The default modes are different for different operating systems. The values allowed also differ. There is no `text` installation mode under Windows.

```
--debugtrace <debugtrace>      Debug filename
                                Default:
--installer-language <installer-language> Language selection
                                Default:
                                Allowed: en jp
--installdir <installdir>       Installation directory
                                (Windows)Default: C:\Program Files\MySQL\Enterprise\Agent
                                (Unix)Default: /opt/mysql/enterprise/agent
                                (Mac OS X)Default: /Applications/mysql/enterprise/agent
--mysqlhost <mysqlhost>        MySQL hostname or IP address
                                Default: 127.0.0.1
--checkmysqlhost <checkmysqlhost> Validation of MySQL hostname or IP address
                                Default: yes
--mysqlport <mysqlport>        MySQL port on 127.0.0.1
                                Default: 3306
--mysqluser <mysqluser>        User name on 127.0.0.1:3306
                                Default:
--mysqlpassword <mysqlpassword> Password for mysqluser on 127.0.0.1:3306
                                Default:
--managerhost <managerhost>    Hostname or IP address
                                Default: 127.0.0.1
--tomcatport <tomcatport>      Port on 127.0.0.1
                                Default: 18080
--agentuser <agentuser>        Agent username on 127.0.0.1:18080
                                Default: agent
--agentpassword <agentpassword> Agent password for agent on 127.0.0.1:18080
                                Default:
--servername <servername>     Hostname to display
                                Default:
```

Again, the agent options are the same for all operating systems except as noted.

15.3.4.2. Unattended Windows Installation

For unattended installation on Windows, create an option file named `options.server.txt`. The following is an example of what the contents of an option file might be.

```
debugtrace=C:\Program Files\MySQL\Enterprise\install.debugtrace.log
mode=unattended
installdir=C:\Program Files\MySQL\Enterprise
tomcatport=8080
tomcatshutdownport=8005
tomcatsslport=8443
adminpassword=myadminpassword
dbport=3300
```

This file identifies a directory and file name for a log file, sets the `mode` to `unattended`, and uses the `installdir` option to specify an installation directory. The meaning of the other options is fairly self-evident.

Note

Set the `installdir` and `debugtrace` options to values appropriate to your locale and operating system.

The only options that must be specified in an option file when installing the MySQL Enterprise Service Manager are `mode` (if not specified at the command line), `installdir`, and `adminpassword`.

Check the options in your option file closely before installation; no warnings will be issued if there are errors.

Ensure that the monitor installer file and the options file are in the same directory and, if you saved the options file as `options.server.txt`, you can invoke an unattended installation from the command line by typing:

```
C:\mysqlmonitor-version-windows-installer.exe --optionfile options.server.txt
```

You can install the MySQL Enterprise Monitor Agent in exactly the same fashion. Create an agent option file and call the agent installer using the `optionfile` option.

As a minimum for the agent installation, you must specify the `mode` (if not specified at the command line), `mysqluser`, `installdir`, `mysqlpassword`, `installdir`, `managerhost`, and `agentpassword` options. Create a file containing these values and use it with the `optionfile` option for unattended agent installation.

If you wish, you can create one script that calls both the Service Manager and the Monitor Agent programs passing appropriate `optionfile` options.

15.3.4.3. Unattended Unix and Mac OS X Installation

For unattended installation on Unix, create an option file named `options.server.txt`. The following is an example of what the contents of an option file might be for installation on Unix.

```
debugtrace=/opt/mysql/enterprise/install.debugtrace.monitor.log
mode=unattended
installdir=/opt/mysql/enterprise/monitor
tomcatport=8080
tomcatshutdownport=8005
tomcatsslport=8443
adminpassword=myadminpassword
dbport=3300
```

This file identifies a directory and file name for a log file, sets the `mode` to `unattended`, and uses the `installdir` option to specify an installation directory. The meaning of the other options is fairly self-evident.

Note

Set the `installdir` and `debugtrace` options to values appropriate to your locale and operating system.

The only options that must be specified in an option file when installing the MySQL Enterprise Service Manager are `mode` (if not specified at the command line), `installdir`, and `adminpassword`.

Check the options in your option file closely before installation; no warnings will be issued if there are errors.

Ensure that the monitor installer file and the options file are in the same directory and, if you saved the options file as `options.server.txt`, you can invoke an unattended installation from the command line by typing:

```
shell> mysqlmonitor-version-installer.bin --optionfile options.server.txt
```

You can install the MySQL Enterprise Monitor Agent in exactly the same fashion. Create an agent option file and call the agent installer using the `optionfile` option.

As a minimum for the agent installation, you must specify the `mode` (if not specified at the command line), `mysqluser`, `installdir`, `mysqlpassword`, and `agentpassword` options. Create a file containing these values and use it with the `optionfile` option for unattended agent installation.

If you wish, you can create one script that calls both the Service Manager and the Monitor Agent programs passing appropriate `optionfile` options.

Note

The Service Manager does not automatically start up on rebooting. For more information, see [Bug#31676](#).

The procedure for unattended agent installation under Mac OS X is identical to the procedure under Unix.

15.3.4.4. Starting the Services

For instructions on starting the services needed by the MySQL Enterprise Service Manager see, [Section 15.3.2.5, “Starting/Stopping the MySQL Enterprise Monitor Service on Windows”](#) for Windows and, [Section 15.3.2.6, “Starting/Stopping the MySQL Enterprise Monitor Service on Unix and Mac OS X”](#) for Unix and Mac OS X.

For instructions on starting the MySQL Enterprise Monitor Agent see:

- Windows – [Section 15.3.3.5.1, “Starting/Stopping the Agent on Windows”](#)
- Unix – [Section 15.3.3.5.3, “Starting/Stopping the Agent on Unix”](#)
- Mac OS X – [Section 15.3.3.5.2, “Starting/Stopping the Agent on Mac OS X”](#)

If you wish, you can script the startup of these services.

15.3.5. Post-Installation Considerations

Depending upon how you plan to use the MySQL Enterprise Monitor, there are some tasks you may want to perform after installation. Find some suggestions in the following list:

- **Email settings** — Test email notification by deliberately triggering an alert.
- **Auto Startup** — On Unix systems, the MySQL Enterprise Service Manager does not automatically restart when the system is rebooted. You may wish to create a system initialization script appropriate to your operating system.
- **Log files** — Check the log files for any irregularities. For the locations of the various log files see [Files Associated with The MySQL Enterprise Monitor](#).
- **Agent Log file rotation** — Implement log file rotation for the service agent.
- **Back up the repository** — For a back-up strategy suitable to your circumstances, see the [MySQL reference manual documentation](#).
- **Configuration backup** — Back up the `mysql-monitor-agent.ini` file and the associated `instances` directory and contents.

For more information about the `mysql-monitor-agent.ini` file see [Section 15.3.3.6, “Advanced Agent Configuration”](#).

- **Configuration file** — Store the `configuration_report.txt` in a safe place. There is no mechanism for retrieving the password stored in this file.
- **Repository credentials** — The repository user name and password are stored in unencrypted form in the `config.properties` file. Take care to protect this file.
- **Disk management** — Remove installation files, and monitor the space used by the repository. Ensure that you have adequate disk space by regularly purging data. For more information, see [??? \[1268\]](#)
- **Firewall changes** — You may want to limit or expand access to the MySQL Enterprise Service Manager.
- **Open ports** — As with firewall changes, you may want to limit or expand access to the MySQL Enterprise Service Manager. The dashboard uses non-standard ports, none of which are usually open by default.
- **Server upgrades** — See [Section 15.3.6.3.1, “Upgrading the Monitored MySQL Server”](#) for instructions on upgrading a server.
- **Repository access** — You may want to add other users.

15.3.6. Upgrading, Re-Installing or Changing Your Installation

You can upgrade

- For instructions on upgrading your existing installation, see [Section 15.3.6.1, “Upgrading MySQL Enterprise Monitor”](#).
- For more information on re-installing an existing installation, see [Section 15.3.6.2, “Reinstalling MySQL Enterprise Monitor”](#).
- To change an existing installation, such as changing the monitored server, see [Section 15.3.6.3, “Changing Your MySQL Enterprise Monitor Installation”](#).

15.3.6.1. Upgrading MySQL Enterprise Monitor

From time to time there may be updates to the MySQL Enterprise Service Manager or the MySQL Enterprise Monitor Agent. This section describes how to perform an update for either of these components.

You cannot use the update installers to change to a different operating system or chip architecture. For example, you cannot update a 32-bit Linux installation to a 64-bit version using an update installer — in cases such as this you must do a fresh installation.

The name of the update file varies but it shows the target operating system and the version the update applies to. If a specific component is being updated it may also appear in the file name. For example, a file named `mysqlenterprise-2.0.0-windows-update-installer.exe` would indicate a Windows update to MySQL Enterprise Service Manager version 2.0.0.

You may install an update in the same way that you initially installed the service manager or the agent; in `win32` or `unattended` mode on Windows in `gtk`, `text`, `xwindow`, or `unattended` mode on Unix and in `osx`, `text`, or `unattended` mode on OS X.

Warning

Before updating the MySQL Enterprise Service Manager stop all agents that are reporting to that MySQL Enterprise Service Manager. If you are updating the MySQL Enterprise Monitor Agent you must also stop the MySQL Enterprise Service Manager. On a machine that runs more than one agent, the primary agent will restart when the update is complete. Any secondary agents must be restarted manually. To stop or start agents see:

- Windows – [Section 15.3.3.5.1, “Starting/Stopping the Agent on Windows”](#)
- Unix – [Section 15.3.3.5.3, “Starting/Stopping the Agent on Unix”](#)
- Mac OS X – [Section 15.3.3.5.2, “Starting/Stopping the Agent on Mac OS X”](#)

Important

The upgrade installer will overwrite `items-mysql-monitor.xml`. On Windows this file is found in the `C:\Program Files\MySQL\Enterprise\Agent\share\mysql-monitor-agent` directory and on Unix in the `/opt/mysql/enterprise/agent/share/mysql-monitor-agent` directory. You should back this file up if you have made any changes to it.

Warning

If you use the Upgrade installer to update MySQL Enterprise Service Manager and you have made any changes to the `my.cnf` within your MySQL Enterprise Service Manager installation, any changes will be lost. You should copy the existing `my.cnf` file before starting the upgrade installer.

Otherwise, updating is a fairly straightforward process. Run the installation file and choose the directory of your current installation and whether or not you wish to back up your current installation. The time required to complete the process varies depending upon the nature of the update.

If you chose to back up your current installation, a directory named `backup` will be created in the current installation directory. This directory will contain copies of the directory or directories that were replaced during the update. In cases where only specific files are replaced, the `backup` directory may contain only these files. If you are unhappy with the update simply overwrite the new files or directories with the originals found in the `backup` directory. Be sure to stop both the MySQL Enterprise Service Manager and MySQL Enterprise Monitor Agent before restoring the original files. You can delete or archive this directory when you are satisfied that the update was successful.

If you choose to back up your current installation, the installer checks that there is adequate disk space for your repository backup. If there is not enough space, you are given the option of choosing another location; you may also choose not to back up the repository.

To update your Advisors see, [Section 15.3.2.7.4, “Upgrading and Updating Advisors”](#).

15.3.6.1.1. Upgrading from MySQL Enterprise Monitor 1.3 to 2.0

To upgrade your existing installation from MySQL Enterprise Monitor 1.3 to MySQL Enterprise Monitor 2.0, you need to upgrade both your MySQL Enterprise Service Manager and your MySQL Enterprise Monitor Agent on each machine that you are monitoring.

To perform the update process you must use an `update` installer. This ensures that your current configuration information is migrated to the new version of MySQL Enterprise Service Manager.

Before you start the migration, shutdown your MySQL Enterprise Service Manager and MySQL Enterprise Monitor Agent on each monitored host. Then install the updated MySQL Enterprise Service Manager application to migrate the configuration and data of the main application and repository. Once the new MySQL Enterprise Service Manager is running, you can start to update and migrate each agent.

For more information on upgrading your MySQL Enterprise Service Manager, see [Section 15.3.6.1.1.1, “Upgrading to MySQL Enterprise Service Manager 2.0”](#). For more information on upgrading an MySQL Enterprise Monitor Agent, see [Section 15.3.6.1.1.2, “Upgrading to MySQL Enterprise Monitor Agent 2.0”](#).

15.3.6.1.1.1. Upgrading to MySQL Enterprise Service Manager 2.0

Upgrading MySQL Enterprise Service Manager requires you to use one of the *update* installers. The update installer performs a number of operations during installation:

- A new database, required to support 2.0 functionality, is created.
- Your core dashboard, user, and rule information is migrated from the old database to the new database.
- The core configuration parameters for the MySQL Enterprise Service Manager are migrated from MySQL Enterprise Monitor 1.3 are migrated to MySQL Enterprise Monitor 2.0.

The installation of the new software using the update installer follows this basic sequence:

1. Request the installation language.
2. Confirm the location of the current MySQL Enterprise Service Manager installation.
3. Specify whether you want to keep a copy of the old server, application, and database files.
4. Configure the Tomcat server settings, including whether the new server should support SSL connections from agents.
5. If requested, the application and database information is backed up and upgraded, before the new application is installed.

The installation process is consistent for all platforms. A sample of the process for Max OS X has been provided below:

1. Double click on the update installer. The update installer will have `update` in the file name. For example, `mysqlmonit-or-2.0.0.7101-osx-update-installer.app`.
2. Confirm the language you want to use when installing the software.

Figure 15.24. MySQL Enterprise Monitor: Server Update: Language Selection

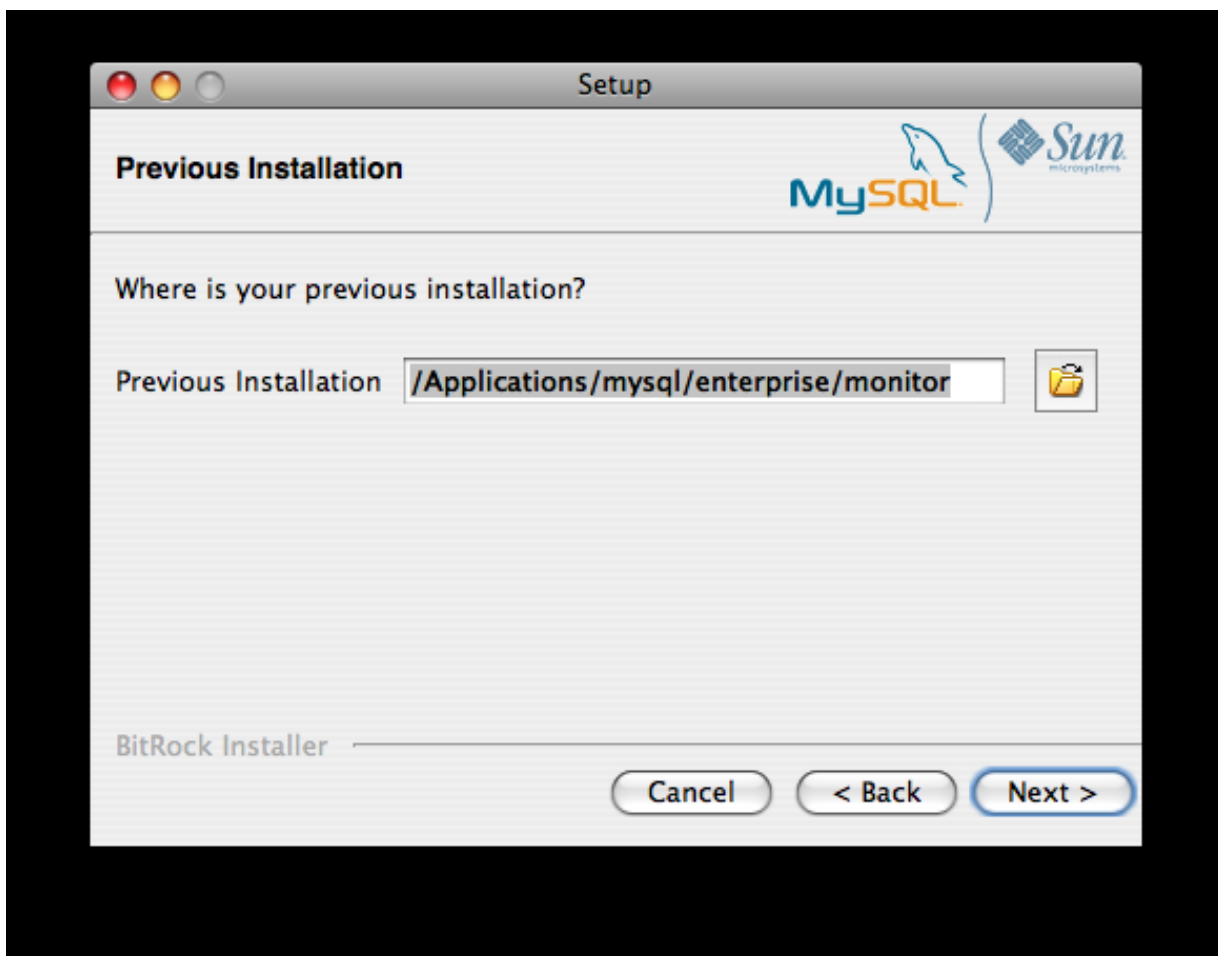

Click OK

3. You will be presented with an information screen showing the application you are installing. Click NEXT to continue.

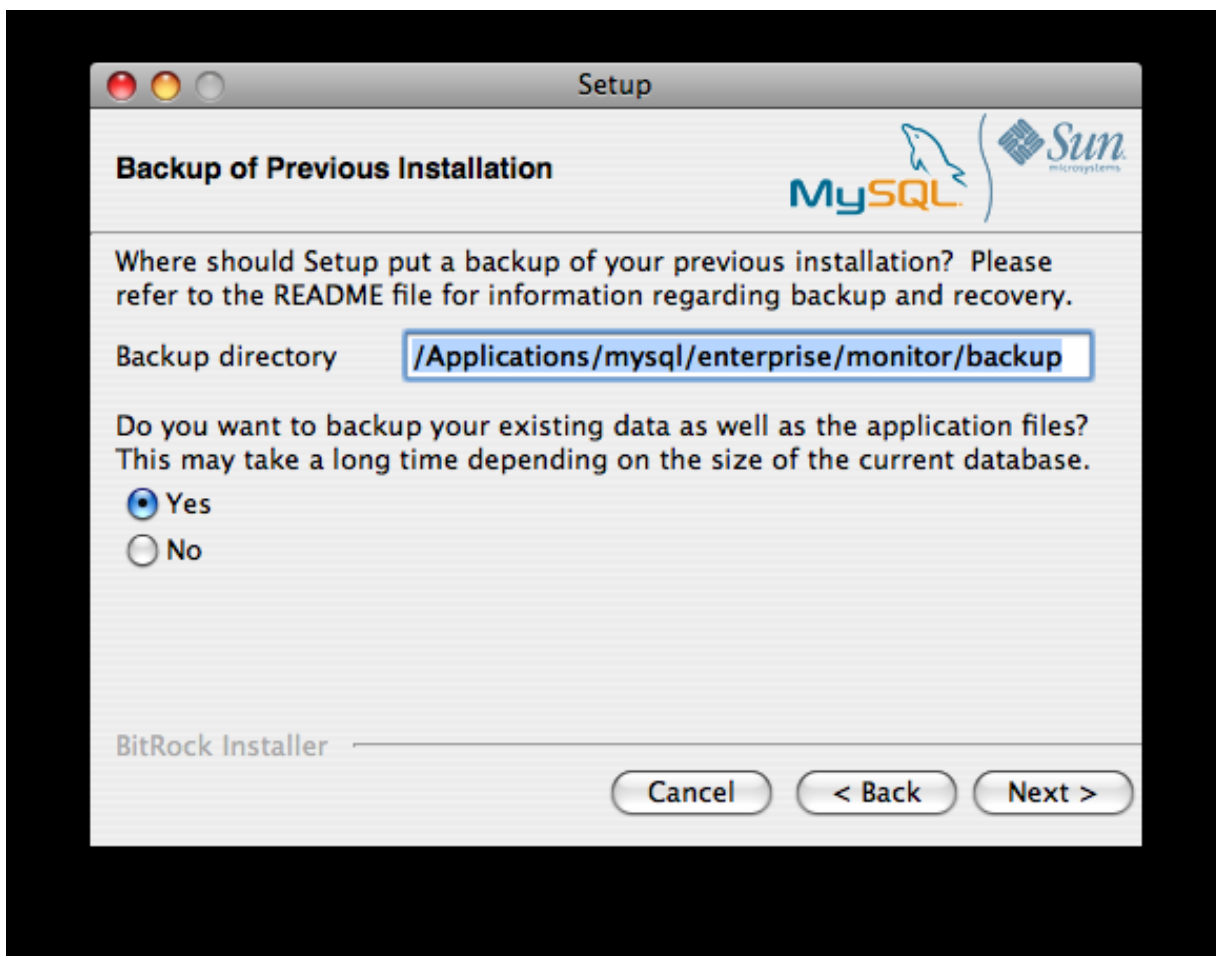

- Specify, or locate, the previous installation of MySQL Enterprise Service Manager. If you installed the server within the default location, the current version of the application should be located automatically.

Figure 15.25. MySQL Enterprise Monitor: Server Update: Previous Installation

- The installer can keep a backup copy of your existing application, including keeping a complete backup of the data stored within your MySQL Enterprise Monitor repository database.

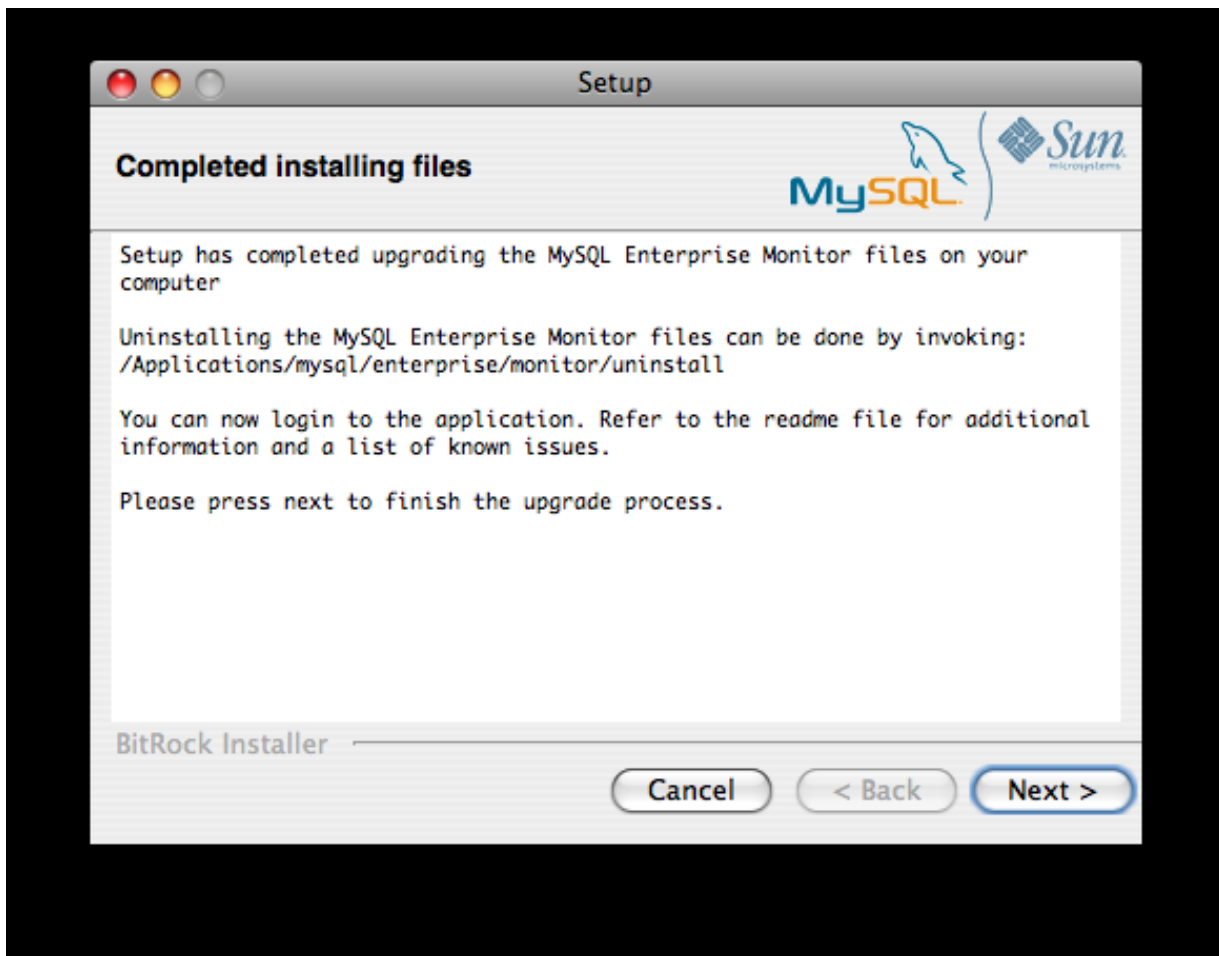

Figure 15.26. MySQL Enterprise Monitor: Server Update: Backup of Previous Installation

Specify the location of the backup (default is to use the `backup` directory within your installation directory). Note that backing up the database in addition to the main application will increase the installation time as the files have to be copied. The larger the size of your repository data, the longer the installation process will take.

6. Specify the Tomcat Server options. The Tomcat Server Port is the default port you will use to access the MySQL Enterprise Dashboard. If you want to support agents using SSL to communicate to MySQL Enterprise Service Manager, you must check the **IS SSL SUPPORT REQUIRED?**
7. Confirm that you want to continue the installation. Once installation has started, the backup of you existing application (and database) will start, although the process may take some time. Wait until the process completes.
8. Once the process has completed you will be provided with a notification of the installation process, including how to uninstall the application if you want to do so in the future. If any errors occurred, they will be reported here.

Figure 15.27. MySQL Enterprise Monitor: Server Update: Completed installing files

9. The installation has now completed. You can automatically start the MySQL Enterprise Service Manager and view the attached Readme file by ensuring the checkboxes on this page are selected.
10. You can now quit the installer.

Once the installation has completed, the first time you login to MySQL Enterprise Dashboard you will be asked to provide your login credentials, if they do not already exist in the server configuration, or to provide a copy of the Advisor jar suitable for your MySQL Enterprise Service Manager version.

Figure 15.28. MySQL Enterprise Monitor: Server Update: Final Setup

MySQL Enterprise Monitor has now been updated. You must update each of your agents to MySQL Enterprise Monitor Agent 2.0 to ensure that they are providing the correct information to MySQL Enterprise Service Manager

15.3.6.1.1.2. Upgrading to MySQL Enterprise Monitor Agent 2.0

To upgrade an agent you should use a [update](#) installer. This will migrate your configuration information, simplifying the upgrade process significantly.

Note

The agent log file, `mysql-service-agent.log`, if it exists, will be retained during the upgrade. A new log file, `mysql-monitor-agent.log` is used by MySQL Enterprise Monitor Agent 2.0.

The core sequence is the same on all platforms, the update process on Linux is shown below:

1. Start the update installer.

```
shell> ./mysqlmonitoragent-2.0.0.7101-linux-glibc2.3-x86-32bit-update-installer.bin
```

2. Set the language for the installation process.

```
Language Selection
Please select the installation language
[1] English
[2] Japanese
Please choose an option [1] :
```

3. Confirm or update the location of the installation directory of the previous version.

```
-----
Welcome to the setup wizard for the MySQL Enterprise Monitor Agent Update
-----
Please specify the directory that contains the previous installation of
the MySQL Enterprise Monitor Agent
Installation directory [/opt/mysql/enterprise/agent]:
```

- Specify whether you want to create a backup of the current application and configuration information, and if so, where the backup directory should be created.

```
-----
Current installation backup
Do you want to create a backup during the update process?
Backup the current installation [Y/n]: Y

Backup directory [/opt/mysql/enterprise/agent/patchbackup]:
```

- You will be asked whether you want to enable the Query Analyzer. The Query Analyzer enables you to monitor the execution statistics for individual queries executed through your MySQL servers. To enable, you must specify the proxy port, MySQL server and MySQL server port that you want to use. If you do not enable Query Analyzer now, you can enable it later. See [Section 15.10, “The Query Analyzer Page”](#).

```
-----
Query Analysis Configuration

MySQL Proxy enables query monitoring and analysis by listening on the port
specified below for client connections that are then passed through to a
backend MySQL database server. It is not needed for basic monitoring
functionality, but is required for query monitoring and analysis.

Visit the following URL for more information:
https://enterprise.mysql.com/docs/monitor/2.0/en/mem-query-analysis.html

Enable Proxy (recommended) [Y/n]:

Proxy Port [4040]:
Backend Host: 127.0.0.1 (cannot be changed)
Backend Port: 3306 (cannot be changed)
```

- You are now ready to complete the installation. Confirm that you want to continue.

```
-----
Setup is now ready to begin installing MySQL Enterprise Monitor Agent Update on your computer.
Do you want to continue? [Y/n]:

-----
Please wait while Setup installs MySQL Enterprise Monitor Agent Update on your computer.

Installing
0% _____ 50% _____ 100%
#####

-----
Setup has finished installing MySQL Enterprise Monitor Agent Update on your computer.
Restart MySQL Enterprise Monitor Agent now [Y/n]:
View Readme File [Y/n]: n
```

Before connecting your MySQL Enterprise Monitor Agent to your MySQL server you must update the grants for the MySQL Enterprise Monitor Agent. Connect to the MySQL server and run this statement to update the required grants:

```
GRANT CREATE, INSERT
ON mysql.*
TO 'mysqluser'@'localhost'
IDENTIFIED BY 'agent_password';
```

Replacing the `mysqluser` and `agent_password` parameters with the values used for connecting your agent to your MySQL server.

Once the update agent has communicated with the MySQL Enterprise Service Manager the core information about the agent and the MySQL server it is monitoring will be migrated to the new data format required by MySQL Enterprise Service Manager 2.0. To migrate the existing stored data, see [Section 15.4.2, “Migrating 1.3.x Historical Data to MySQL Enterprise Monitor 2.0”](#).

15.3.6.1.2. Unattended MySQL Enterprise Monitor Update

The options available when performing an unattended MySQL Enterprise Service Manager update are as follows:

```
--help                Display the list of valid options
--version             Display product information
--optionfile <optionfile>  Installation option file
                        Default:
--mode <mode>         Installation mode
                        (Windows)Default: win32
                        (Unix)Default: gtk
                        (Mac OS X)Default: osx
                        (Windows)Allowed: win32 unattended
                        (Unix)Allowed: gtk text xwindow unattended
                        (Mac OS X)Allowed: osx text unattended
--debugtrace <debugtrace>  Debug filename
                        Default:
--installer-language <installer-language>  Language selection
                        Default:
                        Allowed: en jp
--installdir <installdir>  Previous Installation
                        Default:
--createDataBackup <createDataBackup>
                        Default: 1
--backupDir <backupDir>   Backup directory
                        Default:
```

The options for an unattended update of the agent differ only in that the `createDataBackup` option is replaced by `createBackup`.

If you did not install the MySQL Enterprise Service Manager to the default directory the `installdir` option must be specified. `mode` must also be specified when performing an unattended update. Otherwise, performing an unattended update is identical to the process described in [Section 15.3.4, “Unattended Installation”](#).

15.3.6.2. Reinstalling MySQL Enterprise Monitor

In some cases you may want to reinstall MySQL Enterprise Monitor rather than updating your current installation. To reinstall rather than update MySQL Enterprise Monitor follow these steps:

1. Stop all the Monitor Agents
2. Run the `uninstall` programs for both the MySQL Enterprise Service Manager and the MySQL Enterprise Monitor Agent
3. Begin the new installation

To stop the Monitor Agents see:

- Windows – [Section 15.3.3.5.1, “Starting/Stopping the Agent on Windows”](#)
- Unix – [Section 15.3.3.5.3, “Starting/Stopping the Agent on Unix”](#)
- Mac OS X – [Section 15.3.3.5.2, “Starting/Stopping the Agent on Mac OS X”](#)

Instructions for removing the MySQL Enterprise Service Manager and the MySQL Enterprise Monitor Agent are given in [Section 15.3.7, “Uninstalling the MySQL Enterprise Monitor”](#).

15.3.6.3. Changing Your MySQL Enterprise Monitor Installation

This section describes the best practices to employ when changing your MySQL Enterprise Monitor installation.

15.3.6.3.1. Upgrading the Monitored MySQL Server

When upgrading a monitored MySQL server first stop the agent. To stop the agent see:

- Windows – [Section 15.3.3.5.1, “Starting/Stopping the Agent on Windows”](#)

- Unix – [Section 15.3.3.5.3, “Starting/Stopping the Agent on Unix”](#)
- Mac OS X – [Section 15.3.3.5.2, “Starting/Stopping the Agent on Mac OS X”](#)

Stop the MySQL server and perform the upgrade. For instructions on stopping and restarting the MySQL service under Windows see [Section 15.3.2.5, “Starting/Stopping the MySQL Enterprise Monitor Service on Windows”](#).

To stop and restart the MySQL daemon under Unix and Mac OS X, see, [Section 15.3.2.6, “Starting/Stopping the MySQL Enterprise Monitor Service on Unix and Mac OS X”](#).

Once the service/daemon is stopped you may upgrade your server. For instructions on upgrading your MySQL server see the reference manual pertaining to your server version. When the upgrade is complete restart the MySQL server.

Note

The agent's log file will show that the server was down.

15.3.6.3.2. Changing the Server That an Agent Monitors

You need not reinstall the MySQL Enterprise Monitor Agent in order to change the MySQL server that it monitors. It is possible to adapt an existing agent so that it monitors a different server.

To do this you must stop the service agent and then remove the server that it is monitoring. To stop the agent see:

- Windows – [Section 15.3.3.5.1, “Starting/Stopping the Agent on Windows”](#)
- Unix – [Section 15.3.3.5.3, “Starting/Stopping the Agent on Unix”](#)
- Mac OS X – [Section 15.3.3.5.2, “Starting/Stopping the Agent on Mac OS X”](#)

For instructions on removing a server see, [Section 15.6.3.3, “Removing a Server From the Dashboard”](#).

Once the agent is stopped and the server is removed from the Dashboard, changes may be made to the `mysql-monitor-agent.ini`, or the `agent-instance.ini` file within the agent `instances` directory. You can find the location of the directory by examining the content of the `mysql-monitor-agent.ini` and checking the value of the `mysqld-instance-dir` parameter.

If you want to make changes to the monitored MySQL server, edit the `agent-instance.ini` file. Change the `user`, `password`, `hostname`, and `port` values if required. For more information, see [Section 15.3.3.6.2, “MySQL Server \(agent-instance.ini\) Configuration”](#).

To change other settings, such as enabling proxy support (required for Query Analyzer), the management host, or the port number used by the agent, modify the `mysql-monitor-agent.ini` file. For more information, see [Section 15.3.3.6.1, “MySQL Enterprise Monitor Agent \(mysql-monitor-agent.ini\) Configuration”](#).

To restart the agent see:

- Windows – [Section 15.3.3.5.1, “Starting/Stopping the Agent on Windows”](#)
- Unix – [Section 15.3.3.5.3, “Starting/Stopping the Agent on Unix”](#)
- Mac OS X – [Section 15.3.3.5.2, “Starting/Stopping the Agent on Mac OS X”](#)

Note

If you are adapting an existing agent to monitor a remote server make sure that the agent has the credentials for remote access and that the port on the remote MySQL server instance is open. For more information, see [Section 15.3.3.6.4, “Configuring an Agent to Monitor a Remote MySQL Server”](#).

If you experience difficulties starting the agent, check [Section 15.3.3.7, “Troubleshooting the Agent”](#).

Log in to the Dashboard and you should find your new server in the `All Servers` group.

15.3.6.3.3. Temporarily Suspending the Agent

In some situations you may need to bring down a monitored server. When this is necessary, it is good practice to stop the agent first—doing so will avoid generating a “Server is unreachable” event.

For instance, suppose you need to stop the server in order to do a backup. The steps to follow are:

1. Stop the agent
2. Stop the service/daemon
3. Perform the backup
4. Restart the service/daemon
5. Restart the agent

To stop or start the agent see:

- Windows – see [Section 15.3.3.5.1, “Starting/Stopping the Agent on Windows”](#)
- Unix – see [Section 15.3.3.5.3, “Starting/Stopping the Agent on Unix”](#)
- Mac OS X – see [Section 15.3.3.5.2, “Starting/Stopping the Agent on Mac OS X”](#)

To stop the MySQL service/daemon see the MySQL reference manual for your server version. You can find the manual online at <http://dev.mysql.com/doc/refman>.

Follow these steps and there will be no “noise” associated with backing up your server. In contrast, if you leave the agent running while bringing down the server, you will generate a “Server is unreachable” event.

As an alternative to stopping the agent, you can change the logic associated with a rule. For instance, you could alter the threshold of the rule “Server is unreachable”:

```
%server.reachable% == THRESHOLD
```

to:

```
%server.reachable% == THRESHOLD && CURTIME() NOT BETWEEN '22:00:00' AND '23:00:00'
```

This would effectively blackout the rule between 10 and 11 pm, during which time you could perform a backup.

For more information about editing rules see [Section 15.7.3, “Editing Built-in Rules”](#). To blackout all events associated with a specific server or group of servers see [Section 15.7.6, “Advisor Blackout Periods”](#).

15.3.7. Uninstalling the MySQL Enterprise Monitor

Removal of the MySQL Enterprise Monitor requires removal of the MySQL Enterprise Service Manager and the MySQL Enterprise Monitor Agent Service. In some circumstances, when running multiple agents on one machine for instance, you may not want to remove the entire MySQL Enterprise Monitor Agent Service but only a single monitored server.

15.3.7.1. Removing the MySQL Enterprise Monitor: Windows

15.3.7.1.1. Removing the MySQL Enterprise Service Manager

Remove the MySQL Enterprise Service Manager by going to the [Control Panel](#) and choosing [Add or Remove Programs](#). Find the entry for [MySQL Enterprise Monitoring and Advisory Service](#) and remove it. During the uninstall process you will be given the option of saving existing data and log files. Choose this option if you plan to reinstall the MySQL Enterprise Monitor.

If you are not saving existing data, after MySQL Enterprise Service Manager has been removed you may delete the [C:\Program Files\MySQL\Enterprise\Monitor](#) directory.

Warning

If you chose not to remove existing data and log files when uninstalling MySQL Enterprise Service Manager do **not** remove the [C:\Program Files\MySQL\Enterprise\Monitor](#) directory. Doing so will delete these files.

If you added the Tomcat/Apache web server to the list of Windows firewall exceptions, remove this service by opening the [Windows Firewall](#) from the [Control Panel](#). Choose the [Exceptions](#) tab and delete the [Tomcat/Apache](#) entry.

15.3.7.1.1.1. Removing MySQL Enterprise Monitor Services Only

When the MySQL Enterprise Service Manager is installed, the Tomcat/Apache and MySQL server services are started. It is possible to remove these services without also removing your MySQL Enterprise Service Manager installation. (For more information about these services see, [Section 15.3.2.5, “Starting/Stopping the MySQL Enterprise Monitor Service on Windows”](#) or, [Section 15.3.2.6, “Starting/Stopping the MySQL Enterprise Monitor Service on Unix and Mac OS X”](#).)

Do this by finding the [MySQL Enterprise Monitor](#) menu option and choosing [Services](#) and then [Uninstall MySQL Enterprise Monitor Services](#). This will remove all the services associated with MySQL Enterprise Service Manager.

You can confirm that these services have been removed by checking services in the Microsoft Management Console Services window.

If you wish to reinstall these services you can do this by using the [Install MySQL Enterprise Monitor Services](#) menu option.

It is also possible to remove services using the `mysqlmonitorctl.bat` file found in the `C:\Program Files\MySQL\Enterprise\Monitor` directory. To see the available options, go to the command line and type: `mysqlnet-workctrl help`. This batch file is discussed in more detail in [Section 15.3.2.5, “Starting/Stopping the MySQL Enterprise Monitor Service on Windows”](#).

15.3.7.1.2. Removing the Monitor Agent

To remove the Monitor Agent itself, open the [Control Panel](#) and choose [Add or Remove Programs](#). Find the entry for [MySQL Enterprise Monitor Agent](#) and remove it. This will execute the uninstall program located in the `C:\Program Files\MySQL\Enterprise\Agent` directory.

Warning

If you are running more than one agent on the same machine and wish to remove only one of the agents, do **not** remove the [MySQL Enterprise Monitor Agent](#) entry from the [Add or Remove Programs](#) menu. To remove a single agent see [Section 15.3.7.1.2.1, “Removing a Single Agent”](#).

After removing the Monitor Agent you may also need to remove the directories, `C:\Program Files\MySQL\Enterprise` and `C:\Program Files\MySQL\Enterprise\Agent`.

Removing the Monitor Agent in this fashion will remove the default service. However, if you are running additional Monitor Agents as described in [Section 15.3.3.6.2, “MySQL Server \(agent-instance.ini\) Configuration”](#), you will have to remove those agents manually. See the next section for instructions on doing this.

15.3.7.1.2.1. Removing a Single Agent

If you are running more than one agent on the same machine and wish to remove only one of the agents, do **not** remove the [MySQL Enterprise Monitor Agent](#) entry from the [Add or Remove Programs](#) menu. To remove a single agent and leave other agents intact follow these steps:

1. Stop the agent
2. Confirm the location of the log files
3. Remove the agent as a service
4. Remove/Archive the associated files

It is best to stop the agent before removing it; for instructions on stopping an agent see, [Section 15.3.3.5.1, “Starting/Stopping the Agent on Windows”](#).

You can confirm the location of the agent log files by checking the `ini` file. For more information on this topic see [Section 15.3.3.6.1, “MySQL Enterprise Monitor Agent \(mysql-monitor-agent.ini\) Configuration”](#).

Go to the command line and remove the MySQL Enterprise Monitor Agent as a Windows service by typing:

```
shell> sc delete AgentName
```

You can confirm that the agent has been removed by checking the Microsoft Management Console Services window. There should

no longer be an entry for the removed agent.

You should also remove or archive any log or configuration files associated with this agent. If you have installed any additional agents, remove them in the same fashion.

15.3.7.2. Removing the MySQL Enterprise Monitor: Unix and Mac OS X

15.3.7.2.1. Removing the MySQL Enterprise Service Manager

To remove the MySQL Enterprise Service Manager, find the `uninstall` file in the `/opt/mysql/enterprise/monitor` directory.

Execute this file by typing:

```
shell> ./uninstall
```

During the uninstall process you will be given the option of saving existing data and log files. Choose this option if you plan to re-install the MySQL Enterprise Monitor.

If you are not saving existing data, after uninstalling the MySQL Enterprise Service Manager you may remove the `/opt/mysql/enterprise/monitor` directory.

Warning

If you chose not to remove existing data and log files when uninstalling the MySQL Enterprise Monitor do **not** remove the `/opt/mysql/enterprise/monitor` directory; doing so will delete these files.

On Red Hat Enterprise Linux 4 and Fedora Core 4, the uninstall script may not stop the Tomcat server. Do this manually if necessary. To do this see, [Section 15.3.2.6, “Starting/Stopping the MySQL Enterprise Monitor Service on Unix and Mac OS X”](#).

There may be other Java processes running on your system. Be careful not to accidentally stop them.

15.3.7.2.2. Removing the Monitor Agent

Prior to removal of the Monitor Agent Service you should stop any agents. Do this by changing to the `init.d` directory and issuing the command, `./mysql-monitor-agent stop`.

You will find the `uninstall` file in the `/opt/mysql/enterprise/agent` directory under Unix and in the `/Applications/mysql/enterprise/agent` directory on Mac OS X. Execute this file by navigating to this directory and typing:

```
shell> ./uninstall
```

After uninstalling the Monitor Agent you may remove the `/opt/mysql/enterprise/agent` directory. Under Mac OS X this directory is called `/Applications/mysql/enterprise/agent`.

Removing the Monitor Agent in this fashion will remove the default service, and all the configuration files for different instances.

15.3.7.2.2.1. Removing a Single Agent

If you are running more than one agent on the same machine and wish to remove only one of the agents, do **not** run the uninstall program. To remove a single agent and leave other agents intact follow these steps:

1. Stop the agent
2. Confirm the location of the log files
3. Remove the agent as a service
4. Remove/Archive associated files

It is best to stop the agent before removing it; for instructions on stopping an agent see:

- Unix – [Section 15.3.3.5.3, “Starting/Stopping the Agent on Unix”](#)
- Mac OS X – [Section 15.3.3.5.2, “Starting/Stopping the Agent on Mac OS X”](#)

You can confirm the location of the agent log files by checking the `ini` file. For more information on this topic see [Section 15.3.3.6.1, “MySQL Enterprise Monitor Agent \(`mysql-monitor-agent.ini`\) Configuration”](#).

You may then remove the agent as a daemon by removing its entry in the `init.d` directory. You should also remove or archive any log or configuration files associated with this agent.

If you have installed any additional agents, remove them in the same fashion.

15.4. Deploying MySQL Enterprise Service Manager

Note

MySQL Enterprise subscription, MySQL Enterprise Monitor, MySQL Replication Monitor, and MySQL Query Analyzer are only available to commercial customers. To learn more, see: <http://www.mysql.com/products/enterprise/features.html>.

This chapter provides some notes and guidance on deploying MySQL Enterprise Service Manager, including hardware and server requirements for the MySQL Enterprise Service Manager, and how to backup the monitoring data.

15.4.1. Backing up MySQL Enterprise Service Manager

If you want to backup the data stored within your MySQL Enterprise Service Manager, you can use any of the typical backup solutions, such as `mysqldump`, to save your data. All you need to backup the information is host name, user name and password details that were set during the installation of the MySQL Enterprise Service Manager

You can locate this information by examining the contents of the `configuration_report.txt` file that was generated when MySQL Enterprise Service Manager was installed. A sample of the file is provided below:

```
MySQL Enterprise Monitor (Version 2.0.0.7088 : 20081031_152749_r7088)
Here are the settings you specified:
Application hostname and port: http://127.0.0.1:18080
Tomcat Ports: 18080 - 18443 (SSL)
MySQL Port : 13306
Repository Credentials (bundled MySQL):
-----
service_manager/Password
Use the following command to login to the MySQL Enterprise Monitor database:
mysql -uservice_manager -pPassword -P13306 -h127.0.0.1
```

The last line provides the information about how to connect to the server using the standard `mysql` command line client.

All the MySQL Enterprise Monitor repository information, including your configuration, rule and historical data is stored within the `mem` database.

To backup this information using `mysqldump` you might use the following command:

```
shell> mysqldump --single-transaction >
-uservice_manager -pPassword -P13306 -h127.0.0.1 mem >mem.dump
```

The above command would create a file, `mem.dump`, containing all of the MySQL Enterprise Monitor data.

To ensure consistency in a recovery situation, you may also want to backup the agent configuration and metadata stored on each monitored MySQL server. To do this:

- Backup the configuration files of each agent. You should keep a copy of the `etc` directory for each agent. This directory contains the main configuration file, `mysql-monitor-agent.ini`, and the configuration information for each server being monitored, which is stored within the `etc/instances` directory.
- On each server being monitored, retain a copy of the `mysql.inventory` table, which contains the unique ID of the MySQL server.

15.4.2. Migrating 1.3.x Historical Data to MySQL Enterprise Monitor 2.0

You can migrate the data generated during a MySQL Enterprise Monitor 1.3.x installation using the Data Migration functionality of the **SERVER CONFIGURATION** panel.

To use the data migration feature, you must have installed MySQL Enterprise Service Manager using an *update* installer. The update installer performs the initial migration of your configuration, rules, schedule, and events data. The historical data is not migrated until you explicitly request the migration of information within the **MANAGE SERVERS** section of the **SETTINGS** panel.

Data migration works on a single server, allowing you to select on which servers you want to migrate information. The migration is subject to the following:

- You must elect to migrate the data from each server individually.
- Migration takes approximately 5-6 hours, for each month, for each server. Therefore, if you have six months of data on 10 servers it could take between 300 and 360 hours (15 days) to migrate all of your historical data one server at a time.
- To limit the data migration, set the **DATA PURGE BEHAVIOR** within the **SETTINGS** page. Only data more recent than the specified purge period will be migrated. Data older than the purge period will be ignored.
- To prevent performance issues, migrate only one or a small number of servers concurrently.
- You can start and stop the migration of the data at any time. As a general guide, you should avoid stopping the data migration process and allow it to complete unless:
 - Run out of disk space.
 - MySQL Enterprise Service Manager becomes too slow and unresponsive.
 - Migration never completes.

With the last item, where the migration never completes, occasionally there are some aspects of the data that cannot be migrated successfully. This will prevent the migration process completing, but does not affect the conversion of any data that could be migrated.

Starting Historical Data Migration

To start data migration:

- Switch to the **MANAGE SERVERS** display of the **SETTINGS** panel within MySQL Enterprise Dashboard.
- Ensure that the data migration functionality has been enabled. The **START** and **STOP** buttons next to **HISTORICAL DATA MIGRATION** will be visible.

Figure 15.29. MySQL Enterprise Monitor: Historical Data Migration Availability

Server	Query Analyzer Enabled	Query Analyzer Examples	Query Analyzer Explains	MySQL	Up Since	Last MySQL	Agent	Last Agent	Migration Status
<input type="checkbox"/> All Servers (3)									
<input type="checkbox"/> bear:3306 (ungrouped)	On	Off	Off	5.0.60-log	Sep 13, 2008 6:37:12 PM	Nov 19, 2008 1:36:00 PM	2.0.0.7085	Nov 19, 2008 1:36:19 PM	N/A
<input type="checkbox"/> gentoo1.vmbear:3306 (ungrouped)	On	Off	Off	5.0.60-log	Nov 17, 2008 10:26:45 AM	Nov 19, 2008 2:12:00 PM	2.0.0.7101	Nov 19, 2008 1:36:19 PM	Not Migrated
<input type="checkbox"/> gentoo2.vmbear:6906 (ungrouped)	On	Off	Off	5.0.60-log	Stopped		2.0.0.7101	Nov 19, 2008 1:36:17 PM	Not Migrated

- Select the servers you want to migrate by using the checkbox next to each server name. You can select one or more servers to migrate. Servers that are suitable for migration will show their migration status within the **MIGRATION STATUS** column. If the server is not able to be migrated, **N/A** will be shown.
- Click **START** next to **HISTORICAL DATA MIGRATION**.
- You will be presented with a confirmation dialog box. To start the migration, click **START MIGRATION**. To cancel migration, click **CANCEL**.
- The servers that have been selected for migration will show **Queued for Migration** in the **MIGRATION STATUS** column.

Figure 15.30. MySQL Enterprise Monitor: Confirming Historical Data Migration

Monitoring Historical Data Migration

You can check the migration status of any individual server by examining the **MIGRATION STATUS** column for each server. You can see an example of the migration status below.

Figure 15.31. MySQL Enterprise Monitor: Historical Data Migration Progress

Manage Groups & Servers									
Server	Query Analyzer			MySQL	Up Since	Last MySQL	Agent	Last Agent	Migration Status
	Enabled	Examples	Explains						
<input type="checkbox"/> All Servers (3)									
<input type="checkbox"/> bear:3306 (ungrouped)	On	Off	Off	5.0.60-log	Sep 13, 2008 6:37:12 PM	Nov 19, 2008 1:51:00 PM	2.0.0.7085	Nov 19, 2008 1:51:55 PM	N/A
<input type="checkbox"/> gentoo1.vmbear:3306 (ungrouped)	On	Off	Off	5.0.60-log	Nov 17, 2008 10:26:45 AM	Nov 19, 2008 2:27:00 PM	2.0.0.7101	Nov 19, 2008 1:51:55 PM	Migrating : 41 variables (50%) Start: Nov 19, 2008 1:51:28 PM
<input type="checkbox"/> gentoo2.vmbear:3306 (ungrouped)	On	Off	Off	5.0.60-log	Stopped		2.0.0.7101	Nov 19, 2008 1:51:54 PM	Migrating : 8 variables (9%) Start: Nov 19, 2008 1:51:27 PM

Note that the migration status is shown according to the state of migration at the time the page was loaded. The actual migration continues in the background, and the current state may not match the state of the migration at the time it is viewed.

Servers showing **Done** in the **MIGRATION STATUS** column have already completed their migration.

You can check the overall migration status by examining the **UPGRADE STATUS** display.

Stopping Historical Data Migration

You can stop the migration process for any server that is still migrating data. The migration can be restarted at any time without causing any problems.

To stop the historical data migration:

1. Select the servers you want to stop migrating by using the checkbox next to each server name. You can select one or more servers to stop migrating.
2. Click **STOP** next to **HISTORICAL DATA MIGRATION**.

Confirmation that the migration has been stopped will be provided. If migration has already completed, you will be notified.

Removing Old Data

Once data migration has been completed for all the servers you want to migrate, you may want to delete or remove access to the old data within your MySQL Enterprise Monitor repository. Data for MySQL Enterprise Monitor 1.3 was stored in a database called **merlin** within the MySQL repository. Data for MySQL Enterprise Monitor 2.0 is stored within a database called **mem**.

To create a backup of the old information, use `mysqldump`:

```
shell> mysqldump -uservice_manager -pPassword -P13306 -h127.0.0.1 merlin >data-1.3.sql
```

The above will create a file, `data-1.3.sql` containing all of the MySQL Enterprise Monitor 1.3 information.

If you remove access to the old data, then the data migration options for old servers will be removed from the **MANAGE SERVERS** panel within MySQL Enterprise Service Manager. To remove access, you need to **REVOKE** access to the `merlin` database:

```
mysql& REVOKE ALL on merlin.* FROM 'service_manager';
```

Note that revoking access to the old data will not reclaim any of the disk space used by the old data.

To delete the data from the database and free up the space being used by the historical information, **DROP** the `merlin` database:

```
mysql& DROP DATABASE merlin;
```

Once all the data has been migrated you can hide the migration user interface by clicking on the **HIDE MIGRATION INTERFACE** button.

15.4.3. Regular MySQL Enterprise Monitor Maintenance

MySQL Enterprise Monitor is generally self managing and does not need excessive maintenance. You should, however, be aware of certain maintenance tasks that you can automate or will need to manually perform to keep your MySQL Enterprise Monitor running efficiently.

- Make sure you have set the purge interval for your data to an appropriate value according to duration and history of data that you want to keep. For more information, see [??? \[1268\]](#)
- Check, and delete, the contents of the temporary directory with your MySQL Enterprise Service Manager installation directory.

15.4.4. Choosing Suitable MySQL Enterprise Service Manager Hardware Configurations

Running MySQL Enterprise Service Manager places a reasonable load on your system, and this load increases linearly as you add more agents monitoring more servers. Ideally, you should use a dedicated machine for MySQL Enterprise Service Manager, rather than running it alongside other applications and services.

Minimum System Requirements

- 2 or more CPU cores
- 2 or more GB of RAM
- Disk I/O subsystem applicable for a write-intensive database

Recommended System Requirements (if monitoring 100 or more MySQL servers)

- 4 or more CPU cores
- 8 or more GB of RAM
- Disk I/O subsystem applicable for a write-intensive database (RAID10, RAID 0+1)

15.5. MySQL Enterprise Dashboard

Note

MySQL Enterprise subscription, MySQL Enterprise Monitor, MySQL Replication Monitor, and MySQL Query Analyzer are only available to commercial customers. To learn more, see: <http://www.mysql.com/products/enterprise/features.html>.

The purpose of the MySQL Enterprise Dashboard is to provide you with information about your MySQL servers. It provides a list of the latest MySQL Enterprise Advisor reports, server status information, MySQL Enterprise alerts, and updated views of monitored MySQL servers. The **Monitor** screen gives a quick overview of the status of your MySQL servers.

Open the Dashboard by typing the host name into the address bar of your web browser. If you are unsure of the host name check the [Application host name and port](#) in the [configuration_report.txt](#) file. The default value is `http://127.0.0.1:18080/Auth.action` but this login is only valid if you are logging in from the machine that hosts the dashboard. If you are logging in from a remote machine you will have to specify a value other than `127.0.0.1`. Likewise, choose a different port if you are not using the default. After logging in, select the [Monitor](#) tab.

The Monitoring page provides an instant health check for all of the MySQL servers across the enterprise.

From this page users can:

- View monitoring data and all critical MySQL Advisor Rule violations for all or selected servers.
- Close and annotate MySQL Advisor Rule violations.
- Quickly determine if there is a Monitor Agent that is not communicating with the Service Manager.
- Quickly determine if there is a server that is in trouble or completely down.
- View indicator value graphs for key MySQL and operating system (OS) level metrics. Graph presentation will default to a thumbnail view but will open into a larger image upon being clicked.

The monitored server or servers are displayed in a tab on the left known as the [Server Tree](#). You can navigate to a number pages that provide more detailed information. These pages include:

- [Monitor](#) — the overview page providing you with a quick summary of the servers, their status, events, availability and load. The remainder of this chapter details the contents of this page.
- [Advisors](#) — shows the various advisors configured in your installation and allows you to schedule their execution on different servers, apply and manage rules and manage the advisor installation itself. For more information, see [Section 15.7, “The Advisors Page”](#).
- [Events](#) — provides an interface into the event system that highlights specific issues and problems on your monitored servers. For more information on using Events, see [Section 15.8, “The Events Page”](#).
- [Query Analyzer](#) — interfaces to the query monitoring system that can be used to monitor and track the individual queries that are being executed on a system and help to highlight problem queries that may need optimization or that may be affecting server load. For more information, see [Section 15.10, “The Query Analyzer Page”](#).
- [Graphs](#) — enables you to view and configure a number of individual graphs covering a range of different statistics. For more details on how to view and use these graphs, see [Section 15.9, “The Graphs Page”](#).
- [Replication](#) — provides information on the status and structure of your servers that are using replication. This page is only available if you have a suitable subscription level. For more information, see [Section 15.11, “The Replication Page”](#).
- [Settings](#) — controls the settings for the server, including email configuration, passwords, and server and user management. For more information, see [Section 15.6, “The Settings Page”](#).

Graphs are shown in the center of the page beneath the tabs. If applicable, you'll also find a list of critical events.

On the right is the color-coded [Heat Chart](#), showing the advisors that are installed by default. The [Heat Chart](#) shows the most important advisors, allowing a quick overview of the state of your servers. You may open the [Heat Chart](#) in its own window by clicking the [Standalone Heat Chart](#) link. If applicable, you'll also find a list of critical events.

The [Show/Hide Legend](#) link toggles display of the key to the icons used in the [Heat Chart](#).

Note

Find colorblind-accessible icons in the [alternate](#) directory. On Linux this directory is immediately below the `/monitor/apache-tomcat/webapps/ROOT/web/resources/images/` directory. These images are stored in the same directory on Windows. To use them, backup the originals and then copy and paste the alternate set into the [images](#) directory.

If a specific server is selected in the [Server Tree](#) details about this server are shown beneath the legend in the [Meta Info](#) area. The information shown in this area is the host name, the MySQL version number, the number of scheduled rules, the operating system, and the CPU.

The [Meta Info](#) section also shows how long the agent has been running, when it last contacted the MySQL server it is monitor-

ing, and the last time the agent contacted the dashboard. Mouse over the date shown beside **UP SINCE** and a pop-up box displays the time that has elapsed since the server instance was last started. You can also mouse over the **LAST MYSQL CONTACT** and the **LAST AGENT CONTACT** dates.

Note

In the case of remote monitoring, the agent runs on a different machine than the MySQL server that it is monitoring. The **Hostname**, **MySQL**, and **Rules** information applies to the system being monitored. The **OS** and **CPU** information applies to the machine on which the agent is running. For more information about remote monitoring see, [Section 15.3.3.6.4, “Configuring an Agent to Monitor a Remote MySQL Server”](#).

The top of the screen shows the refresh cycle and **Help** and **Log Out** links. Click the **Help** link to open the documentation in a separate browser window. Choose **Log Out** if you wish to leave the Dashboard or to log in as a different user. Different refresh rates are available from the drop-down listbox.

In the footer are external links to MySQL Enterprise and information about the current user. Users can remain connected to the Dashboard and update their subscription, use the Enterprise Knowledge Base, and contact technical support. Your subscription information is also displayed here, showing the number of days remaining and the number of licenses. The number of licenses indicates to the number of machines that may be monitored; any number of MySQL servers may be running on a specific machine.

The footer also contains a link to the **Settings** page. If your subscription is current it reads **SUBSCRIPTION IS UP-TO-DATE. MORE INFO.....** For more information about the **Settings** page see [Section 15.6.7, “The Product Information Screen”](#).

15.5.1. The Server Tree

The tab on the left displays the Server tree. By default the first group of servers is selected. This selection determines the information shown on the **Monitor** page.

If a server group is selected, the information presented on the **Monitor** page is aggregate information for this group; if only one server is selected the information applies to that server only.

Change your server selection and the information shown in the graphs and in the **Heat Chart** changes.

Note

For more information about server groups see, [Section 15.6.3.2, “Grouping Servers”](#).

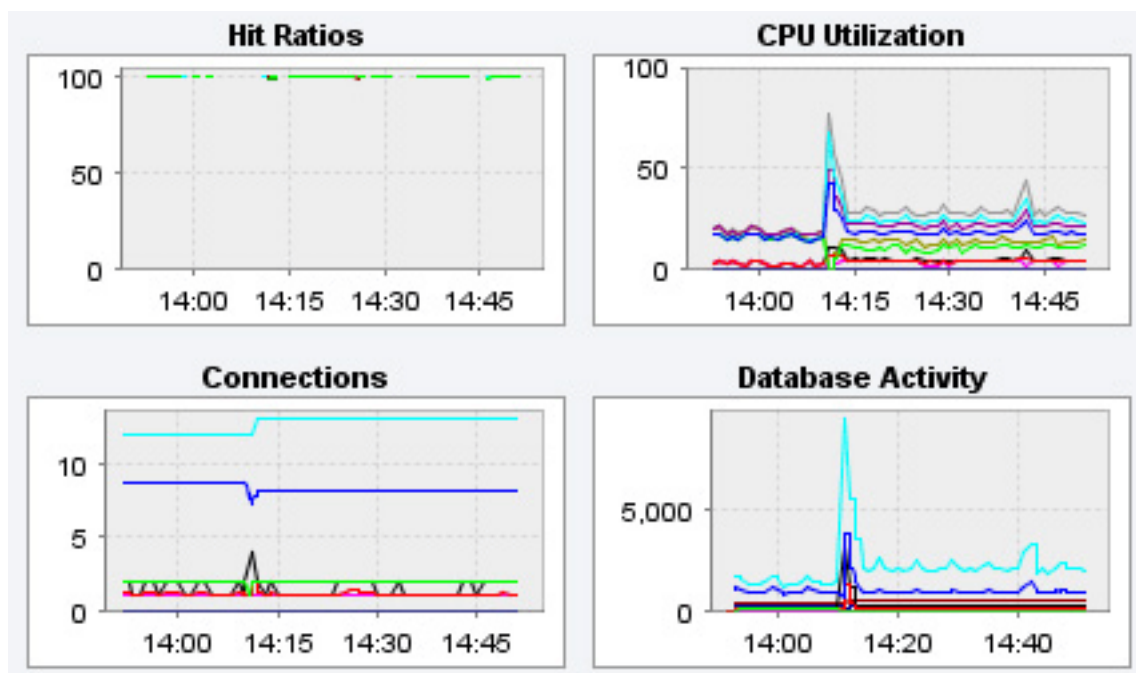

The individual server, or server group, selected in the Server Tree also determines what information appears when the **Advisors** tab or the **Events** tab is selected.

The Server Tree presents an easy way to navigate to different groups or to specific servers.

15.5.2. The Server Graphs and Critical Events

The center of the **Monitor** page gives a visual representation of the state of your servers.

Figure 15.32. MySQL Enterprise Dashboard: The Graphs screen

The graphs present information about the currently selected server or server group. The default graphs show the hit ratios, CPU utilization, connections, and database activity for a specific interval.

To set the interval click the [configure graphs](#) link immediately below the graphs. This opens a dialog box where you can choose the default interval for the x-axis of the graphs. Defining a shorter or longer interval gives you a shorter or longer term view of server activity. The thumbnail and full-size graph dimensions can also be adjusted from this dialog box. Save any changes that you have made and the values chosen will be the defaults whenever you log in.

You can also choose the default graphs shown on the [Monitor](#) page. To do this click the [edit favorites](#) link and choose the graphs you want from the drop-down list box. To choose contiguous graphs, hold down the **Shift** key and click on the desired graphs. For a non-contiguous selection, click the desired graphs while holding down the **Ctrl** key. The maximum number of graphs that can be displayed on the [Monitor](#) page is six. Save your changes and these will be the default graphs whenever you log in.

Color coding helps distinguish different aspects of each graph. With [Database Activity](#) for example, you can readily distinguish [SELECT](#) statements from database insertions.

Clicking a graph opens a detailed view with **GRAPH DISPLAY** and **CONFIGURE** tabs. Choose the [Configure](#) tab to temporarily change the way that a graph displays. Changes made from this tab only apply to the standalone graph while it is open. Persistent changes are made as described above.

Dismiss the enlarged graph by clicking the **HIDE** button.

[Critical](#) alerts appear on this page immediately below the graphs—quickly attracting your attention. For a description of all the different alarm levels see, [Section 15.5.3, “The Heat Chart”](#). This is the subject of discussion in [Section 15.8, “The Events Page”](#).

15.5.3. The Heat Chart

The [Heat Chart](#) is found on the right side of the [Monitor](#) page and shows the status of critical rules. Monitored servers are organized by groups. To view the status of a specific server, click the + button next to the appropriate server group.

Whenever a new agent contacts the Service Manager for the first time, all the rules in the Heat Chart Advisor are automatically activated. These Advisors monitor the status of the server and agent, critical operating system indicators, and important events related to your MySQL servers. An example follows.

Figure 15.33. MySQL Enterprise Dashboard: The Heat Chart

	Agent Status	Server Status	CPU Usage	IO Usage	RAM Usage	Lock Contention	My/SAM Usage	Query Cache	Temp Tables	Table Cache	Table to Disk	Critical Scans	Warnings	Info	
+ All Servers (11)	●	⊗	○	○	○	○	○	○	○	○	○	●	29	55	33
- Dev (3)	●	⊗	○	○	○	○	○	○	○	○	○	○	3	10	2

To interpret the Heat Chart see the following legend.

Figure 15.34. MySQL Enterprise Dashboard: The Heat Chart legend

Server & Agent Status	Monitored Events
● up	○ ok
● down	● info
⊗ unknown	● warning
	● critical
	⊗ unknown

The status **unknown** will typically apply when an agent is down and can no longer report the status of the server that it is monitoring. The status **unknown** may also apply if the data collection that should be collected is not available on the server being monitored.

You may open the Heat Chart in its own browser window by clicking the [Standalone Heat Chart](#) link immediately below the [Heat Chart](#) on the left. If you like, the refresh rate can be set to a different rate than the setting on the [Monitor](#) page.

In addition to showing the most important advisors, the [Heat Chart](#) also has columns that display the number of critical, warning, and informational alarms. Clicking the hyperlink in any one of these columns takes you to the [Event](#) screen, which gives more detailed information. For more information about events see, [Section 15.8, “The Events Page”](#).

When the Dashboard is first installed no notification groups are associated with the Advisors shown in the Heat Chart. For more information on this topic see, [Section 15.3.2.7.3, “Installing Advisors After Initial Log-in”](#) and, [Section 15.6.5, “Manage Notification Groups”](#).

15.6. The Settings Page

Note

MySQL Enterprise subscription, MySQL Enterprise Monitor, MySQL Replication Monitor, and MySQL Query Analyzer are only available to commercial customers. To learn more, see: <http://www.mysql.com/products/enterprise/features.html>.

Upon initial installation you may have configured your MySQL Enterprise credentials and also outgoing email settings. This section explores the configuration settings in more detail, and also shows how to manage servers, users, notification groups, Simple Network Management Protocol (SNMP) traps, log files, and the product information screen.

Knowledge of server management is a prerequisite for properly configuring advisors — the subject of [Section 15.7, “The Advisors Page”](#).

To get to the [Settings](#) page open the Dashboard and choose the [Settings](#) tab.

15.6.1. Global Settings

The **GLOBAL SETTINGS** control the main configuration parameters for the entire MySQL Enterprise Monitor system, including your email notifications, data purge, and Enterprise website credentials.

Figure 15.35. MySQL Enterprise Dashboard: Settings

The screenshot shows the MySQL Enterprise Monitor interface with the following sections and settings:

- Outgoing Email Settings:**
 - Enable Email Notifications
 - From Address (ex. "MySQL Dashboard" <name@domain.com>): [text box]
 - SMTP Server: [text box]
 - SMTP Server Login: [text box]
 - Disable JavaMail TLS/SSL
 - Update Password On Save
 - SMTP Server Password: [text box] Confirm Password: [text box]
 - On Save, Send Test Email Message to (optional): [text box]
 - [save]
- SNMP Traps:**
 - Enable SNMP Notifications
 - Target: [text box] Port: [text box]
 - Community String: [text box] (value: public)
 - On Save send test trap (optional)
 - Up/Down Application
 - Advisor Event with a severity of [Critical]
 - Application Error
 - [save]
- Server Locale:**
 - Locale: [English (United States)]
 - This locale overrides the operating system locale for use in notifications.
 - [save]
- Data Purge Behavior:**
 - Remove Historical Data Collection Older Than: [never]
 - Remove Service Manager Logs Older Than: [never]
 - Remove Query Analyzer Data Older Than: [never]
 - [save]
- Remote Server Inventory Schedule:**
 - Re-inventory Remote Servers Every: [12 hours]
 - This will re-inventory all connected servers. The information collected may be used in custom data collection.
 - [save]
- MySQL Enterprise Credentials:**
 - These credentials are used to login to MySQL Enterprise at mysql.com to enable subscription updates.
 - Email Address (MySQL Enterprise Login): [text box]
 - Enterprise Password (MySQL Enterprise Password): [text box]
 - Confirm Password: [text box]
 - [save]
- MySQL Enterprise Product Key:**
 - In the event that this machine cannot connect to mysql.com to verify subscription information, you may manually import this information from a file provided by MySQL Enterprise. Subscription updates will require that you retrieve a new file from MySQL Enterprise.
 - MySQL Enterprise Product Key: [Choose File] no file selected
 - [save]

Footer: MySQL Enterprise © 2005-2008 MySQL AB, 2008 Sun Microsystems, Inc. All rights reserved. Enterprise Software | Update Service | Knowledge Base | Technical Support | About. Logged in as "admin" (Nov 19, 2008 3:38:40 PM). Monitoring 3 instances on 2 hosts (198 hosts remaining). Subscription is up-to-date. More info...

The **GLOBAL SETTINGS** page is divided into a number of different sections:

- **OUTGOING EMAIL SETTINGS**

Configures the settings for email notified by MySQL Enterprise Service Manager. You must configure the **FROM ADDRESS** **SMTP SERVER** settings. If your server requires authorization, complete the necessary server login details, and whether SSL is required.

You can test your configuration immediately by adding an email address to the **ON SAVE, SEND TEST EMAIL MESSAGE TO** box.

For more information about [Outgoing Email Settings](#) see, [Section 15.3.2.7.5, "Outgoing Email Settings"](#).

- **SNMP TRAPS**

The **SNMP Traps** section of the [Global Preferences](#) page allows you to enable Simple Network Management Protocol so that your Network Management System (NMS) can handle events created by the MySQL Enterprise Monitor. Configure this section to route alerts and notifications to standard SNMP-enabled nodes on your network.

In the **TARGET** text box enter the IP address or the host name of your NMS listener. The port number defaults to the well-known SNMP port, **162**. If you are not using this port, enter the port that your Network Management System is listening on.

Enter the appropriate community string in the **Community String** text box. The default value for this string is **public**.

To ensure that the target you have specified is valid, check the **On Save, Send Test Trap** check box. The remaining check boxes help you to configure how your NMS responds to MySQL Enterprise Monitor. Check the **UP/DOWN APPLICATION** check box to configure NMS for starting up or shutting down the MySQL Enterprise Monitor. For configuration of advisor events choose a level of severity and check the **ADVISOR EVENT WITH THE SEVERITY OF CRITICAL** check box. Finally,

choose the **APPLICATION ERROR** check box to configure NMS to support application error traps. Be sure to save your settings before exiting.

If you wish to enable SNMP traps globally, check the [Enable SNMP Notifications](#) checkbox. To enable SNMP traps only for specific rules run against specific servers or server groups leave this checkbox unchecked — enabling specific SNMP traps is done as rules are scheduled. For instructions on doing this see [Section 15.7.2, “Scheduling Rules”](#).

The Management Information Base (MIB) file associated with SNMP trapping is called `MONITOR.MIB`. For the location this file see [The Management Information Base \(MIB\) File](#).

- **SERVER LOCALE**

The [Server Locale](#) setting determines the language of notification for the following items:

- Email notifications
- SNMP traps
- The naming conventions for shared resources such as a replication group name prefix

The initial value in this drop down list box is the locale for the OS on which the Dashboard is running.

- **DATA PURGE BEHAVIOR**

The [Data Purge Behavior](#) section of the [Global Preferences](#) page lets you remove old log files and also old data from the repository. The default purge interval is `never`. If you wish to purge data, change this setting by choosing from the drop-down list. Choosing `52 weeks`, for example, will remove all data that is older than a year.

Warning

Purging data will permanently remove information from the repository. Since events are derived from data contained in the repository, they will be purged along with the data.

Ensure that there is adequate disk space for the repository. If you are monitoring numerous servers and running many rules the size of the repository can increase rapidly. Choose purge behavior accordingly.

The default value for purging, `never`, is the safest option. However, please choose a purge setting that makes sense for your environment.

Note

The purge process is started approximately once every minute. If you change the purge duration from a larger timespan to a smaller one, the data may start to be purged immediately.

You can configure the data purge behavior for a number of different systems individually:

- **Remove Historical Data Collection Older Than** configures the duration that the main data about your servers is retained. This includes all data collections, including CPU, memory and connections and activity statistics.
- **Remove Service Manager Logs Older Than** configures the duration that the main MySQL Enterprise Service Manager logs are retained.
- **Remove Query Analyzer Data Older Than** configures the duration that the query analyzer statistics and information about individual queries is retained.

Note

Purging can be carried out manually by enabling the `innodb_file_per_table` for the repository database and then using an `OPTIMIZE TABLE` operation to reclaim space from deleted rows in the table.

- **REMOTE SERVER INVENTORY SCHEDULE**

MySQL Enterprise Monitor keeps track of all the databases and tables in a server, as well as the amount of RAM, disk space, and other items. A re-inventory updates this information in case you've added or dropped databases and tables. Depending upon the configuration of your system, this operation can tax resources. If you are monitoring many remote servers this is an operation you may want to perform in off-peak hours only.

- **MYSQL ENTERPRISE CREDENTIALS**

You can specify the credentials for logging into the MySQL Enterprise Website. These should match the user name and password that you have registered with MySQL for your enterprise subscription.

Note

Only administrators can change the [MySQL Enterprise Credentials](#) section or enter a product key; for other users, this section does not show up in the interface. For more information about different users and their rights see [Section 15.6.4, “Managing Users”](#). Specifying incorrect credentials results in the error message, “Your credentials do not appear to be valid.”

- **MYSQL ENTERPRISE PRODUCT KEY**

You may update your [MySQL Enterprise Product Key](#). If you do not have access to the Internet from the Dashboard, this provides an alternate way to update or activate the MySQL Enterprise Monitor.

To enter your product key first download it from the MySQL Enterprise website. Copy the key to a location accessible from the Dashboard. Use the BROWSE button to locate the key and then press the SAVE button.

If you wish to switch from using your MySQL Enterprise credentials to using a product key to update MySQL Enterprise Monitor, you must first clear your credentials. Do this by removing the email address from the **MYSQL ENTERPRISE CREDENTIALS** section and then clicking the SAVE button. You may then enter and save your MySQL Enterprise product key.

Note

Only administrators can change the [MySQL Enterprise Credentials](#) section or enter a product key; for other users, this section does not show up in the interface. For more information about different users and their rights see [Section 15.6.4, “Managing Users”](#). Specifying incorrect credentials results in the error message, “Your credentials do not appear to be valid.”

15.6.2. User Preferences

On this page users can change their passwords, user names, and locale information.

Figure 15.36. MySQL Enterprise Dashboard: User Preferences

The screenshot shows the 'User Preferences' section of the MySQL Enterprise Dashboard. The interface includes a navigation bar at the top with tabs for Monitor, Advisors, Events, Graphs, Query Analyzer, Replication, Settings, and What's New?. Below the navigation bar, the 'User Preferences' section is displayed with the following fields and controls:

- User Name:** A text input field containing 'admin'.
- Role:** A dropdown menu currently set to 'manager'.
- Password:** A text input field with the instruction '(Leave empty to keep password unchanged)'.
- Confirm Password:** A text input field.
- Timezone:** A dropdown menu set to '(GMT+00:00) Greenwich Mean Time - Europe/London'.
- Locale:** A dropdown menu set to 'English'.
- save:** A button at the bottom left of the form.

Change your password by entering a new value into the **PASSWORD** text box. To change your user name enter a new value into the **USERNAME** text box. Click the **SAVE USER PROPERTIES** button to commit this change.

You may also adjust your time zone and locale information from this page. The settings on this page apply only to the user who is currently logged in.

The MySQL Enterprise Service Manager determines the default value for the locale by looking at your browser settings. Changing this value, determines the language setting for any future logins to the Dashboard, overriding your browser settings.

Note

Be sure to set the correct time zone so that alerts are time stamped correctly.

This setting applies only to the specific user.

15.6.3. Manage Servers

To help with server management, the Service Manager supports the logical grouping of MySQL servers. This allows you to group servers in any fashion you choose. For example, you can manage servers according to purpose. You can group servers by whether the servers handle Internet or intranet data, by whether they power finance or HR applications, or, if you prefer, you may organize them by physical location rather than by functionality.

Figure 15.37. MySQL Enterprise Dashboard: Manage Servers

Server	Query Analyzer			MySQL	Up Since	Last MySQL	Agent	Last Agent	Migration Status
	Enabled	Examples	Explains						
<input type="checkbox"/> All Servers (3)									
<input type="checkbox"/> bear:3306 (ungrouped)	On	On	On	5.0.60-log	Sep 13, 2008 6:37:12 PM	Nov 19, 2008 4:07:00 PM	2.0.0.7085	Nov 19, 2008 4:07:13 PM	N/A
<input type="checkbox"/> gentoo1.vmbear:3306 (ungrouped)	On	Off	Off	5.0.60-log	Nov 17, 2008 10:26:45 AM	Nov 19, 2008 4:42:00 PM	2.0.0.7101	Nov 19, 2008 4:07:13 PM	Done
<input type="checkbox"/> gentoo2.vmbear:3306 (ungrouped)	On	Off	Off	5.0.60-log	Nov 17, 2008 9:04:53 AM	Nov 19, 2008 1:51:00 PM	2.0.0.7101	Nov 19, 2008 4:07:11 PM	Done

For a server to appear in the Dashboard there must be an agent monitoring it. If you wish to add a server to the Dashboard follow the procedure for installing an agent found at [Section 15.3.3, “Monitor Agent Installation”](#). Instructions for adding a remote server are found at [Section 15.3.3.6.4, “Configuring an Agent to Monitor a Remote MySQL Server”](#).

The **MANAGE SERVERS** panel also allows you control the Query Analyzer and Data Migration. For more information, see [Section 15.10.6, “Query Analyzer Settings”](#) and [Section 15.4.2, “Migrating 1.3.x Historical Data to MySQL Enterprise Monitor 2.0”](#).

Note

The **All Servers** group is built in and every monitored server is a member of this group.

15.6.3.1. Renaming a Server

You can rename an existing server without losing the current historical data or configuration information. Renaming the server also allows you to modify the name of the server to be more descriptive according to the server's role within your organization. For example, you may want to rename a server from the default host name to include the department and application for the MySQL server.

To rename a server, click the **RENAME** link next to the server. You will be prompted with information about the server, including the host name and registered IP addresses for the agent. Fill in the alternative name that you want to be displayed in the text box at the bottom of the window.

Figure 15.38. MySQL Enterprise Dashboard: Server Renaming

Rename Server

Rename Server "bear:3306".

host
bear.mcslp.pri
localhost

ip
192.168.0.2
127.0.0.1
192.168.92.1
172.16.217.1

port
3306

name

save cancel

15.6.3.2. Grouping Servers

All monitored servers are automatically included in the top level server grouping, [All Servers](#). Other server groupings are replication groups or user-defined groups.

You can create a user-defined group by clicking on the [Manage Servers](#) link. Add a group name and then click the CREATE GROUP button. The new group will be displayed immediately.

Replication groups are automatically discovered by MySQL Enterprise Monitor and in this respect differ from user-defined groups. For more information about replication groups see [Section 15.11, "The Replication Page"](#). However, like user-defined groups you can edit the name of a replication group and add other servers to it.

To add to a group, select the [add to group](#) link. Choose the server or servers you wish to add and then complete the operation by choosing the ADD TO GROUP button. You can add a server to a group even if the agent is down.

To remove a server from a group expand the server group tree and click the [remove from group](#) link. To delete a server altogether see [Section 15.6.3.3, "Removing a Server From the Dashboard"](#).

Note

Slaves removed from a replication group will be rediscovered and re-added to that group.

There are three ways to modify an existing group; by renaming it, adding to it, or removing it. Select the [rename](#) link to change the name of a group and [add to group](#) to add additional servers. Deleting a group simply requires clicking the [remove all from group](#) link. This removes the server group but has no effect on individual servers.

15.6.3.3. Removing a Server From the Dashboard

If you no longer wish to monitor a MySQL server you can remove it from the Dashboard. There is no provision for deleting an active server from the Dashboard—to remove a server you must make it inactive by stopping the agent.

For instructions on stopping an agent see:

- Windows – [Section 15.3.3.5.1, "Starting/Stopping the Agent on Windows"](#)
- Unix – [Section 15.3.3.5.3, "Starting/Stopping the Agent on Unix"](#)
- Mac OS X – [Section 15.3.3.5.2, "Starting/Stopping the Agent on Mac OS X"](#)

Once the agent is stopped you may delete the monitored server. Deleting a server simply means that it will no longer show up in the Dashboard.

Remove a server by choosing the [Settings](#) tab and then the [Manage Servers](#) link. Find the server you wish to remove and delete it by clicking the [delete](#) link. Deleting a server from the [All Servers](#) group or from any other group will remove it from the Dashboard entirely.

Note

A [delete](#) link will not appear beside an active server. You must stop the agent before this link will appear.

You may remove a server from any group at any time. Removing the last server from a group also removes that group.

15.6.4. Managing Users

The **MANAGE SERVERS** panel allows to create, delete and manage individual users that have access to MySQL Enterprise Service Manager

Figure 15.39. MySQL Enterprise Dashboard: Manage Users

To log in to the Dashboard a user account is required. There are three types of users with varying privileges; Administrators, Database Administrators, and Agents. The **Administrator** can create additional users and differs from a **DBA** in this respect. For this reason the **Manage Users** does not display if a **DBA** user logs in. Additionally, only administrators can change the MySQL Enterprise Credentials section or enter a product key on the [Global Settings](#) page. These sections do not appear when **DBA** users log in. For more information on this subject see [Section 15.6.1, "Global Settings"](#). The **Agent** account simply allows the MySQL Enterprise Monitor Agent to communicate with the Dashboard. There is no need for more than one agent account but defining an account for each server that is monitored can be an advantage since this minimizes exposure should any one agent be compromised. You cannot log in to the Dashboard using the agent's credentials.

When the Dashboard is first launched there are two default users, **Administrator** and **Agent**, both created during installation. Their default user names are respectively, **admin** and **agent**. The Administrator defined during installation as having the root role is unique; this user cannot be deleted.

If you are logged in as an **Administrator**, you can add a new user by choosing the [Manage Users](#) link from the [Settings](#) page. To create a user click the **CREATE USER** button, select a role for the user, and enter a user name and password.

When a new user first logs in, a dialog box opens requesting time zone and locale information. This information may be changed later from the [User Preferences](#) page. For more information, see [Section 15.6.2, "User Preferences"](#).

If you installed the Advisors through the Dashboard you should have already configured the settings for the root role user. (See [Section 15.6.1, "Global Settings"](#) and following for more information about this topic.)

Warning

To receive MySQL Enterprise and Advisor updates configure the MySQL Enterprise settings for at least one user. The MySQL Enterprise settings were set up on the first login to the Dashboard. For information on changing these settings see, [Section 15.6.1, "Global Settings"](#).

To edit an existing user's information, select the [Manage Users](#) link, then select the user you wish to edit. Make your desired changes in the fields provided and then save your changes.

To delete an existing user, merely select the [delete](#) link.

15.6.5. Manage Notification Groups

The **MANAGE NOTIFICATION GROUPS** panels allows you to create and manage the notification groups used when different notifications and warnings are distributed.

Figure 15.40. MySQL Enterprise Dashboard: Manage Notification Groups

Notification groups are collections of users who should be notified when advisor alerts occur. These users may have login credentials for the Dashboard but this is not a requirement.

You can create a group by clicking on the [create group](#) link. Specify a group name and add recipients. When adding a user an email address must be specified. If you are adding multiple users separate them with commas.

To modify an existing notification group, select the [edit](#) link next to the group name. Deleting a group simply requires clicking the [delete](#) link.

If a rule triggers an alarm, an email will be sent to the members of the notification group specified when the rule was scheduled. For more information about scheduling rules see [Section 15.7.2, “Scheduling Rules”](#).

Note

You should ensure that there is a mail server available for sending out alerts and that there is an account configured for receiving any alerts that are created.

15.6.6. Logs

Use the [Logs](#) link to inspect the various log files associated with the MySQL Enterprise Service Manager. The following image is an example of this screen.

Figure 15.41. MySQL Enterprise Dashboard: Logs

Log Name	Threshold	Last Modified	Entries
All	N/A	Nov 19, 2008 4:07:37 PM	838
Advisors	Info	Nov 19, 2008 11:44:28 AM	338
Agent Monitoring	Info	N/A	0
Agent Tasks	Info	N/A	0
Data Collection	Info	N/A	0
Graphs	Info	Nov 19, 2008 11:44:12 AM	4
Groups	Info	N/A	0
Inventory	Info	Nov 19, 2008 11:44:24 AM	4
JDBC	Info	N/A	0
Misc	Info	Nov 19, 2008 11:44:29 AM	11
Migration	Info	Nov 19, 2008 1:52:09 PM	340
Notification	Info	N/A	0
Preferences	Info	N/A	0
Replication	Info	N/A	0
Security	Info	N/A	0
SQL	Info	N/A	0
Timing	Info	Nov 19, 2008 4:07:37 PM	140
Xwork	Warning	N/A	0
Apache	Warning	Nov 19, 2008 11:26:32 AM	1
Catalina	Warning	N/A	0
Hibernate	Warning	N/A	0
Freemarket	Warning	N/A	0
Spring	Warning	N/A	0
EH Cache	Warning	N/A	0

The various categories of logs are shown in alphabetical order. The most recent changes to each log are shown in the **LAST MODIFIED** column. The number of entries in any specific log is shown under the **ENTRIES** column.

To view detailed information click the [Log Name](#). This will open a separate browser window showing the date, time, alert type, and accompanying message.

On this screen you can filter log information in a couple of ways; by the message type and by time period .

To filter by message type select from the options in the **LEVEL** drop-down box. These are, in order of decreasing severity:

- All
- Error
- Warning

- Information
- Trace
- Debug

You can also adjust the number of items that appear on each page.

Press the [clear all logs](#) link to remove all log entries. To remove entries of a specific kind click the [clear logs](#) link associated with the specific log you would like to remove. A confirmation dialog box allows you to back out of this operation and avoid accidentally removing log information.

To clear log files of a specific age see the [Data Purge Behavior](#) section of the [Global Preferences](#) page. For more information on this topic see [??? \[1268\]](#).

Use the [edit log level](#) link to change the type of error logged. The value selected from the [Edit Log Level](#) dialog box determines what appears under the **THRESHOLD** column (second from the left in [??? \[1268\]](#)).

Selecting [Error](#) from the list box will create the least number of log entries and [Debug](#) the most. Choosing [None](#) turns off logging altogether.

It is also possible to download a compressed version of all the log files. For more information, see [Section 15.6.7, “The Product Information Screen”](#).

15.6.7. The Product Information Screen

Use the [Product Information](#) link to view detailed information about your subscription level and contract status.

The **CONTRACT STATUS** section displays the subscription level, expiration date, contract number, the number of servers supported, and your MySQL Enterprise user name. The **SUBSCRIPTION LEVEL** section gives more detailed information, including features and any restrictions that may apply. You may update your subscription at any time by clicking the **UPDATE** button.

Note

The **UPDATE** button was added in version 1.3 of the MySQL Enterprise Monitor. If your version of MySQL Enterprise Monitor does not have an **UPDATE** button, saving your credentials again will download a new key. See [Section 15.6.1, “Global Settings”](#) for instructions on doing this. If you do not have Internet access from the Dashboard, you can install a new key manually. This process is described in [Section 15.6.1, “Global Settings”](#).

This page also contains Enterprise Dashboard Server information; the version number, uptime, and other information related to the memory used by the Java Virtual Machine.

The [Enterprise Dashboard Server information](#) section also contains the hyperlink, [Download diagnostic report](#). Click this link to download a compressed version of the MySQL Enterprise Service Manager log files. All the log files found on the [Logs](#) page (for more information about logs see [Section 15.6.6, “Logs”](#)) are contained in this file. It also contains the Java properties file, the monitored MySQL servers property file, information about the status of the JDBC connection and Java threads, and the [subscription.xml](#) file. This report is especially useful for debugging the MySQL Enterprise Service Manager and the MySQL Enterprise Monitor Agent.

15.6.7.1. Subscription Warning

The [Subscriptions Warning](#) section on the product information page displays any warnings relative to your subscription. For example, if your subscription has expired you may receive a message such as the following:

```
Your Subscription Needs to be Updated
* Your Platinum subscription expired 3 days ago on Feb 14, 2008 11:59:59 PM.
If the subscription information on this page is not current, you can
update it by going to the Enterprise Monitor Global Settings page and
providing MySQL Enterprise credentials or by importing a new product
key that you downloaded from http://www.mysql.com/enterprise/download.php.
To update or renew your subscription, please contact your MySQL
Account Representative at sales@mysql.com or visit
http://www.mysql.com/about/contact/renew.html. After the update or
renewal is complete you can then follow the above instructions for
updating your subscription.
```

Follow these instructions to update your subscription. If you see this message and your subscription has already been updated, simply click the **UPDATE** button in the **CONTRACT STATUS** section of this page. This should update your subscription and remove the warning.

Note

After updating your subscription remember to also update your advisors. For instructions on doing this see [Section 15.7.1, “Installing and Updating Advisors”](#).

15.7. The Advisors Page

Note

MySQL Enterprise subscription, MySQL Enterprise Monitor, MySQL Replication Monitor, and MySQL Query Analyzer are only available to commercial customers. To learn more, see: <http://www.mysql.com/products/enterprise/features.html>.

MySQL Enterprise Advisors are a series of scripts that gather information from your MySQL servers via the Service Manager and the Service Agents, analyze that information based on custom rules developed by MySQL AB, and then offer alerts and advice when necessary. As new rules are introduced, the MySQL Enterprise Advisors can be updated through the MySQL Enterprise website.

The MySQL Enterprise Advisors fall into the following categories:

- Administration
 - Better manage databases
 - Suggest improvements for smoother operation
- Heat Chart
 - Drive the status indicators in the Heat Chart
 - Identify up/down status and performance issues
- Performance
 - Identify potential performance bottlenecks
 - Make suggestions for improved database speed
- Replication
 - Identify replication bottlenecks
 - Improve replication design
- Schema
 - Identify schema changes
 - Find security loopholes
- Security
 - Protect MySQL servers
 - Find security loopholes

An advisor category provides a set of rules designed to enforce MySQL best practices for that specific category. Rules can be targeted to run at the individual server or group level and, upon rule violation, provide alerts and expert advice on how to address and correct a problem before it becomes a costly outage.

Individual rules are defined in the `items-mysql-monitor.xml` file. On Windows this file is found in the `C:\Program Files\MySQL\Enterprise\Agent\share\mysql-monitor-agent` directory and on Unix in the `/opt/mysql/enterprise/agent/share/mysql-monitor-agent` directory. Find below the rule for discovering a root account with no password.

```
<ITEM>
<NAME>no_root_password</NAME>
<FIELD>no_password</FIELD>
<SCOPE>table</SCOPE>
<CODE>
<![CDATA[SELECT COUNT(*) AS no_password FROM mysql.user WHERE user='root' AND password='']]>
</CODE>
<NAMESPACE>mysql</NAMESPACE>
```

```
<RETURNS>INTEGER</RETURNS>
<SOURCE>table</SOURCE>
<INSTANCE>mysql.user</INSTANCE>
</ITEM>
```

Your MySQL Enterprise subscription level determines which rules are available to you. Subscription levels are cumulative, meaning that higher MySQL Enterprise levels have access to all the rules of the lower levels.

When the Dashboard is first installed, the only rules that are scheduled are those that belong to the [Heat Chart](#) group.

Go to the Advisors screen by logging in to the Dashboard and choosing the [Advisors](#) tab.

15.7.1. Installing and Updating Advisors

Instructions for installing Advisors are given in [Section 15.3.2.7.3, “Installing Advisors After Initial Log-in”](#), and following. Principally, you need to configure your MySQL Enterprise login or enter your product key before you can update your Advisors.

If your MySQL Enterprise login is configured, you can download the latest Advisors by navigating to the [Advisors](#) page and finding the [Check for Updates](#) link. You can periodically update advisors in this way.

Note

If you do not have Internet access and cannot use the online update option you can manually import advisors. This process is described in [Section 15.3.2.7.3, “Installing Advisors After Initial Log-in”](#).

15.7.2. Scheduling Rules

Once the MySQL Enterprise Advisors have been installed, you can configure which advisors you would like to run on a scheduled basis.

You can schedule rules by individual server or by group. This is done by first selecting the desired server or server group from the [Server](#) tree found on the left side of the screen. Next select the [Advisors](#) tab.

Opening the [Advisors](#) tab takes you to the [Current Schedule](#) page. If you have only just installed the MySQL Enterprise Monitor then you will only see the [Heat Chart](#) group of advisors. Clicking the + button will show all the rules in the Heat Chart group.

Clicking the + button beside any specific rule will show the servers that this rule is running on, its frequency, and its status. Initially, all the [Heat Chart](#) rules are enabled.

For a more complete description of a rule, click the rule's name. This opens a dialog box that gives detailed information about the rule.

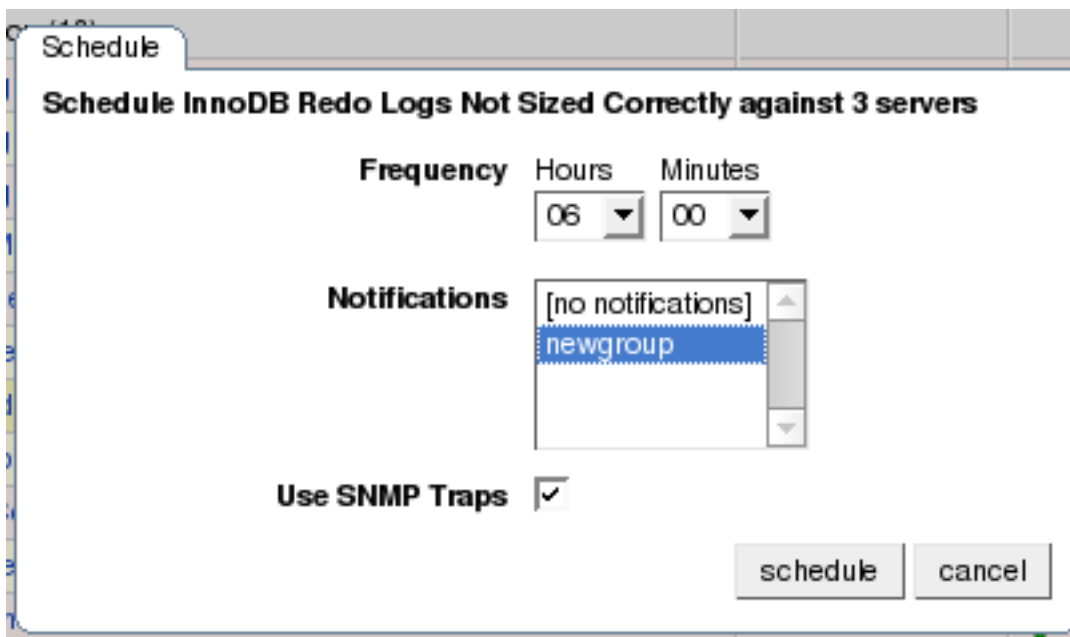

To view the advisors other than the Heat Chart group, select the [Add to Schedule](#) link. This will show all the advisors available for your subscription level.

Rules are grouped by functionality and displayed in alphabetic order. To expand a group click the + button to the left of the advisor name.

You may activate all the rules in a group by selecting the checkbox beside the group name. Once selected you may apply rules against a specific server or a group of servers. A message showing the group of servers or the specific server you have selected will display immediately below the SCHEDULE button. For example, if the [All Servers](#) group is selected in the server tree, then the message will read, “Schedule Advisors Against **All Servers**”.

To select a specific rule, expand the group tree by clicking the + button. Select the checkbox to the left of the rule you wish to schedule. Click SCHEDULE to display the following dialog box:

Figure 15.42. MySQL Enterprise Dashboard: Scheduling Dialog

The Schedule dialog box allows you to configure the following fields:

- **Frequency** – Dictates how often the rule will run. The default value for different rules varies but a rule can be set to run at any interval desired.

Warning

Setting the frequency of a rule involves tradeoffs. Rule evaluation consumes system resources — CPU, memory, and disk space. While the amount consumed is small, if you run all the rules against dozens of servers on a very frequent basis, you may put a significant load on the Service Manager. So select an appropriate frequency. For example, unless you are stopping and restarting your servers frequently, rules that check server configuration variables probably don't need to run very often.

Another consideration is that certain status variables increase monotonically until a server is restarted. Examples of these are `Key_reads`, `Qcache_hits`, `Questions`, `Table_locks_waited`, and similar variables. The value returned by `SHOW STATUS` for these variables is the value since the server was started (or since the last `FLUSH STATUS` command), which is not very useful for performance tuning, especially if the server has been running for an extended period of time. For performance tuning it is much better to know the change in state (i.e. delta) of these values over the last 10 minutes, 1 hour, or whatever time frame is appropriate for your application. The frequency at which you schedule a rule is the time frame used to calculate the delta values of these variables, and it is the delta that is used in expression evaluation, not the absolute value. Consequently, select a frequency that is appropriate for the metrics being used in the expression.

- **Notifications** – A listbox of users and/or notification groups who will be emailed when an advisor reaches an alert level. Single or multiple selections are allowed. For instructions on setting up notification groups see, [Section 15.6.5, “Manage Notification Groups”](#).

Set the frequency, identify whomever you wish to notify, and click SCHEDULE to schedule the advisor. Upon completion, you should see the message, [Successfully scheduled](#).

If you haven't set up global SNMP traps and would like your Network Management System (NMS) to handle events related to a specific rule then check the [Use SNMP Traps](#) checkbox. For more information about Simple Network Management Protocol (SNMP) see [Simple Network Management Protocol \(SNMP\) Traps](#).

Scheduling rules using the checkbox and the SCHEDULE button is an effective way to schedule multiple rules. To schedule a single rule you may also use the [schedule](#) link.

When scheduling more than one rule, you have the option of selecting a checkbox to use the default frequency of each rule or you may choose a frequency that will apply to all selected rules. When customizing the frequency, take care that you choose a value that is appropriate to all the rules selected.

Note

If the agent does not have the `SUPER` privilege and InnoDB-related rules are scheduled, a warning will appear in the `DataCollection` log. This also occurs if `mysqld` is started with the `skip-innodb` option. For more information about agent rights see [Section 15.3.3.1, “Creating a MySQL User Account for the Monitor Agent”](#).

15.7.2.1. Heat Chart Notifications

It is particularly important that `Notifications` be set for the `Heat Chart` group of rules. This is easily done from the `Current Schedule` page by clicking the + button beside a rule and then clicking a server.

Doing this opens a window with three tabs—`Overview`, `Settings`, and `Advanced`.

The `Overview` tab shows which advisor group a rule belongs to, a description of its purpose, and a link to the history of this alert.

In the `Settings` tab you can adjust the frequency of this rule and also specify a notification group. To select more than one contiguous group press the `Shift` key and click the desired groups. (Some web browsers may require that you drag your selection.) Non-contiguous selections are made by holding down the `Control` key and clicking the desired groups.

If you haven't set up global SNMP traps and would like your Network Management System (NMS) to handle events related to a specific rule then check the `Use SNMP Traps` checkbox. For more information about Simple Network Management Protocol (SNMP) see [??? \[1267\]](#).

The `Advanced` tab gives detailed information about how this rule is implemented.

15.7.3. Editing Built-in Rules

The frequency and thresholds defined for a rule are default recommendations. To edit these properties choose the `Create/Edit Rule` link.

The following image shows the screen used to edit rules:

Figure 15.43. MySQL Enterprise Dashboard: Editing Rules

Rule Name	Advisor	Version	
Temporary Tables To Disk Ratio Excessive - copy	Heat Chart	1.0	
Expression			
(%Uptime% > 10800) && (((%Created_tmp_disk_tables% / (%Created_tmp_tables%)) * 100) > THRESHOLD)			
Thresholds			
Critical Alert	<input type="text" value="90"/>		
Warning Alert	<input type="text" value="75"/>		
Info Alert	<input type="text" value="50"/>		
Variable Assignment			
Variable	Data Item	Instance	
%Uptime%	mysql:server:Uptime	local	delete
%Created_tmp_disk_table	mysql:server:Created_tmp_disk_tables	local	delete
%Created_tmp_tables%	mysql:server:Created_tmp_tables	local	delete
%tmp_table_size%	mysql:server:tmp_table_size	local	delete
%max_heap_table_size%	mysql:server:max_heap_table_size	local	delete
<input type="button" value="add row"/>			
Default Frequency			
Hours	Minutes		
<input type="text" value="00"/>	<input type="text" value="05"/>		

Beside the rule name is the [Advisor](#) drop-down list box, used for setting the advisor group. This list box shows existing groupings and any you may have added. The [Expression](#) text area shows the advisor rule, [Variable Assignment](#) the data item associated with variable(s) used in the rule and [Thresholds](#) determines when to trigger each alert type.

The three levels of [Thresholds](#) are [Info Alert](#), [Warning Alert](#), and [Critical Alert](#) indicating increasing levels of severity. Levels can be triggered by the expression result being equal to a certain value, greater than a certain value, or less than a certain value.

The data items that variables are associated with are operating system (OS) properties such as available RAM or MySQL characteristics such as the InnoDB buffer pool. To see all available data items drop down the [Data Item](#) list box. For a listing of these data items see [The Data Collection Items Used to Create Rules](#).

In [Figure 15.43, “MySQL Enterprise Dashboard: Editing Rules”](#) the drop-down [Data Item](#) list box within the [Variable Assignment](#) frame shows the various MySQL server status or operating system specific variables that may be used in expressions. The text boxes below [Thresholds](#) define the levels at which informational, warning, or critical alerts are issued.

To lower the threshold for an informational alert, simply increase the number given in the [Info Alert](#) text box.

When a data item can apply to multiple objects, you need to specify which instance to use for that item, hence the [Instance](#) text box. In almost all cases this should be set to `local`. The exceptions are as follows:

- For CPU-related items set **INSTANCE** to `cpu0`. Additional CPUs on a system are referred to as `cpu1`, `cpu2` and so on.
- There can be multiple disks mounted on a system. To refer to a specific drive set **INSTANCE** to the name of the mounted drive. On Windows this would be `C:`, `D:`, and so on. On Unix systems, use whatever is valid for the `df` command.
- For RAM-related items set **INSTANCE** to `mem`.

- Where there are table-specific variables, the database name and table name must be specified in the **INSTANCE** text box. This topic is discussed in detail in what follows.

Note

It is not possible to have a data item that is unrelated to an instance. This raises the error, `You must map "<variable>" to an instance`, and you will be unable to save the rule.

An agent can only collect data from one MySQL server, so the `instance` entry for a variable in a rule does not need to specify which MySQL server to use; no matter how many servers are being monitored there is always a one-to-one relationship between an agent and its monitored server.

However, on one server there may be multiple occurrences of a variable. For example, there are multiple possible occurrences of table-specific variables such as `Avg_row_length` because there can be multiple databases and tables defined in a MySQL server. In this case, the “instance” refers to the database and table that a data item should be associated with, specified in the form `database.table`. So, for example, if you want to reference the `Avg_row_length` of the `mysql` database `user` table in an expression, select the `mysql:tablestatus:Avg_row_length` from the **DATA ITEM** list box and specify `mysql.user` in the **INSTANCE** text box.

On the other hand, in the case of a global server variable, there is only one possible target. For example, there can only be one instance of `delay_key_write` because this variable is global and applies to the server as a whole. In this case specify `local` in the **INSTANCE** text box.

To save your changes click the **SAVE** button at the bottom of the page.

Note

You can change only the thresholds and the frequency of built-in rules. So that rules function properly when updated, other changes are prohibited.

Should you wish to make other changes to a built-in rule, copy it and modify it as desired.

You can edit a rule even if it is currently scheduled. Your changes will not be overwritten when new rules are imported using the [Check for Updates](#) link.

15.7.4. Creating Advisors and Rules

In addition to using and editing the advisors and rules provided by MySQL Enterprise, users can create their own advisors and rules to meet their own unique needs. To do this go to the [Advisors](#) page and choose the [Create/Edit Rule](#) link.

15.7.4.1. Creating Advisors

Similar existing rules are grouped together in advisor groups.

The built-in advisors are:

- Administration
- Heat Chart
- Performance
- Replication
- Schema
- Security

The ability to create your own advisor group allows you to create groupings suitable to your circumstances.

You can create your own grouping by simply clicking the **CREATE ADVISOR** button. Enter an appropriate name and click the **ADD** button. The newly created group will appear in the [Advisor](#) column.

The newly created advisor is added to the list box of advisors shown in [Figure 15.43, “MySQL Enterprise Dashboard: Editing Rules”](#). You can now use this category of advisors when you create a new rule.

15.7.4.2. Overview of Rule Creation

Rules are created using the same screen seen in [Figure 15.43, “MySQL Enterprise Dashboard: Editing Rules”](#). To begin creating a rule from scratch, click the CREATE RULE button. However, the simplest way to create a new rule is to copy an existing one. Unlike editing an existing rule, when you copy a rule, every element of that rule is editable.

You can change the rule name, the advisor group that a rule belongs to and you can set your own version number. In [Figure 15.43, “MySQL Enterprise Dashboard: Editing Rules”](#), you have already seen how the threshold and frequency of a rule may be altered.

Most importantly you can alter a rule's expression. Expressions are the core of a MySQL Enterprise Advisor and are used to define the scenario being monitored. An expression can be as simple as a single server parameter or can be quite complex, combining multiple parameters with various mathematical operations.

An expression has two main characteristics:

- An expression defines a situation where a best practice is not being followed
- The result of an expression must always be 1 or 0 (that is, true or false)

If an expression evaluates to true for a specific server, an alarm is raised, indicating that a best practice is not being followed. If an expression evaluates to false no alarm is raised because the best practice is indeed being followed.

For example, if having binary logging enabled is considered a best practice for a production server (which we believe it is), then this best practice is being violated if `log_bin` is `OFF`. Consequently, the expression for the “Binary Logging Not Enabled” rule is “`%log_bin% == OFF`”. If this evaluates to 1, an alarm is raised because the best practice is not being followed.

An expression is made up of one or more variables and zero or more mathematical operators. The MySQL Enterprise Monitor uses the MySQL database server's expression parser and evaluator. For a complete list of operators and functions see <http://dev.mysql.com/doc/refman/5.0/en/functions.html>. For a complete list of the built-in variables used when creating rules see <http://dev.mysql.com/doc/refman/5.0/en/mysqld-option-tables.html>.

Creating an expression is dependent on variables defined in the **VARIABLE ASSIGNMENT** frame. This frame links variables used in the expression field with data gathered from the target MySQL server instance—server status variables, operating system status information, and table information. Variable names are associated with elements in the **DATA ITEM** drop-down list. If you need to define more than one variable simply click the ADD ROW button. For a complete listing of the data collection items used in creating rules see [The Data Collection Items Used to Create Rules](#).

The remaining fields determine the information that displays in a notification email or the informational pop-up window associated with each advisor.

Note

When saving a new rule ensure that you do not duplicate the name of an existing rule.

15.7.4.3. Variables

When an expression is evaluated variables get replaced by values. For example, part of the expression for the “MyISAM Key Cache Has Sub-Optimal Hit Rate” rule calculates the hit rate as follows:

```
100 - ((%Key_reads% / %Key_read_requests%)*100)
```

If the current value of `%Key_reads%` is 4522 and the current value of `%Key_read_requests%` is 125989, the hit ratio assesses to 96.4%:

```
100 - ((4522 / 125989) * 100)
```

By convention, the Advisors supplied by MySQL use ‘%’ as the delimiter, for example, `%Key_reads%`. This makes variables more readily identifiable.

In addition to being used in an expression, variables may also be used in the [Description](#), [Advice](#), [Action](#), and [Links](#) attributes of a rule. This allows you to report the current value of an expression.

For instance, you can add the message, “The current value of Key_reads is `%Key_reads%`.” to the [Advice](#) text box. When this is displayed on the screen, the value of `%Key_reads%` is substituted into the text. Supposing `%Key_reads%` has a value of 4522, the message becomes “The current value of Key_reads is 4522.”

15.7.4.4. Thresholds

Each expression has a threshold value that triggers an alert. The `THRESHOLD` keyword is used to associate that value with an alert level—either an [Info](#), [Warning](#), or [Critical](#) alert.

For example, the expression for the performance advisor, “Thread Cache Size May Not Be Optimal”, is:

```
100-((%Threads_created% / %Connections%) * 100) < THRESHOLD
```

The `THRESHOLD` is set at 95% for an Info level alert, 85% for a Warning alert, and 75% for a Critical alert; producing alerts of three different levels.

Expressions can be quite simple. The expression for “Binary Logging Not Enabled” (one of the Administration alerts) is:

```
%log_bin% == THRESHOLD
```

When the result is `OFF`, only one alert is triggered—a Warning level alert. In this situation you might think we could just use the expression `%log_bin% == "OFF"`. However, doing this would not test binary logging against a threshold so would not result in an alert.

When you create an expression, think carefully about the conditions under which it should be evaluated and the conditions under which it should not. For example, the expression for the “MyISAM Key Cache Has Sub-Optimal Hit Rate” rule is:

```
(%Uptime% > 10800) && (%Key_read_requests% > 10000) >
&& (100-((%Key_reads% / %Key_read_requests%) * 100) < THRESHOLD)
```

The essence of the rule is really: `(100-((%Key_reads% / %Key_read_requests%) * 100) < THRESHOLD)`. However, when a server is first starting up, it may take a while to reach a state that is representative of normal operations. For example, the key cache and the query cache may need some period of time before they have cached typical application data as opposed to start-up and initialization data. In this case, the first part of the expression, `(%Uptime% > 10800)`, holds off evaluating this expression until the system has been running for 10800 seconds (3 hours).

In addition, if some part of the system is not heavily used an alert may be triggered based on limited data. For example, if your application does not use the MyISAM storage engine, the “MyISAM Key Cache Has Sub-Optimal Hit Rate” rule may be triggered based on very limited use of other MyISAM tables such as the `mysql.user` table. For this reason, this advisor has a second part—`(%Key_read_requests% > 10000)`—meaning the rule won't be evaluated unless there is plenty of activity associated with the key cache.

In other circumstances, there may be periods of time during which you don't want a rule to be evaluated—a blackout period. For example, the expression for the “Slave Too Far Behind Master” rule is: `%Seconds_Behind_Master% > THRESHOLD`. However, suppose you run a backup process between 6 and 7 pm on a replication slave, and it's normal for that slave to get behind the master by an amount more than the `THRESHOLD` during that time. In that case you don't want to receive an alert because the rule violation is expected. You can achieve this by adding the following to the expression: `&& CURTIME() NOT BETWEEN '18:00:00' AND '19:00:00'` In essence, this means “don't trigger an alert between 18:00:00 and 19:00:00 (6 pm and 7 pm)”.

15.7.4.5. Using Strings

String values may appear in the `Expression` or the `Thresholds` text boxes. In both cases, they must be enclosed within quotation marks. For example, the expression for the “Slave I/O Thread Not Running” rule is:

```
(%Slave_running% == "ON") && (%Slave_IO_Running% != THRESHOLD)
```

In similar fashion the `Critical Alerts` threshold text box is set to a value of `"Yes"`.

When the expression is evaluated, either `"OFF"` or `"ON"` will be substituted for `%Slave_running%`, and `"Yes"` or `"No"` for `%Slave_IO_Running%`, depending on the state of your system. If the slave is running but the I/O thread is not, the expression then becomes:

```
("ON" == "ON") && ("No" != "Yes")
```

Without quotation marks this expression would not evaluate to `TRUE` as it should.

Note

So that it is interpreted properly, the `==` operator is converted to `=` before being passed to the MySQL expression parser.

15.7.4.6. Wiki Format

When editing or defining a rule, the text entered in the `Problem Description`, `Advice`, `Recommended Action`, and `Links and Further Reading` text boxes may be formatted in Wiki format. This allows you to format text and add hyperlinks when creating or editing your own rules.

Find a brief introduction to using Wiki formatting in the following table.

Table 15.1. MySQL Enterprise Monitor: Wiki formatting

Example	Description
<code>__bold__</code>	boldface text
<code>~~italic~~</code>	italicize text
<code>\\</code>	create a line break
<code>\\\</code>	create a double line break
<code>\\\\G</code>	create a backslash
<code>*item 1</code>	create a bulleted list item
<code>#item 1</code>	create a numbered list item
<code>\</code>	use the ‘\’ to escape special characters
<code>{moreInfo:name url}</code>	create a hyperlink

So the following Wiki text:

```
Replication is a __very nice feature__ of MySQL.  Replication can be very
useful for solving problems in the following areas:
* Data Distribution
* Load Balancing
* Backup and Recovery
You can check replication status and start a slave using the following
commands: SHOW SLAVE STATUS \G; \START SLAVE;
{moreInfo:MySQL Manual: Replication
FAQ|http://dev.mysql.com/doc/refman/5.0/en/replication-faq.html}
```

Would be translated into the following HTML markup:

```
Replication is a <b>very nice feature</b> of MySQL.  Replication can be very
useful for solving problems in the following areas:
<ul>
  <li>Data distribution</li>
  <li>Load Balancing</li>
  <li>Backup and recovery</li>
</ul>You can check replication status and start a slave with the following
commands: SHOW SLAVE STATUS \G;<br/>START SLAVE;
<a href=" ../mysql-monitor-2.0/http://dev.mysql.com/doc/refman/5.0/en/replication-faq.html"
target="_blank" >MySQL Manual: Replication FAQ</a>
```

To find out more about this format go to the wikipedia.org web site.

15.7.4.7. Creating a New Rule: An Example

This section documents the steps required to create a rule. Before attempting to create a rule, please review the preceding sections of this chapter.

This example creates a rule that checks the number of rows in a table. Having 50,000 rows in this table is deemed to warrant a critical alert. Lesser numbers are assigned to informational and warning level alerts.

Begin by navigating to the [Advisors](#) tab and clicking the [manage rules](#) link. Then choose the CREATE RULE button.

Create your custom rule by following these steps:

1. Using the [Rule Name](#) text box, give the rule an appropriate name. Something such as "Excessive number of records in [table_name](#) table", may be appropriate.
2. From the [Advisor](#) drop down list box choose an advisor group for your rule. The [Administration](#) group of rules might be suitable but if you wish, create your own group of advisors. For instructions on doing this see [Section 15.7.4.1, "Creating Advisors"](#).
3. Enter the following expression in the **EXPRESSION** text area: '%[table_name](#)_num_rows% > THRESHOLD'. Replace [table_name](#) with the name of the table you wish to monitor. Note that the variable %[table_name](#)_num_rows% has not yet been defined.
4. Set the Thresholds.

- a. Set the **Critical Alert** level to 50000.
 - b. Set the **Warning Alert** level to 10000.
 - c. Set the **Info Alert** level to 5000.
5. Define your variable in the **Variable Assignment** frame.
 - a. In the **Variable** text box enter `'%table_name_num_rows%`, the variable used in the **Expression** text box
 - b. In the **Data Item** drop down list box find and select the `mysql:table:numrows` entry. (For a description of all the data items available see [The Data Collection Items Used to Create Rules](#).)
 - c. In the **Instance** text box enter `database_name.table_name`.
 6. Add appropriate entries for the **Problem Description**, the **Advice**, and the **Links** text areas. If you wish, use Wiki markup for these text areas. See [Section 15.7.4.6, “Wiki Format”](#) for more information. Note that you can also reference the `'%table_name_num_rows%` variable in these text areas. For example, you can display the current number of rows with a message such as `'table_name currently has %table_name_num_rows% rows.'`
 7. Save the rule.

Once the rule is created it needs to be scheduled against the server that contains the database table you wish to monitor. For instructions on scheduling rules see [Section 15.7.2, “Scheduling Rules”](#).

15.7.4.8. Creating a Custom Data Collection Item

[Section 15.7.4.7, “Creating a New Rule: An Example”](#) shows how to create a custom rule and [The Data Collection Items Used to Create Rules](#) shows the data items that can be used in rule creation. However, in some circumstances you may want to create a rule that uses a custom data collection item.

This section describes how to create a custom data collection item. The steps are as follows:

1. Create an XML file to define how the data is collected.
2. Point the agent configuration file to this XML file.
3. Restart the agent.

15.7.4.8.1. Creating and Using a Custom Data Item XML File

As an example, this section shows how to create a data item for monitoring the amount of free InnoDB tablespace. The format and content of the XML file that defines the data to be collected is as follows:

```
<?xml version="1.0" encoding="utf-8"?>
<classes>
  <class>
    <classname>innodb_min_free</classname>
    <namespace>mysql</namespace>
    <query><![CDATA[SELECT MIN(substring_index(substring_index(table_comment, " ", 3), " ", -1)/1024/1024)
      as Free FROM INFORMATION_SCHEMA.TABLES WHERE engine = 'InnoDB']]></query>
  </class>
</classes>
```

Save this file as:

- Windows – `C:\Program Files\MySQL\Enterprise\Agent\share\mysql-proxy\items\innodb_min_free.xml`
- Unix – `/opt/mysql/enterprise/agent/share/mysql-proxy/items/innodb_min_free.xml`
- Mac OS X – `/Applications/mysql/enterprise/agent/share/mysql-proxy/items/innodb_min_free.xml`

After saving this file, you must point your `mysql-monitor-agent.ini` file to it. (For the location of this file on your operating system see [Section 15.3.3.6.1, “MySQL Enterprise Monitor Agent \(mysql-monitor-agent.ini\) Configuration”](#).) Find the `[mysql-proxy]` section and add the file name `innodb_min_free.xml` to the `item-files` parameter using a semi-colon as a separator. For example:

```
[mysql-proxy]
...
item-files = items-mysql-monitor.xml,innodb_min_free.xml
...
```

For this change to take effect you must restart the agent. To do this see:

- Windows – [Section 15.3.3.5.1, “Starting/Stopping the Agent on Windows”](#)
- Unix – [Section 15.3.3.5.3, “Starting/Stopping the Agent on Unix”](#)
- Mac OS X – [Section 15.3.3.5.2, “Starting/Stopping the Agent on Mac OS X”](#)

Once the agent has restarted, you will find the new data item in the [Data Item](#) drop down list box on the [Rule Definition](#) page. Its fully qualified name is `mysql:table:innodb_min_free`.

15.7.5. Disabling and Uncheduling Rules

In some circumstances you may no longer wish to apply a rule against a specific server or group of servers and in other circumstances you may want to suspend a rule for a short length of time. With this in mind, it is possible to disable or unschedule a rule.

To disable or unschedule an advisor choose the [Current Schedule](#) screen of the [Advisors](#) tab.

Rules may be disabled or unscheduled using the buttons on the upper or lower left of the screen. You may also change a rule by clicking the [enabled](#) or [unschedule](#) hyperlink to the right of a rule. The buttons are particularly useful when you are altering more than one rule.

To no longer run a rule against a specific server, expand the advisor group and the specific rule by clicking the + button. You may then click the UNSCHEDULE button. When the dialog window opens, choose the UNSCHEDULE button and that rule will no longer be applied. If you wish to back out of the operation choose CANCEL. If, at a later date, you wish to institute this rule again, you may do so from the [Add to Schedule](#) page.

If you want to suspend a rule temporarily, use the DISABLE button and follow the same process you would for uncheduling. Once a rule is disabled the link under the status column changes to red and reads [disabled](#). When a rule is disabled, data is no longer collected for that rule. A disabled rule is easily re-enabled by clicking the [disabled](#) link or by using the ENABLE button.

Multiple rules may be altered for one or more servers by selecting the appropriate checkbox and then clicking the UNSCHEDULE, ENABLE, or DISABLE button.

Note

Rules associated with the heat chart cannot be disabled or unscheduled as they are required by MySQL Enterprise Monitor.

15.7.6. Advisor Blackout Periods

Database servers require regular maintenance and during these periods you may wish to stop Monitor Agents from reporting their findings. During a blackout period rules are not evaluated and notifications are put on hold but Monitor Agents continue to collect data. In this respect blacked-out rules differ from disabled rules; data continues to be collected and stored in the repository.

Blackout periods are enabled by entering the following URL into the address bar of your browser, substituting the appropriate host name, port and server name:

```
http://localhost:18080/rest?command=blackout »
&server_name=SuSE:3306&blackout_state=true
```

If you are unsure of the host name and port to use, check the [configuration_report.txt](#) file. Be sure to specify the correct port for the Tomcat server. Specify the server you wish to blackout using the name that appears in the Server Tree, being sure to include a colon and port number as shown in the preceding example.

An HTTP authentication dialog box requesting your Dashboard user name and password will open. Specify the administrator's credentials. The default user name is `admin`; use the password you specified when you initially logged in to the Dashboard.

You can also blackout a server group by entering the following URL into the address bar of your browser, substituting the appropriate host name, and server group name:

```
http://localhost:18080/rest?command=blackout »
&group_name=Finance&blackout_state=true
```

When the HTTP authentication dialog box opens, enter the administrator's credentials.

You can confirm that a server is blacked out by looking at the server name in the Dashboard; the name of a blacked out server is greyed.

To reactivate the blacked-out server or server group, use the appropriate URL and query string, changing the `blackout_state=true` name/value pair to `blackout_state=false`. Again, this must be done by a user with administrative privileges.

Note

Restarting MySQL Enterprise Monitor will **not** reactivate a blacked out server.

15.7.6.1. Scripting Blackouts

Rather than opening your web browser and blacking out a server by typing entries into the address bar, you can write a script to achieve the same effect. This section documents a sample blackout script that can be run from the command line.

Create the following file and save it as `blackout.pl`.

```
#!/usr/bin/perl
use LWP 5.64;
# USAGE: blackout.pl servicemanager:18080 admin password servername:3306 true
# $ARGV[0] = management server hostname:port
# $ARGV[1] = management server username
# $ARGV[2] = management server password
# $ARGV[3] = mysqld managed instance server name and port
# $ARGV[4] = blackout state (true/false)
my $browser = LWP::UserAgent->new;
$browser->credentials(
    $ARGV[0],
    $ARGV[1],
    $ARGV[2]
);
my $url = URI->new('http://'.$ARGV[0].'/rest');
$url->query_form( # And here the form data pairs:
    'command' => 'blackout',
    'server_name' => $ARGV[3],
    'blackout_state' => $ARGV[4]
);
my $response = $browser->post( $url );
if (!$response->is_success) {
    die $response->status_line . "\n";
}
```

Note

Windows users can omit the shebang line.

On Unix systems use the `chmod +x blackout.pl` command to make the file executable.

At the command line enter `blackout.pl servicemanager:18080 admin password servername:3306 true`.

If you are unsure of the host name and port to use, check the `configuration_report.txt` file. Be sure to specify the correct port for the Tomcat server. Specify the server you wish to blackout using the name that appears in the Server Tree, being sure to include a colon and port number as shown in the preceding example. Make sure that the user you specify is a "manager". Specifying a user with "dba" rights only will not black out a server and no error will be displayed.

You can confirm that a server is blacked out by looking at the server name in the Dashboard; the name of a blacked out server is greyed. To end the blackout, run the same script, changing the final argument to `false`.

Note

Restarting MySQL Enterprise Monitor will **not** reactivate a blacked out server.

15.8. The Events Page

Note

MySQL Enterprise subscription, MySQL Enterprise Monitor, MySQL Replication Monitor, and MySQL Query Analyzer are only available to commercial customers. To learn more, see: <http://www.mysql.com/products/enterprise/features.html>.

Once an advisor has been scheduled, it will run at set intervals. If it finds nothing of interest no alerts or emails will be created.

When alerts are triggered, they appear on the [Events](#) screen. Alerts also appear on the [Monitor](#) screen in order of severity. The notification group or groups associated with a specific rule receive email notification when an alert is triggered. For more information about creating notification groups see [Section 15.6.5, “Manage Notification Groups”](#).

To view open events, click on the [Events](#) tab. The tree-view on the left determines which server or server group these events belong to. Open events are shown in tabular format.

Figure 15.44. MySQL Enterprise Dashboard: Events screen

Severity	From	To	Advisors	Rules		
All			All Categories	All		
Status	Limit					
All	20	filter	reset			
Severity	Server	Advisor	Rule	Time	Status	
	susieQ:3306	Heat Chart	CPU I/O Usage Excessive	2/22/2007 12:51 PM	Open	
	susieQ:3306	Heat Chart	CPU Usage Excessive	2/22/2007 12:35 PM	Open	
	susieQ:3306	Heat Chart	RAM Usage Excessive	2/22/2007 11:35 AM	Open	
	susieQ:3306	Heat Chart	MySQL Agent Not Reachable	2/22/2007 7:01 AM	Open	
	susieQ:3306	Heat Chart	Table Scans Excessive	2/21/2007 8:24 PM	Open	
	susieQ:3306	Security	Users Can View All Databases On MySQL Server	2/21/2007 8:20 PM	Open	
	susieQ:3306	Security	Server Includes A Root User Account	2/21/2007 8:20 PM	Open	
	susieQ:3306	Security	Server Has Anonymous Accounts	2/21/2007 8:20 PM	Open	

The event table has the following columns:

- **SEVERITY** – An icon indicating the severity of the alert
- **SERVER** – The name of the server the alert applies to
- **ADVISOR** – The category of the advisor
- **RULE** – A short description of the rule that has been violated
- **TIME** – The approximate time the event occurred
- **STATUS** – The status of the event
- **UNNAMED COLUMN** – Provides a link to the [Close](#) dialog box

By default, all events are shown but the list of events can be filtered using the form displayed above the event list. The options include filtering by:

- Severity
- Date
- Advisor group
- Specific rule
- Status

Choose the options you are interested in and click the **FILTER** button to refresh the display. You may limit the number of items that appear on a page by choosing a different value from the **LIMIT** drop down listbox.

The drop down list box showing severity has the options: [All](#), [Alerts](#), [Critical](#), [Warning](#), [Info](#), [Success](#), and [Unknown](#). Selecting the option [All](#) shows all alerts and also those rules that have run successfully. A successful rule is one that has not been violated and is indicated by a star icon. [Alerts](#) shows only those rules that have been violated.

Columns are sorted by clicking on the individual column headings. The alerts shown in [Figure 15.44, “MySQL Enterprise Dashboard: Events screen”](#), are sorted by decreasing severity. An octagonal red icon indicates a critical alert, a triangular yellow icon a

warning, and a conversation bubble an informational alert. A star beside an event indicates that the rule has run successfully and no alert created. A question mark icon indicates that the status of the rule is unknown.

The server shown in [Figure 15.44, “MySQL Enterprise Dashboard: Events screen”](#), is filtered for **All**. Typically, when filtering by severity you would choose **Alerts** and, if you see a **Critical**, **Warning**, or **Info** alert, use the **All** filter to see when the rule last ran successfully. This may assist in determining the cause of the alert.

Besides filtering for severity, you can also choose to filter for a specific time period using the **From** and **To** text boxes. You also have the choice of filtering by specific rules or categories of rules. The **Status** drop-down list box let's you choose **All**, **Open**, or **Closed** events. To avoid excessive scrolling, you can also limit the number of events that show on a specific page.

For more information about an alert, click on the rule name. A pop-up window will appear showing a description of the alert and the exact time of occurrence. This pop-up windows provides links to useful resources and advice for resolution. You can also view the exact expression that generated the event.

15.8.1. Closing an Event

After determining what action to take, events should be closed.

To resolve an individual alert click the **close** link in the **OPERATIONS/NOTES** column. Document the resolution using the **Notes** text area and choose the **CLOSE EVENT(S)** button.

To close a number of alerts simultaneously, select the checkbox beside the alerts you wish to close and then click the **CLOSE** button to the lower or upper left side of the screen.

Once an event has been closed it appears on the **Events** screen showing a **resolution notes** link. Click this link to review the notes. Events that have been closed are saved in the Repository. If you wish to view closed events filter the display by choosing **Closed** from the **STATUS** drop-down box.

15.9. The Graphs Page

Note

MySQL Enterprise subscription, MySQL Enterprise Monitor, MySQL Replication Monitor, and MySQL Query Analyzer are only available to commercial customers. To learn more, see: <http://www.mysql.com/products/enterprise/features.html>.

Navigate to the **Graphs** page by choosing the **GRAPHS** tab.

By default four graphs are displayed on the **Monitor** page. These graphs present information about the currently selected server or server group, showing the hit ratios, CPU utilization, connections, and database activity. Color coding helps distinguish different aspects of each graph.

From the **Monitor** page you can make permanent or temporary changes to the way a graph is displayed. For example, you can choose to display the last hour's activity or you can choose to view a specific period of time.

Persistent changes to the way the graphs display are only made from the **Monitor** page. You can set the size of the thumbnails and the full-sized graphs and you can also set their refresh interval. For more information, see [Section 15.5.2, “The Server Graphs and Critical Events”](#). As with the **Monitor** page, the data shown in the graphs is determined by the server or group of servers selected in the server tree.

The **Graphs** page shows all the available graphs and provides the capability of adjusting the scale of the graphs, allowing a more or less detailed view as the situation requires. To ensure that you have the latest versions of the various graphs click on the **CHECK FOR UPDATES** link on the top left of this page.

15.9.1. Displaying Graphs

The total number of graphs varies depending upon your subscription level. The four graphs that appear by default on the **Monitor** page are:

- Hit Ratios
- Database Activity
- Connections
- CPU Utilization

When the [Graphs](#) page is first opened, no graphs are visible. To view a graph click the + button on the left or, to view all graphs, use the EXPAND ALL button.

The larger size of graphs is the primary reason for viewing graphs on the [Graphs](#) page rather than on the [Monitor](#) page. Additionally, you can only show a maximum of six graphs on the [Monitor](#) page; the remaining graphs can only be viewed from the [Graphs](#) page.

15.9.2. Setting an Interval

Change the interval for a graph by choosing values from the **HOURS** and **MINUTES** drop-down list boxes. If necessary adjust the width and height of the graph and then click the UPDATE button. The changes to the time span apply to all the graphs on the [Graphs](#) page but have *no* effect on the graphs on the [Monitor](#) page.

To change the graphs both here and on the [Monitor](#) page use the [configure graphs](#) link on the top right. This opens a dialog box for setting the default interval for the x-axis. Save any changes that you have made and the values chosen will be the defaults whenever you log in. You can also change the defaults from the [Monitor](#) page as described in [Section 15.5.2, “The Server Graphs and Critical Events”](#); defaults for other users will be unchanged.

Use the RESET button to restore the default value for the interval. Doing this will also reset the default size of the graphs.

15.9.3. Setting a Time Span

Setting a graph to display a time span gives you a historical perspective on server activity. You may want to know what was happening at a specific point in time or you may wish to look at an extended period in order to determine patterns or trends. Changing the time span gives you the flexibility to do this.

In the **TIME DISPLAY** drop-down list box select the [From/To](#) option. Choosing this option updates the display to include **TO** and **FROM** text boxes.

Set the date you wish to start viewing from by manually entering the date in year, month, and day format (2007-03-14). However, it is much easier to click the calendar icon and choose a date from the drop-down calendar. Enter a terminating date in the same way. If you wish, you may also choose the specific time of day by selecting the hour and minute.

If necessary adjust the width and height of the graph and then click the UPDATE button. The changes to the time span apply to all the graphs on the [Graphs](#) page but have *no* effect on the graphs on the [Monitor](#) page. You cannot change the time span of the graphs that appear on the [Monitor](#) page. Changes apply only to the current user; defaults for other users will be unchanged.

Use the RESET button to cancel your changes.

15.10. The Query Analyzer Page

Note

MySQL Enterprise subscription, MySQL Enterprise Monitor, MySQL Replication Monitor, and MySQL Query Analyzer are only available to commercial customers. To learn more, see: <http://www.mysql.com/products/enterprise/features.html>.

Query Analyzer enables you to monitor the statements being executed on a monitored server and retrieve information about the query, number of executions and the execution times of each query. Queries are normalized, so that the unique data defined within each query has been removed. By removing the data specific elements of the queries, the generic queries can be counted and identified more easily.

Important

After this release is pronounced Generally Available, the MySQL Agent will be ready for use in your production systems; however, we strongly recommend reading these guidelines before using/deploying MySQL Query Analyzer.

MySQL Query Analyzer is designed to gather query performance information from a variety of sources. In this initial release, Query Analyzer uses a new agent plug-in to proxy your queries and collect performance data that is then transmitted to the Enterprise Monitor. This is a new role for the Agent: it is no longer just monitoring, it is now **optionally** between your MySQL client application and the mysql server.

Depending upon your system load, it is possible to overload the proxy or have the proxy/agent consume system resources needed by mysql itself. In particular, the memory needed by the MySQL Agent for basic monitoring is fairly small and consistent and depends on the number of rules you have enabled. However, when the Query Analyzer is enabled, the Agent can use significantly more memory to monitor and analyze whatever queries you direct through it. In this case, the amount of memory used depends on the number of unique normalized queries, example queries and example [EXPLAINs](#) being processed plus the network bandwidth required to send this query performance data to the

Service Manager. In general, the amount of memory used for the Query Analyzer is well-bounded, but under heavy load or, in some cases under older versions of linux, RAM usage by Query Analyzer may be too high for your environment and load.

Therefore we advise you to use this initial release of Query Analyzer extensively in development, test and stage environments under load for an extended period of time before considering usage in a production environment. For all deployments:

1. We recommend carefully monitoring the Agent's resource consumption using the new graph **MEMORY USAGE - AGENT** graphs available on the **GRAPH** tab. You can also add an SMTP or SNMP notification to the new Heat Chart rule **MYSQL AGENT MEMORY USAGE EXCESSIVE**.
2. If the amount of memory consumed is too high, consider sampling queries during non-peak hours or monitoring only a subset of queries on this system.

If you experience any problems with Query Analyzer, we're interested in working with you closely and quickly to resolve them. Please open a Support issue right away. We're already working hard on optimizing Agent/proxy RAM usage and are planning a series of rapid releases to quickly distribute these and other improvements to you.

Query Analyzer works by intercepting the SQL statements that your MySQL client application sends to the MySQL server. Instead of connecting direct to the MySQL Server, queries are routed through the MySQL Enterprise Monitor Agent, the agent/proxy forwards the queries on to the server and sends the replies back to the client application as normal. In addition to forwarding the queries, the agent/proxy will also normalize the queries and then supply the execution information about each query to the monitor. The forwarding functionality is provided by the same module that supports the MySQL Proxy application. For information on MySQL Proxy, see [Section 14.6, "MySQL Proxy"](#).

Important

The MySQL Proxy component, and Query Analyzer, require that clients connecting through MySQL Enterprise Monitor Agent are using MySQL 5.0 or later. Clients that use the library provided with MySQL 4.1 or earlier will not work with MySQL Enterprise Monitor Agent.

Once your MySQL client application has been configured to communicate via the MySQL Enterprise Monitor Agent, queries will be monitored and the simplified queries, without the query specific data, will be sent to the MySQL Enterprise Monitor Agent.

There are a number of different ways that you can enable Query Analysis. For more information on the different options, see [Section 15.10.1, "Enabling Query Analyzer"](#).

To analyse the queries captured by the agent/proxy, change to the [Query Analyzer](#) page. You can see an example of the table on that page in the figure below.

Figure 15.45. MySQL Enterprise Dashboard: Query Analyzer

Query	Database	Exec Count	Exec Time (hh:mm:ss.ms)			Rows			Bytes			First Seen
			Total	Max	Avg	Total	Max	Avg	Total	Max	Avg

The main Query Analyzer table provides the summary information for all of the queries executed via the agent/proxy. The table will track all the queries submitted to the server via the agent/proxy. The table will show a maximum of 20 rows, and you can page through the list of queries by using the page numbers, or the **NEXT**, **PREVIOUS**, **FIRST**, and **LAST** buttons. To filter the list of queries that are displayed, or to change the number of queries, see [Section 15.10.3, “Filtering Query Analyzer Data”](#).

Each row within the table provides the statistical information for one normalized query statement. If you have configured multiple agent/proxies to accept and forward queries to different servers, then you can expand the server view. The summary information displayed is different depending on whether you have selected a server group or an individual server.

If you have selected a server group, then the information displayed is aggregated from across the entire group. The same query executed on multiple servers will show average, total and minimum/maximum information for that query across all the servers. If you select an individual server, then only queries executed on that server are included within the table.

For each row, the following columns are populated according to the selected filtering options. For example, if the filter have been configured to show queries within the last 30 minutes (**INTERVAL**), then only queries executed during that time will be displayed, and the corresponding statistics, such as execution times, rows returned and bytes returned will be according to that 30 minute timespan.

- **QUERY** — the normalized version of the query. Normalization removes the query-specific data so that different queries with different data parameters are identified as the same basic query.

The information is shown as one query per row. Each query row is expandable, and can be expanded to show the execution times for individual servers for that query.

- **DATABASE** — the name of the database used in the query. The column may be blank if the database name has not been explicitly stated within the query.
- **EXEC COUNT** — the number of times that the query has been executed.
- **EXEC TIME** — the execution time for all the matching queries. This is the time, for every invocation of the corresponding query, as calculated by comparing the time when the query was submitted and when the results were returned by the server. Times are expressed in HH:MM::SS.MS (hours, minutes, seconds, and milliseconds).

The **EXECUTION** column is further subdivided into the following columns:

- **COUNT** — the total number of executions.
- **TOTAL** — the cumulative execution time for all the executions of this query.
- **MAX** — the maximum execution time for an execution of this query.
- **AVG** — the average execution time for the execution of this query.

When looking at the information provided in this query, you should consider comparing the average and maximum execution times to see if there was a problem on a specific server or during a specific time period when the query took place, as this may indicate an issue that needs to be investigated. For more information, see [Section 15.10.4, “Using Query Analyzer Data”](#).

- **ROWS** — the rows returned by the query. The column is sub-divided into the following columns:
 - **TOTAL** — the sum total number of rows returned by all executions of the query.
 - **MAX** — the maximum number of rows returned by a single execution of the query.
 - **AVG** — the average number of rows returned by all executions of the query.
- **BYTES** — the number of bytes returned by each query. The column is sub-divided into the following columns:
 - **TOTAL** — the sum total bytes returned by all executions of the query.
 - **MAX** — the maximum number of bytes returned by a single execution of the query.
 - **AVG** — the average number of bytes returned by all executions of the query.
- **FIRST SEEN** — the first time the query was seen within the given filter conditions.

You can sort the list of queries by clicking on the column name. The direction of the sort (highest to lowest, or lowest to highest) is indicated by a triangle next to the currently selected column. The default is to sort the list of queries by the Total Execution time.

15.10.1. Enabling Query Analyzer

There are three different ways of enabling query analyzer:

- Change your MySQL client application to talk to the Proxy port you configured during installation. This requires changing your MySQL client application code, and may require that you stop and restart your MySQL client application, but does not require any changes to your MySQL server. For more information, see [Section 15.10.1.1, “Enabling Query Analyzer by Changing the MySQL Client Application”](#).
- Change your MySQL server to listen on a different port, and configure the Agent/proxy to listen on the original MySQL server port. This does not require any changes to your MySQL client application, but will require shutting down and restarting your MySQL server, which may affect your cache and performance. For more information, see [Section 15.10.1.2, “Enabling Query Analyzer by Changing MySQL Server”](#).
- Use IP tables to redirect the network packets to the agent/proxy.

Important

After this release is pronounced Generally Available, the MySQL Agent/proxy will be ready for use in your production systems; however, we strongly recommend reading these guidelines before using/deploying MySQL Query Analyzer.

MySQL Query Analyzer is designed to gather query performance information from a variety of sources. In this initial release, Query Analyzer uses a new agent plug-in to proxy your queries and collect performance data that is then transmitted to the Enterprise Monitor. This is a new role for the Agent: it is no longer just monitoring, it is now *optionally* between your MySQL client application and the mysql server.

Depending upon your system load, it is possible to overload the proxy or have the proxy/agent consume system resources needed by mysql itself. In particular, the memory needed by the MySQL Agent for basic monitoring is fairly small and consistent and depends on the number of rules you have enabled. However, when the Query Analyzer is enabled, the Agent can use significantly more memory to monitor and analyze whatever queries you direct through it. In this case, the amount of memory used depends on the number of unique normalized queries, example queries and example `EXPLAINs` being processed plus the network bandwidth required to send this query performance data to the Service Manager. In general, the amount of memory used for the Query Analyzer is well-bounded, but under heavy load or, in some cases under older versions of linux, RAM usage by Query Analyzer may be too high for your environment and load.

Therefore we advise you to use this initial release of Query Analyzer extensively in development, test and stage environments under load for an extended period of time before considering usage in a production environment. For all deployments:

1. We recommend carefully monitoring the Agent's resource consumption using the new graph **MEMORY USAGE - AGENT** graphs available on the **GRAPH** tab. You can also add an SMTP or SNMP notification to the new Heat Chart rule **MYSQL AGENT MEMORY USAGE EXCESSIVE**.
2. If the amount of memory consumed is too high, consider sampling queries during non-peak hours or monitoring only a subset of queries on this system.

If you experience any problems with Query Analyzer, we're interested in working with you closely and quickly to resolve them. Please open a Support issue right away. We're already working hard on optimizing Agent/proxy RAM usage and are planning a series of rapid releases to quickly distribute these and other improvements to you.

Note that you must have enabled Query Analyzer within the agent/proxy during installation. If you did not enable Query Analyzer during the installation of the agent/proxy, check the following elements within the main `mysql-monitor-agent.ini` configuration file:

- Add the `proxy` plugin to the `plugins` parameter:

```
plugins=proxy,agent
```

- Ensure that the `quan.lua` items file is enabled in the `agent-item-files` configuration property:

```
agent-item-files = share/mysql-proxy/items/quan.lua,share/mysql-proxy/items/items-mysql-monitor.xml
```

- Check and set the `proxy-address`, `proxy-backend-addresses`, and `proxy-lua-script` settings are configured:

```
proxy-address=:4040
proxy-backend-addresses = 127.0.0.1:3306
```

```
proxy-lua-script = share/mysql-proxy/luan.lua
```

For more information on these configuration options, see [Section 15.3.3.6.1, “MySQL Enterprise Monitor Agent \(mysql-monitor-agent.ini\) Configuration”](#).

Note

The Query Analyzer functionality may show as being enabled on a server, even though the modules within MySQL Enterprise Monitor Agent may not have been enabled.

You may also need to make some additional changes to the security configuration on your server to ensure that queries are correctly reported to MySQL Enterprise Service Manager:

- You must ensure that each user configured within your MySQL client application that connects through the agent/proxy and is required to report query analyzer information is allowed to connect to the server from the host on which the agent/proxy is running. When the user connects to the agent/proxy, and the agent/proxy connects to the server the host of the agent/proxy will be used as the identifying client host name during the connection.

To update your user credentials, you need to use the [GRANT](#) statement. For example:

```
mysql> GRANT SELECT,UPDATE,INSERT on database.* to 'user'@'localhost' IDENTIFIED BY 'password';
```

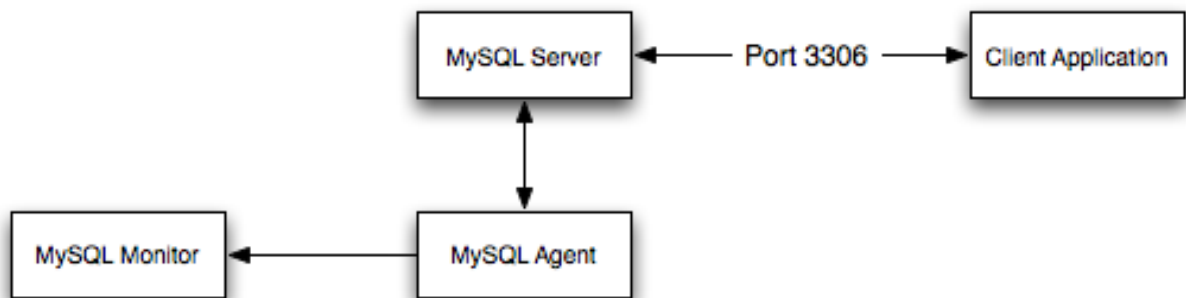

- The MySQL client application user must have [SELECT](#) privileges on the `mysql.inventory` table. This table contains the server UUID and is required to report the query analyzer data to the MySQL Enterprise Service Manager. To enable this, use the [GRANT](#) option:

```
mysql> GRANT SELECT on mysql.inventory to 'user'@'localhost' IDENTIFIED BY 'password';
```

15.10.1.1. Enabling Query Analyzer by Changing the MySQL Client Application

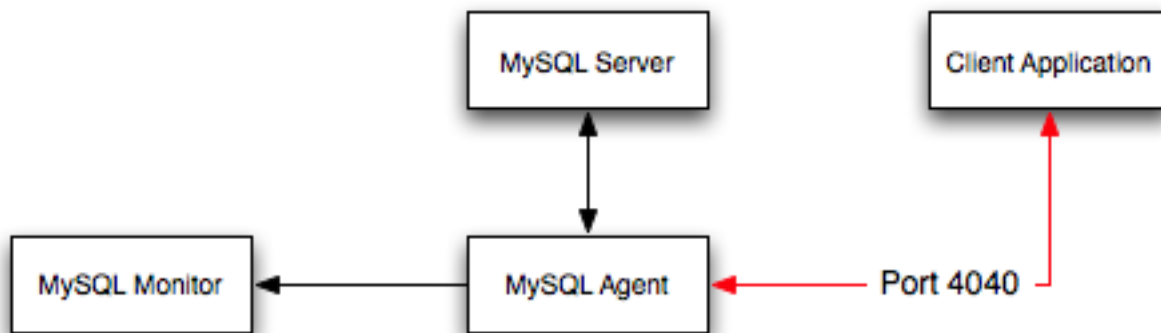

Generally, changing your MySQL client application is the easiest and recommended method. For example, given a typical structure like the one shown in the figure below, the client application would need to be modified so that it no longer communicated directly with the MySQL server, but to the agent/proxy.

Figure 15.46. MySQL Enterprise Dashboard: Standard agent/monitor topology

You can see an example of the structure when communicating via the agent/proxy below.

Figure 15.47. MySQL Enterprise Dashboard: Query Analyzer agent/monitor topology

To enable query analyzer within your MySQL client application:

1. Make sure that the MySQL Enterprise Service Manager and your MySQL Enterprise Monitor Agent are configured and running.
2. Confirm the configuration of your agent by examining the contents of the `etc/mysql-monitor-agent.ini` file within your installed Agent directory.

Queries will be sent to the host specified in the `proxy-backend-addresses` parameter, and the agent will listen for connections to be redirected to the server on the host name and port configured in the `proxy-address` parameter.

3. Now modify your MySQL client application to communicate with the address specified in the `proxy-address` parameter.

Alternatively, if you do not want to modify your application directly, you can use iptables or firewall rules to redirect queries from the original host/port combination to the agent's port.

Because connections to the MySQL server will be coming from the agent/proxy, not the original host, the user credentials used must be have a suitable `GRANT` statement for connections from `localhost`, or the host on which the agent/proxy is executing. The user name and password information will be passed on directly through the agent/proxy from the client to the server.

4. Confirm that your MySQL client application still operates normally. There should be no difference between communicating directly with the MySQL server and communicating via the agent/proxy.

Note

If you are using the `mysql` client to connect to the agent/proxy and your backend servers, make sure that you are communicating with the proxy over the right port. By default, if you specify `localhost` as the host name, then `mysql` will connect using the local Unix domain socket, rather than the TCP/IP socket.

You can enforce `mysql` to use the right port either by explicitly requesting the protocol type, or by using the IP address rather than `localhost`. For example, both of these command lines will start the client using the right protocol:

```
shell> mysql --port=4040 --protocol=tcp
shell> mysql --port=4040 --host=127.0.0.1
```

Note

It is recommended that you use one agent/proxy per MySQL server instance. The agent/proxy is not able to forward queries to multiple MySQL server backends.

15.10.1.2. Enabling Query Analyzer by Changing MySQL Server

When enabling Query Analyzer by changing the MySQL Server, you need to shutdown your server, edit the MySQL configuration file, and then restart MySQL. You will also need to change your Agent/proxy configuration so that the Agent/proxy is listening on the original MySQL TCP/IP port. To use this method:

1. Edit the `/etc/my.cnf` or other MySQL configuration file and change or add the `port` setting from it's current value (default 3306), to another value. For example:

```
port = 3307
```

2. Shutdown your MySQL Server.
3. Startup your MySQL Server and confirm that is running.
4. Edit your MySQL Enterprise Monitor Agent configuration so that the agent/proxy is listening for connections on the original MySQL port:

```
proxy-address=:3306  
proxy-backend-addresses = 127.0.0.1:3307
```

5. Stop and restart MySQL Enterprise Monitor Agent.

You should now be able to connect to your MySQL server through the MySQL Enterprise Monitor Agent by connecting on the original port:

```
shell> mysql --host=127.0.0.1
```

15.10.2. Getting Detailed Query Information

If you click on an individual query, a pop-up window will provide more detailed information about the individual query. You can see an example of this in the figure below. The available tabs within this window will depend on whether you have configured the more detailed query information. By default, you will always be provided the Summary Details page. If enabled, you may also view Example Details, which provide more detailed data about a specific query, including the data and parameters submitted. In addition, you may also enable Example Explain, which provides you with the ability to remotely execute an [EXPLAIN](#) statement with the specified query and view the resulting information.

- The **Canonical Query** tab:

Figure 15.48. MySQL Enterprise Dashboard: Canonical Query Tab for a Query

Canonical Query
Example Query
Explain Query
908 B
165 B
1

Overview of information collected and aggregated for queries of this form.

Alias
None specified.

Canonical Form
[truncated](#) | [full](#) | [formatted](#)

```
SELECT
  COUNT( message_id ) AS cnt,
  DATE_FORMAT(FROM_UNIXTIME(datetime), ?) AS
  fmtdate
, process_mode, process_type
FROM
  logs_amavis
WHERE
  datetime >= ? AND datetime <= ?
GROUP BY
  process_mode ASC, process_type ASC, fmtdate
ASC
```

Execution Time Statistics

Max Time	Min Time	Avg Time	Total Time	Standard Deviation
11.123	0.274	2.140	12.838	

Row Statistics

Max Rows	Min Rows	Avg Rows	Total Rows	Standard Deviation	Total Size	Max Size
408	37	129	776	82	24.21 KB	12.8 KB

Number of Executions
6

Time Span
From Oct 27, 2008 10:16:07 AM to Oct 27, 2008 10:46:07 AM.

[expand »](#)

In addition to the summary information given in the table, you will get detailed execution statistics, including the minimum time, maximum time, average time, total time and the standard deviation. The standard deviation will enable you to determine whether a particular invocation of a query is outside the normal distribution of times for the given query.

Row statistics provide more detailed contents on the maximum, minimum, average, total, and standard deviation for the number of rows returned by the query, and the total size and maximum size of the data returned. The time period for the total and average figures is shown under the Summary Time Span.

The detailed view for a query also provides three different views of the query. The [truncated](#) version is a shortened version of the query. The [full](#) version of the query is the entire query statement. Normalization removes the constants from the indi-

vidual queries so that queries following the same logical structure are identified as the same basic query.

To close the query detail window, click the HIDE button.

To simplify the identification of a given query, you can create a query alias. The alias will be used in place of the normalized query text within the Query Analyzer table. To create an alias for a query, click the CREATE ALIAS link against the query. The maximum length for a query alias is 255 characters.

- The **Example Query** tab:

Figure 15.49. MySQL Enterprise Dashboard: Example Query Tab for a Query

Canonical Query	Example Query	Explain Query	908 B	165 B	134.
<p>The query with the longest execution time during the Time Span (usually the slowest but not always).</p> <p>Sampled Query truncated full formatted</p> <hr/> <pre> SELECT COUNT(message_id) AS cnt, date_format(from_unixtime(datetime), "%Y-%m-%d") AS fmtdate , process_mode, process_type FROM logs_amavis WHERE datetime >= 1224498843 and datetime <= 1225080000 GROUP BY process_mode ASC, process_type ASC, fmtdate ASC </pre> <hr/> <p>Execution Time 11,122 ms</p> <p>Date Oct 27, 2008 10:35:01 AM</p> <p>User root</p> <p>Thread ID 298107</p> <p>From Host 192.168.0.2:22717</p> <p>To Host 127.0.0.1:3306</p> <p>Comments</p>					
					<input type="button" value="hide"/>
					expand »

The Example Details tab provides detailed information about the most expensive query executed, as determined by the execution time.

In addition to the full query, with data, that was executed, the tab shows the execution time, data, user, thread ID, client host and execution host for the given query.

- The **Explain Query** tab:

Figure 15.50. MySQL Enterprise Dashboard: Explain Query Tab for a Query

id	select_type	table	type	possible_keys	key	key_len	ref	rows	extra
1	SIMPLE	logs_amavis	index	null	mdatetimepmt	47	null	276087	Using where; Using index; Using temporary; Using filesort

The Example Explain tab enables you to view the output from running the query with the `EXPLAIN` prefix. For more information, see [Section 12.3.2, “EXPLAIN Syntax”](#).

15.10.3. Filtering Query Analyzer Data

You can filter the queries shown within the Query Analyzer table by using the form at the top of the table. The different fields of the form are used to specify the parameters for the filter process. Once you have specified a filter, all the queries and related statistics shown within the Query Analyzer table are displayed in relation to the filter settings. For example, by default, the filter settings show the queries for the last 30 minutes. All the statistics shown are relative to the last 30 minutes, including average, maximum and execution counts.

The filter fields are:

- **SEARCH TYPE** and **QUERY SEARCH** support text searching of the normalized query. For the search type you can specify either a basic text match, or a regular expression match. In addition to the basic text match, you can also search for a query that does not contain a particular string. For regular expression searches, you can specify whether the regular expression should match, or not match (negative regexp) the queries. Regular expressions are parsed using the standard MySQL `REGEXP ()` function. For more information, see [Section 11.4.2, “Regular Expressions”](#).

Note

The search is performed against the canonical version of the query. You cannot search against specific text or values within the parameters of the query itself.

- **DATABASE** — limit the queries to those executed within a specific database. The database match is performed using the `LIKE` match from the MySQL database, hence you can use the `%` and `_` characters to multiple and single character matches. For more information, see [Section 3.3.4.7, “Pattern Matching”](#).
- The **TIME DISPLAY** menu selects whether the time selection for filtering should be based on the time **INTERVAL** (only queries recorded within the displayed time period are shown, using the **HOURS** and **MINUTES** popup), or whether the selection should be based on a time period (**FROM/TO**), where you can select the time range to be displayed.

Using the **INTERVAL** mode shows queries within the given time period from the point the graph was updated. For example, if you select 30 minutes, then the queries shown were captured within the last 30 minutes. If you updated the display at 14:00, then the queries displayed would have been captured between 13:30 and 14:00. Using interval mode limits the timespan for the filter selection to a maximum of 23 hours and 59 minutes.

Using the **FROM/TO** mode enables you to show queries between specific dates and times. Using this mode you can show only the queries received during a specific time span, and you can display the query history for a much longer time period, for as long as you have been recording query analysis information.

- The **VIEW** selection determines whether the information should be returned on a group basis, where an aggregate of the same query executed on all monitored servers is shown, or on a **SERVER** basis, where queries are summarized by individual server. If the latter option has been selected, the table includes an additional column showing the server.

- **QUERY TYPE** lets you select the type of query on which to filter queries. Selecting **ALL** will show all queries. Additional query types you can select include **SELECT**, **INSERT**, **UPDATE** and other main SQL query types.
- **LIMIT** specifies the number of queries to be displayed within each page.

When you have set your filter parameters, you can update the Query Analysis display by clicking the **FILTER** button. To reset the fields to the default settings click the **RESET** button.

15.10.4. Using Query Analyzer Data

The information provided by Query Analyzer can be complex to understand and resolve into simple targets and resolutions for your MySQL client application. The information can be used in different ways to find problems in your queries or your servers, or both. Provided below are some tips on how to get the best out of the Query Analysis interface, and how to identify different queries and problems based on the information shown by the Query Analyzer system.

First, consider the information provided by individual columns by your queries. In particular, the following columns can highlight specific problems with your queries or database server:

- **Execution Count** — High execution counts, especially for a query that you expect to be executed very rarely, may indicate that your MySQL client application is either running a simple query to frequently, or may be running a query multiple times that could otherwise be cached. You should pay particular attention to queries where the execution count increases significantly in a short period of time compared to the normal execution rate.

How to find: Use the sort feature to sort the queries by execution count.

- **New queries** — new queries appearing in the Query Analyzer tab, especially if they appear after other queries have been in the display for a number of hours or days may indicate a number of issues:
- **Execution times** — long execution times, and a long max execution time compared to the average execution time may indicate a problem with a specific query and specific parameters.

How to find: Use the sort feature to sort the queries by execution count.

You can also use the filtering and sort options to get specific information about potential problem queries.

15.10.5. Troubleshooting Query Analyzer

If you are having trouble with Query Analyzer, either because the information is not being shown or the full range of queries that you expect are not appearing in the Query Analyzer page then there are a number of systems you can check.

To confirm that your system is correctly configured for Query Analysis, check the following:

- Confirm that the agent is running by checking the Agent log and the status of the server within MySQL Enterprise Service Manager
- Check the configuration of the agent. You must confirm the following:

- The **plugins** parameter within the main configuration file, `mysql-monitor-agent.ini`, must contain the **proxy** plugin:

```
plugins=proxy,agent
```

- The **agent-item-files** parameter within the main configuration file, `mysql-monitor-agent.ini`, must specify the `share/mysql-proxy/items/quan.lua` script:

```
agent-item-files = share/mysql-proxy/items/quan.lua, »
                 share/mysql-proxy/items/items-mysql-monitor.xml
```

- The proxy configuration parameters must point to the MySQL server where you want your queries to be sent. For example, if you are running your agent on the same host as your MySQL server then you might have the following lines in your `mysql-monitor-agent.ini` file:

```
proxy-address=:4040
proxy-backend-addresses = 127.0.0.1:3306
proxy-lua-script         = share/mysql-proxy/quan.lua
```

The above configuration can mean:

- The agent/proxy will listen on the current machine, using port 4040 ([proxy-address](#)).
- The agent/proxy will send all queries received on to the host 127.0.0.1 on port 3306 (the standard MySQL port), as per the [proxy-backend-addresses](#) parameter.

You can see a sample complete configuration file ([mysql-monitor-agent.ini](#)), using the 127.0.0.1 as the MySQL backend server, and reporting to a MySQL Enterprise Service Manager called [monitor](#):

```
[mysql-proxy]
plugins=proxy,agent
agent-mgmt-hostname = http://agent:password@monitor:18080/heartbeat
mysqld-instance-dir= etc/instances
agent-item-files = share/mysql-proxy/items/luan.lua,share/mysql-proxy/items/items-mysql-monitor.xml
proxy-address=:4040
proxy-backend-addresses = 127.0.0.1:3306
proxy-lua-script      = share/mysql-proxy/luan.lua
agent-uuid = a3113263-4993-4890-8235-cadef9617c4b
log-file = mysql-monitor-agent.log
pid-file=/opt/mysql/enterprise/agent/mysql-monitor-agent.pid
```

- Confirm that you can connect through the agent proxy to your backend MySQL server. You can do this by checking with the MySQL client. You must specify the same options as you would if you were connecting to the original server, including specifying the same user and password information:

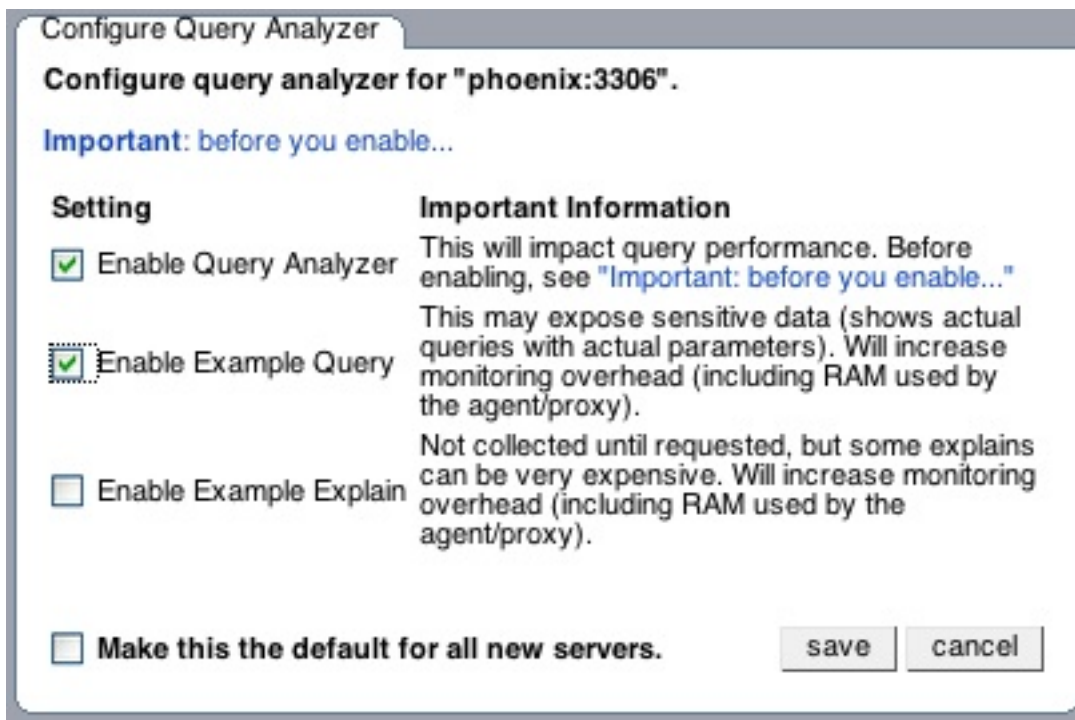

```
shell> mysql -h 127.0.0.1 --port 4040 --user=root -p
Enter password:
Welcome to the MySQL monitor.  Commands end with ; or \g.
Your MySQL connection id is 299239
Server version: 5.0.60-log Gentoo Linux mysql-5.0.60-r1
Type 'help;' or '\h' for help. Type '\c' to clear the buffer.
mysql>
```

- Check that your MySQL client application is configured to use the configured proxy port, instead of the real MySQL port when sending queries.
- Confirm that Query Analyzer enabled for your host. For more information, see [Section 15.10.6, “Query Analyzer Settings”](#).

15.10.6. Query Analyzer Settings

There are a number of settings related to the Query Analyzer data. You can configure the query analyzer operation by using the [CONFIGURE QUERY ANALYZER](#) link within the [QUERY ANALYZER](#) tab, or through the [CONFIGURE QUERY ANALYZER](#) button within the [MANAGE SERVERS](#) tab within the [SETTINGS](#) tab. Both methods provide you with the same dialog:

Figure 15.51. MySQL Enterprise Dashboard: Query Analyzer Configuration

Through either solution, the configuration options that you select are applied to the individual server or server group selected within the **SERVICES** navigation panel.

There are three configuration options available through either method:

- **ENABLE QUERY ANALYZER** configures whether query analyzer should be enabled for this server or server group. If selected, query analyzer will be enabled. To disable, delect the check box.

If Query Analyzer has been enabled, then you can additional configure the Example Query function by selecting the **ENABLE EXAMPLE QUERY** checkbox. Enabling this option provides an additional tab when you open the **CANONICAL QUERY** window when clicking on a query.

- **ENABLE EXAMPLE QUERY** allows the Query Analyzer to display more information about individual queries. When enabled, queries and their data items (rather than the canonical form shown by default) will be provided. Enabling this option may expose the full query statements and therefore may present a security issue.

With the **EXAMPLE QUERY** option enabled, an additional tab within the query summary details is made available. For more information, see [Section 15.10.2, "Getting Detailed Query Information"](#).

If you have enabled **EXAMPLE QUERY**, then you can additional enable **EXAMPLE EXPLAIN**, To enable this tab, select the **ENABLE EXAMPLE EXPLAIN** checkbox.

- **ENABLE EXAMPLE EXPLAIN** provides another tab when viewing a query where you can view the output from **EXPLAIN** output from MySQL for the selected query. This will show the full query and how the query was executed within the servers.

Enabling this option may add additional overhead to the execution of your server, as the server will run an **EXPLAIN** statement each time it identifies a long running query. For more information, [Section 15.12, "MySQL Enterprise Monitor Frequently Asked Questions"](#).

To enable or disable query analyzer for an individual server, go to the **SETTINGS** page and click on the **MANAGE SERVERS** link. To configure all the properties, click the **CONFIGURE QUERY ANALYZER** link next to server you want modify.

Alternatively, for each server, the **QUERY ANALYZER** column shows the current setting, On or Off, and whether the **EXAMPLE** and **EXPLAIN** functionality is enabled. To change any setting, click on the current status to toggle between the On/Off position.

To disable or enable Query Analyzer for the selected servers, use the **DISABLE QUERY ANALYZER** or [enable query analyzer](#) buttons within the **SETTINGS** page. You must have selected one or more servers from the list of available servers before selecting these buttons.

You can use the options that you have just selected as the default for all new servers that register with MySQL Enterprise Service

Manager by using select the **MAKE THIS THE DEFAULT FOR ALL NEW SERVERS** checkbox. By default, when a new server registers with MySQL Monitor, the server is automatically configured to supply Query Analysis data. This can have impact on the performance of your monitor and agent as it increases the amount of information supplied to the MySQL Monitor.

Configuration of Query Analyzer occurs through the **CONFIGURE DEFAULTS** button from within the **QUERY ANALYZER** page.

15.11. The Replication Page

Note

MySQL Enterprise subscription, MySQL Enterprise Monitor, MySQL Replication Monitor, and MySQL Query Analyzer are only available to commercial customers. To learn more, see: <http://www.mysql.com/products/enterprise/features.html>.

Navigate to the [Replication](#) page by choosing the **REPLICATION** tab. This page provides a quick summary view of the state of your replication servers or, if you wish, you can drill down and determine specifics about any master or slave.

Note

Servers, whether masters or slaves, must be monitored in order for them to appear on this page.

Note

There will be no [Replication](#) page if your subscription level does not support this feature.

The [Replication](#) page groups all master servers with their slaves. Masters and their slaves are autodiscovered and a grouping is created. This grouping shows up on the replication page and also in the [Heat Chart](#) on the [Monitor](#) page. Scans run on a five minute interval, so depending upon the order of discovery, it can take as long as 2 polling intervals to create a complete group.

Figure 15.52. MySQL Enterprise Dashboard: Replication groups

Servers	Type	Slave IO	Slave SQL	Time Behind	Binlog
Replication 1 (5)	TREE	Running	Stopped		
local-tree-master:10001	master				master-bin.000035
local-tree-master-slave:10002	master/slave	Running	Running	00:00:00	master-slave-bin.000035
local-tree-slave3:10008	slave	Running	Running	00:00:00	
local-tree-slave2:10007	slave	Running	Running	00:00:00	
local-tree-slave:10003	slave	Running	Stopped		
Replication 4 (4)	MIXED	Running	Running		
ring1:10004	master/slave	Running	Running	00:00:00	master-bin.000030
ring2:10005	master/slave	Running	Running	00:00:00	master-bin.000030
ring2-slave:10009	slave	Running	Running	00:00:00	
ring3:10006	master/slave	Running	Running	00:00:00	master-bin.000030

Discovery events are logged to the [Replication](#) log. To view this log navigate to the [Settings](#) page and choose the **LOGS** link. View all replication-related events by clicking the **REPLICATION** link. This log can be a useful tool should you need to debug the replication topology discovery process.

Warning

The agent must be installed on the same machine as the server you are monitoring in order for discovery to work properly. Do **not** use remote monitoring.

Replication groups can be managed from the [Manage Servers](#) page in the same way as other groups. However, any slaves removed from a server group will automatically be restored to that group. It is also possible to add non-slaves to a replication group-

ing. For more information about server groupings see [Section 15.6.3.2, “Grouping Servers”](#).

15.11.1. Replication Page Details

Choose a value from the **REFRESH** drop-down list box to set the rate at which information is updated. This refresh rate applies only to the information presented on this page: It is independent of the rate set for the [Monitor](#) page.

The following columns describe replication servers and their slaves:

- Servers – Displays the group name and any master servers and slaves
- Type – Indicates the topology of a server group or in the case of individual servers, whether a server is a master, a master/slave, or a slave
- Slave IO – Reports the status of the slave IO thread
- Slave SQL – Reports the status of the slave SQL thread
- Seconds Behind – The number of seconds the slave is behind the master. This column is blank if a server is a master.
- Binlog – The binlog file name
- Binlog Pos – The current position in the binlog file
- Master Binlog – The master binlog file name
- Master Binlog Pos – The current position in the master binlog file
- Last Error – The most recent error
- Unlabeled Column – Use the **RENAME GROUP** link on the server group line to edit the server group name

Levels of indentation in the [Servers](#) column show the relationship between master servers and their slaves. Most column headings are active links that allow you to change the order of display by clicking on the header. Sorting works differently for different column groupings. Click the [Seconds Behind](#) header to order servers by the number of seconds they are behind their master. However, in all cases, the server topology is respected. For example, in a [TREE](#) topology, ordering occurs within branches only.

If the agent is down, servers show in bold red in the [Servers](#) column. The [Slave IO](#) and the [Slave SQL](#) columns display **stopped** in red text if these threads are not running. If an agent is down, italics is used to display the last know status of the IO or SQL threads.

Clicking on a master server opens a dialog box that displays information about the server. The information shown includes:

- The number of slave servers
- The binlog file name
- The binlog position
- Which databases are replicated and which not

The dialog box also includes a link that allows the user to hide or show the slave servers.

Clicking on a slave server opens a dialog window showing extensive information about the slave.

15.12. MySQL Enterprise Monitor Frequently Asked Questions

Note

MySQL Enterprise subscription, MySQL Enterprise Monitor, MySQL Replication Monitor, and MySQL Query Analyzer are only available to commercial customers. To learn more, see: <http://www.mysql.com/products/enterprise/features.html>.

- **15.12.1:** While monitoring my network traffic I have noticed that the agents communicate information at irregular intervals to the MySQL Enterprise Service Manager. I cannot see anything in my configuration that would explain this behaviour. What is going on?
- **15.12.2:** How frequently is the data purge process executed?
- **15.12.3:** Does Query Analyzer work with all versions of MySQL and the MySQL Client Libraries?
- **15.12.4:** My MySQL Enterprise Service Manager is behind a firewall but it cannot communicate with the MySQL Enterprise website to register and download my license key and advisor bundle. I normally use a proxy service to access external websites. How do I configure the proxy settings for MySQL Enterprise Dashboard?
- **15.12.5:** What is the relationship between the advisor JAR file and the key?
- **15.12.6:** I have set the graphs to update every 5 minutes, and the page refresh to occur every minute. The page is refreshing correctly, but the graphs do not seem to update.
- **15.12.7:** Can the Trial-level key work with the Gold-level advisors JAR file?
- **15.12.8:** During query analysis, I am unable to obtain an [EXAMPLE](#) or [EXPLAIN](#) information when examining the detail of the analyzed query within the **QUERY ANALYZER** panel.
- **15.12.9:** Does the Gold-level key support Silver-level advisors?
- **15.12.10:** I have enabled [EXPLAIN](#) queries for Query Analyzer, but no queries with the [EXPLAIN](#) data are showing up in the display.
- **15.12.11:** Can I run MySQL Enterprise Service Manager on machine with other applications running?
- **15.12.12:** Why do some rules appear to have a **SEVERITY** of **UNKNOWN**?
- **15.12.13:** How do I change the name of a server?
- **15.12.14:** I have started a Data Migration of my old data for a server to MySQL Enterprise Service Manager 2.0, but I have noticed that the performance of the monitor server has degraded significantly. Can I stop the migration?

Questions and Answers

15.12.1: While monitoring my network traffic I have noticed that the agents communicate information at irregular intervals to the MySQL Enterprise Service Manager. I cannot see anything in my configuration that would explain this behaviour. What is going on?

Each MySQL Enterprise Monitor Agent periodically sends information to the server about a range of different information, including the core rule and statistical data, Query Analyzer information and other data used to monitor the status of your MySQL server.

One element of this is called the MySQL Enterprise Monitor Agent Heartbeat, which is core information exchange that indicates that the monitored server is still up and running. The heartbeat information is vital because it tells the MySQL Enterprise Service Manager that the agent and server are still communicating. This information is sent regularly to the MySQL Enterprise Service Manager, but to prevent multiple agents from sending the information at the same time, and creating a large network load (or storm), the interval is randomized with each heartbeat. The randomization ensures that the information is still uploaded periodically, but without the potential to overload the network with this data.

15.12.2: How frequently is the data purge process executed?

A data purge process is started approximately once a minute. If you have changed the purge period then the data will start to be purged within the next minute.

15.12.3: Does Query Analyzer work with all versions of MySQL and the MySQL Client Libraries?

The MySQL Proxy component, and Query Analyzer, require that clients connecting through MySQL Enterprise Monitor Agent are using MySQL 5.0 or later. Clients that use the library provided with MySQL 4.1 or earlier will not work with MySQL Enterprise Monitor Agent.

15.12.4: My MySQL Enterprise Service Manager is behind a firewall but it cannot communicate with the MySQL Enterprise website to register and download my license key and advisor bundle. I normally use a proxy service to access external websites. How do I configure the proxy settings for MySQL Enterprise Dashboard?

To configure a proxy service, you need to edit the `apache-tomcat/conf/catalina.properties` file within the MySQL Enterprise Service Manager installation directory. To make the changes, the proxy configuration information to the end of the file by setting the `http.proxyHost` and `http.proxyPort` properties:

```
http.proxyHost=proxy.example.com
http.proxyPort=8080
```

You will need to restart the MySQL Enterprise Service Manager for the change to take effect:

```
shell> mysqlmonitorctl.sh restart
```

15.12.5: What is the relationship between the advisor JAR file and the key?

The JAR file contains graph and advisor definitions. The key file contains typical customer validation data such as contract information, number of servers covered, subscription level and dates.

15.12.6: I have set the graphs to update every 5 minutes, and the page refresh to occur every minute. The page is refreshing correctly, but the graphs do not seem to update.

The graph refresh and page refresh are two different parameters. The graphs will update according to their refresh period, regardless of the refresh period set for the main display page.

15.12.7: Can the Trial-level key work with the Gold-level advisors JAR file?

The Trial-level key can only be used with the Trial-level advisors JAR file.

15.12.8: During query analysis, I am unable to obtain an `EXAMPLE` or `EXPLAIN` information when examining the detail of the analyzed query within the QUERY ANALYZER panel.

You must explicitly enable the `EXAMPLE` and `EXPLAIN` query functionality. Make sure that you have enabled both panels. See [Section 15.10.6, “Query Analyzer Settings”](#).

15.12.9: Does the Gold-level key support Silver-level advisors?

The Gold-level advisor JAR file will contain Silver-level advisors plus Gold-level advisors. However, you cannot use the Gold-level key with the Silver-level advisors JAR file. The Gold-level key can only be used with the Gold-level advisors JAR file.

15.12.10: I have enabled `EXPLAIN` queries for Query Analyzer, but no queries with the `EXPLAIN` data are showing up in the display.

Query Analyzer only obtains `EXPLAIN` information when the MySQL Enterprise Monitor Agent identifies a long running query. If none of your queries exceed the defined threshold, then the `EXPLAIN` information is not obtain and provided to the Query Analyzer for display.

To change the query duration at which an `EXPLAIN` is triggered, you must edit the `share/mysql-proxy/quant.lua` file within the MySQL Enterprise Monitor Agent directory on each server. You need to change the value configured in the `auto_explain_min_exec_time_us`. The default is 500ms:

```
---
-- configuration
--
-- SET GLOBAL analyze_query.auto_filter = 0
if not proxy.global.config.quan then
  proxy.global.config.quan = {
    analyze_queries = true,    -- track all queries
    query_cutoff    = 160,    -- only show the first 160 chars of the query
    num_worst_queries = 5,
    auto_explain    = true,
    auto_explain_min_exec_time_us = 500 * 1000
  }
end
```

The value is expressed in microseconds, which is why the value must be multiplied by 1000. To reduce this value to 100ms you would modify the line:

```
auto_explain_min_exec_time_us = 100 * 1000
```

You do not need to restart MySQL Enterprise Monitor Agent for the changes to take effect.

15.12.11: Can I run MySQL Enterprise Service Manager on machine with other applications running?

You can, but ideally you should be running your MySQL Enterprise Service Manager on a dedicated machine, especially if you are monitoring a number of different agents. For more information, see [Section 15.4.4, “Choosing Suitable MySQL Enterprise Service Manager Hardware Configurations”](#).

15.12.12: Why do some rules appear to have a SEVERITY of UNKNOWN?

Due to timing issues, certain rules such as “32-Bit Binary Running on 64-Bit AMD Or Intel System” and “Key Buffer Size Greater Than 4 GB” do not evaluate correctly due to timing issues. This is a known issue and will be resolved in future versions of MySQL Enterprise Monitor.

15.12.13: How do I change the name of a server?

Go to the **MANAGE SERVERS** panel within **SETTINGS** and click **RENAME SERVER**.

15.12.14: I have started a Data Migration of my old data for a server to MySQL Enterprise Service Manager 2.0, but I have noticed that the performance of the monitor server has degraded significantly. Can I stop the migration?

You can stop the migration of your historical data at any time. Go to the **MANAGE SERVERS** display of the **SETTINGS** panel and click **STOP** next to each server that is being migrated. You can restart the migration at any point.

- [15.12.22](#): What is MySQL Consultative Support?

Questions and Answers

15.12.1: How should I decide between MySQL Enterprise Basic, Silver, Gold and Platinum?

MySQL Enterprise subscriptions are available in 4 tiers, providing you the flexibility of choosing the capabilities and SLA that best meet your requirements. [Learn More](#) If you have questions and what to discuss your specific requirements, please [Contact MySQL Sales](#)

15.12.2: What is MySQL Enterprise Server?

MySQL Enterprise Server software is the most reliable, secure and up-to-date version of MySQL for cost-effectively delivering E-commerce, Online Transaction Processing (OLTP), and multi-terabyte Data Warehousing applications. It is a fully integrated transaction-safe, ACID compliant database with full commit, rollback, crash recovery and row level locking capabilities. MySQL delivers the ease of use, scalability, and performance that has made it MySQL the world's most popular open source database. [Learn More](#)

15.12.3: How do I get a 30-day trial on MySQL Enterprise?

You can experience the MySQL Enterprise Monitor for 30 days by registering to receive an email with login instructions. [Learn More](#)

15.12.4: Does MySQL Enterprise include Maintenance, Updates, and Upgrades?

Yes. As long as you have a valid contract for MySQL Enterprise, you will receive all new MySQL Enterprise Server software releases including Software Maintenance, Updates, and Upgrades. The Software Update Service will automatically notify you of the new releases.

15.12.5: What is a Technical Account Manager?

MySQL Enterprise, at the Platinum tier, provides the option for a Technical Account Manager (TAM). The TAM is your advocate within MySQL, who proactively works to maximize your benefits from MySQL Support Services. [Learn More](#)

15.12.6: Are there any Webinars available?

Yes. MySQL provides regularly scheduled Live Webinars. [Learn More](#) MySQL also provides On-Demand Webinars to fit your schedule. These are recordings of previously held Live Webinars that you can replay at any time. [Learn More](#)

15.12.7: What is the pricing of MySQL Enterprise?

The pricing model for MySQL Enterprise is based on two key components: per server and per year. MySQL Enterprise does not have artificial restrictions based on CPUs, Memory, Machine Size, or Named Users. MySQL Enterprise is available in 4 tiers (Basic, Silver, Gold and Platinum). Choose the tier that best meets your requirements and budget. [Learn More](#)

15.12.8: Does MySQL Enterprise include Emergency Hot Fix Builds?

MySQL Enterprise, at the Gold and Platinum tiers, gives you the ability to request an Emergency Hot Fix Build to fix issues not already fixed in a MySQL Rapid Update or MySQL Quarterly Service Pack.

15.12.9: Are there any MySQL Enterprise White Papers available?

Yes. Detailed architecture, technology, and business white papers are available. [Learn More](#)

15.12.10: How do I buy MySQL Enterprise?

For pricing and to buy MySQL Enterprise, visit the [Online Shop](#) For volume discounts or for more information, please [Contact MySQL Sales](#)

15.12.11: What is MySQL Enterprise?

The MySQL Enterprise subscription is the most comprehensive offering of MySQL database software, services and production support to ensure your business achieves the highest levels of reliability, security and uptime.

MySQL Enterprise includes:

- MySQL Enterprise Server software, the most reliable, secure and up-to date version of the world's most popular open source database
- MySQL Enterprise Monitor that continuously monitors your database and proactively advises you on how to implement MySQL best practices

- MySQL 24x7 Production Support with fast response times to assist you in the development, deployment and management of MySQL applications

MySQL Enterprise is available in 4 tiers (Basic, Silver, Gold, Platinum). [Learn More](#)

15.12.12: Does MySQL provide IP (Intellectual Property) Indemnification?

MySQL Enterprise, at the Gold and Platinum tiers, has the option of IP Indemnification, for qualifying customers at no extra cost. This provides you with legal protection that you expect from enterprise software providers. [Learn More](#)

15.12.13: Can I buy MySQL Enterprise subscriptions for multiple years?

MySQL Enterprise subscriptions have duration of at least 1 year. Customers have the flexibility of choosing terms with multi-year durations. To purchase multi-year contracts, please [Contact MySQL Sales](#)

15.12.14: What is MySQL Enterprise Unlimited?

MySQL Enterprise Unlimited is a unique offering that allows you to deploy an unlimited number of MySQL Enterprise Servers for the price of a single CPU of Oracle Enterprise Edition. [Learn More](#)

15.12.15: What is MySQL Production Support?

Production Support consists of 4 components:

- Problem Resolution Support
- Consultative Support
- Knowledge Base
- Technical Account Manager (option)

MySQL Production Support gives you priority access with guaranteed response times to assist you with the development, deployment and management of your MySQL applications. [Learn More](#)

15.12.16: Can I buy MySQL Enterprise subscriptions for only some of my production MySQL database servers?

When you choose MySQL Enterprise subscriptions, they must cover all database servers that power that specific application. To negotiate volume discounts, please [Contact MySQL Sales](#)

15.12.17: Are there any Demo/Tutorials available for MySQL Enterprise?

Yes. Multiple self-running demos are available. [Learn More](#)

15.12.18: Does MySQL Enterprise include 24x7 Technical Support?

MySQL Enterprise, at the Gold and Platinum tiers, includes 24x7 phone and email access to the MySQL Support Team. [Learn More](#)

15.12.19: What if I plan to add more MySQL servers to my MySQL Enterprise subscription?

A great option is the MySQL Enterprise Unlimited offering that allows you cover an unlimited number of MySQL servers for a fixed, low price. [Learn More](#)

15.12.20: What is the list of Supported Platforms?

MySQL Enterprise provides broad coverage in its list of Supported Platforms. [Learn More](#)

15.12.21: Do all my MySQL Enterprise subscriptions need to be at the same tier?

MySQL Enterprise subscriptions must be at the same tier (Basic, Silver, Gold, Platinum) for all database servers that power that specific application.

15.12.22: What is MySQL Consultative Support?

MySQL Enterprise, at the Gold and Platinum tiers, includes Consultative Support. This is a proactive approach to support that is designed to help you avoid critical outages. MySQL Support Engineers advise you on how to properly design and tune your MySQL servers, schema, queries, and replication set-up to maximize performance and availability. Also, by taking the initiative to properly design and tune your MySQL database applications you can avoid having to purchase expensive hardware for your IT infrastructure. [Learn More](#)

MySQL Monitor

Questions

- [15.12.1](#): What is MySQL Enterprise Monitor?
- [15.12.2](#): What versions of MySQL are supported by the MySQL Enterprise Monitor?
- [15.12.3](#): What MySQL Enterprise subscription levels include the MySQL Enterprise Monitor?

- [15.12.7](#): What operating system platforms are supported by the MySQL Enterprise Monitor?
- [15.12.8](#): How do I get the MySQL Enterprise Monitor?
- [15.12.9](#): What makes MySQL Enterprise unique?
- [15.12.10](#): What are the long-term benefits of the MySQL Enterprise Monitor?
- [15.12.11](#): Which set of Enterprise Advisors, Advisor Rules and features are best for my use of MySQL?
- [15.12.12](#): How is the MySQL Enterprise Monitor installed and deployed?
- [15.12.13](#): What are the immediate benefits of implementing the MySQL Enterprise Monitor?
- [15.12.14](#): How are subscribers notified about the availability of new or updated MySQL Enterprise Monitor, MySQL Enterprise Advisors and Advisor Rules?
- [15.12.15](#): Which Advisors and features are included under different MySQL Enterprise subscription levels?

Questions and Answers

15.12.1: What is MySQL Enterprise Monitor?

Included as part of a MySQL Enterprise subscription, the MySQL Enterprise Monitor is a distributed, web-based application that helps customers reduce downtime, tighten security and increase throughput of their MySQL servers by telling them about problems in their database applications before they occur. It is downloadable from the Enterprise Customer web site and is deployed within the safety of the customer datacenter. [Learn More](#)

15.12.2: What versions of MySQL are supported by the MySQL Enterprise Monitor?

The MySQL Enterprise Monitor can be used to monitor MySQL versions 4.0 – 5.x.

15.12.3: What MySQL Enterprise subscription levels include the MySQL Enterprise Monitor?

The Enterprise Monitor is available under MySQL Enterprise subscription levels Silver, Gold and Platinum. [Learn More](#)

15.12.4: What are the features and related benefits of the MySQL Enterprise Monitor?

The MySQL Enterprise Monitor is like having a "Virtual DBA Assistant" at your side to recommend best practices to eliminate security vulnerabilities, improve replication, and optimize performance. For the complete features and benefits, visit the [MySQL Enterprise Monitor Features and Benefits page](#).

15.12.5: What are the MySQL Enterprise Advisors and Advisor Rules?

The MySQL Enterprise Advisors are a set of best practice guidelines for the optimal use of MySQL. Advisors are spread across database specific disciplines and are comprised of a set of MySQL Advisor Rules that proactively monitor all MySQL servers and report on database application problems before they occur. Each Advisor Rule provides a detailed overview of the problem it is designed to identify, advices on how to correct the problem, specifies commands to implement the recommended fix and links to additional resources for additional research into the issue at hand. [Learn More](#)

15.12.6: How is the Enterprise Monitor web application architected?

The Enterprise Monitor web application is comprised of 3 components:

- **Service Agent:** A lightweight C program that is installed on each of the monitored MySQL servers. Its purpose is to collect MySQL SQL and operating system metrics that allow the DBA to monitor the overall health, availability and performance of the MySQL server. The Service Agent is the only component within the application that touches or connects to the MySQL Server. It reports the data it collects via XML over HTTP to the centralized Service Manager.
- **Service Manager:** The main server of the application. The Service Manager manages and stores the data collections that come in from each service agent. It analyzes these collections using MySQL provided best practice Advisor rules to determine the health, security, availability and performance of each of the monitored MySQL Servers. The Service Manager also provides the content for the Enterprise Dashboard which serves as the client user interface for the distributed web application.
- **Repository:** A MySQL database that is used to stored data collections and application-level configuration data.

15.12.7: What operating system platforms are supported by the MySQL Enterprise Monitor?

The Enterprise Monitor Service Manager is fully supported on most current versions of Linux, Windows XP and Server Editions, Solaris and Mac OSX. The Service Agent supports any platform supported by the MySQL Enterprise server. For the complete list of MySQL Enterprise supported operating systems and CPUs, visit the [Supported Platforms page](#).

15.12.8: How do I get the MySQL Enterprise Monitor?

The MySQL Enterprise Monitor is available for download to MySQL Enterprise customers at the Silver, Gold and Platinum subscription levels.

- To experience the MySQL Enterprise Monitor for 30 days, visit the [Trial Subscription page](#)
- To buy MySQL Enterprise, visit the [Online Shop](#)

15.12.9: What makes MySQL Enterprise unique?

Of the products on the market that monitor MySQL, SQL code and OS specific metrics, the MySQL Enterprise Monitor is the only solution that is built and supported by the engineers at MySQL. Unlike other solutions that report on raw MySQL and OS level metrics, the MySQL Enterprise Monitor is designed to optimize the use of MySQL by proactively monitoring MySQL instances and providing notifications and “MySQL DBA expertise in a box” advice on corrective measures DBAs can take before problems occur.

15.12.10: What are the long-term benefits of the MySQL Enterprise Monitor?

Over time, the task of managing even medium-scale MySQL server farms becomes exponentially more complicated, especially as the load of users, connections, application queries, and objects on each MySQL server increases. The Enterprise Monitor continually monitors the dynamic security, performance, replication and schema relevant metrics of all MySQL servers, so as the number of MySQL continues to grow, DBAs are kept up to date on potential problems and proactive measures that can be implemented to ensure each server continues to operate at the highest levels of security, performance and reliability.

15.12.11: Which set of Enterprise Advisors, Advisor Rules and features are best for my use of MySQL?

The Enterprise Monitor Advisors and Advisor Rules are available at 3 MySQL Enterprise subscription tiers: Choose MySQL Enterprise Silver if you need:

- Assurance you are running the most current, bug-free version of MySQL across all of your servers.
- Recoverability of your MySQL servers.
- The highest level of security for your MySQL servers.
- Monitoring of maximum or disallowed MySQL connections.
- Optimized startup configuration settings.

Choose MySQL Enterprise Gold, when you need everything in Silver, PLUS:

- Easy collection and detection of problematic SQL code running on your production or development systems.
- Insight and corrective advice on MySQL replication status, sync, and performance related issues.
- Auto detection and documenting of your Replication topologies.

- Advanced monitoring of your Replication and Scale-out environment.

Choose MySQL Enterprise Platinum, when you need everything in Gold, PLUS:

- Identification and advice on unplanned database and object level schema changes (Create, Alter, and Drop) across your MySQL servers.
- Proactive monitoring and advice on tuning the performance of your MySQL servers.

15.12.12: How is the MySQL Enterprise Monitor installed and deployed?

The Enterprise Monitor is powered by a distributed web application that is installed and deployed within the confines of the corporate firewall.

15.12.13: What are the immediate benefits of implementing the MySQL Enterprise Monitor?

Often MySQL installations are implemented with default settings that may not be best suited for specific applications or usage patterns. The MySQL Advisors go to work immediately in these environments to identify potential problems and proactively notify and advise DBAs on key MySQL settings that can be tuned to improve availability, tighten security, and increase the throughput of their existing MySQL servers

15.12.14: How are subscribers notified about the availability of new or updated MySQL Enterprise Monitor, MySQL Enterprise Advisors and Advisor Rules?

Customers will receive notifications of new and updated MySQL Enterprise Monitor and Advisors as they become available via the MySQL Enterprise Software Update Service. Notifications will be generated and sent based on the customer profile and the MySQL Enterprise subscription level.

15.12.15: Which Advisors and features are included under different MySQL Enterprise subscription levels?

For the complete list of the MySQL Enterprise Advisors that are available under each MySQL Enterprise subscription level, visit the [Features page](#).

MySQL Query Analyzer

Questions

- [15.12.1](#): Can I leave the MySQL Query Analyzer enabled at all times?
- [15.12.2](#): What are the typical use cases of the MySQL Query Analyzer?
- [15.12.3](#): What is the MySQL Query Analyzer?
- [15.12.4](#): What are the main features and benefits of the MySQL Query Analyzer?
- [15.12.5](#): What makes the MySQL Query Analyzer unique?
- [15.12.6](#): How are subscribers notified about updates to the MySQL Query Analyzer application components?
- [15.12.7](#): How can I get the MySQL Query Analyzer?
- [15.12.8](#): How is the MySQL Query Analyzer installed and enabled?
- [15.12.9](#): What overhead can I expect when the MySQL Query Analyzer is installed and enabled?

Questions and Answers

15.12.1: Can I leave the MySQL Query Analyzer enabled at all times?

We have customers who have the Query Analyzer enabled and collecting queries on their development and QA servers so they can tune their code and monitor the fixes as part of the development process. For production systems, Query collection and analysis can easily be toggled on when a slowdown occurs. To avoid collection mode overhead many users are using simple scripts to enable the Query Analyzer to sample queries during non-peak hours, typically during 30 minute windows. They can then view the collected queries using the date/time or interval filter options.

15.12.2: What are the typical use cases of the MySQL Query Analyzer?

The typical use cases for developers, DBAs and system administrators are:

- Developers – Monitor and tune application queries during development before they are promoted to production.
- DBAs and System Administrators – Identify problem SQL code as it runs in production and advise development teams on how to tune. This use case benefits the most from regular sampling of queries as they are running, most often during non-peak hours.

15.12.3: What is the MySQL Query Analyzer?

The MySQL Query Analyzer allows DBAs, developers and system administrators to improve application performance by collecting, monitoring, and analyzing queries as they run on their MySQL servers. [Learn More](#)

15.12.4: What are the main features and benefits of the MySQL Query Analyzer?

For the complete features and benefits, visit the [MySQL Enterprise Monitor Features and Benefits page](#).

15.12.5: What makes the MySQL Query Analyzer unique?

Other products (free, open source and commercial) that provide MySQL query monitoring are dependent on the MySQL Slow Query Log being enabled and available for sampling. While this provides some time savings over the DBA collecting and parsing the Log, the Slow Query Log comes with overhead and does not capture sub millisecond executions. The log data also grows very large very quickly.

The MySQL Query Analyzer collects queries and execution statistics with no dependence on the SQL Query Log, it captures all SQL statements sent to the MySQL server and provides an aggregated view into the most expensive queries in number of executions and total execution time. It is also fully supported as part of the MySQL Enterprise subscription.

15.12.6: How are subscribers notified about updates to the MySQL Query Analyzer application components?

Customers will receive notifications of the MySQL Query Analyzer updates as they become available via the MySQL Enterprise Software Update and Alert Service. Notifications will be generated and sent based on the customer profile and the MySQL Enterprise subscription level.

15.12.7: How can I get the MySQL Query Analyzer?

The MySQL Query Analyzer is available for download to MySQL Enterprise customers at the Gold and Platinum subscription levels.

- To experience the MySQL Enterprise Monitor for 30 days, visit the [Trial Subscription page](#)
- To buy MySQL Enterprise, visit the [Online Shop](#)

15.12.8: How is the MySQL Query Analyzer installed and enabled?

The Query Analyzer feature is installed with the Service Agent. It is enabled during agent installation and can be toggled between collection and pass-thru modes from the Query Analysis page of the Enterprise Monitor.

15.12.9: What overhead can I expect when the MySQL Query Analyzer is installed and enabled?

The average overhead when in active collection mode is in the 15-20% range. In pass-thru mode the overhead is minimal, weighing in at 1-5% on most MySQL systems of average load.

Chapter 16. Replication

Replication enables data from one MySQL database server (called the master) to be replicated to one or more MySQL database servers (slaves). Replication is asynchronous - your replication slaves do not need to be connected permanently to receive updates from the master, which means that updates can occur over long-distance connections and even temporary solutions such as a dial-up service. Depending on the configuration, you can replicate all databases, selected databases, or even selected tables within a database.

The target uses for replication in MySQL include:

- Scale-out solutions - spreading the load among multiple slaves to improve performance. In this environment, all writes and updates must take place on the master server. Reads, however, may take place on one or more slaves. This model can improve the performance of writes (since the master is dedicated to updates), while dramatically increasing read speed across an increasing number of slaves.
- Data security - because data is replicated to the slave, and the slave can pause the replication process, it is possible to run backup services on the slave without corrupting the corresponding master data.
- Analytics - live data can be created on the master, while the analysis of the information can take place on the slave without affecting the performance of the master.
- Long-distance data distribution - if a branch office would like to work with a copy of your main data, you can use replication to create a local copy of the data for their use without requiring permanent access to the master.

Replication in MySQL features support for one-way, asynchronous replication, in which one server acts as the master, while one or more other servers act as slaves. This is in contrast to the *synchronous* replication which is a characteristic of MySQL Cluster (see [MySQL Cluster NDB 6.X/7.X](#)).

There are a number of solutions available for setting up replication between two servers, but the best method to use depends on the presence of data and the engine types you are using. For more information on the available options, see [Section 16.1.1, “How to Set Up Replication”](#).

There are two core types of replication format, Statement Based Replication (SBR), which replicates entire SQL statements, and Row Based Replication (RBR), which replicates only the changed rows. You may also use a third variety, Mixed Based Replication (MBR), which is the default mode in MySQL 5.4 and later. For more information on the different replication formats, see [Section 16.1.2, “Replication Formats”](#).

Replication is controlled through a number of different options and variables. These control the core operation of the replication, timeouts and the databases and filters that can be applied on databases and tables. For more information on the available options, see [Section 16.1.3, “Replication and Binary Logging Options and Variables”](#).

You can use replication to solve a number of different problems, including problems with performance, supporting the backup of different databases and for use as part of a larger solution to alleviate system failures. For information on how to address these issues, see [Section 16.2, “Replication Solutions”](#).

For notes and tips on how different data types and statements are treated during replication, including details of replication features, version compatibility, upgrades, and problems and their resolution, including an FAQ, see [Section 16.3, “Replication Notes and Tips”](#).

Detailed information on the implementation of replication, how replication works, the process and contents of the binary log, background threads and the rules used to decide how statements are recorded and replication, see [Section 16.4, “Replication Implementation”](#).

MySQL Enterprise

The MySQL Enterprise Monitor provides numerous advisors that provide immediate feedback about replication-related problems. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

16.1. Replication Configuration

Replication between servers in MySQL works through the use of the binary logging mechanism. The MySQL instance operating as the master (the source of the database changes) writes updates and changes as “events” to the binary log. The information in the binary log is stored in different logging formats according to the database changes being recorded. Slaves are configured to read the binary log from the master and to execute the events in the binary log on the slave’s local database.

The master is “dumb” in this scenario. Once binary logging has been enabled, all statements are recorded in the binary log. Each slave will receive a copy of the entire contents of the binary log. It is the responsibility of the slave to decide which statements in the binary log should be executed; you cannot configure the master to log only certain events. If you do not specify otherwise, all

events in the master binary log are executed on the slave. If required, you can configure the slave to process only events that apply to particular databases or tables.

Each slave keeps a record of the binary log file and position within the log file that it has read and processed from the master. This means that multiple slaves can be connected to the master and executing different parts of the same binary log. Because the slaves control this process, individual slaves can be connected and disconnected from the server without affecting the master's operation. Also, because each slave remembers the position within the binary log, it is possible for slaves to be disconnected, reconnect and then “catch up” by continuing from the recorded position.

Both the master and each slave must be configured with a unique ID (using the `server-id` option). In addition, the slave must be configured with information about the master host name, log file name and position within that file. These details can be controlled from within a MySQL session using the `CHANGE MASTER TO` statement. The details are stored within the `master.info` file.

In this section the setup and configuration required for a replication environment is described, including step-by-step instructions for creating a new replication environment. The major components of this section are:

- For a guide to setting up two or more servers for replication see [Section 16.1.1, “How to Set Up Replication”](#). This section deals with the setup of the systems and provides methods for copying data between the master and slaves.
- Events in the binary log are recorded using a number of formats. These are referred to as statement-based replication (SBR) or row-based replication (RBR). A third type, mixed-format replication (MIXED), uses SBR or RBR replication automatically to take advantage of the benefits of both SBR and RBR formats when appropriate. The different formats are discussed in [Section 16.1.2, “Replication Formats”](#).
- Detailed information on the different configuration options and variables that apply to replication is provided in [Section 16.1.3, “Replication and Binary Logging Options and Variables”](#).
- Once started, the replication process should require little administration or monitoring. However, for advice on common tasks that you may want to execute, see [Section 16.1.4, “Common Replication Administration Tasks”](#).

16.1.1. How to Set Up Replication

This section describes how to set up complete replication of a MySQL server. There are a number of different methods for setting up replication, and the exact method that you use will depend on how you are setting up replication, and whether you already have data within your master database.

There are some generic tasks which may be required for all replication setups:

- You may want to create a separate user that will be used by your slaves to authenticate with the master to read the binary log for replication. The step is optional. See [Section 16.1.1.1, “Creating a User for Replication”](#).
- You must configure the master to support the binary log and configure a unique ID. See [Section 16.1.1.2, “Setting the Replication Master Configuration”](#).
- You must configure a unique ID for each slave that you want to connect to the master. See [Section 16.1.1.3, “Setting the Replication Slave Configuration”](#).
- Before starting a data snapshot or the replication process, you should record the position of the binary log on the master. You will need this information when configuring the slave so that the slave knows where within the binary log to start executing events. See [Section 16.1.1.4, “Obtaining the Master Replication Information”](#).
- If you already have data on your master and you want to synchronize your slave with this base data, then you will need to create a data snapshot of your database. You can create a snapshot using `mysqldump` (see [Section 16.1.1.5, “Creating a Data Snapshot Using `mysqldump`”](#)) or by copying the data files directly (see [Section 16.1.1.6, “Creating a Data Snapshot Using Raw Data Files”](#)).
- You will need to configure the slave with the master settings, such as the host name, login credentials and binary log name and positions. See [Section 16.1.1.10, “Setting the Master Configuration on the Slave”](#).

Once you have configured the basic options, you will need to follow the instructions for your replication setup. A number of alternatives are provided:

- If you are establishing a new MySQL master and one or more slaves, then you need only set up the configuration, as you have no data to exchange. For guidance on setting up replication in this situation, see [Section 16.1.1.7, “Setting Up Replication with New Master and Slaves”](#).

- If you are already running a MySQL server, and therefore already have data that will need to be transferred to your slaves before replication starts, have not previously configured the binary log and are able to shut down your MySQL server for a short period during the process, see [Section 16.1.1.8, “Setting Up Replication with Existing Data”](#).
- If you are setting up additional slaves to an existing replication environment then you can set up the slaves without affecting the master. See [Section 16.1.1.9, “Introducing Additional Slaves to an Existing Replication Environment”](#).

If you want to administer a MySQL replication setup, we suggest that you read this entire chapter through and try all statements mentioned in [Section 12.6.1, “SQL Statements for Controlling Master Servers”](#), and [Section 12.6.2, “SQL Statements for Controlling Slave Servers”](#). You should also familiarize yourself with the replication startup options described in [Section 16.1.3, “Replication and Binary Logging Options and Variables”](#).

Note

Note that certain steps within the setup process require the `SUPER` privilege. If you do not have this privilege then enabling replication may not be possible.

16.1.1.1. Creating a User for Replication

Each slave must connect to the master using a standard MySQL user name and password, so there must be a user account on the master that the slave can use to connect. Any account can be used for this operation, providing it has been granted the `REPLICATION SLAVE` privilege.

You do not need to create a specific user for replication. However, you should be aware that the user name and password will be stored in plain text within the `master.info` file. Therefore, you may want to create a user that only has privileges for the replication process.

To create a user or grant an existing user the privileges required for replication, use the `GRANT` statement. If you create a user solely for the purposes of replication then that user needs only the `REPLICATION SLAVE` privilege. For example, to create a user, `repl`, that can connect for replication from any host within the `mydomain.com` domain, issue this statement on the master:

```
mysql> GRANT REPLICATION SLAVE ON *.*
-> TO 'repl'@'%mydomain.com' IDENTIFIED BY 'slavepass';
```

See [Section 12.5.1.3, “GRANT Syntax”](#), for more information on the `GRANT` statement.

You may wish to create a different user for each slave, or use the same user for each slave that needs to connect. As long as each user that you want to use for the replication process has the `REPLICATION SLAVE` privilege you can create as many users as you require.

16.1.1.2. Setting the Replication Master Configuration

For replication to work you *must* enable binary logging on the master. If binary logging is not enabled, replication will not be possible as it is the binary log that is used to exchange data between the master and slaves.

Each server within a replication group must be configured with a unique `server-id` value. The server ID is used to identify individual servers within the group, and must be positive integer between 1 and $(2^{32})-1$. How you organize and select the numbers is entirely up to you.

To configure the binary log and server ID options, you will need to shut down your MySQL server and edit the configuration of the `my.cnf` or `my.ini` file.

You will need to add the following options to the configuration file within the `[mysqld]` section. If these options already exist, but are commented out, uncomment the options and alter them according to your needs. For example, to enable binary logging, using a log file name prefix of `mysql-bin`, and setting a server ID of 1:

```
[mysqld]
log-bin=mysql-bin
server-id=1
```

Note

For the greatest possible durability and consistency in a replication setup using `InnoDB` with transactions, you should use `innodb_flush_log_at_trx_commit=1` and `sync_binlog=1` in the master `my.cnf` file.

Note

Ensure that the `skip-networking` option has not been enabled on your replication master. If networking has been disabled, then your slave will not be able to communicate with the master and replication will fail.

16.1.1.3. Setting the Replication Slave Configuration

The only option you must configure on the slave is to set the unique server ID. If this option is not already set, or the current value conflicts with the value that you have chosen for the master server, then you should shut down your slave server, and edit the configuration to specify the server ID. For example:

```
[mysqld]
server-id=2
```

If you are setting up multiple slaves, each one must have a unique `server-id` value that differs from that of the master and from each of the other slaves. Think of `server-id` values as something similar to IP addresses: These IDs uniquely identify each server instance in the community of replication partners.

If you do not specify a `server-id` value, it defaults to 0.

Note

If you omit `server-id` (or set it explicitly to 0), a master refuses connections from all slaves, and a slave refuses to connect to a master. Thus, omitting `server-id` is good only for backup with a binary log.

You do not have to enable binary logging on the slave for replication to be enabled. However, if you enable binary logging on the slave then you can use the binary log for data backups and crash recovery on the slave, and also use the slave as part of a more complex replication topology (for example, where the slave acts as a master to other slaves).

16.1.1.4. Obtaining the Master Replication Information

To configure replication on the slave you must determine the master's current point within the master binary log. You will need this information so that when the slave starts the replication process, it is able to start processing events from the binary log at the correct point.

If you have existing data on your master that you want to synchronize on your slaves before starting the replication process, then you must stop processing statements on the master, obtain the current position, and then dump the data, before allowing the master to continue executing statements. If you do not stop the execution of statements, the data dump and the master status information that you use will not match and you will end up with inconsistent or corrupted databases on the slaves.

To get the master status information, follow these steps:

1. Start the command-line client and flush all tables and block write statements by executing the `FLUSH TABLES WITH READ LOCK` statement:

```
mysql> FLUSH TABLES WITH READ LOCK;
```

For `InnoDB` tables, note that `FLUSH TABLES WITH READ LOCK` also blocks `COMMIT` operations.

Warning

Leave the client from which you issued the `FLUSH TABLES` statement running so that the read lock remains in effect. If you exit the client, the lock is released.

2. Use the `SHOW MASTER STATUS` statement to determine the current binary log file name and offset on the master:

```
mysql > SHOW MASTER STATUS;
+-----+-----+-----+-----+
| File           | Position | Binlog_Do_DB | Binlog_Ignore_DB |
+-----+-----+-----+-----+
| mysql-bin.003 | 73       | test         | manual,mysql      |
+-----+-----+-----+-----+
```

The `File` column shows the name of the log file and `Position` shows the offset within the file. In this example, the binary log file is `mysql-bin.003` and the offset is 73. Record these values. You need them later when you are setting up the slave. They represent the replication coordinates at which the slave should begin processing new updates from the master.

If the master has been running previously without binary logging enabled, the log name and position values displayed by `SHOW MASTER STATUS` or `mysqldump --master-data` will be empty. In that case, the values that you need to use later when specifying the slave's log file and position are the empty string (' ') and 4.

You now have the information you need to enable the slave to start reading from the binary log in the correct place to start replication.

If you have existing data that needs to be synchronized with the slave before you start replication, leave the client running so that the lock remains in place and then proceed to [Section 16.1.1.5, “Creating a Data Snapshot Using `mysqldump`”](#), or [Section 16.1.1.6, “Creating a Data Snapshot Using Raw Data Files”](#).

If you are setting up a brand new master and slave replication group, then you can exit the client and release the locks.

16.1.1.5. Creating a Data Snapshot Using `mysqldump`

One way to create a snapshot of the data in an existing master database is to use the `mysqldump` tool. Once the data dump has been completed, you then import this data into the slave before starting the replication process.

To obtain a snapshot of the data using `mysqldump`:

- If you haven't already locked the tables on the server to prevent statements that update data from executing:

Start the command-line client and flush all tables and block write statements by executing the `FLUSH TABLES WITH READ LOCK` statement:

```
mysql> FLUSH TABLES WITH READ LOCK;
```

Remember to use `SHOW MASTER STATUS` and record the binary log details for use when starting up the slave. The point in time of your snapshot and the binary log position must match. See [Section 16.1.1.4, “Obtaining the Master Replication Information”](#).

- In another session, use `mysqldump` to create a dump either of all the databases you want to replicate, or of selected individual databases. For example:

```
shell> mysqldump --all-databases --lock-all-tables >dbdump.db
```

- An alternative to using a bare dump, is to use the `--master-data` option, which automatically appends the `CHANGE MASTER TO` statement required on the slave to start the replication process.

```
shell> mysqldump --all-databases --master-data >dbdump.db
```

- In the client where you acquired the read lock, release the lock:

```
mysql> UNLOCK TABLES;
```

When choosing databases to include in the dump, remember that you will need to filter out databases on each slave that you do not want to include in the replication process.

You will need either to copy the dump file to the slave, or to use the file from the master when connecting remotely to the slave to import the data.

16.1.1.6. Creating a Data Snapshot Using Raw Data Files

If your database is particularly large, copying the raw data files may be more efficient than using `mysqldump` and importing the file on each slave.

However, using this method with tables in storage engines with complex caching or logging algorithms may not give you a perfect “in time” snapshot as cache information and logging updates may not have been applied, even if you have acquired a global read lock. How the storage engine responds to this depends on its crash recovery abilities.

In addition, this method does not work reliably if the master and slave have different values for `ft_stopword_file`, `ft_min_word_len`, or `ft_max_word_len` and you are copying tables having fulltext indexes.

If you are using `InnoDB` tables, you should use the `InnoDB Hot Backup` tool to obtain a consistent snapshot. This tool records the log name and offset corresponding to the snapshot to be later used on the slave. `Hot Backup` is a non-free (commercial) tool that is not included in the standard MySQL distribution. See the `InnoDB Hot Backup` home page at <http://www.innodb.com/hot-backup> for detailed information.

Otherwise, you can obtain a reliable binary snapshot of `InnoDB` tables only after shutting down the MySQL Server.

To create a raw data snapshot of `MyISAM` tables you can use standard copy tools such as `cp` or `copy`, a remote copy tool such as `scp` or `rsync`, an archiving tool such as `zip` or `tar`, or a file system snapshot tool such as `dump`, providing that your MySQL data files exist on a single file system. If you are replicating only certain databases then make sure you copy only those files that related to those tables. (For `InnoDB`, all tables in all databases are stored in a single file unless you have the `in-`

`nodb_file_per_table` option enabled.)

You may want to specifically exclude the following files from your archive:

- Files relating to the `mysql` database.
- The `master.info` file.
- The master's binary log files.
- Any relay log files.

To get the most consistent results with a raw data snapshot you should shut down the server during the process, as below:

1. Acquire a read lock and get the master's status. See [Section 16.1.1.4, “Obtaining the Master Replication Information”](#).
2. In a separate session, shut down the MySQL server:

```
shell> mysqladmin shutdown
```

3. Make a copy of the MySQL data files. Examples are shown below for common ways to do this - you need to choose only one of them:

```
shell> tar cf /tmp/db.tar ./data
shell> zip -r /tmp/db.zip ./data
shell> rsync --recursive ./data /tmp/dbdata
```

4. Start up the MySQL instance on the master.

If you are not using `InnoDB` tables, you can get a snapshot of the system from a master without shutting down the server as described in the following steps:

1. Acquire a read lock and get the master's status. See [Section 16.1.1.4, “Obtaining the Master Replication Information”](#).
2. Take a copy of the MySQL data files. Examples are shown below for common solutions - you need to choose only one of these solutions:

```
shell> tar cf /tmp/db.tar ./data
shell> zip -r /tmp/db.zip ./data
shell> rsync --recursive ./data /tmp/dbdata
```

3. In the client where you acquired the read lock, release the lock:

```
mysql> UNLOCK TABLES;
```

Once you have created the archive or copy of the database, you will need to copy the files to each slave before starting the slave replication process.

16.1.1.7. Setting Up Replication with New Master and Slaves

Setting up replication with a new master and slaves (that is, with no existing data) is the easiest and most straightforward method for setting up replication.

You can also use this method if you are setting up new servers but have an existing dump of the databases from a different server that you want to load into your replication configuration. By loading the data into a new master, the data will be automatically replicated to the slaves.

To set up replication between a new master and slave:

1. Configure the MySQL master with the necessary configuration properties. See [Section 16.1.1.2, “Setting the Replication Master Configuration”](#).
2. Start up the MySQL master.
3. Set up a user. See [Section 16.1.1.1, “Creating a User for Replication”](#).

4. Obtain the master status information. See [Section 16.1.1.4, “Obtaining the Master Replication Information”](#).
5. On the master, release the read lock:

```
mysql> UNLOCK TABLES;
```

6. On the slave, edit the MySQL configuration. See [Section 16.1.1.3, “Setting the Replication Slave Configuration”](#).
7. Start up the MySQL slave.
8. Execute the `CHANGE MASTER TO` statement to set the master replication server configuration.

Perform the slave setup steps on each slave.

Because there is no data to load or exchange on a new server configuration you do not need to copy or import any information.

If you are setting up a new replication environment using the data from a different existing database server, you will now need to run the dump file generated from that server on the new master. The database updates will automatically be propagated to the slaves:

```
shell> mysql -h master < fulldb.dump
```

16.1.1.8. Setting Up Replication with Existing Data

When setting up replication with existing data, you will need to decide how best to get the data from the master to the slave before starting the replication service.

The basic process for setting up replication with existing data is as follows:

1. If you have not already configured the `server-id` and binary logging, you will need to shut down your master to configure these options. See [Section 16.1.1.2, “Setting the Replication Master Configuration”](#).

If you have to shut down your master server, this is a good opportunity to take a snapshot of its databases. You should obtain the master status (see [Section 16.1.1.4, “Obtaining the Master Replication Information”](#)) before taking down the master, updating the configuration and taking a snapshot. For information on how to create a snapshot using raw data files, see [Section 16.1.1.6, “Creating a Data Snapshot Using Raw Data Files”](#).

2. If your server is already correctly configured, obtain the master status (see [Section 16.1.1.4, “Obtaining the Master Replication Information”](#)) and then use `mysqldump` to take a snapshot (see [Section 16.1.1.5, “Creating a Data Snapshot Using `mysqldump`”](#)) or take a raw snapshot of the live server using the guide in [Section 16.1.1.6, “Creating a Data Snapshot Using Raw Data Files”](#).
3. With the MySQL master running, create a user to be used by the slave when connecting to the master during replication. See [Section 16.1.1.1, “Creating a User for Replication”](#).
4. Update the configuration of the slave. See [Section 16.1.1.3, “Setting the Replication Slave Configuration”](#).
5. The next step depends on how you created the snapshot of data on the master.

If you used `mysqldump`:

- a. Start the slave, skipping replication by using the `--skip-slave` option.
- b. Import the dump file:

```
shell> mysql < fulldb.dump
```

If you created a snapshot using the raw data files:

- a. Extract the data files into your slave data directory. For example:

```
shell> tar xvf dbdump.tar
```

You may need to set permissions and ownership on the files to match the configuration of your slave.

- b. Start the slave, skipping replication by using the `--skip-slave` option.

- Configure the slave with the master status information. This will tell the slave the binary log file and position within the file where replication needs to start, and configure the login credentials and host name of the master. For more information on the statement required, see [Section 16.1.1.10, “Setting the Master Configuration on the Slave”](#).
- Start the slave threads:

```
mysql> START SLAVE;
```

After you have performed this procedure, the slave should connect to the master and catch up on any updates that have occurred since the snapshot was taken.

If you have forgotten to set the `server-id` option for the master, slaves cannot connect to it.

If you have forgotten to set the `server-id` option for the slave, you get the following error in the slave's error log:

```
Warning: You should set server-id to a non-0 value if master_host
is set; we will force server id to 2, but this MySQL server will
not act as a slave.
```

You also find error messages in the slave's error log if it is not able to replicate for any other reason.

Once a slave is replicating, you can find in its data directory one file named `master.info` and another named `relay-log.info`. The slave uses these two files to keep track of how much of the master's binary log it has processed. Do *not* remove or edit these files unless you know exactly what you are doing and fully understand the implications. Even in that case, it is preferred that you use the `CHANGE MASTER TO` statement to change replication parameters. The slave will use the values specified in the statement to update the status files automatically.

Note

The content of `master.info` overrides some of the server options specified on the command line or in `my.cnf`. See [Section 16.1.3, “Replication and Binary Logging Options and Variables”](#), for more details.

Once you have a snapshot of the master, you can use it to set up other slaves by following the slave portion of the procedure just described. You do not need to take another snapshot of the master; you can use the same one for each slave.

16.1.1.9. Introducing Additional Slaves to an Existing Replication Environment

If you want to add another slave to the existing replication configuration then you can do so without stopping the master. Instead, you duplicate the settings on the slaves by making a copy of one of the slaves.

To duplicate the slave:

- Shut down the existing slave:

```
shell> mysqladmin shutdown
```

- Copy the data directory from the existing slave to the new slave. You can do this by creating an archive using `tar` or `Win-Zip`, or by performing a direct copy using a tool such as `cp` or `rsync`. Ensure that you also copy the log files and relay log files.

Note

A common problem that is encountered when adding new replication slaves is that the new slave fails with a series of warning and error messages like these:

```
071118 16:44:10 [Warning] Neither --relay-log nor --relay-log-index were used; so
replication may break when this MySQL server acts as a slave and has his hostname
changed!! Please use '--relay-log=new_slave_hostname-relay-bin' to avoid this problem.
071118 16:44:10 [ERROR] FAILED TO OPEN THE RELAY LOG './OLD_SLAVE_HOSTNAME-RELAY-BIN.003525'
(RELAY_LOG_POS 22940879)
071118 16:44:10 [ERROR] COULD NOT FIND TARGET LOG DURING RELAY LOG INITIALIZATION
071118 16:44:10 [ERROR] FAILED TO INITIALIZE THE MASTER INFO STRUCTURE
```

This is due to the fact that, if the `--relay-log` option is not specified, the relay log files contain the host name as part of their file names. (This is also true of the relay log index file if the `--relay-log-index` option is not used. See [Section 16.1.3, “Replication and Binary Logging Options and Variables”](#), for more information about these options.)

To avoid this problem, use the same value for `--relay-log` on the new slave that was used on the existing slave. (If this option was not set explicitly on the existing slave, use `existing_slave_hostname-relay-bin`.) If

this is not feasible, then copy the existing slave's relay log index file to the new slave and set the `-relay-log-index` option on the new slave to match what was used on the existing slave. (If this option was not set explicitly on the existing slave, use `existing_slave_hostname-relay-bin.index`.) Alternatively — if you have already tried to start the new slave (after following the remaining steps in this section) and have encountered errors like those described previously — then perform the following steps:

- a. If you have not already done so, issue a `STOP SLAVE` on the new slave.
If you have already started the existing slave again, issue a `STOP SLAVE` on the existing slave as well.
 - b. Copy the contents of the existing slave's relay log index file into the new slave's relay log index file, making sure to overwrite any content already in the file.
 - c. Proceed with the remaining steps in this section.
3. Copy the `master.info` and `relay-log.info` files from the existing slave to the new slave. These files hold the current log positions.
 4. Start the existing slave.
 5. On the new slave, edit the configuration and give the new slave a new unique `server-id`.
 6. Start the new slave; the `master.info` file options will be used to start the replication process.

16.1.1.10. Setting the Master Configuration on the Slave

To set up the slave to communicate with the master for replication, you must tell the slave the necessary connection information. To do this, execute the following statement on the slave, replacing the option values with the actual values relevant to your system:

```
mysql> CHANGE MASTER TO
->     MASTER_HOST='master_host_name',
->     MASTER_USER='replication_user_name',
->     MASTER_PASSWORD='replication_password',
->     MASTER_LOG_FILE='recorded_log_file_name',
->     MASTER_LOG_POS=recorded_log_position;
```

Note

Replication cannot use Unix socket files. You must be able to connect to the master MySQL server using TCP/IP.

The following table shows the maximum allowable length for the string-valued options.

Option	Maximum Length
<code>MASTER_HOST</code>	60
<code>MASTER_USER</code>	16
<code>MASTER_PASSWORD</code>	32
<code>MASTER_LOG_FILE</code>	255

16.1.2. Replication Formats

Replication works because events written to the binary log are read from the master and then processed on the slave. The events are recorded within the binary log in different formats according to the type of event being recorded. The different replication formats used correspond to the binary logging format used when the events were recorded in the master's binary log. The correlation between binary logging formats and the terms used during replication are:

- Replication capabilities in MySQL originally were based on propagation of SQL statements from master to slave. This is called *statement-based replication* (often abbreviated as *SBR*), which corresponds to the standard statement-based binary logging format. In older versions of MySQL (5.1.4 and earlier), binary logging and replication used this format exclusively.
- Row-based binary logging logs changes in individual table rows. When used with MySQL replication, this is known as *row-based replication* (often abbreviated as *RBR*). In row-based replication, the master writes messages known as *events* to the binary log that indicate how individual table rows are changed.
- The binary logging format can be changed in real time according to the event being logged using *mixed-format logging*.

When the mixed format is in effect, statement-based logging is used by default, but automatically switches to row-based log-

ging in particular cases as described below. Replication using the mixed format is often referred to as *mixed-based replication* or *mixed-format replication*. For more information, see [Section 5.2.4.3, “Mixed Binary Logging Format”](#).

In MySQL 5.4, statement-based format is the default.

Note

MySQL Cluster. The default binary logging format in all MySQL Cluster NDB 6.1, 6.2, 6.3, and later 6.x releases is `ROW`. MySQL Cluster Replication always uses row-based replication, and the `NDBCLUSTER` storage engine is incompatible with statement-based replication. Using `NDBCLUSTER` sets row-based logging format automatically.

See [MySQL Cluster Replication — Assumptions and General Requirements](#), for more information.

When using `MIXED` format, the binary logging format is determined in part by the storage engine being used and the statement being executed. For more information on mixed-format logging and the rules governing the support of different logging formats, see [Section 5.2.4.3, “Mixed Binary Logging Format”](#).

The logging format in a running MySQL server is controlled by setting the `binlog_format` server system variable. This variable can be set with session or global scope. The rules governing when and how the new setting takes effect are the same as for other MySQL server system variables — setting the variable for the current session lasts only until the end of that session, and the change is not visible to other sessions; setting the variable globally requires a restart of the server in order to take effect. For more information, see [Section 12.5.4, “SET Syntax”](#).

You must have the `SUPER` privilege to set the binary logging format on the global level or for the current session.

The statement-based and row-based replication formats have different issues and limitations. For a comparison of their relative advantages and disadvantages, see [Section 16.1.2.1, “Comparison of Statement-Based and Row-Based Replication”](#).

With statement-based replication, you may encounter issues with replicating stored routines or triggers. You can avoid these issues by using row-based replication instead. For more information, see [Section 18.6, “Binary Logging of Stored Programs”](#).

If you build MySQL from source, row-based replication is available by default unless you invoke `configure` with the `--without-row-based-replication` option.

For MySQL 5.1.20 and later (and MySQL 5.0.46 for backward compatibility), the following session variables are written to the binary log and honored by the replication slave when parsing the binary log:

- `sql_mode`
- `foreign_key_checks`
- `unique_checks`
- `character_set_client`
- `collation_connection`
- `collation_database`
- `collation_server`
- `sql_auto_is_null`

Important

Even though session variables relating to character sets and collations are written to the binary log, replication between different character sets is not supported.

16.1.2.1. Comparison of Statement-Based and Row-Based Replication

Each binary logging format has advantages and disadvantages. For most users, the mixed replication format should provide the best combination of data integrity and performance. If, however, you want to take advantage of the features specific to the statement-based or row-based replication format when performing certain tasks, then you can use the information in this section, which provides a summary of their relative advantages and disadvantages, to determine which is best for your needs.

Advantages of statement-based replication:

- Proven technology that has existed in MySQL since 3.23.
- Less data written to log files. When updates or deletes affect many rows, this results in *much* less storage space required for log files. This also means that taking and restoring from backups can be accomplished more quickly.
- Log files contain all statements that made any changes, so they can be used to audit the database.
- Tables replicated using statement-based replication are not required to have explicit primary keys.

Disadvantages of statement-based replication:

- **Statements which are unsafe for SBR.** Not all statements which modify data (such as `INSERT DELETE`, `UPDATE`, and `REPLACE` statements) can be replicated using statement-based replication. Any non-deterministic behavior is difficult to replicate when using statement-based replication. Examples of such DML (Data Modification Language) statements include the following:
 - A statement that depends on a UDF or stored program that is non-deterministic, since the value returned by such a UDF or stored program or depends on factors other than the parameters supplied to it. (Row-based replication, however, simply replicates the value returned by the UDF or stored program, so its effect on table rows and data is the same on both the master and slave.) See [Section 16.3.1.7, “Replication of Invoked Features”](#), for more information.
 - `DELETE` and `UPDATE` statements that use a `LIMIT` clause without an `ORDER BY` are also non-deterministic. See [Section 16.3.1.11, “Replication and LIMIT”](#).
 - Statements using any of the following functions cannot be replicated properly using statement-based replication:
 - `LOAD_FILE()`
 - `UUID()`, `UUID_SHORT()`
 - `USER()`
 - `FOUND_ROWS()`
 - `SYSDATE()` (unless the server is started with the `--sysdate-is-now` option)

However, all other functions are replicated correctly using statement-based replication, including `RAND()`, `NOW()`, `LOAD DATA INFILE`, and so forth.

For more information, see [Section 16.3.1.10, “Replication and System Functions”](#).

When using statement-based replication, statements that cannot be replicated correctly using statement-based mode are logged with a warning like the one shown here:

```
090213 16:58:54 [Warning] Statement is not safe to log in statement format.
```

A similar warning is also issued to the client in such cases.

- `INSERT ... SELECT` requires a greater number of row-level locks than with row-based replication.
- `UPDATE` statements that require a table scan (because no index is used in the `WHERE` clause) must lock a greater number of rows than with row-based replication.
- For `InnoDB`: An `INSERT` statement that uses `AUTO_INCREMENT` blocks other non-conflicting `INSERT` statements.
- For complex statements, the statement must be evaluated and executed on the slave before the rows are updated or inserted. With row-based replication, the slave only has to run the statement to apply the differences, not the full statement.
- Stored functions execute with the same `NOW()` value as the calling statement. However, this is not true of stored procedures.
- Deterministic UDFs must be applied on the slaves.
- If there is an error in evaluation on the slave, particularly when executing complex statements, then using statement-based replication may slowly increase the margin of error across the affected rows over time. See [Section 16.3.1.20, “Slave Errors during Replication”](#).
- Tables must be (nearly) identical on master and slave. See [Section 16.3.1.4, “Replication with Differing Tables on Master and Slave”](#), for more information.

Advantages of row-based replication:

- All changes can be replicated. This is the safest form of replication.

The `mysql` database is not replicated. The `mysql` database is instead seen as a node-specific database. Row-based replication is not supported on tables in this database. Instead, statements that would normally update this information — such as `GRANT`, `REVOKE` and the manipulation of triggers, stored routines (including stored procedures), and views — are all replicated to slaves using statement-based replication.

For statements like `CREATE ... SELECT`, a `CREATE` statement is generated from the table definition and replicated using the statement-based format, while the row insertions are replicated using the row-based format.

- The technology is the same as in most other database management systems; knowledge about other systems transfers to MySQL.
- Fewer locks are needed (and thus higher concurrency) on the master for the following types of statements:
 - `INSERT ... SELECT`
 - `INSERT` statements with `AUTO_INCREMENT`
 - `UPDATE` or `DELETE` statements with `WHERE` clauses that don't use keys or don't change most of the examined rows.
- Fewer locks are required on the slave for any `INSERT`, `UPDATE`, or `DELETE` statement.

Disadvantages of row-based replication:

- RBR tends to generate more data that must be logged. This is because, when using row-based replication to replicate a DML statement (such as an `UPDATE` or `DELETE` statement), each changed row must be written to the binary log. (When using statement-based replication, only the statement is written to the binary log.) This means that, if the statement changes many rows, row-based replication may write significantly more data to the binary log; this is true even for statements that are rolled back. This also means that taking and restoring from backup can require more time. In addition, the binary log is locked for a longer time to write the data, which may cause concurrency problems.
- All tables replicated using row-based replication must have explicit primary keys.
- Deterministic UDFs that generate large `BLOB` values take longer to replicate with row-based replication than with statement-based replication. This is because, when using row-based replication, the `BLOB` column data is itself logged, rather than the statement generating the data.
- You cannot examine the logs to see what statements were executed, nor can you see on the slave what statements were received from the master and executed.

However, you can see what data was changed using `mysqlbinlog` with the options `--base64-output=DECODE-ROWS` and `--verbose`.

- When performing a bulk operation that includes non-transactional storage engines, changes are applied as the statement executes. With row-based replication logging, this means that the binary log is written while the statement is running. On the master, this does not cause problems with concurrency, because tables are locked until the bulk operation terminates. On the slave server, however, tables are not locked while the slave applies changes, because the slave does not know that those changes are part of a bulk operation.

In such cases, if you retrieve data from a table on the master (for example, using `SELECT * FROM table_name`), the server waits for the bulk operation to complete before executing the `SELECT` statement, because the table is read-locked. On the slave, the server does not wait (because there is no lock). This means that, until the bulk operation on the slave has completed, you obtain different results for the same `SELECT` query on the master and on the slave.

This behavior is expected to change in a future MySQL release; however, until it changes, you may prefer to use statement-based replication when your application requires concurrent large bulk inserts and selects.

16.1.2.2. Usage of Row-based Logging and Row-Based Replication

Using row-based logging or replication, rather than statement-based logging or replication, can result in major changes in the replication environment and in the behavior of applications. This section describes a number of issues known to exist when using row-based logging or row-based replication, and discusses some best practices for taking advantage of row-based logging (RBL) and row-based replication (RBR).

For additional information, see [Section 16.1.2.1, “Comparison of Statement-Based and Row-Based Replication”](#), and [Section 16.1.2, “Replication Formats”](#).

- **RBR and primary keys.** Currently, row-based replication may fail if any table to be replicated does not have an explicit primary key. This is a known issue which we are working to fix in a future MySQL release.

Note

It is possible to replicate `NDBCLUSTER` tables without explicit primary keys. However, in the event that a MySQL Cluster data node fails, MySQL Cluster Replication can also fail for tables without explicit primary keys. For this reason, it is highly recommended that all `NDBCLUSTER` tables being replicated have explicit primary keys. For more information, see [Known Issues in MySQL Cluster Replication](#).

- **RBL, RBR, and temporary tables.** As noted elsewhere in this chapter (see [Section 16.3.1.22, “Replication and Temporary Tables”](#)), temporary tables are not replicated when using the row-based format. However, you can use the mixed format; when mixed format is in effect, “safe” statements involving temporary tables are logged using the statement-based format. For more information, see [Section 16.1.2.1, “Comparison of Statement-Based and Row-Based Replication”](#).

Note

There is actually no need to replicate temporary tables when using RBR. In addition, since temporary tables can be read only from the thread which created them, there is seldom if ever any benefit obtained from replicating them, even when using statement-based mode.

- **RBL and synchronization of non-transactional tables.** When using row-based replication of a `MyISAM` or other non-transactional table, changed rows are written to the transaction cache. Often, when many rows are affected, the set of changes are split into several events; when the statement commits, all of these events are written to the binary log. When executing on the slave, a table lock is taken on all tables involved, then the rows are applied in batch mode. (This may or may not be effective, depending on the engine used for the slave’s copy of the table).
- **Latency and binary log size.** Because RBL writes changes for each row to the binary log, the size of the binary log can grow quite rapidly. When used in a replication environment, this can significantly increase the time required for making the changes on the slave that match those on the master. You should be aware of the potential for this delay in your applications.
- **Reading the binary log.** With the `--base64-output=DECODE-ROWS` and `--verbose` options, `mysqlbinlog` is able to format the contents of the binary log in a manner that is easily human-readable, in case you want to read or recover from a replication or database failure using the contents of the binary log. For more information, see [Section 4.6.7.2, “mysqlbinlog Row Event Display”](#).
- **Binary log execution errors and `slave_exec_mode`.** If you use `slave_exec_mode=IDEMPOTENT`, a failure to apply changes from RBL because the original row cannot be found does not trigger an error, and does not cause replication to fail. This means that it is possible that updates are not applied on the slave, so that the master and slave are no longer synchronized. Latency issues and use of non-transactional tables when using `slave_exec_mode=IDEMPOTENT` and RBR can cause the master and slave to diverge even further. For more information about `slave_exec_mode`, see [Section 5.1.3, “Server System Variables”](#).

Note

`slave_exec_mode=IDEMPOTENT` is generally useful only for circular replication or multi-master replication with MySQL Cluster (see [MySQL Cluster Replication](#)). For other scenarios, the default value (`slave_exec_mode=STRICT`) is normally sufficient.

- **Lack of binary log checksums.** No checksums are used for RBL. This means that network, disk, and other errors may not be identified when processing the binary log. To ensure that data is transmitted without network corruption, you may want to consider using SSL, which adds another layer of checksumming, for replication connections. See [Section 5.5.7, “Using SSL for Secure Connections”](#), for more information about setting up MySQL with SSL.
- **Filtering based on server ID not supported.** A common practice is to filter out changes on some slaves by using a `WHERE` clause that includes the relation `@server_id <> server-id` clause with `UPDATE` and `DELETE` statements, a simple example of such a clause being `WHERE @server_id <> 1`. However, this does not work correctly with row-based logging. If you must use the `server_id` system variable for statement filtering, then you must also use `--binlog_format=STATEMENT`.
- **Database-level replication options.** The effects of the options `--replicate-do-db`, `--replicate-ignore-db`, and `--replicate-rewrite-db` differ considerably depending on whether row-based or statement-based logging is in use. Because of this, we recommend that you avoid the database-level options and use the table-level options such as `--replicate-do-table` and `--replicate-ignore-table` instead. For more information about these options and the impact that your choice of replication format has on how they operate, see [Section 16.1.3, “Replication and Binary Logging Options and Variables”](#).

16.1.3. Replication and Binary Logging Options and Variables

The next few sections contain information about `mysql` options and server variables that are used in replication and for controlling the binary log. Options and variables for use on replication masters and replication slaves are covered separately, as are options and variables relating to binary logging. A set of quick-reference tables providing basic information about these options and variables is also included (in the next section following this one).

Of particular importance is the `--server-id` option.

Command Line Format	<code>--server-id=#</code>	
Config File Format	<code>server-id</code>	
Option Sets Variable	Yes, <code>server_id</code>	
Variable Name	<code>server_id</code>	
Variable Scope	Global	
Dynamic Variable	Yes	
Value Set	Type	numeric
	Default	0
	Range	0-4294967295

This option is common to both master and slave replication servers, and is used in replication to enable master and slave servers to identify themselves uniquely. For additional information, see [Section 16.1.3.2, “Replication Master Options and Variables”](#), and [Section 16.1.3.3, “Replication Slave Options and Variables”](#).

On the master and each slave, you *must* use the `--server-id` option to establish a unique replication ID in the range from 1 to $2^{32} - 1$; by “unique”, we mean that each ID must be different from every other ID in use by any other replication master or slave. Example: `server-id=3`.

If you omit `--server-id`, it assumes the default value 0, in which case a master refuses connections from all slaves, and a slave refuses to connect to a master. See [Section 16.1.1.3, “Setting the Replication Slave Configuration”](#), for more information.

16.1.3.1. Replication and Binary Logging Option and Variable Reference

The following tables list basic information about the MySQL command-line options and system variables applicable to replication and the binary log.

Table 16.1. `mysql` Replication Option/Variable Summary

Name	Cmd-Line	Option file	System Var	Status Var	Var Scope	Dynamic
<code>abort-slave-event-count</code>	Yes	Yes				
<code>Com_change_master</code>				Yes	Both	No
<code>Com_show_master_status</code>				Yes	Both	No
<code>Com_show_new_master</code>				Yes	Both	No
<code>Com_show_slave_hosts</code>				Yes	Both	No
<code>Com_show_slave_status</code>				Yes	Both	No
<code>Com_slave_start</code>				Yes	Both	No
<code>Com_slave_stop</code>				Yes	Both	No
<code>disconnect-slave-event-count</code>	Yes	Yes				
<code>init_slave</code>	Yes	Yes	Yes		Global	Yes
<code>log-slave-updates</code>	Yes	Yes			Global	No
- Variable: <code>log_slave_updates</code>			Yes		Global	No
<code>master-bind</code>	Yes	Yes	Yes			No
<code>master-info-file</code>	Yes	Yes				
<code>master-retry-count</code>	Yes	Yes				
<code>relay-log</code>	Yes	Yes				
<code>relay-log-index</code>	Yes	Yes				

Name	Cmd-Line	Option file	System Var	Status Var	Var Scope	Dynamic
- Variable: relay_log_index						
relay_log_purge	Yes	Yes	Yes		Global	Yes
replicate-do-db	Yes	Yes				
replicate-do-table	Yes	Yes				
replicate-ignore-db	Yes	Yes				
replicate-ignore-table	Yes	Yes				
replicate-rewrite-db	Yes	Yes				
replicate-same-server-id	Yes	Yes				
replicate-wild-do-table	Yes	Yes				
replicate-wild-ignore-table	Yes	Yes				
report-host	Yes	Yes			Global	No
- Variable: report_host			Yes		Global	No
report-password	Yes	Yes			Global	No
- Variable: report_password			Yes		Global	No
report-port	Yes	Yes			Global	No
- Variable: report_port			Yes		Global	No
report-user	Yes	Yes			Global	No
- Variable: report_user			Yes		Global	No
rpl_recovery_rank			Yes		Global	Yes
Rpl_status				Yes	Global	No
show-slave-auth-info	Yes	Yes				
skip-slave-start	Yes	Yes				
slave_compressed_protocol	Yes	Yes	Yes		Global	Yes
slave_exec_mode			Yes		Global	Yes
Slave_heartbeat_period				Yes	Global	No
slave-load-tmpdir	Yes	Yes			Global	No
- Variable: slave_load_tmpdir			Yes		Global	No
slave-net-timeout	Yes	Yes			Global	Yes
- Variable: slave_net_timeout			Yes		Global	Yes
Slave_open_temp_tables				Yes	Global	No
Slave_received_heartbeats				Yes	Global	No
Slave_retried_transactions				Yes	Global	No
Slave_running				Yes	Global	No
slave-skip-errors	Yes	Yes			Global	No
- Variable: slave_skip_errors			Yes		Global	No
slave_transaction_retries	Yes	Yes	Yes		Global	Yes
sql_slave_skip_counter			Yes		Global	Yes

Section 16.1.3.2, “Replication Master Options and Variables”, provides more detailed information about options and variables relating to replication master servers. For more information about options and variables relating to replication slaves see Section 16.1.3.3, “Replication Slave Options and Variables”.

Table 16.2. `mysqld` Binary Logging Option/Variable Summary

Name	Cmd-Line	Option file	System Var	Status Var	Var Scope	Dynamic
Binlog_cache_disk_use				Yes	Global	No
binlog_cache_size	Yes	Yes	Yes		Global	Yes
Binlog_cache_use				Yes	Global	No

Name	Cmd-Line	Option file	System Var	Status Var	Var Scope	Dynamic
binlog-do-db	Yes	Yes				
binlog-format	Yes	Yes			Both	Yes
- Variable: <code>binlog_format</code>			Yes		Both	Yes
binlog-ignore-db	Yes	Yes				
binlog-row-event-max-size	Yes	Yes				
Com_show_binlog_events				Yes	Both	No
Com_show_binlogs				Yes	Both	No
max_binlog_cache_size	Yes	Yes	Yes		Global	Yes
max-binlog-dump-events	Yes	Yes				
max_binlog_size	Yes	Yes	Yes		Global	Yes
sporadic-binlog-dump-fail	Yes	Yes				

Section 16.1.3.4, “Binary Log Options and Variables”, provides more detailed information about options and variables relating to binary logging. For additional general information about the binary log, see Section 5.2.4, “The Binary Log”.

For a table showing *all* command-line options, system and status variables used with `mysqld`, see Section 5.1.1, “Server Option and Variable Reference”.

16.1.3.2. Replication Master Options and Variables

This section describes the server options and system variables that you can use on replication master servers. You can specify the options either on the [command line](#) or in an [option file](#). You can specify system variable values using [SET](#).

On the master and each slave, you must use the `server-id` option to establish a unique replication ID. For each server, you should pick a unique positive integer in the range from 1 to $2^{32} - 1$, and each ID must be different from every other ID in use by any other replication master or slave. Example: `server-id=3`.

For options used on the master for controlling binary logging, see Section 16.1.3.4, “Binary Log Options and Variables”.

- `auto_increment_increment`

Command Line Format	<code>--auto_increment_increment[=#]</code>	
Config File Format	<code>auto_increment_increment</code>	
Option Sets Variable	Yes, <code>auto_increment_increment</code>	
Variable Name	<code>auto_increment_increment</code>	
Variable Scope	Both	
Dynamic Variable	Yes	
Value Set	Type	<code>numeric</code>
	Default	<code>1</code>
	Range	<code>1-65535</code>

`auto_increment_increment` and `auto_increment_offset` are intended for use with master-to-master replication, and can be used to control the operation of `AUTO_INCREMENT` columns. Both variables have global and session values, and each can assume an integer value between 1 and 65,535 inclusive. Setting the value of either of these two variables to 0 causes its value to be set to 1 instead. Attempting to set the value of either of these two variables to an integer greater than 65,535 or less than 0 causes its value to be set to 65,535 instead. Attempting to set the value of `auto_increment_increment` or `auto_increment_offset` to a non-integer value gives rise to an error, and the actual value of the variable remains unchanged.

Note

`auto_increment_increment` is supported for use with `NDB` tables beginning with MySQL 5.1.20, MySQL Cluster NDB 6.2.5, and MySQL Cluster NDB 6.3.2. Previously, setting it when using MySQL Cluster tables or MySQL Cluster Replication produced unpredictable results.

These two variables affect `AUTO_INCREMENT` column behavior as follows:

- `auto_increment_increment` controls the interval between successive column values. For example:

```
mysql> SHOW VARIABLES LIKE 'auto_inc%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| auto_increment_increment | 1 |
| auto_increment_offset | 1 |
+-----+-----+
2 rows in set (0.00 sec)

mysql> CREATE TABLE autoinc1
-> (col INT NOT NULL AUTO_INCREMENT PRIMARY KEY);
Query OK, 0 rows affected (0.04 sec)

mysql> SET @@auto_increment_increment=10;
Query OK, 0 rows affected (0.00 sec)

mysql> SHOW VARIABLES LIKE 'auto_inc%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| auto_increment_increment | 10 |
| auto_increment_offset | 1 |
+-----+-----+
2 rows in set (0.01 sec)

mysql> INSERT INTO autoinc1 VALUES (NULL), (NULL), (NULL), (NULL);
Query OK, 4 rows affected (0.00 sec)
Records: 4 Duplicates: 0 Warnings: 0

mysql> SELECT col FROM autoinc1;
+-----+
| col |
+-----+
| 1 |
| 11 |
| 21 |
| 31 |
+-----+
4 rows in set (0.00 sec)
```

(Note how `SHOW VARIABLES` is used here to obtain the current values for these variables.)

- `auto_increment_offset` determines the starting point for the `AUTO_INCREMENT` column value. Consider the following, assuming that these statements are executed during the same session as the example given in the description for `auto_increment_increment`:

```
mysql> SET @@auto_increment_offset=5;
Query OK, 0 rows affected (0.00 sec)

mysql> SHOW VARIABLES LIKE 'auto_inc%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| auto_increment_increment | 10 |
| auto_increment_offset | 5 |
+-----+-----+
2 rows in set (0.00 sec)

mysql> CREATE TABLE autoinc2
-> (col INT NOT NULL AUTO_INCREMENT PRIMARY KEY);
Query OK, 0 rows affected (0.06 sec)

mysql> INSERT INTO autoinc2 VALUES (NULL), (NULL), (NULL), (NULL);
Query OK, 4 rows affected (0.00 sec)
Records: 4 Duplicates: 0 Warnings: 0

mysql> SELECT col FROM autoinc2;
+-----+
| col |
+-----+
| 5 |
| 15 |
| 25 |
| 35 |
+-----+
4 rows in set (0.02 sec)
```

If the value of `auto_increment_offset` is greater than that of `auto_increment_increment`, the value of `auto_increment_offset` is ignored.

Should one or both of these variables be changed and then new rows inserted into a table containing an `AUTO_INCREMENT` column, the results may seem counterintuitive because the series of `AUTO_INCREMENT` values is calculated without regard to any values already present in the column, and the next value inserted is the least value in the series that is greater than the maximum existing value in the `AUTO_INCREMENT` column. In other words, the series is calculated like so:

$\text{auto_increment_offset} + N \times \text{auto_increment_increment}$

where N is a positive integer value in the series [1, 2, 3, ...]. For example:

```
mysql> SHOW VARIABLES LIKE 'auto_inc%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| auto_increment_increment | 10 |
| auto_increment_offset | 5 |
+-----+-----+
2 rows in set (0.00 sec)

mysql> SELECT col FROM autoinc1;
+----+
| col |
+----+
| 1 |
| 11 |
| 21 |
| 31 |
+----+
4 rows in set (0.00 sec)

mysql> INSERT INTO autoinc1 VALUES (NULL), (NULL), (NULL), (NULL);
Query OK, 4 rows affected (0.00 sec)
Records: 4 Duplicates: 0 Warnings: 0

mysql> SELECT col FROM autoinc1;
+----+
| col |
+----+
| 1 |
| 11 |
| 21 |
| 31 |
| 35 |
| 45 |
| 55 |
| 65 |
+----+
8 rows in set (0.00 sec)
```

The values shown for `auto_increment_increment` and `auto_increment_offset` generate the series $5 + N \times 10$, that is, [5, 15, 25, 35, 45, ...]. The greatest value present in the `col` column prior to the `INSERT` is 31, and the next available value in the `AUTO_INCREMENT` series is 35, so the inserted values for `col` begin at that point and the results are as shown for the `SELECT` query.

It is not possible to confine the effects of these two variables to a single table, and thus they do not take the place of the sequences offered by some other database management systems; these variables control the behavior of all `AUTO_INCREMENT` columns in *all* tables on the MySQL server. If the global value of either variable is set, its effects persist until the global value is changed or overridden by setting the session value, or until `mysqld` is restarted. If the local value is set, the new value affects `AUTO_INCREMENT` columns for all tables into which new rows are inserted by the current user for the duration of the session, unless the values are changed during that session.

The default value of `auto_increment_increment` is 1. See [Section 16.3.1.1, “Replication and AUTO_INCREMENT”](#).

- `auto_increment_offset`

Command Line Format	<code>--auto_increment_offset[=#]</code>	
Config File Format	<code>auto_increment_offset</code>	
Option Sets Variable	Yes, <code>auto_increment_offset</code>	
Variable Name	<code>auto_increment_offset</code>	
Variable Scope	Both	
Dynamic Variable	Yes	
Value Set	Type	numeric
	Default	1
	Range	1-65535

This variable has a default value of 1. For particulars, see the description for `auto_increment_increment`.

Note

`auto_increment_offset` is supported for use with `NDB` tables beginning with MySQL 5.1.20, MySQL Cluster

NDB 6.2.5, and MySQL Cluster NDB 6.3.2. Previously, setting it when using MySQL Cluster tables or MySQL Cluster Replication produced unpredictable results.

16.1.3.3. Replication Slave Options and Variables

This section describes the server options and system variables that you can use on slave replication servers. You can specify the options either on the [command line](#) or in an [option file](#). Many of the options can be reset while the server is running by using the `CHANGE MASTER TO` statement. You can specify system variable values using `SET`.

Server ID. On the master and each slave, you must use the `server-id` option to establish a unique replication ID. For each server, you should pick a unique positive integer in the range from 1 to $2^{32} - 1$, and each ID must be different from every other ID. Example: `server-id=3`.

Important

Certain options are handled in a special way in order to ensure that the active replication configuration is not inadvertently altered or affected:

These options are deprecated. As of MySQL 6.0, they have been removed. They have no effect when `mysqld` is started and an appropriate warning is written to the error log. To set the replication parameters associated with these you must use the `CHANGE MASTER TO ...` statement (see [Section 12.6.2.1, “CHANGE MASTER TO Syntax”](#)).

The options affected are shown in this list:

- `--master-host`
- `--master-user`
- `--master-password`
- `--master-port`
- `--master-connect-retry`
- `--master-ssl`
- `--master-ssl-ca`
- `--master-ssl-capath`
- `--master-ssl-cert`
- `--master-ssl-cipher`
- `--master-ssl-key`

The `master.info` file format in MySQL 5.4 includes values corresponding to the SSL options. In addition, the file format includes as its first line the number of lines in the file. (See [Section 16.4.2, “Replication Relay and Status Files”](#).) If you upgrade an older server (before MySQL 4.1.1) to a newer version, the new server upgrades the `master.info` file to the new format automatically when it starts. However, if you downgrade a newer server to an older version, you should remove the first line manually before starting the older server for the first time.

If no `master.info` file exists when the slave server starts, it uses the values for those options that are specified in option files or on the command line. This occurs when you start the server as a replication slave for the very first time, or when you have run `RESET SLAVE` and then have shut down and restarted the slave.

If the `master.info` file exists when the slave server starts, the server uses its contents and ignores any options that correspond to the values listed in the file. Thus, if you start the slave server with different values of the startup options that correspond to values in the `master.info` file, the different values have no effect, because the server continues to use the `master.info` file. To use different values, you must either restart after removing the `master.info` file or (preferably) use the `CHANGE MASTER TO` statement to reset the values while the slave is running.

Suppose that you specify this option in your `my.cnf` file:

```
[mysqld]
master-host=some_host
```

The first time you start the server as a replication slave, it reads and uses that option from the `my.cnf` file. The server then records

the value in the `master.info` file. The next time you start the server, it reads the master host value from the `master.info` file only and ignores the value in the option file. If you modify the `my.cnf` file to specify a different master host of `some_other_host`, the change still has no effect. You should use `CHANGE MASTER TO` instead.

This example shows a more extensive use of startup options to configure a slave server:

```
[mysqld]
server-id=2
master-host=db-master.mycompany.com
master-port=3306
master-user=pertinax
master-password=freitag
master-connect-retry=60
report-host=db-slave.mycompany.com
```

Note

Because the server gives an existing `master.info` file precedence over the startup options just described, you might prefer not to use startup options for these values at all, and instead to specify them by using the `CHANGE MASTER TO` statement. See [Section 12.6.2.1, “CHANGE MASTER TO Syntax”](#).

Startup options for replication slaves. The following list describes startup options for controlling replication slaves. Many of these options can be reset while the server is running by using the `CHANGE MASTER TO` statement. Others, such as the `-replicate-*` options, can be set only when the slave server starts. Replication-related system variables are discussed later in this section.

- `--log-slave-updates`

Normally, a slave does not log to its own binary log any updates that are received from a master server. This option tells the slave to log the updates performed by its SQL thread to its own binary log. For this option to have any effect, the slave must also be started with the `--log-bin` option to enable binary logging. `--log-slave-updates` is used when you want to chain replication servers. For example, you might want to set up replication servers using this arrangement:

```
A -> B -> C
```

Here, `A` serves as the master for the slave `B`, and `B` serves as the master for the slave `C`. For this to work, `B` must be both a master *and* a slave. You must start both `A` and `B` with `--log-bin` to enable binary logging, and `B` with the `--log-slave-updates` option so that updates received from `A` are logged by `B` to its binary log.

When using MySQL Cluster Replication prior to MySQL Cluster NDB 6.2.16 and MySQL Cluster NDB 6.3.13, records for “empty” epochs — that is, epochs in which no changes to `NDBCLUSTER` data or tables took place — were inserted into the `ndb_apply_status` and `ndb_binlog_index` tables on the slave even when `--log-slave-updates` was disabled ([Bug#37472](#)). Beginning with MySQL Cluster NDB 6.3.21 and MySQL Cluster NDB 6.4.1, it is possible to re-enable the older behavior by using the `--ndb-log-empty-epochs` option.

- `--log-slow-slave-statements`

Command Line Format	<code>--log-slow-slave-statements</code>	
Config File Format	<code>log-slow-slave-statements</code>	
Value Set	Type	boolean
	Default	off

When the slow query log is enabled, this option enables logging for queries that have taken more than `long_query_time` seconds to execute on the slave.

- `--log-warnings[=level]`

This option causes a server to print more messages to the error log about what it is doing. With respect to replication, the server generates warnings that it succeeded in reconnecting after a network/connection failure, and informs you as to how each slave thread started. This option is enabled by default; to disable it, use `--skip-log-warnings`. Aborted connections are not logged to the error log unless the value is greater than 1.

Note that the effects of this option are not limited to replication. It produces warnings across a spectrum of server activities.

- `--master-connect-retry=seconds`

The number of seconds that the slave thread sleeps before trying to reconnect to the master in case the master goes down or the connection is lost. The value in the `master.info` file takes precedence if it can be read. If not set, the default is 60. Connec-

tion retries are not invoked until the slave times out reading data from the master according to the value of `--slave-net-timeout`. The number of reconnection attempts is limited by the `--master-retry-count` option.

This option is deprecated, and removed as of MySQL 6.0.

- `--master-host=host_name`

The host name or IP number of the master replication server. The value in `master.info` takes precedence if it can be read. If no master host is specified, the slave thread does not start.

This option is deprecated, and removed as of MySQL 6.0.

- `--master-info-file=file_name`

The name to use for the file in which the slave records information about the master. The default name is `master.info` in the data directory.

- `--master-password=password`

The password of the account that the slave thread uses for authentication when it connects to the master. The value in the `master.info` file takes precedence if it can be read. If not set, an empty password is assumed.

This option is deprecated, and removed as of MySQL 6.0.

- `--master-port=port_number`

The TCP/IP port number that the master is listening on. The value in the `master.info` file takes precedence if it can be read. If not set, the compiled-in setting is assumed (normally 3306).

This option is deprecated, and removed as of MySQL 6.0.

- `--master-retry-count=count`

The number of times that the slave tries to connect to the master before giving up. Reconnects are attempted at intervals set by `--master-connect-retry` and reconnects are triggered when data reads by the slave time out according to the `--slave-net-timeout` option. The default value is 86400.

You can also set the retry count by using the `MASTER_CONNECT_RETRY` option for the `CHANGE MASTER TO` statement.

- `--master-ssl, --master-ssl-ca=file_name, --master-ssl-capath=directory_name, --master-ssl-cert=file_name, --master-ssl-cipher=cipher_list, --master-ssl-key=file_name`

These options are used for setting up a secure replication connection to the master server using SSL. Their meanings are the same as the corresponding `--ssl, --ssl-ca, --ssl-capath, --ssl-cert, --ssl-cipher, --ssl-key` options that are described in [Section 5.5.7.3, “SSL Command Options”](#). The values in the `master.info` file take precedence if they can be read.

These options are deprecated, and removed as of MySQL 6.0.

- `--master-user=user_name`

The user name of the account that the slave thread uses for authentication when it connects to the master. This account must have the `REPLICATION SLAVE` privilege. The value in the `master.info` file takes precedence if it can be read. If the master user name is not set, the name `test` is assumed.

This option is deprecated, and removed as of MySQL 6.0.

- `--max-relay-log-size=size`

The size at which the server rotates relay log files automatically. For more information, see [Section 16.4.2, “Replication Relay and Status Files”](#). The default size is 1GB.

- `--read-only`

Cause the slave to allow no updates except from slave threads or from users having the `SUPER` privilege. On a slave server, this can be useful to ensure that the slave accepts updates only from its master server and not from clients. This variable does not apply to `TEMPORARY` tables.

- `--relay-log=file_name`

The basename for the relay log. The default basename is `host_name-relay-bin`. The server creates relay log files in se-

quence by adding a numeric suffix to the basename.

Due to the manner in which MySQL parses server options, if you specify this option, you must supply a value; *the default base-name is used only if the option is not actually specified*. If you use the `--relay-log` option without specifying a value, unexpected behavior is likely to result; this behavior depends on the other options used, the order in which they are specified, and whether they are specified on the command line or in an option file. For more information about how MySQL handles server options, see [Section 4.2.3, “Specifying Program Options”](#).

If you specify this option, the value specified is also used as the basename for the relay log index file. You can override this behavior by specifying a different relay log index file basename using the `--relay-log-index` option.

You may find the `--relay-log` option useful in performing the following tasks:

- Creating relay logs whose names are independent of host names.
- If you need to put the relay logs in some area other than the data directory, because your relay logs tend to be very large and you do not want to decrease `max_relay_log_size`.
- To increase speed by using load-balancing between disks.
- `--relay-log-index=file_name`

The name to use for the relay log index file. The default name is `host_name-relay-bin.index` in the data directory, where `host_name` is the name of the slave server.

Due to the manner in which MySQL parses server options, if you specify this option, you must supply a value; *the default base-name is used only if the option is not actually specified*. If you use the `--relay-log-index` option without specifying a value, unexpected behavior is likely to result; this behavior depends on the other options used, the order in which they are specified, and whether they are specified on the command line or in an option file. For more information about how MySQL handles server options, see [Section 4.2.3, “Specifying Program Options”](#).

If you specify this option, the value specified is also used as the basename for the relay logs. You can override this behavior by specifying a different relay log file basename using the `--relay-log` option.

- `--relay-log-info-file=file_name`

The name to use for the file in which the slave records information about the relay logs. The default name is `relay-log.info` in the data directory.

- `--relay-log-purge={0|1}`

Disable or enable automatic purging of relay logs as soon as they are no longer needed. The default value is 1 (enabled). This is a global variable that can be changed dynamically with `SET GLOBAL relay_log_purge = N`.

- `--relay-log-space-limit=size`

This option places an upper limit on the total size in bytes of all relay logs on the slave. A value of 0 means “no limit.” This is useful for a slave server host that has limited disk space. When the limit is reached, the I/O thread stops reading binary log events from the master server until the SQL thread has caught up and deleted some unused relay logs. Note that this limit is not absolute: There are cases where the SQL thread needs more events before it can delete relay logs. In that case, the I/O thread exceeds the limit until it becomes possible for the SQL thread to delete some relay logs, because not doing so would cause a deadlock. You should not set `--relay-log-space-limit` to less than twice the value of `--max-relay-log-size` (or `--max-binlog-size` if `--max-relay-log-size` is 0). In that case, there is a chance that the I/O thread waits for free space because `--relay-log-space-limit` is exceeded, but the SQL thread has no relay log to purge and is unable to satisfy the I/O thread. This forces the I/O thread to ignore `--relay-log-space-limit` temporarily.

- `--replicate-do-db=db_name`

The effects of this option depend on whether statement-based or row-based replication is in use.

Statement-based replication. Tell the slave to restrict replication to statements where the default database (that is, the one selected by `USE`) is `db_name`. To specify more than one database, use this option multiple times, once for each database; however, doing so does *not* replicate cross-database statements such as `UPDATE some_db.some_table SET foo='bar'` while a different database (or no database) is selected.

Warning

To specify multiple databases you *must* use multiple instances of this option. Because database names can contain commas, if you supply a comma separated list then the list will be treated as the name of a single database.

An example of what does not work as you might expect when using statement-based replication: If the slave is started with –

`--replicate-do-db=sales` and you issue the following statements on the master, the `UPDATE` statement is *not* replicated:

```
USE prices;
UPDATE sales.january SET amount=amount+1000;
```

The main reason for this “check just the default database” behavior is that it is difficult from the statement alone to know whether it should be replicated (for example, if you are using multiple-table `DELETE` statements or multiple-table `UPDATE` statements that act across multiple databases). It is also faster to check only the default database rather than all databases if there is no need.

Row-based replication. Tells the slave to restrict replication to database `db_name`. Only tables belonging to `db_name` are changed; the current database has no effect on this. For example, suppose that the slave is started with `--replicate-do-db=sales` and row-based replication is in effect, and then the following statements are run on the master:

```
USE prices;
UPDATE sales.february SET amount=amount+100;
```

The `february` table in the `sales` database on the slave is changed in accordance with the `UPDATE` statement; this occurs whether or not the `USE` statement was issued. However, issuing the following statements on the master has no effect on the slave when using row-based replication and `--replicate-do-db=sales`:

```
USE prices;
UPDATE prices.march SET amount=amount-25;
```

Even if the statement `USE prices` were changed to `USE sales`, the `UPDATE` statement's effects would still not be replicated.

Another important difference in how `--replicate-do-db` is handled in statement-based replication as opposed to row-based replication occurs with regard to statements that refer to multiple databases. Suppose the slave is started with `--replicate-do-db=db1`, and the following statements are executed on the master:

```
USE db1;
UPDATE db1.table1 SET col1 = 10, db2.table2 SET col2 = 20;
```

If you are using statement-based replication, then both tables are updated on the slave. However, when using row-based replication, only `table1` is affected on the slave; since `table2` is in a different database, `table2` on the slave is not changed by the `UPDATE`. Now suppose that, instead of the `USE db1` statement, a `USE db4` statement had been used:

```
USE db4;
UPDATE db1.table1 SET col1 = 10, db2.table2 SET col2 = 20;
```

In this case, the `UPDATE` statement would have no effect on the slave when using statement-based replication. However, if you are using row-based replication, the `UPDATE` would change `table1` on the slave, but not `table2` — in other words, only tables in the database named by `--replicate-do-db` are changed, and the choice of current database has no effect on this behavior.

If you need cross-database updates to work, use `--replicate-wild-do-table=db_name.%` instead. See [Section 16.4.3, “How Servers Evaluate Replication Rules”](#).

Note

This option effects replication in the same manner that `--binlog-do-db` affects binary logging, and the affects of the replication format on how `--replicate-do-db` affects replication behavior are the same as those of the logging format on the behavior of `--binlog-do-db`.

- `--replicate-ignore-db=db_name`

As with `--replicate-do-db`, the effects of this option depend on whether statement-based or row-based replication is in use.

Statement-based replication. Tells the slave to not replicate any statement where the default database (that is, the one selected by `USE`) is `db_name`.

Row-based replication. Tells the slave not to update any tables in the database `db_name`. The current database has no effect.

When using statement-based replication, the following example does not work as you might expect. Suppose that the slave is started with `--replicate-ignore-db=sales` and you issue the following statements on the master:

```
USE prices;
UPDATE sales.january SET amount=amount+1000;
```

The `UPDATE` statement *is* replicated in such a case because `--replicate-ignore-db` applies only to the default database (determined by the `USE` statement). Because the `sales` database was specified explicitly in the statement, the statement has not been filtered. However, when using row-based replication, the `UPDATE` statement's effects are *not* propagated to the slave, and the slave's copy of the `sales.january` table is unchanged; in this instance, `--replicate-ignore-db=sales`

causes *all* changes made to tables in the master's copy of the `sales` database to be ignored by the slave.

To specify more than one database to ignore, use this option multiple times, once for each database. Because database names can contain commas, if you supply a comma separated list then the list will be treated as the name of a single database.

You should not use this option if you are using cross-database updates and you do not want these updates to be replicated. See [Section 16.4.3, “How Servers Evaluate Replication Rules”](#).

If you need cross-database updates to work, use `--replicate-wild-ignore-table=db_name.%` instead. See [Section 16.4.3, “How Servers Evaluate Replication Rules”](#).

Note

This option effects replication in the same manner that `--binlog-ignore-db` affects binary logging, and the affects of the replication format on how `--replicate-ignore-db` affects replication behavior are the same as those of the logging format on the behavior of `--binlog-ignore-db`.

- `--replicate-do-table=db_name.tbl_name`

Tells the slave thread to restrict replication to the specified table. To specify more than one table, use this option multiple times, once for each table. This works for cross-database updates, in contrast to `--replicate-do-db`. See [Section 16.4.3, “How Servers Evaluate Replication Rules”](#).

- `--replicate-ignore-table=db_name.tbl_name`

Tells the slave thread to not replicate any statement that updates the specified table, even if any other tables might be updated by the same statement. To specify more than one table to ignore, use this option multiple times, once for each table. This works for cross-database updates, in contrast to `--replicate-ignore-db`. See [Section 16.4.3, “How Servers Evaluate Replication Rules”](#).

- `--replicate-rewrite-db=from_name->to_name`

Tells the slave to translate the default database (that is, the one selected by `USE`) to `to_name` if it was `from_name` on the master. Only statements involving tables are affected (not statements such as `CREATE DATABASE`, `DROP DATABASE`, and `ALTER DATABASE`), and only if `from_name` is the default database on the master. This does not work for cross-database updates. To specify multiple rewrites, use this option multiple times. The server uses the first one with a `from_name` value that matches. The database name translation is done *before* the `--replicate-*` rules are tested.

If you use this option on the command line and the “>” character is special to your command interpreter, quote the option value. For example:

```
shell> mysqld --replicate-rewrite-db="olddb->newdb"
```

- `--replicate-same-server-id`

To be used on slave servers. Usually you should use the default setting of 0, to prevent infinite loops caused by circular replication. If set to 1, the slave does not skip events having its own server ID. Normally, this is useful only in rare configurations. Cannot be set to 1 if `--log-slave-updates` is used. By default, the slave I/O thread does not write binary log events to the relay log if they have the slave's server ID (this optimization helps save disk usage). If you want to use `--replicate-same-server-id`, be sure to start the slave with this option before you make the slave read its own events that you want the slave SQL thread to execute.

- `--replicate-wild-do-table=db_name.tbl_name`

Tells the slave thread to restrict replication to statements where any of the updated tables match the specified database and table name patterns. Patterns can contain the “%” and “_” wildcard characters, which have the same meaning as for the `LIKE` pattern-matching operator. To specify more than one table, use this option multiple times, once for each table. This works for cross-database updates. See [Section 16.4.3, “How Servers Evaluate Replication Rules”](#).

Example: `--replicate-wild-do-table=foo%.bar%` replicates only updates that use a table where the database name starts with `foo` and the table name starts with `bar`.

If the table name pattern is %, it matches any table name and the option also applies to database-level statements (`CREATE DATABASE`, `DROP DATABASE`, and `ALTER DATABASE`). For example, if you use `--replicate-wild-do-table=foo%.%`, database-level statements are replicated if the database name matches the pattern `foo%`.

To include literal wildcard characters in the database or table name patterns, escape them with a backslash. For example, to replicate all tables of a database that is named `my_own%db`, but not replicate tables from the `my1ownAABCdb` database, you should escape the “_” and “%” characters like this: `--replicate-wild-do-table=my_own\%db`. If you're using the

option on the command line, you might need to double the backslashes or quote the option value, depending on your command interpreter. For example, with the `bash` shell, you would need to type `--replicate-wild-do-table=my_own\\%db`.

- `--replicate-wild-ignore-table=db_name.tbl_name`

Tells the slave thread not to replicate a statement where any table matches the given wildcard pattern. To specify more than one table to ignore, use this option multiple times, once for each table. This works for cross-database updates. See [Section 16.4.3, “How Servers Evaluate Replication Rules”](#).

Example: `--replicate-wild-ignore-table=foo%.bar%` does not replicate updates that use a table where the database name starts with `foo` and the table name starts with `bar`.

For information about how matching works, see the description of the `--replicate-wild-do-table` option. The rules for including literal wildcard characters in the option value are the same as for `--replicate-wild-ignore-table` as well.

- `--report-host=host_name`

The host name or IP number of the slave to be reported to the master during slave registration. This value appears in the output of `SHOW SLAVE HOSTS` on the master server. Leave the value unset if you do not want the slave to register itself with the master. Note that it is not sufficient for the master to simply read the IP number of the slave from the TCP/IP socket after the slave connects. Due to NAT and other routing issues, that IP may not be valid for connecting to the slave from the master or other hosts.

- `--report-password=password`

The account password of the slave to be reported to the master during slave registration. This value appears in the output of `SHOW SLAVE HOSTS` on the master server if the `--show-slave-auth-info` option is given.

- `--report-port=slave_port_num`

The TCP/IP port number for connecting to the slave, to be reported to the master during slave registration. Set this only if the slave is listening on a non-default port or if you have a special tunnel from the master or other clients to the slave. If you are not sure, do not use this option.

- `--report-user=user_name`

The account user name of the slave to be reported to the master during slave registration. This value appears in the output of `SHOW SLAVE HOSTS` on the master server if the `--show-slave-auth-info` option is given.

- `--show-slave-auth-info`

Display slave user names and passwords in the output of `SHOW SLAVE HOSTS` on the master server for slaves started with the `--report-user` and `--report-password` options.

- `--skip-slave-start`

Tells the slave server not to start the slave threads when the server starts. To start the threads later, use a `START SLAVE` statement.

- `--slave_compressed_protocol={0|1}`

If this option is set to 1, use compression for the slave/master protocol if both the slave and the master support it. The default is 0 (no compression).

- `--slave-load-tmpdir=file_name`

The name of the directory where the slave creates temporary files. This option is by default equal to the value of the `tmpdir` system variable. When the slave SQL thread replicates a `LOAD DATA INFILE` statement, it extracts the file to be loaded from the relay log into temporary files, and then loads these into the table. If the file loaded on the master is huge, the temporary files on the slave are huge, too. Therefore, it might be advisable to use this option to tell the slave to put temporary files in a directory located in some file system that has a lot of available space. In that case, the relay logs are huge as well, so you might also want to use the `--relay-log` option to place the relay logs in that file system.

The directory specified by this option should be located in a disk-based file system (not a memory-based file system) because the temporary files used to replicate `LOAD DATA INFILE` must survive machine restarts. The directory also should not be one that is cleared by the operating system during the system startup process.

- `--slave-net-timeout=seconds`

The number of seconds to wait for more data from the master before the slave considers the connection broken, aborts the read, and tries to reconnect. The first retry occurs immediately after the timeout. The interval between retries is controlled by the `MASTER_CONNECT_RETRY` option for the `CHANGE MASTER TO` statement or `--master-connect-retry` option, and the number of reconnection attempts is limited by the `--master-retry-count` option. The default is 3600 seconds (one hour).

- `--slave-skip-errors=[err_code1,err_code2,...|all]`

Normally, replication stops when an error occurs on the slave. This gives you the opportunity to resolve the inconsistency in the data manually. This option tells the slave SQL thread to continue replication when a statement returns any of the errors listed in the option value.

Do not use this option unless you fully understand why you are getting errors. If there are no bugs in your replication setup and client programs, and no bugs in MySQL itself, an error that stops replication should never occur. Indiscriminate use of this option results in slaves becoming hopelessly out of synchrony with the master, with you having no idea why this has occurred.

For error codes, you should use the numbers provided by the error message in your slave error log and in the output of `SHOW SLAVE STATUS`. [Appendix B, Errors, Error Codes, and Common Problems](#), lists server error codes.

You can also (but should not) use the very non-recommended value of `all` to cause the slave to ignore all error messages and keeps going regardless of what happens. Needless to say, if you use `all`, there are no guarantees regarding the integrity of your data. Please do not complain (or file bug reports) in this case if the slave's data is not anywhere close to what it is on the master. *You have been warned.*

Examples:

```
--slave-skip-errors=1062,1053
--slave-skip-errors=all
```

- `sql_slave_skip_counter`

Variable Name	<code>sql_slave_skip_counter</code>	
Variable Scope	Global	
Dynamic Variable	Yes	
Value Set	Type	<code>numeric</code>

The number of events from the master that a slave server should skip.

Important

If skipping the number of events specified by setting this variable would cause the slave to begin in the middle of an event group, the slave continues to skip until it finds the beginning of the next event group and begins from that point. See [Section 12.6.2.6, “SET GLOBAL SQL_SLAVE_SKIP_COUNTER Syntax”](#), for more information.

- `--abort-slave-event-count`

Command Line Format	<code>--abort-slave-event-count=#</code>	
Config File Format	<code>abort-slave-event-count</code>	
Value Set	Type	<code>numeric</code>
	Default	<code>0</code>
	Min Value	<code>0</code>

When this option is set to some positive integer *value* other than 0 (the default) it affects replication behavior as follows: After the slave SQL thread has started, *value* log events are allowed to be executed; after that, the slave SQL thread does not receive any more events, just as if the network connection from the master were cut. The slave thread continues to run, and the output from `SHOW SLAVE STATUS` displays `Yes` in both the `Slave_IO_Running` and the `Slave_SQL_Running` columns, but no further events are read from the relay log.

This option is used internally by the MySQL test suite for replication testing and debugging. It is not intended for use in a production setting.

- `--disconnect-slave-event-count`

Command Line Format	<code>--disconnect-slave-event-count=#</code>	
Config File Format	<code>disconnect-slave-event-count</code>	
Value Set	Type	numeric
	Default	0

This option is used internally by the MySQL test suite for replication testing and debugging.

System variables used on replication slaves. The following system variables are used for controlling replication slave servers. Those that can be set are specified using `SET`. Server options used with replication slaves are listed earlier in this section.

- `init_slave`

Command Line Format	<code>--init-slave=name</code>	
Config File Format	<code>init_slave</code>	
Option Sets Variable	Yes, <code>init_slave</code>	
Variable Name	<code>init_slave</code>	
Variable Scope	Global	
Dynamic Variable	Yes	
Value Set	Type	string
	Default	

This variable is similar to `init_connect`, but is a string to be executed by a slave server each time the SQL thread starts. The format of the string is the same as for the `init_connect` variable.

Note

The SQL thread sends an acknowledgement to the client before `init_slave` is executed. Therefore, it is not guaranteed that `init_slave` has been executed when `START SLAVE` returns. See [Section 12.6.2.7, “START SLAVE Syntax”](#), for more information.

- `rpl_recovery_rank`

This variable is unused.

- `slave_compressed_protocol`

Command Line Format	<code>--slave_compressed_protocol</code>	
Config File Format	<code>slave_compressed_protocol</code>	
Option Sets Variable	Yes, <code>slave_compressed_protocol</code>	
Variable Name	<code>slave_compressed_protocol</code>	
Variable Scope	Global	
Dynamic Variable	Yes	
Value Set	Type	boolean
	Default	FALSE

Whether to use compression of the slave/master protocol if both the slave and the master support it.

- `slave_exec_mode`

Variable Name	<code>slave_exec_mode</code>	
Variable Scope	Global	
Dynamic Variable	Yes	
Value Set	Type	enumeration
	Default	STRICT

	Valid Values	IDEMPOTENT, STRICT
--	---------------------	--------------------

Controls whether `IDEMPOTENT` or `STRICT` mode is used in replication conflict resolution and error checking. `IDEMPOTENT` mode causes suppression of duplicate-key and no-key-found errors. This mode should be employed in multi-master replication, circular replication, and some other special replication scenarios. `STRICT` mode is the default, and is suitable for most other cases.

- `slave_load_tmpdir`

Command Line Format	<code>--slave-load-tmpdir=name</code>	
Config File Format	<code>slave-load-tmpdir</code>	
Option Sets Variable	Yes, <code>slave_load_tmpdir</code>	
Variable Name	<code>slave_load_tmpdir</code>	
Variable Scope	Global	
Dynamic Variable	No	
Value Set	Type	<code>filename</code>
	Default	<code>/tmp</code>

The name of the directory where the slave creates temporary files for replicating `LOAD DATA INFILE` statements.

- `slave_net_timeout`

Command Line Format	<code>--slave-net-timeout=#</code>	
Config File Format	<code>slave-net-timeout</code>	
Option Sets Variable	Yes, <code>slave_net_timeout</code>	
Variable Name	<code>slave_net_timeout</code>	
Variable Scope	Global	
Dynamic Variable	Yes	
Value Set	Type	<code>numeric</code>
	Default	<code>3600</code>
	Min Value	<code>1</code>

The number of seconds to wait for more data from a master/slave connection before aborting the read. This timeout applies only to TCP/IP connections, not to connections made via Unix socket files, named pipes, or shared memory.

- `slave_skip_errors`

Command Line Format	<code>--slave-skip-errors=name</code>	
Config File Format	<code>slave-skip-errors</code>	
Option Sets Variable	Yes, <code>slave_skip_errors</code>	
Variable Name	<code>slave_skip_errors</code>	
Variable Scope	Global	
Dynamic Variable	No	

Normally, replication stops when an error occurs on the slave. This gives you the opportunity to resolve the inconsistency in the data manually. This variable tells the slave SQL thread to continue replication when a statement returns any of the errors listed in the variable value.

- `sql_slave_skip_counter`

Variable Name	<code>sql_slave_skip_counter</code>
Variable Scope	Global
Dynamic Variable	Yes

Value Set	Type	numeric
------------------	-------------	---------

The number of events from the master that a slave server should skip.

Important

If skipping the number of events specified by setting this variable would cause the slave to begin in the middle of an event group, the slave continues to skip until it finds the beginning of the next event group and begins from that point. See [Section 12.6.2.6, “SET GLOBAL SQL_SLAVE_SKIP_COUNTER Syntax”](#), for more information.

- `slave_transaction_retries`

Command Line Format	<code>--slave_transaction_retries=#</code>	
Config File Format	<code>slave_transaction_retries</code>	
Option Sets Variable	Yes, <code>slave_transaction_retries</code>	
Variable Name	<code>slave_transaction_retries</code>	
Variable Scope	Global	
Dynamic Variable	Yes	
Value Set	Platform Bit Size	32
	Type	numeric
	Default	10
	Range	0-4294967295
Value Set	Platform Bit Size	64
	Type	numeric
	Default	10
	Range	0-18446744073709547520

If a replication slave SQL thread fails to execute a transaction because of an InnoDB deadlock or because the transaction's execution time exceeded InnoDB's `innodb_lock_wait_timeout` or NDBCLUSTER's `TransactionDeadlockDetectionTimeout` or `TransactionInactiveTimeout`, it automatically retries `slave_transaction_retries` times before stopping with an error. The default value is 10.

16.1.3.4. Binary Log Options and Variables

You can use the `mysqld` options and system variables that are described in this section to affect the operation of the binary log as well as to control which statements are written to the binary log. For additional information about the binary log, see [Section 5.2.4, “The Binary Log”](#). For additional information about using MySQL server options and system variables, see [Section 5.1.2, “Server Command Options”](#), and [Section 5.1.3, “Server System Variables”](#).

Startup options used with binary logging. The following list describes startup options for enabling and configuring the binary log. Many of these options can be reset while the server is running by using the `CHANGE MASTER TO` statement. Others, can be set only when the slave server starts. System variables used with binary logging are discussed later in this section.

- `--binlog-row-event-max-size=N`

Command Line Format	<code>--binlog-row-event-max-size=#</code>	
Config File Format	<code>binlog-row-event-max-size</code>	
Value Set	Platform Bit Size	32
	Type	numeric
	Default	1024
	Range	256-4294967295
Value Set	Platform Bit Size	64
	Type	numeric

	Default	1024
	Range	256-18446744073709547520

Specify the maximum size of a row-based binary log event, in bytes. Rows are grouped into events smaller than this size if possible. The value should be a multiple of 256. The default is 1024. See [Section 16.1.2, “Replication Formats”](#).

- `--log-bin[=base_name]`

Command Line Format	<code>--log-bin</code>	
Config File Format	<code>log-bin</code>	
Variable Name	<code>log_bin</code>	
Variable Scope	Global	
Dynamic Variable	No	
Value Set	Type	<code>filename</code>
	Default	OFF

Enable binary logging. The server logs all statements that change data to the binary log, which is used for backup and replication. See [Section 5.2.4, “The Binary Log”](#).

The option value, if given, is the basename for the log sequence. The server creates binary log files in sequence by adding a numeric suffix to the basename. It is recommended that you specify a basename (see [Additional Known Issues](#), for the reason). Otherwise, MySQL uses `host_name-bin` as the basename.

- `--log-bin-index[=file_name]`

Command Line Format	<code>--log-bin-index=name</code>	
Config File Format	<code>log-bin-index</code>	
Value Set	Type	<code>filename</code>
	Default	OFF

The index file for binary log file names. See [Section 5.2.4, “The Binary Log”](#). If you omit the file name, and if you didn't specify one with `--log-bin`, MySQL uses `host_name-bin.index` as the file name.

- **Statement selection options.** The options in the following list affect which statements are written to the binary log, and thus sent by a replication master server to its slaves.
 - `--binlog-do-db=db_name`

This option affects binary logging in the same manner that `--replicate-do-db` affects replication.

The effects of this option depend on whether the statement-based or row-based logging format is in use, in the same way that the effects of `--replicate-do-db` depend on whether statement-based or row-based replication is in use.

Statement-based logging. Only those statements where the default database (that is, the one selected by `USE`) is `db_name` are written to the binary log. To specify more than one database, use this option multiple times, once for each database; however, doing so does *not* cause cross-database statements such as `UPDATE some_db.some_table SET foo='bar'` to be logged while a different database (or no database) is selected.

Warning

To specify multiple databases you *must* use multiple instances of this option. Because database names can contain commas, if you supply a comma separated list then the list will be treated as the name of a single database.

An example of what does not work as you might expect when using statement-based logging: If the server is started with `--binlog-do-db=sales` and you issue the following statements, the `UPDATE` statement is *not* logged:

```
USE prices;
UPDATE sales.january SET amount=amount+1000;
```

The main reason for this “just check the default database” behavior is that it is difficult from the statement alone to know whether it should be replicated (for example, if you are using multiple-table `DELETE` statements or multiple-table `UPDATE`

statements that act across multiple databases). It is also faster to check only the default database rather than all databases if there is no need.

Row-based logging. Logging is restricted to database `db_name`. Only changes to tables belonging to `db_name` are logged; the current database has no effect on this. For example, suppose that the server is started with `--replicate-do-db=sales` and row-based logging is in effect, and then the following statements are executed:

```
USE prices;
UPDATE sales.february SET amount=amount+100;
```

The `february` table in the `sales` database is changed in accordance with the `UPDATE` statement; this occurs whether or not the `USE` statement was issued. However, the following statements are not logged when using the row-based logging format and `--binlog-do-db=sales`:

```
USE prices;
UPDATE prices.march SET amount=amount-25;
```

Even if the statement `USE prices` were changed to `USE sales`, the `UPDATE` statement's effects would still not be written to the binary log.

Another important difference in how `--binlog-do-db` is handled when using the statement-based logging format as opposed to the row-based format occurs with regard to statements that refer to multiple databases. Suppose the server is started with `--binlog-do-db=db1`, and the following statements are executed:

```
USE db1;
UPDATE db1.table1 SET col1 = 10, db2.table2 SET col2 = 20;
```

If you are using statement-based logging, then the updates to both tables are written to the binary log. However, when using the row-based format, only the changes to `table1` are logged; since `table2` is in a different database, it is not changed by the `UPDATE`. Now suppose that, instead of the `USE db1` statement, a `USE db4` statement had been used:

```
USE db4;
UPDATE db1.table1 SET col1 = 10, db2.table2 SET col2 = 20;
```

In this case, the `UPDATE` statement would not be written to the binary log when using statement-based logging. However, if using row-based logging, the `UPDATE` would change `table1`, but not `table2` — in other words, only tables in the database named by `--binlog-do-db` are changed, and the choice of current database has no effect on this behavior.

- `--binlog-ignore-db=db_name`

This option affects binary logging in the same manner that `--replicate-ignore-db` affects replication.

The effects of this option depend on whether the statement-based or row-based logging format is in use, in the same way that the effects of `--replicate-ignore-db` depend on whether statement-based or row-based replication is in use.

Statement-based logging. Tells the server to not log any statement where the default database (that is, the one selected by `USE`) is `db_name`.

Row-based format. Tells the server not to log updates to any tables in the database `db_name`. The current database has no effect.

When using statement-based logging, the following example does not work as you might expect. Suppose that the server is started with `--binlog-ignore-db=sales` and you issue the following statements:

```
USE prices;
UPDATE sales.january SET amount=amount+1000;
```

The `UPDATE` statement *is* logged in such a case because `--binlog-ignore-db` applies only to the default database (determined by the `USE` statement). Because the `sales` database was specified explicitly in the statement, the statement has not been filtered. However, when using row-based logging, the `UPDATE` statement's effects are *not* written to the binary log, which means that no changes to the `sales.january` table are logged; in this instance, `--binlog-ignore-db=sales` causes *all* changes made to tables in the master's copy of the `sales` database to be ignored for purposes of binary logging.

To specify more than one database to ignore, use this option multiple times, once for each database. Because database names can contain commas, if you supply a comma-separated list then the list will be treated as the name of a single database.

You should not use this option if you are using cross-database updates and you do not want these updates to be logged.

Additional server options that can be used to control logging also affect the binary log. For more information about these, see [Section 5.1.2, “Server Command Options”](#). For more information about how the options in the previous list are applied, see [Section 5.2.4, “The Binary Log”](#).

There are also options for slave servers that control which statements received from the master should be executed or ignored. For details, see [Section 16.1.3.3, “Replication Slave Options and Variables”](#).

- `--log-bin-trust-function-creators[={0|1}]`

Command Line Format	<code>--log-bin-trust-function-creators</code>	
Config File Format	<code>log-bin-trust-function-creators</code>	
Option Sets Variable	Yes, <code>log_bin_trust_function_creators</code>	
Variable Name	<code>log_bin_trust_function_creators</code>	
Variable Scope	Global	
Dynamic Variable	Yes	
Value Set	Type	boolean
	Default	FALSE

With no argument or an argument of 1, this option sets the `log_bin_trust_function_creators` system variable to 1. With an argument of 0, this option sets the system variable to 0. `log_bin_trust_function_creators` affects how MySQL enforces restrictions on stored function and trigger creation. See [Section 18.6, “Binary Logging of Stored Programs”](#).

Note

Previously, this option was known as `--log-bin-trust-routine-creators`, which is now deprecated.

Testing and debugging options. The following binary log options are used in replication testing and debugging. They are not intended for use in normal operations.

- `--max-binlog-dump-events`

Command Line Format	<code>--max-binlog-dump-events=#</code>	
Config File Format	<code>max-binlog-dump-events</code>	
Value Set	Type	numeric
	Default	0

This option is used internally by the MySQL test suite for replication testing and debugging.

- `--sporadic-binlog-dump-fail`

Command Line Format	<code>--sporadic-binlog-dump-fail</code>	
Config File Format	<code>sporadic-binlog-dump-fail</code>	
Value Set	Type	boolean
	Default	FALSE

This option is used internally by the MySQL test suite for replication testing and debugging.

System variables used with the binary log. The following system variables are used for controlling replication slave servers. Those that can be set are specified using `SET`. Server options used with replication slaves are listed earlier in this section.

- `binlog_cache_size`

Command Line Format	<code>--binlog_cache_size=#</code>	
Config File Format	<code>binlog_cache_size</code>	
Option Sets Variable	Yes, <code>binlog_cache_size</code>	
Variable Name	<code>binlog_cache_size</code>	
Variable Scope	Global	

Dynamic Variable	Yes	
Value Set	Platform Bit Size	32
	Type	numeric
	Default	32768
	Range	4096-4294967295
Value Set	Platform Bit Size	64
	Type	numeric
	Default	32768
	Range	4096-18446744073709547520

The size of the cache to hold the SQL statements for the binary log during a transaction. A binary log cache is allocated for each client if the server supports any transactional storage engines and if the server has the binary log enabled (`--log-bin` option). If you often use large, multiple-statement transactions, you can increase this cache size to get more performance. The `Binlog_cache_use` and `Binlog_cache_disk_use` status variables can be useful for tuning the size of this variable. See [Section 5.2.4, “The Binary Log”](#).

MySQL Enterprise

For recommendations on the optimum setting for `binlog_cache_size` subscribe to the MySQL Enterprise Monitor. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

- `binlog_format`

Command Line Format	<code>--binlog-format</code>	
Config File Format	<code>binlog-format</code>	
Option Sets Variable	Yes, <code>binlog_format</code>	
Variable Name	<code>binlog_format</code>	
Variable Scope	Both	
Dynamic Variable	Yes	
Value Set	Type	enumeration
	Default	STATEMENT
	Valid Values	ROW, STATEMENT, MIXED

This variable sets the binary logging format, and can be any one of `STATEMENT`, `ROW`, or `MIXED`. `binlog_format` is set by the `--binlog-format` option at startup, or by the `binlog_format` variable at runtime.

You must have the `SUPER` privilege to set this variable, which (unlike with most system variables) is true even for the session value. See [Section 16.1.2, “Replication Formats”](#).

The rules governing when changing this variable takes effect and how long the effect lasts are the same as for other MySQL server system variables. See [Section 12.5.4, “SET Syntax”](#), for more information.

The default mode is `STATEMENT`.

When `MIXED` is specified, statement-based replication is used, except for cases where only row-based replication is guaranteed to lead to proper results. For example, this happens when statements contain user-defined functions (UDF) or the `UUID()` function. An exception to this rule is that `MIXED` always uses statement-based replication for stored functions and triggers.

As with other global variables, to set `binlog_format` globally, you must have the `SUPER` privilege. You must also have the `SUPER` privilege to set `binlog_format` on the session level.

There are exceptions when you cannot switch the replication format at runtime:

- From within a stored function or a trigger.
 - If the `NDBCLUSTER` storage engine is enabled.
 - If the session is currently in row-based replication mode and has open temporary tables.
- Trying to switch the format in those cases results in an error.

The binlog format affects the behavior of the following server options:

- `--replicate-do-db`
- `--replicate-ignore-db`
- `--binlog-do-db`
- `--binlog-ignore-db`

These effects are discussed in detail in the descriptions of the individual options.

- `max_binlog_cache_size`

Command Line Format	<code>--max_binlog_cache_size=#</code>	
Config File Format	<code>max_binlog_cache_size</code>	
Option Sets Variable	Yes, <code>max_binlog_cache_size</code>	
Variable Name	<code>max_binlog_cache_size</code>	
Variable Scope	Global	
Dynamic Variable	Yes	
Value Set	Platform Bit Size	32
	Type	numeric
	Default	4294967295
	Range	4096-4294967295
Value Set	Platform Bit Size	64
	Type	numeric
	Default	18446744073709547520
	Range	4096-18446744073709547520

If a multiple-statement transaction requires more than this many bytes of memory, the server generates a `MULTI-STATEMENT TRANSACTION REQUIRED MORE THAN 'MAX_BINLOG_CACHE_SIZE' BYTES OF STORAGE` error. The minimum value is 4096; the maximum and default values are 4GB on 32-bit platforms and 16 PB (petabytes) on 64-bit platforms.

- `max_binlog_size`

Command Line Format	<code>--max_binlog_size=#</code>	
Config File Format	<code>max_binlog_size</code>	
Option Sets Variable	Yes, <code>max_binlog_size</code>	
Variable Name	<code>max_binlog_size</code>	
Variable Scope	Global	
Dynamic Variable	Yes	
Value Set	Type	numeric
	Default	1073741824
	Min Value	4096

If a write to the binary log causes the current log file size to exceed the value of this variable, the server rotates the binary logs (closes the current file and opens the next one). You cannot set this variable to more than 1GB or to less than 4096 bytes. The default value is 1GB.

A transaction is written in one chunk to the binary log, so it is never split between several binary logs. Therefore, if you have big transactions, you might see binary logs larger than `max_binlog_size`.

If `max_relay_log_size` is 0, the value of `max_binlog_size` applies to relay logs as well.

- `sync_binlog`

Command Line Format	<code>--sync-binlog=#</code>	
Config File Format	<code>sync-binlog</code>	
Option Sets Variable	Yes, <code>sync_binlog</code>	
Variable Name	<code>sync_binlog</code>	
Variable Scope	Global	
Dynamic Variable	Yes	
Value Set	Platform Bit Size	32
	Type	numeric
	Default	0
	Range	0-4294967295
Value Set	Platform Bit Size	64
	Type	numeric
	Default	0
	Range	0-18446744073709547520

If the value of this variable is greater than 0, the MySQL server synchronizes its binary log to disk (using `fdatasync()`) after every `sync_binlog` writes to the binary log. There is one write to the binary log per statement if autocommit is enabled, and one write per transaction otherwise. The default value of `sync_binlog` is 0, which does no synchronizing to disk — in this case, the server relies on the operating system to flush the binary log's contents from time to time as for any other file. A value of 1 is the safest choice, because in the event of a crash you lose at most one statement or transaction from the binary log. However, it is also the slowest choice (unless the disk has a battery-backed cache, which makes synchronization very fast).

16.1.4. Common Replication Administration Tasks

Once replication has been started it should execute without requiring much regular administration. Depending on your replication environment, you will want to check the replication status of each slave either periodically, daily, or even more frequently.

MySQL Enterprise

For regular reports regarding the status of your slaves, subscribe to the MySQL Enterprise Monitor. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

16.1.4.1. Checking Replication Status

The most common task when managing a replication process is to ensure that replication is taking place and that there have been no errors between the slave and the master.

The primary statement for this is `SHOW SLAVE STATUS` which you must execute on each slave:

```
mysql> SHOW SLAVE STATUS\G
***** 1. row *****
      Slave_IO_State: Waiting for master to send event
        Master_Host: master1
        Master_User: root
        Master_Port: 3306
        Connect_Retry: 60
        Master_Log_File: mysql-bin.000004
        Read_Master_Log_Pos: 931
        Relay_Log_File: slavel-relay-bin.000056
        Relay_Log_Pos: 950
        Relay_Master_Log_File: mysql-bin.000004
        Slave_IO_Running: Yes
        Slave_SQL_Running: Yes
        Replicate_Do_DB:
        Replicate_Ignore_DB:
        Replicate_Do_Table:
        Replicate_Ignore_Table:
        Replicate_Wild_Do_Table:
        Replicate_Wild_Ignore_Table:
          Last_Errno: 0
          Last_Error:
        Skip_Counter: 0
        Exec_Master_Log_Pos: 931
        Relay_Log_Space: 1365
        Until_Condition: None
        Until_Log_File:
        Until_Log_Pos: 0
        Master_SSL_Allowed: No
        Master_SSL_CA_File:
```

```

Master_SSL_CA_Path:
Master_SSL_Cert:
Master_SSL_Cipher:
Master_SSL_Key:
Seconds_Behind_Master: 0
1 row in set (0.01 sec)

```

The key fields from the status report to examine are:

- `Slave_IO_State` — indicates the current status of the slave. See [Section 7.5.6.5, “Replication Slave I/O Thread States”](#), and [Section 7.5.6.6, “Replication Slave SQL Thread States”](#), for more information.
- `Slave_IO_Running` — shows whether the IO thread for the reading the master's binary log is running.
- `Slave_SQL_Running` — shows whether the SQL thread for the executing events in the relay log is running.
- `Last_Error` — shows the last error registered when processing the relay log. Ideally this should be blank, indicating no errors.
- `Seconds_Behind_Master` — shows the number of seconds that the slave SQL thread is behind processing the master binary log. A high number (or an increasing one) can indicate that the slave is unable to cope with the large number of statements from the master.

A value of 0 for `Seconds_Behind_Master` can usually be interpreted as meaning that the slave has caught up with the master, but there are some cases where this is not strictly true. For example, this can occur if the network connection between master and slave is broken but the slave I/O thread has not yet noticed this — that is, `slave_net_timeout` has not yet elapsed.

It is also possible that transient values for `Seconds_Behind_Master` may not reflect the situation accurately. When the slave SQL thread has caught up on I/O, `Seconds_Behind_Master` displays 0; but when the slave I/O thread is still queuing up a new event, `Seconds_Behind_Master` may show a large value until the SQL thread finishes executing the new event. This is especially likely when the events have old timestamps; in such cases, if you execute `SHOW SLAVE STATUS` several times in a relatively short period, you may see this value change back and forth repeatedly between 0 and a relatively large value.

On the master, you can check the status of slaves by examining the list of running processes. Slaves execute the `Binlog Dump` command:

```

mysql> SHOW PROCESSLIST \G;
***** 4. row *****
  Id: 10
  User: root
  Host: slave1:58371
  db: NULL
  Command: Binlog Dump
  Time: 777
  State: Has sent all binlog to slave; waiting for binlog to be updated
  Info: NULL

```

Because it is the slave that drives the core of the replication process, very little information is available in this report.

If you have used the `--report-host` option, then the `SHOW SLAVE HOSTS` statement will show basic information about connected slaves:

```

mysql> SHOW SLAVE HOSTS;
+-----+-----+-----+-----+-----+
| Server_id | Host   | Port | Rpl_recovery_rank | Master_id |
+-----+-----+-----+-----+-----+
|          10 | slave1 | 3306 |          0         |          1 |
+-----+-----+-----+-----+-----+
1 row in set (0.00 sec)

```

The output includes the ID of the slave server, the value of the `--report-host` option, the connecting port, master ID and the priority of the slave for receiving binary log updates.

16.1.4.2. Pausing Replication on the Slave

You can stop and start the replication of statements on the slave using the `STOP SLAVE` and `START SLAVE` statements.

To stop execution of the binary log from the master, use `STOP SLAVE`:

```
mysql> STOP SLAVE;
```

When execution is stopped, the slave does not read the binary log from the master (the [IO_THREAD](#)) and stops processing events from the relay log that have not yet been executed (the [SQL_THREAD](#)). You can pause either the IO or SQL threads individually by specifying the thread type. For example:

```
mysql> STOP SLAVE IO_THREAD;
```

Stopping the SQL thread can be useful if you want to perform a backup or other task on a slave that only processes events from the master. The IO thread will continue to be read from the master, but not executed, which will make it easier for the slave to catch up when you start slave operations again.

Stopping the IO thread will allow the statements in the relay log to be executed up until the point where the relay log has ceased to receive new events. Using this option can be useful when you want to pause execution to allow the slave to catch up with events from the master, when you want to perform administration on the slave but also ensure you have the latest updates to a specific point. This method can also be used to pause execution on the slave while you conduct administration on the master while ensuring that there is not a massive backlog of events to be executed when replication is started again.

To start execution again, use the [START SLAVE](#) statement:

```
mysql> START SLAVE;
```

If necessary, you can start either the [IO_THREAD](#) or [SQL_THREAD](#) threads individually.

16.2. Replication Solutions

Replication can be used in many different environments for a range of purposes. In this section you will find general notes and advice on using replication for specific solution types.

For information on using replication in a backup environment, including notes on the setup, backup procedure, and files to back up, see [Section 16.2.1, “Using Replication for Backups”](#).

For advice and tips on using different storage engines on the master and slaves, see [Section 16.2.2, “Using Replication with Different Master and Slave Storage Engines”](#).

Using replication as a scale-out solution requires some changes in the logic and operation of applications that use the solution. See [Section 16.2.3, “Using Replication for Scale-Out”](#).

For performance or data distribution reasons you may want to replicate different databases to different replication slaves. See [Section 16.2.4, “Replicating Different Databases to Different Slaves”](#)

As the number of replication slaves increases, the load on the master can increase (because of the need to replicate the binary log to each slave) and lead to a reduction in performance of the master. For tips on improving your replication performance, including using a single secondary server as an replication master, see [Section 16.2.5, “Improving Replication Performance”](#).

For guidance on switching masters, or converting slaves into masters as part of an emergency failover solution, see [Section 16.2.6, “Switching Masters During Failover”](#).

To secure your replication communication you can encrypt the communication channel by using SSL to exchange data. Step-by-step instructions can be found in [Section 16.2.7, “Setting Up Replication Using SSL”](#).

16.2.1. Using Replication for Backups

You can use replication as a backup solution by replicating data from the master to a slave, and then backing up the data slave. Because the slave can be paused and shut down without affecting the running operation of the master you can produce an effective snapshot of 'live' data that would otherwise require a shutdown of the master database.

How you back up the database will depend on the size of the database and whether you are backing up only the data, or the data and the replication slave state so that you can rebuild the slave in the event of failure. There are therefore two choices:

If you are using replication as a solution to enable you to back up the data on the master, and the size of your database is not too large, then the `mysqldump` tool may be suitable. See [Section 16.2.1.1, “Backing Up a Slave Using `mysqldump`”](#).

For larger databases, where `mysqldump` would be impractical or inefficient, you can back up the raw data files instead. Using the raw data files option also means that you can back up the binary and relay logs that will enable you to recreate the slave in the event of a slave failure. For more information, see [Section 16.2.1.2, “Backing Up Raw Data from a Slave”](#).

Another backup strategy, which can be used for either master or slave servers, is to put the server in a read-only state. The backup is performed against the read-only server, which then is changed back to its usual read/write operational status. See [Section 16.2.1.3, “Backing Up a Master or Slave by Making It Read Only”](#).

16.2.1.1. Backing Up a Slave Using `mysqldump`

Using `mysqldump` to create a copy of the database enables you to capture all of the data in the database in a format that allows the information to be imported into another instance of MySQL. Because the format of the information is SQL statements the file can easily be distributed and applied to running servers in the event that you need access to the data in an emergency. However, if the size of your data set is very large then `mysqldump` may be impractical.

When using `mysqldump` you should stop the slave before starting the dump process to ensure that the dump contains a consistent set of data:

1. Stop the slave from processing requests. You can either stop the slave completely using `mysqladmin`:

```
shell> mysqladmin stop-slave
```

Alternatively, you can stop processing the relay log files by stopping the replication SQL thread. Using this method will allow the binary log data to be transferred. Within busy replication environments this may speed up the catch-up process when you start the slave processing again:

```
shell> mysql -e 'STOP SLAVE SQL_THREAD;'
```

2. Run `mysqldump` to dump your databases. You may either select databases to be dumped, or dump all databases. For more information, see [Section 4.5.4, “mysqldump — A Database Backup Program”](#). For example, to dump all databases:

```
shell> mysqldump --all-databases >fulldb.dump
```

3. Once the dump has completed, start slave operations again:

```
shell> mysqladmin start-slave
```

In the preceding example you may want to add login credentials (user name, password) to the commands, and bundle the process up into a script that you can run automatically each day.

If you use this approach, make sure you monitor the slave replication process to ensure that the time taken to run the backup in this way is not affecting the slave's ability to keep up with events from the master. See [Section 16.1.4.1, “Checking Replication Status”](#). If the slave is unable to keep up you may want to add another server and distribute the backup process. For an example of how to configure this scenario, see [Section 16.2.4, “Replicating Different Databases to Different Slaves”](#).

16.2.1.2. Backing Up Raw Data from a Slave

To guarantee the integrity of the files that are copied, backing up the raw data files on your MySQL replication slave should take place while your slave server is shut down. If the MySQL server is still running then background tasks, particularly with storage engines with background processes such as InnoDB, may still be updating the database files. With InnoDB, these problems should be resolved during crash recovery, but since the slave server can be shut down during the backup process without affecting the execution of the master it makes sense to take advantage of this facility.

To shut down the server and back up the files:

1. Shut down the slave MySQL server:

```
shell> mysqladmin shutdown
```

2. Copy the data files. You can use any suitable copying or archive utility, including `cp`, `tar` or `WinZip`:

```
shell> tar cf /tmp/dbbackup.tar ./data
```

3. Start up the `mysqld` process again:

```
shell> mysqld_safe &
```

Under Windows:

```
C:\> "C:\Program Files\MySQL\MySQL Server 5.4\bin\mysqld"
```

Normally you should back up the entire data folder for the slave MySQL server. If you want to be able to restore the data and operate as a slave (for example, in the event of failure of the slave), then when you back up the slave's data, you should back up the slave status files, `master.info` and `relay-log.info`, along with the relay log files. These files are needed to resume replication after you restore the slave's data.

If you lose the relay logs but still have the `relay-log.info` file, you can check it to determine how far the SQL thread has executed in the master binary logs. Then you can use `CHANGE MASTER TO` with the `MASTER_LOG_FILE` and `MASTER_LOG_POS` options to tell the slave to re-read the binary logs from that point. Of course, this requires that the binary logs still exist on the master server.

If your slave is subject to replicating `LOAD DATA INFILE` statements, you should also back up any `SQL_LOAD-*` files that exist in the directory that the slave uses for this purpose. The slave needs these files to resume replication of any interrupted `LOAD DATA INFILE` operations. The directory location is specified using the `--slave-load-tmpdir` option. If this option is not specified, the directory location is the value of the `tmpdir` system variable.

16.2.1.3. Backing Up a Master or Slave by Making It Read Only

It is possible to back up either master or slave servers in a replication setup by acquiring a global read lock and manipulating the `read_only` system variable to change the read-only state of the server to be backed up:

1. Make the server read-only, so that it processes only retrievals and blocks updates
2. Perform the backup
3. Change the server back to its normal read/write state

The following instructions describe how to do this for a master server and for a slave server.

Note

The instructions in this section place the server to be backed up in a state that is safe for backup methods that get the data from the server, such as `mysqldump` (see [Section 4.5.4, “mysqldump — A Database Backup Program”](#)). You should not attempt to use these instructions to make a binary backup by copying files directly because the server may still have modified data cached in memory and not flushed to disk.

For both scenarios discussed here, suppose that you have the following replication setup:

- A master server M1
- A slave server S1 that has M1 as its master
- A client C1 connected to M1
- A client C2 connected to S1

Scenario 1: Backup with a Read-Only Master

Put the master M1 in a read-only state by executing these statements on it:

```
FLUSH TABLES WITH READ LOCK;
SET GLOBAL read_only = ON;
```

While M1 is in a read-only state, the following properties are true:

- Requests for updates sent by C1 to M1 will fail because the server is in read-only mode
- Requests for retrievals sent by C1 to M1 will succeed
- Making a backup on M1 is safe
- Making a backup on S1 is not safe: this server is still running, and might be processing the binary log or update requests coming from client C2 (S1 might not be in a read-only state)

While M1 is read only, perform the backup. For example, you can use `mysqldump`.

After the backup on M1 has been done, restore M1 to its normal operational state by executing these statements:

```
SET GLOBAL read_only = OFF;
UNLOCK TABLES;
```

Although performing the backup on M1 is safe (as far as the backup is concerned), it is not optimal because clients of M1 are blocked from executing updates.

This strategy also applies to backing up a single server in a non-replication setting.

Scenario 2: Backup with a Read-Only Slave

Put the slave S1 in a read-only state by executing these statements on it:

```
FLUSH TABLES WITH READ LOCK;
SET GLOBAL read_only = ON;
```

While S1 is in a read-only state, the following properties are true:

- The master M1 will continue to operate
- Making a backup on the master is not safe
- The slave S1 is stopped
- Making a backup on the slave S1 is safe

These properties provide the basis for a popular backup scenario: Having one slave busy performing a backup for a while is not a problem because it does not affect the entire network, and the system is still running during the backup. (For example, clients can still perform updates on the master server.)

While S1 is read only, perform the backup.

After the backup on S1 has been done, restore S1 to its normal operational state by executing these statements:

```
SET GLOBAL read_only = OFF;
UNLOCK TABLES;
```

After the slave is restored to normal operation, it again synchronizes to the master by catching up with any outstanding updates in the binary log from the master.

In either scenario, the statements to acquire the global read lock and manipulate the `read_only` variable are performed on the server to be backed up and do not propagate to any slaves of that server.

16.2.2. Using Replication with Different Master and Slave Storage Engines

The replication process does not care if the source table on the master and the replicated table on the slave use different engine types. In fact, the system variables `storage_engine` and `table_type` are not replicated.

This provides a number of advantages in the replication process in that you can take advantage of different engine types for different replication scenarios. For example, in a typical scaleout scenario (see [Section 16.2.3, “Using Replication for Scale-Out”](#)), you want to use `InnoDB` tables on the master to take advantage of the transactional functionality, but use `MyISAM` on the slaves where transaction support is not required because the data is only read. When using replication in a data logging environment you may want to use the `Archive` storage engine on the slave.

Setting up different engines on the master and slave depends on how you set up the initial replication process:

- If you used `mysqldump` to create the database snapshot on your master then you could edit the dump text to change the engine type used on each table.

Another alternative for `mysqldump` is to disable engine types that you do not want to use on the slave before using the dump to build the data on the slave. For example, you can add the `--skip-innodb` option on your slave to disable the `InnoDB` engine. If a specific engine does not exist, MySQL will use the default engine type, usually `MyISAM`. If you want to disable further engines in this way, you may want to consider building a special binary to be used on the slave that only supports the engines you want.

- If you are using raw data files for the population of the slave, you will be unable to change the initial table format. Instead, use

`ALTER TABLE` to change the table types after the slave has been started.

- For new master/slave replication setups where there are currently no tables on the master, avoid specifying the engine type when creating new tables.

If you are already running a replication solution and want to convert your existing tables to another engine type, follow these steps:

1. Stop the slave from running replication updates:

```
mysql> STOP SLAVE;
```

This will enable you to change engine types without interruptions.

2. Execute an `ALTER TABLE ... Engine='enginetype'` for each table where you want to change the engine type.
3. Start the slave replication process again:

```
mysql> START SLAVE;
```

Although the `storage_engine` and `table_type` variables are not replicated, be aware that `CREATE TABLE` and `ALTER TABLE` statements that include the engine specification will be correctly replicated to the slave. For example, if you have a CSV table and you execute:

```
mysql> ALTER TABLE csvtable Engine='MyISAM';
```

The above statement will be replicated to the slave and the engine type on the slave will be converted to `MyISAM`, even if you have previously changed the table type on the slave to an engine other than CSV. If you want to retain engine differences on the master and slave, you should be careful to use the `storage_engine` variable on the master when creating a new table. For example, instead of:

```
mysql> CREATE TABLE tablea (columna int) Engine=MyISAM;
```

Use this format:

```
mysql> SET storage_engine=MyISAM;
mysql> CREATE TABLE tablea (columna int);
```

When replicated, the `storage_engine` variable will be ignored, and the `CREATE TABLE` statement will be executed with the slave's default engine type.

16.2.3. Using Replication for Scale-Out

You can use replication as a scale-out solution, i.e. where you want to split up the load of database queries across multiple database servers, within some reasonable limitations.

Because replication works from the distribution of one master to one or more slaves, using replication for scaleout works best in an environment where you have a high number of reads and low number of writes/updates. Most websites fit into this category, where users are browsing the website, reading articles, posts, or viewing products. Updates only occur during session management, or when making a purchase or adding a comment/message to a forum.

Replication in this situation enables you to distribute the reads over the replication slaves, while still allowing your web servers to communicate with the replication master when a write is required. You can see a sample replication layout for this scenario in [Figure 16.1, "Using replication to improve the performance during scaleout"](#).

Figure 16.1. Using replication to improve the performance during scaleout

If the part of your code that is responsible for database access has been properly abstracted/modularized, converting it to run with a replicated setup should be very smooth and easy. Change the implementation of your database access to send all writes to the master, and to send reads to either the master or a slave. If your code does not have this level of abstraction, setting up a replicated system gives you the opportunity and motivation to clean it up. Start by creating a wrapper library or module that implements the following functions:

- `safe_writer_connect()`
- `safe_reader_connect()`
- `safe_reader_statement()`
- `safe_writer_statement()`

`safe_` in each function name means that the function takes care of handling all error conditions. You can use different names for the functions. The important thing is to have a unified interface for connecting for reads, connecting for writes, doing a read, and doing a write.

Then convert your client code to use the wrapper library. This may be a painful and scary process at first, but it pays off in the long run. All applications that use the approach just described are able to take advantage of a master/slave configuration, even one involving multiple slaves. The code is much easier to maintain, and adding troubleshooting options is trivial. You need modify only one or two functions; for example, to log how long each statement took, or which statement among those issued gave you an error.

If you have written a lot of code, you may want to automate the conversion task by using the `replace` utility that comes with standard MySQL distributions, or write your own conversion script. Ideally, your code uses consistent programming style conventions. If not, then you are probably better off rewriting it anyway, or at least going through and manually regularizing it to use a consistent style.

16.2.4. Replicating Different Databases to Different Slaves

There may be situations where you have a single master and want to replicate different databases to different slaves. For example, you may want to distribute different sales data to different departments to help spread the load during data analysis. A sample of this layout is shown in [Figure 16.2, “Using replication to replicate databases to separate replication slaves”](#).

Figure 16.2. Using replication to replicate databases to separate replication slaves

You can achieve this separation by configuring the master and slaves as normal, and then limiting the binary log statements that each slave processes by using the `--replicate-wild-do-table` configuration option on each slave.

Important

You should *not* use `--replicate-do-db` for this purpose when using statement-based replication, since statement-based replication causes this option's affects to vary according to the database that is currently selected. This applies to mixed-format replication as well, since this allows some updates to be replicated using the statement-based format.

However, it should be to use `--replicate-do-db` for this purpose if you are using row-based replication only, since in this case the currently-selected database has no effect on the option's operation.

For example, to support the separation as shown in [Figure 16.2, “Using replication to replicate databases to separate replication slaves”](#), you should configure each replication slave as follows, before executing `START SLAVE`:

- Replication slave 1 should use `--replicate-wild-do-table=databaseA.%`.
- Replication slave 2 should use `--replicate-wild-do-table=databaseB.%`.
- Replication slave 3 should use `--replicate-wild-do-table=databaseC.%`.

If you have data that needs to be synchronized to the slaves before replication starts, you have a number of choices:

- Synchronize all the data to each slave, and delete the databases, tables, or both that you do not want to keep.
- Use `mysqldump` to create a separate dump file for each database and load the appropriate dump file on each slave.
- Use a raw data file dump and include only the specific files and databases that you need for each slave.

Note

This does not work with InnoDB databases unless you use `innodb_file_per_table`.

Each slave in this configuration receives the entire binary log from the master, but executes only those events from the binary log that apply to the databases and tables included by the `--replicate-wild-do-table` option in effect on that slave.

16.2.5. Improving Replication Performance

As the number of slaves connecting to a master increases, the load, although minimal, also increases, as each slave uses up a client connection to the master. Also, as each slave must receive a full copy of the master binary log, the network load on the master may also increase and start to create a bottleneck.

If you are using a large number of slaves connected to one master, and that master is also busy processing requests (for example, as part of a scaleout solution), then you may want to improve the performance of the replication process.

One way to improve the performance of the replication process is to create a deeper replication structure that enables the master to

replicate to only one slave, and for the remaining slaves to connect to this primary slave for their individual replication requirements. A sample of this structure is shown in [Figure 16.3, “Using an additional replication host to improve performance”](#).

Figure 16.3. Using an additional replication host to improve performance

For this to work, you must configure the MySQL instances as follows:

- Master 1 is the primary master where all changes and updates are written to the database. Binary logging should be enabled on this machine.
- Master 2 is the slave to the Master 1 that provides the replication functionality to the remainder of the slaves in the replication structure. Master 2 is the only machine allowed to connect to Master 1. Master 2 also has binary logging enabled, and the `--log-slave-updates` option so that replication instructions from Master 1 are also written to Master 2's binary log so that they can then be replicated to the true slaves.
- Slave 1, Slave 2, and Slave 3 act as slaves to Master 2, and replicate the information from Master 2, which is really the data logged on Master 1.

The above solution reduces the client load and the network interface load on the primary master, which should improve the overall performance of the primary master when used as a direct database solution.

If your slaves are having trouble keeping up with the replication process on the master then there are a number of options available:

- If possible, you should put the relay logs and the data files on different physical drives. To do this, use the `--relay-log` option to specify the location of the relay log.
- If the slaves are significantly slower than the master, then you may want to divide up the responsibility for replicating different databases to different slaves. See [Section 16.2.4, “Replicating Different Databases to Different Slaves”](#).
- If your master makes use of transactions and you are not concerned about transaction support on your slaves, then use `MyISAM` or another non-transactional engine. See [Section 16.2.2, “Using Replication with Different Master and Slave Storage Engines”](#).
- If your slaves are not acting as masters, and you have a potential solution in place to ensure that you can bring up a master in the event of failure, then you can switch off `--log-slave-updates`. This prevents 'dumb' slaves from also logging events they have executed into their own binary log.

16.2.6. Switching Masters During Failover

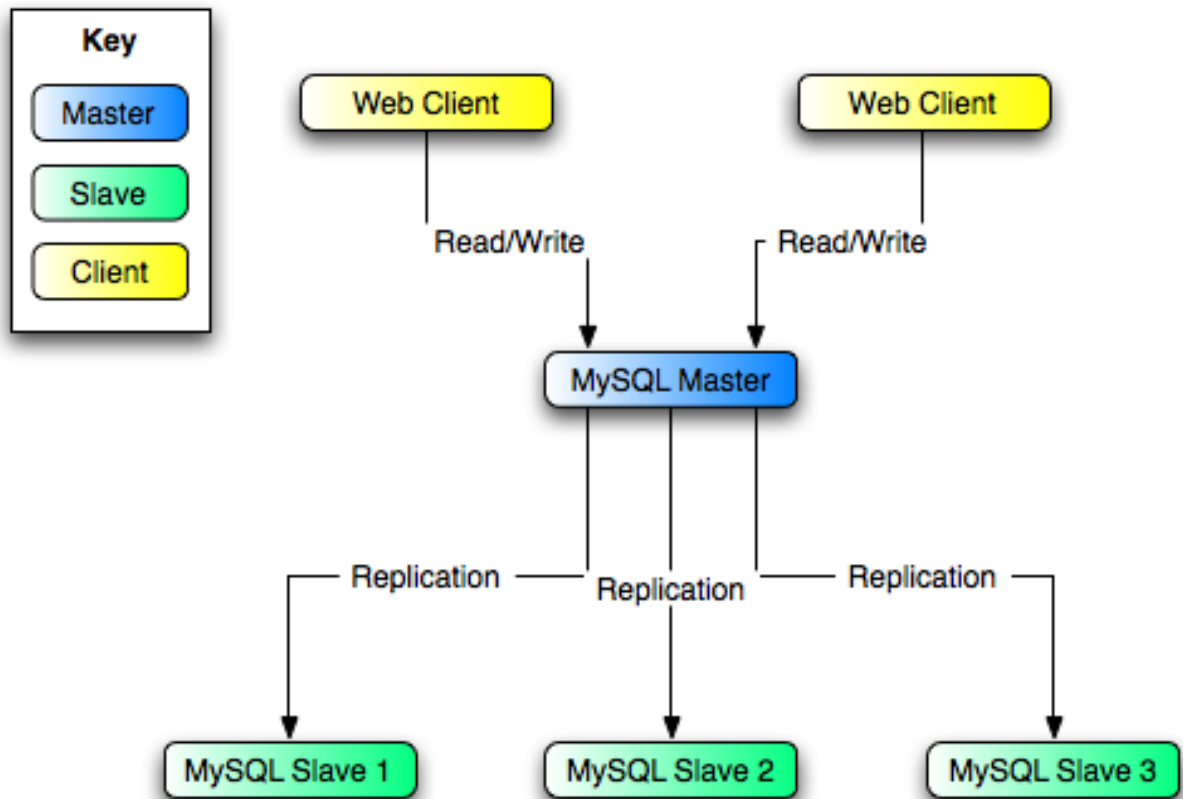

There is currently no official solution for providing failover between master and slaves in the event of a failure. With the currently available features, you would have to set up a master and a slave (or several slaves), and to write a script that monitors the master to check whether it is up. Then instruct your applications and the slaves to change master in case of failure.

Remember that you can tell a slave to change its master at any time, using the `CHANGE MASTER TO` statement. The slave will not check whether the databases on the master are compatible with the slave, it will just start executing events from the specified log and position on the new master. In a failover situation all the servers in the group are probably executing the same events from the same binary log, so changing the source of the events should not affect the database structure or integrity providing you are careful.

Run your slaves with the `--log-bin` option and without `--log-slave-updates`. In this way, the slave is ready to become a

master as soon as you issue `STOP SLAVE; RESET MASTER`, and `CHANGE MASTER TO` statement on the other slaves. For example, assume that you have the structure shown in Figure 16.4, “Redundancy using replication, initial structure”.

Figure 16.4. Redundancy using replication, initial structure

In this diagram, the `MySQL Master` holds the master database, the `MySQL Slave` computers are replication slaves, and the `Web Client` machines are issuing database reads and writes. Web clients that issue only reads (and would normally be connected to the slaves) are not shown, as they do not need to switch to a new server in the event of failure. For a more detailed example of a read/write scaleout replication structure, see Section 16.2.3, “Using Replication for Scale-Out”.

Each `MySQL Slave` (`Slave 1`, `Slave 2`, and `Slave 3`) are slaves running with `--log-bin` and without `--log-slave-updates`. Because updates received by a slave from the master are not logged in the binary log unless `--log-slave-updates` is specified, the binary log on each slave is empty initially. If for some reason `MySQL Master` becomes unavailable, you can pick one of the slaves to become the new master. For example, if you pick `Slave 1`, all `Web Clients` should be redirected to `Slave 1`, which will log updates to its binary log. `Slave 2` and `Slave 3` should then replicate from `Slave 1`.

The reason for running the slave without `--log-slave-updates` is to prevent slaves from receiving updates twice in case you cause one of the slaves to become the new master. Suppose that `Slave 1` has `--log-slave-updates` enabled. Then it will write updates that it receives from `Master` to its own binary log. When `Slave 2` changes from `Master` to `Slave 1` as its master, it may receive updates from `Slave 1` that it has already received from `Master`.

Make sure that all slaves have processed any statements in their relay log. On each slave, issue `STOP SLAVE IO_THREAD`, then check the output of `SHOW PROCESSLIST` until you see `Has read all relay log`. When this is true for all slaves, they can be reconfigured to the new setup. On the slave `Slave 1` being promoted to become the master, issue `STOP SLAVE` and `RESET MASTER`.

On the other slaves `Slave 2` and `Slave 3`, use `STOP SLAVE` and `CHANGE MASTER TO MASTER_HOST='Slave1'` (where `'Slave1'` represents the real host name of `Slave 1`). To use `CHANGE MASTER TO`, add all information about how to connect to `Slave 1` from `Slave 2` or `Slave 3` (`user`, `password`, `port`). In `CHANGE MASTER TO`, there is no need to specify the name of `Slave 1`'s binary log or binary log position to read from: We know it is the first binary log and position 4, which are the defaults for `CHANGE MASTER TO`. Finally, use `START SLAVE` on `Slave 2` and `Slave 3`.

Once the new replication is in place, you will then need to instruct each `Web Client` to direct their statements to `Slave 1`.

From that point on, all updates statements sent by `Web Client` to `Slave 1` are written to the binary log of `Slave 1`, which then contains every update statement sent to `Slave 1` since `Master` died.

The resulting server structure is shown in Figure 16.5, “Redundancy using replication, after master failure”.

Figure 16.5. Redundancy using replication, after master failure

When `Master` is up again, you must issue on it the same `CHANGE MASTER TO` as that issued on `Slave 2` and `Slave 3`, so that `Master` becomes a slave of `S1` and picks up each `Web Client` writes that it missed while it was down.

To make `Master` a master again (because it is the most powerful machine, for example), use the preceding procedure as if `Slave 1` was unavailable and `Master` was to be the new master. During this procedure, do not forget to run `RESET MASTER` on `Master` before making `Slave 1`, `Slave 2`, and `Slave 3` slaves of `Master`. Otherwise, they may pick up old `Web Client` writes from before the point at which `Master` became unavailable.

Note that there is no synchronization between the different slaves to a master. Some slaves might be ahead of others. This means that the concept outlined in the previous example might not work. In practice, however, the relay logs of different slaves will most likely not be far behind the master, so it would work, anyway (but there is no guarantee).

A good way to keep your applications informed as to the location of the master is by having a dynamic DNS entry for the master. With `bind` you can use `nsupdate` to dynamically update your DNS.

16.2.7. Setting Up Replication Using SSL

Setting up replication using an SSL connection is similar to setting up a server and client using SSL. You will need to obtain (or create) a suitable security certificate that you can use on the master, and a similar certificate (from the same certificate authority) on each slave.

To use SSL for encrypting the transfer of the binary log required during replication you must first set up the master to support SSL

network connections. If the master does not support SSL connections (because it has not been compiled or configured for SSL), then replication through an SSL connection will not be possible.

For more information on setting up a server and client for SSL connectivity, see [Section 5.5.7.2, “Using SSL Connections”](#).

To enable SSL on the master you will need to create or obtain suitable certificates and then add the following configuration options to the master's configuration within the `mysqld` section:

```
ssl-ca=cacert.pem
ssl-cert=server-cert.pem
ssl-key=server-key.pem
```

Note

You should use full path to specify the location of your certificate files.

The options are as follows:

- `ssl-ca` identifies the Certificate Authority (CA) certificate.
- `ssl-cert` identifies the server public key. This can be sent to the client and authenticated against the CA certificate that it has.
- `ssl-key` identifies the server private key.

On the slave, you have two options available for setting the SSL information. You can either add the slaves certificates to the `client` section of the slave configuration file, or you can explicitly specify the SSL information using the `CHANGE MASTER TO` statement.

Using the former option, add the following lines to the `client` section of the slave configuration file:

```
[client]
ssl-ca=cacert.pem
ssl-cert=server-cert.pem
ssl-key=server-key.pem
```

Restart the slave server, using the `--skip-slave` to prevent the slave from connecting to the master. Use `CHANGE MASTER TO` to specify the master configuration, using the `master_ssl` option to enable SSL connectivity:

```
mysql> CHANGE MASTER TO \
  MASTER_HOST='master_hostname', \
  MASTER_USER='replicate', \
  MASTER_PASSWORD='password', \
  MASTER_SSL=1;
```

To specify the SSL certificate options during the `CHANGE MASTER TO` command, append the SSL options:

```
CHANGE MASTER TO \
  MASTER_HOST='master_hostname', \
  MASTER_USER='replicate', \
  MASTER_PASSWORD='password', \
  MASTER_SSL=1, \
  MASTER_SSL_CA = 'ca_file_name', \
  MASTER_SSL_CAPATH = 'ca_directory_name', \
  MASTER_SSL_CERT = 'cert_file_name', \
  MASTER_SSL_KEY = 'key_file_name';
```

Once the master information has been updated, start the slave replication process:

```
mysql> START SLAVE;
```

You can use the `SHOW SLAVE STATUS` to confirm that SSL connection has been completed.

For more information on the `CHANGE MASTER TO` syntax, see [Section 12.6.2.1, “CHANGE MASTER TO Syntax”](#).

If you want to enforce SSL connections to be used during replication, then create a user with the `REPLICATION SLAVE` privilege and use the `REQUIRE_SSL` option for that user. For example:

```
mysql> GRANT REPLICATION SLAVE ON *.*
-> TO 'repl'@'%'.mydomain.com IDENTIFIED BY 'slavepass' REQUIRE SSL;
```

16.3. Replication Notes and Tips

16.3.1. Replication Features and Issues

The following sections provide information about what is supported and what is not in MySQL replication, and about specific issues and situations that may occur when replicating certain statements.

Statement-based replication depends on compatibility at the SQL level between the master and slave. In others, successful SBR requires that any SQL features used be supported by both the master and the slave servers. For example, if you use a feature on the master server that is available only in MySQL 5.4 (or later), you cannot replicate to a slave that uses MySQL 5.1 (or earlier).

Such incompatibilities also can occur within a release series when using pre-production releases of MySQL. For example, the `SLEEP()` function is available beginning with MySQL 5.0.12. If you use this function on the master, you cannot replicate to a slave that uses MySQL 5.0.11 or earlier.

For this reason, we recommend that you use Generally Available (GA) releases of MySQL for statement-based replication in a production setting, since we do not introduce new SQL statements or change their behavior within a given release series once that series reaches GA release status.

If you are planning to use statement-based replication between MySQL 5.4 and a previous MySQL release series, it is also a good idea to consult the edition of the *MySQL Reference Manual* corresponding to the earlier release series for information regarding the replication characteristics of that series.

With MySQL's classic statement-based replication, there may be issues with replicating stored routines or triggers. You can avoid these issues by using MySQL's row-based replication instead. For a detailed list of issues, see [Section 18.6, “Binary Logging of Stored Programs”](#). For more information about row-based replication, see [Section 16.1.2, “Replication Formats”](#).

For additional information specific to replication and InnoDB, see [Section 13.6.4.5, “InnoDB and MySQL Replication”](#). For information relating to replication with MySQL Cluster, see [MySQL Cluster Replication](#).

16.3.1.1. Replication and `AUTO_INCREMENT`

Statement-based replication of `AUTO_INCREMENT`, `LAST_INSERT_ID()`, and `TIMESTAMP` values is done correctly, subject to the following exceptions:

- An insert into an `AUTO_INCREMENT` column caused by a stored routine or trigger running on a master that uses MySQL 5.0.60 or earlier does not replicate correctly to a slave running MySQL 5.1.12 through 5.1.23 (inclusive). ([Bug#33029](#))
- Adding an `AUTO_INCREMENT` column to a table with `ALTER TABLE` might not produce the same ordering of the rows on the slave and the master. This occurs because the order in which the rows are numbered depends on the specific storage engine used for the table and the order in which the rows were inserted. If it is important to have the same order on the master and slave, the rows must be ordered before assigning an `AUTO_INCREMENT` number. Assuming that you want to add an `AUTO_INCREMENT` column to the table `t1`, the following statements produce a new table `t2` identical to `t1` but with an `AUTO_INCREMENT` column:

```
CREATE TABLE t2 LIKE t1;
ALTER TABLE t2 ADD id INT AUTO_INCREMENT PRIMARY KEY;
INSERT INTO t2 SELECT * FROM t1 ORDER BY col1, col2;
```

This assumes that the table `t1` has columns `col1` and `col2`.

Important

To guarantee the same ordering on both master and slave, *all* columns of `t1` must be referenced in the `ORDER BY` clause.

The instructions just given are subject to the limitations of `CREATE TABLE ... LIKE`: Foreign key definitions are ignored, as are the `DATA DIRECTORY` and `INDEX DIRECTORY` table options. If a table definition includes any of those characteristics, create `t2` using a `CREATE TABLE` statement that is identical to the one used to create `t1`, but with the addition of the `AUTO_INCREMENT` column.

Regardless of the method used to create and populate the copy having the `AUTO_INCREMENT` column, the final step is to drop the original table and then rename the copy:

```
DROP t1;
ALTER TABLE t2 RENAME t1;
```

See also [Section B.1.7.1, “Problems with `ALTER TABLE`”](#).

16.3.1.2. Replication and Character Sets

The following applies to replication between MySQL servers that use different character sets:

1. If the master uses MySQL 4.1, you must *always* use the same *global* character set and collation on the master and the slave, regardless of the MySQL version running on the slave. (These are controlled by the `--character-set-server` and `--collation-server` options.) Otherwise, you may get duplicate-key errors on the slave, because a key that is unique in the master character set might not be unique in the slave character set. Note that this is not a cause for concern when master and slave are both MySQL 5.0 or later.
2. If the master is older than MySQL 4.1.3, the character set of any client should never be made different from its global value because this character set change is not known to the slave. In other words, clients should not use `SET NAMES`, `SET CHARACTER SET`, and so forth. If both the master and the slave are 4.1.3 or newer, clients can freely set session values for character set variables because these settings are written to the binary log and so are known to the slave. That is, clients can use `SET NAMES` or `SET CHARACTER SET` or can set variables such as `collation_client` or `collation_server`. However, clients are prevented from changing the *global* value of these variables; as stated previously, the master and slave must always have identical global character set values. This is true whether you are using statement-based or row-based replication.
3. If you have databases on the master with character sets that differ from the global `character_set_server` value, you should design your `CREATE TABLE` statements so that tables in those databases do not implicitly rely on the database default character set. A good workaround is to state the character set and collation explicitly in `CREATE TABLE` statements.

16.3.1.3. Replication of `CREATE TABLE ... SELECT` Statements

This section discusses the rules that are applied when a `CREATE TABLE ... SELECT` statement is replicated.

Note

`CREATE TABLE ... SELECT` always performs an implicit commit (Section 12.4.3, “Statements That Cause an Implicit Commit”).

Statement succeeds. If the `CREATE TABLE ... SELECT` statement succeeds on the master, then it is replicated as follows:

- **STATEMENT or MIXED format.** The `CREATE TABLE ... SELECT` statement is itself replicated.
- **ROW format.** The statement is replicated as a `CREATE TABLE` statement followed by a series of `binwrite` events (that is, binary inserts).

Statement fails. The failure of a `CREATE TABLE ... SELECT` is handled according to the following criteria:

- **No `IF NOT EXISTS` option.** If the `CREATE TABLE ... SELECT` does not contain an `IF NOT EXISTS` option, then the statement has no effect. However, the implicit commit caused by the statement is logged. This is true regardless of the replication format, storage engine used, and the reason for which the statement failed.
- **Statement uses `IF NOT EXISTS`.** If the `CREATE TABLE ... SELECT` statement includes the `IF NOT EXISTS` option and fails, the failure is handled according to the replication format. If the row-based format is in use, the action taken depends additionally on whether or not the table to be created uses a transactional or non-transactional storage engine, and on the reason for the failure:
 - **STATEMENT or MIXED format.** When using statement-based or mixed-format replication, the `CREATE TABLE IF NOT EXISTS ... SELECT` is logged with an error.
 - **ROW format.** When row-based replication is used, failure of a `CREATE TABLE ... SELECT` that includes `IF NOT EXISTS` is handled differently depending on the reason for the failure, as shown in the following diagram:

Transactional Table?	Reason for Failure		
	CREATE Succeeded; SELECT or Inserts Failed	CREATE Failed (Table Already Exists)	CREATE Failed (Other Reason)
YES	<ol style="list-style-type: none"> 1. Table is dropped 2. Implicit commit is logged 	<ol style="list-style-type: none"> 1. CREATE TABLE statement is not logged 2. Applied rows are logged 3. Implicit commit is logged 	Only implicit commit is logged
NO	<ol style="list-style-type: none"> 1. CREATE TABLE statement is logged 2. Applied rows are logged 3. Implicit commit is logged 		

16.3.1.4. Replication with Differing Tables on Master and Slave

Source and target tables for replication do not have to be identical. A table on the master can have more or fewer columns than the slave's copy of the table. In addition — subject to certain conditions — corresponding table columns on the master and the slave can use different data types.

In all cases where the source and target tables do not have identical definitions, the following must be true in order for replication to work:

- You must be using row-based replication. (Using `MIXED` for the binary logging format does not work.)
- The database and table names must be the same on both the master and the slave.

Additional conditions are discussed (and examples provided) in the following two sections.

16.3.1.4.1. Replication with More Columns on Master or Slave

You can replicate a table from the master to the slave such that the master's copy of the table and the slave's copy of the table do not have the same number of columns, subject to the following conditions:

- Each “extra” column in the version of the table having more columns must have a default value.

Note

A column's default value is determined by a number of factors, including its type, whether it is defined with a `DEFAULT` option, whether it is declared as `NULL`, and the server SQL mode in effect at the time of its creation; see [Section 10.1.4, “Data Type Default Values”](#), for more information.

- Matching columns must be defined in the same order on both the master and the slave.
- Any additional columns must be defined following the matching columns.

In addition, when the slave's copy of the table has more columns than the master's copy, then each matching column must use the same data type.

Examples. The following examples illustrate some valid and invalid table definitions:

- **More columns on the master.** The following table definitions are valid:

```
master> CREATE TABLE t1 (c1 INT, c2 INT, c3 INT);
slave> CREATE TABLE t1 (c1 INT, c2 INT);
```

The following table definitions would raise Error 1532 (`ER_BINLOG_ROW_RBR_TO_SBR`) because the definitions of the columns common to both versions of the table are in a different order on the slave than they are on the master:

```

master> CREATE TABLE t1 (c1 INT, c2 INT, c3 INT);
slave> CREATE TABLE t1 (c2 INT, c1 INT);

```

The following table definitions would also raise Error 1532, because the definition of the extra column on the master appears before the definitions of the columns common to both versions of the table:

```

master> CREATE TABLE t1 (c3 INT, c1 INT, c2 INT);
slave> CREATE TABLE t1 (c1 INT, c2 INT);

```

- **More columns on the slave.** The following definitions replicate correctly:

```

master> CREATE TABLE t1 (c1 INT, c2 INT);
slave> CREATE TABLE t1 (c1 INT, c2 INT, c3 INT);

```

The following definitions raise Error 1532 because the columns common to both versions of the table are not defined in the same order on both the master and the slave:

```

master> CREATE TABLE t1 (c1 INT, c2 INT);
slave> CREATE TABLE t1 (c2 INT, c1 INT, c3 INT);

```

The following table definitions also raise Error 1532 because the definition for the extra column in the slave's version of the table appears before the definitions for the columns which are common to both versions of the table:

```

master> CREATE TABLE t1 (c1 INT, c2 INT);
slave> CREATE TABLE t1 (c3 INT, c1 INT, c2 INT);

```

The following table definitions fail, because the slave's version of the table has additional columns compared to the master's version, and the two versions of the table define column `c2` as a different data type.

```

master> CREATE TABLE t1 (c1 INT, c2 BIGINT);
slave> CREATE TABLE t1 (c1 INT, c2 INT, c3 INT);

```

16.3.1.4.2. Replication of Columns Having Different Data Types

Corresponding columns on the master's and the slave's copies of the same table ideally should have the same data type. However, this is not always strictly enforced, as long as certain conditions are met. These conditions are listed here:

- The slave's copy of the table cannot contain more columns than the master's copy.
- For columns holding numeric data types, the sizes may differ, as long as the size of the slave's version of the column is equal or greater to the size of the master's version of the column. This is sometimes referred to as *attribute promotion*, because the data type of the master's version of the column is promoted to a type that is the same size or larger on the slave.

Data type conversions currently supported by attribute promotion are shown in the following table, in which *X* and *N* both represent positive integers.

Original Data Type	Promoted Data Type(s)
CHAR(<i>X</i>)	CHAR(<i>X+N</i>)
VARCHAR(<i>X</i>)	VARCHAR(<i>X+N</i>)
CHAR(<i>X</i>)	VARCHAR(<i>X+N</i>)
BINARY(<i>X</i>)	BINARY(<i>X+N</i>)
VARBINARY(<i>X</i>)	VARBINARY(<i>X+N</i>)
BINARY(<i>X</i>)	VARBINARY(<i>X+N</i>)
BIT(<i>X</i>)	BIT(<i>X+N</i>)
TINYINT	SMALLINT, MEDIUMINT, INT, or BIGINT
SMALLINT	MEDIUMINT, INT, or BIGINT
MEDIUMINT	INT or BIGINT
INT	BIGINT

Unsigned integer columns can be promoted to larger unsigned types; for example, a column declared as `TINYINT UNSIGNED` can be restored to a column declared as `SMALLINT UNSIGNED`, `MEDIUMINT UNSIGNED`, `INT UNSIGNED`, or `BIGINT UNSIGNED`. You cannot promote a signed column to an unsigned type, or an unsigned column to a signed type.

For columns holding numeric data types the sizes may differ, as long as the size of the slave's version of the column is equal or greater to the size of the master's version of the column. For example, the following table definitions are allowed:

```
master> CREATE TABLE t1 (c1 TINYINT, c2 INT);
slave> CREATE TABLE t1 (c1 INT, c2 INT);
```

The slave's versions of both columns `c1` and `c2` are the same size as or larger than the master's versions of these columns. However, the following definitions would fail:

```
master> CREATE TABLE t1 (c1 INT, c2 FLOAT(8,3));
slave> CREATE TABLE t1 (c1 INT, c2 FLOAT(7,3));
```

In this case, Error 1532 would be raised because the master's copy of column `c2` is larger than its counterpart on the slave — that is, the master's copy of `c2` on the master can hold more digits than the slave's copy of the column.

- There is no conversion between integer (`TINYINT`, `SMALLINT`, `MEDIUMINT`, and so on) and non-integer (`FLOAT`, `DOUBLE`, `DECIMAL`, and so on) numeric data types, and so the following definitions would fail with Error 1532:

```
master> CREATE TABLE t1 (c1 INT, c2 FLOAT(8,3));
slave> CREATE TABLE t1 (c1 INT, c2 BIGINT);
```

A column using a non-integer numeric data type must always have the same definition on both the master and the slave.

- For columns storing `CHAR` and `BINARY` data, the size of the slave's copy of the column must be equal to or greater than the size of the master's copy. For example, the following table definitions would replicate successfully:

```
master> CREATE TABLE t1 (c1 INT, c2 CHAR(30));
slave> CREATE TABLE t1 (c1 INT, c2 CHAR(50));
```

If the size of the master's version of the column is greater than that of the slave's version of the column, replication fails with Error 1532.

- The replication process can convert freely between `BINARY`, `VARBINARY`, `CHAR` and `VARCHAR` columns, as long as the slave's version of the column is the same size as or larger than the master's version. For example, the following table definitions can be used successfully:

```
master> CREATE TABLE t1 (c1 INT, c2 VARBINARY(30));
slave> CREATE TABLE t1 (c1 INT, c2 CHAR(30));
```

Note

Since replication is currently not supported between different character sets, it is sufficient when comparing sizes of columns containing character data to count the number of characters rather than the number of bytes.

- Attribute promotion can be used with both statement-based and row-based replication, and is not dependent on the storage engine used by either the master or the slave.

16.3.1.5. Replication and `DIRECTORY` Table Options

If a `DATA DIRECTORY` or `INDEX DIRECTORY` table option is used in a `CREATE TABLE` statement on the master server, the table option is also used on the slave. This can cause problems if no corresponding directory exists in the slave host file system or if it exists but is not accessible to the slave server. This can be overridden by using the `NO_DIR_IN_CREATE` server SQL mode on the slave, which causes the slave to ignore the `DATA DIRECTORY` and `INDEX DIRECTORY` table options when replicating `CREATE TABLE` statements. The result is that `MyISAM` data and index files are created in the table's database directory.

For more information, see [Section 5.1.7, “Server SQL Modes”](#).

16.3.1.6. Replication of `DROP ... IF EXISTS` Statements

The statements `DROP DATABASE IF EXISTS`, `DROP TABLE IF EXISTS`, and `DROP VIEW IF EXISTS` are always replicated, even if the database, table, or view to be dropped does not exist on the master. This is to ensure that the object to be dropped no longer exists on either the master or the slave, once the slave has caught up with the master.

The statements `DROP PROCEDURE IF EXISTS` and `DROP FUNCTION IF EXISTS` are also replicated, even if the procedure or function to be dropped does not exist on the master. ([Bug#13684](#))

16.3.1.7. Replication of Invoked Features

Replication of invoked features such as scheduled events, user-defined functions (UDFs), stored routines (including both stored procedures and stored functions), and triggers provides the following characteristics:

- The effects of the feature are always replicated.
- The following statements are replicated using statement-based replication:
 - `CREATE EVENT`
 - `ALTER EVENT`
 - `DROP EVENT`
 - `CREATE PROCEDURE`
 - `DROP PROCEDURE`
 - `CREATE FUNCTION`
 - `DROP FUNCTION`
 - `CREATE TRIGGER`
 - `DROP TRIGGER`

However, the *effects* of features created, modified, or dropped using these statements are replicated using row-based replication.

Note

Attempting to replicate invoked features using statement-based replication produces the warning `STATEMENT IS NOT SAFE TO LOG IN STATEMENT FORMAT`. For example, trying to replicate a UDF with statement-based replication generates this warning because it currently cannot be determined by the MySQL server whether the UDF is deterministic. If you are absolutely certain that the invoked feature's effects are deterministic, you can safely disregard such warnings.

In a future MySQL release, we may implement ways for users to indicate that such features are deterministic, so that they can be recognized by the server as “safe” for statement-based replication. ([Bug#34597](#))

- In the case of `CREATE EVENT` and `ALTER EVENT`:
 - The status of the event is set to `SLAVESIDE_DISABLED` on the slave regardless of the state specified (this does not apply to `DROP EVENT`).
 - The master on which the event was created is identified on the slave by its server ID. The `ORIGINATOR` column in `INFORMATION_SCHEMA.EVENTS` and the `originator` column in `mysql.event` store this information. (See [Section 19.20](#), “The `INFORMATION_SCHEMA.EVENTS` Table”, and [Section 12.5.5.19](#), “`SHOW EVENTS` Syntax”.)
- The feature implementation resides on the slave in a renewable state so that if the master fails, the slave can be used as the master without loss of event processing.

To determine whether there are any scheduled events on a MySQL server that were created on a different server (that was acting as a replication master), use `SHOW EVENTS`, like this:

```
SHOW EVENTS
WHERE STATUS = 'SLAVESIDE_DISABLED';
```

Alternatively, you might wish to query the `INFORMATION_SCHEMA.EVENTS` table as shown here:

```
SELECT EVENT_SCHEMA, EVENT_NAME, ORIGINATOR
FROM INFORMATION_SCHEMA.EVENTS
WHERE STATUS = 'SLAVESIDE_DISABLED';
```

When promoting a replication slave having such events to a replication master, use the following query to enable the events:

```
UPDATE mysql.event
SET STATUS = 'ENABLED'
WHERE STATUS = 'SLAVESIDE_DISABLED';
```

If more than one master was involved in creating events on this slave, and you wish to enable events that were created only on a given master having the server ID `master_id`, use the following query instead:

```
UPDATE mysql.event
SET STATUS = 'ENABLED'
WHERE ORIGINATOR = master_id
AND STATUS = 'SLAVESIDE_DISABLED';
```

Important

Before executing either of the previous two `UPDATE` statements, you should disable the Event Scheduler on the slave (using `SET GLOBAL EVENT_SCHEDULER = OFF;`), run the `UPDATE`, restart the server, then re-enable the Event Scheduler afterwards (using `SET GLOBAL EVENT_SCHEDULER = ON;`).

If you later demote the new master back to being a replication slave, you must disable manually all events enabled by the `UPDATE` statement. You can do this by storing in a separate table the event names from the `SELECT` statement shown previously, or using an `UPDATE` statement to rename the events with a common prefix to identify them, as shown in this example:

```
UPDATE mysql.event
  SET name = CONCAT('replicated_', name)
  WHERE status = 'SLAVESIDE_DISABLED';
```

When demoting this server back to being a replication slave, you can then rename and disable the events like this:

```
UPDATE mysql.event
  SET name = REPLACE(name, 'replicated_', ''),
      status = 'SLAVESIDE_DISABLED'
  WHERE INSTR(name, 'replicated_') = 1;
```

16.3.1.8. Replication with Floating-Point Values

With statement-based replication, values are converted from decimal to binary. Because conversions between decimal and binary representations of them may be approximate, comparisons involving floating-point values are inexact. This is true for operations that use floating-point values explicitly, or that use values that are converted to floating-point implicitly. Comparisons of floating-point values might yield different results on master and slave servers due to differences in computer architecture, the compiler used to build MySQL, and so forth. See [Section 11.2.2, “Type Conversion in Expression Evaluation”](#), and [Section B.1.5.8, “Problems with Floating-Point Comparisons”](#).

16.3.1.9. Replication and FLUSH

Some forms of the `FLUSH` statement are not logged because they could cause problems if replicated to a slave: `FLUSH LOGS`, `FLUSH MASTER`, `FLUSH SLAVE`, and `FLUSH TABLES WITH READ LOCK`. For a syntax example, see [Section 12.5.6.3, “FLUSH Syntax”](#). The `FLUSH TABLES`, `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` statements are written to the binary log and thus replicated to slaves. This is not normally a problem because these statements do not modify table data.

However, this behavior can cause difficulties under certain circumstances. If you replicate the privilege tables in the `mysql` database and update those tables directly without using `GRANT`, you must issue a `FLUSH PRIVILEGES` on the slaves to put the new privileges into effect. In addition, if you use `FLUSH TABLES` when renaming a `MyISAM` table that is part of a `MERGE` table, you must issue `FLUSH TABLES` manually on the slaves. These statements are written to the binary log unless you specify `NO_WRITE_TO_BINLOG` or its alias `LOCAL`.

16.3.1.10. Replication and System Functions

Certain functions do not replicate well under some conditions:

- The `USER()`, `CURRENT_USER()`, `UUID()`, `VERSION()`, and `LOAD_FILE()` functions are replicated without change and thus do not work reliably on the slave unless row-based replication is enabled. This is also true for `CURRENT_USER`. (See [Section 16.1.2, “Replication Formats”](#).)

`USER()`, `CURRENT_USER()`, and `CURRENT_USER` are automatically replicated using row-based replication when using `MIXED` mode, and generate a warning in `STATEMENT` mode. ([Bug#28086](#))

- For `NOW()`, the binary log includes the timestamp and replicates correctly.

Unlike `NOW()`, the `SYSDATE()` function is not replication-safe because it is not affected by `SET TIMESTAMP` statements in the binary log and is non-deterministic if statement-based logging is used. This is not a problem if row-based logging is used. Another option is to start the server with the `--sysdate-is-now` option to cause `SYSDATE()` to be an alias for `NOW()`.

- *The following restriction applies to statement-based replication only, not to row-based replication.* The `GET_LOCK()`, `RELEASE_LOCK()`, `IS_FREE_LOCK()`, and `IS_USED_LOCK()` functions that handle user-level locks are replicated without the slave knowing the concurrency context on master. Therefore, these functions should not be used to insert into a master's table because the content on the slave would differ. (For example, do not issue a statement such as `INSERT INTO mytable VALUES(GET_LOCK(...))`.)

As a workaround for the preceding limitations when statement-based replication is in effect, you can use the strategy of saving the problematic function result in a user variable and referring to the variable in a later statement. For example, the following single-

row `INSERT` is problematic due to the reference to the `UUID()` function:

```
INSERT INTO t VALUES(UUID());
```

To work around the problem, do this instead:

```
SET @my_uuid = UUID();
INSERT INTO t VALUES(@my_uuid);
```

That sequence of statements replicates because the value of `@my_uuid` is stored in the binary log as a user-variable event prior to the `INSERT` statement and is available for use in the `INSERT`.

The same idea applies to multiple-row inserts, but is more cumbersome to use. For a two-row insert, you can do this:

```
SET @my_uuid1 = UUID(); @my_uuid2 = UUID();
INSERT INTO t VALUES(@my_uuid1),(@my_uuid2);
```

However, if the number of rows is large or unknown, the workaround is difficult or impracticable. For example, you cannot convert the following statement to one in which a given individual user variable is associated with each row:

```
INSERT INTO t2 SELECT UUID(), * FROM t1;
```

Within a stored function, `RAND()` replicates correctly as long as it is invoked only once during the execution of the function. (You can consider the function execution timestamp and random number seed as implicit inputs that are identical on the master and slave.)

The `FOUND_ROWS()` and `ROW_COUNT()` functions are not replicated reliably using statement-based replication. A workaround is to store the result of the function call in a user variable, and then use that in the `INSERT` statement. For example, if you wish to store the result in a table named `mytable`, you might normally do so like this:

```
SELECT SQL_CALC_FOUND_ROWS FROM mytable LIMIT 1;
INSERT INTO mytable VALUES( FOUND_ROWS() );
```

However, if you are replicating `mytable`, then you should use `SELECT INTO`, and then store the variable in the table, like this:

```
SELECT SQL_CALC_FOUND_ROWS INTO @found_rows FROM mytable LIMIT 1;
INSERT INTO mytable VALUES(@found_rows);
```

In this way, the user variable is replicated as part of the context, and applied on the slave correctly.

These functions are automatically replicated using row-based replication when using `MIXED` mode, and generate a warning in `STATEMENT` mode. ([Bug#12092](#), [Bug#30244](#))

16.3.1.11. Replication and `LIMIT`

Statement-based replication of `LIMIT` clauses in `DELETE`, `UPDATE`, and `INSERT ... SELECT` statements is unsafe since the order of the rows affected is not defined. (Such statements can be replicated correctly when using `STATEMENT` mode only if they also contain an `ORDER BY` clause.) When such a statement is encountered:

- When using `STATEMENT` mode, a warning that the statement is not safe for statement-based replication is now issued.

Currently, when using `STATEMENT` mode, warnings are issued for DML statements containing `LIMIT` even when they also have an `ORDER BY` clause (and so are made deterministic). This is a known issue which we are working to resolve in a future MySQL release. ([Bug#42851](#))

- When using `MIXED` mode, the statement is now automatically replicated using row-based mode.

16.3.1.12. Replication and `LOAD DATA`

The `LOAD DATA` statement is not replicated correctly to a slave running MySQL 5.1 or later from a master running MySQL 4.0 or earlier.

When using statement-based replication, the `LOAD DATA INFILE` statement's `CONCURRENT` option is not replicated; that is, `LOAD DATA CONCURRENT INFILE` is replicated as `LOAD DATA INFILE`, and `LOAD DATA CONCURRENT LOCAL INFILE` is replicated as `LOAD DATA LOCAL INFILE`. The `CONCURRENT` option is replicated when using row-based replication. ([Bug#34628](#))

16.3.1.13. Replication and the Slow Query Log

Replication slaves do not write replicated queries to the slow query log, even if the same queries were written to the slow query log on the master.

This is a known issue which we intend to fix in a future version of MySQL. ([Bug#23300](#))

16.3.1.14. Replication During a Master Crash

A crash on the master side can result in the master's binary log having a final position less than the most recent position read by the slave, due to the master's binary log file not being flushed. This can cause the slave not to be able to replicate when the master comes back up. Setting `sync_binlog=1` in the master `my.cnf` file helps to minimize this problem because it causes the master to flush its binary log more frequently.

16.3.1.15. Replication During a Master Shutdown

It is safe to shut down a master server and restart it later. When a slave loses its connection to the master, the slave tries to reconnect immediately and retries periodically if that fails. The default is to retry every 60 seconds. This may be changed with the `CHANGE MASTER TO` statement or `--master-connect-retry` option. A slave also is able to deal with network connectivity outages. However, the slave notices the network outage only after receiving no data from the master for `slave_net_timeout` seconds. If your outages are short, you may want to decrease `slave_net_timeout`. See [Section 5.1.3, “Server System Variables”](#).

16.3.1.16. Replication with MEMORY Tables

When a server shuts down and restarts, its `MEMORY` tables become empty. The master replicates this effect to slaves as follows: The first time that the master uses each `MEMORY` table after startup, it logs an event that notifies the slaves that the table needs to be emptied by writing a `DELETE` statement for that table to the binary log. See [Section 13.9, “The MEMORY \(HEAP\) Storage Engine”](#), for more information about `MEMORY` tables.

16.3.1.17. Replication of the System `mysql` Database

Data modification statements made to tables in the `mysql` database are replicated according to the value of `binlog_format`; if this value is `MIXED`, then these statements are replicated using the row-based format. However, statements that would normally update this information indirectly — such as `GRANT`, `REVOKE`, and statements manipulating triggers, stored routines, and views — are replicated to slaves using statement-based replication.

16.3.1.18. Replication and the Query Optimizer

It is possible for the data on the master and slave to become different if a statement is designed in such a way that the data modification is non-deterministic; that is, left up to the query optimizer. (This is in general not a good practice, even outside of replication.) Examples of non-deterministic statements include `DELETE` or `UPDATE` statements that use `LIMIT` with no `ORDER BY` clause; see [Section 16.3.1.11, “Replication and LIMIT”](#), for a detailed discussion of these.

16.3.1.19. Replication and Reserved Words

You can encounter problems when you are attempting to replicate from an older master to a newer slave and you make use of identifiers on the master that are reserved words in the newer MySQL version running on the slave. An example of this is using a table column named `current_user` on a 4.0 master that is replicating to a 4.1 or higher slave, because `CURRENT_USER` is a reserved word beginning in MySQL 4.1. Replication can fail in such cases with Error 1064 `YOU HAVE AN ERROR IN YOUR SQL SYNTAX. . . , even if a database or table named using the reserved word or a table having a column named using the reserved word is excluded from replication`. This is due to the fact that each SQL statement must be parsed by the slave prior to execution, so that the slave knows which database object or objects would be effected by the statement; only after the statement is parsed can the slave apply any filtering rules defined by `--replicate-do-db`, `--replicate-do-table`, `--replicate-ignore-db`, and `--replicate-ignore-table`.

To work around the problem of database, table, or column names on the master which would be regarded as reserved words by the slave, do one of the following:

- Use one or more `ALTER TABLE` statements on the master to change the names of any database objects where these names would be considered reserved words on the slave, and change any SQL statements that use the old names to use the new names instead.
- In any SQL statements using these database object names, set the names off using backtick characters (```).

For listings of reserved words by MySQL version, see [Reserved Words](#), in the *MySQL Server Version Reference*.

16.3.1.20. Slave Errors during Replication

If a statement on a slave produces an error, the slave SQL thread terminates, and the slave writes a message to its error log. You should then connect to the slave manually and determine the cause of the problem. (`SHOW SLAVE STATUS` is useful for this.) Then fix the problem (for example, you might need to create a non-existent table) and run `START SLAVE`.

16.3.1.21. Replication during a Slave Shutdown

Shutting down the slave (cleanly) is also safe because it keeps track of where it left off. Unclean shutdowns might produce problems, especially if the disk cache was not flushed to disk before the system went down. Your system fault tolerance is greatly increased if you have a good uninterruptible power supply. Unclean shutdowns of the master may cause inconsistencies between the content of tables and the binary log in master.

16.3.1.22. Replication and Temporary Tables

This item does not apply when row-based replication is in use because in that case temporary tables are not replicated (see [Section 16.1.2](#), “Replication Formats”).

Safe shutdown of slaves when using temporary tables. Temporary tables are replicated except in the case where you shut down the slave server (not just the slave threads) and you have replicated temporary tables that are used in updates that have not yet been executed on the slave. If you shut down the slave server, the temporary tables needed by those updates are no longer available when the slave is restarted. To avoid this problem, do not shut down the slave while it has temporary tables open. Instead, use the following procedure:

1. Issue a `STOP SLAVE SQL_THREAD` statement.
2. Use `SHOW STATUS` to check the value of the `Slave_open_temp_tables` variable.
3. If the value is 0, issue a `mysqladmin shutdown` command to stop the slave.
4. If the value is not 0, restart the slave SQL thread with `START SLAVE SQL_THREAD`.
5. Repeat the procedure later until the `Slave_open_temp_tables` variable is 0 and you can stop the slave.

Temporary tables and replication options. By default, all temporary tables are replicated; this happens whether or not there are any matching `--replicate-do-db`, `--replicate-do-table`, or `--replicate-wild-do-table` options in effect. However, the `--replicate-ignore-table` and `--replicate-wild-ignore-table` options are honored for temporary tables.

A recommended practice when using statement-based or mixed-format replication is to designate a prefix for exclusive use in naming temporary tables that you do not want replicated, then employ a matching `--replicate-wild-ignore-table` option. For example, you might give all such tables names beginning with `norep_` (such as `norep_tablea`, `norep_tableb`, and so on), then use `--replicate-wild-ignore-table=norep_` to prevent the replication of these tables.

16.3.1.23. Replication Retries and Timeouts

The global system variable `slave_transaction_retries` affects replication as follows: If the replication slave SQL thread fails to execute a transaction because of an InnoDB deadlock or because it exceeded the InnoDB `innodb_lock_wait_timeout` value, or the NDBCLUSTER `TransactionDeadlockDetectionTimeout` or `TransactionInactiveTimeout` value, the transaction is automatically retried `slave_transaction_retries` times before stopping with an error. The default value is 10. The total retry count can be seen in the output of `SHOW STATUS`; see [Section 5.1.6](#), “Server Status Variables”.

16.3.1.24. Replication and Time Zones

If the master uses MySQL 4.1, the same system time zone should be set for both master and slave. Otherwise some statements will not be replicated properly, such as statements that use the `NOW()` or `FROM_UNIXTIME()` functions. You can set the time zone in which MySQL server runs by using the `--timezone=timezone_name` option of the `mysqld_safe` script or by setting the `TZ` environment variable. Both master and slave should also have the same default connection time zone setting; that is, the `--default-time-zone` parameter should have the same value for both master and slave. Note that this is not necessary when the master is MySQL 5.0 or later.

`CONVERT_TZ(..., ..., @session.time_zone)` is properly replicated only if both master and slave are running MySQL 5.0.4 or newer.

16.3.1.25. Replication and Transactions

It is possible to replicate transactional tables on the master using non-transactional tables on the slave. For example, you can replicate an InnoDB master table as a MyISAM slave table. However, if you do this, there are problems if the slave is stopped in the

middle of a `BEGIN/COMMIT` block because the slave restarts at the beginning of the `BEGIN` block.

Mixing transactional and non-transactional statements within the same transaction. Any statement appearing after a `BEGIN` is always considered part of the transaction and cached. This means that non-transactional changes do not propagate to the slave until the transaction is committed and thus written to the binary log. In addition, if `AUTOMCOMMIT` is set to 0, any statement appearing immediately following a `COMMIT` is handled in the same way.

Previously, a statement was considered non-transactional if it changed a non-transactional table. This behavior had the following subtle but non-trivial consequences:

- A statement containing only non-transactional changes was written immediately to the binary log (sometime referred to as “write-ahead”).
- A statement containing only transactional changes was always cached while waiting for the transaction to be committed.
- A statement containing a mix of transactional and non-transactional changes (that is, a statement updating both transactional and non-transactional tables) could lead to mismatched tables on the master and the slave.

In situations where transactions mix updates to transactional and non-transactional tables, the order of statements in the binary log is correct, and all needed statements are written to the binary log even in case of a `ROLLBACK`. However, when a second connection updates the non-transactional table before the first connection's transaction is complete, statements can be logged out of order, because the second connection's update is written immediately after it is performed, regardless of the state of the transaction being performed by the first connection.

Due to the non-transactional nature of `MyISAM` tables, it is possible to have a statement that only partially updates a table and returns an error code. This can happen, for example, on a multiple-row insert that has one row violating a key constraint, or if a long update statement is killed after updating some of the rows. If that happens on the master, the slave thread exits and waits for the database administrator to decide what to do about it unless the error code is legitimate and execution of the statement results in the same error code on the slave. If this error code validation behavior is not desirable, some or all errors can be masked out (ignored) with the `--slave-skip-errors` option.

Caution

You should avoid transactions that update both transactional and non-transactional tables in a replication environment.

When the storage engine type of the slave is non-transactional, transactions on the master that mix updates of transactional and non-transactional tables should be avoided because they can cause inconsistency of the data between the master's transactional table and the slave's non-transactional table. That is, such transactions can lead to master storage engine-specific behavior with the possible effect of replication going out of synchrony. MySQL does not issue a warning about this currently, so extra care should be taken when replicating transactional tables from the master to non-transactional ones on the slaves.

16.3.1.26. Replication and Triggers

Triggers are not executed on the slave under row-based replication. However, they are executed on the slave under statement-based replication. Instead, when using row-based replication, the changes caused by executing the trigger on the master are applied on the slave.

This behavior is by design. The reason for this is that, if both the master and the slave applied the changes from the master and, in addition, the trigger causing these changes were applied on the slave, the changes would in effect be applied twice on the slave, leading to different data on the master and the slave.

If you wish for triggers to execute on both the master and the slave — perhaps because you have different triggers on the master and slave — then you must use statement-based replication. However, it is not necessary to use statement-based replication exclusively if you want to enable slave-side triggers; it is sufficient in such cases to switch to statement-based replication only for those statements where you want this effect, and to use row-based replication the rest of the time.

16.3.1.27. Replication and `TRUNCATE`

`TRUNCATE` is normally regarded as a DML statement, and so would be expected to be logged and replicated using row-based format when the binary logging mode is `ROW` or `MIXED`. However this caused issues when logging or replicating, in `STATEMENT` or `MIXED` mode, tables that used transactional storage engines such as `InnoDB` when the transaction isolation level was `READ COMMITTED` or `READ UNCOMMITTED`, which precludes statement-based logging.

`TRUNCATE` is treated for purposes of logging and replication as DDL rather than DML so that it can be logged and replicated as a statement. However, the effects of the statement as applicable to `InnoDB` and other transactional tables on replication slaves still follow the rules described in [Section 12.2.10, “TRUNCATE Syntax”](#) governing such tables. ([Bug#36763](#))

16.3.1.28. Replication and Variables

The `foreign_key_checks`, `unique_checks`, and `sql_auto_is_null` variables are all replicated.

`sql_mode` is also replicated except for the `NO_DIR_IN_CREATE` mode. However, when `mysqlbinlog` parses a `SET @@sql_mode = value` statement, the full `value`, including `NO_DIR_IN_CREATE`, is passed to the receiving server.

The `storage_engine` system variable is not replicated, which is a good thing for replication between different storage engines.

Session variables are not replicated properly when used in statements that update tables. For example, `SET MAX_JOIN_SIZE=1000` followed by `INSERT INTO mytable VALUES(@@MAX_JOIN_SIZE)` will not insert the same data on the master and the slave. This does not apply to the common sequence of `SET TIME_ZONE=...` followed by `INSERT INTO mytable VALUES(CONVERT_TZ(..., ..., @@time_zone))`.

Replication of session variables is not a problem when row-based replication is being used. See [Section 16.1.2, “Replication Formats”](#).

16.3.1.29. Replication and Views

Views are always replicated to slaves. Views are filtered by their own name, not by the tables they refer to. This means that a view can be replicated to the slave even if the view contains a table that would normally be filtered out by `replication-ignore-table` rules. Care should therefore be taken to ensure that views do not replicate table data that would normally be filtered for security reasons.

16.3.2. Replication Compatibility Between MySQL Versions

MySQL supports replication from one major version to the next higher major version. For example, you can replicate from a master running MySQL 4.1 to a slave running MySQL 5.0, from a master running MySQL 5.0 to a slave running MySQL 5.1, and so on.

In some cases, it is also possible to replicate between a master and a slave that is more than one major version newer than the master. However, there are known issues with trying to replicate from a master running MySQL 4.1 or earlier to a slave running MySQL 5.1 or later. To work around such problems, you can insert a MySQL server running an intermediate version between the two; for example, rather than replicating directly from a MySQL 4.1 master to a MySQL 5.1 slave, it is possible to replicate from a MySQL 4.1 server to a MySQL 5.0 server, and then from the MySQL 5.0 server to a MySQL 5.1 server.

Important

We strongly recommend using the most recent release available within a given MySQL major version because replication (and other) capabilities are continually being improved. We also recommend upgrading masters and slaves that use alpha or beta releases of a major version of MySQL to GA (production) releases when these become available for that major version.

Replication from newer masters to older slaves may be possible, but is generally not supported. This is due to a number of factors:

- **Binary log format changes.** The binary log format can change between major releases. While we attempt to maintain backward compatibility, this is not always possible. For example, the binary log format implemented in MySQL 5.0 changed considerably from that used in previous versions, especially with regard to handling of character sets, `LOAD DATA INFILE`, and time zones. This means that replication from a MySQL 5.0 (or later) master to a MySQL 4.1 (or earlier) slave is generally not supported.

This also has significant implications for upgrading replication servers; see [Section 16.3.3, “Upgrading a Replication Setup”](#), for more information.

- **Use of row-based replication.** You cannot replicate using row-based replication from a MySQL 5.1.5 or later master to a slave running an earlier version of MySQL, since MySQL versions prior to 5.1.5 do not support RBR.

For more information about row-based replication, see [Section 16.1.2, “Replication Formats”](#).

- **SQL incompatibilities.** You cannot replicate from a newer master to an older slave using statement-based replication if the statements to be replicated use SQL features available on the master but not on the slave.

However, if both the master and the slave support row-based replication, and there are no data definition statements to be replicated that depend on SQL features found on the master but not on the slave, then you can use row-based replication to replicate the effects of data modification statements even if the DDL run on the master is not supported on the slave.

For more information on potential replication issues, see [Section 16.3.1, “Replication Features and Issues”](#).

16.3.3. Upgrading a Replication Setup

When you upgrade servers that participate in a replication setup, the procedure for upgrading depends on the current server versions and the version to which you are upgrading.

This section applies to upgrading replication from older versions of MySQL to MySQL 5.4. A 4.0 server should be 4.0.3 or newer.

When you upgrade a master to 5.4 from an earlier MySQL release series, you should first ensure that all the slaves of this master are using the same 5.4.x release. If this is not the case, you should first upgrade the slaves. To upgrade each slave, shut it down, upgrade it to the appropriate 5.4.x version, restart it, and restart replication. The 5.4 slave is able to read the old relay logs written prior to the upgrade and to execute the statements they contain. Relay logs created by the slave after the upgrade are in 5.4 format.

After the slaves have been upgraded, shut down the master, upgrade it to the same 5.4.x release as the slaves, and restart it. The 5.4 master is able to read the old binary logs written prior to the upgrade and to send them to the 5.4 slaves. The slaves recognize the old format and handle it properly. Binary logs created by the master following the upgrade are in 5.4 format. These too are recognized by the 5.4 slaves.

In other words, there are no measures to take when upgrading to MySQL 5.4, except that the slaves must be MySQL 5.4 before you can upgrade the master to 5.4. Note that downgrading from 5.4 to older versions does not work so simply: You must ensure that any 5.4 binary logs or relay logs have been fully processed, so that you can remove them before proceeding with the downgrade.

Downgrading a replication setup to a previous version cannot be done once you have switched from statement-based to row-based replication, and after the first row-based statement has been written to the binlog. See [Section 16.1.2, “Replication Formats”](#).

16.3.4. Replication FAQ

Questions

- [16.3.4.1](#): Does the slave need to be connected to the master all the time?

- [16.3.4.12](#): How do I prevent `GRANT` and `REVOKE` statements from replicating to slave machines?
- [16.3.4.13](#): Does replication work on mixed operating systems (for example, the master runs on Linux while slaves run on Mac OS X and Windows)?
- [16.3.4.14](#): Does replication work on mixed hardware architectures (for example, the master runs on a 64-bit machine while slaves run on 32-bit machines)?

Questions and Answers

16.3.4.1: Does the slave need to be connected to the master all the time?

No, it does not. The slave can go down or stay disconnected for hours or even days, and then reconnect and catch up on updates. For example, you can set up a master/slave relationship over a dial-up link where the link is up only sporadically and for short periods of time. The implication of this is that, at any given time, the slave is not guaranteed to be in sync with the master unless you take some special measures.

To ensure that this is the case, you must not remove binary logs from the master, where the information has not been replicated to

the slaves. Asynchronous replication can only work if the slave is able to read the binary log from the last point in the binary logs where it had read the replication statements.

16.3.4.2: Do I have to enable networking on my master to enable replication?

Networking must be enabled on the master. If networking is not enabled, then the slave is unable to connect to the master and transfer the binary log. Check that the `skip-networking` option has not been enabled in your configuration file.

16.3.4.3: How do I know how late a slave is compared to the master? In other words, how do I know the date of the last statement replicated by the slave?

You can read the `Seconds_Behind_Master` column in `SHOW SLAVE STATUS`. See [Section 16.4.1, “Replication Implementation Details”](#).

When the slave SQL thread executes an event read from the master, it modifies its own time to the event timestamp. (This is why `TIMESTAMP` is well replicated.) In the `Time` column in the output of `SHOW PROCESSLIST`, the number of seconds displayed for the slave SQL thread is the number of seconds between the timestamp of the last replicated event and the real time of the slave machine. You can use this to determine the date of the last replicated event. Note that if your slave has been disconnected from the master for one hour, and then reconnects, you may immediately see `Time` values like 3600 for the slave SQL thread in `SHOW PROCESSLIST`. This is because the slave is executing statements that are one hour old.

16.3.4.4: How do I force the master to block updates until the slave catches up?

Use the following procedure:

1. On the master, execute these statements:

```
mysql> FLUSH TABLES WITH READ LOCK;
mysql> SHOW MASTER STATUS;
```

Record the replication coordinates (the log file name and offset) from the output of the `SHOW` statement.

2. On the slave, issue the following statement, where the arguments to the `MASTER_POS_WAIT()` function are the replication coordinate values obtained in the previous step:

```
mysql> SELECT MASTER_POS_WAIT('log_name', log_offset);
```

The `SELECT` statement blocks until the slave reaches the specified log file and offset. At that point, the slave is in synchrony with the master and the statement returns.

3. On the master, issue the following statement to allow the master to begin processing updates again:

```
mysql> UNLOCK TABLES;
```

16.3.4.5: What issues should I be aware of when setting up two-way replication?

MySQL replication currently does not support any locking protocol between master and slave to guarantee the atomicity of a distributed (cross-server) update. In other words, it is possible for client A to make an update to co-master 1, and in the meantime, before it propagates to co-master 2, client B could make an update to co-master 2 that makes the update of client A work differently than it did on co-master 1. Thus, when the update of client A makes it to co-master 2, it produces tables that are different from what you have on co-master 1, even after all the updates from co-master 2 have also propagated. This means that you should not chain two servers together in a two-way replication relationship unless you are sure that your updates can safely happen in any order, or unless you take care of mis-ordered updates somehow in the client code.

You should also realize that two-way replication actually does not improve performance very much (if at all) as far as updates are concerned. Each server must do the same number of updates, just as you would have a single server do. The only difference is that there is a little less lock contention, because the updates originating on another server are serialized in one slave thread. Even this benefit might be offset by network delays.

16.3.4.6: How can I use replication to improve performance of my system?

You should set up one server as the master and direct all writes to it. Then configure as many slaves as you have the budget and rackspace for, and distribute the reads among the master and the slaves. You can also start the slaves with the `--skip-innodb`, `--low-priority-updates`, and `--delay-key-write=ALL` options to get speed improvements on the slave end. In this case, the slave uses non-transactional `MyISAM` tables instead of `InnoDB` tables to get more speed by eliminating transactional overhead.

16.3.4.7: What should I do to prepare client code in my own applications to use performance-enhancing replication?

See the guide to using replication as a scale-out solution, [Section 16.2.3, “Using Replication for Scale-Out”](#).

16.3.4.8: When and how much can MySQL replication improve the performance of my system?

MySQL replication is most beneficial for a system that processes frequent reads and infrequent writes. In theory, by using a single-master/multiple-slave setup, you can scale the system by adding more slaves until you either run out of network bandwidth, or your update load grows to the point that the master cannot handle it.

To determine how many slaves you can use before the added benefits begin to level out, and how much you can improve performance of your site, you need to know your query patterns, and to determine empirically by benchmarking the relationship between the throughput for reads (reads per second, or `reads`) and for writes (`writes`) on a typical master and a typical slave. The example here shows a rather simplified calculation of what you can get with replication for a hypothetical system.

Let's say that system load consists of 10% writes and 90% reads, and we have determined by benchmarking that `reads` is $1200 - 2 \times \text{writes}$. In other words, the system can do 1,200 reads per second with no writes, the average write is twice as slow as the average read, and the relationship is linear. Let us suppose that the master and each slave have the same capacity, and that we have one master and N slaves. Then we have for each server (master or slave):

$$\text{reads} = 1200 - 2 \times \text{writes}$$

$$\text{reads} = 9 \times \text{writes} / (N + 1) \text{ (reads are split, but writes go to all servers)}$$

$$9 \times \text{writes} / (N + 1) + 2 \times \text{writes} = 1200$$

$$\text{writes} = 1200 / (2 + 9/(N+1))$$

The last equation indicates the maximum number of writes for N slaves, given a maximum possible read rate of 1,200 per minute and a ratio of nine reads per write.

This analysis yields the following conclusions:

- If $N = 0$ (which means we have no replication), our system can handle about $1200/11 = 109$ writes per second.
- If $N = 1$, we get up to 184 writes per second.
- If $N = 8$, we get up to 400 writes per second.
- If $N = 17$, we get up to 480 writes per second.
- Eventually, as N approaches infinity (and our budget negative infinity), we can get very close to 600 writes per second, increasing system throughput about 5.5 times. However, with only eight servers, we increase it nearly four times.

Note that these computations assume infinite network bandwidth and neglect several other factors that could be significant on your system. In many cases, you may not be able to perform a computation similar to the one just shown that accurately predicts what will happen on your system if you add N replication slaves. However, answering the following questions should help you decide whether and by how much replication will improve the performance of your system:

- What is the read/write ratio on your system?
- How much more write load can one server handle if you reduce the reads?
- For how many slaves do you have bandwidth available on your network?

16.3.4.9: How can I use replication to provide redundancy or high availability?

How you implement redundancy is entirely dependent on your application and circumstances. High-availability solutions (with automatic failover) require active monitoring and either custom scripts or third party tools to provide the failover support from the original MySQL server to the slave.

To handle the process manually, you should be able to switch from a failed master to a pre-configured slave by altering your application to talk to the new server or by adjusting the DNS for the MySQL server from the failed server to the new server.

For more information and some example solutions, see [Section 16.2.6, “Switching Masters During Failover”](#).

16.3.4.10: How do I tell whether a master server is using statement-based or row-based binary logging format?

Check the value of the `binlog_format` system variable:

```
mysql> SHOW VARIABLES LIKE 'binlog_format';
```

The value shown is one of `STATEMENT`, `ROW`, or `MIXED`. When `MIXED` mode is in use, row-based replication is preferred but replication switches automatically to statement-based format under certain conditions; see [Section 5.2.4.3, “Mixed Binary Logging Format”](#), for information about when this may occur.

16.3.4.11: How do I tell a slave to use row-based replication?

Slaves automatically know which format to use.

16.3.4.12: How do I prevent `GRANT` and `REVOKE` statements from replicating to slave machines?

Start the server with the `--replicate-wild-ignore-table=mysql.%` option.

16.3.4.13: Does replication work on mixed operating systems (for example, the master runs on Linux while slaves run on Mac OS X and Windows)?

Yes.

16.3.4.14: Does replication work on mixed hardware architectures (for example, the master runs on a 64-bit machine while slaves run on 32-bit machines)?

Yes.

16.3.5. Troubleshooting Replication

If you have followed the instructions, and your replication setup is not working, the first thing to do is *check the error log for messages*. Many users have lost time by not doing this soon enough after encountering problems.

If you cannot tell from the error log what the problem was, try the following techniques:

- Verify that the master has binary logging enabled by issuing a `SHOW MASTER STATUS` statement. If logging is enabled, `Position` is nonzero. If binary logging is not enabled, verify that you are running the master with the `--log-bin` and `--server-id` options.
- Verify that the slave is running. Use `SHOW SLAVE STATUS` to check whether the `Slave_IO_Running` and `Slave_SQL_Running` values are both `Yes`. If not, verify the options that were used when starting the slave server. For example, `--skip-slave-start` prevents the slave threads from starting until you issue a `START SLAVE` statement.
- If the slave is running, check whether it established a connection to the master. Use `SHOW PROCESSLIST`, find the I/O and SQL threads and check their `State` column to see what they display. See [Section 16.4.1, “Replication Implementation Details”](#). If the I/O thread state says `Connecting to master`, check the following:
 - Verify the privileges for the user being used for replication on the master.
 - Check that the host name of the master is correct and that you are using the correct port to connect to the master. The port used for replication is the same as used for client network communication (the default is `3306`). For the host name, ensure that the name resolves to the correct IP address.
 - Check that networking on the master has not been disabled. Look for the `skip-networking` option in the configuration file. It should either be commented out or deleted entirely.
 - If the master has a firewall or IP filtering configuration, ensure that the network port being used for MySQL is not being filtered.
 - Check that you can reach the master by using `ping` or `traceroute/tracert` to reach the host.
- If the slave was running previously but has stopped, the reason usually is that some statement that succeeded on the master failed on the slave. This should never happen if you have taken a proper snapshot of the master, and never modified the data on the slave outside of the slave thread. If the slave stops unexpectedly, it is a bug or you have encountered one of the known replication limitations described in [Section 16.3.1, “Replication Features and Issues”](#). If it is a bug, see [Section 16.3.6, “How to Report Replication Bugs or Problems”](#), for instructions on how to report it.
- If a statement that succeeded on the master refuses to run on the slave, try the following procedure if it is not feasible to do a full database resynchronization by deleting the slave's databases and copying a new snapshot from the master:
 1. Determine whether the affected table on the slave is different from the master table. Try to understand how this happened. Then make the slave's table identical to the master's and run `START SLAVE`.

2. If the preceding step does not work or does not apply, try to understand whether it would be safe to make the update manually (if needed) and then ignore the next statement from the master.
3. If you decide that you can skip the next statement from the master, issue the following statements:

```
mysql> SET GLOBAL SQL_SLAVE_SKIP_COUNTER = N;
mysql> START SLAVE;
```

The value of *N* should be 1 if the next statement from the master does not use `AUTO_INCREMENT` or `LAST_INSERT_ID()`. Otherwise, the value should be 2. The reason for using a value of 2 for statements that use `AUTO_INCREMENT` or `LAST_INSERT_ID()` is that they take two events in the binary log of the master.

See also [Section 12.6.2.6, “SET GLOBAL SQL_SLAVE_SKIP_COUNTER Syntax”](#).

4. If you are sure that the slave started out perfectly synchronized with the master, and that no one has updated the tables involved outside of the slave thread, then presumably the discrepancy is the result of a bug. If you are running the most recent version of MySQL, please report the problem. If you are running an older version, try upgrading to the latest production release to determine whether the problem persists.

16.3.6. How to Report Replication Bugs or Problems

When you have determined that there is no user error involved, and replication still either does not work at all or is unstable, it is time to send us a bug report. We need to obtain as much information as possible from you to be able to track down the bug. Please spend some time and effort in preparing a good bug report.

If you have a repeatable test case that demonstrates the bug, please enter it into our bugs database using the instructions given in [Section 1.6, “How to Report Bugs or Problems”](#). If you have a “phantom” problem (one that you cannot duplicate at will), use the following procedure:

1. Verify that no user error is involved. For example, if you update the slave outside of the slave thread, the data goes out of synchrony, and you can have unique key violations on updates. In this case, the slave thread stops and waits for you to clean up the tables manually to bring them into synchrony. *This is not a replication problem. It is a problem of outside interference causing replication to fail.*
2. Run the slave with the `--log-slave-updates` and `--log-bin` options. These options cause the slave to log the updates that it receives from the master into its own binary logs.
3. Save all evidence before resetting the replication state. If we have no information or only sketchy information, it becomes difficult or impossible for us to track down the problem. The evidence you should collect is:
 - All binary logs from the master
 - All binary logs from the slave
 - The output of `SHOW MASTER STATUS` from the master at the time you discovered the problem
 - The output of `SHOW SLAVE STATUS` from the slave at the time you discovered the problem
 - Error logs from the master and the slave
4. Use `mysqlbinlog` to examine the binary logs. The following should be helpful to find the problem statement. `log_pos` and `log_file` are the `Master_Log_File` and `Read_Master_Log_Pos` values from `SHOW SLAVE STATUS`.

```
shell> mysqlbinlog --start-position=log_pos log_file | head
```

After you have collected the evidence for the problem, try to isolate it as a separate test case first. Then enter the problem with as much information as possible into our bugs database using the instructions at [Section 1.6, “How to Report Bugs or Problems”](#).

16.4. Replication Implementation

The basic mechanics of replication is based on the master server keeping track of all changes to your databases (updates, deletes, and so on) in its binary logs. The binary log serves as a written record of each to the database from the moment the database was started. The binary log contains records of all the statements which edit or modify either the database structure or the data that the structure contains. Typically `SELECT` statements are not recorded, as they do not modify the database data or structure.

Each slave that connects to the master receives a copy of the binary log, and executes the events within the binary log. This has the effect of repeating the original statements and changes just as they were made on the master. Tables are created or their structure modified, and data is inserted, deleted and updated according to the statements that were originally executed on the master.

Because each slave is independent, the replaying of the statements in the master's binary log can occur on each slave that is connected to the master. In addition, because each slave only receives a copy of the binary log by requesting it from the master (it pulls the data from the master, rather than the master pushing the data to the slave), the slave is able to read and update the copy of the database at its own pace and rate and can start and stop the replication process at will without affecting the master or the slave's ability to update to the latest database status.

For more information on the specifics of the replication implementation, see [Section 16.4.1, “Replication Implementation Details”](#).

Slaves and masters report their status in respect of the replication process regularly so that you can monitor the situation. For information on slave states, see [Section 7.5.6.5, “Replication Slave I/O Thread States”](#), and [Section 7.5.6.6, “Replication Slave SQL Thread States”](#). For master states, see [Section 7.5.6.4, “Replication Master Thread States”](#).

The master binary log is written to a local relay log on the slave before it is processed. The slave also records information about the current position with the master's binary log and the local relayed log. See [Section 16.4.2, “Replication Relay and Status Files”](#).

Databases and tables are updated on the slave according to a set of rules that are applied according to the various configuration options and variables that control statement evaluation. For details on how these rules are applied, see [Section 16.4.3, “How Servers Evaluate Replication Rules”](#).

16.4.1. Replication Implementation Details

MySQL replication capabilities are implemented using three threads (one on the master server and two on the slave):

- **Slave I/O thread.** When a `START SLAVE` statement is issued on a slave server, the slave creates an *I/O thread*, which connects to the master and asks it to send the updates recorded in its binary logs.

The slave I/O thread reads the updates that the master's `Binlog Dump` thread sends (see next item) and copies them to local files — known as *relay logs* - in the slave's data directory.

The state of this thread is shown as `Slave_IO_running` in the output of `SHOW SLAVE STATUS` or as `Slave_running` in the output of `SHOW STATUS`.

- **Binlog dump thread.** The master creates a thread to send the binary log contents to the slave. This thread can be identified in the output of `SHOW PROCESSLIST` on the master as the `Binlog Dump` thread.

The binlog dump thread acquires a lock on the master's binary log for reading each event that is to be sent to the slave. As soon as the event has been read, the lock is released, even before the event is sent to the slave.

- **Slave SQL thread.** The slave creates this thread to read the relay logs that were written by the slave I/O thread. The *slave SQL thread* is also used to execute the updates contained in the relay logs.

MySQL Enterprise

For constant monitoring of the status of slaves subscribe to the MySQL Enterprise Monitor. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

In the preceding description, there are three threads per master/slave connection. A master that has multiple slaves creates one binlog dump thread for each currently-connected slave, and each slave has its own I/O and SQL threads.

The slave uses two threads so that reading updates from the master and executing them can be separated into two independent tasks. Thus, the task of reading statements is not slowed down if statement execution is slow. For example, if the slave server has not been running for a while, its I/O thread can quickly fetch all the binary log contents from the master when the slave starts, even if the SQL thread lags far behind. If the slave stops before the SQL thread has executed all the fetched statements, the I/O thread has at least fetched everything so that a safe copy of the statements is stored locally in the slave's relay logs, ready for execution the next time that the slave starts. This enables the master server to purge its binary logs sooner because it no longer needs to wait for the slave to fetch their contents.

The `SHOW PROCESSLIST` statement provides information that tells you what is happening on the master and on the slave regarding replication. See [Section 7.5.6, “Examining Thread Information”](#), for descriptions of all replicated-related states.

The following example illustrates how the three threads show up in the output from `SHOW PROCESSLIST`.

On the master server, the output from `SHOW PROCESSLIST` looks like this:

```
mysql> SHOW PROCESSLIST\G
***** 1. row *****
```

```

Id: 2
User: root
Host: localhost:32931
db: NULL
Command: Binlog Dump
Time: 94
State: Has sent all binlog to slave; waiting for binlog to
      be updated
Info: NULL

```

Here, thread 2 is a [Binlog Dump](#) replication thread for a connected slave. The [State](#) information indicates that all outstanding updates have been sent to the slave and that the master is waiting for more updates to occur. If you see no [Binlog Dump](#) threads on a master server, this means that replication is not running — that is, that no slaves are currently connected.

On the slave server, the output from [SHOW PROCESSLIST](#) looks like this:

```

mysql> SHOW PROCESSLIST\G
***** 1. row *****
  Id: 10
  User: system user
  Host:
  db: NULL
  Command: Connect
  Time: 11
  State: Waiting for master to send event
  Info: NULL
***** 2. row *****
  Id: 11
  User: system user
  Host:
  db: NULL
  Command: Connect
  Time: 11
  State: Has read all relay log; waiting for the slave I/O
        thread to update it
  Info: NULL

```

This information indicates that thread 10 is the I/O thread that is communicating with the master server, and thread 11 is the SQL thread that is processing the updates stored in the relay logs. At the time that the [SHOW PROCESSLIST](#) was run, both threads were idle, waiting for further updates.

The value in the [Time](#) column can show how late the slave is compared to the master. See [Section 16.3.4, “Replication FAQ”](#). The amount of time that the slave lags behind the master that is required before the master determines that the slave is no longer connected — as with any other client connection — is dependent on the values of [net_write_timeout](#) and [net_retry_count](#); for more information about these, see [Section 5.1.3, “Server System Variables”](#).

16.4.2. Replication Relay and Status Files

During replication the MySQL server creates a number of files that are used to hold the relayed binary log from the master, and record information about the current status and location within the relayed log. There are three file types used in the process:

- The *relay log* consists of the events read from the binary log of the master. Events in this binary log are executed on the slave as part of the replication thread.
- The *master.info* file contains the status and current configuration information for the slave's connectivity to the master. The file holds information on the master host name, login credentials, and the current position within the master's binary log.
- The *relay-log.info* file holds the status information about the execution point within the slave's relay log files.

The relationship between the three files and the replication process is as follows. The [master.info](#) file retains the point within the master binary log that has been read from the master. These read events are written to the relay log. The [relay-log.info](#) file records the position within the relay log of the statements that have been executed.

16.4.2.1. The Slave Relay Log

By default, relay log file names have the form *host_name-relay-bin.nnnnnn*, where *host_name* is the name of the slave server host and *nnnnnn* is a sequence number. Successive relay log files are created using successive sequence numbers, beginning with *000001*. The slave uses an index file to track the relay log files currently in use. The default relay log index file name is *host_name-relay-bin.index*. By default, the slave server creates relay log files in its data directory.

The default file names for relay logs and relay log index files can be overridden with, respectively, the [--relay-log](#) and [--relay-log-index](#) server options (see [Section 16.1.3, “Replication and Binary Logging Options and Variables”](#)). For this reason, changing a replication slave's host name can cause replication to fail with the errors `FAILED TO OPEN THE RELAY LOG` and `COULD NOT FIND TARGET LOG DURING RELAY LOG INITIALIZATION`. This is a known issue which we intend to fix in a future MySQL release (see [Bug#2122](#)). If you anticipate that a slave's host name may change in the future (for example, if networking is

set up on the slave such that its host name can be modified via DHCP), then you can use these options to prevent this problem from occurring. However, if you encounter this issue, one way to work around it is to stop the slave server, prepend the contents of the old relay log index file to the new one, then restart the slave. On a Unix system, this can be done as shown here, where `new_host_name` is the new host name and `old_host_name` is the old one:

```
shell> cat new_host_name-relay-bin.index >> old_host_name-relay-bin.index
shell> mv old_host_name-relay-bin.index new_host_name-relay-bin.index
```

Relay logs have the same format as binary logs and can be read using `mysqlbinlog`. The SQL thread automatically deletes each relay log file as soon as it has executed all events in the file and no longer needs it. There is no explicit mechanism for deleting relay logs because the SQL thread takes care of doing so. However, `FLUSH LOGS` rotates relay logs, which influences when the SQL thread deletes them.

A slave server creates a new relay log file under the following conditions:

- Each time the I/O thread starts.
- When the logs are flushed; for example, with `FLUSH LOGS` or `mysqladmin flush-logs`.
- When the size of the current relay log file becomes too large. The meaning of “too large” is determined as follows:
 - If the value of `max_relay_log_size` is greater than 0, that is the maximum relay log file size.
 - If the value of `max_relay_log_size` is 0, `max_binlog_size` determines the maximum relay log file size.

16.4.2.2. The Slave Status Files

A slave replication server creates two small files in the data directory. These *status files* are named `master.info` and `relay-log.info` by default. Their names can be changed by using the `--master-info-file` and `--relay-log-info-file` options. See [Section 16.1.3, “Replication and Binary Logging Options and Variables”](#).

The two status files contain information like that shown in the output of the `SHOW SLAVE STATUS` statement, which is discussed in [Section 12.6.2, “SQL Statements for Controlling Slave Servers”](#). Because the status files are stored on disk, they survive a slave server’s shutdown. The next time the slave starts up, it reads the two files to determine how far it has proceeded in reading binary logs from the master and in processing its own relay logs.

The I/O thread updates the `master.info` file. The following table shows the correspondence between the lines in the file and the columns displayed by `SHOW SLAVE STATUS`.

Line	Status Column	Description
1		Number of lines in the file
2	<code>Master_Log_File</code>	The name of the master binary log currently being read from the master.
3	<code>Read_Master_Log_Pos</code>	The current position within the master binary log that have been read from the master.
4	<code>Master_Host</code>	The host name of the master.
5	<code>Master_User</code>	The user name used to connect to the master.
6	Password (not shown by <code>SHOW SLAVE STATUS</code>)	The password used to connect to the master.
7	<code>Master_Port</code>	The network port used to connect to the master.
8	<code>Connect_Retry</code>	The period (in seconds) that the slave will wait before trying to reconnect to the master.
9	<code>Master_SSL_Allowed</code>	Indicates whether the server supports SSL connections.
10	<code>Master_SSL_CA_File</code>	The file used for the Certificate Authority (CA) certificate.
11	<code>Master_SSL_CA_Path</code>	The path to the Certificate Authority (CA) certificates.
12	<code>Master_SSL_Cert</code>	The name of the SSL certificate file.
13	<code>Master_SSL_Cipher</code>	The name of the cipher in use for the SSL connection.
14	<code>Master_SSL_Key</code>	The name of the SSL key file.
15	<code>Master_SSL_Verify_Server_Cert</code>	Whether to verify the server certificate.

The SQL thread updates the `relay-log.info` file. The following table shows the correspondence between the lines in the file and the columns displayed by `SHOW SLAVE STATUS`.

Line	Status Column	Description
1	<code>Relay_Log_File</code>	The name of the current relay log file.
2	<code>Relay_Log_Pos</code>	The current position within the relay log file. Events up to this position have been executed on the slave database.
3	<code>Relay_Master_Log_File</code>	The name of the master binary log file from which the events in the relay log file were read.
4	<code>Exec_Master_Log_Pos</code>	The equivalent position within the master's binary log file of events that have already been executed.

The contents of the `relay-log.info` file and the states shown by the `SHOW SLAVE STATES` command may not match if the `relay-log.info` file has not been flushed to disk. Ideally, you should only view `relay-log.info` on a slave that is offline (i.e. `mysqld` is not running). For a running system, `SHOW SLAVE STATUS` should be used.

16.4.3. How Servers Evaluate Replication Rules

If a master server does not write a statement to its binary log, the statement is not replicated. If the server does log the statement, the statement is sent to all slaves and each slave determines whether to execute it or ignore it.

On the master you can control which databases write events to the binary log using the `--binlog-do-db` and `--binlog-ignore-db` options to control binary logging. For a description of the rules that servers use in evaluating these options, see [Section 5.2.4, “The Binary Log”](#). You should not use these options to control the databases and tables that are replicated, instead, use filtering on the slave to control the events that are executed on the slave.

On the slave side, decisions about whether to execute or ignore statements received from the master are made according to the `--replicate-*` options that the slave was started with. (See [Section 16.1.3, “Replication and Binary Logging Options and Variables”](#).) The slave evaluates these options using the following procedure, which first checks the database-level options and then the table-level options.

In the simplest case, when there are no `--replicate-*` options, the procedure yields the result that the slave executes all statements that it receives from the master. Otherwise, the result depends on the particular options given. In general, to make it easier to determine what effect an option set will have, it is recommended that you avoid mixing “do” and “ignore” options, or wildcard and non-wildcard options.

Stage 1. Check the database options.

At this stage, the slave checks whether there are any `--replicate-do-db` or `--replicate-ignore-db` options that specify database-specific conditions:

- *No*: Permit the statement and proceed to the table-checking stage.
- *Yes*: Test the options using the same rules as for the `--binlog-do-db` and `--binlog-ignore-db` options to determine whether to permit or ignore the statement. What is the result of the test?
 - *Permit*: Do not execute the statement immediately. Defer the decision and proceed to the table-checking stage.
 - *Ignore*: Ignore the statement and exit.

This stage can permit a statement for further option-checking, or cause it to be ignored. However, statements that are permitted at this stage are not actually executed yet. Instead, they pass to the following stage that checks the table options.

Stage 2. Check the table options.

First, as a preliminary condition, the slave checks whether statement-based replication is enabled. If so and the statement occurs within a stored function, execute the statement and exit. (If row-based replication is enabled, the slave does not know whether a statement occurred within a stored function on the master, so this condition does not apply.)

Next, the slave checks for table options and evaluates them. If the server reaches this point, it executes all statements if there are no table options. If there are “do” table options, the statement must match one of them if it is to be executed; otherwise, it is ignored. If there are any “ignore” options, all statements are executed except those that match any “ignore” option. The following steps describe how this evaluation occurs in more detail.

1. Are there any `--replicate-*-table` options?

- *No*: There are no table restrictions, so all statements match. Execute the statement and exit.
- *Yes*: There are table restrictions. Evaluate the tables to be updated against them. There might be multiple tables to update, so loop through the following steps for each table looking for a matching option. In this case, the behavior depends on whether statement-based replication or row-based replication is enabled:
 - *Statement-based replication*: Proceed to the next step and begin evaluating the table options in the order shown (first the non-wild options, and then the wild options). Only tables that are to be updated are compared to the options. For example, if the statement is `INSERT INTO sales SELECT * FROM prices`, only `sales` is compared to the options). If several tables are to be updated (multiple-table statement), the first table that matches “do” or “ignore” wins. That is, the server checks the first table against the options. If no decision could be made, it checks the second table against the options, and so on.
 - *Row-based replication*: All table row changes are filtered individually. For multiple-table updates, each table is filtered separately according to the options. Some updates may be executed and some not, depending on the options and the changes to be made. Row-based replication correctly handles cases that would not replicate correctly with statement-based replication, as in this example which assumes that tables in the `foo` database should be replicated:

```
mysql> USE bar;
mysql> INSERT INTO foo.sometable VALUES (1);
```

2. Are there any `--replicate-do-table` options?

- *No*: Proceed to the next step.
- *Yes*: Does the table match any of them?
 - *No*: Proceed to the next step.
 - *Yes*: Execute the statement and exit.

3. Are there any `--replicate-ignore-table` options?

- *No*: Proceed to the next step.
- *Yes*: Does the table match any of them?
 - *No*: Proceed to the next step.
 - *Yes*: Ignore the statement and exit.

4. Are there any `--replicate-wild-do-table` options?

- *No*: Proceed to the next step.
- *Yes*: Does the table match any of them?
 - *No*: Proceed to the next step.
 - *Yes*: Execute the statement and exit.

5. Are there any `--replicate-wild-ignore-table` options?

- *No*: Proceed to the next step.
- *Yes*: Does the table match any of them?
 - *No*: Proceed to the next step.
 - *Yes*: Ignore the statement and exit.

6. No `--replicate-*-table` option was matched. Is there another table to test against these options?

- *No*: We have now tested all tables to be updated and could not match any option. Are there `--replicate-do-table` or `--replicate-wild-do-table` options?
 - *No*: There were no “do” table options, so no explicit “do” match is required. Execute the statement and exit.
 - *Yes*: There were “do” table options, so the statement is executed only with an explicit match to one of them. Ignore the

statement and exit.

- *Yes*: Loop.

Examples:

- No `--replicate-*` options at all

The slave executes all statements that it receives from the master.

- `--replicate-*-db` options, but no table options

The slave permits or ignores statements using the database options. Then it executes all statements permitted by those options because there are no table restrictions.

- `--replicate-*-table` options, but no database options

All statements are permitted at the database-checking stage because there are no database conditions. The slave executes or ignores statements based on the table options.

- A mix of database and table options

The slave permits or ignores statements using the database options. Then it evaluates all statements permitted by those options according to the table options. In some cases, this process can yield what might seem a counterintuitive result. Consider the following set of options:

```
[mysqld]
replicate-do-db = db1
replicate-do-table = db2.mytbl2
```

Suppose that `db1` is the default database and the slave receives this statement:

```
INSERT INTO mytbl1 VALUES(1,2,3);
```

The database is `db1`, which matches the `--replicate-do-db` option at the database-checking stage. The algorithm then proceeds to the table-checking stage. If there were no table options, the statement would be executed. However, because the options include a “do” table option, the statement must match if it is to be executed. The statement does not match, so it is ignored. (The same would happen for any table in `db1`.)

Chapter 17. Partitioning

This chapter discusses MySQL's implementation of *user-defined partitioning*. You can determine whether your MySQL Server supports partitioning by means of a `SHOW VARIABLES` command such as this one:

```
mysql> SHOW VARIABLES LIKE '%partition%';
```

Variable_name	Value
have_partitioning	YES

1 row in set (0.00 sec)

You can also check the output of the `SHOW PLUGINS` statement, as shown here:

```
mysql> SHOW PLUGINS;
```

Name	Status	Type	Library	License
binlog	ACTIVE	STORAGE ENGINE	NULL	GPL
partition	ACTIVE	STORAGE ENGINE	NULL	GPL
ARCHIVE	ACTIVE	STORAGE ENGINE	NULL	GPL
BLACKHOLE	ACTIVE	STORAGE ENGINE	NULL	GPL
CSV	ACTIVE	STORAGE ENGINE	NULL	GPL
FEDERATED	DISABLED	STORAGE ENGINE	NULL	GPL
MEMORY	ACTIVE	STORAGE ENGINE	NULL	GPL
InnoDB	ACTIVE	STORAGE ENGINE	NULL	GPL
MRG_MYISAM	ACTIVE	STORAGE ENGINE	NULL	GPL
MyISAM	ACTIVE	STORAGE ENGINE	NULL	GPL
ndbcluster	DISABLED	STORAGE ENGINE	NULL	GPL

11 rows in set (0.00 sec)

If you do not see the `have_partitioning` variable with the value `YES` listed in the output of an appropriate `SHOW VARIABLES` statement, or if you do not see the `partition` plugin listed with the value `ACTIVE` for the `Status` column in the output of `SHOW PLUGINS` (show in bold text in the example just given), then your version of MySQL does not support partitioning.

MySQL Community binaries provided by Sun Microsystems include partitioning support. For information about partitioning support offered in commercial MySQL Server binaries, see *MySQL Enterprise Server 5.1*, on the MySQL website.

If you are compiling MySQL 5.4 from source, the build must be configured using `--with-partition` to enable partitioning.

If your MySQL binary is built with partitioning support, nothing further needs to be done in order to enable it (for example, no special entries are required in your `my.cnf` file).

An introduction to partitioning and partitioning concepts may be found in [Section 17.1, “Overview of Partitioning in MySQL”](#).

MySQL supports several types of partitioning, which are discussed in [Section 17.2, “Partition Types”](#), as well as subpartitioning, which is described in [Section 17.2.5, “Subpartitioning”](#).

Methods of adding, removing, and altering partitions in existing partitioned tables are covered in [Section 17.3, “Partition Management”](#).

Table maintenance commands for use with partitioned tables are discussed in [Section 17.3.3, “Maintenance of Partitions”](#).

The `PARTITIONS` table in the `INFORMATION_SCHEMA` database provides information about partitions and partitioned tables. See [Section 19.19, “The INFORMATION_SCHEMA PARTITIONS Table”](#), for more information; for some examples of queries against this table, see [Section 17.2.6, “How MySQL Partitioning Handles NULL”](#).

The partitioning implementation in MySQL 5.4 is still undergoing development. For known issues with MySQL partitioning, see [Section 17.5, “Restrictions and Limitations on Partitioning”](#), where we have noted these.

You may also find the following resources to be useful when working with partitioned tables.

Additional Resources. Other sources of information about user-defined partitioning in MySQL include the following:

- [MySQL Partitioning Forum](#)

This is the official discussion forum for those interested in or experimenting with MySQL Partitioning technology. It features announcements and updates from MySQL developers and others. It is monitored by members of the Partitioning Development and Documentation Teams.

- [Mikael Ronström's Blog](#)

MySQL Partitioning Architect and Lead Developer Mikael Ronström frequently posts articles here concerning his work with MySQL Partitioning and MySQL Cluster.

- [PlanetMySQL](#)

A MySQL news site featuring MySQL-related blogs, which should be of interest to anyone using my MySQL. We encourage you to check here for links to blogs kept by those working with MySQL Partitioning, or to have your own blog added to those covered.

MySQL 5.4 binaries are available from <http://dev.mysql.com/downloads/mysql/5.4.html>. However, for the latest partitioning bugfixes and feature additions, you can obtain the source from our Bazaar repository. To enable partitioning, you need to compile the server using the `--with-partition` option. For more information about building MySQL, see [Section 2.10, “MySQL Installation Using a Source Distribution”](#). If you have problems compiling a partitioning-enabled MySQL 5.4 build, check the [MySQL Partitioning Forum](#) and ask for assistance there if you do not find a solution to your problem already posted.

17.1. Overview of Partitioning in MySQL

This section provides a conceptual overview of partitioning in MySQL 5.4.

For information on partitioning restrictions and feature limitations, see [Section 17.5, “Restrictions and Limitations on Partitioning”](#).

The SQL standard does not provide much in the way of guidance regarding the physical aspects of data storage. The SQL language itself is intended to work independently of any data structures or media underlying the schemas, tables, rows, or columns with which it works. Nonetheless, most advanced database management systems have evolved some means of determining the physical location to be used for storing specific pieces of data in terms of the file system, hardware or even both. In MySQL, the `InnoDB` storage engine has long supported the notion of a tablespace, and the MySQL Server, even prior to the introduction of partitioning, could be configured to employ different physical directories for storing different databases (see [Section 7.6.1, “Using Symbolic Links”](#), for an explanation of how this is done).

Partitioning takes this notion a step further, by allowing you to distribute portions of individual tables across a file system according to rules which you can set largely as needed. In effect, different portions of a table are stored as separate tables in different locations. The user-selected rule by which the division of data is accomplished is known as a *partitioning function*, which in MySQL can be the modulus, simple matching against a set of ranges or value lists, an internal hashing function, or a linear hashing function. The function is selected according to the partitioning type specified by the user, and takes as its parameter the value of a user-supplied expression. This expression can be either an integer column value, or a function acting on one or more column values and returning an integer. The value of this expression is passed to the partitioning function, which returns an integer value representing the number of the partition in which that particular record should be stored. This function must be non-constant and non-random. It may not contain any queries, but may use an SQL expression that is valid in MySQL, as long as that expression returns either `NULL` or an integer *intval* such that

```
-MAXVALUE <= intval <= MAXVALUE
```

(`MAXVALUE` is used to represent the least upper bound for the type of integer in question. `-MAXVALUE` represents the greatest lower bound.) There are some additional restrictions on partitioning functions; see [Section 17.5, “Restrictions and Limitations on Partitioning”](#), for more information about these.

Examples of partitioning functions can be found in the discussions of partitioning types later in this chapter (see [Section 17.2, “Partition Types”](#)), as well as in the partitioning syntax descriptions given in [Section 12.1.14, “CREATE TABLE Syntax”](#).

This is known as *horizontal partitioning* — that is, different rows of a table may be assigned to different physical partitions. MySQL 5.4 does not support *vertical partitioning*, in which different columns of a table are assigned to different physical partitions. There are not at this time any plans to introduce vertical partitioning into MySQL 5.4.

For information about determining whether your MySQL Server binary supports user-defined partitioning, see [Chapter 17, Partitioning](#).

For creating partitioned tables, you can use most storage engines that are supported by your MySQL server; the MySQL partitioning engine runs in a separate layer and can interact with any of these. In MySQL 5.4, all partitions of the same partitioned table must use the same storage engine; for example, you cannot use `MyISAM` for one partition and `InnoDB` for another. However, there is nothing preventing you from using different storage engines for different partitioned tables on the same MySQL server or even in the same database.

Note

MySQL partitioning cannot be used with the `MERGE`, `CSV`, or `FEDERATED` storage engines. Partitioning by `KEY` is possible with `NDBCLUSTER`, but other types of user-defined partitioning are not supported for tables using this storage engine.

To employ a particular storage engine for a partitioned table, it is necessary only to use the `[STORAGE] ENGINE` option just as you would for a non-partitioned table. However, you should keep in mind that `[STORAGE] ENGINE` (and other table options) need to be listed *before* any partitioning options are used in a `CREATE TABLE` statement. This example shows how to create a table that is partitioned by hash into 6 partitions and which uses the `InnoDB` storage engine:

```
CREATE TABLE ti (id INT, amount DECIMAL(7,2), tr_date DATE)
ENGINE=INNODB
PARTITION BY HASH( MONTH(tr_date) )
PARTITIONS 6;
```

Note

Each `PARTITION` clause can include a `[STORAGE] ENGINE` option, but in MySQL 5.4 this has no effect.

Important

Partitioning applies to all data and indexes of a table; you cannot partition only the data and not the indexes, or *vice versa*, nor can you partition only a portion of the table.

Data and indexes for each partition can be assigned to a specific directory using the `DATA DIRECTORY` and `INDEX DIRECTORY` options for the `PARTITION` clause of the `CREATE TABLE` statement used to create the partitioned table.

Note

The `DATA DIRECTORY` and `INDEX DIRECTORY` options have no effect when defining partitions for tables using the `InnoDB` storage engine.

`DATA DIRECTORY` and `INDEX DIRECTORY` are not supported for individual partitions or subpartitions on Windows. These options are ignored on Windows, except that a warning is generated.

In addition, `MAX_ROWS` and `MIN_ROWS` can be used to determine the maximum and minimum numbers of rows, respectively, that can be stored in each partition. See [Section 17.3, “Partition Management”](#), for more information on these options.

Some of the advantages of partitioning include:

- Being able to store more data in one table than can be held on a single disk or file system partition.
- Data that loses its usefulness can often be easily removed from the table by dropping the partition containing only that data. Conversely, the process of adding new data can in some cases be greatly facilitated by adding a new partition specifically for that data.
- Some queries can be greatly optimized in virtue of the fact that data satisfying a given `WHERE` clause can be stored only on one or more partitions, thereby excluding any remaining partitions from the search. Because partitions can be altered after a partitioned table has been created, you can reorganize your data to enhance frequent queries that may not have been so when the partitioning scheme was first set up. This capability is sometimes referred to as *partition pruning*. For more information, see [Section 17.4, “Partition Pruning”](#).

Other benefits usually associated with partitioning include those in the following list. These features are not currently implemented in MySQL Partitioning, but are high on our list of priorities.

- Queries involving aggregate functions such as `SUM()` and `COUNT()` can easily be parallelized. A simple example of such a query might be `SELECT salesperson_id, COUNT(orders) as order_total FROM sales GROUP BY salesperson_id;` By “parallelized,” we mean that the query can be run simultaneously on each partition, and the final result obtained merely by summing the results obtained for all partitions.
- Achieving greater query throughput in virtue of spreading data seeks over multiple disks.

Be sure to check this section and chapter frequently for updates as Partitioning development continues.

17.2. Partition Types

This section discusses the types of partitioning which are available in MySQL 5.4. These include:

- **RANGE partitioning:** Assigns rows to partitions based on column values falling within a given range. See [Section 17.2.1, “RANGE Partitioning”](#).

- **LIST partitioning:** Similar to partitioning by range, except that the partition is selected based on columns matching one of a set of discrete values. See [Section 17.2.2, “LIST Partitioning”](#).
- **HASH partitioning:** A partition is selected based on the value returned by a user-defined expression that operates on column values in rows to be inserted into the table. The function may consist of any expression valid in MySQL that yields a non-negative integer value. See [Section 17.2.3, “HASH Partitioning”](#).
- **KEY partitioning:** Similar to partitioning by hash, except that only one or more columns to be evaluated are supplied, and the MySQL server provides its own hashing function. These columns can contain other than integer values, since the hashing function supplied by MySQL guarantees an integer result regardless of the column data type. See [Section 17.2.4, “KEY Partitioning”](#).

A very common use of database partitioning is to segregate data by date. Some database systems support explicit date partitioning, which MySQL does not implement in 5.4. However, it is not difficult in MySQL to create partitioning schemes based on [DATE](#), [TIME](#), or [DATETIME](#) columns, or based on expressions making use of such columns.

When partitioning by [KEY](#) or [LINEAR KEY](#), you can use a [DATE](#), [TIME](#), or [DATETIME](#) column as the partitioning column without performing any modification of the column value. For example, this table creation statement is perfectly valid in MySQL:

```
CREATE TABLE members (
  firstname VARCHAR(25) NOT NULL,
  lastname VARCHAR(25) NOT NULL,
  username VARCHAR(16) NOT NULL,
  email VARCHAR(35),
  joined DATE NOT NULL
)
PARTITION BY KEY(joined)
PARTITIONS 6;
```

MySQL's other partitioning types, however, require a partitioning expression that yields an integer value or [NULL](#). If you wish to use date-based partitioning by [RANGE](#), [LIST](#), [HASH](#), or [LINEAR HASH](#), you can simply employ a function that operates on a [DATE](#), [TIME](#), or [DATETIME](#) column and returns such a value, as shown here:

```
CREATE TABLE members (
  firstname VARCHAR(25) NOT NULL,
  lastname VARCHAR(25) NOT NULL,
  username VARCHAR(16) NOT NULL,
  email VARCHAR(35),
  joined DATE NOT NULL
)
PARTITION BY RANGE( YEAR(joined) ) (
  PARTITION p0 VALUES LESS THAN (1960),
  PARTITION p1 VALUES LESS THAN (1970),
  PARTITION p2 VALUES LESS THAN (1980),
  PARTITION p3 VALUES LESS THAN (1990),
  PARTITION p4 VALUES LESS THAN MAXVALUE
);
```

Additional examples of partitioning using dates may be found here:

- [Section 17.2.1, “RANGE Partitioning”](#)
- [Section 17.2.3, “HASH Partitioning”](#)
- [Section 17.2.3.1, “LINEAR HASH Partitioning”](#)

For more complex examples of date-based partitioning, see:

- [Section 17.4, “Partition Pruning”](#)
- [Section 17.2.5, “Subpartitioning”](#)

MySQL partitioning is optimized for use with the [TO_DAYS\(\)](#) and [YEAR\(\)](#) functions. However, you can use other date and time functions that return an integer or [NULL](#), such as [WEEKDAY\(\)](#), [DAYOFYEAR\(\)](#), or [MONTH\(\)](#). See [Section 11.6, “Date and Time Functions”](#), for more information about such functions.

It is important to remember — regardless of the type of partitioning that you use — that partitions are always numbered automatically and in sequence when created, starting with 0. When a new row is inserted into a partitioned table, it is these partition numbers that are used in identifying the correct partition. For example, if your table uses 4 partitions, these partitions are numbered 0, 1, 2, and 3. For the [RANGE](#) and [LIST](#) partitioning types, it is necessary to ensure that there is a partition defined for each partition number. For [HASH](#) partitioning, the user function employed must return an integer value greater than 0. For [KEY](#) partitioning, this issue

is taken care of automatically by the hashing function which the MySQL server employs internally.

Names of partitions generally follow the rules governing other MySQL identifiers, such as those for tables and databases. However, you should note that partition names are not case-sensitive. For example, the following `CREATE TABLE` statement fails as shown:

```
mysql> CREATE TABLE t2 (val INT)
-> PARTITION BY LIST(val)(
->     PARTITION mypart VALUES IN (1,3,5),
->     PARTITION MyPart VALUES IN (2,4,6)
-> );
ERROR 1488 (HY000): Duplicate partition name mypart
```

Failure occurs because MySQL sees no difference between the partition names `mypart` and `MyPart`.

When you specify the number of partitions for the table, this must be expressed as a positive, nonzero integer literal with no leading zeroes, and may not be an expression such as `0.8E+01` or `6-2`, even if it evaluates to an integer value. Decimal fractions are not allowed.

In the sections that follow, we do not necessarily provide all possible forms for the syntax that can be used for creating each partition type; this information may be found in [Section 12.1.14, “CREATE TABLE Syntax”](#).

17.2.1. RANGE Partitioning

A table that is partitioned by range is partitioned in such a way that each partition contains rows for which the partitioning expression value lies within a given range. Ranges should be contiguous but not overlapping, and are defined using the `VALUES LESS THAN` operator. For the next few examples, suppose that you are creating a table such as the following to hold personnel records for a chain of 20 video stores, numbered 1 through 20:

```
CREATE TABLE employees (
  id INT NOT NULL,
  fname VARCHAR(30),
  lname VARCHAR(30),
  hired DATE NOT NULL DEFAULT '1970-01-01',
  separated DATE NOT NULL DEFAULT '9999-12-31',
  job_code INT NOT NULL,
  store_id INT NOT NULL
);
```

This table can be partitioned by range in a number of ways, depending on your needs. One way would be to use the `store_id` column. For instance, you might decide to partition the table 4 ways by adding a `PARTITION BY RANGE` clause as shown here:

```
CREATE TABLE employees (
  id INT NOT NULL,
  fname VARCHAR(30),
  lname VARCHAR(30),
  hired DATE NOT NULL DEFAULT '1970-01-01',
  separated DATE NOT NULL DEFAULT '9999-12-31',
  job_code INT NOT NULL,
  store_id INT NOT NULL
)
PARTITION BY RANGE (store_id) (
  PARTITION p0 VALUES LESS THAN (6),
  PARTITION p1 VALUES LESS THAN (11),
  PARTITION p2 VALUES LESS THAN (16),
  PARTITION p3 VALUES LESS THAN (21)
);
```

In this partitioning scheme, all rows corresponding to employees working at stores 1 through 5 are stored in partition `p0`, to those employed at stores 6 through 10 are stored in partition `p1`, and so on. Note that each partition is defined in order, from lowest to highest. This is a requirement of the `PARTITION BY RANGE` syntax; you can think of it as being analogous to a series of `if ... elseif ...` statements in C or Java in this regard.

It is easy to determine that a new row containing the data (`72`, `'Michael'`, `'Widenius'`, `'1998-06-25'`, `NULL`, `13`) is inserted into partition `p2`, but what happens when your chain adds a 21st store? Under this scheme, there is no rule that covers a row whose `store_id` is greater than 20, so an error results because the server does not know where to place it. You can keep this from occurring by using a “catchall” `VALUES LESS THAN` clause in the `CREATE TABLE` statement that provides for all values greater than highest value explicitly named:

```
CREATE TABLE employees (
  id INT NOT NULL,
  fname VARCHAR(30),
  lname VARCHAR(30),
  hired DATE NOT NULL DEFAULT '1970-01-01',
  separated DATE NOT NULL DEFAULT '9999-12-31',
  job_code INT NOT NULL,
  store_id INT NOT NULL
)
PARTITION BY RANGE (store_id) (
  PARTITION p0 VALUES LESS THAN (6),
  PARTITION p1 VALUES LESS THAN (11),
  PARTITION p2 VALUES LESS THAN (16),
  PARTITION p3 VALUES LESS THAN (21)
);
```

```

PARTITION p3 VALUES LESS THAN MAXVALUE
);

```

Note

Another way to avoid an error when no matching value is found is to use the `IGNORE` keyword as part of the `INSERT` statement. For an example, see [Section 17.2.2, “LIST Partitioning”](#). Also see [Section 12.2.5, “INSERT Syntax”](#), for general information about `IGNORE`.

`MAXVALUE` represents an integer value that is always greater than the largest possible integer value (in mathematical language, it serves as a *least upper bound*). Now, any rows whose `store_id` column value is greater than or equal to 16 (the highest value defined) are stored in partition `p3`. At some point in the future — when the number of stores has increased to 25, 30, or more — you can use an `ALTER TABLE` statement to add new partitions for stores 21-25, 26-30, and so on (see [Section 17.3, “Partition Management”](#), for details of how to do this).

In much the same fashion, you could partition the table based on employee job codes — that is, based on ranges of `job_code` column values. For example — assuming that two-digit job codes are used for regular (in-store) workers, three-digit codes are used for office and support personnel, and four-digit codes are used for management positions — you could create the partitioned table using the following:

```

CREATE TABLE employees (
  id INT NOT NULL,
  fname VARCHAR(30),
  lname VARCHAR(30),
  hired DATE NOT NULL DEFAULT '1970-01-01',
  separated DATE NOT NULL DEFAULT '9999-12-31',
  job_code INT NOT NULL,
  store_id INT NOT NULL
)
PARTITION BY RANGE (job_code) (
  PARTITION p0 VALUES LESS THAN (100),
  PARTITION p1 VALUES LESS THAN (1000),
  PARTITION p2 VALUES LESS THAN (10000)
);

```

In this instance, all rows relating to in-store workers would be stored in partition `p0`, those relating to office and support staff in `p1`, and those relating to managers in partition `p2`.

It is also possible to use an expression in `VALUES LESS THAN` clauses. However, MySQL must be able to evaluate the expression's return value as part of a `LESS THAN (<)` comparison.

Rather than splitting up the table data according to store number, you can use an expression based on one of the two `DATE` columns instead. For example, let us suppose that you wish to partition based on the year that each employee left the company; that is, the value of `YEAR(separated)`. An example of a `CREATE TABLE` statement that implements such a partitioning scheme is shown here:

```

CREATE TABLE employees (
  id INT NOT NULL,
  fname VARCHAR(30),
  lname VARCHAR(30),
  hired DATE NOT NULL DEFAULT '1970-01-01',
  separated DATE NOT NULL DEFAULT '9999-12-31',
  job_code INT,
  store_id INT
)
PARTITION BY RANGE ( YEAR(separated) ) (
  PARTITION p0 VALUES LESS THAN (1991),
  PARTITION p1 VALUES LESS THAN (1996),
  PARTITION p2 VALUES LESS THAN (2001),
  PARTITION p3 VALUES LESS THAN MAXVALUE
);

```

In this scheme, for all employees who left before 1991, the rows are stored in partition `p0`; for those who left in the years 1991 through 1995, in `p1`; for those who left in the years 1996 through 2000, in `p2`; and for any workers who left after the year 2000, in `p3`.

Range partitioning is particularly useful when:

- You want or need to delete “old” data. If you are using the partitioning scheme shown immediately above, you can simply use `ALTER TABLE employees DROP PARTITION p0;` to delete all rows relating to employees who stopped working for the firm prior to 1991. (See [Section 12.1.6, “ALTER TABLE Syntax”](#), and [Section 17.3, “Partition Management”](#), for more information.) For a table with a great many rows, this can be much more efficient than running a `DELETE` query such as `DELETE FROM employees WHERE YEAR(separated) <= 1990;`
- You want to use a column containing date or time values, or containing values arising from some other series.

- You frequently run queries that depend directly on the column used for partitioning the table. For example, when executing a query such as `EXPLAIN PARTITIONS SELECT COUNT(*) FROM employees WHERE separated BETWEEN '2000-01-01' AND '2000-12-31' GROUP BY store_id;` MySQL can quickly determine that only partition `p2` needs to be scanned because the remaining partitions cannot contain any records satisfying the `WHERE` clause. See [Section 17.4, “Partition Pruning”](#), for more information about how this is accomplished.

17.2.2. LIST Partitioning

List partitioning in MySQL is similar to range partitioning in many ways. As in partitioning by `RANGE`, each partition must be explicitly defined. The chief difference is that, in list partitioning, each partition is defined and selected based on the membership of a column value in one of a set of value lists, rather than in one of a set of contiguous ranges of values. This is done by using `PARTITION BY LIST(expr)` where `expr` is a column value or an expression based on a column value and returning an integer value, and then defining each partition by means of a `VALUES IN (value_list)`, where `value_list` is a comma-separated list of integers.

Note

In MySQL 5.4, it is possible to match against only a list of integers (and possibly `NULL` — see [Section 17.2.6, “How MySQL Partitioning Handles NULL”](#)) when partitioning by `LIST`.

Unlike the case with partitions defined by range, list partitions do not need to be declared in any particular order. For more detailed syntactical information, see [Section 12.1.14, “CREATE TABLE Syntax”](#).

For the examples that follow, we assume that the basic definition of the table to be partitioned is provided by the `CREATE TABLE` statement shown here:

```
CREATE TABLE employees (
  id INT NOT NULL,
  fname VARCHAR(30),
  lname VARCHAR(30),
  hired DATE NOT NULL DEFAULT '1970-01-01',
  separated DATE NOT NULL DEFAULT '9999-12-31',
  job_code INT,
  store_id INT
);
```

(This is the same table used as a basis for the examples in [Section 17.2.1, “RANGE Partitioning”](#).)

Suppose that there are 20 video stores distributed among 4 franchises as shown in the following table.

Region	Store ID Numbers
North	3, 5, 6, 9, 17
East	1, 2, 10, 11, 19, 20
West	4, 12, 13, 14, 18
Central	7, 8, 15, 16

To partition this table in such a way that rows for stores belonging to the same region are stored in the same partition, you could use the `CREATE TABLE` statement shown here:

```
CREATE TABLE employees (
  id INT NOT NULL,
  fname VARCHAR(30),
  lname VARCHAR(30),
  hired DATE NOT NULL DEFAULT '1970-01-01',
  separated DATE NOT NULL DEFAULT '9999-12-31',
  job_code INT,
  store_id INT
)
PARTITION BY LIST(store_id) (
  PARTITION pNorth VALUES IN (3,5,6,9,17),
  PARTITION pEast VALUES IN (1,2,10,11,19,20),
  PARTITION pWest VALUES IN (4,12,13,14,18),
  PARTITION pCentral VALUES IN (7,8,15,16)
);
```

This makes it easy to add or drop employee records relating to specific regions to or from the table. For instance, suppose that all stores in the West region are sold to another company. All rows relating to employees working at stores in that region can be deleted with the query `ALTER TABLE employees DROP PARTITION pWest;` which can be executed much more efficiently than the equivalent `DELETE` statement `DELETE FROM employees WHERE store_id IN (4,12,13,14,18);`

As with `RANGE` partitioning, it is possible to combine `LIST` partitioning with partitioning by hash or key to produce a composite

partitioning (subpartitioning). See [Section 17.2.5, “Subpartitioning”](#).

Unlike the case with [RANGE](#) partitioning, there is no “catch-all” such as [MAXVALUE](#); all expected values for the partitioning expression should be covered in [PARTITION ... VALUES IN \(...\)](#) clauses. An [INSERT](#) statement containing an unmatched partitioning column value fails with an error, as shown in this example:

```
mysql> CREATE TABLE h2 (
->   c1 INT,
->   c2 INT
-> )
-> PARTITION BY LIST(c1) (
->   PARTITION p0 VALUES IN (1, 4, 7),
->   PARTITION p1 VALUES IN (2, 5, 8)
-> );
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO h2 VALUES (3, 5);
ERROR 1525 (HY000): TABLE HAS NO PARTITION FOR VALUE 3
```

When inserting multiple rows using a single [INSERT](#) statement, any rows coming before the row containing the unmatched value are inserted, but any coming after it are not:

```
mysql> SELECT * FROM h2;
Empty set (0.00 sec)

mysql> INSERT INTO h2 VALUES (4, 7), (3, 5), (6, 0);
ERROR 1525 (HY000): TABLE HAS NO PARTITION FOR VALUE 3
mysql> SELECT * FROM h2;
+-----+-----+
| c1   | c2   |
+-----+-----+
| 4   | 7   |
+-----+-----+
1 row in set (0.00 sec)
```

You can cause this type of error to be ignored by using the [IGNORE](#) key word. If you do so, rows containing unmatched partitioning column values are not inserted, but any rows with matching values *are* inserted, and no errors are reported:

```
mysql> TRUNCATE h2;
Query OK, 1 row affected (0.00 sec)

mysql> SELECT * FROM h2;
Empty set (0.00 sec)

mysql> INSERT IGNORE INTO h2 VALUES (2, 5), (6, 10), (7, 5), (3, 1), (1, 9);
Query OK, 3 rows affected (0.00 sec)
Records: 5 Duplicates: 2 Warnings: 0

mysql> SELECT * FROM h2;
+-----+-----+
| c1   | c2   |
+-----+-----+
| 7   | 5   |
| 1   | 9   |
| 2   | 5   |
+-----+-----+
3 rows in set (0.00 sec)
```

17.2.3. HASH Partitioning

Partitioning by [HASH](#) is used primarily to ensure an even distribution of data among a predetermined number of partitions. With range or list partitioning, you must specify explicitly into which partition a given column value or set of column values is to be stored; with hash partitioning, MySQL takes care of this for you, and you need only specify a column value or expression based on a column value to be hashed and the number of partitions into which the partitioned table is to be divided.

To partition a table using [HASH](#) partitioning, it is necessary to append to the [CREATE TABLE](#) statement a [PARTITION BY HASH \(expr\)](#) clause, where *expr* is an expression that returns an integer. This can simply be the name of a column whose type is one of MySQL’s integer types. In addition, you will most likely want to follow this with a [PARTITIONS num](#) clause, where *num* is a positive integer representing the number of partitions into which the table is to be divided.

For example, the following statement creates a table that uses hashing on the `store_id` column and is divided into 4 partitions:

```
CREATE TABLE employees (
  id INT NOT NULL,
  fname VARCHAR(30),
  lname VARCHAR(30),
  hired DATE NOT NULL DEFAULT '1970-01-01',
  separated DATE NOT NULL DEFAULT '9999-12-31',
  job_code INT,
  store_id INT
)
PARTITION BY HASH(store_id)
PARTITIONS 4;
```

If you do not include a [PARTITIONS](#) clause, the number of partitions defaults to 1.

Using the `PARTITIONS` keyword without a number following it results in a syntax error.

You can also use an SQL expression that returns an integer for *expr*. For instance, you might want to partition based on the year in which an employee was hired. This can be done as shown here:

```
CREATE TABLE employees (
  id INT NOT NULL,
  fname VARCHAR(30),
  lname VARCHAR(30),
  hired DATE NOT NULL DEFAULT '1970-01-01',
  separated DATE NOT NULL DEFAULT '9999-12-31',
  job_code INT,
  store_id INT
)
PARTITION BY HASH( YEAR(hired) )
PARTITIONS 4;
```

expr must return a non-constant, non-random integer value (in other words, it should be varying but deterministic), and must not contain any prohibited constructs as described in Section 17.5, “Restrictions and Limitations on Partitioning”. You should also keep in mind that this expression is evaluated each time a row is inserted or updated (or possibly deleted); this means that very complex expressions may give rise to performance issues, particularly when performing operations (such as batch inserts) that affect a great many rows at one time.

The most efficient hashing function is one which operates upon a single table column and whose value increases or decreases consistently with the column value, as this allows for “pruning” on ranges of partitions. That is, the more closely that the expression varies with the value of the column on which it is based, the more efficiently MySQL can use the expression for hash partitioning.

For example, where *date_col* is a column of type `DATE`, then the expression `TO_DAYS(date_col)` is said to vary directly with the value of *date_col*, because for every change in the value of *date_col*, the value of the expression changes in a consistent manner. The variance of the expression `YEAR(date_col)` with respect to *date_col* is not quite as direct as that of `TO_DAYS(date_col)`, because not every possible change in *date_col* produces an equivalent change in `YEAR(date_col)`. Even so, `YEAR(date_col)` is a good candidate for a hashing function, because it varies directly with a portion of *date_col* and there is no possible change in *date_col* that produces a disproportionate change in `YEAR(date_col)`.

By way of contrast, suppose that you have a column named *int_col* whose type is `INT`. Now consider the expression `POW(5-int_col, 3) + 6`. This would be a poor choice for a hashing function because a change in the value of *int_col* is not guaranteed to produce a proportional change in the value of the expression. Changing the value of *int_col* by a given amount can produce by widely different changes in the value of the expression. For example, changing *int_col* from 5 to 6 produces a change of -1 in the value of the expression, but changing the value of *int_col* from 6 to 7 produces a change of -7 in the expression value.

In other words, the more closely the graph of the column value *versus* the value of the expression follows a straight line as traced by the equation $y=nx$ where *n* is some nonzero constant, the better the expression is suited to hashing. This has to do with the fact that the more nonlinear an expression is, the more uneven the distribution of data among the partitions it tends to produce.

In theory, pruning is also possible for expressions involving more than one column value, but determining which of such expressions are suitable can be quite difficult and time-consuming. For this reason, the use of hashing expressions involving multiple columns is not particularly recommended.

When `PARTITION BY HASH` is used, MySQL determines which partition of *num* partitions to use based on the modulus of the result of the user function. In other words, for an expression *expr*, the partition in which the record is stored is partition number *N*, where $N = \text{MOD}(\text{expr}, \text{num})$. For example, suppose table `t1` is defined as follows, so that it has 4 partitions:

```
CREATE TABLE t1 (col1 INT, col2 CHAR(5), col3 DATE)
PARTITION BY HASH( YEAR(col3) )
PARTITIONS 4;
```

If you insert a record into `t1` whose `col3` value is '2005-09-15', then the partition in which it is stored is determined as follows:

```
MOD(YEAR('2005-09-01'), 4)
= MOD(2005, 4)
= 1
```

MySQL 5.4 also supports a variant of `HASH` partitioning known as *linear hashing* which employs a more complex algorithm for determining the placement of new rows inserted into the partitioned table. See Section 17.2.3.1, “`LINEAR HASH Partitioning`”, for a description of this algorithm.

The user function is evaluated each time a record is inserted or updated. It may also — depending on the circumstances — be evaluated when records are deleted.

Note

If a table to be partitioned has a **UNIQUE** key, then any columns supplied as arguments to the **HASH** user function or to the **KEY**'s *column_list* must be part of that key.

17.2.3.1. LINEAR HASH Partitioning

MySQL also supports linear hashing, which differs from regular hashing in that linear hashing utilizes a linear powers-of-two algorithm whereas regular hashing employs the modulus of the hashing function's value.

Syntactically, the only difference between linear-hash partitioning and regular hashing is the addition of the **LINEAR** keyword in the **PARTITION BY** clause, as shown here:

```
CREATE TABLE employees (
  id INT NOT NULL,
  fname VARCHAR(30),
  lname VARCHAR(30),
  hired DATE NOT NULL DEFAULT '1970-01-01',
  separated DATE NOT NULL DEFAULT '9999-12-31',
  job_code INT,
  store_id INT
)
PARTITION BY LINEAR HASH( YEAR(hired) )
PARTITIONS 4;
```

Given an expression *expr*, the partition in which the record is stored when linear hashing is used is partition number *N* from among *num* partitions, where *N* is derived according to the following algorithm:

1. Find the next power of 2 greater than *num*. We call this value *V*; it can be calculated as:

```
V = POWER(2, CEILING(LOG(2, num)))
```

(For example, suppose that *num* is 13. Then **LOG(2, 13)** is 3.7004397181411. **CEILING(3.7004397181411)** is 4, and **V = POWER(2, 4)**, which is 16.)

2. Set $N = F(\textit{column_list}) \& (V - 1)$.
3. While $N \geq \textit{num}$:
 - Set $V = \text{CEIL}(V / 2)$
 - Set $N = N \& (V - 1)$

For example, suppose that the table **t1**, using linear hash partitioning and having 6 partitions, is created using this statement:

```
CREATE TABLE t1 (col1 INT, col2 CHAR(5), col3 DATE)
PARTITION BY LINEAR HASH( YEAR(col3) )
PARTITIONS 6;
```

Now assume that you want to insert two records into **t1** having the **col3** column values '2003-04-14' and '1998-10-19'. The partition number for the first of these is determined as follows:

```
V = POWER(2, CEILING( LOG(2,6) )) = 8
N = YEAR('2003-04-14') & (8 - 1)
  = 2003 & 7
  = 3
(3 >= 6 is FALSE: record stored in partition #3)
```

The number of the partition where the second record is stored is calculated as shown here:

```
V = 8
N = YEAR('1998-10-19') & (8-1)
  = 1998 & 7
  = 6
(6 >= 6 is TRUE: additional step required)
N = 6 & CEILING(8 / 2)
  = 6 & 3
  = 2
(2 >= 6 is FALSE: record stored in partition #2)
```

The advantage in partitioning by linear hash is that the adding, dropping, merging, and splitting of partitions is made much faster, which can be beneficial when dealing with tables containing extremely large amounts (terabytes) of data. The disadvantage is that data is less likely to be evenly distributed between partitions as compared with the distribution obtained using regular hash partitioning.

17.2.4. KEY Partitioning

Partitioning by key is similar to partitioning by hash, except that where hash partitioning employs a user-defined expression, the hashing function for key partitioning is supplied by the MySQL server. MySQL Cluster uses `MD5()` for this purpose; for tables using other storage engines, the server employs its own internal hashing function which is based on the same algorithm as `PASS-WORD()`.

The syntax rules for `CREATE TABLE ... PARTITION BY KEY` are similar to those for creating a table that is partitioned by hash. The major differences are that:

- `KEY` is used rather than `HASH`.
- `KEY` takes only a list of one or more column names. The column or columns used as the partitioning key must comprise part or all of the table's primary key, if the table has one.

`KEY` takes a list of zero or more column names. Where no column name is specified as the partitioning key, the table's primary key is used, if there is one. For example, the following `CREATE TABLE` statement is valid in MySQL 5.4:

```
CREATE TABLE k1 (
  id INT NOT NULL PRIMARY KEY,
  name VARCHAR(20)
)
PARTITION BY KEY()
PARTITIONS 2;
```

If there is no primary key but there is a unique key, then the unique key is used for the partitioning key:

```
CREATE TABLE k1 (
  id INT NOT NULL,
  name VARCHAR(20),
  UNIQUE KEY (id)
)
PARTITION BY KEY()
PARTITIONS 2;
```

However, if the unique key column were not defined as `NOT NULL`, then the previous statement would fail.

In both of these cases, the partitioning key is the `id` column, even though it is not shown in the output of `SHOW CREATE TABLE` or in the `PARTITION_EXPRESSION` column of the `INFORMATION_SCHEMA.PARTITIONS` table.

Unlike the case with other partitioning types, columns used for partitioning by `KEY` are not restricted to integer or `NULL` values. For example, the following `CREATE TABLE` statement is valid:

```
CREATE TABLE tm1 (
  s1 CHAR(32) PRIMARY KEY
)
PARTITION BY KEY(s1)
PARTITIONS 10;
```

The preceding statement would *not* be valid, were a different partitioning type to be specified.

Note

In this case, simply using `PARTITION BY KEY()` would also be valid and have the same effect as `PARTITION BY KEY(s1)`, since `s1` is the table's primary key.

For additional information about this issue, see [Section 17.5, “Restrictions and Limitations on Partitioning”](#).

Note

Tables using the `NDBCLUSTER` storage engine are implicitly partitioned by `KEY`, again using the table's primary key as the partitioning key. In the event that the Cluster table has no explicit primary key, the “hidden” primary key generated by the `NDBCLUSTER` storage engine for each MySQL Cluster table is used as the partitioning key.

Important

For a key-partitioned table using any MySQL storage engine other than `NDBCLUSTER`, you cannot execute an `ALTER TABLE DROP PRIMARY KEY`, as doing so generates the error `ERROR 1466 (HY000): FIELD IN LIST OF FIELDS FOR PARTITION FUNCTION NOT FOUND IN TABLE`. This is not an issue for MySQL Cluster tables which are partitioned by `KEY`; in such cases, the table is reorganized using the “hidden” primary key as the table's new partitioning key. See [MySQL Cluster NDB 6.X/7.X](#).

It is also possible to partition a table by linear key. Here is a simple example:

```
CREATE TABLE tk (
  col1 INT NOT NULL,
  col2 CHAR(5),
  col3 DATE
)
PARTITION BY LINEAR KEY (col1)
PARTITIONS 3;
```

Using [LINEAR](#) has the same effect on [KEY](#) partitioning as it does on [HASH](#) partitioning, with the partition number being derived using a powers-of-two algorithm rather than modulo arithmetic. See [Section 17.2.3.1, “LINEAR HASH Partitioning”](#), for a description of this algorithm and its implications.

17.2.5. Subpartitioning

Subpartitioning — also known as *composite partitioning* — is the further division of each partition in a partitioned table. For example, consider the following [CREATE TABLE](#) statement:

```
CREATE TABLE ts (id INT, purchased DATE)
PARTITION BY RANGE( YEAR(purchased) )
SUBPARTITION BY HASH( TO_DAYS(purchased) )
SUBPARTITIONS 2 (
  PARTITION p0 VALUES LESS THAN (1990),
  PARTITION p1 VALUES LESS THAN (2000),
  PARTITION p2 VALUES LESS THAN MAXVALUE
);
```

Table `ts` has 3 [RANGE](#) partitions. Each of these partitions — `p0`, `p1`, and `p2` — is further divided into 2 subpartitions. In effect, the entire table is divided into $3 * 2 = 6$ partitions. However, due to the action of the [PARTITION BY RANGE](#) clause, the first 2 of these store only those records with a value less than 1990 in the `purchased` column.

In MySQL 5.4, it is possible to subpartition tables that are partitioned by [RANGE](#) or [LIST](#). Subpartitions may use either [HASH](#) or [KEY](#) partitioning. This is also known as *composite partitioning*.

It is also possible to define subpartitions explicitly using [SUBPARTITION](#) clauses to specify options for individual subpartitions. For example, a more verbose fashion of creating the same table `ts` as shown in the previous example would be:

```
CREATE TABLE ts (id INT, purchased DATE)
PARTITION BY RANGE( YEAR(purchased) )
SUBPARTITION BY HASH( TO_DAYS(purchased) ) (
  PARTITION p0 VALUES LESS THAN (1990) (
    SUBPARTITION s0,
    SUBPARTITION s1
  ),
  PARTITION p1 VALUES LESS THAN (2000) (
    SUBPARTITION s2,
    SUBPARTITION s3
  ),
  PARTITION p2 VALUES LESS THAN MAXVALUE (
    SUBPARTITION s4,
    SUBPARTITION s5
  )
);
```

Some syntactical items of note:

- Each partition must have the same number of subpartitions.
- If you explicitly define any subpartitions using [SUBPARTITION](#) on any partition of a partitioned table, you must define them all. In other words, the following statement will fail:

```
CREATE TABLE ts (id INT, purchased DATE)
PARTITION BY RANGE( YEAR(purchased) )
SUBPARTITION BY HASH( TO_DAYS(purchased) ) (
  PARTITION p0 VALUES LESS THAN (1990) (
    SUBPARTITION s0,
    SUBPARTITION s1
  ),
  PARTITION p1 VALUES LESS THAN (2000),
  PARTITION p2 VALUES LESS THAN MAXVALUE (
    SUBPARTITION s2,
    SUBPARTITION s3
  )
);
```

This statement would still fail even if it included a [SUBPARTITIONS 2](#) clause.

- Each `SUBPARTITION` clause must include (at a minimum) a name for the subpartition. Otherwise, you may set any desired option for the subpartition or allow it to assume its default setting for that option.
- Subpartition names must be unique across the entire table. For example, the following `CREATE TABLE` statement is valid in MySQL 5.4:

```
CREATE TABLE ts (id INT, purchased DATE)
PARTITION BY RANGE( YEAR(purchased) )
SUBPARTITION BY HASH( TO_DAYS(purchased) ) (
  PARTITION p0 VALUES LESS THAN (1990) (
    SUBPARTITION s0,
    SUBPARTITION s1
  ),
  PARTITION p1 VALUES LESS THAN (2000) (
    SUBPARTITION s2,
    SUBPARTITION s3
  ),
  PARTITION p2 VALUES LESS THAN MAXVALUE (
    SUBPARTITION s4,
    SUBPARTITION s5
  )
);
```

Subpartitions can be used with especially large tables to distribute data and indexes across many disks. Suppose that you have 6 disks mounted as `/disk0`, `/disk1`, `/disk2`, and so on. Now consider the following example:

```
CREATE TABLE ts (id INT, purchased DATE)
PARTITION BY RANGE( YEAR(purchased) )
SUBPARTITION BY HASH( TO_DAYS(purchased) ) (
  PARTITION p0 VALUES LESS THAN (1990) (
    SUBPARTITION s0
      DATA DIRECTORY = '/disk0/data'
      INDEX DIRECTORY = '/disk0/idx',
    SUBPARTITION s1
      DATA DIRECTORY = '/disk1/data'
      INDEX DIRECTORY = '/disk1/idx'
  ),
  PARTITION p1 VALUES LESS THAN (2000) (
    SUBPARTITION s2
      DATA DIRECTORY = '/disk2/data'
      INDEX DIRECTORY = '/disk2/idx',
    SUBPARTITION s3
      DATA DIRECTORY = '/disk3/data'
      INDEX DIRECTORY = '/disk3/idx'
  ),
  PARTITION p2 VALUES LESS THAN MAXVALUE (
    SUBPARTITION s4
      DATA DIRECTORY = '/disk4/data'
      INDEX DIRECTORY = '/disk4/idx',
    SUBPARTITION s5
      DATA DIRECTORY = '/disk5/data'
      INDEX DIRECTORY = '/disk5/idx'
  )
);
```

In this case, a separate disk is used for the data and for the indexes of each `RANGE`. Many other variations are possible; another example might be:

```
CREATE TABLE ts (id INT, purchased DATE)
PARTITION BY RANGE(YEAR(purchased))
SUBPARTITION BY HASH( TO_DAYS(purchased) ) (
  PARTITION p0 VALUES LESS THAN (1990) (
    SUBPARTITION s0a
      DATA DIRECTORY = '/disk0'
      INDEX DIRECTORY = '/disk1',
    SUBPARTITION s0b
      DATA DIRECTORY = '/disk2'
      INDEX DIRECTORY = '/disk3'
  ),
  PARTITION p1 VALUES LESS THAN (2000) (
    SUBPARTITION s1a
      DATA DIRECTORY = '/disk4/data'
      INDEX DIRECTORY = '/disk4/idx',
    SUBPARTITION s1b
      DATA DIRECTORY = '/disk5/data'
      INDEX DIRECTORY = '/disk5/idx'
  ),
  PARTITION p2 VALUES LESS THAN MAXVALUE (
    SUBPARTITION s2a,
    SUBPARTITION s2b
  )
);
```

Here, the storage is as follows:

- Rows with `purchased` dates from before 1990 take up a vast amount of space, so are split up 4 ways, with a separate disk dedicated to the data and to the indexes for each of the two subpartitions (`s0a` and `s0b`) making up partition `p0`. In other words:
 - The data for subpartition `s0a` is stored on `/disk0`.
 - The indexes for subpartition `s0a` are stored on `/disk1`.
 - The data for subpartition `s0b` is stored on `/disk2`.
 - The indexes for subpartition `s0b` are stored on `/disk3`.
- Rows containing dates ranging from 1990 to 1999 (partition `p1`) do not require as much room as those from before 1990. These are split between 2 disks (`/disk4` and `/disk5`) rather than 4 disks as with the legacy records stored in `p0`:
 - Data and indexes belonging to `p1`'s first subpartition (`s1a`) are stored on `/disk4` — the data in `/disk4/data`, and the indexes in `/disk4/idx`.
 - Data and indexes belonging to `p1`'s second subpartition (`s1b`) are stored on `/disk5` — the data in `/disk5/data`, and the indexes in `/disk5/idx`.
- Rows reflecting dates from the year 2000 to the present (partition `p2`) do not take up as much space as required by either of the two previous ranges. Currently, it is sufficient to store all of these in the default location.

In future, when the number of purchases for the decade beginning with the year 2000 grows to a point where the default location no longer provides sufficient space, the corresponding rows can be moved using an `ALTER TABLE ... REORGANIZE PARTITION` statement. See [Section 17.3, “Partition Management”](#), for an explanation of how this can be done.

The `DATA DIRECTORY` and `INDEX DIRECTORY` options are disallowed when the `NO_DIR_IN_CREATE` server SQL mode is in effect. This is true for partitions and subpartitions.

17.2.6. How MySQL Partitioning Handles `NULL`

Partitioning in MySQL does nothing to disallow `NULL` as the value of a partitioning expression, whether it is a column value or the value of a user-supplied expression. Even though it is permitted to use `NULL` as the value of an expression that must otherwise yield an integer, it is important to keep in mind that `NULL` is not a number. The partitioning implementation treats `NULL` as being less than any non-`NULL` value, just as `ORDER BY` does.

This means that treatment of `NULL` varies between partitioning of different types, and may produce behavior which you do not expect if you are not prepared for it. This being the case, we discuss in this section how each MySQL partitioning type handles `NULL` values when determining the partition in which a row should be stored, and provide examples for each.

Handling of `NULL` with `RANGE` partitioning. If you insert a row into a table partitioned by `RANGE` such that the column value used to determine the partition is `NULL`, the row is inserted into the lowest partition. For example, consider these two tables in a database named `p`, created as follows:

```
mysql> CREATE TABLE t1 (
->   c1 INT,
->   c2 VARCHAR(20)
-> )
-> PARTITION BY RANGE(c1) (
->   PARTITION p0 VALUES LESS THAN (0),
->   PARTITION p1 VALUES LESS THAN (10),
->   PARTITION p2 VALUES LESS THAN MAXVALUE
-> );
Query OK, 0 rows affected (0.09 sec)

mysql> CREATE TABLE t2 (
->   c1 INT,
->   c2 VARCHAR(20)
-> )
-> PARTITION BY RANGE(c1) (
->   PARTITION p0 VALUES LESS THAN (-5),
->   PARTITION p1 VALUES LESS THAN (0),
->   PARTITION p2 VALUES LESS THAN (10),
->   PARTITION p3 VALUES LESS THAN MAXVALUE
-> );
Query OK, 0 rows affected (0.09 sec)
```

You can see the partitions created by these two `CREATE TABLE` statements using the following query against the `PARTITIONS` table in the `INFORMATION_SCHEMA` database:

```
mysql> SELECT TABLE_NAME, PARTITION_NAME, TABLE_ROWS, AVG_ROW_LENGTH, DATA_LENGTH
-> FROM INFORMATION_SCHEMA.PARTITIONS
-> WHERE TABLE_SCHEMA = 'p' AND TABLE_NAME LIKE 't_';
+-----+-----+-----+-----+-----+
| TABLE_NAME | PARTITION_NAME | TABLE_ROWS | AVG_ROW_LENGTH | DATA_LENGTH |
```

```

+-----+-----+-----+-----+-----+
| t1    | p0    | 0    | 0    | 0    |
| t1    | p1    | 0    | 0    | 0    |
| t1    | p2    | 0    | 0    | 0    |
| t2    | p0    | 0    | 0    | 0    |
| t2    | p1    | 0    | 0    | 0    |
| t2    | p2    | 0    | 0    | 0    |
| t2    | p3    | 0    | 0    | 0    |
+-----+-----+-----+-----+-----+
7 rows in set (0.00 sec)

```

(For more information about this table, see [Section 19.19](#), “The `INFORMATION_SCHEMA.PARTITIONS` Table”.) Now let us populate each of these tables with a single row containing a `NULL` in the column used as the partitioning key, and verify that the rows were inserted using a pair of `SELECT` statements:

```

mysql> INSERT INTO t1 VALUES (NULL, 'mothra');
Query OK, 1 row affected (0.00 sec)

mysql> INSERT INTO t2 VALUES (NULL, 'mothra');
Query OK, 1 row affected (0.00 sec)

mysql> SELECT * FROM t1;
+-----+-----+
| id   | name |
+-----+-----+
| NULL | mothra |
+-----+-----+
1 row in set (0.00 sec)

mysql> SELECT * FROM t2;
+-----+-----+
| id   | name |
+-----+-----+
| NULL | mothra |
+-----+-----+
1 row in set (0.00 sec)

```

You can see which partitions are used to store the inserted rows by rerunning the previous query against `INFORMATION_SCHEMA.PARTITIONS` and inspecting the output:

```

mysql> SELECT TABLE_NAME, PARTITION_NAME, TABLE_ROWS, AVG_ROW_LENGTH, DATA_LENGTH
> FROM INFORMATION_SCHEMA.PARTITIONS
> WHERE TABLE_SCHEMA = 'p' AND TABLE_NAME LIKE 't_';
+-----+-----+-----+-----+-----+
| TABLE_NAME | PARTITION_NAME | TABLE_ROWS | AVG_ROW_LENGTH | DATA_LENGTH |
+-----+-----+-----+-----+-----+
| t1          | p0              | 1           | 20              | 20           |
| t1          | p1              | 0           | 0               | 0            |
| t1          | p2              | 0           | 0               | 0            |
| t2          | p0              | 1           | 20              | 20           |
| t2          | p1              | 0           | 0               | 0            |
| t2          | p2              | 0           | 0               | 0            |
| t2          | p3              | 0           | 0               | 0            |
+-----+-----+-----+-----+-----+
7 rows in set (0.01 sec)

```

You can also demonstrate that these rows were stored in the lowest partition of each table by dropping these partitions, and then rerunning the `SELECT` statements:

```

mysql> ALTER TABLE t1 DROP PARTITION p0;
Query OK, 0 rows affected (0.16 sec)

mysql> ALTER TABLE t2 DROP PARTITION p0;
Query OK, 0 rows affected (0.16 sec)

mysql> SELECT * FROM t1;
Empty set (0.00 sec)

mysql> SELECT * FROM t2;
Empty set (0.00 sec)

```

(For more information on `ALTER TABLE ... DROP PARTITION`, see [Section 12.1.6](#), “`ALTER TABLE Syntax`”.)

`NULL` is also treated in this way for partitioning expressions that use SQL functions. Suppose that we define a table using a `CREATE TABLE` statement such as this one:

```

CREATE TABLE tndate (
  id INT,
  dt DATE
)
PARTITION BY RANGE( YEAR(dt) ) (
  PARTITION p0 VALUES LESS THAN (1990),
  PARTITION p1 VALUES LESS THAN (2000),
  PARTITION p2 VALUES LESS THAN MAXVALUE
);

```

As with other MySQL functions, `YEAR(NULL)` returns `NULL`. A row with a `dt` column value of `NULL` is treated as though the partitioning expression evaluated to a value less than any other value, and so is inserted into partition `p0`.

Handling of `NULL` with `LIST` partitioning. A table that is partitioned by `LIST` admits `NULL` values if and only if one of its par-

titions is defined using that value-list that contains `NULL`. The converse of this is that a table partitioned by `LIST` which does not explicitly use `NULL` in a value list rejects rows resulting in a `NULL` value for the partitioning expression, as shown in this example:

```
mysql> CREATE TABLE ts1 (
->   c1 INT,
->   c2 VARCHAR(20)
-> )
-> PARTITION BY LIST(c1) (
->   PARTITION p0 VALUES IN (0, 3, 6),
->   PARTITION p1 VALUES IN (1, 4, 7),
->   PARTITION p2 VALUES IN (2, 5, 8)
-> );
Query OK, 0 rows affected (0.01 sec)

mysql> INSERT INTO ts1 VALUES (9, 'mothra');
ERROR 1504 (HY000): TABLE HAS NO PARTITION FOR VALUE 9

mysql> INSERT INTO ts1 VALUES (NULL, 'mothra');
ERROR 1504 (HY000): TABLE HAS NO PARTITION FOR VALUE NULL
```

Only rows having a `c1` value between 0 and 8 inclusive can be inserted into `ts1`. `NULL` falls outside this range, just like the number 9. We can create tables `ts2` and `ts3` having value lists containing `NULL`, as shown here:

```
mysql> CREATE TABLE ts2 (
->   c1 INT,
->   c2 VARCHAR(20)
-> )
-> PARTITION BY LIST(c1) (
->   PARTITION p0 VALUES IN (0, 3, 6),
->   PARTITION p1 VALUES IN (1, 4, 7),
->   PARTITION p2 VALUES IN (2, 5, 8),
->   PARTITION p3 VALUES IN (NULL)
-> );
Query OK, 0 rows affected (0.01 sec)

mysql> CREATE TABLE ts3 (
->   c1 INT,
->   c2 VARCHAR(20)
-> )
-> PARTITION BY LIST(c1) (
->   PARTITION p0 VALUES IN (0, 3, 6),
->   PARTITION p1 VALUES IN (1, 4, 7, NULL),
->   PARTITION p2 VALUES IN (2, 5, 8)
-> );
Query OK, 0 rows affected (0.01 sec)
```

When defining value lists for partitioning, you can (and should) treat `NULL` just as you would any other value. For example, both `VALUES IN (NULL)` and `VALUES IN (1, 4, 7, NULL)` are valid, as are `VALUES IN (1, NULL, 4, 7)`, `VALUES IN (NULL, 1, 4, 7)`, and so on. You can insert a row having `NULL` for column `c1` into each of the tables `ts2` and `ts3`:

```
mysql> INSERT INTO ts2 VALUES (NULL, 'mothra');
Query OK, 1 row affected (0.00 sec)

mysql> INSERT INTO ts3 VALUES (NULL, 'mothra');
Query OK, 1 row affected (0.00 sec)
```

By issuing the appropriate query against `INFORMATION_SCHEMA.PARTITIONS`, you can determine which partitions were used to store the rows just inserted (we assume, as in the previous examples, that the partitioned tables were created in the `p` database):

```
mysql> SELECT TABLE_NAME, PARTITION_NAME, TABLE_ROWS, AVG_ROW_LENGTH, DATA_LENGTH
-> FROM INFORMATION_SCHEMA.PARTITIONS
-> WHERE TABLE_SCHEMA = 'p' AND TABLE_NAME LIKE 'ts_';
```

TABLE_NAME	PARTITION_NAME	TABLE_ROWS	AVG_ROW_LENGTH	DATA_LENGTH
ts2	p0	0	0	0
ts2	p1	0	0	0
ts2	p2	0	0	0
ts2	p3	1	20	20
ts3	p0	0	0	0
ts3	p1	1	20	20
ts3	p2	0	0	0

7 rows in set (0.01 sec)

As shown earlier in this section, you can also verify which partitions were used for storing the rows by deleting these partitions and then performing a `SELECT`.

Handling of `NULL` with `HASH` and `KEY` partitioning. `NULL` is handled somewhat differently for tables partitioned by `HASH` or `KEY`. In these cases, any partition expression that yields a `NULL` value is treated as though its return value were zero. We can verify this behavior by examining the effects on the file system of creating a table partitioned by `HASH` and populating it with a record containing appropriate values. Suppose that you have a table `th` (also in the `p` database) created using the following statement:

```
mysql> CREATE TABLE th (
->   c1 INT,
->   c2 VARCHAR(20)
-> )
-> PARTITION BY HASH(c1)
-> PARTITIONS 2;
Query OK, 0 rows affected (0.00 sec)
```

The partitions belonging to this table can be viewed like this:

```
mysql> SELECT TABLE_NAME, PARTITION_NAME, TABLE_ROWS, AVG_ROW_LENGTH, DATA_LENGTH
> FROM INFORMATION_SCHEMA.PARTITIONS
> WHERE TABLE_SCHEMA = 'p' AND TABLE_NAME = 'th';
```

TABLE_NAME	PARTITION_NAME	TABLE_ROWS	AVG_ROW_LENGTH	DATA_LENGTH
th	p0	0	0	0
th	p1	0	0	0

2 rows in set (0.00 sec)

Note that `TABLE_ROWS` for each partition is 0. Now insert two rows into `th` whose `c1` column values are `NULL` and 0, and verify that these rows were inserted:

```
mysql> INSERT INTO th VALUES (NULL, 'mothra'), (0, 'gigan');
Query OK, 1 row affected (0.00 sec)
```

```
mysql> SELECT * FROM th;
```

c1	c2
NULL	mothra
0	gigan

2 rows in set (0.01 sec)

Recall that for any integer N , the value of `NULL MOD N` is always `NULL`. For tables that are partitioned by `HASH` or `KEY`, this result is treated for determining the correct partition as 0. Checking the `INFORMATION_SCHEMA.PARTITIONS` table once again, we can see that both rows were inserted into partition `p0`:

```
mysql> SELECT TABLE_NAME, PARTITION_NAME, TABLE_ROWS, AVG_ROW_LENGTH, DATA_LENGTH
> FROM INFORMATION_SCHEMA.PARTITIONS
> WHERE TABLE_SCHEMA = 'p' AND TABLE_NAME = 'th';
```

TABLE_NAME	PARTITION_NAME	TABLE_ROWS	AVG_ROW_LENGTH	DATA_LENGTH
th	p0	2	20	20
th	p1	0	0	0

2 rows in set (0.00 sec)

If you repeat this example using `PARTITION BY KEY` in place of `PARTITION BY HASH` in the definition of the table, you can verify easily that `NULL` is also treated like 0 for this type of partitioning as well.

17.3. Partition Management

MySQL 5.4 provides a number of ways to modify partitioned tables. It is possible to add, drop, redefine, merge, or split existing partitions. All of these actions can be carried out using the partitioning extensions to the `ALTER TABLE` command (see [Section 12.1.6, “ALTER TABLE Syntax”](#), for syntax definitions). There are also ways to obtain information about partitioned tables and partitions. We discuss these topics in the sections that follow.

- For information about partition management in tables partitioned by `RANGE` or `LIST`, see [Section 17.3.1, “Management of RANGE and LIST Partitions”](#).
- For a discussion of managing `HASH` and `KEY` partitions, see [Section 17.3.2, “Management of HASH and KEY Partitions”](#).
- See [Section 17.3.4, “Obtaining Information About Partitions”](#), for a discussion of mechanisms provided in MySQL 5.4 for obtaining information about partitioned tables and partitions.
- For a discussion of performing maintenance operations on partitions, see [Section 17.3.3, “Maintenance of Partitions”](#).

Note

In MySQL 5.4, all partitions of a partitioned table must have the same number of subpartitions, and it is not possible to change the subpartitioning once the table has been created.

To change a table's partitioning scheme, it is necessary only to use the `ALTER TABLE` command with a `partition_options` clause. This clause has the same syntax as that as used with `CREATE TABLE` for creating a partitioned table, and always begins with the keywords `PARTITION BY`. For example, suppose that you have a table partitioned by range using the following `CREATE TABLE` statement:

```
CREATE TABLE trb3 (id INT, name VARCHAR(50), purchased DATE)
PARTITION BY RANGE( YEAR(purchased) ) (
PARTITION p0 VALUES LESS THAN (1990),
PARTITION p1 VALUES LESS THAN (1995),
PARTITION p2 VALUES LESS THAN (2000),
```

```

PARTITION p3 VALUES LESS THAN (2005)
);

```

To repartition this table so that it is partitioned by key into two partitions using the `id` column value as the basis for the key, you can use this statement:

```
ALTER TABLE trb3 PARTITION BY KEY(id) PARTITIONS 2;
```

This has the same effect on the structure of the table as dropping the table and re-creating it using `CREATE TABLE trb3 PARTITION BY KEY(id) PARTITIONS 2;`.

`ALTER TABLE ... ENGINE = ...` changes only the storage engine used by the table, and leaves the table's partitioning scheme intact. Use `ALTER TABLE ... REMOVE PARTITIONING` to remove a table's partitioning. See [Section 12.1.6, “ALTER TABLE Syntax”](#).

Important

Only a single `PARTITION BY`, `ADD PARTITION`, `DROP PARTITION`, `REORGANIZE PARTITION`, or `COALESCE PARTITION` clause can be used in a given `ALTER TABLE` statement. If you (for example) wish to drop a partition and reorganize a table's remaining partitions, you must do so in two separate `ALTER TABLE` statements (one using `DROP PARTITION` and then a second one using `REORGANIZE PARTITIONS`).

17.3.1. Management of RANGE and LIST Partitions

Range and list partitions are very similar with regard to how the adding and dropping of partitions are handled. For this reason we discuss the management of both sorts of partitioning in this section. For information about working with tables that are partitioned by hash or key, see [Section 17.3.2, “Management of HASH and KEY Partitions”](#). Dropping a `RANGE` or `LIST` partition is more straightforward than adding one, so we discuss this first.

Dropping a partition from a table that is partitioned by either `RANGE` or by `LIST` can be accomplished using the `ALTER TABLE` statement with a `DROP PARTITION` clause. Here is a very basic example, which supposes that you have already created a table which is partitioned by range and then populated with 10 records using the following `CREATE TABLE` and `INSERT` statements:

```

mysql> CREATE TABLE tr (id INT, name VARCHAR(50), purchased DATE)
-> PARTITION BY RANGE( YEAR(purchased) ) (
-> PARTITION p0 VALUES LESS THAN (1990),
-> PARTITION p1 VALUES LESS THAN (1995),
-> PARTITION p2 VALUES LESS THAN (2000),
-> PARTITION p3 VALUES LESS THAN (2005)
-> );
Query OK, 0 rows affected (0.01 sec)

mysql> INSERT INTO tr VALUES
-> (1, 'desk organiser', '2003-10-15'),
-> (2, 'CD player', '1993-11-05'),
-> (3, 'TV set', '1996-03-10'),
-> (4, 'bookcase', '1982-01-10'),
-> (5, 'exercise bike', '2004-05-09'),
-> (6, 'sofa', '1987-06-05'),
-> (7, 'popcorn maker', '2001-11-22'),
-> (8, 'aquarium', '1992-08-04'),
-> (9, 'study desk', '1984-09-16'),
-> (10, 'lava lamp', '1998-12-25');
Query OK, 10 rows affected (0.01 sec)

```

You can see which items should have been inserted into partition `p2` as shown here:

```

mysql> SELECT * FROM tr
-> WHERE purchased BETWEEN '1995-01-01' AND '1999-12-31';
+----+-----+-----+
| id | name  | purchased |
+----+-----+-----+
| 3  | TV set | 1996-03-10 |
| 10 | lava lamp | 1998-12-25 |
+----+-----+-----+
2 rows in set (0.00 sec)

```

To drop the partition named `p2`, execute the following command:

```
mysql> ALTER TABLE tr DROP PARTITION p2;
Query OK, 0 rows affected (0.03 sec)
```

Note

The `NDBCLUSTER` storage engine does not support `ALTER TABLE ... DROP PARTITION`. It does, however, support the other partitioning-related extensions to `ALTER TABLE` that are described in this chapter.

It is very important to remember that, *when you drop a partition, you also delete all the data that was stored in that partition*. You can see that this is the case by re-running the previous `SELECT` query:

```
mysql> SELECT * FROM tr WHERE purchased
-> BETWEEN '1995-01-01' AND '1999-12-31';
Empty set (0.00 sec)
```

Because of this, you must have the `DROP` privilege for a table before you can execute `ALTER TABLE ... DROP PARTITION` on that table.

If you wish to drop all data from all partitions while preserving the table definition and its partitioning scheme, use the `TRUNCATE TABLE` command. (See [Section 12.2.10](#), “`TRUNCATE Syntax`”.)

If you intend to change the partitioning of a table *without* losing data, use `ALTER TABLE ... REORGANIZE PARTITION` instead. See below or in [Section 12.1.6](#), “`ALTER TABLE Syntax`”, for information about `REORGANIZE PARTITION`.

If you now execute a `SHOW CREATE TABLE` command, you can see how the partitioning makeup of the table has been changed:

```
mysql> SHOW CREATE TABLE tr\G
***** 1. row *****
Table: tr
Create Table: CREATE TABLE `tr` (
  `id` int(11) default NULL,
  `name` varchar(50) default NULL,
  `purchased` date default NULL
) ENGINE=MyISAM DEFAULT CHARSET=latin1
PARTITION BY RANGE ( YEAR(purchased) ) (
  PARTITION p0 VALUES LESS THAN (1990) ENGINE = MyISAM,
  PARTITION p1 VALUES LESS THAN (1995) ENGINE = MyISAM,
  PARTITION p3 VALUES LESS THAN (2005) ENGINE = MyISAM
)
1 row in set (0.01 sec)
```

When you insert new rows into the changed table with `purchased` column values between `'1995-01-01'` and `'2004-12-31'` inclusive, those rows will be stored in partition `p3`. You can verify this as follows:

```
mysql> INSERT INTO tr VALUES (11, 'pencil holder', '1995-07-12');
Query OK, 1 row affected (0.00 sec)

mysql> SELECT * FROM tr WHERE purchased
-> BETWEEN '1995-01-01' AND '2004-12-31';
+-----+-----+-----+
| id | name | purchased |
+-----+-----+-----+
| 11 | pencil holder | 1995-07-12 |
| 1 | desk organiser | 2003-10-15 |
| 5 | exercise bike | 2004-05-09 |
| 7 | popcorn maker | 2001-11-22 |
+-----+-----+-----+
4 rows in set (0.00 sec)

mysql> ALTER TABLE tr DROP PARTITION p3;
Query OK, 0 rows affected (0.03 sec)

mysql> SELECT * FROM tr WHERE purchased
-> BETWEEN '1995-01-01' AND '2004-12-31';
Empty set (0.00 sec)
```

Note that the number of rows dropped from the table as a result of `ALTER TABLE ... DROP PARTITION` is not reported by the server as it would be by the equivalent `DELETE` query.

Dropping `LIST` partitions uses exactly the same `ALTER TABLE ... DROP PARTITION` syntax as used for dropping `RANGE` partitions. However, there is one important difference in the effect this has on your use of the table afterward: You can no longer insert into the table any rows having any of the values that were included in the value list defining the deleted partition. (See [Section 17.2.2](#), “`LIST Partitioning`”, for an example.)

To add a new range or list partition to a previously partitioned table, use the `ALTER TABLE ... ADD PARTITION` statement. For tables which are partitioned by `RANGE`, this can be used to add a new range to the end of the list of existing partitions. For example, suppose that you have a partitioned table containing membership data for your organisation, which is defined as follows:

```
CREATE TABLE members (
  id INT,
  fname VARCHAR(25),
  lname VARCHAR(25),
  dob DATE
)
PARTITION BY RANGE( YEAR(dob) ) (
  PARTITION p0 VALUES LESS THAN (1970),
  PARTITION p1 VALUES LESS THAN (1980),
  PARTITION p2 VALUES LESS THAN (1990)
);
```

Suppose further that the minimum age for members is 16. As the calendar approaches the end of 2005, you realize that you will soon be admitting members who were born in 1990 (and later in years to come). You can modify the `members` table to accommodate new members born in the years 1990-1999 as shown here:

```
ALTER TABLE ADD PARTITION (PARTITION p3 VALUES LESS THAN (2000));
```

Important

With tables that are partitioned by range, you can use `ADD PARTITION` to add new partitions to the high end of the partitions list only. Trying to add a new partition in this manner between or before existing partitions will result in an error as shown here:

```
mysql> ALTER TABLE members
> ADD PARTITION (
> PARTITION p3 VALUES LESS THAN (1960));
ERROR 1463 (HY000): VALUES LESS THAN value must be strictly »
increasing for each partition
```

In a similar fashion, you can add new partitions to a table that is partitioned by `LIST`. For example, given a table defined like so:

```
CREATE TABLE tt (
  id INT,
  data INT
)
PARTITION BY LIST(data) (
  PARTITION p0 VALUES IN (5, 10, 15),
  PARTITION p1 VALUES IN (6, 12, 18)
);
```

You can add a new partition in which to store rows having the `data` column values `7`, `14`, and `21` as shown:

```
ALTER TABLE tt ADD PARTITION (PARTITION p2 VALUES IN (7, 14, 21));
```

Note that you *cannot* add a new `LIST` partition encompassing any values that are already included in the value list of an existing partition. If you attempt to do so, an error will result:

```
mysql> ALTER TABLE tt ADD PARTITION
> (PARTITION np VALUES IN (4, 8, 12));
ERROR 1465 (HY000): Multiple definition of same constant »
in list partitioning
```

Because any rows with the `data` column value `12` have already been assigned to partition `p1`, you cannot create a new partition on table `tt` that includes `12` in its value list. To accomplish this, you could drop `p1`, and add `np` and then a new `p1` with a modified definition. However, as discussed earlier, this would result in the loss of all data stored in `p1` — and it is often the case that this is not what you really want to do. Another solution might appear to be to make a copy of the table with the new partitioning and to copy the data into it using `CREATE TABLE ... SELECT ...`, then drop the old table and rename the new one, but this could be very time-consuming when dealing with a large amounts of data. This also might not be feasible in situations where high availability is a requirement.

You can add multiple partitions in a single `ALTER TABLE ... ADD PARTITION` statement as shown here:

```
CREATE TABLE employees (
  id INT NOT NULL,
  fname VARCHAR(50) NOT NULL,
  lname VARCHAR(50) NOT NULL,
  hired DATE NOT NULL
)
PARTITION BY RANGE( YEAR(hired) ) (
  PARTITION p1 VALUES LESS THAN (1991),
  PARTITION p2 VALUES LESS THAN (1996),
  PARTITION p3 VALUES LESS THAN (2001),
  PARTITION p4 VALUES LESS THAN (2005)
);

ALTER TABLE employees ADD PARTITION (
  PARTITION p5 VALUES LESS THAN (2010),
  PARTITION p6 VALUES LESS THAN MAXVALUE
);
```

Fortunately, MySQL's partitioning implementation provides ways to redefine partitions without losing data. Let us look first at a couple of simple examples involving `RANGE` partitioning. Recall the `members` table which is now defined as shown here:

```
mysql> SHOW CREATE TABLE members\G
***** 1. row *****
Table: members
Create Table: CREATE TABLE `members` (
  `id` int(11) default NULL,
  `fname` varchar(25) default NULL,
```

```

`lname` varchar(25) default NULL,
`dob` date default NULL
) ENGINE=MyISAM DEFAULT CHARSET=latin1
PARTITION BY RANGE ( YEAR(dob) ) (
PARTITION p0 VALUES LESS THAN (1970) ENGINE = MyISAM,
PARTITION p1 VALUES LESS THAN (1980) ENGINE = MyISAM,
PARTITION p2 VALUES LESS THAN (1990) ENGINE = MyISAM,
PARTITION p3 VALUES LESS THAN (2000) ENGINE = MyISAM
)

```

Suppose that you would like to move all rows representing members born before 1960 into a separate partition. As we have already seen, this cannot be done using `ALTER TABLE ... ADD PARTITION`. However, you can use another partition-related extension to `ALTER TABLE` in order to accomplish this:

```

ALTER TABLE members REORGANIZE PARTITION p0 INTO (
PARTITION s0 VALUES LESS THAN (1960),
PARTITION s1 VALUES LESS THAN (1970)
);

```

In effect, this command splits partition `p0` into two new partitions `s0` and `s1`. It also moves the data that was stored in `p0` into the new partitions according to the rules embodied in the two `PARTITION ... VALUES ...` clauses, so that `s0` contains only those records for which `YEAR(dob)` is less than 1960 and `s1` contains those rows in which `YEAR(dob)` is greater than or equal to 1960 but less than 1970.

A `REORGANIZE PARTITION` clause may also be used for merging adjacent partitions. You can return the `members` table to its previous partitioning as shown here:

```

ALTER TABLE members REORGANIZE PARTITION s0,s1 INTO (
PARTITION p0 VALUES LESS THAN (1970)
);

```

No data is lost in splitting or merging partitions using `REORGANIZE PARTITION`. In executing the above statement, MySQL moves all of the records that were stored in partitions `s0` and `s1` into partition `p0`.

The general syntax for `REORGANIZE PARTITION` is:

```

ALTER TABLE tbl_name
REORGANIZE PARTITION partition_list
INTO (partition_definitions);

```

Here, *tbl_name* is the name of the partitioned table, and *partition_list* is a comma-separated list of names of one or more existing partitions to be changed. *partition_definitions* is a comma-separated list of new partition definitions, which follow the same rules as for the *partition_definitions* list used in `CREATE TABLE` (see Section 12.1.14, “CREATE TABLE Syntax”). It should be noted that you are not limited to merging several partitions into one, or to splitting one partition into many, when using `REORGANIZE PARTITION`. For example, you can reorganize all four partitions of the `members` table into two, as follows:

```

ALTER TABLE members REORGANIZE PARTITION p0,p1,p2,p3 INTO (
PARTITION m0 VALUES LESS THAN (1980),
PARTITION m1 VALUES LESS THAN (2000)
);

```

You can also use `REORGANIZE PARTITION` with tables that are partitioned by `LIST`. Let us return to the problem of adding a new partition to the list-partitioned `tt` table and failing because the new partition had a value that was already present in the value-list of one of the existing partitions. We can handle this by adding a partition that contains only non-conflicting values, and then reorganizing the new partition and the existing one so that the value which was stored in the existing one is now moved to the new one:

```

ALTER TABLE tt ADD PARTITION (PARTITION np VALUES IN (4, 8));
ALTER TABLE tt REORGANIZE PARTITION p1,np INTO (
PARTITION p1 VALUES IN (6, 18),
PARTITION np VALUES in (4, 8, 12)
);

```

Here are some key points to keep in mind when using `ALTER TABLE ... REORGANIZE PARTITION` to repartition tables that are partitioned by `RANGE` or `LIST`:

- The `PARTITION` clauses used to determine the new partitioning scheme are subject to the same rules as those used with a `CREATE TABLE` statement.

Most importantly, you should remember that the new partitioning scheme cannot have any overlapping ranges (applies to tables partitioned by `RANGE`) or sets of values (when reorganizing tables partitioned by `LIST`).

- The combination of partitions in the *partition_definitions* list should account for the same range or set of values

overall as the combined partitions named in the *partition_list*.

For instance, in the `members` table used as an example in this section, partitions `p1` and `p2` together cover the years 1980 through 1999. Therefore, any reorganization of these two partitions should cover the same range of years overall.

- For tables partitioned by `RANGE`, you can reorganize only adjacent partitions; you cannot skip over range partitions.

For instance, you could not reorganize the `members` table used as an example in this section using a statement beginning with `ALTER TABLE members REORGANIZE PARTITION p0,p2 INTO ...` because `p0` covers the years prior to 1970 and `p2` the years from 1990 through 1999 inclusive, and thus the two are not adjacent partitions.

- You cannot use `REORGANIZE PARTITION` to change the table's partitioning type; that is, you cannot (for example) change `RANGE` partitions to `HASH` partitions or *vice versa*. You also cannot use this command to change the partitioning expression or column. To accomplish either of these tasks without dropping and re-creating the table, you can use `ALTER TABLE ... PARTITION BY ...`. For example:

```
ALTER TABLE members
PARTITION BY HASH( YEAR(dob) )
PARTITIONS 8;
```

17.3.2. Management of `HASH` and `KEY` Partitions

Tables which are partitioned by hash or by key are very similar to one another with regard to making changes in a partitioning setup, and both differ in a number of ways from tables which have been partitioned by range or list. For that reason, this section addresses the modification of tables partitioned by hash or by key only. For a discussion of adding and dropping of partitions of tables that are partitioned by range or list, see [Section 17.3.1, “Management of `RANGE` and `LIST` Partitions”](#).

You cannot drop partitions from tables that are partitioned by `HASH` or `KEY` in the same way that you can from tables that are partitioned by `RANGE` or `LIST`. However, you can merge `HASH` or `KEY` partitions using the `ALTER TABLE ... COALESCE PARTITION` command. For example, suppose that you have a table containing data about clients, which is divided into twelve partitions. The `clients` table is defined as shown here:

```
CREATE TABLE clients (
  id INT,
  fname VARCHAR(30),
  lname VARCHAR(30),
  signed DATE
)
PARTITION BY HASH( MONTH(signed) )
PARTITIONS 12;
```

To reduce the number of partitions from twelve to eight, execute the following `ALTER TABLE` command:

```
mysql> ALTER TABLE clients COALESCE PARTITION 4;
Query OK, 0 rows affected (0.02 sec)
```

`COALESCE` works equally well with tables that are partitioned by `HASH`, `KEY`, `LINEAR HASH`, or `LINEAR KEY`. Here is an example similar to the previous one, differing only in that the table is partitioned by `LINEAR KEY`:

```
mysql> CREATE TABLE clients_lk (
->   id INT,
->   fname VARCHAR(30),
->   lname VARCHAR(30),
->   signed DATE
-> )
-> PARTITION BY LINEAR KEY(signed)
-> PARTITIONS 12;
Query OK, 0 rows affected (0.03 sec)

mysql> ALTER TABLE clients_lk COALESCE PARTITION 4;
Query OK, 0 rows affected (0.06 sec)
Records: 0 Duplicates: 0 Warnings: 0
```

Note that the number following `COALESCE PARTITION` is the number of partitions to merge into the remainder — in other words, it is the number of partitions to remove from the table.

If you attempt to remove more partitions than the table has, the result is an error like the one shown:

```
mysql> ALTER TABLE clients COALESCE PARTITION 18;
ERROR 1478 (HY000): Cannot remove all partitions, use DROP TABLE instead
```

To increase the number of partitions for the `clients` table from 12 to 18, use `ALTER TABLE ... ADD PARTITION` as shown here:

```
ALTER TABLE clients ADD PARTITION PARTITIONS 6;
```

17.3.3. Maintenance of Partitions

A number of table and partition maintenance tasks can be carried out using SQL statements intended for such purposes on partitioned tables in MySQL 5.4.

Table maintenance of partitioned tables can be accomplished using the statements `CHECK TABLE`, `OPTIMIZE TABLE`, `ANALYZE TABLE`, and `REPAIR TABLE`, which are supported for partitioned tables.

You can use a number of extensions to `ALTER TABLE` for performing operations of this type on one or more partitions directly, as described in the following list:

- **Rebuilding partitions.** Rebuilds the partition; this has the same effect as dropping all records stored in the partition, then reinserting them. This can be useful for purposes of defragmentation.

Example:

```
ALTER TABLE t1 REBUILD PARTITION p0, p1;
```

- **Optimizing partitions.** If you have deleted a large number of rows from a partition or if you have made many changes to a partitioned table with variable-length rows (that is, having `VARCHAR`, `BLOB`, or `TEXT` columns), you can use `ALTER TABLE ... OPTIMIZE PARTITION` to reclaim any unused space and to defragment the partition data file.

Example:

```
ALTER TABLE t1 OPTIMIZE PARTITION p0, p1;
```

Using `OPTIMIZE PARTITION` on a given partition is equivalent to running `CHECK PARTITION`, `ANALYZE PARTITION`, and `REPAIR PARTITION` on that partition.

- **Analyzing partitions.** This reads and stores the key distributions for partitions.

Example:

```
ALTER TABLE t1 ANALYZE PARTITION p3;
```

- **Repairing partitions.** This repairs corrupted partitions.

Example:

```
ALTER TABLE t1 REPAIR PARTITION p0, p1;
```

- **Checking partitions.** You can check partitions for errors in much the same way that you can use `CHECK TABLE` with non-partitioned tables.

Example:

```
ALTER TABLE trb3 CHECK PARTITION p1;
```

This command will tell you if the data or indexes in partition `p1` of table `t1` are corrupted. If this is the case, use `ALTER TABLE ... REPAIR PARTITION` to repair the partition.

17.3.4. Obtaining Information About Partitions

This section discusses obtaining information about existing partitions, which can be done in a number of ways. These include:

- Using the `SHOW CREATE TABLE` statement to view the partitioning clauses used in creating a partitioned table.
- Using the `SHOW TABLE STATUS` statement to determine whether a table is partitioned.
- Querying the `INFORMATION_SCHEMA.PARTITIONS` table.
- Using the statement `EXPLAIN PARTITIONS SELECT` to see which partitions are used by a given `SELECT`.

As discussed elsewhere in this chapter, `SHOW CREATE TABLE` includes in its output the `PARTITION BY` clause used to create a partitioned table. For example:

```
mysql> SHOW CREATE TABLE trb3\G
***** 1. row *****
      Table: trb3
Create Table: CREATE TABLE `trb3` (
  `id` int(11) default NULL,
  `name` varchar(50) default NULL,
  `purchased` date default NULL
) ENGINE=MyISAM DEFAULT CHARSET=latin1
PARTITION BY RANGE (YEAR(purchased)) (
  PARTITION p0 VALUES LESS THAN (1990) ENGINE = MyISAM,
  PARTITION p1 VALUES LESS THAN (1995) ENGINE = MyISAM,
  PARTITION p2 VALUES LESS THAN (2000) ENGINE = MyISAM,
  PARTITION p3 VALUES LESS THAN (2005) ENGINE = MyISAM
)
1 row in set (0.00 sec)
```

The output from `SHOW TABLE STATUS` for partitioned tables is the same as that for non-partitioned tables, except that the `Create_options` column contains the string `partitioned`. The `Engine` column contains the name of the storage engine used by all partitions of the table. (See [Section 12.5.5.37](#), “`SHOW TABLE STATUS Syntax`”, for more information about this statement.)

You can also obtain information about partitions from `INFORMATION_SCHEMA`, which contains a `PARTITIONS` table. See [Section 19.19](#), “`The INFORMATION_SCHEMA PARTITIONS Table`”.

It is possible to determine which partitions of a partitioned table are involved in a given `SELECT` query using `EXPLAIN PARTITIONS`. The `PARTITIONS` keyword adds a `partitions` column to the output of `EXPLAIN` listing the partitions from which records would be matched by the query.

Suppose that you have a table `trb1` defined and populated as follows:

```
CREATE TABLE trb1 (id INT, name VARCHAR(50), purchased DATE)
PARTITION BY RANGE(id)
(
  PARTITION p0 VALUES LESS THAN (3),
  PARTITION p1 VALUES LESS THAN (7),
  PARTITION p2 VALUES LESS THAN (9),
  PARTITION p3 VALUES LESS THAN (11)
);

INSERT INTO trb1 VALUES
(1, 'desk organiser', '2003-10-15'),
(2, 'CD player', '1993-11-05'),
(3, 'TV set', '1996-03-10'),
(4, 'bookcase', '1982-01-10'),
(5, 'exercise bike', '2004-05-09'),
(6, 'sofa', '1987-06-05'),
(7, 'popcorn maker', '2001-11-22'),
(8, 'aquarium', '1992-08-04'),
(9, 'study desk', '1984-09-16'),
(10, 'lava lamp', '1998-12-25');
```

You can see which partitions are used in a query such as `SELECT * FROM trb1;`, as shown here:

```
mysql> EXPLAIN PARTITIONS SELECT * FROM trb1\G
***** 1. row *****
      id: 1
select_type: SIMPLE
      table: trb1
  partitions: p0,p1,p2,p3
         type: ALL
possible_keys: NULL
          key: NULL
        key_len: NULL
           ref: NULL
          rows: 10
      Extra: Using filesort
```

In this case, all four partitions are searched. However, when a limiting condition making use of the partitioning key is added to the query, you can see that only those partitions containing matching values are scanned, as shown here:

```
mysql> EXPLAIN PARTITIONS SELECT * FROM trb1 WHERE id < 5\G
***** 1. row *****
      id: 1
select_type: SIMPLE
      table: trb1
  partitions: p0,p1
         type: ALL
possible_keys: NULL
          key: NULL
        key_len: NULL
           ref: NULL
          rows: 10
```

```
Extra: Using where
```

`EXPLAIN PARTITIONS` provides information about keys used and possible keys, just as with the standard `EXPLAIN SELECT` statement:

```
mysql> ALTER TABLE trb1 ADD PRIMARY KEY (id);
Query OK, 10 rows affected (0.03 sec)
Records: 10 Duplicates: 0 Warnings: 0

mysql> EXPLAIN PARTITIONS SELECT * FROM trb1 WHERE id < 5\G
***** 1. row *****
      id: 1
    select_type: SIMPLE
      table: trb1
    partitions: p0,p1
              type: range
possible_keys: PRIMARY
              key: PRIMARY
            key_len: 4
              ref: NULL
              rows: 7
            Extra: Using where
```

You should take note of the following restrictions and limitations on `EXPLAIN PARTITIONS`:

- You cannot use the `PARTITIONS` and `EXTENDED` keywords together in the same `EXPLAIN ... SELECT` statement. Attempting to do so produces a syntax error.
- If `EXPLAIN PARTITIONS` is used to examine a query against a non-partitioned table, no error is produced, but the value of the `partitions` column is always `NULL`.

The `rows` column of `EXPLAIN PARTITIONS` output displays the total number of records in the table.

See also [Section 12.3.2, “EXPLAIN Syntax”](#).

17.4. Partition Pruning

This section discusses an optimization known as *partition pruning*. The core concept behind partition pruning is relatively simple, and can be described as “Do not scan partitions where there can be no matching values”. For example, suppose you have a partitioned table `t1` defined by this statement:

```
CREATE TABLE t1 (
  fname VARCHAR(50) NOT NULL,
  lname VARCHAR(50) NOT NULL,
  region_code TINYINT UNSIGNED NOT NULL,
  dob DATE NOT NULL
)
PARTITION BY RANGE( region_code ) (
  PARTITION p0 VALUES LESS THAN (64),
  PARTITION p1 VALUES LESS THAN (128),
  PARTITION p2 VALUES LESS THAN (192),
  PARTITION p3 VALUES LESS THAN MAXVALUE
);
```

Consider the case where you wish to obtain results from a query such as this one:

```
SELECT fname, lname, region_code, dob
FROM t1
WHERE region_code > 125 AND region_code < 130;
```

It is easy to see that none of the rows which ought to be returned will be in either of the partitions `p0` or `p3`; that is, we need to search only in partitions `p1` and `p2` to find matching rows. By doing so, it is possible to expend much more time and effort in finding matching rows than it is to scan all partitions in the table. This “cutting away” of unneeded partitions is known as *pruning*. When the optimizer can make use of partition pruning in performing a query, execution of the query can be an order of magnitude faster than the same query against a non-partitioned table containing the same column definitions and data.

The query optimizer can perform pruning whenever a `WHERE` condition can be reduced to either one of the following:

- `partition_column = constant`
- `partition_column IN (constant1, constant2, ..., constantN)`

In the first case, the optimizer simply evaluates the partitioning expression for the value given, determines which partition contains

that value, and scans only this partition. In many cases, the equals sign can be replaced with another arithmetic comparison, including `<`, `>`, `<=`, `>=`, and `<>`. Some queries using `BETWEEN` in the `WHERE` clause can also take advantage of partition pruning. See the examples later in this section.

In the second case, the optimizer evaluates the partitioning expression for each value in the list, creates a list of matching partitions, and then scans only the partitions in this partition list.

Pruning can also be applied to short ranges, which the optimizer can convert into equivalent lists of values. For instance, in the previous example, the `WHERE` clause can be converted to `WHERE region_code IN (125, 126, 127, 128, 129, 130)`. Then the optimizer can determine that the first three values in the list are found in partition `p1`, the remaining three values in partition `p2`, and that the other partitions contain no relevant values and so do not need to be searched for matching rows.

This type of optimization can be applied whenever the partitioning expression consists of an equality or a range which can be reduced to a set of equalities, or when the partitioning expression represents an increasing or decreasing relationship. Pruning can also be applied for tables partitioned on a `DATE` or `DATETIME` column when the partitioning expression uses the `YEAR()` or `TO_DAYS()` function.

Note

We plan to add pruning support in a future MySQL release for additional functions that act on a `DATE` or `DATETIME` value, return an integer, and are increasing or decreasing.

For example, suppose that table `t2`, defined as shown here, is partitioned on a `DATE` column:

```
CREATE TABLE t2 (
  fname VARCHAR(50) NOT NULL,
  lname VARCHAR(50) NOT NULL,
  region_code TINYINT UNSIGNED NOT NULL,
  dob DATE NOT NULL
)
PARTITION BY RANGE( YEAR(dob) ) (
  PARTITION d0 VALUES LESS THAN (1970),
  PARTITION d1 VALUES LESS THAN (1975),
  PARTITION d2 VALUES LESS THAN (1980),
  PARTITION d3 VALUES LESS THAN (1985),
  PARTITION d4 VALUES LESS THAN (1990),
  PARTITION d5 VALUES LESS THAN (2000),
  PARTITION d6 VALUES LESS THAN (2005),
  PARTITION d7 VALUES LESS THAN MAXVALUE
);
```

The following queries on `t2` can make use of partition pruning:

```
SELECT * FROM t2 WHERE dob = '1982-06-23';
SELECT * FROM t2 WHERE dob BETWEEN '1991-02-15' AND '1997-04-25';
SELECT * FROM t2 WHERE dob >= '1984-06-21' AND dob <= '1999-06-21'
```

In the case of the last query, the optimizer can also act as follows:

1. Find the partition containing the low end of the range.
`YEAR('1984-06-21')` yields the value `1984`, which is found in partition `d3`.
2. Find the partition containing the high end of the range.
`YEAR('1999-06-21')` evaluates to `1999`, which is found in partition `d5`.
3. Scan only these two partitions and any partitions that may lie between them.

In this case, this means that only partitions `d3`, `d4`, and `d5` are scanned. The remaining partitions may be safely ignored (and are ignored).

Important

Invalid `DATE` and `DATETIME` values referenced in the `WHERE` clause of a query on a partitioned table are treated as `NULL`. This means that a query such as `SELECT * FROM partitioned_table WHERE date_column < '2008-12-00'` does not return any values (see [Bug#40972](#)).

So far, we have looked only at examples using `RANGE` partitioning, but pruning can be applied with other partitioning types as well.

Consider a table that is partitioned by `LIST`, where the partitioning expression is increasing or decreasing, such as the table `t3`

shown here. (In this example, we assume for the sake of brevity that the `region_code` column is limited to values between 1 and 10 inclusive.)

```
CREATE TABLE t3 (
  fname VARCHAR(50) NOT NULL,
  lname VARCHAR(50) NOT NULL,
  region_code TINYINT UNSIGNED NOT NULL,
  dob DATE NOT NULL
)
PARTITION BY LIST(region_code) (
  PARTITION r0 VALUES IN (1, 3),
  PARTITION r1 VALUES IN (2, 5, 8),
  PARTITION r2 VALUES IN (4, 9),
  PARTITION r3 VALUES IN (6, 7, 10)
);
```

For a query such as `SELECT * FROM t3 WHERE region_code BETWEEN 1 AND 3`, the optimizer determines in which partitions the values 1, 2, and 3 are found (`r0` and `r1`) and skips the remaining ones (`r2` and `r3`).

For tables that are partitioned by `HASH` or `KEY`, partition pruning is also possible in cases in which the `WHERE` clause uses a simple `=` relation against a column used in the partitioning expression. Consider a table created like this:

```
CREATE TABLE t4 (
  fname VARCHAR(50) NOT NULL,
  lname VARCHAR(50) NOT NULL,
  region_code TINYINT UNSIGNED NOT NULL,
  dob DATE NOT NULL
)
PARTITION BY KEY(region_code)
PARTITIONS 8;
```

Any query such as this one can be pruned:

```
SELECT * FROM t4 WHERE region_code = 7;
```

Pruning can also be employed for short ranges, because the optimizer can turn such conditions into `IN` relations. For example, using the same table `t4` as defined previously, queries such as these can be pruned:

```
SELECT * FROM t4 WHERE region_code > 2 AND region_code < 6;
SELECT * FROM t4 WHERE region_code BETWEEN 3 AND 5;
```

In both these cases, the `WHERE` clause is transformed by the optimizer into `WHERE region_code IN (3, 4, 5)`.

Important

This optimization is used only if the range size is smaller than the number of partitions. Consider this query:

```
SELECT * FROM t4 WHERE region_code BETWEEN 4 AND 8;
```

The range in the `WHERE` clause covers 5 values (4, 5, 6, 7, 8), but `t4` has only 4 partitions. This means that the previous query cannot be pruned.

Pruning can be used only on integer columns of tables partitioned by `HASH` or `KEY`. For example, this query on table `t4` cannot use pruning because `dob` is a `DATE` column:

```
SELECT * FROM t4 WHERE dob >= '2001-04-14' AND dob <= '2005-10-15';
```

However, if the table stores year values in an `INT` column, then a query having `WHERE year_col >= 2001 AND year_col <= 2005` can be pruned.

17.5. Restrictions and Limitations on Partitioning

This section discusses current restrictions and limitations on MySQL partitioning support, as listed here:

- **Prohibited constructs.** The following constructs are not permitted in partitioning expressions:

- Stored functions, stored procedures, UDFs, or plugins.
- Declared variables or user variables.

For a list of SQL functions which are permitted in partitioning expressions, see [Section 17.5.3, “Partitioning Limitations Relating to Functions”](#).

- **Arithmetic and logical operators.** Use of the arithmetic operators `+`, `-`, and `*` is permitted in partitioning expressions.

However, the result must be an integer value or `NULL` (except in the case of `[LINEAR] KEY` partitioning, as discussed elsewhere in this chapter — see [Section 17.2, “Partition Types”](#), for more information).

The `DIV` operator is also supported, and the `/` operator is disallowed. ([Bug#30188](#), [Bug#33182](#))

The bit operators `|`, `&`, `^`, `<<`, `>>`, and `~` are not permitted in partitioning expressions.

- **Server SQL mode.** Tables employing user-defined partitioning do not preserve the SQL mode in effect at the time that they were created. As discussed in [Section 5.1.7, “Server SQL Modes”](#), the results of many MySQL functions and operators may change according to the server SQL mode. Therefore, a change in the SQL mode at any time after the creation of partitioned tables may lead to major changes in the behavior of such tables, and could easily lead to corruption or loss of data. For these reasons, *it is strongly recommended that you never change the server SQL mode after creating partitioned tables.*

Examples. The following examples illustrate some changes in behavior of partitioned tables due to a change in the server SQL mode:

1. **Error handling.** Suppose you create a partitioned table whose partitioning expression is one such as `column DIV 0` or `column MOD 0`, as shown here:

```
mysql> CREATE TABLE tn (c1 INT)
-> PARTITION BY LIST(1 DIV c1) (
-> PARTITION p0 VALUES IN (NULL),
-> PARTITION p1 VALUES IN (1)
-> );
Query OK, 0 rows affected (0.05 sec)
```

The default behavior for MySQL is to return `NULL` for the result of a division by zero, without producing any errors:

```
mysql> SELECT @@SQL_MODE;
+-----+
| @@SQL_MODE |
+-----+
|             |
+-----+
1 row in set (0.00 sec)

mysql> INSERT INTO tn VALUES (NULL), (0), (1);
Query OK, 3 rows affected (0.00 sec)
Records: 3 Duplicates: 0 Warnings: 0
```

However, changing the server SQL mode to treat division by zero as an error and to enforce strict error handling causes the same `INSERT` statement to fail, as shown here:

```
mysql> SET SQL_MODE='STRICT_ALL_TABLES,ERROR_FOR_DIVISION_BY_ZERO';
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO tn VALUES (NULL), (0), (1);
ERROR 1365 (22012): DIVISION BY 0
```

2. **Table accessibility.** Sometimes a change in the server SQL mode can make partitioned tables unusable. The following `CREATE TABLE` statement can be executed successfully only if the `NO_UNSIGNED_SUBTRACTION` mode is in effect:

```
mysql> SELECT @@SQL_MODE;
+-----+
| @@SQL_MODE |
+-----+
|             |
+-----+
1 row in set (0.00 sec)

mysql> CREATE TABLE tu (c1 BIGINT UNSIGNED)
-> PARTITION BY RANGE(c1 - 10) (
-> PARTITION p0 VALUES LESS THAN (-5),
-> PARTITION p1 VALUES LESS THAN (0),
-> PARTITION p2 VALUES LESS THAN (5),
-> PARTITION p3 VALUES LESS THAN (10),
-> PARTITION p4 VALUES LESS THAN (MAXVALUE)
-> );
ERROR 1563 (HY000): PARTITION CONSTANT IS OUT OF PARTITION FUNCTION DOMAIN

mysql> SET SQL_MODE='NO_UNSIGNED_SUBTRACTION';
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT @@SQL_MODE;
+-----+
| @@SQL_MODE |
+-----+
| NO_UNSIGNED_SUBTRACTION |
+-----+
1 row in set (0.00 sec)

mysql> CREATE TABLE tu (c1 BIGINT UNSIGNED)
-> PARTITION BY RANGE(c1 - 10) (
-> PARTITION p0 VALUES LESS THAN (-5),
-> PARTITION p1 VALUES LESS THAN (0),
```

```

-> PARTITION p2 VALUES LESS THAN (5),
-> PARTITION p3 VALUES LESS THAN (10),
-> PARTITION p4 VALUES LESS THAN (MAXVALUE)
-> );
Query OK, 0 rows affected (0.05 sec)

```

If you remove the `NO_UNSIGNED_SUBTRACTION` server SQL mode after creating `tu`, you may no longer be able to access this table:

```

mysql> SET SQL_MODE='';
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT * FROM tu;
ERROR 1563 (HY000): PARTITION CONSTANT IS OUT OF PARTITION FUNCTION DOMAIN
mysql> INSERT INTO tu VALUES (20);
ERROR 1563 (HY000): PARTITION CONSTANT IS OUT OF PARTITION FUNCTION DOMAIN

```

- **Performance considerations.**

- **File system operations.** Partitioning and repartitioning operations (such as `ALTER TABLE` with `PARTITION BY ...`, `REORGANIZE PARTITIONS`, or `REMOVE PARTITIONING`) depend on file system operations for their implementation. This means that the speed of these operations is affected by such factors as file system type and characteristics, disk speed, swap space, file handling efficiency of the operating system, and MySQL server options and variables that relate to file handling. In particular, you should make sure that `large_files_support` is enabled and that `open_files_limit` is set properly. For partitioned tables using the `MyISAM` storage engine, increasing `myisam_max_sort_file_size` may improve performance; partitioning and repartitioning operations involving `InnoDB` tables may be made more efficient by enabling `innodb_file_per_table`.
- **Table locks.** The process executing a partitioning operation on a table takes a write lock on the table. Reads from such tables are relatively unaffected; pending `INSERT` and `UPDATE` operations are performed as soon as the partitioning operation has completed.
- **Storage engine.** Partitioning operations, queries, and update operations generally tend to be faster with `MyISAM` tables than with `InnoDB` or `NDB` tables.
- **Use of indexes and partition pruning.** As with non-partitioned tables, proper use of indexes can speed up queries on partitioned tables significantly. In addition, designing partitioned tables and queries on these tables to take advantage of *partition pruning* can improve performance dramatically. See [Section 17.4, “Partition Pruning”](#), for more information.
- **Performance with `LOAD DATA`.** When importing into partitioned tables, `LOAD DATA` uses buffering to improve performance; however, the buffer uses 130 KB memory per partition to achieve this. ([Bug#26527](#))
- **Maximum number of partitions.** The maximum number of partitions possible for a given table is 1024. This includes subpartitions.

If, when creating tables with a very large number of partitions (but which is less than the maximum stated previously), you encounter an error message such as `GOT ERROR 24 FROM STORAGE ENGINE`, this means that you may need to increase the value of the `open_files_limit` system variable. See [Section B.1.2.18, “‘FILE’ NOT FOUND and Similar Errors”](#).

- **Foreign keys not supported.** Partitioned tables do not support foreign keys. This means that:
 1. Definitions of tables employing user-defined partitioning may not contain foreign key references to other tables.
 2. No table definition may contain a foreign key reference to a partitioned table. The scope of these restrictions includes tables that use the `InnoDB` storage engine.
- **`ALTER TABLE ... ORDER BY`.** An `ALTER TABLE ... ORDER BY column` statement run against a partitioned table causes ordering of rows only within each partition.
- **FULLTEXT indexes.** Partitioned tables do not support `FULLTEXT` indexes. This includes partitioned tables employing the `MyISAM` storage engine.
- **Spatial columns.** Columns with spatial data types such as `POINT` or `GEOMETRY` cannot be used in partitioned tables.
- **Temporary tables.** Temporary tables cannot be partitioned. ([Bug#17497](#))
- **Log tables.** It is not possible to partition the log tables; an `ALTER TABLE ... PARTITION BY ...` statement on such a table fails with an error. ([Bug#27816](#))
- **Data type of partitioning key.** A partitioning key must be either an integer column or an expression that resolves to an integer. The column or expression value may also be `NULL`. (See [Section 17.2.6, “How MySQL Partitioning Handles NULL”](#).)

The lone exception to this restriction occurs when partitioning by `[LINEAR] KEY`, where it is possible to use columns of other

types as partitioning keys, because MySQL's internal key-hashing functions produce the correct data type from these types. For example, the following `CREATE TABLE` statement is valid:

```
CREATE TABLE tkc (c1 CHAR)
PARTITION BY KEY(c1)
PARTITIONS 4;
```

This exception does *not* apply to `BLOB` or `TEXT` column types.

- **Subqueries.** A partitioning key may not be a subquery, even if that subquery resolves to an integer value or `NULL`.
- **Subpartitions.** Subpartitions are limited to `HASH` or `KEY` partitioning. `HASH` and `KEY` partitions cannot be subpartitioned.
- **Key caches not supported.** Key caches are not supported for partitioned tables. The `CACHE INDEX` and `LOAD INDEX INTO CACHE` statements, when you attempt to use them on tables having user-defined partitioning, fail with the errors `THE STORAGE ENGINE FOR THE TABLE DOESN'T SUPPORT ASSIGN_TO_KEYCACHE` and `THE STORAGE ENGINE FOR THE TABLE DOESN'T SUPPORT PRELOAD_KEYS`, respectively.
- **DELAYED option not supported.** Use of `INSERT DELAYED` to insert rows into a partitioned table is not supported. Attempting to do so fails with an error. ([Bug#31210](#))
- **DATA DIRECTORY and INDEX DIRECTORY options.** `DATA DIRECTORY` and `INDEX DIRECTORY` are subject to the following restrictions when used with partitioned tables:
 - Table-level `DATA DIRECTORY` and `INDEX DIRECTORY` options are ignored. ([Bug#32091](#))
 - On Windows, the `DATA DIRECTORY` and `INDEX DIRECTORY` options are not supported for individual partitions or subpartitions ([Bug#30459](#)).
- **Repairing and rebuilding partitioned tables.** The statements `CHECK TABLE`, `OPTIMIZE TABLE`, `ANALYZE TABLE`, and `REPAIR TABLE` are supported for partitioned tables. (See [Bug#20129](#).) `mysqlcheck` and `myisamchk` are not supported with partitioned tables.

In addition, you can use `ALTER TABLE ... REBUILD PARTITION` to rebuild one or more partitions of a partitioned table; `ALTER TABLE ... REORGANIZE PARTITION` also causes partitions to be rebuilt. See [Section 12.1.6, “ALTER TABLE Syntax”](#), for more information about these two statements.

17.5.1. Partitioning Keys, Primary Keys, and Unique Keys

This section discusses the relationship of partitioning keys with primary keys and unique keys. The rule governing this relationship can be expressed as follows: All columns used in the partitioning expression for a partitioned table must be part of every unique key that the table may have.

In other words, *every unique key on the table must use every column in the table's partitioning expression*. (This also includes the table's primary key, since it is by definition a unique key. This particular case is discussed later in this section.) For example, each of the following table creation statements is invalid:

```
CREATE TABLE t1 (
  col1 INT NOT NULL,
  col2 DATE NOT NULL,
  col3 INT NOT NULL,
  col4 INT NOT NULL,
  UNIQUE KEY (col1, col2)
)
PARTITION BY HASH(col3)
PARTITIONS 4;

CREATE TABLE t2 (
  col1 INT NOT NULL,
  col2 DATE NOT NULL,
  col3 INT NOT NULL,
  col4 INT NOT NULL,
  UNIQUE KEY (col1),
  UNIQUE KEY (col3)
)
PARTITION BY HASH(col1 + col3)
PARTITIONS 4;
```

In each case, the proposed table would have at least one unique key that does not include all columns used in the partitioning expression.

Each of the following statements is valid, and represents one way in which the corresponding invalid table creation statement could be made to work:

```
CREATE TABLE t1 (
```

```

    col1 INT NOT NULL,
    col2 DATE NOT NULL,
    col3 INT NOT NULL,
    col4 INT NOT NULL,
    UNIQUE KEY (col1, col2, col3)
)
PARTITION BY HASH(col3)
PARTITIONS 4;

CREATE TABLE t2 (
    col1 INT NOT NULL,
    col2 DATE NOT NULL,
    col3 INT NOT NULL,
    col4 INT NOT NULL,
    UNIQUE KEY (col1, col3)
)
PARTITION BY HASH(col1 + col3)
PARTITIONS 4;

```

This example shows the error produced in such cases:

```

mysql> CREATE TABLE t3 (
->     col1 INT NOT NULL,
->     col2 DATE NOT NULL,
->     col3 INT NOT NULL,
->     col4 INT NOT NULL,
->     UNIQUE KEY (col1, col2),
->     UNIQUE KEY (col3)
-> )
-> PARTITION BY HASH(col1 + col3)
-> PARTITIONS 4;
ERROR 1491 (HY000): A PRIMARY KEY MUST INCLUDE ALL COLUMNS IN THE TABLE'S PARTITIONING FUNCTION

```

The **CREATE** statement fails because both `col1` and `col3` are included in the proposed partitioning key, but neither of these columns is part of both of unique keys on the table. This shows one possible fix for the invalid table definition;

```

mysql> CREATE TABLE t3 (
->     col1 INT NOT NULL,
->     col2 DATE NOT NULL,
->     col3 INT NOT NULL,
->     col4 INT NOT NULL,
->     UNIQUE KEY (col1, col2, col3),
->     UNIQUE KEY (col3)
-> )
-> PARTITION BY HASH(col3)
-> PARTITIONS 4;
Query OK, 0 rows affected (0.05 sec)

```

In this case, the proposed partitioning key `col3` is part of both unique keys, and the table creation statement succeeds.

Since every primary key is by definition a unique key, this restriction also includes the table's primary key, if it has one. For example, the next two statements are invalid:

```

CREATE TABLE t4 (
    col1 INT NOT NULL,
    col2 DATE NOT NULL,
    col3 INT NOT NULL,
    col4 INT NOT NULL,
    PRIMARY KEY(col1, col2)
)
PARTITION BY HASH(col3)
PARTITIONS 4;

CREATE TABLE t5 (
    col1 INT NOT NULL,
    col2 DATE NOT NULL,
    col3 INT NOT NULL,
    col4 INT NOT NULL,
    PRIMARY KEY(col1, col3),
    UNIQUE KEY(col2)
)
PARTITION BY HASH( YEAR(col2) )
PARTITIONS 4;

```

In both cases, the primary key does not include all columns referenced in the partitioning expression. However, both of the next two statements are valid:

```

CREATE TABLE t6 (
    col1 INT NOT NULL,
    col2 DATE NOT NULL,
    col3 INT NOT NULL,
    col4 INT NOT NULL,
    PRIMARY KEY(col1, col2)
)
PARTITION BY HASH(col1 + YEAR(col2))
PARTITIONS 4;

CREATE TABLE t7 (
    col1 INT NOT NULL,

```

```

col2 DATE NOT NULL,
col3 INT NOT NULL,
col4 INT NOT NULL,
PRIMARY KEY(col1, col2, col4),
UNIQUE KEY(col2, col1)
)
PARTITION BY HASH(col1 + YEAR(col2))
PARTITIONS 4;

```

If a table has no unique keys — this includes having no primary key — then this restriction does not apply, and you may use any column or columns in the partitioning expression as long as the column type is compatible with the partitioning type.

For the same reason, you cannot later add a unique key to a partitioned table unless the key includes all columns used by the table's partitioning expression. Consider given the partitioned table defined as shown here:

```

mysql> CREATE TABLE t_no_pk (c1 INT, c2 INT)
-> PARTITION BY RANGE(c1) (
-> PARTITION p0 VALUES LESS THAN (10),
-> PARTITION p1 VALUES LESS THAN (20),
-> PARTITION p2 VALUES LESS THAN (30),
-> PARTITION p3 VALUES LESS THAN (40)
-> );
Query OK, 0 rows affected (0.12 sec)

```

It is possible to add a primary key to `t_no_pk` using either of these `ALTER TABLE` statements:

```

# possible PK
mysql> ALTER TABLE t_no_pk ADD PRIMARY KEY(c1);
Query OK, 0 rows affected (0.13 sec)
Records: 0 Duplicates: 0 Warnings: 0

# drop this PK
mysql> ALTER TABLE t_no_pk DROP PRIMARY KEY;
Query OK, 0 rows affected (0.10 sec)
Records: 0 Duplicates: 0 Warnings: 0

# use another possible PK
mysql> ALTER TABLE t_no_pk ADD PRIMARY KEY(c1, c2);
Query OK, 0 rows affected (0.12 sec)
Records: 0 Duplicates: 0 Warnings: 0

# drop this PK
mysql> ALTER TABLE t_no_pk DROP PRIMARY KEY;
Query OK, 0 rows affected (0.09 sec)
Records: 0 Duplicates: 0 Warnings: 0

```

However, the next statement fails, because `c1` is part of the partitioning key, but is not part of the proposed primary key:

```

# fails with error 1503
mysql> ALTER TABLE t_no_pk ADD PRIMARY KEY(c2);
ERROR 1503 (HY000): A PRIMARY KEY MUST INCLUDE ALL COLUMNS IN THE TABLE'S PARTITIONING FUNCTION

```

Since `t_no_pk` has only `c1` in its partitioning expression, attempting to adding a unique key on `c2` alone fails. However, you can add a unique key that uses both `c1` and `c2`.

These rules also apply to existing non-partitioned tables that you wish to partition using `ALTER TABLE ... PARTITION BY`. Consider a table `np_pk` defined as shown here:

```

mysql> CREATE TABLE np_pk (
-> id INT NOT NULL AUTO_INCREMENT,
-> name VARCHAR(50),
-> added DATE,
-> PRIMARY KEY (id)
-> );
Query OK, 0 rows affected (0.08 sec)

```

The following `ALTER TABLE` statements fails with an error, because the `added` column is not part of any unique key in the table:

```

mysql> ALTER TABLE np_pk
-> PARTITION BY HASH( TO_DAYS(added) )
-> PARTITIONS 4;
ERROR 1503 (HY000): A PRIMARY KEY MUST INCLUDE ALL COLUMNS IN THE TABLE'S PARTITIONING FUNCTION

```

However, this statement using the `id` column for the partitioning column is valid, as shown here:

```

mysql> ALTER TABLE np_pk
-> PARTITION BY HASH(id)
-> PARTITIONS 4;
Query OK, 0 rows affected (0.11 sec)
Records: 0 Duplicates: 0 Warnings: 0

```

In the case of `np_pk`, the only column that may be used as part of a partitioning expression is `id`; if you wish to partition this table using any other column or columns in the partitioning expression, you must first modify the table, either by adding the desired column or columns to the primary key, or by dropping the primary key altogether.

We are working to remove this limitation in a future MySQL release series.

17.5.2. Partitioning Limitations Relating to Storage Engines

The following limitations apply to the use of storage engines with user-defined partitioning of tables.

MERGE storage engine. User-defined partitioning and the `MERGE` storage engine are not compatible. Tables using the `MERGE` storage engine cannot be partitioned. Partitioned tables cannot be merged.

FEDERATED storage engine. Partitioning of `FEDERATED` tables is not supported; it is not possible to create partitioned `FEDERATED` tables. We are working to remove this limitation in a future MySQL release.

CSV storage engine. Partitioned tables using the `CSV` storage engine are not supported; it is not possible to create partitioned `CSV` tables.

NDBCLUSTER storage engine (MySQL Cluster). Partitioning by `KEY` (or `LINEAR KEY`) is the only type of partitioning supported for the `NDBCLUSTER` storage engine. It is not possible to create a MySQL Cluster table using any partitioning type other than `[LINEAR] KEY`, and attempting to do so fails with an error.

In addition, the maximum number of partitions that can be defined for an `NDBCLUSTER` table is 8 times the number of node groups in the cluster. (See [MySQL Cluster Nodes, Node Groups, Replicas, and Partitions](#), for more information about node groups in MySQL Cluster.)

Upgrading partitioned tables. When performing an upgrade, tables which are partitioned by `KEY` and which use any storage engine other than `NDBCLUSTER` must be dumped and reloaded.

Same storage engine for all partitions. All partitions of a partitioned table must use the same storage engine and it must be the same storage engine used by the table as a whole. In addition, if one does not specify an engine on the table level, then one must do either of the following when creating or altering a partitioned table:

- Do *not* specify any engine for *any* partition or subpartition
- Specify the engine for *all* partitions or subpartitions

We are working to remove this limitation in a future MySQL release.

17.5.3. Partitioning Limitations Relating to Functions

This section discusses limitations in MySQL Partitioning relating specifically to functions used in partitioning expressions.

Only the following MySQL functions are supported in partitioning expressions:

- `ABS()`
- `CEILING()` (see `CEILING()` and `FLOOR()`, immediately following this list)
- `DAY()`
- `DAYOFMONTH()`
- `DAYOFWEEK()`
- `DAYOFYEAR()`
- `DATEDIFF()`
- `EXTRACT()`
- `FLOOR()` (see `CEILING()` and `FLOOR()`, immediately following this list)
- `HOUR()`
- `MICROSECOND()`
- `MINUTE()`

- `MOD()`
- `MONTH()`
- `QUARTER()`
- `SECOND()`
- `TIME_TO_SEC()`
- `TO_DAYS()`
- `WEEKDAY()`
- `YEAR()`
- `YEARWEEK()`

Note

`CEILING()` and `FLOOR()`. Each of these functions returns an integer only if it is passed an integer argument. This means, for example, that the following `CREATE TABLE` statement fails with an error, as shown here:

```
mysql> CREATE TABLE t (c FLOAT) PARTITION BY LIST( FLOOR(c) )(
-> PARTITION p0 VALUES IN (1,3,5),
-> PARTITION p1 VALUES IN (2,4,6)
-> );
ERROR 1490 (HY000): THE PARTITION FUNCTION RETURNS THE WRONG TYPE
```

See [Section 11.5.2, “Mathematical Functions”](#), for more information about the return types of these functions.

Chapter 18. Stored Programs and Views

This chapter discusses stored programs and views, which are database objects defined in terms of SQL code that is stored on the server for later invocation.

Stored programs include these objects:

- Stored routines, that is, stored procedures and functions. A stored function is used much like a built-in function. you invoke it in an expression and it returns a value during expression evaluation. A stored procedure is invoked using the `CALL` statement. A procedure does not have a return value but can modify its parameters for later inspection by the caller. It can also generate result sets to be returned to the client program.
- Triggers. A trigger is a named database object that is associated with a table and that is activated when a particular event occurs for the table, such as an insert or update.
- Events. An event is a task that runs according to schedule.

Views are stored queries that when invoked produce a result set. A view acts as a virtual table.

This chapter describes how to use each type of stored program and views. Additional information about SQL syntax for statements related to these objects is available in the following locations:

- For each object type, there are `CREATE`, `ALTER`, and `DROP` statements that control which objects exist and how they are defined. See [Section 12.1, “Data Definition Statements”](#).
- The `CALL` statement is used to invoke stored procedures. See [Section 12.2.1, “CALL Syntax”](#).
- Stored program definitions contain a body that may use compound statements, loops, conditionals, and declared variables. See [Section 12.8, “MySQL Compound-Statement Syntax”](#).

18.1. Defining Stored Programs

Each stored program contains a body that consists of an SQL statement. This statement may be a compound statement made up of several statements separated by semicolon (`;`) characters. For example, the following stored procedure has a body made up of a `BEGIN ... END` block that contains a `SET` statement and a `REPEAT` loop that itself contains another `SET` statement:

```
CREATE PROCEDURE dorepeat(p1 INT)
BEGIN
  SET @x = 0;
  REPEAT SET @x = @x + 1; UNTIL @x > p1 END REPEAT;
END
```

If you use the `mysql` client program to define a stored program that contains the semicolon characters within its definition, a problem arises. By default, `mysql` itself recognizes semicolon as a statement delimiter, so you must redefine the delimiter temporarily to cause `mysql` to pass the entire stored program definition to the server.

To redefine the `mysql` delimiter, use the `delimiter` command. The following example shows how to do this for the `dorepeat()` procedure just shown. The delimiter is changed to `//` to enable the entire definition to be passed to the server as a single statement, and then restored to `;` before invoking the procedure. This allows the `;` delimiter used in the procedure body to be passed through to the server rather than being interpreted by `mysql` itself.

```
mysql> delimiter //
mysql> CREATE PROCEDURE dorepeat(p1 INT)
-> BEGIN
->   SET @x = 0;
->   REPEAT SET @x = @x + 1; UNTIL @x > p1 END REPEAT;
-> END
-> //
Query OK, 0 rows affected (0.00 sec)

mysql> delimiter ;
mysql> CALL dorepeat(1000);
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT @x;
+-----+
| @x    |
+-----+
| 1001  |
+-----+
```

```
1 row in set (0.00 sec)
```

You can redefine the delimiter to a string other than `//`, and the delimiter can consist of a single character or multiple characters. You should avoid the use of the backslash ("`\`") character because that is the escape character for MySQL.

The following is an example of a function that takes a parameter, performs an operation using an SQL function, and returns the result. In this case, it is unnecessary to use `delimiter` because the function definition contains no internal `;` statement delimiters:

```
mysql> CREATE FUNCTION hello (s CHAR(20))
mysql> RETURNS CHAR(50) DETERMINISTIC
-> RETURN CONCAT('Hello, ',s,'!');
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT hello('world');
+-----+
| hello('world') |
+-----+
| Hello, world!  |
+-----+
1 row in set (0.00 sec)
```

18.2. Using Stored Routines (Procedures and Functions)

Stored routines (procedures and functions) are supported in MySQL 5.4. A stored routine is a set of SQL statements that can be stored in the server. Once this has been done, clients don't need to keep reissuing the individual statements but can refer to the stored routine instead.

Stored routines require the `proc` table in the `mysql` database. This table is created during the MySQL 5.4 installation procedure. If you are upgrading to MySQL 5.4 from an earlier version, be sure to update your grant tables to make sure that the `proc` table exists. See [Section 4.4.8, “mysql_upgrade — Check Tables for MySQL Upgrade”](#).

MySQL Enterprise

For expert advice on using stored procedures and functions subscribe to the MySQL Enterprise Monitor. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

Stored routines can be particularly useful in certain situations:

- When multiple client applications are written in different languages or work on different platforms, but need to perform the same database operations.
- When security is paramount. Banks, for example, use stored procedures and functions for all common operations. This provides a consistent and secure environment, and routines can ensure that each operation is properly logged. In such a setup, applications and users would have no access to the database tables directly, but can only execute specific stored routines.

Stored routines can provide improved performance because less information needs to be sent between the server and the client. The tradeoff is that this does increase the load on the database server because more of the work is done on the server side and less is done on the client (application) side. Consider this if many client machines (such as Web servers) are serviced by only one or a few database servers.

Stored routines also allow you to have libraries of functions in the database server. This is a feature shared by modern application languages that allow such design internally (for example, by using classes). Using these client application language features is beneficial for the programmer even outside the scope of database use.

MySQL follows the SQL:2003 syntax for stored routines, which is also used by IBM's DB2.

The MySQL implementation of stored routines is still in progress. All syntax described here is supported and any limitations and extensions are documented where appropriate.

Additional resources

- You may find the [Stored Procedures User Forum](#) of use when working with stored procedures and functions.
- For answers to some commonly asked questions regarding stored routines in MySQL, see [Section A.4, “MySQL 5.4 FAQ — Stored Procedures and Functions”](#).
- There are some restrictions on the use of stored routines. See [Section D.1, “Restrictions on Stored Routines, Triggers, and Events”](#).
- Binary logging for stored routines takes place as described in [Section 18.6, “Binary Logging of Stored Programs”](#).

18.2.1. Stored Routine Syntax

A stored routine is either a procedure or a function. Stored routines are created with the `CREATE PROCEDURE` and `CREATE FUNCTION` statements (see Section 12.1.12, “`CREATE PROCEDURE` and `CREATE FUNCTION` Syntax”). A procedure is invoked using a `CALL` statement (see Section 12.2.1, “`CALL` Syntax”), and can only pass back values using output variables. A function can be called from inside a statement just like any other function (that is, by invoking the function’s name), and can return a scalar value. The body of a stored routine can use compound statements (see Section 12.8, “`MySQL Compound-Statement Syntax`”).

Stored routines can be dropped with the `DROP PROCEDURE` and `DROP FUNCTION` statements (see Section 12.1.21, “`DROP PROCEDURE` and `DROP FUNCTION` Syntax”), and altered with the `ALTER PROCEDURE` and `ALTER FUNCTION` statements (see Section 12.1.4, “`ALTER PROCEDURE` Syntax”).

A stored procedure or function is associated with a particular database. This has several implications:

- When the routine is invoked, an implicit `USE db_name` is performed (and undone when the routine terminates). `USE` statements within stored routines are disallowed.
- You can qualify routine names with the database name. This can be used to refer to a routine that is not in the current database. For example, to invoke a stored procedure `p` or function `f` that is associated with the `test` database, you can say `CALL test.p()` or `test.f()`.
- When a database is dropped, all stored routines associated with it are dropped as well.

Stored functions cannot be recursive.

Recursion in stored procedures is allowed but disabled by default. To enable recursion, set the `max_sp_recursion_depth` server system variable to a value greater than zero. Stored procedure recursion increases the demand on thread stack space. If you increase the value of `max_sp_recursion_depth`, it may be necessary to increase thread stack size by increasing the value of `thread_stack` at server startup. See Section 5.1.3, “`Server System Variables`”, for more information.

MySQL supports the very useful extension that allows the use of regular `SELECT` statements (that is, without using cursors or local variables) inside a stored procedure. The result set of such a query is simply sent directly to the client. Multiple `SELECT` statements generate multiple result sets, so the client must use a MySQL client library that supports multiple result sets. This means the client must use a client library from a version of MySQL at least as recent as 4.1. The client should also specify the `CLIENT_MULTI_RESULTS` option when it connects. For C programs, this can be done with the `mysql_real_connect()` C API function. See Section 20.10.3.52, “`mysql_real_connect()`”, and Section 20.10.12, “`C API Support for Multiple Statement Execution`”.

MySQL Enterprise

MySQL Enterprise subscribers will find numerous articles about stored routines in the MySQL Enterprise Knowledge Base. Access to this collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

18.2.2. Stored Routines and MySQL Privileges

The MySQL grant system takes stored routines into account as follows:

- The `CREATE ROUTINE` privilege is needed to create stored routines.
- The `ALTER ROUTINE` privilege is needed to alter or drop stored routines. This privilege is granted automatically to the creator of a routine if necessary, and dropped when the routine creator drops the routine.
- The `EXECUTE` privilege is required to execute stored routines. However, this privilege is granted automatically to the creator of a routine if necessary (and dropped when the creator drops the routine). Also, the default `SQL SECURITY` characteristic for a routine is `DEFINER`, which enables users who have access to the database with which the routine is associated to execute the routine.
- If the `automatic_sp_privileges` system variable is 0, the `EXECUTE` and `ALTER ROUTINE` privileges are not automatically granted and dropped.

The server manipulates the `mysql.proc` table in response to statements that create, alter, or drop stored routines. It is not supported that the server will notice manual manipulation of this table.

18.2.3. Stored Routine Metadata

Metadata about stored routines can be obtained as follows:

- Query the `ROUTINES` table of the `INFORMATION_SCHEMA` database. See [Section 19.14, “The INFORMATION_SCHEMA ROUTINES Table”](#).
- Use the `SHOW CREATE PROCEDURE` and `SHOW CREATE FUNCTION` statements to see routine definitions. See [Section 12.5.5.11, “SHOW CREATE PROCEDURE Syntax”](#).
- Use the `SHOW PROCEDURE STATUS` and `SHOW FUNCTION STATUS` statements to see routine characteristics. See [Section 12.5.5.30, “SHOW PROCEDURE STATUS Syntax”](#).
- `INFORMATION_SCHEMA` does not have a `PARAMETERS` table until MySQL 6.0, so applications that need to acquire routine parameter information at runtime must use workarounds such as parsing the output of `SHOW CREATE` statements or the `param_list` column of the `mysql.proc` table. `param_list` contents can be processed from within a stored routine, unlike the output from `SHOW`.

18.2.4. Stored Procedures, Functions, Triggers, and `LAST_INSERT_ID()`

Within the body of a stored routine (procedure or function) or a trigger, the value of `LAST_INSERT_ID()` changes the same way as for statements executed outside the body of these kinds of objects (see [Section 11.11.3, “Information Functions”](#)). The effect of a stored routine or trigger upon the value of `LAST_INSERT_ID()` that is seen by following statements depends on the kind of routine:

- If a stored procedure executes statements that change the value of `LAST_INSERT_ID()`, the changed value is seen by statements that follow the procedure call.
- For stored functions and triggers that change the value, the value is restored when the function or trigger ends, so following statements do not see a changed value.

18.3. Using Triggers

A trigger is a named database object that is associated with a table, and that activates when a particular event occurs for the table. Some uses for triggers are to perform checks of values to be inserted into a table or to perform calculations on values involved in an update.

A trigger is defined to activate when an `INSERT`, `DELETE`, or `UPDATE` statement executes for the associated table. A trigger can be set to activate either before or after the triggering statement. For example, you can have a trigger activate before each row that is inserted into a table or after each row that is updated.

Important

MySQL triggers are activated by SQL statements *only*. They are not activated by changes in tables made by APIs that do not transmit SQL statements to the MySQL Server; in particular, they are not activated by updates made using the `NDB` API.

To use triggers if you have upgraded to MySQL 5.4 from an older release that did not support triggers, you should upgrade your grant tables so that they contain the trigger-related privileges. See [Section 4.4.8, “mysql_upgrade — Check Tables for MySQL Upgrade”](#).

The following discussion describes the syntax for creating and dropping triggers, and shows some examples of how to use them.

Additional resources

- You may find the [Triggers User Forum](#) of use when working with views.
- For answers to some commonly asked questions regarding triggers in MySQL, see [Section A.5, “MySQL 5.4 FAQ — Triggers”](#).
- There are some restrictions on the use of triggers; see [Section D.1, “Restrictions on Stored Routines, Triggers, and Events”](#).
- Binary logging for triggers takes place as described in [Section 18.6, “Binary Logging of Stored Programs”](#).

18.3.1. Trigger Syntax

To create a trigger or drop a trigger, use the `CREATE TRIGGER` or `DROP TRIGGER` statement. The syntax for these statements is described in [Section 12.1.15, “CREATE TRIGGER Syntax”](#), and [Section 12.1.24, “DROP TRIGGER Syntax”](#).

Here is a simple example that associates a trigger with a table for `INSERT` statements. The trigger acts as an accumulator, summing the values inserted into one of the columns of the table.

```
mysql> CREATE TABLE account (acct_num INT, amount DECIMAL(10,2));
Query OK, 0 rows affected (0.03 sec)

mysql> CREATE TRIGGER ins_sum BEFORE INSERT ON account
-> FOR EACH ROW SET @sum = @sum + NEW.amount;
Query OK, 0 rows affected (0.06 sec)
```

The `CREATE TRIGGER` statement creates a trigger named `ins_sum` that is associated with the `account` table. It also includes clauses that specify the trigger activation time, the triggering event, and what to do with the trigger activates:

- The keyword `BEFORE` indicates the trigger action time. In this case, the trigger should activate before each row inserted into the table. The other allowable keyword here is `AFTER`.
- The keyword `INSERT` indicates the event that activates the trigger. In the example, `INSERT` statements cause trigger activation. You can also create triggers for `DELETE` and `UPDATE` statements.
- The statement following `FOR EACH ROW` defines the statement to execute each time the trigger activates, which occurs once for each row affected by the triggering statement. In the example, the triggered statement is a simple `SET` that accumulates the values inserted into the `amount` column. The statement refers to the column as `NEW.amount` which means “the value of the `amount` column to be inserted into the new row.”

To use the trigger, set the accumulator variable to zero, execute an `INSERT` statement, and then see what value the variable has afterward:

```
mysql> SET @sum = 0;
mysql> INSERT INTO account VALUES(137,14.98),(141,1937.50),(97,-100.00);
mysql> SELECT @sum AS 'Total amount inserted';
+-----+
| Total amount inserted |
+-----+
| 1852.48                |
+-----+
```

In this case, the value of `@sum` after the `INSERT` statement has executed is $14.98 + 1937.50 - 100$, or `1852.48`.

To destroy the trigger, use a `DROP TRIGGER` statement. You must specify the schema name if the trigger is not in the default schema:

```
mysql> DROP TRIGGER test.ins_sum;
```

Triggers for a table are also dropped if you drop the table.

Trigger names exist in the schema namespace, meaning that all triggers must have unique names within a schema. Triggers in different schemas can have the same name.

In addition to the requirement that trigger names be unique for a schema, there are other limitations on the types of triggers you can create. In particular, you cannot have two triggers for a table that have the same activation time and activation event. For example, you cannot define two `BEFORE INSERT` triggers or two `AFTER UPDATE` triggers for a table. This should rarely be a significant limitation, because it is possible to define a trigger that executes multiple statements by using the `BEGIN . . . END` compound statement construct after `FOR EACH ROW`. (An example appears later in this section.)

The `OLD` and `NEW` keywords enable you to access columns in the rows affected by a trigger. (`OLD` and `NEW` are not case sensitive.) In an `INSERT` trigger, only `NEW.col_name` can be used; there is no old row. In a `DELETE` trigger, only `OLD.col_name` can be used; there is no new row. In an `UPDATE` trigger, you can use `OLD.col_name` to refer to the columns of a row before it is updated and `NEW.col_name` to refer to the columns of the row after it is updated.

A column named with `OLD` is read only. You can refer to it (if you have the `SELECT` privilege), but not modify it. A column named with `NEW` can be referred to if you have the `SELECT` privilege for it. In a `BEFORE` trigger, you can also change its value with `SET NEW.col_name = value` if you have the `UPDATE` privilege for it. This means you can use a trigger to modify the values to be inserted into a new row or that are used to update a row.

In a `BEFORE` trigger, the `NEW` value for an `AUTO_INCREMENT` column is 0, not the automatically generated sequence number that will be generated when the new record actually is inserted.

`OLD` and `NEW` are MySQL extensions to triggers.

By using the `BEGIN . . . END` construct, you can define a trigger that executes multiple statements. Within the `BEGIN` block, you also can use other syntax that is allowed within stored routines such as conditionals and loops. However, just as for stored

routines, if you use the `mysql` program to define a trigger that executes multiple statements, it is necessary to redefine the `mysql` statement delimiter so that you can use the `;` statement delimiter within the trigger definition. The following example illustrates these points. It defines an `UPDATE` trigger that checks the new value to be used for updating each row, and modifies the value to be within the range from 0 to 100. This must be a `BEFORE` trigger because the value needs to be checked before it is used to update the row:

```
mysql> delimiter //
mysql> CREATE TRIGGER upd_check BEFORE UPDATE ON account
-> FOR EACH ROW
-> BEGIN
->     IF NEW.amount < 0 THEN
->         SET NEW.amount = 0;
->     ELSEIF NEW.amount > 100 THEN
->         SET NEW.amount = 100;
->     END IF;
-> END; //
mysql> delimiter ;
```

It can be easier to define a stored procedure separately and then invoke it from the trigger using a simple `CALL` statement. This is also advantageous if you want to invoke the same routine from within several triggers.

There are some limitations on what can appear in statements that a trigger executes when activated:

- The trigger cannot use the `CALL` statement to invoke stored procedures that return data to the client or that use dynamic SQL. (Stored procedures are allowed to return data to the trigger through `OUT` or `INOUT` parameters.)
- The trigger cannot use statements that explicitly or implicitly begin or end a transaction such as `START TRANSACTION`, `COMMIT`, or `ROLLBACK`.

MySQL handles errors during trigger execution as follows:

- If a `BEFORE` trigger fails, the operation on the corresponding row is not performed.
- A `BEFORE` trigger is activated by the *attempt* to insert or modify the row, regardless of whether the attempt subsequently succeeds.
- An `AFTER` trigger is executed only if the `BEFORE` trigger (if any) and the row operation both execute successfully.
- An error during either a `BEFORE` or `AFTER` trigger results in failure of the entire statement that caused trigger invocation.
- For transactional tables, failure of a statement should cause rollback of all changes performed by the statement. Failure of a trigger causes the statement to fail, so trigger failure also causes rollback. For non-transactional tables, such rollback cannot be done, so although the statement fails, any changes performed prior to the point of the error remain in effect.

18.3.2. Trigger Metadata

Metadata about triggers can be obtained as follows:

- Query the `TRIGGERS` table of the `INFORMATION_SCHEMA` database. See [Section 19.16, “The INFORMATION_SCHEMA TRIGGERS Table”](#).
- Use the `SHOW TRIGGERS` statement. See [Section 12.5.5.39, “SHOW TRIGGERS Syntax”](#).

18.4. Using the Event Scheduler

The *MySQL Event Scheduler* manages the scheduling and execution of events: Tasks that run according to schedule. The following discussion covers the Event Scheduler and is divided into the following sections:

- [Section 18.4.1, “Event Scheduler Overview”](#), provides an introduction to and conceptual overview of MySQL Events.
- [Section 18.4.3, “Event Syntax”](#), discusses the SQL statements for creating, altering, and dropping MySQL Events.
- [Section 18.4.4, “Event Metadata”](#), shows how to obtain information about events and how this information is stored by the MySQL Server.
- [Section 18.4.6, “The Event Scheduler and MySQL Privileges”](#), discusses the privileges required to work with events and the

ramifications that events have with regard to privileges when executing.

Stored routines require the `event` table in the `mysql` database. This table is created during the MySQL 5.4 installation procedure. If you are upgrading to MySQL 5.4 from an earlier version, be sure to update your grant tables to make sure that the `event` table exists. See [Section 4.4.8, “mysql_upgrade — Check Tables for MySQL Upgrade”](#).

Additional resources

- You may find the [MySQL Event Scheduler User Forum](#) of use when working with scheduled events.
- There are some restrictions on the use of events; see [Section D.1, “Restrictions on Stored Routines, Triggers, and Events”](#).
- Binary logging for events takes place as described in [Section 18.6, “Binary Logging of Stored Programs”](#).

18.4.1. Event Scheduler Overview

MySQL Events are tasks that run according to a schedule. Therefore, we sometimes refer to them as *scheduled* events. When you create an event, you are creating a named database object containing one or more SQL statements to be executed at one or more regular intervals, beginning and ending at a specific date and time. Conceptually, this is similar to the idea of the Unix `crontab` (also known as a “cron job”) or the Windows Task Scheduler.

Scheduled tasks of this type are also sometimes known as “temporal triggers”, implying that these are objects that are triggered by the passage of time. While this is essentially correct, we prefer to use the term *events* in order to avoid confusion with triggers of the type discussed in [Section 18.3, “Using Triggers”](#). Events should more specifically not be confused with “temporary triggers”. Whereas a trigger is a database object whose statements are executed in response to a specific type of event that occurs on a given table, a (scheduled) event is an object whose statements are executed in response to the passage of a specified time interval.

While there is no provision in the SQL Standard for event scheduling, there are precedents in other database systems, and you may notice some similarities between these implementations and that found in the MySQL Server.

MySQL Events have the following major features and properties:

- In MySQL 5.4, an event is uniquely identified by its name and the schema to which it is assigned.
- An event performs a specific action according to a schedule. This action consists of an SQL statement, which can be a compound statement in a `BEGIN . . . END` block if desired (see [Section 12.8, “MySQL Compound-Statement Syntax”](#)). An event’s timing can be either *one-time* or *recurrent*. A one-time event executes one time only. A recurrent event repeats its action at a regular interval, and the schedule for a recurring event can be assigned a specific start day and time, end day and time, both, or neither. (By default, a recurring event’s schedule begins as soon as it is created, and continues indefinitely, until it is disabled or dropped.)

If a repeating event does not terminate within its scheduling interval, the result may be multiple instances of the event executing simultaneously. If this is undesirable, you should institute a mechanism to prevent simultaneous instances. For example, you could use the `GET_LOCK()` function, or row or table locking.

- Users can create, modify, and drop scheduled events using SQL statements intended for these purposes. Syntactically invalid event creation and modification statements fail with an appropriate error message. *A user may include statements in an event’s action which require privileges that the user does not actually have.* The event creation or modification statement succeeds but the event’s action fails. See [Section 18.4.6, “The Event Scheduler and MySQL Privileges”](#) for details.
- Many of the properties of an event can be set or modified using SQL statements. These properties include the event’s name, timing, persistence (that is, whether it is preserved following the expiration of its schedule), status (enabled or disabled), action to be performed, and the schema to which it is assigned. See [Section 12.1.2, “ALTER EVENT Syntax”](#).

The default definer of an event is the user who created the event, unless the event has been altered, in which case the definer is the user who issued the last `ALTER EVENT` statement affecting that event. An event can be modified by any user having the `EVENT` privilege on the database for which the event is defined. See [Section 18.4.6, “The Event Scheduler and MySQL Privileges”](#).

- An event’s action statement may include most SQL statements permitted within stored routines. For restrictions, see [Section D.1, “Restrictions on Stored Routines, Triggers, and Events”](#).

18.4.2. Event Scheduler Configuration

Events are executed by a special *event scheduler thread*; when we refer to the Event Scheduler, we actually refer to this thread.

When running, the event scheduler thread and its current state can be seen by users having the `PROCESS` privilege in the output of `SHOW PROCESSLIST`, as shown in the discussion that follows.

The global `event_scheduler` system variable determines whether the Event Scheduler is enabled and running on the server. It has one of these 3 values, which affect event scheduling as described here:

- **OFF**: The Event Scheduler is stopped. The event scheduler thread does not run, is not shown in the output of `SHOW PROCESSLIST`, and no scheduled events are executed. **OFF** is the default value for `event_scheduler`.

When the Event Scheduler is stopped (`event_scheduler` is **OFF**), it can be started by setting the value of `event_scheduler` to **ON**. (See next item.)

- **ON**: The Event Scheduler is started; the event scheduler thread runs and executes all scheduled events.

When the Event Scheduler is **ON**, the event scheduler thread is listed in the output of `SHOW PROCESSLIST` as a daemon process, and its state is represented as shown here:

```
mysql> SHOW PROCESSLIST\G
***** 1. row *****
  Id: 1
  User: root
  Host: localhost
  db: NULL
  Command: Query
  Time: 0
  State: NULL
  Info: show processlist
***** 2. row *****
  Id: 2
  User: event_scheduler
  Host: localhost
  db: NULL
  Command: Daemon
  Time: 3
  State: Waiting for next activation
  Info: NULL
2 rows in set (0.00 sec)
```

Event scheduling can be stopped by setting the value of `event_scheduler` to **OFF**.

- **DISABLED**: This value renders the Event Scheduler non-operational. When the Event Scheduler is **DISABLED**, the event scheduler thread does not run (and so does not appear in the output of `SHOW PROCESSLIST`). In addition, the Event Scheduler state cannot be changed at runtime.

If the Event Scheduler status has not been set to **DISABLED**, `event_scheduler` can be toggled between **ON** and **OFF** (using `SET`). It is also possible to use `0` for **OFF**, and `1` for **ON** when setting this variable. Thus, any of the following 4 statements can be used in the `mysql` client to turn on the Event Scheduler:

```
SET GLOBAL event_scheduler = ON;
SET @@global.event_scheduler = ON;
SET GLOBAL event_scheduler = 1;
SET @@global.event_scheduler = 1;
```

Similarly, any of these 4 statements can be used to turn off the Event Scheduler:

```
SET GLOBAL event_scheduler = OFF;
SET @@global.event_scheduler = OFF;
SET GLOBAL event_scheduler = 0;
SET @@global.event_scheduler = 0;
```

Although **ON** and **OFF** have numeric equivalents, the value displayed for `event_scheduler` by `SELECT` or `SHOW VARIABLES` is always one of **OFF**, **ON**, or **DISABLED**. *DISABLED has no numeric equivalent.* For this reason, **ON** and **OFF** are usually preferred over `1` and `0` when setting this variable.

Note that attempting to set `event_scheduler` without specifying it as a global variable causes an error:

```
mysql< SET @@event_scheduler = OFF;
ERROR 1229 (HY000): VARIABLE 'EVENT_SCHEDULER' IS A GLOBAL
VARIABLE AND SHOULD BE SET WITH SET GLOBAL
```

Important

It is possible to set the Event Scheduler to **DISABLED** only at server startup. If `event_scheduler` is **ON** or **OFF**, you cannot set it to **DISABLED** at runtime. Also, if the Event Scheduler is set to **DISABLED** at startup, you cannot change the value of `event_scheduler` at runtime.

To disable the event scheduler, use one of the following two methods:

- As a command-line option when starting the server:

```
--event-scheduler=DISABLED
```

- In the server configuration file (`my.cnf`, or `my.ini` on Windows systems), include the line where it will be read by the server (for example, in a `[mysqld]` section):

```
event_scheduler=DISABLED
```

To enable the Event Scheduler, restart the server without the `--event-scheduler=DISABLED` command-line option, or after removing or commenting out the line containing `event_scheduler=DISABLED` in the server configuration file, as appropriate. Alternatively, you can use `ON` (or `1`) or `OFF` (or `0`) in place of the `DISABLED` value when starting the server.

Note

You can issue event-manipulation statements when `event_scheduler` is set to `DISABLED`. No warnings or errors are generated in such cases (provided that the statements are themselves valid). However, scheduled events cannot execute until this variable is set to `ON` (or `1`). Once this has been done, the event scheduler thread executes all events whose scheduling conditions are satisfied.

Starting the MySQL server with the `--skip-grant-tables` option causes `event_scheduler` to be set to `DISABLED`, overriding any other value set either on the command line or in the `my.cnf` or `my.ini` file ([Bug#26807](#)).

For SQL statements used to create, alter, and drop events, see [Section 18.4.3, “Event Syntax”](#).

MySQL 5.4 provides an `EVENTS` table in the `INFORMATION_SCHEMA` database. This table can be queried to obtain information about scheduled events which have been defined on the server. See [Section 18.4.4, “Event Metadata”](#), and [Section 19.20, “The INFORMATION_SCHEMA EVENTS Table”](#), for more information.

For information regarding event scheduling and the MySQL privilege system, see [Section 18.4.6, “The Event Scheduler and MySQL Privileges”](#).

18.4.3. Event Syntax

MySQL 5.4 provides several SQL statements for working with scheduled events:

- New events are defined using the `CREATE EVENT` statement. See [Section 12.1.9, “CREATE EVENT Syntax”](#).
- The definition of an existing event can be changed by means of the `ALTER EVENT` statement. See [Section 12.1.2, “ALTER EVENT Syntax”](#).
- When a scheduled event is no longer wanted or needed, it can be deleted from the server by its definer using the `DROP EVENT` statement. See [Section 12.1.18, “DROP EVENT Syntax”](#). Whether an event persists past the end of its schedule also depends on its `ON COMPLETION` clause, if it has one. See [Section 12.1.9, “CREATE EVENT Syntax”](#).

An event can be dropped by any user having the `EVENT` privilege for the database on which the event is defined. See [Section 18.4.6, “The Event Scheduler and MySQL Privileges”](#).

18.4.4. Event Metadata

Metadata about events can be obtained as follows:

- Query the `EVENTS` table of the `INFORMATION_SCHEMA` database. See [Section 19.20, “The INFORMATION_SCHEMA EVENTS Table”](#).
- Use the `SHOW CREATE EVENT` statement. See [Section 12.5.5.9, “SHOW CREATE EVENT Syntax”](#).
- Use the `SHOW EVENTS` statement. See [Section 12.5.5.19, “SHOW EVENTS Syntax”](#).

18.4.5. Event Scheduler Status

The Event Scheduler writes information about event execution that terminates with an error or warning to the MySQL Server's error log. See [Section 18.4.6, “The Event Scheduler and MySQL Privileges”](#) for an example.

Information about the state of the Event Scheduler for debugging and troubleshooting purposes can be obtained by running `mysqladmin debug` (see [Section 4.5.2, “mysqladmin — Client for Administering a MySQL Server”](#)); after running this command, the server's error log contains output relating to the Event Scheduler, similar to what is shown here:

```
Events status:
LLA = Last Locked At  LUA = Last Unlocked At
WOC = Waiting On Condition  DL = Data Locked

Event scheduler status:
State      : INITIALIZED
Thread id  : 0
LLA        : init_scheduler:313
LUA        : init_scheduler:318
WOC        : NO
Workers    : 0
Executed   : 0
Data locked: NO

Event queue status:
Element count : 1
Data locked   : NO
Attempting lock : NO
LLA           : init_queue:148
LUA           : init_queue:168
WOC           : NO
Next activation : 0000-00-00 00:00:00
```

For `SELECT ... INTO var_list` statements, if the query returns no rows, a warning with error code 1329 occurs (**No data**), and the variable values remain unchanged. If the query returns multiple rows, error 1172 occurs (**Result consisted of more than one row**). In the context of such statements that occur as part of events executed by the Event Scheduler, diagnostics messages (not only errors, but also warnings) are written to the error log, and, on Windows, to the application event log. For frequently executed events, it is possible for this to result in many logged messages. For either condition, you can avoid this problem by declaring a condition handler; see [Section 12.8.4.2, “DECLARE for Handlers”](#). For statements that may retrieve multiple rows, another strategy is to use `LIMIT 1` to limit the result set to a single row.

18.4.6. The Event Scheduler and MySQL Privileges

To enable or disable the execution of scheduled events, it is necessary to set the value of the global `event_scheduler` system variable. This requires the `SUPER` privilege.

The `EVENT` privilege governs the creation, modification, and deletion of events. This privilege can be bestowed using `GRANT`. For example, this `GRANT` statement confers the `EVENT` privilege for the schema named `myschema` on the user `jon@ghidora`:

```
GRANT EVENT ON myschema.* TO jon@ghidora;
```

(We assume that this user account already exists, and that we wish for it to remain unchanged otherwise.)

To grant this same user the `EVENT` privilege on all schemas, use the following statement:

```
GRANT EVENT ON *.* TO jon@ghidora;
```

The `EVENT` privilege has global or schema-level scope. Therefore, trying to grant it on a single table results in an error as shown:

```
mysql> GRANT EVENT ON myschema.mytable TO jon@ghidora;
ERROR 1144 (42000): ILLEGAL GRANT/REVOKE COMMAND; PLEASE
CONSULT THE MANUAL TO SEE WHICH PRIVILEGES CAN BE USED
```

It is important to understand that an event is executed with the privileges of its definer, and that it cannot perform any actions for which its definer does not have the requisite privileges. For example, suppose that `jon@ghidora` has the `EVENT` privilege for `myschema`. Suppose also that this user has the `SELECT` privilege for `myschema`, but no other privileges for this schema. It is possible for `jon@ghidora` to create a new event such as this one:

```
CREATE EVENT e_store_ts
ON SCHEDULE
  EVERY 10 SECOND
DO
  INSERT INTO myschema.mytable VALUES (UNIX_TIMESTAMP());
```

The user waits for a minute or so, and then performs a `SELECT * FROM mytable;` query, expecting to see several new rows in the table. Instead, the table is empty. Since the user does not have the `INSERT` privilege for the table in question, the event has no effect.

If you inspect the MySQL error log (`hostname.err`), you can see that the event is executing, but the action it is attempting to perform fails, as indicated by `RetCode=0`:

```
060209 22:39:44 [Note] EVEX EXECUTING event newdb.e [EXPR:10]
060209 22:39:44 [Note] EVEX EXECUTED event newdb.e [EXPR:10]. RetCode=0
060209 22:39:54 [Note] EVEX EXECUTING event newdb.e [EXPR:10]
060209 22:39:54 [Note] EVEX EXECUTED event newdb.e [EXPR:10]. RetCode=0
060209 22:40:04 [Note] EVEX EXECUTING event newdb.e [EXPR:10]
060209 22:40:04 [Note] EVEX EXECUTED event newdb.e [EXPR:10]. RetCode=0
```

Since this user very likely does not have access to the error log, it is possible to verify whether the event's action statement is valid by executing it directly:

```
mysql> INSERT INTO myschema.mytable VALUES (UNIX_TIMESTAMP());
ERROR 1142 (42000): INSERT COMMAND DENIED TO USER
'JON'@'GHIDORA' FOR TABLE 'MYTABLE'
```

Inspection of the `INFORMATION_SCHEMA.EVENTS` table shows that `e_store_ts` exists and is enabled, but its `LAST_EXECUTED` column is `NULL`:

```
mysql> SELECT * FROM INFORMATION_SCHEMA.EVENTS
> WHERE EVENT_NAME='e_store_ts'
> AND EVENT_SCHEMA='myschema'\G
***** 1. row *****
EVENT_CATALOG: NULL
EVENT_SCHEMA: myschema
EVENT_NAME: e_store_ts
DEFINER: jon@ghidora
EVENT_BODY: SQL
EVENT_DEFINITION: INSERT INTO myschema.mytable VALUES (UNIX_TIMESTAMP())
EVENT_TYPE: RECURRING
EXECUTE_AT: NULL
INTERVAL_VALUE: 5
INTERVAL_FIELD: SECOND
SQL_MODE: NULL
STARTS: 0000-00-00 00:00:00
ENDS: 0000-00-00 00:00:00
STATUS: ENABLED
ON_COMPLETION: NOT PRESERVE
CREATED: 2006-02-09 22:36:06
LAST_ALTERED: 2006-02-09 22:36:06
LAST_EXECUTED: NULL
EVENT_COMMENT:
1 row in set (0.00 sec)
```

To rescind the `EVENT` privilege, use the `REVOKE` statement. In this example, the `EVENT` privilege on the schema `myschema` is removed from the `jon@ghidora` user account:

```
REVOKE EVENT ON myschema.* FROM jon@ghidora;
```

Important

Revoking the `EVENT` privilege from a user does not delete or disable any events that may have been created by that user.

An event is not migrated or dropped as a result of renaming or dropping the user who created it.

For example, suppose that the user `jon@ghidora` has been granted the `EVENT` and `INSERT` privileges on the `myschema` schema. This user then creates the following event:

```
CREATE EVENT e_insert
ON SCHEDULE
EVERY 7 SECOND
DO
INSERT INTO myschema.mytable;
```

After this event has been created, `root` revokes the `EVENT` privilege for `jon@ghidora`. However, `e_insert` continues to execute, inserting a new row into `mytable` each seven seconds. The same would be true if `root` had issued either of these statements:

- `DROP USER jon@ghidora;`
- `RENAME USER jon@ghidora TO someotherguy@ghidora;`

You can verify that this is true by examining the `mysql.event` table (discussed later in this section) or the `INFORMATION_SCHEMA.EVENTS` table (see Section 19.20, “The `INFORMATION_SCHEMA.EVENTS` Table”) before and after issuing a

`DROP USER` or `RENAME USER` statement.

Event definitions are stored in the `mysql.event` table. To drop an event created by another user account, the MySQL `root` user (or another user with the necessary privileges) can delete rows from this table. For example, to remove the event `e_insert` shown previously, `root` can use the following statement:

```
DELETE FROM mysql.event
WHERE db = 'myschema'
AND definer = 'jon@ghidora'
AND name = 'e_insert';
```

It is very important to match the event name, database schema name, and user account when deleting rows from the `mysql.event` table. This is because the same user can create different events of the same name in different schemas.

Users' `EVENT` privileges are stored in the `Event_priv` columns of the `mysql.user` and `mysql.db` tables. In both cases, this column holds one of the values 'Y' or 'N'. 'N' is the default. `mysql.user.Event_priv` is set to 'Y' for a given user only if that user has the global `EVENT` privilege (that is, if the privilege was bestowed using `GRANT EVENT ON *.*`). For a schema-level `EVENT` privilege, `GRANT` creates a row in `mysql.db` and sets that row's `Db` column to the name of the schema, the `User` column to the name of the user, and the `Event_priv` column to 'Y'. There should never be any need to manipulate these tables directly, since the `GRANT EVENT` and `REVOKE EVENT` statements perform the required operations on them.

Five status variables provide counts of event-related operations (but *not* of statements executed by events; see [Section D.1, “Restrictions on Stored Routines, Triggers, and Events”](#)). These are:

- `Com_create_event`: The number of `CREATE EVENT` statements executed since the last server restart.
- `Com_alter_event`: The number of `ALTER EVENT` statements executed since the last server restart.
- `Com_drop_event`: The number of `DROP EVENT` statements executed since the last server restart.
- `Com_show_create_event`: The number of `SHOW CREATE EVENT` statements executed since the last server restart.
- `Com_show_events`: The number of `SHOW EVENTS` statements executed since the last server restart.

You can view current values for all of these at one time by running the statement `SHOW STATUS LIKE '%event%';`

18.5. Using Views

Views (including updatable views) are available in MySQL Server 5.4. Views are stored queries that when invoked produce a result set. A view acts as a virtual table.

To use views if you have upgraded to MySQL 5.4 from an older release that did not support views, you should upgrade your grant tables so that they contain the view-related privileges. See [Section 4.4.8, “mysql_upgrade — Check Tables for MySQL Upgrade”](#).

The following discussion describes the syntax for creating and dropping views, and shows some examples of how to use them.

Additional resources

- You may find the [Views User Forum](#) of use when working with views.
- For answers to some commonly asked questions regarding views in MySQL, see [Section A.6, “MySQL 5.4 FAQ — Views”](#).
- There are some restrictions on the use of views; see [Section D.4, “Restrictions on Views”](#).

18.5.1. View Syntax

The `CREATE VIEW` statement creates a new view (see [Section 12.1.16, “CREATE VIEW Syntax”](#)). To alter the definition of a view or drop a view, use `ALTER VIEW` (see [Section 12.1.7, “ALTER VIEW Syntax”](#)), or `DROP VIEW` (see [Section 12.1.25, “DROP VIEW Syntax”](#)).

A view can be created from many kinds of `SELECT` statements. It can refer to base tables or other views. It can use joins, `UNION`, and subqueries. The `SELECT` need not even refer to any tables. The following example defines a view that selects two columns from another table, as well as an expression calculated from those columns:

```
mysql> CREATE TABLE t (qty INT, price INT);
mysql> INSERT INTO t VALUES(3, 50), (5, 60);
mysql> CREATE VIEW v AS SELECT qty, price, qty*price AS value FROM t;
mysql> SELECT * FROM v;
```

```

+----+----+----+
| qty | price | value |
+----+----+----+
| 3   | 50   | 150   |
| 5   | 60   | 300   |
+----+----+----+
mysql> SELECT * FROM v WHERE qty = 5;
+----+----+----+
| qty | price | value |
+----+----+----+
| 5   | 60   | 300   |
+----+----+----+

```

18.5.2. View Processing Algorithms

The optional `ALGORITHM` clause for `CREATE VIEW` or `ALTER VIEW` is a MySQL extension to standard SQL. It affects how MySQL processes the view. `ALGORITHM` takes three values: `MERGE`, `TEMPTABLE`, or `UNDEFINED`. The default algorithm is `UNDEFINED` if no `ALGORITHM` clause is present.

For `MERGE`, the text of a statement that refers to the view and the view definition are merged such that parts of the view definition replace corresponding parts of the statement.

For `TEMPTABLE`, the results from the view are retrieved into a temporary table, which then is used to execute the statement.

For `UNDEFINED`, MySQL chooses which algorithm to use. It prefers `MERGE` over `TEMPTABLE` if possible, because `MERGE` is usually more efficient and because a view cannot be updatable if a temporary table is used.

A reason to choose `TEMPTABLE` explicitly is that locks can be released on underlying tables after the temporary table has been created and before it is used to finish processing the statement. This might result in quicker lock release than the `MERGE` algorithm so that other clients that use the view are not blocked as long.

A view algorithm can be `UNDEFINED` for three reasons:

- No `ALGORITHM` clause is present in the `CREATE VIEW` statement.
- The `CREATE VIEW` statement has an explicit `ALGORITHM = UNDEFINED` clause.
- `ALGORITHM = MERGE` is specified for a view that can be processed only with a temporary table. In this case, MySQL generates a warning and sets the algorithm to `UNDEFINED`.

As mentioned earlier, `MERGE` is handled by merging corresponding parts of a view definition into the statement that refers to the view. The following examples briefly illustrate how the `MERGE` algorithm works. The examples assume that there is a view `v_merge` that has this definition:

```
CREATE ALGORITHM = MERGE VIEW v_merge (vc1, vc2) AS
SELECT c1, c2 FROM t WHERE c3 > 100;
```

Example 1: Suppose that we issue this statement:

```
SELECT * FROM v_merge;
```

MySQL handles the statement as follows:

- `v_merge` becomes `t`
- `*` becomes `vc1, vc2`, which corresponds to `c1, c2`
- The view `WHERE` clause is added

The resulting statement to be executed becomes:

```
SELECT c1, c2 FROM t WHERE c3 > 100;
```

Example 2: Suppose that we issue this statement:

```
SELECT * FROM v_merge WHERE vc1 < 100;
```

This statement is handled similarly to the previous one, except that `vc1 < 100` becomes `c1 < 100` and the view `WHERE` clause is added to the statement `WHERE` clause using an `AND` connective (and parentheses are added to make sure the parts of the clause

are executed with correct precedence). The resulting statement to be executed becomes:

```
SELECT c1, c2 FROM t WHERE (c3 > 100) AND (c1 < 100);
```

Effectively, the statement to be executed has a `WHERE` clause of this form:

```
WHERE (select WHERE) AND (view WHERE)
```

If the `MERGE` algorithm cannot be used, a temporary table must be used instead. `MERGE` cannot be used if the view contains any of the following constructs:

- Aggregate functions (`SUM()`, `MIN()`, `MAX()`, `COUNT()`, and so forth)
- `DISTINCT`
- `GROUP BY`
- `HAVING`
- `LIMIT`
- `UNION` or `UNION ALL`
- Subquery in the select list
- Refers only to literal values (in this case, there is no underlying table)

18.5.3. Updatable and Insertable Views

Some views are updatable. That is, you can use them in statements such as `UPDATE`, `DELETE`, or `INSERT` to update the contents of the underlying table. For a view to be updatable, there must be a one-to-one relationship between the rows in the view and the rows in the underlying table. There are also certain other constructs that make a view non-updatable. To be more specific, a view is not updatable if it contains any of the following:

- Aggregate functions (`SUM()`, `MIN()`, `MAX()`, `COUNT()`, and so forth)
- `DISTINCT`
- `GROUP BY`
- `HAVING`
- `UNION` or `UNION ALL`
- Subquery in the select list
- Certain joins (see additional join discussion later in this section)
- Non-updatable view in the `FROM` clause
- A subquery in the `WHERE` clause that refers to a table in the `FROM` clause
- Refers only to literal values (in this case, there is no underlying table to update)
- Uses `ALGORITHM = TEMPTABLE` (use of a temporary table always makes a view non-updatable)
- Multiple references to any column of a base table.

With respect to insertability (being updatable with `INSERT` statements), an updatable view is insertable if it also satisfies these additional requirements for the view columns:

- There must be no duplicate view column names.
- The view must contain all columns in the base table that do not have a default value.
- The view columns must be simple column references and not derived columns. A derived column is one that is not a simple column reference but is derived from an expression. These are examples of derived columns:

```
3.14159
col1 + 3
UPPER(col2)
col3 / col4
(subquery)
```

A view that has a mix of simple column references and derived columns is not insertable, but it can be updatable if you update only those columns that are not derived. Consider this view:

```
CREATE VIEW v AS SELECT col1, 1 AS col2 FROM t;
```

This view is not insertable because `col2` is derived from an expression. But it is updatable if the update does not try to update `col2`. This update is allowable:

```
UPDATE v SET col1 = 0;
```

This update is not allowable because it attempts to update a derived column:

```
UPDATE v SET col2 = 0;
```

It is sometimes possible for a multiple-table view to be updatable, assuming that it can be processed with the [MERGE](#) algorithm. For this to work, the view must use an inner join (not an outer join or a [UNION](#)). Also, only a single table in the view definition can be updated, so the [SET](#) clause must name only columns from one of the tables in the view. Views that use [UNION ALL](#) are disallowed even though they might be theoretically updatable, because the implementation uses temporary tables to process them.

For a multiple-table updatable view, [INSERT](#) can work if it inserts into a single table. [DELETE](#) is not supported.

[INSERT DELAYED](#) is not supported for views.

If a table contains an [AUTO_INCREMENT](#) column, inserting into an insertable view on the table that does not include the [AUTO_INCREMENT](#) column does not change the value of [LAST_INSERT_ID\(\)](#), because the side effects of inserting default values into columns not part of the view should not be visible.

The [WITH CHECK OPTION](#) clause can be given for an updatable view to prevent inserts or updates to rows except those for which the [WHERE](#) clause in the *select_statement* is true.

In a [WITH CHECK OPTION](#) clause for an updatable view, the [LOCAL](#) and [CASCADED](#) keywords determine the scope of check testing when the view is defined in terms of another view. The [LOCAL](#) keyword restricts the [CHECK OPTION](#) only to the view being defined. [CASCADED](#) causes the checks for underlying views to be evaluated as well. When neither keyword is given, the default is [CASCADED](#). Consider the definitions for the following table and set of views:

```
mysql> CREATE TABLE t1 (a INT);
mysql> CREATE VIEW v1 AS SELECT * FROM t1 WHERE a < 2
-> WITH CHECK OPTION;
mysql> CREATE VIEW v2 AS SELECT * FROM v1 WHERE a > 0
-> WITH LOCAL CHECK OPTION;
mysql> CREATE VIEW v3 AS SELECT * FROM v1 WHERE a > 0
-> WITH CASCADED CHECK OPTION;
```

Here the `v2` and `v3` views are defined in terms of another view, `v1`. `v2` has a [LOCAL](#) check option, so inserts are tested only against the `v2` check. `v3` has a [CASCADED](#) check option, so inserts are tested not only against its own check, but against those of underlying views. The following statements illustrate these differences:

```
mysql> INSERT INTO v2 VALUES (2);
Query OK, 1 row affected (0.00 sec)
mysql> INSERT INTO v3 VALUES (2);
ERROR 1369 (HY000): CHECK OPTION failed 'test.v3'
```

MySQL sets a flag, called the view updatability flag, at [CREATE VIEW](#) time. The flag is set to [YES](#) (true) if [UPDATE](#) and [DELETE](#) (and similar operations) are legal for the view. Otherwise, the flag is set to [NO](#) (false). The [IS_UPDATABLE](#) column in the [INFORMATION_SCHEMA.VIEWS](#) table displays the status of this flag. It means that the server always knows whether a view is updatable. If the view is not updatable, statements such [UPDATE](#), [DELETE](#), and [INSERT](#) are illegal and will be rejected. (Note that even if a view is updatable, it might not be possible to insert into it, as described elsewhere in this section.)

The updatability of views may be affected by the value of the [updatable_views_with_limit](#) system variable. See [Section 5.1.3, "Server System Variables"](#).

18.5.4. View Metadata

Metadata about views can be obtained as follows:

- Query the `VIEWS` table of the `INFORMATION_SCHEMA` database. See [Section 19.15, “The INFORMATION_SCHEMA VIEWS Table”](#).
- Use the `SHOW CREATE VIEW` statement. See [Section 12.5.5.14, “SHOW CREATE VIEW Syntax”](#).

18.6. Binary Logging of Stored Programs

The binary log contains information about SQL statements that modify database contents. This information is stored in the form of “events” that describe the modifications. The binary log has two important purposes:

- For replication, the binary log is used on master replication servers as a record of the statements to be sent to slave servers. The master server sends the events contained in its binary log to its slaves, which execute those events to make the same data changes that were made on the master. See [Section 16.4, “Replication Implementation”](#).
- Certain data recovery operations require use of the binary log. After a backup file has been restored, the events in the binary log that were recorded after the backup was made are re-executed. These events bring databases up to date from the point of the backup. See [Section 6.2.2, “Using Backups for Recovery”](#).

However, there are certain binary logging issues that apply with respect to stored programs (stored procedures and functions, triggers, and events), if logging occurs at the statement level:

- In some cases, it is possible that a statement will affect different sets of rows on a master and a slave.
- Replicated statements executed on a slave are processed by the slave SQL thread, which has full privileges. It is possible for a procedure to follow different execution paths on master and slave servers, so a user can write a routine containing a dangerous statement that will execute only on the slave where it is processed by a thread that has full privileges.
- If a stored program that modifies data is non-deterministic, it is not repeatable. This can result in different data on a master and slave, or cause restored data to differ from the original data.

This section describes how MySQL 5.4 handles binary logging for stored programs. It states the current conditions that the implementation places on the use of stored programs, and what you can do to avoid problems. It also provides additional information about the reasons for these conditions.

In general, the issues described here result when binary logging occurs at the SQL statement level. If you use row-based binary logging, the log contains changes made to individual rows as a result of executing SQL statements. When routines or triggers execute, row changes are logged, not the statements that make the changes. For stored procedures, this means that the `CALL` statement is not logged. For stored functions, row changes made within the function are logged, not the function invocation. For triggers, row changes made by the trigger are logged. On the slave side, only the row changes are seen, not the stored program invocation. For general information about row-based logging, see [Section 16.1.2, “Replication Formats”](#).

Unless noted otherwise, the remarks here assume that you have enabled binary logging by starting the server with the `--log-bin` option. (See [Section 5.2.4, “The Binary Log”](#).) If the binary log is not enabled, replication is not possible, nor is the binary log available for data recovery.

The current conditions on the use of stored functions in MySQL 5.4 can be summarized as follows. These conditions do not apply to stored procedures or Event Scheduler events and they do not apply unless binary logging is enabled.

- To create or alter a stored function, you must have the `SUPER` privilege, in addition to the `CREATE ROUTINE` or `ALTER ROUTINE` privilege that is normally required.
- When you create a stored function, you must declare either that it is deterministic or that it does not modify data. Otherwise, it may be unsafe for data recovery or replication.

By default, for a `CREATE FUNCTION` statement to be accepted, at least one of `DETERMINISTIC`, `NO SQL`, or `READS SQL DATA` must be specified explicitly. Otherwise an error occurs:

```
ERROR 1418 (HY000): This function has none of DETERMINISTIC, NO SQL,
or READS SQL DATA in its declaration and binary logging is enabled
(you *might* want to use the less safe log_bin_trust_function_creators
variable)
```

This function is deterministic (and does not modify data), so it is safe:

```
CREATE FUNCTION f1(i INT)
RETURNS INT
DETERMINISTIC
READS SQL DATA
BEGIN
    RETURN i;
END;
```

This function uses `UUID()`, which is not deterministic, so the function also is not deterministic and is not safe:

```
CREATE FUNCTION f2()
RETURNS CHAR(36) CHARACTER SET utf8
BEGIN
    RETURN UUID();
END;
```

This function modifies data, so it may not be safe:

```
CREATE FUNCTION f3(p_id INT)
RETURNS INT
BEGIN
    UPDATE t SET modtime = NOW() WHERE id = p_id;
    RETURN ROW_COUNT();
END;
```

Assessment of the nature of a function is based on the “honesty” of the creator: MySQL does not check that a function declared `DETERMINISTIC` is free of statements that produce non-deterministic results.

- Although it is possible to create a deterministic stored function without specifying `DETERMINISTIC`, you cannot execute this function using statement-based binary logging. To execute such a function, you must use row-based or mixed binary logging. Alternatively, if you explicitly specify `DETERMINISTIC` in the function definition, you can use any kind of logging, including statement-based logging.
- To relax the preceding conditions on function creation (that you must have the `SUPER` privilege and that a function must be declared deterministic or to not modify data), set the global `log_bin_trust_function_creators` system variable to 1. By default, this variable has a value of 0, but you can change it like this:

```
mysql> SET GLOBAL log_bin_trust_function_creators = 1;
```

You can also set this variable by using the `--log-bin-trust-function-creators=1` option when starting the server.

If binary logging is not enabled, `log_bin_trust_function_creators` does not apply and `SUPER` is not required for function creation.

- For information about built-in functions that may be unsafe for replication (and thus cause stored functions that use them to be unsafe as well), see [Section 16.3.1, “Replication Features and Issues”](#).

Triggers are similar to stored functions, so the preceding remarks regarding functions also apply to triggers with the following exception: `CREATE TRIGGER` does not have an optional `DETERMINISTIC` characteristic, so triggers are assumed to be always deterministic. However, this assumption might in some cases be invalid. For example, the `UUID()` function is non-deterministic (and does not replicate). You should be careful about using such functions in triggers.

Triggers can update tables, so error messages similar to those for stored functions occur with `CREATE TRIGGER` if you do not have the required privileges. On the slave side, the slave uses the trigger `DEFINER` attribute to determine which user is considered to be the creator of the trigger.

The rest of this section provides additional detail about the logging implementation and its implications. You need not read it unless you are interested in the background on the rationale for the current logging-related conditions on stored routine use. This discussion applies only for statement-based logging, and not for row-based logging, with the exception of the first item: `CREATE` and `DROP` statements are logged as statements regardless of the logging mode.

- The server writes `CREATE EVENT`, `CREATE PROCEDURE`, `CREATE FUNCTION`, `ALTER EVENT`, `ALTER PROCEDURE`, `ALTER FUNCTION`, `DROP EVENT`, `DROP PROCEDURE`, and `DROP FUNCTION` statements to the binary log.
- A stored function invocation is logged as a `SELECT` statement if the function changes data and occurs within a statement that would not otherwise be logged. This prevents non-replication of data changes that result from use of stored functions in non-logged statements. For example, `SELECT` statements are not written to the binary log, but a `SELECT` might invoke a stored function that makes changes. To handle this, a `SELECT func_name()` statement is written to the binary log when the given

function makes a change. Suppose that the following statements are executed on the master:

```
CREATE FUNCTION f1(a INT) RETURNS INT
BEGIN
  IF (a < 3) THEN
    INSERT INTO t2 VALUES (a);
  END IF;
  RETURN 0;
END;

CREATE TABLE t1 (a INT);
INSERT INTO t1 VALUES (1),(2),(3);

SELECT f1(a) FROM t1;
```

When the `SELECT` statement executes, the function `f1()` is invoked three times. Two of those invocations insert a row, and MySQL logs a `SELECT` statement for each of them. That is, MySQL writes the following statements to the binary log:

```
SELECT f1(1);
SELECT f1(2);
```

The server also logs a `SELECT` statement for a stored function invocation when the function invokes a stored procedure that causes an error. In this case, the server writes the `SELECT` statement to the log along with the expected error code. On the slave, if the same error occurs, that is the expected result and replication continues. Otherwise, replication stops.

- Logging stored function invocations rather than the statements executed by a function has a security implication for replication, which arises from two factors:
 - It is possible for a function to follow different execution paths on master and slave servers.
 - Statements executed on a slave are processed by the slave SQL thread which has full privileges.

The implication is that although a user must have the `CREATE ROUTINE` privilege to create a function, the user can write a function containing a dangerous statement that will execute only on the slave where it is processed by a thread that has full privileges. For example, if the master and slave servers have server ID values of 1 and 2, respectively, a user on the master server could create and invoke an unsafe function `unsafe_func()` as follows:

```
mysql> delimiter //
mysql> CREATE FUNCTION unsafe_func () RETURNS INT
-> BEGIN
->   IF @@server_id=2 THEN dangerous_statement; END IF;
->   RETURN 1;
-> END;
-> //
mysql> delimiter ;
mysql> INSERT INTO t VALUES(unsafe_func());
```

The `CREATE FUNCTION` and `INSERT` statements are written to the binary log, so the slave will execute them. Because the slave SQL thread has full privileges, it will execute the dangerous statement. Thus, the function invocation has different effects on the master and slave and is not replication-safe.

To guard against this danger for servers that have binary logging enabled, stored function creators must have the `SUPER` privilege, in addition to the usual `CREATE ROUTINE` privilege that is required. Similarly, to use `ALTER FUNCTION`, you must have the `SUPER` privilege in addition to the `ALTER ROUTINE` privilege. Without the `SUPER` privilege, an error will occur:

```
ERROR 1419 (HY000): You do not have the SUPER privilege and
binary logging is enabled (you *might* want to use the less safe
log_bin_trust_function_creators variable)
```

If you do not want to require function creators to have the `SUPER` privilege (for example, if all users with the `CREATE ROUTINE` privilege on your system are experienced application developers), set the global `log_bin_trust_function_creators` system variable to 1. You can also set this variable by using the `-log-bin-trust-function-creators=1` option when starting the server. If binary logging is not enabled, `log_bin_trust_function_creators` does not apply and `SUPER` is not required for function creation.

- If a function that performs updates is non-deterministic, it is not repeatable. This can have two undesirable effects:
 - It will make a slave different from the master.
 - Restored data will be different from the original data.

To deal with these problems, MySQL enforces the following requirement: On a master server, creation and alteration of a function is refused unless you declare the function to be deterministic or to not modify data. Two sets of function characteristics apply here:

- The `DETERMINISTIC` and `NOT DETERMINISTIC` characteristics indicate whether a function always produces the same result for given inputs. The default is `NOT DETERMINISTIC` if neither characteristic is given. To declare that a function is deterministic, you must specify `DETERMINISTIC` explicitly.
- The `CONTAINS SQL`, `NO SQL`, `READS SQL DATA`, and `MODIFIES SQL DATA` characteristics provide information about whether the function reads or writes data. Either `NO SQL` or `READS SQL DATA` indicates that a function does not change data, but you must specify one of these explicitly because the default is `CONTAINS SQL` if no characteristic is given.

By default, for a `CREATE FUNCTION` statement to be accepted, at least one of `DETERMINISTIC`, `NO SQL`, or `READS SQL DATA` must be specified explicitly. Otherwise an error occurs:

```
ERROR 1418 (HY000): This function has none of DETERMINISTIC, NO SQL,
or READS SQL DATA in its declaration and binary logging is enabled
(you *might* want to use the less safe log_bin_trust_function_creators
variable)
```

If you set `log_bin_trust_function_creators` to 1, the requirement that functions be deterministic or not modify data is dropped.

- Stored procedure calls are logged at the statement level rather than at the `CALL` level. That is, the server does not log the `CALL` statement, it logs those statements within the procedure that actually execute. As a result, the same changes that occur on the master will be observed on slave servers. This prevents problems that could result from a procedure having different execution paths on different machines.

In general, statements executed within a stored procedure are written to the binary log using the same rules that would apply were the statements to be executed in standalone fashion. Some special care is taken when logging procedure statements because statement execution within procedures is not quite the same as in non-procedure context:

- A statement to be logged might contain references to local procedure variables. These variables do not exist outside of stored procedure context, so a statement that refers to such a variable cannot be logged literally. Instead, each reference to a local variable is replaced by this construct for logging purposes:

```
NAME_CONST(var_name, var_value)
```

`var_name` is the local variable name, and `var_value` is a constant indicating the value that the variable has at the time the statement is logged. `NAME_CONST()` has a value of `var_value`, and a “name” of `var_name`. Thus, if you invoke this function directly, you get a result like this:

```
mysql> SELECT NAME_CONST('myname', 14);
+-----+
| myname |
+-----+
|      14 |
+-----+
```

`NAME_CONST()` allows a logged standalone statement to be executed on a slave with the same effect as the original statement that was executed on the master within a stored procedure.

The use of `NAME_CONST()` can result in a problem for `CREATE TABLE ... SELECT` statements when the source column expressions refer to local variables. Converting these references to `NAME_CONST()` expressions can result in column names that are different on the master and slave servers, or names that are too long to be legal column identifiers. A workaround is to supply aliases for columns that refer to local variables. Consider this statement when `myvar` has a value of 1:

```
CREATE TABLE t1 SELECT myvar;
```

That will be rewritten as follows:

```
CREATE TABLE t1 SELECT NAME_CONST(myvar, 1);
```

To ensure that the master and slave tables have the same column names, write the statement like this:

```
CREATE TABLE t1 SELECT myvar AS myvar;
```

The rewritten statement becomes:

```
CREATE TABLE t1 SELECT NAME_CONST(myvar, 1) AS myvar;
```

- A statement to be logged might contain references to user-defined variables. To handle this, MySQL writes a `SET` statement to the binary log to make sure that the variable exists on the slave with the same value as on the master. For example, if a statement refers to a variable `@my_var`, that statement will be preceded in the binary log by the following statement, where `value` is the value of `@my_var` on the master:

```
SET @my_var = value;
```

- Procedure calls can occur within a committed or rolled-back transaction. Transactional context is accounted for so that the transactional aspects of procedure execution are replicated correctly. That is, the server logs those statements within the procedure that actually execute and modify data, and also logs `BEGIN`, `COMMIT`, and `ROLLBACK` statements as necessary. For example, if a procedure updates only transactional tables and is executed within a transaction that is rolled back, those updates are not logged. If the procedure occurs within a committed transaction, `BEGIN` and `COMMIT` statements are logged with the updates. For a procedure that executes within a rolled-back transaction, its statements are logged using the same rules that would apply if the statements were executed in standalone fashion:
 - Updates to transactional tables are not logged.
 - Updates to non-transactional tables are logged because rollback does not cancel them.
 - Updates to a mix of transactional and non-transactional tables are logged surrounded by `BEGIN` and `ROLLBACK` so that slaves will make the same changes and rollbacks as on the master.
- A stored procedure call is *not* written to the binary log at the statement level if the procedure is invoked from within a stored function. In that case, the only thing logged is the statement that invokes the function (if it occurs within a statement that is logged) or a `DO` statement (if it occurs within a statement that is not logged). For this reason, care should be exercised in the use of stored functions that invoke a procedure, even if the procedure is otherwise safe in itself.

Chapter 19. INFORMATION_SCHEMA Tables

`INFORMATION_SCHEMA` provides access to database metadata.

Metadata is data about the data, such as the name of a database or table, the data type of a column, or access privileges. Other terms that sometimes are used for this information are *data dictionary* and *system catalog*.

`INFORMATION_SCHEMA` is the information database, the place that stores information about all the other databases that the MySQL server maintains. Inside `INFORMATION_SCHEMA` there are several read-only tables. They are actually views, not base tables, so there are no files associated with them.

In effect, we have a database named `INFORMATION_SCHEMA`, although the server does not create a database directory with that name. It is possible to select `INFORMATION_SCHEMA` as the default database with a `USE` statement, but it is possible only to read the contents of tables. You cannot insert into them, update them, or delete from them.

Here is an example of a statement that retrieves information from `INFORMATION_SCHEMA`:

```
mysql> SELECT table_name, table_type, engine
-> FROM information_schema.tables
-> WHERE table_schema = 'db5'
-> ORDER BY table_name DESC;
```

table_name	table_type	engine
v56	VIEW	NULL
v3	VIEW	NULL
v2	VIEW	NULL
v	VIEW	NULL
tables	BASE TABLE	MyISAM
t7	BASE TABLE	MyISAM
t3	BASE TABLE	MyISAM
t2	BASE TABLE	MyISAM
t	BASE TABLE	MyISAM
pk	BASE TABLE	InnoDB
loop	BASE TABLE	MyISAM
kurs	BASE TABLE	MyISAM
k	BASE TABLE	MyISAM
into	BASE TABLE	MyISAM
goto	BASE TABLE	MyISAM
fk2	BASE TABLE	InnoDB
fk	BASE TABLE	InnoDB

17 rows in set (0.01 sec)

Explanation: The statement requests a list of all the tables in database `db5`, in reverse alphabetical order, showing just three pieces of information: the name of the table, its type, and its storage engine.

Each MySQL user has the right to access these tables, but can see only the rows in the tables that correspond to objects for which the user has the proper access privileges. In some cases (for example, the `ROUTINE_DEFINITION` column in the `INFORMATION_SCHEMA.ROUTINES` table), users who have insufficient privileges will see `NULL`.

The `SELECT . . . FROM INFORMATION_SCHEMA` statement is intended as a more consistent way to provide access to the information provided by the various `SHOW` statements that MySQL supports (`SHOW DATABASES`, `SHOW TABLES`, and so forth). Using `SELECT` has these advantages, compared to `SHOW`:

- It conforms to Codd's rules. That is, all access is done on tables.
- Nobody needs to learn a new statement syntax. Because they already know how `SELECT` works, they only need to learn the object names.
- The implementor need not worry about adding keywords.
- There are millions of possible output variations, instead of just one. This provides more flexibility for applications that have varying requirements about what metadata they need.
- Migration is easier because every other DBMS does it this way.

However, because `SHOW` is popular with MySQL employees and users, and because it might be confusing were it to disappear, the advantages of conventional syntax are not a sufficient reason to eliminate `SHOW`. In fact, along with the implementation of `INFORMATION_SCHEMA`, there are enhancements to `SHOW` as well. These are described in [Section 19.28, "Extensions to SHOW Statements"](#).

There is no difference between the privileges required for `SHOW` statements and those required to select information from `INFORMATION_SCHEMA`. In either case, you have to have some privilege on an object in order to see information about it.

The implementation for the `INFORMATION_SCHEMA` table structures in MySQL follows the ANSI/ISO SQL:2003 standard Part 11 *Schemata*. Our intent is approximate compliance with SQL:2003 core feature F021 *Basic information schema*.

Users of SQL Server 2000 (which also follows the standard) may notice a strong similarity. However, MySQL has omitted many columns that are not relevant for our implementation, and added columns that are MySQL-specific. One such column is the `ENGINE` column in the `INFORMATION_SCHEMA.TABLES` table.

Although other DBMSs use a variety of names, like `syscat` or `system`, the standard name is `INFORMATION_SCHEMA`.

The following sections describe each of the tables and columns that are in `INFORMATION_SCHEMA`. For each column, there are three pieces of information:

- “`INFORMATION_SCHEMA Name`” indicates the name for the column in the `INFORMATION_SCHEMA` table. This corresponds to the standard SQL name unless the “Remarks” field says “MySQL extension.”
- “`SHOW Name`” indicates the equivalent field name in the closest `SHOW` statement, if there is one.
- “Remarks” provides additional information where applicable. If this field is `NULL`, it means that the value of the column is always `NULL`. If this field says “MySQL extension,” the column is a MySQL extension to standard SQL.

To avoid using any name that is reserved in the standard or in DB2, SQL Server, or Oracle, we changed the names of some columns marked “MySQL extension”. (For example, we changed `COLLATION` to `TABLE_COLLATION` in the `TABLES` table.) See the list of reserved words near the end of this article: http://web.archive.org/web/20070409075643rn_1/www.dbazine.com/db2/db2-disarticles/gulutzan5.

The definition for character columns (for example, `TABLES.TABLE_NAME`) is generally `VARCHAR(N) CHARACTER SET utf8` where `N` is at least 64. MySQL uses the default collation for this character set (`utf8_general_ci`) for all searches, sorts, comparisons, and other string operations on such columns. If the default collation is not correct for your needs, you can force a suitable collation with a `COLLATE` clause (Section 9.1.6.1, “Using `COLLATE` in SQL Statements”).

Each section indicates what `SHOW` statement is equivalent to a `SELECT` that retrieves information from `INFORMATION_SCHEMA`, if there is such a statement. For `SHOW` statements that display information for the current database if you omit a `FROM db_name` clause, you can often select information for the current database by adding an `AND TABLE_SCHEMA = CURRENT_SCHEMA()` condition to the `WHERE` clause of a query that retrieves information from an `INFORMATION_SCHEMA` table.

Note

At present, there are some missing columns and some columns out of order. We are working on this and updating the documentation as changes are made.

For answers to questions that are often asked concerning the `INFORMATION_SCHEMA` database, see Section A.7, “MySQL 5.0 FAQ — `INFORMATION_SCHEMA`”.

19.1. The `INFORMATION_SCHEMA SCHEMATA` Table

A schema is a database, so the `SCHEMATA` table provides information about databases.

<code>INFORMATION_SCHEMA Name</code>	<code>SHOW Name</code>	Remarks
<code>CATALOG_NAME</code>		<code>NULL</code>
<code>SCHEMA_NAME</code>		Database
<code>DEFAULT_CHARACTER_SET_NAME</code>		
<code>DEFAULT_COLLATION_NAME</code>		
<code>SQL_PATH</code>		<code>NULL</code>

The following statements are equivalent:

```
SELECT SCHEMA_NAME AS `Database`
FROM INFORMATION_SCHEMA.SCHEMATA
[WHERE SCHEMA_NAME LIKE 'wild']

SHOW DATABASES
[LIKE 'wild']
```

19.2. The `INFORMATION_SCHEMA TABLES` Table

The `TABLES` table provides information about tables in databases.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
<code>TABLE_CATALOG</code>		<code>NULL</code>
<code>TABLE_SCHEMA</code>	<code>Table_...</code>	
<code>TABLE_NAME</code>	<code>Table_...</code>	
<code>TABLE_TYPE</code>		
<code>ENGINE</code>	<code>Engine</code>	MySQL extension
<code>VERSION</code>	<code>Version</code>	The version number of the table's <code>.frm</code> file, MySQL extension
<code>ROW_FORMAT</code>	<code>Row_format</code>	MySQL extension
<code>TABLE_ROWS</code>	<code>Rows</code>	MySQL extension
<code>AVG_ROW_LENGTH</code>	<code>Avg_row_length</code>	MySQL extension
<code>DATA_LENGTH</code>	<code>Data_length</code>	MySQL extension
<code>MAX_DATA_LENGTH</code>	<code>Max_data_length</code>	MySQL extension
<code>INDEX_LENGTH</code>	<code>Index_length</code>	MySQL extension
<code>DATA_FREE</code>	<code>Data_free</code>	MySQL extension
<code>AUTO_INCREMENT</code>	<code>Auto_increment</code>	MySQL extension
<code>CREATE_TIME</code>	<code>Create_time</code>	MySQL extension
<code>UPDATE_TIME</code>	<code>Update_time</code>	MySQL extension
<code>CHECK_TIME</code>	<code>Check_time</code>	MySQL extension
<code>TABLE_COLLATION</code>	<code>Collation</code>	MySQL extension
<code>CHECKSUM</code>	<code>Checksum</code>	MySQL extension
<code>CREATE_OPTIONS</code>	<code>Create_options</code>	MySQL extension
<code>TABLE_COMMENT</code>	<code>Comment</code>	MySQL extension

Notes:

- `TABLE_SCHEMA` and `TABLE_NAME` are a single field in a `SHOW` display, for example `Table_in_db1`.
- `TABLE_TYPE` should be `BASE TABLE` or `VIEW`. Currently, the `TABLES` table does not list `TEMPORARY` tables.
- For partitioned tables, the `ENGINE` column shows the name of the storage engine used by all partitions. (Previously, this column showed `PARTITION` for such tables.)
- The `TABLE_ROWS` column is `NULL` if the table is in the `INFORMATION_SCHEMA` database.

For `InnoDB` tables, the row count is only a rough estimate used in SQL optimization. (This is also true if the `InnoDB` table is partitioned.)

- For tables using the `NDBCLUSTER` storage engine, the `DATA_LENGTH` column reflects the true amount of storage for variable-width columns. (See [Bug#18413](#).)

Note

Because MySQL Cluster allocates storage for variable-width columns in 10-page extents of 32 kilobytes each, space usage for such columns is reported in increments of 320 KB.

- The `DATA_FREE` column shows the free space in bytes for `InnoDB` tables.
- We have nothing for the table's default character set. `TABLE_COLLATION` is close, because collation names begin with a character set name.
- The `CREATE_OPTIONS` column shows `partitioned` if the table is partitioned.

The following statements are equivalent:

```
SELECT table_name FROM INFORMATION_SCHEMA.TABLES
WHERE table_schema = 'db_name'
```

```
[AND table_name LIKE 'wild']
SHOW TABLES
FROM db_name
[LIKE 'wild']
```

19.3. The INFORMATION_SCHEMA COLUMNS Table

The `COLUMNS` table provides information about columns in tables.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
TABLE_CATALOG		NULL
TABLE_SCHEMA		
TABLE_NAME		
COLUMN_NAME	Field	
ORDINAL_POSITION		see notes
COLUMN_DEFAULT	Default	
IS_NULLABLE	Null	
DATA_TYPE	Type	
CHARACTER_MAXIMUM_LENGTH	Type	
CHARACTER_OCTET_LENGTH		
NUMERIC_PRECISION	Type	
NUMERIC_SCALE	Type	
CHARACTER_SET_NAME		
COLLATION_NAME	Collation	
COLUMN_TYPE	Type	MySQL extension
COLUMN_KEY	Key	MySQL extension
EXTRA	Extra	MySQL extension
PRIVILEGES	Privileges	MySQL extension
COLUMN_COMMENT	Comment	MySQL extension

Notes:

- In `SHOW`, the `Type` display includes values from several different `COLUMNS` columns.
- `ORDINAL_POSITION` is necessary because you might want to say `ORDER BY ORDINAL_POSITION`. Unlike `SHOW, SELECT` does not have automatic ordering.
- `CHARACTER_OCTET_LENGTH` should be the same as `CHARACTER_MAXIMUM_LENGTH`, except for multi-byte character sets.
- `CHARACTER_SET_NAME` can be derived from `Collation`. For example, if you say `SHOW FULL COLUMNS FROM t`, and you see in the `Collation` column a value of `latin1_swedish_ci`, the character set is what is before the first underscore: `latin1`.

The following statements are nearly equivalent:

```
SELECT COLUMN_NAME, DATA_TYPE, IS_NULLABLE, COLUMN_DEFAULT
FROM INFORMATION_SCHEMA.COLUMNS
WHERE table_name = 'tbl_name'
[AND table_schema = 'db_name']
[AND column_name LIKE 'wild']

SHOW COLUMNS
FROM tbl_name
[FROM db_name]
[LIKE 'wild']
```

19.4. The INFORMATION_SCHEMA STATISTICS Table

The `STATISTICS` table provides information about table indexes.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
TABLE_CATALOG		NULL
TABLE_SCHEMA		= Database
TABLE_NAME	Table	
NON_UNIQUE	Non_unique	
INDEX_SCHEMA		= Database
INDEX_NAME	Key_name	
SEQ_IN_INDEX	Seq_in_index	
COLUMN_NAME	Column_name	
COLLATION	Collation	
CARDINALITY	Cardinality	
SUB_PART	Sub_part	MySQL extension
PACKED	Packed	MySQL extension
NULLABLE	Null	MySQL extension
INDEX_TYPE	Index_type	MySQL extension
COMMENT	Comment	MySQL extension

Notes:

- There is no standard table for indexes. The preceding list is similar to what SQL Server 2000 returns for `sp_statistics`, except that we replaced the name `QUALIFIER` with `CATALOG` and we replaced the name `OWNER` with `SCHEMA`.

Clearly, the preceding table and the output from `SHOW INDEX` are derived from the same parent. So the correlation is already close.

The following statements are equivalent:

```
SELECT * FROM INFORMATION_SCHEMA.STATISTICS
  WHERE table_name = 'tbl_name'
  AND table_schema = 'db_name'

SHOW INDEX
  FROM tbl_name
  FROM db_name
```

19.5. The INFORMATION_SCHEMA USER_PRIVILEGES Table

The `USER_PRIVILEGES` table provides information about global privileges. This information comes from the `mysql.user` grant table.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
GRANTEE		'user_name'@'host_name' value, MySQL extension
TABLE_CATALOG		NULL, MySQL extension
PRIVILEGE_TYPE		MySQL extension
IS_GRANTABLE		MySQL extension

Notes:

- This is a non-standard table. It takes its values from the `mysql.user` table.

19.6. The INFORMATION_SCHEMA SCHEMA_PRIVILEGES Table

The `SCHEMA_PRIVILEGES` table provides information about schema (database) privileges. This information comes from the `mysql.db` grant table.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
GRANTEE		'user_name'@'host_name' value, MySQL extension
TABLE_CATALOG		NULL, MySQL extension
TABLE_SCHEMA		MySQL extension
PRIVILEGE_TYPE		MySQL extension
IS_GRANTABLE		MySQL extension

Notes:

- This is a non-standard table. It takes its values from the `mysql.db` table.

19.7. The INFORMATION_SCHEMA TABLE_PRIVILEGES Table

The `TABLE_PRIVILEGES` table provides information about table privileges. This information comes from the `mysql.tables_priv` grant table.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
GRANTEE		'user_name'@'host_name' value
TABLE_CATALOG		NULL
TABLE_SCHEMA		
TABLE_NAME		
PRIVILEGE_TYPE		
IS_GRANTABLE		

Notes:

- `PRIVILEGE_TYPE` can contain one (and only one) of these values: `SELECT`, `INSERT`, `UPDATE`, `REFERENCES`, `ALTER`, `INDEX`, `DROP`, `CREATE VIEW`.

The following statements are *not* equivalent:

```
SELECT ... FROM INFORMATION_SCHEMA.TABLE_PRIVILEGES
SHOW GRANTS ...
```

19.8. The INFORMATION_SCHEMA COLUMN_PRIVILEGES Table

The `COLUMN_PRIVILEGES` table provides information about column privileges. This information comes from the `mysql.columns_priv` grant table.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
GRANTEE		'user_name'@'host_name' value
TABLE_CATALOG		NULL
TABLE_SCHEMA		
TABLE_NAME		
COLUMN_NAME		
PRIVILEGE_TYPE		
IS_GRANTABLE		

Notes:

- In the output from `SHOW FULL COLUMNS`, the privileges are all in one field and in lowercase, for example, `select, insert, update, references`. In `COLUMN_PRIVILEGES`, there is one privilege per row, in uppercase.
- `PRIVILEGE_TYPE` can contain one (and only one) of these values: `SELECT, INSERT, UPDATE, REFERENCES`.
- If the user has `GRANT OPTION` privilege, `IS_GRANTABLE` should be `YES`. Otherwise, `IS_GRANTABLE` should be `NO`. The output does not list `GRANT OPTION` as a separate privilege.

The following statements are *not* equivalent:

```
SELECT ... FROM INFORMATION_SCHEMA.COLUMN_PRIVILEGES
SHOW GRANTS ...
```

19.9. The INFORMATION_SCHEMA CHARACTER_SETS Table

The `CHARACTER_SETS` table provides information about available character sets.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
<code>CHARACTER_SET_NAME</code>	<code>Charset</code>	
<code>DEFAULT_COLLATE_NAME</code>	<code>Default collation</code>	
<code>DESCRIPTION</code>	<code>Description</code>	MySQL extension
<code>MAXLEN</code>	<code>Maxlen</code>	MySQL extension

The following statements are equivalent:

```
SELECT * FROM INFORMATION_SCHEMA.CHARACTER_SETS
  [WHERE name LIKE 'wild']
SHOW CHARACTER SET
  [LIKE 'wild']
```

19.10. The INFORMATION_SCHEMA COLLATIONS Table

The `COLLATIONS` table provides information about collations for each character set.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
<code>COLLATION_NAME</code>	<code>Collation</code>	
<code>CHARACTER_SET_NAME</code>	<code>Charset</code>	MySQL extension
<code>ID</code>	<code>Id</code>	MySQL extension
<code>IS_DEFAULT</code>	<code>Default</code>	MySQL extension
<code>IS_COMPILED</code>	<code>Compiled</code>	MySQL extension
<code>SORTLEN</code>	<code>Sortlen</code>	MySQL extension

The following statements are equivalent:

```
SELECT COLLATION_NAME FROM INFORMATION_SCHEMA.COLLATIONS
  [WHERE collation_name LIKE 'wild']
SHOW COLLATION
  [LIKE 'wild']
```

19.11. The INFORMATION_SCHEMA COLLATION_CHARACTER_SET_APPLICABILITY Table

The `COLLATION_CHARACTER_SET_APPLICABILITY` table indicates what character set is applicable for what collation. The columns are equivalent to the first two display fields that we get from `SHOW COLLATION`.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
<code>COLLATION_NAME</code>	<code>Collation</code>	

CHARACTER_SET_NAME	Charset	
--------------------	---------	--

19.12. The INFORMATION_SCHEMA TABLE_CONSTRAINTS Table

The `TABLE_CONSTRAINTS` table describes which tables have constraints.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
CONSTRAINT_CATALOG		NULL
CONSTRAINT_SCHEMA		
CONSTRAINT_NAME		
TABLE_SCHEMA		
TABLE_NAME		
CONSTRAINT_TYPE		

Notes:

- The `CONSTRAINT_TYPE` value can be `UNIQUE`, `PRIMARY KEY`, or `FOREIGN KEY`.
- The `UNIQUE` and `PRIMARY KEY` information is about the same as what you get from the `Key_name` field in the output from `SHOW INDEX` when the `Non_unique` field is 0.
- The `CONSTRAINT_TYPE` column can contain one of these values: `UNIQUE`, `PRIMARY KEY`, `FOREIGN KEY`, `CHECK`. This is a `CHAR` (not `ENUM`) column. The `CHECK` value is not available until we support `CHECK`.

19.13. The INFORMATION_SCHEMA KEY_COLUMN_USAGE Table

The `KEY_COLUMN_USAGE` table describes which key columns have constraints.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
CONSTRAINT_CATALOG		NULL
CONSTRAINT_SCHEMA		
CONSTRAINT_NAME		
TABLE_CATALOG		
TABLE_SCHEMA		
TABLE_NAME		
COLUMN_NAME		
ORDINAL_POSITION		
POSITION_IN_UNIQUE_CONSTRAINT		
REFERENCED_TABLE_SCHEMA		
REFERENCED_TABLE_NAME		
REFERENCED_COLUMN_NAME		

Notes:

- If the constraint is a foreign key, then this is the column of the foreign key, not the column that the foreign key references.
- The value of `ORDINAL_POSITION` is the column's position within the constraint, not the column's position within the table. Column positions are numbered beginning with 1.
- The value of `POSITION_IN_UNIQUE_CONSTRAINT` is `NULL` for unique and primary-key constraints. For foreign-key constraints, it is the ordinal position in key of the table that is being referenced.

For example, suppose that there are two tables name `t1` and `t3` that have the following definitions:

```
CREATE TABLE t1
```

```
(
  s1 INT,
  s2 INT,
  s3 INT,
  PRIMARY KEY(s3)
) ENGINE=InnoDB;

CREATE TABLE t3
(
  s1 INT,
  s2 INT,
  s3 INT,
  KEY(s1),
  CONSTRAINT CO FOREIGN KEY (s2) REFERENCES t1(s3)
) ENGINE=InnoDB;
```

For those two tables, the `KEY_COLUMN_USAGE` table has two rows:

- One row with `CONSTRAINT_NAME = 'PRIMARY'`, `TABLE_NAME = 't1'`, `COLUMN_NAME = 's3'`, `ORDINAL_POSITION = 1`, `POSITION_IN_UNIQUE_CONSTRAINT = NULL`.
- One row with `CONSTRAINT_NAME = 'CO'`, `TABLE_NAME = 't3'`, `COLUMN_NAME = 's2'`, `ORDINAL_POSITION = 1`, `POSITION_IN_UNIQUE_CONSTRAINT = 1`.

19.14. The INFORMATION_SCHEMA ROUTINES Table

The `ROUTINES` table provides information about stored routines (both procedures and functions). The `ROUTINES` table does not include user-defined functions (UDFs) at this time.

The column named “`mysql.proc name`” indicates the `mysql.proc` table column that corresponds to the `INFORMATION_SCHEMA.ROUTINES` table column, if any.

INFORMATION_SCHEMA Name	mysql.proc Name	Remarks
SPECIFIC_NAME	specific_name	
ROUTINE_CATALOG		NULL
ROUTINE_SCHEMA	db	
ROUTINE_NAME	name	
ROUTINE_TYPE	type	{PROCEDURE FUNCTION}
DTD_IDENTIFIER		data type descriptor
ROUTINE_BODY		SQL
ROUTINE_DEFINITION	body	
EXTERNAL_NAME		NULL
EXTERNAL_LANGUAGE	language	NULL
PARAMETER_STYLE		SQL
IS_DETERMINISTIC	is_deterministic	
SQL_DATA_ACCESS	sql_data_access	
SQL_PATH		NULL
SECURITY_TYPE	security_type	
CREATED	created	
LAST_ALTERED	modified	
SQL_MODE	sql_mode	MySQL extension
ROUTINE_COMMENT	comment	MySQL extension
DEFINER	definer	MySQL extension
CHARACTER_SET_CLIENT		MySQL extension
COLLATION_CONNECTION		MySQL extension
DATABASE_COLLATION		MySQL extension

Notes:

- MySQL calculates `EXTERNAL_LANGUAGE` thus:
 - If `mysql.proc.language = 'SQL'`, `EXTERNAL_LANGUAGE` is `NULL`
 - Otherwise, `EXTERNAL_LANGUAGE` is what is in `mysql.proc.language`. However, we do not have external languages yet, so it is always `NULL`.
- `CHARACTER_SET_CLIENT` is the session value of the `character_set_client` system variable when the routine was created. `COLLATION_CONNECTION` is the session value of the `collation_connection` system variable when the routine was created. `DATABASE_COLLATION` is the collation of the database with which the routine is associated.

19.15. The INFORMATION_SCHEMA VIEWS Table

The `VIEWS` table provides information about views in databases. You must have the `SHOW VIEW` privilege to access this table.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
<code>TABLE_CATALOG</code>		<code>NULL</code>
<code>TABLE_SCHEMA</code>		
<code>TABLE_NAME</code>		
<code>VIEW_DEFINITION</code>		
<code>CHECK_OPTION</code>		
<code>IS_UPDATABLE</code>		
<code>DEFINER</code>		
<code>SECURITY_TYPE</code>		
<code>CHARACTER_SET_CLIENT</code>		MySQL extension
<code>COLLATION_CONNECTION</code>		MySQL extension

Notes:

- The `VIEW_DEFINITION` column has most of what you see in the `Create Table` field that `SHOW CREATE VIEW` produces. Skip the words before `SELECT` and skip the words `WITH CHECK OPTION`. Suppose that the original statement was:

```
CREATE VIEW v AS
  SELECT s2,s1 FROM t
  WHERE s1 > 5
  ORDER BY s1
  WITH CHECK OPTION;
```

Then the view definition looks like this:

```
SELECT s2,s1 FROM t WHERE s1 > 5 ORDER BY s1
```

- The `CHECK_OPTION` column has a value of `NONE`, `CASCADE`, or `LOCAL`.
- MySQL sets a flag, called the view updatability flag, at `CREATE VIEW` time. The flag is set to `YES` (true) if `UPDATE` and `DELETE` (and similar operations) are legal for the view. Otherwise, the flag is set to `NO` (false). The `IS_UPDATABLE` column in the `VIEWS` table displays the status of this flag. It means that the server always knows whether a view is updatable. If the view is not updatable, statements such `UPDATE`, `DELETE`, and `INSERT` are illegal and will be rejected. (Note that even if a view is updatable, it might not be possible to insert into it; for details, refer to [Section 12.1.16, “CREATE VIEW Syntax”](#).)
- The `DEFINER` column indicates who defined the view. `SECURITY_TYPE` has a value of `DEFINER` or `INVOKER`.
- `CHARACTER_SET_CLIENT` is the session value of the `character_set_client` system variable when the view was created. `COLLATION_CONNECTION` is the session value of the `collation_connection` system variable when the view was created.

MySQL lets you use different `sql_mode` settings to tell the server the type of SQL syntax to support. For example, you might use the `ANSI` SQL mode to ensure MySQL correctly interprets the standard SQL concatenation operator, the double bar (`|`), in your queries. If you then create a view that concatenates items, you might worry that changing the `sql_mode` setting to a value different from `ANSI` could cause the view to become invalid. But this is not the case. No matter how you write out a view definition, MySQL always stores it the same way, in a canonical form. Here is an example that shows how the server changes a double bar

concatenation operator to a `CONCAT()` function:

```
mysql> SET sql_mode = 'ANSI';
Query OK, 0 rows affected (0.00 sec)

mysql> CREATE VIEW test.v AS SELECT 'a' || 'b' as coll;
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT VIEW_DEFINITION FROM INFORMATION_SCHEMA.VIEWS
-> WHERE TABLE_SCHEMA = 'test' AND TABLE_NAME = 'v';
+-----+-----+
| VIEW_DEFINITION |
+-----+-----+
| select concat('a','b') AS `coll` |
+-----+-----+
1 row in set (0.00 sec)
```

The advantage of storing a view definition in canonical form is that changes made later to the value of `sql_mode` will not affect the results from the view. However an additional consequence is that comments prior to `SELECT` are stripped from the definition by the server.

19.16. The INFORMATION_SCHEMA TRIGGERS Table

The `TRIGGERS` table provides information about triggers. You must have the `TRIGGER` privilege to access this table.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
TRIGGER_CATALOG		NULL
TRIGGER_SCHEMA		
TRIGGER_NAME	Trigger	
EVENT_MANIPULATION	Event	
EVENT_OBJECT_CATALOG		NULL
EVENT_OBJECT_SCHEMA		
EVENT_OBJECT_TABLE	Table	
ACTION_ORDER		0
ACTION_CONDITION		NULL
ACTION_STATEMENT	Statement	
ACTION_ORIENTATION		ROW
ACTION_TIMING	Timing	
ACTION_REFERENCE_OLD_TABLE		NULL
ACTION_REFERENCE_NEW_TABLE		NULL
ACTION_REFERENCE_OLD_ROW		OLD
ACTION_REFERENCE_NEW_ROW		NEW
CREATED		NULL (0)
SQL_MODE		MySQL extension
DEFINER		MySQL extension
CHARACTER_SET_CLIENT		MySQL extension
COLLATION_CONNECTION		MySQL extension
DATABASE_COLLATION		MySQL extension

Notes:

- The `TRIGGER_SCHEMA` and `TRIGGER_NAME` columns contain the name of the database in which the trigger occurs and the trigger name, respectively.
- The `EVENT_MANIPULATION` column contains one of the values `'INSERT'`, `'DELETE'`, or `'UPDATE'`.
- As noted in [Section 18.3, “Using Triggers”](#), every trigger is associated with exactly one table. The `EVENT_OBJECT_SCHEMA` and `EVENT_OBJECT_TABLE` columns contain the database in which this table occurs, and the table's name.
- The `ACTION_ORDER` statement contains the ordinal position of the trigger's action within the list of all similar triggers on the same table. Currently, this value is always 0, because it is not possible to have more than one trigger with the same

`EVENT_MANIPULATION` and `ACTION_TIMING` on the same table.

- The `ACTION_STATEMENT` column contains the statement to be executed when the trigger is invoked. This is the same as the text displayed in the `Statement` column of the output from `SHOW TRIGGERS`. Note that this text uses UTF-8 encoding.
- The `ACTION_ORIENTATION` column always contains the value 'ROW'.
- The `ACTION_TIMING` column contains one of the two values 'BEFORE' or 'AFTER'.
- The columns `ACTION_REFERENCE_OLD_ROW` and `ACTION_REFERENCE_NEW_ROW` contain the old and new column identifiers, respectively. This means that `ACTION_REFERENCE_OLD_ROW` always contains the value 'OLD' and `ACTION_REFERENCE_NEW_ROW` always contains the value 'NEW'.
- The `SQL_MODE` column shows the server SQL mode that was in effect at the time when the trigger was created (and thus which remains in effect for this trigger whenever it is invoked, *regardless of the current server SQL mode*). The possible range of values for this column is the same as that of the `sql_mode` system variable. See [Section 5.1.7, “Server SQL Modes”](#).
- `DEFINER` indicates who defined the trigger.
- `CHARACTER_SET_CLIENT` is the session value of the `character_set_client` system variable when the trigger was created. `COLLATION_CONNECTION` is the session value of the `collation_connection` system variable when the trigger was created. `DATABASE_COLLATION` is the collation of the database with which the trigger is associated.
- The following columns currently always contain NULL: `TRIGGER_CATALOG`, `EVENT_OBJECT_CATALOG`, `ACTION_CONDITION`, `ACTION_REFERENCE_OLD_TABLE`, `ACTION_REFERENCE_NEW_TABLE`, and `CREATED`.

Example, using the `ins_sum` trigger defined in [Section 18.3, “Using Triggers”](#):

```
mysql> SELECT * FROM INFORMATION_SCHEMA.TRIGGERS\G
***** 1. ROW *****
TRIGGER_CATALOG: NULL
TRIGGER_SCHEMA: test
TRIGGER_NAME: ins_sum
EVENT_MANIPULATION: INSERT
EVENT_OBJECT_CATALOG: NULL
EVENT_OBJECT_SCHEMA: test
EVENT_OBJECT_TABLE: account
ACTION_ORDER: 0
ACTION_CONDITION: NULL
ACTION_STATEMENT: SET @sum = @sum + NEW.amount
ACTION_ORIENTATION: ROW
ACTION_TIMING: BEFORE
ACTION_REFERENCE_OLD_TABLE: NULL
ACTION_REFERENCE_NEW_TABLE: NULL
ACTION_REFERENCE_OLD_ROW: OLD
ACTION_REFERENCE_NEW_ROW: NEW
CREATED: NULL
SQL_MODE:
DEFINER: me@localhost
```

See also [Section 12.5.5.39, “SHOW TRIGGERS Syntax”](#).

19.17. The INFORMATION_SCHEMA PLUGINS Table

The `PLUGINS` table provides information about server plugins.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
<code>PLUGIN_NAME</code>	Name	MySQL extension
<code>PLUGIN_VERSION</code>		MySQL extension
<code>PLUGIN_STATUS</code>	Status	MySQL extension
<code>PLUGIN_TYPE</code>	Type	MySQL extension
<code>PLUGIN_TYPE_VERSION</code>		MySQL extension
<code>PLUGIN_LIBRARY</code>	Library	MySQL extension
<code>PLUGIN_LIBRARY_VERSION</code>		MySQL extension
<code>PLUGIN_AUTHOR</code>		MySQL extension
<code>PLUGIN_DESCRIPTION</code>		MySQL extension
<code>PLUGIN_LICENSE</code>		MySQL extension

Notes:

- The `PLUGINS` table is a non-standard table.

See also [Section 12.5.5.27, “SHOW PLUGINS Syntax”](#).

19.18. The INFORMATION_SCHEMA ENGINES Table

The `PLUGINS` table provides information about storage engines.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
<code>ENGINE</code>	<code>Engine</code>	MySQL extension
<code>SUPPORT</code>	<code>Support</code>	MySQL extension
<code>COMMENT</code>	<code>Comment</code>	MySQL extension
<code>TRANSACTIONS</code>	<code>Transactions</code>	MySQL extension
<code>XA</code>	<code>XA</code>	MySQL extension
<code>SAVEPOINTS</code>	<code>Savepoints</code>	MySQL extension

Notes:

- The `ENGINES` table is a non-standard table.

See also [Section 12.5.5.17, “SHOW ENGINES Syntax”](#).

19.19. The INFORMATION_SCHEMA PARTITIONS Table

The `PARTITIONS` table provides information about table partitions. See [Chapter 17, Partitioning](#), for more information about partitioning tables.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
<code>TABLE_CATALOG</code>		MySQL extension
<code>TABLE_SCHEMA</code>		MySQL extension
<code>TABLE_NAME</code>		MySQL extension
<code>PARTITION_NAME</code>		MySQL extension
<code>SUBPARTITION_NAME</code>		MySQL extension
<code>PARTITION_ORDINAL_POSITION</code>		MySQL extension
<code>SUBPARTITION_ORDINAL_POSITION</code>		MySQL extension
<code>PARTITION_METHOD</code>		MySQL extension
<code>SUBPARTITION_METHOD</code>		MySQL extension
<code>PARTITION_EXPRESSION</code>		MySQL extension
<code>SUBPARTITION_EXPRESSION</code>		MySQL extension
<code>PARTITION_DESCRIPTION</code>		MySQL extension
<code>TABLE_ROWS</code>		MySQL extension
<code>AVG_ROW_LENGTH</code>		MySQL extension
<code>DATA_LENGTH</code>		MySQL extension
<code>MAX_DATA_LENGTH</code>		MySQL extension
<code>INDEX_LENGTH</code>		MySQL extension
<code>DATA_FREE</code>		MySQL extension
<code>CREATE_TIME</code>		MySQL extension
<code>UPDATE_TIME</code>		MySQL extension
<code>CHECK_TIME</code>		MySQL extension

CHECKSUM		MySQL extension
PARTITION_COMMENT		MySQL extension
NODEGROUP		MySQL extension
TABLESPACE_NAME		MySQL extension

Notes:

- The `PARTITIONS` table is a non-standard table.
Each record in this table corresponds to an individual partition or subpartition of a partitioned table.
- `TABLE_CATALOG`: This column is always `NULL`.
- `TABLE_SCHEMA`: This column contains the name of the database to which the table belongs.
- `TABLE_NAME`: This column contains the name of the table containing the partition.
- `PARTITION_NAME`: The name of the partition.
- `SUBPARTITION_NAME`: If the `PARTITIONS` table record represents a subpartition, then this column contains the name of subpartition; otherwise it is `NULL`.
- `PARTITION_ORDINAL_POSITION`: All partitions are indexed in the same order as they are defined, with `1` being the number assigned to the first partition. The indexing can change as partitions are added, dropped, and reorganized; the number shown in this column reflects the current order, taking into account any indexing changes.
- `SUBPARTITION_ORDINAL_POSITION`: Subpartitions within a given partition are also indexed and reindexed in the same manner as partitions are indexed within a table.
- `PARTITION_METHOD`: One of the values `RANGE`, `LIST`, `HASH`, `LINEAR HASH`, `KEY`, or `LINEAR KEY`; that is, one of the available partitioning types as discussed in Section 17.2, “Partition Types”.
- `SUBPARTITION_METHOD`: One of the values `HASH`, `LINEAR HASH`, `KEY`, or `LINEAR KEY`; that is, one of the available subpartitioning types as discussed in Section 17.2.5, “Subpartitioning”.
- `PARTITION_EXPRESSION`: This is the expression for the partitioning function used in the `CREATE TABLE` or `ALTER TABLE` statement that created the table's current partitioning scheme.

For example, consider a partitioned table created in the `test` database using this statement:

```
CREATE TABLE tp (
  c1 INT,
  c2 INT,
  c3 VARCHAR(25)
)
PARTITION BY HASH(c1 + c2)
PARTITIONS 4;
```

The `PARTITION_EXPRESSION` column in a `PARTITIONS` table record for a partition from this table displays `c1 + c2`, as shown here:

```
mysql> SELECT DISTINCT PARTITION_EXPRESSION
> FROM INFORMATION_SCHEMA.PARTITIONS
> WHERE TABLE_NAME='tp' AND TABLE_SCHEMA='test';
+-----+
| PARTITION_EXPRESSION |
+-----+
| c1 + c2              |
+-----+
1 row in set (0.09 sec)
```

- `SUBPARTITION_EXPRESSION`: This works in the same fashion for the subpartitioning expression that defines the subpartitioning for a table as `PARTITION_EXPRESSION` does for the partitioning expression used to define a table's partitioning.

If the table has no subpartitions, then this column is `NULL`.

- `PARTITION_DESCRIPTION`: This column is used for `RANGE` and `LIST` partitions. For a `RANGE` partition, it contains the value set in the partition's `VALUES LESS THAN` clause, which can be either an integer or `MAXVALUE`. For a `LIST` partition, this column contains the values defined in the partition's `VALUES IN` clause, which is a comma-separated list of integer values.

For partitions whose `PARTITION_METHOD` is other than `RANGE` or `LIST`, this column is always `NULL`.

- `TABLE_ROWS`: The number of table rows in the partition.

For partitioned `InnoDB` tables, the row count given in the `TABLE_ROWS` column is only an estimated value used in SQL optimization, and may not always be exact.

- `AVG_ROW_LENGTH`: The average length of the rows stored in this partition or subpartition, in bytes.

This is the same as `DATA_LENGTH` divided by `TABLE_ROWS`.

- `DATA_LENGTH`: The total length of all rows stored in this partition or subpartition, in bytes — that is, the total number of bytes stored in the partition or subpartition.
- `MAX_DATA_LENGTH`: The maximum number of bytes that can be stored in this partition or subpartition.
- `INDEX_LENGTH`: The length of the index file for this partition or subpartition, in bytes.
- `DATA_FREE`: The number of bytes allocated to the partition or subpartition but not used.
- `CREATE_TIME`: The time of the partition's or subpartition's creation.
- `UPDATE_TIME`: The time that the partition or subpartition was last modified.
- `CHECK_TIME`: The last time that the table to which this partition or subpartition belongs was checked.

Note

Some storage engines do not update this time; for tables using these storage engines, this value is always `NULL`.

- `CHECKSUM`: The checksum value, if any; otherwise, this column is `NULL`.
- `PARTITION_COMMENT`: This column contains the text of any comment made for the partition.

The default value for this column is an empty string.

- `NODEGROUP`: This is the nodegroup to which the partition belongs. This is relevant only to MySQL Cluster tables; otherwise the value of this column is always `0`.
- `TABLESPACE_NAME`: This column contains the name of tablespace to which the partition belongs. In MySQL 5.4, the value of this column is always `DEFAULT`.
- A non-partitioned table has one record in `INFORMATION_SCHEMA.PARTITIONS`; however, the values of the `PARTITION_NAME`, `SUBPARTITION_NAME`, `PARTITION_ORDINAL_POSITION`, `SUBPARTITION_ORDINAL_POSITION`, `PARTITION_METHOD`, `SUBPARTITION_METHOD`, `PARTITION_EXPRESSION`, `SUBPARTITION_EXPRESSION`, and `PARTITION_DESCRIPTION` columns are all `NULL`. (The `PARTITION_COMMENT` column in this case is blank.)

In MySQL 5.4, there is also only one record in the `PARTITIONS` table for a table using the `NDBCLUSTER` storage engine. The same columns are also `NULL` (or empty) as for a non-partitioned table.

19.20. The INFORMATION_SCHEMA EVENTS Table

The `EVENTS` table provides information about scheduled events, which are discussed in [Section 18.4, “Using the Event Scheduler”](#).

INFORMATION_SCHEMA Name	SHOW Name	Remarks
<code>EVENT_CATALOG</code>		<code>NULL</code> , MySQL extension
<code>EVENT_SCHEMA</code>	<code>Db</code>	MySQL extension
<code>EVENT_NAME</code>	<code>Name</code>	MySQL extension
<code>DEFINER</code>	<code>Definer</code>	MySQL extension
<code>TIME_ZONE</code>	<code>Time zone</code>	MySQL extension
<code>EVENT_BODY</code>		MySQL extension
<code>EVENT_DEFINITION</code>		MySQL extension
<code>EVENT_TYPE</code>	<code>Type</code>	MySQL extension

EXECUTE_AT	Execute at	MySQL extension
INTERVAL_VALUE	Interval value	MySQL extension
INTERVAL_FIELD	Interval field	MySQL extension
SQL_MODE		MySQL extension
STARTS	Starts	MySQL extension
ENDS	Ends	MySQL extension
STATUS	Status	MySQL extension
ON_COMPLETION		MySQL extension
CREATED		MySQL extension
LAST_ALTERED		MySQL extension
LAST_EXECUTED		MySQL extension
EVENT_COMMENT		MySQL extension
ORIGINATOR	Originator	MySQL extension
CHARACTER_SET_CLIENT		MySQL extension
COLLATION_CONNECTION		MySQL extension
DATABASE_COLLATION		MySQL extension

Notes:

- The `EVENTS` table is a non-standard table.
- `EVENT_CATALOG`: The value of this column is always `NULL`.
- `EVENT_SCHEMA`: The name of the schema (database) to which this event belongs.
- `EVENT_NAME`: The name of the event.
- `DEFINER`: The user who created the event. Always displayed in '`user_name`'@'`host_name`' format.
- `TIME_ZONE`: The time zone in effect when schedule for the event was last modified. If the event's schedule has not been modified since the event was created, then this is the time zone that was in effect at the event's creation. The default value is `SYSTEM`.
- `EVENT_BODY`: The language used for the statements in the event's `DO` clause; in MySQL 5.4, this is always `SQL`.
This column is not to be confused with the column of the same name (now named `EVENT_DEFINITION`) that existed in earlier MySQL versions.
- `EVENT_DEFINITION`: The text of the SQL statement making up the event's `DO` clause; in other words, the statement executed by this event.
- `EVENT_TYPE`: One of the two values `ONE TIME` or `RECURRING`.
- `EXECUTE_AT`: For a one-time event, this is the `DATETIME` value specified in the `AT` clause of the `CREATE EVENT` statement used to create the event, or of the last `ALTER EVENT` statement that modified the event. The value shown in this column reflects the addition or subtraction of any `INTERVAL` value included in the event's `AT` clause. For example, if an event is created using `ON SCHEDULE AT CURRENT_TIMESTAMP + '1:6' DAY_HOUR`, and the event was created at 2006-02-09 14:05:30, the value shown in this column would be '`2006-02-10 20:05:30`'.

If the event's timing is determined by an `EVERY` clause instead of an `AT` clause (that is, if the event is recurring), the value of this column is `NULL`.
- `INTERVAL_VALUE`: For recurring events, this column contains the numeric portion of the event's `EVERY` clause.
For a one-time event (that is, an event whose timing is determined by an `AT` clause), this column's value is `NULL`.
- `INTERVAL_FIELD`: For recurring events, this column contains the units portion of the `EVERY` clause governing the timing of the event. Thus, this column contains a value such as '`YEAR`', '`QUARTER`', '`DAY`', and so on.
For a one-time event (that is, an event whose timing is determined by an `AT` clause), this column's value is `NULL`.
- `SQL_MODE`: The SQL mode in effect at the time the event was created or altered.

- **STARTS:** For a recurring event whose definition includes a **STARTS** clause, this column contains the corresponding **DATE-TIME** value. As with the **EXECUTE_AT** column, this value resolves any expressions used.

If there is no **STARTS** clause affecting the timing of the event, this column is empty.

- **ENDS:** For a recurring event whose definition includes a **ENDS** clause, this column contains the corresponding **DATETIME** value. As with the **EXECUTE_AT** column (see previous example), this value resolves any expressions used.

If there is no **ENDS** clause affecting the timing of the event, this column contains **NULL**.

- **STATUS:** One of the three values **ENABLED**, **DISABLED**, or **SLAVESIDE_DISABLED**.

SLAVESIDE_DISABLED indicates that the creation of the event occurred on another MySQL server acting as a replication master and was replicated to the current MySQL server which is acting as a slave, but the event is not presently being executed on the slave. See [Section 16.3.1.7, “Replication of Invoked Features”](#), for more information.

- **ON_COMPLETION:** One of the two values **PRESERVE** or **NOT PRESERVE**.

- **CREATED:** The date and time when the event was created. This is a **DATETIME** value.

- **LAST_ALTERED:** The date and time when the event was last modified. This is a **DATETIME** value. If the event has not been modified since its creation, this column holds the same value as the **CREATED** column.

- **LAST_EXECUTED:** The date and time when the event last executed. A **DATETIME** value. If the event has never executed, this column's value is **NULL**.

LAST_EXECUTED indicates when the event started. As a result, the **ENDS** column is never less than **LAST_EXECUTED**.

- **EVENT_COMMENT:** The text of a comment, if the event has one. If there is no comment, the value of this column is an empty string.

- **ORIGINATOR:** The server ID of the MySQL server on which the event was created; used in replication. The default value is 0.

- **CHARACTER_SET_CLIENT** is the session value of the **character_set_client** system variable when the event was created. **COLLATION_CONNECTION** is the session value of the **collation_connection** system variable when the event was created. **DATABASE_COLLATION** is the collation of the database with which the event is associated.

Example: Suppose the user **jon@ghidora** creates an event named **e_daily**, and then modifies it a few minutes later using an **ALTER EVENT** statement, as shown here:

```
DELIMITER |
CREATE EVENT e_daily
ON SCHEDULE
EVERY 1 DAY
COMMENT 'Saves total number of sessions then clears the table each day'
DO
BEGIN
INSERT INTO site_activity.totals (time, total)
SELECT CURRENT_TIMESTAMP, COUNT(*)
FROM site_activity.sessions;
DELETE FROM site_activity.sessions;
END |
DELIMITER ;
ALTER EVENT e_daily
ENABLED;
```

(Note that comments can span multiple lines.)

This user can then run the following **SELECT** statement, and obtain the output shown:

```
mysql> SELECT * FROM INFORMATION_SCHEMA.EVENTS
> WHERE EVENT_NAME = 'e_daily'
> AND EVENT_SCHEMA = 'myschema'\G
***** 1. row *****
EVENT_CATALOG: NULL
EVENT_SCHEMA: test
EVENT_NAME: e_daily
DEFINER: paul@localhost
TIME_ZONE: SYSTEM
EVENT_BODY: SQL
EVENT_DEFINITION: BEGIN
INSERT INTO site_activity.totals (time, total)
SELECT CURRENT_TIMESTAMP, COUNT(*)
FROM site_activity.sessions;
DELETE FROM site_activity.sessions;
END
```

```

EVENT_TYPE: RECURRING
EXECUTE_AT: NULL
INTERVAL_VALUE: 1
INTERVAL_FIELD: DAY
SQL_MODE:
STARTS: 2008-09-03 12:13:39
ENDS: NULL
STATUS: ENABLED
ON_COMPLETION: NOT PRESERVE
CREATED: 2008-09-03 12:13:39
LAST_ALTERED: 2008-09-03 12:13:39
LAST_EXECUTED: NULL
EVENT_COMMENT: Saves total number of sessions then clears the
table each day
ORIGINATOR: 1
CHARACTER_SET_CLIENT: latin1
COLLATION_CONNECTION: latin1_swedish_ci
DATABASE_COLLATION: latin1_swedish_ci
    
```

These times are all given in terms of local time as determined by the MySQL server's `time_zone` setting. (The same was true of the `starts`, `ends`, and `last_executed` columns of the `mysql.event` table as well as the `Starts` and `Ends` columns in the output of `SHOW [FULL] EVENTS`.)

The `CREATED` and `LAST_ALTERED` columns use the server time zone (as do the `created` and `last_altered` columns of the `mysql.event` table).

See also [Section 12.5.5.19, "SHOW EVENTS Syntax"](#).

19.21. The INFORMATION_SCHEMA FILES Table

The `FILES` table provides information about the files in which MySQL NDB Disk Data tables are stored.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
<code>FILE_ID</code>		MySQL extension
<code>FILE_NAME</code>		MySQL extension
<code>FILE_TYPE</code>		MySQL extension
<code>TABLESPACE_NAME</code>		MySQL extension
<code>TABLE_CATALOG</code>		MySQL extension
<code>TABLE_SCHEMA</code>		MySQL extension
<code>TABLE_NAME</code>		MySQL extension
<code>LOGFILE_GROUP_NAME</code>		MySQL extension
<code>LOGFILE_GROUP_NUMBER</code>		MySQL extension
<code>ENGINE</code>		MySQL extension
<code>FULLTEXT_KEYS</code>		MySQL extension
<code>DELETED_ROWS</code>		MySQL extension
<code>UPDATE_COUNT</code>		MySQL extension
<code>FREE_EXTENTS</code>		MySQL extension
<code>TOTAL_EXTENTS</code>		MySQL extension
<code>EXTENT_SIZE</code>		MySQL extension
<code>INITIAL_SIZE</code>		MySQL extension
<code>MAXIMUM_SIZE</code>		MySQL extension
<code>AUTOEXTEND_SIZE</code>		MySQL extension
<code>CREATION_TIME</code>		MySQL extension
<code>LAST_UPDATE_TIME</code>		MySQL extension
<code>LAST_ACCESS_TIME</code>		MySQL extension
<code>RECOVER_TIME</code>		MySQL extension
<code>TRANSACTION_COUNTER</code>		MySQL extension
<code>VERSION</code>		MySQL extension
<code>ROW_FORMAT</code>		MySQL extension
<code>TABLE_ROWS</code>		MySQL extension
<code>AVG_ROW_LENGTH</code>		MySQL extension

DATA_LENGTH		MySQL extension
MAX_DATA_LENGTH		MySQL extension
INDEX_LENGTH		MySQL extension
DATA_FREE		MySQL extension
CREATE_TIME		MySQL extension
UPDATE_TIME		MySQL extension
CHECK_TIME		MySQL extension
CHECKSUM		MySQL extension
STATUS		MySQL extension
EXTRA		MySQL extension

Notes:

- `FILE_ID` column values are auto-generated.
- `FILE_NAME` is the name of an `UNDO` log file created by `CREATE LOGFILE GROUP` or `ALTER LOGFILE GROUP`, or of a data file created by `CREATE TABLESPACE` or `ALTER TABLESPACE`.
- `FILE_TYPE` is one of the values `UNDOFILE` or `DATAFILE`.
- `TABLESPACE_NAME` is the name of the tablespace with which the file is associated.
- Currently, the value of the `TABLESPACE_CATALOG` column is always `NULL`.
- `TABLE_NAME` is the name of the Disk Data table with which the file is associated, if any.
- The `LOGFILE_GROUP_NAME` column gives the name of the log file group to which the log file or data file belongs.
- For an `UNDO` log file, the `LOGFILE_GROUP_NUMBER` contains the auto-generated ID number of the log file group to which the log file belongs.
- For a MySQL Cluster Disk Data log file or data file, the value of the `ENGINE` column is always `NDB` or `NDBCLUSTER`.
- For a MySQL Cluster Disk Data log file or data file, the value of the `FULLTEXT_KEYS` column is always empty.
- The `FREE_EXTENTS` column displays the number of extents which have not yet been used by the file. The `TOTAL_EXTENTS` column show the total number of extents allocated to the file.

The difference between these two columns is the number of extents currently in use by the file:

```
SELECT TOTAL_EXTENTS - FREE_EXTENTS AS extents_used
FROM INFORMATION_SCHEMA.FILES
WHERE FILE_NAME = 'myfile.dat';
```

You can approximate the amount of disk space in use by the file by multiplying this difference by the value of the `EXTENT_SIZE` column, which gives the size of an extent for the file in bytes:

```
SELECT (TOTAL_EXTENTS - FREE_EXTENTS) * EXTENT_SIZE AS bytes_used
FROM INFORMATION_SCHEMA.FILES
WHERE FILE_NAME = 'myfile.dat';
```

Similarly, you can estimate the amount of space that remains available in a given file by multiplying `FREE_EXTENTS` by `EXTENT_SIZE`:

```
SELECT FREE_EXTENTS * EXTENT_SIZE AS bytes_free
FROM INFORMATION_SCHEMA.FILES
WHERE FILE_NAME = 'myfile.dat';
```

Important

The byte values produced by the preceding queries are approximations only, and their precision is inversely proportional to the value of `EXTENT_SIZE`. That is, the larger `EXTENT_SIZE` becomes, the less accurate the approximations are.

It is also important to remember that once an extent is used, it cannot be freed again without dropping the data file of which it is

a part. This means that deletes from a Disk Data table do *not* release disk space.

The extent size can be set in a `CREATE TABLESPACE` statement. See [CREATE TABLESPACE Syntax](#), for more information.

- The `INITIAL_SIZE` column shows the size in bytes of the file. This is the same value that was used in the `INITIAL_SIZE` clause of the `CREATE LOGFILE GROUP`, `ALTER LOGFILE GROUP`, `CREATE TABLESPACE`, or `ALTER TABLESPACE` statement used to create the file.

For MySQL Cluster Disk Data files, the value of the `MAXIMUM_SIZE` column is always the same as `INITIAL_SIZE`, and the `AUTOEXTEND_SIZE` column is always empty.

- The `CREATION_TIME` column shows the date and time when the file was created. The `LAST_UPDATE_TIME` column displays the date and time when the file was last modified. The `LAST_ACCESSED` column provides the date and time when the file was last accessed by the server.

Currently, the values of these columns are as reported by the operating system, and are not supplied by the NDB storage engine. Where no value is provided by the operating system, these columns display `0000-00-00 00:00:00`.

- For MySQL Cluster Disk Data files, the value of the `RECOVER_TIME` and `TRANSACTION_COUNTER` columns is always 0.
- For MySQL Cluster Disk Data files, the following columns are always `NULL`:

- `VERSION`
- `ROW_FORMAT`
- `TABLE_ROWS`
- `AVG_ROW_LENGTH`
- `DATA_LENGTH`
- `MAX_DATA_LENGTH`
- `INDEX_LENGTH`
- `DATA_FREE`
- `CREATE_TIME`
- `UPDATE_TIME`
- `CHECK_TIME`
- `CHECKSUM`

- For MySQL Cluster Disk Data files, the value of the `STATUS` column is always `NORMAL`.
- For MySQL Cluster Disk Data files, the `EXTRA` column shows which data node the file belongs to, as each data node has its own copy of the file. For example, suppose you use this statement on a MySQL Cluster with four data nodes:

```
CREATE LOGFILE GROUP mygroup
  ADD UNDOFILE 'new_undo.dat'
  INITIAL_SIZE 2G
  ENGINE NDB;
```

After running the `CREATE LOGFILE GROUP` statement successfully, you should see a result similar to the one shown here for this query against the `FILES` table:

```
mysql> SELECT LOGFILE_GROUP_NAME, FILE_TYPE, EXTRA
-> FROM INFORMATION_SCHEMA.FILES
-> WHERE FILE_NAME = 'new_undo.dat';
```

LOGFILE_GROUP_NAME	FILE_TYPE	EXTRA
mygroup	UNDO FILE	CLUSTER_NODE=3
mygroup	UNDO FILE	CLUSTER_NODE=4
mygroup	UNDO FILE	CLUSTER_NODE=5
mygroup	UNDO FILE	CLUSTER_NODE=6

```
4 rows in set (0.01 sec)
```

- The `FILES` table is a non-standard table.

- An additional row is present in the `FILES` table following the creation of a logfile group. This row has `NULL` for the value of the `FILE_NAME` column. For this row, the value of the `FILE_ID` column is always 0, that of the `FILE_TYPE` column is always `UNDO FILE`, and that of the `STATUS` column is always `NORMAL`. Currently, the value of the `ENGINE` column is always `NDBCLUSTER`.

The `FREE_EXTENTS` column in this row shows the total number of free extents available to all undo files belonging to a given log file group whose name and number are shown in the `LOGFILE_GROUP_NAME` and `LOGFILE_GROUP_NUMBER` columns, respectively.

Suppose there are no existing log file groups on your MySQL Cluster, and you create one using the following statement:

```
mysql> CREATE LOGFILE GROUP lg1
-> ADD UNDOFILE 'undofile.dat'
-> INITIAL_SIZE = 16M
-> UNDO_BUFFER_SIZE = 1M
-> ENGINE = NDB;
Query OK, 0 rows affected (3.81 sec)
```

You can now see this `NULL` row when you query the `FILES` table:

```
mysql> SELECT DISTINCT
-> FILE_NAME AS File,
-> FREE_EXTENTS AS Free,
-> TOTAL_EXTENTS AS Total,
-> EXTENT_SIZE AS Size,
-> INITIAL_SIZE AS Initial
-> FROM INFORMATION_SCHEMA.FILES;
```

File	Free	Total	Size	Initial
undofile.dat	NULL	4194304	4	16777216
NULL	4184068	NULL	4	NULL

2 rows in set (0.01 sec)

The total number of free extents available for undo logging is always somewhat less than the sum of the `TOTAL_EXTENTS` column values for all undo files in the log file group due to overhead required for maintaining the undo files. This can be seen by adding a second undo file to the log file group, then repeating the previous query against the `FILES` table:

```
mysql> ALTER LOGFILE GROUP lg1
-> ADD UNDOFILE 'undofile02.dat'
-> INITIAL_SIZE = 4M
-> ENGINE = NDB;
Query OK, 0 rows affected (1.02 sec)

mysql> SELECT DISTINCT
-> FILE_NAME AS File,
-> FREE_EXTENTS AS Free,
-> TOTAL_EXTENTS AS Total,
-> EXTENT_SIZE AS Size,
-> INITIAL_SIZE AS Initial
-> FROM INFORMATION_SCHEMA.FILES;
```

File	Free	Total	Size	Initial
undofile.dat	NULL	4194304	4	16777216
undofile02.dat	NULL	1048576	4	4194304
NULL	5223944	NULL	4	NULL

3 rows in set (0.01 sec)

The amount of free space in bytes which is available for undo logging by Disk Data tables using this log file group can be approximated by multiplying the number of free extents by the initial size:

```
mysql> SELECT
-> FREE_EXTENTS AS 'Free Extents',
-> FREE_EXTENTS * EXTENT_SIZE AS 'Free Bytes'
-> FROM INFORMATION_SCHEMA.FILES
-> WHERE LOGFILE_GROUP_NAME = 'lg1'
-> AND FILE_NAME IS NULL;
```

Free Extents	Free Bytes
5223944	20895776

1 row in set (0.02 sec)

If you create a MySQL Cluster Disk Data table and then insert some rows into it, you can see approximately how much space remains for undo logging afterwards, for example:

```
mysql> CREATE TABLESPACE ts1
-> ADD DATAFILE 'data1.dat'
-> USE LOGFILE GROUP lg1
```

```

-> INITIAL_SIZE 512M
-> ENGINE = NDB;
Query OK, 0 rows affected (8.71 sec)

mysql> CREATE TABLE dd (
-> c1 INT NOT NULL PRIMARY KEY,
-> c2 INT,
-> c3 DATE
-> )
-> TABLESPACE ts1 STORAGE DISK
-> ENGINE = NDB;
Query OK, 0 rows affected (2.11 sec)

mysql> INSERT INTO dd VALUES
-> (NULL, 1234567890, '2007-02-02'),
-> (NULL, 1126789005, '2007-02-03'),
-> (NULL, 1357924680, '2007-02-04'),
-> (NULL, 1642097531, '2007-02-05');
Query OK, 4 rows affected (0.01 sec)

mysql> SELECT
-> FREE_EXTENTS AS 'Free Extents',
-> FREE_EXTENTS * EXTENT_SIZE AS 'Free Bytes'
-> FROM INFORMATION_SCHEMA.FILES
-> WHERE LOGFILE_GROUP_NAME = 'lg1'
-> AND FILE_NAME IS NULL;
+-----+-----+
| Free Extents | Free Bytes |
+-----+-----+
|          5207565 |      20830260 |
+-----+-----+
1 row in set (0.01 sec)

```

- There are no `SHOW` commands associated with the `FILES` table.
- For additional information, and examples of creating and dropping MySQL Cluster Disk Data objects, see [MySQL Cluster Disk Data Tables](#).

19.22. The INFORMATION_SCHEMA PROCESSLIST Table

The `PROCESSLIST` table provides information about which threads are running.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
ID	Id	MySQL extension
USER	User	MySQL extension
HOST	Host	MySQL extension
DB	db	MySQL extension
COMMAND	Command	MySQL extension
TIME	Time	MySQL extension
STATE	State	MySQL extension
INFO	Info	MySQL extension

For an extensive description of the table columns, see [Section 12.5.5.31, “SHOW PROCESSLIST Syntax”](#).

Notes:

- The `PROCESSLIST` table is a non-standard table.
- Like the output from the corresponding `SHOW` statement, the `PROCESSLIST` table will only show information about your own threads, unless you have the `PROCESS` privilege, in which case you will see information about other threads, too. As an anonymous user, you cannot see any rows at all.
- If an SQL statement refers to `INFORMATION_SCHEMA.PROCESSLIST`, then MySQL will populate the entire table once, when statement execution begins, so there is read consistency during the statement. There is no read consistency for a multi-statement transaction, though.

The following statements are equivalent:

```

SELECT * FROM INFORMATION_SCHEMA.PROCESSLIST
SHOW FULL PROCESSLIST

```

19.23. The INFORMATION_SCHEMA REFERENTIAL_CONSTRAINTS Table

The `REFERENTIAL_CONSTRAINTS` table provides information about foreign keys.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
CONSTRAINT_CATALOG		NULL
CONSTRAINT_SCHEMA		
CONSTRAINT_NAME		
UNIQUE_CONSTRAINT_CATALOG		NULL
UNIQUE_CONSTRAINT_SCHEMA		
UNIQUE_CONSTRAINT_NAME		
MATCH_OPTION		
UPDATE_RULE		
DELETE_RULE		
TABLE_NAME		
REFERENCED_TABLE_NAME		

Notes:

- `TABLE_NAME` has the same value as `TABLE_NAME` in `INFORMATION_SCHEMA.TABLE_CONSTRAINTS`.
- `CONSTRAINT_SCHEMA` and `CONSTRAINT_NAME` identify the foreign key.
- `UNIQUE_CONSTRAINT_SCHEMA`, `UNIQUE_CONSTRAINT_NAME`, and `REFERENCED_TABLE_NAME` identify the referenced key.
- The only valid value at this time for `MATCH_OPTION` is `NONE`.
- The possible values for `UPDATE_RULE` or `DELETE_RULE` are `CASCADE`, `SET NULL`, `SET DEFAULT`, `RESTRICT`, `NO ACTION`.

19.24. The INFORMATION_SCHEMA GLOBAL_STATUS and SESSION_STATUS Tables

The `GLOBAL_STATUS` and `SESSION_STATUS` tables provide information about server status variables. Their contents correspond to the information produced by the `SHOW GLOBAL STATUS` and `SHOW SESSION STATUS` statements (see [Section 12.5.5.36, “SHOW STATUS Syntax”](#)).

INFORMATION_SCHEMA Name	SHOW Name	Remarks
VARIABLE_NAME	Variable_name	
VARIABLE_VALUE	Value	

Notes:

- The `VARIABLE_VALUE` column for each of these tables is defined as `VARCHAR(20480)`.

19.25. The INFORMATION_SCHEMA GLOBAL_VARIABLES and SESSION_VARIABLES Tables

The `GLOBAL_VARIABLES` and `SESSION_VARIABLES` tables provide information about server status variables. Their contents correspond to the information produced by the `SHOW GLOBAL VARIABLES` and `SHOW SESSION VARIABLES` statements

(see [Section 12.5.5.40](#), “`SHOW VARIABLES Syntax`”).

INFORMATION_SCHEMA Name	SHOW Name	Remarks
VARIABLE_NAME	Variable_name	
VARIABLE_VALUE	Value	

Notes:

- The `VARIABLE_VALUE` column for each of these tables is defined as `VARCHAR(20480)`.

19.26. The INFORMATION_SCHEMA PROFILING Table

The `PROFILING` table provides statement profiling information. Its contents correspond to the information produced by the `SHOW PROFILES` and `SHOW PROFILE` statements (see [Section 12.5.5.33](#), “`SHOW PROFILES Syntax`”). The table is empty unless the `profiling` session variable is set to 1.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
QUERY_ID	Query_ID	
SEQ		
STATE	Status	
DURATION	Duration	
CPU_USER	CPU_user	
CPU_SYSTEM	CPU_system	
CONTEXT_VOLUNTARY	Context_voluntary	
CONTEXT_INVOLUNTARY	Context_involuntary	
BLOCK_OPS_IN	Block_ops_in	
BLOCK_OPS_OUT	Block_ops_out	
MESSAGES_SENT	Messages_sent	
MESSAGES_RECEIVED	Messages_received	
PAGE_FAULTS_MAJOR	Page_faults_major	
PAGE_FAULTS_MINOR	Page_faults_minor	
SWAPS	Swaps	
SOURCE_FUNCTION	Source_function	
SOURCE_FILE	Source_file	
SOURCE_LINE	Source_line	

Notes:

- `QUERY_ID` is a numeric statement identifier.
- `SEQ` is a sequence number indicating the display order for rows with the same `QUERY_ID` value.
- `STATE` is the profiling state to which the row measurements apply.
- `DURATION` indicates how long statement execution remained in the given state, in seconds.
- `CPU_USER` and `CPU_SYSTEM` indicate user and system CPU use, in seconds.
- `CONTEXT_VOLUNTARY` and `CONTEXT_INVOLUNTARY` indicate how many voluntary and involuntary context switches occurred.
- `BLOCK_OPS_IN` and `BLOCK_OPS_OUT` indicate the number of block input and output operations.
- `MESSAGES_SENT` and `MESSAGES_RECEIVED` indicate the number of communication messages sent and received.
- `PAGE_FAULTS_MAJOR` and `PAGE_FAULTS_MINOR` indicate the number of major and minor page faults.

- `SWAPS` indicates how many swaps occurred.
- `SOURCE_FUNCTION`, `SOURCE_FILE`, and `SOURCE_LINE` provide information indicating where in the source code the profiled state executes.

19.27. Other `INFORMATION_SCHEMA` Tables

We intend to implement additional `INFORMATION_SCHEMA` tables. In particular, we acknowledge the need for the `PARAMETERS` table. (`PARAMETERS` is implemented in MySQL 6.0.)

19.28. Extensions to `SHOW` Statements

Some extensions to `SHOW` statements accompany the implementation of `INFORMATION_SCHEMA`:

- `SHOW` can be used to get information about the structure of `INFORMATION_SCHEMA` itself.
- Several `SHOW` statements accept a `WHERE` clause that provides more flexibility in specifying which rows to display.

`INFORMATION_SCHEMA` is an information database, so its name is included in the output from `SHOW DATABASES`. Similarly, `SHOW TABLES` can be used with `INFORMATION_SCHEMA` to obtain a list of its tables:

```
mysql> SHOW TABLES FROM INFORMATION_SCHEMA;
+-----+
| Tables_in_INFORMATION_SCHEMA |
+-----+
| CHARACTER_SETS                |
| COLLATIONS                    |
| COLLATION_CHARACTER_SET_APPLICABILITY |
| COLUMNS                      |
| COLUMN_PRIVILEGES             |
| ENGINES                       |
| EVENTS                        |
| FILES                         |
| GLOBAL_STATUS                 |
| GLOBAL_VARIABLES              |
| KEY_COLUMN_USAGE              |
| PARTITIONS                    |
| PLUGINS                       |
| PROCESSLIST                   |
| REFERENTIAL_CONSTRAINTS       |
| ROUTINES                      |
| SCHEMATA                      |
| SCHEMA_PRIVILEGES             |
| SESSION_STATUS                |
| SESSION_VARIABLES             |
| STATISTICS                    |
| TABLES                       |
| TABLE_CONSTRAINTS            |
| TABLE_PRIVILEGES             |
| TRIGGERS                      |
| USER_PRIVILEGES               |
| VIEWS                         |
+-----+
27 rows in set (0.00 sec)
```

`SHOW COLUMNS` and `DESCRIBE` can display information about the columns in individual `INFORMATION_SCHEMA` tables.

`SHOW` statements that accept a `LIKE` clause to limit the rows displayed also allow a `WHERE` clause that enables specification of more general conditions that selected rows must satisfy:

```
SHOW CHARACTER SET
SHOW COLLATION
SHOW COLUMNS
SHOW DATABASES
SHOW FUNCTION STATUS
SHOW INDEX
SHOW OPEN TABLES
SHOW PROCEDURE STATUS
SHOW STATUS
SHOW TABLE STATUS
SHOW TABLES
SHOW TRIGGERS
SHOW VARIABLES
```

The `WHERE` clause, if present, is evaluated against the column names displayed by the `SHOW` statement. For example, the `SHOW CHARACTER SET` statement produces these output columns:

```
mysql> SHOW CHARACTER SET;
```

Charset	Description	Default collation	Maxlen
big5	Big5 Traditional Chinese	big5_chinese_ci	2
dec8	DEC West European	dec8_swedish_ci	1
cp850	DOS West European	cp850_general_ci	1
hp8	HP West European	hp8_english_ci	1
koi8r	KOI8-R Relcom Russian	koi8r_general_ci	1
latin1	cp1252 West European	latin1_swedish_ci	1
latin2	ISO 8859-2 Central European	latin2_general_ci	1
...			

To use a `WHERE` clause with `SHOW CHARACTER SET`, you would refer to those column names. As an example, the following statement displays information about character sets for which the default collation contains the string `'japanese'`:

```
mysql> SHOW CHARACTER SET WHERE `Default collation` LIKE '%japanese%';
```

Charset	Description	Default collation	Maxlen
ujis	EUC-JP Japanese	ujis_japanese_ci	3
sjis	Shift-JIS Japanese	sjis_japanese_ci	2
cp932	SJIS for Windows Japanese	cp932_japanese_ci	2
eucjpms	UJIS for Windows Japanese	eucjpms_japanese_ci	3

This statement displays the multi-byte character sets:

```
mysql> SHOW CHARACTER SET WHERE Maxlen > 1;
```

Charset	Description	Default collation	Maxlen
big5	Big5 Traditional Chinese	big5_chinese_ci	2
ujis	EUC-JP Japanese	ujis_japanese_ci	3
sjis	Shift-JIS Japanese	sjis_japanese_ci	2
euckr	EUC-KR Korean	euckr_korean_ci	2
gb2312	GB2312 Simplified Chinese	gb2312_chinese_ci	2
gbk	GBK Simplified Chinese	gbk_chinese_ci	2
utf8	UTF-8 Unicode	utf8_general_ci	3
ucs2	UCS-2 Unicode	ucs2_general_ci	2
cp932	SJIS for Windows Japanese	cp932_japanese_ci	2
eucjpms	UJIS for Windows Japanese	eucjpms_japanese_ci	3

Chapter 20. Connectors and APIs

MySQL Connectors provide connectivity to the MySQL server for client programs. APIs provide low-level access to the MySQL protocol and MySQL resources. Both Connectors and the APIs enable you to connect and execute MySQL statements from another language or environment, including Java (JDBC), ODBC, Perl, Python, PHP, Ruby, and native C and embedded MySQL instances.

Note

Connector version numbers do not correlate with MySQL Server version numbers. See also [Table 20.2, “MySQL Connector versions and MySQL Server versions”](#).

A number of connectors are developed by MySQL:

- Connector/ODBC provides driver support for connecting to a MySQL server using the Open Database Connectivity (ODBC) API. Support is available for ODBC connectivity from Windows, Unix and Mac OS X platforms.
- Connector/NET enables developers to create .NET applications that use data stored in a MySQL database. Connector/NET implements a fully-functional ADO.NET interface and provides support for use with ADO.NET aware tools. Applications that want to use Connector/NET can be written in any of the supported .NET languages.

The MySQL Visual Studio Plugin works with Connector/NET and Visual Studio 2005. The plugin is a MySQL DDEX Provider, which means that you can use the schema and data manipulation tools within Visual Studio to create and edit objects within a MySQL database.

- Connector/J provides driver support for connecting to MySQL from a Java application using the standard Java Database Connectivity (JDBC) API.
- Connector/MXJ is a tool that enables easy deployment and management of MySQL server and database through your Java application.
- Connector/C++ is a tool that enables easy deployment and management of MySQL server and database through your C++ application.
- Connector/C is a stand-alone replacement for the MySQL Client Library ([libmysql](#)).
- Connector/OpenOffice.org is a tool that enables OpenOffice.org applications to connect to MySQL server.

There are two direct access methods for using MySQL natively within a C application:

- The C API provides low-level access to the MySQL protocol through the [libmysql](#) client library; this is the primary method used to connect to an instance of the MySQL server, and is used both by MySQL command line clients and many of the APIs also detailed in this section. MySQL Connector/C can now also be used for this purpose.
- [libmysqld](#) is an embedded MySQL server library that enables you to embed an instance of the MySQL server into your C applications.

If you need to access MySQL from a C application, or build an interface to MySQL for a language not supported by the Connectors or APIs in this chapter, the C API is where you would start. A number of programmers utilities are available to help with the process, and also covered in this section.

The remaining APIs provide an interface to MySQL from specific application languages. These solutions are not developed or supported by MySQL. Basic information on their usage and abilities is provided here for reference purposes only.

All the language APIs are developed using one of two methods, using [libmysql](#) or by building a *native driver*. The two solutions offer different benefits:

- Using [libmysql](#) offers complete compatibility with MySQL as it uses the same libraries as the MySQL client applications. However, the feature set is limited to the implementation and interfaces exposed through [libmysql](#) and the performance may be lower as data is copied between the native language, and the MySQL API components. MySQL Connector/C is a possible alternative to using [libmysql](#).
- *Native drivers* are an implementation of the MySQL network protocol entirely within the host language or environment. Native drivers are fast, as there is less copying of data between components, and they can offer advanced functionality not available through the standard MySQL API. Native drivers are also easier to build and deploy, as you do not need a copy of the MySQL client libraries to build the native driver components.

A list of many of the libraries and interfaces available for MySQL are shown in the table. See Table 20.1, “MySQL APIs and Interfaces”.

Table 20.1. MySQL APIs and Interfaces

Environment	API	Type	Notes
Ada	MySQL Bindings for GNU Ada	<code>libmysql</code>	See MySQL Bindings for GNU Ada
C	Connector/C	Replacement for <code>libmysql</code>	See Section 20.7, “MySQL Connector/C” .
C++	Connector/C++	<code>libmysql</code>	See Section 20.6, “MySQL Connector/C++” .
	MySQL++	<code>libmysql</code>	See Section 20.13, “MySQL C++ API” .
	MySQL wrapped	<code>libmysql</code>	See MySQL wrapped .
Cocoa	MySQL-Cocoa	<code>libmysql</code>	Compatible with the Objective-C Cocoa environment. See http://mysql-cocoa.sourceforge.net/
D	MySQL for D	<code>libmysql</code>	See MySQL for D .
Eiffel	Eiffel MySQL	<code>libmysql</code>	See Section 20.17, “MySQL Eiffel Wrapper” .
Erlang	<code>erlang-mysql-driver</code>	<code>libmysql</code>	See erlang-mysql-driver .
Haskell	Haskell MySQL Bindings	Native Driver	See Brian O’Sullivan’s pure Haskell MySQL bindings .
	<code>hsqldb-mysql</code>	<code>libmysql</code>	See MySQL driver for Haskell .
Java/JDBC	Connector/J	Native Driver	See Section 20.4, “MySQL Connector/J” .
Kaya	MyDB	<code>libmysql</code>	See MyDB .
Lua	LuaSQL	<code>libmysql</code>	See LuaSQL .
.NET/Mono	Connector/NET	Native Driver	See Section 20.2, “MySQL Connector/NET” .

Octave	Database bindings for GNU Octave	<code>libmysql</code>	See Database bindings for GNU Octave .
ODBC	Connector/ODBC	<code>libmysql</code>	See Section 20.1, “MySQL Connector/ODBC” .
OpenOffice	MySQL Connector/OpenOffice.org	<code>libmysql</code>	Direct connectivity, without using JDBC/ODBC. See Section 20.8, “MySQL Connector/OpenOffice.org” .
Perl	<code>DBI/DBD::mysql</code>	<code>libmysql</code>	See Section 20.12, “MySQL Perl API” .
	<code>Net::MySQL</code>	Native Driver	See Net::MySQL at CPAN
PHP	<code>mysql</code> , <code>ext/mysql</code> interface (deprecated)	<code>libmysql</code>	See Section 20.11.1, “MySQL” .
	<code>mysqli</code> , <code>ext/mysqli</code> interface	<code>libmysql</code>	See Section 20.11.2, “MySQL Improved Extension (mysqli)” .
	<code>PDO_MYSQL</code>	<code>libmysql</code>	See Section 20.11.3, “MySQL Functions (PDO_MYSQL)” .
	<code>PDO mysqlnd</code>	Native Driver	See PHP PDO mysqlnd .
Python	MySQLdb	<code>libmysql</code>	See Section 20.14, “MySQL Python API” .
Ruby	MySQL/Ruby	<code>libmysql</code>	Uses <code>libmysql</code> . See Section 20.15.1, “The MySQL/Ruby API” .
	Ruby/MySQL	Native Driver	See Section 20.15.2, “The Ruby/MySQL API” .
Scheme	<code>Myscsh</code>	<code>libmysql</code>	See Myscsh .
SPL	<code>sql_mysql</code>	<code>libmysql</code>	See sql_mysql for SPL.
Tcl	MySQLtcl	<code>libmysql</code>	See Section 20.16, “MySQL Tcl API” .

Table 20.2. MySQL Connector versions and MySQL Server versions

Connector	Connector version	MySQL Server version
Connector/C++	1.0.5 (Beta)	5.1, 5.4, 6.0

Connector	Connector version	MySQL Server version
Connector/OpenOffice.org	1.0 (Alpha)	5.0, 5.1, 5.4, 6.0
Connector/J	5.1	4.1, 5.0, 5.1, 5.4, 6.0
Connector/NET	1.0	4.0, 5.0
Connector/NET	5.2	4.0, 4.1, 5.0, 5.1, 5.4, 6.0
Connector/NET	5.3	4.1, 5.0, 5.1, 5.4, 6.0
Connector/ODBC	3.51 (Unicode not supported)	4.1, 5.0, 5.1, 5.4, 6.0
Connector/ODBC	5.1	4.1, 5.0, 5.1, 5.4, 6.0

20.1. MySQL Connector/ODBC

The MySQL Connector/ODBC is the name for the family of MySQL ODBC drivers (previously called MyODBC drivers) that provide access to a MySQL database using the industry standard Open Database Connectivity (ODBC) API. This reference covers Connector/ODBC 3.51 and Connector/ODBC 5.1. Both releases provide an ODBC compliant interface to MySQL Server.

MySQL Connector/ODBC provides both driver-manager based and native interfaces to the MySQL database, which full support for MySQL functionality, including stored procedures, transactions and, with Connector/ODBC 5.1, full Unicode compliance.

For more information on the ODBC API standard and how to use it, refer to <http://support.microsoft.com/kb/110093>.

The application development part of this reference assumes a good working knowledge of C, general DBMS knowledge, and finally, but not least, familiarity with MySQL. For more information about MySQL functionality and its syntax, refer to <http://dev.mysql.com/doc/>.

Typically, you need to install Connector/ODBC only on Windows machines. For Unix and Mac OS X you can use the native MySQL network or named pipe to communicate with your MySQL database. You may need Connector/ODBC for Unix or Mac OS X if you have an application that requires an ODBC interface to communicate with the database. Applications that require ODBC to communicate with MySQL include ColdFusion, Microsoft Office, and Filemaker Pro.

Key topics:

- For help installing Connector/ODBC see [Section 20.1.3, “Connector/ODBC Installation”](#).
- For information on the configuration options, see [Section 20.1.4.2, “Connector/ODBC Connection Parameters”](#).
- For more information on connecting to a MySQL database from a Windows host using Connector/ODBC see [Section 20.1.5.2, “Step-by-step Guide to Connecting to a MySQL Database through Connector/ODBC”](#).
- If you want to use Microsoft Access as an interface to a MySQL database using Connector/ODBC see [Section 20.1.5.4, “Using Connector/ODBC with Microsoft Access”](#).
- General tips on using Connector/ODBC, including obtaining the last auto-increment ID see [Section 20.1.7.1, “Connector/ODBC General Functionality”](#).
- For tips and common questions on using Connector/ODBC with specific application see [Section 20.1.7.2, “Connector/ODBC Application Specific Tips”](#).
- For a general list of Frequently Asked Questions see [Section 20.1.7.3, “Connector/ODBC Errors and Resolutions \(FAQ\)”](#).
- Additional support when using Connector/ODBC is available, see [Section 20.1.8, “Connector/ODBC Support”](#).

MySQL Enterprise

MySQL Enterprise subscribers will find more information about MySQL and ODBC in the Knowledge Base articles about [ODBC](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

20.1.1. Connector/ODBC Versions

There are currently two version of Connector/ODBC available:

- Connector/ODBC 5.1, currently in GA status, is a partial rewrite of the of the 3.51 code base and is designed to work with all versions of MySQL from 4.1. Connector/ODBC 5.1 will be a complete implementation of the ODBC Core interface, plus more

Level 1 and Level 2 functionality of the ODBC specification than that currently supported by Connector/ODBC 3.51. See [Section 20.1.2.1, “Connector/ODBC Roadmap”](#).

Connector/ODBC 5.1 also includes the following changes and improvements over the 3.51 release:

- Improved support on Windows 64-bit platforms.
- Full Unicode support at the driver level. This includes support for the `SQL_WCHAR` datatype, and support for Unicode login, password and DSN configurations. For more information, see [Microsoft Knowledgebase Article #716246](#).
- Support for the `SQL_NUMERIC_STRUCT` datatype, which provides easier access to the precise definition of numeric values. For more information, see [Microsoft Knowledgebase Article #714556](#)
- Native Windows setup library. This replaces the Qt library based interface for configuring DSN information within the ODBC Data Sources application.
- Support for the ODBC descriptor, which improves the handling and metadata of columns and parameter data. For more information, see [Microsoft Knowledgebase Article #716339](#).
- Connector/ODBC 3.51 is the current release of the 32-bit ODBC driver, also known as the MySQL ODBC 3.51 driver. Connector/ODBC 3.51 has support for ODBC 3.5x specification level 1 (complete core API + level 2 features) in order to continue to provide all functionality of ODBC for accessing MySQL.

The manual for versions of Connector/ODBC older than 3.51 can be located in the corresponding binary or source distribution. Please note that versions of Connector/ODBC earlier than the 3.51 revision were not fully compliant with the ODBC specification.

Note

Development on Connector/ODBC 5.0 was stopped due to development issues. Connector/ODBC 5.1 is now the current development release.

Note

From this section onward, the primary focus of this guide is the Connector/ODBC 3.51 and Connector/ODBC 5.1 drivers.

Note

Version numbers for MySQL products are formatted as X.X.X. However, Windows tools (Control Panel, properties display) may show the version numbers as XX.XX.XX. For example, the official MySQL formatted version number 5.0.9 may be displayed by Windows tools as 5.00.09. The two versions are the same; only the number display format is different.

20.1.2. Connector/ODBC Introduction

ODBC (Open Database Connectivity) provides a way for client programs to access a wide range of databases or data sources. ODBC is a standardized API that allows connections to SQL database servers. It was developed according to the specifications of the SQL Access Group and defines a set of function calls, error codes, and data types that can be used to develop database-independent applications. ODBC usually is used when database independence or simultaneous access to different data sources is required.

For more information about ODBC, refer to <http://support.microsoft.com/kb/110093>.

20.1.2.1. Connector/ODBC Roadmap

Connector/ODBC 5.1 is currently in development and will be a complete implementation of the ODBC Core interface, plus more Level 1 and Level 2 functionality of the ODBC specification than that currently supported by Connector/ODBC 3.51.

The following functionality was added or changed as part of 5.1:

- Add support for `SQL_NUMERIC_STRUCT`: [MSDN Article 714556](#).
- Replace installer library with new implementation (from v5 tree).
- Implement native Windows setup library.
- Implement `SQLCancel()` ([Bug#15601](#)): [MSDN Article 714112](#).

The following functionality will be added in a version after 5.1:

- Implement native Mac OS X setup library.
- Replace OPTIONS flags with individual DSN settings (but support OPTIONS for backwards-compatibility).
- Fix support for SQLBIGINT ([Bug#28887](#)): [MSDN Article 714121](#).
- Make diagnostics support standards-compliant: [MSDN Article 711021](#).
- Add support for SQL_ATTR_METADATA_ID: [MSDN Article 716447](#).
- Implement SQLBrowseConnect(): [MSDN Article 714565](#), [MSDN Article 712446](#).
- Implement arrays of parameters: [MSDN Article 711818](#).

20.1.2.2. General Information About ODBC and Connector/ODBC

Open Database Connectivity (ODBC) is a widely accepted application-programming interface (API) for database access. It is based on the Call-Level Interface (CLI) specifications from X/Open and ISO/IEC for database APIs and uses Structured Query Language (SQL) as its database access language.

A survey of ODBC functions supported by Connector/ODBC is given at [Section 20.1.6.1, "Connector/ODBC API Reference"](#). For general information about ODBC, see <http://support.microsoft.com/kb/110093>.

20.1.2.2.1. Connector/ODBC Architecture

The Connector/ODBC architecture is based on five components, as shown in the following diagram:

- **Application:**

The Application uses the ODBC API to access the data from the MySQL server. The ODBC API in turn uses the communicates with the Driver Manager. The Application communicates with the Driver Manager using the standard ODBC calls. The Application does not care where the data is stored, how it is stored, or even how the system is configured to access the data. It needs to know only the Data Source Name (DSN).

A number of tasks are common to all applications, no matter how they use ODBC. These tasks are:

- Selecting the MySQL server and connecting to it
- Submitting SQL statements for execution
- Retrieving results (if any)
- Processing errors
- Committing or rolling back the transaction enclosing the SQL statement
- Disconnecting from the MySQL server

Because most data access work is done with SQL, the primary tasks for applications that use ODBC are submitting SQL statements and retrieving any results generated by those statements.

- **Driver manager:**

The Driver Manager is a library that manages communication between application and driver or drivers. It performs the following tasks:

- Resolves Data Source Names (DSN). The DSN is a configuration string that identifies a given database driver, database, database host and optionally authentication information that enables an ODBC application to connect to a database using a standardized reference.

Because the database connectivity information is identified by the DSN, any ODBC compliant application can connect to the data source using the same DSN reference. This eliminates the need to separately configure each application that needs access to a given database; instead you instruct the application to use a pre-configured DSN.

- Loading and unloading of the driver required to access a specific database as defined within the DSN. For example, if you have configured a DSN that connects to a MySQL database then the driver manager will load the Connector/ODBC driver to enable the ODBC API to communicate with the MySQL host.
- Processes ODBC function calls or passes them to the driver for processing.

- **Connector/ODBC Driver:**

The Connector/ODBC driver is a library that implements the functions supported by the ODBC API. It processes ODBC function calls, submits SQL requests to MySQL server, and returns results back to the application. If necessary, the driver modifies an application's request so that the request conforms to syntax supported by MySQL.

- **DSN Configuration:**

The ODBC configuration file stores the driver and database information required to connect to the server. It is used by the Driver Manager to determine which driver to be loaded according to the definition in the DSN. The driver uses this to read connection parameters based on the DSN specified. For more information, [Section 20.1.4, “Connector/ODBC Configuration”](#).

- **MySQL Server:**

The MySQL database where the information is stored. The database is used as the source of the data (during queries) and the destination for data (during inserts and updates).

20.1.2.2.2. ODBC Driver Managers

An ODBC Driver Manager is a library that manages communication between the ODBC-aware application and any drivers. Its main functionality includes:

- Resolving Data Source Names (DSN).
- Driver loading and unloading.
- Processing ODBC function calls or passing them to the driver.

Both Windows and Mac OS X include ODBC driver managers with the operating system. Most ODBC Driver Manager implementations also include an administration application that makes the configuration of DSN and drivers easier. Examples and information on these managers, including Unix ODBC driver managers are listed below:

- Microsoft Windows ODBC Driver Manager (`odbc32.dll`), <http://support.microsoft.com/kb/110093>.
- Mac OS X includes [ODBC Administrator](#), a GUI application that provides a simpler configuration mechanism for the Unix iODBC Driver Manager. You can configure DSN and driver information either through ODBC Administrator or through the iODBC configuration files. This also means that you can test ODBC Administrator configurations using the `iodbctest` command. <http://www.apple.com>.
- [unixODBC Driver Manager for Unix](#) (`libodbc.so`). See <http://www.unixodbc.org>, for more information. The [unixODBC Driver Manager](#) includes the Connector/ODBC driver 3.51 in the installation package, starting with version [unixODBC 2.1.2](#).
- [iODBC ODBC Driver Manager for Unix](#) (`libiodbc.so`), see <http://www.iodbc.org>, for more information.

20.1.3. Connector/ODBC Installation

You can install the Connector/ODBC drivers using two different methods, a binary installation and a source installation. The binary

installation is the easiest and most straightforward method of installation. Using the source installation methods should only be necessary on platforms where a binary installation package is not available, or in situations where you want to customize or modify the installation process or Connector/ODBC drivers before installation.

Where to Get Connector/ODBC

Sun Microsystems, Inc distributes its MySQL products under the General Public License (GPL). You can get a copy of the latest version of Connector/ODBC binaries and sources from our Web site at <http://dev.mysql.com/downloads/>.

For more information about Connector/ODBC, visit <http://www.mysql.com/products/myodbc/>.

For more information about licensing, visit <http://www.mysql.com/company/legal/licensing/>.

Supported Platforms

Connector/ODBC can be used on all major platforms supported by MySQL. You can install it on:

- Windows 95, 98, Me, NT, 2000, XP, and 2003
- All Unix-like Operating Systems, including: AIX, Amiga, BSDI, DEC, FreeBSD, HP-UX 10/11, Linux, NetBSD, OpenBSD, OS/2, SGI Irix, Solaris, SunOS, SCO OpenServer, SCO UnixWare, Tru64 Unix
- Mac OS X and Mac OS X Server

Using a binary distribution offers the most straightforward method for installing Connector/ODBC. If you want more control over the driver, the installation location and or to customize elements of the driver you will need to build and install from the source.

If a binary distribution is not available for a particular platform build the driver from the original source code. You can contribute the binaries you create to MySQL by sending a mail message to [<myodbc@lists.mysql.com>](mailto:myodbc@lists.mysql.com), so that it becomes available for other users.

Note

On all non-Windows platforms except Mac OS X, the driver is built against `unixODBC` and is expecting a 2-byte `SQLWCHAR`, not 4 bytes as `iODBC` is using. For this reason, the binaries are **only** compatible with `unixODBC` and you will need to recompile the driver against `iODBC` if you wish to use them together. For further information see [Section 20.1.2.2.2, “ODBC Driver Managers”](#).

For further instructions:

Platform	Binary	Source
Windows	Installation Instructions	Build Instructions
Unix/Linux	Installation Instructions	Build Instructions
Mac OS X	Installation Instructions	

20.1.3.1. Installing Connector/ODBC from a Binary Distribution on Windows

Before installing the Connector/ODBC drivers on Windows you should ensure that your Microsoft Data Access Components (MDAC) are up to date. You can obtain the latest version from the [Microsoft Data Access and Storage Web site](#).

There are three available distribution types to use when installing for Windows. The contents in each case are identical, it is only the installation method which is different.

- Zipped installer consists of a Zipped package containing a standalone installation application. To install from this package, you must unzip the installer, and then run the installation application. See [Section 20.1.3.1.1, “Installing the Windows Connector/ODBC Driver using an installer”](#) to complete the installation.
- MSI installer, an installation file that can be used with the installer included in Windows 2000, Windows XP and Windows Server 2003. See [Section 20.1.3.1.1, “Installing the Windows Connector/ODBC Driver using an installer”](#) to complete the installation.
- Zipped DLL package, containing the DLL files that need must be manually installed. See [Section 20.1.3.1.2, “Installing the Windows Connector/ODBC Driver using the Zipped DLL package”](#) to complete the installation.

Note

An OLEDB/ODBC driver for Windows 64-bit is available from [Microsoft Downloads](#).

20.1.3.1.1. Installing the Windows Connector/ODBC Driver using an installer

The installer packages offer a very simple method for installing the Connector/ODBC drivers. If you have downloaded the zipped installer then you must extract the installer application. The basic installation process is identical for both installers.

You should follow these steps to complete the installation:

1. Double click on the standalone installer that you extracted, or the MSI file you downloaded.
2. The MySQL Connector/ODBC 3.51 - Setup Wizard will start. Click the NEXT button to begin the installation process.

3. You will need to choose the installation type. The Typical installation provides the standard files you will need to connect to a MySQL database using ODBC. The Complete option installs all the available files, including debug and utility components. It is recommended you choose one of these two options to complete the installation. If choose one of these methods, click NEXT and then proceed to step 5.

You may also choose a Custom installation, which enables you to select the individual components that you want to install. You have chosen this method, click NEXT and then proceed to step 4.

4. If you have chosen a custom installation, use the pop-ups to select which components to install and then click NEXT to install the necessary files.

5. Once the files have copied to your machine, the installation is complete. Click FINISH to exit the installer.

Now the installation is complete, you can continue to configure your ODBC connections using [Section 20.1.4, “Connector/ODBC Configuration”](#).

20.1.3.1.2. Installing the Windows Connector/ODBC Driver using the Zipped DLL package

If you have downloaded the Zipped DLL package then you must install the individual files required for Connector/ODBC operation manually. Once you have unzipped the installation files, you can either perform this operation by hand, executing each statement individually, or you can use the included Batch file to perform an installation to the default locations.

To install using the Batch file:

1. Unzip the Connector/ODBC Zipped DLL package.
2. Open a Command Prompt.
3. Change to the directory created when you unzipped the Connector/ODBC Zipped DLL package.
4. Run `Install.bat`:

```
c:\> Install.bat
```

This will copy the necessary files into the default location, and then register the Connector/ODBC driver with the Windows ODBC manager.

If you want to copy the files to an alternative location - for example, to run or test different versions of the Connector/ODBC driver on the same machine, then you must copy the files by hand. It is however not recommended to install these files in a non-standard location. To copy the files by hand to the default installation location use the following steps:

1. Unzip the Connector/ODBC Zipped DLL package.

2. Open a Command Prompt.
3. Change to the directory created when you unzipped the Connector/ODBC Zipped DLL package.
4. Copy the library files to a suitable directory. The default is to copy them into the default Windows system directory `\Windows\System32`:

```
C:\> copy lib\myodbc3S.dll \Windows\System32
C:\> copy lib\myodbc3S.lib \Windows\System32
C:\> copy lib\myodbc3.dll \Windows\System32
C:\> copy lib\myodbc3.lib \Windows\System32
```

5. Copy the Connector/ODBC tools. These must be placed into a directory that is in the system `PATH`. The default is to install these into the Windows system directory `\Windows\System32`:

```
C:\> copy bin\myodbc3i.exe \Windows\System32
C:\> copy bin\myodbc3m.exe \Windows\System32
C:\> copy bin\myodbc3c.exe \Windows\System32
```

6. Optionally copy the help files. For these files to be accessible through the help system, they must be installed in the Windows system directory:

```
C:\> copy doc\*.hlp \Windows\System32
```

7. Finally, you must register the Connector/ODBC driver with the ODBC manager:

```
C:\> myodbc3i -a -d -t"MySQL ODBC 3.51 Driver;\
DRIVER=myodbc3.dll;SETUP=myodbc3S.dll"
```

You must change the references to the DLL files and command location in the above statement if you have not installed these files into the default location.

20.1.3.2. Installing Connector/ODBC from a Binary Distribution on Unix

There are two methods available for installing Connector/ODBC on Unix from a binary distribution. For most Unix environments you will need to use the tarball distribution. For Linux systems, there is also an RPM distribution available.

Note

To install Connector/ODBC 5.1 on Unix you require unixODBC 2.2.12 or later to be installed.

20.1.3.2.1. Installing Connector/ODBC from a Binary Tarball Distribution

To install the driver from a tarball distribution (`.tar.gz` file), download the latest version of the driver for your operating system and follow these steps that demonstrate the process using the Linux version of the tarball:

```
shell> su root
shell> gunzip mysql-connector-odbc-3.51.11-i686-pc-linux.tar.gz
shell> tar xvf mysql-connector-odbc-3.51.11-i686-pc-linux.tar
shell> cd mysql-connector-odbc-3.51.11-i686-pc-linux
```

Read the installation instructions in the `INSTALL` file and execute these commands.

Then proceed on to [Section 20.1.4.5, “Configuring a Connector/ODBC DSN on Unix”](#), to configure the DSN for Connector/ODBC. For more information, refer to the `INSTALL` file that comes with your distribution.

20.1.3.2.2. Installing Connector/ODBC from an RPM Distribution

To install or upgrade Connector/ODBC from an RPM distribution on Linux, simply download the RPM distribution of the latest version of Connector/ODBC and follow the instructions below. Use `su root` to become `root`, then install the RPM file.

If you are installing for the first time:

```
shell> su root
shell> rpm -ivh mysql-connector-odbc-3.51.12.i386.rpm
```

If the driver exists, upgrade it like this:

```
shell> su root
shell> rpm -Uvh mysql-connector-odbc-3.51.12.i386.rpm
```

If there is any dependency error for MySQL client library, `libmysqlclient`, simply ignore it by supplying the `--nodeps` option, and then make sure the MySQL client shared library is in the path or set through `LD_LIBRARY_PATH`.

This installs the driver libraries and related documents to `/usr/local/lib` and `/usr/share/doc/MyODBC`, respectively. Proceed onto [Section 20.1.4.5, “Configuring a Connector/ODBC DSN on Unix”](#).

To **uninstall** the driver, become `root` and execute an `rpm` command:

```
shell> su root
shell> rpm -e mysql-connector-odbc
```

20.1.3.3. Installing Connector/ODBC from a Binary Distribution on Mac OS X

Mac OS X is based on the FreeBSD operating system, and you can normally use the MySQL network port for connecting to MySQL servers on other hosts. Installing the Connector/ODBC driver enables you to connect to MySQL databases on any platform through the ODBC interface. You should only need to install the Connector/ODBC driver when your application requires an ODBC interface. Applications that require or can use ODBC (and therefore the Connector/ODBC driver) include ColdFusion, Filemaker Pro, 4th Dimension and many other applications.

Mac OS X includes its own ODBC manager, based on the `iODBC` manager. Mac OS X includes an administration tool that provides easier administration of ODBC drivers and configuration, updating the underlying `iODBC` configuration files.

The method for installing Connector/ODBC on Mac OS X depends on the version on Connector/ODBC you are using. For Connector/ODBC 3.51.14 and later, the package is provided as a compressed tar archive that you must manually install. For Connector/ODBC 3.51.13 and earlier the software was provided on a compressed disk image (`.dmg`) file and included an installer.

In either case, the driver is designed to work with the `iODBC` driver manager included with Mac OS X.

To install Connector/ODBC 3.51.14 and later:

1. Download the installation file. Note that versions are available for both PowerPC and Intel platforms.
2. Extract the archive:

```
shell> tar zxf mysql-connector-odbc-3.51.16-osx10.4-x86-32bit.tar.gz
```

3. The directory created will contain two subdirectories, `lib` and `bin`. You need to copy these to a suitable location such as `/usr/local`:

```
shell> cp bin/* /usr/local/bin
shell> cp lib/* /usr/local/lib
```

4. Finally, you must register the driver with `iODBC` using the `myodbc3i` tool you just installed:

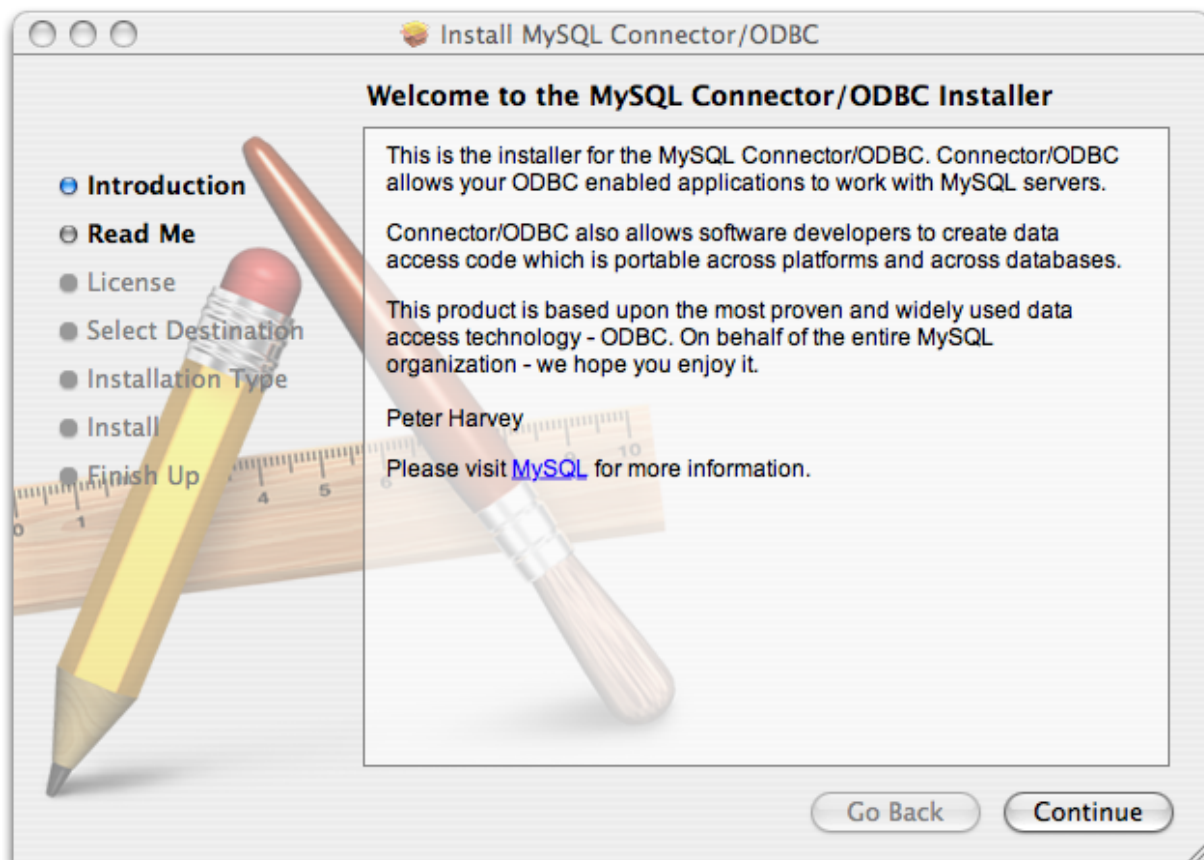

```
shell> myodbc3i -a -d -t"MySQL ODBC 3.51 Driver;Driver=/usr/local/lib/libmyodbc3.so;Setup=/usr/local/lib/libmyodbc3i" /usr/local/lib/libmyodbc3i
```

You can verify the installed drivers either by using the ODBC Administrator application or the `myodbc3i` utility:

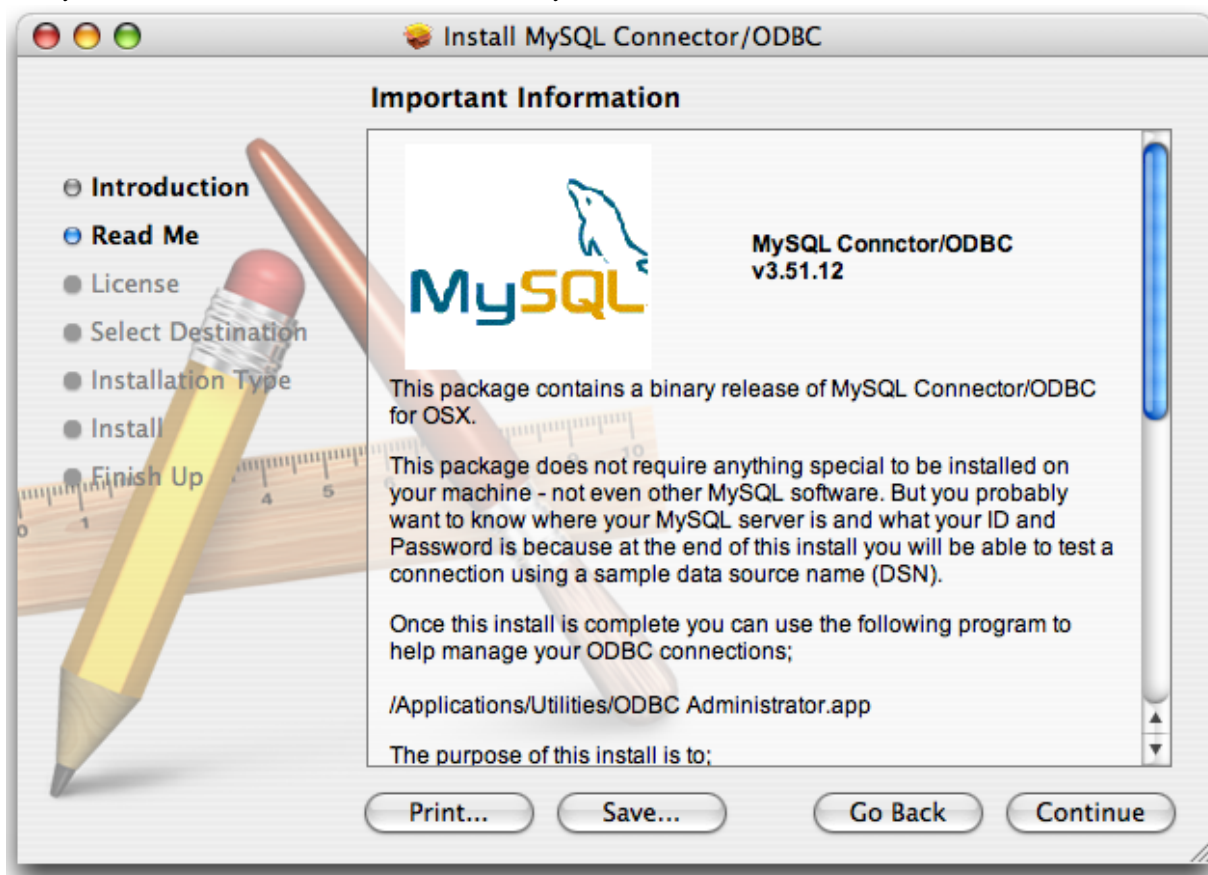

```
shell> myodbc3i -q -d
```

To install Connector/ODBC 3.51.13 and earlier, follow these steps:

1. Download the file to your computer and double-click on the downloaded image file.
2. Within the disk image you will find an installer package (with the `.pkg` extension). Double click on this file to start the Mac OS X installer.
3. You will be presented with the installer welcome message. Click the `CONTINUE` button to begin the installation process.

4. Please take the time to read the Important Information as it contains guidance on how to complete the installation process. Once you have read the notice and collected the necessary information, click CONTINUE.

- Connector/ODBC drivers are made available under the GNU General Public License. Please read the license if you are not familiar with it before continuing installation. Click CONTINUE to approve the license (you will be asked to confirm that decision) and continue the installation.

- Choose a location to install the Connector/ODBC drivers and the ODBC Administrator application. You must install the files onto a drive with an operating system and you may be limited in the choices available. Select the drive you want to use, and then click CONTINUE.

7. The installer will automatically select the files that need to be installed on your machine. Click **INSTALL** to continue. The installer will copy the necessary files to your machine. A progress bar will be shown indicating the installation progress.

8. When installation has been completed you will get a window like the one shown below. Click CLOSE to close and quit the installer.

20.1.3.4. Installing Connector/ODBC from a Source Distribution on Windows

You should only need to install Connector/ODBC from source on Windows if you want to change or modify the source or installation. If you are unsure whether to install from source, please use the binary installation detailed in [Section 20.1.3.1, “Installing Connector/ODBC from a Binary Distribution on Windows”](#).

Installing Connector/ODBC from source on Windows requires a number of different tools and packages:

- MDAC, Microsoft Data Access SDK from <http://support.microsoft.com/kb/110093>.
- Suitable C compiler, such as Microsoft Visual C++ or the C compiler included with Microsoft Visual Studio.
- Compatible `make` tool. Microsoft's `nmake` is used in the examples in this section.
- MySQL client libraries and include files from MySQL 4.0.0 or higher. (Preferably MySQL 4.0.16 or higher). This is required because Connector/ODBC uses new calls and structures that exist only starting from this version of the library. To get the client libraries and include files, visit <http://dev.mysql.com/downloads/>.

20.1.3.4.1. Building Connector/ODBC 3.51

Connector/ODBC source distributions include `Makefiles` that require the `nmake` or other `make` utility. In the distribution, you can find `Makefile` for building the release version and `Makefile_debug` for building debugging versions of the driver libraries and DLLs.

To build the driver, use this procedure:

1. Download and extract the sources to a folder, then change directory into that folder. The following command assumes the folder is named `myodbc3-src`:

```
C:\> cd myodbc3-src
```

2. Edit `Makefile` to specify the correct path for the MySQL client libraries and header files. Then use the following commands to build and install the release version:

```
C:\> nmake -f Makefile
C:\> nmake -f Makefile install
```

`nmake -f Makefile` builds the release version of the driver and places the binaries in subdirectory called `Release`.

`nmake -f Makefile install` installs (copies) the driver DLLs and libraries (`myodbc3.dll`, `myodbc3.lib`) to your system directory.

3. To build the debug version, use `Makefile_Debug` rather than `Makefile`, as shown below:

```
C:\> nmake -f Makefile_debug
C:\> nmake -f Makefile_debug install
```

4. You can clean and rebuild the driver by using:

```
C:\> nmake -f Makefile clean
C:\> nmake -f Makefile install
```

Note

- Make sure to specify the correct MySQL client libraries and header files path in the Makefiles (set the `MYSQL_LIB_PATH` and `MYSQL_INCLUDE_PATH` variables). The default header file path is assumed to be `C:\mysql\include`. The default library path is assumed to be `C:\mysql\lib\opt` for release DLLs and `C:\mysql\lib\debug` for debug versions.
- For the complete usage of `nmake`, visit http://msdn.microsoft.com/library/default.asp?url=/library/en-us/dv_vcce4/html/evgrfRunningNMAKE.asp.
- If you are using the Subversion tree for compiling, all Windows-specific `Makefiles` are named as `Win_Makefile*`.

20.1.3.4.2. Testing

After the driver libraries are copied/installed to the system directory, you can test whether the libraries are properly built by using the samples provided in the `samples` subdirectory:

```
C:\> cd samples
C:\> nmake -f Makefile all
```

20.1.3.5. Installing Connector/ODBC from a Source Distribution on Unix

You need the following tools to build MySQL from source on Unix:

- A working ANSI C++ compiler. `gcc` 2.95.2 or later, SGI C++, and SunPro C++ are some of the compilers that are known to work.
- A good `make` program. GNU `make` is always recommended and is sometimes required.
- MySQL client libraries and include files from MySQL 4.0.0 or higher. (Preferably MySQL 4.0.16 or higher). This is required because Connector/ODBC uses new calls and structures that exist only starting from this version of the library. To get the client libraries and include files, visit <http://dev.mysql.com/downloads/>.

If you have built your own MySQL server and/or client libraries from source then you must have used the `-enable-thread-safe-client` option to `configure` when the libraries were built.

You should also ensure that the `libmysqlclient` library were built and installed as a shared library.

- A compatible ODBC manager must be installed. Connector/ODBC is known to work with the `iODBC` and `unixODBC` managers. See [Section 20.1.2.2.2, “ODBC Driver Managers”](#), for more information.
- If you are using a character set that isn't compiled into the MySQL client library then you need to install the MySQL character

definitions from the `charsets` directory into `SHAREDIR` (by default, `/usr/local/mysql/share/mysql/charsets`). These should be in place if you have installed the MySQL server on the same machine. See [Section 9.1, “Character Set Support”](#), for more information on character set support.

Once you have all the required files, unpack the source files to a separate directory, you then have to run `configure` and build the library using `make`.

20.1.3.5.1. Typical `configure` Options

The `configure` script gives you a great deal of control over how you configure your Connector/ODBC build. Typically you do this using options on the `configure` command line. You can also affect `configure` using certain environment variables. For a list of options and environment variables supported by `configure`, run this command:

```
shell> ./configure --help
```

Some of the more commonly used `configure` options are described here:

1. To compile Connector/ODBC, you need to supply the MySQL client include and library files path using the `--with-mysql-path=DIR` option, where `DIR` is the directory where MySQL is installed.

MySQL compile options can be determined by running `DIR/bin/mysql_config`.

2. Supply the standard header and library files path for your ODBC Driver Manager (`iODBC` or `unixODBC`).

- If you are using `iODBC` and `iODBC` is not installed in its default location (`/usr/local`), you might have to use the `--with-iodbc=DIR` option, where `DIR` is the directory where `iODBC` is installed.

If the `iODBC` headers do not reside in `DIR/include`, you can use the `--with-iodbc-includes=INCDIR` option to specify their location.

The applies to libraries. If they are not in `DIR/lib`, you can use the `--with-iodbc-libs=LIBDIR` option.

- If you are using `unixODBC`, use the `--with-unixODBC=DIR` option (case sensitive) to make `configure` look for `unixODBC` instead of `iODBC` by default, `DIR` is the directory where `unixODBC` is installed.

If the `unixODBC` headers and libraries aren't located in `DIR/include` and `DIR/lib`, use the `--with-unixODBC-includes=INCDIR` and `--with-unixODBC-libs=LIBDIR` options.

3. You might want to specify an installation prefix other than `/usr/local`. For example, to install the Connector/ODBC drivers in `/usr/local/odbc/lib`, use the `--prefix=/usr/local/odbc` option.

The final configuration command looks something like this:

```
shell> ./configure --prefix=/usr/local \
  --with-iodbc=/usr/local \
  --with-mysql-path=/usr/local/mysql
```

20.1.3.5.2. Additional `configure` Options

There are a number of other options that you need, or want, to set when configuring the Connector/ODBC driver before it is built.

- To link the driver with MySQL thread safe client libraries `libmysqlclient_r.so` or `libmysqlclient_r.a`, you must specify the following `configure` option:

```
--enable-thread-safe
```

and can be disabled (default) using

```
--disable-thread-safe
```

This option enables the building of the driver thread-safe library `libmyodbc3_r.so` from by linking with MySQL thread-safe client library `libmysqlclient_r.so` (The extensions are OS dependent).

If the compilation with the thread-safe option fails, it may be because the correct thread-libraries on the system could not be located. You should set the value of `LIBS` to point to the correct thread library for your system.

```
LIBS="-lpthread" ./configure ..
```

- You can enable or disable the shared and static versions of Connector/ODBC using these options:

```
--enable-shared[=yes/no]
--disable-shared
--enable-static[=yes/no]
--disable-static
```

- By default, all the binary distributions are built as non-debugging versions (configured with `--without-debug`).

To enable debugging information, build the driver from source distribution and use the `--with-debug` option when you run `configure`.

- This option is available only for source trees that have been obtained from the Subversion repository. This option does not apply to the packaged source distributions.

By default, the driver is built with the `--without-docs` option. If you would like the documentation to be built, then execute `configure` with:

```
--with-docs
```

20.1.3.5.3. Building and Compilation

To build the driver libraries, you have to just execute `make`.

```
shell> make
```

If any errors occur, correct them and continue the build process. If you aren't able to build, then send a detailed email to myodbc@lists.mysql.com for further assistance.

20.1.3.5.4. Building Shared Libraries

On most platforms, MySQL does not build or support `.so` (shared) client libraries by default. This is based on our experience of problems when building shared libraries.

In cases like this, you have to download the MySQL distribution and configure it with these options:

```
--without-server --enable-shared
```

To build shared driver libraries, you must specify the `--enable-shared` option for `configure`. By default, `configure` does not enable this option.

If you have configured with the `--disable-shared` option, you can build the `.so` file from the static libraries using the following commands:

```
shell> cd mysql-connector-odbc-3.51.01
shell> make
shell> cd driver
shell> CC=/usr/bin/gcc \
    $CC -bundle -flat_namespace -undefined error \
    -o .libs/libmyodbc3-3.51.01.so \
    catalog.o connect.o cursor.o dll.o error.o execute.o \
    handle.o info.o misc.o myodbc3.o options.o prepare.o \
    results.o transact.o utility.o \
    -L/usr/local/mysql/lib/mysql/ \
    -L/usr/local/iodbc/lib/ \
    -lz -lc -lmysqlclient -liodbcinst
```

Make sure to change `-liodbcinst` to `-lodbcinst` if you are using `unixODBC` instead of `iODBC`, and configure the library paths accordingly.

This builds and places the `libmyodbc3-3.51.01.so` file in the `.libs` directory. Copy this file to the Connector/ODBC library installation directory (`/usr/local/lib` (or the `lib` directory under the installation directory that you supplied with the `-prefix`)).

```
shell> cd .libs
shell> cp libmyodbc3-3.51.01.so /usr/local/lib
shell> cd /usr/local/lib
shell> ln -s libmyodbc3-3.51.01.so libmyodbc3.so
```

To build the thread-safe driver library:

```
shell> CC=/usr/bin/gcc \
  $CC -bundle -flat_namespace -undefined error
  -o .libs/libmyodbc3_r-3.51.01.so
  catalog.o connect.o cursor.o dll.o error.o execute.o
  handle.o info.o misc.o myodbc3.o options.o prepare.o
  results.o transact.o utility.o
  -L/usr/local/mysql/lib/mysql/
  -L/usr/local/iodbc/lib/
  -lz -lc -lmysqlclient_r -liodbcinst
```

20.1.3.5.5. Installing Driver Libraries

To install the driver libraries, execute the following command:

```
shell> make install
```

That command installs one of the following sets of libraries:

For Connector/ODBC 3.51:

- `libmyodbc3.so`
- `libmyodbc3-3.51.01.so`, where 3.51.01 is the version of the driver
- `libmyodbc3.a`

For thread-safe Connector/ODBC 3.51:

- `libmyodbc3_r.so`
- `libmyodbc3-3_r.51.01.so`
- `libmyodbc3_r.a`

For more information on build process, refer to the `INSTALL` file that comes with the source distribution. Note that if you are trying to use the `make` from Sun, you may end up with errors. On the other hand, GNU `gmake` should work fine on all platforms.

20.1.3.5.6. Testing Connector/ODBC on Unix

To run the basic samples provided in the distribution with the libraries that you built, use the following command:

```
shell> make test
```

Before running the tests, create the DSN 'myodbc3' in `odbc.ini` and set the environment variable `ODBCINI` to the correct `odbc.ini` file; and MySQL server is running. You can find a sample `odbc.ini` with the driver distribution.

You can even modify the `samples/run-samples` script to pass the desired DSN, UID, and PASSWORD values as the command-line arguments to each sample.

20.1.3.5.7. Building Connector/ODBC from Source on Mac OS X

To build the driver on Mac OS X (Darwin), make use of the following `configure` example:

```
shell> ./configure --prefix=/usr/local
  --with-unixODBC=/usr/local
  --with-mysql-path=/usr/local/mysql
  --disable-shared
  --enable-gui=no
  --host=powerpc-apple
```

The command assumes that the `unixODBC` and MySQL are installed in the default locations. If not, configure accordingly.

On Mac OS X, `--enable-shared` builds `.dylib` files by default. You can build `.so` files like this:

```
shell> make
shell> cd driver
shell> CC=/usr/bin/gcc \
  $CC -bundle -flat_namespace -undefined error
```

```
-o .libs/libmyodbc3-3.51.01.so *.o
-L/usr/local/mysql/lib/
-L/usr/local/iodbc/lib
-liodbcinst -lmysqlclient -lz -lc
```

To build the thread-safe driver library:

```
shell> CC=/usr/bin/gcc \
$CC -bundle -flat_namespace -undefined error
-o .libs/libmyodbc3-3.51.01.so *.o
-L/usr/local/mysql/lib/
-L/usr/local/iodbc/lib
-liodbcinst -lmysqlclient_r -lz -lc -lpthread
```

Make sure to change the `-liodbcinst` to `-lodbcinst` in case of using `unixODBC` instead of `iODBC` and configure the libraries path accordingly.

In Apple's version of GCC, both `cc` and `gcc` are actually symbolic links to `gcc3`.

Copy this library to the `$prefix/lib` directory and symlink to `libmyodbc3.so`.

You can cross-check the output shared-library properties using this command:

```
shell> otool -LD .libs/libmyodbc3-3.51.01.so
```

20.1.3.5.8. Building Connector/ODBC from Source on HP-UX

To build the driver on HP-UX 10.x or 11.x, make use of the following `configure` example:

If using `cc`:

```
shell> CC="cc" \
CFLAGS="+z" \
LDFLAGS="-Wl,+b:-Wl,+s" \
./configure --prefix=/usr/local
--with-unixodbc=/usr/local
--with-mysql-path=/usr/local/mysql/lib/mysql
--enable-shared
--enable-thread-safe
```

If using `gcc`:

```
shell> CC="gcc" \
LDFLAGS="-Wl,+b:-Wl,+s" \
./configure --prefix=/usr/local
--with-unixodbc=/usr/local
--with-mysql-path=/usr/local/mysql
--enable-shared
--enable-thread-safe
```

Once the driver is built, cross-check its attributes using `chatr .libs/libmyodbc3.sl` to determine whether you need to have set the MySQL client library path using the `SHLIB_PATH` environment variable. For static versions, ignore all shared-library options and run `configure` with the `--disable-shared` option.

20.1.3.5.9. Building Connector/ODBC from Source on AIX

To build the driver on AIX, make use of the following `configure` example:

```
shell> ./configure --prefix=/usr/local
--with-unixodbc=/usr/local
--with-mysql-path=/usr/local/mysql
--disable-shared
--enable-thread-safe
```

Note

For more information about how to build and set up the static and shared libraries across the different platforms refer to 'Using static and shared libraries across platforms'.

20.1.3.6. Installing Connector/ODBC from the Development Source Tree

Caution

You should read this section only if you are interested in helping us test our new code. If you just want to get MySQL Connector/ODBC up and running on your system, you should use a standard release distribution.

To be able to access the Connector/ODBC source tree, you must have Subversion installed. Subversion is freely available from <http://subversion.tigris.org/>.

To build from the source trees, you need the following tools:

- autoconf 2.52 (or newer)
- automake 1.4 (or newer)
- libtool 1.4 (or newer)
- m4

The most recent development source tree is available from our public Subversion trees at <http://dev.mysql.com/tech-resources/sources.html>.

To checkout out the Connector/ODBC sources, change to the directory where you want the copy of the Connector/ODBC tree to be stored, then use the following command:

```
shell> svn co http://svn.mysql.com/svnpublic/connector-odbc3
```

You should now have a copy of the entire Connector/ODBC source tree in the directory `connector-odbc3`. To build from this source tree on Unix or Linux follow these steps:

```
shell> cd connector-odbc3
shell> aclocal
shell> autoheader
shell> autoconf
shell> automake;
shell> ./configure # Add your favorite options here
shell> make
```

For more information on how to build, refer to the `INSTALL` file located in the same directory. For more information on options to `configure`, see [Section 20.1.3.5.1, “Typical configure Options”](#)

When the build is done, run `make install` to install the Connector/ODBC 3.51 driver on your system.

If you have gotten to the `make` stage and the distribution does not compile, please report it to <myodbc@lists.mysql.com>.

On Windows, make use of Windows Makefiles `WIN-Makefile` and `WIN-Makefile_debug` in building the driver. For more information, see [Section 20.1.3.4, “Installing Connector/ODBC from a Source Distribution on Windows”](#).

After the initial checkout operation to get the source tree, you should run `svn update` periodically update your source according to the latest version.

20.1.4. Connector/ODBC Configuration

Before you connect to a MySQL database using the Connector/ODBC driver you must configure an ODBC *Data Source Name*. The DSN associates the various configuration parameters required to communicate with a database to a specific name. You use the DSN in an application to communicate with the database, rather than specifying individual parameters within the application itself. DSN information can be user specific, system specific, or provided in a special file. ODBC data source names are configured in different ways, depending on your platform and ODBC driver.

20.1.4.1. Data Source Names

A Data Source Name associates the configuration parameters for communicating with a specific database. Generally a DSN consists of the following parameters:

- Name
- Host Name
- Database Name
- Login
- Password

In addition, different ODBC drivers, including Connector/ODBC, may accept additional driver-specific options and parameters.

There are three types of DSN:

- A *System DSN* is a global DSN definition that is available to any user and application on a particular system. A System DSN can normally only be configured by a systems administrator, or by a user who has specific permissions that let them create System DSNs.
- A *User DSN* is specific to an individual user, and can be used to store database connectivity information that the user regularly uses.
- A *File DSN* uses a simple file to define the DSN configuration. File DSNs can be shared between users and machines and are therefore more practical when installing or deploying DSN information as part of an application across many machines.

DSN information is stored in different locations depending on your platform and environment.

20.1.4.2. Connector/ODBC Connection Parameters

You can specify the parameters in the following tables for Connector/ODBC when configuring a DSN. Users on Windows can use the Options and Advanced panels when configuring a DSN to set these parameters; see the table for information on which options relate to which fields and checkboxes. On Unix and Mac OS X, use the parameter name and value as the keyword/value pair in the DSN configuration. Alternatively, you can set these parameters within the `InConnectionString` argument in the `SQLDriverConnect()` call.

Parameter	Default Value	Comment
<code>user</code>	ODBC	The user name used to connect to MySQL.
<code>uid</code>	ODBC	Synonymous with <code>user</code> . Added in 3.51.16.
<code>server</code>	<code>localhost</code>	The host name of the MySQL server.
<code>database</code>		The default database.
<code>option</code>	0	Options that specify how Connector/ODBC should work. See below.
<code>port</code>	3306	The TCP/IP port to use if <code>server</code> is not <code>localhost</code> .
<code>initstmt</code>		Initial statement. A statement to execute when connecting to MySQL. In version 3.51 the parameter is called <code>stmt</code> . Note, the driver supports the initial statement being executed only at the time of the initial connection.
<code>password</code>		The password for the <code>user</code> account on <code>server</code> .
<code>pwd</code>		Synonymous with <code>password</code> . Added in 3.51.16.
<code>socket</code>		The Unix socket file or Windows named pipe to connect to if <code>server</code> is <code>localhost</code> .
<code>sslca</code>		The path to a file with a list of trust SSL CAs. Added in 3.51.16.
<code>sslcapath</code>		The path to a directory that contains trusted SSL CA certificates in PEM format. Added in 3.51.16.
<code>sslcert</code>		The name of the SSL certificate file to use for establishing a secure connection. Added in 3.51.16.
<code>sslcipher</code>		A list of allowable ciphers to use for SSL encryption. The cipher list has the same format as the <code>openssl ciphers</code> command. Added in 3.51.16.
<code>sslkey</code>		The name of the SSL key file to use for establishing a secure connection. Added in 3.51.16.
<code>charset</code>		The character set to use for the connection. Added in 3.51.17.
<code>sslverify</code>		If set to 1, the SSL certificate will be verified when used with the MySQL connection. If not set, then the default behaviour is to ignore SSL certificate verification.
<code>readtimeout</code>		The timeout in seconds for attempts to read from the server. Each attempt uses this timeout value and there are retries if necessary, so the total effective timeout value is three times the option value. You can set the value so that a lost connection can be detected earlier than the TCP/IP <code>Close_Wait_Timeout</code> value of 10 minutes. This option works only for TCP/IP connections, and only for Windows prior to MySQL 5.1.12. Corresponds to the <code>MYSQL_OPT_READ_TIMEOUT</code> option of the MySQL Client Library. This option was added in Connector/ODBC 3.51.27.
<code>writetimeout</code>		The timeout in seconds for attempts to write to the server. Each attempt uses this timeout value and there are <code>net_retry_count</code> retries if necessary, so the total

Parameter	Default Value	Comment
		effective timeout value is <code>net_retry_count</code> times the option value. This option works only for TCP/IP connections, and only for Windows prior to MySQL 5.1.12. Corresponds to the <code>MYSQL_OPT_WRITE_TIMEOUT</code> option of the MySQL Client Library. This option was added in Connector/ODBC 3.51.27.

Note

The SSL configuration parameters can also be automatically loaded from a `my.ini` or `my.cnf` file.

The `option` argument is used to tell Connector/ODBC that the client isn't 100% ODBC compliant. On Windows, you normally select options by toggling the checkboxes in the connection screen, but you can also select them in the `option` argument. The following options are listed in the order in which they appear in the Connector/ODBC connect screen.

Value	Flagname	GUI Option	Description
1	<code>FLAG_FIELD_LENGTH</code>	Do not Optimize Column Width	The client cannot handle that Connector/ODBC returns the real width of a column. This option was removed in 3.51.18.
2	<code>FLAG_FOUND_ROWS</code>	Return Matching Rows	The client cannot handle that MySQL returns the true value of affected rows. If this flag is set, MySQL returns "found rows" instead. You must have MySQL 3.21.14 or newer to get this to work.
4	<code>FLAG_DEBUG</code>	Trace Driver Calls To myodbc.log	Make a debug log in <code>C:\myodbc.log</code> on Windows, or <code>/tmp/myodbc.log</code> on Unix variants. This option was removed in Connector/ODBC 3.51.18.
8	<code>FLAG_BIG_PACKETS</code>	Allow Big Results	Do not set any packet limit for results and bind parameters. Without this option, parameter binding will be truncated to 255 characters.
16	<code>FLAG_NO_PROMPT</code>	Do not Prompt Upon Connect	Do not prompt for questions even if driver would like to prompt.
32	<code>FLAG_DYNAMIC_CURSOR</code>	Enable Dynamic Cursor	Enable or disable the dynamic cursor support.
64	<code>FLAG_NO_SCHEMA</code>	Ignore # in Table Name	Ignore use of database name in <code>db_name.tbl_name.col_name</code> .
128	<code>FLAG_NO_DEFAULT_CURSOR</code>	User Manager Cursors	Force use of ODBC manager cursors (experimental).
256	<code>FLAG_NO_LOCALE</code>	Do not Use Set Locale	Disable the use of extended fetch (experimental).
512	<code>FLAG_PAD_SPACE</code>	Pad Char To Full Length	Pad <code>CHAR</code> columns to full column length.
1024	<code>FLAG_FULL_COLUMN_NAMES</code>	Return Table Names for SQLDescribeCol	<code>SQLDescribeCol()</code> returns fully qualified column names.
2048	<code>FLAG_COMPRESSED_PROTO</code>	Use Compressed Protocol	Use the compressed client/server protocol.
4096	<code>FLAG_IGNORE_SPACE</code>	Ignore Space After Function Names	Tell server to ignore space after function name and before "(" (needed by PowerBuilder). This makes all function names keywords.
8192	<code>FLAG_NAMED_PIPE</code>	Force Use of Named Pipes	Connect with named pipes to a <code>mysqld</code> server running on NT.
16384	<code>FLAG_NO_BIGINT</code>	Change BIGINT Columns to Int	Change <code>BIGINT</code> columns to <code>INT</code> columns (some applications cannot handle <code>BIGINT</code>).
32768	<code>FLAG_NO_CATALOG</code>	No Catalog	Forces results from the catalog functions, such as <code>SQLTables</code> , to always return <code>NULL</code> and the driver to report that catalogs are not supported.
65536	<code>FLAG_USE_MYCNF</code>	Read Options From my.cnf	Read parameters from the <code>[client]</code> and <code>[odbc]</code> groups from <code>my.cnf</code> .
131072	<code>FLAG_SAFE</code>	Safe	Add some extra safety checks.
262144	<code>FLAG_NO_TRANSACTIONS</code>	Disable transactions	Disable transactions.
524288	<code>FLAG_LOG_QUERY</code>	Save queries to myodbc.sql	Enable query logging to <code>c:\myodbc.sql(/tmp/myodbc.sql)</code> file. (Enabled only in debug mode.)

1048576	FLAG_NO_CACHE	Do not Cache Result (forward only cursors)	Do not cache the results locally in the driver, instead read from server (<code>mysql_use_result()</code>). This works only for forward-only cursors. This option is very important in dealing with large tables when you do not want the driver to cache the entire result set.
2097152	FLAG_FORWARD_CURSOR	Force Use Of Forward Only Cursors	Force the use of <code>Forward-only</code> cursor type. In case of applications setting the default static/dynamic cursor type, and one wants the driver to use non-cache result sets, then this option ensures the forward-only cursor behavior.
4194304	FLAG_AUTO_RECONNECT	Enable auto-reconnect.	Enables auto-reconnection functionality. You should not use this option with transactions, since a auto reconnection during a incomplete transaction may cause corruption. Note that an auto-reconnected connection will not inherit the same settings and environment as the original. This option was added in Connector/ODBC 3.51.13.
8388608	FLAG_AUTO_IS_NULL	Flag Auto Is Null	<p>When <code>FLAG_AUTO_IS_NULL</code> is set, the driver does not change the default value of <code>sql_auto_is_null</code>, leaving it at 1, so you get the MySQL default, not the SQL standard behavior.</p> <p>When <code>FLAG_AUTO_IS_NULL</code> is not set, the driver changes the default value of <code>SQL_AUTO_IS_NULL</code> to 0 after connecting, so you get the SQL standard, not the MySQL default behaviour.</p> <p>Thus, omitting the flag disables the compatibility option and forces SQL standard behaviour.</p> <p>See <code>IS NULL</code>. This option was added in Connector/ODBC 3.51.13.</p>
16777216	FLAG_ZERO_DATE_TO_MIN	Flag Zero Date to Min	Translates zero dates (<code>XXXX-00-00</code>) into the minimum date values supported by ODBC, <code>XXXX-01-01</code> . This resolves an issue where some statements will not work because the date returned and the minimum ODBC date value are incompatible. This option was added in Connector/ODBC 3.51.17.
33554432	FLAG_MIN_DATE_TO_ZERO	Flag Min Date to Zero	Translates the minimum ODBC date value (<code>XXXX-01-01</code>) to the zero date format supported by MySQL (<code>XXXX-00-00</code>). This resolves an issue where some statements will not work because the date returned and the minimum ODBC date value are incompatible. This option was added in Connector/ODBC 3.51.17.
67108864	FLAG_MULTI_STATEMENTS	Allow multiple statements	Enables support for batched statements. This option was added in Connector/ODBC 3.51.18.
134217728	FLAG_COLUMN_SIZE_S32	Limit column size to 32-bit value	Limits the column size to a signed 32-bit value to prevent problems with larger column sizes in applications that do not support them. This option is automatically enabled when working with ADO applications. This option was added in Connector/ODBC 3.51.22.
268435456	FLAG_NO_BINARY_RESULT	Always handle binary function results as character data	When set this option disables charset 63 for columns with an empty <code>org_table</code> . This option was added in Connector/ODBC 3.51.26.

To select multiple options, add together their values. For example, setting `option` to 12 (4+8) gives you debugging without packet limits.

The following table shows some recommended `option` values for various configurations.

Configuration	Option Value
Microsoft Access, Visual Basic	3
Driver trace generation (Debug mode)	4
Microsoft Access (with improved DELETE queries)	35
Large tables with too many rows	2049
Sybase PowerBuilder	135168

Query log generation (Debug mode)	524288
Generate driver trace as well as query log (Debug mode)	524292
Large tables with no-cache results	3145731

20.1.4.3. Configuring a Connector/ODBC DSN on Windows

The [ODBC Data Source Administrator](#) within Windows enables you to create DSNs, check driver installation and configure ODBC systems such as tracing (used for debugging) and connection pooling.

Different editions and versions of Windows store the [ODBC Data Source Administrator](#) in different locations depending on the version of Windows that you are using.

To open the [ODBC Data Source Administrator](#) in Windows Server 2003:

Tip

Because it is possible to create DSN using either the 32-bit or 64-bit driver, but using the same DNS identifier, it is advisable to include the driver being used within the DSN identifier. This will help you to identify the DSN when using it from applications such as Excel that are only compatible with the 32-bit driver. For example, you might add [Using32bitCODBC](#) to the DSN identifier for the 32-bit interface and [Using64bitCODBC](#) for those using the 64-bit Connector/ODBC driver.

1. On the [Start](#) menu, choose [Administrative Tools](#), and then click [Data Sources \(ODBC\)](#).

To open the [ODBC Data Source Administrator](#) in Windows 2000 Server or Windows 2000 Professional:

1. On the [Start](#) menu, choose [Settings](#), and then click [Control Panel](#).
2. In [Control Panel](#), click [Administrative Tools](#).
3. In [Administrative Tools](#), click [Data Sources \(ODBC\)](#).

To open the [ODBC Data Source Administrator](#) on Windows XP:

1. On the [Start](#) menu, click [Control Panel](#).
2. In the [Control Panel](#) when in [Category View](#) click [Performance and Maintenance](#) and then click [Administrative Tools](#). If you are viewing the [Control Panel](#) in [Classic View](#), click [Administrative Tools](#).
3. In [Administrative Tools](#), click [Data Sources \(ODBC\)](#).

Irrespective of your Windows version, you should be presented the [ODBC Data Source Administrator](#) window:

Within Windows XP, you can add the [Administrative Tools](#) folder to your START menu to make it easier to locate the ODBC Data Source Administrator. To do this:

1. Right click on the START menu.
2. Select [Properties](#).
3. Click CUSTOMIZE....
4. Select the ADVANCED tab.
5. Within [Start menu items](#), within the [System Administrative Tools](#) section, select [Display on the All Programs menu](#).

Within both Windows Server 2003 and Windows XP you may want to permanently add the [ODBC Data Source Administrator](#) to your START menu. To do this, locate the [Data Sources \(ODBC\)](#) icon using the methods shown, then right-click on the icon and then choose PIN TO START MENU.

The interfaces for the 3.51 and 5.1 versions of the Connector/ODBC driver are different, although the fields and information that you need to enter remain the same.

To configure a DSN using Connector/ODBC 3.51.x or Connector/ODBC 5.1.0, see [Section 20.1.4.3.1, “Configuring a Connector/ODBC 3.51 DSN on Windows”](#).

To configure a DSN using Connector/ODBC 5.1.1 or later, see [Section 20.1.4.3.2, “Configuring a Connector/ODBC 5.1 DSN on Windows”](#).

20.1.4.3.1. Configuring a Connector/ODBC 3.51 DSN on Windows

To add and configure a new Connector/ODBC data source on Windows, use the [ODBC Data Source Administrator](#):

1. Open the [ODBC Data Source Administrator](#).
2. To create a System DSN (which will be available to all users) , select the [System DSN](#) tab. To create a User DSN, which will be unique only to the current user, click the [ADD...](#) button.
3. You will need to select the ODBC driver for this DSN.

Select [MySQL ODBC 3.51 Driver](#), then click **FINISH**.

4. You now need to configure the specific fields for the DSN you are creating through the [Add Data Source Name](#) dialog.

In the **DATA SOURCE NAME** box, enter the name of the data source you want to access. It can be any valid name that you choose.

5. In the **DESCRIPTION** box, enter some text to help identify the connection.
6. In the **SERVER** field, enter the name of the MySQL server host that you want to access. By default, it is `localhost`.
7. In the **USER** field, enter the user name to use for this connection.
8. In the **PASSWORD** field, enter the corresponding password for this connection.
9. The **DATABASE** pop-up should automatically populate with the list of databases that the user has permissions to access.
10. Click **OK** to save the DSN.

A completed DSN configuration may look like this:

You can verify the connection using the parameters you have entered by clicking the TEST button. If the connection could be made successfully, you will be notified with a `Success; connection was made!` dialog.

If the connection failed, you can obtain more information on the test and why it may have failed by clicking the DIAGNOSTICS... button to show additional error messages.

You can configure a number of options for a specific DSN by using either the CONNECT OPTIONS or ADVANCED tabs in the DSN configuration dialog.

The three options you can configure are:

- **PORT** sets the TCP/IP port number to use when communicating with MySQL. Communication with MySQL uses port 3306 by default. If your server is configured to use a different TCP/IP port, you must specify that port number here.
- **SOCKET** sets the name or location of a specific socket or Windows pipe to use when communicating with MySQL.
- **INITIAL STATEMENT** defines an SQL statement that will be executed when the connection to MySQL is opened. You can use this to set MySQL options for your connection, such as disabling autocommit.
- **CHARACTER SET** is a pop-up list from which you can select the default character set to be used with this connection. The Character Set option was added in 3.5.17.

The **ADVANCED** tab enables you to configure Connector/ODBC connection parameters. Refer to [Section 20.1.4.2, “Connector/ODBC Connection Parameters”](#), for information about the meaning of these options.

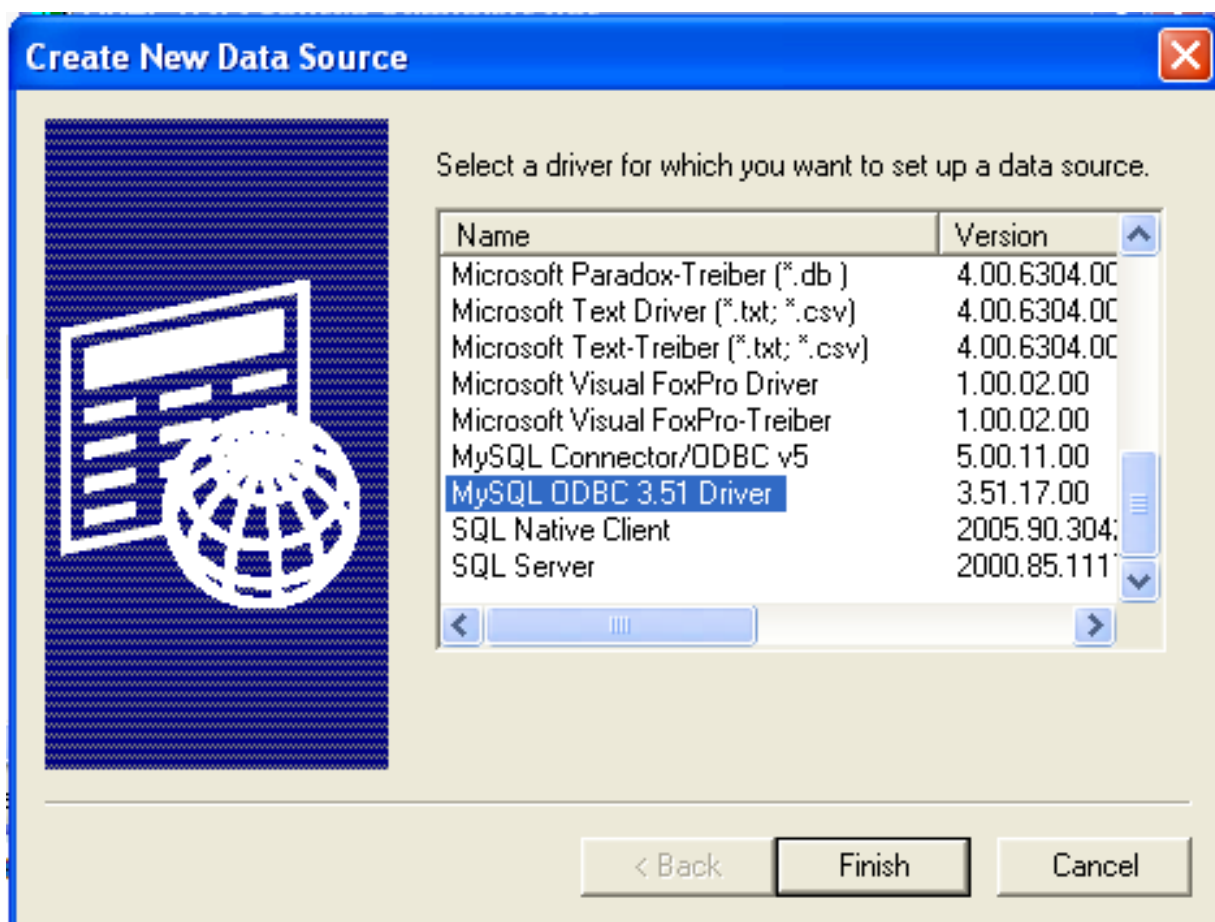

20.1.4.3.2. Configuring a Connector/ODBC 5.1 DSN on Windows

The DSN configuration when using Connector/ODBC 5.1.1 and later has a slightly different layout. Also, due to the native Unicode support within Connector/ODBC 5.1, you no longer need to specify the initial character set to be used with your connection.

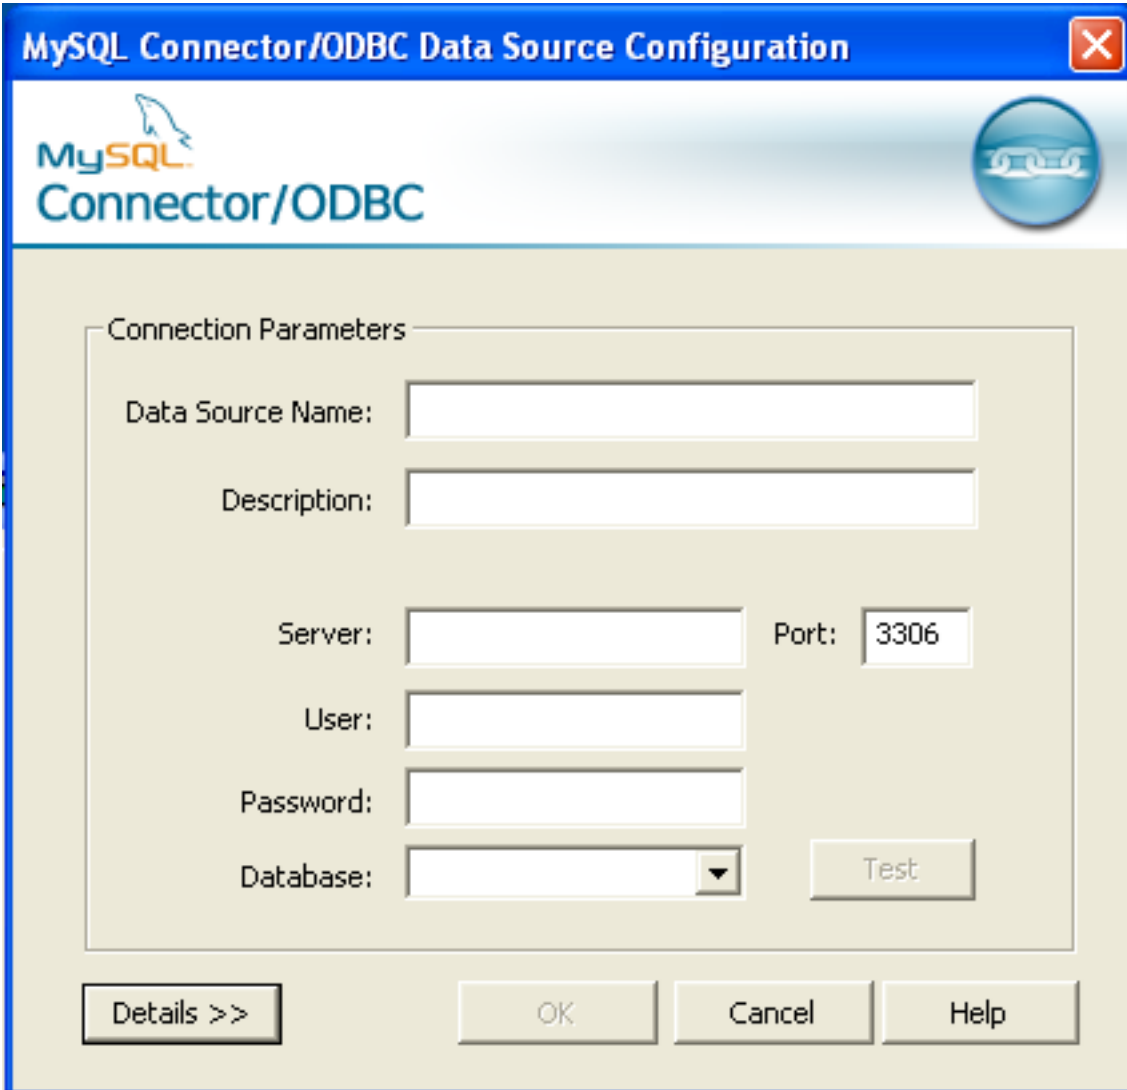

To configure a DSN using the Connector/ODBC 5.1.1 or later driver:

1. Open the [ODBC Data Source Administrator](#).
2. To create a System DSN (which will be available to all users), select the **SYSTEM DSN** tab. To create a User DSN, which will be unique only to the current user, click the **ADD...** button.
3. You will need to select the ODBC driver for this DSN.

Select **MySQL ODBC 3.51 Driver**, then click FINISH.

4. You now need to configure the specific fields for the DSN you are creating through the [Connection Parameters](#) dialog.

MySQL Connector/ODBC Data Source Configuration

MySQL Connector/ODBC

Connection Parameters

Data Source Name:

Description:

Server: Port:

User:

Password:

Database:

In the **DATA SOURCE NAME** box, enter the name of the data source you want to access. It can be any valid name that you choose.

5. In the **DESCRIPTION** box, enter some text to help identify the connection.
6. In the **SERVER** field, enter the name of the MySQL server host that you want to access. By default, it is `localhost`.
7. In the **USER** field, enter the user name to use for this connection.
8. In the **PASSWORD** field, enter the corresponding password for this connection.
9. The **DATABASE** pop-up should automatically populate with the list of databases that the user has permissions to access.
10. To communicate over a different TCP/IP port than the default (3306), change the value of the **PORT**.
11. Click OK to save the DSN.

You can verify the connection using the parameters you have entered by clicking the **TEST** button. If the connection could be made successfully, you will be notified with a `Success; connection was made!` dialog.

You can configure a number of options for a specific DSN by using the **DETAILS** button.

MySQL Connector/ODBC Data Source Configuration

MySQL Connector/ODBC

Connection Parameters

Data Source Name:

Description:

Server: Port:

User:

Password:

Database:

Flags 1 | Flags 2 | Flags 3 | Debug | SSL Settings

- Return matched rows instead of affected rows
- Allow big result sets
- Use compression
- Treat BIGINT columns as INT columns
- Enable safe options (see documentation)
- Enable automatic reconnect
- Enable SQL_AUTO_IS_NULL

The **DETAILS** button opens a tabbed display which allows you to set additional options:

- **FLAGS 1**, **FLAGS 2**, and **FLAGS 3** enable you to select the additional flags for the DSN connection. For more information on these flags, see [Section 20.1.4.2, “Connector/ODBC Connection Parameters”](#).
- **DEBUG** allows you to enable ODBC debugging to record the queries you execute through the DSN to the `myodbc.sql` file. For more information, see [Section 20.1.4.8, “Getting an ODBC Trace File”](#).
- **SSL SETTINGS** configures the additional options required for using the Secure Sockets Layer (SSL) when communicating with MySQL server. Note that you must have enabled SSL and configured the MySQL server with suitable certificates to communicate over SSL.

The **ADVANCED** tab enables you to configure Connector/ODBC connection parameters. Refer to [Section 20.1.4.2, “Connector/ODBC Connection Parameters”](#), for information about the meaning of these options.

20.1.4.3.3. Errors and Debugging

This section answers Connector/ODBC connection-related questions.

- **While configuring a Connector/ODBC DSN, a [Could Not Load Translator or Setup Library](#) error occurs**

For more information, refer to [MS KnowledgeBase Article\(Q260558\)](#). Also, make sure you have the latest valid `ct13d32.dll` in your system directory.

- On Windows, the default `myodbc3.dll` is compiled for optimal performance. If you want to debug Connector/ODBC 3.51 (for example, to enable tracing), you should instead use `myodbc3d.dll`. To install this file, copy `myodbc3d.dll` over the installed `myodbc3.dll` file. Make sure to revert back to the release version of the driver DLL once you are done with the debugging because the debug version may cause performance issues. Note that the `myodbc3d.dll` isn't included in Connector/ODBC 3.51.07 through 3.51.11. If you are using one of these versions, you should copy that DLL from a previous version (for example, 3.51.06).

20.1.4.4. Configuring a Connector/ODBC DSN on Mac OS X

To configure a DSN on Mac OS X you can either use the `myodbc3i` utility, edit the `odbc.ini` file within the `Library/ODBC` directory of the user or the should use the ODBC Administrator. If you have Mac OS X 10.2 or earlier, refer to [Section 20.1.4.5, “Configuring a Connector/ODBC DSN on Unix”](#). Select whether you want to create a User DSN or a System DSN. If you want to add a System DSN, you may need to authenticate with the system. You must click the padlock and enter a user and password with administrator privileges.

For correct operation of ODBC Administrator, you should ensure that the `/Library/ODBC/odbc.ini` file used to set up ODBC connectivity and DSNs are writable by the `admin` group. If this file is not writable by this group then the ODBC Administrator may fail, or may appear to have worked but not generated the correct entry.

Warning

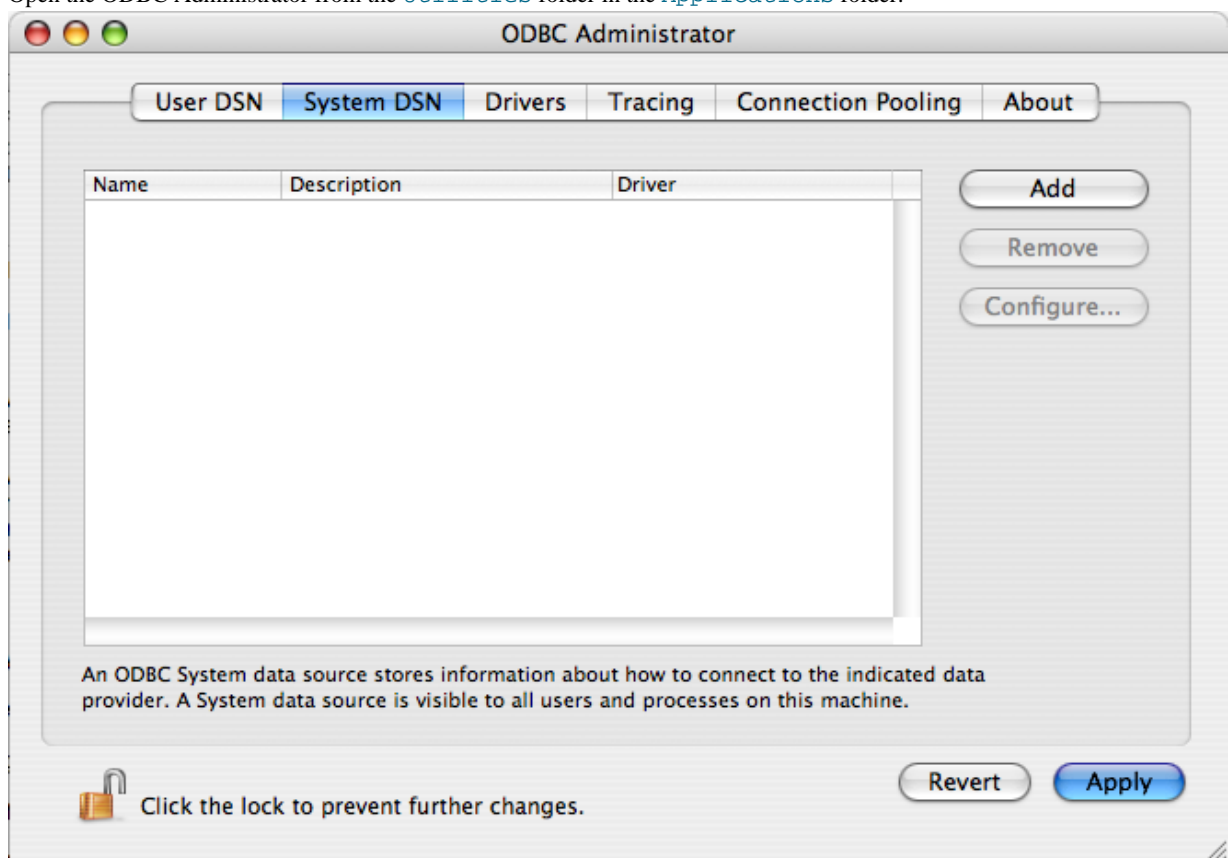

There are known issues with the OS X ODBC Administrator and Connector/ODBC that may prevent you from creating a DSN using this method. In this case you should use the command-line or edit the `odbc.ini` file directly. Note that existing DSNs or those that you create via the `myodbc3i` or `myodbc-installertool` can still be checked and edited using ODBC Administrator.

To create a DSN using the `myodbc3i` utility, you need only specify the DSN type and the DSN connection string. For example:

```
shell> myodbc3i -a -s -t "DSN=mydb;DRIVER=MySQL ODBC 3.51 Driver;SERVER=mysql;USER=username;PASSWORD=pass"
```

To use ODBC Administrator:

1. Open the ODBC Administrator from the `Utilities` folder in the `Applications` folder.

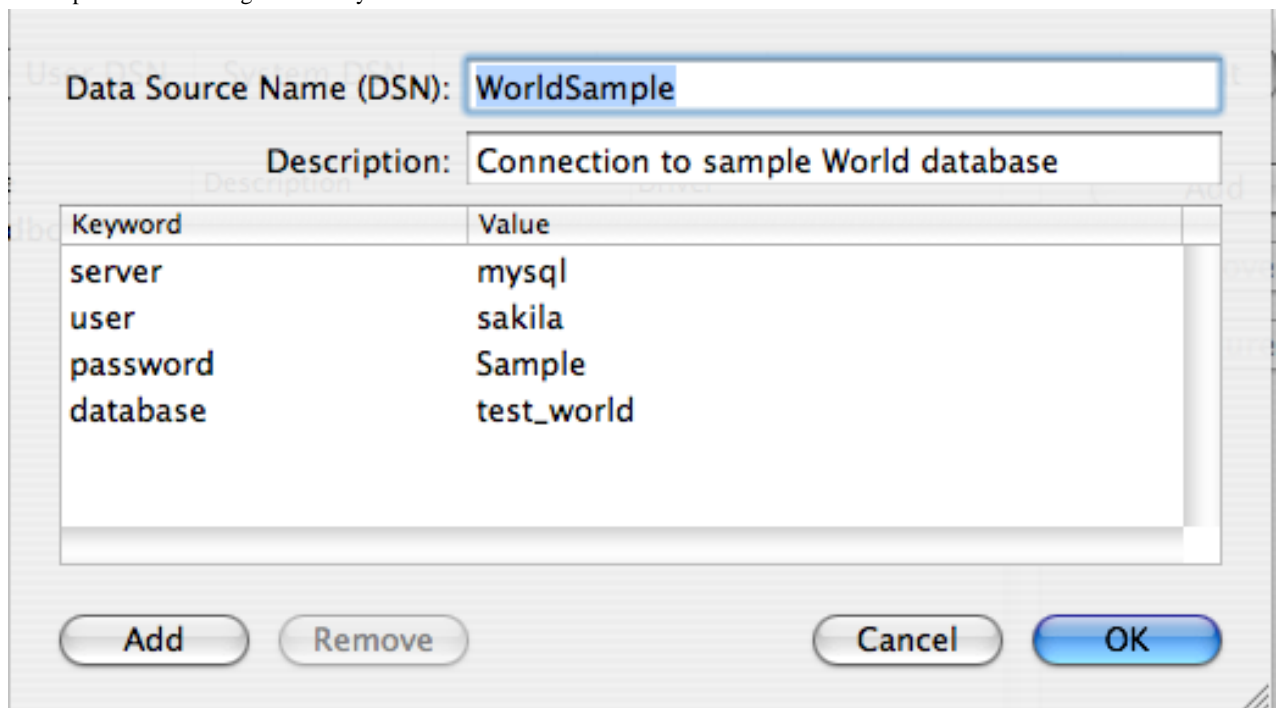

2. On the User DSN or System DSN panel, click ADD.
3. Select the Connector/ODBC driver and click OK.
4. You will be presented with the `Data Source Name` dialog. Enter The `Data Source Name` and an optional `Description` for the DSN.

5. Click ADD to add a new keyword/value pair to the panel. You should configure at least four pairs to specify the `server`, `username`, `password` and `database` connection parameters. See [Section 20.1.4.2, “Connector/ODBC Connection Parameters”](#).
6. Click OK to add the DSN to the list of configured data source names.

A completed DSN configuration may look like this:

You can configure additional ODBC options to your DSN by adding further keyword/value pairs and setting the corresponding values. See [Section 20.1.4.2, “Connector/ODBC Connection Parameters”](#).

20.1.4.5. Configuring a Connector/ODBC DSN on Unix

On [Unix](#), you configure DSN entries directly in the `odbc.ini` file. Here is a typical `odbc.ini` file that configures `myodbc3` as the DSN name for Connector/ODBC 3.51:

```
;
; odbc.ini configuration for Connector/ODBC and Connector/ODBC 3.51 drivers
;

[ODBC Data Sources]
myodbc3      = MyODBC 3.51 Driver DSN

[myodbc3]
Driver       = /usr/local/lib/libmyodbc3.so
Description  = Connector/ODBC 3.51 Driver DSN
SERVER      = localhost
PORT        =
USER        = root
Password    =
Database    = test
OPTION     = 3
SOCKET     =

[Default]
Driver       = /usr/local/lib/libmyodbc3.so
Description  = Connector/ODBC 3.51 Driver DSN
SERVER      = localhost
PORT        =
USER        = root
Password    =
Database    = test
OPTION     = 3
SOCKET     =
```

Refer to the [Section 20.1.4.2, “Connector/ODBC Connection Parameters”](#), for the list of connection parameters that can be supplied.

Note

If you are using `unixODBC`, you can use the following tools to set up the DSN:

- ODBCConfig GUI tool([HOWTO: ODBCConfig](#))
- `odbcinst`

In some cases when using `unixODBC`, you might get this error:

```
Data source name not found and no default driver specified
```

If this happens, make sure the `ODBCINI` and `ODBCSYSINI` environment variables are pointing to the right `odbc.ini` file. For example, if your `odbc.ini` file is located in `/usr/local/etc`, set the environment variables like this:

```
export ODBCINI=/usr/local/etc/odbc.ini
export ODBCSYSINI=/usr/local/etc
```

20.1.4.6. Connecting Without a Predefined DSN

You can connect to the MySQL server using `SQLDriverConnect`, by specifying the `DRIVER` name field. Here are the connection strings for Connector/ODBC using DSN-Less connections:

For Connector/ODBC 3.51:

```
ConnectionString = "DRIVER={MySQL ODBC 3.51 Driver};\
SERVER=localhost;\
DATABASE=test;\
USER=venu;\
PASSWORD=venu;\
OPTION=3;"
```

If your programming language converts backslash followed by whitespace to a space, it is preferable to specify the connection string as a single long string, or to use a concatenation of multiple strings that does not add spaces in between. For example:

```
ConnectionString = "DRIVER={MySQL ODBC 3.51 Driver};"
```

```
"SERVER=localhost;"  
"DATABASE=test;"  
"USER=venu;"  
"PASSWORD=venu;"  
"OPTION=3;"
```

Note. Note that on Mac OS X you may need to specify the full path to the Connector/ODBC driver library.

Refer to the [Section 20.1.4.2, “Connector/ODBC Connection Parameters”](#), for the list of connection parameters that can be supplied.

20.1.4.7. ODBC Connection Pooling

Connection pooling enables the ODBC driver to re-use existing connections to a given database from a pool of connections, instead of opening a new connection each time the database is accessed. By enabling connection pooling you can improve the overall performance of your application by lowering the time taken to open a connection to a database in the connection pool.

For more information about connection pooling: <http://support.microsoft.com/default.aspx?scid=kb;EN-US;q169470>.

20.1.4.8. Getting an ODBC Trace File

If you encounter difficulties or problems with Connector/ODBC, you should start by making a log file from the [ODBC Manager](#) and Connector/ODBC. This is called *tracing*, and is enabled through the ODBC Manager. The procedure for this differs for Windows, Mac OS X and Unix.

20.1.4.8.1. Enabling ODBC Tracing on Windows

To enable the trace option on Windows:

1. The [Tracing](#) tab of the ODBC Data Source Administrator dialog box enables you to configure the way ODBC function calls are traced.

2. When you activate tracing from the [Tracing](#) tab, the [Driver Manager](#) logs all ODBC function calls for all subsequently run applications.
3. ODBC function calls from applications running before tracing is activated are not logged. ODBC function calls are recorded in a log file you specify.
4. Tracing ceases only after you click [Stop Tracing Now](#). Remember that while tracing is on, the log file continues to increase in size and that tracing affects the performance of all your ODBC applications.

20.1.4.8.2. Enabling ODBC Tracing on Mac OS X

To enable the trace option on Mac OS X 10.3 or later you should use the [Tracing](#) tab within ODBC Administrator .

1. Open the ODBC Administrator.
2. Select the [Tracing](#) tab.

3. Select the `Enable Tracing` checkbox.
4. Enter the location where you want to save the Tracing log. If you want to append information to an existing log file, click the `CHOOSE...` button.

20.1.4.8.3. Enabling ODBC Tracing on Unix

To enable the trace option on Mac OS X 10.2 (or earlier) or Unix you must add the `trace` option to the ODBC configuration:

1. On Unix, you need to explicitly set the `Trace` option in the `ODBC.INI` file.

Set the tracing `ON` or `OFF` by using `TraceFile` and `Trace` parameters in `odbc.ini` as shown below:

```
TraceFile = /tmp/odbc.trace
Trace     = 1
```

`TraceFile` specifies the name and full path of the trace file and `Trace` is set to `ON` or `OFF`. You can also use `1` or `YES` for `ON` and `0` or `NO` for `OFF`. If you are using `ODBCConfig` from `unixODBC`, then follow the instructions for tracing `unixODBC` calls at [HOWTO-ODBCConfig](#).

20.1.4.8.4. Enabling a Connector/ODBC Log

To generate a Connector/ODBC log, do the following:

1. Within Windows, enable the `Trace Connector/ODBC` option flag in the Connector/ODBC connect/configure screen. The log is written to file `C:\myodbc.log`. If the trace option is not remembered when you are going back to the above screen, it means that you are not using the `myodbcd.dll` driver, see [Section 20.1.4.3.3, "Errors and Debugging"](#).

On Mac OS X, Unix, or if you are using DSN-Less connection, then you need to supply `OPTION=4` in the connection string or set the corresponding keyword/value pair in the DSN.

2. Start your application and try to get it to fail. Then check the Connector/ODBC trace file to find out what could be wrong.

If you need help determining what is wrong, see [Section 20.1.8.1, “Connector/ODBC Community Support”](#).

20.1.5. Connector/ODBC Examples

Once you have configured a DSN to provide access to a database, how you access and use that connection is dependent on the application or programming language. As ODBC is a standardized interface, any application or language that supports ODBC can use the DSN and connect to the configured database.

20.1.5.1. Basic Connector/ODBC Application Steps

Interacting with a MySQL server from an applications using the Connector/ODBC typically involves the following operations:

- Configure the Connector/ODBC DSN
- Connect to MySQL server
- Initialization operations
- Execute SQL statements
- Retrieve results
- Perform Transactions
- Disconnect from the server

Most applications use some variation of these steps. The basic application steps are shown in the following diagram:

20.1.5.2. Step-by-step Guide to Connecting to a MySQL Database through Connector/ODBC

A typical installation situation where you would install Connector/ODBC is when you want to access a database on a Linux or Unix host from a Windows machine.

As an example of the process required to set up access between two machines, the steps below take you through the basic steps. These instructions assume that you want to connect to system ALPHA from system BETA with a user name and password of `my-user` and `mypassword`.

On system ALPHA (the MySQL server) follow these steps:

1. Start the MySQL server.
2. Use `GRANT` to set up an account with a user name of `myuser` that can connect from system BETA using a password of `my-user` to the database `test`:

```
GRANT ALL ON test.* to 'myuser'@'BETA' IDENTIFIED BY 'mypassword';
```

For more information about MySQL privileges, refer to [Section 5.5, “MySQL User Account Management”](#).

On system BETA (the Connector/ODBC client), follow these steps:

1. Configure a Connector/ODBC DSN using parameters that match the server, database and authentication information that you have just configured on system ALPHA.

Parameter	Value	Comment
DSN	remote_test	A name to identify the connection.
SERVER	ALPHA	The address of the remote server.
DATABASE	test	The name of the default database.
USER	myuser	The user name configured for access to this database.
PASSWORD	mypassword	The password for <code>myuser</code> .

2. Using an ODBC-capable application, such as Microsoft Office, connect to the MySQL server using the DSN you have just created. If the connection fails, use tracing to examine the connection process. See [Section 20.1.4.8, “Getting an ODBC Trace File”](#), for more information.

20.1.5.3. Connector/ODBC and Third-Party ODBC Tools

Once you have configured your Connector/ODBC DSN, you can access your MySQL database through any application that supports the ODBC interface, including programming languages and third-party applications. This section contains guides and help on using Connector/ODBC with various ODBC-compatible tools and applications, including Microsoft Word, Microsoft Excel and Adobe/Macromedia ColdFusion.

Connector/ODBC has been tested with the following applications.

Publisher	Application	Notes
Adobe	ColdFusion	Formerly Macromedia ColdFusion
Borland	C++ Builder	
	Builder 4	
	Delphi	
Business Objects	Crystal Reports	
Claris	Filemaker Pro	
Corel	Paradox	
Computer Associates	Visual Objects	Also known as CAVO
	AllFusion ERwin Data Modeler	
Gupta	Team Developer	Previously known as Centura Team Developer; Gupta SQL/Windows
Gensym	G2-ODBC Bridge	
Inline	iHTML	
Lotus	Notes	Versions 4.5 and 4.6
Microsoft	Access	
	Excel	
	Visio Enterprise	
	Visual C++	
	Visual Basic	

	ODBC.NET	Using C#, Visual Basic, C++
	FoxPro	
	Visual Interdev	
OpenOffice.org	OpenOffice.org	
Perl	DBD::ODBC	
Pervasive Software	DataJunction	
Sambar Technologies	Sambar Server	
SPSS	SPSS	
SoftVelocity	Clarion	
SQLExpress	SQLExpress for Xbase++	
Sun	StarOffice	
SunSystems	Vision	
Sybase	PowerBuilder	
	PowerDesigner	
theKompany.com	Data Architect	

If you know of any other applications that work with Connector/ODBC, please send mail to [<myodbc@lists.mysql.com>](mailto:myodbc@lists.mysql.com) about them.

20.1.5.4. Using Connector/ODBC with Microsoft Access

You can use MySQL database with Microsoft Access using Connector/ODBC. The MySQL database can be used as an import source, an export source, or as a linked table for direct use within an Access application, so you can use Access as the front-end interface to a MySQL database.

20.1.5.4.1. Exporting Access Data to MySQL

To export a table of data from an Access database to MySQL, follow these instructions:

1. When you open an Access database or an Access project, a Database window appears. It displays shortcuts for creating new database objects and opening existing objects.

2. Click the name of the [table](#) or [query](#) you want to export, and then in the **File** menu, select **Export**.
3. In the **Export Object Type Object name To** dialog box, in the **Save As Type** box, select **ODBC Databases ()** as shown here:

4. In the **Export** dialog box, enter a name for the file (or use the suggested name), and then select **OK**.
5. The **Select Data Source** dialog box is displayed; it lists the defined data sources for any ODBC drivers installed on your computer. Click either the **File Data Source** or **Machine Data Source** tab, and then double-click the **Connector/ODBC** or **Connector/ODBC 3.51** data source that you want to export to. To define a new data source for **Connector/ODBC**, please [Section 20.1.4.3, "Configuring a Connector/ODBC DSN on Windows"](#).

Note

Ensure that the information that you are exporting to the MySQL table is valid for the corresponding MySQL data types. Values that are outside of the supported range of the MySQL data type but valid within Access may trigger an "overflow" error during the export.

Microsoft Access connects to the MySQL Server through this data source and exports new tables and or data.

20.1.5.4.2. Importing MySQL Data to Access

To import a table or tables from MySQL to Access, follow these instructions:

1. Open a database, or switch to the Database window for the open database.
2. To import tables, on the **File** menu, point to **Get External Data**, and then click **Import**.
3. In the **Import** dialog box, in the Files Of Type box, select **ODBC DATABASES ()**. The Select Data Source dialog box lists the defined data sources **THE SELECT DATA SOURCE** dialog box is displayed; it lists the defined data source names.
4. If the ODBC data source that you selected requires you to log on, enter your login ID and password (additional information might also be required), and then click **OK**.
5. Microsoft Access connects to the MySQL server through **ODBC data source** and displays the list of tables that you can **import**.
6. Click each table that you want to **import**, and then click **OK**.

20.1.5.4.3. Using Microsoft Access as a Front-end to MySQL

You can use Microsoft Access as a front end to a MySQL database by linking tables within your Microsoft Access database to tables that exist within your MySQL database. When a query is requested on a table within Access, ODBC is used to execute the queries on the MySQL database instead.

To create a linked table:

1. Open the Access database that you want to link to MySQL.
2. From the **FILE**, choose **GET EXTERNAL DATA->LINK TABLES**.

3. From the browser, choose **ODBC DATABASES ()** from the **FILES OF TYPE** pop-up.
4. In the **SELECT DATA SOURCE** window, choose an existing DSN, either from a **FILE DATA SOURCE** or **MACHINE DATA SOURCE**. You can also create a new DSN using the **NEW...** button. For more information on creating a DSN see [Section 20.1.4.3, "Configuring a Connector/ODBC DSN on Windows"](#).

5. In the **LINK TABLES** dialog, select one or more tables from the MySQL database. A link will be created to each table that you select from this list.

- If Microsoft Access is unable to determine the unique record identifier for a table automatically then it may ask you to confirm the column, or combination of columns, to be used to uniquely identify each row from the source table. Select the columns you want to use and click OK.

Once the process has been completed, you can now build interfaces and queries to the linked tables just as you would for any Access database.

Use the following procedure to view or to refresh links when the structure or location of a linked table has changed. The Linked Table Manager lists the paths to all currently linked tables.

To view or refresh links:

- Open the database that contains links to MySQL tables.
- On the **Tools** menu, point to **Add-ins (Database Utilities)** in Access 2000 or newer, and then click **Linked Table Manager**.
- Select the check box for the tables whose links you want to refresh.
- Click OK to refresh the links.

Microsoft Access confirms a successful refresh or, if the table wasn't found, displays the **Select New Location of <table name>** dialog box in which you can specify its the table's new location. If several selected tables have moved to the new location that you specify, the Linked Table Manager searches that location for all selected tables, and updates all links in one step.

To change the path for a set of linked tables:

- Open the database that contains links to tables.
- On the **Tools** menu, point to **Add-ins (Database Utilities)** in Access 2000 or newer, and then click **Linked Table Manager**.
- Select the **Always Prompt For A New Location** check box.
- Select the check box for the tables whose links you want to change, and then click **OK**.
- In the **Select New Location of <table name>** dialog box, specify the new location, click **Open**, and then click **OK**.

20.1.5.5. Using Connector/ODBC with Microsoft Word or Excel

You can use Microsoft Word and Microsoft Excel to access information from a MySQL database using Connector/ODBC. Within Microsoft Word, this facility is most useful when importing data for mailmerge, or for tables and data to be included in reports. Within Microsoft Excel, you can execute queries on your MySQL server and import the data directly into an Excel Worksheet, presenting the data as a series of rows and columns.

With both applications, data is accessed and imported into the application using Microsoft Query, which enables you to execute a query through an ODBC source. You use Microsoft Query to build the SQL statement to be executed, selecting the tables, fields, selection criteria and sort order. For example, to insert information from a table in the World test database into an Excel spreadsheet, using the DSN samples shown in [Section 20.1.4, "Connector/ODBC Configuration"](#):

1. Create a new Worksheet.
2. From the **Data** menu, choose **Import External Data**, and then select **New Database Query**.
3. Microsoft Query will start. First, you need to choose the data source, by selecting an existing Data Source Name.

4. Within the **Query Wizard**, you must choose the columns that you want to import. The list of tables available to the user configured through the DSN is shown on the left, the columns that will be added to your query are shown on the right. The columns you choose are equivalent to those in the first section of a **SELECT** query. Click **NEXT** to continue.

5. You can filter rows from the query (the equivalent of a `WHERE` clause) using the `Filter Data` dialog. Click `NEXT` to continue.

6. Select an (optional) sort order for the data. This is equivalent to using a `ORDER BY` clause in your SQL query. You can select up to three fields for sorting the information returned by the query. Click `NEXT` to continue.

Query Wizard - Sort Order

Specify how you want your data sorted.
If you don't want to sort the data, click Next.

Sort by
Name Ascending Descending

Then by Ascending Descending

Then by Ascending Descending

7. Select the destination for your query. You can select to return the data Microsoft Excel, where you can choose a worksheet and cell where the data will be inserted; you can continue to view the query and results within Microsoft Query, where you can edit the SQL query and further filter and sort the information returned; or you can create an OLAP Cube from the query, which can then be used directly within Microsoft Excel. Click FINISH.

Query Wizard - Finish

What would you like to do next?

Return Data to Microsoft Office Excel

View data or edit query in Microsoft Query

Create an OLAP Cube from this query

The same process can be used to import data into a Word document, where the data will be inserted as a table. This can be used for mail merge purposes (where the field data is read from a Word table), or where you want to include data and reports within a report or other document.

20.1.5.6. Using Connector/ODBC with Crystal Reports

Crystal Reports can use an ODBC DSN to connect to a database from which you to extract data and information for reporting purposes.

Note

There is a known issue with certain versions of Crystal Reports where the application is unable to open and browse tables and fields through an ODBC connection. Before using Crystal Reports with MySQL, please ensure that you have update to the latest version, including any outstanding service packs and hotfixes. For more information on this issue, see the [Business\) Objects Knowledgebase](#) for more information.

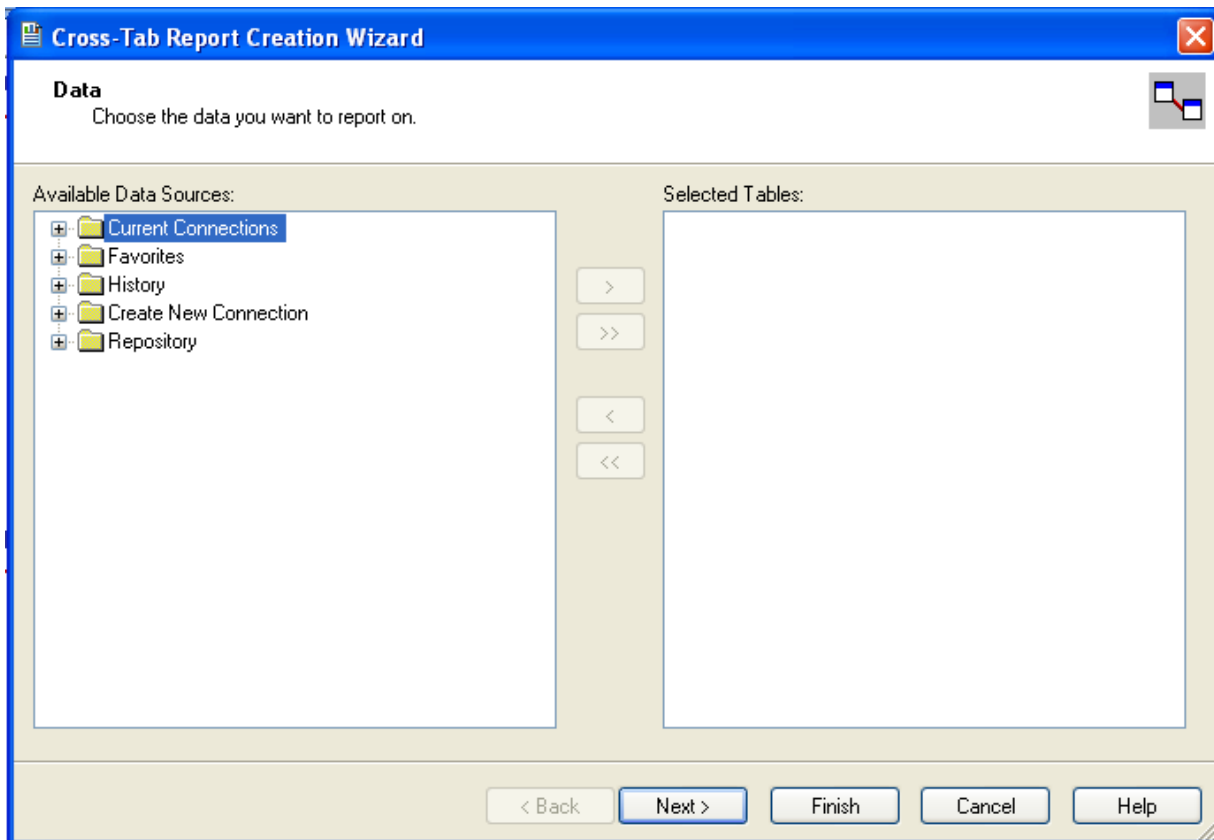

For example, to create a simple crosstab report within Crystal Reports XI, you should follow these steps:

1. Create a DSN using the [Data Sources \(ODBC\)](#) tool. You can either specify a complete database, including user name and password, or you can build a basic DSN and use Crystal Reports to set the user name and password.

For the purposes of this example, a DSN that provides a connection to an instance of the MySQL Sakila sample database has been created.

2. Open Crystal Reports and create a new project, or an open an existing reporting project into which you want to insert data from your MySQL data source.
3. Start the Cross-Tab Report Wizard, either by clicking on the option on the Start Page. Expand the **CREATE NEW CONNECTION** folder, then expand the **ODBC (RDO)** folder to obtain a list of ODBC data sources.

You will be asked to select a data source.

4. When you first expand the **ODBC (RDO)** folder you will be presented the Data Source Selection screen. From here you can select either a pre-configured DSN, open a file-based DSN or enter and manual connection string. For this example, the **SAKILA** DSN will be used.

If the DSN contains a user name/password combination, or you want to use different authentication credentials, click **NEXT** to enter the user name and password that you want to use. Otherwise, click **FINISH** to continue the data source selection wizard.

5. You will be returned the Cross-Tab Report Creation Wizard. You now need to select the database and tables that you want to include in your report. For our example, we will expand the selected Sakila database. Click the `city` table and use the `>` button to add the table to the report. Then repeat the action with the `country` table. Alternatively you can select multiple tables and add them to the report.

Finally, you can select the parent **SAKILA** resource and add of the tables to the report.

Once you have selected the tables you want to include, click **NEXT** to continue.

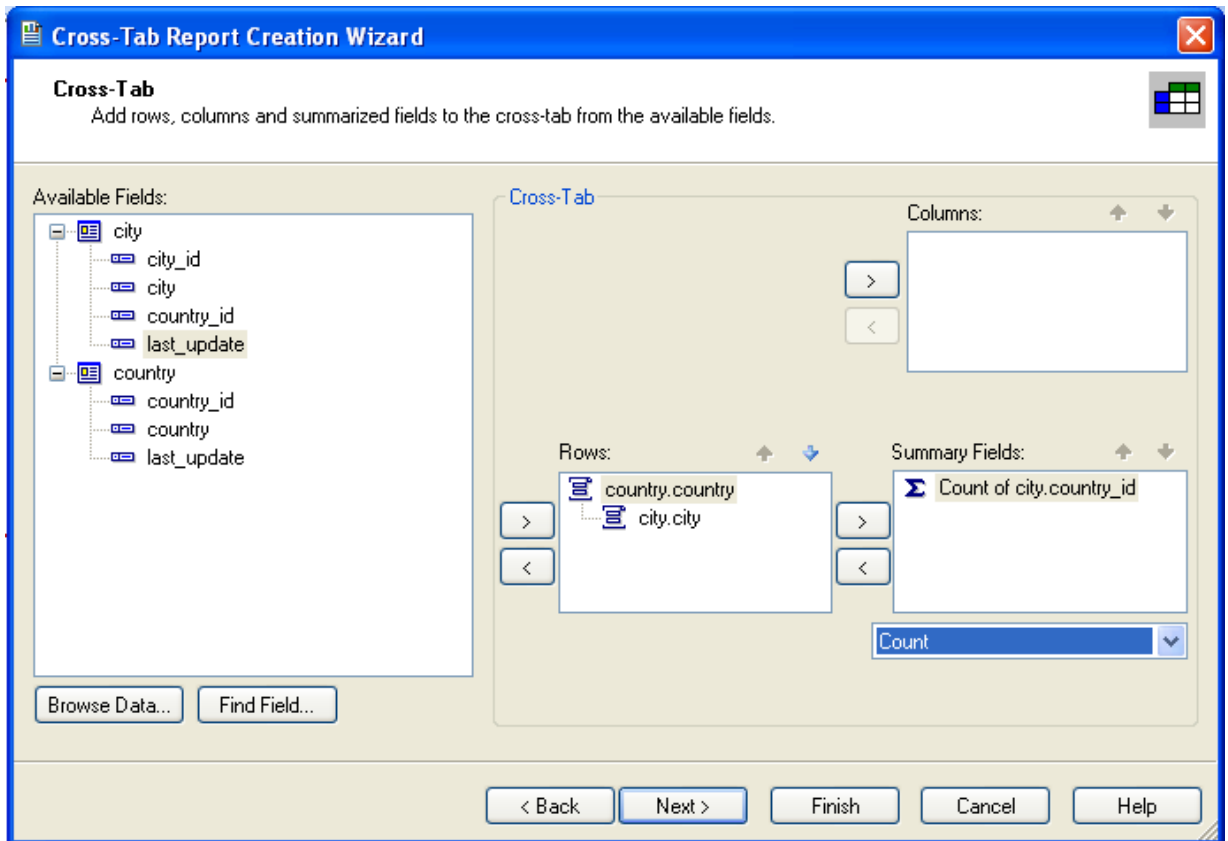

6. Crystal Reports will now read the table definitions and automatically identify the links between the tables. The identification of links between tables enables Crystal Reports to automatically lookup and summarize information based on all the tables in the database according to your query. If Crystal Reports is unable to perform the linking itself, you can manually create the links between fields in the tables you have selected.

Click NEXT to continue the process.

7. You can now select the columns and rows that you wish to include within the Cross-Tab report. Drag and drop or use the > buttons to add fields to each area of the report. In the example shown, we will report on cities, organized by country, incorporating a count of the number of cities within each country. If you want to browse the data, select a field and click the BROWSE DATA... button.

Click NEXT to create a graph of the results. Since we are not creating a graph from this data, click FINISH to generate the report.

8. The finished report will be shown, a sample of the output from the Sakila sample database is shown below.

		Total
Total		600
Afghanistan	Total	1
	Kabul	1
Algeria	Total	3
	Batna	1
	Bchar	1
	Skikda	1
American Samoa	Total	1
	Tafuna	1
Angola	Total	2
	Benguela	1
	Namibe	1
Anguilla	Total	1
	South Hill	1
Argentina	Total	13
	Almirante Brow	1

Once the ODBC connection has been opened within Crystal Reports, you can browse and add any fields within the available tables into your reports.

20.1.5.7. Connector/ODBC Programming

With a suitable ODBC Manager and the Connector/ODBC driver installed, any programming language or environment that can support ODBC should be able to connect to a MySQL database through Connector/ODBC.

This includes, but is certainly not limited to, Microsoft support languages (including Visual Basic, C# and interfaces such as ODBC.NET), Perl (through the DBI module, and the DBD::ODBC driver).

20.1.5.7.1. Using Connector/ODBC with Visual Basic Using ADO, DAO and RDO

This section contains simple examples of the use of MySQL ODBC 3.51 Driver with ADO, DAO and RDO.

20.1.5.7.1.1. ADO: `rs.addNew`, `rs.delete`, and `rs.update`

The following ADO (ActiveX Data Objects) example creates a table `my_ado` and demonstrates the use of `rs.addNew`, `rs.delete`, and `rs.update`.

```
Private Sub myodbc_ado_Click()

Dim conn As ADODB.Connection
Dim rs As ADODB.Recordset
Dim fld As ADODB.Field
Dim sql As String

'connect to MySQL server using MySQL ODBC 3.51 Driver
Set conn = New ADODB.Connection
conn.ConnectionString = "DRIVER={MySQL ODBC 3.51 Driver};" _
& "SERVER=localhost;" _
& "DATABASE=test;" _
& "UID=venu;PWD=venu; OPTION=3"

conn.Open

'create table
conn.Execute "DROP TABLE IF EXISTS my_ado"
conn.Execute "CREATE TABLE my_ado(id int not null primary key, name varchar(20)," _
& "txt text, dt date, tm time, ts timestamp)"

'direct insert
conn.Execute "INSERT INTO my_ado(id,name,txt) values(1,100,'venu')"
conn.Execute "INSERT INTO my_ado(id,name,txt) values(2,200,'MySQL')"
conn.Execute "INSERT INTO my_ado(id,name,txt) values(3,300,'Delete')"

Set rs = New ADODB.Recordset
rs.CursorLocation = adUseServer

'fetch the initial table ..
rs.Open "SELECT * FROM my_ado", conn
Debug.Print rs.RecordCount
rs.MoveFirst
Debug.Print String(50, "-") & "Initial my_ado Result Set " & String(50, "-")
For Each fld In rs.Fields
Debug.Print fld.Name,
Next
Debug.Print

Do Until rs.EOF
For Each fld In rs.Fields
Debug.Print fld.Value,
Next
rs.MoveNext
Debug.Print
Loop
rs.Close

'rs insert
rs.Open "select * from my_ado", conn, adOpenDynamic, adLockOptimistic
rs.AddNew
rs!Name = "Monty"
rs!txt = "Insert row"
rs.Update
rs.Close

'rs update
rs.Open "SELECT * FROM my_ado"
rs!Name = "update"
rs!txt = "updated-row"
rs.Update
rs.Close

'rs update second time..
rs.Open "SELECT * FROM my_ado"
rs!Name = "update"
rs!txt = "updated-second-time"
rs.Update
rs.Close

'rs delete
rs.Open "SELECT * FROM my_ado"
rs.MoveNext
rs.MoveNext
rs.Delete
rs.Close

'fetch the updated table ..
rs.Open "SELECT * FROM my_ado", conn
Debug.Print rs.RecordCount
rs.MoveFirst
Debug.Print String(50, "-") & "Updated my_ado Result Set " & String(50, "-")
For Each fld In rs.Fields
Debug.Print fld.Name,
Next
Debug.Print

Do Until rs.EOF
For Each fld In rs.Fields
Debug.Print fld.Value,
```

```

Next
rs.MoveNext
Debug.Print
Loop
rs.Close
conn.Close
End Sub

```

20.1.5.7.1.2. DAO: `rs.addNew`, `rs.update`, and Scrolling

The following DAO (Data Access Objects) example creates a table `my_dao` and demonstrates the use of `rs.addNew`, `rs.update`, and result set scrolling.

```

Private Sub myodbc_dao_Click()

Dim ws As Workspace
Dim conn As Connection
Dim queryDef As queryDef
Dim str As String

'connect to MySQL using MySQL ODBC 3.51 Driver

ws.Close

End Sub

```

20.1.5.7.1.3. RDO: `rs.addNew` and `rs.update`

The following RDO (Remote Data Objects) example creates a table `my_rdo` and demonstrates the use of `rs.addNew` and `rs.update`.

```

Dim rs As rdoResultset
Dim cn As New rdoConnection
Dim cl As rdoColumn
Dim SQL As String

'cn.Connect = "DSN=test;"
cn.Connect = "DRIVER={MySQL ODBC 3.51 Driver};"_
& "SERVER=localhost;"_
& "DATABASE=test;"_
& "UID=venu;PWD=venu; OPTION=3"

cn.CursorDriver = rdUseOdbc
cn.EstablishConnection rdDriverPrompt

'drop table my_rdo
SQL = "drop table if exists my_rdo"
cn.Execute SQL, rdExecDirect

'create table my_rdo
SQL = "create table my_rdo(id int, name varchar(20))"
cn.Execute SQL, rdExecDirect

'insert - direct
SQL = "insert into my_rdo values (100,'venu')"
cn.Execute SQL, rdExecDirect

SQL = "insert into my_rdo values (200,'MySQL')"
cn.Execute SQL, rdExecDirect

'rs insert
SQL = "select * from my_rdo"
Set rs = cn.OpenResultset(SQL, rdOpenStatic, rdConcurRowVer, rdExecDirect)
rs.AddNew
rs!id = 300
rs!Name = "Insert1"
rs.Update
rs.Close

'rs insert
SQL = "select * from my_rdo"
Set rs = cn.OpenResultset(SQL, rdOpenStatic, rdConcurRowVer, rdExecDirect)
rs.AddNew
rs!id = 400
rs!Name = "Insert 2"
rs.Update
rs.Close

'rs update
SQL = "select * from my_rdo"
Set rs = cn.OpenResultset(SQL, rdOpenStatic, rdConcurRowVer, rdExecDirect)
rs.Edit
rs!id = 999
rs!Name = "updated"
rs.Update
rs.Close

'fetch back...
SQL = "select * from my_rdo"
Set rs = cn.OpenResultset(SQL, rdOpenStatic, rdConcurRowVer, rdExecDirect)
Do Until rs.EOF
For Each cl In rs.rdoColumns
Debug.Print cl.Value,
Next
rs.MoveNext
Debug.Print
Loop
Debug.Print "Row count="; rs.RowCount

'close
rs.Close
cn.Close

End Sub

```

20.1.5.7.2. Using Connector/ODBC with .NET

This section contains simple examples that demonstrate the use of Connector/ODBC drivers with ODBC.NET.

20.1.5.7.2.1. Using Connector/ODBC with ODBC.NET and C# (C sharp)

The following sample creates a table `my_odbc_net` and demonstrates its use in C#.

```

/**
 * @sample      : mycon.cs
 * @purpose     : Demo sample for ODBC.NET using Connector/ODBC
 * @author      : Venu, <myodbc@lists.mysql.com>
 *
 * (C) Copyright MySQL AB, 1995-2006
 *
 **/

```

```

/* build command
 *
 * csc /t:exe
 * /out:mycon.exe mycon.cs
 * /r:Microsoft.Data.Odbc.dll
 */

using Console = System.Console;
using Microsoft.Data.Odbc;

namespace myodbc3
{
    class mycon
    {
        static void Main(string[] args)
        {
            try
            {
                //Connection string for Connector/ODBC 3.51
                string MyConString = "DRIVER={MySQL ODBC 3.51 Driver};" +
                    "SERVER=localhost;" +
                    "DATABASE=test;" +
                    "UID=venu;" +
                    "PASSWORD=venu;" +
                    "OPTION=3";

                //Connect to MySQL using Connector/ODBC
                OdbcConnection MyConnection = new OdbcConnection(MyConString);
                MyConnection.Open();

                Console.WriteLine("\n !!! success, connected successfully !!!\n");

                //Display connection information
                Console.WriteLine("Connection Information:");
                Console.WriteLine("\tConnection String:" +
                    MyConnection.ConnectionString);
                Console.WriteLine("\tConnection Timeout:" +
                    MyConnection.ConnectionTimeout);
                Console.WriteLine("\tDatabase:" +
                    MyConnection.Database);
                Console.WriteLine("\tDataSource:" +
                    MyConnection.DataSource);
                Console.WriteLine("\tDriver:" +
                    MyConnection.Driver);
                Console.WriteLine("\tServerVersion:" +
                    MyConnection.ServerVersion);

                //Create a sample table
                OdbcCommand MyCommand =
                    new OdbcCommand("DROP TABLE IF EXISTS my_odbc_net",
                    MyConnection);
                MyCommand.ExecuteNonQuery();
                MyCommand.CommandText =
                    "CREATE TABLE my_odbc_net(id int, name varchar(20), idb bigint)";
                MyCommand.ExecuteNonQuery();

                //Insert
                MyCommand.CommandText =
                    "INSERT INTO my_odbc_net VALUES(10,'venu', 300)";
                Console.WriteLine("INSERT, Total rows affected:" +
                    MyCommand.ExecuteNonQuery());

20.1.6. Connector/ODBC Reference

This section provides reference material for the Connector/ODBC API, showing supported functions and methods, supported MySQL column types and the corresponding native type in Connector/ODBC, and the error codes returned by Connector/ODBC when a fault occurs.

20.1.6.1. Connector/ODBC API Reference

This section summarizes ODBC routines, categorized by functionality.

For the complete ODBC API reference, please refer to the ODBC Programmer's Reference at <http://msdn.microsoft.com/en-us/library/ms714177.aspx>.

An application can call [SQLGetInfo](#) function to obtain conformance information about Connector/ODBC. To obtain information about support for a specific function in the driver, an application can call [SQLGetFunctions](#).

Note

For backward compatibility, the Connector/ODBC 3.51 driver supports all deprecated functions.

The following tables list Connector/ODBC API calls grouped by task:

Connecting to a data source

Function name	C/ODBC 3.51	Standard	Purpose
SQLAllocHandle	Yes	ISO 92	Obtains an environment, connection, statement, or descriptor handle.
SQLConnect	Yes	ISO 92	Connects to a specific driver by data source name, user ID, and password.
SQLDriverConnect	Yes	ODBC	Connects to a specific driver by connection string or requests that the Driver Manager and driver display connection dialog boxes for the user.

SQLAllocEnv	Yes	Deprecated	Obtains an environment handle allocated from driver.
SQLAllocConnect	Yes	Deprecated	Obtains a connection handle

Obtaining information about a driver and data source

Function name	C/ODBC 3.51	Standard	Purpose
SQLDataSources	No	ISO 92	Returns the list of available data sources, handled by the Driver Manager
SQLDrivers	No	ODBC	Returns the list of installed drivers and their attributes, handles by Driver Manager
SQLGetInfo	Yes	ISO 92	Returns information about a specific driver and data source.
SQLGetFunctions	Yes	ISO 92	Returns supported driver functions.
SQLGetTypeInfo	Yes	ISO 92	Returns information about supported data types.

Setting and retrieving driver attributes

Function name	C/ODBC 3.51	Standard	Purpose
SQLSetConnectAttr	Yes	ISO 92	Sets a connection attribute.
SQLGetConnectAttr	Yes	ISO 92	Returns the value of a connection attribute.
SQLSetConnectOption	Yes	Deprecated	Sets a connection option
SQLGetConnectOption	Yes	Deprecated	Returns the value of a connection option
SQLSetEnvAttr	Yes	ISO 92	Sets an environment attribute.
SQLGetEnvAttr	Yes	ISO 92	Returns the value of an environment attribute.
SQLSetStmtAttr	Yes	ISO 92	Sets a statement attribute.
SQLGetStmtAttr	Yes	ISO 92	Returns the value of a statement attribute.
SQLSetStmtOption	Yes	Deprecated	Sets a statement option
SQLGetStmtOption	Yes	Deprecated	Returns the value of a statement option

Preparing SQL requests

Function name	C/ODBC 3.51	Standard	Purpose
SQLAllocStmt	Yes	Deprecated	Allocates a statement handle
SQLPrepare	Yes	ISO 92	Prepares an SQL statement for later execution.
SQLBindParameter	Yes	ODBC	Assigns storage for a parameter in an SQL statement.
SQLGetCursorName	Yes	ISO 92	Returns the cursor name associated with a statement handle.
SQLSetCursorName	Yes	ISO 92	Specifies a cursor name.
SQLSetScrollOptions	Yes	ODBC	Sets options that control cursor behavior.

Submitting requests

Function name	C/ODBC 3.51	Standard	Purpose
SQLExecute	Yes	ISO 92	Executes a prepared statement.
SQLExecDirect	Yes	ISO 92	Executes a statement
SQLNativeSql	Yes	ODBC	Returns the text of an SQL statement as translated by the driver.
SQLDescribeParam	Yes	ODBC	Returns the description for a specific parameter in a statement.
SQLNumParams	Yes	ISO 92	Returns the number of parameters in a statement.
SQLParamData	Yes	ISO 92	Used in conjunction with SQLPutData to supply parameter data at execution time. (Useful for long data values.)

SQLPutData	Yes	ISO 92	Sends part or all of a data value for a parameter. (Useful for long data values.)
------------	-----	--------	---

Retrieving results and information about results

Function name	C/ODBC 3.51	Standard	Purpose
SQLRowCount	Yes	ISO 92	Returns the number of rows affected by an insert, update, or delete request.
SQLNumResultCols	Yes	ISO 92	Returns the number of columns in the result set.
SQLDescribeCol	Yes	ISO 92	Describes a column in the result set.
SQLColAttribute	Yes	ISO 92	Describes attributes of a column in the result set.
SQLColAttributes	Yes	Deprecated	Describes attributes of a column in the result set.
SQLFetch	Yes	ISO 92	Returns multiple result rows.
SQLFetchScroll	Yes	ISO 92	Returns scrollable result rows.
SQLExtendedFetch	Yes	Deprecated	Returns scrollable result rows.
SQLSetPos	Yes	ODBC	Positions a cursor within a fetched block of data and allows an application to refresh data in the rowset or to update or delete data in the result set.
SQLBulkOperations	Yes	ODBC	Performs bulk insertions and bulk bookmark operations, including update, delete, and fetch by bookmark.

Retrieving error or diagnostic information

Function name	C/ODBC 3.51	Standard	Purpose
SQLError	Yes	Deprecated	Returns additional error or status information
SQLGetDiagField	Yes	ISO 92	Returns additional diagnostic information (a single field of the diagnostic data structure).
SQLGetDiagRec	Yes	ISO 92	Returns additional diagnostic information (multiple fields of the diagnostic data structure).

Obtaining information about the data source's system tables (catalog functions) item

Function name	C/ODBC 3.51	Standard	Purpose
SQLColumnPrivileges	Yes	ODBC	Returns a list of columns and associated privileges for one or more tables.
SQLColumns	Yes	X/Open	Returns the list of column names in specified tables.
SQLForeignKeys	Yes	ODBC	Returns a list of column names that make up foreign keys, if they exist for a specified table.
SQLPrimaryKeys	Yes	ODBC	Returns the list of column names that make up the primary key for a table.
SQLSpecialColumns	Yes	X/Open	Returns information about the optimal set of columns that uniquely identifies a row in a specified table, or the columns that are automatically updated when any value in the row is updated by a transaction.
SQLStatistics	Yes	ISO 92	Returns statistics about a single table and the list of indexes associated with the table.
SQLTablePrivileges	Yes	ODBC	Returns a list of tables and the privileges associated with each table.
SQLTables	Yes	X/Open	Returns the list of table names stored in a specific data source.

Performing transactions

Function name	C/ODBC 3.51	Standard	Purpose
SQLTransact	Yes	Deprecated	Commits or rolls back a transaction
SQLEndTran	Yes	ISO 92	Commits or rolls back a transaction.

Terminating a statement

Function name	C/ODBC 3.51	Standard	Purpose
SQLFreeStmt	Yes	ISO 92	Ends statement processing, discards pending results, and, optionally, frees all resources associated with the statement handle.
SQLCloseCursor	Yes	ISO 92	Closes a cursor that has been opened on a statement handle.
SQLCancel	Yes	ISO 92	Cancels an SQL statement.

Terminating a connection

Function name	C/ODBC 3.51	Standard	Purpose
SQLDisconnect	Yes	ISO 92	Closes the connection.
SQLFreeHandle	Yes	ISO 92	Releases an environment, connection, statement, or descriptor handle.
SQLFreeConnect	Yes	Deprecated	Releases connection handle
SQLFreeEnv	Yes	Deprecated	Releases an environment handle

20.1.6.2. Connector/ODBC Data Types

The following table illustrates how driver maps the server data types to default SQL and C data types.

Native Value	SQL Type	C Type
<code>bigint unsigned</code>	<code>SQL_BIGINT</code>	<code>SQL_C_UBIGINT</code>
<code>bigint</code>	<code>SQL_BIGINT</code>	<code>SQL_C_SBIGINT</code>
<code>bit</code>	<code>SQL_BIT</code>	<code>SQL_C_BIT</code>
<code>bit</code>	<code>SQL_CHAR</code>	<code>SQL_C_CHAR</code>
<code>blob</code>	<code>SQL_LONGVARBINARY</code>	<code>SQL_C_BINARY</code>
<code>bool</code>	<code>SQL_CHAR</code>	<code>SQL_C_CHAR</code>
<code>char</code>	<code>SQL_CHAR</code>	<code>SQL_C_CHAR</code>
<code>date</code>	<code>SQL_DATE</code>	<code>SQL_C_DATE</code>
<code>datetime</code>	<code>SQL_TIMESTAMP</code>	<code>SQL_C_TIMESTAMP</code>
<code>decimal</code>	<code>SQL_DECIMAL</code>	<code>SQL_C_CHAR</code>
<code>double precision</code>	<code>SQL_DOUBLE</code>	<code>SQL_C_DOUBLE</code>
<code>double</code>	<code>SQL_FLOAT</code>	<code>SQL_C_DOUBLE</code>
<code>enum</code>	<code>SQL_VARCHAR</code>	<code>SQL_C_CHAR</code>
<code>float</code>	<code>SQL_REAL</code>	<code>SQL_C_FLOAT</code>
<code>int unsigned</code>	<code>SQL_INTEGER</code>	<code>SQL_C_ULONG</code>
<code>int</code>	<code>SQL_INTEGER</code>	<code>SQL_C_SLONG</code>
<code>integer unsigned</code>	<code>SQL_INTEGER</code>	<code>SQL_C_ULONG</code>
<code>integer</code>	<code>SQL_INTEGER</code>	<code>SQL_C_SLONG</code>
<code>long varbinary</code>	<code>SQL_LONGVARBINARY</code>	<code>SQL_C_BINARY</code>
<code>long varchar</code>	<code>SQL_LONGVARCHAR</code>	<code>SQL_C_CHAR</code>
<code>longblob</code>	<code>SQL_LONGVARBINARY</code>	<code>SQL_C_BINARY</code>
<code>longtext</code>	<code>SQL_LONGVARCHAR</code>	<code>SQL_C_CHAR</code>

mediumblob	SQL_LONGVARBINARY	SQL_C_BINARY
mediumint unsigned	SQL_INTEGER	SQL_C_ULONG
mediumint	SQL_INTEGER	SQL_C_SLONG
mediumtext	SQL_LONGVARCHAR	SQL_C_CHAR
numeric	SQL_NUMERIC	SQL_C_CHAR
real	SQL_FLOAT	SQL_C_DOUBLE
set	SQL_VARCHAR	SQL_C_CHAR
smallint unsigned	SQL_SMALLINT	SQL_C_USHORT
smallint	SQL_SMALLINT	SQL_C_SSHORT
text	SQL_LONGVARCHAR	SQL_C_CHAR
time	SQL_TIME	SQL_C_TIME
timestamp	SQL_TIMESTAMP	SQL_C_TIMESTAMP
tinyblob	SQL_LONGVARBINARY	SQL_C_BINARY
tinyint unsigned	SQL_TINYINT	SQL_C_UTINYINT
tinyint	SQL_TINYINT	SQL_C_STINYINT
tinytext	SQL_LONGVARCHAR	SQL_C_CHAR
varchar	SQL_VARCHAR	SQL_C_CHAR
year	SQL_SMALLINT	SQL_C_SHORT

20.1.6.3. Connector/ODBC Error Codes

The following tables lists the error codes returned by the driver apart from the server errors.

Native Code	SQLSTATE 2	SQLSTATE 3	Error Message
500	01000	01000	General warning
501	01004	01004	String data, right truncated
502	01S02	01S02	Option value changed
503	01S03	01S03	No rows updated/deleted
504	01S04	01S04	More than one row updated/deleted
505	01S06	01S06	Attempt to fetch before the result set returned the first row set
506	07001	07002	<code>SQLBindParameter</code> not used for all parameters
507	07005	07005	Prepared statement not a cursor-specification
508	07009	07009	Invalid descriptor index
509	08002	08002	Connection name in use
510	08003	08003	Connection does not exist
511	24000	24000	Invalid cursor state
512	25000	25000	Invalid transaction state
513	25S01	25S01	Transaction state unknown
514	34000	34000	Invalid cursor name
515	S1000	HY000	General driver defined error
516	S1001	HY001	Memory allocation error
517	S1002	HY002	Invalid column number
518	S1003	HY003	Invalid application buffer type
519	S1004	HY004	Invalid SQL data type
520	S1009	HY009	Invalid use of null pointer
521	S1010	HY010	Function sequence error
522	S1011	HY011	Attribute can not be set now
523	S1012	HY012	Invalid transaction operation code

524	S1013	HY013	Memory management error
525	S1015	HY015	No cursor name available
526	S1024	HY024	Invalid attribute value
527	S1090	HY090	Invalid string or buffer length
528	S1091	HY091	Invalid descriptor field identifier
529	S1092	HY092	Invalid attribute/option identifier
530	S1093	HY093	Invalid parameter number
531	S1095	HY095	Function type out of range
532	S1106	HY106	Fetch type out of range
533	S1117	HY117	Row value out of range
534	S1109	HY109	Invalid cursor position
535	S1C00	HYC00	Optional feature not implemented
0	21S01	21S01	Column count does not match value count
0	23000	23000	Integrity constraint violation
0	42000	42000	Syntax error or access violation
0	42S02	42S02	Base table or view not found
0	42S12	42S12	Index not found
0	42S21	42S21	Column already exists
0	42S22	42S22	Column not found
0	08S01	08S01	Communication link failure

20.1.7. Connector/ODBC Notes and Tips

Here are some common notes and tips for using Connector/ODBC within different environments, applications and tools. The notes provided here are based on the experiences of Connector/ODBC developers and users.

20.1.7.1. Connector/ODBC General Functionality

This section provides help with common queries and areas of functionality in MySQL and how to use them with Connector/ODBC.

20.1.7.1.1. Obtaining Auto-Increment Values

Obtaining the value of column that uses `AUTO_INCREMENT` after an `INSERT` statement can be achieved in a number of different ways. To obtain the value immediately after an `INSERT`, use a `SELECT` query with the `LAST_INSERT_ID()` function.

For example, using Connector/ODBC you would execute two separate statements, the `INSERT` statement and the `SELECT` query to obtain the auto-increment value.

```
INSERT INTO tbl (auto,text) VALUES(NULL,'text');
SELECT LAST_INSERT_ID();
```

If you do not require the value within your application, but do require the value as part of another `INSERT`, the entire process can be handled by executing the following statements:

```
INSERT INTO tbl (auto,text) VALUES(NULL,'text');
INSERT INTO tbl2 (id,text) VALUES(LAST_INSERT_ID(),'text');
```

Certain ODBC applications (including Delphi and Access) may have trouble obtaining the auto-increment value using the previous examples. In this case, try the following statement as an alternative:

```
SELECT * FROM tbl WHERE auto IS NULL;
```

See [Section 20.10.10.3, “How to Get the Unique ID for the Last Inserted Row”](#).

20.1.7.1.2. Dynamic Cursor Support

Support for the `dynamic cursor` is provided in Connector/ODBC 3.51, but dynamic cursors are not enabled by default. You can enable this function within Windows by selecting the `Enable Dynamic Cursor` checkbox within the ODBC Data Source Administrator.

On other platforms, you can enable the dynamic cursor by adding 32 to the `OPTION` value when creating the DSN.

20.1.7.1.3. Connector/ODBC Performance

The Connector/ODBC driver has been optimized to provide very fast performance. If you experience problems with the performance of Connector/ODBC, or notice a large amount of disk activity for simple queries, there are a number of aspects you should check:

- Ensure that `ODBC Tracing` is not enabled. With tracing enabled, a lot of information is recorded in the tracing file by the ODBC Manager. You can check, and disable, tracing within Windows using the TRACING panel of the ODBC Data Source Administrator. Within Mac OS X, check the TRACING panel of ODBC Administrator. See [Section 20.1.4.8, “Getting an ODBC Trace File”](#).
- Make sure you are using the standard version of the driver, and not the debug version. The debug version includes additional checks and reporting measures.
- Disable the Connector/ODBC driver trace and query logs. These options are enabled for each DSN, so make sure to examine only the DSN that you are using in your application. Within Windows, you can disable the Connector/ODBC and query logs by modifying the DSN configuration. Within Mac OS X and Unix, ensure that the driver trace (option value 4) and query logging (option value 524288) are not enabled.

20.1.7.1.4. Setting ODBC Query Timeout in Windows

For more information on how to set the query timeout on Microsoft Windows when executing queries through an ODBC connection, read the Microsoft knowledgebase document at <http://support.microsoft.com/default.aspx?scid=kb%3Ben-us%3B153756>.

20.1.7.2. Connector/ODBC Application Specific Tips

Most programs should work with Connector/ODBC, but for each of those listed here, there are specific notes and tips to improve or enhance the way you work with Connector/ODBC and these applications.

With all applications you should ensure that you are using the latest Connector/ODBC drivers, ODBC Manager and any supporting libraries and interfaces used by your application. For example, on Windows, using the latest version of Microsoft Data Access Components (MDAC) will improve the compatibility with ODBC in general, and with the Connector/ODBC driver.

20.1.7.2.1. Using Connector/ODBC with Microsoft Applications

The majority of Microsoft applications have been tested with Connector/ODBC, including Microsoft Office, Microsoft Access and the various programming languages supported within ASP and Microsoft Visual Studio.

20.1.7.2.1.1. Microsoft Access

To improve the integration between Microsoft Access and MySQL through Connector/ODBC:

- For all versions of Access, you should enable the Connector/ODBC `Return matching rows` option. For Access 2.0, you should additionally enable the `Simulate ODBC 1.0` option.
- You should have a `TIMESTAMP` column in all tables that you want to be able to update. For maximum portability, do not use a length specification in the column declaration (which is unsupported within MySQL in versions earlier than 4.1).
- You should have a primary key in each MySQL table you want to use with Access. If not, new or updated rows may show up as `#DELETED#`.
- Use only `DOUBLE` float fields. Access fails when comparing with single-precision floats. The symptom usually is that new or updated rows may show up as `#DELETED#` or that you cannot find or update rows.
- If you are using Connector/ODBC to link to a table that has a `BIGINT` column, the results are displayed as `#DELETED#`. The work around solution is:
 - Have one more dummy column with `TIMESTAMP` as the data type.
 - Select the `Change BIGINT columns to INT` option in the connection dialog in ODBC DSN Administrator.
 - Delete the table link from Access and re-create it.

Old records may still display as `#DELETED#`, but newly added/updated records are displayed properly.

- If you still get the error [Another user has changed your data](#) after adding a `TIMESTAMP` column, the following trick may help you:

Do not use a `table` data sheet view. Instead, create a form with the fields you want, and use that `form` data sheet view. You should set the `DefaultValue` property for the `TIMESTAMP` column to `NOW()`. It may be a good idea to hide the `TIMESTAMP` column from view so your users are not confused.

- In some cases, Access may generate SQL statements that MySQL cannot understand. You can fix this by selecting "`Query|SQLSpecific|Pass-Through`" from the Access menu.
- On Windows NT, Access reports `BLOB` columns as `OLE OBJECTS`. If you want to have `MEMO` columns instead, you should change `BLOB` columns to `TEXT` with `ALTER TABLE`.
- Access cannot always handle the MySQL `DATE` column properly. If you have a problem with these, change the columns to `DATETIME`.
- If you have in Access a column defined as `BYTE`, Access tries to export this as `TINYINT` instead of `TINYINT UNSIGNED`. This gives you problems if you have values larger than 127 in the column.
- If you have very large (long) tables in Access, it might take a very long time to open them. Or you might run low on virtual memory and eventually get an `ODBC Query Failed` error and the table cannot open. To deal with this, select the following options:
 - Return Matching Rows (2)
 - Allow BIG Results (8).

These add up to a value of 10 (`OPTION=10`).

Some external articles and tips that may be useful when using Access, ODBC and Connector/ODBC:

- Read [How to Trap ODBC Login Error Messages in Access](#)
- [Optimizing Access ODBC Applications](#)
 - [Optimizing for Client/Server Performance](#)
 - [Tips for Converting Applications to Using ODBCdirect](#)
 - [Tips for Optimizing Queries on Attached SQL Tables](#)
- For a list of tools that can be used with Access and ODBC data sources, refer to [converters](#) section for list of available tools.

MySQL Enterprise

MySQL Enterprise subscribers will find more information about using ODBC with Access in Knowledge Base articles such as [Use MySQL-Specific Syntax with Microsoft Access](#). To subscribe to MySQL Enterprise see <http://www.mysql.com/products/enterprise/advisors.html>.

20.1.7.2.1.2. Microsoft Excel and Column Types

If you have problems importing data into Microsoft Excel, particularly numerical, date, and time values, this is probably because of a bug in Excel, where the column type of the source data is used to determine the data type when that data is inserted into a cell within the worksheet. The result is that Excel incorrectly identifies the content and this affects both the display format and the data when it is used within calculations.

To address this issue, use the `CONCAT()` function in your queries. The use of `CONCAT()` forces Excel to treat the value as a string, which Excel will then parse and usually correctly identify the embedded information.

However, even with this option, some data may be incorrectly formatted, even though the source data remains unchanged. Use the [Format Cells](#) option within Excel to change the format of the displayed information.

20.1.7.2.1.3. Microsoft Visual Basic

To be able to update a table, you must define a primary key for the table.

Visual Basic with ADO cannot handle big integers. This means that some queries like `SHOW PROCESSLIST` do not work properly. The fix is to use `OPTION=16384` in the ODBC connect string or to select the `Change BIGINT columns to INT` option in the Connector/ODBC connect screen. You may also want to select the [Return matching rows](#) option.

MySQL Enterprise

MySQL Enterprise subscribers can find a discussion about using VBA in the Knowledge Base article, [MySQL-Specific Syntax with VBA](http://www.mysql.com/products/enterprise/advisors.html). To subscribe to MySQL Enterprise see <http://www.mysql.com/products/enterprise/advisors.html>.

20.1.7.2.1.4. Microsoft Visual InterDev

If you have a `BIGINT` in your result, you may get the error `[Microsoft][ODBC Driver Manager] Driver does not support this parameter`. Try selecting the `Change BIGINT columns to INT` option in the Connector/ODBC connect screen.

20.1.7.2.1.5. Visual Objects

You should select the `Don't optimize column widths` option.

20.1.7.2.1.6. Microsoft ADO

When you are coding with the ADO API and Connector/ODBC, you need to pay attention to some default properties that aren't supported by the MySQL server. For example, using the `CursorLocation Property` as `adUseServer` returns a result of `-1` for the `RecordCount Property`. To have the right value, you need to set this property to `adUseClient`, as shown in the VB code here:

```
Dim myconn As New ADOConnection
Dim myrs As New Recordset
Dim mySQL As String
Dim myrows As Long

myconn.Open "DSN=MyODBCsample"
mySQL = "SELECT * from user"
myrs.Source = mySQL
Set myrs.ActiveConnection = myconn
myrs.CursorLocation = adUseClient
myrs.Open
myrows = myrs.RecordCount

myrs.Close
myconn.Close
```

Another workaround is to use a `SELECT COUNT(*)` statement for a similar query to get the correct row count.

To find the number of rows affected by a specific SQL statement in ADO, use the `RecordsAffected` property in the ADO `execute` method. For more information on the usage of `execute` method, refer to <http://msdn.microsoft.com/library/default.asp?url=/library/en-us/ado270/htm/mdmthcnnextexecute.asp>.

For information, see [ActiveX Data Objects\(ADO\) Frequently Asked Questions](#).

20.1.7.2.1.7. Using Connector/ODBC with Active Server Pages (ASP)

You should select the `Return matching rows` option in the DSN.

For more information about how to access MySQL via ASP using Connector/ODBC, refer to the following articles:

- [Using MyODBC To Access Your MySQL Database Via ASP](#)
- [ASP and MySQL at DWAM.NT](#)

A Frequently Asked Questions list for ASP can be found at <http://support.microsoft.com/default.aspx?scid=/Support/ActiveServer/faq/data/adofaq.asp>.

20.1.7.2.1.8. Using Connector/ODBC with Visual Basic (ADO, DAO and RDO) and ASP

Some articles that may help with Visual Basic and ASP:

- [MySQL BLOB columns and Visual Basic 6](#) by Mike Hillyer (<mike@openwin.org>).
- [How to map Visual basic data type to MySQL types](#) by Mike Hillyer (<mike@openwin.org>).

20.1.7.2.2. Using Connector/ODBC with Borland Applications

With all Borland applications where the Borland Database Engine (BDE) is used, follow these steps to improve compatibility:

- Update to BDE 3.2 or newer.
- Enable the `Don't optimize column widths` option in the DSN.
- Enabled the `Return matching rows` option in the DSN.

20.1.7.2.2.1. Using Connector/ODBC with Borland Builder 4

When you start a query, you can use the `Active` property or the `Open` method. Note that `Active` starts by automatically issuing a `SELECT * FROM ...` query. That may not be a good thing if your tables are large.

20.1.7.2.2.2. Using Connector/ODBC with Delphi

Also, here is some potentially useful Delphi code that sets up both an ODBC entry and a BDE entry for Connector/ODBC. The BDE entry requires a BDE Alias Editor that is free at a Delphi Super Page near you. (Thanks to Bryan Brunton <bryan@flesherfab.com> for this):

```
fReg:= TRegistry.Create;
fReg.OpenKey('\Software\ODBC\ODBC.INI\DocumentsFab', True);
fReg.WriteString('Database', 'Documents');
fReg.WriteString('Description', '');
fReg.WriteString('Driver', 'C:\WINNT\System32\myodbc.dll');
fReg.WriteString('Flag', '1');
fReg.WriteString('Password', '');
fReg.WriteString('Port', '');
fReg.WriteString('Server', 'xmark');
fReg.WriteString('User', 'winuser');
fReg.OpenKey('\Software\ODBC\ODBC.INI\ODBC Data Sources', True);
fReg.WriteString('DocumentsFab', 'MySQL');
fReg.CloseKey;
fReg.Free;

Memol.Lines.Add('DATABASE NAME=');
Memol.Lines.Add('USER NAME=');
Memol.Lines.Add('ODBC DSN=DocumentsFab');
Memol.Lines.Add('OPEN MODE=READ/WRITE');
Memol.Lines.Add('BATCH COUNT=200');
Memol.Lines.Add('LANGDRIVER=');
Memol.Lines.Add('MAX ROWS=-1');
Memol.Lines.Add('SCHEMA CACHE DIR=');
Memol.Lines.Add('SCHEMA CACHE SIZE=8');
Memol.Lines.Add('SCHEMA CACHE TIME=-1');
Memol.Lines.Add('SQLPASSTHRU MODE=SHARED AUTOCOMMIT');
Memol.Lines.Add('SQLQRYMODE=');
Memol.Lines.Add('ENABLE SCHEMA CACHE=FALSE');
Memol.Lines.Add('ENABLE BCD=FALSE');
Memol.Lines.Add('ROWSET SIZE=20');
Memol.Lines.Add('BLOBS TO CACHE=64');
Memol.Lines.Add('BLOB SIZE=32');

AliasEditor.Add('DocumentsFab', 'MySQL', Memol.Lines);
```

20.1.7.2.2.3. Using Connector/ODBC with C++ Builder

Tested with BDE 3.0. The only known problem is that when the table schema changes, query fields are not updated. BDE, however, does not seem to recognize primary keys, only the index named `PRIMARY`, although this has not been a problem.

20.1.7.2.3. Using Connector/ODBC with ColdFusion

The following information is taken from the ColdFusion documentation:

Use the following information to configure ColdFusion Server for Linux to use the `unixODBC` driver with Connector/ODBC for MySQL data sources. You can download Connector/ODBC at <http://dev.mysql.com/downloads/connector/odbc/>.

ColdFusion version 4.5.1 allows you to use the ColdFusion Administrator to add the MySQL data source. However, the driver is not included with ColdFusion version 4.5.1. Before the MySQL driver appears in the ODBC data sources drop-down list, you must build and copy the Connector/ODBC driver to `/opt/coldfusion/lib/libmyodbc.so`.

The Contrib directory contains the program `mysdn-xxx.zip` which allows you to build and remove the DSN registry file for the Connector/ODBC driver on ColdFusion applications.

For more information and guides on using ColdFusion and Connector/ODBC, see the following external sites:

- [Troubleshooting Data Sources and Database Connectivity for Unix Platforms](#).

20.1.7.2.4. Using Connector/ODBC with OpenOffice.org

Open Office (<http://www.openoffice.org>) [How-to: MySQL + OpenOffice](#). [How-to: OpenOffice + MyODBC + unixODBC](#).

20.1.7.2.5. Using Connector/ODBC with Sambar Server

Sambar Server (<http://www.sambarserver.info>) [How-to: MyODBC + SambarServer + MySQL](#).

20.1.7.2.6. Using Connector/ODBC with Pervasive Software DataJunction

You have to change it to output `VARCHAR` rather than `ENUM`, as it exports the latter in a manner that causes MySQL problems.

20.1.7.2.7. Using Connector/ODBC with SunSystems Vision

You should select the `Return matching rows` option.

20.1.7.3. Connector/ODBC Errors and Resolutions (FAQ)

The following section details some common errors and their suggested fix or alternative solution. If you are still experiencing problems, use the Connector/ODBC mailing list; see [Section 20.1.8.1, “Connector/ODBC Community Support”](#).

Many problems can be resolved by upgrading your Connector/ODBC drivers to the latest available release. On Windows, you should also make sure that you have the latest versions of the Microsoft Data Access Components (MDAC) installed.

Questions

- [20.1.7.3.1](#): I have installed Connector/ODBC on Windows XP x64 Edition or Windows Server 2003 R2 x64. The installation completed successfully, but the Connector/ODBC driver does not appear in `ODBC Data Source Administrator`.
- [20.1.7.3.2](#): When connecting or using the TEST button in `ODBC Data Source Administrator` I get error 10061 (Cannot connect to server)
- [20.1.7.3.3](#): The following error is reported when using transactions: `Transactions are not enabled`
- [20.1.7.3.4](#): Access reports records as `#DELETED#` when inserting or updating records in linked tables.
- [20.1.7.3.5](#): How do I handle Write Conflicts or Row Location errors?
- [20.1.7.3.6](#): Exporting data from Access 97 to MySQL reports a `Syntax Error`.
- [20.1.7.3.7](#): Exporting data from Microsoft DTS to MySQL reports a `Syntax Error`.
- [20.1.7.3.8](#): Using ODBC.NET with Connector/ODBC, while fetching empty string (0 length), it starts giving the `SQL_NO_DATA` exception.
- [20.1.7.3.9](#): Using `SELECT COUNT(*) FROM tbl_name` within Visual Basic and ASP returns an error.
- [20.1.7.3.10](#): Using the `AppendChunk()` or `GetChunk()` ADO methods, the `Multiple-step operation generated errors. Check each status value` error is returned.
- [20.1.7.3.11](#): Access Returns `Another user had modified the record that you have modified while editing records on a Linked Table`.
- [20.1.7.3.12](#): When linking an application directly to the Connector/ODBC library under Unix/Linux, the application crashes.
- [20.1.7.3.13](#): Applications in the Microsoft Office suite are unable to update tables that have `DATE` or `TIMESTAMP` columns.
- [20.1.7.3.14](#): When connecting Connector/ODBC 5.x (Beta) to a MySQL 4.x server, the error `1044 Access denied for user 'xxx'@'%' to database 'information_schema'` is returned.
- [20.1.7.3.15](#): When calling `SQLTables`, the error `S1T00` is returned, but I cannot find this in the list of error numbers for Connector/ODBC.
- [20.1.7.3.16](#): When linking to tables in Access 2000 and generating links to tables programmatically, rather than through the table designer interface, you may get errors about tables not existing.
- [20.1.7.3.17](#): When I try to use batched statements, the execution of the batched statements fails.
- [20.1.7.3.18](#): When connecting to a MySQL server using ADODB and Excel, occasionally the application fails to communicate with the server and the error `Got an error reading communication packets` appears in the error log.
- [20.1.7.3.19](#): When using some applications to access a MySQL server using C/ODBC and outer joins, an error is reported re-

garding the Outer Join Escape Sequence.

- [20.1.7.3.20](#): I can correctly store extended characters in the database (Hebrew/CJK) using C/ODBC 5.1, but when I retrieve the data, the text is not formatted correctly and I get garbled characters.
- [20.1.7.3.21](#): I have a duplicate MySQL Connector/ODBC entry within my **INSTALLED PROGRAMS** list, but I cannot delete one of them.
- [20.1.7.3.22](#): When submitting queries with parameter binding using `UPDATE`, my field values are being truncated to 255 characters.
- [20.1.7.3.23](#): Is it possible to disable data-at-execution using a flag?

Questions and Answers

20.1.7.3.1: I have installed Connector/ODBC on Windows XP x64 Edition or Windows Server 2003 R2 x64. The installation completed successfully, but the Connector/ODBC driver does not appear in ODBC Data Source Administrator.

This is not a bug, but is related to the way Windows x64 editions operate with the ODBC driver. On Windows x64 editions, the Connector/ODBC driver is installed in the `%SystemRoot%\SysWOW64` folder. However, the default `ODBC Data Source Administrator` that is available through the `Administrative Tools` or `Control Panel` in Windows x64 Editions is located in the `%SystemRoot%\system32` folder, and only searches this folder for ODBC drivers.

On Windows x64 editions, you should use the ODBC administration tool located at `%SystemRoot%\SysWOW64\odbcad32.exe`, this will correctly locate the installed Connector/ODBC drivers and enable you to create a Connector/ODBC DSN.

This issue was originally reported as [Bug#20301](#).

20.1.7.3.2: When connecting or using the TEST button in ODBC Data Source Administrator I get error 10061 (Cannot connect to server)

This error can be raised by a number of different issues, including server problems, network problems, and firewall and port blocking problems. For more information, see [Section B.1.2.2](#), “Can't connect to [local] MySQL server”.

20.1.7.3.3: The following error is reported when using transactions: Transactions are not enabled

This error indicates that you are trying to use transactions with a MySQL table that does not support transactions. Transactions are supported within MySQL when using the `InnoDB` database engine. In versions of MySQL before MySQL 5.1 you may also use the `BDB` engine.

You should check the following before continuing:

- Verify that your MySQL server supports a transactional database engine. Use `SHOW ENGINES` to obtain a list of the available engine types.
- Verify that the tables you are updating use a transaction database engine.
- Ensure that you have not enabled the `disable transactions` option in your DSN.

20.1.7.3.4: Access reports records as #DELETED# when inserting or updating records in linked tables.

If the inserted or updated records are shown as `#DELETED#` in the access, then:

- If you are using Access 2000, you should get and install the newest (version 2.6 or higher) Microsoft MDAC ([Microsoft Data Access Components](#)) from <http://support.microsoft.com/kb/110093>. This fixes a bug in Access that when you export data to MySQL, the table and column names aren't specified.

You should also get and apply the Microsoft Jet 4.0 Service Pack 5 (SP5) which can be found at <http://support.microsoft.com/default.aspx?scid=kb;EN-US;q239114>. This fixes some cases where columns are marked as `#DELETED#` in Access.

- For all versions of Access, you should enable the Connector/ODBC `Return matching rows` option. For Access 2.0, you should additionally enable the `Simulate ODBC 1.0` option.
- You should have a timestamp in all tables that you want to be able to update.
- You should have a primary key in the table. If not, new or updated rows may show up as `#DELETED#`.

- Use only `DOUBLE` float fields. Access fails when comparing with single-precision floats. The symptom usually is that new or updated rows may show up as `#DELETED#` or that you cannot find or update rows.
- If you are using Connector/ODBC to link to a table that has a `BIGINT` column, the results are displayed as `#DELETED`. The work around solution is:
 - Have one more dummy column with `TIMESTAMP` as the data type.
 - Select the `Change BIGINT columns to INT` option in the connection dialog in ODBC DSN Administrator.
 - Delete the table link from Access and re-create it.

Old records still display as `#DELETED#`, but newly added/updated records are displayed properly.

20.1.7.3.5: How do I handle Write Conflicts or Row Location errors?

If you see the following errors, select the `Return Matching Rows` option in the DSN configuration dialog, or specify `OPTION=2`, as the connection parameter:

```
Write Conflict. Another user has changed your data.
Row cannot be located for updating. Some values may have been changed
since it was last read.
```

20.1.7.3.6: Exporting data from Access 97 to MySQL reports a `Syntax Error`.

This error is specific to Access 97 and versions of Connector/ODBC earlier than 3.51.02. Update to the latest version of the Connector/ODBC driver to resolve this problem.

20.1.7.3.7: Exporting data from Microsoft DTS to MySQL reports a `Syntax Error`.

This error occurs only with MySQL tables using the `TEXT` or `VARCHAR` data types. You can fix this error by upgrading your Connector/ODBC driver to version 3.51.02 or higher.

20.1.7.3.8: Using ODBC.NET with Connector/ODBC, while fetching empty string (0 length), it starts giving the `SQL_NO_DATA` exception.

You can get the patch that addresses this problem from <http://support.microsoft.com/default.aspx?scid=kb;EN-US;q319243>.

20.1.7.3.9: Using `SELECT COUNT(*) FROM tbl_name` within Visual Basic and ASP returns an error.

This error occurs because the `COUNT(*)` expression is returning a `BIGINT`, and ADO cannot make sense of a number this big. Select the `Change BIGINT columns to INT` option (option value 16384).

20.1.7.3.10: Using the `AppendChunk()` or `GetChunk()` ADO methods, the `Multiple-step operation generated errors. Check each status value error` is returned.

The `GetChunk()` and `AppendChunk()` methods from ADO doesn't work as expected when the cursor location is specified as `adUseServer`. On the other hand, you can overcome this error by using `adUseClient`.

A simple example can be found from http://www.dwam.net/iishelp/ado/docs/adomth02_4.htm

20.1.7.3.11: Access Returns `Another user had modified the record that you have modified while editing records on a Linked Table`.

In most cases, this can be solved by doing one of the following things:

- Add a primary key for the table if one doesn't exist.
- Add a timestamp column if one doesn't exist.
- Only use double-precision float fields. Some programs may fail when they compare single-precision floats.

If these strategies do not help, you should start by making a log file from the ODBC manager (the log you get when requesting logs from ODBCADMIN) and a Connector/ODBC log to help you figure out why things go wrong. For instructions, see [Section 20.1.4.8, "Getting an ODBC Trace File"](#).

20.1.7.3.12: When linking an application directly to the Connector/ODBC library under Unix/Linux, the application crashes.

Connector/ODBC 3.51 under Unix/Linux is not compatible with direct application linking. You must use a driver manager, such as iODBC or unixODBC to connect to an ODBC source.

20.1.7.3.13: Applications in the Microsoft Office suite are unable to update tables that have `DATE` or `TIMESTAMP` columns.

This is a known issue with Connector/ODBC. You must ensure that the field has a default value (rather than `NULL` and that the default value is non-zero (i.e. the default value is not `0000-00-00 00:00:00`).

20.1.7.3.14: When connecting Connector/ODBC 5.x (Beta) to a MySQL 4.x server, the error `1044 Access denied for user 'xxx'@'%' to database 'information_schema'` is returned.

Connector/ODBC 5.x is designed to work with MySQL 5.0 or later, taking advantage of the `INFORMATION_SCHEMA` database to determine data definition information. Support for MySQL 4.1 is planned for the final release.

20.1.7.3.15: When calling `SQLTables`, the error `S1T00` is returned, but I cannot find this in the list of error numbers for Connector/ODBC.

The `S1T00` error indicates that a general timeout has occurred within the ODBC system and is not a MySQL error. Typically it indicates that the connection you are using is stale, the server is too busy to accept your request or that the server has gone away.

20.1.7.3.16: When linking to tables in Access 2000 and generating links to tables programmatically, rather than through the table designer interface, you may get errors about tables not existing.

There is a known issue with a specific version of the `msjet40.dll` that exhibits this issue. The version affected is 4.0.9025.0. Reverting to an older version will enable you to create the links. If you have recently updated your version, check your `WINDOWS` directory for the older version of the file and copy it to the drivers directory.

20.1.7.3.17: When I try to use batched statements, the execution of the batched statements fails.

Batched statement support was added in 3.51.18. Support for batched statements is not enabled by default. You must enable option `FLAG_MULTI_STATEMENTS`, value 67108864, or select the `ALLOW MULTIPLE STATEMENTS` flag within a GUI configuration.

20.1.7.3.18: When connecting to a MySQL server using `ADODB` and Excel, occasionally the application fails to communicate with the server and the error `Got an error reading communication packets` appears in the error log.

This error may be related to Keyboard Logger 1.1 from PanteraSoft.com, which is known to interfere with the network communication between MySQL Connector/ODBC and MySQL.

20.1.7.3.19: When using some applications to access a MySQL server using `C/ODBC` and outer joins, an error is reported regarding the Outer Join Escape Sequence.

This is a known issue with MySQL Connector/ODBC which is not correctly parsing the "Outer Join Escape Sequence", as per the specs at [Microsoft ODBC Specs](#). Currently, Connector/ODBC will return value `> 0` when asked for `SQL_OJ_CAPABILITIES` even though no parsing takes place in the driver to handle the outer join escape sequence.

20.1.7.3.20: I can correctly store extended characters in the database (Hebrew/CJK) using `C/ODBC 5.1`, but when I retrieve the data, the text is not formatted correctly and I get garbled characters.

When using ASP and UTF8 characters you should add the following to your ASP files to ensure that the data returned is correctly encoded:

```
Response.CodePage = 65001
Response.CharSet = "utf-8"
```

20.1.7.3.21: I have a duplicate MySQL Connector/ODBC entry within my `INSTALLED PROGRAMS` list, but I cannot delete one of them.

This problem can occur when you upgrade an existing Connector/ODBC installation, rather than removing and then installing the updated version.

Warning

To fix the problem you should use any working uninstallers to remove existing installations and then may have to edit the contents of the registry. Make sure you have a backup of your registry information before attempting any editing of the registry contents.

20.1.7.3.22: When submitting queries with parameter binding using `UPDATE`, my field values are being truncated to 255 characters.

You should ensure that the `FLAG_BIG_PACKETS` option is set for your connection. This removes the 255 character limitation on bound parameters.

20.1.7.3.23: Is it possible to disable data-at-execution using a flag?

If you do not wish to use data-at-execution, simply remove the corresponding calls. For example:

```
SQLLEN ylen = SQL_LEN_DATA_AT_EXEC(10);
SQLBindCol(hstmt,2,SQL_C_BINARY, buf, 10, &ylen);
```

Would become:

```
SQLBindCol(hstmt,2,SQL_C_BINARY, buf, 10, NULL);
```

Note that in the call to `SQLBindCol()`, `&ylen` has been replaced by `NULL`.

For further information please refer to the [MSDN documentation](#) for `SQLBindCol()`.

20.1.8. Connector/ODBC Support

There are many different places where you can get support for using Connector/ODBC. You should always try the Connector/ODBC Mailing List or Connector/ODBC Forum. See [Section 20.1.8.1, “Connector/ODBC Community Support”](#), for help before reporting a specific bug or issue to MySQL.

20.1.8.1. Connector/ODBC Community Support

Sun Microsystems, Inc. provides assistance to the user community by means of its mailing lists. For Connector/ODBC-related issues, you can get help from experienced users by using the `<myodbc@lists.mysql.com>` mailing list. Archives are available online at <http://lists.mysql.com/myodbc>.

For information about subscribing to MySQL mailing lists or to browse list archives, visit <http://lists.mysql.com/>. See [Section 1.5.1, “MySQL Mailing Lists”](#).

Community support from experienced users is also available through the [ODBC Forum](#). You may also find help from other users in the other MySQL Forums, located at <http://forums.mysql.com>. See [Section 1.5.2, “MySQL Community Support at the MySQL Forums”](#).

20.1.8.2. How to Report Connector/ODBC Problems or Bugs

If you encounter difficulties or problems with Connector/ODBC, you should start by making a log file from the [ODBC Manager](#) (the log you get when requesting logs from `ODBC ADMIN`) and Connector/ODBC. The procedure for doing this is described in [Section 20.1.4.8, “Getting an ODBC Trace File”](#).

Check the Connector/ODBC trace file to find out what could be wrong. You should be able to determine what statements were issued by searching for the string `>mysql_real_query` in the `myodbc.log` file.

You should also try issuing the statements from the `mysql` client program or from `admindemo`. This helps you determine whether the error is in Connector/ODBC or MySQL.

If you find out something is wrong, please only send the relevant rows (maximum 40 rows) to the `myodbc` mailing list. See [Section 1.5.1, “MySQL Mailing Lists”](#). Please never send the whole Connector/ODBC or ODBC log file!

You should ideally include the following information with the email:

- Operating system and version
- Connector/ODBC version
- ODBC Driver Manager type and version
- MySQL server version
- ODBC trace from Driver Manager
- Connector/ODBC log file from Connector/ODBC driver
- Simple reproducible sample

Remember that the more information you can supply to us, the more likely it is that we can fix the problem!

Also, before posting the bug, check the MyODBC mailing list archive at <http://lists.mysql.com/myodbc>.

If you are unable to find out what is wrong, the last option is to create an archive in [tar](#) or Zip format that contains a Connector/ODBC trace file, the ODBC log file, and a [README](#) file that explains the problem. You can send this to <ftp://ftp.mysql.com/pub/mysql/upload/>. Only MySQL engineers have access to the files you upload, and we are very discreet with the data.

If you can create a program that also demonstrates the problem, please include it in the archive as well.

If the program works with another SQL server, you should include an ODBC log file where you perform exactly the same SQL statements so that we can compare the results between the two systems.

Remember that the more information you can supply to us, the more likely it is that we can fix the problem.

20.1.8.3. How to Submit a Connector/ODBC Patch

You can send a patch or suggest a better solution for any existing code or problems by sending a mail message to [<myodbc@lists.mysql.com>](mailto:myodbc@lists.mysql.com).

20.1.8.4. Connector/ODBC Change History

The Connector/ODBC Change History (Changelog) is located with the main Changelog for MySQL. See [Section C.3, “MySQL Connector/ODBC \(MyODBC\) Change History”](#).

20.1.8.5. Credits

These are the developers that have worked on the Connector/ODBC and Connector/ODBC 3.51 Drivers from MySQL AB.

- Michael (Monty) Widenius
- Venu Anuganti
- Peter Harvey

20.2. MySQL Connector/NET

Connector/NET enables developers to easily create .NET applications that require secure, high-performance data connectivity with MySQL. It implements the required ADO.NET interfaces and integrates into ADO.NET aware tools. Developers can build applications using their choice of .NET languages. Connector/NET is a fully managed ADO.NET driver written in 100% pure C#.

Connector/NET includes full support for:

- MySQL 6.0 features
- MySQL 5.1 features
- MySQL 5.0 features (such as stored procedures)
- MySQL 4.1 features (server-side prepared statements, Unicode, and shared memory access, and so forth)
- Large-packet support for sending and receiving rows and BLOBs up to 2 gigabytes in size.
- Protocol compression which allows for compressing the data stream between the client and server.
- Support for connecting using TCP/IP sockets, named pipes, or shared memory on Windows.
- Support for connecting using TCP/IP sockets or Unix sockets on Unix.
- Support for the Open Source Mono framework developed by Novell.
- Fully managed, does not utilize the MySQL client library.

This document is intended as a user's guide to Connector/NET and includes a full syntax reference. Syntax information is also included within the [Documentation.chm](#) file included with the Connector/NET distribution.

If you are using MySQL 5.0 or later, and Visual Studio as your development environment, you may want also want to use the MySQL Visual Studio Plugin. The plugin acts as a DDEX (Data Designer Extensibility) provider, enabling you to use the data design tools within Visual Studio to manipulate the schema and objects within a MySQL database. For more information, see [Sec-](#)

tion 20.2.3, “Visual Studio User Guide”.

Note

Connector/NET 5.1.2 and later include the Visual Studio Plugin by default.

Key topics:

- For connection string properties when using the `MySqlConnection` class, see [Section 20.2.4.5, “Connector/NET Connection String Options Reference”](#).

20.2.1. Connector/NET Versions

There are several versions of Connector/NET available:

- Connector/NET 1.0 includes support for MySQL 4.0, and MySQL 5.0 features, and full compatibility with the ADO.NET driver interface.
- Connector/NET 5.0 includes support for MySQL 4.0, MySQL 4.1, MySQL 5.0 and MySQL 5.1 features. Connector/NET 5.0 also includes full support for the ADO.Net 2.0 interfaces and subclasses, includes support for the usage advisor and performance monitor (PerfMon) hooks.
- Connector/NET 5.1 includes support for MySQL 4.0, MySQL 5.0, MySQL 5.1 and MySQL 6.0 (Falcon Preview) features. Connector/NET 5.1 also includes support for a new membership/role provider, Compact Framework 2.0, a new stored procedure parser and improvements to `GetSchema`. Connector/NET 5.1 also includes the Visual Studio Plugin as a standard installable component.
- Connector/NET 5.2 includes support for MySQL 4.0, MySQL 5.0, MySQL 5.1 and MySQL 6.0 (Falcon Preview) features. Connector/NET 5.2 also includes support for a new membership/role provider, Compact Framework 2.0, a new stored procedure parser and improvements to `GetSchema`. Connector/NET 5.2 also includes the Visual Studio Plugin as a standard installable component.
- Connector/NET 6.0 includes support for MySQL 4.0, MySQL 5.0, MySQL 5.1 and MySQL 6.0. Connector/NET 6.0 is currently available as an Alpha release.

The latest source code for Connector/NET can be downloaded from the MySQL public Subversion server. For further details see [Section 20.2.2.3, “Installing Connector/NET from the source code”](#).

The following table shows the .NET Framework version required, and MySQL Server version supported by Connector/NET:

Connector/NET version	ADO.NET version supported	.NET Framework version required	MySQL Server version supported
1.0	1.x	1.x	4.0, 5.0
5.0	1.x+	1.x+	4.0, 5.0
5.1	1.x+	1.x+	4.0, 5.0, 5.1, 6.0
5.2	1.x+	1.x+	4.0, 5.0, 5.1, 6.0
6.0	2.x+	2.x+	4.0, 5.0, 5.1, 6.0

Note

Version numbers for MySQL products are formatted as X.X.X. However, Windows tools (Control Panel, properties display) may show the version numbers as XX.XX.XX. For example, the official MySQL formatted version number 5.0.9 may be displayed by Windows tools as 5.00.09. The two versions are the same; only the number display format is different.

20.2.2. Connector/NET Installation

Connector/NET runs on any platform that supports the .NET framework. The .NET framework is primarily supported on recent versions of Microsoft Windows, and is supported on Linux through the Open Source Mono framework (see <http://www.mono-project.com>).

Connector/NET is available for download from <http://dev.mysql.com/downloads/connector/net/5.2.html>.

20.2.2.1. Installing Connector/NET on Windows

On Windows, installation is supported either through a binary installation process or by downloading a Zip file with the Connector/NET components.

Before installing, you should ensure that your system is up to date, including installing the latest version of the .NET Framework.

20.2.2.1.1. Installing Connector/NET using the Installer

Using the installer is the most straightforward method of installing Connector/NET on Windows and the installed components include the source code, test code and full reference documentation.

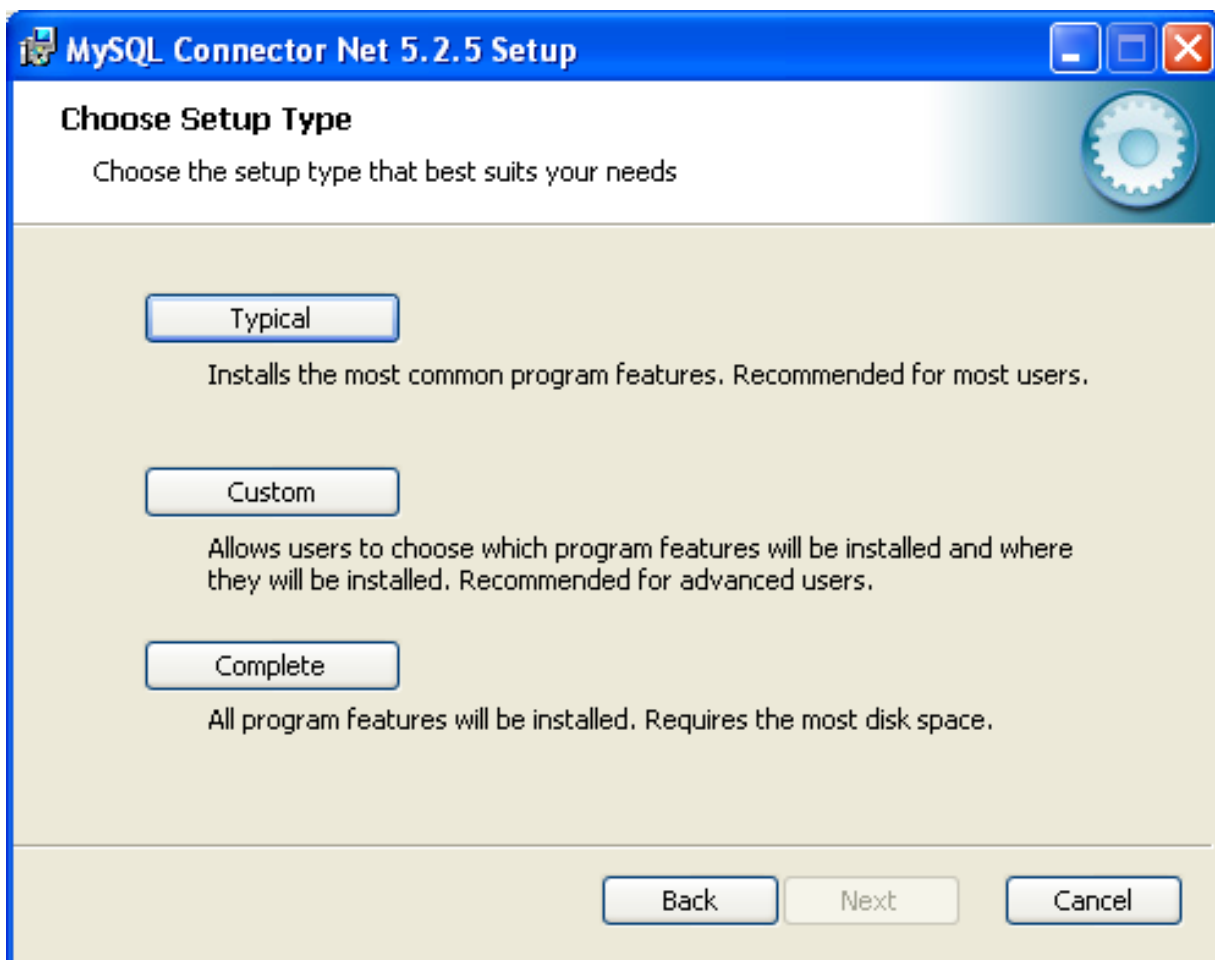

Connector/NET is installed through the use of a Windows Installer (.msi) installation package, which can be used to install Connector/NET on all Windows operating systems. The MSI package is contained within a ZIP archive named `mysql-connector-net-version.zip`, where `version` indicates the Connector/NET version.

To install Connector/NET:

1. Double click on the MSI installer file extracted from the Zip you downloaded. Click NEXT to start the installation.

2. You must choose the type of installation that you want to perform.

For most situations, the Typical installation will be suitable. Click the TYPICAL button and proceed to Step 5. A Complete installation installs all the available files. To conduct a Complete installation, click the COMPLETE button and proceed to step 5. If you want to customize your installation, including choosing the components to install and some installation options, click the CUSTOM button and proceed to Step 3.

The Connector/NET installer will register the connector within the Global Assembly Cache (GAC) - this will make the Connector/NET component available to all applications, not just those where you explicitly reference the Connector/NET component. The installer will also create the necessary links in the Start menu to the documentation and release notes.

3. If you have chosen a custom installation, you can select the individual components that you want to install, including the core interface component, supporting documentation (a CHM file) samples and examples and the source code. Select the items, and their installation level, and then click NEXT to continue the installation.

Note

For Connector/NET 1.0.8 or lower and Connector 5.0.4 and lower the installer will attempt to install binaries for both 1.x and 2.x of the .NET Framework. If you only have one version of the framework installed, the connector installation may fail. If this happens, you can choose the framework version to be installed through the custom installation step.

4. You will be given a final opportunity to confirm the installation. Click **INSTALL** to copy and install the files onto your machine.

5. Once the installation has been completed, click FINISH to exit the installer.

Unless you choose otherwise, Connector/NET is installed in `C:\Program Files\MySQL\MySQL Connector Net X.X.X`, where `X.X.X` is replaced with the version of Connector/NET you are installing. New installations do not overwrite existing versions of Connector/NET.

Depending on your installation type, the installed components will include some or all of the following components:

- `bin` - Connector/NET MySQL libraries for different versions of the .NET environment.
- `docs` - contains a CHM of the Connector/NET documentation.
- `samples` - sample code and applications that use the Connector/NET component.
- `src` - the source code for the Connector/NET component.

You may also use the `/quiet` or `/q` command-line option with the `msiexec` tool to install the Connector/NET package automatically (using the default options) with no notification to the user. Using this method the user cannot select options. Additionally, no prompts, messages or dialog boxes will be displayed.

```
C:\> msiexec /package conector-net.msi /quiet
```

To provide a progress bar to the user during automatic installation, use the `/passive` option.

20.2.2.1.2. Installing Connector/NET using the Zip packages

If you are having problems running the installer, you can download a Zip file without an installer as an alternative. That file is called `mysql-connector-net-version-noinstall.zip`. Once downloaded, you can extract the files to a location of your choice.

The file contains the following directories:

- [bin](#) - Connector/NET MySQL libraries for different versions of the .NET environment.
- [Docs](#) - contains a CHM of the Connector/NET documentation.
- [Samples](#) - sample code and applications that use the Connector/NET component.

Connector/NET 6.0.x has a different directory structure:

- [Assemblies](#) - contains a collection of DLLs that make up the connector functionality.
- [Documentation](#) - contains the Connector/NET documentation as a CHM file.
- [Samples](#) - sample code and applications that use the Connector/NET component.

There is also another Zip file available for download called [mysql-connector-net-version-src.zip](#). This file contains the source code distribution.

The file contains the following directories:

- [Documentation](#) - This folder contains the source files to build the documentation into the compiled HTML (CHM) format.
- [Installer](#) - This folder contains the source files to build the Connector/NET installer program.
- [MySQL.Data](#) - This folder contains the source files for the core data provider.
- [MySQL.VisualStudio](#) - This folder contains the source files for the Microsoft Visual Studio extensions.
- [MySQL.Web](#) - This folder contains the source files for the web providers. This includes code for the membership provider, role provider and profile provider. These are used in ASP.NET web sites.
- [Samples](#) - This folder contains the source files for several example applications.
- [Tests](#) - This folder contains a spreadsheet listing test cases.
- [VisualStudio](#) - Contains resources used by the Visual Studio plug in.

Finally, you need to ensure that [MySQL.Data.dll](#) is accessible to your program at build time (and run time). If using Microsoft Visual Studio you will need to add [MySQL.Data](#) as a Reference to your project.

20.2.2.2. Installing Connector/NET on Unix with Mono

There is no installer available for installing the Connector/NET component on your Unix installation. Before installing, please ensure that you have a working Mono project installation. You can test whether your system has Mono installed by typing:

```
shell> mono --version
```

The version of the Mono JIT compiler will be displayed.

To compile C# source code you will also need to make sure a Mono C# compiler, is installed. Note that there are two Mono C# compilers available, [mcs](#), which accesses the 1.0-profile libraries, and [gmcs](#), which accesses the 2.0-profile libraries.

To install Connector/NET on Unix/Mono:

1. Download the [mysql-connector-net-version-noinstall.zip](#) and extract the contents to a directory of your choice, for example: [~/connector-net/](#).
2. In the directory where you unzipped the connector to, change into the [bin](#) directory. Ensure the file [MySQL.Data.dll](#) is present.
3. You must register the Connector/NET component, [MySQL.Data](#), in the Global Assembly Cache (GAC). In the current directory enter the [gacutil](#) command:

```
root-shell> gacutil /i MySQL.Data.dll
```

This will register [MySQL.Data](#) into the GAC. You can check this by listing the contents of [/usr/lib/mono/gac](#), where

you will find `MySQL.Data` if the registration has been successful.

You are now ready to compile your application. You must ensure that when you compile your application you include the Connector/NET component using the `-r:` command-line option. For example:

```
shell> gmcsc -r:System.dll -r:System.Data.dll -r:MySQL.Data.dll HelloWorld.cs
```

Note, the assemblies that need to be referenced will depend on the requirements of the application, but applications using Connector/NET will need to provide `-r:MySQL.Data` as a minimum.

You can further check your installation by running the compiled program, for example:

```
shell> mono HelloWorld.exe
```

20.2.2.3. Installing Connector/NET from the source code

Caution

You should read this section only if you are interested in helping us test our new code. If you just want to get Connector/NET up and running on your system, you should use a standard release distribution.

Obtaining the source code

To be able to access the Connector/NET source tree, you must have Subversion installed. Subversion is freely available from <http://subversion.tigris.org/>.

The most recent development source tree is available from our public Subversion trees at <http://dev.mysql.com/tech-resources/sources.html>.

To checkout out the Connector/NET sources, change to the directory where you want the copy of the Connector/NET tree to be stored, then use the following command:

```
shell> svn co http://svn.mysql.com/svnpublic/connector-net
```

Source packages are also available on the downloads page.

Building the source code on Windows

The following procedure can be used to build the connector on Microsoft Windows.

- Obtain the source code, either from the Subversion server, or through one of the prepared source code packages.
- Navigate to the root of the source code tree.
- A Microsoft Visual Studio 2005 solution file is available to build the connector, this is called `MySQL-VS2005.sln`. Click on this file to load the solution into Visual Studio.
- Select **BUILD**, **BUILD SOLUTION** from the main menu to build the solution.

Building the source code on Unix

Support for building Connector/NET on Mono/Unix is currently not available.

20.2.3. Visual Studio User Guide

20.2.3.1. Making a connection

Once the connector is installed, you can use it to create, modify, and delete connections to MySQL databases. To create a connection with a MySQL database, perform the following steps:

- Start Visual Studio, and open the Server Explorer window (**VIEW**, **SERVER EXPLORER** option in the main Visual Studio menu, or **Ctrl+W, L** hot keys).
- Right-click on the Data Connections node, and choose the **ADD CONNECTION...** menu item.

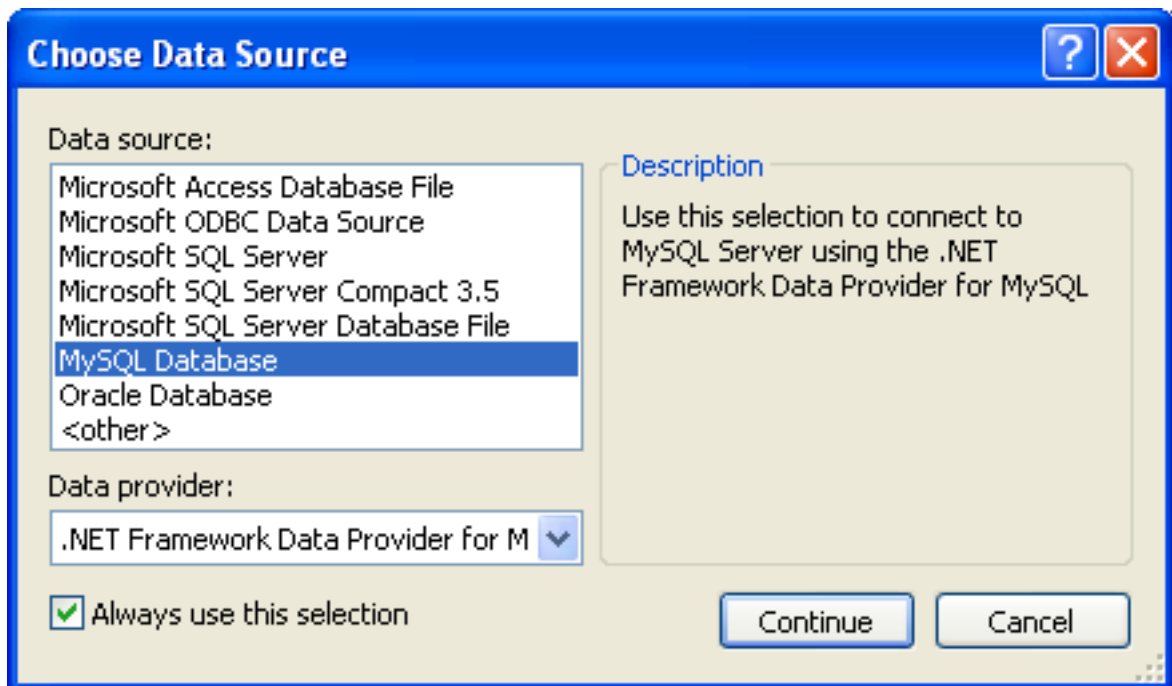

- Add Connection dialog opens. Press the CHANGE button to choose MySQL Database as a data source.

Figure 20.1. Add Connection Context Menu

- Change Data Source dialog opens. Choose MySQL Database in the list of data sources (or the <other> option, if MySQL Database is absent), and then choose .NET Framework Data Provider for MySQL in the combo box of data providers.

Figure 20.2. Choose Data Source

- Input the connection settings: the server host name (for example, localhost if the MySQL server is installed on the local machine), the user name, the password, and the default schema name. Note that you must specify the default schema name to open the connection.

Figure 20.3. Add Connection Dialog

- You can also set the port to connect with the MySQL server by pressing the **ADVANCED** button. To test connection with the MySQL server, set the server host name, the user name, and the password, and press the **TEST CONNECTION** button. If the test succeeds, the success confirmation dialog opens.
- After you set all settings and test the connection, press **OK**. The newly created connection is displayed in Server Explorer. Now you can work with the MySQL server through standard Server Explorer GUI.

Figure 20.4. New Data Connection

After the connection is successfully established, all settings are saved for future use. When you start Visual Studio for the next time, just open the connection node in Server Explorer to establish a connection to the MySQL server again.

To modify and delete a connection, use the Server Explorer context menu for the corresponding node. You can modify any of the settings just by overwriting the existing values with new ones. Note that the connection may be modified or deleted only if no active editor for its objects is opened: otherwise you may lose your data.

20.2.3.2. Editing Tables

Connector/Net contains a table editor, which enables the visual creation and modification of tables.

The Table Designer can be accessed through a mouse action on table-type node of Server Explorer. To create a new table, right-click on the **TABLES** node (under the connection node) and choose the **CREATE TABLE** command from the context menu.

To modify an existing table, double-click on the node of the table you wish to modify, or right-click on this node and choose the **DESIGN** item from the context menu. Either of the commands opens the Table Designer.

The table editor is implemented in the manner of the well-known Query Browser Table Editor, but with minor differences.

Figure 20.5. Editing New Table

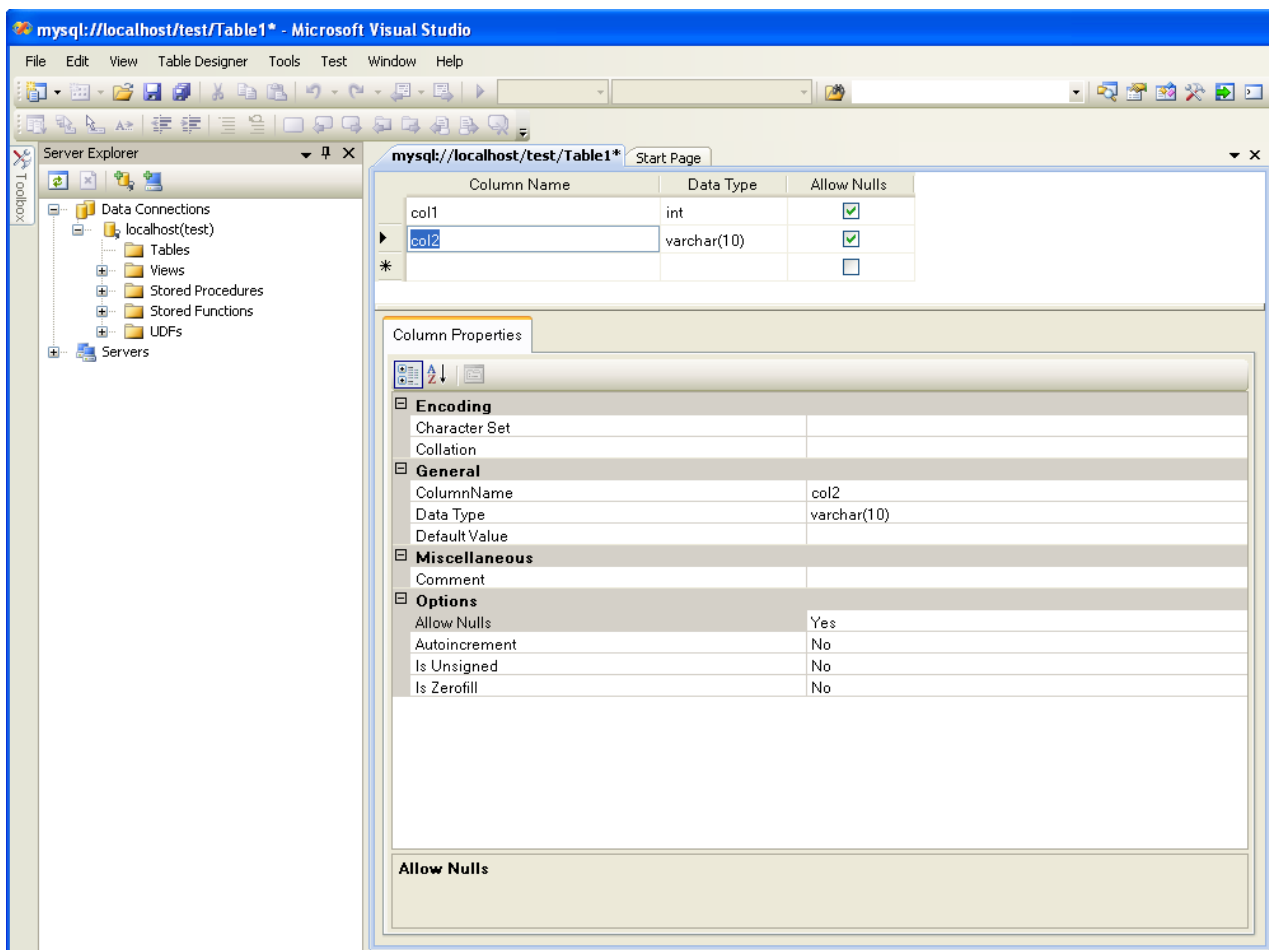

Table Designer consists of the following parts:

- Columns Editor - a data grid on top of the Table Designer. Use the Columns grid for column creation, modification, and deletion.
- Indexes tab - a tab on bottom of the Table Designer. Use the Indexes tab for indexes management.
- Foreign Keys tab - a tab on bottom of the Table Designer. Use the Foreign Keys tab for foreign keys management.
- Column Details tab - a tab on bottom of the Table Designer. Use the Column Details tab to set advanced column options.
- Properties window - a standard Visual Studio Properties window, where the properties of the edited table are displayed. Use the Properties window to set the table properties.

Each of these areas is discussed in more detail in subsequent sections.

To save changes you have made in the Table Designer, use either **SAVE** or **SAVE ALL** button of the Visual Studio main toolbar, or just press **Ctrl+S**. If you have not already named the table you will be prompted to do so.

Figure 20.6. Choose Table Name

Once created you can view the table in the Server Explorer.

Figure 20.7. Newly Created Table

The Table Designer main menu allows you to set a Primary Key column, edit Relationships such as Foreign Keys, and create Indexes.

Figure 20.8. Table Designer Main Menu

20.2.3.2.1. Column Editor

You can use the Column Editor to set or change the name, data type, default value, and other properties of a table column. To set

the focus to a needed cell of a grid, use the mouse click. Also you can move through the grid using **Tab** and **Shift+Tab** keys.

To set or change the name, data type, default value and comment of a column, activate the appropriate cell and type the desired value.

To set or unset flag-type column properties (**NOT NULL**, auto incremented, flags), check or uncheck the corresponding check boxes. Note that the set of column flags depends on its data type.

To reorder columns, index columns or foreign key columns in the Column Editor, select the whole column you wish to reorder by clicking on the selector column on the left of the column grid. Then move the column by using **Ctrl+Up** (to move the column up) or **Ctrl+Down** (to move the column down) keys.

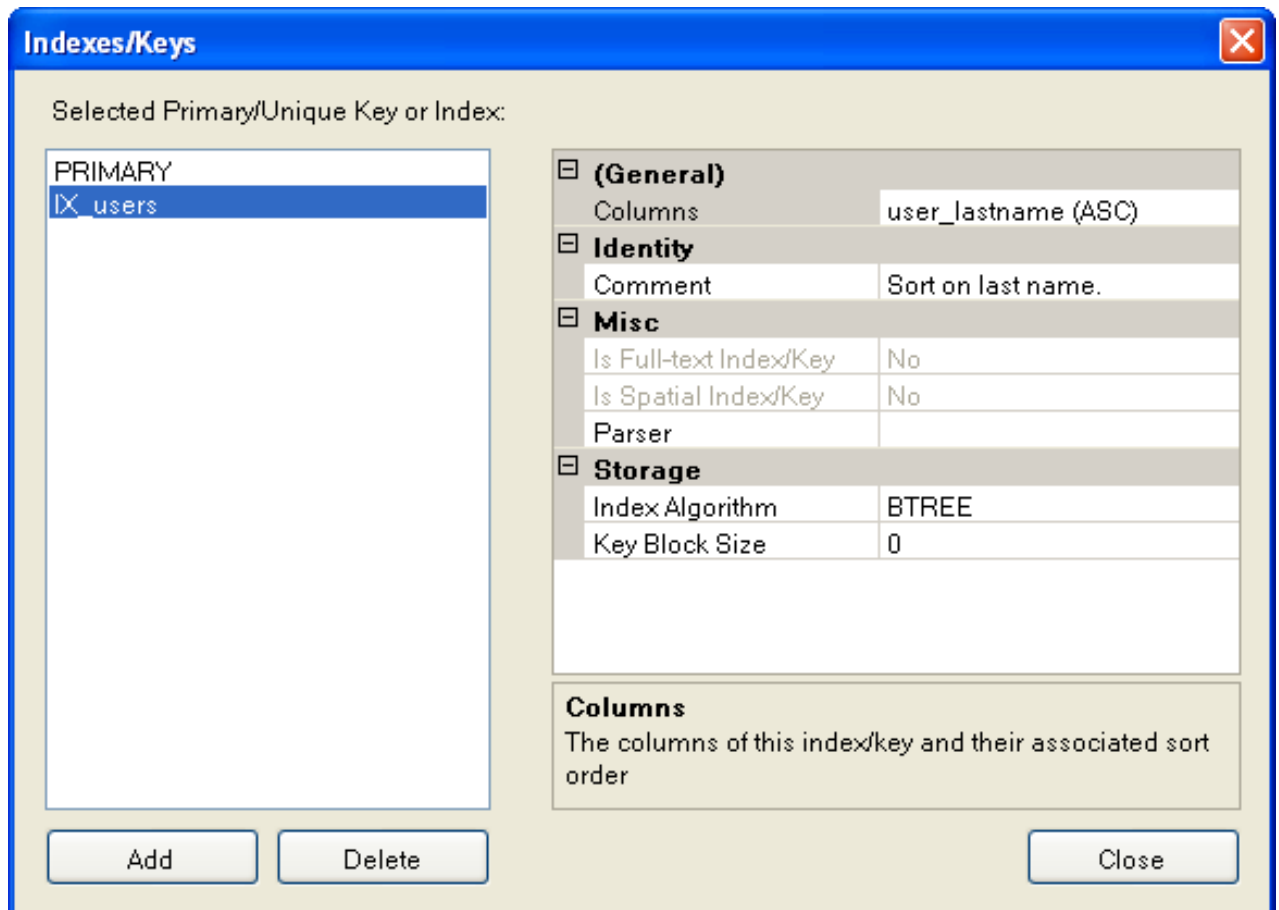

To delete a column, select it by clicking on the selector column on the left of the column grid, then press the **Delete** button on a keyboard.

20.2.3.2.2. Editing Indexes

Indexes management is performed via the **INDEXES/KEYS** dialog.

To add an index, select **TABLE DESIGNER, INDEXES/KEYS...** from the main menu, and click **ADD** to add a new index. You can then set the index name, index kind, index type, and a set of index columns.

Figure 20.9. Indexes Dialog

To remove an index, select it in the list box on the left, and click the **DELETE** button.

To change index settings, select the needed index in the list box on the left. The detailed information about the index is displayed in the panel on the right hand side. Change the desired values.

20.2.3.2.3. Editing Foreign Keys

Foreign Keys management is performed via the **FOREIGN KEY RELATIONSHIPS** dialog.

To add a foreign key, select **TABLE DESIGNER, RELATIONSHIPS...** from the main menu. This displays the **FOREIGN KEY RELATIONSHIP** dialog. Click **ADD**. You can then set the foreign key name, referenced table name, foreign key columns, and actions upon update and delete.

To remove a foreign key, select it in the list box on the left, and click the **DELETE** button.

To change foreign key settings, select the required foreign key in the list box on the left. The detailed information about the foreign key is displayed in the right hand panel. Change the desired values.

Figure 20.10. Foreign Key Relationships Dialog

20.2.3.2.4. Column Properties

The **COLUMN PROPERTIES** tab can be used to set column options. In addition to the general column properties presented in the Column Editor, in the **COLUMN PROPERTIES** tab you can set additional properties such as Character Set, Collation and Precision.

20.2.3.2.5. Table Properties

To bring up Table Properties select the table and right click to activate the context menu. Select **PROPERTIES**. The **TABLE PROPERTIES** dockable window will be displayed.

Figure 20.11. Table Properties Menu Item

The following table properties can be set:

- Auto Increment
- Average Row Length
- Character Set
- Collation
- Comment
- Data Directory
- Index Directory
- Maximum Rows
- Minimum Rows
- Name
- Row Format
- Schema
- Storage Engine

The property [Schema](#) is read only.

Figure 20.12. Table Properties

20.2.3.3. Editing Views

To create a new view, right click the Views node under the connection node in Server Explorer. From the node's context menu, choose the CREATE VIEW command. This command opens the SQL Editor.

Figure 20.13. Editing View SQL

You can then enter the SQL for your view.

Figure 20.14. View SQL Added

To modify an existing view, double click on a node of the view you wish to modify, or right click on this node and choose the ALTER VIEW command from a context menu. Either of the commands opens the SQL Editor.

All other view properties can be set in the Properties window. These properties are:

- Catalog
- Check Option

- Definer
- Definition
- Definer
- Is Updatable
- Name
- Schema
- Security Type

Some of these properties can have arbitrary text values, others accept values from a predefined set. In the latter case you set the desired value with an embedded combobox.

The properties `Is Updatable` and `Schema` are readonly.

To save changes you have made, use either `SAVE` or `SAVE ALL` buttons of the Visual Studio main toolbar, or just press `Ctrl+S`.

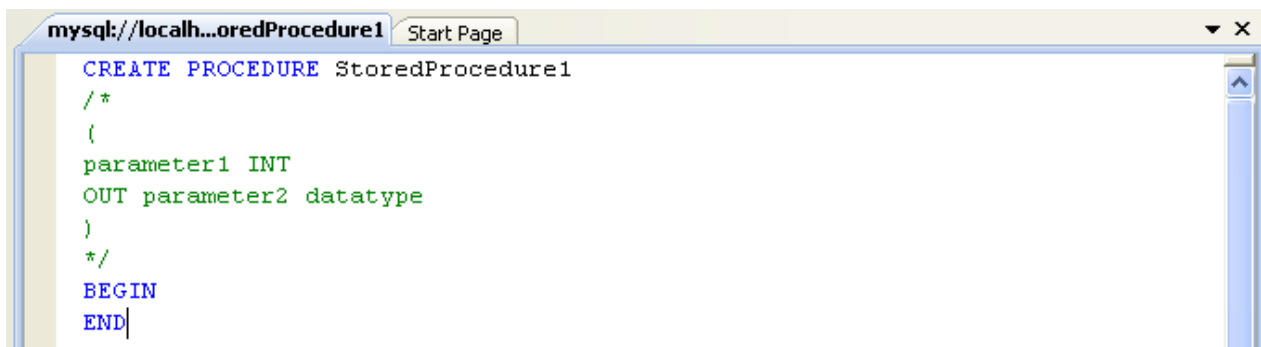

Figure 20.15. View SQL Saved

20.2.3.4. Editing Stored Procedures and Functions

To create a new stored procedure, right-click on the **STORED PROCEDURES** node under the connection node in Server Explorer. From the node's context menu, choose the **CREATE ROUTINE** command. This command opens the SQL Editor.

Figure 20.16. Edit Stored Procedure SQL

```
mysql://localh...oredProcedure1 Start Page
CREATE PROCEDURE StoredProcedure1
/*
(
parameter1 INT
OUT parameter2 datatype
)
*/
BEGIN
END|
```

To create a new stored function, right-click on the **FUNCTIONS** node under the connection node in Server Explorer. From the node's context menu, choose the **CREATE ROUTINE** command.

To modify an existing stored routine (procedure or function), double-click on the node of the routine you wish to modify, or right-click on this node and choose the **ALTER ROUTINE** command from the context menu. Either of the commands opens the SQL Editor.

To create or alter the routine definition using SQL Editor, type this definition in the SQL Editor using standard SQL. All other routine properties can be set in the Properties window. These properties are:

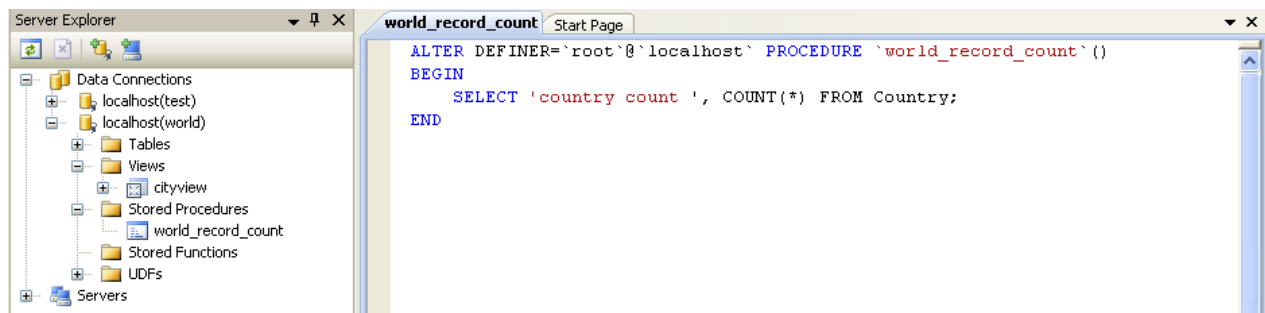

- Body
- Catalog
- Comment
- Creation Time
- Data Access
- Definer
- Definition
- External Name
- External Language
- Is Deterministic
- Last Modified
- Name
- Parameter Style
- Returns
- Schema
- Security Type
- Specific Name
- SQL Mode
- SQL Path
- Type

Some of these properties can have arbitrary text values, others accept values from a predefined set. In the latter case set the desired value using the embedded combo box.

You can also set all the options directly in the SQL Editor, using the standard **CREATE PROCEDURE** or **CREATE FUNCTION** statement. However, it is recommended to use the Properties window instead.

To save changes you have made, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**.

Figure 20.17. Stored Procedure SQL Saved

20.2.3.5. Editing Triggers

To create a new trigger, right-click on the node of the table, for which you wish to add a trigger. From the node's context menu, choose the **CREATE TRIGGER** command. This command opens the SQL Editor.

To modify an existing trigger, double-click on the node of the trigger you wish to modify, or right-click on this node and choose the **ALTER TRIGGER** command from the context menu. Either of the commands opens the SQL Editor.

To create or alter the trigger definition using SQL Editor, type the trigger statement in the SQL Editor using standard SQL.

Note

You should enter only the trigger statement, that is, the part of the **CREATE TRIGGER** query that is placed after the **FOR EACH ROW** clause.

All other trigger properties are set in the Properties window. These properties are:

- Definer
- Event Manipulation
- Name
- Timing

Some of these properties can have arbitrary text values, others accept values from a predefined set. In the latter case set the desired value using the embedded combo box.

The properties **Event Table**, **Schema**, and **Server** in the Properties window are read only.

To save changes you have made, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. Before changes are saved, you will be asked to confirm the execution of the corresponding SQL query in a confirmation dialog.

20.2.3.6. Editing User Defined Functions (UDF)

To create a new User Defined Function (UDF), right-click on the **UDFS** node under the connection node in Server Explorer. From the node's context menu, choose the **CREATE UDF** command. This command opens the UDF Editor.

To modify an existing UDF, double-click on the node of the UDF you wish to modify, or right-click on this node and choose the **ALTER UDF** command from the context menu. Either of the commands opens the UDF Editor.

The UDF editor allows you to set the following properties:

- Name
- So-name (DLL name)
- Return type

- Is Aggregate

There are text fields for both names, a combo box for the return type, and a check box to indicate if the UDF is aggregate. All these options are also accessible via the Properties window.

The property `Server` in the Properties window is read only.

To save changes you have made, use either `SAVE` or `SAVE ALL` buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. Before changes are saved, you will be asked to confirm the execution of the corresponding SQL query in a confirmation dialog.

20.2.3.7. Cloning Database Objects

Tables, views, stored procedures, and functions can be cloned using the appropriate Clone command from the context menu: `CLONE TABLE`, `CLONE VIEW`, `CLONE ROUTINE`. The clone commands open the corresponding editor for a new object: the `TABLE EDITOR` for cloning a table, and the `SQL EDITOR` for cloning a view or a routine.

The editor is filled with values of the original object. You can modify these values in a usual manner.

To save the cloned object, use either `Save` or `Save All` buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. Before changes are saved, you will be asked to confirm the execution of the corresponding SQL query in a confirmation dialog.

20.2.3.8. Dropping Database Objects

Tables, views, stored routines, triggers, and UDFs can be dropped with the appropriate Drop command selected from its context menu: `DROP TABLE`, `DROP VIEW`, `DROP ROUTINE`, `DROP TRIGGER`, `DROP UDF`.

You will be asked to confirm the execution of the corresponding drop query in a confirmation dialog.

Dropping of multiple objects is not supported.

20.2.3.9. Using the ADO.NET Entity Framework

Connector/NET 6.0 introduced support for the ADO.NET Entity Framework. ADO.NET Entity Framework was included with .NET Framework 3.5 Service Pack 1, and Visual Studio 2008 Service Pack 1. ADO.NET Entity Framework was released on 11th August 2008.

ADO.NET Entity Framework provides an Object Relational Mapping (ORM) service, mapping the relational database schema to objects. The ADO.NET Entity Framework defines several layers, these can be summarized as:

- **Logical** - this layer defines the relational data and is defined by the Store Schema Definition Language (SSDL).
- **Conceptual** - this layer defines the .NET classes and is defined by the Conceptual Schema Definition Language (CSDL)
- **Mapping** - this layer defines the mapping from .NET classes to relational tables and associations, and is defined by Mapping Specification Language (MSL).

Connector/NET integrates with Visual Studio 2008 to provide a range of helpful tools to assist the developer.

A full treatment of ADO.NET Entity Framework is beyond the scope of this manual. You are encouraged to review the [Microsoft ADO.NET Entity Framework documentation](#).

20.2.3.9.1. Tutorial: Using an Entity Framework Entity as a Windows Forms Data Source

In this tutorial you will learn how to create a Windows Forms Data Source from an Entity in an Entity Data Model. This tutorial assumes that you have installed the World example database, which can be downloaded from the [MySQL Documentation page](#). You can also find details on how to install the database on the same page. It will also be convenient for you to create a connection to the World database after it is installed. For instructions on how to do this see [Section 20.2.3.1, "Making a connection"](#).

Creating a new Windows Forms application

The first step is to create a new Windows Forms application.

1. In Visual Studio, select `FILE`, `NEW`, `PROJECT` from the main menu.
2. Choose the `WINDOWS FORMS APPLICATION` installed template. Click `OK`. The solution is created.

Adding an Entity Data Model

You will now add an Entity Data Model to your solution.

1. In the Solution Explorer, right click on your application and select **ADD, NEW ITEM...**. From **VISUAL STUDIO INSTALLED TEMPLATES** select **ADO.NET ENTITY DATA MODEL**. Click **ADD**.

Figure 20.18. Add Entity Data Model

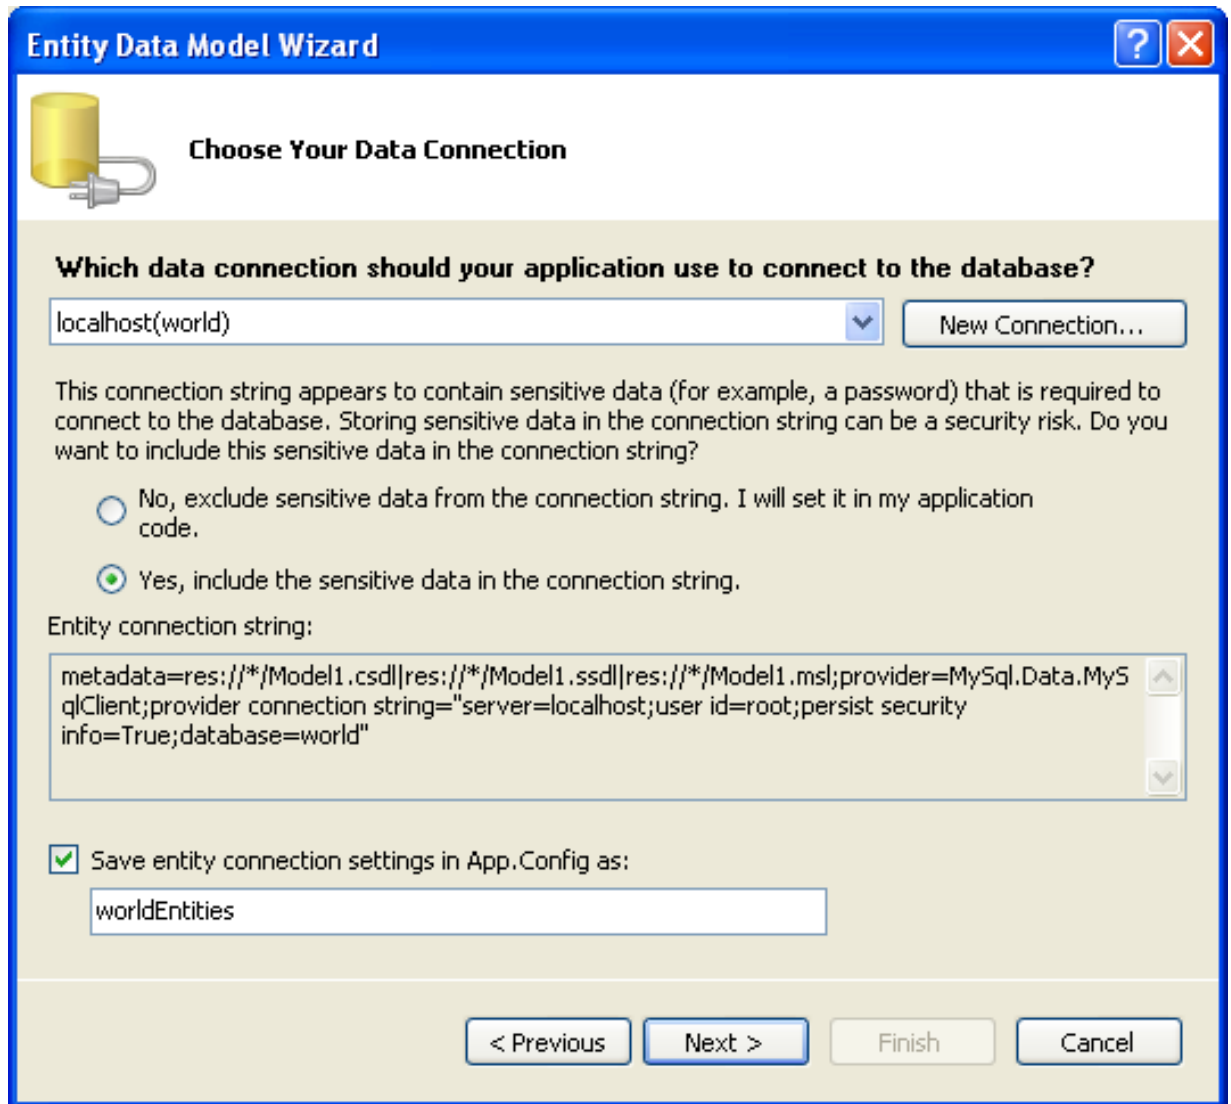

2. You will now see the Entity Data Model Wizard. You will use the wizard to generate the Entity Data Model from the world example database. Select the icon **GENERATE FROM DATABASE**. Click **NEXT**.

Figure 20.19. Entity Data Model Wizard Screen 1

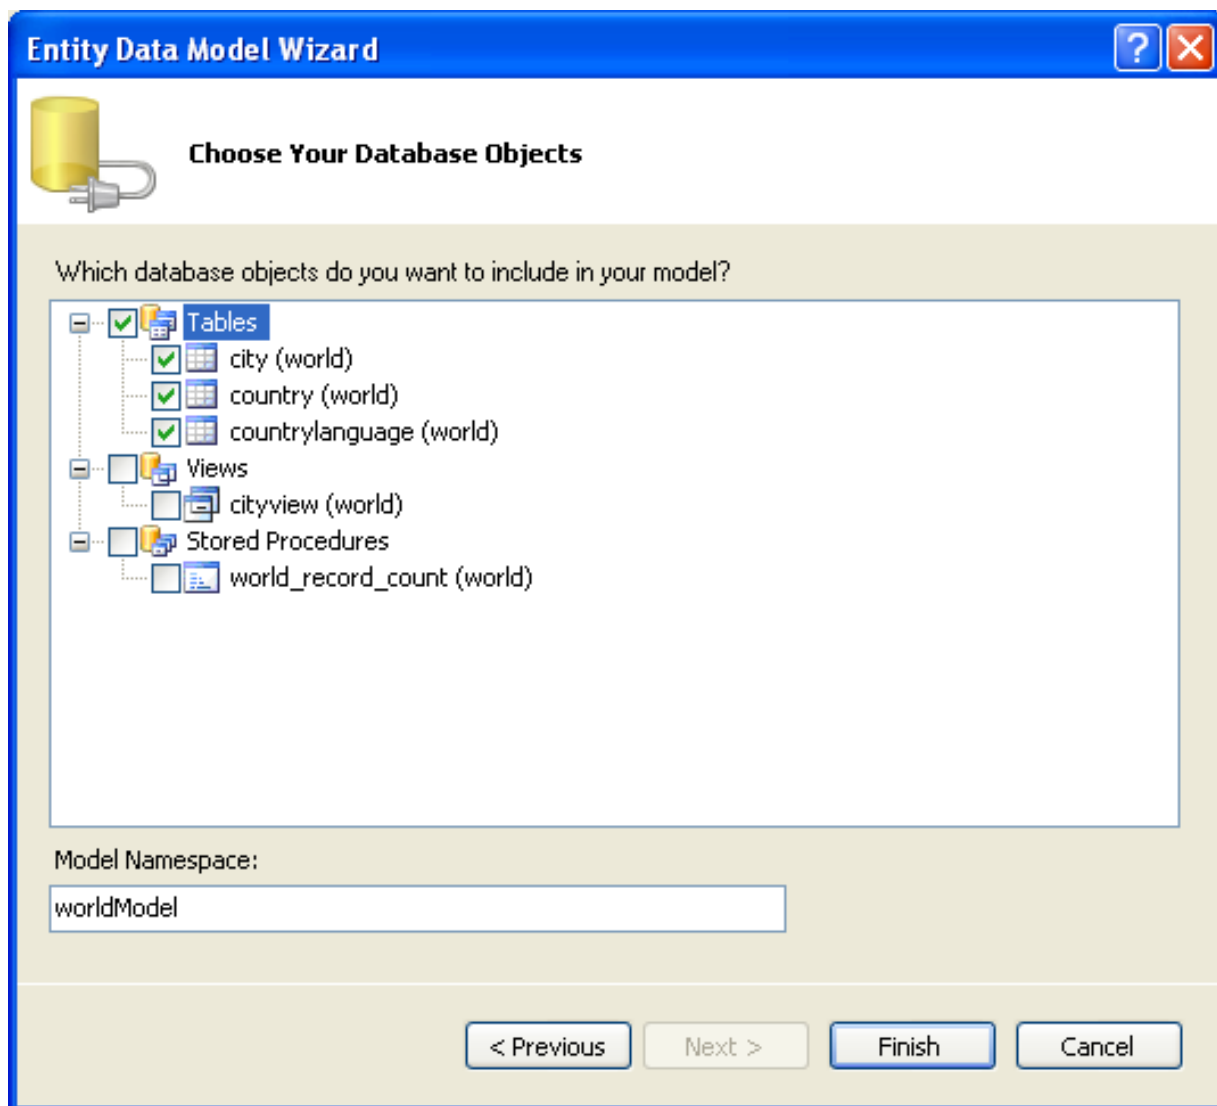

3. You can now select the connection you made earlier to the World database. If you have not already done so, you can create the new connection at this time by clicking on NEW CONNECTION.... For further instructions on creating a connection to a database see [Section 20.2.3.1, "Making a connection"](#).

Figure 20.20. Entity Data Model Wizard Screen 2

4. Make a note of the entity connection settings to be used in App.Config, as these will be used later to write the necessary control code.
5. Click NEXT.
6. The Entity Data Model Wizard connects to the database. You are then presented with a tree structure of the database. From this you can select the object you would like to include in your model. If you had created Views and Stored Routines these will be displayed along with any tables. In this example you just need to select the tables. Click FINISH to create the model and exit the wizard.

Figure 20.21. Entity Data Model Wizard Screen 3

7. Visual Studio will generate the model and then display it.

Figure 20.22. Entity Data Model Diagram

8. From the Visual Studio main menu select **BUILD, BUILD SOLUTION**, to ensure that everything compiles correctly so far.

Adding a new Data Source

You will now add a new Data Source to your project and see how it can be used to read and write to the database.

1. From the Visual Studio main menu select **DATA, ADD NEW DATA SOURCE...**. You will be presented with the Data Source Configuration Wizard.

Figure 20.23. Entity Data Source Configuration Wizard Screen 1

2. Select the **OBJECT** icon. Click NEXT.
3. You will now select the Object you wish to bind to. Expand the tree. In this tutorial you will select the city table. Once the city table has been selected click NEXT.

Figure 20.24. Entity Data Source Configuration Wizard Screen 2

4. The wizard will confirm that the city object is to be added. Click FINISH.

Figure 20.25. Entity Data Source Configuration Wizard Screen 3

5. The city object will be display in the Data Sources panel. If the Data Sources panel is not displayed, select DATA, SHOW DATA SOURCES from the Visual Studio main menu. The docked panel will then be displayed.

Figure 20.26. Data Sources

Using the Data Source in a Windows Form

You will now learn how to use the Data Source in a Windows Form.

1. In the Data Sources panel select the Data Source you just created and drag and drop it onto the Form Designer. By default the Data Source object will be added as a Data Grid View control. Note that the Data Grid View control is bound to the `cityBindingSource` and the Navigator control is bound to `cityBindingNavigator`.

Figure 20.27. Data Form Designer

2. Save and rebuild the solution before continuing.

Adding Code to Populate the Data Grid View

You are now ready to add code to ensure that the Data Grid View control will be populated with data from the City database table.

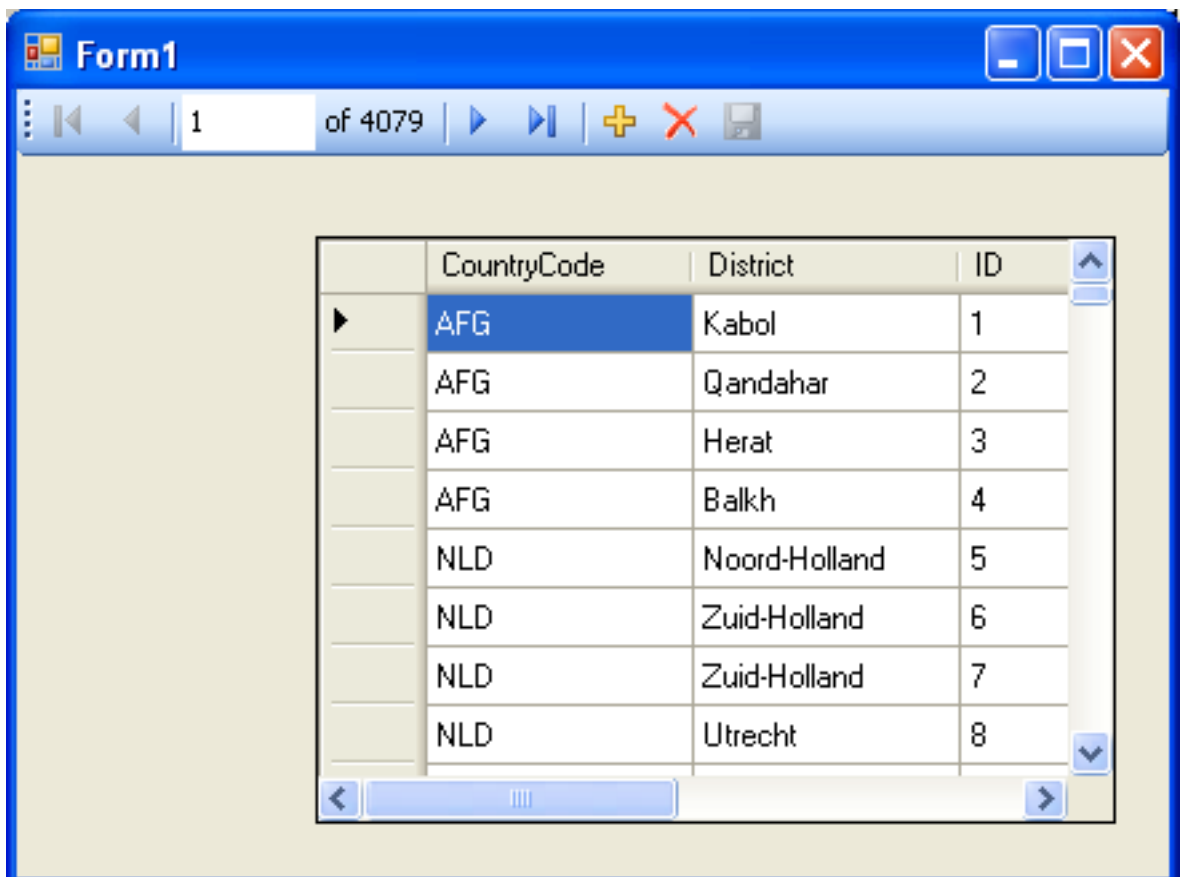

1. Double click the form to access its code.
2. Add code to instantiate the Entity Data Model's EntityContainer object and retrieve data from the database to populate the control.

Figure 20.28. Adding Code to the Form

3. Save and rebuild the solution.
4. Run the solution. Ensure the grid is populated and you can navigate the database.

Figure 20.29. The Populated Grid Control

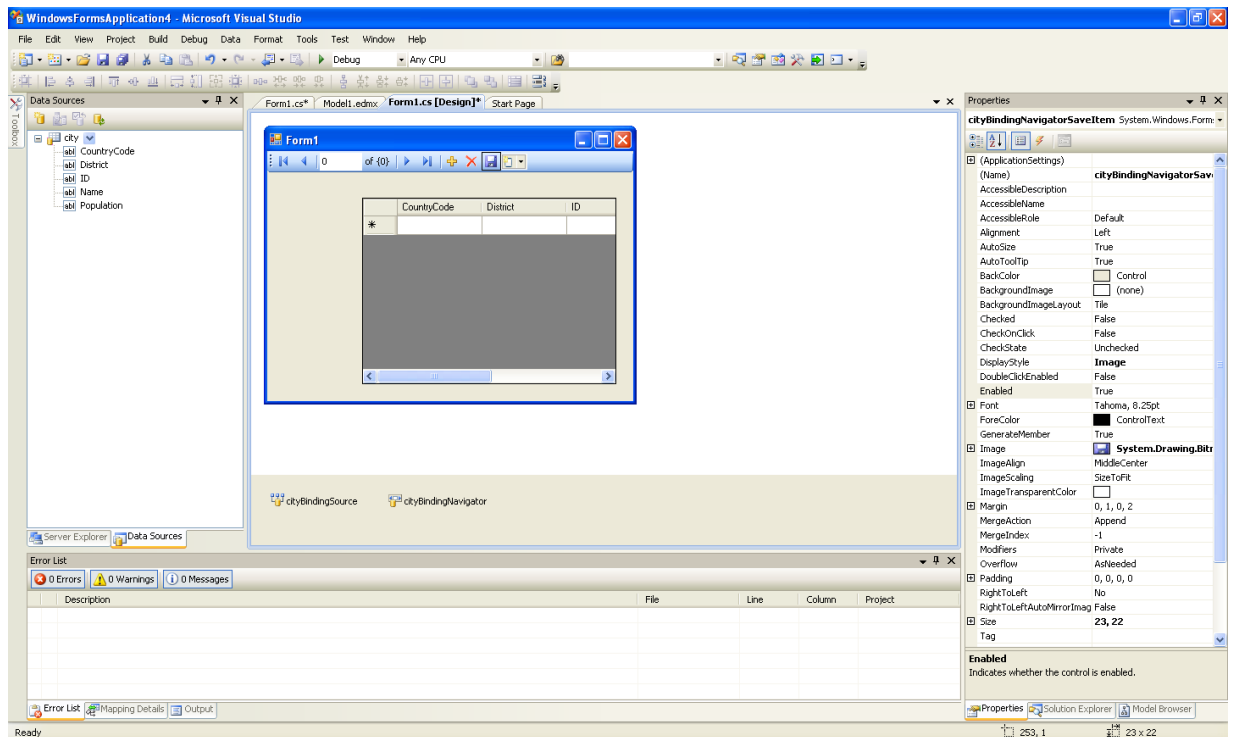

Adding Code to Save Changes to the Database

You will now add code to enable you to save changes to the database.

The Binding source component ensures that changes made in the Data Grid View control are also made to the Entity classes bound to it. However, that data needs to be saved back from the entities to the database itself. This can be achieved by the enabling of the Save button in the Navigator control, and the addition of some code.

1. In the Form Designer click on the Save icon in the Form toolbar and ensure that its Enabled property is set to True.

Figure 20.30. Save Button Enabled

2. Double click the Save icon in the Form toolbar to display its code.
3. You now need to add code to ensure that data is saved to the database when the save button is click in the application.

Figure 20.31. Adding Save Code to the Form

- Once the code has been added, save the solution and rebuild it. Run the application and verify that changes made in the grid are saved.

20.2.3.9.2. Tutorial: Databinding in ASP.NET using LINQ on Entities

In this tutorial you create an ASP.NET web page that binds LINQ queries to entities using the Entity Framework mapping.

If you have not already done so, you should install the World example database prior to attempting this tutorial. Instructions on where to obtain the database and instructions on how to install it where given in the tutorial [Section 20.2.3.9.1, "Tutorial: Using an Entity Framework Entity as a Windows Forms Data Source"](#).

Creating an ASP.NET web site

In this part of the tutorial you will create an ASP.NET web site. The web site will use the World database. The main web page will feature a drop down list from which you can select a country, data about that country's cities will then be displayed in a grid view control.

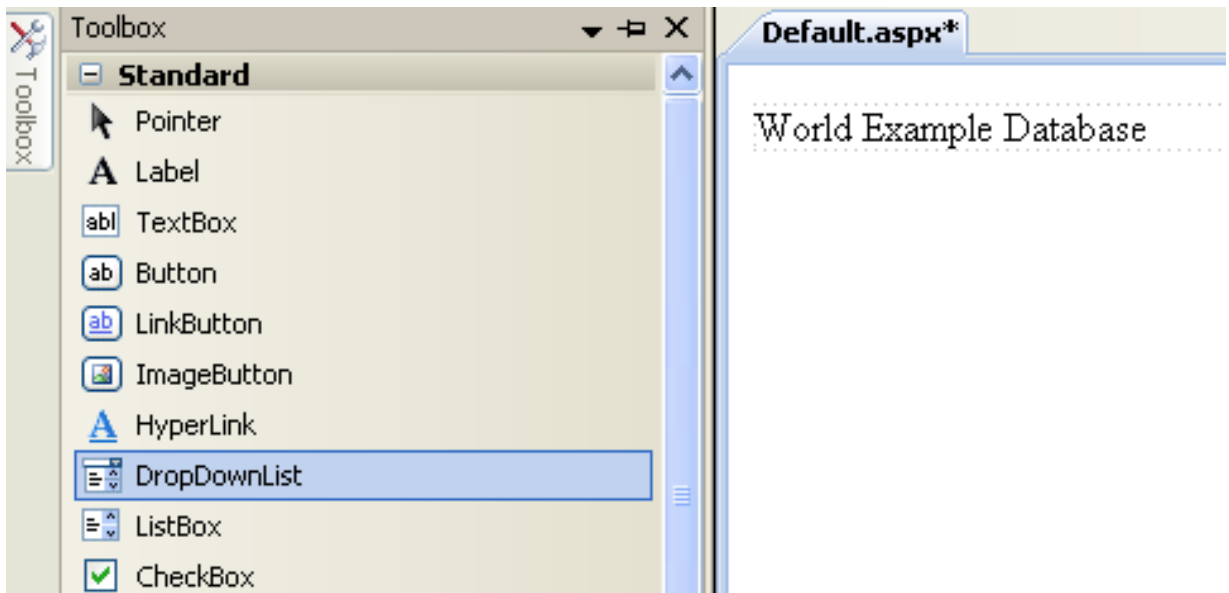

- From the Visual Studio main menu select **FILE, NEW, WEB SITE....**
- From the Visual Studio installed templates select **ASP.NET WEB SITE**. Click OK. You will be presented with the Source view of your web page by default.
- Click the Design view tab situated underneath the Source view panel.

Figure 20.32. The Design Tab

4. In the Design view panel, enter some text to decorate the blank web page.
5. Click on Toolbox. From the list of controls select **DROPDOWNLIST**. Drag and drop the control to a location beneath the text on your web page.

Figure 20.33. Drop Down List

6. From the **DROPDOWNLIST** control's context menu, ensure that the **ENABLE AUTOPOSTBACK** check box is enabled. This will ensure the control's event handler is called when an item is selected. The user's choice will in turn be used to populate the **GRIDVIEW** control.

Figure 20.34. Enable AutoPostBack

- From the Toolbox select the **GRIDVIEW** control.

Figure 20.35. Grid View Control

Drag and drop the Grid View control to a location just below the Drop Down List you already placed.

Figure 20.36. Placed Grid View Control

- At this point it is recommended that you save your solution, and build the solution to ensure that there are no errors.
- If you run the solution you will see that the text and drop down list are displayed, but the list is empty. Also, the grid view does not appear at all. Adding this functionality is described in the following sections.

At this stage you have a web site that will build, but further functionality is required. The next step will be to use the Entity Framework to create a mapping from the World database into entities that you can control programmatically.

Creating an ADO.NET Entity Data Model

In this stage of the tutorial you will add an ADO.NET Entity Data Model to your project, using the World database at the storage level. The procedure for doing this is described in the tutorial [Section 20.2.3.9.1, “Tutorial: Using an Entity Framework Entity as a Windows Forms Data Source”](#), and so will not be repeated here.

Populating a Drop Data List Box with using the results of a entity LINQ query

In this part of the tutorial you will write code to populate the DropDownList control. When the web page loads the data to populate the list will be achieved by using the results of a LINQ query on the model created previously.

1. In the Design view panel, double click on any blank area. This brings up the [Page_Load](#) method.
2. Modify the relevant section of code according to the following listing:

```
...
public partial class _Default : System.Web.UI.Page
{
    worldModel.worldEntities we;

    protected void Page_Load(object sender, EventArgs e)
    {
        we = new worldModel.worldEntities();

        if (!IsPostBack)
        {
            var countryQuery = from c in we.country
                               orderby c.Name
                               select new { c.Code, c.Name };
            DropDownList1.DataValueField = "Code";
            DropDownList1.DataTextField = "Name";
            DropDownList1.DataSource = countryQuery;
            DataBind();
        }
    }
}
...
```

Note that the list control only needs to be populated when the page first loads. The conditional code ensures that if the page is subsequently reloaded, the list control is not repopulated, which would cause the user selection to be lost.

3. Save the solution, build it and run it. You should see the list control has been populated. You can select an item, but as yet the grid view control does not appear.

At this point you have a working Drop Down List control, populated by a LINQ query on your entity data model.

Populating a Grid View control using an entity LINQ query

In the last part of this tutorial you will populate the Grid View Control using a LINQ query on your entity data model.

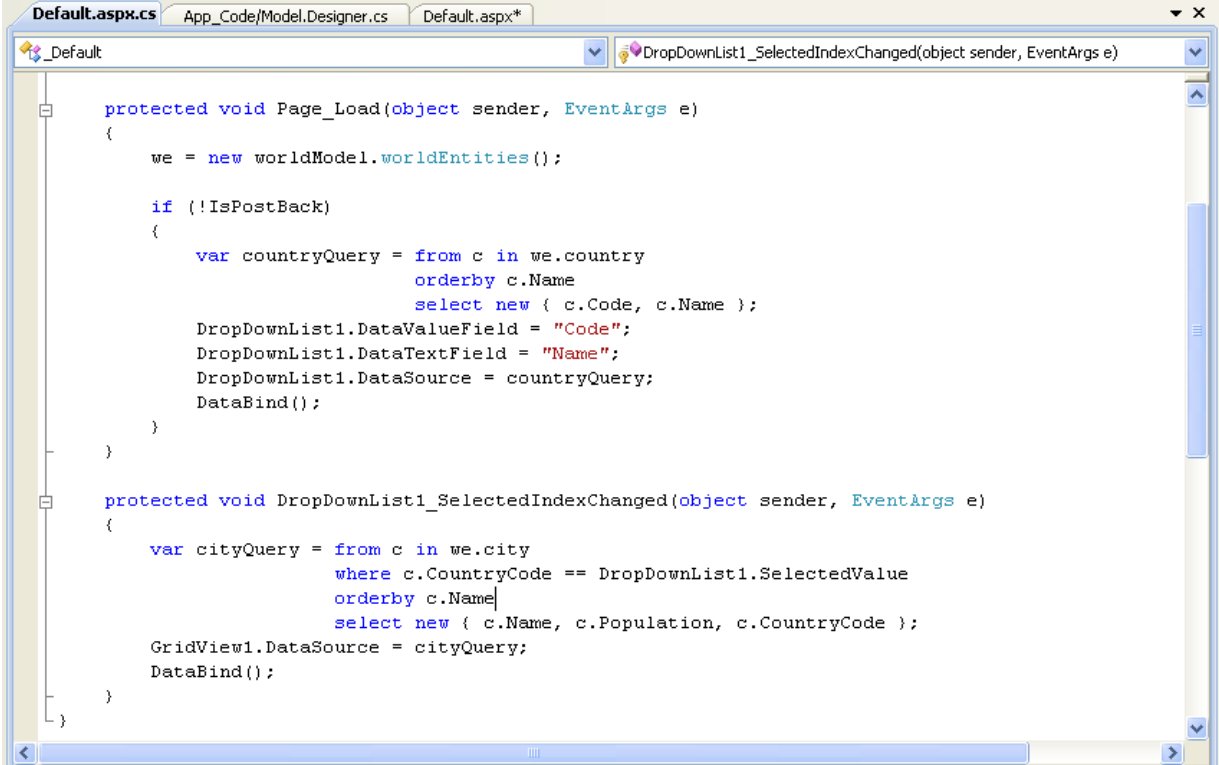

1. In the Design view double click on the **DROPDOWNLIST** control. This causes its [SelectedIndexChanged](#) code to be displayed. This method is called when a user selects an item in the list control and thus fires an AutoPostBack event.
2. Modify the relevant section of code accordingly to the following listing:

```
...
protected void DropDownList1_SelectedIndexChanged(object sender, EventArgs e)
{
    var cityQuery = from c in we.city
                    where c.CountryCode == DropDownList1.SelectedValue
                    orderby c.Name
                    select new { c.Name, c.Population, c.CountryCode };
    GridView1.DataSource = cityQuery;
    DataBind();
}
...
```

The grid view control is populated from the result of the LINQ query on the entity data model.

3. As a check compare your code to that shown in the following screenshot:

Figure 20.37. Source Code

```
protected void Page_Load(object sender, EventArgs e)
{
    we = new worldModel.worldEntities();

    if (!IsPostBack)
    {
        var countryQuery = from c in we.country
                           orderby c.Name
                           select new { c.Code, c.Name };
        DropDownList1.DataValueField = "Code";
        DropDownList1.DataTextField = "Name";
        DropDownList1.DataSource = countryQuery;
        DataBind();
    }
}

protected void DropDownList1_SelectedIndexChanged(object sender, EventArgs e)
{
    var cityQuery = from c in we.city
                   where c.CountryCode == DropDownList1.SelectedValue
                   orderby c.Name
                   select new { c.Name, c.Population, c.CountryCode };
    GridView1.DataSource = cityQuery;
    DataBind();
}
```

4. Save, build and run the solution. As you select a country you will see its cities are displayed in the grid view control.

Figure 20.38. The Working Web Site

In this tutorial you have seen how to create an ASP.NET web site, you have also seen how you can access a MySQL database via LINQ queries on an entity data model.

20.2.4. Connector/NET Programming

Connector/NET comprises several classes that are used to connect to the database, execute queries and statements, and manage query results.

The following are the major classes of Connector/NET:

- **MySqlCommand**: Represents an SQL statement to execute against a MySQL database.
- **MySqlCommandBuilder**: Automatically generates single-table commands used to reconcile changes made to a DataSet with the associated MySQL database.
- **MySqlConnection**: Represents an open connection to a MySQL Server database.
- **MySqlDataAdapter**: Represents a set of data commands and a database connection that are used to fill a data set and update a MySQL database.
- **MySqlDataReader**: Provides a means of reading a forward-only stream of rows from a MySQL database.
- **MySqlException**: The exception that is thrown when MySQL returns an error.

- [MySQLHelper](#): Helper class that makes it easier to work with the provider.
- [MySQLTransaction](#): Represents an SQL transaction to be made in a MySQL database.

In the following sections you will learn about some common use cases for Connector/NET, including BLOB handling, date handling, and using Connector/NET with common tools such as Crystal Reports.

20.2.4.1. Tutorial: An Introduction to Connector/NET Programming

This section provides a gentle introduction to programming with Connector/NET. The example code is written in C#, and is designed to work on both Microsoft .NET Framework and Mono.

This tutorial is designed to get you up and running with Connector/NET as quickly as possible, it does not go into detail on any particular topic. However, the following sections of this manual describe each of the topics introduced in this tutorial in more detail. In this tutorial you are encouraged to type in and run the code, modifying it as required for your setup.

This tutorial assumes you have MySQL and Connector/NET already installed. It also assumes that you have installed the World example database, which can be downloaded from the [MySQL Documentation page](#). You can also find details on how to install the database on the same page.

Note

Before compiling the example code make sure that you have added References to your project as required. The References required are [System](#), [System.Data](#) and [MySQL.Data](#).

20.2.4.1.1. The MySqlConnection Object

For your Connector/NET application to connect to a MySQL database it needs to establish a connection. This is achieved through the use of a [MySqlConnection](#) object.

The MySqlConnection constructor takes a connection string as one of its parameters. The connection string provides necessary information to make the connection to the MySQL database. The connection string is discussed more fully in [Section 20.2.4.2, "Connecting to MySQL Using Connector/NET"](#). A reference containing a list of supported connection string options can also be found in [Section 20.2.4.5, "Connector/NET Connection String Options Reference"](#).

The following code shows how to create a connection object.

```
using System;
using System.Data;

using MySql.Data;
using MySql.Data.MySqlClient;

public class Tutorial1
{
    public static void Main()
    {
        string connStr = "server=localhost;user=root;database=world;port=3306;password=*****";
        MySqlConnection conn = new MySqlConnection(connStr);
        try
        {
            Console.WriteLine("Connecting to MySQL...");
            conn.Open();
            // Perform database operations
            conn.Close();
        }
        catch (Exception ex)
        {
            Console.WriteLine(ex.ToString());
        }
        Console.WriteLine("Done.");
    }
}
```

When the [MySqlConnection](#) constructor is invoked it returns a connection object, which is used for subsequent database operations. The first operation in this example is to open the connection. This needs to be done before further operations take place. Before the application exits the connection to the database needs to be closed by calling [Close](#) on the connection object.

Sometimes an attempt to perform an [Open](#) on a connection object can fail, this will generate an exception that can be handled via standard exception handling code.

In this section you have learned how to create a connection to a MySQL database, and open and close the corresponding connection object.

20.2.4.1.2. The MySqlCommand Object

Once a connection has been established with the MySQL database, the next step is to carry out the desired database operations. This can be achieved through the use of the [MySQLCommand](#) object.

You will see how to create a [MySQLCommand](#) object. Once it has been created there are three main methods of interest that you can call:

- **ExecuteReader** - used to query the database. Results are usually returned in a [MySQLDataReader](#) object, created by [ExecuteReader](#).
- **ExecuteNonQuery** - used to insert and delete data.
- **ExecuteScalar** - used to return a single value.

Once a [MySQLCommand](#) object has been created, you will call one of the above methods on it to carry out a database operation, such as perform a query. The results are usually returned into a [MySQLDataReader](#) object, and then processed, for example the results might be displayed. The following code demonstrates how this could be done.

```
using System;
using System.Data;

using MySql.Data;
using MySql.Data.MySqlClient;

public class Tutorial2
{
    public static void Main()
    {
        string connStr = "server=localhost;user=root;database=world;port=3306;password=*****";
        MySqlConnection conn = new MySqlConnection(connStr);
        try
        {
            Console.WriteLine("Connecting to MySQL...");
            conn.Open();

            string sql = "SELECT Name, HeadOfState FROM Country WHERE Continent='Oceania'";
            MySqlCommand cmd = new MySqlCommand(sql, conn);
            MySQLDataReader rdr = cmd.ExecuteReader();

            while (rdr.Read())
            {
                Console.WriteLine(rdr[0]+" -- "+rdr[1]);
            }

            rdr.Close();
            conn.Close();
        }
        catch (Exception ex)
        {
            Console.WriteLine(ex.ToString());
        }
        Console.WriteLine("Done.");
    }
}
```

When a connection has been created and opened, the code then creates a [MySQLCommand](#) object. Note that the SQL query to be executed is passed to the [MySQLCommand](#) constructor. The [ExecuteReader](#) method is then used to generate a [MySQLReader](#) object. The [MySQLReader](#) object contains the results generated by the SQL executed on the command object. Once the results have been obtained in a [MySQLReader](#) object, the results can be processed. In this case the information is simply printed out as part of a [while](#) loop. Finally, the [MySQLReader](#) object is disposed of by running its [Close](#) method on it.

In the next example you will see how to use the [ExecuteNonQuery](#) method.

The procedure for performing an [ExecuteNonQuery](#) method call is simpler, as there is no need to create an object to store results. This is because [ExecuteNonQuery](#) is only used for inserting, updating and deleting data. The following example illustrates a simple update to the Country table:

```
using System;
using System.Data;

using MySql.Data;
using MySql.Data.MySqlClient;

public class Tutorial3
{
    public static void Main()
    {
        string connStr = "server=localhost;user=root;database=world;port=3306;password=*****";
        MySqlConnection conn = new MySqlConnection(connStr);
        try
        {
            Console.WriteLine("Connecting to MySQL...");
            conn.Open();
```

```

        string sql = "INSERT INTO Country (Name, HeadOfState, Continent) VALUES ('Disneyland','Mickey Mouse', 'Nor'
        MySqlCommand cmd = new MySqlCommand(sql, conn);
        cmd.ExecuteNonQuery();

        conn.Close();
    }
    catch (Exception ex)
    {
        Console.WriteLine(ex.ToString());
    }
    Console.WriteLine("Done.");
}
}

```

The query is constructed, the command object created and the [ExecuteNonQuery](#) method called on the command object. You can access your MySQL database with the MySQL Client program and verify that the update was carried out correctly.

Finally, you will see how the [ExecuteScalar](#) method can be used to return a single value. Again, this is straightforward, as a [MySqlDataReader](#) object is not required to store results, a simple variable will do. The following code illustrates how to use [ExecuteScalar](#):

```

using System;
using System.Data;

using MySql.Data;
using MySql.Data.MySqlClient;

public class Tutorial4
{
    public static void Main()
    {
        string connStr = "server=localhost;user=root;database=world;port=3306;password=*****";
        MySqlConnection conn = new MySqlConnection(connStr);
        try
        {
            Console.WriteLine("Connecting to MySQL...");
            conn.Open();

            string sql = "SELECT COUNT(*) FROM Country";
            MySqlCommand cmd = new MySqlCommand(sql, conn);
            object result = cmd.ExecuteScalar();
            if (result != null)
            {
                int r = Convert.ToInt32(result);
                Console.WriteLine("Number of countries in the World database is: " + r);
            }

            conn.Close();
        }
        catch (Exception ex)
        {
            Console.WriteLine(ex.ToString());
        }
        Console.WriteLine("Done.");
    }
}

```

This example uses a simple query to count the rows in the Country table. The result is obtained by calling [ExecuteScaler](#) on the command object.

20.2.4.1.3. Working with Decoupled Data

Previously, when using [MySqlDataReader](#), the connection to the database was continually maintained, unless explicitly closed. It is also possible to work in a manner where a connection is only established when needed. For example, in this mode, a connection could be established in order to read a chunk of data, the data could then be modified by the application as required. A connection could then be reestablished only if and when the application needs to write data back to the database. This decouples the working data set from the database.

This decouple mode of working with data is supported by Connector/NET. There are several parts involved in allowing this method to work:

- **Data Set** - The Data Set is the area in which data is loaded in order to read or modify it. A [DataSet](#) object is instantiated, which can store multiple tables of data.
- **Data Adapter** - The Data Adapter is the interface between the Data Set and the database itself. The Data Adapter is responsible for efficiently managing connections to the database, opening and closing them as required. The Data Adapter is created by instantiating an object of the [MySqlDataAdapter](#) class. The [MySqlDataAdapter](#) object has two main methods: [Fill](#) which reads data into the Data Set, and [Update](#), which writes data from the Data Set to the database.
- **Command Builder** - The Command Builder is a support object. The Command Builder works in conjunction with the Data

Adapter. When a `MySqlDataAdapter` object is created it is typically given an initial SELECT statement. From this SELECT statement the Command Builder can work out the corresponding INSERT, UPDATE and DELETE statements that would be required should the database need to be updated. To create the Command Builder an object of the class `MySqlCommandBuilder` is created.

Each of these classes will now be discussed in more detail.

Instantiating a DataSet object

A `DataSet` object can be created simply, as shown in the following example code snippet:

```
DataSet dsCountry;
...
dsCountry = new DataSet();
```

Although this creates the `DataSet` object it has not yet filled it with data. For that a Data Adapter is required.

Instantiating a MySqlDataAdapter object

The `MySqlDataAdapter` can be created as illustrated by the following example:

```
MySqlDataAdapter daCountry;
...
string sql = "SELECT Code, Name, HeadOfState FROM Country WHERE Continent='North America'";
daCountry = new MySqlDataAdapter (sql, conn);
```

Note, the `MySqlDataAdapter` is given the SQL specifying the data you wish to work with.

Instantiating a MySqlCommandBuilder object

Once the `MySqlDataAdapter` has been created, it is necessary to generate the additional statements required for inserting, updating and deleting data. There are several ways to do this, but in this tutorial you will see how this can most easily be done with `MySqlCommandBuilder`. The following code snippet illustrates how this is done:

```
MySqlCommandBuilder cb = new MySqlCommandBuilder(daCountry);
```

Note that the `MySqlDataAdapter` object is passed as a parameter to the command builder.

Filling the Data Set

In order to do anything useful with the data from your database, you need to load it into a Data Set. This is one of the jobs of the `MySqlDataAdapter` object, and is carried out with its `Fill` method. The following example code illustrates this:

```
DataSet dsCountry;
...
dsCountry = new DataSet();
...
daCountry.Fill(dsCountry, "Country");
```

Note the `Fill` method is a `MySqlDataAdapter` method, the Data Adapter knows how to establish a connection with the database and retrieve the required data, and then populates the Data Set when the `Fill` method is called. The second parameter "Country" is the table in the Data Set to update.

Updating the Data Set

The data in the Data Set can now be manipulated by the application as required. At some point, changes to data will need to be written back to the database. This is achieved through a `MySqlDataAdapter` method, the `Update` method.

```
daCountry.Update(dsCountry, "Country");
```

Again, the Data Set and the table within the Data Set to update are specified.

Working Example

The interactions between the `DataSet`, `MySqlDataAdapter` and `MySqlCommandBuilder` classes can be a little confusing, so their operation can perhaps be best illustrated by working code.

In this example, data from the World database is read into a Data Grid View control. Here, the data can be viewed and changed before clicking an update button. The update button then activates code to write changes back to the database. The code uses the principles explained above. The application was built using the Microsoft Visual Studio in order to place and create the user interface

controls, but the main code that uses the key classes described above is shown below, and is portable.

```
using System;
using System.Collections.Generic;
using System.ComponentModel;
using System.Data;
using System.Drawing;
using System.Linq;
using System.Text;
using System.Windows.Forms;

using MySql.Data;
using MySql.Data.MySqlClient;

namespace WindowsFormsApplication5
{
    public partial class Form1 : Form
    {
        MySqlDataAdapter daCountry;
        DataSet dsCountry;

        public Form1()
        {
            InitializeComponent();
        }

        private void Form1_Load(object sender, EventArgs e)
        {
            string connStr = "server=localhost;user=root;database=world;port=3306;password=*****";
            MySqlConnection conn = new MySqlConnection(connStr);
            try
            {
                label2.Text = "Connecting to MySQL...";

                string sql = "SELECT Code, Name, HeadOfState FROM Country WHERE Continent='North America'";
                daCountry = new MySqlDataAdapter (sql, conn);
                MySqlCommandBuilder cb = new MySqlCommandBuilder(daCountry);

                dsCountry = new DataSet();
                daCountry.Fill(dsCountry, "Country");
                dataGridView1.DataSource = dsCountry;
                dataGridView1.DataMember = "Country";
            }
            catch (Exception ex)
            {
                label2.Text = ex.ToString();
            }
        }

        private void button1_Click(object sender, EventArgs e)
        {
            daCountry.Update(dsCountry, "Country");
            label2.Text = "MySQL Database Updated!";
        }
    }
}
```

The application running is shown below:

Figure 20.39. World Database Application

20.2.4.1.4. Working with Parameters

This part of the tutorial shows you how to use parameters in your Connector/NET application.

Although it is possible to build SQL query strings directly from user input, this is not advisable as it does not prevent from erroneous or malicious information being entered. It is safer to use parameters as they will be processed as field data only. For example, imagine the following query was constructed from user input:

```
string sql = "SELECT Name, HeadOfState FROM Country WHERE Continent = "+user_continent;
```

If the string `user_continent` came from a Text Box control, there would potentially be no control over the string entered by the user. The user could enter a string that generates a run time error, or in the worst case actually harms the system. When using parameters it is not possible to do this because a parameter is only ever treated as a field parameter, rather than an arbitrary piece of SQL code.

The same query written using a parameter for user input would be:

```
string sql = "SELECT Name, HeadOfState FROM Country WHERE Continent = @Continent";
```

Note that the parameter is preceded by an '@' symbol to indicate it is to be treated as a parameter.

As well as marking the position of the parameter in the query string, it is necessary to create a parameter object that can be passed to the Command object. In Connector/NET the class `MySqlParameter` is used for this purpose. The use of `MySqlParameter` is best illustrated by a small code snippet:

```

MySQLParameter param = new MySQLParameter();
param.ParameterName = "@Continent";
param.Value = "North America";
cmd.Parameters.Add(param);

```

In this example the string "North America" is supplied as the parameter value statically, but in a more practical example it would come from a user input control. Once the parameter has its name and value set it needs to be added to the Command object using the [Add](#) method.

A further example illustrates this:

```

using System;
using System.Data;

using MySql.Data;
using MySql.Data.MySqlClient;

public class Tutorial5
{
    public static void Main()
    {
        string connStr = "server=localhost;user=root;database=world;port=3306;password=*****";
        MySqlConnection conn = new MySqlConnection(connStr);
        try
        {
            Console.WriteLine("Connecting to MySQL...");
            conn.Open();

            string sql = "SELECT Name, HeadOfState FROM Country WHERE Continent=@Continent";
            MySqlCommand cmd = new MySqlCommand(sql, conn);

            Console.WriteLine("Enter a continent e.g. 'North America', 'Europe': ");
            string user_input = Console.ReadLine();

            MySQLParameter param = new MySQLParameter();
            param.ParameterName = "@Continent";
            param.Value = user_input;
            cmd.Parameters.Add(param);

            MySqlDataReader rdr = cmd.ExecuteReader();

            while (rdr.Read())
            {
                Console.WriteLine(rdr["Name"]+" --- "+rdr["HeadOfState"]);
            }

            conn.Close();
        }
        catch (Exception ex)
        {
            Console.WriteLine(ex.ToString());
        }
        Console.WriteLine("Done.");
    }
}

```

In this part of the tutorial you have see how to use parameters to make your code more secure.

20.2.4.1.5. Working with Stored Procedures

In this section you will see how to work with Stored Procedures. This section assumes you have a basic understanding of what a Stored Procedure is, and how to create one.

For the purposes of this tutorial, you will create a simple Stored Procedure to see how it can be called from Connector/NET. In the MySQL Client program, connect to the World database and enter the following Stored Procedure:

```

DELIMITER //
CREATE PROCEDURE country_hos
(IN con CHAR(20))
BEGIN
    SELECT Name, HeadOfState FROM Country
    WHERE Continent = con;
END //
DELIMITER ;

```

Test the Stored Procedure works as expected by typing the following into the MySQL Client program:

```
CALL country_hos('Europe');
```

Note that The Stored Routine takes a single parameter, which is the continent you wish to restrict your search to.

Having confirmed that the Stored Procedure is present and correct you can now move on to seeing how it can be accessed from Connector/NET.

Calling a Stored Procedure from your Connector/NET application is similar to techniques you have seen earlier in this tutorial. A `MySQLCommand` object is created, but rather than taking a SQL query as a parameter it takes the name of the Stored Procedure to call. The `MySQLCommand` object also needs to be set to the type of Stored Procedure. This is illustrated by the following code snippet:

```
string rtn = "country_hos";
MySQLCommand cmd = new MySQLCommand(rtn, conn);
cmd.CommandType = CommandType.StoredProcedure;
```

In this case you also need to pass a parameter to the Stored Procedure. This can be achieved using the techniques seen in the previous section on parameters, [Section 20.2.4.1.4, "Working with Parameters"](#). This is shown in the following code snippet:

```
MySQLParameter param = new MySQLParameter();
param.ParameterName = "@con";
param.Value = "Europe";
cmd.Parameters.Add(param);
```

The value of the parameter `@con` could more realistically have come from a user input control, but for simplicity it is set as a static string in this example.

At this point everything is set up and all that now needs to be done is to call the routine. This can be achieved using techniques also learned in earlier sections, but in this case the `ExecuteReader` method of the `MySQLCommand` object is used.

Complete working code for the Stored Procedure example is shown below:

```
using System;
using System.Data;

using MySql.Data;
using MySql.Data.MySqlClient;

public class Tutorial6
{
    public static void Main()
    {
        string connStr = "server=localhost;user=root;database=world;port=3306;password=*****";
        MySqlConnection conn = new MySqlConnection(connStr);
        try
        {
            Console.WriteLine("Connecting to MySQL...");
            conn.Open();

            string rtn = "country_hos";
            MySQLCommand cmd = new MySQLCommand(rtn, conn);
            cmd.CommandType = CommandType.StoredProcedure;
            MySQLParameter param = new MySQLParameter();
            param.ParameterName = "@con";
            param.Value = "Europe";
            cmd.Parameters.Add(param);

            MySQLDataReader rdr = cmd.ExecuteReader();
            while (rdr.Read())
            {
                Console.WriteLine(rdr[0] + " --- " + rdr[1]);
            }
            conn.Close();
        }
        catch (Exception ex)
        {
            Console.WriteLine(ex.ToString());
        }
        Console.WriteLine("Done.");
    }
}
```

In this section you have seen how to call a Stored Procedure from Connector/NET. For the moment, this concludes our introductory tutorial on programming with Connector/NET.

20.2.4.2. Connecting to MySQL Using Connector/NET

Introduction

All interaction between a .NET application and the MySQL server is routed through a `MySQLConnection` object. Before your application can interact with the server, a `MySQLConnection` object must be instantiated, configured, and opened.

Even when using the `MySQLHelper` class, a `MySQLConnection` object is created by the helper class.

In this section, we will describe how to connect to MySQL using the `MySQLConnection` object.

20.2.4.3. Creating a Connection String

The `MySqlConnection` object is configured using a connection string. A connection string contains several key/value pairs, separated by semicolons. Each key/value pair is joined with an equals sign.

The following is a sample connection string:

```
Server=127.0.0.1;Uid=root;Pwd=12345;Database=test;
```

In this example, the `MySqlConnection` object is configured to connect to a MySQL server at `127.0.0.1`, with a user name of `root` and a password of `12345`. The default database for all statements will be the `test` database.

The following options are available:

Note

Using the '@' symbol for parameters is now the preferred approach although the old pattern of using '?' is still supported.

Please be aware however that using '@' can cause conflicts when user variables are also used. To help with this situation please see the documentation on the [Allow User Variables](#) connection string option, which can be found here: [Section 20.2.4.3, "Creating a Connection String"](#). The `Old Syntax` connection string option has now been deprecated.

20.2.4.3.1. Opening a Connection

Once you have created a connection string it can be used to open a connection to the MySQL server.

The following code is used to create a `MySqlConnection` object, assign the connection string, and open the connection.

Visual Basic Example

```
Dim conn As New MySql.Data.MySqlClient.MySqlConnection
Dim myConnectionString as String

myConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test;"

Try
    conn.ConnectionString = myConnectionString
    conn.Open()
Catch ex As MySql.Data.MySqlClient.MySqlException
    MessageBox.Show(ex.Message)
End Try
```

C# Example

```
MySql.Data.MySqlClient.MySqlConnection conn;
string myConnectionString;

myConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn = new MySql.Data.MySqlClient.MySqlConnection();
    conn.ConnectionString = myConnectionString;
    conn.Open();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message);
}
```

You can also pass the connection string to the constructor of the `MySqlConnection` class:

Visual Basic Example

```
Dim myConnectionString as String

myConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test;"

Try
    Dim conn As New MySql.Data.MySqlClient.MySqlConnection(myConnectionString)
    conn.Open()
End Try
```

```
Catch ex As MySql.Data.MySqlClient.MySqlException
    MessageBox.Show(ex.Message)
End Try
```

C# Example

```
MySql.Data.MySqlClient.MySqlConnection conn;
string myConnectionString;

myConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn = new MySql.Data.MySqlClient.MySqlConnection(myConnectionString);
    conn.Open();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message);
}
```

Once the connection is open it can be used by the other Connector/.NET classes to communicate with the MySQL server.

20.2.4.3.2. Handling Connection Errors

Because connecting to an external server is unpredictable, it is important to add error handling to your .NET application. When there is an error connecting, the `MySqlConnection` class will return a `MySqlException` object. This object has two properties that are of interest when handling errors:

- **Message:** A message that describes the current exception.
- **Number:** The MySQL error number.

When handling errors, you can your application's response based on the error number. The two most common error numbers when connecting are as follows:

- **0:** Cannot connect to server.
- **1045:** Invalid user name and/or password.

The following code shows how to adapt the application's response based on the actual error:

Visual Basic Example

```
Dim myConnectionString as String

myConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test;"

Try
    Dim conn As New MySql.Data.MySqlClient.MySqlConnection(myConnectionString)
    conn.Open()
Catch ex As MySql.Data.MySqlClient.MySqlException
    Select Case ex.Number
        Case 0
            MessageBox.Show("Cannot connect to server. Contact administrator")
        Case 1045
            MessageBox.Show("Invalid username/password, please try again")
    End Select
End Try
```

C# Example

```
MySql.Data.MySqlClient.MySqlConnection conn;
string myConnectionString;

myConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn = new MySql.Data.MySqlClient.MySqlConnection(myConnectionString);
    conn.Open();
}
```

```

}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    switch (ex.Number)
    {
        case 0:
            MessageBox.Show("Cannot connect to server. Contact administrator");
        case 1045:
            MessageBox.Show("Invalid username/password, please try again");
    }
}

```

Important

Note that if you are using multilanguage databases you must specify the character set in the connection string. If you do not specify the character set, the connection defaults to the `latin1` charset. You can specify the character set as part of the connection string, for example:

```

MySqlConnection myConnection = new MySqlConnection("server=127.0.0.1;uid=root;" +
"pwd=12345;database=test;Charset=latin1;");

```

20.2.4.4. Using Connector/NET with Connection Pooling

The Connector/NET supports connection pooling. This is enabled by default, but can be turned off via connection string options. See [Section 20.2.4.3, “Creating a Connection String”](#) for further information.

Connection pooling works by keeping the native connection to the server live when the client disposes of a `MySqlConnection`. Subsequently, if a new `MySqlConnection` object is opened, it will be created from the connection pool, rather than creating a new native connection. This improves performance.

To work as designed, it is best to let the connection pooling system manage all connections. You should not create a globally accessible instance of `MySqlConnection` and then manually open and close it. This interferes with the way the pooling works and can lead to unpredictable results or even exceptions.

One approach that simplifies things is to avoid manually creating a `MySqlConnection` object. Instead use the overloaded methods that take a connection string as an argument. Using this approach, Connector/NET will automatically create, open, close and destroy connections, using the connection pooling system for best performance.

Typed Datasets and the `MembershipProvider` and `RoleProvider` classes use this approach. Most classes that have methods that take a `MySqlConnection` as an argument, also have methods that take a connection string as an argument. This includes `MySqlDataAdapter`.

Instead of manually creating `MySqlCommand` objects, you can use the static methods of the `MySqlHelper` class. These take a connection string as an argument, and they fully support connection pooling.

20.2.4.5. Connector/NET Connection String Options Reference

Name	Default	Description
<code>Allow Batch</code>	true	When true, multiple SQL statements can be sent with one command execution. -Note- Starting with MySQL 4.1.1, batch statements should be separated by the server-defined separator character. Commands sent to earlier versions of MySQL should be separated with ';
<code>Allow User Variables</code>	false	Setting this to <code>true</code> indicates that the provider expects user variables in the SQL. This option was added in Connector/NET version 5.2.2.
<code>Allow Zero Datetime</code>	false	True to have <code>MySqlDataReader.GetValue()</code> return a <code>MySqlDateTime</code> for date or datetime columns that have illegal values. False will cause a <code>System.DateTime</code> object to be returned for legal values and an exception will be thrown for illegal values.
<code>AutoEnlist</code>	true	
<code>BlobAsUTF8ExcludePattern</code>	null	
<code>BlobAsUTF8IncludePattern</code>	null	
<code>CharSet, Character Set</code>		Specifies the character set that should be used to encode all queries sent to the server. Resultsets are still returned in the character set of the data returned.
<code>Connect Timeout, Connection Timeout</code>	15	The length of time (in seconds) to wait for a connection to the server before terminating the attempt and generating an error.
<code>Connection Reset</code>	false	

Convert Zero Datetime	false	True to have <code>MySqlDataReader.GetValue()</code> and <code>MySqlDataReader.GetDateTime()</code> return <code>DateTime.MinValue</code> for date or datetime columns that have illegal values.
Default Command Timeout		Sets the default value of the command timeout to be used. This does not supercede the individual command timeout property on an individual command object. If you set the command timeout property, that will be used. This option was added in Connector/NET 5.1.4
Encrypt, UseSSL	false	For Connector/NET 5.0.3 and later, when <code>true</code> , SSL encryption is used for all data sent between the client and server if the server has a certificate installed. Recognized values are <code>true</code> , <code>false</code> , <code>yes</code> , and <code>no</code> . In versions before 5.0.3, this option had no effect.
FunctionsReturnString	false	
Host, Server, Data Source, Data-Source, Address, Addr, Network Address	localhost	The name or network address of the instance of MySQL to which to connect. Multiple hosts can be specified separated by <code>&</code> . This can be useful where multiple MySQL servers are configured for replication and you are not concerned about the precise server you are connecting to. No attempt is made by the provider to synchronize writes to the database so care should be taken when using this option. In Unix environment with Mono, this can be a fully qualified path to MySQL socket file name. With this configuration, the Unix socket will be used instead of TCP/IP socket. Currently only a single socket name can be given so accessing MySQL in a replicated environment using Unix sockets is not currently supported.
Ignore Prepare	true	When true, instructs the provider to ignore any calls to <code>MySqlCommand.Prepare()</code> . This option is provided to prevent issues with corruption of the statements when use with server side prepared statements. If you want to use server-side prepare statements, set this option to false. This option was added in Connector/NET 5.0.3 and Connector/NET 1.0.9.
Initial Catalog, Database	mysql	The name of the database to use intially
InteractiveSession	false	
Logging	false	When true, various pieces of information is output to any configured <code>TraceListeners</code> .
Old Syntax, OldSyntax	false	Allows use of <code>'@'</code> symbol as a parameter marker. See <code>MySqlCommand</code> for more info. This option was deprecated in Connector/NET 5.2.2. All future code should be written using the <code>'@'</code> symbol.
Password, pwd		The password for the MySQL account being used.
Persist Security Info	false	When set to <code>false</code> or <code>no</code> (strongly recommended), security-sensitive information, such as the password, is not returned as part of the connection if the connection is open or has ever been in an open state. Re-setting the connection string resets all connection string values including the password. Recognized values are <code>true</code> , <code>false</code> , <code>yes</code> , and <code>no</code> .
Pipe Name, Pipe	mysql	When set to the name of a named pipe, the <code>MySqlConnection</code> will attempt to connect to MySQL on that named pipe. This settings only applies to the Windows platform.
Port	3306	The port MySQL is using to listen for connections. This value is ignored if Unix socket is used.
Procedure Cache Size	25	Sets the size of the stored procedure cache. By default, Connector/NET will store the metadata (input/output datatypes) about the last 25 stored procedures used. To disable the stored procedure cache, set the value to zero (0). This option was added in Connector/NET 5.0.2 and Connector/NET 1.0.9.
Protocol	socket	Specifies the type of connection to make to the server. Values can be: <code>socket</code> or <code>tcp</code> for a socket connection, <code>pipe</code> for a named pipe connection, <code>unix</code> for a Unix socket connection, <code>memory</code> to use MySQL shared memory.
Respect Binary Flags	true	Setting this option to <code>false</code> means that Connector/NET will ignore a column's binary flags as set by the server. This option was added in Connector/NET version 5.1.3.
Shared Memory Name	MYSQL	The name of the shared memory object to use for communication if the connection protocol is set to memory.

<code>TreatBlobsAsUTF8</code>	false	
<code>Treat Tiny As Boolean</code>	true	Setting this value to <code>false</code> indicates that <code>TINYINT(1)</code> will be treated as an <code>INT</code> . See also Section 10.1.1, “Overview of Numeric Types” for a further explanation of the <code>TINYINT</code> and <code>BOOL</code> data types.
<code>Use Affected Rows</code>	false	When <code>true</code> the connection will report changed rows instead of found rows. This option was added in Connector/NET version 5.2.6.
<code>Use Procedure Bodies</code>	true	Setting this option to <code>false</code> indicates that the user connecting to the database does not have the <code>SELECT</code> privileges for the <code>mysql.proc</code> (stored procedures) table. When set to <code>false</code> , Connector/NET will not rely on this information being available when the procedure is called. Because Connector/NET will be unable to determine this information, you should explicitly set the types of all the parameters before the call and the parameters should be added to the command in the exact same order as they appear in the procedure definition. This option was added in Connector/NET 5.0.4 and Connector/NET 1.0.10.
<code>User Id, Username, Uid, User name</code>		The MySQL login account being used.
<code>Use Compression</code>	false	Setting this option to <code>true</code> enables compression of packets exchanged between the client and the server. This exchange is defined by the MySQL client-server protocol. Compression is used if both client and server support ZLIB compression, and the client has requested compression using this option. A compressed packet header is: packet length (3 bytes), packet number (1 byte), and Uncompressed Packet Length (3 bytes). The Uncompressed Packet Length is the number of bytes in the original, uncompressed packet. If this is zero then the data in this packet has not been compressed. When the compression protocol is in use, either the client or the server may compress packets. However, compression will not occur if the compressed length is greater than the original length. Thus, some packets will contain compressed data while other packets will not.
<code>Use Usage Advisor</code>	false	
<code>Use Performance Monitor</code>	false	

The following table lists the valid names for connection pooling values within the `ConnectionString`. For more information about connection pooling, see [Connection Pooling](#) for the MySQL Data Provider.

Name	Default	Description
<code>Cache Server Configuration, CacheServerConfiguration, CacheServerConfig</code>	false	Specifies whether server variables should be updated when a pooled connection is returned. Turning this one will yield faster opens but will also not catch any server changes made by other connections.
<code>Connection Lifetime</code>	0	When a connection is returned to the pool, its creation time is compared with the current time, and the connection is destroyed if that time span (in seconds) exceeds the value specified by <code>Connection Lifetime</code> . This is useful in clustered configurations to force load balancing between a running server and a server just brought online. A value of zero (0) causes pooled connections to have the maximum connection timeout.
<code>Max Pool Size</code>	100	The maximum number of connections allowed in the pool.
<code>Min Pool Size</code>	0	The minimum number of connections allowed in the pool.
<code>Pooling</code>	true	When <code>true</code> , the <code>MySqlConnection</code> object is drawn from the appropriate pool, or if necessary, is created and added to the appropriate pool. Recognized values are <code>true</code> , <code>false</code> , <code>yes</code> , and <code>no</code> .
<code>Reset Pooled Connections, ResetConnections, ResetPooledConnections</code>	true	Specifies whether a ping and a reset should be sent to the server before a pooled connection is returned. Not resetting will yield faster connection opens but also will not clear out session items such as temp tables.

20.2.4.6. Using the Connector/NET with Prepared Statements

Introduction

As of MySQL 4.1, it is possible to use prepared statements with Connector/NET. Use of prepared statements can provide significant performance improvements on queries that are executed more than once.

Prepared execution is faster than direct execution for statements executed more than once, primarily because the query is parsed only once. In the case of direct execution, the query is parsed every time it is executed. Prepared execution also can provide a reduction of network traffic because for each execution of the prepared statement, it is necessary only to send the data for the parameters.

Another advantage of prepared statements is that it uses a binary protocol that makes data transfer between client and server more efficient.

20.2.4.6.1. Preparing Statements in Connector/NET

To prepare a statement, create a command object and set the `.CommandText` property to your query.

After entering your statement, call the `.Prepare` method of the `MySQLCommand` object. After the statement is prepared, add parameters for each of the dynamic elements in the query.

After you enter your query and enter parameters, execute the statement using the `.ExecuteNonQuery()`, `.ExecuteScalar()`, or `.ExecuteReader` methods.

For subsequent executions, you need only modify the values of the parameters and call the execute method again, there is no need to set the `.CommandText` property or redefine the parameters.

Visual Basic Example

```
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

conn.ConnectionString = strConnection

Try
    conn.Open()
    cmd.Connection = conn

    cmd.CommandText = "INSERT INTO myTable VALUES(NULL, @number, @text)"
    cmd.Prepare()

    cmd.Parameters.Add("@number", 1)
    cmd.Parameters.Add("@text", "One")

    For i = 1 To 1000
        cmd.Parameters["@number"].Value = i
        cmd.Parameters["@text"].Value = "A string value"

        cmd.ExecuteNonQuery()
    Next
Catch ex As MySqlException
    MessageBox.Show("Error " & ex.Number & " has occurred: " & ex.Message, "Error", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try
```

C# Example

```
MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;

conn = new MySQL.Data.MySqlClient.MySqlConnection();
cmd = new MySQL.Data.MySqlClient.MySqlCommand();

conn.ConnectionString = strConnection;

try
{
    conn.Open();
    cmd.Connection = conn;

    cmd.CommandText = "INSERT INTO myTable VALUES(NULL, @number, @text)";
    cmd.Prepare();

    cmd.Parameters.Add("@number", 1);
    cmd.Parameters.Add("@text", "One");

    for (int i=1; i <= 1000; i++)
    {
        cmd.Parameters["@number"].Value = i;
        cmd.Parameters["@text"].Value = "A string value";

        cmd.ExecuteNonQuery();
    }
}
catch (MySQL.Data.MySqlClient.MySqlException ex)
```

```
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}
```

20.2.4.7. Accessing Stored Procedures with Connector/NET

Introduction

With the release of MySQL version 5 the MySQL server now supports stored procedures with the SQL 2003 stored procedure syntax.

A stored procedure is a set of SQL statements that can be stored in the server. Once this has been done, clients do not need to keep reissuing the individual statements but can refer to the stored procedure instead.

Stored procedures can be particularly useful in situations such as the following:

- When multiple client applications are written in different languages or work on different platforms, but need to perform the same database operations.
- When security is paramount. Banks, for example, use stored procedures for all common operations. This provides a consistent and secure environment, and procedures can ensure that each operation is properly logged. In such a setup, applications and users would not get any access to the database tables directly, but can only execute specific stored procedures.

Connector/NET supports the calling of stored procedures through the `MySQLCommand` object. Data can be passed in and out of a MySQL stored procedure through use of the `MySQLCommand.Parameters` collection.

Note

When you call a stored procedure, the command object makes an additional `SELECT` call to determine the parameters of the stored procedure. You must ensure that the user calling the procedure has the `SELECT` privilege on the `mysql.proc` table to enable them to verify the parameters. Failure to do this will result in an error when calling the procedure.

This section will not provide in-depth information on creating Stored Procedures. For such information, please refer to <http://dev.mysql.com/doc/mysql/en/stored-routines.html>.

A sample application demonstrating how to use stored procedures with Connector/NET can be found in the `Samples` directory of your Connector/NET installation.

20.2.4.7.1. Creating Stored Procedures from Connector/NET

Stored procedures in MySQL can be created using a variety of tools. First, stored procedures can be created using the `mysql` command-line client. Second, stored procedures can be created using the `MySQL Query Browser` GUI client. Finally, stored procedures can be created using the `.ExecuteNonQuery` method of the `MySQLCommand` object:

Visual Basic Example

```
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

Try
    conn.Open()
    cmd.Connection = conn

    cmd.CommandText = "CREATE PROCEDURE add_emp(" _
        & "IN fname VARCHAR(20), IN lname VARCHAR(20), IN bday DATETIME, OUT empno INT) " _
        & "BEGIN INSERT INTO emp(first_name, last_name, birthdate) " _
        & "VALUES(fname, lname, DATE(bday)); SET empno = LAST_INSERT_ID(); END"

    cmd.ExecuteNonQuery()
Catch ex As MySqlException
    MessageBox.Show("Error " & ex.Number & " has occurred: " & ex.Message, "Error", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try
```

C# Example

```
MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;
```

```

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn.Open();
    cmd.Connection = conn;

    cmd.CommandText = "CREATE PROCEDURE add_emp(" +
        "IN fname VARCHAR(20), IN lname VARCHAR(20), IN bday DATETIME, OUT empno INT) " +
        "BEGIN INSERT INTO emp(first_name, last_name, birthdate) " +
        "VALUES(fname, lname, DATE(bday)); SET empno = LAST_INSERT_ID(); END";

    cmd.ExecuteNonQuery();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

It should be noted that, unlike the command-line and GUI clients, you are not required to specify a special delimiter when creating stored procedures in Connector/NET.

20.2.4.7.2. Calling a Stored Procedure from Connector/NET

To call a stored procedure using Connector/NET, create a `MySqlCommand` object and pass the stored procedure name as the `.CommandText` property. Set the `.CommandType` property to `CommandType.StoredProcedure`.

After the stored procedure is named, create one `MySqlCommand` parameter for every parameter in the stored procedure. `IN` parameters are defined with the parameter name and the object containing the value, `OUT` parameters are defined with the parameter name and the datatype that is expected to be returned. All parameters need the parameter direction defined.

After defining parameters, call the stored procedure by using the `MySqlCommand.ExecuteNonQuery()` method:

Visual Basic Example

```

Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

conn.ConnectionString = "server=127.0.0.1;" & _
    & "uid=root;" & _
    & "pwd=12345;" & _
    & "database=test"

Try
    conn.Open()
    cmd.Connection = conn

    cmd.CommandText = "add_emp"
    cmd.CommandType = CommandType.StoredProcedure

    cmd.Parameters.Add("@lname", 'Jones')
    cmd.Parameters["@lname"].Direction = ParameterDirection.Input

    cmd.Parameters.Add("@fname", 'Tom')
    cmd.Parameters["@fname"].Direction = ParameterDirection.Input

    cmd.Parameters.Add("@bday", #12/13/1977 2:17:36 PM#)
    cmd.Parameters["@bday"].Direction = ParameterDirection.Input

    cmd.Parameters.Add("@empno", MySqlDbType.Int32)
    cmd.Parameters["@empno"].Direction = ParameterDirection.Output

    cmd.ExecuteNonQuery()

    MessageBox.Show(cmd.Parameters["@empno"].Value)
Catch ex As MySqlException
    MessageBox.Show("Error " & ex.Number & " has occurred: " & ex.Message, "Error", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try

```

C# Example

```

MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{

```

```

conn.Open();
cmd.Connection = conn;

cmd.CommandText = "add_emp";
cmd.CommandType = CommandType.StoredProcedure;

cmd.Parameters.Add("@lname", "Jones");
cmd.Parameters["@lname"].Direction = ParameterDirection.Input;

cmd.Parameters.Add("@fname", "Tom");
cmd.Parameters["@fname"].Direction = ParameterDirection.Input;

cmd.Parameters.Add("@bday", DateTime.Parse("12/13/1977 2:17:36 PM"));
cmd.Parameters["@bday"].Direction = ParameterDirection.Input;

cmd.Parameters.Add("@empno", MySqlDbType.Int32);
cmd.Parameters["@empno"].Direction = ParameterDirection.Output;

cmd.ExecuteNonQuery();

MessageBox.Show(cmd.Parameters["@empno"].Value);
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

Once the stored procedure is called, the values of output parameters can be retrieved by using the `.Value` property of the `MySqlConnector.Parameters` collection.

20.2.4.8. Handling BLOB Data With Connector/NET

Introduction

One common use for MySQL is the storage of binary data in **BLOB** columns. MySQL supports four different BLOB datatypes: `TINYBLOB`, `BLOB`, `MEDIUMBLOB`, and `LONGBLOB`.

Data stored in a BLOB column can be accessed using Connector/NET and manipulated using client-side code. There are no special requirements for using Connector/NET with BLOB data.

Simple code examples will be presented within this section, and a full sample application can be found in the `Samples` directory of the Connector/NET installation.

20.2.4.8.1. Preparing the MySQL Server

The first step in using MySQL with BLOB data is to configure the server. Let's start by creating a table to be accessed. In my file tables, I usually have four columns: an `AUTO_INCREMENT` column of appropriate size (`UNSIGNED SMALLINT`) to serve as a primary key to identify the file, a `VARCHAR` column that stores the file name, an `UNSIGNED MEDIUMINT` column that stores the size of the file, and a `MEDIUMBLOB` column that stores the file itself. For this example, I will use the following table definition:

```

CREATE TABLE file(
file_id SMALLINT UNSIGNED AUTO_INCREMENT NOT NULL PRIMARY KEY,
file_name VARCHAR(64) NOT NULL,
file_size MEDIUMINT UNSIGNED NOT NULL,
file MEDIUMBLOB NOT NULL);

```

After creating a table, you may need to modify the `max_allowed_packet` system variable. This variable determines how large of a packet (i.e. a single row) can be sent to the MySQL server. By default, the server will only accept a maximum size of 1 meg from our client application. If you do not intend to exceed 1 meg, this should be fine. If you do intend to exceed 1 meg in your file transfers, this number has to be increased.

The `max_allowed_packet` option can be modified using MySQL Administrator's Startup Variables screen. Adjust the Maximum allowed option in the Memory section of the Networking tab to an appropriate setting. After adjusting the value, click the `APPLY CHANGES` button and restart the server using the `Service Control` screen of MySQL Administrator. You can also adjust this value directly in the `my.cnf` file (add a line that reads `max_allowed_packet=xxM`), or use the `SET max_allowed_packet=xxM`; syntax from within MySQL.

Try to be conservative when setting `max_allowed_packet`, as transfers of BLOB data can take some time to complete. Try to set a value that will be adequate for your intended use and increase the value if necessary.

20.2.4.8.2. Writing a File to the Database

To write a file to a database we need to convert the file to a byte array, then use the byte array as a parameter to an `INSERT` query.

The following code opens a file using a `FileStream` object, reads it into a byte array, and inserts it into the `file` table:

Visual Basic Example

```

Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

Dim SQL As String

Dim FileSize As UInt32
Dim rawData() As Byte
Dim fs As FileStream

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

Try
    fs = New FileStream("c:\image.png", FileMode.Open, FileAccess.Read)
    FileSize = fs.Length

    rawData = New Byte(FileSize) {}
    fs.Read(rawData, 0, FileSize)
    fs.Close()

    conn.Open()

    SQL = "INSERT INTO file VALUES(NULL, @FileName, @FileSize, @File)"

    cmd.Connection = conn
    cmd.CommandText = SQL
    cmd.Parameters.Add("@FileName", strFileName)
    cmd.Parameters.Add("@FileSize", FileSize)
    cmd.Parameters.Add("@File", rawData)

    cmd.ExecuteNonQuery()

    MessageBox.Show("File Inserted into database successfully!", _
        "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk)

    conn.Close()
Catch ex As Exception
    MessageBox.Show("There was an error: " & ex.Message, "Error", _
        MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try

```

C# Example

```

MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;

conn = new MySQL.Data.MySqlClient.MySqlConnection();
cmd = new MySQL.Data.MySqlClient.MySqlCommand();

string SQL;
UInt32 FileSize;
byte[] rawData;
FileStream fs;

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    fs = new FileStream(@"c:\image.png", FileMode.Open, FileAccess.Read);
    FileSize = fs.Length;

    rawData = new byte[FileSize];
    fs.Read(rawData, 0, FileSize);
    fs.Close();

    conn.Open();

    SQL = "INSERT INTO file VALUES(NULL, @FileName, @FileSize, @File)";

    cmd.Connection = conn;
    cmd.CommandText = SQL;
    cmd.Parameters.Add("@FileName", strFileName);
    cmd.Parameters.Add("@FileSize", FileSize);
    cmd.Parameters.Add("@File", rawData);

    cmd.ExecuteNonQuery();

    MessageBox.Show("File Inserted into database successfully!",
        "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk);

    conn.Close();
}
catch (MySQL.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

The `Read` method of the `FileStream` object is used to load the file into a byte array which is sized according to the `Length` property of the `FileStream` object.

After assigning the byte array as a parameter of the `MySQLCommand` object, the `ExecuteNonQuery` method is called and the BLOB is inserted into the `file` table.

20.2.4.8.3. Reading a BLOB from the Database to a File on Disk

Once a file is loaded into the `file` table, we can use the `MySQLDataReader` class to retrieve it.

The following code retrieves a row from the `file` table, then loads the data into a `FileStream` object to be written to disk:

Visual Basic Example

```
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myData As MySQLDataReader
Dim SQL As String
Dim rawData() As Byte
Dim FileSize As UInt32
Dim fs As FileStream

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

SQL = "SELECT file_name, file_size, file FROM file"

Try
    conn.Open()

    cmd.Connection = conn
    cmd.CommandText = SQL

    myData = cmd.ExecuteReader

    If Not myData.HasRows Then Throw New Exception("There are no BLOBs to save")

    myData.Read()

    FileSize = myData.GetUInt32(myData.GetOrdinal("file_size"))
    rawData = New Byte(FileSize) {}

    myData.GetBytes(myData.GetOrdinal("file"), 0, rawData, 0, FileSize)

    fs = New FileStream("C:\newfile.png", FileMode.OpenOrCreate, FileAccess.Write)
    fs.Write(rawData, 0, FileSize)
    fs.Close()

    MessageBox.Show("File successfully written to disk!", "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk)

    myData.Close()
    conn.Close()
Catch ex As Exception
    MessageBox.Show("There was an error: " & ex.Message, "Error", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try
```

C# Example

```
MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;
MySQL.Data.MySqlClient.MySQLDataReader myData;

conn = new MySQL.Data.MySqlClient.MySqlConnection();
cmd = new MySQL.Data.MySqlClient.MySqlCommand();

string SQL;
UInt32 FileSize;
byte[] rawData;
FileStream fs;

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

SQL = "SELECT file_name, file_size, file FROM file";

try
{
    conn.Open();

    cmd.Connection = conn;
    cmd.CommandText = SQL;

    myData = cmd.ExecuteReader();

    if (! myData.HasRows)
        throw new Exception("There are no BLOBs to save");
```

```

myData.Read();
FileSize = myData.GetUInt32(myData.GetOrdinal("file_size"));
rawData = new byte[FileSize];

myData.GetBytes(myData.GetOrdinal("file"), 0, rawData, 0, FileSize);

fs = new FileStream(@"C:\newfile.png", FileMode.OpenOrCreate, FileAccess.Write);
fs.Write(rawData, 0, FileSize);
fs.Close();

MessageBox.Show("File successfully written to disk!",
    "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk);

myData.Close();
conn.Close();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

After connecting, the contents of the `file` table are loaded into a `MySqlDataReader` object. The `GetBytes` method of the `MySqlDataReader` is used to load the BLOB into a byte array, which is then written to disk using a `FileStream` object.

The `GetOrdinal` method of the `MySqlDataReader` can be used to determine the integer index of a named column. Use of the `GetOrdinal` method prevents errors if the column order of the `SELECT` query is changed.

20.2.4.9. Using Connector/NET with Crystal Reports

Introduction

Crystal Reports is a common tool used by Windows application developers to perform reporting and document generation. In this section we will show how to use Crystal Reports XI with MySQL and Connector/NET.

20.2.4.9.1. Creating a Data Source

When creating a report in Crystal Reports there are two options for accessing the MySQL data while designing your report.

The first option is to use Connector/ODBC as an ADO data source when designing your report. You will be able to browse your database and choose tables and fields using drag and drop to build your report. The disadvantage of this approach is that additional work must be performed within your application to produce a data set that matches the one expected by your report.

The second option is to create a data set in VB.NET and save it as XML. This XML file can then be used to design a report. This works quite well when displaying the report in your application, but is less versatile at design time because you must choose all relevant columns when creating the data set. If you forget a column you must re-create the data set before the column can be added to the report.

The following code can be used to create a data set from a query and write it to disk:

Visual Basic Example

```

Dim myData As New DataSet
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myAdapter As New MySqlDataAdapter

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=world"

Try
    conn.Open()
    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " _
        & "country.name, country.population, country.continent " _
        & "FROM country, city ORDER BY country.continent, country.name"
    cmd.Connection = conn

    myAdapter.SelectCommand = cmd
    myAdapter.Fill(myData)

    myData.WriteXml("C:\dataset.xml", XmlWriteMode.WriteSchema)
Catch ex As Exception
    MessageBox.Show(ex.Message, "Report could not be created", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try

```

C# Example

```

DataSet myData = new DataSet();
MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;
MySQL.Data.MySqlClient.MySqlDataAdapter myAdapter;

conn = new MySQL.Data.MySqlClient.MySqlConnection();
cmd = new MySQL.Data.MySqlClient.MySqlCommand();
myAdapter = new MySQL.Data.MySqlClient.MySqlDataAdapter();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " +
        "country.name, country.population, country.continent " +
        "FROM country, city ORDER BY country.continent, country.name";
    cmd.Connection = conn;

    myAdapter.SelectCommand = cmd;
    myAdapter.Fill(myData);

    myData.WriteXml(@"C:\dataset.xml", XmlWriteMode.WriteSchema);
}
catch (MySQL.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message, "Report could not be created",
        MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

The resulting XML file can be used as an ADO.NET XML datasource when designing your report.

If you choose to design your reports using Connector/ODBC, it can be downloaded from dev.mysql.com.

20.2.4.9.2. Creating the Report

For most purposes the Standard Report wizard should help with the initial creation of a report. To start the wizard, open Crystal Reports and choose the New > Standard Report option from the File menu.

The wizard will first prompt you for a data source. If you are using Connector/ODBC as your data source, use the OLEDB provider for ODBC option from the OLE DB (ADO) tree instead of the ODBC (RDO) tree when choosing a data source. If using a saved data set, choose the ADO.NET (XML) option and browse to your saved data set.

The remainder of the report creation process is done automatically by the wizard.

After the report is created, choose the Report Options... entry of the File menu. Un-check the Save Data With Report option. This prevents saved data from interfering with the loading of data within our application.

20.2.4.9.3. Displaying the Report

To display a report we first populate a data set with the data needed for the report, then load the report and bind it to the data set. Finally we pass the report to the crViewer control for display to the user.

The following references are needed in a project that displays a report:

- CrystalDecisions.CrystalReports.Engine
- CrystalDecisions.ReportSource
- CrystalDecisions.Shared
- CrystalDecisions.Windows.Forms

The following code assumes that you created your report using a data set saved using the code shown in [Section 20.2.4.9.1, "Creating a Data Source"](#), and have a crViewer control on your form named `myViewer`.

Visual Basic Example

```

Imports CrystalDecisions.CrystalReports.Engine
Imports System.Data
Imports MySQL.Data.MySqlClient

Dim myReport As New ReportDocument
Dim myData As New DataSet
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myAdapter As New MySqlDataAdapter

conn.ConnectionString = _

```

```

"server=127.0.0.1;" _
& "uid=root;" _
& "pwd=12345;" _
& "database=test"

Try
    conn.Open()

    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " _
        & "country.name, country.population, country.continent " _
        & "FROM country, city ORDER BY country.continent, country.name"
    cmd.Connection = conn

    myAdapter.SelectCommand = cmd
    myAdapter.Fill(myData)

    myReport.Load(".\world_report.rpt")
    myReport.SetDataSource(myData)
    myViewer.ReportSource = myReport
Catch ex As Exception
    MessageBox.Show(ex.Message, "Report could not be created", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try

```

C# Example

```

using CrystalDecisions.CrystalReports.Engine;
using System.Data;
using MySql.Data.MySqlClient;

ReportDocument myReport = new ReportDocument();
DataSet myData = new DataSet();
MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;
MySql.Data.MySqlClient.MySqlDataAdapter myAdapter;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();
myAdapter = new MySql.Data.MySqlClient.MySqlDataAdapter();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " +
        "country.name, country.population, country.continent " +
        "FROM country, city ORDER BY country.continent, country.name";
    cmd.Connection = conn;

    myAdapter.SelectCommand = cmd;
    myAdapter.Fill(myData);

    myReport.Load(@".\world_report.rpt");
    myReport.SetDataSource(myData);
    myViewer.ReportSource = myReport;
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message, "Report could not be created",
        MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

A new data set is generated using the same query used to generate the previously saved data set. Once the data set is filled, a `ReportDocument` is used to load the report file and bind it to the data set. The `ReportDocument` is then passed as the `ReportSource` of the `crViewer`.

This same approach is taken when a report is created from a single table using Connector/ODBC. The data set replaces the table used in the report and the report is displayed properly.

When a report is created from multiple tables using Connector/ODBC, a data set with multiple tables must be created in our application. This allows each table in the report data source to be replaced with a report in the data set.

We populate a data set with multiple tables by providing multiple `SELECT` statements in our `MySqlCommand` object. These `SELECT` statements are based on the SQL query shown in Crystal Reports in the Database menu's Show SQL Query option. Assume the following query:

```

SELECT `country`.`Name`, `country`.`Continent`, `country`.`Population`, `city`.`Name`, `city`.`Population`
FROM `world`.`country` `country` LEFT OUTER JOIN `world`.`city` `city` ON `country`.`Code`=`city`.`CountryCode`
ORDER BY `country`.`Continent`, `country`.`Name`, `city`.`Name`

```

This query is converted to two `SELECT` queries and displayed with the following code:

Visual Basic Example

```

Imports CrystalDecisions.CrystalReports.Engine
Imports System.Data

```

```
Imports MySql.Data.MySqlClient

Dim myReport As New ReportDocument
Dim myData As New DataSet
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myAdapter As New MySqlDataAdapter

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=world"

Try
    conn.Open()
    cmd.CommandText = "SELECT name, population, countrycode FROM city ORDER BY countrycode, name;" _
        & "SELECT name, population, code, continent FROM country ORDER BY continent, name"
    cmd.Connection = conn

    myAdapter.SelectCommand = cmd
    myAdapter.Fill(myData)

    myReport.Load(".\world_report.rpt")
    myReport.Database.Tables(0).SetDataSource(myData.Tables(0))
    myReport.Database.Tables(1).SetDataSource(myData.Tables(1))
    myViewer.ReportSource = myReport
Catch ex As Exception
    MessageBox.Show(ex.Message, "Report could not be created", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try
```

C# Example

```
using CrystalDecisions.CrystalReports.Engine;
using System.Data;
using MySql.Data.MySqlClient;

ReportDocument myReport = new ReportDocument();
DataSet myData = new DataSet();
MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;
MySql.Data.MySqlClient.MySqlDataAdapter myAdapter;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();
myAdapter = new MySql.Data.MySqlClient.MySqlDataAdapter();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    cmd.CommandText = "SELECT name, population, countrycode FROM city ORDER " +
        "BY countrycode, name; SELECT name, population, code, continent FROM " +
        "country ORDER BY continent, name";
    cmd.Connection = conn;

    myAdapter.SelectCommand = cmd;
    myAdapter.Fill(myData);

    myReport.Load(@".\world_report.rpt");
    myReport.Database.Tables(0).SetDataSource(myData.Tables(0));
    myReport.Database.Tables(1).SetDataSource(myData.Tables(1));
    myViewer.ReportSource = myReport;
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message, "Report could not be created",
        MessageBoxButtons.OK, MessageBoxIcon.Error);
}
```

It is important to order the [SELECT](#) queries in alphabetical order, as this is the order the report will expect its source tables to be in. One `SetDataSource` statement is needed for each table in the report.

This approach can cause performance problems because Crystal Reports must bind the tables together on the client-side, which will be slower than using a pre-saved data set.

20.2.4.10. Handling Date and Time Information in Connector/NET

Introduction

MySQL and the .NET languages handle date and time information differently, with MySQL allowing dates that cannot be represented by a .NET data type, such as '0000-00-00 00:00:00'. These differences can cause problems if not properly handled.

In this section we will demonstrate how to properly handle date and time information when using Connector/NET.

20.2.4.10.1. Problems when Using Invalid Dates

The differences in date handling can cause problems for developers who use invalid dates. Invalid MySQL dates cannot be loaded into native .NET `DateTime` objects, including `NULL` dates.

Because of this issue, .NET `DataSet` objects cannot be populated by the `Fill` method of the `MySqlDataAdapter` class as invalid dates will cause a `System.ArgumentOutOfRangeException` exception to occur.

20.2.4.10.2. Restricting Invalid Dates

The best solution to the date problem is to restrict users from entering invalid dates. This can be done on either the client or the server side.

Restricting invalid dates on the client side is as simple as always using the .NET `DateTime` class to handle dates. The `DateTime` class will only allow valid dates, ensuring that the values in your database are also valid. The disadvantage of this is that it is not useful in a mixed environment where .NET and non .NET code are used to manipulate the database, as each application must perform its own date validation.

Users of MySQL 5.0.2 and higher can use the new `traditional` SQL mode to restrict invalid date values. For information on using the `traditional` SQL mode, see [Section 5.1.7, “Server SQL Modes”](#).

20.2.4.10.3. Handling Invalid Dates

Although it is strongly recommended that you avoid the use of invalid dates within your .NET application, it is possible to use invalid dates by means of the `MySqlDateTime` datatype.

The `MySqlDateTime` datatype supports the same date values that are supported by the MySQL server. The default behavior of Connector/NET is to return a .NET `DateTime` object for valid date values, and return an error for invalid dates. This default can be modified to cause Connector/NET to return `MySqlDateTime` objects for invalid dates.

To instruct Connector/NET to return a `MySqlDateTime` object for invalid dates, add the following line to your connection string:

```
Allow Zero Datetime=True
```

Please note that the use of the `MySqlDateTime` class can still be problematic. The following are some known issues:

1. Data binding for invalid dates can still cause errors (zero dates like 0000-00-00 do not seem to have this problem).
2. The `ToString` method return a date formatted in the standard MySQL format (for example, 2005-02-23 08:50:25). This differs from the `ToString` behavior of the .NET `DateTime` class.
3. The `MySqlDateTime` class supports `NULL` dates, while the .NET `DateTime` class does not. This can cause errors when trying to convert a `MySqlDateTime` to a `DateTime` if you do not check for `NULL` first.

Because of the known issues, the best recommendation is still to use only valid dates in your application.

20.2.4.10.4. Handling NULL Dates

The .NET `DateTime` datatype cannot handle `NULL` values. As such, when assigning values from a query to a `DateTime` variable, you must first check whether the value is in fact `NULL`.

When using a `MySqlDataReader`, use the `.IsDBNull` method to check whether a value is `NULL` before making the assignment:

Visual Basic Example

```
If Not myReader.IsDBNull(myReader.GetOrdinal("mytime")) Then
    myTime = myReader.GetDateTime(myReader.GetOrdinal("mytime"))
Else
    myTime = DateTime.MinValue
End If
```

C# Example

```
if (! myReader.IsDBNull(myReader.GetOrdinal("mytime")))
    myTime = myReader.GetDateTime(myReader.GetOrdinal("mytime"));
else
    myTime = DateTime.MinValue;
```

[NULL](#) values will work in a data set and can be bound to form controls without special handling.

20.2.4.11. ASP.NET Provider Model

MySQL Connector/Net provides support for the ASP.NET 2.0 provider model. This model allows application developers to focus on the business logic of their application instead of having to recreate such boilerplate items as membership and roles support. Currently, only membership and role providers are supplied although session state and profile providers will be provided in upcoming releases.

Installing The Providers

The installation of Connector/Net 5.1 or later will install the providers and register them in your machine's .NET configuration file. The providers are implemented in the file `mysql.web.dll` and this file can be found in your Connector/Net installation folder. There is no need to run any type of SQL script to setup the database as the providers create and maintain the proper schema automatically.

Using The Providers

The easiest way to start using the providers is to use the ASP.NET configuration tool that is available on the Solution Explorer toolbar when you have a website project loaded.

In the web pages that open you will be able to select the MySQL membership and roles provider by indicating that you want to pick a custom provider for each area.

When the provider is installed, it creates a dummy connection string named `LocalMySqlServer`. This has to be done so that the provider will work in the ASP.NET configuration tool. However, you will want to override this connection string in your `web.config` file. You do this by first removing the dummy connection string and then adding in the proper one. Here is an example:

```
<connectionStrings>
  <remove name="LocalMySqlServer" />
  <add name="LocalMySqlServer" connectionString="server=xxx;uid=xxx;pwd=xxx" />
</connectionStrings>
```

Distribution

To use the providers on a production server you will need to distribute the `MySql.Data` and the `MySql.Web` assemblies and either register them in the remote system's Global Assembly Cache or keep them in your application's bin folder.

20.2.4.12. Binary/Nonbinary Issues

There are certain situations where MySQL will return incorrect metadata about one or more columns. More specifically, the server will sometimes report that a column is binary when it is not and vice versa. In these situations, it becomes practically impossible for the connector to be able to correctly identify the correct metadata.

Some examples of situations that may return incorrect metadata are:

- Execution of `SHOW PROCESSLIST`. Some of the columns will be returned as binary even though they only hold string data.
- When a temp table is used to process a resultset, some columns may be returned with incorrect binary flags.
- Some server functions such as `DATE_FORMAT` will incorrectly return the column as binary.

With the availability of `BINARY` and `VARBINARY` data types it is important that we respect the metadata returned by the server. However, we are aware that some existing applications may break with this change so we are creating a connection string option to enable or disable it. By default, Connector/Net 5.1 will respect the binary flags returned by the server. This will mean that you may need to make small changes to your application to accommodate this change.

In the event that the changes required to your application would be too large, you can add `'respect binary flags=false'` to your connection string. This will cause the connector to use the prior behavior. In a nutshell, that behavior was that any column that is marked as string, regardless of binary flags, will be returned as string. Only columns that are specifically marked as `BLOB` will be returned as `BLOB`.

20.2.4.13. Character Sets

Treating Binary Blobs As UTF8

MySQL doesn't currently support 4 byte UTF8 sequences. This makes it difficult to represent some multi-byte languages such as Japanese. To try and alleviate this, Connector/Net now supports a mode where binary blobs can be treated as strings.

To do this, you set the 'Treat Blobs As UTF8' connection string keyword to yes. This is all that needs to be done to enable conversion of all binary blobs to UTF8 strings. If you wish to convert only some of your blob columns, then you can make use of the 'BlobAsUTF8IncludePattern' and 'BlobAsUTF8ExcludePattern' keywords. These should be set to the regular expression pattern that matches the column names you wish to include or exclude respectively.

One thing to note is that the regular expression patterns can both match a single column. When this happens, the include pattern is applied before the exclude pattern. The result, in this case, would be that the column would be excluded. You should also be aware that this mode does not apply to columns of type `BINARY` or `VARBINARY` and also do not apply to nonbinary `BLOB` columns.

Currently this mode only applies to reading strings out of MySQL. To insert 4-byte UTF8 strings into blob columns you will need to use the `.NET Encoding.GetBytes` function to convert your string to a series of bytes. You can then set this byte array as a parameter for a `BLOB` column.

20.2.4.14. Working with medium trust

.NET applications operate under a given trust level. Normal desktop applications operate under full trust while web applications that are hosted in shared environments are normally run under the medium trust level. Some hosting providers host shared applications in their own app pools and allow the application to run under full trust, but this seems to be the exception rather than the rule.

Connector/Net versions prior to 5.0.8 and 5.1.3 were not compatible with medium trust hosting. Starting with these versions, Connector/Net can be used under medium trust hosting that has been modified to allow the use of sockets for communication. By default, medium trust does not include `SocketPermission`. Connector/Net uses sockets to talk with the MySQL server so it is required that a new trust level be created that is an exact clone of medium trust but that has `SocketPermission` added.

20.2.5. Connector/NET Support

The developers of Connector/NET greatly value the input of our users in the software development process. If you find Connector/NET lacking some feature important to you, or if you discover a bug and need to file a bug report, please use the instructions in [Section 1.6, "How to Report Bugs or Problems"](#).

20.2.5.1. Connector/NET Community Support

- Community support for Connector/NET can be found through the forums at <http://forums.mysql.com>.
- Community support for Connector/NET can also be found through the mailing lists at <http://lists.mysql.com>.
- Paid support is available from Sun Microsystems, Inc. Additional information is available at <http://www.mysql.com/support/>.

20.2.5.2. How to report Connector/NET Problems or Bugs

If you encounter difficulties or problems with Connector/NET, contact the Connector/NET community [Section 20.2.5.1, "Connector/NET Community Support"](#).

You should first try to execute the same SQL statements and commands from the `mysql` client program or from `admindemo`. This helps you determine whether the error is in Connector/NET or MySQL.

If reporting a problem, you should ideally include the following information with the email:

- Operating system and version
- Connector/NET version
- MySQL server version
- Copies of error messages or other unexpected output
- Simple reproducible sample

Remember that the more information you can supply to us, the more likely it is that we can fix the problem.

If you believe the problem to be a bug, then you must report the bug through <http://bugs.mysql.com/>.

20.2.5.3. Connector/NET Change History

The Connector/NET Change History (Changelog) is located with the main Changelog for MySQL. See [Section C.4, "MySQL Con-](#)

ector/NET Change History”.

20.2.6. Connector/NET FAQ

Questions

- [20.2.6.1](#): How do I obtain the value of an auto-incremented column?

Questions and Answers

20.2.6.1: How do I obtain the value of an auto-incremented column?

When using the `commandBuilder` you should make sure that you set the `ReturnGeneratedIdentifiers` property to `true`.

Then, you can use an active view on a table to access the updated ID. For example:

```
conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();
da = new MySql.Data.MySqlClient.MySqlDataAdapter();
cmdBuilder = new MySql.Data.MySqlClient.MySqlCommandBuilder();
SystemDataDataSet = new System.Data.DataSet();
SystemDataDataView = new System.Data.DataView();
...
cmd.Connection = conn;
cmd.CommandText = "SELECT * FROM contacts";
da.SelectCommand = cmd;
da.Fill(SystemDataDataSet, "contacts");
cmdBuilder.DataAdapter = da;
cmdBuilder.ReturnGeneratedIdentifiers = true;
cmdBuilder.DataAdapter.SelectCommand.CommandText = "SELECT * FROM contacts";
cmdBuilder.RefreshSchema();

SystemDataDataView = SystemDataDataSet.Tables["contacts"].DefaultView;

SystemDataDataRow = SystemDataDataView.Table.NewRow();
SystemDataDataRow["status"] = 1;

SystemDataDataView.Table.Rows.Add(SystemDataDataRow);
da.Update(SystemDataDataSet, "contacts");
System.Console.WriteLine("ID after update: " + SystemDataDataRow["id"]);
```

The `SystemDataDataRow` object in this instance provides the interface to the updated auto-increment value in the `id` column.

20.3. MySQL Visual Studio Plugin

The MySQL Visual Studio Plugin is a DDEX provider; a plug-in for Visual Studio 2005 that allows developers to maintain database structures, and supports built-in data-driven application development tools.

The current version of the MySQL Visual Studio Plugin includes only database maintenance tools. Data-driven application development tools are not supported.

The MySQL DDEX Provider operates as a standard extension to the Visual Studio Data Designer functionality available through the Server Explorer menu of Visual Studio 2005, and enables developers to create database objects and data within a MySQL database.

The MySQL Visual Studio Plugin is designed to work with MySQL version 5.0, but is also compatible with MySQL 4.1.1 and provides limited compatibility with MySQL 5.1.

20.3.1. Installing the MySQL Visual Studio Plugin

The MySQL Visual Studio Plugin requires one of Visual Studio 2005 Standard, Professional or Team Developer Edition to be installed. Other editions of Visual Studio 2005 are not supported.

Note

Starting with Connector/NET 5.1.2, the Visual Studio Plugin is included in the installation. If you have installed Connector/NET 5.1.2, then you do not need to separately install the Visual Studio Plugin.

Here is the list of components that should already be installed before starting the installation of the MySQL Visual Studio Plugin:

- Visual Studio 2005 Standard, Professional or Team Developer Edition.

- MySQL Server 4.1.1 or later (either installed on the same machine, or a separate server).
- MySQL Connector/NET 5.0.

Note

When installing Connector/NET you must ensure that the connector is installed into the Global Assembly Cache (GAC). The Connector/NET installer handles this for you automatically, but in a custom installation the option may have been disabled.

The user used to connect to the MySQL server must have the following privileges to use the functionality provided by the MySQL Visual Studio Plugin:

- The `SELECT` privilege for the `INFORMATION_SCHEMA` database.
- The `EXECUTE` privilege for the `SHOW CREATE TABLE` statement.
- The `SELECT` privilege for the `mysql.proc` table (required for operations with stored procedures and functions).
- The `SELECT` privilege for the `mysql.func` table (required for operations with User Defined Functions (UDF)).
- The `EXECUTE` privilege for the `SHOW ENGINE STATUS` statement (required for retrieving extended error information).
- Appropriate privileges for performed operations (e.g. the `SELECT` privilege is required to browse data from a table etc.).

The MySQL Visual Studio Plugin is delivered as a MSI package that can be used to install, uninstall or reinstall the Provider. If you are not using Windows XP or Windows Server 2003 you upgrade the Windows Installer system to the latest version (see <http://support.microsoft.com/default.aspx?scid=kb;EN-US;292539> for details).

The MSI-package is named `MySQL.VisualStudio.msi`. To install the MySQL Visual Studio Plugin, right click on the MSI file and select `INSTALL`. The installation process is as follow:

1. The standard Welcome dialog is opened. Click Next to continue installation.
2. The License agreement (GNU GPL) window is opened. Accept the agreement and click NEXT to continue.
3. The destination folder choice dialog is opened. Here you can point out the folder where the MySQL Visual Studio Plugin will be installed. The default destination folder is `%ProgramFilesDir%\MySQL\MySQL DDEX Data Provider`, where `%ProgramFilesDir%` is the Program Files folder of the installation machine. After choosing the destination folder, click NEXT to continue.
4. The installer will ask to confirm that installation. Click Install to start installation process.
5. The installation will now take place. At the end of this step the Visual Studio command table is rebuilt (this process may take several minutes).
6. Once installation is complete, click FINISH to end the installation process.

To uninstall the MySQL Visual Studio Plugin, you can use either Add/Remove Programs component of the Control Panel or the same MSI-package. Choose the **REMOVE** option, and the Provider will be uninstalled automatically.

To repair the Provider, right click the MSI-package and choose the `REPAIR` option. The MySQL Visual Studio Plugin will be repaired automatically.

The installation package includes the following files:

- `MySQL.VisualStudio.dll` — the MySQL DDEX Provider assembly.
- `MySQL.Data.dll` — the assembly containing the MySQL Connector .NET which is used by the Provider.
- `MySQL.VisualStudio.dll.config` — the configuration file for the MySQL Visual Studio Plugin. This file contains default values for the provider GUI layout.

Note

Do not remove this file before the first use of the Provider.

- [Register.reg](#) — the file with registry entries that can be used to register the MySQL DDEX Provider in the case of the manual installation.
- [Install.js](#) — the script used to register the Connector .NET as an ADO.NET data provider in the machine.config file.
- [Release notes.doc](#) — the document with release notes.

To install the Provider manually, copy all files of the installation package in a desired folder, then set the full path to the Provider assembly as a value of the CodeBase entry. For example:

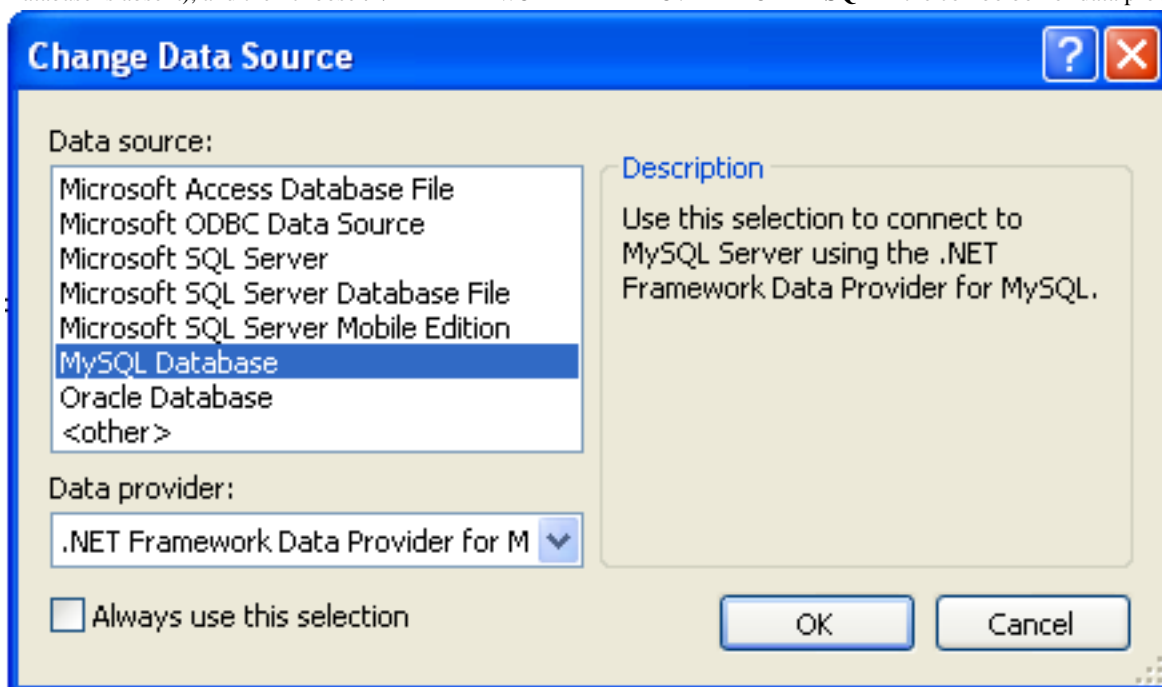

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\VisualStudio\8.0\Packages\{79A115C9-B133-4891-9E7B-242509DAD272}]@"MySQL.Data.InprocServer32"="C:\\WINNT\\system32\\mscoree.dll"
"Class"="MySQL.Data.VisualStudio.MySqlDataProviderPackage"
"CodeBase"="C:\\MySQLDdexProvider\\MySQL.VisualStudio.dll"
```

Then import information from the Register.reg file to the registry by clicking of the file. At the confirmation dialog choose Yes. Next you must run the command `devenv.exe /setup` within a Command Prompt to rebuild the Visual Studio command table.

20.3.2. Creating a connection to the MySQL server

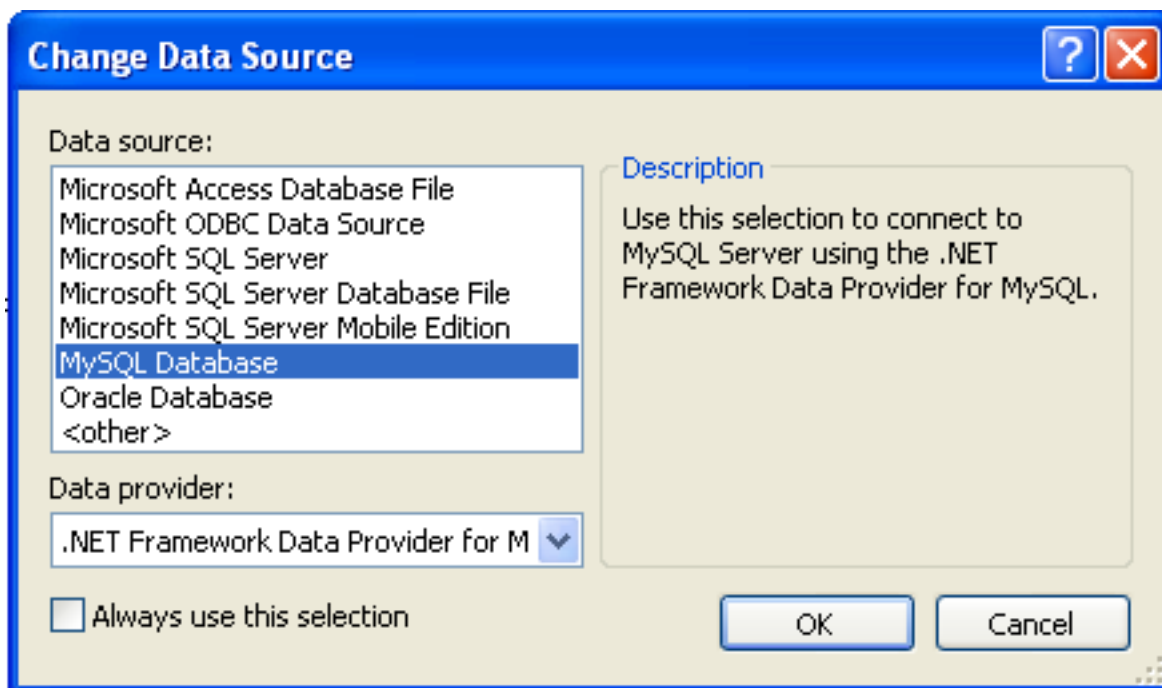

Once the MySQL Visual Studio Plugin is installed, you can use it to create, modify and delete connections to MySQL databases. To create a connection with a MySQL database, perform the following steps:

1. Start Visual Studio 2005 and open Server Explorer window by choosing the **SERVER EXPLORER** option from the **VIEW** menu.
2. Right click on the **DATA CONNECTIONS** node and choose the **ADD CONNECTION** button.
3. The Add Connection dialog is opened. Press the **CHANGE** button to choose MySQL Database as a data source.
4. Change Data Source dialog is opened. Choose MySQL Database in the list of data sources (or the **other** option, if MySQL Database is absent), and then choose **.NET FRAMEWORK DATA PROVIDER FOR MYSQL** in the combo box of data providers.

Press OK to confirm your choice.

5. Enter the connection settings: the server host name (for example, localhost if the MySQL server is installed on the local machine), the user name, the password, and the default database schema. Note that you must specify the default schema name to open the connection.

6. You can also set the port to connect with the MySQL server by pressing the **ADVANCED** button. To test a connection with the MySQL server, set the server host name, the user name, and the password, and press the **TEST CONNECTION** button. If the test fails, check the connection values that you have supplied are correct and that the corresponding user and privileges have been configured on the MySQL server.
7. After you set all settings and test the connection, press **OK**. The newly created connection is displayed in Server Explorer. Now you can work with the MySQL server through standard Server Explorer interface.

After a connection is successfully established, all the connection settings are saved. When you next open Visual Studio, the connection to the MySQL server will appear within Server Explorer so that you can re-establish a connection to the MySQL server.

To modify and delete a connection, use the **SERVER EXPLORER** context menu for the corresponding node. You can modify any of the settings just by overwriting the existing values with new ones. Note that a connection should be modified or deleted only if no active editor for its objects is opened. Otherwise your data could be lost.

20.3.3. Using the MySQL Visual Studio Plugin

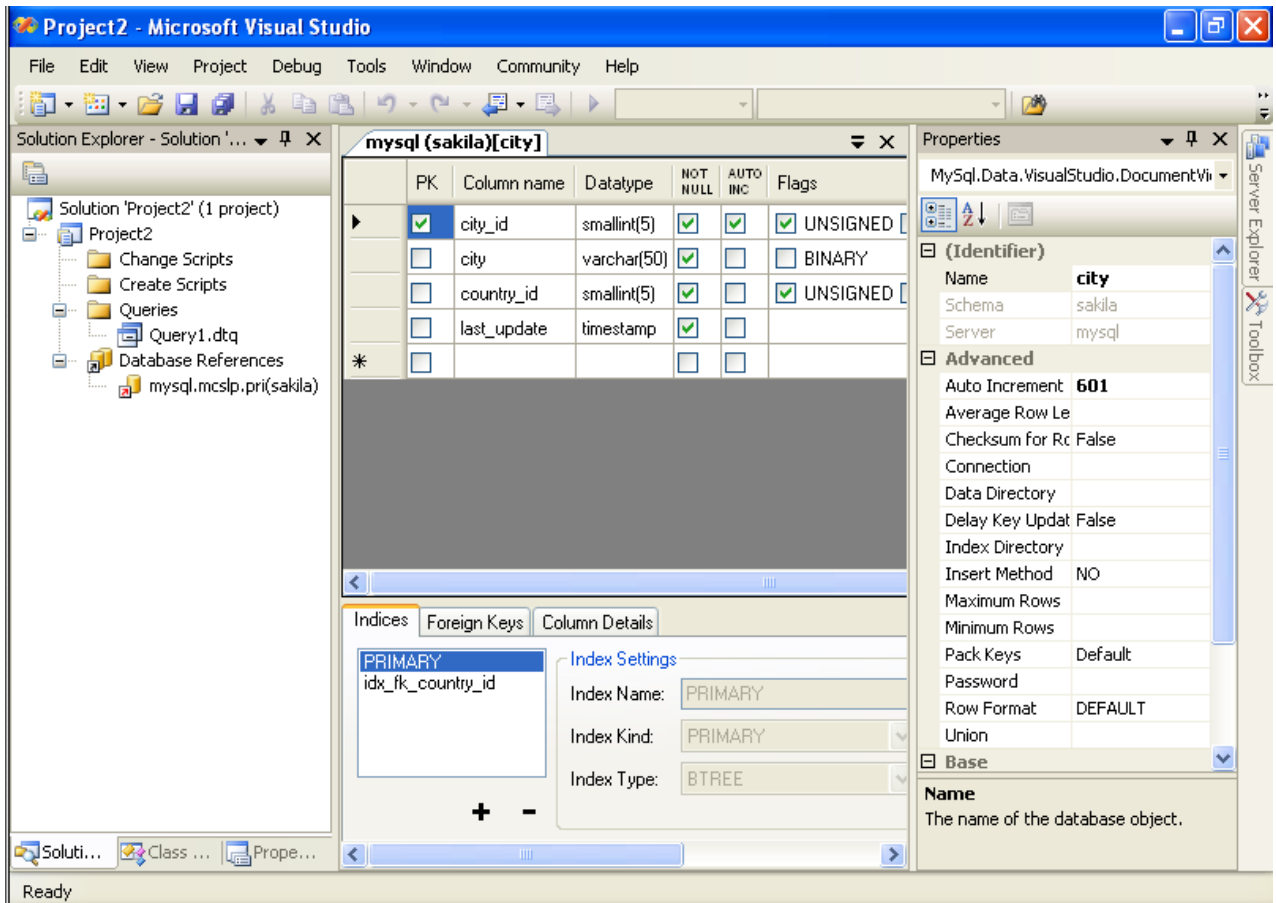

To work with a MySQL server using the MySQL Visual Studio Plugin, open the Visual Studio 2005, open the **SERVER EXPLORER**, and select the required connection. The working area of the MySQL Visual Studio Plugin consists of three parts.

- Database objects (tables, views, stored routines, triggers, and user defined functions) are displayed in the Server Explorer tree. Here you can choose an object and edit its properties and definition.
- Properties of a selected database object are displayed in the **PROPERTIES** panel. Certain properties can be edited directly within this window.
- The editor panel provides direct access to the SQL statement and definition of specific objects. For example, the SQL statements within a stored procedure definition are shown and edited within this panel.

20.3.3.1. Editing Tables

The Table Editor can be accessed through a mouse action on table-type node of Server Explorer. To create a new table, right click on the **TABLES** node (under the connection node) and choose the **CREATE TABLE** command from a context menu. To modify an existing table, double click on a node of the table you wish to modify, or right click on this node and choose the **ALTER TABLE** command from a context menu. Either of the commands opens the Table Editor.

The MySQL Visual Studio Plugin Table Editor is implemented in a similar fashion to the standard Query Browser Table Editor, but with minor differences.

The Table Editor consists of the following parts:

- Columns Editor — for column creation, modification and deletion.
- Indexes tab — for table/column index management.
- Foreign Keys tab — for configuration of foreign keys.
- Column Details tab — used to set advanced column options.
- Properties window — used to set table properties.

To save changes you have made in the Table Editor, use either Save or Save All buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. Before changes are saved, a confirmation dialog will be displayed to confirm that you want to update the corresponding object within the MySQL database.

20.3.3.1.1. Column Editor

You can use the Column Editor to set or change the name, data type, default value and other properties of a table column. To set the properties of an individual column, select the column using the mouse. Alternatively, you can move through the grid using **Tab** and **Shift+Tab** keys.

- To set or change the name, data type, default value and comment of a column, select the appropriate cell and edit the desired value.
- To set or unset flag-type column properties (i.e., primary key, **NOT NULL**, auto-incremented, flags), check or uncheck the corresponding checkboxes. Note that the available column flags will depend on the columns data type.
- To reorder columns, index columns or foreign key columns in the Column Editor, select the whole column you wish to reorder by clicking on the selector column at the left of the column grid. Then move the column by using **Ctrl+Up** (to move the

column up) and **Ctrl+Down** (to move the column down) keys.

- To delete a column, select it by clicking on the selector column at the left of the column grid, then press the **Delete** button on a keyboard.

20.3.3.1.2. Indexes tab

Index management is performed via the Indexes tab.

- To add an index, press the + button and set the properties in the **INDEX SETTINGS** groupbox at the right. You can set the index name, index kind, index type and a set of index columns.
- To remove an index, select the index from the list and press the - button.
- To change index settings, select the index from the list; detailed information about the index is displayed in the **INDEX SETTINGS** panel.

You cannot change a table column to an index column using drag and drop. Instead, you can add new index columns to a table and set their table columns by using the embedded editor within the Indexes tab

20.3.3.1.3. Foreign Keys tab

Foreign Key management is performed via the Foreign Keys tab.

- To add a foreign key, press the + button and set properties in the **FOREIGN KEYS SETTINGS** panel. You can set the foreign key name, referenced table name, foreign key columns and actions on update and delete.
- To remove a foreign key, select the foreign key and press the - button.
- To change foreign key settings, select the foreign key and use the **FOREIGN KEYS SETTINGS** panel to edit the properties.
- When a foreign key is changed, the MySQL Visual Studio Plugin generates two queries: the first query drops the changed keys and the second one recreates the new values. The reason for such a behavior is to avoid the [Bug#8377](#) and [Bug#8919](#).

Note

If changed values are for some reason inconsistent and cause the second query to fail, all affected foreign keys will be dropped. If this is the case, the MySQL Visual Studio Plugin will mark them as new in the Table Editor, and you will have to recreate them later. But if you close the Table Editor without saving, these foreign keys will be lost.

20.3.3.1.4. Column Details tab

The Column Details tab can be used to set column options. Besides the main column properties that are presented in the Column Editor, in the Column Details tab you can set two additional properties options: the character set and the collation sequence.

20.3.3.1.5. Table Properties window

There is no separate tab for table options and advanced options. All table options can be browsed and changed using the **PROPERTIES** window of Visual Studio 2005.

The following table properties can be set:

- **AUTO INCREMENT**
- **AVERAGE ROW LENGTH**
- **CHARACTER SET**
- **CHECKSUM FOR ROWS**
- **COLLATION**
- **COMMENT**
- **CONNECTION**

- **DATA DIRECTORY**
- **DELAY KEY UPDATES**
- **ENGINE**
- **INDEX DIRECTORY**
- **INSERT METHOD**
- **MAXIMUM ROWS**
- **MINIMUM ROWS**
- **NAME**
- **PACK KEYS**
- **PASSWORD**
- **ROW FORMAT**
- **UNION**

Some of these properties can have arbitrary text values, others accept values from a predefined set.

The properties **SCHEMA** and **SERVER** are read only.

20.3.3.2. Editing Table Data

The Table Data Editor, allows a user to browse, create and edit data of tables. The Table Data Editor is implemented as a simple data grid with auto generated columns.

To access the Table Data Editor, right click on a node representing the table or view in Server Explorer. From the nodes context menu, choose the **BROWSE** or **EDIT DATA** command. For tables and updatable views, this command opens the Table Data Editor in edit mode. For non-updatable views, this command opens the Table Data Editor in read-only mode.

When in the edit mode, you can modify table data by modifying the displayed table contents directly. To add a row, set desired values in the last row of the grid. To modify values, set new values in appropriate cells. To delete a row, select it by clicking on the selector column at the left of the grid, then press the **DELETE** button.

To save changes you have made in the Table Data Editor, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. A confirmation dialog will confirm whether you want the changes saved to the database.

20.3.3.3. Editing Views

To create a new view, right click the Views node under the connection node in Server Explorer. From the nodes context menu, choose the **CREATE VIEW** command. This command opens the SQL Editor.

To modify an existing view, double click on a node of the view you wish to modify, or right click on this node and choose the **ALTER VIEW** command from a context menu. Either of the commands opens the SQL Editor.

To create or alter the view definition using SQL Editor, type the appropriate SQL statement in the SQL Editor.

Note

You should enter only the defining statement itself, without the **CREATE VIEW AS** preface.

All other view properties can be set in the **PROPERTIES** window. These properties are:

- **ALGORITHM**
- **CHECK OPTION**
- **DEFINER**
- **NAME**
- **SECURITY TYPE**

Some of these properties can have arbitrary text values, others accept values from a predefined set.

The properties **IS UPDATABLE**, **SCHEMA** and **SERVER** are readonly.

To save changes you have made, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. A confirmation dialog will confirm whether you want the changes saved to the database.

20.3.3.4. Editing Stored Procedures and Functions

To create a new stored procedure, right click the Stored Procedures node under the connection node in Server Explorer. From the nodes context menu, choose the **CREATE ROUTINE** command. This command opens the SQL Editor.

To create a new stored function, right click the **FUNCTIONS** node under the connection node in Server Explorer. From the node's context menu, choose the **CREATE ROUTINE** command.

To modify an existing stored routine (procedure or function), double click on a node of the routine you wish to modify, or right click on this node and choose the **ALTER ROUTINE** command from a context menu. Either of the commands opens the SQL Editor.

To create or alter the routine definition using SQL Editor, type this definition in the SQL Editor using standard SQL.

All other routine properties can be set in the **PROPERTIES** window. These properties are:

- Comment
- Data Access
- Definer
- Is Deterministic
- Security Type

Some of these properties can have arbitrary text values, others accept values only from a predefined set.

Also you can set all the options directly in the SQL Editor, using the standard **CREATE PROCEDURE** or **CREATE FUNCTION** statement. However, it is recommended to use the **PROPERTIES** window instead.

Note

You should never add the **CREATE** preface to the routine definition.

The properties **NAME**, **SCHEMA** and **SERVER** in the **PROPERTIES** window are read-only. Set or change the procedure name in the SQL editor.

To save changes you have made, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. A confirmation dialog will confirm whether you want the changes saved to the database..

20.3.3.5. Editing Triggers

To create a new trigger, right click on a node of a table for which you wish to add a trigger. From the node's context menu, choose the **CREATE TRIGGER** command. This command opens the SQL Editor.

To modify an existing trigger, double click on a node of the trigger you wish to modify, or right click on this node and choose the **ALTER TRIGGER** command from a context menu. Either of the commands opens the SQL Editor.

To create or alter the trigger definition using SQL Editor, type the trigger statement in the SQL Editor using standard SQL.

Note

You should enter only the trigger statement, that is the part of the **CREATE TRIGGER** query that is placed after the **FOR EACH ROW** clause.

All other trigger properties are set in the **PROPERTIES** window. These properties are:

- **DEFINER**
- **EVENT MANIPULATION**

- **NAME**
- **TIMING**

Some of these properties can have arbitrary text values, others accept values only from a predefined set.

The properties **EVENT TABLE**, **SCHEMA** and **SERVER** in the **PROPERTIES** window are read-only.

To save changes you have made, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. A confirmation dialog will confirm whether you want the changes saved to the database.

20.3.3.6. Editing User Defined Functions (UDF)

To create a new User Defined Function (UDF), right click the UDFs node under the connection node in Server Explorer. From the node's context menu, choose the **CREATE UDF** command. This command opens the UDF Editor.

To modify an existing UDF, double click on a node of the UDF you wish to modify, or right click on this node and choose the **Alter UDF** command from a context menu. Either of the commands opens the UDF Editor.

The UDF editor allows you to set the following properties through the properties panel:

- **NAME**
- **SO-NAME (DLL NAME)**
- **RETURN TYPE**
- **IS AGGREGATE**

The property **Server** in the **PROPERTIES** window is read-only.

To save changes you have made, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. A confirmation dialog will confirm whether you want the changes saved to the database.

20.3.3.7. Dropping database objects

Tables, views, stored routines, triggers, and UDFs can be dropped with the appropriate **DROP** command from its context menu: **DROP TABLE**, **DROP VIEW**, **DROP ROUTINE**, **DROP TRIGGER**, **DROP UDF**.

You will be asked to confirm the execution of the corresponding drop query in a confirmation dialog.

Dropping of multiple objects is not supported.

20.3.3.8. Cloning database objects

Tables, views, stored procedures and functions can be cloned with the appropriate **CLONE** command from its context menu: **CLONE TABLE**, **CLONE VIEW**, **CLONE ROUTINE**. The clone commands open the corresponding editor for a new object: the **TABLE EDITOR** for cloning a table and the **SQL Editor** for cloning a view or a routine.

To save the cloned object, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. A confirmation dialog will confirm whether you want the changes saved to the database.

20.3.4. Visual Studio Plugin Support

If you have a comment, or if you discover a bug, please, use our MySQL bug tracking system (<http://bugs.mysql.com>) to report problem or add your suggestion.

20.3.4.1. Visual Studio Plugin FAQ

Questions

- **20.3.4.1.1:** When creating a connection, typing the connection details causes the connection window to immediately close.

Questions and Answers

20.3.4.1.1: When creating a connection, typing the connection details causes the connection window to immediately close.

There are known issues with versions of Connector/NET earlier than 5.0.2. Connector/NET 1.0.x is known not to work. If you have any of these versions installed, or have previously upgraded from an earlier version, uninstall Connector/NET completely and then install Connector/NET 5.0.2.

20.4. MySQL Connector/J

MySQL provides connectivity for client applications developed in the Java programming language via a JDBC driver, which is called MySQL Connector/J.

MySQL Connector/J is a JDBC Type 4 driver. Different versions are available that are compatible with the JDBC 3.0 and JDBC 4.0 specifications. The Type 4 designation means that the driver is pure-Java implementation of the MySQL protocol and does not rely on the MySQL client libraries.

Although JDBC is useful by itself, we would hope that if you are not familiar with JDBC that after reading the first few sections of this manual, that you would avoid using naked JDBC for all but the most trivial problems and consider using one of the popular persistence frameworks such as [Hibernate](#), [Spring's JDBC templates](#) or [Ibatis SQL Maps](#) to do the majority of repetitive work and heavier lifting that is sometimes required with JDBC.

This section is not designed to be a complete JDBC tutorial. If you need more information about using JDBC you might be interested in the following online tutorials that are more in-depth than the information presented here:

- [JDBC Basics](#) — A tutorial from Sun covering beginner topics in JDBC
- [JDBC Short Course](#) — A more in-depth tutorial from Sun and JGuru

Key topics:

- For help with connection strings, connection options setting up your connection through JDBC, see [Section 20.4.4.1, “Driver/Datasource Class Names, URL Syntax and Configuration Properties for Connector/J”](#).
- For tips on using Connector/J and JDBC with generic J2EE toolkits, see [Section 20.4.5.2, “Using Connector/J with J2EE and Other Java Frameworks”](#).
- Developers using the Tomcat server platform, see [Section 20.4.5.2.2, “Using Connector/J with Tomcat”](#).
- Developers using JBoss, see [Section 20.4.5.2.3, “Using Connector/J with JBoss”](#).
- Developers using Spring, see [Section 20.4.5.2.4, “Using Connector/J with Spring”](#).

MySQL Enterprise

MySQL Enterprise subscribers will find more information about using JDBC with MySQL in the Knowledge Base articles about [JDBC](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

20.4.1. Connector/J Versions

There are currently four versions of MySQL Connector/J available:

- Connector/J 5.1 is the Type 4 pure Java JDBC driver, which conforms to the JDBC 3.0 and JDBC 4.0 specifications. It provides compatibility with all the functionality of MySQL, including 4.1, 5.0, 5.1 and the 6.0 alpha release featuring the new Falcon storage engine. Connector/J 5.1 provides ease of development features, including auto-registration with the Driver Manager, standardized validity checks, categorized SQLExceptions, support for the JDBC-4.0 XML processing, per connection client information, [NCHAR](#), [NVARCHAR](#) and [NCLOB](#) types. This release also includes all bug fixes up to and including Connector/J 5.0.6.
- Connector/J 5.0 provides support for all the functionality offered by Connector/J 3.1 and includes distributed transaction (XA) support.
- Connector/J 3.1 was designed for connectivity to MySQL 4.1 and MySQL 5.0 servers and provides support for all the functionality in MySQL 5.0 except distributed transaction (XA) support.
- Connector/J 3.0 provides core functionality and was designed with connectivity to MySQL 3.x or MySQL 4.1 servers, although

it will provide basic compatibility with later versions of MySQL. Connector/J 3.0 does not support server-side prepared statements, and does not support any of the features in versions of MySQL later than 4.1.

The following table summarizes the Connector/J versions available:

Connector/J version	Driver Type	JDBC version	MySQL Server version	Status
5.1	4	3.0, 4.0	4.1, 5.0, 5.1, 6.0	Recommended version
5.0	4	3.0	4.1, 5.0	Released version
3.1	4	3.0	4.1, 5.0	Obsolete
3.0	4	3.0	3.x, 4.1	Obsolete

The current recommended version for Connector/J is 5.1. This guide covers all four connector versions, with specific notes given where a setting applies to a specific option.

20.4.1.1. Java Versions Supported

The following table summarizes Connector/J Java dependencies:

Connector/J version	Java RTE required	JDK required (to build source code)
5.1	1.4.x, 1.5.x, 1.6.x	1.6.x and 1.5.x (or older)
5.0	1.3.x, 1.4.x, 1.5.x, 1.6.x	1.4.2, 1.5.x, 1.6.x
3.1	1.2.x, 1.3.x, 1.4.x, 1.5.x, 1.6.x	1.4.2, 1.5.x, 1.6.x
3.0	1.2.x, 1.3.x, 1.4.x, 1.5.x, 1.6.x	1.4.2, 1.5.x, 1.6.x

MySQL Connector/J does not support JDK-1.1.x or JDK-1.0.x.

Because of the implementation of `java.sql.Savepoint`, Connector/J 3.1.0 and newer will not run on a Java runtime older than 1.4 unless the class verifier is turned off (by setting the `-Xverify:none` option to the Java runtime). This is because the class verifier will try to load the class definition for `java.sql.Savepoint` even though it is not accessed by the driver unless you actually use savepoint functionality.

Caching functionality provided by Connector/J 3.1.0 or newer is also not available on JVMs older than 1.4.x, as it relies on `java.util.LinkedHashMap` which was first available in JDK-1.4.0.

If you are building Connector/J from source code using the source distribution (see [Section 20.4.2.4, “Installing from the Development Source Tree”](#)) then you must use JDK 1.4.2 or newer to compile the Connector package. For Connector/J 5.1 you must have both JDK-1.6.x. and JDK-1.5.x installed in order to be able to build the source code.

20.4.2. Connector/J Installation

You can install the Connector/J package using either the binary or source distribution. The binary distribution provides the easiest method for installation; the source distribution enables you to customize your installation further. With either solution, you must manually add the Connector/J location to your Java `CLASSPATH`.

If you are upgrading from a previous version, read the upgrade information before continuing. See [Section 20.4.2.3, “Upgrading from an Older Version”](#).

20.4.2.1. Installing Connector/J from a Binary Distribution

The easiest method of installation is to use the binary distribution of the Connector/J package. The binary distribution is available either as a Tar/Gzip or Zip file which you must extract to a suitable location and then optionally make the information about the package available by changing your `CLASSPATH` (see [Section 20.4.2.2, “Installing the Driver and Configuring the CLASSPATH”](#)).

MySQL Connector/J is distributed as a .zip or .tar.gz archive containing the sources, the class files, and the JAR archive named `mysql-connector-java-[version]-bin.jar`, and starting with Connector/J 3.1.8 a debug build of the driver in a file named `mysql-connector-java-[version]-bin-g.jar`.

Starting with Connector/J 3.1.9, the `.class` files that constitute the JAR files are only included as part of the driver JAR file.

You should not use the debug build of the driver unless instructed to do so when reporting a problem or a bug to MySQL AB, as it

is not designed to be run in production environments, and will have adverse performance impact when used. The debug binary also depends on the Aspect/J runtime library, which is located in the `src/lib/aspectjrt.jar` file that comes with the Connector/J distribution.

You will need to use the appropriate graphical or command-line utility to extract the distribution (for example, WinZip for the .zip archive, and `tar` for the .tar.gz archive). Because there are potentially long file names in the distribution, we use the GNU tar archive format. You will need to use GNU tar (or an application that understands the GNU tar archive format) to unpack the .tar.gz variant of the distribution.

20.4.2.2. Installing the Driver and Configuring the CLASSPATH

Once you have extracted the distribution archive, you can install the driver by placing `mysql-connector-java-[version]-bin.jar` in your classpath, either by adding the full path to it to your `CLASSPATH` environment variable, or by directly specifying it with the command line switch `-cp` when starting your JVM.

If you are going to use the driver with the JDBC DriverManager, you would use `com.mysql.jdbc.Driver` as the class that implements `java.sql.Driver`.

You can set the `CLASSPATH` environment variable under UNIX, Linux or Mac OS X either locally for a user within their `.profile`, `.login` or other login file. You can also set it globally by editing the global `/etc/profile` file.

For example, under a C shell (csh, tcsh) you would add the Connector/J driver to your `CLASSPATH` using the following:

```
shell> setenv CLASSPATH /path/mysql-connector-java-[ver]-bin.jar:$CLASSPATH
```

Or with a Bourne-compatible shell (sh, ksh, bash):

```
shell> export set CLASSPATH=/path/mysql-connector-java-[ver]-bin.jar:$CLASSPATH
```

Within Windows 2000, Windows XP, Windows Server 2003 and Windows Vista, you must set the environment variable through the System Control Panel.

If you want to use MySQL Connector/J with an application server such as GlassFish, Tomcat or JBoss, you will have to read your vendor's documentation for more information on how to configure third-party class libraries, as most application servers ignore the `CLASSPATH` environment variable. For configuration examples for some J2EE application servers, see [Section 20.4.5.2, "Using Connector/J with J2EE and Other Java Frameworks"](#). However, the authoritative source for JDBC connection pool configuration information for your particular application server is the documentation for that application server.

If you are developing servlets or JSPs, and your application server is J2EE-compliant, you can put the driver's .jar file in the `WEB-INF/lib` subdirectory of your webapp, as this is a standard location for third party class libraries in J2EE web applications.

You can also use the `MysqlDataSource` or `MysqlConnectionPoolDataSource` classes in the `com.mysql.jdbc.jdbc2.optional` package, if your J2EE application server supports or requires them. Starting with Connector/J 5.0.0, the `javax.sql.XADataSource` interface is implemented via the `com.mysql.jdbc.jdbc2.optional.MysqlXADataSource` class, which supports XA distributed transactions when used in combination with MySQL server version 5.0.

The various `MysqlDataSource` classes support the following parameters (through standard set mutators):

- user
- password
- serverName (see the previous section about fail-over hosts)
- databaseName
- port

20.4.2.3. Upgrading from an Older Version

We try to keep the upgrade process as easy as possible, however as is the case with any software, sometimes changes need to be made in new versions to support new features, improve existing functionality, or comply with new standards.

This section has information about what users who are upgrading from one version of Connector/J to another (or to a new version of the MySQL server, with respect to JDBC functionality) should be aware of.

20.4.2.3.1. Upgrading from MySQL Connector/J 3.0 to 3.1

Connector/J 3.1 is designed to be backward-compatible with Connector/J 3.0 as much as possible. Major changes are isolated to new functionality exposed in MySQL-4.1 and newer, which includes Unicode character sets, server-side prepared statements, SQL-State codes returned in error messages by the server and various performance enhancements that can be enabled or disabled via configuration properties.

- **Unicode Character Sets** — See the next section, as well as [Section 9.1, “Character Set Support”](#), for information on this new feature of MySQL. If you have something misconfigured, it will usually show up as an error with a message similar to `Illegal mix of collations`.
- **Server-side Prepared Statements** — Connector/J 3.1 will automatically detect and use server-side prepared statements when they are available (MySQL server version 4.1.0 and newer).

Starting with version 3.1.7, the driver scans SQL you are preparing via all variants of `Connection.prepareStatement()` to determine if it is a supported type of statement to prepare on the server side, and if it is not supported by the server, it instead prepares it as a client-side emulated prepared statement. You can disable this feature by passing `emulateUnsupportedPstmts=false` in your JDBC URL.

If your application encounters issues with server-side prepared statements, you can revert to the older client-side emulated prepared statement code that is still presently used for MySQL servers older than 4.1.0 with the connection property `useServerPrepStmts=false`

- **Datetimes** with all-zero components (`0000-00-00 . . .`) — These values can not be represented reliably in Java. Connector/J 3.0.x always converted them to NULL when being read from a `ResultSet`.

Connector/J 3.1 throws an exception by default when these values are encountered as this is the most correct behavior according to the JDBC and SQL standards. This behavior can be modified using the `zeroDateTimeBehavior` configuration property. The allowable values are:

- `exception` (the default), which throws an `SQLException` with an `SQLState` of `S1009`.
- `convertToNull`, which returns `NULL` instead of the date.
- `round`, which rounds the date to the nearest closest value which is `0001-01-01`.

Starting with Connector/J 3.1.7, `ResultSet.getString()` can be decoupled from this behavior via `noDatetimeStringSync=true` (the default value is `false`) so that you can retrieve the unaltered all-zero value as a `String`. It should be noted that this also precludes using any time zone conversions, therefore the driver will not allow you to enable `noDatetimeStringSync` and `useTimezone` at the same time.

- **New SQLState Codes** — Connector/J 3.1 uses SQL:1999 SQLState codes returned by the MySQL server (if supported), which are different from the legacy X/Open state codes that Connector/J 3.0 uses. If connected to a MySQL server older than MySQL-4.1.0 (the oldest version to return SQLStates as part of the error code), the driver will use a built-in mapping. You can revert to the old mapping by using the configuration property `useSqlStateCodes=false`.
- **`ResultSet.getString()`** — Calling `ResultSet.getString()` on a `BLOB` column will now return the address of the `byte[]` array that represents it, instead of a `String` representation of the `BLOB`. `BLOB` values have no character set, so they cannot be converted to `java.lang.Strings` without data loss or corruption.

To store strings in MySQL with LOB behavior, use one of the `TEXT` types, which the driver will treat as a `java.sql.Clob`.

- **Debug builds** — Starting with Connector/J 3.1.8 a debug build of the driver in a file named `mysql-connector-java-[version]-bin-g.jar` is shipped alongside the normal binary jar file that is named `mysql-connector-java-[version]-bin.jar`.

Starting with Connector/J 3.1.9, we do not ship the `.class` files unbundled, they are only available in the JAR archives that ship with the driver.

You should not use the debug build of the driver unless instructed to do so when reporting a problem or bug, as it is not designed to be run in production environments, and will have adverse performance impact when used. The debug binary also depends on the Aspect/J runtime library, which is located in the `src/lib/aspectjrt.jar` file that comes with the Connector/J distribution.

20.4.2.3.2. Upgrading to MySQL Connector/J 5.1.x

- In Connector/J 5.0.x and earlier, the alias for a table in a `SELECT` statement is returned when accessing the result set metadata

using `ResultSetMetaData.getColumnNames()`. This behavior however is not JDBC compliant, and in Connector/J 5.1 this behavior was changed so that the original table name, rather than the alias, is returned.

The JDBC-compliant behavior is designed to let API users reconstruct the DML statement based on the metadata within `ResultSet` and `ResultSetMetaData`.

You can get the alias for a column in a result set by calling `ResultSetMetaData.getColumnLabel()`. If you want to use the old non-compliant behavior with `ResultSetMetaData.getColumnNames()`, use the `useOldAliasMetadataBehavior` option and set the value to `true`.

In Connector/J 5.0.x the default value of `useOldAliasMetadataBehavior` was true, but in Connector/J 5.1 this was changed to a default value of false.

20.4.2.3.3. JDBC-Specific Issues When Upgrading to MySQL Server 4.1 or Newer

- *Using the UTF-8 Character Encoding* - Prior to MySQL server version 4.1, the UTF-8 character encoding was not supported by the server, however the JDBC driver could use it, allowing storage of multiple character sets in latin1 tables on the server.

Starting with MySQL-4.1, this functionality is deprecated. If you have applications that rely on this functionality, and can not upgrade them to use the official Unicode character support in MySQL server version 4.1 or newer, you should add the following property to your connection URL:

```
useOldUTF8Behavior=true
```

- *Server-side Prepared Statements* - Connector/J 3.1 will automatically detect and use server-side prepared statements when they are available (MySQL server version 4.1.0 and newer). If your application encounters issues with server-side prepared statements, you can revert to the older client-side emulated prepared statement code that is still presently used for MySQL servers older than 4.1.0 with the following connection property:

```
useServerPrepStmts=false
```

20.4.2.4. Installing from the Development Source Tree

Caution

You should read this section only if you are interested in helping us test our new code. If you just want to get MySQL Connector/J up and running on your system, you should use a standard binary release distribution.

To install MySQL Connector/J from the development source tree, make sure that you have the following prerequisites:

- A Bazaar client, to check out the sources from our Launchpad repository (available from <http://bazaar-vcs.org/>).
- Apache Ant version 1.7 or newer (available from <http://ant.apache.org/>).
- JDK 1.4.2 or later. Although MySQL Connector/J can be used with older JDKs, to compile it from source you must have at least JDK 1.4.2. If you are building Connector/J 5.1 you will need JDK 1.6.x and an older JDK such as JDK 1.5.x. You will then need to point your JAVA_HOME environment variable at the older installation.

The source code repository for MySQL Connector/J is located on Launchpad at <https://code.launchpad.net/connectorj>.

To check out and compile a specific branch of MySQL Connector/J, follow these steps:

1. Check out the latest code from the branch that you want with one of the following commands.

To check out the latest development branch use:

```
shell> bzz branch lp:connectorj
```

This creates a `connectorj` subdirectory in the current directory that contains the latest sources for the requested branch.

To check out the latest 5.1 code use:

```
shell> bzz branch lp:connectorj/5.1
```

This will create a [5.1](#) subdirectory in the current directory containing the latest 5.1 code.

2. If you are building Connector/J 5.1 make sure that you have both JDK 1.6.x installed and an older JDK such as JDK 1.5.x. This is because Connector/J supports both JDBC 3.0 (which was prior to JDK 1.6.x) and JDBC 4.0. Set your `JAVA_HOME` environment variable to the path of the older JDK installation.
3. Change location to either the `connectorj` or `5.1` directory, depending on which branch you want to build, to make it your current working directory. For example:

```
shell> cd connectorj
```

4. If you are building Connector/J 5.1 you need to edit the `build.xml` to reflect the location of your JDK 1.6.x installation. The lines that you need to change are:

```
<property name="com.mysql.jdbc.java6.javac" value="C:\jvms\jdk1.6.0\bin\javac.exe" />
<property name="com.mysql.jdbc.java6.rtcjar" value="C:\jvms\jdk1.6.0\jre\lib\rt.jar" />
```

Alternatively, you can set the value of these property names through the Ant `-D` option.

5. Issue the following command to compile the driver and create a `.jar` file suitable for installation:

```
shell> ant dist
```

This creates a `build` directory in the current directory, where all build output will go. A directory is created in the `build` directory that includes the version number of the sources you are building from. This directory contains the sources, compiled `.class` files, and a `.jar` file suitable for deployment. For other possible targets, including ones that will create a fully packaged distribution, issue the following command:

```
shell> ant -projecthelp
```

6. A newly created `.jar` file containing the JDBC driver will be placed in the directory `build/mysql-connector-java-[version]`.

Install the newly created JDBC driver as you would a binary `.jar` file that you download from MySQL by following the instructions in [Section 20.4.2.2](#), “Installing the Driver and Configuring the `CLASSPATH`”.

A package containing both the binary and source code for Connector/J 5.1 can also be found at the following location: [Connector/J 5.1 Download](#)

20.4.3. Connector/J Examples

Examples of using Connector/J are located throughout this document, this section provides a summary and links to these examples.

- [Example 20.1](#), “Connector/J: Obtaining a connection from the `DriverManager`”
- [Example 20.2](#), “Connector/J: Using `java.sql.Statement` to execute a `SELECT` query”
- [Example 20.3](#), “Connector/J: Calling Stored Procedures”
- [Example 20.4](#), “Connector/J: Using `Connection.prepareStatement()`”
- [Example 20.5](#), “Connector/J: Registering output parameters”
- [Example 20.6](#), “Connector/J: Setting `CallableStatement` input parameters”
- [Example 20.7](#), “Connector/J: Retrieving results and output parameter values”
- [Example 20.8](#), “Connector/J: Retrieving `AUTO_INCREMENT` column values using `Statement.getGeneratedKeys()`”
- [Example 20.9](#), “Connector/J: Retrieving `AUTO_INCREMENT` column values using `SELECT LAST_INSERT_ID()`”
- [Example 20.10](#), “Connector/J: Retrieving `AUTO_INCREMENT` column values in `Updatable ResultSets`”
- [Example 20.11](#), “Connector/J: Using a connection pool with a J2EE application server”
- [Example 20.12](#), “Connector/J: Example of transaction with retry logic”

20.4.4. Connector/J (JDBC) Reference

This section of the manual contains reference material for MySQL Connector/J, some of which is automatically generated during the Connector/J build process.

20.4.4.1. Driver/Datasource Class Names, URL Syntax and Configuration Properties for Connector/J

The name of the class that implements `java.sql.Driver` in MySQL Connector/J is `com.mysql.jdbc.Driver`. The `org.gjt.mm.mysql.Driver` class name is also usable to remain backward-compatible with MM.MySQL. You should use this class name when registering the driver, or when otherwise configuring software to use MySQL Connector/J.

The JDBC URL format for MySQL Connector/J is as follows, with items in square brackets ([,]) being optional:

```
jdbc:mysql://[host][,failoverhost...][:port]/[database] »
[?propertyName1[=propertyValue1][&propertyName2[=propertyValue2]...
```

If the host name is not specified, it defaults to 127.0.0.1. If the port is not specified, it defaults to 3306, the default port number for MySQL servers.

```
jdbc:mysql://[host:port],[host:port].../[database] »
[?propertyName1[=propertyValue1][&propertyName2[=propertyValue2]...
```

If the database is not specified, the connection will be made with no default database. In this case, you will need to either call the `setCatalog()` method on the Connection instance or fully-specify table names using the database name (i.e. `SELECT dbname.tablename.colname FROM dbname.tablename...`) in your SQL. Not specifying the database to use upon connection is generally only useful when building tools that work with multiple databases, such as GUI database managers.

MySQL Connector/J has fail-over support. This allows the driver to fail-over to any number of slave hosts and still perform read-only queries. Fail-over only happens when the connection is in an `autoCommit(true)` state, because fail-over can not happen reliably when a transaction is in progress. Most application servers and connection pools set `autoCommit` to `true` at the end of every transaction/connection use.

The fail-over functionality has the following behavior:

- If the URL property `autoReconnect` is `false`: Failover only happens at connection initialization, and failback occurs when the driver determines that the first host has become available again.
- If the URL property `autoReconnect` is `true`: Failover happens when the driver determines that the connection has failed (before every query), and falls back to the first host when it determines that the host has become available again (after `queriesBeforeRetryMaster` queries have been issued).

In either case, whenever you are connected to a "failed-over" server, the connection will be set to read-only state, so queries that would modify data will have exceptions thrown (the query will **never** be processed by the MySQL server).

Configuration properties define how Connector/J will make a connection to a MySQL server. Unless otherwise noted, properties can be set for a `DataSource` object or for a `Connection` object.

Configuration Properties can be set in one of the following ways:

- Using the `set*()` methods on MySQL implementations of `java.sql.DataSource` (which is the preferred method when using implementations of `java.sql.DataSource`):
 - `com.mysql.jdbc.jdbc2.optional.MysqlDataSource`
 - `com.mysql.jdbc.jdbc2.optional.MysqlConnectionPoolDataSource`
- As a key/value pair in the `java.util.Properties` instance passed to `DriverManager.getConnection()` or `Driver.connect()`
- As a JDBC URL parameter in the URL given to `java.sql.DriverManager.getConnection()`, `java.sql.Driver.connect()` or the MySQL implementations of the `javax.sql.DataSource` `setURL()` method.

Note

If the mechanism you use to configure a JDBC URL is XML-based, you will need to use the XML character literal

& to separate configuration parameters, as the ampersand is a reserved character for XML.

The properties are listed in the following tables.

Connection/Authentication.

Property Name	Definition	Default Value	Since Version
user	The user to connect as		all versions
password	The password to use when connecting		all versions
socketFactory	The name of the class that the driver should use for creating socket connections to the server. This class must implement the interface 'com.mysql.jdbc.SocketFactory' and have public no-args constructor.	com.mysql.jdbc.StandardSocketFactory	3.0.3
connectTimeout	Timeout for socket connect (in milliseconds), with 0 being no timeout. Only works on JDK-1.4 or newer. Defaults to '0'.	0	3.0.1
socketTimeout	Timeout on network socket operations (0, the default means no timeout).	0	3.0.1
connectionLifecycleInterceptors	A comma-delimited list of classes that implement "com.mysql.jdbc.ConnectionLifecycleInterceptor" that should notified of connection lifecycle events (creation, destruction, commit, rollback, setCatalog and setAutoCommit) and potentially alter the execution of these commands. ConnectionLifecycleInterceptors are "stackable", more than one interceptor may be specified via the configuration property as a comma-delimited list, with the interceptors executed in order from left to right.		5.1.4
useConfigs	Load the comma-delimited list of configuration properties before parsing the URL or applying user-specified properties. These configurations are explained in the 'Configurations' of the documentation.		3.1.5
interactiveClient	Set the CLIENT_INTERACTIVE flag, which tells MySQL to timeout connections based on INTERACTIVE_TIMEOUT instead of WAIT_TIMEOUT	false	3.1.0
localSocketAddress	Host name or IP address given to explicitly configure the interface that the driver will bind the client side of the TCP/IP connection to when connecting.		5.0.5
mysqlIOFactory	The name of the class which implements "com.mysql.jdbc.MysqlIO" for communicating with mysqld. (default is "com.mysql.jdbc.MysqlIOprotocol")	com.mysql.jdbc.MysqlIOprotocol	6.0.0
propertiesTransform	An implementation of com.mysql.jdbc.ConnectionPropertiesTransform that the driver will use to modify URL properties passed to the driver before attempting a connection		3.1.4
useCompression	Use zlib compression when communicating with the server (true/false)? Defaults to 'false'.	false	3.0.17

Networking.

Property Name	Definition	Default Value	Since Version
tcpKeepAlive	If connecting using TCP/IP, should the driver set SO_KEEPALIVE?	true	5.0.7
tcpNoDelay	If connecting using TCP/IP, should the driver set SO_TCP_NODELAY (disabling the Nagle Algorithm)?	true	5.0.7
tcpRcvBuf	If connecting using TCP/IP, should the driver set SO_RCV_BUF to the given value? The default value of '0', means use the platform default value for this property)	0	5.0.7

tcpSndBuf	If connecting using TCP/IP, should the driver set SO_SND_BUF to the given value? The default value of '0', means use the platform default value for this property)	0	5.0.7
tcpTrafficClass	If connecting using TCP/IP, should the driver set traffic class or type-of-service fields ?See the documentation for java.net.Socket.setTrafficClass() for more information.	0	5.0.7

High Availability and Clustering.

Property Name	Definition	Default Value	Since Version
autoReconnect	Should the driver try to re-establish stale and/or dead connections? If enabled the driver will throw an exception for a queries issued on a stale or dead connection, which belong to the current transaction, but will attempt reconnect before the next query issued on the connection in a new transaction. The use of this feature is not recommended, because it has side effects related to session state and data consistency when applications do not handle SQLExceptions properly, and is only designed to be used when you are unable to configure your application to handle SQLExceptions resulting from dead and stale connections properly. Alternatively, investigate setting the MySQL server variable "wait_timeout" to some high value rather than the default of 8 hours.	false	1.1
autoReconnectForPools	Use a reconnection strategy appropriate for connection pools (defaults to 'false')	false	3.1.3
failOverReadOnly	When failing over in autoReconnect mode, should the connection be set to 'read-only'?	true	3.0.12
maxReconnects	Maximum number of reconnects to attempt if autoReconnect is true, default is '3'.	3	1.1
reconnectAtTxEnd	If autoReconnect is set to true, should the driver attempt reconnects at the end of every transaction?	false	3.0.10
initialTimeout	If autoReconnect is enabled, the initial time to wait between reconnect attempts (in seconds, defaults to '2').	2	1.1
roundRobinLoadBalance	When autoReconnect is enabled, and failoverReadonly is false, should we pick hosts to connect to on a round-robin basis?	false	3.1.2
queriesBeforeRetryMaster	Number of queries to issue before falling back to master when failed over (when using multi-host failover). Whichever condition is met first, 'queriesBeforeRetryMaster' or 'secondsBeforeRetryMaster' will cause an attempt to be made to reconnect to the master. Defaults to 50.	50	3.0.2
secondsBeforeRetryMaster	How long should the driver wait, when failed over, before attempting	30	3.0.2
selfDestructOnPingMaxOperations	=If set to a nonzero value, the driver will report close the connection and report failure when Connection.ping() or Connection.isValid(int) is called if the connection's count of commands sent to the server exceeds this value.	0	5.1.6
selfDestructOnPingSecondsLifetime	If set to a nonzero value, the driver will report close the connection and report failure when Connection.ping() or Connection.isValid(int) is called if the connection's lifetime exceeds this value.	0	5.1.6
resourceId	A globally unique name that identifies the resource that this datasource or connection is connected to, used for XAResource.isSameRM() when the driver cannot determine this value based on host names used in the URL		5.0.1

Security.

Property Name	Definition	Default Value	Since Version
allowMultiQueries	Allow the use of ';' to delimit multiple queries during one state-	false	3.1.1

	ment (true/false), defaults to 'false'		
useSSL	Use SSL when communicating with the server (true/false), defaults to 'false'	false	3.0.2
requireSSL	Require SSL connection if useSSL=true? (defaults to 'false').	false	3.1.0
verifyServerCertificate	If "useSSL" is set to "true", should the driver verify the server's certificate? When using this feature, the keystore parameters should be specified by the "clientCertificateKeyStore*" properties, rather than system properties.	true	5.1.6
clientCertificateKeyStoreUrl	URL to the client certificate KeyStore (if not specified, use defaults)		5.1.0
clientCertificateKeyStoreType	KeyStore type for client certificates (NULL or empty means use default, standard keystore types supported by the JVM are "JKS" and "PKCS12", your environment may have more available depending on what security products are installed and available to the JVM.		5.1.0
clientCertificateKeyStorePassword	Password for the client certificates KeyStore		5.1.0
trustCertificateKeyStoreUrl	URL to the trusted root certificate KeyStore (if not specified, use defaults)		5.1.0
trustCertificateKeyStoreType	KeyStore type for trusted root certificates (NULL or empty means use default, standard keystore types supported by the JVM are "JKS" and "PKCS12", your environment may have more available depending on what security products are installed and available to the JVM.		5.1.0
trustCertificateKeyStorePassword	Password for the trusted root certificates KeyStore		5.1.0
allowLoadLocalInfile	Should the driver allow use of 'LOAD DATA LOCAL INFILE...' (defaults to 'true').	true	3.0.3
allowUrlInLocalInfile	Should the driver allow URLs in 'LOAD DATA LOCAL INFILE' statements?	false	3.1.4
paranoid	Take measures to prevent exposure sensitive information in error messages and clear data structures holding sensitive data when possible? (defaults to 'false')	false	3.0.1

Performance Extensions.

Property Name	Definition	Default Value	Since Version
callableStmtCacheSize	If 'cacheCallableStmts' is enabled, how many callable statements should be cached?	100	3.1.2
metadataCacheSize	The number of queries to cache ResultSetMetadata for if cacheResultSetMeta data is set to 'true' (default 50)	50	3.1.1
prepStmtCacheSize	If prepared statement caching is enabled, how many prepared statements should be cached?	25	3.0.10
prepStmtCacheSqlLimit	If prepared statement caching is enabled, what is the largest SQL the driver will cache the parsing for?	256	3.0.10
alwaysSendSetIsolation	Should the driver always communicate with the database when Connection.setTransactionIsolation() is called? If set to false, the driver will only communicate with the database when the requested transaction isolation is different than the whichever is newer, the last value that was set via Connection.setTransactionIsolation(), or the value that was read from the server when the connection was established.	true	3.1.7
maintainTimeStats	Should the driver maintain various internal timers to enable idle time calculations as well as more verbose error messages when the connection to the server fails? Setting this property to false removes at least two calls to System.getCurrentTimeMillis() per query.	true	3.1.9
useCursorFetch	If connected to MySQL > 5.0.2, and setFetchSize() > 0 on a statement, should that statement use cursor-based fetching to retrieve rows?	false	5.0.0

blobSendChunkSize	Chunk to use when sending BLOB/CLOBs via ServerPrepared-Statements	1048576	3.1.9
cacheCallableStmts	Should the driver cache the parsing stage of CallableStatements	false	3.1.2
cachePrepStmts	Should the driver cache the parsing stage of PreparedStatements of client-side prepared statements, the "check" for suitability of server-side prepared and server-side prepared statements themselves?	false	3.0.10
cacheResultSetMetadata	Should the driver cache ResultSetMetaData for Statements and PreparedStatements? (Req. JDK-1.4+, true/false, default 'false')	false	3.1.1
cacheServerConfiguration	Should the driver cache the results of 'SHOW VARIABLES' and 'SHOW COLLATION' on a per-URL basis?	false	3.1.5
defaultFetchSize	The driver will call setFetchSize(n) with this value on all newly-created Statements	0	3.1.9
dontTrackOpenResources	The JDBC specification requires the driver to automatically track and close resources, however if your application doesn't do a good job of explicitly calling close() on statements or result sets, this can cause memory leakage. Setting this property to true relaxes this constraint, and can be more memory efficient for some applications.	false	3.1.7
dynamicCalendars	Should the driver retrieve the default calendar when required, or cache it per connection/session?	false	3.1.5
elideSetAutoCommits	If using MySQL-4.1 or newer, should the driver only issue 'set autocommit=n' queries when the server's state doesn't match the requested state by Connection.setAutoCommit(boolean)?	false	3.1.3
enableQueryTimeouts	When enabled, query timeouts set via Statement.setQueryTimeout() use a shared java.util.Timer instance for scheduling. Even if the timeout doesn't expire before the query is processed, there will be memory used by the TimerTask for the given timeout which will not be reclaimed until the time the timeout would have expired if it hadn't been cancelled by the driver. High-load environments might want to consider disabling this functionality.	true	5.0.6
holdResultsOpenOverStatementClose	Should the driver close result sets on Statement.close() as required by the JDBC specification?	false	3.1.7
largeRowSizeThreshold	What size result set row should the JDBC driver consider "large", and thus use a more memory-efficient way of representing the row internally?	2048	5.1.1
loadBalanceStrategy	If using a load-balanced connection to connect to SQL nodes in a MySQL Cluster/NDB configuration (by using the URL prefix "jdbc:mysql:loadbalance://"), which load balancing algorithm should the driver use: (1) "random" - the driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload. (2) "bestResponseTime" - the driver will route the request to the host that had the best response time for the previous transaction.	random	5.0.6
locatorFetchBufferSize	If 'emulateLocators' is configured to 'true', what size buffer should be used when fetching BLOB data for getBinaryInputStream?	1048576	3.2.1
rewriteBatchedStatements	Should the driver use multiqueries (irregardless of the setting of "allowMultiQueries") as well as rewriting of prepared statements for INSERT into multi-value inserts when executeBatch() is called? Notice that this has the potential for SQL injection if using plain java.sql.Statements and your code doesn't sanitize input correctly. Notice that for prepared statements, server-side prepared statements can not currently take advantage of this rewrite option, and that if you do not specify stream lengths when using PreparedStatement.set*Stream(), the driver will not be able to determine the optimum number of parameters per batch and you might receive an error from the driver that the resultant packet is too large. Statement.getGeneratedKeys() for these re-	false	3.1.13

	written statements only works when the entire batch includes INSERT statements.		
useDirectRowUnpack	Use newer result set row unpacking code that skips a copy from network buffers to a MySQL packet instance and instead reads directly into the result set row data buffers.	true	5.1.1
useDynamicCharsetInfo	Should the driver use a per-connection cache of character set information queried from the server when necessary, or use a built-in static mapping that is more efficient, but isn't aware of custom character sets or character sets implemented after the release of the JDBC driver?	true	5.0.6
useFastDateParsing	Use internal String->Date/Time/Timestamp conversion routines to avoid excessive object creation?	true	5.0.5
useFastIntParsing	Use internal String->Integer conversion routines to avoid excessive object creation?	true	3.1.4
useJvmCharsetConverters	Always use the character encoding routines built into the JVM, rather than using lookup tables for single-byte character sets?	false	5.0.1
useLocalSessionState	Should the driver refer to the internal values of autocommit and transaction isolation that are set by Connection.setAutoCommit() and Connection.setTransactionIsolation() and transaction state as maintained by the protocol, rather than querying the database or blindly sending commands to the database for commit() or rollback() method calls?	false	3.1.7
useReadAheadInput	Use newer, optimized non-blocking, buffered input stream when reading from the server?	true	3.1.5

Debugging/Profiling.

Property Name	Definition	Default Value	Since Version
logger	The name of a class that implements "com.mysql.jdbc.log.Log" that will be used to log messages to. (default is "com.mysql.jdbc.log.StandardLogger", which logs to STDERR)	com.mysql.jdbc.log.StandardLogger	3.1.1
gatherPerfMetrics	Should the driver gather performance metrics, and report them via the configured logger every 'reportMetricsIntervalMillis' milliseconds?	false	3.1.2
profileSQL	Trace queries and their execution/fetch times to the configured logger (true/false) defaults to 'false'	false	3.1.0
profileSql	Deprecated, use 'profileSQL' instead. Trace queries and their execution/fetch times on STDERR (true/false) defaults to 'false'		2.0.14
reportMetricsIntervalMillis	If 'gatherPerfMetrics' is enabled, how often should they be logged (in ms)?	30000	3.1.2
maxQuerySizeToLog	Controls the maximum length/size of a query that will get logged when profiling or tracing	2048	3.1.3
packetDebugBufferSize	The maximum number of packets to retain when 'enablePacketDebug' is true	20	3.1.3
slowQueryThresholdMillis	If 'logSlowQueries' is enabled, how long should a query (in ms) before it is logged as 'slow'?	2000	3.1.2
slowQueryThresholdNanos	If 'useNanosForElapsedTime' is set to true, and this property is set to a nonzero value, the driver will use this threshold (in nanosecond units) to determine if a query was slow.	0	5.0.7
useUsageAdvisor	Should the driver issue 'usage' warnings advising proper and efficient usage of JDBC and MySQL Connector/J to the log (true/false, defaults to 'false')?	false	3.1.1
autoGenerateTestcaseScript	Should the driver dump the SQL it is executing, including server-side prepared statements to STDERR?	false	3.1.9
autoSlowLog	Instead of using slowQueryThreshold* to determine if a query is slow enough to be logged, maintain statistics that allow the driver to determine queries that are outside the 99th percentile?	true	5.1.4

clientInfoProvider	The name of a class that implements the com.mysql.jdbc.JDBC4ClientInfoProvider interface in order to support JDBC-4.0's Connection.getClientInfo() methods	com.mysql.jdbc.JDBC4ClientInfoProvider	5.1.0
dumpMetadataOnColumnNotFound	Should the driver dump the field-level metadata of a result set into the exception message when ResultSet.findColumn() fails?	false	3.1.13
dumpQueriesOnException	Should the driver dump the contents of the query sent to the server in the message for SQLExceptions?	false	3.1.3
enablePacketDebug	When enabled, a ring-buffer of 'packetDebugBufferSize' packets will be kept, and dumped when exceptions are thrown in key areas in the driver's code	false	3.1.3
explainSlowQueries	If 'logSlowQueries' is enabled, should the driver automatically issue an 'EXPLAIN' on the server and send the results to the configured log at a WARN level?	false	3.1.2
includeInnodbStatusInDeadlockExceptions	Include the output of "SHOW ENGINE INNODB STATUS" in exception messages when deadlock exceptions are detected?	false	5.0.7
logSlowQueries	Should queries that take longer than 'slowQueryThresholdMillis' be logged?	false	3.1.2
logXaCommands	Should the driver log XA commands sent by MySQLXaConnection to the server, at the DEBUG level of logging?	false	5.0.5
profilerEventHandler	Name of a class that implements the interface com.mysql.jdbc.profiler.ProfilerEventHandler that will be used to handle profiling/tracing events.	com.mysql.jdbc.profiler.LoggingProfilerEventHandler	5.1.6
resultSetSizeThreshold	If the usage advisor is enabled, how many rows should a result set contain before the driver warns that it is suspiciously large?	100	5.0.5
traceProtocol	Should trace-level network protocol be logged?	false	3.1.2
useNanosForElapsedTime	For profiling/debugging functionality that measures elapsed time, should the driver try to use nanoseconds resolution if available (JDK >= 1.5)?	false	5.0.7

Miscellaneous.

Property Name	Definition	Default Value	Since Version
useUnicode	Should the driver use Unicode character encodings when handling strings? Should only be used when the driver cannot determine the character set mapping, or you are trying to 'force' the driver to use a character set that MySQL either doesn't natively support (such as UTF-8), true/false, defaults to 'true'	true	1.1g
characterEncoding	If 'useUnicode' is set to true, what character encoding should the driver use when dealing with strings? (defaults is to 'autodetect')		1.1g
characterSetResults	Character set to tell the server to return results as.		3.0.13
connectionCollation	If set, tells the server to use this collation via 'set collation_connection'		3.0.13
useBlobToStoreUTF8OutsideBMP	Tells the driver to treat [MEDIUM/LONG]BLOB columns as [LONG]VARCHAR columns holding text encoded in UTF-8 that has characters outside the BMP (4-byte encodings), which MySQL server cannot handle natively.	false	5.1.3
utf8OutsideBmpExcludedColumnNamePattern	When "useBlobToStoreUTF8OutsideBMP" is set to "true", column names matching the given regex will still be treated as BLOBs unless they match the regex specified for "utf8OutsideBmpIncludedColumnNamePattern". The regex must follow the patterns used for the java.util.regex package.		5.1.3

utf8OutsideBmpIncludedColumnNamePattern	Used to specify exclusion rules to "utf8OutsideBmpExcludedColumnNamePattern". The regex must follow the patterns used for the java.util.regex package.		5.1.3
sessionVariables	A comma-separated list of name/value pairs to be sent as SET SESSION ... to the server when the driver connects.		3.1.8
allowNaNAndInf	Should the driver allow NaN or +/- INF values in PreparedStatement.setDouble()?	false	3.1.5
autoClosePstmtStreams	Should the driver automatically call .close() on streams/readers passed as arguments via set*() methods?	false	3.1.12
autoDeserialize	Should the driver automatically detect and de-serialize objects stored in BLOB fields?	false	3.1.5
blobsAreStrings	Should the driver always treat BLOBs as Strings - specifically to work around dubious metadata returned by the server for GROUP BY clauses?	false	5.0.8
capitalizeTypeNames	Capitalize type names in DatabaseMetaData? (usually only useful when using WebObjects, true/false, defaults to 'false')	true	2.0.7
clobCharacterEncoding	The character encoding to use for sending and retrieving TEXT, MEDIUMTEXT and LONGTEXT values instead of the configured connection characterEncoding		5.0.0
clobberStreamingResults	This will cause a 'streaming' ResultSet to be automatically closed, and any outstanding data still streaming from the server to be discarded if another query is executed before all the data has been read from the server.	false	3.0.9
continueBatchOnError	Should the driver continue processing batch commands if one statement fails. The JDBC spec allows either way (defaults to 'true').	true	3.0.3
createDatabaseIfNotExist	Creates the database given in the URL if it doesn't yet exist. Assumes the configured user has permissions to create databases.	false	3.1.9
emptyStringsConvertToZero	Should the driver allow conversions from empty string fields to numeric values of '0'?	true	3.1.8
emulateLocators	Should the driver emulate java.sql.Blobs with locators? With this feature enabled, the driver will delay loading the actual Blob data until the one of the retrieval methods (getInputStream(), getBytes(), and so forth) on the blob data stream has been accessed. For this to work, you must use a column alias with the value of the column to the actual name of the Blob. The feature also has the following restrictions: The SELECT that created the result set must reference only one table, the table must have a primary key; the SELECT must alias the original blob column name, specified as a string, to an alternate name; the SELECT must cover all columns that make up the primary key.	false	3.1.0
emulateUnsupportedPstmts	Should the driver detect prepared statements that are not supported by the server, and replace them with client-side emulated versions?	true	3.1.7
functionsNeverReturnBlobs	Should the driver always treat data from functions returning BLOBs as Strings - specifically to work around dubious metadata returned by the server for GROUP BY clauses?	false	5.0.8
generateSimpleParameterMetadata	Should the driver generate simplified parameter metadata for PreparedStatement when no metadata is available either because the server couldn't support preparing the statement, or server-side prepared statements are disabled?	false	5.0.5
ignoreNonTxTables	Ignore non-transactional table warning for rollback? (defaults to 'false').	false	3.0.9
jdbcCompliantTruncation	Should the driver throw java.sql.DataTruncation exceptions when data is truncated as is required by the JDBC specification when connected to a server that supports warnings (MySQL 4.1.0 and newer)? This property has no effect if the server sql-mode includes STRICT_TRANS_TABLES.	true	3.1.2
maxRows	The maximum number of rows to return (0, the default means return all rows).	-1	all versions

netTimeoutForStreamingResults	What value should the driver automatically set the server setting 'net_write_timeout' to when the streaming result sets feature is in use? (value has unit of seconds, the value '0' means the driver will not try and adjust this value)	600	5.1.0
noAccessToProcedureBodies	When determining procedure parameter types for CallableStatements, and the connected user cannot access procedure bodies through "SHOW CREATE PROCEDURE" or select on mysql.proc should the driver instead create basic metadata (all parameters reported as IN VARCHARs, but allowing registerOutParameter() to be called on them anyway) instead of throwing an exception?	false	5.0.3
noDatetimeStringSync	Do not ensure that ResultSet.getDateType().toString().equals(ResultSet.getString())	false	3.1.7
noTimezoneConversionForTimeType	Do not convert TIME values using the server timezone if 'useTimezone'='true'	false	5.0.0
nullCatalogMeansCurrent	When DatabaseMetadataMethods ask for a 'catalog' parameter, does the value null mean use the current catalog? (this is not JDBC-compliant, but follows legacy behavior from earlier versions of the driver)	true	3.1.8
nullNamePatternMatchesAll	Should DatabaseMetaMethods that accept *pattern parameters treat null the same as '%' (this is not JDBC-compliant, however older versions of the driver accepted this departure from the specification)	true	3.1.8
overrideSupportsIntegrityEnhancementFacility	Should the driver return "true" for DatabaseMetaMethods.supportsIntegrityEnhancementFacility() even if the database doesn't support it to workaround applications that require this method to return "true" to signal support of foreign keys, even though the SQL specification states that this facility contains much more than just foreign key support (one such application being OpenOffice)?	false	3.1.12
padCharsWithSpace	If a result set column has the CHAR type and the value does not fill the amount of characters specified in the DDL for the column, should the driver pad the remaining characters with space (for ANSI compliance)?	false	5.0.6
pedantic	Follow the JDBC spec to the letter.	false	3.0.0
pinGlobalTxToPhysicalConnection	When using XAConnections, should the driver ensure that operations on a given XID are always routed to the same physical connection? This allows the XAConnection to support "XA START ... JOIN" after "XA END" has been called	false	5.0.1
populateInsertRowWithDefaultValues	When using ResultSets that are CONCUR_UPDATABLE, should the driver pre-populate the "insert" row with default values from the DDL for the table used in the query so those values are immediately available for ResultSet accessors? This functionality requires a call to the database for metadata each time a result set of this type is created. If disabled (the default), the default values will be populated by the an internal call to refreshRow() which pulls back default values and/or values changed by triggers.	false	5.0.5
processEscapeCodesForPrepStmts	Should the driver process escape codes in queries that are prepared?	true	3.1.12
relaxAutoCommit	If the version of MySQL the driver connects to does not support transactions, still allow calls to commit(), rollback() and setAutoCommit() (true/false, defaults to 'false')?	false	2.0.13
retainStatementAfterResultSetClose	Should the driver retain the Statement reference in a ResultSet after ResultSet.close() has been called. This is not JDBC-compliant after JDBC-4.0.	false	3.1.11
rollbackOnPooledClose	Should the driver issue a rollback() when the logical connection in a pool is closed?	true	3.0.15
runningCTS13	Enables workarounds for bugs in Sun's JDBC compliance test-suite version 1.3	false	3.1.7
serverTimezone	Override detection/mapping of timezone. Used when timezone from server doesn't map to Java timezone		3.0.2

statementInterceptors	A comma-delimited list of classes that implement "com.mysql.jdbc.StatementInterceptor" that should be placed "in between" query execution to influence the results. StatementInterceptors are "chainable", the results returned by the "current" interceptor will be passed on to the next in the chain, from left-to-right order, as specified in this property.		5.1.1
strictFloatingPoint	Used only in older versions of compliance test	false	3.0.0
strictUpdates	Should the driver do strict checking (all primary keys selected) of updatable result sets (true, false, defaults to 'true')?	true	3.0.4
tinyIntIsBit	Should the driver treat the datatype TINYINT(1) as the BIT type (because the server silently converts BIT -> TINYINT(1) when creating tables)?	true	3.0.16
transformedBitIsBoolean	If the driver converts TINYINT(1) to a different type, should it use BOOLEAN instead of BIT for future compatibility with MySQL-5.0, as MySQL-5.0 has a BIT type?	false	3.1.9
treatUtilDateAsTimestamp	Should the driver treat java.util.Date as a TIMESTAMP for the purposes of PreparedStatement.setObject()?	true	5.0.5
ultraDevHack	Create PreparedStatements for prepareCall() when required, because UltraDev is broken and issues a prepareCall() for _all_ statements? (true/false, defaults to 'false')	false	2.0.3
useGmtMillisForDatetimes	Convert between session timezone and GMT before creating Date and Timestamp instances (value of "false" is legacy behavior, "true" leads to more JDBC-compliant behavior.	false	3.1.12
useHostsInPrivileges	Add '@hostname' to users in Database-MetaData.getColumn/TablePrivileges() (true/false), defaults to 'true'.	true	3.0.2
useInformationSchema	When connected to MySQL-5.0.7 or newer, should the driver use the INFORMATION_SCHEMA to derive information used by DatabaseMetaData?	false	5.0.0
useJDBCCompliantTimezoneShift	Should the driver use JDBC-compliant rules when converting TIME/TIMESTAMP/DATETIME values' timezone information for those JDBC arguments which take a java.util.Calendar argument? (Notice that this option is exclusive of the "use-Timezone=true" configuration option.)	false	5.0.0
useLegacyDatetimeCode	Use code for DATE/TIME/DATETIME/TIMESTAMP handling in result sets and statements that consistently handles timezone conversions from client to server and back again, or use the legacy code for these datatypes that has been in the driver for backwards-compatibility?	true	5.1.6
useOldAliasMetadataBehavior	Should the driver use the legacy behavior for "AS" clauses on columns and tables, and only return aliases (if any) for ResultSetMetaData.getColumn() or ResultSetMetaData.getTableName() rather than the original column/table name? In 5.0.x, the default value was true.	false	5.0.4
useOldUTF8Behavior	Use the UTF-8 behavior the driver did when communicating with 4.0 and older servers	false	3.1.6
useOnlyServerErrorMessages	Do not prepend 'standard' SQLState error messages to error messages returned by the server.	true	3.0.15
useSSPSCompatibleTimezoneShift	If migrating from an environment that was using server-side prepared statements, and the configuration property "useJDBCCompliantTimezoneShift" set to "true", use compatible behavior when not using server-side prepared statements when sending TIMESTAMP values to the MySQL server.	false	5.0.5
useServerPrepStmts	Use server-side prepared statements if the server supports them?	false	3.1.0
useSqlStateCodes	Use SQL Standard state codes instead of 'legacy' X/Open/SQL state codes (true/false), default is 'true'	true	3.1.3
useStreamLengthsInPrepStmts	Honor stream length parameter in PreparedStatement/ResultSet.setXXXStream() method calls (true/false, defaults to 'true')?	true	3.0.2
useTimezone	Convert time/date types between client and server timezones (true/false, defaults to 'false')?	false	3.0.2

useUnbufferedInput	Do not use BufferedInputStream for reading data from the server	true	3.0.11
yearIsDateType	Should the JDBC driver treat the MySQL type "YEAR" as a java.sql.Date, or as a SHORT?	true	3.1.9
zeroDateTimeBehavior	What should happen when the driver encounters DATETIME values that are composed entirely of zeroes (used by MySQL to represent invalid dates)? Valid values are "exception", "round" and "convertToNull".	exception	3.1.4

Connector/J also supports access to MySQL via named pipes on Windows NT/2000/XP using the NamedPipeSocketFactory as a plugin-socket factory via the socketFactory property. If you do not use a namedPipePath property, the default of '\\.\pipe\MySQL' will be used. If you use the [NamedPipeSocketFactory](#), the host name and port number values in the JDBC url will be ignored. You can enable this feature using:

```
socketFactory=com.mysql.jdbc.NamedPipeSocketFactory
```

Named pipes only work when connecting to a MySQL server on the same physical machine as the one the JDBC driver is being used on. In simple performance tests, it appears that named pipe access is between 30%-50% faster than the standard TCP/IP access. However, this varies per system, and named pipes are slower than TCP/IP in many Windows configurations.

You can create your own socket factories by following the example code in [com.mysql.jdbc.NamedPipeSocketFactory](#), or [com.mysql.jdbc.StandardSocketFactory](#).

20.4.4.2. JDBC API Implementation Notes

MySQL Connector/J passes all of the tests in the publicly-available version of Sun's JDBC compliance test suite. However, in many places the JDBC specification is vague about how certain functionality should be implemented, or the specification allows leeway in implementation.

This section gives details on a interface-by-interface level about how certain implementation decisions may affect how you use MySQL Connector/J.

- **Blob**

Starting with Connector/J version 3.1.0, you can emulate Blobs with locators by adding the property 'emulateLocators=true' to your JDBC URL. Using this method, the driver will delay loading the actual Blob data until you retrieve the other data and then use retrieval methods ([getInputStream\(\)](#), [getBytes\(\)](#), and so forth) on the blob data stream.

For this to work, you must use a column alias with the value of the column to the actual name of the Blob, for example:

```
SELECT id, 'data' as blob_data from blobtable
```

For this to work, you must also follow these rules:

- The **SELECT** must also reference only one table, the table must have a primary key.
- The **SELECT** must alias the original blob column name, specified as a string, to an alternate name.
- The **SELECT** must cover all columns that make up the primary key.

The Blob implementation does not allow in-place modification (they are copies, as reported by the [DatabaseMetaData.locatorsUpdateCopies\(\)](#) method). Because of this, you should use the corresponding [PreparedStatement.setBlob\(\)](#) or [ResultSet.updateBlob\(\)](#) (in the case of updatable result sets) methods to save changes back to the database.

MySQL Enterprise

MySQL Enterprise subscribers will find more information about type conversion in the Knowledge Base article, [Type Conversions Supported by MySQL Connector/J](#). To subscribe to MySQL Enterprise see <http://www.mysql.com/products/enterprise/advisors.html>.

- **CallableStatement**

Starting with Connector/J 3.1.1, stored procedures are supported when connecting to MySQL version 5.0 or newer via the [CallableStatement](#) interface. Currently, the [getParameterMetaData\(\)](#) method of [CallableStatement](#) is not supported.

- **Clob**

The Clob implementation does not allow in-place modification (they are copies, as reported by the `DatabaseMetaData.locatorsUpdateCopies()` method). Because of this, you should use the `PreparedStatement.setClob()` method to save changes back to the database. The JDBC API does not have a `ResultSet.updateClob()` method.

- **Connection**

Unlike older versions of MM.MySQL the `isClosed()` method does not ping the server to determine if it is alive. In accordance with the JDBC specification, it only returns true if `closed()` has been called on the connection. If you need to determine if the connection is still valid, you should issue a simple query, such as `SELECT 1`. The driver will throw an exception if the connection is no longer valid.

- **DatabaseMetaData**

Foreign Key information (`getImportedKeys()/getExportedKeys()` and `getCrossReference()`) is only available from InnoDB tables. However, the driver uses `SHOW CREATE TABLE` to retrieve this information, so when other storage engines support foreign keys, the driver will transparently support them as well.

- **PreparedStatement**

PreparedStatements are implemented by the driver, as MySQL does not have a prepared statement feature. Because of this, the driver does not implement `getParameterMetaData()` or `getMetaData()` as it would require the driver to have a complete SQL parser in the client.

Starting with version 3.1.0 MySQL Connector/J, server-side prepared statements and binary-encoded result sets are used when the server supports them.

Take care when using a server-side prepared statement with **large** parameters that are set via `setBinaryStream()`, `setAsciiStream()`, `setUnicodeStream()`, `setBlob()`, or `setClob()`. If you want to re-execute the statement with any large parameter changed to a non-large parameter, it is necessary to call `clearParameters()` and set all parameters again. The reason for this is as follows:

- During both server-side prepared statements and client-side emulation, large data is exchanged only when `PreparedStatement.execute()` is called.
- Once that has been done, the stream used to read the data on the client side is closed (as per the JDBC spec), and cannot be read from again.
- If a parameter changes from large to non-large, the driver must reset the server-side state of the prepared statement to allow the parameter that is being changed to take the place of the prior large value. This removes all of the large data that has already been sent to the server, thus requiring the data to be re-sent, via the `setBinaryStream()`, `setAsciiStream()`, `setUnicodeStream()`, `setBlob()` or `setClob()` methods.

Consequently, if you want to change the type of a parameter to a non-large one, you must call `clearParameters()` and set all parameters of the prepared statement again before it can be re-executed.

- **ResultSet**

By default, ResultSets are completely retrieved and stored in memory. In most cases this is the most efficient way to operate, and due to the design of the MySQL network protocol is easier to implement. If you are working with ResultSets that have a large number of rows or large values, and can not allocate heap space in your JVM for the memory required, you can tell the driver to stream the results back one row at a time.

To enable this functionality, you need to create a Statement instance in the following manner:

```
stmt = conn.createStatement( java.sql.ResultSet.TYPE_FORWARD_ONLY,
                             java.sql.ResultSet.CONCUR_READ_ONLY );
stmt.setFetchSize( Integer.MIN_VALUE );
```

The combination of a forward-only, read-only result set, with a fetch size of `Integer.MIN_VALUE` serves as a signal to the driver to stream result sets row-by-row. After this any result sets created with the statement will be retrieved row-by-row.

There are some caveats with this approach. You will have to read all of the rows in the result set (or close it) before you can issue any other queries on the connection, or an exception will be thrown.

The earliest the locks these statements hold can be released (whether they be `MyISAM` table-level locks or row-level locks in some other storage engine such as `InnoDB`) is when the statement completes.

If the statement is within scope of a transaction, then locks are released when the transaction completes (which implies that the

statement needs to complete first). As with most other databases, statements are not complete until all the results pending on the statement are read or the active result set for the statement is closed.

Therefore, if using streaming results, you should process them as quickly as possible if you want to maintain concurrent access to the tables referenced by the statement producing the result set.

- **ResultSetMetaData**

The `isAutoIncrement()` method only works when using MySQL servers 4.0 and newer.

- **Statement**

When using versions of the JDBC driver earlier than 3.2.1, and connected to server versions earlier than 5.0.3, the `setFetchSize()` method has no effect, other than to toggle result set streaming as described above.

Connector/J 5.0.0 and later include support for both `Statement.cancel()` and `Statement.setQueryTimeout()`. Both require MySQL 5.0.0 or newer server, and require a separate connection to issue the `KILL QUERY` statement. In the case of `setQueryTimeout()`, the implementation creates an additional thread to handle the timeout functionality.

Note

Failures to cancel the statement for `setQueryTimeout()` may manifest themselves as `RuntimeException` rather than failing silently, as there is currently no way to unblock the thread that is executing the query being cancelled due to timeout expiration and have it throw the exception instead.

MySQL does not support SQL cursors, and the JDBC driver doesn't emulate them, so "setCursorName()" has no effect.

Connector/J 5.1.3 and later include two additional methods:

- `setLocalInfileInputStream()` sets an `InputStream` instance that will be used to send data to the MySQL server for a `LOAD DATA LOCAL INFILE` statement rather than a `FileInputStream` or `URLInputStream` that represents the path given as an argument to the statement.

This stream will be read to completion upon execution of a `LOAD DATA LOCAL INFILE` statement, and will automatically be closed by the driver, so it needs to be reset before each call to `execute*()` that would cause the MySQL server to request data to fulfill the request for `LOAD DATA LOCAL INFILE`.

If this value is set to `NULL`, the driver will revert to using a `FileInputStream` or `URLInputStream` as required.

- `getLocalInfileInputStream()` returns the `InputStream` instance that will be used to send data in response to a `LOAD DATA LOCAL INFILE` statement.

This method returns `NULL` if no such stream has been set via `setLocalInfileInputStream()`.

20.4.4.3. Java, JDBC and MySQL Types

MySQL Connector/J is flexible in the way it handles conversions between MySQL data types and Java data types.

In general, any MySQL data type can be converted to a `java.lang.String`, and any numerical type can be converted to any of the Java numerical types, although round-off, overflow, or loss of precision may occur.

Starting with Connector/J 3.1.0, the JDBC driver will issue warnings or throw `DataTruncation` exceptions as is required by the JDBC specification unless the connection was configured not to do so by using the property `jdbcCompliantTruncation` and setting it to `false`.

The conversions that are always guaranteed to work are listed in the following table:

Connection Properties - Miscellaneous.

These MySQL Data Types	Can always be converted to these Java types
<code>CHAR</code> , <code>VARCHAR</code> , <code>BLOB</code> , <code>TEXT</code> , <code>ENUM</code> , and <code>SET</code>	<code>java.lang.String</code> , <code>java.io.InputStream</code> , <code>java.io.Reader</code> , <code>java.sql.Blob</code> , <code>java.sql.Clob</code>
<code>FLOAT</code> , <code>REAL</code> , <code>DOUBLE PRECISION</code> , <code>NUMERIC</code> , <code>DECIMAL</code> , <code>TINYINT</code> , <code>SMALLINT</code> , <code>MEDIUMINT</code> , <code>IN-</code> <code>TEGER</code> , <code>BIGINT</code>	<code>java.lang.String</code> , <code>java.lang.Short</code> , <code>java.lang.Integer</code> , <code>java.lang.Long</code> , <code>java.lang.Double</code> , <code>java.math.BigDecimal</code>
<code>DATE</code> , <code>TIME</code> , <code>DATETIME</code> , <code>TIMESTAMP</code>	<code>java.lang.String</code> , <code>java.sql.Date</code> ,

	<code>java.sql.Timestamp</code>
--	---------------------------------

Note

Round-off, overflow or loss of precision may occur if you choose a Java numeric data type that has less precision or capacity than the MySQL data type you are converting to/from.

The `ResultSet.getObject()` method uses the type conversions between MySQL and Java types, following the JDBC specification where appropriate. The value returned by `ResultSetMetaData.getColumnClassName()` is also shown below. For more information on the `java.sql.Types` classes see [Java 2 Platform Types](#).

MySQL Types to Java Types for `ResultSet.getObject()`.

MySQL Type Name	Return value of <code>getColumnClassName</code>	Returned as Java Class
BIT(1) (new in MySQL-5.0)	BIT	<code>java.lang.Boolean</code>
BIT(> 1) (new in MySQL-5.0)	BIT	<code>byte[]</code>
TINYINT	TINYINT	<code>java.lang.Boolean</code> if the configuration property <code>tinyIntIsBit</code> is set to <code>true</code> (the default) and the storage size is 1, or <code>java.lang.Integer</code> if not.
BOOL, BOOLEAN	TINYINT	See TINYINT, above as these are aliases for TINYINT(1), currently.
SMALLINT[(M)] [UNSIGNED]	SMALLINT [UNSIGNED]	<code>java.lang.Integer</code> (regardless if UNSIGNED or not)
MEDIUMINT[(M)] [UNSIGNED]	MEDIUMINT [UNSIGNED]	<code>java.lang.Integer</code> , if UNSIGNED <code>java.lang.Long</code> (C/J 3.1 and earlier), or <code>java.lang.Integer</code> for C/J 5.0 and later
INT,INTEGER[(M)] [UNSIGNED]	INTEGER [UNSIGNED]	<code>java.lang.Integer</code> , if UNSIGNED <code>java.lang.Long</code>
BIGINT[(M)] [UNSIGNED]	BIGINT [UNSIGNED]	<code>java.lang.Long</code> , if UNSIGNED <code>java.math.BigInteger</code>
FLOAT[(M,D)]	FLOAT	<code>java.lang.Float</code>
DOUBLE[(M,B)]	DOUBLE	<code>java.lang.Double</code>
DECIMAL[(M,D)]	DECIMAL	<code>java.math.BigDecimal</code>
DATE	DATE	<code>java.sql.Date</code>
DATETIME	DATETIME	<code>java.sql.Timestamp</code>
TIMESTAMP[(M)]	TIMESTAMP	<code>java.sql.Timestamp</code>
TIME	TIME	<code>java.sql.Time</code>
YEAR[(2 4)]	YEAR	If <code>yearIsDateType</code> configuration property is set to false, then the returned object type is <code>java.sql.Short</code> . If set to true (the default) then an object of type <code>java.sql.Date</code> (with the date set to January 1st, at midnight).
CHAR(M)	CHAR	<code>java.lang.String</code> (unless the character set for the column is BINARY, then <code>byte[]</code> is returned).
VARCHAR(M) [BINARY]	VARCHAR	<code>java.lang.String</code> (unless the character set for the column is BINARY, then <code>byte[]</code> is returned).
BINARY(M)	BINARY	<code>byte[]</code>
VARBINARY(M)	VARBINARY	<code>byte[]</code>
TINYBLOB	TINYBLOB	<code>byte[]</code>
TINYTEXT	VARCHAR	<code>java.lang.String</code>
BLOB	BLOB	<code>byte[]</code>
TEXT	VARCHAR	<code>java.lang.String</code>
MEDIUMBLOB	MEDIUMBLOB	<code>byte[]</code>
MEDIUMTEXT	VARCHAR	<code>java.lang.String</code>
LOBLOB	LOBLOB	<code>byte[]</code>
LONGTEXT	VARCHAR	<code>java.lang.String</code>

ENUM('value1','value2',...)	CHAR	<code>java.lang.String</code>
SET('value1','value2',...)	CHAR	<code>java.lang.String</code>

20.4.4.4. Using Character Sets and Unicode

All strings sent from the JDBC driver to the server are converted automatically from native Java Unicode form to the client character encoding, including all queries sent via `Statement.execute()`, `Statement.executeUpdate()`, `Statement.executeQuery()` as well as all `PreparedStatement` and `CallableStatement` parameters with the exclusion of parameters set using `setBytes()`, `setBinaryStream()`, `setAsciiStream()`, `setUnicodeStream()` and `setBlob()`.

Prior to MySQL Server 4.1, Connector/J supported a single character encoding per connection, which could either be automatically detected from the server configuration, or could be configured by the user through the `useUnicode` and `characterEncoding` properties.

Starting with MySQL Server 4.1, Connector/J supports a single character encoding between client and server, and any number of character encodings for data returned by the server to the client in `ResultSets`.

The character encoding between client and server is automatically detected upon connection. The encoding used by the driver is specified on the server via the `character_set` system variable for server versions older than 4.1.0 and `character_set_server` for server versions 4.1.0 and newer. For more information, see [Section 9.1.3.1, “Server Character Set and Collation”](#).

To override the automatically-detected encoding on the client side, use the `characterEncoding` property in the URL used to connect to the server.

When specifying character encodings on the client side, Java-style names should be used. The following table lists Java-style names for MySQL character sets:

MySQL to Java Encoding Name Translations.

MySQL Character Set Name	Java-Style Character Encoding Name
ascii	US-ASCII
big5	Big5
gbk	GBK
sjis	SJIS (or Cp932 or MS932 for MySQL Server < 4.1.11)
cp932	Cp932 or MS932 (MySQL Server > 4.1.11)
gb2312	EUC_CN
ujis	EUC_JP
euckr	EUC_KR
latin1	ISO8859_1
latin2	ISO8859_2
greek	ISO8859_7
hebrew	ISO8859_8
cp866	Cp866
tis620	TIS620
cp1250	Cp1250
cp1251	Cp1251
cp1257	Cp1257
macroman	MacRoman
macce	MacCentralEurope
utf8	UTF-8
ucs2	UnicodeBig

Warning

Do not issue the query 'set names' with Connector/J, as the driver will not detect that the character set has changed,

and will continue to use the character set detected during the initial connection setup.

To allow multiple character sets to be sent from the client, the UTF-8 encoding should be used, either by configuring `utf8` as the default server character set, or by configuring the JDBC driver to use UTF-8 through the `characterEncoding` property.

20.4.4.5. Connecting Securely Using SSL

SSL in MySQL Connector/J encrypts all data (other than the initial handshake) between the JDBC driver and the server. The performance penalty for enabling SSL is an increase in query processing time between 35% and 50%, depending on the size of the query, and the amount of data it returns.

For SSL Support to work, you must have the following:

- A JDK that includes JSSE (Java Secure Sockets Extension), like JDK-1.4.1 or newer. SSL does not currently work with a JDK that you can add JSSE to, like JDK-1.2.x or JDK-1.3.x due to the following JSSE bug: <http://developer.java.sun.com/developer/bugParade/bugs/4273544.html>
- A MySQL server that supports SSL and has been compiled and configured to do so, which is MySQL-4.0.4 or later, see [Section 5.5.7, “Using SSL for Secure Connections”](#), for more information.
- A client certificate (covered later in this section)

The system works through two Java truststore files, one file contains the certificate information for the server (`truststore` in the examples below). The other file contains the certificate for the client (`keystore` in the examples below). All Java truststore files are password protected by supplying a suitable password to the `keytool` when you create the files. You need the file names and associated passwords to create an SSL connection.

You will first need to import the MySQL server CA Certificate into a Java truststore. A sample MySQL server CA Certificate is located in the `SSL` subdirectory of the MySQL source distribution. This is what SSL will use to determine if you are communicating with a secure MySQL server. Alternatively, use the CA Certificate that you have generated or been provided with by your SSL provider.

To use Java's `keytool` to create a truststore in the current directory, and import the server's CA certificate (`cacert.pem`), you can do the following (assuming that `keytool` is in your path. The `keytool` should be located in the `bin` subdirectory of your JDK or JRE):

```
shell> keytool -import -alias mysqlServerCACert \
               -file cacert.pem -keystore truststore
```

You will need to enter the password when prompted for the keystore file. Interaction with `keytool` will look like this:

```
Enter keystore password: *****
Owner: EMAILADDRESS=walrus@example.com, CN=Walrus,
O=MySQL AB, L=Orenburg, ST=Some-State, C=RU
Issuer: EMAILADDRESS=walrus@example.com, CN=Walrus,
O=MySQL AB, L=Orenburg, ST=Some-State, C=RU
Serial number: 0
Valid from:
  Fri Aug 02 16:55:53 CDT 2002 until: Sat Aug 02 16:55:53 CDT 2003
Certificate fingerprints:
  MD5: 61:91:A0:F2:03:07:61:7A:81:38:66:DA:19:C4:8D:AB
  SHA1: 25:77:41:05:D5:AD:99:8C:14:8C:CA:68:9C:2F:B8:89:C3:34:4D:6C
Trust this certificate? [no]: yes
Certificate was added to keystore
```

You then have two options, you can either import the client certificate that matches the CA certificate you just imported, or you can create a new client certificate.

To import an existing certificate, the certificate should be in DER format. You can use `openssl` to convert an existing certificate into the new format. For example:

```
shell> openssl x509 -outform DER -in client-cert.pem -out client.cert
```

You now need to import the converted certificate into your keystore using `keytool`:

```
shell> keytool -import -file client.cert -keystore keystore -alias mysqlClientCertificate
```

To generate your own client certificate, use `keytool` to create a suitable certificate and add it to the `keystore` file:

```
shell> keytool -genkey -keyalg rsa \
```

```
-alias mysqlClientCertificate -keystore keystore
```

Keytool will prompt you for the following information, and create a keystore named `keystore` in the current directory.

You should respond with information that is appropriate for your situation:

```
Enter keystore password: *****
What is your first and last name?
[Unknown]: Matthews
What is the name of your organizational unit?
[Unknown]: Software Development
What is the name of your organization?
[Unknown]: MySQL AB
What is the name of your City or Locality?
[Unknown]: Flossmoor
What is the name of your State or Province?
[Unknown]: IL
What is the two-letter country code for this unit?
[Unknown]: US
Is <CN=Matthews, OU=Software Development, O=MySQL AB,
L=Flossmoor, ST=IL, C=US> correct?
[no]: y

Enter key password for <mysqlClientCertificate>
(RETURN if same as keystore password):
```

Finally, to get JSSE to use the keystore and truststore that you have generated, you need to set the following system properties when you start your JVM, replacing `path_to_keystore_file` with the full path to the keystore file you created, `path_to_truststore_file` with the path to the truststore file you created, and using the appropriate password values for each property. You can do this either on the command line:

```
-Djavax.net.ssl.keyStore=path_to_keystore_file
-Djavax.net.ssl.keyStorePassword=password
-Djavax.net.ssl.trustStore=path_to_truststore_file
-Djavax.net.ssl.trustStorePassword=password
```

Or you can set the values directly within the application:

```
System.setProperty("javax.net.ssl.keyStore","path_to_keystore_file");
System.setProperty("javax.net.ssl.keyStorePassword","password");
System.setProperty("javax.net.ssl.trustStore","path_to_truststore_file");
System.setProperty("javax.net.ssl.trustStorePassword","password");
```

You will also need to set `useSSL` to `true` in your connection parameters for MySQL Connector/J, either by adding `useSSL=true` to your URL, or by setting the property `useSSL` to `true` in the `java.util.Properties` instance you pass to `DriverManager.getConnection()`.

You can test that SSL is working by turning on JSSE debugging (as detailed below), and look for the following key events:

```

JSSSE provides debugging (to STDOUT) when you set the following system property: `-Djavax.net.debug=all`. This will tell you what keystores and truststores are being used, as well as what is going on during the SSL handshake and certificate exchange. It will be helpful when trying to determine what is not working when trying to get an SSL connection to happen.

20.4.4.6. Using Master/Slave Replication with ReplicationConnection

Starting with Connector/J 3.1.7, we've made available a variant of the driver that will automatically send queries to a read/write master, or a failover or round-robin loadbalanced set of slaves based on the state of `Connection.getReadOnly()`.

An application signals that it wants a transaction to be read-only by calling `Connection.setReadOnly(true)`, this replication-aware connection will use one of the slave connections, which are load-balanced per-vm using a round-robin scheme (a given connection is sticky to a slave unless that slave is removed from service). If you have a write transaction, or if you have a read that is time-sensitive (remember, replication in MySQL is asynchronous), set the connection to be not read-only, by calling `Connection.setReadOnly(false)` and the driver will ensure that further calls are sent to the master MySQL server. The driver takes care of propagating the current state of autocommit, isolation level, and catalog between all of the connections that it uses to accomplish this load balancing functionality.

To enable this functionality, use the "`com.mysql.jdbc.ReplicationDriver`" class when configuring your application server's connection pool or when creating an instance of a JDBC driver for your standalone application. Because it accepts the same URL format as the standard MySQL JDBC driver, `ReplicationDriver` does not currently work with `java.sql.DriverManager`-based connection creation unless it is the only MySQL JDBC driver registered with the `DriverManager`.

Here is a short, simple example of how `ReplicationDriver` might be used in a standalone application.

```
import java.sql.Connection;
import java.sql.ResultSet;
import java.util.Properties;

import com.mysql.jdbc.ReplicationDriver;

public class ReplicationDriverDemo {

    public static void main(String[] args) throws Exception {
        ReplicationDriver driver = new ReplicationDriver();

        Properties props = new Properties();

        // We want this for failover on the slaves
        props.put("autoReconnect", "true");

        // We want to load balance between the slaves
        props.put("roundRobinLoadBalance", "true");

        props.put("user", "foo");
        props.put("password", "bar");

        //
        // Looks like a normal MySQL JDBC url, with a
        // comma-separated list of hosts, the first
        // being the 'master', the rest being any number
        // of slaves that the driver will load balance against
        //
        Connection conn =
            driver.connect("jdbc:mysql://master,slave1,slave2,slave3/test",
                props);

        //
        // Perform read/write work on the master
        // by setting the read-only flag to "false"
        //
        conn.setReadOnly(false);
        conn.setAutoCommit(false);
        conn.createStatement().executeUpdate("UPDATE some_table ...");
        conn.commit();

        //
        // Now, do a query from a slave, the driver automatically picks one
        // from the list
        //
        conn.setReadOnly(true);

        ResultSet rs =
            conn.createStatement().executeQuery("SELECT a,b FROM alt_table");

        .....
    }
}
```

You may also want to investigate the Load Balancing JDBC Pool (lbpool) tool, which provides a wrapper around the standard JDBC driver and allows you to use DB connection pools that includes checks for system failures and uneven load distribution. For more

information, see [Load Balancing JDBC Pool \(lbpool\)](#).

20.4.4.7. Mapping MySQL Error Numbers to SQLStates

The table below provides a mapping of the MySQL Error Numbers to [SQL States](#)

Table 20.3. Mapping of MySQL Error Numbers to SQLStates

MySQL Error Number	MySQL Error Name	Legacy (X/Open) SQLState	SQL Standard SQLState
1022	ER_DUP_KEY	S1000	23000
1037	ER_OUT_OFMEMORY	S1001	HY001
1038	ER_OUT_OF_SORTMEMORY	S1001	HY001

20.4.5. Connector/J Notes and Tips

20.4.5.1. Basic JDBC Concepts

This section provides some general JDBC background.

20.4.5.1.1. Connecting to MySQL Using the `DriverManager` Interface

When you are using JDBC outside of an application server, the `DriverManager` class manages the establishment of Connections.

The `DriverManager` needs to be told which JDBC drivers it should try to make Connections with. The easiest way to do this is to use `Class.forName()` on the class that implements the `java.sql.Driver` interface. With MySQL Connector/J, the name of this class is `com.mysql.jdbc.Driver`. With this method, you could use an external configuration file to supply the driver class name and driver parameters to use when connecting to a database.

The following section of Java code shows how you might register MySQL Connector/J from the `main()` method of your application:

```
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;

// Notice, do not import com.mysql.jdbc.*
// or you will have problems!

public class LoadDriver {
    public static void main(String[] args) {
        try {
            // The newInstance() call is a work around for some
            // broken Java implementations

            Class.forName("com.mysql.jdbc.Driver").newInstance();
        } catch (Exception ex) {
            // handle the error
        }
    }
}
```

After the driver has been registered with the `DriverManager`, you can obtain a `Connection` instance that is connected to a particular database by calling `DriverManager.getConnection()`:

Example 20.1. Connector/J: Obtaining a connection from the `DriverManager`

This example shows how you can obtain a `Connection` instance from the `DriverManager`. There are a few different signatures for the `getConnection()` method. You should see the API documentation that comes with your JDK for more specific in-

formation on how to use them.

```
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;

Connection conn = null;
...
try {
    conn =
        DriverManager.getConnection("jdbc:mysql://localhost/test?" +
                                   "user=monty&password=greatsqldb");

    // Do something with the Connection

    ...
} catch (SQLException ex) {
    // handle any errors
    System.out.println("SQLException: " + ex.getMessage());
    System.out.println("SQLState: " + ex.getSQLState());
    System.out.println("VendorError: " + ex.getErrorCode());
}
```

Once a `Connection` is established, it can be used to create `Statement` and `PreparedStatement` objects, as well as retrieve metadata about the database. This is explained in the following sections.

20.4.5.1.2. Using Statements to Execute SQL

`Statement` objects allow you to execute basic SQL queries and retrieve the results through the `ResultSet` class which is described later.

To create a `Statement` instance, you call the `createStatement()` method on the `Connection` object you have retrieved via one of the `DriverManager.getConnection()` or `DataSource.getConnection()` methods described earlier.

Once you have a `Statement` instance, you can execute a `SELECT` query by calling the `executeQuery(String)` method with the SQL you want to use.

To update data in the database, use the `executeUpdate(String SQL)` method. This method returns the number of rows affected by the update statement.

If you do not know ahead of time whether the SQL statement will be a `SELECT` or an `UPDATE/INSERT`, then you can use the `execute(String SQL)` method. This method will return true if the SQL query was a `SELECT`, or false if it was an `UPDATE`, `INSERT`, or `DELETE` statement. If the statement was a `SELECT` query, you can retrieve the results by calling the `getResultSet()` method. If the statement was an `UPDATE`, `INSERT`, or `DELETE` statement, you can retrieve the affected rows count by calling `getUpdateCount()` on the `Statement` instance.

Example 20.2. Connector/J: Using `java.sql.Statement` to execute a `SELECT` query

```
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;
import java.sql.Statement;
import java.sql.ResultSet;

// assume that conn is an already created JDBC connection (see previous examples)

Statement stmt = null;
ResultSet rs = null;

try {
    stmt = conn.createStatement();
    rs = stmt.executeQuery("SELECT foo FROM bar");

    // or alternatively, if you don't know ahead of time that
    // the query will be a SELECT...

    if (stmt.execute("SELECT foo FROM bar")) {
        rs = stmt.getResultSet();
    }

    // Now do something with the ResultSet ....
}
catch (SQLException ex){
    // handle any errors
    System.out.println("SQLException: " + ex.getMessage());
    System.out.println("SQLState: " + ex.getSQLState());
    System.out.println("VendorError: " + ex.getErrorCode());
}
finally {
    // it is a good idea to release
    // resources in a finally{} block
    // in reverse-order of their creation
    // if they are no-longer needed
}
```

```

if (rs != null) {
    try {
        rs.close();
    } catch (SQLException sqlEx) { } // ignore
    rs = null;
}

if (stmt != null) {
    try {
        stmt.close();
    } catch (SQLException sqlEx) { } // ignore
    stmt = null;
}
}

```

20.4.5.1.3. Using `CallableStatements` to Execute Stored Procedures

Starting with MySQL server version 5.0 when used with Connector/J 3.1.1 or newer, the `java.sql.CallableStatement` interface is fully implemented with the exception of the `getParameterMetaData()` method.

For more information on MySQL stored procedures, please refer to <http://dev.mysql.com/doc/mysql/en/stored-routines.html>.

Connector/J exposes stored procedure functionality through JDBC's `CallableStatement` interface.

Note

Current versions of MySQL server do not return enough information for the JDBC driver to provide result set metadata for callable statements. This means that when using `CallableStatement`, `ResultSetMetaData` may return `NULL`.

The following example shows a stored procedure that returns the value of `inOutParam` incremented by 1, and the string passed in via `inputParam` as a `ResultSet`:

Example 20.3. Connector/J: Calling Stored Procedures

```

CREATE PROCEDURE demoSp(IN inputParam VARCHAR(255), \
                        INOUT inOutParam INT)
BEGIN
    DECLARE z INT;
    SET z = inOutParam + 1;
    SET inOutParam = z;

    SELECT inputParam;

    SELECT CONCAT('zyxw', inputParam);
END

```

To use the `demoSp` procedure with Connector/J, follow these steps:

1. Prepare the callable statement by using `Connection.prepareCall()`.

Notice that you have to use JDBC escape syntax, and that the parentheses surrounding the parameter placeholders are not optional:

Example 20.4. Connector/J: Using `Connection.prepareCall()`

```

import java.sql.CallableStatement;
...

//
// Prepare a call to the stored procedure 'demoSp'
// with two parameters
//
// Notice the use of JDBC-escape syntax ({call ...})
//

CallableStatement cStmt = conn.prepareCall("{call demoSp(?, ?)}");

cStmt.setString(1, "abcdefg");

```

Note

`Connection.prepareStatement()` is an expensive method, due to the metadata retrieval that the driver performs to support output parameters. For performance reasons, you should try to minimize unnecessary calls to `Connection.prepareStatement()` by reusing `CallableStatement` instances in your code.

2. Register the output parameters (if any exist)

To retrieve the values of output parameters (parameters specified as `OUT` or `INOUT` when you created the stored procedure), JDBC requires that they be specified before statement execution using the various `registerOutputParameter()` methods in the `CallableStatement` interface:

Example 20.5. Connector/J: Registering output parameters

```
import java.sql.Types;
...
//
// Connector/J supports both named and indexed
// output parameters. You can register output
// parameters using either method, as well
// as retrieve output parameters using either
// method, regardless of what method was
// used to register them.
//
// The following examples show how to use
// the various methods of registering
// output parameters (you should of course
// use only one registration per parameter).
//
//
// Registers the second parameter as output, and
// uses the type 'INTEGER' for values returned from
// getObject()
//
cStmt.registerOutParameter(2, Types.INTEGER);
//
// Registers the named parameter 'inOutParam', and
// uses the type 'INTEGER' for values returned from
// getObject()
//
cStmt.registerOutParameter("inOutParam", Types.INTEGER);
...
```

3. Set the input parameters (if any exist)

Input and in/out parameters are set as for `PreparedStatement` objects. However, `CallableStatement` also supports setting parameters by name:

Example 20.6. Connector/J: Setting `CallableStatement` input parameters

```
...
//
// Set a parameter by index
//
cStmt.setString(1, "abcdefg");
//
// Alternatively, set a parameter using
// the parameter name
//
cStmt.setString("inputParameter", "abcdefg");
//
// Set the 'in/out' parameter using an index
//
cStmt.setInt(2, 1);
//
// Alternatively, set the 'in/out' parameter
// by name
//
cStmt.setInt("inOutParam", 1);
```

...

4. Execute the `CallableStatement`, and retrieve any result sets or output parameters.

Although `CallableStatement` supports calling any of the `Statement` execute methods (`executeUpdate()`, `executeQuery()` or `execute()`), the most flexible method to call is `execute()`, as you do not need to know ahead of time if the stored procedure returns result sets:

Example 20.7. Connector/J: Retrieving results and output parameter values

...

```

boolean hadResults = cStmt.execute();

//
// Process all returned result sets
//

while (hadResults) {
    ResultSet rs = cStmt.getResultSet();

    // process result set
    ...

    hadResults = cStmt.getMoreResults();
}

//
// Retrieve output parameters
//
// Connector/J supports both index-based and
// name-based retrieval
//

int outputValue = cStmt.getInt(2); // index-based
outputValue = cStmt.getInt("inOutParam"); // name-based

```

...

20.4.5.1.4. Retrieving `AUTO_INCREMENT` Column Values

Before version 3.0 of the JDBC API, there was no standard way of retrieving key values from databases that supported auto increment or identity columns. With older JDBC drivers for MySQL, you could always use a MySQL-specific method on the `Statement` interface, or issue the query `SELECT LAST_INSERT_ID()` after issuing an `INSERT` to a table that had an `AUTO_INCREMENT` key. Using the MySQL-specific method call isn't portable, and issuing a `SELECT` to get the `AUTO_INCREMENT` key's value requires another round-trip to the database, which isn't as efficient as possible. The following code snippets demonstrate the three different ways to retrieve `AUTO_INCREMENT` values. First, we demonstrate the use of the new JDBC-3.0 method `getGeneratedKeys()` which is now the preferred method to use if you need to retrieve `AUTO_INCREMENT` keys and have access to JDBC-3.0. The second example shows how you can retrieve the same value using a standard `SELECT LAST_INSERT_ID()` query. The final example shows how updatable result sets can retrieve the `AUTO_INCREMENT` value when using the `insertRow()` method.

Example 20.8. Connector/J: Retrieving `AUTO_INCREMENT` column values using `Statement.getGeneratedKeys()`

```

Statement stmt = null;
ResultSet rs = null;

try {

    //
    // Create a Statement instance that we can use for
    // 'normal' result sets assuming you have a
    // Connection 'conn' to a MySQL database already
    // available

    stmt = conn.createStatement(java.sql.ResultSet.TYPE_FORWARD_ONLY,
                               java.sql.ResultSet.CONCUR_UPDATABLE);

    //
    // Issue the DDL queries for the table for this example
    //

    stmt.executeUpdate("DROP TABLE IF EXISTS autoIncTutorial");
    stmt.executeUpdate(

```

```

        "CREATE TABLE autoIncTutorial ("
        + "priKey INT NOT NULL AUTO_INCREMENT, "
        + "dataField VARCHAR(64), PRIMARY KEY (priKey))");

//
// Insert one row that will generate an AUTO INCREMENT
// key in the 'priKey' field
//
stmt.executeUpdate(
    "INSERT INTO autoIncTutorial (dataField) "
    + "values ('Can I Get the Auto Increment Field?')",
    Statement.RETURN_GENERATED_KEYS);

//
// Example of using Statement.getGeneratedKeys()
// to retrieve the value of an auto-increment
// value
//
int autoIncKeyFromApi = -1;

rs = stmt.getGeneratedKeys();

if (rs.next()) {
    autoIncKeyFromApi = rs.getInt(1);
} else {
    // throw an exception from here
}

rs.close();

rs = null;

System.out.println("Key returned from getGeneratedKeys():"
    + autoIncKeyFromApi);
} finally {
    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException ex) {
            // ignore
        }
    }

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException ex) {
            // ignore
        }
    }
}
}

```

Example 20.9. Connector/J: Retrieving `AUTO_INCREMENT` column values using `SELECT LAST_INSERT_ID()`

```

Statement stmt = null;
ResultSet rs = null;

try {
    //
    // Create a Statement instance that we can use for
    // 'normal' result sets.

    stmt = conn.createStatement();

    //
    // Issue the DDL queries for the table for this example
    //

    stmt.executeUpdate("DROP TABLE IF EXISTS autoIncTutorial");
    stmt.executeUpdate(
        "CREATE TABLE autoIncTutorial ("
        + "priKey INT NOT NULL AUTO_INCREMENT, "
        + "dataField VARCHAR(64), PRIMARY KEY (priKey))");

    //
    // Insert one row that will generate an AUTO INCREMENT
    // key in the 'priKey' field
    //

    stmt.executeUpdate(
        "INSERT INTO autoIncTutorial (dataField) "
        + "values ('Can I Get the Auto Increment Field?')");

    //
    // Use the MySQL LAST_INSERT_ID()

```

```

// function to do the same thing as getGeneratedKeys()
//
int autoIncKeyFromFunc = -1;
rs = stmt.executeQuery("SELECT LAST_INSERT_ID()");

if (rs.next()) {
    autoIncKeyFromFunc = rs.getInt(1);
} else {
    // throw an exception from here
}

rs.close();

System.out.println("Key returned from " +
    "'SELECT LAST_INSERT_ID()': " +
    autoIncKeyFromFunc);
} finally {
    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException ex) {
            // ignore
        }
    }

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException ex) {
            // ignore
        }
    }
}
}

```

Example 20.10. Connector/J: Retrieving `AUTO_INCREMENT` column values in `Updatable ResultSets`

```

Statement stmt = null;
ResultSet rs = null;

try {
    //
    // Create a Statement instance that we can use for
    // 'normal' result sets as well as an 'updatable'
    // one, assuming you have a Connection 'conn' to
    // a MySQL database already available
    //
    stmt = conn.createStatement(java.sql.ResultSet.TYPE_FORWARD_ONLY,
        java.sql.ResultSet.CONCUR_UPDATABLE);

    //
    // Issue the DDL queries for the table for this example
    //
    stmt.executeUpdate("DROP TABLE IF EXISTS autoIncTutorial");
    stmt.executeUpdate(
        "CREATE TABLE autoIncTutorial ("
        + "priKey INT NOT NULL AUTO_INCREMENT, "
        + "dataField VARCHAR(64), PRIMARY KEY (priKey))");

    //
    // Example of retrieving an AUTO INCREMENT key
    // from an updatable result set
    //
    rs = stmt.executeQuery("SELECT priKey, dataField "
        + "FROM autoIncTutorial");

    rs.moveToInsertRow();

    rs.updateString("dataField", "AUTO INCREMENT here?");
    rs.insertRow();

    //
    // the driver adds rows at the end
    //
    rs.last();

    //
    // We should now be on the row we just inserted
    //
    int autoIncKeyFromRS = rs.getInt("priKey");
}

```

```

rs.close();

rs = null;

System.out.println("Key returned for inserted row: "
    + autoIncKeyFromRS);
} finally {
    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException ex) {
            // ignore
        }
    }

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException ex) {
            // ignore
        }
    }
}
}

```

When you run the preceding example code, you should get the following output: Key returned from `getGeneratedKeys()`: 1 Key returned from `SELECT LAST_INSERT_ID()`: 1 Key returned for inserted row: 2 You should be aware, that at times, it can be tricky to use the `SELECT LAST_INSERT_ID()` query, as that function's value is scoped to a connection. So, if some other query happens on the same connection, the value will be overwritten. On the other hand, the `getGeneratedKeys()` method is scoped by the `Statement` instance, so it can be used even if other queries happen on the same connection, but not on the same `Statement` instance.

20.4.5.2. Using Connector/J with J2EE and Other Java Frameworks

This section describes how to use Connector/J in several contexts.

20.4.5.2.1. General J2EE Concepts

This section provides general background on J2EE concepts that pertain to use of Connector/J.

20.4.5.2.1.1. Understanding Connection Pooling

Connection pooling is a technique of creating and managing a pool of connections that are ready for use by any thread that needs them.

This technique of pooling connections is based on the fact that most applications only need a thread to have access to a JDBC connection when they are actively processing a transaction, which usually take only milliseconds to complete. When not processing a transaction, the connection would otherwise sit idle. Instead, connection pooling allows the idle connection to be used by some other thread to do useful work.

In practice, when a thread needs to do work against a MySQL or other database with JDBC, it requests a connection from the pool. When the thread is finished using the connection, it returns it to the pool, so that it may be used by any other threads that want to use it.

When the connection is loaned out from the pool, it is used exclusively by the thread that requested it. From a programming point of view, it is the same as if your thread called `DriverManager.getConnection()` every time it needed a JDBC connection, however with connection pooling, your thread may end up using either a new, or already-existing connection.

Connection pooling can greatly increase the performance of your Java application, while reducing overall resource usage. The main benefits to connection pooling are:

- Reduced connection creation time

Although this is not usually an issue with the quick connection setup that MySQL offers compared to other databases, creating new JDBC connections still incurs networking and JDBC driver overhead that will be avoided if connections are recycled.

- Simplified programming model

When using connection pooling, each individual thread can act as though it has created its own JDBC connection, allowing you to use straight-forward JDBC programming techniques.

- Controlled resource usage

If you do not use connection pooling, and instead create a new connection every time a thread needs one, your application's resource usage can be quite wasteful and lead to unpredictable behavior under load.

Remember that each connection to MySQL has overhead (memory, CPU, context switches, and so forth) on both the client and server side. Every connection limits how many resources there are available to your application as well as the MySQL server. Many of these resources will be used whether or not the connection is actually doing any useful work!

Connection pools can be tuned to maximize performance, while keeping resource utilization below the point where your application will start to fail rather than just run slower.

Luckily, Sun has standardized the concept of connection pooling in JDBC through the JDBC-2.0 Optional interfaces, and all major application servers have implementations of these APIs that work fine with MySQL Connector/J.

Generally, you configure a connection pool in your application server configuration files, and access it via the Java Naming and Directory Interface (JNDI). The following code shows how you might use a connection pool from an application deployed in a J2EE application server:

Example 20.11. Connector/J: Using a connection pool with a J2EE application server

```
import java.sql.Connection;
import java.sql.SQLException;
import java.sql.Statement;

import javax.naming.InitialContext;
import javax.sql.DataSource;

public class MyServletJspOrEjb {

    public void doSomething() throws Exception {
        /*
         * Create a JNDI Initial context to be able to
         * lookup the DataSource
         *
         * In production-level code, this should be cached as
         * an instance or static variable, as it can
         * be quite expensive to create a JNDI context.
         *
         * Note: This code only works when you are using servlets
         * or EJBs in a J2EE application server. If you are
         * using connection pooling in standalone Java code, you
         * will have to create/configure datasources using whatever
         * mechanisms your particular connection pooling library
         * provides.
         */

        InitialContext ctx = new InitialContext();

        /*
         * Lookup the DataSource, which will be backed by a pool
         * that the application server provides. DataSource instances
         * are also a good candidate for caching as an instance
         * variable, as JNDI lookups can be expensive as well.
         */

        DataSource ds =
            (DataSource)ctx.lookup("java:comp/env/jdbc/MySQLDB");

        /*
         * The following code is what would actually be in your
         * Servlet, JSP or EJB 'service' method...where you need
         * to work with a JDBC connection.
         */

        Connection conn = null;
        Statement stmt = null;

        try {
            conn = ds.getConnection();

            /*
             * Now, use normal JDBC programming to work with
             * MySQL, making sure to close each resource when you're
             * finished with it, which allows the connection pool
             * resources to be recovered as quickly as possible
             */

            stmt = conn.createStatement();
            stmt.execute("SOME SQL QUERY");

            stmt.close();
            stmt = null;

            conn.close();
            conn = null;
        }
    }
}
```

```

    } finally {
        /*
         * close any jdbc instances here that weren't
         * explicitly closed during normal code path, so
         * that we don't 'leak' resources...
         */

        if (stmt != null) {
            try {
                stmt.close();
            } catch (SQLException sqlex) {
                // ignore -- as we can't do anything about it here
            }

            stmt = null;
        }

        if (conn != null) {
            try {
                conn.close();
            } catch (SQLException sqlex) {
                // ignore -- as we can't do anything about it here
            }

            conn = null;
        }
    }
}

```

As shown in the example above, after obtaining the JNDI InitialContext, and looking up the DataSource, the rest of the code should look familiar to anyone who has done JDBC programming in the past.

The most important thing to remember when using connection pooling is to make sure that no matter what happens in your code (exceptions, flow-of-control, and so forth), connections, and anything created by them (such as statements or result sets) are closed, so that they may be re-used, otherwise they will be stranded, which in the best case means that the MySQL server resources they represent (such as buffers, locks, or sockets) may be tied up for some time, or worst case, may be tied up forever.

What Is the Best Size for my Connection Pool?

As with all other configuration rules-of-thumb, the answer is: it depends. Although the optimal size depends on anticipated load and average database transaction time, the optimum connection pool size is smaller than you might expect. If you take Sun's Java Petstore blueprint application for example, a connection pool of 15-20 connections can serve a relatively moderate load (600 concurrent users) using MySQL and Tomcat with response times that are acceptable.

To correctly size a connection pool for your application, you should create load test scripts with tools such as Apache JMeter or The Grinder, and load test your application.

An easy way to determine a starting point is to configure your connection pool's maximum number of connections to be unbounded, run a load test, and measure the largest amount of concurrently used connections. You can then work backward from there to determine what values of minimum and maximum pooled connections give the best performance for your particular application.

20.4.5.2.2. Using Connector/J with Tomcat

The following instructions are based on the instructions for Tomcat-5.x, available at <http://tomcat.apache.org/tomcat-5.5-doc/jndi-datasource-examples-howto.html> which is current at the time this document was written.

First, install the .jar file that comes with Connector/J in `§CATALINA_HOME/common/lib` so that it is available to all applications installed in the container.

Next, Configure the JNDI DataSource by adding a declaration resource to `§CATALINA_HOME/conf/server.xml` in the context that defines your web application:

```

<Context ...>
    ...
    <Resource name="jdbc/MySQLDB"
              auth="Container"
              type="javax.sql.DataSource"/>

    <!-- The name you used above, must match _exactly_ here!

         The connection pool will be bound into JNDI with the name
         "java:/comp/env/jdbc/MySQLDB"
    -->

    <ResourceParams name="jdbc/MySQLDB">
        <parameter>
            <name>factory</name>
            <value>org.apache.commons.dbcp.BasicDataSourceFactory</value>
        </parameter>
    </ResourceParams>

```

```

<!-- Don't set this any higher than max_connections on your
MySQL server, usually this should be a 10 or a few 10's
of connections, not hundreds or thousands -->

<parameter>
  <name>maxActive</name>
  <value>10</value>
</parameter>

<!-- You don't want too many idle connections hanging around
if you can avoid it, only enough to soak up a spike in
the load -->

<parameter>
  <name>maxIdle</name>
  <value>5</value>
</parameter>

<!-- Don't use autoReconnect=true, it's going away eventually
and it's a crutch for older connection pools that couldn't
test connections. You need to decide whether your application
is supposed to deal with SQLExceptions (hint, it should), and
how much of a performance penalty you're willing to pay
to ensure 'freshness' of the connection -->

<parameter>
  <name>validationQuery</name>
  <value>SELECT 1</value>
</parameter>

<!-- The most conservative approach is to test connections
before they're given to your application. For most applications
this is okay, the query used above is very small and takes
no real server resources to process, other than the time used
to traverse the network.

If you have a high-load application you'll need to rely on
something else. -->

<parameter>
  <name>testOnBorrow</name>
  <value>true</value>
</parameter>

<!-- Otherwise, or in addition to testOnBorrow, you can test
while connections are sitting idle -->

<parameter>
  <name>testWhileIdle</name>
  <value>true</value>
</parameter>

<!-- You have to set this value, otherwise even though
you've asked connections to be tested while idle,
the idle evictor thread will never run -->

<parameter>
  <name>timeBetweenEvictionRunsMillis</name>
  <value>10000</value>
</parameter>

<!-- Don't allow connections to hang out idle too long,
never longer than what wait_timeout is set to on the
server...A few minutes or even fraction of a minute
is sometimes okay here, it depends on your application
and how much spikey load it will see -->

<parameter>
  <name>minEvictableIdleTimeMillis</name>
  <value>60000</value>
</parameter>

<!-- Username and password used when connecting to MySQL -->

<parameter>
  <name>username</name>
  <value>someuser</value>
</parameter>

<parameter>
  <name>password</name>
  <value>somepass</value>
</parameter>

<!-- Class name for the Connector/J driver -->

<parameter>
  <name>driverClassName</name>
  <value>com.mysql.jdbc.Driver</value>
</parameter>

<!-- The JDBC connection url for connecting to MySQL, notice
that if you want to pass any other MySQL-specific parameters
you should pass them here in the URL, setting them using the
parameter tags above will have no effect, you will also
need to use &amp; to separate parameter values as the

```

```

    ampersand is a reserved character in XML -->
    <parameter>
      <name>url</name>
      <value>jdbc:mysql://localhost:3306/test</value>
    </parameter>
  </ResourceParams>
</Context>

```

In general, you should follow the installation instructions that come with your version of Tomcat, as the way you configure data-sources in Tomcat changes from time-to-time, and unfortunately if you use the wrong syntax in your XML file, you will most likely end up with an exception similar to the following:

```

Error: java.sql.SQLException: Cannot load JDBC driver class 'null ' SQL
state: null

```

20.4.5.2.3. Using Connector/J with JBoss

These instructions cover JBoss-4.x. To make the JDBC driver classes available to the application server, copy the .jar file that comes with Connector/J to the `lib` directory for your server configuration (which is usually called `default`). Then, in the same configuration directory, in the subdirectory named `deploy`, create a datasource configuration file that ends with "-ds.xml", which tells JBoss to deploy this file as a JDBC Datasource. The file should have the following contents:

```

<datasources>
  <local-tx-datasource>
    <!-- This connection pool will be bound into JNDI with the name
         "java/MySQLDB" -->
    <jndi-name>MySQLDB</jndi-name>
    <connection-url>jdbc:mysql://localhost:3306/dbname</connection-url>
    <driver-class>com.mysql.jdbc.Driver</driver-class>
    <user-name>user</user-name>
    <password>pass</password>

    <min-pool-size>5</min-pool-size>

    <!-- Don't set this any higher than max_connections on your
         MySQL server, usually this should be a 10 or a few 10's
         of connections, not hundreds or thousands -->
    <max-pool-size>20</max-pool-size>

    <!-- Don't allow connections to hang out idle too long,
         never longer than what wait_timeout is set to on the
         server...A few minutes is usually okay here,
         it depends on your application
         and how much spikey load it will see -->
    <idle-timeout-minutes>5</idle-timeout-minutes>

    <!-- If you're using Connector/J 3.1.8 or newer, you can use
         our implementation of these to increase the robustness
         of the connection pool. -->
    <exception-sorter-class-name>
      com.mysql.jdbc.integration.jboss.ExtendedMysqlExceptionSorter
    </exception-sorter-class-name>
    <valid-connection-checker-class-name>
      com.mysql.jdbc.integration.jboss.MysqlValidConnectionChecker
    </valid-connection-checker-class-name>

  </local-tx-datasource>
</datasources>

```

20.4.5.2.4. Using Connector/J with Spring

The Spring Framework is a Java-based application framework designed for assisting in application design by providing a way to configure components. The technique used by Spring is a well known design pattern called Dependency Injection (see [Inversion of Control Containers and the Dependency Injection pattern](#)). This article will focus on Java-oriented access to MySQL databases with Spring 2.0. For those wondering, there is a .NET port of Spring appropriately named Spring.NET.

Spring is not only a system for configuring components, but also includes support for aspect oriented programming (AOP). This is one of the main benefits and the foundation for Spring's resource and transaction management. Spring also provides utilities for integrating resource management with JDBC and Hibernate.

For the examples in this section the MySQL world sample database will be used. The first task is to set up a MySQL data source through Spring. Components within Spring use the "bean" terminology. For example, to configure a connection to a MySQL server supporting the world sample database you might use:

```

<util:map id="dbProps">
  <entry key="db.driver" value="com.mysql.jdbc.Driver"/>
  <entry key="db.jdbcurl" value="jdbc:mysql://localhost/world"/>

```

```
<entry key="db.username" value="myuser" />
<entry key="db.password" value="mypass" />
</util:map>
```

In the above example we are assigning values to properties that will be used in the configuration. For the datasource configuration:

```
<bean id="dataSource"
      class="org.springframework.jdbc.datasource.DriverManagerDataSource">
  <property name="driverClassName" value="${db.driver}" />
  <property name="url" value="${db.jdbcurl}" />
  <property name="username" value="${db.username}" />
  <property name="password" value="${db.password}" />
</bean>
```

The placeholders are used to provide values for properties of this bean. This means that you can specify all the properties of the configuration in one place instead of entering the values for each property on each bean. We do, however, need one more bean to pull this all together. The last bean is responsible for actually replacing the placeholders with the property values.

```
<bean
  class="org.springframework.beans.factory.config.PropertyPlaceholderConfigurer">
  <property name="properties" ref="dbProps" />
</bean>
```

Now that we have our MySQL data source configured and ready to go, we write some Java code to access it. The example below will retrieve three random cities and their corresponding country using the data source we configured with Spring.

```
// Create a new application context. this processes the Spring config
ApplicationContext ctx =
  new ClassPathXmlApplicationContext("exlappContext.xml");
// Retrieve the data source from the application context
DataSource ds = (DataSource) ctx.getBean("dataSource");
// Open a database connection using Spring's DataSourceUtils
Connection c = DataSourceUtils.getConnection(ds);
try {
  // retrieve a list of three random cities
  PreparedStatement ps = c.prepareStatement(
    "select City.Name as 'City', Country.Name as 'Country' " +
    "from City inner join Country on City.CountryCode = Country.Code " +
    "order by rand() limit 3");
  ResultSet rs = ps.executeQuery();
  while(rs.next()) {
    String city = rs.getString("City");
    String country = rs.getString("Country");
    System.out.printf("The city %s is in %s\n", city, country);
  }
} catch (SQLException ex) {
  // something has failed and we print a stack trace to analyse the error
  ex.printStackTrace();
  // ignore failure closing connection
  try { c.close(); } catch (SQLException e) { }
} finally {
  // properly release our connection
  DataSourceUtils.releaseConnection(c, ds);
}
```

This is very similar to normal JDBC access to MySQL with the main difference being that we are using `DataSourceUtils` instead of the `DriverManager` to create the connection.

While it may seem like a small difference, the implications are somewhat far reaching. Spring manages this resource in a way similar to a container managed data source in a J2EE application server. When a connection is opened, it can be subsequently accessed in other parts of the code if it is synchronized with a transaction. This makes it possible to treat different parts of your application as transactional instead of passing around a database connection.

20.4.5.2.4.1. Using `JdbcTemplate`

Spring makes extensive use of the Template method design pattern (see [Template Method Pattern](#)). Our immediate focus will be on the `JdbcTemplate` and related classes, specifically `NamedParameterJdbcTemplate`. The template classes handle obtaining and releasing a connection for data access when one is needed.

The next example shows how to use `NamedParameterJdbcTemplate` inside of a DAO (Data Access Object) class to retrieve a random city given a country code.

```
public class Ex2JdbcDao {
  /**
   * Data source reference which will be provided by Spring.
   */
  private DataSource dataSource;
```

```

/**
 * Our query to find a random city given a country code. Notice
 * the ":country" parameter towards the end. This is called a
 * named parameter.
 */
private String queryString = "select Name from City " +
    "where CountryCode = :country order by rand() limit 1";

/**
 * Retrieve a random city using Spring JDBC access classes.
 */
public String getRandomCityByCountryCode(String cntryCode) {
    // A template that allows using queries with named parameters
    NamedParameterJdbcTemplate template =
        new NamedParameterJdbcTemplate(dataSource);
    // A java.util.Map is used to provide values for the parameters
    Map params = new HashMap();
    params.put("country", cntryCode);
    // We query for an Object and specify what class we are expecting
    return (String)template.queryForObject(queryString, params, String.class);
}

/**
 * A JavaBean setter-style method to allow Spring to inject the data source.
 * @param dataSource
 */
public void setDataSource(DataSource dataSource) {
    this.dataSource = dataSource;
}
}

```

The focus in the above code is on the `getRandomCityByCountryCode()` method. We pass a country code and use the `NamedParameterJdbcTemplate` to query for a city. The country code is placed in a Map with the key "country", which is the parameter is named in the SQL query.

To access this code, you need to configure it with Spring by providing a reference to the data source.

```

<bean id="dao" class="code.Ex2JdbcDao">
  <property name="dataSource" ref="dataSource"/>
</bean>

```

At this point, we can just grab a reference to the DAO from Spring and call `getRandomCityByCountryCode()`.

```

// Create the application context
ApplicationContext ctx =
    new ClassPathXmlApplicationContext("ex2appContext.xml");
// Obtain a reference to our DAO
Ex2JdbcDao dao = (Ex2JdbcDao) ctx.getBean("dao");

String countryCode = "USA";

// Find a few random cities in the US
for(int i = 0; i < 4; ++i)
    System.out.printf("A random city in %s is %s%n", countryCode,
        dao.getRandomCityByCountryCode(countryCode));

```

This example shows how to use Spring's JDBC classes to completely abstract away the use of traditional JDBC classes including `Connection` and `PreparedStatement`.

20.4.5.2.4.2. Transactional JDBC Access

You might be wondering how we can add transactions into our code if we do not deal directly with the JDBC classes. Spring provides a transaction management package that not only replaces JDBC transaction management, but also allows declarative transaction management (configuration instead of code).

In order to use transactional database access, we will need to change the storage engine of the tables in the world database. The downloaded script explicitly creates MyISAM tables which do not support transactional semantics. The InnoDB storage engine does support transactions and this is what we will be using. We can change the storage engine with the following statements.

```

ALTER TABLE City ENGINE=InnoDB;
ALTER TABLE Country ENGINE=InnoDB;
ALTER TABLE CountryLanguage ENGINE=InnoDB;

```

A good programming practice emphasized by Spring is separating interfaces and implementations. What this means is that we can create a Java interface and only use the operations on this interface without any internal knowledge of what the actual implementation is. We will let Spring manage the implementation and with this it will manage the transactions for our implementation.

First you create a simple interface:

```

public interface Ex3Dao {
    Integer createCity(String name, String countryCode,

```

```
String district, Integer population);
}
```

This interface contains one method that will create a new city record in the database and return the id of the new record. Next you need to create an implementation of this interface.

```
public class Ex3DaoImpl implements Ex3Dao {
    protected DataSource dataSource;
    protected SqlUpdate updateQuery;
    protected SqlFunction idQuery;

    public Integer createCity(String name, String countryCode,
        String district, Integer population) {
        updateQuery.update(new Object[] { name, countryCode,
            district, population });
        return getLastId();
    }

    protected Integer getLastId() {
        return idQuery.run();
    }
}
```

You can see that we only operate on abstract query objects here and do not deal directly with the JDBC API. Also, this is the complete implementation. All of our transaction management will be dealt with in the configuration. To get the configuration started, we need to create the DAO.

```
<bean id="dao" class="code.Ex3DaoImpl">
    <property name="dataSource" ref="dataSource"/>
    <property name="updateQuery">...</property>
    <property name="idQuery">...</property>
</bean>
```

Now you need to set up the transaction configuration. The first thing you must do is create transaction manager to manage the data source and a specification of what transaction properties are required for the `dao` methods.

```
<bean id="transactionManager"
    class="org.springframework.jdbc.datasource.DataSourceTransactionManager">
    <property name="dataSource" ref="dataSource"/>
</bean>

<tx:advice id="txAdvice" transaction-manager="transactionManager">
    <tx:attributes>
        <tx:method name="*" />
    </tx:attributes>
</tx:advice>
```

The preceding code creates a transaction manager that handles transactions for the data source provided to it. The `txAdvice` uses this transaction manager and the attributes specify to create a transaction for all methods. Finally you need to apply this advice with an AOP pointcut.

```
<aop:config>
    <aop:pointcut id="daoMethods"
        expression="execution(* code.Ex3Dao.*(..))"/>
    <aop:advisor advice-ref="txAdvice" pointcut-ref="daoMethods"/>
</aop:config>
```

This basically says that all methods called on the `Ex3Dao` interface will be wrapped in a transaction. To make use of this, you only have to retrieve the `dao` from the application context and call a method on the `dao` instance.

```
Ex3Dao dao = (Ex3Dao) ctx.getBean("dao");
Integer id = dao.createCity(name, countryCode, district, pop);
```

We can verify from this that there is no transaction management happening in our Java code and it is all configured with Spring. This is a very powerful notion and regarded as one of the most beneficial features of Spring.

20.4.5.2.4.3. Connection Pooling

In many situations, such as web applications, there will be a large number of small database transactions. When this is the case, it usually makes sense to create a pool of database connections available for web requests as needed. Although MySQL does not spawn an extra process when a connection is made, there is still a small amount of overhead to create and set up the connection. Pooling of connections also alleviates problems such as collecting large amounts of sockets in the `TIME_WAIT` state.

Setting up pooling of MySQL connections with Spring is as simple as changing the data source configuration in the application context. There are a number of configurations that we can use. The first example is based on the [Jakarta Commons DBCP library](#). The example below replaces the source configuration that was based on `DriverManagerDataSource` with DBCP's `BasicDataSource`.

```
<bean id="dataSource" destroy-method="close"
  class="org.apache.commons.dbcp.BasicDataSource">
  <property name="driverClassName" value="{db.driver}"/>
  <property name="url" value="{db.jdbcurl}"/>
  <property name="username" value="{db.username}"/>
  <property name="password" value="{db.password}"/>
  <property name="initialSize" value="3"/>
</bean>
```

The configuration of the two solutions is very similar. The difference is that DBCP will pool connections to the database instead of creating a new connection every time one is requested. We have also set a parameter here called `initialSize`. This tells DBCP that we want three connections in the pool when it is created.

Another way to configure connection pooling is to configure a data source in our J2EE application server. Using JBoss as an example, you can set up the MySQL connection pool by creating a file called `mysql-local-ds.xml` and placing it in the server/default/deploy directory in JBoss. Once we have this setup, we can use JNDI to look it up. With Spring, this lookup is very simple. The data source configuration looks like this.

```
<jee:jndi-lookup id="dataSource" jndi-name="java:MySQL_DS"/>
```

20.4.5.2.5. Using Connector/J with GlassFish

20.4.5.3. Common Problems and Solutions

There are a few issues that seem to be commonly encountered often by users of MySQL Connector/J. This section deals with their symptoms, and their resolutions.

Questions

- [20.4.5.3.1](#): When I try to connect to the database with MySQL Connector/J, I get the following exception:

```
SQLException: Server configuration denies access to data source
SQLState: 08001
VendorError: 0
```

What is going on? I can connect just fine with the MySQL command-line client.

- [20.4.5.3.2](#): My application throws an SQLException 'No Suitable Driver'. Why is this happening?
- [20.4.5.3.3](#): I'm trying to use MySQL Connector/J in an applet or application and I get an exception similar to:

```
SQLException: Cannot connect to MySQL server on host:3306.
Is there a MySQL server running on the machine/port you
are trying to connect to?

(java.security.AccessControlException)
SQLState: 08S01
VendorError: 0
```

- [20.4.5.3.4](#): I have a servlet/application that works fine for a day, and then stops working overnight
- [20.4.5.3.5](#): I'm trying to use JDBC-2.0 updatable result sets, and I get an exception saying my result set is not updatable.
- [20.4.5.3.6](#): I cannot connect to the MySQL server using Connector/J, and I'm sure the connection parameters are correct.
- [20.4.5.3.7](#): I am trying to connect to my MySQL server within my application, but I get the following error and stack trace:

```
java.net.SocketException
MESSAGE: Software caused connection abort: recv failed

STACKTRACE:

java.net.SocketException: Software caused connection abort: recv failed
at java.net.SocketInputStream.socketRead0(Native Method)
at java.net.SocketInputStream.read(Unknown Source)
at com.mysql.jdbc.MysqlIO.readFully(MysqlIO.java:1392)
at com.mysql.jdbc.MysqlIO.readPacket(MysqlIO.java:1414)
at com.mysql.jdbc.MysqlIO.doHandshake(MysqlIO.java:625)
at com.mysql.jdbc.Connection.createNewIO(Connection.java:1926)
at com.mysql.jdbc.Connection.<init>(Connection.java:452)
at com.mysql.jdbc.NonRegisteringDriver.connect(NonRegisteringDriver.java:411)
```

- [20.4.5.3.8](#): My application is deployed through JBoss and I am using transactions to handle the statements on the MySQL database. Under heavy loads I am getting an error and stack trace, but these only occur after a fixed period of heavy activity.

- [20.4.5.3.9](#): When using `gcj` an `java.io.CharConversionException` is raised when working with certain character sequences.
- [20.4.5.3.10](#): Updating a table that contains a primary key that is either `FLOAT` or compound primary key that uses `FLOAT` fails to update the table and raises an exception.
- [20.4.5.3.11](#): You get an `ER_NET_PACKET_TOO_LARGE` exception, even though the binary blob size you want to insert via JDBC is safely below the `max_allowed_packet` size.

Questions and Answers

20.4.5.3.1: When I try to connect to the database with MySQL Connector/J, I get the following exception:

```
SQLException: Server configuration denies access to data source
SQLState: 08001
VendorError: 0
```

What is going on? I can connect just fine with the MySQL command-line client.

MySQL Connector/J must use TCP/IP sockets to connect to MySQL, as Java does not support Unix Domain Sockets. Therefore, when MySQL Connector/J connects to MySQL, the security manager in MySQL server will use its grant tables to determine whether the connection should be allowed.

You must add the necessary security credentials to the MySQL server for this to happen, using the `GRANT` statement to your MySQL Server. See [Section 12.5.1.3, “GRANT Syntax”](#), for more information.

Note

Testing your connectivity with the `mysql` command-line client will not work unless you add the `--host` flag, and use something other than `localhost` for the host. The `mysql` command-line client will use Unix domain sockets if you use the special host name `localhost`. If you are testing connectivity to `localhost`, use `127.0.0.1` as the host name instead.

Warning

Changing privileges and permissions improperly in MySQL can potentially cause your server installation to not have optimal security properties.

20.4.5.3.2: My application throws an SQLException 'No Suitable Driver'. Why is this happening?

There are three possible causes for this error:

- The Connector/J driver is not in your `CLASSPATH`, see [Section 20.4.2, “Connector/J Installation”](#).
- The format of your connection URL is incorrect, or you are referencing the wrong JDBC driver.
- When using `DriverManager`, the `jdbc.drivers` system property has not been populated with the location of the Connector/J driver.

20.4.5.3.3: I'm trying to use MySQL Connector/J in an applet or application and I get an exception similar to:

```
SQLException: Cannot connect to MySQL server on host:3306.
Is there a MySQL server running on the machine/port you
are trying to connect to?

(java.security.AccessControlException)
SQLState: 08S01
VendorError: 0
```

Either you're running an Applet, your MySQL server has been installed with the `--skip-networking` option set, or your MySQL server has a firewall sitting in front of it.

Applets can only make network connections back to the machine that runs the web server that served the `.class` files for the applet. This means that MySQL must run on the same machine (or you must have some sort of port re-direction) for this to work. This also means that you will not be able to test applets from your local file system, you must always deploy them to a web server.

MySQL Connector/J can only communicate with MySQL using TCP/IP, as Java does not support Unix domain sockets. TCP/IP communication with MySQL might be affected if MySQL was started with the `--skip-networking` flag, or if it is firewalled.

If MySQL has been started with the `--skip-networking` option set (the Debian Linux package of MySQL server does this for ex-

ample), you need to comment it out in the file `/etc/mysql/my.cnf` or `/etc/my.cnf`. Of course your `my.cnf` file might also exist in the `data` directory of your MySQL server, or anywhere else (depending on how MySQL was compiled for your system). Binaries created by us always look in `/etc/my.cnf` and `[datadir]/my.cnf`. If your MySQL server has been firewalled, you will need to have the firewall configured to allow TCP/IP connections from the host where your Java code is running to the MySQL server on the port that MySQL is listening to (by default, 3306).

20.4.5.3.4: I have a servlet/application that works fine for a day, and then stops working overnight

MySQL closes connections after 8 hours of inactivity. You either need to use a connection pool that handles stale connections or use the `"autoReconnect"` parameter (see [Section 20.4.4.1, "Driver/Datasource Class Names, URL Syntax and Configuration Properties for Connector/J"](#)).

Also, you should be catching `SQLExceptions` in your application and dealing with them, rather than propagating them all the way until your application exits, this is just good programming practice. MySQL Connector/J will set the `SQLState` (see [`java.sql.SQLException.getSQLState\(\)`](#) in your APIDocs) to `"08S01"` when it encounters network-connectivity issues during the processing of a query. Your application code should then attempt to re-connect to MySQL at this point.

The following (simplistic) example shows what code that can handle these exceptions might look like:

Example 20.12. Connector/J: Example of transaction with retry logic

```
public void doBusinessOp() throws SQLException {
    Connection conn = null;
    Statement stmt = null;
    ResultSet rs = null;

    //
    // How many times do you want to retry the transaction
    // (or at least _getting_ a connection)?
    //
    int retryCount = 5;

    boolean transactionCompleted = false;

    do {
        try {
            conn = getConnection(); // assume getting this from a
                                   // javax.sql.DataSource, or the
                                   // java.sql.DriverManager

            conn.setAutoCommit(false);

            //
            // Okay, at this point, the 'retry-ability' of the
            // transaction really depends on your application logic,
            // whether or not you're using autocommit (in this case
            // not), and whether you're using transaccational storage
            // engines
            //
            // For this example, we'll assume that it's _not_ safe
            // to retry the entire transaction, so we set retry
            // count to 0 at this point
            //
            // If you were using exclusively transaction-safe tables,
            // or your application could recover from a connection going
            // bad in the middle of an operation, then you would not
            // touch 'retryCount' here, and just let the loop repeat
            // until retryCount == 0.
            //
            retryCount = 0;

            stmt = conn.createStatement();

            String query = "SELECT foo FROM bar ORDER BY baz";

            rs = stmt.executeQuery(query);

            while (rs.next()) {
            }

            rs.close();
            rs = null;

            stmt.close();
            stmt = null;

            conn.commit();
            conn.close();
            conn = null;

            transactionCompleted = true;
        } catch (SQLException sqlEx) {

            //
            // The two SQL states that are 'retry-able' are 08S01
            // for a communications error, and 40001 for deadlock.

```

```

//
// Only retry if the error was due to a stale connection,
// communications problem or deadlock
//

String sqlState = sqlEx.getSQLState();

if ("08S01".equals(sqlState) || "40001".equals(sqlState)) {
    retryCount--;
} else {
    retryCount = 0;
}
} finally {
    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException sqlEx) {
            // You'd probably want to log this . . .
        }
    }

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException sqlEx) {
            // You'd probably want to log this as well . . .
        }
    }

    if (conn != null) {
        try {
            //
            // If we got here, and conn is not null, the
            // transaction should be rolled back, as not
            // all work has been done

            try {
                conn.rollback();
            } finally {
                conn.close();
            }
        } catch (SQLException sqlEx) {
            //
            // If we got an exception here, something
            // pretty serious is going on, so we better
            // pass it up the stack, rather than just
            // logging it. . .

            throw sqlEx;
        }
    }
}
} while (!transactionCompleted && (retryCount > 0));
}

```

Note

Use of the `autoReconnect` option is not recommended because there is no safe method of reconnecting to the MySQL server without risking some corruption of the connection state or database state information. Instead, you should use a connection pool which will enable your application to connect to the MySQL server using an available connection from the pool. The `autoReconnect` facility is deprecated, and may be removed in a future release.

20.4.5.3.5: I'm trying to use JDBC-2.0 updatable result sets, and I get an exception saying my result set is not updatable.

Because MySQL does not have row identifiers, MySQL Connector/J can only update result sets that have come from queries on tables that have at least one primary key, the query must select every primary key and the query can only span one table (that is, no joins). This is outlined in the JDBC specification.

Note that this issue only occurs when using updatable result sets, and is caused because Connector/J is unable to guarantee that it can identify the correct rows within the result set to be updated without having a unique reference to each row. There is no requirement to have a unique field on a table if you are using `UPDATE` or `DELETE` statements on a table where you can individually specify the criteria to be matched using a `WHERE` clause.

20.4.5.3.6: I cannot connect to the MySQL server using Connector/J, and I'm sure the connection parameters are correct.

Make sure that the `skip-networking` option has not been enabled on your server. Connector/J must be able to communicate with your server over TCP/IP, named sockets are not supported. Also ensure that you are not filtering connections through a Firewall or other network security system. For more information, see [Section B.1.2.2, "Can't connect to \[local\] MySQL server"](#).

20.4.5.3.7: I am trying to connect to my MySQL server within my application, but I get the following error and stack trace:

```

java.net.SocketException
MESSAGE: Software caused connection abort: recv failed

```

STACKTRACE:

```

java.net.SocketException: Software caused connection abort: recv failed
at java.net.SocketInputStream.socketRead0(Native Method)
at java.net.SocketInputStream.read(Unknown Source)
at com.mysql.jdbc.MysqlIO.readFully(MysqlIO.java:1392)
at com.mysql.jdbc.MysqlIO.readPacket(MysqlIO.java:1414)
at com.mysql.jdbc.MysqlIO.doHandshake(MysqlIO.java:625)
at com.mysql.jdbc.Connection.createNewIO(Connection.java:1926)
at com.mysql.jdbc.Connection.<init>(Connection.java:452)
at com.mysql.jdbc.NonRegisteringDriver.connect(NonRegisteringDriver.java:411)

```

The error probably indicates that you are using an older version of the Connector/J JDBC driver (2.0.14 or 3.0.x) and you are trying to connect to a MySQL server with version 4.1x or newer. The older drivers are not compatible with 4.1 or newer of MySQL as they do not support the newer authentication mechanisms.

It is likely that the older version of the Connector/J driver exists within your application directory or your `CLASSPATH` includes the older Connector/J package.

20.4.5.3.8: My application is deployed through JBoss and I am using transactions to handle the statements on the MySQL database. Under heavy loads I am getting an error and stack trace, but these only occur after a fixed period of heavy activity.

This is a JBoss, not Connector/J, issue and is connected to the use of transactions. Under heavy loads the time taken for transactions to complete can increase, and the error is caused because you have exceeded the predefined timeout.

You can increase the timeout value by setting the `TransactionTimeout` attribute to the `TransactionManagerService` within the `/conf/jboss-service.xml` file (pre-4.0.3) or `/deploy/jta-service.xml` for JBoss 4.0.3 or later. See `TransactionTimeout` within the JBoss wiki for more information.

20.4.5.3.9: When using gcj an java.io.CharConversionException is raised when working with certain character sequences.

This is a known issue with `gcj` which raises an exception when it reaches an unknown character or one it cannot convert. You should add `useJvmCharsetConverters=true` to your connection string to force character conversion outside of the `gcj` libraries, or try a different JDK.

20.4.5.3.10: Updating a table that contains a primary key that is either FLOAT or compound primary key that uses FLOAT fails to update the table and raises an exception.

Connector/J adds conditions to the `WHERE` clause during an `UPDATE` to check the old values of the primary key. If there is no match then Connector/J considers this a failure condition and raises an exception.

The problem is that rounding differences between supplied values and the values stored in the database may mean that the values never match, and hence the update fails. The issue will affect all queries, not just those from Connector/J.

To prevent this issue, use a primary key that does not use `FLOAT`. If you have to use a floating point column in your primary key use `DOUBLE` or `DECIMAL` types in place of `FLOAT`.

20.4.5.3.11: You get an ER_NET_PACKET_TOO_LARGE exception, even though the binary blob size you want to insert via JDBC is safely below the max_allowed_packet size.

This is because the `hexEscapeBlock()` method in `com.mysql.jdbc.PreparedStatement.streamToBytes()` may almost double the size of your data.

20.4.6. Connector/J Support

20.4.6.1. Connector/J Community Support

Sun Microsystems, Inc. provides assistance to the user community by means of its mailing lists. For Connector/J related issues, you can get help from experienced users by using the MySQL and Java mailing list. Archives and subscription information is available online at <http://lists.mysql.com/java>.

For information about subscribing to MySQL mailing lists or to browse list archives, visit <http://lists.mysql.com/>. See [Section 1.5.1, “MySQL Mailing Lists”](#).

Community support from experienced users is also available through the [JDBC Forum](#). You may also find help from other users in the other MySQL Forums, located at <http://forums.mysql.com>. See [Section 1.5.2, “MySQL Community Support at the MySQL Forums”](#).

20.4.6.2. How to Report Connector/J Bugs or Problems

The normal place to report bugs is <http://bugs.mysql.com/>, which is the address for our bugs database. This database is public, and can be browsed and searched by anyone. If you log in to the system, you will also be able to enter new reports.

If you have found a sensitive security bug in MySQL, you can send email to [<security@mysql.com>](mailto:security@mysql.com).

Writing a good bug report takes patience, but doing it right the first time saves time both for us and for yourself. A good bug report, containing a full test case for the bug, makes it very likely that we will fix the bug in the next release.

This section will help you write your report correctly so that you do not waste your time doing things that may not help us much or at all.

If you have a repeatable bug report, please report it to the bugs database at <http://bugs.mysql.com/>. Any bug that we are able to repeat has a high chance of being fixed in the next MySQL release.

To report other problems, you can use one of the MySQL mailing lists.

Remember that it is possible for us to respond to a message containing too much information, but not to one containing too little. People often omit facts because they think they know the cause of a problem and assume that some details do not matter.

A good principle is this: If you are in doubt about stating something, state it. It is faster and less troublesome to write a couple more lines in your report than to wait longer for the answer if we must ask you to provide information that was missing from the initial report.

The most common errors made in bug reports are (a) not including the version number of Connector/J or MySQL used, and (b) not fully describing the platform on which Connector/J is installed (including the JVM version, and the platform type and version number that MySQL itself is installed on).

This is highly relevant information, and in 99 cases out of 100, the bug report is useless without it. Very often we get questions like, "Why doesn't this work for me?" Then we find that the feature requested wasn't implemented in that MySQL version, or that a bug described in a report has already been fixed in newer MySQL versions.

Sometimes the error is platform-dependent; in such cases, it is next to impossible for us to fix anything without knowing the operating system and the version number of the platform.

If at all possible, you should create a repeatable, standalone testcase that doesn't involve any third-party classes.

To streamline this process, we ship a base class for testcases with Connector/J, named `'com.mysql.jdbc.util.BaseBugReport'`. To create a testcase for Connector/J using this class, create your own class that inherits from `com.mysql.jdbc.util.BaseBugReport` and override the methods `setUp()`, `tearDown()` and `runTest()`.

In the `setUp()` method, create code that creates your tables, and populates them with any data needed to demonstrate the bug.

In the `runTest()` method, create code that demonstrates the bug using the tables and data you created in the `setUp` method.

In the `tearDown()` method, drop any tables you created in the `setUp()` method.

In any of the above three methods, you should use one of the variants of the `getConnection()` method to create a JDBC connection to MySQL:

- `getConnection()` - Provides a connection to the JDBC URL specified in `getUrl()`. If a connection already exists, that connection is returned, otherwise a new connection is created.
- `getNewConnection()` - Use this if you need to get a new connection for your bug report (that is, there is more than one connection involved).
- `getConnection(String url)` - Returns a connection using the given URL.
- `getConnection(String url, Properties props)` - Returns a connection using the given URL and properties.

If you need to use a JDBC URL that is different from `'jdbc:mysql:///test'`, override the method `getUrl()` as well.

Use the `assertTrue(boolean expression)` and `assertTrue(String failureMessage, boolean expression)` methods to create conditions that must be met in your testcase demonstrating the behavior you are expecting (vs. the behavior you are observing, which is why you are most likely filing a bug report).

Finally, create a `main()` method that creates a new instance of your testcase, and calls the `run` method:

```
public static void main(String[] args) throws Exception {
    new MyBugReport().run();
}
```

}

Once you have finished your testcase, and have verified that it demonstrates the bug you are reporting, upload it with your bug report to <http://bugs.mysql.com/>.

20.4.6.3. Connector/J Change History

The Connector/J Change History (Changelog) is located with the main Changelog for MySQL. See [Section C.6, “MySQL Connector/J Change History”](#).

20.5. MySQL Connector/MXJ

MySQL Connector/MXJ is a Java Utility package for deploying and managing a MySQL database. Deploying and using MySQL can be as easy as adding an additional parameter to the JDBC connection url, which will result in the database being started when the first connection is made. This makes it easy for Java developers to deploy applications which require a database by reducing installation barriers for their end-users.

MySQL Connector/MXJ makes the MySQL database appear to be a java-based component. It does this by determining what platform the system is running on, selecting the appropriate binary, and launching the executable. It will also optionally deploy an initial database, with any specified parameters.

Included are instructions for use with a JDBC driver and deploying as a JMX MBean to JBoss.

You can download sources and binaries from: <http://dev.mysql.com/downloads/connector/mxj/>

This a beta release and feedback is welcome and encouraged.

Please send questions or comments to the [MySQL and Java mailing list](#).

20.5.1. Connector/MXJ Overview

Connector/MXJ consists of a Java class, a copy of the `mysqld` binary for a specific list of platforms, and associated files and support utilities. The Java class controls the initialization of an instance of the embedded `mysqld` binary, and the ongoing management of the `mysqld` process. The entire sequence and management can be controlled entirely from within Java using the Connector/MXJ Java classes. You can see an overview of the contents of the Connector/MXJ package in the figure below.

It is important to note that Connector/MXJ is not an embedded version of MySQL, or a version of MySQL written as part of a Java class. Connector/MXJ works through the use of an embedded, compiled binary of `mysqld` as would normally be used when deploying a standard MySQL installation.

It is the Connector/MXJ wrapper, support classes and tools, that enable Connector/MXJ to appear as a MySQL instance.

When Connector/MXJ is initialized, the corresponding `mysqld` binary for the current platform is extracted, along with a pre-

configured data directed. Both are contained within the Connector/MXJ JAR file. The `mysqld` instance is then started, with any additional options as specified during the initialization, and the MySQL database becomes accessible.

Because Connector/MXJ works in combination with Connector/J, you can access and integrate with the MySQL instance through a JDBC connection. When you have finished with the server, the instance is terminated, and, by default, any data created during the session is retained within the temporary directory created when the instance was started.

Connector/MXJ and the embedded `mysqld` instance can be deployed in a number of environments where relying on an existing database, or installing a MySQL instance would be impossible, including CD-ROM embedded database applications and temporary database requirements within a Java-based application environment.

20.5.2. Connector/MXJ Versions

- Connector/MXJ 5.x, currently in beta status, includes `mysqld` version 5.x and includes binaries for Linux x86, Mac OS X PPC, Windows XP/NT/2000 x86 and Solaris SPARC. Connector/MXJ 5.x requires the Connector/J 5.x package.

The exact version of `mysqld` included depends on the version of Connector/MXJ

- Connector/MXJ v5.0.3 included MySQL v5.0.22
 - Connector/MXJ v5.0.4 includes MySQL v5.0.27 (Community) or MySQL v5.0.32 (Enterprise)
 - Connector/MXJ v5.0.6 includes MySQL 5.0.37 (Community)
 - Connector/MXJ v5.0.7 includes MySQL 5.0.41 (Community) or MySQL 5.0.42 (Enterprise)
 - Connector/MXJ v5.0.8 includes MySQL 5.0.45 (Community) or MySQL 5.0.46 (Enterprise)
 - Connector/MXJ v5.0.9 includes MySQL 5.0.51a (Community) or MySQL 5.0.54 (Enterprise)
- Connector/MXJ 1.x includes `mysqld` version 4.1.13 and includes binaries for Linux x86, Windows XP/NT/2000 x86 and Solaris SPARC. Connector/MXJ 1.x requires the Connector/J 3.x package.

A summary of the different MySQL versions supplied with each Connector/MXJ release are shown in the table.

Connector/MXJ Version	MySQL Version(s)
5.0.8	5.0.45 (CS), 5.0.46 (ES)
5.0.7	5.0.41 (CS), 5.0.42 (ES)
5.0.6	5.0.37 (CS), 5.0.40 (ES)
5.0.5	5.0.37 (CS), 5.0.36 (ES)
5.0.4	5.0.27 (CS), 5.0.32 (ES)
5.0.3	5.0.22
5.0.2	5.0.19

This guide provides information on the Connector/MXJ 5.x release. For information on using the older releases, please see the documentation included with the appropriate distribution.

20.5.3. Connector/MXJ Installation

Connector/MXJ does not have a installation application or process, but there are some steps you can follow to make the installation and deployment of Connector/MXJ easier.

Before you start, there are some baseline requirements for

- Java Runtime Environment (v1.4.0 or newer) if you are only going to deploy the package.
- Java Development Kit (v1.4.0 or newer) if you want to build Connector/MXJ from source.
- Connector/J 5.0 or newer.

Depending on your target installation/deployment environment you may also require:

- JBoss - 4.0rc1 or newer
- Apache Tomcat - 5.0 or newer
- Sun's JMX reference implementation version 1.2.1 (from <http://java.sun.com/products/JavaManagement/>)

20.5.3.1. Supported Platforms

Connector/MXJ is compatible with any platform supporting Java and MySQL. By default, Connector/MXJ incorporates the `mysqld` binary for a select number of platforms which differs by version. The following platforms have been tested and working as deployment platforms. Support for all the platforms listed below is not included by default.

- Linux (i386)
- FreeBSD (i386)
- Windows NT (x86), Windows 2000 (x86), Windows XP (x86), Windows Vista (x86)
- Solaris 8, SPARC 32-bit (compatible with Solaris 8, Solaris 9 and Solaris 10 on SPARC 32-bit and 64-bit platforms)
- Mac OS X (PowerPC and Intel)

The Connector/MXJ 5.0.8 release includes `mysqld` binaries for the following platforms by as standard:

- Linux (i386)
- Windows (x86), compatible with Windows NT, Windows 2000, Windows XP , Windows Vista
- Solaris 8, SPARC 32-bit (compatible with Solaris 8, Solaris 9 and Solaris 10 on SPARC 32-bit and 64-bit platforms)
- Mac OS X (PowerPC and Intel)

For more information on packaging your own Connector/MXJ with the platforms you require, see [Section 20.5.6.1, “Creating your own Connector/MXJ Package”](#)

20.5.3.2. Connector/MXJ Base Installation

Because there is no formal installation process, the method, installation directory, and access methods you use for Connector/MXJ are entirely up to your individual requirements.

To perform a basic installation, choose a target directory for the files included in the Connector/MXJ package. On Unix/Linux systems you may opt to use a directory such as `/usr/local/connector-mxj`; On Windows, you may want to install the files in the base directory, `C:\Connector-MXJ`, or within the `Program Files` directory.

To install the files, for a Connector/MXJ 5.0.4 installation:

1. Download the Connector/MXJ package, either in Tar/Gzip format (ideal for Unix/Linux systems) or Zip format (Windows).
2. Extract the files from the package. This will create a directory `mysql-connector-mxj-gpl-[ver]`. Copy and optionally rename this directory to your desired location.
3. For best results, you should update your global `CLASSPATH` variable with the location of the required `jar` files.

Within Unix/Linux you can do this globally by editing the global shell profile, or on a user by user basis by editing their individual shell profile.

On Windows 2000, Windows NT and Windows XP, you can edit the global `CLASSPATH` by editing the `Environment Variables` configured through the `System` control panel.

For Connector/MXJ 5.0.6 and later you need the following JAR files in your `CLASSPATH`:

1. `mysql-connector-mxj-gpl-[ver].jar` — contains the main Connector/MXJ classes.

2. `mysql-connector-mxj-gpl-[ver]-db-files.jar` — contains the embedded `mysqld` and database files.
3. `aspectjrt.jar` — the AspectJ runtime library, located in `lib/aspectjrt.jar` in the Connector/MXJ package.
4. `mysql-connector-java-[ver]-bin.jar` — Connector/J, see [Section 20.4, “MySQL Connector/J”](#).

For Connector/MXJ 5.0.4 and later you need the following JAR files in your `CLASSPATH`:

1. `connector-mxj.jar` — contains the main Connector/MXJ classes.
2. `connector-mxj-db-files.jar` — contains the embedded `mysqld` and database files.
3. `aspectjrt.jar` — the AspectJ runtime library, located in `lib/aspectjrt.jar` in the Connector/MXJ package.
4. `mysql-connector-mxj-gpl-[ver].jar` — Connector/J, see [Section 20.4, “MySQL Connector/J”](#).

For Connector/MXJ 5.0.3 and earlier, you need the following JAR files:

1. `connector-mxj.jar`
2. `aspectjrt.jar` — the AspectJ runtime library, located in `lib/aspectjrt.jar` in the Connector/MXJ package.
3. `mysql-connector-mxj-gpl-[ver].jar` — Connector/J, see [Section 20.4, “MySQL Connector/J”](#).

20.5.3.3. Connector/MXJ Quick Start Guide

Once you have extracted the Connector/MXJ and Connector/J components you can run one of the sample applications that initiates a MySQL instance. You can test the installation by running the `ConnectorMXJUrlTestExample`:

```
shell> java ConnectorMXJUrlTestExample
jdbc:mysql:mxj://localhost:3336/our_test_app?server.basedir»
=/var/tmp/test-mxj&createDatabaseIfNotExist=true&server.initialize-user=true
[/var/tmp/test-mxj/bin/mysqld][--no-defaults][--port=3336][--socket=mysql.sock]»
[--basedir=/var/tmp/test-mxj][--datadir=/var/tmp/test-mxj/data]»
[--pid-file=/var/tmp/test-mxj/data/MysqldResource.pid]
[MysqldResource] launching mysqld (driver_launched_mysqld_1)
InnoDB: The first specified data file ./ibdata1 did not exist:
InnoDB: a new database to be created!
080220 9:40:20 InnoDB: Setting file ./ibdata1 size to 10 MB
InnoDB: Database physically writes the file full: wait...
080220 9:40:20 InnoDB: Log file ./ib_logfile0 did not exist: new to be created
InnoDB: Setting log file ./ib_logfile0 size to 5 MB
InnoDB: Database physically writes the file full: wait...
080220 9:40:20 InnoDB: Log file ./ib_logfile1 did not exist: new to be created
InnoDB: Setting log file ./ib_logfile1 size to 5 MB
InnoDB: Database physically writes the file full: wait...
InnoDB: Doublewrite buffer not found: creating new
InnoDB: Doublewrite buffer created
InnoDB: Creating foreign key constraint system tables
InnoDB: Foreign key constraint system tables created
080220 9:40:21 InnoDB: Started; log sequence number 0 0
080220 9:40:21 [Note] /var/tmp/test-mxj/bin/mysqld: ready for connections.
Version: '5.0.51a' socket: 'mysql.sock' port: 3336 MySQL Community Server (GPL)
[MysqldResource] mysqld running as process: 2238

SELECT VERSION()
-----
5.0.51a
-----
[MysqldResource] stopping mysqld (process: 2238)
080220 9:40:27 [Note] /var/tmp/test-mxj/bin/mysqld: Normal shutdown

080220 9:40:27 InnoDB: Starting shutdown...
080220 9:40:29 InnoDB: Shutdown completed; log sequence number 0 43655
080220 9:40:29 [Note] /var/tmp/test-mxj/bin/mysqld: Shutdown complete

[MysqldResource] shutdown complete
```

The above output shows an instance of MySQL starting, the necessary files being created (log files, InnoDB data files) and the MySQL database entering the running state. The instance is then shutdown by Connector/MXJ before the example terminates.

Warning

You should avoid running your Connector/MXJ application as the `root` user, because this will cause the `mysqld` to also be executed with root privileges. For more information, see [Section 5.3.5, “How to Run MySQL as a Normal User”](#).

20.5.3.4. Deploying Connector/MXJ using Driver Launch

Connector/MXJ and Connector/J work together to enable you to launch an instance of the `mysqld` server through the use of a keyword in the JDBC connection string. Deploying Connector/MXJ within a Java application can be automated through this method, making the deployment of Connector/MXJ a simple process:

1. Download and unzip Connector/MXJ, add `mysql-connector-mxj-gpl-[ver].jar` to the `CLASSPATH`.
If you are using Connector/MXJ v5.0.4 or later you will also need to add the `mysql-connector-mxj-gpl-[ver]-db-files.jar` file to your `CLASSPATH`.
2. To the JDBC connection string, embed the `mxj` keyword, for example: `jdbc:mysql:mxj://localhost:PORT/DB-NAME`.

For more details, see [Section 20.5.4, "Connector/MXJ Configuration"](#).

20.5.3.5. Deploying Connector/MXJ within JBoss

For deployment within a JBoss environment, you must configure the JBoss environment to use the Connector/MXJ component within the JDBC parameters:

1. Download Connector/MXJ and copy the `mysql-connector-mxj-gpl-[ver].jar` file to the `$JBOSS_HOME/server/default/lib` directory.
If you are using Connector/MXJ v5.0.4 or later you will also need to copy the `mysql-connector-mxj-gpl-[ver]-db-files.jar` file to `$JBOSS_HOME/server/default/lib`.
2. Download Connector/J and copy the `mysql-connector-java-5.1.5-bin.jar` file to the `$JBOSS_HOME/server/default/lib` directory.
3. Create an MBean service xml file in the `$JBOSS_HOME/server/default/deploy` directory with any attributes set, for instance the `datadir` and `autostart`.
4. Set the JDBC parameters of your web application to use:

```
String driver = "com.mysql.jdbc.Driver";
String url = "jdbc:mysql:///test?propertiesTransform="+
    "com.mysql.management.jmx.ConnectorMXJPropertiesTransform";
String user = "root";
String password = "";
Class.forName(driver);
Connection conn = DriverManager.getConnection(url, user, password);
```

You may wish to create a separate users and database table spaces for each application, rather than using "root and test".

We highly suggest having a routine backup procedure for backing up the database files in the `datadir`.

20.5.3.6. Verifying Installation using JUnit

The best way to ensure that your platform is supported is to run the JUnit tests. These will test the Connector/MXJ classes and the associated components.

20.5.3.6.1. JUnit Test Requirements

The first thing to do is make sure that the components will work on the platform. The `MysqldResource` class is really a wrapper for a native version of MySQL, so not all platforms are supported. At the time of this writing, Linux on the i386 architecture has been tested and seems to work quite well, as does OS X v10.3. There has been limited testing on Windows and Solaris.

Requirements:

1. JDK-1.4 or newer (or the JRE if you aren't going to be compiling the source or JSPs).
2. MySQL Connector/J version 5.0 or newer (from <http://dev.mysql.com/downloads/connector/j/>) installed and available via your `CLASSPATH`.
3. The `javax.management` classes for JMX version 1.2.1, these are present in the following application servers:

- JBoss - 4.0rc1 or newer.
 - Apache Tomcat - 5.0 or newer.
 - Sun's JMX reference implementation version 1.2.1 (from <http://java.sun.com/products/JavaManagement/>).
4. JUnit 3.8.1 (from <http://www.junit.org/>).

If building from source, All of the requirements from above, plus:

1. Ant version 1.5 or newer (download from <http://ant.apache.org/>).

20.5.3.6.2. Running the JUnit Tests

1. The tests attempt to launch MySQL on the port 3336. If you have a MySQL running, it may conflict, but this isn't very likely because the default port for MySQL is 3306. However, You may set the "c-mxj_test_port" Java property to a port of your choosing. Alternatively, you may wish to start by shutting down any instances of MySQL you have running on the target machine.

The tests suppress output to the console by default. For verbose output, you may set the "c-mxj_test_silent" Java property to "false".

2. To run the JUnit test suite, the \$CLASSPATH must include the following:

- JUnit
- JMX
- Connector/J
- MySQL Connector/MXJ

3. If `connector-mxj.jar` is not present in your download, unzip MySQL Connector/MXJ source archive.

```
cd mysqljmx
ant dist
```

Then add `$TEMP/cmj/stage/connector-mxj/connector-mxj.jar` to the CLASSPATH.

4. if you have `junit`, execute the unit tests. From the command line, type:

```
java com.mysql.management.AllTestsSuite
```

The output should look something like this:

```
.....
.....
.....
Time: 259.438
OK (101 tests)
```

Note that the tests are a bit slow near the end, so please be patient.

20.5.4. Connector/MXJ Configuration

20.5.4.1. Running as part of the JDBC Driver

A feature of the MySQL Connector/J JDBC driver is the ability to specify a connection to an embedded Connector/MXJ instance through the use of the `mxj` keyword in the JDBC connection string.

In the following example, we have a program which creates a connection, executes a query, and prints the result to the `System.out`. The MySQL database will be deployed and started as part of the connection process, and shutdown as part of the finally block.

You can find this file in the Connector/MXJ package as [src/ConnectorMXJUrlTestExample.java](#).

```
import java.io.File;
import java.sql.Connection;
import java.sql.DriverManager;

import com.mysql.management.driverlaunched.ServerLauncherSocketFactory;
import com.mysql.management.util.QueryUtil;

public class ConnectorMXJUrlTestExample {
    public static String DRIVER = "com.mysql.jdbc.Driver";

    public static String JAVA_IO_TMPDIR = "java.io.tmpdir";

    public static void main(String[] args) throws Exception {
        File ourAppDir = new File(System.getProperty(JAVA_IO_TMPDIR));
        File databaseDir = new File(ourAppDir, "test-mxj");
        int port = Integer.parseInt(System.getProperty("c-mxj_test_port", "3336"));
        String dbName = "our_test_app";

        String url = "jdbc:mysql:mxj://localhost:" + port + "/" + dbName //
            + "?" + "serverbasedir=" + databaseDir //
            + "&" + "createDatabaseIfNotExist=true" //
            + "&" + "server.initialize-user=true" //
        ;

        System.out.println(url);

        String userName = "alice";
        String password = "q93uti0opwhkd";

        Class.forName(DRIVER);
        Connection conn = null;
        try {
            conn = DriverManager.getConnection(url, userName, password);
            String sql = "SELECT VERSION()";
            String queryForString = new QueryUtil(conn).queryForString(sql);

            System.out.println("-----");
            System.out.println(sql);
            System.out.println("-----");
            System.out.println(queryForString);
            System.out.println("-----");
            System.out.flush();
            Thread.sleep(100); // wait for System.out to finish flush
        } finally {
            try {
                if (conn != null)
                    conn.close();
            } catch (Exception e) {
                e.printStackTrace();
            }
        }

        ServerLauncherSocketFactory.shutdown(databaseDir, null);
    }
}
```

To run the above program, be sure to have connector-mxj.jar and Connector/J in the CLASSPATH. Then type:

```
java ConnectorMXJTestExample
```

20.5.4.2. Running within a Java Object

If you have a java application and wish to “embed” a MySQL database, make use of the [com.mysql.management.MysqldResource](#) class directly. This class may be instantiated with the default (no argument) constructor, or by passing in a [java.io.File](#) object representing the directory you wish the server to be “unzipped” into. It may also be instantiated with printstreams for “stdout” and “stderr” for logging.

Once instantiated, a [java.util.Map](#), the object will be able to provide a [java.util.Map](#) of server options appropriate for the platform and version of MySQL which you will be using.

The [MysqldResource](#) enables you to “start” MySQL with a [java.util.Map](#) of server options which you provide, as well as “shutdown” the database. The following example shows a simplistic way to embed MySQL in an application using plain java objects.

You can find this file in the Connector/MXJ package as [src/ConnectorMXJObjectTestExample.java](#).

```
import java.io.File;
import java.sql.Connection;
import java.sql.DriverManager;
import java.util.HashMap;
import java.util.Map;

import com.mysql.management.MysqldResource;
```

```

import com.mysql.management.MysqldResourceI;
import com.mysql.management.util.QueryUtil;

public class ConnectorMXJObjectTestExample {
    public static final String DRIVER = "com.mysql.jdbc.Driver";

    public static final String JAVA_IO_TMPDIR = "java.io.tmpdir";

    public static void main(String[] args) throws Exception {
        File ourAppDir = new File(System.getProperty(JAVA_IO_TMPDIR));
        File databaseDir = new File(ourAppDir, "mysql-mxj");
        int port = Integer.parseInt(System.getProperty("c-mxj_test_port",
            "3336"));
        String userName = "alice";
        String password = "q93uti0opwhkd";

        MysqldResource mysqldResource = startDatabase(databaseDir, port,
            userName, password);

        Class.forName(DRIVER);
        Connection conn = null;
        try {
            String dbName = "our_test_app";
            String url = "jdbc:mysql://localhost:" + port + "/" + dbName //
                + "?" + "createDatabaseIfNotExist=true//";

            ;
            conn = DriverManager.getConnection(url, userName, password);
            String sql = "SELECT VERSION()";
            String queryForString = new QueryUtil(conn).queryForString(sql);

            System.out.println("-----");
            System.out.println(sql);
            System.out.println("-----");
            System.out.println(queryForString);
            System.out.println("-----");
            System.out.flush();
            Thread.sleep(100); // wait for System.out to finish flush
        } finally {
            try {
                if (conn != null) {
                    conn.close();
                }
            } catch (Exception e) {
                e.printStackTrace();
            }
            try {
                mysqldResource.shutdown();
            } catch (Exception e) {
                e.printStackTrace();
            }
        }
    }

    public static MysqldResource startDatabase(File databaseDir, int port,
        String userName, String password) {
        MysqldResource mysqldResource = new MysqldResource(databaseDir);

        Map database_options = new HashMap();
        database_options.put(MysqldResourceI.PORT, Integer.toString(port));
        database_options.put(MysqldResourceI.INITIALIZE_USER, "true");
        database_options.put(MysqldResourceI.INITIALIZE_USER_NAME, userName);
        database_options.put(MysqldResourceI.INITIALIZE_PASSWORD, password);

        mysqldResource.start("test-mysqld-thread", database_options);

        if (!mysqldResource.isRunning()) {
            throw new RuntimeException("MySQL did not start.");
        }

        System.out.println("MySQL is running.");

        return mysqldResource;
    }
}

```

20.5.4.3. Setting server options

Of course there are many options we may wish to set for a MySQL database. These options may be specified as part of the JDBC connection string simply by prefixing each server option with `server..` In the following example we set two driver parameters and two server parameters:

```

String url = "jdbc:mysql://" + hostColonPort + "/"
    + "?"
    + "cacheServerConfiguration=true"
    + "&"
    + "useLocalSessionState=true"
    + "&"
    + "server.basedir=/opt/myapp/db"
    + "&"
    + "server.datadir=/mnt/bigdisk/myapp/data";

```

Starting with Connector/MXJ 5.0.6 you can use the `initializer-user` property to a connection string. If set to true, the default anonymous and root users will be removed and the user/password combination from the connection URL will be used to create a new user. For example:

```
String url = "jdbc:mysql:mxj://localhost:" + port
+ "/alice_db"
+ "?server.dataDir=" + dataDir.getPath()
+ "&server.initialize-user=true"
+ "&createDatabaseIfNotExist=true"
;
```

20.5.5. Connector/MXJ Reference

The following sections include detailed information on the different API interfaces to Connector/MXJ.

20.5.5.1. MysqlResource Constructors

The `MysqlResource` class supports three different constructor forms:

- `public MysqlResource(File baseDir, File dataDir, String mysqlVersionString, PrintStream out, PrintStream err)`

Enables you to set the base directory, data directory, select a server by its version string, standard out and standard error.
- `public MysqlResource(File baseDir, File dataDir, String mysqlVersionString)`

Enables you to set the base directory, data directory and select a server by its version string. Output for standard out and standard err are directed to `System.out` and `System.err`.
- `public MysqlResource(File baseDir, File dataDir)`

Enables you to set the base directory and data directory. The default MySQL version is selected, and output for standard out and standard err are directed to `System.out` and `System.err`.
- `public MysqlResource(File baseDir);`

Allows the setting of the "basedir" to deploy the MySQL files to. Output for standard out and standard err are directed to `System.out` and `System.err`.
- `public MysqlResource();`

The basedir is defaulted to a subdirectory of the `java.io.tmpdir`. Output for standard out and standard err are directed to `System.out` and `System.err`;

20.5.5.2. MysqlResource Methods

`MysqlResource` API includes the following methods:

- `void start(String threadName, Map mysqlArgs);`

Deploys and starts MySQL. The "threadName" string is used to name the thread which actually performs the execution of the MySQL command line. The map is the set of arguments and their values to be passed to the command line.
- `void shutdown();`

Shuts down the MySQL instance managed by the `MysqlResource` object.
- `Map getServerOptions();`

Returns a map of all the options and their current (or default, if not running) options available for the MySQL database.
- `boolean isRunning();`

Returns true if the MySQL database is running.
- `boolean isReadyForConnections();`

Returns true once the database reports that is ready for connections.

- `void setKillDelay(int millis);`

The default “Kill Delay” is 30 seconds. This represents the amount of time to wait between the initial request to shutdown and issuing a “force kill” if the database has not shutdown by itself.

- `void addCompletionListener(Runnable listener);`

Allows for applications to be notified when the server process completes. Each "listener" will be fired off in its own thread.

- `String getVersion();`

Returns the version of MySQL.

- `void setVersion(int MajorVersion, int minorVersion, int patchLevel);`

The standard distribution comes with only one version of MySQL packaged. However, it is possible to package multiple versions, and specify which version to use.

20.5.6. Connector/MXJ Notes and Tips

This section contains notes and tips on using the Connector/MXJ component within your applications.

20.5.6.1. Creating your own Connector/MXJ Package

If you want to create a custom Connector/MXJ package that includes a specific `mysqld` version or platform then you must extract and rebuild the `mysql-connector-mxj.jar` (Connector/MXJ v5.0.3 or earlier) or `mysql-connector-mxj-gpl-[ver]-db-files.jar` (Connector/MXJ v5.0.4 or later) file.

First, you should create a new directory into which you can extract the current `connector-mxj.jar`:

```
shell> mkdir custom-mxj
shell> cd custom-mxj
shell> jar -xf connector-mxj.jar
shell> ls
5-0-22/
ConnectorMXJObjectTestExample.class
ConnectorMXJUrlTestExample.class
META-INF/
TestDb.class
com/
kill.exe
```

If you are using Connector/MXJ v5.0.4 or later, you should unpack the `connector-mxj-db-files.jar`:

```
shell> mkdir custom-mxj
shell> cd custom-mxj
shell> jar -xf connector-mxj-db-files.jar
shell> ls
5-0-51a/
META-INF/
connector-mxj.properties
```

The MySQL version directory, `5-0-22` or `5-0-51a` in the preceding examples, contains all of the files used to create an instance of MySQL when Connector/MXJ is executed. All of the files in this directory are required for each version of MySQL that you want to embed. Note as well the format of the version number, which uses hyphens instead of periods to separate the version number components.

Within the version specific directory are the platform specific directories, and archives of the `data` and `share` directory required by MySQL for the various platforms. For example, here is the listing for the default Connector/MXJ package:

```
shell>> ls
Linux-i386/
META-INF/
Mac_OS_X-ppc/
SunOS-sparc/
Win-x86/
com/
data_dir.jar
share_dir.jar
win_share_dir.jar
```

Platform specific directories are listed by their OS and platform - for example the `mysqld` for Mac OS X PowerPC is located within the `Mac_OS_X-ppc` directory. You can delete directories from this location that you do not require, and add new directories for additional platforms that you want to support.

To add a platform specific `mysqld`, create a new directory with the corresponding name for your operating system/platform. For example, you could add a directory for Mac OS X/Intel using the directory `Mac_OS_X-i386`.

On Unix systems, you can determine the platform using `uname`:

```
shell> uname -p
i386
```

In Connector/MXJ v5.0.9 and later, an additional `platform-map.properties` file is used to associate a specific platform and operating system combination with the directory in which the `mysqld` for that combination is located. The determined operating system and platform are on the left, and the directory name where the appropriate `mysqld` is located is on the right. You can see a sample of the file below:

```
Linux-i386=Linux-i386
Linux-x86=Linux-i386
Linux-i686=Linux-i386
Linux-x86_64=Linux-i386
Linux-ia64=Linux-i386

#Linux-ppc=Linux-ppc
#Linux-ppc64=Linux-ppc

Mac_OS_X-i386=Mac_OS_X-i386
Mac_OS_X-ppc=Mac_OS_X-ppc
Rhapsody-PowerPC=Mac_OS_X-ppc
#Mac_OS-PowerPC=
#macos-PowerPC=
#MacOS-PowerPC=

SunOS-sparc=SunOS-sparc
Solaris-sparc=SunOS-sparc
SunOS-x86=SunOS-x86
Solaris-x86=SunOS-x86

FreeBSD-x86=FreeBSD-x86

Windows_Vista-x86=Win-x86
Windows_2003-x86=Win-x86
Windows_XP-x86=Win-x86
Windows_2000-x86=Win-x86
Windows_NT-x86=Win-x86
Windows_NT_(unknown)-x86=Win-x86
```

Now you need to download or compile `mysqld` for the MySQL version and platform you want to include in your custom `connector-mxj.jar` package into the new directory.

Create a file called `version.txt` in the OS/platform directory you have just created that contains the version string/path of the `mysqld` binary. For example:

```
mysql-5.0.22-osx10.3-i386/bin/mysqld
```

You can now recreate the `connector-mxj.jar` file with the added `mysqld`:

```
shell> cd custom-mxj
shell> jar -cf ../connector-mxj.jar *
```

For Connector/MXJ v5.0.4 and later, you should repackage to the `connector-mxj-db-files.jar`:

```
shell> cd custom-mxj
shell> jar -cf ../mysql-connector-mxj-gpl-[ver]-db-files.jar *
```

You should test this package using the steps outlined in [Section 20.5.3.3, “Connector/MXJ Quick Start Guide”](#).

Note

Because the `mysql-connector-mxj-gpl-[ver]-db-files.jar` file is separate from the main Connector/MXJ classes you can distribute different `mysql-connector-mxj-gpl-[ver]-db-files.jar` files to different hosts or for different projects without having to create a completely new main `mysql-connector-mxj-gpl-[ver].jar` file for each one.

20.5.6.2. Deploying Connector/MXJ with a pre-configured database

To include a pre-configured/populated database within your Connector/MXJ JAR file you must create a custom `data_dir.jar` file, as included within the main `connector-mxj.jar` (Connector/MXJ 5.0.3 or earlier) or `mysql-connector-mxj-gpl-[ver]-db-files.jar` (Connector/MXJ 5.0.4 or later) file:

1. First extract the `connector-mxj.jar` or `mysql-connector-gpl-[ver]-db-files.jar` file, as outlined in the previous section (see [Section 20.5.6.1](#), “Creating your own Connector/MXJ Package”).
2. First, create your database and populate the database with the information you require in an existing instance of MySQL - including Connector/MXJ instances. Data file formats are compatible across platforms.
3. Shutdown the instance of MySQL.
4. Create a JAR file of the data directory and databases that you want to include your Connector/MXJ package. You should include the `mysql` database, which includes user authentication information, in addition to the specific databases you want to include. For example, to create a JAR of the `mysql` and `mxjtest` databases:

```
shell> jar -cf ../data_dir.jar mysql mxjtest
```

5. For Connector/MXJ 5.0.3 or earlier, copy the `data_dir.jar` file into the extracted `connector-mxj.jar` directory, and then create an archive for `connector-mxj.jar`.

For Connector/MXJ 5.0.4 or later, copy the `data_dir.jar` file into the extracted `mysql-connector-mxj-gpl-[ver]-db-files.jar` directory, and then create an archive for `mysql-connector-mxj-gpl-[ver]-db-files.jar`.

Note that if you are create databases using the InnoDB engine, you must include the `ibdata.*` and `ib_logfile*` files within the `data_dir.jar` archive.

20.5.6.3. Running within a JMX Agent (custom)

As a JMX MBean, MySQL Connector/MXJ requires a JMX v1.2 compliant MBean container, such as JBoss version 4. The MBean will use the standard JMX management APIs to present (and allow the setting of) parameters which are appropriate for that platform.

If you are not using the SUN Reference implementation of the JMX libraries, you should skip this section. Or, if you are deploying to JBoss, you also may wish to skip to the next section.

We want to see the `MysqldDynamicMBean` in action inside of a JMX agent. In the `com.mysql.management.jmx.sunri` package is a custom JMX agent with two MBeans:

1. the `MysqldDynamicMBean`, and
2. a `com.sun.jdmk.comm.HtmlAdaptorServer`, which provides a web interface for manipulating the beans inside of a JMX agent.

When this very simple agent is started, it will allow a MySQL database to be started and stopped with a web browser.

1. Complete the testing of the platform as above.
 - current JDK, JUnit, Connector/J, MySQL Connector/MXJ
 - this section *requires* the SUN reference implementation of JMX
 - `PATH`, `JAVA_HOME`, `ANT_HOME`, `CLASSPATH`

2. If not building from source, skip to next step

rebuild with the "sunri.present"

```
ant -Dsunri.present=true dist
re-run tests:
java junit.textui.TestRunner com.mysql.management.AllTestsSuite
```

3. launch the test agent from the command line:

```
java com.mysql.management.jmx.sunri.MysqldTestAgentSunHtmlAdaptor &
```

4. from a browser:

```
http://localhost:9092/
```

5. under MysqlAgent,

```
select "name=mysqlid"
```

6. Observe the MBean View
7. scroll to the bottom of the screen press the STARTMYSQLD button
8. click [Back to MBean View](#)
9. scroll to the bottom of the screen press STOPMYSQLD button
10. kill the java process running the Test Agent (jmx server)

20.5.6.4. Deployment in a standard JMX Agent environment (JBoss)

Once there is confidence that the MBean will function on the platform, deploying the MBean inside of a standard JMX Agent is the next step. Included are instructions for deploying to JBoss.

1. Ensure a current version of java development kit (v1.4.x), see above.
 - Ensure `JAVA_HOME` is set (JBoss requires `JAVA_HOME`)
 - Ensure `JAVA_HOME/bin` is in the `PATH` (You will NOT need to set your `CLASSPATH`, nor will you need any of the jars used in the previous tests).
2. Ensure a current version of JBoss (v4.0RC1 or better)

```
http://www.jboss.org/index.html
select "Downloads"
select "jboss-4.0.zip"
pick a mirror
unzip ~/dload/jboss-4.0.zip
create a JBOSS_HOME environment variable set to the unzipped directory
unix only:
cd $JBOSS_HOME/bin
chmod +x *.sh
```

3. Deploy (copy) the `connector-mxj.jar` to `$JBOSS_HOME/server/default/lib`.
4. Deploy (copy) `mysql-connector-java-3.1.4-beta-bin.jar` to `$JBOSS_HOME/server/default/lib`.
5. Create a `mxjtest.war` directory in `$JBOSS_HOME/server/default/deploy`.
6. Deploy (copy) `index.jsp` to `$JBOSS_HOME/server/default/deploy/mxjtest.war`.
7. Create a `mysqlid-service.xml` file in `$JBOSS_HOME/server/default/deploy`.

```
<?xml version="1.0" encoding="UTF-8"?>
<server>
  <mbean code="com.mysql.management.jmx.jboss.JBossMysqlidDynamicMBean"
    name="mysql:type=service,name=mysqlid">
    <attribute name="datadir">/tmp/xxx_data_xxx</attribute>
    <attribute name="autostart">true</attribute>
  </mbean>
</server>
```

8. Start jboss:
 - on unix: `$JBOSS_HOME/bin/run.sh`
 - on windows: `%JBOSS_HOME%\bin\run.bat`

Be ready: JBoss sends a lot of output to the screen.

9. When JBoss seems to have stopped sending output to the screen, open a web browser to: <http://localhost:8080/jmx-console>
10. Scroll down to the bottom of the page in the `mysql` section, select the bulleted `mysqlid` link.
11. Observe the JMX MBean View page. MySQL should already be running.

12. (If "autostart=true" was set, you may skip this step.) Scroll to the bottom of the screen. You may press the INVOKE button to stop (or start) MySQL observe `Operation completed successfully without a return value`. Click `Back to MBean View`
13. To confirm MySQL is running, open a web browser to `http://localhost:8080/mxjtest/` and you should see that

```
SELECT 1
```

returned with a result of

```
1
```

14. Guided by the `$JBOSS_HOME/server/default/deploy/mxjtest.war/index.jsp` you will be able to use MySQL in your Web Application. There is a `test` database and a `root` user (no password) ready to experiment with. Try creating a table, inserting some rows, and doing some selects.
15. Shut down MySQL. MySQL will be stopped automatically when JBoss is stopped, or: from the browser, scroll down to the bottom of the MBean View press the stop service INVOKE button to halt the service. Observe `Operation completed successfully without a return value`. Using `ps` or `task manager` see that MySQL is no longer running

As of 1.0.6-beta version is the ability to have the MBean start the MySQL database upon start up. Also, we've taken advantage of the JBoss life-cycle extension methods so that the database will gracefully shut down when JBoss is shutdown.

20.5.7. Connector/MXJ Support

There are a wide variety of options available for obtaining support for using Connector/MXJ. You should contact the Connector/MXJ community for help before reporting a potential bug or problem. See [Section 20.5.7.1, "Connector/MXJ Community Support"](#).

20.5.7.1. Connector/MXJ Community Support

Sun Microsystems, Inc. provides assistance to the user community by means of a number of mailing lists and web based forums.

You can find help and support through the [MySQL and Java](#) mailing list.

For information about subscribing to MySQL mailing lists or to browse list archives, visit <http://lists.mysql.com/>. See [Section 1.5.1, "MySQL Mailing Lists"](#).

Community support from experienced users is also available through the [MyODBC Forum](#). You may also find help from other users in the other MySQL Forums, located at <http://forums.mysql.com>. See [Section 1.5.2, "MySQL Community Support at the MySQL Forums"](#).

20.5.7.2. How to Report Connector/MXJ Problems

If you encounter difficulties or problems with Connector/MXJ, contact the Connector/MXJ community [Section 20.5.7.1, "Connector/MXJ Community Support"](#).

If reporting a problem, you should ideally include the following information with the email:

- Operating system and version
- Connector/MXJ version
- MySQL server version
- Copies of error messages or other unexpected output
- Simple reproducible sample

Remember that the more information you can supply to us, the more likely it is that we can fix the problem.

If you believe the problem to be a bug, then you must report the bug through <http://bugs.mysql.com/>.

20.5.7.3. Connector/MXJ Change History

The Connector/MXJ Change History (Changelog) is located with the main Changelog for MySQL. See [Section C.7, "MySQL Con-](#)

[nector/MXJ Change History](#)".

20.6. MySQL Connector/C++

Caution

Please note, official support is not available for the beta version of MySQL Connector/C++.

MySQL Connector/C++ is a MySQL database connector for C++.

The MySQL Connector/C++ is licensed under the terms of the GPL, like most MySQL Connectors. There are special exceptions to the terms and conditions of the GPL as it is applied to this software, see FLOSS License Exception. If you need a non-GPL license for commercial distribution please contact us.

The MySQL Connector/C++ is compatible with the JDBC 4.0 API. However, MySQL Connector/C++ does not implement all of the JDBC 4.0 API. The MySQL Connector/C++ current version features the following classes:

- [Connection](#)
- [DatabaseMetaData](#)
- [Driver](#)
- [PreparedStatement](#)
- [ResultSet](#)
- [ResultSetMetaData](#)
- [Savepoint](#)
- [Statement](#)

The JDBC 4.0 API defines approximately 450 methods for the above mentioned classes. MySQL Connector/C++ implements around 80% of these and makes them available in the preview release.

The Beta release has been successfully compiled and tested on the following platforms:

AIX

- 5.2 (PPC32, PPC64)
- 5.3 (PPC32, PPC64)

FreeBSD

- 6.0 (x86, x86_64)

HPUX

- 11.11 (PA-RISC 32bit, PA-RISC 64bit)

Linux

- Debian 3.1 (PPC32, x86)
- FC4 (x86)
- RHEL 3 (ia64, x86, x86_64)
- RHEL 4 (ia64, x86, x86_64)
- RHEL 5 (ia64, x86, x86_64)

- SLES 9 (ia64, x86, x86_64)
- SLES 10 (ia64, x86_64)
- SuSE 10.3, (x86_64)
- Ubuntu 8.04 (x86)
- Ubuntu 8.10 (x86_64)

Mac

- MacOSX 10.3 (PPC32, PPC64)
- MacOSX 10.4 (PPC32, PPC64, x86)
- MacOSX 10.5 (PPC32, PPC64, x86, x86_64)

SunOS

- Solaris 8 (SPARC32, SPARC64, x86)
- Solaris 9 (SPARC32, SPARC64, x86)
- Solaris 10 (SPARC32, SPARC64, x86, x86_64)

Windows

- XP Professional (32bit)
- 2003 (64bit)

Future versions will run on all platforms supported by the MySQL Server.

Note

MySQL Connector/C++ supports MySQL 5.1 and later.

Note

MySQL Connector/C++ supports only Microsoft Visual Studio 2003 and above on Windows.

MySQL Connector/C++ Download

You can download the source code for the MySQL Connector/C++ preview release at the [download site](#).

MySQL Connector/C++ Source repository

The latest development version is also available through [Launchpad](#).

Bazaar is used for the MySQL Connector/C++ code repository. You can check out the source code using the [bzc](#) command line tool:

```
shell> bzr branch lp:~mysql/mysql-connector-cpp/trunk .
```

The source of the 1.0.3alpha release is available from the following branch:

```
shell> bzr branch lp:~andrey-mysql/mysql-connector-cpp/v1_0_3
```

The source of the 1.0.2alpha release is available from the following branch:

```
shell> bzr branch lp:~andrey-mysql/mysql-connector-cpp/v1_0_2
```

The source of the 1.0.1alpha release is available from the following branch:

```
shell> bzr branch lp:~andrey-mysql/mysql-connector-cpp/v1_0_1
```

Binary distributions

Starting with 1.0.4 Beta, binary distributions will be made available in addition to source code releases. The releases available are shown below.

Microsoft Windows platform:

- Without installer, a Zip file
- MSI installer package

Other platforms:

- Compressed GNU TAR archive (tar.gz)

Note

Note that source packages are available for all platforms in the Compressed GNU TAR archive (tar.gz) format.

MySQL Connector/C++ Advantages

Using MySQL Connector/C++ instead of the MySQL C API (MySQL Client Library) offers the following advantages for C++ users:

- Convenience of pure C++, no C function calls required
- Supports an industry standard API, JDBC 4.0
- Supports the object-oriented programming paradigm
- Reduces development time
- MySQL Connector/C++ is licensed under the GPL with the FLOSS License Exception
- MySQL Connector/C++ is available under a commercial license upon request

MySQL Connector/C++ Status

MySQL Connector/C++ is available as a development preview version. We kindly ask users and developers to try it out and provide us with feedback. We do not encourage you to use it in production environments.

Note that MySQL Workbench is successfully using MySQL Connector/C++.

Note

Sun Microsystems does not provide formal support for MySQL Connector/C++.

If you have any queries please [contact us](#).

20.6.1. MySQL Connector/C++ Binary Installation

Caution

Please note, official support is not available for the beta version of MySQL Connector/C++.

Caution

One problem that can occur is when the tools you use to build your application are not compatible with the tools used to build the binary versions of MySQL Connector/C++. Ideally you need to build your application with the same tools that were used to build the MySQL Connector/C++ binaries. To help with this the following resources are provided.

All distributions contain a [README](#) file, which contains platform-specific notes. At the end of the [README](#) file contained in the binary distribution you will find the settings used to build the binaries. If you experience build-related is-

sues on a platform, it may help to check the settings used on the platform to build the binary.

For your convenience the same information, but more frequently updated, can be found on the [MySQL Forge site](#).

A better solution is to build your MySQL Connector/C++ libraries from the source code, using the same tools that you use for building your application. This ensures compatibility.

Archive Package

Unpack the archive into an appropriate directory. If you plan to use a dynamically linked version of MySQL Connector/C++, make sure that your system can reference the MySQL Client Library. Consult your operating system documentation on how to modify and expand the search path for libraries. In case you cannot modify the library search path it may help to copy your application, the MySQL Connector/C++ library and the MySQL Client Library into the same directory. Most systems search for libraries in the current directory.

Windows MSI Installer

Windows users can choose between two binary packages:

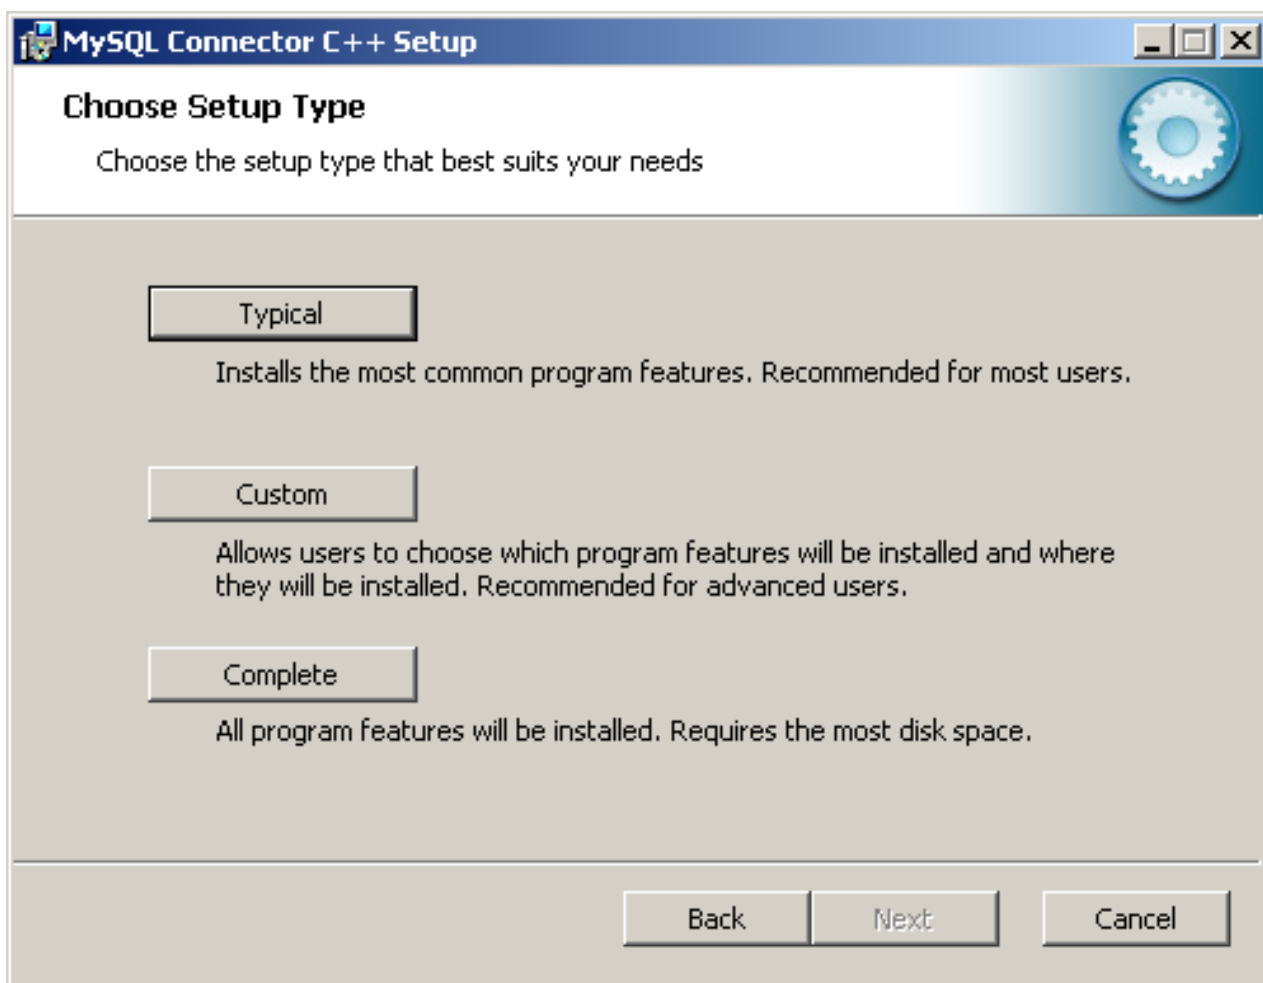

1. Without installer (unzip in C:\)
2. Windows MSI Installer (x86)

Using the MSI Installer may be the easiest solution. Running the MSI Installer does not require any administrative permissions as it simply copies files.

Figure 20.40. Windows Installer Welcome Screen

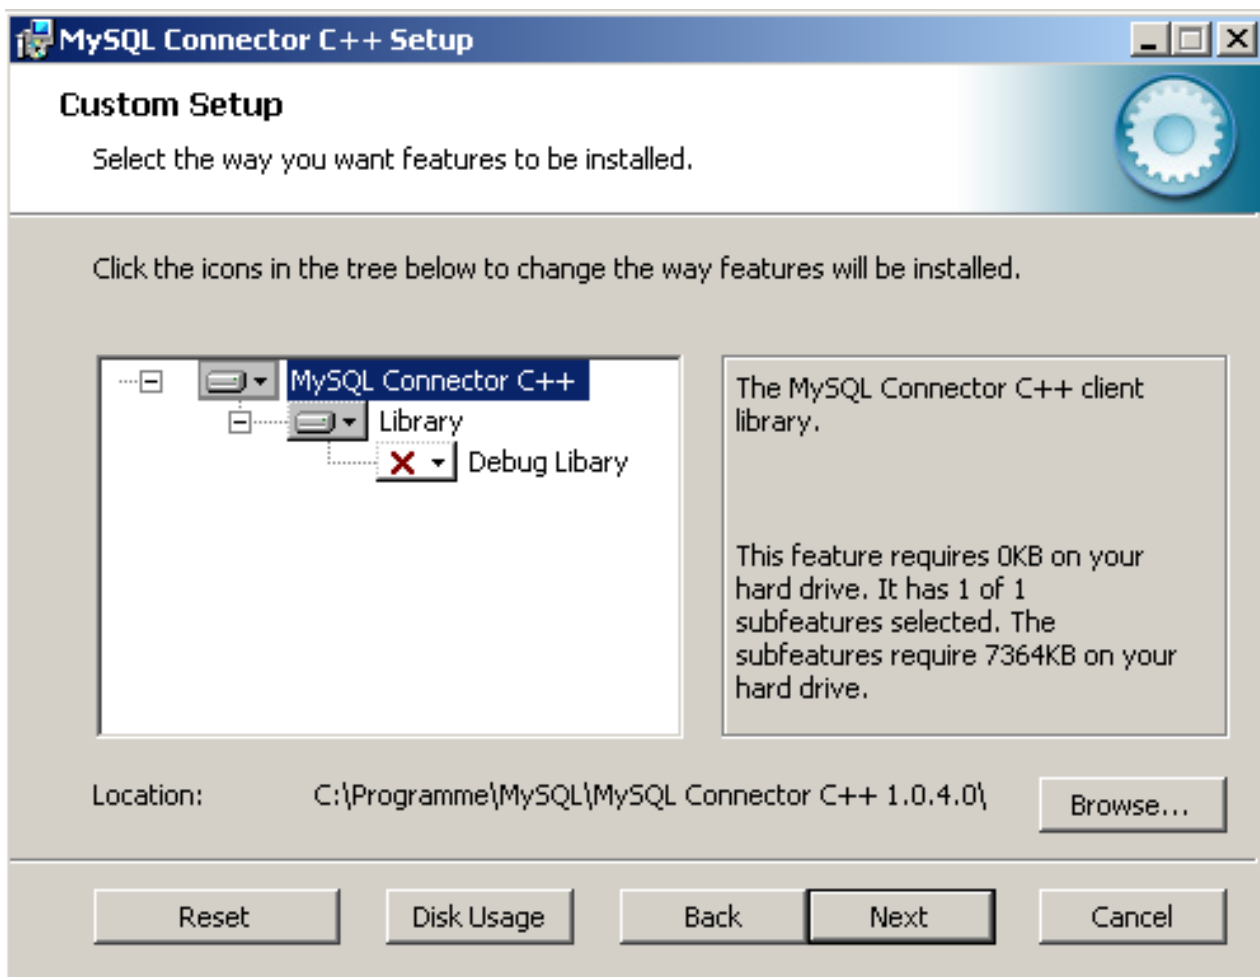

Figure 20.41. Windows Installer Overview Screen

The “Typical” installation consists of all required header files and the Release libraries. The only available “Custom” installation option allows you to install additional Debug versions of the connector libraries.

Figure 20.42. Windows Installer Custom Setup Screen

20.6.2. MySQL Connector/C++ Source Installation

Caution

Please note, official support is not available for the beta version of MySQL Connector/C++.

The MySQL Connector/C++ is based on the MySQL Client Library (MySQL C API). MySQL Connector/C++ is linked against the MySQL Client Library. You need to have the MySQL Client Library installed in order to compile MySQL Connector/C++.

You also need to have the cross-platform build tool CMake 2.4, or newer, and GLib 2.2.3 or newer installed. Check the README file included with the distribution for platform specific notes on building for Windows and SunOS.

Typically the MySQL Client Library is installed when the MySQL Server is installed. However, check your operating system documentation for other installation options.

20.6.2.1. Building source on Unix, Solaris and Mac OS X

1. Run CMake to build a Makefile:

```
shell> me@host:/path/to/mysql-connector-cpp> cmake .
-- Check for working C compiler: /usr/local/bin/gcc
-- Check for working C compiler: /usr/local/bin/gcc -- works
[...]
-- Generating done
-- Build files have been written to: /path/to/mysql-connector-cpp/
```

On non-Windows systems, CMake first checks to see if the CMake variable `MYSQL_CONFIG_EXECUTABLE` is set. If it is not found CMake will try to locate `mysql_config` in the default locations.

If you have any problems with the configure process please check the troubleshooting instructions below.

2. Use make to build the libraries. First make sure you have a clean build:

```
shell> me@host:/path/to/mysql-connector-cpp> make clean
```

Then build the connector:

```
me@host:/path/to/mysql-connector-cpp> make
[ 1%] Building CXX object »
driver/CMakeFiles/mysqlcppconn.dir/mysql_connection.o
[ 3%] Building CXX object »
driver/CMakeFiles/mysqlcppconn.dir/mysql_constructed_resultset.o
[...]
[100%] Building CXX object examples/CMakeFiles/statement.dir/statement.o
Linking CXX executable statement
```

If all goes well, you will find the MySQL Connector/C++ library in `/path/to/cppconn/libmysqlcppconn.so`.

3. Finally make sure the header and library files are installed to their correct locations:

```
make install
```

Unless you have changed this in the configuration step, the header files will be copied to the directory `/usr/local/include`. The header files copied are `mysql_connection.h` and `mysql_driver.h`.

Again, unless you have specified otherwise, the library files will be copied to `/usr/local/lib`. The files copied are `libmysqlcppcon.so`, the dynamic library, and `libmysqlcppconn-static.a`, the static library.

If you encounter any errors, please first carry out the checks shown below:

1. CMake options: MySQL installation path, debug version and more

In case of configure and/or compile problems check the list of CMake options:

```
shell> me@host:/path/to/mysql-connector-cpp> cmake -L
[...]
CMAKE_BACKWARDS_COMPATIBILITY:STRING=2.4
CMAKE_BUILD_TYPE:STRING=
CMAKE_INSTALL_PREFIX:PATH=/usr/local
EXECUTABLE_OUTPUT_PATH:PATH=
LIBRARY_OUTPUT_PATH:PATH=
MYSQLCPPCONN_GCOV_ENABLE:BOOL=0
MYSQLCPPCONN_TRACE_ENABLE:BOOL=0
MYSQL_CONFIG_EXECUTABLE:FILEPATH=/usr/bin/mysql_config
```

For example, if your MySQL Server installation path is not `/usr/local/mysql` and you want to build a debug version of the MySQL Connector/C++ use:

```
shell> me@host:/path/to/mysql-connector-cpp> cmake »
-D CMAKE_BUILD_TYPE:STRING=Debug »
-D MYSQL_CONFIG_EXECUTABLE=/path/to/my/mysql/server/bin/mysql_config .
```

2. Verify your settings with `cmake -L`:

```
shell> me@host:/path/to/mysql-connector-cpp> cmake -L
[...]
CMAKE_BACKWARDS_COMPATIBILITY:STRING=2.4
CMAKE_BUILD_TYPE:STRING=
CMAKE_INSTALL_PREFIX:PATH=/usr/local
EXECUTABLE_OUTPUT_PATH:PATH=
LIBRARY_OUTPUT_PATH:PATH=
MYSQLCPPCONN_GCOV_ENABLE:BOOL=0
MYSQLCPPCONN_TRACE_ENABLE:BOOL=0
MYSQL_CONFIG_EXECUTABLE=/path/to/my/mysql/server/bin/mysql_config
```

Proceed by carrying out a `make clean` command followed by a `make` command, as described above.

20.6.2.2. Building on Windows

Note

Please note the only compiler formally supported for Windows is Microsoft Visual Studio 2003 and above.

The basic steps for building the connector on Windows are the same as for Unix. It is important to use CMake 2.6.2 or newer to

generate build files for your compiler and to invoke the compiler.

Note

On Windows, `mysql_config` is not present, so CMake will attempt to retrieve the location of MySQL from the environment variable `$ENV{MYSQL_DIR}`. If `MYSQL_DIR` is not set, CMake will then proceed to check for MySQL in the following locations: `$ENV{ProgramFiles}/MySQL/*/include`, and `$ENV{SystemDrive}/MySQL/*/include`.

CMake makes it easy for you to try out other compilers. However, you may experience compile warnings, compile errors or linking issues not detected by Visual Studio. Patches are gratefully accepted to fix issues with other compilers.

Consult the CMake manual or check `cmake --help` to find out which build systems are supported by your CMake version:

```
C:\>cmake --help
cmake version 2.6-patch 2
Usage
[...]
Generators

The following generators are available on this platform:
  Borland Makefiles      = Generates Borland makefiles.
  MSYS Makefiles         = Generates MSYS makefiles.
  MinGW Makefiles        = Generates a make file for use with
                          mingw32-make.
  NMake Makefiles        = Generates NMake makefiles.
  Unix Makefiles          = Generates standard UNIX makefiles.
  Visual Studio 6         = Generates Visual Studio 6 project files.
  Visual Studio 7         = Generates Visual Studio .NET 2002 project
                          files.
  Visual Studio 7 .NET 2003 = Generates Visual Studio .NET 2003 project
                          files.
  Visual Studio 8 2005    = Generates Visual Studio .NET 2005 project
                          files.
  Visual Studio 8 2005 Win64 = Generates Visual Studio .NET 2005 Win64
                          project files.
  Visual Studio 9 2008    = Generates Visual Studio 9 2008 project fil
  Visual Studio 9 2008 Win64 = Generates Visual Studio 9 2008 Win64 proje
                          files.
[...]

```

It is likely that your CMake binary will support more compilers, known by CMake as *generators*, than supported by MySQL Connector/C++. We have built the connector using the following generators:

- Microsoft Visual Studio 8 (Visual Studio 2005)
- Microsoft Visual Studio 9 (Visual Studio 2008, Visual Studio 2008 Express)
- NMake

Please see the building instructions for Unix, Solaris and Mac OS X for troubleshooting and configuration hints.

The steps to build the connector are given below:

1. Run CMake to generate build files for your *generator*:

Visual Studio

```
C:\path_to_mysql_cpp>cmake -G "Visual Studio 9 2008"

```

20.6.3. MySQL Connector/C++ Building Windows applications with Microsoft Visual Studio

MySQL Connector/C++ is available as a static or dynamic library to use with your application. This section looks at how to link the library to your application.

Note

To avoid potential crashes the build configuration of MySQL Connector/C++ should match the build configuration of the application using it. For example, do not use the release build of MySQL Connector/C++ with a debug build of the client application.

Static library

The MySQL Connector/C++ static library file is `mysqlcppconn-static.lib`. This needs to be statically linked with your application. You also need to link against the files `libmysql.dll` and `libmysql.lib`. Once linking has been successfully completed, the application will require access to `libmysql.dll` at run time.

Dynamic library

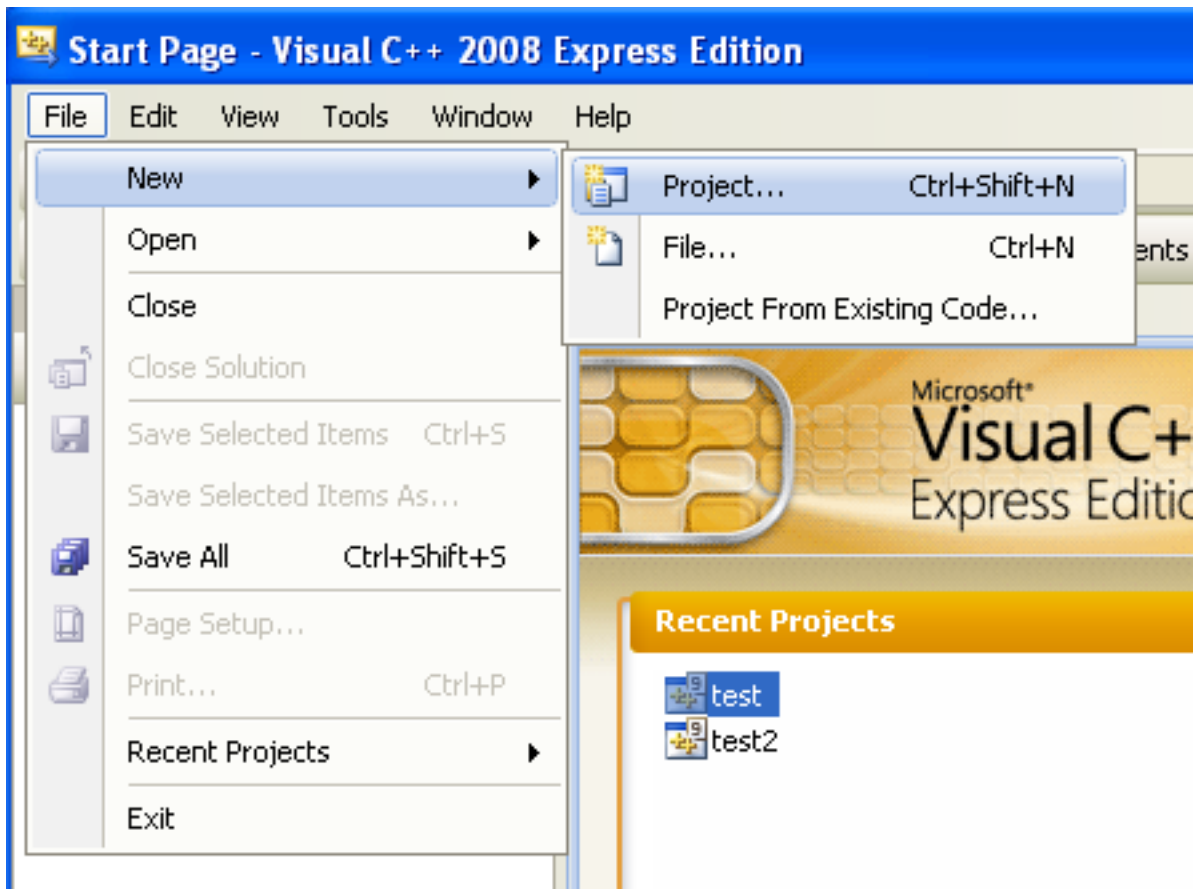

The MySQL Connector/C++ dynamic library file is `mysqlcppconn.dll`. In order to build your client application you need to link it with the file `mysqlcppconn.lib`. At run time the application will require access to the files `mysqlcppconn.dll` and `libmysql.dll`.

Building a MySQL Connector/C++ application with Microsoft Visual Studio

Initially, the procedure for building an application to use either the static or dynamic library is the same. You then carry out some additional steps depending on whether you want to build your application to use the `static` or `dynamic` library.

1. Select **FILE**, **NEW**, **PROJECT** from the main menu.

Figure 20.43. Creating a new project

2. In the wizard select **VISUAL C++**, **WIN32**. From **VISUAL STUDIO INSTALLED TEMPLATES** select the application type **WIN32 CONSOLE APPLICATION**. Enter a name for the application, and then click **OK**, to move to the Win32 Application Wizard.

Figure 20.44. The New Project dialog box

3. In the Win32 Application Wizard, click on **APPLICATION SETTINGS** and ensure the defaults are selected. The radio button **CONSOLE APPLICATION**, and the checkbox **PRECOMPILED HEADERS** will be selected. Click **FINISH** to close the wizard.

Figure 20.45. The Win32 Application Wizard

- From the drop down list box on the toolbar, change from the default **DEBUG** build to the **RELEASE** build.

Figure 20.46. Selecting the Release build

- From the main menu select **PROJECT, PROPERTIES**. This can also be accessed using the hot key ALT + F7.

Figure 20.47. Selecting Project Properties from the main menu

6. Under **CONFIGURATION PROPERTIES**, open the tree view.
7. Select **C++**, **GENERAL** in the tree view.

Figure 20.48. Setting properties

```

C:\mysql\include>dir

15/11/2008  06:53           1,501  typelib.h
          32 File(s)              325,486 bytes
           3 Dir(s)  4,091,248,640 bytes free

C:\mysql\include>

```

- Then in the **ADDITIONAL INCLUDE DIRECTORIES** text field, add the MySQL `include/` directory.

Figure 20.50. Select Directory dialog

10. You will also need to set the location of additional libraries that Visual Studio will need in order to build the application. These are located in the MySQL `lib/opt` directory, a sub-directory of the MySQL Server installation directory.

Figure 20.51. Typical contents of MySQL `lib/opt` directory

```

c:\ Command Prompt

C:\mysql\lib\opt>dir
Volume in drive C has no label.
Volume Serial Number is 9484-B7C3

Directory of C:\mysql\lib\opt

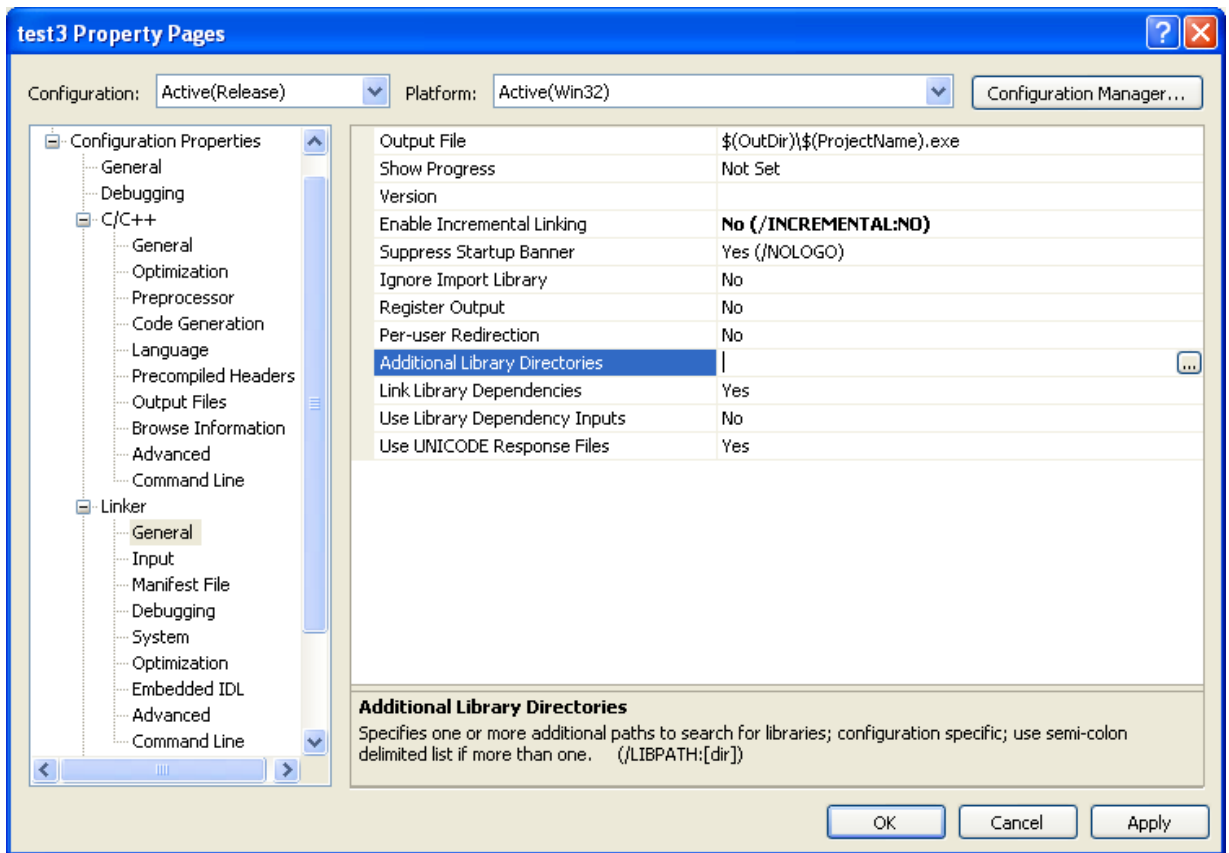

10/12/2008  13:56    <DIR>          .
10/12/2008  13:56    <DIR>          ..
15/11/2008  06:53             34,876  libmysql.lib
15/11/2008  06:53      6,590,464  libmysql.pdb
15/11/2008  06:53      7,710,426  mysqlclient.lib
15/11/2008  06:53      397,312  mysqlclient.pdb
15/11/2008  06:53      2,675,708  mysys.lib
15/11/2008  06:53       135,168  mysys.pdb
15/11/2008  06:53       235,420  regex.lib
15/11/2008  06:53        77,824  regex.pdb

15/11/2008  06:53        86,016  strings.pdb
15/11/2008  06:53       202,226  zlib.lib
15/11/2008  06:53        69,632  zlib.pdb
             12 File(s)      20,781,234 bytes
             2 Dir(s)  4,091,240,448 bytes free

C:\mysql\lib\opt>_

```

11. In the tree view open **LINKER, GENERAL, ADDITIONAL LIBRARY DIRECTORIES**.

Figure 20.52. Additional Library Directories

12. Add the `lib/opt` directory into the **ADDITIONAL LIBRARY DIRECTORIES** text field. This allows the library file `libmysql.lib` to be found.

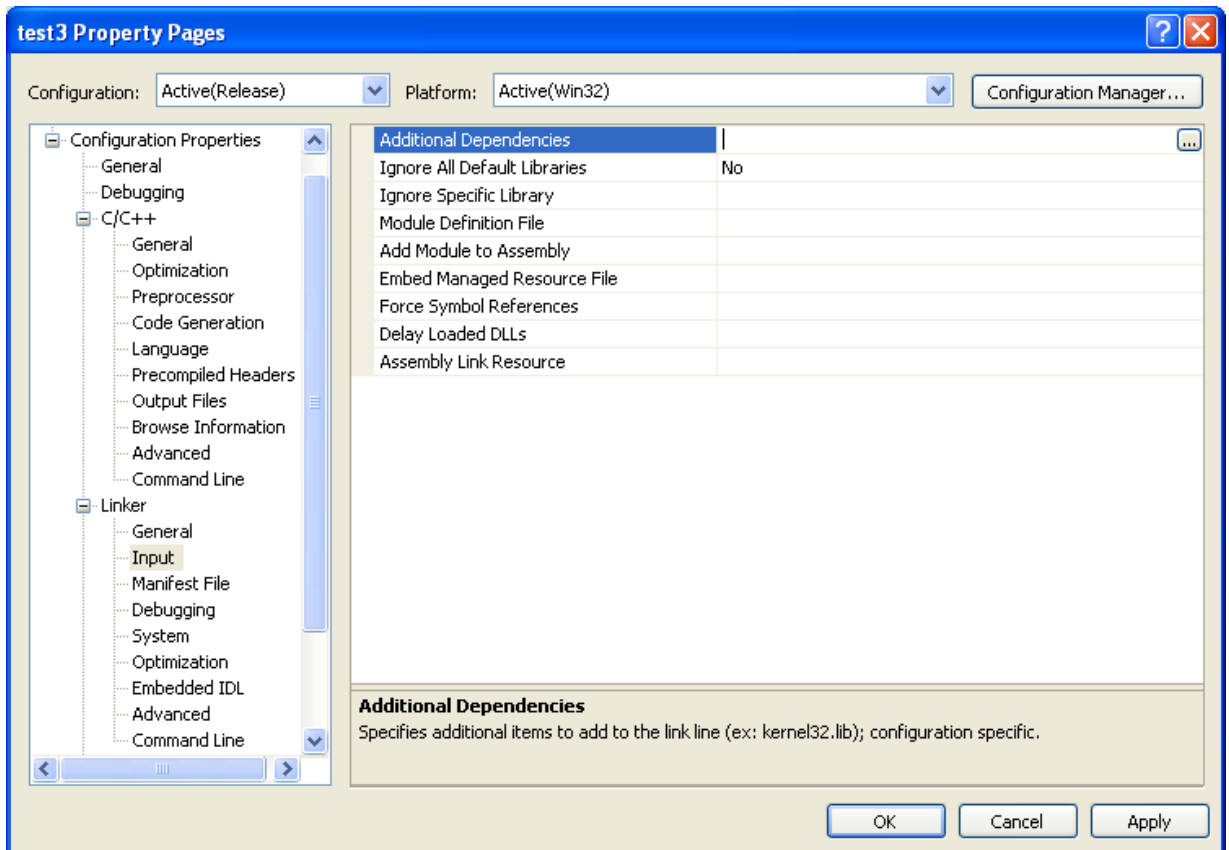

Figure 20.53. Additional Library Directories dialog

The remaining steps depend on whether you are building an application to use the MySQL Connector/C++ static or dynamic library. If you are building your application to use the dynamic library [go here](#). If you are building your application to use the static library, carry out the following steps:

1. Then open **LINKER, INPUT, ADDITIONAL DEPENDENCIES**.

Figure 20.54.

2. Enter `mysqlcppconn-static.lib` and `libmysql.lib`.

Figure 20.55. Adding additional dependencies

3. By default `CPPCONN_PUBLIC_FUNC` is defined to declare functions to be compatible with an application that calls a DLL. If building an application to call the static library, you must ensure that function prototypes are compatible with this. In this case `CPPCONN_PUBLIC_FUNC` needs to be defined to be an empty string, so that functions are declared with the correct prototype.

In the **PROJECT, PROPERTIES** tree view, under **C++**, **PREPROCESSOR**, enter `CPPCONN_PUBLIC_FUNC=` into the **PREPROCESSOR DEFINITIONS** text field.

Figure 20.56. Setting the CPPCONN_PUBLIC_FUNC define

Note

Make sure you enter `CPPCONN_PUBLIC_FUNC=` and not `CPPCONN_PUBLIC_FUNC`, as it needs to be defined as an empty string.

If building an application to use the MySQL Connector/C++ dynamically linked library carry out these steps:

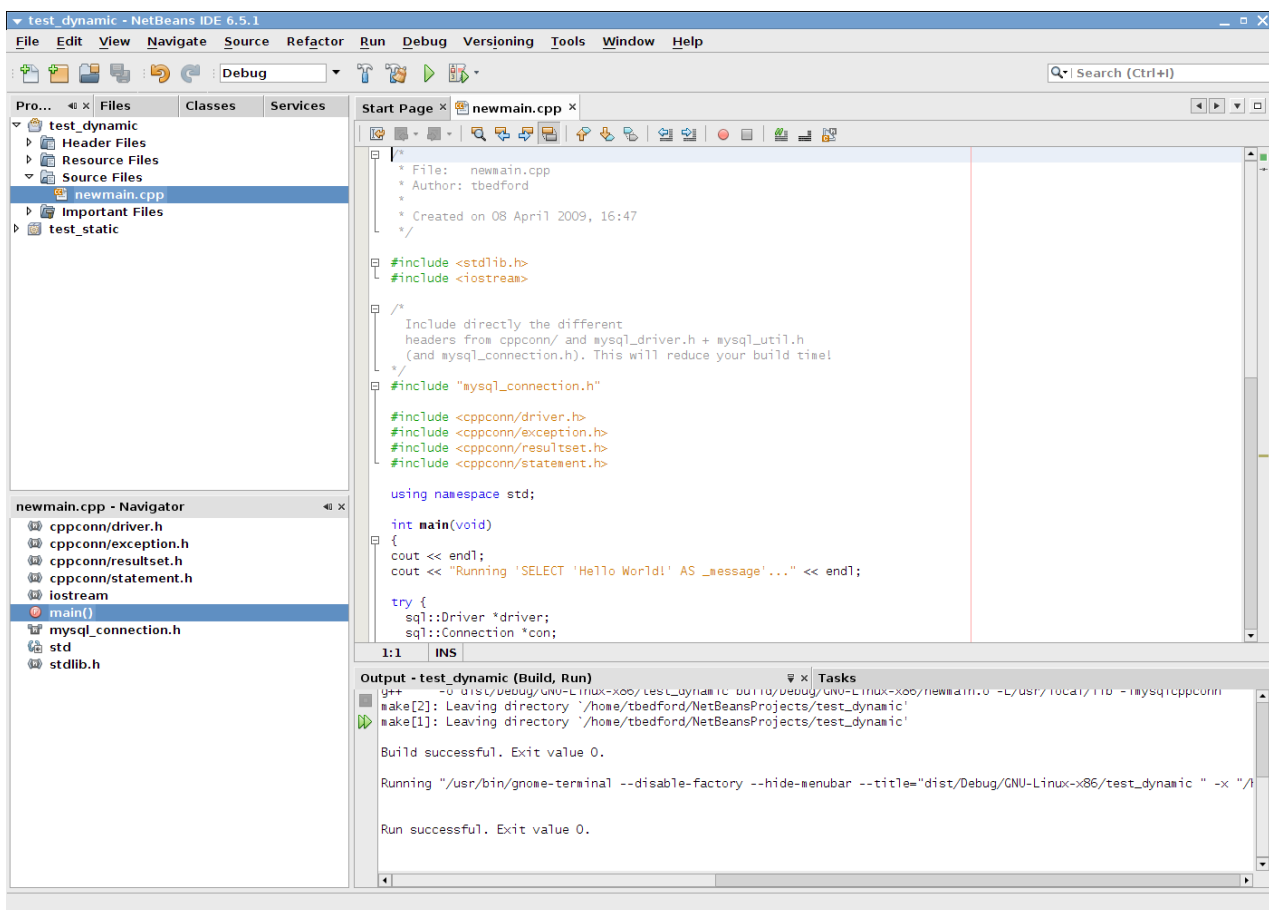

1. Under **LINKER, INPUT**, add `mysqlcppconn.lib` into the **ADDITIONAL DEPENDENCIES** text field.
2. The application will need to access the MySQL Connector/C++ Dynamic Linked Library at run time. Therefore, `mysqlcppconn.dll` needs to be in the same directory as the application executable, or somewhere on the system's path.

Copy `mysqlcppconn.dll` to the same directory as the application. Alternatively, extend the `PATH` environment variable using `SET PATH=%PATH%;C:\path\to\cpp`. Alternatively, you can copy `mysqlcppconn.dll` to the Windows installation Directory, typically `c:\windows`.

20.6.4. MySQL Connector/C++ Building Linux applications with NetBeans

This section describes how you can build MySQL Connector/C++ applications for Linux using the NetBeans IDE.

Figure 20.57. The NetBeans IDE

Note

To avoid potential crashes the build configuration of MySQL Connector/C++ should match the build configuration of the application using it. For example, do not use the release build of MySQL Connector/C++ with a debug build of the client application.

1. The first step of building your application is to create a new project. Select **FILE, NEW PROJECT**. Choose a **C/C++ APPLICATION** and click **NEXT**.
2. Give the project a name and click **FINISH**. A new project is created.
3. In the **PROJECTS** tab, right-click on **SOURCE FILES** and select **NEW**, then **MAIN C++ FILE...**
4. Change the filename, or simply select the defaults and click **FINISH** to add the new file to the project.
5. You now need to add some working code to your main source file. Explore your MySQL Connector/C++ installation and navigate to the [examples](#) directory.
6. Select a suitable example such as [standalone_example_docs1.cpp](#). Copy all the code in this file, and use it to replace the code in your existing main source file. Amend the code to reflect the connection properties required for your test database. You now have a working example that will access a MySQL database using MySQL Connector/C++.
7. You will notice that at this point NetBeans is showing some errors in the source code. This is because you need to direct NetBeans to the necessary header files that need to be included. Select **FILE, PROJECT PROPERTIES** from the main menu.
8. In the **CATEGORIES:** tree view panel, navigate to **BUILD, C++ COMPILER**.
9. In the **GENERAL** panel, select **INCLUDE DIRECTORIES**.
10. Click the ... button.
11. Click **ADD** and then navigate to the directory where the MySQL Connector/C++ header files are located. This will be [/usr/local/include](#) unless you have installed the files to a different location. Click **SELECT**. Click **OK**.

Figure 20.58. Setting the header include directory

12. Click OK again to close the **PROJECT PROPERTIES** dialog.

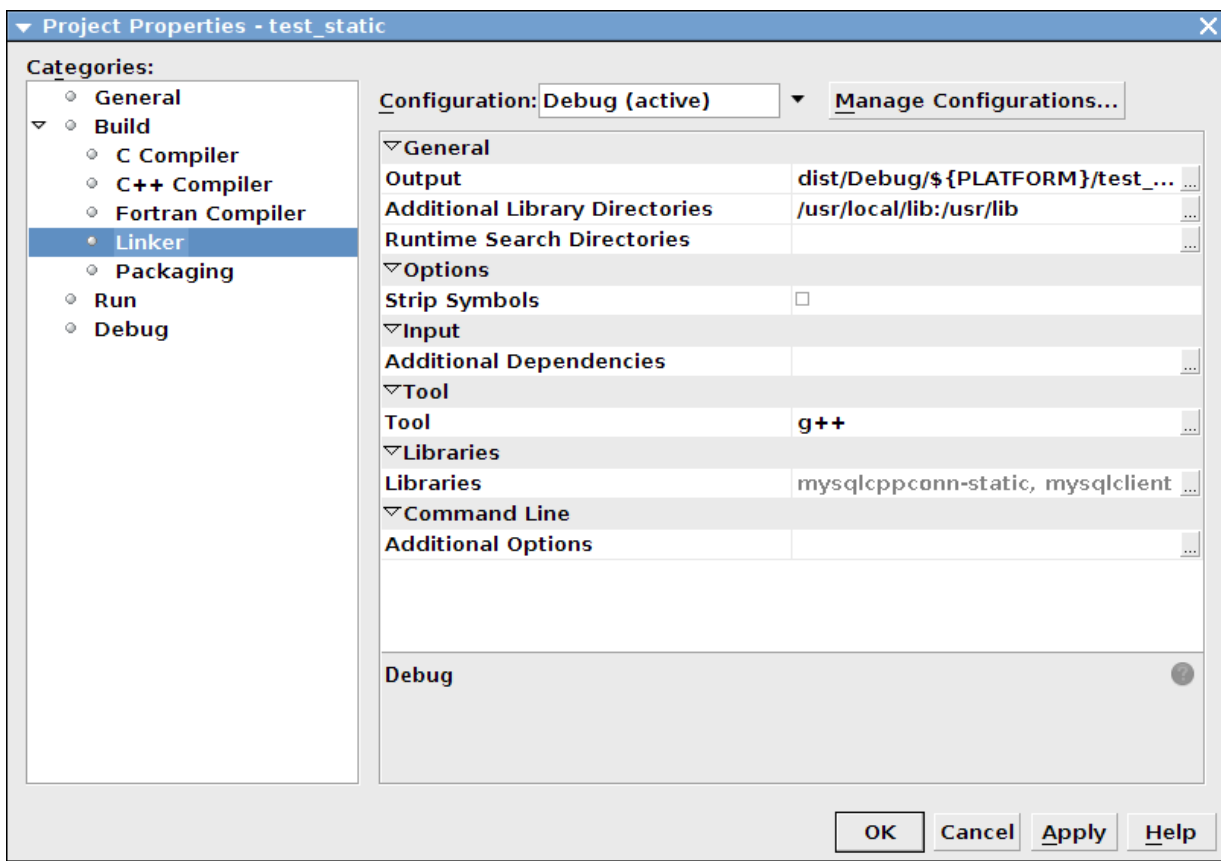

At this point you have created a NetBeans project, containing a single C++ source file. You have also ensured that the necessary include files are accessible. Before continuing, you need to decide whether your project is to use the MySQL Connector/C++ static or dynamic library. The project settings are slightly different in each case, as you need to link against a different library.

Using the static library

If you intend to use the static library you will need to link against two library files, `libmysqlcppconn-static.a` and `libmysqlclient.a`. The locations of the files will depend on your setup, but typically the former will be found in `/usr/local/lib` and the latter in `/usr/lib`. Note the file `libmysqlclient.a` is not part of MySQL Connector/C++, but is the MySQL Client Library file distributed with MySQL Server. Remember, the MySQL Client Library is an optional component as part of the MySQL Server installation process. Note the MySQL Client Library is also available as part of the new MySQL Connector/C distribution.

1. The first step is to set the project to link the necessary library files. Select **FILE, PROJECT PROPERTIES** from the main menu.
2. In the **CATEGORIES:** tree view navigate to **LINKER**.
3. In the **GENERAL** panel select **ADDITIONAL LIBRARY DIRECTORIES**. Click the ... button.
4. Select and add the `/usr/lib` and `/usr/local/lib` directories.
5. In the same panel add the two library files required for static linking as discussed earlier. The properties panel should then look similar to the following screenshot:

Figure 20.59. Setting the static library directories and file names

6. Click OK to close the **PROJECT PROPERTIES** dialog.

Using the dynamic library

If you require your application to use the MySQL Connector/C++ dynamic library, you simply need to link your project with a single library file, `libmysqlcppconn.so`. The location of this file will depend on how you configured your installation of MySQL Connector/C++, but will typically be `/usr/local/lib`.

1. The first step is to set the project to link the necessary library file. Select **FILE, PROJECT PROPERTIES** from the main menu.
2. In the **CATEGORIES:** tree view navigate to **LINKER**.
3. In the **GENERAL** panel select **ADDITIONAL LIBRARY DIRECTORIES**. Click the ... button.
4. Select and add the `/usr/local/lib` directories.
5. In the same panel add the library file required for static linking as discussed earlier. The properties panel should then look similar to the following screenshot:

Figure 20.60. Setting the dynamic library directory and file name

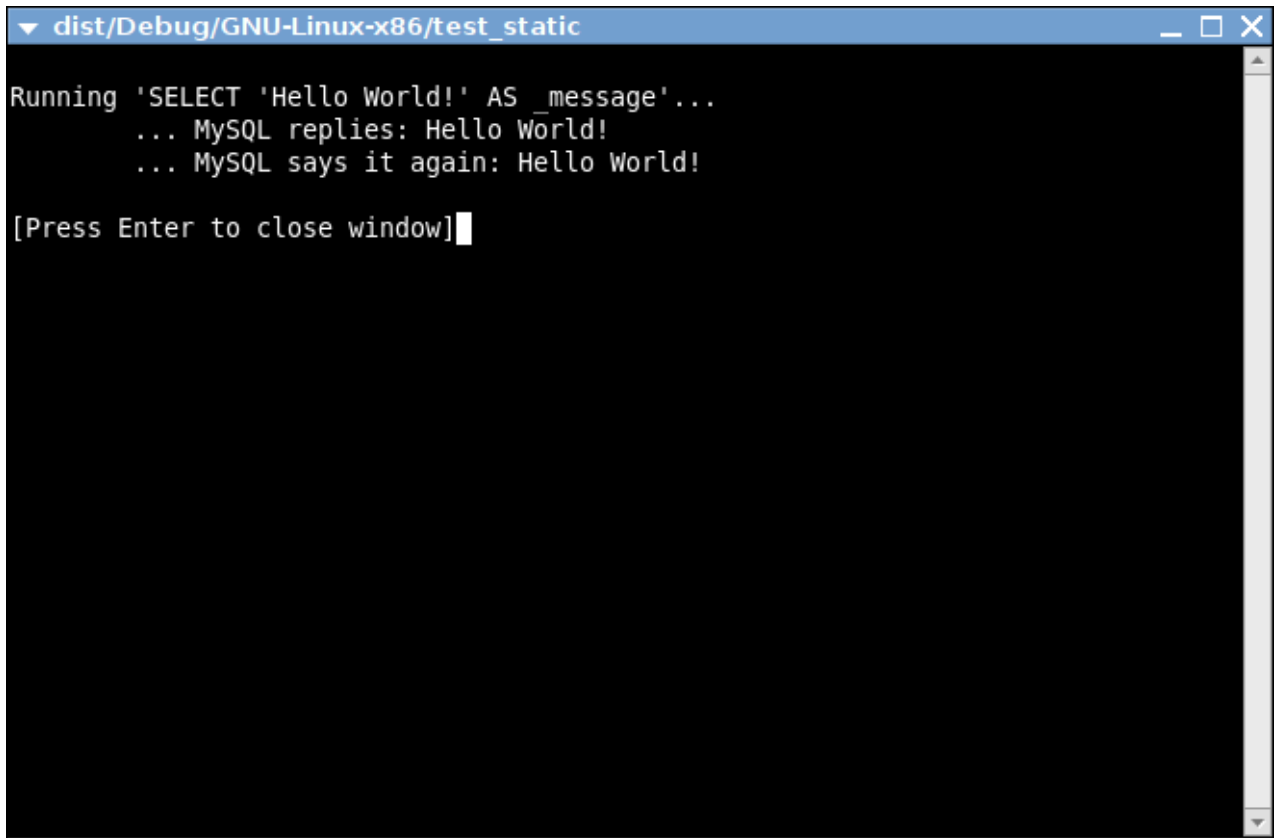

6. Click OK to close the Project Properties dialog.

Having configured your project you can build it by selecting **RUN, BUILD MAIN PROJECT** from the main menu. You can then run the project using **RUN, RUN MAIN PROJECT**.

On running the application you should see a screen similar to the following (this is actually the static version of the application shown):

Figure 20.61. The example application running

A terminal window titled 'dist/Debug/GNU-Linux-x86/test_static' with a black background and white text. The text shows the execution of a MySQL query: 'SELECT 'Hello World!' AS _message'...'. The output shows 'MySQL replies: Hello World!' and 'MySQL says it again: Hello World!'. At the bottom, it says '[Press Enter to close window]' with a cursor.

```
dist/Debug/GNU-Linux-x86/test_static
Running 'SELECT 'Hello World!' AS _message'...
... MySQL replies: Hello World!
... MySQL says it again: Hello World!

[Press Enter to close window]
```

Note

Note the above settings and procedures were carried out for the default [Debug](#) configuration. If you want to create a [Release](#) configuration you will need to select that configuration before setting the Project Properties.

20.6.5. MySQL Connector/C++ Getting Started: Usage Examples

Caution

Please note, official support is not available for the beta version of MySQL Connector/C++.

The download package contains usage examples in the directory [examples/](#). The examples explain the basic usage of the following classes:

- [Connection](#)
- [Driver](#)
- [PreparedStatement](#)
- [ResultSet](#)
- [ResultSetMetaData](#)
- [Statement](#)

The examples cover:

- Using the [Driver](#) class to connect to MySQL
- Creating tables, inserting rows, fetching rows using (simple) statements
- Creating tables, inserting rows, fetching rows using prepared statements

- Hints for working around prepared statement limitations
- Accessing result set meta data

The examples in this document are only code snippets. The code snippets provide a brief overview on the API. They are not complete programs. Please check the `examples/` directory of your MySQL Connector/C++ installation for complete programs. Please also read the `README` file in the `examples/` directory. Note to test the example code you will first need to edit the `examples.h` file in the `examples/` directory, to add your connection information. Then simply rebuild the code by issuing a `make` command.

The examples in the `examples/` directory include:

- `examples/connect.cpp`:
How to create a connection, insert data into MySQL and handle exceptions.
- `examples/connection_meta_schemaobj.cpp`:
How to obtain meta data associated with a connection object, for example, a list of tables, databases, MySQL version, connector version.
- `examples/debug.cpp`:
How to activate and deactivate the MySQL Connector/C++ debug protocol.
- `examples/exceptions.cpp`:
A closer look at the exceptions thrown by the connector and how to fetch error information.
- `examples/prepared_statements.cpp`:
How to run Prepared Statements including an example how to handle SQL commands that cannot be prepared by the MySQL Server.
- `examples/resultset.cpp`:
How to fetch data and iterate over the result set (cursor).
- `examples/resultset_meta.cpp`:
How to obtain meta data associated with a result set, for example, number of columns and column types.
- `examples/resultset_types.cpp`:
Result sets returned from meta data methods - this is more a test than much of an example.
- `examples/standalone_example.cpp`:
Simple standalone program not integrated into regular CMake builds.
- `examples/statements.cpp`:
How to run SQL commands without using Prepared Statements.
- `examples/cpp_trace_analyzer.cpp`:
This example shows how to filter the output of the `debug trace`. Please see the inline comments for further documentation. This script is unsupported.

20.6.5.1. MySQL Connector/C++ Connecting to MySQL

A connection to MySQL is established by retrieving an instance of `sql::Connection` from a `sql::mysql::MySQL_Driver` object. A `sql::mysql::MySQL_Driver` object is returned by `sql::mysql::MySQL_Driver::get_mysql_driver_instance()`.

```
sql::mysql::MySQL_Driver *driver;
sql::Connection *con;

driver = sql::mysql::MySQL_Driver::get_mysql_driver_instance();
con = driver->connect("tcp://127.0.0.1:3306", "user", "password");
```

```
delete con;
```

Make sure that you free the `sql::Connection` object as soon as you do not need it any more. But do not explicitly free the connector object!

20.6.5.2. MySQL Connector/C++ Running a simple query

For running simple queries you can use the methods `sql::Statement::execute()`, `sql::Statement::executeQuery()` and `sql::Statement::executeUpdate()`. The method `sql::Statement::execute()` should be used if your query does not return a result set or if your query returns more than one result set. See the `examples/` directory for more on this.

```
sql::mysql::MySQL_Driver *driver;
sql::Connection *con;
sql::Statement *stmt

driver = sql::mysql::get_mysql_driver_instance();
con = driver->connect("tcp://127.0.0.1:3306", "user", "password");

stmt = con->createStatement();
stmt->execute("USE " EXAMPLE_DB);
stmt->execute("DROP TABLE IF EXISTS test");
stmt->execute("CREATE TABLE test(id INT, label CHAR(1))");
stmt->execute("INSERT INTO test(id, label) VALUES (1, 'a')");

delete stmt;
delete con;
```

Note that you have to free `sql::Statement` and `sql::Connection` objects explicitly using `delete`.

20.6.5.3. MySQL Connector/C++ Fetching results

The API for fetching result sets is identical for (simple) statements and prepared statements. If your query returns one result set you should use `sql::Statement::executeQuery()` or `sql::PreparedStatement::executeQuery()` to run your query. Both methods return `sql::ResultSet` objects. The preview version does buffer all result sets on the client to support cursors.

```
// ...
sql::Connection *con;
sql::Statement *stmt
sql::ResultSet *res;
// ...
stmt = con->createStatement();
// ...

res = stmt->executeQuery("SELECT id, label FROM test ORDER BY id ASC");
while (res->next()) {
    // You can use either numeric offsets...
    cout << "id = " <&& res->getInt(0);
    // ... or column names for accessing results. »
    The latter is recommended.
    cout << ", label = '" <&& res->getString("label") << "' << endl;
}

delete res;
delete stmt;
delete con;
```

Note that you have to free `sql::Statement`, `sql::Connection` and `sql::ResultSet` objects explicitly using `delete`.

The usage of cursors is demonstrated in the examples contained in the download package.

20.6.5.4. MySQL Connector/C++ Using Prepared Statements

If you are not familiar with Prepared Statements on MySQL have an extra look at the source code comments and explanations in the file `examples/prepared_statement.cpp`.

`sql::PreparedStatement` is created by passing a SQL query to `sql::Connection::prepareStatement()`. As `sql::PreparedStatement` is derived from `sql::Statement`, you will feel familiar with the API once you have learned how to use (simple) statements (`sql::Statement`). For example, the syntax for fetching results is identical.

```
// ...
sql::Connection *con;
sql::PreparedStatement *prep_stmt
// ...

prep_stmt = con->prepareStatement("INSERT INTO test(id, label) VALUES (?, ?);");
```

```

prep_stmt->setInt(1, 1);
prep_stmt->setString(2, "a");
prep_stmt->execute();

prep_stmt->setInt(1, 2);
prep_stmt->setString(2, "b");
prep_stmt->execute();

delete prep_stmt;
delete con;

```

As usual, you have to free `sql::PreparedStatement` and `sql::Connection` objects explicitly.

20.6.5.5. MySQL Connector/C++ Complete Example 1

The following code shows a complete example of how to use MySQL Connector/C++:

```

/* Standard C++ includes */
#include <stdlib.h>
#include <iostream>

/*
  Include directly the different
  headers from cppconn/ and mysql_driver.h + mysql_util.h
  (and mysql_connection.h). This will reduce your build time!
*/
#include "mysql_connection.h"

#include <cppconn/driver.h>
#include <cppconn/exception.h>
#include <cppconn/resultset.h>
#include <cppconn/statement.h>

using namespace std;

int main(void)
{
  cout << endl;
  cout << "Running 'SELECT 'Hello World!' AS _message' >
    AS _message'..." << endl;

  try {
    sql::Driver *driver;
    sql::Connection *con;
    sql::Statement *stmt;
    sql::ResultSet *res;

    /* Create a connection */
    driver = get_driver_instance();
    con = driver->connect("tcp://127.0.0.1:3306", "root", "root");
    /* Connect to the MySQL test database */
    con->setSchema("test");

    stmt = con->createStatement();
    res = stmt->executeQuery("SELECT 'Hello World!' AS _message");
    while (res->next()) {
      cout << "\t... MySQL replies: ";
      /* Access column data by alias or column name */
      cout << res->getString("_message") << endl;
      cout << "\t... MySQL says it again: ";
      /* Access column data by numeric offset, 1 is the first column */
      cout << res->getString(1) << endl;
    }
    delete res;
    delete stmt;
    delete con;

  } catch (sql::SQLException &e) {
    cout << "# ERR: SQLException in " << __FILE__;
    cout << "(" << __FUNCTION__ << ") on line " >
      << __LINE__ << endl;
    cout << "# ERR: " << e.what();

```

```

    cout << " (MySQL error code: " << e.getErrorCode();
    cout << ", SQLState: " << e.getSQLState() << ") " << endl;
}

cout << endl;

return EXIT_SUCCESS;
}

```

20.6.5.6. MySQL Connector/C++ Complete Example 2

The following code shows a complete example of how to use MySQL Connector/C++:

```

/* Copyright 2008 Sun Microsystems, Inc.

*/

/* Standard C++ includes */
#include <stdlib.h>
#include <iostream>

/*
   Include directly the different
   headers from cppconn/ and mysql_driver.h + mysql_util.h
   (and mysql_connection.h). This will reduce your build time!
*/
#include "mysql_connection.h"

#include <cppconn/driver.h>
#include <cppconn/exception.h>
#include <cppconn/resultset.h>
#include <cppconn/statement.h>
#include <cppconn/prepared_statement.h>

using namespace std;

int main(void)
{
    cout << endl;
    cout << "Let's have MySQL count from 10 to 1..." << endl;

    try {
        sql::Driver *driver;
        sql::Connection *con;
        sql::Statement *stmt;
        sql::ResultSet *res;
        sql::PreparedStatement *pstmt;

        /* Create a connection */
        driver = get_driver_instance();
        con = driver->connect("tcp://127.0.0.1:3306", "root", "root");
        /* Connect to the MySQL test database */
        con->setSchema("test");

        stmt = con->createStatement();
        stmt->execute("DROP TABLE IF EXISTS test");
        stmt->execute("CREATE TABLE test(id INT)");
        delete stmt;

        /* '?' is the supported placeholder syntax */
        pstmt = con->prepareStatement("INSERT INTO test(id) VALUES (?)");
        for (int i = 1; i <= 10; i++) {
            pstmt->setInt(1, i);
            pstmt->executeUpdate();
        }
        delete pstmt;

        /* Select in ascending order */
        pstmt = con->prepareStatement("SELECT id FROM test ORDER BY id ASC");
        res = pstmt->executeQuery();

        /* Fetch in reverse = descending order! */
        res->afterLast();
        while (res->previous())
            cout << "\t... MySQL counts: " << res->getInt("id") << endl;
        delete res;
    }
}

```

```

delete pstmt;
delete con;

} catch (sql::SQLException &e) {
cout << "# ERR: SQLException in " << __FILE__;
cout << "(" << __FUNCTION__ << ") on line " <<
    << __LINE__ << endl;
cout << "# ERR: " << e.what();
cout << " (MySQL error code: " << e.getErrorCode();
cout << ", SQLState: " << e.getSQLState() << "
    " )" << endl;
}

cout << endl;

return EXIT_SUCCESS;
}

```

20.6.6. MySQL Connector/C++ Debug Tracing

Caution

Please note, official support is not available for the beta version of MySQL Connector/C++.

Although a debugger can be used to debug your application, you may find it beneficial to turn on the debug traces of the connector. Some problems happen randomly which makes them difficult to debug using a debugger. In such cases debug traces and protocol files are more useful because they allow you to trace the activities of all instances of your program.

DTrace is a very powerful technology to trace any application without having to develop an extra trace module for your application. Unfortunately, DTrace is currently only available on OpenSolaris, Solaris, MacOS 10.5 and FreeBSD.

The MySQL Connector/C++ can write two trace files:

1. Trace file generated by the MySQL Client Library
2. Trace file generated internally by MySQL Connector/C++

The first trace file can be generated by the underlying MySQL Client Library (libmysql). To enable this trace the connector will call the C-API function `mysql_debug()` internally. Only debug versions of the MySQL Client Library are capable of writing a trace file. Therefore you need to compile MySQL Connector/C++ against a debug version of the library, if you want utilize this trace. The trace shows the internal function calls and the addresses of internal objects as you can see below:

```

>mysql_stmt_init
|
| >_mymalloc
|   enter: Size: 816
|   exit: ptr: 0x68e7b8
| <_mymalloc | >init_alloc_root
|   enter: root: 0x68e7b8
|   >_mymalloc
|     enter: Size: 2064
|     exit: ptr: 0x68eb28
| [...]

```

The second trace is the MySQL Connector/C++ internal trace. It is available with debug and non-debug builds of the connector as long as you have enabled the tracing module at compile time using `cmake -DMYSQLCPPCONN_TRACE_ENABLE=BOOL=1`. By default, the tracing functionality is not available and calls to trace functions are removed by the preprocessor.

Compiling the connector with tracing functionality enabled will cause two additional tracing function calls per each connector function call. You will need to run your own benchmark to find out how much this will impact the performance of your application.

A simple test using a loop running 30,000 INSERT SQL statements showed no significant real-time impact. The two variants of this application using a trace enabled and trace disabled version of the connector performed equally well. The run time measured in real-time was not significantly impacted as long as writing a debug trace was not enabled. However, there will be a difference in the time spent in the application. When writing a debug trace the IO subsystem may become a bottleneck.

In summary, use connector builds with tracing enabled carefully. Trace enabled versions may cause higher CPU usage even if the overall run time of your application is not impacted significantly.

```

| INF: Tracing enabled
| <MySQL_Connection::setClientOption
| >MySQL_Prepared_Statement::setInt
|   INF: this=0x69a2e0
|   >MySQL_Prepared_Statement::checkClosed
|   <MySQL_Prepared_Statement::checkClosed
|   <MySQL_Prepared_Statement::setInt
| [...]

```

The example from [examples/debug.cpp](#) demonstrates how to activate the debug traces in your program. Currently they can only be activated through API calls. The traces are controlled on a per-connection basis. You can use the `setClientOptions()` method of a connection object to activate and deactivate the generation of a trace. The MySQL Client Library trace is always written into a file, whereas the connector's protocol messages are printed to standard out.

```
sql::Driver *driver;
int on_off = 1;

/* Using the Driver to create a connection */
driver = get_driver_instance();
std::auto_ptr< sql::Connection > con(driver->connect(host, user, pass));

/*
Activate debug trace of the MySQL Client Library (C-API)
Only available with a debug build of the MySQL Client Library!
*/
con->setClientOption("libmysql_debug", "d:t:0,client.trace");

/*
Tracing is available if you have compiled the driver using
cmake -DMYSQLCPPCONN_TRACE_ENABLE=BOOL=1
*/
con->setClientOption("client_trace", &on_off);
```

20.6.7. MySQL Connector/C++ References

Caution

Please note, official support is not available for the beta version of MySQL Connector/C++.

See the [JDBC overview](#) for information on JDBC 4.0. Please also check the [examples/](#) directory of the download package.

Notes on using the MySQL Connector/C++ API

- `DatabaseMetaData::supportsBatchUpdates()` returns `true` because MySQL supports batch updates in general. However, no API calls for batch updates are provided by the MySQL Connector/C++ API.
- Two non-JDBC methods have been introduced for fetching and setting unsigned integers: `getUInt64()` and `getUInt()`. These are available for `ResultSet` and `PreparedStatement`:

- `ResultSet::getUInt64()`
- `ResultSet::getUInt()`
- `PreparedStatement::setUInt64()`
- `PreparedStatement::setUInt()`

The corresponding `getLong()` and `setLong()` methods have been removed.

- The method `DatabaseMetaData::getColumns()` has 23 columns in its result set, rather than the 22 columns defined by JDBC. The first 22 columns are as described in the JDBC documentation, but column 23 is new:

23. `IS_AUTOINCREMENT`: String which is “YES” if the column is an auto-increment column. Otherwise the string contains “NO”.

- MySQL Connector/C++ may return different metadata for the same column.

When you have any column that accepts a charset and a collation in its specification and you specify a binary collation, such as:

```
CHAR(250) CHARACTER SET 'latin1' COLLATE 'latin1_bin'
```

The server sets the `BINARY` flag in the result set metadata of this column. The method `ResultSetMetadata::getColumnTypeName()` uses the metadata and will report, due to the `BINARY` flag, that the column type name is `BINARY`. This is illustrated below:

```
mysql> create table varbin(a varchar(20) character set utf8 collate utf8_bin);
Query OK, 0 rows affected (0.00 sec)

mysql> select * from varbin;
Field 1: `a`
Catalog: `def`
Database: `test`
Table: `varbin`
Org_table: `varbin`
Type: VAR_STRING
```

```

Collation: latin1_swedish_ci (8)
Length: 20
Max_length: 0
Decimals: 0
Flags: BINARY

0 rows in set (0.00 sec)

mysql> select * from information_schema.columns where table_name='varbin'\G
***** 1. row *****
      TABLE_CATALOG: NULL
      TABLE_SCHEMA: test
      TABLE_NAME: varbin
      COLUMN_NAME: a
      ORDINAL_POSITION: 1
      COLUMN_DEFAULT: NULL
      IS_NULLABLE: YES
      DATA_TYPE: varchar
CHARACTER_MAXIMUM_LENGTH: 20
CHARACTER_OCTET_LENGTH: 60
      NUMERIC_PRECISION: NULL
      NUMERIC_SCALE: NULL
      CHARACTER_SET_NAME: utf8
      COLLATION_NAME: utf8_bin
      COLUMN_TYPE: varchar(20)
      COLUMN_KEY:
      EXTRA:
      PRIVILEGES: select,insert,update,references
      COLUMN_COMMENT:
1 row in set (0.01 sec)

```

However, `INFORMATION_SCHEMA` gives no hint in its `COLUMNS` table that metadata will contain the `BINARY` flag. `DatabaseMetaData::getColumn()` uses `INFORMATION_SCHEMA`. It will report the type name `CHAR` for the same column. Note, a different type code is also returned.

- The MySQL Connector/C++ class `sql::DataType` defines the following JDBC standard data types: `UNKNOWN`, `BIT`, `TINYINT`, `SMALLINT`, `MEDIUMINT`, `INTEGER`, `BIGINT`, `REAL`, `DOUBLE`, `DECIMAL`, `NUMERIC`, `CHAR`, `BINARY`, `VARCHAR`, `VARBINARY`, `LONGVARCHAR`, `LONGVARBINARY`, `TIMESTAMP`, `DATE`, `TIME`, `GEOMETRY`, `ENUM`, `SET`, `SQL-NULL`.

However, the following JDBC standard data types are *not* supported by MySQL Connector/C++: `ARRAY`, `BLOB`, `CLOB`, `DISTINCT`, `FLOAT`, `OTHER`, `REF`, `STRUCT`.

- When inserting or updating `BLOB` or `TEXT` columns, MySQL Connector/C++ developers are advised not to use `setString()`. Instead it is recommended that the dedicated API function `setBlob()` be used instead.

The use of `setString()` can cause a `Packet too large` error message. The error will occur if the length of the string passed to the connector using `setString()` exceeds `max_allowed_packet` (minus a few bytes reserved in the protocol for control purposes). This situation is not handled in MySQL Connector/C++, as this could lead to security issues, such as extremely large memory allocation requests due to malevolently long strings.

However, if `setBlob()` is used, this problem does not arise. This is because `setBlob()` takes a streaming approach based on `std::istream`. When sending the data from the stream to MySQL Server, MySQL Connector/C++ will split the stream into chunks appropriate for MySQL Server and observe the `max_allowed_packet` setting currently being used.

Caution

When using `setString()` it is not possible to set `max_packet_size` to a value large enough for the string, prior to passing it to MySQL Connector/C++. The MySQL 6.0 [documentation](#) for `max_packet_size` states: “As of MySQL 6.0.9, the session value of this variable is read only. Before 6.0.9, setting the session value is allowed but has no effect.”

This difference with the JDBC specification ensures that MySQL Connector/C++ is not vulnerable to memory flooding attacks.

- In general MySQL Connector/C++ works with MySQL 5.0, but it is not completely supported. Some methods may not be available when connecting to MySQL 5.0. This is because the Information Schema is used to obtain the requested information. There are no plans to improve the support for 5.0 because the current GA version of MySQL Server is 5.1. As a new product, MySQL Connector/C++ is primarily targeted at the MySQL Server GA version that was available on its release.

The following methods will throw a `sql::MethodNotImplemented` exception when you connect to MySQL earlier than 5.1.0:

- `DatabaseMetadata::getCrossReference()`
- `DatabaseMetadata::getExportedKeys()`

- MySQL Connector/C++ includes a method `Connection::getClientOption()` which is not included in the JDBC API specification. The prototype is:

```
void getClientOption(const std::string & optionName, void * optionValue)
```

The method can be used to check the value of connection properties set when establishing a database connection. The values are returned through the `optionValue` argument passed to the method with the type `void *`.

Currently, `getClientOption()` supports fetching the `optionValue` of the following options:

- `metadataUseInfoSchema`
- `defaultStatementResultType`
- `defaultPreparedStatementResultType`

The connection option `metadataUseInfoSchema` controls whether to use the `Information_Schemata` for returning the meta data of `SHOW` commands. In the case of `metadataUseInfoSchema` the `optionValue` argument should be interpreted as a boolean upon return.

In the case of both `defaultStatementResultType` and `defaultPreparedStatementResultType`, the `optionValue` argument should be interpreted as an integer upon return.

The connection property can be either set when establishing the connection through the connection property map or using `void Connection::setClientOption(const std::string & optionName, const void * optionValue)` where `optionName` is assigned the value `metadataUseInfoSchema`.

Some examples are given below:

```
int defaultStmtResType;
int defaultPStmtResType;
conn->getClientOption("defaultStatementResultType", (void *) &defaultStmtResType);
conn->getClientOption("defaultPreparedStatementResultType", (void *) &defaultPStmtResType);

bool isInfoSchemaUsed;
conn->getClientOption("metadataUseInfoSchema", (void *) &isInfoSchemaUsed);
```

- MySQL Connector/C++ also supports the following methods not found in the JDBC API standard:

```
std::string MySQL_Connection::getSessionVariable(const std::string & varname)
```

```
void MySQL_Connection::setSessionVariable(const std::string & varname, const std::string & value)
```

Note that both methods are members of the `MySQL_Connection` class. The methods get and set MySQL session variables.

`setSessionVariable()` is equivalent to executing:

```
SET SESSION <varname> = <value>
```

`getSessionVariable()` is equivalent to executing the following and fetching the first return value:

```
SHOW SESSION VARIABLES LIKE "<varname>"
```

You can use “%” and other placeholders in `<varname>`, if the underlying MySQL server supports this.

20.6.8. MySQL Connector/C++ Known Bugs and Issues

Caution

Please note, official support is not available for the beta version of MySQL Connector/C++.

Note

Please report bugs through [MySQL Bug System](#).

Known bugs:

None.

Known issues:

- When linking against a static library for 1.0.3 on Windows you need to define `CPPDBC_PUBLIC_FUNC` either in the compiler options (preferable) or with `/D "CPPCONN_PUBLIC_FUNC="`. You can also explicitly define it in your code by placing `#define CPPCONN_PUBLIC_FUNC` before the header inclusions.
- Generally speaking C++ library binaries are less portable than C library binaries. Issues can be caused by name mangling, different Standard Template Library (STL) versions and using different compilers and linkers for linking against the libraries than were used for building the library itself.

Even a small change in the compiler version can, but does not have to, cause problems. If you obtain error messages, that you suspect are related to binary incompatibilities, build MySQL Connector/C++ from source, using the same compiler and linker that you will use to build and link your application.

Due to the variations between Linux distributions, compiler and linker versions and STL versions, it is not possible to provide binaries for each and every possible configuration. However, the MySQL Connector/C++ binary distributions contain a [README](#) file that describes the environment and settings used to build the binary versions of the libraries.

- To avoid potential crashes the build configuration of MySQL Connector/C++ should match the build configuration of the application using it. For example, do not use the release build of MySQL Connector/C++ with a debug build of the client application.

See also the MySQL Connector/C++ Changelogs which can be found here [Section C.8, “MySQL Connector/C++ Change History”](#).

20.6.9. MySQL Connector/C++ Feature requests

Caution

Please note, official support is not available for the beta version of MySQL Connector/C++.

You can suggest new features in the first instance by joining the mailing list or forum and talking with the developers directly. See [Section 20.6.10, “MySQL Connector/C++ Support”](#)

The following feature requests are currently being worked on:

- C++ references for [Statements](#), [ResultSets](#), and exceptions, are being considered, instead of pointers to heap memory. This reduces the exception handling burden for the programmer.
- Adopt STL (suggestions are welcome).
- JDBC compliance: datatype interfaces and support through `ResultSet:getType()` and `PreparedStatement:bind()`. Introduce `sql::Blob`, `sql::Clob`, `sql::Date`, `sql::Time`, `sql::Timestamp`, `sql::URL`. Support `get|setBlob()`, `get|setClob()`, `get|setDate()`, `get|setTime()`, `get|setTimestamp()`, `get|setURL()`
- Add support for all C-API connection options. Improved support for `mysql_options`.
- Add connect method which supports passing options using HashMaps.
- Create Windows installer.

20.6.10. MySQL Connector/C++ Support

Caution

Please note, official support is not available for the beta version of MySQL Connector/C++.

For general discussion of the MySQL Connector/C++ please use the [C/C++ community forum](#) or join the [MySQL Connector/C++ mailing list](#).

Bugs can be reported at the [MySQL bug website](#).

For Licensing questions, and to purchase MySQL Products and Services, please [Contact MySQL](#)

The MySQL Connector/C++ Changelogs can be found here [Section C.8, “MySQL Connector/C++ Change History”](#)

20.6.11. MySQL Connector/C++ FAQ

Questions

- [20.6.11.1](#): What is MySQL Connector/C++?
- [20.6.11.2](#): Which MySQL Server version(s) is MySQL Connector/C++ compatible with?
- [20.6.11.3](#): Does MySQL Connector/C++ implement the client-server protocol?
- [20.6.11.4](#): Are any MySQL products using MySQL Connector/C++?

Questions and Answers

20.6.11.1: What is MySQL Connector/C++?

MySQL Connector/C++ is a MySQL database connector for C++. It allows you develop applications in C++ that connect to the MySQL Server. MySQL Connector/C++ is compatible with the JDBC 4.0 API.

20.6.11.2: Which MySQL Server version(s) is MySQL Connector/C++ compatible with?

MySQL Connector/C++ fully supports MySQL Server version 5.1 and later.

20.6.11.3: Does MySQL Connector/C++ implement the client-server protocol?

No. MySQL Connector/C++ uses the MySQL Client Library for the client-server communication.

20.6.11.4: Are any MySQL products using MySQL Connector/C++?

Yes, MySQL Workbench and MySQL Connector/OpenOffice.org.

20.7. MySQL Connector/C

What is MySQL Connector/C?

MySQL Connector/C is a C client library for client-server communication. It is a standalone replacement for the MySQL Client Library shipped with the MySQL Server.

Why have a replacement for MySQL Client Library?

There is no need to compile or install the MySQL Server package if you only need the client library.

MySQL Connector/C does not rely on the MySQL Server release cycle, so bug fixes and new features are released more often.

MySQL Connector/C API documentation is available [online](#).

Supported platforms include:

- Windows
- Windows x64
- Linux
- Solaris
- FreeBSD
- Mac OS X
- HP-UX
- IBM AIX
- IBM i5/OS

20.7.1. Building MySQL Connector/C from the Source Code

Obtaining the Source Code

The source can be downloaded as a Zip file or tar-ball from the source repository on [Launchpad](#).

- **Building on Unix**

Examples of supported Unix or Unix-like operating systems include:

- Solaris
- Linux
- HP-UX
- AIX
- OS X

Compiler Tools

Ideally, the native compiler tool set for the target platform is used for compilation. This would be SunStudio for Solaris and aCC for HP-UX for example. However, the GNU tool-chain can be used across all platforms.

You also need CMake 2.6 or newer, which is available [online](#).

To Build

If using GNU AutoTools change to the MySQL Connector/C source directory and follow the procedure below.

1. To generate the makefile enter:

```
shell> cmake -G "Unix Makefiles"
```

or for a Debug build enter:

```
shell> cmake -G "Unix Makefiles" -DCMAKE_BUILD_TYPE=Debug
```

2. Then build the project using:

```
shell> make
```

To Install

By default make install will install the MySQL Connector/C files in the `/usr/local` directory. You can change this behavior by specifying another directory when generating the [makefile](#):

```
shell> cmake -G "Unix Makefiles" -DCMAKE_INSTALL_PREFIX=/mypath
```

Now, in the root shell, enter the following to install the MySQL Connector/C libraries and tools:

```
root-shell> make install
```

At this point all of the MySQL Connector/C files will be in place.

- **Building on Microsoft Windows**

Older versions of Microsoft Windows are not supported. Supported versions are Windows 2000, Windows XP, Windows Vista, Windows Server 2003, or Windows Server 2008.

Compiler Tools

Microsoft Visual Studio 8 and 9 are recommended. The Express Edition of Visual Studio and other compilers may work, but are untested.

You also need CMake 2.6 or newer, available at <http://www.cmake.org>

To Build

You need to have the environment variables set for the Visual Studio toolchain. Visual Studio includes a batch file to set these for you, and installs a shortcut into the **START** menu to open a command prompt with these variables set.

Build MySQL Connector/C using the CMake command-line tool by entering the following from the source root directory in a command prompt window:

```
shell> cmake -G "Visual Studio 9 2008"
```

This produces a project file that you can open with Visual Studio or build from the command line with either of:

```
shell> devenv.com libmysql.sln /build Release
```

```
shell> devenv.com libmysql.sln /build RelWithDebInfo
```

For other versions of Visual Studio or `nmake` based build, run the following command:

```
shell> cmake --help
```

to check the supported generators.

To compile the Debug build, you must run set the CMake build type so the correct version of external libraries are used:

```
shell> cmake -G "Visual Studio 8 2005" -DCMAKE_BUILD_TYPE=Debug
```

Followed by:

```
shell> devenv.com libmysql.sln /build Debug
```

To Install

To create a install package you can choose between two variants:

1. Creating a Zip package
2. Creating an MSI install package

- **Zip package**

To create a Zip package, run the `cpack` command from the root of your MySQL Connector/C source directory.

- **MSI Install package**

The required tools include Windows XML Installer toolset (WIX), which is available [online](#).

To create the MSI install package change to the subdirectory `win` and generate the `makefile`:

```
shell> cmake -G "NMake Makefiles"
```

Create the MSI install package by calling `nmake`:

```
shell> nmake
```

20.7.2. Testing MySQL Connector/C

For testing MySQL Connector/C you will need a running MySQL server instance. Before you run the test suite you need to specify the following environment variables:

- `MYSQL_TEST_HOST` (default localhost)
- `MYSQL_TEST_USER`
- `MYSQL_TEST_PASSWD`
- `MYSQL_TEST_PORT`
- `MYSQL_TEST_SOCKET`
- `MYSQL_TEST_DB` (default test)

To run the test suite, execute `ctest` from the command line:

```
shell> ctest
```

20.7.3. MySQL Connector/C FAQ

Questions

- [20.7.3.1](#): What is “libmysqld”?
- [20.7.3.2](#): What is “MySQL Connector/C”?
- [20.7.3.3](#): What is the “MySQL Native C API”? What are its typical benefits and use cases?
- [20.7.3.4](#): What is the difference between “Native C API”, “libmysql”, “libmysqld” and “MySQL Connector/C”?
- [20.7.3.5](#): Does MySQL Connector/C replace any of “Native C API”, “libmysql” and “libmysqld”?
- [20.7.3.6](#): What is “libmysql”?

Questions and Answers

20.7.3.1: What is “libmysqld”?

`libmysqld` is an embedded database server with the same API as MySQL Connector/C. It is included with the MySQL Server distribution.

20.7.3.2: What is “MySQL Connector/C”?

MySQL Connector/C is a standalone distribution of the `libmysql` library, which was previously only available as part of the MySQL Server distribution. The version of `libmysql` included with MySQL Connector/C and the version bundled with the server are functionally equivalent, but the cross-platform build system for MySQL Connector/C uses CMake.

20.7.3.3: What is the “MySQL Native C API”? What are its typical benefits and use cases?

MySQL Connector/C, also known as `libmysql`, or MySQL Native C API, is a standalone, C-based API and library that you can use in C applications to connect with the MySQL Server. It implements the same MySQL client API that has been in use for a decade.

It is also used as the foundation for drivers for standard database APIs such as ODBC, Perl's DBI, and Python's DB API.

20.7.3.4: What is the difference between “Native C API”, “libmysql”, “libmysqld” and “MySQL Connector/C”?

MySQL Connector/C and `libmysql` are the “native C API for MySQL”, and all three terms can be used interchangeably. “libmysqld” is the embedded version of the MySQL Server, and is included in the server distribution.

20.7.3.5: Does MySQL Connector/C replace any of “Native C API”, “libmysql” and “libmysqld”?

MySQL Connector/C contains `libmysql`, and implements a native C API. It does not include `libmysqld`, which can be found with the MySQL server distribution.

20.7.3.6: What is “libmysql”?

`libmysql` is the name of the library that MySQL Connector/C provides.

20.8. MySQL Connector/OpenOffice.org

MySQL Connector/OpenOffice.org is a native MySQL database connector for OpenOffice.org. Currently, it is in preview status and supports OpenOffice.org 2.4 only. It can be used to connect OpenOffice.org applications to a MySQL server.

Before MySQL Connector/OpenOffice.org became available you would have to use MySQL Connector/J (JDBC) or MySQL Connector/ODBC to connect to a MySQL server.

Connector/OpenOffice.org is a community project, although Sun Microsystems actively contributes code. The source code for Connector/OpenOffice.org is available under GPL with the FLOSS License Exception.

In the future a closed-source StarOffice version of Connector/OpenOffice.org will be made available.

Advantages

Using MySQL Connector/OpenOffice.org has the following advantages:

- Easy installation through the OpenOffice.org Extension Manager.
- Seamless integration into OpenOffice.org.
- No need to go through an additional Connector installation routine (ODBC/JDBC)
- No need to configure or register an additional Connector (ODBC)
- No need to install or configure a driver manager (ODBC)

Status

MySQL Connector/OpenOffice.org is available as a development preview version. We kindly ask users and developers to try it out and provide us with feedback. We do not encourage you to use it in production environments, though.

Note

Sun Microsystems does not provide formal support for Connector/OpenOffice.org.

If you have any queries please contact us through our mailing list at [<users@dba.openoffice.org>](mailto:users@dba.openoffice.org)

20.8.1. Installation

1. Install or upgrade to OpenOffice.org 2.4.
2. Download MySQL Connector/OpenOffice.org from [The OpenOffice.org download site](#). Save the file, `mysql-native-win32.oxt` or `mysql-native-linux.oxt`, respectively, to a location of your choice, for example `My Documents` or `~/Documents`.
3. Add the `.oxt` extension through the Extension Manager of OpenOffice.org. In OpenOffice.org, select **TOOLS, EXTENSION MANAGER...** and specify the `.oxt` file as a new extension. When done, MySQL Connector/OpenOffice.org will show up as a new extension under **MY EXTENSIONS**.

Figure 20.62. Adding an extension

- Restart OpenOffice.org.

20.8.2. Getting Started: Connecting to MySQL

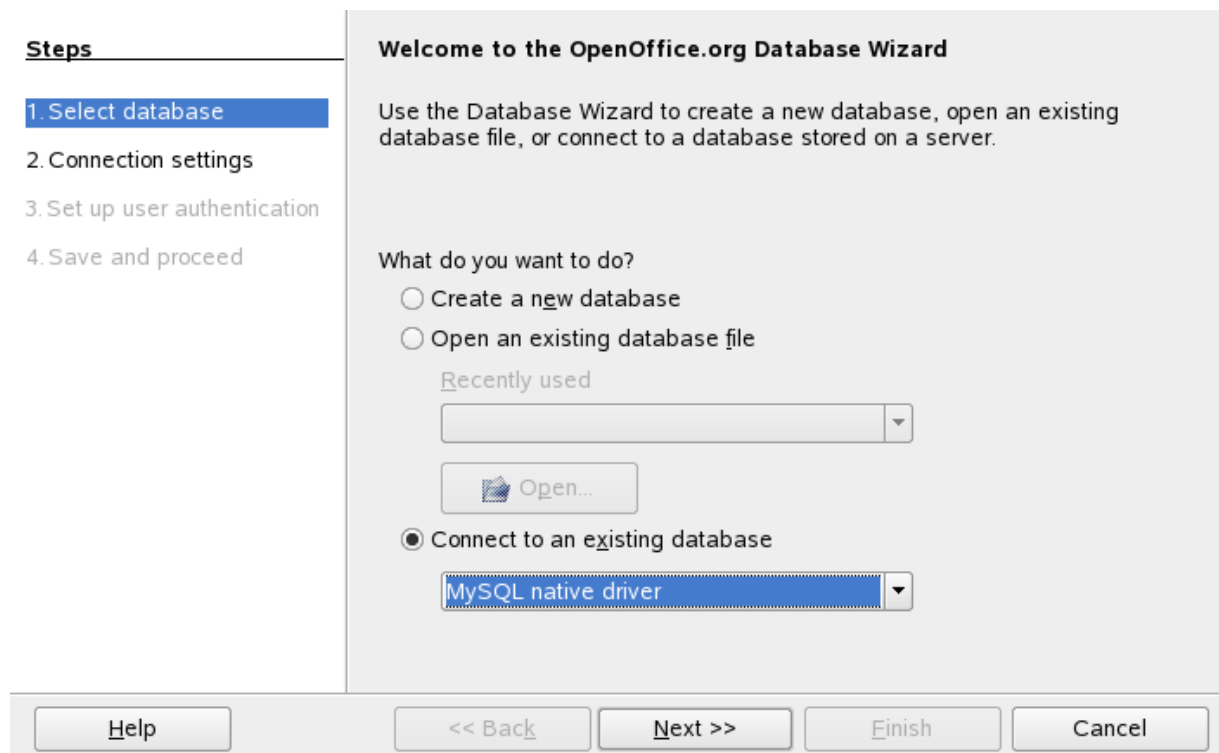

MySQL Connector/OpenOffice.org allows you to access the MySQL Server and its schemata from the OpenOffice.org suite. Currently the connector is in preview status, and only OpenOffice.org 2.4 is supported.

The following example demonstrates the creation of a new OpenOffice.org Base database which uses a local MySQL Server for storage and the new connector for connecting.

- Select the database

Create a new database by selecting **FILE, NEW, DATABASE**. This starts a wizard that allows you to create a new, open an existing, or connect to existing database. Select the latter option. From the drop-down list, select MySQL native driver. Click **NEXT >>**.

Figure 20.63. Selecting the database

- Fill in the connection settings

Under **MYSQL NATIVE DRIVER**, fill in the host name, and optionally a database name, and port name, for example:

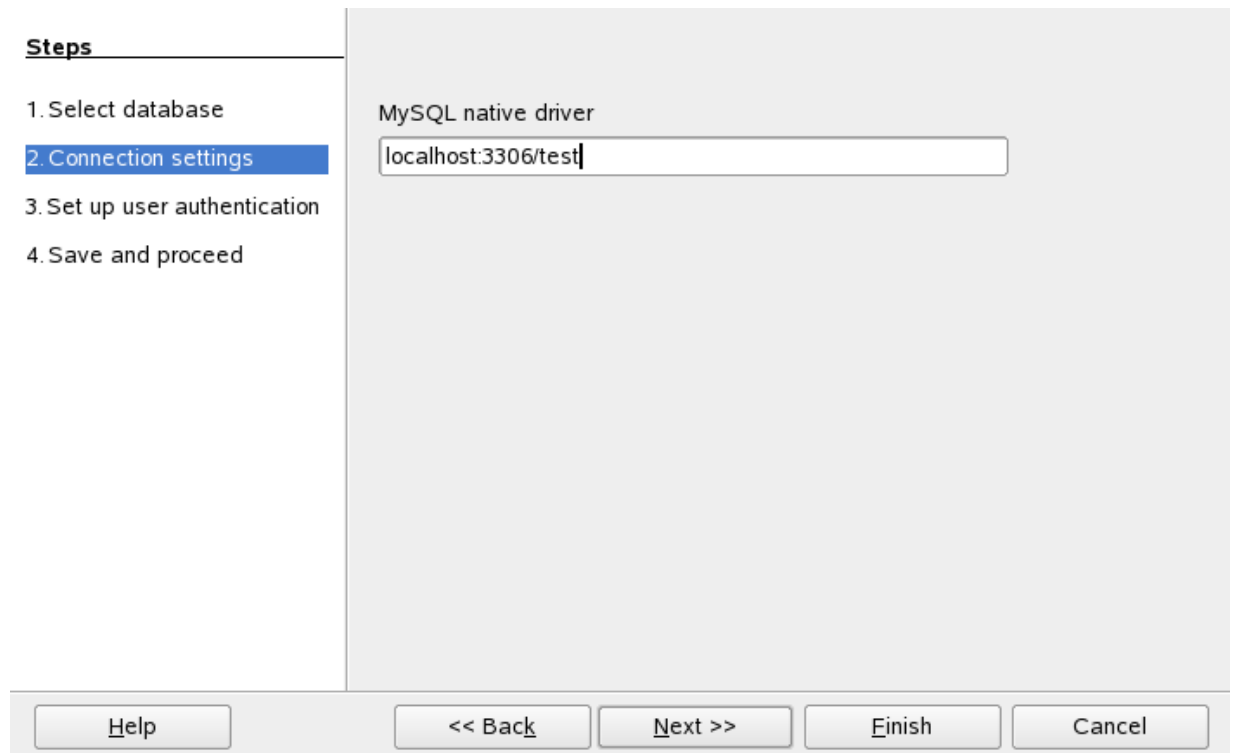

localhost/test

This will connect to a MySQL server running on the local host and select the test database. Note that if you do not specify a database the process below will still work, and all databases will be available for selection.

On Linux, you may have to specify an IP number and a port number instead, due to a limitation in Connector/OpenOffice.org. You have to do so if your MySQL socket file is not `/tmp/mysql.sock`. Enter your data using the format illustrated in the following example:

127.0.0.1:3306/test

This will connect to a MySQL server running on the local host, but do so via TCP/IP using 3306 as the port number. Click **NEXT >>**.

Figure 20.64. Entering connection settings

3. Fill in credentials

If you are using MySQL server's anonymous account without a password, you do not have to fill in anything in this step. Otherwise, fill in your MySQL user name and check the password checkbox. Note, for security reasons, you should not normally use the anonymous account without a password.

Figure 20.65. Setting up user authentication

You can now test your connection to the MySQL database server by clicking the TEST CONNECTION button. Check the checkbox if you do not want OpenOffice.org to ask you for your password again in the current session. Testing the connection is optional, although recommended.

Figure 20.66. Entering user credentials

Click NEXT >>.

4. Finish the wizard

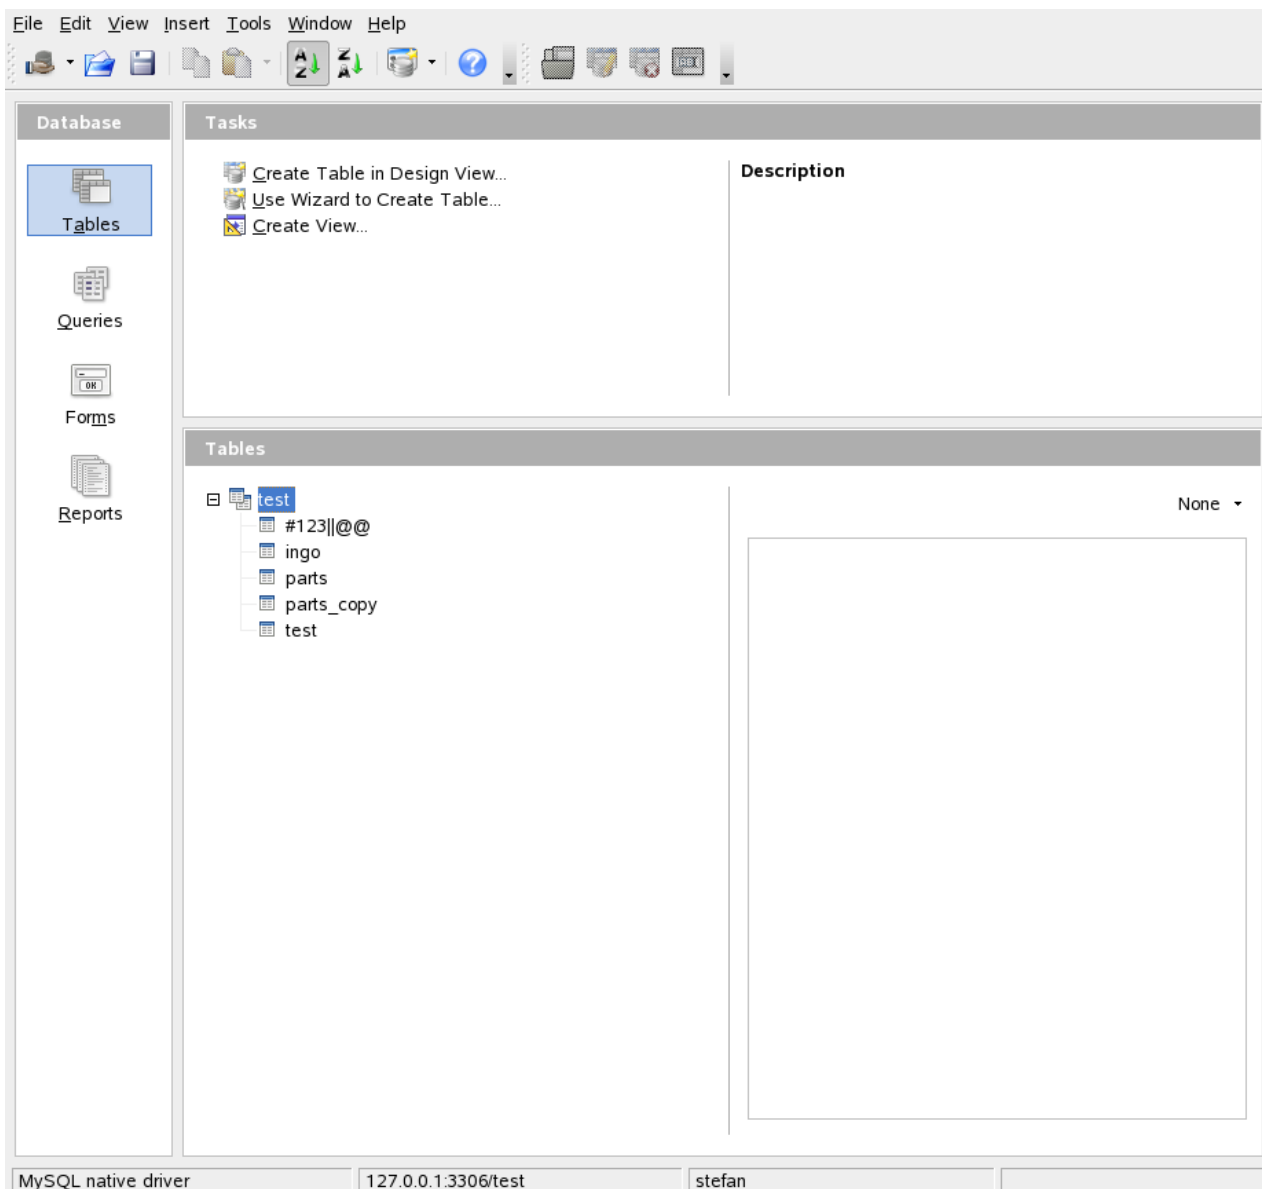

Leave the default settings and click FINISH. You will be forwarded to the OpenOffice.org Base main window. Note that you can invoke the wizard again at any point by right-clicking in the **TABLES** section of the **BASE** main window and selecting **DATABASE, CONNECTION TYPE**.

20.8.3. Getting Started: Usage Examples

Listing Tables

In the **DATABASE** area of the **BASE** main window, select **TABLES**. If this is the first time you are accessing the database you will be prompted for your credentials (user name and password); you can store these settings for your current Base session.

Figure 20.67. Listing tables

Depending on your connection settings you will now see all databases with all their tables, or just the database you have specified in the connection settings.

20.8.4. References

See the [OpenOffice.org website](http://openoffice.org) for documentation of the office suite and its Extension Manager.

20.8.5. Known Bugs

If you discover a bug in Connector/OpenOffice.org please [add it to this list](#) and send an email to users@dba.openoffice.org. You need to be logged in with an OpenOffice.org account for both; see the [project mailing list](#) for details.

20.8.6. Contact

To discuss the new MySQL Connector/OpenOffice.org, please subscribe to the mailing list users@dba.openoffice.org. It is a low-volume list with less than 10 mails per day.

20.9. libmysqld, the Embedded MySQL Server Library

The embedded MySQL server library makes it possible to run a full-featured MySQL server inside a client application. The main benefits are increased speed and more simple management for embedded applications.

The embedded server library is based on the client/server version of MySQL, which is written in C/C++. Consequently, the embedded server also is written in C/C++. There is no embedded server available in other languages.

The API is identical for the embedded MySQL version and the client/server version. To change an old threaded application to use the embedded library, you normally only have to add calls to the following functions.

Function	When to Call
<code>mysql_library_init()</code>	Should be called before any other MySQL function is called, preferably early in the <code>main()</code> function.
<code>mysql_library_end()</code>	Should be called before your program exits.
<code>mysql_thread_init()</code>	Should be called in each thread you create that accesses MySQL.
<code>mysql_thread_end()</code>	Should be called before calling <code>pthread_exit()</code>

Then you must link your code with `libmysqld.a` instead of `libmysqlclient.a`. To ensure binary compatibility between your application and the server library, be sure to compile your application against headers for the same series of MySQL that was used to compile the server library. For example, if `libmysqld` was compiled against MySQL 4.1 headers, do not compile your application against MySQL 5.1 headers, or vice versa.

The `mysql_library_xxx()` functions are also included in `libmysqlclient.a` to allow you to change between the embedded and the client/server version by just linking your application with the right library. See [Section 20.10.3.40](#), “`mysql_library_init()`”.

One difference between the embedded server and the standalone server is that for the embedded server, authentication for connections is disabled by default. To use authentication for the embedded server, specify the `-with-embedded-privilege-control` option when you invoke `configure` to configure your MySQL distribution.

20.9.1. Compiling Programs with `libmysqld`

In precompiled binary MySQL distributions that include `libmysqld`, the embedded server library, MySQL builds the library using the appropriate vendor compiler if there is one.

To get a `libmysqld` library if you build MySQL from source yourself, you should configure MySQL with the `-with-embedded-server` option. See [Section 2.10.2](#), “Typical configure Options”.

When you link your program with `libmysqld`, you must also include the system-specific `pthread` libraries and some libraries that the MySQL server uses. You can get the full list of libraries by executing `mysql_config --libmysqld-libs`.

The correct flags for compiling and linking a threaded program must be used, even if you do not directly call any thread functions in your code.

To compile a C program to include the necessary files to embed the MySQL server library into an executable version of a program, the compiler will need to know where to find various files and need instructions on how to compile the program. The following example shows how a program could be compiled from the command line, assuming that you are using `gcc`, use the GNU C compiler:

```
gcc mysql_test.c -o mysql_test -lz `
  /usr/local/mysql/bin/mysql_config --include --libmysqld-libs`
```

Immediately following the `gcc` command is the name of the C program source file. After it, the `-o` option is given to indicate that the file name that follows is the name that the compiler is to give to the output file, the compiled program. The next line of code tells the compiler to obtain the location of the include files and libraries and other settings for the system on which it is compiled. Because of a problem with `mysql_config`, the option `-lz` (for compression) is added here. The `mysql_config` command is contained in backticks, not single quotes.

On some non-`gcc` platforms, the embedded library depends on C++ runtime libraries and linking against the embedded library might result in missing-symbol errors. To solve this, link using a C++ compiler or explicitly list the required libraries on the link command line.

20.9.2. Restrictions When Using the Embedded MySQL Server

The embedded server has the following limitations:

- No user-defined functions (UDFs).
- No stack trace on core dump.
- You cannot set this up as a master or a slave (no replication).
- Very large result sets may be unusable on low memory systems.
- You cannot connect to an embedded server from an outside process with sockets or TCP/IP. However, you can connect to an intermediate application, which in turn can connect to an embedded server on the behalf of a remote client or outside process.
- **InnoDB** is not reentrant in the embedded server and cannot be used for multiple connections, either successively or simultaneously.
- The Event Scheduler is not available. Because of this, the `event_scheduler` system variable is disabled.

Some of these limitations can be changed by editing the `mysql_embed.h` include file and recompiling MySQL.

20.9.3. Options with the Embedded Server

Any options that may be given with the `mysqld` server daemon, may be used with an embedded server library. Server options may be given in an array as an argument to the `mysql_library_init()`, which initializes the server. They also may be given in an option file like `my.cnf`. To specify an option file for a C program, use the `--defaults-file` option as one of the elements of the second argument of the `mysql_library_init()` function. See [Section 20.10.3.40, “mysql_library_init\(\)”](#), for more information on the `mysql_library_init()` function.

Using option files can make it easier to switch between a client/server application and one where MySQL is embedded. Put common options under the `[server]` group. These are read by both MySQL versions. Client/server-specific options should go under the `[mysqld]` section. Put options specific to the embedded MySQL server library in the `[embedded]` section. Options specific to applications go under section labeled `[ApplicationName_SERVER]`. See [Section 4.2.3.2, “Using Option Files”](#).

20.9.4. Embedded Server Examples

These two example programs should work without any changes on a Linux or FreeBSD system. For other operating systems, minor changes are needed, mostly with file paths. These examples are designed to give enough details for you to understand the problem, without the clutter that is a necessary part of a real application. The first example is very straightforward. The second example is a little more advanced with some error checking. The first is followed by a command-line entry for compiling the program. The second is followed by a GNUmake file that may be used for compiling instead.

Example 1

`test1_libmysqld.c`

```
#include <stdio.h>
#include <stdlib.h>
#include <stdarg.h>
#include "mysql.h"

MYSQL *mysql;
MYSQL_RES *results;
MYSQL_ROW record;

static char *server_options[] = \
    { "mysql_test", "--defaults-file=my.cnf", NULL };
int num_elements = (sizeof(server_options) / sizeof(char *)) - 1;

static char *server_groups[] = { "libmysqld_server",
    "libmysqld_client", NULL };

int main(void)
{
    mysql_library_init(num_elements, server_options, server_groups);
    mysql = mysql_init(NULL);
    mysql_options(mysql, MYSQL_READ_DEFAULT_GROUP, "libmysqld_client");
    mysql_options(mysql, MYSQL_OPT_USE_EMBEDDED_CONNECTION, NULL);

    mysql_real_connect(mysql, NULL,NULL,NULL, "database1", 0,NULL,0);

    mysql_query(mysql, "SELECT column1, column2 FROM table1");

    results = mysql_store_result(mysql);

    while((record = mysql_fetch_row(results)) {
        printf("%s - %s \n", record[0], record[1]);
    }

    mysql_free_result(results);
    mysql_close(mysql);
    mysql_library_end();
}
```

```
    return 0;
}
```

Here is the command line for compiling the above program:

```
gcc test1_libmysqld.c -o test1_libmysqld -lz \
`/usr/local/mysql/bin/mysql_config --include --libmysqld-libs`
```

Example 2

To try out the example, create an `test2_libmysqld` directory at the same level as the MySQL source directory. Save the `test2_libmysqld.c` source and the `GNUmakefile` in the directory, and run GNU `make` from inside the `test2_libmysqld` directory.

test2_libmysqld.c

```
/*
 * A simple example client, using the embedded MySQL server library
 */

#include <mysql.h>
#include <stdarg.h>
#include <stdio.h>
#include <stdlib.h>

MYSQL *db_connect(const char *dbname);
void db_disconnect(MYSQL *db);
void db_do_query(MYSQL *db, const char *query);

const char *server_groups[] = {
    "test2_libmysqld_SERVER", "embedded", "server", NULL
};

int
main(int argc, char **argv)
{
    MYSQL *one, *two;

    /* mysql_library_init() must be called before any other mysql
     * functions.
     *
     * You can use mysql_library_init(0, NULL, NULL), and it
     * initializes the server using groups = {
     *   "server", "embedded", NULL
     * }.
     *
     * In your $HOME/.my.cnf file, you probably want to put:
     [test2_libmysqld_SERVER]
     language = /path/to/source/of/mysql/sql/share/english
     *
     * You could, of course, modify argc and argv before passing
     * them to this function. Or you could create new ones in any
     * way you like. But all of the arguments in argv (except for
     * argv[0], which is the program name) should be valid options
     * for the MySQL server.
     *
     * If you link this client against the normal mysqlclient
     * library, this function is just a stub that does nothing.
     */
    mysql_library_init(argc, argv, (char **)server_groups);

    one = db_connect("test");
    two = db_connect(NULL);

    db_do_query(one, "SHOW TABLE STATUS");
    db_do_query(two, "SHOW DATABASES");

    mysql_close(two);
    mysql_close(one);

    /* This must be called after all other mysql functions */
    mysql_library_end();

    exit(EXIT_SUCCESS);
}

static void
die(MYSQL *db, char *fmt, ...)
{
    va_list ap;
    va_start(ap, fmt);
    vfprintf(stderr, fmt, ap);
    va_end(ap);
    (void)putc('\n', stderr);
    if (db)
        db_disconnect(db);
    exit(EXIT_FAILURE);
}
```

```

MYSQL *
db_connect(const char *dbname)
{
    MYSQL *db = mysql_init(NULL);
    if (!db)
        die(db, "mysql_init failed: no memory");
    /*
     * Notice that the client and server use separate group names.
     * This is critical, because the server does not accept the
     * client's options, and vice versa.
     */
    mysql_options(db, MYSQL_READ_DEFAULT_GROUP, "test2_libmysqld_CLIENT");
    if (!mysql_real_connect(db, NULL, NULL, NULL, dbname, 0, NULL, 0))
        die(db, "mysql_real_connect failed: %s", mysql_error(db));

    return db;
}

void
db_disconnect(MYSQL *db)
{
    mysql_close(db);
}

void
db_do_query(MYSQL *db, const char *query)
{
    if (mysql_query(db, query) != 0)
        goto err;

    if (mysql_field_count(db) > 0)
    {
        MYSQL_RES *res;
        MYSQL_ROW row, end_row;
        int num_fields;

        if (!(res = mysql_store_result(db)))
            goto err;
        num_fields = mysql_num_fields(res);
        while ((row = mysql_fetch_row(res)))
        {
            (void)fputs(">> ", stdout);
            for (end_row = row + num_fields; row < end_row; ++row)
                (void)printf("%s\t", row ? (char*)*row : "NULL");
            (void)fputc('\n', stdout);
        }
        (void)fputc('\n', stdout);
        mysql_free_result(res);
    }
    else
        (void)printf("Affected rows: %lld\n", mysql_affected_rows(db));

    return;
err:
    die(db, "db_do_query failed: %s [%s]", mysql_error(db), query);
}

```

GNUmakefile

```

# This assumes the MySQL software is installed in /usr/local/mysql
inc      := /usr/local/mysql/include/mysql
lib      := /usr/local/mysql/lib

# If you have not installed the MySQL software yet, try this instead
#inc     := $(HOME)/mysql-5.4/include
#lib     := $(HOME)/mysql-5.4/libmysqld

CC       := gcc
CPPFLAGS := -I$(inc) -D_THREAD_SAFE -D_REENTRANT
CFLAGS  := -g -W -Wall
LDFLAGS := -static
# You can change -lmysqld to -lmysqlclient to use the
# client/server library

targets := $(basename $(sources))

all: $(targets)

clean:
    rm -f $(targets) $(objects) *.core

```

20.9.5. Licensing the Embedded Server

We encourage everyone to promote free software by releasing code under the GPL or a compatible license. For those who are not able to do this, another option is to purchase a commercial license for the MySQL code from Sun Microsystems, Inc. For details, please see <http://www.mysql.com/company/legal/licensing/>.

20.10. MySQL C API

The C API code is distributed with MySQL. It is included in the `mysqlclient` library and allows C programs to access a database.

Many of the clients in the MySQL source distribution are written in C. If you are looking for examples that demonstrate how to use the C API, take a look at these clients. You can find these in the `client` directory in the MySQL source distribution.

Most of the other client APIs (all except Connector/J and Connector/NET) use the `mysqlclient` library to communicate with the MySQL server. This means that, for example, you can take advantage of many of the same environment variables that are used by other client programs, because they are referenced from the library. See [Chapter 4, MySQL Programs](#), for a list of these variables.

The client has a maximum communication buffer size. The size of the buffer that is allocated initially (16KB) is automatically increased up to the maximum size (the maximum is 16MB). Because buffer sizes are increased only as demand warrants, simply increasing the default maximum limit does not in itself cause more resources to be used. This size check is mostly a check for erroneous statements and communication packets.

The communication buffer must be large enough to contain a single SQL statement (for client-to-server traffic) and one row of returned data (for server-to-client traffic). Each thread's communication buffer is dynamically enlarged to handle any query or row up to the maximum limit. For example, if you have `BLOB` values that contain up to 16MB of data, you must have a communication buffer limit of at least 16MB (in both server and client). The client's default maximum is 16MB, but the default maximum in the server is 1MB. You can increase this by changing the value of the `max_allowed_packet` parameter when the server is started. See [Section 7.5.3, "Tuning Server Parameters"](#).

The MySQL server shrinks each communication buffer to `net_buffer_length` bytes after each query. For clients, the size of the buffer associated with a connection is not decreased until the connection is closed, at which time client memory is reclaimed.

For programming with threads, see [Section 20.10.17, "How to Make a Threaded Client"](#). For creating a standalone application which includes the "server" and "client" in the same program (and does not communicate with an external MySQL server), see [Section 20.9, "libmysqld, the Embedded MySQL Server Library"](#).

MySQL Enterprise

MySQL Enterprise subscribers will find more information about using the C API in the Knowledge Base articles, [The C API](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

20.10.1. C API Data Types

This section describes C API data types other than those used for prepared statements. For information about the latter, see [Section 20.10.5, "C API Prepared Statement Data Types"](#).

- `MYSQL`

This structure represents a handle to one database connection. It is used for almost all MySQL functions. You should not try to make a copy of a `MYSQL` structure. There is no guarantee that such a copy will be usable.

- `MYSQL_RES`

This structure represents the result of a query that returns rows (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`). The information returned from a query is called the *result set* in the remainder of this section.

- `MYSQL_ROW`

This is a type-safe representation of one row of data. It is currently implemented as an array of counted byte strings. (You cannot treat these as null-terminated strings if field values may contain binary data, because such values may contain null bytes internally.) Rows are obtained by calling `mysql_fetch_row()`.

- `MYSQL_FIELD`

This structure contains information about a field, such as the field's name, type, and size. Its members are described in more detail here. You may obtain the `MYSQL_FIELD` structures for each field by calling `mysql_fetch_field()` repeatedly. Field

values are not part of this structure; they are contained in a `MYSQL_ROW` structure.

- `MYSQL_FIELD_OFFSET`

This is a type-safe representation of an offset into a MySQL field list. (Used by `mysql_field_seek()`.) Offsets are field numbers within a row, beginning at zero.

- `my_ulonglong`

The type used for the number of rows and for `mysql_affected_rows()`, `mysql_num_rows()`, and `mysql_insert_id()`. This type provides a range of 0 to 1.84e19.

On some systems, attempting to print a value of type `my_ulonglong` does not work. To print such a value, convert it to `unsigned long` and use a `%lu` print format. Example:

```
printf ("Number of rows: %lu\n",
        (unsigned long) mysql_num_rows(result));
```

- `my_bool`

A boolean type, for values that are true (nonzero) or false (zero).

The `MYSQL_FIELD` structure contains the members described in the following list:

- `char * name`

The name of the field, as a null-terminated string. If the field was given an alias with an `AS` clause, the value of `name` is the alias.

- `char * org_name`

The name of the field, as a null-terminated string. Aliases are ignored.

- `char * table`

The name of the table containing this field, if it isn't a calculated field. For calculated fields, the `table` value is an empty string. If the column is selected from a view, `table` names the view. If the table or view was given an alias with an `AS` clause, the value of `table` is the alias. For a `UNION`, the value is the empty string.

- `char * org_table`

The name of the table, as a null-terminated string. Aliases are ignored. If the column is selected from a view, `org_table` names the underlying table. For a `UNION`, the value is the empty string.

- `char * db`

The name of the database that the field comes from, as a null-terminated string. If the field is a calculated field, `db` is an empty string. For a `UNION`, the value is the empty string.

- `char * catalog`

The catalog name. This value is always `"def"`.

- `char * def`

The default value of this field, as a null-terminated string. This is set only if you use `mysql_list_fields()`.

- `unsigned long length`

The width of the field. This corresponds to the display length, in bytes.

- `unsigned long max_length`

The maximum width of the field for the result set (the length in bytes of the longest field value for the rows actually in the result set). If you use `mysql_store_result()` or `mysql_list_fields()`, this contains the maximum length for the field. If you use `mysql_use_result()`, the value of this variable is zero.

The value of `max_length` is the length of the string representation of the values in the result set. For example, if you retrieve a `FLOAT` column and the “widest” value is `-12.345`, `max_length` is 7 (the length of `'-12.345'`).

If you are using prepared statements, `max_length` is not set by default because for the binary protocol the lengths of the values depend on the types of the values in the result set. (See [Section 20.10.5, “C API Prepared Statement Data types”](#).) If you want the `max_length` values anyway, enable the `STMT_ATTR_UPDATE_MAX_LENGTH` option with `mysql_stmt_attr_set()` and the lengths will be set when you call `mysql_stmt_store_result()`. (See [Section 20.10.7.3, “mysql_stmt_attr_set\(\)”](#), and [Section 20.10.7.27, “mysql_stmt_store_result\(\)”](#).)

- `unsigned int name_length`
The length of `name`.
- `unsigned int org_name_length`
The length of `org_name`.
- `unsigned int table_length`
The length of `table`.
- `unsigned int org_table_length`
The length of `org_table`.
- `unsigned int db_length`
The length of `db`.
- `unsigned int catalog_length`
The length of `catalog`.
- `unsigned int def_length`
The length of `def`.
- `unsigned int flags`
Different bit-flags for the field. The `flags` value may have zero or more of the following bits set.

Flag Value	Flag Description
<code>NOT_NULL_FLAG</code>	Field can't be <code>NULL</code>
<code>PRI_KEY_FLAG</code>	Field is part of a primary key
<code>UNIQUE_KEY_FLAG</code>	Field is part of a unique key
<code>MULTIPLE_KEY_FLAG</code>	Field is part of a non-unique key
<code>UNSIGNED_FLAG</code>	Field has the <code>UNSIGNED</code> attribute
<code>ZEROFILL_FLAG</code>	Field has the <code>ZEROFILL</code> attribute
<code>BINARY_FLAG</code>	Field has the <code>BINARY</code> attribute
<code>AUTO_INCREMENT_FLAG</code>	Field has the <code>AUTO_INCREMENT</code> attribute
<code>ENUM_FLAG</code>	Field is an <code>ENUM</code> (deprecated)
<code>SET_FLAG</code>	Field is a <code>SET</code> (deprecated)
<code>BLOB_FLAG</code>	Field is a <code>BLOB</code> or <code>TEXT</code> (deprecated)
<code>TIMESTAMP_FLAG</code>	Field is a <code>TIMESTAMP</code> (deprecated)
<code>NO_DEFAULT_VALUE_FLAG</code>	Field has no default value; see additional notes following table

Use of the `BLOB_FLAG`, `ENUM_FLAG`, `SET_FLAG`, and `TIMESTAMP_FLAG` flags is deprecated because they indicate the type of a field rather than an attribute of its type. It is preferable to test `field->type` against `MYSQL_TYPE_BLOB`, `MYSQL_TYPE_ENUM`, `MYSQL_TYPE_SET`, or `MYSQL_TYPE_TIMESTAMP` instead.

`NUM_FLAG` indicates that a column is numeric. This includes columns with a type of `MYSQL_TYPE_DECIMAL`, `MYSQL_TYPE_TINY`, `MYSQL_TYPE_SHORT`, `MYSQL_TYPE_LONG`, `MYSQL_TYPE_FLOAT`, `MYSQL_TYPE_DOUBLE`, `MYSQL_TYPE_NULL`, `MYSQL_TYPE_TIMESTAMP`, `MYSQL_TYPE_LONGLONG`, `MYSQL_TYPE_INT24`, and `MYSQL_TYPE_YEAR`.

`NO_DEFAULT_VALUE_FLAG` indicates that a column has no `DEFAULT` clause in its definition. This does not apply to `NULL`

columns (because such columns have a default of `NULL`), or to `AUTO_INCREMENT` columns (which have an implied default value).

The following example illustrates a typical use of the `flags` value:

```
if (field->flags & NOT_NULL_FLAG)
    printf("Field can't be null\n");
```

You may use the following convenience macros to determine the boolean status of the `flags` value.

Flag Status	Description
<code>IS_NOT_NULL(flags)</code>	True if this field is defined as <code>NOT NULL</code>
<code>IS_PRI_KEY(flags)</code>	True if this field is a primary key
<code>IS_BLOB(flags)</code>	True if this field is a <code>BLOB</code> or <code>TEXT</code> (deprecated; test <code>field->type</code> instead)

- `unsigned int decimals`

The number of decimals for numeric fields.

- `unsigned int charsetnr`

An ID number that indicates the character set/collation pair for the field.

To distinguish between binary and nonbinary data for string data types, check whether the `charsetnr` value is 63. If so, the character set is `binary`, which indicates binary rather than nonbinary data. This enables you to distinguish `BINARY` from `CHAR`, `VARBINARY` from `VARCHAR`, and the `BLOB` types from the `TEXT` types.

`charsetnr` values are the same as those displayed in the `Id` column of the `SHOW COLLATION` statement or the `ID` column of the `INFORMATION_SCHEMA.COLLATIONS` table. You can use those information sources to see which character set and collation specific `charsetnr` values indicate:

```
mysql> SHOW COLLATION WHERE Id = 63;
+-----+-----+-----+-----+-----+-----+
| Collation | Charset | Id | Default | Compiled | Sortlen |
+-----+-----+-----+-----+-----+-----+
| binary   | binary  | 63 | Yes     | Yes     | 1       |
+-----+-----+-----+-----+-----+-----+

mysql> SELECT COLLATION_NAME, CHARACTER_SET_NAME
-> FROM INFORMATION_SCHEMA.COLLATIONS WHERE ID = 33;
+-----+-----+
| COLLATION_NAME | CHARACTER_SET_NAME |
+-----+-----+
| utf8_general_ci | utf8                |
+-----+-----+
```

- `enum enum_field_types type`

The type of the field. The `type` value may be one of the `MYSQL_TYPE_` symbols shown in the following table.

Type Value	Type Description
<code>MYSQL_TYPE_TINY</code>	<code>TINYINT</code> field
<code>MYSQL_TYPE_SHORT</code>	<code>SMALLINT</code> field
<code>MYSQL_TYPE_LONG</code>	<code>INTEGER</code> field
<code>MYSQL_TYPE_INT24</code>	<code>MEDIUMINT</code> field
<code>MYSQL_TYPE_LONGLONG</code>	<code>BIGINT</code> field
<code>MYSQL_TYPE_DECIMAL</code>	<code>DECIMAL</code> or <code>NUMERIC</code> field
<code>MYSQL_TYPE_NEWDECIMAL</code>	Precision math <code>DECIMAL</code> or <code>NUMERIC</code>
<code>MYSQL_TYPE_FLOAT</code>	<code>FLOAT</code> field
<code>MYSQL_TYPE_DOUBLE</code>	<code>DOUBLE</code> or <code>REAL</code> field
<code>MYSQL_TYPE_BIT</code>	<code>BIT</code> field
<code>MYSQL_TYPE_TIMESTAMP</code>	<code>TIMESTAMP</code> field
<code>MYSQL_TYPE_DATE</code>	<code>DATE</code> field
<code>MYSQL_TYPE_TIME</code>	<code>TIME</code> field

<code>MYSQL_TYPE_DATETIME</code>	<code>DATETIME</code> field
<code>MYSQL_TYPE_YEAR</code>	<code>YEAR</code> field
<code>MYSQL_TYPE_STRING</code>	<code>CHAR</code> or <code>BINARY</code> field
<code>MYSQL_TYPE_VAR_STRING</code>	<code>VARCHAR</code> or <code>VARBINARY</code> field
<code>MYSQL_TYPE_BLOB</code>	<code>BLOB</code> or <code>TEXT</code> field (use <code>max_length</code> to determine the maximum length)
<code>MYSQL_TYPE_SET</code>	<code>SET</code> field
<code>MYSQL_TYPE_ENUM</code>	<code>ENUM</code> field
<code>MYSQL_TYPE_GEOMETRY</code>	Spatial field
<code>MYSQL_TYPE_NULL</code>	<code>NULL</code> -type field

You can use the `IS_NUM()` macro to test whether a field has a numeric type. Pass the `type` value to `IS_NUM()` and it evaluates to `TRUE` if the field is numeric:

```
if (IS_NUM(field->type))
    printf("Field is numeric\n");
```

20.10.2. C API Function Overview

The functions available in the C API are summarized here and described in greater detail in a later section. See [Section 20.10.3, “C API Function Descriptions”](#).

Function	Description
<code>my_init()</code>	Initialize global variables, and thread handler in thread-safe programs
<code>mysql_affected_rows()</code>	Returns the number of rows changed/deleted/inserted by the last <code>UPDATE</code> , <code>DELETE</code> , or <code>INSERT</code> query
<code>mysql_autocommit()</code>	Toggles autocommit mode on/off
<code>mysql_change_user()</code>	Changes user and database on an open connection
<code>mysql_character_set_name()</code>	Return default character set name for current connection
<code>mysql_close()</code>	Closes a server connection
<code>mysql_commit()</code>	Commits the transaction
<code>mysql_connect()</code>	Connects to a MySQL server (this function is deprecated; use <code>mysql_real_connect()</code> instead)
<code>mysql_create_db()</code>	Creates a database (this function is deprecated; use the SQL statement <code>CREATE DATABASE</code> instead)
<code>mysql_data_seek()</code>	Seeks to an arbitrary row number in a query result set
<code>mysql_debug()</code>	Does a <code>DEBUG_PUSH</code> with the given string
<code>mysql_drop_db()</code>	Drops a database (this function is deprecated; use the SQL statement <code>DROP DATABASE</code> instead)
<code>mysql_dump_debug_info()</code>	Makes the server write debug information to the log
<code>mysql_eof()</code>	Determines whether the last row of a result set has been read (this function is deprecated; <code>mysql_errno()</code> or <code>mysql_error()</code> may be used instead)
<code>mysql_errno()</code>	Returns the error number for the most recently invoked MySQL function
<code>mysql_error()</code>	Returns the error message for the most recently invoked MySQL function
<code>mysql_escape_string()</code>	Escapes special characters in a string for use in an SQL statement
<code>mysql_fetch_field()</code>	Returns the type of the next table field
<code>mysql_fetch_field_direct()</code>	Returns the type of a table field, given a field number
<code>mysql_fetch_fields()</code>	Returns an array of all field structures
<code>mysql_fetch_lengths()</code>	Returns the lengths of all columns in the current row
<code>mysql_fetch_row()</code>	Fetches the next row from the result set
<code>mysql_field_count()</code>	Returns the number of result columns for the most recent statement
<code>mysql_field_seek()</code>	Puts the column cursor on a specified column

<code>mysql_field_tell()</code>	Returns the position of the field cursor used for the last <code>mysql_fetch_field()</code>
<code>mysql_free_result()</code>	Frees memory used by a result set
<code>mysql_get_character_set_info()</code>	Return information about default character set
<code>mysql_get_client_info()</code>	Returns client version information as a string
<code>mysql_get_client_version()</code>	Returns client version information as an integer
<code>mysql_get_host_info()</code>	Returns a string describing the connection
<code>mysql_get_proto_info()</code>	Returns the protocol version used by the connection
<code>mysql_get_server_info()</code>	Returns the server version number
<code>mysql_get_server_version()</code>	Returns version number of server as an integer
<code>mysql_get_ssl_cipher()</code>	Return current SSL cipher
<code>mysql_hex_string()</code>	Encode string in hexadecimal format
<code>mysql_info()</code>	Returns information about the most recently executed query
<code>mysql_init()</code>	Gets or initializes a <code>MYSQL</code> structure
<code>mysql_insert_id()</code>	Returns the ID generated for an <code>AUTO_INCREMENT</code> column by the previous query
<code>mysql_kill()</code>	Kills a given thread
<code>mysql_library_end()</code>	Finalize the MySQL C API library
<code>mysql_library_init()</code>	Initialize the MySQL C API library
<code>mysql_list_dbs()</code>	Returns database names matching a simple regular expression
<code>mysql_list_fields()</code>	Returns field names matching a simple regular expression
<code>mysql_list_processes()</code>	Returns a list of the current server threads
<code>mysql_list_tables()</code>	Returns table names matching a simple regular expression
<code>mysql_more_results()</code>	Checks whether any more results exist
<code>mysql_next_result()</code>	Returns/initiates the next result in multiple-statement executions
<code>mysql_num_fields()</code>	Returns the number of columns in a result set
<code>mysql_num_rows()</code>	Returns the number of rows in a result set
<code>mysql_options()</code>	Sets connect options for <code>mysql_real_connect()</code>
<code>mysql_ping()</code>	Checks whether the connection to the server is working, reconnecting as necessary
<code>mysql_query()</code>	Executes an SQL query specified as a null-terminated string
<code>mysql_real_connect()</code>	Connects to a MySQL server
<code>mysql_real_escape_string()</code>	Escapes special characters in a string for use in an SQL statement, taking into account the current character set of the connection
<code>mysql_real_query()</code>	Executes an SQL query specified as a counted string
<code>mysql_refresh()</code>	Flush or reset tables and caches
<code>mysql_reload()</code>	Tells the server to reload the grant tables
<code>mysql_rollback()</code>	Rolls back the transaction
<code>mysql_row_seek()</code>	Seeks to a row offset in a result set, using value returned from <code>mysql_row_tell()</code>
<code>mysql_row_tell()</code>	Returns the row cursor position
<code>mysql_select_db()</code>	Selects a database
<code>mysql_server_end()</code>	Finalize the MySQL C API library
<code>mysql_server_init()</code>	Initialize the MySQL C API library
<code>mysql_set_character_set()</code>	Set default character set for current connection
<code>mysql_set_local_infile_default()</code>	Set the <code>LOAD DATA LOCAL INFILE</code> handler callbacks to their default values
<code>mysql_set_local_infile_handler()</code>	Install application-specific <code>LOAD DATA LOCAL INFILE</code> handler callbacks
<code>mysql_set_server_option()</code>	Sets an option for the connection (like <code>multi-statements</code>)
<code>mysql_sqlstate()</code>	Returns the <code>SQLSTATE</code> error code for the last error
<code>mysql_shutdown()</code>	Shuts down the database server
<code>mysql_ssl_set()</code>	Prepare to establish SSL connection to server

<code>mysql_stat()</code>	Returns the server status as a string
<code>mysql_store_result()</code>	Retrieves a complete result set to the client
<code>mysql_thread_end()</code>	Finalize thread handler
<code>mysql_thread_id()</code>	Returns the current thread ID
<code>mysql_thread_init()</code>	Initialize thread handler
<code>mysql_thread_safe()</code>	Returns 1 if the clients are compiled as thread-safe
<code>mysql_use_result()</code>	Initiates a row-by-row result set retrieval
<code>mysql_warning_count()</code>	Returns the warning count for the previous SQL statement

Application programs should use this general outline for interacting with MySQL:

1. Initialize the MySQL library by calling `mysql_library_init()`. This function exists in both the `mysqlclient` C client library and the `mysqld` embedded server library, so it is used whether you build a regular client program by linking with the `-libmysqlclient` flag, or an embedded server application by linking with the `-libmysqld` flag.
2. Initialize a connection handler by calling `mysql_init()` and connect to the server by calling `mysql_real_connect()`.
3. Issue SQL statements and process their results. (The following discussion provides more information about how to do this.)
4. Close the connection to the MySQL server by calling `mysql_close()`.
5. End use of the MySQL library by calling `mysql_library_end()`.

The purpose of calling `mysql_library_init()` and `mysql_library_end()` is to provide proper initialization and finalization of the MySQL library. For applications that are linked with the client library, they provide improved memory management. If you don't call `mysql_library_end()`, a block of memory remains allocated. (This does not increase the amount of memory used by the application, but some memory leak detectors will complain about it.) For applications that are linked with the embedded server, these calls start and stop the server.

In a non-multi-threaded environment, the call to `mysql_library_init()` may be omitted, because `mysql_init()` will invoke it automatically as necessary. However, `mysql_library_init()` is not thread-safe in a multi-threaded environment, and thus neither is `mysql_init()`, which calls `mysql_library_init()`. You must either call `mysql_library_init()` prior to spawning any threads, or else use a mutex to protect the call, whether you invoke `mysql_library_init()` or indirectly via `mysql_init()`. This should be done prior to any other client library call.

To connect to the server, call `mysql_init()` to initialize a connection handler, then call `mysql_real_connect()` with that handler (along with other information such as the host name, user name, and password). Upon connection, `mysql_real_connect()` sets the `reconnect` flag (part of the `MYSQL` structure) to a value of `1` in versions of the API older than 5.0.3, or `0` in newer versions. A value of `1` for this flag indicates that if a statement cannot be performed because of a lost connection, to try reconnecting to the server before giving up. You can use the `MYSQL_OPT_RECONNECT` option to `mysql_options()` to control reconnection behavior. When you are done with the connection, call `mysql_close()` to terminate it.

While a connection is active, the client may send SQL statements to the server using `mysql_query()` or `mysql_real_query()`. The difference between the two is that `mysql_query()` expects the query to be specified as a null-terminated string whereas `mysql_real_query()` expects a counted string. If the string contains binary data (which may include null bytes), you must use `mysql_real_query()`.

For each non-`SELECT` query (for example, `INSERT`, `UPDATE`, `DELETE`), you can find out how many rows were changed (affected) by calling `mysql_affected_rows()`.

For `SELECT` queries, you retrieve the selected rows as a result set. (Note that some statements are `SELECT`-like in that they return rows. These include `SHOW`, `DESCRIBE`, and `EXPLAIN`. They should be treated the same way as `SELECT` statements.)

There are two ways for a client to process result sets. One way is to retrieve the entire result set all at once by calling `mysql_store_result()`. This function acquires from the server all the rows returned by the query and stores them in the client. The second way is for the client to initiate a row-by-row result set retrieval by calling `mysql_use_result()`. This function initializes the retrieval, but does not actually get any rows from the server.

In both cases, you access rows by calling `mysql_fetch_row()`. With `mysql_store_result()`, `mysql_fetch_row()` accesses rows that have previously been fetched from the server. With `mysql_use_result()`, `mysql_fetch_row()` actually retrieves the row from the server. Information about the size of the data in each row is available by calling `mysql_fetch_lengths()`.

After you are done with a result set, call `mysql_free_result()` to free the memory used for it.

The two retrieval mechanisms are complementary. Client programs should choose the approach that is most appropriate for their requirements. In practice, clients tend to use `mysql_store_result()` more commonly.

An advantage of `mysql_store_result()` is that because the rows have all been fetched to the client, you not only can access rows sequentially, you can move back and forth in the result set using `mysql_data_seek()` or `mysql_row_seek()` to change the current row position within the result set. You can also find out how many rows there are by calling `mysql_num_rows()`. On the other hand, the memory requirements for `mysql_store_result()` may be very high for large result sets and you are more likely to encounter out-of-memory conditions.

An advantage of `mysql_use_result()` is that the client requires less memory for the result set because it maintains only one row at a time (and because there is less allocation overhead, `mysql_use_result()` can be faster). Disadvantages are that you must process each row quickly to avoid tying up the server, you don't have random access to rows within the result set (you can only access rows sequentially), and you don't know how many rows are in the result set until you have retrieved them all. Furthermore, you **must** retrieve all the rows even if you determine in mid-retrieval that you've found the information you were looking for.

The API makes it possible for clients to respond appropriately to statements (retrieving rows only as necessary) without knowing whether the statement is a `SELECT`. You can do this by calling `mysql_store_result()` after each `mysql_query()` (or `mysql_real_query()`). If the result set call succeeds, the statement was a `SELECT` and you can read the rows. If the result set call fails, call `mysql_field_count()` to determine whether a result was actually to be expected. If `mysql_field_count()` returns zero, the statement returned no data (indicating that it was an `INSERT`, `UPDATE`, `DELETE`, and so forth), and was not expected to return rows. If `mysql_field_count()` is nonzero, the statement should have returned rows, but didn't. This indicates that the statement was a `SELECT` that failed. See the description for `mysql_field_count()` for an example of how this can be done.

Both `mysql_store_result()` and `mysql_use_result()` allow you to obtain information about the fields that make up the result set (the number of fields, their names and types, and so forth). You can access field information sequentially within the row by calling `mysql_fetch_field()` repeatedly, or by field number within the row by calling `mysql_fetch_field_direct()`. The current field cursor position may be changed by calling `mysql_field_seek()`. Setting the field cursor affects subsequent calls to `mysql_fetch_field()`. You can also get information for fields all at once by calling `mysql_fetch_fields()`.

For detecting and reporting errors, MySQL provides access to error information by means of the `mysql_errno()` and `mysql_error()` functions. These return the error code or error message for the most recently invoked function that can succeed or fail, allowing you to determine when an error occurred and what it was.

20.10.3. C API Function Descriptions

In the descriptions here, a parameter or return value of `NULL` means `NULL` in the sense of the C programming language, not a MySQL `NULL` value.

Functions that return a value generally return a pointer or an integer. Unless specified otherwise, functions returning a pointer return a non-`NULL` value to indicate success or a `NULL` value to indicate an error, and functions returning an integer return zero to indicate success or nonzero to indicate an error. Note that “nonzero” means just that. Unless the function description says otherwise, do not test against a value other than zero:

```
if (result)                /* correct */
    ... error ...

if (result < 0)           /* incorrect */
    ... error ...

if (result == -1)        /* incorrect */
    ... error ...
```

When a function returns an error, the **Errors** subsection of the function description lists the possible types of errors. You can find out which of these occurred by calling `mysql_errno()`. A string representation of the error may be obtained by calling `mysql_error()`.

MySQL Enterprise

MySQL Enterprise subscribers will find more information about the C API functions in the Knowledge Base articles, [The C API](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

20.10.3.1. `mysql_affected_rows()`

```
my_ulonglong mysql_affected_rows(MYSQL *mysql)
```

Description

After executing a statement with `mysql_query()` or `mysql_real_query()`, returns the number of rows changed (for `UPDATE`), deleted (for `DELETE`), or inserted (for `INSERT`). For `SELECT` statements, `mysql_affected_rows()` works like `mysql_num_rows()`.

Return Values

An integer greater than zero indicates the number of rows affected or retrieved. Zero indicates that no records were updated for an `UPDATE` statement, no rows matched the `WHERE` clause in the query or that no query has yet been executed. -1 indicates that the query returned an error or that, for a `SELECT` query, `mysql_affected_rows()` was called prior to calling `mysql_store_result()`. Because `mysql_affected_rows()` returns an unsigned value, you can check for -1 by comparing the return value to `(my_ulonglong)-1` (or to `(my_ulonglong)~0`, which is equivalent).

Errors

None.

Example

```
char *stmt = "UPDATE products SET cost=cost*1.25 WHERE group=10";
mysql_query(&mysql, stmt);
printf("%ld products updated",
       (long) mysql_affected_rows(&mysql));
```

For `UPDATE` statements, if you specify the `CLIENT_FOUND_ROWS` flag when connecting to `mysqld`, `mysql_affected_rows()` returns the number of rows matched by the `WHERE` clause. Otherwise, the default behavior is to return the number of rows actually changed.

Note that when you use a `REPLACE` command, `mysql_affected_rows()` returns 2 if the new row replaced an old row, because in this case, one row was inserted after the duplicate was deleted.

If you use `INSERT ... ON DUPLICATE KEY UPDATE` to insert a row, `mysql_affected_rows()` returns 1 if the row is inserted as a new row and 2 if an existing row is updated.

`mysql_affected_rows()` returns 0 following a `CALL` statement for a stored procedure that contains a statement that modifies rows because in this case `mysql_insert_id()` applies to `CALL` and not the statement within the procedure. Within the procedure, you can use `ROW_COUNT()` at the SQL level to obtain the `AUTO_INCREMENT` value.

20.10.3.2. `mysql_autocommit()`

```
my_bool mysql_autocommit(MYSQL *mysql, my_bool mode)
```

Description

Sets autocommit mode on if `mode` is 1, off if `mode` is 0.

Return Values

Zero if successful. Nonzero if an error occurred.

Errors

None.

20.10.3.3. `mysql_change_user()`

```
my_bool mysql_change_user(MYSQL *mysql, const char *user, const char *password, const char *db)
```

Description

Changes the user and causes the database specified by `db` to become the default (current) database on the connection specified by `mysql`. In subsequent queries, this database is the default for table references that do not include an explicit database specifier.

`mysql_change_user()` fails if the connected user cannot be authenticated or doesn't have permission to use the database. In this case, the user and database are not changed.

The `db` parameter may be set to `NULL` if you don't want to have a default database.

This command resets the state as if one had done a new connect. (See [Section 20.10.11, "Controlling Automatic Reconnection Behavior"](#).) It always performs a `ROLLBACK` of any active transactions, closes and drops all temporary tables, and unlocks all locked tables. Session system variables are reset to the values of the corresponding global system variables. Prepared statements are re-

leased and `HANDLER` variables are closed. Locks acquired with `GET_LOCK()` are released. These effects occur even if the user didn't change.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

The same that you can get from `mysql_real_connect()`.

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.
- `ER_UNKNOWN_COM_ERROR`
The MySQL server doesn't implement this command (probably an old server).
- `ER_ACCESS_DENIED_ERROR`
The user or password was wrong.
- `ER_BAD_DB_ERROR`
The database didn't exist.
- `ER_DBACCESS_DENIED_ERROR`
The user did not have access rights to the database.
- `ER_WRONG_DB_NAME`
The database name was too long.

Example

```
if (mysql_change_user(&mysql, "user", "password", "new_database"))
{
    fprintf(stderr, "Failed to change user. Error: %s\n",
            mysql_error(&mysql));
}
```

20.10.3.4. `mysql_character_set_name()`

```
const char *mysql_character_set_name(MYSQL *mysql)
```

Description

Returns the default character set name for the current connection.

Return Values

The default character set name

Errors

None.

20.10.3.5. `mysql_close()`

```
void mysql_close(MYSQL *mysql)
```

Description

Closes a previously opened connection. `mysql_close()` also deallocates the connection handle pointed to by `mysql` if the handle was allocated automatically by `mysql_init()` or `mysql_connect()`.

Return Values

None.

Errors

None.

20.10.3.6. `mysql_commit()`

```
my_bool mysql_commit(MYSQL *mysql)
```

Description

Commits the current transaction.

The action of this function is subject to the value of the `completion_type` system variable. In particular, if the value of `completion_type` is 2, the server performs a release after terminating a transaction and closes the client connection. The client program should call `mysql_close()` to close the connection from the client side.

Return Values

Zero if successful. Nonzero if an error occurred.

Errors

None.

20.10.3.7. `mysql_connect()`

```
MYSQL *mysql_connect(MYSQL *mysql, const char *host, const char *user, const char *passwd)
```

Description

This function is deprecated. Use `mysql_real_connect()` instead.

`mysql_connect()` attempts to establish a connection to a MySQL database engine running on `host`. `mysql_connect()` must complete successfully before you can execute any of the other API functions, with the exception of `mysql_get_client_info()`.

The meanings of the parameters are the same as for the corresponding parameters for `mysql_real_connect()` with the difference that the connection parameter may be `NULL`. In this case, the C API allocates memory for the connection structure automatically and frees it when you call `mysql_close()`. The disadvantage of this approach is that you can't retrieve an error message if the connection fails. (To get error information from `mysql_errno()` or `mysql_error()`, you must provide a valid `MYSQL` pointer.)

Return Values

Same as for `mysql_real_connect()`.

Errors

Same as for `mysql_real_connect()`.

20.10.3.8. `mysql_create_db()`

```
int mysql_create_db(MYSQL *mysql, const char *db)
```

Description

Creates the database named by the `db` parameter.

This function is deprecated. It is preferable to use `mysql_query()` to issue an SQL `CREATE DATABASE` statement instead.

Return Values

Zero if the database was created successfully. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

Example

```
if(mysql_create_db(&mysql, "my_database"))
{
    fprintf(stderr, "Failed to create new database. Error: %s\n",
            mysql_error(&mysql));
}
```

20.10.3.9. `mysql_data_seek()`

```
void mysql_data_seek(MYSQL_RES *result, my_ulonglong offset)
```

Description

Seeks to an arbitrary row in a query result set. The `offset` value is a row number and should be in the range from 0 to `mysql_num_rows(result)-1`.

This function requires that the result set structure contains the entire result of the query, so `mysql_data_seek()` may be used only in conjunction with `mysql_store_result()`, not with `mysql_use_result()`.

Return Values

None.

Errors

None.

20.10.3.10. `mysql_debug()`

```
void mysql_debug(const char *debug)
```

Description

Does a `DEBUG_PUSH` with the given string. `mysql_debug()` uses the Fred Fish debug library. To use this function, you must compile the client library to support debugging. See [MySQL Internals: Porting](#).

Return Values

None.

Errors

None.

Example

The call shown here causes the client library to generate a trace file in `/tmp/client.trace` on the client machine:

```
mysql_debug("d:t:0,/tmp/client.trace");
```

20.10.3.11. `mysql_drop_db()`

```
int mysql_drop_db(MYSQL *mysql, const char *db)
```

Description

Drops the database named by the `db` parameter.

This function is deprecated. It is preferable to use `mysql_query()` to issue an SQL `DROP DATABASE` statement instead.

Return Values

Zero if the database was dropped successfully. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

Example

```
if(mysql_drop_db(&mysql, "my_database"))  
    fprintf(stderr, "Failed to drop the database: Error: %s\n",  
           mysql_error(&mysql));
```

20.10.3.12. `mysql_dump_debug_info()`

```
int mysql_dump_debug_info(MYSQL *mysql)
```

Description

Instructs the server to write some debug information to the log. For this to work, the connected user must have the `SUPER` privilege.

Return Values

Zero if the command was successful. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

20.10.3.13. `mysql_eof()`

```
my_bool mysql_eof(MYSQL_RES *result)
```

Description

This function is deprecated. `mysql_errno()` or `mysql_error()` may be used instead.

`mysql_eof()` determines whether the last row of a result set has been read.

If you acquire a result set from a successful call to `mysql_store_result()`, the client receives the entire set in one operation. In this case, a `NULL` return from `mysql_fetch_row()` always means the end of the result set has been reached and it is unnecessary to call `mysql_eof()`. When used with `mysql_store_result()`, `mysql_eof()` always returns true.

On the other hand, if you use `mysql_use_result()` to initiate a result set retrieval, the rows of the set are obtained from the server one by one as you call `mysql_fetch_row()` repeatedly. Because an error may occur on the connection during this process, a `NULL` return value from `mysql_fetch_row()` does not necessarily mean the end of the result set was reached normally. In this case, you can use `mysql_eof()` to determine what happened. `mysql_eof()` returns a nonzero value if the end of the result set was reached and zero if an error occurred.

Historically, `mysql_eof()` predates the standard MySQL error functions `mysql_errno()` and `mysql_error()`. Because those error functions provide the same information, their use is preferred over `mysql_eof()`, which is deprecated. (In fact, they provide more information, because `mysql_eof()` returns only a boolean value whereas the error functions indicate a reason for the error when one occurs.)

Return Values

Zero if no error occurred. Nonzero if the end of the result set has been reached.

Errors

None.

Example

The following example shows how you might use `mysql_eof()`:

```
mysql_query(&mysql,"SELECT * FROM some_table");
result = mysql_use_result(&mysql);
while((row = mysql_fetch_row(result)))
{
    // do something with data
}
if(!mysql_eof(result)) // mysql_fetch_row() failed due to an error
{
    fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
}
```

However, you can achieve the same effect with the standard MySQL error functions:

```
mysql_query(&mysql,"SELECT * FROM some_table");
result = mysql_use_result(&mysql);
while((row = mysql_fetch_row(result)))
{
    // do something with data
}
if(mysql_errno(&mysql)) // mysql_fetch_row() failed due to an error
{
    fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
}
```

20.10.3.14. `mysql_errno()`

```
unsigned int mysql_errno(MYSQL *mysql)
```

Description

For the connection specified by `mysql`, `mysql_errno()` returns the error code for the most recently invoked API function that can succeed or fail. A return value of zero means that no error occurred. Client error message numbers are listed in the MySQL `errmsg.h` header file. Server error message numbers are listed in `mysqld_error.h`. Errors also are listed at [Appendix B, Errors, Error Codes, and Common Problems](#).

Note that some functions like `mysql_fetch_row()` don't set `mysql_errno()` if they succeed.

A rule of thumb is that all functions that have to ask the server for information reset `mysql_errno()` if they succeed.

MySQL-specific error numbers returned by `mysql_errno()` differ from SQLSTATE values returned by `mysql_sqlstate()`. For example, the `mysql` client program displays errors using the following format, where `1146` is the `mysql_errno()` value and `'42S02'` is the corresponding `mysql_sqlstate()` value:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

Return Values

An error code value for the last `mysql_xxx()` call, if it failed. zero means no error occurred.

Errors

None.

20.10.3.15. `mysql_error()`

```
const char *mysql_error(MYSQL *mysql)
```

Description

For the connection specified by `mysql`, `mysql_error()` returns a null-terminated string containing the error message for the most recently invoked API function that failed. If a function didn't fail, the return value of `mysql_error()` may be the previous error or an empty string to indicate no error.

A rule of thumb is that all functions that have to ask the server for information reset `mysql_error()` if they succeed.

For functions that reset `mysql_error()`, the following two tests are equivalent:

```
if(*mysql_error(&mysql))
{
    // an error occurred
}

if(mysql_error(&mysql)[0])
{
    // an error occurred
}
```

The language of the client error messages may be changed by recompiling the MySQL client library. Currently, you can choose error messages in several different languages. See [Section 9.3, “Setting the Error Message Language”](#).

Return Values

A null-terminated character string that describes the error. An empty string if no error occurred.

Errors

None.

20.10.3.16. `mysql_escape_string()`

You should use `mysql_real_escape_string()` instead!

This function is identical to `mysql_real_escape_string()` except that `mysql_real_escape_string()` takes a connection handler as its first argument and escapes the string according to the current character set. `mysql_escape_string()` does not take a connection argument and does not respect the current character set.

20.10.3.17. `mysql_fetch_field()`

```
MYSQL_FIELD *mysql_fetch_field(MYSQL_RES *result)
```

Description

Returns the definition of one column of a result set as a `MYSQL_FIELD` structure. Call this function repeatedly to retrieve information about all columns in the result set. `mysql_fetch_field()` returns `NULL` when no more fields are left.

`mysql_fetch_field()` is reset to return information about the first field each time you execute a new `SELECT` query. The field returned by `mysql_fetch_field()` is also affected by calls to `mysql_field_seek()`.

If you've called `mysql_query()` to perform a `SELECT` on a table but have not called `mysql_store_result()`, MySQL returns the default blob length (8KB) if you call `mysql_fetch_field()` to ask for the length of a `BLOB` field. (The 8KB size is chosen because MySQL doesn't know the maximum length for the `BLOB`. This should be made configurable sometime.) Once you've retrieved the result set, `field->max_length` contains the length of the largest value for this column in the specific query.

Return Values

The `MYSQL_FIELD` structure for the current column. `NULL` if no columns are left.

Errors

None.

Example

```
MYSQL_FIELD *field;

while((field = mysql_fetch_field(result)))
{
    printf("field name %s\n", field->name);
}
```

20.10.3.18. `mysql_fetch_field_direct()`

```
MYSQL_FIELD *mysql_fetch_field_direct(MYSQL_RES *result, unsigned int fieldnr)
```

Description

Given a field number `fieldnr` for a column within a result set, returns that column's field definition as a `MYSQL_FIELD` structure. You may use this function to retrieve the definition for an arbitrary column. The value of `fieldnr` should be in the range from 0 to `mysql_num_fields(result)-1`.

Return Values

The `MYSQL_FIELD` structure for the specified column.

Errors

None.

Example

```
unsigned int num_fields;
unsigned int i;
MYSQL_FIELD *field;

num_fields = mysql_num_fields(result);
for(i = 0; i < num_fields; i++)
{
    field = mysql_fetch_field_direct(result, i);
    printf("Field %u is %s\n", i, field->name);
}
```

20.10.3.19. `mysql_fetch_fields()`

```
MYSQL_FIELD *mysql_fetch_fields(MYSQL_RES *result)
```

Description

Returns an array of all `MYSQL_FIELD` structures for a result set. Each structure provides the field definition for one column of the result set.

Return Values

An array of `MYSQL_FIELD` structures for all columns of a result set.

Errors

None.

Example

```
unsigned int num_fields;
unsigned int i;
MYSQL_FIELD *fields;

num_fields = mysql_num_fields(result);
fields = mysql_fetch_fields(result);
for(i = 0; i < num_fields; i++)
{
    printf("Field %u is %s\n", i, fields[i].name);
}
```

20.10.3.20. `mysql_fetch_lengths()`

```
unsigned long *mysql_fetch_lengths(MYSQL_RES *result)
```

Description

Returns the lengths of the columns of the current row within a result set. If you plan to copy field values, this length information is also useful for optimization, because you can avoid calling `strlen()`. In addition, if the result set contains binary data, you **must** use this function to determine the size of the data, because `strlen()` returns incorrect results for any field containing null characters.

The length for empty columns and for columns containing `NULL` values is zero. To see how to distinguish these two cases, see the description for `mysql_fetch_row()`.

Return Values

An array of unsigned long integers representing the size of each column (not including any terminating null characters). `NULL` if an error occurred.

Errors

`mysql_fetch_lengths()` is valid only for the current row of the result set. It returns `NULL` if you call it before calling `mysql_fetch_row()` or after retrieving all rows in the result.

Example

```
MYSQL_ROW row;
unsigned long *lengths;
unsigned int num_fields;
unsigned int i;

row = mysql_fetch_row(result);
if (row)
{
    num_fields = mysql_num_fields(result);
    lengths = mysql_fetch_lengths(result);
    for(i = 0; i < num_fields; i++)
    {
        printf("Column %u is %lu bytes in length.\n",
            i, lengths[i]);
    }
}
```

20.10.3.21. `mysql_fetch_row()`

```
MYSQL_ROW mysql_fetch_row(MYSQL_RES *result)
```

Description

Retrieves the next row of a result set. When used after `mysql_store_result()`, `mysql_fetch_row()` returns `NULL` when there are no more rows to retrieve. When used after `mysql_use_result()`, `mysql_fetch_row()` returns `NULL` when there are no more rows to retrieve or if an error occurred.

The number of values in the row is given by `mysql_num_fields(result)`. If `row` holds the return value from a call to `mysql_fetch_row()`, pointers to the values are accessed as `row[0]` to `row[mysql_num_fields(result)-1]`. `NULL` values in the row are indicated by `NULL` pointers.

The lengths of the field values in the row may be obtained by calling `mysql_fetch_lengths()`. Empty fields and fields containing `NULL` both have length 0; you can distinguish these by checking the pointer for the field value. If the pointer is `NULL`, the field is `NULL`; otherwise, the field is empty.

Return Values

A `MYSQL_ROW` structure for the next row. `NULL` if there are no more rows to retrieve or if an error occurred.

Errors

Note that error is not reset between calls to `mysql_fetch_row()`

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

Example

```
MYSQL_ROW row;
unsigned int num_fields;
unsigned int i;

num_fields = mysql_num_fields(result);
while ((row = mysql_fetch_row(result)))
{
    unsigned long *lengths;
    lengths = mysql_fetch_lengths(result);
    for(i = 0; i < num_fields; i++)
    {
        printf("[%s] ", (int) lengths[i],
            row[i] ? row[i] : "NULL");
    }
    printf("\n");
}
```

20.10.3.22. `mysql_field_count()`

```
unsigned int mysql_field_count(MYSQL *mysql)
```

Description

Returns the number of columns for the most recent query on the connection.

The normal use of this function is when `mysql_store_result()` returned `NULL` (and thus you have no result set pointer). In this case, you can call `mysql_field_count()` to determine whether `mysql_store_result()` should have produced a non-empty result. This allows the client program to take proper action without knowing whether the query was a `SELECT` (or `SELECT`-like) statement. The example shown here illustrates how this may be done.

See [Section 20.10.10.1, “Why `mysql_store_result\(\)` Sometimes Returns `NULL` After `mysql_query\(\)` Returns Success”](#).

Return Values

An unsigned integer representing the number of columns in a result set.

Errors

None.

Example

```
MYSQL_RES *result;
unsigned int num_fields;
unsigned int num_rows;

if (mysql_query(&mysql, query_string))
{
    // error
}
else // query succeeded, process any data returned by it
{
    result = mysql_store_result(&mysql);
    if (result) // there are rows
    {
        num_fields = mysql_num_fields(result);
        // retrieve rows, then call mysql_free_result(result)
    }
}
```

```

else // mysql_store_result() returned nothing; should it have?
{
    if(mysql_field_count(&mysql) == 0)
    {
        // query does not return data
        // (it was not a SELECT)
        num_rows = mysql_affected_rows(&mysql);
    }
    else // mysql_store_result() should have returned data
    {
        fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
    }
}
}

```

An alternative is to replace the `mysql_field_count(&mysql)` call with `mysql_errno(&mysql)`. In this case, you are checking directly for an error from `mysql_store_result()` rather than inferring from the value of `mysql_field_count()` whether the statement was a `SELECT`.

20.10.3.23. `mysql_field_seek()`

```
MYSQL_FIELD_OFFSET mysql_field_seek(MYSQL_RES *result, MYSQL_FIELD_OFFSET offset)
```

Description

Sets the field cursor to the given offset. The next call to `mysql_fetch_field()` retrieves the field definition of the column associated with that offset.

To seek to the beginning of a row, pass an `offset` value of zero.

Return Values

The previous value of the field cursor.

Errors

None.

20.10.3.24. `mysql_field_tell()`

```
MYSQL_FIELD_OFFSET mysql_field_tell(MYSQL_RES *result)
```

Description

Returns the position of the field cursor used for the last `mysql_fetch_field()`. This value can be used as an argument to `mysql_field_seek()`.

Return Values

The current offset of the field cursor.

Errors

None.

20.10.3.25. `mysql_free_result()`

```
void mysql_free_result(MYSQL_RES *result)
```

Description

Frees the memory allocated for a result set by `mysql_store_result()`, `mysql_use_result()`, `mysql_list_dbs()`, and so forth. When you are done with a result set, you must free the memory it uses by calling `mysql_free_result()`.

Do not attempt to access a result set after freeing it.

Return Values

None.

Errors

None.

20.10.3.26. `mysql_get_character_set_info()`

```
void mysql_get_character_set_info(MYSQL *mysql, MY_CHARSET_INFO *cs)
```

Description

This function provides information about the default client character set. The default character set may be changed with the `mysql_set_character_set()` function.

Example

This example shows the fields that are available in the `MY_CHARSET_INFO` structure:

```
if (!mysql_set_character_set(&mysql, "utf8"))
{
    MY_CHARSET_INFO cs;
    mysql_get_character_set_info(&mysql, &cs);
    printf("character set information:\n");
    printf("character set+collation number: %d\n", cs.number);
    printf("character set name: %s\n", cs.name);
    printf("collation name: %s\n", cs.csname);
    printf("comment: %s\n", cs.comment);
    printf("directory: %s\n", cs.dir);
    printf("multi byte character min. length: %d\n", cs.mbminlen);
    printf("multi byte character max. length: %d\n", cs.mbmaxlen);
}
```

20.10.3.27. `mysql_get_client_info()`

```
const char *mysql_get_client_info(void)
```

Description

Returns a string that represents the client library version.

Return Values

A character string that represents the MySQL client library version.

Errors

None.

20.10.3.28. `mysql_get_client_version()`

```
unsigned long mysql_get_client_version(void)
```

Description

Returns an integer that represents the client library version. The value has the format `XYZZZ` where `X` is the major version, `YY` is the release level, and `ZZ` is the version number within the release level. For example, a value of `40102` represents a client library version of `4.1.2`.

Return Values

An integer that represents the MySQL client library version.

Errors

None.

20.10.3.29. `mysql_get_host_info()`

```
const char *mysql_get_host_info(MYSQL *mysql)
```

Description

Returns a string describing the type of connection in use, including the server host name.

Return Values

A character string representing the server host name and the connection type.

Errors

None.

20.10.3.30. `mysql_get_proto_info()`

```
unsigned int mysql_get_proto_info(MYSQL *mysql)
```

Description

Returns the protocol version used by current connection.

Return Values

An unsigned integer representing the protocol version used by the current connection.

Errors

None.

20.10.3.31. `mysql_get_server_info()`

```
const char *mysql_get_server_info(MYSQL *mysql)
```

Description

Returns a string that represents the server version number.

Return Values

A character string that represents the server version number.

Errors

None.

20.10.3.32. `mysql_get_server_version()`

```
unsigned long mysql_get_server_version(MYSQL *mysql)
```

Description

Returns the version number of the server as an integer.

Return Values

A number that represents the MySQL server version in this format:

```
major_version*10000 + minor_version *100 + sub_version
```

For example, 5.1.5 is returned as 50105.

This function is useful in client programs for quickly determining whether some version-specific server capability exists.

Errors

None.

20.10.3.33. `mysql_get_ssl_cipher()`

```
const char *mysql_get_ssl_cipher(MYSQL *mysql)
```

Description

`mysql_get_ssl_cipher()` returns the SSL cipher used for the given connection to the server. `mysql` is the connection handler returned from `mysql_init()`.

Return Values

A string naming the SSL cipher used for the connection, or `NULL` if no cipher is being used.

20.10.3.34. `mysql_hex_string()`

```
unsigned long mysql_hex_string(char *to, const char *from, unsigned long length)
```

Description

This function is used to create a legal SQL string that you can use in an SQL statement. See [Section 8.1.1, “Strings”](#).

The string in `from` is encoded to hexadecimal format, with each character encoded as two hexadecimal digits. The result is placed in `to` and a terminating null byte is appended.

The string pointed to by `from` must be `length` bytes long. You must allocate the `to` buffer to be at least `length*2+1` bytes long. When `mysql_hex_string()` returns, the contents of `to` is a null-terminated string. The return value is the length of the encoded string, not including the terminating null character.

The return value can be placed into an SQL statement using either `0xvalue` or `X'value'` format. However, the return value does not include the `0x` or `X'...`. The caller must supply whichever of those is desired.

Example

```
char query[1000],*end;

end = strmov(query,"INSERT INTO test_table values(");
end = strmov(end,"0x");
end += mysql_hex_string(end,"What is this",12);
end = strmov(end,"0x");
end += mysql_hex_string(end,"binary data: \0\r\n",16);
*end++ = '\0';

if (mysql_real_query(&mysql,query,(unsigned int) (end - query)))
{
    fprintf(stderr, "Failed to insert row, Error: %s\n",
            mysql_error(&mysql));
}
```

The `strmov()` function used in the example is included in the `mysqlclient` library and works like `strcpy()` but returns a pointer to the terminating null of the first parameter.

Return Values

The length of the value placed into `to`, not including the terminating null character.

Errors

None.

20.10.3.35. `mysql_info()`

```
const char *mysql_info(MYSQL *mysql)
```

Description

Retrieves a string providing information about the most recently executed statement, but only for the statements listed here. For other statements, `mysql_info()` returns `NULL`. The format of the string varies depending on the type of statement, as described here. The numbers are illustrative only; the string contains values appropriate for the statement.

- `INSERT INTO ... SELECT ...`
String format: Records: 100 Duplicates: 0 Warnings: 0
- `INSERT INTO ... VALUES (...),(...),(...)...`
String format: Records: 3 Duplicates: 0 Warnings: 0
- `LOAD DATA INFILE ...`
String format: Records: 1 Deleted: 0 Skipped: 0 Warnings: 0
- `ALTER TABLE`
String format: Records: 3 Duplicates: 0 Warnings: 0
- `UPDATE`

String format: `Rows matched: 40 Changed: 40 Warnings: 0`

Note that `mysql_info()` returns a non-NULL value for `INSERT ... VALUES` only for the multiple-row form of the statement (that is, only if multiple value lists are specified).

Return Values

A character string representing additional information about the most recently executed statement. `NULL` if no information is available for the statement.

Errors

None.

20.10.3.36. `mysql_init()`

```
MYSQL *mysql_init(MYSQL *mysql)
```

Description

Allocates or initializes a `MYSQL` object suitable for `mysql_real_connect()`. If `mysql` is a `NULL` pointer, the function allocates, initializes, and returns a new object. Otherwise, the object is initialized and the address of the object is returned. If `mysql_init()` allocates a new object, it is freed when `mysql_close()` is called to close the connection.

Return Values

An initialized `MYSQL*` handle. `NULL` if there was insufficient memory to allocate a new object.

Errors

In case of insufficient memory, `NULL` is returned.

20.10.3.37. `mysql_insert_id()`

```
my_ulonglong mysql_insert_id(MYSQL *mysql)
```

Description

Returns the value generated for an `AUTO_INCREMENT` column by the previous `INSERT` or `UPDATE` statement. Use this function after you have performed an `INSERT` statement into a table that contains an `AUTO_INCREMENT` field, or have used `INSERT` or `UPDATE` to set a column value with `LAST_INSERT_ID(expr)`.

The return value of `mysql_insert_id()` is always zero unless explicitly updated under one of the following conditions:

- `INSERT` statements that store a value into an `AUTO_INCREMENT` column. This is true whether the value is automatically generated by storing the special values `NULL` or `0` into the column, or is an explicit non-special value.
- In the case of a multiple-row `INSERT` statement, the return value of `mysql_insert_id()` depends on the MySQL server version.

`mysql_insert_id()` returns the *first* automatically generated `AUTO_INCREMENT` value that was *successfully* inserted.

If no rows are successfully inserted, `mysql_insert_id()` returns 0.

- If an `INSERT ... SELECT` statement is executed, and no automatically generated value is successfully inserted, `mysql_insert_id()` returns the ID of the last inserted row.
- If an `INSERT ... SELECT` statement uses `LAST_INSERT_ID(expr)`, `mysql_insert_id()` returns `expr`.
- `INSERT` statements that generate an `AUTO_INCREMENT` value by inserting `LAST_INSERT_ID(expr)` into any column or by updating any column to `LAST_INSERT_ID(expr)`.
- If the previous statement returned an error, the value of `mysql_insert_id()` is undefined.

The return value of `mysql_insert_id()` can be simplified to the following sequence:

1. If there is an `AUTO_INCREMENT` column, and an automatically generated value was successfully inserted, return the first such value.
2. If `LAST_INSERT_ID(expr)` occurred in the statement, return *expr*, even if there was an `AUTO_INCREMENT` column in the affected table.
3. The return value varies depending on the statement used. When called after an `INSERT` statement:
 - If there is an `AUTO_INCREMENT` column in the table, and there were some explicit values for this column that were successfully inserted into the table, return the last of the explicit values.

When called after an `INSERT . . . ON DUPLICATE KEY UPDATE` statement:

- If there is an `AUTO_INCREMENT` column in the table and there were some explicit successfully inserted values, or some updated rows, return the last of the inserted or updated values.

`mysql_insert_id()` returns 0 if the previous statement does not use an `AUTO_INCREMENT` value. If you need to save the value for later, be sure to call `mysql_insert_id()` immediately after the statement that generates the value.

The value of `mysql_insert_id()` is affected only by statements issued within the current client connection. It is not affected by statements issued by other clients.

The `LAST_INSERT_ID()` SQL function returns the value of the first automatically generated value that was successfully inserted. `LAST_INSERT_ID()` is not reset between statements because the value of that function is maintained in the server. Another difference from `mysql_insert_id()` is that `LAST_INSERT_ID()` is not updated if you set an `AUTO_INCREMENT` column to a specific non-special value. See [Section 11.11.3, “Information Functions”](#).

`mysql_insert_id()` returns 0 following a `CALL` statement for a stored procedure that generates an `AUTO_INCREMENT` value because in this case `mysql_insert_id()` applies to `CALL` and not the statement within the procedure. Within the procedure, you can use `LAST_INSERT_ID()` at the SQL level to obtain the `AUTO_INCREMENT` value.

The reason for the differences between `LAST_INSERT_ID()` and `mysql_insert_id()` is that `LAST_INSERT_ID()` is made easy to use in scripts while `mysql_insert_id()` tries to provide more exact information about what happens to the `AUTO_INCREMENT` column.

Return Values

Described in the preceding discussion.

Errors

None.

20.10.3.38. `mysql_kill()`

```
int mysql_kill(MYSQL *mysql, unsigned long pid)
```

Description

Asks the server to kill the thread specified by `pid`.

This function is deprecated. It is preferable to use `mysql_query()` to issue an `SQL KILL` statement instead.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

20.10.3.39. `mysql_library_end()`

```
void mysql_library_end(void)
```

Description

This function finalizes the MySQL library. You should call it when you are done using the library (for example, after disconnecting from the server). The action taken by the call depends on whether your application is linked to the MySQL client library or the MySQL embedded server library. For a client program linked against the `libmysqlclient` library by using the `-lmysqlclient` flag, `mysql_library_end()` performs some memory management to clean up. For an embedded server application linked against the `libmysqld` library by using the `-lmysqld` flag, `mysql_library_end()` shuts down the embedded server and then cleans up.

For usage information, see [Section 20.10.2, “C API Function Overview”](#), and [Section 20.10.3.40, “mysql_library_init\(\)”](#).

20.10.3.40. `mysql_library_init()`

```
int mysql_library_init(int argc, char **argv, char **groups)
```

Description

This function should be called to initialize the MySQL library before you call any other MySQL function, whether your application is a regular client program or uses the embedded server. If the application uses the embedded server, this call starts the server and initializes any subsystems (`mysys`, `InnoDB`, and so forth) that the server uses.

After your application is done using the MySQL library, call `mysql_library_end()` to clean up. See [Section 20.10.3.39, “mysql_library_end\(\)”](#).

The choice of whether the application operates as a regular client or uses the embedded server depends on whether you use the `libmysqlclient` or `libmysqld` library at link time to produce the final executable. For additional information, see [Section 20.10.2, “C API Function Overview”](#).

In a non-multi-threaded environment, the call to `mysql_library_init()` may be omitted, because `mysql_init()` will invoke it automatically as necessary. However, `mysql_library_init()` is not thread-safe in a multi-threaded environment, and thus neither is `mysql_init()`, which calls `mysql_library_init()`. You must either call `mysql_library_init()` prior to spawning any threads, or else use a mutex to protect the call, whether you invoke `mysql_library_init()` or indirectly via `mysql_init()`. This should be done prior to any other client library call.

The `argc` and `argv` arguments are analogous to the arguments to `main()`, and enable passing of options to the embedded server. For convenience, `argc` may be 0 (zero) if there are no command-line arguments for the server. This is the usual case for applications intended for use only as regular (non-embedded) clients, and the call typically is written as `mysql_library_init(0, NULL, NULL)`.

```
#include <mysql.h>
#include <stdlib.h>

int main(void) {
    if (mysql_library_init(0, NULL, NULL)) {
        fprintf(stderr, "could not initialize MySQL library\n");
        exit(1);
    }

    /* Use any MySQL API functions here */

    mysql_library_end();

    return EXIT_SUCCESS;
}
```

When arguments are to be passed (`argc` is greater than 0), the first element of `argv` is ignored (it typically contains the program name). `mysql_library_init()` makes a copy of the arguments so it is safe to destroy `argv` or `groups` after the call.

For embedded applications, if you want to connect to an external server without starting the embedded server, you have to specify a negative value for `argc`.

The `groups` argument should be an array of strings that indicate the groups in option files from which options should be read. See

Section 4.2.3.2, “Using Option Files”. The final entry in the array should be `NULL`. For convenience, if the `groups` argument itself is `NULL`, the `[server]` and `[embedded]` groups are used by default.

```
#include <mysql.h>
#include <stdlib.h>

static char *server_args[] = {
    "this_program", /* this string is not used */
    "--datadir=",
    "--key_buffer_size=32M"
};
static char *server_groups[] = {
    "embedded",
    "server",
    "this_program_SERVER",
    (char *)NULL
};

int main(void) {
    if (mysql_library_init(sizeof(server_args) / sizeof(char *),
                          server_args, server_groups)) {
        fprintf(stderr, "could not initialize MySQL library\n");
        exit(1);
    }

    /* Use any MySQL API functions here */

    mysql_library_end();

    return EXIT_SUCCESS;
}
```

Return Values

Zero if successful. Nonzero if an error occurred.

20.10.3.41. `mysql_list_dbs()`

```
MYSQL_RES *mysql_list_dbs(MYSQL *mysql, const char *wild)
```

Description

Returns a result set consisting of database names on the server that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters “%” or “_”, or may be a `NULL` pointer to match all databases. Calling `mysql_list_dbs()` is similar to executing the query `SHOW DATABASES [LIKE wild]`.

You must free the result set with `mysql_free_result()`.

Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

20.10.3.42. `mysql_list_fields()`

```
MYSQL_RES *mysql_list_fields(MYSQL *mysql, const char *table, const char *wild)
```

Description

Returns a result set consisting of field names in the given table that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters “%” or “_”, or may be a `NULL` pointer to match all fields. Calling `mysql_list_fields()` is similar to executing the query `SHOW COLUMNS FROM tbl_name [LIKE wild]`.

It is recommended that you use `SHOW COLUMNS FROM tbl_name` instead of `mysql_list_fields()`.

You must free the result set with `mysql_free_result()`.

Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

20.10.3.43. `mysql_list_processes()`

```
MYSQL_RES *mysql_list_processes(MYSQL *mysql)
```

Description

Returns a result set describing the current server threads. This is the same kind of information as that reported by `mysqladmin processlist` or a `SHOW PROCESSLIST` query.

You must free the result set with `mysql_free_result()`.

Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

20.10.3.44. `mysql_list_tables()`

```
MYSQL_RES *mysql_list_tables(MYSQL *mysql, const char *wild)
```

Description

Returns a result set consisting of table names in the current database that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters “%” or “_”, or may be a `NULL` pointer to match all tables. Calling `mysql_list_tables()` is similar to executing the query `SHOW TABLES [LIKE wild]`.

You must free the result set with `mysql_free_result()`.

Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

20.10.3.45. `mysql_more_results()`

```
my_bool mysql_more_results(MYSQL *mysql)
```

Description

This function is used when you execute multiple statements specified as a single statement string, or when you execute `CALL` statements, which can return multiple result sets.

`mysql_more_results()` true if more results exist from the currently executed statement, in which case the application must call `mysql_next_result()` to fetch the results.

Return Values

`TRUE` (1) if more results exist. `FALSE` (0) if no more results exist.

In most cases, you can call `mysql_next_result()` instead to test whether more results exist and initiate retrieval if so.

See Section 20.10.12, “C API Support for Multiple Statement Execution”, and Section 20.10.3.46, “`mysql_next_result()`”.

Errors

None.

20.10.3.46. `mysql_next_result()`

```
int mysql_next_result(MYSQL *mysql)
```

Description

This function is used when you execute multiple statements specified as a single statement string, or when you use `CALL` statements to execute stored procedures, which can return multiple result sets.

`mysql_next_result()` reads the next statement result and returns a status to indicate whether more results exist. If `mysql_next_result()` returns an error, there are no more results.

Before each call to `mysql_next_result()`, you must call `mysql_free_result()` for the current statement if it is a statement that returned a result set (rather than just a result status).

After calling `mysql_next_result()` the state of the connection is as if you had called `mysql_real_query()` or `mysql_query()` for the next statement. This means that you can call `mysql_store_result()`, `mysql_warning_count()`, `mysql_affected_rows()`, and so forth.

If your program uses `CALL` statements to execute stored procedures, the `CLIENT_MULTI_RESULTS` flag must be enabled. This is because each `CALL` returns a result to indicate the call status, in addition to any result sets that might be returned by statements executed within the procedure. Because `CALL` can return multiple results, you should process them using a loop that calls `mysql_next_result()` to determine whether there are more results.

`CLIENT_MULTI_RESULTS` can be enabled when you call `mysql_real_connect()`, either explicitly by passing the `CLIENT_MULTI_RESULTS` flag itself, or implicitly by passing `CLIENT_MULTI_STATEMENTS` (which also enables `CLIENT_MULTI_RESULTS`).

It is also possible to test whether there are more results by calling `mysql_more_results()`. However, this function does not change the connection state, so if it returns true, you must still call `mysql_next_result()` to advance to the next result.

For an example that shows how to use `mysql_next_result()`, see [Section 20.10.12, “C API Support for Multiple Statement Execution”](#).

Return Values

Return Value	Description
0	Successful and there are more results
-1	Successful and there are no more results
>0	An error occurred

Errors

- `CR_COMMANDS_OUT_OF_SYNC`**
 Commands were executed in an improper order. For example if you didn't call `mysql_use_result()` for a previous result set.
- `CR_SERVER_GONE_ERROR`**
 The MySQL server has gone away.
- `CR_SERVER_LOST`**
 The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`**
 An unknown error occurred.

20.10.3.47. `mysql_num_fields()`

```
unsigned int mysql_num_fields(MYSQL_RES *result)
```

To pass a `MYSQL*` argument instead, use `unsigned int mysql_field_count(MYSQL *mysql)`.

Description

Returns the number of columns in a result set.

Note that you can get the number of columns either from a pointer to a result set or to a connection handle. You would use the connection handle if `mysql_store_result()` or `mysql_use_result()` returned `NULL` (and thus you have no result set pointer). In this case, you can call `mysql_field_count()` to determine whether `mysql_store_result()` should have produced a non-empty result. This allows the client program to take proper action without knowing whether the query was a `SELECT` (or `SELECT`-like) statement. The example shown here illustrates how this may be done.

See [Section 20.10.10.1, “Why `mysql_store_result\(\)` Sometimes Returns `NULL` After `mysql_query\(\)` Returns Success”](#).

Return Values

An unsigned integer representing the number of columns in a result set.

Errors

None.

Example

```

MYSQL_RES *result;
unsigned int num_fields;
unsigned int num_rows;

if (mysql_query(&mysql, query_string))
{
    // error
}
else // query succeeded, process any data returned by it
{
    result = mysql_store_result(&mysql);
    if (result) // there are rows
    {
        num_fields = mysql_num_fields(result);
        // retrieve rows, then call mysql_free_result(result)
    }
    else // mysql_store_result() returned nothing; should it have?
    {
        if (mysql_errno(&mysql))
        {
            fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
        }
        else if (mysql_field_count(&mysql) == 0)
        {
            // query does not return data
            // (it was not a SELECT)
            num_rows = mysql_affected_rows(&mysql);
        }
    }
}

```

An alternative (if you know that your query should have returned a result set) is to replace the `mysql_errno(&mysql)` call with a check whether `mysql_field_count(&mysql)` returns 0. This happens only if something went wrong.

20.10.3.48. `mysql_num_rows()`

```
my_ulonglong mysql_num_rows(MYSQL_RES *result)
```

Description

Returns the number of rows in the result set.

The use of `mysql_num_rows()` depends on whether you use `mysql_store_result()` or `mysql_use_result()` to return the result set. If you use `mysql_store_result()`, `mysql_num_rows()` may be called immediately. If you use `mysql_use_result()`, `mysql_num_rows()` does not return the correct value until all the rows in the result set have been retrieved.

`mysql_num_rows()` is intended for use with statements that return a result set, such as `SELECT`. For statements such as `INSERT`, `UPDATE`, or `DELETE`, the number of affected rows can be obtained with `mysql_affected_rows()`.

Return Values

The number of rows in the result set.

Errors

None.

20.10.3.49. `mysql_options()`

```
int mysql_options(MYSQL *mysql, enum mysql_option option, const void *arg)
```

Description

Can be used to set extra connect options and affect behavior for a connection. This function may be called multiple times to set several options.

`mysql_options()` should be called after `mysql_init()` and before `mysql_connect()` or `mysql_real_connect()`.

The `option` argument is the option that you want to set; the `arg` argument is the value for the option. If the option is an integer,

`arg` should point to the value of the integer.

The following list describes the possible options, their effect, and how `arg` is used for each option. Several of the options apply only when the application is linked against the `libmysqld` embedded server library and are unused for applications linked against the `libmysql` client library. For option descriptions that indicate `arg` is unused, its value is irrelevant; it is conventional to pass 0.

- `MYSQL_INIT_COMMAND` (argument type: `char *`)
SQL statement to execute when connecting to the MySQL server. Automatically re-executed if reconnection occurs.
- `MYSQL_OPT_COMPRESS` (argument: not used)
Use the compressed client/server protocol.
- `MYSQL_OPT_CONNECT_TIMEOUT` (argument type: `unsigned int *`)
Connect timeout in seconds.
- `MYSQL_OPT_GUESS_CONNECTION` (argument: not used)
For an application linked against the `libmysqld` embedded server library, this allows the library to guess whether to use the embedded server or a remote server. “Guess” means that if the host name is set and is not `localhost`, it uses a remote server. This behavior is the default. `MYSQL_OPT_USE_EMBEDDED_CONNECTION` and `MYSQL_OPT_USE_REMOTE_CONNECTION` can be used to override it. This option is ignored for applications linked against the `libmysqlclient` client library.
- `MYSQL_OPT_LOCAL_INFILE` (argument type: optional pointer to `unsigned int`)
If no pointer is given or if pointer points to an `unsigned int` that has a nonzero value, the `LOAD LOCAL INFILE` statement is enabled.
- `MYSQL_OPT_NAMED_PIPE` (argument: not used)
Use named pipes to connect to a MySQL server on Windows, if the server allows named-pipe connections.
- `MYSQL_OPT_PROTOCOL` (argument type: `unsigned int *`)
Type of protocol to use. Should be one of the enum values of `mysql_protocol_type` defined in `mysql.h`.
- `MYSQL_OPT_READ_TIMEOUT` (argument type: `unsigned int *`)
The timeout in seconds for attempts to read from the server. Each attempt uses this timeout value and there are retries if necessary, so the total effective timeout value is three times the option value. You can set the value so that a lost connection can be detected earlier than the TCP/IP `Close_Wait_Timeout` value of 10 minutes. This option works only for TCP/IP connections.
- `MYSQL_OPT_RECONNECT` (argument type: `my_bool *`)
Enable or disable automatic reconnection to the server if the connection is found to have been lost. Reconnect is off by default; this option provides a way to set reconnection behavior explicitly.
- `MYSQL_SET_CLIENT_IP` (argument type: `char *`)
For an application linked against the `libmysqld` embedded server library (when `libmysqld` is compiled with authentication support), this means that the user is considered to have connected from the specified IP address (specified as a string) for authentication purposes. This option is ignored for applications linked against the `libmysqlclient` client library.
- `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` (argument type: `my_bool *`)
Enable or disable verification of the server's Common Name value in its certificate against the host name used when connecting to the server. The connection is rejected if there is a mismatch. This feature can be used to prevent man-in-the-middle attacks. Verification is disabled by default.
- `MYSQL_OPT_USE_EMBEDDED_CONNECTION` (argument: not used)
For an application linked against the `libmysqld` embedded server library, this forces the use of the embedded server for the connection. This option is ignored for applications linked against the `libmysqlclient` client library.
- `MYSQL_OPT_USE_REMOTE_CONNECTION` (argument: not used)

For an application linked against the `libmysqld` embedded server library, this forces the use of a remote server for the connection. This option is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_OPT_USE_RESULT` (argument: not used)

This option is unused.

- `MYSQL_OPT_WRITE_TIMEOUT` (argument type: `unsigned int *`)

The timeout in seconds for attempts to write to the server. Each attempt uses this timeout value and there are `net_retry_count` retries if necessary, so the total effective timeout value is `net_retry_count` times the option value. This option works only for TCP/IP connections.

- `MYSQL_READ_DEFAULT_FILE` (argument type: `char *`)

Read options from the named option file instead of from `my.cnf`.

- `MYSQL_READ_DEFAULT_GROUP` (argument type: `char *`)

Read options from the named group from `my.cnf` or the file specified with `MYSQL_READ_DEFAULT_FILE`.

- `MYSQL_REPORT_DATA_TRUNCATION` (argument type: `my_bool *`)

Enable or disable reporting of data truncation errors for prepared statements via the `error` member of `MYSQL_BIND` structures. (Default: enabled.)

- `MYSQL_SECURE_AUTH` (argument type: `my_bool *`)

Whether to connect to a server that does not support the password hashing used in MySQL 4.1.1 and later.

- `MYSQL_SET_CHARSET_DIR` (argument type: `char *`)

The path name to the directory that contains character set definition files.

- `MYSQL_SET_CHARSET_NAME` (argument type: `char *`)

The name of the character set to use as the default character set.

- `MYSQL_SHARED_MEMORY_BASE_NAME` (argument type: `char *`)

The name of the shared-memory object for communication to the server on Windows, if the server supports shared-memory connections. Should have the same value as the `--shared-memory-base-name` option used for the `mysqld` server you want to connect to.

The `client` group is always read if you use `MYSQL_READ_DEFAULT_FILE` or `MYSQL_READ_DEFAULT_GROUP`.

The specified group in the option file may contain the following options.

Option	Description
<code>character-sets-dir=path</code>	The directory where character sets are installed.
<code>compress</code>	Use the compressed client/server protocol.
<code>connect-timeout=seconds</code>	Connect timeout in seconds. On Linux this timeout is also used for waiting for the first answer from the server.
<code>database=db_name</code>	Connect to this database if no database was specified in the connect command.
<code>debug</code>	Debug options.
<code>default-character-set=charset_name</code>	The default character set to use.
<code>disable-local-infile</code>	Disable use of <code>LOAD DATA LOCAL</code> .
<code>host=host_name</code>	Default host name.
<code>init-command=stmt</code>	Statement to execute when connecting to MySQL server. Automatically re-executed if reconnection occurs.
<code>interactive-timeout=seconds</code>	Same as specifying <code>CLIENT_INTERACTIVE</code> to <code>mysql_real_connect()</code> . See Section 20.10.3.52, “ <code>mysql_real_connect()</code> ”.
<code>local-infile[={0 1}]</code>	If no argument or nonzero argument, enable use of <code>LOAD DATA LOCAL</code> ; other-

	wise disable.
<code>max_allowed_packet=bytes</code>	Maximum size of packet that client can read from server.
<code>multi-queries, multi-results</code>	Allow multiple result sets from multiple-statement executions or stored procedures.
<code>multi-statements</code>	Allow the client to send multiple statements in a single string (separated by “;”).
<code>password=password</code>	Default password.
<code>pipe</code>	Use named pipes to connect to a MySQL server on Windows.
<code>port=port_num</code>	Default port number.
<code>protocol={TCP SOCKET PIPE MEMORY}</code>	The protocol to use when connecting to the server.
<code>return-found-rows</code>	Tell <code>mysql_info()</code> to return found rows instead of updated rows when using <code>UPDATE</code> .
<code>shared-memory-base-name=name</code>	Shared-memory name to use to connect to server.
<code>socket=path</code>	Default socket file.
<code>ssl-ca=file_name</code>	Certificate Authority file.
<code>ssl-capath=path</code>	Certificate Authority directory.
<code>ssl-cert=file_name</code>	Certificate file.
<code>ssl-cipher=cipher_list</code>	Allowable SSL ciphers.
<code>ssl-key=file_name</code>	Key file.
<code>timeout=seconds</code>	Like <code>connect-timeout</code> .
<code>user</code>	Default user.

`timeout` has been replaced by `connect-timeout`, but `timeout` is still supported in MySQL 5.4 for backward compatibility.

For more information about option files, see [Section 4.2.3.2, “Using Option Files”](#).

Return Values

Zero for success. Nonzero if you specify an unknown option.

Example

The following `mysql_options()` calls request the use of compression in the client/server protocol, cause options to be read from the `[odbc]` group of option files, and disable transaction autocommit mode:

```
MYSQL mysql;

mysql_init(&mysql);
mysql_options(&mysql, MYSQL_OPT_COMPRESS, 0);
mysql_options(&mysql, MYSQL_READ_DEFAULT_GROUP, "odbc");
mysql_options(&mysql, MYSQL_INIT_COMMAND, "SET autocommit=0");
if (!mysql_real_connect(&mysql, "host", "user", "passwd", "database", 0, NULL, 0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
            mysql_error(&mysql));
}
```

This code requests that the client use the compressed client/server protocol and read the additional options from the `odbc` section in the `my.cnf` file.

20.10.3.50. `mysql_ping()`

```
int mysql_ping(MYSQL *mysql)
```

Description

Checks whether the connection to the server is working. If the connection has gone down and auto-reconnect is enabled an attempt to reconnect is made. If the connection is down and auto-reconnect is disabled, `mysql_ping()` returns an error.

Auto-reconnect is disabled by default. To enable it, call `mysql_options()` with the `MYSQL_OPT_RECONNECT` option. For details, see [Section 20.10.3.49, “mysql_options\(\)”](#).

`mysql_ping()` can be used by clients that remain idle for a long while, to check whether the server has closed the connection and reconnect if necessary.

If `mysql_ping()` does cause a reconnect, there is no explicit indication of it. To determine whether a reconnect occurs, call `mysql_thread_id()` to get the original connection identifier before calling `mysql_ping()`, and then call `mysql_thread_id()` again to see whether the identifier has changed.

If reconnect occurs, some characteristics of the connection will have been reset. For details about these characteristics, see [Section 20.10.11, “Controlling Automatic Reconnection Behavior”](#).

Return Values

Zero if the connection to the server is alive. Nonzero if an error occurred. A nonzero return does not indicate whether the MySQL server itself is down; the connection might be broken for other reasons such as network problems.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

20.10.3.51. `mysql_query()`

```
int mysql_query(MYSQL *mysql, const char *stmt_str)
```

Description

Executes the SQL statement pointed to by the null-terminated string `stmt_str`. Normally, the string must consist of a single SQL statement and you should not add a terminating semicolon (“;”) or `\g` to the statement. If multiple-statement execution has been enabled, the string can contain several statements separated by semicolons. See [Section 20.10.12, “C API Support for Multiple Statement Execution”](#).

`mysql_query()` cannot be used for statements that contain binary data; you must use `mysql_real_query()` instead. (Binary data may contain the “\0” character, which `mysql_query()` interprets as the end of the statement string.)

If you want to know whether the statement should return a result set, you can use `mysql_field_count()` to check for this. See [Section 20.10.3.22, “mysql_field_count\(\)”](#).

Return Values

Zero if the statement was successful. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

20.10.3.52. `mysql_real_connect()`

```
MYSQL *mysql_real_connect(MYSQL *mysql, const char *host, const char *user, const char
*passwd, const char *db, unsigned int port, const char *unix_socket, unsigned long cli-
ent_flag)
```

Description

`mysql_real_connect()` attempts to establish a connection to a MySQL database engine running on `host`. `mysql_real_connect()` must complete successfully before you can execute any other API functions that require a valid MySQL connection handle structure.

The parameters are specified as follows:

- The first parameter should be the address of an existing `MYSQL` structure. Before calling `mysql_real_connect()` you must call `mysql_init()` to initialize the `MYSQL` structure. You can change a lot of connect options with the `mysql_options()` call. See [Section 20.10.3.49](#), “`mysql_options()`”.
- The value of `host` may be either a host name or an IP address. If `host` is `NULL` or the string “localhost”, a connection to the local host is assumed: For Windows, the client connects using a shared-memory connection, if the server has shared-memory connections enabled. Otherwise, TCP/IP is used. For Unix, the client connects using a Unix socket file. For local connections, you can also influence the type of connection to use with the `MYSQL_OPT_PROTOCOL` or `MYSQL_OPT_NAMED_PIPE` options to `mysql_options()`. The type of connection must be supported by the server. For a `host` value of “.” on Windows, the client connects using a named pipe, if the server has named-pipe connections enabled. If named-pipe connections are not enabled, an error occurs.
- The `user` parameter contains the user's MySQL login ID. If `user` is `NULL` or the empty string “”, the current user is assumed. Under Unix, this is the current login name. Under Windows ODBC, the current user name must be specified explicitly. See the MyODBC section of [Chapter 20, Connectors and APIs](#).
- The `passwd` parameter contains the password for `user`. If `passwd` is `NULL`, only entries in the `user` table for the user that have a blank (empty) password field are checked for a match. This allows the database administrator to set up the MySQL privilege system in such a way that users get different privileges depending on whether they have specified a password.

Note

Do not attempt to encrypt the password before calling `mysql_real_connect()`; password encryption is handled automatically by the client API.

- The `user` and `passwd` parameters use whatever character set has been configured for the `MYSQL` object. By default, this is `latin1`, but can be changed by calling `mysql_options(mysql, MYSQL_SET_CHARSET_NAME, "charset_name")` prior to connecting.
- `db` is the database name. If `db` is not `NULL`, the connection sets the default database to this value.
- If `port` is not 0, the value is used as the port number for the TCP/IP connection. Note that the `host` parameter determines the type of the connection.
- If `unix_socket` is not `NULL`, the string specifies the socket or named pipe that should be used. Note that the `host` parameter determines the type of the connection.
- The value of `client_flag` is usually 0, but can be set to a combination of the following flags to enable certain features.

Flag Name	Flag Description
<code>CLIENT_COMPRESS</code>	Use compression protocol.
<code>CLIENT_FOUND_ROWS</code>	Return the number of found (matched) rows, not the number of changed rows.
<code>CLIENT_IGNORE_SIGPIPE</code>	Prevents the client library from installing a <code>SIGPIPE</code> signal handler. This can be used to avoid conflicts with a handler that the application has already installed.
<code>CLIENT_IGNORE_SPACE</code>	Allow spaces after function names. Makes all functions names reserved words.
<code>CLIENT_INTERACTIVE</code>	Allow <code>interactive_timeout</code> seconds (instead of <code>wait_timeout</code> seconds) of inactivity before closing the connection. The client's session <code>wait_timeout</code> variable is set to the value of the session <code>interactive_timeout</code> variable.
<code>CLIENT_LOCAL_FILES</code>	Enable <code>LOAD DATA LOCAL</code> handling.
<code>CLIENT_MULTI_RESULTS</code>	Tell the server that the client can handle multiple result sets from multiple-statement executions or stored procedures. This flag is automatically enabled if <code>CLIENT_MULTI_STATEMENTS</code> is enabled. See the note following this table for more information about this flag.
<code>CLIENT_MULTI_STATEMENTS</code>	Tell the server that the client may send multiple statements in a single string

	(separated by “;”). If this flag is not set, multiple-statement execution is disabled. See the note following this table for more information about this flag.
<code>CLIENT_NO_SCHEMA</code>	Don't allow the <code>db_name.tbl_name.col_name</code> syntax. This is for ODBC. It causes the parser to generate an error if you use that syntax, which is useful for trapping bugs in some ODBC programs.
<code>CLIENT_ODBC</code>	Unused.
<code>CLIENT_SSL</code>	Use SSL (encrypted protocol). This option should not be set by application programs; it is set internally in the client library. Instead, use <code>mysql_ssl_set()</code> before calling <code>mysql_real_connect()</code> .
<code>CLIENT_REMEMBER_OPTIONS</code>	Remember options specified by calls to <code>mysql_options()</code> . Without this option, if <code>mysql_real_connect()</code> fails, you must repeat the <code>mysql_options()</code> calls before trying to connect again. With this option, the <code>mysql_options()</code> calls need not be repeated.

If your program uses `CALL` statements to execute stored procedures, the `CLIENT_MULTI_RESULTS` flag must be enabled. This is because each `CALL` returns a result to indicate the call status, in addition to any result sets that might be returned by statements executed within the procedure. Because `CALL` can return multiple results, you should process them using a loop that calls `mysql_next_result()` to determine whether there are more results.

`CLIENT_MULTI_RESULTS` can be enabled when you call `mysql_real_connect()`, either explicitly by passing the `CLIENT_MULTI_RESULTS` flag itself, or implicitly by passing `CLIENT_MULTI_STATEMENTS` (which also enables `CLIENT_MULTI_RESULTS`).

If you enable `CLIENT_MULTI_STATEMENTS` or `CLIENT_MULTI_RESULTS`, you should process the result for every call to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see [Section 20.10.12, “C API Support for Multiple Statement Execution”](#).

For some parameters, it is possible to have the value taken from an option file rather than from an explicit value in the `mysql_real_connect()` call. To do this, call `mysql_options()` with the `MYSQL_READ_DEFAULT_FILE` or `MYSQL_READ_DEFAULT_GROUP` option before calling `mysql_real_connect()`. Then, in the `mysql_real_connect()` call, specify the “no-value” value for each parameter to be read from an option file:

- For `host`, specify a value of `NULL` or the empty string (“”).
- For `user`, specify a value of `NULL` or the empty string.
- For `passwd`, specify a value of `NULL`. (For the password, a value of the empty string in the `mysql_real_connect()` call cannot be overridden in an option file, because the empty string indicates explicitly that the MySQL account must have an empty password.)
- For `db`, specify a value of `NULL` or the empty string.
- For `port`, specify a value of 0.
- For `unix_socket`, specify a value of `NULL`.

If no value is found in an option file for a parameter, its default value is used as indicated in the descriptions given earlier in this section.

Return Values

A `MYSQL*` connection handle if the connection was successful, `NULL` if the connection was unsuccessful. For a successful connection, the return value is the same as the value of the first parameter.

Errors

- `CR_CONN_HOST_ERROR`
Failed to connect to the MySQL server.
- `CR_CONNECTION_ERROR`
Failed to connect to the local MySQL server.

- `CR_IPSOCKET_ERROR`
Failed to create an IP socket.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_SOCKET_CREATE_ERROR`
Failed to create a Unix socket.
- `CR_UNKNOWN_HOST`
Failed to find the IP address for the host name.
- `CR_VERSION_ERROR`
A protocol mismatch resulted from attempting to connect to a server with a client library that uses a different protocol version.
- `CR_NAMEDPIPEOPEN_ERROR`
Failed to create a named pipe on Windows.
- `CR_NAMEDPIPEWAIT_ERROR`
Failed to wait for a named pipe on Windows.
- `CR_NAMEDPIPESETSTATE_ERROR`
Failed to get a pipe handler on Windows.
- `CR_SERVER_LOST`
If `connect_timeout > 0` and it took longer than `connect_timeout` seconds to connect to the server or if the server died while executing the `init-command`.
- `CR_ALREADY_CONNECTED`
The `MYSQL` connection handle is already connected.

Example

```
MYSQL mysql;

mysql_init(&mysql);
mysql_options(&mysql, MYSQL_READ_DEFAULT_GROUP, "your_prog_name");
if (!mysql_real_connect(&mysql, "host", "user", "passwd", "database", 0, NULL, 0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
            mysql_error(&mysql));
}
```

By using `mysql_options()` the MySQL library reads the `[client]` and `[your_prog_name]` sections in the `my.cnf` file which ensures that your program works, even if someone has set up MySQL in some non-standard way.

Note that upon connection, `mysql_real_connect()` sets the `reconnect` flag (part of the `MYSQL` structure) to a value of `1` in versions of the API older than 5.0.3, or `0` in newer versions. A value of `1` for this flag indicates that if a statement cannot be performed because of a lost connection, to try reconnecting to the server before giving up. You can use the `MYSQL_OPT_RECONNECT` option to `mysql_options()` to control reconnection behavior.

20.10.3.53. `mysql_real_escape_string()`

```
unsigned long mysql_real_escape_string(MYSQL *mysql, char *to, const char *from, unsigned long length)
```

Note that `mysql` must be a valid, open connection. This is needed because the escaping depends on the character set in use by the server.

Description

This function is used to create a legal SQL string that you can use in an SQL statement. See [Section 8.1.1, “Strings”](#).

The string in `from` is encoded to an escaped SQL string, taking into account the current character set of the connection. The result is placed in `to` and a terminating null byte is appended. Characters encoded are `NUL` (ASCII 0), “\n”, “\r”, “\”, “'”, “””, and Control-Z (see [Section 8.1, “Literal Values”](#)). (Strictly speaking, MySQL requires only that backslash and the quote character used to quote the string in the query be escaped. This function quotes the other characters to make them easier to read in log files.)

The string pointed to by `from` must be `length` bytes long. You must allocate the `to` buffer to be at least `length*2+1` bytes long. (In the worst case, each character may need to be encoded as using two bytes, and you need room for the terminating null byte.) When `mysql_real_escape_string()` returns, the contents of `to` is a null-terminated string. The return value is the length of the encoded string, not including the terminating null character.

If you need to change the character set of the connection, you should use the `mysql_set_character_set()` function rather than executing a `SET NAMES` (or `SET CHARACTER SET`) statement. `mysql_set_character_set()` works like `SET NAMES` but also affects the character set used by `mysql_real_escape_string()`, which `SET NAMES` does not.

Example

```
char query[1000],*end;

end = strmov(query,"INSERT INTO test_table values(");
*end++ = '\\';
end += mysql_real_escape_string(&mysql, end,"What is this",12);
*end++ = '\\';
*end++ = ',';
*end++ = '\\';
end += mysql_real_escape_string(&mysql, end,"binary data: \\0\\r\\n",16);
*end++ = '\\';
*end++ = ')';

if (mysql_real_query(&mysql,query,(unsigned int) (end - query)))
{
    fprintf(stderr, "Failed to insert row, Error: %s\\n",
            mysql_error(&mysql));
}
```

The `strmov()` function used in the example is included in the `mysqlclient` library and works like `strcpy()` but returns a pointer to the terminating null of the first parameter.

Return Values

The length of the value placed into `to`, not including the terminating null character.

Errors

None.

20.10.3.54. `mysql_real_query()`

```
int mysql_real_query(MYSQL *mysql, const char *stmt_str, unsigned long length)
```

Description

Executes the SQL statement pointed to by `stmt_str`, which should be a string `length` bytes long. Normally, the string must consist of a single SQL statement and you should not add a terminating semicolon (“;”) or `\g` to the statement. If multiple-statement execution has been enabled, the string can contain several statements separated by semicolons. See [Section 20.10.12, “C API Support for Multiple Statement Execution”](#).

`mysql_query()` cannot be used for statements that contain binary data; you must use `mysql_real_query()` instead. (Binary data may contain the “\0” character, which `mysql_query()` interprets as the end of the statement string.) In addition, `mysql_real_query()` is faster than `mysql_query()` because it does not call `strlen()` on the statement string.

If you want to know whether the statement should return a result set, you can use `mysql_field_count()` to check for this. See [Section 20.10.3.22, “mysql_field_count\(\)”](#).

Return Values

Zero if the statement was successful. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

20.10.3.55. `mysql_refresh()`

```
int mysql_refresh(MYSQL *mysql, unsigned int options)
```

Description

This function flushes tables or caches, or resets replication server information. The connected user must have the `RELOAD` privilege.

The `options` argument is a bit mask composed from any combination of the following values. Multiple values can be OR'ed together to perform multiple operations with a single call.

- `REFRESH_GRANT`

Refresh the grant tables, like `FLUSH PRIVILEGES`.

- `REFRESH_LOG`

Flush the logs, like `FLUSH LOGS`.

- `REFRESH_TABLES`

Flush the table cache, like `FLUSH TABLES`.

- `REFRESH_HOSTS`

Flush the host cache, like `FLUSH HOSTS`.

- `REFRESH_STATUS`

Reset status variables, like `FLUSH STATUS`.

- `REFRESH_THREADS`

Flush the thread cache.

- `REFRESH_SLAVE`

On a slave replication server, reset the master server information and restart the slave, like `RESET SLAVE`.

- `REFRESH_MASTER`

On a master replication server, remove the binary log files listed in the binary log index and truncate the index file, like `RESET MASTER`.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- [CR_SERVER_LOST](#)

The connection to the server was lost during the query.

- [CR_UNKNOWN_ERROR](#)

An unknown error occurred.

20.10.3.56. `mysql_reload()`

```
int mysql_reload(MYSQL *mysql)
```

Description

Asks the MySQL server to reload the grant tables. The connected user must have the [RELOAD](#) privilege.

This function is deprecated. It is preferable to use `mysql_query()` to issue an SQL [FLUSH PRIVILEGES](#) statement instead.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- [CR_COMMANDS_OUT_OF_SYNC](#)

Commands were executed in an improper order.

- [CR_SERVER_GONE_ERROR](#)

The MySQL server has gone away.

- [CR_SERVER_LOST](#)

The connection to the server was lost during the query.

- [CR_UNKNOWN_ERROR](#)

An unknown error occurred.

20.10.3.57. `mysql_rollback()`

```
my_bool mysql_rollback(MYSQL *mysql)
```

Description

Rolls back the current transaction.

The action of this function is subject to the value of the `completion_type` system variable. In particular, if the value of `completion_type` is 2, the server performs a release after terminating a transaction and closes the client connection. The client program should call `mysql_close()` to close the connection from the client side.

Return Values

Zero if successful. Nonzero if an error occurred.

Errors

None.

20.10.3.58. `mysql_row_seek()`

```
MYSQL_ROW_OFFSET mysql_row_seek(MYSQL_RES *result, MYSQL_ROW_OFFSET offset)
```

Description

Sets the row cursor to an arbitrary row in a query result set. The `offset` value is a row offset that should be a value returned from `mysql_row_tell()` or from `mysql_row_seek()`. This value is not a row number; if you want to seek to a row within a result set by number, use `mysql_data_seek()` instead.

This function requires that the result set structure contains the entire result of the query, so `mysql_row_seek()` may be used only in conjunction with `mysql_store_result()`, not with `mysql_use_result()`.

Return Values

The previous value of the row cursor. This value may be passed to a subsequent call to `mysql_row_seek()`.

Errors

None.

20.10.3.59. `mysql_row_tell()`

```
MYSQL_ROW_OFFSET mysql_row_tell(MYSQL_RES *result)
```

Description

Returns the current position of the row cursor for the last `mysql_fetch_row()`. This value can be used as an argument to `mysql_row_seek()`.

You should use `mysql_row_tell()` only after `mysql_store_result()`, not after `mysql_use_result()`.

Return Values

The current offset of the row cursor.

Errors

None.

20.10.3.60. `mysql_select_db()`

```
int mysql_select_db(MYSQL *mysql, const char *db)
```

Description

Causes the database specified by `db` to become the default (current) database on the connection specified by `mysql`. In subsequent queries, this database is the default for table references that do not include an explicit database specifier.

`mysql_select_db()` fails unless the connected user can be authenticated as having permission to use the database.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

20.10.3.61. `mysql_set_character_set()`

```
int mysql_set_character_set(MYSQL *mysql, const char *csname)
```

Description

This function is used to set the default character set for the current connection. The string `csname` specifies a valid character set name. The connection collation becomes the default collation of the character set. This function works like the `SET NAMES` statement, but also sets the value of `mysql->charset`, and thus affects the character set used by `mysql_real_escape_string()`

Return Values

Zero for success. Nonzero if an error occurred.

Example

```
MYSQL mysql;

mysql_init(&mysql);
if (!mysql_real_connect(&mysql, "host", "user", "passwd", "database", 0, NULL, 0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
            mysql_error(&mysql));
}

if (!mysql_set_character_set(&mysql, "utf8"))
{
    printf("New client character set: %s\n",
            mysql_character_set_name(&mysql));
}
```

20.10.3.62. `mysql_set_local_infile_default()`

```
void mysql_set_local_infile_default(MYSQL *mysql);
```

Description

Sets the `LOAD LOCAL DATA INFILE` handler callback functions to the defaults used internally by the C client library. The library calls this function automatically if `mysql_set_local_infile_handler()` has not been called or does not supply valid functions for each of its callbacks.

The `mysql_set_local_infile_default()` function was added in MySQL 4.1.2.

Return Values

None.

Errors

None.

20.10.3.63. `mysql_set_local_infile_handler()`

```
void mysql_set_local_infile_handler(MYSQL *mysql, int (*local_infile_init)(void **,
const char *, void *), int (*local_infile_read)(void *, char *, unsigned int), void
(*local_infile_end)(void *), int (*local_infile_error)(void *, char*, unsigned int),
void *userdata);
```

Description

This function installs callbacks to be used during the execution of `LOAD DATA LOCAL INFILE` statements. It enables application programs to exert control over local (client-side) data file reading. The arguments are the connection handler, a set of pointers to callback functions, and a pointer to a data area that the callbacks can use to share information.

To use `mysql_set_local_infile_handler()`, you must write the following callback functions:

```
int
local_infile_init(void **ptr, const char *filename, void *userdata);
```

The initialization function. This is called once to do any setup necessary, open the data file, allocate data structures, and so forth. The first `void**` argument is a pointer to a pointer. You can set the pointer (that is, `*ptr`) to a value that will be passed to each of the other callbacks (as a `void*`). The callbacks can use this pointed-to value to maintain state information. The `userdata` argument is the same value that is passed to `mysql_set_local_infile_handler()`.

The initialization function should return zero for success, nonzero for an error.

```
int
local_infile_read(void *ptr, char *buf, unsigned int buf_len);
```

The data-reading function. This is called repeatedly to read the data file. `buf` points to the buffer where the read data should be stored, and `buf_len` is the maximum number of bytes that the callback can read and store in the buffer. (It can read fewer bytes, but should not read more.)

The return value is the number of bytes read, or zero when no more data could be read (this indicates EOF). Return a value less than zero if an error occurs.

```
void
local_infile_end(void *ptr)
```

The termination function. This is called once after `local_infile_read()` has returned zero (EOF) or an error. This function should deallocate any memory allocated by `local_infile_init()` and perform any other cleanup necessary. It is invoked even if the initialization function returns an error.

```
int
local_infile_error(void *ptr,
                  char *error_msg,
                  unsigned int error_msg_len);
```

The error-handling function. This is called to get a textual error message to return to the user in case any of your other functions returns an error. `error_msg` points to the buffer into which the message should be written, and `error_msg_len` is the length of the buffer. The message should be written as a null-terminated string, so the message can be at most `error_msg_len-1` bytes long.

The return value is the error number.

Typically, the other callbacks store the error message in the data structure pointed to by `ptr`, so that `local_infile_error()` can copy the message from there into `error_msg`.

After calling `mysql_set_local_infile_handler()` in your C code and passing pointers to your callback functions, you can then issue a `LOAD DATA LOCAL INFILE` statement (for example, by using `mysql_query()`). The client library automatically invokes your callbacks. The file name specified in `LOAD DATA LOCAL INFILE` will be passed as the second parameter to the `local_infile_init()` callback.

The `mysql_set_local_infile_handler()` function was added in MySQL 4.1.2.

Return Values

None.

Errors

None.

20.10.3.64. `mysql_set_server_option()`

```
int mysql_set_server_option(MYSQL *mysql, enum enum_mysql_set_option option)
```

Description

Enables or disables an option for the connection. `option` can have one of the following values.

<code>MYSQL_OPTION_MULTI_STATEMENTS_ON</code>	Enable multiple-statement support
<code>MYSQL_OPTION_MULTI_STATEMENTS_OFF</code>	Disable multiple-statement support

If you enable multiple-statement support, you should retrieve results from calls to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see [Section 20.10.12, “C API Support for Multiple Statement Execution”](#).

Enabling multiple-statement support with `MYSQL_OPTION_MULTI_STATEMENTS_ON` does not have quite the same effect as enabling it by passing the `CLIENT_MULTI_STATEMENTS` flag to `mysql_real_connect()`: `CLIENT_MULTI_STATEMENTS` also enables `CLIENT_MULTI_RESULTS`. If you are using the `CALL SQL` statement in your programs, multiple-result support must be enabled; this means that `MYSQL_OPTION_MULTI_STATEMENTS_ON` by itself is insufficient to allow the use of `CALL`.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `ER_UNKNOWN_COM_ERROR`
The server didn't support `mysql_set_server_option()` (which is the case that the server is older than 4.1.1) or the server didn't support the option one tried to set.

20.10.3.65. `mysql_shutdown()`

```
int mysql_shutdown(MYSQL *mysql, enum mysql_enum_shutdown_level shutdown_level)
```

Description

Asks the database server to shut down. The connected user must have the `SHUTDOWN` privilege. MySQL 5.4 servers support only one type of shutdown; `shutdown_level` must be equal to `SHUTDOWN_DEFAULT`. Additional shutdown levels are planned to make it possible to choose the desired level. Dynamically linked executables which have been compiled with older versions of the `libmysqlclient` headers and call `mysql_shutdown()` need to be used with the old `libmysqlclient` dynamic library.

The shutdown process is described in [Section 5.1.10, “The Shutdown Process”](#).

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

20.10.3.66. `mysql_sqlstate()`

```
const char *mysql_sqlstate(MYSQL *mysql)
```

Description

Returns a null-terminated string containing the `SQLSTATE` error code for the most recently executed SQL statement. The error code consists of five characters. `'00000'` means “no error”. The values are specified by ANSI SQL and ODBC. For a list of possible values, see [Appendix B, *Errors, Error Codes, and Common Problems*](#).

SQLSTATE values returned by `mysql_sqlstate()` differ from MySQL-specific error numbers returned by `mysql_errno()`. For example, the `mysql` client program displays errors using the following format, where `1146` is the `mysql_errno()` value and `'42S02'` is the corresponding `mysql_sqlstate()` value:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

Not all MySQL error numbers are mapped to SQLSTATE error codes. The value `'HY000'` (general error) is used for unmapped error numbers.

If you call `mysql_sqlstate()` after `mysql_real_connect()` fails, `mysql_sqlstate()` might not return a useful value. For example, this happens if a host is blocked by the server and the connection is closed without any SQLSTATE value being sent to the client.

Return Values

A null-terminated character string containing the SQLSTATE error code.

See Also

See [Section 20.10.3.14](#), “`mysql_errno()`”, [Section 20.10.3.15](#), “`mysql_error()`”, and [Section 20.10.7.26](#), “`mysql_stmt_sqlstate()`”.

20.10.3.67. `mysql_ssl_set()`

```
my_bool mysql_ssl_set(MYSQL *mysql, const char *key, const char *cert, const char *ca,
const char *capath, const char *cipher)
```

Description

`mysql_ssl_set()` is used for establishing secure connections using SSL. It must be called before `mysql_real_connect()`.

`mysql_ssl_set()` does nothing unless SSL support is enabled in the client library.

`mysql` is the connection handler returned from `mysql_init()`. The other parameters are specified as follows:

- `key` is the path name to the key file.
- `cert` is the path name to the certificate file.
- `ca` is the path name to the certificate authority file.
- `capath` is the path name to a directory that contains trusted SSL CA certificates in pem format.
- `cipher` is a list of allowable ciphers to use for SSL encryption.

Any unused SSL parameters may be given as `NULL`.

Return Values

This function always returns `0`. If SSL setup is incorrect, `mysql_real_connect()` returns an error when you attempt to connect.

20.10.3.68. `mysql_stat()`

```
const char *mysql_stat(MYSQL *mysql)
```

Description

Returns a character string containing information similar to that provided by the `mysqladmin status` command. This includes uptime in seconds and the number of running threads, questions, reloads, and open tables.

Return Values

A character string describing the server status. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

20.10.3.69. `mysql_store_result()`

```
MYSQL_RES *mysql_store_result(MYSQL *mysql)
```

Description

After invoking `mysql_query()` or `mysql_real_query()`, you must call `mysql_store_result()` or `mysql_use_result()` for every statement that successfully produces a result set (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`, `CHECK TABLE`, and so forth). You must also call `mysql_free_result()` after you are done with the result set.

You don't have to call `mysql_store_result()` or `mysql_use_result()` for other statements, but it does not do any harm or cause any notable performance degradation if you call `mysql_store_result()` in all cases. You can detect whether the statement has a result set by checking whether `mysql_store_result()` returns a nonzero value (more about this later on).

If you enable multiple-statement support, you should retrieve results from calls to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see [Section 20.10.12, "C API Support for Multiple Statement Execution"](#).

If you want to know whether a statement should return a result set, you can use `mysql_field_count()` to check for this. See [Section 20.10.3.22, "mysql_field_count\(\)"](#).

`mysql_store_result()` reads the entire result of a query to the client, allocates a `MYSQL_RES` structure, and places the result into this structure.

`mysql_store_result()` returns a null pointer if the statement didn't return a result set (for example, if it was an `INSERT` statement).

`mysql_store_result()` also returns a null pointer if reading of the result set failed. You can check whether an error occurred by checking whether `mysql_error()` returns a non-empty string, `mysql_errno()` returns nonzero, or `mysql_field_count()` returns zero.

An empty result set is returned if there are no rows returned. (An empty result set differs from a null pointer as a return value.)

After you have called `mysql_store_result()` and gotten back a result that isn't a null pointer, you can call `mysql_num_rows()` to find out how many rows are in the result set.

You can call `mysql_fetch_row()` to fetch rows from the result set, or `mysql_row_seek()` and `mysql_row_tell()` to obtain or set the current row position within the result set.

See [Section 20.10.10.1, "Why mysql_store_result\(\) Sometimes Returns NULL After mysql_query\(\) Returns Success"](#).

Return Values

A `MYSQL_RES` result structure with the results. `NULL` (0) if an error occurred.

Errors

`mysql_store_result()` resets `mysql_error()` and `mysql_errno()` if it succeeds.

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

20.10.3.70. `mysql_thread_id()`

```
unsigned long mysql_thread_id(MYSQL *mysql)
```

Description

Returns the thread ID of the current connection. This value can be used as an argument to `mysql_kill()` to kill the thread.

If the connection is lost and you reconnect with `mysql_ping()`, the thread ID changes. This means you should not get the thread ID and store it for later. You should get it when you need it.

Return Values

The thread ID of the current connection.

Errors

None.

20.10.3.71. `mysql_use_result()`

```
MYSQL_RES *mysql_use_result(MYSQL *mysql)
```

Description

After invoking `mysql_query()` or `mysql_real_query()`, you must call `mysql_store_result()` or `mysql_use_result()` for every statement that successfully produces a result set (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`, `CHECK TABLE`, and so forth). You must also call `mysql_free_result()` after you are done with the result set.

`mysql_use_result()` initiates a result set retrieval but does not actually read the result set into the client like `mysql_store_result()` does. Instead, each row must be retrieved individually by making calls to `mysql_fetch_row()`. This reads the result of a query directly from the server without storing it in a temporary table or local buffer, which is somewhat faster and uses much less memory than `mysql_store_result()`. The client allocates memory only for the current row and a communication buffer that may grow up to `max_allowed_packet` bytes.

On the other hand, you shouldn't use `mysql_use_result()` if you are doing a lot of processing for each row on the client side, or if the output is sent to a screen on which the user may type a ^S (stop scroll). This ties up the server and prevent other threads from updating any tables from which the data is being fetched.

When using `mysql_use_result()`, you must execute `mysql_fetch_row()` until a `NULL` value is returned, otherwise, the unfetched rows are returned as part of the result set for your next query. The C API gives the error `Commands out of sync; you can't run this command now` if you forget to do this!

You may not use `mysql_data_seek()`, `mysql_row_seek()`, `mysql_row_tell()`, `mysql_num_rows()`, or `mysql_affected_rows()` with a result returned from `mysql_use_result()`, nor may you issue other queries until `mysql_use_result()` has finished. (However, after you have fetched all the rows, `mysql_num_rows()` accurately returns the number of rows fetched.)

You must call `mysql_free_result()` once you are done with the result set.

When using the `libmysqld` embedded server, the memory benefits are essentially lost because memory usage incrementally increases with each row retrieved until `mysql_free_result()` is called.

Return Values

A `MYSQL_RES` result structure. `NULL` if an error occurred.

Errors

`mysql_use_result()` resets `mysql_error()` and `mysql_errno()` if it succeeds.

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

20.10.3.72. `mysql_warning_count()`

```
unsigned int mysql_warning_count(MYSQL *mysql)
```

Description

Returns the number of warnings generated during execution of the previous SQL statement.

Return Values

The warning count.

Errors

None.

20.10.4. C API Prepared Statements

The MySQL client/server protocol provides for the use of prepared statements. This capability uses the `MYSQL_STMT` statement handler data structure returned by the `mysql_stmt_init()` initialization function. Prepared execution is an efficient way to execute a statement more than once. The statement is first parsed to prepare it for execution. Then it is executed one or more times at a later time, using the statement handle returned by the initialization function.

Prepared execution is faster than direct execution for statements executed more than once, primarily because the query is parsed only once. In the case of direct execution, the query is parsed every time it is executed. Prepared execution also can provide a reduction of network traffic because for each execution of the prepared statement, it is necessary only to send the data for the parameters.

Prepared statements might not provide a performance increase in some situations. For best results, test your application both with prepared and non-prepared statements and choose whichever yields best performance.

Another advantage of prepared statements is that it uses a binary protocol that makes data transfer between client and server more efficient.

The following SQL statements can be used in prepared statements:

```
ALTER TABLE
ANALYZE TABLE
CACHE INDEX
CALL
CHANGE MASTER
CHECKSUM {TABLE | TABLES}
COMMIT
{CREATE | DROP} DATABASE
{CREATE | RENAME | DROP} USER
CREATE INDEX
```

```

CREATE TABLE
DELETE
DO
DROP INDEX
DROP TABLE
FLUSH {TABLE | TABLES | TABLES WITH READ LOCK | HOSTS | PRIVILEGES
      | LOGS | STATUS | MASTER | SLAVE | DES_KEY_FILE | USER_RESOURCES}
GRANT
INSERT
INSTALL PLUGIN
KILL
LOAD INDEX INTO CACHE
OPTIMIZE TABLE
RENAME TABLE
REPAIR TABLE
REPLACE
RESET {MASTER | SLAVE | QUERY CACHE}
REVOKE
SELECT
SET
SHOW BINLOG EVENTS
SHOW CREATE {PROCEDURE | FUNCTION | EVENT | TABLE | VIEW}
SHOW {AUTHORS | CONTRIBUTORS | WARNINGS | ERRORS}
SHOW {MASTER | BINARY} LOGS
SHOW {MASTER | SLAVE} STATUS
SLAVE {START | STOP}
UNINSTALL PLUGIN
UPDATE

```

Other statements are not yet supported in MySQL 5.4.

MySQL Enterprise

MySQL Enterprise subscribers will find more information about using prepared statements in the Knowledge Base article, [How can I create server-side prepared statements?](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

20.10.5. C API Prepared Statement Data types

Prepared statements use several data structures:

- To prepare a statement, pass the statement string to `mysql_stmt_init()`, which returns a pointer to a `MYSQL_STMT` data structure.
- To provide input parameters for a prepared statement, set up `MYSQL_BIND` structures and pass them to `mysql_stmt_bind_param()`. To receive output column values, set up `MYSQL_BIND` structures and pass them to `mysql_stmt_bind_result()`.
- The `MYSQL_TIME` structure is used to transfer temporal data in both directions.

The following discussion describes the prepared statement data types in detail.

- `MYSQL_STMT`

This structure represents a prepared statement. A statement is created by calling `mysql_stmt_init()`, which returns a statement handle (that is, a pointer to a `MYSQL_STMT`). The handle is used for all subsequent operations with the statement until you close it with `mysql_stmt_close()`, at which point the handle becomes invalid.

The `MYSQL_STMT` structure has no members that are intended for application use. Also, you should not try to make a copy of a `MYSQL_STMT` structure. There is no guarantee that such a copy will be usable.

Multiple statement handles can be associated with a single connection. The limit on the number of handles depends on the available system resources.

- `MYSQL_BIND`

This structure is used both for statement input (data values sent to the server) and output (result values returned from the server):

- For input, `MYSQL_BIND` is used with `mysql_stmt_bind_param()` to bind parameter data values to buffers for use by `mysql_stmt_execute()`.
- For output, `MYSQL_BIND` is used with `mysql_stmt_bind_result()` to bind result set buffers for use in fetching rows with `mysql_stmt_fetch()`.

To use a `MYSQL_BIND` structure, you should zero its contents to initialize it, and then set its members appropriately. For example, to declare and initialize an array of three `MYSQL_BIND` structures, use this code:

```
MYSQL_BIND bind[3];
memset(bind, 0, sizeof(bind));
```

The `MYSQL_BIND` structure contains the following members for use by application programs. For several of the members, the manner of use depends on whether the structure is used for input or output.

- `enum enum_field_types buffer_type`

The type of the buffer. This member indicates the data type of the C language variable that you are binding to the statement parameter. The allowable `buffer_type` values are listed later in this section. For input, `buffer_type` indicates the type of the variable containing the value that you will send to the server. For output, it indicates the type of the variable into which you want a value received from the server to be stored.

- `void *buffer`

A pointer to the buffer to be used for data transfer. This is the address of a variable.

For input, `buffer` is a pointer to the variable in which a statement parameter's data value is stored. When you call `mysql_stmt_execute()`, MySQL takes the value that you have stored in the variable and uses it in place of the corresponding parameter marker in the statement.

For output, `buffer` is a pointer to the variable in which to return a result set column value. When you call `mysql_stmt_fetch()`, MySQL returns a column value and stores it in this variable. You can access the value when the call returns.

To minimize the need for MySQL to perform type conversions between C language values on the client side and SQL values on the server side, use variables that have types similar to those of the corresponding SQL values. For numeric data types, `buffer` should point to a variable of the proper numeric C type. (For `char` or integer variables, you should also indicate whether the variable has the `unsigned` attribute by setting the `is_unsigned` member, described later in this list.) For character (nonbinary) and binary string data types, `buffer` should point to a character buffer. For date and time data types, `buffer` should point to a `MYSQL_TIME` structure.

See the notes about type conversions later in the section.

- `unsigned long buffer_length`

The actual size of `*buffer` in bytes. This indicates the maximum amount of data that can be stored in the buffer. For character and binary C data, the `buffer_length` value specifies the length of `*buffer` when used with `mysql_stmt_bind_param()` to specify input values, or the maximum number of output data bytes that can be fetched into the buffer when used with `mysql_stmt_bind_result()`.

- `unsigned long *length`

A pointer to an `unsigned long` variable that indicates the actual number of bytes of data stored in `*buffer`. `length` is used for character or binary C data.

For input parameter data binding, `length` points to an `unsigned long` variable that indicates the actual length of the parameter value stored in `*buffer`; this is used by `mysql_stmt_execute()`.

For output value binding, the return value of `mysql_stmt_fetch()` determines the interpretation of the length:

- If `mysql_stmt_fetch()` returns 0, `*length` indicates the actual length of the parameter value.
- If `mysql_stmt_fetch()` returns `MYSQL_DATA_TRUNCATED`, `*length` indicates the non-truncated length of the parameter value. In this case, the minimum of `*length` and `buffer_length` indicates the actual length of the value.

`length` is ignored for numeric and temporal data types because the length of the data value is determined by the `buffer_type` value.

If you need to be able to determine the length of a returned value before fetching it with `mysql_stmt_fetch()`, see [Section 20.10.7.11](#), “`mysql_stmt_fetch()`”, for some strategies.

- `my_bool *is_null`

This member points to a `my_bool` variable that is true if a value is `NULL`, false if it is not `NULL`. For input, set `*is_null` to true to indicate that you are passing a `NULL` value as a statement parameter.

The reason that `is_null` is not a boolean scalar but is instead a *pointer* to a boolean scalar is to provide flexibility in how you specify `NULL` values:

- If your data values are always `NULL`, use `MYSQL_TYPE_NULL` as the `buffer_type` value when you bind the column. The other members do not matter.
- If your data values are always `NOT NULL`, set the other members appropriately for the variable you are binding, and set `is_null = (my_bool*) 0`.
- In all other cases, set the other members appropriately, and set `is_null` to the address of a `my_bool` variable. Set that variable's value to true or false appropriately between executions to indicate whether data values are `NULL` or `NOT NULL`, respectively.

For output, the value pointed to by `is_null` is set to true after you fetch a row if the result set column value returned from the statement is `NULL`.

- `my_bool is_unsigned`

This member is used for C variables with data types that can be `unsigned` (`char`, `short int`, `int`, `long long int`). Set `is_unsigned` to true if the variable pointed to by `buffer` is `unsigned` and false otherwise. For example, if you bind a `signed char` variable to `buffer`, specify a type code of `MYSQL_TYPE_TINY` and set `is_unsigned` to false. If you bind an `unsigned char` instead, the type code is the same but `is_unsigned` should be true. (For `char`, it is not defined whether it is signed or unsigned, so it is best to be explicit about signedness by using `signed char` or `unsigned char`.)

`is_unsigned` applies only to the C language variable on the client side. It indicates nothing about the signedness of the corresponding SQL value on the server side. For example, if you use an `int` variable to supply a value for a `BIGINT UNSIGNED` column, `is_unsigned` should be false because `int` is a signed type. If you use an `unsigned int` variable to supply a value for a `BIGINT` column, `is_unsigned` should be true because `unsigned int` is an unsigned type. MySQL performs the proper conversion between signed and unsigned values in both directions, although a warning occurs if truncation results.

- `my_bool *error`

For output, set this member to point to a `my_bool` variable to have truncation information for the parameter stored there after a row fetching operation. (Truncation reporting is enabled by default, but can be controlled by calling `mysql_options()` with the `MYSQL_REPORT_DATA_TRUNCATION` option.) When truncation reporting is enabled, `mysql_stmt_fetch()` returns `MYSQL_DATA_TRUNCATED` and `*error` is true in the `MYSQL_BIND` structures for parameters in which truncation occurred. Truncation indicates loss of sign or significant digits, or that a string was too long to fit in a column.

- `MYSQL_TIME`

This structure is used to send and receive `DATE`, `TIME`, `DATETIME`, and `TIMESTAMP` data directly to and from the server. Set the `buffer_type` member of a `MYSQL_BIND` structure to one of the temporal types (`MYSQL_TYPE_TIME`, `MYSQL_TYPE_DATE`, `MYSQL_TYPE_DATETIME`, `MYSQL_TYPE_TIMESTAMP`), and set the `buffer` member to point to a `MYSQL_TIME` structure.

The `MYSQL_TIME` structure contains the members listed in the following table.

Member	Description
<code>unsigned int year</code>	The year
<code>unsigned int month</code>	The month of the year
<code>unsigned int day</code>	The day of the month
<code>unsigned int hour</code>	The hour of the day
<code>unsigned int minute</code>	The minute of the hour
<code>unsigned int second</code>	The second of the minute
<code>my_bool neg</code>	A boolean flag to indicate whether the time is negative
<code>unsigned long second_part</code>	The fractional part of the second in microseconds; currently unused

Only those parts of a `MYSQL_TIME` structure that apply to a given type of temporal value are used. The `year`, `month`, and `day` elements are used for `DATE`, `DATETIME`, and `TIMESTAMP` values. The `hour`, `minute`, and `second` elements are used for `TIME`, `DATETIME`, and `TIMESTAMP` values. See [Section 20.10.14, “C API Prepared Statement Handling of Date and Time Values”](#).

The following table shows the allowable values that may be specified in the `buffer_type` member of `MYSQL_BIND` structures for input values. The value should be chosen according to the data type of the C language variable that you are binding. If the variable is `unsigned`, you should also set the `is_unsigned` member to true. The table shows the C variable types that you can use, the corresponding type codes, and the SQL data types for which the supplied value can be used without conversion.

Input Variable C Type	<code>buffer_type</code> Value	SQL Type of Destination Value
<code>signed char</code>	<code>MYSQL_TYPE_TINY</code>	<code>TINYINT</code>
<code>short int</code>	<code>MYSQL_TYPE_SHORT</code>	<code>SMALLINT</code>
<code>int</code>	<code>MYSQL_TYPE_LONG</code>	<code>INT</code>
<code>long long int</code>	<code>MYSQL_TYPE_LONGLONG</code>	<code>BIGINT</code>
<code>float</code>	<code>MYSQL_TYPE_FLOAT</code>	<code>FLOAT</code>
<code>double</code>	<code>MYSQL_TYPE_DOUBLE</code>	<code>DOUBLE</code>
<code>MYSQL_TIME</code>	<code>MYSQL_TYPE_TIME</code>	<code>TIME</code>
<code>MYSQL_TIME</code>	<code>MYSQL_TYPE_DATE</code>	<code>DATE</code>
<code>MYSQL_TIME</code>	<code>MYSQL_TYPE_DATETIME</code>	<code>DATETIME</code>
<code>MYSQL_TIME</code>	<code>MYSQL_TYPE_TIMESTAMP</code>	<code>TIMESTAMP</code>
<code>char[]</code>	<code>MYSQL_TYPE_STRING</code> (for nonbinary data)	<code>TEXT, CHAR, VARCHAR</code>
<code>char[]</code>	<code>MYSQL_TYPE_BLOB</code> (for binary data)	<code>BLOB, BINARY, VARBINARY</code>
	<code>MYSQL_TYPE_NULL</code>	<code>NULL</code>

The use of `MYSQL_TYPE_NULL` is described earlier in connection with the `is_null` member.

The following table shows the allowable values that may be specified in the `buffer_type` member of `MYSQL_BIND` structures for output values. The value should be chosen according to the data type of the C language variable that you are binding. If the variable is `unsigned`, you should also set the `is_unsigned` member to true. The table shows the SQL types of received values, the corresponding type code that such values have in result set metadata, and the recommended C language data types to bind to the `MYSQL_BIND` structure to receive the SQL values without conversion.

If there is a mismatch between the C variable type on the client side and the corresponding SQL value on the server side, MySQL performs implicit type conversions in both directions.

SQL Type of Received Value	<code>buffer_type</code> Value	Output Variable C Type
<code>TINYINT</code>	<code>MYSQL_TYPE_TINY</code>	<code>signed char</code>
<code>SMALLINT</code>	<code>MYSQL_TYPE_SHORT</code>	<code>short int</code>
<code>MEDIUMINT</code>	<code>MYSQL_TYPE_INT24</code>	<code>int</code>
<code>INT</code>	<code>MYSQL_TYPE_LONG</code>	<code>int</code>
<code>BIGINT</code>	<code>MYSQL_TYPE_LONGLONG</code>	<code>long long int</code>
<code>FLOAT</code>	<code>MYSQL_TYPE_FLOAT</code>	<code>float</code>
<code>DOUBLE</code>	<code>MYSQL_TYPE_DOUBLE</code>	<code>double</code>
<code>DECIMAL</code>	<code>MYSQL_TYPE_NEWDECIMAL</code>	<code>char[]</code>
<code>YEAR</code>	<code>MYSQL_TYPE_SHORT</code>	<code>short int</code>
<code>TIME</code>	<code>MYSQL_TYPE_TIME</code>	<code>MYSQL_TIME</code>
<code>DATE</code>	<code>MYSQL_TYPE_DATE</code>	<code>MYSQL_TIME</code>
<code>DATETIME</code>	<code>MYSQL_TYPE_DATETIME</code>	<code>MYSQL_TIME</code>
<code>TIMESTAMP</code>	<code>MYSQL_TYPE_TIMESTAMP</code>	<code>MYSQL_TIME</code>
<code>CHAR, BINARY</code>	<code>MYSQL_TYPE_STRING</code>	<code>char[]</code>
<code>VARCHAR, VARBINARY</code>	<code>MYSQL_TYPE_VAR_STRING</code>	<code>char[]</code>
<code>TINYBLOB, TINYTEXT</code>	<code>MYSQL_TYPE_TINY_BLOB</code>	<code>char[]</code>
<code>BLOB, TEXT</code>	<code>MYSQL_TYPE_BLOB</code>	<code>char[]</code>
<code>MEDIUMBLOB, MEDIUMTEXT</code>	<code>MYSQL_TYPE_MEDIUM_BLOB</code>	<code>char[]</code>
<code>LOBLOB, LONGTEXT</code>	<code>MYSQL_TYPE_LONG_BLOB</code>	<code>char[]</code>
<code>BIT</code>	<code>MYSQL_TYPE_BIT</code>	<code>char[]</code>

MySQL knows the type code for the SQL value on the server side. The `buffer_type` value indicates the MySQL the type code of the C variable that holds the value on the client side. The two codes together tell MySQL what conversion must be performed, if any. Here are some examples:

- If you use `MYSQL_TYPE_LONG` with an `int` variable to pass an integer value to the server that is to be stored into a `FLOAT` column, MySQL converts the value to floating-point format before storing it.
- If you fetch an SQL `MEDIUMINT` column value, but specify a `buffer_type` value of `MYSQL_TYPE_LONGLONG` and use a C variable of type `long long int` as the destination buffer, MySQL will convert the `MEDIUMINT` value (which requires less than 8 bytes) for storage into the `long long int` (an 8-byte variable).
- If you fetch a numeric column with a value of 255 into a `char[4]` character array and specify a `buffer_type` value of `MYSQL_TYPE_STRING`, the resulting value in the array will be a 4-byte string containing `'255\0'`.
- `DECIMAL` values are returned as strings, which is why the corresponding C type is `char[]`. `DECIMAL` values returned by the server correspond to the string representation of the original server-side value. For example, `12.345` is returned to the client as `'12.345'`. If you specify `MYSQL_TYPE_NEWDECIMAL` and bind a string buffer to the `MYSQL_BIND` structure, `mysql_stmt_fetch()` stores the value in the buffer without conversion. If instead you specify a numeric variable and type code, `mysql_stmt_fetch()` converts the string-format `DECIMAL` value to numeric form.
- For the `MYSQL_TYPE_BIT` type code, `BIT` values are returned into a string buffer (thus, the corresponding C type is `char[]` here, too). The value represents a bit string that requires interpretation on the client side. To return the value as a type that is easier to deal with, you can cause the value to be cast to integer using either of the following types of expressions:

```
SELECT bit_col + 0 FROM t
SELECT CAST(bit_col AS UNSIGNED) FROM t
```

To retrieve the value, bind an integer variable large enough to hold the value and specify the appropriate corresponding integer type code.

Before binding variables to the `MYSQL_BIND` structures that are to be used for fetching column values, you can check the type codes for each column of the result set. This might be desirable if you want to determine which variable types would be best to use to avoid type conversions. To get the type codes, call `mysql_stmt_result_metadata()` after executing the prepared statement with `mysql_stmt_execute()`. The metadata provides access to the type codes for the result set as described in [Section 20.10.7.22](#), “`mysql_stmt_result_metadata()`”, and [Section 20.10.1](#), “C API Data Types”.

If you cause the `max_length` member of the `MYSQL_FIELD` column metadata structures to be set (by calling `mysql_stmt_attr_set()`), be aware that the `max_length` values for the result set indicate the lengths of the longest string representation of the result values, not the lengths of the binary representation. That is, `max_length` does not necessarily correspond to the size of the buffers needed to fetch the values with the binary protocol used for prepared statements. The size of the buffers should be chosen according to the types of the variables into which you fetch the values.

For input character (nonbinary) string data (indicated by `MYSQL_TYPE_STRING`), the value is assumed to be in the character set indicated by the `character_set_client` system variable. If the value is stored into a column with a different character set, the appropriate conversion to that character set occurs. For input binary string data (indicated by `MYSQL_TYPE_BLOB`), the value is treated as having the `binary` character set; that is, it is treated as a byte string and no conversion occurs.

To determine whether output string values in a result set returned from the server contain binary or nonbinary data, check whether the `charsetnr` value of the result set metadata is 63 (see [Section 20.10.1](#), “C API Data Types”). If so, the character set is `binary`, which indicates binary rather than nonbinary data. This enables you to distinguish `BINARY` from `CHAR`, `VARBINARY` from `VARCHAR`, and the `BLOB` types from the `TEXT` types.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic reparation of the statement when it is next executed. For more information, see [Section 12.7.4](#), “Automatic Prepared Statement Reparation”.

20.10.6. C API Prepared Statement Function Overview

The functions available for prepared statement processing are summarized here and described in greater detail in a later section. See [Section 20.10.7](#), “C API Prepared Statement Function Descriptions”.

Function	Description
<code>mysql_stmt_affected_rows()</code>	Returns the number of rows changed, deleted, or inserted by prepared <code>UPDATE</code> , <code>DELETE</code> , or <code>INSERT</code> statement
<code>mysql_stmt_attr_get()</code>	Get value of an attribute for a prepared statement
<code>mysql_stmt_attr_set()</code>	Sets an attribute for a prepared statement
<code>mysql_stmt_bind_param()</code>	Associates application data buffers with the parameter markers in a prepared SQL state-

	ment
<code>mysql_stmt_bind_result()</code>	Associates application data buffers with columns in the result set
<code>mysql_stmt_close()</code>	Frees memory used by prepared statement
<code>mysql_stmt_data_seek()</code>	Seeks to an arbitrary row number in a statement result set
<code>mysql_stmt_errno()</code>	Returns the error number for the last statement execution
<code>mysql_stmt_error()</code>	Returns the error message for the last statement execution
<code>mysql_stmt_execute()</code>	Executes the prepared statement
<code>mysql_stmt_fetch()</code>	Fetches the next row of data from the result set and returns data for all bound columns
<code>mysql_stmt_fetch_column()</code>	Fetch data for one column of the current row of the result set
<code>mysql_stmt_field_count()</code>	Returns the number of result columns for the most recent statement
<code>mysql_stmt_free_result()</code>	Free the resources allocated to the statement handle
<code>mysql_stmt_init()</code>	Allocates memory for <code>MYSQL_STMT</code> structure and initializes it
<code>mysql_stmt_insert_id()</code>	Returns the ID generated for an <code>AUTO_INCREMENT</code> column by prepared statement
<code>mysql_stmt_num_rows()</code>	Returns total row count from the buffered statement result set
<code>mysql_stmt_param_count()</code>	Returns the number of parameters in a prepared SQL statement
<code>mysql_stmt_param_metadata()</code>	(Return parameter metadata in the form of a result set.) Currently, this function does nothing
<code>mysql_stmt_prepare()</code>	Prepares an SQL string for execution
<code>mysql_stmt_reset()</code>	Reset the statement buffers in the server
<code>mysql_stmt_result_metadata()</code>	Returns prepared statement metadata in the form of a result set
<code>mysql_stmt_row_seek()</code>	Seeks to a row offset in a statement result set, using value returned from <code>mysql_stmt_row_tell()</code>
<code>mysql_stmt_row_tell()</code>	Returns the statement row cursor position
<code>mysql_stmt_send_long_data()</code>	Sends long data in chunks to server
<code>mysql_stmt_sqlstate()</code>	Returns the <code>SQLSTATE</code> error code for the last statement execution
<code>mysql_stmt_store_result()</code>	Retrieves the complete result set to the client

Call `mysql_stmt_init()` to create a statement handle, then `mysql_stmt_prepare()` to prepare it, `mysql_stmt_bind_param()` to supply the parameter data, and `mysql_stmt_execute()` to execute the statement. You can repeat the `mysql_stmt_execute()` by changing parameter values in the respective buffers supplied through `mysql_stmt_bind_param()`.

If the statement is a `SELECT` or any other statement that produces a result set, `mysql_stmt_prepare()` also returns the result set metadata information in the form of a `MYSQL_RES` result set through `mysql_stmt_result_metadata()`.

You can supply the result buffers using `mysql_stmt_bind_result()`, so that the `mysql_stmt_fetch()` automatically returns data to these buffers. This is row-by-row fetching.

You can also send the text or binary data in chunks to server using `mysql_stmt_send_long_data()`. See [Section 20.10.7.25](#), “`mysql_stmt_send_long_data()`”.

When statement execution has been completed, the statement handle must be closed using `mysql_stmt_close()` so that all resources associated with it can be freed.

If you obtained a `SELECT` statement's result set metadata by calling `mysql_stmt_result_metadata()`, you should also free the metadata using `mysql_free_result()`.

Execution Steps

To prepare and execute a statement, an application follows these steps:

1. Create a prepared statement handle with `mysql_stmt_init()`. To prepare the statement on the server, call `mysql_stmt_prepare()` and pass it a string containing the SQL statement.
2. If the statement produces a result set, call `mysql_stmt_result_metadata()` to obtain the result set metadata. This metadata is itself in the form of result set, albeit a separate one from the one that contains the rows returned by the query. The metadata result set indicates how many columns are in the result and contains information about each column.

3. Set the values of any parameters using `mysql_stmt_bind_param()`. All parameters must be set. Otherwise, statement execution returns an error or produces unexpected results.
4. Call `mysql_stmt_execute()` to execute the statement.
5. If the statement produces a result set, bind the data buffers to use for retrieving the row values by calling `mysql_stmt_bind_result()`.
6. Fetch the data into the buffers row by row by calling `mysql_stmt_fetch()` repeatedly until no more rows are found.
7. Repeat steps 3 through 6 as necessary, by changing the parameter values and re-executing the statement.

When `mysql_stmt_prepare()` is called, the MySQL client/server protocol performs these actions:

- The server parses the statement and sends the okay status back to the client by assigning a statement ID. It also sends total number of parameters, a column count, and its metadata if it is a result set oriented statement. All syntax and semantics of the statement are checked by the server during this call.
- The client uses this statement ID for the further operations, so that the server can identify the statement from among its pool of statements.

When `mysql_stmt_execute()` is called, the MySQL client/server protocol performs these actions:

- The client uses the statement handle and sends the parameter data to the server.
- The server identifies the statement using the ID provided by the client, replaces the parameter markers with the newly supplied data, and executes the statement. If the statement produces a result set, the server sends the data back to the client. Otherwise, it sends an okay status and total number of rows changed, deleted, or inserted.

When `mysql_stmt_fetch()` is called, the MySQL client/server protocol performs these actions:

- The client reads the data from the packet row by row and places it into the application data buffers by doing the necessary conversions. If the application buffer type is same as that of the field type returned from the server, the conversions are straightforward.

If an error occurs, you can get the statement error code, error message, and SQLSTATE value using `mysql_stmt_errno()`, `mysql_stmt_error()`, and `mysql_stmt_sqlstate()`, respectively.

Prepared Statement Logging

For prepared statements that are executed with the `mysql_stmt_prepare()` and `mysql_stmt_execute()` C API functions, the server writes `Prepare` and `Execute` lines to the general query log so that you can tell when statements are prepared and executed.

Suppose that you prepare and execute a statement as follows:

1. Call `mysql_stmt_prepare()` to prepare the statement string `"SELECT ?"`.
2. Call `mysql_stmt_bind_param()` to bind the value `3` to the parameter in the prepared statement.
3. Call `mysql_stmt_execute()` to execute the prepared statement.

As a result of the preceding calls, the server writes the following lines to the general query log:

```
Prepare [1] SELECT ?
Execute [1] SELECT 3
```

Each `Prepare` and `Execute` line in the log is tagged with a `[N]` statement identifier so that you can keep track of which prepared statement is being logged. `N` is a positive integer. If there are multiple prepared statements active simultaneously for the client, `N` may be greater than 1. Each `Execute` lines shows a prepared statement after substitution of data values for `?` parameters.

Version notes: `Prepare` lines are displayed without `[N]` before MySQL 4.1.10. `Execute` lines are not displayed at all before MySQL 4.1.10.

20.10.7. C API Prepared Statement Function Descriptions

To prepare and execute queries, use the functions described in detail in the following sections.

All functions that operate with a `MYSQL_STMT` structure begin with the prefix `mysql_stmt_`.

To create a `MYSQL_STMT` handle, use the `mysql_stmt_init()` function.

20.10.7.1. `mysql_stmt_affected_rows()`

```
my_ulonglong mysql_stmt_affected_rows(MYSQL_STMT *stmt)
```

Description

Returns the total number of rows changed, deleted, or inserted by the last executed statement. May be called immediately after `mysql_stmt_execute()` for `UPDATE`, `DELETE`, or `INSERT` statements. For `SELECT` statements, `mysql_stmt_affected_rows()` works like `mysql_num_rows()`.

Return Values

An integer greater than zero indicates the number of rows affected or retrieved. Zero indicates that no records were updated for an `UPDATE` statement, no rows matched the `WHERE` clause in the query, or that no query has yet been executed. -1 indicates that the query returned an error or that, for a `SELECT` query, `mysql_stmt_affected_rows()` was called prior to calling `mysql_stmt_store_result()`. Because `mysql_stmt_affected_rows()` returns an unsigned value, you can check for -1 by comparing the return value to `(my_ulonglong)-1` (or to `(my_ulonglong)~0`, which is equivalent).

See [Section 20.10.3.1](#), “`mysql_affected_rows()`”, for additional information on the return value.

Errors

None.

Example

For the usage of `mysql_stmt_affected_rows()`, refer to the Example from [Section 20.10.7.10](#), “`mysql_stmt_execute()`”.

20.10.7.2. `mysql_stmt_attr_get()`

```
my_bool mysql_stmt_attr_get(MYSQL_STMT *stmt, enum enum_stmt_attr_type option, void *arg)
```

Description

Can be used to get the current value for a statement attribute.

The `option` argument is the option that you want to get; the `arg` should point to a variable that should contain the option value. If the option is an integer, then `arg` should point to the value of the integer.

See [Section 20.10.7.3](#), “`mysql_stmt_attr_set()`”, for a list of options and option types.

Return Values

Zero if successful. Nonzero if `option` is unknown.

Errors

None.

20.10.7.3. `mysql_stmt_attr_set()`

```
my_bool mysql_stmt_attr_set(MYSQL_STMT *stmt, enum enum_stmt_attr_type option, const void *arg)
```

Description

Can be used to affect behavior for a prepared statement. This function may be called multiple times to set several options.

The `option` argument is the option that you want to set. The `arg` argument is the value for the option. `arg` should point to a variable that is set to the desired attribute value. The variable type is as indicated in the following table.

The following table shows the possible `option` values.

Option	Argument Type	Function
<code>STMT_ATTR_UPDATE_MAX_LENGTH</code>	<code>my_bool *</code>	If set to 1, causes <code>mysql_stmt_store_result()</code> to update the metadata <code>MYSQL_FIELD->max_length</code> value.
<code>STMT_ATTR_CURSOR_TYPE</code>	<code>unsigned long *</code>	Type of cursor to open for statement when <code>mysql_stmt_execute()</code> is invoked. <code>*arg</code> can be <code>CURSOR_TYPE_NO_CURSOR</code> (the default) or <code>CURSOR_TYPE_READ_ONLY</code> .
<code>STMT_ATTR_PREFETCH_ROWS</code>	<code>unsigned long *</code>	Number of rows to fetch from server at a time when using a cursor. <code>*arg</code> can be in the range from 1 to the maximum value of <code>unsigned long</code> . The default is 1.

If you use the `STMT_ATTR_CURSOR_TYPE` option with `CURSOR_TYPE_READ_ONLY`, a cursor is opened for the statement when you invoke `mysql_stmt_execute()`. If there is already an open cursor from a previous `mysql_stmt_execute()` call, it closes the cursor before opening a new one. `mysql_stmt_reset()` also closes any open cursor before preparing the statement for re-execution. `mysql_stmt_free_result()` closes any open cursor.

If you open a cursor for a prepared statement, `mysql_stmt_store_result()` is unnecessary, because that function causes the result set to be buffered on the client side.

Return Values

Zero if successful. Nonzero if `option` is unknown.

Errors

None.

Example

The following example opens a cursor for a prepared statement and sets the number of rows to fetch at a time to 5:

```
MYSQL_STMT *stmt;
int rc;
unsigned long type;
unsigned long prefetch_rows = 5;

stmt = mysql_stmt_init(mysql);
type = (unsigned long) CURSOR_TYPE_READ_ONLY;
rc = mysql_stmt_attr_set(stmt, STMT_ATTR_CURSOR_TYPE, (void*) &type);
/* ... check return value ... */
rc = mysql_stmt_attr_set(stmt, STMT_ATTR_PREFETCH_ROWS,
                        (void*) &prefetch_rows);
/* ... check return value ... */
```

20.10.7.4. `mysql_stmt_bind_param()`

```
my_bool mysql_stmt_bind_param(MYSQL_STMT *stmt, MYSQL_BIND *bind)
```

Description

`mysql_stmt_bind_param()` is used to bind input data for the parameter markers in the SQL statement that was passed to `mysql_stmt_prepare()`. It uses `MYSQL_BIND` structures to supply the data. `bind` is the address of an array of `MYSQL_BIND` structures. The client library expects the array to contain one element for each “?” parameter marker that is present in the query.

Suppose that you prepare the following statement:

```
INSERT INTO mytbl VALUES(?,?,?)
```

When you bind the parameters, the array of `MYSQL_BIND` structures must contain three elements, and can be declared like this:

```
MYSQL_BIND bind[3];
```

Section 20.10.5, “C API Prepared Statement Data types”, describes the members of each `MYSQL_BIND` element and how they

should be set to provide input values.

Return Values

Zero if the bind operation was successful. Nonzero if an error occurred.

Errors

- `CR_UNSUPPORTED_PARAM_TYPE`
The conversion is not supported. Possibly the `buffer_type` value is illegal or is not one of the supported types.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

Example

For the usage of `mysql_stmt_bind_param()`, refer to the Example from [Section 20.10.7.10](#), “`mysql_stmt_execute()`”.

20.10.7.5. `mysql_stmt_bind_result()`

```
my_bool mysql_stmt_bind_result(MYSQL_STMT *stmt, MYSQL_BIND *bind)
```

Description

`mysql_stmt_bind_result()` is used to associate (that is, bind) output columns in the result set to data buffers and length buffers. When `mysql_stmt_fetch()` is called to fetch data, the MySQL client/server protocol places the data for the bound columns into the specified buffers.

All columns must be bound to buffers prior to calling `mysql_stmt_fetch()`. `bind` is the address of an array of `MYSQL_BIND` structures. The client library expects the array to contain one element for each column of the result set. If you do not bind columns to `MYSQL_BIND` structures, `mysql_stmt_fetch()` simply ignores the data fetch. The buffers should be large enough to hold the data values, because the protocol doesn't return data values in chunks.

A column can be bound or rebound at any time, even after a result set has been partially retrieved. The new binding takes effect the next time `mysql_stmt_fetch()` is called. Suppose that an application binds the columns in a result set and calls `mysql_stmt_fetch()`. The client/server protocol returns data in the bound buffers. Then suppose that the application binds the columns to a different set of buffers. The protocol places data into the newly bound buffers when the next call to `mysql_stmt_fetch()` occurs.

To bind a column, an application calls `mysql_stmt_bind_result()` and passes the type, address, and length of the output buffer into which the value should be stored. [Section 20.10.5](#), “C API Prepared Statement Data types”, describes the members of each `MYSQL_BIND` element and how they should be set to receive output values.

Return Values

Zero if the bind operation was successful. Nonzero if an error occurred.

Errors

- `CR_UNSUPPORTED_PARAM_TYPE`
The conversion is not supported. Possibly the `buffer_type` value is illegal or is not one of the supported types.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

Example

For the usage of `mysql_stmt_bind_result()`, refer to the Example from [Section 20.10.7.11](#), “`mysql_stmt_fetch()`”.

20.10.7.6. `mysql_stmt_close()`

```
my_bool mysql_stmt_close(MYSQL_STMT *)
```

Description

Closes the prepared statement. `mysql_stmt_close()` also deallocates the statement handle pointed to by `stmt`.

If the current statement has pending or unread results, this function cancels them so that the next query can be executed.

Return Values

Zero if the statement was freed successfully. Nonzero if an error occurred.

Errors

- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

Example

For the usage of `mysql_stmt_close()`, refer to the Example from [Section 20.10.7.10](#), “`mysql_stmt_execute()`”.

20.10.7.7. `mysql_stmt_data_seek()`

```
void mysql_stmt_data_seek(MYSQL_STMT *stmt, my_ulonglong offset)
```

Description

Seeks to an arbitrary row in a statement result set. The `offset` value is a row number and should be in the range from 0 to `mysql_stmt_num_rows(stmt)-1`.

This function requires that the statement result set structure contains the entire result of the last executed query, so `mysql_stmt_data_seek()` may be used only in conjunction with `mysql_stmt_store_result()`.

Return Values

None.

Errors

None.

20.10.7.8. `mysql_stmt_errno()`

```
unsigned int mysql_stmt_errno(MYSQL_STMT *stmt)
```

Description

For the statement specified by `stmt`, `mysql_stmt_errno()` returns the error code for the most recently invoked statement API function that can succeed or fail. A return value of zero means that no error occurred. Client error message numbers are listed in the MySQL `errmsg.h` header file. Server error message numbers are listed in `mysqld_error.h`. Errors also are listed at [Appendix B, Errors, Error Codes, and Common Problems](#).

Return Values

An error code value. Zero if no error occurred.

Errors

None.

20.10.7.9. `mysql_stmt_error()`

```
const char *mysql_stmt_error(MYSQL_STMT *stmt)
```

Description

For the statement specified by `stmt`, `mysql_stmt_error()` returns a null-terminated string containing the error message for the most recently invoked statement API function that can succeed or fail. An empty string ("") is returned if no error occurred. This means the following two tests are equivalent:

```
if (*mysql_stmt_errno(stmt))
{
    // an error occurred
}

if (mysql_stmt_error(stmt)[0])
{
    // an error occurred
}
```

The language of the client error messages may be changed by recompiling the MySQL client library. Currently, you can choose error messages in several different languages.

Return Values

A character string that describes the error. An empty string if no error occurred.

Errors

None.

20.10.7.10. `mysql_stmt_execute()`

```
int mysql_stmt_execute(MYSQL_STMT *stmt)
```

Description

`mysql_stmt_execute()` executes the prepared query associated with the statement handle. The currently bound parameter marker values are sent to server during this call, and the server replaces the markers with this newly supplied data.

If the statement is an `UPDATE`, `DELETE`, or `INSERT`, the total number of changed, deleted, or inserted rows can be found by calling `mysql_stmt_affected_rows()`. If this is a statement such as `SELECT` that generates a result set, you must call `mysql_stmt_fetch()` to fetch the data prior to calling any other functions that result in query processing. For more information on how to fetch the results, refer to [Section 20.10.7.11, “mysql_stmt_fetch\(\)”](#).

For statements that generate a result set, you can request that `mysql_stmt_execute()` open a cursor for the statement by calling `mysql_stmt_attr_set()` before executing the statement. If you execute a statement multiple times, `mysql_stmt_execute()` closes any open cursor before opening a new one.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic reparation of the statement when it is next executed. For more information, see [Section 12.7.4, “Automatic Prepared Statement Repreparation”](#).

Return Values

Zero if execution was successful. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

Example

The following example demonstrates how to create and populate a table using `mysql_stmt_init()`, `mysql_stmt_prepare()`, `mysql_stmt_param_count()`, `mysql_stmt_bind_param()`, `mysql_stmt_execute()`, and `mysql_stmt_affected_rows()`. The `mysql` variable is assumed to be a valid connection handle.

```
#define STRING_SIZE 50

#define DROP_SAMPLE_TABLE "DROP TABLE IF EXISTS test_table"
#define CREATE_SAMPLE_TABLE "CREATE TABLE test_table(col1 INT,\
                                         col2 VARCHAR(40),\
                                         col3 SMALLINT,\
                                         col4 TIMESTAMP)"

#define INSERT_SAMPLE "INSERT INTO \
test_table(col1,col2,col3) \
VALUES(?,?,?)"

is_null= 0; /* reset */

/* Execute the INSERT statement - 2*/
if (mysql_stmt_execute(stmt))
{
    fprintf(stderr, "mysql_stmt_execute, 2 failed\n");
    fprintf(stderr, "%s\n", mysql_stmt_error(stmt));
    exit(0);
}

/* Get the total rows affected */
affected_rows= mysql_stmt_affected_rows(stmt);
fprintf(stdout, "total affected rows(insert 2): %lu\n",
        (unsigned long) affected_rows);

if (affected_rows != 1) /* validate affected rows */
{
    fprintf(stderr, "invalid affected rows by MySQL\n");
    exit(0);
}

/* Close the statement */
if (mysql_stmt_close(stmt))
{
    fprintf(stderr, "failed while closing the statement\n");
    fprintf(stderr, "%s\n", mysql_stmt_error(stmt));
    exit(0);
}

```

Note

For complete examples on the use of prepared statement functions, refer to the file [tests/mysql_client_test.c](#). This file can be obtained from a MySQL source distribution or from the Bazaar source repository.

20.10.7.11. `mysql_stmt_fetch()`

```
int mysql_stmt_fetch(MYSQL_STMT *stmt)
```

Description

`mysql_stmt_fetch()` returns the next row in the result set. It can be called only while the result set exists; that is, after a call to `mysql_stmt_execute()` for a statement such as `SELECT` that creates a result set.

`mysql_stmt_fetch()` returns row data using the buffers bound by `mysql_stmt_bind_result()`. It returns the data in those buffers for all the columns in the current row set and the lengths are returned to the `length` pointer. All columns must be bound by the application before it calls `mysql_stmt_fetch()`.

By default, result sets are fetched unbuffered a row at a time from the server. To buffer the entire result set on the client, call `mysql_stmt_store_result()` after binding the data buffers and before calling `mysql_stmt_fetch()`.

If a fetched data value is a `NULL` value, the `*is_null` value of the corresponding `MYSQL_BIND` structure contains `TRUE` (1). Otherwise, the data and its length are returned in the `*buffer` and `*length` elements based on the buffer type specified by the application. Each numeric and temporal type has a fixed length, as listed in the following table. The length of the string types depends on the length of the actual data value, as indicated by `data_length`.

Type	Length
<code>MYSQL_TYPE_TINY</code>	1
<code>MYSQL_TYPE_SHORT</code>	2
<code>MYSQL_TYPE_LONG</code>	4
<code>MYSQL_TYPE_LONGLONG</code>	8
<code>MYSQL_TYPE_FLOAT</code>	4
<code>MYSQL_TYPE_DOUBLE</code>	8
<code>MYSQL_TYPE_TIME</code>	<code>sizeof(MYSQL_TIME)</code>
<code>MYSQL_TYPE_DATE</code>	<code>sizeof(MYSQL_TIME)</code>
<code>MYSQL_TYPE_DATETIME</code>	<code>sizeof(MYSQL_TIME)</code>
<code>MYSQL_TYPE_STRING</code>	<code>data length</code>
<code>MYSQL_TYPE_BLOB</code>	<code>data_length</code>

Return Values

Return Value	Description
0	Successful, the data has been fetched to application data buffers.
1	Error occurred. Error code and message can be obtained by calling <code>mysql_stmt_errno()</code> and <code>mysql_stmt_error()</code> .
<code>MYSQL_NO_DATA</code>	No more rows/data exists
<code>MYSQL_DATA_TRUNCATED</code>	Data truncation occurred

`MYSQL_DATA_TRUNCATED` is returned when truncation reporting is enabled. (Reporting is enabled by default, but can be controlled with `mysql_options()`.) To determine which parameters were truncated when this value is returned, check the `error` members of the `MYSQL_BIND` parameter structures.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

- `CR_UNSUPPORTED_PARAM_TYPE`

The buffer type is `MYSQL_TYPE_DATE`, `MYSQL_TYPE_TIME`, `MYSQL_TYPE_DATETIME`, or `MYSQL_TYPE_TIMESTAMP`, but the data type is not `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP`.

- All other unsupported conversion errors are returned from `mysql_stmt_bind_result()`.

Example

The following example demonstrates how to fetch data from a table using `mysql_stmt_result_metadata()`, `mysql_stmt_bind_result()`, and `mysql_stmt_fetch()`. (This example expects to retrieve the two rows inserted by the example shown in [Section 20.10.7.10](#), “`mysql_stmt_execute()`”). The `mysql` variable is assumed to be a valid connection handle.

```
#define STRING_SIZE 50
#define SELECT_SAMPLE "SELECT col1, col2, col3, col4 \
FROM test_table"

{
    row_count++;
    fprintf(stdout, " row %d\n", row_count);

    /* column 1 */
    fprintf(stdout, " column1 (integer) : ");
    if (is_null[0])
        fprintf(stdout, " NULL\n");
    else
        fprintf(stdout, " %d(%ld)\n", int_data, length[0]);

    /* column 2 */
    fprintf(stdout, " column2 (string) : ");
    if (is_null[1])
        fprintf(stdout, " NULL\n");
    else
        fprintf(stdout, " %s(%ld)\n", str_data, length[1]);

    /* column 3 */
    fprintf(stdout, " column3 (smallint) : ");
    if (is_null[2])
        fprintf(stdout, " NULL\n");
    else
        fprintf(stdout, " %d(%ld)\n", small_data, length[2]);

    /* column 4 */
    fprintf(stdout, " column4 (timestamp): ");
    if (is_null[3])
        fprintf(stdout, " NULL\n");
    else
        fprintf(stdout, " %04d-%02d-%02d %02d:%02d:%02d (%ld)\n",
            ts.year, ts.month, ts.day,
            ts.hour, ts.minute, ts.second,
            length[3]);

    fprintf(stdout, "\n");
}

/* Validate rows fetched */
fprintf(stdout, " total rows fetched: %d\n", row_count);
if (row_count != 2)
{
    fprintf(stderr, " MySQL failed to return all rows\n");
}

```

```

    exit(0);
}

/* Free the prepared result metadata */
mysql_free_result(prepare_meta_result);

/* Close the statement */
if (mysql_stmt_close(stmt))
{
    fprintf(stderr, " failed while closing the statement\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

```

In some cases you might want to determine the length of a column value before fetching it with `mysql_stmt_fetch()`. For example, the value might be a long string or `BLOB` value for which you want to know how much space must be allocated. To accomplish this, you can use these strategies:

- Before invoking `mysql_stmt_fetch()` to retrieve individual rows, invoke `mysql_stmt_store_result()` to buffer the entire result on the client side. Then the maximal length of column values will be indicated by the `max_length` member of the result set metadata returned by `mysql_stmt_result_metadata()`. This strategy requires that you pass `STMT_ATTR_UPDATE_MAX_LENGTH` to `mysql_stmt_attr_set()` or the `max_length` values will not be calculated.
- Invoke `mysql_stmt_fetch()` with a zero-length buffer for the column in question and a pointer in which the real length can be stored. Then use the real length with `mysql_stmt_fetch_column()`.

```

real_length= 0;

bind[0].buffer= 0;
bind[0].buffer_length= 0;
bind[0].length= &real_length;
mysql_stmt_bind_result(stmt, bind);

mysql_stmt_fetch(stmt);
if (real_length > 0)
{
    data= malloc(real_length);
    bind[0].buffer= data;
    bind[0].buffer_length= real_length;
    mysql_stmt_fetch_column(stmt, bind, 0, 0);
}

```

20.10.7.12. `mysql_stmt_fetch_column()`

```

int mysql_stmt_fetch_column(MYSQL_STMT *stmt, MYSQL_BIND *bind, unsigned int column, unsigned long offset)

```

Description

Fetch one column from the current result set row. `bind` provides the buffer where data should be placed. It should be set up the same way as for `mysql_stmt_bind_result()`. `column` indicates which column to fetch. The first column is numbered 0. `offset` is the offset within the data value at which to begin retrieving data. This can be used for fetching the data value in pieces. The beginning of the value is offset 0.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic reparation of the statement when it is next executed. For more information, see [Section 12.7.4, “Automatic Prepared Statement Repreparation”](#).

Return Values

Zero if the value was fetched successfully. Nonzero if an error occurred.

Errors

- `CR_INVALID_PARAMETER_NO`
Invalid column number.
- `CR_NO_DATA`
The end of the result set has already been reached.

20.10.7.13. `mysql_stmt_field_count()`

```
unsigned int mysql_stmt_field_count(MYSQL_STMT *stmt)
```

Description

Returns the number of columns for the most recent statement for the statement handler. This value is zero for statements such as `INSERT` or `DELETE` that do not produce result sets.

`mysql_stmt_field_count()` can be called after you have prepared a statement by invoking `mysql_stmt_prepare()`.

Return Values

An unsigned integer representing the number of columns in a result set.

Errors

None.

20.10.7.14. `mysql_stmt_free_result()`

```
my_bool mysql_stmt_free_result(MYSQL_STMT *stmt)
```

Description

Releases memory associated with the result set produced by execution of the prepared statement. If there is a cursor open for the statement, `mysql_stmt_free_result()` closes it.

Return Values

Zero if the result set was freed successfully. Nonzero if an error occurred.

Errors

20.10.7.15. `mysql_stmt_init()`

```
MYSQL_STMT *mysql_stmt_init(MYSQL *mysql)
```

Description

Create a `MYSQL_STMT` handle. The handle should be freed with `mysql_stmt_close(MYSQL_STMT *)`.

Return values

A pointer to a `MYSQL_STMT` structure in case of success. `NULL` if out of memory.

Errors

- `CR_OUT_OF_MEMORY`

Out of memory.

20.10.7.16. `mysql_stmt_insert_id()`

```
my_ulonglong mysql_stmt_insert_id(MYSQL_STMT *stmt)
```

Description

Returns the value generated for an `AUTO_INCREMENT` column by the prepared `INSERT` or `UPDATE` statement. Use this function after you have executed a prepared `INSERT` statement on a table which contains an `AUTO_INCREMENT` field.

See [Section 20.10.3.37](#), “`mysql_insert_id()`”, for more information.

Return Values

Value for `AUTO_INCREMENT` column which was automatically generated or explicitly set during execution of prepared statement, or value generated by `LAST_INSERT_ID(expr)` function. Return value is undefined if statement does not set `AUTO_INCREMENT` value.

Errors

None.

20.10.7.17. `mysql_stmt_num_rows()`

```
my_ulonglong mysql_stmt_num_rows(MYSQL_STMT *stmt)
```

Description

Returns the number of rows in the result set.

The use of `mysql_stmt_num_rows()` depends on whether you used `mysql_stmt_store_result()` to buffer the entire result set in the statement handle.

If you use `mysql_stmt_store_result()`, `mysql_stmt_num_rows()` may be called immediately. Otherwise, the row count is unavailable unless you count the rows as you fetch them.

`mysql_stmt_num_rows()` is intended for use with statements that return a result set, such as `SELECT`. For statements such as `INSERT`, `UPDATE`, or `DELETE`, the number of affected rows can be obtained with `mysql_stmt_affected_rows()`.

Return Values

The number of rows in the result set.

Errors

None.

20.10.7.18. `mysql_stmt_param_count()`

```
unsigned long mysql_stmt_param_count(MYSQL_STMT *stmt)
```

Description

Returns the number of parameter markers present in the prepared statement.

Return Values

An unsigned long integer representing the number of parameters in a statement.

Errors

None.

Example

For the usage of `mysql_stmt_param_count()`, refer to the Example from [Section 20.10.7.10](#), “`mysql_stmt_execute()`”.

20.10.7.19. `mysql_stmt_param_metadata()`

```
MYSQL_RES *mysql_stmt_param_metadata(MYSQL_STMT *stmt)
```

This function currently does nothing.

Description

Return Values

Errors

20.10.7.20. `mysql_stmt_prepare()`

```
int mysql_stmt_prepare(MYSQL_STMT *stmt, const char *stmt_str, unsigned long length)
```

Description

Given the statement handle returned by `mysql_stmt_init()`, prepares the SQL statement pointed to by the string `stmt_str` and returns a status value. The string length should be given by the `length` argument. The string must consist of a single SQL statement. You should not add a terminating semicolon (“;”) or `\g` to the statement.

The application can include one or more parameter markers in the SQL statement by embedding question mark (“?”) characters in to the SQL string at the appropriate positions.

The markers are legal only in certain places in SQL statements. For example, they are allowed in the `VALUES()` list of an `INSERT` statement (to specify column values for a row), or in a comparison with a column in a `WHERE` clause to specify a comparison value. However, they are not allowed for identifiers (such as table or column names), or to specify both operands of a binary operator such as the `=` equal sign. The latter restriction is necessary because it would be impossible to determine the parameter type. In general, parameters are legal only in Data Manipulation Language (DML) statements, and not in Data Definition Language (DDL) statements.

The parameter markers must be bound to application variables using `mysql_stmt_bind_param()` before executing the statement.

Return Values

Zero if the statement was prepared successfully. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

If the prepare operation was unsuccessful (that is, `mysql_stmt_prepare()` returns nonzero), the error message can be obtained by calling `mysql_stmt_error()`.

Example

For the usage of `mysql_stmt_prepare()`, refer to the Example from [Section 20.10.7.10](#), “`mysql_stmt_execute()`”.

20.10.7.21. `mysql_stmt_reset()`

```
my_bool mysql_stmt_reset(MYSQL_STMT *stmt)
```

Description

Reset the prepared statement on the client and server to state after prepare. This is mainly used to reset data sent with `mysql_stmt_send_long_data()`. Any open cursor for the statement is closed.

To re-prepare the statement with another query, use `mysql_stmt_prepare()`.

Return Values

Zero if the statement was reset successfully. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

20.10.7.22. `mysql_stmt_result_metadata()`

```
MYSQL_RES *mysql_stmt_result_metadata(MYSQL_STMT *stmt)
```

Description

If a statement passed to `mysql_stmt_prepare()` is one that produces a result set, `mysql_stmt_result_metadata()` returns the result set metadata in the form of a pointer to a `MYSQL_RES` structure that can be used to process the meta information such as total number of fields and individual field information. This result set pointer can be passed as an argument to any of the field-based API functions that process result set metadata, such as:

- `mysql_num_fields()`
- `mysql_fetch_field()`
- `mysql_fetch_field_direct()`
- `mysql_fetch_fields()`
- `mysql_field_count()`
- `mysql_field_seek()`
- `mysql_field_tell()`
- `mysql_free_result()`

The result set structure should be freed when you are done with it, which you can do by passing it to `mysql_free_result()`. This is similar to the way you free a result set obtained from a call to `mysql_store_result()`.

The result set returned by `mysql_stmt_result_metadata()` contains only metadata. It does not contain any row results. The rows are obtained by using the statement handle with `mysql_stmt_fetch()`.

Return Values

A `MYSQL_RES` result structure. `NULL` if no meta information exists for the prepared query.

Errors

- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

Example

For the usage of `mysql_stmt_result_metadata()`, refer to the Example from [Section 20.10.7.11](#), “`mysql_stmt_fetch()`”.

20.10.7.23. `mysql_stmt_row_seek()`

```
MYSQL_ROW_OFFSET mysql_stmt_row_seek(MYSQL_STMT *stmt, MYSQL_ROW_OFFSET offset)
```

Description

Sets the row cursor to an arbitrary row in a statement result set. The `offset` value is a row offset that should be a value returned from `mysql_stmt_row_tell()` or from `mysql_stmt_row_seek()`. This value is not a row number; if you want to seek to a row within a result set by number, use `mysql_stmt_data_seek()` instead.

This function requires that the result set structure contains the entire result of the query, so `mysql_stmt_row_seek()` may be used only in conjunction with `mysql_stmt_store_result()`.

Return Values

The previous value of the row cursor. This value may be passed to a subsequent call to `mysql_stmt_row_seek()`.

Errors

None.

20.10.7.24. `mysql_stmt_row_tell()`

```
MYSQL_ROW_OFFSET mysql_stmt_row_tell(MYSQL_STMT *stmt)
```

Description

Returns the current position of the row cursor for the last `mysql_stmt_fetch()`. This value can be used as an argument to `mysql_stmt_row_seek()`.

You should use `mysql_stmt_row_tell()` only after `mysql_stmt_store_result()`.

Return Values

The current offset of the row cursor.

Errors

None.

20.10.7.25. `mysql_stmt_send_long_data()`

```
my_bool mysql_stmt_send_long_data(MYSQL_STMT *stmt, unsigned int parameter_number, const char *data, unsigned long length)
```

Description

Allows an application to send parameter data to the server in pieces (or “chunks”). Call this function after `mysql_stmt_bind_param()` and before `mysql_stmt_execute()`. It can be called multiple times to send the parts of a character or binary data value for a column, which must be one of the `TEXT` or `BLOB` data types.

`parameter_number` indicates which parameter to associate the data with. Parameters are numbered beginning with 0. `data` is a pointer to a buffer containing data to be sent, and `length` indicates the number of bytes in the buffer.

Note

The next `mysql_stmt_execute()` call ignores the bind buffer for all parameters that have been used with `mysql_stmt_send_long_data()` since last `mysql_stmt_execute()` or `mysql_stmt_reset()`.

If you want to reset/forget the sent data, you can do it with `mysql_stmt_reset()`. See [Section 20.10.7.21](#), “`mysql_stmt_reset()`”.

Return Values

Zero if the data is sent successfully to server. Nonzero if an error occurred.

Errors

- `CR_INVALID_BUFFER_USE`

The parameter does not have a string or binary type.

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- [CR_SERVER_GONE_ERROR](#)

The MySQL server has gone away.

- [CR_OUT_OF_MEMORY](#)

Out of memory.

- [CR_UNKNOWN_ERROR](#)

An unknown error occurred.

Example

The following example demonstrates how to send the data for a `TEXT` column in chunks. It inserts the data value `'MySQL - The most popular Open Source database'` into the `text_column` column. The `mysql` variable is assumed to be a valid connection handle.

```
#define INSERT_QUERY "INSERT INTO \
    test_long_data(text_column) VALUES(?)"

MYSQL_BIND bind[1];
long          length;

stmt = mysql_stmt_init(mysql);
if (!stmt)
{
    fprintf(stderr, "mysql_stmt_init(), out of memory\n");
    exit(0);
}
if (mysql_stmt_prepare(stmt, INSERT_QUERY, strlen(INSERT_QUERY))
{
    fprintf(stderr, "\n mysql_stmt_prepare(), INSERT failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}
memset(bind, 0, sizeof(bind));
bind[0].buffer_type= MYSQL_TYPE_STRING;
bind[0].length= &length;
bind[0].is_null= 0;

/* Bind the buffers */
if (mysql_stmt_bind_param(stmt, bind))
{
    fprintf(stderr, "\n param bind failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}

/* Supply data in chunks to server */
if (mysql_stmt_send_long_data(stmt,0,"MySQL",5))
{
    fprintf(stderr, "\n send_long_data failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}

/* Supply the next piece of data */
if (mysql_stmt_send_long_data(stmt,0,
    " - The most popular Open Source database",40))
{
    fprintf(stderr, "\n send_long_data failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}

/* Now, execute the query */
if (mysql_stmt_execute(stmt))
{
    fprintf(stderr, "\n mysql_stmt_execute failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}
}
```

20.10.7.26. `mysql_stmt_sqlstate()`

```
const char *mysql_stmt_sqlstate(MYSQL_STMT *stmt)
```

Description

For the statement specified by `stmt`, `mysql_stmt_sqlstate()` returns a null-terminated string containing the SQLSTATE

error code for the most recently invoked prepared statement API function that can succeed or fail. The error code consists of five characters. "00000" means "no error." The values are specified by ANSI SQL and ODBC. For a list of possible values, see [Appendix B, Errors, Error Codes, and Common Problems](#).

Note that not all MySQL errors are yet mapped to SQLSTATE codes. The value "HY000" (general error) is used for unmapped errors.

Return Values

A null-terminated character string containing the SQLSTATE error code.

20.10.7.27. `mysql_stmt_store_result()`

```
int mysql_stmt_store_result(MYSQL_STMT *stmt)
```

Description

Result sets are produced by executing prepared statements for SQL statements such as `SELECT`, `SHOW`, `DESCRIBE`, and `EXPLAIN`. By default, result sets for successfully executed prepared statements are not buffered on the client and `mysql_stmt_fetch()` fetches them one at a time from the server. To cause the complete result set to be buffered on the client, call `mysql_stmt_store_result()` after binding data buffers with `mysql_stmt_bind_result()` and before calling `mysql_stmt_fetch()` to fetch rows. (For an example, see [Section 20.10.7.11, "mysql_stmt_fetch\(\)"](#).)

`mysql_stmt_store_result()` is optional for result set processing, unless you will call `mysql_stmt_data_seek()`, `mysql_stmt_row_seek()`, or `mysql_stmt_row_tell()`. Those functions require a seekable result set.

It is unnecessary to call `mysql_stmt_store_result()` after executing an SQL statement that does not produce a result set, but if you do, it does not harm or cause any notable performance problem. You can detect whether the statement produced a result set by checking if `mysql_stmt_result_metadata()` returns `NULL`. For more information, refer to [Section 20.10.7.22, "mysql_stmt_result_metadata\(\)"](#).

Note

MySQL doesn't by default calculate `MYSQL_FIELD->max_length` for all columns in `mysql_stmt_store_result()` because calculating this would slow down `mysql_stmt_store_result()` considerably and most applications doesn't need `max_length`. If you want `max_length` to be updated, you can call `mysql_stmt_attr_set(MYSQL_STMT, STMT_ATTR_UPDATE_MAX_LENGTH, &flag)` to enable this. See [Section 20.10.7.3, "mysql_stmt_attr_set\(\)"](#).

Return Values

Zero if the results are buffered successfully. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

20.10.8. C API Threaded Function Descriptions

You need to use the following functions when you want to create a threaded client. See [Section 20.10.17, "How to Make a Threaded Client"](#).

20.10.8.1. `my_init()`

```
void my_init(void)
```

Description

`my_init()` initializes some global variables that MySQL needs. If you are using a thread-safe client library, it also calls `mysql_thread_init()` for this thread.

It is necessary for `my_init()` to be called early in the initialization phase of a program's use of the MySQL library. However, `my_init()` is automatically called by `mysql_init()`, `mysql_library_init()`, `mysql_server_init()`, and `mysql_connect()`. If you ensure that your program invokes one of those functions before any other MySQL calls, there is no need to invoke `my_init()` explicitly.

To access the prototype for `my_init()`, your program should include these header files:

```
#include <my_global.h>
#include <my_sys.h>
```

Return Values

None.

20.10.8.2. `mysql_thread_end()`

```
void mysql_thread_end(void)
```

Description

This function needs to be called before calling `pthread_exit()` to free memory allocated by `mysql_thread_init()`.

`mysql_thread_end()` is not invoked automatically by the client library. It must be called explicitly to avoid a memory leak.

Return Values

None.

20.10.8.3. `mysql_thread_init()`

```
my_bool mysql_thread_init(void)
```

Description

This function must be called early within each created thread to initialize thread-specific variables. However, you may not necessarily need to invoke it explicitly: `mysql_thread_init()` is automatically called by `my_init()`, which itself is automatically called by `mysql_init()`, `mysql_library_init()`, `mysql_server_init()`, and `mysql_connect()`. If you invoke any of those functions, `mysql_thread_init()` will be called for you.

Return Values

Zero if successful. Nonzero if an error occurred.

20.10.8.4. `mysql_thread_safe()`

```
unsigned int mysql_thread_safe(void)
```

Description

This function indicates whether the client library is compiled as thread-safe.

Return Values

1 if the client library is thread-safe, 0 otherwise.

20.10.9. C API Embedded Server Function Descriptions

MySQL applications can be written to use an embedded server. See [Section 20.9, “libmysqld, the Embedded MySQL Server Library”](#). To write such an application, you must link it against the `libmysqld` library by using the `-lmysqld` flag rather than linking it against the `libmysqlclient` client library by using the `-libmysqlclient` flag. However, the calls to initialize and final-

ize the library are the same whether you write a client application or one that uses the embedded server: Call `mysql_library_init()` to initialize the library and `mysql_library_end()` when you are done with it. See [Section 20.10.2, “C API Function Overview”](#).

20.10.9.1. `mysql_server_init()`

```
int mysql_server_init(int argc, char **argv, char **groups)
```

Description

This function initializes the MySQL library, which must be done before you call any other MySQL function. However, `mysql_server_init()` is deprecated and you should call `mysql_library_init()` instead. See [Section 20.10.3.40, “mysql_library_init\(\)”](#).

Return Values

Zero if successful. Nonzero if an error occurred.

20.10.9.2. `mysql_server_end()`

```
void mysql_server_end(void)
```

Description

This function finalizes the MySQL library, which should be done when you are done using the library. However, `mysql_server_end()` is deprecated and `mysql_library_end()` should be used instead. See [Section 20.10.3.39, “mysql_library_end\(\)”](#).

Return Values

None.

20.10.10. Common Questions and Problems When Using the C API

MySQL Enterprise

Subscribers to MySQL Enterprise will find articles about the C API in the MySQL Knowledge Base. Access to the Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

20.10.10.1. Why `mysql_store_result()` Sometimes Returns `NULL` After `mysql_query()` Returns Success

It is possible for `mysql_store_result()` to return `NULL` following a successful call to `mysql_query()`. When this happens, it means one of the following conditions occurred:

- There was a `malloc()` failure (for example, if the result set was too large).
- The data couldn't be read (an error occurred on the connection).
- The query returned no data (for example, it was an `INSERT`, `UPDATE`, or `DELETE`).

You can always check whether the statement should have produced a non-empty result by calling `mysql_field_count()`. If `mysql_field_count()` returns zero, the result is empty and the last query was a statement that does not return values (for example, an `INSERT` or a `DELETE`). If `mysql_field_count()` returns a nonzero value, the statement should have produced a non-empty result. See the description of the `mysql_field_count()` function for an example.

You can test for an error by calling `mysql_error()` or `mysql_errno()`.

20.10.10.2. What Results You Can Get from a Query

In addition to the result set returned by a query, you can also get the following information:

- `mysql_affected_rows()` returns the number of rows affected by the last query when doing an `INSERT`, `UPDATE`, or `DELETE`.

For a fast re-create, use `TRUNCATE TABLE`.

- `mysql_num_rows()` returns the number of rows in a result set. With `mysql_store_result()`, `mysql_num_rows()` may be called as soon as `mysql_store_result()` returns. With `mysql_use_result()`, `mysql_num_rows()` may be called only after you have fetched all the rows with `mysql_fetch_row()`.
- `mysql_insert_id()` returns the ID generated by the last query that inserted a row into a table with an `AUTO_INCREMENT` index. See [Section 20.10.3.37](#), “`mysql_insert_id()`”.
- Some queries (`LOAD DATA INFILE ...`, `INSERT INTO ... SELECT ...`, `UPDATE`) return additional information. The result is returned by `mysql_info()`. See the description for `mysql_info()` for the format of the string that it returns. `mysql_info()` returns a `NULL` pointer if there is no additional information.

20.10.10.3. How to Get the Unique ID for the Last Inserted Row

If you insert a record into a table that contains an `AUTO_INCREMENT` column, you can obtain the value stored into that column by calling the `mysql_insert_id()` function.

You can check from your C applications whether a value was stored in an `AUTO_INCREMENT` column by executing the following code (which assumes that you've checked that the statement succeeded). It determines whether the query was an `INSERT` with an `AUTO_INCREMENT` index:

```
if ((result = mysql_store_result(&mysql)) == 0 &&
    mysql_field_count(&mysql) == 0 &&
    mysql_insert_id(&mysql) != 0)
{
    used_id = mysql_insert_id(&mysql);
}
```

When a new `AUTO_INCREMENT` value has been generated, you can also obtain it by executing a `SELECT LAST_INSERT_ID()` statement with `mysql_query()` and retrieving the value from the result set returned by the statement.

When inserting multiple values, the last automatically incremented value is returned.

For `LAST_INSERT_ID()`, the most recently generated ID is maintained in the server on a per-connection basis. It is not changed by another client. It is not even changed if you update another `AUTO_INCREMENT` column with a non-magic value (that is, a value that is not `NULL` and not `0`). Using `LAST_INSERT_ID()` and `AUTO_INCREMENT` columns simultaneously from multiple clients is perfectly valid. Each client will receive the last inserted ID for the last statement *that* client executed.

If you want to use the ID that was generated for one table and insert it into a second table, you can use SQL statements like this:

```
INSERT INTO foo (auto,text)
VALUES(NULL,'text');           # generate ID by inserting NULL
INSERT INTO foo2 (id,text)
VALUES(LAST_INSERT_ID(),'text'); # use ID in second table
```

Note that `mysql_insert_id()` returns the value stored into an `AUTO_INCREMENT` column, whether that value is automatically generated by storing `NULL` or `0` or was specified as an explicit value. `LAST_INSERT_ID()` returns only automatically generated `AUTO_INCREMENT` values. If you store an explicit value other than `NULL` or `0`, it does not affect the value returned by `LAST_INSERT_ID()`.

For more information on obtaining the last ID in an `AUTO_INCREMENT` column:

- For information on `LAST_INSERT_ID()`, which can be used within an SQL statement, see [Section 11.11.3](#), “Information Functions”.
- For information on `mysql_insert_id()`, the function you use from within the C API, see [Section 20.10.3.37](#), “`mysql_insert_id()`”.
- For information on obtaining the auto-incremented value when using Connector/J, see [Section 20.4.5](#), “Connector/J Notes and Tips”.
- For information on obtaining the auto-incremented value when using Connector/ODBC, see [Section 20.1.7.1.1](#), “Obtaining Auto-Increment Values”.

20.10.10.4. Problems Linking with the C API

When linking with the C API, the following errors may occur on some systems:

```
gcc -g -o client test.o -L/usr/local/lib/mysql \
    -lmysqlclient -lsocket -lnsl
```

```

Undefined      first referenced
 symbol        in file
floor          /usr/local/lib/mysql/libmysqlclient.a(password.o)
ld: fatal: Symbol referencing errors. No output written to client

```

If this happens on your system, you must include the math library by adding `-lm` to the end of the compile/link line.

20.10.11. Controlling Automatic Reconnection Behavior

The MySQL client library can perform an automatic reconnection to the server if it finds that the connection is down when you attempt to send a statement to the server to be executed. In this case, the library tries once to reconnect to the server and send the statement again.

If it is important for your application to know that the connection has been dropped (so that it can exit or take action to adjust for the loss of state information), be sure to disable auto-reconnect. This can be done explicitly by calling `mysql_options()` with the `MYSQL_OPT_RECONNECT` option:

```

my_bool reconnect = 0;
mysql_options(&mysql, MYSQL_OPT_RECONNECT, &reconnect);

```

In MySQL 5.4, auto-reconnect is disabled by default.

If the connection has gone down, the `mysql_ping()` function performs a reconnect if auto-reconnect is enabled. If auto-reconnect is disabled, `mysql_ping()` returns an error instead.

Some client programs might provide the capability of controlling automatic reconnection. For example, `mysql` reconnects by default, but the `--skip-reconnect` option can be used to suppress this behavior.

If an automatic reconnection does occur (for example, as a result of calling `mysql_ping()`), there is no explicit indication of it. To check for reconnection, call `mysql_thread_id()` to get the original connection identifier before calling `mysql_ping()`, and then call `mysql_thread_id()` again to see whether the identifier has changed.

Automatic reconnection can be convenient because you need not implement your own reconnect code, but if a reconnection does occur, several aspects of the connection state are reset and your application will not know about it. The connection-related state is affected as follows:

- Any active transactions are rolled back and autocommit mode is reset.
- All table locks are released.
- All `TEMPORARY` tables are closed (and dropped).
- Session variables are reinitialized to the values of the corresponding variables. This also affects variables that are set implicitly by statements such as `SET NAMES`.
- User variable settings are lost.
- Prepared statements are released.
- `HANDLER` variables are closed.
- The value of `LAST_INSERT_ID()` is reset to 0.
- Locks acquired with `GET_LOCK()` are released.

If the connection drops, it is possible that the session associated with the connection on the server side will still be running if the server has not yet detected that the client is no longer connected. In this case, any locks held by the original connection still belong to that session, so you may want to kill it by calling `mysql_kill()`.

20.10.12. C API Support for Multiple Statement Execution

By default, `mysql_query()` and `mysql_real_query()` interpret their statement string argument as a single statement to be executed, and you process the result according to whether the statement produces a result set (a set of rows, as for `SELECT`) or an affected-rows count (as for `INSERT`, `UPDATE`, and so forth).

MySQL 5.4 also supports the execution of a string containing multiple statements separated by semicolon (“;”) characters. This capability is enabled by special options that are specified either when you connect to the server with `mysql_real_connect()` or after connecting by calling `mysql_set_server_option()`.

Executing a multiple-statement string can produce multiple result sets or row-count indicators. Processing these results involves a different approach than for the single-statement case: After handling the result from the first statement, it is necessary to check whether more results exist and process them in turn if so. To support multiple-result processing, the C API includes the `mysql_more_results()` and `mysql_next_result()` functions. These functions are used at the end of a loop that iterates as long as more results are available. *Failure to process the result this way may result in a dropped connection to the server.*

Multiple-result processing also is required if you execute `CALL` statements for stored procedures. Results from a stored procedure have these characteristics:

- Statements within the procedure may produce result sets (for example, if it executes `SELECT` statements). These result sets are returned in the order that they are produced as the procedure executes.

In general, the caller cannot know how many result sets a procedure will return. Procedure execution may depend on loops or conditional statements that cause the execution path to differ from one call to the next. Therefore, you must be prepared to retrieve multiple results.

- The final result from the procedure is a status result that includes no result set. The status indicates whether the procedure succeeded or an error occurred.

The multiple statement and result capabilities can be used only with `mysql_query()` or `mysql_real_query()`. They cannot be used with the prepared statement interface. Prepared statement handles are defined to work only with strings that contain a single statement. See [Section 20.10.4, “C API Prepared Statements”](#).

To enable multiple-statement execution and result processing, the following options may be used:

- The `mysql_real_connect()` function has a `flags` argument for which two option values are relevant:
 - `CLIENT_MULTI_RESULTS` enables the client program to process multiple results. This option *must* be enabled if you execute `CALL` statements for stored procedures that produce result sets. Otherwise, such procedures result in an error `Error 1312 (0A000): PROCEDURE proc_name can't return a result set in the given context`.
 - `CLIENT_MULTI_STATEMENTS` enables `mysql_query()` and `mysql_real_query()` to execute statement strings containing multiple statements separated by semicolons. This option also enables `CLIENT_MULTI_RESULTS` implicitly, so a `flags` argument of `CLIENT_MULTI_STATEMENTS` to `mysql_real_connect()` is equivalent to an argument of `CLIENT_MULTI_STATEMENTS | CLIENT_MULTI_RESULTS`. That is, `CLIENT_MULTI_STATEMENTS` is sufficient to enable multiple-statement execution and all multiple-result processing.
- After the connection to the server has been established, you can use the `mysql_set_server_option()` function to enable or disable multiple-statement execution by passing it an argument of `MYSQL_OPTION_MULTI_STATEMENTS_ON` or `MYSQL_OPTION_MULTI_STATEMENTS_OFF`. Enabling multiple-statement execution with this function also enables processing of “simple” results for a multiple-statement string where each statement produces a single result, but is *not* sufficient to allow processing of stored procedures that produce result sets.

The following procedure outlines a suggested strategy for handling multiple statements:

1. Pass `CLIENT_MULTI_STATEMENTS` to `mysql_real_connect()`, to fully enable multiple-statement execution and multiple-result processing.
2. After calling `mysql_query()` or `mysql_real_query()` and verifying that it succeeds, enter a loop within which you process statement results.
3. For each iteration of the loop, handle the current statement result, retrieving either a result set or an affected-rows count. If an error occurs, exit the loop.
4. At the end of the loop, call `mysql_next_result()` to check whether another result exists and initiate retrieval for it if so. If no more results are available, exit the loop.

One possible implementation of the preceding strategy is shown following. The final part of the loop can be reduced to a simple test of whether `mysql_next_result()` returns nonzero. The code as written distinguishes between no more results and an error, which allows a message to be printed for the latter occurrence.

```
/* connect to server with the CLIENT_MULTI_STATEMENTS option */
if (mysql_real_connect (mysql, host_name, user_name, password,
    db_name, port_num, socket_name, CLIENT_MULTI_STATEMENTS) == NULL)
{
    printf("mysql_real_connect() failed\n");
    mysql_close(mysql);
}
```

```

    exit(1);
}

/* execute multiple statements */
status = mysql_query(mysql,
    "DROP TABLE IF EXISTS test_table;\
    CREATE TABLE test_table(id INT);\
    INSERT INTO test_table VALUES(10);\
    UPDATE test_table SET id=20 WHERE id=10;\
    SELECT * FROM test_table;\
    DROP TABLE test_table");

if (status)
{
    printf("Could not execute statement(s)");
    mysql_close(mysql);
    exit(0);
}

/* process each statement result */
do {
    /* did current statement return data? */
    result = mysql_store_result(mysql);
    if (result)
    {
        /* yes; process rows and free the result set */
        process_result_set(mysql, result);
        mysql_free_result(result);
    }
    else /* no result set or error */
    {
        if (mysql_field_count(mysql) == 0)
        {
            printf("%lld rows affected\n",
                mysql_affected_rows(mysql));
        }
        else /* some error occurred */
        {
            printf("Could not retrieve result set\n");
            break;
        }
    }
}
/* more results? -1 = no, >0 = error, 0 = yes (keep looping) */
if ((status = mysql_next_result(mysql)) > 0)
    printf("Could not execute statement\n");
} while (status == 0);

mysql_close(mysql);

```

20.10.13. C API Prepared Statement Problems

Here follows a list of the currently known problems with prepared statements:

- [TIME](#), [TIMESTAMP](#), and [DATETIME](#) do not support parts of seconds (for example, from [DATE_FORMAT\(\)](#)).
- When converting an integer to string, [ZEROFILL](#) is honored with prepared statements in some cases where the MySQL server doesn't print the leading zeros. (For example, with [MIN\(number-with-zerofill\)](#)).
- When converting a floating-point number to a string in the client, the rightmost digits of the converted value may differ slightly from those of the original value.
- Prepared statements use the query cache under the conditions described in [Section 7.5.5.1, "How the Query Cache Operates"](#).
- Prepared statements do not support multi-statements (that is, multiple statements within a single string separated by ";" characters).
- In MySQL 5.4, prepared [CALL](#) statements cannot invoke stored procedures that return result sets because prepared statements do not support multiple result sets. Nor can the calling application access a stored procedure's [OUT](#) or [INOUT](#) parameters when the procedure returns. These capabilities are supported beginning with MySQL 6.0.

20.10.14. C API Prepared Statement Handling of Date and Time Values

The binary (prepared statement) protocol allows you to send and receive date and time values ([DATE](#), [TIME](#), [DATETIME](#), and [TIMESTAMP](#)), using the [MYSQL_TIME](#) structure. The members of this structure are described in [Section 20.10.5, "C API Prepared Statement Data types"](#).

To send temporal data values, create a prepared statement using [mysql_stmt_prepare\(\)](#). Then, before calling [mysql_stmt_execute\(\)](#) to execute the statement, use the following procedure to set up each temporal parameter:

1. In the [MYSQL_BIND](#) structure associated with the data value, set the [buffer_type](#) member to the type that indicates what

kind of temporal value you're sending. For `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` values, set `buffer_type` to `MYSQL_TYPE_DATE`, `MYSQL_TYPE_TIME`, `MYSQL_TYPE_DATETIME`, or `MYSQL_TYPE_TIMESTAMP`, respectively.

2. Set the `buffer` member of the `MYSQL_BIND` structure to the address of the `MYSQL_TIME` structure in which you pass the temporal value.
3. Fill in the members of the `MYSQL_TIME` structure that are appropriate for the type of temporal value to be passed.

Use `mysql_stmt_bind_param()` to bind the parameter data to the statement. Then you can call `mysql_stmt_execute()`.

To retrieve temporal values, the procedure is similar, except that you set the `buffer_type` member to the type of value you expect to receive, and the `buffer` member to the address of a `MYSQL_TIME` structure into which the returned value should be placed. Use `mysql_stmt_bind_result()` to bind the buffers to the statement after calling `mysql_stmt_execute()` and before fetching the results.

Here is a simple example that inserts `DATE`, `TIME`, and `TIMESTAMP` data. The `mysql` variable is assumed to be a valid connection handle.

```

MYSQL_TIME  ts;
MYSQL_BIND  bind[3];
MYSQL_STMT  *stmt;

strmov(query, "INSERT INTO test_table(date_field, time_field, \
                timestamp_field) VALUES(?,?,?);");

stmt = mysql_stmt_init(mysql);
if (!stmt)
{
    fprintf(stderr, " mysql_stmt_init(), out of memory\n");
    exit(0);
}
if (mysql_stmt_prepare(mysql, query, strlen(query)))
{
    fprintf(stderr, "\n mysql_stmt_prepare(), INSERT failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}

/* set up input buffers for all 3 parameters */
bind[0].buffer_type= MYSQL_TYPE_DATE;
bind[0].buffer= (char *)&ts;
bind[0].is_null= 0;
bind[0].length= 0;
...
bind[1]= bind[2]= bind[0];
...

mysql_stmt_bind_param(stmt, bind);

/* supply the data to be sent in the ts structure */
ts.year= 2002;
ts.month= 02;
ts.day= 03;

ts.hour= 10;
ts.minute= 45;
ts.second= 20;

mysql_stmt_execute(stmt);
..

```

20.10.15. C API Support for Prepared `CALL` Statements

In MySQL 5.4, prepared `CALL` statements can be used only for stored procedures that produce at most one result set. Nor can the calling application use placeholders for `OUT` or `INOUT` parameters.

MySQL 6.0 expands prepared `CALL` statement support for stored procedures that produce multiple result sets and to provide placeholder access to `OUT` and `INOUT` parameters.

20.10.16. Building Client Programs

If you compile MySQL clients that you've written yourself or that you obtain from a third-party, they must be linked using the `-lmysqlclient -lz` options in the link command. You may also need to specify a `-L` option to tell the linker where to find the library. For example, if the library is installed in `/usr/local/mysql/lib`, use `-L/usr/local/mysql/lib -lmysqlclient -lz` in the link command.

For clients that use MySQL header files, you may need to specify an `-I` option when you compile them (for example, `-`

I/usr/local/mysql/include), so that the compiler can find the header files.

To make it simpler to compile MySQL programs on Unix, we have provided the `mysql_config` script for you. See [Section 4.7.2, “mysql_config — Get Compile Options for Compiling Clients”](#).

You can use it to compile a MySQL client as follows:

```
CFG=/usr/local/mysql/bin/mysql_config
sh -c "gcc -o progname ` $CFG --cflags ` progname.c ` $CFG --libs `"
```

The `sh -c` is needed to get the shell not to treat the output from `mysql_config` as one word.

MySQL Enterprise

Subscribers to MySQL Enterprise will find an example client program in the Knowledge Base article, [Sample C program using the embedded MySQL server library](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

20.10.17. How to Make a Threaded Client

The client library is almost thread-safe. The biggest problem is that the subroutines in `net.c` that read from sockets are not interrupt safe. This was done with the thought that you might want to have your own alarm that can break a long read to a server. If you install interrupt handlers for the `SIGPIPE` interrupt, the socket handling should be thread-safe.

To avoid aborting the program when a connection terminates, MySQL blocks `SIGPIPE` on the first call to `mysql_library_init()`, `mysql_init()`, or `mysql_connect()`. If you want to use your own `SIGPIPE` handler, you should first call `mysql_library_init()` and then install your handler.

Before MySQL 4.0, binary client libraries that we provided other than those for Windows were not normally compiled with the thread-safe option. Current binary distributions should have both a normal and a thread-safe client library.

To create a threaded client where you can interrupt the client from other threads and set timeouts when talking with the MySQL server, you should use the `net_serv.o` code that the server uses and the `-lmysys`, `-lmystrings`, and `-ldbbug` libraries.

If you don't need interrupts or timeouts, you can just compile a thread-safe client library (`mysqlclient_r`) and use it. In this case, you don't have to worry about the `net_serv.o` object file or the other MySQL libraries.

When using a threaded client and you want to use timeouts and interrupts, you can make great use of the routines in the `thr_alarm.c` file. If you are using routines from the `mysys` library, the only thing you must remember is to call `my_init()` first! See [Section 20.10.8, “C API Threaded Function Descriptions”](#).

In all cases, be sure to initialize the client library by calling `mysql_library_init()` before calling any other MySQL functions. When you are done with the library, call `mysql_library_end()`.

`mysql_real_connect()` is not thread-safe by default. The following notes describe how to compile a thread-safe client library and use it in a thread-safe manner. (The notes below for `mysql_real_connect()` also apply to the older `mysql_connect()` routine as well, although `mysql_connect()` is deprecated and should no longer be used.)

To make `mysql_real_connect()` thread-safe, you must configure your MySQL distribution with this command:

```
shell> ./configure --enable-thread-safe-client
```

Then recompile the distribution to create a thread-safe client library, `libmysqlclient_r`. (Assuming that your operating system has a thread-safe `gethostbyname_r()` function.) This library is thread-safe per connection. You can let two threads share the same connection with the following caveats:

- Two threads can't send a query to the MySQL server at the same time on the same connection. In particular, you have to ensure that between calls to `mysql_query()` and `mysql_store_result()` no other thread is using the same connection.
- Many threads can access different result sets that are retrieved with `mysql_store_result()`.
- If you use `mysql_use_result()`, you must ensure that no other thread is using the same connection until the result set is closed. However, it really is best for threaded clients that share the same connection to use `mysql_store_result()`.
- If you want to use multiple threads on the same connection, you must have a mutex lock around your pair of `mysql_query()` and `mysql_store_result()` calls. Once `mysql_store_result()` is ready, the lock can be released and other threads may query the same connection.
- If you use POSIX threads, you can use `pthread_mutex_lock()` and `pthread_mutex_unlock()` to establish and release a mutex lock.

You need to know the following if you have a thread that is calling MySQL functions which did not create the connection to the MySQL database:

When you call `mysql_init()`, MySQL creates a thread-specific variable for the thread that is used by the debug library (among other things). If you call a MySQL function before the thread has called `mysql_init()`, the thread does not have the necessary thread-specific variables in place and you are likely to end up with a core dump sooner or later. To get things to work smoothly you must do the following:

1. Call `mysql_library_init()` before any other MySQL functions. It is not thread-safe, so call it before threads are created, or protect the call with a mutex.
2. Arrange for `mysql_thread_init()` to be called early in the thread handler before calling any MySQL function. If you call `mysql_init()`, they will call `mysql_thread_init()` for you.
3. In the thread, call `mysql_thread_end()` before calling `pthread_exit()`. This frees the memory used by MySQL thread-specific variables.

The preceding notes regarding `mysql_init()` also apply to `mysql_connect()`, which calls `mysql_init()`.

If “undefined symbol” errors occur when linking your client with `libmysqlclient_r`, in most cases this is because you haven't included the thread libraries on the link/compile command.

20.11. MySQL PHP API

PHP is a server-side, HTML-embedded scripting language that may be used to create dynamic Web pages. It is available for most operating systems and Web servers, and can access most common databases, including MySQL. PHP may be run as a separate program or compiled as a module for use with the Apache Web server.

PHP actually provides two different MySQL API extensions:

- `mysql`: Available for PHP versions 4 and 5, this extension is intended for use with MySQL versions prior to MySQL 4.1. This extension does not support the improved authentication protocol used in MySQL 4.1, nor does it support prepared statements or multiple statements. If you wish to use this extension with MySQL 4.1, you will likely want to configure the MySQL server to use the `--old-passwords` option (see Section B.1.2.4, “Client does not support authentication protocol”). This extension is documented on the PHP Web site at <http://php.net/mysql>.
- Section 20.11.2, “MySQL Improved Extension (`mysqli`)” - Stands for “MySQL, Improved”; this extension is available only in PHP 5. It is intended for use with MySQL 4.1.1 and later. This extension fully supports the authentication protocol used in MySQL 5.0, as well as the Prepared Statements and Multiple Statements APIs. In addition, this extension provides an advanced, object-oriented programming interface. You can read the documentation for the `mysqli` extension at <http://php.net/mysqli>. Helpful article can be found at <http://devzone.zend.com/node/view/id/686> and <http://devzone.zend.com/node/view/id/687>.

If you're experiencing problems with enabling both the `mysql` and the `mysqli` extension when building PHP on Linux yourself, see Section 20.11.6, “Enabling Both `mysql` and `mysqli` in PHP”.

The PHP distribution and documentation are available from the [PHP Web site](http://php.net).

MySQL Enterprise

MySQL Enterprise subscribers will find more information about MySQL and PHP in the Knowledge Base articles found at [PHP](http://php.net). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see <http://www.mysql.com/products/enterprise/knowledgebase.html>.

20.11.1. MySQL

Copyright 1997-2008 the PHP Documentation Group.

These functions allow you to access MySQL database servers. More information about MySQL can be found at <http://www.mysql.com>.

<http://www.mysql.com/>.

Documentation for MySQL can be found at <http://dev.mysql.com/doc/>.

20.11.1.1. Installing/Configuring

Copyright 1997-2008 the PHP Documentation Group.

20.11.1.1.1. Requirements

Copyright 1997-2008 the PHP Documentation Group.

In order to have these functions available, you must compile PHP with MySQL support.

20.11.1.1.2. Installation

Copyright 1997-2008 the PHP Documentation Group.

For compiling, simply use the `--with-mysql[=DIR]` configuration option where the optional `[DIR]` points to the MySQL installation directory.

Although this MySQL extension is compatible with MySQL 4.1.0 and greater, it doesn't support the extra functionality that these versions provide. For that, use the [MySQLi](#) extension.

If you would like to install the `mysql` extension along with the `mysqli` extension you have to use the same client library to avoid any conflicts.

20.11.1.1.2.1. Installation on Linux Systems

Copyright 1997-2008 the PHP Documentation Group.

20.11.1.1.2.1.1. PHP 4

Copyright 1997-2008 the PHP Documentation Group.

The option `--with-mysql` is enabled by default. This default behavior may be disabled with the `--without-mysql` configure option. If MySQL is enabled without specifying the path to the MySQL install DIR, PHP will use the bundled MySQL client libraries.

Users who run other applications that use MySQL (for example, `auth-mysql`) should not use the bundled library, but rather specify the path to MySQL's install directory, like so: `--with-mysql=/path/to/mysql`. This will force PHP to use the client libraries installed by MySQL, thus avoiding any conflicts.

20.11.1.1.2.1.2. PHP 5+

Copyright 1997-2008 the PHP Documentation Group.

MySQL is not enabled by default, nor is the MySQL library bundled with PHP. Read this [FAQ](#) for details on why. Use the `--with-mysql[=DIR]` configure option to include MySQL support. You can download *headers and libraries* from [MySQL](#).

20.11.1.1.2.2. Installation on Windows Systems

Copyright 1997-2008 the PHP Documentation Group.

20.11.1.1.2.2.1. PHP 4

Copyright 1997-2008 the PHP Documentation Group.

The PHP MySQL extension is compiled into PHP.

20.11.1.1.2.2.2. PHP 5+

Copyright 1997-2008 the PHP Documentation Group.

MySQL is no longer enabled by default, so the `php_mysql.dll` DLL must be enabled inside of `php.ini`. Also, PHP needs access to the MySQL client library. A file named `libmysql.dll` is included in the Windows PHP distribution and in order for PHP to talk to MySQL this file needs to be available to the Windows systems `PATH`. See the FAQ titled "[How do I add my PHP directory to the PATH on Windows](#)" for information on how to do this. Although copying `libmysql.dll` to the Windows system directory also works (because the system directory is by default in the system's `PATH`), it's not recommended.

As with enabling any PHP extension (such as `php_mysql.dll`), the PHP directive `extension_dir` should be set to the directory

where the PHP extensions are located. See also the [Manual Windows Installation Instructions](#). An example `extension_dir` value for PHP 5 is `c:\php\ext`

Note

If when starting the web server an error similar to the following occurs: "Unable to load dynamic library '.\php_mysql.dll'", this is because `php_mysql.dll` and/or `libmysql.dll` cannot be found by the system.

20.11.1.1.2.3. MySQL Installation Notes

Copyright 1997-2008 the PHP Documentation Group.

Warning

Crashes and startup problems of PHP may be encountered when loading this extension in conjunction with the `recode` extension. See the [recode](#) extension for more information.

Note

If you need charsets other than *latin* (default), you have to install external (not bundled) `libmysql` with compiled charset support.

20.11.1.1.3. Runtime Configuration

Copyright 1997-2008 the PHP Documentation Group.

The behaviour of these functions is affected by settings in `php.ini`.

Table 20.4. MySQL Configuration Options

Name	Default	Changeable	Changelog
<code>mysql.allow_persistent</code>	"1"	PHP_INI_SYSTEM	
<code>mysql.max_persistent</code>	"-1"	PHP_INI_SYSTEM	
<code>mysql.max_links</code>	"-1"	PHP_INI_SYSTEM	
<code>mysql.trace_mode</code>	"0"	PHP_INI_ALL	Available since PHP 4.3.0.
<code>mysql.default_port</code>	NULL	PHP_INI_ALL	
<code>mysql.default_socket</code>	NULL	PHP_INI_ALL	Available since PHP 4.0.1.
<code>mysql.default_host</code>	NULL	PHP_INI_ALL	
<code>mysql.default_user</code>	NULL	PHP_INI_ALL	
<code>mysql.default_password</code>	NULL	PHP_INI_ALL	
<code>mysql.connect_timeout</code>	"60"	PHP_INI_ALL	PHP_INI_SYSTEM in PHP <= 4.3.2. Available since PHP 4.3.0.

For further details and definitions of the `PHP_INI_*` constants, see the [ini](#).

Here's a short explanation of the configuration directives.

<code>mysql.allow_persistent</code> boolean	Whether to allow persistent connections to MySQL.
<code>mysql.max_persistent</code> integer	The maximum number of persistent MySQL connections per process.
<code>mysql.max_links</code> integer	The maximum number of MySQL connections per process, including persistent connections.
<code>mysql.trace_mode</code> boolean	Trace mode. When <code>mysql.trace_mode</code> is enabled, warnings for table/index scans, non free result sets, and SQL-Errors will be displayed. (Introduced in PHP 4.3.0)
<code>mysql.default_port</code> string	The default TCP port number to use when connecting to the database server if no other port is specified. If no default is specified, the port will be obtained from the <code>MYSQL_TCP_PORT</code> environment variable, the <code>mysql-tcp</code> entry in <code>/etc/services</code> or the compile-time <code>MYSQL_PORT</code> constant, in that order. Win32 will only use the <code>MYSQL_PORT</code> constant.

<code>mysql.default_socket</code> string	The default socket name to use when connecting to a local database server if no other socket name is specified.
<code>mysql.default_host</code> string	The default server host to use when connecting to the database server if no other host is specified. Doesn't apply in SQL safe mode .
<code>mysql.default_user</code> string	The default user name to use when connecting to the database server if no other name is specified. Doesn't apply in SQL safe mode .
<code>mysql.default_password</code> string	The default password to use when connecting to the database server if no other password is specified. Doesn't apply in SQL safe mode .
<code>mysql.connect_timeout</code> in- teger	Connect timeout in seconds. On Linux this timeout is also used for waiting for the first answer from the server.

20.11.1.1.4. Resource Types

Copyright 1997-2008 the PHP Documentation Group.

There are two resource types used in the MySQL module. The first one is the link identifier for a database connection, the second a resource which holds the result of a query.

20.11.1.2. Predefined Constants

Copyright 1997-2008 the PHP Documentation Group.

The constants below are defined by this extension, and will only be available when the extension has either been compiled into PHP or dynamically loaded at runtime.

Since PHP 4.3.0 it is possible to specify additional client flags for the `mysql_connect` and `mysql_pconnect` functions. The following constants are defined:

Table 20.5. MySQL client constants

Constant	Description
<code>MYSQL_CLIENT_COMPRESS</code>	Use compression protocol
<code>MYSQL_CLIENT_IGNORE_SPACE</code>	Allow space after function names
<code>MYSQL_CLIENT_INTERACTIVE</code>	Allow <code>interactive_timeout</code> seconds (instead of <code>wait_timeout</code>) of inactivity before closing the connection.
<code>MYSQL_CLIENT_SSL</code>	Use SSL encryption. This flag is only available with version 4.x of the MySQL client library or newer. Version 3.23.x is bundled both with PHP 4 and Windows binaries of PHP 5.

The function `mysql_fetch_array` uses a constant for the different types of result arrays. The following constants are defined:

Table 20.6. MySQL fetch constants

Constant	Description
<code>MYSQL_ASSOC</code>	Columns are returned into the array having the fieldname as the array index.
<code>MYSQL_BOTH</code>	Columns are returned into the array having both a numerical index and the fieldname as the array index.
<code>MYSQL_NUM</code>	Columns are returned into the array having a numerical index to the fields. This index starts with 0, the first field in the result.

20.11.1.3. Examples

Copyright 1997-2008 the PHP Documentation Group.

20.11.1.3.1. Basic

This simple example shows how to connect, execute a query, print resulting rows and disconnect from a MySQL database.

Example 20.13. MySQL extension overview example

Copyright 1997-2008 the PHP Documentation Group.

```

<?php
// Connecting, selecting database
$link = mysql_connect('mysql_host', 'mysql_user', 'mysql_password')
    or die('Could not connect: ' . mysql_error());
echo 'Connected successfully';
mysql_select_db('my_database') or die('Could not select database');

// Performing SQL query
$query = 'SELECT * FROM my_table';
$result = mysql_query($query) or die('Query failed: ' . mysql_error());

// Printing results in HTML
echo "<table>\n";
while ($line = mysql_fetch_array($result, MYSQL_ASSOC)) {
    echo "\t<tr>\n";
    foreach ($line as $col_value) {
        echo "\t\t<td>$col_value</td>\n";
    }
    echo "\t</tr>\n";
}
echo "</table>\n";

// Free resultset
mysql_free_result($result);

// Closing connection
mysql_close($link);
?>

```

20.11.1.4. MySQL Functions

Copyright 1997-2008 the PHP Documentation Group.

Note

Most MySQL functions accept *link_identifier* as the last optional parameter. If it is not provided, last opened connection is used. If it doesn't exist, connection is tried to establish with default parameters defined in `php.ini`. If it is not successful, functions return `FALSE`.

20.11.1.4.1. `mysql_affected_rows`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_affected_rows`

Get number of affected rows in previous MySQL operation

Description

```
int mysql_affected_rows(resource link_identifier);
```

Get the number of affected rows by the last INSERT, UPDATE, REPLACE or DELETE query associated with *link_identifier*.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns the number of affected rows on success, and -1 if the last query failed.

If the last query was a DELETE query with no WHERE clause, all of the records will have been deleted from the table but this function will return zero with MySQL versions prior to 4.1.2.

When using UPDATE, MySQL will not update columns where the new value is the same as the old value. This creates the possibility that `mysql_affected_rows` may not actually equal the number of rows matched, only the number of rows that were literally affected by the query.

The REPLACE statement first deletes the record with the same primary key and then inserts the new record. This function returns the number of deleted records plus the number of inserted records.

Examples

Example 20.14. `mysql_affected_rows` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
mysql_select_db('mydb');

/* this should return the correct numbers of deleted records */
mysql_query('DELETE FROM mytable WHERE id < 10');
printf("Records deleted: %d\n", mysql_affected_rows());

/* with a where clause that is never true, it should return 0 */
mysql_query('DELETE FROM mytable WHERE 0');
printf("Records deleted: %d\n", mysql_affected_rows());
?>
```

The above example will output something similar to:

```
Records deleted: 10
Records deleted: 0
```

Example 20.15. `mysql_affected_rows` example using transactions

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
mysql_select_db('mydb');

/* Update records */
mysql_query("UPDATE mytable SET used=1 WHERE id < 10");
printf ("Updated records: %d\n", mysql_affected_rows());
mysql_query("COMMIT");
?>
```

The above example will output something similar to:

```
Updated Records: 10
```

Notes

Transactions

If you are using transactions, you need to call `mysql_affected_rows` after your INSERT, UPDATE, or DELETE query, not after the COMMIT.

SELECT Statements

To retrieve the number of rows returned by a SELECT, it is possible to use `mysql_num_rows`.

See Also

`mysql_num_rows`
`mysql_info`

20.11.1.4.2. `mysql_change_user`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_change_user`

Change logged in user of the active connection

Description

```
int mysql_change_user(string user,
                     string password,
                     string database,
                     resource link_identifier);
```

`mysql_change_user` changes the logged in user of the current active connection, or the connection given by the optional `link_identifier` parameter. If a database is specified, this will be the current database after the user has been changed. If the new user and password authorization fails, the current connected user stays active.

This function is deprecated and no longer exists in PHP.

Parameters

<code>user</code>	The new MySQL username.
<code>password</code>	The new MySQL password.
<code>database</code>	The MySQL database. If not specified, the current selected database is used.
<code>link_identifier</code>	The MySQL connection. If the link identifier is not specified, the last link opened by <code>mysql_connect</code> is assumed. If no such link is found, it will try to create one as if <code>mysql_connect</code> was called with no arguments. If by chance no connection is found or established, an <code>E_WARNING</code> level error is generated.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

ChangeLog

Version	Description
3.0.14	This function was removed from PHP.

Notes**Requirements**

This function requires MySQL 3.23.3 or higher.

See Also

[mysql_connect](#)

[mysql_query](#)

20.11.1.4.3. [mysql_client_encoding](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysql_client_encoding](#)

Returns the name of the character set

Description

```
string mysql_client_encoding(resource link_identifier);
```

Retrieves the [character_set](#) variable from MySQL.

Parameters

link_identifier The MySQL connection. If the link identifier is not specified, the last link opened by [mysql_connect](#) is assumed. If no such link is found, it will try to create one as if [mysql_connect](#) was called with no arguments. If by chance no connection is found or established, an [E_WARNING](#) level error is generated.

Return Values

Returns the default character set name for the current connection.

Examples**Example 20.16. [mysql_client_encoding](#) example**

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$charset = mysql_client_encoding($link);

echo "The current character set is: $charset\n";
?>
```

The above example will output something similar to:

```
The current character set is: latin1
```

See Also

[mysql_set_charset](#)
[mysql_real_escape_string](#)

20.11.1.4.4. [mysql_close](#)

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_close`

Close MySQL connection

Description

```
bool mysql_close(resource link_identifier);
```

`mysql_close` closes the non-persistent connection to the MySQL server that's associated with the specified link identifier. If `link_identifier` isn't specified, the last opened link is used.

Using `mysql_close` isn't usually necessary, as non-persistent open links are automatically closed at the end of the script's execution. See also [freeing resources](#).

Parameters

`link_identifier` The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.17. `mysql_close` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);
?>
```

The above example will output:

```
Connected successfully
```

Notes

Note

`mysql_close` will not close persistent links created by `mysql_pconnect`.

See Also

`mysql_connect`
`mysql_free_result`

20.11.1.4.5. `mysql_connect`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_connect`

Open a connection to a MySQL Server

Description

```
resource mysql_connect(string server,
                      string username,
                      string password,
                      bool new_link,
                      int client_flags);
```

Opens or reuses a connection to a MySQL server.

Parameters

<code>server</code>	The MySQL server. It can also include a port number, e.g. "hostname:port" or a path to a local socket e.g. ":/path/to/socket" for the localhost. If the PHP directive <code>mysql.default_host</code> is undefined (default), then the default value is 'localhost:3306'. In SQL safe mode , this parameter is ignored and value 'localhost:3306' is always used.
<code>username</code>	The username. Default value is defined by <code>mysql.default_user</code> . In SQL safe mode , this parameter is ignored and the name of the user that owns the server process is used.
<code>password</code>	The password. Default value is defined by <code>mysql.default_password</code> . In SQL safe mode , this parameter is ignored and empty password is used.
<code>new_link</code>	If a second call is made to <code>mysql_connect</code> with the same arguments, no new link will be established, but instead, the link identifier of the already opened link will be returned. The <code>new_link</code> parameter modifies this behavior and makes <code>mysql_connect</code> always open a new link, even if <code>mysql_connect</code> was called before with the same parameters. In SQL safe mode , this parameter is ignored.
<code>client_flags</code>	The <code>client_flags</code> parameter can be a combination of the following constants: 128 (enable <code>LOAD DATA LOCAL</code> handling), <code>MYSQL_CLIENT_SSL</code> , <code>MYSQL_CLIENT_COMPRESS</code> , <code>MYSQL_CLIENT_IGNORE_SPACE</code> or <code>MYSQL_CLIENT_INTERACTIVE</code> . Read the section about Table 20.5, "MySQL client constants" for further information. In SQL safe mode , this parameter is ignored.

Return Values

Returns a MySQL link identifier on success, or `FALSE` on failure.

ChangeLog

Version	Description
4.3.0	Added the <code>client_flags</code> parameter.
4.2.0	Added the <code>new_link</code> parameter.
3.0.10	Added support for ":/path/to/socket" with <code>server</code> .
3.0.0	Added support for ":port" with <code>server</code> .

Examples

Example 20.18. `mysql_connect` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
```

```
echo 'Connected successfully';
mysql_close($link);
?>
```

Example 20.19. `mysql_connect` example using `hostname:port` syntax

```
<?php
// we connect to example.com and port 3307
$link = mysql_connect('example.com:3307', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);

// we connect to localhost at port 3307
$link = mysql_connect('127.0.0.1:3307', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);
?>
```

Example 20.20. `mysql_connect` example using `"/path/to/socket"` syntax

```
<?php
// we connect to localhost and socket e.g. /tmp/mysql.sock

//variant 1: omit localhost
$link = mysql_connect('/:tmp/mysql', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);

// variant 2: with localhost
$link = mysql_connect('localhost:/tmp/mysql.sock', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);
?>
```

Notes

Note

Whenever you specify "localhost" or "localhost:port" as server, the MySQL client library will override this and try to connect to a local socket (named pipe on Windows). If you want to use TCP/IP, use "127.0.0.1" instead of "localhost". If the MySQL client library tries to connect to the wrong local socket, you should set the correct path as [ini.mysql.default-host](#) in your PHP configuration and leave the server field blank.

Note

The link to the server will be closed as soon as the execution of the script ends, unless it's closed earlier by explicitly calling `mysql_close`.

Note

You can suppress the error message on failure by prepending a `@` to the function name.

Note

Error "Can't create TCP/IP socket (10106)" usually means that the `variables_order` configure directive doesn't contain character `E`. On Windows, if the environment is not copied the `SYSTEMROOT` environment variable won't be available and PHP will have problems loading Winsock.

See Also

`mysql_pconnect`
`mysql_close`

20.11.1.4.6. `mysql_create_db`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_create_db`

Create a MySQL database

Description

```
bool mysql_create_db(string database_name,
                    resource link_identifier);
```

`mysql_create_db` attempts to create a new database on the server associated with the specified link identifier.

Parameters

<i>database_name</i>	The name of the database being created.
<i>link_identifier</i>	The MySQL connection. If the link identifier is not specified, the last link opened by <code>mysql_connect</code> is assumed. If no such link is found, it will try to create one as if <code>mysql_connect</code> was called with no arguments. If by chance no connection is found or established, an <code>E_WARNING</code> level error is generated.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.21. `mysql_create_db` alternative example

The function `mysql_create_db` is deprecated. It is preferable to use `mysql_query` to issue a sql `CREATE DATABASE` statement instead.

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}

$sql = 'CREATE DATABASE my_db';
if (mysql_query($sql, $link)) {
    echo "Database my_db created successfully\n";
} else {
    echo 'Error creating database: ' . mysql_error() . "\n";
}
?>
```

The above example will output something similar to:

```
Database my_db created successfully
```

Notes**Note**

For backward compatibility, the following deprecated alias may be used: `mysql_createdb`

Note

This function will not be available if the MySQL extension was built against a MySQL 4.x client library.

See Also

`mysql_query`
`mysql_select_db`

20.11.1.4.7. `mysql_data_seek`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_data_seek`

Move internal result pointer

Description

```
bool mysql_data_seek(resource result,
                    int row_number);
```

`mysql_data_seek` moves the internal row pointer of the MySQL result associated with the specified result identifier to point to the specified row number. The next call to a MySQL fetch function, such as `mysql_fetch_assoc`, would return that row.

`row_number` starts at 0. The `row_number` should be a value in the range from 0 to `mysql_num_rows` - 1. However if the result set is empty (`mysql_num_rows == 0`), a seek to 0 will fail with a `E_WARNING` and `mysql_data_seek` will return `FALSE`.

Parameters

`result` The result resource that is being evaluated. This result comes from a call to `mysql_query`.

`row_number` The desired row number of the new result pointer.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples**Example 20.22. `mysql_data_seek` example**

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
$db_selected = mysql_select_db('sample_db');
if (!$db_selected) {
    die('Could not select database: ' . mysql_error());
}
$query = 'SELECT last_name, first_name FROM friends';
$result = mysql_query($query);
if (!$result) {
    die('Query failed: ' . mysql_error());
```

```

}
/* fetch rows in reverse order */
for ($i = mysql_num_rows($result) - 1; $i >= 0; $i--) {
    if (!mysql_data_seek($result, $i)) {
        echo "Cannot seek to row $i: " . mysql_error() . "\n";
        continue;
    }

    if (!$row = mysql_fetch_assoc($result)) {
        continue;
    }

    echo $row['last_name'] . ' ' . $row['first_name'] . "<br />\n";
}

mysql_free_result($result);
?>

```

Notes

Note

The function `mysql_data_seek` can be used in conjunction only with `mysql_query`, not with `mysql_unbuffered_query`.

20.11.1.4.8. `mysql_db_name`

Copyright 1997-2008 the PHP Documentation Group.

- [mysql_db_name](#)

Get result data

Description

```

string mysql_db_name(resource result,
                    int row,
                    mixed field);

```

Retrieve the database name from a call to `mysql_list_dbs`.

Parameters

<i>result</i>	The result pointer from a call to <code>mysql_list_dbs</code> .
<i>row</i>	The index into the result set.
<i>field</i>	The field name.

Return Values

Returns the database name on success, and `FALSE` on failure. If `FALSE` is returned, use `mysql_error` to determine the nature of the error.

Examples

Example 20.23. `mysql_db_name` example

```

<?php
error_reporting(E_ALL);

$link = mysql_connect('dbhost', 'username', 'password');
$db_list = mysql_list_dbs($link);

$i = 0;
$cnt = mysql_num_rows($db_list);
while ($i < $cnt) {
    echo mysql_db_name($db_list, $i) . "\n";
    $i++;
}
?>

```

Notes**Note**

For backward compatibility, the following deprecated alias may be used: `mysql_dbname`

See Also

[mysql_list_dbs](#)
[mysql_tablename](#)

20.11.1.4.9. `mysql_db_query`

Copyright 1997-2008 the PHP Documentation Group.

- [mysql_db_query](#)

Send a MySQL query

Description

```

resource mysql_db_query(string database,
                       string query,
                       resource link_identifier);

```

`mysql_db_query` selects a database, and executes a query on it.

Parameters

<i>database</i>	The name of the database that will be selected.
<i>query</i>	The MySQL query.
<i>link_identifier</i>	The MySQL connection. If the link identifier is not specified, the last link opened by <code>mysql_connect</code> is assumed. If no such link is found, it will try to create one as if <code>mysql_connect</code> was called with no arguments. If by chance no connection is found or established, an <code>E_WARNING</code> level error is generated.

Return Values

Returns a positive MySQL result resource to the query result, or `FALSE` on error. The function also returns `TRUE` / `FALSE` for `INSERT/UPDATE/DELETE` queries to indicate success/failure.

ChangeLog

Version	Description
5.3.0	This function now throws an E_DEPRECATED notice.
4.0.6	This function is deprecated, do not use this function. Use mysql_select_db and mysql_query instead.

Examples

Example 20.24. [mysql_db_query](#) alternative example

```
<?php
if (!$link = mysql_connect('mysql_host', 'mysql_user', 'mysql_password')) {
    echo 'Could not connect to mysql';
    exit;
}

if (!mysql_select_db('mysql_dbname', $link)) {
    echo 'Could not select database';
    exit;
}

$sql = 'SELECT foo FROM bar WHERE id = 42';
$result = mysql_query($sql, $link);

if (!$result) {
    echo "DB Error, could not query the database\n";
    echo 'MySQL Error: ' . mysql_error();
    exit;
}

while ($row = mysql_fetch_assoc($result)) {
    echo $row['foo'];
}

mysql_free_result($result);

?>
```

Notes

Note

Be aware that this function does *NOT* switch back to the database you were connected before. In other words, you can't use this function to *temporarily* run a sql query on another database, you would have to manually switch back. Users are strongly encouraged to use the [database.table](#) syntax in their sql queries or [mysql_select_db](#) instead of this function.

See Also

[mysql_query](#)
[mysql_select_db](#)

20.11.1.4.10. [mysql_drop_db](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysql_drop_db](#)

Drop (delete) a MySQL database

Description

```
bool mysql_drop_db(string database_name,
                  resource link_identifier);
```

[mysql_drop_db](#) attempts to drop (remove) an entire database from the server associated with the specified link identifier. This function is deprecated, it is preferable to use [mysql_query](#) to issue a sql `DROP DATABASE` statement instead.

Parameters

<i>database_name</i>	The name of the database that will be deleted.
<i>link_identifier</i>	The MySQL connection. If the link identifier is not specified, the last link opened by <code>mysql_connect</code> is assumed. If no such link is found, it will try to create one as if <code>mysql_connect</code> was called with no arguments. If by chance no connection is found or established, an <code>E_WARNING</code> level error is generated.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.25. `mysql_drop_db` alternative example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}

$sql = 'DROP DATABASE my_db';
if (mysql_query($sql, $link)) {
    echo "Database my_db was successfully dropped\n";
} else {
    echo 'Error dropping database: ' . mysql_error() . "\n";
}
?>
```

Notes

Warning

This function will not be available if the MySQL extension was built against a MySQL 4.x client library.

Note

For backward compatibility, the following deprecated alias may be used: `mysql_dropdb`

See Also

[mysql_query](#)

20.11.1.4.11. `mysql_errno`

Copyright 1997-2008 the PHP Documentation Group.

- [mysql_errno](#)

Returns the numerical value of the error message from previous MySQL operation

Description

```
int mysql_errno(resource link_identifier);
```

Returns the error number from the last MySQL function.

Errors coming back from the MySQL database backend no longer issue warnings. Instead, use `mysql_errno` to retrieve the error code. Note that this function only returns the error code from the most recently executed MySQL function (not including `mysql_error` and `mysql_errno`), so if you want to use it, make sure you check the value before calling another MySQL func-

tion.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns the error number from the last MySQL function, or 0 (zero) if no error occurred.

Examples

Example 20.26. `mysql_errno` example

```
<?php
$link = mysql_connect("localhost", "mysql_user", "mysql_password");
if (!mysql_select_db("nonexistentdb", $link)) {
    echo mysql_errno($link) . ": " . mysql_error($link). "\n";
}

mysql_select_db("kossu", $link);
if (!mysql_query("SELECT * FROM nonexistenttable", $link)) {
    echo mysql_errno($link) . ": " . mysql_error($link). "\n";
}
?>
```

The above example will output something similar to:

```
1049: Unknown database 'nonexistentdb'
1146: Table 'kossu.nonexistenttable' doesn't exist
```

See Also

[mysql_error](#)
[MySQL error codes](#)

20.11.1.4.12. `mysql_error`

Copyright 1997-2008 the PHP Documentation Group.

- [mysql_error](#)

Returns the text of the error message from previous MySQL operation

Description

```
string mysql_error(resource link_identifier);
```

Returns the error text from the last MySQL function. Errors coming back from the MySQL database backend no longer issue warnings. Instead, use `mysql_error` to retrieve the error text. Note that this function only returns the error text from the most recently executed MySQL function (not including `mysql_error` and `mysql_errno`), so if you want to use it, make sure you check the value before calling another MySQL function.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns the error text from the last MySQL function, or '' (empty string) if no error occurred.

Examples

Example 20.27. `mysql_error` example

```
<?php
$link = mysql_connect("localhost", "mysql_user", "mysql_password");

mysql_select_db("nonexistentdb", $link);
echo mysql_errno($link) . ": " . mysql_error($link) . "\n";

mysql_select_db("kossu", $link);
mysql_query("SELECT * FROM nonexistenttable", $link);
echo mysql_errno($link) . ": " . mysql_error($link) . "\n";
?>
```

The above example will output something similar to:

```
1049: Unknown database 'nonexistentdb'
1146: Table 'kossu.nonexistenttable' doesn't exist
```

20.11.1.4.13. `mysql_escape_string`

Copyright 1997-2008 the PHP Documentation Group.

- [mysql_escape_string](#)

Escapes a string for use in a `mysql_query`

Description

```
string mysql_escape_string(string unescaped_string);
```

This function will escape the *unescaped_string*, so that it is safe to place it in a `mysql_query`. This function is deprecated.

This function is identical to `mysql_real_escape_string` except that `mysql_real_escape_string` takes a connection handler and escapes the string according to the current character set. `mysql_escape_string` does not take a connection argument and does not respect the current charset setting.

Parameters

unescaped_string

The string that is to be escaped.

Return Values

Returns the escaped string.

ChangeLog

Version	Description
5.3.0	This function now throws an E_DEPRECATED notice.
4.3.0	This function became deprecated, do not use this function. Instead, use mysql_real_escape_string .

Examples**Example 20.28. [mysql_escape_string](#) example**

```
<?php
$item = "Zak's Laptop";
$escaped_item = mysql_escape_string($item);
printf("Escaped string: %s\n", $escaped_item);
?>
```

The above example will output:

```
Escaped string: Zak\'s Laptop
```

Notes**Note**

[mysql_escape_string](#) does not escape % and _.

[mysql_real_escape_string](#)
[addslashes](#)
 The [magic_quotes_gpc](#) directive.

20.11.1.4.14. [mysql_fetch_array](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysql_fetch_array](#)

Fetch a result row as an associative array, a numeric array, or both

Description

```
array mysql_fetch_array(resource result,
                        int result_type);
```

Returns an array that corresponds to the fetched row and moves the internal data pointer ahead.

Parameters

<i>result</i>	The result resource that is being evaluated. This result comes from a call to <code>mysql_query</code> .
<i>result_type</i>	The type of array that is to be fetched. It's a constant and can take the following values: <code>MYSQL_ASSOC</code> , <code>MYSQL_NUM</code> , and the default value of <code>MYSQL_BOTH</code> .

Return Values

Returns an array of strings that corresponds to the fetched row, or `FALSE` if there are no more rows. The type of returned array depends on how *result_type* is defined. By using `MYSQL_BOTH` (default), you'll get an array with both associative and number indices. Using `MYSQL_ASSOC`, you only get associative indices (as `mysql_fetch_assoc` works), using `MYSQL_NUM`, you only get number indices (as `mysql_fetch_row` works).

If two or more columns of the result have the same field names, the last column will take precedence. To access the other column(s) of the same name, you must use the numeric index of the column or make an alias for the column. For aliased columns, you cannot access the contents with the original column name.

Examples

Example 20.29. Query with aliased duplicate field names

```
SELECT table1.field AS foo, table2.field AS bar FROM table1, table2
```

Example 20.30. `mysql_fetch_array` with `MYSQL_NUM`

```
<?php
mysql_connect("localhost", "mysql_user", "mysql_password") or
    die("Could not connect: " . mysql_error());
mysql_select_db("mydb");

$result = mysql_query("SELECT id, name FROM mytable");

while ($row = mysql_fetch_array($result, MYSQL_NUM)) {
    printf("ID: %s Name: %s", $row[0], $row[1]);
}

mysql_free_result($result);
?>
```

Example 20.31. `mysql_fetch_array` with `MYSQL_ASSOC`

```
<?php
mysql_connect("localhost", "mysql_user", "mysql_password") or
    die("Could not connect: " . mysql_error());
mysql_select_db("mydb");

$result = mysql_query("SELECT id, name FROM mytable");

while ($row = mysql_fetch_array($result, MYSQL_ASSOC)) {
    printf("ID: %s Name: %s", $row["id"], $row["name"]);
}

mysql_free_result($result);
?>
```

Example 20.32. `mysql_fetch_array` with `MYSQL_BOTH`

```

<?php
mysql_connect("localhost", "mysql_user", "mysql_password") or
    die("Could not connect: " . mysql_error());
mysql_select_db("mydb");

$result = mysql_query("SELECT id, name FROM mytable");

while ($row = mysql_fetch_array($result, MYSQL_BOTH)) {
    printf ("ID: %s Name: %s", $row[0], $row["name"]);
}

mysql_free_result($result);
?>

```

Notes

Performance

An important thing to note is that using `mysql_fetch_array` is *not significantly* slower than using `mysql_fetch_row`, while it provides a significant added value.

Note

Field names returned by this function are *case-sensitive*.

Note

This function sets NULL fields to the PHP `NULL` value.

See Also

[mysql_fetch_row](#)
[mysql_fetch_assoc](#)
[mysql_data_seek](#)
[mysql_query](#)

20.11.1.4.15. `mysql_fetch_assoc`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_fetch_assoc`

Fetch a result row as an associative array

Description

```
array mysql_fetch_assoc(resource result);
```

Returns an associative array that corresponds to the fetched row and moves the internal data pointer ahead. `mysql_fetch_assoc` is equivalent to calling `mysql_fetch_array` with `MYSQL_ASSOC` for the optional second parameter. It only returns an associative array.

Parameters

result The result resource that is being evaluated. This result comes from a call to `mysql_query`.

Return Values

Returns an associative array of strings that corresponds to the fetched row, or `FALSE` if there are no more rows.

If two or more columns of the result have the same field names, the last column will take precedence. To access the other column(s) of the same name, you either need to access the result with numeric indices by using `mysql_fetch_row` or add alias names. See the example at the `mysql_fetch_array` description about aliases.

Examples

Example 20.33. An expanded `mysql_fetch_assoc` example

```

<?php
$conn = mysql_connect("localhost", "mysql_user", "mysql_password");
if (!$conn) {
    echo "Unable to connect to DB: " . mysql_error();
    exit;
}
if (!mysql_select_db("mydbname")) {
    echo "Unable to select mydbname: " . mysql_error();
    exit;
}
$sql = "SELECT id as userid, fullname, userstatus
      FROM sometable
      WHERE userstatus = 1";
$result = mysql_query($sql);
if (!$result) {
    echo "Could not successfully run query ($sql) from DB: " . mysql_error();
    exit;
}
if (mysql_num_rows($result) == 0) {
    echo "No rows found, nothing to print so am exiting";
    exit;
}
// While a row of data exists, put that row in $row as an associative array
// Note: If you're expecting just one row, no need to use a loop
// Note: If you put extract($row); inside the following loop, you'll
//       then create $userid, $fullname, and $userstatus
while ($row = mysql_fetch_assoc($result)) {
    echo $row["userid"];
    echo $row["fullname"];
    echo $row["userstatus"];
}
mysql_free_result($result);
?>

```

Notes**Performance**

An important thing to note is that using `mysql_fetch_assoc` is *not significantly* slower than using `mysql_fetch_row`, while it provides a significant added value.

Note

Field names returned by this function are *case-sensitive*.

Note

This function sets NULL fields to the PHP `NULL` value.

See Also

`mysql_query`
`mysql_error`

20.11.1.4.16. `mysql_fetch_field`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_fetch_field`

Get column information from a result and return as an object

Description

```
object mysql_fetch_field(resource result,  
                        int field_offset);
```

Returns an object containing field information. This function can be used to obtain information about fields in the provided query result.

Parameters

result The result resource that is being evaluated. This result comes from a call to `mysql_query`.

field_offset The numerical field offset. If the field offset is not specified, the next field that was not yet retrieved by this function is retrieved. The *field_offset* starts at 0.

Return Values

Returns an object containing field information. The properties of the object are:

- name - column name
- table - name of the table the column belongs to
- def - default value of the column
- max_length - maximum length of the column
- not_null - 1 if the column cannot be `NULL`
- primary_key - 1 if the column is a primary key
- unique_key - 1 if the column is a unique key
- multiple_key - 1 if the column is a non-unique key
- numeric - 1 if the column is numeric
- blob - 1 if the column is a BLOB
- type - the type of the column
- unsigned - 1 if the column is unsigned
- zerofill - 1 if the column is zero-filled

Examples

Example 20.34. `mysql_fetch_field` example

```
<?php  
$conn = mysql_connect('localhost', 'mysql_user', 'mysql_password');  
if (!$conn) {  
    die('Could not connect: ' . mysql_error());  
}  
mysql_select_db('database');  
$result = mysql_query('select * from table');  
if (!$result) {  
    die('Query failed: ' . mysql_error());  
}  
/* get column metadata */  
$i = 0;  
while ($i < mysql_num_fields($result)) {  
    echo "Information for column $i:<br />\n";
```

```

    $meta = mysql_fetch_field($result, $i);
    if (!$meta) {
        echo "No information available<br />\n";
    }
    echo "<pre>
blob:          $meta->blob
max_length:   $meta->max_length
multiple_key: $meta->multiple_key
name:         $meta->name
not_null:     $meta->not_null
numeric:      $meta->numeric
primary_key:  $meta->primary_key
table:        $meta->table
type:         $meta->type
default:      $meta->def
unique_key:   $meta->unique_key
unsigned:     $meta->unsigned
zerofill:    $meta->zerofill
</pre>";
    $i++;
}
mysql_free_result($result);
?>

```

Notes

Note

Field names returned by this function are *case-sensitive*.

See Also

[mysql_field_seek](#)

20.11.1.4.17. [mysql_fetch_lengths](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysql_fetch_lengths](#)

Get the length of each output in a result

Description

```
array mysql_fetch_lengths(resource result);
```

Returns an array that corresponds to the lengths of each field in the last row fetched by MySQL.

[mysql_fetch_lengths](#) stores the lengths of each result column in the last row returned by [mysql_fetch_row](#), [mysql_fetch_assoc](#), [mysql_fetch_array](#), and [mysql_fetch_object](#) in an array, starting at offset 0.

Parameters

result

The result resource that is being evaluated. This result comes from a call to [mysql_query](#).

Return Values

An array of lengths on success, or [FALSE](#) on failure.

Examples

Example 20.35. A [mysql_fetch_lengths](#) example

```

<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {

```

```

    echo 'Could not run query: ' . mysql_error();
    exit;
}
$row    = mysql_fetch_assoc($result);
$lengths = mysql_fetch_lengths($result);

print_r($row);
print_r($lengths);
?>

```

The above example will output something similar to:

```

Array
(
    [id] => 42
    [email] => user@example.com
)
Array
(
    [0] => 2
    [1] => 16
)

```

See Also

[mysql_field_len](#)
[mysql_fetch_row](#)
[strlen](#)

20.11.1.4.18. `mysql_fetch_object`

Copyright 1997-2008 the PHP Documentation Group.

- [mysql_fetch_object](#)

Fetch a result row as an object

Description

```

object mysql_fetch_object(resource result,
                          string class_name,
                          array params);

```

Returns an object with properties that correspond to the fetched row and moves the internal data pointer ahead.

Parameters

<i>result</i>	The result resource that is being evaluated. This result comes from a call to mysql_query .
<i>class_name</i>	The name of the class to instantiate, set the properties of and return. If not specified, a stdClass object is returned.
<i>params</i>	An optional array of parameters to pass to the constructor for <i>class_name</i> objects.

Return Values

Returns an object with string properties that correspond to the fetched row, or `FALSE` if there are no more rows.

[mysql_fetch_row](#) fetches one row of data from the result associated with the specified result identifier. The row is returned as an array. Each result column is stored in an array offset, starting at offset 0.

ChangeLog

Version	Description
5.0.0	Added the ability to return as a different object.

Examples

Example 20.36. `mysql_fetch_object` example

```
<?php
mysql_connect("hostname", "user", "password");
mysql_select_db("mydb");
$result = mysql_query("select * from mytable");
while ($row = mysql_fetch_object($result)) {
    echo $row->user_id;
    echo $row->fullname;
}
mysql_free_result($result);
?>
```

Example 20.37. `mysql_fetch_object` example

```
<?php
class foo {
    public $name;
}

mysql_connect("hostname", "user", "password");
mysql_select_db("mydb");

$result = mysql_query("select name from mytable limit 1");
$obj = mysql_fetch_object($result, 'foo');
var_dump($obj);
?>
```

Notes

Performance

Speed-wise, the function is identical to `mysql_fetch_array`, and almost as quick as `mysql_fetch_row` (the difference is insignificant).

Note

`mysql_fetch_object` is similar to `mysql_fetch_array`, with one difference - an object is returned, instead of an array. Indirectly, that means that you can only access the data by the field names, and not by their offsets (numbers are illegal property names).

Note

Field names returned by this function are *case-sensitive*.

Note

This function sets NULL fields to the PHP `NULL` value.

See Also

[mysql_query](#)

20.11.1.4.19. [mysql_fetch_row](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysql_fetch_row](#)

Get a result row as an enumerated array

Description

```
array mysql_fetch_row(resource result);
```

Returns a numerical array that corresponds to the fetched row and moves the internal data pointer ahead.

Parameters

result The result resource that is being evaluated. This result comes from a call to [mysql_query](#).

Return Values

Returns an numerical array of strings that corresponds to the fetched row, or **FALSE** if there are no more rows.

[mysql_fetch_row](#) fetches one row of data from the result associated with the specified result identifier. The row is returned as an array. Each result column is stored in an array offset, starting at offset 0.

Examples

Example 20.38. Fetching one row with [mysql_fetch_row](#)

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}
$row = mysql_fetch_row($result);

echo $row[0]; // 42
echo $row[1]; // the email value
?>
```

Notes

Note

This function sets NULL fields to the PHP [NULL](#) value.

[mysql_fetch_lengths](#)
[mysql_result](#)

20.11.1.4.20. [mysql_field_flags](#)

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_field_flags`

Get the flags associated with the specified field in a result

Description

```
string mysql_field_flags(resource result,
                        int field_offset);
```

`mysql_field_flags` returns the field flags of the specified field. The flags are reported as a single word per flag separated by a single space, so that you can split the returned value using `explode`.

Parameters

result The result resource that is being evaluated. This result comes from a call to `mysql_query`.

field_offset The numerical field offset. The *field_offset* starts at 0. If *field_offset* does not exist, an error of level `E_WARNING` is also issued.

Return Values

Returns a string of flags associated with the result, or `FALSE` on failure.

The following flags are reported, if your version of MySQL is current enough to support them: `"not_null"`, `"primary_key"`, `"unique_key"`, `"multiple_key"`, `"blob"`, `"unsigned"`, `"zerofill"`, `"binary"`, `"enum"`, `"auto_increment"` and `"timestamp"`.

Examples

Example 20.39. A `mysql_field_flags` example

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}
$flags = mysql_field_flags($result, 0);

echo $flags;
print_r(explode(' ', $flags));
?>
```

The above example will output something similar to:

```
not_null primary_key auto_increment
Array
(
    [0] => not_null
    [1] => primary_key
    [2] => auto_increment
)
```

Notes

Note

For backward compatibility, the following deprecated alias may be used: `mysql_fieldflags`

See Also

`mysql_field_type`
`mysql_field_len`

20.11.1.4.21. `mysql_field_len`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_field_len`

Returns the length of the specified field

Description

```
int mysql_field_len(resource result,
                    int field_offset);
```

`mysql_field_len` returns the length of the specified field.

Parameters

<code>result</code>	The result resource that is being evaluated. This result comes from a call to <code>mysql_query</code> .
<code>field_offset</code>	The numerical field offset. The <code>field_offset</code> starts at 0. If <code>field_offset</code> does not exist, an error of level <code>E_WARNING</code> is also issued.

Return Values

The length of the specified field index on success, or `FALSE` on failure.

Examples

Example 20.40. `mysql_field_len` example

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}

// Will get the length of the id field as specified in the database
// schema.
$length = mysql_field_len($result, 0);
echo $length;
?>
```

Notes

Note

For backward compatibility, the following deprecated alias may be used: `mysql_fieldlen`

See Also

`mysql_fetch_lengths`
`strlen`

20.11.1.4.22. `mysql_field_name`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_field_name`

Get the name of the specified field in a result

Description

```
string mysql_field_name(resource result,
                       int field_offset);
```

`mysql_field_name` returns the name of the specified field index.

Parameters

`result` The result resource that is being evaluated. This result comes from a call to `mysql_query`.

`field_offset` The numerical field offset. The `field_offset` starts at 0. If `field_offset` does not exist, an error of level `E_WARNING` is also issued.

Return Values

The name of the specified field index on success, or `FALSE` on failure.

Examples

Example 20.41. `mysql_field_name` example

```
<?php
/* The users table consists of three fields:
 * user_id
 * username
 * password.
 */
$link = @mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect to MySQL server: ' . mysql_error());
}
$dbname = 'mydb';
$db_selected = mysql_select_db($dbname, $link);
if (!$db_selected) {
    die("Could not set $dbname: " . mysql_error());
}
$res = mysql_query('select * from users', $link);

echo mysql_field_name($res, 0) . "\n";
echo mysql_field_name($res, 2);
?>
```

The above example will output:

```
user_id
password
```

Notes

Note

Field names returned by this function are *case-sensitive*.

Note

For backward compatibility, the following deprecated alias may be used: `mysql_fieldname`

See Also

[mysql_field_len](#)

20.11.1.4.23. mysql_field_seek

Copyright 1997-2008 the PHP Documentation Group.

- [mysql_field_seek](#)

Set result pointer to a specified field offset

Description

```
bool mysql_field_seek(resource result,  
                      int field_offset);
```

Seeks to the specified field offset. If the next call to [mysql_fetch_field](#) doesn't include a field offset, the field offset specified in [mysql_field_seek](#) will be returned.

Parameters

<i>result</i>	The result resource that is being evaluated. This result comes from a call to mysql_query .
<i>field_offset</i>	The numerical field offset. The <i>field_offset</i> starts at 0. If <i>field_offset</i> does not exist, an error of level E_WARNING is also issued.

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

See Also

20.11.1.4.24. mysql_field_table

Copyright 1997-2008 the PHP Documentation Group.

- [mysql_field_table](#)

Get name of the table the specified field is in

Description

```
string mysql_field_table(resource result,  
                        int field_offset);
```

Returns the name of the table that the specified field is in.

Parameters

<i>result</i>	The result resource that is being evaluated. This result comes from a call to mysql_query .
<i>field_offset</i>	The numerical field offset. The <i>field_offset</i> starts at 0. If <i>field_offset</i> does not exist, an error of level E_WARNING is also issued.

Return Values

The name of the table on success.

Examples

Example 20.42. A `mysql_field_table` example

```
<?php
$query = "SELECT account.*, country.* FROM account, country WHERE country.name = 'Portugal' AND account.country_id = c
// get the result from the DB
$result = mysql_query($query);

// Lists the table name and then the field name
for ($i = 0; $i < mysql_num_fields($result); ++$i) {
    $table = mysql_field_table($result, $i);
    $field = mysql_field_name($result, $i);

    echo "$table: $field\n";
}
?>
```

Notes

Note

For backward compatibility, the following deprecated alias may be used: `mysql_fieldtable`

See Also

[mysql_list_tables](#)

20.11.1.4.25. `mysql_field_type`

Copyright 1997-2008 the PHP Documentation Group.

- [mysql_field_type](#)

Get the type of the specified field in a result

Description

```
string mysql_field_type(resource result,
                        int field_offset);
```

`mysql_field_type` is similar to the `mysql_field_name` function. The arguments are identical, but the field type is returned instead.

Parameters

result

The result resource that is being evaluated. This result comes from a call to `mysql_query`.

field_offset

The numerical field offset. The *field_offset* starts at 0. If *field_offset* does not exist, an error of level `E_WARNING` is also issued.

Return Values

The returned field type will be one of "int", "real", "string", "blob", and others as detailed in the [MySQL documentation](#).

Examples

Example 20.43. `mysql_field_type` example

```
<?php
mysql_connect("localhost", "mysql_username", "mysql_password");
mysql_select_db("mysql");
$result = mysql_query("SELECT * FROM func");
$fields = mysql_num_fields($result);
$rows = mysql_num_rows($result);
$table = mysql_field_table($result, 0);
echo "Your '" . $table . "' table has " . $fields . " fields and " . $rows . " record(s)\n";
echo "The table has the following fields:\n";
for ($i=0; $i < $fields; $i++) {
    $type = mysql_field_type($result, $i);
    $name = mysql_field_name($result, $i);
    $len = mysql_field_len($result, $i);
    $flags = mysql_field_flags($result, $i);
    echo $type . " " . $name . " " . $len . " " . $flags . "\n";
}
mysql_free_result($result);
mysql_close();
?>
```

The above example will output something similar to:

```
Your 'func' table has 4 fields and 1 record(s)
The table has the following fields:
string name 64 not_null primary_key binary
int ret 1 not_null
string dl 128 not_null
string type 9 not_null enum
```

Notes**Note**

For backward compatibility, the following deprecated alias may be used: `mysql_fieldtype`

See Also

`mysql_field_name`
`mysql_field_len`

20.11.1.4.26. `mysql_free_result`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_free_result`

Free result memory

Description

```
bool mysql_free_result(resource result);
```

`mysql_free_result` will free all memory associated with the result identifier `result`.

`mysql_free_result` only needs to be called if you are concerned about how much memory is being used for queries that return large result sets. All associated result memory is automatically freed at the end of the script's execution.

Parameters

`result`

The result resource that is being evaluated. This result comes from a call to `mysql_query`.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

If a non-resource is used for the `result`, an error of level `E_WARNING` will be emitted. It's worth noting that `mysql_query` only returns a resource for `SELECT`, `SHOW`, `EXPLAIN`, and `DESCRIBE` queries.

Examples**Example 20.44. A `mysql_free_result` example**

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}
/* Use the result, assuming we're done with it afterwards */
$row = mysql_fetch_assoc($result);

/* Now we free up the result and continue on with our script */
mysql_free_result($result);

echo $row['id'];
echo $row['email'];
?>
```

Notes**Note**

For backward compatibility, the following deprecated alias may be used: `mysql_freeresult`

See Also

`mysql_query`
`is_resource`

20.11.1.4.27. `mysql_get_client_info`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_get_client_info`

Get MySQL client info

Description

```
string mysql_get_client_info();
```

`mysql_get_client_info` returns a string that represents the client library version.

Return Values

The MySQL client version.

Examples**Example 20.45. `mysql_get_client_info` example**

```
<?php
printf("MySQL client info: %s\n", mysql_get_client_info());
?>
```

The above example will output something similar to:

```
MySQL client info: 3.23.39
```

[mysql_get_server_info](#)

20.11.1.4.28. [mysql_get_host_info](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysql_get_host_info](#)

Get MySQL host info

Description

```
string mysql_get_host_info(resource link_identifier);
```

Describes the type of connection in use for the connection, including the server host name.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by [mysql_connect](#) is assumed. If no such link is found, it will try to create one as if [mysql_connect](#) was called with no arguments. If by chance no connection is found or established, an [E_WARNING](#) level error is generated.

Return Values

Returns a string describing the type of MySQL connection in use for the connection or [FALSE](#) on failure.

Examples

Example 20.46. [mysql_get_host_info](#) example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
printf("MySQL host info: %s\n", mysql_get_host_info());
?>
```

The above example will output something similar to:

```
MySQL host info: Localhost via UNIX socket
```

See Also

```
mysql_get_client_info

```

20.11.1.4.29. `mysql_get_proto_info`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_get_proto_info`

Get MySQL protocol info

Description

```
int mysql_get_proto_info(resource link_identifier);
```

Retrieves the MySQL protocol.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns the MySQL protocol on success, or `FALSE` on failure.

Examples

Example 20.47. `mysql_get_proto_info` example

```
<?php  
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');  
if (!$link) {  
    die('Could not connect: ' . mysql_error());  
}  
printf("MySQL protocol version: %s\n", mysql_get_proto_info());  
?>
```

The above example will output something similar to:

```
MySQL protocol version: 10
```

```

20.11.1.4.30. `mysql_get_server_info`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_get_server_info`

Get MySQL server info

Description

```
string mysql_get_server_info(resource link_identifier);
```

Retrieves the MySQL server version.

Parameters

link_identifier The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns the MySQL server version on success, or `FALSE` on failure.

Examples

Example 20.48. `mysql_get_server_info` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
printf("MySQL server version: %s\n", mysql_get_server_info());
?>
```

The above example will output something similar to:

```
MySQL server version: 4.0.1-alpha
```

See Also

```
mysql_get_client_info
mysql_get_host_info
mysql_get_proto_info
phpversion
```

20.11.1.4.31. `mysql_info`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_info`

Get information about the most recent query

Description

```
string mysql_info(resource link_identifier);
```

Returns detailed information about the last query.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns information about the statement on success, or `FALSE` on failure. See the example below for which statements provide information, and what the returned value may look like. Statements that are not listed will return `FALSE`.

Examples

Example 20.49. Relevant MySQL Statements

Statements that return string values. The numbers are only for illustrating purpose; their values will correspond to the query.

```
INSERT INTO ... SELECT ...
String format: Records: 23 Duplicates: 0 Warnings: 0
INSERT INTO ... VALUES (...),(...),(...)...
String format: Records: 37 Duplicates: 0 Warnings: 0
LOAD DATA INFILE ...
String format: Records: 42 Deleted: 0 Skipped: 0 Warnings: 0
ALTER TABLE
String format: Records: 60 Duplicates: 0 Warnings: 0
UPDATE
String format: Rows matched: 65 Changed: 65 Warnings: 0
```

Notes

Note

`mysql_info` returns a non-`FALSE` value for the `INSERT ... VALUES` statement only if multiple value lists are specified in the statement.

See Also

`mysql_affected_rows`
`mysql_insert_id`
`mysql_stat`

20.11.1.4.32. `mysql_insert_id`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_insert_id`

Get the ID generated from the previous `INSERT` operation

Description

```
int mysql_insert_id(resource link_identifier);
```

Retrieves the ID generated for an AUTO_INCREMENT column by the previous INSERT query.

Parameters

link_identifier The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

The ID generated for an AUTO_INCREMENT column by the previous INSERT query on success, `0` if the previous query does not generate an AUTO_INCREMENT value, or `FALSE` if no MySQL connection was established.

Examples

Example 20.50. `mysql_insert_id` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
mysql_select_db('mydb');

mysql_query("INSERT INTO mytable (product) values ('kossu')");
printf("Last inserted record has id %d\n", mysql_insert_id());
?>
```

Notes

Caution

`mysql_insert_id` converts the return type of the native MySQL C API function `mysql_insert_id()` to a type of `long` (named `int` in PHP). If your AUTO_INCREMENT column has a column type of BIGINT, the value returned by `mysql_insert_id` will be incorrect. Instead, use the internal MySQL SQL function `LAST_INSERT_ID()` in an SQL query.

Note

Because `mysql_insert_id` acts on the last performed query, be sure to call `mysql_insert_id` immediately after the query that generates the value.

Note

The value of the MySQL SQL function `LAST_INSERT_ID()` always contains the most recently generated AUTO_INCREMENT value, and is not reset between queries.

`mysql_query`
`mysql_info`

20.11.1.4.33. `mysql_list_dbs`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_list_dbs`

List databases available on a MySQL server

Description

```
resource mysql_list_dbs(resource link_identifier);
```

Returns a result pointer containing the databases available from the current mysql daemon.

Parameters

link_identifier The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns a result pointer resource on success, or `FALSE` on failure. Use the `mysql_tablename` function to traverse this result pointer, or any function for result tables, such as `mysql_fetch_array`.

Examples**Example 20.51. `mysql_list_dbs` example**

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$db_list = mysql_list_dbs($link);

while ($row = mysql_fetch_object($db_list)) {
    echo $row->Database . "\n";
}
?>
```

The above example will output something similar to:

```
database1
database2
database3
```

Notes**Note**

For backward compatibility, the following deprecated alias may be used: `mysql_listdbs`

See Also

`mysql_db_name`
`mysql_select_db`

20.11.1.4.34. `mysql_list_fields`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_list_fields`

List MySQL table fields

Description

```
resource mysql_list_fields(string database_name,
                          string table_name,
                          resource link_identifier);
```

Retrieves information about the given table name.

This function is deprecated. It is preferable to use `mysql_query` to issue a `SQL SHOW COLUMNS FROM table [LIKE 'name']` statement instead.

Parameters

<code>database_name</code>	The name of the database that's being queried.
<code>table_name</code>	The name of the table that's being queried.
<code>link_identifier</code>	The MySQL connection. If the link identifier is not specified, the last link opened by <code>mysql_connect</code> is assumed. If no such link is found, it will try to create one as if <code>mysql_connect</code> was called with no arguments. If by chance no connection is found or established, an <code>E_WARNING</code> level error is generated.

Return Values

A result pointer resource on success, or `FALSE` on failure.

The returned result can be used with `mysql_field_flags`, `mysql_field_len`, `mysql_field_name` and `mysql_field_type`.

Examples

Example 20.52. Alternate to deprecated `mysql_list_fields`

```
<?php
$result = mysql_query("SHOW COLUMNS FROM sometable");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}
if (mysql_num_rows($result) > 0) {
    while ($row = mysql_fetch_assoc($result)) {
        print_r($row);
    }
}
?>
```

The above example will output something similar to:

```
Array
(
    [Field] => id
    [Type] => int(7)
    [Null] =>
    [Key] => PRI
    [Default] =>
    [Extra] => auto_increment
)
Array
(
    [Field] => email
    [Type] => varchar(100)
    [Null] =>
    [Key] =>
    [Default] =>
    [Extra] =>
)
```

Notes**Note**

For backward compatibility, the following deprecated alias may be used: `mysql_listfields`

`mysql_info`

20.11.1.4.35. `mysql_list_processes`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_list_processes`

List MySQL processes

Description

```
resource mysql_list_processes(resource link_identifier);
```

Retrieves the current MySQL server threads.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

A result pointer resource on success, or `FALSE` on failure.

Examples**Example 20.53. `mysql_list_processes` example**

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');

$result = mysql_list_processes($link);
while ($row = mysql_fetch_assoc($result)){
    printf("%s %s %s %s %s\n", $row["Id"], $row["Host"], $row["db"],
        $row["Command"], $row["Time"]);
}
mysql_free_result($result);
?>
```

The above example will output something similar to:

```
1 localhost test Processlist 0
4 localhost mysql sleep 5
```

See Also

```
mysql_thread_id
mysql_stat
```

20.11.1.4.36. `mysql_list_tables`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_list_tables`

List tables in a MySQL database

Description

```
resource mysql_list_tables(string database,
                          resource link_identifier);
```

Retrieves a list of table names from a MySQL database.

This function is deprecated. It is preferable to use `mysql_query` to issue a SQL `SHOW TABLES [FROM db_name] [LIKE 'pattern']` statement instead.

Parameters

database

The name of the database

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

A result pointer resource on success, or `FALSE` on failure.

Use the `mysql_tablename` function to traverse this result pointer, or any function for result tables, such as `mysql_fetch_array`.

ChangeLog

Version	Description
4.3.7	This function became deprecated.

Examples

Example 20.54. `mysql_list_tables` alternative example

```
<?php
$dbname = 'mysql_dbname';

if (!mysql_connect('mysql_host', 'mysql_user', 'mysql_password')) {
    echo 'Could not connect to mysql';
    exit;
}

$sql = "SHOW TABLES FROM $dbname";
$result = mysql_query($sql);

if (!$result) {
    echo "DB Error, could not list tables\n";
    echo 'MySQL Error: ' . mysql_error();
    exit;
}

while ($row = mysql_fetch_row($result)) {
    echo "Table: {$row[0]}\n";
}
```

```

}
mysql_free_result($result);
?>

```

Notes

Note

For backward compatibility, the following deprecated alias may be used: `mysql_listtables`

`mysql_tablename`

20.11.1.4.37. `mysql_num_fields`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_num_fields`

Get number of fields in result

Description

```
int mysql_num_fields(resource result);
```

Retrieves the number of fields from a query.

Parameters

`result` The result resource that is being evaluated. This result comes from a call to `mysql_query`.

Return Values

Returns the number of fields in the result set resource on success, or `FALSE` on failure.

Examples

Example 20.55. A `mysql_num_fields` example

```

<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}

/* returns 2 because id,email === two fields */
echo mysql_num_fields($result);
?>

```

Notes

Note

For backward compatibility, the following deprecated alias may be used: `mysql_numfields`

```
mysql_connect
mysql_data_seek
mysql_select_db
mysql_query
```

20.11.1.4.39. `mysql_pconnect`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_pconnect`

Open a persistent connection to a MySQL server

Description

```
resource mysql_pconnect(string server,
                        string username,
                        string password,
                        int client_flags);
```

Establishes a persistent connection to a MySQL server.

`mysql_pconnect` acts very much like `mysql_connect` with two major differences.

First, when connecting, the function would first try to find a (persistent) link that's already open with the same host, username and password. If one is found, an identifier for it will be returned instead of opening a new connection.

Second, the connection to the SQL server will not be closed when the execution of the script ends. Instead, the link will remain open for future use (`mysql_close` will not close links established by `mysql_pconnect`).

This type of link is therefore called 'persistent'.

Parameters

<code>server</code>	The MySQL server. It can also include a port number. e.g. "hostname:port" or a path to a local socket e.g. ":/path/to/socket" for the localhost. If the PHP directive <code>mysql.default_host</code> is undefined (default), then the default value is 'localhost:3306'
<code>username</code>	The username. Default value is the name of the user that owns the server process.
<code>password</code>	The password. Default value is an empty password.
<code>client_flags</code>	The <code>client_flags</code> parameter can be a combination of the following constants: 128 (enable <code>LOAD DATA LOCAL</code> handling), <code>MYSQL_CLIENT_SSL</code> , <code>MYSQL_CLIENT_COMPRESS</code> , <code>MYSQL_CLIENT_IGNORE_SPACE</code> or <code>MYSQL_CLIENT_INTERACTIVE</code> .

Return Values

Returns a MySQL persistent link identifier on success, or `FALSE` on failure.

ChangeLog

Version	Description
4.3.0	Added the <code>client_flags</code> parameter.
3.0.10	Added support for ":/path/to/socket" with <code>server</code> .
3.0.0	Added support for ":port" with <code>server</code> .

Notes

■ Note

Note, that these kind of links only work if you are using a module version of PHP. See the [Persistent Database Connections](#) section for more information.

Warning

Using persistent connections can require a bit of tuning of your Apache and MySQL configurations to ensure that you do not exceed the number of connections allowed by MySQL.

Note

You can suppress the error message on failure by prepending a `@` to the function name.

See Also

[mysql_connect](#)
[Persistent Database Connections](#)

20.11.1.4.40. `mysql_ping`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_ping`

Ping a server connection or reconnect if there is no connection

Description

```
bool mysql_ping(resource link_identifier);
```

Checks whether or not the connection to the server is working. If it has gone down, an automatic reconnection is attempted. This function can be used by scripts that remain idle for a long while, to check whether or not the server has closed the connection and reconnect if necessary.

Note

Since MySQL 5.0.13, automatic reconnection feature is disabled.

Parameters

link_identifier The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns `TRUE` if the connection to the server MySQL server is working, otherwise `FALSE`.

Examples

Example 20.57. A `mysql_ping` example

```
<?php
set_time_limit(0);

$conn = mysql_connect('localhost', 'mysqluser', 'mypass');
$db = mysql_select_db('mydb');

/* Assuming this query will take a long time */
$result = mysql_query($sql);
if (!$result) {
    echo 'Query #1 failed, exiting.';
    exit;
}

/* Make sure the connection is still alive, if not, try to reconnect */
```

```

if (!mysql_ping($conn)) {
    echo 'Lost connection, exiting after query #1';
    exit;
}
mysql_free_result($result);

/* So the connection is still alive, let's run another query */
$result2 = mysql_query($sql2);
?>

```

See Also

[mysql_thread_id](#)
[mysql_list_processes](#)

20.11.1.4.41. mysql_query

Copyright 1997-2008 the PHP Documentation Group.

- [mysql_query](#)

Send a MySQL query

Description

```

resource mysql_query(string query,
                    resource link_identifier);

```

[mysql_query](#) sends an unique query (multiple queries are not supported) to the currently active database on the server that's associated with the specified [link_identifier](#).

Parameters

query	A SQL query The query string should not end with a semicolon.
link_identifier	The MySQL connection. If the link identifier is not specified, the last link opened by mysql_connect is assumed. If no such link is found, it will try to create one as if mysql_connect was called with no arguments. If by chance no connection is found or established, an E_WARNING level error is generated.

Return Values

For SELECT, SHOW, DESCRIBE, EXPLAIN and other statements returning resultset, [mysql_query](#) returns a resource on success, or [FALSE](#) on error.

For other type of SQL statements, INSERT, UPDATE, DELETE, DROP, etc, [mysql_query](#) returns [TRUE](#) on success or [FALSE](#) on error.

The returned result resource should be passed to [mysql_fetch_array](#), and other functions for dealing with result tables, to access the returned data.

Use [mysql_num_rows](#) to find out how many rows were returned for a SELECT statement or [mysql_affected_rows](#) to find out how many rows were affected by a DELETE, INSERT, REPLACE, or UPDATE statement.

[mysql_query](#) will also fail and return [FALSE](#) if the user does not have permission to access the table(s) referenced by the query.

Examples**Example 20.58. Invalid Query**

The following query is syntactically invalid, so `mysql_query` fails and returns `FALSE`.

```
<?php
$result = mysql_query('SELECT * WHERE 1=1');
if (!$result) {
    die('Invalid query: ' . mysql_error());
}
?>
```

Example 20.59. Valid Query

The following query is valid, so `mysql_query` returns a resource.

```
<?php
// This could be supplied by a user, for example
$firstname = 'fred';
$lastname = 'fox';

// Formulate Query
// This is the best way to perform a SQL query
// For more examples, see mysql_real_escape_string()
$query = sprintf("SELECT firstname, lastname, address, age FROM friends WHERE firstname='%s' AND lastname='%s'",
    mysql_real_escape_string($firstname),
    mysql_real_escape_string($lastname));

// Perform Query
$result = mysql_query($query);

// Check result
// This shows the actual query sent to MySQL, and the error. Useful for debugging.
if (!$result) {
    $message = 'Invalid query: ' . mysql_error() . "\n";
    $message .= 'Whole query: ' . $query;
    die($message);
}

// Use result
// Attempting to print $result won't allow access to information in the resource
// One of the mysql result functions must be used
// See also mysql_result(), mysql_fetch_array(), mysql_fetch_row(), etc.
while ($row = mysql_fetch_assoc($result)) {
    echo $row['firstname'];
    echo $row['lastname'];
    echo $row['address'];
    echo $row['age'];
}

// Free the resources associated with the result set
// This is done automatically at the end of the script
mysql_free_result($result);
?>
```

20.11.1.4.42. [mysql_real_escape_string](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysql_real_escape_string](#)

Escapes special characters in a string for use in a SQL statement

Description

```
string mysql_real_escape_string(string unescaped_string,
                               resource link_identifier);
```

Escapes special characters in the *unescaped_string*, taking into account the current character set of the connection so that it is safe to place it in a *mysql_query*. If binary data is to be inserted, this function must be used.

mysql_real_escape_string calls MySQL's library function *mysql_real_escape_string*, which prepends backslashes to the following characters: `\x00`, `\n`, `\r`, `\`, `'`, `"` and `\x1a`.

This function must always (with few exceptions) be used to make data safe before sending a query to MySQL.

Parameters

<i>unescaped_string</i>	The string that is to be escaped.
<i>link_identifier</i>	The MySQL connection. If the link identifier is not specified, the last link opened by <i>mysql_connect</i> is assumed. If no such link is found, it will try to create one as if <i>mysql_connect</i> was called with no arguments. If by chance no connection is found or established, an <code>E_WARNING</code> level error is generated.

Return Values

Returns the escaped string, or `FALSE` on error.

Examples**Example 20.60. Simple *mysql_real_escape_string* example**

```
<?php
// Connect
$link = mysql_connect('mysql_host', 'mysql_user', 'mysql_password')
      OR die(mysql_error());

// Query
$query = sprintf("SELECT * FROM users WHERE user='%s' AND password='%s'",
                mysql_real_escape_string($user),
                mysql_real_escape_string($password));
?>
```

Example 20.61. An example SQL Injection Attack

```
<?php
// Query database to check if there are any matching users
$query = "SELECT * FROM users WHERE user='{$_POST['username']}' AND password='{$_POST['password']}'";
mysql_query($query);

// We didn't check $_POST['password'], it could be anything the user wanted! For example:
$_POST['username'] = 'aidan';
$_POST['password'] = "' OR ''='";

// This means the query sent to MySQL would be:
echo $query;
?>
```

The query sent to MySQL:

```
SELECT * FROM users WHERE user='aidan' AND password='' OR ''=''
```

This would allow anyone to log in without a valid password.

Example 20.62. A "Best Practice" query

Using `mysql_real_escape_string` around each variable prevents SQL Injection. This example demonstrates the "best practice" method for querying a database, independent of the [Magic Quotes](#) setting.

```
<?php
if (isset($_POST['product_name']) && isset($_POST['product_description']) && isset($_POST['user_id'])) {
    // Connect

    $link = mysql_connect('mysql_host', 'mysql_user', 'mysql_password');

    if(!is_resource($link)) {
        echo "Failed to connect to the server\n";
        // ... log the error properly
    } else {
        // Reverse magic_quotes_gpc/magic_quotes_sybase effects on those vars if ON.
        if(get_magic_quotes_gpc()) {
            $product_name = stripslashes($_POST['product_name']);
            $product_description = stripslashes($_POST['product_description']);
        } else {
            $product_name = $_POST['product_name'];
            $product_description = $_POST['product_description'];
        }

        // Make a safe query
        $query = sprintf("INSERT INTO products (`name`, `description`, `user_id`) VALUES ('%s', '%s', %d)",
            mysql_real_escape_string($product_name, $link),
            mysql_real_escape_string($product_description, $link),
            $_POST['user_id']);

        mysql_query($query, $link);

        if (mysql_affected_rows($link) > 0) {
            echo "Product inserted\n";
        }
    } else {
        echo "Fill the form properly\n";
    }
}
?>
```

The query will now execute correctly, and SQL Injection attacks will not work.

Notes

Note

A MySQL connection is required before using `mysql_real_escape_string` otherwise an error of level `E_WARNING` is generated, and `FALSE` is returned. If `link_identifier` isn't defined, the last MySQL connection is used.

Note

If `magic_quotes_gpc` is enabled, first apply `stripslashes` to the data. Using this function on data which has already been escaped will escape the data twice.

Note

If this function is not used to escape data, the query is vulnerable to [SQL Injection Attacks](#).

Note

`mysql_real_escape_string` does not escape `%` and `_`. These are wildcards in MySQL if combined with `LIKE`, `GRANT`, or `REVOKE`.

20.11.1.4.43. [mysql_result](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysql_result](#)

Get result data

Description

```
string mysql_result(resource result,
                   int row,
                   mixed field);
```

Retrieves the contents of one cell from a MySQL result set.

When working on large result sets, you should consider using one of the functions that fetch an entire row (specified below). As these functions return the contents of multiple cells in one function call, they're MUCH quicker than [mysql_result](#). Also, note that specifying a numeric offset for the field argument is much quicker than specifying a fieldname or `tablename.fieldname` argument.

Parameters

<i>result</i>	The result resource that is being evaluated. This result comes from a call to mysql_query .
<i>row</i>	The row number from the result that's being retrieved. Row numbers start at 0.
<i>field</i>	The name or offset of the field being retrieved. It can be the field's offset, the field's name, or the field's table dot field name (<code>tablename.fieldname</code>). If the column name has been aliased ('select foo as bar from...'), use the alias instead of the column name. If undefined, the first field is retrieved.

Return Values

The contents of one cell from a MySQL result set on success, or `FALSE` on failure.

Examples

Example 20.63. [mysql_result](#) example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
$result = mysql_query('SELECT name FROM work.employee');
if (!$result) {
    die('Could not query:' . mysql_error());
}
echo mysql_result($result, 2); // outputs third employee's name

mysql_close($link);
?>
```

Notes

Note

Calls to `mysql_result` should not be mixed with calls to other functions that deal with the result set.

`mysql_fetch_object`

20.11.1.4.44. `mysql_select_db`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_select_db`
 Select a MySQL database

Description

```
bool mysql_select_db(string database_name,
                    resource link_identifier);
```

Sets the current active database on the server that's associated with the specified link identifier. Every subsequent call to `mysql_query` will be made on the active database.

Parameters

<i>database_name</i>	The name of the database that is to be selected.
<i>link_identifier</i>	The MySQL connection. If the link identifier is not specified, the last link opened by <code>mysql_connect</code> is assumed. If no such link is found, it will try to create one as if <code>mysql_connect</code> was called with no arguments. If by chance no connection is found or established, an <code>E_WARNING</code> level error is generated.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples**Example 20.64. `mysql_select_db` example**

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Not connected : ' . mysql_error());
}

// make foo the current db
$db_selected = mysql_select_db('foo', $link);
if (!$db_selected) {
    die ('Can\'t use foo : ' . mysql_error());
}
?>
```

Notes**Note**

For backward compatibility, the following deprecated alias may be used: `mysql_selectdb`

See Also

`mysql_connect`
`mysql_pconnect`
`mysql_query`

20.11.1.4.45. `mysql_set_charset`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_set_charset`

Sets the client character set

Description

```
bool mysql_set_charset(string charset,
                      resource link_identifier);
```

Sets the default character set for the current connection.

Parameters

charset

A valid character set name.

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Notes

Note

This function requires MySQL 5.0.7 or later.

Note

This is the preferred way to change the charset. Using `mysql_query` to execute `SET NAMES ..` is not recommended.

`mysql_client_encoding`
[List of character sets that MySQL supports](#)

20.11.1.4.46. `mysql_stat`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_stat`

Get current system status

Description

```
string mysql_stat(resource link_identifier);
```

`mysql_stat` returns the current server status.

Parameters

link_identifier The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns a string with the status for uptime, threads, queries, open tables, flush tables and queries per second. For a complete list of other status variables, you have to use the `SHOW STATUS` SQL command. If *link_identifier* is invalid, `NULL` is returned.

Examples

Example 20.65. `mysql_stat` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$status = explode(' ', mysql_stat($link));
print_r($status);
?>
```

The above example will output something similar to:

```
Array
(
    [0] => Uptime: 5380
    [1] => Threads: 2
    [2] => Questions: 1321299
    [3] => Slow queries: 0
    [4] => Opens: 26
    [5] => Flush tables: 1
    [6] => Open tables: 17
    [7] => Queries per second avg: 245.595
)
```

Example 20.66. Alternative `mysql_stat` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$result = mysql_query('SHOW VARIABLES', $link);
while ($row = mysql_fetch_assoc($result)) {
    echo $row['Variable_name'] . ' = ' . $row['Value'] . "\n";
}
?>
```

The above example will output something similar to:

```
back_log = 50
basedir = /usr/local/
bdb_cache_size = 8388600
bdb_log_buffer_size = 32768
bdb_home = /var/db/mysql/
bdb_max_lock = 10000
bdb_logdir =
bdb_shared_data = OFF
```

```
bdb_tmpdir = /var/tmp/  
...
```

[mysql_list_processes](#)

20.11.1.4.47. [mysql_tablename](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysql_tablename](#)

Get table name of field

Description

```
string mysql_tablename(resource result,  
int i);
```

Retrieves the table name from a *result*.

This function deprecated. It is preferable to use [mysql_query](#) to issue a SQL `SHOW TABLES [FROM db_name] [LIKE 'pattern']` statement instead.

Parameters

result A result pointer resource that's returned from [mysql_list_tables](#).
i The integer index (row/table number)

Return Values

The name of the table on success, or `FALSE` on failure.

Use the [mysql_tablename](#) function to traverse this result pointer, or any function for result tables, such as [mysql_fetch_array](#).

Examples

Example 20.67. [mysql_tablename](#) example

```
<?php  
mysql_connect("localhost", "mysql_user", "mysql_password");  
$result = mysql_list_tables("mydb");  
$num_rows = mysql_num_rows($result);  
for ($i = 0; $i < $num_rows; $i++) {  
    echo "Table: ", mysql_tablename($result, $i), "\n";  
}  
  
mysql_free_result($result);  
?>
```

Notes

■ Note

The `mysql_num_rows` function may be used to determine the number of tables in the result pointer.

20.11.1.4.48. `mysql_thread_id`

Copyright 1997-2008 the PHP Documentation Group.

- [mysql_thread_id](#)

Return the current thread ID

Description

```
int mysql_thread_id(resource link_identifier);
```

Retrieves the current thread ID. If the connection is lost, and a reconnect with `mysql_ping` is executed, the thread ID will change. This means only retrieve the thread ID when needed.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

The thread ID on success, or `FALSE` on failure.

Examples

Example 20.68. `mysql_thread_id` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$thread_id = mysql_thread_id($link);
if ($thread_id){
    printf("current thread id is %d\n", $thread_id);
}
?>
```

The above example will output something similar to:

```
current thread id is 73
```

See Also

[mysql_ping](#)
[mysql_list_processes](#)

20.11.1.4.49. `mysql_unbuffered_query`

Copyright 1997-2008 the PHP Documentation Group.

- `mysql_unbuffered_query`

Send an SQL query to MySQL, without fetching and buffering the result rows

Description

```
resource mysql_unbuffered_query(string query,
                               resource link_identifier);
```

`mysql_unbuffered_query` sends a SQL query *query* to MySQL, without fetching and buffering the result rows automatically, as `mysql_query` does. On the one hand, this saves a considerable amount of memory with SQL queries that produce large result sets. On the other hand, you can start working on the result set immediately after the first row has been retrieved: you don't have to wait until the complete SQL query has been performed. When using multiple DB-connects, you have to specify the optional parameter *link_identifier*.

Parameters

<i>query</i>	A SQL query
<i>link_identifier</i>	The MySQL connection. If the link identifier is not specified, the last link opened by <code>mysql_connect</code> is assumed. If no such link is found, it will try to create one as if <code>mysql_connect</code> was called with no arguments. If by chance no connection is found or established, an <code>E_WARNING</code> level error is generated.

Return Values

For SELECT, SHOW, DESCRIBE or EXPLAIN statements, `mysql_unbuffered_query` returns a resource on success, or `FALSE` on error.

For other type of SQL statements, UPDATE, DELETE, DROP, etc, `mysql_unbuffered_query` returns `TRUE` on success or `FALSE` on error.

Notes

Note

The benefits of `mysql_unbuffered_query` come at a cost: You cannot use `mysql_num_rows` and `mysql_data_seek` on a result set returned from `mysql_unbuffered_query`. You also have to fetch all result rows from an unbuffered SQL query, before you can send a new SQL query to MySQL.

`mysql_query`

20.11.2. MySQL Improved Extension (`Mysqli`)

Copyright 1997-2008 the PHP Documentation Group.

The `mysqli` extension allows you to access the functionality provided by MySQL 4.1 and above. More information about the MySQL Database server can be found at <http://www.mysql.com/>

An overview of software available for using MySQL from PHP can be found at [Section 20.11.2.2, "Overview"](#)

Documentation for MySQL can be found at <http://dev.mysql.com/doc/>.

Parts of this documentation included from MySQL manual with permissions of MySQL AB.

20.11.2.1. Examples

Copyright 1997-2008 the PHP Documentation Group.

All Examples in the MySQLI documentation use the world database from MySQL AB. The world database can be found at <http://dev.mysql.com/get/Downloads/Manual/world.sql.gz/from/pick>

20.11.2.2. Overview

Copyright 1997-2008 the PHP Documentation Group.

This section provides an introduction to the options available to you when developing a PHP application that needs to interact with a MySQL database.

What is an API?

An Application Programming Interface, or API, defines the classes, methods, functions and variables that your application will need to call in order to carry out its desired task. In the case of PHP applications that need to communicate with databases the necessary APIs are usually exposed via PHP extensions.

APIs can be procedural or object-oriented. With a procedural API you call functions to carry out tasks, with the object-oriented API you instantiate classes and then call methods on the resulting objects. Of the two the latter is usually the preferred interface, as it is more modern and leads to better organised code.

When writing PHP applications that need to connect to the MySQL server there are several API options available. This document discusses what is available and how to select the best solution for your application.

What is a Connector?

In the MySQL documentation, the term *connector* refers to a piece of software that allows your application to connect to the MySQL database server. MySQL provides connectors for a variety of languages, including PHP.

If your PHP application needs to communicate with a database server you will need to write PHP code to perform such activities as connecting to the database server, querying the database and other database-related functions. Software is required to provide the API that your PHP application will use, and also handle the communication between your application and the database server, possibly using other intermediate libraries where necessary. This software is known generically as a connector, as it allows your application to *connect* to a database server.

What is a Driver?

A driver is a piece of software designed to communicate with a specific type of database server. The driver may also call a library, such as the MySQL Client Library or the MySQL Native Driver. These libraries implement the low-level protocol used to communicate with the MySQL database server.

By way of an example, the [PHP Data Objects \(PDO\)](#) database abstraction layer may use one of several database-specific drivers. One of the drivers it has available is the PDO MySQL driver, which allows it to interface with the MySQL server.

Sometimes people use the terms connector and driver interchangeably, this can be confusing. In the MySQL-related documentation the term “driver” is reserved for software that provides the database-specific part of a connector package.

What is an Extension?

In the PHP documentation you will come across another term - *extension*. The PHP code consists of a core, with optional extensions to the core functionality. PHP's MySQL-related extensions, such as the `mysqli` extension, and the `mysql` extension, are implemented using the PHP extension framework.

An extension typically exposes an API to the PHP programmer, to allow its facilities to be used programmatically. However, some extensions which use the PHP extension framework do not expose an API to the PHP programmer.

The PDO MySQL driver extension, for example, does not expose an API to the PHP programmer, but provides an interface to the PDO layer above it.

The terms API and extension should not be taken to mean the same thing, as an extension may not necessarily expose an API to the programmer.

What are the main PHP API offerings for using MySQL?

There are three main API options when considering connecting to a MySQL database server:

- PHP's MySQL Extension
- PHP's `mysqli` Extension
- PHP Data Objects (PDO)

Each has its own advantages and disadvantages. The following discussion aims to give a brief introduction to the key aspects of each API.

What is PHP's MySQL Extension?

This is the original extension designed to allow you to develop PHP applications that interact with a MySQL database. The `mysql` extension provides a procedural interface and is intended for use only with MySQL versions older than 4.1.3. This extension can be used with versions of MySQL 4.1.3 or newer, but not all of the latest MySQL server features will be available.

Note

If you are using MySQL versions 4.1.3 or later it is *strongly* recommended that you use the `mysqli` extension instead.

The `mysql` extension source code is located in the PHP extension directory `ext/mysql`.

For further information on the `mysql` extension, see [Section 20.11.1, “MySQL”](#).

What is PHP's mysqli Extension?

The `mysqli` extension, or as it is sometimes known, the MySQL *improved* extension, was developed to take advantage of new features found in MySQL systems versions 4.1.3 and newer. The `mysqli` extension is included with PHP versions 5 and later.

The `mysqli` extension has a number of benefits, the key enhancements over the `mysql` extension being:

- Object-oriented interface
- Support for Prepared Statements
- Support for Multiple Statements
- Support for Transactions
- Enhanced debugging capabilities
- Embedded server support

Note

If you are using MySQL versions 4.1.3 or later it is *strongly* recommended that you use this extension.

As well as the object-oriented interface the extension also provides a procedural interface.

The `mysqli` extension is built using the PHP extension framework, its source code is located in the directory `ext/mysqli`.

For further information on the `mysqli` extension, see [Section 20.11.2, “MySQL Improved Extension \(Mysqli\)”](#).

What is PDO?

PHP Data Objects, or PDO, is a database abstraction layer specifically for PHP applications. PDO provides a consistent API for your PHP application regardless of the type of database server your application will connect to. In theory, if you are using the PDO API, you could switch the database server you used, from say Firebird to MySQL, and only need to make minor changes to your PHP code.

Other examples of database abstraction layers include JDBC for Java applications and DBI for Perl.

While PDO has its advantages, such as a clean, simple, portable API, its main disadvantage is that it doesn't allow you to use all of the advanced features that are available in the latest versions of MySQL server. For example, PDO does not allow you to use MySQL's support for Multiple Statements.

PDO is implemented using the PHP extension framework, its source code is located in the directory `ext/pdo`.

For further information on PDO, see the [Section 20.11.3, “MySQL Functions \(PDO_MYSQL\)”](#).

What is the PDO MYSQL driver?

The PDO MYSQL driver is not an API as such, at least from the PHP programmer's perspective. In fact the PDO MYSQL driver sits in the layer below PDO itself and provides MySQL-specific functionality. The programmer still calls the PDO API, but PDO uses the PDO MYSQL driver to carry out communication with the MySQL server.

The PDO MYSQL driver is one of several available PDO drivers. Other PDO drivers available include those for the Firebird and PostgreSQL database servers.

The PDO MYSQL driver is implemented using the PHP extension framework. Its source code is located in the directory `ext/pdo_mysql`. It does not expose an API to the PHP programmer.

For further information on the PDO MYSQL driver, see [Section 20.11.3, “MySQL Functions \(PDO_MYSQL\)”](#).

What is PHP's MySQL Native Driver?

In order to communicate with the MySQL database server the `mysql` extension, `mysqli` and the PDO MYSQL driver each use a low-level library that implements the required protocol. In the past, the only available library was the MySQL Client Library, otherwise known as `libmysql`.

However, the interface presented by `libmysql` was not optimized for communication with PHP applications, as `libmysql` was originally designed with C applications in mind. For this reason the MySQL Native Driver, `mysqlnd`, was developed as an alternative to `libmysql` for PHP applications.

The `mysql` extension, the `mysqli` extension and the PDO MySQL driver can each be individually configured to use either `libmysql` or `mysqlnd`. As `mysqlnd` is designed specifically to be utilised in the PHP system it has numerous memory and speed enhancements over `libmysql`. You are strongly encouraged to take advantage of these improvements.

Note

The MySQL Native Driver can only be used with MySQL server versions 4.1.3 and later.

The MySQL Native Driver is implemented using the PHP extension framework. The source code is located in `ext/mysqlnd`. It does not expose an API to the PHP programmer.

Comparison of Features

The following table compares the functionality of the three main methods of connecting to MySQL from PHP:

	PHP's <code>mysqli</code> Extension	PDO (Using PDO MySQL Driver and MySQL Native Driver)	PHP's MySQL Extension
PHP version introduced	5.0	5.0	Prior to 3.0
Included with PHP 5.x	yes	yes	Yes
Comes with PHP 6.0	Yes	Yes	Yes
MySQL development status	Active development	Active development as of PHP 5.3	Maintenance only
Recommended by MySQL for new projects	Yes - preferred option	Yes	No
API supports Charsets	Yes	Yes	No
API supports server-side Prepared Statements	Yes	Yes	No
API supports client-side Prepared Statements	No	Yes	No
API supports Stored Procedures	Yes	Yes	No
API supports Multiple Statements	Yes	Most	No
Supports all MySQL 4.1+ functionality	Yes	Most	No

20.11.2.3. Installing/Configuring

Copyright 1997-2008 the PHP Documentation Group.

20.11.2.3.1. Requirements

Copyright 1997-2008 the PHP Documentation Group.

In order to have these functions available, you must compile PHP with support for the `mysqli` extension.

Note

The `mysqli` extension is designed to work with the version 4.1.3 or above of MySQL. For previous versions, please see the [MySQL extension documentation](#).

20.11.2.3.2. Installation

Copyright 1997-2008 the PHP Documentation Group.

To install the `mysqli` extension for PHP, use the `--with-mysqli=mysql_config_path/mysql_config` configuration option where `mysql_config_path` represents the location of the `mysql_config` program that comes with MySQL versions greater than 4.1.

If you would like to install the `mysql` extension along with the `mysqli` extension you have to use the same client library to avoid any conflicts.

20.11.2.3.2.1. Installation on Windows Systems

Copyright 1997-2008 the PHP Documentation Group.

MySQLi is not enabled by default, so the `php_mysqli.dll` DLL must be enabled inside of `php.ini`. Also, PHP needs access to the MySQL client library. A file named `libmysql.dll` is included in the Windows PHP distribution and in order for PHP to talk to MySQL this file needs to be available to the Windows systems `PATH`. See the FAQ titled "[How do I add my PHP directory to the PATH on Windows](#)" for information on how to do this. Although copying `libmysql.dll` to the Windows system directory also works (because the system directory is by default in the system's `PATH`), it's not recommended.

As with enabling any PHP extension (such as `php_mysqli.dll`), the PHP directive `extension_dir` should be set to the directory where the PHP extensions are located. See also the [Manual Windows Installation Instructions](#). An example `extension_dir` value for PHP 5 is `c:\php\ext`

Note

If when starting the web server an error similar to the following occurs: "Unable to load dynamic library '`./php_mysqli.dll`'", this is because `php_mysqli.dll` and/or `libmysql.dll` cannot be found by the system.

20.11.2.3.3. Runtime Configuration

Copyright 1997-2008 the PHP Documentation Group.

The behaviour of these functions is affected by settings in `php.ini`.

Table 20.7. MySQLi Configuration Options

Name	Default	Changeable	Changelog
<code>mysqli.max_links</code>	"-1"	PHP_INI_SYSTEM	Available since PHP 5.0.0.
<code>mysqli.default_port</code>	"3306"	PHP_INI_ALL	Available since PHP 5.0.0.
<code>mysqli.default_socket</code>	NULL	PHP_INI_ALL	Available since PHP 5.0.0.
<code>mysqli.default_host</code>	NULL	PHP_INI_ALL	Available since PHP 5.0.0.
<code>mysqli.default_user</code>	NULL	PHP_INI_ALL	Available since PHP 5.0.0.
<code>mysqli.default_pw</code>	NULL	PHP_INI_ALL	Available since PHP 5.0.0.

For further details and definitions of the above `PHP_INI_*` constants, see the chapter on [configuration changes](#).

Here's a short explanation of the configuration directives.

<code>mysqli.max_links</code> integer	The maximum number of MySQL connections per process.
<code>mysqli.default_port</code> string	The default TCP port number to use when connecting to the database server if no other port is specified. If no default is specified, the port will be obtained from the <code>MYSQL_TCP_PORT</code> environment variable, the <code>mysql-tcp</code> entry in <code>/etc/services</code> or the compile-time <code>MYSQL_PORT</code> constant, in that order. Win32 will only use the <code>MYSQL_PORT</code> constant.

<code>mysqli.default_socket</code> string	The default socket name to use when connecting to a local database server if no other socket name is specified.
<code>mysqli.default_host</code> string	The default server host to use when connecting to the database server if no other host is specified. Doesn't apply in safe mode .
<code>mysqli.default_user</code> string	The default user name to use when connecting to the database server if no other name is specified. Doesn't apply in safe mode .
<code>mysqli.default_pw</code> string	The default password to use when connecting to the database server if no other password is specified. Doesn't apply in safe mode .

20.11.2.3.4. Resource Types

Copyright 1997-2008 the PHP Documentation Group.

This extension has no resource types defined.

20.11.2.4. Predefined Constants

Copyright 1997-2008 the PHP Documentation Group.

<code>MYSQLI_READ_DEFAULT_GROUP</code>	Read options from the named group from <code>my.cnf</code> or the file specified with <code>MYSQLI_READ_DEFAULT_FILE</code>
<code>MYSQLI_READ_DEFAULT_FILE</code>	Read options from the named option file instead of from <code>my.cnf</code>
<code>MYSQLI_OPT_CONNECT_TIMEOUT</code>	Connect timeout in seconds
<code>MYSQLI_OPT_LOCAL_INFILE</code>	Enables command <code>LOAD LOCAL INFILE</code>
<code>MYSQLI_INIT_COMMAND</code>	Command to execute when connecting to MySQL server. Will automatically be re-executed when reconnecting.
<code>MYSQLI_CLIENT_SSL</code>	Use SSL (encrypted protocol). This option should not be set by application programs; it is set internally in the MySQL client library
<code>MYSQLI_CLIENT_COMPRESS</code>	Use compression protocol
<code>MYSQLI_CLIENT_INTERACTIVE</code>	Allow <code>interactive_timeout</code> seconds (instead of <code>wait_timeout</code> seconds) of inactivity before closing the connection. The client's session <code>wait_timeout</code> variable will be set to the value of the session <code>interactive_timeout</code> variable.
<code>MYSQLI_CLIENT_IGNORE_SPACE</code>	Allow spaces after function names. Makes all functions names reserved words.
<code>MYSQLI_CLIENT_NO_SCHEMA</code>	Don't allow the <code>db_name.tbl_name.col_name</code> syntax.
<code>MYSQLI_CLIENT_MULTI_QUERIES</code>	Allows multiple semicolon-delimited queries in a single <code>mysqli_query</code> call.
<code>MYSQLI_STORE_RESULT</code>	For using buffered resultsets
<code>MYSQLI_USE_RESULT</code>	For using unbuffered resultsets
<code>MYSQLI_ASSOC</code>	Columns are returned into the array having the fieldname as the array index.
<code>MYSQLI_NUM</code>	Columns are returned into the array having an enumerated index.
<code>MYSQLI_BOTH</code>	Columns are returned into the array having both a numerical index and the fieldname as the associative index.
<code>MYSQLI_NOT_NULL_FLAG</code>	Indicates that a field is defined as <code>NOT NULL</code>
<code>MYSQLI_PRI_KEY_FLAG</code>	Field is part of a primary index
<code>MYSQLI_UNIQUE_KEY_FLAG</code>	Field is part of a unique index.
<code>MYSQLI_MULTIPLE_KEY_FLAG</code>	Field is part of an index.
<code>MYSQLI_BLOB_FLAG</code>	Field is defined as <code>BLOB</code>

<code>MYSQLI_UNSIGNED_FLAG</code>	Field is defined as <code>UNSIGNED</code>
<code>MYSQLI_ZEROFILL_FLAG</code>	Field is defined as <code>ZEROFILL</code>
<code>MYSQLI_AUTO_INCREMENT_FLAG</code>	Field is defined as <code>AUTO_INCREMENT</code>
<code>MYSQLI_TIMESTAMP_FLAG</code>	Field is defined as <code>TIMESTAMP</code>
<code>MYSQLI_SET_FLAG</code>	Field is defined as <code>SET</code>
<code>MYSQLI_NUM_FLAG</code>	Field is defined as <code>NUMERIC</code>
<code>MYSQLI_PART_KEY_FLAG</code>	Field is part of an multi-index
<code>MYSQLI_GROUP_FLAG</code>	Field is part of <code>GROUP BY</code>
<code>MYSQLI_TYPE_DECIMAL</code>	Field is defined as <code>DECIMAL</code>
<code>MYSQLI_TYPE_NEWDECIMAL</code>	Precision math <code>DECIMAL</code> or <code>NUMERIC</code> field (MySQL 5.0.3 and up)
<code>MYSQLI_TYPE_BIT</code>	Field is defined as <code>BIT</code> (MySQL 5.0.3 and up)
<code>MYSQLI_TYPE_TINY</code>	Field is defined as <code>TINYINT</code>
<code>MYSQLI_TYPE_SHORT</code>	Field is defined as <code>SMALLINT</code>
<code>MYSQLI_TYPE_LONG</code>	Field is defined as <code>INT</code>
<code>MYSQLI_TYPE_FLOAT</code>	Field is defined as <code>FLOAT</code>
<code>MYSQLI_TYPE_DOUBLE</code>	Field is defined as <code>DOUBLE</code>
<code>MYSQLI_TYPE_NULL</code>	Field is defined as <code>DEFAULT NULL</code>
<code>MYSQLI_TYPE_TIMESTAMP</code>	Field is defined as <code>TIMESTAMP</code>
<code>MYSQLI_TYPE_LONGLONG</code>	Field is defined as <code>BIGINT</code>
<code>MYSQLI_TYPE_INT24</code>	Field is defined as <code>MEDIUMINT</code>
<code>MYSQLI_TYPE_DATE</code>	Field is defined as <code>DATE</code>
<code>MYSQLI_TYPE_TIME</code>	Field is defined as <code>TIME</code>
<code>MYSQLI_TYPE_DATETIME</code>	Field is defined as <code>DATETIME</code>
<code>MYSQLI_TYPE_YEAR</code>	Field is defined as <code>YEAR</code>
<code>MYSQLI_TYPE_NEWDATE</code>	Field is defined as <code>DATE</code>
<code>MYSQLI_TYPE_ENUM</code>	Field is defined as <code>ENUM</code>
<code>MYSQLI_TYPE_SET</code>	Field is defined as <code>SET</code>
<code>MYSQLI_TYPE_TINY_BLOB</code>	Field is defined as <code>TINYBLOB</code>
<code>MYSQLI_TYPE_MEDIUM_BLOB</code>	Field is defined as <code>MEDIUMBLOB</code>
<code>MYSQLI_TYPE_LONG_BLOB</code>	Field is defined as <code>LOB</code>
<code>MYSQLI_TYPE_BLOB</code>	Field is defined as <code>BLOB</code>
<code>MYSQLI_TYPE_VAR_STRING</code>	Field is defined as <code>VARCHAR</code>
<code>MYSQLI_TYPE_STRING</code>	Field is defined as <code>CHAR</code>
<code>MYSQLI_TYPE_GEOMETRY</code>	Field is defined as <code>GEOMETRY</code>
<code>MYSQLI_NEED_DATA</code>	More data available for bind variable
<code>MYSQLI_NO_DATA</code>	No more data available for bind variable

`MYSQLI_DATA_TRUNCATED` Data truncation occurred. Available since PHP 5.1.0 and MySQL 5.0.5.

`MYSQLI_ENUM_FLAG` Field is defined as `ENUM`. Available since PHP 5.3.0.

20.11.2.5. The MySQLi Extension Function Summary

Copyright 1997-2008 the PHP Documentation Group.

MySQLi Class			
OOP Interface	Procedural Interface	Alias (Do not use)	Description
<i>Properties</i>			
<code>\$mysqli->affected_rows</code>	<code>mysqli_affected_rows</code>	N/A	Gets the number of affected rows in a previous MySQL operation
<code>\$mysqli->connect_errno</code>	<code>mysqli_connect_errno</code>	N/A	Returns the error code from last connect call
<code>\$mysqli->connect_error</code>	<code>mysqli_connect_error</code>	N/A	Returns a string description of the last connect error
<code>\$mysqli->errno</code>	<code>mysqli_errno</code>	N/A	Returns the error code for the most recent function call
<code>\$mysqli->error</code>	<code>mysqli_error</code>	N/A	Returns a string description of the last error
<code>\$mysqli->field_count</code>	<code>mysqli_field_count</code>	N/A	Returns the number of columns for the most recent query
<code>\$mysqli->host_info</code>	<code>mysqli_get_host_info</code>	N/A	Returns a string representing the type of connection used
<code>\$mysqli->protocol_version</code>	<code>mysqli_get_proto_info</code>	N/A	Returns the version of the MySQL protocol used
<code>\$mysqli->server_info</code>	<code>mysqli_get_server_info</code>	N/A	Returns the version of the MySQL server
<code>\$mysqli->server_version</code>	<code>mysqli_get_server_version</code>	N/A	Returns the version of the MySQL server as an integer
<code>\$mysqli->info</code>	<code>mysqli_info</code>	N/A	Retrieves information about the most recently executed query
<code>\$mysqli->insert_id</code>	<code>mysqli_insert_id</code>	N/A	Returns the auto generated id used in the last query
<code>\$mysqli->sqlstate</code>	<code>mysqli_sqlstate</code>	N/A	Returns the SQLSTATE error from previous MySQL operation
<code>\$mysqli->warning_count</code>	<code>mysqli_warning_count</code>	N/A	Returns the number of warnings from the last query for the given link
<i>Methods</i>			
<code>mysqli->autocommit</code>	<code>mysqli_autocommit</code>	N/A	Turns on or off auto-committing database modifications
<code>mysqli->change_user</code>	<code>mysqli_change_user</code>	N/A	Changes the user of the specified database connection
<code>mysqli->character_set_name</code> , <code>mysqli->client_encoding</code>	<code>mysqli_character_set_name</code>	<code>mysqli_client_encoding</code>	Returns the default character set for the database connection
<code>mysqli->close</code>	<code>mysqli_close</code>	N/A	Closes a previously opened database connection
<code>mysqli->commit</code>	<code>mysqli_commit</code>	N/A	Commits the current transaction
<code>mysqli::__construct</code>	<code>mysqli_connect</code>	N/A	Open a new connection to the MySQL server [Note: static (i.e. class) method]
<code>mysqli->debug</code>	<code>mysqli_debug</code>	N/A	Performs debugging operations

MySQLi Class			
OOP Interface	Procedural Interface	Alias (Do not use)	Description
<code>mysqli->dump_debug_info</code>	<code>mysqli_dump_debug_info</code>	N/A	Dump debugging information into the log
<code>mysqli->get_charset</code>	<code>mysqli_get_charset</code>	N/A	Returns a character set object
<code>mysqli->get_client_info</code>	<code>mysqli_get_client_info</code>	N/A	Returns the MySQL client version as a string
<code>mysqli->get_client_version</code>	<code>mysqli_get_client_version</code>	N/A	Get MySQL client info
<code>\$mysqli->get_connection_stats()</code>	<code>mysqli_get_connection_stats()</code>	N/A	NOT DOCUMENTED [mysqli only]
<code>mysqli->get_server_info</code>	<code>mysqli_get_server_info</code>	N/A	NOT DOCUMENTED
<code>mysqli->get_warnings</code>	<code>mysqli_get_warnings</code>	N/A	NOT DOCUMENTED
<code>mysqli_init</code>	<code>mysqli_init</code>	N/A	Initializes MySQLi and returns a resource for use with <code>mysqli_real_connect</code> . [Not called on an object, as it returns a <code>\$mysqli</code> object.]
<code>mysqli->kill</code>	<code>mysqli_kill</code>	N/A	Asks the server to kill a MySQL thread
<code>mysqli->more_results</code>	<code>mysqli_more_results</code>	N/A	Check if there are any more query results from a multi query
<code>mysqli->multi_query</code>	<code>mysqli_multi_query</code>	N/A	Performs a query on the database
<code>mysqli->next_result</code>	<code>mysqli_next_result</code>	N/A	Prepare next result from multi_query
<code>mysqli->options</code>	<code>mysqli_options</code>	<code>mysqli_set_opt</code>	Set options
<code>mysqli->ping</code>	<code>mysqli_ping</code>	N/A	Pings a server connection, or tries to reconnect if the connection has gone down
<code>mysqli->prepare</code>	<code>mysqli_prepare</code>	N/A	Prepare a SQL statement for execution
<code>mysqli->query</code>	<code>mysqli_query</code>	N/A	Performs a query on the database
<code>mysqli->real_connect</code>	<code>mysqli_real_connect</code>	N/A	Opens a connection to a mysql server
<code>mysqli->real_escape_string</code> , <code>mysqli->escape_string</code>	<code>mysqli_real_escape_string</code>	<code>mysqli_escape_string</code>	Escapes special characters in a string for use in a SQL statement, taking into account the current charset of the connection
<code>mysqli->real_query</code>	<code>mysqli_real_query</code>	N/A	Execute an SQL query
<code>mysqli->rollback</code>	<code>mysqli_rollback</code>	N/A	Rolls back current transaction
<code>mysqli->select_db</code>	<code>mysqli_select_db</code>	N/A	Selects the default database for database queries
<code>mysqli->set_charset</code>	<code>mysqli_set_charset</code>	N/A	Sets the default client character set
<code>mysqli->set_local_infile_default</code>	<code>mysqli_set_local_infile_default</code>	N/A	Unsets user defined handler for load local infile command
<code>mysqli->set_local_infile_handler</code>	<code>mysqli_set_local_infile_handler</code>	N/A	Set callback function for LOAD DATA LOCAL INFILE command
<code>mysqli->ssl_set</code>	<code>mysqli_ssl_set</code>	N/A	Used for establishing secure connections using SSL

MySQLi Class			
OOP Interface	Procedural Interface	Alias (Do not use)	Description
<code>mysqli->stat</code>	<code>mysqli_stat</code>	N/A	Gets the current system status
<code>mysqli->stmt_init</code>	<code>mysqli_stmt_init</code>	N/A	Initializes a statement and returns an object for use with <code>mysqli_stmt_prepare</code>
<code>mysqli->store_result</code>	<code>mysqli_store_result</code>	N/A	Transfers a result set from the last query
<code>mysqli->thread_id</code>	<code>mysqli_thread_id</code>	N/A	Returns the thread ID for the current connection
<code>mysqli->thread_safe</code>	<code>mysqli_thread_safe</code>	N/A	Returns whether thread safety is given or not
<code>mysqli->use_result</code>	<code>mysqli_use_result</code>	N/A	Initiate a result set retrieval

MySQL_STMT			
OOP Interface	Procedural Interface	Alias (Do not use)	Description
<i>Properties</i>			
<code>\$mysqli_stmt->affected_rows</code>	<code>mysqli_stmt_affected_rows</code>	N/A	Returns the total number of rows changed, deleted, or inserted by the last executed statement
<code>\$mysqli_stmt->errno</code>	<code>mysqli_stmt_errno</code>	N/A	Returns the error code for the most recent statement call
<code>\$mysqli_stmt->error</code>	<code>mysqli_stmt_error</code>	N/A	Returns a string description for last statement error
<code>\$mysqli_stmt->field_count</code>	<code>mysqli_stmt_field_count</code>	N/A	Returns the number of field in the given statement - not documented
<code>\$mysqli_stmt->insert_id</code>	<code>mysqli_stmt_insert_id</code>	N/A	Get the ID generated from the previous INSERT operation
<code>\$mysqli_stmt->num_rows</code>	<code>mysqli_stmt_num_rows</code>	N/A	Return the number of rows in statements result set
<code>\$mysqli_stmt->param_count</code>	<code>mysqli_stmt_param_count</code>	<code>mysqli_param_count</code>	Returns the number of parameter for the given statement
<code>\$mysqli_stmt->sqlstate</code>	<code>mysqli_stmt_sqlstate</code>	N/A	Returns SQLSTATE error from previous statement operation
<i>Methods</i>			
<code>mysqli_stmt->attr_get</code>	<code>mysqli_stmt_attr_get</code>	N/A	NOT DOCUMENTED
<code>mysqli_stmt->attr_set</code>	<code>mysqli_stmt_attr_set</code>	N/A	NOT DOCUMENTED
<code>mysqli_stmt->bind_param</code>	<code>mysqli_stmt_bind_param</code>	<code>mysqli_bind_param</code>	Binds variables to a prepared statement as parameters
<code>mysqli_stmt->bind_result</code>	<code>mysqli_stmt_bind_result</code>	<code>mysqli_bind_result</code>	Binds variables to a prepared statement for result storage
<code>mysqli_stmt->close</code>	<code>mysqli_stmt_close</code>	N/A	Closes a prepared statement
<code>mysqli_stmt->data_seek</code>	<code>mysqli_stmt_data_seek</code>	N/A	Seeks to an arbitrary row in statement result set
<code>mysqli_stmt->execute</code>	<code>mysqli_stmt_execute</code>	<code>mysqli_execute</code>	Executes a prepared Query
<code>mysqli_stmt->fetch</code>	<code>mysqli_stmt_fetch</code>	<code>mysqli_fetch</code>	Fetch results from a prepared statement into the bound variables
<code>mysqli_stmt->free_result</code>	<code>mysqli_stmt_free_result</code>	N/A	Frees stored result memory for the given statement handle
<code>\$mysqli_stmt->get_result()</code>	<code>mysqli_stmt_get_result</code>	N/A	NOT DOCUMENTED [mysqli only]
<code>mysqli_stmt->get_warnings</code>	<code>mysqli_stmt_get_warnings</code>	N/A	NOT DOCUMENTED

MySQL_STMT			
OOP Interface	Procedural Interface	Alias (Do not use)	Description
<code>ings</code>	<code>ngs</code>		
<code>\$mysqli_stmt->more_results()</code>	<code>mysqli_stmt_more_results()</code>	N/A	NOT DOCUMENTED [mysqli only]
<code>\$mysqli_stmt->next_result()</code>	<code>mysqli_stmt_next_result()</code>	N/A	NOT DOCUMENTED [mysqli only]
<code>mysqli_stmt->num_rows</code>	<code>mysqli_stmt_num_rows</code>	N/A	NOT DOCUMENTED [see also num_rows property]
<code>mysqli_stmt->prepare</code>	<code>mysqli_stmt_prepare</code>	N/A	Prepare a SQL statement for execution
<code>mysqli_stmt->reset</code>	<code>mysqli_stmt_reset</code>	N/A	Resets a prepared statement
<code>mysqli_stmt->result_metadata</code>	<code>mysqli_stmt_result_metadata</code>	<code>mysqli_get_metadata</code>	Returns result set metadata from a prepared statement
<code>mysqli_stmt->send_long_data</code>	<code>mysqli_stmt_send_long_data</code>	<code>mysqli_send_long_data</code>	Send data in blocks
<code>mysqli_stmt->store_result</code>	<code>mysqli_stmt_store_result</code>	N/A	Transfers a result set from a prepared statement

MySQLi_RESULT			
OOP Interface	Procedural Interface	Alias (Do not use)	Description
<i>Properties</i>			
<code>\$mysqli_result->current_field</code>	<code>mysqli_field_tell</code>	N/A	Get current field offset of a result pointer
<code>\$mysqli_result->field_count</code>	<code>mysqli_num_fields</code>	N/A	Get the number of fields in a result
<code>\$mysqli_result->lengths</code>	<code>mysqli_fetch_lengths</code>	N/A	Returns the lengths of the columns of the current row in the result set
<code>\$mysqli_result->num_rows</code>	<code>mysqli_num_rows</code>	N/A	Gets the number of rows in a result
<i>Methods</i>			
<code>mysqli_result->data_seek</code>	<code>mysqli_data_seek</code>	N/A	Adjusts the result pointer to an arbitrary row in the result
<code>\$mysqli_result->fetch_all()</code>	<code>mysqli_fetch_all()</code>	N/A	NOT DOCUMENTED [mysqli only]
<code>mysqli_result->fetch_array</code>	<code>mysqli_fetch_array</code>	N/A	Fetch a result row as an associative, a numeric array, or both
<code>mysqli_result->fetch_assoc</code>	<code>mysqli_fetch_assoc</code>	N/A	Fetch a result row as an associative array
<code>mysqli_result->fetch_field_direct</code>	<code>mysqli_fetch_field_direct</code>	N/A	Fetch meta-data for a single field
<code>mysqli_result->fetch_field</code>	<code>mysqli_fetch_field</code>	N/A	Returns the next field in the result set
<code>mysqli_result->fetch_fields</code>	<code>mysqli_fetch_fields</code>	N/A	Returns an array of objects representing the fields in a result set
<code>mysqli_result->fetch_object</code>	<code>mysqli_fetch_object</code>	N/A	Returns the current row of a result set as an object
<code>mysqli_result->fetch_row</code>	<code>mysqli_fetch_row</code>	N/A	Get a result row as an enumerated array
<code>mysqli_result->field_seek</code>	<code>mysqli_field_seek</code>	N/A	Set result pointer to a specified field offset
<code>mysqli_result->free,</code> <code>mysqli_result->close,</code> <code>mysqli_result->free_result</code>	<code>mysqli_free_result</code>	N/A	Frees the memory associated with a result

MySQL_Driver			
OOP Interface	Procedural Interface	Alias (Do not use)	Description
<i>Properties</i>			
N/A			
<i>Methods</i>			
<code>mysqli_driver->embedded_server_end</code>	<code>mysqli_embedded_server_end</code>	N/A	NOT DOCUMENTED
<code>mysqli_driver->embedded_server_start</code>	<code>mysqli_embedded_server_start</code>	N/A	NOT DOCUMENTED

Note

Alias functions are provided for backward compatibility purposes only. Do not use them in new projects.

20.11.2.6. The MySQLi class (**MySQLi**)

Copyright 1997-2008 the PHP Documentation Group.

Represents a connection between PHP and a MySQL database.

```

MySQLi {
    MySQLi

    Properties

    int affected_rows ;

    string connect_errno ;

    string connect_error ;

    int errno ;

    string error ;

    int field_count ;

    string host_info ;

    string protocol_version ;

    string server_info ;

    int server_version ;

    string info ;

    int insert_id ;

    string sqlstate ;

    int thread_id ;

    int warning_count ;

    Methods

    int mysqli_affected_rows(mysqli link);

    bool mysqli::autocommit(bool mode);

    bool mysqli::change_user(string user,
```

```
        string password,
        string database);

string mysqli::character_set_name();

bool mysqli::close();

bool mysqli::commit();

int mysqli_connect_errno();

string mysqli_connect_error();

mysqli mysqli_connect(string host,

}
```

20.11.2.6.1. [mysqli->affected_rows](#), [mysqli_affected_rows](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli->affected_rows](#)
[mysqli_affected_rows](#)

Gets the number of affected rows in a previous MySQL operation

Description

Object oriented style (property):

```
mysqli {
    int affected_rows ;
}
```

Procedural style:

```
int mysqli_affected_rows(mysqli link);
```

Returns the number of rows affected by the last [INSERT](#), [UPDATE](#), [REPLACE](#) or [DELETE](#) query.

For SELECT statements [mysqli_affected_rows](#) works like [mysqli_num_rows](#).

Parameters

[link](#) Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

Return Values

An integer greater than zero indicates the number of rows affected or retrieved. Zero indicates that no records were updated for an UPDATE statement, no rows matched the [WHERE](#) clause in the query or that no query has yet been executed. -1 indicates that the query returned an error.

Note

If the number of affected rows is greater than maximal int value, the number of affected rows will be returned as a string.

Examples

Example 20.69. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Insert rows */
$mysqli->query("CREATE TABLE Language SELECT * from CountryLanguage");
printf("Affected rows (INSERT): %d\n", $mysqli->affected_rows);

$mysqli->query("ALTER TABLE Language ADD Status int default 0");

/* update rows */
$mysqli->query("UPDATE Language SET Status=1 WHERE Percentage > 50");
printf("Affected rows (UPDATE): %d\n", $mysqli->affected_rows);

/* delete rows */
$mysqli->query("DELETE FROM Language WHERE Percentage < 50");
printf("Affected rows (DELETE): %d\n", $mysqli->affected_rows);

/* select all rows */
$result = $mysqli->query("SELECT CountryCode FROM Language");
printf("Affected rows (SELECT): %d\n", $mysqli->affected_rows);

$result->close();

/* Delete table Language */
$mysqli->query("DROP TABLE Language");

/* close connection */
$mysqli->close();
?>
```

Example 20.70. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

if (!$link) {
    printf("Can't connect to localhost. Error: %s\n", mysqli_connect_error());
    exit();
}

/* Insert rows */
mysqli_query($link, "CREATE TABLE Language SELECT * from CountryLanguage");
printf("Affected rows (INSERT): %d\n", mysqli_affected_rows($link));

mysqli_query($link, "ALTER TABLE Language ADD Status int default 0");

/* update rows */
mysqli_query($link, "UPDATE Language SET Status=1 WHERE Percentage > 50");
printf("Affected rows (UPDATE): %d\n", mysqli_affected_rows($link));

/* delete rows */
mysqli_query($link, "DELETE FROM Language WHERE Percentage < 50");
printf("Affected rows (DELETE): %d\n", mysqli_affected_rows($link));

/* select all rows */
$result = mysqli_query($link, "SELECT CountryCode FROM Language");
printf("Affected rows (SELECT): %d\n", mysqli_affected_rows($link));

mysqli_free_result($result);

/* Delete table Language */
mysqli_query($link, "DROP TABLE Language");

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Affected rows (INSERT): 984
Affected rows (UPDATE): 168
Affected rows (DELETE): 815
Affected rows (SELECT): 169

```

20.11.2.6.2. `mysqli::autocommit`, `mysqli_autocommit`

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli::autocommit](#)
[mysqli_autocommit](#)

Turns on or off auto-committing database modifications

Description

Object oriented style (method)

```
bool mysqli::autocommit(bool mode);
```

Procedural style:

```
bool mysqli_autocommit(mysqli link,
                       bool mode);
```

Turns on or off auto-commit mode on queries for the database connection.

To determine the current state of autocommit use the SQL command `SELECT @@autocommit`.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

mode Whether to turn on auto-commit or not.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Notes

Note

This function doesn't work with non transactional table types (like MyISAM or ISAM).

Examples

Example 20.71. Object oriented style

```
<?php
$link = new mysqli("localhost", "my_user", "my_password", "world");

if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* turn autocommit on */
$link->autocommit(TRUE);

if ($result = $link->query("SELECT @@autocommit")) {
    $row = $result->fetch_row();
    printf("Autocommit is %s\n", $row[0]);
    $result->free();
}

/* close connection */
$link->close();
?>
```

Example 20.72. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

if (!$link) {
    printf("Can't connect to localhost. Error: %s\n", mysqli_connect_error());
    exit();
}

/* turn autocommit on */
mysqli_autocommit($link, TRUE);

if ($result = mysqli_query($link, "SELECT @@autocommit")) {
    $row = mysqli_fetch_row($result);
    printf("Autocommit is %s\n", $row[0]);
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Autocommit is 1
```

See Also

[mysqli_commit](#)
[mysqli_rollback](#)

20.11.2.6.3. [mysqli::change_user](#), [mysqli_change_user](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli::change_user](#)
[mysqli_change_user](#)
Changes the user of the specified database connection

Description

Object oriented style (method):

```
bool mysqli::change_user(string user,  
                        string password,  
                        string database);
```

Procedural style:

```
bool mysqli_change_user(mysqli link,  
                        string user,  
                        string password,  
                        string database);
```

Changes the user of the specified database connection and sets the current database.

In order to successfully change users a valid *username* and *password* parameters must be provided and that user must have sufficient permissions to access the desired database. If for any reason authorization fails, the current user authentication will remain.

Parameters

<i>link</i>	Procedural style only: A link identifier returned by mysqli_connect or mysqli_init
<i>user</i>	The MySQL user name.
<i>password</i>	The MySQL password.
<i>database</i>	The database to change to. If desired, the <code>NULL</code> value may be passed resulting in only changing the user and not selecting a database. To select a database in this case use the mysqli_select_db function.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Notes

Note

Using this command will always cause the current database connection to behave as if was a completely new database connection, regardless of if the operation was completed successfully. This reset includes performing a rollback on any active transactions, closing all temporary tables, and unlocking all locked tables.

Examples

Example 20.73. Object oriented style

```
<?php
/* connect database test */
$mysqli = new mysqli("localhost", "my_user", "my_password", "test");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Set Variable a */
$mysqli->query("SET @a:=1");

/* reset all and select a new database */
$mysqli->change_user("my_user", "my_password", "world");

if ($result = $mysqli->query("SELECT DATABASE()")) {
    $row = $result->fetch_row();
    printf("Default database: %s\n", $row[0]);
    $result->close();
}

if ($result = $mysqli->query("SELECT @a")) {
    $row = $result->fetch_row();
    if ($row[0] === NULL) {
        printf("Value of variable a is NULL\n");
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.74. Procedural style

```
<?php
/* connect database test */
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Set Variable a */
mysqli_query($link, "SET @a:=1");

/* reset all and select a new database */
mysqli_change_user($link, "my_user", "my_password", "world");

if ($result = mysqli_query($link, "SELECT DATABASE()")) {
    $row = mysqli_fetch_row($result);
    printf("Default database: %s\n", $row[0]);
    mysqli_free_result($result);
}

if ($result = mysqli_query($link, "SELECT @a")) {
    $row = mysqli_fetch_row($result);
    if ($row[0] === NULL) {
        printf("Value of variable a is NULL\n");
    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
```

```
?>
```

The above example will output:

```
Default database: world
Value of variable a is NULL
```

- [mysqli::character_set_name](#)
[mysqli_character_set_name](#)

Returns the default character set for the database connection

Description

Object oriented style (method):

```
string mysqli::character_set_name();
```

Procedural style:

```
string mysqli_character_set_name(mysqli link);
```

Returns the current character set for the database connection.

Parameters

[link](#) Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

Return Values

The default character set for the current connection

Examples

Example 20.75. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Print current character set */
$charset = $mysqli->character_set_name();
printf ("Current character set is %s\n", $charset);
```

```
$mysqli->close();
?>
```

Example 20.76. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Print current character set */
$charset = mysqli_character_set_name($link);
printf("Current character set is %s\n", $charset);

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Current character set is latin1_swedish_ci
```

[mysqli_close](#)

Closes a previously opened database connection

Description

Object oriented style (method):

```
bool mysqli::close();
```

Procedural style:

```
bool mysqli_close(mysqli link);
```

Closes a previously opened database connection.

Parameters

link

Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

Return Values

Returns `TRUE` on success or `FALSE` on failure.

See Also

`mysqli_connect`
`mysqli_init`

20.11.2.6.6. `mysqli::commit`, `mysqli_commit`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli::commit`
`mysqli_commit`

Commits the current transaction

Description

Object oriented style (method)

```
bool mysqli::commit();
```

Procedural style:

```
bool mysqli_commit(mysqli link);
```

Commits the current transaction for the database connection.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples**Example 20.77. Object oriented style**

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE Language LIKE CountryLanguage Type=InnoDB");

/* set autocommit to off */
$mysqli->autocommit(FALSE);

/* Insert some values */
$mysqli->query("INSERT INTO Language VALUES ('DEU', 'Bavarian', 'F', 11.2)");
$mysqli->query("INSERT INTO Language VALUES ('DEU', 'Swabian', 'F', 9.4)");

/* commit transaction */
$mysqli->commit();

/* drop table */
$mysqli->query("DROP TABLE Language");
```

```
/* close connection */
mysqli->close();
?>
```

Example 20.78. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* set autocommit to off */
mysqli_autocommit($link, FALSE);

mysqli_query($link, "CREATE TABLE Language LIKE CountryLanguage Type=InnoDB");

/* Insert some values */
mysqli_query($link, "INSERT INTO Language VALUES ('DEU', 'Bavarian', 'F', 11.2)");
mysqli_query($link, "INSERT INTO Language VALUES ('DEU', 'Swabian', 'F', 9.4)");

/* commit transaction */
mysqli_commit($link);

/* close connection */
mysqli_close($link);
?>
```

- [mysqli->connect_errno](#)
[mysqli_connect_errno](#)

Returns the error code from last connect call

Description

```
mysqli {
    string connect_errno ;
}
```

```
int mysqli_connect_errno();
```

Returns the last error code number from the last call to [mysqli_connect](#).

Note

Client error message numbers are listed in the MySQL [errmsg.h](#) header file, server error message numbers are listed in [mysqld_error.h](#). In the MySQL source distribution you can find a complete list of error messages and error numbers in the file [Docs/mysqld_error.txt](#).

Return Values

An error code value for the last call to [mysqli_connect](#), if it failed. zero means no error occurred.

Examples

Example 20.79. `mysqli_connect_errno` example

```
<?php
$link = @mysqli_connect("localhost", "nonexisting_user", "");
if (!$link) {
    printf("Can't connect to localhost. Errorcode: %d\n", mysqli_connect_errno());
}
?>

[mysqli_connect_error](#)

Returns a string description of the last connect error

Description

```
mysqli {
    string connect_error ;
}
```

```
string mysqli_connect_error();
```

Returns the last error message string from the last call to [mysqli_connect](#).

Return Values

A string that describes the error. An empty string if no error occurred.

Examples

Example 20.80. `mysqli_connect_error` example

```
<?php
$link = @mysqli_connect("localhost", "nonexisting_user", "");
if (!$link) {
    printf("Can't connect to localhost. Error: %s\n", mysqli_connect_error());
}
?>

20.11.2.6.9. `mysqli::__construct`, `mysqli_connect`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli::__construct`

`mysqli_connect`

Open a new connection to the MySQL server

Description

Object oriented style (constructor):

```
mysqli::__construct(string host,  
                    string username,  
                    string passwd,  
                    string dbname,  
                    int port,  
                    string socket);
```

Procedural style

```
mysqli mysqli_connect(string host,  
                     string username,  
                     string passwd,  
                     string dbname,  
                     int port,  
                     string socket);
```

Opens a connection to the MySQL Server running on.

Parameters

<i>host</i>	Can be either a host name or an IP address. Passing the <code>NULL</code> value or the string "localhost" to this parameter, the local host is assumed. When possible, pipes will be used instead of the TCP/IP protocol.
<i>username</i>	The MySQL user name.
<i>passwd</i>	If not provided or <code>NULL</code> , the MySQL server will attempt to authenticate the user against those user records which have no password only. This allows one username to be used with different permissions (depending on if a password as provided or not).
<i>dbname</i>	If provided will specify the default database to be used when performing queries.
<i>port</i>	Specifies the port number to attempt to connect to the MySQL server.
<i>socket</i>	Specifies the socket or named pipe that should be used.

Note

Specifying the `socket` parameter will not explicitly determine the type of connection to be used when connecting to the MySQL server. How the connection is made to the MySQL database is determined by the `host` parameter.

Return Values

Returns a object which represents the connection to a MySQL Server.

Examples

Example 20.81. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_error) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

printf("Host information: %s\n", $mysqli->host_info);

/* close connection */
$mysqli->close();
?>
```

Example 20.82. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

printf("Host information: %s\n", mysqli_get_host_info($link));

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Host information: Localhost via UNIX socket
```

Notes

Note

OO syntax only: If a connection fails an object is still returned. To check if the connection failed then use the [mysqli->connect_error](#) property like in the examples above.

Note

Error "Can't create TCP/IP socket (10106)" usually means that the [variables_order](#) configure directive doesn't contain character **E**. On Windows, if the environment is not copied the [SYSTEMROOT](#) environment variable won't be available and PHP will have problems loading Winsock.

20.11.2.6.10. [mysqli::debug](#), [mysqli_debug](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli::debug](#)

[mysqli_debug](#)

Performs debugging operations

Description

Object oriented style (method):

```
bool mysqli::debug(string message);
```

Procedural style:

```
bool mysqli_debug(string message);
```

Performs debugging operations using the Fred Fish debugging library.

Parameters

message A string representing the debugging operation to perform

Return Values

Returns `TRUE` .

Notes**Note**

To use the `mysqli_debug` function you must compile the MySQL client library to support debugging.

Examples**Example 20.83. Generating a Trace File**

```
<?php
/* Create a trace file in '/tmp/client.trace' on the local (client) machine: */
mysqli_debug("d:t:0,/tmp/client.trace");
?>
```

- `mysqli::dump_debug_info`
`mysqli_dump_debug_info`

Dump debugging information into the log

Description

Object oriented style (method):

```
bool mysqli::dump_debug_info();
```

Procedural style:

```
bool mysqli_dump_debug_info(mysqli link);
```

This function is designed to be executed by a user with the SUPER privilege and is used to dump debugging information into the log for the MySQL Server relating to the connection.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns `TRUE` on success or `FALSE` on failure.

See Also

`mysqli_debug`

20.11.2.6.12. `mysqli->errno`, `mysqli_errno`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli->errno`

`mysqli_errno`

Returns the error code for the most recent function call

Description

Object oriented style (property):

```
mysqli {
    int errno ;
}
```

Procedural style:

```
int mysqli_errno(mysqli link);
```

Returns the last error code for the most recent MySQLi function call that can succeed or fail.

Client error message numbers are listed in the MySQL `errmsg.h` header file, server error message numbers are listed in `mysqld_error.h`. In the MySQL source distribution you can find a complete list of error messages and error numbers in the file `Docs/mysqld_error.txt`.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

An error code value for the last call, if it failed. zero means no error occurred.

Examples

Example 20.84. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");
```

```

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if (!$mysqli->query("SET a=1")) {
    printf("Errorcode: %d\n", $mysqli->errno);
}

/* close connection */
$mysqli->close();
?>

```

Example 20.85. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if (!mysqli_query($link, "SET a=1")) {
    printf("Errorcode: %d\n", mysqli_errno($link));
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
Errorcode: 1193
```

[mysqli_error](#)

Returns a string description of the last error

Description

Object oriented style (property):

```

mysqli {
    string error ;
}

```

Procedural style:

```
string mysqli_error(mysqli link);
```

Returns the last error message for the most recent MySQLi function call that can succeed or fail.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

A string that describes the error. An empty string if no error occurred.

Examples

Example 20.86. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if (!$mysqli->query("SET a=1")) {
    printf("Errormessage: %s\n", $mysqli->error);
}

/* close connection */
$mysqli->close();
?>
```

Example 20.87. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if (!mysqli_query($link, "SET a=1")) {
    printf("Errormessage: %s\n", mysqli_error($link));
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Errormessage: Unknown system variable 'a'
```

20.11.2.6.14. `mysqli->field_count`, `mysqli_field_count`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli->field_count`
`mysqli_field_count`

Returns the number of columns for the most recent query

Description

Object oriented style (property):

```
mysqli_result {
    int field_count ;
}
```

Procedural style:

```
int mysqli_field_count(mysqli link);
```

Returns the number of columns for the most recent query on the connection represented by the *link* parameter. This function can be useful when using the `mysqli_store_result` function to determine if the query should have produced a non-empty result set or not without knowing the nature of the query.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

An integer representing the number of fields in a result set.

Examples

Example 20.88. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "test");

$mysqli->query( "DROP TABLE IF EXISTS friends");
$mysqli->query( "CREATE TABLE friends (id int, name varchar(20))");
$mysqli->query( "INSERT INTO friends VALUES (1,'Hartmut'), (2, 'Ulf')");

$mysqli->real_query("SELECT * FROM friends");

if ($mysqli->field_count) {
    /* this was a select/show or describe query */
    $result = $mysqli->store_result();

    /* process resultset */
    $row = $result->fetch_row();

    /* free resultset */
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.89. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

mysqli_query($link, "DROP TABLE IF EXISTS friends");
mysqli_query($link, "CREATE TABLE friends (id int, name varchar(20))");
mysqli_query($link, "INSERT INTO friends VALUES (1, 'Hartmut'), (2, 'Ulf')");
mysqli_real_query($link, "SELECT * FROM friends");

if (mysqli_field_count($link)) {
    /* this was a select/show or describe query */
    $result = mysqli_store_result($link);

    /* process resultset */
    $row = mysqli_fetch_row($result);

    /* free resultset */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

20.11.2.6.15. `mysqli::get_charset`, `mysqli_get_charset`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli::get_charset`
`mysqli_get_charset`
Returns a character set object

Description

```
object mysqli::get_charset();
```

```
object mysqli_get_charset(mysqli link);
```

Returns a character set object providing several properties of the current active character set.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

The function returns a character set object with the following properties:

<i>charset</i>	Character set name
<i>collation</i>	Collation name
<i>dir</i>	Directory the charset description was fetched from (?) or "" for builtin character sets
<i>min_length</i>	Minimum character length in bytes
<i>max_length</i>	Maximum character length in bytes

<code>number</code>	Internal character set number
<code>state</code>	Characer set status (?)

Examples**Example 20.90. Object oriented style**

```
<?php
$db = mysqli_init();
$db->real_connect("localhost","root","","test");
var_dump($db->get_charset());
?>
```

Example 20.91. Procedural style

```
<?php
$db = mysqli_init();
mysqli_real_connect($db, "localhost","root","","test");
var_dump($db->get_charset());
?>
```

The above example will output:

```
object(stdClass)#2 (7) {
  ["charset"]=>
  string(6) "latin1"
  ["collation"]=>
  string(17) "latin1_swedish_ci"
  ["dir"]=>
  string(0) ""
  ["min_length"]=>
  int(1)
  ["max_length"]=>
  int(1)
  ["number"]=>
  int(8)
  ["state"]=>
  int(801)
}
```

See Also

[mysqli_characters_set_name](#)
[mysqli_set_charset](#)

20.11.2.6.16. [mysqli::get_client_info](#), [mysqli_get_client_info](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli::get_client_info](#)
[mysqli_get_client_info](#)

Returns the MySQL client version as a string

Description

```
string mysqli::get_client_info();
```

```
string mysqli_get_client_info();
```

The `mysqli_get_client_info` function is used to return a string representing the client version being used in the MySQLi extension.

Return Values

A string that represents the MySQL client library version

Examples

Example 20.92. `mysqli_get_client_info`

```
<?php
/* We don't need a connection to determine
   the version of mysql client library */
printf("Client library version: %s\n", mysqli_get_client_info());

[mysqli_get_client_version](#)
Get MySQL client info

Description

```
int mysqli::get_client_version();
```

```
int mysqli_get_client_version();
```

Returns client version number as an integer.

Return Values

A number that represents the MySQL client library version in format: `main_version*10000 + minor_version *100 + sub_version`. For example, 4.1.0 is returned as 40100.

This is useful to quickly determine the version of the client library to know if some capability exists.

Examples

Example 20.93. `mysqli_get_client_version`

```
<?php
/* We don't need a connection to determine
   the version of mysql client library */
```

```
printf("Client library version: %d\n", mysqli_get_client_version());
?>
```

[mysqli_get_server_version](#)

20.11.2.6.18. `mysqli->host_info`, `mysqli_get_host_info`

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli->host_info](#)
[mysqli_get_host_info](#)

Returns a string representing the type of connection used

Description

Object oriented style (property):

```
mysqli {
    string host_info ;
}
```

Procdural style:

```
string mysqli_get_host_info(mysqli link);
```

The `mysqli_get_host_info` function returns a string describing the connection represented by the `link` parameter is using (including the server host name).

Parameters

`link` Procdural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

A character string representing the server hostname and the connection type.

Examples

Example 20.94. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* print host information */
printf("Host info: %s\n", $mysqli->host_info);

/* close connection */
$mysqli->close();
?>
```

Example 20.95. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* print host information */
printf("Host info: %s\n", mysqli_get_host_info($link));

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Host info: Localhost via UNIX socket
```

[mysqli_get_proto_info](#)

Returns the version of the MySQL protocol used

Description

Object oriented style (property):

```
mysqli {
    string protocol_version ;
}
```

Procedural style:

```
int mysqli_get_proto_info(mysqli link);
```

Returns an integer representing the MySQL protocol version used by the connection represented by the *link* parameter.

Parameters

link Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

Return Values

Returns an integer representing the protocol version.

Examples

Example 20.96. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* print protocol version */
printf("Protocol version: %d\n", $mysqli->protocol_version);

/* close connection */
$mysqli->close();
?>
```

Example 20.97. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* print protocol version */
printf("Protocol version: %d\n", mysqli_get_proto_info($link));

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Protocol version: 10
```

[mysqli_get_server_info](#)

Returns the version of the MySQL server

Description

Object oriented style (property):

```
mysqli {
```

```
string server_info ;
}
```

Procedural style:

```
string mysqli_get_server_info(mysqli link);
```

Returns a string representing the version of the MySQL server that the MySQLi extension is connected to.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

A character string representing the server version.

Examples

Example 20.98. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* print server version */
printf("Server version: %s\n", $mysqli->server_info);

/* close connection */
$mysqli->close();
?>
```

Example 20.99. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* print server version */
printf("Server version: %s\n", mysqli_get_server_info($link));

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Server version: 4.1.2-alpha-debug
```

[mysqli_get_server_version](#)

Returns the version of the MySQL server as an integer

Description

Object oriented style (property):

```
mysqli {
    int server_version ;
}
```

Procedural style:

```
int mysqli_get_server_version(mysqli link);
```

The [mysqli_get_server_version](#) function returns the version of the server connected to (represented by the *link* parameter) as an integer.

Parameters

link Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

Return Values

An integer representing the server version.

The form of this version number is `main_version * 10000 + minor_version * 100 + sub_version` (i.e. version 4.1.0 is 40100).

Examples**Example 20.100. Object oriented style**

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* print server version */
printf("Server version: %d\n", $mysqli->server_version);

/* close connection */
$mysqli->close();
?>
```

Example 20.101. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* print server version */
printf("Server version: %d\n", mysqli_get_server_version($link));

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Server version: 40102
```

- [mysqli->info](#)
[mysqli_info](#)

Retrieves information about the most recently executed query

Description

Object oriented style (property)

```
mysql {
    string info ;
}
```

Procedural style:

```
string mysql_info(mysql link);
```

The `mysql_info` function returns a string providing information about the last query executed. The nature of this string is provided below:

Table 20.8. Possible `mysql_info` return values

Query type	Example result string
INSERT INTO...SELECT...	Records: 100 Duplicates: 0 Warnings: 0
INSERT INTO...VALUES (...),(...),(...)	Records: 3 Duplicates: 0 Warnings: 0
LOAD DATA INFILE ...	Records: 1 Deleted: 0 Skipped: 0 Warnings: 0
ALTER TABLE ...	Records: 3 Duplicates: 0 Warnings: 0
UPDATE ...	Rows matched: 40 Changed: 40 Warnings: 0

Note

Queries which do not fall into one of the above formats are not supported. In these situations, `mysql_info` will return an empty string.

Parameters

`link` Procedural style only: A link identifier returned by `mysql_connect` or `mysql_init`

Return Values

A character string representing additional information about the most recently executed query.

Examples

Example 20.102. Object oriented style

```
<?php
$mysql = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysql->query("CREATE TEMPORARY TABLE t1 LIKE City");

/* INSERT INTO .. SELECT */
$mysql->query("INSERT INTO t1 SELECT * FROM City ORDER BY ID LIMIT 150");
printf("%s\n", $mysql->info);

/* close connection */
$mysql->close();
?>
```

Example 20.103. Procedural style

```
<?php
```

```
$link = mysqli_connect("localhost", "my_user", "my_password", "world");
/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}
mysqli_query($link, "CREATE TEMPORARY TABLE t1 LIKE City");
/* INSERT INTO .. SELECT */
mysqli_query($link, "INSERT INTO t1 SELECT * FROM City ORDER BY ID LIMIT 150");
printf("%s\n", mysqli_info($link));
/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Records: 150 Duplicates: 0 Warnings: 0
```

20.11.2.6.24. [mysqli::init](#), [mysqli_init](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli::init](#)

[mysqli_init](#)

Initializes MySQLi and returns a resource for use with [mysqli_real_connect\(\)](#)

Description

Object oriented style (method):

```
mysqli init();
```

Procedural style:

```
mysqli mysqli_init();
```

Allocates or initializes a MySQL object suitable for [mysqli_options](#) and [mysqli_real_connect](#).

Note

Any subsequent calls to any [mysqli](#) function (except [mysqli_options](#)) will fail until [mysqli_real_connect](#) was called.

Return Values

Returns an object.

[mysqli_options](#)
[mysqli_close](#)

```
mysqli_real_connect
mysqli_connect
```

20.11.2.6.25. `mysqli->insert_id`, `mysqli_insert_id`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli->insert_id`
`mysqli_insert_id`

Returns the auto generated id used in the last query

Description

Object oriented style (property):

```
mysqli {
    int insert_id ;
}
```

Procedural style:

```
int mysqli_insert_id(mysqli link);
```

The `mysqli_insert_id` function returns the ID generated by a query on a table with a column having the `AUTO_INCREMENT` attribute. If the last query wasn't an `INSERT` or `UPDATE` statement or if the modified table does not have a column with the `AUTO_INCREMENT` attribute, this function will return zero.

Note

Performing an `INSERT` or `UPDATE` statement using the `LAST_INSERT_ID()` function will also modify the value returned by the `mysqli_insert_id` function.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

The value of the `AUTO_INCREMENT` field that was updated by the previous query. Returns zero if there was no previous query on the connection or if the query did not update an `AUTO_INCREMENT` value.

Note

If the number is greater than maximal int value, `mysqli_insert_id` will return a string.

Examples

Example 20.104. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCity LIKE City");

$query = "INSERT INTO myCity VALUES (NULL, 'Stuttgart', 'DEU', 'Stuttgart', 617000)";
$mysqli->query($query);

printf ("New Record has id %d.\n", $mysqli->insert_id);

/* drop table */
```

```
$mysqli->query("DROP TABLE myCity");
/* close connection */
$mysqli->close();
?>
```

Example 20.105. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCity LIKE City");

$query = "INSERT INTO myCity VALUES (NULL, 'Stuttgart', 'DEU', 'Stuttgart', 617000)";
mysqli_query($link, $query);

printf ("New Record has id %d.\n", mysqli_insert_id($link));

/* drop table */
mysqli_query($link, "DROP TABLE myCity");

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
New Record has id 1.
```

20.11.2.6.26. `mysqli::kill`, `mysqli_kill`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli::kill`
`mysqli_kill`

Asks the server to kill a MySQL thread

Description

Object oriented style (method)

```
bool mysqli::kill(int processid);
```

Procedural style:

```
bool mysqli_kill(mysqli link,
                 int processid);
```

This function is used to ask the server to kill a MySQL thread specified by the `processid` parameter. This value must be retrieved by calling the `mysqli_thread_id` function.

To stop a running query you should use the SQL command `KILL QUERY processid`.

Parameters

[link](#)Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`**Return Values**Returns `TRUE` on success or `FALSE` on failure.**Examples****Example 20.106. Object oriented style**

```

<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* determine our thread id */
$thread_id = $mysqli->thread_id;

/* Kill connection */
$mysqli->kill($thread_id);

/* This should produce an error */
if (!$mysqli->query("CREATE TABLE myCity LIKE City")) {
    printf("Error: %s\n", $mysqli->error);
    exit;
}

/* close connection */
$mysqli->close();
?>

```

Example 20.107. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* determine our thread id */
$thread_id = mysqli_thread_id($link);

/* Kill connection */
mysqli_kill($link, $thread_id);

/* This should produce an error */
if (!mysqli_query($link, "CREATE TABLE myCity LIKE City")) {
    printf("Error: %s\n", mysqli_error($link));
    exit;
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
Error: MySQL server has gone away
```

See Also

[mysqli_thread_id](#)

- [mysqli::more_results](#)
[mysqli_more_results](#)

Check if there are any more query results from a multi query

Description

```
bool mysqli::more_results();
```

```
bool mysqli_more_results(mysqli link);
```

Indicates if one or more result sets are available from a previous call to [mysqli_multi_query](#).

Parameters

link Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

Examples

See [mysqli_multi_query](#).

See Also

[mysqli_multi_query](#)
[mysqli_next_result](#)
[mysqli_store_result](#)
[mysqli_use_result](#)

20.11.2.6.28. [mysqli::multi_query](#), [mysqli_multi_query](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli::multi_query](#)
[mysqli_multi_query](#)

Performs a query on the database

Description

Object oriented style (method):

```
bool mysqli::multi_query(string query);
```

Procedural style:

```
bool mysqli_multi_query(mysqli link,  
                        string query);
```

Executes one or multiple queries which are concatenated by a semicolon.

To retrieve the resultset from the first query you can use `mysqli_use_result` or `mysqli_store_result`. All subsequent query results can be processed using `mysqli_more_results` and `mysqli_next_result`.

Parameters

`link` Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

`query` The query, as a string.

Return Values

Returns `FALSE` if the first statement failed. To retrieve subsequent errors from other statements you have to call `mysqli_next_result` first.

Examples

Example 20.108. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT CURRENT_USER()";
$query .= "SELECT Name FROM City ORDER BY ID LIMIT 20, 5";

/* execute multi query */
if ($mysqli->multi_query($query)) {
    do {
        /* store first result set */
        if ($result = $mysqli->store_result()) {
            while ($row = $result->fetch_row()) {
                printf("%s\n", $row[0]);
            }
            $result->free();
        }
        /* print divider */
        if ($mysqli->more_results()) {
            printf("-----\n");
        }
    } while ($mysqli->next_result());
}

/* close connection */
$mysqli->close();
?>
```

Example 20.109. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT CURRENT_USER()";
$query .= "SELECT Name FROM City ORDER BY ID LIMIT 20, 5";

/* execute multi query */
if (mysqli_multi_query($link, $query)) {
    do {
        /* store first result set */
        if ($result = mysqli_store_result($link)) {
            while ($row = mysqli_fetch_row($result)) {
                printf("%s\n", $row[0]);
            }
        }
    }
}
```

```

        mysqli_free_result($result);
    }
    /* print divider */
    if (mysqli_more_results($link)) {
        printf("-----\n");
    }
    } while (mysqli_next_result($link));
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output something similar to:

```

my_user@localhost
-----
Amersfoort
Maastricht
Dordrecht
Leiden
Haarlemmermeer

```

20.11.2.6.30. mysqli::options, mysqli_options

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli::options`

```
mysqli_options
```

Set options

Description

Object oriented style (method)

```
bool mysqli::options(int option,
                    mixed value);
```

Procedural style:

```
bool mysqli_options(mysqli link,
                   int option,
                   mixed value);
```

Used to set extra connect options and affect behavior for a connection.

This function may be called multiple times to set several options.

`mysqli_options` should be called after `mysqli_init` and before `mysqli_real_connect`.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

option The option that you want to set. It can be one of the following values:

Table 20.9. Valid options

Name	Description
<code>MYSQLI_OPT_CONNECT_TIMEOUT</code>	connection timeout in seconds
<code>MYSQLI_OPT_LOCAL_INFILE</code>	enable/disable use of <code>LOAD LOCAL INFILE</code>
<code>MYSQLI_INIT_COMMAND</code>	command to execute after when connecting to MySQL server
<code>MYSQLI_READ_DEFAULT_FILE</code>	Read options from named option file instead of <code>my.cnf</code>
<code>MYSQLI_READ_DEFAULT_GROUP</code>	Read options from the named group from <code>my.cnf</code> or the file specified with <code>MYSQLI_READ_DEFAULT_FILE</code> .

value The value for the option.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

See `mysqli_real_connect`.

See Also

`mysqli_init`
`mysqli_real_connect`

20.11.2.6.31. `mysqli::ping`, `mysqli_ping`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli::ping`
`mysqli_ping`

Pings a server connection, or tries to reconnect if the connection has gone down

Description

Object oriented style (method):

```
bool mysqli::ping();
```

Procedural style:

```
bool mysqli_ping(mysqli link);
```

Checks whether the connection to the server is working. If it has gone down, and global option `mysqli.reconnect` is enabled an automatic reconnection is attempted.

This function can be used by clients that remain idle for a long while, to check whether the server has closed the connection and reconnect if necessary.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples**Example 20.110. Object oriented style**

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* check if server is alive */
if ($mysqli->ping()) {
    printf("Our connection is ok!\n");
} else {
    printf("Error: %s\n", $mysqli->error);
}

/* close connection */
$mysqli->close();
?>
```

Example 20.111. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* check if server is alive */
if (mysqli_ping($link)) {
    printf("Our connection is ok!\n");
} else {
    printf("Error: %s\n", mysqli_error($link));
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
Our connection is ok!
```

20.11.2.6.32. `mysqli::prepare`, `mysqli_prepare`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli::prepare`

`mysqli_prepare`

Prepare a SQL statement for execution

Description

Object oriented style (method)

```
mysqli_stmt prepare(string query);
```

Procedure style:

```
mysqli_stmt mysqli_prepare(mysqli link,
                           string query);
```

Prepares the SQL query pointed to by the null-terminated string query, and returns a statement handle to be used for further operations on the statement. The query must consist of a single SQL statement.

The parameter markers must be bound to application variables using `mysqli_stmt_bind_param` and/or `mysqli_stmt_bind_result` before executing the statement or fetching rows.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

query The query, as a string.

Note

You should not add a terminating semicolon or `\g` to the statement.

This parameter can include one or more parameter markers in the SQL statement by embedding question mark (?) characters at the appropriate positions.

Note

The markers are legal only in certain places in SQL statements. For example, they are allowed in the `VALUES ()` list of an `INSERT` statement (to specify column values for a row), or in a comparison with a column in a `WHERE` clause to specify a comparison value.

However, they are not allowed for identifiers (such as table or column names), in the select list that names the columns to be returned by a `SELECT` statement, or to specify both operands of a binary operator such as the `=` equal sign. The latter restriction is necessary because it would be impossible to determine the parameter type. It's not allowed to compare marker with `NULL` by `? IS NULL` too. In general, parameters are legal only in Data Manipulation Language (DML) statements, and not in Data Definition Language (DDL) statements.

Return Values

`mysqli_prepare` returns a statement object or `FALSE` if an error occurred.

Examples**Example 20.112. Object oriented style**

```
<?php
mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$city = "Amersfoort";

/* create a prepared statement */
if ($stmt = mysqli_prepare("SELECT District FROM City WHERE Name=?")) {

    /* bind parameters for markers */
    $stmt->bind_param("s", $city);

    /* execute query */
    $stmt->execute();

    /* bind result variables */
    $stmt->bind_result($district);

    /* fetch value */
    $stmt->fetch();

    printf("%s is in district %s\n", $city, $district);

    /* close statement */
    $stmt->close();
}

/* close connection */
mysqli->close();
?>
```

Example 20.113. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$city = "Amersfoort";

/* create a prepared statement */
if ($stmt = mysqli_prepare($link, "SELECT District FROM City WHERE Name=?")) {

    /* bind parameters for markers */
    mysqli_stmt_bind_param($stmt, "s", $city);

    /* execute query */
```

```

mysqli_stmt_execute($stmt);
/* bind result variables */
mysqli_stmt_bind_result($stmt, $district);

/* fetch value */
mysqli_stmt_fetch($stmt);

printf("%s is in district %s\n", $city, $district);

/* close statement */
mysqli_stmt_close($stmt);
}
/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
Amersfoort is in district Utrecht
```

```

20.11.2.6.33. `mysqli::query`, `mysqli_query`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli::query`
- `mysqli_query`

Performs a query on the database

Description

Object oriented style (method):

```
mixed mysqli::query(string query,
                    int resultmode);
```

Procedural style:

```
mixed mysqli_query(mysqli link,
                  string query,
                  int resultmode);
```

Performs a *query* against the database.

Functionally, using this function is identical to calling `mysqli_real_query` followed either by `mysqli_use_result` or `mysqli_store_result`.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

query The query string.

resultmode

Either the constant `MYSQLI_USE_RESULT` or `MYSQLI_STORE_RESULT` depending on the desired behavior. By default, `MYSQLI_STORE_RESULT` is used.

If you use `MYSQLI_USE_RESULT` all subsequent calls will return error `Commands out of sync` unless you call `mysqli_free_result`

Return Values

Returns `TRUE` on success or `FALSE` on failure. For `SELECT`, `SHOW`, `DESCRIBE` or `EXPLAIN` `mysqli_query` will return a result object.

Examples**Example 20.114. Object oriented style**

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Create table doesn't return a resultset */
if ($mysqli->query("CREATE TEMPORARY TABLE myCity LIKE City") === TRUE) {
    printf("Table myCity successfully created.\n");
}

/* Select queries return a resultset */
if ($result = $mysqli->query("SELECT Name FROM City LIMIT 10")) {
    printf("Select returned %d rows.\n", $result->num_rows);

    /* free result set */
    $result->close();
}

/* If we have to retrieve large amount of data we use MYSQLI_USE_RESULT */
if ($result = $mysqli->query("SELECT * FROM City", MYSQLI_USE_RESULT)) {

    /* Note, that we can't execute any functions which interact with the
    server until result set was closed. All calls will return an
    'out of sync' error */
    if (!$mysqli->query("SET @a:='this will not work'")) {
        printf("Error: %s\n", $mysqli->error);
    }
    $result->close();
}

$mysqli->close();
?>
```

Example 20.115. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Create table doesn't return a resultset */
if (mysqli_query($link, "CREATE TEMPORARY TABLE myCity LIKE City") === TRUE) {
    printf("Table myCity successfully created.\n");
}

/* Select queries return a resultset */
if ($result = mysqli_query($link, "SELECT Name FROM City LIMIT 10")) {
    printf("Select returned %d rows.\n", mysqli_num_rows($result));

    /* free result set */
    mysqli_free_result($result);
}

/* If we have to retrieve large amount of data we use MYSQLI_USE_RESULT */
if ($result = mysqli_query($link, "SELECT * FROM City", MYSQLI_USE_RESULT)) {
```

```

/* Note, that we can't execute any functions which interact with the
server until result set was closed. All calls will return an
'out of sync' error */
if (!mysqli_query($link, "SET @a:='this will not work'")) {
    printf("Error: %s\n", mysqli_error($link));
}
mysqli_free_result($result);
}
mysqli_close($link);
?>

```

The above example will output:

```

Table myCity successfully created.
Select returned 10 rows.
Error: Commands out of sync; You can't run this command now

```

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli::real_connect](#)
[mysqli_real_connect](#)

Opens a connection to a mysql server

Description

Object oriented style (method)

```

bool mysqli::real_connect(string host,
                        string username,
                        string passwd,
                        string dbname,
                        int port,
                        string socket,
                        int flags);

```

Procedural style

```

bool mysqli_real_connect(mysqli link,
                        string host,
                        string username,
                        string passwd,
                        string dbname,
                        int port,
                        string socket,
                        int flags);

```

Establish a connection to a MySQL database engine.

This function differs from [mysqli_connect](#):

- [mysqli_real_connect](#) needs a valid object which has to be created by function [mysqli_init](#).
- With function [mysqli_options](#) you can set various options for connection.

- There is a *flags* parameter.

Parameters

<i>link</i>	Procedural style only: A link identifier returned by <code>mysqli_connect</code> or <code>mysqli_init</code>
<i>host</i>	Can be either a host name or an IP address. Passing the <code>NULL</code> value or the string "localhost" to this parameter, the local host is assumed. When possible, pipes will be used instead of the TCP/IP protocol.
<i>username</i>	The MySQL user name.
<i>passwd</i>	If provided or <code>NULL</code> , the MySQL server will attempt to authenticate the user against those user records which have no password only. This allows one username to be used with different permissions (depending on if a password as provided or not).
<i>dbname</i>	If provided will specify the default database to be used when performing queries.
<i>port</i>	Specifies the port number to attempt to connect to the MySQL server.
<i>socket</i>	Specifies the socket or named pipe that should be used.

Note

Specifying the *socket* parameter will not explicitly determine the type of connection to be used when connecting to the MySQL server. How the connection is made to the MySQL database is determined by the *host* parameter.

flags With the parameter *flags* you can set different connection options:

Table 20.10. Supported flags

Name	Description
<code>MYSQLI_CLIENT_COMPRESS</code>	Use compression protocol
<code>MYSQLI_CLIENT_FOUND_ROWS</code>	return number of matched rows, not the number of affected rows
<code>MYSQLI_CLIENT_IGNORE_SPACE</code>	Allow spaces after function names. Makes all function names reserved words.
<code>MYSQLI_CLIENT_INTERACTIVE</code>	Allow <code>interactive_timeout</code> seconds (instead of <code>wait_timeout</code> seconds) of inactivity before closing the connection
<code>MYSQLI_CLIENT_SSL</code>	Use SSL (encryption)

Note

For security reasons the `MULTI_STATEMENT` flag is not supported in PHP. If you want to execute multiple queries use the `mysqli_multi_query` function.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.116. Object oriented style

```
<?php
/* create a connection object which is not connected */
$mysqli = mysqli_init();

/* set connection options */
$mysqli->options(MYSQLI_INIT_COMMAND, "SET AUTOCOMMIT=0");
$mysqli->options(MYSQLI_OPT_CONNECT_TIMEOUT, 5);

/* connect to server */
```

```

$mysqli->real_connect('localhost', 'my_user', 'my_password', 'world');

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

printf ("Connection: %s\n.", $mysqli->host_info);

$mysqli->close();
?>

```

Example 20.117. Procedural style

```

<?php

/* create a connection object which is not connected */
$link = mysqli_init();

/* set connection options */
mysqli_options($link, MYSQLI_INIT_COMMAND, "SET AUTOCOMMIT=0");
mysqli_options($link, MYSQLI_OPT_CONNECT_TIMEOUT, 5);

/* connect to server */
mysqli_real_connect($link, 'localhost', 'my_user', 'my_password', 'world');

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

printf ("Connection: %s\n.", mysqli_get_host_info($link));

mysqli_close($link);
?>

```

The above example will output:

```

Connection: Localhost via UNIX socket

```

20.11.2.6.35. [mysqli::real_escape_string](#), [mysqli_real_escape_string](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli::real_escape_string](#)
[mysqli_real_escape_string](#)

Escapes special characters in a string for use in a SQL statement, taking into account the current charset of the connection

Description

Object oriented style (both methods are equivalent):

```
string mysqli::escape_string(string escapestr);
```

```
string real_escape_string(string escapestr);
```

Procedural style:

```
string mysqli_real_escape_string(mysqli link,
                                string escapestr);
```

This function is used to create a legal SQL string that you can use in an SQL statement. The given string is encoded to an escaped SQL string, taking into account the current character set of the connection.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

escapestr The string to be escaped.

Characters encoded are NUL (ASCII 0), `\n`, `\r`, `\`, `'`, `"`, and Control-Z.

Return Values

Returns an escaped string.

Examples

Example 20.118. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TEMPORARY TABLE myCity LIKE City");

$city = "'s Hertogenbosch";

/* this query will fail, cause we didn't escape $city */
if (!$mysqli->query("INSERT into myCity (Name) VALUES ('$city')")) {
    printf("Error: %s\n", $mysqli->sqlstate);
}

$city = $mysqli->real_escape_string($city);

/* this query with escaped $city will work */
if ($mysqli->query("INSERT into myCity (Name) VALUES ('$city')")) {
    printf("%d Row inserted.\n", $mysqli->affected_rows);
}

$mysqli->close();
?>
```

Example 20.119. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TEMPORARY TABLE myCity LIKE City");

$city = "'s Hertogenbosch";
```

```

/* this query will fail, cause we didn't escape $city */
if (!mysqli_query($link, "INSERT into myCity (Name) VALUES ('$city')")) {
    printf("Error: %s\n", mysqli_sqlstate($link));
}

$city = mysqli_real_escape_string($link, $city);

/* this query with escaped $city will work */
if (mysqli_query($link, "INSERT into myCity (Name) VALUES ('$city')")) {
    printf("%d Row inserted.\n", mysqli_affected_rows($link));
}

mysqli_close($link);
?>

```

The above example will output:

```

Error: 42000
1 Row inserted.

```

[mysqli_real_query](#)
Execute an SQL query

Description

Object oriented style (method):

```
bool real_query(string query);
```

Procedural style

```
bool mysqli_real_query(mysqli link,
                       string query);
```

Executes a single query against the database whose result can then be retrieved or stored using the [mysqli_store_result](#) or [mysqli_use_result](#) functions.

In order to determine if a given query should return a result set or not, see [mysqli_field_count](#).

Parameters

link Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

query The query, as a string.

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

See Also

```
mysqli_query
mysqli_store_result
mysqli_use_result
```

20.11.2.6.37. `mysqli::rollback`, `mysqli_rollback`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli::rollback`
`mysqli_rollback`
Rolls back current transaction

Description

Object oriented style (method):

```
bool mysqli::rollback();
```

Procedural style:

```
bool mysqli_rollback(mysqli link);
```

Rollbacks the current transaction for the database.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.120. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* disable autocommit */
$mysqli->autocommit(FALSE);

$mysqli->query("CREATE TABLE myCity LIKE City");
$mysqli->query("ALTER TABLE myCity Type=InnoDB");
$mysqli->query("INSERT INTO myCity SELECT * FROM City LIMIT 50");

/* commit insert */
$mysqli->commit();

/* delete all rows */
$mysqli->query("DELETE FROM myCity");

if ($result = $mysqli->query("SELECT COUNT(*) FROM myCity")) {
    $row = $result->fetch_row();
    printf("%d rows in table myCity.\n", $row[0]);
    /* Free result */
    $result->close();
}

/* Rollback */
$mysqli->rollback();

if ($result = $mysqli->query("SELECT COUNT(*) FROM myCity")) {
    $row = $result->fetch_row();
```

```

    printf("%d rows in table myCity (after rollback).\n", $row[0]);
    /* Free result */
    $result->close();
}

/* Drop table myCity */
$mysqli->query("DROP TABLE myCity");

$mysqli->close();
?>

```

Example 20.121. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* disable autocommit */
mysqli_autocommit($link, FALSE);

mysqli_query($link, "CREATE TABLE myCity LIKE City");
mysqli_query($link, "ALTER TABLE myCity Type=InnoDB");
mysqli_query($link, "INSERT INTO myCity SELECT * FROM City LIMIT 50");

/* commit insert */
mysqli_commit($link);

/* delete all rows */
mysqli_query($link, "DELETE FROM myCity");

if ($result = mysqli_query($link, "SELECT COUNT(*) FROM myCity")) {
    $row = mysqli_fetch_row($result);
    printf("%d rows in table myCity.\n", $row[0]);
    /* Free result */
    mysqli_free_result($result);
}

/* Rollback */
mysqli_rollback($link);

if ($result = mysqli_query($link, "SELECT COUNT(*) FROM myCity")) {
    $row = mysqli_fetch_row($result);
    printf("%d rows in table myCity (after rollback).\n", $row[0]);
    /* Free result */
    mysqli_free_result($result);
}

/* Drop table myCity */
mysqli_query($link, "DROP TABLE myCity");

mysqli_close($link);
?>

```

The above example will output:

```

0 rows in table myCity.
50 rows in table myCity (after rollback).

```

- `mysqli::select_db`

`mysqli_select_db`

Selects the default database for database queries

Description

Object oriented style (method):

```
bool mysqli::select_db(string dbname);
```

Procedural style:

```
bool mysqli_select_db(mysqli link,
                     string dbname);
```

Selects the default database to be used when performing queries against the database connection.

Note

This function should only be used to change the default database for the connection. You can select the default database with 4th parameter in `mysqli_connect`.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

dbname The database name.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.122. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "test");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* return name of current default database */
if ($result = $mysqli->query("SELECT DATABASE()")) {
    $row = $result->fetch_row();
    printf("Default database is %s.\n", $row[0]);
    $result->close();
}

/* change db to world db */
$mysqli->select_db("world");

/* return name of current default database */
if ($result = $mysqli->query("SELECT DATABASE()")) {
    $row = $result->fetch_row();
    printf("Default database is %s.\n", $row[0]);
    $result->close();
}

$mysqli->close();
?>
```

Example 20.123. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* return name of current default database */
if ($result = mysqli_query($link, "SELECT DATABASE())) {
    $row = mysqli_fetch_row($result);
    printf("Default database is %s.\n", $row[0]);
    mysqli_free_result($result);
}

/* change db to world db */
mysqli_select_db($link, "world");

/* return name of current default database */
if ($result = mysqli_query($link, "SELECT DATABASE())) {
    $row = mysqli_fetch_row($result);
    printf("Default database is %s.\n", $row[0]);
    mysqli_free_result($result);
}

mysqli_close($link);
?>

```

The above example will output:

```

Default database is test.
Default database is world.

```

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli::set_charset](#)
[mysqli_set_charset](#)

Sets the default client character set

Description

Object oriented style (method):

```
bool mysqli::set_charset(string charset);
```

Procedural style:

```
bool mysqli_set_charset(mysqli link,
                        string charset);
```

Sets the default character set to be used when sending data from and to the database server.

Parameters

link

Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

charset

The charset to be set as default.

Return ValuesReturns **TRUE** on success or **FALSE** on failure.**Notes****Note**

To use this function on a Windows platform you need MySQL client library version 4.1.11 or above (for MySQL 5.0 you need 5.0.6 or above).

Note

This is the preferred way to change the charset. Using `mysqli::query` to execute `SET NAMES ..` is not recommended.

Examples**Example 20.124. Object oriented style**

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "test");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* change character set to utf8 */
if (!$mysqli->set_charset("utf8")) {
    printf("Error loading character set utf8: %s\n", $mysqli->error);
} else {
    printf("Current character set: %s\n", $mysqli->character_set_name());
}

$mysqli->close();
?>
```

Example 20.125. Procedural style

```
<?php
$link = mysqli_connect('localhost', 'my_user', 'my_password', 'test');

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* change character set to utf8 */
if (!mysqli_set_charset($link, "utf8")) {
    printf("Error loading character set utf8: %s\n", mysqli_error($link));
} else {
    printf("Current character set: %s\n", mysqli_character_set_name($link));
}

mysqli_close($link);
?>
```

The above example will output:

```
Current character set: utf8
```

 Set callback function for `LOAD DATA LOCAL INFILE` command

Description

```
bool mysqli_set_local_infile_handler(mysqli link,  
                                     callback read_func);
```

Object oriented style (method)

```
mysqli {  
    bool set_local_infile_handler(mysqli link,  
                                 callback read_func);  
}
```

Set callback function for `LOAD DATA LOCAL INFILE` command

The callback task is to read input from the file specified in the `LOAD DATA LOCAL INFILE` and to reformat it into the format understood by `LOAD DATA INFILE`.

The returned data needs to match the format specified in the `LOAD DATA`

Parameters

<code>link</code>	Procedural style only: A link identifier returned by <code>mysqli_connect</code> or <code>mysqli_init</code>
<code>read_func</code>	A callback function or object method taking the following parameters:
<code>stream</code>	A PHP stream associated with the SQL commands <code>INFILE</code>
<code>&buffer</code>	A string buffer to store the rewritten input into
<code>buflen</code>	The maximum number of characters to be stored in the buffer
<code>&errmsg</code>	If an error occurs you can store an error message in here

The callback function should return the number of characters stored in the `buffer` or a negative value if an error occurred.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.126. Object oriented style

```
<?php
$db = mysqli_init();
$db->real_connect("localhost","root","","test");

function callme($stream, &$buffer, $buflen, &$errmsg)
{
    $buffer = fgets($stream);

    echo $buffer;

    // convert to upper case and replace "," delimiter with [TAB]
    $buffer = strtoupper(str_replace(",","\\t", $buffer));

    return strlen($buffer);
}

echo "Input:\\n";

$db->set_local_infile_handler("callme");
$db->query("LOAD DATA LOCAL INFILE 'input.txt' INTO TABLE t1");
$db->set_local_infile_default();

$res = $db->query("SELECT * FROM t1");

echo "\\nResult:\\n";
while ($row = $res->fetch_assoc()) {
    echo join(", ", $row). "\\n";
}
?>
```

Example 20.127. Procedural style

```
<?php
$db = mysqli_init();
mysqli_real_connect($db, "localhost","root","","test");

function callme($stream, &$buffer, $buflen, &$errmsg)
{
```

```

$buffer = fgets($stream);

echo $buffer;

// convert to upper case and replace "," delimiter with [TAB]
$buffer = strtoupper(str_replace(",","\\t", $buffer));

return strlen($buffer);
}

echo "Input:\\n";

mysqli_set_local_infile_handler($db, "callme");
mysqli_query($db, "LOAD DATA LOCAL INFILE 'input.txt' INTO TABLE t1");
mysqli_set_local_infile_default($db);

$res = mysqli_query($db, "SELECT * FROM t1");

echo "\\nResult:\\n";
while ($row = mysqli_fetch_assoc($res)) {
    echo join(", ", $row). "\\n";
}
?>

```

The above example will output:

```

Input:
23,foo
42,bar

Output:
23,FOO
42,BAR

```

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli->sqlstate](#)
- [mysqli_sqlstate](#)

Returns the SQLSTATE error from previous MySQL operation

Description

Object oriented style (property):

```

mysqli {
    string sqlstate ;
}

```

Procedural style:

```

string mysqli_sqlstate(mysqli link);

```

Returns a string containing the SQLSTATE error code for the last error. The error code consists of five characters. '00000' means no error. The values are specified by ANSI SQL and ODBC. For a list of possible values, see <http://dev.mysql.com/doc/mysql/en/error-handling.html>.

Note

Note that not all MySQL errors are yet mapped to SQLSTATE's. The value `HY000` (general error) is used for un-mapped errors.

Parameters

link

Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns a string containing the SQLSTATE error code for the last error. The error code consists of five characters. `'00000'` means no error.

Examples**Example 20.128. Object oriented style**

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Table City already exists, so we should get an error */
if (!$mysqli->query("CREATE TABLE City (ID INT, Name VARCHAR(30))")) {
    printf("Error - SQLSTATE %s.\n", $mysqli->sqlstate);
}

$mysqli->close();
?>
```

Example 20.129. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Table City already exists, so we should get an error */
if (!$mysqli_query($link, "CREATE TABLE City (ID INT, Name VARCHAR(30))")) {
    printf("Error - SQLSTATE %s.\n", mysqli_sqlstate($link));
}

mysqli_close($link);
?>
```

The above example will output:

```
Error - SQLSTATE 42S01.
```

`mysqli_errno`
`mysqli_error`

20.11.2.6.43. `mysqli::ssl_set`, `mysqli_ssl_set`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli::ssl_set`
`mysqli_ssl_set`

Used for establishing secure connections using SSL

Description

Object oriented style (method):

```
bool mysqli::ssl_set(string key,
                    string cert,
                    string ca,
                    string capath,
                    string cipher);
```

Procedural style:

```
bool mysqli_ssl_set(mysqli link,
                    string key,
                    string cert,
                    string ca,
                    string capath,
                    string cipher);
```

Used for establishing secure connections using SSL. It must be called before `mysqli_real_connect`. This function does nothing unless OpenSSL support is enabled.

Parameters

<i>link</i>	Procedural style only: A link identifier returned by <code>mysqli_connect</code> or <code>mysqli_init</code>
<i>key</i>	The path name to the key file.
<i>cert</i>	The path name to the certificate file.
<i>ca</i>	The path name to the certificate authority file.
<i>capath</i>	The pathname to a directory that contains trusted SSL CA certificates in PEM format.
<i>cipher</i>	A list of allowable ciphers to use for SSL encryption.

Any unused SSL parameters may be given as `NULL`

Return Values

This function always returns `TRUE` value. If SSL setup is incorrect `mysqli_real_connect` will return an error when you attempt to connect.

See Also

`mysqli_options`
`mysqli_real_connect`

20.11.2.6.44. `mysqli::stat`, `mysqli_stat`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli::stat`

`mysqli_stat`

Gets the current system status

Description

Object oriented style (method):

```
string mysqli::stat();
```

Procedural style:

```
string mysqli_stat(mysqli link);
```

`mysqli_stat` returns a string containing information similar to that provided by the 'mysqladmin status' command. This includes uptime in seconds and the number of running threads, questions, reloads, and open tables.

Parameters*link*

Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

A string describing the server status. `FALSE` if an error occurred.

Examples**Example 20.130. Object oriented style**

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

printf ("System status: %s\n", $mysqli->stat());

$mysqli->close();
?>
```

Example 20.131. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

printf("System status: %s\n", mysqli_stat($link));

mysqli_close($link);
?>
```

The above example will output:

```
System status: Uptime: 272  Threads: 1  Questions: 5340  Slow queries: 0
Opens: 13  Flush tables: 1  Open tables: 0  Queries per second avg: 19.632
Memory in use: 8496K  Max memory used: 8560K
```

See Also

20.11.2.6.45. `mysqli::stmt_init`, `mysqli_stmt_init`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli::stmt_init`

`mysqli_stmt_init`

Initializes a statement and returns an object for use with `mysqli_stmt_prepare`

Description

Object oriented style (property):

```
mysqli {
    mysqli_stmt stmt_init();
}
```

Procedural style :

```
mysqli_stmt mysqli_stmt_init(mysqli link);
```

Allocates and initializes a statement object suitable for `mysqli_stmt_prepare`.

Note

Any subsequent calls to any `mysqli_stmt` function will fail until `mysqli_stmt_prepare` was called.

Parameters

link

Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns an object.

See Also

`mysqli_stmt_prepare`

20.11.2.6.46. `mysqli::store_result`, `mysqli_store_result`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli::store_result`

`mysqli_store_result`

Transfers a result set from the last query

Description

Object oriented style (method):

```
mysqli_result store_result();
```

Procedural style:

```
mysqli_result mysqli_store_result(mysqli link);
```

Transfers the result set from the last query on the database connection represented by the *link* parameter to be used with the `mysqli_data_seek` function.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns a buffered result object or `FALSE` if an error occurred.

Note

`mysqli_store_result` returns `FALSE` in case the query didn't return a result set (if the query was, for example an INSERT statement). This function also returns `FALSE` if the reading of the result set failed. You can check if you have got an error by checking if `mysqli_error` doesn't return an empty string, if `mysqli_errno` returns a non zero value, or if `mysqli_field_count` returns a non zero value. Also possible reason for this function returning `FALSE` after successful call to `mysqli_query` can be too large result set (memory for it cannot be allocated). If `mysqli_field_count` returns a non-zero value, the statement should have produced a non-empty result set.

Notes**Note**

Although it is always good practice to free the memory used by the result of a query using the `mysqli_free_result` function, when transferring large result sets using the `mysqli_store_result` this becomes particularly important.

Examples

See `mysqli_multi_query`.

See Also

`mysqli_real_query`
`mysqli_use_result`

20.11.2.6.47. `mysqli::thread_id`, `mysqli_thread_id`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli::thread_id`
`mysqli_thread_id`

Returns the thread ID for the current connection

Description

Object oriented style (property):

```
mysqli {
    int thread_id ;
}
```

Procedural style:

```
int mysqli_thread_id(mysqli link);
```

The `mysqli_thread_id` function returns the thread ID for the current connection which can then be killed using the `mysqli_kill` function. If the connection is lost and you reconnect with `mysqli_ping`, the thread ID will be other. Therefore you should get the thread ID only when you need it.

Note

The thread ID is assigned on a connection-by-connection basis. Hence, if the connection is broken and then re-established a new thread ID will be assigned.

To kill a running query you can use the SQL command `KILL QUERY processid`.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns the Thread ID for the current connection.

Examples

Example 20.132. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* determine our thread id */
$thread_id = $mysqli->thread_id;

/* Kill connection */
$mysqli->kill($thread_id);

/* This should produce an error */
if (!$mysqli->query("CREATE TABLE myCity LIKE City")) {
    printf("Error: %s\n", $mysqli->error);
    exit;
}

/* close connection */
$mysqli->close();
?>
```

Example 20.133. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* determine our thread id */
$thread_id = mysqli_thread_id($link);

/* Kill connection */
mysqli_kill($link, $thread_id);

/* This should produce an error */
if (!mysqli_query($link, "CREATE TABLE myCity LIKE City")) {
    printf("Error: %s\n", mysqli_error($link));
}
```

```
    exit;
}
/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Error: MySQL server has gone away
```

See Also

[mysqli_kill](#)

20.11.2.6.48. [mysqli::thread_safe](#), [mysqli_thread_safe](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli::thread_safe](#)
[mysqli_thread_safe](#)

Returns whether thread safety is given or not

Description

Procedural style:

```
bool mysqli_thread_safe();
```

Tells whether the client library is compiled as thread-safe.

Return Values

`TRUE` if the client library is thread-safe, otherwise `FALSE` .

20.11.2.6.49. [mysqli::use_result](#), [mysqli_use_result](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli::use_result](#)
[mysqli_use_result](#)

Initiate a result set retrieval

Description

Object oriented style (method):

```
mysqli_result use_result();
```

Procedural style:

```
mysqli_result mysqli_use_result(mysqli link);
```

Used to initiate the retrieval of a result set from the last query executed using the [mysqli_real_query](#) function on the database connection.

Either this or the `mysqli_store_result` function must be called before the results of a query can be retrieved, and one or the other must be called to prevent the next query on that database connection from failing.

Note

The `mysqli_use_result` function does not transfer the entire result set from the database and hence cannot be used functions such as `mysqli_data_seek` to move to a particular row within the set. To use this functionality, the result set must be stored using `mysqli_store_result`. One should not use `mysqli_use_result` if a lot of processing on the client side is performed, since this will tie up the server and prevent other threads from updating any tables from which the data is being fetched.

Return Values

Returns an unbuffered result object or `FALSE` if an error occurred.

Examples

Example 20.134. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT CURRENT_USER();";
$query .= "SELECT Name FROM City ORDER BY ID LIMIT 20, 5";

/* execute multi query */
if ($mysqli->multi_query($query)) {
    do {
        /* store first result set */
        if ($result = $mysqli->use_result()) {
            while ($row = $result->fetch_row()) {
                printf("%s\n", $row[0]);
            }
            $result->close();
        }
        /* print divider */
        if ($mysqli->more_results()) {
            printf("-----\n");
        }
    } while ($mysqli->next_result());
}

/* close connection */
$mysqli->close();
?>
```

Example 20.135. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT CURRENT_USER();";
$query .= "SELECT Name FROM City ORDER BY ID LIMIT 20, 5";

/* execute multi query */
if (mysqli_multi_query($link, $query)) {
    do {
        /* store first result set */
        if ($result = mysqli_use_result($link)) {
            while ($row = mysqli_fetch_row($result)) {
                printf("%s\n", $row[0]);
            }
            mysqli_free_result($result);
        }
        /* print divider */
        if (mysqli_more_results($link)) {
            printf("-----\n");
        }
    } while (mysqli_next_result($link));
}
```

```

    }
  } while (mysqli_next_result($link));
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

my_user@localhost
-----
Amersfoort
Maastricht
Dordrecht
Leiden
Haarlemmermeer

```

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli::warning_count](#)
[mysqli_warning_count](#)

Returns the number of warnings from the last query for the given link

Description

Object oriented style (property):

```

mysqli {
    int warning_count ;
}

```

Procedural style:

```

int mysqli_warning_count(mysqli link);

```

Returns the number of warnings from the last query in the connection.

Note

For retrieving warning messages you can use the SQL command `SHOW WARNINGS [limit row_count]`.

Parameters

link Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

Return Values

Number of warnings or zero if there are no warnings.

Examples

Example 20.136. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCity LIKE City");

/* a remarkable city in Wales */
$query = "INSERT INTO myCity (CountryCode, Name) VALUES('GBR',
'Llanfairpwllgwyngyllgogerychwyrndrobwlllllantysiliogogoch)";

$mysqli->query($query);

if ($mysqli->warning_count) {
    if ($result = $mysqli->query("SHOW WARNINGS")) {
        $row = $result->fetch_row();
        printf("%s (%d): %s\n", $row[0], $row[1], $row[2]);
        $result->close();
    }
}

/* close connection */
$mysqli->close();
?>
```

Example 20.137. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCity LIKE City");

/* a remarkable long city name in Wales */
$query = "INSERT INTO myCity (CountryCode, Name) VALUES('GBR',
'Llanfairpwllgwyngyllgogerychwyrndrobwlllllantysiliogogoch)";

mysqli_query($link, $query);

if (mysqli_warning_count($link)) {
    if ($result = mysqli_query($link, "SHOW WARNINGS")) {
        $row = mysqli_fetch_row($result);
        printf("%s (%d): %s\n", $row[0], $row[1], $row[2]);
        mysqli_free_result($result);
    }
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Warning (1264): Data truncated for column 'Name' at row 1
```

20.11.2.7.1. `mysqli_stmt->affected_rows`, `mysqli_stmt_affected_rows`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_stmt->affected_rows`
`mysqli_stmt_affected_rows`

Returns the total number of rows changed, deleted, or inserted by the last executed statement

Description

Object oriented style (property):

```

mysqli_stmt {
    int affected_rows ;
}

```

Procedural style :

```

int mysqli_stmt_affected_rows(mysqli_stmt stmt);

```

Returns the number of rows affected by `INSERT`, `UPDATE`, or `DELETE` query.

This function only works with queries which update a table. In order to get the number of rows from a `SELECT` query, use `mysqli_stmt_num_rows` instead.

Parameters

stmt Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

An integer greater than zero indicates the number of rows affected or retrieved. Zero indicates that no records were updated for an `UPDATE/DELETE` statement, no rows matched the `WHERE` clause in the query or that no query has yet been executed. -1 indicates that the query has returned an error. `NULL` indicates an invalid argument was supplied to the function.

Note

If the number of affected rows is greater than maximal PHP int value, the number of affected rows will be returned as

█ a string value.

Examples

Example 20.138. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* create temp table */
$mysqli->query("CREATE TEMPORARY TABLE myCountry LIKE Country");

$query = "INSERT INTO myCountry SELECT * FROM Country WHERE Code LIKE ?";

/* prepare statement */
if ($stmt = $mysqli->prepare($query)) {

    /* Bind variable for placeholder */
    $code = 'A%';
    $stmt->bind_param("s", $code);

    /* execute statement */
    $stmt->execute();

    printf("rows inserted: %d\n", $stmt->affected_rows);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.139. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* create temp table */
mysqli_query($link, "CREATE TEMPORARY TABLE myCountry LIKE Country");

$query = "INSERT INTO myCountry SELECT * FROM Country WHERE Code LIKE ?";

/* prepare statement */
if ($stmt = mysqli_prepare($link, $query)) {

    /* Bind variable for placeholder */
    $code = 'A%';
    mysqli_stmt_bind_param($stmt, "s", $code);

    /* execute statement */
    mysqli_stmt_execute($stmt);

    printf("rows inserted: %d\n", mysqli_stmt_affected_rows($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
rows inserted: 17
```

```
mysqli_stmt_num_rows  
mysqli_prepare
```

20.11.2.7.2. `mysqli_stmt::attr_get`, `mysqli_stmt_attr_get`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_stmt::attr_get`
`mysqli_stmt_attr_get`

Used to get the current value of a statement attribute

Description

Object oriented style (method):

```
int mysqli_stmt::attr_get(int attr);
```

Procedural style:

```
int mysqli_stmt_attr_get(mysqli_stmt stmt,  
int attr);
```

Gets the current value of a statement attribute.

Parameters

- | | |
|-------------------|---|
| <code>stmt</code> | Procedural style only: A statement identifier returned by <code>mysqli_stmt_init</code> . |
| <code>attr</code> | The attribute that you want to get. |

Return Values

Returns `FALSE` if the attribute is not found, otherwise returns the value of the attribute.

20.11.2.7.3. `mysqli_stmt::attr_set`, `mysqli_stmt_attr_set`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_stmt::attr_set`
`mysqli_stmt_attr_set`

Used to modify the behavior of a prepared statement

Description

Object oriented style (method):

```
bool mysqli_stmt::attr_set(int attr,  
int mode);
```

Procedural style:

```
bool mysqli_stmt_attr_set(mysqli_stmt stmt,
                          int attr,
                          int mode);
```

Used to modify the behavior of a prepared statement. This function may be called multiple times to set several attributes.

Parameters

stmt Procedural style only: A statement identifier returned by `mysqli_stmt_init`.
attr The attribute that you want to set. It can have one of the following values:

Table 20.11. Attribute values

Character	Description
MYSQLI_STMT_ATTR_UPDATE_MAX_LENGTH	If set to 1, causes <code>mysqli_stmt_store_result</code> to update the metadata <code>MYSQL_FIELD->max_length</code> value.
MYSQLI_STMT_ATTR_CURSOR_TYPE	Type of cursor to open for statement when <code>mysqli_stmt_execute</code> is invoked. <i>mode</i> can be <code>MYSQLI_CURSOR_TYPE_NO_CURSOR</code> (the default) or <code>MYSQLI_CURSOR_TYPE_READ_ONLY</code> .
MYSQLI_STMT_ATTR_PREFETCH_ROWS	Number of rows to fetch from server at a time when using a cursor. <i>mode</i> can be in the range from 1 to the maximum value of unsigned long. The default is 1.

If you use the `MYSQLI_STMT_ATTR_CURSOR_TYPE` option with `MYSQLI_CURSOR_TYPE_READ_ONLY`, a cursor is opened for the statement when you invoke `mysqli_stmt_execute`. If there is already an open cursor from a previous `mysqli_stmt_execute` call, it closes the cursor before opening a new one. `mysqli_stmt_reset` also closes any open cursor before preparing the statement for re-execution. `mysqli_stmt_free_result` closes any open cursor.

If you open a cursor for a prepared statement, `mysqli_stmt_store_result` is unnecessary.

mode The value to assign to the attribute.

20.11.2.7.4. `mysqli_stmt::bind_param`, `mysqli_stmt_bind_param`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_stmt::bind_param`
`mysqli_stmt_bind_param`
 Binds variables to a prepared statement as parameters

Description

Object oriented style (method):

```
bool mysqli_stmt::bind_param(string types,
                             mixed var1,
                             mixed ...);
```

Procedural style:

```
bool mysqli_stmt_bind_param(mysqli_stmt stmt,
                             string types,
                             mixed var1,
                             mixed ...);
```

Bind variables for the parameter markers in the SQL statement that was passed to `mysqli_prepare`.

Note

If data size of a variable exceeds max. allowed packet size (`max_allowed_packet`), you have to specify `b` in `types` and use `mysqli_stmt_send_long_data` to send the data in packets.

Parameters

`stmt` Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

`types` A string that contains one or more characters which specify the types for the corresponding bind variables:

Table 20.12. Type specification chars

Character	Description
i	corresponding variable has type integer
d	corresponding variable has type double
s	corresponding variable has type string
b	corresponding variable is a blob and will be sent in packets

`var1` The number of variables and length of string `types` must match the parameters in the statement.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples**Example 20.140. Object oriented style**

```
<?php
$mysqli = new mysqli('localhost', 'my_user', 'my_password', 'world');

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$stmt = $mysqli->prepare("INSERT INTO CountryLanguage VALUES (?, ?, ?, ?)");
$stmt->bind_param('sssd', $code, $language, $official, $percent);

$code = 'DEU';
$language = 'Bavarian';
$official = "F";
$percent = 11.2;

/* execute prepared statement */
$stmt->execute();

printf("%d Row inserted.\n", $stmt->affected_rows);

/* close statement and connection */
$stmt->close();

/* Clean up table CountryLanguage */
$mysqli->query("DELETE FROM CountryLanguage WHERE Language='Bavarian'");
printf("%d Row deleted.\n", $mysqli->affected_rows);

/* close connection */
$mysqli->close();
?>
```

Example 20.141. Procedural style

```

<?php
$link = mysqli_connect('localhost', 'my_user', 'my_password', 'world');

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$stmt = mysqli_prepare($link, "INSERT INTO CountryLanguage VALUES (?, ?, ?, ?)");
mysqli_stmt_bind_param($stmt, 'sssd', $code, $language, $official, $percent);

$code = 'DEU';
$language = 'Bavarian';
$official = "F";
$percent = 11.2;

/* execute prepared statement */
mysqli_stmt_execute($stmt);

printf("%d Row inserted.\n", mysqli_stmt_affected_rows($stmt));

/* close statement and connection */
mysqli_stmt_close($stmt);

/* Clean up table CountryLanguage */
mysqli_query($link, "DELETE FROM CountryLanguage WHERE Language='Bavarian'");
printf("%d Row deleted.\n", mysqli_affected_rows($link));

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

1 Row inserted.
1 Row deleted.

```

- [mysqli_stmt::bind_result](#)

[mysqli_stmt_bind_result](#)

Binds variables to a prepared statement for result storage

Description

Object oriented style (method):

```

bool mysqli_stmt::bind_result(mixed var1,
                             mixed ...);

```

Procedural style:

```

bool mysqli_stmt_bind_result(mysqli_stmt stmt,
                             mixed var1,
                             mixed ...);

```

Binds columns in the result set to variables.

When `mysqli_stmt_fetch` is called to fetch data, the MySQL client/server protocol places the data for the bound columns into the specified variables `var1,`

Note

Note that all columns must be bound after `mysqli_stmt_execute` and prior to calling `mysqli_stmt_fetch`. Depending on column types bound variables can silently change to the corresponding PHP type.

A column can be bound or rebound at any time, even after a result set has been partially retrieved. The new binding takes effect the next time `mysqli_stmt_fetch` is called.

Parameters

<code>stmt</code>	Procedural style only: A statement identifier returned by <code>mysqli_stmt_init</code> .
<code>var1</code>	The variable to be bound.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.142. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* prepare statement */
if ($stmt = $mysqli->prepare("SELECT Code, Name FROM Country ORDER BY Name LIMIT 5")) {
    $stmt->execute();

    /* bind variables to prepared statement */
    $stmt->bind_result($col1, $col2);

    /* fetch values */
    while ($stmt->fetch()) {
        printf("%s %s\n", $col1, $col2);
    }

    /* close statement */
    $stmt->close();
}
/* close connection */
$mysqli->close();

?>
```

Example 20.143. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* prepare statement */
if ($stmt = mysqli_prepare($link, "SELECT Code, Name FROM Country ORDER BY Name LIMIT 5")) {
    mysqli_stmt_execute($stmt);

    /* bind variables to prepared statement */
    mysqli_stmt_bind_result($stmt, $col1, $col2);
```

```
/* fetch values */
while (mysqli_stmt_fetch($stmt)) {
    printf("%s %s\n", $col1, $col2);
}

/* close statement */
mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
AFG Afghanistan
ALB Albania
DZA Algeria
ASM American Samoa
AND Andorra
```

20.11.2.7.6. `mysqli_stmt::close`, `mysqli_stmt_close`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_stmt::close`

`mysqli_stmt_close`

Closes a prepared statement

Description

Object oriented style (method):

```
bool mysqli_stmt::close();
```

Procedural style:

```
bool mysqli_stmt_close(mysqli_stmt stmt);
```

Closes a prepared statement. `mysqli_stmt_close` also deallocates the statement handle. If the current statement has pending or unread results, this function cancels them so that the next query can be executed.

Parameters

stmt

Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

See Also

`mysqli_prepare`

20.11.2.7.7. `mysqli_stmt::data_seek`, `mysqli_stmt_data_seek`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_stmt::data_seek`
`mysqli_stmt_data_seek`

Seeks to an arbitrary row in statement result set

Description

Object oriented style (method):

```
void mysqli_stmt::data_seek(int offset);
```

Procedural style:

```
void mysqli_stmt_data_seek(mysqli_stmt stmt,
int offset);
```

Seeks to an arbitrary result pointer in the statement result set.

`mysqli_stmt_store_result` must be called prior to `mysqli_stmt_data_seek`.

Parameters

<code>stmt</code>	Procedural style only: A statement identifier returned by <code>mysqli_stmt_init</code> .
<code>offset</code>	Must be between zero and the total number of rows minus one (0.. <code>mysqli_stmt_num_rows - 1</code>).

Return Values

No value is returned.

Examples

Example 20.144. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";
if ($stmt = $mysqli->prepare($query)) {

    /* execute query */
    $stmt->execute();

    /* bind result variables */
    $stmt->bind_result($name, $code);

    /* store result */
    $stmt->store_result();

    /* seek to row no. 400 */
```

```

$stmt->data_seek(399);

/* fetch values */
$stmt->fetch();

printf ("City: %s Countrycode: %s\n", $name, $code);

/* close statement */
$stmt->close();
}

/* close connection */
mysqli->close();
?>

```

Example 20.145. Procedural style

```

<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";
if ($stmt = mysqli_prepare($link, $query)) {

    /* execute query */
    mysqli_stmt_execute($stmt);

    /* bind result variables */
    mysqli_stmt_bind_result($stmt, $name, $code);

    /* store result */
    mysqli_stmt_store_result($stmt);

    /* seek to row no. 400 */
    mysqli_stmt_data_seek($stmt, 399);

    /* fetch values */
    mysqli_stmt_fetch($stmt);

    printf ("City: %s Countrycode: %s\n", $name, $code);

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
City: Benin City Countrycode: NGA
```

[mysqli_prepare](#)

20.11.2.7.8. [mysqli_stmt->errno](#), [mysqli_stmt_errno](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli_stmt->errno](#)

`mysqli_stmt_errno`

Returns the error code for the most recent statement call

Description

Object oriented style (property):

```
mysqli_stmt {
    int errno ;
}
```

Procedural style :

```
int mysqli_stmt_errno(mysqli_stmt stmt);
```

Returns the error code for the most recently invoked statement function that can succeed or fail.

Client error message numbers are listed in the MySQL [errmsg.h](#) header file, server error message numbers are listed in [mysqld_error.h](#). In the MySQL source distribution you can find a complete list of error messages and error numbers in the file [Docs/mysqld_error.txt](#).

Parameters

stmt Procedural style only: A statement identifier returned by [mysqli_stmt_init](#).

Return Values

An error code value. Zero means no error occurred.

Examples**Example 20.146. Object oriented style**

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCountry LIKE Country");
$mysqli->query("INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = $mysqli->prepare($query)) {

    /* drop table */
    $mysqli->query("DROP TABLE myCountry");

    /* execute query */
    $stmt->execute();

    printf("Error: %d.\n", $stmt->errno);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.147. Procedural style

```

<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCountry LIKE Country");
mysqli_query($link, "INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = mysqli_prepare($link, $query)) {

    /* drop table */
    mysqli_query($link, "DROP TABLE myCountry");

    /* execute query */
    mysqli_stmt_execute($stmt);

    printf("Error: %d.\n", mysqli_stmt_errno($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
Error: 1146.
```

- [mysqli_stmt->error](#)
[mysqli_stmt_error](#)

Returns a string description for last statement error

Description

Object oriented style (property):

```

mysqli_stmt {
    string error ;
}

```

Procedural style:

```
string mysqli_stmt_error(mysqli_stmt stmt);
```

Returns a containing the error message for the most recently invoked statement function that can succeed or fail.

Parameters

stmt Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

A string that describes the error. An empty string if no error occurred.

Examples

Example 20.148. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCountry LIKE Country");
$mysqli->query("INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = $mysqli->prepare($query)) {

    /* drop table */
    $mysqli->query("DROP TABLE myCountry");

    /* execute query */
    $stmt->execute();

    printf("Error: %s.\n", $stmt->error);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.149. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCountry LIKE Country");
mysqli_query($link, "INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = mysqli_prepare($link, $query)) {

    /* drop table */
    mysqli_query($link, "DROP TABLE myCountry");

    /* execute query */
    mysqli_stmt_execute($stmt);

    printf("Error: %s.\n", mysqli_stmt_error($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}
```

```
/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Error: Table 'world.myCountry' doesn't exist.
```

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli_stmt->execute](#)
[mysqli_stmt_execute](#)

Executes a prepared Query

Description

Object oriented style (method):

```
bool mysqli_stmt::execute();
```

Procedural style:

```
bool mysqli_stmt_execute(mysqli_stmt stmt);
```

Executes a query that has been previously prepared using the [mysqli_prepare](#) function. When executed any parameter markers which exist will automatically be replaced with the appropriate data.

If the statement is [UPDATE](#), [DELETE](#), or [INSERT](#), the total number of affected rows can be determined by using the [mysqli_stmt_affected_rows](#) function. Likewise, if the query yields a result set the [mysqli_stmt_fetch](#) function is used.

Note

When using [mysqli_stmt_execute](#), the [mysqli_stmt_fetch](#) function must be used to fetch the data prior to performing any additional queries.

Parameters

stmt Procedural style only: A statement identifier returned by [mysqli_stmt_init](#).

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

Examples

Example 20.150. Object oriented style

```

<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCity LIKE City");

/* Prepare an insert statement */
$query = "INSERT INTO myCity (Name, CountryCode, District) VALUES (?, ?, ?)";
$stmt = $mysqli->prepare($query);

$stmt->bind_param("sss", $val1, $val2, $val3);

$val1 = 'Stuttgart';
$val2 = 'DEU';
$val3 = 'Baden-Wuerttemberg';

/* Execute the statement */
$stmt->execute();

$val1 = 'Bordeaux';
$val2 = 'FRA';
$val3 = 'Aquitaine';

/* Execute the statement */
$stmt->execute();

/* close statement */
$stmt->close();

/* retrieve all rows from myCity */
$query = "SELECT Name, CountryCode, District FROM myCity";
if ($result = $mysqli->query($query)) {
    while ($row = $result->fetch_row()) {
        printf("%s (%s,%s)\n", $row[0], $row[1], $row[2]);
    }
    /* free result set */
    $result->close();
}

/* remove table */
$mysqli->query("DROP TABLE myCity");

/* close connection */
$mysqli->close();
?>

```

Example 20.151. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCity LIKE City");

/* Prepare an insert statement */
$query = "INSERT INTO myCity (Name, CountryCode, District) VALUES (?, ?, ?)";
$stmt = mysqli_prepare($link, $query);

mysqli_stmt_bind_param($stmt, "sss", $val1, $val2, $val3);

$val1 = 'Stuttgart';
$val2 = 'DEU';
$val3 = 'Baden-Wuerttemberg';

/* Execute the statement */
mysqli_stmt_execute($stmt);

$val1 = 'Bordeaux';
$val2 = 'FRA';
$val3 = 'Aquitaine';

/* Execute the statement */
mysqli_stmt_execute($stmt);

/* close statement */
mysqli_stmt_close($stmt);

```

```

/* retrieve all rows from myCity */
$query = "SELECT Name, CountryCode, District FROM myCity";
if ($result = mysqli_query($link, $query)) {
    while ($row = mysqli_fetch_row($result)) {
        printf("%s (%s,%s)\n", $row[0], $row[1], $row[2]);
    }
    /* free result set */
    mysqli_free_result($result);
}

/* remove table */
mysqli_query($link, "DROP TABLE myCity");

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Stuttgart (DEU,Baden-Wuerttemberg)
Bordeaux (FRA,Aquitaine)

```

Fetch results from a prepared statement into the bound variables

Description

Object oriented style (method):

```
bool mysqli_stmt::fetch();
```

Procedural style:

```
bool mysqli_stmt_fetch(mysqli_stmt stmt);
```

Fetch the result from a prepared statement into the variables bound by [mysqli_stmt_bind_result](#).

Note

Note that all columns must be bound by the application before calling [mysqli_stmt_fetch](#).

Note

Data are transferred unbuffered without calling [mysqli_stmt_store_result](#) which can decrease performance (but reduces memory cost).

Parameters

stmt

Procedural style only: A statement identifier returned by [mysqli_stmt_init](#).

Return Values**Table 20.13. Return Values**

Value	Description
TRUE	Success. Data has been fetched
FALSE	Error occurred
NULL	No more rows/data exists or data truncation occurred

Examples**Example 20.152. Object oriented style**

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 150,5";

if ($stmt = $mysqli->prepare($query)) {

    /* execute statement */
    $stmt->execute();

    /* bind result variables */
    $stmt->bind_result($name, $code);

    /* fetch values */
    while ($stmt->fetch()) {
        printf ("%s (%s)\n", $name, $code);
    }

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.153. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 150,5";

if ($stmt = mysqli_prepare($link, $query)) {

    /* execute statement */
    mysqli_stmt_execute($stmt);

    /* bind result variables */
    mysqli_stmt_bind_result($stmt, $name, $code);

    /* fetch values */
    while (mysqli_stmt_fetch($stmt)) {
        printf ("%s (%s)\n", $name, $code);
    }

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
```

```
?>
```

The above example will output:

```
Rockford (USA)
Tallahassee (USA)
Salinas (USA)
Santa Clarita (USA)
Springfield (USA)
```

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_stmt->field_count`
`mysqli_stmt_field_count`

Returns the number of field in the given statement

Description

```
mysqli_stmt {
    int field_count ;
}
```

```
int mysqli_stmt_field_count(mysqli_stmt stmt);
```

Warning

This function is currently not documented; only its argument list is available.

20.11.2.7.13. `stmt::free_result`, `mysqli_stmt_free_result`

Copyright 1997-2008 the PHP Documentation Group.

- `stmt::free_result`
`mysqli_stmt_free_result`

Frees stored result memory for the given statement handle

Description

Object oriented style (method):

```
void mysqli_stmt::free_result();
```

Procedural style:

```
void mysqli_stmt_free_result(mysqli_stmt stmt);
```

Frees the result memory associated with the statement, which was allocated by `mysqli_stmt_store_result`.

Parameters

`stmt` Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

No value is returned.

See Also

`mysqli_stmt_store_result`

    int insert_id ;
}
```

```
mixed mysqli_stmt_insert_id(mysqli_stmt stmt);
```

Warning

This function is currently not documented; only its argument list is available.

20.11.2.7.16. `mysqli_stmt::num_rows`, `mysqli_stmt_num_rows`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_stmt::num_rows`

`mysqli_stmt_num_rows`

Return the number of rows in statements result set

Description

Object oriented style (property):

```
mysqli_stmt {
    int num_rows ;
}
```

Procedural style :

```
int mysqli_stmt_num_rows(mysqli_stmt stmt);
```

Returns the number of rows in the result set. The use of `mysqli_stmt_num_rows` depends on whether or not you used `mysqli_stmt_store_result` to buffer the entire result set in the statement handle.

If you use `mysqli_stmt_store_result`, `mysqli_stmt_num_rows` may be called immediately.

Parameters

stmt Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

An integer representing the number of rows in result set.

Examples

Example 20.154. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = $mysqli->prepare($query)) {

    /* execute query */
    $stmt->execute();

    /* store result */
    $stmt->store_result();

    printf("Number of rows: %d.\n", $stmt->num_rows);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.155. Procedural style

```

<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = mysqli_prepare($link, $query)) {

    /* execute query */
    mysqli_stmt_execute($stmt);

    /* store result */
    mysqli_stmt_store_result($stmt);

    printf("Number of rows: %d.\n", mysqli_stmt_num_rows($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
Number of rows: 20.
```

20.11.2.7.17. [mysqli_stmt->param_count](#), [mysqli_stmt_param_count](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli_stmt->param_count](#)
[mysqli_stmt_param_count](#)

Returns the number of parameter for the given statement

Description

Object oriented style (property):

```

mysqli_stmt {
    int param_count ;
}

```

Procedural style:

```
int mysqli_stmt_param_count(mysqli_stmt stmt);
```

Returns the number of parameter markers present in the prepared statement.

Parameters

*stmt*Procedural style only: A statement identifier returned by `mysqli_stmt_init`.**Return Values**

Returns an integer representing the number of parameters.

Examples**Example 20.156. Object oriented style**

```

<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($stmt = $mysqli->prepare("SELECT Name FROM Country WHERE Name=? OR Code=?")) {

    $marker = $stmt->param_count;
    printf("Statement has %d markers.\n", $marker);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>

```

Example 20.157. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($stmt = mysqli_prepare($link, "SELECT Name FROM Country WHERE Name=? OR Code=?")) {

    $marker = mysqli_stmt_param_count($stmt);
    printf("Statement has %d markers.\n", $marker);

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

Statement has 2 markers.

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_stmt::prepare`
`mysqli_stmt_prepare`

Prepare a SQL statement for execution

Description

Object oriented style (method)

```
mixed mysqli_stmt::prepare(string query);
```

Procedure style:

```
bool mysqli_stmt_prepare(mysqli_stmt stmt,
                        string query);
```

Prepares the SQL query pointed to by the null-terminated string query.

The parameter markers must be bound to application variables using `mysqli_stmt_bind_param` and/or `mysqli_stmt_bind_result` before executing the statement or fetching rows.

Parameters

stmt

Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

query

The query, as a string. It must consist of a single SQL statement.

You can include one or more parameter markers in the SQL statement by embedding question mark (?) characters at the appropriate positions.

Note

You should not add a terminating semicolon or `\g` to the statement.

Note

The markers are legal only in certain places in SQL statements. For example, they are allowed in the VALUES() list of an INSERT statement (to specify column values for a row), or in a comparison with a column in a WHERE clause to specify a comparison value.

However, they are not allowed for identifiers (such as table or column names), in the select list that names the columns to be returned by a SELECT statement), or to specify both operands of a binary operator such as the = equal sign. The latter restriction is necessary because it would be impossible to determine the parameter type. In general, parameters are legal only in Data Manipulation Language (DML) statements, and not in Data Definition Language (DDL) statements.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.158. Object oriented style

```
<?php
mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$city = "Amersfoort";
```

```

/* create a prepared statement */
$stmt = $mysqli->stmt_init();
if ($stmt->prepare("SELECT District FROM City WHERE Name=?")) {

    /* bind parameters for markers */
    $stmt->bind_param("s", $city);

    /* execute query */
    $stmt->execute();

    /* bind result variables */
    $stmt->bind_result($district);

    /* fetch value */
    $stmt->fetch();

    printf("%s is in district %s\n", $city, $district);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>

```

Example 20.159. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$city = "Amersfoort";

/* create a prepared statement */
$stmt = mysqli_stmt_init($link);
if (mysqli_stmt_prepare($stmt, 'SELECT District FROM City WHERE Name=?')) {

    /* bind parameters for markers */
    mysqli_stmt_bind_param($stmt, "s", $city);

    /* execute query */
    mysqli_stmt_execute($stmt);

    /* bind result variables */
    mysqli_stmt_bind_result($stmt, $district);

    /* fetch value */
    mysqli_stmt_fetch($stmt);

    printf("%s is in district %s\n", $city, $district);

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
Amersfoort is in district Utrecht
```

20.11.2.7.19. `mysqli_stmt::reset`, `mysqli_stmt_reset`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_stmt::reset`
`mysqli_stmt_reset`
Resets a prepared statement

Description

Object oriented style (method):

```
bool mysqli_stmt::reset();
```

Procedural style:

```
bool mysqli_stmt_reset(mysqli_stmt stmt);
```

Resets a prepared statement on client and server to state after prepare.

For now this is mainly used to reset data sent with `mysqli_stmt_send_long_data`.

To prepare a statement with another query use function `mysqli_stmt_prepare`.

Parameters

stmt Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

See Also

`mysqli_prepare`

20.11.2.7.20. `mysqli_stmt::result_metadata`, `mysqli_stmt_result_metadata`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_stmt::result_metadata`
`mysqli_stmt_result_metadata`
Returns result set metadata from a prepared statement

Description

Object oriented style (method):

```
mysqli_result mysqli_stmt::result_metadata();
```

Procedural style:

```
mysqli_result mysqli_stmt_result_metadata(mysqli_stmt stmt);
```

If a statement passed to `mysqli_prepare` is one that produces a result set, `mysqli_stmt_result_metadata` returns the result object that can be used to process the meta information such as total number of fields and individual field information.

■ Note

This result set pointer can be passed as an argument to any of the field-based functions that process result set metadata, such as:

- `mysqli_num_fields`
- `mysqli_fetch_field`
- `mysqli_fetch_field_direct`
- `mysqli_fetch_fields`
- `mysqli_field_count`
- `mysqli_field_seek`
- `mysqli_field_tell`
- `mysqli_free_result`

The result set structure should be freed when you are done with it, which you can do by passing it to `mysqli_free_result`

Note

The result set returned by `mysqli_stmt_result_metadata` contains only metadata. It does not contain any row results. The rows are obtained by using the statement handle with `mysqli_stmt_fetch`.

Parameters

stmt Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

Returns a result object or `FALSE` if an error occurred.

Examples

Example 20.160. Object oriented style

```
<?php
mysqli = new mysqli("localhost", "my_user", "my_password", "test");

mysqli->query("DROP TABLE IF EXISTS friends");
mysqli->query("CREATE TABLE friends (id int, name varchar(20))");

mysqli->query("INSERT INTO friends VALUES (1,'Hartmut'), (2, 'Ulf')");

$stmt = mysqli->prepare("SELECT id,name FROM friends");
$stmt->execute();

/* get resultset for metadata */
$result = $stmt->result_metadata();

/* retrieve field information from metadata result set */
$field = $result->fetch_field();

printf("Fieldname: %s\n", $field->name);

/* close resultset */
$result->close();

/* close connection */
mysqli->close();
?>
```

Example 20.161. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

mysqli_query($link, "DROP TABLE IF EXISTS friends");
mysqli_query($link, "CREATE TABLE friends (id int, name varchar(20))");

mysqli_query($link, "INSERT INTO friends VALUES (1, 'Hartmut'), (2, 'Ulf')");

$stmt = mysqli_prepare($link, "SELECT id, name FROM friends");
mysqli_stmt_execute($stmt);

/* get resultset for metadata */
$result = mysqli_stmt_result_metadata($stmt);

/* retrieve field information from metadata result set */
$field = mysqli_fetch_field($result);

printf("Fieldname: %s\n", $field->name);

/* close resultset */
mysqli_free_result($result);

/* close connection */
mysqli_close($link);
?>

```

See Also

[mysqli_prepare](#)
[mysqli_free_result](#)

20.11.2.7.21. [mysqli_stmt::send_long_data](#), [mysqli_stmt_send_long_data](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli_stmt::send_long_data](#)
[mysqli_stmt_send_long_data](#)

Send data in blocks

Description

Object oriented style (method)

```
bool mysqli_stmt::send_long_data(int param_nr,
                                string data);
```

Procedural style:

```
bool mysqli_stmt_send_long_data(mysqli_stmt stmt,
                                int param_nr,
                                string data);
```

Allows to send parameter data to the server in pieces (or chunks), e.g. if the size of a blob exceeds the size of [max_allowed_packet](#). This function can be called multiple times to send the parts of a character or binary data value for a column, which must be one of the TEXT or BLOB datatypes.

Parameters

<i>stmt</i>	Procedural style only: A statement identifier returned by mysqli_stmt_init .
<i>param_nr</i>	Indicates which parameter to associate the data with. Parameters are numbered beginning with 0.
<i>data</i>	A string containing data to be sent.

Return Values

Returns **TRUE** on success or **FALSE** on failure.

Examples

Example 20.162. Object oriented style

```
<?php
$stmt = $mysqli->prepare("INSERT INTO messages (message) VALUES (?");
>null = NULL;
$stmt->bind_param("b", $null);
$fp = fopen("messages.txt", "r");
while (!feof($fp)) {
    $stmt->send_long_data(0, fread($fp, 8192));
}
fclose($fp);
$stmt->execute();
?>
```

`mysqli_prepare`
`mysqli_stmt_bind_param`

20.11.2.7.22. `mysqli_stmt::sqlstate`, `mysqli_stmt_sqlstate`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_stmt::sqlstate`
`mysqli_stmt_sqlstate`

Returns SQLSTATE error from previous statement operation

Description

Object oriented style (property):

```
mysqli_stmt {
    string sqlstate ;
}
```

Procedural style:

```
string mysqli_stmt_sqlstate(mysqli_stmt stmt);
```

Returns a string containing the SQLSTATE error code for the most recently invoked prepared statement function that can succeed or fail. The error code consists of five characters. '00000' means no error. The values are specified by ANSI SQL and ODBC. For a list of possible values, see <http://dev.mysql.com/doc/mysql/en/error-handling.html>.

Parameters

stmt

Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

Returns a string containing the SQLSTATE error code for the last error. The error code consists of five characters. '00000' means no error.

Notes

■ Note

Note that not all MySQL errors are yet mapped to SQLSTATE's. The value `HY000` (general error) is used for un-mapped errors.

Examples

Example 20.163. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCountry LIKE Country");
$mysqli->query("INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = $mysqli->prepare($query)) {

    /* drop table */
    $mysqli->query("DROP TABLE myCountry");

    /* execute query */
    $stmt->execute();

    printf("Error: %s.\n", $stmt->sqlstate);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.164. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCountry LIKE Country");
mysqli_query($link, "INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = mysqli_prepare($link, $query)) {

    /* drop table */
    mysqli_query($link, "DROP TABLE myCountry");

    /* execute query */
    mysqli_stmt_execute($stmt);

    printf("Error: %s.\n", mysqli_stmt_sqlstate($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Error: 42S02.
```

See Also

`mysqli_stmt_errno`
`mysqli_stmt_error`

20.11.2.7.23. `mysqli_stmt::store_result`, `mysqli_stmt_store_result`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_stmt::store_result`
`mysqli_stmt_store_result`

Transfers a result set from a prepared statement

Description

Object oriented style (method):

```
bool mysqli_stmt::store_result();
```

Procedural style:

```
bool mysqli_stmt_store_result(mysqli_stmt $stmt);
```

You must call `mysqli_stmt_store_result` for every query that successfully produces a result set (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`), and only if you want to buffer the complete result set by the client, so that the subsequent `mysqli_stmt_fetch` call returns buffered data.

Note

It is unnecessary to call `mysqli_stmt_store_result` for other queries, but if you do, it will not harm or cause any notable performance in all cases. You can detect whether the query produced a result set by checking if `mysqli_stmt_result_metadata` returns `NULL`.

Parameters

`$stmt` Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.165. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = $mysqli->prepare($query)) {
```

```

/* execute query */
$stmt->execute();

/* store result */
$stmt->store_result();

printf("Number of rows: %d.\n", $stmt->num_rows);

/* free result */
$stmt->free_result();

/* close statement */
$stmt->close();
}

/* close connection */
mysqli->close();
?>

```

Example 20.166. Procedural style

```

<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = mysqli_prepare($link, $query)) {

    /* execute query */
    mysqli_stmt_execute($stmt);

    /* store result */
    mysqli_stmt_store_result($stmt);

    printf("Number of rows: %d.\n", mysqli_stmt_num_rows($stmt));

    /* free result */
    mysqli_stmt_free_result($stmt);

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
Number of rows: 20.
```

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_result->current_field`

`mysqli_field_tell`

Get current field offset of a result pointer

Description

Object oriented style (property):

```

mysqli_result {
    int current_field ;
}

```

}

Procedural style:

```
int mysqli_field_tell(mysqli_result result);
```

Returns the position of the field cursor used for the last `mysqli_fetch_field` call. This value can be used as an argument to `mysqli_field_seek`.

Parameters

`result` Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

Returns current offset of field cursor.

Examples

Example 20.167. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";
if ($result = $mysqli->query($query)) {

    /* Get field information for all columns */
    while ($finfo = $result->fetch_field()) {

        /* get fieldpointer offset */
        $currentfield = $result->current_field;

        printf("Column %d:\n", $currentfield);
        printf("Name:      %s\n", $finfo->name);
        printf("Table:     %s\n", $finfo->table);
        printf("max. Len:  %d\n", $finfo->max_length);
        printf("Flags:    %d\n", $finfo->flags);
        printf("Type:     %d\n\n", $finfo->type);
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.168. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";
if ($result = mysqli_query($link, $query)) {

    /* Get field information for all fields */
    while ($finfo = mysqli_fetch_field($result)) {

        /* get fieldpointer offset */
```

```

    $currentfield = mysqli_field_tell($result);

    printf("Column %d:\n", $currentfield);
    printf("Name:      %s\n", $finfo->name);
    printf("Table:     %s\n", $finfo->table);
    printf("max. Len:  %d\n", $finfo->max_length);
    printf("Flags:    %d\n", $finfo->flags);
    printf("Type:     %d\n", $finfo->type);
}
mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Column 1:
Name:      Name
Table:     Country
max. Len:  11
Flags:     1
Type:      254

Column 2:
Name:      SurfaceArea
Table:     Country
max. Len:  10
Flags:     32769
Type:      4

```

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli_result::data_seek](#)
[mysqli_data_seek](#)

Adjusts the result pointer to an arbitrary row in the result

Description

Object oriented style (method):

```
bool mysqli_result::data_seek(int offset);
```

Procedural style:

```
bool mysqli_data_seek(mysqli_result result,
                      int offset);
```

The [mysqli_data_seek](#) function seeks to an arbitrary result pointer specified by the *offset* in the result set.

Parameters

result Procedural style only: A result set identifier returned by [mysqli_query](#), [mysqli_store_result](#) or [mysqli_use_result](#).

offset

The field offset. Must be between zero and the total number of rows minus one (0..*mysqli_num_rows* - 1).

Return Values

Returns **TRUE** on success or **FALSE** on failure.

Notes**Note**

This function can only be used with buffered results attained from the use of the *mysqli_store_result* or *mysqli_query* functions.

Examples**Example 20.169. Object oriented style**

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";
if ($result = $mysqli->query($query)) {

    /* seek to row no. 400 */
    $result->data_seek(399);

    /* fetch row */
    $row = $result->fetch_row();

    printf("City: %s Countrycode: %s\n", $row[0], $row[1]);

    /* free result set*/
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.170. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";
if ($result = mysqli_query($link, $query)) {

    /* seek to row no. 400 */
    mysqli_data_seek($result, 399);

    /* fetch row */
    $row = mysqli_fetch_row($result);

    printf("City: %s Countrycode: %s\n", $row[0], $row[1]);

    /* free result set*/
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
City: Benin City Countrycode: NGA
```

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_result::fetch_all`
`mysqli_fetch_all`

Fetches all result rows as an associative array, a numeric array, or both

Description

Object oriented style (method):

```
mixed mysqli_result::fetch_all(int resulttype);
```

Procedural style:

```
mixed mysqli_fetch_all(mysqli_result result,
int resulttype);
```

Available only with `mysqlnd`.

Parameters

<i>result</i>	Procedural style only: A result set identifier returned by <code>mysqli_query</code> , <code>mysqli_store_result</code> or <code>mysqli_use_result</code> .
<i>resulttype</i>	This optional parameter is a constant indicating what type of array should be produced from the current row data. The possible values for this parameter are the constants <code>MYSQLI_ASSOC</code> , <code>MYSQLI_NUM</code> , or <code>MYSQLI_BOTH</code> . Defaults to <code>MYSQLI_NUM</code> .

Return Values

Returns an array of associative or numeric arrays holding result rows.

See Also

```
mysqli_fetch_array
mysqli_query
```

20.11.2.8.4. `mysqli_result::fetch_array`, `mysqli_fetch_array`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_result::fetch_array`
`mysqli_fetch_array`

Fetch a result row as an associative, a numeric array, or both

Description

Object oriented style (method):

```
mixed mysqli_result::fetch_array(int resulttype);
```

Procedural style:

```
mixed mysqli_fetch_array(mysqli_result result,
int resulttype);
```

Returns an array that corresponds to the fetched row or `NULL` if there are no more rows for the resultset represented by the `result` parameter.

`mysqli_fetch_array` is an extended version of the `mysqli_fetch_row` function. In addition to storing the data in the numeric indices of the result array, the `mysqli_fetch_array` function can also store the data in associative indices, using the field names of the result set as keys.

Note

Field names returned by this function are *case-sensitive*.

Note

This function sets `NULL` fields to the PHP `NULL` value.

If two or more columns of the result have the same field names, the last column will take precedence and overwrite the earlier data. In order to access multiple columns with the same name, the numerically indexed version of the row must be used.

Parameters

`result` Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

`resulttype` This optional parameter is a constant indicating what type of array should be produced from the current row data. The possible values for this parameter are the constants `MYSQLI_ASSOC`, `MYSQLI_NUM`, or `MYSQLI_BOTH`. Defaults to `MYSQLI_BOTH`.

By using the `MYSQLI_ASSOC` constant this function will behave identically to the `mysqli_fetch_assoc`, while `MYSQLI_NUM` will behave identically to the `mysqli_fetch_row` function. The final option `MYSQLI_BOTH` will create a single array with the attributes of both.

Return Values

Returns an array of strings that corresponds to the fetched row or `NULL` if there are no more rows in resultset.

Examples

Example 20.171. Object oriented style

```
<?php
$db = new mysqli("localhost", "my_user", "my_password", "world");
/* check connection */
```

```

if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID LIMIT 3";
$result = $mysqli->query($query);

/* numeric array */
$row = $result->fetch_array(MYSQLI_NUM);
printf ("%s (%s)\n", $row[0], $row[1]);

/* associative array */
$row = $result->fetch_array(MYSQLI_ASSOC);
printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);

/* associative and numeric array */
$row = $result->fetch_array(MYSQLI_BOTH);
printf ("%s (%s)\n", $row[0], $row["CountryCode"]);

/* free result set */
$result->close();

/* close connection */
$mysqli->close();
?>

```

Example 20.172. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID LIMIT 3";
$result = mysqli_query($link, $query);

/* numeric array */
$row = mysqli_fetch_array($result, MYSQLI_NUM);
printf ("%s (%s)\n", $row[0], $row[1]);

/* associative array */
$row = mysqli_fetch_array($result, MYSQLI_ASSOC);
printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);

/* associative and numeric array */
$row = mysqli_fetch_array($result, MYSQLI_BOTH);
printf ("%s (%s)\n", $row[0], $row["CountryCode"]);

/* free result set */
mysqli_free_result($result);

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Kabul (AFG)
Qandahar (AFG)
Herat (AFG)

```

`mysqli_data_seek`

20.11.2.8.5. `mysqli_result::fetch_assoc`, `mysqli_fetch_assoc`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_result::fetch_assoc`
`mysqli_fetch_assoc`
Fetch a result row as an associative array

Description

Object oriented style (method):

```
array mysqli_result::fetch_assoc();
```

Procedural style:

```
array mysqli_fetch_assoc(mysqli_result result);
```

Returns an associative array that corresponds to the fetched row or `NULL` if there are no more rows.

Note

Field names returned by this function are *case-sensitive*.

Note

This function sets `NULL` fields to the PHP `NULL` value.

Parameters

result Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

Returns an associative array of strings representing the fetched row in the result set, where each key in the array represents the name of one of the result set's columns or `NULL` if there are no more rows in resultset.

If two or more columns of the result have the same field names, the last column will take precedence. To access the other column(s) of the same name, you either need to access the result with numeric indices by using `mysqli_fetch_row` or add alias names.

Examples

Example 20.173. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";
if ($result = $mysqli->query($query)) {
    /* fetch associative array */
    while ($row = $result->fetch_assoc()) {
        printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);
    }

    /* free result set */
    $result->close();
}
```

```

}
/* close connection */
$mysqli->close();
?>

```

Example 20.174. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = mysqli_query($link, $query)) {

    /* fetch associative array */
    while ($row = mysqli_fetch_assoc($result)) {
        printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);
    }

    /* free result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Pueblo (USA)
Arvada (USA)
Cape Coral (USA)
Green Bay (USA)
Santa Clara (USA)

```

[mysqli_fetch_field_direct](#)

Fetch meta-data for a single field

Description

Object oriented style (method):

```
object mysqli_result::fetch_field_direct(int fieldnr);
```

Procedural style:

```
object mysqli_fetch_field_direct(mysqli_result result,
                                int fieldnr);
```

Returns an object which contains field definition informations from specified resultset.

Parameters

- result* Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.
- fieldnr* The field number. This value must be in the range from 0 to `number of fields - 1`.

Return Values

Returns an object which contains field definition information or `FALSE` if no field information for specified `fieldnr` is available.

Table 20.14. Object attributes

Attribute	Description
name	The name of the column
orgname	Original column name if an alias was specified
table	The name of the table this field belongs to (if not calculated)
orgtable	Original table name if an alias was specified
def	The default value for this field, represented as a string
max_length	The maximum width of the field for the result set.
length	The width of the field, as specified in the tabl definition.
charsetnr	The character set number for the field.
flags	An integer representing the bit-flags for the field.
type	The data type used for this field
decimals	The number of decimals used (for integer fields)

Examples

Example 20.175. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Name LIMIT 5";
if ($result = $mysqli->query($query)) {
    /* Get field information for column 'SurfaceArea' */
    $finfo = $result->fetch_field_direct(1);

    printf("Name:      %s\n", $finfo->name);
    printf("Table:     %s\n", $finfo->table);
    printf("max. Len:  %d\n", $finfo->max_length);
    printf("Flags:     %d\n", $finfo->flags);
    printf("Type:      %d\n", $finfo->type);

    $result->close();
}

/* close connection */
```

```
$mysqli->close();
?>
```

Example 20.176. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Name LIMIT 5";
if ($result = mysqli_query($link, $query)) {

    /* Get field information for column 'SurfaceArea' */
    $finfo = mysqli_fetch_field_direct($result, 1);

    printf("Name:      %s\n", $finfo->name);
    printf("Table:     %s\n", $finfo->table);
    printf("max. Len: %d\n", $finfo->max_length);
    printf("Flags:    %d\n", $finfo->flags);
    printf("Type:     %d\n", $finfo->type);

    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Name:      SurfaceArea
Table:     Country
max. Len:  10
Flags:     32769
Type:      4
```

Returns the next field in the result set

Description

Object oriented style (method):

```
object mysqli_result::fetch_field();
```

Procedural style:

```
object mysqli_fetch_field(mysqli_result result);
```

Returns the definition of one column of a result set as an object. Call this function repeatedly to retrieve information about all columns in the result set.

Parameters

result Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

Returns an object which contains field definition information or `FALSE` if no field information is available.

Table 20.15. Object properties

Property	Description
name	The name of the column
orgname	Original column name if an alias was specified
table	The name of the table this field belongs to (if not calculated)
orgtable	Original table name if an alias was specified
def	The default value for this field, represented as a string
max_length	The maximum width of the field for the result set.
length	The width of the field, as specified in the table definition.
charsetnr	The character set number for the field.
flags	An integer representing the bit-flags for the field.
type	The data type used for this field
decimals	The number of decimals used (for integer fields)

Examples

Example 20.177. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";
if ($result = $mysqli->query($query)) {
    /* Get field information for all columns */
    while ($finfo = $result->fetch_field()) {
        printf("Name:      %s\n", $finfo->name);
        printf("Table:     %s\n", $finfo->table);
        printf("max. Len:  %d\n", $finfo->max_length);
        printf("Flags:      %d\n", $finfo->flags);
        printf("Type:       %d\n\n", $finfo->type);
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.178. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";
if ($result = mysqli_query($link, $query)) {

    /* Get field information for all fields */
    while ($finfo = mysqli_fetch_field($result)) {

        printf("Name:      %s\n", $finfo->name);
        printf("Table:     %s\n", $finfo->table);
        printf("max. Len:  %d\n", $finfo->max_length);
        printf("Flags:    %d\n", $finfo->flags);
        printf("Type:     %d\n", $finfo->type);
    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Name:      Name
Table:     Country
max. Len:  11
Flags:     1
Type:      254

Name:      SurfaceArea
Table:     Country
max. Len:  10
Flags:     32769
Type:      4

```

[mysqli_fetch_fields](#)

Returns an array of objects representing the fields in a result set

Description

Object oriented style (method):

```
array mysqli_result::fetch_fields();
```

Procedural Style:

```
array mysqli_fetch_fields(mysqli_result result);
```

This function serves an identical purpose to the `mysqli_fetch_field` function with the single difference that, instead of returning one object at a time for each field, the columns are returned as an array of objects.

Parameters

`result` Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

Returns an array of objects which contains field definition information or `FALSE` if no field information is available.

Table 20.16. Object properties

Property	Description
name	The name of the column
orgname	Original column name if an alias was specified
table	The name of the table this field belongs to (if not calculated)
orgtable	Original table name if an alias was specified
def	The default value for this field, represented as a string
max_length	The maximum width of the field for the result set.
length	The width of the field, as specified in the table definition.
charsetnr	The character set number for the field.
flags	An integer representing the bit-flags for the field.
type	The data type used for this field
decimals	The number of decimals used (for integer fields)

Examples

Example 20.179. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";
if ($result = $mysqli->query($query)) {

    /* Get field information for all columns */
    $finfo = $result->fetch_fields();

    foreach ($finfo as $val) {
        printf("Name:    %s\n", $val->name);
        printf("Table:    %s\n", $val->table);
        printf("max. Len: %d\n", $val->max_length);
        printf("Flags:    %d\n", $val->flags);
        printf("Type:    %d\n\n", $val->type);
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.180. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";
if ($result = mysqli_query($link, $query)) {

    /* Get field information for all columns */
    $finfo = mysqli_fetch_fields($result);

    foreach ($finfo as $val) {
        printf("Name:      %s\n", $val->name);
        printf("Table:     %s\n", $val->table);
        printf("max. Len:  %d\n", $val->max_length);
        printf("Flags:     %d\n", $val->flags);
        printf("Type:      %d\n", $val->type);
    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Name:      Name
Table:     Country
max. Len:  11
Flags:     1
Type:      254

Name:      SurfaceArea
Table:     Country
max. Len:  10
Flags:     32769
Type:      4

```

20.11.2.8.9. [mysqli_result::fetch_object](#), [mysqli_fetch_object](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli_result::fetch_object](#)
[mysqli_fetch_object](#)

Returns the current row of a result set as an object

Description

Object oriented style (method):

```

object mysqli_result::fetch_object(string class_name,
                                   array params);

```

Procedural style:

```
object mysqli_fetch_object(mysqli_result result,
                          string class_name,
                          array params);
```

The `mysqli_fetch_object` will return the current row result set as an object where the attributes of the object represent the names of the fields found within the result set.

Parameters

<code>result</code>	Procedural style only: A result set identifier returned by <code>mysqli_query</code> , <code>mysqli_store_result</code> or <code>mysqli_use_result</code> .
<code>class_name</code>	The name of the class to instantiate, set the properties of and return. If not specified, a <code>stdClass</code> object is returned.
<code>params</code>	An optional array of parameters to pass to the constructor for <code>class_name</code> objects.

Return Values

Returns an object with string properties that corresponds to the fetched row or `NULL` if there are no more rows in resultset.

Note

Field names returned by this function are *case-sensitive*.

Note

This function sets NULL fields to the PHP `NULL` value.

ChangeLog

Version	Description
5.0.0	Added the ability to return as a different object.

Examples

Example 20.181. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";
if ($result = $mysqli->query($query)) {
    /* fetch object array */
    while ($obj = $result->fetch_object()) {
        printf ("%s (%s)\n", $obj->Name, $obj->CountryCode);
    }

    /* free result set */
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.182. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";
if ($result = mysqli_query($link, $query)) {

    /* fetch associative array */
    while ($obj = mysqli_fetch_object($result)) {
        printf ("%s (%s)\n", $obj->Name, $obj->CountryCode);
    }

    /* free result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Pueblo (USA)
Arvada (USA)
Cape Coral (USA)
Green Bay (USA)
Santa Clara (USA)

```

[mysqli_fetch_row](#)

Get a result row as an enumerated array

Description

Object oriented style (method):

```
mixed mysqli_result::fetch_row();
```

Procedural style:

```
mixed mysqli_fetch_row(mysqli_result result);
```

Fetches one row of data from the result set and returns it as an enumerated array, where each column is stored in an array offset

starting from 0 (zero). Each subsequent call to this function will return the next row within the result set, or `NULL` if there are no more rows.

Parameters

`result` Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

`mysqli_fetch_row` returns an array of strings that corresponds to the fetched row or `NULL` if there are no more rows in result set.

Note

This function sets `NULL` fields to the PHP `NULL` value.

Examples

Example 20.183. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";
if ($result = $mysqli->query($query)) {
    /* fetch object array */
    while ($row = $result->fetch_row()) {
        printf ("%s (%s)\n", $row[0], $row[1]);
    }

    /* free result set */
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.184. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";
if ($result = mysqli_query($link, $query)) {
    /* fetch associative array */
    while ($row = mysqli_fetch_row($result)) {
        printf ("%s (%s)\n", $row[0], $row[1]);
    }

    /* free result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Pueblo (USA)
Arvada (USA)
Cape Coral (USA)
Green Bay (USA)
Santa Clara (USA)
```

20.11.2.8.11. `mysqli_result->field_count`, `mysqli_num_fields`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_result->field_count`

`mysqli_num_fields`

Get the number of fields in a result

Description

Object oriented style (property):

```
mysqli_result {
    int field_count ;
}
```

Procedural style:

```
int mysqli_num_fields(mysqli_result result);
```

Returns the number of fields from specified result set.

Parameters

result Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

The number of fields from a result set.

Examples

Example 20.185. Object oriented style

```
<?php
```

```

$mysqli = new mysqli("localhost", "my_user", "my_password", "world");
/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}
if ($result = $mysqli->query("SELECT * FROM City ORDER BY ID LIMIT 1")) {
    /* determine number of fields in result set */
    $field_cnt = $result->field_count;

    printf("Result set has %d fields.\n", $field_cnt);

    /* close result set */
    $result->close();
}
/* close connection */
$mysqli->close();
?>

```

Example 20.186. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");
/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}
if ($result = mysqli_query($link, "SELECT * FROM City ORDER BY ID LIMIT 1")) {
    /* determine number of fields in result set */
    $field_cnt = mysqli_num_fields($result);

    printf("Result set has %d fields.\n", $field_cnt);

    /* close result set */
    mysqli_free_result($result);
}
/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
Result set has 5 fields.
```

See Also

[mysqli_fetch_field](#)

20.11.2.8.12. [mysqli_result::field_seek](#), [mysqli_field_seek](#)

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli_result::field_seek](#)

[mysqli_field_seek](#)

Set result pointer to a specified field offset

Description

Object oriented style (method):

```
bool mysqli_result::field_seek(int fieldnr);
```

Procedural style:

```
bool mysqli_field_seek(mysqli_result result,
                       int fieldnr);
```

Sets the field cursor to the given offset. The next call to `mysqli_fetch_field` will retrieve the field definition of the column associated with that offset.

Note

To seek to the beginning of a row, pass an offset value of zero.

Parameters

result Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

fieldnr The field number. This value must be in the range from 0 to `number of fields - 1`.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.187. Object oriented style

```
<?php
$link = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";
if ($result = $link->query($query)) {

    /* Get field information for 2nd column */
    $result->field_seek(1);
    $finfo = $result->fetch_field();

    printf("Name:      %s\n", $finfo->name);
    printf("Table:     %s\n", $finfo->table);
    printf("max. Len:  %d\n", $finfo->max_length);
    printf("Flags:      %d\n", $finfo->flags);
    printf("Type:       %d\n\n", $finfo->type);

    $result->close();
}

/* close connection */
$link->close();
?>
```

Example 20.188. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
```

```

    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";
if ($result = mysqli_query($link, $query)) {
    /* Get field information for 2nd column */
    mysqli_field_seek($result, 1);
    $finfo = mysqli_fetch_field($result);

    printf("Name:      %s\n", $finfo->name);
    printf("Table:     %s\n", $finfo->table);
    printf("max. Len: %d\n", $finfo->max_length);
    printf("Flags:    %d\n", $finfo->flags);
    printf("Type:     %d\n\n", $finfo->type);

    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Name:      SurfaceArea
Table:     Country
max. Len: 10
Flags:    32769
Type:     4

```

Copyright 1997-2008 the PHP Documentation Group.

- [mysqli_result::free](#)
[mysqli_free_result](#)

Frees the memory associated with a result

Description

Object oriented style (all methods are equivalent):

```
void mysqli_result::free();
```

```
void mysqli_result::close();
```

```
void mysqli_result::free_result();
```

Procedural style:

```
void mysqli_free_result(mysqli_result result);
```

Frees the memory associated with the result.

■ Note

You should always free your result with `mysqli_free_result`, when your result object is not needed anymore.

Parameters

`result` Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

No value is returned.

See Also

`mysqli_query`
`mysqli_stmt_store_result`
`mysqli_store_result`
`mysqli_use_result`

20.11.2.8.14. `mysqli_result->lengths`, `mysqli_fetch_lengths`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_result->lengths`
`mysqli_fetch_lengths`

Returns the lengths of the columns of the current row in the result set

Description

Object oriented style (property):

```
mysqli_result {  
    array lengths ;  
}
```

Procedural style:

```
array mysqli_fetch_lengths(mysqli_result result);
```

The `mysqli_fetch_lengths` function returns an array containing the lengths of every column of the current row within the result set.

Parameters

`result` Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

An array of integers representing the size of each column (not including any terminating null characters). `FALSE` if an error occurred.

`mysqli_fetch_lengths` is valid only for the current row of the result set. It returns `FALSE` if you call it before calling `mysqli_fetch_row/array/object` or after retrieving all rows in the result.

Examples**Example 20.189. Object oriented style**

```

<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT * from Country ORDER BY Code LIMIT 1";

if ($result = $mysqli->query($query)) {

    $row = $result->fetch_row();

    /* display column lengths */
    foreach ($result->lengths as $i => $val) {
        printf("Field %2d has Length %2d\n", $i+1, $val);
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>

```

Example 20.190. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT * from Country ORDER BY Code LIMIT 1";

if ($result = mysqli_query($link, $query)) {

    $row = mysqli_fetch_row($result);

    /* display column lengths */
    foreach (mysqli_fetch_lengths($result) as $i => $val) {
        printf("Field %2d has Length %2d\n", $i+1, $val);
    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Field 1 has Length 3
Field 2 has Length 5
Field 3 has Length 13
Field 4 has Length 9
Field 5 has Length 6
Field 6 has Length 1
Field 7 has Length 6
Field 8 has Length 4
Field 9 has Length 6
Field 10 has Length 6
Field 11 has Length 5
Field 12 has Length 44
Field 13 has Length 7
Field 14 has Length 3
Field 15 has Length 2

```

20.11.2.8.15. `mysqli_result->num_rows`, `mysqli_num_rows`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_result->num_rows`
`mysqli_num_rows`
Gets the number of rows in a result

Description

Object oriented style (property):

```
mysqli_result {
    int num_rows ;
}
```

Procedural style:

```
int mysqli_num_rows(mysqli_result result);
```

Returns the number of rows in the result set.

The use of `mysqli_num_rows` depends on whether you use buffered or unbuffered result sets. In case you use unbuffered result-sets `mysqli_num_rows` will not correct the correct number of rows until all the rows in the result have been retrieved.

Parameters

result Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

Returns number of rows in the result set.

Note

If the number of rows is greater than maximal int value, the number will be returned as a string.

Examples

Example 20.191. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($result = $mysqli->query("SELECT Code, Name FROM Country ORDER BY Name")) {

    /* determine number of rows result set */
    $row_cnt = $result->num_rows;

    printf("Result set has %d rows.\n", $row_cnt);

    /* close result set */
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 20.192. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($result = mysqli_query($link, "SELECT Code, Name FROM Country ORDER BY Name")) {

    /* determine number of rows result set */
    $row_cnt = mysqli_num_rows($result);

    printf("Result set has %d rows.\n", $row_cnt);

    /* close result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
Result set has 239 rows.
```

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_report`
Enables or disables internal report functions

Description

```
bool mysqli_report(int flags);
```

`mysqli_report` is a powerful function to improve your queries and code during development and testing phase. Depending on the flags it reports errors from `mysqli` function calls or queries which don't use an index (or use a bad index).

Parameters

flags

Table 20.17. Supported flags

Name	Description
<code>MYSQLI_REPORT_OFF</code>	Turns reporting off
<code>MYSQLI_REPORT_ERROR</code>	Report errors from <code>mysqli</code> function calls
<code>MYSQLI_REPORT_STRICT</code>	Report warnings from <code>mysqli</code> function calls
<code>MYSQLI_REPORT_INDEX</code>	Report if no index or bad index was used in a query
<code>MYSQLI_REPORT_ALL</code>	Set all options (report all)

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 20.193. Object oriented style

```

<?php
/* activate reporting */
mysqli_report(MYSQLI_REPORT_ALL);

$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* this query should report an error */
$result = $mysqli->query("SELECT Name FROM Nonexistingtable WHERE population > 50000");

/* this query should report a warning */
$result = $mysqli->query("SELECT Name FROM City WHERE population > 50000");
$result->close();

$mysqli->close();
?>

Description

```
bool mysqli_rpl_probe(mysqli link);
```

Warning

This function is currently not documented; only its argument list is available.

Warning

This function has been *DEPRECATED* and *REMOVED* as of PHP 5.3.0.

20.11.2.10.17. `mysqli_rpl_query_type`, `mysqli->rpl_query_type`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_rpl_query_type`
`mysqli->rpl_query_type`

Returns RPL query type

Description

Procedural style:

```
int mysqli_rpl_query_type(mysqli link,  
                        string query);
```

Object oriented style (method)

```
mysqli {  
    int rpl_query_type(string query);  
}
```

Returns `MYSQLI_RPL_MASTER`, `MYSQLI_RPL_SLAVE` or `MYSQLI_RPL_ADMIN` depending on a query type. `INSERT`, `UPDATE` and similar are *master* queries, `SELECT` is *slave*, and `FLUSH`, `REPAIR` and similar are *admin*.

Warning

This function is currently not documented; only its argument list is available.

Warning

This function has been *DEPRECATED* and *REMOVED* as of PHP 5.3.0.

20.11.2.10.18. `mysqli_send_long_data`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_send_long_data`
Alias for `mysqli_stmt_send_long_data`

Description

This function is an alias of `mysqli_stmt_send_long_data`.

Notes**Note**

`mysqli_send_long_data` is deprecated and will be removed.

See Also

`mysqli_stmt_send_long_data`

20.11.2.10.19. `mysqli_send_query`, `mysqli->send_query`

Copyright 1997-2008 the PHP Documentation Group.

- `mysqli_send_query`
`mysqli->send_query`
Send the query and return

Description

Procedural style:

```
bool mysqli_send_query(mysqli link,  
                        string query);
```

Object oriented style (method)

```
mysqli {  
    bool send_query(string query);  
}
```

Warning

This function is currently not documented; only its argument list is available.

Warning

This function has been *DEPRECATED* and *REMOVED* as of PHP 5.3.0.

20.11.2.10.20. `mysqli_set_opt`

[Copyright 1997-2008 the PHP Documentation Group.](#)

- `mysqli_set_opt`
Alias of `mysqli_options`

Description

This function is an alias of `mysqli_options`.

20.11.2.10.21. `mysqli_slave_query`

[Copyright 1997-2008 the PHP Documentation Group.](#)

- `mysqli_slave_query`
Force execution of a query on a slave in a master/slave setup

Description

```
bool mysqli_slave_query(mysqli link,  
                        string query);
```

Warning

This function is currently not documented; only its argument list is available.

Warning

This function has been *DEPRECATED* and *REMOVED* as of PHP 5.3.0.

20.11.3. MySQL Functions (PDO_MYSQL)

[Copyright 1997-2008 the PHP Documentation Group.](#)

PDO_MYSQL is a driver that implements the [PHP Data Objects \(PDO\) interface](#) to enable access from PHP to MySQL 3.x, 4.x and 5.x databases.

PDO_MYSQL will take advantage of native prepared statement support present in MySQL 4.1 and higher. If you're using an older version of the mysql client libraries, PDO will emulate them for you.

Warning

Beware: Some MySQL table types (storage engines) do not support transactions. When writing transactional database code using a table type that does not support transactions, MySQL will pretend that a transaction was initiated successfully. In addition, any DDL queries issued will implicitly commit any pending transactions.

The constants below are defined by this driver, and will only be available when the extension has been either compiled into PHP or dynamically loaded at runtime. In addition, these driver-specific constants should only be used if you are using this driver. Using mysql-specific attributes with the postgres driver may result in unexpected behaviour. `PDO::getAttribute` may be used to obtain the `PDO_ATTR_DRIVER_NAME` attribute to check the driver, if your code can run against multiple drivers.

`PDO::MYSQL_ATTR_USE_BUFFERED_QUERY` (integer) If this attribute is set to `TRUE` on a `PDOStatement`, the MySQL driver will use the buffered versions of the MySQL API. If you're writing portable code, you should use `PDOStatement::fetchAll` instead.

Example 20.194. Forcing queries to be buffered in mysql

```
<?php
if ($db->getAttribute(PDO::ATTR_DRIVER_NAME) == 'mysql') {
    $stmt = $db->prepare('select * from foo',
        array(PDO::MYSQL_ATTR_USE_BUFFERED_QUERY => true));
} else {
    die("my application only works with mysql; I should use \$stmt->fetchAll() instead");
}
?>
```

`PDO::MYSQL_ATTR_LOCAL_INFILE` (integer) Enable `LOAD LOCAL INFILE`.

`PDO::MYSQL_ATTR_INIT_COMMAND` (integer) Command to execute when connecting to the MySQL server. Will automatically be re-executed when reconnecting.

`PDO::MYSQL_ATTR_READ_DEFAULT_FILE` (integer) Read options from the named option file instead of from `my.cnf`.

`PDO::MYSQL_ATTR_READ_DEFAULT_GROUP` (integer) Read options from the named group from `my.cnf` or the file specified with `MYSQL_READ_DEFAULT_FILE`.

`PDO::MYSQL_ATTR_MAX_BUFFER_SIZE` (integer) Maximum buffer size. Defaults to 1 MiB.

`PDO::MYSQL_ATTR_DIRECT_QUERY` (integer) Perform direct queries, don't use prepared statements.

20.11.3.1. PDO_MYSQL DSN

Copyright 1997-2008 the PHP Documentation Group.

- [PDO_MYSQL DSN](#)

Connecting to MySQL databases

Description

The PDO_MYSQL Data Source Name (DSN) is composed of the following elements:

DSN prefix The DSN prefix is `mysql:`.

`host` The hostname on which the database server resides.

<code>port</code>	The port number where the database server is listening.
<code>dbname</code>	The name of the database.
<code>unix_socket</code>	The MySQL Unix socket (shouldn't be used with <code>host</code> or <code>port</code>).

Examples

Example 20.195. PDO_MYSQL DSN examples

The following example shows a PDO_MYSQL DSN for connecting to MySQL databases:

```
mysql:host=localhost;dbname=testdb
```

More complete examples:

```
mysql:host=localhost;port=3307;dbname=testdb  
mysql:unix_socket=/tmp/mysql.sock;dbname=testdb
```

20.11.4. Connector/PHP

The MySQL Connector/PHP is a version of the `mysql` and `mysqli` extensions for PHP optimized for the Windows operating system. Later versions of the main PHP `mysql/mysqli` drivers are compatible with Windows and a separate, Windows specific driver is no longer required.

For PHP for all platforms, including Windows, you should use the `mysql` or `mysqli` extensions shipped with the PHP sources. See [Section 20.11, “MySQL PHP API”](#).

20.11.5. Common Problems with MySQL and PHP

- **Error: Maximum Execution Time Exceeded:** This is a PHP limit; go into the `php.ini` file and set the maximum execution time up from 30 seconds to something higher, as needed. It is also not a bad idea to double the RAM allowed per script to 16MB instead of 8MB.
- **Fatal error: Call to unsupported or undefined function mysql_connect() in ...:** This means that your PHP version isn't compiled with MySQL support. You can either compile a dynamic MySQL module and load it into PHP or recompile PHP with built-in MySQL support. This process is described in detail in the PHP manual.
- **Error: Undefined reference to 'uncompress':** This means that the client library is compiled with support for a compressed client/server protocol. The fix is to add `-lz` last when linking with `-lmysqlclient`.
- **Error: Client does not support authentication protocol:** This is most often encountered when trying to use the older `mysql` extension with MySQL 4.1.1 and later. Possible solutions are: downgrade to MySQL 4.0; switch to PHP 5 and the newer `mysqli` extension; or configure the MySQL server with `--old-passwords`. (See [Section B.1.2.4, “Client does not support authentication protocol”](#), for more information.)

Those with PHP4 legacy code can make use of a compatibility layer for the old and new MySQL libraries, such as this one: <http://www.coggeshall.org/oss/mysqli2i>.

20.11.6. Enabling Both `mysql` and `mysqli` in PHP

If you're experiencing problems with enabling both the `mysql` and the `mysqli` extension when building PHP on Linux yourself, you should try the following procedure.

1. Configure PHP like this:

```
./configure --with-mysqli=/usr/bin/mysql_config --with-mysql=/usr
```

2. Edit the `Makefile` and search for a line that starts with `EXTRA_LIBS`. It might look like this (all on one line):

```
EXTRA_LIBS = -lcrypt -lcrypt -lmysqlclient -lz -lresolv -lm -ldl -lnsl
-lxml2 -lz -lm -lxml2 -lz -lm -lmysqlclient -lz -lcrypt -lnsl -lm
-lxml2 -lz -lm -lcrypt -lxml2 -lz -lm -lcrypt
```

Remove all duplicates, so that the line looks like this (all on one line):

```
EXTRA_LIBS = -lcrypt -lcrypt -lmysqlclient -lz -lresolv -lm -ldl -lnsl
-lxml2
```

3. Build and install PHP:

```
make
make install
```

MySQL Enterprise

MySQL Enterprise subscribers will find more information about the `mysql` extension in the Knowledge Base articles found at [mysql](http://mysql.com). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

20.12. MySQL Perl API

The Perl `DBI` module provides a generic interface for database access. You can write a `DBI` script that works with many different database engines without change. To use `DBI`, you must install the `DBI` module, as well as a DataBase Driver (DBD) module for each type of server you want to access. For MySQL, this driver is the `DBD: :mysql` module.

Perl `DBI` is the recommended Perl interface. It replaces an older interface called `mysqlperl`, which should be considered obsolete.

Installation instructions for Perl `DBI` support are given in [Section 2.15, “Perl Installation Notes”](#).

`DBI` information is available at the command line, online, or in printed form:

- Once you have the `DBI` and `DBD: :mysql` modules installed, you can get information about them at the command line with the `perldoc` command:

```
shell> perldoc DBI
shell> perldoc DBI: :FAQ
shell> perldoc DBD: :mysql
```

You can also use `pod2man`, `pod2html`, and so forth to translate this information into other formats.

- For online information about Perl `DBI`, visit the `DBI` Web site, <http://dbi.perl.org/>. That site hosts a general `DBI` mailing list. Sun Microsystems, Inc. hosts a list specifically about `DBD: :mysql`; see [Section 1.5.1, “MySQL Mailing Lists”](#).
- For printed information, the official `DBI` book is *Programming the Perl DBI* (Alligator Descartes and Tim Bunce, O'Reilly & Associates, 2000). Information about the book is available at the `DBI` Web site, <http://dbi.perl.org/>.

For information that focuses specifically on using `DBI` with MySQL, see *MySQL and Perl for the Web* (Paul DuBois, New Riders, 2001). This book's Web site is <http://www.kitebird.com/mysql-perl/>.

20.13. MySQL C++ API

`MySQL++` is a MySQL API for C++. Warren Young has taken over this project. More information can be found at <http://tangentsoft.net/mysql++/doc>.

MySQL Enterprise

MySQL Enterprise subscribers will find more information about using C++ with the MySQL API in the MySQL Knowledge Base. articles found at [C++](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

20.14. MySQL Python API

`MySQLdb` provides MySQL support for Python, compliant with the Python DB API version 2.0. It can be found at <http://sourceforge.net/projects/mysql-python/>.

MySQL Enterprise

MySQL Enterprise subscribers will find more information about using Python with the MySQL API in the MySQL Knowledge Base articles found at [Python](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

20.15. MySQL Ruby APIs

Two APIs available for Ruby programmers. The MySQL/Ruby API is based on the `libmysql` API library. The Ruby/MySQL API is written to use the native MySQL network protocol (a native driver).

For more information on Ruby, see [Ruby Programming Language](#).

For information on installing and using the MySQL/Ruby API, see [Section 20.15.1, “The MySQL/Ruby API”](#).

For information on installing and using the Ruby/MySQL API, see [Section 20.15.2, “The Ruby/MySQL API”](#).

20.15.1. The MySQL/Ruby API

The MySQL/Ruby module provides access to MySQL databases using Ruby through `libmysql`.

For information on installing the module, and the functions exposed, see [MySQL/Ruby](#).

20.15.2. The Ruby/MySQL API

The Ruby/MySQL module provides access to MySQL databases using Ruby through a native driver interface using the MySQL network protocol.

For information on installing the module, and the functions exposed, see [Ruby/MySQL](#).

20.16. MySQL Tcl API

`MySQLtcl` is a simple API for accessing a MySQL database server from the Tcl programming language. It can be found at <http://www.xdobry.de/mysqltcl/>.

20.17. MySQL Eiffel Wrapper

Eiffel MySQL is an interface to the MySQL database server using the Eiffel programming language, written by Michael Ravits. It can be found at <http://efsa.sourceforge.net/archive/ravits/mysql.htm>.

Chapter 21. Extending MySQL

21.1. MySQL Internals

This chapter describes a lot of things that you need to know when working on the MySQL code. If you plan to contribute to MySQL development, want to have access to the bleeding-edge versions of the code, or just want to keep track of development, follow the instructions in [Section 2.10.3, “Installing from the Development Source Tree”](#). If you are interested in MySQL internals, you should also subscribe to our `internals` mailing list. This list has relatively low traffic. For details on how to subscribe, please see [Section 1.5.1, “MySQL Mailing Lists”](#). All developers at MySQL AB are on the `internals` list and we help other people who are working on the MySQL code. Feel free to use this list both to ask questions about the code and to send patches that you would like to contribute to the MySQL project!

21.1.1. MySQL Threads

The MySQL server creates the following threads:

- Connection manager threads handle client connection requests on the network interfaces that the server listens to. On all platforms, one manager thread handles TCP/IP connection requests. On Unix, this manager thread also handles Unix socket file connection requests. On Windows, a manager thread handles shared-memory connection requests, and another handles named-pipe connection requests. The server does not create threads to handle interfaces that it does not listen to. For example, a Windows server that does not have support for named-pipe connections enabled does not create a thread to handle them.
- Connection manager threads associate each client connection with a thread dedicated to it that handles authentication and request processing for that connection. Manager threads create a new thread when necessary but try to avoid doing so by consulting the thread cache first to see whether it contains a thread that can be used for the connection. When a connection ends, its thread is returned to the thread cache if the cache is not full.

For information about tuning the parameters that control thread resources, see [Section 7.5.7, “How MySQL Uses Threads for Client Connections”](#).

- On a master replication server, connections from slave servers are handled like client connections: There is one thread per connected slave.
- On a slave replication server, an I/O thread is started to connect to the master server and read updates from it. An SQL thread is started to apply updates read from the master. These two threads run independently and can be started and stopped independently.
- A signal thread handles all signals. This thread also normally handles alarms and calls `process_alarm()` to force timeouts on connections that have been idle too long.
- If InnoDB is used, there will be additional read and write threads by default. The number of these are controlled by the `innodb_read_io_threads` and `innodb_write_io_threads` parameters. See [Section 13.6.3, “InnoDB Startup Options and System Variables”](#).
- If `mysqld` is compiled with `-DUSE_ALARM_THREAD`, a dedicated thread that handles alarms is created. This is only used on some systems where there are problems with `sigwait()` or if you want to use the `thr_alarm()` code in your application without a dedicated signal handling thread.
- If the server is started with the `--flush_time=val` option, a dedicated thread is created to flush all tables every `val` seconds.
- Each table for which `INSERT DELAYED` statements are issued gets its own thread. See [Section 12.2.5.2, “INSERT DELAYED Syntax”](#).
- If the event scheduler is active, there is one thread for the scheduler, and a thread for each event currently running. See [Section 18.4.1, “Event Scheduler Overview”](#).

`mysqladmin processlist` only shows the connection, `INSERT DELAYED`, replication, and event threads.

MySQL Enterprise

For expert advice on thread management subscribe to the MySQL Enterprise Monitor. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

21.1.2. MySQL Test Suite

The test system that is included in Unix source and binary distributions makes it possible for users and developers to perform re-

gression tests on the MySQL code. These tests can be run on Unix.

You can also write your own test cases. For information about the MySQL Test Framework, including system requirements, see the manual available at <http://dev.mysql.com/doc/>.

The current set of test cases doesn't test everything in MySQL, but it should catch most obvious bugs in the SQL processing code, operating system or library issues, and is quite thorough in testing replication. Our goal is to have the tests cover 100% of the code. We welcome contributions to our test suite. You may especially want to contribute tests that examine the functionality critical to your system because this ensures that all future MySQL releases work well with your applications.

The test system consists of a test language interpreter (`mysqltest`), a Perl script to run all tests (`mysql-test-run.pl`), the actual test cases written in a special test language, and their expected results. To run the test suite on your system after a build, type `make test` from the source root directory, or change location to the `mysql-test` directory and type `./mysql-test-run.pl`. If you have installed a binary distribution, change location to the `mysql-test` directory under the installation root directory (for example, `/usr/local/mysql/mysql-test`), and run `./mysql-test-run.pl`. All tests should succeed. If any do not, feel free to try to find out why and report the problem if it indicates a bug in MySQL. See [Section 1.6, “How to Report Bugs or Problems”](#).

If one test fails, you should run `mysql-test-run.pl` with the `--force` option to check whether any other tests fail.

If you have a copy of `mysqld` running on the machine where you want to run the test suite, you do not have to stop it, as long as it is not using ports `9306` or `9307`. If either of those ports is taken, you should set the `MTR_BUILD_THREAD` environment variable to an appropriate value, and the test suite will use a different set of ports for master, slave, NDB, and Instance Manager). For example:

```
shell> export MTR_BUILD_THREAD=31
shell> ./mysql-test-run.pl [options] [test_name]
```

In the `mysql-test` directory, you can run an individual test case with `./mysql-test-run.pl test_name`.

If you have a question about the test suite, or have a test case to contribute, send an email message to the MySQL [internals](#) mailing list. See [Section 1.5.1, “MySQL Mailing Lists”](#). This list does not accept attachments, so you should FTP all the relevant files to: <ftp://ftp.mysql.com/pub/mysql/upload/>

21.2. The MySQL Plugin Interface

MySQL 5.1 and up supports a plugin API that allows the loading and unloading of server components at runtime, without restarting the server. The components supported by this operation include, but are not limited to, full-text parser plugins, storage-engines and server extensions. In MySQL 5.4, the storage engines can be included in the server as `opugins`.

Full-text parser plugins can be used to replace or augment the built-in full-text parser. For example, a plugin can parse text into words using rules that differ from those used by the built-in parser. This can be useful if you need to parse text with characteristics different from those expected by the built-in parser.

The plugin interface is intended as the successor to the older user-defined function (UDF) interface. The plugin interface eventually will include an API for creating UDFs, and it is intended this plugin UDF API will replace the older non-plugin UDF API. After that point, it will be possible for UDFs to be revised for use as plugin UDFs so that they can take advantage of the better security and versioning capabilities of the plugin API. Eventually, support for the older UDF API will be phased out.

The plugin interface requires the `plugin` table in the `mysql` database. This table is created as part of the MySQL installation process. If you are upgrading from a version older than MySQL 5.1, you should run the `mysql_upgrade` command to create this table. See [Section 4.4.8, “mysql_upgrade — Check Tables for MySQL Upgrade”](#).

For more information on the Plugin API and how it can be used with storage engines, see [MySQL Internals: Custom Engine](#).

21.2.1. Characteristics of the Plugin Interface

In some respects, the plugin API is similar to the older user-defined function (UDF) API that it supersedes, but the plugin API has several advantages over the older interface:

- The plugin framework is extendable to accommodate different kinds of plugins.

Some aspects of the plugin API are common to all types of plugins, but the API also allows for type-specific interface elements so that different types of plugins can be created. A plugin with one purpose can have an interface most appropriate to its own requirements and not the requirements of some other plugin type.

Although only the interface for full-text parser plugins is implemented currently, others can be added, such as an interface for UDF plugins.

- The plugin API includes versioning information.

The version information included in the plugin API enables a plugin library and each plugin that it contains to be self-identifying with respect to the API version that was used to build the library. If the API changes over time, the version numbers will change, but a server can examine a given plugin library's version information to determine whether it supports the plugins in the library.

There are two types of version numbers. The first is the version for the general plugin framework itself. Each plugin library includes this kind of version number. The second type of version applies to individual plugins. Each specific type of plugin has a version for its interface, so each plugin in a library has a type-specific version number. For example, library containing a full-text parsing plugin has a general plugin API version number, and the plugin has a version number specific to the full-text plugin interface.

- Plugin security is improved relative to the UDF interface.

The older interface for writing non-plugin UDFs allowed libraries to be loaded from any directory searched by the system's dynamic linker, and the symbols that identified the UDF library were relatively non-specific. The newer rules are more strict. A plugin library must be installed in a specific dedicated directory for which the location is controlled by the server and cannot be changed at runtime. Also, the library must contain specific symbols that identify it as a plugin library. The server will not load something as a plugin if it was not built as a plugin.

The newer plugin interface eliminates the security issues of the older UDF interface. When a UDF plugin type is implemented, that will allow non-plugin UDFs to be brought into the plugin framework and the older interface to be phased out.

The plugin implementation includes the following components:

Source files (the locations given indicate where the files are found in a MySQL source distribution):

- `include/mysql/plugin.h` exposes the public plugin API. This file should be examined by anyone who wants to write a plugin library.
- `sql/sql_plugin.h` and `sql/sql_plugin.cc` comprise the internal plugin implementation. These files need not be consulted by plugin writers. They may be of interest for those who want to know more about how the server handles plugins.

System table:

- The `plugin` table in the `mysql` database lists each installed plugin and is required for plugin use. For new MySQL installations, this table is created during the installation process. If you are upgrading from a version older than MySQL 5.1, you should run `mysql_upgrade` to update your system tables and create the `plugin` table (see [Section 4.4.8](#), “`mysql_upgrade` — Check Tables for MySQL Upgrade”).

SQL statements:

- `INSTALL PLUGIN` registers a plugin in the `plugin` table and loads the plugin code.
- `UNINSTALL PLUGIN` unregisters a plugin from the `plugin` table and unloads the plugin code.
- The `WITH PARSER` clause for full-text index creation associates a full-text parser plugin with a given `FULLTEXT` index.
- `SHOW PLUGINS` displays information about known plugins. The `PLUGINS` table in `INFORMATION_SCHEMA` also contains plugin information.

System variable:

- `plugin_dir` indicates the location of the directory where all plugins must be installed. The value of this variable can be specified at server startup with a `--plugin_dir=path` option.

21.2.2. Full-Text Parser Plugins

MySQL has a built-in parser that it uses by default for full-text operations (parsing text to be indexed, or parsing a query string to determine the terms to be used for a search). For full-text processing, “parsing” means extracting words from text or a query string based on rules that define which character sequences make up a word and where word boundaries lie.

When parsing for indexing purposes, the parser passes each word to the server, which adds it to a full-text index. When parsing a query string, the parser passes each word to the server, which accumulates the words for use in a search.

The parsing properties of the built-in full-text parser are described in [Section 11.8, “Full-Text Search Functions”](#). These properties include rules for determining how to extract words from text. The parser is influenced by certain system variables such as `ft_min_word_len` and `ft_max_word_len` that cause words shorter or longer to be excluded, and by the stopword list that identifies common words to be ignored.

The plugin API enables you to provide a full-text parser of your own so that you have control over the basic duties of a parser. A parser plugin can operate in either of two roles:

- The plugin can replace the built-in parser. In this role, the plugin reads the input to be parsed, splits it up into words, and passes the words to the server (either for indexing or for word accumulation).

One reason to use a parser this way is that you need to use different rules from those of the built-in parser for determining how to split up input into words. For example, the built-in parser considers the text “case-sensitive” to consist of two words “case” and “sensitive,” whereas an application might need to treat the text as a single word.

- The plugin can act in conjunction with the built-in parser by serving as a front end for it. In this role, the plugin extracts text from the input and passes the text to the parser, which splits up the text into words using its normal parsing rules. In particular, this parsing will be affected by the `ft_***` system variables and the stopword list.

One reason to use a parser this way is that you need to index content such as PDF documents, XML documents, or `.doc` files. The built-in parser is not intended for those types of input but a plugin can pull out the text from these input sources and pass it to the built-in parser.

It is also possible for a parser plugin to operate in both roles. That is, it could extract text from non-plaintext input (the front end role), and also parse the text into words (thus replacing the built-in parser).

A full-text plugin is associated with full-text indexes on a per-index basis. That is, when you install a parser plugin initially, that does not cause it to be used for any full-text operations. It simply becomes available. For example, a full-text parser plugin becomes available to be named in a `WITH PARSE` clause when creating individual `FULLTEXT` indexes. To create such an index at table-creation time, do this:

```
CREATE TABLE t
(
  doc CHAR(255),
  FULLTEXT INDEX (doc) WITH PARSE my_parser
);
```

Or you can add the index after the table has been created:

```
ALTER TABLE t ADD FULLTEXT INDEX (doc) WITH PARSE my_parser;
```

The only SQL change for associating the parser with the index is the `WITH PARSE` clause. Searches are specified as before, with no changes needed for queries.

When you associate a parser plugin with a `FULLTEXT` index, the plugin is required for using the index. If the parser plugin is dropped, any index associated with it becomes unusable. Any attempt to use it a table for which a plugin is not available results in an error, although `DROP TABLE` is still possible.

21.2.3. Writing Plugins

This section describes the general and type-specific parts of the plugin API. It also provides a step-by-step guide to creating a plugin library. For example plugin source code, see the `plugin/fulltext` directory of a MySQL source distribution.

You can write plugins in C or C++ (or another language that can use C calling conventions). Plugins are loaded and unloaded dynamically, so your operating system must support dynamic loading and you must have compiled `mysqld` dynamically (not statically).

A plugin contains code that becomes part of the running server, so when you write a plugin, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to plugins that were originally written for older servers. For information about these constraints, see [Section 2.10.2, “Typical configure Options”](#), and [Section 2.10.4, “Dealing with Problems Compiling MySQL”](#).

21.2.3.1. General Plugin Structures and Functions

Every plugin must have a general plugin declaration. The declaration corresponds to the `st_mysql_plugin` structure in the `plugin.h` file:

```
struct st_mysql_plugin
{
    int type; /* the plugin type (a MYSQL_XXX_PLUGIN value) */
    void *info; /* pointer to type-specific plugin descriptor */
    const char *name; /* plugin name */
    const char *author; /* plugin author (for SHOW PLUGINS) */
    const char *descr; /* general descriptive text (for SHOW PLUGINS ) */
    int license; /* the plugin license (PLUGIN_LICENSE_XXX) */
    int (*init)(void *); /* the function to invoke when plugin is loaded */
    int (*deinit)(void *); /* the function to invoke when plugin is unloaded */
    unsigned int version; /* plugin version (for SHOW PLUGINS) */
    struct st_mysql_show_var *status_vars;
    void * __reserved1; /* placeholder for system variables */
    void * __reserved2; /* placeholder for config options */
};
```

The `st_mysql_plugin` structure is common to every type of plugin. Its members should be filled in as follows:

- `type`

The plugin type. This must be one of the plugin-type values from `plugin.h`. For a full-text parser plugin, the `type` value is `MYSQL_FTPARSER_PLUGIN`.

- `info`

A pointer to the descriptor for the plugin. Unlike the general plugin declaration structure, this descriptor's structure depends on the particular type of plugin. Each descriptor has a version number that indicates the API version for that type of plugin, plus any other members needed. The descriptor for full-text plugins is described in [Section 21.2.3.2, “Type-Specific Plugin Structures and Functions”](#).

- `name`

The plugin name. This is the name that will be listed in the `plugin` table and by which you refer to the plugin in SQL statements such as `INSTALL PLUGIN` and `UNINSTALL PLUGIN`.

- `author`

The plugin author. This can be whatever you like.

- `descr`

A general description of the plugin. This can be whatever you like.

- `license`

The plugin license type. The value can be one of `PLUGIN_LICENSE_PROPRIETARY`, `PLUGIN_LICENSE_GPL`, or `PLUGIN_LICENSE_BSD`.

- `init`

A once-only initialization function. This is executed when the plugin is loaded, which happens for `INSTALL PLUGIN` or, for plugins listed in the `plugin` table, at server startup. The function takes no arguments. It returns zero for success and nonzero for failure. If an `init` function is unneeded for a plugin, it can be specified as 0.

- `deinit`

A once-only deinitialization function. This is executed when the plugin is unloaded, which happens for `UNINSTALL PLUGIN` or, for plugins listed in the `plugin` table, at server shutdown. The function takes no arguments. It returns zero for success and nonzero for failure. If a `deinit` function is unneeded for a plugin, it can be specified as 0.

- `version`

The plugin version number. When the plugin is installed, this value can be retrieved from the `INFORMATION_SCHEMA.PLUGINS` table. The value includes major and minor numbers. If you write the value as a hex constant, the format is `0xMMNN`, where `MM` and `NN` are the major and minor numbers, respectively. For example, `0x0302` represents version 3.2.

- `status_vars`

A pointer to a structure for status variables associated with the plugin, or 0 if there are no such variables. When the plugin is installed, these variables are displayed in the output of the `SHOW STATUS` statement.

- `__reserved1`, `__reserved2`

These are placeholders for the future. Currently, they should be set to `NULL`.

The `init` and `deinit` functions in the general plugin declaration are invoked only when loading and unloading the plugin. They have nothing to do with use of the plugin such as happens when an SQL statement causes the plugin to be invoked.

The `status_vars` member, if not 0, points to an array of `st_mysql_show_var` structures, each of which describes one status variable, followed by a structure with all members set to 0. The `st_mysql_show_var` structure has this definition:

```
struct st_mysql_show_var {
    const char *name;
    char *value;
    enum enum_mysql_show_type type;
};
```

When the plugin is installed, the plugin name and the `name` value are joined with an underscore to form the name displayed by `SHOW STATUS`.

The following table shows the allowable status variable `type` values and what the corresponding variable should be.

Type	Meaning
<code>SHOW_BOOL</code>	Pointer to a boolean variable
<code>SHOW_INT</code>	Pointer to an integer variable
<code>SHOW_LONG</code>	Pointer to a long integer variable
<code>SHOW_LONGLONG</code>	Pointer to a longlong integer variable
<code>SHOW_CHAR</code>	A string
<code>SHOW_CHAR_PTR</code>	Pointer to a string
<code>SHOW_ARRAY</code>	Pointer to another <code>st_mysql_show_var</code> array
<code>SHOW_FUNC</code>	Pointer to a function

For the `SHOW_FUNC` type, the function is called and fills in its `out` parameter, which then provides information about the variable to be displayed. The function has this signature:

```
#define SHOW_VAR_FUNC_BUFF_SIZE 1024
typedef int (*mysql_show_var_func) (void *thd,
    struct st_mysql_show_var *out,
    char *buf);
```

Plugins should consider the `thd` parameter to be read only.

21.2.3.2. Type-Specific Plugin Structures and Functions

In the `st_mysql_plugin` structure that defines a plugin's general declaration, the `info` member points to a type-specific plugin descriptor. For a full-text parser plugin, the descriptor corresponds to the `st_mysql_ftparser` structure in the `plugin.h` file:

```
struct st_mysql_ftparser
{
    int interface_version;
    int (*parse)(MYSQL_FTPARSER_PARAM *param);
    int (*init)(MYSQL_FTPARSER_PARAM *param);
    int (*deinit)(MYSQL_FTPARSER_PARAM *param);
};
```

As shown by the structure definition, the descriptor has a version number (`MYSQL_FTPARSER_INTERFACE_VERSION` for full-text parser plugins) and contains pointers to three functions. The `init` and `deinit` members should point to a function or be set to 0 if the function is not needed. The `parse` member must point to the function that performs the parsing.

A full-text parser plugin is used in two different contexts, indexing and searching. In both contexts, the server calls the initialization and deinitialization functions at the beginning and end of processing each SQL statement that causes the plugin to be invoked. However, during statement processing, the server calls the main parsing function in context-specific fashion:

- For indexing, the server calls the parser for each column value to be indexed.
- For searching, the server calls the parser to parse the search string. The parser might also be called for rows processed by the

statement. In natural language mode, there is no need for the server to call the parser. For boolean mode phrase searches or natural language searches with query expansion, the parser is used to parse column values for information that is not in the index. Also, if a boolean mode search is done for a column that has no `FULLTEXT` index, the built-in parser will be called. (Plugins are associated with specific indexes. If there is no index, no plugin is used.)

Note that the plugin declaration in the plugin library descriptor has initialization and deinitialization functions, and so does the plugin descriptor to which it points. These pairs of functions have different purposes and are invoked for different reasons:

- For the plugin declaration in the plugin library descriptor, the initialization and deinitialization functions are invoked when the plugin is loaded and unloaded.
- For the plugin descriptor, the initialization and deinitialization functions are invoked per SQL statement for which the plugin is used.

Each interface function named in the plugin descriptor should return zero for success or nonzero for failure, and each of them receives an argument that points to a `MYSQL_FTPARSER_PARAM` structure containing the parsing context. The structure has this definition:

```
typedef struct st_mysql_ftparser_param
{
    int (*mysql_parse)(struct st_mysql_ftparser_param *,
                     char *doc, int doc_len);
    int (*mysql_add_word)(struct st_mysql_ftparser_param *,
                        char *word, int word_len,
                        MYSQL_FTPARSER_BOOLEAN_INFO *boolean_info);
    void *ftparser_state;
    void *mysql_ftparam;
    struct charset_info_st *cs;
    char *doc;
    int length;
    int flags;
    enum enum_ftparser_mode mode;
} MYSQL_FTPARSER_PARAM;
```

The structure members are used as follows:

- `mysql_parse`

A pointer to a callback function that invokes the server's built-in parser. Use this callback when the plugin acts as a front end to the built-in parser. That is, when the plugin parsing function is called, it should process the input to extract the text and pass the text to the `mysql_parse` callback.

The first parameter for this callback function should be the `param` value itself:

```
param->mysql_parse(param, ...);
```

A front end plugin can extract text and pass it all at once to the built-in parser, or it can extract and pass text to the built-in parser a piece at a time. However, in this case, the built-in parser treats the pieces of text as though there are implicit word breaks between them.

- `mysql_add_word`

A pointer to a callback function that adds a word to a full-text index or to the list of search terms. Use this callback when the parser plugin replaces the built-in parser. That is, when the plugin parsing function is called, it should parse the input into words and invoke the `mysql_add_word` callback for each word.

The first parameter for this callback function should be the `param` value itself:

```
param->mysql_add_word(param, ...);
```

- `ftparser_state`

This is a generic pointer. The plugin can set it to point to information to be used internally for its own purposes.

- `mysql_ftparam`

This is set by the server. It is passed as the first argument to the `mysql_parse` or `mysql_add_word` callback.

- `cs`

A pointer to information about the character set of the text, or 0 if no information is available.

- `doc`

A pointer to the text to be parsed.

- `length`

The length of the text to be parsed, in bytes.

- `flags`

Parser flags. This is zero if there are no special flags. Currently, the only nonzero flag is `MYSQL_FTFLAGS_NEED_COPY`, which means that `mysql_add_word()` must save a copy of the word (that is, it cannot use a pointer to the word because the word is in a buffer that will be overwritten.)

This flag might be set or reset by MySQL before calling the parser plugin, by the parser plugin itself, or by the `mysql_parse()` function.

- `mode`

The parsing mode. This value will be one of the following constants:

- `MYSQL_FTPARSER_SIMPLE_MODE`

Parse in fast and simple mode, which is used for indexing and for natural language queries. The parser should pass to the server only those words that should be indexed. If the parser uses length limits or a stopword list to determine which words to ignore, it should not pass such words to the server.

- `MYSQL_FTPARSER_WITH_STOPWORDS`

Parse in stopword mode. This is used in boolean searches for phrase matching. The parser should pass all words to the server, even stopwords or words that are outside any normal length limits.

- `MYSQL_FTPARSER_FULL_BOOLEAN_INFO`

Parse in boolean mode. This is used for parsing boolean query strings. The parser should recognize not only words but also boolean-mode operators and pass them to the server as tokens via the `mysql_add_word` callback. To tell the server what kind of token is being passed, the plugin needs to fill in a `MYSQL_FTPARSER_BOOLEAN_INFO` structure and pass a pointer to it.

If the parser is called in boolean mode, the `param->mode` value will be `MYSQL_FTPARSER_FULL_BOOLEAN_INFO`. The `MYSQL_FTPARSER_BOOLEAN_INFO` structure that the parser uses for passing token information to the server looks like this:

```
typedef struct st_mysql_ftparser_boolean_info
{
    enum enum_ft_token_type type;
    int yesno;
    int weight_adjust;
    bool wasign;
    bool trunc;
    /* These are parser state and must be removed. */
    byte prev;
    byte *quot;
} MYSQL_FTPARSER_BOOLEAN_INFO;
```

The parser should fill in the structure members as follows:

- `type`

The token type. This should be one of values shown in the following table.

Type	Meaning
<code>FT_TOKEN_EOF</code>	End of data
<code>FT_TOKEN_WORD</code>	A regular word
<code>FT_TOKEN_LEFT_PAREN</code>	The beginning of a group or subexpression
<code>FT_TOKEN_RIGHT_PAREN</code>	The end of a group or subexpression
<code>FT_TOKEN_STOPWORD</code>	A stopword

- `yesno`

Whether the word must be present for a match to occur. 0 means that the word is optional but increases the match relevance if it is present. Values larger than 0 mean that the word must be present. Values smaller than 0 mean that the word must not be present.

- `weight_adjust`

A weighting factor that determines how much a match for the word counts. It can be used to increase or decrease the word's importance in relevance calculations. A value of zero indicates no weight adjustment. Values greater than or less than zero mean higher or lower weight, respectively. The examples at [Section 11.8.2, “Boolean Full-Text Searches”](#), that use the `<` and `>` operators illustrate how weighting works.

- `wasign`

The sign of the weighting factor. A negative value acts like the `~` boolean-search operator, which causes the word's contribution to the relevance to be negative.

- `trunc`

Whether matching should be done as if the boolean-mode `*` truncation operator had been given.

Plugins should not use the `prev` and `quot` members of the `MYSQL_FTPARSER_BOOLEAN_INFO` structure.

21.2.3.3. Creating a Plugin Library

This section provides a step-by-step procedure for creating a plugin library. It shows how to develop a library that contains a full-text parsing plugin named `simple_parser`. This plugin performs parsing based on simpler rules than those used by the MySQL built-in full-text parser: Words are non-empty runs of whitespace characters.

Each plugin library has the following contents:

- A plugin library descriptor that indicates the version number of the general plugin API that the library uses and that contains a general declaration for each plugin in the library.
- Each plugin general declaration contains information that is common to all types of plugin: A value that indicates the plugin type; the plugin name, author, description, and license type; and pointers to the initialization and deinitialization functions that the server invokes when it loads and unloads the plugin.
- The plugin general declaration also contains a pointer to a type-specific plugin descriptor. The structure of these descriptors can vary from one plugin type to another, because each type of plugin can have its own API. A plugin descriptor contains a type-specific API version number and pointers to the functions that are needed to implement that plugin type. For example, a full-text parser plugin has initialization and deinitialization functions, and a main parsing function. The server invokes these functions when it uses the plugin to parse text.
- The plugin library contains the interface functions that are referenced by the library descriptor and by the plugin descriptors.

The easiest way to follow the instructions in this section is to use the source code in the `plugin/fulltext` directory of a MySQL source distribution. The instructions assume that you make a copy of that directory and use it to build the plugin library. To make a copy of the directory, use the following commands, which assume that the MySQL source tree is in a directory named `mysql-5.4` under your current directory:

```
shell> mkdir fulltext_plugin
shell> cp mysql-5.4/plugin/fulltext/* fulltext_plugin
```

After copying the source files, use the following procedure to create a plugin library:

1. Change location into the `fulltext_plugin` directory:

```
shell> cd fulltext_plugin
```

2. The plugin source file should include the header files that the plugin library needs. The `plugin.h` file is required, and the library might require other files as well. For example:

```
#include <stdlib.h>
#include <ctype.h>
#include <mysql/plugin.h>
```

3. Set up the plugin library file descriptor.

Every plugin library must include a library descriptor that must define two symbols:

- `_mysql_plugin_interface_version` specifies the version number of the general plugin framework. This is given by the `MYSQL_PLUGIN_INTERFACE_VERSION` symbol, which is defined in the `plugin.h` file.
- `_mysql_plugin_declarations` defines an array of plugin declarations, terminated by a declaration with all members set to 0. Each declaration is an instance of the `st_mysql_plugin` structure (also defined in `plugin.h`). There must be one of these for each plugin in the library.

If the server does not find these two symbols in a library, it does not accept it as a legal plugin library and rejects it with an error. This prevents use of a library for plugin purposes unless it was built specifically as a plugin library.

The standard (and most convenient) way to define the two required symbols is by using the `mysql_declare_plugin` and `mysql_declare_plugin_end` macros from the `plugin.h` file:

```
mysql_declare_plugin
... one or more plugin declarations here ...
mysql_declare_plugin_end;
```

For example, the library descriptor for a library that contains a single plugin named `simple_parser` looks like this:

```
mysql_declare_plugin
{
    MYSQL_FTPARSER_PLUGIN,      /* type */
    &simple_parser_descriptor,   /* descriptor */
    "simple_parser",            /* name */
    "MySQL AB",                /* author */
    "Simple Full-Text Parser",  /* description */
    PLUGIN_LICENSE_GPL,        /* plugin license */
    simple_parser_plugin_init,  /* init function (when loaded) */
    simple_parser_plugin_deinit, /* deinit function (when unloaded) */
    0x0001,                    /* version */
    simple_status               /* status variables */
}
mysql_declare_plugin_end;
```

For a full-text parser plugin, the type must be `MYSQL_FTPARSER_PLUGIN`. This is the value that identifies the plugin as being legal for use in a `WITH PARSER` clause when creating a `FULLTEXT` index. (No other plugin type is legal for this clause.)

The `mysql_declare_plugin` and `mysql_declare_plugin_end` macros are defined in `plugin.h` like this:

```
#ifndef MYSQL_DYNAMIC_PLUGIN
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS) \
int VERSION= MYSQL_PLUGIN_INTERFACE_VERSION; \
int PSIZE= sizeof(struct st_mysql_plugin); \
struct st_mysql_plugin DECLS[]= {
#else
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS) \
int _mysql_plugin_interface_version= MYSQL_PLUGIN_INTERFACE_VERSION; \
int _mysql_sizeof_struct_st_plugin= sizeof(struct st_mysql_plugin); \
struct st_mysql_plugin _mysql_plugin_declarations[]= {
#endif

#define mysql_declare_plugin(NAME) \
__MYSQL_DECLARE_PLUGIN(NAME, \
    builtin_ ## NAME ## _plugin_interface_version, \
    builtin_ ## NAME ## _sizeof_struct_st_plugin, \
    builtin_ ## NAME ## _plugin)

#define mysql_declare_plugin_end ,{0,0,0,0,0,0,0,0,0}
```

One point to note about those definitions is that the `_mysql_plugin_interface_version` symbol is defined only if the `MYSQL_DYNAMIC_PLUGIN` symbol is defined. This means that you'll need to provide `-DMYSQL_DYNAMIC_PLUGIN` as part of the compilation command when you build the plugin.

When the macros are used as just shown, they expand to the following code, which defines both of the required symbols (`_mysql_plugin_interface_version` and `_mysql_plugin_declarations`):

```
int _mysql_plugin_interface_version= MYSQL_PLUGIN_INTERFACE_VERSION;
struct st_mysql_plugin _mysql_plugin_declarations[]= {
{
    MYSQL_FTPARSER_PLUGIN,      /* type */
    &simple_parser_descriptor,   /* descriptor */
    "simple_parser",            /* name */
    "MySQL AB",                /* author */
    "Simple Full-Text Parser",  /* description */
    PLUGIN_LICENSE_GPL,        /* plugin license */
    simple_parser_plugin_init,  /* init function (when loaded) */
    simple_parser_plugin_deinit, /* deinit function (when unloaded) */
    0x0001,                    /* version */
    simple_status               /* status variables */
}
```

```

simple_status          /* status variables          */
}
, {0,0,0,0,0,0,0,0,0}
};
    
```

The preceding example declares a single plugin in the library descriptor, but it is possible to declare multiple plugins. List the declarations one after the other between `mysql_declare_plugin` and `mysql_declare_plugin_end`, separated by commas.

MySQL plugins can be written in C or C++ (or another language that can use C calling conventions). One feature of C++ is that you can use non-constant variables to initialize global structures. However, if you write a C++ plugin, you should not use this feature. Members of structures such as the `st_mysql_plugin` structure should be initialized with constant variables. See the discussion at the end of this section that describes some legal and illegal initializers for plugins.

4. Set up the plugin descriptor.

Each plugin declaration in the library descriptor points to a type-specific descriptor for the corresponding plugin. In the `simple_parser` declaration, that descriptor is indicated by `&simple_parser_descriptor`. The descriptor specifies the version number for the full-text plugin interface (as given by `MYSQL_FTPARSER_INTERFACE_VERSION`), and the plugin's parsing, initialization, and deinitialization functions:

```

static struct st_mysql_ftparser simple_parser_descriptor=
{
    MYSQL_FTPARSER_INTERFACE_VERSION, /* interface version */
    simple_parser_parse,             /* parsing function */
    simple_parser_init,              /* parser init function */
    simple_parser_deinit             /* parser deinit function */
};
    
```

5. Set up the plugin interface functions.

The general plugin declaration in the library descriptor names the initialization and deinitialization functions that the server should invoke when it loads and unloads the plugin. For `simple_parser`, these functions do nothing but return zero to indicate that they succeeded:

```

static int simple_parser_plugin_init(void)
{
    return(0);
}

static int simple_parser_plugin_deinit(void)
{
    return(0);
}
    
```

Because those functions do not actually do anything, you could omit them and specify 0 for each of them in the plugin declaration.

The type-specific plugin descriptor for `simple_parser` names the initialization, deinitialization, and parsing functions that the server invokes when the plugin is used. For `simple_parser`, the initialization and deinitialization functions do nothing:

```

static int simple_parser_init(MYSQL_FTPARSER_PARAM *param)
{
    return(0);
}

static int simple_parser_deinit(MYSQL_FTPARSER_PARAM *param)
{
    return(0);
}
    
```

Here too, because those functions do nothing, you could omit them and specify 0 for each of them in the plugin descriptor.

The main parsing function, `simple_parser_parse()`, acts as a replacement for the built-in full-text parser, so it needs to split text into words and pass each word to the server. The parsing function's first argument is a pointer to a structure that contains the parsing context. This structure has a `doc` member that points to the text to be parsed, and a `length` member that indicates how long the text is. The simple parsing done by the plugin considers non-empty runs of whitespace characters to be words, so it identifies words like this:

```

static int simple_parser_parse(MYSQL_FTPARSER_PARAM *param)
{
    char *end, *start, *docend= param->doc + param->length;

    for (end= start= param->doc;; end++)
    {
        if (end == docend)
        {
            ;
        }
    }
}
    
```

```

        if (end > start)
            add_word(param, start, end - start);
        break;
    }
    else if (isspace(*end))
    {
        if (end > start)
            add_word(param, start, end - start);
        start= end + 1;
    }
    }
    return(0);
}

```

As the parser finds each word, it invokes a function `add_word()` to pass the word to the server. `add_word()` is a helper function only; it is not part of the plugin interface. The parser passes the parsing context pointer to `add_word()`, as well as a pointer to the word and a length value:

```

static void add_word(MYSQL_FTPARSER_PARAM *param, char *word, size_t len)
{
    MYSQL_FTPARSER_BOOLEAN_INFO bool_info=
    { FT_TOKEN_WORD, 0, 0, 0, 0, ' ', 0 };

    param->mysql_add_word(param, word, len, &bool_info);
}

```

For boolean-mode parsing, `add_word()` fills in the members of the `bool_info` structure as described in [Section 21.2.3.2, “Type-Specific Plugin Structures and Functions”](#).

- Set up the status variables, if there are any. For the `simple_parser` plugin, the following status variable array sets up one status variable with a value that is static text, and another with a value that is stored in a long integer variable:

```

long number_of_calls= 0;

struct st_mysql_show_var simple_status[]=
{
    {"static", (char *)"just a static text", SHOW_CHAR},
    {"called", (char *)&number_of_calls, SHOW_LONG},
    {0,0,0}
};

```

When the plugin is installed, the plugin name and the `name` value are joined with an underscore to form the name displayed by `SHOW STATUS`. For the array just shown, the resulting status variable names are `simple_parser_static` and `simple_parser_called`. This convention means that you can easily display the variables for a plugin using its name:

```

mysql> SHOW STATUS LIKE 'simple_parser%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| simple_parser_static | just a static text |
| simple_parser_called | 0 |
+-----+-----+

```

- Compile the plugin library as a shared library and install it in the plugin directory.

Note

As mentioned earlier, be sure to specify `-DMYSQL_DYNAMIC_PLUGIN` as part of the compilation command when you build the plugin.

The procedure for compiling shared objects varies from system to system. If you build your library using the GNU autotools, `libtool` should be able to generate the correct compilation commands for your system. If the library is named `mypluglib`, you should end up with a shared object file that has a name something like `libmypluglib.so`. (The file name might have a different extension on your system.)

To use the autotools, you'll need to make a few changes to the configuration files at this point to enable the plugin to be compiled and installed. Assume that your MySQL distribution is installed at a base directory of `/usr/local/mysql` and that its header files are located in the `include` directory under the base directory.

Edit `Makefile.am`, which should look something like this:

```

#Makefile.am example for a plugin

pkglibdir=$(libdir)/mysql
INCLUDES= -I$(top_builddir)/include -I$(top_srcdir)/include
#noinst_LTLIBRARIES= mypluglib.la
pkglib_LTLIBRARIES= mypluglib.la
mypluglib_la_SOURCES= plugin_example.c
mypluglib_la_LDFLAGS= -module -rpath $(pkglibdir)

```

```
mypluglib_la_CFLAGS= -DMYSQL_DYNAMIC_PLUGIN
```

The `mypluglib_la_CFLAGS` line takes care of passing the `-DMYSQL_DYNAMIC_PLUGIN` flag to the compilation command.

Adjust the `INCLUDES` line to specify the path name to the installed MySQL header files. Edit it to look like this:

```
INCLUDES= -I/usr/local/mysql/include
```

Make sure that the `noinst_LTLIBRARIES` line is commented out or remove it. Make sure that the `pkglib_LTLIBRARIES` line is not commented out; it enables the `make install` command.

Set up the files needed for the `configure` command, invoke it, and run `make`:

```
shell> autoreconf --force --install --symlink
shell> ./configure --prefix=/usr/local/mysql
shell> make
```

The `--prefix` option to `configure` indicates the MySQL base directory under which the plugin should be installed. You can see what value to use for this option with `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'basedir';
+-----+-----+
| Variable_name | Value                |
+-----+-----+
| base          | /usr/local/mysql    |
+-----+-----+
```

The location of the plugin directory where you should install the library is given by the `plugin_dir` system variable. For example:

```
mysql> SHOW VARIABLES LIKE 'plugin_dir';
+-----+-----+
| Variable_name | Value                |
+-----+-----+
| plugin_dir    | /usr/local/mysql/lib/mysql/plugin |
+-----+-----+
```

To install the plugin library, use `make`:

```
shell> make install
```

Verify that `make install` installed the plugin library in the proper directory. After installing it, make sure that the library permissions allow it to be executed by the server.

8. Register the plugin with the server.

The `INSTALL PLUGIN` statement causes the server to list the plugin in the `plugin` table and to load the plugin code from the library file. Use that statement to register `simple_parser` with the server, and then verify that the plugin is listed in the `plugin` table:

```
mysql> INSTALL PLUGIN simple_parser SONAME 'libmypluglib.so';
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT * FROM mysql.plugin;
+-----+-----+
| name          | dl                  |
+-----+-----+
| simple_parser | libmypluglib.so    |
+-----+-----+
1 row in set (0.00 sec)
```

9. Try the plugin.

Create a table that contains a string column and associate the parser plugin with a `FULLTEXT` index on the column:

```
mysql> CREATE TABLE t (c VARCHAR(255),
-> FULLTEXT (c) WITH PARSE simple_parser);
Query OK, 0 rows affected (0.01 sec)
```

Insert some text into the table and try some searches. These should verify that the parser plugin treats all non-whitespace characters as word characters:

```
mysql> INSERT INTO t VALUES
-> ('latin1_general_cs is a case-sensitive collation'),
-> ('I\'d like a case of oranges'),
-> ('this is sensitive information'),
-> ('another row'),
-> ('yet another row');
Query OK, 5 rows affected (0.02 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> SELECT c FROM t;
+-----+
| c |
+-----+
| latin1_general_cs is a case-sensitive collation |
| I'd like a case of oranges |
| this is sensitive information |
| another row |
| yet another row |
+-----+
5 rows in set (0.00 sec)

mysql> SELECT MATCH(c) AGAINST('case') FROM t;
+-----+
| MATCH(c) AGAINST('case') |
+-----+
| 0 |
| 1.2968142032623 |
| 0 |
| 0 |
| 0 |
+-----+
5 rows in set (0.00 sec)

mysql> SELECT MATCH(c) AGAINST('sensitive') FROM t;
+-----+
| MATCH(c) AGAINST('sensitive') |
+-----+
| 0 |
| 1.3253291845322 |
| 0 |
| 0 |
| 0 |
+-----+
5 rows in set (0.01 sec)

mysql> SELECT MATCH(c) AGAINST('case-sensitive') FROM t;
+-----+
| MATCH(c) AGAINST('case-sensitive') |
+-----+
| 1.3109166622162 |
| 0 |
| 0 |
| 0 |
| 0 |
+-----+
5 rows in set (0.01 sec)

mysql> SELECT MATCH(c) AGAINST('I\'d') FROM t;
+-----+
| MATCH(c) AGAINST('I\'d') |
+-----+
| 0 |
| 1.2968142032623 |
| 0 |
| 0 |
| 0 |
+-----+
5 rows in set (0.01 sec)
```

Note how neither “case” nor “insensitive” match “case-insensitive” the way that they would for the built-in parser.

MySQL plugins can be written in C or C++ (or another language that can use C calling conventions). One feature of C++ is that you can use non-constant variables to initialize global structures. However, if you write a C++ plugin, you should not use this feature. Members of structures such as the `st_mysql_plugin` structure should be initialized with constant variables. The `simple_parser` descriptor shown earlier is allowable in a C++ plugin because it satisfies that requirement:

```
mysql_declare_plugin
{
  MYSQL_FTPARSER_PLUGIN, /* type */
  &simple_parser_descriptor, /* descriptor */
  "simple_parser", /* name */
  "MySQL AB", /* author */
  "Simple Full-Text Parser", /* description */
  PLUGIN_LICENSE_GPL, /* plugin license */
  simple_parser_plugin_init, /* init function (when loaded) */
  simple_parser_plugin_deinit, /* deinit function (when unloaded) */
  0x0001, /* version */
  simple_status /* status variables */
}
mysql_declare_plugin_end;
```

Here is another valid way to write the descriptor. It uses constant variables to indicate the plugin name, author, and description:

```
const char *simple_parser_name = "simple_parser";
const char *simple_parser_author = "MySQL AB";
const char *simple_parser_description = "Simple Full-Text Parser";

mysql_declare_plugin
{
    MYSQL_FTPARSER_PLUGIN,          /* type                */
    &simple_parser_descriptor,       /* descriptor          */
    simple_parser_name,             /* name                */
    simple_parser_author,          /* author              */
    simple_parser_description,     /* description         */
    PLUGIN_LICENSE_GPL,           /* plugin license     */
    simple_parser_plugin_init,     /* init function (when loaded) */
    simple_parser_plugin_deinit,   /* deinit function (when unloaded) */
    0x0001,                        /* version             */
    simple_status                  /* status variables   */
}
mysql_declare_plugin_end;
```

However, the following descriptor is invalid. It uses structure members to indicate the plugin name, author, and description, but structures are not considered constant initializers in C++:

```
typedef struct
{
    const char *name;
    const char *author;
    const char *description;
} plugin_info;

plugin_info parser_info = {
    "simple_parser",
    "MySQL AB",
    "Simple Full-Text Parser"
};

mysql_declare_plugin
{
    MYSQL_FTPARSER_PLUGIN,          /* type                */
    &simple_parser_descriptor,       /* descriptor          */
    parser_info.name,              /* name                */
    parser_info.author,           /* author              */
    parser_info.description,      /* description         */
    PLUGIN_LICENSE_GPL,           /* plugin license     */
    simple_parser_plugin_init,     /* init function (when loaded) */
    simple_parser_plugin_deinit,   /* deinit function (when unloaded) */
    0x0001,                        /* version             */
    simple_status                  /* status variables   */
}
mysql_declare_plugin_end;
```

21.3. Adding New Functions to MySQL

There are three ways to add new functions to MySQL:

- You can add functions through the user-defined function (UDF) interface. User-defined functions are compiled as object files and then added to and removed from the server dynamically using the [CREATE FUNCTION](#) and [DROP FUNCTION](#) statements. See [Section 12.5.3.1, “CREATE FUNCTION Syntax”](#).
- You can add functions as native (built-in) MySQL functions. Native functions are compiled into the `mysqld` server and become available on a permanent basis.
- Another way to add functions is by creating stored functions. These are written using SQL statements rather than by compiling object code. The syntax for writing stored functions is not covered here. See [Section 18.2, “Using Stored Routines \(Procedures and Functions\)”](#).

Each method of creating compiled functions has advantages and disadvantages:

- If you write user-defined functions, you must install object files in addition to the server itself. If you compile your function into the server, you don't need to do that.
- Native functions require you to modify a source distribution. UDFs do not. You can add UDFs to a binary MySQL distribution. No access to MySQL source is necessary.
- If you upgrade your MySQL distribution, you can continue to use your previously installed UDFs, unless you upgrade to a

newer version for which the UDF interface changes. For native functions, you must repeat your modifications each time you upgrade.

Whichever method you use to add new functions, they can be invoked in SQL statements just like native functions such as `ABS()` or `SOUNDEX()`.

See [Section 8.2.4, “Function Name Parsing and Resolution”](#), for the rules describing how the server interprets references to different kinds of functions.

The following sections describe features of the UDF interface, provide instructions for writing UDFs, discuss security precautions that MySQL takes to prevent UDF misuse, and describe how to add native MySQL functions.

For example source code that illustrates how to write UDFs, take a look at the `sql/udf_example.c` file that is provided in MySQL source distributions.

21.3.1. Features of the User-Defined Function Interface

The MySQL interface for user-defined functions provides the following features and capabilities:

- Functions can return string, integer, or real values and can accept arguments of those same types.
- You can define simple functions that operate on a single row at a time, or aggregate functions that operate on groups of rows.
- Information is provided to functions that enables them to check the number, types, and names of the arguments passed to them.
- You can tell MySQL to coerce arguments to a given type before passing them to a function.
- You can indicate that a function returns `NULL` or that an error occurred.

21.3.2. Adding a New User-Defined Function

For the UDF mechanism to work, functions must be written in C or C++ and your operating system must support dynamic loading. The MySQL source distribution includes a file `sql/udf_example.c` that defines 5 new functions. Consult this file to see how UDF calling conventions work. UDF-related symbols and data structures are defined in the `include/mysql_com.h` header file. (You need not include this header file directly because it is included by `mysql.h`.)

A UDF contains code that becomes part of the running server, so when you write a UDF, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to UDFs that were originally written for older servers. For information about these constraints, see [Section 2.10.2, “Typical configure Options”](#), and [Section 2.10.4, “Dealing with Problems Compiling MySQL”](#).

To be able to use UDFs, you need to link `mysqld` dynamically. Don't configure MySQL using `-with-mysqld-ldflags=-all-static`. If you want to use a UDF that needs to access symbols from `mysqld` (for example, the `metaphone` function in `sql/udf_example.c` that uses `default_charset_info`), you must link the program with `-rdynamic` (see `man dlopen`). If you plan to use UDFs, the rule of thumb is to configure MySQL with `-with-mysqld-ldflags=-rdynamic` unless you have a very good reason not to.

For each function that you want to use in SQL statements, you should define corresponding C (or C++) functions. In the following discussion, the name “xxx” is used for an example function name. To distinguish between SQL and C/C++ usage, `XXX()` (uppercase) indicates an SQL function call, and `xxx()` (lowercase) indicates a C/C++ function call.

The C/C++ functions that you write to implement the interface for `XXX()` are:

- `xxx()` (required)

The main function. This is where the function result is computed. The correspondence between the SQL function data type and the return type of your C/C++ function is shown here.

SQL Type	C/C++ Type
<code>STRING</code>	<code>char *</code>
<code>INTEGER</code>	<code>long long</code>
<code>REAL</code>	<code>double</code>

It is also possible to declare a `DECIMAL` function, but currently the value is returned as a string, so you should write the UDF as though it were a `STRING` function. `ROW` functions are not implemented.

- `xxx_init()` (optional)

The initialization function for `xxx()`. It can be used for the following purposes:

- To check the number of arguments to `XXX()`.
 - To check that the arguments are of a required type or, alternatively, to tell MySQL to coerce arguments to the types you want when the main function is called.
 - To allocate any memory required by the main function.
 - To specify the maximum length of the result.
 - To specify (for `REAL` functions) the maximum number of decimal places in the result.
 - To specify whether the result can be `NULL`.
- `xxx_deinit()` (optional)

The deinitialization function for `xxx()`. It should deallocate any memory allocated by the initialization function.

When an SQL statement invokes `xxx()`, MySQL calls the initialization function `xxx_init()` to let it perform any required setup, such as argument checking or memory allocation. If `xxx_init()` returns an error, MySQL aborts the SQL statement with an error message and does not call the main or deinitialization functions. Otherwise, MySQL calls the main function `xxx()` once for each row. After all rows have been processed, MySQL calls the deinitialization function `xxx_deinit()` so that it can perform any required cleanup.

For aggregate functions that work like `SUM()`, you must also provide the following functions:

- `xxx_clear()`
Reset the current aggregate value but do not insert the argument as the initial aggregate value for a new group.
- `xxx_add()`
Add the argument to the current aggregate value.

MySQL handles aggregate UDFs as follows:

1. Call `xxx_init()` to let the aggregate function allocate any memory it needs for storing results.
2. Sort the table according to the `GROUP BY` expression.
3. Call `xxx_clear()` for the first row in each new group.
4. Call `xxx_add()` for each row that belongs in the same group.
5. Call `xxx()` to get the result for the aggregate when the group changes or after the last row has been processed.
6. Repeat 3-5 until all rows has been processed
7. Call `xxx_deinit()` to let the UDF free any memory it has allocated.

All functions must be thread-safe. This includes not just the main function, but the initialization and deinitialization functions as well, and also the additional functions required by aggregate functions. A consequence of this requirement is that you are not allowed to allocate any global or static variables that change! If you need memory, you should allocate it in `xxx_init()` and free it in `xxx_deinit()`.

21.3.2.1. UDF Calling Sequences for Simple Functions

This section describes the different functions that you need to define when you create a simple UDF. [Section 21.3.2, “Adding a New User-Defined Function”](#), describes the order in which MySQL calls these functions.

The main `xxx()` function should be declared as shown in this section. Note that the return type and parameters differ, depending on whether you declare the SQL function `XXX()` to return `STRING`, `INTEGER`, or `REAL` in the `CREATE FUNCTION` statement:

For `STRING` functions:

```
char *xxx(UDF_INIT *initid, UDF_ARGS *args,
         char *result, unsigned long *length,
         char *is_null, char *error);
```

For `INTEGER` functions:

```
long long xxx(UDF_INIT *initid, UDF_ARGS *args,
             char *is_null, char *error);
```

For `REAL` functions:

```
double xxx(UDF_INIT *initid, UDF_ARGS *args,
          char *is_null, char *error);
```

`DECIMAL` functions return string values and should be declared the same way as `STRING` functions. `ROW` functions are not implemented.

The initialization and deinitialization functions are declared like this:

```
my_bool xxx_init(UDF_INIT *initid, UDF_ARGS *args, char *message);
void xxx_deinit(UDF_INIT *initid);
```

The `initid` parameter is passed to all three functions. It points to a `UDF_INIT` structure that is used to communicate information between functions. The `UDF_INIT` structure members follow. The initialization function should fill in any members that it wishes to change. (To use the default for a member, leave it unchanged.)

- `my_bool maybe_null`

`xxx_init()` should set `maybe_null` to 1 if `xxx()` can return `NULL`. The default value is 1 if any of the arguments are declared `maybe_null`.

- `unsigned int decimals`

The number of decimal digits to the right of the decimal point. The default value is the maximum number of decimal digits in the arguments passed to the main function. For example, if the function is passed `1.34`, `1.345`, and `1.3`, the default would be 3, because `1.345` has 3 decimal digits.

For arguments that have no fixed number of decimals, the `decimals` value is set to 31, which is 1 more than the maximum number of decimals allowed for the `DECIMAL`, `FLOAT`, and `DOUBLE` data types.

A `decimals` value of 31 is used for arguments in cases such as a `FLOAT` or `DOUBLE` column declared without an explicit number of decimals (for example, `FLOAT` rather than `FLOAT(10,3)`) and for floating-point constants such as `1345E-3`. It is also used for string and other non-number arguments that might be converted within the function to numeric form.

The value to which the `decimals` member is initialized is only a default. It can be changed within the function to reflect the actual calculation performed. The default is determined such that the largest number of decimals of the arguments is used. If the number of decimals is 31 for even one of the arguments, that is the value used for `decimals`.

- `unsigned int max_length`

The maximum length of the result. The default `max_length` value differs depending on the result type of the function. For string functions, the default is the length of the longest argument. For integer functions, the default is 21 digits. For real functions, the default is 13 plus the number of decimal digits indicated by `initid->decimals`. (For numeric functions, the length includes any sign or decimal point characters.)

If you want to return a blob value, you can set `max_length` to 65KB or 16MB. This memory is not allocated, but the value is used to decide which data type to use if there is a need to temporarily store the data.

- `char *ptr`

A pointer that the function can use for its own purposes. For example, functions can use `initid->ptr` to communicate allocated memory among themselves. `xxx_init()` should allocate the memory and assign it to this pointer:

```
initid->ptr = allocated_memory;
```

In `xxx()` and `xxx_deinit()`, refer to `initid->ptr` to use or deallocate the memory.

- `my_bool const_item`

`xxx_init()` should set `const_item` to 1 if `xxx()` always returns the same value and to 0 otherwise.

21.3.2.2. UDF Calling Sequences for Aggregate Functions

This section describes the different functions that you need to define when you create an aggregate UDF. [Section 21.3.2, “Adding a New User-Defined Function”](#), describes the order in which MySQL calls these functions.

- `xxx_reset()`

This function is called when MySQL finds the first row in a new group. It should reset any internal summary variables and then use the given `UDF_ARGS` argument as the first value in your internal summary value for the group. Declare `xxx_reset()` as follows:

```
void xxx_reset(UDF_INIT *initid, UDF_ARGS *args,
              char *is_null, char *error);
```

`xxx_reset()` is not needed or used in MySQL 5.4, in which the UDF interface uses `xxx_clear()` instead. However, you can define both `xxx_reset()` and `xxx_clear()` if you want to have your UDF work with older versions of the server. (If you do include both functions, the `xxx_reset()` function in many cases can be implemented internally by calling `xxx_clear()` to reset all variables, and then calling `xxx_add()` to add the `UDF_ARGS` argument as the first value in the group.)

- `xxx_clear()`

This function is called when MySQL needs to reset the summary results. It is called at the beginning for each new group but can also be called to reset the values for a query where there were no matching rows. Declare `xxx_clear()` as follows:

```
void xxx_clear(UDF_INIT *initid, char *is_null, char *error);
```

`is_null` is set to point to `CHAR(0)` before calling `xxx_clear()`.

If something went wrong, you can store a value in the variable to which the `error` argument points. `error` points to a single-byte variable, not to a string buffer.

`xxx_clear()` is required by MySQL 5.4.

- `xxx_add()`

This function is called for all rows that belong to the same group. You should use it to add the value in the `UDF_ARGS` argument to your internal summary variable.

```
void xxx_add(UDF_INIT *initid, UDF_ARGS *args,
            char *is_null, char *error);
```

The `xxx()` function for an aggregate UDF should be declared the same way as for a non-aggregate UDF. See [Section 21.3.2.1, “UDF Calling Sequences for Simple Functions”](#).

For an aggregate UDF, MySQL calls the `xxx()` function after all rows in the group have been processed. You should normally never access its `UDF_ARGS` argument here but instead return a value based on your internal summary variables.

Return value handling in `xxx()` should be done the same way as for a non-aggregate UDF. See [Section 21.3.2.4, “UDF Return Values and Error Handling”](#).

The `xxx_reset()` and `xxx_add()` functions handle their `UDF_ARGS` argument the same way as functions for non-aggregate UDFs. See [Section 21.3.2.3, “UDF Argument Processing”](#).

The pointer arguments to `is_null` and `error` are the same for all calls to `xxx_reset()`, `xxx_clear()`, `xxx_add()` and `xxx()`. You can use this to remember that you got an error or whether the `xxx()` function should return `NULL`. You should not store a string into `*error`! `error` points to a single-byte variable, not to a string buffer.

`*is_null` is reset for each group (before calling `xxx_clear()`). `*error` is never reset.

If `*is_null` or `*error` are set when `xxx()` returns, MySQL returns `NULL` as the result for the group function.

21.3.2.3. UDF Argument Processing

The `args` parameter points to a `UDF_ARGS` structure that has the members listed here:

- `unsigned int arg_count`

The number of arguments. Check this value in the initialization function if you require your function to be called with a particular number of arguments. For example:

```
if (args->arg_count != 2)
{
    strcpy(message, "XXX() requires two arguments");
    return 1;
}
```

For other `UDF_ARGS` member values that are arrays, array references are zero-based. That is, refer to array members using index values from 0 to `args->arg_count - 1`.

- `enum Item_result *arg_type`

A pointer to an array containing the types for each argument. The possible type values are `STRING_RESULT`, `INT_RESULT`, `REAL_RESULT`, and `DECIMAL_RESULT`.

To make sure that arguments are of a given type and return an error if they are not, check the `arg_type` array in the initialization function. For example:

```
if (args->arg_type[0] != STRING_RESULT ||
    args->arg_type[1] != INT_RESULT)
{
    strcpy(message, "XXX() requires a string and an integer");
    return 1;
}
```

Arguments of type `DECIMAL_RESULT` are passed as strings, so you should handle them the same way as `STRING_RESULT` values.

As an alternative to requiring your function's arguments to be of particular types, you can use the initialization function to set the `arg_type` elements to the types you want. This causes MySQL to coerce arguments to those types for each call to `xxx()`. For example, to specify that the first two arguments should be coerced to string and integer, respectively, do this in `xxx_init()`:

```
args->arg_type[0] = STRING_RESULT;
args->arg_type[1] = INT_RESULT;
```

Exact-value decimal arguments such as `1.3` or `DECIMAL` column values are passed with a type of `DECIMAL_RESULT`. However, the values are passed as strings. If you want to receive a number, use the initialization function to specify that the argument should be coerced to a `REAL_RESULT` value:

```
args->arg_type[2] = REAL_RESULT;
```

- `char **args`

`args->args` communicates information to the initialization function about the general nature of the arguments passed to your function. For a constant argument `i`, `args->args[i]` points to the argument value. (See below for instructions on how to access the value properly.) For a non-constant argument, `args->args[i]` is 0. A constant argument is an expression that uses only constants, such as `3` or `4*7-2` or `SIN(3.14)`. A non-constant argument is an expression that refers to values that may change from row to row, such as column names or functions that are called with non-constant arguments.

For each invocation of the main function, `args->args` contains the actual arguments that are passed for the row currently being processed.

If argument `i` represents `NULL`, `args->args[i]` is a null pointer (0). If the argument is not `NULL`, functions can refer to it as follows:

- An argument of type `STRING_RESULT` is given as a string pointer plus a length, to allow handling of binary data or data of arbitrary length. The string contents are available as `args->args[i]` and the string length is `args->lengths[i]`. Do not assume that the string is null-terminated.
- For an argument of type `INT_RESULT`, you must cast `args->args[i]` to a `long long` value:

```
long long int_val;
int_val = *((long long*) args->args[i]);
```

- For an argument of type `REAL_RESULT`, you must cast `args->args[i]` to a `double` value:

```
double real_val;
real_val = *((double*) args->args[i]);
```

- For an argument of type `DECIMAL_RESULT`, the value is passed as a string and should be handled like a `STRING_RESULT` value.
- `ROW_RESULT` arguments are not implemented.

- `unsigned long *lengths`

For the initialization function, the `lengths` array indicates the maximum string length for each argument. You should not change these. For each invocation of the main function, `lengths` contains the actual lengths of any string arguments that are passed for the row currently being processed. For arguments of types `INT_RESULT` or `REAL_RESULT`, `lengths` still contains the maximum length of the argument (as for the initialization function).

- `char *maybe_null`

For the initialization function, the `maybe_null` array indicates for each argument whether the argument value might be null (0 if no, 1 if yes).

- `char **attributes`

`args->attributes` communicates information about the names of the UDF arguments. For argument `i`, the attribute name is available as a string in `args->attributes[i]` and the attribute length is `args->attribute_lengths[i]`. Do not assume that the string is null-terminated.

By default, the name of a UDF argument is the text of the expression used to specify the argument. For UDFs, an argument may also have an optional `[AS] alias_name` clause, in which case the argument name is `alias_name`. The `attributes` value for each argument thus depends on whether an alias was given.

Suppose that a UDF `my_udf()` is invoked as follows:

```
SELECT my_udf(expr1, expr2 AS alias1, expr3 alias2);
```

In this case, the `attributes` and `attribute_lengths` arrays will have these values:

```
args->attributes[0] = "expr1"
args->attribute_lengths[0] = 5

args->attributes[1] = "alias1"
args->attribute_lengths[1] = 6

args->attributes[2] = "alias2"
args->attribute_lengths[2] = 6
```

- `unsigned long *attribute_lengths`

The `attribute_lengths` array indicates the length of each argument name.

21.3.2.4. UDF Return Values and Error Handling

The initialization function should return `0` if no error occurred and `1` otherwise. If an error occurs, `xxx_init()` should store a null-terminated error message in the `message` parameter. The message is returned to the client. The message buffer is `MYSQL_ERRMSG_SIZE` characters long, but you should try to keep the message to less than 80 characters so that it fits the width of a standard terminal screen.

The return value of the main function `xxx()` is the function value, for `long long` and `double` functions. A string function should return a pointer to the result and set `*length` to the length (in bytes) of the return value. For example:

```
memcpy(result, "result string", 13);
*length = 13;
```

MySQL passes a buffer to the `xxx()` function via the `result` parameter. This buffer is sufficiently long to hold 255 characters,

which can be multi-byte characters. The `xxx()` function can store the result in this buffer if it fits, in which case the return value should be a pointer to the buffer. If the function stores the result in a different buffer, it should return a pointer to that buffer.

If your string function does not use the supplied buffer (for example, if it needs to return a string longer than 255 characters), you must allocate the space for your own buffer with `malloc()` in your `xxx_init()` function or your `xxx()` function and free it in your `xxx_deinit()` function. You can store the allocated memory in the `ptr` slot in the `UDF_INIT` structure for reuse by future `xxx()` calls. See [Section 21.3.2.1, “UDF Calling Sequences for Simple Functions”](#).

To indicate a return value of `NULL` in the main function, set `*is_null` to 1:

```
*is_null = 1;
```

To indicate an error return in the main function, set `*error` to 1:

```
*error = 1;
```

If `xxx()` sets `*error` to 1 for any row, the function value is `NULL` for the current row and for any subsequent rows processed by the statement in which `XXX()` was invoked. (`xxx()` is not even called for subsequent rows.)

21.3.2.5. Compiling and Installing User-Defined Functions

Files implementing UDFs must be compiled and installed on the host where the server runs. This process is described below for the example UDF file `sql/udf_example.c` that is included in the MySQL source distribution.

The immediately following instructions are for Unix. Instructions for Windows are given later in this section.

The `udf_example.c` file contains the following functions:

- `metaphon()` returns a metaphon string of the string argument. This is something like a soundex string, but it is more tuned for English.
- `myfunc_double()` returns the sum of the ASCII values of the characters in its arguments, divided by the sum of the length of its arguments.
- `myfunc_int()` returns the sum of the length of its arguments.
- `sequence([const int])` returns a sequence starting from the given number or 1 if no number has been given.
- `lookup()` returns the IP number for a host name.
- `reverse_lookup()` returns the host name for an IP number. The function may be called either with a single string argument of the form `'xxx.xxx.xxx.xxx'` or with four numbers.

A dynamically loadable file should be compiled as a sharable object file, using a command something like this:

```
shell> gcc -shared -o udf_example.so udf_example.c
```

If you are using `gcc` with `configure` and `libtool` (which is how MySQL is configured), you should be able to create `udf_example.so` with a simpler command:

```
shell> make udf_example.la
```

After you compile a shared object containing UDFs, you must install it and tell MySQL about it. Compiling a shared object from `udf_example.c` using `gcc` directly produces a file named `udf_example.so`. Compiling the shared object using `make` produces a file named something like `udf_example.so.0.0.0` in the `.libs` directory (the exact name may vary from platform to platform). Copy the shared object to the server's plugin directory and name it `udf_example.so`. This directory is given by the value of the `plugin_dir` system variable.

On some systems, the `ldconfig` program that configures the dynamic linker does not recognize a shared object unless its name begins with `lib`. In this case you should rename a file such as `udf_example.so` to `libudf_example.so`.

On Windows, you can compile user-defined functions by using the following procedure:

1. You need to obtain the Bazaar source repository for MySQL 5.4. See [Section 2.10.3, “Installing from the Development Source Tree”](#).
2. You must obtain the CMake build utility from <http://www.cmake.org>. (Version 2.4.2 or later is required).

- In the source repository, look in the `sql` directory. There are files named `udf_example.def` and `udf_example.c` there. Copy both files from this directory to your working directory.
- Create a CMake `makefile` (`CMakeLists.txt`) with these contents:

```
PROJECT(udf_example)

# Path for MySQL include directory
INCLUDE_DIRECTORIES("c:/mysql/include")

ADD_DEFINITIONS("-DHAVE_DLOPEN")
ADD_LIBRARY(udf_example MODULE udf_example.c udf_example.def)
TARGET_LINK_LIBRARIES(udf_example wssock32)
```

- Create the VC project and solution files:

```
cmake -G "<Generator>"
```

Invoking `cmake --help` shows you a list of valid Generators.

- Create `udf_example.dll`:

```
devenv udf_example.sln /build Release
```

After the shared object file has been installed, notify `mysqld` about the new functions with these statements:

```
mysql> CREATE FUNCTION metaphon RETURNS STRING SONAME 'udf_example.dll';
mysql> CREATE FUNCTION myfunc_double RETURNS REAL SONAME 'udf_example.dll';
mysql> CREATE FUNCTION myfunc_int RETURNS INTEGER SONAME 'udf_example.dll';
mysql> CREATE FUNCTION sequence RETURNS INTEGER SONAME 'udf_example.dll';
mysql> CREATE FUNCTION lookup RETURNS STRING SONAME 'udf_example.dll';
mysql> CREATE FUNCTION reverse_lookup
-> RETURNS STRING SONAME 'udf_example.dll';
mysql> CREATE AGGREGATE FUNCTION avgcost
-> RETURNS REAL SONAME 'udf_example.dll';
```

Functions can be deleted using `DROP FUNCTION`:

```
mysql> DROP FUNCTION metaphon;
mysql> DROP FUNCTION myfunc_double;
mysql> DROP FUNCTION myfunc_int;
mysql> DROP FUNCTION sequence;
mysql> DROP FUNCTION lookup;
mysql> DROP FUNCTION reverse_lookup;
mysql> DROP FUNCTION avgcost;
```

The `CREATE FUNCTION` and `DROP FUNCTION` statements update the `func` system table in the `mysql` database. The function's name, type and shared library name are saved in the table. You must have the `INSERT` and `DELETE` privileges for the `mysql` database to create and drop functions.

You should not use `CREATE FUNCTION` to add a function that has previously been created. If you need to reinstall a function, you should remove it with `DROP FUNCTION` and then reinstall it with `CREATE FUNCTION`. You would need to do this, for example, if you recompile a new version of your function, so that `mysqld` gets the new version. Otherwise, the server continues to use the old version.

An active function is one that has been loaded with `CREATE FUNCTION` and not removed with `DROP FUNCTION`. All active functions are reloaded each time the server starts, unless you start `mysqld` with the `--skip-grant-tables` option. In this case, UDF initialization is skipped and UDFs are unavailable.

If the new function will be referred to in statements that will be replicated to slave servers, you must ensure that every slave server also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

21.3.2.6. User-Defined Function Security Precautions

MySQL takes the following measures to prevent misuse of user-defined functions.

You must have the `INSERT` privilege to be able to use `CREATE FUNCTION` and the `DELETE` privilege to be able to use `DROP FUNCTION`. This is necessary because these statements add and delete rows from the `mysql.func` table.

UDFs should have at least one symbol defined in addition to the `xxx` symbol that corresponds to the main `xxx()` function. These auxiliary symbols correspond to the `xxx_init()`, `xxx_deinit()`, `xxx_reset()`, `xxx_clear()`, and `xxx_add()` functions. `mysqld` also supports an `--allow-suspicious-udfs` option that controls whether UDFs that have only an `xxx` symbol can be loaded. By default, the option is off, to prevent attempts at loading functions from shared object files other than those

containing legitimate UDFs. If you have older UDFs that contain only the `xxx` symbol and that cannot be recompiled to include an auxiliary symbol, it may be necessary to specify the `--allow-suspicious-udfs` option. Otherwise, you should avoid enabling this capability.

UDF object files cannot be placed in arbitrary directories. They must be located in the server's plugin directory. This directory is given by the value of the `plugin_dir` system variable.

21.3.3. Adding a New Native Function

To add a new native MySQL function, use the procedure described here, which requires that you use a source distribution. You cannot add native functions to a binary distribution because it is necessary to modify MySQL source code and compile MySQL from the modified source. If you migrate to another version of MySQL (for example, when a new version is released), you must repeat the procedure with the new version.

If the new native function will be referred to in statements that will be replicated to slave servers, you must ensure that every slave server also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

To add a new native function, follow these steps to modify source files in the `sql` directory:

1. Create a subclass for the function in `item_create.cc`:
 - If the function takes a fixed number of arguments, create a subclass of `Create_func_arg0`, `Create_func_arg1`, `Create_func_arg2`, or `Create_func_arg3`, respectively, depending on whether the function takes zero, one, two, or three arguments. For examples, see the `Create_func_uuid`, `Create_func_abs`, `Create_func_pow`, and `Create_func_lpad` classes.
 - If the function takes a variable number of arguments, create a subclass of `Create_native_func`. For an example, see `Create_func_concat`.
2. To provide a name by which the function can be referred to in SQL statements, register the name in `item_create.cc` by adding a line to this array:

```
static Native_func_registry func_array[]
```

You can register several names for the same function. For example, see the lines for `"LCASE"` and `"LOWER"`, which are aliases for `Create_func_lcase`.

3. In `item_func.h`, declare a class inheriting from `Item_num_func` or `Item_str_func`, depending on whether your function returns a number or a string.
4. In `item_func.cc`, add one of the following declarations, depending on whether you are defining a numeric or string function:

```
double Item_func_newname::val()
longlong Item_func_newname::val_int()
String *Item_func_newname::Str(String *str)
```

If you inherit your object from any of the standard items (like `Item_num_func`), you probably only have to define one of these functions and let the parent object take care of the other functions. For example, the `Item_str_func` class defines a `val()` function that executes `atof()` on the value returned by `::str()`.

5. If the function is non-deterministic, include the following statement in the item constructor to indicate that function results should not be cached:

```
current_thd->lex->safe_to_cache_query=0;
```

A function is non-deterministic if, given fixed values for its arguments, it can return different results for different invocations.

6. You should probably also define the following object function:

```
void Item_func_newname::fix_length_and_dec()
```

This function should at least calculate `max_length` based on the given arguments. `max_length` is the maximum number of characters the function may return. This function should also set `maybe_null = 0` if the main function can't return a `NULL` value. The function can check whether any of the function arguments can return `NULL` by checking the arguments' `maybe_null` variable. Look at `Item_func_mod::fix_length_and_dec` for a typical example of how to do this.

All functions must be thread-safe. In other words, do not use any global or static variables in the functions without protecting them

with mutexes.

If you want to return `NULL` from `::val()`, `::val_int()`, or `::str()`, you should set `null_value` to 1 and return 0.

For `::str()` object functions, there are additional considerations to be aware of:

- The `String *str` argument provides a string buffer that may be used to hold the result. (For more information about the `String` type, take a look at the `sql_string.h` file.)
- The `::str()` function should return the string that holds the result, or `(char*) 0` if the result is `NULL`.
- All current string functions try to avoid allocating any memory unless absolutely necessary!

21.4. Adding New Procedures to MySQL

In MySQL, you can define a procedure in C++ that can access and modify the data in a query before it is sent to the client. The modification can be done on a row-by-row or `GROUP BY` level.

We have created an example procedure to show you what can be done.

Additionally, we recommend that you take a look at `mysqlua`. With this you can use the LUA language to load a procedure at runtime into `mysqld`.

21.4.1. PROCEDURE ANALYSE

```
analyse([max_elements[,max_memory]])
```

This procedure is defined in the `sql/sql_analyse.cc` file. It examines the result from a query and returns an analysis of the results that suggests optimal data types for each column. To obtain this analysis, append `PROCEDURE ANALYSE` to the end of a `SELECT` statement:

```
SELECT ... FROM ... WHERE ... PROCEDURE ANALYSE([max_elements,[max_memory]])
```

For example:

```
SELECT col1, col2 FROM table1 PROCEDURE ANALYSE(10, 2000);
```

The results show some statistics for the values returned by the query, and propose an optimal data type for the columns. This can be helpful for checking your existing tables, or after importing new data. You may need to try different settings for the arguments so that `PROCEDURE ANALYSE()` does not suggest the `ENUM` data type when it is not appropriate.

The arguments are optional and are used as follows:

- `max_elements` (default 256) is the maximum number of distinct values that `analyse` notices per column. This is used by `analyse` to check whether the optimal data type should be of type `ENUM`; if there are more than `max_elements` distinct values, then `ENUM` is not a suggested type.
- `max_memory` (default 8192) is the maximum amount of memory that `analyse` should allocate per column while trying to find all distinct values.

21.4.2. Writing a Procedure

For the moment, the only documentation for this is the source.

You can find all information about procedures by examining the following files:

- `sql/sql_analyse.cc`
- `sql/procedure.h`
- `sql/procedure.cc`
- `sql/sql_select.cc`

21.5. Debugging and Porting MySQL

This appendix helps you port MySQL to other operating systems. Do check the list of currently supported operating systems first. See [Section 2.1.1, “Operating Systems Supported by MySQL Community Server”](#). If you have created a new port of MySQL, please let us know so that we can list it here and on our Web site (<http://www.mysql.com/>), recommending it to other users.

Note: If you create a new port of MySQL, you are free to copy and distribute it under the GPL license, but it does not make you a copyright holder of MySQL.

A working POSIX thread library is needed for the server. On Solaris 2.5 we use Sun PThreads (the native thread support in 2.4 and earlier versions is not good enough), on Linux we use LinuxThreads by Xavier Leroy, <Xavier.Leroy@inria.fr>.

The hard part of porting to a new Unix variant without good native thread support is probably to port MIT-pthreads. See [mit-pthreads/README](#) and Programming POSIX Threads (<http://www.humanfactor.com/pthreads/>).

Up to MySQL 4.0.2, the MySQL distribution included a patched version of Chris Provenzano's Pthreads from MIT (see the MIT Pthreads Web page at <http://www.mit.edu/afs/sipb/project/pthreads/> and a programming introduction at http://www.mit.edu:8001/people/proven/IAP_2000/). These can be used for some operating systems that do not have POSIX threads. See [Section 2.10.5, “MIT-pthreads Notes”](#).

It is also possible to use another user level thread package named FSU Pthreads (see <http://moss.csc.ncsu.edu/~mueller/pthreads/>). This implementation is being used for the SCO port.

See the `thr_lock.c` and `thr_alarm.c` programs in the `mysys` directory for some tests/examples of these problems.

Both the server and the client need a working C++ compiler. We use `gcc` on many platforms. Other compilers that are known to work are SPARCworks, Sun Forte, Irix `cc`, HP-UX `aCC`, IBM AIX `x1C_r`, Intel `ecc/icc` and Compaq `cxx`.

Important

If you are trying to build MySQL 5.4 with `icc` on the IA64 platform, and need support for MySQL Cluster, you should first ensure that you are using `icc` version 9.1.043 or later. (For details, see [Bug#21875](#).)

To compile only the client use `./configure --without-server`.

There is currently no support for only compiling the server, nor is it likely to be added unless someone has a good reason for it.

If you want/need to change any `Makefile` or the configure script you also need GNU Automake and Autoconf. See [Section 2.10.3, “Installing from the Development Source Tree”](#).

All steps needed to remake everything from the most basic files.

```
/bin/rm */.deps/*.P
/bin/rm -f config.cache
aclocal
autoheader
aclocal
automake
autoconf
./configure --with-debug=full --prefix='your installation directory'

# The makefiles generated above need GNU make 3.75 or newer.
# (called gmake below)
gmake clean all install init-db
```

If you run into problems with a new port, you may have to do some debugging of MySQL! See [Section 21.5.1, “Debugging a MySQL Server”](#).

Note

Before you start debugging `mysqld`, first get the test programs `mysys/thr_alarm` and `mysys/thr_lock` to work. This ensures that your thread installation has even a remote chance to work!

21.5.1. Debugging a MySQL Server

If you are using some functionality that is very new in MySQL, you can try to run `mysqld` with the `--skip-new` (which disables all new, potentially unsafe functionality) or with `--safe-mode` which disables a lot of optimization that may cause problems. See [Section B.1.4.2, “What to Do If MySQL Keeps Crashing”](#).

If `mysqld` doesn't want to start, you should verify that you don't have any `my.cnf` files that interfere with your setup! You can check your `my.cnf` arguments with `mysqld --print-defaults` and avoid using them by starting with `mysqld --no-defaults ...`

If `mysqld` starts to eat up CPU or memory or if it “hangs,” you can use `mysqladmin processlist status` to find out if someone is executing a query that takes a long time. It may be a good idea to run `mysqladmin -i10 processlist status` in some window if you are experiencing performance problems or problems when new clients can't connect.

The command `mysqladmin debug` dumps some information about locks in use, used memory and query usage to the MySQL log file. This may help solve some problems. This command also provides some useful information even if you haven't compiled MySQL for debugging!

If the problem is that some tables are getting slower and slower you should try to optimize the table with `OPTIMIZE TABLE` or `myisamchk`. See [Chapter 5, MySQL Server Administration](#). You should also check the slow queries with `EXPLAIN`.

You should also read the OS-specific section in this manual for problems that may be unique to your environment. See [Section 2.13, “Operating System-Specific Notes”](#).

21.5.1.1. Compiling MySQL for Debugging

If you have some very specific problem, you can always try to debug MySQL. To do this you must configure MySQL with the `--with-debug` or the `--with-debug=full` option. You can check whether MySQL was compiled with debugging by doing: `mysqld --help`. If the `--debug` flag is listed with the options then you have debugging enabled. `mysqladmin ver` also lists the `mysqld` version as `mysql ... --debug` in this case.

If you are using `gcc`, the recommended `configure` line is:

```
CC=gcc CFLAGS="-O2" CXX=gcc CXXFLAGS="-O2 -felide-constructors \
-fno-exceptions -fno-rtti" ./configure --prefix=/usr/local/mysql \
--with-debug --with-extra-charsets=complex
```

This avoids problems with the `libstdc++` library and with C++ exceptions (many compilers have problems with C++ exceptions in threaded code) and compile a MySQL version with support for all character sets.

If you suspect a memory overrun error, you can configure MySQL with `--with-debug=full`, which installs a memory allocation (`SAFEMALLOC`) checker. However, running with `SAFEMALLOC` is quite slow, so if you get performance problems you should start `mysqld` with the `--skip-safemalloc` option. This disables the memory overrun checks for each call to `malloc()` and `free()`.

If `mysqld` stops crashing when you compile it with `--with-debug`, you probably have found a compiler bug or a timing bug within MySQL. In this case, you can try to add `-g` to the `CFLAGS` and `CXXFLAGS` variables above and not use `--with-debug`. If `mysqld` dies, you can at least attach to it with `gdb` or use `gdb` on the core file to find out what happened.

When you configure MySQL for debugging you automatically enable a lot of extra safety check functions that monitor the health of `mysqld`. If they find something “unexpected,” an entry is written to `stderr`, which `mysqld_safe` directs to the error log! This also means that if you are having some unexpected problems with MySQL and are using a source distribution, the first thing you should do is to configure MySQL for debugging! (The second thing is to send mail to a MySQL mailing list and ask for help. See [Section 1.5.1, “MySQL Mailing Lists”](#). If you believe that you have found a bug, please use the instructions at [Section 1.6, “How to Report Bugs or Problems”](#).)

In the Windows MySQL distribution, `mysqld.exe` is by default compiled with support for trace files.

21.5.1.2. Creating Trace Files

If the `mysqld` server doesn't start or if you can cause it to crash quickly, you can try to create a trace file to find the problem.

To do this, you must have a `mysqld` that has been compiled with debugging support. You can check this by executing `mysqld -V`. If the version number ends with `-debug`, it is compiled with support for trace files. (On Windows, the debugging server is named `mysqld-debug` rather than `mysqld` as of MySQL 4.1.)

Start the `mysqld` server with a trace log in `/tmp/mysqld.trace` on Unix or `C:\mysqld.trace` on Windows:

```
shell> mysqld --debug
```

On Windows, you should also use the `--standalone` flag to not start `mysqld` as a service. In a console window, use this command:

```
C:\> mysqld-debug --debug --standalone
```

After this, you can use the `mysql.exe` command-line tool in a second console window to reproduce the problem. You can stop the `mysqld` server with `mysqladmin shutdown`.

Note that the trace file become **very big**! If you want to generate a smaller trace file, you can use debugging options something like

this:

```
mysqld --debug=d,info,error,query,general,where:0,/tmp/mysqld.trace
```

This only prints information with the most interesting tags to the trace file.

If you make a bug report about this, please only send the lines from the trace file to the appropriate mailing list where something seems to go wrong! If you can't locate the wrong place, you can ftp the trace file, together with a full bug report, to <ftp://ftp.mysql.com/pub/mysql/upload/> so that a MySQL developer can take a look at it.

The trace file is made with the **DEBUG** package by Fred Fish. See [Section 21.5.3, “The DEBUG Package”](#).

21.5.1.3. Using `pdb` to create a Windows crashdump

Program Database files (extension `pdb`) are included in the Noinstall distribution of MySQL. These files provide information for debugging your MySQL installation in the event of a problem.

The PDB file contains more detailed information about `mysqld` and other tools that enables more detailed trace and dump files to be created. You can use these with Dr Watson, `WinDbg` and Visual Studio to debug `mysqld`.

For more information on PDB files, see [Microsoft Knowledge Base Article 121366](#). For more information on the debugging options available, see [Debugging Tools for Windows](#).

Dr Watson is installed with all Windows distributions, but if you have installed Windows development tools, Dr Watson may have been replaced with `WinDbg`, the debugger included with Visual Studio, or the debugging tools provided with Borland or Delphi.

To generate a crash file using Dr Watson, follow these steps:

1. Start Dr Watson by running `drwtsn32.exe` interactively using the `-i` option:

```
C:\> drwtsn32 -i
```

2. Set the **LOG FILE PATH** to the directory where you want to store trace files.
3. Make sure **DUMP ALL THREAD CONTEXTS** and **APPEND TO EXISTING LOG FILE**.
4. Uncheck **DUMP SUMBOL TABLE**, **VISUAL NOTIFICATION**, **SOUND NOTIFICATION** and **CREATE CRASH DUMP FILE**.
5. Set the **NUMBER OF INSTRUCTIONS** to a suitable value to capture enough calls in the stacktrace. A value of at 25 should be enough.

Note that the file generated can be very large.

21.5.1.4. Debugging `mysqld` under `gdb`

On most systems you can also start `mysqld` from `gdb` to get more information if `mysqld` crashes.

With some older `gdb` versions on Linux you must use `run --one-thread` if you want to be able to debug `mysqld` threads. In this case, you can only have one thread active at a time. We recommend you to upgrade to `gdb 5.1` ASAP as thread debugging works much better with this version!

NPTL threads (the new thread library on Linux) may cause problems while running `mysqld` under `gdb`. Some symptoms are:

- `mysqld` hangs during startup (before it writes `ready for connections`).
- `mysqld` crashes during a `pthread_mutex_lock()` or `pthread_mutex_unlock()` call.

In this case, you should set the following environment variable in the shell before starting `gdb`:

```
LD_ASSUME_KERNEL=2.4.1
export LD_ASSUME_KERNEL
```

When running `mysqld` under `gdb`, you should disable the stack trace with `--skip-stack-trace` to be able to catch segfaults within `gdb`.

In MySQL 4.0.14 and above you should use the `--gdb` option to `mysqld`. This installs an interrupt handler for `SIGINT` (needed to stop `mysqld` with `^C` to set breakpoints) and disable stack tracing and core file handling.

It is very hard to debug MySQL under `gdb` if you do a lot of new connections the whole time as `gdb` doesn't free the memory for old threads. You can avoid this problem by starting `mysqld` with `thread_cache_size` set to a value equal to `max_connections + 1`. In most cases just using `--thread_cache_size=5` helps a lot!

If you want to get a core dump on Linux if `mysqld` dies with a SIGSEGV signal, you can start `mysqld` with the `--core-file` option. This core file can be used to make a backtrace that may help you find out why `mysqld` died:

```
shell> gdb mysqld core
gdb> backtrace full
gdb> quit
```

See [Section B.1.4.2, “What to Do If MySQL Keeps Crashing”](#).

If you are using `gdb` 4.17.x or above on Linux, you should install a `.gdb` file, with the following information, in your current directory:

```
set print sevenbit off
handle SIGUSR1 nostop noprint
handle SIGUSR2 nostop noprint
handle SIGWAITING nostop noprint
handle SIGLWP nostop noprint
handle SIGPIPE nostop
handle SIGALRM nostop
handle SIGHUP nostop
handle SIGTERM nostop noprint
```

If you have problems debugging threads with `gdb`, you should download `gdb` 5.x and try this instead. The new `gdb` version has very improved thread handling!

Here is an example how to debug `mysqld`:

```
shell> gdb /usr/local/libexec/mysqld
gdb> run
...
backtrace full # Do this when mysqld crashes
```

Include the above output in a bug report, which you can file using the instructions in [Section 1.6, “How to Report Bugs or Problems”](#).

If `mysqld` hangs you can try to use some system tools like `strace` or `/usr/proc/bin/pstack` to examine where `mysqld` has hung.

```
strace /tmp/log libexec/mysqld
```

If you are using the Perl `DBI` interface, you can turn on debugging information by using the `trace` method or by setting the `DBI_TRACE` environment variable.

21.5.1.5. Using a Stack Trace

On some operating systems, the error log contains a stack trace if `mysqld` dies unexpectedly. You can use this to find out where (and maybe why) `mysqld` died. See [Section 5.2.2, “The Error Log”](#). To get a stack trace, you must not compile `mysqld` with the `-fomit-frame-pointer` option to gcc. See [Section 21.5.1.1, “Compiling MySQL for Debugging”](#).

A stack trace in the error log looks something like this:

```
mysqld got signal 11;
Attempting backtrace. You can use the following information
to find out where mysqld died. If you see no messages after
this, something went terribly wrong...

stack_bottom = 0x41fd0110 thread_stack 0x40000
mysqld(my_print_stacktrace+0x32)[0x9da402]
mysqld(handle_segfault+0x28a)[0x6648e9]
/lib/libpthread.so.0[0x7f1a5af000f0]
/lib/libc.so.6(strcmp+0x2)[0x7f1a5a10f0f2]
mysqld(_Z21check_change_passwordP3THDPKcS2_Pcj+0x7c)[0x7412cb]
mysqld(_ZN16set_var_password5checkEP3THD+0xd0)[0x688354]
mysqld(_Z17sql_set_variablesP3THDP4ListI12set_var_baseE+0x68)[0x688494]
mysqld(_Z21mysql_execute_commandP3THD+0x41a0)[0x67a170]
mysqld(_Z11mysql_parseP3THDPKc jPS2_+0x282)[0x67f0ad]
mysqld(_Z16dispatch_command19enum_server_commandP3THDPcj+0xbb7)[0x67fd8]
mysqld(_Z10do_commandP3THD+0x24d)[0x6811b6]
mysqld(handle_one_connection+0x11c)[0x66e05e]
```

If resolution of function names for the trace fails, the trace contains less information:

```
mysqld got signal 11;
```

Attempting backtrace. You can use the following information to find out where mysqld died. If you see no messages after this, something went terribly wrong...

```
stack_bottom = 0x41fd0110 thread_stack 0x40000
[0x9da402]
[0x6648e9]
[0x7f1a5af000f0]
[0x7f1a5a10f0f2]
[0x7412cb]
[0x688354]
[0x688494]
[0x67a170]
[0x67f0ad]
[0x67fd8]
[0x6811b6]
[0x66e05e]
```

In the latter case, you can use the `resolve_stack_dump` utility to determine where `mysqld` died by using the following procedure:

1. Copy the numbers from the stack trace to a file, for example `mysqld.stack`. The numbers should not include the surrounding square brackets:

```
0x9da402
0x6648e9
0x7f1a5af000f0
0x7f1a5a10f0f2
0x7412cb
0x688354
0x688494
0x67a170
0x67f0ad
0x67fd8
0x6811b6
0x66e05e
```

2. Make a symbol file for the `mysqld` server:

```
shell> nm -n libexec/mysqld > /tmp/mysqld.sym
```

If `mysqld` is not linked statically, use the following command instead:

```
shell> nm -D -n libexec/mysqld > /tmp/mysqld.sym
```

If you want to decode C++ symbols, use the `--demangle`, if available, to `nm`. If your version of `nm` does not have this option, you will need to use the `c++filt` command after the stack dump has been produced to demangle the C++ names.

3. Execute the following command:

```
shell> resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack
```

If you were not able to include demangled C++ names in your symbol file, process the `resolve_stack_dump` output using `c++filt`:

```
shell> resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack | c++filt
```

This prints out where `mysqld` died. If that does not help you find out why `mysqld` died, you should create a bug report and include the output from the preceding command with the bug report.

However, in most cases it does not help us to have just a stack trace to find the reason for the problem. To be able to locate the bug or provide a workaround, in most cases we need to know the statement that killed `mysqld` and preferably a test case so that we can repeat the problem! See [Section 1.6, “How to Report Bugs or Problems”](#).

21.5.1.6. Using Server Logs to Find Causes of Errors in `mysqld`

Note that before starting `mysqld` with the general query log enabled, you should check all your tables with `myisamchk`. See [Chapter 5, MySQL Server Administration](#).

If `mysqld` dies or hangs, you should start `mysqld` with the general query log enabled. See [Section 5.2.3, “The General Query Log”](#). When `mysqld` dies again, you can examine the end of the log file for the query that killed `mysqld`.

If you use the default general query log file, the log is stored in the database directory as `host_name.log`. In most cases it is the

last query in the log file that killed `mysqld`, but if possible you should verify this by restarting `mysqld` and executing the found query from the `mysql` command-line tools. If this works, you should also test all complicated queries that didn't complete.

You can also try the command `EXPLAIN` on all `SELECT` statements that takes a long time to ensure that `mysqld` is using indexes properly. See [Section 12.3.2, “EXPLAIN Syntax”](#).

You can find the queries that take a long time to execute by starting `mysqld` with the slow query log enabled. See [Section 5.2.5, “The Slow Query Log”](#).

If you find the text `mysqld restarted` in the error log file (normally named `hostname.err`) you probably have found a query that causes `mysqld` to fail. If this happens, you should check all your tables with `myisamchk` (see [Chapter 5, *MySQL Server Administration*](#)), and test the queries in the MySQL log files to see whether one fails. If you find such a query, try first upgrading to the newest MySQL version. If this doesn't help and you can't find anything in the `mysql` mail archive, you should report the bug to a MySQL mailing list. The mailing lists are described at <http://lists.mysql.com/>, which also has links to online list archives.

If you have started `mysqld` with `--myisam-recover`, MySQL automatically checks and tries to repair `MyISAM` tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file 'Warning: Checking table ...' which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further. See [Section 5.1.2, “Server Command Options”](#).

It is not a good sign if `mysqld` did die unexpectedly, but in this case, you should not investigate the `Checking table...` messages, but instead try to find out why `mysqld` died.

21.5.1.7. Making a Test Case If You Experience Table Corruption

If you get corrupted tables or if `mysqld` always fails after some update commands, you can test whether this bug is reproducible by doing the following:

- Take down the MySQL daemon (with `mysqladmin shutdown`).
- Make a backup of the tables (to guard against the very unlikely case that the repair does something bad).
- Check all tables with `myisamchk -s database/*.MYI`. Repair any wrong tables with `myisamchk -r database/table.MYI`.
- Make a second backup of the tables.
- Remove (or move away) any old log files from the MySQL data directory if you need more space.
- Start `mysqld` with the binary log enabled. If you want to find a query that crashes `mysqld`, you should start the server with both the general query log enabled as well. See [Section 5.2.3, “The General Query Log”](#), and [Section 5.2.4, “The Binary Log”](#).
- When you have gotten a crashed table, stop the `mysqld server`.
- Restore the backup.
- Restart the `mysqld` server **without** the binary log enabled.
- Re-execute the commands with `mysqlbinlog binary-log-file | mysql`. The binary log is saved in the MySQL database directory with the name `hostname-bin.NNNNNNN`.
- If the tables are corrupted again or you can get `mysqld` to die with the above command, you have found reproducible bug that should be easy to fix! FTP the tables and the binary log to <ftp://ftp.mysql.com/pub/mysql/upload/> and report it in our bugs database using the instructions given in [Section 1.6, “How to Report Bugs or Problems”](#). (Please note that the `/pub/mysql/upload/` FTP directory is not listable, so you'll not see what you've uploaded in your FTP client.) If you are a support customer, you can use the MySQL Customer Support Center <https://support.mysql.com/> to alert the MySQL team about the problem and have it fixed as soon as possible.

You can also use the script `mysql_find_rows` to just execute some of the update statements if you want to narrow down the problem.

21.5.2. Debugging a MySQL Client

To be able to debug a MySQL client with the integrated debug package, you should configure MySQL with `--with-debug` or `--with-debug=full`. See [Section 2.10.2, “Typical configure Options”](#).

Before running a client, you should set the `MYSQL_DEBUG` environment variable:

```
shell> MYSQL_DEBUG=d:t:O,/tmp/client.trace
```

```
shell> export MYSQL_DEBUG
```

This causes clients to generate a trace file in `/tmp/client.trace`.

If you have problems with your own client code, you should attempt to connect to the server and run your query using a client that is known to work. Do this by running `mysql` in debugging mode (assuming that you have compiled MySQL with debugging on):

```
shell> mysql --debug=d:t:0,/tmp/client.trace
```

This provides useful information in case you mail a bug report. See [Section 1.6, “How to Report Bugs or Problems”](#).

If your client crashes at some 'legal' looking code, you should check that your `mysql.h` include file matches your MySQL library file. A very common mistake is to use an old `mysql.h` file from an old MySQL installation with new MySQL library.

21.5.3. The DBUG Package

The MySQL server and most MySQL clients are compiled with the DBUG package originally created by Fred Fish. When you have configured MySQL for debugging, this package makes it possible to get a trace file of what the program is debugging. See [Section 21.5.1.2, “Creating Trace Files”](#).

This section summarizes the argument values that you can specify in debug options on the command line for MySQL programs that have been built with debugging support. For more information about programming with the DBUG package, see the DBUG manual in the `debug` directory of MySQL source distributions. It is best to use a recent distribution to get the most updated DBUG manual.

You use the debug package by invoking a program with the `--debug="..."` or the `-#...` option.

Most MySQL programs have a default debug string that is used if you don't specify an option to `--debug`. The default trace file is usually `/tmp/program_name.trace` on Unix and `\program_name.trace` on Windows.

The debug control string is a sequence of colon-separated fields as follows:

```
<field_1>:<field_2>:...:<field_N>
```

Each field consists of a mandatory flag character followed by an optional “,” and comma-separated list of modifiers:

```
flag[,modifier,modifier,...,modifier]
```

The following table shows the currently recognized flag characters.

Flag	Description
d	Enable output from <code>DEBUG_<N></code> macros for the current state. May be followed by a list of keywords which selects output only for the DBUG macros with that keyword. An empty list of keywords implies output for all macros.
D	Delay after each debugger output line. The argument is the number of tenths of seconds to delay, subject to machine capabilities. For example, <code>-#D,20</code> specifies a delay of two seconds.
f	Limit debugging, tracing, and profiling to the list of named functions. Note that a null list disables all functions. The appropriate <code>d</code> or <code>t</code> flags must still be given; this flag only limits their actions if they are enabled.
F	Identify the source file name for each line of debug or trace output.
i	Identify the process with the PID or thread ID for each line of debug or trace output.
g	Enable profiling. Create a file called <code>debugmon.out</code> containing information that can be used to profile the program. May be followed by a list of keywords that select profiling only for the functions in that list. A null list implies that all functions are considered.
L	Identify the source file line number for each line of debug or trace output.
n	Print the current function nesting depth for each line of debug or trace output.
N	Number each line of debug output.
o	Redirect the debugger output stream to the specified file. The default output is <code>stderr</code> .
O	Like <code>o</code> , but the file is really flushed between each write. When needed, the file is closed and reopened between each write.
p	Limit debugger actions to specified processes. A process must be identified with the <code>DEBUG_PROCESS</code> macro and match one in the list for debugger actions to occur.
P	Print the current process name for each line of debug or trace output.
r	When pushing a new state, do not inherit the previous state's function nesting level. Useful when the output is to start at the left margin.

S	Do function <code>_sanity(_file_, _line_)</code> at each debugged function until <code>_sanity()</code> returns something that differs from 0. (Mostly used with <code>safemalloc</code> to find memory leaks)
t	Enable function call/exit trace lines. May be followed by a list (containing only one modifier) giving a numeric maximum trace level, beyond which no output occurs for either debugging or tracing macros. The default is a compile time option.

Some examples of debug control strings that might appear on a shell command line (the `-#` is typically used to introduce a control string to an application program) are:

```
-#d:t
-#d:f,main,subr1:F:L:t,20
-#d,input,output,files:n
-#d:t:i:0,\\mysqld.trace
```

In MySQL, common tags to print (with the `d` option) are `enter`, `exit`, `error`, `warning`, `info`, and `loop`.

21.5.4. Comments about RTS Threads

I have tried to use the RTS thread packages with MySQL but stumbled on the following problems:

They use old versions of many POSIX calls and it is very tedious to make wrappers for all functions. I am inclined to think that it would be easier to change the thread libraries to the newest POSIX specification.

Some wrappers are currently written. See `mysys/my_pthread.c` for more info.

At least the following should be changed:

`pthread_get_specific` should use one argument. `sigwait` should take two arguments. A lot of functions (at least `pthread_cond_wait`, `pthread_cond_timedwait()`) should return the error code on error. Now they return `-1` and set `errno`.

Another problem is that user-level threads use the `ALRM` signal and this aborts a lot of functions (`read`, `write`, `open...`). MySQL should do a retry on interrupt on all of these but it is not that easy to verify it.

The biggest unsolved problem is the following:

To get thread-level alarms I changed `mysys/thr_alarm.c` to wait between alarms with `pthread_cond_timedwait()`, but this aborts with error `EINTR`. I tried to debug the thread library as to why this happens, but couldn't find any easy solution.

If someone wants to try MySQL with RTS threads I suggest the following:

- Change functions MySQL uses from the thread library to POSIX. This shouldn't take that long.
- Compile all libraries with the `-DHAVE_rts_threads`.
- Compile `thr_alarm`.
- If there are some small differences in the implementation, they may be fixed by changing `my_pthread.h` and `my_pthread.c`.
- Run `thr_alarm`. If it runs without any “warning,” “error,” or aborted messages, you are on the right track. Here is a successful run on Solaris:

```
Main thread: 1
Thread 0 (5) started
Thread: 5 Waiting
process_alarm
Thread 1 (6) started
Thread: 6 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 1 (1) sec
Thread: 6 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 2 (2) sec
Thread: 6 Simulation of no alarm needed
Thread: 6 Slept for 0 (3) sec
Thread: 6 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 4 (4) sec
```

```
Thread: 6  Waiting
process_alarm
thread_alarm
Thread: 5  Slept for 10 (10) sec
Thread: 5  Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6  Slept for 5 (5) sec
Thread: 6  Waiting
process_alarm
process_alarm
...
thread_alarm
Thread: 5  Slept for 0 (1) sec
end
```

21.5.5. Differences Between Thread Packages

MySQL is very dependent on the thread package used. So when choosing a good platform for MySQL, the thread package is very important.

There are at least three types of thread packages:

- User threads in a single process. Thread switching is managed with alarms and the threads library manages all non-thread-safe functions with locks. Read, write and select operations are usually managed with a thread-specific select that switches to another thread if the running threads have to wait for data. If the user thread packages are integrated in the standard libs (FreeBSD and BSDI threads) the thread package requires less overhead than thread packages that have to map all unsafe calls (MIT-pthreads, FSU Pthreads and RTS threads). In some environments (for example, SCO), all system calls are thread-safe so the mapping can be done very easily (FSU Pthreads on SCO). Downside: All mapped calls take a little time and it is quite tricky to be able to handle all situations. There are usually also some system calls that are not handled by the thread package (like MIT-pthreads and sockets). Thread scheduling isn't always optimal.
- User threads in separate processes. Thread switching is done by the kernel and all data are shared between threads. The thread package manages the standard thread calls to allow sharing data between threads. LinuxThreads is using this method. Downside: Lots of processes. Thread creating is slow. If one thread dies the rest are usually left hanging and you must kill them all before restarting. Thread switching is somewhat expensive.
- Kernel threads. Thread switching is handled by the thread library or the kernel and is very fast. Everything is done in one process, but on some systems, `ps` may show the different threads. If one thread aborts, the whole process aborts. Most system calls are thread-safe and should require very little overhead. Solaris, HP-UX, AIX and OSF/1 have kernel threads.

In some systems kernel threads are managed by integrating user level threads in the system libraries. In such cases, the thread switching can only be done by the thread library and the kernel isn't really "thread aware."

Appendix A. MySQL 5.4 Frequently Asked Questions

A.1. MySQL 5.4 FAQ — General

Questions

- [22.1.1](#): Which version of MySQL is production-ready (GA)?
- [22.1.2](#): Can MySQL 5.4 do subqueries?
- [22.1.3](#): Can MySQL 5.4 perform multiple-table inserts, updates, and deletes?
- [22.1.4](#): Does MySQL 5.4 have a Query Cache? Does it work on Server, Instance or Database?
- [22.1.5](#): Does MySQL 5.4 have Sequences?
- [22.1.6](#): Does MySQL 5.4 have a `NOW()` function with fractions of seconds?
- [22.1.7](#): Does MySQL 5.4 work with multi-core processors?
- [22.1.8](#): Is there a hot backup tool for MyISAM like InnoDB Hot Backup?
- [22.1.9](#): Have there been there any improvements in error reporting when foreign keys fail? Does MySQL now report which column and reference failed?
- [22.1.10](#): Can MySQL 5.4 perform ACID transactions?

Questions and Answers

22.1.1: Which version of MySQL is production-ready (GA)?

Currently, both MySQL 5.0 and MySQL 5.1 are supported for production use.

MySQL 5.0 achieved General Availability (GA) status with MySQL 5.0.15, which was released for production use on 19 October 2005.

MySQL 5.1 achieved General Availability (GA) status with MySQL 5.1.30, which was released for production use on 14 November 2008.

Development work on MySQL 5.4 has started; currently, MySQL 5.4 is in beta status.

Development work on MySQL 6.0 has started; currently, MySQL 6.0 is in alpha status.

22.1.2: Can MySQL 5.4 do subqueries?

Yes. See [Section 12.2.9](#), “Subquery Syntax”.

22.1.3: Can MySQL 5.4 perform multiple-table inserts, updates, and deletes?

Yes. For the syntax required to perform multiple-table updates, see [Section 12.2.11](#), “UPDATE Syntax”; for that required to perform multiple-table deletes, see [Section 12.2.2](#), “DELETE Syntax”.

A multiple-table insert can be accomplished using a trigger whose `FOR EACH ROW` clause contains multiple `INSERT` statements within a `BEGIN . . . END` block. See [Section 18.3](#), “Using Triggers”.

22.1.4: Does MySQL 5.4 have a Query Cache? Does it work on Server, Instance or Database?

Yes. The query cache operates on the server level, caching complete result sets matched with the original query string. If an exactly identical query is made (which often happens, particularly in web applications), no parsing or execution is necessary; the result is sent directly from the cache. Various tuning options are available. See [Section 7.5.5](#), “The MySQL Query Cache”.

22.1.5: Does MySQL 5.4 have Sequences?

No. However, MySQL has an `AUTO_INCREMENT` system, which in MySQL 5.4 can also handle inserts in a multi-master replication setup. With the `auto_increment_increment` and `auto_increment_offset` system variables, you can set each server to generate auto-increment values that don't conflict with other servers. The `auto_increment_increment` value should be greater than the number of servers, and each server should have a unique offset.

22.1.6: Does MySQL 5.4 have a `NOW()` function with fractions of seconds?

No. This is on the MySQL roadmap as a “rolling feature”. This means that it is not a flagship feature, but will be implemented, development time permitting. Specific customer demand may change this scheduling.

However, MySQL does parse time strings with a fractional component. See [Section 10.3.2, “The `TIME` Type”](#).

22.1.7: Does MySQL 5.4 work with multi-core processors?

Yes. MySQL is fully multi-threaded, and will make use of multiple CPUs, provided that the operating system supports them.

22.1.8: Is there a hot backup tool for MyISAM like InnoDB Hot Backup?

This is currently under development for a future MySQL release.

22.1.9: Have there been there any improvements in error reporting when foreign keys fail? Does MySQL now report which column and reference failed?

The foreign key support in [InnoDB](#) has seen improvements in each major version of MySQL. Foreign key support generic to all storage engines is scheduled for MySQL 6.x; this should resolve any inadequacies in the current storage engine specific implementation.

22.1.10: Can MySQL 5.4 perform ACID transactions?

Yes. All current MySQL versions support transactions. The [InnoDB](#) storage engine offers full ACID transactions with row-level locking, multi-versioning, non-locking repeatable reads, and all four SQL standard isolation levels.

The [NDB](#) storage engine supports the [READ COMMITTED](#) transaction isolation level only.

A.2. MySQL 5.4 FAQ — Storage Engines

Questions

- [22.2.1](#): Where can I obtain complete documentation for MySQL storage engines and the pluggable storage engine architecture?
- [22.2.2](#): Are there any new storage engines in MySQL 5.4?
- [22.2.3](#): Have any storage engines been removed in MySQL 5.4?
- [22.2.4](#): What are the unique benefits of the [ARCHIVE](#) storage engine?
- [22.2.5](#): Do the new features in MySQL 5.4 apply to all storage engines?

Questions and Answers

22.2.1: Where can I obtain complete documentation for MySQL storage engines and the pluggable storage engine architecture?

See [Chapter 13, *Storage Engines*](#). That chapter contains information about all MySQL storage engines except for the [NDB](#) storage engine used for MySQL Cluster; [NDB](#) is covered in [MySQL Cluster NDB 6.X/7.X](#).

MySQL Enterprise

For expert advice about the storage engine(s) most suitable to your circumstances subscribe to the MySQL Enterprise Monitor. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

22.2.2: Are there any new storage engines in MySQL 5.4?

No. There have been significant improvements in existing storage engines, in particular for the [NDB](#) storage engine that forms the basis for MySQL Cluster.

The Falcon storage engine is available in MySQL 6.0. See [MySQL 6.0 Reference Manual](#).

22.2.3: Have any storage engines been removed in MySQL 5.4?

Yes. MySQL 5.4 no longer supports the [BDB](#) storage engine. Any existing [BDB](#) tables should be converted to another storage engine before upgrading to MySQL 5.4.

22.2.4: What are the unique benefits of the [ARCHIVE](#) storage engine?

The [ARCHIVE](#) storage engine is ideally suited for storing large amounts of data without indexes; it has a very small footprint, and performs selects using table scans. See [Section 13.12, “The ARCHIVE Storage Engine”](#), for details.

22.2.5: Do the new features in MySQL 5.4 apply to all storage engines?

The general new features such as views, stored procedures, triggers, [INFORMATION_SCHEMA](#), precision math ([DECIMAL](#) column type), and the [BIT](#) column type, apply to all storage engines. There are also additions and changes for specific storage engines.

A.3. MySQL 5.4 FAQ — Server SQL Mode

Questions

- [22.3.1](#): What are server SQL modes?
- [22.3.2](#): How many server SQL modes are there?
- [22.3.3](#): How do you determine the server SQL mode?
- [22.3.4](#): Is the mode dependent on the database or connection?
- [22.3.5](#): Can the rules for strict mode be extended?
- [22.3.6](#): Does strict mode impact performance?
- [22.3.7](#): What is the default server SQL mode when My SQL 5.4 is installed?

Questions and Answers

22.3.1: What are server SQL modes?

Server SQL modes define what SQL syntax MySQL should support and what kind of data validation checks it should perform. This makes it easier to use MySQL in different environments and to use MySQL together with other database servers. The MySQL Server apply these modes individually to different clients. For more information, see [Section 5.1.7, “Server SQL Modes”](#).

22.3.2: How many server SQL modes are there?

Each mode can be independently switched on and off. See [Section 5.1.7, “Server SQL Modes”](#), for a complete list of available modes.

22.3.3: How do you determine the server SQL mode?

You can set the default SQL mode (for `mysqld` startup) with the `--sql-mode` option. Using the statement `SET [GLOBAL|SESSION] sql_mode='modes'`, you can change the settings from within a connection, either locally to the connection, or to take effect globally. You can retrieve the current mode by issuing a `SELECT @@sql_mode` statement.

22.3.4: Is the mode dependent on the database or connection?

A mode is not linked to a particular database. Modes can be set locally to the session (connection), or globally for the server. you can change these settings using `SET [GLOBAL|SESSION] sql_mode='modes'`.

22.3.5: Can the rules for strict mode be extended?

When we refer to *strict mode*, we mean a mode where at least one of the modes [TRADITIONAL](#), [STRICT_TRANS_TABLES](#), or [STRICT_ALL_TABLES](#) is enabled. Options can be combined, so you can add additional restrictions to a mode. See [Section 5.1.7, “Server SQL Modes”](#), for more information.

22.3.6: Does strict mode impact performance?

The intensive validation of input data that some settings requires more time than if the validation is not done. While the performance impact is not that great, if you do not require such validation (perhaps your application already handles all of this), then MySQL gives you the option of leaving strict mode disabled. However — if you do require it — strict mode can provide such validation.

22.3.7: What is the default server SQL mode when My SQL 5.4 is installed?

By default, no special modes are enabled. See [Section 5.1.7, “Server SQL Modes”](#), for information about all available modes and MySQL's default behavior.

A.4. MySQL 5.4 FAQ — Stored Procedures and Functions

Questions

- [22.4.1](#): Does MySQL 5.4 support stored procedures and functions?
- [22.4.2](#): Where can I find documentation for MySQL stored procedures and stored functions?
- [22.4.3](#): Is there a discussion forum for MySQL stored procedures?
- [22.4.4](#): Where can I find the ANSI SQL 2003 specification for stored procedures?
- [22.4.5](#): How do you manage stored routines?
- [22.4.6](#): Is there a way to view all stored procedures and stored functions in a given database?
- [22.4.7](#): Where are stored procedures stored?
- [22.4.8](#): Is it possible to group stored procedures or stored functions into packages?
- [22.4.9](#): Can a stored procedure call another stored procedure?
- [22.4.10](#): Can a stored procedure call a trigger?
- [22.4.11](#): Can a stored procedure access tables?
- [22.4.12](#): Do stored procedures have a statement for raising application errors?
- [22.4.13](#): Do stored procedures provide exception handling?
- [22.4.14](#): Can MySQL 5.4 stored routines return result sets?
- [22.4.15](#): Is `WITH RECOMPILE` supported for stored procedures?
- [22.4.16](#): Is there a MySQL equivalent to using `mod_plsql` as a gateway on Apache to talk directly to a stored procedure in the database?
- [22.4.17](#): Can I pass an array as input to a stored procedure?
- [22.4.18](#): Can I pass a cursor as an `IN` parameter to a stored procedure?
- [22.4.19](#): Can I return a cursor as an `OUT` parameter from a stored procedure?
- [22.4.20](#): Can I print out a variable's value within a stored routine for debugging purposes?
- [22.4.21](#): Can I commit or roll back transactions inside a stored procedure?
- [22.4.22](#): Do MySQL 5.4 stored procedures and functions work with replication?
- [22.4.23](#): Are stored procedures and functions created on a master server replicated to a slave?
- [22.4.24](#): How are actions that take place inside stored procedures and functions replicated?
- [22.4.25](#): Are there special security requirements for using stored procedures and functions together with replication?
- [22.4.26](#): What limitations exist for replicating stored procedure and function actions?
- [22.4.27](#): Do the preceding limitations affect MySQL's ability to do point-in-time recovery?
- [22.4.28](#): What is being done to correct the aforementioned limitations?

Questions and Answers

22.4.1: Does MySQL 5.4 support stored procedures and functions?

Yes. MySQL 5.4 supports two types of stored routines — stored procedures and stored functions.

22.4.2: Where can I find documentation for MySQL stored procedures and stored functions?

See [Section 18.2, “Using Stored Routines \(Procedures and Functions\)”](#).

22.4.3: Is there a discussion forum for MySQL stored procedures?

Yes. See <http://forums.mysql.com/list.php?98>.

22.4.4: Where can I find the ANSI SQL 2003 specification for stored procedures?

Unfortunately, the official specifications are not freely available (ANSI makes them available for purchase). However, there are books — such as *SQL-99 Complete, Really* by Peter Gulutzan and Trudy Pelzer — which give a comprehensive overview of the standard, including coverage of stored procedures.

22.4.5: How do you manage stored routines?

It is always good practice to use a clear naming scheme for your stored routines. You can manage stored procedures with `CREATE [FUNCTION|PROCEDURE]`, `ALTER [FUNCTION|PROCEDURE]`, `DROP [FUNCTION|PROCEDURE]`, and `SHOW CREATE [FUNCTION|PROCEDURE]`. You can obtain information about existing stored procedures using the `ROUTINES` table in the `INFORMATION_SCHEMA` database (see [Section 19.14](#), “The `INFORMATION_SCHEMA ROUTINES Table`”).

22.4.6: Is there a way to view all stored procedures and stored functions in a given database?

Yes. For a database named `dbname`, use this query on the `INFORMATION_SCHEMA.ROUTINES` table:

```
SELECT ROUTINE_TYPE, ROUTINE_NAME
FROM INFORMATION_SCHEMA.ROUTINES
WHERE ROUTINE_SCHEMA= 'dbname' ;
```

For more information, see [Section 19.14](#), “The `INFORMATION_SCHEMA ROUTINES Table`”.

The body of a stored routine can be viewed using `SHOW CREATE FUNCTION` (for a stored function) or `SHOW CREATE PROCEDURE` (for a stored procedure). See [Section 12.5.5.11](#), “`SHOW CREATE PROCEDURE Syntax`”, for more information.

22.4.7: Where are stored procedures stored?

In the `proc` table of the `mysql` system database. However, you should not access the tables in the system database directly. Instead, use `SHOW CREATE FUNCTION` to obtain information about stored functions, and `SHOW CREATE PROCEDURE` to obtain information about stored procedures. See [Section 12.5.5.11](#), “`SHOW CREATE PROCEDURE Syntax`”, for more information about these statements.

You can also query the `ROUTINES` table in the `INFORMATION_SCHEMA` database — see [Section 19.14](#), “The `INFORMATION_SCHEMA ROUTINES Table`”, for information about this table.

22.4.8: Is it possible to group stored procedures or stored functions into packages?

No. This is not supported in MySQL 5.4.

22.4.9: Can a stored procedure call another stored procedure?

Yes.

22.4.10: Can a stored procedure call a trigger?

A stored procedure can execute an SQL statement, such as an `UPDATE`, that causes a trigger to activate.

22.4.11: Can a stored procedure access tables?

Yes. A stored procedure can access one or more tables as required.

22.4.12: Do stored procedures have a statement for raising application errors?

Not in MySQL 5.4. The SQL standard `SIGNAL` and `RESIGNAL` statements are implemented in MySQL 6.0.

22.4.13: Do stored procedures provide exception handling?

MySQL implements `HANDLER` definitions according to the SQL standard. See [Section 12.8.4.2](#), “`DECLARE for Handlers`”, for details.

22.4.14: Can MySQL 5.4 stored routines return result sets?

Stored procedures can, but stored functions cannot. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You need to use the MySQL 4.1 (or above) client-server protocol for this to work. This means that — for instance — in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

22.4.15: Is `WITH RECOMPILE` supported for stored procedures?

Not in MySQL 5.4.

22.4.16: Is there a MySQL equivalent to using `mod_plsql` as a gateway on Apache to talk directly to a stored procedure in the database?

There is no equivalent in MySQL 5.4.

22.4.17: Can I pass an array as input to a stored procedure?

Not in MySQL 5.4.

22.4.18: Can I pass a cursor as an `IN` parameter to a stored procedure?

In MySQL 5.4, cursors are available inside stored procedures only.

22.4.19: Can I return a cursor as an `OUT` parameter from a stored procedure?

In MySQL 5.4, cursors are available inside stored procedures only. However, if you do not open a cursor on a `SELECT`, the result will be sent directly to the client. You can also `SELECT INTO` variables. See [Section 12.2.8, “SELECT Syntax”](#).

22.4.20: Can I print out a variable's value within a stored routine for debugging purposes?

Yes, you can do this in a *stored procedure*, but not in a stored function. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You will need to use the MySQL 4.1 (or above) client-server protocol for this to work. This means that — for instance — in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

22.4.21: Can I commit or roll back transactions inside a stored procedure?

Yes. However, you cannot perform transactional operations within a stored function.

22.4.22: Do MySQL 5.4 stored procedures and functions work with replication?

Yes, standard actions carried out in stored procedures and functions are replicated from a master MySQL server to a slave server. There are a few limitations that are described in detail in [Section 18.6, “Binary Logging of Stored Programs”](#).

22.4.23: Are stored procedures and functions created on a master server replicated to a slave?

Yes, creation of stored procedures and functions carried out through normal DDL statements on a master server are replicated to a slave, so the objects will exist on both servers. `ALTER` and `DROP` statements for stored procedures and functions are also replicated.

22.4.24: How are actions that take place inside stored procedures and functions replicated?

MySQL records each DML event that occurs in a stored procedure and replicates those individual actions to a slave server. The actual calls made to execute stored procedures are not replicated.

Stored functions that change data are logged as function invocations, not as the DML events that occur inside each function.

22.4.25: Are there special security requirements for using stored procedures and functions together with replication?

Yes. Because a slave server has authority to execute any statement read from a master's binary log, special security constraints exist for using stored functions with replication. If replication or binary logging in general (for the purpose of point-in-time recovery) is active, then MySQL DBAs have two security options open to them:

1. Any user wishing to create stored functions must be granted the `SUPER` privilege.
2. Alternatively, a DBA can set the `log_bin_trust_function_creators` system variable to 1, which enables anyone with the standard `CREATE ROUTINE` privilege to create stored functions.

22.4.26: What limitations exist for replicating stored procedure and function actions?

Non-deterministic (random) or time-based actions embedded in stored procedures may not replicate properly. By their very nature, randomly produced results are not predictable and cannot be exactly reproduced, and therefore, random actions replicated to a slave will not mirror those performed on a master. Note that declaring stored functions to be `DETERMINISTIC` or setting the `log_bin_trust_function_creators` system variable to 0 will not allow random-valued operations to be invoked.

In addition, time-based actions cannot be reproduced on a slave because the timing of such actions in a stored procedure is not reproducible through the binary log used for replication. It records only DML events and does not factor in timing constraints.

Finally, non-transactional tables for which errors occur during large DML actions (such as bulk inserts) may experience replication issues in that a master may be partially updated from DML activity, but no updates are done to the slave because of the errors that

occurred. A workaround is for a function's DML actions to be carried out with the `IGNORE` keyword so that updates on the master that cause errors are ignored and updates that do not cause errors are replicated to the slave.

22.4.27: Do the preceding limitations affect MySQL's ability to do point-in-time recovery?

The same limitations that affect replication do affect point-in-time recovery.

22.4.28: What is being done to correct the aforementioned limitations?

You can choose either statement-based replication or row-based replication. The original replication implementation is based on statement-based binary logging. Row-based binary logging resolves the limitations mentioned earlier.

Mixed replication is also available (by starting the server with `--binlog-format=mixed`). This hybrid, “smart” form of replication “knows” whether statement-level replication can safely be used, or row-level replication is required.

For additional information, see [Section 16.1.2, “Replication Formats”](#).

A.5. MySQL 5.4 FAQ — Triggers

Questions

- [22.5.1](#): Where can I find the documentation for MySQL 5.4 triggers?
- [22.5.2](#): Is there a discussion forum for MySQL Triggers?
- [22.5.3](#): Does MySQL 5.4 have statement-level or row-level triggers?
- [22.5.4](#): Are there any default triggers?
- [22.5.5](#): How are triggers managed in MySQL?
- [22.5.6](#): Is there a way to view all triggers in a given database?
- [22.5.7](#): Where are triggers stored?
- [22.5.8](#): Can a trigger call a stored procedure?
- [22.5.9](#): Can triggers access tables?
- [22.5.10](#): Can triggers call an external application through a UDF?
- [22.5.11](#): Is it possible for a trigger to update tables on a remote server?
- [22.5.12](#): Do triggers work with replication?
- [22.5.13](#): How are actions carried out through triggers on a master replicated to a slave?

Questions and Answers

22.5.1: Where can I find the documentation for MySQL 5.4 triggers?

See [Section 18.3, “Using Triggers”](#).

22.5.2: Is there a discussion forum for MySQL Triggers?

Yes. It is available at <http://forums.mysql.com/list.php?99>.

22.5.3: Does MySQL 5.4 have statement-level or row-level triggers?

In MySQL 5.4, all triggers are `FOR EACH ROW` — that is, the trigger is activated for each row that is inserted, updated, or deleted. MySQL 5.4 does not support triggers using `FOR EACH STATEMENT`.

22.5.4: Are there any default triggers?

Not explicitly. MySQL does have specific special behavior for some `TIMESTAMP` columns, as well as for columns which are defined using `AUTO_INCREMENT`.

22.5.5: How are triggers managed in MySQL?

In MySQL 5.4, triggers can be created using the `CREATE TRIGGER` statement, and dropped using `DROP TRIGGER`. See [Section 12.1.15](#), “`CREATE TRIGGER Syntax`”, and [Section 12.1.24](#), “`DROP TRIGGER Syntax`”, for more about these statements.

Information about triggers can be obtained by querying the `INFORMATION_SCHEMA.TRIGGERS` table. See [Section 19.16](#), “[The INFORMATION_SCHEMA TRIGGERS Table](#)”.

22.5.6: Is there a way to view all triggers in a given database?

Yes. You can obtain a listing of all triggers defined on database `dbname` using a query on the `INFORMATION_SCHEMA.TRIGGERS` table such as the one shown here:

```
SELECT TRIGGER_NAME, EVENT_MANIPULATION, EVENT_OBJECT_TABLE, ACTION_STATEMENT
FROM INFORMATION_SCHEMA.TRIGGERS
WHERE TRIGGER_SCHEMA='dbname';
```

For more information about this table, see [Section 19.16](#), “[The INFORMATION_SCHEMA TRIGGERS Table](#)”.

You can also use the `SHOW TRIGGERS` statement, which is specific to MySQL. See [Section 12.5.5.39](#), “`SHOW TRIGGERS Syntax`”.

22.5.7: Where are triggers stored?

Triggers for a table are currently stored in `.TRG` files, with one such file one per table.

22.5.8: Can a trigger call a stored procedure?

Yes.

22.5.9: Can triggers access tables?

A trigger can access both old and new data in its own table. A trigger can also affect other tables, but it is not permitted to modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.

22.5.10: Can triggers call an external application through a UDF?

Yes. For example, a trigger could invoke the `sys_exec()` UDF available at MySQL Forge here: <http://forge.mysql.com/projects/project.php?id=211>

22.5.11: Is it possible for a trigger to update tables on a remote server?

Yes. A table on a remote server could be updated using the `FEDERATED` storage engine. (See [Section 13.11](#), “[The FEDERATED Storage Engine](#)”).

22.5.12: Do triggers work with replication?

Yes. However, the way in which they work depends whether you are using MySQL’s “classic” statement-based replication available in all versions of MySQL, or the row-based replication format introduced in MySQL 5.1.

When using statement-based replication, triggers on the slave are executed by statements that are executed on the master (and replicated to the slave).

When using row-based replication, triggers are not executed on the slave due to statements that were run on the master and then replicated to the slave. Instead, when using row-based replication, the changes caused by executing the trigger on the master are applied on the slave.

For more information, see [Section 16.3.1.26](#), “[Replication and Triggers](#)”.

22.5.13: How are actions carried out through triggers on a master replicated to a slave?

Again, this depends on whether you are using statement-based or row-based replication.

Statement-based replication. First, the triggers that exist on a master must be re-created on the slave server. Once this is done, the replication flow works as any other standard DML statement that participates in replication. For example, consider a table `EMP` that has an `AFTER` insert trigger, which exists on a master MySQL server. The same `EMP` table and `AFTER` insert trigger exist on the slave server as well. The replication flow would be:

1. An `INSERT` statement is made to `EMP`.
2. The `AFTER` trigger on `EMP` activates.
3. The `INSERT` statement is written to the binary log.

4. The replication slave picks up the `INSERT` statement to `EMP` and executes it.
5. The `AFTER` trigger on `EMP` that exists on the slave activates.

Row-based replication. When you use row-based replication, the changes caused by executing the trigger on the master are applied on the slave. However, the triggers themselves are not actually executed on the slave under row-based replication. This is because, if both the master and the slave applied the changes from the master and — in addition — the trigger causing these changes were applied on the slave, the changes would in effect be applied twice on the slave, leading to different data on the master and the slave.

In most cases, the outcome is the same for both row-based and statement-based replication. However, if you use different triggers on the master and slave, you cannot use row-based replication. (This is because the row-based format replicates the changes made by triggers executing on the master to the slaves, rather than the statements that caused the triggers to execute, and the corresponding triggers on the slave are not executed.) Instead, any statements causing such triggers to be executed must be replicated using statement-based replication.

For more information, see [Section 16.3.1.26, “Replication and Triggers”](#).

A.6. MySQL 5.4 FAQ — Views

Questions

- [22.6.1](#): Where can I find documentation covering MySQL Views?
- [22.6.2](#): Is there a discussion forum for MySQL Views?
- [22.6.3](#): What happens to a view if an underlying table is dropped or renamed?
- [22.6.4](#): Does MySQL 5.4 have table snapshots?
- [22.6.5](#): Does MySQL 5.4 have materialized views?
- [22.6.6](#): Can you insert into views that are based on joins?

Questions and Answers

22.6.1: Where can I find documentation covering MySQL Views?

See [Section 18.5, “Using Views”](#).

22.6.2: Is there a discussion forum for MySQL Views?

Yes. See <http://forums.mysql.com/list.php?100>

22.6.3: What happens to a view if an underlying table is dropped or renamed?

After a view has been created, it is possible to drop or alter a table or view to which the definition refers. To check a view definition for problems of this kind, use the `CHECK TABLE` statement. (See [Section 12.5.2.3, “CHECK TABLE Syntax”](#).)

22.6.4: Does MySQL 5.4 have table snapshots?

No.

22.6.5: Does MySQL 5.4 have materialized views?

No.

22.6.6: Can you insert into views that are based on joins?

It is possible, provided that your `INSERT` statement has a column list that makes it clear there is only one table involved.

You *cannot* insert into multiple tables with a single insert on a view.

A.7. MySQL 5.0 FAQ — `INFORMATION_SCHEMA`

Questions

- [22.7.1](#): Where can I find documentation for the MySQL `INFORMATION_SCHEMA` database?
- [22.7.2](#): Is there a discussion forum for `INFORMATION_SCHEMA`?
- [22.7.3](#): Where can I find the ANSI SQL 2003 specification for `INFORMATION_SCHEMA`?
- [22.7.4](#): What is the difference between the Oracle Data Dictionary and MySQL's `INFORMATION_SCHEMA`?
- [22.7.5](#): Can I add to or otherwise modify the tables found in the `INFORMATION_SCHEMA` database?

Questions and Answers

22.7.1: Where can I find documentation for the MySQL `INFORMATION_SCHEMA` database?

See [Chapter 19, `INFORMATION_SCHEMA` Tables](#)

22.7.2: Is there a discussion forum for `INFORMATION_SCHEMA`?

See <http://forums.mysql.com/list.php?101>.

22.7.3: Where can I find the ANSI SQL 2003 specification for `INFORMATION_SCHEMA`?

Unfortunately, the official specifications are not freely available. (ANSI makes them available for purchase.) However, there are books available — such as *SQL-99 Complete, Really* by Peter Gulutzan and Trudy Pelzer — which give a comprehensive overview of the standard, including `INFORMATION_SCHEMA`.

22.7.4: What is the difference between the Oracle Data Dictionary and MySQL's `INFORMATION_SCHEMA`?

Both Oracle and MySQL provide metadata in tables. However, Oracle and MySQL use different table names and column names. MySQL's implementation is more similar to those found in DB2 and SQL Server, which also support `INFORMATION_SCHEMA` as defined in the SQL standard.

22.7.5: Can I add to or otherwise modify the tables found in the `INFORMATION_SCHEMA` database?

No. Since applications may rely on a certain standard structure, this should not be modified. For this reason, *we cannot support bugs or other issues which result from modifying `INFORMATION_SCHEMA` tables or data.*

A.8. MySQL 5.4 FAQ — Migration

Questions

- [22.8.1](#): Where can I find information on how to migrate from MySQL 5.1 to MySQL 5.4?
- [22.8.2](#): How has storage engine (table type) support changed in MySQL 5.4 from previous versions?

Questions and Answers

22.8.1: Where can I find information on how to migrate from MySQL 5.1 to MySQL 5.4?

For detailed upgrade information, see [Section 2.12.1, “Upgrading MySQL”](#). We recommend that you do not skip a major version when upgrading, but rather complete the process in steps, upgrading from one major version to the next in each step. This may seem more complicated, but it will you save time and trouble — if you encounter problems during the upgrade, their origin will be easier to identify, either by you or — if you have a MySQL Network subscription — by MySQL support.

22.8.2: How has storage engine (table type) support changed in MySQL 5.4 from previous versions?

Storage engine support has changed as follows:

- Support for `ISAM` tables was removed in MySQL 5.0 and you should now use the `MyISAM` storage engine in place of `ISAM`. To convert a table `tblname` from `ISAM` to `MyISAM`, simply issue a statement such as this one:

```
ALTER TABLE tblname ENGINE=MYISAM;
```

- Internal `RAID` for `MyISAM` tables was also removed in MySQL 5.0. This was formerly used to allow large tables in file systems that did not support file sizes greater than 2GB. All modern file systems allow for larger tables; in addition, there are now other solutions such as `MERGE` tables and views.

- The `VARCHAR` column type now retains trailing spaces in all storage engines.
- `MEMORY` tables (formerly known as `HEAP` tables) can also contain `VARCHAR` columns.

A.9. MySQL 5.4 FAQ — Security

Questions

- [22.9.1](#): Where can I find documentation that addresses security issues for MySQL?
- [22.9.2](#): Does MySQL 5.4 have native support for SSL?
- [22.9.3](#): Is SSL support be built into MySQL binaries, or must I recompile the binary myself to enable it?
- [22.9.4](#): Does MySQL 5.4 have built-in authentication against LDAP directories?
- [22.9.5](#): Does MySQL 5.4 include support for Roles Based Access Control (RBAC)?

Questions and Answers

22.9.1: Where can I find documentation that addresses security issues for MySQL?

The best place to start is [Section 5.3, “General Security Issues”](#).

Other portions of the MySQL Documentation which you may find useful with regard to specific security concerns include the following:

- [Section 5.3.1, “General Security Guidelines”](#).
- [Section 5.3.2, “Making MySQL Secure Against Attackers”](#).
- [Section B.1.4.1, “How to Reset the Root Password”](#).
- [Section 5.3.5, “How to Run MySQL as a Normal User”](#).
- [Section 21.3.2.6, “User-Defined Function Security Precautions”](#).
- [Section 5.3.3, “Security-Related `mysqld` Options”](#).
- [Section 5.3.4, “Security Issues with `LOAD DATA LOCAL`”](#).
- [Section 2.11, “Post-Installation Setup and Testing”](#).
- [Section 2.13.1.11, “SELinux Notes”](#).
- [Section 5.5.7.1, “Basic SSL Concepts”](#).

MySQL Enterprise

The MySQL Enterprise Monitor enforces best practices for maximizing the security of your servers. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

22.9.2: Does MySQL 5.4 have native support for SSL?

Most 5.4 binaries have support for SSL connections between the client and server. We can't currently build with the new YaSSL library everywhere, as it is still quite new and does not compile on all platforms yet. See [Section 5.5.7, “Using SSL for Secure Connections”](#).

You can also tunnel a connection via SSH, if (for instance) if the client application doesn't support SSL connections. For an example, see [Section 5.5.8, “Connecting to MySQL Remotely from Windows with SSH”](#).

22.9.3: Is SSL support be built into MySQL binaries, or must I recompile the binary myself to enable it?

Most 5.4 binaries have SSL enabled for client-server connections that are secured, authenticated, or both. However, the YaSSL library currently does not compile on all platforms. See [Section 5.5.7, “Using SSL for Secure Connections”](#), for a complete listing of supported and unsupported platforms.

22.9.4: Does MySQL 5.4 have built-in authentication against LDAP directories?

No. Support for external authentication methods is on the MySQL roadmap as a “rolling feature”, which means that we plan to implement it in the future, but we have not yet determined when this will be done.

22.9.5: Does MySQL 5.4 include support for Roles Based Access Control (RBAC)?

No. Support for roles is on the MySQL roadmap as a “rolling feature”, which means that we plan to implement it in the future, but we have not yet determined when this will be done.

A.10. MySQL 5.4 FAQ — MySQL Cluster

In the following section, we answer questions that are frequently asked about MySQL Cluster and the `NDBCLUSTER` storage engine.

Questions

- [22.10.1](#): Which versions of the MySQL software support Cluster? Do I have to compile from source?
- [22.10.2](#): What happened to MySQL Cluster NDB 6.4?
- [22.10.3](#): What do “NDB” and “NDBCLUSTER” mean?
- [22.10.4](#): What is the difference between using MySQL Cluster *vs* using MySQL replication?
- [22.10.5](#): Do I need to do any special networking to run MySQL Cluster? How do computers in a cluster communicate?
- [22.10.6](#): How many computers do I need to run a MySQL Cluster, and why?
- [22.10.7](#): What do the different computers do in a MySQL Cluster?
- [22.10.8](#): When I run the `SHOW` command in the MySQL Cluster management client, I see a line of output that looks like this:

```
id=2 @10.100.10.32 (Version: 5.1.34-ndb-6.3.26, Nodegroup: 0, Master)
```

What is a “master node”, and what does it do? How do I configure a node so that it is the master?
- [22.10.9](#): With which operating systems can I use Cluster?
- [22.10.10](#): What are the hardware requirements for running MySQL Cluster?
- [22.10.11](#): How much RAM do I need to use MySQL Cluster? Is it possible to use disk memory at all?
- [22.10.12](#): What file systems can I use with MySQL Cluster? What about network file systems or network shares?
- [22.10.13](#): Can I run MySQL Cluster nodes inside virtual machines (such as those created by VirtualBox, VMWare, Parallels, or Xen)?
- [22.10.14](#): I am trying to populate a MySQL Cluster database. The loading process terminates prematurely and I get an error message like this one: `ERROR 1114: THE TABLE 'MY_CLUSTER_TABLE' IS FULL` Why is this happening?
- [22.10.15](#): MySQL Cluster uses TCP/IP. Does this mean that I can run it over the Internet, with one or more nodes in remote locations?
- [22.10.16](#): Do I have to learn a new programming or query language to use MySQL Cluster?
- [22.10.17](#): How do I find out what an error or warning message means when using MySQL Cluster?
- [22.10.18](#): Is MySQL Cluster transaction-safe? What isolation levels are supported?
- [22.10.19](#): What storage engines are supported by MySQL Cluster?
- [22.10.20](#): In the event of a catastrophic failure — say, for instance, the whole city loses power *and* my UPS fails — would I lose all my data?
- [22.10.21](#): Is it possible to use `FULLTEXT` indexes with MySQL Cluster?
- [22.10.22](#): Can I run multiple nodes on a single computer?
- [22.10.23](#): Can I add data nodes to a MySQL Cluster without restarting it?

- [22.10.24](#): Are there any limitations that I should be aware of when using MySQL Cluster?
- [22.10.25](#): How do I import an existing MySQL database into a MySQL Cluster?
- [22.10.26](#): How do cluster nodes communicate with one another?
- [22.10.27](#): What is an *arbiter*?
- [22.10.28](#): What data types are supported by MySQL Cluster?
- [22.10.29](#): How do I start and stop MySQL Cluster?
- [22.10.30](#): What happens to MySQL Cluster data when the cluster is shut down?
- [22.10.31](#): Is it a good idea to have more than one management node for a MySQL Cluster?
- [22.10.32](#): Can I mix different kinds of hardware and operating systems in one MySQL Cluster?
- [22.10.33](#): Can I run two data nodes on a single host? Two SQL nodes?
- [22.10.34](#): Can I use host names with MySQL Cluster?
- [22.10.35](#): Does MySQL Cluster support IPv6?
- [22.10.36](#): How do I handle MySQL users in a MySQL Cluster having multiple MySQL servers?
- [22.10.37](#): How do I continue to send queries in the event that one of the SQL nodes fails?

Questions and Answers

22.10.1: Which versions of the MySQL software support Cluster? Do I have to compile from source?

Beginning with MySQL 5.1.24, MySQL Cluster is no longer supported in standard MySQL Server 5.1 releases. Instead, MySQL Cluster is now released as a separate product. Currently, two MySQL Cluster release series are available:

- **MySQL Cluster NDB 6.2.** This series is Generally Available (GA) and can be used in production. However, MySQL Cluster NDB 6.3 is also now available as GA, so you are encouraged to upgrade existing deployments and to use MySQL Cluster NDB 6.3 for new MySQL Cluster deployments. The latest MySQL Cluster NDB 6.2 sources and binaries can be obtained from <http://dev.mysql.com/downloads/cluster6.2.html>.
- **MySQL Cluster NDB 6.3.** This series is now Generally Available (GA) for use in production. The latest MySQL Cluster NDB 6.3 sources and binaries can be obtained from <http://dev.mysql.com/downloads/cluster>.
- **MySQL Cluster NDB 7.0.** This series is now in Beta development phase. It is not yet certified for use in production, but is available if you wish to preview and test new features. The latest MySQL Cluster NDB 7.0 sources can be obtained from <http://dev.mysql.com/downloads/cluster>.

We encourage you to use MySQL Cluster NDB 6.3 for new MySQL Cluster deployments, and to upgrade to this release series if you are using a previous version of MySQL with clustering support. For an overview of improvements in MySQL Cluster NDB 6.3, see [Features Added in MySQL Cluster NDB 6.3](#).

For information about new features and other improvements made in MySQL Cluster NDB 7.0, see [Features Added in MySQL Cluster NDB 7.0](#).

You can determine whether your MySQL Server has `NDBCLUSTER` support using either of the statements `SHOW VARIABLES LIKE 'have_%%'` or `SHOW ENGINES`.

22.10.2: What happened to MySQL Cluster NDB 6.4?

Because of the number and impact of new features introduced into MySQL Cluster following the General Availability of MySQL Cluster NDB 6.3, it was decided that the following release series represented a “major” new release series rather than a “minor” one, and should be known as MySQL Cluster 7.0.

The earliest development versions of MySQL Cluster NDB 7.0 were originally designated “MySQL Cluster 6.4”, and the first four releases in this series were identified as MySQL Cluster NDB 6.4.0 through NDB 6.4.3. MySQL Cluster NDB 7.0.4 is the fifth MySQL Cluster NDB 7.0 release; it is the successor to MySQL Cluster NDB 6.4.3.

For more information about MySQL Cluster NDB 7.0, see [Features Added in MySQL Cluster NDB 7.0](#), and [Changes in MySQL Cluster NDB 7.0](#).

22.10.3: What do “NDB” and “NDBCLUSTER” mean?

“NDB” stands for “Network Database”. `NDB` and `NDBCLUSTER` are both names for the storage engine that enables clustering support in MySQL. Either name is equally correct; both names appear in our documentation, and either name can be used in the `ENGINE` option of a `CREATE TABLE` statement for creating a MySQL Cluster table.

22.10.4: What is the difference between using MySQL Cluster vs using MySQL replication?

In traditional MySQL replication, a master MySQL server updates one or more slaves. Transactions are committed sequentially, and a slow transaction can cause the slave to lag behind the master. This means that if the master fails, it is possible that the slave might not have recorded the last few transactions. If a transaction-safe engine such as `InnoDB` is being used, a transaction will either be complete on the slave or not applied at all, but replication does not guarantee that all data on the master and the slave will be consistent at all times. In MySQL Cluster, all data nodes are kept in synchrony, and a transaction committed by any one data node is committed for all data nodes. In the event of a data node failure, all remaining data nodes remain in a consistent state.

In short, whereas standard MySQL replication is *asynchronous*, MySQL Cluster is *synchronous*.

We have implemented (asynchronous) replication for MySQL Cluster in MySQL 5.1 and MySQL Cluster NDB 6.x. *MySQL Cluster Replication* (also sometimes known as “geo-replication”) includes the capability to replicate both between two MySQL Clusters, and from a MySQL Cluster to a non-Cluster MySQL server. See [MySQL Cluster Replication](#), for more information.

22.10.5: Do I need to do any special networking to run MySQL Cluster? How do computers in a cluster communicate?

MySQL Cluster is intended to be used in a high-bandwidth environment, with computers connecting via TCP/IP. Its performance depends directly upon the connection speed between the cluster's computers. The minimum connectivity requirements for MySQL Cluster include a typical 100-megabit Ethernet network or the equivalent. We recommend you use gigabit Ethernet whenever available.

The faster SCI protocol is also supported, but requires special hardware. See [Using High-Speed Interconnects with MySQL Cluster](#), for more information about SCI.

22.10.6: How many computers do I need to run a MySQL Cluster, and why?

A minimum of three computers is required to run a viable cluster. However, the minimum **recommended** number of computers in a MySQL Cluster is four: one each to run the management and SQL nodes, and two computers to serve as data nodes. The purpose of the two data nodes is to provide redundancy; the management node must run on a separate machine to guarantee continued arbitration services in the event that one of the data nodes fails.

To provide increased throughput and high availability, you should use multiple SQL nodes (MySQL Servers connected to the cluster). It is also possible (although not strictly necessary) to run multiple management servers.

22.10.7: What do the different computers do in a MySQL Cluster?

A MySQL Cluster has both a physical and logical organization, with computers being the physical elements. The logical or functional elements of a cluster are referred to as *nodes*, and a computer housing a cluster node is sometimes referred to as a *cluster host*. There are three types of nodes, each corresponding to a specific role within the cluster. These are:

- **Management node.** This node provides management services for the cluster as a whole, including startup, shutdown, backups, and configuration data for the other nodes. The management node server is implemented as the application `ndb_mgmd`; the management client used to control MySQL Cluster is `ndb_mgm`.
- **Data node.** This type of node stores and replicates data. Data node functionality is handled by instances of the `NDB` data node process `ndbd`.
- **SQL node.** This is simply an instance of MySQL Server (`mysqld`) that is built with support for the `NDBCLUSTER` storage engine and started with the `--ndb-cluster` option to enable the engine and the `--ndb-connectstring` option to enable it to connect to a MySQL Cluster management server. For more about these options, see [mysqld Command Options for MySQL Cluster](#).

Note

An *API node* is any application that makes direct use of Cluster data nodes for data storage and retrieval. An SQL node can thus be considered a type of API node that uses a MySQL Server to provide an SQL interface to the Cluster. You can write such applications (that do not depend on a MySQL Server) using the NDB API, which supplies a direct, object-oriented transaction and scanning interface to MySQL Cluster data; see [The NDB API](#), for more information.

22.10.8: When I run the `SHOW` command in the MySQL Cluster management client, I see a line of output that looks like this:

```
id=2 @10.100.10.32 (Version: 5.1.34-ndb-6.3.26, Nodegroup: 0, Master)
```

What is a “master node”, and what does it do? How do I configure a node so that it is the master?

The simplest answer is, “It's not something you can control, and it's nothing that you need to worry about in any case, unless you're a software engineer writing or analyzing the MySQL Cluster source code”.

If you don't find that answer satisfactory, here's a longer and more technical version:

A number of mechanisms in MySQL Cluster require distributed coordination among the data nodes. These distributed algorithms and protocols include global checkpointing, DDL (schema) changes, and node restart handling. To make this coordination simpler, the data nodes “elect” one of their number to be a “master”. There is no user-facing mechanism for influencing this selection, which is is completely automatic; the fact that it *is* automatic is a key part of MySQL Cluster's internal architecture.

When a node acts as a master for any of these mechanisms, it is usually the point of coordination for the activity, and the other nodes act as “servants”, carrying out their parts of the activity as directed by the master. If the node acting as master fails, then the remaining nodes elect a new master. Tasks in progress that were being coordinated by the old master may either fail or be continued by the new master, depending on the actual mechanism involved.

It is possible for some of these different mechanisms and protocols to have different master nodes, but in general the same master is chosen for all of them. The node indicated as the master in the output of `SHOW` in the management client is actually the `DICT` master (see [The DBDICT Block](#), in the *MySQL Cluster API Developer Guide*, for more information), responsible for coordinating DDL and metadata activity.

MySQL Cluster is designed in such a way that the choice of master has no discernable effect outside the cluster itself. For example, the current master does not have significantly higher CPU or resource usage than the other data nodes, and failure of the master should not have a significantly different impact on the cluster than the failure of any other data node.

22.10.9: With which operating systems can I use Cluster?

MySQL Cluster is supported on most Unix-like operating systems, including Linux, Mac OS X, Solaris, and HP-UX. Beginning with MySQL Cluster NDB 6.4, it is also possible to run MySQL Cluster on Windows platforms. We are continuing to work on providing MySQL Cluster support for additional platforms; eventually we intend to offer MySQL Cluster on all platforms for which MySQL itself is supported.

For more detailed information concerning the level of support which is offered for MySQL Cluster on various operating system versions, OS distributions, and hardware platforms, please refer to <http://www.mysql.com/support/supportedplatforms/cluster.html>.

22.10.10: What are the hardware requirements for running MySQL Cluster?

MySQL Cluster should run on any platform for which `NDBCLUSTER`-enabled binaries are available. For data nodes, faster CPUs and more memory are likely to improve performance, and 64-bit CPUs are likely to be more effective than 32-bit processors. There must be sufficient memory on machines used for data nodes to hold each node's share of the database (see *How much RAM do I Need?* for more information). Nodes can communicate via a standard TCP/IP network and hardware. For SCI support, special networking hardware is required (see [Using High-Speed Interconnects with MySQL Cluster](#)).

22.10.11: How much RAM do I need to use MySQL Cluster? Is it possible to use disk memory at all?

In MySQL 5.0 and earlier, MySQL Cluster was in-memory only. This meant that all table data (including indexes) was stored in RAM. If your data took up 1 GB of space and you wanted to replicate it once in the cluster, you needed 2 GB of memory to do so (1 GB per replica). This was in addition to the memory required by the operating system and any applications running on the cluster computers. This is still true of in-memory tables.

If a data node's memory usage exceeds what is available in RAM, then the system will attempt to use swap space up to the limit set for `DataMemory`. However, this will at best result in severely degraded performance, and may cause the node to be dropped due to slow response time (missed heartbeats). We do not recommend on relying on disk swapping in a production environment for this reason. In any case, once the `DataMemory` limit is reached, any operations requiring additional memory (such as inserts) will fail.

`NDBCLUSTER` in MySQL Cluster NDB 6.x includes support for Disk Data, which helps to alleviate these issues. See [MySQL Cluster Disk Data Tables](#), for more information.

You can use the following formula for obtaining a rough estimate of how much RAM is needed for each data node in the cluster:

```
(SizeofDatabase × NumberOfReplicas × 1.1 ) / NumberOfDataNodes
```

To calculate the memory requirements more exactly requires determining, for each table in the cluster database, the storage space required per row (see [Section 10.5, “Data Type Storage Requirements”](#), for details), and multiplying this by the number of rows. You must also remember to account for any column indexes as follows:

- Each primary key or hash index created for an `NDBCLUSTER` table requires 21–25 bytes per record. These indexes use `In-`

[dexMemory](#).

- Each ordered index requires 10 bytes storage per record, using [DataMemory](#).
- Creating a primary key or unique index also creates an ordered index, unless this index is created with `USING HASH`. In other words:
 - A primary key or unique index on a Cluster table normally takes up 31 to 35 bytes per record.
 - However, if the primary key or unique index is created with `USING HASH`, then it requires only 21 to 25 bytes per record.

Note that creating MySQL Cluster tables with `USING HASH` for all primary keys and unique indexes will generally cause table updates to run more quickly — in some cases by a much as 20 to 30 percent faster than updates on tables where `USING HASH` was not used in creating primary and unique keys. This is due to the fact that less memory is required (because no ordered indexes are created), and that less CPU must be utilized (because fewer indexes must be read and possibly updated). However, it also means that queries that could otherwise use range scans must be satisfied by other means, which can result in slower selects.

When calculating Cluster memory requirements, you may find useful the `ndb_size.pl` utility which is available in recent MySQL 5.4 releases. This Perl script connects to a current (non-Cluster) MySQL database and creates a report on how much space that database would require if it used the `NDBCLUSTER` storage engine. For more information, see `ndb_size.pl`.

It is especially important to keep in mind that *every MySQL Cluster table must have a primary key*. The `NDB` storage engine creates a primary key automatically if none is defined, and this primary key is created without `USING HASH`.

To determine how much memory is being used for storage of Cluster indexes at any given time, you can check the Cluster log for the warnings which are written to it when 80% of available [DataMemory](#) or [IndexMemory](#) is in use, and again when use reaches 85%, 90%, and so on. Beginning with MySQL Cluster NDB 6.2.3 and 6.3.0, you can use the `REPORT MemoryUsage` command in the cluster management client to obtain a real-time report of the amount of memory used to store MySQL Cluster data and indexes. For more information about this command, see

22.10.12: What file systems can I use with MySQL Cluster? What about network file systems or network shares?

Generally, any file system that is native to the host operating system should work well with MySQL Cluster. If you find that a given file system works particularly well (or not so especially well) with MySQL Cluster, we invite you to discuss your findings in the [MySQL Cluster Forums](#).

For Windows, we recommend that you use `NTFS` file systems for MySQL Cluster, just as we do for standard MySQL. We do not test MySQL Cluster with `FAT` or `VFAT` file systems. Because of this, we do not recommend their use with MySQL or MySQL Cluster.

MySQL Cluster is implemented as a shared-nothing solution; the idea behind this is that the failure of a single piece of hardware should not cause the failure of multiple cluster nodes, or possibly even the failure of the cluster as a whole. For this reason, the use of network shares or network file systems is not supported for MySQL Cluster. This also applies to shared storage devices such as SANs.

22.10.13: Can I run MySQL Cluster nodes inside virtual machines (such as those created by VirtualBox, VMWare, Parallels, or Xen)?

This is possible but not recommended for a production environment.

We have found that running MySQL Cluster processes inside a virtual machine can give rise to issues with timing and disk subsystems that have a strong negative impact on the operation of the cluster. The behavior of the cluster is often unpredictable in these cases.

If an issue can be reproduced outside the virtual environment, then we may be able to provide assistance. Otherwise, we cannot support it at this time.

22.10.14: I am trying to populate a MySQL Cluster database. The loading process terminates prematurely and I get an error message like this one: `ERROR 1114: THE TABLE 'MY_CLUSTER_TABLE' IS FULL` Why is this happening?

The cause is very likely to be that your setup does not provide sufficient RAM for all table data and all indexes, *including the primary key required by the `NDB` storage engine and automatically created in the event that the table definition does not include the definition of a primary key*.

It is also worth noting that all data nodes should have the same amount of RAM, since no data node in a cluster can use more memory than the least amount available to any individual data node. For example, if there are four computers hosting Cluster data nodes, and three of these have 3GB of RAM available to store Cluster data while the remaining data node has only 1GB RAM, then each data node can devote at most 1GB to MySQL Cluster data and indexes.

22.10.15: MySQL Cluster uses TCP/IP. Does this mean that I can run it over the Internet, with one or more nodes in remote

locations?

It is *very* unlikely that a cluster would perform reliably under such conditions, as MySQL Cluster was designed and implemented with the assumption that it would be run under conditions guaranteeing dedicated high-speed connectivity such as that found in a LAN setting using 100 Mbps or gigabit Ethernet — preferably the latter. We neither test nor warrant its performance using anything slower than this.

In addition, it is *extremely* important to keep in mind that communications between the nodes in a MySQL Cluster are not secure; they are neither encrypted nor safeguarded by any other protective mechanism. The most secure configuration for a cluster is in a private network behind a firewall, with no direct access to any Cluster data or management nodes from outside. (For SQL nodes, you should take the same precautions as you would with any other instance of the MySQL server.) For more information, see [MySQL Cluster Security Issues](#).

22.10.16: Do I have to learn a new programming or query language to use MySQL Cluster?

No. Although some specialized commands are used to manage and configure the cluster itself, only standard (My)SQL queries and commands are required for the following operations:

- Creating, altering, and dropping tables (including Disk Data tables and related objects)
- Inserting, updating, and deleting table data
- Creating, changing, and dropping primary and unique indexes

Some specialized configuration parameters and files are required to set up a MySQL Cluster — see [MySQL Cluster Configuration Files](#), for information about these.

A few simple commands are used in the MySQL Cluster management client (`ndb_mgm`) for tasks such as starting and stopping cluster nodes. See [Commands in the MySQL Cluster Management Client](#).

22.10.17: How do I find out what an error or warning message means when using MySQL Cluster?

There are two ways in which this can be done:

- From within the `mysql` client, use `SHOW ERRORS` or `SHOW WARNINGS` immediately upon being notified of the error or warning condition. Errors and warnings also be displayed in MySQL Query Browser.
- From a system shell prompt, use `perror --ndb error_code`.

22.10.18: Is MySQL Cluster transaction-safe? What isolation levels are supported?

Yes: For tables created with the `NDBCLUSTER` storage engine, transactions are supported. Currently, MySQL Cluster supports only the `READ COMMITTED` transaction isolation level.

22.10.19: What storage engines are supported by MySQL Cluster?

Clustering with MySQL is supported only by the `NDBCLUSTER` storage engine (also called `NDB`). That is, in order for a table to be shared between nodes in a MySQL Cluster, the table must be created using `ENGINE=NDBCLUSTER` (or the equivalent option `ENGINE=NDB`).

It is possible to create tables using other storage engines (such as `MyISAM` or `InnoDB`) on a MySQL server being used with a MySQL Cluster, but these non-`NDBCLUSTER` tables do *not* participate in clustering; such a table is strictly local to the individual MySQL server instance on which it is created.

22.10.20: In the event of a catastrophic failure — say, for instance, the whole city loses power and my UPS fails — would I lose all my data?

All committed transactions are logged. Therefore, although it is possible that some data could be lost in the event of a catastrophe, this should be quite limited. Data loss can be further reduced by minimizing the number of operations per transaction. (It is not a good idea to perform large numbers of operations per transaction in any case.)

22.10.21: Is it possible to use `FULLTEXT` indexes with MySQL Cluster?

`FULLTEXT` indexing is not supported by any storage engine other than `MyISAM`. We are working to add this capability to MySQL Cluster tables in a future release.

22.10.22: Can I run multiple nodes on a single computer?

It is possible but not always advisable. One of the chief reasons to run a cluster is to provide redundancy. To obtain the full benefits of this redundancy, each node should reside on a separate machine. If you place multiple nodes on a single machine and that machine fails, you lose all of those nodes. For this reason, if you do run multiple data nodes on a single machine, it is *extremely* important that they be set up in such a way that the failure of this machine does not cause the loss of all the data nodes in a given node group.

Given that MySQL Cluster can be run on commodity hardware loaded with a low-cost (or even no-cost) operating system, the expense of an extra machine or two is well worth it to safeguard mission-critical data. It also worth noting that the requirements for a cluster host running a management node are minimal. This task can be accomplished with a 200 MHz Pentium CPU and sufficient RAM for the operating system plus a small amount of overhead for the `ndb_mgmd` and `ndb_mgm` processes.

It is acceptable to run multiple cluster data nodes on a single host that has multiple CPUs, cores, or both. Beginning with MySQL Cluster NDB 6.4, there is also a special multi-threaded version of the data node binary intended for use on such systems. For more information, see [ndbmt.d](#).

It is also possible in some cases to run data nodes and SQL nodes concurrently on the same machine; how well such an arrangement performs is dependent on a number of factors such as number of cores and CPUs as well as the amount of disk and memory available to the data node and SQL node processes, and you must take these factors into account when planning such a configuration.

22.10.23: Can I add data nodes to a MySQL Cluster without restarting it?

Beginning with MySQL Cluster NDB 6.4, it is possible to add new data nodes to a running MySQL Cluster without taking it offline. For more information, see [Adding MySQL Cluster Data Nodes Online](#).

For other types of MySQL Cluster nodes, a rolling restart is all that is required (see [Performing a Rolling Restart of a MySQL Cluster](#)).

In MySQL Cluster NDB 6.3 and earlier, it was not possible to add new data nodes without shutting down and restarting the MySQL Cluster.

22.10.24: Are there any limitations that I should be aware of when using MySQL Cluster?

Limitations on [NDB](#) tables in MySQL 5.4 (including MySQL Cluster NDB 6.x) include the following:

- Temporary tables are not supported; a `CREATE TEMPORARY TABLE` statement using `ENGINE=NDB` or `ENGINE=NDBCLUSTER` fails with an error.
- The only types of user-defined partitioning supported for `NDBCLUSTER` tables are `KEY` and `LINEAR KEY`. (Attempting to create an `NDB` table using any other partitioning type fails with an error.)
- `FULLTEXT` indexes and index prefixes are not supported. Only complete columns may be indexed.
- Spatial indexes are not supported (although spatial columns can be used). See [Section 11.13, “Spatial Extensions”](#).
- Prior to MySQL Cluster NDB 6.3.19, the `NDBCLUSTER` storage engine did not support partial transactions or partial rollbacks of transactions. Beginning with MySQL Cluster NDB 6.3.19, this limitation has been removed, and the behavior of `NDBCLUSTER` is now in line with that of other transactional storage engines (such as `InnoDB`) that can roll back individual statements.
- The maximum number of attributes allowed per table is 128, and attribute names cannot be any longer than 31 characters. For each table, the maximum combined length of the table and database names is 122 characters.
- The maximum size for a table row is 8 kilobytes, not counting `BLOB` values. There is no set limit for the number of rows per table. Table size limits depend on a number of factors, in particular on the amount of RAM available to each data node.
- The `NDBCLUSTER` engine does not support foreign key constraints. As with `MyISAM` tables, if these are specified in a `CREATE TABLE` or `ALTER TABLE` statement, they are ignored.

For a complete listing of limitations in MySQL Cluster, see [Known Limitations of MySQL Cluster](#).

22.10.25: How do I import an existing MySQL database into a MySQL Cluster?

You can import databases into MySQL Cluster much as you would with any other version of MySQL. Other than the limitations mentioned elsewhere in this FAQ, the only other special requirement is that any tables to be included in the cluster must use the `NDB` storage engine. This means that the tables must be created with `ENGINE=NDB` or `ENGINE=NDBCLUSTER`.

It is also possible to convert existing tables using other storage engines to `NDBCLUSTER` using one or more `ALTER TABLE` statement. However, the definition of the table must be compatible with the `NDBCLUSTER` storage engine prior to making the conver-

sion.

See [Known Limitations of MySQL Cluster](#), for details.

22.10.26: How do cluster nodes communicate with one another?

Cluster nodes can communicate via any of three different transport mechanisms: TCP/IP, SHM (shared memory), and SCI (Scalable Coherent Interface). Where available, SHM is used by default between nodes residing on the same cluster host; however, this is considered experimental. SCI is a high-speed (1 gigabit per second and higher), high-availability protocol used in building scalable multi-processor systems; it requires special hardware and drivers. See [Using High-Speed Interconnects with MySQL Cluster](#), for more about using SCI as a transport mechanism for MySQL Cluster.

22.10.27: What is an *arbiter*?

If one or more nodes in a cluster fail, it is possible that not all cluster nodes will be able to “see” one another. In fact, it is possible that two sets of nodes might become isolated from one another in a network partitioning, also known as a “split brain” scenario. This type of situation is undesirable because each set of nodes tries to behave as though it is the entire cluster.

When cluster nodes go down, there are two possibilities. If more than 50% of the remaining nodes can communicate with each other, we have what is sometimes called a “majority rules” situation, and this set of nodes is considered to be the cluster. The arbiter comes into play when there is an even number of nodes: in such cases, the set of nodes to which the arbiter belongs is considered to be the cluster, and nodes not belonging to this set are shut down.

The preceding information is somewhat simplified. A more complete explanation taking into account node groups follows:

When all nodes in at least one node group are alive, network partitioning is not an issue, because no one portion of the cluster can form a functional cluster. The real problem arises when no single node group has all its nodes alive, in which case network partitioning (the “split-brain” scenario) becomes possible. Then an arbiter is required. All cluster nodes recognize the same node as the arbiter, which is normally the management server; however, it is possible to configure any of the MySQL Servers in the cluster to act as the arbiter instead. The arbiter accepts the first set of cluster nodes to contact it, and tells the remaining set to shut down. Arbiter selection is controlled by the `ArbitrationRank` configuration parameter for MySQL Server and management server nodes. (See [Defining a MySQL Cluster Management Server](#), for details.)

The role of arbiter does not in and of itself impose any heavy demands upon the host so designated, and thus the arbiter host does not need to be particularly fast or to have extra memory especially for this purpose.

22.10.28: What data types are supported by MySQL Cluster?

MySQL Cluster NDB 6.x, supports all of the usual MySQL data types, including those associated with MySQL’s spatial extensions; however, the `NDBCLUSTER` storage engine does not support spatial indexes. (Spatial indexes are supported only by `MyISAM`; see [Section 11.13, “Spatial Extensions”](#), for more information.) In addition, there are some differences with regard to indexes when used with `NDBCLUSTER` tables.

Note

MySQL Cluster Disk Data tables (that is, tables created with `TABLESPACE ... STORAGE DISK ENGINE=NDBCLUSTER`) have only fixed-width rows. This means that (for example) each Disk Data table record containing a `VARCHAR(255)` column requires space for 255 characters (as required for the character set and collation being used for the table), regardless of the actual number of characters stored therein.

See [Known Limitations of MySQL Cluster](#), for more information about these issues.

22.10.29: How do I start and stop MySQL Cluster?

It is necessary to start each node in the cluster separately, in the following order:

1. Start the management node, using the `ndb_mgmd` command.

You must include the `-f` or `--config-file` option to tell the management node where its configuration file can be found. Beginning with MySQL Cluster NDB 6.4, the management server must also know where it is to keep its configuration cache.

2. Start each data node with the `ndbd` command. (Beginning with MySQL Cluster NDB 6.4, the `ndbmt` command can be used on computers with multiple CPUs, multiple cores, or both.)

Each data node must be started with the `-c` or `--connect-string` option so that the data node knows how to connect to the management server.

3. Start each MySQL Server (SQL node) using your preferred startup script, such as `mysqld_safe`.

Each MySQL Server must be started with the `--ndbcluster` and `--ndb-connectstring` options. These options cause `mysqld` to enable `NDBCLUSTER` storage engine support and how to connect to the management server.

Each of these commands must be run from a system shell on the machine housing the affected node. (You do not have to be physically present at the machine — a remote login shell can be used for this purpose.) You can verify that the cluster is running by starting the NDB management client `ndb_mgm` on the machine housing the management node and issuing the `SHOW` or `ALL STATUS` command.

To shut down a running cluster, issue the command `SHUTDOWN` in the management client. Alternatively, you may enter the following command in a system shell:

```
shell> ndb_mgm -e "SHUTDOWN"
```

(The quotation marks are optional; in addition, the `SHUTDOWN` command is not case-sensitive.)

Either of these commands causes the `ndb_mgm`, `ndb_mgm`, and any `ndbd` processes to terminate gracefully. MySQL servers running as Cluster SQL nodes can be stopped using `mysqladmin shutdown`.

For more information, see [Commands in the MySQL Cluster Management Client](#), and [Safe Shutdown and Restart of MySQL Cluster](#).

22.10.30: What happens to MySQL Cluster data when the cluster is shut down?

The data that was held in memory by the MySQL Cluster data nodes is written to disk, and is reloaded into memory the next time that the cluster is started.

22.10.31: Is it a good idea to have more than one management node for a MySQL Cluster?

It can be helpful as a fail-safe. Only one management node controls the cluster at any given time, but it is possible to configure one management node as primary, and one or more additional management nodes to take over in the event that the primary management node fails.

See [MySQL Cluster Configuration Files](#), for information on how to configure MySQL Cluster management nodes.

22.10.32: Can I mix different kinds of hardware and operating systems in one MySQL Cluster?

Yes, as long as all machines and operating systems have the same “endianness” (all big-endian or all little-endian). We are working to overcome this limitation in a future MySQL Cluster release.

It is also possible to use software from different MySQL Cluster releases on different nodes. However, we support this only as part of a rolling upgrade procedure (see [Performing a Rolling Restart of a MySQL Cluster](#)).

22.10.33: Can I run two data nodes on a single host? Two SQL nodes?

Yes, it is possible to do this. In the case of multiple data nodes, it is advisable (but not required) for each node to use a different data directory. If you want to run multiple SQL nodes on one machine, each instance of `mysqld` must use a different TCP/IP port. However, running more than one cluster node of a given type per machine is generally not encouraged or supported for production use.

We also advise against running data nodes and SQL nodes together on the same host, since the `ndbd` and `mysqld` processes may compete for memory.

22.10.34: Can I use host names with MySQL Cluster?

Yes, it is possible to use DNS and DHCP for cluster hosts. However, if your application requires “five nines” availability, we recommend using fixed (numeric) IP addresses. Making communication between Cluster hosts dependent on services such as DNS and DHCP introduces additional potential points of failure.

22.10.35: Does MySQL Cluster support IPv6?

Beginning with MySQL Cluster NDB 6.4, IPv6 is supported for connections between SQL nodes (MySQL servers). However, connections between all other types of nodes must use IPv4.

In practical terms, this means that you can use IPv6 for replication between MySQL Clusters, but connections between nodes in the same MySQL Cluster must use IPv4. For more information, see [Known Issues in MySQL Cluster Replication](#).

22.10.36: How do I handle MySQL users in a MySQL Cluster having multiple MySQL servers?

MySQL user accounts and privileges are not automatically propagated between different MySQL servers accessing the same MySQL Cluster. Therefore, you must make sure that these are copied between the SQL nodes yourself. You can do this manually, or automate the task with scripts.

■ Warning

Do not attempt to work around this issue by converting the MySQL system tables to use the `NDBCLUSTER` storage engine. Only the `MyISAM` storage engine is supported for these tables.

22.10.37: How do I continue to send queries in the event that one of the SQL nodes fails?

MySQL Cluster does not provide any sort of automatic failover between SQL nodes. Your application must be prepared to handle any loss of SQL nodes and to fail over between them.

A.11. MySQL 5.4 FAQ — MySQL Chinese, Japanese, and Korean Character Sets

This set of Frequently Asked Questions derives from the experience of MySQL's Support and Development groups in handling many inquiries about CJK (Chinese-Japanese-Korean) issues.

Questions

- [22.11.1](#): What CJK character sets are available in MySQL?
- [22.11.2](#): I have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters?
- [22.11.3](#): What problems should I be aware of when working with the Big5 Chinese character set?

Questions and Answers

22.11.1: What CJK character sets are available in MySQL?

The list of CJK character sets may vary depending on your MySQL version. For example, the `eurjpm` character set was not supported prior to MySQL 5.0.3. However, since the name of the applicable language appears in the `DESCRIPTION` column for every entry in the `INFORMATION_SCHEMA.CHARACTER_SETS` table, you can obtain a current list of all the non-Unicode CJK character sets using this query:

```
mysql> SELECT CHARACTER_SET_NAME, DESCRIPTION
-> FROM INFORMATION_SCHEMA.CHARACTER_SETS
-> WHERE DESCRIPTION LIKE '%Chinese%'
```

```

-> OR DESCRIPTION LIKE '%Japanese%'
-> OR DESCRIPTION LIKE '%Korean%'
-> ORDER BY CHARACTER_SET_NAME;

```

CHARACTER_SET_NAME	DESCRIPTION
big5	Big5 Traditional Chinese
cp932	SJIS for Windows Japanese
euc_jpms	UJIS for Windows Japanese
euckr	EUC-KR Korean
gb2312	GB2312 Simplified Chinese
gbk	GBK Simplified Chinese
sjis	Shift-JIS Japanese
ujis	EUC-JP Japanese

8 rows in set (0.01 sec)

(See [Section 19.9](#), “[The INFORMATION_SCHEMA CHARACTER_SETS Table](#)”, for more information.)

MySQL supports the two common variants of the *GB* (*Guojia Biaozhun*, or *National Standard*, or *Simplified Chinese*) character sets which are official in the People's Republic of China: [gb2312](#) and [gbk](#). Sometimes people try to insert [gbk](#) characters into [gb2312](#), and it works most of the time because [gbk](#) is a superset of [gb2312](#) — but eventually they try to insert a rarer Chinese character and it doesn't work. (See [Bug#16072](#) for an example).

Here, we try to clarify exactly what characters are legitimate in [gb2312](#) or [gbk](#), with reference to the official documents. Please check these references before reporting [gb2312](#) or [gbk](#) bugs.

- For a complete listing of the [gb2312](#) characters, ordered according to the [gb2312_chinese_ci](#) collation: [gb2312](#)
- MySQL's [gbk](#) is in reality “Microsoft code page 936”. This differs from the official [gbk](#) for characters [A1A4](#) (middle dot), [A1AA](#) (em dash), [A6E0–A6F5](#), and [A8BB–A8C0](#). For a listing of the differences, see <http://recode.progiciels-bpi.ca/showfile.html?name=dist/libiconv/gbk.h>.
- For a listing of [gbk](#)/Unicode mappings, see <http://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WINDOWS/CP936.TXT>.
- For MySQL's listing of [gbk](#) characters, see [gbk](#).

22.11.2: I have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters?

This problem is usually due to a setting in MySQL that doesn't match the settings for the application program or the operating system. Here are some common steps for correcting these types of issues:

- *Be certain of what MySQL version you are using.*
Use the statement `SELECT VERSION();` to determine this.
- *Make sure that the database is actually using the desired character set.*

People often think that the client character set is always the same as either the server character set or the character set used for display purposes. However, both of these are false assumptions. You can make sure by checking the result of `SHOW CREATE TABLE tablename` or — better — yet by using this statement:

```

SELECT character_set_name, collation_name
FROM information_schema.columns
WHERE table_schema = your_database_name
AND table_name = your_table_name
AND column_name = your_column_name;

```

- *Determine the hexadecimal value of the character or characters that are not being displayed correctly.*

You can obtain this information for a column `column_name` in the table `table_name` using the following query:

```

SELECT HEX(column_name)
FROM table_name;

```

`3F` is the encoding for the `?` character; this means that `?` is the character actually stored in the column. This most often happens because of a problem converting a particular character from your client character set to the target character set.

- *Make sure that a round trip possible — that is, when you select `literal` (or `_introducer hexadecimal-value`), you obtain `literal` as a result.*

For example, the Japanese *Katakana* character *Pe* (ペ) exists in all CJK character sets, and has the code point value (hexadecimal coding) `0x30da`. To test a round trip for this character, use this query:

```
SELECT 'ㄹ' AS `ㄹ`; /* or SELECT _ucs2 0x30da; */
```

If the result is not also ㄹ, then the round trip has failed.

For bug reports regarding such failures, we might ask you to follow up with `SELECT HEX('ㄹ');`. Then we can determine whether the client encoding is correct.

- *Make sure that the problem is not with the browser or other application, rather than with MySQL.*

Use the `mysql` client program (on Windows: `mysql.exe`) to accomplish this task. If `mysql` displays correctly but your application doesn't, then your problem is probably due to system settings.

To find out what your settings are, use the `SHOW VARIABLES` statement, whose output should resemble what is shown here:

```
mysql> SHOW VARIABLES LIKE 'char%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| character_set_client | utf8 |
| character_set_connection | utf8 |
| character_set_database | latin1 |
| character_set_filesystem | binary |
| character_set_results | utf8 |
| character_set_server | latin1 |
| character_set_system | utf8 |
| character_sets_dir | /usr/local/mysql/share/mysqlCharsets/ |
+-----+-----+
8 rows in set (0.03 sec)
```

These are typical character-set settings for an international-oriented client (notice the use of `utf8` Unicode) connected to a server in the West (`latin1` is a West Europe character set and a default for MySQL).

Although Unicode (usually the `utf8` variant on Unix, and the `ucs2` variant on Windows) is preferable to Latin, it is often not what your operating system utilities support best. Many Windows users find that a Microsoft character set, such as `cp932` for Japanese Windows, is suitable.

If you cannot control the server settings, and you have no idea what your underlying computer is, then try changing to a common character set for the country that you're in (`euckr` = Korea; `gb2312` or `gbk` = People's Republic of China; `big5` = Taiwan; `sjis`, `ujis`, `cp932`, or `eucjpms` = Japan; `ucs2` or `utf8` = anywhere). Usually it is necessary to change only the client and connection and results settings. There is a simple statement which changes all three at once: `SET NAMES`. For example:

```
SET NAMES 'big5';
```

Once the setting is correct, you can make it permanent by editing `my.cnf` or `my.ini`. For example you might add lines looking like these:

```
[mysqld]
character-set-server=big5
[client]
default-character-set=big5
```

It is also possible that there are issues with the API configuration setting being used in your application; see *Why does my GUI front end or browser not display CJK characters correctly...?* for more information.

22.11.3: What problems should I be aware of when working with the Big5 Chinese character set?

MySQL supports the Big5 character set which is common in Hong Kong and Taiwan (Republic of China). MySQL's `big5` is in reality Microsoft code page 950, which is very similar to the original `big5` character set. We changed to this character set starting with MySQL version 4.1.16 / 5.0.16 (as a result of [Bug#12476](#)). For example, the following statements work in current versions of MySQL, but not in old versions:

```
mysql> CREATE TABLE big5 (BIG5 CHAR(1) CHARACTER SET BIG5);
Query OK, 0 rows affected (0.13 sec)

mysql> INSERT INTO big5 VALUES (0xf9dc);
Query OK, 1 row affected (0.00 sec)

mysql> SELECT * FROM big5;
+-----+
| big5 |
+-----+
| 嫻 |
+-----+
1 row in set (0.02 sec)
```

A feature request for adding `HKSCS` extensions has been filed. People who need this extension may find the suggested patch for

[Bug#13577](#) to be of interest.

22.11.4: Why do Japanese character set conversions fail?

MySQL supports the `sjis`, `ujis`, `cp932`, and `ujis` character sets, as well as Unicode. A common need is to convert between character sets. For example, there might be a Unix server (typically with `sjis` or `ujis`) and a Windows client (typically with `cp932`).

In the following conversion table, the `ucs2` column represents the source, and the `sjis`, `cp932`, `ujis`, and `ujis` columns represent the destinations — that is, the last 4 columns provide the hexadecimal result when we use `CONVERT(ucs2)` or we assign a `ucs2` column containing the value to an `sjis`, `cp932`, `ujis`, or `ujis` column.

Character Name	ucs2	sjis	cp932	ujis	ujis
BROKEN BAR	00A6	3F	3F	8FA2C3	3F
FULLWIDTH BROKEN BAR	FFE4	3F	FA55	3F	8FA2
YEN SIGN	00A5	3F	3F	20	3F
FULLWIDTH YEN SIGN	FFE5	818F	818F	A1EF	3F
TILDE	007E	7E	7E	7E	7E
OVERLINE	203E	3F	3F	20	3F
HORIZONTAL BAR	2015	815C	815C	A1BD	A1BD
EM DASH	2014	3F	3F	3F	3F
REVERSE SOLIDUS	005C	815F	5C	5C	5C
FULLWIDTH ""	FF3C	3F	815F	3F	A1C0
WAVE DASH	301C	8160	3F	A1C1	3F
FULLWIDTH TILDE	FF5E	3F	8160	3F	A1C1
DOUBLE VERTICAL LINE	2016	8161	3F	A1C2	3F
PARALLEL TO	2225	3F	8161	3F	A1C2
MINUS SIGN	2212	817C	3F	A1DD	3F
FULLWIDTH HYPHEN-MINUS	FF0D	3F	817C	3F	A1DD
CENT SIGN	00A2	8191	3F	A1F1	3F
FULLWIDTH CENT SIGN	FFE0	3F	8191	3F	A1F1
POUND SIGN	00A3	8192	3F	A1F2	3F
FULLWIDTH POUND SIGN	FFE1	3F	8192	3F	A1F2
NOT SIGN	00AC	81CA	3F	A2CC	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA	3F	A2CC

Now consider the following portion of the table.

	ucs2	sjis	cp932
NOT SIGN	00AC	81CA	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA

This means that MySQL converts the `NOT SIGN` (Unicode `U+00AC`) to `sjis` code point `0x81CA` and to `cp932` code point `3F`. (`3F` is the question mark (“?”) — this is what is always used when the conversion cannot be performed.)

22.11.5: What should I do if I want to convert SJIS 81CA to cp932?

Our answer is: “?”. There are serious complaints about this: many people would prefer a “loose” conversion, so that `81CA` (`NOT SIGN`) in `sjis` becomes `81CA` (`FULLWIDTH NOT SIGN`) in `cp932`. We are considering a change to this behavior.

22.11.6: How does MySQL represent the Yen (¥) sign?

A problem arises because some versions of Japanese character sets (both `sjis` and `ujis`) treat `5C` as a *reverse solidus* (`\` — also known as a backslash), and others treat it as a yen sign (¥).

MySQL follows only one version of the JIS (Japanese Industrial Standards) standard description. In MySQL, `5C` is always the *reverse solidus* (`\`).

22.11.7: Do MySQL plan to make a separate character set where 5C is the Yen sign, as at least one other major DBMS does?

This is one possible solution to the Yen sign issue; however, this will not happen in MySQL 5.1 or 6.0.

22.11.8: Of what issues should I be aware when working with Korean character sets in MySQL?

In theory, while there have been several versions of the `euckr` (*Extended Unix Code Korea*) character set, only one problem has been noted.

We use the “ASCII” variant of EUC-KR, in which the code point `0x5c` is REVERSE SOLIDUS, that is `\`, instead of the “KS-Roman” variant of EUC-KR, in which the code point `0x5c` is `₩` (`₩`). This means that you cannot convert Unicode `U+20A9` to `euckr`:

```
mysql> SELECT
->     CONVERT('₩' USING euckr) AS euckr,
->     HEX(CONVERT('₩' USING euckr)) AS hexeuckr;
+-----+-----+
| euckr | hexeuckr |
+-----+-----+
| ?     | 3F       |
+-----+-----+
1 row in set (0.00 sec)
```

MySQL's graphic Korean chart is here: [euckr](#).

22.11.9: Why do I get `DATA TRUNCATED` error messages?

For illustration, we'll create a table with one Unicode (`ucs2`) column and one Chinese (`gb2312`) column.

```
mysql> CREATE TABLE ch
-> (ucs2 CHAR(3) CHARACTER SET ucs2,
->  gb2312 CHAR(3) CHARACTER SET gb2312);
Query OK, 0 rows affected (0.05 sec)
```

We'll try to place the rare character `ㄹ` in both columns.

```
mysql> INSERT INTO ch VALUES ('AㄹB','AㄹB');
Query OK, 1 row affected, 1 warning (0.00 sec)
```

Ah, there is a warning. Use the following statement to see what it is:

```
mysql> SHOW WARNINGS;
+-----+-----+-----+
| Level | Code | Message
+-----+-----+-----+
| Warning | 1265 | Data truncated for column 'gb2312' at row 1
+-----+-----+-----+
1 row in set (0.00 sec)
```

So it is a warning about the `gb2312` column only.

```
mysql> SELECT ucs2,HEX(ucs2),gb2312,HEX(gb2312) FROM ch;
+-----+-----+-----+-----+
| ucs2 | HEX(ucs2) | gb2312 | HEX(gb2312) |
+-----+-----+-----+-----+
| AㄹB | 00416C4C0042 | A?B | 413F42 |
+-----+-----+-----+-----+
1 row in set (0.00 sec)
```

There are several things that need explanation here.

1. The fact that it is a “warning” rather than an “error” is characteristic of MySQL. We like to try to do what we can, to get the best fit, rather than give up.
2. The `ㄹ` character isn't in the `gb2312` character set. We described that problem earlier.
3. Admittedly the message is misleading. We didn't “truncate” in this case, we replaced with a question mark. We've had a complaint about this message (See [Bug#9337](#)). But until we come up with something better, just accept that error/warning code 2165 can mean a variety of things.
4. With `SQL_MODE=TRADITIONAL`, there would be an error message, but instead of error 2165 you would see: `ERROR 1406 (22001): Data too long for column 'gb2312' at row 1`.

22.11.10: Why does my GUI front end or browser not display CJK characters correctly in my application using Access, PHP, or another API?

Obtain a direct connection to the server using the `mysql` client (Windows: `mysql.exe`), and try the same query there. If `mysql` responds correctly, then the trouble may be that your application interface requires initialization. Use `mysql` to tell you what character set or sets it uses with the statement `SHOW VARIABLES LIKE 'char%';`. If you are using Access, then you are most likely connecting with MyODBC. In this case, you should check [Section 20.1.4](#), “Connector/ODBC Configuration”. If, for in-

stance, you use `big5`, you would enter `SET NAMES 'big5'`. (Note that no `;` is required in this case). If you are using ASP, you might need to add `SET NAMES` in the code. Here is an example that has worked in the past:

```
<%
Session.CodePage=0
Dim strConnection
Dim Conn
strConnection="driver={MySQL ODBC 3.51 Driver};server=server;uid=username;" \
& "pwd=password;database=database;stmt=SET NAMES 'big5';"
Set Conn = Server.CreateObject("ADODB.Connection")
Conn.Open strConnection
%>
```

In much the same way, if you are using any character set other than `latin1` with Connector/NET, then you must specify the character set in the connection string. See [Section 20.2.4.2, “Connecting to MySQL Using Connector/NET”](#), for more information.

If you are using PHP, try this:

```
<?php
$link = mysql_connect($host, $usr, $pwd);

mysql_select_db($db);

if( mysql_error() ) { print "Database ERROR: " . mysql_error(); }
mysql_query("SET NAMES 'utf8'", $link);
?>
```

In this case, we used `SET NAMES` to change `character_set_client` and `character_set_connection` and `character_set_results`.

We encourage the use of the newer `mysqli` extension, rather than `mysql`. Using `mysqli`, the previous example could be rewritten as shown here:

```
<?php
$link = new mysqli($host, $usr, $pwd, $db);

if( mysqli_connect_errno() )
{
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$link->query("SET NAMES 'utf8'");
?>
```

Another issue often encountered in PHP applications has to do with assumptions made by the browser. Sometimes adding or changing a `<meta>` tag suffices to correct the problem: for example, to insure that the user agent interprets page content as `UTF-8`, you should include `<meta http-equiv="Content-Type" content="text/html; charset=utf-8">` in the `<head>` of the HTML page.

If you are using Connector/J, see [Section 20.4.4.4, “Using Character Sets and Unicode”](#).

22.11.11: I've upgraded to MySQL 5.4. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?

In MySQL Version 4.0, there was a single “global” character set for both server and client, and the decision as to which character to use was made by the server administrator. This changed starting with MySQL Version 4.1. What happens now is a “handshake”, as described in [Section 9.1.4, “Connection Character Sets and Collations”](#):

When a client connects, it sends to the server the name of the character set that it wants to use. The server uses the name to set the `character_set_client`, `character_set_results`, and `character_set_connection` system variables. In effect, the server performs a `SET NAMES` operation using the character set name.

The effect of this is that you cannot control the client character set by starting `mysqld` with `-character-set-server=utf8`. However, some of our Asian customers have said that they prefer the MySQL 4.0 behavior. To make it possible to retain this behavior, we added a `mysqld` switch, `--character-set-client-handshake`, which can be turned off with `--skip-character-set-client-handshake`. If you start `mysqld` with `-skip-character-set-client-handshake`, then, when a client connects, it sends to the server the name of the character set that it wants to use — however, *the server ignores this request from the client*.

By way of example, suppose that your favorite server character set is `latin1` (unlikely in a CJK area, but this is the default value). Suppose further that the client uses `utf8` because this is what the client's operating system supports. Now, start the server with `latin1` as its default character set:

```
mysqld --character-set-server=latin1
```

And then start the client with the default character set `utf8`:

```
mysql --default-character-set=utf8
```

The current settings can be seen by viewing the output of `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'char%';
```

Variable_name	Value
character_set_client	utf8
character_set_connection	utf8
character_set_database	latin1
character_set_filesystem	binary
character_set_results	utf8
character_set_server	latin1
character_set_system	utf8
character_sets_dir	/usr/local/mysql/share/mysqlCharsets/

```
8 rows in set (0.01 sec)
```

Now stop the client, and then stop the server using `mysqldadmin`. Then start the server again, but this time tell it to skip the handshake like so:

```
mysqld --character-set-server=utf8 --skip-character-set-client-handshake
```

Start the client with `utf8` once again as the default character set, then display the current settings:

```
mysql> SHOW VARIABLES LIKE 'char%';
```

Variable_name	Value
character_set_client	latin1
character_set_connection	latin1
character_set_database	latin1
character_set_filesystem	binary
character_set_results	latin1
character_set_server	latin1
character_set_system	utf8
character_sets_dir	/usr/local/mysql/share/mysqlCharsets/

```
8 rows in set (0.01 sec)
```

As you can see by comparing the differing results from `SHOW VARIABLES`, the server ignores the client's initial settings if the `--skip-character-set-client-handshake` is used.

22.11.12: Why do some `LIKE` and `FULLTEXT` searches with CJK characters fail?

There is a very simple problem with `LIKE` searches on `BINARY` and `BLOB` columns: we need to know the end of a character. With multi-byte character sets, different characters might have different octet lengths. For example, in `utf8`, `A` requires one byte but `Æ` requires three bytes, as shown here:

```
mysql> SELECT OCTET_LENGTH(utf8 'A'), OCTET_LENGTH(utf8 'Æ');
```

1	3
---	---

```
1 row in set (0.00 sec)
```

If we don't know where the first character ends, then we don't know where the second character begins, in which case even very simple searches such as `LIKE '_A%'` fail. The solution is to use a regular CJK character set in the first place, or to convert to a CJK character set before comparing.

This is one reason why MySQL cannot allow encodings of non-existent characters. If it is not strict about rejecting bad input, then it has no way of knowing where characters end.

For `FULLTEXT` searches, we need to know where words begin and end. With Western languages, this is rarely a problem because most (if not all) of these use an easy-to-identify word boundary — the space character. However, this is not usually the case with Asian writing. We could use arbitrary halfway measures, like assuming that all Han characters represent words, or (for Japanese) depending on changes from Katakana to Hiragana due to grammatical endings. However, the only sure solution requires a comprehensive word list, which means that we would have to include a dictionary in the server for each Asian language supported. This is simply not feasible.

22.11.13: How do I know whether character `x` is available in all character sets?

The majority of simplified Chinese and basic non-halfwidth Japanese *Kana* characters appear in all CJK character sets. This stored procedure accepts a `UCS-2` Unicode character, converts it to all other character sets, and displays the results in hexadecimal.

```
DELIMITER //
CREATE PROCEDURE p_convert(ucs2_char CHAR(1) CHARACTER SET ucs2)
BEGIN
CREATE TABLE tj
(ucs2 CHAR(1) character set ucs2,
utf8 CHAR(1) character set utf8,
big5 CHAR(1) character set big5,
cp932 CHAR(1) character set cp932,
eucjpms CHAR(1) character set eucjpms,
euckr CHAR(1) character set euckr,
gb2312 CHAR(1) character set gb2312,
```

```

gbk CHAR(1) character set gbk,
sjis CHAR(1) character set sjis,
ujis CHAR(1) character set ujis);

INSERT INTO tj (ucs2) VALUES (ucs2_char);

UPDATE tj SET utf8=ucs2,
             big5=ucs2,
             cp932=ucs2,
             eucjpms=ucs2,
             euckr=ucs2,
             gb2312=ucs2,
             gbk=ucs2,
             sjis=ucs2,
             ujis=ucs2;

/* If there is a conversion problem, UPDATE will produce a warning. */

SELECT hex(ucs2) AS ucs2,
       hex(utf8) AS utf8,
       hex(big5) AS big5,
       hex(cp932) AS cp932,
       hex(eucjpms) AS eucjpms,
       hex(euckr) AS euckr,
       hex(gb2312) AS gb2312,
       hex(gbk) AS gbk,
       hex(sjis) AS sjis,
       hex(ujis) AS ujis
FROM tj;

DROP TABLE tj;

END//

```

The input can be any single `ucs2` character, or it can be the code point value (hexadecimal representation) of that character. For example, from Unicode's list of `ucs2` encodings and names (<http://www.unicode.org/Public/UNIDATA/UnicodeData.txt>), we know that the *Katakana* character *Pe* appears in all CJK character sets, and that its code point value is `0x30da`. If we use this value as the argument to `p_convert()`, the result is as shown here:

```

mysql> CALL p_convert(0x30da)//
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| ucs2 | utf8 | big5 | cp932 | eucjpms | euckr | gb2312 | gbk | sjis | ujis |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| 30DA | E3839A | C772 | 8379 | A5DA | ABDA | A5DA | A5DA | 8379 | A5DA |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
1 row in set (0.04 sec)

```

Since none of the column values is `3F` — that is, the question mark character (?) — we know that every conversion worked.

22.11.14: Why don't CJK strings sort correctly in Unicode? (I)

Sometimes people observe that the result of a `utf8_unicode_ci` or `ucs2_unicode_ci` search, or of an `ORDER BY` sort is not what they think a native would expect. Although we never rule out the possibility that there is a bug, we have found in the past that many people do not read correctly the standard table of weights for the Unicode Collation Algorithm. MySQL uses the table found at <http://www.unicode.org/Public/UCA/4.0.0/allkeys-4.0.0.txt>. This is not the first table you will find by navigating from the [unicode.org](http://www.unicode.org) home page, because MySQL uses the older 4.0.0 “allkeys” table, rather than the more recent 4.1.0 table. This is because we are very wary about changing ordering which affects indexes, lest we bring about situations such as that reported in [Bug#16526](#), illustrated as follows:

```

mysql< CREATE TABLE tj (s1 CHAR(1) CHARACTER SET utf8 COLLATE utf8_unicode_ci);
Query OK, 0 rows affected (0.05 sec)

mysql> INSERT INTO tj VALUES ('が'),('か');
Query OK, 2 rows affected (0.00 sec)
Records: 2 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM tj WHERE s1 = 'か';
+-----+
| s1 |
+-----+
| が |
| か |
+-----+
2 rows in set (0.00 sec)

```

The character in the first result row is not the one that we searched for. Why did MySQL retrieve it? First we look for the Unicode code point value, which is possible by reading the hexadecimal number for the `ucs2` version of the characters:

```

mysql> SELECT s1, HEX(CONVERT(s1 USING ucs2)) FROM tj;
+-----+-----+
| s1 | HEX(CONVERT(s1 USING ucs2)) |
+-----+-----+
| が | 304C |
| か | 304B |
+-----+-----+
2 rows in set (0.03 sec)

```

Now we search for `304B` and `304C` in the 4.0.0 `allkeys` table, and find these lines:

```
304B ; [.1E57.0020.000E.304B] # HIRAGANA LETTER KA
304C ; [.1E57.0020.000E.304B][.0000.0140.0002.3099] # HIRAGANA LETTER GA; QOCM
```

The official Unicode names (following the “#” mark) tell us the Japanese syllabary (Hiragana), the informal classification (letter, digit, or punctuation mark), and the Western identifier (*KA* or *GA*, which happen to be voiced and unvoiced components of the same letter pair). More importantly, the *primary weight* (the first hexadecimal number inside the square brackets) is `1E57` on both lines. For comparisons in both searching and sorting, MySQL pays attention to the primary weight only, ignoring all the other numbers. This means that we are sorting `が` and `カ` correctly according to the Unicode specification. If we wanted to distinguish them, we'd have to use a non-UCA (Unicode Collation Algorithm) collation (`utf8_bin` or `utf8_general_ci`), or to compare the `HEX()` values, or use `ORDER BY CONVERT(s1 USING sjis)`. Being correct “according to Unicode” isn't enough, of course: the person who submitted the bug was equally correct. We plan to add another collation for Japanese according to the JIS X 4061 standard, in which voiced/unvoiced letter pairs like *KA/GA* are distinguishable for ordering purposes.

22.11.15: Why don't CJK strings sort correctly in Unicode? (II)

If you are using Unicode (`ucs2` or `utf8`), and you know what the Unicode sort order is (see [Section A.11, “MySQL 5.4 FAQ — MySQL Chinese, Japanese, and Korean Character Sets”](#)), but MySQL still seems to sort your table incorrectly, then you should first verify the table character set:

```
mysql> SHOW CREATE TABLE t\G
***** 1. row *****
Table: t
Create Table: CREATE TABLE `t` (
  `s1` char(1) CHARACTER SET ucs2 DEFAULT NULL
) ENGINE=MyISAM DEFAULT CHARSET=latin1
1 row in set (0.00 sec)
```

Since the character set appears to be correct, let's see what information the `INFORMATION_SCHEMA.COLUMNS` table can provide about this column:

```
mysql> SELECT COLUMN_NAME, CHARACTER_SET_NAME, COLLATION_NAME
-> FROM INFORMATION_SCHEMA.COLUMNS
-> WHERE COLUMN_NAME = 's1'
-> AND TABLE_NAME = 't';
+-----+-----+-----+
| COLUMN_NAME | CHARACTER_SET_NAME | COLLATION_NAME |
+-----+-----+-----+
| s1          | ucs2               | ucs2_general_ci |
+-----+-----+-----+
1 row in set (0.01 sec)
```

(See [Section 19.3, “The INFORMATION_SCHEMA COLUMNS Table”](#), for more information.)

You can see that the collation is `ucs2_general_ci` instead of `ucs2_unicode_ci`. The reason why this is so can be found using `SHOW CHARSET`, as shown here:

```
mysql> SHOW CHARSET LIKE 'ucs2%';
+-----+-----+-----+-----+
| Charset | Description | Default collation | Maxlen |
+-----+-----+-----+-----+
| ucs2    | UCS-2 Unicode | ucs2_general_ci   | 2       |
+-----+-----+-----+-----+
1 row in set (0.00 sec)
```

For `ucs2` and `utf8`, the default collation is “general”. To specify a Unicode collation, use `COLLATE ucs2_unicode_ci`.

22.11.16: Why are my supplementary characters rejected by MySQL?

Before MySQL 6.0.4, MySQL does not support supplementary characters — that is, characters which need more than 3 bytes — for `UTF-8`. We support only what Unicode calls the *Basic Multilingual Plane / Plane 0*. Only a few very rare Han characters are supplementary; support for them is uncommon. This has led to reports such as that found in [Bug#12600](#), which we rejected as “not a bug”. With `utf8`, we must truncate an input string when we encounter bytes that we don't understand. Otherwise, we wouldn't know how long the bad multi-byte character is.

One possible workaround is to use `ucs2` instead of `utf8`, in which case the “bad” characters are changed to question marks; however, no truncation takes place. You can also change the data type to `BLOB` or `BINARY`, which perform no validity checking.

As of MySQL 6.0.4, Unicode support is extended to include supplementary characters by means of additional Unicode character sets: `utf16`, `utf32`, and 4-byte `utf8`. These character sets support supplementary Unicode characters outside the Basic Multilingual Plane (BMP).

22.11.17: Shouldn't it be “CJKV”?

No. The term “CJKV” (*Chinese Japanese Korean Vietnamese*) refers to Vietnamese character sets which contain Han (originally Chinese) characters. MySQL has no plan to support the old Vietnamese script using Han characters. MySQL does of course support the modern Vietnamese script with Western characters.

[Bug#4745](#) is a request for a specialized Vietnamese collation, which we might add in the future if there is sufficient demand for it.

22.11.18: Does MySQL allow CJK characters to be used in database and table names?

This issue is fixed in MySQL 5.1, by automatically rewriting the names of the corresponding directories and files.

For example, if you create a database named 精 on a server whose operating system does not support CJK in directory names, MySQL creates a directory named @0w@00a5@00ae. which is just a fancy way of encoding E6A5AE — that is, the Unicode hexadecimal representation for the 精 character. However, if you run a `SHOW DATABASES` statement, you can see that the database is listed as 精.

22.11.19: Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?

A Simplified Chinese version of the Manual, current for MySQL 5.1.12, can be found at <http://dev.mysql.com/doc/>. The Japanese translation of the MySQL 4.1 manual can be downloaded from <http://dev.mysql.com/doc/>.

22.11.20: Where can I get help with CJK and related issues in MySQL?

The following resources are available:

- A listing of MySQL user groups can be found at <http://dev.mysql.com/user-groups/>.
- You can contact a sales engineer at the MySQL KK Japan office using any of the following:

```
Tel: +81(0)3-5326-3133
Fax: +81(0)3-5326-3001
Email: dsaito@mysql.com
```

- View feature requests relating to character set issues at <http://tinyurl.com/y6xcuf>.
- Visit the MySQL [Character Sets, Collation, Unicode Forum](#). We are also in the process of adding foreign-language forums at <http://forums.mysql.com/>.

A.12. MySQL 5.4 FAQ — Connectors & APIs

For common questions, issues, and answers relating to the MySQL Connectors and other APIs, see the following areas of the Manual:

- [Section 20.10.10, “Common Questions and Problems When Using the C API”](#)
- [Section 20.11.5, “Common Problems with MySQL and PHP”](#)
- [Section 20.1.7, “Connector/ODBC Notes and Tips”](#)
- [Section 20.2.4, “Connector/NET Programming”](#)
- [Section 20.4.5, “Connector/J Notes and Tips”](#)
- [Section 20.5.6, “Connector/MXJ Notes and Tips”](#)

A.13. MySQL 5.4 FAQ — Replication

For answers to common queries and question regarding Replication within MySQL, see [Section 16.3.4, “Replication FAQ”](#).

A.14. MySQL 5.4 FAQ — MySQL, DRBD, and Heartbeat

A.14.1. Distributed Replicated Block Device (DRBD)

In the following section, we provide answers to questions that are most frequently asked about Distributed Replicated Block Device (DRBD).

Questions

- [22.14.1.1: What is DRBD?](#)
- [22.14.1.2: What are “Block Devices”?](#)

- [22.14.1.3](#): How is DRBD licensed?
- [22.14.1.4](#): Where can I download DRBD?
- [22.14.1.5](#): If I find a bug in DRBD, to whom do I submit the issue?
- [22.14.1.6](#): Where can I get more technical and business information concerning MySQL and DRBD?

Questions and Answers

22.14.1.1: What is DRBD?

DRBD is an acronym for Distributed Replicated Block Device. DRBD is an open source Linux kernel block device which leverages synchronous replication to achieve a consistent view of data between two systems, typically an Active and Passive system. DRBD currently supports all the major flavors of Linux and comes bundled in several major Linux distributions. The DRBD project is maintained by [LINBIT](#).

22.14.1.2: What are “Block Devices”?

A *block device* is the type of device used to represent storage in the Linux Kernel. All physical disk devices present a block device interface. Additionally, virtual disk systems like LVM or DRBD present a block device interface. In this way, the file system or other software that might want to access a disk device can be used with any number of real or virtual devices without having to know anything about their underlying implementation details.

22.14.1.3: How is DRBD licensed?

DRBD is licensed under the GPL.

22.14.1.4: Where can I download DRBD?

Please see <http://www.drbd.org/download/packages/>.

22.14.1.5: If I find a bug in DRBD, to whom do I submit the issue?

Bug reports should be submitted to the DRBD mailing list. Please see <http://lists.linbit.com/>.

22.14.1.6: Where can I get more technical and business information concerning MySQL and DRBD?

Please visit <http://mysql.com/drbd/>.

A.14.2. Linux Heartbeat

In the following section, we provide answers to questions that are most frequently asked about Linux Heartbeat.

Questions

- [22.14.2.1](#): What is Linux Heartbeat?
- [22.14.2.2](#): How is Linux Heartbeat licensed?
- [22.14.2.3](#): Where can I download Linux Heartbeat?
- [22.14.2.4](#): If I find a bug with Linux Heartbeat, to whom do I submit the issue?

Questions and Answers

22.14.2.1: What is Linux Heartbeat?

The Linux-HA project (<http://www.linux-ha.org/>) offers a high availability solution commonly referred to as Linux Heartbeat. Linux Heartbeat ships as part of several Linux distributions, as well as within several embedded high availability systems. This solution can also be used for other applications besides databases servers, such as mail servers, web servers, file servers, and DNS servers.

Linux Heartbeat implements a heartbeat-protocol. A heartbeat-protocol means that messages are sent at regular intervals between two or more nodes. If a message is not received from a node within a given interval, then it is assumed the node has failed and some type of failover or recovery action is required. Linux Heartbeat is typically configured to send these heartbeat messages over standard Ethernet interfaces, but it does also support other methods, such as serial-line links.

22.14.2.2: How is Linux Heartbeat licensed?

Linux Heartbeat is licensed under the GPL.

22.14.2.3: Where can I download Linux Heartbeat?

Please see <http://linux-ha.org/download/index.html>.

22.14.2.4: If I find a bug with Linux Heartbeat, to whom do I submit the issue?

Bug reports should be submitted to <http://www.linux-ha.org/ClusterResourceManager/BugReports>.

A.14.3. DRBD Architecture

In the following section, we provide answers to questions that are most frequently asked about DRBD Architecture.

Questions

- [22.14.3.1](#): Is an Active/Active option available for MySQL with DRBD?
- [22.14.3.2](#): What MySQL storage engines are supported with DRBD?
- [22.14.3.3](#): How long does a failover take?
- [22.14.3.4](#): How long does it take to resynchronize data after a failure?
- [22.14.3.5](#): Are there any situations where you shouldn't use DRBD?
- [22.14.3.6](#): Are there any limitations to DRBD?
- [22.14.3.7](#): Where can I find more information on sample architectures?

Questions and Answers

22.14.3.1: Is an Active/Active option available for MySQL with DRBD?

Currently, MySQL does not support Active/Active configurations using DRBD “out of the box”.

22.14.3.2: What MySQL storage engines are supported with DRBD?

All of the MySQL transactional storage engines are supported by DRBD, including InnoDB and Falcon. For archived or read-only data, MyISAM or Archive can also be used.

22.14.3.3: How long does a failover take?

Failover time is dependent on many things, some of which are configurable. After activating the passive host, MySQL will have to start and run a normal recovery process. If the InnoDB log files have been configured to a large size and there was heavy write traffic, this may take a reasonably long period of time. However, under normal circumstances, failover tends to take less than a minute.

22.14.3.4: How long does it take to resynchronize data after a failure?

Resynchronization time depends on how long the two machines are out of communication and how much data was written during that period of time. Resynchronization time is a function of data to be synced, network speed and disk speed. DRBD maintains a bitmap of changed blocks on the primary machine, so only those blocks that have changed will need to be transferred.

22.14.3.5: Are there any situations where you shouldn't use DRBD?

See [When Not To Use DRBD](#).

22.14.3.6: Are there any limitations to DRBD?

See [DRBD limitations \(or are they?\)](#).

22.14.3.7: Where can I find more information on sample architectures?

For an example of a Heartbeat R1-compatible resource configuration involving a MySQL database backed by DRBD, see [DRBD User's Guide](#).

For an example of the same DRBD-backed configuration for a MySQL database in a Heartbeat CRM cluster, see [DRBD User's Guide](#).

A.14.4. DRBD and MySQL Replication

In the following section, we provide answers to questions that are most frequently asked about MySQL Replication Scale-out.

Questions

- [22.14.4.1](#): What is the difference between MySQL Cluster and DRBD?
- [22.14.4.2](#): What is the difference between MySQL Replication and DRBD?
- [22.14.4.3](#): How can I combine MySQL Replication scale-out with DRBD?

Questions and Answers

22.14.4.1: What is the difference between MySQL Cluster and DRBD?

Both MySQL Cluster and DRBD replicate data synchronously. MySQL Cluster leverages a shared-nothing storage architecture in which the cluster can be architected beyond an Active/Passive configuration. DRBD operates at a much lower level within the “stack”, at the disk I/O level. For a comparison of various high availability features between these two options, please refer to [Chapter 14, High Availability and Scalability](#).

22.14.4.2: What is the difference between MySQL Replication and DRBD?

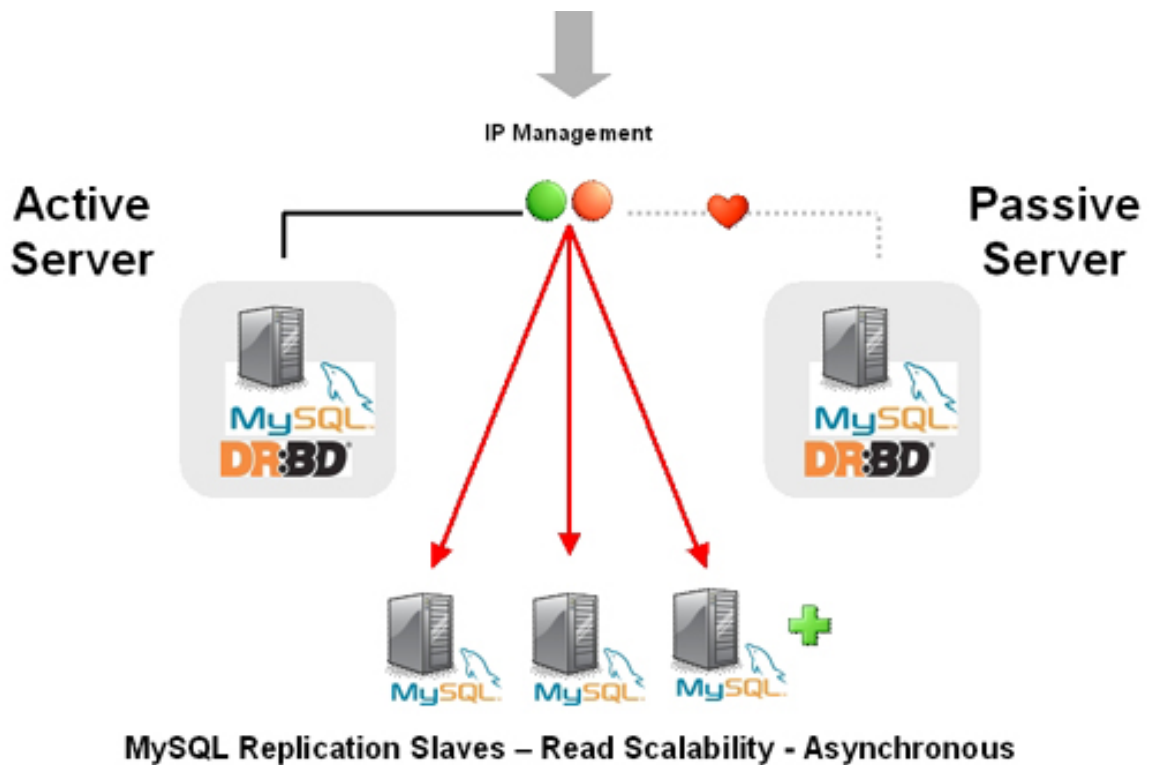

MySQL Replication replicates data asynchronously while DRBD replicates data synchronously. Also, MySQL Replication replicates MySQL statements, while DRBD replicates the underlying block device that stores the MySQL data files. For a comparison of various high availability features between these two options, please refer to the high availability comparison grid, [Chapter 14, High Availability and Scalability](#).

22.14.4.3: How can I combine MySQL Replication scale-out with DRBD?

MySQL Replication is typically deployed in a Master to many Slaves configuration. In this configuration, having many Slaves provides read scalability. DRBD is used to provide high-availability for the Master MySQL Server in an Active/Passive configuration. This provides for automatic failover, safeguards against data loss, and automatically synchronizes the failed MySQL Master after a failover.

The most likely scenario in which MySQL Replication scale-out can be leveraged with DRBD is in the form of attaching replicated MySQL “read-slaves” off of the Active-Master MySQL Server, shown in [Figure A.1, “Active-Master MySQL server”](#). Since DRBD replicates an entire block device, master information such as the binary logs are also replicated. In this way, all of the slaves can attach to the Virtual IP Address managed by Linux Heartbeat. In the event of a failure, the asynchronous nature of MySQL Replication allows the slaves to continue with the new Active machine as their master with no intervention needed.

Figure A.1. Active-Master MySQL server

A.14.5. DRBD and File Systems

In the following section, we provide answers to questions that are most frequently asked about DRBD and file systems.

Questions

- [22.14.5.1](#): Can XFS be used with DRBD?

Questions and Answers

22.14.5.1: Can XFS be used with DRBD?

Yes. XFS uses dynamic block size, thus DRBD 0.7 or later is needed.

A.14.6. DRBD and LVM

In the following section, we provide answers to questions that are most frequently asked about DRBD and LVM.

Questions

- [22.14.6.1](#): Can I use DRBD on top of LVM?
- [22.14.6.2](#): Can I use LVM on top of DRBD?
- [22.14.6.3](#): Can I use DRBD on top of LVM while at the same time running LVM on top of that DRBD?

Questions and Answers

22.14.6.1: Can I use DRBD on top of LVM?

Yes, DRBD supports on-line resizing. If you enlarge your logical volume that acts as a backing device for DRBD, you can enlarge DRBD itself too, and of course your file system if it supports resizing.

22.14.6.2: Can I use LVM on top of DRBD?

Yes, you can use DRBD as a Physical Volume (PV) for LVM. Depending on the default LVM configuration shipped with your dis-

tribution, you may need to add the `/dev/drbd*` device files to the `filter` option in your `lvm.conf` so LVM scans your DRBDs for PV signatures.

22.14.6.3: Can I use DRBD on top of LVM while at the same time running LVM on top of that DRBD?

This requires careful tuning of your LVM configuration to avoid duplicate PV scans, but yes, it is possible.

A.14.7. DRBD and Virtualization

In the following section, we provide answers to questions that are most frequently asked about DRBD and virtualization.

Questions

- [22.14.7.1: Can I use DRBD with OpenVZ?](#)
- [22.14.7.2: Can I use DRBD with Xen and/or KVM?](#)

Questions and Answers

22.14.7.1: Can I use DRBD with OpenVZ?

See http://wiki.openvz.org/HA_cluster_with_DRBD_and_Heartbeat.

22.14.7.2: Can I use DRBD with Xen and/or KVM?

Yes. If you are looking for professional consultancy or expert commercial support for Xen- or KVM-based virtualization clusters with DRBD, contact LINBIT (<http://www.linbit.com>).

A.14.8. DRBD and Security

In the following section, we provide answers to questions that are most frequently asked about DRBD and security.

Questions

- [22.14.8.1: Can I encrypt/compress the exchanged data?](#)
- [22.14.8.2: Does DRBD do mutual node authentication?](#)

Questions and Answers

22.14.8.1: Can I encrypt/compress the exchanged data?

Yes. But there is no option within DRBD to allow for this. You'll need to leverage a VPN and the network layer should do the rest.

22.14.8.2: Does DRBD do mutual node authentication?

Yes, starting with DRBD 8 shared-secret mutual node authentication is supported.

A.14.9. DRBD and System Requirements

In the following section, we provide answers to questions that are most frequently asked about DRBD and System Requirements.

Questions

- [22.14.9.1: What other packages besides DRBD are required?](#)
- [22.14.9.2: How many machines are required to set up DRBD?](#)
- [22.14.9.3: Does DRBD only run on Linux?](#)

Questions and Answers

22.14.9.1: What other packages besides DRBD are required?

When using pre-built binary packages, none except a matching kernel, plus packages for `glibc` and your favorite shell. When

compiling DRBD from source additional prerequisite packages may be required. They include but are not limited to:

- glib-devel
- openssl
- devel
- libgcrypt-devel
- glib2-devel
- pkgconfig
- ncurses-devel
- rpm-build
- rpm-devel
- redhat-rpm-config
- gcc
- gcc-c++
- bison
- flex
- gnutls-devel
- lm_sensors-devel
- net-snmp-devel
- python-devel
- bzip2-devel
- libselinux-devel
- perl-DBI
- libnet

Pre-built x86 and x86_64 packages for specific kernel versions are available with a support subscription from LINBIT. Please note that if the kernel is upgraded, DRBD must be as well.

22.14.9.2: How many machines are required to set up DRBD?

Two machines are required to achieve the minimum degree of high availability. Although at any one given point in time one will be primary and one will be secondary, it is better to consider the machines as part of a mirrored pair without a “natural” primary machine.

22.14.9.3: Does DRBD only run on Linux?

DRBD is a Linux Kernel Module, and can work with many popular Linux distributions. DRBD is currently not available for non-Linux operating systems.

A.14.10. DRBD and Support and Consulting

In the following section, we provide answers to questions that are most frequently asked about DRBD and resources.

Questions

- [22.14.10.1](#): Does MySQL offer professional consulting to help with designing a DRBD system?
- [22.14.10.2](#): Does MySQL offer support for DRBD and Linux Heartbeat from MySQL?

- [22.14.10.3](#): Are pre-built binaries or RPMs available?
- [22.14.10.4](#): Does MySQL have documentation to help me with the installation and configuration of DRBD and Linux Heartbeat?
- [22.14.10.5](#): Is there a dedicated discussion forum for MySQL High-Availability?
- [22.14.10.6](#): Where can I get more information about MySQL for DRBD?

Questions and Answers

22.14.10.1: Does MySQL offer professional consulting to help with designing a DRBD system?

Yes. MySQL offers consulting for the design, installation, configuration, and monitoring of high availability DRBD. For more information concerning a High Availability Jumpstart, please see: <http://www.mysql.com/consulting/packaged/scaleout.html>.

22.14.10.2: Does MySQL offer support for DRBD and Linux Heartbeat from MySQL?

Yes. Support for DRBD and Linux Heartbeat is available with an add-on subscription to MySQL Enterprise called “DRBD for MySQL”. For more information about support options for DRBD see: <http://mysql.com/products/enterprise/features.html>.

For the list of supported Linux distributions, please see: <http://www.mysql.com/support/supportedplatforms/enterprise.html>.

Note

DRBD is only available on Linux. DRBD is not available on Windows, MacOS, Solaris, HP-UX, AIX, FreeBSD, or other non-Linux platforms.

22.14.10.3: Are pre-built binaries or RPMs available?

Yes. “DRBD for MySQL” is an add-on subscription to MySQL Enterprise, which provides pre-built binaries for DRBD. For more information, see: <http://mysql.com/products/enterprise/features.html>.

22.14.10.4: Does MySQL have documentation to help me with the installation and configuration of DRBD and Linux Heartbeat?

For MySQL-specific DRBD documentation, see [Section 14.1, “Using MySQL with DRBD”](#).

For general DRBD documentation, see [DRBD User's Guide](#).

22.14.10.5: Is there a dedicated discussion forum for MySQL High-Availability?

Yes, <http://forums.mysql.com/list.php?144>.

22.14.10.6: Where can I get more information about MySQL for DRBD?

For more information about MySQL for DRBD, including a technical white paper please see: [DRBD for MySQL High Availability](#).

Appendix B. Errors, Error Codes, and Common Problems

This appendix lists common problems and errors that may occur and potential resolutions, in addition to listing the errors that may appear when you call MySQL from any host language. The first section covers problems and resolutions. Detailed information on errors is provided; The first list displays server error messages. The second list displays client program messages.

MySQL Enterprise

The MySQL Enterprise Monitor provides a “Virtual DBA” to assist with problem solving. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

B.1. Problems and Common Errors

This section lists some common problems and error messages that you may encounter. It describes how to determine the causes of the problems and what to do to solve them.

B.1.1. How to Determine What Is Causing a Problem

When you run into a problem, the first thing you should do is to find out which program or piece of equipment is causing it:

- If you have one of the following symptoms, then it is probably a hardware problems (such as memory, motherboard, CPU, or hard disk) or kernel problem:
 - The keyboard doesn't work. This can normally be checked by pressing the Caps Lock key. If the Caps Lock light doesn't change, you have to replace your keyboard. (Before doing this, you should try to restart your computer and check all cables to the keyboard.)
 - The mouse pointer doesn't move.
 - The machine doesn't answer to a remote machine's pings.
 - Other programs that are not related to MySQL don't behave correctly.
 - Your system restarted unexpectedly. (A faulty user-level program should never be able to take down your system.)

In this case, you should start by checking all your cables and run some diagnostic tool to check your hardware! You should also check whether there are any patches, updates, or service packs for your operating system that could likely solve your problem. Check also that all your libraries (such as `glibc`) are up to date.

It is always good to use a machine with ECC memory to discover memory problems early.

- If your keyboard is locked up, you may be able to recover by logging in to your machine from another machine and executing `kbd_mode -a`.
- Please examine your system log file (`/var/log/messages` or similar) for reasons for your problem. If you think the problem is in MySQL, you should also examine MySQL's log files. See [Section 5.2, “MySQL Server Logs”](#).
- If you don't think you have hardware problems, you should try to find out which program is causing problems. Try using `top`, `ps`, Task Manager, or some similar program, to check which program is taking all CPU or is locking the machine.
- Use `top`, `df`, or a similar program to check whether you are out of memory, disk space, file descriptors, or some other critical resource.
- If the problem is some runaway process, you can always try to kill it. If it doesn't want to die, there is probably a bug in the operating system.

If after you have examined all other possibilities and you have concluded that the MySQL server or a MySQL client is causing the problem, it is time to create a bug report for our mailing list or our support team. In the bug report, try to give a very detailed description of how the system is behaving and what you think is happening. You should also state why you think that MySQL is causing the problem. Take into consideration all the situations in this chapter. State any problems exactly how they appear when you examine your system. Use the “copy and paste” method for any output and error messages from programs and log files.

Try to describe in detail which program is not working and all symptoms you see. We have in the past received many bug reports that state only “the system doesn't work.” This doesn't provide us with any information about what could be the problem.

If a program fails, it is always useful to know the following information:

- Has the program in question made a segmentation fault (did it dump core)?
- Is the program taking up all available CPU time? Check with `top`. Let the program run for a while, it may simply be evaluating something computationally intensive.
- If the `mysqld` server is causing problems, can you get any response from it with `mysqladmin -u root ping` or `mysqladmin -u root processlist`?
- What does a client program say when you try to connect to the MySQL server? (Try with `mysql`, for example.) Does the client jam? Do you get any output from the program?

When sending a bug report, you should follow the outline described in [Section 1.6, “How to Report Bugs or Problems”](#).

B.1.2. Common Errors When Using MySQL Programs

This section lists some errors that users frequently encounter when running MySQL programs. Although the problems show up when you try to run client programs, the solutions to many of the problems involves changing the configuration of the MySQL server.

B.1.2.1. Access denied

An `Access denied` error can have many causes. Often the problem is related to the MySQL accounts that the server allows client programs to use when connecting. See [Section 5.4, “The MySQL Access Privilege System”](#), and [Section 5.4.7, “Causes of Access-Denied Errors”](#).

B.1.2.2. Can't connect to [local] MySQL server

A MySQL client on Unix can connect to the `mysqld` server in two different ways: By using a Unix socket file to connect through a file in the file system (default `/tmp/mysql.sock`), or by using TCP/IP, which connects through a port number. A Unix socket file connection is faster than TCP/IP, but can be used only when connecting to a server on the same computer. A Unix socket file is used if you don't specify a host name or if you specify the special host name `localhost`.

If the MySQL server is running on Windows, you can connect via TCP/IP. If the server is started with the `-enable-named-pipe` option, you can also connect with named pipes if you run the client on the host where the server is running. The name of the named pipe is `MySQL` by default. If you don't give a host name when connecting to `mysqld`, a MySQL client first tries to connect to the named pipe. If that doesn't work, it connects to the TCP/IP port. You can force the use of named pipes on Windows by using `.` as the host name.

The error (2002) `Can't connect to ...` normally means that there is no MySQL server running on the system or that you are using an incorrect Unix socket file name or TCP/IP port number when trying to connect to the server. You should also check that the TCP/IP port you are using has not been blocked by a firewall or port blocking service.

The error (2003) `Can't connect to MySQL server on 'server' (10061)` indicates that the network connection has been refused. You should check that there is a MySQL server running, that it has network connections enabled, and that the network port you specified is the one configured on the server.

Start by checking whether there is a process named `mysqld` running on your server host. (Use `ps xa | grep mysqld` on Unix or the Task Manager on Windows.) If there is no such process, you should start the server. See [Section 2.11.2.3, “Starting and Troubleshooting the MySQL Server”](#).

If a `mysqld` process is running, you can check it by trying the following commands. The port number or Unix socket file name might be different in your setup. `host_ip` represents the IP number of the machine where the server is running.

```
shell> mysqladmin version
shell> mysqladmin variables
shell> mysqladmin -h `hostname` version variables
shell> mysqladmin -h `hostname` --port=3306 version
shell> mysqladmin -h host_ip version
shell> mysqladmin --protocol=SOCKET --socket=/tmp/mysql.sock version
```

Note the use of backticks rather than forward quotes with the `hostname` command; these cause the output of `hostname` (that is, the current host name) to be substituted into the `mysqladmin` command. If you have no `hostname` command or are running on Windows, you can manually type the host name of your machine (without backticks) following the `-h` option. You can also try `-h 127.0.0.1` to connect with TCP/IP to the local host.

Make sure that the server has not been configured to ignore network connections or (if you are attempting to connect remotely) that it has not been configured to listen only locally on its network interfaces. If the server was started with `--skip-networking`, it will not accept TCP/IP connections at all. If the server was started with `--bind-address=127.0.0.1`, it will listen for TCP/IP connections only locally on the loopback interface and will not accept remote connections.

Check to make sure that there is no firewall blocking access to MySQL. Your firewall may be configured on the basis of the application being executed, or the port number used by MySQL for communication (3306 by default). Under Linux or Unix, check your IP tables (or similar) configuration to ensure that the port has not been blocked. Under Windows, applications such as ZoneAlarm or the Windows XP personal firewall may need to be configured not to block the MySQL port.

Here are some reasons the `Can't connect to local MySQL server` error might occur:

- `mysqld` is not running on the local host. Check your operating system's process list to ensure the `mysqld` process is present.
- You're running a MySQL server on Windows with many TCP/IP connections to it. If you're experiencing that quite often your clients get that error, you can find a workaround here: [Section B.1.2.2.1, "Connection to MySQL Server Failing on Windows"](#).
- You are running on a system that uses MIT-pthreads. If you are running on a system that doesn't have native threads, `mysqld` uses the MIT-pthreads package. See [Section 2.1.1, "Operating Systems Supported by MySQL Community Server"](#). However, not all MIT-pthreads versions support Unix socket files. On a system without socket file support, you must always specify the host name explicitly when connecting to the server. Try using this command to check the connection to the server:

```
shell> mysqladmin -h `hostname` version
```

- Someone has removed the Unix socket file that `mysqld` uses (`/tmp/mysql.sock` by default). For example, you might have a `cron` job that removes old files from the `/tmp` directory. You can always run `mysqladmin version` to check whether the Unix socket file that `mysqladmin` is trying to use really exists. The fix in this case is to change the `cron` job to not remove `mysql.sock` or to place the socket file somewhere else. See [Section B.1.4.5, "How to Protect or Change the MySQL Unix Socket File"](#).
- You have started the `mysqld` server with the `--socket=/path/to/socket` option, but forgotten to tell client programs the new name of the socket file. If you change the socket path name for the server, you must also notify the MySQL clients. You can do this by providing the same `--socket` option when you run client programs. You also need to ensure that clients have permission to access the `mysql.sock` file. To find out where the socket file is, you can do:

```
shell> netstat -ln | grep mysql
```

See [Section B.1.4.5, "How to Protect or Change the MySQL Unix Socket File"](#).

- You are using Linux and one server thread has died (dumped core). In this case, you must kill the other `mysqld` threads (for example, with `kill` or with the `mysql_zap` script) before you can restart the MySQL server. See [Section B.1.4.2, "What to Do If MySQL Keeps Crashing"](#).
- The server or client program might not have the proper access privileges for the directory that holds the Unix socket file or the socket file itself. In this case, you must either change the access privileges for the directory or socket file so that the server and clients can access them, or restart `mysqld` with a `--socket` option that specifies a socket file name in a directory where the server can create it and where client programs can access it.

If you get the error message `Can't connect to MySQL server on some_host`, you can try the following things to find out what the problem is:

- Check whether the server is running on that host by executing `telnet some_host 3306` and pressing the Enter key a couple of times. (3306 is the default MySQL port number. Change the value if your server is listening to a different port.) If there is a MySQL server running and listening to the port, you should get a response that includes the server's version number. If you get an error such as `telnet: Unable to connect to remote host: Connection refused`, then there is no server running on the given port.
- If the server is running on the local host, try using `mysqladmin -h localhost variables` to connect using the Unix socket file. Verify the TCP/IP port number that the server is configured to listen to (it is the value of the `port` variable.)
- If you are running under Linux and Security-Enhanced Linux (SELinux) is enabled, make sure you have disabled SELinux protection for the `mysqld` process.

B.1.2.2.1. Connection to MySQL Server Failing on Windows

When you're running a MySQL server on Windows with many TCP/IP connections to it, and you're experiencing that quite often your clients get a `Can't connect to MySQL server` error, the reason might be that Windows doesn't allow for enough ephemeral (short-lived) ports to serve those connections.

By default, Windows allows 5000 ephemeral (short-lived) TCP ports to the user. After any port is closed it will remain in a

`TIME_WAIT` status for 120 seconds. This status allows the connection to be reused at a much lower cost than reinitializing a brand new connection. However, the port will not be available again until this time expires.

With a small stack of available TCP ports (5000) and a high number of TCP ports being open and closed over a short period of time along with the `TIME_WAIT` status you have a good chance for running out of ports. There are two ways to address this problem:

- Reduce the number of TCP ports consumed quickly by investigating connection pooling or persistent connections where possible
- Tune some settings in the Windows registry (see below)

IMPORTANT: The following procedure involves modifying the Windows registry. Before you modify the registry, make sure to back it up and make sure that you understand how to restore the registry if a problem occurs. For information about how to back up, restore, and edit the registry, view the following article in the Microsoft Knowledge Base: <http://support.microsoft.com/kb/256986/EN-US/>.

1. Start Registry Editor (`Regedt32.exe`).
2. Locate the following key in the registry:

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters
```

3. On the `Edit` menu, click `Add Value`, and then add the following registry value:

```
Value Name: MaxUserPort
Data Type: REG_DWORD
Value: 65534
```

This sets the number of ephemeral ports available to any user. The valid range is between 5000 and 65534 (decimal). The default value is 0x1388 (5000 decimal).

4. On the `Edit` menu, click `Add Value`, and then add the following registry value:

```
Value Name: TcpTimedWaitDelay
Data Type: REG_DWORD
Value: 30
```

This sets the number of seconds to hold a TCP port connection in `TIME_WAIT` state before closing. The valid range is between 0 (zero) and 300 (decimal). The default value is 0x78 (120 decimal).

5. Quit Registry Editor.
6. Reboot the machine.

Note: Undoing the above should be as simple as deleting the registry entries you've created.

B.1.2.3. Lost connection to MySQL server

There are three likely causes for this error message.

Usually it indicates network connectivity trouble and you should check the condition of your network if this error occurs frequently. If the error message includes “during query,” this is probably the case you are experiencing.

Sometimes the “during query” form happens when millions of rows are being sent as part of one or more queries. If you know that this is happening, you should try increasing `net_read_timeout` from its default of 30 seconds to 60 seconds or longer, sufficient for the data transfer to complete.

More rarely, it can happen when the client is attempting the initial connection to the server. In this case, if your `connect_timeout` value is set to only a few seconds, you may be able to resolve the problem by increasing it to ten seconds, perhaps more if you have a very long distance or slow connection. You can determine whether you are experiencing this more uncommon cause by using `SHOW GLOBAL STATUS LIKE 'Aborted_connects'`. It will increase by one for each initial connection attempt that the server aborts. You may see “reading authorization packet” as part of the error message; if so, that also suggests that this is the solution that you need.

If the cause is none of those just described, you may be experiencing a problem with `BLOB` values that are larger than `max_allowed_packet`, which can cause this error with some clients. Sometime you may see “packet too large” as part of the error message, and that confirms that you need to increase `max_allowed_packet`.

B.1.2.4. Client does not support authentication protocol

MySQL 5.4 uses an authentication protocol based on a password hashing algorithm that is incompatible with that used by older (pre-4.1) clients. If you upgrade the server from 4.0, attempts to connect to it with an older client may fail with the following message:

```
shell> mysql
Client does not support authentication protocol requested
by server; consider upgrading MySQL client
```

To solve this problem, you should use one of the following approaches:

- Upgrade all client programs to use a 4.1.1 or newer client library.
- When connecting to the server with a pre-4.1 client program, use an account that still has a pre-4.1-style password.
- Reset the password to pre-4.1 style for each user that needs to use a pre-4.1 client program. This can be done using the `SET PASSWORD` statement and the `OLD_PASSWORD()` function:

```
mysql> SET PASSWORD FOR
-> 'some_user'@'some_host' = OLD_PASSWORD('newpwd');
```

Alternatively, use `UPDATE` and `FLUSH PRIVILEGES`:

```
mysql> UPDATE mysql.user SET Password = OLD_PASSWORD('newpwd')
-> WHERE Host = 'some_host' AND User = 'some_user';
mysql> FLUSH PRIVILEGES;
```

Substitute the password you want to use for “`newpwd`” in the preceding examples. MySQL cannot tell you what the original password was, so you’ll need to pick a new one.

- Tell the server to use the older password hashing algorithm:
 1. Start `mysqld` with the `--old-passwords` option.
 2. Assign an old-format password to each account that has had its password updated to the longer 4.1 format. You can identify these accounts with the following query:

```
mysql> SELECT Host, User, Password FROM mysql.user
-> WHERE LENGTH>Password) > 16;
```

For each account record displayed by the query, use the `Host` and `User` values and assign a password using the `OLD_PASSWORD()` function and either `SET PASSWORD` or `UPDATE`, as described earlier.

Note

In older versions of PHP, the `mysql` extension does not support the authentication protocol in MySQL 4.1.1 and higher. This is true regardless of the PHP version being used. If you wish to use the `mysql` extension with MySQL 4.1 or newer, you may need to follow one of the options discussed above for configuring MySQL to work with old clients. The `mysqli` extension (stands for “MySQL, Improved”; added in PHP 5) is compatible with the improved password hashing employed in MySQL 4.1 and higher, and no special configuration of MySQL need be done to use this MySQL client library. For more information about the `mysqli` extension, see <http://php.net/mysqli>.

It may also be possible to compile the older `mysql` extension against the new MySQL client library. This is beyond the scope of this Manual; consult the PHP documentation for more information. You also be able to obtain assistance with these issues in our [MySQL with PHP forum](#).

For additional background on password hashing and authentication, see [Section 5.5.6.3, “Password Hashing in MySQL”](#).

B.1.2.5. Password Fails When Entered Interactively

MySQL client programs prompt for a password when invoked with a `--password` or `-p` option that has no following password value:

```
shell> mysql -u user_name -p
Enter password:
```

On some systems, you may find that your password works when specified in an option file or on the command line, but not when

you enter it interactively at the `Enter password:` prompt. This occurs when the library provided by the system to read passwords limits password values to a small number of characters (typically eight). That is a problem with the system library, not with MySQL. To work around it, change your MySQL password to a value that is eight or fewer characters long, or put your password in an option file.

B.1.2.6. Host '*host_name*' is blocked

If you get the following error, it means that `mysqld` has received many connect requests from the host '*host_name*' that have been interrupted in the middle:

```
Host 'host_name' is blocked because of many connection errors.
Unblock with 'mysqladmin flush-hosts'
```

The number of interrupted connect requests allowed is determined by the value of the `max_connect_errors` system variable. After `max_connect_errors` failed requests, `mysqld` assumes that something is wrong (for example, that someone is trying to break in), and blocks the host from further connections until you execute a `mysqladmin flush-hosts` command or issue a `FLUSH HOSTS` statement. See [Section 5.1.3, “Server System Variables”](#).

By default, `mysqld` blocks a host after 10 connection errors. You can adjust the value by starting the server like this:

```
shell> mysqld_safe --max_connect_errors=10000 &
```

If you get this error message for a given host, you should first verify that there isn't anything wrong with TCP/IP connections from that host. If you are having network problems, it does you no good to increase the value of the `max_connect_errors` variable.

B.1.2.7. Too many connections

If you get a `Too many connections` error when you try to connect to the `mysqld` server, this means that all available connections are in use by other clients.

The number of connections allowed is controlled by the `max_connections` system variable. The default value is 151 to improve performance when MySQL is used with the Apache Web server. (Previously, the default was 100.) If you need to support more connections, you should set a larger value for this variable.

MySQL Enterprise

Subscribers to the MySQL Enterprise Monitor receive advice on dynamically configuring the `max_connections` variable — avoiding failed connection attempts. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

`mysqld` actually allows `max_connections+1` clients to connect. The extra connection is reserved for use by accounts that have the `SUPER` privilege. By granting the `SUPER` privilege to administrators and not to normal users (who should not need it), an administrator can connect to the server and use `SHOW PROCESSLIST` to diagnose problems even if the maximum number of unprivileged clients are connected. See [Section 12.5.5.31, “SHOW PROCESSLIST Syntax”](#).

The maximum number of connections MySQL can support depends on the quality of the thread library on a given platform. Linux or Solaris should be able to support 500-1000 simultaneous connections, depending on how much RAM you have and what your clients are doing. Static Linux binaries provided by Sun Microsystems, Inc. can support up to 4000 connections.

B.1.2.8. Out of memory

If you issue a query using the `mysql` client program and receive an error like the following one, it means that `mysql` does not have enough memory to store the entire query result:

```
mysql: Out of memory at line 42, 'malloc.c'
mysql: needed 8136 byte (8k), memory in use: 12481367 bytes (12189k)
ERROR 2008: MySQL client ran out of memory
```

To remedy the problem, first check whether your query is correct. Is it reasonable that it should return so many rows? If not, correct the query and try again. Otherwise, you can invoke `mysql` with the `--quick` option. This causes it to use the `mysql_use_result()` C API function to retrieve the result set, which places less of a load on the client (but more on the server).

B.1.2.9. MySQL server has gone away

This section also covers the related `Lost connection to server during query` error.

The most common reason for the `MySQL server has gone away` error is that the server timed out and closed the connection. In this case, you normally get one of the following error codes (which one you get is operating system-dependent).

Error Code	Description
<code>CR_SERVER_GONE_ERROR</code>	The client couldn't send a question to the server.
<code>CR_SERVER_LOST</code>	The client didn't get an error when writing to the server, but it didn't get a full answer (or any answer) to the question.

By default, the server closes the connection after eight hours if nothing has happened. You can change the time limit by setting the `wait_timeout` variable when you start `mysqld`. See [Section 5.1.3, “Server System Variables”](#).

If you have a script, you just have to issue the query again for the client to do an automatic reconnection. This assumes that you have automatic reconnection in the client enabled (which is the default for the `mysql` command-line client).

Some other common reasons for the `MySQL server has gone away` error are:

- You (or the db administrator) has killed the running thread with a `KILL` statement or a `mysqladmin kill` command.
- You tried to run a query after closing the connection to the server. This indicates a logic error in the application that should be corrected.
- A client application running on a different host does not have the necessary privileges to connect to the MySQL server from that host.
- You got a timeout from the TCP/IP connection on the client side. This may happen if you have been using the commands: `mysql_options(..., MYSQL_OPT_READ_TIMEOUT, ...)` or `mysql_options(..., MYSQL_OPT_WRITE_TIMEOUT, ...)`. In this case increasing the timeout may help solve the problem.
- You have encountered a timeout on the server side and the automatic reconnection in the client is disabled (the `reconnect` flag in the `MYSQL` structure is equal to 0).
- You are using a Windows client and the server had dropped the connection (probably because `wait_timeout` expired) before the command was issued.

The problem on Windows is that in some cases MySQL doesn't get an error from the OS when writing to the TCP/IP connection to the server, but instead gets the error when trying to read the answer from the connection.

The solution to this is to either do a `mysql_ping()` on the connection if there has been a long time since the last query (this is what `MyODBC` does) or set `wait_timeout` on the `mysqld` server so high that it in practice never times out.

- You can also get these errors if you send a query to the server that is incorrect or too large. If `mysqld` receives a packet that is too large or out of order, it assumes that something has gone wrong with the client and closes the connection. If you need big queries (for example, if you are working with big `BLOB` columns), you can increase the query limit by setting the server's `max_allowed_packet` variable, which has a default value of 1MB. You may also need to increase the maximum packet size on the client end. More information on setting the packet size is given in [Section B.1.2.10, “Packet too large”](#).

An `INSERT` or `REPLACE` statement that inserts a great many rows can also cause these sorts of errors. Either one of these statements sends a single request to the server irrespective of the number of rows to be inserted; thus, you can often avoid the error by reducing the number of rows sent per `INSERT` or `REPLACE`.

- You also get a lost connection if you are sending a packet 16MB or larger if your client is older than 4.0.8 and your server is 4.0.8 and above, or the other way around.
- It is also possible to see this error if host name lookups fail (for example, if the DNS server on which your server or network relies goes down). This is because MySQL is dependent on the host system for name resolution, but has no way of knowing whether it is working — from MySQL's point of view the problem is indistinguishable from any other network timeout.

You may also see the `MySQL server has gone away` error if MySQL is started with the `--skip-networking` option.

Another networking issue that can cause this error occurs if the MySQL port (default 3306) is blocked by your firewall, thus preventing any connections at all to the MySQL server.

- You can also encounter this error with applications that fork child processes, all of which try to use the same connection to the MySQL server. This can be avoided by using a separate connection for each child process.
- You have encountered a bug where the server died while executing the query.

You can check whether the MySQL server died and restarted by executing `mysqladmin version` and examining the server's uptime. If the client connection was broken because `mysqld` crashed and restarted, you should concentrate on finding the reason

for the crash. Start by checking whether issuing the query again kills the server again. See [Section B.1.4.2, “What to Do If MySQL Keeps Crashing”](#).

You can get more information about the lost connections by starting `mysqld` with the `--log-warnings=2` option. This logs some of the disconnected errors in the `hostname.err` file. See [Section 5.2.2, “The Error Log”](#).

If you want to create a bug report regarding this problem, be sure that you include the following information:

- Indicate whether the MySQL server died. You can find information about this in the server error log. See [Section B.1.4.2, “What to Do If MySQL Keeps Crashing”](#).
- If a specific query kills `mysqld` and the tables involved were checked with `CHECK TABLE` before you ran the query, can you provide a reproducible test case? See [MySQL Internals: Porting](#).
- What is the value of the `wait_timeout` system variable in the MySQL server? (`mysqladmin variables` gives you the value of this variable.)
- Have you tried to run `mysqld` with the general query log enabled to determine whether the problem query appears in the log? (See [Section 5.2.3, “The General Query Log”](#).)

See also [Section B.1.2.11, “Communication Errors and Aborted Connections”](#), and [Section 1.6, “How to Report Bugs or Problems”](#).

B.1.2.10. Packet too large

A communication packet is a single SQL statement sent to the MySQL server, a single row that is sent to the client, or a binary log event sent from a master replication server to a slave.

The largest possible packet that can be transmitted to or from a MySQL 5.4 server or client is 1GB.

When a MySQL client or the `mysqld` server receives a packet bigger than `max_allowed_packet` bytes, it issues a `Packet too large` error and closes the connection. With some clients, you may also get a `Lost connection to MySQL server during query` error if the communication packet is too large.

Both the client and the server have their own `max_allowed_packet` variable, so if you want to handle big packets, you must increase this variable both in the client and in the server.

If you are using the `mysql` client program, its default `max_allowed_packet` variable is 16MB. To set a larger value, start `mysql` like this:

```
shell> mysql --max_allowed_packet=32M
```

That sets the packet size to 32MB.

The server's default `max_allowed_packet` value is 1MB. You can increase this if the server needs to handle big queries (for example, if you are working with big `BLOB` columns). For example, to set the variable to 16MB, start the server like this:

```
shell> mysqld --max_allowed_packet=16M
```

You can also use an option file to set `max_allowed_packet`. For example, to set the size for the server to 16MB, add the following lines in an option file:

```
[mysqld]
max_allowed_packet=16M
```

It is safe to increase the value of this variable because the extra memory is allocated only when needed. For example, `mysqld` allocates more memory only when you issue a long query or when `mysqld` must return a large result row. The small default value of the variable is a precaution to catch incorrect packets between the client and server and also to ensure that you do not run out of memory by using large packets accidentally.

You can also get strange problems with large packets if you are using large `BLOB` values but have not given `mysqld` access to enough memory to handle the query. If you suspect this is the case, try adding `ulimit -d 256000` to the beginning of the `mysqld_safe` script and restarting `mysqld`.

B.1.2.11. Communication Errors and Aborted Connections

The server error log can be a useful source of information about connection problems. See [Section 5.2.2, “The Error Log”](#). If you start the server with the `--log-warnings` option, you might find messages like this in your error log:

```
010301 14:38:23 Aborted connection 854 to db: 'users' user: 'josh'
```

If a client successfully connects but later disconnects improperly or is terminated, the server increments the `Aborted_clients` status variable, and logs an `ABORTED CONNECTION` message to the error log. The cause can be any of the following:

- The client program did not call `mysql_close()` before exiting.
- The client had been sleeping more than `wait_timeout` or `interactive_timeout` seconds without issuing any requests to the server. See [Section 5.1.3, “Server System Variables”](#).
- The client program ended abruptly in the middle of a data transfer.

If a client is unable even to connect, the server increments the `Aborted_connects` status variable. Unsuccessful connect attempts can occur for the following reasons:

- A client doesn't have privileges to connect to a database.
- A client uses an incorrect password.
- A connection packet doesn't contain the right information.
- It takes more than `connect_timeout` seconds to get a connect packet. See [Section 5.1.3, “Server System Variables”](#).

If these kinds of things happen, it might indicate that someone is trying to break into your server! Messages for these types of problems are logged to the general query log if it is enabled.

MySQL Enterprise

For reasons of security and performance the advisors provided by the MySQL Enterprise Monitor pay special attention to the `Aborted_connects` status variable. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

Other reasons for problems with aborted clients or aborted connections:

- Use of Ethernet protocol with Linux, both half and full duplex. Many Linux Ethernet drivers have this bug. You should test for this bug by transferring a huge file via FTP between the client and server machines. If a transfer goes in burst-pause-burst-pause mode, you are experiencing a Linux duplex syndrome. The only solution is switching the duplex mode for both your network card and hub/switch to either full duplex or to half duplex and testing the results to determine the best setting.
- Some problem with the thread library that causes interrupts on reads.
- Badly configured TCP/IP.
- Faulty Ethernets, hubs, switches, cables, and so forth. This can be diagnosed properly only by replacing hardware.
- The `max_allowed_packet` variable value is too small or queries require more memory than you have allocated for `mysqld`. See [Section B.1.2.10, “Packet too large”](#).

See also [Section B.1.2.9, “MySQL server has gone away”](#).

B.1.2.12. The table is full

The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. The following table lists some examples of operating system file-size limits. This is only a rough guide and is not intended to be definitive. For the most up-to-date information, be sure to check the documentation specific to your operating system.

Operating System	File-size Limit
Win32 w/ FAT/FAT32	2GB/4GB
Win32 w/ NTFS	2TB (possibly larger)
Linux 2.2-Intel 32-bit	2GB (LFS: 4GB)
Linux 2.4+	(using ext3 file system) 4TB
Solaris 9/10	16TB

MacOS X w/ HFS+	2TB
NetWare w/NSS file system	8TB

Windows users, please note that FAT and VFAT (FAT32) are *not* considered suitable for production use with MySQL. Use NTFS instead.

On Linux 2.2, you can get [MyISAM](#) tables larger than 2GB in size by using the Large File Support (LFS) patch for the ext2 file system. Most current Linux distributions are based on kernel 2.4 or higher and include all the required LFS patches. On Linux 2.4, patches also exist for ReiserFS to get support for big files (up to 2TB). With JFS and XFS, petabyte and larger files are possible on Linux.

For a detailed overview about LFS in Linux, have a look at Andreas Jaeger's *Large File Support in Linux* page at http://www.suse.de/~aj/linux_lfs.html.

If you do encounter a full-table error, there are several reasons why it might have occurred:

- The [InnoDB](#) storage engine maintains [InnoDB](#) tables within a tablespace that can be created from several files. This allows a table to exceed the maximum individual file size. The tablespace can include raw disk partitions, which allows extremely large tables. The maximum tablespace size is 64TB.

If you are using [InnoDB](#) tables and run out of room in the [InnoDB](#) tablespace. In this case, the solution is to extend the [InnoDB](#) tablespace. See [Section 13.6.5, “Adding, Removing, or Resizing InnoDB Data and Log Files”](#).

- You are using [MyISAM](#) tables on an operating system that supports files only up to 2GB in size and you have hit this limit for the data file or index file.
- You are using a [MyISAM](#) table and the space required for the table exceeds what is allowed by the internal pointer size. [MyISAM](#) allows data and index files to grow up to 256TB by default, but this limit can be changed up to the maximum allowable size of 65,536TB ($256^7 - 1$ bytes).

If you need a [MyISAM](#) table that is larger than the default limit and your operating system supports large files, the [CREATE TABLE](#) statement supports [AVG_ROW_LENGTH](#) and [MAX_ROWS](#) options. See [Section 12.1.14, “CREATE TABLE Syntax”](#). The server uses these options to determine how large a table to allow.

If the pointer size is too small for an existing table, you can change the options with [ALTER TABLE](#) to increase a table's maximum allowable size. See [Section 12.1.6, “ALTER TABLE Syntax”](#).

```
ALTER TABLE tbl_name MAX_ROWS=1000000000 AVG_ROW_LENGTH=nnn;
```

You have to specify [AVG_ROW_LENGTH](#) only for tables with [BLOB](#) or [TEXT](#) columns; in this case, MySQL can't optimize the space required based only on the number of rows.

To change the default size limit for [MyISAM](#) tables, set the [myisam_data_pointer_size](#), which sets the number of bytes used for internal row pointers. The value is used to set the pointer size for new tables if you do not specify the [MAX_ROWS](#) option. The value of [myisam_data_pointer_size](#) can be from 2 to 7. A value of 4 allows tables up to 4GB; a value of 6 allows tables up to 256TB.

You can check the maximum data and index sizes by using this statement:

```
SHOW TABLE STATUS FROM db_name LIKE 'tbl_name';
```

You also can use [myisamchk -dv /path/to/table-index-file](#). See [Section 12.5.5, “SHOW Syntax”](#), or [Section 4.6.3, “myisamchk — MyISAM Table-Maintenance Utility”](#).

Other ways to work around file-size limits for [MyISAM](#) tables are as follows:

- If your large table is read only, you can use [myisampack](#) to compress it. [myisampack](#) usually compresses a table by at least 50%, so you can have, in effect, much bigger tables. [myisampack](#) also can merge multiple tables into a single table. See [Section 4.6.5, “myisampack — Generate Compressed, Read-Only MyISAM Tables”](#).
- MySQL includes a [MERGE](#) library that allows you to handle a collection of [MyISAM](#) tables that have identical structure as a single [MERGE](#) table. See [Section 13.8, “The MERGE Storage Engine”](#).
- You are using the [NDB](#) storage engine, in which case you need to increase the values for the [DataMemory](#) and [IndexMemory](#) configuration parameters in your [config.ini](#) file. See [MySQL Cluster Data Node Configuration Parameters](#).
- You are using the [MEMORY \(HEAP\)](#) storage engine; in this case you need to increase the value of the

`max_heap_table_size` system variable. See [Section 5.1.3, “Server System Variables”](#).

B.1.2.13. Can't create/write to file

If you get an error of the following type for some queries, it means that MySQL cannot create a temporary file for the result set in the temporary directory:

```
Can't create/write to file '\\sqla3fe_0.ism'.
```

The preceding error is a typical message for Windows; the Unix message is similar.

One fix is to start `mysqld` with the `--tmpdir` option or to add the option to the `[mysqld]` section of your option file. For example, to specify a directory of `C:\temp`, use these lines:

```
[mysqld]
tmpdir=C:/temp
```

The `C:\temp` directory must exist and have sufficient space for the MySQL server to write to. See [Section 4.2.3.2, “Using Option Files”](#).

Another cause of this error can be permissions issues. Make sure that the MySQL server can write to the `tmpdir` directory.

Check also the error code that you get with `pererror`. One reason the server cannot write to a table is that the file system is full:

```
shell> pererror 28
OS error code 28: No space left on device
```

If you get an error of the following type during startup, it indicates that the file system and/or directory used for storing data files is write protected. Providing the write error is to a test file, This error is not serious and can be safely ignored.

```
Can't create test file /usr/local/mysql/data/master.lower-test
```

B.1.2.14. Commands out of sync

If you get `Commands out of sync; you can't run this command now` in your client code, you are calling client functions in the wrong order.

This can happen, for example, if you are using `mysql_use_result()` and try to execute a new query before you have called `mysql_free_result()`. It can also happen if you try to execute two queries that return data without calling `mysql_use_result()` or `mysql_store_result()` in between.

B.1.2.15. Ignoring user

If you get the following error, it means that when `mysqld` was started or when it reloaded the grant tables, it found an account in the `user` table that had an invalid password.

```
Found wrong password for user 'some_user'@'some_host'; ignoring user
```

As a result, the account is simply ignored by the permission system.

The following list indicates possible causes of and fixes for this problem:

- You may be running a new version of `mysqld` with an old `user` table. You can check this by executing `mysqlshow mysql user` to see whether the `Password` column is shorter than 16 characters. If so, you can correct this condition by running the `scripts/add_long_password` script.
- The account has an old password (eight characters long). Update the account in the `user` table to have a new password.
- You have specified a password in the `user` table without using the `PASSWORD()` function. Use `mysql` to update the account in the `user` table with a new password, making sure to use the `PASSWORD()` function:

```
mysql> UPDATE user SET Password=PASSWORD('newpwd')
-> WHERE User='some_user' AND Host='some_host';
```

B.1.2.16. Table 'tbl_name' doesn't exist

If you get either of the following errors, it usually means that no table exists in the default database with the given name:

```
Table 'tbl_name' doesn't exist
Can't find file: 'tbl_name' (errno: 2)
```

In some cases, it may be that the table does exist but that you are referring to it incorrectly:

- Because MySQL uses directories and files to store databases and tables, database and table names are case sensitive if they are located on a file system that has case-sensitive file names.
- Even for file systems that are not case sensitive, such as on Windows, all references to a given table within a query must use the same lettercase.

You can check which tables are in the default database with `SHOW TABLES`. See [Section 12.5.5, “SHOW Syntax”](#).

B.1.2.17. Can't initialize character set

You might see an error like this if you have character set problems:

```
MySQL Connection Failed: Can't initialize character set charset_name
```

This error can have any of the following causes:

- The character set is a multi-byte character set and you have no support for the character set in the client. In this case, you need to recompile the client by running `configure` with the `--with-charset=charset_name` or `role="configure"--with-extra-charsets=charset_name` option. See [Section 2.10.2, “Typical configure Options”](#).

All standard MySQL binaries are compiled with `--with-extra-charsets=complex`, which enables support for all multi-byte character sets. See [Section 9.2, “The Character Set Used for Data and Sorting”](#).

- The character set is a simple character set that is not compiled into `mysqld`, and the character set definition files are not in the place where the client expects to find them.

In this case, you need to use one of the following methods to solve the problem:

- Recompile the client with support for the character set. See [Section 2.10.2, “Typical configure Options”](#).
- Specify to the client the directory where the character set definition files are located. For many clients, you can do this with the `--character-sets-dir` option.
- Copy the character definition files to the path where the client expects them to be.

B.1.2.18. 'FILE' NOT FOUND and Similar Errors

If you get `ERROR '...' not found (errno: 23)`, `Can't open file: ... (errno: 24)`, or any other error with `errno 23` or `errno 24` from MySQL, it means that you haven't allocated enough file descriptors for the MySQL server. You can use the `pererror` utility to get a description of what the error number means:

```
shell> pererror 23
OS error code 23: File table overflow
shell> pererror 24
OS error code 24: Too many open files
shell> pererror 11
OS error code 11: Resource temporarily unavailable
```

The problem here is that `mysqld` is trying to keep open too many files simultaneously. You can either tell `mysqld` not to open so many files at once or increase the number of file descriptors available to `mysqld`.

To tell `mysqld` to keep open fewer files at a time, you can make the table cache smaller by reducing the value of the `table_open_cache` system variable (the default value is 64). Reducing the value of `max_connections` also reduces the number of open files (the default value is 100).

To change the number of file descriptors available to `mysqld`, you can use the `--open-files-limit` option to `mysqld_safe` or set the `open_files_limit` system variable. See [Section 5.1.3, “Server System Variables”](#). The easiest way to set these values is to add an option to your option file. See [Section 4.2.3.2, “Using Option Files”](#). If you have an old version of `mysqld` that doesn't support setting the open files limit, you can edit the `mysqld_safe` script. There is a commented-out line

`ulimit -n 256` in the script. You can remove the “#” character to uncomment this line, and change the number `256` to set the number of file descriptors to be made available to `mysqld`.

`--open-files-limit` and `ulimit` can increase the number of file descriptors, but only up to the limit imposed by the operating system. There is also a “hard” limit that can be overridden only if you start `mysqld_safe` or `mysqld` as `root` (just remember that you also need to start the server with the `--user` option in this case so that it does not continue to run as `root` after it starts up). If you need to increase the operating system limit on the number of file descriptors available to each process, consult the documentation for your system.

Note

If you run the `tcsh` shell, `ulimit` does not work! `tcsh` also reports incorrect values when you ask for the current limits. In this case, you should start `mysqld_safe` using `sh`.

B.1.2.19. Table-Corruption Issues

If you have started `mysqld` with `--myisam-recover`, MySQL automatically checks and tries to repair `MyISAM` tables if they are marked as ‘not closed properly’ or ‘crashed’. If this happens, MySQL writes an entry in the `hostname.err` file ‘Warning: Checking table ...’ which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further.

See also [Section 5.1.2, “Server Command Options”](#), and [Section 21.5.1.7, “Making a Test Case If You Experience Table Corruption”](#).

B.1.3. Installation-Related Issues

B.1.3.1. Problems Linking to the MySQL Client Library

When you are linking an application program to use the MySQL client library, you might get undefined reference errors for symbols that start with `mysql_`, such as those shown here:

```
/tmp/ccFKsdPa.o: In function `main':
/tmp/ccFKsdPa.o(.text+0xb): undefined reference to `mysql_init'
/tmp/ccFKsdPa.o(.text+0x31): undefined reference to `mysql_real_connect'
/tmp/ccFKsdPa.o(.text+0x57): undefined reference to `mysql_real_connect'
/tmp/ccFKsdPa.o(.text+0x69): undefined reference to `mysql_error'
/tmp/ccFKsdPa.o(.text+0x9a): undefined reference to `mysql_close'
```

You should be able to solve this problem by adding `-Ldir_path -lmysqlclient` at the end of your link command, where `dir_path` represents the path name of the directory where the client library is located. To determine the correct directory, try this command:

```
shell> mysql_config --libs
```

The output from `mysql_config` might indicate other libraries that should be specified on the link command as well.

If you get `undefined reference` errors for the `uncompress` or `compress` function, add `-lz` to the end of your link command and try again.

If you get `undefined reference` errors for a function that should exist on your system, such as `connect`, check the manual page for the function in question to determine which libraries you should add to the link command.

You might get `undefined reference` errors such as the following for functions that don't exist on your system:

```
mf_format.o(.text+0x201): undefined reference to `__lxstat'
```

This usually means that your MySQL client library was compiled on a system that is not 100% compatible with yours. In this case, you should download the latest MySQL source distribution and compile MySQL yourself. See [Section 2.10, “MySQL Installation Using a Source Distribution”](#).

You might get undefined reference errors at runtime when you try to execute a MySQL program. If these errors specify symbols that start with `mysql_` or indicate that the `mysqlclient` library can't be found, it means that your system can't find the shared `libmysqlclient.so` library. The fix for this is to tell your system to search for shared libraries where the library is located. Use whichever of the following methods is appropriate for your system:

- Add the path to the directory where `libmysqlclient.so` is located to the `LD_LIBRARY_PATH` environment variable.
- Add the path to the directory where `libmysqlclient.so` is located to the `LD_LIBRARY` environment variable.

- Copy `libmysqlclient.so` to some directory that is searched by your system, such as `/lib`, and update the shared library information by executing `ldconfig`.

Another way to solve this problem is by linking your program statically with the `-static` option, or by removing the dynamic MySQL libraries before linking your code. Before trying the second method, you should be sure that no other programs are using the dynamic libraries.

B.1.3.2. Problems with File Permissions

If you have problems with file permissions, the `UMASK` environment variable might be set incorrectly when `mysqld` starts. For example, MySQL might issue the following error message when you create a table:

```
ERROR: Can't find file: 'path/with/filename.frm' (Errcode: 13)
```

The default `UMASK` value is `0660`. You can change this behavior by starting `mysqld_safe` as follows:

```
shell> UMASK=384 # = 600 in octal
shell> export UMASK
shell> mysqld_safe &
```

By default, MySQL creates database directories with an access permission value of `0700`. You can modify this behavior by setting the `UMASK_DIR` variable. If you set its value, new directories are created with the combined `UMASK` and `UMASK_DIR` values. For example, if you want to give group access to all new directories, you can do this:

```
shell> UMASK_DIR=504 # = 770 in octal
shell> export UMASK_DIR
shell> mysqld_safe &
```

MySQL assumes that the value for `UMASK` or `UMASK_DIR` is in octal if it starts with a zero.

See [Section 2.14, “Environment Variables”](#).

B.1.4. Administration-Related Issues

B.1.4.1. How to Reset the Root Password

If you have never set a `root` password for MySQL, the server does not require a password at all for connecting as `root`. However, it is recommended to set a password for each account. See [Section 5.3.1, “General Security Guidelines”](#).

If you set a `root` password previously, but have forgotten what it was, you can set a new password. The next two sections show procedures for Windows and Unix systems, respectively.

B.1.4.1.1. Resetting the Root Password on Windows Systems

Use the following procedure for resetting the password for any MySQL `root` accounts on Windows:

1. Log on to your system as Administrator.
2. Stop the MySQL server if it is running. For a server that is running as a Windows service, go to the Services manager:

```
Start Menu -> Control Panel -> Administrative Tools -> Services
```

Then find the MySQL service in the list, and stop it.

If your server is not running as a service, you may need to use the Task Manager to force it to stop.

3. Create a text file and place the following statements in it. Replace the password with the password that you want to use.

```
UPDATE mysql.user SET Password=PASSWORD('MyNewPass') WHERE User='root';
FLUSH PRIVILEGES;
```

The `UPDATE` and `FLUSH` statements each must be written on a single line. The `UPDATE` statement resets the password for all existing `root` accounts, and the `FLUSH` statement tells the server to reload the grant tables into memory.

4. Save the file. For this example, the file will be named `C:\mysql-init.txt`.
5. Open a console window to get to the command prompt:

```
Start Menu -> Run -> cmd
```

6. Start the MySQL server with the special `--init-file` option:

```
C:\> C:\mysql\bin\mysqld --init-file=C:\mysql-init.txt
```

If you installed MySQL to a location other than `C:\mysql`, adjust the command accordingly.

The server executes the contents of the file named by the `--init-file` option at startup, changing each `root` account password.

You can also add the `--console` option to the command if you want server output to appear in the console window rather than in a log file.

If you installed MySQL using the MySQL Installation Wizard, you may need to specify a `--defaults-file` option:

```
C:\> "C:\Program Files\MySQL\MySQL Server 5.4\bin\mysqld.exe"
--defaults-file="C:\Program Files\MySQL\MySQL Server 5.4\my.ini"
--init-file=C:\mysql-init.txt
```

The appropriate `--defaults-file` setting can be found using the Services Manager:

```
Start Menu -> Control Panel -> Administrative Tools -> Services
```

Find the MySQL service in the list, right-click on it, and choose the `Properties` option. The `Path to executable` field contains the `--defaults-file` setting.

7. After the server has started successfully, delete `C:\mysql-init.txt`.
8. Stop the MySQL server, then restart it in normal mode again. If you run the server as a service, start it from the Windows Services window. If you start the server manually, use whatever command you normally use.

You should now be able to connect to MySQL as `root` using the new password.

B.1.4.1.2. Resetting the Root Password on Unix Systems

MySQL Enterprise

For expert advice on security-related issues, subscribe to the MySQL Enterprise Monitor. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

Use the following procedure for resetting the password for any MySQL `root` accounts on Unix. The instructions assume that you will start the server so that it runs using the Unix login account that you normally use for running the server. For example, if you run the server using the `mysql` login account, you should log in as `mysql` before using the instructions. (Alternatively, you can log in as `root`, but in this case you *must* start `mysqld` with the `--user=mysql` option. If you start the server as `root` without using `--user=mysql`, the server may create `root`-owned files in the data directory, such as log files, and these may cause permission-related problems for future server startups. If that happens, you will need to either change the ownership of the files to `mysql` or remove them.)

1. Log on to your system as the Unix `mysql` user that the `mysqld` server runs as.
2. Locate the `.pid` file that contains the server's process ID. The exact location and name of this file depend on your distribution, host name, and configuration. Common locations are `/var/lib/mysql/`, `/var/run/mysqld/`, and `/usr/local/mysql/data/`. Generally, the file name has an extension of `.pid` and begins with either `mysqld` or your system's host name.

You can stop the MySQL server by sending a normal `kill` (not `kill -9`) to the `mysqld` process, using the path name of the `.pid` file in the following command:

```
shell> kill `cat /mysql-data-directory/host_name.pid`
```

Note the use of backticks rather than forward quotes with the `cat` command; these cause the output of `cat` to be substituted into the `kill` command.

3. Create a text file and place the following statements in it. Replace the password with the password that you want to use.

```
UPDATE mysql.user SET Password=PASSWORD('MyNewPass') WHERE User='root';
FLUSH PRIVILEGES;
```

The `UPDATE` and `FLUSH` statements each must be written on a single line. The `UPDATE` statement resets the password for all existing `root` accounts, and the `FLUSH` statement tells the server to reload the grant tables into memory.

4. Save the file. For this example, the file will be named `/home/me/mysql-init`. The file contains the password, so it should not be saved where it can be read by other users.
5. Start the MySQL server with the special `--init-file` option:

```
shell> mysqld_safe --init-file=/home/me/mysql-init &
```

The server executes the contents of the file named by the `--init-file` option at startup, changing each `root` account password.

6. After the server has started successfully, delete `/home/me/mysql-init`.

You should now be able to connect to MySQL as `root` using the new password.

Alternatively, on any platform, you can set the new password using the `mysql` client (but this approach is less secure):

1. Stop `mysqld` and restart it with the `--skip-grant-tables` option.
2. Connect to the `mysqld` server with this command:

```
shell> mysql
```

3. Issue the following statements in the `mysql` client. Replace the password with the password that you want to use.

```
mysql> UPDATE mysql.user SET Password=PASSWORD('MyNewPass')
-> WHERE User='root';
mysql> FLUSH PRIVILEGES;
```

You should now be able to connect to MySQL as `root` using the new password.

B.1.4.2. What to Do If MySQL Keeps Crashing

Each MySQL version is tested on many platforms before it is released. This doesn't mean that there are no bugs in MySQL, but if there are bugs, they should be very few and can be hard to find. If you have a problem, it always helps if you try to find out exactly what crashes your system, because you have a much better chance of getting the problem fixed quickly.

First, you should try to find out whether the problem is that the `mysqld` server dies or whether your problem has to do with your client. You can check how long your `mysqld` server has been up by executing `mysqladmin version`. If `mysqld` has died and restarted, you may find the reason by looking in the server's error log. See [Section 5.2.2, "The Error Log"](#).

On some systems, you can find in the error log a stack trace of where `mysqld` died that you can resolve with the `resolve_stack_dump` program. See [MySQL Internals: Porting](#). Note that the variable values written in the error log may not always be 100% correct.

Many server crashes are caused by corrupted data files or index files. MySQL updates the files on disk with the `write()` system call after every SQL statement and before the client is notified about the result. (This is not true if you are running with `--delay-key-write`, in which case data files are written but not index files.) This means that data file contents are safe even if `mysqld` crashes, because the operating system ensures that the unflushed data is written to disk. You can force MySQL to flush everything to disk after every SQL statement by starting `mysqld` with the `--flush` option.

The preceding means that normally you should not get corrupted tables unless one of the following happens:

- The MySQL server or the server host was killed in the middle of an update.
- You have found a bug in `mysqld` that caused it to die in the middle of an update.
- Some external program is manipulating data files or index files at the same time as `mysqld` without locking the table properly.
- You are running many `mysqld` servers using the same data directory on a system that doesn't support good file system locks (normally handled by the `lockd` lock manager), or you are running multiple servers with external locking disabled.

- You have a crashed data file or index file that contains very corrupt data that confused `mysqld`.
- You have found a bug in the data storage code. This isn't likely, but it is at least possible. In this case, you can try to change the storage engine to another engine by using `ALTER TABLE` on a repaired copy of the table.

Because it is very difficult to know why something is crashing, first try to check whether things that work for others crash for you. Please try the following things:

- Stop the `mysqld` server with `mysqladmin shutdown`, run `myisamchk --silent --force */*.MYI` from the data directory to check all MyISAM tables, and restart `mysqld`. This ensures that you are running from a clean state. See [Chapter 5, MySQL Server Administration](#).
- Start `mysqld` with the general query log enabled (see [Section 5.2.3, “The General Query Log”](#)). Then try to determine from the information written to the log whether some specific query kills the server. About 95% of all bugs are related to a particular query. Normally, this is one of the last queries in the log file just before the server restarts. See [Section 5.2.3, “The General Query Log”](#). If you can repeatedly kill MySQL with a specific query, even when you have checked all tables just before issuing it, then you have been able to locate the bug and should submit a bug report for it. See [Section 1.6, “How to Report Bugs or Problems”](#).
- Try to make a test case that we can use to repeat the problem. See [MySQL Internals: Porting](#).
- Try running the tests in the `mysql-test` directory and the MySQL benchmarks. See [Section 21.1.2, “MySQL Test Suite”](#). They should test MySQL rather well. You can also add code to the benchmarks that simulates your application. The benchmarks can be found in the `sql-bench` directory in a source distribution or, for a binary distribution, in the `sql-bench` directory under your MySQL installation directory.
- Try the `fork_big.pl` script. (It is located in the `tests` directory of source distributions.)
- If you configure MySQL for debugging, it is much easier to gather information about possible errors if something goes wrong. Configuring MySQL for debugging causes a safe memory allocator to be included that can find some errors. It also provides a lot of output about what is happening. Reconfigure MySQL with the `--with-debug` or `--with-debug=full` option to `configure` and then recompile. See [MySQL Internals: Porting](#).
- Make sure that you have applied the latest patches for your operating system.
- Use the `--skip-external-locking` option to `mysqld`. On some systems, the `lockd` lock manager does not work properly; the `--skip-external-locking` option tells `mysqld` not to use external locking. (This means that you cannot run two `mysqld` servers on the same data directory and that you must be careful if you use `myisamchk`. Nevertheless, it may be instructive to try the option as a test.)
- Have you tried `mysqladmin -u root processlist` when `mysqld` appears to be running but not responding? Sometimes `mysqld` is not comatose even though you might think so. The problem may be that all connections are in use, or there may be some internal lock problem. `mysqladmin -u root processlist` usually is able to make a connection even in these cases, and can provide useful information about the current number of connections and their status.
- Run the command `mysqladmin -i 5 status` or `mysqladmin -i 5 -r status` in a separate window to produce statistics while you run your other queries.
- Try the following:
 1. Start `mysqld` from `gdb` (or another debugger). See [MySQL Internals: Porting](#).
 2. Run your test scripts.
 3. Print the backtrace and the local variables at the three lowest levels. In `gdb`, you can do this with the following commands when `mysqld` has crashed inside `gdb`:

```
backtrace
info local
up
info local
up
info local
```

With `gdb`, you can also examine which threads exist with `info threads` and switch to a specific thread with `thread N`, where `N` is the thread ID.

- Try to simulate your application with a Perl script to force MySQL to crash or misbehave.
- Send a normal bug report. See [Section 1.6, “How to Report Bugs or Problems”](#). Be even more detailed than usual. Because

MySQL works for many people, it may be that the crash results from something that exists only on your computer (for example, an error that is related to your particular system libraries).

- If you have a problem with tables containing dynamic-length rows and you are using only `VARCHAR` columns (not `BLOB` or `TEXT` columns), you can try to change all `VARCHAR` to `CHAR` with `ALTER TABLE`. This forces MySQL to use fixed-size rows. Fixed-size rows take a little extra space, but are much more tolerant to corruption.

The current dynamic row code has been in use for several years with very few problems, but dynamic-length rows are by nature more prone to errors, so it may be a good idea to try this strategy to see whether it helps.

- Do not rule out your server hardware when diagnosing problems. Defective hardware can be the cause of data corruption. Particular attention should be paid to your memory and disk subsystems when troubleshooting hardware.

B.1.4.3. How MySQL Handles a Full Disk

This section describes how MySQL responds to disk-full errors (such as “no space left on device”), and to quota-exceeded errors (such as “write failed” or “user block limit reached”).

This section is relevant for writes to `MyISAM` tables. It also applies for writes to binary log files and binary log index file, except that references to “row” and “record” should be understood to mean “event.”

When a disk-full condition occurs, MySQL does the following:

- It checks once every minute to see whether there is enough space to write the current row. If there is enough space, it continues as if nothing had happened.
- Every 10 minutes it writes an entry to the log file, warning about the disk-full condition.

To alleviate the problem, you can take the following actions:

- To continue, you only have to free enough disk space to insert all records.
- To abort the thread, you must use `mysqladmin kill`. The thread is aborted the next time it checks the disk (in one minute).
- Other threads might be waiting for the table that caused the disk-full condition. If you have several “locked” threads, killing the one thread that is waiting on the disk-full condition allows the other threads to continue.

Exceptions to the preceding behavior are when you use `REPAIR TABLE` or `OPTIMIZE TABLE` or when the indexes are created in a batch after `LOAD DATA INFILE` or after an `ALTER TABLE` statement. All of these statements may create large temporary files that, if left to themselves, would cause big problems for the rest of the system. If the disk becomes full while MySQL is doing any of these operations, it removes the big temporary files and mark the table as crashed. The exception is that for `ALTER TABLE`, the old table is left unchanged.

MySQL Enterprise

For early notification of possible problems with your MySQL configuration subscribe to the MySQL Enterprise Monitor. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

B.1.4.4. Where MySQL Stores Temporary Files

MySQL uses the value of the `TMPDIR` environment variable as the path name of the directory in which to store temporary files. If you don't have `TMPDIR` set, MySQL uses the system default, which is normally `/tmp`, `/var/tmp`, or `/usr/tmp`. If the file system containing your temporary file directory is too small, you can use the `--tmpdir` option to `mysqld` to specify a directory in a file system where you have enough space.

In MySQL 5.4, the `--tmpdir` option can be set to a list of several paths that are used in round-robin fashion. Paths should be separated by colon characters (“:”) on Unix and semicolon characters (“;”) on Windows, NetWare, and OS/2.

Note

To spread the load effectively, these paths should be located on different *physical* disks, not different partitions of the same disk.

If the MySQL server is acting as a replication slave, you should not set `--tmpdir` to point to a directory on a memory-based file system or to a directory that is cleared when the server host restarts. A replication slave needs some of its temporary files to survive a machine restart so that it can replicate temporary tables or `LOAD DATA INFILE` operations. If files in the temporary file direct-

ory are lost when the server restarts, replication fails.

MySQL creates all temporary files as hidden files. This ensures that the temporary files are removed if `mysqld` is terminated. The disadvantage of using hidden files is that you do not see a big temporary file that fills up the file system in which the temporary file directory is located.

MySQL Enterprise

Advisors provided by the MySQL Enterprise Monitor automatically detect excessive temporary table storage to disk. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

When sorting (`ORDER BY` or `GROUP BY`), MySQL normally uses one or two temporary files. The maximum disk space required is determined by the following expression:

```
(length of what is sorted + sizeof(row pointer))
* number of matched rows
* 2
```

The row pointer size is usually four bytes, but may grow in the future for really big tables.

For some `SELECT` queries, MySQL also creates temporary SQL tables. These are not hidden and have names of the form `SQL_*`.

`ALTER TABLE` creates a temporary table in the same directory as the original table.

B.1.4.5. How to Protect or Change the MySQL Unix Socket File

The default location for the Unix socket file that the server uses for communication with local clients is `/tmp/mysql.sock`. (For some distribution formats, the directory might be different, such as `/var/lib/mysql` for RPMs.)

On some versions of Unix, anyone can delete files in the `/tmp` directory or other similar directories used for temporary files. If the socket file is located in such a directory on your system, this might cause problems.

On most versions of Unix, you can protect your `/tmp` directory so that files can be deleted only by their owners or the superuser (`root`). To do this, set the `sticky` bit on the `/tmp` directory by logging in as `root` and using the following command:

```
shell> chmod +t /tmp
```

You can check whether the `sticky` bit is set by executing `ls -ld /tmp`. If the last permission character is `t`, the bit is set.

Another approach is to change the place where the server creates the Unix socket file. If you do this, you should also let client programs know the new location of the file. You can specify the file location in several ways:

- Specify the path in a global or local option file. For example, put the following lines in `/etc/my.cnf`:

```
[mysqld]
socket=/path/to/socket

[client]
socket=/path/to/socket
```

See Section 4.2.3.2, “Using Option Files”.

- Specify a `--socket` option on the command line to `mysqld_safe` and when you run client programs.
- Set the `MYSQL_UNIX_PORT` environment variable to the path of the Unix socket file.
- Recompile MySQL from source to use a different default Unix socket file location. Define the path to the file with the `--with-unix-socket-path` option when you run `configure`. See Section 2.10.2, “Typical configure Options”.

You can test whether the new socket location works by attempting to connect to the server with this command:

```
shell> mysqladmin --socket=/path/to/socket version
```

B.1.4.6. Time Zone Problems

If you have a problem with `SELECT NOW()` returning values in UTC and not your local time, you have to tell the server your current time zone. The same applies if `UNIX_TIMESTAMP()` returns the wrong value. This should be done for the environment in which the server runs; for example, in `mysqld_safe` or `mysql.server`. See Section 2.14, “Environment Variables”.

You can set the time zone for the server with the `--timezone=timezone_name` option to `mysqld_safe`. You can also set it

by setting the `TZ` environment variable before you start `mysqld`.

The allowable values for `--timezone` or `TZ` are system-dependent. Consult your operating system documentation to see what values are acceptable.

B.1.5. Query-Related Issues

B.1.5.1. Case Sensitivity in String Searches

For nonbinary strings (`CHAR`, `VARCHAR`, `TEXT`), string searches use the collation of the comparison operands. For binary strings (`BINARY`, `VARBINARY`, `BLOB`), comparisons use the numeric values of the bytes in the operands; this means that for alphabetic characters, comparisons will be case sensitive.

A comparison between a nonbinary string and binary string is treated as a comparison of binary strings.

Simple comparison operations (`>=`, `>`, `=`, `<`, `<=`, sorting, and grouping) are based on each character's "sort value." Characters with the same sort value are treated as the same character. For example, if "e" and "é" have the same sort value in a given collation, they compare as equal.

The default character set and collation are `latin1` and `latin1_swedish_ci`, so nonbinary string comparisons are case insensitive by default. This means that if you search with `col_name LIKE 'a%'`, you get all column values that start with `A` or `a`. To make this search case sensitive, make sure that one of the operands has a case sensitive or binary collation. For example, if you are comparing a column and a string that both have the `latin1` character set, you can use the `COLLATE` operator to cause either operand to have the `latin1_general_cs` or `latin1_bin` collation:

```
col_name COLLATE latin1_general_cs LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_general_cs
col_name COLLATE latin1_bin LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_bin
```

If you want a column always to be treated in case-sensitive fashion, declare it with a case sensitive or binary collation. See [Section 12.1.14, "CREATE TABLE Syntax"](#).

To cause a case-sensitive comparison of nonbinary strings to be case insensitive, use `COLLATE` to name a case-insensitive collation. The strings in the following example normally are case sensitive, but `COLLATE` changes the comparison to be case insensitive:

```
mysql> SET @s1 = 'MySQL' COLLATE latin1_bin,
->      @s2 = 'mysql' COLLATE latin1_bin;
mysql> SELECT @s1 = @s2;
+-----+
| @s1 = @s2 |
+-----+
|          0 |
+-----+
mysql> SELECT @s1 COLLATE latin1_swedish_ci = @s2;
+-----+
| @s1 COLLATE latin1_swedish_ci = @s2 |
+-----+
|                                  1 |
+-----+
```

A binary string is case sensitive in comparisons. To compare the string as case insensitive, convert it to a nonbinary string and use `COLLATE` to name a case-insensitive collation:

```
mysql> SET @s = BINARY 'MySQL';
mysql> SELECT @s = 'mysql';
+-----+
| @s = 'mysql' |
+-----+
|          0 |
+-----+
mysql> SELECT CONVERT(@s USING latin1) COLLATE latin1_swedish_ci = 'mysql';
+-----+
| CONVERT(@s USING latin1) COLLATE latin1_swedish_ci = 'mysql' |
+-----+
|                                  1 |
+-----+
```

To determine whether a value will compare as a nonbinary or binary string, use the `COLLATION()` function. This example shows that `VERSION()` returns a string that has a case-insensitive collation, so comparisons are case insensitive:

```
mysql> SELECT COLLATION(VERSION());
+-----+
| COLLATION(VERSION()) |
+-----+
| utf8_general_ci     |
+-----+
```

For binary strings, the collation value is `binary`, so comparisons will be case sensitive. One context in which you will see `binary` is for compression and encryption functions, which return binary strings as a general rule: string:

```
mysql> SELECT COLLATION(ENCRYPT('x')), COLLATION(SHA1('x'));
+-----+-----+
| COLLATION(ENCRYPT('x')) | COLLATION(SHA1('x')) |
+-----+-----+
| binary                  | binary                |
+-----+-----+
```

B.1.5.2. Problems Using `DATE` Columns

The format of a `DATE` value is `'YYYY-MM-DD'`. According to standard SQL, no other format is allowed. You should use this format in `UPDATE` expressions and in the `WHERE` clause of `SELECT` statements. For example:

```
mysql> SELECT * FROM tbl_name WHERE date >= '2003-05-05';
```

As a convenience, MySQL automatically converts a date to a number if the date is used in a numeric context (and vice versa). It is also smart enough to allow a “relaxed” string form when updating and in a `WHERE` clause that compares a date to a `TIMESTAMP`, `DATE`, or `DATETIME` column. (“Relaxed form” means that any punctuation character may be used as the separator between parts. For example, `'2004-08-15'` and `'2004#08#15'` are equivalent.) MySQL can also convert a string containing no separators (such as `'20040815'`), provided it makes sense as a date.

When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` to a constant string with the `<`, `<=`, `=`, `>=`, `>`, or `BETWEEN` operators, MySQL normally converts the string to an internal long integer for faster comparison (and also for a bit more “relaxed” string checking). However, this conversion is subject to the following exceptions:

- When you compare two columns
- When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` column to an expression
- When you use any other comparison method than those just listed, such as `IN` or `STRCMP()`.

For these exceptional cases, the comparison is done by converting the objects to strings and performing a string comparison.

To keep things safe, assume that strings are compared as strings and use the appropriate string functions if you want to compare a temporal value to a string.

The special date `'0000-00-00'` can be stored and retrieved as `'0000-00-00'`. When using a `'0000-00-00'` date through MyODBC, it is automatically converted to `NULL` in MyODBC 2.50.12 and above, because ODBC can't handle this kind of date.

Because MySQL performs the conversions described above, the following statements work:

```
mysql> INSERT INTO tbl_name (idate) VALUES (19970505);
mysql> INSERT INTO tbl_name (idate) VALUES ('19970505');
mysql> INSERT INTO tbl_name (idate) VALUES ('97-05-05');
mysql> INSERT INTO tbl_name (idate) VALUES ('1997.05.05');
mysql> INSERT INTO tbl_name (idate) VALUES ('1997 05 05');
mysql> INSERT INTO tbl_name (idate) VALUES ('0000-00-00');

mysql> SELECT idate FROM tbl_name WHERE idate >= '1997-05-05';
mysql> SELECT idate FROM tbl_name WHERE idate >= 19970505;
mysql> SELECT MOD(idate,100) FROM tbl_name WHERE idate >= 19970505;
mysql> SELECT idate FROM tbl_name WHERE idate >= '19970505';
```

However, the following does not work:

```
mysql> SELECT idate FROM tbl_name WHERE STRCMP(idate,'20030505')=0;
```

`STRCMP()` is a string function, so it converts `idate` to a string in `'YYYY-MM-DD'` format and performs a string comparison. It does not convert `'20030505'` to the date `'2003-05-05'` and perform a date comparison.

If you are using the `ALLOW_INVALID_DATES` SQL mode, MySQL allows you to store dates that are given only limited checking: MySQL requires only that the day is in the range from 1 to 31 and the month is in the range from 1 to 12.

This makes MySQL very convenient for Web applications where you obtain year, month, and day in three different fields and you want to store exactly what the user inserted (without date validation).

If you are not using the `NO_ZERO_IN_DATE` SQL mode, the day or month part can be zero. This is convenient if you want to store a birthdate in a `DATE` column and you know only part of the date.

If you are not using the `NO_ZERO_DATE` SQL mode, MySQL also allows you to store `'0000-00-00'` as a “dummy date.” This is in some cases more convenient than using `NULL` values.

If the date cannot be converted to any reasonable value, a `0` is stored in the `DATE` column, which is retrieved as `'0000-00-00'`. This is both a speed and a convenience issue. We believe that the database server's responsibility is to retrieve the same date you stored (even if the data was not logically correct in all cases). We think it is up to the application and not the server to check the dates.

If you want MySQL to check all dates and accept only legal dates (unless overridden by `IGNORE`), you should set `sql_mode` to `"NO_ZERO_IN_DATE,NO_ZERO_DATE"`.

B.1.5.3. Problems with `NULL` Values

The concept of the `NULL` value is a common source of confusion for newcomers to SQL, who often think that `NULL` is the same thing as an empty string `' '`. This is not the case. For example, the following statements are completely different:

```
mysql> INSERT INTO my_table (phone) VALUES (NULL);
mysql> INSERT INTO my_table (phone) VALUES ('');
```

Both statements insert a value into the `phone` column, but the first inserts a `NULL` value and the second inserts an empty string. The meaning of the first can be regarded as “phone number is not known” and the meaning of the second can be regarded as “the person is known to have no phone, and thus no phone number.”

To help with `NULL` handling, you can use the `IS NULL` and `IS NOT NULL` operators and the `IFNULL()` function.

In SQL, the `NULL` value is never true in comparison to any other value, even `NULL`. An expression that contains `NULL` always produces a `NULL` value unless otherwise indicated in the documentation for the operators and functions involved in the expression. All columns in the following example return `NULL`:

```
mysql> SELECT NULL, 1+NULL, CONCAT('Invisible',NULL);
```

If you want to search for column values that are `NULL`, you cannot use an `expr = NULL` test. The following statement returns no rows, because `expr = NULL` is never true for any expression:

```
mysql> SELECT * FROM my_table WHERE phone = NULL;
```

To look for `NULL` values, you must use the `IS NULL` test. The following statements show how to find the `NULL` phone number and the empty phone number:

```
mysql> SELECT * FROM my_table WHERE phone IS NULL;
mysql> SELECT * FROM my_table WHERE phone = '';
```

See [Section 3.3.4.6, “Working with `NULL` Values”](#), for additional information and examples.

You can add an index on a column that can have `NULL` values if you are using the `MyISAM`, `InnoDB`, or `MEMORY` storage engine. Otherwise, you must declare an indexed column `NOT NULL`, and you cannot insert `NULL` into the column.

When reading data with `LOAD DATA INFILE`, empty or missing columns are updated with `' '`. If you want a `NULL` value in a column, you should use `\N` in the data file. The literal word “`NULL`” may also be used under some circumstances. See [Section 12.2.6, “LOAD DATA INFILE Syntax”](#).

When using `DISTINCT`, `GROUP BY`, or `ORDER BY`, all `NULL` values are regarded as equal.

When using `ORDER BY`, `NULL` values are presented first, or last if you specify `DESC` to sort in descending order.

Aggregate (summary) functions such as `COUNT()`, `MIN()`, and `SUM()` ignore `NULL` values. The exception to this is `COUNT(*)`, which counts rows and not individual column values. For example, the following statement produces two counts. The first is a count of the number of rows in the table, and the second is a count of the number of non-`NULL` values in the `age` column:

```
mysql> SELECT COUNT(*), COUNT(age) FROM person;
```

For some data types, MySQL handles `NULL` values specially. If you insert `NULL` into a `TIMESTAMP` column, the current date and time is inserted. If you insert `NULL` into an integer or floating-point column that has the `AUTO_INCREMENT` attribute, the next number in the sequence is inserted.

B.1.5.4. Problems with Column Aliases

You can use an alias to refer to a column in `GROUP BY`, `ORDER BY`, or `HAVING` clauses. Aliases can also be used to give columns better names:

```
SELECT SQRT(a*b) AS root FROM tbl_name GROUP BY root HAVING root > 0;
SELECT id, COUNT(*) AS cnt FROM tbl_name GROUP BY id HAVING cnt > 0;
SELECT id AS 'Customer identity' FROM tbl_name;
```

Standard SQL doesn't allow you to refer to a column alias in a `WHERE` clause. This restriction is imposed because when the `WHERE` code is executed, the column value may not yet be determined. For example, the following query is illegal:

```
SELECT id, COUNT(*) AS cnt FROM tbl_name WHERE cnt > 0 GROUP BY id;
```

The `WHERE` statement is executed to determine which rows should be included in the `GROUP BY` part, whereas `HAVING` is used to decide which rows from the result set should be used.

B.1.5.5. Rollback Failure for Non-Transactional Tables

If you receive the following message when trying to perform a `ROLLBACK`, it means that one or more of the tables you used in the transaction do not support transactions:

```
Warning: Some non-transactional changed tables couldn't be rolled back
```

These non-transactional tables are not affected by the `ROLLBACK` statement.

If you were not deliberately mixing transactional and non-transactional tables within the transaction, the most likely cause for this message is that a table you thought was transactional actually is not. This can happen if you try to create a table using a transactional storage engine that is not supported by your `mysqld` server (or that was disabled with a startup option). If `mysqld` doesn't support a storage engine, it instead creates the table as a `MyISAM` table, which is non-transactional.

You can check the storage engine for a table by using either of these statements:

```
SHOW TABLE STATUS LIKE 'tbl_name';
SHOW CREATE TABLE tbl_name;
```

See [Section 12.5.5.37, “SHOW TABLE STATUS Syntax”](#), and [Section 12.5.5.12, “SHOW CREATE TABLE Syntax”](#).

You can check which storage engines your `mysqld` server supports by using this statement:

```
SHOW ENGINES;
```

You can also use the following statement, and check the value of the variable that is associated with the storage engine in which you are interested:

```
SHOW VARIABLES LIKE 'have_%';
```

For example, to determine whether the `InnoDB` storage engine is available, check the value of the `have_innodb` variable.

See [Section 12.5.5.17, “SHOW ENGINES Syntax”](#), and [Section 12.5.5.40, “SHOW VARIABLES Syntax”](#).

MySQL Enterprise

Ensure that your data is adequately protected by subscribing to the MySQL Enterprise Monitor. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

B.1.5.6. Deleting Rows from Related Tables

If the total length of the `DELETE` statement for `related_table` is more than 1MB (the default value of the `max_allowed_packet` system variable), you should split it into smaller parts and execute multiple `DELETE` statements. You probably get the fastest `DELETE` by specifying only 100 to 1,000 `related_column` values per statement if the `related_column` is indexed. If the `related_column` isn't indexed, the speed is independent of the number of arguments in the `IN` clause.

B.1.5.7. Solving Problems with No Matching Rows

If you have a complicated query that uses many tables but that doesn't return any rows, you should use the following procedure to find out what is wrong:

1. Test the query with `EXPLAIN` to check whether you can find something that is obviously wrong. See [Section 12.3.2, “EXPLAIN Syntax”](#).
2. Select only those columns that are used in the `WHERE` clause.

3. Remove one table at a time from the query until it returns some rows. If the tables are large, it is a good idea to use `LIMIT 10` with the query.
4. Issue a `SELECT` for the column that should have matched a row against the table that was last removed from the query.
5. If you are comparing `FLOAT` or `DOUBLE` columns with numbers that have decimals, you can't use equality (`=`) comparisons. This problem is common in most computer languages because not all floating-point values can be stored with exact precision. In some cases, changing the `FLOAT` to a `DOUBLE` fixes this. See [Section B.1.5.8, “Problems with Floating-Point Comparisons”](#).
6. If you still can't figure out what is wrong, create a minimal test that can be run with `mysql test < query.sql` that shows your problems. You can create a test file by dumping the tables with `mysqldump --quick db_name tbl_name_1 ... tbl_name_n > query.sql`. Open the file in an editor, remove some insert lines (if there are more than needed to demonstrate the problem), and add your `SELECT` statement at the end of the file.

Verify that the test file demonstrates the problem by executing these commands:

```
shell> mysqladmin create test2
shell> mysql test2 < query.sql
```

Attach the test file to a bug report, which you can file using the instructions in [Section 1.6, “How to Report Bugs or Problems”](#).

B.1.5.8. Problems with Floating-Point Comparisons

Floating-point numbers sometimes cause confusion because they are approximate. That is, they are not stored as exact values inside computer architecture. What you can see on the screen usually is not the exact value of the number. The `FLOAT` and `DOUBLE` data types are such. For `DECIMAL` columns, MySQL performs operations with a precision of 65 decimal digits, which should solve most common inaccuracy problems.

The following example demonstrates the problem using `DOUBLE`. It shows that are calculations that are done using floating-point operations are subject to floating-point error.

```
mysql> CREATE TABLE t1 (i INT, d1 DOUBLE, d2 DOUBLE);
mysql> INSERT INTO t1 VALUES (1, 101.40, 21.40), (1, -80.00, 0.00),
-> (2, 0.00, 0.00), (2, -13.20, 0.00), (2, 59.60, 46.40),
-> (2, 30.40, 30.40), (3, 37.00, 7.40), (3, -29.60, 0.00),
-> (4, 60.00, 15.40), (4, -10.60, 0.00), (4, -34.00, 0.00),
-> (5, 33.00, 0.00), (5, -25.80, 0.00), (5, 0.00, 7.20),
-> (6, 0.00, 0.00), (6, -51.40, 0.00);

mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b
-> FROM t1 GROUP BY i HAVING a <> b;
```

i	a	b
1	21.4	21.4
2	76.8	76.8
3	7.4	7.4
4	15.4	15.4
5	7.2	7.2
6	-51.4	0

The result is correct. Although the first five records look like they should not satisfy the comparison (the values of `a` and `b` do not appear to be different), they may do so because the difference between the numbers shows up around the tenth decimal or so, depending on factors such as computer architecture or the compiler version or optimization level. For example, different CPUs may evaluate floating-point numbers differently.

If columns `d1` and `d2` had been defined as `DECIMAL` rather than `DOUBLE`, the result of the `SELECT` query would have contained only one row — the last one shown above.

The correct way to do floating-point number comparison is to first decide on an acceptable tolerance for differences between the numbers and then do the comparison against the tolerance value. For example, if we agree that floating-point numbers should be regarded the same if they are same within a precision of one in ten thousand (0.0001), the comparison should be written to find differences larger than the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) > 0.0001;

+-----+-----+-----+
| i | a | b |
+-----+-----+-----+
| 6 | -51.4 | 0 |
+-----+-----+-----+
1 row in set (0.00 sec)
```

Conversely, to get rows where the numbers are the same, the test should find differences within the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) <= 0.0001;
+----+-----+-----+
| i  | a     | b     |
+----+-----+-----+
| 1  | 21.4  | 21.4  |
| 2  | 76.8  | 76.8  |
| 3  | 7.4   | 7.4   |
| 4  | 15.4  | 15.4  |
| 5  | 7.2   | 7.2   |
+----+-----+-----+
5 rows in set (0.03 sec)
```

B.1.6. Optimizer-Related Issues

MySQL uses a cost-based optimizer to determine the best way to resolve a query. In many cases, MySQL can calculate the best possible query plan, but sometimes MySQL doesn't have enough information about the data at hand and has to make "educated" guesses about the data.

For the cases when MySQL does not do the "right" thing, tools that you have available to help MySQL are:

- Use the `EXPLAIN` statement to get information about how MySQL processes a query. To use it, just add the keyword `EXPLAIN` to the front of your `SELECT` statement:

```
mysql> EXPLAIN SELECT * FROM t1, t2 WHERE t1.i = t2.i;
```

`EXPLAIN` is discussed in more detail in [Section 12.3.2, "EXPLAIN Syntax"](#).

- Use `ANALYZE TABLE tbl_name` to update the key distributions for the scanned table. See [Section 12.5.2.1, "ANALYZE TABLE Syntax"](#).
- Use `FORCE INDEX` for the scanned table to tell MySQL that table scans are very expensive compared to using the given index:

```
SELECT * FROM t1, t2 FORCE INDEX (index_for_column)
WHERE t1.col_name=t2.col_name;
```

`USE INDEX` and `IGNORE INDEX` may also be useful. See [Section 12.2.8.2, "Index Hint Syntax"](#).

- Global and table-level `STRAIGHT_JOIN`. See [Section 12.2.8, "SELECT Syntax"](#).
- You can tune global or thread-specific system variables. For example, start `mysqld` with the `-max-seeks-for-key=1000` option or use `SET max_seeks_for_key=1000` to tell the optimizer to assume that no key scan causes more than 1,000 key seeks. See [Section 5.1.3, "Server System Variables"](#).

B.1.7. Table Definition-Related Issues

B.1.7.1. Problems with `ALTER TABLE`

`ALTER TABLE` changes a table to the current character set. If you get a duplicate-key error during `ALTER TABLE`, the cause is either that the new character sets maps two keys to the same value or that the table is corrupted. In the latter case, you should run `REPAIR TABLE` on the table.

If `ALTER TABLE` dies with the following error, the problem may be that MySQL crashed during an earlier `ALTER TABLE` operation and there is an old table named `A-xxx` or `B-xxx` lying around:

```
Error on rename of './database/name.frm'
to './database/B-xxx.frm' (Errcode: 17)
```

In this case, go to the MySQL data directory and delete all files that have names starting with `A-` or `B-`. (You may want to move them elsewhere instead of deleting them.)

`ALTER TABLE` works in the following way:

- Create a new table named `A-xxx` with the requested structural changes.
- Copy all rows from the original table to `A-xxx`.
- Rename the original table to `B-xxx`.
- Rename `A-xxx` to your original table name.
- Delete `B-xxx`.

If something goes wrong with the renaming operation, MySQL tries to undo the changes. If something goes seriously wrong (although this shouldn't happen), MySQL may leave the old table as `B-xxx`. A simple rename of the table files at the system level should get your data back.

If you use `ALTER TABLE` on a transactional table or if you are using Windows or OS/2, `ALTER TABLE` unlocks the table if you had done a `LOCK TABLE` on it. This is done because `InnoDB` and these operating systems cannot drop a table that is in use.

B.1.7.2. How to Change the Order of Columns in a Table

First, consider whether you really need to change the column order in a table. The whole point of SQL is to abstract the application from the data storage format. You should always specify the order in which you wish to retrieve your data. The first of the following statements returns columns in the order `col_name1, col_name2, col_name3`, whereas the second returns them in the order `col_name1, col_name3, col_name2`:

```
mysql> SELECT col_name1, col_name2, col_name3 FROM tbl_name;
mysql> SELECT col_name1, col_name3, col_name2 FROM tbl_name;
```

If you decide to change the order of table columns anyway, you can do so as follows:

1. Create a new table with the columns in the new order.
2. Execute this statement:

```
mysql> INSERT INTO new_table
-> SELECT columns-in-new-order FROM old_table;
```

3. Drop or rename `old_table`.
4. Rename the new table to the original name:

```
mysql> ALTER TABLE new_table RENAME old_table;
```

`SELECT *` is quite suitable for testing queries. However, in an application, you should *never* rely on using `SELECT *` and retrieving the columns based on their position. The order and position in which columns are returned does not remain the same if you add, move, or delete columns. A simple change to your table structure could cause your application to fail.

B.1.7.3. TEMPORARY Table Problems

The following list indicates limitations on the use of `TEMPORARY` tables:

- A `TEMPORARY` table can only be of type `MEMORY`, `MyISAM`, `MERGE`, or `InnoDB`.

Temporary tables are not supported for MySQL Cluster.

- You cannot refer to a `TEMPORARY` table more than once in the same query. For example, the following does not work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

This error also occurs if you refer to a temporary table multiple times in a stored function under different aliases, even if the references occur in different statements within the function.

- The `SHOW TABLES` statement does not list `TEMPORARY` tables.
- You cannot use `RENAME` to rename a `TEMPORARY` table. However, you can use `ALTER TABLE` instead:

```
mysql> ALTER TABLE orig_name RENAME new_name;
```

- There are known issues in using temporary tables with replication. See [Section 16.3.1, “Replication Features and Issues”](#), for more information.

B.1.8. Known Issues in MySQL

This section is a list of the known issues in recent versions of MySQL.

For information about platform-specific issues, see the installation and porting instructions in [Section 2.13, “Operating System-Specific Notes”](#), and [MySQL Internals: Porting](#).

B.1.8.1. Open Issues in MySQL

The following problems are also known and fixing them is also a high priority:

- Subquery optimization for `IN` is not as effective as for `=`.
- Even if you use `lower_case_table_names=2` (which enables MySQL to remember the case used for databases and table names), MySQL does not remember the case used for database names for the function `DATABASE()` or within the various logs (on case-insensitive systems).
- Dropping a `FOREIGN KEY` constraint doesn't work in replication because the constraint may have another name on the slave.
- `REPLACE` (and `LOAD DATA` with the `REPLACE` option) does not trigger `ON DELETE CASCADE`.
- `DISTINCT` with `ORDER BY` doesn't work inside `GROUP_CONCAT()` if you don't use all and only those columns that are in the `DISTINCT` list.
- If one user has a long-running transaction and another user drops a table that is updated in the transaction, there is small chance that the binary log may contain the `DROP TABLE` command before the table is used in the transaction itself. We plan to fix this by having the `DROP TABLE` command wait until the table is not being used in any transaction.
- When inserting a big integer value (between 2^{63} and $2^{64}-1$) into a decimal or string column, it is inserted as a negative value because the number is evaluated in a signed integer context.
- `FLUSH TABLES WITH READ LOCK` does not block `COMMIT` if the server is running without binary logging, which may cause a problem (of consistency between tables) when doing a full backup.
- `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` may cause problems on tables for which you are using `INSERT DELAYED`.
- Performing `LOCK TABLE ...` and `FLUSH TABLES ...` doesn't guarantee that there isn't a half-finished transaction in progress on the table.
- Replication uses query-level logging: The master writes the executed queries to the binary log. This is a very fast, compact, and efficient logging method that works perfectly in most cases.

It is possible for the data on the master and slave to become different if a query is designed in such a way that the data modification is non-deterministic (generally not a recommended practice, even outside of replication).

For example:

- `CREATE ... SELECT` or `INSERT ... SELECT` statements that insert zero or `NULL` values into an `AUTO_INCREMENT` column.
- `DELETE` if you are deleting rows from a table that has foreign keys with `ON DELETE CASCADE` properties.
- `REPLACE ... SELECT`, `INSERT IGNORE ... SELECT` if you have duplicate key values in the inserted data.

If and only if the preceding queries have no `ORDER BY` clause guaranteeing a deterministic order.

For example, for `INSERT ... SELECT` with no `ORDER BY`, the `SELECT` may return rows in a different order (which results in a row having different ranks, hence getting a different number in the `AUTO_INCREMENT` column), depending on the choices made by the optimizers on the master and slave.

A query is optimized differently on the master and slave only if:

- The table is stored using a different storage engine on the master than on the slave. (It is possible to use different storage engines on the master and slave. For example, you can use `InnoDB` on the master, but `MyISAM` on the slave if the slave has less available disk space.)
- MySQL buffer sizes (`key_buffer_size`, and so on) are different on the master and slave.
- The master and slave run different MySQL versions, and the optimizer code differs between these versions.

This problem may also affect database restoration using `mysqlbinlog|mysql`.

The easiest way to avoid this problem is to add an `ORDER BY` clause to the aforementioned non-deterministic queries to ensure that the rows are always stored or modified in the same order.

In future MySQL versions, we will automatically add an `ORDER BY` clause when needed.

The following issues are known and will be fixed in due time:

- Log file names are based on the server host name (if you don't specify a file name with the startup option). You have to use options such as `--log-bin=old_host_name-bin` if you change your host name to something else. Another option is to rename the old files to reflect your host name change (if these are binary logs, you need to edit the binary log index file and fix the binlog names there as well). See [Section 5.1.2, “Server Command Options”](#).
- `mysqlbinlog` does not delete temporary files left after a `LOAD DATA INFILE` command. See [Section 4.6.7, “mysqlbinlog — Utility for Processing Binary Log Files”](#).
- `RENAME` doesn't work with `TEMPORARY` tables or tables used in a `MERGE` table.
- Due to the way table format (`.frm`) files are stored, you cannot use character 255 (`CHAR(255)`) in table names, column names, or enumerations.
- When using `SET CHARACTER SET`, you can't use translated characters in database, table, and column names.
- You can't use “_” or “%” with `ESCAPE` in `LIKE ... ESCAPE`.
- You cannot build the server in another directory when using MIT-pthreads. Because this requires changes to MIT-pthreads, we are not likely to fix this. See [Section 2.10.5, “MIT-pthreads Notes”](#).
- `BLOB` and `TEXT` values can't reliably be used in `GROUP BY`, `ORDER BY` or `DISTINCT`. Only the first `max_sort_length` bytes are used when comparing `BLOB` values in these cases. The default value of `max_sort_length` is 1024 and can be changed at server startup time or at runtime.
- Numeric calculations are done with `BIGINT` or `DOUBLE` (both are normally 64 bits long). Which precision you get depends on the function. The general rule is that bit functions are performed with `BIGINT` precision, `IF()` and `ELT()` with `BIGINT` or `DOUBLE` precision, and the rest with `DOUBLE` precision. You should try to avoid using unsigned long long values if they resolve to be larger than 63 bits (9223372036854775807) for anything other than bit fields.
- You can have up to 255 `ENUM` and `SET` columns in one table.
- In `MIN()`, `MAX()`, and other aggregate functions, MySQL currently compares `ENUM` and `SET` columns by their string value rather than by the string's relative position in the set.
- `mysqld_safe` redirects all messages from `mysqld` to the `mysqld` log. One problem with this is that if you execute `mysqladmin refresh` to close and reopen the log, `stdout` and `stderr` are still redirected to the old log. If you use the general query log extensively, you should edit `mysqld_safe` to log to `host_name.err` instead of `host_name.log` so that you can easily reclaim the space for the old log by deleting it and executing `mysqladmin refresh`.
- In an `UPDATE` statement, columns are updated from left to right. If you refer to an updated column, you get the updated value instead of the original value. For example, the following statement increments `KEY` by 2, **not** 1:

```
mysql> UPDATE tbl_name SET KEY=KEY+1,KEY=KEY+1;
```

- You can refer to multiple temporary tables in the same query, but you cannot refer to any given temporary table more than once. For example, the following doesn't work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

- The optimizer may handle `DISTINCT` differently when you are using “hidden” columns in a join than when you are not. In a

join, hidden columns are counted as part of the result (even if they are not shown), whereas in normal queries, hidden columns don't participate in the `DISTINCT` comparison. We will probably change this in the future to never compare the hidden columns when executing `DISTINCT`.

An example of this is:

```
SELECT DISTINCT mp3id FROM band_downloads
WHERE userid = 9 ORDER BY id DESC;
```

and

```
SELECT DISTINCT band_downloads.mp3id
FROM band_downloads,band_mp3
WHERE band_downloads.userid = 9
AND band_mp3.id = band_downloads.mp3id
ORDER BY band_downloads.id DESC;
```

In the second case, using MySQL Server 3.23.x, you may get two identical rows in the result set (because the values in the hidden `id` column may differ).

Note that this happens only for queries where that do not have the `ORDER BY` columns in the result.

- If you execute a `PROCEDURE` on a query that returns an empty set, in some cases the `PROCEDURE` does not transform the columns.
- Creation of a table of type `MERGE` doesn't check whether the underlying tables are compatible types.
- If you use `ALTER TABLE` to add a `UNIQUE` index to a table used in a `MERGE` table and then add a normal index on the `MERGE` table, the key order is different for the tables if there was an old, non-`UNIQUE` key in the table. This is because `ALTER TABLE` puts `UNIQUE` indexes before normal indexes to be able to detect duplicate keys as early as possible.

B.2. Types of Error Values

When an error occurs in MySQL, the server returns two types of error values:

- A MySQL-specific error code. This value is numeric. It is not portable to other database systems.
- An SQLSTATE value. The value is a five-character string (for example, '42S02'). The values are specified by ANSI SQL and ODBC and are more standardized.

When an error occurs, you can access the MySQL error code, the SQLSTATE value, and a string containing an error message using C API functions:

- MySQL error code: Call `mysql_errno()`
- SQLSTATE value: Call `mysql_sqlstate()`
- Error message: Call `mysql_error()`

For prepared statements, the corresponding error functions are `mysql_stmt_errno()`, `mysql_stmt_sqlstate()`, and `mysql_stmt_error()`. All error functions are described in [Section 20.10, "MySQL C API"](#).

The first two characters of an SQLSTATE value indicate the error class:

- '00' indicates success.
- '01' indicates a warning.
- '02' indicates "not found." These values are relevant only within the context of cursors and are used to control what happens when a cursor reaches the end of a data set.
- Other values indicate an exception.

B.3. Server Error Codes and Messages

MySQL programs have access to several types of error information when the server returns an error. For example, the `mysql` client program displays errors using the following format:

```
shell> SELECT * FROM no_such_table;  
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

The message displayed contains three types of information:

- A numeric error code (1146). This number is MySQL-specific and is not portable to other database systems.
- A five-character SQLSTATE value ('42S02'). The values are specified by ANSI SQL and ODBC and are more standardized. Not all MySQL error numbers are mapped to SQLSTATE error codes. The value 'HY000' (general error) is used for un-mapped errors.
- A string that provides a textual description of the error.

Server error information comes from the following source files. For details about the way that error information is defined, see the MySQL Internals manual, available at <http://dev.mysql.com/doc/>.

- Error message information is listed in the `share/errmsg.txt` file. `%d` and `%s` represent numbers and strings, respectively, that are substituted into the Message values when they are displayed.
- The Error values listed in `share/errmsg.txt` are used to generate the definitions in the `include/mysqld_error.h` and `include/mysqld_ename.h` MySQL source files.
- The SQLSTATE values listed in `share/errmsg.txt` are used to generate the definitions in the `include/sql_state.h` MySQL source file.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: 1000 SQLSTATE: HY000 (ER_HASHCHK)
Message: hashchk
- Error: 1001 SQLSTATE: HY000 (ER_NISAMCHK)

Message: Trigger in wrong schema

- Error: 1436 SQLSTATE: HY000 ([ER_STACK_OVERRUN_NEED_MORE](#))

Message: Thread stack overrun: %ld bytes used of a %ld byte stack, and %ld bytes needed. Use 'mysqld -O thread_stack=#' to

specify a bigger stack.

- Error: 1437 SQLSTATE: 42000 (ER_TOO_LONG_BODY)
 Message: Routine body for '%s' is too long
- Error: 1438 SQLSTATE: HY000 (ER_WARN_CANT_DROP_DEFAULT_KEYCACHE)
 Message: Cannot drop default keycache
- Error: 1439 SQLSTATE: 42000 (ER_TOO_BIG_DISPLAYWIDTH)
 Message: Display width out of range for column '%s' (max = %lu)
- Error: 1440 SQLSTATE: XAE08 (ER_XAER_DUPID)
 Message: XAER_DUPID: The XID already exists
- Error: 1441 SQLSTATE: 22008 (ER_DATETIME_FUNCTION_OVERFLOW)
 Message: Datetime function: %s field overflow
- Error: 1442 SQLSTATE: HY000 (ER_CANT_UPDATE_USED_TABLE_IN_SF_OR_TRG)
 Message: Can't update table '%s' in stored function/trigger because it is already used by statement which invoked this stored function/trigger.
- Error: 1443 SQLSTATE: HY000 (ER_VIEW_PREVENT_UPDATE)
 Message: The definition of table '%s' prevents operation %s on table '%s'.
- Error: 1444 SQLSTATE: HY000 (ER_PS_NO_RECURSION)
 Message: The prepared statement contains a stored routine call that refers to that same statement. It's not allowed to execute a prepared statement in such a recursive manner
- Error: 1445 SQLSTATE: HY000 (ER_SP_CANT_SET_AUTOCOMMIT)
 Message: Not allowed to set autocommit from a stored function or trigger
- Error: 1446 SQLSTATE: HY000 (ER_MALFORMED_DEFINER)
 Message: Definer is not fully qualified
- Error: 1447 SQLSTATE: HY000 (ER_VIEW_FRM_NO_USER)
 Message: View '%s'.'%s' has no definer information (old table format). Current user is used as definer. Please recreate the view!
- Error: 1448 SQLSTATE: HY000 (ER_VIEW_OTHER_USER)
 Message: You need the SUPER privilege for creation view with '%s'@'%s' definer
- Error: 1449 SQLSTATE: HY000 (ER_NO_SUCH_USER)
 Message: The user specified as a definer ('%s'@'%s') does not exist
- Error: 1450 SQLSTATE: HY000 (ER_FORBID_SCHEMA_CHANGE)
 Message: Changing schema from '%s' to '%s' is not allowed.
- Error: 1451 SQLSTATE: 23000 (ER_ROW_IS_REFERENCED_2)
 Message: Cannot delete or update a parent row: a foreign key constraint fails (%s)
- Error: 1452 SQLSTATE: 23000 (ER_NO_REFERENCED_ROW_2)
 Message: Cannot add or update a child row: a foreign key constraint fails (%s)
- Error: 1453 SQLSTATE: 42000 (ER_SP_BAD_VAR_SHADOW)
 Message: Variable '%s' must be quoted with `...`, or renamed

- Error: 1454 SQLSTATE: HY000 ([ER_TRG_NO_DEFINER](#))
 Message: No definer attribute for trigger '%s'.%s'. The trigger will be activated under the authorization of the invoker, which may have insufficient privileges. Please recreate the trigger.
- Error: 1455 SQLSTATE: HY000 ([ER_OLD_FILE_FORMAT](#))
 Message: '%s' has an old format, you should re-create the '%s' object(s)
- Error: 1456 SQLSTATE: HY000 ([ER_SP_RECURSION_LIMIT](#))
 Message: Recursive limit %d (as set by the max_sp_recursion_depth variable) was exceeded for routine %s
- Error: 1457 SQLSTATE: HY000 ([ER_SP_PROC_TABLE_CORRUPT](#))
 Message: Failed to load routine %s. The table mysql.proc is missing, corrupt, or contains bad data (internal code %d)
- Error: 1458 SQLSTATE: 42000 ([ER_SP_WRONG_NAME](#))
 Message: Incorrect routine name '%s'
- Error: 1459 SQLSTATE: HY000 ([ER_TABLE_NEEDS_UPGRADE](#))
 Message: Table upgrade required. Please do "REPAIR TABLE ` %s`" to fix it!
- Error: 1460 SQLSTATE: 42000 ([ER_SP_NO_AGGREGATE](#))
 Message: AGGREGATE is not supported for stored functions
- Error: 1461 SQLSTATE: 42000 ([ER_MAX_PREPARED_STMT_COUNT_REACHED](#))
 Message: Can't create more than max_prepared_stmt_count statements (current value: %lu)
- Error: 1462 SQLSTATE: HY000 ([ER_VIEW_RECURSIVE](#))
 Message: `%s`.` %s` contains view recursion
- Error: 1463 SQLSTATE: 42000 ([ER_NON_GROUPING_FIELD_USED](#))
 Message: non-grouping field '%s' is used in %s clause
- Error: 1464 SQLSTATE: HY000 ([ER_TABLE_CANT_HANDLE_SPKEYS](#))
 Message: The used table type doesn't support SPATIAL indexes
- Error: 1465 SQLSTATE: HY000 ([ER_NO_TRIGGERS_ON_SYSTEM_SCHEMA](#))
 Message: Triggers can not be created on system tables
- Error: 1466 SQLSTATE: HY000 ([ER_REMOVED_SPACES](#))
 Message: Leading spaces are removed from name '%s'
- Error: 1467 SQLSTATE: HY000 ([ER_AUTOINC_READ_FAILED](#))
 Message: Failed to read auto-increment value from storage engine
- Error: 1468 SQLSTATE: HY000 ([ER_USERNAME](#))
 Message: user name
- Error: 1469 SQLSTATE: HY000 ([ER_HOSTNAME](#))
 Message: host name
- Error: 1470 SQLSTATE: HY000 ([ER_WRONG_STRING_LENGTH](#))
 Message: String '%s' is too long for %s (should be no longer than %d)
- Error: 1471 SQLSTATE: HY000 ([ER_NON_INSERTABLE_TABLE](#))
 Message: The target table %s of the %s is not insertable-into

- Error: 1472 SQLSTATE: HY000 ([ER_ADMIN_WRONG_MRG_TABLE](#))
 Message: Table '%s' is differently defined or of non-MyISAM type or doesn't exist
- Error: 1473 SQLSTATE: HY000 ([ER_TOO_HIGH_LEVEL_OF_NESTING_FOR_SELECT](#))
 Message: Too high level of nesting for select
- Error: 1474 SQLSTATE: HY000 ([ER_NAME_BECOMES_EMPTY](#))
 Message: Name '%s' has become "
- Error: 1475 SQLSTATE: HY000 ([ER_AMBIGUOUS_FIELD_TERM](#))
 Message: First character of the FIELDS TERMINATED string is ambiguous; please use non-optional and non-empty FIELDS ENCLOSED BY
- Error: 1476 SQLSTATE: HY000 ([ER_FOREIGN_SERVER_EXISTS](#))
 Message: The foreign server, %s, you are trying to create already exists.
- Error: 1477 SQLSTATE: HY000 ([ER_FOREIGN_SERVER_DOESNT_EXIST](#))
 Message: The foreign server name you are trying to reference does not exist. Data source error: %s
- Error: 1478 SQLSTATE: HY000 ([ER_ILLEGAL_HA_CREATE_OPTION](#))
 Message: Table storage engine '%s' does not support the create option '%s'
- Error: 1479 SQLSTATE: HY000 ([ER_PARTITION_REQUIRES_VALUES_ERROR](#))
 Message: Syntax error: %s PARTITIONING requires definition of VALUES %s for each partition
- Error: 1480 SQLSTATE: HY000 ([ER_PARTITION_WRONG_VALUES_ERROR](#))
 Message: Only %s PARTITIONING can use VALUES %s in partition definition
- Error: 1481 SQLSTATE: HY000 ([ER_PARTITION_MAXVALUE_ERROR](#))
 Message: MAXVALUE can only be used in last partition definition
- Error: 1482 SQLSTATE: HY000 ([ER_PARTITION_SUBPARTITION_ERROR](#))
 Message: Subpartitions can only be hash partitions and by key
- Error: 1483 SQLSTATE: HY000 ([ER_PARTITION_SUBPART_MIX_ERROR](#))
 Message: Must define subpartitions on all partitions if on one partition
- Error: 1484 SQLSTATE: HY000 ([ER_PARTITION_WRONG_NO_PART_ERROR](#))
 Message: Wrong number of partitions defined, mismatch with previous setting
- Error: 1485 SQLSTATE: HY000 ([ER_PARTITION_WRONG_NO_SUBPART_ERROR](#))
 Message: Wrong number of subpartitions defined, mismatch with previous setting
- Error: 1486 SQLSTATE: HY000 ([ER_CONST_EXPR_IN_PARTITION_FUNC_ERROR](#))
 Message: Constant/Random expression in (sub)partitioning function is not allowed
- Error: 1487 SQLSTATE: HY000 ([ER_NO_CONST_EXPR_IN_RANGE_OR_LIST_ERROR](#))
 Message: Expression in RANGE/LIST VALUES must be constant
- Error: 1488 SQLSTATE: HY000 ([ER_FIELD_NOT_FOUND_PART_ERROR](#))
 Message: Field in list of fields for partition function not found in table
- Error: 1489 SQLSTATE: HY000 ([ER_LIST_OF_FIELDS_ONLY_IN_HASH_ERROR](#))
 Message: List of fields is only allowed in KEY partitions

- Error: 1490 SQLSTATE: HY000 ([ER_INCONSISTENT_PARTITION_INFO_ERROR](#))
Message: The partition info in the frm file is not consistent with what can be written into the frm file
- Error: 1491 SQLSTATE: HY000 ([ER_PARTITION_FUNC_NOT_ALLOWED_ERROR](#))
Message: The %s function returns the wrong type
- Error: 1492 SQLSTATE: HY000 ([ER_PARTITIONS_MUST_BE_DEFINED_ERROR](#))
Message: For %s partitions each partition must be defined
- Error: 1493 SQLSTATE: HY000 ([ER_RANGE_NOT_INCREASING_ERROR](#))
Message: VALUES LESS THAN value must be strictly increasing for each partition
- Error: 1494 SQLSTATE: HY000 ([ER_INCONSISTENT_TYPE_OF_FUNCTIONS_ERROR](#))
Message: VALUES value must be of same type as partition function
- Error: 1495 SQLSTATE: HY000 ([ER_MULTIPLE_DEF_CONST_IN_LIST_PART_ERROR](#))
Message: Multiple definition of same constant in list partitioning
- Error: 1496 SQLSTATE: HY000 ([ER_PARTITION_ENTRY_ERROR](#))
Message: Partitioning can not be used stand-alone in query
- Error: 1497 SQLSTATE: HY000 ([ER_MIX_HANDLER_ERROR](#))
Message: The mix of handlers in the partitions is not allowed in this version of MySQL
- Error: 1498 SQLSTATE: HY000 ([ER_PARTITION_NOT_DEFINED_ERROR](#))
Message: For the partitioned engine it is necessary to define all %s
- Error: 1499 SQLSTATE: HY000 ([ER_TOO_MANY_PARTITIONS_ERROR](#))
Message: Too many partitions (including subpartitions) were defined
- Error: 1500 SQLSTATE: HY000 ([ER_SUBPARTITION_ERROR](#))
Message: It is only possible to mix RANGE/LIST partitioning with HASH/KEY partitioning for subpartitioning
- Error: 1501 SQLSTATE: HY000 ([ER_CANT_CREATE_HANDLER_FILE](#))
Message: Failed to create specific handler file
- Error: 1502 SQLSTATE: HY000 ([ER_BLOB_FIELD_IN_PART_FUNC_ERROR](#))
Message: A BLOB field is not allowed in partition function
- Error: 1503 SQLSTATE: HY000 ([ER_UNIQUE_KEY_NEED_ALL_FIELDS_IN_PF](#))
Message: A %s must include all columns in the table's partitioning function
- Error: 1504 SQLSTATE: HY000 ([ER_NO_PARTS_ERROR](#))
Message: Number of %s = 0 is not an allowed value
- Error: 1505 SQLSTATE: HY000 ([ER_PARTITION_MGMT_ON_NONPARTITIONED](#))
Message: Partition management on a not partitioned table is not possible
- Error: 1506 SQLSTATE: HY000 ([ER_FOREIGN_KEY_ON_PARTITIONED](#))
Message: Foreign key condition is not yet supported in conjunction with partitioning
- Error: 1507 SQLSTATE: HY000 ([ER_DROP_PARTITION_NON_EXISTENT](#))
Message: Error in list of partitions to %s

- Error: 1508 SQLSTATE: HY000 ([ER_DROP_LAST_PARTITION](#))
Message: Cannot remove all partitions, use DROP TABLE instead
- Error: 1509 SQLSTATE: HY000 ([ER_COALESCE_ONLY_ON_HASH_PARTITION](#))
Message: COALESCE PARTITION can only be used on HASH/KEY partitions
- Error: 1510 SQLSTATE: HY000 ([ER_REORG_HASH_ONLY_ON_SAME_NO](#))
Message: REORGANISE PARTITION can only be used to reorganise partitions not to change their numbers
- Error: 1511 SQLSTATE: HY000 ([ER_REORG_NO_PARAM_ERROR](#))
Message: REORGANISE PARTITION without parameters can only be used on auto-partitioned tables using HASH PARTITIONS
- Error: 1512 SQLSTATE: HY000 ([ER_ONLY_ON_RANGE_LIST_PARTITION](#))
Message: %s PARTITION can only be used on RANGE/LIST partitions
- Error: 1513 SQLSTATE: HY000 ([ER_ADD_PARTITION_SUBPART_ERROR](#))
Message: Trying to Add partition(s) with wrong number of subpartitions
- Error: 1514 SQLSTATE: HY000 ([ER_ADD_PARTITION_NO_NEW_PARTITION](#))
Message: At least one partition must be added
- Error: 1515 SQLSTATE: HY000 ([ER_COALESCE_PARTITION_NO_PARTITION](#))
Message: At least one partition must be coalesced
- Error: 1516 SQLSTATE: HY000 ([ER_REORG_PARTITION_NOT_EXIST](#))
Message: More partitions to reorganise than there are partitions
- Error: 1517 SQLSTATE: HY000 ([ER_SAME_NAME_PARTITION](#))
Message: Duplicate partition name %s
- Error: 1518 SQLSTATE: HY000 ([ER_NO_BINLOG_ERROR](#))
Message: It is not allowed to shut off binlog on this command
- Error: 1519 SQLSTATE: HY000 ([ER_CONSECUTIVE_REORG_PARTITIONS](#))
Message: When reorganising a set of partitions they must be in consecutive order
- Error: 1520 SQLSTATE: HY000 ([ER_REORG_OUTSIDE_RANGE](#))
Message: Reorganize of range partitions cannot change total ranges except for last partition where it can extend the range
- Error: 1521 SQLSTATE: HY000 ([ER_PARTITION_FUNCTION_FAILURE](#))
Message: Partition function not supported in this version for this handler
- Error: 1522 SQLSTATE: HY000 ([ER_PART_STATE_ERROR](#))
Message: Partition state cannot be defined from CREATE/ALTER TABLE
- Error: 1523 SQLSTATE: HY000 ([ER_LIMITED_PART_RANGE](#))
Message: The %s handler only supports 32 bit integers in VALUES
- Error: 1524 SQLSTATE: HY000 ([ER_PLUGIN_IS_NOT_LOADED](#))
Message: Plugin '%s' is not loaded
- Error: 1525 SQLSTATE: HY000 ([ER_WRONG_VALUE](#))
Message: Incorrect %s value: '%s'

- Error: 1526 SQLSTATE: HY000 ([ER_NO_PARTITION_FOR_GIVEN_VALUE](#))
Message: Table has no partition for value %s
- Error: 1527 SQLSTATE: HY000 ([ER_FILEGROUP_OPTION_ONLY_ONCE](#))
Message: It is not allowed to specify %s more than once
- Error: 1528 SQLSTATE: HY000 ([ER_CREATE_FILEGROUP_FAILED](#))
Message: Failed to create %s
- Error: 1529 SQLSTATE: HY000 ([ER_DROP_FILEGROUP_FAILED](#))
Message: Failed to drop %s
- Error: 1530 SQLSTATE: HY000 ([ER_TABLESPACE_AUTO_EXTEND_ERROR](#))
Message: The handler doesn't support autoextend of tablespaces
- Error: 1531 SQLSTATE: HY000 ([ER_WRONG_SIZE_NUMBER](#))
Message: A size parameter was incorrectly specified, either number or on the form 10M
- Error: 1532 SQLSTATE: HY000 ([ER_SIZE_OVERFLOW_ERROR](#))
Message: The size number was correct but we don't allow the digit part to be more than 2 billion
- Error: 1533 SQLSTATE: HY000 ([ER_ALTER_FILEGROUP_FAILED](#))
Message: Failed to alter: %s
- Error: 1534 SQLSTATE: HY000 ([ER_BINLOG_ROW_LOGGING_FAILED](#))
Message: Writing one row to the row-based binary log failed
- Error: 1535 SQLSTATE: HY000 ([ER_BINLOG_ROW_WRONG_TABLE_DEF](#))
Message: Table definition on master and slave does not match: %s
- Error: 1536 SQLSTATE: HY000 ([ER_BINLOG_ROW_RBR_TO_SBR](#))
Message: Slave running with --log-slave-updates must use row-based binary logging to be able to replicate row-based binary log events
- Error: 1537 SQLSTATE: HY000 ([ER_EVENT_ALREADY_EXISTS](#))
Message: Event '%s' already exists
- Error: 1538 SQLSTATE: HY000 ([ER_EVENT_STORE_FAILED](#))
Message: Failed to store event %s. Error code %d from storage engine.
- Error: 1539 SQLSTATE: HY000 ([ER_EVENT_DOES_NOT_EXIST](#))
Message: Unknown event '%s'
- Error: 1540 SQLSTATE: HY000 ([ER_EVENT_CANT ALTER](#))
Message: Failed to alter event '%s'
- Error: 1541 SQLSTATE: HY000 ([ER_EVENT_DROP_FAILED](#))
Message: Failed to drop %s
- Error: 1542 SQLSTATE: HY000 ([ER_EVENT_INTERVAL_NOT_POSITIVE_OR_TOO_BIG](#))
Message: INTERVAL is either not positive or too big
- Error: 1543 SQLSTATE: HY000 ([ER_EVENT_ENDS_BEFORE_STARTS](#))
Message: ENDS is either invalid or before STARTS

- Error: 1544 SQLSTATE: HY000 ([ER_EVENT_EXEC_TIME_IN_THE_PAST](#))
Message: Event execution time is in the past. Event has been disabled
- Error: 1545 SQLSTATE: HY000 ([ER_EVENT_OPEN_TABLE_FAILED](#))
Message: Failed to open mysql.event
- Error: 1546 SQLSTATE: HY000 ([ER_EVENT_NEITHER_M_EXPR_NOR_M_AT](#))
Message: No datetime expression provided
- Error: 1547 SQLSTATE: HY000 ([ER_COL_COUNT_DOESNT_MATCH_CORRUPTED](#))
Message: Column count of mysql.%s is wrong. Expected %d, found %d. The table is probably corrupted
- Error: 1548 SQLSTATE: HY000 ([ER_CANNOT_LOAD_FROM_TABLE](#))
Message: Cannot load from mysql.%s. The table is probably corrupted
- Error: 1549 SQLSTATE: HY000 ([ER_EVENT_CANNOT_DELETE](#))
Message: Failed to delete the event from mysql.event
- Error: 1550 SQLSTATE: HY000 ([ER_EVENT_COMPILE_ERROR](#))
Message: Error during compilation of event's body
- Error: 1551 SQLSTATE: HY000 ([ER_EVENT_SAME_NAME](#))
Message: Same old and new event name
- Error: 1552 SQLSTATE: HY000 ([ER_EVENT_DATA_TOO_LONG](#))
Message: Data for column '%s' too long
- Error: 1553 SQLSTATE: HY000 ([ER_DROP_INDEX_FK](#))
Message: Cannot drop index '%s': needed in a foreign key constraint
- Error: 1554 SQLSTATE: HY000 ([ER_WARN_DEPRECATED_SYNTAX_WITH_VER](#))
Message: The syntax '%s' is deprecated and will be removed in MySQL %s. Please use %s instead
- Error: 1555 SQLSTATE: HY000 ([ER_CANT_WRITE_LOCK_LOG_TABLE](#))
Message: You can't write-lock a log table. Only read access is possible
- Error: 1556 SQLSTATE: HY000 ([ER_CANT_LOCK_LOG_TABLE](#))
Message: You can't use locks with log tables.
- Error: 1557 SQLSTATE: 23000 ([ER_FOREIGN_DUPLICATE_KEY](#))
Message: Upholding foreign key constraints for table '%s', entry '%s', key %d would lead to a duplicate entry
- Error: 1558 SQLSTATE: HY000 ([ER_COL_COUNT_DOESNT_MATCH_PLEASE_UPDATE](#))
Message: Column count of mysql.%s is wrong. Expected %d, found %d. Created with MySQL %d, now running %d. Please use mysql_upgrade to fix this error.
- Error: 1559 SQLSTATE: HY000 ([ER_TEMP_TABLE_PREVENTS_SWITCH_OUT_OF_RBR](#))
Message: Cannot switch out of the row-based binary log format when the session has open temporary tables
- Error: 1560 SQLSTATE: HY000 ([ER_STORED_FUNCTION_PREVENTS_SWITCH_BINLOG_FORMAT](#))
Message: Cannot change the binary logging format inside a stored function or trigger
- Error: 1561 SQLSTATE: HY000 ([ER_NDB_CANT_SWITCH_BINLOG_FORMAT](#))
Message: The NDB cluster engine does not support changing the binlog format on the fly yet

- Error: 1562 SQLSTATE: HY000 (ER_PARTITION_NO_TEMPORARY)
 Message: Cannot create temporary table with partitions
- Error: 1563 SQLSTATE: HY000 (ER_PARTITION_CONST_DOMAIN_ERROR)
 Message: Partition constant is out of partition function domain
- Error: 1564 SQLSTATE: HY000 (ER_PARTITION_FUNCTION_IS_NOT_ALLOWED)
 Message: This partition function is not allowed
- Error: 1565 SQLSTATE: HY000 (ER_DDL_LOG_ERROR)
 Message: Error in DDL log
- Error: 1566 SQLSTATE: HY000 (ER_NULL_IN_VALUES_LESS_THAN)
 Message: Not allowed to use NULL value in VALUES LESS THAN
- Error: 1567 SQLSTATE: HY000 (ER_WRONG_PARTITION_NAME)
 Message: Incorrect partition name
- Error: 1568 SQLSTATE: 25001 (ER_CANT_CHANGE_TX_ISOLATION)
 Message: Transaction isolation level can't be changed while a transaction is in progress
- Error: 1569 SQLSTATE: HY000 (ER_DUP_ENTRY_AUTOINCREMENT_CASE)
 Message: ALTER TABLE causes auto_increment resequencing, resulting in duplicate entry '%s' for key '%s'
- Error: 1570 SQLSTATE: HY000 (ER_EVENT_MODIFY_QUEUE_ERROR)
 Message: Internal scheduler error %d
- Error: 1571 SQLSTATE: HY000 (ER_EVENT_SET_VAR_ERROR)
 Message: Error during starting/stopping of the scheduler. Error code %u
- Error: 1572 SQLSTATE: HY000 (ER_PARTITION_MERGE_ERROR)
 Message: Engine cannot be used in partitioned tables
- Error: 1573 SQLSTATE: HY000 (ER_CANT_ACTIVATE_LOG)
 Message: Cannot activate '%s' log
- Error: 1574 SQLSTATE: HY000 (ER_RBR_NOT_AVAILABLE)
 Message: The server was not built with row-based replication
- Error: 1575 SQLSTATE: HY000 (ER_BASE64_DECODE_ERROR)

B.4. Client Error Codes and Messages

Client error information comes from the following source files:

- The Error values and the symbols in parentheses correspond to definitions in the `include/errmsg.h` MySQL source file.
- The Message values correspond to the error messages that are listed in the `libmysql/errmsg.c` file. `%d` and `%s` represent numbers and strings, respectively, that are substituted into the messages when they are displayed.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: 2000 (CR_UNKNOWN_ERROR)

Message: Unknown MySQL error

- Error: 2001 (CR_SOCKET_CREATE_ERROR)

Message: Can't create UNIX socket (%d)

- Error: 2002 (CR_CONNECTION_ERROR)

Message: Can't connect to local MySQL server through socket '%s' (%d)

- Error: 2003 (CR_CONN_HOST_ERROR)

Message: Can't connect to MySQL server on '%s' (%d)

- Error: 2004 (CR_IPSOCK_ERROR)

Message: Can't create TCP/IP socket (%d)

- Error: 2005 (CR_UNKNOWN_HOST)

Message: Unknown MySQL server host '%s' (%d)

- Error: 2006 (CR_SERVER_GONE_ERROR)

Message: MySQL server has gone away

- Error: 2007 (CR_VERSION_ERROR)

- Message: Protocol mismatch; server version = %d, client version = %d
- Error: 2008 (CR_OUT_OF_MEMORY)
Message: MySQL client ran out of memory
- Error: 2009 (CR_WRONG_HOST_INFO)
Message: Wrong host info
- Error: 2010 (CR_LOCALHOST_CONNECTION)
Message: Localhost via UNIX socket
- Error: 2011 (CR_TCP_CONNECTION)
Message: %s via TCP/IP
- Error: 2012 (CR_SERVER_HANDSHAKE_ERR)
Message: Error in server handshake
- Error: 2013 (CR_SERVER_LOST)
Message: Lost connection to MySQL server during query
- Error: 2014 (CR_COMMANDS_OUT_OF_SYNC)
Message: Commands out of sync; you can't run this command now
- Error: 2015 (CR_NAMEDPIPE_CONNECTION)
Message: Named pipe: %s
- Error: 2016 (CR_NAMEDPIPEWAIT_ERROR)
Message: Can't wait for named pipe to host: %s pipe: %s (%lu)
- Error: 2017 (CR_NAMEDPIPEOPEN_ERROR)
Message: Can't open named pipe to host: %s pipe: %s (%lu)
- Error: 2018 (CR_NAMEDPIPESETSTATE_ERROR)
Message: Can't set state of named pipe to host: %s pipe: %s (%lu)
- Error: 2019 (CR_CANT_READ_CHARSET)
Message: Can't initialize character set %s (path: %s)
- Error: 2020 (CR_NET_PACKET_TOO_LARGE)
Message: Got packet bigger than 'max_allowed_packet' bytes
- Error: 2021 (CR_EMBEDDED_CONNECTION)
Message: Embedded server
- Error: 2022 (CR_PROBE_SLAVE_STATUS)
Message: Error on SHOW SLAVE STATUS:
- Error: 2023 (CR_PROBE_SLAVE_HOSTS)

Message: Error connecting to master:

- Error: 2026 (CR_SSL_CONNECTION_ERROR)

Message: SSL connection error

- Error: 2027 (CR_MALFORMED_PACKET)

Message: Malformed packet

- Error: 2028 (CR_WRONG_LICENSE)

Message: This client library is licensed only for use with MySQL servers having '%s' license

- Error: 2029 (CR_NULL_POINTER)

Message: Invalid use of null pointer

- Error: 2030 (CR_NO_PREPARE_STMT)

Message: Statement not prepared

- Error: 2031 (CR_PARAMS_NOT_BOUND)

Message: No data supplied for parameters in prepared statement

- Error: 2032 (CR_DATA_TRUNCATED)

Message: Data truncated

- Error: 2033 (CR_NO_PARAMETERS_EXISTS)

Message: No parameters exist in the statement

- Error: 2034 (CR_INVALID_PARAMETER_NO)

Message: Invalid parameter number

- Error: 2035 (CR_INVALID_BUFFER_USE)

Message: Can't send long data for non-string/non-binary data types (parameter: %d)

- Error: 2036 (CR_UNSUPPORTED_PARAM_TYPE)

Message: Using unsupported buffer type: %d (parameter: %d)

- Error: 2037 (CR_SHARED_MEMORY_CONNECTION)

Message: Shared memory: %s

- Error: 2038 (CR_SHARED_MEMORY_CONNECT_REQUEST_ERROR)

Message: Can't open shared memory; client could not create request event (%lu)

- Error: 2039 (CR_SHARED_MEMORY_CONNECT_ANSWER_ERROR)

Message: Can't open shared memory; no answer event received from server (%lu)

- Error: 2040 (CR_SHARED_MEMORY_CONNECT_FILE_MAP_ERROR)

Message: Can't open shared memory; server could not allocate file mapping (%lu)

- Error: 2041 (CR_SHARED_MEMORY_CONNECT_MAP_ERROR)

Message: Can't open shared memory; server could not get pointer to file mapping (%lu)

- Error: 2042 (CR_SHARED_MEMORY_FILE_MAP_ERROR)

Message: Can't open shared memory; client could not allocate file mapping (%lu)

- Error: 2043 (CR_SHARED_MEMORY_MAP_ERROR)

Message: Can't open shared memory; client could not get pointer to file mapping (%lu)

- Error: 2044 (CR_SHARED_MEMORY_EVENT_ERROR)

Message: Can't open shared memory; client could not create %s event (%lu)

- Error: 2045 (CR_SHARED_MEMORY_CONNECT_ABANDONED_ERROR)

Message: Can't open shared memory; no answer from server (%lu)

- Error: 2046 (CR_SHARED_MEMORY_CONNECT_SET_ERROR)

Message: Can't open shared memory; cannot send request event to server (%lu)

- Error: 2047 (CR_CONN_UNKNOW_PROTOCOL)

Message: Wrong or unknown protocol

- Error: 2048 (CR_INVALID_CONN_HANDLE)

Message: Invalid connection handle

- Error: 2049 (CR_SECURE_AUTH)

Message: Connection using old (pre-4.1.1) authentication protocol refused (client option 'secure_auth' enabled)

- Error: 2050 (CR_FETCH_CANCELED)

Message: Row retrieval was canceled by mysql_stmt_close() call

- Error: 2051 (CR_NO_DATA)

Message: Attempt to read column without prior row fetch

- Error: 2052 (CR_NO_STMT_METADATA)

Message: Prepared statement contains no metadata

- Error: 2053 (CR_NO_RESULT_SET)

Message: Attempt to read a row while there is no result set associated with the statement

- Error: 2054 (CR_NOT_IMPLEMENTED)

Message: This feature is not implemented yet

- Error: 2055 (CR_SERVER_LOST_EXTENDED)

Message: Lost connection to MySQL server at '%s', system error: %d

- Error: 2056 (CR_STMT_CLOSED)

Message: Statement closed indirectly because of a preceding %s() call

- Error: 2057 (CR_NEW_STMT_METADATA)

Message: The number of columns in the result set differs from the number of bound buffers. You must reset the statement, re-bind the result set columns, and execute the statement again

Appendix C. MySQL Change History

This appendix lists the changes from version to version in the MySQL source code through the latest version of MySQL 5.4, which is currently MySQL 5.4.0. Starting with MySQL 5.0, we began offering a new version of the Manual for each new series of MySQL releases (5.0, 5.1, and so on). For information about changes in previous release series of the MySQL database software, see the corresponding version of this Manual. For information about legacy versions of the MySQL software through the 4.1 series, see *MySQL 3.23, 4.0, 4.1 Reference Manual*.

We update this section as we add new features in the 5.4 series, so that everybody can follow the development process.

Note that we tend to update the manual at the same time we make changes to MySQL. If you find a recent version of MySQL listed here that you can't find on our download page (<http://dev.mysql.com/downloads/>), it means that the version has not yet been released.

The date mentioned with a release version is the date of the last Bazaar ChangeSet on which the release was based, not the date when the packages were made available. The binaries are usually made available a few days after the date of the tagged ChangeSet, because building and testing all packages takes some time.

The manual included in the source and binary distributions may not be fully accurate when it comes to the release changelog entries, because the integration of the manual happens at build time. For the most up-to-date release changelog, please refer to the online version instead.

C.1. Changes in release 5.4.x (Development)

An overview of which features were added in MySQL 5.4 can be found here: [Section 1.4.1, “What Is New in MySQL 5.4”](#).

For a full list of changes, please refer to the changelog sections for each individual 5.4.x release.

C.1.1. Changes in MySQL 5.4.0 (05 April 2009 Beta)

Binary MySQL 5.4.0 distributions are available as 64-bit builds for Solaris 10-x86_64, Solaris10-SPARC, and Linux x86_64-glibc23.

If you use a source distribution, the `BUILD/build_mccge.sh` script can be used to configure and build MySQL 5.4.0. Run this script with the `--help` option to see the available options.

Functionality added or changed:

- **Incompatible Change:** The following `InnoDB` system variable changes were made:
 - `innodb_file_io_threads`: Removed (replaced by `innodb_read_io_threads` and `innodb_write_io_threads`).
 - If you upgrade to MySQL 5.4 from an existing MySQL 5.1 installation and explicitly set `innodb_file_io_threads` at server startup, you will need to change your configuration. `innodb_read_io_threads` and `innodb_write_io_threads` can be used instead.
 - `innodb_read_io_threads` and `innodb_write_io_threads`: Default changed from 1 to 8.
 - `innodb_buffer_pool_size`: Default increased from 8 MB to 1GB. Minimum increased from 1MB to 64MB.
 - `innodb_additional_mem_pool_size`: Default increased from 1MB to 8MB. Minimum increased from 512KB to 2MB.
 - `innodb_max_dirty_pages_pct`: Default decreased from 90 to 75. Maximum decreased from 100 to 99 to never allow a completely dirty buffer pool.
 - `innodb_log_buffer_size`: Default increased from 1MB to 16MB. Minimum increased from 256KB to 2MB.
 - `innodb_log_file_size`: Default increased from 5MB to 128MB. Minimum increased from 1MB to 32MB.
 - `innodb_log_files_in_group`: Default increased from 2 to 3.
 - `innodb_io_capacity`: Default increased from 100 to 200.
 - `innodb_autoextend_increment`: Default increased from 8MB to 64MB.

([Bug#42607](#), [Bug#42608](#))

- **Incompatible Change:** If you upgrade to MySQL 5.4 from an existing MySQL 5.1 installation, an issue may occur due to `InnoDB` log file configuration changes. MySQL 5.4 increases the default value of `innodb_log_files_in_group` from 2 to 3. It also increases the default value of `innodb_log_file_size` from 5MB to 128MB and the minimum value of `innodb_log_file_size` from 1MB to 32MB.

For an upgrade, it is necessary to account for these changes. There are two ways to do so:

1. Configure MySQL 5.4 to use your current configuration values. *This can be done only if your current `InnoDB` log file size is at least as large as the new minimum size of 32MB.* For example, if you use the previous default number of files (2), configured to a size of 64MB each, put these lines in your server's `my.cnf` file before starting the 5.4 server:

```
[mysqld]
innodb_log_files_in_group=2
innodb_log_file_size=64M
```

2. Discard the old `InnoDB` log files and let MySQL 5.4 create new ones. This can be done regardless of your current configuration values, but it is necessary to shut down your current server cleanly so that no outstanding transaction information remains in the log. The procedure to use depends on the value of `innodb_fast_shutdown`:
 - If `innodb_fast_shutdown` is not set to 2: Stop your current MySQL server and make sure that it shuts down without errors (to ensure that there is no information for outstanding transactions in the log). Copy the old log files into a safe place in case something went wrong during the shutdown and you need them to recover the tablespace. Delete the old log files and edit `my.cnf` if necessary to specify the desired log file configuration. Then upgrade to MySQL 5.4 and start the new server. `mysqld` sees that no `InnoDB` log files exist at startup and creates new ones.
 - If `innodb_fast_shutdown` is set to 2: Shut down your current server, set `innodb_fast_shutdown` to 1, and restart the server. The server should be allowed to recover. Then you should shut down the server again and follow the procedure described in the preceding item to change `InnoDB` log file size. Set `innodb_fast_shutdown` back to 2 and start the MySQL 5.4 server.
- The Instance Manager (`mysqlmanager`) has been discontinued and is no longer provided in MySQL releases.

Bugs fixed:

- The server unnecessarily acquired a query cache mutex even with the query cache disabled, resulting in a small performance decrement. ([Bug#38551](#))

C.2. MySQL Enterprise Monitor Change History

This appendix lists the changes to the MySQL Enterprise Monitor, beginning with the most recent release. Each release section covers added or changed functionality, bug fixes, and known issues, if applicable. All bug fixes are referenced by bug number and include a link to the bug database. Bugs are listed in order of resolution. To find a bug quickly, search by bug number.

C.2.1. Changes in MySQL Enterprise Monitor 2.1.0 (Not yet released)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.0.6.

Functionality added or changed:

- The agent should be able to run as a non-root user. However, the startup scripts always started it as root.

The agent chassis now has a new option `--user` to drop privileges after being started as root. Note, this does not work when not started as superuser, nor on Windows.

A new dialog box has also been added to the agent installer. The dialog has the following text: “The agent does not need to run with root user privileges. The agent will switch to the user account provided below when started by the root user.”

The dialog also has a text field to allow the entry of the user account.

A new parameter was also added to the `mysql-monitor-agent.ini` file. The parameter has the format `user=xxx`, where `xxx` is the user account to be used. ([Bug#33778](#))

Bugs fixed:

- The recommendation for the rule [Table Cache Not Optimal](#) says:

```
Recommended Action
SET GLOBAL table_cache = (64 + 16);
```

But an error was generated on executing that query:

```
mysql> SET GLOBAL table_cache = (64 + 16);
ERROR 1193 (HY000): Unknown system variable 'table_cache'

mysql> select version();
+-----+
| version() |
+-----+
| 5.1.31-log |
+-----+
1 row in set (0.01 sec)
```

([Bug#44602](#))

- The Mac OS X version of the Service Manager uses the system JRE. The system JRE loads the libraries located in [/Library/Java/Extensions](#). As libraries in the extensions directory take precedence over other libraries, this caused conflicts when user extension libraries were installed there, as these would be used by the JRE when running Service Manager, instead of the shipped libraries. This happened when Java-related products were installed such as Connector/J, Spring, and Hibernate.

This fix stops user-installed extension libraries from being used when the JRE runs the Service Manager, thus giving a “pristine” environment with no library collisions. ([Bug#44157](#))

- Accessing the Query Analyzer tab caused a full table scan to take place on the MySQL Enterprise Monitor database. ([Bug#43989](#))
- The Replication Group was renamed back to its default name after a new topology was discovered. ([Bug#43816](#))
- A new topology was not discovered after the previous replication group was renamed. ([Bug#43815](#))
- On Unix systems, executing the command:

```
./mysqlmonitorctl.sh stop
```

did not make sure that `mysqld` was shutdown before finishing.

This resulted in a situation such as the following:

```
# /opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh stop
Using CATALINA_BASE:   /opt/mysql/enterprise/monitor/apache-tomcat
Using CATALINA_HOME:   /opt/mysql/enterprise/monitor/apache-tomcat
Using CATALINA_TMPDIR: /opt/mysql/enterprise/monitor/apache-tomcat/temp
Using JRE_HOME:        /opt/mysql/enterprise/monitor-2.0.0.7092/java
Stopping tomcat service ... [ OK ]
/opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh : mysql stopped
```

However, running the following command a few minutes later showed that the MySQL server was still running:

```
# /opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh status
MySQL Network MySQL is running
MySQL Network Tomcat is not running
```

([Bug#43803](#))

- The MySQL Enterprise Monitor upgrade installer incorrectly replaced the `AdvisorScript.jar` in `<instDir>/apache-tomcat/webapps/ROOT/WEB-INF/lib/` with the default Advisor JAR. ([Bug#43773](#))
- The SNMP trap source IP was always set to 127.0.0.1. ([Bug#43738](#))
- The installer exited with a return code 0, even if an error was detected and reported to the user during the installation.

```
.../mysqlmonitor-2.1.0.1015-linux-x86-64bit-installer.bin --mode unattended --installdir
/data0/merlin/monitoring/2.1.0.1015/host/38080 --tomcatport 38080 --tomcatshutdownport
38503 --tomcatsslport 38443 --dbport 33300 --usessl 1 --adminuser **user** --adminpassword **pwd**
Error running /data0/merlin/monitoring/2.1.0.1015/host/38080/mysql/bin/mysql
--defaults-file=/data0/merlin/monitoring/2.1.0.1015/host/38080/mysql/my.cnf -S
/data0/merlin/monitoring/2.1.0.1015/qa-merlin/38080/mysql/tmp/mysql.sock -u root -D mysql
-e "update user set Password = PASSWORD('**pwd**') where User = 'root'; update user set
User = '**user**' where User = 'root';delete from user where User = '';flush privileges;"
: ERROR 2002 (HY000): Can't connect to local MySQL server through socket
'/data0/merlin/monitoring/2.1.0.1015/host/38080/mysql/tmp/mysql.sock' (2)
```

(Bug#43676)

- The agent created the `mysql.inventory` table with an engine type of InnoDB, instead of MyISAM, when InnoDB was specified as the default engine type in `my.cnf`. This happened because the agent did not explicitly specify the table engine type to be of MyISAM. (Bug#43551)
- When a trailing space, or tab character, was added at the end of a parameter in the `config.properties` file, MySQL Enterprise Monitor failed to start and generated the following errors in log:

```
ERROR [Thread-1:org.springframework.web.context.ContextLoader] Context initialization
failed
...
Caused by: java.sql.SQLException: Illegal connection port value '13306'
...
```

Resolving the problem required detailed log analysis because the configuration file did not show any apparent problems. (Bug#43540)

- If a host was not a slave during the initial discovery phase, then it would not be displayed in the Replication tab if it subsequently became a slave.

This was because after the initial discovery phase, if a host did not have `slavestatus` present, no subsequent checks were made to check for the host being a slave. It was therefore missed for the purposes of replication discovery and never showed in the Replication tab. (Bug#42997)

- Heat Chart rules could not be disabled or unscheduled. (Bug#42932)
- There were four columns added to the `SHOW SLAVE STATUS` query in MySQL Server 5.1: `Last_IO_Errno`, `Last_IO_Error`, `Last_SQL_Errno`, and `Last_SQL_Error`.

However, these were not displayed within the Replication tab. (Bug#42811)

- The installer used to upgrade from version 1.3 corrupted passwords containing the “?” character. (Bug#42452)
- Sun multi-core processors caused all cores to be reported on the meta information page.

The larger T-series SPARC processors have 32+ cores. This caused the meta information page in the Dashboard to scroll as it reported each one. (Bug#42355)

- The username field for new users was populated by the last username used.

When creating a new user for the second time in Dashboard, the previously created username appeared in the dialog. (Bug#42314)

- The `my.cnf` file for the Enterprise Monitor internal database had the following configuration item:

```
innodb_autoextend_increment = 50M
```

This generated the error:

```
16:36:23 [Warning] option 'innodb_autoextend_increment': unsigned value 52428800
adjusted to 1000
```

This variable is interpreted as being specified in MB, so 50M would be 50 TB. Such a high value results in the variable being adjusted to 1000 MB.

The value in the configuration file should be:

```
innodb_autoextend_increment = 50
```

(Bug#42096)

- A number of Advisor rules had advice text that had not been translated into Japanese. The Advisors that contained untranslated rules included Performance, Schema and Security. (Bug#42067)
- `OM_REFRESH` was not supported by MySQL Proxy, it caused an `abort()`.

```
shell> ./mysql-proxy --proxy-backend-addresses=192.168.250.3:3306
network-mysqld-proxy.c.3524: COM_(0x07) is not handled
Aborted (core dumped)
```

```

```

([Bug#41991](#))

- The MySQL Enterprise Monitor file `my.cnf` specified an initial size of 500M for the central tablespace. However, `innodb_file_per_table` was used as well, resulting in approximately 500M of space being potentially wasted. ([Bug#41967](#))
- After an error was generated due to an incorrect password while trying to create a new user, the following error was obtained when subsequently attempting to create a valid new user:

```
U0002 You must log in to access the requested resource
```

([Bug#41384](#))

- SNMP trap messages were sending 127.0.0.1 as the IP address, and there was no feature to allow the user to configure the IP address contained in the SNMP message, which would have been useful for troubleshooting. ([Bug#41361](#))
- Allowing the heat chart rules to be set to unscheduled caused the user interface to appear broken. ([Bug#41312](#))
- Graphs were incorrect for data that did not change. The graphs appeared as if no data had been gathered.

The Hit Ratios graph had gaps in it where there had not been any activity on the parameters being monitored. For instance, if MyISAM tables were not used, then no Key Cache hit ratio series was plotted, even though the variables were still being collected. ([Bug#41232](#))

- When creating a new Database Administrator user in FireFox 2 the following error message was generated:

```
U0002 You must log in to access the requested resource.
```

This occurred in a new installation using the default administrator account. No Query Analysis permissions were given. However, the operation worked correctly using the Safari web browser. ([Bug#41032](#))

- The **MANAGE SERVERS** page did not refresh in a manner consistent with other pages. This meant that changes to configuration made by others would not be reflected on the page. Also, changes in the status of the servers were not displayed automatically. ([Bug#40792](#))
- The agent installer for Solaris 8 x86 32-bit was missing. ([Bug#40248](#))
- Even though Query Analysis was disabled through the user interface, the queries that go through the agent were still being collected.

When Query Analysis was turned back on in the user interface, those queries were then displayed. ([Bug#40032](#))

- Alerts sent from MySQL Enterprise Monitor used the GMT timezone, for example:

```
Time: 2008-09-17 19:41:08 GMT
```

That was not convenient for users, as their timezones may not have been GMT. ([Bug#39504](#))

- The MySQL Enterprise Monitor upgrade installer replaced the `my.cnf` file. This resulted in the loss of any changes that had been made to the configuration file. ([Bug#36528](#))
- If the “On Save send test trap” checkbox was checked when the SAVE button was clicked and the locale was set to Japanese, an error occurred. The orange error banner was displayed at the top of the page with the error message in Japanese. ([Bug#32069](#))

C.2.2. Changes in MySQL Enterprise Monitor 2.0.6 (Not yet released)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.0.5.

Bugs fixed:

- An error was generated when an attempt was made to rename a Replication Group to one that had previously been deleted. ([Bug#43846](#))
- A new topology was not discovered after the previous replication group was renamed. ([Bug#43815](#))
- On Unix systems, executing the command:

```
./mysqlmonitorctl.sh stop
```

did not make sure that `mysqld` was shutdown before finishing.

This resulted in a situation such as the following:

```
# /opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh stop
Using CATALINA_BASE:   /opt/mysql/enterprise/monitor/apache-tomcat
Using CATALINA_HOME:   /opt/mysql/enterprise/monitor/apache-tomcat
Using CATALINA_TMPDIR: /opt/mysql/enterprise/monitor/apache-tomcat/temp
Using JRE_HOME:        /opt/mysql/enterprise/monitor-2.0.0.7092/java
Stopping tomcat service ... [ OK ]
/opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh : mysql stopped
```

However, running the following command a few minutes later showed that the MySQL server was still running:

```
# /opt/mysql/enterprise/monitor-2.0.0.7092/mysqlmonitorctl.sh status
MySQL Network MySQL is running
MySQL Network Tomcat is not running
```

([Bug#43803](#))

- The MySQL Enterprise Monitor upgrade installer incorrectly replaced the `AdvisorScript.jar` in `<instDir>/apache-tomcat/webapps/ROOT/WEB-INF/lib/` with the default Advisor JAR. ([Bug#43773](#))
- The agent created the `mysql.inventory` table with an engine type of InnoDB, instead of MyISAM, when InnoDB was specified as the default engine type in `my.cnf`. This happened because the agent did not explicitly specify the table engine type to be of MyISAM. ([Bug#43551](#))
- If a host was not a slave during the initial discovery phase, then it would not be displayed in the Replication tab if it subsequently became a slave.

This was because after the initial discovery phase, if a host did not have `slavestatus` present, no subsequent checks were made to check for the host being a slave. It was therefore missed for the purposes of replication discovery and never showed in the Replication tab. ([Bug#42997](#))

C.2.3. Changes in MySQL Enterprise Monitor 2.0.5 (18th March 2009)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.0.4.

Bugs fixed:

- The FreeBSD 7 Agent was inadvertently a Linux binary.

```
shell> file mysqlmonitoragent-2.0.5.7153-freebsd7-x86-32bit-installer.bin
mysqlmonitoragent-2.0.5.7153-freebsd7-x86-32bit-installer.bin: ELF 32-bit LSB executable,
Intel 80386, version 1 (SYSV), for GNU/Linux 2.2.5, dynamically linked (uses shared libs),
stripped
```

([Bug#44263](#))

- Calling the Agent with the option `--agent-run-os-tests` resulted in a crash. This happened on Linux x86-64 systems. The resultant stack trace was:

```
(qa-merlin)
2009-03-04 16:39:42: (critical) chassis.c:1097: could not raise RLIMIT_NOFILE to 8192,
Invalid argument (22). Current limit still 1024.
```

```

sigar-test-all.c.124 (test_sigar_pid_get):
  pid = 5188
sigar-test-all.c.106 (test_sigar_mem_get):

  diskusage.write_bytes = 25879511040
  diskusage.read_bytes = 6561092608
  diskusage.queue = 47457530080206
Segmentation fault

```

On some systems no output was shown, other than the message “Segmentation fault”. ([Bug#43381](#))

- Following a change in the replication configuration, MySQL Enterprise Monitor did not display the new topology correctly. ([Bug#43240](#))
- When a data collection became invalid, the agent sent NULLs for those collection values. However, the timestamps that it sent with the values were the timestamps from the last valid value that was collected.

Due to key constraints on the Service Manager side, MySQL Enterprise Monitor disregarded anything sent with duplicate timestamps, thus the NULLs received from the agent were never processed. Some mechanisms, such as replication discovery, depend on the NULLs to identify a situation where data has become invalid. ([Bug#43239](#))

- MySQL Enterprise Monitor did not add a log entry each time data was purged. The log entry should have noted how many rows of each type of data were purged (historical data, logs, quan data). ([Bug#43159](#))
- MySQL Enterprise Monitor generated a stack overflow. This was as a result of a bug in Hibernate, which caused Hibernate to enter infinite recursion while trying to load a relationship. ([Bug#43107](#))
- The “Table Cache Set Too Low For Startup” and “Table Cache Not Optimal” rules were not supported on MySQL 5.1 because the `table_cache` system variable was deprecated and replaced with `table_open_cache`. ([Bug#42663](#))
- Migrated server was not completely deleted.

In a Monitor that had been updated from 1.3.2 to 2.0.4, with 2 database servers queued for migration, if a server being migrated was deleted, or a migrated server was deleted, this would not be reflected in the user interface or in the license count, until Tomcat was restarted. ([Bug#42604](#))

- The installer used to upgrade from version 1.3 corrupted passwords containing the “?” character. ([Bug#42452](#))
- Sun multi-core processors caused all cores to be reported on the meta information page.

The larger T-series SPARC processors have 32+ cores. This caused the meta information page in the Dashboard to scroll as it reported each one. ([Bug#42355](#))

- If an attempt was made to disable a rule using the link next to the rule, the following error message was generated:

```
U0002 You must log in to access the requested resource. Go to login page.
```

However, clicking on the link did not prompt the user to login again. ([Bug#42313](#))

- Changing `ssh-agent` from OpenSSH or specifying a malevolent value of `agent-host-id`, could inject data into the monitored MySQL Server.

For example, setting `agent-host-id` to the value “I’m a test” would result in the following message in the error log:

```

2009-01-23 15:45:11: ((error)) agent_mysql.c:281: mysql_real_query('INSERT INTO
mysql.inventory (name, value) VALUES ( 'hostid', 'I'm a test' )') on 'mysql' failed: You
have an error in your SQL syntax; check the manual that corresponds to your MySQL server
version for the right syntax to use near 'm a test' )' at line 1 (mysql-errno = 1064)

```

([Bug#42306](#))

- When `SHOW GLOBAL STATUS` returned a value greater than 214748364, it was sent to the Service Manager as 214748364. ([Bug#42245](#))
- The Agent failed to identify local sockets as local on Mac OS X 10.4.

If the Agent was configured to use a Unix domain socket on Mac OS X 10.4, it did not treat the connection as local and failed to provide CPU and memory information to MySQL Enterprise Monitor. This is shown in the log file:

```
2009-01-20 18:15:02: (message) network-socket.c:752: is-local family 0 != 1
2009-01-20 18:15:02: (message) agent_mysql.c:322: [mysql] mysqld is not local or not
directly connected
```

However, this problem did not happen on Mac OS X 10.5. ([Bug#42220](#))

- Some graphs on the **GRAPH** tab were not updated after the page was refreshed, or UPDATE was clicked.

The only way to get an updated graph was to change the graph size (in pixels) and then click UPDATE. ([Bug#42162](#))

- The `my.cnf` file for the Enterprise Monitor internal database had the following configuration item:

```
innodb_autoextend_increment = 50M
```

This generated the error:

```
16:36:23 [Warning] option 'innodb_autoextend_increment': unsigned value 52428800
adjusted to 1000
```

This variable is interpreted as being specified in MB, so 50M would be 50 TB. Such a high value results in the variable being adjusted to 1000 MB.

The value in the configuration file should be:

```
innodb_autoextend_increment = 50
```

([Bug#42096](#))

- A number of Advisor rules had advice text that had not been translated into Japanese. The Advisors that contained untranslated rules included Performance, Schema and Security. ([Bug#42067](#))
- The Service Manager did not handle the case where the agent failed to supply a valid `master_ip`. The Service Manager would then not restart. The logs contained the following:

```
2009-01-09 14:39:50,472 ERROR [main:org.springframework.web.context.ContextLoader] Context
initialization failed
org.springframework.beans.factory.UnsatisfiedDependencyException: Error creating bean with
name 'serverConnectionMonitor' defined in ServletContext resource
[/WEB-INF/applicationContext.xml]: Unsatisfied dependency expressed through constructor
argument with index 2 of type [com.mysql.etools.monitor.bo.Manager]: Error creating bean
with name 'manager' defined in ServletContext resource [/WEB-INF/applicationContext.xml]:
Invocation of init method failed; nested exception is
com.mysql.etools.monitor.pom.UnsupportedAttributeException:
101c6b5b-15eb-49aa-916c-843c51b28d38: mysql.slavestatus.Master_ip
```

([Bug#42005](#))

- Having too many users with strong privileges generated Service Manager errors and events failed to be triggered.

If there were approximately 1000 users with full privileges and the value of `group_concat_max_len` was set to 100001, the size of the data that the agent sent to the Service Manager was too large and caused Service Manager errors. Also, the Security event “Account has Strong MySQL privileges” did not trigger. ([Bug#41987](#))

- Query Analyzer's Query Type filter for `SELECT` ignored statements starting with parenthesis.

If you sent a statement through Query Analyzer starting with parenthesis, such as:

```
(SELECT 1 FROM dual);
```

and then attempted to filter for `SELECT` queries only, queries starting with parenthesis were not displayed. ([Bug#41968](#))

- The agent angel process was spawning too soon, which caused a duplicate UUID error.

`g_error()` logged a fatal error, and called `abort()`. This terminated the program. Then the angel respawned with the same

UUID, but with a -1 session resync request, which the MEM server denied because the old session was still active. This resulted in a permissions denied error (1142) on the `mysql.inventory` table.

```
2008-12-17 18:58:58: (message) agent_mysql.c:313: [mysql] mysql is local and directly connected
2008-12-17 18:58:58: ((error)) agent_mysql.c:444: [mysql] mysql_real_query("SELECT value

2008-12-17 18:59:00: (message) mysql-proxy 0.7.0 started
2008-12-17 18:59:00: (message) MySQL Monitor Agent 2.0.0.7111 started.
```

(Bug#41600)

- `master_uuid` discovery did not work with MySQL Server versions prior to 5.1. `master_uuid` did not show in any Agent to Monitor communications, and no log or error messages were generated.

However, now the bug has been fixed, an Agent monitoring a 5.0 MySQL Server would register the following in its logs:

```
...
<classname>slavestatus</classname>
<instance>12515cdc-8c00-4223-9d2a-2666a403512c</instance>
<attribute>Master_uuid</attribute>
</target>
<utc>2009-03-03T19:58:05.700Z</utc>
<value>b2fd9f86-6e42-49f2-b930-e8fb3e728179</value>
```

Note the presence of `master_uuid`. (Bug#41525)

- The `master_uuid` was not used for replication topology discovery.

The agent collected `master_uuid` by reading the `master.info` file, and then running a `SELECT` directly against its master. This was to try and read the `mysql.inventory` table on the master to obtain the instance `master_uuid`.

However, this was not being used correctly by the replication topology discovery within the server. (Bug#41519)

- Queries such as `SELECT` against the master `mysql.inventory` was not logged on slave-based agents. This made diagnosing topology discovery issues difficult. (Bug#41518)
- After an error was generated due to an incorrect password while trying to create a new user, the following error was obtained when subsequently attempting to create a valid new user:

```
U0002 You must log in to access the requested resource
```

(Bug#41384)

- Agent startup failed on Solaris 10. The error generated was:

```
# ./mysql-monitor-agent start
Bad string
ERROR! /opt/mysql/enterprise/agent/etc/mysql-monitor-agent.ini has to have a
[mysql-proxy].pid-file setting
```

This was caused by unexpected behavior of the `tr` command. (Bug#41260)

- On the Query Analysis page, if a query was clicked the minimum displayed was greater than the average. (Bug#41259)
- In some circumstances the agent/proxy ran out of file descriptors, causing secondary failures. It could not recover from that state. The relevant part of the log file is shown here:

```
2008-11-27 11:11:00: (critical) last message repeated 2 times
2008-11-27 11:11:00: (critical) job_collect_os.c:411: sigar_cpu_info_list_get() failed

```

(Bug#41068)

- If an installation of Service Manager 2.0.0.7102 included a `backup` directory, due to a previous upgrade, and was upgraded using at least Service Manager 2.0.0.7103, then the installer displayed an error message and exited.

The error message displayed was:

```
There has been an error.
Error renaming /Applications/mysql/enterprise/monitor/apache-tomcat to
/Applications/mysql/enterprise/monitor/backup/apache-tomcat
The application will exit now
```

(Bug#40996)

- The Agent started without problems and connected to the master. But it was unable to perform a `SELECT` from the table `mysql.inventory` in order to obtain server information. (Bug#40933)
- Canonical Query Text for `Select -1` was displayed as `SELECT -?` instead of `SELECT ?` on the Query Analyzer tab. (Bug#40435)
- The agent installer for Solaris 8 x86 32-bit was missing. (Bug#40248)
- The startup scripts supplied with MySQL Network Monitoring and Advisory tool did not supply all of the LSB `init.d` script options required. A list of the required options can be found at the following website http://refspecs.freestandards.org/LSB_3.1.0/LSB-Core-generic/LSB-Core-generic/iniscriptact.html
The required options missing include `status` and `force-reload`. The option `status` is used by monitoring tools and cluster software such as Red Hat Cluster, to ensure that the service is still running. The `force-reload` option is an alias for restart. (Bug#29848)
- Multiple errors showed in the agent log after issuing a `SHOW INNODB STATUS` statement. The `InnoDB Buffer Poolgraph` also went blank. (Bug#27372)

C.2.4. Changes in MySQL Enterprise Monitor 2.0.4 (5th February 2009)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.0.3.

Bugs fixed:

- The Service Agent did not log connections to, and disconnects from, the monitored database.
This meant it was not possible to check if the Agent was connected to the database by simply looking at the log file. (Bug#42403)
- The Service Agent failed to create the `mysql.inventory` table. The logs displayed the following error message:

```
(critical) (share/mysql-proxy/quant.lua:711) [proxy] please add SELECT permissions for
this user on mysql.inventory to enable the QUAN feature, got Table 'mysql.inventory'
doesn't exist
```

This happened even though the Service Agent used the `root` account. (Bug#42389)

- After installing Service Agent 2.0.4.7138 and then starting it with `--version`, the incorrect version was displayed. Although 2.0.4.7138 was installed, the Service Agent displayed the version number as 2.0.2.7138. (Bug#42263)
- An invalid path was shown in the error message if the upgrade installer failed to find the previous install location.

The error message is shown below, note that the error message displays a different path to that provided by the user:

```
Please specify the directory that contains the previous installation of the MySQL
Enterprise Monitor Agent

Installation directory [/home/mysql/mysql/enterprise/agent]: /var/lib/mysql/agent

Warning: The directory /home/mysql/mysql/enterprise/agent does not contain a
previous installation. Please select the right installation directory.
Press [Enter] to continue :
-----
```

```
Please specify the directory that contains the previous installation of the MySQL
Enterprise Monitor Agent
```

([Bug#42200](#))

- The agent password error in the Service Manager did not log the originating host, making it impossible to determine the agent that failed to log in:

```
ErrorJan 5, 2009 4:56:08 PM<?xml version='1.0'?><exceptions><error><![CDATA[E1702:
IncorrectPasswordException: [agent]]]></error></exceptions>
```

([Bug#42139](#))

- The Service Manager's JDBC connections did not have `sql_mode` set to include `NO_ENGINE_SUBSTITUTION`. This resulted in the failure of Data Definition Language (DDL) if the Service Manager was inadvertently pointed to an incorrect `mysqld` instance. ([Bug#42137](#))
- A number of Advisor rules had advice text that had not been translated into Japanese. The Advisors that contained untranslated rules included Performance, Schema and Security. ([Bug#42067](#))
- Service Agent configuration files had global read privileges on the filesystem. ([Bug#41794](#))
- When the log files rotated to the maximum allowed by the `log4j` configuration, the metadata contained in the `FileAppender` became out of synchronization due to a logic bug. This caused an assertion error on any subsequent request for the logs tab or data. ([Bug#41593](#))
- SNMP trap messages were sending 127.0.0.1 as the IP address, and there was no feature to allow the user to configure the IP address contained in the SNMP message, which would have been useful for troubleshooting. ([Bug#41361](#))
- On all available test systems, including SUSE Linux Enterprise Server (SLES) 9 and 10 x86-32, x86-64, IA64, and Ubuntu 6.10 x86-64, the agent memory grew incrementally within ~3 hours to ~25M.

The agents then switched to the 'red' condition on the dashboard and no more data was reported. The agent processes were still alive.

This was also present in MySQL Enterprise Monitor version 2.0.0.7111 on Suse 7.3, with the glibc2.2 x86 agent.

There was no load on the monitored servers, and the problem also occurred when the “self-quan” was not configured. ([Bug#41244](#))

- Although the **MONITOR** tab loaded initially, after a 64-bit MySQL server running a 32-bit MySQL Monitor Agent was clicked, a Null Pointer Exception was generated. ([Bug#41164](#))
- The Service Agent startup configuration did not seem to work and did not generate a log file. ([Bug#40583](#))
- An error generated by a rule failed to clear.

When a rule was created with the `os:disk:fs_used` data item, if the instance was not a valid mount point then the Service Agent reported the error:

```
2008-08-11 17:57:00: (critical) disk-get failed for all: 2
```

Note the above instance was for “all”, and similar results occurred for instance “disk”.

The issue was that upon editing the rule, or even deleting the rule, the agent still showed the above error type. Restarting the agent and the monitoring service failed to remove the error. ([Bug#38709](#))

- If the “On Save send test trap” checkbox was checked when the SAVE button was clicked and the locale was set to Japanese, an error occurred. The orange error banner was displayed at the top of the page with the error message in Japanese. ([Bug#32069](#))

C.2.5. Changes in MySQL Enterprise Monitor 2.0.3 (23rd January 2009)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.0.2.

Bugs fixed:

- The Service Agent failed to connect to the server, and no error message was displayed in the log file.

However, when the log verbosity level was set to `message`, the following message was recorded:

```
2009-01-12 13:34:43: (warning) agent_mysqlqd.c:600: agent connecting to mysql-server
failed: mysql_real_connect(host = '127.0.0.1', port = 3306, socket = ''): Lost connection
to MySQL server at 'reading initial communication packet', system error: 0 (mysql-errno =
2013)
```

([Bug#42044](#))

- There was a mismatch between the contents of an SNMP Trap from MySQL Enterprise Monitor and the definition given in the file `MONITOR.MIB`. ([Bug#41912](#))
- If a copy was made of a standard rule, the resulting Wiki markup was incorrect, resulting in the display of user-interface text containing HTML markup. ([Bug#41375](#))
- Allowing the heat chart rules to be set to unscheduled caused the user interface to appear broken. ([Bug#41312](#))
- When a custom rule requiring disk information was created, for example:

```
[Expression]
%disk_reads% > THRESHOLD

[Thresholds]
Critical Alert: 9000
Warning Alert: 3000
Info Alert: 1000

[Variable Assignment]
variables: %disk_reads%
Data Item: os:disk:disk_reads
Instance: /
```

The following error was written to the file `mysql-service-agent.log`:

```
2007-09-05 17:11:00: (critical) disk-get failed for c0d0p1: 2
```

It therefore appeared that the Service Agent was not able to obtain the required information. ([Bug#30820](#))

C.2.6. Changes in MySQL Enterprise Monitor 2.0.2 (14th January 2009)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.0.1.

Bugs fixed:

- The COMPLETE SETUP button was missing from the `SETUP` page you were taken to after the current subscription expired. ([Bug#41685](#))
- If the `host-id` of the monitored instance and the `host-id` of the current agent did not match, the agent generated the following error message:

```
Please TRUNCATE TABLE mysql.inventory on this mysql-instance and restart the agent.
```

However, it did not suggest using `sql_log_bin = 0`. This is used for all other actions against this table so that they are not replicated to slaves, each of which has their own copy of this table. ([Bug#41673](#))

- The Agent did not start up when the monitored server had many databases and tables, and was under heavy load. This was because the `trigger_schema` query was taking too long on agent start up. ([Bug#41555](#))
- The Service Agent failed to install on Solaris 10 x86. The following error was generated:

```
Installing
0% _____ 50% _____ 100%
#####
Warning: Problem running post-install step.
Installation may not complete correctly
Error running /usr/local/mysqlagent/bin/mysql-monitor-agent
--defaults-file=/usr/local/mysqlagent/etc/mysql-monitor-agent.ini
--plugins=agent --agent-generate-uuid=true : 2008-12-12 13:06:02: (critical)
Conversion from character set '646' to 'UTF-8' is not supported
2008-12-12 13:06:02: (message) shutting down normally
```

([Bug#41445](#))

- The console/stdout appender remained in the log4j configuration, which meant that all the MySQL Enterprise Monitor server logs were duplicated to Catalina's stdout, and thus `catalina.out`, which was wasteful, especially as that file was not rotated or managed. ([Bug#41439](#))
- When creating new multiple user accounts, the first attempt worked fine. However, following attempts to create new users did not show the **QUERY ANALYZER OPTIONS** in the **CREATE USER** popup until the role field was changed. ([Bug#41430](#))
- When login privileges were required the Service Manager did not redirect the user to the login page. This resulted in error messages being displayed rather than simply redirecting the user to the login page. This problem typically occurred if it was necessary to restart Tomcat. ([Bug#41320](#))
- The monitor 2.0.0.7105 and 2.0.0.7122 Solaris Intel update installer quits unexpectedly. The installer exits from the GUI in the **BACKUP OF PREVIOUS INSTALLATION** screen, when OpenSolaris is running on top of Sun xVM.

The console output for both installer versions is given below:

```
shell> ./mysqlmonitor-2.0.0.7105-solaris-intel-update-installer.bin
X Error of failed request: BadMatch (invalid parameter attributes)
Major opcode of failed request: 73 (X_GetImage)
Serial number of failed request: 21161
Current serial number in output stream: 21161
```

```
shell> ./mysqlmonitor-2.0.0.7122-solaris-intel-update-installer.bin
X Error of failed request: BadMatch (invalid parameter attributes)
Major opcode of failed request: 73 (X_GetImage)
Serial number of failed request: 21148
Current serial number in output stream: 21148
```

([Bug#41315](#))

- The **RENAME GROUP** function failed if the new group name was different to the current one only in the case used; for example, if "Merlin" was changed to "MERLIN".

The error generated was:

```
U0105 This group name is already in use. Enter a different name.
```

([Bug#41266](#))

- The Agent returned an inventory list of all databases and tables. This information was not used by MySQL Enterprise Monitor, other than to populate the `inv_databases` and `inv_tables` tables. For large-scale deployments, where there were many databases and tables, this resulted in redundant XML messages being sent from the Agent to the Service Manager. ([Bug#33150](#))

C.2.7. Changes in MySQL Enterprise Monitor 2.0.1 (15th December 2008)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 2.0.0.

Bugs fixed:

- Having an installation with over 420 master binlogs resulted in the `mysql::status` graph not being plotted. ([Bug#41314](#))
- The MySQL Enterprise Monitor installer generated a segfault on RedHat Fedora 10:

```
shell> ./mysqlmonitor-2.0.0.7105-linux-x86-installer.bin
Segmentation fault
```

([Bug#41196](#))

C.2.8. Changes in MySQL Enterprise Monitor 2.0.0 (11th December 2008)

This section documents all changes and bug fixes that have been applied since the release of MySQL Enterprise Monitor, version 1.3.3.

Functionality added or changed:

- **Important Change:** The `server-name` configuration parameter is deprecated. For compatibility, during an upgrade, the information will be migrated to a `displayname` configuration parameter within the individual instance configuration files. This configuration parameter is provided only for compatibility, as display name information is now stored within the main repository. Support for `displayname` is also deprecated and will be removed in a future release.
- **Important Note:** The rules “32-Bit Binary Running on 64-Bit AMD Or Intel System” and “Key Buffer Size Greater Than 4 GB” occasionally do not evaluate correctly due to timing issues. This causes them to be displayed with the **SEVERITY** level of “Unknown”. This is a known issue and will be resolved in future versions of MySQL Enterprise Monitor.
- **Important Note:** When you start the Merlin 2.0 agent from the command line on Windows, you get the following error dialog:

```
"mysql-proxy.exe - Entry Point Not Found"
"The procedure entry point libiconv_set_relocation_prefix could not be located in the
dynamic link library iconv.dll"
```

If you click OK the agent works fine after that.

This only occurs when starting the agent from the command line, and only when there is another version of one of the DLLs that the agent uses somewhere on the current path. This error can be avoided by opening a command prompt, typing `SET PATH=` to clear the path, and then starting the agent.

- **Important Note:** If you are monitoring one instance of MySQL server (`mysqld`) and then upgrade that MySQL server, the correct version of the MySQL server is not displayed in the Dashboard. This is a known issue that will be fixed in future versions of MySQL Enterprise Monitor.
- The following has been added to the Tomcat `config.properties` properties file:

```
# max connections in the pool for the repository
default.maxActive=70
```

([Bug#40652](#))

- The dashboard could be used to change the agent password to one containing the `@` character, or other special characters, which subsequently caused errors. To fix this problem, special characters in passwords are now prevented by the dashboard. The list of disallowed special characters can be found at the following location: http://en.wikipedia.org/wiki/Percent-encoding#Types_of_URI_characters ([Bug#37172](#))
- The **QUERY ANALYSIS** page was missing the **REFRESH** dropdown control that the **MONITOR**, **EVENTS**, and **GRAPHS** pages had at the top. ([Bug#36831](#))
- The User Interface only returned error strings, without any associated error codes. This meant that if the error string was in a language that the user did not understand, it would be very difficult to determine which error actually occurred.
The User Interface now supports error codes, as well as error strings. This change allows easier testing of multiple locales. ([Bug#32131](#))
- The wording was changed on the fading popup subscription alert. The text “account” was changed to “subscription”. ([Bug#31492](#))
- The alert thresholds for the Query Cache Advisor were changed:

	Information	Warning	Critical
From	95	85	75
To	60	50	40

([Bug#30969](#))

- The agent log file name has changed from `mysql-service-agent.log` to `mysql-monitor-agent.log`. The old log file will be retained during a upgrade install.

Bugs fixed:

- Starting a new agent against an instance that contained many databases broke up the initial discovery packet, causing collections such as CPU usage and their graphs to fail. See also [Bug#33150](#) and [Bug#41314](#). ([Bug#41933](#))

- When altering an existing rule you had to add an empty string, " ", to any threshold level that was empty. Otherwise, the rule failed to run and the resulting exceptions caused the **EVENTS** page to be unusable due to duplicate key exceptions. (Bug#41310)
- After installing the 2.0.0.7119 Dashboard the following error was generated in the logs:

```
com.opensymphony.xwork2.util.OgnlValueStack Warning Dec 5, 2008 10:41:26 AM Caught
an Ognl exception while getting property titleAddition
```

(Bug#41252)

- The `dc_ng_long_now` table became very large partly due to an unused column `begin_time`. (Bug#41093)
- Although there was a unique constraint on the user name, it was not enforced during first-time setup. This resulted in a stack trace being produced, rather than a more user-friendly error message, if the same name was used for the `admin` and `agent` accounts. (Bug#40870)
- MySQL Enterprise Monitor server had stopped sending up/down SNMP traps. (Bug#40861)
- The Query Analyzer's **EXPLAIN QUERY** tab did not have pop up text or a link to the documentation regarding `SELECT` queries. (Bug#40841)
- When you tried to import a Trial-level advisor JAR using a Trial user account, one of the following error messages was generated:

```
U0009 The uploaded Advisor jar was invalid
```

```
U0161 Please import a Platinum level Advisor .jar to use with this Platinum level product key
```

(Bug#40834)

- Meta Info on the Dashboard did not display information for the meta data `os_description`. (Bug#40830)
- Attempting to create an alias of statements such as `COMMIT`, `ROLLBACK`, `BEGIN`, resulted in the error:

```
Can't find template commitTxn.st; group hierarchy is [HTMLFormatting]
org.apache.velocity.runtime.template.StringTemplateGroup.lookupTemplate(StringTemplateGroup.java:507)
```

(Bug#40736)

- Trying to upgrade from 2.0.0.7088 to 2.0.0.7092 failed as there was a missing file. When the update program `mysqlmonitor-2.0.0.7092-solaris-intel-update-installer.bin` was run, the file `/tmp/com/mysql/merlin/server/version.props` could not be found. (Bug#40692)
- On OS X with Java 1.5, Tomcat crashed on launch with the error:

```
Invalid memory access of location 00000007 eip=013df179
```

(Bug#40689)

- When the agent was installed using the command line installer and `--enableproxy 0` was specified, the installer should have removed `quan.lua` from the `agent-item-files` option in the INI file. (Bug#40551)
- The Agent could not connect to a database with the `hostname` set to `localhost`. Doing so resulted in the error:

```
(critical) the MySQL server could not be reached at socket '(null)', we will check in 10 seconds
```

(Bug#40530)

- The update installer for the 2.0 Monitor did not have an **IS SSL SUPPORT REQUIRED?** checkbox. Therefore, the appropriate SSL connector definition was commented out in the `conf/server.xml` file. (Bug#40414)
- The Service Manager installer did not uninstall or wipe out the previous installation if you answered "Yes" to the question: "The directory you selected already contains a MySQL installation. If you continue installation all data will be lost. Do you wish to continue?" (Bug#40410)
- If you unchecked the **ENABLE PROXY** checkbox on the **QUERY ANALYSIS CONFIGURATION** screen, the agent's INI file still contained proxy configuration data and was not commented out. (Bug#40272)

- As different queries were sent through the agent it used increasing amounts of memory. (Bug#40260)
- The Service Manager installer set the Java Virtual Machine option `HeapDumpPath` to `<install_root>\temp` on Windows and `/tmp` on other platforms. For consistency the `HeapDumpPath` directory should have been set to `<install_root>\tmp` on Windows. (Bug#40215)
- When using the command line agent setup program, a socket file was not accepted for the monitored instance. (Bug#40085)
- The language option when installing the MySQL Enterprise Monitor in Japanese using the command-line installer has been changed from `jp` to `ja`. (Bug#40082)
- When monitoring MySQL 5.1.24 and above, the user used by the agent to connect to the MySQL server for monitoring must have the `PROCESS` privilege. (Bug#40050)
- The check box option string “Is SSL support required?”, on the Tomcat Server Option dialog of the Monitor installation, was not correctly translated into Japanese. (Bug#39814)
- The base application directory for the MySQL Enterprise Dashboard has been updated from `http://localhost:18080/merlin` to `http://localhost:18080/`. (Bug#39403)
- If the Service Manager or the MySQL Server running the Repository crashed, they did not restart automatically. (Bug#39377)
- If the agent crashed, there was no watchdog, angel or keep-alive mechanism to restart the agent and keep it running. (Bug#39374)
- If the MySQL client libraries were located in a non-standard location, the agent 2.0.0.7042 installer failed with a “library not found” error. (Bug#39317)
- For the rule “Server-Enforced Data Integrity Checking Not Strict”, the Recommended Action did not display correctly. It displayed as `SET sql_mode=modes`, rather than `SET [GLOBAL|SESSION] sql_mode=modes`. (Bug#39261)
- A query that was issued through the proxy, and that had an auto-explain performed on that query, did not give the correct response to a subsequent query of `SELECT FOUND_ROWS()`. (Bug#39223)
- It was not possible to establish a connection with the Dashboard using the SSL protocol (`https://`). (Bug#39198)
- When a 1.3 MySQL Enterprise Monitor installation with many rules scheduled was upgraded to 2.0, the upgraded installation was then found to have only the heat chart rules scheduled. (Bug#39043)
- The agent installer did not allow a second agent to be installed on Windows. (Bug#38976)
- The Dashboard incorrectly displayed that insufficient licenses were available, even though sufficient licenses had been purchased. (Bug#38514)
- After running the MySQL Service Agent uninstall program, the file `/etc/init.d/mysql-service-agent` remained present on the server. (Bug#38490)
- The notice fader continued to display English text after you changed the locale to Japanese. (Bug#38460)
- The **SUBSCRIPTION EXPIRED** pop-up window referred to the “Global Preferences” page, instead of the “Global Settings” page. (Bug#38358)
- An inappropriate time zone was used to parse user-entered date and time strings. (Bug#38323)
- A sigar network stats error was generated on the Solaris platform:

```
# /opt/mysql/enterprise/agent/bin/mysql-service-agent --version
MySQL Service Agent - 1.2.0.7879, (glib lib=2.8.5, headers=2.8.5)

SunOS mysqlprd01 5.10 Generic_127127-11 sun4v sparc SUNW,T5240

2008-07-21 10:07:24: (critical) sigar_net_interface_config_primary_get() failed: 6
2008-07-21 10:08:00: (critical) sigar_net_interface_config_primary_get() failed: 6

# /opt/mysql/enterprise/agent/bin/sigar-test-all >/tmp/test.txt
sigar_net_interface_stat_get(e1000g0:2) failed#
```

(Bug#38302)

- After deleting a server from the **SETTINGS, MANAGE SERVERS** tab, at the very bottom of the page the **MONITORING X INSTANCES ON X HOST** values did not reflect the deletion. (Bug#38225)
- The MySQL Enterprise Monitor alert “INFO Alert - Users Can View All Databases On MySQL Server (v 1.5 *)” from the Se-

curity advisor was incorrect. This is because the default server behavior allows users to see databases for which they have privileges, not “all databases on server” as suggested by the alert. ([Bug#38052](#))

- The “Maximum Connection Limit Nearing Or Reached” advisor did not generate a new Critical Alert event when there was an open info success event. ([Bug#37816](#))
- The Linux IA64 installer appeared to crash. The installer appeared to crash on RH4_IA64 if called with option “--version”:

```
-----
<INSTALLER> --version
mysqlmonitorage(30704): unaligned access to 0x6000000000a8413c, ip=0x2000000003ddd5f0
mysqlmonitorage(30704): unaligned access to 0x6000000000a84144, ip=0x2000000003ddd5f1
mysqlmonitorage(30704): unaligned access to 0x6000000000a8414c, ip=0x2000000003ddd600
mysqlmonitorage(30704): unaligned access to 0x6000000000a84154, ip=0x2000000003ddd601
MySQL Enterprise Monitor Agent 0.7.0.1737 --- Built on 2008-06-25 19:31:53
-----
```

However, this warning is harmless and will not impact the operation of the agent. ([Bug#37496](#))

- If the log-level option in the agent configuration file was set to an unknown level by mistake, the `init.d` script appeared to enter an infinite loop. ([Bug#37108](#))
- Malformatted server meta information appeared on the Dashboard; **RAM** and **DISK SPACE** appeared under the **CPU** category. ([Bug#36740](#))
- A “rename” link incorrectly appeared next to the **UPGRADE** category on the **MANAGE RULES** page. ([Bug#36584](#))
- In the case where exceptions were passed through to the User Interface, the substituted arguments in the message contained developer-only information. ([Bug#36580](#))
- **AGENT VERSION**, **LAST MYSQL CONTACT**, **OS INFO**, **CPU INFO**, and **IP ADDRESSES** were all blank on the dashboard when the agent for the selected server was not functioning. ([Bug#36301](#))
- `mysql-monitor-agent` became confused by the `.DS_Store` files that are created on Mac OS X. ([Bug#36216](#))
- The rule “Key Buffer Size Greater Than 4 GB” incorrectly triggered the following alert:

```
CRITICAL ALERT - KEY BUFFER SIZE GREATER THAN 4 GB
```

However, on non-Windows systems, a key buffer size greater than 4 GB is supported. ([Bug#36143](#))

- Since the repository database for MySQL Enterprise Monitor uses InnoDB there was no way to reduce the size of the data files after an old log/event data purge operation. Further, the purge data operation executed once per day, and had no option to trigger the purge operation manually. ([Bug#35971](#))
- On the Graphs page, if all graphs were expanded, then the Time Display interval updated, the page was refreshed with the EXPAND ALL button displayed, even though all the graphs were already expanded. ([Bug#35917](#), [Bug#35133](#))
- The Meta Info area of the Monitor page incorrectly reported the operating system version number for the MySQL version. ([Bug#35836](#))
- The rule “XA Distributed Transaction Support Enabled For InnoDB” incorrectly sent a warning when the binary log was on. ([Bug#35786](#))
- On the Monitor page, the time displayed for `Last MySQL Contact` lagged behind that for `Last Agent Contact` by a large amount. ([Bug#35774](#))
- MySQL Enterprise Monitor did not update replication settings correctly. After a slave became the master, the Adviser still referred to it as a slave. ([Bug#35771](#))
- The Adviser email suggested using the `--log-queries-not-using-indexes` option. However, this option is not available in MySQL Server versions prior to 4.1. ([Bug#35770](#))
- Thumbnail graphs did not update properly after a time zone change. ([Bug#35756](#))
- If a system had a global `wait_timeout` lower than the general activity of the agent, the agent was disconnected. The monitored server then logged an error and incremented `Aborted_clients`. ([Bug#35648](#))
- Alerts fired after a blackout period based on data collections that happened during the blackout. ([Bug#35617](#))
- The translation of the ADD ROW button on the Rule Definition window was incorrect. ([Bug#35495](#))

- An uninstallation message asked about removing Apache files, even though Apache is no longer used. ([Bug#35154](#))
- After updating from a previous version to the latest 1.3 version, the **QUERY CACHE HAS SUB-OPTIMAL HIT RATE** was still displayed in English after setting the locale to Japanese. Note, the rule was translated correctly if the full installer was used. ([Bug#35134](#))
- The MySQL Enterprise Monitor uninstall dialog box had missing text when using the Japanese locale. ([Bug#34982](#))
- Running the installer with the `--help` option caused an incorrect message to be displayed. ([Bug#34200](#))
- When using the unattended `unInstall` script on Linux together with the option `--env deleteUserData=yes` the correct warning text was displayed. However, this text should not be displayed in unattended mode. Further, the option `--env deleteUserData=yes` was not displayed by the `--help` output. ([Bug#34071](#))
- Platinum Unlimited customers sometimes received a warning stating incorrectly that their subscription supported zero hosts. ([Bug#34010](#))
- Clicking on the resolution notes link for a closed event on the events tab showed incorrect behaviour. The popup initially showed the resolution notes, but when the resolution tab was clicked the notes disappeared and were replaced by an edit box. ([Bug#33935](#))
- The status on the product information page was not translated when the user locale was set to Japanese. ([Bug#32785](#))
- When the locale was set to Japanese, the date picker still had English month titles. ([Bug#32741](#))
- Flashing display of a pop-up used while saving outgoing email settings was caused by problematic initial placement calculations. ([Bug#32579](#))
- AIX 5.2 Agent did not work on AIX 5.3. ([Bug#32414](#))
- When the First Time Setup program was run it did not prompt the user to allow importing an Advisor bundle. ([Bug#32199](#))
- Agent on MacOSX did not read IP addresses for network interfaces correctly, so the monitor displayed empty host IP addresses. ([Bug#32188](#))
- HTML code in queries was not escaped when reporting replication errors, causing the code to be rendered into the page. ([Bug#32186](#))
- The First Run pop-up defaulted to English rather than to the locale set in the browser. ([Bug#32129](#))
- The error dialog box flashed in the upper left corner before being positioned in the center of the screen. This error dialog box now opens in the center of the screen. ([Bug#32068](#))
- The Events list did not take into account Daylight Time and Standard Time when listing events that happened during 1:00am-1:59am. An event that occurred at 1:10am Standard Time was listed before an event that occurred 50 minutes before it at 1:20am Daylight Time. ([Bug#32016](#))
- The pop-up for editing log levels failed to load due to bad instantiation data. ([Bug#32013](#))
- During the repeated hour of Daylight Savings Time (when 2am turns back into 1am), the graphs were not drawing data. Instead, there was a straight line from the point at 1:00 to the second 1:00, which is what happens if there is no data. The repository did, however, have data for this hour. ([Bug#31997](#))
- Only US English was supported for a locale setting. Other English variants are now available for the `locale` setting on the [General Settings](#) or the [User Preferences](#) pages. ([Bug#31801](#))
- If the user locale was changed the graph cache would continue to display the graph in the last locale until it timed out. ([Bug#31680](#))
- No init script was installed for the MySQL Network Monitoring Service Manager, and so it did not restart automatically on reboot. ([Bug#31676](#))
- The graph's displayed time was not the local time of the Dashboard corresponding to the requested time on the monitored server. ([Bug#31656](#))
- Saving a rule with a name that already existed resulted in a stack trace in the window, instead of a more user-friendly error message. ([Bug#30925](#))
- The `network.mysql.com` error messages were remapped thereby causing confusion. For example, the following error message:

E9000: MySQL ENTERPRISE CUSTOMER CENTER IS HAVING DIFFICULTIES FETCHING YOUR CONTRACT INFORMATION. PLEASE CONTACT ENTERPRISE-FEEDBACK@MYSQL.COM FOR ASSISTANCE.

Was remapped to:

UNABLE TO CONNECT TO VERIFY CREDENTIALS ([Bug#30873](#))

- A newly added server showed as “down” in the user interface, and could potentially have sent a false alarm notification. ([Bug#30735](#))
- The information on the [ADVISORS, CHECK FOR UPDATES](#) page did not accurately reflect how many rules and graphs were actually in the database and available to the user. ([Bug#29623](#))
- The agent did not process [SIGHUP](#). ([Bug#29380](#))
- Monitor did not have a facility to stop or downgrade an agent collection frequency. ([Bug#28589](#))
- After an agent installation was updated from 1.0.1.4391 to 1.1.0.4899, the version in the [ADD/REMOVE PROGRAMS](#) menu was incorrectly displayed as 1.0.1.4391, even though the update was successful and the file version of `agent.exe` was correctly displayed as 1.1.0.4899. ([Bug#27447](#))
- When viewing the **RESULTS** of an **EVENT** in the **EVENTS** tab of the **DASHBOARD**, the **NOTIFICATIONS** section did not reflect the **NOTIFICATIONS** settings at the time the **EVENT** was triggered, but rather the **NOTIFICATIONS** settings at the time the **EVENT RESULTS** were viewed. ([Bug#26349](#))
- When the Service Agent was remotely monitoring a MySQL server it incorrectly reported that it could collect operating system information. ([Bug#22497](#))
- The Account Without Password advisor did not report all users who were without a password, it only reported one. ([Bug#15165](#))

C.3. MySQL Connector/ODBC (MyODBC) Change History

C.3.1. Changes in MySQL Connector/ODBC 5.1.6 (Not yet released)

Bugs fixed:

- Connector/ODBC failed to build with MySQL 5.1.30 due to incorrect use of the data type `bool`. ([Bug#42120](#))
- Calling `SQLDescribeCol()` with a NULL buffer and nonzero buffer length caused a crash. ([Bug#41942](#))
- MySQL Connector/ODBC updated some fields with random values, rather than with `NULL`. ([Bug#41256](#))
- Calling `SQLDriverConnect()` with a `NULL` pointer for the output buffer caused a crash if `SQL_DRIVER_NOPROMPT` was also specified:

```
SQLDriverConnect(dbc, NULL, "DSN=myodbc5", SQL_NTS, NULL, 0, NULL, SQL_DRIVER_NOPROMPT)
```

([Bug#40316](#))

- Setting the ADO `Recordset` decimal field value to 44.56 resulted in an incorrect value of 445600.0000 being stored when the record set was updated with the `Update` method. ([Bug#39961](#))
- The `SQLTablesW` API gave incorrect results. For example, table name and table type were returned as `NULL` rather than as the correct values. ([Bug#39957](#))
- MyODBC would crash when a character set was being used on the server that was not supported in the client, for example `cp1251`:

```
[MySQL][ODBC 5.1 Driver][mysqld-5.0.27-community-nt]Restricted data type attribute violation
```

The fix causes MyODBC to return an error message instead of crashing. ([Bug#39831](#))

- When the `SQLTables` method was called with `NULL` passed as the `tablename` parameter, only one row in the `resultset`, with table name of `NULL` was returned, instead of all tables for the given database. ([Bug#39561](#))

- The `SQLGetInfo()` function returned 0 for `SQL_CATALOG_USAGE` information. (Bug#39560)
- MyODBC Driver 5.1.5 was not able to connect if the connection string parameters contained spaces or tab symbols. For example, if the `SERVER` parameter was specified as “SERVER= localhost” instead of “SERVER=localhost” the following error message will be displayed:

```
[MySQL][ODBC 5.1 Driver] Unknown MySQL server host ' localhost' (11001).
```

(Bug#39085)

- The pointer passed to the `SQLDriverConnect` method to retrieve the output connection string length was one greater than it should have been due to the inclusion of the NULL terminator. (Bug#38949)
- Data-at-execution parameters were not supported during positioned update. This meant updating a long text field with a cursor update would erroneously set the value to null. This would lead to the error `Column 'column_name' cannot be null` while updating the database, even when `column_name` had been assigned a valid non-null string. (Bug#37649)
- The `SQLDriverConnect` method truncated the `OutputConnectionString` parameter to 52 characters. (Bug#37278)
- The connection string option `Enable Auto-reconnect` did not work. When the connection failed, it could not be restored, and the errors generated were the same as if the option had not been selected. (Bug#37179)
- Insertion of data into a `LONGTEXT` table field did not work. If such an attempt was made the corresponding field would be found to be empty on examination, or contain random characters. (Bug#36071)
- No result record was returned for `SQLGetTypeInfo` for the `TIMESTAMP` data type. An application would receive the result `return code 100 (SQL_NO_DATA_FOUND)`. (Bug#30626)
- It was not possible to use Connector/ODBC to connect to a server using SSL. The following error was generated:

```
Runtime error '-2147467259 (80004005)':  
[MySQL][ODBC 3.51 Driver]SSL connection error.
```

(Bug#29955)

- When the `recordSet.Update` function was called to update an `adLongVarChar` field, the field was updated but the recordset was immediately lost. This happened with driver cursors, whether the cursor was opened in optimistic or pessimistic mode.

When the next update was called the test code would exit with the following error:

```
-2147467259 : Query-based update failed because the row to update could not be found.
```

(Bug#26950)

C.3.2. Changes in MySQL Connector/ODBC 5.1.5 (18 August 2008)

Bugs fixed:

- ODBC `TIMESTAMP` string format is not handled properly by the MyODBC driver. When passing a `TIMESTAMP` or `DATE` to MyODBC, in the ODBC format: `{d <date>}` or `{ts <timestamp>}`, the string that represents this is copied once into the SQL statement, and then added again, as an escaped string. (Bug#37342)
- The connector failed to prompt for additional information required to create a DSN-less connection from an application such as Microsoft Excel. (Bug#37254)
- `SQLDriverConnect` does not return `SQL_NO_DATA` on cancel. The ODBC documentation specifies that this method should return `SQL_NO_DATA` when the user cancels the dialog to connect. The connector, however, returns `SQL_ERROR`. (Bug#36293)
- Assigning a string longer than 67 characters to the `TableType` parameter resulted in a buffer overrun when the `SQLTables()` function was called. (Bug#36275)
- The ODBC connector randomly uses logon information stored in `odbc-profile`, or prompts the user for connection information and ignores any settings stored in `odbc-profile`. (Bug#36203)
- After having successfully established a connection, a crash occurs when calling `SQLProcedures()` followed by `SQL-`

`FreeStmt()`, using the ODBC C API. ([Bug#36069](#))

C.3.3. Changes in MySQL Connector/ODBC 5.1.4 (15 April 2008)

Bugs fixed:

- Wrong result obtained when using `sum()` on a `decimal(8,2)` field type. ([Bug#35920](#))
- The driver installer could not create a new DSN if many other drivers were already installed. ([Bug#35776](#))
- The `SQLColAttribute()` function returned `SQL_TRUE` when querying the `SQL_DESC_FIXED_PREC_SCALE` (`SQL_COLUMN_MONEY`) attribute of a `DECIMAL` column. Previously, the correct value of `SQL_FALSE` was returned; this is now again the case. ([Bug#35581](#))
- On Linux, `SQLGetDiagRec()` returned `SQL_SUCCESS` in cases when it should have returned `SQL_NO_DATA`. ([Bug#33910](#))
- The driver crashes ODBC Administrator on attempting to add a new DSN. ([Bug#32057](#))

C.3.4. Changes in MySQL Connector/ODBC 5.1.3 (26 March 2008)

Platform specific notes:

- **Important Change:** You must uninstall previous 5.1.x editions of Connector/ODBC before installing the new version.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.

Bugs fixed:

- **Important Change:** In previous versions, the SSL certificate would automatically be verified when used as part of the Connector/ODBC connection. The default mode is now to ignore the verification of certificates. To enforce verification of the SSL certificate during connection, use the `SSLVERIFY` DSN parameter, setting the value to 1. ([Bug#29955](#), [Bug#34648](#))
- Inserting characters to a UTF8 table using surrogate pairs would fail and insert invalid data. ([Bug#34672](#))
- Installation of Connector/ODBC would fail because it was unable to uninstall a previous installed version. The file being requested would match an older release version than any installed version of the connector. ([Bug#34522](#))
- Using `SqlGetData` in combination with `SQL_C_WCHAR` would return overlapping data. ([Bug#34429](#))
- Descriptor records were not cleared correctly when calling `SQLFreeStmt(SQL_UNBIND)`. ([Bug#34271](#))
- The dropdown selection for databases on a server when creating a DSN was too small. The list size now automatically adjusts up to a maximum size of 20 potential databases. ([Bug#33918](#))
- Microsoft Access would be unable to use `DBEngine.RegisterDatabase` to create a DSN using the Connector/ODBC driver. ([Bug#33825](#))
- Connector/ODBC erroneously reported that it supported the `CAST()` and `CONVERT()` ODBC functions for parsing values in SQL statements, which could lead to bad SQL generation during a query. ([Bug#33808](#))
- Using a linked table in Access 2003 where the table has a `BIGINT` column as the first column in the table, and is configured as the primary key, shows `#DELETED` for all rows of the table. ([Bug#24535](#))
- Updating a `RecordSet` when the query involves a `BLOB` field would fail. ([Bug#19065](#))

C.3.5. Changes in MySQL Connector/ODBC 5.1.2 (13 February 2008)

MySQL Connector/ODBC 5.1.2-beta, a new version of the ODBC driver for the MySQL database management system, has been released. This release is the second beta (feature-complete) release of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a beta release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data.

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.
- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that uninstall any existing versions of Connector/ODBC 5.1.x before upgrading.

See also [Bug#34571](#).

Functionality added or changed:

- Explicit descriptors are implemented. ([Bug#32064](#))
- A full implementation of `SQLForeignKeys` based on the information available from `INFORMATION_SCHEMA` in 5.0 and later versions of the server has been implemented.
- Changed `SQL_ATTR_PARAMSET_SIZE` to return an error until support for it is implemented.
- Disabled `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` when using an SSL connection.
- `SQLForeignKeys` uses `INFORMATION_SCHEMA` when it is available on the server, which allows more complete information to be returned.

Bugs fixed:

- The `SSLCIPHER` option would be incorrectly recorded within the SSL configuration on Windows. ([Bug#33897](#))
- Within the GUI interface, when connecting to a MySQL server on a non-standard port, the connection test within the GUI would fail. The issue was related to incorrect parsing of numeric values within the DSN when the option was not configured as the last parameter within the DSN. ([Bug#33822](#))
- Specifying a non-existent database name within the GUI dialog would result in an empty list, not an error. ([Bug#33615](#))
- When deleting rows from a static cursor, the cursor position would be incorrectly reported. ([Bug#33388](#))
- `SQLGetInfo()` reported characters for `SQL_SPECIAL_CHARACTERS` that were not encoded correctly. ([Bug#33130](#))
- Retrieving data from a `BLOB` column would fail within `SQLGetData` when the target data type was `SQL_C_WCHAR` due to incorrect handling of the character buffer. ([Bug#32684](#))
- Renaming an existing DSN entry would create a new entry with the new name without deleting the old entry. ([Bug#31165](#))
- Reading a `TEXT` column that had been used to store UTF8 data would result in the wrong information being returned during a query. ([Bug#28617](#))
- `SQLForeignKeys` would return an empty string for the schema columns instead of `NULL`. ([Bug#19923](#))
- When accessing column data, `FLAG_COLUMN_SIZE_S32` did not limit the octet length or display size reported for fields, causing problems with Microsoft Visual FoxPro.

The list of ODBC functions that could have caused failures in Microsoft software when retrieving the length of `LONGBLOB` or `LONGTEXT` columns includes:

- `SQLColumns`

- [SQLColAttribute](#)
- [SQLColAttributes](#)
- [SQLDescribeCol](#)
- [SQLSpecialColumns](#) (theoretically can have the same problem) ([Bug#12805](#), [Bug#30890](#))
- Dynamic cursors on statements with parameters were not supported. ([Bug#11846](#))
- Evaluating a simple numeric expression when using the OLEDB for ODBC provider and ADO would return an error, instead of the result. ([Bug#10128](#))
- Adding or updating a row using [SQLSetPos\(\)](#) on a result set with aliased columns would fail. ([Bug#6157](#))

C.3.6. Changes in MySQL Connector/ODBC 5.1.1 (13 December 2007)

MySQL Connector/ODBC 5.1.1-beta, a new version of the ODBC driver for the MySQL database management system, has been released. This release is the first beta (feature-complete) release of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a beta release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data.

Includes changes from [Connector/ODBC 3.51.21](#) and [3.51.22](#).

Built using MySQL 5.0.52.

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.
- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that uninstall any existing versions of Connector/ODBC 5.1.x before upgrading.

See also [Bug#34571](#).

Functionality added or changed:

- **Incompatible Change:** Replaced myodbc3i (now myodbc-installer) with Connector/ODBC 5.0 version.
- **Incompatible Change:** Removed monitor (myodbc3m) and dsn-editor (myodbc3c).
- **Incompatible Change:** Disallow [SET NAMES](#) in initial statement and in executed statements.
- A wrapper for the [SQLGetPrivateProfileStringW\(\)](#) function, which is required for Unicode support, has been created. This function is missing from the unixODBC driver manager. ([Bug#32685](#))
- Added MSI installer for Windows 64-bit. ([Bug#31510](#))
- Implemented support for [SQLCancel\(\)](#). ([Bug#15601](#))
- Added support for [SQL_NUMERIC_STRUCT](#). ([Bug#3028](#), [Bug#24920](#))
- Removed non-threadsafe configuration of the driver. The driver is now always built against the threadsafe version of libmysql.
- Implemented native Windows setup library
- Replaced the internal library which handles creation and loading of DSN information. The new library, which was originally a

part of Connector/ODBC 5.0, supports Unicode option values.

- The Windows installer now places files in a subdirectory of the `Program Files` directory instead of the Windows system directory.

Bugs fixed:

- The `SET NAMES` statement has been disabled because it causes problems in the ODBC driver when determining the current client character set. (Bug#32596)
- `SQLDescribeColW` returned UTF-8 column as `SQL_VARCHAR` instead of `SQL_WVARCHAR`. (Bug#32161)
- ADO was unable to open record set using dynamic cursor. (Bug#32014)
- ADO applications would not open a `RecordSet` that contained a `DECIMAL` field. (Bug#31720)
- Memory usage would increase considerably. (Bug#31115)
- SQL statements are limited to 64KB. (Bug#30983, Bug#30984)
- `SQLSetPos` with `SQL_DELETE` advances dynamic cursor incorrectly. (Bug#29765)
- Using an ODBC prepared statement with bound columns would produce an empty result set when called immediately after inserting a row into a table. (Bug#29239)
- ADO Not possible to update a client side cursor. (Bug#27961)
- Recordset `Update()` fails when using `adUseClient` cursor. (Bug#26985)
- Connector/ODBC would fail to connect to the server if the password contained certain characters, including the semicolon and other punctuation marks. (Bug#16178)
- Fixed `SQL_ATTR_PARAM_BIND_OFFSET`, and fixed row offsets to work with updatable cursors.
- `SQLSetConnectAttr()` did not clear previous errors, possibly confusing `SQLERROR()`.
- `SQLERROR()` incorrectly cleared the error information, making it unavailable from subsequent calls to `SQLGetDiagRec()`.
- NULL pointers passed to `SQLGetInfo()` could result in a crash.
- `SQL_ODBC_SQL_CONFORMANCE` was not handled by `SQLGetInfo()`.
- `SQLCopyDesc()` did not correctly copy all records.
- Diagnostics were not correctly cleared on connection and environment handles.

C.3.7. Changes in MySQL Connector/ODBC 5.1.0 (10 September 2007)

This release is the first of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a alpha release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data. Not all of the features planned for the final Connector/ODBC 5.1 release are implemented.

Functionality is based on Connector/ODBC 3.51.20.

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- There are no installer packages for Microsoft Windows x64 Edition.
- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that un-

install any existing versions of Connector/ODBC 5.1.x before upgrading.

See also [Bug#34571](#).

Functionality added or changed:

- Added support for Unicode functions ([SQLConnectW](#), etc).
- Added descriptor support ([SQLGetDescField](#), [SQLGetDescRec](#), etc).
- Added support for [SQL_C_WCHAR](#).

C.3.8. Changes in MySQL Connector/ODBC 5.0.12 (Never released)

Note

Development on Connector/ODBC 5.0.x has ceased. New features and functionality will be incorporated into Connector/ODBC 5.1. See [Section 20.1.2.1](#), “Connector/ODBC Roadmap”.

Bugs fixed:

- Inserting [NULL](#) values into a [DATETIME](#) column from Access reports an error. ([Bug#27896](#))
- Tables with [TEXT](#) columns would be incorrectly identified, returning an `Unknown SQL type - 65535` error. ([Bug#20127](#))

C.3.9. Changes in MySQL Connector/ODBC 5.0.11 (31 January 2007)

Functionality added or changed:

- Added support for ODBC v2 statement options using attributes.
- Driver now builds and is partially tested under Linux with the iODBC driver manager.

Bugs fixed:

- Connection string parsing for DSN-less connections could fail to identify some parameters. ([Bug#25316](#))
- Updates of [MEMO](#) or [TEXT](#) columns from within Microsoft Access would fail. ([Bug#25263](#))
- Transaction support has been added and tested. ([Bug#25045](#))
- Internal function, `my_setpos_delete_ignore()` could cause a crash. ([Bug#22796](#))
- Fixed occasional mis-handling of the [SQL_NUMERIC_C](#) type.
- Fixed the binding of certain integer types.

C.3.10. Changes in MySQL Connector/ODBC 5.0.10 (14 December 2006)

Connector/ODBC 5.0.10 is the sixth BETA release.

Functionality added or changed:

- Significant performance improvement when retrieving large text fields in pieces using `SQLGetData()` with a buffer smaller than the whole data. Mainly used in Access when fetching very large text fields. ([Bug#24876](#))
- Added initial unicode support in data and metadata. ([Bug#24837](#))
- Added initial support for removing braces when calling stored procedures and retrieving result sets from procedure calls. ([Bug#24485](#))

- Added loose handling of retrieving some diagnostic data. ([Bug#15782](#))
- Added wide-string type info for `SQLGetTypeInfo()`.

Bugs fixed:

- Editing DSN no longer crashes ODBC data source administrator. ([Bug#24675](#))
- String query parameters are now escaped correctly. ([Bug#19078](#))

C.3.11. Changes in MySQL Connector/ODBC 5.0.9 (22 November 2006)

Connector/ODBC 5.0.9 is the fifth BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Added support for column binding as `SQL_NUMERIC_STRUCT`.
- Added recognition of `SQL_C_SHORT` and `SQL_C_TINYINT` as C types.

Bugs fixed:

- Fixed wildcard handling of and listing of catalogs and tables in `SQLTables`.
- Added limit of display size when requested via `SQLColAttribute/SQL_DESC_DISPLAY_SIZE`.
- Fixed buffer length return for `SQLDriverConnect`.
- ODBC v2 behaviour in driver now supports ODBC v3 date/time types (since `DriverManager` maps them).
- Catch use of `SQL_ATTR_PARAMSET_SIZE` and report error until we fully support.
- Fixed statistics to fail if it couldn't be completed.
- Corrected retrieval multiple field types bit and blob/text.
- Fixed `SQLGetData` to clear the NULL indicator correctly during multiple calls.

C.3.12. Changes in MySQL Connector/ODBC 5.0.8 (17 November 2006)

Connector/ODBC 5.0.8 is the fourth BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Also made `SQL_DESC_NAME` only fill in the name if there was a data pointer given, otherwise just the length.
- Fixed display size to be length if max length isn't available.
- Made distinction between `CHAR/BINARY` (and VAR versions).
- Wildcards now support escaped chars and underscore matching (needed to link tables with underscores in access).

Bugs fixed:

- Fixed binding using `SQL_C_LONG`.
- Fixed using wrong pointer for `SQL_MAX_DRIVER_CONNECTIONS` in `SQLGetInfo`.

- Set default return to `SQL_SUCCESS` if nothing is done for `SQLSpecialColumns`.
- Fixed `MDiagnostic` to use correct v2/v3 error codes.
- Allow `SQLDescribeCol` to be called to retrieve the length of the column name, but not the name itself.
- Length now used when handling bind parameter (needed in particular for `SQL_WCHAR`) - this enables updating char data in MS Access.
- Updated retrieval of descriptor fields to use the right pointer types.
- Fixed handling of numeric pointers in `SQLColAttribute`.
- Fixed type returned for `MYSQL_TYPE_LONG` to `SQL_INTEGER` instead of `SQL_TINYINT`.
- Fix size return from `SQLDescribeCol`.
- Fixed string length to chars, not bytes, returned by `SQLGetDiagRec`.

C.3.13. Changes in MySQL Connector/ODBC 5.0.7 (08 November 2006)

Connector/ODBC 5.0.7 is the third BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Added support for `SQLStatistics` to `MYODBCShell`.
- Improved trace/log.

Bugs fixed:

- `SQLBindParameter` now handles `SQL_C_DEFAULT`.
- Corrected incorrect column index within `SQLStatistics`. Many more tables can now be linked into MS Access.
- Fixed `SQLDescribeCol` returning column name length in bytes rather than chars.

C.3.14. Changes in MySQL Connector/ODBC 5.0.6 (03 November 2006)

Connector/ODBC 5.0.6 is the second BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Features, limitations and notes on this release

- Connector/ODBC supports both `User` and `System` DSNs.
- Installation is provided in the form of a standard Microsoft System Installer (MSI).
- You no longer have to have Connector/ODBC 3.51 installed before installing this version.

Bugs fixed:

- You no longer have to have Connector/ODBC 3.51 installed before installing this version.
- Connector/ODBC supports both `User` and `System` DSNs.
- Installation is provided in the form of a standard Microsoft System Installer (MSI).

C.3.15. Changes in MySQL Connector/ODBC 5.0.5 (17 October 2006)

Connector/ODBC 5.0.5 is the first BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

You no longer have to have Connector/ODBC 3.51 installed before installing this version.

Bugs fixed:

- You no longer have to have Connector/ODBC 3.51 installed before installing this version.

C.3.16. Changes in Connector/ODBC 5.0.3 (Connector/ODBC 5.0 Alpha 3) (20 June 2006)

This is an implementation and testing release, and is not designed for use within a production environment.

Features, limitations and notes on this release:

- The following ODBC API functions have been added in this release:
 - [SQLBindParameter](#)
 - [SQLBindCol](#)

C.3.17. Changes in Connector/ODBC 5.0.2 (Never released)

Connector/ODBC 5.0.2 was an internal implementation and testing release.

C.3.18. Changes in Connector/ODBC 5.0.1 (Connector/ODBC 5.0 Alpha 2) (05 June 2006)

Features, limitations and notes on this release:

- Connector/ODBC 5.0 is Unicode aware.
- Connector/ODBC is currently limited to basic applications. ADO applications and Microsoft Office are not supported.
- Connector/ODBC must be used with a Driver Manager.
- The following ODBC API functions are implemented:
 - [SQLAllocHandle](#)
 - [SQLCloseCursor](#)
 - [SQLColAttribute](#)
 - [SQLColumns](#)
 - [SQLConnect](#)
 - [SQLCopyDesc](#)
 - [SQLDisconnect](#)
 - [SQLExecDirect](#)
 - [SQLExecute](#)
 - [SQLFetch](#)
 - [SQLFreeHandle](#)
 - [SQLFreeStmt](#)

- `SQLGetConnectAttr`
- `SQLGetData`
- `SQLGetDescField`
- `SQLGetDescRec`
- `SQLGetDiagField`
- `SQLGetDiagRec`
- `SQLGetEnvAttr`
- `SQLGetFunctions`
- `SQLGetStmtAttr`
- `SQLGetTypeInfo`
- `SQLNumResultCols`
- `SQLPrepare`
- `SQLRowcount`
- `SQLTables`

The following ODBC API function are implemented, but not yet support all the available attributes/options:

- `SQLSetConnectAttr`
- `SQLSetDescField`
- `SQLSetDescRec`
- `SQLSetEnvAttr`
- `SQLSetStmtAttr`

C.3.19. Changes in MySQL Connector/ODBC 3.51.27 (20 November 2008)

Bugs fixed:

- The client program hung when the network connection to the server was interrupted. ([Bug#40407](#))
- The connection string option `Enable Auto-reconnect` did not work. When the connection failed, it could not be restored, and the errors generated were the same as if the option had not been selected. ([Bug#37179](#))
- It was not possible to use Connector/ODBC to connect to a server using SSL. The following error was generated:

```
Runtime error '-2147467259 (80004005)':  
[MySQL][ODBC 3.51 Driver]SSL connection error.
```

([Bug#29955](#))

C.3.20. Changes in MySQL Connector/ODBC 3.51.26 (07 July 2008)

Functionality added or changed:

- There is a new connection option, `FLAG_NO_BINARY_RESULT`. When set this option disables charset 63 for columns with an empty `org_table`. ([Bug#29402](#))

Bugs fixed:

- When an `ADOConnection` is created and attempts to open a schema with `ADOConnection.OpenSchema` an access violation occurs in `myodbc3.dll`. (Bug#30770)
- When `SHOW CREATE TABLE` was invoked and then the field values read, the result was truncated and unusable if the table had many rows and indexes. (Bug#24131)

C.3.21. Changes in MySQL Connector/ODBC 3.51.25 (11 April 2008)

Bugs fixed:

- The `SQLColAttribute()` function returned `SQL_TRUE` when querying the `SQL_DESC_FIXED_PREC_SCALE` (`SQL_COLUMN_MONEY`) attribute of a `DECIMAL` column. Previously, the correct value of `SQL_FALSE` was returned; this is now again the case. (Bug#35581)
- The driver crashes ODBC Administrator on attempting to add a new DSN. (Bug#32057)
- When accessing column data, `FLAG_COLUMN_SIZE_S32` did not limit the octet length or display size reported for fields, causing problems with Microsoft Visual FoxPro.

The list of ODBC functions that could have caused failures in Microsoft software when retrieving the length of `LONGBLOB` or `LONGTEXT` columns includes:

- `SQLColumns`
- `SQLColAttribute`
- `SQLColAttributes`
- `SQLDescribeCol`
- `SQLSpecialColumns` (theoretically can have the same problem) (Bug#12805, Bug#30890)

C.3.22. Changes in MySQL Connector/ODBC 3.51.24 (14 March 2008)

Bugs fixed:

- **Security Enhancement:** Accessing a parameter with the type of `SQL_C_CHAR`, but with a numeric type and a length of zero, the parameter marker would get stripped from the query. In addition, an SQL injection was possible if the parameter value had a nonzero length and was not numeric, the text would be inserted verbatim. (Bug#34575)
- **Important Change:** In previous versions, the SSL certificate would automatically be verified when used as part of the Connector/ODBC connection. The default mode is now to ignore the verification of certificates. To enforce verification of the SSL certificate during connection, use the `SSLVERIFY` DSN parameter, setting the value to 1. (Bug#29955, Bug#34648)
- When using ADO, the count of parameters in a query would always return zero. (Bug#33298)
- Using tables with a single quote or other non-standard characters in the table or column names through ODBC would fail. (Bug#32989)
- When using Crystal Reports, table and column names would be truncated to 21 characters, and truncated columns in tables where the truncated name was the duplicated would lead to only a single column being displayed. (Bug#32864)
- `SQLExtendedFetch()` and `SQLFetchScroll()` ignored the rowset size if the `Don't cache result` DSN option was set. (Bug#32420)
- When using the ODBC `SQL_TXN_READ_COMMITTED` option, 'dirty' records would be read from tables as if the option had not been applied. (Bug#31959)
- When creating a System DSN using the ODBC Administrator on Mac OS X, a User DSN would be created instead. The root cause is a problem with the iODBC driver manager used on Mac OS X. The fix works around this issue.

Note

ODBC Administrator may still be unable to register a System DSN unless the `/Library/ODBC/odbc.ini` file has the correct permissions. You should ensure that the file is writable by the `admin` group.

([Bug#31495](#))

- Calling `SQLFetch` or `SQLFetchScroll` would return negative data lengths when using `SQL_C_WCHAR`. ([Bug#31220](#))
- `SQLSetParam()` caused memory allocation errors due to driver manager's mapping of deprecated functions (buffer length - 1). ([Bug#29871](#))
- Static cursor was unable to be used through ADO when dynamic cursors were enabled. ([Bug#27351](#))
- Using `connection.Execute` to create a record set based on a table without declaring the cmd option as `adCmdTable` will fail when communicating with versions of MySQL 5.0.37 and higher. The issue is related to the way that `SQLSTATE` is returned when ADO tries to confirm the existence of the target object. ([Bug#27158](#))
- Updating a `RecordSet` when the query involves a `BLOB` field would fail. ([Bug#19065](#))
- With some connections to MySQL databases using Connector/ODBC, the connection would mistakenly report 'user cancelled' for accesses to the database information. ([Bug#16653](#))

C.3.23. Changes in MySQL Connector/ODBC 3.51.23 (09 January 2008)

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- There are no installer packages for Microsoft Windows x64 Edition.

Bugs fixed:

- Connector/ODBC would incorrectly return `SQL_SUCCESS` when checking for distributed transaction support. ([Bug#32727](#))
- When using unixODBC or directly linked applications where the thread level is set to less than 3 (within `odbcinst.ini`), a thread synchronization issue would lead to an application crash. This was because `SQLAllocStmt()` and `SQLFreeStmt()` did not synchronize access to the list of statements associated with a connection. ([Bug#32587](#))
- Cleaning up environment handles in multithread environments could result in a five (or more) second delay. ([Bug#32366](#))
- Renaming an existing DSN entry would create a new entry with the new name without deleting the old entry. ([Bug#31165](#))
- Setting the default database using the `DefaultDatabase` property of an ADO `Connection` object would fail with the error `Provider does not support this property`. The `SQLGetInfo()` returned the wrong value for `SQL_DATABASE_NAME` when no database was selected. ([Bug#3780](#))

C.3.24. Changes in MySQL Connector/ODBC 3.51.22 (13 November 2007)

Functionality added or changed:

- The workaround for this bug was removed due to the fixes in MySQL Server 5.0.48 and 5.1.21.
This regression was introduced by [Bug#10491](#).

Bugs fixed:

- The `English` locale would be used when formatting floating point values. The `C` locale is now used for these values. ([Bug#32294](#))
- When accessing information about supported operations, the driver would return incorrect information about the support for `UNION`. ([Bug#32253](#))
- Unsigned integer values greater than the maximum value of a signed integer would be handled incorrectly. ([Bug#32171](#))

- The wrong result was returned by `SQLGetData()` when the data was an empty string and a zero-sized buffer was specified. (Bug#30958)
- Added the `FLAG_COLUMN_SIZE_S32` option to limit the reported column size to a signed 32-bit integer. This option is automatically enabled for ADO applications to provide a work around for a bug in ADO. (Bug#13776)

C.3.25. Changes in MySQL Connector/ODBC 3.51.21 (08 October 2007)

Bugs fixed:

- When using a rowset/cursor and add a new row with a number of fields, subsequent rows with fewer fields will include the original fields from the previous row in the final `INSERT` statement. (Bug#31246)
- Uninitiated memory could be used when C/ODBC internally calls `SQLGetFunctions()`. (Bug#31055)
- The wrong `SQL_DESC_LITERAL_PREFIX` would be returned for date/time types. (Bug#31009)
- The wrong `COLUMN_SIZE` would be returned by `SQLGetTypeInfo` for the TIME columns (`SQL_TYPE_TIME`). (Bug#30939)
- Clicking outside the character set selection box when configuring a new DSN could cause the wrong character set to be selected. (Bug#30568)
- Not specifying a user in the DSN dialog would raise a warning even though the parameter is optional. (Bug#30499)
- `SQLSetParam()` caused memory allocation errors due to driver manager's mapping of deprecated functions (buffer length - 1). (Bug#29871)
- When using ADO, a column marked as `AUTO_INCREMENT` could incorrectly report that the column allowed `NULL` values. This was due to an issue with `NULLABLE` and `IS_NULLABLE` return values from the call to `SQLColumns()`. (Bug#26108)
- Connector/ODBC would return the wrong the error code when the server disconnects the active connection because the configured `wait_timeout` has expired. Previously it would return `HY000`. Connector/ODBC now correctly returns an `SQLSTATE` of `08S01`. (Bug#3456)

C.3.26. Changes in MySQL Connector/ODBC 3.51.20 (10 September 2007)

Bugs fixed:

- Using `FLAG_NO_PROMPT` doesn't suppress the dialogs normally handled by `SQLDriverConnect`. (Bug#30840)
- The specified length of the user name and authentication parameters to `SQLConnect()` were not being honored. (Bug#30774)
- The wrong column size was returned for binary data. (Bug#30547)
- `SQLGetData()` will now always return `SQL_NO_DATA_FOUND` on second call when no data left, even if requested size is 0. (Bug#30520)
- `SQLGetConnectAttr()` did not reflect the connection state correctly. (Bug#14639)
- Removed checkbox in setup dialog for `FLAG_FIELD_LENGTH` (identified as `Don't Optimize Column Width` within the GUI dialog), which was removed from the driver in 3.51.18.

C.3.27. Changes in MySQL Connector/ODBC 3.51.19 (10 August 2007)

Connector/ODBC 3.51.19 fixes a specific issue with the 3.51.18 release. For a list of changes in the 3.51.18 release, see [Section C.3.28, "Changes in MySQL Connector/ODBC 3.51.18 \(08 August 2007\)"](#).

Functionality added or changed:

- Because of [Bug#10491](#) in the server, character string results were sometimes incorrectly identified as `SQL_VARBINARY`. Until this server bug is corrected, the driver will identify all variable-length strings as `SQL_VARCHAR`.

C.3.28. Changes in MySQL Connector/ODBC 3.51.18 (08 August 2007)

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- Binary packages as disk images with installers are now available for Mac OS X.
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.

Functionality added or changed:

- **Incompatible Change:** The `FLAG_DEBUG` option was removed.
- When connecting to a specific database when using a DSN, the system tables from the `mysql` database are no longer also available. Previously, tables from the `mysql` database (catalog) were listed as `SYSTEM TABLES` by `SQLTables()` even when a different catalog was being queried. ([Bug#28662](#))
- Installed for Mac OS X has been re-instated. The installer registers the driver at a system (not user) level and makes it possible to create both user and system DSNs using the Connector/ODBC driver. The installer also fixes the situation where the necessary drivers would be installed local to the user, not globally. ([Bug#15326](#), [Bug#10444](#))
- Connector/ODBC now supports batched statements. In order to enable cached statement support you must switch enable the batched statement option (`FLAG_MULTI_STATEMENTS`, 67108864, or `ALLOW MULTIPLE STATEMENTS` within a GUI configuration). Be aware that batched statements create an increased chance of SQL injection attacks and you must ensure that your application protects against this scenario. ([Bug#7445](#))
- The `SQL_ATTR_ROW_BIND_OFFSET_PTR` is now supported for row bind offsets. ([Bug#6741](#))
- The `TRACE` and `TRACEFILE` DSN options have been removed. Use the ODBC driver manager trace options instead.

Bugs fixed:

- When using a table with multiple `TIMESTAMP` columns, the final `TIMESTAMP` column within the table definition would not be updateable. Note that there is still a limitation in MySQL server regarding multiple `TIMESTAMP` columns. ([Bug#9927](#)) ([Bug#30081](#))
- Fixed an issue where the `myodbc3i` would update the user ODBC configuration file (`~/Library/ODBC/odbcinst.ini`) instead of the system `/Library/ODBC/odbcinst.ini`. This was caused because `myodbc3i` was not honoring the `s` and `u` modifiers for the `-d` command-line option. ([Bug#29964](#))
- Getting table metadata (through the `SQLColumns()`) would fail, returning a bad table definition to calling applications. ([Bug#29888](#))
- `DATETIME` column types would return `FALSE` in place of `SQL_SUCCESS` when requesting the column type information. ([Bug#28657](#))
- The `SQL_COLUMN_TYPE`, `SQL_COLUMN_DISPLAY` and `SQL_COLUMN_PRECISION` values would be returned incorrectly by `SQLColumns()`, `SQLDescribeCol()` and `SQLColAttribute()` when accessing character columns, especially those generated through `concat()`. The lengths returned should now conform to the ODBC specification. The `FLAG_FIELD_LENGTH` option no longer has any affect on the results returned. ([Bug#27862](#))
- Obtaining the length of a column when using a character set for the connection of `utf8` would result in the length being returned incorrectly. ([Bug#19345](#))
- The `SQLColumns()` function could return incorrect information about `TIMESTAMP` columns, indicating that the field was not nullable. ([Bug#14414](#))
- The `SQLColumns()` function could return incorrect information about `AUTO_INCREMENT` columns, indicating that the field was not nullable. ([Bug#14407](#))

- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- `BIT(n)` columns are now treated as `SQL_BIT` data where `n = 1` and binary data where `n > 1`.
- The wrong value from `SQL_DESC_LITERAL_SUFFIX` was returned for binary fields.
- The `SQL_DATETIME_SUB` column in `SQLColumns()` was not correctly set for date and time types.
- The value for `SQL_DESC_FIXED_PREC_SCALE` was not returned correctly for values in MySQL 5.0 and later.
- The wrong value for `SQL_DESC_TYPE` was returned for date and time types.
- `SQLConnect()` and `SQLDriverConnect()` were rewritten to eliminate duplicate code and ensure all options were supported using both connection methods. `SQLDriverConnect()` now only requires the setup library to be present when the call requires it.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- Binary packages as disk images with installers are now available for Mac OS X.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- The wrong value for `DECIMAL_DIGITS` in `SQLColumns()` was reported for `FLOAT` and `DOUBLE` fields, as well as the wrong value for the scale parameter to `SQLDescribeCol()`, and the `SQL_DESC_SCALE` attribute from `SQLColAttribute()`.
- The `SQL_DATA_TYPE` column in `SQLColumns()` results did not report the correct value for date and time types.

C.3.29. Changes in MySQL Connector/ODBC 3.51.17 (14 July 2007)

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- Binary packages as disk images with installers are now available for Mac OS X.
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.

Functionality added or changed:

- It is now possible to specify a different character set as part of the DSN or connection string. This must be used instead of the `SET NAMES` statement. You can also configure the character set value from the GUI configuration. ([Bug#9498](#), [Bug#6667](#))
- Fixed calling convention ptr and wrong free in `myodbc3i`, and fixed the null terminating (was only one, not two) when writing DSN to string.
- Dis-allow NULL ptr for null indicator when calling `SQLGetData()` if value is null. Now returns `SQL_ERROR` w/state 22002.
- The setup library has been split into its own RPM package, to allow installing the driver itself with no GUI dependencies.

Bugs fixed:

- `myodbc3i` did not correctly format driver info, which could cause the installation to fail. ([Bug#29709](#))
- Connector/ODBC crashed with Crystal Reports due to a rproblem with `SQLProcedures()`. ([Bug#28316](#))

- Fixed a problem where the GUI would crash when configuring or removing a System or User DSN. ([Bug#27315](#))
- Fixed error handling of out-of-memory and bad connections in catalog functions. This might raise errors in code paths that had ignored them in the past. ([Bug#26934](#))
- For a stored procedure that returns multiple result sets, Connector/ODBC returned only the first result set. ([Bug#16817](#))
- Calling `SQLGetDiagField` with `RecNumber 0`, `DiagIdentifier NOT 0` returned `SQL_ERROR`, preventing access to diagnostic header fields. ([Bug#16224](#))
- Added a new DSN option (`FLAG_ZERO_DATE_TO_MIN`) to retrieve `XXXX-00-00` dates as the minimum allowed ODBC date (`XXXX-01-01`). Added another option (`FLAG_MIN_DATE_TO_ZERO`) to mirror this but for bound parameters. `FLAG_MIN_DATE_TO_ZERO` only changes `0000-01-01` to `0000-00-00`. ([Bug#13766](#))
- If there was more than one unique key on a table, the correct fields were not used in handling `SQLSetPos()`. ([Bug#10563](#))
- When inserting a large `BLOB` field, Connector/ODBC would crash due to a memory allocation error. ([Bug#10562](#))
- The driver was using `mysql_odbc_escape_string()`, which does not handle the `NO_BACKSLASH_ESCAPES` SQL mode. Now it uses `mysql_real_escape_string()`, which does. ([Bug#9498](#))
- `SQLColumns()` did not handle many of its parameters correctly, which could lead to incorrect results. The table name argument was not handled as a pattern value, and most arguments were not escaped correctly when they contained non-alphanumeric characters. ([Bug#8860](#))
- There are no binary packages for Microsoft Windows x64 Edition.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Correctly return error if `SQLBindCol` is called with an invalid column.
- Fixed possible crash if `SQLBindCol()` was not called before `SQLSetPos()`.
- The Mac OS X binary packages are only provided as tarballs, there is no installer.
- The binary packages for Sun Solaris are only provided as tarballs, not the PKG format.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

C.3.30. Changes in MySQL Connector/ODBC 3.51.16 (14 June 2007)

Functionality added or changed:

- Connector/ODBC now supports using SSL for communication. This is not yet exposed in the setup GUI, but must be enabled through configuration files or the DSN. ([Bug#12918](#))

Bugs fixed:

- Calls to `SQLNativeSql()` could cause stack corruption due to an incorrect pointer cast. ([Bug#28758](#))
- Using cursors on results sets with multi-column keys could select the wrong value. ([Bug#28255](#))
- `SQLForeignKeys` does not escape `_` and `%` in the table name arguments. ([Bug#27723](#))
- When using stored procedures, making a `SELECT` or second stored procedure call after an initial stored procedure call, the second statement will fail. ([Bug#27544](#))
- `SQLTables()` did not distinguish tables from views. ([Bug#23031](#))
- Data in `TEXT` columns would fail to be read correctly. ([Bug#16917](#))
- Specifying strings as parameters using the `adBSTR` or `adVarChar` types, (`SQL_WVARCHAR` and `SQL_WLONGVARCHAR`) would be incorrectly quoted. ([Bug#16235](#))
- `SQL_WVARCHAR` and `SQL_WLONGVARCHAR` parameters were not properly quoted and escaped. ([Bug#16235](#))

- Using `BETWEEN` with date values, the wrong results could be returned. ([Bug#15773](#))
- When using the `Don't Cache Results` (option value `1048576`) with Microsoft Access, the connection will fail using DAO/VisualBasic. ([Bug#4657](#))
- Return values from `SQLTables()` may be truncated. (Bugs #22797)

C.3.31. Changes in MySQL Connector/ODBC 3.51.15 (07 May 2007)

Bugs fixed:

- Connector/ODBC would incorrectly claim to support `SQLProcedureColumns` (by returning true when queried about `SQLPROCEDURECOLUMNS` with `SQLGetFunctions`), but this functionality is not supported. ([Bug#27591](#))
- An incorrect transaction isolation level may not be returned when accessing the connection attributes. ([Bug#27589](#))
- Adding a new DSN with the `myodbc3i` utility under AIX would fail. ([Bug#27220](#))
- When inserting data using bulk statements (through `SQLBulkOperations`), the indicators for all rows within the insert would not updated correctly. ([Bug#24306](#))
- Using `SQLProcedures` does not return the database name within the returned resultset. ([Bug#23033](#))
- The `SQLTransact()` function did not support an empty connection handle. ([Bug#21588](#))
- Using `SQLDriverConnect` instead of `SQLConnect` could cause later operations to fail. ([Bug#7912](#))
- When using blobs and parameter replacement in a statement with `WHERE CURSOR OF`, the SQL is truncated. ([Bug#5853](#))
- Connector/ODBC would return too many foreign key results when accessing tables with similar names. ([Bug#4518](#))

C.3.32. Changes in MySQL Connector/ODBC 3.51.14 (08 March 2007)

Functionality added or changed:

- Use of `SQL_ATTR_CONNECTION_TIMEOUT` on the server has now been disabled. If you attempt to set this attribute on your connection the `SQL_SUCCESS_WITH_INFO` will be returned, with an error number/string of `HYC00: Optional feature not supported`. ([Bug#19823](#))
- Added auto is null option to Connector/ODBC option parameters. ([Bug#10910](#))
- Added auto-reconnect option to Connector/ODBC option parameters.
- Added support for the `HENV` handlers in `SQLEndTran()`.

Bugs fixed:

- On 64-bit systems, some types would be incorrectly returned. ([Bug#26024](#))
- When retrieving `TIME` columns, C/ODBC would incorrectly interpret the type of the string and could interpret it as a `DATE` type instead. ([Bug#25846](#))
- Connector/ODBC may insert the wrong parameter values when using prepared statements under 64-bit Linux. ([Bug#22446](#))
- Using Connector/ODBC, with `SQLBindCol` and binding the length to the return value from `SQL_LEN_DATA_AT_EXEC` fails with a memory allocation error. ([Bug#20547](#))
- Using `DataAdapter`, Connector/ODBC may continually consume memory when reading the same records within a loop (Windows Server 2003 SP1/SP2 only). ([Bug#20459](#))
- When retrieving data from columns that have been compressed using `COMPRESS()`, the retrieved data would be truncated to 8KB. ([Bug#20208](#))
- The ODBC driver name and version number were incorrectly reported by the driver. ([Bug#19740](#))

- A string format exception would be raised when using iODBC, Connector/ODBC and the embedded MySQL server. ([Bug#16535](#))
- The `SQLDriverConnect()` ODBC method did not work with recent Connector/ODBC releases. ([Bug#12393](#))

C.3.33. Changes in MySQL Connector/ODBC 3.51.13 (Never released)

Connector/ODBC 3.51.13 was an internal implementation and testing release.

C.3.34. Changes in MySQL Connector/ODBC 3.51.12 (11 February 2005)

Functionality added or changed:

- N/A

Bugs fixed:

- Using stored procedures with ADO, where the `CommandType` has been set correctly to `adCmdStoredProc`, calls to stored procedures would fail. ([Bug#15635](#))
- File DSNs could not be saved. ([Bug#12019](#))
- `SQLColumns()` returned no information for tables that had a column named using a reserved word. ([Bug#9539](#))

C.3.35. Changes in MySQL Connector/ODBC 3.51.11 (28 January 2005)

Bugs fixed:

- `mysql_list_dbcolumns()` and `insert_fields()` were retrieving all rows from a table. Fixed the queries generated by these functions to return no rows. ([Bug#8198](#))
- `SQLGetTypeInfo()` returned `tinyblob` for `SQL_VARBINARY` and nothing for `SQL_BINARY`. Fixed to return `varbinary` for `SQL_VARBINARY`, `binary` for `SQL_BINARY`, and `longblob` for `SQL_LONGVARBINARY`. ([Bug#8138](#))

C.4. MySQL Connector/NET Change History

C.4.1. Changes in MySQL Connector/NET 6.0.4 (Not yet released beta)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- A SQL query string containing an escaped backslash caused an exception to be generated:

```
Index and length must refer to a location within the string.
Parameter name: length
at System.String.InternalSubStringWithChecks(Int32 startIndex, Int32 length, Boolean
fAlwaysCopy)
at MySql.Data.MySqlClient.MySqlTokenizer.NextParameter()
at MySql.Data.MySqlClient.Statement.InternalBindParameters(String sql,
MySqlParameterCollection parameters, MySqlPacket packet)
at MySql.Data.MySqlClient.Statement.BindParameters()
at MySql.Data.MySqlClient.PreparableStatement.Execute()
at MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
at MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
```

([Bug#44960](#))

- The Microsoft Visual Studio solution file `MySQL-VS2005.sln` was invalid. Several projects could not be loaded and thus it was not possible to build Connector/NET from source. ([Bug#44822](#))
- The `DataReader` in Connector/NET 6.0.3 considered a `BINARY(16)` field as a GUID with a length of 16. ([Bug#44507](#))

- When creating a new DataSet the following error was generated:

```
Failed to open a connection to database.
Cannot load type with name 'MySQL.Data.VisualStudio.StoredProcedureColumnEnumerator'
```

([Bug#44460](#))

- The Connector/NET MySQLRoleProvider reported that there were no roles, even when roles existed. ([Bug#44414](#))

C.4.2. Changes in MySQL Connector/NET 6.0.3 (28 April 2009 beta)

This is a new Beta development release, fixing recently discovered bugs.

Functionality added or changed:

- The `MySqlTokenizer` failed to split fieldnames from values if they were not separated by a space. This also happened if the string contained certain characters. As a result `MySqlCommand.ExecuteNonQuery` raised an index out of range exception.

The resulting errors are illustrated by the following examples. Note, the example statements do not have delimiting spaces around the = operator.

```
INSERT INTO anytable SET Text='test--test';
```

The tokenizer incorrectly interpreted the value as containing a comment.

```
UPDATE anytable SET Project='123-456',Text='Can you explain this ?',Duration=15 WHERE
ID=4711;'
```

A `MySqlException` was generated, as the ? in the value was interpreted by the tokenizer as a parameter sign. The error message generated was:

```
Fatal error encountered during command execution.
EXCEPTION: MySqlException - Parameter '?' must be defined.
```

([Bug#44318](#))

Bugs fixed:

- `MySQL.Data` was not displayed as a Reference inside Microsoft Visual Studio 2008 Professional.

When a new C# project was created in Microsoft Visual Studio 2008 Professional, `MySQL.Data` was not displayed when `REFERENCES`, `ADD REFERENCE` was selected. ([Bug#44141](#))

- Column types for `SchemaProvider` and `ISSchemaProvider` did not match.

When the source code in `SchemaProvider.cs` and `ISSchemaProvider.cs` were compared it was apparent that they were not using the same column types. The base provider used SQL such as `SHOW CREATE TABLE`, while `ISSchemaProvider` used the schema information tables. Column types used by the base class were `INT64` and the column types used by `ISSchemaProvider` were `UNSIGNED`. ([Bug#44123](#))

C.4.3. Changes in MySQL Connector/NET 6.0.2 (07 April 2009 beta)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- Connector/Net 6.0.1 did not load in Microsoft Visual Studio 2008 and Visual Studio 2005 Pro.

The following error message was generated:

```
.NET Framework Data Provider for MySQL: The data provider object factory service was not
found.
```

([Bug#44064](#))

C.4.4. Changes in MySQL Connector/NET 6.0.1 (02 April 2009 beta)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- An insert and update error was generated by the decimal data type in the Entity Framework, when a German collation was used. ([Bug#43574](#))
- Generating an Entity Data Model (EDM) schema with a table containing columns with data types `MEDIUMTEXT` and `LONG-TEXT` generated a runtime error message “Max value too long or too short for Int32”. ([Bug#43480](#))

C.4.5. Changes in MySQL Connector/NET 6.0.0 (02 March 2009 alpha)

This is a new Alpha development release.

Bugs fixed:

- A null reference exception was generated when `MySqlConnection.ClearPool(connection)` was called. ([Bug#42801](#))

C.4.6. Changes in MySQL Connector/NET 5.3.0 (Not yet released)

Bugs fixed:

- The Web Provider did not work at all on a remote host, and did not create a database when using `autogenerates-chema="true"`. ([Bug#39072](#))
- The Connector/NET installer program ended prematurely without reporting the specific error. ([Bug#39019](#))
- When called with an incorrect password the `MembershipProvider.GetPassword()` method threw a `MySQLException` instead of a `MembershipPasswordException`. ([Bug#38939](#))
- Possible overflow in `MySqlPacket.ReadLong()`. ([Bug#36997](#))
- The `TokenizeSql` method was adding query overhead and causing high CPU utilization for larger queries. ([Bug#36836](#))

C.4.7. Changes in MySQL Connector/NET 5.2.7 (Not yet released)

Bugs fixed:

- The Microsoft Visual Studio solution file `MySQL-VS2005.sln` was invalid. Several projects could not be loaded and thus it was not possible to build Connector/NET from source. ([Bug#44822](#))
- The Connector/NET `MySQLRoleProvider` reported that there were no roles, even when roles existed. ([Bug#44414](#))
- When a `TableAdapter` was created on a `DataSet`, it was not possible to use a stored procedure with variables. The following error was generated:

```
The method or operation is not implemented
```

([Bug#39409](#))

C.4.8. Changes in MySQL Connector/NET 5.2.6 (28 April 2009)

Functionality added or changed:

- A new connection string option has been added: `use affected rows`. When `true` the connection will report changed rows instead of found rows. ([Bug#44194](#))

Bugs fixed:

- Calling `GetSchema()` on `Indexes` or `IndexColumns` failed where index or column names were restricted.

In `SchemaProvider.cs`, methods `GetIndexes()` and `GetIndexColumns()` passed their restrictions directly to `GetTables()`. This only worked if the restrictions were no more specific than `schemaName` and `tableName`. If `IndexName` was given, this was passed to `GetTables()` where it was treated as `TableType`. As a result no tables were returned, unless the index name happened to be `BASE TABLE` or `VIEW`. This meant that both methods failed to return any rows. (Bug#43991)

- `GetSchema("MetaDataCollections")` should have returned a table with a column named "NumberOfRestrictions" not "NumberOfRestriction".

This can be confirmed by referencing the [Microsoft Documentation](#). (Bug#43990)

- Requests sent to the Connector/NET role provider to remove a user from a role failed. The query log showed the query was correctly executed within a transaction which was immediately rolled back. The rollback was caused by a missing call to the `Complete` method of the transaction. (Bug#43553)
- When using `MySQLBulkLoader.Load()`, the text file is opened by `NativeDriver.SendFileToServer`. If it encountered a problem opening the file as a stream, an exception was generated and caught. An attempt to clean up resources was then made in the `finally{}` clause by calling `fs.Close()`, but since the stream was never successfully opened, this was an attempt to execute a method of a null reference. (Bug#43332)
- A null reference exception was generated when `MySQLConnection.ClearPool(connection)` was called. (Bug#42801)
- `MySQLMembershipProvider.ValidateUser` only used the `userId` to validate. However, it should also use the `applicationId` to perform the validation correctly.

The generated query was, for example:

```
SELECT Password, PasswordKey, PasswordFormat, IsApproved, Islockedout
FROM my_aspnet_Membership WHERE userId=13
```

Note that `applicationId` is not used. (Bug#42574)

- There was an error in the `ProfileProvider` class in the `private ProfileInfoCollection GetProfiles()` function. The column of the final table was named "lastUpdatdDate" ('e' is missing) instead of the correct "lastUpdatedDate". (Bug#41654)
- The `GetGuid()` method of `MySQLDataReader` did not treat `BINARY(16)` column data as a GUID. When operating on such a column a `FormatException` exception was generated. (Bug#41452)
- When ASP.NET membership was configured to not require password question and answer using `requiresQuestionAndAnswer="false"`, a `SqlNullValueException` was generated when using `MembershipUser.ResetPassword()` to reset the user password. (Bug#41408)
- If a `Stored Procedure` contained spaces in its parameter list, and was then called from Connector/NET, an exception was generated. However, the same `Stored Procedure` called from the MySQL Query Analyzer or the MySQL Client worked correctly.

The exception generated was:

```
Parameter '0' not found in the collection.
```

(Bug#41034)

- The `DATETIME` format contained an erroneous space. (Bug#41021)
- When `MySQL.Web.Profile.MySQLProfileProvider` was configured, it was not possible to assign a name other than the default name `MySQLProfileProvider`.

If the name `SCC_MySQLProfileProvider` was assigned, an exception was generated when attempting to use `Page.Context.Profile['custom prop']`.

The exception generated was:

```
The profile default provider was not found.
```

Note that the exception stated: 'the profile **default provider...**', even though a different name was explicitly requested. ([Bug#40871](#))

- When `ExecuteNonQuery` was called with a command type of `Stored Procedure` it worked for one user but resulted in a hang for another user with the same database permissions.

However, if `CALL` was used in the command text and `ExecuteNonQuery` was used with a command type of `Text`, the call worked for both users. ([Bug#40139](#))

C.4.9. Changes in MySQL Connector/NET 5.2.5 (19 November 2008)

Bugs fixed:

- Visual Studio 2008 displayed the following error three times on start-up:

```
"Package Load Failure
Package 'MySql.Data.VisualStudio.MySqlDataProviderPackage, MySql.VisualStudio,
Version=5.2.4, Culture=neutral, PublicKeyToken=null' has failed to load properly (GUID =
{79A115C9-B133-4891-9E7B-242509DAD272}). Please contact the package vendor for
assistance. Application restart is recommended, due to possible environment corruption.
Would you like to disable loading the package in the future? You may use
'devenve/resetskipkgs' to re-enable package loading."
```

([Bug#40726](#))

C.4.10. Changes in MySQL Connector/NET 5.2.4 (13 November 2008)

Bugs fixed:

- `MySqlDataReader` did not feature a `GetSByte` method. ([Bug#40571](#))
- When working with stored procedures Connector/NET generated an exception `Unknown "table parameters" in information_schema`. ([Bug#40382](#))
- `GetDefaultCollation` and `GetMaxLength` were not thread safe. These functions called the database to get a set of parameters and cached them in two static dictionaries in the function `InitCollections`. However, if many threads called them they would try to insert the same keys in the collections resulting in duplicate key exceptions. ([Bug#40231](#))
- If connection pooling was not set explicitly in the connection string, Connector/NET added `“;Pooling=False”` to the end of the connection string when `MySqlCommand.ExecuteReader()` was called.

If connection pooling was explicitly set in the connection string, when `MySqlConnection.Open()` was called it converted `“Pooling=True”` to `“pooling=True”`.

If `MySqlCommand.ExecuteReader()` was subsequently called, it concatenated `“;Pooling=False”` to the end of the connection string. The resulting connection string was thus terminated with `“pooling=True;Pooling=False”`. This disabled connection pooling completely. ([Bug#40091](#))

- The connection string option `Functions Return String` did not set the correct encoding for the result string. Even though the connection string option `Functions Return String=true;` is set, the result of `SELECT DES_DECRYPT()` contained `“??”` instead of the correct national character symbols. ([Bug#40076](#))
- If, when using the `MySqlTransaction` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. ([Bug#39817](#))
- After the `ConnectionString` property was initialized via the public setter of `DbConnectionStringBuilder`, the `GetConnectionString` method of `MySqlConnectionStringBuilder` incorrectly returned `null` when `true` was assigned to the `includePass` parameter. ([Bug#39728](#))
- When using `ProfileProvider`, attempting to update a previously saved property failed. ([Bug#39330](#))
- Reading a negative time value greater than `-01:00:00` returned the absolute value of the original time value. ([Bug#39294](#))
- Inserting a negative time value (negative `TimeSpan`) into a `Time` column through the use of `MySqlParameter` caused `MySqlException` to be thrown. ([Bug#39275](#))

- When a data connection was created in the server explorer of Visual Studio 2008 Team, an error was generated when trying to expand stored procedures that had parameters.

Also, if **TABLEADAPTER** was right-clicked and then **ADD, QUERY, USE EXISTING STORED PROCEDURES** selected, if you then attempted to select a stored procedure, the window would close and no error message would be displayed. (Bug#39252)

- The Web Provider did not work at all on a remote host, and did not create a database when using `autogenerateschema=true`. (Bug#39072)
- Connector/NET called hashed password methods not supported in Mono 2.0 Preview 2. (Bug#38895)

C.4.11. Changes in MySQL Connector/NET 5.2.3 (19 August 2008)

Functionality added or changed:

- Error string was returned after a 28000 second `wait_timeout`. This has been changed to generate a `ConnectionState.Closed` event. (Bug#38119)
- Changed how the procedure schema collection is retrieved. If the connection string contains `use procedure bodies=true` then a `SELECT` is performed on the `mysql.proc` table directly, as this is up to 50 times faster than the current Information Schema implementation. If the connection string contains `use procedure bodies=false`, then the Information Schema collection is queried. (Bug#36694)
- Changed how the procedure schema collection is retrieved. If `use procedure bodies=true` then the `mysql.proc` table is selected directly as this is up to 50 times faster than the current `information_schema` implementation. If `use procedure bodies=false`, then the `information_schema` collection is queried. (Bug#36694)
- String escaping functionality has been moved from the `MySqlString` class to the `MySqlHelper` class, where it can be accessed by the `EscapeString` method. (Bug#36205)

Bugs fixed:

- The `GetOrdinal()` method failed to return the ordinal if the column name string contained an accent. (Bug#38721)
- Connector/Net uninstaller did not clean up all installed files. (Bug#38534)
- There was a short circuit evaluation error in the `MySqlCommand.CheckState()` method. When the statement `connection == null` was true a `NullReferenceException` was thrown and not the expected `InvalidOperationException`. (Bug#38276)
- The provider did not silently create the user if the user did not exist. (Bug#38243)
- Executing a command that resulted in a fatal exception did not close the connection. (Bug#37991)
- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that should be inserted is corrupted and no error is thrown. (Bug#37968)
- In a .NET application MySQL Connector/NET modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

The original connection string:

```
host=localhost;database=test;uid=****;pwd=****;
connect timeout=25; auto enlist=false;pooling=false;
```

The connection string after closing `MySqlDataReader`:

```
host=localhost;database=test;uid=****;pwd=****;
connect timeout=25;auto enlist=false;pooling=false;
Allow User Variables=True;Allow User Variables=False;
Allow User Variables=True;Allow User Variables=False;
```

(Bug#37955)

- Unnecessary network traffic was generated for the normal case where the web provider schema was up to date. (Bug#37469)
- `MySqlReader.GetOrdinal()` performance enhancements break existing functionality. (Bug#37239)

- The `autogenerateschema` option produced tables with incorrect collations. ([Bug#36444](#))
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. ([Bug#35459](#))
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. ([Bug#33322](#))
- Using the MySQL Visual Studio plugin and a MySQL 4.1 server, certain field types ([ENUM](#)) would not be identified correctly. Also, when looking for tables, the plugin would list all tables matching a wildcard pattern of the database name supplied in the connection string, instead of only tables within the specified database. ([Bug#30603](#))

C.4.12. Changes in MySQL Connector/NET 5.2.2 (12 May 2008)

Bugs fixed:

- Product documentation incorrectly stated '?' is the preferred parameter marker. ([Bug#37349](#))
- An incorrect value for a bit field would returned in a multi-row query if a preceding value for the field returned `NULL`. ([Bug#36313](#))
- Tables with `GEOMETRY` field types would return an unknown datatype exception. ([Bug#36081](#))
- When using the `MySQLProfileProvider`, setting profile details and then reading back saved data would result in the default values being returned instead of the updated values. ([Bug#36000](#))
- When creating a connection, setting the `ConnectionString` property of `MySqlConnection` to `NULL` would throw an exception. ([Bug#35619](#))
- The `DbCommandBuilder.QuoteIdentifier` method was not implemented. ([Bug#35492](#))
- When using encrypted passwords, the `GetPassword()` function would return the wrong string. ([Bug#35336](#))
- An error would be raised when calling `GetPassword()` with a `NULL` value. ([Bug#35332](#))
- When retrieving data where a field has been identified as containing a GUID value, the incorrect value would be returned when a previous row contained a `NULL` value for that field. ([Bug#35041](#))
- Using the `TableAdapter Wizard` would fail when generating commands that used stored procedures due to the change in supported parameter characters. ([Bug#34941](#))
- When creating a new stored procedured, the new parameter code which allows the use of the @ symbol would interfere with the specification of a `DEFINER`. ([Bug#34940](#))
- When using `SqlDataSource` to open a connection, the connection would not automatically be closed when access had completed. ([Bug#34460](#))
- There was a high level of contention in the connection pooling code that could lead to delays when opening connections and submitting queries. The connection pooling code has been modified to try and limit the effects of the contention issue. ([Bug#34001](#))
- Using the `TableAdaptor` wizard in combination with a suitable `SELECT` statement, only the associated `INSERT` statement would also be created, rather than the required `DELETE` and `UPDATE` statements. ([Bug#31338](#))
- Fixed problem in datagrid code related to creating a new table. This problem may have been introduced with .NET 2.0 SP1.
- Fixed profile provider that would throw an exception if you were updating a profile that already existed.

C.4.13. Changes in MySQL Connector/NET 5.2.1 (27 February 2008)

Bugs fixed:

- When using the provider to generate or update users and passwords, the password checking algorithm would not validate the password strength or requirements correctly. ([Bug#34792](#))
- When executing statements that used stored procedures and functions, the new parameter code could fail to identify the correct parameter format. ([Bug#34699](#))

- The installer would fail to the DDEX provider binary if the Visual Studio 2005 component was not selected. The result would lead to Connector/NET not loading properly when using the interface to a MySQL server within Visual Studio. ([Bug#34674](#))
- A number issues were identified in the case, connection and schema areas of the code for [MembershipProvider](#), [RoleProvider](#), [ProfileProvider](#). ([Bug#34495](#))
- When using web providers, the Connector/NET would check the schema and cache the application id, even when the connection string had been set. The effect would be to break the membership provider list. ([Bug#34451](#))
- Attempting to use an isolation level other than the default with a transaction scope would use the default isolation level. ([Bug#34448](#))
- When altering a stored procedure within Visual Studio, the parameters to the procedure could be lost. ([Bug#34359](#))
- A race condition could occur within the procedure cache resulting the cache contents overflowing beyond the configured cache size. ([Bug#34338](#))
- Fixed problem with Visual Studio 2008 integration that caused pop-up menus on server explorer nodes to not function
- The provider code has been updated to fix a number of outstanding issues.

C.4.14. Changes in MySQL Connector/NET 5.2.0 (11 February 2008)

Functionality added or changed:

- Performing `GetValue()` on a field `TINYINT(1)` returned a `BOOLEAN`. While not a bug, this caused problems in software that expected an `INT` to be returned. A new connection string option `Treat Tiny As Boolean` has been added with a default value of `true`. If set to `false` the provider will treat `TINYINT(1)` as `INT`. ([Bug#34052](#))
- Added support for `DbDataAdapter UpdateBatchSize`. Batching is fully supported including collapsing inserts down into the multi-value form if possible.
- DDEX provider now works under Visual Studio 2008 beta 2.
- Added `ClearPool` and `ClearAllPools` features.

Bugs fixed:

- Some speed improvements have been implemented in the `TokenizeSql` process used to identify elements of SQL statements. ([Bug#34220](#))
- When accessing tables from different databases within the same `TransactionScope`, the same user/password combination would be used for each database connection. Connector/NET does not handle multiple connections within the same transaction scope. An error is now returned if you attempt this process, instead of using the incorrect authorization information. ([Bug#34204](#))
- The status of connections reported through the state change handler was not being updated correctly. ([Bug#34082](#))
- Incorporated some connection string cache optimizations sent to us by Maxim Mass. ([Bug#34000](#))
- In an open connection where the server had disconnected unexpectedly, the status information of the connection would not be updated properly. ([Bug#33909](#))
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This led to updated connection string options not being recognized if they were of a different case than the existing cached values. ([Bug#31433](#))
- Column name metadata was not using the character set as defined within the connection string being used. ([Bug#31185](#))
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. ([Bug#31090](#))
- Commands executed from within the state change handler would fail with a `NULL` exception. ([Bug#30964](#))
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. ([Bug#30116](#))
- Using compression in the MySQL connection with Connector/NET would be slower than using native (uncompressed) commu-

nication. (Bug#27865)

- The `MySqlDbType.Datetime` has been replaced with `MySqlDbType.DateTime`. The old format has been obsoleted. (Bug#26344)

C.4.15. Changes in MySQL Connector/NET 5.1.8 (Not yet released)

Bugs fixed:

- Calling `GetSchema()` on `Indexes` or `IndexColumns` failed where index or column names were restricted.
In `SchemaProvider.cs`, methods `GetIndexes()` and `GetIndexColumns()` passed their restrictions directly to `GetTables()`. This only worked if the restrictions were no more specific than `schemaName` and `tableName`. If `IndexName` was given, this was passed to `GetTables()` where it was treated as `TableType`. As a result no tables were returned, unless the index name happened to be `BASE TABLE` or `VIEW`. This meant that both methods failed to return any rows. (Bug#43991)
- The `DATETIME` format contained an erroneous space. (Bug#41021)
- If connection pooling was not set explicitly in the connection string, Connector/NET added “;Pooling=False” to the end of the connection string when `MySqlCommand.ExecuteReader()` was called.
If connection pooling was explicitly set in the connection string, when `MySqlConnection.Open()` was called it converted “Pooling=True” to “pooling=True”.
If `MySqlCommand.ExecuteReader()` was subsequently called, it concatenated “;Pooling=False” to the end of the connection string. The resulting connection string was thus terminated with “pooling=True;Pooling=False”. This disabled connection pooling completely. (Bug#40091)
- If, when using the `MySqlTransaction` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. (Bug#39817)
- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that should be inserted is corrupted and no error is thrown. (Bug#37968)

C.4.16. Changes in MySQL Connector/NET 5.1.7 (21 August 2008)

Bugs fixed:

- There was a short circuit evaluation error in the `MySqlCommand.CheckState()` method. When the statement `connection == null` was true a `NullReferenceException` was thrown and not the expected `InvalidOperationException`. (Bug#38276)
- Executing a command that resulted in a fatal exception did not close the connection. (Bug#37991)
- In a .NET application MySQL Connector/NET modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

The original connection string:

```
host=localhost;database=test;uid=****;pwd=****;
connect timeout=25; auto enlist=false;pooling=false;
```

The connection string after closing `MySqlDataReader`:

```
host=localhost;database=test;uid=****;pwd=****;
connect timeout=25;auto enlist=false;pooling=false;
Allow User Variables=True;Allow User Variables=False;
Allow User Variables=True;Allow User Variables=False;
```

(Bug#37955)

- As `MySqlDbType.DateTime` is not available in `VB.Net` the warning `THE DATETIME ENUM VALUE IS OBSOLETE` was always shown during compilation. (Bug#37406)
- An unknown `MySqlErrorCode` was encountered when opening a connection with an incorrect password. (Bug#37398)

- Documentation incorrectly stated that “the DataColumn class in .NET 1.0 and 1.1 does not allow columns with type of UInt16, UInt32, or UInt64 to be autoincrement columns”. ([Bug#37350](#))
- `SemaphoreFullException` is generated when application is closed. ([Bug#36688](#))
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. ([Bug#35459](#))
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. ([Bug#33322](#))
- Using the MySQL Visual Studio plugin and a MySQL 4.1 server, certain field types (`ENUM`) would not be identified correctly. Also, when looking for tables, the plugin would list all tables matching a wildcard pattern of the database name supplied in the connection string, instead of only tables within the specified database. ([Bug#30603](#))

C.4.17. Changes in MySQL Connector/NET 5.1.6 (12 May 2008)

Bugs fixed:

- When creating a connection pool, specifying an invalid IP address will cause the entire application to crash, instead of providing an exception. ([Bug#36432](#))
- An incorrect value for a bit field would returned in a multi-row query if a preceding value for the field returned `NULL`. ([Bug#36313](#))
- The `MembershipProvider` will raise an exception when the connection string is configured with `enablePasswordRetrieval = true` and `RequireQuestionAndAnswer = false`. ([Bug#36159](#))
- When calling `GetNumberOfUsersOnline` an exception is raised on the submitted query due to a missing parameter. ([Bug#36157](#))
- Tables with `GEOMETRY` field types would return an unknown datatype exception. ([Bug#36081](#))
- When creating a connection, setting the `ConnectionString` property of `MySqlConnection` to `NULL` would throw an exception. ([Bug#35619](#))
- The `DbCommandBuilder.QuoteIdentifier` method was not implemented. ([Bug#35492](#))
- When using `SqlDataSource` to open a connection, the connection would not automatically be closed when access had completed. ([Bug#34460](#))
- Attempting to use an isolation level other than the default with a transaction scope would use the default isolation level. ([Bug#34448](#))
- When altering a stored procedure within Visual Studio, the parameters to the procedure could be lost. ([Bug#34359](#))
- A race condition could occur within the procedure cache resulting the cache contents overflowing beyond the configured cache size. ([Bug#34338](#))
- Using the `TableAdaptor` wizard in combination with a suitable `SELECT` statement, only the associated `INSERT` statement would also be created, rather than the required `DELETE` and `UPDATE` statements. ([Bug#31338](#))

C.4.18. Changes in MySQL Connector/NET 5.1.5 (Not yet released)

Functionality added or changed:

- Performing `GetValue()` on a field `TINYINT(1)` returned a `BOOLEAN`. While not a bug, this caused problems in software that expected an `INT` to be returned. A new connection string option `Treat Tiny As Boolean` has been added with a default value of `true`. If set to `false` the provider will treat `TINYINT(1)` as `INT`. ([Bug#34052](#))

Bugs fixed:

- Some speed improvements have been implemented in the `TokenizeSql` process used to identify elements of SQL statements. ([Bug#34220](#))
- When accessing tables from different databases within the same `TransactionScope`, the same user/password combination

would be used for each database connection. Connector/NET does not handle multiple connections within the same transaction scope. An error is now returned if you attempt this process, instead of using the incorrect authorization information. ([Bug#34204](#))

- The status of connections reported through the state change handler was not being updated correctly. ([Bug#34082](#))
- Incorporated some connection string cache optimizations sent to us by Maxim Mass. ([Bug#34000](#))
- In an open connection where the server had disconnected unexpectedly, the status information of the connection would not be updated properly. ([Bug#33909](#))
- Connector/NET would fail to compile properly with `nant`. ([Bug#33508](#))
- Problem with membership provider would mean that `FindUserByEmail` would fail with a `MySqlException` because it was trying to add a second parameter with the same name as the first. ([Bug#33347](#))
- Using compression in the MySQL connection with Connector/NET would be slower than using native (uncompressed) communication. ([Bug#27865](#))

C.4.19. Changes in MySQL Connector/NET 5.1.4 (20 November 2007)

Bugs fixed:

- Setting the size of a string parameter after the value could cause an exception. ([Bug#32094](#))
- Creation of parameter objects with non-input direction using a constructor would fail. This was caused by some old legacy code preventing their use. ([Bug#32093](#))
- A date string could be returned incorrectly by `MySqlDateTime.ToString()` when the date returned by MySQL was `0000-00-00 00:00:00`. ([Bug#32010](#))
- A syntax error in a set of batch statements could leave the data adapter in a state that appears hung. ([Bug#31930](#))
- Installing over a failed uninstall of a previous version could result in multiple clients being registered in the `machine.config`. This would prevent certain aspects of the MySQL connection within Visual Studio to work properly. ([Bug#31731](#))
- Connector/NET would incorrectly report success when enlisting in a distributed transaction, although distributed transactions are not supported. ([Bug#31703](#))
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This led to updated connection string options not being recognized if they were of a different case than the existing cached values. ([Bug#31433](#))
- Trying to use a connection that was not open could return an ambiguous and misleading error message. ([Bug#31262](#))
- Column name metadata was not using the character set as defined within the connection string being used. ([Bug#31185](#))
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. ([Bug#31090](#))
- Commands executed from within the state change handler would fail with a `NULL` exception. ([Bug#30964](#))
- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. ([Bug#30233](#))
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. ([Bug#30116](#))
- Column types with only 1-bit (such as `BOOLEAN` and `TINYINT(1)`) were not returned as boolean fields. ([Bug#27959](#))
- When accessing certain statements, the command would timeout before the command completed. Because this cannot always be controlled through the individual command timeout options, a `default command timeout` has been added to the connection string options. ([Bug#27958](#))
- The server error code was not updated in the `Data[]` hash, which prevented `DbProviderFactory` users from accessing the server error code. ([Bug#27436](#))
- The `MySqlDbType.Datetime` has been replaced with `MySqlDbType.DateTime`. The old format has been obsoleted. ([Bug#26344](#))

- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. ([Bug#13991](#))

C.4.20. Changes in MySQL Connector/NET 5.1.3 (21 September 2007 beta)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. ([Bug#30204](#))
- A `DATE` field would be updated with a date/time value, causing a `MySqlDataAdapter.Update()` exception. ([Bug#30077](#))
- The Saudi Hijri calendar was not supported. ([Bug#29931](#))
- Calling `SHOW CREATE PROCEDURE` for routines with a hyphen in the catalog name produced a syntax error. ([Bug#29526](#))
- Connecting to a MySQL server earlier than version 4.1 would raise a `NullException`. ([Bug#29476](#))
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. ([Bug#29409](#))
- A `FormatException` error would be raised if a parameter had not been found, instead of `Resources.ParameterMustBeDefined`. ([Bug#29312](#))
- An exception would be thrown when using the Manage Role functionality within the web administrator to assign a role to a user. ([Bug#29236](#))
- Using the membership/role providers when `validationKey` or `decryptionKey` parameters are set to `AutoGenerate`, an exception would be raised when accessing the corresponding values. ([Bug#29235](#))
- Certain operations would not check the `UsageAdvisor` setting, causing log messages from the Usage Advisor even when it was disabled. ([Bug#29124](#))
- Using the same connection string multiple times would result in `Database=dbname` appearing multiple times in the resulting string. ([Bug#29123](#))
- *Visual Studio Plugin*: Adding a new query based on a stored procedure that uses the `SELECT` statement would terminate the query/TableAdapter wizard. ([Bug#29098](#))
- Using `TransactionScope` would cause an `InvalidOperationException`. ([Bug#28709](#))

C.4.21. Changes in MySQL Connector/NET 5.1.2 (18 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- Log messages would be truncated to 300 bytes. ([Bug#28706](#))
- Creating a user would fail due to the application name being set incorrectly. ([Bug#28648](#))
- *Visual Studio Plugin*: Adding a new query based on a stored procedure that used a `UPDATE`, `INSERT` or `DELETE` statement would terminate the query/TableAdapter wizard. ([Bug#28536](#))
- *Visual Studio Plugin*: Query Builder would fail to show `TINYTEXT` columns, and any columns listed after a `TINYTEXT` column correctly. ([Bug#28437](#))
- Accessing the results from a large query when using data compression in the connection would fail to return all the data. ([Bug#28204](#))
- *Visual Studio Plugin*: Update commands would not be generated correctly when using the TableAdapter wizard. ([Bug#26347](#))

C.4.22. Changes in MySQL Connector/NET 5.1.1 (23 May 2007)

Bugs fixed:

- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. ([Bug#28448](#))
- Installation of the Connector/NET on Windows would fail if VisualStudio had not already been installed. ([Bug#28260](#))
- Connector/NET would look for the wrong table when executing `User.IsRole()`. ([Bug#28251](#))
- Building a connection string within a tight loop would show slow performance. ([Bug#28167](#))
- The `UNSIGNED` flag for parameters in a stored procedure would be ignored when using `MySqlCommandBuilder` to obtain the parameter information. ([Bug#27679](#))
- Using `MySQLDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. ([Bug#27668](#))
- `DATETIME` fields from versions of MySQL before 4.1 would be incorrectly parsed, resulting in an exception. ([Bug#23342](#))
- Fixed password property on `MySqlConnectionStringBuilder` to use `PasswordPropertyText` attribute. This causes dots to show instead of actual password text.

C.4.23. Changes in MySQL Connector/NET 5.1.0 (01 May 2007)

Functionality added or changed:

- Now compiles for .NET CF 2.0.
- Rewrote stored procedure parsing code using a new SQL tokenizer. Really nasty procedures including nested comments are now supported.
- `GetSchema` will now report objects relative to the currently selected database. What this means is that passing in null as a database restriction will report objects on the currently selected database only.
- Added Membership and Role provider contributed by Sean Wright (thanks!).

C.4.24. Changes in MySQL Connector/NET 5.0.10 (Not yet released)

Bugs fixed:

- If, when using the `MySqlTransaction` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. ([Bug#39817](#))
- Executing a command that resulted in a fatal exception did not close the connection. ([Bug#37991](#))
- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that should be inserted is corrupted and no error is thrown. ([Bug#37968](#))
- In a .NET application MySQL Connector/NET modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

The original connection string:

```
host=localhost;database=test;uid=*****;pwd=*****;
connect timeout=25; auto enlist=false;pooling=false;
```

The connection string after closing `MySqlDataReader`:

```
host=localhost;database=test;uid=*****;pwd=*****;
connect timeout=25;auto enlist=false;pooling=false;
Allow User Variables=True;Allow User Variables=False;
Allow User Variables=True;Allow User Variables=False;
```

([Bug#37955](#))

- When creating a connection pool, specifying an invalid IP address will cause the entire application to crash, instead of providing an exception. ([Bug#36432](#))
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. ([Bug#35459](#))
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. ([Bug#33322](#))

C.4.25. Changes in MySQL Connector/NET 5.0.9 (Not yet released)

Bugs fixed:

- The `DbCommandBuilder.QuoteIdentifier` method was not implemented. ([Bug#35492](#))
- Setting the size of a string parameter after the value could cause an exception. ([Bug#32094](#))
- Creation of parameter objects with non-input direction using a constructor would fail. This was caused by some old legacy code preventing their use. ([Bug#32093](#))
- A date string could be returned incorrectly by `MySqlDateTime.ToString()` when the date returned by MySQL was `0000-00-00 00:00:00`. ([Bug#32010](#))
- A syntax error in a set of batch statements could leave the data adapter in a state that appears hung. ([Bug#31930](#))
- Installing over a failed uninstall of a previous version could result in multiple clients being registered in the `machine.config`. This would prevent certain aspects of the MySQL connection within Visual Studio to work properly. ([Bug#31731](#))
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This led to updated connection string options not being recognized if they were of a different case than the existing cached values. ([Bug#31433](#))
- Column name metadata was not using the character set as defined within the connection string being used. ([Bug#31185](#))
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. ([Bug#31090](#))
- Commands executed from within the state change handler would fail with a `NULL` exception. ([Bug#30964](#))
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. ([Bug#30116](#))
- The server error code was not updated in the `Data[]` hash, which prevented `DbProviderFactory` users from accessing the server error code. ([Bug#27436](#))
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. ([Bug#13991](#))

C.4.26. Changes in MySQL Connector/NET 5.0.8 (21 August 2007)

Note

This version introduces a new installer technology.

Bugs fixed:

- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. ([Bug#30233](#))
- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. ([Bug#30204](#))
- A `DATE` field would be updated with a date/time value, causing a `MySqlDataAdapter.Update()` exception. ([Bug#30077](#))
- Fixed bug where Connector/Net was hand building some date time patterns rather than using the patterns provided under `CultureInfo`. This caused problems with some calendars that do not support the same ranges as Gregorian.. ([Bug#29931](#))

- Calling `SHOW CREATE PROCEDURE` for routines with a hyphen in the catalog name produced a syntax error. (Bug#29526)
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. (Bug#29409)
- A `FormatException` error would be raised if a parameter had not been found, instead of `Resources.ParameterMustBeDefined`. (Bug#29312)
- Certain operations would not check the `UsageAdvisor` setting, causing log messages from the Usage Advisor even when it was disabled. (Bug#29124)
- Using the same connection string multiple times would result in `Database=dbname` appearing multiple times in the resulting string. (Bug#29123)
- Log messages would be truncated to 300 bytes. (Bug#28706)
- Accessing the results from a large query when using data compression in the connection will fail to return all the data. (Bug#28204)
- Fixed problem where `MySqlConnection.BeginTransaction` checked the drivers status var before checking if the connection was open. The result was that the driver could report an invalid condition on a previously opened connection.
- Fixed problem where we were not closing prepared statement handles when commands are disposed. This could lead to using up all prepared statement handles on the server.
- Fixed the database schema collection so that it works on servers that are not properly respecting the `lower_case_table_names` setting.
- Fixed problem where any attempt to not read all the records returned from a select where each row of the select is greater than 1024 bytes would hang the driver.
- Fixed problem where a command timing out just after it actually finished would cause an exception to be thrown on the command timeout thread which would then be seen as an unhandled exception.
- Fixed some serious issues with command timeout and cancel that could present as exceptions about thread ownership. The issue was that not all queries cancel the same. Some produce resultsets while others don't. `ExecuteReader` had to be changed to check for this.

C.4.27. Changes in MySQL Connector/NET 5.0.7 (18 May 2007)

Bugs fixed:

- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. (Bug#28448)
- Building a connection string within a tight loop would show slow performance. (Bug#28167)
- Using logging (with the `logging=true` parameter to the connection string) would not generate a log file. (Bug#27765)
- The `UNSIGNED` flag for parameters in a stored procedure would be ignored when using `MySqlCommandBuilder` to obtain the parameter information. (Bug#27679)
- Using `MySQLDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. (Bug#27668)
- If you close an open connection with an active transaction, the transaction is not automatically rolled back. (Bug#27289)
- When cloning an open `MySqlClient.MySqlConnection` with the `Persist Security Info=False` option set, the cloned connection is not usable because the security information has not been cloned. (Bug#27269)
- Enlisting a null transaction would affect the current connection object, such that further enlistment operations to the transaction are not possible. (Bug#26754)
- Attempting to change the `Connection Protocol` property within a `PropertyGrid` control would raise an exception. (Bug#26472)
- The `characterset` property would not be identified during a connection (also affected Visual Studio Plugin). (Bug#26147, Bug#27240)

- The `CreateFormat` column of the `DataTypes` collection did not contain a format specification for creating a new column type. ([Bug#25947](#))
- `DATETIME` fields from versions of MySQL before 4.1 would be incorrectly parsed, resulting in an exception. ([Bug#23342](#))

C.4.28. Changes in MySQL Connector/NET 5.0.6 (22 March 2007)

Bugs fixed:

- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. ([Bug#27253](#))
- `DESCRIBE` SQL statement returns byte arrays rather than data on MySQL versions older than 4.1.15. ([Bug#27221](#))
- `cmd.Parameters.RemoveAt("Id")` will cause an error if the last item is requested. ([Bug#27187](#))
- `MySqlParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. ([Bug#27135](#))
- Exception thrown when using large values in `UInt64` parameters. ([Bug#27093](#))
- MySQL Visual Studio Plugin 1.1.2 does not work with Connector/Net 5.0.5. ([Bug#26960](#))

C.4.29. Changes in MySQL Connector/NET 5.0.5 (07 March 2007)

Functionality added or changed:

- Reverted behavior that required parameter names to start with the parameter marker. We apologize for this back and forth but we mistakenly changed the behavior to not match what `SqlClient` supports. We now support using either syntax for adding parameters however we also respond exactly like `SqlClient` in that if you ask for the index of a parameter using a syntax different from when you added the parameter, the result will be -1.
- Assembly now properly appears in the Visual Studio 2005 Add/Remove Reference dialog.
- Fixed problem that prevented use of `SchemaOnly` or `SingleRow` command behaviors with stored procedures or prepared statements.
- Added `MySqlParameterCollection.AddWithValue` and marked the `Add(name, value)` method as obsolete.
- Return parameters created with `DeriveParameters` now have the name `RETURN_VALUE`.
- Fixed problem with parameter name hashing where the hashes were not getting updated when parameters were removed from the collection.
- Fixed problem with calling stored functions when a return parameter was not given.
- Added `Use Procedure Bodies` connection string option to allow calling procedures without using procedure metadata.

Bugs fixed:

- `MySqlConnection.GetSchema` fails with `NullReferenceException` for Foreign Keys. ([Bug#26660](#))
- Connector/NET would fail to install under Windows Vista. ([Bug#26430](#))
- Opening a connection would be slow due to host name lookup. ([Bug#26152](#))
- Incorrect values/formats would be applied when the `OldSyntax` connection string option was used. ([Bug#25950](#))
- Registry would be incorrectly populated with installation locations. ([Bug#25928](#))
- Times with negative values would be returned incorrectly. ([Bug#25912](#))
- Returned data types of a `DataTypes` collection do not contain the right correct CLR Datatype. ([Bug#25907](#))
- `GetSchema` and `DataTypes` would throw an exception due to an incorrect table name. ([Bug#25906](#))

- `MySqlConnection` throws an exception when connecting to MySQL v4.1.7. (Bug#25726)
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. (Bug#25651)
- When closing and then re-opening a connection to a database, the character set specification is lost. (Bug#25614)
- Filling a table schema through a stored procedure triggers a runtime error. (Bug#25609)
- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, datatype. (Bug#25605)
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. (Bug#25603)
- The `UpdateRowSource.FirstReturnedRecord` method does not work. (Bug#25569)
- When connecting to a MySQL Server earlier than version 4.1, the connection would hang when reading data. (Bug#25458)
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. (Bug#25443)
- When a `MySqlConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. (Bug#24957)
- When connecting to a server, the return code from the connection could be zero, even though the host name was incorrect. (Bug#24802)
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySqlPool.GetConnection`. (Bug#24373)
- Connector/NET would not compile properly when used with Mono 1.2. (Bug#24263)
- Applications would crash when calling with `CommandType` set to `StoredProcedure`.

C.4.30. Changes in MySQL Connector/NET 5.0.4 (Not released)

This is a new Beta development release, fixing recently discovered bugs.

C.4.31. Changes in MySQL Connector/NET 5.0.3 (05 January 2007)

Functionality added or changed:

- Usage Advisor has been implemented. The Usage Advisor checks your queries and will report if you are using the connection inefficiently.
- PerfMon hooks have been added to monitor the stored procedure cache hits and misses.
- The `MySqlCommand` object now supports asynchronous query methods. This is implemented using the `BeginExecuteNonQuery` and `EndExecuteNonQuery` methods.
- Metadata from stored procedures and stored function execution are cached.
- The `CommandBuilder.DeriveParameters` function has been updated to the procedure cache.
- The `ViewColumns.GetSchema` collection has been updated.
- Improved speed and performance by re-architecting certain sections of the code.
- Support for the embedded server and client library have been removed from this release. Support will be added back to a later release.
- The `ShapZipLib` library has been replaced with the deflate support provided within .NET 2.0.
- SSL support has been updated.

Bugs fixed:

- Additional text added to error message (Bug#25178)
- An exception would be raised, or the process would hang, if `SELECT` privileges on a database were not granted and a stored

procedure was used. ([Bug#25033](#))

- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. ([Bug#25013](#))
- Using `Driver.IsTooOld()` would return the wrong value. ([Bug#24661](#))
- When using a `DBNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DBNull.Value`. ([Bug#24565](#))
- Stored procedure executions are not thread safe. ([Bug#23905](#))
- Deleting a connection to a disconnected server when using the Visual Studio Plugin would cause an assertion failure. ([Bug#23687](#))
- Nested transactions (which are unsupported) do not raise an error or warning. ([Bug#22400](#))

C.4.32. Changes in MySQL Connector/NET 5.0.2 (06 November 2006)

Functionality added or changed:

- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.
- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the number of procedures that are cached by using the `procedure cache` connection string.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/NET 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string properties:

```
ignore prepare=false
```

The default value of this property is true.

Bugs fixed:

- One system where IPv6 was enabled, Connector/NET would incorrectly resolve host names. ([Bug#23758](#))
- Column names with accented characters were not parsed properly causing malformed column names in result sets. ([Bug#23657](#))
- An exception would be thrown when calling `GetSchemaTable` and `fields` was null. ([Bug#23538](#))
- A `System.FormatException` exception would be raised when invoking a stored procedure with an `ENUM` input parameter. ([Bug#23268](#))
- During installation, an antivirus error message would be raised (indicating a malicious script problem). ([Bug#23245](#))
- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that Connector/NET 5.0.2 must be installed. ([Bug#23071](#))
- Using Windows Vista (RC2) as a non-privileged user would raise a `Registry key 'Global' access denied`. ([Bug#22882](#))
- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. ([Bug#18186](#))
- Connector/NET did not work as a data source for the `SqlDataSource` object used by ASP.NET 2.0. ([Bug#16126](#))

C.4.33. Changes in MySQL Connector/NET 5.0.1 (01 October 2006)

Bugs fixed:

- Connector/NET on a Turkish operating system, may fail to execute certain SQL statements correctly. ([Bug#22452](#))
- Starting a transaction on a connection created by `MySql.Data.MySqlClient.MySqlClientFactory`, using `BeginTransaction` without specifying an isolation level, causes the SQL statement to fail with a syntax error. ([Bug#22042](#))
- The `MySqlException` class is now derived from the `DbException` class. ([Bug#21874](#))
- The `#` would not be accepted within column/table names, even though it was valid. ([Bug#21521](#))
- You can now install the Connector/NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. ([Bug#19994](#))
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a Connector/Net exception. ([Bug#18391](#))
- Using `ExecuteScalar` with a datetime field, where the value of the field is "0000-00-00 00:00:00", a `MySqlConversionException` exception would be raised. ([Bug#11991](#))
- An `MySql.Data.Types.MySqlConversionException` would be raised when trying to update a row that contained a date field, where the date field contained a zero value (0000-00-00 00:00:00). ([Bug#9619](#))
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first`. ([Bug#7248](#))
- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. Bug (#14592)

C.4.34. Changes in MySQL Connector/NET 5.0.0 (08 August 2006)

Functionality added or changed:

- Replaced use of `ICSharpCode` with .NET 2.0 internal deflate support.
- Refactored test suite to test all protocols in a single pass.
- Added usage advisor warnings for requesting column values by the wrong type.
- Reimplemented `PacketReader/PacketWriter` support into `MySqlStream` class.
- Reworked connection string classes to be simpler and faster.
- Added procedure metadata caching.
- Added internal implementation of SHA1 so we don't have to distribute the OpenNetCF on mobile devices.
- Implemented `MySqlClientFactory` class.
- Added perfmon hooks for stored procedure cache hits and misses.
- Implemented classes and interfaces for ADO.Net 2.0 support.
- Added Async query methods.
- Implemented Usage Advisor.
- Completely refactored how column values are handled to avoid boxing in some cases.
- Implemented `MySqlConnectionBuilder` class.

Bugs fixed:

- `CommandText`: Question mark in comment line is being parsed as a parameter. ([Bug#6214](#))

C.4.35. Changes in MySQL Connector/NET 1.0.11 (Not yet released)

Bugs fixed:

- Attempting to utilize MySQL Connector .Net version 1.0.10 throws a fatal exception under Mono when pooling is enabled. ([Bug#33682](#))
- Setting the size of a string parameter after the value could cause an exception. ([Bug#32094](#))
- Creation of parameter objects with non-input direction using a constructor would fail. This was caused by some old legacy code preventing their use. ([Bug#32093](#))
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. ([Bug#31090](#))
- Commands executed from within the state change handler would fail with a `NULL` exception. ([Bug#30964](#))
- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. ([Bug#30233](#))
- Using compression in the MySQL connection with Connector/NET would be slower than using native (uncompressed) communication. ([Bug#27865](#))
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. ([Bug#13991](#))

C.4.36. Changes in MySQL Connector/NET 1.0.10 (24 August 2007)

Bugs fixed:

- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. ([Bug#30204](#))
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server became available while the application was still running. ([Bug#29409](#))
- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. ([Bug#27253](#))
- `MySqlParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. ([Bug#27135](#))
- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, datatype. ([Bug#25605](#))
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. ([Bug#25603](#))
- When a `MySqlConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. ([Bug#24957](#))
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySqlConnection.GetConnection`. ([Bug#24373](#))

C.4.37. Changes in MySQL Connector/NET 1.0.9 (02 February 2007)

Functionality added or changed:

- The `ICSharpCode ZipLib` is no longer used by the Connector, and is no longer distributed with it.
- **Important change:** Binaries for .NET 1.0 are no longer supplied with this release. If you need support for .NET 1.0, you must build from source.
- Improved `CommandBuilder.DeriveParameters` to first try and use the procedure cache before querying for the stored procedure metadata. Return parameters created with `DeriveParameters` now have the name `RETURN_VALUE`.
- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.
- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the number of procedures that are cached by using the `procedure cache` connection string.

- **Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/NET 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string properties:

```
ignore_prepare=false
```

The default value of this property is true.

Bugs fixed:

- Times with negative values would be returned incorrectly. ([Bug#25912](#))
- `MySqlConnection` throws a `NullReferenceException` and `ArgumentNullException` when connecting to MySQL v4.1.7. ([Bug#25726](#))
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. ([Bug#25651](#))
- When closing and then re-opening a connection to a database, the character set specification is lost. ([Bug#25614](#))
- Trying to fill a table schema through a stored procedure triggers a runtime error. ([Bug#25609](#))
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. ([Bug#25443](#))
- Additional text added to error message. ([Bug#25178](#))
- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. ([Bug#25013](#))
- When connecting to a server, the return code from the connection could be zero, even though the host name was incorrect. ([Bug#24802](#))
- Using `Driver.IsTooOld()` would return the wrong value. ([Bug#24661](#))
- When using a `DBNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DBNull.Value`. ([Bug#24565](#))
- Stored procedure executions are not thread safe. ([Bug#23905](#))
- The `CommandBuilder` would mistakenly add insert parameters for a table column with auto incrementation enabled. ([Bug#23862](#))
- One system where IPv6 was enabled, Connector/NET would incorrectly resolve host names. ([Bug#23758](#))
- Nested transactions do not raise an error or warning. ([Bug#22400](#))
- An `System.OverflowException` would be raised when accessing a varchar field over 255 bytes. Bug (#23749)
- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. (Bug 18186)

C.4.38. Changes in MySQL Connector/NET 1.0.8 (20 October 2006)

Functionality added or changed:

- Stored procedures are now cached.
- The method for retrieving stored procedured metadata has been changed so that users without `SELECT` privileges on the `mysql.proc` table can use a stored procedure.

Bugs fixed:

- Connector/NET on a Turkish operating system, may fail to execute certain SQL statements correctly. ([Bug#22452](#))

- The # would not be accepted within column/table names, even though it was valid. (Bug#21521)
- Calling `Close` on a connection after calling a stored procedure would trigger a `NullReferenceException`. (Bug#20581)
- You can now install the Connector/NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. (Bug#19994)
- The `DiscoverParameters` function would fail when a stored procedure used a `NUMERIC` parameter type. (Bug#19515)
- When running a query that included a date comparison, a `DateReader` error would be raised. (Bug#19481)
- `IDataRecord.GetString` would raise `NullPointerException` for null values in returned rows. Method now throws `SqlNullValueException`. (Bug#19294)
- Parameter substitution in queries where the order of parameters and table fields did not match would substitute incorrect values. (Bug#19261)
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a Connector/Net exception. (Bug#18391)
- An exception would be raised when using an output parameter to a `System.String` value. (Bug#17814)
- CHAR type added to `MySQLDbType`. (Bug#17749)
- A `SELECT` query on a table with a date with a value of '0000-00-00' would hang the application. (Bug#17736)
- The `CommandBuilder` ignored `Unsigned` flag at Parameter creation. (Bug#17375)
- When working with multiple threads, character set initialization would generate errors. (Bug#17106)
- When using an unsigned 64-bit integer in a stored procedure, the unsigned bit would be lost stored. (Bug#16934)
- `DataReader` would show the value of the previous row (or last row with non-null data) if the current row contained a `date-time` field with a null value. (Bug#16884)
- Unsigned data types were not properly supported. (Bug#16788)
- The connection string parser did not allow single or double quotes in the password. (Bug#16659)
- The `MySQLDateTime` class did not contain constructors. (Bug#15112)
- Called `MySQLCommandBuilder.DeriveParameters` for a stored procedure that has no paramers would cause an application crash. (Bug#15077)
- Using `ExecuteScalar` with a datetime field, where the value of the field is "0000-00-00 00:00:00", a `MySQLConversionException` exception would be raised. (Bug#11991)
- An `MySQL.Data.Types.MySQLConversionException` would be raised when trying to update a row that contained a date field, where the date field contained a zero value (0000-00-00 00:00:00). (Bug#9619)
- When using `MySQLDataAdapter`, connections to a MySQL server may remain open and active, even though the use of the connection has been completed and the data received. (Bug#8131)
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first`. (Bug#7248)
- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. Bug (#14592)

C.4.39. Changes in MySQL Connector/NET 1.0.7 (21 November 2005)

Bugs fixed:

- Unsigned `tinyint` (NET byte) would lead to and incorrectly determined parameter type from the parameter value. (Bug#18570)
- A `#42000Query was empty` exception occurred when executing a query built with `MySQLCommandBuilder`, if the query string ended with a semicolon. (Bug#14631)
- The parameter collection object's `Add()` method added parameters to the list without first checking to see whether they already

existed. Now it updates the value of the existing parameter object if it exists. ([Bug#13927](#))

- Added support for the `cp932` character set. ([Bug#13806](#))
- Calling a stored procedure where a parameter contained special characters (such as '@') would produce an exception. Note that `ANSI_QUOTES` had to be enabled to make this possible. ([Bug#13753](#))
- The `Ping()` method did not update the `State` property of the `Connection` object. ([Bug#13658](#))
- Implemented the `MySqlCommandBuilder.DeriveParameters` method that is used to discover the parameters for a stored procedure. ([Bug#13632](#))
- A statement that contained multiple references to the same parameter could not be prepared. ([Bug#13541](#))

C.4.40. Changes in MySQL Connector/NET 1.0.6 (03 October 2005)

Bugs fixed:

- Connector/NET 1.0.5 could not connect on Mono. ([Bug#13345](#))
- Serializing a parameter failed if the first value passed in was `NULL`. ([Bug#13276](#))
- Field names that contained the following characters caused errors: `()%<>/` ([Bug#13036](#))
- The `nant` build sequence had problems. ([Bug#12978](#))
- The Connector/NET 1.0.5 installer would not install alongside Connector/NET 1.0.4. ([Bug#12835](#))

C.4.41. Changes in MySQL Connector/NET 1.0.5 (29 August 2005)

Bugs fixed:

- Connector/NET could not connect to MySQL 4.1.14. ([Bug#12771](#))
- With multiple hosts in the connection string, Connector/NET would not connect to the last host in the list. ([Bug#12628](#))
- The `ConnectionString` property could not be set when a `MySqlConnection` object was added with the designer. ([Bug#12551](#), [Bug#8724](#))
- The `cp1250` character set was not supported. ([Bug#11621](#))
- A call to a stored procedure caused an exception if the stored procedure had no parameters. ([Bug#11542](#))
- Certain malformed queries would trigger a `Connection must be valid and open` error message. ([Bug#11490](#))
- Trying to use a stored procedure when `Connection.Database` was not populated generated an exception. ([Bug#11450](#))
- Connector/NET interpreted the new decimal data type as a byte array. ([Bug#11294](#))
- Added support to call a stored function from Connector/NET. ([Bug#10644](#))
- Connection could fail when .NET thread pool had no available worker threads. ([Bug#10637](#))
- Calling `MySqlConnection.clone` when a connection string had not yet been set on the original connection would generate an error. ([Bug#10281](#))
- Decimal parameters caused syntax errors. ([Bug#10152](#), [Bug#11550](#), [Bug#10486](#))
- Parameters were not recognized when they were separated by linefeeds. ([Bug#9722](#))
- The `MySqlCommandBuilder` class could not handle queries that referenced tables in a database other than the default database. ([Bug#8382](#))
- Trying to read a `TIMESTAMP` column generated an exception. ([Bug#7951](#))
- Connector/NET could not work properly with certain regional settings. (WL#8228)

C.4.42. Changes in MySQL Connector/NET 1.0.4 (20 January 2005)

Bugs fixed:

- `MySqlReader.GetInt32` throws exception if column is unsigned. ([Bug#7755](#))
- Quote character `\222` not quoted in `EscapeString`. ([Bug#7724](#))
- `GetBytes` is working no more. ([Bug#7704](#))
- `MySqlDataReader.GetString(index)` returns non-Null value when field is `Null`. ([Bug#7612](#))
- Clone method bug in `MySqlCommand`. ([Bug#7478](#))
- Problem with Multiple resultsets. ([Bug#7436](#))
- `MySqlAdapter.Fill` method throws error message `Non-negative number required`. ([Bug#7345](#))
- `MySqlCommand.Connection` returns an `IDbConnection`. ([Bug#7258](#))
- Calling `prepare` causing exception. ([Bug#7243](#))
- Fixed problem with shared memory connections.
- Added or filled out several more topics in the API reference documentation.
- Fixed another small problem with prepared statements.
- Fixed problem that causes named pipes to not work with some blob functionality.

C.4.43. Changes in MySQL Connector/NET 1.0.3 (12 October 2004 gamma)

Bugs fixed:

- Invalid query string when using inout parameters ([Bug#7133](#))
- Inserting `DateTime` causes `System.InvalidCastException` to be thrown. ([Bug#7132](#))
- `MySqlDateTime` in Databases sorting by Text, not Date. ([Bug#7032](#))
- Exception stack trace lost when re-throwing exceptions. ([Bug#6983](#))
- Errors in parsing stored procedure parameters. ([Bug#6902](#))
- `InvalidCast` when using `DATE_ADD`-function. ([Bug#6879](#))
- Int64 Support in `MySqlCommand` Parameters. ([Bug#6863](#))
- Test suite fails with MySQL 4.0 because of case sensitivity of table names. ([Bug#6831](#))
- `MySqlDataReader.GetChar(int i)` throws `IndexOutOfRangeException` exception. ([Bug#6770](#))
- Integer "out" parameter from stored procedure returned as string. ([Bug#6668](#))
- An Open Connection has been Closed by the Host System. ([Bug#6634](#))
- Fixed Invalid character set index: 200. ([Bug#6547](#))
- Connections now do not have to give a database on the connection string.
- Installer now includes options to install into GAC and create `START MENU` items.
- Fixed major problem with detecting null values when using prepared statements.
- Fixed problem where multiple resultsets having different numbers of columns would cause a problem.
- Added `ServerThread` property to `MySqlConnection` to expose server thread id.
- Added `Ping` method to `MySqlConnection`.

- Changed the name of the test suite to `MySql.Data.Tests.dll`.
- Now `SHOW COLLATION` is used upon connection to retrieve the full list of charset ids.
- Made MySQL the default named pipe name.

C.4.44. Changes in MySQL Connector/NET 1.0.2 (15 November 2004 gamma)

Bugs fixed:

- Fixed Objects not being disposed ([Bug#6649](#))
- Fixed Charset-map for UCS-2 ([Bug#6541](#))
- Fixed Zero date "0000-00-00" is returned wrong when filling Dataset ([Bug#6429](#))
- Fixed double type handling in `MySqlParameter(string parameterName, object value)` ([Bug#6428](#))
- Fixed Installation directory ignored using custom installation ([Bug#6329](#))
- Fixed #HY000 Illegal mix of collations (latin1_swedish_ci,IMPLICIT) and (utf8_general_ ([Bug#6322](#))
- Added the TableEditor CS and VB sample
- Added charset connection string option
- Fixed problem with `MySqlBinary` where string values could not be used to update extended text columns
- Provider is now using character set specified by server as default
- Updated the installer to include the new samples
- Fixed problem where setting command text leaves the command in a prepared state
- Fixed Long inserts take very long time (Bu #5453)
- Fixed problem where calling stored procedures might cause an "Illegal mix of collations" problem.

C.4.45. Changes in MySQL Connector/NET 1.0.1 (27 October 2004 beta)

Bugs fixed:

- Fixed `IndexOutOfRangeException` when reading BLOB with `DataReader` with `GetString(index)` ([Bug#6230](#))
- Fixed `GetBoolean` returns wrong values ([Bug#6227](#))
- Fixed `Method TokenizeSql()` uses only a limited set of valid characters for parameters ([Bug#6217](#))
- Fixed NET Connector source missing resx files ([Bug#6216](#))
- Fixed `System.OverflowException` when using YEAR datatype ([Bug#6036](#))
- Fixed `MySqlDateTime` sets `IsZero` property on all subseq.records after first zero found ([Bug#6006](#))
- Fixed serializing of floating point parameters (double, numeric, single, decimal) ([Bug#5900](#))
- Fixed missing Reference in `DbType` setter ([Bug#5897](#))
- Fixed Parsing the ';' char ([Bug#5876](#))
- Fixed `DBNull` Values causing problems with retrieving/updating queries. ([Bug#5798](#))
- `Nullable` error ([Bug#5796](#))
- Fixed problem where `MySqlParameterCollection.Add()` would throw unclear exception when given a null value ([Bug#5621](#))
- Fixed constructor initialize problems in `MySqlCommand()` ([Bug#5613](#))

- Fixed Yet Another "object reference not set to an instance of an object" ([Bug#5496](#))
- Fixed Can't display Chinese correctly ([Bug#5288](#))
- Fixed MySQLDataReader and 'show tables from ...' behavior ([Bug#5256](#))
- Fixed problem in PacketReader where it could try to allocate the wrong buffer size in EnsureCapacity
- Fixed problem where using old syntax while using the interfaces caused problems
- Fixed [Bug#5458](#) Calling GetChars on a longtext column throws an exception
- Added test case for resetting the command text on a prepared command
- Fixed [Bug#5388](#) DataReader reports all rows as NULL if one row is NULL
- Fixed problem where connection lifetime on the connect string was not being respected
- Fixed [Bug#5602](#) Possible bug in MySQLParameter(string, object) constructor
- Field buffers being reused to decrease memory allocations and increase speed
- Fixed [Bug#5392](#) MySqlCommand sees "?" as parameters in string literals
- Added Aggregate function test (wasn't really a bug)
- Using PacketWriter instead of Packet for writing to streams
- Implemented SequentialAccess
- Fixed problem with ConnectionInternal where a key might be added more than once
- Fixed Russian character support as well
- Fixed [Bug#5474](#) cannot run a stored procedure populating mysqlcommand.parameters
- Fixed problem where connector was not issuing a CMD_QUIT before closing the socket
- Fixed problem where Min Pool Size was not being respected
- Refactored compression code into CompressedStream to clean up NativeDriver
- CP1252 is now used for Latin1 only when the server is 4.1.2 and later
- Fixed [Bug#5469](#) Setting DbType throws NullReferenceException
- Virtualized driver subsystem so future releases could easily support client or embedded server support

C.4.46. Changes in MySQL Connector/NET 1.0.0 (01 September 2004)

Bugs fixed:

- Thai encoding not correctly supported. ([Bug#3889](#))
- Bumped version number to 1.0.0 for beta 1 release.
- Removed all of the XML comment warnings.
- Added `COPYING.rtf` file for use in installer.
- Updated many of the test cases.
- Fixed problem with using compression.
- Removed some last references to ByteFX.

C.4.47. Changes in MySQL Connector/NET Version 0.9.0 (30 August 2004)

- Added test fixture for prepared statements.
- All type classes now implement a `SerializeBinary` method for sending their data to a `PacketWriter`.
- Added `PacketWriter` class that will enable future low-memory large object handling.
- Fixed many small bugs in running prepared statements and stored procedures.
- Changed command so that an exception will not be thrown in executing a stored procedure with parameters in old syntax mode.
- `SingleRow` behavior now working right even with limit.
- `GetBytes` now only works on binary columns.
- Logger now truncates long sql commands so blob columns do not blow out our log.
- host and database now have a default value of "" unless otherwise set.
- Connection Timeout seems to be ignored. (Bug#5214)
- Added test case for bug# 5051: GetSchema not working correctly.
- Fixed problem where `GetSchema` would return false for `IsUnique` when the column is key.
- `MySqlDataReader` `GetXXX` methods now using the field level `MySqlValue` object and not performing conversions.
- `DataReader` returning `NULL` for time column. (Bug#5097)
- Added test case for `LOAD DATA LOCAL INFILE`.
- Added `replacetext` custom nant task.
- Added `CommandBuilderTest` fixture.
- Added Last One Wins feature to `CommandBuilder`.
- Fixed persist security info case problem.
- Fixed `GetBool` so that 1, true, "true", and "yes" all count as true.
- Make parameter mark configurable.
- Added the "old syntax" connection string parameter to allow use of @ parameter marker.
- `MySqlCommandBuilder`. (Bug#4658)
- `ByteFX.MySqlClient` caches passwords if `Persist Security Info` is false. (Bug#4864)
- Updated license banner in all source files to include FLOSS exception.
- Added new `.Types` namespace and implementations for most current `MySql` types.
- Added `MySqlField41` as a subclass of `MySqlField`.
- Changed many classes to now use the new `.Types` types.
- Changed type `enum int` to `Int32`, `short` to `Int16`, and `bigint` to `Int64`.
- Added dummy types `UInt16`, `UInt32`, and `UInt64` to allow an unsigned parameter to be made.
- Connections are now reset when they are pulled from the connection pool.
- Refactored auth code in driver so it can be used for both auth and reset.
- Added `UserReset` test in `PoolingTests.cs`.
- Connections are now reset using `COM_CHANGE_USER` when pulled from the pool.
- Implemented `SingleResultSet` behavior.
- Implemented support of unicode.

- Added char set mappings for utf-8 and ucs-2.
- Time fields overflow using bytefx .net mysql driver ([Bug#4520](#))
- Modified time test in data type test fixture to check for time spans where hours > 24.
- Wrong string with backslash escaping in `ByteFx.Data.MySqlClient.MySqlParameter`. ([Bug#4505](#))
- Added code to Parameter test case TestQuoting to test for backslashes.
- `MySqlCommandBuilder` fails with multi-word column names. ([Bug#4486](#))
- Fixed bug in `TokenizeSql` where underscore would terminate character capture in parameter name.
- Added test case for spaces in column names.
- `MySqlDataReader.GetBytes` do not work correctly. ([Bug#4324](#))
- Added `GetBytes()` test case to `DataReader` test fixture.
- Now reading all server variables in `InternalConnection.Configure` into `Hashtable`.
- Now using `string[]` for index map in `CharSetMap`.
- Added CRInSQL test case for carriage returns in SQL.
- Setting `maxPacketSize` to default value in `Driver.ctor`.
- Setting `MySqlDbType` on a parameter doesn't set generic type. ([Bug#4442](#))
- Removed obsolete data types `Long` and `LongLong`.
- Overflow exception thrown when using "use pipe" on connection string. ([Bug#4071](#))
- Changed "use pipe" keyword to "pipe name" or just "pipe".
- Allow reading multiple resultsets from a single query.
- Added flags attribute to `ServerStatusFlags` enum.
- Changed name of `ServerStatus` enum to `ServerStatusFlags`.
- Inserted data row doesn't update properly.
- Error processing show create table. ([Bug#4074](#))
- Change `Packet.ReadLenInteger` to `ReadPackedLong` and added `packet.ReadPackedInteger` that always reads integers packed with 2,3,4.
- Added `syntax.cs` test fixture to test various SQL syntax bugs.
- Improper handling of time values. Now time value of 00:00:00 is not treated as null. ([Bug#4149](#))
- Moved all test suite files into `TestSuite` folder.
- Fixed bug where null column would move the result packet pointer backward.
- Added new nant build script.
- Clear tablename so it will be regen'ed properly during the next `GenerateSchema`. ([Bug#3917](#))
- `GetValues` was always returning zero and was also always trying to copy all fields rather than respecting the size of the array passed in. ([Bug#3915](#))
- Implemented shared memory access protocol.
- Implemented prepared statements for MySQL 4.1.
- Implemented stored procedures for MySQL 5.0.
- Renamed `MySqlInternalConnection` to `InternalConnection`.

- SQL is now parsed as chars, fixes problems with other languages.
- Added logging and allow batch connection string options.
- [RowUpdating](#) event not set when setting the [DataAdapter](#) property. ([Bug#3888](#))
- Fixed bug in char set mapping.
- Implemented 4.1 authentication.
- Improved open/auth code in driver.
- Improved how connection bits are set during connection.
- Database name is now passed to server during initial handshake.
- Changed namespace for client to [MySql.Data.MySqlClient](#).
- Changed assembly name of client to [MySql.Data.dll](#).
- Changed license text in all source files to GPL.
- Added the [MySqlClient.build](#) Nant file.
- Removed the mono batch files.
- Moved some of the unused files into notused folder so nant build file can use wildcards.
- Implemented shared memory access.
- Major revamp in code structure.
- Prepared statements now working for MySql 4.1.1 and later.
- Finished implementing auth for 4.0, 4.1.0, and 4.1.1.
- Changed namespace from [MySQL.Data.MySQLClient](#) back to [MySql.Data.MySqlClient](#).
- Fixed bug in [CharSetMapping](#) where it was trying to use text names as ints.
- Changed namespace to [MySQL.Data.MySQLClient](#).
- Integrated auth changes from UC2004.
- Fixed bug where calling any of the GetXXX methods on a datareader before or after reading data would not throw the appropriate exception (thanks Luca Morelli).
- Added [TimeSpan](#) code in parameter.cs to properly serialize a timespan object to mysql time format (thanks Gianluca Colombo).
- Added [TimeStamp](#) to parameter serialization code. Prevented [DataAdatper](#) updates from working right (thanks Michael King).
- Fixed a misspelling in [MySqlHelper.cs](#) (thanks Patrick Kristiansen).

C.4.48. Changes in MySQL Connector/NET Version 0.76

- Driver now using charset number given in handshake to create encoding.
- Changed command editor to point to [MySqlClient.Design](#).
- Fixed bug in [Version.isAtLeast](#).
- Changed [DBConnectionString](#) to support changes done to [MySqlConnectionString](#).
- Removed [SqlCommandEditor](#) and [DataAdapterPreviewDialog](#).
- Using new long return values in many places.
- Integrated new [CompressedStream](#) class.

- Changed `ConnectionString` and added attributes to allow it to be used in `MySqlConnection.Design`.
- Changed `packet.cs` to support newer lengths in `ReadLenInteger`.
- Changed other classes to use new properties and fields of `MySqlConnection`.
- `ConnectionInternal` is now using PING to see whether the server is alive.
- Moved toolbox bitmaps into resource folder.
- Changed `field.cs` to allow values to come directly from row buffer.
- Changed to use the new `driver.Send` syntax.
- Using a new packet queuing system.
- Started work handling the "broken" compression packet handling.
- Fixed bug in `StreamCreator` where failure to connect to a host would continue to loop infinitely (thanks Kevin Casella).
- Improved connectstring handling.
- Moved designers into Pro product.
- Removed some old commented out code from `command.cs`.
- Fixed a problem with compression.
- Fixed connection object where an exception throw prior to the connection opening would not leave the connection in the connecting state (thanks Chris Cline).
- Added GUID support.
- Fixed sequence out of order bug (thanks Mark Reay).

C.4.49. Changes in MySQL Connector/NET Version 0.75

- Enum values now supported as parameter values (thanks Philipp Sumi).
- Year datatype now supported.
- Fixed compression.
- Fixed bug where a parameter with a `TimeSpan` as the value would not serialize properly.
- Fixed bug where default constructor would not set default connection string values.
- Added some XML comments to some members.
- Work to fix/improve compression handling.
- Improved `ConnectionString` handling so that it better matches the standard set by `SqlClient`.
- A `MySqlException` is now thrown if a user name is not included in the connection string.
- Localhost is now used as the default if not specified on the connection string.
- An exception is now thrown if an attempt is made to set the connection string while the connection is open.
- Small changes to `ConnectionString` docs.
- Removed `MultiHostStream` and `MySqlStream`. Replaced it with `Common/StreamCreator`.
- Added support for Use Pipe connection string value.
- Added Platform class for easier access to platform utility functions.
- Fixed small pooling bug where new connection was not getting created after `IsAlive` fails.
- Added `Platform.cs` and `StreamCreator.cs`.

- Fixed `Field.cs` to properly handle 4.1 style timestamps.
- Changed `Common.Version` to `Common.DBVersion` to avoid name conflict.
- Fixed `field.cs` so that text columns return the right field type.
- Added `MySqlError` class to provide some reference for error codes (thanks Geert Veenstra).

C.4.50. Changes in MySQL Connector/NET Version 0.74

- Added Unix socket support (thanks Mohammad DAMT).
- Only calling `Thread.Sleep` when no data is available.
- Improved escaping of quote characters in parameter data.
- Removed misleading comments from `parameter.cs`.
- Fixed pooling bug.
- Fixed `ConnectionString` editor dialog (thanks marco p (pomarc)).
- `UserId` now supported in connection strings (thanks Jeff Neeley).
- Attempting to create a parameter that is not input throws an exception (thanks Ryan Gregg).
- Added much documentation.
- Checked in new `MultiHostStream` capability. Big thanks to Dan Guisinger for this. he originally submitted the code and idea of supporting multiple machines on the connect string.
- Added a lot of documentation.
- Fixed speed issue with 0.73.
- Changed to `Thread.Sleep(0)` in `MySqlDataStream` to help optimize the case where it doesn't need to wait (thanks Todd German).
- Prepopulating the idlepools to `MinPoolSize`.
- Fixed `MySqlPool` deadlock condition as well as stupid bug where `CreateNewPooledConnection` was not ever adding new connections to the pool. Also fixed `MySqlStream.ReadBytes` and `ReadByte` to not use `TicksPerSecond` which does not appear to always be right. (thanks Matthew J. Peddlesden)
- Fix for precision and scale (thanks Matthew J. Peddlesden).
- Added `Thread.Sleep(1)` to stream reading methods to be more cpu friendly (thanks Sean McGinnis).
- Fixed problem where `ExecuteReader` would sometime return null (thanks Lloyd Dupont).
- Fixed major bug with null field handling (thanks Naucki).
- Enclosed queries for `max_allowed_packet` and `characterset` inside try catch (and set defaults).
- Fixed problem where socket was not getting closed properly (thanks Steve!).
- Fixed problem where `ExecuteNonQuery` was not always returning the right value.
- Fixed `InternalConnection` to not use `@@session.max_allowed_packet` but use `@@max_allowed_packet`. (Thanks Miguel)
- Added many new XML doc lines.
- Fixed sql parsing to not send empty queries (thanks Rory).
- Fixed problem where the reader was not unpeeking the packet on close.
- Fixed problem where user variables were not being handled (thanks Sami Vaaraniemi).

- Fixed loop checking in the MySqlPool (thanks Steve M. Brown)
- Fixed `ParameterCollection.Add` method to match `SqlClient` (thanks Joshua Mouch).
- Fixed `ConnectionString` parsing to handle no and yes for boolean and not lowercase values (thanks Naucki).
- Added `InternalConnection` class, changes to pooling.
- Implemented Persist Security Info.
- Added `security.cs` and `version.cs` to project
- Fixed `DateTime` handling in `Parameter.cs` (thanks Burkhard Perens-Golomb).
- Fixed parameter serialization where some types would throw a cast exception.
- Fixed `DataReader` to convert all returned values to prevent casting errors (thanks Keith Murray).
- Added code to `Command.ExecuteReader` to return null if the initial SQL statement throws an exception (thanks Burkhard Perens-Golomb).
- Fixed `ExecuteScalar` bug introduced with restructure.
- Restructure to allow for `LOCAL DATA INFILE` and better sequencing of packets.
- Fixed several bugs related to restructure.
- Early work done to support more secure passwords in Mysql 4.1. Old passwords in 4.1 not supported yet.
- Parameters appearing after system parameters are now handled correctly (Adam M. (adammmil)).
- Strings can now be assigned directly to blob fields (Adam M.).
- Fixed float parameters (thanks Pent).
- Improved Parameter constructor and `ParameterCollection.Add` methods to better match `SqlClient` (thanks Joshua Mouch).
- Corrected `Connection.CreateCommand` to return a `MySqlCommand` type.
- Fixed connection string designer dialog box problem (thanks Abraham Guyt).
- Fixed problem with sending commands not always reading the response packet (thanks Joshua Mouch).
- Fixed parameter serialization where some blobs types were not being handled (thanks Sean McGinnis).
- Removed spurious `MessageBox.show` from `DataReader` code (thanks Joshua Mouch).
- Fixed a nasty bug in the split sql code (thanks everyone!).

C.4.51. Changes in MySQL Connector/NET Version 0.71

- Fixed bug in `MySqlStream` where too much data could attempt to be read (thanks Peter Belbin)
- Implemented `HasRows` (thanks Nash Pherson).
- Fixed bug where tables with more than 252 columns cause an exception (thanks Joshua Kessler).
- Fixed bug where SQL statements ending in ; would cause a problem (thanks Shane Krueger).
- Fixed bug in driver where error messages were getting truncated by 1 character (thanks Shane Krueger).
- Made `MySqlException` serializable (thanks Mathias Hasselmann).

C.4.52. Changes in MySQL Connector/NET Version 0.70

- Updated some of the character code pages to be more accurate.

- Fixed problem where readers could be opened on connections that had readers open.
- Moved test to separate assembly `MySQLClientTests`.
- Fixed stupid problem in driver with sequence out of order (Thanks Peter Belbin).
- Added some pipe tests.
- Increased default max pool size to 50.
- Compiles with Mono 0-24.
- Fixed connection and data reader dispose problems.
- Added `String` datatype handling to parameter serialization.
- Fixed sequence problem in driver that occurred after thrown exception (thanks Burkhard Perken-Golomb).
- Added support for `CommandBehavior.SingleRow` to `DataReader`.
- Fixed command sql processing so quotes are better handled (thanks Theo Spears).
- Fixed parsing of double, single, and decimal values to account for non-English separators. You still have to use the right syntax if you using hard coded sql, but if you use parameters the code will convert floating point types to use '.' appropriately internal both into the server and out.
- Added `MySQLStream` class to simplify timeouts and driver coding.
- Fixed `DataReader` so that it is closed properly when the associated connection is closed. [thanks smishra]
- Made client more `SqlClient` compliant so that `DataReaders` have to be closed before the connection can be used to run another command.
- Improved `DBNull.Value` handling in the fields.
- Added several unit tests.
- Fixed `MySQLException` base class.
- Improved driver coding
- Fixed bug where `NextResult` was returning false on the last resultset.
- Added more tests for MySQL.
- Improved casting problems by equating unsigned 32bit values to `Int64` and unsigned 16bit values to `Int32`, and so forth.
- Added new constructor for `MySQLParameter` for (name, type, size, srccol)
- Fixed bug in `MySQLDataReader` where it didn't check for null fieldlist before returning field count.
- Started adding `MySQLClient` unit tests (added `MySQLClient/Tests` folder and some test cases).
- Fixed some things in Connection String handling.
- Moved `INIT_DB` to `MySQLPool`. I may move it again, this is in preparation of the conference.
- Fixed bug inside `CommandBuilder` that prevented inserts from happening properly.
- Reworked some of the internals so that all three execute methods of `Command` worked properly.
- Fixed many small bugs found during benchmarking.
- The first cut of `CoonnectionPooling` is working. "min pool size" and "max pool size" are respected.
- Work to enable multiple resultsets to be returned.
- Character sets are handled much more intelligently now. The driver queries MySQL at startup for the default character set. That character set is then used for conversions if that code page can be loaded. If not, then the default code page for the current OS is used.
- Added code to save the inferred type in the name,value constructor of `Parameter`.

- Also, inferred type if value of null parameter is changed using `Value` property.
- Converted all files to use proper Camel case. MySQL is now `MySql` in all files. PostgreSQL is now `PgSql`.
- Added attribute to `PgSql` code to prevent designer from trying to show.
- Added `MySQLDbType` property to `Parameter` object and added proper conversion code to convert from `DbType` to `MySQLDbType`.
- Removed unused `ObjectToString` method from `MySQLParameter.cs`.
- Fixed `Add(..)` method in `ParameterCollection` so that it doesn't use `Add(name, value)` instead.
- Fixed `IndexOf` and `Contains` in `ParameterCollection` to be aware that parameter names are now stored without `@`.
- Fixed `Command.ConvertSQLToBytes` so it only allows characters that can be in MySQL variable names.
- Fixed `DataReader` and `Field` so that blob fields read their data from `Field.cs` and `GetBytes` works right.
- Added simple query builder editor to `CommandText` property of `MySQLCommand`.
- Fixed `CommandBuilder` and `Parameter` serialization to account for Parameters not storing `@` in their names.
- Removed `MySQLFieldType` enum from `Field.cs`. Now using `MySQLDbType` enum.
- Added `Designer` attribute to several classes to prevent designer view when using VS.Net.
- Fixed Initial catalog typo in `ConnectionString` designer.
- Removed 3 parameter constructor for `MySQLParameter` that conflicted with (name, type, value).
- Changed `MySQLParameter` so `paramName` is now stored without leading `@` (this fixed null inserts when using designer).
- Changed `TypeConverter` for `MySQLParameter` to use the constructor with all properties.

C.4.53. Changes in MySQL Connector/NET Version 0.68

- Fixed sequence issue in driver.
- Added `DbParametersEditor` to make parameter editing more like `SqlClient`.
- Fixed `Command` class so that parameters can be edited using the designer
- Update connection string designer to support `Use Compression` flag.
- Fixed string encoding so that European characters will work correctly.
- Creating base classes to aid in building new data providers.
- Added support for `UID` key in connection string.
- `Field`, `parameter`, `command` now using `DBNull.Value` instead of `null`.
- `CommandBuilder` using `DBNull.Value`.
- `CommandBuilder` now builds insert command correctly when an `auto_insert` field is not present.
- `Field` now uses `typeof` keyword to return `System.Types` (performance).

C.4.54. Changes in MySQL Connector/NET Version 0.65

- `MySQLCommandBuilder` now implemented.
- Transaction support now implemented (not all table types support this).
- `GetSchemaTable` fixed to not use `xsd` (for Mono).

- Driver is now Mono-compatible.
- TIME data type now supported.
- More work to improve Timestamp data type handling.
- Changed signatures of all classes to match corresponding `SqlClient` classes.

C.4.55. Changes in MySQL Connector/NET Version 0.60

- Protocol compression using SharpZipLib (www.icsharpcode.net).
- Named pipes on Windows now working properly.
- Work done to improve `Timestamp` data type handling.
- Implemented `IEnumerable` on `DataReader` so `DataGrid` would work.

C.4.56. Changes in MySQL Connector/NET Version 0.50

- Speed increased dramatically by removing bugging network sync code.
- Driver no longer buffers rows of data (more ADO.Net compliant).
- Conversion bugs related to `TIMESTAMP` and `DATETIME` fields fixed.

C.5. MySQL Visual Studio Plugin Change History

Note

As of Connector/NET 5.1.2 (14 June 2007), the Visual Studio Plugin is part of the main Connector/NET package. For the change history for the Visual Studio Plugin, see [Section C.4, "MySQL Connector/NET Change History"](#).

C.5.1. Changes in MySQL Visual Studio Plugin 1.0.3 (Not yet released)

Bugs fixed:

- Running queries based on a stored procedure would cause the data set designer to terminate. (Bugs #26364)
- DataSet wizard would show all tables instead of only the tables available within the selected database. (Bugs #26348)

C.5.2. Changes in MySQL Visual Studio Plugin 1.0.2 (Not yet released)

Bugs fixed:

- The Add Connection dialog of the Server Explorer would freeze when accessing databases with capitalized characters in their name. (Bug#24875)
- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that Connector/NET 5.0.2 must be installed. (Bug#23071)

C.5.3. Changes in MySQL Visual Studio Plugin 1.0.1 (4 October 2006)

This is a bug fix release to resolve an incompatibility issue with Connector/NET 5.0.1.

It is critical that this release only be used with Connector/NET 5.0.1. After installing Connector/NET 5.0.1, you will need to make a small change in your `machine.config` file. This file should be located at `%win%\Microsoft .Net\Framework\v2.0.50727\CONFIG\machine.config` (`%win%` should be the location of your Windows folder). Near the bottom of the file you will see a line like this:

```
<add name="MySQL Data Provider" invariant="MySql.Data.MySqlClient"
description=".Net Framework Data Provider for MySQL"
type="MySql.Data.MySqlClient.MySqlClientFactory, MySql.Data"/>
```

It needs to be changed to be like this:

```
<add name="MySQL Data Provider" invariant="MySql.Data.MySqlClient"
description=".Net Framework Data Provider for MySQL"
type="MySql.Data.MySqlClient.MySqlClientFactory, MySql.Data,
Version=5.0.1.0, Culture=neutral, PublicKeyToken=c5687fc88969c44d"/>
```

C.5.4. Changes in MySQL Visual Studio Plugin 1.0.0 (4 October 2006)

Bugs fixed:

- Ability to work with MySQL objects (tables, views, stored procedures, etc) from within Server Explorer.
- DDEX (Data Designer Extensibility) compatibility.

C.6. MySQL Connector/J Change History

C.6.1. Changes in MySQL Connector/J 5.1.x

C.6.1.1. Changes in MySQL Connector/J 5.1.8 (Not yet released)

Bugs fixed:

- The result set returned by `getIndexInfo()` did not have the format defined in the JDBC API specifications. The fourth column, `DATA_TYPE`, of the result set should be of type `BOOLEAN`. Connector/J however returns `CHAR`. ([Bug#44869](#))
- The result set returned by `getTypeInfo()` did not have the format defined in the JDBC API specifications. The second column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. ([Bug#44868](#))
- The `DEFERRABILITY` column in database metadata result sets was expected to be of type `SHORT`. However, Connector/J returned it as `INTEGER`.

This affected the following methods: `getImportedKeys()`, `getExportedKeys()`, `getCrossReference()`. ([Bug#44867](#))

- The result set returned by `getColumns()` did not have the format defined in the JDBC API specifications. The fifth column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. ([Bug#44865](#))
- The result set returned by `getVersionColumns()` did not have the format defined in the JDBC API specifications. The third column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. ([Bug#44863](#))
- The result set returned by `getBestRowIdentifier()` did not have the format defined in the JDBC API specifications. The third column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. ([Bug#44862](#))
- Connector/J contains logic to generate a message text specifically for streaming result sets when there are `CommunicationsException` exceptions generated. However, this code was never reached.

In the `CommunicationsException` code:

```
private boolean streamingResultSetInPlay = false;

public CommunicationsException(ConnectionImpl conn, long lastPacketSentTimeMs,
long lastPacketReceivedTimeMs, Exception underlyingException) {

this.exceptionMessage = SQLError.createLinkFailureMessageBasedOnHeuristics(conn,
lastPacketSentTimeMs, lastPacketReceivedTimeMs, underlyingException,
this.streamingResultSetInPlay);
```

`streamingResultSetInPlay` was always false, which in the following code in `SQLError.createLinkFailureMessageBasedOnHeuristics()` never being executed:

```
if (streamingResultSetInPlay) {
```

```
exceptionMessageBuf.append(
    Messages.getString("CommunicationsException.ClientWasStreaming")); //$NON-NLS-1$
} else {
    ...

```

(Bug#44588)

- `Statement.getGeneratedKeys()` retained result set instances until the statement was closed. This caused memory leaks for long-lived statements, or statements used in tight loops. (Bug#44056)
- `LoadBalancingConnectionProxy.doPing()` did not have blacklist awareness.

`LoadBalancingConnectionProxy` implemented `doPing()` to ping all underlying connections, but it threw any exceptions it encountered during this process.

With the global blacklist enabled, it catches these exceptions, adds the host to the global blacklist, and only throws an exception if all hosts are down. (Bug#43421)

- When the MySQL Server was upgraded from 4.0 to 5.0, the Connector/J application then failed to connect to the server. This was because authentication failed when the application ran from EBCDIC platforms such as z/OS. (Bug#43071)
- When connecting with `traceProtocol=true`, no trace data was generated for the server greeting or login request. (Bug#43070)
- A `ConcurrentModificationException` was generated in `LoadBalancingConnectionProxy`:

```
java.util.ConcurrentModificationException
at java.util.HashMap$HashIterator.nextEntry(Unknown Source)
at java.util.HashMap$KeyIterator.next(Unknown Source)

at
com.mysql.jdbc.LoadBalancingConnectionProxy.invoke(LoadBalancingConnectionProxy.java:390)

```

(Bug#42055)

- SQL injection was possible when using a string containing U+00A5 in a client-side prepared statement, and the character set being used was SJIS/Windows-31J. (Bug#41730)
- MySQL Connector/J 5.1.7 was slower than previous versions when the `rewriteBatchedStatements` option was set to `true`.

Note

The performance regression in `indexOfIgnoreCaseRespectMarker()` has been fixed. It has also been made possible for the driver to rewrite `INSERT` statements with `ON DUPLICATE KEY UPDATE` clauses in them, as long as the `UPDATE` clause contains no reference to `LAST_INSERT_ID()`, as that would cause the driver to return bogus values for `getGeneratedKeys()` invocations. This has resulted in improved performance over version 5.1.7.

(Bug#41532)

- `PreparedStatement.addBatch()` did not check for all parameters being set, which led to inconsistent behavior in `executeBatch()`, especially when rewriting batched statements into multi-value `INSERT`s. (Bug#41161)

C.6.1.2. Changes in MySQL Connector/J 5.1.7 (21 October 2008)

Functionality added or changed:

- When statements include `ON DUPLICATE UPDATE`, and `rewriteBatchedStatements` is set to true, batched statements are not rewritten into the form `INSERT INTO table VALUES (), (), ()`, instead the statements are executed sequentially.

Bugs fixed:

- `Statement.getGeneratedKeys()` returned two keys when using `ON DUPLICATE KEY UPDATE` and the row was

updated, not inserted. ([Bug#42309](#))

- When using the replication driver with `autoReconnect=true`, Connector/J checks in `PreparedStatement.execute` (also called by `CallableStatement.execute`) to determine if the first character of the statement is an “S”, in an attempt to block all statements that are not read-only-safe, for example non-`SELECT` statements. However, this also blocked `CALLs` to stored procedures, even if the stored procedures were defined as `SQL READ DATA` or `NO SQL`. ([Bug#40031](#))
- With large result sets `ResultSet.findColumn` became a performance bottleneck. ([Bug#39962](#))
- Connector/J ignored the value of the MySQL Server variable `auto_increment_increment`. ([Bug#39956](#))
- Connector/J failed to parse `TIMESTAMP` strings for nanos correctly. ([Bug#39911](#))
- When the `LoadBalancingConnectionProxy` handles a `SQLException` with SQL state starting with “08”, it calls `invalidateCurrentConnection`, which in turn removes that `Connection` from `liveConnections` and the `connectionsToHostsMap`, but it did not add the host to the new global blacklist, if the global blacklist was enabled.

There was also the possibility of a `NullPointerException` when trying to update stats, where `connectionsToHostsMap.get(this.currentConn)` was called:

```
int hostIndex = ((Integer) this.hostsToListIndexMap.get(this.connectionsToHostsMap.get(this.currentConn))).intValue
```

This could happen if a client tried to issue a rollback after catching a `SQLException` caused by a connection failure. ([Bug#39784](#))

- When configuring the Java Replication Driver the last slave specified was never used. ([Bug#39611](#))
- When an `INSERT ON DUPLICATE KEY UPDATE` was performed, and the key already existed, the `affected-rows` value was returned as 1 instead of 0. ([Bug#39352](#))
- When using the random load balancing strategy and starting with two servers that were both unavailable, an `IndexOutOfBoundsException` was generated when removing a server from the `whiteList`. ([Bug#38782](#))
- Connector/J threw the following exception when using a read-only connection:

```
java.sql.SQLException: Connection is read-only. Queries leading to data
modification are not allowed.
```

([Bug#38747](#))

- Connector/J was unable to connect when using a non-latin1 password. ([Bug#37570](#))
- Incorrect result is returned from `isAfterLast()` in streaming `ResultSet` when using `setFetchSize(Integer.MIN_VALUE)`. ([Bug#35170](#))
- When `getGeneratedKeys()` was called on a statement that had not been created with `RETURN_GENERATED_KEYS`, no exception was thrown, and batched executions then returned erroneous values. ([Bug#34185](#))
- The `loadBalance bestResponseTime` blacklists did not have a global state. ([Bug#33861](#))

C.6.1.3. Changes in MySQL Connector/J 5.1.6 (07 March 2008)

Functionality added or changed:

- Multiple result sets were not supported when using streaming mode to return data. Both normal statements and the result sets from stored procedures now return multiple result sets, with the exception of result sets using registered `OUTPUT` parameters. ([Bug#33678](#))
- `XAConnections` and `datasources` have been updated to the JDBC-4.0 standard.
- The profiler event handling has been made extensible via the `profilerEventHandler` connection property.
- Add the `verifyServerCertificate` property. If set to "false" the driver will not verify the server's certificate when `useSSL` is set to "true"

When using this feature, the keystore parameters should be specified by the `clientCertificateKeyStore*` properties, rather than system properties, as the JSSE doesn't it straightforward to have a non-verifying trust store and the "default" key store.

Bugs fixed:

- `DatabaseMetaData.getColumns()` returns incorrect `COLUMN_SIZE` value for `SET` column. (Bug#36830)
- When trying to read `Time` values like “00:00:00” with `ResultSet.getTime(int)` an exception is thrown. (Bug#36051)
- JDBC connection URL parameters is ignored when using `MysqlConnectionPoolDataSource`. (Bug#35810)
- When `useServerPrepStmts=true` and slow query logging is enabled, the connector throws a `NullPointerException` when it encounters a slow query. (Bug#35666)
- When using the keyword “loadbalance” in the connection string and trying to perform load balancing between two databases, the driver appears to hang. (Bug#35660)
- JDBC data type getter method was changed to accept only column name, whereas previously it accepted column label. (Bug#35610)
- Prepared statements from pooled connections caused a `NullPointerException` when `closed()` under JDBC-4.0. (Bug#35489)
- In calling a stored function returning a `bigint`, an exception is encountered beginning:

```
java.sql.SQLException: java.lang.NumberFormatException: For input string:
```

followed by the text of the stored function starting after the argument list. (Bug#35199)

- The JDBC driver uses a different method for evaluating column names in `resultsetmetadata.getColumnName()` and when looking for a column in `resultset.getObject(columnName)`. This causes Hibernate to fail in queries where the two methods yield different results, for example in queries that use alias names:

```
SELECT column AS aliasName from table
```

(Bug#35150)

- `MysqlConnectionPoolDataSource` does not support `ReplicationConnection`. Notice that we implemented `com.mysql.jdbc.Connection` for `ReplicationConnection`, however, only accessors from `ConnectionProperties` are implemented (not the mutators), and they return values from the currently active connection. All other methods from `com.mysql.jdbc.Connection` are implemented, and operate on the currently active connection, with the exception of `resetServerState()` and `changeUser()`. (Bug#34937)
- `ResultSet.getTimestamp()` returns incorrect values for month/day of `TIMESTAMPS` when using server-side prepared statements (not enabled by default). (Bug#34913)
- `RowDataStatic` doesn't always set the metadata in `ResultSetRow`, which can lead to failures when unpacking `DATE`, `TIME`, `DATETIME` and `TIMESTAMP` types when using absolute, relative, and previous result set navigation methods. (Bug#34762)
- When calling `isValid()` on an active connection, if the timeout is nonzero then the `Connection` is invalidated even if the `Connection` is valid. (Bug#34703)
- It was not possible to truncate a `BLOB` using `Blob.truncate()` when using 0 as an argument. (Bug#34677)
- When using a cursor fetch for a statement, the internal prepared statement could cause a memory leak until the connection was closed. The internal prepared statement is now deleted when the corresponding result set is closed. (Bug#34518)
- When retrieving the column type name of a geometry field, the driver would return `UNKNOWN` instead of `GEOMETRY`. (Bug#34194)
- Statements with batched values do not return correct values for `getGeneratedKeys()` when `rewriteBatchedStatements` is set to `true`, and the statement has an `ON DUPLICATE KEY UPDATE` clause. (Bug#34093)
- The internal class `ResultSetInternalMethods` referenced the non-public class `com.mysql.jdbc.CachedResultSetMetaData`. (Bug#33823)
- A `NullPointerException` could be raised when using client-side prepared statements and enabled the prepared statement cache using the `cachePrepStmts`. (Bug#33734)
- Using server side cursors and cursor fetch, the table metadata information would return the data type name instead of the column name. (Bug#33594)

- `ResultSet.getTimestamp()` would throw a `NullPointerException` instead of a `SQLException` when called on an empty `ResultSet`. (Bug#33162)
- Load balancing connection using best response time would incorrectly "stick" to hosts that were down when the connection was first created.

We solve this problem with a black list that is used during the picking of new hosts. If the black list ends up including all configured hosts, the driver will retry for a configurable number of times (the `retriesAllDown` configuration property, with a default of 120 times), sleeping 250ms between attempts to pick a new connection.

We've also went ahead and made the balancing strategy extensible. To create a new strategy, implement the interface `com.mysql.jdbc.BalanceStrategy` (which also includes our standard "extension" interface), and tell the driver to use it by passing in the class name via the `loadBalanceStrategy` configuration property. (Bug#32877)

- During a Daylight Savings Time (DST) switchover, there was no way to store two timestamp/datetime values, as the hours end up being the same when sent as the literal that MySQL requires.

Note that to get this scenario to work with MySQL (since it doesn't support per-value timezones), you need to configure your server (or session) to be in UTC, and tell the driver not to use the legacy date/time code by setting `useLegacyDatetimeCode` to "false". This will cause the driver to always convert to/from the server and client timezone consistently.

This bug fix also fixes Bug#15604, by adding entirely new date/time handling code that can be switched on by `useLegacyDatetimeCode` being set to "false" as a JDBC configuration property. For Connector/J 5.1.x, the default is "true", in trunk and beyond it will be "false" (i.e. the old date/time handling code will be deprecated) (Bug#32577, Bug#15604)

- When unpacking rows directly, we don't hand off error message packets to the internal method which decodes them correctly, so no exception is raised, and the driver then hangs trying to read rows that aren't there. This tends to happen when calling stored procedures, as normal SELECTs won't have an error in this spot in the protocol unless an I/O error occurs. (Bug#32246)
- When using a connection from `ConnectionPoolDataSource`, some `Connection.prepareStatement()` methods would return null instead of the prepared statement. (Bug#32101)
- Using `CallableStatement.setNull()` on a stored function would throw an `ArrayIndexOutOfBoundsException` exception when setting the last parameter to null. (Bug#31823)
- `MysqlValidConnectionChecker` doesn't properly handle connections created using `ReplicationConnection`. (Bug#31790)
- Retrieving the server version information for an active connection could return invalid information if the default character encoding on the host was not ASCII compatible. (Bug#31192)
- Further fixes have been made to this bug in the event that a node is non-responsive. Connector/J will now try a different random node instead of waiting for the node to recover before continuing. (Bug#31053)
- `ResultSet` returned by `Statement.getGeneratedKeys()` is not closed automatically when statement that created it is closed. (Bug#30508)
- `DatabaseMetadata.getColumns()` doesn't return the correct column names if the connection character isn't UTF-8. A bug in MySQL server compounded the issue, but was fixed within the MySQL 5.0 release cycle. The fix includes changes to all the sections of the code that access the server metadata. (Bug#20491)
- Fixed `ResultSetMetadata.getColumnname()` for result sets returned from `Statement.getGeneratedKeys()` - it was returning null instead of "GENERATED_KEY" as in 5.0.x.

C.6.1.4. Changes in MySQL Connector/J 5.1.5 (09 October 2007)

The following features are new, compared to the 5.0 series of Connector/J

- Support for JDBC-4.0 `NCHAR`, `NVARCHAR` and `NCLOB` types.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query via `SHOW PROCESSLIST` on a MySQL server, or can be extended to support custom persistence of the information via a public interface).
- Support for JDBC-4.0 XML processing via JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.

Functionality added or changed:

- Added `autoSlowLog` configuration property, overrides `slowQueryThreshold*` properties, driver determines slow queries by those that are slower than $5 * \text{stddev}$ of the mean query time (outside the 96% percentile).

Bugs fixed:

- When a connection is in read-only mode, queries that are wrapped in parentheses were incorrectly identified DML statements. ([Bug#28256](#))

C.6.1.5. Changes in MySQL Connector/J 5.1.4 (Not Released)

Only released internally.

C.6.1.6. Changes in MySQL Connector/J 5.1.3 (10 September 2007)

The following features are new, compared to the 5.0 series of Connector/J

- Support for JDBC-4.0 `NCHAR`, `NVARCHAR` and `NCLOB` types.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query via `SHOW PROCESSLIST` on a MySQL server, or can be extended to support custom persistence of the information via a public interface).
- Support for JDBC-4.0 XML processing via JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.

Functionality added or changed:

- Connector/J now connects using an initial character set of `utf-8` solely for the purpose of authentication to allow user names or database names in any character set to be used in the JDBC connection URL. ([Bug#29853](#))
- Added two configuration parameters:
 - `blobsAreStrings` — Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
 - `functionsNeverReturnBlobs` — Should the driver always treat data from functions returning BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- Setting `rewriteBatchedStatements` to `true` now causes CallableStatements with batched arguments to be re-written in the form "CALL (...); CALL (...); ..." to send the batch in as few client-server round trips as possible.
- The driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has `BLOB` or `TEXT` types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property `largeRowSizeThreshold`, which has a default value of 2KB.
- The data (and how it is stored) for `ResultSet` rows are now behind an interface which allows us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.
- Added experimental support for statement "interceptors" via the `com.mysql.jdbc.StatementInterceptor` interface, examples are in `com/mysql/jdbc/interceptors`. Implement this interface to be placed "in between" query execution, so that it can be influenced (currently experimental).
- The driver will automatically adjust the server session variable `net_write_timeout` when it determines its been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (The configuration property is named `netTimeoutForStreamingResults`, with a unit of seconds, the value '0' means the driver will not try and adjust this value).
- JDBC-4.0 ease-of-development features including auto-registration with the `DriverManager` via the service provider mechanism, standardized Connection validity checks and categorized `SQLExceptions` based on recoverability/retry-ability and

class of the underlying error.

- `Statement.setQueryTimeout()`s now affect the entire batch for batched statements, rather than the individual statements that make up the batch.
- Errors encountered during `Statement/PreparedStatement/CallableStatement.executeBatch()` when `rewriteBatchStatements` has been set to `true` now return `BatchUpdateExceptions` according to the setting of `continueBatchOnError`.

If `continueBatchOnError` is set to `true`, the update counts for the "chunk" that were sent as one unit will all be set to `EXECUTE_FAILED`, but the driver will attempt to process the remainder of the batch. You can determine which "chunk" failed by looking at the update counts returned in the `BatchUpdateException`.

If `continueBatchOnError` is set to "false", the update counts returned will contain all updates up-to and including the failed "chunk", with all counts for the failed "chunk" set to `EXECUTE_FAILED`.

Since MySQL doesn't return multiple error codes for multiple-statements, or for multi-value `INSERT/REPLACE`, it is the application's responsibility to handle determining which item(s) in the "chunk" actually failed.

- New methods on `com.mysql.jdbc.Statement`: `setLocalInfileInputStream()` and `getLocalInfileInputStream()`:
 - `setLocalInfileInputStream()` sets an `InputStream` instance that will be used to send data to the MySQL server for a `LOAD DATA LOCAL INFILE` statement rather than a `FileInputStream` or `URLInputStream` that represents the path given as an argument to the statement.

This stream will be read to completion upon execution of a `LOAD DATA LOCAL INFILE` statement, and will automatically be closed by the driver, so it needs to be reset before each call to `execute*()` that would cause the MySQL server to request data to fulfill the request for `LOAD DATA LOCAL INFILE`.

If this value is set to `NULL`, the driver will revert to using a `FileInputStream` or `URLInputStream` as required.
 - `getLocalInfileInputStream()` returns the `InputStream` instance that will be used to send data in response to a `LOAD DATA LOCAL INFILE` statement.
- This method returns `NULL` if no such stream has been set via `setLocalInfileInputStream()`.
- Setting `useBlobToStoreUTF8OutsideBMP` to `true` tells the driver to treat `[MEDIUM/LONG]BLOB` columns as `[LONG]VARCHAR` columns holding text encoded in UTF-8 that has characters outside the BMP (4-byte encodings), which MySQL server can't handle natively.

Set `utf8OutsideBmpExcludedColumnNamePattern` to a regex so that column names matching the given regex will still be treated as BLOBs. The regex must follow the patterns used for the `java.util.regex` package. The default is to exclude no columns, and include all columns.

Set `utf8OutsideBmpIncludedColumnNamePattern` to specify exclusion rules to `utf8OutsideBmpExcludedColumnNamePattern`. The regex must follow the patterns used for the `java.util.regex` package.

Bugs fixed:

- `setObject(int, Object, int, int)` delegate in `PreparedStatementWrapper` delegates to wrong method. (Bug#30892)
- NPE with null column values when `padCharsWithSpace` is set to true. (Bug#30851)
- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from subqueries and functions were indistinguishable from each other, leading to type-related bugs. (Bug#30664)
- An `ArithmeticException` or `NullPointerException` would be raised when the batch had zero members and `rewriteBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immediately after `clearBatch()`. (Bug#30550)
- Closing a load-balanced connection would cause a `ClassCastException`. (Bug#29852)
- Connection checker for JBoss didn't use same method parameters via reflection, causing connections to always seem "bad". (Bug#29106)

- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3-5.0.5 and 65 for versions newer than 5.0.5. ([Bug#28972](#))
- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.

The fix involves changing the behavior of `noAccessToProcedureBodies`, in that the driver will now report all parameters as "IN" parameters but allow callers to call `registerOutParameter()` on them without throwing an exception. ([Bug#28689](#))
- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. ([Bug#27915](#))
- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. ([Bug#27867](#))
- `Connection.getServerCharacterEncoding()` doesn't work for servers with version \geq 4.1. ([Bug#27182](#))
- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. ([Bug#21116](#))
- Specifying a "validation query" in your connection pool that starts with `"/ * ping * /" _exactly_` will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and when using a `ReplicationConnection` or a `LoadBalancedConnection`, will send the ping across all active connections.

C.6.1.7. Changes in MySQL Connector/J 5.1.2 (29 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

Functionality added or changed:

- Setting the configuration property `rewriteBatchedStatements` to `true` will now cause the driver to rewrite batched prepared statements with more than 3 parameter sets in a batch into multi-statements (separated by ";") if they are not plain (that is, without `SELECT` or `ON DUPLICATE KEY UPDATE` clauses) `INSERT` or `REPLACE` statements.

C.6.1.8. Changes in MySQL Connector/J 5.1.1 (22 June 2007)

This is a new Alpha development release, adding new features and fixing recently discovered bugs.

Functionality added or changed:

- **Incompatible Change:** Pulled vendor-extension methods of `Connection` implementation out into an interface to support `java.sql.Wrapper` functionality from `ConnectionPoolDataSource`. The vendor extensions are javadoc'd in the `com.mysql.jdbc.Connection` interface.

For those looking further into the driver implementation, it is not an API that is used for pluggability of implementations inside our driver (which is why there are still references to `ConnectionImpl` throughout the code).

We've also added server and client `prepareStatement()` methods that cover all of the variants in the JDBC API.

`Connection.serverPrepare(String)` has been re-named to `Connection.serverPrepareStatement()` for consistency with `Connection.clientPrepareStatement()`.

- Row navigation now causes any streams/readers open on the result set to be closed, as in some cases we're reading directly from a shared network packet and it will be overwritten by the "next" row.
- Made it possible to retrieve prepared statement parameter bindings (to be used in `StatementInterceptors`, primarily).
- Externalized the descriptions of connection properties.
- The data (and how it is stored) for `ResultSet` rows are now behind an interface which allows us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.
- Similar to `Connection`, we pulled out vendor extensions to `Statement` into an interface named `com.mysql.Statement`, and moved the `Statement` class into `com.mysql.StatementImpl`. The two methods (javadoc'd in `com.mysql.Statement` are `enableStreamingResults()`, which already existed, and `disableStreamingResults()` which sets the statement instance back to the fetch size and result set type it had before `enableStreamingResults()` was called.

- Driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has `BLOB` or `TEXT` types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property `largeRowSizeThreshold`, which has a default value of 2KB.
- Added experimental support for statement "interceptors" via the `com.mysql.jdbc.StatementInterceptor` interface, examples are in [com/mysql/jdbc/interceptors](#).
Implement this interface to be placed "in between" query execution, so that you can influence it. (currently experimental).
`StatementInterceptors` are "chainable" when configured by the user, the results returned by the "current" interceptor will be passed on to the next on in the chain, from left-to-right order, as specified by the user in the JDBC configuration property `statementInterceptors`.
- See the sources (fully javadoc'd) for `com.mysql.jdbc.StatementInterceptor` for more details until we iron out the API and get it documented in the manual.
- Setting `rewriteBatchedStatements` to `true` now causes `CallableStatements` with batched arguments to be rewritten in the form `CALL (...); CALL (...); ...` to send the batch in as few client-server round trips as possible.

C.6.1.9. Changes in MySQL Connector/J 5.1.0 (11 April 2007)

This is the first public alpha release of the current Connector/J 5.1 development branch, providing an insight to upcoming features. Although some of these are still under development, this release includes the following new features and changes (in comparison to the current Connector/J 5.0 production release):

Important change: Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

Note

The disabling of server-side prepared statements does not affect the operation of the connector. However, if you use the `useTimezone=true` connection option and use client-side prepared statements (instead of server-side prepared statements) you should also set `useSSPSCompatibleTimezoneShift=true`.

Functionality added or changed:

- Refactored `CommunicationsException` into a JDBC-3.0 version, and a JDBC-4.0 version (which extends `SQLRecoverableException`, now that it exists).

Note

This change means that if you were catching `com.mysql.jdbc.CommunicationsException` in your applications instead of looking at the `SQLState` class of `08`, and are moving to Java 6 (or newer), you need to change your imports to that exception to be `com.mysql.jdbc.exceptions.jdbc4.CommunicationsException`, as the old class will not be instantiated for communications link-related errors under Java 6.

- Added support for JDBC-4.0 categorized `SQLExceptions`.
- Added support for JDBC-4.0's `NCLOB`, and `NCHAR/NVARCHAR` types.
- `com.mysql.jdbc.java6.javac` — full path to your Java-6 `javac` executable
- Added support for JDBC-4.0's `SQLXML` interfaces.
- Re-worked Ant buildfile to build JDBC-4.0 classes separately, as well as support building under Eclipse (since Eclipse can't mix/match JDKs).

To build, you must set `JAVA_HOME` to J2SDK-1.4.2 or Java-5, and set the following properties on your Ant command line:

- `com.mysql.jdbc.java6.javac` — full path to your Java-6 `javac` executable

- `com.mysql.jdbc.java6.rt.jar` — full path to your Java-6 `rt.jar` file
- New feature — driver will automatically adjust session variable `net_write_timeout` when it determines it has been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (configuration property is named `netTimeoutForStreamingResults` value and has a unit of seconds, the value 0 means the driver will not try and adjust this value).
- Added support for JDBC-4.0's client information. The backend storage of information provided via `Connection.setClientInfo()` and retrieved by `Connection.getClientInfo()` is pluggable by any class that implements the `com.mysql.jdbc.JDBC4ClientInfoProvider` interface and has a no-args constructor.

The implementation used by the driver is configured using the `clientInfoProvider` configuration property (with a default of value of `com.mysql.jdbc.JDBC4CommentClientInfoProvider`, an implementation which lists the client information as a comment prepended to every query sent to the server).

This functionality is only available when using Java-6 or newer.

- `com.mysql.jdbc.java6.rt.jar` — full path to your Java-6 `rt.jar` file
- Added support for JDBC-4.0's `Wrapper` interface.

C.6.2. Changes in MySQL Connector/J 5.0.x

C.6.2.1. Changes in MySQL Connector/J 5.0.8 (09 October 2007)

Functionality added or changed:

- `blobsAreStrings` — Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- Added two configuration parameters:
 - `blobsAreStrings` — Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
 - `functionsNeverReturnBlobs` — Should the driver always treat data from functions returning BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- `functionsNeverReturnBlobs` — Should the driver always treat data from functions returning BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- XAConnections now start in auto-commit mode (as per JDBC-4.0 specification clarification).
- Driver will now fall back to sane defaults for `max_allowed_packet` and `net_buffer_length` if the server reports them incorrectly (and will log this situation at `WARN` level, since it is actually an error condition).

Bugs fixed:

- Connections established using URLs of the form `jdbc:mysql:loadbalance://` weren't doing failover if they tried to connect to a MySQL server that was down. The driver now attempts connections to the next "best" (depending on the load balance strategy in use) server, and continues to attempt connecting to the next "best" server every 250 milliseconds until one is found that is up and running or 5 minutes has passed.
If the driver gives up, it will throw the last-received `SQLException`. (Bug#31053)
- `setObject(int, Object, int, int)` delegate in `PreparedStatementWrapper` delegates to wrong method. (Bug#30892)
- NPE with null column values when `padCharsWithSpace` is set to true. (Bug#30851)
- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from subqueries and functions were indistinguishable from each other, leading to type-related bugs. (Bug#30664)
- An `ArithmeticException` or `NullPointerException` would be raised when the batch had zero members and `rewriteBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immedi-

ately after `clearBatch()`. (Bug#30550)

- Closing a load-balanced connection would cause a `ClassCastException`. (Bug#29852)
- Connection checker for JBoss didn't use same method parameters via reflection, causing connections to always seem "bad". (Bug#29106)
- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3-5.0.5 and 65 for versions newer than 5.0.5. (Bug#28972)
- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.

The fix involves changing the behavior of `noAccessToProcedureBodies`, in that the driver will now report all parameters as "IN" parameters but allow callers to call `registerOutParameter()` on them without throwing an exception. (Bug#28689)

- When a connection is in read-only mode, queries that are wrapped in parentheses were incorrectly identified DML statements. (Bug#28256)
- `UNSIGNED` types not reported via `DBMD.getTypeInfo()`, and capitalization of type names is not consistent between `DBMD.getColumns()`, `RSMMD.getColumnTypeName()` and `DBMD.getTypeInfo()`.

This fix also ensures that the precision of `UNSIGNED MEDIUMINT` and `UNSIGNED BIGINT` is reported correctly via `DBMD.getColumns()`. (Bug#27916)

- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. (Bug#27915)
- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. (Bug#27867)
- Cached metadata with `PreparedStatement.execute()` throws `NullPointerException`. (Bug#27412)
- `Connection.getServerCharacterEncoding()` doesn't work for servers with version ≥ 4.1 . (Bug#27182)
- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. (Bug#21116)
- Specifying a "validation query" in your connection pool that starts with `"/ * ping * /"` _exactly_ will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and when using a `ReplicationConnection` or a `LoadBalancedConnection`, will send the ping across all active connections.

C.6.2.2. Changes in MySQL Connector/J 5.0.7 (20 July 2007)

Functionality added or changed:

- The driver will now automatically set `useServerPrepStmts` to `true` when `useCursorFetch` has been set to `true`, since the feature requires server-side prepared statements in order to function.
- `tcpKeepAlive` - Should the driver set `SO_KEEPALIVE` (default `true`)?
- Give more information in `EOFExceptions` thrown out of `MysqlIO` (how many bytes the driver expected to read, how many it actually read, say that communications with the server were unexpectedly lost).
- Driver detects when it is running in a ColdFusion MX server (tested with version 7), and uses the configuration bundle `cold-Fusion`, which sets `useDynamicCharsetInfo` to `false` (see previous entry), and sets `useLocalSessionState` and `autoReconnect` to `true`.
- `tcpNoDelay` - Should the driver set `SO_TCP_NODELAY` (disabling the Nagle Algorithm, default `true`)?
- Added configuration property `slowQueryThresholdNanos` - if `useNanosForElapsedTime` is set to `true`, and this property is set to a nonzero value the driver will use this threshold (in nanosecond units) to determine if a query was slow, instead of using millisecond units.
- `tcpRcvBuf` - Should the driver set `SO_RCV_BUF` to the given value? The default value of '0', means use the platform default value for this property.
- Setting `useDynamicCharsetInfo` to `false` now causes driver to use static lookups for collations as well (makes `ResultSetMetadata.isCaseSensitive()` much more efficient, which leads to performance increase for ColdFusion, which calls this method for every column on every table it sees, it appears).

- Added configuration properties to allow tuning of TCP/IP socket parameters:
 - `tcpNoDelay` - Should the driver set `SO_TCP_NODELAY` (disabling the Nagle Algorithm, default `true`)?
 - `tcpKeepAlive` - Should the driver set `SO_KEEPALIVE` (default `true`)?
 - `tcpRcvBuf` - Should the driver set `SO_RCV_BUF` to the given value? The default value of '0', means use the platform default value for this property.
 - `tcpSndBuf` - Should the driver set `SO_SND_BUF` to the given value? The default value of '0', means use the platform default value for this property.
 - `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for `java.net.Socket.setTrafficClass()` for more information.
- Setting the configuration parameter `useCursorFetch` to `true` for MySQL-5.0+ enables the use of cursors that allow Connector/J to save memory by fetching result set rows in chunks (where the chunk size is set by calling `setFetchSize()` on a Statement or ResultSet) by using fully-materialized cursors on the server.
- `tcpSndBuf` - Should the driver set `SO_SND_BUF` to the given value? The default value of '0', means use the platform default value for this property.
- `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for `java.net.Socket.setTrafficClass()` for more information.
- Added new debugging functionality - Setting configuration property `includeInnodbStatusInDeadlockExceptions` to `true` will cause the driver to append the output of `SHOW ENGINE INNODB STATUS` to deadlock-related exceptions, which will enumerate the current locks held inside InnoDB.
- Added configuration property `useNanosForElapsedTime` - for profiling/debugging functionality that measures elapsed time, should the driver try to use nanoseconds resolution if available (requires JDK \geq 1.5)?

Note

If `useNanosForElapsedTime` is set to `true`, and this property is set to "0" (or left default), then elapsed times will still be measured in nanoseconds (if possible), but the slow query threshold will be converted from milliseconds to nanoseconds, and thus have an upper bound of approximately 2000 milliseconds (as that threshold is represented as an integer, not a long).

Bugs fixed:

- Don't send any file data in response to `LOAD DATA LOCAL INFILE` if the feature is disabled at the client side. This is to prevent a malicious server or man-in-the-middle from asking the client for data that the client is not expecting. Thanks to Jan Kneschke for discovering the exploit and Andrey "Poohie" Hristov, Konstantin Osipov and Sergei Golubchik for discussions about implications and possible fixes. ([Bug#29605](#))
- Parser in client-side prepared statements runs to end of statement, rather than end-of-line for '#' comments. Also added support for '--' single-line comments. ([Bug#28956](#))
- Parser in client-side prepared statements eats character following '/' if it is not a multi-line comment. ([Bug#28851](#))
- `PreparedStatement.getMetaData()` for statements containing leading one-line comments is not returned correctly.

As part of this fix, we also overhauled detection of DML for `executeQuery()` and `SELECT`s for `executeUpdate()` in plain and prepared statements to be aware of the same types of comments. ([Bug#28469](#))

C.6.2.3. Changes in MySQL Connector/J 5.0.6 (15 May 2007)

Functionality added or changed:

- Added an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment (This is not for master-slave replication. For that, we suggest you look at [ReplicationConnection](#) or `lbpool`).

If the JDBC URL starts with `jdbc:mysql:loadbalance://host-1,host-2,...host-n`, the driver will create an implementation of `java.sql.Connection` that load balances requests across a series of MySQL JDBC connections to the given hosts, where the balancing takes place after transaction commit.

Therefore, for this to work (at all), you must use transactions, even if only reading data.

Physical connections to the given hosts will not be created until needed.

The driver will invalidate connections that it detects have had communication errors when processing a request. A new connection to the problematic host will be attempted the next time it is selected by the load balancing algorithm.

There are two choices for load balancing algorithms, which may be specified by the `loadBalanceStrategy` JDBC URL configuration property:

- `random` — the driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.
- `bestResponseTime` — the driver will route the request to the host that had the best response time for the previous transaction.
- `bestResponseTime` — the driver will route the request to the host that had the best response time for the previous transaction.
- Added configuration property `padCharsWithSpace` (defaults to `false`). If set to `true`, and a result set column has the `CHAR` type and the value does not fill the amount of characters specified in the DDL for the column, the driver will pad the remaining characters with space (for ANSI compliance).
- When `useLocalSessionState` is set to `true` and connected to a MySQL-5.0 or later server, the JDBC driver will now determine whether an actual `commit` or `rollback` statement needs to be sent to the database when `Connection.commit()` or `Connection.rollback()` is called.

This is especially helpful for high-load situations with connection pools that always call `Connection.rollback()` on connection check-in/check-out because it avoids a round-trip to the server.

- Added configuration property `useDynamicCharsetInfo`. If set to `false` (the default), the driver will use a per-connection cache of character set information queried from the server when necessary, or when set to `true`, use a built-in static mapping that is more efficient, but isn't aware of custom character sets or character sets implemented after the release of the JDBC driver.

Note

This only affects the `padCharsWithSpace` configuration property and the `ResultSetMetaData.getColumnDisplayWidth()` method.

- New configuration property, `enableQueryTimeouts` (default `true`).

When enabled, query timeouts set via `Statement.setQueryTimeout()` use a shared `java.util.Timer` instance for scheduling. Even if the timeout doesn't expire before the query is processed, there will be memory used by the `TimerTask` for the given timeout which won't be reclaimed until the time the timeout would have expired if it hadn't been cancelled by the driver. High-load environments might want to consider disabling this functionality. (this configuration property is part of the `maxPerformance` configuration bundle).

- Give better error message when "streaming" result sets, and the connection gets clobbered because of exceeding `net_write_timeout` on the server.
- `random` — the driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.
- `com.mysql.jdbc.[NonRegistering]Driver` now understands URLs of the format `jdbc:mysql:replication://` and `jdbc:mysql:loadbalance://` which will create a `ReplicationConnection` (exactly like when using `[NonRegistering]ReplicationDriver`) and an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment, respectively.

In an effort to simplify things, we're working on deprecating multiple drivers, and instead specifying different core behavior based upon JDBC URL prefixes, so watch for `[NonRegistering]ReplicationDriver` to eventually disappear, to be replaced with `com.mysql.jdbc.[NonRegistering]Driver` with the new URL prefix.

- Fixed issue where a failed-over connection would let an application call `setReadOnly(false)`, when that call should be ignored until the connection is reconnected to a writable master unless `failoverReadOnly` had been set to `false`.
- Driver will now use `INSERT INTO ... VALUES (DEFAULT)` form of statement for updatable result sets for `ResultSet.insertRow()`, rather than pre-populating the insert row with values from

(which results in a `SHOW FULL COLUMNS` on the server for every result set). If an application requires access to the default values before `insertRow()` has been called, the JDBC URL should be configured with `populateInsertRowWithDefaultValues` set to `true`.

This fix specifically targets performance issues with ColdFusion and the fact that it seems to ask for updatable result sets no matter what the application does with them.

- More intelligent initial packet sizes for the "shared" packets are used (512 bytes, rather than 16K), and initial packets used during handshake are now sized appropriately as to not require reallocation.

Bugs fixed:

- More useful error messages are generated when the driver thinks a result set is not updatable. (Thanks to Ashley Martens for the patch). ([Bug#28085](#))
- `Connection.getTransactionIsolation()` uses "`SHOW VARIABLES LIKE`" which is very inefficient on MySQL-5.0+ servers. ([Bug#27655](#))
- Fixed issue where calling `getGeneratedKeys()` on a prepared statement after calling `execute()` didn't always return the generated keys (`executeUpdate()` worked fine however). ([Bug#27655](#))
- `CALL /* ... */ some_proc()` doesn't work. As a side effect of this fix, you can now use `/* */` and `#` comments when preparing statements using client-side prepared statement emulation.

If the comments happen to contain parameter markers (?), they will be treated as belonging to the comment (that is, not recognized) rather than being a parameter of the statement.

Note

The statement when sent to the server will contain the comments as-is, they're not stripped during the process of preparing the `PreparedStatement` or `CallableStatement`.

([Bug#27400](#))

- `ResultSet.get*()` with a column index < 1 returns misleading error message. ([Bug#27317](#))
- Using `ResultSet.get*()` with a column index less than 1 returns a misleading error message. ([Bug#27317](#))
- Comments in DDL of stored procedures/functions confuse procedure parser, and thus metadata about them can not be created, leading to inability to retrieve said metadata, or execute procedures that have certain comments in them. ([Bug#26959](#))
- Fast date/time parsing doesn't take into account `00:00:00` as a legal value. ([Bug#26789](#))
- `PreparedStatement` is not closed in `BlobFromLocator.getBytes()`. ([Bug#26592](#))
- When the configuration property `useCursorFetch` was set to `true`, sometimes server would return new, more exact metadata during the execution of the server-side prepared statement that enables this functionality, which the driver ignored (using the original metadata returned during `prepare()`), causing corrupt reading of data due to type mismatch when the actual rows were returned. ([Bug#26173](#))
- `CallableStatements` with `OUT/INOUT` parameters that are "binary" (`BLOB`, `BIT`, `(VAR) BINARY`, `JAVA_OBJECT`) have extra 7 bytes. ([Bug#25715](#))
- Whitespace surrounding storage/size specifiers in stored procedure parameters declaration causes `NumberFormatException` to be thrown when calling stored procedure on JDK-1.5 or newer, as the Number classes in JDK-1.5+ are whitespace intolerant. ([Bug#25624](#))
- Client options not sent correctly when using SSL, leading to stored procedures not being able to return results. Thanks to Don Cohen for the bug report, testcase and patch. ([Bug#25545](#))
- `Statement.setMaxRows()` is not effective on result sets materialized from cursors. ([Bug#25517](#))
- `BIT(> 1)` is returned as `java.lang.String` from `ResultSet.getObject()` rather than `byte[]`. ([Bug#25328](#))

C.6.2.4. Changes in MySQL Connector/J 5.0.5 (02 March 2007)

Functionality added or changed:

- Usage Advisor will now issue warnings for result sets with large numbers of rows. You can configure the trigger value by using the `resultSetSizeThreshold` parameter, which has a default value of 100.
- The `rewriteBatchedStatements` feature can now be used with server-side prepared statements.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

- Improved speed of `datetime` parsing for ResultSets that come from plain or non-server-side prepared statements. You can enable old implementation with `useFastDateParsing=false` as a configuration parameter.
- Usage Advisor now detects empty results sets and does not report on columns not referenced in those empty sets.
- Fixed logging of XA commands sent to server, it is now configurable via `logXaCommands` property (defaults to `false`).
- Added configuration property `localSocketAddress`, which is the host name or IP address given to explicitly configure the interface that the driver will bind the client side of the TCP/IP connection to when connecting.
- We've added a new configuration option `treatUtilDateAsTimestamp`, which is `false` by default, as (1) We already had specific behavior to treat `java.util.Date` as a `java.sql.Timestamp` because it is useful to many folks, and (2) that behavior will very likely be required for drivers JDBC-post-4.0.

Bugs fixed:

- Connection property `socketFactory` wasn't exposed via correctly named mutator/accessor, causing data source implementations that use JavaBean naming conventions to set properties to fail to set the property (and in the case of SJAS, fail silently when trying to set this parameter). (Bug#26326)
- A query execution which timed out did not always throw a `MySQLTimeoutException`. (Bug#25836)
- Storing a `java.util.Date` object in a `BLOB` column would not be serialized correctly during `setObject`. (Bug#25787)
- Timer instance used for `Statement.setQueryTimeout()` created per-connection, rather than per-VM, causing memory leak. (Bug#25514)
- `EscapeProcessor` gets confused by multiple backslashes. We now push the responsibility of syntax errors back on to the server for most escape sequences. (Bug#25399)
- `INOUT` parameters in `CallableStatements` get doubly-escaped. (Bug#25379)
- When using the `rewriteBatchedStatements` connection option with `PreparedStatement.executeBatch()` an internal memory leak would occur. (Bug#25073)
- Fixed issue where field-level for metadata from `DatabaseMetaData` when using `INFORMATION_SCHEMA` didn't have references to current connections, sometimes leading to Null Pointer Exceptions (NPEs) when introspecting them via `ResultSetMetaData`. (Bug#25073)
- `StringUtils.indexOfIgnoreCaseRespectQuotes()` isn't case-insensitive on the first character of the target. This bug also affected `rewriteBatchedStatements` functionality when prepared statements did not use uppercase for the `VALUES` clause. (Bug#25047)
- Client-side prepared statement parser gets confused by in-line comments `/*...*/` and therefore cannot rewrite batch statements or reliably detect the type of statements when they are used. (Bug#25025)
- Results sets from `UPDATE` statements that are part of multi-statement queries would cause an `SQLException` error, "Result is from UPDATE". (Bug#25009)
- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly. (Bug#24840)
- Using `DatabaseMetaData.getSQLKeywords()` does not return a all of the of the reserved keywords for the current MySQL version. Current implementation returns the list of reserved words for MySQL 5.1, and does not distinguish between versions. (Bug#24794)

- Calling `Statement.cancel()` could result in a Null Pointer Exception (NPE). (Bug#24721)
- Using `setFetchSize()` breaks prepared `SHOW` and other commands. (Bug#24360)
- Calendars and timezones are now lazily instantiated when required. (Bug#24351)
- Using `DATETIME` columns would result in time shifts when `useServerPrepStmts` was true. The reason was due to different behavior when using client-side compared to server-side prepared statements and the `useJDBCCompliantTimezoneShift` option. This is now fixed if moving from server-side prepared statements to client-side prepared statements by setting `useSSPSCompatibleTimezoneShift` to `true`, as the driver can't tell if this is a new deployment that never used server-side prepared statements, or if it is an existing deployment that is switching to client-side prepared statements from server-side prepared statements. (Bug#24344)
- Connector/J now returns a better error message when server doesn't return enough information to determine stored procedure/function parameter types. (Bug#24065)
- A connection error would occur when connecting to a MySQL server with certain character sets. Some collations/character sets reported as "unknown" (specifically `cias` variants of existing character sets), and inability to override the detected server character set. (Bug#23645)
- Inconsistency between `getSchemas` and `INFORMATION_SCHEMA`. (Bug#23304)
- `DatabaseMetaData.getSchemas()` doesn't return a `TABLE_CATALOG` column. (Bug#23303)
- When using a JDBC connection URL that is malformed, the `NonRegisteringDriver.getPropertyInfo` method will throw a Null Pointer Exception (NPE). (Bug#22628)
- Some exceptions thrown out of `StandardSocketFactory` were needlessly wrapped, obscuring their true cause, especially when using socket timeouts. (Bug#21480)
- When using a server-side prepared statement the driver would send timestamps to the server using nanoseconds instead of milliseconds. (Bug#21438)
- When using server-side prepared statements and timestamp columns, value would be incorrectly populated (with nanoseconds, not microseconds). (Bug#21438)
- `ParameterMetaData` throws `NullPointerException` when prepared SQL has a syntax error. Added `generateSimpleParameterMetadata` configuration property, which when set to `true` will generate metadata reflecting `VARCHAR` for every parameter (the default is `false`, which will cause an exception to be thrown if no parameter metadata for the statement is actually available). (Bug#21267)
- Fixed an issue where `XADataSources` couldn't be bound into JNDI, as the `DataSourceFactory` didn't know how to create instances of them.

Other changes:

- Avoid static synchronized code in JVM class libraries for dealing with default timezones.
- Performance enhancement of initial character set configuration, driver will only send commands required to configure connection character set session variables if the current values on the server do not match what is required.
- Re-worked stored procedure parameter parser to be more robust. Driver no longer requires `BEGIN` in stored procedure definition, but does have requirement that if a stored function begins with a label directly after the "returns" clause, that the label is not a quoted identifier.
- Throw exceptions encountered during timeout to thread calling `Statement.execute*()`, rather than `RuntimeException`.
- Changed cached result set metadata (when using `cacheResultSetMetadata=true`) to be cached per-connection rather than per-statement as previously implemented.
- Reverted back to internal character conversion routines for single-byte character sets, as the ones internal to the JVM are using much more CPU time than our internal implementation.
- When extracting foreign key information from `SHOW CREATE TABLE` in `DatabaseMetaData`, ignore exceptions relating to tables being missing (which could happen for cross-reference or imported-key requests, as the list of tables is generated first, then iterated).
- Fixed some Null Pointer Exceptions (NPEs) when cached metadata was used with `UpdatableResultSets`.

- Take `localSocketAddress` property into account when creating instances of `CommunicationsException` when the underlying exception is a `java.net.BindException`, so that a friendlier error message is given with a little internal diagnostics.
- Fixed cases where `ServerPreparedStatement` weren't using cached metadata when `cacheResultSetMetadata=true` was used.
- Use a `java.util.TreeMap` to map column names to ordinal indexes for `ResultSet.findColumn()` instead of a `HashMap`. This allows us to have case-insensitive lookups (required by the JDBC specification) without resorting to the many transient object instances needed to support this requirement with a normal `HashMap` with either case-adjusted keys, or case-insensitive keys. (In the worst case scenario for lookups of a 1000 column result set, `TreeMaps` are about half as fast wall-clock time as a `HashMap`, however in normal applications their use gives many orders of magnitude reduction in transient object instance creation which pays off later for CPU usage in garbage collection).
- When using cached metadata, skip field-level metadata packets coming from the server, rather than reading them and discarding them without creating `com.mysql.jdbc.Field` instances.

C.6.2.5. Changes in MySQL Connector/J 5.0.4 (20 October 2006)

Bugs fixed:

- `DBMD.getColumns()` does not return expected `COLUMN_SIZE` for the SET type, now returns length of largest possible set disregarding whitespace or the "," delimiters to be consistent with the ODBC driver. (Bug#22613)
- Added new `_ci` collations to `CharsetMapping` - `utf8_unicode_ci` not working. (Bug#22456)
- Driver was using milliseconds for `Statement.setQueryTimeout()` when specification says argument is to be in seconds. (Bug#22359)
- Workaround for server crash when calling stored procedures via a server-side prepared statement (driver now detects prepare(stored procedure) and substitutes client-side prepared statement). (Bug#22297)
- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). (Bug#22290)
- Newlines causing whitespace to span confuse procedure parser when getting parameter metadata for stored procedures. (Bug#22024)
- When using `information_schema` for metadata, `COLUMN_SIZE` for `getColumns()` is not clamped to range of `java.lang.Integer` as is the case when not using `information_schema`, thus leading to a truncation exception that isn't present when not using `information_schema`. (Bug#21544)
- Column names don't match metadata in cases where server doesn't return original column names (column functions) thus breaking compatibility with applications that expect 1-1 mappings between `findColumn()` and `rsmd.getColumnname()`, usually manifests itself as "Can't find column ()" exceptions. (Bug#21379)
- Driver now sends numeric 1 or 0 for client-prepared statement `setBoolean()` calls instead of '1' or '0'.
- Fixed configuration property `jdbcCompliantTruncation` was not being used for reads of result set values.
- `DatabaseMetaData` correctly reports `true` for `supportsCatalog*` methods.
- Driver now supports `{call sp}` (without "()") if procedure has no arguments.

C.6.2.6. Changes in MySQL Connector/J 5.0.3 (26 July 2006 beta)

Functionality added or changed:

- Added configuration option `noAccessToProcedureBodies` which will cause the driver to create basic parameter metadata for `CallableStatements` when the user does not have access to procedure bodies via `SHOW CREATE PROCEDURE` or selecting from `mysql.proc` instead of throwing an exception. The default value for this option is `false`

Bugs fixed:

- Fixed `Statement.cancel()` causes `NullPointerException` if underlying connection has been closed due to server

failure. ([Bug#20650](#))

- If the connection to the server has been closed due to a server failure, then the cleanup process will call `Statement.cancel()`, triggering a `NullPointerException`, even though there is no active connection. ([Bug#20650](#))

C.6.2.7. Changes in MySQL Connector/J 5.0.2 (11 July 2006)

Bugs fixed:

- `MysqlXaConnection.recover(int flags)` now allows combinations of `XAResource.TMSTARTRSCAN` and `TMENDRSCAN`. To simulate the “scanning” nature of the interface, we return all prepared XIDs for `TMSTARTRSCAN`, and no new XIDs for calls with `TMNOFLAGS`, or `TMENDRSCAN` when not in combination with `TMSTARTRSCAN`. This change was made for API compliance, as well as integration with IBM WebSphere's transaction manager. ([Bug#20242](#))
- Fixed `MysqlValidConnectionChecker` for JBoss doesn't work with `MySQLXADataSources`. ([Bug#20242](#))
- Added connection/datasource property `pinGlobalTxToPhysicalConnection` (defaults to `false`). When set to `true`, when using `XAConnections`, the driver ensures that operations on a given XID are always routed to the same physical connection. This allows the `XAConnection` to support `XA START ... JOIN` after `XA END` has been called, and is also a workaround for transaction managers that don't maintain thread affinity for a global transaction (most either always maintain thread affinity, or have it as a configuration option). ([Bug#20242](#))
- Better caching of character set converters (per-connection) to remove a bottleneck for multibyte character sets. ([Bug#20242](#))
- Fixed `ConnectionProperties` (and thus some subclasses) are not serializable, even though some J2EE containers expect them to be. ([Bug#19169](#))
- Fixed driver fails on non-ASCII platforms. The driver was assuming that the platform character set would be a superset of MySQL's `latin1` when doing the handshake for authentication, and when reading error messages. We now use `Cp1252` for all strings sent to the server during the handshake phase, and a hard-coded mapping of the `language` system variable to the character set that is used for error messages. ([Bug#18086](#))
- Fixed can't use `XAConnection` for local transactions when no global transaction is in progress. ([Bug#17401](#))

C.6.2.8. Changes in MySQL Connector/J 5.0.1 (Not Released)

Not released due to a packaging error

C.6.2.9. Changes in MySQL Connector/J 5.0.0 (22 December 2005)

Bugs fixed:

- Added support for Connector/MXJ integration via url subprotocol `jdbc:mysql:mxj://...` ([Bug#14729](#))
- Idle timeouts cause `XAConnections` to whine about rolling themselves back. ([Bug#14729](#))
- When fix for [Bug#14562](#) was merged from 3.1.12, added functionality for `CallableStatement`'s parameter metadata to return correct information for `.getParameterClassName()`. ([Bug#14729](#))
- Added service-provider entry to `META-INF/services/java.sql.Driver` for JDBC-4.0 support. ([Bug#14729](#))
- Fuller synchronization of `Connection` to avoid deadlocks when using multithreaded frameworks that multithread a single connection (usually not recommended, but the JDBC spec allows it anyways), part of fix to [Bug#14972](#). ([Bug#14729](#))
- Moved all `SQLException` constructor usage to a factory in `SQLException` (ground-work for JDBC-4.0 `SQLState`-based exception classes). ([Bug#14729](#))
- Removed Java5-specific calls to `BigDecimal` constructor (when result set value is `'', (int)0` was being used as an argument indirectly via method return value. This signature doesn't exist prior to Java5.) ([Bug#14729](#))
- Implementation of `Statement.cancel()` and `Statement.setQueryTimeout()`. Both require MySQL-5.0.0 or newer server, require a separate connection to issue the `KILL QUERY` statement, and in the case of `setQueryTimeout()` creates an additional thread to handle the timeout functionality.

Note: Failures to cancel the statement for `setQueryTimeout()` may manifest themselves as `RuntimeExceptions` rather than failing silently, as there is currently no way to unblock the thread that is executing the query being cancelled due to

timeout expiration and have it throw the exception instead. ([Bug#14729](#))

- Return "[VAR]BINARY" for `RSMD.getColumnTypeName()` when that is actually the type, and it can be distinguished (MySQL-4.1 and newer). ([Bug#14729](#))
- Attempt detection of the MySQL type `BINARY` (it is an alias, so this isn't always reliable), and use the `java.sql.Types.BINARY` type mapping for it.
- Added unit tests for `XADataSource`, as well as friendlier exceptions for XA failures compared to the "stock" `XAException` (which has no messages).
- If the connection `useTimezone` is set to `true`, then also respect time zone conversions in escape-processed string literals (for example, "`{ts ...}`" and "`{t ...}`").
- Don't allow `.setAutoCommit(true)`, or `.commit()` or `.rollback()` on an XA-managed connection as per the JDBC specification.
- `XADataSource` implemented (ported from 3.2 branch which won't be released as a product). Use `com.mysql.jdbc.jdbc2.optional.MysqlXADataSource` as your datasource class name in your application server to utilize XA transactions in MySQL-5.0.10 and newer.
- Moved `-bin-g.jar` file into separate `debug` subdirectory to avoid confusion.
- Return original column name for `RSMD.getColumnLabel()` if the column was aliased, alias name for `.getColumnLabel()` (if aliased), and original table name for `.getTableName()`. Note this only works for MySQL-4.1 and newer, as older servers don't make this information available to clients.
- Setting `useJDBCCompliantTimezoneShift=true` (it is not the default) causes the driver to use GMT for *all* `TIMESTAMP/DATETIME` time zones, and the current VM time zone for any other type that refers to time zones. This feature can not be used when `useTimezone=true` to convert between server and client time zones.
- `PreparedStatement.setString()` didn't work correctly when `sql_mode` on server contained `NO_BACKSLASH_ESCAPES` and no characters that needed escaping were present in the string.
- Add one level of indirection of internal representation of `CallableStatement` parameter metadata to avoid class not found issues on JDK-1.3 for `ParameterMetadata` interface (which doesn't exist prior to JDBC-3.0).

C.6.3. Changes in MySQL Connector/J 3.1.x

C.6.3.1. Changes in MySQL Connector/J 3.1.15 (Not yet released)

Important change: Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

Bugs fixed:

- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly. ([Bug#24840](#))

C.6.3.2. Changes in MySQL Connector/J 3.1.14 (10-19-2006)

Bugs fixed:

- Check and store value for `continueBatchOnError` property in constructor of `Statements`, rather than when executing batches, so that Connections closed out from underneath statements don't cause `NullPointerExceptions` when it is required to check this property. ([Bug#22290](#))
- Fixed [Bug#18258](#) - `DatabaseMetaData.getTables()`, `columns()` with bad catalog parameter threw exception rather than return empty result set (as required by spec). ([Bug#22290](#))

- Driver now sends numeric 1 or 0 for client-prepared statement `setBoolean()` calls instead of '1' or '0'. ([Bug#22290](#))
- Fixed bug where driver would not advance to next host if `roundRobinLoadBalance=true` and the last host in the list is down. ([Bug#22290](#))
- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). ([Bug#22290](#))
- Fixed bug when calling stored functions, where parameters weren't numbered correctly (first parameter is now the return value, subsequent parameters if specified start at index "2"). ([Bug#22290](#))
- Removed logger autodetection altogether, must now specify logger explicitly if you want to use a logger other than one that logs to `STDERR`. ([Bug#21207](#))
- `DDriver` throws `NPE` when tracing prepared statements that have been closed (in `asSQL()`). ([Bug#21207](#))
- `ResultSet.getSomeInteger()` doesn't work for `BIT(>1)`. ([Bug#21062](#))
- Escape of quotes in client-side prepared statements parsing not respected. Patch covers more than bug report, including `NO_BACKSLASH_ESCAPES` being set, and stacked quote characters forms of escaping (that is, " or ""). ([Bug#20888](#))
- Fixed can't pool server-side prepared statements, exception raised when re-using them. ([Bug#20687](#))
- Fixed `Updatable` result set that contains a `BIT` column fails when server-side prepared statements are used. ([Bug#20485](#))
- Fixed `updatable` result set throws `ClassCastException` when there is row data and `moveToInsertRow()` is called. ([Bug#20479](#))
- Fixed `ResultSet.getShort()` for `UNSIGNED TINYINT` returns incorrect values when using server-side prepared statements. ([Bug#20306](#))
- `ReplicationDriver` does not always round-robin load balance depending on URL used for slaves list. ([Bug#19993](#))
- Fixed calling `toString()` on `ResultSetMetaData` for driver-generated (that is, from `DatabaseMetaData` method calls, or from `GeneratedKeys()`) result sets would raise a `NullPointerException`. ([Bug#19993](#))
- Connection fails to localhost when using timeout and IPv6 is configured. ([Bug#19726](#))
- `ResultSet.getFloatFromString()` can't retrieve values near `Float.MIN/MAX_VALUE`. ([Bug#18880](#))
- Fixed memory leak with `profileSQL=true`. ([Bug#16987](#))
- Fixed `NullPointerException` in `MysqlDataSourceFactory` due to `Reference` containing `RefAddr`s with null content. ([Bug#16791](#))

C.6.3.3. Changes in MySQL Connector/J 3.1.13 (26 May 2006)

Bugs fixed:

- Fixed `PreparedStatement.setObject(int, Object, int)` doesn't respect scale of `BigDecimal`s. ([Bug#19615](#))
- Fixed `ResultSet.isNull()` returns incorrect value when extracting native string from server-side prepared statement generated result set. ([Bug#19282](#))
- Fixed invalid classname returned for `ResultSetMetaData.getColumnClassName()` for `BIGINT` type. ([Bug#19282](#))
- Fixed case where driver wasn't reading server status correctly when fetching server-side prepared statement rows, which in some cases could cause warning counts to be off, or multiple result sets to not be read off the wire. ([Bug#19282](#))
- Fixed data truncation and `getWarnings()` only returns last warning in set. ([Bug#18740](#))
- Fixed aliased column names where length of name > 251 are corrupted. ([Bug#18554](#))
- Improved performance of retrieving `BigDecimal`, `Time`, `Timestamp` and `Date` values from server-side prepared statements by creating fewer short-lived instances of `Strings` when the native type is not an exact match for the requested type. ([Bug#18496](#))
- Added performance feature, re-writing of batched executes for `Statement.executeBatch()` (for all DML statements) and `PreparedStatement.executeBatch()` (for INSERTs with VALUE clauses only). Enable by using "rewrite-

BatchedStatements=true" in your JDBC URL. ([Bug#18041](#))

- Fixed issue where server-side prepared statements don't cause truncation exceptions to be thrown when truncation happens. ([Bug#18041](#))
- Fixed `CallableStatement.registerOutParameter()` not working when some parameters pre-populated. Still waiting for feedback from JDBC experts group to determine what correct parameter count from `getMetaData()` should be, however. ([Bug#17898](#))
- Fixed calling `clearParameters()` on a closed prepared statement causes NPE. ([Bug#17587](#))
- Map "latin1" on MySQL server to CP1252 for MySQL > 4.1.0. ([Bug#17587](#))
- Added additional accessor and mutator methods on `ConnectionProperties` so that `DataSource` users can use same naming as regular URL properties. ([Bug#17587](#))
- Fixed `ResultSet.wasNull()` not always reset correctly for booleans when done via conversion for server-side prepared statements. ([Bug#17450](#))
- Fixed `Statement.getGeneratedKeys()` throws `NullPointerException` when no query has been processed. ([Bug#17099](#))
- Fixed updatable result set doesn't return `AUTO_INCREMENT` values for `insertRow()` when multiple column primary keys are used. (the driver was checking for the existence of single-column primary keys and an autoincrement value > 0 instead of a straightforward `isAutoIncrement()` check). ([Bug#16841](#))
- `DBMD.getColumns()` returns wrong type for `BIT`. ([Bug#15854](#))
- `lib-nodist` directory missing from package breaks out-of-box build. ([Bug#15676](#))
- Fixed issue with `ReplicationConnection` incorrectly copying state, doesn't transfer connection context correctly when transitioning between the same read-only states. ([Bug#15570](#))
- No "dos" character set in MySQL > 4.1.0. ([Bug#15544](#))
- `INOUT` parameter does not store `IN` value. ([Bug#15464](#))
- `PreparedStatement.setObject()` serializes `BigInteger` as object, rather than sending as numeric value (and is thus not complementary to `getObject()` on an `UNSIGNED LONG` type). ([Bug#15383](#))
- Fixed issue where driver was unable to initialize character set mapping tables. Removed reliance on `.properties` files to hold this information, as it turns out to be too problematic to code around class loader hierarchies that change depending on how an application is deployed. Moved information back into the `CharsetMapping` class. ([Bug#14938](#))
- Exception thrown for new decimal type when using updatable result sets. ([Bug#14609](#))
- Driver now aware of fix for `BIT` type metadata that went into MySQL-5.0.21 for server not reporting length consistently. ([Bug#13601](#))
- Added support for Apache Commons logging, use "com.mysql.jdbc.log.CommonsLogger" as the value for the "logger" configuration property. ([Bug#13469](#))
- Fixed driver trying to call methods that don't exist on older and newer versions of Log4j. The fix is not trying to auto-detect presence of log4j, too many different incompatible versions out there in the wild to do this reliably.

If you relied on autodetection before, you will need to add "logger=com.mysql.jdbc.log.Log4JLogger" to your JDBC URL to enable Log4J usage, or alternatively use the new "CommonsLogger" class to take care of this. ([Bug#13469](#))
- `LogFactory` now prepends "com.mysql.jdbc.log" to log class name if it can't be found as-specified. This allows you to use "short names" for the built-in log factories, for example "logger=CommonsLogger" instead of "logger=com.mysql.jdbc.log.CommonsLogger". ([Bug#13469](#))
- `ResultSet.getShort()` for `UNSIGNED TINYINT` returned wrong values. ([Bug#11874](#))

C.6.3.4. Changes in MySQL Connector/J 3.1.12 (30 November 2005)

Bugs fixed:

- Process escape tokens in `Connection.prepareStatement(...)`. You can disable this behavior by setting the JDBC

- URL configuration property `processEscapeCodesForPrepStmts` to `false`. (Bug#15141)
- Usage advisor complains about unreferenced columns, even though they've been referenced. (Bug#15065)
- Driver incorrectly closes streams passed as arguments to `PreparedStatement`s. Reverts to legacy behavior by setting the JDBC configuration property `autoClosePstmtStreams` to `true` (also included in the 3-0-Compat configuration “bundle”). (Bug#15024)
- Deadlock while closing server-side prepared statements from multiple threads sharing one connection. (Bug#14972)
- Unable to initialize character set mapping tables (due to J2EE classloader differences). (Bug#14938)
- Escape processor replaces quote character in quoted string with string delimiter. (Bug#14909)
- `DatabaseMetaData.getColumns()` doesn't return `TABLE_NAME` correctly. (Bug#14815)
- `storesMixedCaseIdentifiers()` returns `false` (Bug#14562)
- `storesLowerCaseIdentifiers()` returns `true` (Bug#14562)
- `storesMixedCaseQuotedIdentifiers()` returns `false` (Bug#14562)
- `storesMixedCaseQuotedIdentifiers()` returns `true` (Bug#14562)
- If `lower_case_table_names=0` (on server):
 - `storesLowerCaseIdentifiers()` returns `false`
 - `storesLowerCaseQuotedIdentifiers()` returns `false`
 - `storesMixedCaseIdentifiers()` returns `true`
 - `storesMixedCaseQuotedIdentifiers()` returns `true`
 - `storesUpperCaseIdentifiers()` returns `false`
 - `storesUpperCaseQuotedIdentifiers()` returns `true`(Bug#14562)
- `storesUpperCaseIdentifiers()` returns `false` (Bug#14562)
- `storesUpperCaseQuotedIdentifiers()` returns `true` (Bug#14562)
- If `lower_case_table_names=1` (on server):
 - `storesLowerCaseIdentifiers()` returns `true`
 - `storesLowerCaseQuotedIdentifiers()` returns `true`
 - `storesMixedCaseIdentifiers()` returns `false`
 - `storesMixedCaseQuotedIdentifiers()` returns `false`
 - `storesUpperCaseIdentifiers()` returns `false`
 - `storesUpperCaseQuotedIdentifiers()` returns `true`(Bug#14562)
- `storesLowerCaseQuotedIdentifiers()` returns `true` (Bug#14562)
- Fixed `DatabaseMetaData.stores*Identifiers()`:
 - If `lower_case_table_names=0` (on server):
 - `storesLowerCaseIdentifiers()` returns `false`
 - `storesLowerCaseQuotedIdentifiers()` returns `false`
 - `storesMixedCaseIdentifiers()` returns `true`

- `storesMixedCaseQuotedIdentifiers()` returns `true`
 - `storesUpperCaseIdentifiers()` returns `false`
 - `storesUpperCaseQuotedIdentifiers()` returns `true`
 - If `lower_case_table_names=1` (on server):
 - `storesLowerCaseIdentifiers()` returns `true`
 - `storesLowerCaseQuotedIdentifiers()` returns `true`
 - `storesMixedCaseIdentifiers()` returns `false`
 - `storesMixedCaseQuotedIdentifiers()` returns `false`
 - `storesUpperCaseIdentifiers()` returns `false`
 - `storesUpperCaseQuotedIdentifiers()` returns `true`
- (Bug#14562)
- `storesMixedCaseIdentifiers()` returns `true` (Bug#14562)
 - `storesLowerCaseQuotedIdentifiers()` returns `false` (Bug#14562)
 - Java type conversion may be incorrect for `MEDIUMINT`. (Bug#14562)
 - `storesLowerCaseIdentifiers()` returns `false` (Bug#14562)
 - Added configuration property `useGmtMillisForDatetimes` which when set to `true` causes `ResultSet.getDate()`, `ResultSet.getTimestamp()` to return correct millis-since GMT when `ResultSet.getTime()` is called on the return value (currently default is `false` for legacy behavior). (Bug#14562)
 - Extraneous sleep on `autoReconnect`. (Bug#13775)
 - Reconnect during middle of `executeBatch()` should not occur if `autoReconnect` is enabled. (Bug#13255)
 - `maxQuerySizeToLog` is not respected. Added logging of bound values for `execute()` phase of server-side prepared statements when `profileSQL=true` as well. (Bug#13048)
 - OpenOffice expects `DBMD.supportsIntegrityEnhancementFacility()` to return `true` if foreign keys are supported by the datasource, even though this method also covers support for check constraints, which MySQL *doesn't* have. Setting the configuration property `overrideSupportsIntegrityEnhancementFacility` to `true` causes the driver to return `true` for this method. (Bug#12975)
 - Added `com.mysql.jdbc.testsuite.url.default` system property to set default JDBC url for testsuite (to speed up bug resolution when I'm working in Eclipse). (Bug#12975)
 - `logSlowQueries` should give better info. (Bug#12230)
 - Don't increase timeout for failover/reconnect. (Bug#6577)
 - Fixed client-side prepared statement bug with embedded `?` characters inside quoted identifiers (it was recognized as a placeholder, when it was not).
 - Don't allow `executeBatch()` for `CallableStatements` with registered `OUT/INOUT` parameters (JDBC compliance).
 - Fall back to platform-encoding for `URLDecoder.decode()` when parsing driver URL properties if the platform doesn't have a two-argument version of this method.

C.6.3.5. Changes in MySQL Connector/J 3.1.11 (07 October 2005)

Bugs fixed:

- The configuration property `sessionVariables` now allows you to specify variables that start with the "@" sign. (Bug#13453)

- URL configuration parameters don't allow "&" or "=" in their values. The JDBC driver now parses configuration parameters as if they are encoded using the application/x-www-form-urlencoded format as specified by `java.net.URLDecoder` (<http://java.sun.com/j2se/1.5.0/docs/api/java/net/URLDecoder.html>).
If the "%" character is present in a configuration property, it must now be represented as %25, which is the encoded form of "%" when using application/x-www-form-urlencoded encoding. (Bug#13453)
- Workaround for Bug#13374: `ResultSet.getStatement()` on closed result set returns `NULL` (as per JDBC 4.0 spec, but not backward-compatible). Set the connection property `retainStatementAfterResultSetClose` to `true` to be able to retrieve a `ResultSet`'s statement after the `ResultSet` has been closed via `.getStatement()` (the default is `false`, to be JDBC-compliant and to reduce the chance that code using JDBC leaks `Statement` instances). (Bug#13277)
- `ResultSetMetaData` from `Statement.getGeneratedKeys()` caused a `NullPointerException` to be thrown whenever a method that required a connection reference was called. (Bug#13277)
- Backport of `VAR[BINARY|CHAR] [BINARY]` types detection from 5.0 branch. (Bug#13277)
- Fixed `NullPointerException` when converting `catalog` parameter in many `DatabaseMetaDataMethods` to `byte[]`s (for the result set) when the parameter is `null`. (`null` isn't technically allowed by the JDBC specification, but we've historically allowed it). (Bug#13277)
- Backport of `Field` class, `ResultSetMetaData.getColumnClassName()`, and `ResultSet.getObject(int)` changes from 5.0 branch to fix behavior surrounding `VARCHAR BINARY/VARBINARY` and related types. (Bug#13277)
- Read response in `MySQLIO.sendFileToServer()`, even if the local file can't be opened, otherwise next query issued will fail, because it is reading the response to the empty `LOAD DATA INFILE` packet sent to the server. (Bug#13277)
- When `gatherPerfMetrics` is enabled for servers older than 4.1.0, a `NullPointerException` is thrown from the constructor of `ResultSet` if the query doesn't use any tables. (Bug#13043)
- `java.sql.Types.OTHER` returned for `BINARY` and `VARBINARY` columns when using `DatabaseMetaData.getColumns()`. (Bug#12970)
- `ServerPreparedStatement.getBinding()` now checks if the statement is closed before attempting to reference the list of parameter bindings, to avoid throwing a `NullPointerException`. (Bug#12970)
- Tokenizer for = in URL properties was causing `sessionVariables=...` to be parameterized incorrectly. (Bug#12753)
- `cp1251` incorrectly mapped to `win1251` for servers newer than 4.0.x. (Bug#12752)
- `getExportedKeys()` (Bug#12541)
- Specifying a catalog works as stated in the API docs. (Bug#12541)
- Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties. (Bug#12541)
- `getIndexInfo()` (Bug#12541)
- `getProcedures()` (and thus indirectly `getProcedureColumns()`) (Bug#12541)
- `getImportedKeys()` (Bug#12541)
- Specifying "" means "current" catalog, even though this isn't quite JDBC spec compliant, it is there for legacy users. (Bug#12541)
- `getCrossReference()` (Bug#12541)
- Added `Connection.isMasterConnection()` for clients to be able to determine if a multi-host master/slave connection is connected to the first host in the list. (Bug#12541)
- `getColumns()` (Bug#12541)
- Handling of catalog argument in `DatabaseMetaData.getIndexInfo()`, which also means changes to the following methods in `DatabaseMetaData`:
 - `getBestRowIdentifier()`
 - `getColumns()`
 - `getCrossReference()`

- `getExportedKeys()`
- `getImportedKeys()`
- `getIndexInfo()`
- `getPrimaryKeys()`
- `getProcedures()` (and thus indirectly `getProcedureColumns()`)
- `getTables()`

The `catalog` argument in all of these methods now behaves in the following way:

- Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties.
- Specifying `" "` means “current” catalog, even though this isn't quite JDBC spec compliant, it is there for legacy users.
- Specifying a catalog works as stated in the API docs.
- Made `Connection.clientPrepare()` available from “wrapped” connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances).

([Bug#12541](#))

- `getBestRowIdentifier()` ([Bug#12541](#))
- Made `Connection.clientPrepare()` available from “wrapped” connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances). ([Bug#12541](#))
- `getTables()` ([Bug#12541](#))
- `getPrimaryKeys()` ([Bug#12541](#))
- `Connection.prepareCall()` is database name case-sensitive (on Windows systems). ([Bug#12417](#))
- `explainSlowQueries` hangs with server-side prepared statements. ([Bug#12229](#))
- Properties shared between master and slave with replication connection. ([Bug#12218](#))
- Geometry types not handled with server-side prepared statements. ([Bug#12104](#))
- `maxPerformance.properties` mis-spells “`elideSetAutoCommits`”. ([Bug#11976](#))
- `ReplicationConnection` won't switch to slave, throws “Catalog can't be null” exception. ([Bug#11879](#))
- `Pstmt.setObject(..., Types.BOOLEAN)` throws exception. ([Bug#11798](#))
- Escape tokenizer doesn't respect stacked single quotes for escapes. ([Bug#11797](#))
- `GEOMETRY` type not recognized when using server-side prepared statements. ([Bug#11797](#))
- Foreign key information that is quoted is parsed incorrectly when `DatabaseMetaData` methods use that information. ([Bug#11781](#))
- The `sendBlobChunkSize` property is now clamped to `max_allowed_packet` with consideration of stream buffer size and packet headers to avoid `PacketTooBigExceptions` when `max_allowed_packet` is similar in size to the default `sendBlobChunkSize` which is 1M. ([Bug#11781](#))
- `CallableStatement.clearParameters()` now clears resources associated with `INOUT/OUTPUT` parameters as well as `INPUT` parameters. ([Bug#11781](#))
- Fixed regression caused by fix for [Bug#11552](#) that caused driver to return incorrect values for unsigned integers when those integers were within the range of the positive signed type. ([Bug#11663](#))
- Moved source code to Subversion repository. ([Bug#11663](#))
- Incorrect generation of testcase scripts for server-side prepared statements. ([Bug#11663](#))
- Fixed statements generated for testcases missing `;` for “plain” statements. ([Bug#11629](#))

- Spurious ! on console when character encoding is `utf8`. (Bug#11629)
- `StringUtils.getBytes()` doesn't work when using multi-byte character encodings and a length in *characters* is specified. (Bug#11614)
- `DBMD.storesLower/Mixed/UpperIdentifiers()` reports incorrect values for servers deployed on Windows. (Bug#11575)
- Reworked `Field` class, `*Buffer`, and `MysqlIO` to be aware of field lengths > `Integer.MAX_VALUE`. (Bug#11498)
- Escape processor didn't honor strings demarcated with double quotes. (Bug#11498)
- Updated `DBMD.supportsCorrelatedQueries()` to return `true` for versions > 4.1, `supportsGroupByUnrelated()` to return `true` and `getResultSetHoldability()` to return `HOLD_CURSORS_OVER_COMMIT`. (Bug#11498)
- Lifted restriction of changing streaming parameters with server-side prepared statements. As long as *all* streaming parameters were set before execution, `.clearParameters()` does not have to be called. (due to limitation of client/server protocol, prepared statements can not reset *individual* stream data on the server side). (Bug#11498)
- `ResultSet.moveToCurrentRow()` fails to work when preceded by a call to `ResultSet.moveToInsertRow()`. (Bug#11190)
- `VARBINARY` data corrupted when using server-side prepared statements and `.setBytes()`. (Bug#11115)
- `Statement.getWarnings()` fails with NPE if statement has been closed. (Bug#10630)
- Only get `char[]` from SQL in `PreparedStatement.ParseInfo()` when needed. (Bug#10630)

C.6.3.6. Changes in MySQL Connector/J 3.1.10 (23 June 2005)

Bugs fixed:

- Initial implementation of `ParameterMetadata` for `PreparedStatement.getParameterMetadata()`. Only works fully for `CallableStatements`, as current server-side prepared statements return every parameter as a `VARCHAR` type.
- Fixed connecting without a database specified raised an exception in `MysqlIO.changeDatabaseTo()`.

C.6.3.7. Changes in MySQL Connector/J 3.1.9 (22 June 2005)

Bugs fixed:

- Production package doesn't include JBoss integration classes. (Bug#11411)
- Removed nonsensical “costly type conversion” warnings when using usage advisor. (Bug#11411)
- Fixed `PreparedStatement.setClob()` not accepting `null` as a parameter. (Bug#11360)
- Connector/J dumping query into `SQLException` twice. (Bug#11360)
- `autoReconnect` ping causes exception on connection startup. (Bug#11259)
- `Connection.setCatalog()` is now aware of the `useLocalSessionState` configuration property, which when set to `true` will prevent the driver from sending `USE ...` to the server if the requested catalog is the same as the current catalog. (Bug#11115)
- `3-0-Compat` — Compatibility with Connector/J 3.0.x functionality (Bug#11115)
- `maxPerformance` — maximum performance without being reckless (Bug#11115)
- `solarisMaxPerformance` — maximum performance for Solaris, avoids syscalls where it can (Bug#11115)
- Added `maintainTimeStats` configuration property (defaults to `true`), which tells the driver whether or not to keep track of the last query time and the last successful packet sent to the server's time. If set to `false`, removes two syscalls per query. (Bug#11115)
- `VARBINARY` data corrupted when using server-side prepared statements and `ResultSet.getBytes()`. (Bug#11115)

- Added the following configuration bundles, use one or many via the `useConfigs` configuration property:
 - `maxPerformance` — maximum performance without being reckless
 - `solarisMaxPerformance` — maximum performance for Solaris, avoids syscalls where it can
 - `3-0-Compat` — Compatibility with Connector/J 3.0.x functionality([Bug#11115](#))
- Try to handle `OutOfMemoryErrors` more gracefully. Although not much can be done, they will in most cases close the connection they happened on so that further operations don't run into a connection in some unknown state. When an OOM has happened, any further operations on the connection will fail with a "Connection closed" exception that will also list the OOM exception as the reason for the implicit connection close event. ([Bug#10850](#))
- Setting `cachePrepStmts=true` now causes the `Connection` to also cache the check the driver performs to determine if a prepared statement can be server-side or not, as well as caches server-side prepared statements for the lifetime of a connection. As before, the `prepStmtCacheSize` parameter controls the size of these caches. ([Bug#10850](#))
- Don't send `COM_RESET_STMT` for each execution of a server-side prepared statement if it isn't required. ([Bug#10850](#))
- 0-length streams not sent to server when using server-side prepared statements. ([Bug#10850](#))
- Driver detects if you're running MySQL-5.0.7 or later, and does not scan for `LIMIT ?[, ?]` in statements being prepared, as the server supports those types of queries now. ([Bug#10850](#))
- Reorganized directory layout. Sources now are in `src` folder. Don't pollute parent directory when building, now output goes to `./build`, distribution goes to `./dist`. ([Bug#10496](#))
- Added support/bug hunting feature that generates `.sql` test scripts to `STDERR` when `autoGenerateTestcaseScript` is set to `true`. ([Bug#10496](#))
- `SQLException` is thrown when using property `characterSetResults` with `cp932` or `eucljms`. ([Bug#10496](#))
- The datatype returned for `TINYINT(1)` columns when `tinyIntIsBit=true` (the default) can be switched between `Types.BOOLEAN` and `Types.BIT` using the new configuration property `transformedBitIsBoolean`, which defaults to `false`. If set to `false` (the default), `DatabaseMetaData.getColumns()` and `ResultSetMetaData.getColumnType()` will return `Types.BOOLEAN` for `TINYINT(1)` columns. If `true`, `Types.BOOLEAN` will be returned instead. Regardless of this configuration property, if `tinyIntIsBit` is enabled, columns with the type `TINYINT(1)` will be returned as `java.lang.Boolean` instances from `ResultSet.getObject(...)`, and `ResultSetMetaData.getColumnClassName()` will return `java.lang.Boolean`. ([Bug#10485](#))
- `SQLException` thrown when retrieving `YEAR(2)` with `ResultSet.getString()`. The driver will now always treat `YEAR` types as `java.sql.Date`s and return the correct values for `getString()`. Alternatively, the `yearIsDateType` connection property can be set to `false` and the values will be treated as `SHORTS`. ([Bug#10485](#))
- Driver doesn't support `{?=CALL(...)}` for calling stored functions. This involved adding support for function retrieval to `DatabaseMetaData.getProcedures()` and `getProcedureColumns()` as well. ([Bug#10310](#))
- Unsigned `SMALLINT` treated as signed for `ResultSet.getInt()`, fixed all cases for `UNSIGNED` integer values and server-side prepared statements, as well as `ResultSet.getObject()` for `UNSIGNED TINYINT`. ([Bug#10156](#))
- Made `ServerPreparedStatement.asSql()` work correctly so auto-explain functionality would work with server-side prepared statements. ([Bug#10155](#))
- Double quotes not recognized when parsing client-side prepared statements. ([Bug#10155](#))
- Made JDBC2-compliant wrappers public in order to allow access to vendor extensions. ([Bug#10155](#))
- `DatabaseMetaData.supportsMultipleOpenResults()` now returns `true`. The driver has supported this for some time, DBMD just missed that fact. ([Bug#10155](#))
- Cleaned up logging of profiler events, moved code to dump a profiler event as a string to `com.mysql.jdbc.log.LogUtils` so that third parties can use it. ([Bug#10155](#))
- Made `enableStreamingResults()` visible on `com.mysql.jdbc.jdbc2.optional.StatementWrapper`. ([Bug#10155](#))
- Actually write manifest file to correct place so it ends up in the binary jar file. ([Bug#10144](#))
- Added `createDatabaseIfNotExist` property (default is `false`), which will cause the driver to ask the server to create

the database specified in the URL if it doesn't exist. You must have the appropriate privileges for database creation for this to work. (Bug#10144)

- Memory leak in `ServerPreparedStatement` if `serverPrepare()` fails. (Bug#10144)
- `com.mysql.jdbc.PreparedStatement.ParseInfo` does unnecessary call to `toCharArray()`. (Bug#9064)
- Driver now correctly uses CP932 if available on the server for Windows-31J, CP932 and MS932 java encoding names, otherwise it resorts to SJIS, which is only a close approximation. Currently only MySQL-5.0.3 and newer (and MySQL-4.1.12 or .13, depending on when the character set gets backported) can reliably support any variant of CP932.
- Overhaul of character set configuration, everything now lives in a properties file.

C.6.3.8. Changes in MySQL Connector/J 3.1.8 (14 April 2005)

Bugs fixed:

- Should accept `null` for catalog (meaning use current) in DBMD methods, even though it is not JDBC-compliant for legacy's sake. Disable by setting connection property `nullCatalogMeansCurrent` to `false` (which will be the default value in C/J 3.2.x). (Bug#9917)
- Fixed driver not returning `true` for `-1` when `ResultSet.getBoolean()` was called on result sets returned from server-side prepared statements. (Bug#9778)
- Added a `Manifest.MF` file with implementation information to the `.jar` file. (Bug#9778)
- More tests in `Field.isOpaqueBinary()` to distinguish opaque binary (that is, fields with type `CHAR(n)` and `CHARACTER SET BINARY`) from output of various scalar and aggregate functions that return strings. (Bug#9778)
- `DBMD.getTables()` shouldn't return tables if views are asked for, even if the database version doesn't support views. (Bug#9778)
- Should accept `null` for name patterns in DBMD (meaning “%”), even though it isn't JDBC compliant, for legacy's sake. Disable by setting connection property `nullNamePatternMatchesAll` to `false` (which will be the default value in C/J 3.2.x). (Bug#9769)
- The performance metrics feature now gathers information about number of tables referenced in a SELECT. (Bug#9704)
- The logging system is now automatically configured. If the value has been set by the user, via the URL property `logger` or the system property `com.mysql.jdbc.logger`, then use that, otherwise, autodetect it using the following steps:
 1. Log4j, if it is available,
 2. Then JDK1.4 logging,
 3. Then fallback to our `STDERR` logging.(Bug#9704)
- `Statement.getMoreResults()` could throw NPE when existing result set was `.close()`d. (Bug#9704)
- Stored procedures with `DECIMAL` parameters with storage specifications that contained “,” in them would fail. (Bug#9682)
- `PreparedStatement.setObject(int, Object, int type, int scale)` now uses scale value for `BigDecimal` instances. (Bug#9682)
- Added support for the c3p0 connection pool's (<http://c3p0.sf.net/>) validation/connection checker interface which uses the lightweight `COM_PING` call to the server if available. To use it, configure your c3p0 connection pool's `connectionTesterClassName` property to use `com.mysql.jdbc.integration.c3p0.MysqlConnectionTester`. (Bug#9320)
- `PreparedStatement.getMetaData()` inserts blank row in database under certain conditions when not using server-side prepared statements. (Bug#9320)
- Better detection of `LIMIT` inside/outside of quoted strings so that the driver can more correctly determine whether a prepared statement can be prepared on the server or not. (Bug#9320)
- `Connection.canHandleAsPreparedStatement()` now makes “best effort” to distinguish `LIMIT` clauses with placeholders in them from ones without in order to have fewer false positives when generating work-arounds for statements the server cannot currently handle as server-side prepared statements. (Bug#9320)

- Fixed `build.xml` to not compile `log4j` logging if `log4j` not available. (Bug#9320)
- Added finalizers to `ResultSet` and `Statement` implementations to be JDBC spec-compliant, which requires that if not explicitly closed, these resources should be closed upon garbage collection. (Bug#9319)
- Stored procedures with same name in different databases confuse the driver when it tries to determine parameter counts/types. (Bug#9319)
- A continuation of Bug#8868, where functions used in queries that should return non-string types when resolved by temporary tables suddenly become opaque binary strings (work-around for server limitation). Also fixed fields with type of `CHAR(n)` `CHARACTER SET BINARY` to return correct/matching classes for `RSMD.getColumnClassName()` and `ResultSet.getObject()`. (Bug#9236)
- Cannot use `UTF-8` for `characterSetResults` configuration property. (Bug#9206)
- `PreparedStatement.addBatch()` doesn't work with server-side prepared statements and streaming `BINARY` data. (Bug#9040)
- `ServerPreparedStatements` now correctly “stream” `BLOB/CLOB` data to the server. You can configure the threshold chunk size using the JDBC URL property `blobSendChunkSize` (the default is 1MB). (Bug#8868)
- `DATE_FORMAT()` queries returned as `BLOBs` from `getObject()`. (Bug#8868)
- Server-side session variables can be preset at connection time by passing them as a comma-delimited list for the connection property `sessionVariables`. (Bug#8868)
- `BlobFromLocator` now uses correct identifier quoting when generating prepared statements. (Bug#8868)
- Fixed regression in `ping()` for users using `autoReconnect=true`. (Bug#8868)
- Check for empty strings (' ') when converting `CHAR/VARCHAR` column data to numbers, throw exception if `emptyStringsConvertToZero` configuration property is set to `false` (for backward-compatibility with 3.0, it is now set to `true` by default, but will most likely default to `false` in 3.2). (Bug#8803)
- `DATA_TYPE` column from `DBMD.getBestRowIdentifier()` causes `ArrayIndexOutOfBoundsException` when accessed (and in fact, didn't return any value). (Bug#8803)
- `DBMD.supportsMixedCase*Identifiers()` returns wrong value on servers running on case-sensitive file systems. (Bug#8800)
- `DBMD.supportsResultSetConcurrency()` not returning `true` for forward-only/read-only result sets (we obviously support this). (Bug#8792)
- Fixed `ResultSet.getTime()` on a `NULL` value for server-side prepared statements throws `NPE`.
- Made `Connection.ping()` a public method.
- Added support for new precision-math `DECIMAL` type in MySQL 5.0.3 and up.
- Fixed `DatabaseMetaData.getTables()` returning views when they were not asked for as one of the requested table types.

C.6.3.9. Changes in MySQL Connector/J 3.1.7 (18 February 2005)

Bugs fixed:

- `PreparedStatements` not creating streaming result sets. (Bug#8487)
- Don't pass `NULL` to `String.valueOf()` in `ResultSet.getNativeConvertToString()`, as it stringifies it (that is, returns `null`), which is not correct for the method in question. (Bug#8487)
- Fixed `NPE` in `ResultSet.realClose()` when using usage advisor and result set was already closed. (Bug#8428)
- `ResultSet.getString()` doesn't maintain format stored on server, bug fix only enabled when `noDatetimeStringSync` property is set to `true` (the default is `false`). (Bug#8428)
- Added support for `BIT` type in MySQL-5.0.3. The driver will treat `BIT(1-8)` as the JDBC standard `BIT` type (which maps to `java.lang.Boolean`), as the server does not currently send enough information to determine the size of a bitfield when `< 9` bits are declared. `BIT(>9)` will be treated as `VARBINARY`, and will return `byte[]` when `getObject()` is called.

Bug#8424)

- Added `useLocalSessionState` configuration property, when set to `true` the JDBC driver trusts that the application is well-behaved and only sets autocommit and transaction isolation levels using the methods provided on `java.sql.Connection`, and therefore can manipulate these values in many cases without incurring round-trips to the database server. (Bug#8424)
- Added `enableStreamingResults()` to `Statement` for connection pool implementations that check `Statement.setFetchSize()` for specification-compliant values. Call `Statement.setFetchSize(>=0)` to disable the streaming results for that statement. (Bug#8424)
- `ResultSet.getBigDecimal()` throws exception when rounding would need to occur to set scale. The driver now chooses a rounding mode of “half up” if non-rounding `BigDecimal.setScale()` fails. (Bug#8424)
- Fixed synchronization issue with `ServerPreparedStatement.serverPrepare()` that could cause deadlocks/crashes if connection was shared between threads. (Bug#8096)
- Emulated locators corrupt binary data when using server-side prepared statements. (Bug#8096)
- Infinite recursion when “falling back” to master in failover configuration. (Bug#7952)
- Disable multi-statements (if enabled) for MySQL-4.1 versions prior to version 4.1.10 if the query cache is enabled, as the server returns wrong results in this configuration. (Bug#7952)
- Removed `dontUnpackBinaryResults` functionality, the driver now always stores results from server-side prepared statements as is from the server and unpacks them on demand. (Bug#7952)
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly. (Bug#7952)
- Added `holdResultsOpenOverStatementClose` property (default is `false`), that keeps result sets open over `statement.close()` or new execution on same statement (suggested by Kevin Burton). (Bug#7715)
- Detect new `sql_mode` variable in string form (it used to be integer) and adjust quoting method for strings appropriately. (Bug#7715)
- Timestamps converted incorrectly to strings with server-side prepared statements and updatable result sets. (Bug#7715)
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. (Bug#7686)
- Choose correct “direction” to apply time adjustments when both client and server are in GMT time zone when using `ResultSet.get(..., cal)` and `PreparedStatement.set(..., cal)`. (Bug#4718)
- Remove `_binary` introducer from parameters used as in/out parameters in `CallableStatement`. (Bug#4718)
- Always return `byte[]`s for output parameters registered as `*BINARY`. (Bug#4718)
- By default, the driver now scans SQL you are preparing via all variants of `Connection.prepareStatement()` to determine if it is a supported type of statement to prepare on the server side, and if it is not supported by the server, it instead prepares it as a client-side emulated prepared statement. You can disable this by passing `emulateUnsupportedPstmts=false` in your JDBC URL. (Bug#4718)
- Added `dontTrackOpenResources` option (default is `false`, to be JDBC compliant), which helps with memory use for non-well-behaved apps (that is, applications that don't close `Statement` objects when they should). (Bug#4718)
- Send correct value for “boolean” `true` to server for `PreparedStatement.setObject(n, "true", Types.BIT)`. (Bug#4718)
- Fixed bug with Connection not caching statements from `prepareStatement()` when the statement wasn't a server-side prepared statement. (Bug#4718)

C.6.3.10. Changes in MySQL Connector/J 3.1.6 (23 December 2004)

Bugs fixed:

- `DBMD.getProcedures()` doesn't respect catalog parameter. (Bug#7026)
- Fixed hang on `SocketInputStream.read()` with `Statement.setMaxRows()` and multiple result sets when driver has to truncate result set directly, rather than tacking a `LIMIT n` on the end of it.

C.6.3.11. Changes in MySQL Connector/J 3.1.5 (02 December 2004)

Bugs fixed:

- Use 1MB packet for sending file for `LOAD DATA LOCAL INFILE` if that is `< max_allowed_packet` on server. (Bug#6537)
- `SUM()` on `DECIMAL` with server-side prepared statement ignores scale if zero-padding is needed (this ends up being due to conversion to `DOUBLE` by server, which when converted to a string to parse into `BigDecimal`, loses all “padding” zeros). (Bug#6537)
- Use `DatabaseMetaData.getIdentifierQuoteString()` when building DBMD queries. (Bug#6537)
- Use our own implementation of buffered input streams to get around blocking behavior of `java.io.BufferedInputStream`. Disable this with `useReadAheadInput=false`. (Bug#6399)
- Make auto-deserialization of `java.lang.Objects` stored in `BLOB` columns configurable via `autoDeserialize` property (defaults to `false`). (Bug#6399)
- `ResultSetMetaData.getColumnDisplaySize()` returns incorrect values for multi-byte charsets. (Bug#6399)
- Re-work `Field.isOpaqueBinary()` to detect `CHAR(n) CHARACTER SET BINARY` to support fixed-length binary fields for `ResultSet.getObject()`. (Bug#6399)
- Failing to connect to the server when one of the addresses for the given host name is IPV6 (which the server does not yet bind on). The driver now loops through *all* IP addresses for a given host, and stops on the first one that `accepts()` a `socket.connect()`. (Bug#6348)
- Removed unwanted new `Throwable()` in `ResultSet` constructor due to bad merge (caused a new object instance that was never used for every result set created). Found while profiling for Bug#6359. (Bug#6225)
- `ServerSidePreparedStatement` allocating short-lived objects unnecessarily. (Bug#6225)
- Use null-safe-equals for key comparisons in updatable result sets. (Bug#6225)
- Fixed too-early creation of `StringBuffer` in `EscapeProcessor.escapeSQL()`, also return `String` when escaping not needed (to avoid unnecessary object allocations). Found while profiling for Bug#6359. (Bug#6225)
- `UNSIGNED BIGINT` unpacked incorrectly from server-side prepared statement result sets. (Bug#5729)
- Added experimental configuration property `dontUnpackBinaryResults`, which delays unpacking binary result set values until they're asked for, and only creates object instances for non-numerical values (it is set to `false` by default). For some usecase/jvm combinations, this is friendlier on the garbage collector. (Bug#5706)
- Don't throw exceptions for `Connection.releaseSavepoint()`. (Bug#5706)
- Inefficient detection of pre-existing string instances in `ResultSet.getNativeString()`. (Bug#5706)
- Use a per-session `Calendar` instance by default when decoding dates from `ServerPreparedStatements` (set to old, less performant behavior by setting property `dynamicCalendars=true`). (Bug#5706)
- Fixed batched updates with server prepared statements weren't looking if the types had changed for a given batched set of parameters compared to the previous set, causing the server to return the error “Wrong arguments to mysql_stmt_execute()”. (Bug#5235)
- Handle case when string representation of timestamp contains trailing “.” with no numbers following it. (Bug#5235)
- Server-side prepared statements did not honor `zeroDateTimeBehavior` property, and would cause class-cast exceptions when using `ResultSet.getObject()`, as the all-zero string was always returned. (Bug#5235)
- Fix comparisons made between string constants and dynamic strings that are converted with either `toUpperCase()` or `toLowerCase()` to use `Locale.ENGLISH`, as some locales “override” case rules for English. Also use `StringUtils.indexOfIgnoreCase()` instead of `.toUpperCase().indexOf()`, avoids creating a very short-lived transient `String` instance.

C.6.3.12. Changes in MySQL Connector/J 3.1.4 (04 September 2004)

Bugs fixed:

- Fixed `ServerPreparedStatement` to read prepared statement metadata off the wire, even though it is currently a placeholder instead of using `MysqlIO.clearInputStream()` which didn't work at various times because data wasn't available to read from the server yet. This fixes sporadic errors users were having with `ServerPreparedStatements` throwing `ArrayIndexOutOfBoundsException`. (Bug#5032)
- Added three ways to deal with all-zero datetimes when reading them from a `ResultSet: exception` (the default), which throws an `SQLException` with an `SQLState` of `S1009`; `convertToNull`, which returns `NULL` instead of the date; and `round`, which rounds the date to the nearest closest value which is `'0001-01-01'`. (Bug#5032)
- The driver is more strict about truncation of numerics on `ResultSet.get*()`, and will throw an `SQLException` when truncation is detected. You can disable this by setting `jdbcCompliantTruncation` to `false` (it is enabled by default, as this functionality is required for JDBC compliance). (Bug#5032)
- You can now use URLs in `LOAD DATA LOCAL INFILE` statements, and the driver will use Java's built-in handlers for retrieving the data and sending it to the server. This feature is not enabled by default, you must set the `allowUrlInLocalInfile` connection property to `true`. (Bug#5032)
- `ResultSet.getObject()` doesn't return type `Boolean` for pseudo-bit types from prepared statements on 4.1.x (shortcut for avoiding extra type conversion when using binary-encoded result sets obscured test in `getObject()` for “pseudo” bit type). (Bug#5032)
- Use `com.mysql.jdbc.Message`'s classloader when loading resource bundle, should fix sporadic issues when the caller's classloader can't locate the resource bundle. (Bug#5032)
- `ServerPreparedStatements` dealing with return of `DECIMAL` type don't work. (Bug#5012)
- Track packet sequence numbers if `enablePacketDebug=true`, and throw an exception if packets received out-of-order. (Bug#4689)
- `ResultSet.isNull()` does not work for primitives if a previous `null` was returned. (Bug#4689)
- Optimized integer number parsing, enable “old” slower integer parsing using JDK classes via `useFastIntParsing=false` property. (Bug#4642)
- Added `useOnlyServerErrorMessages` property, which causes message text in exceptions generated by the server to only contain the text sent by the server (as opposed to the `SQLState`'s “standard” description, followed by the server's error message). This property is set to `true` by default. (Bug#4642)
- `ServerPreparedStatement.execute*()` sometimes threw `ArrayIndexOutOfBoundsException` when unpacking field metadata. (Bug#4642)
- Connector/J 3.1.3 beta does not handle integers correctly (caused by changes to support unsigned reads in `Buffer.readInt() -> Buffer.readShort()`). (Bug#4510)
- Added support in `DatabaseMetaData.getTables()` and `getTableTypes()` for views, which are now available in MySQL server 5.0.x. (Bug#4510)
- `ResultSet.getObject()` returns wrong type for strings when using prepared statements. (Bug#4482)
- Calling `MysqlPooledConnection.close()` twice (even though an application error), caused NPE. Fixed. (Bug#4482)

C.6.3.13. Changes in MySQL Connector/J 3.1.3 (07 July 2004)

Bugs fixed:

- Support new time zone variables in MySQL-4.1.3 when `useTimezone=true`. (Bug#4311)
- Error in retrieval of `mediumint` column with prepared statements and binary protocol. (Bug#4311)
- Support for unsigned numerics as return types from prepared statements. This also causes a change in `ResultSet.getObject()` for the `bigint unsigned` type, which used to return `BigDecimal` instances, it now returns instances of `java.lang.BigInteger`. (Bug#4311)
- Externalized more messages (on-going effort). (Bug#4119)
- Null bitmask sent for server-side prepared statements was incorrect. (Bug#4119)
- Added constants for MySQL error numbers (publicly accessible, see `com.mysql.jdbc.MysqlErrorNumbers`), and the ability to generate the mappings of vendor error codes to `SQLStates` that the driver uses (for documentation purposes).

[Bug#4119](#))

- Added packet debugging code (see the `enablePacketDebug` property documentation). ([Bug#4119](#))
- Use SQL Standard SQL states by default, unless `useSqlStateCodes` property is set to `false`. ([Bug#4119](#))
- Mangle output parameter names for `CallableStatements` so they will not clash with user variable names.
- Added support for `INOUT` parameters in `CallableStatements`.

C.6.3.14. Changes in MySQL Connector/J 3.1.2 (09 June 2004)

Bugs fixed:

- Don't enable server-side prepared statements for server version 5.0.0 or 5.0.1, as they aren't compatible with the '4.1.2+' style that the driver uses (the driver expects information to come back that isn't there, so it hangs). ([Bug#3804](#))
- `getWarnings()` returns `SQLWarning` instead of `DataTruncation`. ([Bug#3804](#))
- `getProcedureColumns()` doesn't work with wildcards for procedure name. ([Bug#3540](#))
- `getProcedures()` does not return any procedures in result set. ([Bug#3539](#))
- Fixed `DatabaseMetaData.getProcedures()` when run on MySQL-5.0.0 (output of `SHOW PROCEDURE STATUS` changed between 5.0.0 and 5.0.1). ([Bug#3520](#))
- Added `connectionCollation` property to cause driver to issue `set collation_connection=...` query on connection init if default collation for given charset is not appropriate. ([Bug#3520](#))
- `DBMD.getSQLStateType()` returns incorrect value. ([Bug#3520](#))
- Correctly map output parameters to position given in `prepareCall()` versus order implied during `registerOutParameter()`. ([Bug#3146](#))
- Cleaned up detection of server properties. ([Bug#3146](#))
- Correctly detect initial character set for servers $\geq 4.1.0$. ([Bug#3146](#))
- Support placeholder for parameter metadata for server $\geq 4.1.2$. ([Bug#3146](#))
- Added `gatherPerformanceMetrics` property, along with properties to control when/where this info gets logged (see docs for more info).
- Fixed case when no parameters could cause a `NullPointerException` in `CallableStatement.setOutputParameters()`.
- Enabled callable statement caching via `cacheCallableStmts` property.
- Fixed sending of split packets for large queries, enabled nio ability to send large packets as well.
- Added `.toString()` functionality to `ServerPreparedStatement`, which should help if you're trying to debug a query that is a prepared statement (it shows SQL as the server would process).
- Added `logSlowQueries` property, along with `slowQueriesThresholdMillis` property to control when a query should be considered "slow."
- Removed wrapping of exceptions in `MysqlIO.changeUser()`.
- Fixed stored procedure parameter parsing info when size was specified for a parameter (for example, `char()`, `varchar()`).
- `ServerPreparedStatements` weren't actually de-allocating server-side resources when `.close()` was called.
- Fixed case when no output parameters specified for a stored procedure caused a bogus query to be issued to retrieve out parameters, leading to a syntax error from the server.

C.6.3.15. Changes in MySQL Connector/J 3.1.1 (14 February 2004 alpha)

Bugs fixed:

- Use DocBook version of docs for shipped versions of drivers. (Bug#2671)
- `NULL` fields were not being encoded correctly in all cases in server-side prepared statements. (Bug#2671)
- Fixed rare buffer underflow when writing numbers into buffers for sending prepared statement execution requests. (Bug#2671)
- Fixed `ConnectionProperties` that weren't properly exposed via accessors, cleaned up `ConnectionProperties` code. (Bug#2623)
- Class-cast exception when using scrolling result sets and server-side prepared statements. (Bug#2623)
- Merged unbuffered input code from 3.0. (Bug#2623)
- Enabled streaming of result sets from server-side prepared statements. (Bug#2606)
- Server-side prepared statements were not returning datatype `YEAR` correctly. (Bug#2606)
- Fixed charset conversion issue in `getTables()`. (Bug#2502)
- Implemented multiple result sets returned from a statement or stored procedure. (Bug#2502)
- Implemented `Connection.prepareCall()`, and `DatabaseMetaData.getProcedures()` and `getProcedureColumns()`. (Bug#2359)
- Merged prepared statement caching, and `.getMetaData()` support from 3.0 branch. (Bug#2359)
- Fixed off-by-1900 error in some cases for years in `TimeUtil.fastDate/TimeCreate()` when unpacking results from server-side prepared statements. (Bug#2359)
- Reset `long binary` parameters in `ServerPreparedStatement` when `clearParameters()` is called, by sending `COM_RESET_STMT` to the server. (Bug#2359)
- `NULL` values for numeric types in binary encoded result sets causing `NullPointerException`s. (Bug#2359)
- Display where/why a connection was implicitly closed (to aid debugging). (Bug#1673)
- `DatabaseMetaData.getColumns()` is not returning correct column ordinal info for non-'%' column name patterns. (Bug#1673)
- Fixed `NullPointerException` in `ServerPreparedStatement.setTimestamp()`, as well as year and month discrepancies in `ServerPreparedStatement.setTimestamp(), setDate()`. (Bug#1673)
- Added ability to have multiple database/JVM targets for compliance and regression/unit tests in `build.xml`. (Bug#1673)
- Fixed sending of queries larger than 16M. (Bug#1673)
- Merged fix of datatype mapping from MySQL type `FLOAT` to `java.sql.Types.REAL` from 3.0 branch. (Bug#1673)
- Fixed NPE and year/month bad conversions when accessing some datetime functionality in `ServerPreparedStatements` and their resultant result sets. (Bug#1673)
- Added named and indexed input/output parameter support to `CallableStatement`. MySQL-5.0.x or newer. (Bug#1673)
- `CommunicationsException` implemented, that tries to determine why communications was lost with a server, and displays possible reasons when `.getMessage()` is called. (Bug#1673)
- Detect collation of column for `RSMD.isCaseSensitive()`. (Bug#1673)
- Optimized `Buffer.readLenByteArray()` to return shared empty byte array when length is 0.
- Fix support for table aliases when checking for all primary keys in `UpdatableResultSet`.
- Unpack “unknown” data types from server prepared statements as `Strings`.
- Implemented `Statement.getWarnings()` for MySQL-4.1 and newer (using `SHOW WARNINGS`).
- Ensure that warnings are cleared before executing queries on prepared statements, as-per JDBC spec (now that we support warnings).
- Correctly initialize datasource properties from JNDI Refs, including explicitly specified URLs.
- Implemented long data (Blobs, Clobs, InputStreams, Readers) for server prepared statements.

- Deal with 0-length tokens in `EscapeProcessor` (caused by callable statement escape syntax).
- `DatabaseMetaData` now reports `supportsStoredProcedures()` for MySQL versions $\geq 5.0.0$
- Support for `mysql_change_user()`. See the `changeUser()` method in `com.mysql.jdbc.Connection`.
- Removed `useFastDates` connection property.
- Support for NIO. Use `useNIO=true` on platforms that support NIO.
- Check for closed connection on delete/update/insert row operations in `UpdatableResultSet`.
- Support for transaction savepoints (MySQL $\geq 4.0.14$ or 4.1.1).
- Support “old” `profileSql` capitalization in `ConnectionProperties`. This property is deprecated, you should use `profileSQL` if possible.
- Fixed character encoding issues when converting bytes to ASCII when MySQL doesn't provide the character set, and the JVM is set to a multi-byte encoding (usually affecting retrieval of numeric values).
- Centralized setting of result set type and concurrency.
- Fixed bug with `UpdatableResultSets` not using client-side prepared statements.
- Default result set type changed to `TYPE_FORWARD_ONLY` (JDBC compliance).
- Fixed `IllegalAccessError` to `Calendar.getTimeInMillis()` in `DateTimeValue` (for JDK < 1.4).
- Allow contents of `PreparedStatement.setBlob()` to be retained between calls to `.execute*()`.
- Fixed stack overflow in `Connection.prepareCall()` (bad merge).
- Refactored how connection properties are set and exposed as `DriverPropertyInfo` as well as `Connection` and `DataSource` properties.
- Reduced number of methods called in average query to be more efficient.
- Prepared `Statements` will be re-prepared on auto-reconnect. Any errors encountered are postponed until first attempt to re-execute the re-prepared statement.

C.6.3.16. Changes in MySQL Connector/J 3.1.0 (18 February 2003 alpha)

Bugs fixed:

- Added `useServerPrepStmts` property (default `false`). The driver will use server-side prepared statements when the server version supports them (4.1 and newer) when this property is set to `true`. It is currently set to `false` by default until all bind/fetch functionality has been implemented. Currently only DML prepared statements are implemented for 4.1 server-side prepared statements.
- Added `requireSSL` property.
- Track open `Statements`, close all when `Connection.close()` is called (JDBC compliance).

C.6.4. Changes in MySQL Connector/J 3.0.x

C.6.4.1. Changes in MySQL Connector/J 3.0.17 (23 June 2005)

Bugs fixed:

- Workaround for server [Bug#9098](#): Default values of `CURRENT_*` for `DATE`, `TIME`, `DATETIME`, and `TIMESTAMP` columns can't be distinguished from `string` values, so `UpdatableResultSet.moveToInsertRow()` generates bad SQL for inserting default values. ([Bug#8812](#))
- `NON_UNIQUE` column from `DBMD.getIndexInfo()` returned inverted value. ([Bug#8812](#))
- `EUCKR` charset is sent as `SET NAMES euc_kr` which MySQL-4.1 and newer doesn't understand. ([Bug#8629](#))

- Added support for the `EUC_JP_Solaris` character encoding, which maps to a MySQL encoding of `ujjps` (backported from 3.1 branch). This only works on servers that support `ujjps`, namely 5.0.3 or later. (Bug#8629)
- Use hex escapes for `PreparedStatement.setBytes()` for double-byte charsets including “aliases” `Windows-31J`, `CP934`, `MS932`. (Bug#8629)
- `DatabaseMetaData.supportsSelectForUpdate()` returns correct value based on server version. (Bug#8629)
- Which requires hex escaping of binary data when using multi-byte charsets with prepared statements. (Bug#8064)
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly. (Bug#7952)
- Backported SQLState codes mapping from Connector/J 3.1, enable with `useSqlStateCodes=true` as a connection property, it defaults to `false` in this release, so that we don't break legacy applications (it defaults to `true` starting with Connector/J 3.1). (Bug#7686)
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. (Bug#7686)
- `MS932`, `SHIFT_JIS`, and `Windows_31J` not recognized as aliases for `sjis`. (Bug#7607)
- Handle streaming result sets with more than 2 billion rows properly by fixing wraparound of row number counter. (Bug#7601)
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. (Bug#7601)
- Escape sequence `{fn convert(..., type)}` now supports ODBC-style types that are prepended by `SQL_`. (Bug#7601)
- Statements created from a pooled connection were returning physical connection instead of logical connection when `getConnection()` was called. (Bug#7316)
- Support new protocol type `MYSQL_TYPE_VARCHAR`. (Bug#7081)
- Added `useOldUTF8Behavior` configuration property, which causes JDBC driver to act like it did with MySQL-4.0.x and earlier when the character encoding is `utf-8` when connected to MySQL-4.1 or newer. (Bug#7081)
- `DatabaseMetaData.getIndexInfo()` ignored `unique` parameter. (Bug#7081)
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. (Bug#7061)
- `PreparedStatements` don't encode Big5 (and other multi-byte) character sets correctly in static SQL strings. (Bug#7033)
- Connections starting up failed-over (due to down master) never retry master. (Bug#6966)
- Adding `CP943` to aliases for `sjis`. (Bug#6549, Bug#7607)
- `Timestamp/Time` conversion goes in the wrong “direction” when `useTimeZone=true` and server time zone differs from client time zone. (Bug#5874)

C.6.4.2. Changes in MySQL Connector/J 3.0.16 (15 November 2004)

Bugs fixed:

- Made `TINYINT(1) -> BIT/Boolean` conversion configurable via `tinyIntIsBit` property (default `true` to be JDBC compliant out of the box). (Bug#5664)
- Off-by-one bug in `Buffer.readString(string)`. (Bug#5664)
- `ResultSet.updateByte()` when on insert row throws `ArrayOutOfBoundsException`. (Bug#5664)
- Fixed regression where `useUnbufferedInput` was defaulting to `false`. (Bug#5664)
- `ResultSet.getTimestamp()` on a column with `TIME` in it fails. (Bug#5664)
- Fixed `DatabaseMetaData.getTypes()` returning incorrect (this is, non-negative) scale for the `NUMERIC` type. (Bug#5664)
- Only set `character_set_results` during connection establishment if server version `>= 4.1.1`. (Bug#5664)

- Fixed `ResultSetMetaData.isReadOnly()` to detect non-writable columns when connected to MySQL-4.1 or newer, based on existence of “original” table and column names.
- Re-issue character set configuration commands when re-using pooled connections and/or `Connection.changeUser()` when connected to MySQL-4.1 or newer.

C.6.4.3. Changes in MySQL Connector/J 3.0.15 (04 September 2004)

Bugs fixed:

- `ResultSet.getMetaData()` should not return incorrectly initialized metadata if the result set has been closed, but should instead throw an `SQLException`. Also fixed for `getRow()` and `getWarnings()` and traversal methods by calling `checkClosed()` before operating on instance-level fields that are nullified during `.close()`. (Bug#5069)
- Use `_binary` introducer for `PreparedStatement.setBytes()` and `set*Stream()` when connected to MySQL-4.1.x or newer to avoid misinterpretation during character conversion. (Bug#5069)
- Parse new time zone variables from 4.1.x servers. (Bug#5069)
- `ResultSet` should release `Field[]` instance in `.close()`. (Bug#5022)
- `RSMD.getPrecision()` returning 0 for non-numeric types (should return max length in chars for nonbinary types, max length in bytes for binary types). This fix also fixes mapping of `RSMD.getColumnType()` and `RSMD.getColumnTypeName()` for the BLOB types based on the length sent from the server (the server doesn't distinguish between `TINYBLOB`, `BLOB`, `MEDIUMBLOB` or `LONGBLOB` at the network protocol level). (Bug#4880)
- “Production” is now “GA” (General Availability) in naming scheme of distributions. (Bug#4860, Bug#4138)
- `DBMD.getColumns()` returns incorrect JDBC type for unsigned columns. This affects type mappings for all numeric types in the `RSMD.getColumnType()` and `RSMD.getColumnTypeNames()` methods as well, to ensure that “like” types from `DBMD.getColumns()` match up with what `RSMD.getColumnType()` and `getColumnTypeNames()` return. (Bug#4860, Bug#4138)
- Calling `.close()` twice on a `PooledConnection` causes NPE. (Bug#4808)
- `DOUBLE` mapped twice in `DBMD.getTypeInfo()`. (Bug#4742)
- Added FLOSS license exemption. (Bug#4742)
- Removed redundant calls to `checkRowPos()` in `ResultSet`. (Bug#4334)
- Failover for `autoReconnect` not using port numbers for any hosts, and not retrying all hosts.

Warning

This required a change to the `SocketFactory.connect()` method signature, which is now `public Socket connect(String host, int portNumber, Properties props)`; therefore, any third-party socket factories will have to be changed to support this signature.

(Bug#4334)

- Logical connections created by `MysqlConnectionPoolDataSource` will now issue a `rollback()` when they are closed and sent back to the pool. If your application server/connection pool already does this for you, you can set the `rollbackOnPooledClose` property to `false` to avoid the overhead of an extra `rollback()`. (Bug#4334)
- `StringUtils.escapeEasternUnicodeByteStream` was still broken for GBK. (Bug#4010)

C.6.4.4. Changes in MySQL Connector/J 3.0.14 (28 May 2004)

Bugs fixed:

- Fixed URL parsing error.

C.6.4.5. Changes in MySQL Connector/J 3.0.13 (27 May 2004)

Bugs fixed:

- `No Database Selected` when using `MysqlConnectionPoolDataSource`. ([Bug#3920](#))
- `PreparedStatement.getGeneratedKeys()` method returns only 1 result for batched insertions. ([Bug#3873](#))
- Using a `MySQLDataSource` without server name fails. ([Bug#3848](#))

C.6.4.6. Changes in MySQL Connector/J 3.0.12 (18 May 2004)

Bugs fixed:

- Inconsistent reporting of data type. The server still doesn't return all types for *BLOBs *TEXT correctly, so the driver won't return those correctly. ([Bug#3570](#))
- `UpdatableResultSet` not picking up default values for `moveToInsertRow()`. ([Bug#3557](#))
- Not specifying database in URL caused `MalformedURLException` exception. ([Bug#3554](#))
- Auto-convert MySQL encoding names to Java encoding names if used for `characterEncoding` property. ([Bug#3554](#))
- Use `junit.textui.TestRunner` for all unit tests (to allow them to be run from the command line outside of Ant or Eclipse). ([Bug#3554](#))
- Added encoding names that are recognized on some JVMs to fix case where they were reverse-mapped to MySQL encoding names incorrectly. ([Bug#3554](#))
- Made `StringRegressionTest` 4.1-unicode aware. ([Bug#3520](#))
- Fixed regression in `PreparedStatement.setString()` and eastern character encodings. ([Bug#3520](#))
- `DBMD.getSQLStateType()` returns incorrect value. ([Bug#3520](#))
- Renamed `StringUtils.escapeSJISByteStream()` to more appropriate `escapeEasternUnicodeByteStream()`. ([Bug#3511](#))
- `StringUtils.escapeSJISByteStream()` not covering all eastern double-byte charsets correctly. ([Bug#3511](#))
- Return creating statement for `ResultSets` created by `getGeneratedKeys()`. ([Bug#2957](#))
- Use `SET character_set_results` during initialization to allow any charset to be returned to the driver for result sets. ([Bug#2670](#))
- Don't truncate BLOB or CLOB values when using `setBytes()` and/or `setBinary/CharacterStream()`. ([Bug#2670](#))
- Dynamically configure character set mappings for field-level character sets on MySQL-4.1.0 and newer using `SHOW COLLATION` when connecting. ([Bug#2670](#))
- Map `binary` character set to `US-ASCII` to support `DATETIME` charset recognition for servers \geq 4.1.2. ([Bug#2670](#))
- Use `charsetnr` returned during connect to encode queries before issuing `SET NAMES` on MySQL \geq 4.1.0. ([Bug#2670](#))
- Add helper methods to `ResultSetMetaData` (`getColumnCharacterEncoding()` and `getColumnCharacterSet()`) to allow end-users to see what charset the driver thinks it should be using for the column. ([Bug#2670](#))
- Only set `character_set_results` for MySQL \geq 4.1.0. ([Bug#2670](#))
- Allow `url` parameter for `MysqlDataSource` and `MysqlConnectionPool DataSource` so that passing of other properties is possible from inside appservers.
- Don't escape SJIS/GBK/BIG5 when using MySQL-4.1 or newer.
- Backport documentation tooling from 3.1 branch.
- Added `failOverReadOnly` property, to allow end-user to configure state of connection (read-only/writable) when failed over.
- Allow `java.util.Date` to be sent in as parameter to `PreparedStatement.setObject()`, converting it to a `Timestamp` to maintain full precision. ([Bug#103](#))

- Add unsigned attribute to `DatabaseMetaData.getColumns()` output in the `TYPE_NAME` column.
- Map duplicate key and foreign key errors to `SQLState` of `23000`.
- Backported “change user” and “reset server state” functionality from 3.1 branch, to allow clients of `MySQLConnectionPoolDataSource` to reset server state on `getConnection()` on a pooled connection.

C.6.4.7. Changes in MySQL Connector/J 3.0.11 (19 February 2004)

Bugs fixed:

- Return `java.lang.Double` for `FLOAT` type from `ResultSetMetaData.getColumnClassName()`. (Bug#2855)
- Return `[B` instead of `java.lang.Object` for `BINARY`, `VARBINARY` and `LONGVARBINARY` types from `ResultSetMetaData.getColumnClassName()` (JDBC compliance). (Bug#2855)
- Issue connection events on all instances created from a `ConnectionPoolDataSource`. (Bug#2855)
- Return `java.lang.Integer` for `TINYINT` and `SMALLINT` types from `ResultSetMetaData.getColumnClassName()`. (Bug#2852)
- Added `useUnbufferedInput` parameter, and now use it by default (due to JVM issue <http://developer.java.sun.com/developer/bugParade/bugs/4401235.html>) (Bug#2578)
- Fixed failover always going to last host in list. (Bug#2578)
- Detect `on/off` or `1, 2, 3` form of `lower_case_table_names` value on server. (Bug#2578)
- `AutoReconnect` time was growing faster than exponentially. (Bug#2447)
- Trigger a `SET NAMES utf8` when encoding is forced to `utf8` or `utf-8` via the `characterEncoding` property. Previously, only the Java-style encoding name of `utf-8` would trigger this.

C.6.4.8. Changes in MySQL Connector/J 3.0.10 (13 January 2004)

Bugs fixed:

- Enable caching of the parsing stage of prepared statements via the `cachePrepStmts`, `prepStmtCacheSize`, and `prepStmtCacheSqlLimit` properties (disabled by default). (Bug#2006)
- Fixed security exception when used in Applets (applets can't read the system property `file.encoding` which is needed for `LOAD DATA LOCAL INFILE`). (Bug#2006)
- Speed up parsing of `PreparedStatements`, try to use one-pass whenever possible. (Bug#2006)
- Fixed exception `Unknown character set 'danish'` on connect with JDK-1.4.0 (Bug#2006)
- Fixed mappings in `SQLException` to report deadlocks with `SQLStates` of `41000`. (Bug#2006)
- Removed static synchronization bottleneck from instance factory method of `SingleByteCharsetConverter`. (Bug#2006)
- Removed static synchronization bottleneck from `PreparedStatement.setTimestamp()`. (Bug#2006)
- `ResultSet.findColumn()` should use first matching column name when there are duplicate column names in `SELECT` query (JDBC-compliance). (Bug#2006)
- `maxRows` property would affect internal statements, so check it for all statement creation internal to the driver, and set to 0 when it is not. (Bug#2006)
- Use constants for `SQLStates`. (Bug#2006)
- Map charset `ko18_ru` to `ko18r` when connected to MySQL-4.1.0 or newer. (Bug#2006)
- Ensure that `Buffer.writeString()` saves room for the `\0`. (Bug#2006)
- `ArrayIndexOutOfBoundsException` when parameter number == number of parameters + 1. (Bug#1958)

- Connection property `maxRows` not honored. (Bug#1933)
- Statements being created too many times in `DBMD.extractForeignKeyFromCreateTable()`. (Bug#1925)
- Support escape sequence `{fn convert ... }`. (Bug#1914)
- Implement `ResultSet.updateClob()`. (Bug#1913)
- Autoreconnect code didn't set catalog upon reconnect if it had been changed. (Bug#1913)
- `ResultSet.getObject()` on `TINYINT` and `SMALLINT` columns should return Java type `Integer`. (Bug#1913)
- Added more descriptive error message `Server Configuration Denies Access to DataSource`, as well as retrieval of message from server. (Bug#1913)
- `ResultSetMetaData.isCaseSensitive()` returned wrong value for `CHAR/VARCHAR` columns. (Bug#1913)
- Added `alwaysClearStream` connection property, which causes the driver to always empty any remaining data on the input stream before each query. (Bug#1913)
- `DatabaseMetaData.getSystemFunction()` returning bad function `VResultsSion`. (Bug#1775)
- Foreign Keys column sequence is not consistent in `DatabaseMetaData.getImported/Exported/CrossReference()`. (Bug#1731)
- Fix for `ArrayIndexOutOfBoundsException` exception when using `Statement.setMaxRows()`. (Bug#1695)
- Subsequent call to `ResultSet.updateFoo()` causes NPE if result set is not updatable. (Bug#1630)
- Fix for 4.1.1-style authentication with no password. (Bug#1630)
- Cross-database updatable result sets are not checked for updatability correctly. (Bug#1592)
- `DatabaseMetaData.getColumns()` should return `Types.LONGVARCHAR` for MySQL `LONGTEXT` type. (Bug#1592)
- Fixed regression of `Statement.getGeneratedKeys()` and `REPLACE` statements. (Bug#1576)
- Barge blobs and split packets not being read correctly. (Bug#1576)
- Backported fix for aliased tables and `UpdatableResultSets` in `checkUpdatability()` method from 3.1 branch. (Bug#1534)
- “Friendlier” exception message for `PacketTooLargeException`. (Bug#1534)
- Don't count quoted IDs when inside a 'string' in `PreparedStatement` parsing. (Bug#1511)

C.6.4.9. Changes in MySQL Connector/J 3.0.9 (07 October 2003)

Bugs fixed:

- `ResultSet.get/setString` mashing char 127. (Bug#1247)
- Added property to “clobber” streaming results, by setting the `clobberStreamingResults` property to `true` (the default is `false`). This will cause a “streaming” `ResultSet` to be automatically closed, and any outstanding data still streaming from the server to be discarded if another query is executed before all the data has been read from the server. (Bug#1247)
- Added `com.mysql.jdbc.util.BaseBugReport` to help creation of testcases for bug reports. (Bug#1247)
- Backported authentication changes for 4.1.1 and newer from 3.1 branch. (Bug#1247)
- Made `databaseName`, `portNumber`, and `serverName` optional parameters for `MysqlDataSourceFactory`. (Bug#1246)
- Optimized `CLOB.setCharacterStream()`. (Bug#1131)
- Fixed `CLOB.truncate()`. (Bug#1130)
- Fixed deadlock issue with `Statement.setMaxRows()`. (Bug#1099)
- `DatabaseMetaData.getColumns()` getting confused about the keyword “set” in character columns. (Bug#1099)

- Clip +/- INF (to smallest and largest representative values for the type in MySQL) and NaN (to 0) for `setDouble/setFloat()`, and issue a warning on the statement when the server does not support +/- INF or NaN. (Bug#884)
- Don't fire connection closed events when closing pooled connections, or on `PooledConnection.getConnection()` with already open connections. (Bug#884)
- Double-escaping of `'\'` when charset is SJIS or GBK and `'\'` appears in non-escaped input. (Bug#879)
- When emptying input stream of unused rows for “streaming” result sets, have the current thread `yield()` every 100 rows in order to not monopolize CPU time. (Bug#879)
- Issue exception on `ResultSet.getXXX()` on empty result set (wasn't caught in some cases). (Bug#848)
- Don't hide messages from exceptions thrown in I/O layers. (Bug#848)
- Fixed regression in large split-packet handling. (Bug#848)
- Better diagnostic error messages in exceptions for “streaming” result sets. (Bug#848)
- Don't change timestamp TZ twice if `useTimezone==true`. (Bug#774)
- Don't wrap `SQLExceptions` in `RowDataDynamic`. (Bug#688)
- Don't try and reset isolation level on reconnect if MySQL doesn't support them. (Bug#688)
- The `insertRow` in an `UpdatableResultSet` is now loaded with the default column values when `moveToInsertRow()` is called. (Bug#688)
- `DatabaseMetaData.getColumns()` wasn't returning `NULL` for default values that are specified as `NULL`. (Bug#688)
- Change default statement type/concurrency to `TYPE_FORWARD_ONLY` and `CONCUR_READ_ONLY` (spec compliance). (Bug#688)
- Fix `UpdatableResultSet` to return values for `getXXX()` when on insert row. (Bug#675)
- Support `InnoDB` constraint names when extracting foreign key information in `DatabaseMetaData` (implementing ideas from Parwinder Sekhon). (Bug#664, Bug#517)
- Backported 4.1 protocol changes from 3.1 branch (server-side SQL states, new field information, larger client capability flags, connect-with-database, and so forth). (Bug#664, Bug#517)
- `refreshRow` didn't work when primary key values contained values that needed to be escaped (they ended up being doubly escaped). (Bug#661)
- Fixed `ResultSet.previous()` behavior to move current position to before result set when on first row of result set. (Bug#496)
- Fixed `Statement` and `PreparedStatement` issuing bogus queries when `setMaxRows()` had been used and a `LIMIT` clause was present in the query. (Bug#496)
- Faster date handling code in `ResultSet` and `PreparedStatement` (no longer uses `Date` methods that synchronize on static calendars).
- Fixed test for end of buffer in `Buffer.readString()`.

C.6.4.10. Changes in MySQL Connector/J 3.0.8 (23 May 2003)

Bugs fixed:

- Fixed SJIS encoding bug, thanks to Naoto Sato. (Bug#378)
- Fix problem detecting server character set in some cases. (Bug#378)
- Allow multiple calls to `Statement.close()`. (Bug#378)
- Return correct number of generated keys when using `REPLACE` statements. (Bug#378)
- Unicode character `0xFFFF` in a string would cause the driver to throw an `ArrayOutOfBoundsException`. (Bug#378)

- Fix row data decoding error when using *very* large packets. (Bug#378)
- Optimized row data decoding. (Bug#378)
- Issue exception when operating on an already closed prepared statement. (Bug#378)
- Optimized usage of `EscapeProcessor`. (Bug#378)
- Use JVM charset with file names and `LOAD DATA [LOCAL] INFILE`.
- Fix infinite loop with `Connection.cleanup()`.
- Changed Ant target `compile-core` to `compile-driver`, and made testsuite compilation a separate target.
- Fixed result set not getting set for `Statement.executeUpdate()`, which affected `getGeneratedKeys()` and `getUpdateCount()` in some cases.
- Return list of generated keys when using multi-value `INSERTS` with `Statement.getGeneratedKeys()`.
- Allow bogus URLs in `Driver.getPropertyInfo()`.

C.6.4.11. Changes in MySQL Connector/J 3.0.7 (08 April 2003)

Bugs fixed:

- Fixed charset issues with database metadata (charset was not getting set correctly).
- You can now toggle profiling on/off using `Connection.setProfileSql(boolean)`.
- 4.1 Column Metadata fixes.
- Fixed `MysqlPooledConnection.close()` calling wrong event type.
- Fixed `StringIndexOutOfBoundsException` in `PreparedStatement.setClob()`.
- `IOExceptions` during a transaction now cause the `Connection` to be closed.
- Remove synchronization from `Driver.connect()` and `Driver.acceptsUrl()`.
- Fixed missing conversion for `YEAR` type in `ResultSetMetaData.getColumnTypeName()`.
- Updatable `ResultSets` can now be created for aliased tables/columns when connected to MySQL-4.1 or newer.
- Fixed `LOAD DATA LOCAL INFILE` bug when file > `max_allowed_packet`.
- Don't pick up indexes that start with `pri` as primary keys for `DBMD.getPrimaryKeys()`.
- Ensure that packet size from `alignPacketSize()` does not exceed `max_allowed_packet` (JVM bug)
- Don't reset `Connection.isReadOnly()` when autoReconnecting.
- Fixed escaping of `0x5c ('\\')` character for GBK and Big5 charsets.
- Fixed `ResultSet.getTimestamp()` when underlying field is of type `DATE`.
- Throw `SQLExceptions` when trying to do operations on a forcefully closed `Connection` (that is, when a communication link failure occurs).

C.6.4.12. Changes in MySQL Connector/J 3.0.6 (18 February 2003)

Bugs fixed:

- Backported 4.1 charset field info changes from Connector/J 3.1.
- Fixed `Statement.setMaxRows()` to stop sending `LIMIT` type queries when not needed (performance).
- Fixed `DBMD.getTypeInfo()` and `DBMD.getColumns()` returning different value for precision in `TEXT` and `BLOB` types.

- Fixed `SQLExceptions` getting swallowed on initial connect.
- Fixed `ResultSetMetaData` to return "" when catalog not known. Fixes `NullPointerExceptions` with Sun's `CachedRowSet`.
- Allow ignoring of warning for “non transactional tables” during rollback (compliance/usability) by setting `ignoreNonTxTables` property to `true`.
- Clean up `Statement` query/method mismatch tests (that is, `INSERT` not allowed with `.executeQuery()`).
- Fixed `ResultSetMetaData.isWritable()` to return correct value.
- More checks added in `ResultSet` traversal method to catch when in closed state.
- Implemented `Blob.setBytes()`. You still need to pass the resultant `Blob` back into an updatable `ResultSet` or `PreparedStatement` to persist the changes, because MySQL does not support “locators”.
- Add “window” of different `NULL` sorting behavior to `DBMD.nullsAreSortedAtStart` (4.0.2 to 4.0.10, true; otherwise, no).

C.6.4.13. Changes in MySQL Connector/J 3.0.5 (22 January 2003)

Bugs fixed:

- Fixed `ResultSet.isBeforeFirst()` for empty result sets.
- Added missing `LONGTEXT` type to `DBMD.getColumns()`.
- Implemented an empty `TypeMap` for `Connection.getTypeMap()` so that some third-party apps work with MySQL (IBM WebSphere 5.0 Connection pool).
- Added update options for foreign key metadata.
- Fixed `Buffer.fastSkipLenString()` causing `ArrayIndexOutOfBoundsException` exceptions with some queries when unpacking fields.
- Quote table names in `DatabaseMetaData.getColumns()`, `getPrimaryKeys()`, `getIndexInfo()`, `getBestRowIdentifier()`.
- Retrieve `TX_ISOLATION` from database for `Connection.getTransactionIsolation()` when the MySQL version supports it, instead of an instance variable.
- Greatly reduce memory required for `setBinaryStream()` in `PreparedStatements`.

C.6.4.14. Changes in MySQL Connector/J 3.0.4 (06 January 2003)

Bugs fixed:

- Streamlined character conversion and `byte[]` handling in `PreparedStatements` for `setByte()`.
- Fixed `PreparedStatement.executeBatch()` parameter overwriting.
- Added quoted identifiers to database names for `Connection.setCatalog`.
- Added support for 4.0.8-style large packets.
- Reduce memory footprint of `PreparedStatements` by sharing outbound packet with `MySQLIO`.
- Added `strictUpdates` property to allow control of amount of checking for “correctness” of updatable result sets. Set this to `false` if you want faster updatable result sets and you know that you create them from `SELECT` statements on tables with primary keys and that you have selected all primary keys in your query.
- Added support for quoted identifiers in `PreparedStatement` parser.

C.6.4.15. Changes in MySQL Connector/J 3.0.3 (17 December 2002)

Bugs fixed:

- Allow user to alter behavior of `Statement/PreparedStatement.executeBatch()` via `continueBatchOnError` property (defaults to `true`).
- More robust escape tokenizer: Recognize `--` comments, and allow nested escape sequences (see `test-suite.EscapeProcessingTest`).
- Fixed `Buffer.isLastDataPacket()` for 4.1 and newer servers.
- `NamedPipeSocketFactory` now works (only intended for Windows), see [README](#) for instructions.
- Changed `charsToByte` in `SingleByteCharConverter` to be non-static.
- Use non-aliased table/column names and database names to fully qualify tables and columns in `UpdatableResultSet` (requires MySQL-4.1 or newer).
- `LOAD DATA LOCAL INFILE ...` now works, if your server is configured to allow it. Can be turned off with the `allowLoadLocalInfile` property (see the [README](#)).
- Implemented `Connection.nativeSQL()`.
- Fixed `ResultSetMetaData.getColumnTypeName()` returning `BLOB` for `TEXT` and `TEXT` for `BLOB` types.
- Fixed charset handling in `Fields.java`.
- Because of above, implemented `ResultSetMetaData.isAutoIncrement()` to use `Field.isAutoIncrement()`.
- Substitute `'?'` for unknown character conversions in single-byte character sets instead of `'\0'`.
- Added `CLIENT_LONG_FLAG` to be able to get more column flags (`isAutoIncrement()` being the most important).
- Honor `lower_case_table_names` when enabled in the server when doing table name comparisons in `DatabaseMetaData` methods.
- `DBMD.getImported/ExportedKeys()` now handles multiple foreign keys per table.
- More robust implementation of updatable result sets. Checks that *all* primary keys of the table have been selected.
- Some MySQL-4.1 protocol support (extended field info from selects).
- Check for connection closed in more `Connection` methods (`createStatement`, `prepareStatement`, `setTransactionIsolation`, `setAutoCommit`).
- Fixed `ResultSetMetaData.getPrecision()` returning incorrect values for some floating-point types.
- Changed `SingleByteCharConverter` to use lazy initialization of each converter.

C.6.4.16. Changes in MySQL Connector/J 3.0.2 (08 November 2002)

Bugs fixed:

- Implemented `Clob.setString()`.
- Added `com.mysql.jdbc.MiniAdmin` class, which allows you to send `shutdown` command to MySQL server. This is intended to be used when “embedding” Java and MySQL server together in an end-user application.
- Added SSL support. See [README](#) for information on how to use it.
- All `DBMD` result set columns describing schemas now return `NULL` to be more compliant with the behavior of other JDBC drivers for other database systems (MySQL does not support schemas).
- Use `SHOW CREATE TABLE` when possible for determining foreign key information for `DatabaseMetaData`. Also allows cascade options for `DELETE` information to be returned.
- Implemented `Clob.setCharacterStream()`.
- Failover and `autoReconnect` work only when the connection is in an `autoCommit(false)` state, in order to stay transaction-safe.

- Fixed `DBMD.supportsResultSetConcurrency()` so that it returns `true` for `ResultSet.TYPE_SCROLL_INSENSITIVE` and `ResultSet.CONCUR_READ_ONLY` or `ResultSet.CONCUR_UPDATABLE`.
- Implemented `Clob.setAsciiStream()`.
- Removed duplicate code from `UpdatableResultSet` (it can be inherited from `ResultSet`, the extra code for each method to handle updatability I thought might someday be necessary has not been needed).
- Fixed `UnsupportedEncodingException` thrown when “forcing” a character encoding via properties.
- Fixed incorrect conversion in `ResultSet.getLong()`.
- Implemented `ResultSet.updateBlob()`.
- Removed some not-needed temporary object creation by smarter use of `Strings` in `EscapeProcessor`, `Connection` and `DatabaseMetaData` classes.
- Escape `0x5c` character in strings for the SJIS charset.
- `PreparedStatement` now honors stream lengths in `setBinary/Ascii/Character Stream()` unless you set the connection property `useStreamLengthsInPrepStmnts` to `false`.
- Fixed issue with updatable result sets and `PreparedStatements` not working.
- Fixed start position off-by-1 error in `Clob.getSubString()`.
- Added `connectTimeout` parameter that allows users of JDK-1.4 and newer to specify a maximum time to wait to establish a connection.
- Fixed various non-ASCII character encoding issues.
- Fixed `ResultSet.isLast()` for empty result sets (should return `false`).
- Added driver property `useHostsInPrivileges`. Defaults to `true`. Affects whether or not `@hostname` will be used in `DBMD.getColumn/TablePrivileges`.
- Fixed `ResultSet.setFetchDirection(FETCH_UNKNOWN)`.
- Added `queriesBeforeRetryMaster` property that specifies how many queries to issue when failed over before attempting to reconnect to the master (defaults to 50).
- Fixed issue when calling `Statement.setFetchSize()` when using arbitrary values.
- Properly restore connection properties when `autoReconnecting` or failing-over, including `autoCommit` state, and isolation level.
- Implemented `Clob.truncate()`.

C.6.4.17. Changes in MySQL Connector/J 3.0.1 (21 September 2002)

Bugs fixed:

- Charsets now automatically detected. Optimized code for single-byte character set conversion.
- Fixed `ResultSetMetaData.isSigned()` for `TINYINT` and `BIGINT`.
- Fixed `RowDataStatic.getAt()` off-by-one bug.
- Fixed `ResultSet.getRow()` off-by-one bug.
- Massive code clean-up to follow Java coding conventions (the time had come).
- Implemented `ResultSet.getCharacterStream()`.
- Added limited `Clob` functionality (`ResultSet.getClob()`, `PreparedStatement.setClob()`, `PreparedStatement.setObject(Clob)`).
- `Connection.isClosed()` no longer “pings” the server.
- `Connection.close()` issues `rollback()` when `getAutoCommit()` is `false`.

- Added `socketTimeout` parameter to URL.
- Added `LOCAL TEMPORARY` to table types in `DatabaseMetaData.getTableTypes()`.
- Added `paranoid` parameter, which sanitizes error messages by removing “sensitive” information from them (such as host names, ports, or user names), as well as clearing “sensitive” data structures when possible.

C.6.4.18. Changes in MySQL Connector/J 3.0.0 (31 July 2002)

Bugs fixed:

- General source-code cleanup.
- The driver now only works with JDK-1.2 or newer.
- Fix and sort primary key names in `DBMetaData` (SF bugs 582086 and 582086).
- `ResultSet.getTimestamp()` now works for `DATE` types (SF bug 559134).
- Float types now reported as `java.sql.Types.FLOAT` (SF bug 579573).
- Support for streaming (row-by-row) result sets (see [README](#)) Thanks to Doron.
- Testsuite now uses Junit (which you can get from <http://www.junit.org>).
- JDBC Compliance: Passes all tests besides stored procedure tests.
- `ResultSet.getDate/Time/Timestamp` now recognizes all forms of invalid values that have been set to all zeros by MySQL (SF bug 586058).
- Added multi-host failover support (see [README](#)).
- Repackaging: New driver name is `com.mysql.jdbc.Driver`, old name still works, though (the driver is now provided by MySQL-AB).
- Support for large packets (new addition to MySQL-4.0 protocol), see [README](#) for more information.
- Better checking for closed connections in `Statement` and `PreparedStatement`.
- Performance improvements in string handling and field metadata creation (lazily instantiated) contributed by Alex Twisleton-Wykeham-Fiennes.
- JDBC-3.0 functionality including `Statement/PreparedStatement.getGeneratedKeys()` and `ResultSet.getURL()`.
- Overall speed improvements via controlling transient object creation in `MysqlIO` class when reading packets.
- **!!! LICENSE CHANGE !!!** The driver is now GPL. If you need non-GPL licenses, please contact me [<mark@mysql.com>](mailto:mark@mysql.com).
- Performance enhancements: Driver is now 50–100% faster in most situations, and creates fewer temporary objects.

C.6.5. Changes in MySQL Connector/J 2.0.x

C.6.5.1. Changes in MySQL Connector/J 2.0.14 (16 May 2002)

Bugs fixed:

- `ResultSet.getDouble()` now uses code built into JDK to be more precise (but slower).
- Fixed typo for `relaxAutoCommit` parameter.
- `LogicalHandle.isClosed()` calls through to physical connection.
- Added SQL profiling (to `STDERR`). Set `profileSql=true` in your JDBC URL. See [README](#) for more information.
- `PreparedStatement` now releases resources on `.close()`. (SF bug 553268)

- More code cleanup.
- Quoted identifiers not used if server version does not support them. Also, if server started with `--ansi` or `--sql-mode=ANSI_QUOTES`, “” will be used as an identifier quote character, otherwise “'” will be used.

C.6.5.2. Changes in MySQL Connector/J 2.0.13 (24 April 2002)

Bugs fixed:

- Fixed unicode chars being read incorrectly. (SF bug 541088)
- Faster blob escaping for `PreparedStatement`.
- Added `setURL()` to `MySQLXADataSource`. (SF bug 546019)
- Added `set/getPortNumber()` to `DataSource(s)`. (SF bug 548167)
- `PreparedStatement.toString()` fixed. (SF bug 534026)
- More code cleanup.
- Rudimentary version of `Statement.getGeneratedKeys()` from JDBC-3.0 now implemented (you need to be using JDK-1.4 for this to work, I believe).
- `DBMetaData.getIndexInfo()` - bad PAGES fixed. (SF BUG 542201)
- `ResultSetMetaData.getColumnClassName()` now implemented.

C.6.5.3. Changes in MySQL Connector/J 2.0.12 (07 April 2002)

Bugs fixed:

- Fixed `TestSuite.TraversalAfterLast()` bug, thanks to Igor Lastric.
- Added new types to `getTypeInfo()`, fixed existing types thanks to Al Davis and Kid Kalanon.
- Fixed time zone off-by-1-hour bug in `PreparedStatement` (538286, 528785).
- Added identifier quoting to all `DatabaseMetaData` methods that need them (should fix 518108).
- Added support for `BIT` types (51870) to `PreparedStatement`.
- `ResultSet.insertRow()` should now detect `auto_increment` fields in most cases and use that value in the new row. This detection will not work in multi-valued keys, however, due to the fact that the MySQL protocol does not return this information.
- Relaxed synchronization in all classes, should fix 520615 and 520393.
- `DataSources` - fixed `setUrl` bug (511614, 525565), wrong datasource class name (532816, 528767).
- Added support for `YEAR` type (533556).
- Fixes for `ResultSet` updatability in `PreparedStatement`.
- `ResultSet`: Fixed updatability (values being set to `null` if not updated).
- Added `getTable/ColumnPrivileges()` to `DBMD` (fixes 484502).
- Added `getIdleFor()` method to `Connection` and `MySQLLogicalHandle`.
- `ResultSet.refreshRow()` implemented.
- Fixed `getRow()` bug (527165) in `ResultSet`.
- General code cleanup.

C.6.5.4. Changes in MySQL Connector/J 2.0.11 (27 January 2002)

Bugs fixed:

- Full synchronization of `Statement.java`.
- Fixed missing `DELETE_RULE` value in `DBMD.getImported/ExportedKeys()` and `getCrossReference()`.
- More changes to fix `Unexpected end of input stream` errors when reading `BLOB` values. This should be the last fix.

C.6.5.5. Changes in MySQL Connector/J 2.0.10 (24 January 2002)

Bugs fixed:

- Fixed null-pointer-exceptions when using `MysqlConnectionPoolDataSource` with Websphere 4 (bug 505839).
- Fixed spurious `Unexpected end of input stream` errors in `MysqlIO` (bug 507456).

C.6.5.6. Changes in MySQL Connector/J 2.0.9 (13 January 2002)

Bugs fixed:

- Fixed extra memory allocation in `MysqlIO.readPacket()` (bug 488663).
- Added detection of network connection being closed when reading packets (thanks to Todd Lizambri).
- Fixed casting bug in `PreparedStatement` (bug 488663).
- `DataSource` implementations moved to `org.gjt.mm.mysql.jdbc2.optional` package, and (initial) implementations of `PooledConnectionDataSource` and `XADataSource` are in place (thanks to Todd Wolff for the implementation and testing of `PooledConnectionDataSource` with IBM WebSphere 4).
- Fixed quoting error with escape processor (bug 486265).
- Removed concatenation support from driver (the `||` operator), as older versions of VisualAge seem to be the only thing that use it, and it conflicts with the logical `||` operator. You will need to start `mysqld` with the `--ansi` flag to use the `||` operator as concatenation (bug 491680).
- `Ant` build was corrupting included `jar` files, fixed (bug 487669).
- Report batch update support through `DatabaseMetaData` (bug 495101).
- Implementation of `DatabaseMetaData.getExported/ImportedKeys()` and `getCrossReference()`.
- Fixed off-by-one-hour error in `PreparedStatement.setTimestamp()` (bug 491577).
- Full synchronization on methods modifying instance and class-shared references, driver should be entirely thread-safe now (please let me know if you have problems).

C.6.5.7. Changes in MySQL Connector/J 2.0.8 (25 November 2001)

Bugs fixed:

- `XADataSource/ConnectionPoolDataSource` code (experimental)
- `DatabaseMetaData.getPrimaryKeys()` and `getBestRowIdentifier()` are now more robust in identifying primary keys (matches regardless of case or abbreviation/full spelling of `Primary Key` in `Key_type` column).
- Batch updates now supported (thanks to some inspiration from Daniel Rall).
- `PreparedStatement.setAnyNumericType()` now handles positive exponents correctly (adds `+` so MySQL can understand it).

C.6.5.8. Changes in MySQL Connector/J 2.0.7 (24 October 2001)

Bugs fixed:

- Character sets read from database if `useUnicode=true` and `characterEncoding` is not set. (thanks to Dmitry Vereshchagin)
- Initial transaction isolation level read from database (if available). (thanks to Dmitry Vereshchagin)
- Fixed `PreparedStatement` generating SQL that would end up with syntax errors for some queries.
- `PreparedStatement.setCharacterStream()` now implemented
- Capitalize type names when `capitalizeTypeNames=true` is passed in URL or properties (for WebObjects. (thanks to Anjo Krank)
- `ResultSet.getBlob()` now returns `null` if column value was `null`.
- Fixed `ResultSetMetaData.getPrecision()` returning one less than actual on newer versions of MySQL.
- Fixed dangling socket problem when in high availability (`autoReconnect=true`) mode, and finalizer for `Connection` will close any dangling sockets on GC.
- Fixed time zone issue in `PreparedStatement.setTimestamp()`. (thanks to Erik Olofsson)
- `PreparedStatement.setDouble()` now uses full-precision doubles (reverting a fix made earlier to truncate them).
- Fixed `DatabaseMetaData.supportsTransactions()`, and `supportsTransactionIsolationLevel()` and `getTypeInfo()` `SQL_DATETIME_SUB` and `SQL_DATA_TYPE` fields not being readable.
- Updatable result sets now correctly handle `NULL` values in fields.
- `PreparedStatement.setBoolean()` will use 1/0 for values if your MySQL version is 3.21.23 or higher.
- Fixed `ResultSet.isAfterLast()` always returning `false`.

C.6.5.9. Changes in MySQL Connector/J 2.0.6 (16 June 2001)

Bugs fixed:

- Fixed `PreparedStatement` parameter checking.
- Fixed case-sensitive column names in `ResultSet.java`.

C.6.5.10. Changes in MySQL Connector/J 2.0.5 (13 June 2001)

Bugs fixed:

- `ResultSet.insertRow()` works now, even if not all columns are set (they will be set to `NULL`).
- Added `Byte` to `PreparedStatement.setObject()`.
- Fixed data parsing of `TIMESTAMP` values with 2-digit years.
- Added `ISOLATION` level support to `Connection.setIsolationLevel()`
- `DatabaseMetaData.getCrossReference()` no longer `ArrayIndexOOB`.
- `ResultSet.getBoolean()` now recognizes `-1` as `true`.
- `ResultSet` has `+/-Inf/inf` support.
- `getObject()` on `ResultSet` correctly does `TINYINT->Byte` and `SMALLINT->Short`.
- Fixed `ResultSetMetaData.getColumnTypeName` for `TEXT/BLOB`.

- Fixed `ArrayIndexOutOfBoundsException` when sending large `BLOB` queries. (Max size packet was not being set)
- Fixed NPE on `PreparedStatement.executeUpdate()` when all columns have not been set.
- Fixed `ResultSet.getBlob()` `ArrayIndex` out-of-bounds.

C.6.5.11. Changes in MySQL Connector/J 2.0.3 (03 December 2000)

Bugs fixed:

- Fixed composite key problem with updatable result sets.
- Faster ASCII string operations.
- Fixed off-by-one error in `java.sql.Blob` implementation code.
- Fixed incorrect detection of `MAX_ALLOWED_PACKET`, so sending large blobs should work now.
- Added detection of `-/+INF` for doubles.
- Added `ultraDevHack` URL parameter, set to `true` to allow (broken) Macromedia UltraDev to use the driver.
- Implemented `getBigDecimal()` without scale component for JDBC2.

C.6.5.12. Changes in MySQL Connector/J 2.0.1 (06 April 2000)

Bugs fixed:

- Columns that are of type `TEXT` now return as `Strings` when you use `getObject()`.
- Cleaned up exception handling when driver connects.
- Fixed `RSMD.isWritable()` returning wrong value. Thanks to Moritz Maass.
- `DatabaseMetaData.getPrimaryKeys()` now works correctly with respect to `key_seq`. Thanks to Brian Slesinsky.
- Fixed many JDBC-2.0 traversal, positioning bugs, especially with respect to empty result sets. Thanks to Ron Smits, Nick Brook, Cessar Garcia and Carlos Martinez.
- No escape processing is done on `PreparedStatements` anymore per JDBC spec.
- Fixed some issues with updatability support in `ResultSet` when using multiple primary keys.

C.6.5.13. Changes in MySQL Connector/J 2.0.0pre5 (21 February 2000)

- Fixed Bad Handshake problem.

C.6.5.14. Changes in MySQL Connector/J 2.0.0pre4 (10 January 2000)

- Fixes to `ResultSet` for `insertRow()` - Thanks to Cesar Garcia
- Fix to Driver to recognize JDBC-2.0 by loading a JDBC-2.0 class, instead of relying on JDK version numbers. Thanks to John Baker.
- Fixed `ResultSet` to return correct row numbers
- `Statement.executeUpdate()` now returns rows matched, instead of rows actually updated, which is more SQL-92 like.

10-29-99

- `Statement/PreparedStatement.getMoreResults()` bug fixed. Thanks to Noel J. Bergman.

- Added Short as a type to PreparedStatement.setObject(). Thanks to Jeff Crowder
- Driver now automagically configures maximum/preferred packet sizes by querying server.
- Autoreconnect code uses fast ping command if server supports it.
- Fixed various bugs with respect to packet sizing when reading from the server and when alloc'ing to write to the server.

C.6.5.15. Changes in MySQL Connector/J 2.0.0pre (17 August 1999)

- Now compiles under JDK-1.2. The driver supports both JDK-1.1 and JDK-1.2 at the same time through a core set of classes. The driver will load the appropriate interface classes at runtime by figuring out which JVM version you are using.
- Fixes for result sets with all nulls in the first row. (Pointed out by Tim Endres)
- Fixes to column numbers in SQLExceptions in ResultSet (Thanks to Blas Rodriguez Somoza)
- The database no longer needs to be specified to connect. (Thanks to Christian Motschke)

C.6.6. Changes in MySQL Connector/J 1.2b (04 July 1999)

- Better Documentation (in progress), in doc/mm.doc/book1.html
- DBMD now allows null for a column name pattern (not in spec), which it changes to '%'
- DBMD now has correct types/lengths for getXXX().
- ResultSet.getDate(), getTime(), and getTimestamp() fixes. (contributed by Alan Wilken)
- EscapeProcessor now handles \{ \} and { } inside quotes correctly. (thanks to Alik for some ideas on how to fix it)
- Fixes to properties handling in Connection. (contributed by Juho Tikkala)
- ResultSet.getObject() now returns null for NULL columns in the table, rather than bombing out. (thanks to Ben Grosman)
- ResultSet.getObject() now returns Strings for types from MySQL that it doesn't know about. (Suggested by Chris Perdue)
- Removed DataInput/Output streams, not needed, 1/2 number of method calls per IO operation.
- Use default character encoding if one is not specified. This is a work-around for broken JVMs, because according to spec, EVERY JVM must support "ISO8859_1", but they do not.
- Fixed Connection to use the platform character encoding instead of "ISO8859_1" if one isn't explicitly set. This fixes problems people were having loading the character- converter classes that didn't always exist (JVM bug). (thanks to Fritz Elfert for pointing out this problem)
- Changed MySQLIO to re-use packets where possible to reduce memory usage.
- Fixed escape-processor bugs pertaining to { } inside quotes.

C.6.7. Changes in MySQL Connector/J 1.2.x and lower

C.6.7.1. Changes in MySQL Connector/J 1.2a (14 April 1999)

- Fixed character-set support for non-Javasoft JVMs (thanks to many people for pointing it out)
- Fixed ResultSet.getBoolean() to recognize 'y' & 'n' as well as '1' & '0' as boolean flags. (thanks to Tim Pizey)
- Fixed ResultSet.getTimestamp() to give better performance. (thanks to Richard Swift)
- Fixed getByte() for numeric types. (thanks to Ray Bellis)
- Fixed DatabaseMetaData.getTypeInfo() for DATE type. (thanks to Paul Johnston)

- Fixed EscapeProcessor for "fn" calls. (thanks to Piyush Shah at locomotive.org)
- Fixed EscapeProcessor to not do extraneous work if there are no escape codes. (thanks to Ryan Gustafson)
- Fixed Driver to parse URLs of the form "jdbc:mysql://host:port" (thanks to Richard Lobb)

C.6.7.2. Changes in MySQL Connector/J 1.1i (24 March 1999)

- Fixed Timestamps for PreparedStatements
- Fixed null pointer exceptions in RSMD and RS
- Re-compiled with jikes for valid class files (thanks ms!)

C.6.7.3. Changes in MySQL Connector/J 1.1h (08 March 1999)

- Fixed escape processor to deal with unmatched { and } (thanks to Craig Coles)
- Fixed escape processor to create more portable (between DATETIME and TIMESTAMP types) representations so that it will work with BETWEEN clauses. (thanks to Craig Longman)
- MysqlIO.quit() now closes the socket connection. Before, after many failed connections some OS's would run out of file descriptors. (thanks to Michael Brinkman)
- Fixed NullPointerException in Driver.getPropertyInfo. (thanks to Dave Potts)
- Fixes to MysqlDefs to allow all *text fields to be retrieved as Strings. (thanks to Chris at Leverage)
- Fixed setDouble in PreparedStatement for large numbers to avoid sending scientific notation to the database. (thanks to J.S. Ferguson)
- Fixed getScale() and getPrecision() in RSMD. (contrib'd by James Klicman)
- Fixed getObject() when field was DECIMAL or NUMERIC (thanks to Bert Hobbs)
- DBMD.getTables() bombed when passed a null table-name pattern. Fixed. (thanks to Richard Lobb)
- Added check for "client not authorized" errors during connect. (thanks to Hannes Wallnoefer)

C.6.7.4. Changes in MySQL Connector/J 1.1g (19 February 1999)

- Result set rows are now byte arrays. Blobs and Unicode work bidirectionally now. The useUnicode and encoding options are implemented now.
- Fixes to PreparedStatement to send binary set by setXXXStream to be sent untouched to the MySQL server.
- Fixes to getDriverPropertyInfo().

C.6.7.5. Changes in MySQL Connector/J 1.1f (31 December 1998)

- Changed all ResultSet fields to Strings, this should allow Unicode to work, but your JVM must be able to convert between the character sets. This should also make reading data from the server be a bit quicker, because there is now no conversion from StringBuffer to String.
- Changed PreparedStatement.streamToString() to be more efficient (code from Uwe Schaefer).
- URL parsing is more robust (throws SQL exceptions on errors rather than NullPointerExceptions)
- PreparedStatement now can convert Strings to Time/Date values via setObject() (code from Robert Currey).
- IO no longer hangs in Buffer.readInt(), that bug was introduced in 1.1d when changing to all byte-arrays for result sets. (Pointed out by Samo Login)

C.6.7.6. Changes in MySQL Connector/J 1.1b (03 November 1998)

- Fixes to DatabaseMetaData to allow both IBM VA and J-Builder to work. Let me know how it goes. (thanks to Jac Kersing)
- Fix to ResultSet.getBoolean() for NULL strings (thanks to Barry Lagerweij)
- Beginning of code cleanup, and formatting. Getting ready to branch this off to a parallel JDBC-2.0 source tree.
- Added "final" modifier to critical sections in MysqlIO and Buffer to allow compiler to inline methods for speed.

9-29-98

- If object references passed to setXXX() in PreparedStatement are null, setNull() is automatically called for you. (Thanks for the suggestion goes to Erik Ostrom)
- setObject() in PreparedStatement will now attempt to write a serialized representation of the object to the database for objects of Types.OTHER and objects of unknown type.
- Util now has a static method readObject() which given a ResultSet and a column index will re-instantiate an object serialized in the above manner.

C.6.7.7. Changes in MySQL Connector/J 1.1 (02 September 1998)

- Got rid of "ugly hack" in MysqlIO.nextRow(). Rather than catch an exception, Buffer.isLastDataPacket() was fixed.
- Connection.getCatalog() and Connection.setCatalog() should work now.
- Statement.setMaxRows() works, as well as setting by property maxRows. Statement.setMaxRows() overrides maxRows set via properties or url parameters.
- Automatic re-connection is available. Because it has to "ping" the database before each query, it is turned off by default. To use it, pass in "autoReconnect=true" in the connection URL. You may also change the number of reconnect tries, and the initial timeout value via "maxReconnects=n" (default 3) and "initialTimeout=n" (seconds, default 2) parameters. The timeout is an exponential backoff type of timeout; for example, if you have initial timeout of 2 seconds, and maxReconnects of 3, then the driver will timeout 2 seconds, 4 seconds, then 16 seconds between each re-connection attempt.

C.6.7.8. Changes in MySQL Connector/J 1.0 (24 August 1998)

- Fixed handling of blob data in Buffer.java
- Fixed bug with authentication packet being sized too small.
- The JDBC Driver is now under the LPGL

8-14-98

- Fixed Buffer.readLenString() to correctly read data for BLOBS.
- Fixed PreparedStatement.stringToStream to correctly read data for BLOBS.
- Fixed PreparedStatement.setDate() to not add a day. (above fixes thanks to Vincent Partington)
- Added URL parameter parsing (?user=... and so forth).

C.6.7.9. Changes in MySQL Connector/J 0.9d (04 August 1998)

- Big news! New package name. Tim Endres from ICE Engineering is starting a new source tree for GNU GPL'd Java software. He's graciously given me the org.gjt.mm package directory to use, so now the driver is in the org.gjt.mm.mysql package scheme. I'm "legal" now. Look for more information on Tim's project soon.

- Now using dynamically sized packets to reduce memory usage when sending commands to the DB.
- Small fixes to `getTypeInfo()` for parameters, and so forth.
- `DatabaseMetaData` is now fully implemented. Let me know if these drivers work with the various IDEs out there. I've heard that they're working with JBuilder right now.
- Added JavaDoc documentation to the package.
- Package now available in .zip or .tar.gz.

C.6.7.10. Changes in MySQL Connector/J 0.9 (28 July 1998)

- Implemented `getTypeInfo()`. `Connection.rollback()` now throws an `SQLException` per the JDBC spec.
- Added `PreparedStatement` that supports all JDBC API methods for `PreparedStatement` including `InputStreams`. Please check this out and let me know if anything is broken.
- Fixed a bug in `ResultSet` that would break some queries that only returned 1 row.
- Fixed bugs in `DatabaseMetaData.getTables()`, `DatabaseMetaData.getColumns()` and `DatabaseMetaData.getCatalogs()`.
- Added functionality to `Statement` that allows `executeUpdate()` to store values for IDs that are automatically generated for `AUTO_INCREMENT` fields. Basically, after an `executeUpdate()`, look at the `SQLWarnings` for warnings like `"LAST_INSERTED_ID = 'some number', COMMAND = 'your SQL query'"`. If you are using `AUTO_INCREMENT` fields in your tables and are executing a lot of `executeUpdate(s)` on one `Statement`, be sure to `clearWarnings()` every so often to save memory.

C.6.7.11. Changes in MySQL Connector/J 0.8 (06 July 1998)

- Split `MysqlIO` and `Buffer` to separate classes. Some `ClassLoaders` gave an `IllegalAccessException` error for some fields in those two classes. Now `mm.mysql` works in applets and all classloaders. Thanks to Joe Ennis <jce@mail.boone.com> for pointing out the problem and working on a fix with me.

C.6.7.12. Changes in MySQL Connector/J 0.7 (01 July 1998)

- Fixed `DatabaseMetadata` problems in `getColumns()` and bug in switch statement in the `Field` constructor. Thanks to Costin Manolache <costin@tdiinc.com> for pointing these out.

C.6.7.13. Changes in MySQL Connector/J 0.6 (21 May 1998)

- Incorporated efficiency changes from Richard Swift <Richard.Swift@kanatek.ca> in `MysqlIO.java` and `ResultSet.java`:
- We're now 15% faster than gwe's driver.
- Started working on `DatabaseMetaData`.
- The following methods are implemented:
 - `getTables()`
 - `getTableTypes()`
 - `getColumns()`
 - `getCatalogs()`

C.7. MySQL Connector/MXJ Change History

C.7.1. Changes in MySQL Connector/MXJ 5.0.6 (04 May 2007)

Functionality added or changed:

- Updated internal jar file names to include version information and be more consistent with Connector/J jar naming. For example, `connector-mxj.jar` is now `mysql-connector-mxj-${mxj-version}.jar`.
- Updated commercial license files.
- Added copyright notices to some classes which were missing them.
- Added `InitializeUser` and `QueryUtil` classes to support new feature.
- Added new tests for initial-user & expanded some existing tests.
- `ConnectorMXJUrlTestExample` and `ConnectorMXJObjectTestExample` now demonstrate the initialization of user/password and creating the initial database (rather than using "test").
- Added new connection property `initialize-user` which, if set to `true` will remove the default, un-passworded anonymous and root users, and create the user/password from the connection url.
- Removed obsolete field `SimpleMySqlDynamicMBean.lastInvocation`.
- Clarified code in `DefaultsMap.entrySet()`.
- Removed obsolete `PatchedStandardSocketFactory` java file.
- Added `main(String[])` to `com/mysql/management/AllTestsSuite.java`.
- Errors reading `portFile` are now reported using `stacktrace(err)`, previously `System.err` was used.
- `portFile` now contains a new-line to be consistent with `pidFile`.
- Fixed where `versionString.trim()` was ignored.
- Removed references to `File.deleteOnExit`, a warning is printed instead.

Bugs fixed:

- Changed tests to shutdown `mysqld` prior to deleting files.
- Fixed port file to always be written to `datadir`.
- Added `os.name-os.arch` to resource directory mapping properties file.
- Swapped out commercial binaries for v5.0.40.
- Delete `portFile` on shutdown.
- Moved `platform-map.properties` into `db-files.jar`.
- Clarified the startup max wait numbers.
- Updated `build.xml` in preparation for next beta build.
- Removed `use-default-architecture` property replaced.
- Added null-check to deal with C/MXJ being loaded by the bootstrap classloaders with JVMs for which `getClassLoader()` returns null.
- Added robustness around reading portfile.
- Removed `PatchedStandardSocketFactory` (fixed in Connector/J 5.0.6).
- Refactored duplication from tests and examples to `QueryUtil`.
- Removed obsolete `InitializePasswordExample`

C.7.2. Changes in MySQL Connector/MXJ 5.0.5 (14 March 2007)

Bugs fixed:

- Moved `MysqldFactory` to main package.
- Reformatting: Added newlines some files which did not end in them.
- Swapped out commercial binaries for v5.0.36.
- Found and removed dynamic linking in `mysql_kill`; updated solution.
- Changed protected constructor of `SimpleMysqldDynamicMBean` from taking a `MysqldResource` to taking a `MysqldFactory`, in order to lay groundwork for addressing BUG discovered by Andrew Rubinger. See: [MySQL Forums](#) (Actual testing with JBoss, and filing a bug, is still required.)
- `build.xml: usage` now slightly more verbose; some reformatting.
- Now incorporates Reggie Bennett's `SafeTerminateProcess` and only calls the unsafe `TerminateProcess` as a final last resort.
- New windows `kill.exe` fixes bug where `mysqld` was being force terminated. Issue reported by bruno haleblan and others, see: [MySQL Forums](#).
- Replaced `Boolean.parseBoolean` with JDK 1.4 compliant `valueOf`.
- Changed `connector-mxj.properties` default `mysql` version to 5.0.37.
- In testing so far `mysqld` reliably shuts down cleanly much faster.
- Added testcase to `com.mysql.management.jmx.AcceptanceTest` which demonstrates that `dataDir` is a mutable MBean property.
- Updated `build.xml` in prep for next release.
- Changed `SimpleMysqldDynamicMBean` to create `MysqldResource` on demand in order to allow setting of `datadir`. (Rubinger bug groundwork).
- Clarified the synchronization of `MysqldResource` methods.
- `SIGHUP` is replaced with `MySQLShutdown<PID>` event.
- Clarified the immutability of `baseDir`, `dataDir`, `pidFile`, `portFile`.
- Added 5.1.15 binaries to the repository.
- Removed 5.1.14 binaries from the repository.
- Added `getDataDir()` to interface `MysqldResourceI`.
- Added 5.1.14 binaries to repository.
- Replaced windows `kill.exe` resource with re-written version specific to `mysqld`.
- Added Patched `StandardSocketFactory` from Connector/J 5-0 HEAD.
- Ensured 5.1.14 compatibility.
- Swapped out `gpl` binaries for v5.0.37.
- Removed 5.0.22 binaries from the repository.

C.7.3. Changes in MySQL Connector/MXJ 5.0.4 (28 January 2007)

Bugs fixed:

- Allow multiple calls to start server from URL connection on non-3306 port. ([Bug#24004](#))
- Updated `build.xml` to build to handle with different `gpl` and commercial `mysld` version numbers.

- Only populate the options map from the help text if specifically requested or in the MBean case.
- Introduced property for Linux & WinXX to default to 32bit versions.
- Swapped out gpl binaries for v5.0.27.
- Swapped out commercial binaries for v5.0.32.
- Moved mysqld binary resourced into separate jar file NOTICE: `CLASSPATH` will now need to `connector-mxj-db-files.jar`.
- Minor test robustness improvements.
- Moved default version string out of java class into a text editable properties file (`connector-mxj.properties`) in the resources directory.
- Fixed test to be tollerant of `/tmp` being a symlink to `/foo/tmp`.

C.7.4. Changes in MySQL Connector/MXJ 5.0.3 (24 June 2006)

Bugs fixed:

- Removed unused imports, formatted code, made minor edits to tests.
- Removed "TeeOutputStream" - no longer needed.
- Swapped out the mysqld binaries for MySQL v5.0.22.

C.7.5. Changes in MySQL Connector/MXJ 5.0.2 (15 June 2006)

Bugs fixed:

- Replaced string parsing with JDBC connection attempt for determining if a mysqld is "ready for connections" `CLASSPATH` will now need to include Connector/J jar.
- "platform" directories replace spaces with underscores
- extracted array and list printing to ListToString utility class
- Swapped out the mysqld binaries for MySQL v5.0.21
- Added trace level logging with Aspect/J. `CLASSPATH` will now need to include `lib/aspectjrt.jar`
- reformatted code
- altered to be "basedir" rather than "port" oriented.
- help parsing test reflects current help options
- insulated users from problems with "." in basedir
- swapped out the mysqld binaries for MySQL v5.0.18
- Made tests more robust by deleting the `/tmp/test-c.mxj` directory before running tests.
- `ServerLauncherSocketFactory.shutdown` API change: now takes File parameter (basedir) instead of port.
- socket is now "mysql.sock" in datadir
- added ability to specify "mysql-version" as an url parameter
- Extended timeout for help string parsing, to avoid cases where the help text was getting prematurely flushed, and thus truncated.
- swapped out the mysqld binaries for MySQL v5.0.19
- `MysqldResource` now tied to `dataDir` as well as `basedir` (API CHANGE)

- moved PID file into datadir
- `ServerLauncherSocketFactory.shutdown` now works across JVMs.
- extracted `splitLines(String)` to `Str` utility class
- `ServerLauncherSocketFactory.shutdown(port)` no longer throws, only reports to `System.err`
- `ServerLauncherSocketFactory` now treats URL parameters in the form of `&server.foo=null` as `serverOptionMap.put("foo", null)`
- `ServerLauncherSocketFactory.shutdown` API change: now takes 2 File parameters (basedir, datadir)

C.7.6. Changes in MySQL Connector/MXJ 5.0.1 (Never released)

This was an internal only release.

C.7.7. Changes in MySQL Connector/MXJ 5.0.0 (09 December 2005)

Bugs fixed:

- Removed `HelpOptionsParser`'s need to reference a `MysqldResource`.
- Reorganized utils into a single "Utils" collaborator.
- Minor test tweaks
- Altered examples and tests to use new Connector/J 5.0 URL syntax for launching Connector/MXJ ("`jdbc:mysql:mxj://`")
- Swapped out the `mysqld` binaries for MySQL v5.0.16.
- Ditched "ClassUtil" (merged with `Str`).
- Minor refactorings for type casting and exception handling.

C.8. MySQL Connector/C++ Change History

C.8.1. Changes in MySQL Connector/C++ 1.0.x

C.8.1.1. Changes in MySQL Connector/CPP 1.0.5 (21 April 2009)

This is the first Generally Available (GA) release.

Functionality added or changed:

- The interface of `sql::ConnectionMetaData`, `sql::ResultSetMetaData` and `sql::ParameterMetaData` was modified to have a protected destructor. As a result the client code has no need to destruct the metadata objects returned by the connector. MySQL Connector/C++ handles the required destruction. This enables statements such as:

```
connection->getMetaData->getSchema();
```

This avoids potential memory leaks that could occur as a result of losing the pointer returned by `getMetaData()`.

- Improved memory management. Potential memory leak situations are handled more robustly.
- Changed the interface of `sql::Driver` and `sql::Connection` so they accept the options map by alias instead of by value.
- Changed the return type of `sql::SQLException::getSQLState()` from `std::string` to `const char *` to be consistent with `std::exception::what()`.
- Implemented `getResultSetType()` and `setResultSetType()` for `Statement`. Uses `TYPE_FORWARD_ONLY`, which means unbuffered result set and `TYPE_SCROLL_INSENSITIVE`, which means buffered result set.
- Implemented `getResultSetType()` for `PreparedStatement`. The setter is not implemented because currently `Pre-`

`paredStatement` cannot do refetching. Storing the result means the bind buffers will be correct.

- Added the option `defaultStatementResultType` to `MySQL_Connection::setClientOption()`. Also, the method now returns `sql::Connection *`.
- Added `Result::getType()`. Implemented for the three result set classes.
- Enabled tracing functionality when building with Microsoft Visual C++ 8 and later, which corresponds to Microsoft Visual Studio 2005 and later.
- Added better support for named pipes, on Windows. Use `pipe://` and add the path to the pipe. Shared memory connections are currently not supported.

Bugs fixed:

- A bug was fixed in `MySQL_Connection::setSessionVariable()`, which had been causing exceptions to be thrown.

C.8.1.2. Changes in MySQL Connector/CPP 1.0.4 (31 March 2009 beta)

Functionality added or changed:

- An installer was added for the Windows operating system.
- Minimum CMake version required was changed from 2.4.2 to 2.6.2. The latest version is required for building on Windows.
- `metadataUseInfoSchema` was added to the connection property map, which allows control of the `INFORMATION_SCHEMA` for meta data.
- Implemented `MySQL_ConnectionMetaData::supportsConvert(from, to)`.
- Added support for MySQL Connector/C.

Bugs fixed:

- A bug was fixed in all implementations of `ResultSet::relative()` which was giving a wrong return value although positioning was working correctly.
- A leak was fixed in `MySQL_PreparedResultSet`, which occurred when the result contained a `BLOB` column.

C.8.1.3. Changes in MySQL Connector/CPP 1.0.3 (02 March 2009 alpha)

Functionality added or changed:

- Added new tests in `test/unit/classes`. Those tests are mostly about code coverage. Most of the actual functionality of the driver is tested by the tests found in `test/CJUnitPort`.
- New data types added to the list returned by `DatabaseMetaData::getTypeInfo()` are `FLOAT UNSIGNED`, `DECIMAL UNSIGNED`, `DOUBLE UNSIGNED`. Those tests may not be in the JDBC specification. However, due to the change you should be able to look up every type and type name returned by, for example, `ResultSetMetaData::getColumnTypeName()`.
- `MySQL_Driver::getPatchVersion` introduced.
- Major performance improvements due to new buffered `ResultSet` implementation.
- Addition of `test/unit/README` with instructions for writing bug and regression tests.
- Experimental support for STLPort. This feature may be removed again at any time later without prior warning! Type `cmake -L` for configuration instructions.
- Added properties enabled methods for connecting, which add many connect options. This uses a dictionary (map) of key value pairs. Methods added are `Driver::connect(map)`, and `Connection::Connection(map)`.

- New BLOB implementation. `sql::Blob` was removed in favor of `std::istream`. C++'s `IOStream` library is very powerful, similar to PHP's streams. It makes no sense to reinvent the wheel. For example, you can pass a `std::istream` object to `setBlob()` if the data is in memory, or just open a file `std::fstream` and let it stream to the DB, or write its own stream. This is also true for `getBlob()` where you can just copy data (if a buffered result set), or stream data (if implemented).
- Implemented `ResultSet::getBlob()` which returns `std::stream`.
- Fixed `MySQL_DatabaseMetaData::getTablePrivileges()`. Test cases were added in the first unit testing framework.
- Implemented `MySQL_Connection::setSessionVariable()` for setting variables like `sql_mode`.
- Implemented `MySQL_DatabaseMetaData::getColumnPrivileges()`.
- `cppconn/datatype.h` has changed and is now used again. Reimplemented the type subsystem to be more usable - more types for binary and nonbinary strings.
- Implementation for `MySQL_DatabaseMetaData::getImportedKeys()` for MySQL versions before 5.1.16 using `SHOW`, and above using `INFORMATION_SCHEMA`.
- Implemented `MySQL_ConnectionMetaData::getProcedureColumns()`.
- `make package_source` now packs with `bzip2`.
- Re-added `getTypeInfo()` with information about all types supported by MySQL and the `sql::DataType`.
- Changed the implementation of `MySQL_ConstructedResultSet` to use the more efficient O(1) access method. This should improve the speed with which the metadata result sets are used. Also, there is less copying during the construction of the result set, which means that all result sets returned from the meta data functions will be faster.
- Introduced, internally, `sql::mysql::MyVal` which has implicit constructors. Used in `mysql_metadata.cpp` to create result sets with native data instead of always string (varchar).
- Renamed `ResultSet::getLong()` to `ResultSet::getInt64()`. `resultset.h` includes typedefs for Windows to be able to use `int64_t`.
- Introduced `ResultSet::getUInt()` and `ResultSet::getUInt64()`.
- Improved the implementation for `ResultSetMetaData::isReadOnly()`. Values generated from views are read-only. These generated values don't have `db` in `MYSQL_FIELD` set, while all normal columns do have.
- Implemented `MySQL_DatabaseMetaData::getExportedKeys()`.
- Implemented `MySQL_DatabaseMetaData::getCrossReference()`.

Bugs fixed:

- Bug fixed in `MySQL_PreparedResultSet::getString()`. Returned string that had real data but the length was random. Now, the string is initialized with the correct length and thus is binary safe.
- Corrected handling of unsigned server types. Now returning correct values.
- Fixed handling of numeric columns in `ResultSetMetaData::isCaseSensitive` to return `false`.

C.8.1.4. Changes in MySQL Connector/CPP 1.0.2 (19 December 2008 alpha)

Functionality added or changed:

- Implemented `getScale()`, `getPrecision()` and `getColumnDisplaySize()` for `MySQL_ResultSetMetaData` and `MySQL_Prepared_ResultSetMetaData`.
- Changed `ResultSetMetaData` methods `getColumnDisplaySize()`, `getPrecision()`, `getScale()` to return `unsigned int` instead of `signed int`.
- `DATE`, `DATETIME` and `TIME` are now being handled when calling the `MySQL_PreparedResultSet` methods `getString()`, `getDouble()`, `getInt()`, `getLong()`, `getBoolean()`.

- Reverted implementation of `MySQL_DatabaseMetaData::getTypeInfo()`. Now unimplemented. In addition, removed `cppconn/datatype.h` for now, until a more robust implementation of the types can be developed.
- Implemented `MySQL_PreparedStatement::setNull()`.
- Implemented `MySQL_PreparedStatement::clearParameters()`.
- Added PHP script `examples/cpp_trace_analyzer.php` to filter the output of the debug trace. Please see the inline comments for documentation. This script is unsupported.
- Implemented `MySQL_ResultSetMetaData::getPrecision()` and `MySQL_Prepared_ResultSetMetaData::getPrecision()`, updating example.
- Added new unit test framework for JDBC compliance and regression testing.
- Added `test/unit` as a basis for general unit tests using the new test framework, see `test/unit/example` for basic usage examples.

Bugs fixed:

- Fixed `MySQL_PreparedStatementResultSet::getDouble()` to return the correct value when the underlying type is `MYSQL_TYPE_FLOAT`.
- Fixed bug in `MySQL_ConnectionMetaData::getIndexInfo()`. The method did not work because the schema name wasn't included in the query sent to the server.
- Fixed a bug in `MySQL_ConnectionMetaData::getColumns()` which was performing a cartesian product of the columns in the table times the columns matching `columnNamePattern`. The example `example/connection_meta_schemaobj.cpp` was extended to cover the function.
- Fixed bugs in `MySQL_DatabaseMetaData`. All `supportsCatalogXXXXX` methods were incorrectly returning `true` and all `supportsSchemaXXXX` methods were incorrectly returning `false`. Now `supportsCatalogXXXXX` returns `false` and `supportsSchemaXXXXX` returns `true`.
- Fixed bugs in the `MySQL_PreparedStatements` methods `setBigInt()` and `setDatetime()`. They decremented the internal column index before forwarding the request. This resulted in a double-decrement and therefore the wrong internal column index. The error message generated was:

```
setString() ... invalid "parameterIndex"
```
- Fixed a bug in `getString().getString()` is now binary safe. A new example was also added.
- Fixed bug in `FLOAT` handling.
- Fixed `MySQL_PreparedStatement::setBlob()`. In the tests there is a simple example of a class implementing `sql::Blob`.

C.8.1.5. Changes in MySQL Connector/CPP 1.0.1 (01 December 2008 alpha)

Functionality added or changed:

- `sql::mysql::MySQL_SQLException` was removed. The distinction between server and client (connector) errors, based on the type of the exception, has been removed. However, the error code can still be checked in order to evaluate the error type.
- Support for (n)make install was added. You can change the default installation path. Carefully read the messages displayed after executing `cmake`. The following are installed:
 - Static and the dynamic version of the library, `libmysqlcppconn`.
 - Generic interface, `cppconn`.
 - Two MySQL specific headers:

`mysql_driver.h`, use this if you want to get your connections from the driver instead of instantiating a `MySQL_Connection` object. This makes your code portable when using the common interface.

`mysql_connection.h`, use this if you intend to link directly to the `MySQL_Connection` class and use its specifics

not found in `sql::Connection`.

However, you can make your application fully abstract by using the generic interface rather than these two headers.

- Driver Manager was removed.
- Added `ConnectionMetaData::getSchemas()` and `Connection::setSchema()`.
- `ConnectionMetaData::getCatalogTerm()` returns not applicable, there is no counterpart to catalog in MySQL Connector/C++.
- Added experimental GCov support, `cmake -DMYSQLCPPCONN_GCOV_ENABLE:BOOL=1`
- All examples can be given optional connection parameters on the command line, for example:

```
examples/connect tcp://host:port user pass database
```

or

```
examples/connect unix:///path/to/mysql.sock user pass database
```

- Renamed `ConnectionMetaData::getTables: TABLE_COMMENT` to `REMARKS`.
- Renamed `ConnectionMetaData::getProcedures: PROCEDURE_SCHEMA` to `PROCEDURE_SCHEM`.
- Renamed `ConnectionMetaData::getPrimaryKeys(): COLUMN` to `COLUMN_NAME`, `SEQUENCE` to `KEY_SEQ`, and `INDEX_NAME` to `PK_NAME`.
- Renamed `ConnectionMetaData::getImportedKeys(): PKTABLE_CATALOG` to `PKTABLE_CAT`, `PKTABLE_SCHEMA` to `PKTABLE_SCHEM`, `FKTABLE_CATALOG` to `FKTABLE_CAT`, `FKTABLE_SCHEMA` to `FKTABLE_SCHEM`.
- Changed metadata column name `TABLE_CATALOG` to `TABLE_CAT` and `TABLE_SCHEMA` to `TABLE_SCHEM` to ensure JDBC compliance.
- Introduced experimental CPack support, see make help.
- All tests changed to create TAP compliant output.
- Renamed `sql::DbcMethodNotImplemented` to `sql::MethodNotImplementedException`
- Renamed `sql::DbcInvalidArgument` to `sql::InvalidArgumentException`
- Changed `sql::DbcException` to implement the interface of JDBC's `SQLException`. Renamed to `sql::SQLException`.
- Converted Connector/J tests added.
- MySQL Workbench 5.1 changed to use MySQL Connector/C++ for its database connectivity.
- New directory layout.

C.9. MySQL Proxy Change History

C.9.1. Changes in MySQL Proxy 0.7.0 (Not yet released)

Bugs fixed:

- **Security Enhancement:** Accessing `mysql-proxy` using a client or backend with a MySQL protocol less than MySQL 5.0 would result in `mysql-proxy` aborting with an assertion. This is because `mysql-proxy` only supports MySQL Protocol 5.0 or higher. The proxy will now report a fault. ([Bug#31419](#))
- Using `mysql-proxy` with very large return datasets from queries, with or without manipulate of the dataset within the Lua engine could cause a crash. ([Bug#39332](#))
- If a submitted packet was smaller than expected by the protocol, MySQL Proxy would terminate. ([Bug#36743](#))
- When using `mysql-proxy` in a master-master replication scenario, a failure in one of the replication masters would fail to be

identified by the proxy and connections would not be redirected to the other master. ([Bug#35295](#))

C.9.2. Changes in MySQL Proxy 0.6.1 (06 February 2008)

Functionality added or changed:

- Fixed assertions on write-errors
- Fixed sending fake server-greetings in `connect_server()`.
- Fixed error handling for socket functions on Windows.
- Added new features to `run-tests.lua`.

C.9.3. Changes in MySQL Proxy 0.6.0 (11 September 2007)

Functionality added or changed:

- When using read/write splitting and the `rw-splitting.lua` example script, connecting a second user to the proxy returns an error message. ([Bug#30867](#))
- Added support in `read_query_result()` to overwrite the result-set.
- Added `--no-daemon` and `--pid-file`.
- Added hooks for `read_auth()`, `read_handshake()` and `read_auth_result()`.
- Added handling of `proxy.connection.backend_ndx` in `connect_server()` and `read_query()` to support read/write splitting.
- Added support for `proxy.response.packets`.
- Added testcases.
- Added `--no-proxy` to disable the proxy.
- Added support for listening UNIX sockets.
- Added a global lua-scope `proxy.global.*`.
- Added connection pooling.

Bugs fixed:

- Fixed assertion on `COM_BINLOG_DUMP`. ([Bug#29764](#))
- Fixed assertion on result-packets like `[field-len | fields | EOF | ERR]`. ([Bug#29732](#))
- Fixed assertion at login with empty password + empty default db. ([Bug#29719](#))
- Fixed assertion at `COM_SHUTDOWN`. ([Bug#29719](#))
- Fixed crash if `proxy.connection` is used in `connect_server()`.
- Fixed check for `glib2` to require at least 2.6.0.
- Fixed assertion when all backends are down and we try to connect.
- Fixed connection-stalling if `read_query_result()` throws an `assert()` ion.
- Fixed len-encoding on `proxy.resultsets`.
- Fixed compilation on win32.
- Fixed assertion when connecting to the MySQL 6.0.1.

- Fixed decoding of len-encoded ints for 3-byte notation.
- Fixed `inj.resultset.affected_rows` on `SELECT` queries.
- Fixed handling of (SQL) `NULL` in result-sets.
- Fixed mem-leak with `proxy.response.*` is used.

C.9.4. Changes in MySQL Proxy 0.5.1 (30 June 2007)

Functionality added or changed:

- Added `resultset.affected_rows` and `resultset.insert_id`.
- Changed `--proxy.profiling` to `--proxy-skip-profiling`.
- Added missing dependency to `libmysqlclient-dev` to the `INSTALL` file.
- Added `inj.query_time` and `inj.response_time` into the lua scripts.
- Added support for pre-4.1 passwords in a 4.1 connection.
- Added script examples for rewriting and injection.
- Added `proxy.VERSION`.
- Added support for UNIX sockets.
- Added protection against duplicate resultsets from a script.

Bugs fixed:

- Fixed mysql check in configure to die when `mysql.h` isn't detected.
- Fixed handling of duplicate ERR on `COM_CHANGE_USER` in MySQL 5.1.18+.
- Fixed compile error with MySQL 4.1.x on missing `COM_STMT_*`.
- Fixed crash on fields > 250 bytes when the resultset is inspected.
- Fixed warning if `connect_server()` is not provided.
- Fixed assertion when a error occurs at initial script exec time.
- Fixed assertion when `read_query_result()` is not provided when `PROXY_SEND_QUERY` is used.

C.9.5. Changes in MySQL Proxy 0.5.0 (19 June 2007)

This is the first beta release.

Bugs fixed:

- Added `automake/autoconf` support.
- Added `cmake` support.

Appendix D. Restrictions and Limits

The discussion here describes restrictions that apply to the use of MySQL features such as subqueries or views.

D.1. Restrictions on Stored Routines, Triggers, and Events

Some of the restrictions noted here apply to all stored routines; that is, both to stored procedures and stored functions. Some of these restrictions apply to stored functions but not to stored procedures.

The restrictions for stored functions also apply to triggers. There are also some restrictions specific to triggers.

The restrictions for stored procedures also apply to the `DO` clause of Event Scheduler event definitions. There are also some restrictions specific to events.

Stored routines cannot contain arbitrary SQL statements. The following statements are disallowed:

- The locking statements `LOCK TABLES` and `UNLOCK TABLES`.
- `ALTER VIEW`.
- `LOAD DATA` and `LOAD TABLE`.
- SQL prepared statements (`PREPARE`, `EXECUTE`, `DEALLOCATE PREPARE`) can be used in stored procedures, but not stored functions or triggers. Implication: You cannot use dynamic SQL within stored functions or triggers (where you construct dynamically statements as strings and then execute them).

In addition, SQL statements that are not permitted within prepared statements are also not permitted in stored routines. See [Section 12.7, “SQL Syntax for Prepared Statements”](#), for a list of statements supported as prepared statements. Statements not listed there are not supported for SQL prepared statements and thus are also not supported for stored routines unless noted otherwise in [Section 18.2, “Using Stored Routines \(Procedures and Functions\)”](#).

- Inserts cannot be delayed. `INSERT DELAYED` syntax is accepted but the statement is handled as a normal `INSERT`.
- Within all stored programs (stored procedures and functions, triggers, and events), the parser treats `BEGIN [WORK]` as the beginning of a `BEGIN . . . END` block. Begin a transaction in this context with `START TRANSACTION` instead.

For stored functions (but not stored procedures), the following additional statements or operations are disallowed:

- Statements that perform explicit or implicit commit or rollback. Support for these statements is not required by the SQL standard, which states that each DBMS vendor may decide whether to allow them.
- Statements that return a result set. This includes `SELECT` statements that do not have an `INTO var_list` clause and other statements such as `SHOW`, `EXPLAIN`, and `CHECK TABLE`. A function can process a result set either with `SELECT . . . INTO var_list` or by using a cursor and `FETCH` statements. See [Section 12.8.3.3, “SELECT . . . INTO Statement”](#).
- `FLUSH` statements.
- Stored functions cannot be used recursively.
- Within a stored function or trigger, it is not permitted to modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.
- If you refer to a temporary table multiple times in a stored function under different aliases, a `Can't reopen table: 'tbl_name'` error occurs, even if the references occur in different statements within the function.
- A stored function acquires table locks before executing, to avoid inconsistency in the binary log due to mismatch of the order in which statements execute and when they appear in the log. When statement-based binary logging is used, statements that invoke a function are recorded rather than the statements executed within the function. Consequently, stored functions that update the same underlying tables do not execute in parallel. In contrast, stored procedures do not acquire table-level locks. All statements executed within stored procedures are written to the binary log even for statement-based binary logging. See [Section 18.6, “Binary Logging of Stored Programs”](#).

Although some restrictions normally apply to stored functions and triggers but not to stored procedures, those restrictions do apply to stored procedures if they are invoked from within a stored function or trigger. For example, if you use `FLUSH` in a stored procedure, that stored procedure cannot be called from a stored function or trigger.

It is possible for the same identifier to be used for a routine parameter, a local variable, and a table column. Also, the same local variable name can be used in nested blocks. For example:

```
CREATE PROCEDURE p (i INT)
BEGIN
  DECLARE i INT DEFAULT 0;
  SELECT i FROM t;
  BEGIN
    DECLARE i INT DEFAULT 1;
    SELECT i FROM t;
  END;
END;
```

In such cases the identifier is ambiguous and the following precedence rules apply:

- A local variable takes precedence over a routine parameter or table column
- A routine parameter takes precedence over a table column
- A local variable in an inner block takes precedence over a local variable in an outer block

The behavior that variables take precedence over table columns is non-standard.

Use of stored routines can cause replication problems. This issue is discussed further in [Section 18.6, “Binary Logging of Stored Programs”](#).

`INFORMATION_SCHEMA` does not have a `PARAMETERS` table until MySQL 6.0, so applications that need to acquire routine parameter information at runtime must use workarounds such as parsing the output of `SHOW CREATE` statements or the `param_list` column of the `mysql.proc` table. `param_list` contents can be processed from within a stored routine, unlike the output from `SHOW`.

There are no stored routine debugging facilities.

`UNDO` handlers are not supported.

`FOR` loops are not supported.

To prevent problems of interaction between server threads, when a client issues a statement, the server uses a snapshot of routines and triggers available for execution of the statement. That is, the server calculates a list of procedures, functions, and triggers that may be used during execution of the statement, loads them, and then proceeds to execute the statement. This means that while the statement executes, it will not see changes to routines performed by other threads.

For triggers, the following additional statements or operations are disallowed:

- Triggers currently are not activated by foreign key actions.
- When using row-based replication, triggers on the slave are not activated by statements originating on the master. This does not apply when using statement-based replication. For more information, see [Section 16.3.1.26, “Replication and Triggers”](#).
- The `RETURN` statement is disallowed in triggers, which cannot return a value. To exit a trigger immediately, use the `LEAVE` statement.
- Triggers are not allowed on tables in the `mysql` database.

The following limitations are specific to the Event Scheduler:

- Event names are handled in case-insensitive fashion. For example, this means that you cannot have two events in the same database with the names `anEvent` and `AnEvent`.
- An event may not be created, altered, or dropped by a stored routine, trigger, or another event. An event also may not create, alter, or drop stored routines or triggers. ([Bug#16409](#), [Bug#18896](#))
- Event timings using the intervals `YEAR`, `QUARTER`, `MONTH`, and `YEAR_MONTH` are resolved in months; those using any other interval are resolved in seconds. There is no way to cause events scheduled to occur at the same second to execute in a given order. In addition — due to rounding, the nature of threaded applications, and the fact that a nonzero length of time is required to create events and to signal their execution — events may be delayed by as much as 1 or 2 seconds. However, the time shown in the `INFORMATION_SCHEMA.EVENTS` table's `LAST_EXECUTED` column or the `mysql.event` table's `last_executed` column is always accurate to within one second of the actual event execution time. (See also [Bug#16522](#).)

- Each execution of the statements contained in the body of an event takes place in a new connection; thus, these statements has no effect in a given user session on the server's statement counts such as `Com_select` and `Com_insert` that are displayed by `SHOW STATUS`. However, such counts *are* updated in the global scope. (Bug#16422)
- Events do not support times later than the end of the Unix Epoch; this is approximately the beginning of the year 2038. Such dates are specifically disallowed by the Event Scheduler. (Bug#16396)
- References to stored functions, user-defined functions, and tables in the `ON SCHEDULE` clauses of `CREATE EVENT` and `ALTER EVENT` statements are not supported. These sorts of references are disallowed. (See Bug#22830 for more information.)
- Generally speaking, statements which are not permitted in stored routines or in SQL prepared statements are also not allowed in the body of an event. For more information, see Section 12.7, “SQL Syntax for Prepared Statements”.

Stored routines and triggers in MySQL Cluster. Stored functions, stored procedures, and triggers are all supported by tables using the `NDB` storage engine; however, it is important to keep in mind that they do *not* propagate automatically between MySQL Servers acting as Cluster SQL nodes. This is because of the following:

- Stored routine definitions are kept in tables in the `mysql` system database using the `MyISAM` storage engine, and so do not participate in clustering.
- The `.TRN` and `.TRG` files containing trigger definitions are not read by the `NDB` storage engine, and are not copied between Cluster nodes.

Any stored routine or trigger that interacts with MySQL Cluster tables must be re-created by running the appropriate `CREATE PROCEDURE`, `CREATE FUNCTION`, or `CREATE TRIGGER` statements on each MySQL Server that participates in the cluster where you wish to use the stored routine or trigger. Similarly, any changes to existing stored routines or triggers must be carried out explicitly on all Cluster SQL nodes, using the appropriate `ALTER` or `DROP` statements on each MySQL Server accessing the cluster.

Warning

Do *not* attempt to work around the issue described in the first item mentioned previously by converting any `mysql` database tables to use the `NDB` storage engine. *Altering the system tables in the `mysql` database is not supported* and is very likely to produce undesirable results.

D.2. Restrictions on Server-Side Cursors

Server-side cursors are implemented in the C API via the `mysql_stmt_attr_set()` function. The same implementation is used for cursors in stored routines. A server-side cursor allows a result set to be generated on the server side, but not transferred to the client except for those rows that the client requests. For example, if a client executes a query but is only interested in the first row, the remaining rows are not transferred.

In MySQL, a server-side cursor is materialized into a temporary table. Initially, this is a `MEMORY` table, but is converted to a `MyISAM` table if its size reaches the value of the `max_heap_table_size` system variable. One limitation of the implementation is that for a large result set, retrieving its rows through a cursor might be slow.

Cursors are read only; you cannot use a cursor to update rows.

`UPDATE WHERE CURRENT OF` and `DELETE WHERE CURRENT OF` are not implemented, because updatable cursors are not supported.

Cursors are non-holdable (not held open after a commit).

Cursors are asensitive.

Cursors are non-scrollable.

Cursors are not named. The statement handler acts as the cursor ID.

You can have open only a single cursor per prepared statement. If you need several cursors, you must prepare several statements.

You cannot use a cursor for a statement that generates a result set if the statement is not supported in prepared mode. This includes statements such as `CHECK TABLE`, `HANDLER READ`, and `SHOW BINLOG EVENTS`.

D.3. Restrictions on Subqueries

- A subquery's outer statement can be any one of: `SELECT`, `INSERT`, `UPDATE`, `DELETE`, `SET`, or `DO`.
- Subquery optimization for `IN` is not as effective as for the `=` operator or for the `IN(value_list)` operator.

A typical case for poor `IN` subquery performance is when the subquery returns a small number of rows but the outer query returns a large number of rows to be compared to the subquery result.

The problem is that, for a statement that uses an `IN` subquery, the optimizer rewrites it as a correlated subquery. Consider the following statement that uses an uncorrelated subquery:

```
SELECT ... FROM t1 WHERE t1.a IN (SELECT b FROM t2);
```

The optimizer rewrites the statement to a correlated subquery:

```
SELECT ... FROM t1 WHERE EXISTS (SELECT 1 FROM t2 WHERE t2.b = t1.a);
```

If the inner and outer queries return M and N rows, respectively, the execution time becomes on the order of $O(M \times N)$, rather than $O(M+N)$ as it would be for an uncorrelated subquery.

An implication is that an `IN` subquery can be much slower than a query written using an `IN(value_list)` operator that lists the same values that the subquery would return.

- In general, you cannot modify a table and select from the same table in a subquery. For example, this limitation applies to statements of the following forms:

```
DELETE FROM t WHERE ... (SELECT ... FROM t ...);
UPDATE t ... WHERE col = (SELECT ... FROM t ...);
{INSERT|REPLACE} INTO t (SELECT ... FROM t ...);
```

Exception: The preceding prohibition does not apply if you are using a subquery for the modified table in the `FROM` clause. Example:

```
UPDATE t ... WHERE col = (SELECT * FROM (SELECT ... FROM t...) AS _t ...);
```

Here the prohibition does not apply because the result from a subquery in the `FROM` clause is stored as a temporary table, so the relevant rows in `t` have already been selected by the time the update to `t` takes place.

- Row comparison operations are only partially supported:
 - For `expr IN (subquery)`, `expr` can be an n -tuple (specified via row constructor syntax) and the subquery can return rows of n -tuples.
 - For `expr op {ALL|ANY|SOME} (subquery)`, `expr` must be a scalar value and the subquery must be a column subquery; it cannot return multiple-column rows.

In other words, for a subquery that returns rows of n -tuples, this is supported:

```
(val_1, ..., val_n) IN (subquery)
```

But this is not supported:

```
(val_1, ..., val_n) op {ALL|ANY|SOME} (subquery)
```

The reason for supporting row comparisons for `IN` but not for the others is that `IN` is implemented by rewriting it as a sequence of `=` comparisons and `AND` operations. This approach cannot be used for `ALL`, `ANY`, or `SOME`.

- Row constructors are not well optimized. The following two expressions are equivalent, but only the second can be optimized:

```
(col1, col2, ...) = (val1, val2, ...)
col1 = val1 AND col2 = val2 AND ...
```

- Subqueries in the `FROM` clause cannot be correlated subqueries. They are materialized (executed to produce a result set) before evaluating the outer query, so they cannot be evaluated per row of the outer query.
- The optimizer is more mature for joins than for subqueries, so in many cases a statement that uses a subquery can be executed more efficiently if you rewrite it as a join.

An exception occurs for the case where an `IN` subquery can be rewritten as a `SELECT DISTINCT` join. Example:

```
SELECT col FROM t1 WHERE id_col IN (SELECT id_col2 FROM t2 WHERE condition);
```

That statement can be rewritten as follows:

```
SELECT DISTINCT col FROM t1, t2 WHERE t1.id_col = t2.id_col AND condition;
```

But in this case, the join requires an extra `DISTINCT` operation and is not more efficient than the subquery.

- Possible future optimization: MySQL does not rewrite the join order for subquery evaluation. In some cases, a subquery could be executed more efficiently if MySQL rewrote it as a join. This would give the optimizer a chance to choose between more execution plans. For example, it could decide whether to read one table or the other first.

Example:

```
SELECT a FROM outer_table AS ot
WHERE a IN (SELECT a FROM inner_table AS it WHERE ot.b = it.b);
```

For that query, MySQL always scans `outer_table` first and then executes the subquery on `inner_table` for each row. If `outer_table` has a lot of rows and `inner_table` has few rows, the query probably will not be as fast as it could be.

The preceding query could be rewritten like this:

```
SELECT a FROM outer_table AS ot, inner_table AS it
WHERE ot.a = it.a AND ot.b = it.b;
```

In this case, we can scan the small table (`inner_table`) and look up rows in `outer_table`, which will be fast if there is an index on `(ot.a, ot.b)`.

- Possible future optimization: A correlated subquery is evaluated for each row of the outer query. A better approach is that if the outer row values do not change from the previous row, do not evaluate the subquery again. Instead, use its previous result.
- Possible future optimization: A subquery in the `FROM` clause is evaluated by materializing the result into a temporary table, and this table does not use indexes. This does not allow the use of indexes in comparison with other tables in the query, although that might be useful.
- Possible future optimization: If a subquery in the `FROM` clause resembles a view to which the merge algorithm can be applied, rewrite the query and apply the merge algorithm so that indexes can be used. The following statement contains such a subquery:

```
SELECT * FROM (SELECT * FROM t1 WHERE t1.t1_col)
AS _t1, t2 WHERE t2.t2_col;
```

The statement can be rewritten as a join like this:

```
SELECT * FROM t1, t2 WHERE t1.t1_col AND t2.t2_col;
```

This type of rewriting would provide two benefits:

- It avoids the use of a temporary table for which no indexes can be used. In the rewritten query, the optimizer can use indexes on `t1`.
- It gives the optimizer more freedom to choose between different execution plans. For example, rewriting the query as a join allows the optimizer to use `t1` or `t2` first.
- Possible future optimization: For `IN`, `= ANY`, `<> ANY`, `= ALL`, and `<> ALL` with uncorrelated subqueries, use an in-memory hash for a result or a temporary table with an index for larger results. Example:

```
SELECT a FROM big_table AS bt
WHERE non_key_field IN (SELECT non_key_field FROM table WHERE condition)
```

In this case, we could create a temporary table:

```
CREATE TABLE t (key (non_key_field))
(SELECT non_key_field FROM table WHERE condition)
```

Then, for each row in `big_table`, do a key lookup in `t` based on `bt.non_key_field`.

D.4. Restrictions on Views

View processing is not optimized:

- It is not possible to create an index on a view.
- Indexes can be used for views processed using the merge algorithm. However, a view that is processed with the temptable algorithm is unable to take advantage of indexes on its underlying tables (although indexes can be used during generation of the temporary tables).

Subqueries cannot be used in the `FROM` clause of a view.

There is a general principle that you cannot modify a table and select from the same table in a subquery. See [Section D.3, “Restrictions on Subqueries”](#).

The same principle also applies if you select from a view that selects from the table, if the view selects from the table in a subquery and the view is evaluated using the merge algorithm. Example:

```
CREATE VIEW v1 AS
SELECT * FROM t2 WHERE EXISTS (SELECT 1 FROM t1 WHERE t1.a = t2.a);
UPDATE t1, v2 SET t1.a = 1 WHERE t1.b = v2.b;
```

If the view is evaluated using a temporary table, you *can* select from the table in the view subquery and still modify that table in the outer query. In this case the view will be stored in a temporary table and thus you are not really selecting from the table in a subquery and modifying it “at the same time.” (This is another reason you might wish to force MySQL to use the temptable algorithm by specifying `ALGORITHM = TEMPTABLE` in the view definition.)

You can use `DROP TABLE` or `ALTER TABLE` to drop or alter a table that is used in a view definition. No warning results from the `DROP` or `ALTER` operation, even though this invalidates the view. Instead, an error occurs later, when the view is used. `CHECK TABLE` can be used to check for views that have been invalidated by `DROP` or `ALTER` operations.

A view definition is “frozen” by certain statements:

- If a statement prepared by `PREPARE` refers to a view, the view definition seen each time the statement is executed later will be the definition of the view at the time it was prepared. This is true even if the view definition is changed after the statement is prepared and before it is executed. Example:

```
CREATE VIEW v AS SELECT RAND();
PREPARE s FROM 'SELECT * FROM v';
ALTER VIEW v AS SELECT NOW();
EXECUTE s;
```

The result returned by the `EXECUTE` statement is a random number, not the current date and time.

With regard to view updatability, the overall goal for views is that if any view is theoretically updatable, it should be updatable in practice. This includes views that have `UNION` in their definition. Currently, not all views that are theoretically updatable can be updated. The initial view implementation was deliberately written this way to get usable, updatable views into MySQL as quickly as possible. Many theoretically updatable views can be updated now, but limitations still exist:

- Updatable views with subqueries anywhere other than in the `WHERE` clause. Some views that have subqueries in the `SELECT` list may be updatable.
- You cannot use `UPDATE` to update more than one underlying table of a view that is defined as a join.
- You cannot use `DELETE` to update a view that is defined as a join.

There exists a shortcoming with the current implementation of views. If a user is granted the basic privileges necessary to create a view (the `CREATE VIEW` and `SELECT` privileges), that user will be unable to call `SHOW CREATE VIEW` on that object unless the user is also granted the `SHOW VIEW` privilege.

That shortcoming can lead to problems backing up a database with `mysqldump`, which may fail due to insufficient privileges. This problem is described in [Bug#22062](#).

The workaround to the problem is for the administrator to manually grant the `SHOW VIEW` privilege to users who are granted `CREATE VIEW`, since MySQL doesn't grant it implicitly when views are created.

Views do not have indexes, so index hints do not apply. Use of index hints when selecting from a view is disallowed.

`SHOW CREATE VIEW` displays view definitions using an `AS alias_name` clause for each column. If a column is created from an expression, the default alias is the expression text, which can be quite long. Aliases for column names in `CREATE VIEW` statements are checked against the maximum column length of 64 characters (not the maximum alias length of 256 characters). As a result, views created from the output of `SHOW CREATE VIEW` fail if any column alias exceeds 64 characters. This can cause problems in the following circumstances for views with too-long aliases:

- View definitions fail to replicate to newer slaves that enforce the column-length restriction.
- Dump files created with `mysqldump` cannot be loaded into servers that enforce the column-length restriction.

A workaround for either problem is to modify each problematic view definition to use aliases that provide shorter column names. Then the view will replicate properly, and can be dumped and reloaded without causing an error. To modify the definition, drop and create the view again with `DROP VIEW` and `CREATE VIEW`, or replace the definition with `CREATE OR REPLACE VIEW`.

For problems that occur when reloading view definitions in dump files, another workaround is to edit the dump file to modify its `CREATE VIEW` statements. However, this does not change the original view definitions, which may cause problems for subsequent dump operations.

D.5. Restrictions on XA Transactions

XA transaction support is limited to the `InnoDB` storage engine.

For “external XA,” a MySQL server acts as a Resource Manager and client programs act as Transaction Managers. For “Internal XA”, storage engines within a MySQL server act as RMs, and the server itself acts as a TM. Internal XA support is limited by the capabilities of individual storage engines. Internal XA is required for handling XA transactions that involve more than one storage engine. The implementation of internal XA requires that a storage engine support two-phase commit at the table handler level, and currently this is true only for `InnoDB`.

For `XA START`, the `JOIN` and `RESUME` clauses are not supported.

For `XA END`, the `SUSPEND [FOR MIGRATE]` clause is not supported.

The requirement that the `bqual` part of the `xid` value be different for each XA transaction within a global transaction is a limitation of the current MySQL XA implementation. It is not part of the XA specification.

If an XA transaction has reached the `PREPARED` state and the MySQL server is killed (for example, with `kill -9` on Unix) or shuts down abnormally, the transaction can be continued after the server restarts. However, if the client reconnects and commits the transaction, the transaction will be absent from the binary log even though it has been committed. This means the data and the binary log have gone out of synchrony. An implication is that XA cannot be used safely together with replication.

It is possible that the server will roll back a pending XA transaction, even one that has reached the `PREPARED` state. This happens if a client connection terminates and the server continues to run, or if clients are connected and the server shuts down gracefully. (In the latter case, the server marks each connection to be terminated, and then rolls back the `PREPARED` XA transaction associated with it.) It should be possible to commit or roll back a `PREPARED` XA transaction, but this cannot be done without changes to the binary logging mechanism.

D.6. Restrictions on Character Sets

- Identifiers are stored in `mysql` database tables (`user`, `db`, and so forth) using `utf8`, but identifiers can contain only characters in the Basic Multilingual Plane (BMP). Supplementary characters are not allowed in identifiers.
- The `ucs2` character sets has the following restrictions:
 - It cannot be used as a client character set, which means that it does not work for `SET NAMES` or `SET CHARACTER SET`. (See [Section 9.1.4, “Connection Character Sets and Collations”](#).)
 - It is currently not possible to use `LOAD DATA INFILE` to load data files that use this character set.
 - `FULLTEXT` indexes cannot be created on a column that this character set. However, you can perform `IN BOOLEAN MODE` searches on the column without an index.
- The `REGEXP` and `RLIKE` operators work in byte-wise fashion, so they are not multi-byte safe and may produce unexpected results with multi-byte character sets. In addition, these operators compare characters by their byte values and accented characters may not compare as equal even if a given collation treats them as equal.

D.7. Limits in MySQL

This section lists current limits in MySQL 5.4.

D.7.1. Limits of Joins

The maximum number of tables that can be referenced in a single join is 61. This also applies to the number of tables that can be referenced in the definition of a view.

D.7.2. The Maximum Number of Columns Per Table

There is a hard limit of 4096 columns per table, but the effective maximum may be less for a given table. The exact limit depends on several interacting factors, listed in the following discussion.

- Every table has a maximum row size of 65,535 bytes. This maximum applies to all storage engines, but a given engine might have additional constraints that result in a lower effective maximum row size.

The maximum row size constrains the number of columns because the total width of all columns cannot exceed this size. For example, `utf8` characters require up to three bytes per character, so for a `CHAR(255) CHARACTER SET utf8` column, the server must allocate $255 \times 3 = 765$ bytes per value. Consequently, a table cannot contain more than $65,535 / 765 = 85$ such columns.

Storage for variable-length columns includes length bytes, which are assessed against the row size. For example, a `VARCHAR(255) CHARACTER SET utf8` column takes two bytes to store the length of the value, so each value can take up to 767 bytes.

`BLOB` and `TEXT` columns count from one to four plus eight bytes each toward the row-size limit because their contents are stored separately.

Declaring columns `NULL` can reduce the maximum number of columns allowed. `NULL` columns require additional space in the row to record whether or not their values are `NULL`.

For `MyISAM` tables, each `NULL` column takes one bit extra, rounded up to the nearest byte. The maximum row length in bytes can be calculated as follows:

```
row length = 1
             + (sum of column lengths)
             + (number of NULL columns + delete_flag + 7)/8
             + (number of variable-length columns)
```

`delete_flag` is 1 for tables with static row format. Static tables use a bit in the row record for a flag that indicates whether the row has been deleted. `delete_flag` is 0 for dynamic tables because the flag is stored in the dynamic row header.

These calculations do not apply for `InnoDB` tables, for which storage size is no different for `NULL` columns than for `NOT NULL` columns.

The following statement to create table `t1` succeeds because the columns require 32,765 + 2 bytes and 32,766 + 2 bytes, which falls within the maximum row size of 65,535 bytes:

```
mysql> CREATE TABLE t1
-> (c1 VARCHAR(32765) NOT NULL, c2 VARCHAR(32766) NOT NULL);
Query OK, 0 rows affected (0.01 sec)
```

The following statement to create table `t2` fails because the columns are `NULL` and require additional space that causes the row size to exceed 65,535 bytes:

```
mysql> CREATE TABLE t2
-> (c1 VARCHAR(32765) NULL, c2 VARCHAR(32766) NULL);
ERROR 1118 (42000): Row size too large. The maximum row size for the
used table type, not counting BLOBs, is 65535. You have to change some
columns to TEXT or BLOBs
```

- Each table has an `.frm` file that contains the table definition. The `.frm` file size limit is fixed at 64KB. If a table definition reaches this size, no more columns can be added. The expression that checks information to be stored in the `.frm` file against the limit looks like this:

```
if (info_length+(ulong) create_fields.elements*FCOMP+288+
    n_length+int_length+com_length > 65535L || int_count > 255)
```

The relevant factors in this expression are:

- `info_length` is space needed for “screens.” This is related to MySQL's Unireg heritage.
- `create_fields.elements` is the number of columns.
- `FCOMP` is 17.
- `n_length` is the total length of all column names, including one byte per name as a separator.
- `int_length` is related to the list of values for SET and ENUM columns.
- `com_length` is the total length of column and table comments.

Thus, using long column names can reduce the maximum number of columns, as can the inclusion of `ENUM` or `SET` columns, or use of column or table comments.

- Individual storage engines might impose additional restrictions that limit table column count. Examples:
 - `InnoDB` allows no more than 1000 columns.
 - `InnoDB` restricts row size to something less than half a database page (approximately 8000 bytes), not including `VARBINARY`, `VARCHAR`, `BLOB`, or `TEXT` columns.
 - Different `InnoDB` storage formats (`COMPRESSED`, `REDUNDANT`) use different amounts of page header and trailer data, which affects the amount of storage available for rows.

D.7.3. Windows Platform Limitations

The following limitations apply only to the Windows platform:

- The number of open file descriptors on Windows is limited to a maximum of 2048, which may limit the ability to open a large number of tables simultaneously. This limit is due to the compatibility functions used to open files on Windows that use the POSIX compatibility layer.

This limitation will also cause problems if you try to set `open_files_limit` to a value greater than the 2048 file limit.

- On Windows 32-bit platforms it is not possible to use more than 2GB of RAM within a single process, including MySQL. This is because the physical address limit on Windows 32-bit is 4GB and the default setting within Windows is to split the virtual address space between kernel (2GB) and user/applications (2GB).

To use more memory than this you will need to use a 64-bit version of Windows.

- When using `MyISAM` tables, you cannot use aliases within Windows link to the data files on another volume and then link back to the main MySQL `datadir` location.

This facility is often used to move the data and index files to a RAID or other fast solution, while retaining the main `.FRM` files in the default data directory configured with the `datadir` option.

- The timers within MySQL used on Windows are of a lower precision than the timers used on Linux. For most situations you may not notice a difference, but the delay implied by a call to `SLEEP()` on Windows and Linux may differ slightly due to the differences in precision.
- There is no 64-bit OLEDB Provider for ODBC (`MSDASQL`) in any 64-bit Windows operating system up to and including Windows Vista. In practical terms this means that you can't use the MySQL ODBC driver from ADO and other users of OLEDB.
