.0.18
- Made tests more robust by deleting the `/tmp/test-c.mxj` directory before running tests.
- `ServerLauncherSocketFactory.shutdown` API change: now takes File parameter (basedir) instead of port.
- socket is now "mysql.sock" in datadir
- added ability to specify "mysql-version" as an url parameter
- Extended timeout for help string parsing, to avoid cases where the help text was getting prematurely flushed, and thus truncated.
- swapped out the mysqld binaries for MySQL v5.0.19
- `MysqldResource` now tied to `dataDir` as well as `basedir` (API CHANGE)
- moved PID file into datadir
- `ServerLauncherSocketFactory.shutdown` now works across JVMs.
- extracted `splitLines(String)` to `Str` utility class
- `ServerLauncherSocketFactory.shutdown(port)` no longer throws, only reports to `System.err`
- `ServerLauncherSocketFactory` now treats URL parameters in the form of `&server.foo=null` as `serverOptionMap.put("foo", null)`
- `ServerLauncherSocketFactory.shutdown` API change: now takes 2 File parameters (basedir, datadir)

## C.8.6. Changes in MySQL Connector/MXJ 5.0.1 (Never released)

This was an internal only release.

## C.8.7. Changes in MySQL Connector/MXJ 5.0.0 (09 December 2005)

Bugs fixed:

- Removed `HelpOptionsParser`'s need to reference a `MysqldResource`.
- Reorganized utils into a single "Utils" collaborator.
- Minor test tweaks
- Altered examples and tests to use new Connector/J 5.0 URL syntax for launching Connector/MXJ ("`jdbc:mysql:mxj://`")
- Swapped out the mysqld binaries for MySQL v5.0.16.
- Ditched "ClassUtil" (merged with `Str`).
- Minor refactorings for type casting and exception handling.

## C.9. MySQL Proxy Change History

### C.9.1. Changes in MySQL Proxy 0.7.0 (Not yet released)

Bugs fixed:

- **Security Enhancement:** Accessing `mysql-proxy` using a client or backend with a MySQL protocol less than MySQL 5.0 would result in `mysql-proxy` aborting with an assertion. This is because `mysql-proxy` only supports MySQL Protocol 5.0 or higher. The proxy will now report a fault. ([Bug#31419](#))
- Using `mysql-proxy` with very large return datasets from queries, with or without manipulate of the dataset within the Lua engine could cause a crash. ([Bug#39332](#))
- If a submitted packet was smaller than expected by the protocol, MySQL Proxy would terminate. ([Bug#36743](#))
- When using `mysql-proxy` in a master-master replication scenario, a failure in one of the replication masters would fail to be identified by the proxy and connections would not be redirected to the other master. ([Bug#35295](#))

### C.9.2. Changes in MySQL Proxy 0.6.1 (06 February 2008)

Functionality added or changed:

- Fixed assertions on write-errors
- Fixed sending fake server-greetings in `connect_server()`.
- Fixed error handling for socket functions on Windows.
- Added new features to `run-tests.lua`.

### C.9.3. Changes in MySQL Proxy 0.6.0 (11 September 2007)

Functionality added or changed:

- When using read/write splitting and the `rw-splitting.lua` example script, connecting a second user to the proxy returns an error message. ([Bug#30867](#))
- Added support in `read_query_result()` to overwrite the result-set.
- Added `--no-daemon` and `--pid-file`.
- Added hooks for `read_auth()`, `read_handshake()` and `read_auth_result()`.
- Added handling of `proxy.connection.backend_ndx` in `connect_server()` and `read_query()` to support read/write splitting.
- Added support for `proxy.response.packets`.
- Added testcases.
- Added `--no-proxy` to disable the proxy.
- Added support for listening UNIX sockets.
- Added a global lua-scope `proxy.global.*`.
- Added connection pooling.

Bugs fixed:

- Fixed assertion on `COM_BINLOG_DUMP`. ([Bug#29764](#))
- Fixed assertion on result-packets like `[ field-len | fields | EOF | ERR ]`. ([Bug#29732](#))

- Fixed assertion at login with empty password + empty default db. (Bug#29719)
- Fixed assertion at `COM_SHUTDOWN`. (Bug#29719)
- Fixed crash if `proxy.connection` is used in `connect_server()`.
- Fixed check for `glib2` to require at least 2.6.0.
- Fixed assertion when all backends are down and we try to connect.
- Fixed connection-stalling if `read_query_result()` throws an `assert()` ion.
- Fixed len-encoding on `proxy.resultsets`.
- Fixed compilation on win32.
- Fixed assertion when connecting to the MySQL 6.0.1.
- Fixed decoding of len-encoded ints for 3-byte notation.
- Fixed `inj.resultset.affected_rows` on `SELECT` queries.
- Fixed handling of (SQL) `NULL` in result-sets.
- Fixed mem-leak with `proxy.response.*` is used.

#### C.9.4. Changes in MySQL Proxy 0.5.1 (30 June 2007)

Functionality added or changed:

- Added `resultset.affected_rows` and `resultset.insert_id`.
- Changed `--proxy.profiling` to `--proxy-skip-profiling`.
- Added missing dependency to `libmysqlclient-dev` to the `INSTALL` file.
- Added `inj.query_time` and `inj.response_time` into the lua scripts.
- Added support for pre-4.1 passwords in a 4.1 connection.
- Added script examples for rewriting and injection.
- Added `proxy.VERSION`.
- Added support for UNIX sockets.
- Added protection against duplicate resultsets from a script.

Bugs fixed:

- Fixed mysql check in configure to die when `mysql.h` isn't detected.
- Fixed handling of duplicate ERR on `COM_CHANGE_USER` in MySQL 5.1.18+.
- Fixed compile error with MySQL 4.1.x on missing `COM_STMT_*`.
- Fixed crash on fields > 250 bytes when the resultset is inspected.
- Fixed warning if `connect_server()` is not provided.
- Fixed assertion when a error occurs at initial script exec time.
- Fixed assertion when `read_query_result()` is not provided when `PROXY_SEND_QUERY` is used.

#### C.9.5. Changes in MySQL Proxy 0.5.0 (19 June 2007)

This is the first beta release.

Bugs fixed:

- Added [automake/autoconf](#) support.
- Added [cmake](#) support.

---

## Appendix D. Restrictions and Limits

The discussion here describes restrictions that apply to the use of MySQL features such as subqueries or views.

### D.1. Restrictions on Stored Routines, Triggers, and Events

Some of the restrictions noted here apply to all stored routines; that is, both to stored procedures and stored functions. Some of these restrictions apply to stored functions but not to stored procedures.

The restrictions for stored functions also apply to triggers. There are also some restrictions specific to triggers.

The restrictions for stored procedures also apply to the `DO` clause of Event Scheduler event definitions. There are also some restrictions specific to events.

Stored routines cannot contain arbitrary SQL statements. The following statements are disallowed:

- The locking statements `LOCK TABLES` and `UNLOCK TABLES`.
- `ALTER VIEW`. (Before MySQL 5.1.21, this restriction is enforced only for stored functions.)
- `LOAD DATA` and `LOAD TABLE`.
- SQL prepared statements (`PREPARE`, `EXECUTE`, `DEALLOCATE PREPARE`) can be used in stored procedures, but not stored functions or triggers. Implication: You cannot use dynamic SQL within stored functions or triggers (where you construct dynamically statements as strings and then execute them).

In addition, SQL statements that are not permitted within prepared statements are also not permitted in stored routines. See [Section 12.7, “SQL Syntax for Prepared Statements”](#), for a list of statements supported as prepared statements. Statements not listed there are not supported for SQL prepared statements and thus are also not supported for stored routines unless noted otherwise in [Section 18.2, “Using Stored Routines \(Procedures and Functions\)”](#).

- Inserts cannot be delayed. `INSERT DELAYED` syntax is accepted but the statement is handled as a normal `INSERT`.
- Within all stored programs (stored procedures and functions, triggers, and events), the parser treats `BEGIN [WORK]` as the beginning of a `BEGIN . . . END` block. Begin a transaction in this context with `START TRANSACTION` instead.

For stored functions (but not stored procedures), the following additional statements or operations are disallowed:

- Statements that perform explicit or implicit commit or rollback. Support for these statements is not required by the SQL standard, which states that each DBMS vendor may decide whether to allow them.
- Statements that return a result set. This includes `SELECT` statements that do not have an `INTO var_list` clause and other statements such as `SHOW`, `EXPLAIN`, and `CHECK TABLE`. A function can process a result set either with `SELECT . . . INTO var_list` or by using a cursor and `FETCH` statements. See [Section 12.8.3.3, “SELECT . . . INTO Statement”](#).
- `FLUSH` statements.
- Stored functions cannot be used recursively.
- Within a stored function or trigger, it is not permitted to modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.
- If you refer to a temporary table multiple times in a stored function under different aliases, a `Can't reopen table: 'tbl_name'` error occurs, even if the references occur in different statements within the function.
- A stored function acquires table locks before executing, to avoid inconsistency in the binary log due to mismatch of the order in which statements execute and when they appear in the log. When statement-based binary logging is used, statements that invoke a function are recorded rather than the statements executed within the function. Consequently, stored functions that update the same underlying tables do not execute in parallel. In contrast, stored procedures do not acquire table-level locks. All statements executed within stored procedures are written to the binary log even for statement-based binary logging. See [Section 18.6, “Binary Logging of Stored Programs”](#).

Although some restrictions normally apply to stored functions and triggers but not to stored procedures, those restrictions do apply to stored procedures if they are invoked from within a stored function or trigger. For example, if you use `FLUSH` in a stored procedure, that stored procedure cannot be called from a stored function or trigger.

It is possible for the same identifier to be used for a routine parameter, a local variable, and a table column. Also, the same local variable name can be used in nested blocks. For example:

```
CREATE PROCEDURE p (i INT)
BEGIN
  DECLARE i INT DEFAULT 0;
  SELECT i FROM t;
  BEGIN
    DECLARE i INT DEFAULT 1;
    SELECT i FROM t;
  END;
END;
```

In such cases the identifier is ambiguous and the following precedence rules apply:

- A local variable takes precedence over a routine parameter or table column
- A routine parameter takes precedence over a table column
- A local variable in an inner block takes precedence over a local variable in an outer block

The behavior that variables take precedence over table columns is non-standard.

Use of stored routines can cause replication problems. This issue is discussed further in [Section 18.6, “Binary Logging of Stored Programs”](#).

`INFORMATION_SCHEMA` does not have a `PARAMETERS` table until MySQL 6.0, so applications that need to acquire routine parameter information at runtime must use workarounds such as parsing the output of `SHOW CREATE` statements or the `param_list` column of the `mysql.proc` table. `param_list` contents can be processed from within a stored routine, unlike the output from `SHOW`.

There are no stored routine debugging facilities.

Before MySQL 5.1.4, `CALL` statements cannot be prepared. This true both for server-side prepared statements and for SQL prepared statements.

`UNDO` handlers are not supported.

`FOR` loops are not supported.

To prevent problems of interaction between server threads, when a client issues a statement, the server uses a snapshot of routines and triggers available for execution of the statement. That is, the server calculates a list of procedures, functions, and triggers that may be used during execution of the statement, loads them, and then proceeds to execute the statement. This means that while the statement executes, it will not see changes to routines performed by other threads.

For triggers, the following additional statements or operations are disallowed:

- Triggers currently are not activated by foreign key actions.
- When using row-based replication, triggers on the slave are not activated by statements originating on the master. This does not apply when using statement-based replication. For more information, see [Section 16.3.1.26, “Replication and Triggers”](#).
- The `RETURN` statement is disallowed in triggers, which cannot return a value. To exit a trigger immediately, use the `LEAVE` statement.
- Triggers are not allowed on tables in the `mysql` database.

The following limitations are specific to the Event Scheduler:

- In MySQL 5.1.6 only, any table referenced in an event's action statement must be fully qualified with the name of the schema in which it occurs (that is, as `schema_name.table_name`).
- Beginning with MySQL 5.1.8, event names are handled in case-insensitive fashion. For example, this means that you cannot have two events in the same database (and — prior to MySQL 5.1.12 — with the same definer) with the names `anEvent` and `AnEvent`.

### ■ Important

If you have events created in MySQL 5.1.7 or earlier which are assigned to the same database and have the same definer, and whose names differ only with respect to lettercase, then you must rename these events to respect case-sensitive handling before upgrading to MySQL 5.1.8 or later.

- An event may not be created, altered, or dropped by a stored routine, trigger, or another event. An event also may not create, alter, or drop stored routines or triggers. (Bug#16409, Bug#18896)
- Event timings using the intervals `YEAR`, `QUARTER`, `MONTH`, and `YEAR_MONTH` are resolved in months; those using any other interval are resolved in seconds. There is no way to cause events scheduled to occur at the same second to execute in a given order. In addition — due to rounding, the nature of threaded applications, and the fact that a nonzero length of time is required to create events and to signal their execution — events may be delayed by as much as 1 or 2 seconds. However, the time shown in the `INFORMATION_SCHEMA.EVENTS` table's `LAST_EXECUTED` column or the `mysql.event` table's `last_executed` column is always accurate to within one second of the actual event execution time. (See also Bug#16522.)
- Each execution of the statements contained in the body of an event takes place in a new connection; thus, these statements has no effect in a given user session on the server's statement counts such as `Com_select` and `Com_insert` that are displayed by `SHOW STATUS`. However, such counts *are* updated in the global scope. (Bug#16422)
- Prior to MySQL 5.1.12, you could not view another user's events in the `INFORMATION_SCHEMA.EVENTS` table. In other words, any query made against this table was treated as though it contained the condition `DEFINER = CURRENT_USER()` in the `WHERE` clause.
- Events do not support times later than the end of the Unix Epoch; this is approximately the beginning of the year 2038. Prior to MySQL 5.1.8, handling in scheduled events of dates later than this was buggy; starting with MySQL 5.1.8, such dates are specifically disallowed by the Event Scheduler. (Bug#16396)
- In MySQL 5.1.6, `INFORMATION_SCHEMA.EVENTS` shows `NULL` in the `SQL_MODE` column. Beginning with MySQL 5.1.7, the `SQL_MODE` displayed is that in effect when the event was created.
- In MySQL 5.1.6, the only way to drop or alter an event created by a user who was not the definer of that event was by manipulation of the `mysql.event` system table by the MySQL `root` user or by another user with privileges on this table. Beginning with MySQL 5.1.7, `DROP USER` drops all events for which that user was the definer; also beginning with MySQL 5.1.7 `DROP SCHEMA` drops all events associated with the dropped schema.
- References to stored functions, user-defined functions, and tables in the `ON SCHEDULE` clauses of `CREATE EVENT` and `ALTER EVENT` statements are not supported. Beginning with MySQL 5.1.13, these sorts of references are disallowed. (See Bug#22830 for more information.)
- Generally speaking, statements which are not permitted in stored routines or in SQL prepared statements are also not allowed in the body of an event. For more information, see Section 12.7, “SQL Syntax for Prepared Statements”.
- When upgrading to MySQL 5.1.18 or 5.1.19 from a previous MySQL version where scheduled events were in use, the upgrade utilities `mysql_upgrade` and `mysql_fix_privilege_tables` do not accomodate changes in system tables relating to the Event Scheduler. This issue was fixed in MySQL 5.1.20 (see Bug#28521).

**Stored routines and triggers in MySQL Cluster.** Stored functions, stored procedures, and triggers are all supported by tables using the `NDB` storage engine; however, it is important to keep in mind that they do *not* propagate automatically between MySQL Servers acting as Cluster SQL nodes. This is because of the following:

- Stored routine definitions are kept in tables in the `mysql` system database using the `MyISAM` storage engine, and so do not participate in clustering.
- The `.TRN` and `.TRG` files containing trigger definitions are not read by the `NDB` storage engine, and are not copied between Cluster nodes.

Any stored routine or trigger that interacts with MySQL Cluster tables must be re-created by running the appropriate `CREATE PROCEDURE`, `CREATE FUNCTION`, or `CREATE TRIGGER` statements on each MySQL Server that participates in the cluster where you wish to use the stored routine or trigger. Similarly, any changes to existing stored routines or triggers must be carried out explicitly on all Cluster SQL nodes, using the appropriate `ALTER` or `DROP` statements on each MySQL Server accessing the cluster.

### Warning

Do *not* attempt to work around the issue described in the first item mentioned previously by converting any `mysql` database tables to use the `NDB` storage engine. *Altering the system tables in the `mysql` database is not supported* and is very likely to produce undesirable results.

## D.2. Restrictions on Server-Side Cursors

Server-side cursors are implemented in the C API via the `mysql_stmt_attr_set()` function. The same implementation is used for cursors in stored routines. A server-side cursor allows a result set to be generated on the server side, but not transferred to the client except for those rows that the client requests. For example, if a client executes a query but is only interested in the first row, the remaining rows are not transferred.

In MySQL, a server-side cursor is materialized into a temporary table. Initially, this is a `MEMORY` table, but is converted to a `MyISAM` table if its size reaches the value of the `max_heap_table_size` system variable. One limitation of the implementation is that for a large result set, retrieving its rows through a cursor might be slow.

Cursors are read only; you cannot use a cursor to update rows.

`UPDATE WHERE CURRENT OF` and `DELETE WHERE CURRENT OF` are not implemented, because updatable cursors are not supported.

Cursors are non-holdable (not held open after a commit).

Cursors are asensitive.

Cursors are non-scrollable.

Cursors are not named. The statement handler acts as the cursor ID.

You can have open only a single cursor per prepared statement. If you need several cursors, you must prepare several statements.

You cannot use a cursor for a statement that generates a result set if the statement is not supported in prepared mode. This includes statements such as `CHECK TABLE`, `HANDLER READ`, and `SHOW BINLOG EVENTS`.

## D.3. Restrictions on Subqueries

- In MySQL 5.1 before 5.1.16, if you compare a `NULL` value to a subquery using `ALL`, `ANY`, or `SOME`, and the subquery returns an empty result, the comparison might evaluate to the non-standard result of `NULL` rather than to `TRUE` or `FALSE`. As of 5.1.16, the comparison evaluates to `TRUE` or `FALSE` except for subqueries inside `IS NULL`, such as this:

```
SELECT ... WHERE NULL IN (SELECT ...) IS NULL
```

As of 5.1.32, the `IS NULL` limitation is removed and the comparison evaluates to `TRUE` or `FALSE`.

- A subquery's outer statement can be any one of: `SELECT`, `INSERT`, `UPDATE`, `DELETE`, `SET`, or `DO`.
- Subquery optimization for `IN` is not as effective as for the `=` operator or for the `IN(value_list)` operator.

A typical case for poor `IN` subquery performance is when the subquery returns a small number of rows but the outer query returns a large number of rows to be compared to the subquery result.

The problem is that, for a statement that uses an `IN` subquery, the optimizer rewrites it as a correlated subquery. Consider the following statement that uses an uncorrelated subquery:

```
SELECT ... FROM t1 WHERE t1.a IN (SELECT b FROM t2);
```

The optimizer rewrites the statement to a correlated subquery:

```
SELECT ... FROM t1 WHERE EXISTS (SELECT 1 FROM t2 WHERE t2.b = t1.a);
```

If the inner and outer queries return  $M$  and  $N$  rows, respectively, the execution time becomes on the order of  $O(M \times N)$ , rather than  $O(M+N)$  as it would be for an uncorrelated subquery.

An implication is that an `IN` subquery can be much slower than a query written using an `IN(value_list)` operator that lists the same values that the subquery would return.

- In general, you cannot modify a table and select from the same table in a subquery. For example, this limitation applies to statements of the following forms:

```
DELETE FROM t WHERE ... (SELECT ... FROM t ...);
UPDATE t ... WHERE col = (SELECT ... FROM t ...);
{INSERT|REPLACE} INTO t (SELECT ... FROM t ...);
```

Exception: The preceding prohibition does not apply if you are using a subquery for the modified table in the `FROM` clause. Example:

```
UPDATE t ... WHERE col = (SELECT * FROM (SELECT ... FROM t...) AS _t ...);
```

Here the prohibition does not apply because the result from a subquery in the `FROM` clause is stored as a temporary table, so the relevant rows in `t` have already been selected by the time the update to `t` takes place.

- Row comparison operations are only partially supported:
  - For `expr IN (subquery)`, `expr` can be an  $n$ -tuple (specified via row constructor syntax) and the subquery can return rows of  $n$ -tuples.
  - For `expr op {ALL|ANY|SOME} (subquery)`, `expr` must be a scalar value and the subquery must be a column subquery; it cannot return multiple-column rows.

In other words, for a subquery that returns rows of  $n$ -tuples, this is supported:

```
(val_1, ..., val_n) IN (subquery)
```

But this is not supported:

```
(val_1, ..., val_n) op {ALL|ANY|SOME} (subquery)
```

The reason for supporting row comparisons for `IN` but not for the others is that `IN` is implemented by rewriting it as a sequence of `=` comparisons and `AND` operations. This approach cannot be used for `ALL`, `ANY`, or `SOME`.

- Row constructors are not well optimized. The following two expressions are equivalent, but only the second can be optimized:

```
(col1, col2, ...) = (val1, val2, ...)
col1 = val1 AND col2 = val2 AND ...
```

- Subqueries in the `FROM` clause cannot be correlated subqueries. They are materialized (executed to produce a result set) before evaluating the outer query, so they cannot be evaluated per row of the outer query.
- The optimizer is more mature for joins than for subqueries, so in many cases a statement that uses a subquery can be executed more efficiently if you rewrite it as a join.

An exception occurs for the case where an `IN` subquery can be rewritten as a `SELECT DISTINCT` join. Example:

```
SELECT col FROM t1 WHERE id_col IN (SELECT id_col2 FROM t2 WHERE condition);
```

That statement can be rewritten as follows:

```
SELECT DISTINCT col FROM t1, t2 WHERE t1.id_col = t2.id_col AND condition;
```

But in this case, the join requires an extra `DISTINCT` operation and is not more efficient than the subquery.

- Possible future optimization: MySQL does not rewrite the join order for subquery evaluation. In some cases, a subquery could be executed more efficiently if MySQL rewrote it as a join. This would give the optimizer a chance to choose between more execution plans. For example, it could decide whether to read one table or the other first.

Example:

```
SELECT a FROM outer_table AS ot
WHERE a IN (SELECT a FROM inner_table AS it WHERE ot.b = it.b);
```

For that query, MySQL always scans `outer_table` first and then executes the subquery on `inner_table` for each row. If `outer_table` has a lot of rows and `inner_table` has few rows, the query probably will not be as fast as it could be.

The preceding query could be rewritten like this:

```
SELECT a FROM outer_table AS ot, inner_table AS it
WHERE ot.a = it.a AND ot.b = it.b;
```

In this case, we can scan the small table (`inner_table`) and look up rows in `outer_table`, which will be fast if there is an index on `(ot.a, ot.b)`.

- Possible future optimization: A correlated subquery is evaluated for each row of the outer query. A better approach is that if the outer row values do not change from the previous row, do not evaluate the subquery again. Instead, use its previous result.
- Possible future optimization: A subquery in the `FROM` clause is evaluated by materializing the result into a temporary table, and this table does not use indexes. This does not allow the use of indexes in comparison with other tables in the query, although that might be useful.
- Possible future optimization: If a subquery in the `FROM` clause resembles a view to which the merge algorithm can be applied, rewrite the query and apply the merge algorithm so that indexes can be used. The following statement contains such a subquery:

```
SELECT * FROM (SELECT * FROM t1 WHERE t1.t1_col)
             AS _t1, t2 WHERE t2.t2_col;
```

The statement can be rewritten as a join like this:

```
SELECT * FROM t1, t2 WHERE t1.t1_col AND t2.t2_col;
```

This type of rewriting would provide two benefits:

- It avoids the use of a temporary table for which no indexes can be used. In the rewritten query, the optimizer can use indexes on `t1`.
- It gives the optimizer more freedom to choose between different execution plans. For example, rewriting the query as a join allows the optimizer to use `t1` or `t2` first.
- Possible future optimization: For `IN`, `= ANY`, `<> ANY`, `= ALL`, and `<> ALL` with uncorrelated subqueries, use an in-memory hash for a result or a temporary table with an index for larger results. Example:

```
SELECT a FROM big_table AS bt
WHERE non_key_field IN (SELECT non_key_field FROM table WHERE condition)
```

In this case, we could create a temporary table:

```
CREATE TABLE t (key (non_key_field))
(SELECT non_key_field FROM table WHERE condition)
```

Then, for each row in `big_table`, do a key lookup in `t` based on `bt.non_key_field`.

## D.4. Restrictions on Views

View processing is not optimized:

- It is not possible to create an index on a view.
- Indexes can be used for views processed using the merge algorithm. However, a view that is processed with the temptable algorithm is unable to take advantage of indexes on its underlying tables (although indexes can be used during generation of the temporary tables).

Subqueries cannot be used in the `FROM` clause of a view.

There is a general principle that you cannot modify a table and select from the same table in a subquery. See [Section D.3, “Restrictions on Subqueries”](#).

The same principle also applies if you select from a view that selects from the table, if the view selects from the table in a subquery and the view is evaluated using the merge algorithm. Example:

```
CREATE VIEW v1 AS
SELECT * FROM t2 WHERE EXISTS (SELECT 1 FROM t1 WHERE t1.a = t2.a);
UPDATE t1, v2 SET t1.a = 1 WHERE t1.b = v2.b;
```

If the view is evaluated using a temporary table, you *can* select from the table in the view subquery and still modify that table in the outer query. In this case the view will be stored in a temporary table and thus you are not really selecting from the table in a subquery and modifying it “at the same time.” (This is another reason you might wish to force MySQL to use the temptable algorithm by specifying `ALGORITHM = TEMPTABLE` in the view definition.)

You can use `DROP TABLE` or `ALTER TABLE` to drop or alter a table that is used in a view definition. No warning results from

the `DROP` or `ALTER` operation, even though this invalidates the view. Instead, an error occurs later, when the view is used. `CHECK TABLE` can be used to check for views that have been invalidated by `DROP` or `ALTER` operations.

A view definition is “frozen” by certain statements:

- If a statement prepared by `PREPARE` refers to a view, the view definition seen each time the statement is executed later will be the definition of the view at the time it was prepared. This is true even if the view definition is changed after the statement is prepared and before it is executed. Example:

```
CREATE VIEW v AS SELECT RAND();
PREPARE s FROM 'SELECT * FROM v';
ALTER VIEW v AS SELECT NOW();
EXECUTE s;
```

The result returned by the `EXECUTE` statement is a random number, not the current date and time.

- If a statement in a stored routine refers to a view, the view definition seen by the statement are its definition the first time that statement is executed. For example, this means that if the statement is executed in a loop, further iterations of the statement see the same view definition, even if the definition is changed later in the loop. Example:

```
CREATE VIEW v AS SELECT 1;
delimiter //
CREATE PROCEDURE p ()
BEGIN
  DECLARE i INT DEFAULT 0;
  WHILE i < 5 DO
    SELECT * FROM v;
    SET i = i + 1;
    ALTER VIEW v AS SELECT 2;
  END WHILE;
END;
//
delimiter ;
CALL p();
```

When the procedure `p()` is called, the `SELECT` returns 1 each time through the loop, even though the view definition is changed within the loop.

As of MySQL 5.1.21, `ALTER VIEW` is prohibited within stored routines, so this restriction does not apply.

With regard to view updatability, the overall goal for views is that if any view is theoretically updatable, it should be updatable in practice. This includes views that have `UNION` in their definition. Currently, not all views that are theoretically updatable can be updated. The initial view implementation was deliberately written this way to get usable, updatable views into MySQL as quickly as possible. Many theoretically updatable views can be updated now, but limitations still exist:

- Updatable views with subqueries anywhere other than in the `WHERE` clause. Some views that have subqueries in the `SELECT` list may be updatable.
- You cannot use `UPDATE` to update more than one underlying table of a view that is defined as a join.
- You cannot use `DELETE` to update a view that is defined as a join.

There exists a shortcoming with the current implementation of views. If a user is granted the basic privileges necessary to create a view (the `CREATE VIEW` and `SELECT` privileges), that user will be unable to call `SHOW CREATE VIEW` on that object unless the user is also granted the `SHOW VIEW` privilege.

That shortcoming can lead to problems backing up a database with `mysqldump`, which may fail due to insufficient privileges. This problem is described in [Bug#22062](#).

The workaround to the problem is for the administrator to manually grant the `SHOW VIEW` privilege to users who are granted `CREATE VIEW`, since MySQL doesn't grant it implicitly when views are created.

Views do not have indexes, so index hints do not apply. Use of index hints when selecting from a view is disallowed.

`SHOW CREATE VIEW` displays view definitions using an `AS alias_name` clause for each column. If a column is created from an expression, the default alias is the expression text, which can be quite long. As of MySQL 5.1.23, aliases for column names in `CREATE VIEW` statements are checked against the maximum column length of 64 characters (not the maximum alias length of 256 characters). As a result, views created from the output of `SHOW CREATE VIEW` fail if any column alias exceeds 64 characters. This can cause problems in the following circumstances for views with too-long aliases:

- View definitions fail to replicate to newer slaves that enforce the column-length restriction.

- Dump files created with `mysqldump` cannot be loaded into servers that enforce the column-length restriction.

A workaround for either problem is to modify each problematic view definition to use aliases that provide shorter column names. Then the view will replicate properly, and can be dumped and reloaded without causing an error. To modify the definition, drop and create the view again with `DROP VIEW` and `CREATE VIEW`, or replace the definition with `CREATE OR REPLACE VIEW`.

For problems that occur when reloading view definitions in dump files, another workaround is to edit the dump file to modify its `CREATE VIEW` statements. However, this does not change the original view definitions, which may cause problems for subsequent dump operations.

## D.5. Restrictions on XA Transactions

XA transaction support is limited to the `InnoDB` storage engine.

For “external XA,” a MySQL server acts as a Resource Manager and client programs act as Transaction Managers. For “Internal XA”, storage engines within a MySQL server act as RMs, and the server itself acts as a TM. Internal XA support is limited by the capabilities of individual storage engines. Internal XA is required for handling XA transactions that involve more than one storage engine. The implementation of internal XA requires that a storage engine support two-phase commit at the table handler level, and currently this is true only for `InnoDB`.

For `XA START`, the `JOIN` and `RESUME` clauses are not supported.

For `XA END`, the `SUSPEND [FOR MIGRATE]` clause is not supported.

The requirement that the `bqual` part of the `xid` value be different for each XA transaction within a global transaction is a limitation of the current MySQL XA implementation. It is not part of the XA specification.

If an XA transaction has reached the `PREPARED` state and the MySQL server is killed (for example, with `kill -9` on Unix) or shuts down abnormally, the transaction can be continued after the server restarts. However, if the client reconnects and commits the transaction, the transaction will be absent from the binary log even though it has been committed. This means the data and the binary log have gone out of synchrony. An implication is that XA cannot be used safely together with replication.

It is possible that the server will roll back a pending XA transaction, even one that has reached the `PREPARED` state. This happens if a client connection terminates and the server continues to run, or if clients are connected and the server shuts down gracefully. (In the latter case, the server marks each connection to be terminated, and then rolls back the `PREPARED` XA transaction associated with it.) It should be possible to commit or roll back a `PREPARED` XA transaction, but this cannot be done without changes to the binary logging mechanism.

## D.6. Restrictions on Character Sets

- Identifiers are stored in `mysql` database tables (`user`, `db`, and so forth) using `utf8`, but identifiers can contain only characters in the Basic Multilingual Plane (BMP). Supplementary characters are not allowed in identifiers.
- The `ucs2` character sets has the following restrictions:
  - It cannot be used as a client character set, which means that it does not work for `SET NAMES` or `SET CHARACTER SET`. (See [Section 9.1.4](#), “Connection Character Sets and Collations”.)
  - It is currently not possible to use `LOAD DATA INFILE` to load data files that use this character set.
  - `FULLTEXT` indexes cannot be created on a column that this character set. However, you can perform `IN BOOLEAN MODE` searches on the column without an index.
- The `REGEXP` and `RLIKE` operators work in byte-wise fashion, so they are not multi-byte safe and may produce unexpected results with multi-byte character sets. In addition, these operators compare characters by their byte values and accented characters may not compare as equal even if a given collation treats them as equal.

## D.7. Limits in MySQL

This section lists current limits in MySQL 5.1.

### D.7.1. Limits of Joins

The maximum number of tables that can be referenced in a single join is 61. This also applies to the number of tables that can be referenced in the definition of a view.

## D.7.2. The Maximum Number of Columns Per Table

There is a hard limit of 4096 columns per table, but the effective maximum may be less for a given table. The exact limit depends on several interacting factors, listed in the following discussion.

- Every table has a maximum row size of 65,535 bytes. This maximum applies to all storage engines, but a given engine might have additional constraints that result in a lower effective maximum row size.

The maximum row size constrains the number of columns because the total width of all columns cannot exceed this size. For example, `utf8` characters require up to three bytes per character, so for a `CHAR(255) CHARACTER SET utf8` column, the server must allocate  $255 \times 3 = 765$  bytes per value. Consequently, a table cannot contain more than  $65,535 / 765 = 85$  such columns.

Storage for variable-length columns includes length bytes, which are assessed against the row size. For example, a `VARCHAR(255) CHARACTER SET utf8` column takes two bytes to store the length of the value, so each value can take up to 767 bytes.

`BLOB` and `TEXT` columns count from one to four plus eight bytes each toward the row-size limit because their contents are stored separately.

Declaring columns `NULL` can reduce the maximum number of columns allowed. `NULL` columns require additional space in the row to record whether or not their values are `NULL`.

For `MyISAM` tables, each `NULL` column takes one bit extra, rounded up to the nearest byte. The maximum row length in bytes can be calculated as follows:

```
row length = 1
             + (sum of column lengths)
             + (number of NULL columns + delete_flag + 7)/8
             + (number of variable-length columns)
```

`delete_flag` is 1 for tables with static row format. Static tables use a bit in the row record for a flag that indicates whether the row has been deleted. `delete_flag` is 0 for dynamic tables because the flag is stored in the dynamic row header.

These calculations do not apply for `InnoDB` tables, for which storage size is no different for `NULL` columns than for `NOT NULL` columns.

The following statement to create table `t1` succeeds because the columns require 32,765 + 2 bytes and 32,766 + 2 bytes, which falls within the maximum row size of 65,535 bytes:

```
mysql> CREATE TABLE t1
-> (c1 VARCHAR(32765) NOT NULL, c2 VARCHAR(32766) NOT NULL);
Query OK, 0 rows affected (0.01 sec)
```

The following statement to create table `t2` fails because the columns are `NULL` and require additional space that causes the row size to exceed 65,535 bytes:

```
mysql> CREATE TABLE t2
-> (c1 VARCHAR(32765) NULL, c2 VARCHAR(32766) NULL);
ERROR 1118 (42000): Row size too large. The maximum row size for the
used table type, not counting BLOBs, is 65535. You have to change some
columns to TEXT or BLOBs
```

- Each table has an `.frm` file that contains the table definition. The `.frm` file size limit is fixed at 64KB. If a table definition reaches this size, no more columns can be added. The expression that checks information to be stored in the `.frm` file against the limit looks like this:

```
if (info_length+(ulong) create_fields.elements*FCOMP+288+
    n_length+int_length+com_length > 65535L || int_count > 255)
```

The relevant factors in this expression are:

- `info_length` is space needed for “screens.” This is related to MySQL's Unireg heritage.
- `create_fields.elements` is the number of columns.
- `FCOMP` is 17.
- `n_length` is the total length of all column names, including one byte per name as a separator.
- `int_length` is related to the list of values for SET and ENUM columns.

- `com_length` is the total length of column and table comments.

Thus, using long column names can reduce the maximum number of columns, as can the inclusion of `ENUM` or `SET` columns, or use of column or table comments.

- Individual storage engines might impose additional restrictions that limit table column count. Examples:
  - `InnoDB` allows no more than 1000 columns.
  - `InnoDB` restricts row size to something less than half a database page (approximately 8000 bytes), not including `VARBINARY`, `VARCHAR`, `BLOB`, or `TEXT` columns.
  - Different `InnoDB` storage formats (`COMPRESSED`, `REDUNDANT`) use different amounts of page header and trailer data, which affects the amount of storage available for rows.

### D.7.3. Windows Platform Limitations

The following limitations apply only to the Windows platform:

- The number of open file descriptors on Windows is limited to a maximum of 2048, which may limit the ability to open a large number of tables simultaneously. This limit is due to the compatibility functions used to open files on Windows that use the POSIX compatibility layer.

This limitation will also cause problems if you try to set `open_files_limit` to a value greater than the 2048 file limit.

- On Windows 32-bit platforms it is not possible to use more than 2GB of RAM within a single process, including MySQL. This is because the physical address limit on Windows 32-bit is 4GB and the default setting within Windows is to split the virtual address space between kernel (2GB) and user/applications (2GB).

To use more memory than this you will need to use a 64-bit version of Windows.

- When using `MyISAM` tables, you cannot use aliases within Windows link to the data files on another volume and then link back to the main MySQL `datadir` location.

This facility is often used to move the data and index files to a RAID or other fast solution, while retaining the main `.FRM` files in the default data directory configured with the `datadir` option.

- The timers within MySQL used on Windows are of a lower precision than the timers used on Linux. For most situations you may not notice a difference, but the delay implied by a call to `SLEEP()` on Windows and Linux may differ slightly due to the differences in precision.
- There is no 64-bit OLEDB Provider for ODBC (MSDASQL) in any 64-bit Windows operating system up to and including Windows Vista. In practical terms this means that you can't use the MySQL ODBC driver from ADO and other users of OLEDB.

## Symbols
